16. Check for continuity between ECM connector terminal A10 and body ground.

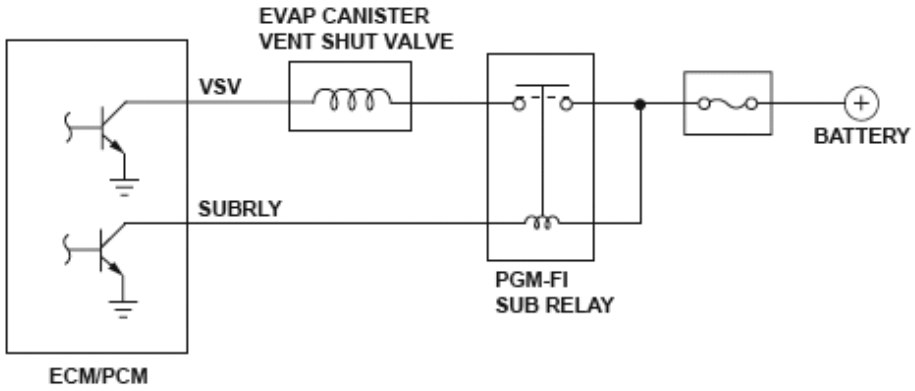

Fig. 37: Checking Continuity Between ECM Connector Terminal A10 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the EVAP canister vent shut valve and the ECM (A10), then go to step 18.

17. Replace the EVAP canister vent shut valve (see **EVAP CANISTER VENT SHUT VALVE REPLACEMENT**).
18. Reconnect all connectors.
19. Turn the ignition switch ON (II).
20. Reset the ECM with the HDS.
21. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
22. Select EVAP CVS ON in the INSPECTION MENU with the HDS.
23. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0498 indicated?

YES - Check for poor connections or loose terminals at the EVAP canister vent shut valve and the ECM, then go to step 1.

NO - Go to step 24.

24. Monitor the OBD STATUS for DTC P0498 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other Temporary DTCs or DTSs were indicated in step 23, go to the indicated DTC's troubleshooting.

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the EVAP canister vent shut valve and the ECM, then go to step 1. If the screen indicates NOT COMPLETED,

go to step 22.

25. Reconnect all connectors.
26. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
27. Select EVAP CVS ON in the INSPECTION MENU with the HDS.
28. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0498 indicated?

    YES - Check for poor connections or loose terminals at the EVAP canister vent shut valve and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 27. If the ECM was substituted, go to step 1.

    NO - Go to step 29.

29. Monitor the OBD STATUS for DTC P0498 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 28, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the EVAP canister vent shut valve and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 27. If the ECM was substituted, go to step 1. If the screen indicates NOT COMPLETED, go to step 27.

DTC P0499: EVAP CANISTER VENT SHUT VALVE CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Select EVAP CVS ON in the INSPECTION MENU with the HDS.
4. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0499 indicated?

    YES - Go to step 5.

    NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP canister vent shut valve and the ECM.

5. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).

6. Select EVAP CVS ON in the INSPECTION MENU with the HDS.
7. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0499 indicated?

   YES - Check for poor connections or loose terminals at the EVAP canister vent shut valve and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 6. If the ECM was substituted, go to step 1.

   NO - Go to step 8.

8. Monitor the OBD STATUS for DTC P0499 in the DTCs MENU with the HDS.

   Does the screen indicate PASSED?

   YES - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 7, go to the indicated DTC's troubleshooting.

   NO - If the screen indicates FAILED, check for poor connections or loose terminals at the EVAP canister vent shut valve and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 6. If the ECM was substituted, go to step 1. If the screen indicates NOT COMPLETED, go to step 6.

DTC P1454: FTP SENSOR RANGE/PERFORMANCE PROBLEM; DTC P2422: EVAP CANISTER VENT SHUT VALVE STUCK CLOSED MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch OFF.
4. Remove the fuel fill cap, and wait 1 minute.
5. Check the FTP SENSOR in the DATA LIST with the HDS.

   Is it between - 0.67 and 0.67 kPa (- 0.2 and 0.2 in.Hg, - 5 and 5 mmHg), or 2.4 and 2.6 V?

   YES - Go to step 6.

   NO - Go to step 17.

6. Install the fuel fill cap.
7. Clear the DTC with the HDS.
8. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
9. Monitor the OBD STATUS for DTC P1454 in the DTCs MENU with the HDS.

Does the screen indicate FAILED?

YES - Go to step 10.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the FTP sensor, the EVAP canister vent shut valve, and the ECM. Also check for a blockage in the vent hoses and the drain joint. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

10. Clear the DTC with the HDS.
11. Turn the ignition switch OFF.
12. Remove the EVAP canister vent shut valve from the EVAP canister (see **EVAP CANISTER VENT SHUT VALVE REPLACEMENT**).
13. Connect the 2P connector to the EVAP canister vent shut valve.
14. Turn the ignition switch ON (II).
15. Select EVAP CVS ON in the INSPECTION MENU with the HDS.
16. Check the EVAP canister vent shut valve (A) operation.

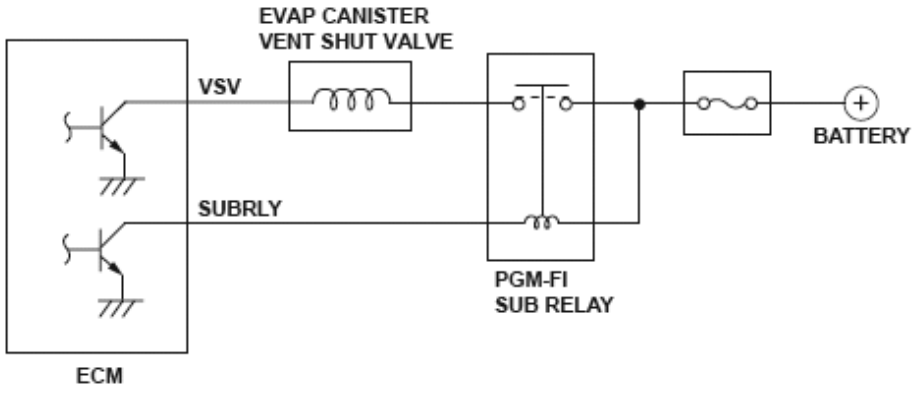

Fig. 38: Checking EVAP Canister Vent Shut Valve Operation
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Does the valve operate?

YES - Check for a blockage in the EVAP canister, vent hoses, and drain joint, then install the EVAP canister vent shut valve, and go to step 23.

NO - Replace the EVAP canister vent shut valve (see **EVAP CANISTER VENT SHUT VALVE REPLACEMENT**), then go to step 23.

17. Disconnect the air tube (A) from the FTP sensor (B).

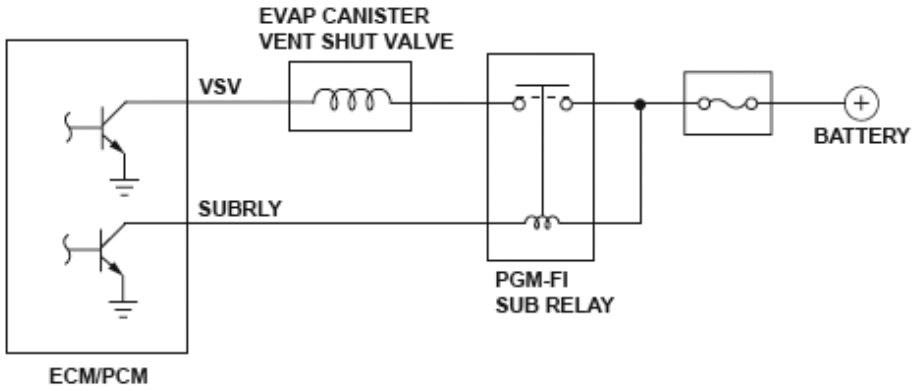

Fig. 39: Disconnecting Air Tube From FTP Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

18. Check the FTP SENSOR in the DATA LIST with the HDS.

    Is it between - 0.67 and 0.67 kPa (- 0.2 and 0.2 in.Hg, - 5 and 5 mmHg), or 2.4 and 2.6 V?

    YES - Check for a blockage in the FTP sensor air tube or vent, then go to step 23.

    NO - Go to step 19.

19. Turn the ignition switch OFF.
20. Remove the FTP sensor (A) from the EVAP canister with its connector connected (see **EVAP CANISTER REPLACEMENT**).

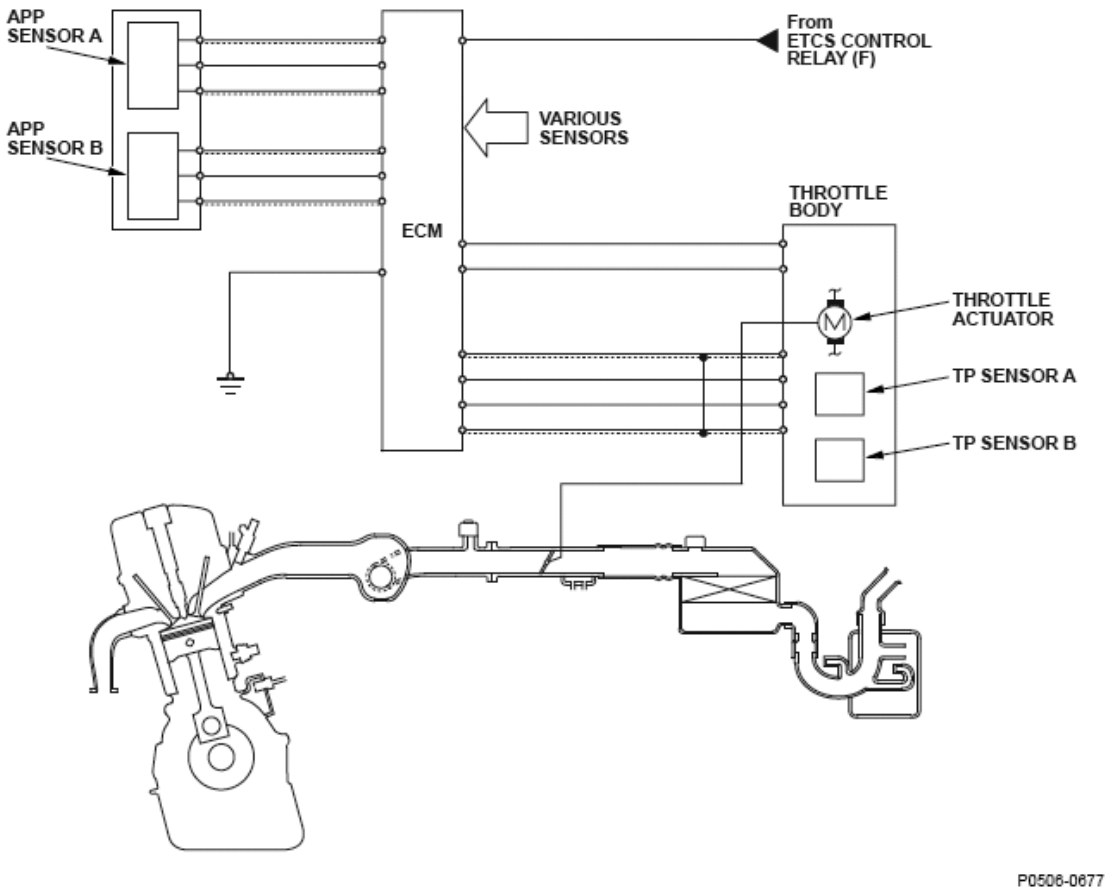

Fig. 40: Removing FTP Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Turn the ignition switch ON (II).
22. Check the FTP SENSOR in the DATA LIST with the HDS.

    Is it between - 0.67 kPa and 0.67 kPa (- 0.2 and 0.2 in.Hg, - 5 and 5 mmHg), or 2.4 and 2.6 V?

    YES - Check for debris or clogging at the EVAP canister and the FTP sensor port, then go to step 23.

    NO - Replace the FTP sensor (see **FTP SENSOR REPLACEMENT**), then go to step 23.

23. Turn the ignition switch ON (II).
24. Reset the ECM with the HDS.
25. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
26. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
27. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1454 and/or P2422 indicated?

    YES - Check for poor connections or loose terminals at the FTP sensor, the EVAP canister vent shut valve, and the ECM, then go to step 1.

NO - Go to step 28.

28. Monitor the OBD STATUS for DTC PI 454 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 27, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the FTP sensor, the EVAP canister vent shut valve, and the ECM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P145C: EVAP SYSTEM PURGE FLOW MALFUNCTION ('07 MODEL)

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P145C is indicated alone, do the troubleshooting for DTC P0496 and P0497 using freeze date for P145C.**
- **If any of the DTCs listed below are indicated at the same time as DTC P145C, troubleshoot those DTC first, then recheck for P145C:**

  P0496, P0497: EVAP system purge flow

FUEL CAP WARNING MESSAGE SYSTEM TROUBLESHOOTING

Special Tools Required

- Vacuum/pressure gauge, 0-4 in.Hg 07JAZ-001000B
- Vacuum pump/gauge, 0-30 in.Hg, Snap-on YA4000A or equivalent, commercially available

When the fuel cap warning message does not go off after fuel cap tightened, or the message turned on frequently, do this troubleshooting procedure.

'07-08 model

1. Check the fuel fill cap (the cap must say "TIGHTEN TO CLICK"). It should turn 1/4 after it's tight, then it clicks.

   Is the correct fuel fill cap installed and properly tightened?

   YES - Go to step 2.

   NO - Replace or tighten the cap, then go to step 13.

2. Check the fuel fill cap seal (A) and the fuel fill pipe mating surface (B). Verify that the fuel fill cap tether cord (C) is not caught under the cap.

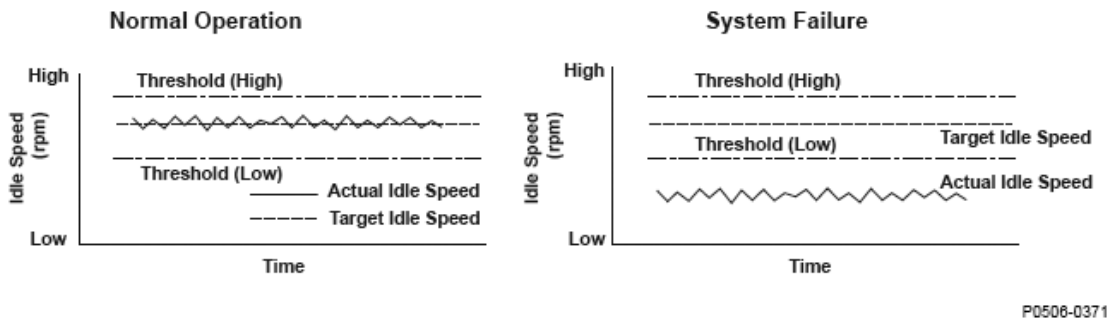

Fig. 41: Checking Fuel Fill Cap Seal And Fuel Fill Pipe Mating Surface
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the fuel fill cap seal missing or damaged, is the fuel fill pipe damaged, or is the tether cord caught under the cap?

YES - Replace the fuel fill cap or the fuel fill pipe, then go to step 13.

NO - Go to step 3.

3. Reinstall and tighten the fuel fill cap.
4. Clear the DTC with the HDS.
5. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle for 1 minute.
6. Test drive at 45 mph (72 km/h) for 1 minute or more.

Does fuel cap warning message come on?

YES - Go to step 7.

NO - Intermittent failure, the system is OK at this time.

7. Turn the ignition switch OFF.
8. Disconnect the vacuum hose (A) from the EVAP canister purge valve (B) in the engine compartment, and connect a T-fitting (C) from the vacuum gauge and the vacuum pump/gauge 0-30 in.Hg, to the EVAP canister purge valve as shown.

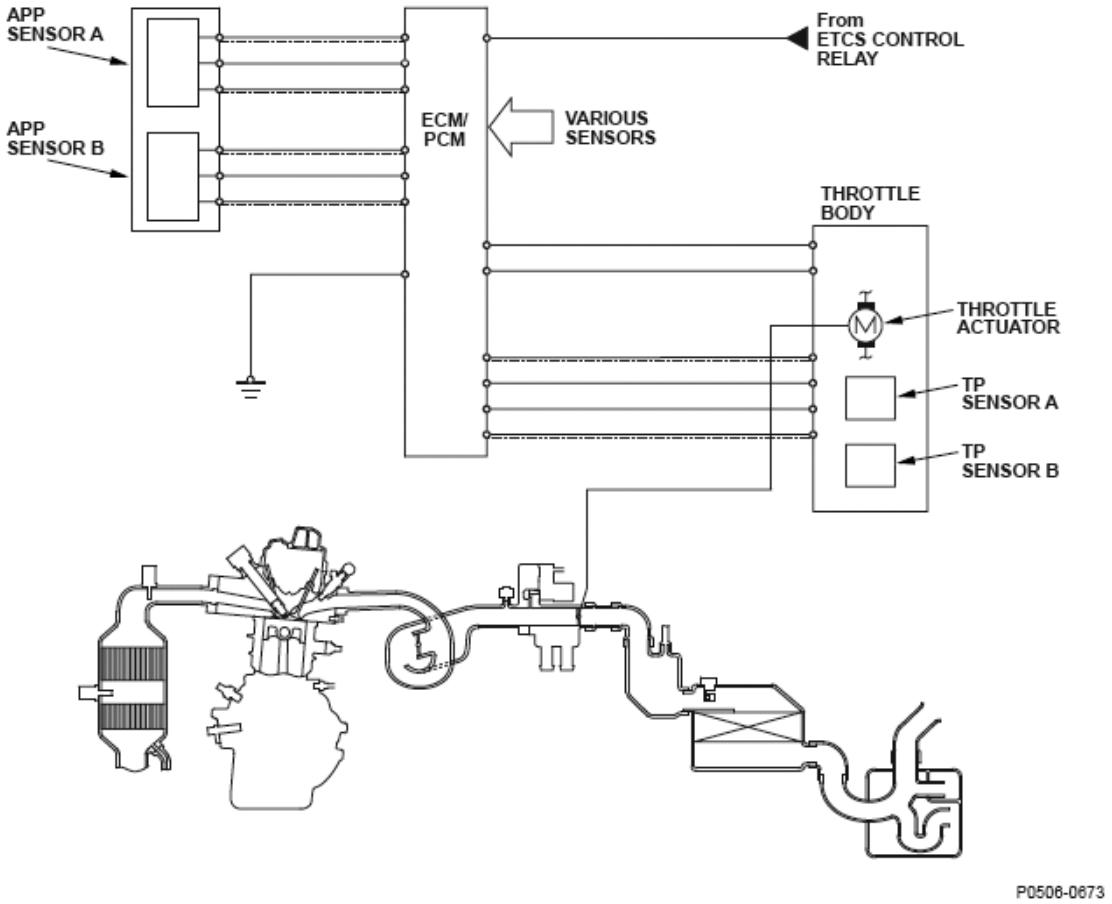

Fig. 42: Connecting T-Fitting From Vacuum Gauge And Vacuum Pump/Gauge To EVAP Canister Purge Valve
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Turn the ignition switch ON (II).
10. Apply about 2 kPa (0.6 in.Hg, 15 mmHg) of vacuum to the hose.
11. Select the EVAP PCS ON in the INSPECTION MENU with the HDS.

    Does the vacuum release momentary?

    YES - Check for blockage at the EVAP canister purge line between EVAP canister purge valve and the EVAP canister, then go to step 12.

    NO - Replace the EVAP canister purge valve (see **EVAP CANISTER VENT SHUT VALVE REPLACEMENT**), then go to step 12.

12. Reconnect all hoses.
13. Turn the ignition switch ON (II).
14. Reset the PCM with the HDS.
15. Do the PCM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
16. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until a radiator fan comes on, then let it idle for 1 minute.
17. Test drive at 45 mph (72 km/h) for 1 minute or more.

Does the fuel cap message come on?

YES - Go to step 1 and recheck.

NO - Troubleshooting is complete.

EVAP CANISTER REPLACEMENT

1. Raise the vehicle on a lift.
2. Remove the cover (A).

Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Remove the EVAP canister.
6. Remove the cap (A).

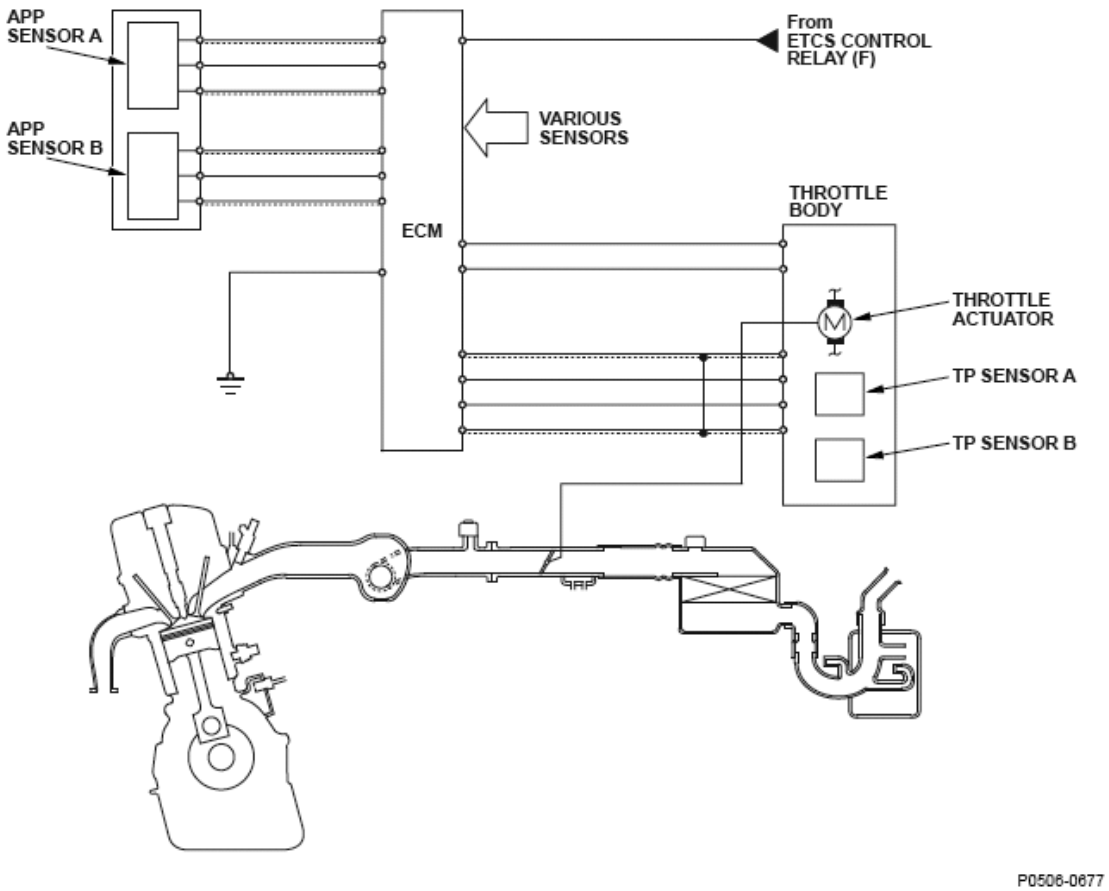

Fig. 46: Removing Cap
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Remove the EVAP canister vent shut valve (B).
8. Install the EVAP canister vent shut valve on the new EVAP canister with new O-rings (C).

NOTE: Do not coat the O-rings with oil.

9. Install the parts in the reverse order of removal.

FTP SENSOR REPLACEMENT

1. Remove the cover (see step 1 in **EVAP CANISTER REPLACEMENT**).
2. Disconnect the FTP sensor connector (A).

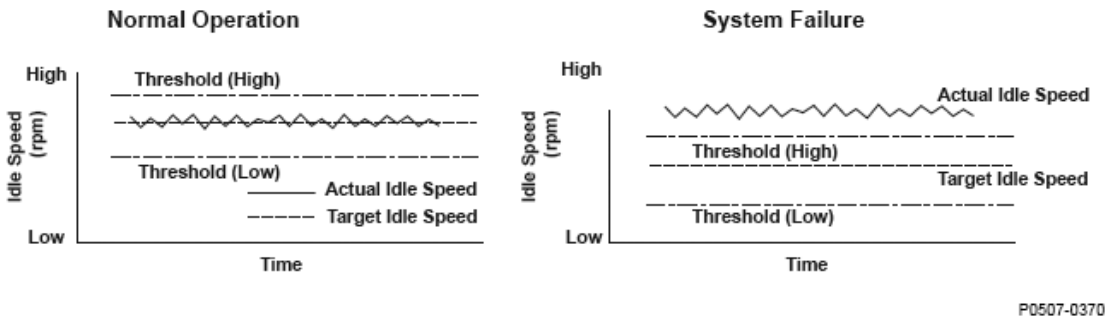

Fig. 47: Disconnecting FTP Sensor Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Disconnect the hose (B), and then remove the FTP sensor (C).
4. Install the parts in the reverse order of removal with a new O-ring (D) and a new retainer (E).

EVAP CANISTER VENT SHUT VALVE REPLACEMENT

1. Remove the EVAP canister (see **EVAP CANISTER REPLACEMENT**).
2. Remove the cap (A).

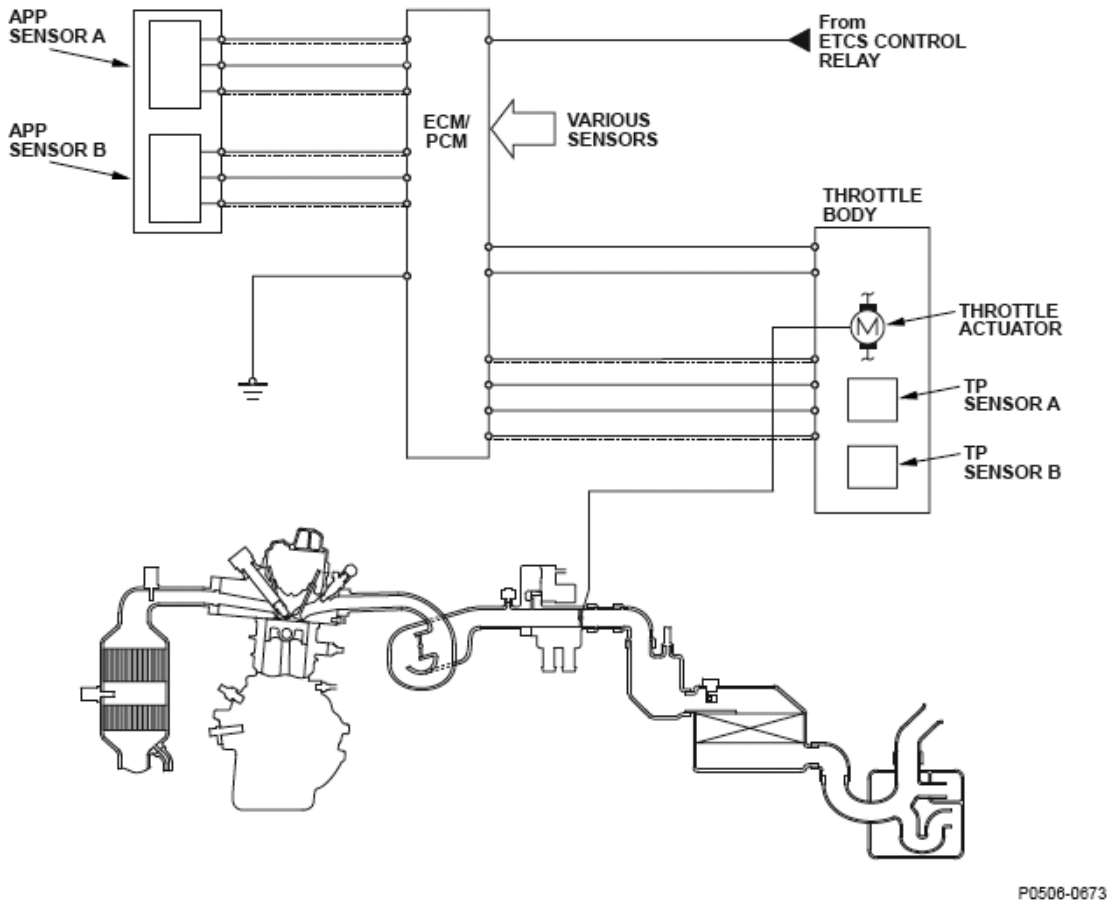

Fig. 48: Removing Cap
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the EVAP canister vent shut valve (B).
4. Install the parts in the reverse order of removal with new O-rings (C) and a new cap (A).

NOTE: Do not coat the O-rings with oil.

EVAP CANISTER PURGE VALVE REPLACEMENT

1. Remove the intake manifold cover (see **INTAKE MANIFOLD AND EXHAUST SYSTEM (K20Z3)**).

2. Remove the air cleaner (see **AIR CLEANER REMOVAL/INSTALLATION**).
3. Relieve the fuel pressure (see **FUEL PRESSURE RELIEVING**).
4. Remove the fuel line (A).

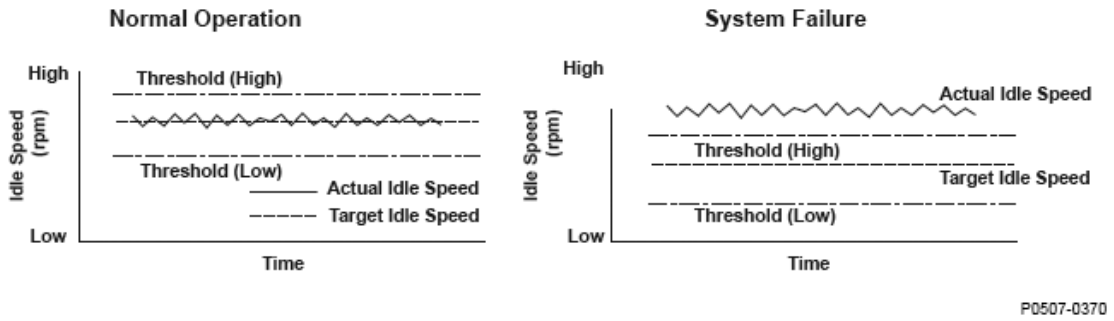

Fig. 49: Removing Fuel Line
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Disconnect the EVAP canister purge valve 2P connector (B).
6. Remove the bolts (C) and the hoses (D), then remove the EVAP canister purge valve (E).
7. Install the parts in the reverse order of removal.

DTC TROUBLESHOOTING

DTC P0443: EVAP CANISTER PURGE VALVE CIRCUIT MALFUNCTION

Special Tools Required

Vacuum pump/gauge, 0-30 in.Hg, Snap-on YA4000A or equivalent, commercially available

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
4. Check for Temporary DTCs or DTCs with the HDS. Is DTC P0443 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP canister purge valve and the ECM/PCM.

5. Turn the ignition switch OFF, and allow the engine to cool below HOT (60°C).
6. Disconnect the vacuum hose (A) from the EVAP canister purge valve (B) in the engine compartment, and connect a vacuum pump/gauge, 0-30 in.Hg, to the hose.

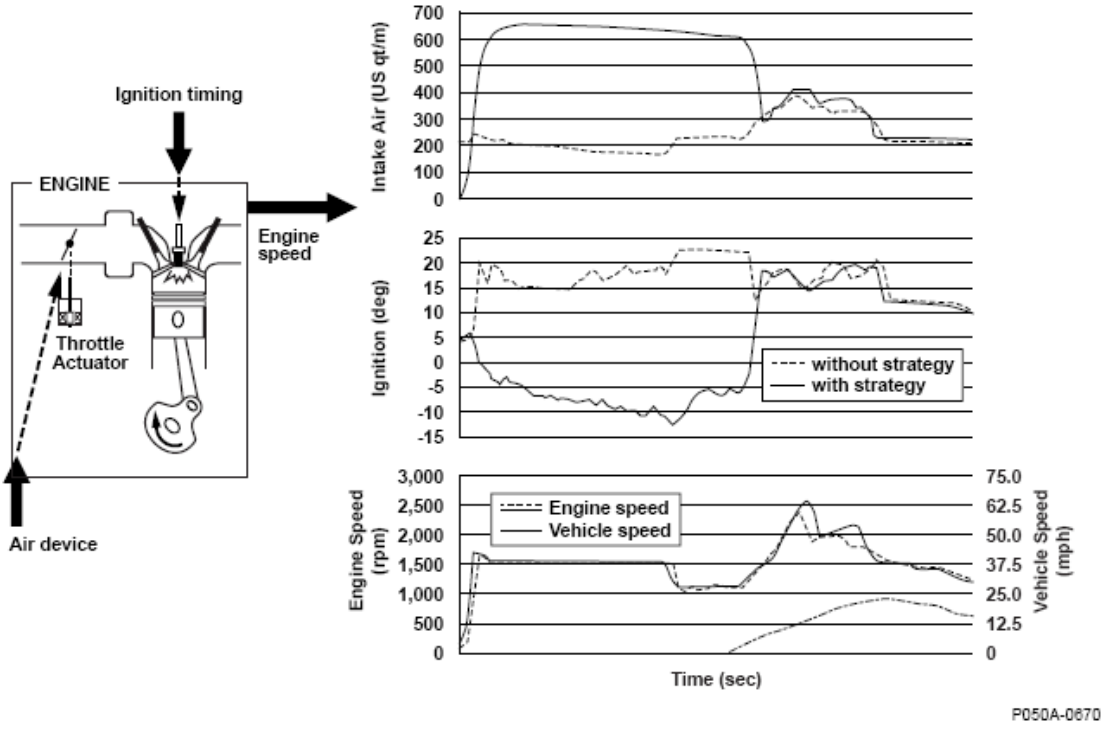

Fig. 2: Disconnecting Vacuum Hose From EVAP Canister Purge Valve
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Start the engine, and let it idle.

   Is there vacuum?

   YES - Go to step 8.

   NO - Go to step 14.

8. Turn the ignition switch OFF.
9. Disconnect the EVAP canister purge valve 2P connector.
10. Check for continuity between EVAP canister purge valve 2P connector terminal No. 2 and body ground.

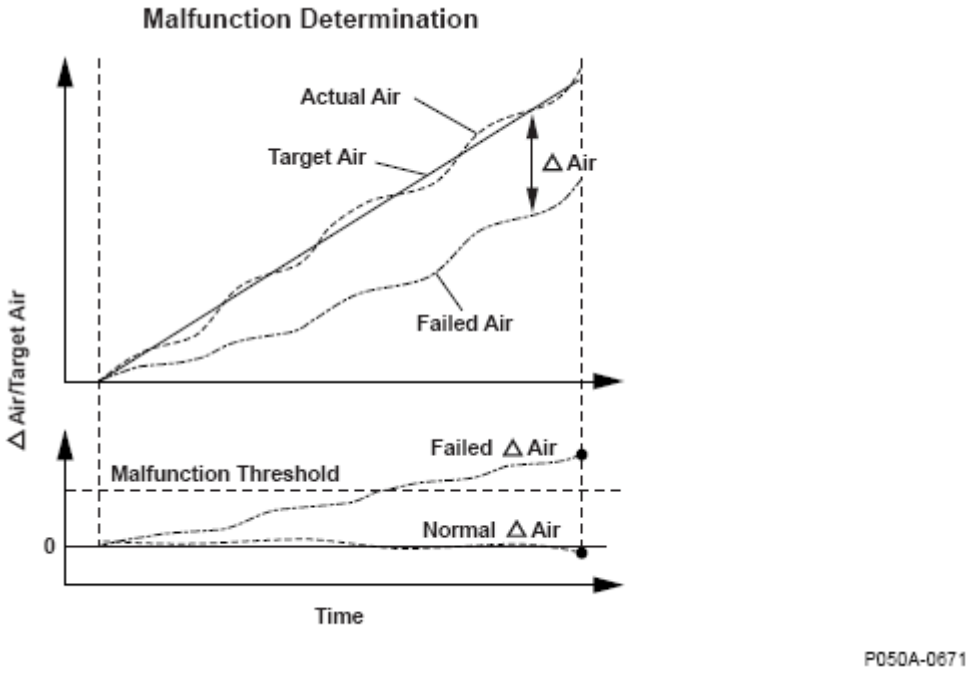

Fig. 3: Checking Continuity Between EVAP Canister Purge Valve 2P Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 11.

NO - Go to step 23.

11. Jump the SCS line with the HDS.
12. Disconnect ECM/PCM connector B (44P).
13. Check for continuity between EVAP canister purge valve 2P connector terminal No. 2 and body ground.

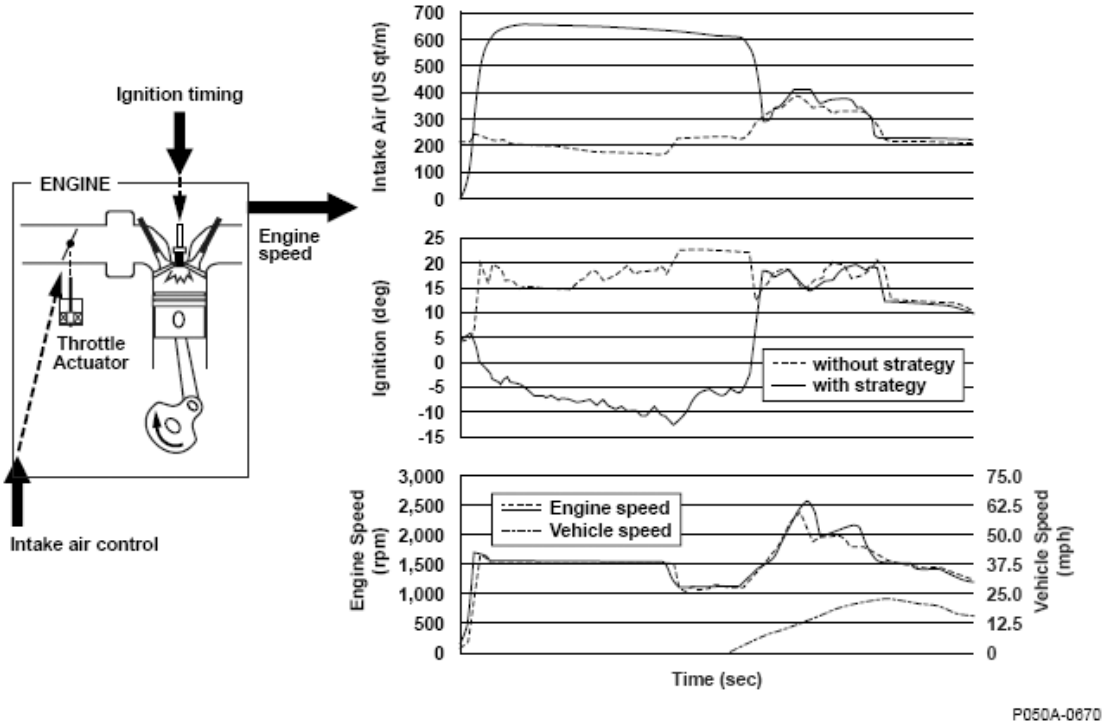

Fig. 4: Checking Continuity Between EVAP Canister Purge Valve 2P Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the EVAP canister purge valve and the ECM/PCM (B3), then go to step 24.

NO - Go to step 30.

14. Turn the ignition switch OFF.
15. Disconnect the EVAP canister purge valve 2P connector.
16. Turn the ignition switch ON (II).
17. Measure voltage between EVAP canister purge valve 2P connector terminal No. 1 and body ground.

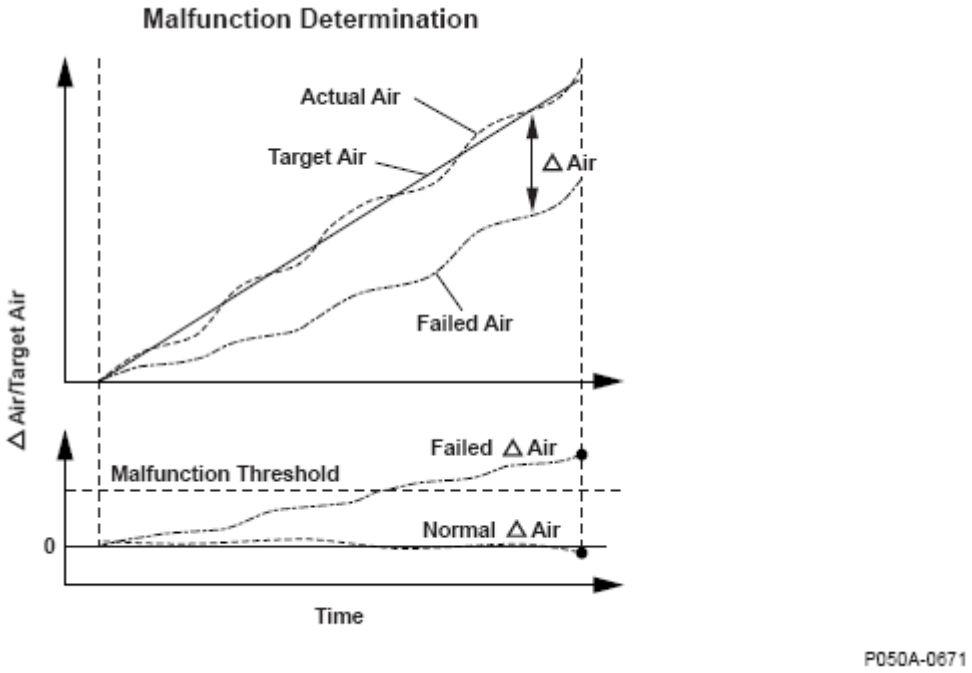

Fig. 5: Measuring Voltage Between EVAP Canister Purge Valve 2P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 18.

NO - Repair open in the wire between the EVAP canister purge valve and the No. 3 ALTERNATOR (10 A) fuse in the under-dash fuse/relay box, then go to step 24.

18. Turn the ignition switch OFF.
19. Jump the SCS line with the HDS.
20. Disconnect ECM/PCM connector B (44P).
21. Check for continuity between ECM/PCM connector terminal B3 and EVAP canister purge valve 2P connector terminal No. 2.

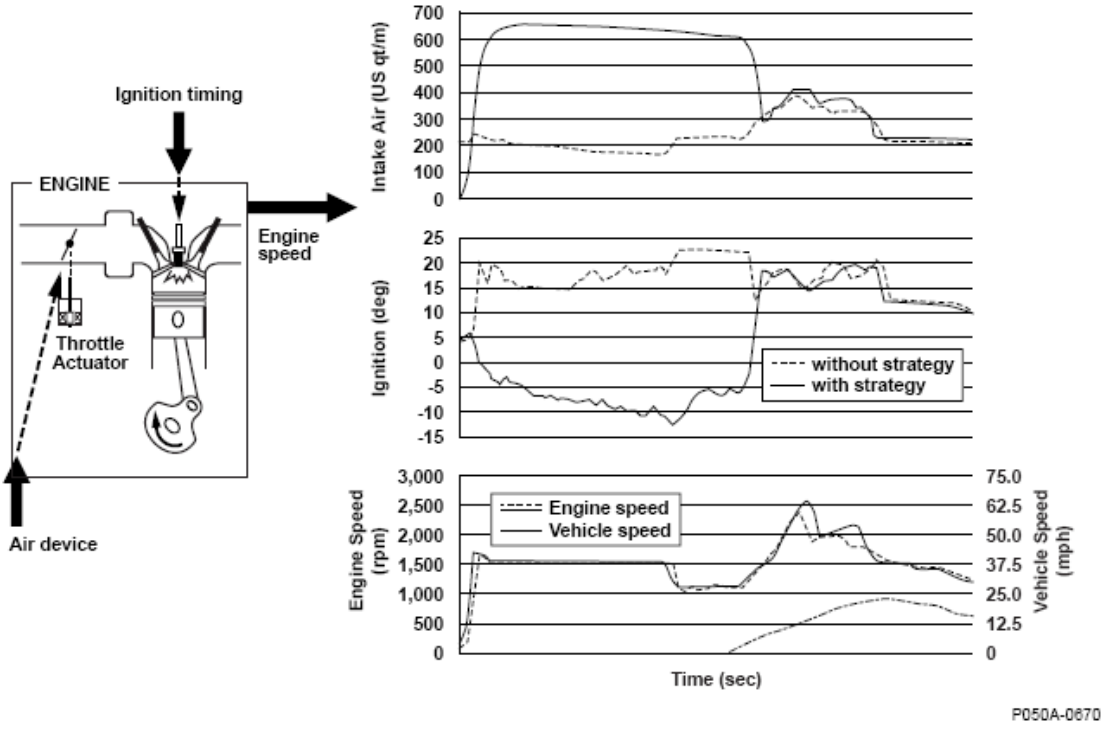

Fig. 6: Checking Continuity Between ECM/PCM Terminal B3 And EVAP Canister Purge Valve 2P Terminal No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 22.

NO - Repair open in the wire between the EVAP canister purge valve and the ECM/PCM (B3), then go to step 24.

22. At the purge valve side, measure resistance between EVAP canister purge valve 2P connector terminals No. 1 and No. 2.

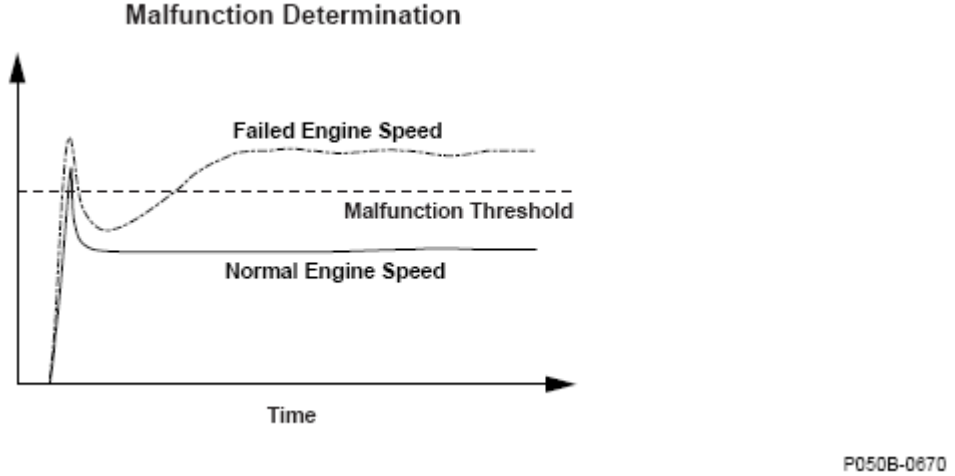

Fig. 7: Measuring Resistance Between EVAP Canister Purge Valve 2P Connector Terminals No. 1 And 2

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 25 ohms at room temperature?

YES - Go to step 30.

NO - Go to step 23.

23. Replace the EVAP canister purge valve (see **EVAP CANISTER PURGE VALVE REPLACEMENT**).
24. Reconnect all connectors.
25. Turn the ignition switch ON (II).
26. Reset the ECM/PCM with the HDS.
27. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
28. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0443 indicated?

YES - Check for poor connections or loose terminals at the EVAP canister purge valve and the ECM/PCM, then go to step 1.

NO - Go to step 29.

29. Monitor the OBD STATUS for DTC P0443 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 28, go to the indicated DTCs troubleshooting.

NO -If the screen indicates FAILED, check for poor connections or loose terminals at the EVAP canister purge valve and the ECM/PCM, then go to step 1. If the screen indicates EXECUTING or OUT OF CONDITION, keep idling until a result comes on.

30. Reconnect all connectors.
31. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
32. Start the engine, and let it idle.
33. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0443 indicated?

YES - Check for poor connections or loose terminals at the EVAP canister purge valve and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 32. If the ECM/PCM was substituted, go to step 1.

NO - Go to step 34.

34. Monitor the OBD STATUS for DTC P0443 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 33, go to the indicated DTCs troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the EVAP canister purge valve and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 32. If the ECM/PCM was substituted, go to step 1. If the screen indicates EXECUTING or OUT OF CONDITION, keep idling until a result comes on.

DTC P0451: FTP SENSOR CIRCUIT RANGE/PERFORMANCE PROBLEM

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P2422 is stored at the same time as DTC P0451, troubleshoot DTC P2422 first, then recheck for DTC P0451.**

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle 1 minute.
4. Monitor the OBD STATUS for DTC P0451 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 5.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the FTP sensor and the ECM/PCM. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

5. Turn the ignition switch OFF.
6. Replace the FTP sensor (see **FTP SENSOR REPLACEMENT**).
7. Turn the ignition switch ON (II).
8. Reset the ECM/PCM with the HDS.
9. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
10. Start the engine, and let it idle 1 minute.
11. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0451 indicated?

    YES - Check for poor connections or loose terminals at the FTP sensor and the ECM/PCM, then go to step 1.

NO - Go to step 12.

12. Monitor the OBD STATUS for DTC P0451 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 11, go to the indicated DTCs troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the FTP sensor and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P0452: FTP SENSOR CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch OFF.
4. Remove the fuel fill cap.
5. Turn the ignition switch ON (II).
6. Check the FTP SENSOR in the DATA LIST with the HDS.

   Is about - 7.3 kPa (-2.16 in.Hg, - 55 mmHg), or 0.3 V or less indicated?

   YES - Go to step 10.

   NO - Go to step 7.

7. Install the fuel fill cap.
8. Start the engine.
9. Monitor the OBD STATUS for DTC P0452 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 10.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the FTP sensor and the ECM/PCM. If the screen indicates NOT COMPLETED, go to step 4 and recheck.

10. Turn the ignition switch OFF.
11. Disconnect the FTP sensor 3P connector.
12. Turn the ignition switch ON (II).

13. Check the FTP SENSOR in the DATA LIST with the HDS.

    Is about 7.3 kPa (2.15 in.Hg, 54.7 mmHg) or 4.90 V indicated?

    YES - Go to step 24.

    NO - Go to step 14.

14. Measure voltage between FTP sensor 3P connector terminal No. 1 and body ground.

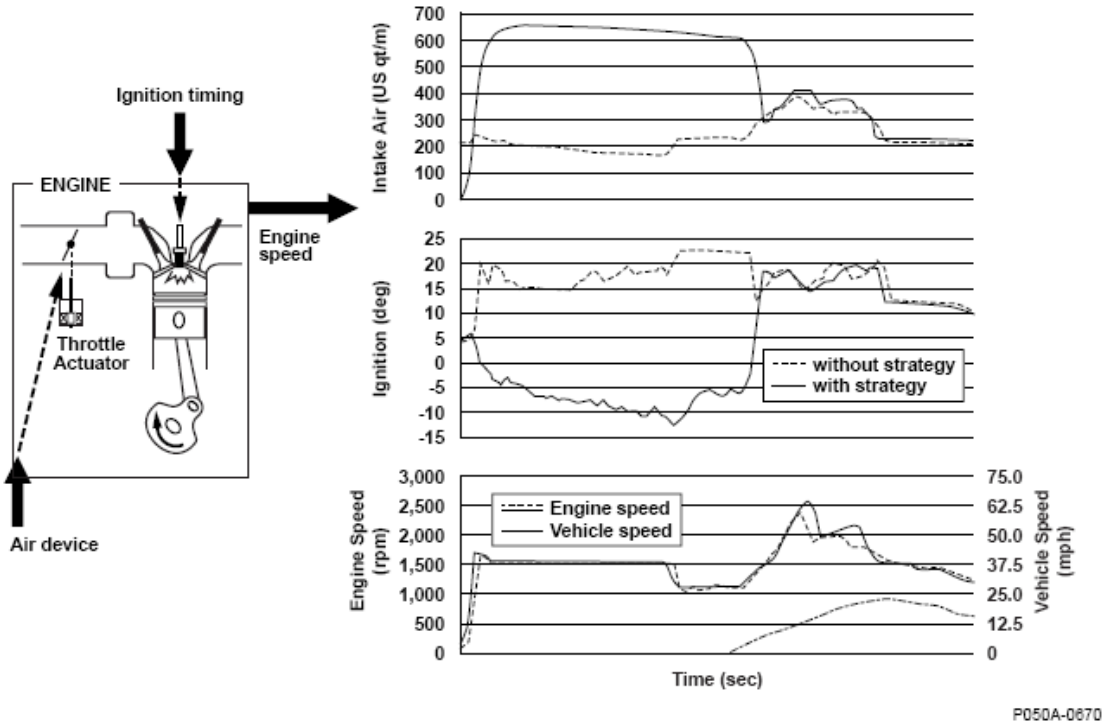

Fig. 8: Measuring Voltage Between FTP Sensor 3P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 20.

NO - Go to step 15.

15. Turn the ignition switch OFF.
16. Jump the SCS line with the HDS.
17. Disconnect ECM/PCM connector A (44P).
18. Connect FTP sensor 3P connector terminal No. 1 to body ground with a jumper wire.

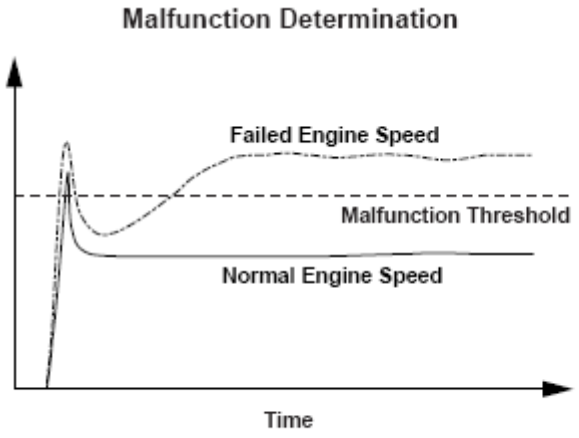

Fig. 9: Connecting FTP Sensor 3P Connector Terminal No. 1 To Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. Check for continuity between ECM/PCM connector terminal A19 and body ground.

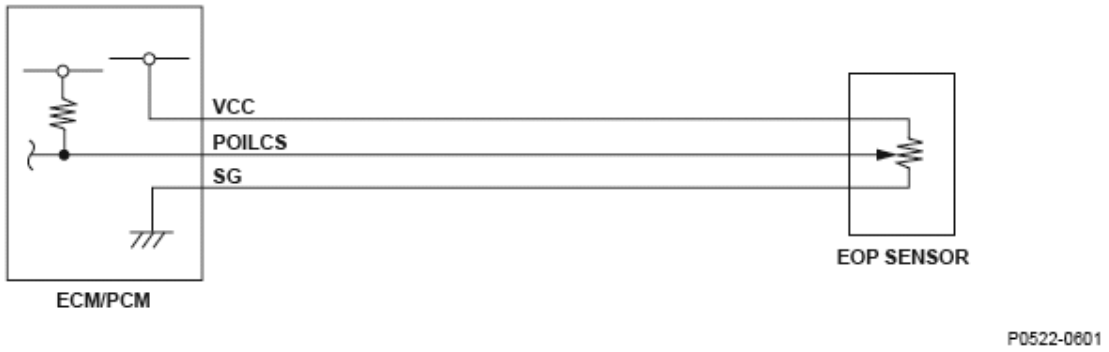

Fig. 10: Checking Continuity Between ECM/PCM Connector Terminal A19 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 32.

NO - Repair open in the wire between the ECM/PCM (A19) and the FTP sensor, then go to step 26.

20. Turn the ignition switch OFF.
21. Jump the SCS line with the HDS.
22. Disconnect ECM/PCM connector A (44P).
23. Check for continuity between FTP sensor 3P connector terminal No. 2 and body ground.

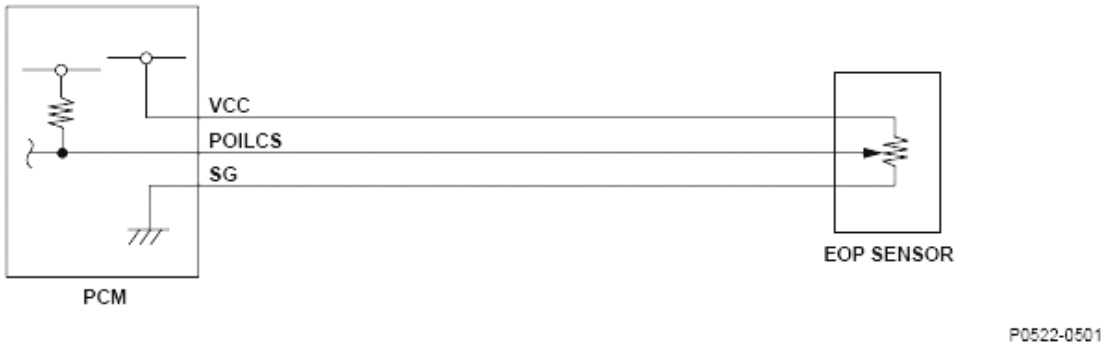

Fig. 11: Checking Continuity Between FTP Sensor 3P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (A26) and the FTP sensor, then go to step 26.

NO - Go to step 32.

24. Turn the ignition switch OFF.
25. Replace the FTP sensor (see **FTP SENSOR REPLACEMENT**).
26. Reconnect all connectors.
27. Turn the ignition switch ON (II).
28. Reset the ECM/PCM with the HDS.
29. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
30. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0452 indicated?

    YES - Check for poor connections or loose terminals at the FTP sensor and the ECM/PCM, then go to step 1.

    NO - Go to step 31.

31. Monitor the OBD STATUS for DTC P0452 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 30, go to the indicated DTCs troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the FTP sensor and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

32. Reconnect all connectors.
33. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or

substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).

34. Start the engine, and let it idle.
35. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0452 indicated?

    YES - Check for poor connections or loose terminals at the FTP sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 34. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 36.

36. Monitor the OBD STATUS for DTC P0452 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 35, go to the indicated DTCs troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the FTP sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 34. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P0453: FTP SENSOR CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch OFF.
4. Remove the fuel fill cap.
5. Turn the ignition switch ON (II).
6. Check the FTP SENSOR in the DATA LIST with the HDS.

   Is about 7.3 kPa (2.16 in.Hg, 55 mmHg), or 4.7 V or more Indicated?

   YES - Go to step 10.

   NO - Go to step 7.

7. Install the fuel fill cap.
8. Start the engine.
9. Monitor the OBD STATUS for DTC P0453 in the DTCs MENU with the HDS.

Does the screen indicate FAILED?

YES - Go to step 10.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the FTP sensor and the ECM/PCM. If the screen indicates NOT COMPLETED, go to step 6 and recheck.

10. Turn the ignition switch OFF.
11. Disconnect the FTP sensor 3P connector.
12. Connect FTP sensor 3P connector terminals No. 2 and No. 3 with a jumper wire.

13. Turn the ignition switch ON (II).
14. Check the FTP SENSOR in the DATA LIST with the HDS.

Is about 7.3 kPa (2.16 in.Hg, 55 mmHg), or 4.7 V or more indicated?

YES - Go to step 15.

NO - Go to step 26.

15. Measure voltage between FTP sensor 3P connector terminals No. 1 and No. 3.

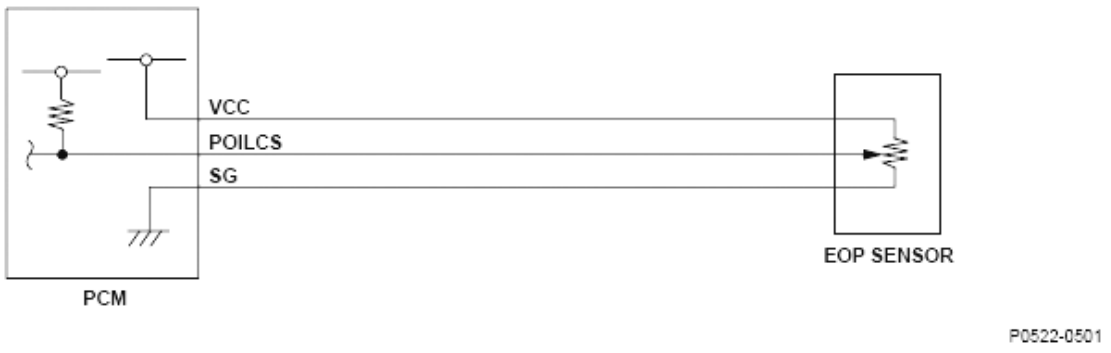

Fig. 13: Measuring Voltage Between FTP Sensor 3P Connector Terminals No. 1 And 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 21.

NO - Go to step 16.

16. Turn the ignition switch OFF.
17. Jump the SCS line with the HDS.
18. Disconnect ECM/PCM connector A (44P).
19. Connect FTP sensor 3P connector terminal No. 3 to body ground with a jumper wire.

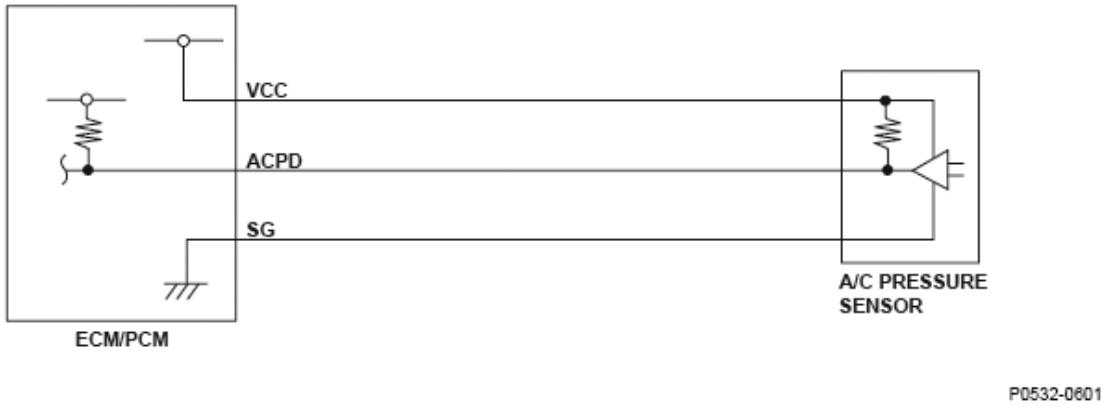

Fig. 14: Connecting FTP Sensor 3P Connector Terminal No. 3 To Body Ground With Jumper Wire

20. Check for continuity between ECM/PCM connector terminal A9 and body ground.

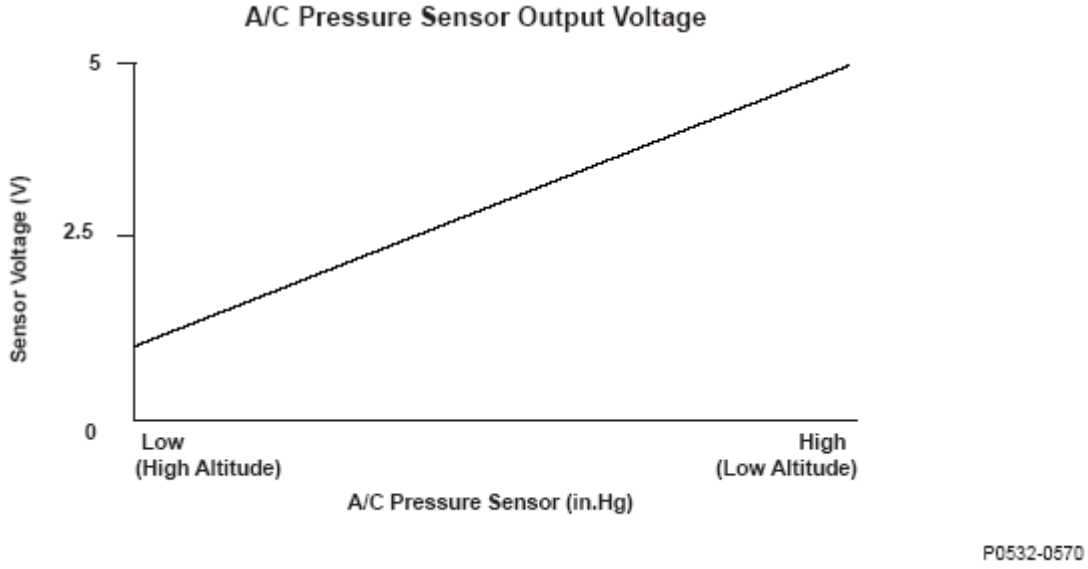

Fig. 15: Checking Continuity Between ECM/PCM Connector Terminal A9 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 34.

NO - Repair open in the wire between the ECM/PCM (A9) and the FTP sensor, then go to step 28.

21. Turn the ignition switch OFF.
22. Jump the SCS line with the HDS.
23. Disconnect ECM/PCM connector A (44P).
24. Connect FTP sensor 3P connector terminal No. 2 to body ground with a jumper wire.

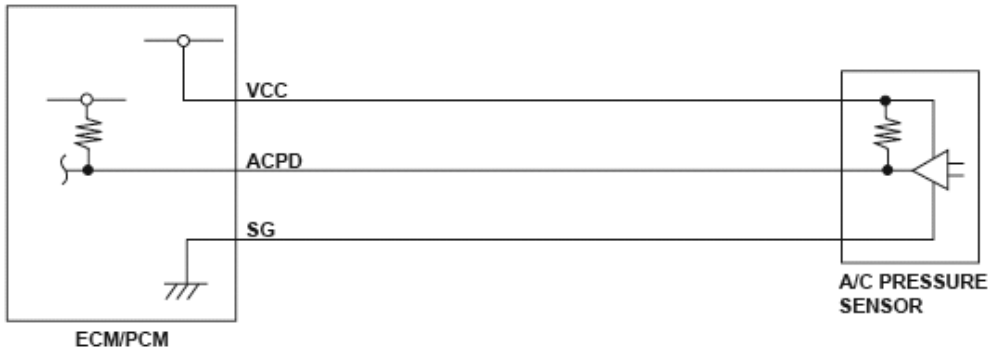

Fig. 16: Connecting FTP Sensor 3P Connector Terminal No. 2 To Body Ground With Jumper Wire

25. Check for continuity between ECM/PCM connector terminal A26 and body ground.

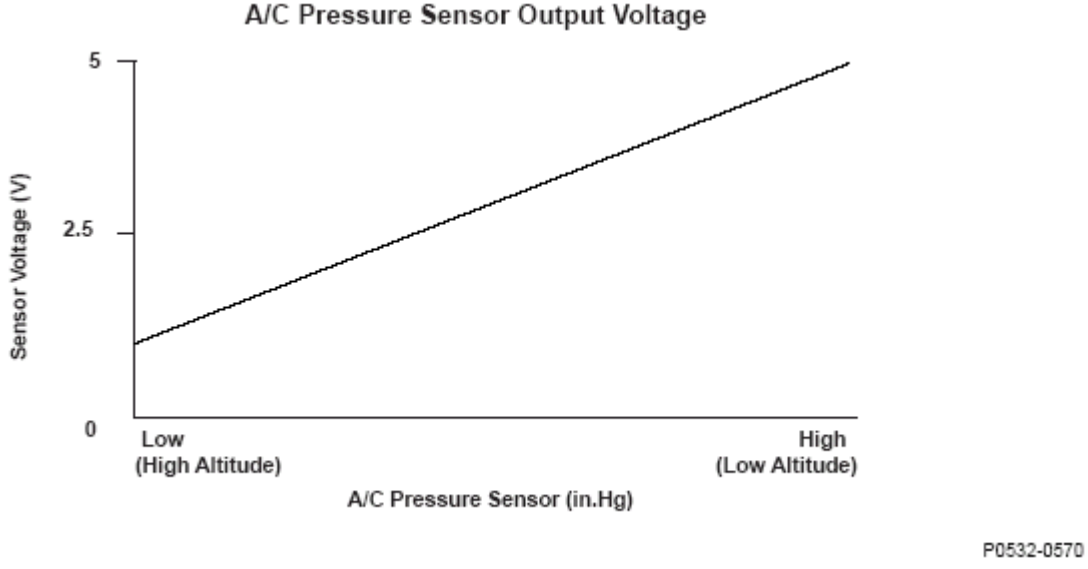

Fig. 17: Checking Continuity Between ECM/PCM Connector Terminal A26 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 34.

NO - Repair open in the wire between the ECM/PCM (A26) and the FTP sensor, then go to step 28.

26. Turn the ignition switch OFF.
27. Replace the FTP sensor (see **FTP SENSOR REPLACEMENT**).
28. Reconnect all connectors.
29. Turn the ignition switch ON (II).
30. Reset the ECM/PCM with the HDS.
31. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
32. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0453 indicated?

    YES - Check for poor connections or loose terminals at the FTP sensor and the ECM/PCM, then go to step 1.

    NO - Go to step 33.

33. Monitor the OBD STATUS for DTC P0453 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 32, go to the indicated DTCs troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the FTP sensor and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

34. Reconnect all connectors.
35. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
36. Start the engine, and let it idle.
37. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0453 indicated?

    YES - Check for poor connections or loose terminals at the FTP sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 36. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 38.

38. Monitor the OBD STATUS for DTC P0453 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs

or DTCs were indicated in step 37, go to the indicated DTCs troubleshooting.

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the FTP sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 36. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P0455: EVAP SYSTEM LARGE LEAK DETECTED; DTC P0456: EVAP SYSTEM VERY SMALL LEAK DETECTED

NOTE: **The fuel system is designed to allow specified maximum vacuum and pressure conditions. Do not deviate from the vacuum and pressure tests as indicated in these procedures. Excessive pressure/vacuum would damage the EVAP components or cause eventual fuel tank failure.**

Special Tools Required

Vacuum pump/gauge, 0-30 in.Hg, Snap-on YA4000A or equivalent, commercially available

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Fresh fuel has a higher volatility that will create greater pressure/vacuum. The optimum condition for testing is less than a full tank of fresh fuel. If possible, to assist in leak detection, add 1 gallon of fresh fuel to the tank (as long as it will not fill the tank), just before starting these procedures.**

1. Check the fuel fill cap (the cap must say "TIGHTEN TO CLICK"). It should turn 1/4 turn after it's tight, then it clicks.

   Is the correct fuel fill cap installed and properly tightened?

   YES - Go to step 2.

   NO - Replace or tighten the cap, then go to step 22.

2. Check the fuel fill cap seal (A) and the fuel fill pipe mating surface (B). Verify that the fuel fill cap tether cord (C) is not caught under the cap.

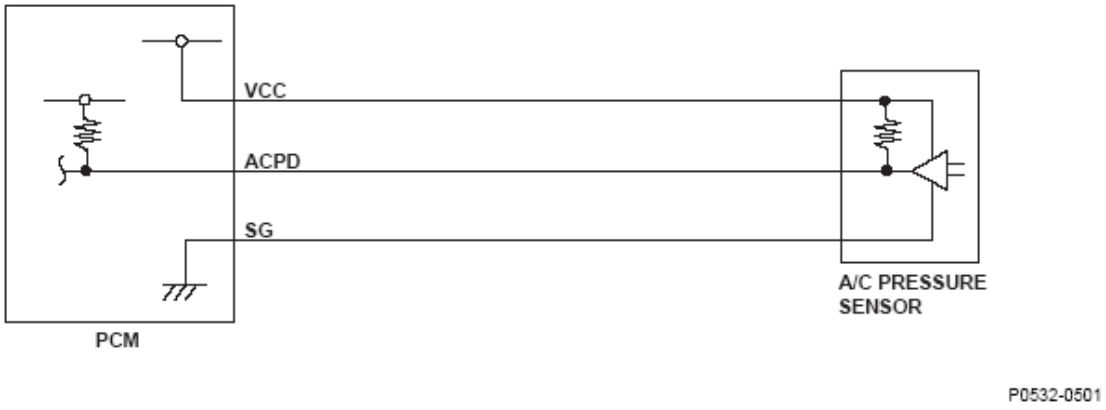

Fig. 18: Checking Fuel Fill Cap Seal And Mating Surface
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the fuel fill cap seal missing or damaged, is the fuel fill pipe damaged, or is the tether cord caught under the cap?

YES - Replace the fuel fill cap or the fuel fill pipe, then go to step 22.

NO - Go to step 3.

3. Turn the ignition switch ON (II).
4. Clear the DTC with the HDS.
5. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the FTP sensor, the EVAP canister purge valve, or the EVAP canister vent shut valve and the ECM/PCM.

   NO - Go to step 6.

6. Turn the ignition switch OFF.
7. Check for a poor connection or damage at the fuel tank vapor recirculation tube.

   Is the tube OK?

   YES - Go to step 8.

   NO -

   - Replace the fuel tank vapor recirculation tube, then go to step 22.
   - If necessary, replace the fuel tank (see **FUEL TANK REPLACEMENT**), then go to step 22.
8. Disconnect the fuel tank vapor recirculation tube (A) from the EVAP canister (B), and plug the EVAP canister port (C).

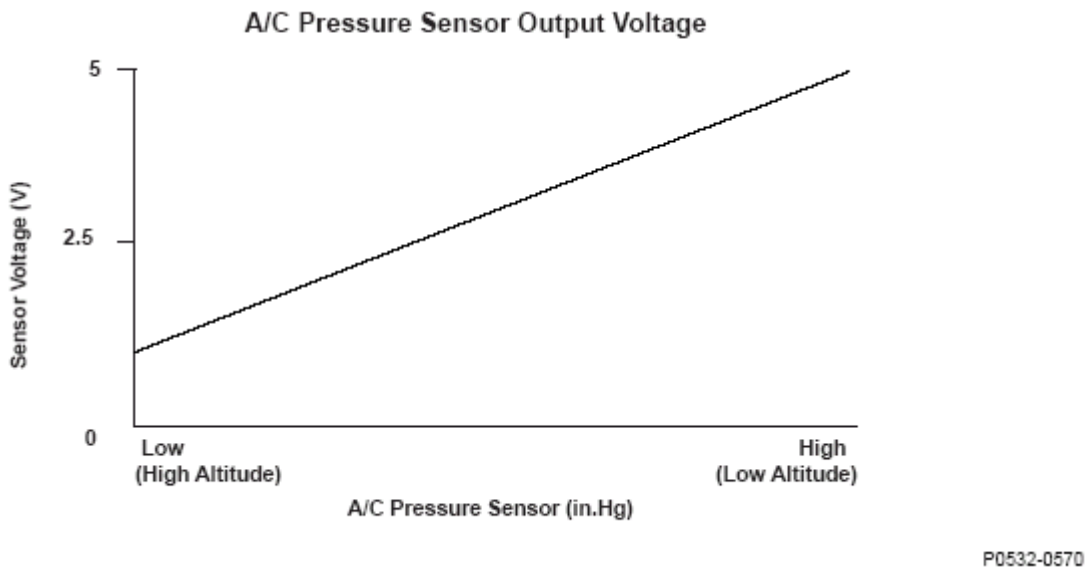

Fig. 19: Disconnecting Fuel Tank Vapor Recirculation Tube From EVAP Canister
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Disconnect the vacuum hose (purge line) (A) from the EVAP canister purge valve (B) in the engine compartment, and connect a vacuum pump/gauge, 0-30 in.Hg, to the vacuum hose as shown.

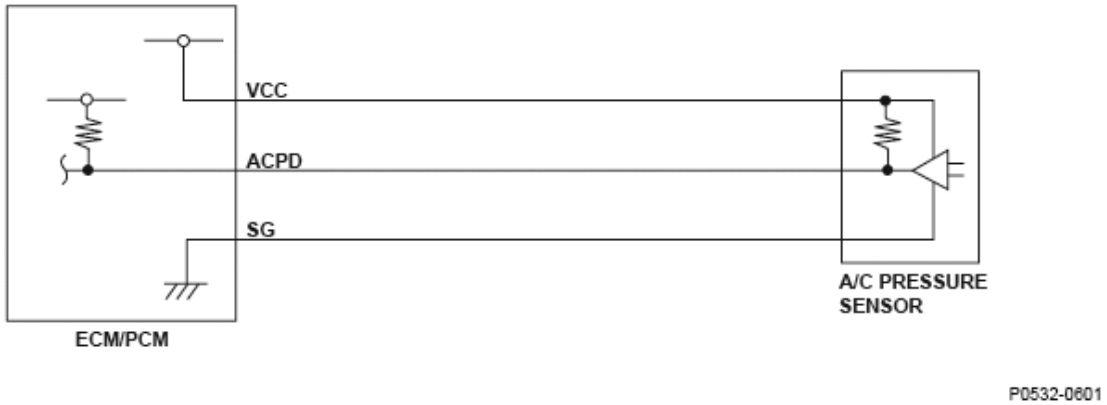

Fig. 20: Disconnecting Vacuum Hose (Purge Line) And EVAP Canister Purge Valve
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Turn the ignition switch ON (II).
11. Select EVAP CVS ON in the INSPECTION MENU with the HDS.
12. Apply vacuum to the hose until the FTP reads 1.90 V (-0.59 in.Hg,-15.1 mmHg).

NOTE: Be careful not to exceed the pressure. If you exceed the pressure, the FTP sensor can be damaged.

13. Monitor the FTP SENSOR in the DATA LIST for 1 minute with the HDS.

Does the voltage increase more than 0.2 V (0.1 in.Hg, 0.5 mmHg)?

YES - Go to step 14.

NO - Go to step 19.

14. Select EVAP CVS OFF in the INSPECTION MENU with the HDS.
15. Disconnect the fresh air hose (A) from the EVAP canister (B), and plug the EVAP canister port (C).

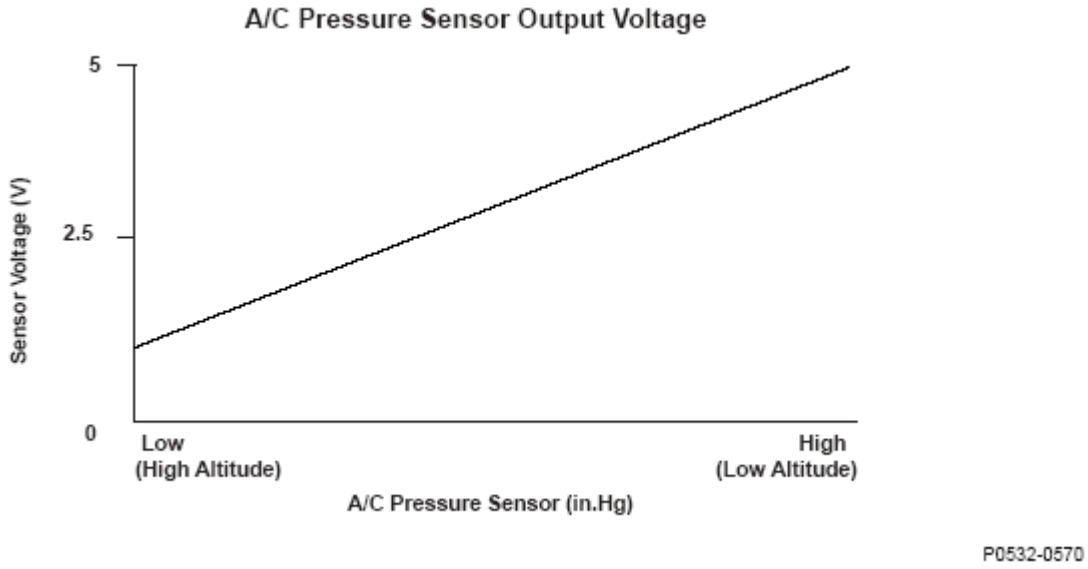

Fig. 21: Disconnecting Fresh Air Hose From EVAP Canister
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Apply vacuum to the EVAP system until the FTP reads 1.90 V (-0.59 in.Hg,-15.1 mmHg).

NOTE: Be careful not to exceed the pressure. If you exceed the pressure, the FTP sensor can be damaged.

17. Monitor the FTP SENSOR in the DATA LIST for 1 minute with the HDS.

Does the voltage increase more than 0.2 V (0.1 in.Hg, 2.5 mmHg)?

YES - Go to step 18.

NO - Replace the EVAP canister vent shut valve (see **EVAP CANISTER VENT SHUT VALVE REPLACEMENT**), then go to step 21.

18. Check for a loose or damaged EVAP canister purge line between the EVAP canister and the EVAP canister purge valve.

Is the line OK?

YES - Replace these parts, then go to step 21:

- FTP sensor O-ring
- EVAP canister vent shut valve case and O-ring
- EVAP canister

NO - Reconnect or repair the EVAP canister purge hose, then go to step 21.

19. Select EVAP CVS OFF in the INSPECTION MENU with the HDS.
20. Check these parts for looseness or damage:
    - Fuel fill pipe
    - Fuel vapor return pipe

    Are the parts OK?

    YES - Check the fuel tank unit base gasket (see **FUEL TANK REPLACEMENT**), and check the fuel tank, then go to step 21.

    NO - Repair or replace the damaged parts, then go to step 21.

21. Reconnect all hoses and connectors.
22. Turn the ignition switch ON (II).
23. Reset the ECM/PCM with the HDS.
24. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
25. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

    Is the result OK?

    YES - Troubleshooting is complete.

    NO - Check for poor connections or loose terminals at the FTP sensor, the EVAP canister purge valve, the EVAP canister vent shut valve, and the ECM/PCM, then go to step 1.

DTC P0457: EVAP SYSTEM LEAK DETECTED/FUEL FILL CAP LOOSE OR MISSING

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Check the fuel fill cap (the cap must say "TIGHTEN TO CLICK"). It should turn 1/4 turn after it's tight, then it clicks.

   Is the correct fuel fill cap installed and properly tightened?

   YES - Go to step 2.

   NO - Replace or tighten the cap, then go to step 19.

2. Check the fuel fill cap seal (A) and the fuel fill pipe mating surface (B). Verify that the fuel fill cap tether cord (C) is not caught under the cap.

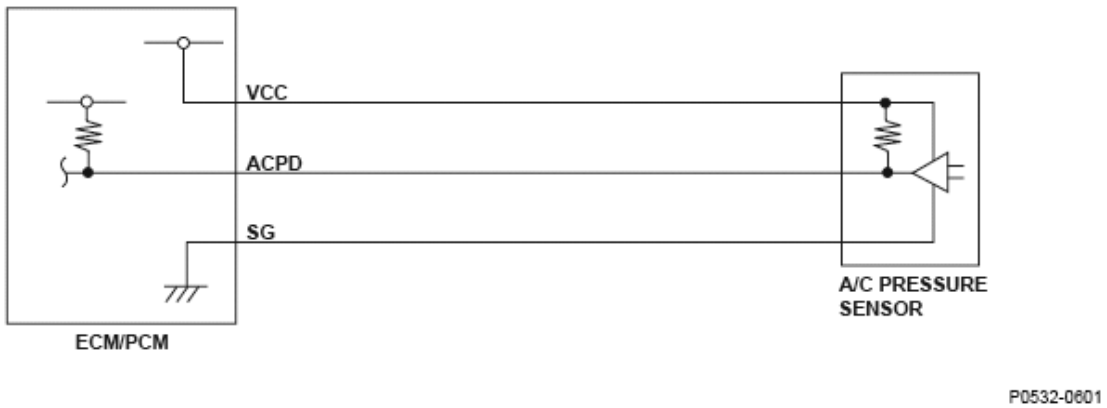

Fig. 22: Checking Fuel Fill Cap Seal And Fuel Fill Pipe Mating Surface
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the fuel fill cap seal missing or damaged, is the fuel fill pipe damaged, or is the tether cord caught under the cap?

YES - Replace the fuel fill cap or the fuel fill pipe, then go to step 19.

NO - Go to step 3.

3. Turn the ignition switch ON (II).
4. Clear the DTC with the HDS.
5. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the FTP sensor, or the EVAP canister vent shut valve and the ECM/PCM.

   NO - Go to step 6.

6. Turn the ignition switch OFF.
7. Remove the EVAP canister vent shut valve from the EVAP canister (see **EVAP CANISTER VENT SHUT VALVE REPLACEMENT**).
8. Connect the 2P connector to the EVAP canister vent shut valve.
9. Turn the ignition switch ON (II).
10. Select EVAP CVS ON in the INSPECTION MENU with the HDS.
11. Check the EVAP canister vent shut valve (A) operation.

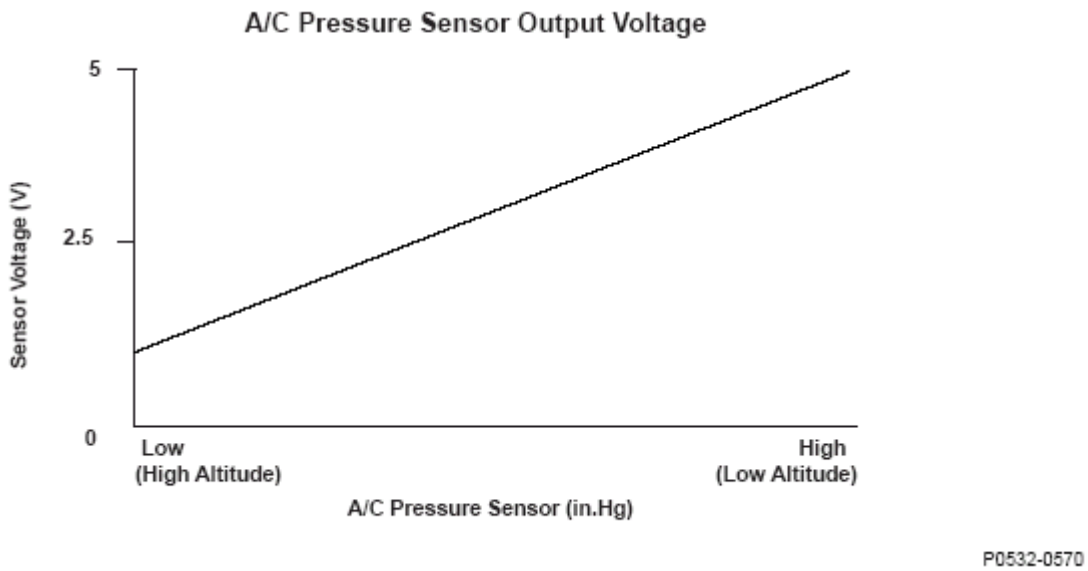

Fig. 23: Checking EVAP Canister Vent Shut Valve Operation
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Does the valve operate?

YES - Check the routing of the EVAP canister vent tube, then go to step 18.

NO - Go to step 12.

12. Turn the ignition switch OFF.
13. Replace the EVAP canister vent shut valve (see **EVAP CANISTER VENT SHUT VALVE REPLACEMENT**).
14. Turn the ignition switch ON (II).
15. Reset the ECM/PCM with the HDS.
16. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
17. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

Is the result OK?

YES - Troubleshooting is complete.

NO - Check for poor connections or loose terminals at the FTP sensor, the EVAP canister vent shut valve, and the ECM/PCM, then go to step 1.

18. Reinstall the EVAP canister vent shut valve.
19. Turn the ignition switch ON (II).
20. Reset the ECM/PCM with the HDS.
21. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
22. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

Is the result OK?

YES - Troubleshooting is complete.

NO - Check for poor connections or loose terminals at the FTP sensor, the EVAP canister vent shut valve, and the ECM/PCM, then go to step 1.

DTC P0496: EVAP SYSTEM HIGH PURGE FLOW DETECTED

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the FTP sensor, the EVAP canister purge valve, the EVAP canister vent shut valve, and the ECM/PCM.

   NO - Go to step 4.

4. Turn the ignition switch OFF.
5. Replace the EVAP canister purge valve (see **EVAP CANISTER PURGE VALVE REPLACEMENT**).
6. Turn the ignition switch ON (II).
7. Reset the ECM/PCM with the HDS.
8. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
9. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES - Troubleshooting is complete.

   NO - Check for poor connections or loose terminals at the FTP sensor, the EVAP canister purge valve, the EVAP canister vent shut valve, and the ECM/PCM, then go to step 1.

DTC P0497: EVAP SYSTEM LOW PURGE FLOW DETECTED

Special Tools Required

- Vacuum/pressure gauge, 0-4 in.Hg, 07JAZ-001000B
- Vacuum pump/gauge, 0-30 in.Hg, Snap-on YA4000A or equivalent, commercially available

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Check the fuel fill cap installation. (The cap must say "TIGHTEN TO CLICK." The cap should tighten 1/4 turn after it is tight.)

   Is the fuel fill cap installed and properly tightened?

   YES - Go to step 2.

   NO - Properly install the fuel fill cap, then go to step 23.

2. Turn the ignition switch ON (II).
3. Clear the DTC with the HDS.
4. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the FTP sensor, the EVAP canister purge valve, or the EVAP canister vent shut valve and the ECM/PCM.

   NO - Go to step 5.

5. Check for a loose or damaged EVAP canister purge line between the intake manifold and the EVAP canister purge valve.

   Is the line OK?

   YES - Go to step 6.

   NO - Reconnect or repair the EVAP canister purge line, then go to step 23.

6. Disconnect the vacuum hose (A) from the EVAP canister purge valve (B) in the engine compartment, and connect a T-fitting (C) from the vacuum gauge and the vacuum pump/gauge, 0-30 in.Hg, to the vacuum hose (A) as shown.

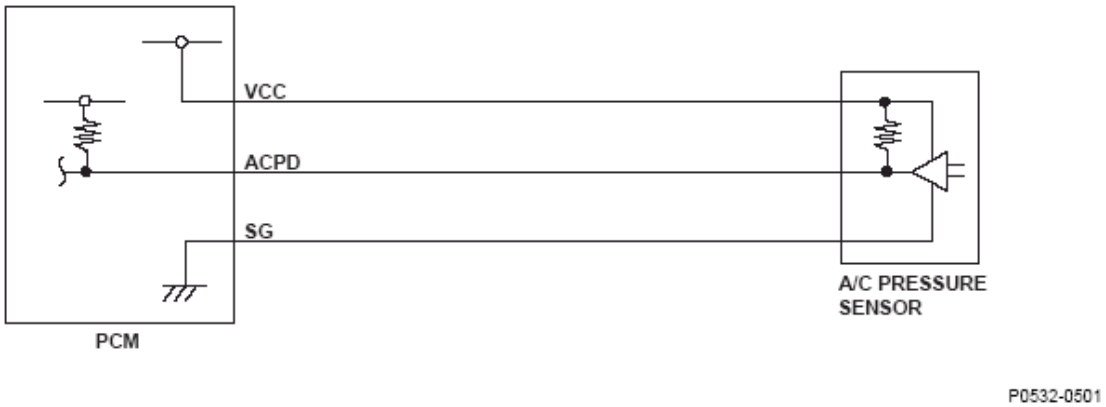

Fig. 24: Connecting T-Fitting From Vacuum Gauge And Vacuum Pump/Gauge, To Vacuum Hose
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Select EVAP PCS ON in the INSPECTION MENU with the HDS.
8. Slowly apply about 0.6 in.Hg (15 mmHg) of vacuum to the hose.

   Does it hold vacuum?

   YES - Replace the EVAP canister purge valve, then go to step 22.

   NO - Go to step 9.

9. Reconnect the vacuum hose to the EVAP canister purge valve.
10. Disconnect the vacuum hose from the purge line (at the EVAP canister side), and connect a T-fitting (A) from the vacuum gauge and the vacuum pump/gauge, 0-30 in.Hg, to the hose as shown.

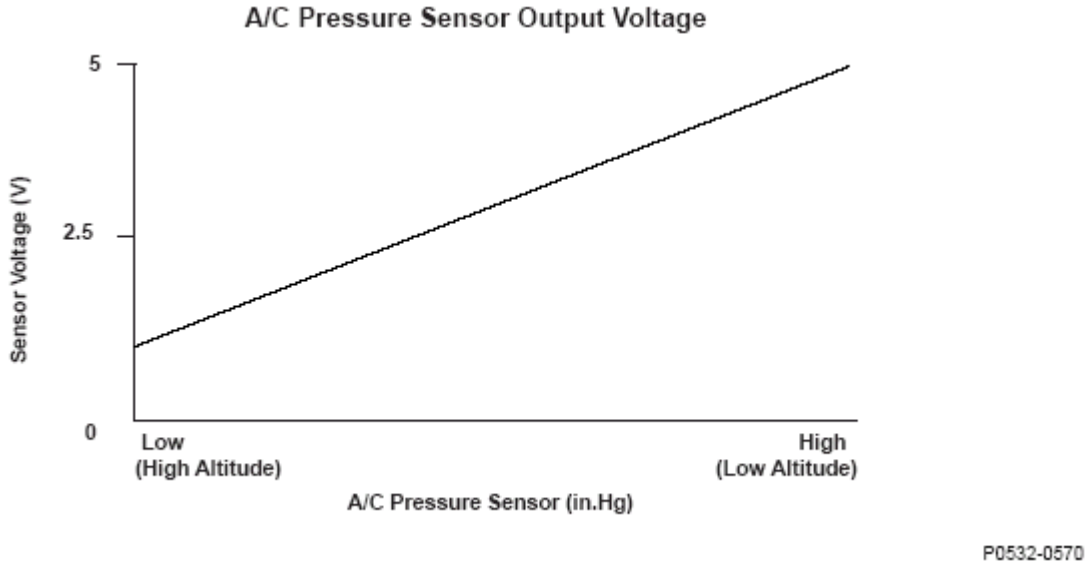

Fig. 25: Connecting T-Fitting From Vacuum Gauge And Vacuum Pump/ Gauge To Hose
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Select EVAP PCS ON in the INSPECTION MENU with the HDS.
12. Slowly apply about 2 kPa (0.6 in.Hg, 15 mmHg) of vacuum to the hose.

    Does it hold vacuum?

    YES - Check for a restricted EVAP canister purge line between the EVAP canister purge valve and the EVAP canister, then go to step 22.

    NO - Go to step 13.

13. Remove the FTP sensor with its connector connected (see **FTP SENSOR REPLACEMENT**).
14. Connect a T-fitting (A) from the vacuum pump/gauge, 0-30 in.Hg, and the vacuum pump to the FTP sensor (B) as shown.

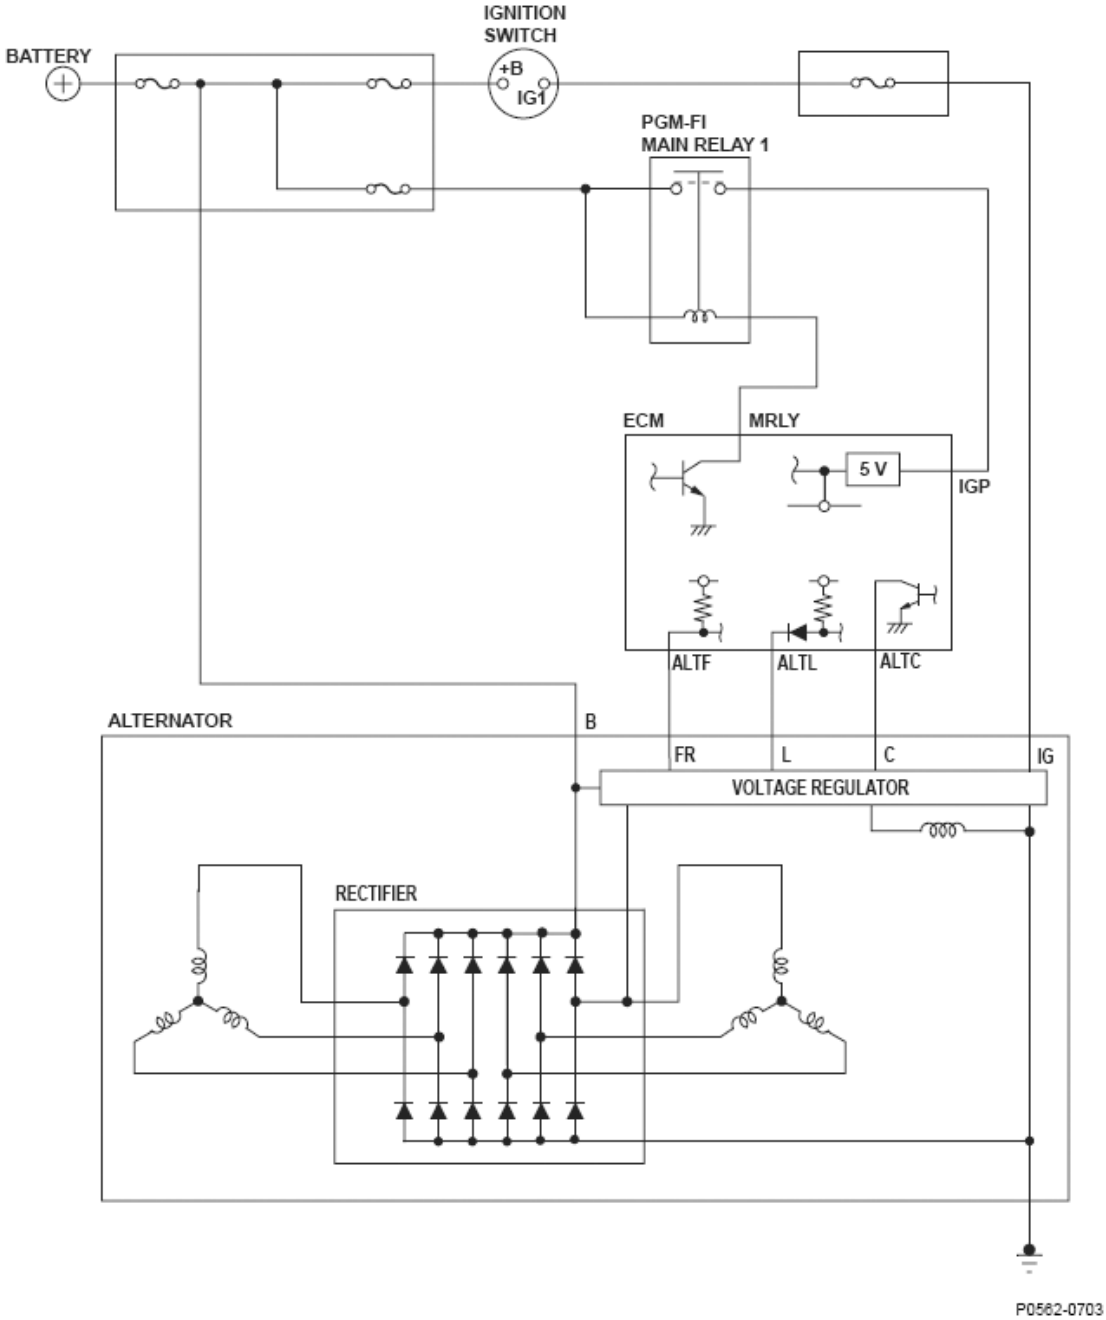

Fig. 26: Connecting T-Fitting From Vacuum Pump/Gauge And Vacuum Pump To FTP Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Check and record the FTP SENSOR reading in the DATA LIST with the HDS.
16. Slowly apply about 1.3 kPa (0.4 in.Hg, 10 mmHg) of vacuum to the hose.
17. Check the FTP SENSOR in the DATA LIST with the HDS.

Is the difference more than 1.1 kPa (0.31 in.Hg, 8 mmHg) before and after applying vacuum?

YES - Go to step 18.

NO - Replace the FTP sensor (see **FTP SENSOR REPLACEMENT**), then go to step 22.

18. Reconnect the vacuum hoses to the EVAP canister purge line (EVAP canister side), and reinstall the FTP sensor.
19. Disconnect the vacuum hose (purge line) (A) from the EVAP canister purge valve (B), and connect a T-fitting (C) from the vacuum gauge and the vacuum pump/gauge, 0-30 in.Hg, to the hose as shown.

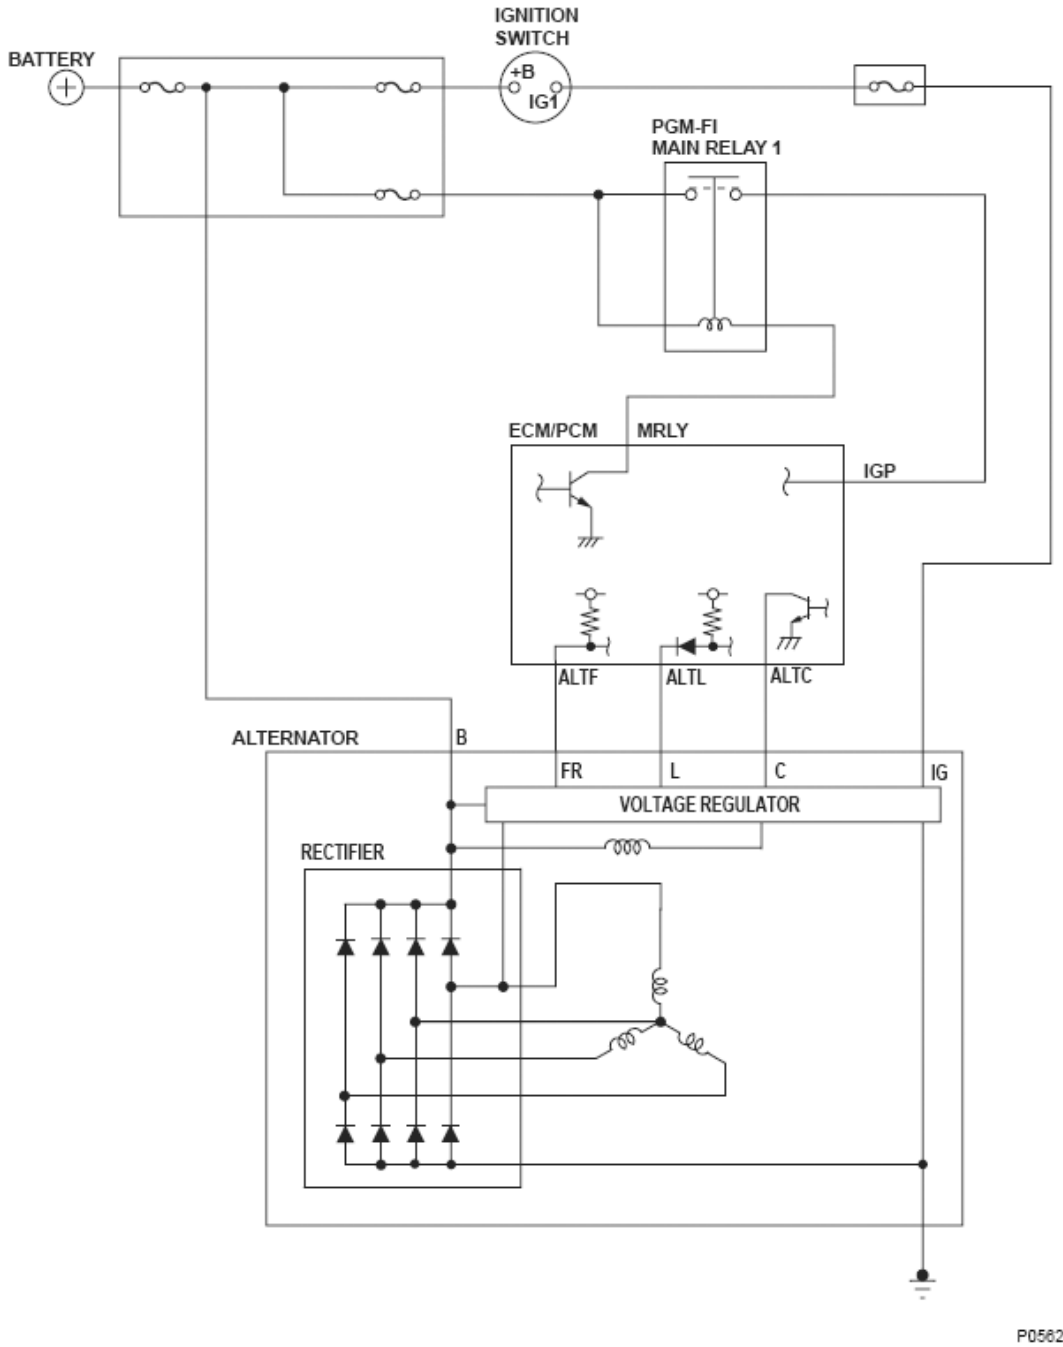

Fig. 27: Connecting T-Fitting From Vacuum Gauge And Vacuum Pump/Gauge To Hose
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Select EVAP CVS ON in the INSPECTION MENU with the HDS.
21. Slowly apply about 2 kPa (0.6 in.Hg, 15 mmHg) of vacuum to the hose.

Does the hose hold vacuum?

YES - Check for a blockage at the EVAP canister port, then go to step 22.

NO - Replace the EVAP canister vent shut valve (see **EVAP CANISTER VENT SHUT VALVE REPLACEMENT**), then go to step 22.

22. Reconnect all hoses.
23. Turn the ignition switch ON (II).
24. Reset the ECM/PCM with the HDS.
25. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
26. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

Is the result OK?

YES - Troubleshooting is complete.

NO - Check for poor connections or loose terminals at the FTP sensor, the EVAP canister purge valve, the EVAP canister vent shut valve, and the ECM/PCM, then go to step 1.

DTC P0498: EVAP CANISTER VENT SHUT VALVE CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check for Temporary DTCs or DTCs with the HDS. Is DTC P0498 indicated?

YES - Go to step 6.

NO - Go to step 4.

4. Select EVAP CVS ON in the INSPECTION MENU with the HDS.
5. Check for Temporary DTCs or DTCs with the HDS. Is DTC P0498 indicated?

YES - Go to step 6.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP canister vent shut valve and the ECM/PCM.

6. Turn the ignition switch OFF.
7. Disconnect the EVAP canister vent shut valve 2P connector.
8. Turn the ignition switch ON (II).
9. Measure voltage between EVAP canister vent shut valve 2P connector terminal No. 2 and body ground.

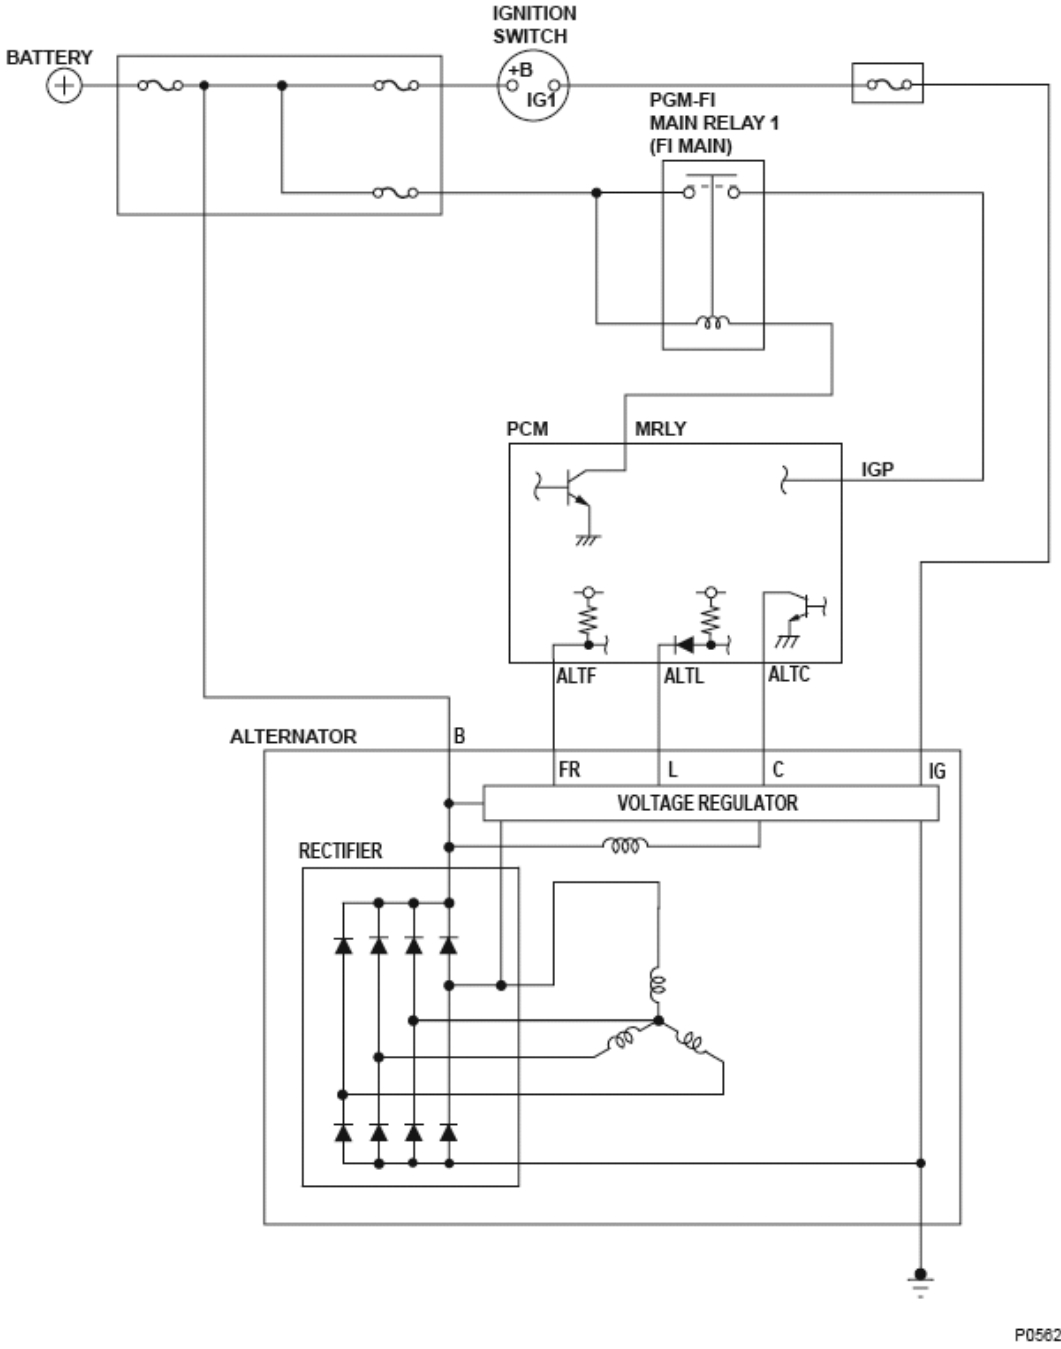

Fig. 28: Measuring Voltage Between EVAP Canister Vent Shut Valve 2P Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 10.

NO - Repair open in the wire between the EVAP canister vent shut valve and the PGM-FI subrelay (E), then go to step 18.

10. Turn the ignition switch OFF.

11. At the valve side, measure resistance between EVAP canister vent shut valve 2P connector terminals No. 1 and No. 2.

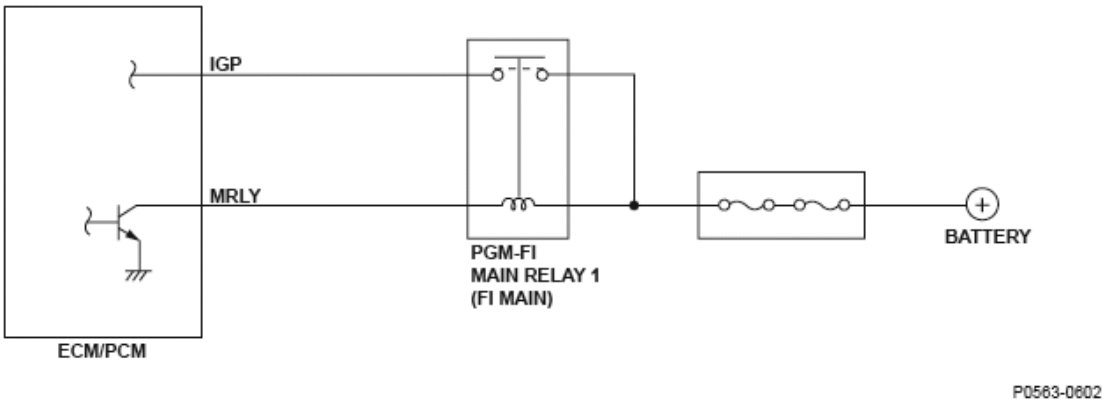

Fig. 29: Measuring Resistance Between EVAP Canister Vent Shut Valve 2P Connector Terminals No. 1 And 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 25-30 ohms at room temperature?

YES - Go to step 12.

NO - Go to step 17.

12. Jump the SCS line with the HDS.
13. Disconnect ECM/PCM connector A (44P).
14. Check for continuity between ECM/PCM connector terminal A10 and body ground.

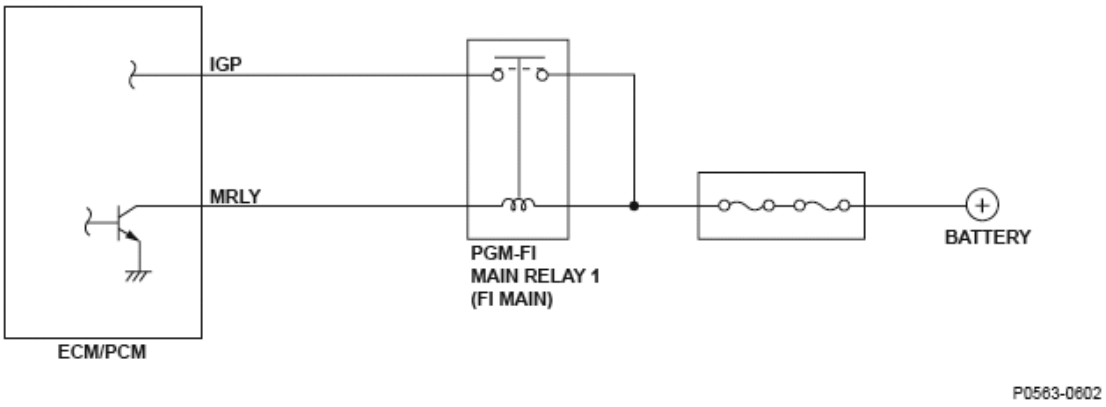

Fig. 30: Checking Continuity Between ECM/PCM Connector Terminal A10 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the EVAP canister vent shut valve and the ECM/PCM (A10), then go to step 18.

NO - Go to step 15.

15. Connect EVAP canister vent shut valve 2P connector terminal No. 1 to body ground with a jumper wire.

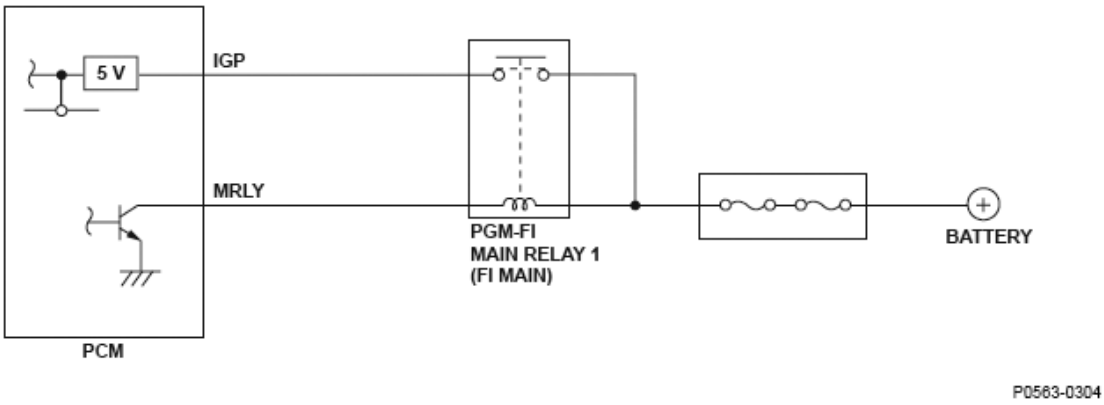

Fig. 31: Connecting EVAP Canister Vent Shut Valve Terminal No. 1 To Body Ground With Jumper Wire

16. Check for continuity between ECM/PCM connector terminal A10 and body ground.

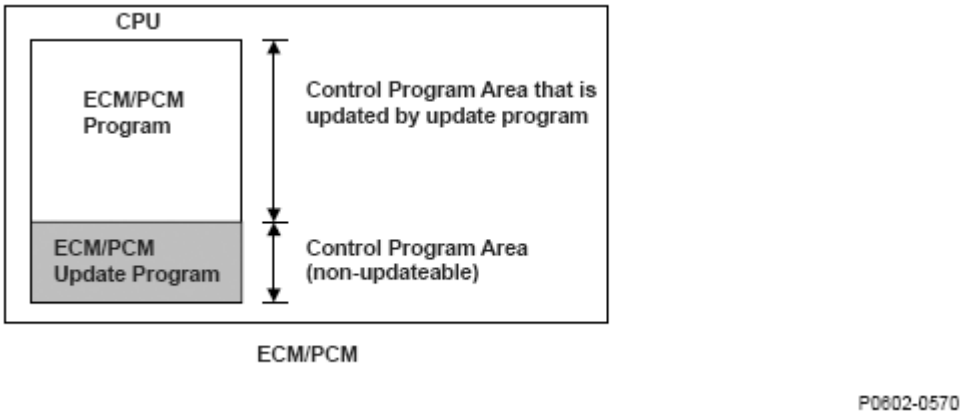

Fig. 32: Checking Continuity Between ECM/PCM Connector Terminal A10 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the EVAP canister vent shut valve and the ECM/PCM (A10), then go to step 18.

17. Replace the EVAP canister vent shut valve (see **EVAP CANISTER VENT SHUT VALVE REPLACEMENT**).
18. Reconnect all connectors.
19. Turn the ignition switch ON (II).
20. Reset the ECM/PCM with the HDS.
21. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).

22. Select EVAP CVS ON in the INSPECTION MENU with the HDS.
23. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0498 indicated?

    YES - Check for poor connections or loose terminals at the EVAP canister vent shut valve and the ECM/PCM, then go to step 1.

    NO - Go to step 24.

24. Monitor the OBD STATUS for DTC P0498 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 23, go to the indicated DTCs troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the EVAP canister vent shut valve and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 22.

25. Reconnect all connectors.
26. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
27. Select EVAP CVS ON in the INSPECTION MENU with the HDS.
28. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0498 indicated?

    YES - Check for poor connections or loose terminals at the EVAP canister vent shut valve and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 27. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 29.

29. Monitor the OBD STATUS for DTC P0498 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 28, go to the indicated DTCs troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the EVAP canister vent shut valve and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 27. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, go to step 27.

DTC P0499: EVAP CANISTER VENT SHUT VALVE CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Select EVAP CVS ON in the INSPECTION MENU with the HDS.
4. Check for Temporary DTCs or DTCs with the HDS. Is DTC P0499 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP canister vent shut valve and the ECM/PCM.

5. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
6. Select EVAP CVS ON in the INSPECTION MENU with the HDS.
7. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0499 indicated?

   YES - Check for poor connections or loose terminals at the EVAP canister vent shut valve and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 6. If the ECM/PCM was substituted, go to step 1.

   NO - Go to step 8.

8. Monitor the OBD STATUS for DTC P0499 in the DTCs MENU with the HDS.

   Does the screen indicate PASSED?

   YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 7, go to the indicated DTCs troubleshooting.

   NO - If the screen indicates FAILED, check for poor connections or loose terminals at the EVAP canister vent shut valve and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 6. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, go to step 6.

DTC P1454: FTP SENSOR RANGE/PERFORMANCE PROBLEM; DTC P2422: EVAP CANISTER VENT SHUT VALVE STUCK CLOSED MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch OFF.
4. Remove the fuel fill cap, and wait 1 minute.
5. Check the FTP SENSOR in the DATA LIST with the HDS.

   Is it between - 0.67 and 0.67 kPa (- 0.2 and 0.2 in.Hg, -5 and 5 mmHg), or 2.4 and 2.6 V?

   YES - Go to step 6.

   NO - Go to step 17.

6. Install the fuel fill cap.
7. Clear the DTC with the HDS.
8. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park on neutral) until the radiator fan comes on, then let it idle.
9. Monitor the OBD STATUS for DTC P1454 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 10.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the FTP sensor, the EVAP canister vent shut valve, and the ECM/PCM. Also check for a blockage in the vent hoses and the drain joint. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

10. Clear the DTC with the HDS.
11. Turn the ignition switch OFF.
12. Remove the EVAP canister vent shut valve from the EVAP canister (see **EVAP CANISTER VENT SHUT VALVE REPLACEMENT**).
13. Connect the 2P connector to the EVAP canister vent shut valve.
14. Turn the ignition switch ON (II).
15. Select EVAP CVS ON in the INSPECTION MENU with the HDS.
16. Check the EVAP canister vent shut valve (A) operation.

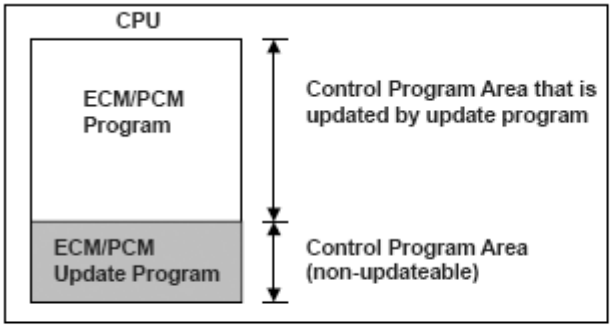

Fig. 33: Checking EVAP Canister Vent Shut Valve Operation
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Does the valve operate?

YES - Check for a blockage in the EVAP canister, vent hoses, and drain joint, then install the EVAP canister vent shut valve, and go to step 23.

NO - Replace the EVAP canister vent shut valve (see **EVAP CANISTER VENT SHUT VALVE REPLACEMENT**), then go to step 23.

17. Disconnect the air tube (A) from the FTP sensor (B).

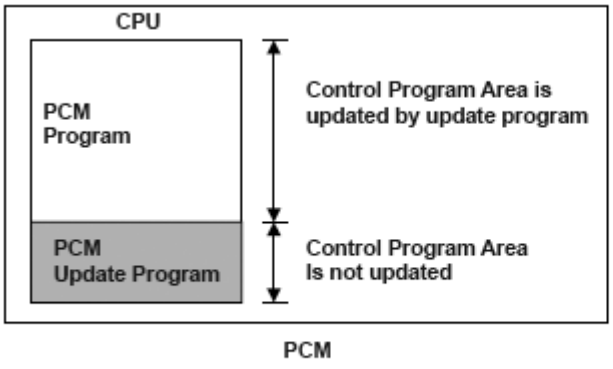

Fig. 34: Disconnecting Air Tube From FTP Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

18. Check the FTP SENSOR in the DATA LIST with the HDS.

    Is it between - 0.67 and 0.67 kPa (- 0.2 and 0.2 in.Hg, -5 and 5 mmHg), or 2.4 and 2.6 V?

    YES - Check for a blockage in the FTP sensor air tube or vent, then go to step 23.

    NO - Go to step 19.

19. Turn the ignition switch OFF.

20. Remove the FTP sensor (A) from the EVAP canister with its connector connected (see **FTP SENSOR REPLACEMENT**).

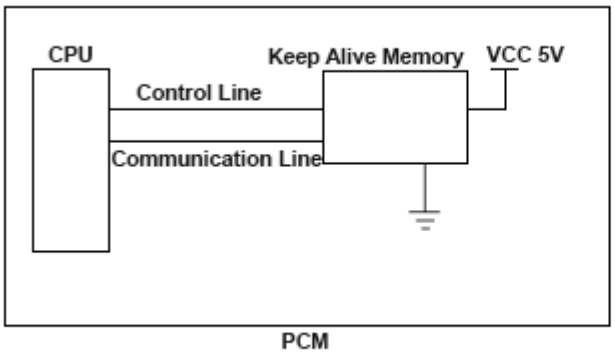

Fig. 35: Removing FTP Sensor From EVAP Canister With Connector Connected
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Turn the ignition switch ON (II).
22. Check the FTP SENSOR in the DATA LIST with the HDS.

    Is it between - 0.67 kPa and 0.67 kPa (- 0.2 and 0.2 in.Hg, -5 and 5 mmHg), or 2.4 and 2.6 V?

    YES - Check for debris or clogging at the EVAP canister and the FTP sensor port, then go to step 23.

    NO - Replace the FTP sensor (see **FTP SENSOR REPLACEMENT**), then go to step 23.

23. Turn the ignition switch ON (II).
24. Reset the ECM/PCM with the HDS.
25. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
26. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
27. Check for Temporary DTCs or DTCs with the HDS.

    If DTC P1454 and/or P2422 indicated?

    YES - Check for poor connections or loose terminals at the FTP sensor, the EVAP canister vent shut valve, and the ECM/PCM, then go to step 1.

    NO - Go to step 28.

28. Monitor the OBD STATUS for DTC P1454 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 27, go to the indicated DTCs troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the FTP

sensor, the EVAP canister vent shut valve, and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

EVAP CANISTER REPLACEMENT

6. Remove the EVAP canister vent shut valve (B).
7. Install the EVAP canister vent shut valve in the new EVAP canister with new O-rings (C).

NOTE: Do not coat the O-rings with oil.

8. Install the parts in the reverse order of removal.

FTP SENSOR REPLACEMENT

1. Remove the cover (see step 1 in **EVAP CANISTER REPLACEMENT**).
2. Disconnect the FTP sensor connector (A).

GENERAL TROUBLESHOOTING INFORMATION

INTERMITTENT FAILURES

The term "intermittent failure" means a system may have had a failure, but it checks OK now. If the malfunction indicator lamp (MIL) on the dash does not come on, check for poor connections or loose pins at all connectors related to the circuit that you are troubleshooting. If the MIL was on but then went out, the original problem may have been intermittent.

SERVICE INFORMATION

Periodically, new ECM software or new service procedures may become available. Always check online for he latest software or service information troubleshooting.

OPENS AND SHORTS

"Open" and "short" are common electrical terms. An open is a break in a wire or at a connection. A short is an accidental connection of a wire to ground or to another wire. In simple electronics, this usually means something won't work at all. With complex electronics (such as ECMs) this can sometimes mean something works, but not the way it's supposed to.

HOW TO USE THE HDS (HONDA DIAGNOSTIC SYSTEM)

If the MIL (malfunction indicator lamp) has come on

1. Start the engine, and check the MIL (A).

NOTE: **If the ignition switch is turned ON (II), and the engine is not started, the MIL stays on for 15-20 seconds (see MALFUNCTION INDICATOR LAMP (MIL) INDICATION (IN RELATION TO READINESS CODES)).**

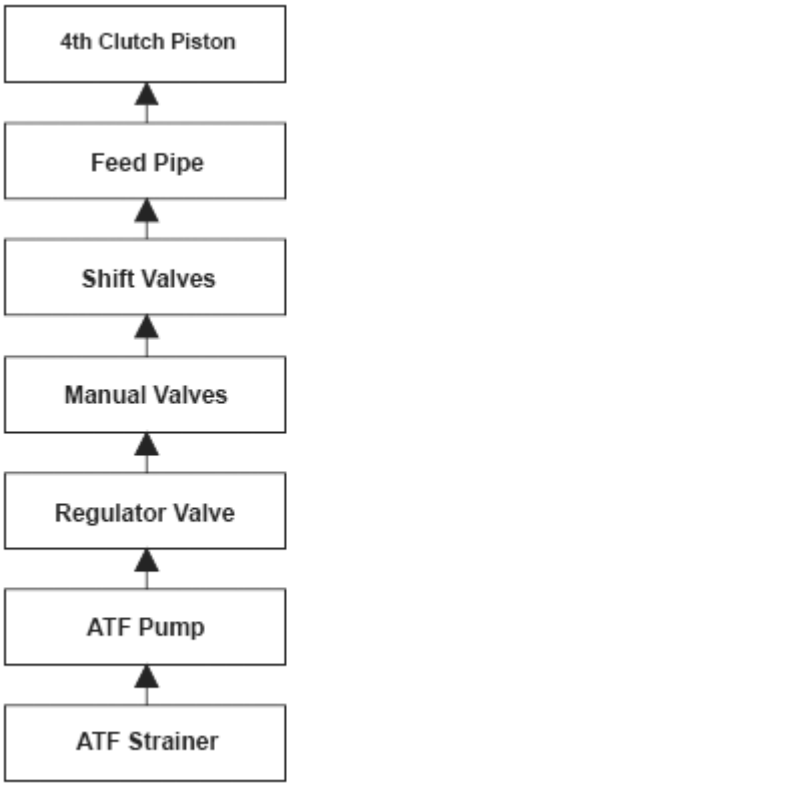

Fig. 2: Identifying MIL
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. If the MIL stays on, connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

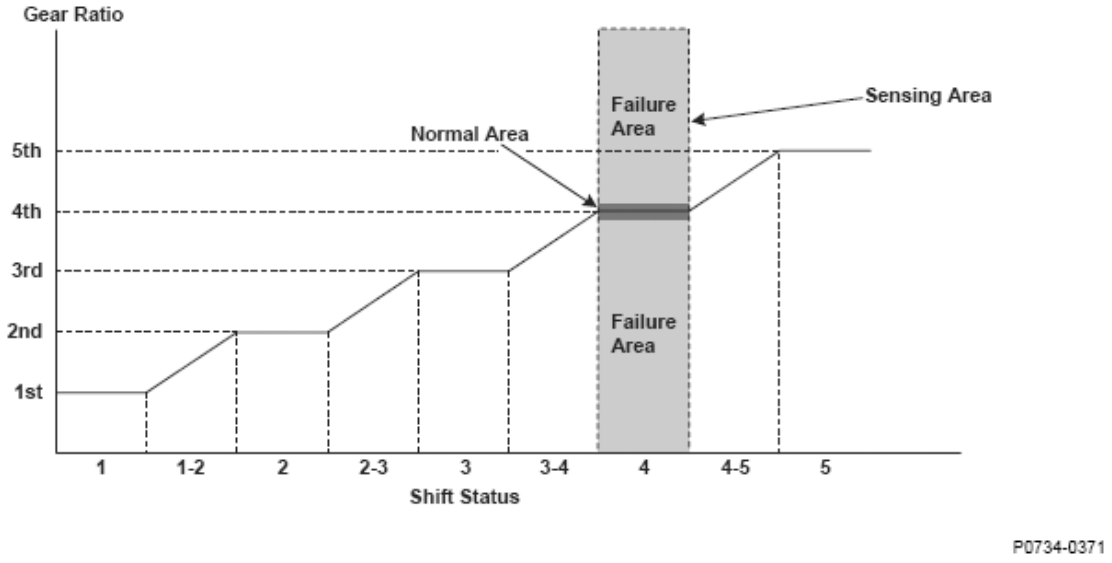

Fig. 3: Connecting HDS To DLC
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Turn the ignition switch ON (II).
4. Make sure the HDS communicates with the ECM. If it doesn't, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**)
5. Check the diagnostic trouble code (DTC) and note it. Also check the freeze data and/or on-board snapshot data, and download any data found. Then refer to the indicated DTC's troubleshooting, and begin the appropriate troubleshooting procedure.

NOTE:

- **Freeze data indicates the engine conditions when the first malfunction, misfire, or fuel trim malfunction was detected.**
- **The HDS can read the DTC, freeze data, on-board snapshot, current data, and other engine control module (ECM) data.**
- **For specific operations, refer to the user's manual that came with the HDS.**

6. If no DTCs are found, go to MIL troubleshooting (see **MIL CIRCUIT TROUBLESHOOTING**).

If the MIL did not stay on

If the MIL did not stay on but there is a driveability problem, do the symptom troubleshooting.

If you can't duplicate the DTC

Some of the troubleshooting requires you to reset the ECM and try to duplicate the DTC. If the problem is intermittent and you can't duplicate the code, do not continue through the procedure. To do so will only result in confusion and possibly, a needlessly replaced ECM.

HDS CLEAR COMMAND

The ECM stores various specific data to correct the system even if there is no electrical power such as when the battery negative terminal or No. 19 Fl MAIN (15 A) fuse are disconnected. Stored data based on failed

parts should be cleared by using the "CLEAR COMMAND" of the HDS, if parts are replaced.

The HDS has three kinds of clear commands to meet this purpose. They are DTC clear, ECM reset, and crank (CKP) pattern clear. DTC clear command erases all stored DTC codes, freeze data, on-board snapshot, and readiness codes. This must be done with the HDS after reproducing the DTC during troubleshooting. The ECM reset command erases all stored DTC codes, freeze data, on-board snapshot, readiness codes, and all specific data to correct the system except crank (CKP) pattern. If the crank (CKP) pattern data in the ECM was cleared, you must do the crank (CKP) pattern learn procedure. The crank (CKP) pattern clear command erases only crank (CKP) pattern data. This command is for repair of a misfire or the CKP sensor.

SCAN TOOL CLEAR COMMAND

If you are using a generic scan tool to clear commands, be aware that there is only one setting for clearing the ECM, and it clears all commands at the same time (crank (CKP) pattern learn, idle learn, readiness codes, freeze data, on-board snapshot, and DTCs). After you clear all commands, you then need to do these procedures, in this order: ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**); crank (CKP) pattern learn procedure; test-drive to set readiness codes to complete (see **HOW TO SET READINESS CODES**).

DTC CLEAR

1. Clear the DTC with the HDS while the engine is stopped.
2. Turn the ignition switch OFF.
3. Turn the ignition switch ON (II), and wait for 30 seconds.
4. Turn the ignition switch OFF, and disconnect the HDS from the DLC.

ECM RESET

1. Reset the ECM with the HDS while the engine is stopped.
2. Turn the ignition switch OFF.
3. Turn the ignition switch ON (II), and wait for 30 seconds.
4. Turn the ignition switch OFF, and disconnect the HDS from the DLC.
5. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).

CRANK (CKP) PATTERN CLEAR/CRANK (CKP) PATTERN LEARN

Clear/Learn Procedure (with the HDS)

1. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

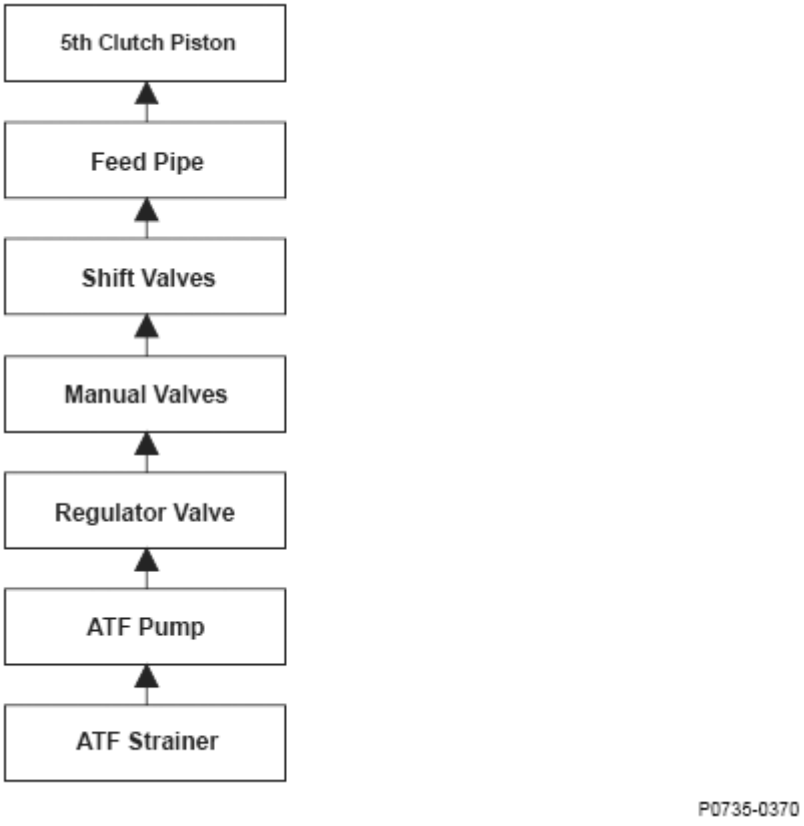

Fig. 4: Connecting HDS To DLC
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch ON (II).
3. Make sure the HDS communicates with the ECM. If it doesn't, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Select CRANK PATTERN in the ADJUSTMENT MENU with the HDS.
5. Select CRANK PATTERN LEARNING with the HDS, and follow the screen prompts.

LEARN PROCEDURE (WITHOUT THE HDS)

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on.
2. Test-drive the vehicle on a level road: Decelerate (with the throttle fully closed) from an engine speed of 2,500 rpm down to 1,000 rpm with the transmission in 1st gear.
3. Test-drive the vehicle on a level road: Decelerate (with the throttle fully closed) from an engine speed of 5,000 rpm down to 3,000 rpm with the transmission in 1st gear.
4. Repeat step 2 and 3 several times.
5. Turn the ignition switch OFF.
6. Turn the ignition switch ON (II), and wait for 30 seconds.

HOW TO END A TROUBLESHOOTING SESSION (REQUIRED AFTER ANY TROUBLESHOOTING)

1. Reset the ECM with the HDS.

2. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
3. Turn the ignition switch OFF.
4. Disconnect the HDS from the DLC.

NOTE: j
The ECM is part of the immobilizer system. If you replace the ECM, it will have a different immobilizer code. In order for the engine to start, you must rewrite the immobilizer code with the HDS.

HOW TO TROUBLESHOOT CIRCUITS AT THE ECM CONNECTORS

NOTE: The ECM overwrites data and monitors the EVAP system for up to 15 minutes after the ignition switch is turned OFF. Jumping the SCS line after turning the ignition switch OFF cancels this function. Disconnecting the ECM during this function, without jumping the SCS line first, can damage the ECM.

1. Jump the SCS line with the HDS.
2. Remove the cover (A).

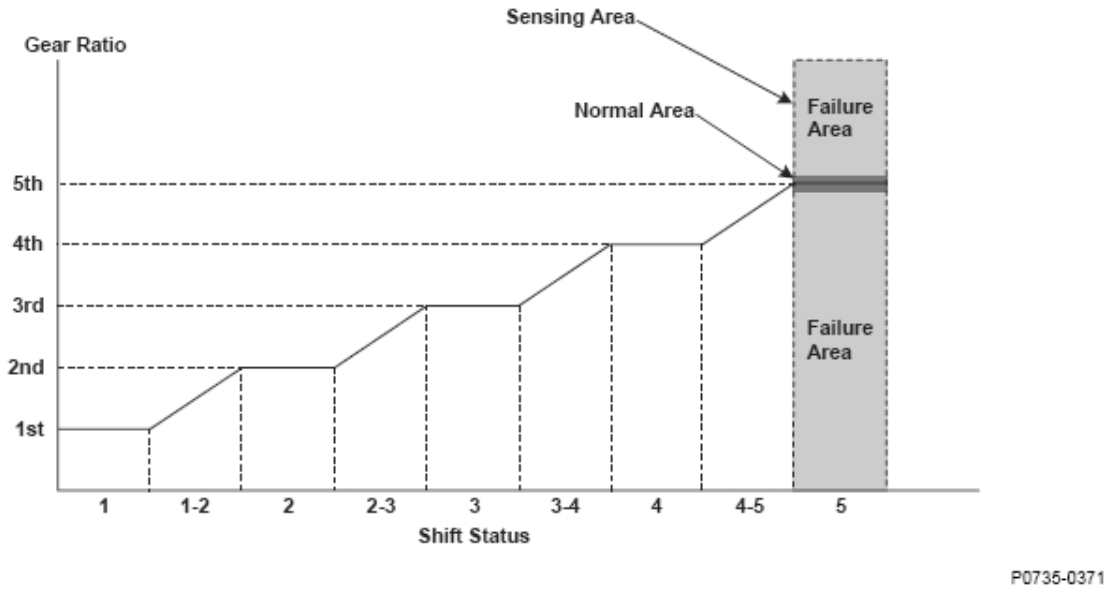

Fig. 5: Removing Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Lift up the under-hood fuse/relay box (D).

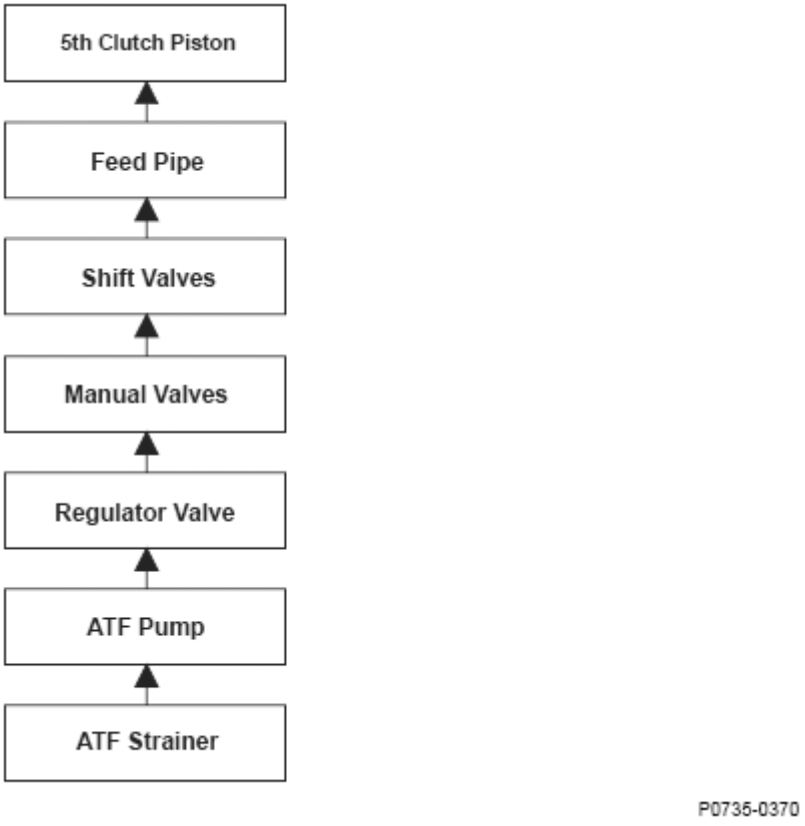

Fig. 6: Lifting Up Under-Hood Fuse/Relay Box
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the coolant reservoir (E). Disconnect the ECM connectors A, B, and C.
5. When diagnosis/troubleshooting is done at the ECM connector, use the terminal test port (A) above the terminal you need to check.

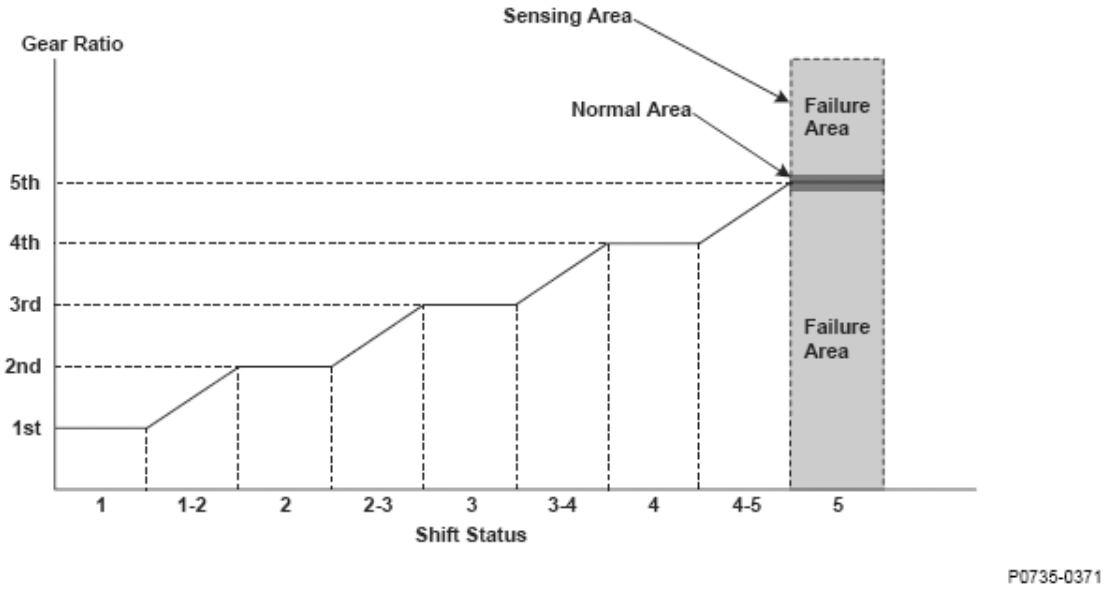

Fig. 7: Using Test Port To Check ECM Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Connect one side of the patch cord (A) terminals to a commercially available digital multimeter (B), and connect the other side of the patch cord terminals to a commercially available banana jack (Pomona Electronics Tool No. 3563 or equivalent) (C).

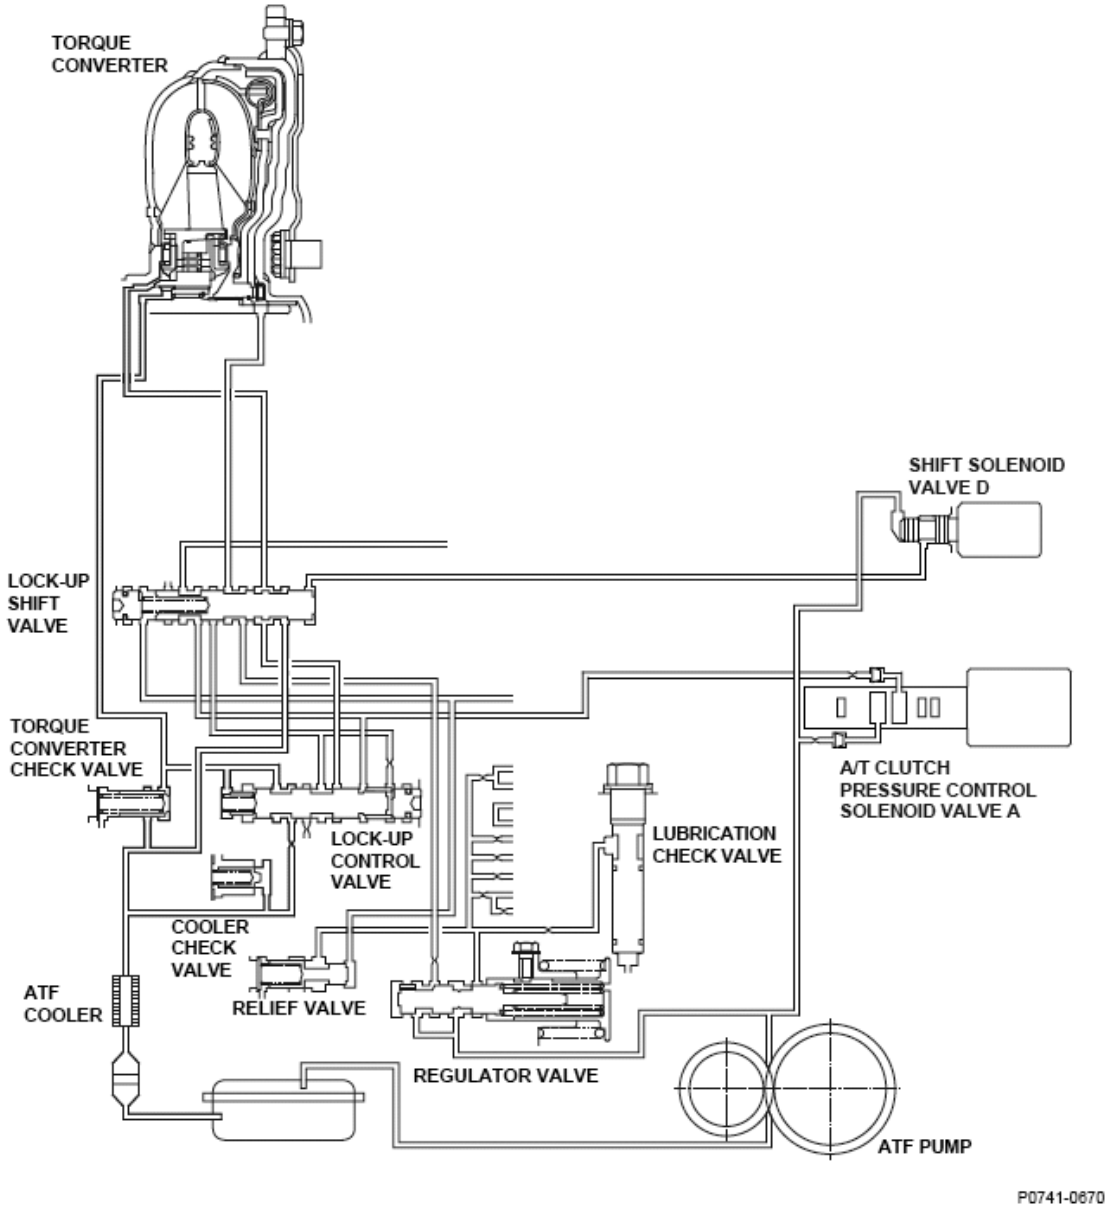

Fig. 8: Connecting Patch Cord Terminals To Commercially Available Digital Multimeter
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Gently contact the pin probe (male) at the terminal test port from the terminal side. Do not force the tips into the terminals.

NOTE:

- **For accurate results, always use the pin probe (male).**
- **To prevent damage to the connector terminals, do not insert test equipment probes, paper clips, or other substitutes as they can damage the terminals. Damaged terminals cause a poor connection and an incorrect measurement.**

- **Do not puncture the insulation on a wire. Punctures can cause poor or intermittent electrical connections.**

SUBSTITUTING THE ECM

Special Tools Required

- Honda diagnostic system (HDS) tablet tester
- Honda interface module (HIM) and an iN workstation with the latest HDS software version
- HDS pocket tester
- GNA600 and an iN workstation with the latest HDS software version

Any one of the above updating tools can be used.

NOTE: Use this procedure when you have to substitute a known-good ECM during troubleshooting procedures.

1. **Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.**
2. **Turn the ignition switch to ON (II).**
3. **Make sure the HDS communicates with the ECM and other vehicle systems. If it doesn't, go to the DLC circuit troubleshooting. If you are returning from DLC circuit troubleshooting, skip steps 4 and 5, then clean the throttle body after substituting the ECM.**
4. **Select the INSPECTION MENU with the HDS.**
5. **Select the ETCS TEST, then select the TP POSITION CHECK, and follow the screen prompts.**

   NOTE: If the TP POSITION CHECK indicates FAILED, continue this procedure.

6. **Turn the ignition switch to LOCK (0).**
7. **Jump the SCS line with the HDS.**
8. **Do the battery removal procedure.**

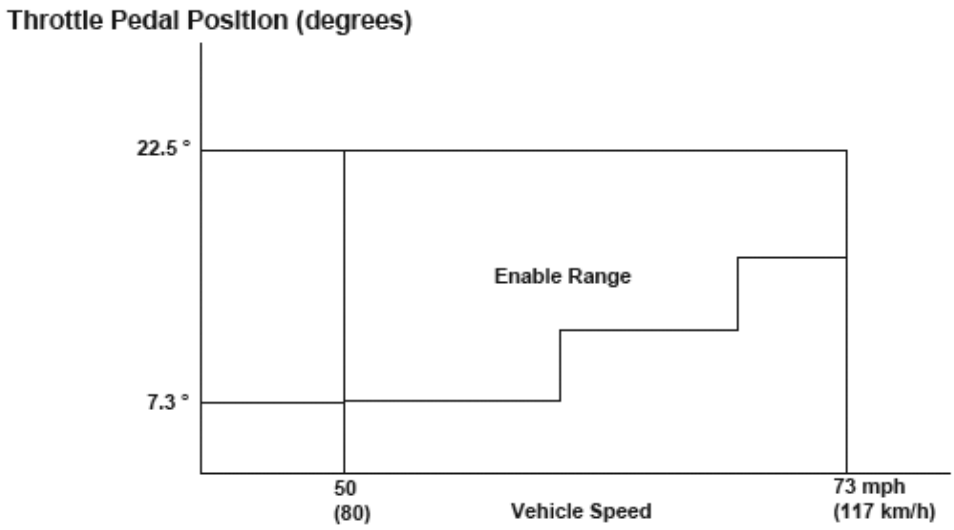

Fig. 9: Connecting HDS To DLC
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. **Remove the cover (A).**

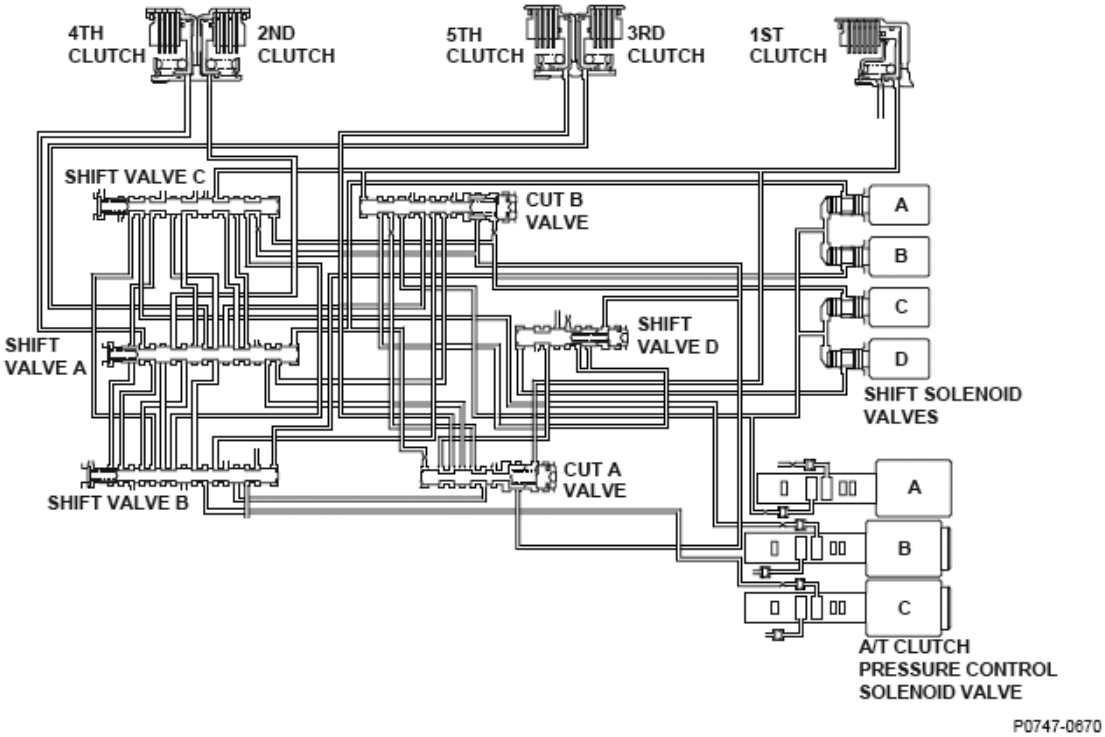

Fig. 10: Remove the Cover
Courtesy of TOYOTA

10. **Remove the bolts (D), then remove the ECM (E).**
11. **Disconnect ECM connectors A, B, and C.**

NOTE: ECM connectors A, B, and C have symbols (A=?, B=? , C=?)

embossed on them for identification.

12. **Install a known-good ECM in the reverse order of removal.**
13. **Do the battery installation procedure. (See BATTERY REMOVAL AND INSTALLATION).**

NOTE: While doing the battery terminal reconnection procedure, do not start the engine.

14. **Turn the ignition switch to ON (II).**

NOTE: DTC P0630 VIN Not Programmed or Mismatch may be stored because the VIN has not been programmed into the ECM; ignore it, and continue this procedure.

15. **Manually input the VIN to the ECM with the HDS.**
16. **Select the IMMOBI SYSTEM with the HDS.**
17. **Enter the immobilizer ECM code that you got from the iN, and use the ECM replacement procedure in the IMMOBI MENU of the HDS; it allows you to start the engine.**
18. **Reset the ECM with the HDS.**
19. **If the TP POSITION CHECK failed in step 5, clean the throttle body. (See THROTTLE BODY CLEANING).**
20. **Update the ECM if it does not have the latest software. (see ECM REPLACEMENT).**
21. **Do the ECM idle learn procedure.(seeECM IDLE LEARN PROCEDURE).**
22. **Do the CKP pattern clear/CKP pattern learn procedure.**

1. Turn the ignition switch ON (II), but do not start the engine.
2. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.
3. Make sure the HDS communicates with the ECM. If it doesn't, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**). If you are returning from the DLC circuit troubleshooting, skip step 4 to 5 and clean the throttle body after updating the ECM (see **THROTTLE BODY CLEANING**).
4. USA, Canada models: Select the INSPECTION MENU with the HDS.
5. USA, Canada models: Select the ETCS TEST, then select the TP POSITION CHECK, and follow the HDS screen prompts.

NOTE: If the TP POSITION CHECK indicates FAILED, continue this procedure.

6. Exit the HDS (USA, Canada models). Select the update program, and follow the screen prompts to update the ECM.
7. If the software in the ECM is the latest disconnect the HDS/HIM from the DLC, and go back to the procedure that you were doing. If the software in the ECM is not the latest, follow the instructions on the screen.

NOTE: If the ECM update system requires you to cool the ECM, follow the instructions on screen. If you run into a problem during the update procedure, (programming takes over 15 minutes, status bar goes over 100%, immobilizer light flashes, HDS tablet freezes, etc.), follow these steps to minimize the chance of damaging the ECM:

- Leave the ignition switch in the ON (II) position.
- Connect a jumper battery (do not connect a battery charger).
- Shut down the HDS.
- Disconnect the HDS from the DLC.
- Reboot the HDS.
- Reconnect the HDS to the DLC, and try the update procedure again.

8. USA, Canada models: If the TP POSITION CHECK failed in step 6, clean the throttle body (see **THROTTLE BODY CLEANING**).
9. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
10. Do the CKP learn procedure.

SUBSTITUTING THE ECM

Special Tools Required

- Honda diagnostic system (HDS)
- Honda interface module (HIM)
- HDS pocket tester

NOTE: Use this procedure when you need to substitute a known-good ECM during troubleshooting procedures.

1. Make sure you have the anti-theft codes for the radio and the navigation system (if equipped).
2. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

22. Enter the anti-theft codes for the radio and the navigation system (if equipped), and set the clock.

OBD STATUS

The OBD status shows the current system status of each DTC and all of the parameters. This function is used to see if the repair was successfully completed. The results of diagnostic tests for the DTC are displayed as:

- PASSED: The on board diagnosis is successfully finished.
- FAILED: The on board diagnosis has finished but failed.

- EXECUTING: The vehicle is in enable criteria conditions for the DTC and the on board diagnosis is running.
- NOT COMPLETED: The on board diagnosis was running but is out of the enable conditions of the DTC.
- OUT OF CONDITION: The vehicle has stayed out of the enable conditions for the DTC.

SYSTEM DESCRIPTION

ELECTRONIC CONTROL SYSTEM

The functions of the fuel and emission control systems are managed by the engine control module (ECM).

Self-diagnosis

The ECM detects a failure of a signal from a sensor or from another control unit and stores a Temporary DTC or a DTC. Depending on the failure, a DTC is stored in either the first or the second drive cycle (for '07 model DTC P0457, the DTC is set in the beginning of the third drive cycle). When a DTC is stored, the ECM turns on the malfunction indicator lamp (MIL) by supplying ground to the MIL circuit.

- **One Drive Cycle Detection Method**

  When an abnormality occurs in the signal from a sensor or from another control unit, the ECM stores a DTC for the failure and turns on the MIL immediately.

- **Two Drive Cycle Detection Method**

  When an abnormality occurs in the signal from a sensor or from another control unit in the first drive cycle, the ECM stores a Temporary DTC. The MIL does not come on at this time. If the failure

continues in the second drive cycle, the ECM stores a DTC and turns on the MIL.

Fail-safe Function

When an abnormality occurs in the signal from a sensor or from another control unit, the ECM ignores that signal and substitute a pre-programmed value for them that allows the engine to continue running. This causes a DTC to be stored and the MIL to come on.

MIL Bulb Check and Readiness Code Condition

When the ignition switch is turned ON (II), the ECM supplies ground to the MIL circuit for about 15 to 20 seconds to check the bulb condition. If any readiness codes are not set to complete, the MIL flashes five times. If all readiness codes are set to complete, the MIL goes off.

Self Shut Down (SSD) Mode

After the ignition switch is turned OFF, the ECM stays on (up to 30 minutes). If the ECM connector is disconnected during this time, the ECM may be damaged. To cancel this mode, disconnect the negative cable from the battery or jump the SCS line with the HDS after the ignition switch is turned OFF.

PGM-FI System

The programmed fuel injection (PGM-FI) system is a sequential multiport fuel injection system.

Air Conditioning (A/C) Compressor Clutch Relay

When the ECM receives a demand for cooling from the A/C system, it delays the compressor from being energized, and enriches the mixture to assure smooth transition to the A/C mode.

Air Fuel Ratio (A/F) Sensor

The A/F sensor operates over a wide air/fuel range. The A/F sensor is installed upstream of the TWC, and sends signals to the ECM which varies the duration of fuel injection accordingly.

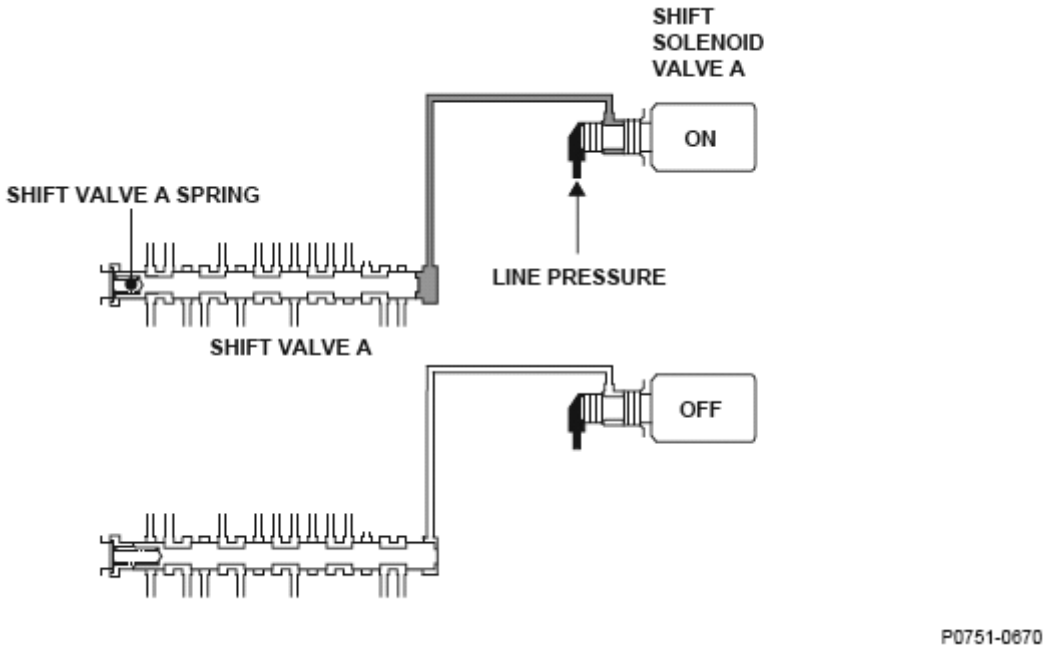

Fig. 24: Identifying Air Fuel Ratio (A/F) Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Barometric Pressure (BARO) Sensor

The BARO sensor is inside the ECM. It converts atmospheric pressure into a voltage signal that modifies the basic duration of the fuel injection discharge.

Camshaft Position (CMP) Sensor B

CMP sensor B detects the position of the No. 1 cylinder as a reference for sequential fuel injection to each cylinder.

Crankshaft Position (CKP) Sensor

The CKP sensor detects crankshaft speed and is used by the ECM to determine ignition timing and timing for fuel injection of each cylinder as well as detecting engine misfire.

Engine Coolant Temperature (ECT) Sensor 1 and 2

ECT sensors 1 and 2 are temperature dependent resistor (thermistors). The resistance decreases as the engine coolant temperature increases.

Ignition Timing Control

The ECM contains the memory for basic ignition timing at various engine speeds and manifold absolute pressures. It also adjusts the timing according to engine coolant temperature and intake air temperature.

Injector Timing and Duration

The ECM contains the memory for basic discharge duration at various engine speeds and manifold pressures. The basic discharge duration, after being read out from the memory, is further modified by signals sent from various sensors to obtain the final discharge duration.

By monitoring long term fuel trim, the ECM detects long term malfunctions in the fuel system and sets a

diagnostic trouble code (DTC).

Knock Sensor

The knock control system adjusts the ignition timing to minimize knock.

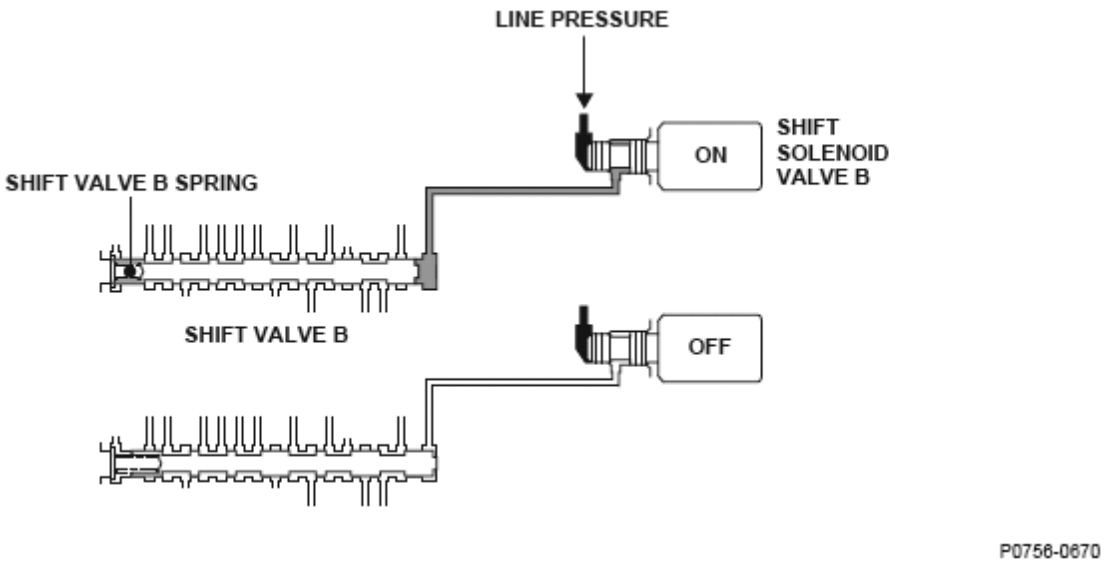

Fig. 28: Identifying Knock Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Manifold Absolute Pressure (MAP) Sensor

The MAP sensor converts manifold absolute pressure into electrical signals to the ECM.

Malfunction Indicator Lamp (MIL) Indication (In relation to Readiness Codes)

The vehicle has certain "readiness codes" that are part of the on-board diagnostics for the emissions systems. If the vehicle's battery has been disconnected or gone dead, if the DTCs have been cleared, or if the ECM has been reset, these codes are reset. In some states, part of the emissions testing is to make sure these codes are set to complete. If all of them are not set to complete, the vehicle may fail the test, or the test cannot be finished.

To check if the readiness codes are set to complete, turn the ignition switch ON (II), but do not start the engine. The MIL will come on for 15-20 seconds. If it then goes off, the readiness codes are complete. If it flashes five times, one or more readiness codes are not complete. To set each code, drive the vehicle or run the engine as described in the procedures (see **MALFUNCTION INDICATOR LAMP (MIL) INDICATION (IN RELATION TO READINESS CODES)**).

Mass Air Flow (MAF) Sensor/Intake Air Temperature (IAT) Sensor

The mass air flow (MAF) sensor/intake air temperature (IAT) sensor contains a hot wire and a thermistor. It is located in the intake air passage. The resistance of the hot wire and thermistor changes due to intake air temperature and air flow. The control circuit in the MAF sensor controls the current to keep the hot wire at a set temperature. The current is converted to voltage in the control circuit, then output to the ECM.

Secondary Heated Oxygen Sensor (Secondary H02S)

The secondary H02S detects the oxygen content in the exhaust gas downstream of the three way catalytic converter (TWC), and sends signals to the ECM which varies the duration of fuel injection accordingly. To stabilize its output, the sensor has an internal heater. The ECM compares the H02S output with the A/F sensor output to determine catalyst efficiency. The secondary H02S is located on the TWC.

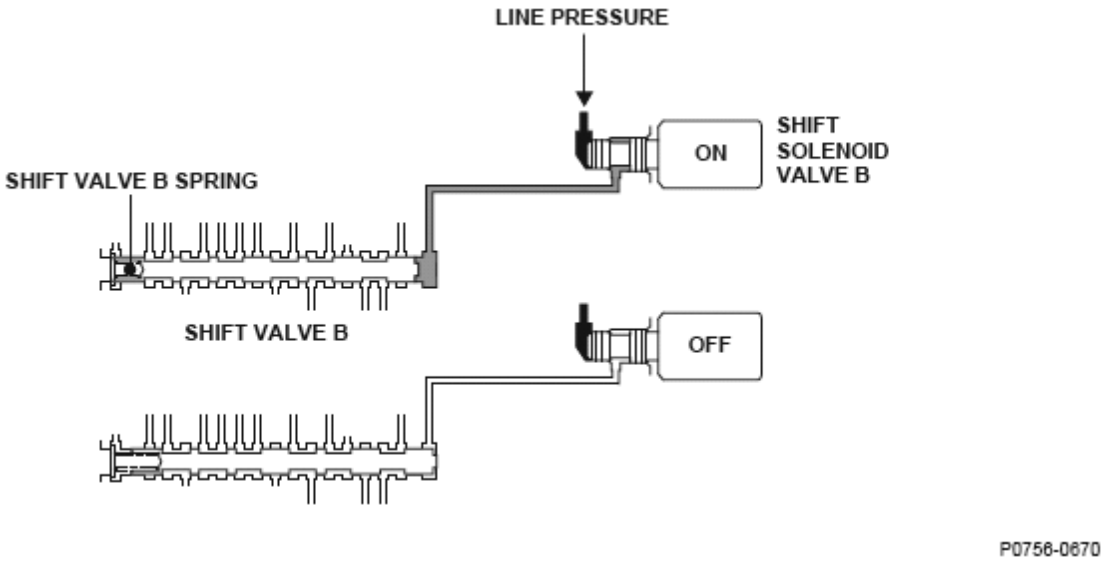

Fig. 32: Identifying Secondary Heated Oxygen Sensor (Secondary H02S)

Electronic Throttle Control System

The throttle is electronically controlled by the electronic throttle control system. Refer to the system diagram to see a functional layout of the system.

Idle control: When the engine is idling, the ECM controls the throttle actuator to maintain the proper idle speed according to engine loads.

Acceleration control: When the accelerator pedal is pressed, the ECM opens the throttle valve depending on the accelerator pedal position (APP) sensor signal.

Cruise control: The ECM controls the throttle actuator to maintain set speed when the cruise control is operating. The throttle actuator takes the place of the cruise control actuator.

Accelerator Pedal Position (APP) Sensor

As the accelerator pedal position changes, the sensor varies the signal voltage to the ECM.

Throttle Body

The throttle body is a single-barrel side draft type. The lower portion of the throttle valve is heated by engine coolant from the cylinder head to prevent icing of the throttle plate.

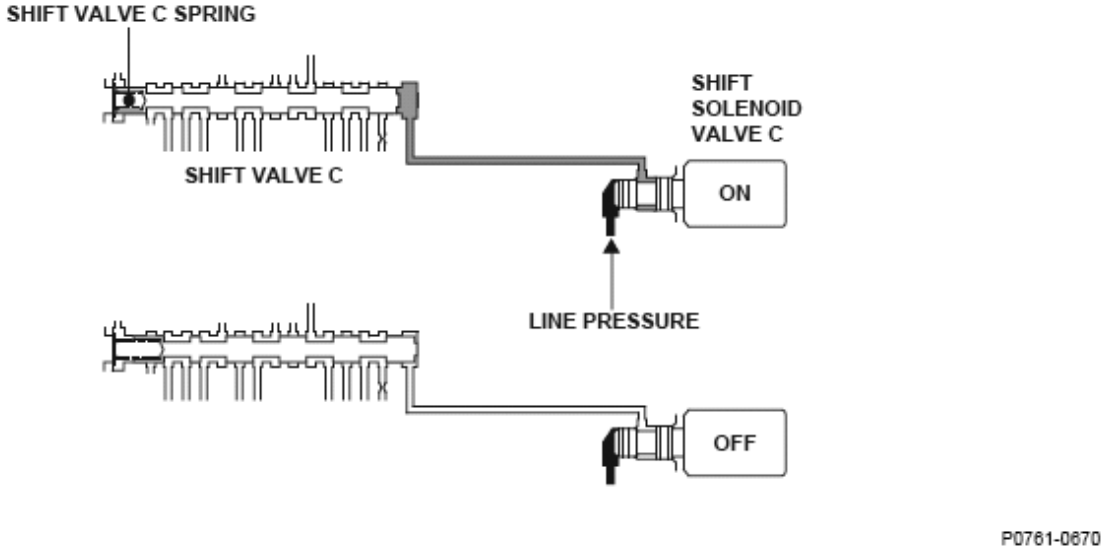

Fig. 34: Identifying Throttle Body
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Idle Control System

When the engine is cold, the A/C compressor is on, the transmission is in gear, the brake pedal is pressed, the power steering load is high, or the alternator is charging, the ECM controls current to the throttle actuator to maintain the correct idle speed.

Brake Pedal Position Switch

The brake pedal position switch signals the ECM when the brake pedal is pressed.

Electrical Power Steering (EPS) Signal

The EPS signals the ECM when the power steering load is high.

Fuel Supply System

Fuel Cutoff Control

During deceleration with the throttle valve closed, current to the injectors is cut off to improve fuel economy at engine speeds over 1,150 rpm. Fuel cutoff control also occurs when the engine speed exceeds 8,200 rpm, regardless of the position of the throttle valve, to protect the engine from over-revving. When the vehicle is stopped, the ECM cuts the fuel at engine speeds over 7,700 rpm. Engine speed of fuel cut is lower on a cold engine.

Fuel Pump Control

When the ignition is turned on, the ECM grounds PGM-FI main relay 2 (FUEL PUMP) which feeds current to the fuel pump for 2 seconds to pressurize the fuel system. With the engine running, the ECM grounds PGM-FI main relay 2 (FUEL PUMP) and feeds current to the fuel pump. When the engine is not running and the ignition is on, the ECM cuts ground to PGM-FI main relay 2 (FUEL PUMP) which cuts current to the fuel pump.

PGM-FI Main Relay 1 and 2

PGM-FI main relay 1 is energized whenever the ignition switch is ON (II) to supply battery voltage to the ECM, power to the injectors, and power for PGM-FI main relay 2 (FUEL PUMP). PGM-FI main relay 2 (FUEL PUMP) is energized to supply power to the fuel pump for 2 seconds when the ignition switch is turned ON (II), and when the engine is cranking or running.

VTEC/VTC

- The i-VTEC has a variable valve timing control (VTC) mechanism on the intake camshaft in addition to the usual VTEC.

  This mechanism improves fuel efficiency and reduces exhaust emissions at all levels of engine speed, vehicle speed, and engine load.

- The VTEC mechanism changes the valve lift and timing by using more than one cam profile.
- The VTC changes the phase of the intake camshaft via oil pressure. It changes the intake valve timing continuously.

VTC CONTROL DESCRIPTION

Driving Condition	VTC Control	Description
(1) Light-load	Base Position	For stable combustion the cam angle is retarded, and it reduces the entry of exhaust gas into the cylinder.
(2) Medium/high-load	Advance Control	Cam phase angle is controlled to optimize valve timing, improving fuel efficiency and reducing emissions.
(3) High speed	Advance-Base Position	To reduce pumping loss, the intake valve is closed quickly. This gives a charging effect to the air/fuel mixture, maximizing engine power.

VTC System

- The VTC system makes continuous intake valve timing changes based on operating conditions.
- Intake valve timing is optimized to allow the engine to produce maximum power.
- Cam angle is advanced to obtain the desired EGR effect and reduce pumping loss. The intake valve is closed quickly to reduce the entry of the air/fuel mixture into the intake port and improve the charging effect.
- The system reduces the cam advance at idle, stabilizes combustion, and reduces engine speed.
- If a malfunction occurs, the VTC system control is disabled and the valve timing is fixed at the fully retarded position.

VTEC System

- The VTEC system changes the cam profile to correspond to the engine speed. It maximizes torque at low engine speed and output at high engine speed.

- The low lift cam is used at low engine speeds, and the high lift cam is used at high engine speeds.

Intake Air System

This system supplies air for engine needs.

Intake Air Bypass Control Thermal Valve

When the engine is cold, the intake air bypass control thermal valve sends air to the injector. The amount of air is regulated by engine coolant temperature. Once the engine is hot, the intake air bypass control thermal valve closes, stopping air to the injector.

EVAP Canister

The EVAP canister temporarily stores fuel vapor from the fuel tank until it can be purged back into the engine and burned.

When the engine coolant temperature is below 140°F (60°C), the ECM turns off the EVAP canister purge valve which cuts vacuum to the EVAP canister.

Fuel Cap Warning Message ('06 model)

The ECM detects whether the fuel fill cap is loose or missing under certain conditions and alerts the driver by showing the information in the gauge display. If the ECM detects a small volume leak, the MIL may come on during the third drive cycle and store a DTC.

First drive cycle

During the first drive cycle after a cold start, the ECM alerts the driver to check the fuel fill cap by showing a "CHECK FUEL CAP" message in the gauge display (A), and it stores Temporary DTC P0457 "Evaporative Emission (EVAP) System Leak Detected/Fuel Fill Cap Loose or Missing". Tightening the fuel cap does not make the message go off immediately.

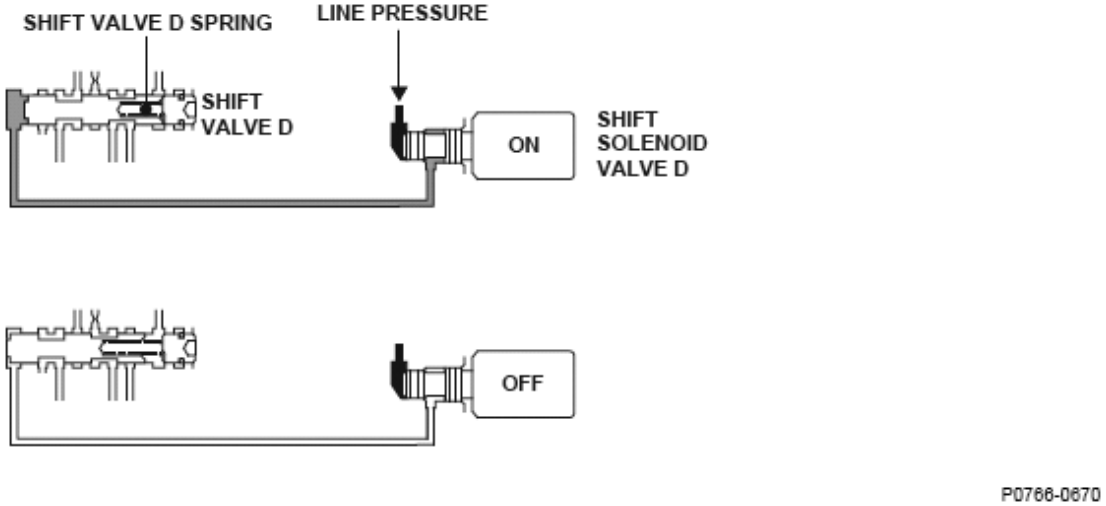

Fig. 46: Identifying Fuel Cap Warning Message In Gauge Display
Courtesy of AMERICAN HONDA MOTOR CO., INC.

To make the message go off (With the HDS)

Procedure

1. Tighten the fuel fill cap until it clicks.

2. Clear the Temporary DTC with the HDS.
3. Verify there is no leak by doing the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

To make the message go off (Without the HDS) ('06 model)

Procedure

1. Tighten the fuel fill cap until it clicks.
2. The message should go off after several days of normal driving.

To make the message go off (Without the HDS) ('07-08 model)

Procedure

1. Tighten the fuel fill cap until it clicks.
2. Start the engine, then turn the ignition switch OFF.
3. Repeat step 2 two more times.

Fuel Cap Warning Message ('07 model)

The ECM will detect a loose or missing fuel fill cap as an evaporative system leak and alerts the driver by showing a warning message in the gauge display.

First drive cycle

The first time a leak is detected a "CHECK FUEL CAP" message in the gauge display (A). To scroll to another message, press the select/reset button. The "CHECK FUEL CAP" message will appear each time you restart the engine until the system turns the message off. Turn the engine off then replace or tighten the fuel fill cap until clicks at least once. The message should go off after several days of normal driving after the fuel fill cap has been tightened or replaced.

Electronic Throttle Control System Diagram

The electronic throttle control system consists of the throttle actuator, throttle position (TP) sensor A/B, accelerator pedal position (APP) sensor A/B, the electronic throttle control system (ETCS) control relay, and the ECM.

Evaporative Emission (EVAP) Control Diagram

The EVAP controls minimize the amount of fuel vapor escaping to the atmosphere. Vapor from the fuel tank is temporarily stored in the EVAP canister until it can be purged from the canister into the engine and burned.

The EVAP canister is purged by drawing fresh air through it and into a port on the intake manifold.

The purging vacuum is controlled by the EVAP canister purge valve, which operates whenever engine coolant temperature is above 140°F (60°C).

HOW TO SET READINESS CODES

MALFUNCTION INDICATOR LAMP (MIL) INDICATION (IN RELATION TO READINESS CODES)

The vehicle has certain "readiness codes" that are part of the on-board diagnostics for the emissions systems. If the vehicle's battery has been disconnected or gone dead, if the DTCs have been cleared, or if the ECM has been reset, these readiness codes are reset to incomplete. In some states, part of the emissions testing is to make sure these codes are set to complete. If all of them are not set to complete, the vehicle may fail the emission test, or the test cannot be finished.

To check if the readiness codes are set to complete, turn the ignition switch ON (II), but do not start the engine. The MIL will come on for 15-20 seconds. If it then goes off, the readiness codes are set to complete. If it flashes five times, one or more readiness codes are not set to complete. To set readiness codes from incomplete to complete, do the procedure for the appropriate code.

To check the status of a specific DTC system, check the OBD status in the DTC MENU with the HDS (see **OBD STATUS**). This screen displays the code, the current data list of the enable criteria, and the status of the readiness testing.

CATALYTIC CONVERTER MONITOR AND READINESS CODE

NOTE:

- **Do not turn the ignition switch off during the procedure.**
- **All readiness codes are cleared when the battery is disconnected, if the DTCs have been cleared, or if the ECM is reset with the HDS.**

- **Low ambient temperatures or excessive stop-and-go traffic may increase the drive time needed to switch the readiness code from incomplete to complete.**
- **The readiness code will not switch to complete until all the enable criteria are met.**
- **If a fault in the secondary H02S system caused the MIL to come on, the readiness code cannot be set to complete until you correct the fault.**

Enable Criteria

- Engine coolant temperature (ECT SENSOR 1) at 158°F (70°C) or more.
- Intake air temperature (IAT SENSOR) at 20°F (-7°C) or more.
- Vehicle speed sensor (VSS) above 25 mph (40 km/h).

Procedure

1. Connect the HDS to the vehicle's data link connector (DLC), and bring up the READINESS CODEs screen for Catalyst in the DTCs MENU.
2. Start the engine.
3. Test-drive the vehicle under stop-and-go conditions with short periods of steady cruise. After about 5 miles (8 km), the readiness code should switch to complete.
4. If the readiness code is still not set to complete, check for a Temporary DTC with the HDS. If there is no DTC, one or more of the enable criteria were probably not met; repeat the procedure.

EVAPORATIVE EMISSION (EVAP) CONTROL SYSTEM MONITOR AND READINESS CODE

NOTE: All readiness codes are cleared when the battery is disconnected, if the DTCs have been cleared, or if the ECM is reset with the HDS.

Enable Criteria

- Battery voltage is more than 10.5 V.
- Engine at idle.
- Engine coolant temperature (ECT SENSOR 1 and 2) between 176°F (80°C) and 212°F (100°C).
- MAP sensor less than 46.6 kPa (14 in.Hg, 350 mmHg).
- Vehicle speed (VSS) 0 mph (0 km/h).
- Intake air temperature (IAT SENSOR 1) between 32°F (0°C)and 212°F (100°C).

Procedure

1. Connect the HDS to the DLC.
2. Start the engine.
3. Select EVAP TEST in the INSPECTION MENU with the HDS, then select the FUNCTION TEST in the EVAP TEST MENU.
    - If the result is normal, readiness is complete.
    - If the result is not normal, go to the next step.

4. Check for a Temporary DTC. If there is no DTC, one or more of the enable criteria were probably not met; repeat the procedure.

AIR FUEL RATIO (A/F) SENSOR MONITOR AND READINESS CODE

NOTE:
- **Do not turn the ignition switch off during the procedure.**
- **All readiness codes are cleared when the battery is disconnected, if the DTCs have been cleared, or if the ECM is reset with the HDS.**

Enable Criteria

Engine coolant temperature (ECT SENSOR 1) at 140°F (60°C) or more.

Procedure

1. Start the engine.
2. Test-drive the vehicle under stop-and-go conditions with short periods of steady cruise. During the drive, decelerate (with the throttle fully closed) for 5 seconds. After about 3.5 miles (5.6 km), the readiness code should switch from incomplete to complete.
3. Check the readiness codes screen for the AIR FUEL RATIO (A/F) SENSOR in the DTCs MENU with the HDS.
   - If the screen shows complete, readiness is complete.
   - If the screen shows not complete, go to the next step.
4. Check for a Temporary DTC. If there is no DTC, the enable criteria was probably not met. Select the DATA LIST MENU. Check the ECT SENSOR 1 in the ALL DATA LIST with the HDS. If the ECT SENSOR 1 is less than 140°F (60°C), run the engine until it is more than 140°F (60°C), then repeat the procedure.

AIR FUEL RATIO (A/F) SENSOR HEATER MONITOR READINESS CODE

NOTE: **All readiness codes are cleared when the battery is disconnected, if the DTCs have been cleared, or if the ECM is reset with the HDS.**

Procedure

1. Start the engine, and let it idle for 1 minute. The readiness code should switch from incomplete to complete.
2. If the readiness code is still not set to complete, check for a Temporary DTC. If there is no DTC, repeat the procedure.

MISFIRE MONITOR AND READINESS CODE

- This readiness code is always set to available because misfiring is continuously monitored.
- Monitoring pauses, and the misfire counter resets, if the vehicle is driven over a rough road.
- Monitoring also pauses, and the misfire counter holds at its current value, if the throttle position changes more than a predetermined value, or if driving conditions fall outside the range of any related enable criteria.

FUEL SYSTEM MONITOR AND READINESS CODE

- This readiness code is always set to available because the fuel system is continuously monitored during closed loop operation.
- Monitoring pauses when the catalytic converter, EVAP control system, and A/F sensor monitors are active.
- Monitoring also pauses when any related enable criteria are not being met. Monitoring resumes when the enable criteria is again being met.

COMPREHENSIVE COMPONENT MONITOR AND READINESS CODE

This readiness code is always set to available because the comprehensive component monitor is continuously running whenever the engine is cranking or running.

GENERAL TROUBLESHOOTING INFORMATION

INTERMITTENT FAILURES

The term "intermittent failure" means a system may have had a failure, but it checks OK now. If the malfunction indicator lamp (MIL) on the dash does not come on, check for poor connections or loose pins at all connectors related to the circuit that you are troubleshooting. If the MIL was on but then went out, the original problem may have been intermittent.

SERVICE INFORMATION

Periodically, new ECM/PCM software or new service procedures may become available. Always check online for the latest software or service information related to the DTCs or symptoms you are troubleshooting.

OPENS AND SHORTS

"Open" and "short" are common electrical terms. An open is a break in a wire or at a connection. A short is an accidental connection of a wire to ground or to another wire. In simple electronics, this usually means something won't work at all. With complex electronics (such as ECMs or PCMs) this can sometimes mean something works, but not the way it's supposed to.

HOW TO USE THE HDS (HONDA DIAGNOSTIC SYSTEM)

If the MIL (malfunction indicator lamp) has come on

1. Start the engine, and check the MIL (A).

NOTE: If the ignition switch is turned ON (II), and the engine is not started, the MIL stays on for 15-20 seconds (see MALFUNCTION INDICATOR LAMP (MIL) INDICATION (IN RELATION TO READINESS CODES)).

2. If the MIL stays on, connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

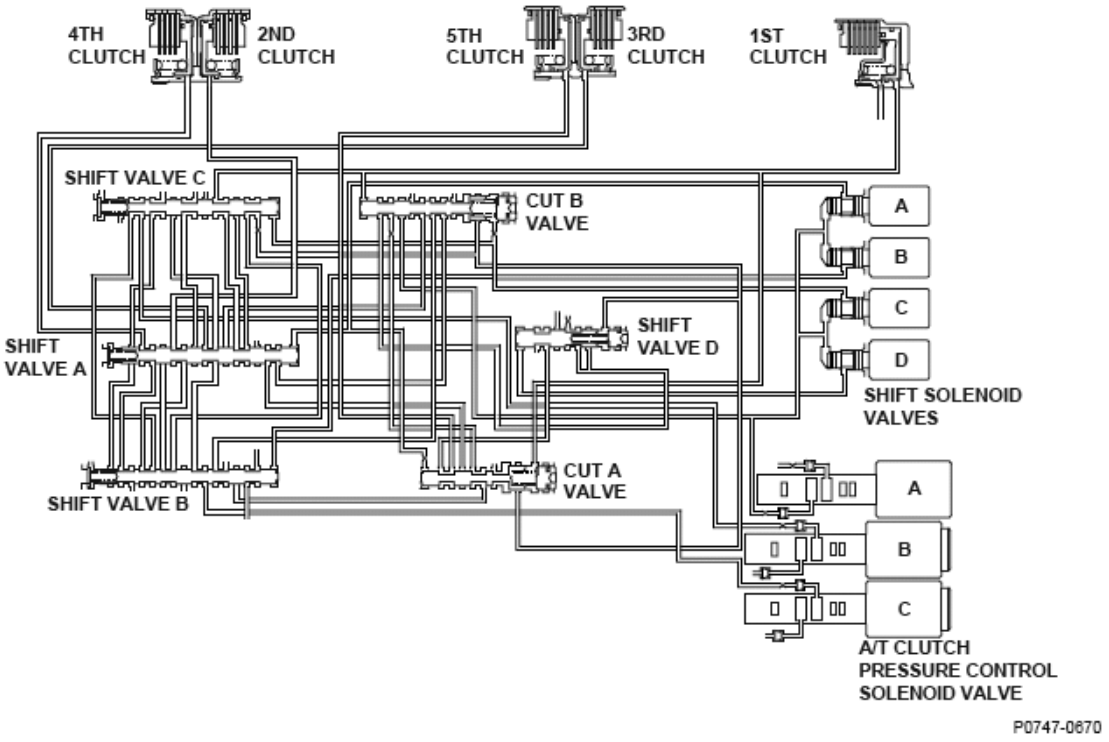

Fig. 3: Connecting HDS To DLC
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Turn the ignition switch ON (II).
4. Make sure the HDS communicates with the ECM/PCM. If it doesn't, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
5. Check the diagnostic trouble code (DTC) and note it. Also check the freeze data and/or on-board snapshot data, and download any data found. Then refer to the indicated DTC's troubleshooting and begin the appropriate troubleshooting procedure.

NOTE:

- **Freeze data indicates the engine conditions when the first malfunction, misfire, or fuel trim malfunction was detected.**
- **The HDS can read the DTC, freeze data, on-board snapshot, current data, and other engine control module (ECM) or powertrain control module (PCM) data.**
- **For specific operations, refer to the user's manual that came with the HDS.**

6. If no DTCs are found, go to MIL troubleshooting (see **MIL CIRCUIT TROUBLESHOOTING**).

If the MIL did not stay on

If the MIL did not stay on but there is a driveability problem, do the symptom troubleshooting.

If you can't duplicate the DTC

Some of the troubleshooting requires you to reset the ECM/PCM and try to duplicate the DTC. If the problem is intermittent and you can't duplicate the code, do not continue through the procedure. To do so

will only result in confusion and possibly, a needlessly replaced ECM/PCM.

HDS CLEAR COMMAND

The ECM/PCM stores various specific data to correct the system even if there is no electrical power such as when the battery negative terminal or No. 19 Fl MAIN (15 A) fuse are disconnected. Stored data based on failed parts should be cleared by using the "CLEAR COMMAND" of the HDS, if parts are replaced.

The HDS has three kinds of clear commands to meet this purpose. They are DTC clear, ECM/PCM reset, and CKP pattern clear. DTC clear command erases all stored DTC codes, freeze data, on-board snapshot, and readiness codes. This must be done with the HDS after reproducing the DTC during troubleshooting. The ECM/PCM reset command erases all stored DTC codes, freeze data, on-board snapshot, readiness codes, and all specific data to correct the system except CKP pattern. If the CKP pattern data in the ECM/PCM was cleared, you must do the CKP pattern learn procedure. The CKP pattern clear command erases only CKP pattern data. This command is for repair of a misfire or the CKP sensor.

SCAN TOOL CLEAR COMMAND

If you are using a generic scan tool to clear commands, be aware that there is only one setting for clearing the ECM/PCM, and it clears all commands at the same time (CKP pattern learn, idle learn, readiness codes, freeze data, on-board snapshot, and DTCs). After you clear all commands, you then need to do these procedures, in this order: ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**); CKP pattern learn procedure; Test-drive to set readiness codes to complete (see **MALFUNCTION INDICATOR LAMP (MIL) INDICATION (IN RELATION TO READINESS CODES)**).

DTC CLEAR

1. Clear the DTC with the HDS while the engine is stopped.
2. Turn the ignition switch OFF.
3. Turn the ignition switch ON (II), and wait for 30 seconds.
4. Turn the ignition switch OFF, and disconnect the HDS from the DLC.

ECM/PCM RESET

1. Reset the ECM/PCM with the HDS while the engine is stopped.
2. Turn the ignition switch OFF.
3. Turn the ignition switch ON (II), and wait for 30 seconds.
4. Turn the ignition switch OFF, and disconnect the HDS from the DLC.
5. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).

CRANK (CKP) PATTERN CLEAR/CRANK (CKP) PATTERN LEARN

Clear/Learn Procedure (with the HDS)

1. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

2. Turn the ignition switch ON (II).
3. Make sure the HDS communicates with the ECM/PCM. If it doesn't, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Select CRANK PATTERN in the ADJUSTMENT MENU with the HDS.
5. Select CRANK PATTERN LEARNING with the HDS, and follow the screen prompts.

Learn Procedure (without the HDS)

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Test-drive the vehicle on a level road: Decelerate (with the throttle fully closed) from an engine speed of 2,500 rpm down to 1,000 rpm with the A/T in 2 position, or M/T in 1st gear.
3. Test-drive the vehicle on a level road: Decelerate (with the throttle fully closed) from an engine speed of 5,000 rpm down to 3,000 rpm with the A/T in 2 position, or M/T in 1st gear.
4. Repeat step 2 and 3 several times.
5. Turn the ignition switch OFF.
6. Turn the ignition switch ON (II), and wait for 30 seconds.

How to End a Troubleshooting Session (required after any troubleshooting)

1. Reset the ECM/PCM with the HDS.
2. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
3. Turn the ignition switch OFF.
4. Disconnect the HDS from the DLC.

NOTE: The ECM/PCM is part of the immobilizer system. If you replace the ECM/PCM, it will have a different immobilizer code. In order for the engine to start, you must rewrite the immobilizer code with the HDS.

HOW TO TROUBLESHOOT CIRCUITS AT THE ECM/PCM CONNECTORS

NOTE: The ECM/PCM overwrites data and monitors the EVAP system for up to 15

minutes after the ignition switch is turned OFF. Jumping the SCS line after turning the ignition switch OFF cancels this function. Disconnecting the ECM/PCM during this function, without jumping the SCS line first, can damage the ECM/PCM.

1. Jump the SCS line with the HDS.
2. Remove the cover (A).

3. Lift up the under-hood fuse/relay box (D).

4. Remove the coolant reservoir (E). Disconnect the ECM/PCM connectors A, B, and C, and probe the

terminals from the terminal side of the connectors.

NOTE: ECM/PCM connectors A, B, and C have symbols (A=[], B=delta, C= o) embossed on them for identification.

5. When diagnosis/troubleshooting is done at the ECM/PCM connector, use the terminal test port (A) above the terminal you need to check.

6. Connect one side of the patch cord (A) terminals to a commercially available digital multimeter (B), and connect the other side of the patch cord terminals to a commercially available banana jack (Pomona Electronics Tool No. 3563 or equivalent) (C).

7. Gently contact the pin probe (male) at the terminal test port from the terminal side. Do not force the tips into the terminals.

NOTE:

- **For accurate results, always use the pin probe (male).**
- **To prevent damage to the connector terminals, do not insert test equipment probes, paper clips, or other substitutes as they can damage the terminals. Damaged terminals cause a poor connection and an incorrect measurement.**
- **Do not puncture the insulation on a wire. Punctures can cause poor or intermittent electrical connections.**

SUBSTITUTING THE ECM/PCM

Special Tools Required

- Honda diagnostic system (HDS) tablet tester
- Honda interface module (HIM) and an iN workstation with the latest HDS software version
- HDS pocket tester
- GNA600 and an iN workstation with the latest HDS software version

Any one of the above updating tools can be used.

NOTE: Use this procedure when you need to substitute a known-good PCM during troubleshooting procedures.

1. **Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.**

2. **Turn the ignition switch to ON (II).**
3. **Make sure the HDS communicates with the PCM and other vehicle systems. If it doesn't, go to the DLC circuit troubleshooting. If you are returning from DLC circuit troubleshooting, skip steps 4 and 5, then clean the throttle body after substituting the PCM.**
4. **Select the INSPECTION MENU with the HDS.**
5. **Select the ETCS TEST, then select the TP POSITION CHECK and follow the screen prompts.**

NOTE: If the TP POSITION CHECK indicates FAILED, continue this procedure.

6. **Turn the ignition switch to LOCK (0).**
7. **Jump the SCS line with the HDS.**
8. **Do the battery removal procedure.**

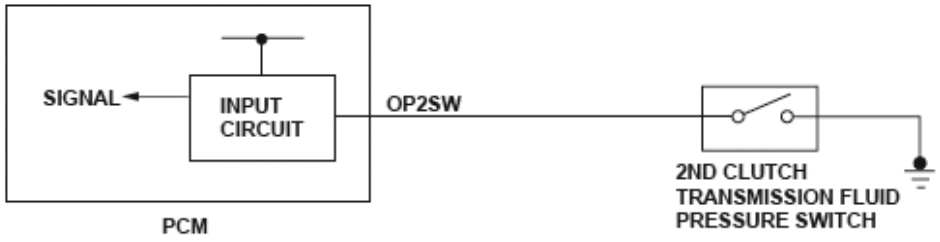

Fig. 9: Connecting HDS To DLC
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. **Remove the cover (A).**
10. **Remove the bolts (D), then remove the PCM (E).**
11. **Disconnect PCM connectors A, B, and C.**

NOTE: PCM connectors A, B, and C have symbols (A=?, B=? , C=?) embossed on them for identification.

12. **Install a known-good PCM in the reverse order of removal.**
13. **Do the battery installation procedure.**
14. **Turn the ignition switch to ON (II).**

NOTE: DTC P0630 VIN Not Programmed or Mismatch may be stored because the VIN has not been programmed into the PCM; ignore it, and continue this procedure.

15. **Manually input the VIN to the PCM with the HDS.**
16. **Select the IMMOBI SYSTEM with the HDS.**
17. **Enter the immobilizer PCM code that you got from the iN, and use the PCM replacement procedure in the IMMOBI MENU of the HDS; it allows**

you to start the engine.

18. **Update the PCM if it does not have the latest software.**
19. **Reset the PCM with the HDS.**
20. **If the TP POSITION CHECK failed in step 7, clean the throttle body.**
21. **Do the PCM idle learn procedure.**
22. **Do the CKP pattern clear/CKP pattern learn procedure.**

OBD Status

The OBD status shows the current system status of each DTC and all of the parameters. This function is used to see if the repair was successfully completed. The results of diagnostic tests for the DTC are displayed as:

- **PASSED: The on board diagnosis is successfully finished.**
- **FAILED: The on board diagnosis has finished but failed.**
- **EXECUTING: The vehicle is in enable criteria conditions of the DTC, and the on board diagnosis is running.**
- **NOT COMPLETED: The on board diagnosis was running but is out of the enable conditions of the DTC.**
- **OUT OF CONDITION: The vehicle has stayed out of the enable conditions of the DTC.**

SUBSTITUTING THE ECM/PCM

Special Tools Required

- Honda diagnostic system (HDS)

- Honda interface module (HIM)
- HDS pocket tester

NOTE: Use this procedure when you need to substitute a known-good ECM/PCM during troubleshooting procedures.

1. Make sure you have the anti-theft codes for the radio and the navigation system (if equipped).
2. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

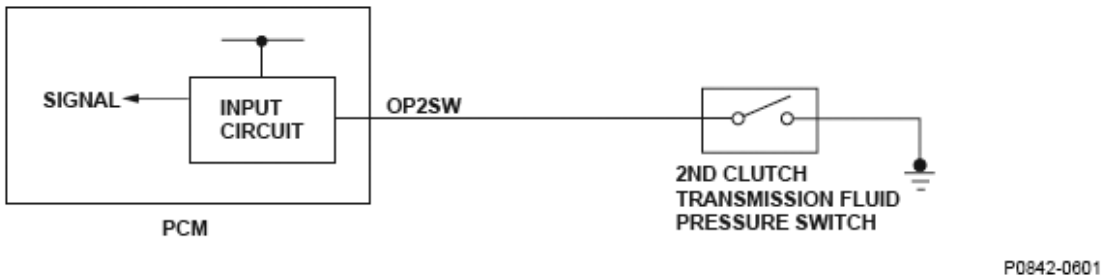

Fig. 11: Connecting HDS To DLC
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Turn the ignition switch ON (II).
4. Make sure the HDS communicates with the ECM/PCM. If it doesn't, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**). If you are returning from DLC circuit troubleshooting, skip step 5 to 10, and clean the throttle body after substituting the ECM/PCM (see **THROTTLE BODY CLEANING**).
5. USA, Canada models: Select the INSPECTION MENU with the HDS.
6. USA, Canada models: Select the ETCS TEST, then select the TP POSITION CHECK, and follow the screen prompts.

NOTE: If the TP POSITION CHECK indicates FAILED, continue this procedure.

7. Turn the ignition switch OFF.
8. Remove the battery.
9. Remove the cover (A).

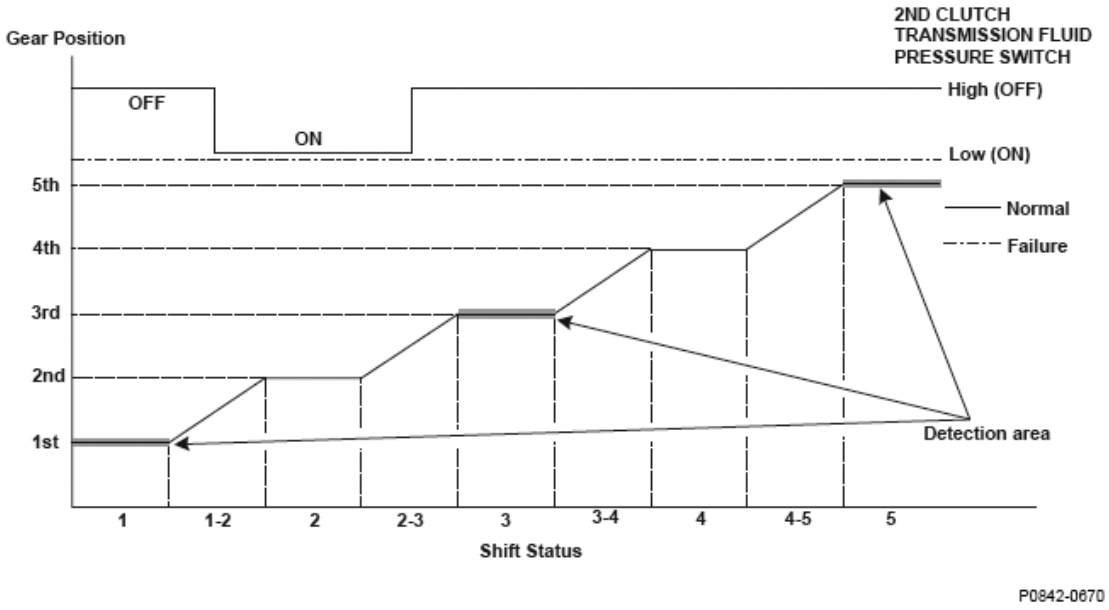

Fig. 12: Removing Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Remove the bolts (D), then remove the ECM/PCM (E).
11. Disconnect ECM/PCM connectors A, B, and C.

NOTE: ECM/PCM connectors A, B, and C have symbols (A=[], B=delta, C=o) embossed on them for identification.

12. Install the ECM/PCM and the battery in the reverse order of removal.
13. Turn the ignition switch ON (II).

NOTE: USA, Canada models: DTC P0630 "VIN Not Programmed or Mismatch" may be stored because the VIN has not been programmed into the ECM/PCM; ignore it, and continue this procedure.

14. USA, Canada models: Manually input the VIN to the ECM/PCM with the HDS.
15. Update the ECM/PCM if it does not have the latest software.
16. Select the IMMOBI SYSTEM with the HDS.
17. Enter the immobilizer code using the ECM/PCM replacement procedure in the HDS; this allows you to start the engine.
18. Reset the ECM/PCM with the HDS.
19. USA, Canada models: If the TP POSITION CHECK failed in step 6, clean the throttle body (see **THROTTLE BODY CLEANING**).
20. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
21. Do the CKP pattern learn procedure.
22. Enter the anti-theft codes for the radio and the navigation system (if equipped), and set the clock.

OBD STATUS

The OBD status shows the current system status of each DTC and all of the parameters. This function is used to see if the repair was successfully completed. The results of diagnostic tests for the DTC are displayed as:

- PASSED: The on board diagnosis is successfully finished.
- FAILED: The on board diagnosis has finished but failed.
- EXECUTING: The vehicle is in enable criteria conditions for the DTC and the on board diagnosis is running.
- NOT COMPLETED: The on board diagnosis was running but is out of the enable conditions of the DTC.
- OUT OF CONDITION: The vehicle has stayed out of the enable conditions for the DTC.

SYSTEM DESCRIPTION

ELECTRONIC CONTROL SYSTEM

The functions of the fuel and emission control systems are managed by the engine control module (ECM) on vehicles with manual transmissions or the powertrain control module (PCM) on vehicles with automatic transmissions.

Self-diagnosis

The ECM/PCM detects a failure of a signal from a sensor or from another control unit and stores a Temporary DTC or a DTC. Depending on the failure, a DTC is stored in either the first or the second drive cycle. When a DTC is stored, the ECM/PCM turns on the malfunction indicator lamp (MIL) by supplying ground to the MIL circuit.

- **One Drive Cycle Detection Method**

  When an abnormality occurs in the signal from a sensor or from another control unit, the ECM/PCM stores a DTC for the failure and turns on the MIL immediately.

- **Two Drive Cycle Detection Method**

  When an abnormality occurs in the signal from a sensor or from another control unit in the first drive cycle, the ECM/PCM stores a Temporary DTC for the failure. The MIL does not come on at this time. If the failure continues in the second drive cycle, the ECM/PCM stores a DTC and turns on the MIL.

Fail-safe Function

When an abnormality occurs in the signal from a sensor or from another control unit, the ECM/PCM ignores that signal and substitutes a pre-programmed value for them that allows the engine to continue running. This causes a DTC to be stored and the MIL to come on.

MIL Bulb Check and Readiness Code Condition

When the ignition switch is turned ON (II), the ECM/PCM supplies ground to the MIL circuit for about 15 to 20 seconds to check the bulb condition. If any readiness codes are not set to complete, the MIL flashes five times. If all readiness codes are set to complete, the MIL goes off.

Self Shut Down (SSD) Mode

After the ignition switch is turned OFF, the ECM/PCM stays on (up to 30 minutes). If the ECM/PCM connector is disconnected during this time, the ECM/PCM may be damaged. To cancel this mode, disconnect the negative cable from the battery or jump the SCS line with the HDS after the ignition switch is turned OFF.

PGM-FI SYSTEM

The programmed fuel injection (PGM-FI) system is a sequential multiport fuel injection system.

Air Conditioning (A/C) Compressor Clutch Relay

When the ECM/PCM receives a demand for cooling from the A/C system, it delays the compressor from being energized, and enriches the mixture to assure smooth transition to the A/C mode.

Air Fuel Ratio (A/F) Sensor

The A/F sensor operates over a wide air/fuel range. The A/F sensor is installed upstream of the TWC, and sends signals to the ECM/PCM which varies the duration of fuel injection accordingly.

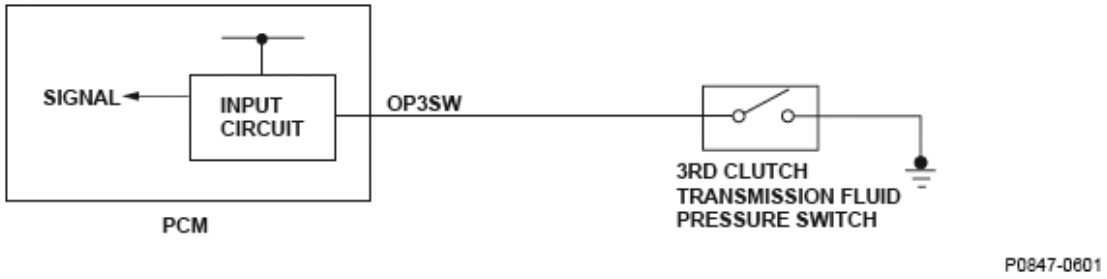

Fig. 23: Identifying Air Fuel Ratio (A/F) Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Barometric Pressure (BARO) Sensor

The BARO sensor is inside the ECM/PCM. It converts atmospheric pressure into a voltage signal that modifies the basic duration of the fuel injection discharge.

Camshaft Position (CMP) Sensor

The CMP sensor detects the position of the No. 1 cylinder as a reference for sequential fuel injection to each cylinder.

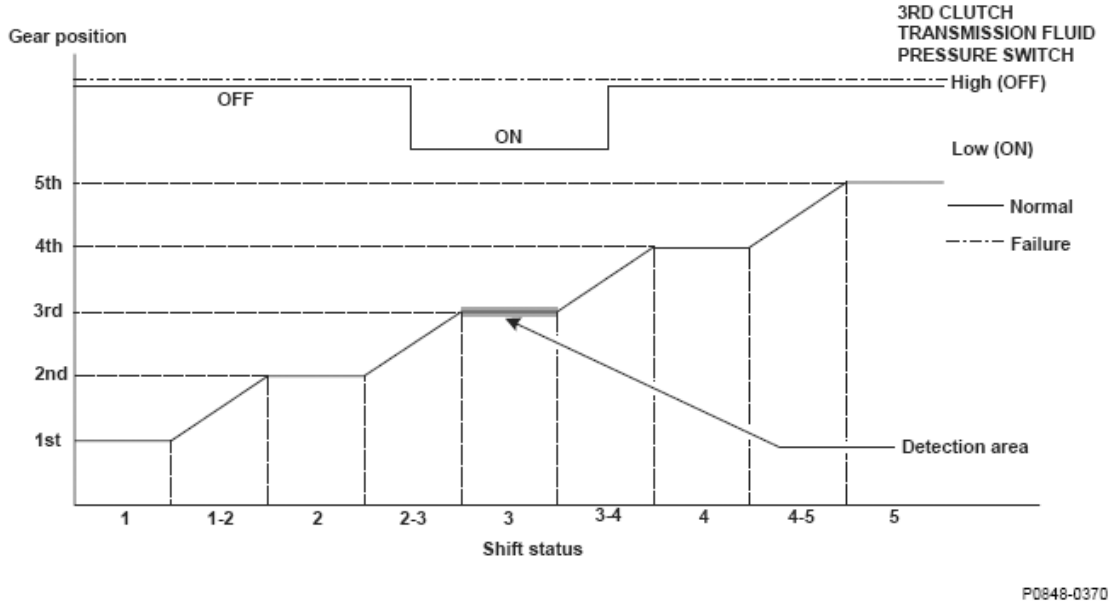

Fig. 24: Identifying Camshaft Position (CMP) Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Crankshaft Position (CKP) Sensor

The CKP sensor detects crankshaft speed and is used by the ECM/PCM to determine ignition timing and timing for fuel injection of each cylinder as well as detecting engine misfire.

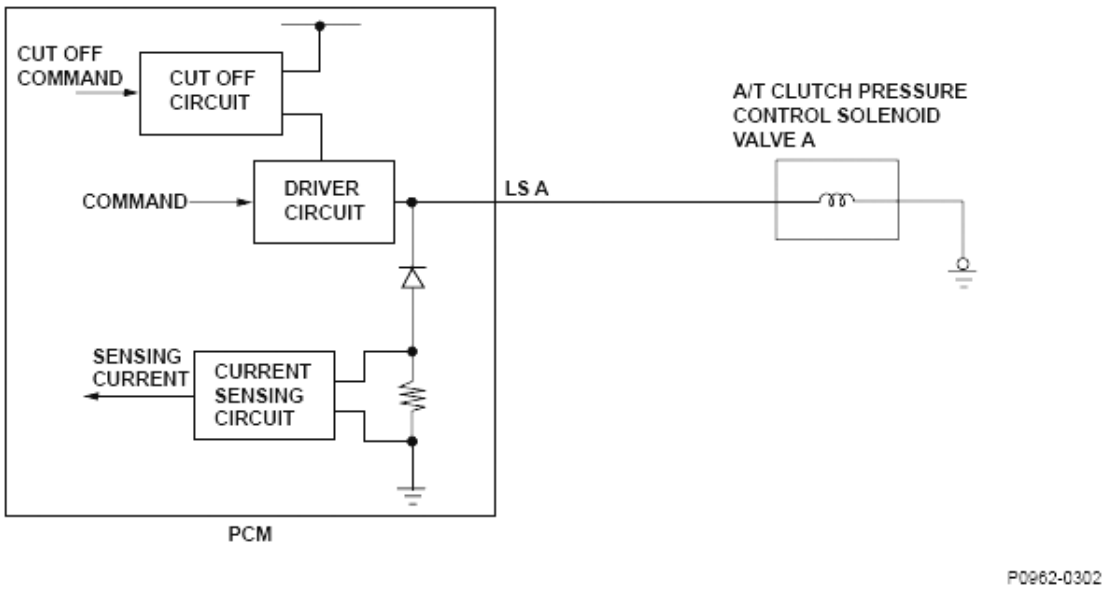

Fig. 25: Identifying Crankshaft Position (CKP) Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Engine Coolant Temperature (ECT) Sensor 1 and 2

The ECT sensors 1 and 2 are temperature dependent resistor (thermistors). The resistance decreases as the engine coolant temperature increases.

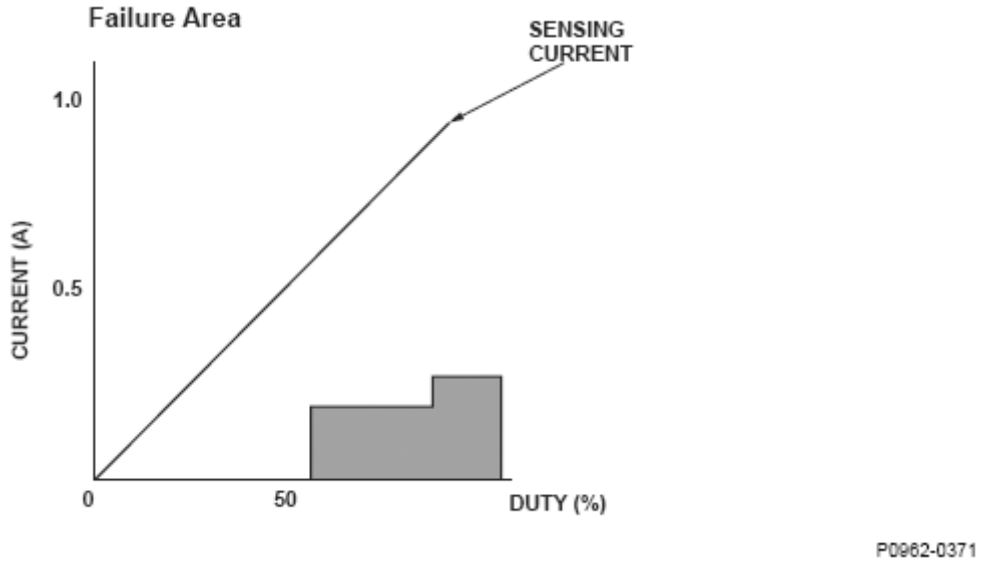

Fig. 26: Engine Coolant Temperature (ECT) Sensor 1 And 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Ignition Timing Control

ECM/PCM contains the memory for basic ignition timing at various engine speeds and manifold absolute pressure. It also adjusts the timing according to engine coolant temperature and intake air temperature.

Injector Timing and Duration

The ECM/PCM contains the memory for basic discharge duration at various engine speeds and manifold pressures. The basic discharge duration, after being read out from the memory, is further modified by signals sent from various sensors to obtain the final discharge duration.

By monitoring long term fuel trim, the ECM/PCM detects long term malfunctions in the fuel system and sets a diagnostic trouble code (DTC).

Knock Sensor

The knock control system adjusts the ignition timing to minimize knock.

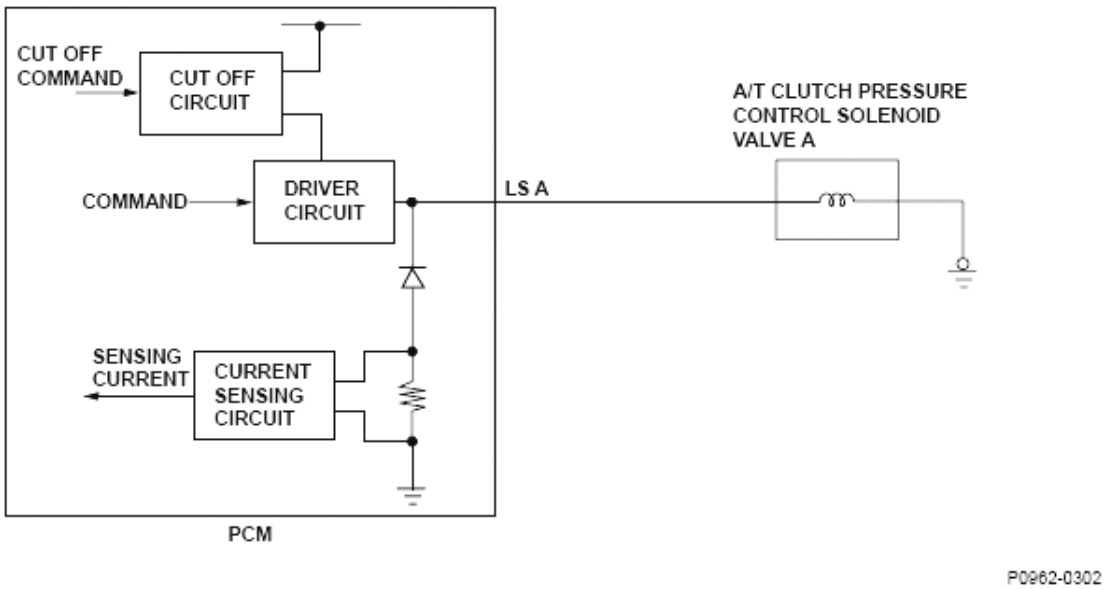

Fig. 27: Identifying Knock Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Manifold Absolute Pressure (MAP) Sensor

The MAP sensor converts manifold absolute pressure into electrical signals to the ECM/PCM.

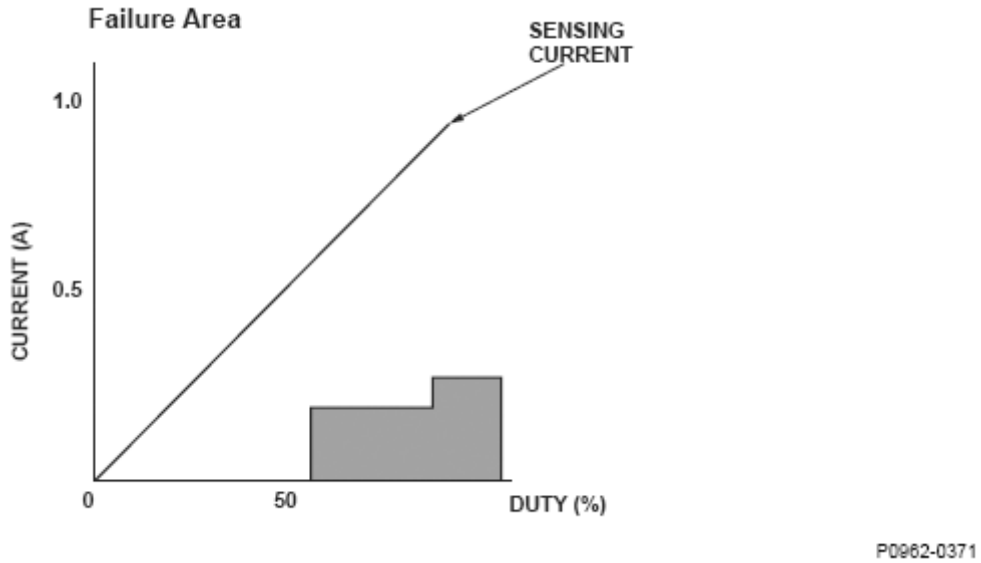

Fig. 28: Identifying Manifold Absolute Pressure (MAP) Sensor

Malfunction Indicator Lamp (MIL) Indication (In relation to Readiness Codes)

The vehicle has certain "readiness codes" that are part of the on-board diagnostics for the emissions systems. If the vehicle's battery has been disconnected or gone dead, if the DTCs have been cleared, or if the ECM/PCM has been reset, these codes are reset. In some states, part of the emissions testing is to make sure these codes are set to complete. If all of them are not set to complete, the vehicle may fail the test, or the test cannot be finished.

To check if the readiness codes are set to complete, turn the ignition switch ON (II), but do not start the engine. The MIL will come on for 15-20 seconds. If it then goes off, the readiness codes are complete. If it flashes five times, one or more readiness codes are not complete. To set each code, drive the vehicle or run the engine as described in the procedures (see **MALFUNCTION INDICATOR LAMP (MIL) INDICATION (IN RELATION TO READINESS CODES)**).

Mass Air Flow (MAF) Sensor/Intake Air Temperature (IAT) Sensor

The mass air flow (MAF) sensor/intake air temperature (IAT) sensor contains a hot wire and a thermistor. It is located in the intake air passage. The resistance of the hot wire and thermistor changes due to intake air temperature and air flow. The control circuit in the MAF sensor controls the current to keep the hot wire at a set temperature. The current is converted to voltage in the control circuit, then output to the ECM/PCM.

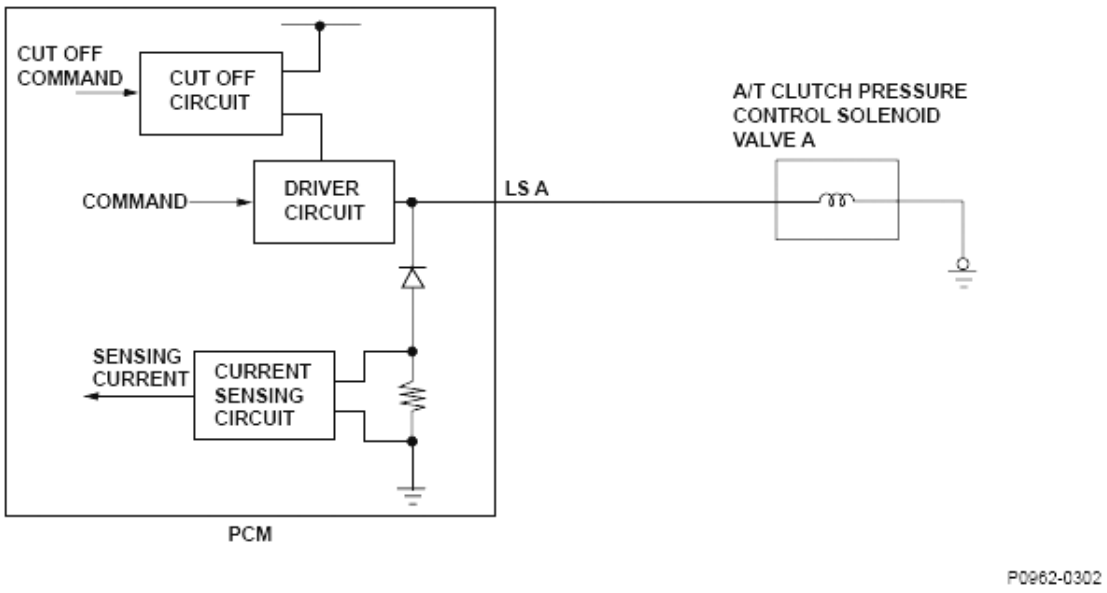

Fig. 29: Identifying Mass Air Flow (MAF) Sensor/Intake Air Temperature (IAT) Sensor

Output Shaft (Countershaft) Speed Sensor (M/T)

This sensor detects countershaft speed.

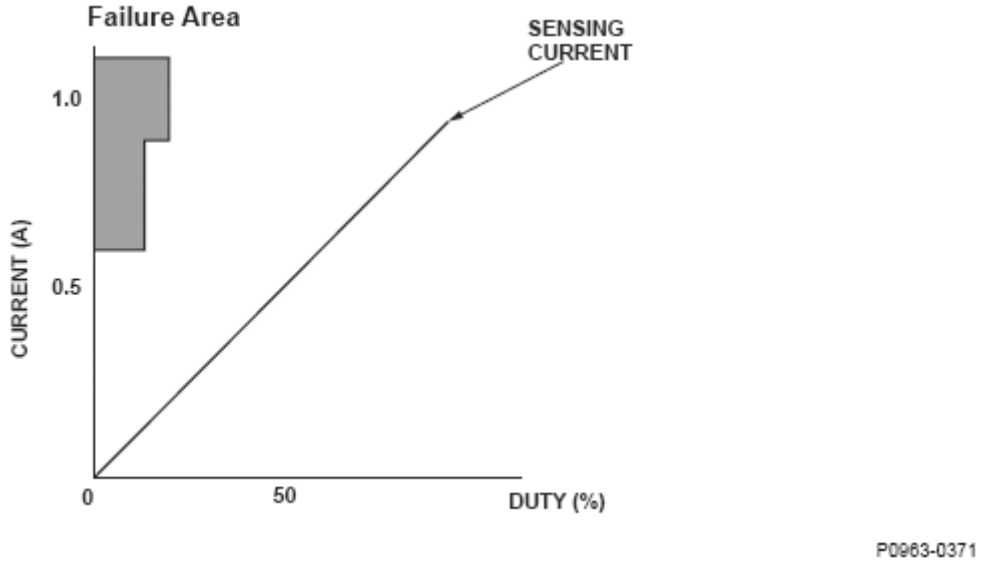

Fig. 30: Identifying Output Shaft (Countershaft) Speed Sensor (M/T)

Secondary Heated Oxygen Sensor (Secondary HO2S)

The secondary HO2S detects the oxygen content in the exhaust gas downstream of the three way catalytic converter (TWO, and sends signals to the ECM/PCM which varies the duration of fuel injection accordingly. To stabilize its output, the sensor has an internal heater. The ECM/PCM compares the HO2S output with the A/F sensor output to determine catalyst efficiency. The secondary HO2S is located on the TWC.

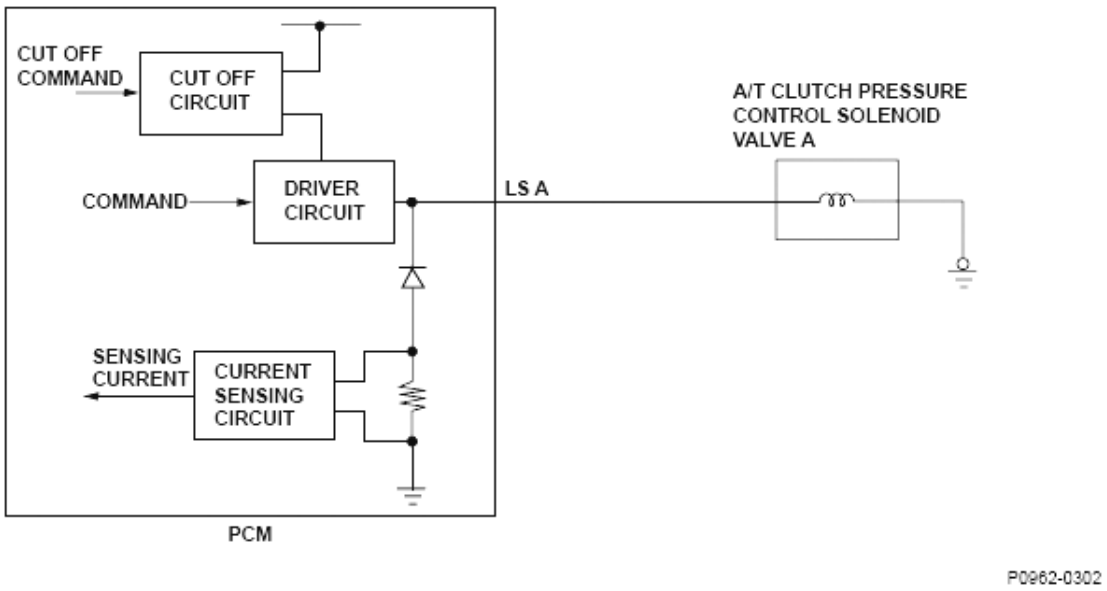

Fig. 31: Identifying Secondary Heated Oxygen Sensor (Secondary HO2S) And Sensor Terminals And Heater Terminals

ELECTRONIC THROTTLE CONTROL SYSTEM

The throttle is electronically controlled by the electronic throttle control system. Refer to the system diagram to see a functional layout of the system.

Idle control: When the engine is idling, the ECM/PCM controls the throttle actuator to maintain the proper idle speed according to engine loads.

Acceleration control: When the accelerator pedal is pressed, the ECM/PCM opens the throttle valve depending on the accelerator pedal position (APP) sensor signal.

Cruise control: The ECM/PCM controls the throttle actuator to maintain set speed when the cruise control is operating. The throttle actuator takes the place of the cruise control actuator.

Accelerator Pedal Position (APP) Sensor

As the accelerator pedal position changes, the sensor varies the signal voltage to the ECM/PCM.

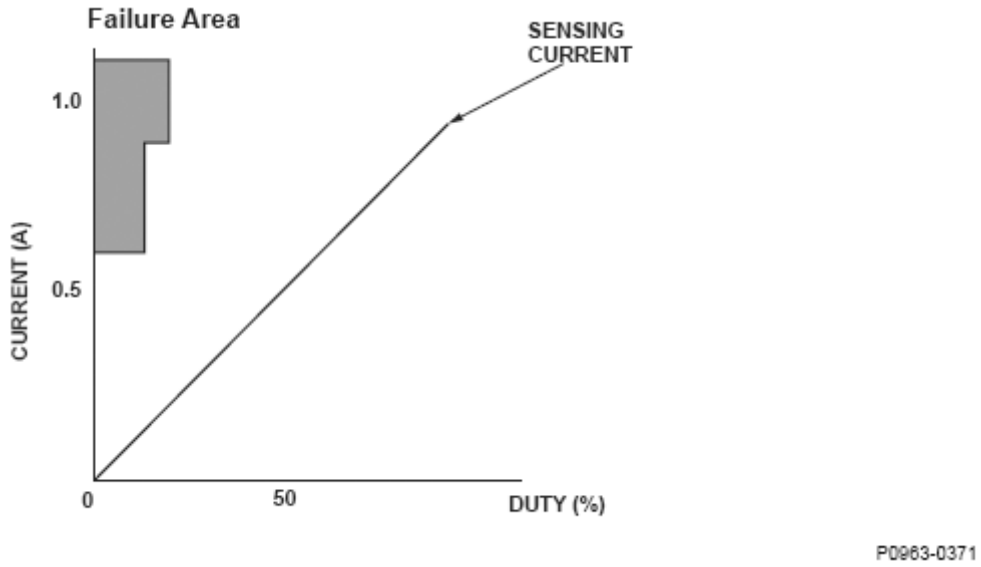

Fig. 32: Identifying Accelerator Pedal Position (APP) Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Throttle Body

The throttle body is a single-barrel side draft type. The lower portion of the throttle valve is heated by engine coolant from the cylinder head to prevent icing of the throttle plate.

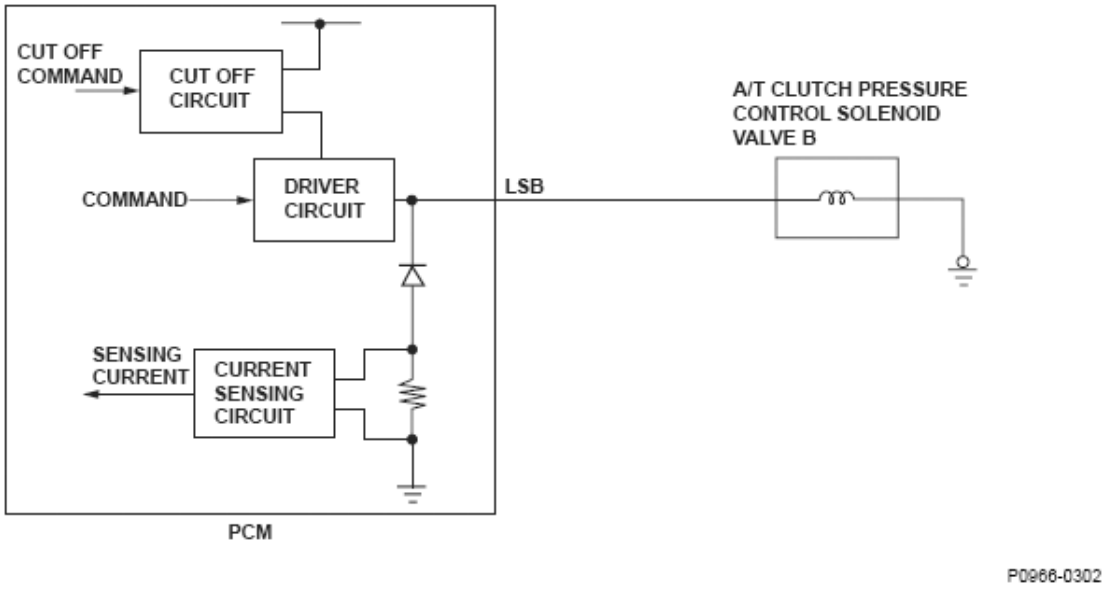

Fig. 33: Identifying Throttle Body
Courtesy of AMERICAN HONDA MOTOR CO., INC.

IDLE CONTROL SYSTEM

When the engine is cold, the A/C compressor is on, the transmission is in gear, the brake pedal is pressed, the power steering load is high, or the alternator is charging, the ECM/PCM controls current to the throttle actuator to maintain the correct idle speed.

Brake Pedal Position Switch

The brake pedal position switch signals the ECM/PCM when the brake pedal is pressed.

Power Steering Pressure (PSP) Switch

The PSP switch signals the ECM/PCM when the power steering load is high.

FUEL SUPPLY SYSTEM

Fuel Cutoff Control

During deceleration with the throttle valve closed, current to the injectors is cut off to improve fuel economy at engine speeds over 910 rpm (A/T model), or 950 rpm (M/T model). Fuel cutoff also occurs when the engine speed exceeds 6,900 rpm, regardless of the position of the throttle valve, to protect the engine from over-revving. When the vehicle is stopped, the ECM/PCM cuts the fuel at engine speeds over 5,000 rpm. The engine speed of fuel cut is lower on a cold engine.

Fuel Pump Control

When the ignition is turned on, the ECM/PCM grounds PGM-FI main relay 2 (FUEL PUMP) which feeds current to the fuel pump for 2 seconds to pressurize the fuel system. With the engine running, the ECM/PCM grounds PGM-FI main relay 2 (FUEL PUMP) and feeds current to the fuel pump. When the engine is not running and the ignition is on, the ECM/PCM cuts ground to PGM-FI main relay 2 (FUEL PUMP) which cuts current to the fuel pump.

PGM-FI Main Relay 1 and 2

PGM-FI main relay 1 is energized whenever the ignition switch is ON (II) to supply battery voltage to the ECM/PCM, power to the injectors, and power for PGM-FI main relay 2 (FUEL PUMP). PGM-FI main relay 2 (FUEL PUMP) is energized to supply power to the fuel pump for 2 seconds when the ignition switch is turned ON (II), and when the engine is cranking or running.

VTEC SYSTEM

- This mechanism improves fuel efficiency and reduces exhaust emissions at all levels of engine speed, vehicle speed, and engine load.
- The VTEC mechanism changes the valve lift and timing by using more than one cam profile.
- The VTEC system changes the cam profile (angle) at cruising speeds.

  (Cam angle is changed to obtain the desired EGR effect and reduce pumping loss).

OPERATION

At engine start, and high load

- The rocker arm oil control valve is OFF.
- Oil pressure enters secondary rocker arm B from the oil passage in the intake rocker shaft.

  This forces the VTEC switching piston into secondary rocker arm A against the return spring and

disengages the secondary arm A from the secondary arm B to stop valve actuation.

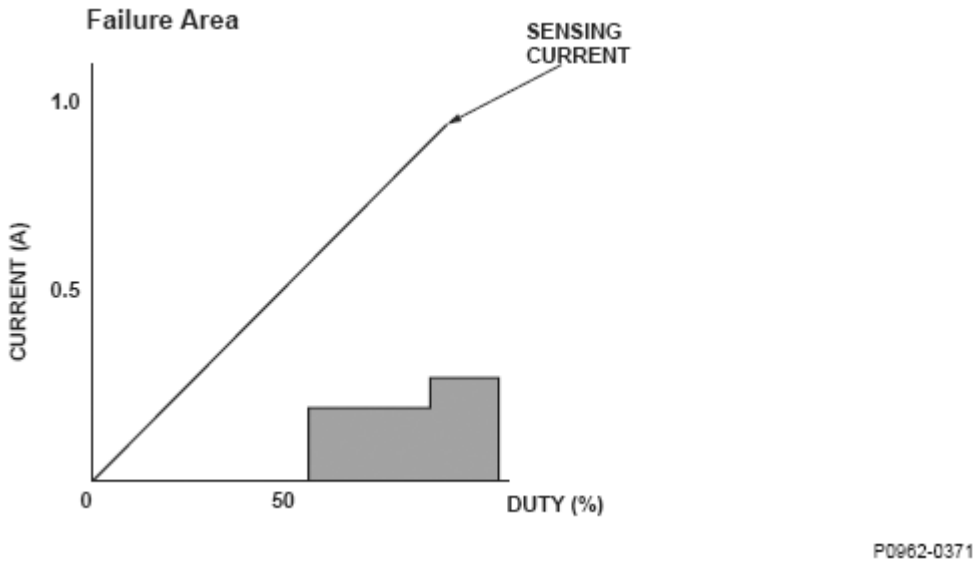

Fig. 34: Identifying VTEC System Operation Diagram - At Engine Start, And High Load
Courtesy of AMERICAN HONDA MOTOR CO., INC.

At cruise

The rocker arm oil control valve switches oil pressure to the oil passage in the intake rocker arm shaft. Oil pressure then enters secondary rocker arm A, and it moves the VTEC switching piston in the rocker arm.

This causes the VTEC switching piston to slide into secondary rocker arm B, locking secondary rocker arms A and B together.

CATALYTIC CONVERTER SYSTEM

Three Way Catalytic Converter (TW)

The TWC converts hydrocarbons (HO, carbon monoxide (CO), and oxides of nitrogen (NOx) in the exhaust gas to carbon dioxide (CO_2), nitrogen (N_2), and water vapor.

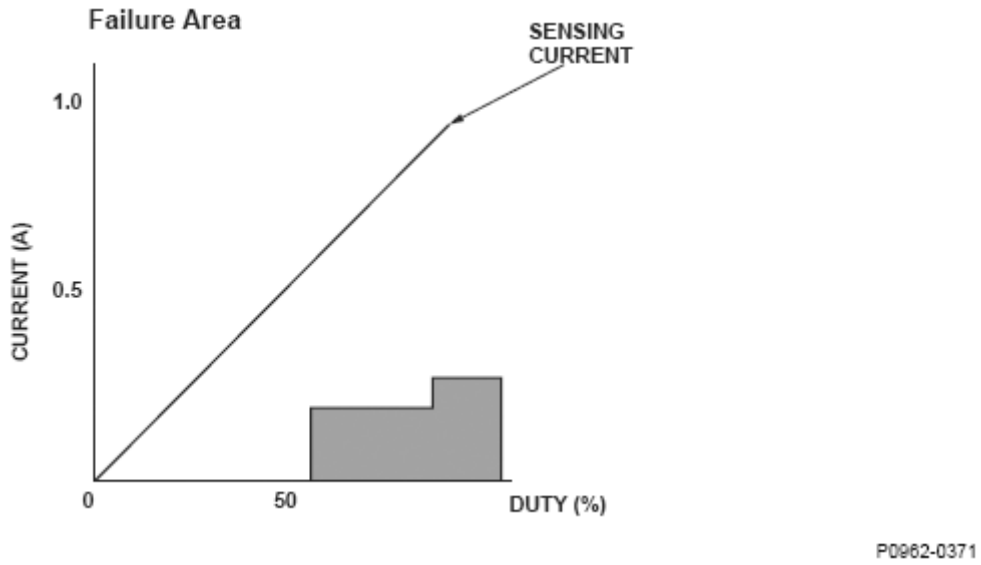

Fig. 36: Identifying Three Way Catalytic Converter (TW)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

POSITIVE CRANKCASE VENTILATION (PCV) SYSTEM

The PCV valve prevents blow-by gasses from escaping into the atmosphere by venting them into the intake manifold.

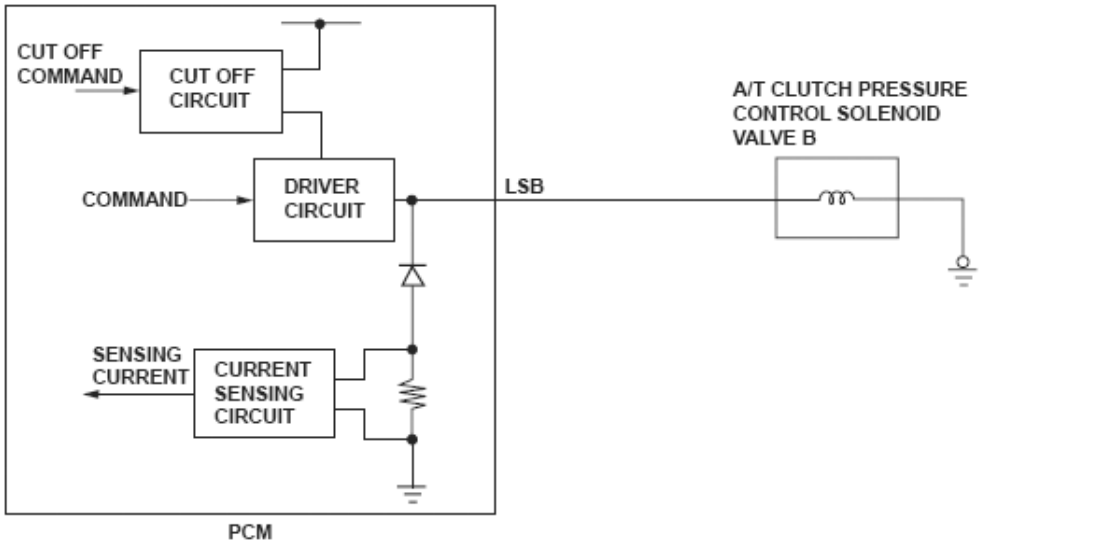

Fig. 37: Identifying Positive Crankcase Ventilation (PCV) System
Courtesy of AMERICAN HONDA MOTOR CO., INC.

EXHAUST GAS RECIRCULATION (EGR) SYSTEM

Refer to the system diagram to see a functional layout of the system.

EGR Valve

The EGR valve lowers peak combustion temperatures and reduces oxides of nitrogen emissions (NOx) by recirculating exhaust gas through the intake manifold and into the combustion chambers.

EVAPORATIVE EMISSION (EVAP) CONTROL SYSTEM

Refer to the system diagram to see a functional layout of the system.

EVAP Canister

The EVAP canister temporarily stores fuel vapor from the fuel tank until it can be purged from the EVAP canister into the engine and burned.

EVAP Canister Purge Valve

When the engine coolant temperature is below 140°F (60°C), the ECM/PCM turns off the EVAP canister purge valve cutting vacuum to the EVAP canister.

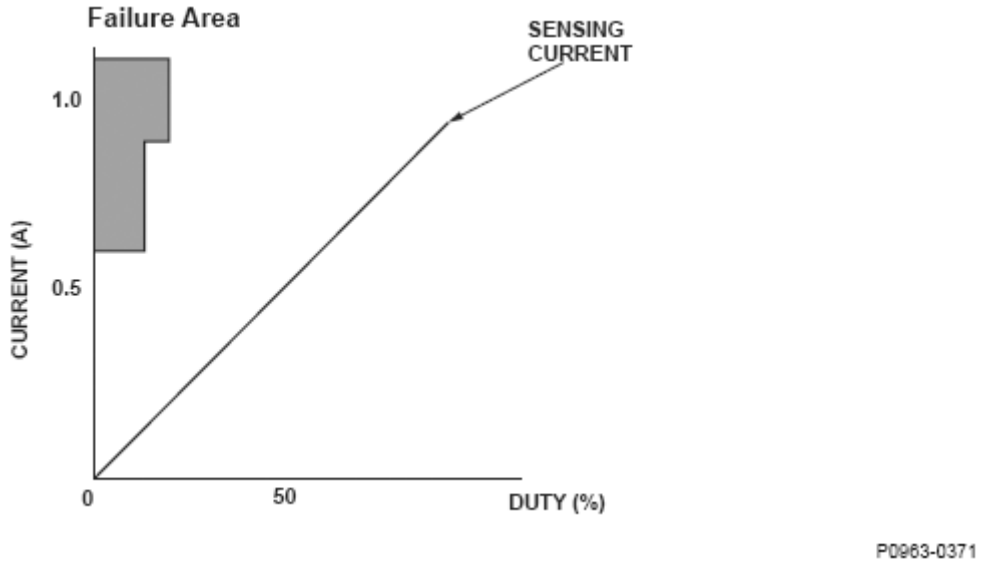

Fig. 38: Identifying EVAP Canister Purge Valve
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Fuel Tank Pressure (FTP) Sensor

The FTP sensor converts fuel tank absolute pressure into an electrical input to the ECM/PCM during the EVAP leak check.

EVAP Canister Vent Shut Valve

The EVAP canister vent shut valve is on the EVAP canister.

The EVAP canister vent shut valve controls the venting of the EVAP canister.

FUEL CAP WARNING MESSAGE

The ECM/PCM detects a loose or missing fuel fill cap as an evaporative system leak and alerts the driver by showing a warning message in the gauge display.

First drive cycle

The first time a leak is detected a "CHECK FUEL CAP" message appears in the gauge display (A). To scroll to another message, press the select/reset button. The "CHECK FUEL CAP" message will appear each time you restart the engine until the system turns the message off. Turn the engine off hen replace or tighten the fuel fill cap until it clicks at least once.

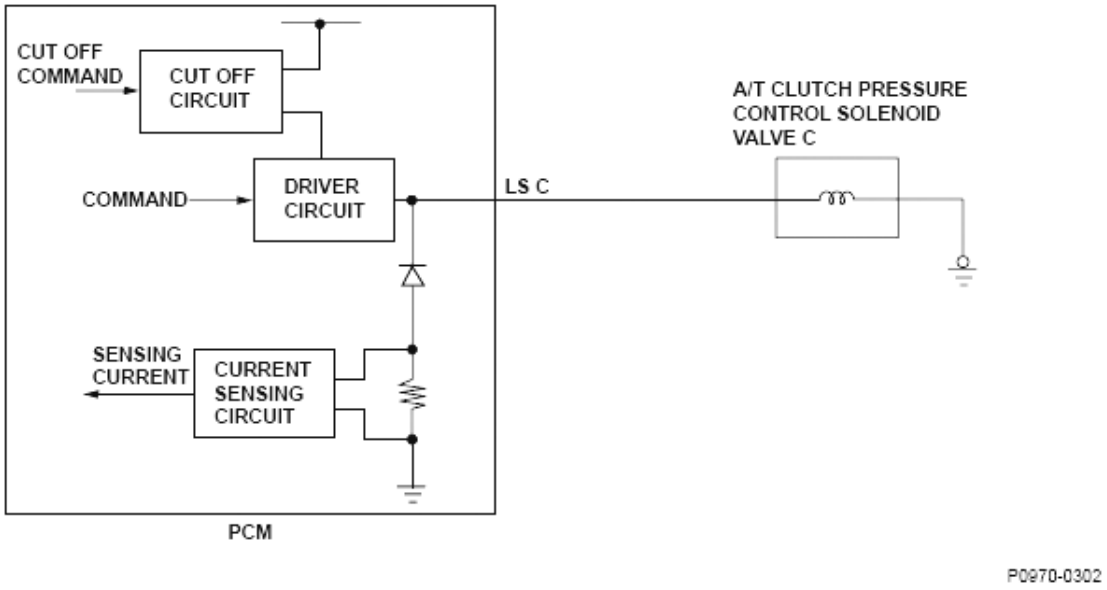

Fig. 41: Identifying Message In Gauge Display
Courtesy of AMERICAN HONDA MOTOR CO., INC.

TO MAKE THE MESSAGE GO OFF (WITH THE HDS)

Procedure

1. Tighten the fuel fill cap until it clicks.
2. Clear the Temporary DTC with the HDS.
3. Verify there is no leak by doing the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

TO MAKE THE MESSAGE GO OFF (WITHOUT THE HDS) ('06 MODEL)

Procedure

1. Tighten the fuel fill cap until it clicks.
2. The message should go off after several days of normal driving.

TO MAKE THE MESSAGE GO OFF (WITHOUT THE HDS) ('07-08 MODELS)

Procedure

1. Tighten the fuel fill cap until it clicks.
2. Start the engine, then turn the ignition switch OFF.

3. Do step 2 two more times.

ELECTRONIC THROTTLE CONTROL SYSTEM DIAGRAM

The electronic throttle control system consists of the throttle actuator, throttle position (TP) sensor A/B, accelerator pedal position (APP) sensor A/B, electronic throttle control system (ETCS) control relay, and the ECM/PCM.

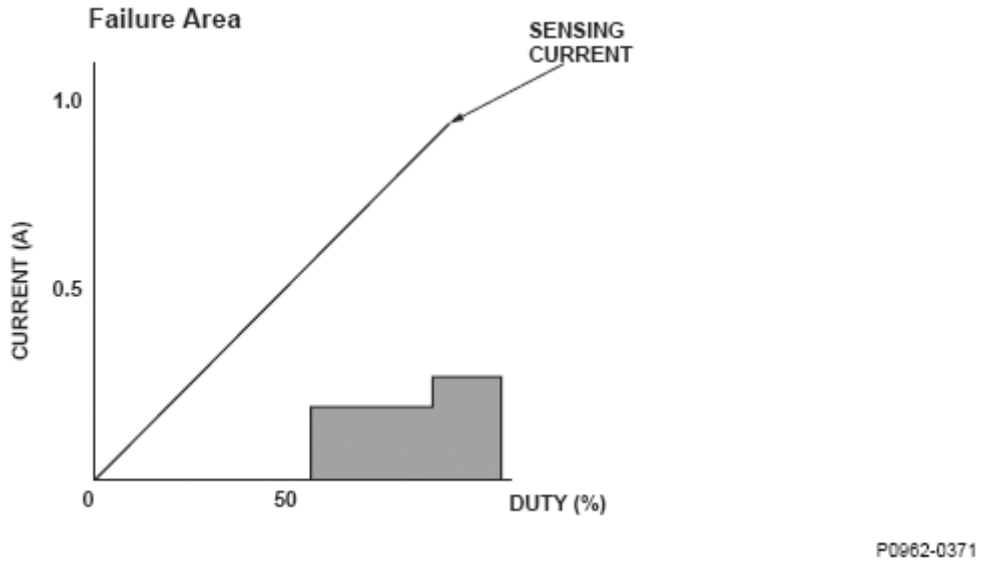

Fig. 42: Identifying Electronic Throttle Control System Diagram

INTAKE MANIFOLD TUNING (IMT) VALVE SYSTEM

Engine power is adjusted by opening and closing the intake manifold tuning (IMT) actuator. When the valve is closed, there is high torque at low engine speed. When the valve is open, there is high torque at high engine speed. The intake manifold tuning (IMT) valve actuator contains a sensor that detects the IMT valve position and sends it to the ECM/PCM.

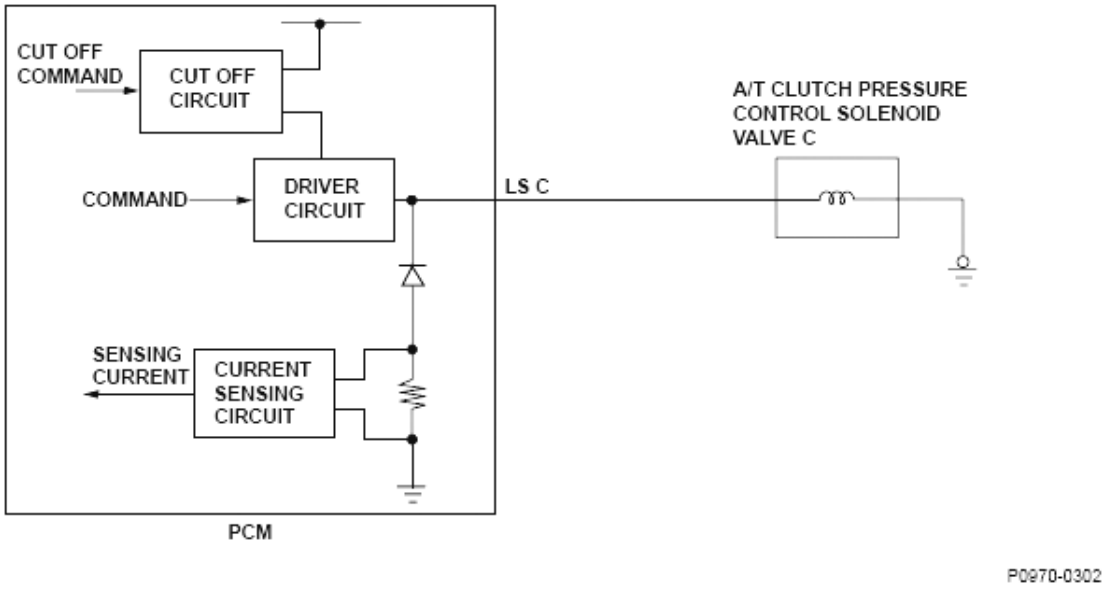

Fig. 43: Identifying Intake Manifold Tuning (IMT) Valve System
Courtesy of AMERICAN HONDA MOTOR CO., INC.

EXHAUST GAS RECIRCULATION (EGR) SYSTEM DIAGRAM

The EGR system reduces oxides of nitrogen (NOx) emissions by recirculating exhaust gas through the EGR pipe and the intake manifold, and into the combustion chambers. Routing the exhaust gas through the EGR pipe helps to prevent carbon deposits from forming in the intake manifold and the throttle body. The ECM/PCM memory includes the ideal EGR valve position for varying operating conditions.

The EGR valve position sensor detects the amount of EGR valve lift and sends it to the ECM/PCM. The ECM/PCM then compares it with the ideal lift in its memory (based on signals sent from other sensors). If there is any difference between the two, the ECM/PCM cuts current to the EGR valve.

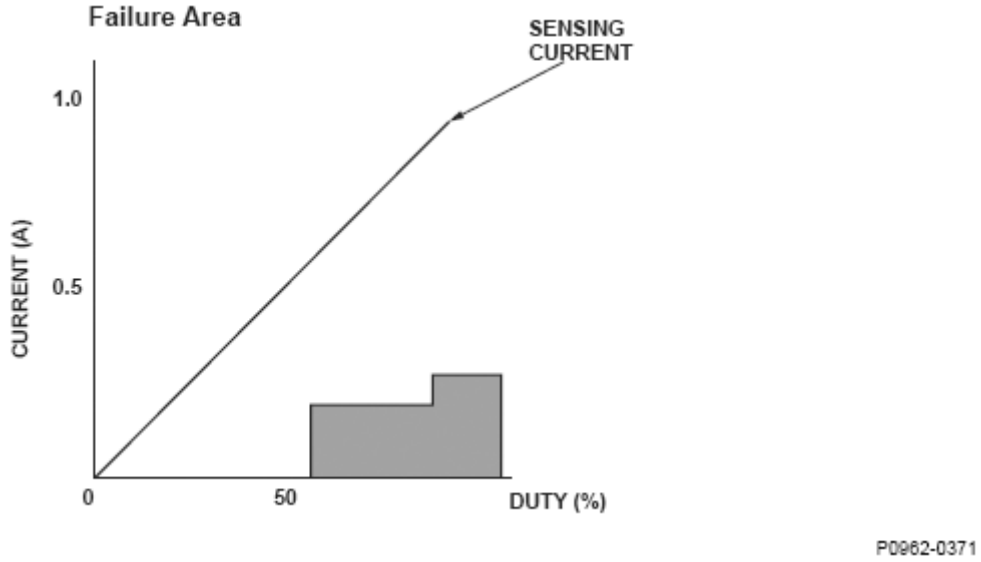

Fig. 44: Identifying Exhaust Gas Recirculation (EGR) System Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

EVAPORATIVE EMISSION (EVAP) CONTROL DIAGRAM

The EVAP controls minimize the amount of fuel vapor escaping to the atmosphere. Vapor from the fuel tank is temporarily stored in the EVAP canister until it can be purged from the canister into the engine and burned.

The EVAP canister is purged by drawing fresh air through it and into a port on the intake manifold.

The purging vacuum is controlled by the EVAP canister purge valve, which operates whenever engine coolant temperature is above 140°F (60°C).

HOW TO SET READINESS CODES

MALFUNCTION INDICATOR LAMP (MIL) INDICATION (IN RELATION TO READINESS CODES)

The vehicle has certain "readiness codes" that are part of the on-board diagnostics for the emissions systems. If the vehicle's battery has been disconnected or gone dead, if the DTCs have been cleared, or if the ECM/PCM has been reset, these readiness codes are reset to incomplete. In some states, part of the emissions testing is to make sure these codes are set to complete. If all of them are not set to complete, the vehicle may fail the emission test, or the test cannot be finished.

To check if the readiness codes are set to complete, turn the ignition switch ON (II), but do not start the engine. The MIL will come on for 15-20 seconds. If it then goes off, the readiness codes are set to complete. If it flashes five times, one or more readiness codes are not set to complete. To set readiness codes from incomplete to complete, do the procedure for the appropriate code.

To check the status of a specific DTC system, check the OBD status in the DTC MENU with the HDS (see **OBD STATUS**). This screen displays the code, the current data list of the enable criteria, and the status of the readiness testing.

CATALYTIC CONVERTER MONITOR AND READINESS CODE

NOTE:

- **Do not turn the ignition switch off during the procedure.**
- **All readiness codes are cleared when the battery is disconnected, if the DTCs have been cleared, or if the ECM/PCM is reset with the HDS.**
- **Low ambient temperatures or excessive stop-and-go traffic may increase the drive time needed to switch the readiness code from incomplete to complete.**
- **The readiness code will not switch to complete until all the enable**

criteria are met.

- **If a fault in the secondary HO2S system caused the MIL to come on, the readiness code cannot be set to complete until you correct the fault.**

Enable Criteria

- Engine coolant temperature (ECT SENSOR 1) at 158°F (70°C) or more.
- Intake air temperature (IAT SENSOR) at 20°F (-7°C) or more.
- Vehicle speed sensor (VSS) above 25 mph (40 km/h).

Procedure

1. Connect the HDS to the vehicle's data link connector (DLC), and bring up the READINESS CODEs screen for Catalyst in the DTCs MENU.
2. Start the engine.
3. Test-drive the vehicle under stop-and-go conditions with short periods of steady cruise. After about 5 miles (8 km), the readiness code should switch to complete.
4. If the readiness code is still not set to complete, check for a Temporary DTC with the HDS. If there is no DTC, one or more of the enable criteria were probably not met; repeat the procedure.

EVAPORATIVE EMISSION (EVAP) CONTROL SYSTEM MONITOR AND READINESS CODE

NOTE: All readiness codes are cleared when the battery is disconnected, if the DTCs have been cleared, or if the ECM/PCM is reset with the HDS.

Enable Criteria

- Battery voltage is more than 10.5 V.
- Engine at idle.
- Engine coolant temperature (ECT SENSOR 1 and 2) between 176°F (80°C) and 212°F (100°C).
- MAP sensor less than 46.6 kPa (14 in.Hg, 350 mmHg).
- Vehicle speed (VSS) 0 mph (0 km/h).
- Intake air temperature (IAT SENSOR) between 32°F (0°C) and 212°F (100°C).

Procedure

1. Connect the HDS to the DLC.
2. Start the engine.
3. Select EVAP TEST in the INSPECTION MENU with the HDS, then select the FUNCTION TEST in the EVAP TEST MENU.
    - If the result is normal, readiness is complete.
    - If the result is not normal, go to the next step.
4. Check for a Temporary DTC. If there is no DTC, one or more of the enable criteria were probably not met; repeat the procedure.

AIR FUEL RATIO (A/F) SENSOR MONITOR AND READINESS CODE

NOTE:

- **Do not turn the ignition switch off during the procedure.**
- **All readiness codes are cleared when the battery is disconnected, if the DTCs have been cleared, or if the ECM/PCM is reset with the HDS.**

Enable Criteria

Engine coolant temperature (ECT SENSOR 1) at 140°F (60°C) or more.

Procedure

1. Start the engine.
2. Test-drive the vehicle under stop-and-go conditions with short periods of steady cruise. During the drive, decelerate (with the throttle fully closed) for 5 seconds. After about 3.5 miles (5.6 km), the readiness code should switch from incomplete to complete.
3. Check the readiness codes screen for the AIR FUEL RATIO (A/F) SENSOR in the DTCs MENU with the HDS.
   - If the screen shows complete, readiness is complete.
   - If the screen shows not complete, go to the next step.
4. Check for a Temporary DTC. If there is no DTC, the enable criteria was probably not met. Select the DATA LIST MENU. Check the ECT SENSOR 1 in the ALL DATA LIST with the HDS. If the ECT SENSOR 1 is less than 140°F (60°C), run the engine until it is more than 140°F (60°C), then repeat the procedure.

AIR FUEL RATIO (A/F) SENSOR HEATER MONITOR READINESS CODE

NOTE: **All readiness codes are cleared when the battery is disconnected, if the DTCs have been cleared, or if the ECM/PCM is reset with the HDS.**

Procedure

1. Start the engine, and let it idle for 1 minute. The readiness code should switch from incomplete to complete.
2. If the readiness code is still not set to complete, check for a Temporary DTC. If there is no DTC, repeat the procedure.

MISFIRE MONITOR AND READINESS CODE

- This readiness code is always set to available because misfiring is continuously monitored.
- Monitoring pauses, and the misfire counter resets, if the vehicle is driven over a rough road.
- Monitoring also pauses, and the misfire counter holds at its current value, if the throttle position changes more than a predetermined value, or if driving conditions fall outside the range of any related enable criteria.

FUEL SYSTEM MONITOR AND READINESS CODE

- This readiness code is always set to available because the fuel system is continuously monitored during closed loop operation.

- Monitoring pauses when the catalytic converter, EVAP control system, and A/F sensor monitors are active.
- Monitoring also pauses when any related enable criteria are not being met. Monitoring resumes when the enable criteria is again being met.

COMPREHENSIVE COMPONENT MONITOR AND READINESS CODE

This readiness code is always set to available because the comprehensive component monitor is continuously running whenever the engine is cranking or running.

EGR MONITOR AND READINESS CODE

NOTE:

- **Do not turn the ignition switch off during the procedure.**
- **All readiness codes are cleared when the battery is disconnected, if the DTCs have been cleared, or if the ECM/PCM is reset with the HDS.**

Enable Criteria

Engine coolant temperature (ECT SENSOR 1) at 176°F (80°C) or more.

Procedure

1. Connect the HDS to the DLC.
2. Start the engine.
3. Drive at a steady speed with the A/T in D position or M/T in 4th gear, at 50-62 mph (80-100 km/h) or above for more than 10 seconds.
4. With the A/T in D position or M/T in 4th gear, decelerate from 62 mph (100 km/h) or above by completely releasing the throttle for at least 5 seconds. If the engine is stopped during this procedure, go to step 3 and do the procedure again.
5. Check the OBD status screen for DTC P0401 in the DTCs MENU with the HDS.
    - If it is PASSED, readiness is complete.
    - If it is not PASSED, go to step 3 and retest.

DTC TROUBLESHOOTING

DTC P0506: IDLE CONTROL SYSTEM RPM LOWER THAN EXPECTED

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
4. Check under these DATA LIST parameter conditions with the HDS:
   - Engine coolant temperature (ECT SENSOR 1) above 156 °F (70 °C)
   - IAT SENSOR above 32 °F (0 °C)
   - VSS is 0 mph (0 km/h)
   - ST FUEL TRIM between 0.69-1.47
   - FSS is CLOSED
5. Monitor the OBD STATUS for DTC P0506 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

YES -Go to step 6.

NO -If the screen indicates PASSED, go to step 15. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 4 and recheck.

6. Remove the air intake duct from the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
7. Check for dirt, carbon, or damage in the throttle bore.

   Is there dirt, carbon, or damage in the throttle bore?

   YES -If there is dirt or carbon, clean the throttle body (see **THROTTLE BODY CLEANING**). Also check for damage to the air cleaner element (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**), then go to step 9. If there is damage in the throttle bore, go to step 8.

   NO -Check the A/C system or power steering system, then go to step 9.

8. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
9. Reset the ECM with the HDS.
10. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
11. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
12. Check under these DATA LIST parameter conditions with the HDS:
    - Engine coolant temperature (ECT SENSOR 1) above 156 °F (70 °C)
    - IAT SENSOR above 32 °F (0 °C)
    - VSS is 0 mph (0 km/h)
    - ST FUEL TRIM between 0.69-1.47
    - FSS is CLOSED
13. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0506 indicated?

    YES -Go to step 19.

    NO -Go to step 14.

14. Monitor the OBD STATUS for DTC P0506 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES -Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 13, go to the indicated DTCs troubleshooting.

    NO -If the screen indicates FAILED, go to step 19. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 11 and recheck.

15. Remove the air intake duct from the throttle body (see **THROTTLE BODY**

REMOVAL/INSTALLATION).

16. Check for dirt, carbon, or damage in the throttle bore.

    Is there dirt, carbon, or damage in the throttle bore?

    YES -If there is dirt or carbon, clean the throttle body (see **THROTTLE BODY CLEANING**). Also check for damage to the air cleaner element (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**), then go to step 9. If there is damage in the throttle bore, go to step 8.

    NO -Go to step 17.

17. Recheck with different load conditions (turn on the headlights, blower motor, rear window defogger and/or A/C, change the gear position, etc.).
18. Monitor the OBD STATUS for DTC P0506 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES -Intermittent failure, the system is OK at this time.

    NO -If the screen indicates FAILED, check the A/C system and/or power steering system, then go to step 1 and recheck. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 17.

19. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
20. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
21. Check under these DATA LIST parameter conditions with the HDS:
    - Engine coolant temperature (ECT SENSOR 1) above 156 °F (70 °C)
    - IAT SENSOR above 32 °F (0 °C)
    - VSS is 0 mph (0 km/h)
    - ST FUEL TRIM between 0.69-1.47
    - FSS is CLOSED
22. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0506 indicated?

    YES -Check for poor connections or loose terminals at the throttle body and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 20. If the ECM was substituted, go to step 1.

    NO -Go to step 23.

23. Monitor the OBD STATUS for DTC P0506 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

YES -If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 22, go to the indicated DTCs troubleshooting.

NO -If the screen indicates FAILED, check for poor connections or loose terminals at the throttle body and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 20. If the ECM was substituted, go to step 1. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 20.

DTC P0507: IDLE CONTROL SYSTEM RPM HIGHER THAN EXPECTED

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle for at least 20 seconds.
4. Monitor the OBD STATUS for DTC P0507 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES -Go to step 5.

   NO -If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, recheck with different load conditions (electrical, A/C, gear position, etc.), then go to step 3.

5. Check for vacuum leaks at these parts:
   - PCV valve
   - PCV hose
   - EVAP canister purge valve
   - Throttle body
   - Intake manifold
   - Brake booster hose
   - Brake booster

   Are there any leaks?

   YES -Repair or replace the leaking part(s), then go to step 6.

   NO -Go to step 6.

6. Turn the ignition switch ON (II).

7. Reset the ECM with the HDS.
8. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
9. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle for at least 20 seconds.
10. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0507 indicated?

    YES -Go to step 12.

    NO -Go to step 11.

11. Monitor the OBD STATUS for DTC P0507 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES -Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 10, go to the indicated DTCs troubleshooting.

    NO -If the screen indicates FAILED, go to step 12. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, recheck with different load conditions (turn on the headlights, blower motor, or A/C; change the gear position, etc.), then go to step 9.

12. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
13. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
14. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0507 indicated?

    YES -Check for poor connections or loose terminals at the throttle body and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 13. If the ECM was substituted, go to step 1.

    NO -Go to step 15.

15. Monitor the OBD STATUS for DTC P0507 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES -If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 14, go to the indicated DTCs troubleshooting.

    NO -If the screen indicates FAILED, check for poor connections or loose terminals at the throttle body and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 13. If the ECM was substituted, go to step 1. If the screen indicates

EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 13.

DTC P0532: A/C PRESSURE SENSOR CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Start the engine, and let it idle.
2. Turn the blower switch on.
3. Turn the A/C switch on.
4. Check the A/C PRESSURE SENSOR in the DATA LIST with the HDS.

   Is there about 0.3 V or less?

   YES -Go to step 5.

   NO -Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/C pressure sensor and the ECM.

5. Turn the ignition switch OFF.
6. Disconnect the A/C pressure sensor 3P connector.
7. Turn the ignition switch ON (II).
8. Check the A/C PRESSURE SENSOR in the DATA LIST with the HDS.

   Is there about 0.3 V or less?

   YES -Go to step 10.

   NO -Go to step 9.

9. Measure voltage between A/C pressure sensor 3P connector terminals No. 1 and No. 3.

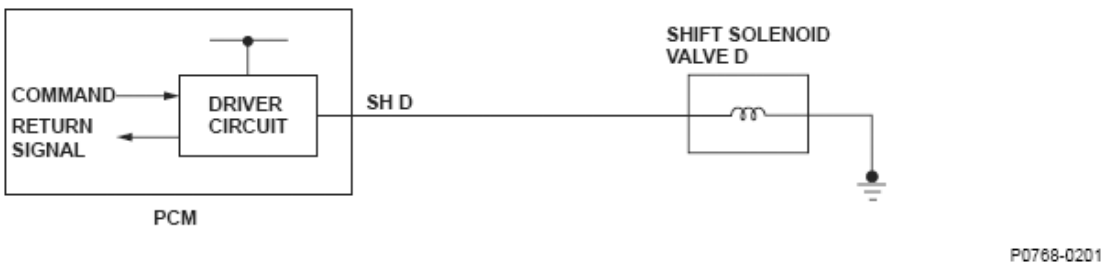

Fig. 2: Measuring Voltage Between A/C Pressure Sensor 3P Connector Terminals No 1 And 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES -Go to step 18.

NO -Go to step 14.

10. Turn the ignition switch OFF.
11. Jump the SCS line with the HDS.
12. Disconnect ECM connector A (44P).
13. Check for continuity between A/C pressure sensor 3P connector terminal No. 2 and body ground.

Is there continuity?

YES -Repair short in the wire between the ECM (A16) and the A/C pressure sensor, then go to step 20.

NO -Go to step 28.

14. Turn the ignition switch OFF.
15. Jump the SCS line with the HDS.
16. Disconnect ECM connector A (44P).
17. Check for continuity between A/C pressure sensor 3P connector terminal No. 1 and ECM connector terminal A19.

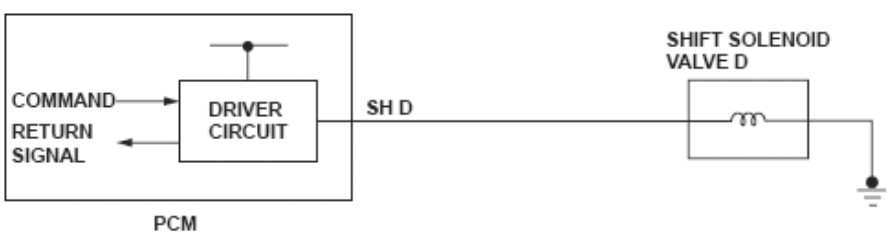

Fig. 4: Checking Continuity Between A/C Pressure Sensor 3P Terminal No 1 And ECM Terminal A19

Is there continuity?

YES -Go to step 28.

NO -Repair open in the wire between the ECM (A19) and the A/C pressure sensor, then go to step 20.

18. Turn the ignition switch OFF.
19. Replace the A/C pressure sensor (see **A/C LINE REPLACEMENT**).
20. Reconnect all connectors.
21. Turn the ignition switch ON (II).
22. Reset the ECM with the HDS.
23. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
24. Start the engine, and let it idle.
25. Turn the blower switch on.
26. Turn the A/C switch on.
27. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0532 indicated?

YES -Check for poor connections or loose terminals at the A/C pressure sensor and the ECM, then go to step 1.

NO -Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

28. Reconnect all connectors.
29. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
30. Start the engine, and let it idle.
31. Turn the blower switch on.
32. Turn the A/C switch on.
33. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0532 indicated?

YES -Check for poor connections or loose terminals at the A/C pressure sensor and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 30. If the ECM was substituted, go to step 1.

NO -If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P0533: A/C PRESSURE SENSOR CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Start the engine, and let it idle.
2. Turn the blower switch on.
3. Turn the A/C switch on.
4. Check the A/C PRESSURE SENSOR in the DATA LIST with the HDS.

   Is there about 4.75 V or more?

   YES -Go to step 5.

   NO -Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/C pressure sensor and the ECM.

5. Turn the ignition switch OFF.
6. Disconnect the A/C pressure sensor 3P connector.
7. Connect A/C pressure sensor 3P connector terminals No. 2 and No. 3 with a jumper wire.

18. Turn the ignition switch OFF.
19. Jump the SCS line with the HDS.
20. Disconnect ECM connector A (44P).
21. Check for continuity between A/C pressure sensor 3P connector terminal No. 3 and ECM connector terminal A9.

Is there continuity?

YES -Go to step 32.

NO -Repair open in the wire between the ECM (A9) and the A/C pressure sensor, then go to step 24.

22. Turn the ignition switch OFF.
23. Replace the A/C pressure sensor (see **A/C LINE REPLACEMENT**).
24. Reconnect all connectors.
25. Turn the ignition switch ON (II).
26. Reset the ECM with the HDS.
27. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
28. Start the engine, and let it idle.
29. Turn the blower switch on.
30. Turn the A/C switch on.
31. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0533 indicated?

YES -Check for poor connections or loose terminals at the A/C pressure sensor and the ECM, then go to step 1.

NO -Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

32. Reconnect all connectors.
33. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
34. Start the engine, and let it idle.
35. Turn the blower switch on.
36. Turn the A/C switch on.
37. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0533 indicated?

    YES -Check for poor connections or loose terminals at the A/C pressure sensor and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 34. If the ECM was substituted, go to step 1.

    NO -If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

A/C SIGNAL CIRCUIT TROUBLESHOOTING

1. Start the engine, and let it idle.
2. Turn the blower switch on.
3. Turn the A/C switch on.
4. Check the A/C CLUTCH in the DATA LIST with the HDS.

   Does it indicate ON?

   YES -Go to step 5.

   NO -Do the A/C system test (see **A/C SYSTEM TEST**).

5. Check the A/C system.

   Does the A/C system operate?

   YES -The air conditioning system circuit is OK.

   NO -Go to step 6.

6. Turn the ignition switch OFF.
7. Turn the ignition switch ON (II).
8. Activate the A/C CLUTCH in the INSPECTION MENU with the HDS.

   Is there a clicking noise from the A/C compressor clutch?

YES -Do the A/C system test (see **A/C SYSTEM TEST**).

NO -Go to step 9.

9. Turn the ignition switch OFF.
10. Jump the SCS line with the HDS.
11. Disconnect ECM connector A (44P).
12. Turn the ignition switch ON (II).
13. Momentarily connect ECM connector terminal A14 to body ground with a jumper wire several times.

5th	OFF	ON	OFF	ON/OFF

Fig. 9: Connecting ECM Connector Terminal A14 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there a clicking noise from the A/C compressor clutch?

YES -Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the symptom/indication goes away with a known-good ECM, replace the original ECM (see **ECM REPLACEMENT**).

NO -Check for poor connections or loose terminals at the A/C compressor clutch relay and the ECM. If the connections are OK, check the A/C compressor clutch relay (see **POWER RELAY TEST**). Then repair open in the wire between the ECM (A14) and the A/C compressor clutch relay and the other A/C systems.

ALTERNATOR FR SIGNAL CIRCUIT TROUBLESHOOTING

1. Start the engine, and let it idle.
2. Monitor the ALTERNATOR in the DATA LIST with the HDS.
3. Check if the indicated percentage varies when the headlight switch is turned on.

Does the percentage vary?

YES -The alternator signal circuit is OK.

NO -Go to step 4.

4. Turn the headlight switch and ignition switch OFF.
5. Jump the SCS line with the HDS.
6. Disconnect the alternator 4P connector.
7. Disconnect ECM connector B (44P).
8. Check for continuity between body ground and ECM connector terminal B43.

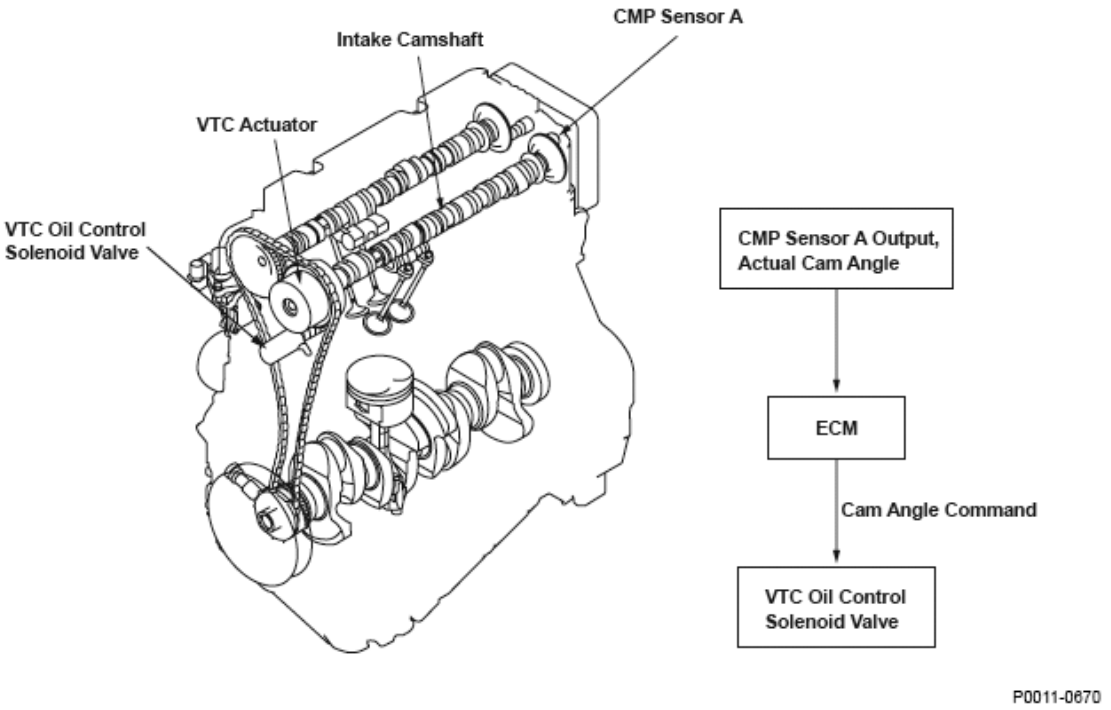

Fig. 10: Checking Continuity Between Body Ground And ECM Connector Terminal B43
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair short in the wire between the ECM (B43) and the alternator.

NO -Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the symptom/indication goes away with a known-good ECM, replace the original ECM (see **ECM REPLACEMENT**).

BRAKE PEDAL POSITION SWITCH SIGNAL CIRCUIT TROUBLESHOOTING

1. Turn the ignition switch ON (II).
2. Check the BRAKE SWITCH in the DATA LIST with the HDS.

Does it indicate OFF?

YES -Go to step 3.

NO -Inspect the brake pedal position switch (see **BRAKE PEDAL AND BRAKE PEDAL POSITION SWITCH ADJUSTMENT**).

3. Press the brake pedal, and check the BRAKE SWITCH in the DATA LIST with the HDS.

   Does it change to ON?

   YES -The brake pedal position switch signal circuit (BKSW line) is OK.

   NO -Go to step 4.

4. Turn the ignition switch OFF.
5. Jump the SCS line with the HDS.
6. Disconnect the brake pedal position switch 4P connector.
7. Disconnect ECM connector A (44P).
8. Check for continuity between ECM connector terminal A40 and body ground.

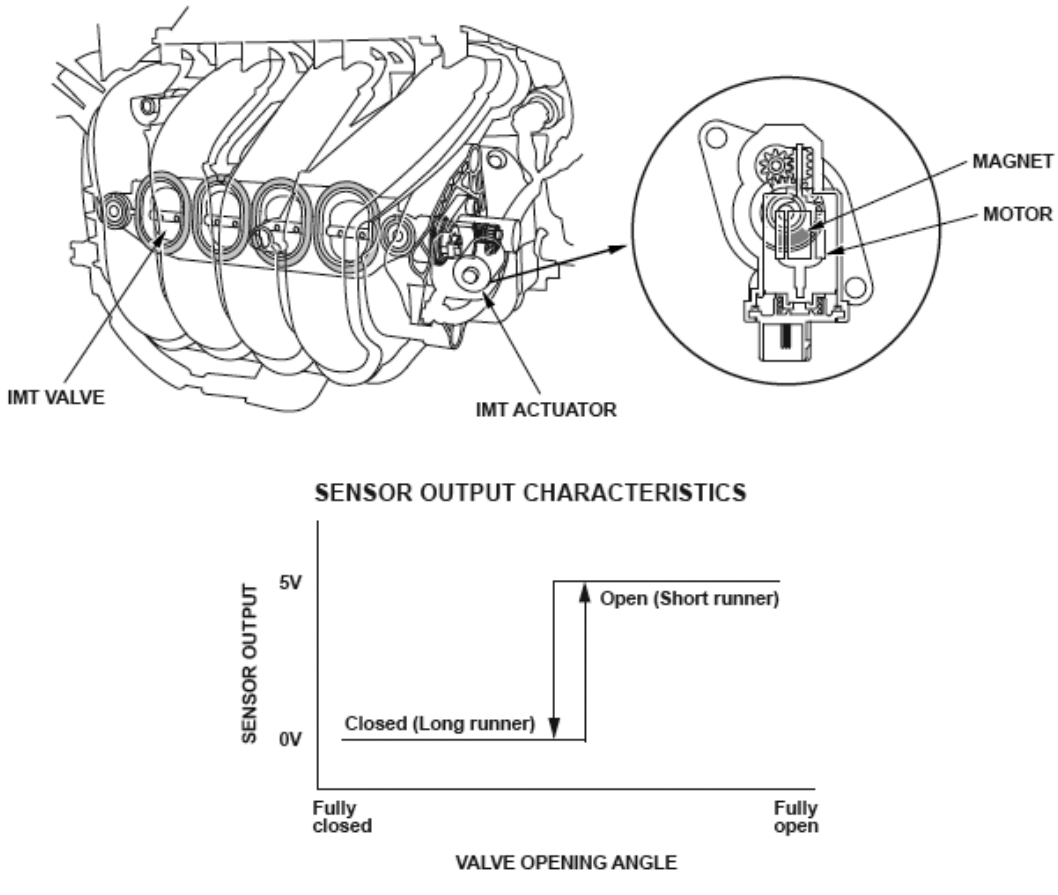

Fig. 11: Checking Continuity Between ECM Connector Terminal A40 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair short in the wire between the ECM (A40) and the No. 12 HORN, STOP (15 A) fuse. Replace the No. 12 HORN, STOP (15 A) fuse.

NO -Go to step 9.

9. Connect brake pedal position switch 4P connector terminal No. 2 to body ground with a jumper wire.

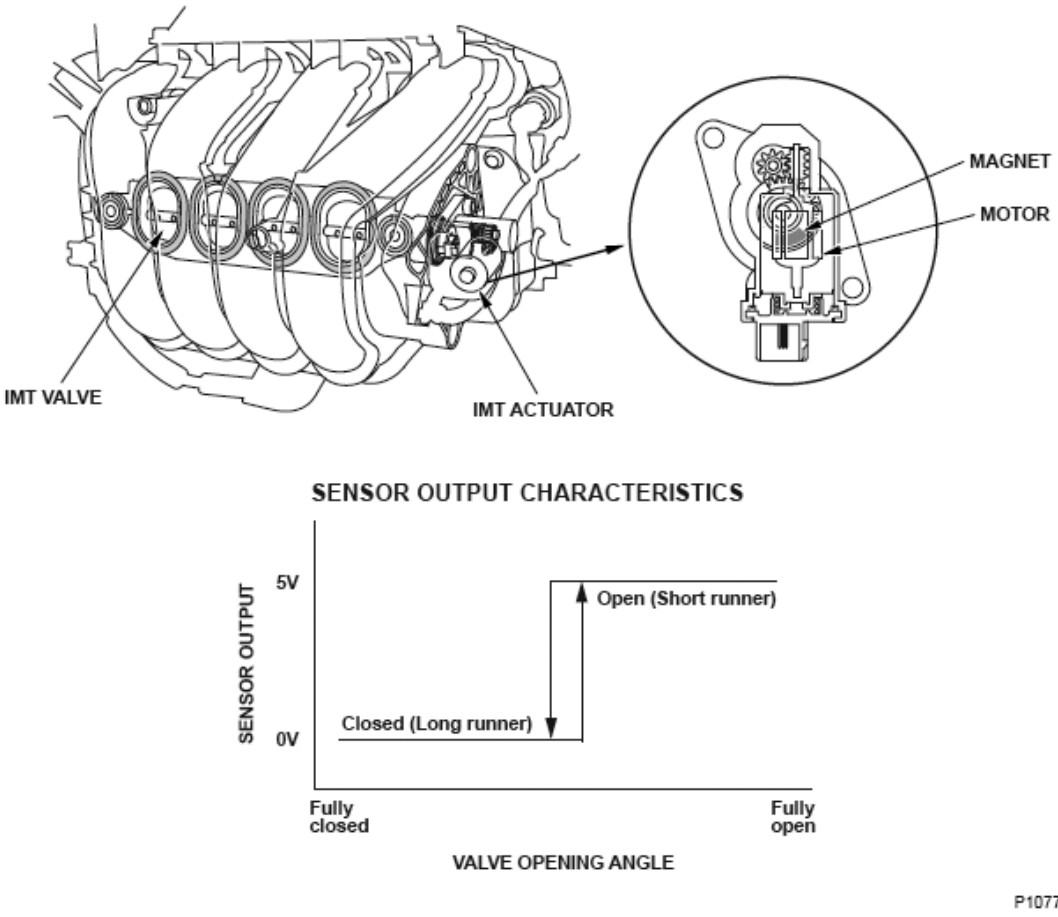

Fig. 12: Connecting Brake Pedal Position Switch 4P Terminal No 2 To Body Ground With Jumper Wire

10. Check for continuity between ECM connector terminal A40 and body ground.

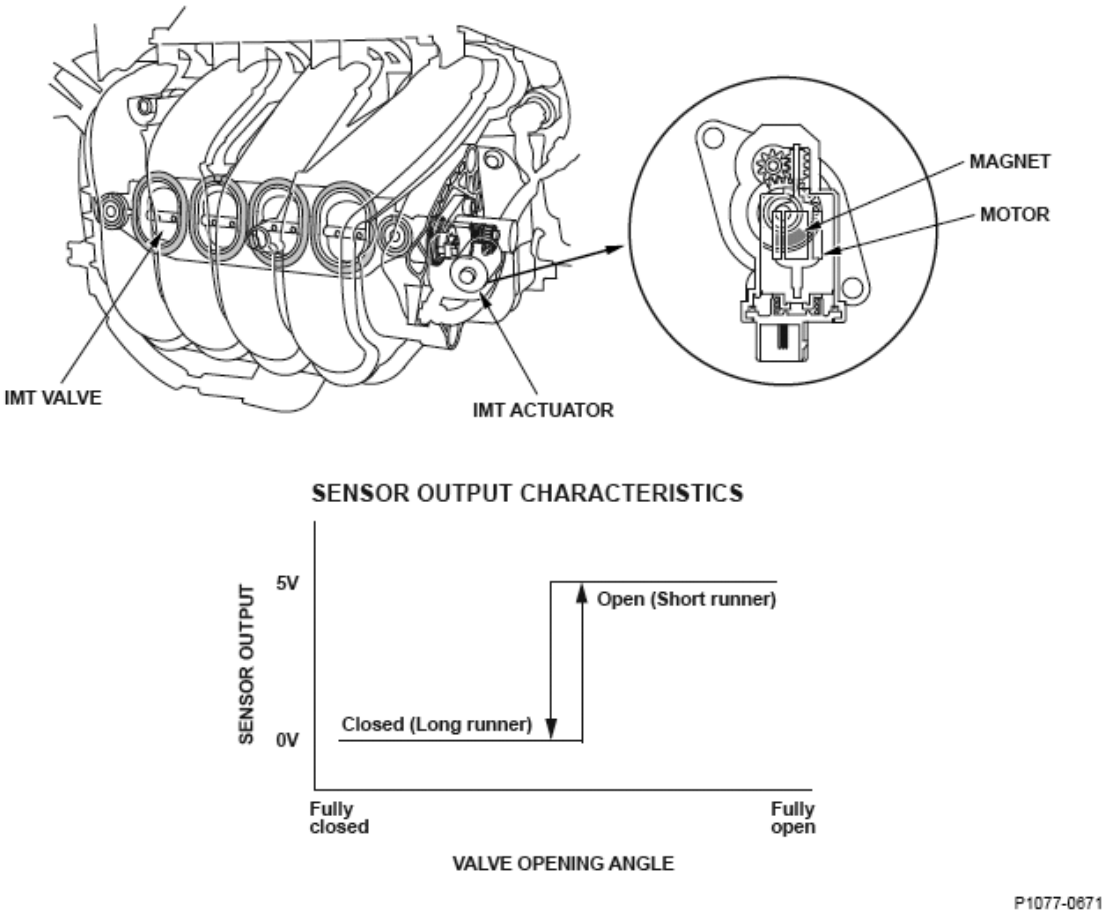

Fig. 13: Checking Continuity Between ECM Connector Terminal A40 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair open in the wire between the brake pedal position switch and the No. 12 HORN, STOP (15 A) fuse. Inspect the brake pedal position switch (see **BRAKE PEDAL AND BRAKE PEDAL POSITION SWITCH ADJUSTMENT**).

NO -Repair open in the wire between the ECM (A40) and the brake pedal position switch.

IDLE SPEED INSPECTION

NOTE:

- **Before checking the idle speed, check these items:**
  - **The malfunction indicator lamp (MIL) has not been reported on, and there are no DTCs.**
  - **Ignition timing**
  - **Spark plugs**
  - **Air cleaner**
  - **PCV system**
- **Apply the parking brake, and make sure the headlights are off.**

1. Disconnect the evaporative emission (EVAP) canister purge valve connector.
2. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

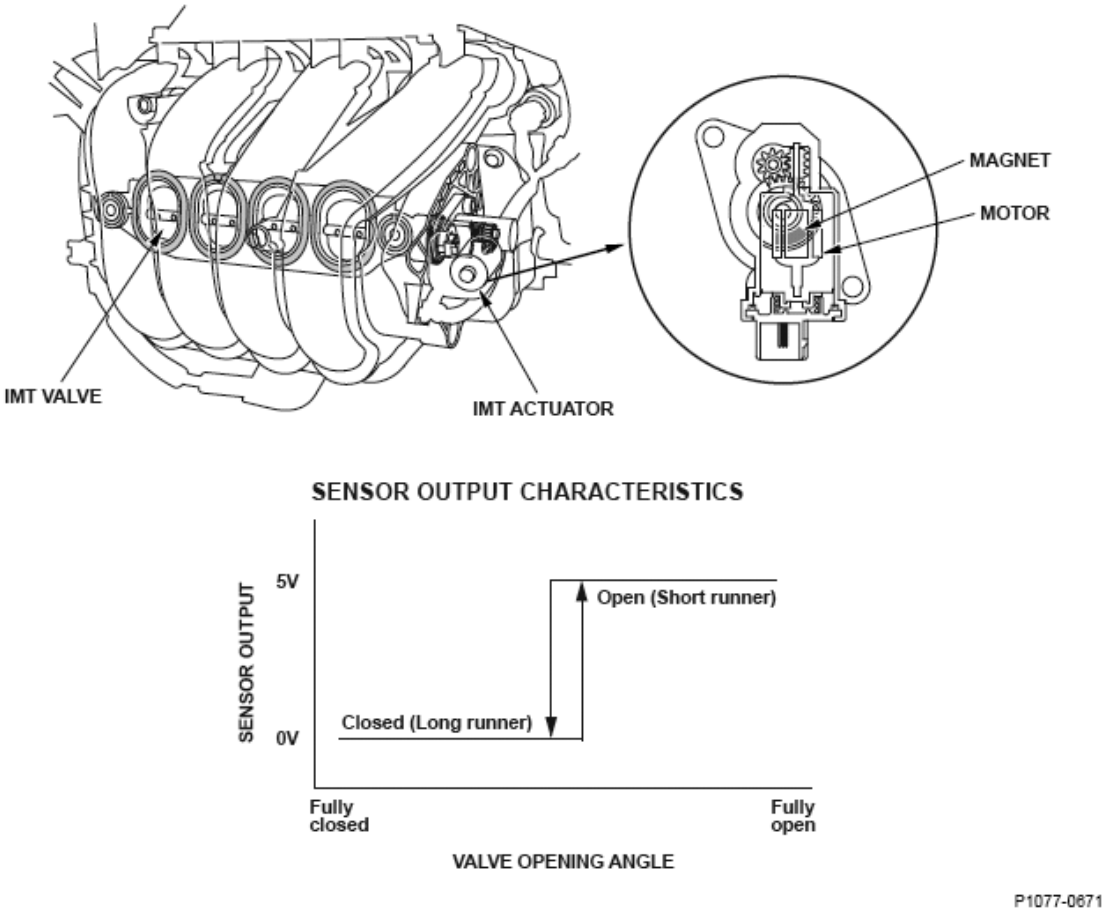

Fig. 14: Identifying Data Link Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Make sure the HDS communicates with the ECM and other vehicle systems. If it doesn't, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
5. Check the idle speed without load conditions: headlights, blower fan, radiator fan, and air conditioner off.

   Idle speed should be: 750±50 rpm

6. Let the engine idle for 1 minute with high electric load (A/C switch on, temperature set to max cool, blower fan on high, and headlights on high beam).

   Idle speed should be: 750±50 rpm

NOTE: **If the idle speed is not within specification, do the ECM idle learn procedure (see ECM IDLE LEARN PROCEDURE). If the idle speed is**

still not within specification, go to symptom troubleshooting.

7. Reconnect the EVAP canister purge valve connector.

ECM IDLE LEARN PROCEDURE

The idle learn procedure must be done so the ECM can learn the engine idle characteristics.

Do the idle learn procedure whenever you do any of these actions:

- Replace ECM.
- Reset ECM.
- Update ECM.
- Replace or clean the throttle body.

NOTE: Erasing DTCs with the HDS does not require you to do the idle learn procedure.

PROCEDURE

1. Make sure all electrical items (A/C, audio, lights, etc.) are off.
2. Reset the ECM with the HDS.
3. Turn the ignition switch ON (II), and wait 2 seconds.
4. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, or until the engine coolant temperature reaches 194 °F (90 °C).
5. Let the engine idle for about 5 minutes with the throttle fully closed.

   NOTE: If the radiator fan comes on, do not include its running time in the 5 minutes.

6. Verify on the HDS data list that the idle learn procedure is complete.

DTC TROUBLESHOOTING

DTC P0506: IDLE CONTROL SYSTEM RPM LOWER THAN EXPECTED

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
4. Check under these DATA LIST parameter conditions with the HDS:
   - ECT SENSOR 1 above 156°F (70°C)
   - IAT SENSOR above 32°F (0°C)
   - VSS is 0 mph (0 km/h)
   - ST FUEL TRIM between 0.73-1.47
   - FSS is CLOSED
5. Monitor the OBD STATUS for DTC P0506 in the DTCs MENU with the HDS.

Does the screen indicate FAILED?

YES - Go to step 6.

NO - If the screen indicates PASSED, go to step 15. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 4 and recheck.

6. Remove the intake air duct from the throttle body (see **THROTTLE BODY CLEANING**).
7. Check for dirt, carbon, or damage in the throttle bore.

   Is there dirt, carbon, or damage in the throttle bore?

   YES - If there is dirt or carbon, clean the throttle body (see **THROTTLE BODY CLEANING**). Also check for damage to the air cleaner element (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**), then go to step 9. If there is damage in the throttle bore, go to step 8.

   NO - Check the A/C system or power steering system, then go to step 17.

8. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
9. Reset the ECM/PCM with the HDS.
10. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
11. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
12. Check under these DATA LIST parameter conditions with the HDS:
    - ECT SENSOR 1 above 156°F (70°C)
    - IAT SENSOR above 32°F (0°C)
    - VSS is 0 mph (0 km/h)
    - ST FUEL TRIM between 0.73-1.47
    - FSS is CLOSED
13. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0506 indicated?

    YES - Go to step 19.

    NO - Go to step 14.

14. Monitor the OBD STATUS for DTC P0506 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 13, go to the indicated DTCs troubleshooting.

    NO -If the screen indicates FAILED, go to step 19. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 11 and recheck.

15. Remove the air intake duct from the throttle body (see **THROTTLE BODY CLEANING**).
16. Check for dirt, carbon, or damage in the throttle bore.

    Is there dirt, carbon, or damage in the throttle bore?

    YES - If there is dirt or carbon, clean the throttle body (see **THROTTLE BODY CLEANING**). Also check for damage to the air cleaner element (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**), then go to step 9. If there is damage in the throttle bore, go to step 8.

    NO - Go to step 17.

17. Recheck with different load conditions (turn on the headlights, blower motor, rear window defogger and/or A/C, change the gear position, etc.).
18. Monitor the OBD STATUS for DTC P0506 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Intermittent failure, the system is OK at this time.

    NO - If the screen indicates FAILED, check the A/C system and/or power steering system, then go to step 1 and recheck. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 17.

19. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
20. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
21. Check under these DATA LIST parameter conditions with the HDS:
    - ECT SENSOR 1 above 156°F (70°C)
    - IAT SENSOR above 32°F (0°C)
    - VSS is 0 mph (0 km/h)
    - ST FUEL TRIM between 0.73-1.47
    - FSS is CLOSED
22. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0506 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 20. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 23.

23. Monitor the OBD STATUS for DTC P0506 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 22, go to the indicated DTCs troubleshooting.

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the throttle body and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 20. If the ECM/PCM was substituted, go to step 1. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 20.

DTC P0507: IDLE CONTROL SYSTEM RPM HIGHER THAN EXPECTED

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
4. Monitor the OBD STATUS for DTC P0507 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 5.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, recheck with different load conditions (electrical, A/C, gear position, etc.), then go to step 3.

5. Check for vacuum leaks at these parts:
   - PCV valve
   - PCV hose
   - EVAP canister purge valve
   - Throttle body
   - Intake manifold
   - Brake booster hose
   - Brake booster

   Are there any leaks?

   YES - Repair or replace the leaking part(s), then go to step 6.

   NO - Go to step 6.

6. Turn the ignition switch ON (II).

7. Reset the ECM/PCM with the HDS.
8. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
9. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
10. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0507 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM, then go to step 1.

    NO - Go to step 11.

11. Monitor the OBD STATUS for DTC P0507 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 10, go to the indicated DTCs troubleshooting.

    NO - If the screen indicates FAILED, go to step 12. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, recheck with different load conditions (turn on the headlights, blower motor, or A/C; change the gear position, etc.), then go to step 9.

12. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
13. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
14. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0507 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 13. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 15.

15. Monitor the OBD STATUS for DTC P0507 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 14, go to the indicated DTCs troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the throttle body and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see

SUBSTITUTING THE ECM/PCM), then go to step 13. If the ECM/PCM was substituted, go to step 1. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 13.

DTC P0532: A/C PRESSURE SENSOR CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Start the engine, and let it idle.
2. Turn the blower switch on.
3. Turn the A/C switch on.
4. Check the A/C PRESSURE SENSOR in the DATA LIST with the HDS.

   Is there about 0.3 V or less?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/C pressure sensor and the ECM/PCM.

5. Turn the ignition switch OFF.
6. Disconnect the A/C pressure sensor 3P connector.
7. Turn the ignition switch ON (II).
8. Check the A/C PRESSURE SENSOR in the DATA LIST with the HDS.

   Is there about 0.3 V or less?

   YES - Go to step 10.

   NO - Go to step 9.

9. Measure voltage between A/C pressure sensor 3P connector terminals No. 1 and No. 3.

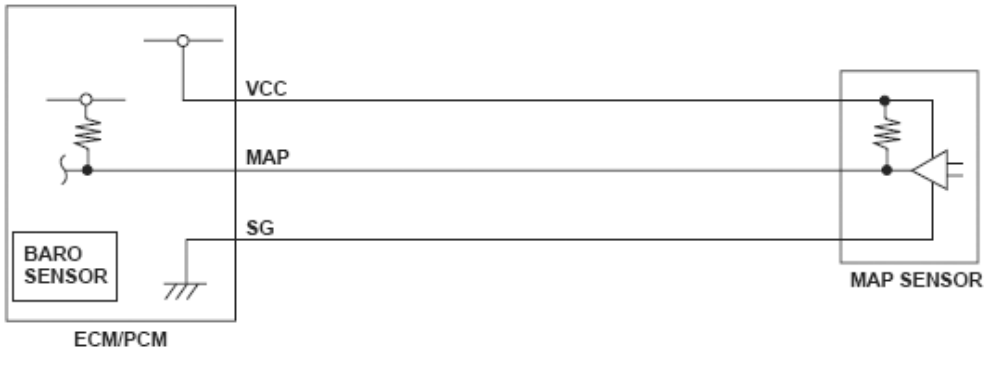

Fig. 2: Measuring Voltage Between A/C Pressure Sensor 3P Connector Terminals No. 1 And 3

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 18.

NO - Go to step 14.

10. Turn the ignition switch OFF.
11. Jump the SCS line with the HDS.
12. Disconnect ECM/PCM connector A (44P).
13. Check for continuity between A/C pressure sensor 3P connector terminal No. 2 and body ground.

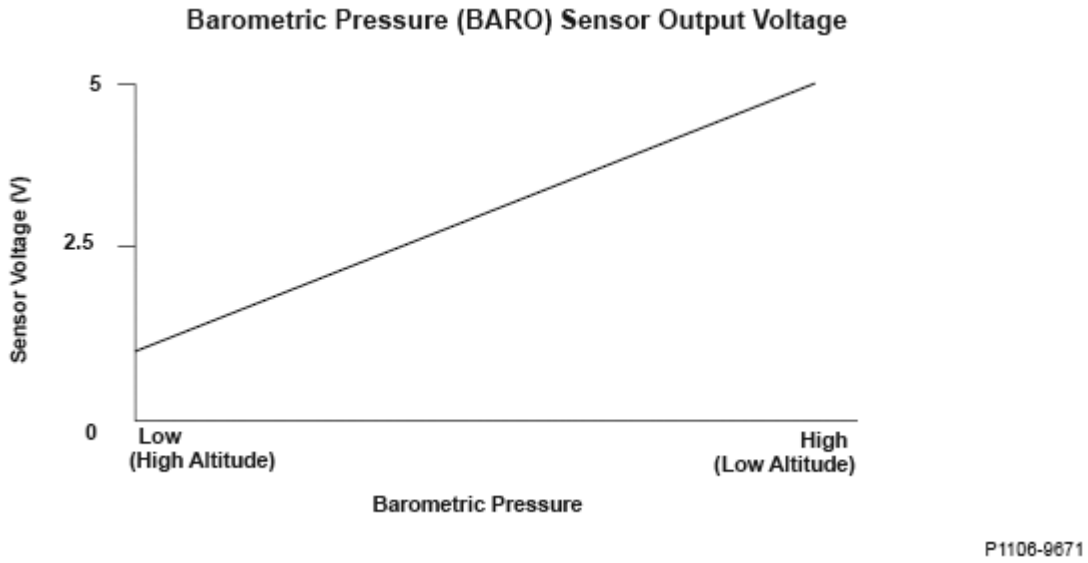

Fig. 3: Checking Continuity Between A/C Pressure Sensor 3P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (A16) and the A/C pressure sensor, then go to step 20.

NO - Go to step 28.

14. Turn the ignition switch OFF.
15. Jump the SCS line with the HDS.
16. Disconnect ECM/PCM connector A (44P).
17. Check for continuity between A/C pressure sensor 3P connector terminal No. 1 and ECM/PCM connector terminal A19.

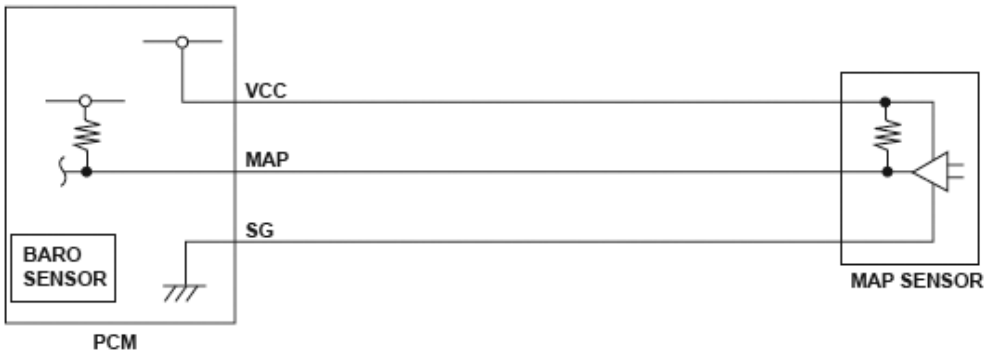

Fig. 4: Checking Continuity Between A/C Pressure Sensor 3P Terminal No. 1 And ECM/PCM Terminal A19
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 28.

NO - Repair open in the wire between the ECM/PCM (A19) and the A/C pressure sensor, then go to step 20.

18. Turn the ignition switch OFF.
19. Replace the A/C pressure sensor (see **A/C LINE REPLACEMENT**).
20. Reconnect all connectors.
21. Turn the ignition switch ON (II).
22. Reset the ECM/PCM with the HDS.
23. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
24. Start the engine, and let it idle.
25. Turn the blower switch on.
26. Turn the A/C switch on.
27. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0532 indicated?

YES - Check for poor connections or loose terminals at the A/C pressure sensor and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

28. Reconnect all connectors.
29. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
30. Start the engine, and let it idle.
31. Turn the blower switch on.

32. Turn the A/C switch on.
33. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0532 indicated?

YES - Check for poor connections or loose terminals at the A/C pressure sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 30. If the ECM/PCM was substituted, go to step 1.

NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P0533: A/C PRESSURE SENSOR CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Start the engine, and let it idle.
2. Turn the blower switch on.
3. Turn the A/C switch on.
4. Check the A/C PRESSURE SENSOR in the DATA LIST with the HDS.

Is there about 4.75 V or more?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/C pressure sensor and the ECM/PCM.

5. Turn the ignition switch OFF.
6. Disconnect the A/C pressure sensor 3P connector.
7. Connect A/C pressure sensor 3P connector terminals No. 2 and No. 3 with a jumper wire.

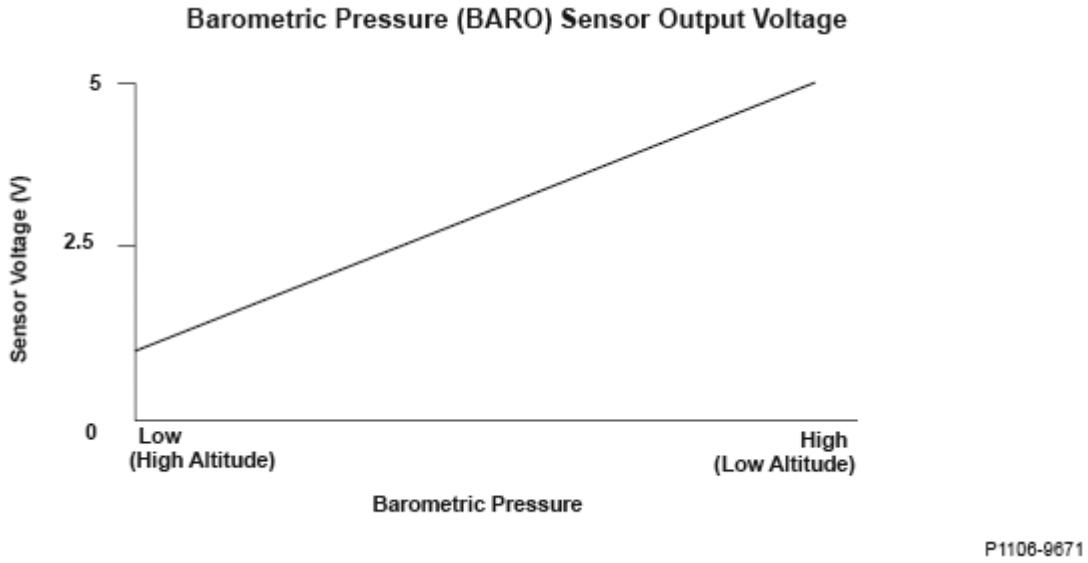

Fig. 5: Connecting A/C Pressure Sensor 3P Connector Terminals No. 2 And 3 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Turn the ignition switch ON (II).
9. Check the A/C PRESSURE SENSOR in the DATA LIST with the HDS.

   Is there about 4.75 V or more?

   YES - Go to step 10.

   NO - Go to step 22.

10. Turn the ignition switch OFF.
11. Remove the jumper wire from the A/C pressure sensor 3P connector.
12. Turn the ignition switch ON (II).
13. Measure voltage between A/C pressure sensor 3P connector terminal No. 1 and No. 3.

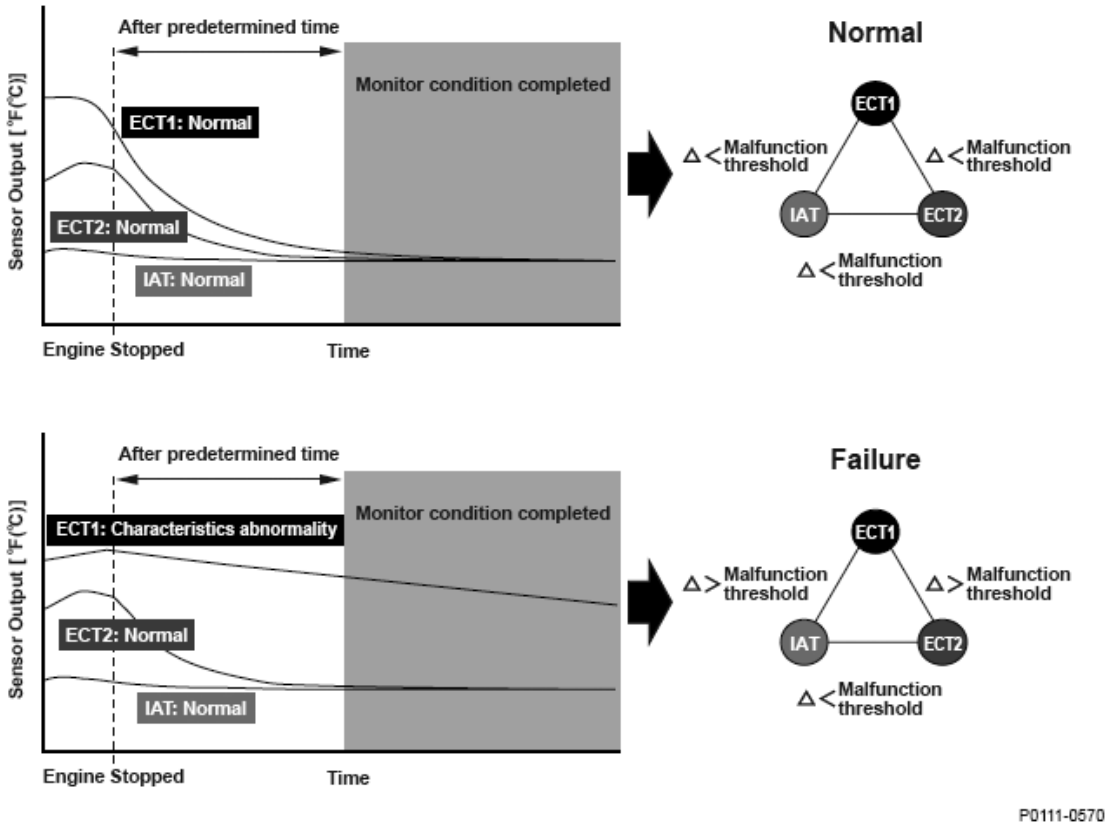

Fig. 6: Checking Voltage Between A/C Pressure Sensor 3P Connector Terminal No. 1 And 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 14.

NO - Go to step 18.

14. Turn the ignition switch OFF.
15. Jump the SCS line with the HDS.
16. Disconnect ECM/PCM connector A (44P).
17. Check for continuity between A/C pressure sensor 3P connector terminal No. 2 and ECM/PCM connector terminal A16.

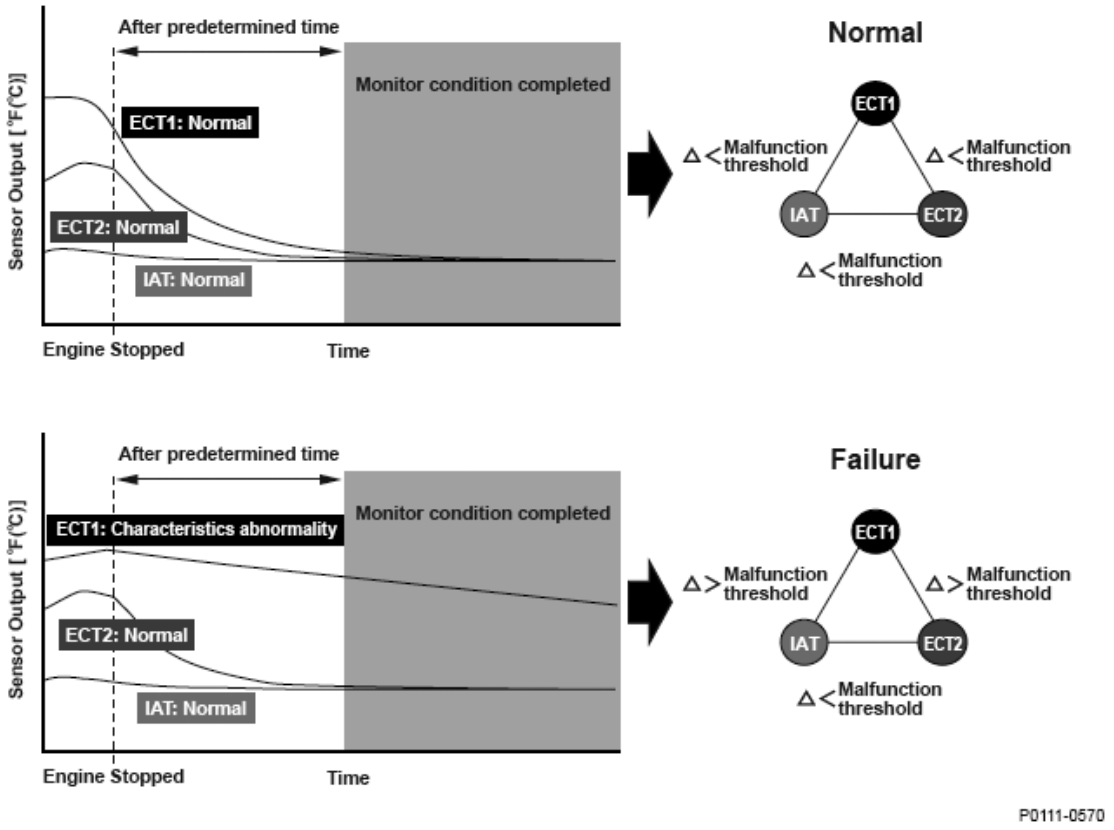

Fig. 7: Checking Continuity Between A/C Pressure Sensor 3P Terminal No. 2 And ECM/PCM A16
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 32.

NO - Repair open in the wire between the ECM/PCM (A16) and the A/C pressure sensor, then go to step 24.

18. Turn the ignition switch OFF.
19. Jump the SCS line with the HDS.
20. Disconnect ECM/PCM connector A (44P).
21. Check for continuity between A/C pressure sensor 3P connector terminal No. 3 and ECM/PCM connector terminal A9.

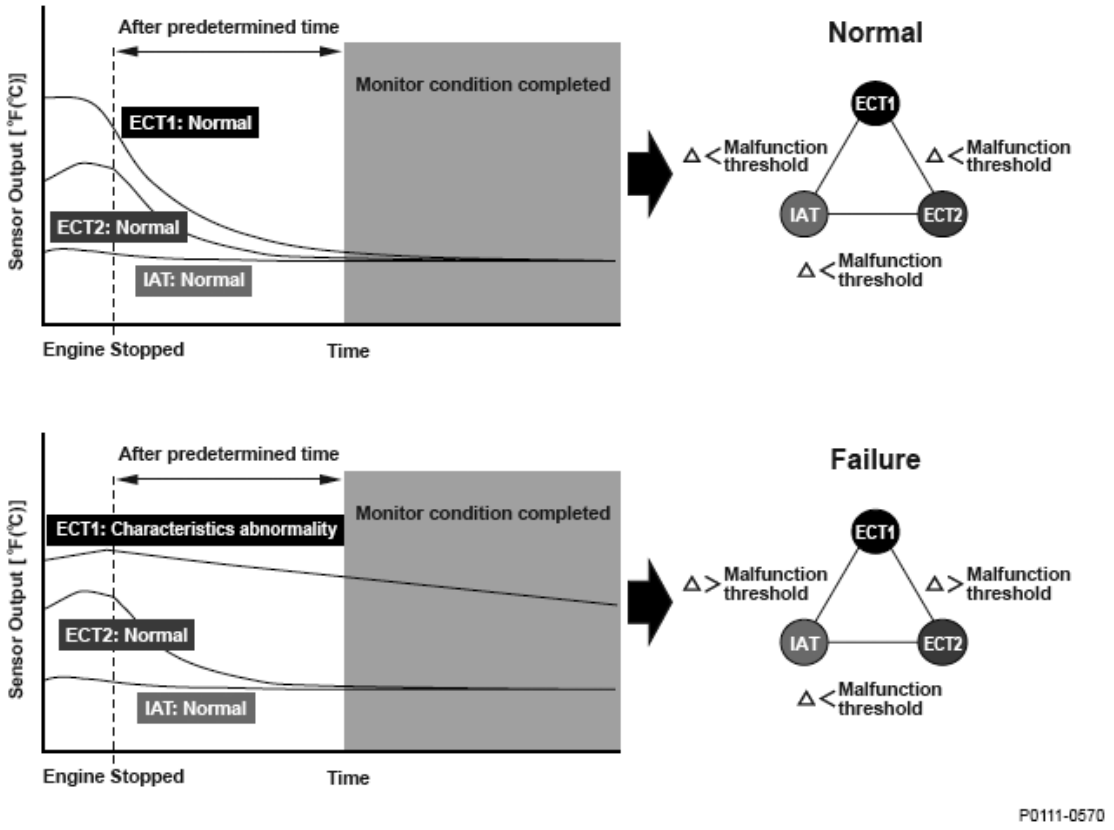

Fig. 8: Checking Continuity Between A/C Pressure Sensor 3P Terminal No. 3 And ECM/PCM Terminal A9
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 32.

NO - Repair open in the wire between the ECM/PCM (A9) and the A/C pressure sensor, then go to step 24.

22. Turn the ignition switch OFF.
23. Replace the A/C pressure sensor (see **A/C LINE REPLACEMENT**).
24. Reconnect all connectors.
25. Turn the ignition switch ON (II).
26. Reset the ECM/PCM with the HDS.
27. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
28. Start the engine, and let it idle.
29. Turn the blower switch on.
30. Turn the A/C switch on.
31. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0533 indicated?

YES - Check for poor connections or loose terminals at the A/C pressure sensor and the ECM/PCM.

then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

32. Reconnect all connectors.
33. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
34. Start the engine, and let it idle.
35. Turn the blower switch on.
36. Turn the A/C switch on.
37. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0533 indicated?

    YES - Check for poor connections or loose terminals at the A/C pressure sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 34. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

A/C SIGNAL CIRCUIT TROUBLESHOOTING

1. Start the engine, and let it idle.
2. Turn the blower switch on.
3. Turn the A/C switch on.
4. Check the A/C CLUTCH in the DATA LIST with the HDS.

   Does it indicate ON?

   YES - Go to step 5.

   NO - Do the A/C system test (see **A/C SYSTEM TEST**).

5. Check the A/C system.

   Does the A/C system operate?

   YES - The air conditioning system circuit is OK.

   NO - Go to step 6.

6. Turn the ignition switch OFF.
7. Turn the ignition switch ON (II).
8. Activate the A/C CLUTCH in the INSPECTION MENU with the HDS.

Is there a clicking noise from the A/C compressor clutch?

YES - Do the A/C system test (see **A/C SYSTEM TEST**).

NO - Go to step 9.

9. Turn the ignition switch OFF.
10. Jump the SCS line with the HDS.
11. Disconnect ECM/PCM connector A (44P).
12. Turn the ignition switch ON (II).
13. Momentarily connect ECM/PCM connector terminal A14 to body ground with a jumper wire several times.

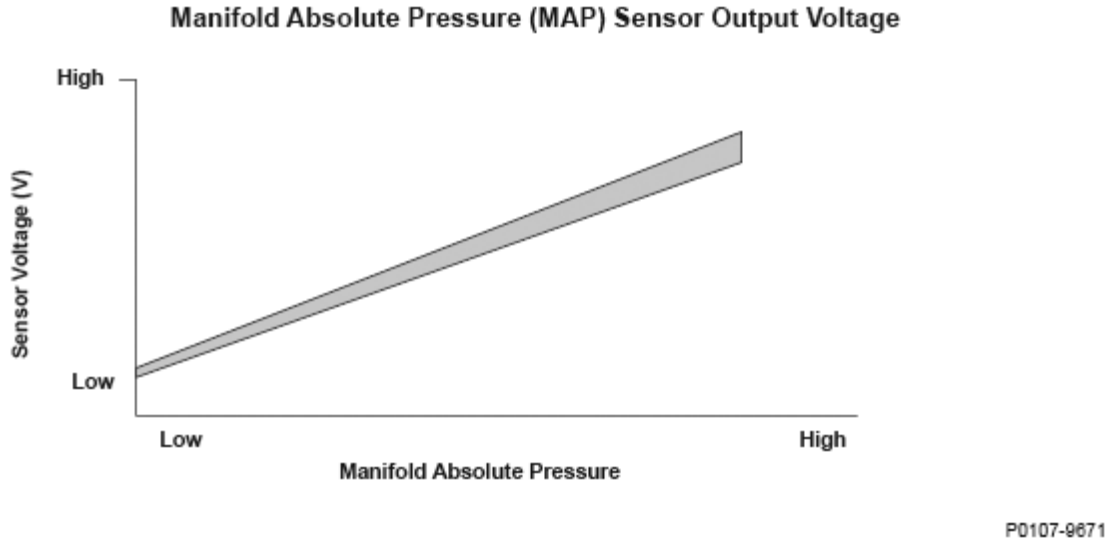

Fig. 9: Connecting ECM/PCM Connector Terminal A14 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there a clicking noise from the A/C compressor clutch?

YES - Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**).

NO - Check for poor connections or loose terminals at the A/C clutch relay and the ECM/PCM. If the connections are OK, check the A/C clutch relay (see **POWER RELAY TEST**), repair open in the wire between the ECM/PCM (A14) and the A/C clutch relay and the other A/C systems.

ALTERNATOR FR SIGNAL CIRCUIT TROUBLESHOOTING

1. Start the engine, and let it idle.
2. Monitor the ALTERNATOR in the DATA LIST with the HDS.
3. Check if the indicated percentage varies when the headlight switch is turned on.

Does the percentage vary?

YES - The alternator signal circuit is OK.

NO - Go to step 4.

4. Turn the headlight switch and ignition switch OFF.
5. Jump the SCS line with the HDS.
6. Disconnect the alternator 4P connector.
7. Disconnect ECM/PCM connector B (44P).
8. Check for continuity between body ground and ECM/PCM connector terminal B43.

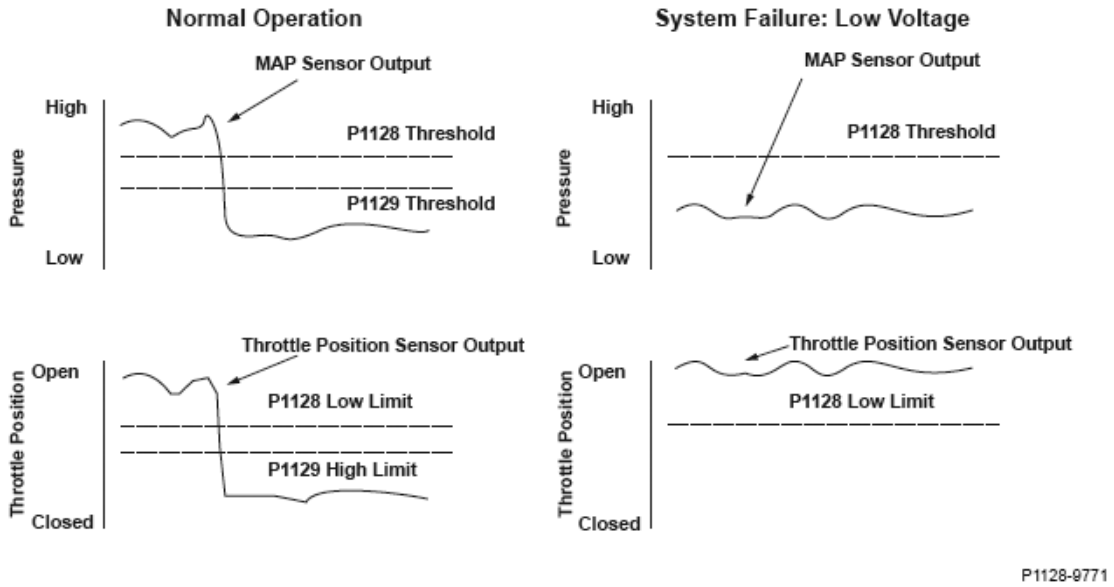

Fig. 10: Checking Continuity Between Body Ground And ECM/PCM Connector Terminal B43
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (B43) and the alternator.

NO - Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**).

PSP SWITCH SIGNAL CIRCUIT TROUBLESHOOTING

1. Start the engine, and let it idle.
2. Align the steering wheel straight ahead.
3. Check the PSP SWITCH in the DATA LIST with the HDS.

Does it indicate ON?

YES - Go to step 4.

NO - Go to step 14.

4. Turn the steering wheel to the full lock position.
5. Check the PSP SWITCH in the DATA LIST with the HDS.

Does it change to OFF?

YES - The PSP switch signal circuit is OK.

NO - Go to step 6.

6. Turn the ignition switch OFF.
7. Disconnect the PSP switch 2P connector.
8. Start the engine.
9. Check the PSP SWITCH in the DATA LIST with the HDS.

Does it change to OFF?

YES - Replace the PSP switch (see **COMPONENT LOCATION INDEX** .

NO - Go to step 10.

10. Turn the ignition switch OFF.
11. Jump the SCS line with the HDS.
12. Disconnect ECM/PCM connector A (44P).
13. Check for continuity between PSP switch 2P connector terminal No. 1 and body ground.

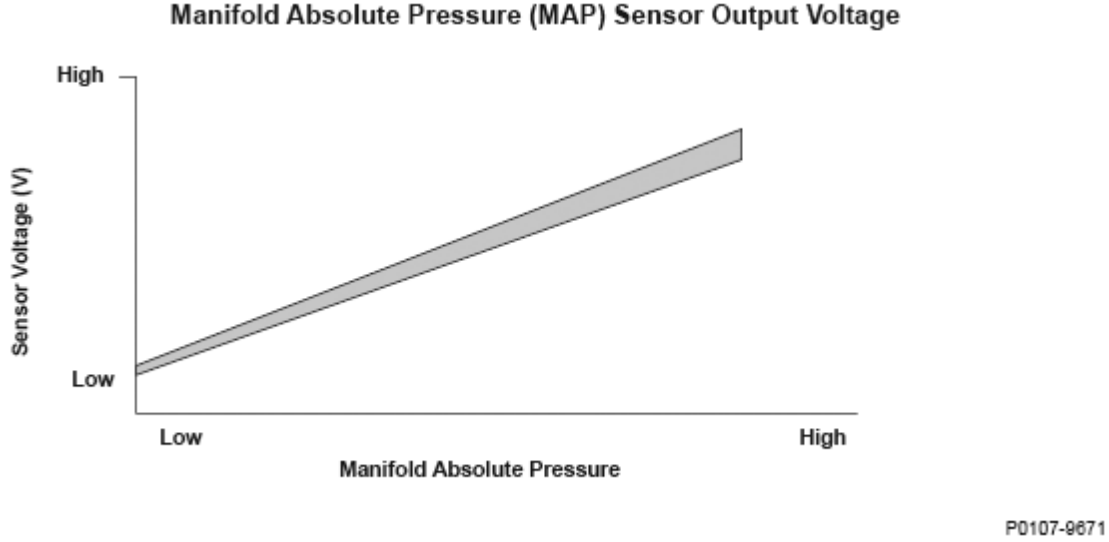

Fig. 11: Checking Continuity Between PSP Switch 2P Connector Terminal No. 1And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (A22) and the PSP switch.

NO - Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**).

14. Turn the ignition switch OFF.
15. Disconnect the PSP switch 2P connector.
16. Connect PSP switch 2P connector terminals No. 1 and No. 2 with a jumper wire, then start the engine.

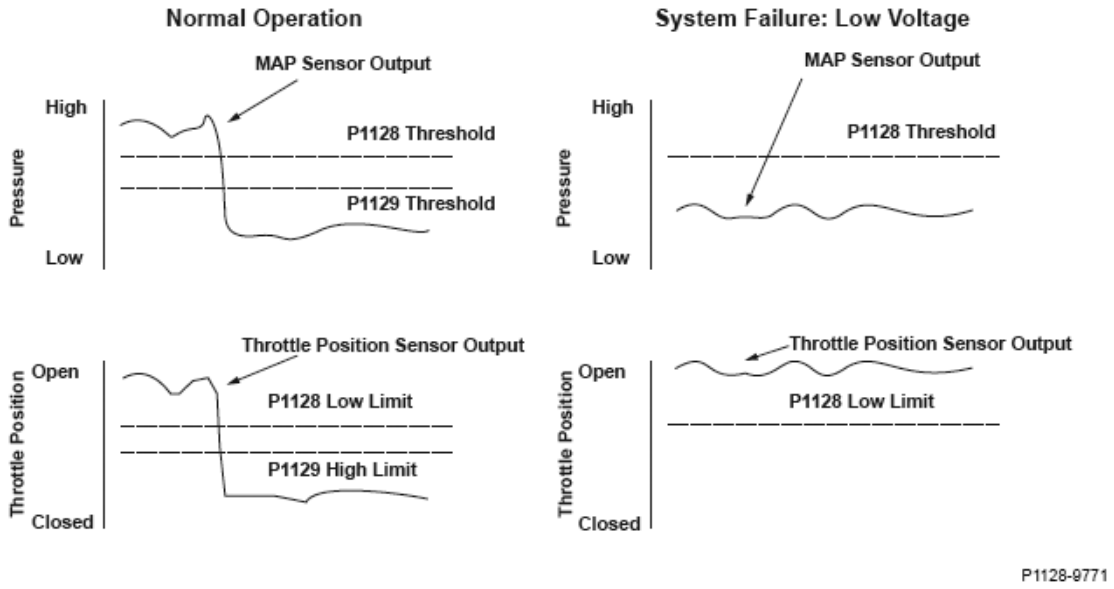

Fig. 12: Connecting PSP Switch 2P Connector Terminals No. 1 And 2 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Check the PSP SWITCH in the DATA LIST with the HDS.

Does it change to ON?

YES - Replace the PSP switch (see **POWER STEERING HOSE, LINE, AND PRESSURE SWITCH REPLACEMENT**).

NO - Go to step 18.

18. Turn the ignition switch OFF.
19. Remove the jumper wire from the PSP switch 2P connector.
20. Jump the SCS line with the HDS.
21. Disconnect ECM/PCM connector A (44P).
22. Connect PSP switch 2P connector terminal No. 1 to body ground with a jumper wire.

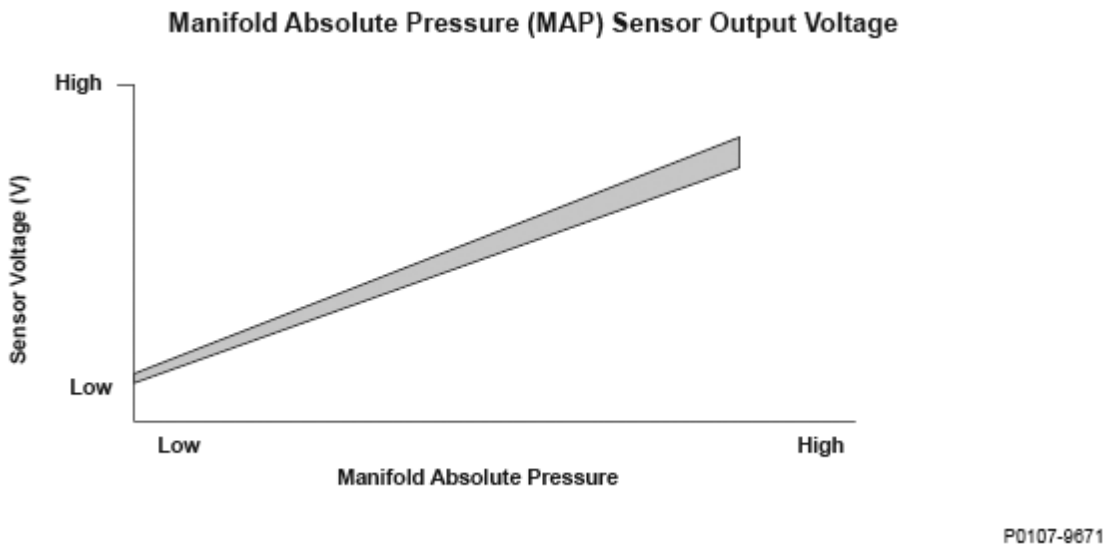

Fig. 13: Connecting PSP Switch 2P Connector Terminal No. 1 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

23. Check for continuity between body ground and ECM/PCM connector terminal A22.

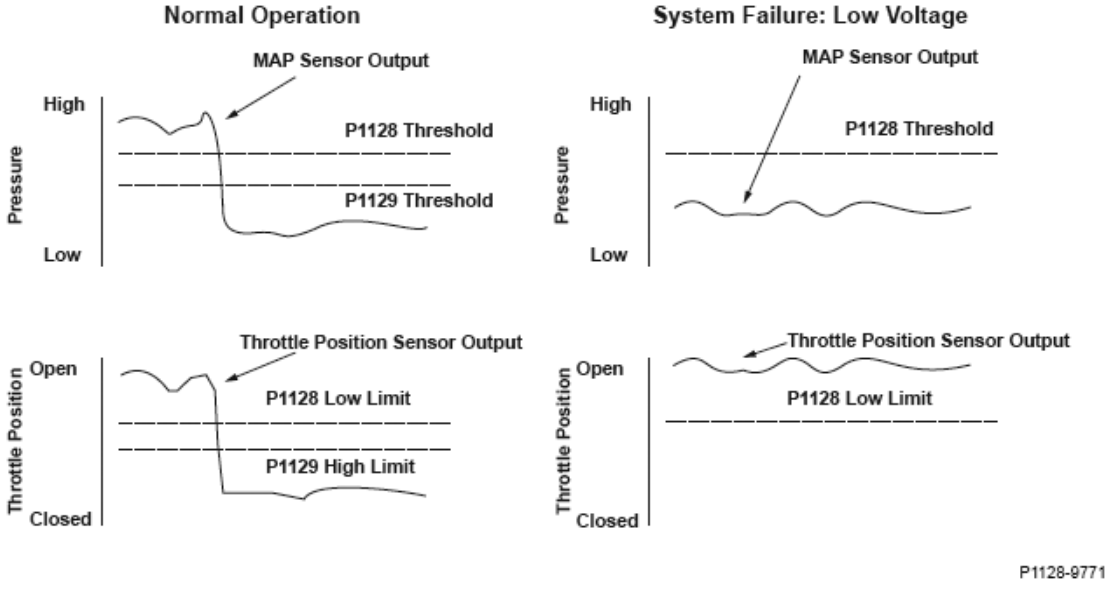

Fig. 14: Checking Continuity Between Body Ground And ECM/PCM Connector Terminal A22
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 24.

NO - Repair open in the wire between the PSP switch and the ECM/PCM (A22).

24. Check for continuity between PSP switch 2P connector terminal No. 2 and body ground.

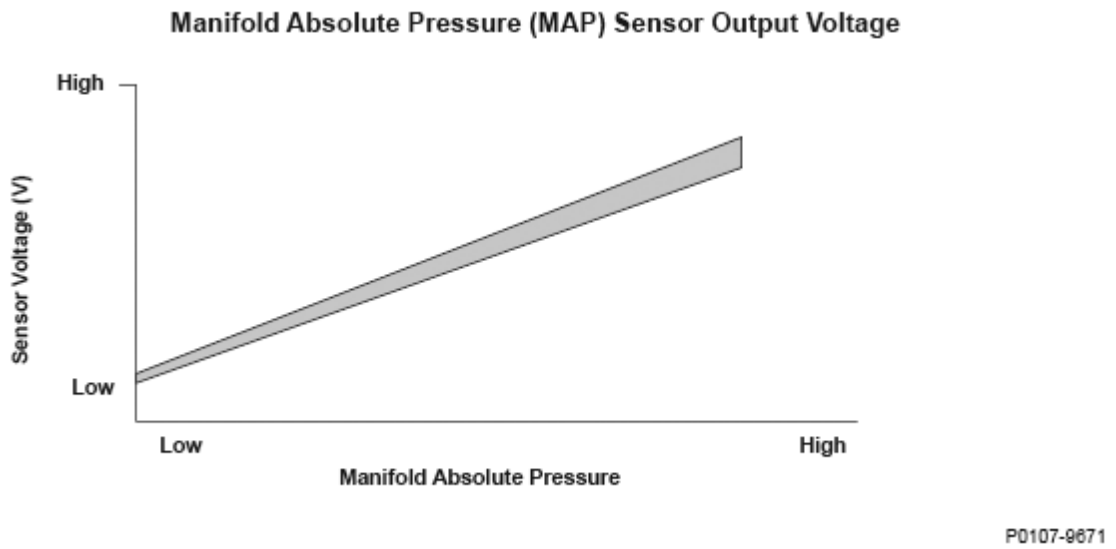

Fig. 15: Checking Continuity Between PSP Switch 2P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**).

NO - Repair open in the wire between the PSP switch and G401 (see **CONNECTOR TO HARNESS INDEX**).

BRAKE PEDAL POSITION SWITCH SIGNAL CIRCUIT TROUBLESHOOTING

1. Turn the ignition switch ON (II).
2. Check the BRAKE SWITCH in the DATA LIST with the HDS.

   Does it indicate OFF?

   YES - Go to step 3.

   NO - Inspect the brake pedal position switch (see **BRAKE PEDAL AND BRAKE PEDAL POSITION SWITCH ADJUSTMENT**).

3. Press the brake pedal, and check the BRAKE SWITCH in the DATA LIST with the HDS.

   Does it change to ON?

   YES - The brake pedal position switch signal circuit (BKSW line) is OK.

   NO - Go to step 4.

4. Turn the ignition switch OFF.
5. Jump the SCS line with the HDS.
6. Disconnect the brake pedal position switch 4P connector.
7. Disconnect ECM/PCM connector A (44P).
8. Check for continuity between ECM/PCM connector terminal A40 and body ground.

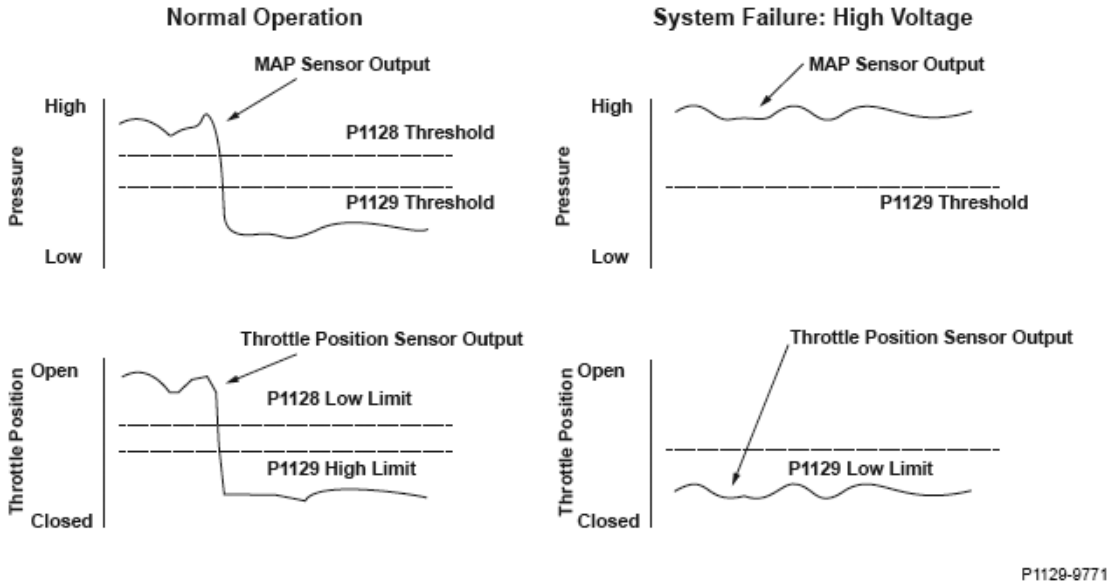

Fig. 16: Checking Continuity Between ECM/PCM Connector Terminal A40 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (A40) and the No. 12 HORN, STOP (15 A) fuse. Replace the No. 12 HORN, STOP (15 A) fuse.

NO - Go to step 9.

9. Connect brake pedal position switch 4P connector terminal No. 2 to body ground with a jumper wire.

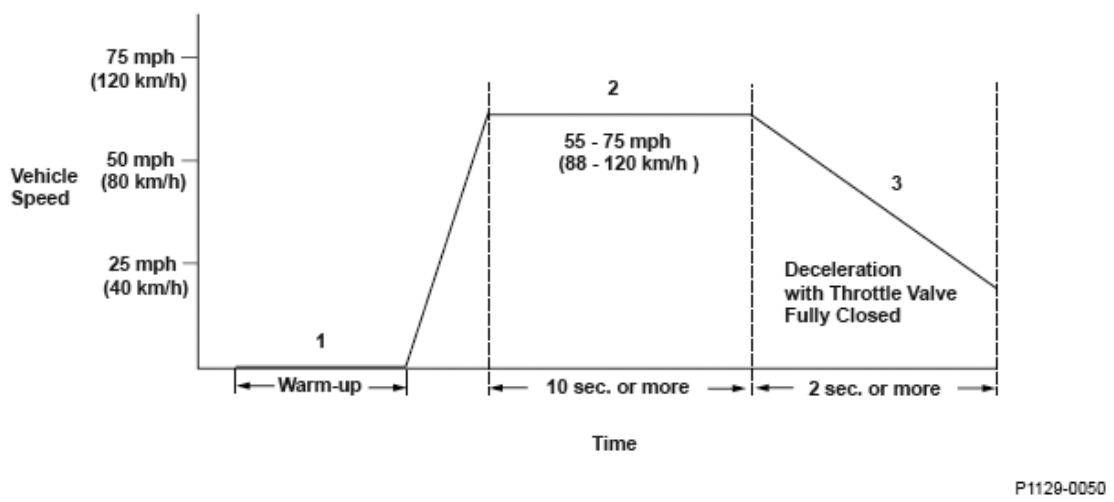

Fig. 17: Connecting Brake Pedal Position Switch 4P Connector Terminal No. 2 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Check for continuity between ECM/PCM connector terminal A40 and body ground.

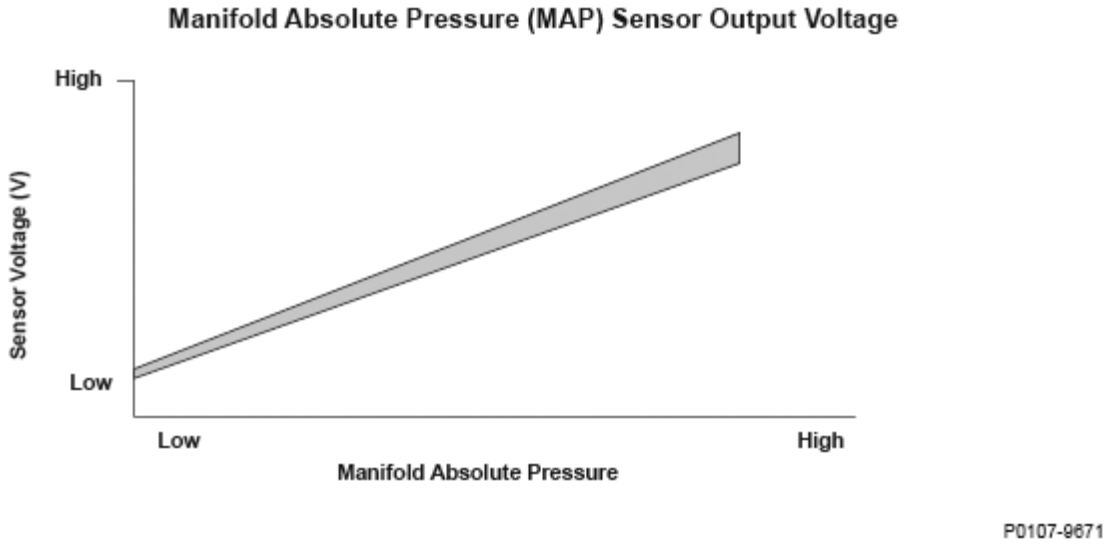

Fig. 18: Checking Continuity Between ECM/PCM Connector Terminal A40 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair open in the wire between the brake pedal position switch and the No. 12 HORN, STOP (15 A) fuse. Inspect the brake pedal position switch (see **BRAKE PEDAL AND BRAKE PEDAL POSITION SWITCH ADJUSTMENT**).

NO - Repair open in the wire between the ECM/PCM (A40) and the brake pedal position switch.

IDLE SPEED INSPECTION

NOTE:

- **Before checking the idle speed, check these items:**
  - **The malfunction indicator lamp (MIL) has not been reported on, and there are no DTCs.**
  - **Ignition timing**
  - **Spark plugs**
  - **Air cleaner**
  - **PCV system**
- **Apply the parking brake, and make sure the headlights are off.**

1. Disconnect the evaporative emission (EVAP) canister purge valve connector.
2. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

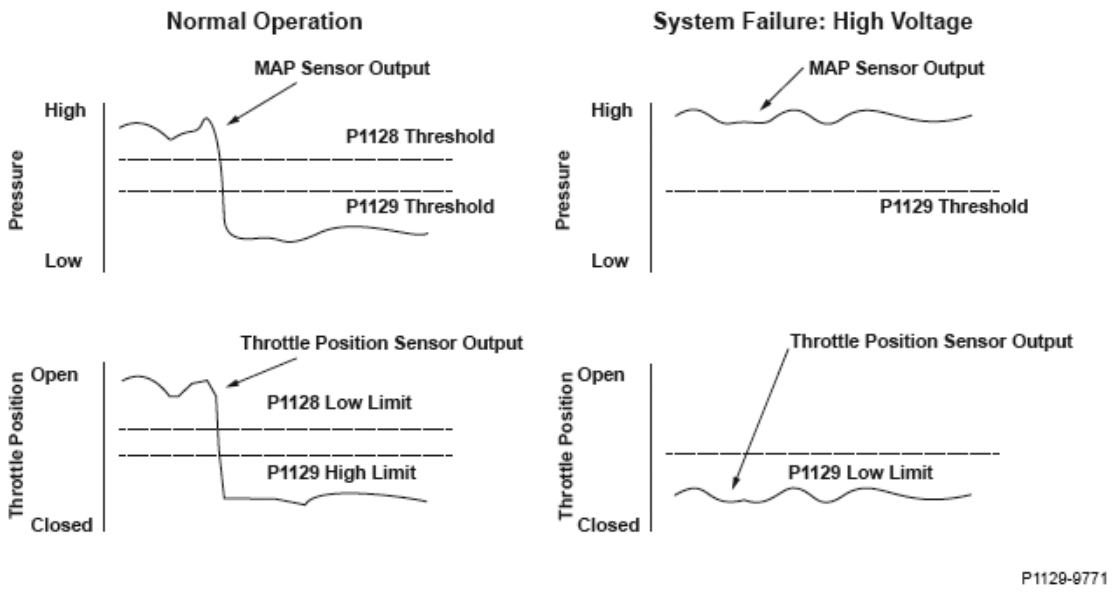

Fig. 19: Connecting HDS To DLC
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Make sure the HDS communicates with the ECM/PCM and other vehicle systems. If it doesn't, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
5. Check the idle speed without load conditions: headlights, blower fan, radiator fan, and air conditioner off.

Idle speed should be:

IDLE SPEED SPECIFICATION FOR USA MODELS

M/T	670±50 rpm
A/T	670±50 rpm (in Park or neutral)

IDLE SPEED SPECIFICATION FOR ALL MODELS EXCEPT USA

M/T	750±50 rpm
A/T	750±50 rpm (in Park or neutral)

6. Let the engine idle for 1 minute with high electric load (A/C switch on, temperature set to max cool, blower fan on high, and headlights on high beam).

Idle speed should be:

IDLE SPEED SPECIFICATION FOR USA MODELS

M/T	710±50 rpm
A/T	710±50 rpm (in Park or neutral)

IDLE SPEED SPECIFICATION FOR ALL MODELS EXCEPT USA

M/T	750±50 rpm

A/T	750±50 rpm (in Park or neutral)

NOTE: If the idle speed is not within specification, do the ECM/PCM idle learn procedure (see ECM/PCM IDLE LEARN PROCEDURE). If the idle speed is still not within specification, go to symptom troubleshooting.

7. Reconnect the EVAP canister purge valve connector.

ECM/PCM IDLE LEARN PROCEDURE

The idle learn procedure must be done so the ECM/PCM can learn the engine idle characteristics.

Do the idle learn procedure whenever you do any of these actions:

- Replace ECM/PCM.
- Reset ECM/PCM.
- Update ECM/PCM.
- Replace or clean the throttle body.

NOTE: Erasing DTCs with the HDS does not require you to do the idle learn procedure.

PROCEDURE

1. Make sure all electrical items (A/C, audio, lights, etc.) are off.
2. Reset the ECM/PCM with the HDS.
3. Turn the ignition switch ON (II), and wait 2 seconds.
4. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, or until the engine coolant temperature reaches 194°F (90°C).
5. Let the engine idle for about 5 minutes with the throttle fully closed.

NOTE: If the radiator fan comes on, do not include its running time in the 5 minutes.

6. Verify on the HDS data list that the idle learn procedure is complete.

2006-08 ENGINE PERFORMANCE

Intake Air System (K20Z3) - Civic (All Except Si)

THROTTLE BODY TEST

CARBON ACCUMULATION CHECK

NOTE: If the malfunction indicator lamp (MIL) has been reported on, check for diagnostic trouble codes (DTCs).

1. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

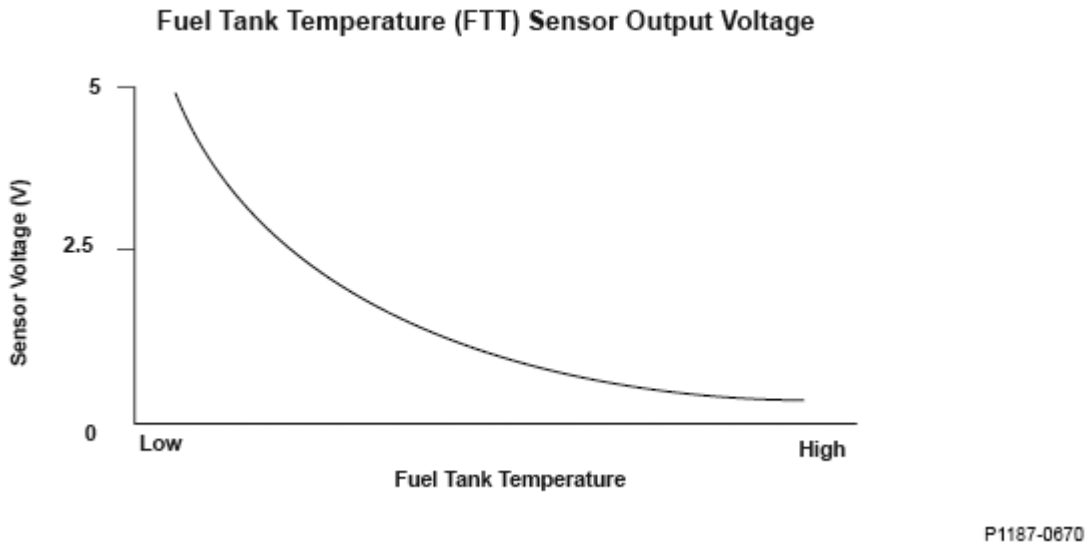

Fig. 1: Identifying Data Link Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch ON (II).
3. Make sure the HDS communicates with the ECM and other vehicle systems. If it doesn't, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
5. Check the REL TP SENSOR in the DATA LIST with the HDS. The reading should be below 2.46 deg. If it is not, clean the throttle body (see **THROTTLE BODY CLEANING**).

THROTTLE POSITION LEARNING CHECK

NOTE: If the malfunction indicator lamp (MIL) has been reported on, check for diagnostic trouble codes (DTCs).

1. Connect the HDS to the data link connector (DLC)

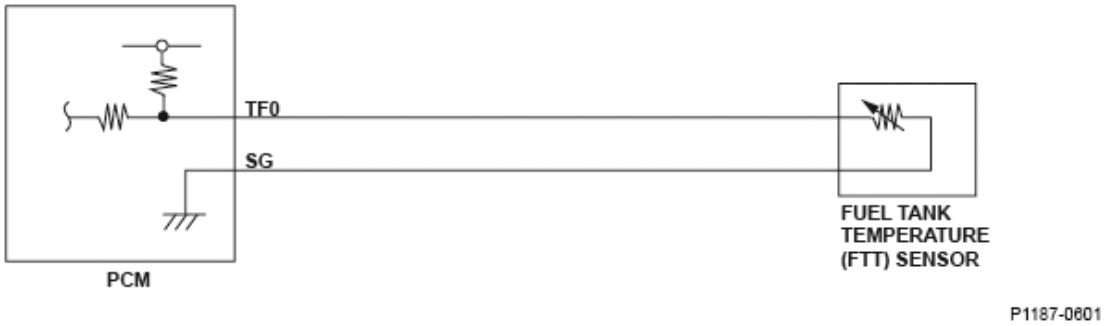

Fig. 2: Identifying Data Link Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch ON (II).
3. Make sure the HDS communicates with the ECM and other vehicle systems. If it doesn't, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Select the INSPECTION MENU with the HDS.
5. Do the TP POSITION CHECK in the ETCS TEST. If needed, clean the throttle body (see **THROTTLE BODY CLEANING**).

THROTTLE BODY CLEANING

CAUTION: Do not insert your fingers into the installed throttle body when you turn the ignition switch ON (II) or while the ignition switch is ON (II). If you do, you will seriously injure your fingers if the throttle valve is activated.

1. Check for damage to the air cleaner. If the air cleaner is damaged, replace it (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**).
2. Remove the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
3. Clean off the carbon from the throttle valve and inside the throttle body with a paper towel soaked in throttle plate and induction cleaner.

NOTE:
- **Remove the throttle body to clean it.**
- **Be careful not to pinch your fingers.**
- **To avoid removing the molybdenum coating, do not clean the bearing area of the throttle shaft (A).**
- **Do not spray throttle plate and induction cleaner directly on the throttle body.**
- **Use Honda genuine throttle plate and induction cleaner.**

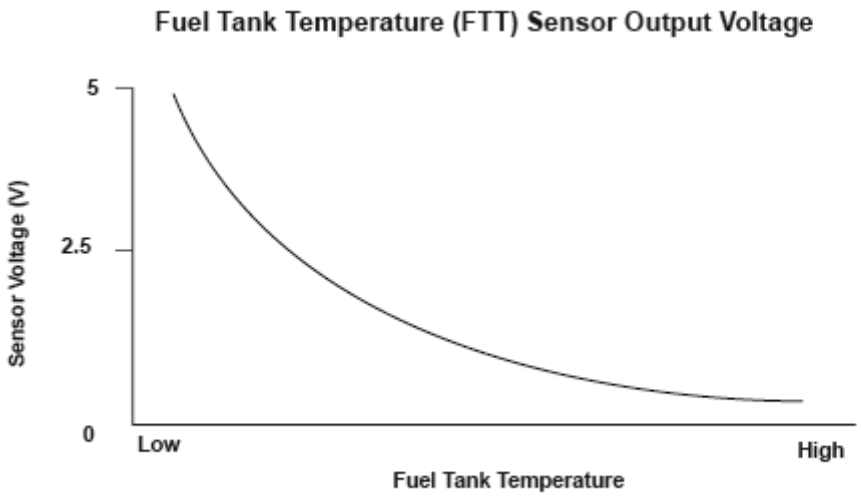

Fig. 3: Identifying Throttle Shaft Bearing Area
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
5. Reset the ECM with the HDS (see **HDS CLEAR COMMAND**).
6. Turn the ignition switch ON (II), and wait for 2 seconds.
7. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).

INTAKE AIR BYPASS CONTROL THERMAL VALVE TEST

Special Tools Required

Vacuum pump/gauge, 0-30 in.Hg, Snap-on YA4000A or equivalent, commercially available

1. Start the engine, and let it idle.

NOTE: Engine coolant temperature must be below 149°F (65°C).

2. Remove the intake manifold cover .
3. Remove the vacuum hose (A) from the air intake duct, and connect a vacuum pump/gauge, 0-30 in.Hg, to the hose.

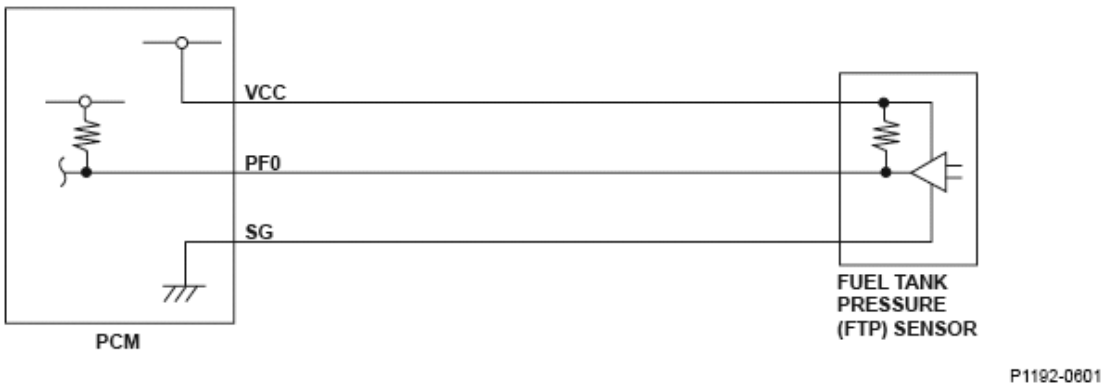

Fig. 4: Identifying Vacuum Hose
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Raise and lower the engine speed, and make sure the vacuum gauge reading changes as the engine speed changes.

   If the vacuum reading does not change, check for these problems:

   - Misrouted, leaking, broken, or clogged intake air bypass control system vacuum lines.
   - A cracked or damaged intake air bypass control thermal valve. Replace the valve if needed (see **INTAKE AIR BYPASS CONTROL THERMAL VALVE REPLACEMENT**).
5. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
6. Raise and lower the engine speed, and make sure the vacuum gauge reading does not change as the rpm changes.

   If the vacuum reading changes, check for these problems:

   - Misrouted, leaking, broken, or clogged intake air bypass control system vacuum lines.
   - A cracked or damaged intake air bypass control thermal valve. Replace the valve if needed (see **INTAKE AIR BYPASS CONTROL THERMAL VALVE REPLACEMENT**).

AIR CLEANER REMOVAL/INSTALLATION

1. Disconnect the MAF sensor/IAT sensor connector (A).

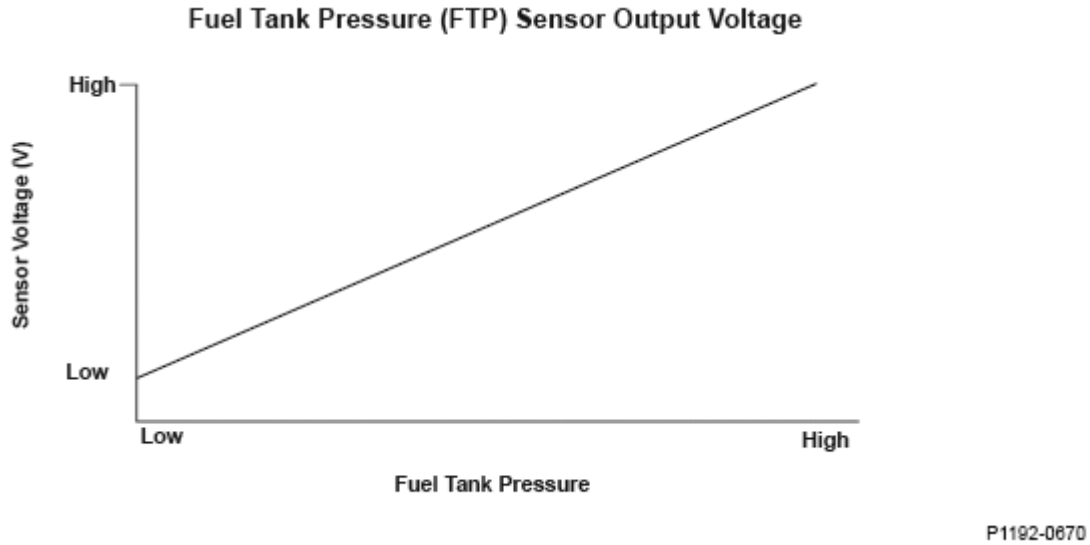

Fig. 5: Identifying MAF Sensor/IAT Sensor Connector And Air Cleaner
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the bolts (B), then remove the air cleaner (C).
3. Install the parts in the reverse order of removal.

AIR CLEANER ELEMENT INSPECTION/REPLACEMENT

1. Open the air cleaner housing cover (A).

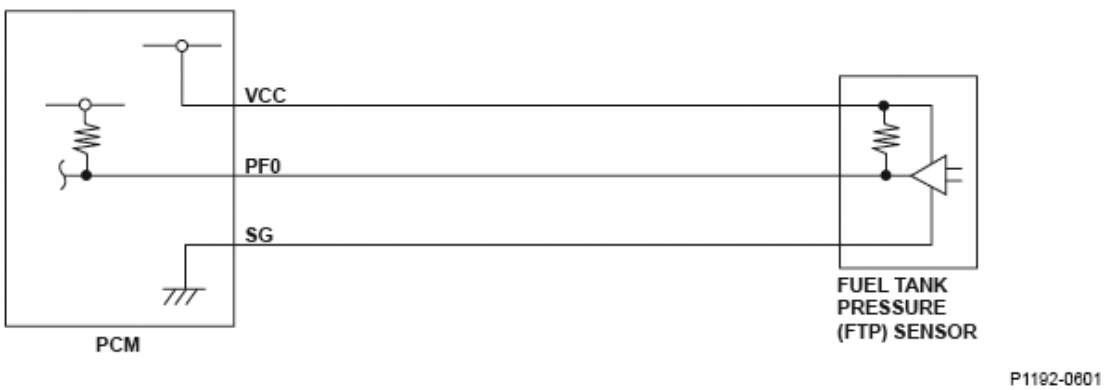

Fig. 6: Identifying Air Cleaner Housing Cover, Air Cleaner Element And Air Cleaner Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the air cleaner element (B) from the air cleaner housing (C).
3. Check the air cleaner element for damage or clogging. If there is damage or clogging, replace the air cleaner element.

NOTE: Do not use compressed air to clean the air cleaner element.

4. Install the parts in the reverse order of removal. Clean and remove any debris from inside the air cleaner housing.
5. If the maintenance minder required to replace the air cleaner element, reset the maintenance minder

(see **MAINTENANCE MINDER**).

- If you did not replace the air cleaner element, this procedure is complete.
- If the maintenance minder required air cleaner element replacement, reset the maintenance minder. (see**MAINTENANCE MINDER**).
- If you replaced the air cleaner element, reset the ECM with the HDS, and do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).

INTAKE AIR RESONATOR REMOVAL/INSTALLATION

1. Make sure you have the anti-theft code for the audio system and the navigation system (if equipped).
2. Remove the front bumper (see **FRONT BUMPER REMOVAL/INSTALLATION**).
3. Remove the bolt (A), and pipe (B).

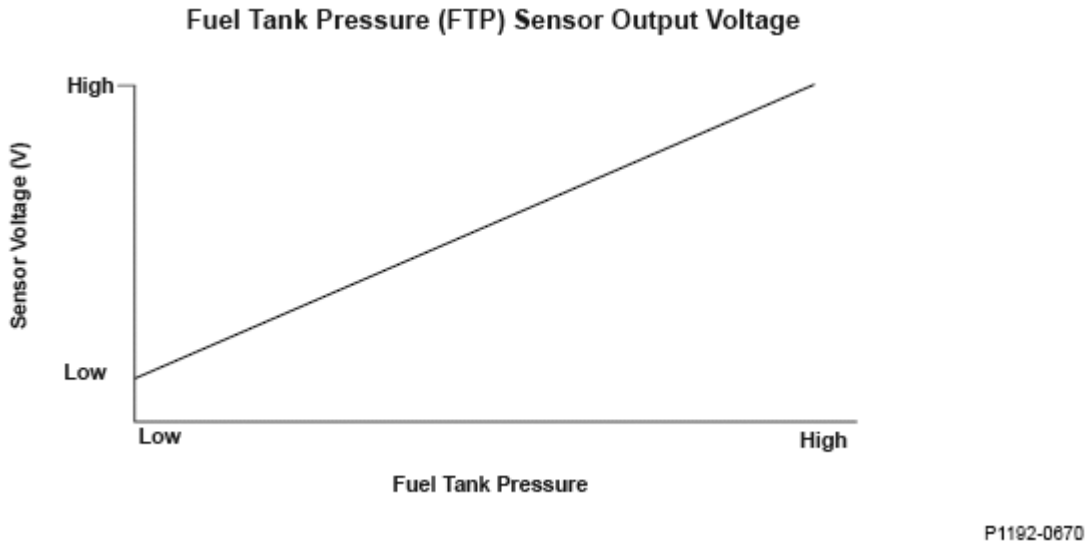

Fig. 7: Identifying Pipe, Duct And Resonator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the resonator (C).
5. Remove the battery.
6. Remove the bolt (D), and duct (E).
7. Install the parts in the reverse order of removal.
8. Reinstall the battery, and do these items:
   - Enter the anti-theft code for the audio system and the navigation system (if equipped).
   - Set the clock (if needed).

THROTTLE BODY REMOVAL/INSTALLATION

CAUTION: Do not insert your fingers into the installed throttle body when you turn the ignition switch ON (II) or while the ignition switch is ON (II). If you do, there will be serious injury to your fingers if the throttle valve is activated.

NOTE: If you are replacing or cleaning the throttle body, start at step 1. If you are removing the throttle body, start at step 5.

1. Connect the HDS to the DLC while the engine is stopped.
2. USA, Canada models: Select the INSPECTION MENU on the HDS.
3. USA, Canada models: Do the TP POSITION CHECK in the ETCS TEST.
4. Turn the ignition switch OFF.
5. Remove the air intake duct (A).

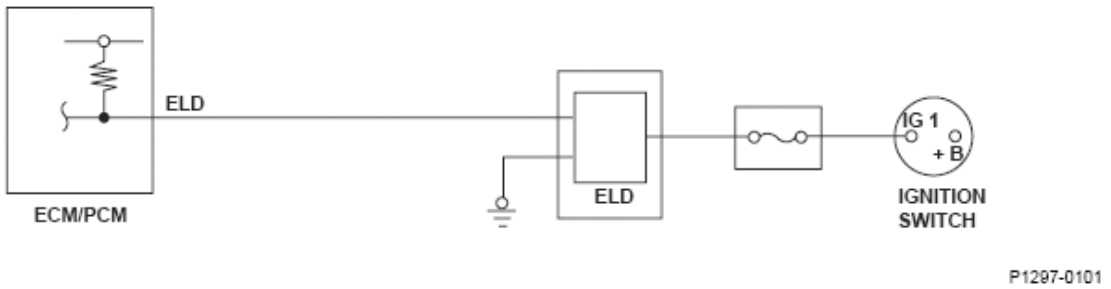

Fig. 8: Identifying Air Intake Duct, Throttle Body And Water Bypass/Vacuum Hoses (With Torque Specification)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Disconnect the throttle body connector (B).
7. Disconnect the water bypass hoses (C), and plug them.
8. Disconnect the vacuum hoses (D) and the clamp (E).
9. Remove the throttle body (F).
10. Install the parts in the reverse order of removal with a new gasket (G), then do this:
    - Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
    - Refill the radiator with engine coolant (see **COOLANT CHECK**).

THROTTLE BODY DISASSEMBLY/REASSEMBLY

INTAKE AIR BYPASS CONTROL THERMAL VALVE REPLACEMENT

1. Remove the engine cover .

2. Remove the air intake duct (A).

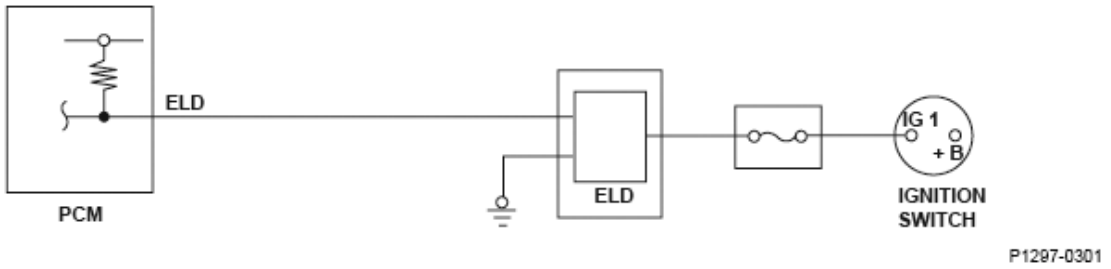

Fig. 10: Identifying Air Intake Duct And Intake Air Bypass Control Thermal Valve (With Torque Specification)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Disconnect the hoses (B).
4. Remove the intake air bypass control thermal valve (C).
5. Install the parts in the reverse order of removal.

NOTE:

- **Position the valve angle as shown.**
- **Make sure the center of the clamp (D) and its lever end (E) are within the ranges shown.**

DTC TROUBLESHOOTING

DTC P1077: IMT VALVE STUCK IN HIGH RPM POSITION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Do the IMT TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the IMT actuator and the ECM/PCM.

   NO - Go to step 4.

4. Turn the ignition switch OFF.
5. Disconnect the IMT actuator 5P connector.
6. Turn the ignition switch ON (II).
7. Measure voltage between IMT actuator 5P connector terminal No. 1 and body ground.

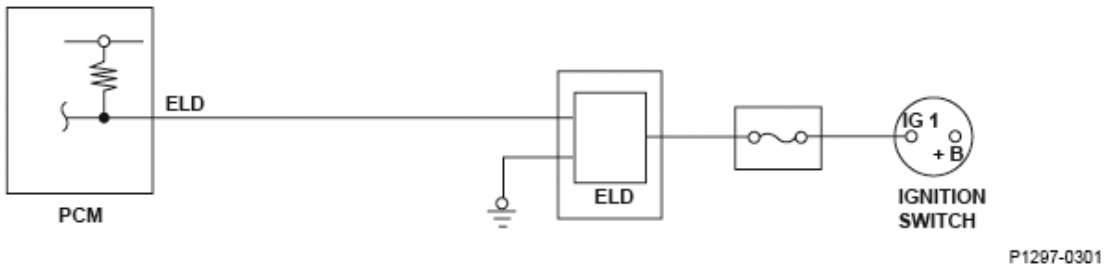

Fig. 2: Measuring Voltage Between IMT Actuator 5P Connector Terminal No 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 12.

NO - Go to step 8.

8. Turn the ignition switch OFF.
9. Jump the SCS line with the HDS.
10. Disconnect ECM/PCM connector B (44P).
11. Check for continuity between IMT actuator 5P connector terminal No. 1 and ECM/PCM connector terminal B18.

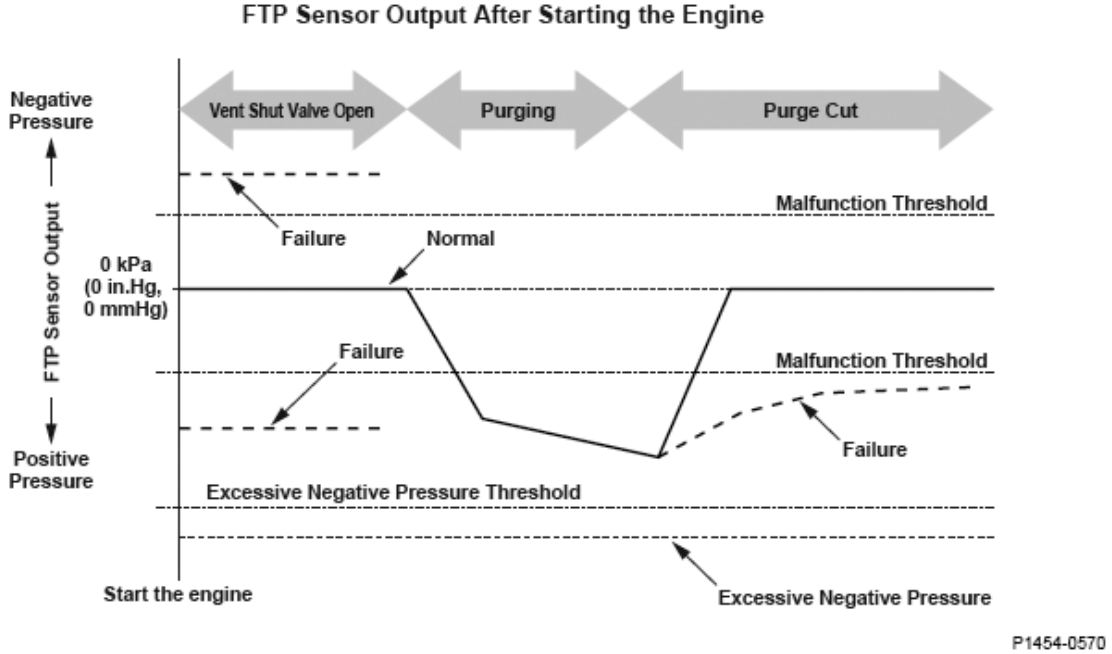

Fig. 3: Checking Continuity Between IMT Actuator 5P Connector Terminal No. 1 And ECM/PCM Terminal B18
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 36.

NO - Repair open in the wire between the ECM/PCM (B18) and the IMT actuator, then go to step 30.

12. Measure voltage between IMT actuator 5P connector terminal No. 3 and body ground.

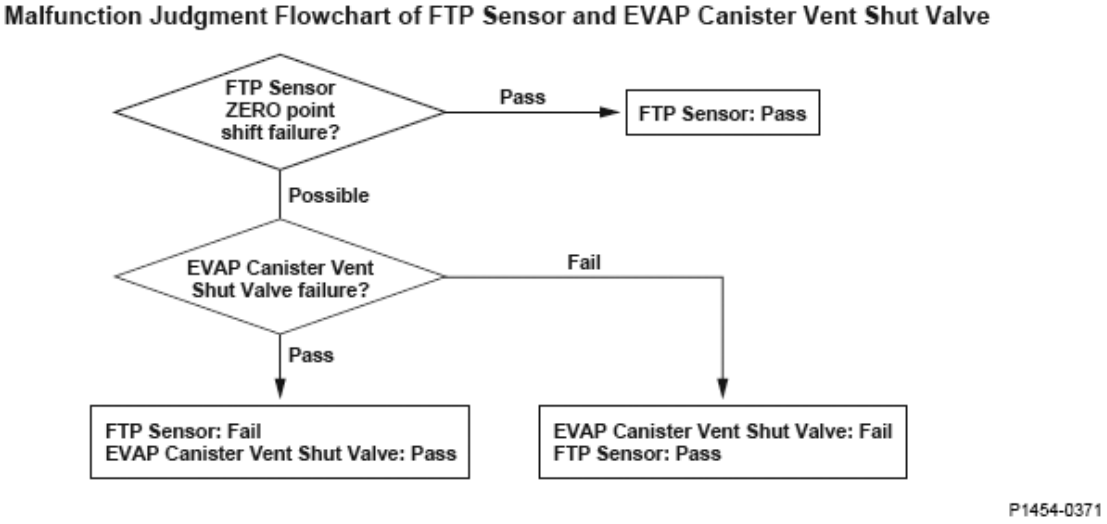

Fig. 4: Measuring Voltage Between IMT Actuator 5P Connector Terminal No 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 17.

NO - Go to step 13.

13. Turn the ignition switch OFF.
14. Jump the SCS line with the HDS.
15. Disconnect ECM/PCM connector B (44P).
16. Check for continuity between IMT actuator 5P connector terminal No. 3 and ECM/PCM connector terminal B39.

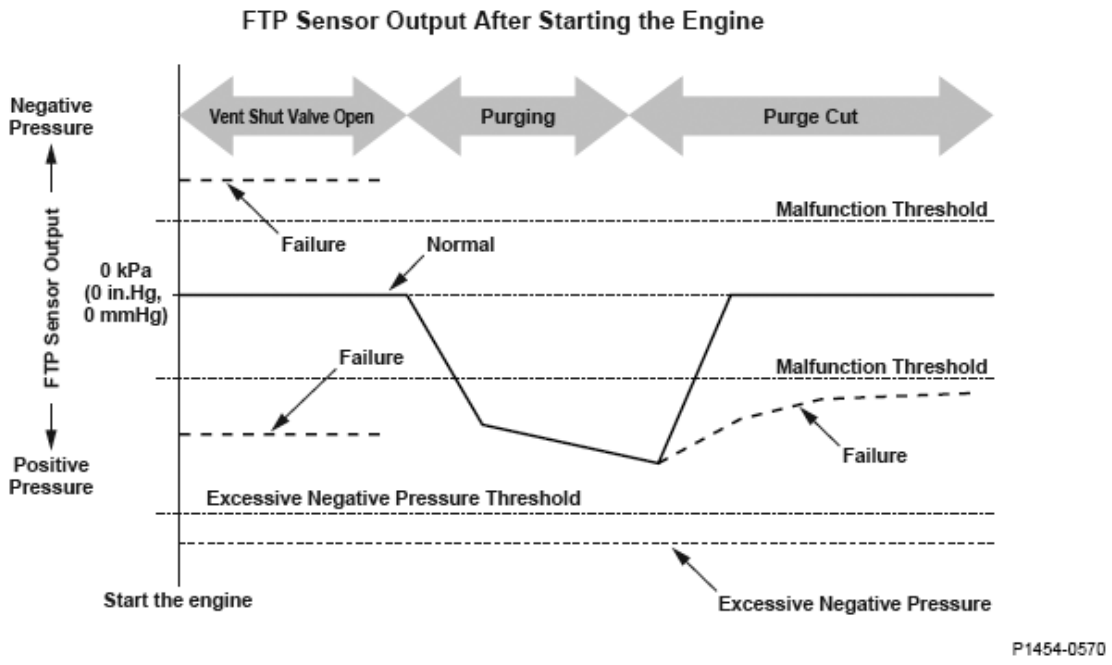

Fig. 5: Checking Continuity Between IMT Actuator 5P Connector Terminal No. 3 And ECM/PCM Terminal B39
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 36.

NO - Repair open in the wire between the ECM/PCM (B39) and the IMT actuator, then go to step 30.

17. Turn the ignition switch OFF.
18. Jump the SCS line with the HDS.
19. Disconnect ECM/PCM connector B (44P).
20. Check for continuity between IMT actuator 5P connector terminal No. 2 and ECM/PCM connector terminal B33.

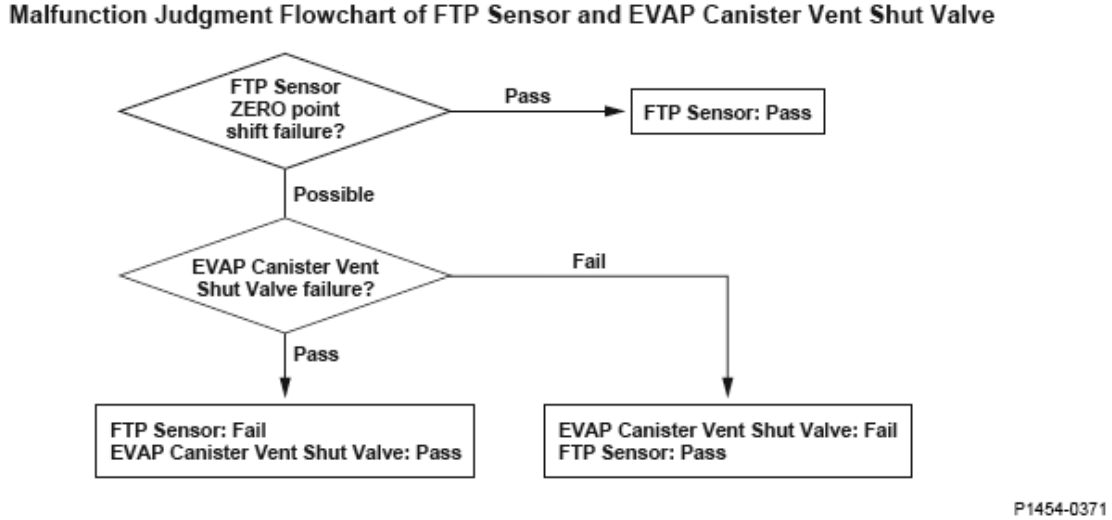

Fig. 6: Checking Continuity Between IMT Actuator 5P Connector Terminal No. 2 And ECM/PCM Terminal B33
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 21.

NO - Repair open in the wire between the ECM/PCM (B33) and the IMT actuator, then go to step 30.

21. Check for continuity between ECM/PCM connector terminal B37 and body ground.

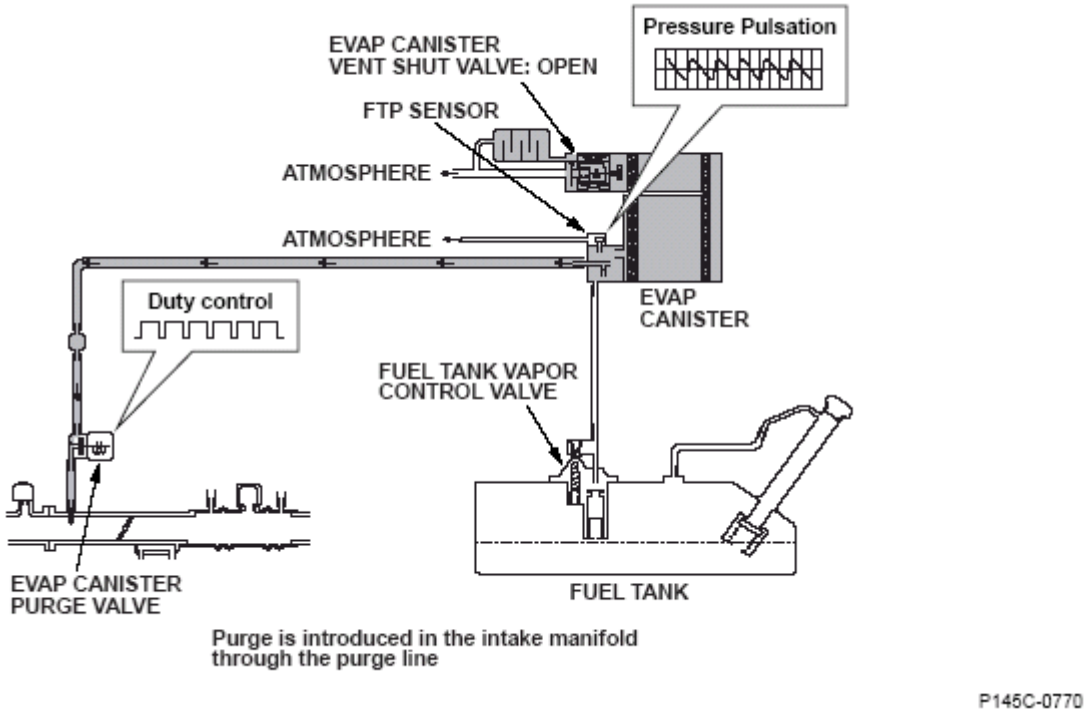

Fig. 7: Checking Continuity Between ECM/PCM Connector Terminal B37 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (B37) and the IMT actuator, then go to step 30.

NO - Go to step 22.

22. Check for continuity between ECM/PCM connector terminal B38 and body ground.

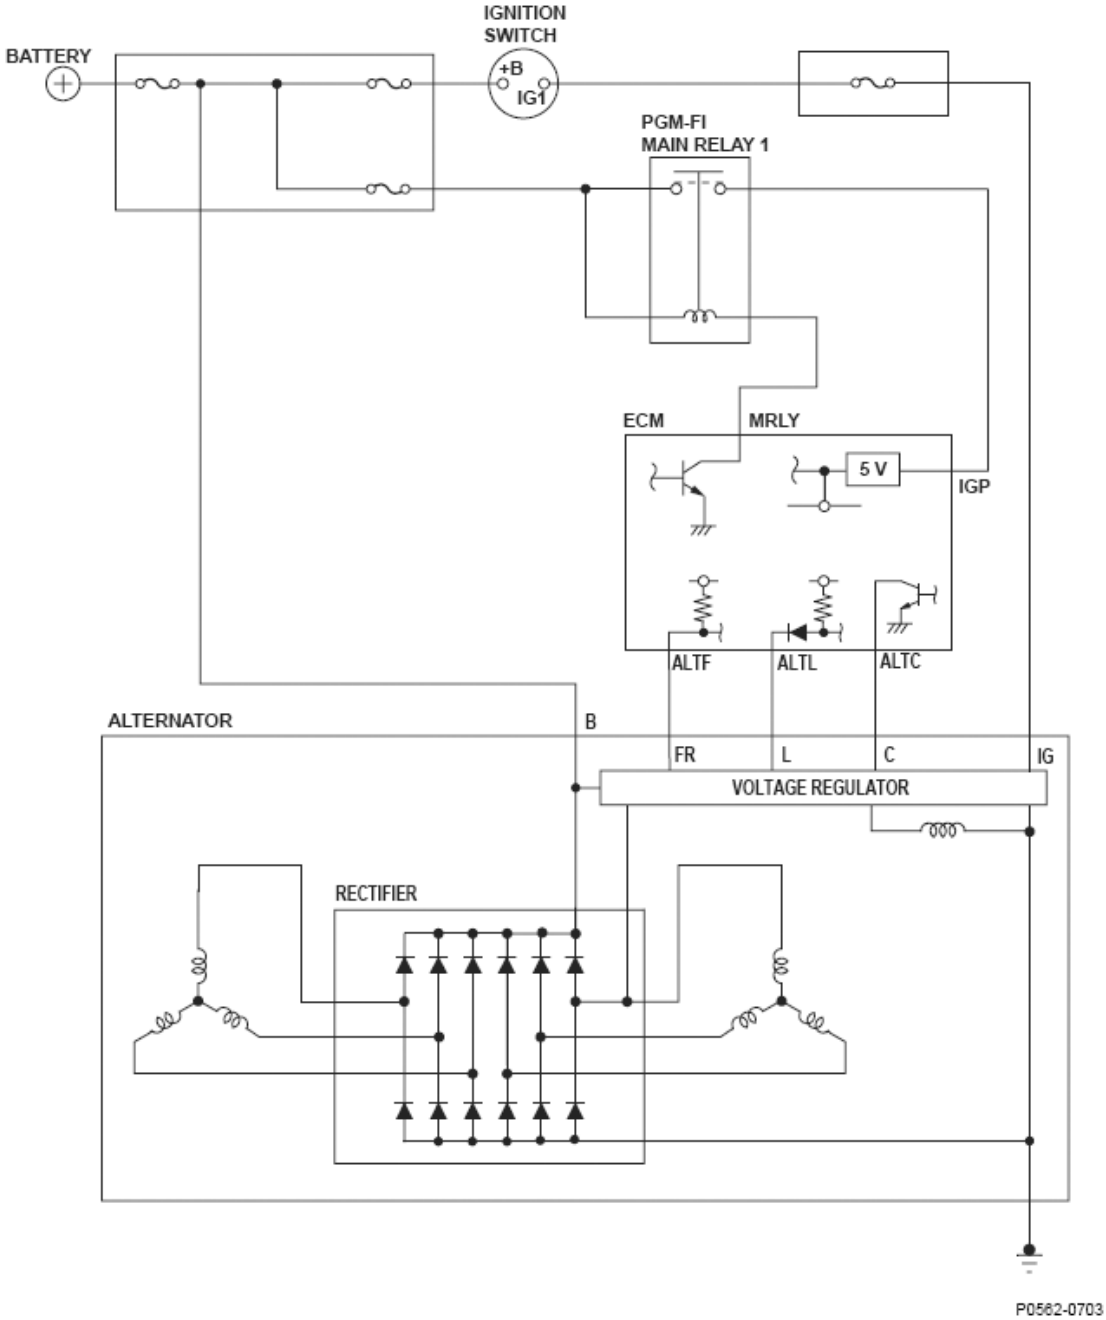

Fig. 8: Checking Continuity Between ECM/PCM Connector Terminal B38 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (B38) and the IMT actuator, then go to step 30.

NO - Go to step 23.

23. Check for continuity between IMT actuator 5P connector terminal No. 4 and ECM/PCM connector terminal B37.

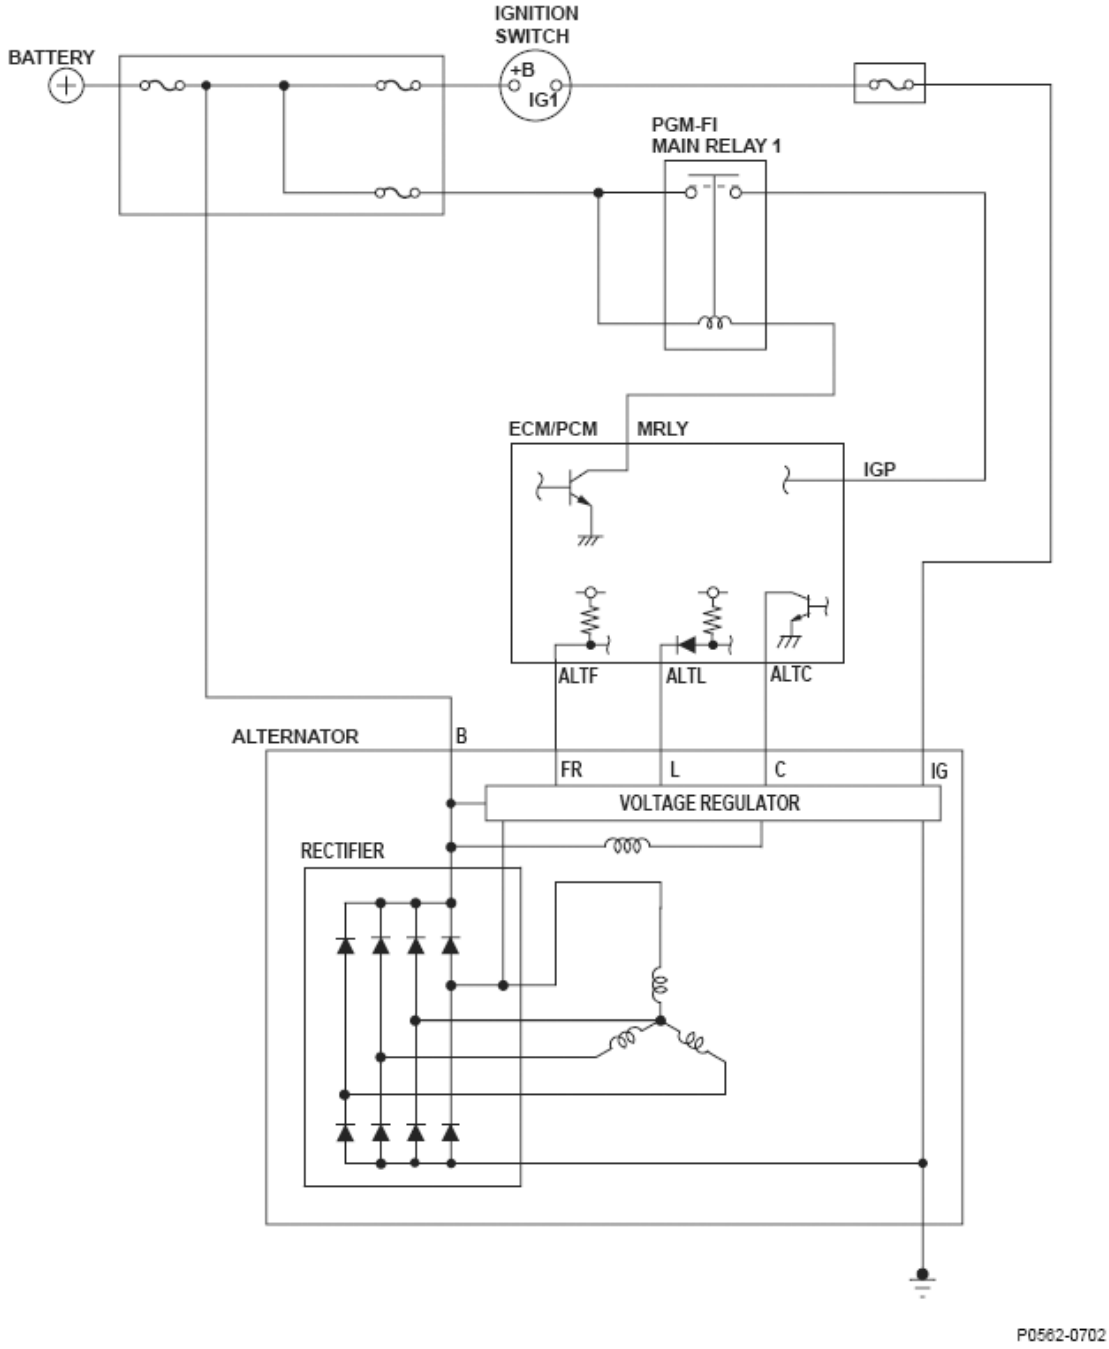

Fig. 9: Checking Continuity Between IMT Actuator 5P Connector Terminal No 4 And ECM/PCM Terminal B37
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 24.

NO - Repair open in the wire between the ECM/PCM (B37) and the IMT actuator, then go to step 30.

24. Check for continuity between IMT actuator 5P connector terminal No. 5 and ECM/PCM connector terminal B38.

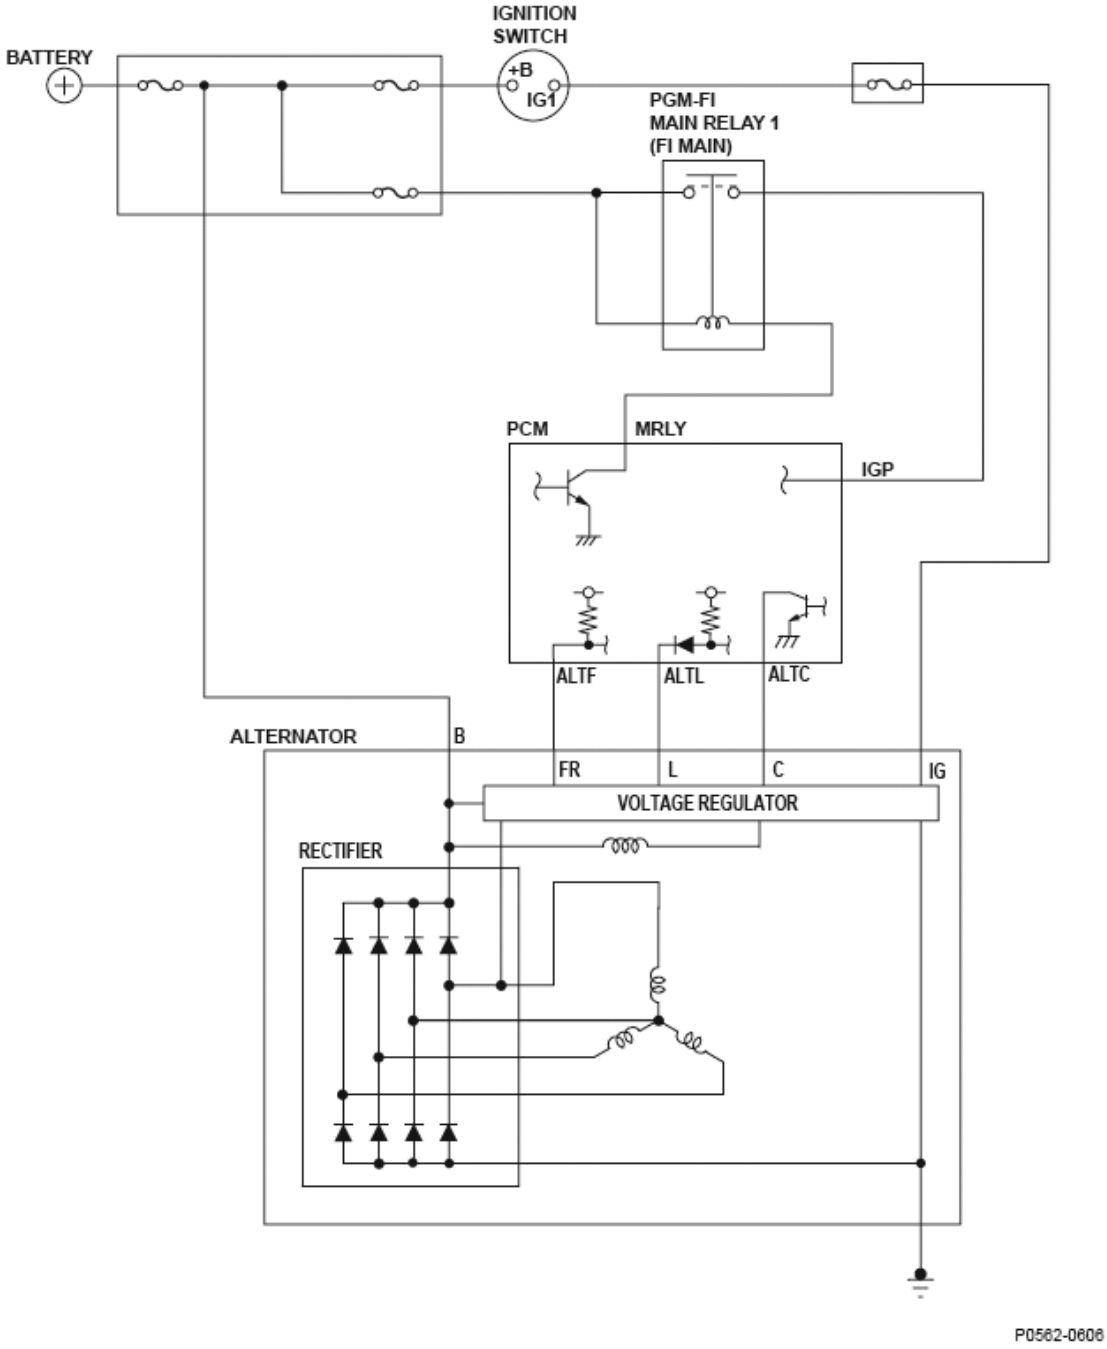

Fig. 10: Checking Continuity Between IMT Actuator 5P Connector Terminal No. 5 And ECM/PCM Terminal B38
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the ECM/PCM (B38) and the IMT actuator, then go to step 30.

25. Remove the IMT actuator (see **IMT ACTUATOR REMOVAL/INSTALLATION**).
26. Move the IMT valve by hand.

Does it move smoothly?

YES - Go to step 27.

NO - Replace the IMT valve (see **IMT VALVE REPLACEMENT**), then go to step 30.

27. Substitute a known-good IMT actuator (see **IMT ACTUATOR REMOVAL/INSTALLATION**).
28. Turn the ignition switch ON (II).
29. Do the IMT TEST in the INSPECTION MENU with the HDS.

Is the result OK?

YES - Replace the original IMT actuator (see **IMT ACTUATOR REMOVAL/INSTALLATION**), then go to step 30.

NO - Go to step 36.

30. Reconnect all connectors.
31. Turn the ignition switch ON (II).
32. Reset the ECM/PCM with the HDS.
33. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
34. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P1077 indicated?

YES - Check for poor connections or loose terminals at the IMT actuator and the ECM/PCM, then go to step 1.

NO - Go to step 35.

35. Monitor the OBD STATUS for DTC P1077 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 34, go to the indicated DTCs troubleshooting.

NO -If the screen indicates FAILED, check for poor connections or loose terminals at the IMT actuator and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

36. Reconnect all connectors.
37. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
38. Start the engine, and let it idle.
39. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P1077 indicated?

YES - Check for poor connections or loose terminals at the IMT actuator and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 38. If the ECM/PCM was substituted, go to step 1.

NO - Go to step 40.

40. Monitor the OBD STATUS for DTC P1077 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 39, go to the indicated DTCs troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the IMT actuator and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 38. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P1078: IMT VALVE STUCK IN LOW RPM POSITION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Do the IMT TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the IMT actuator and the ECM/PCM.

   NO - Go to step 4.

4. Turn the ignition switch OFF.
5. Disconnect the IMT actuator 5P connector.
6. Turn the ignition switch ON (II).
7. Check the IMT VALVE SW in the DATA LIST with the HDS.

   Is CLOSE indicated?

   YES - Go to step 12.

   NO - Go to step 8.

8. Turn the ignition switch OFF.
9. Jump the SCS line with the HDS.

10. Disconnect ECM/PCM connector B (44P).
11. Check for continuity between ECM/PCM connector terminal B39 and body ground.

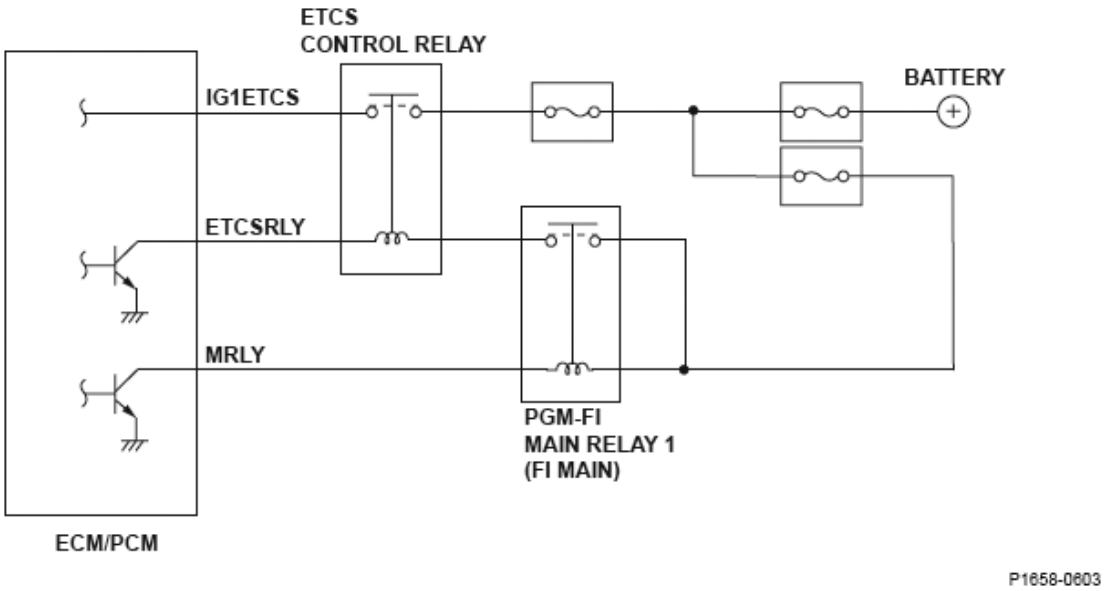

Fig. 11: Checking Continuity Between ECM/PCM Connector Terminal B39 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (B39) and the IMT actuator, then go to step 21.

NO - Go to step 28.

12. Check for continuity between ECM/PCM connector terminal B37 and body ground.

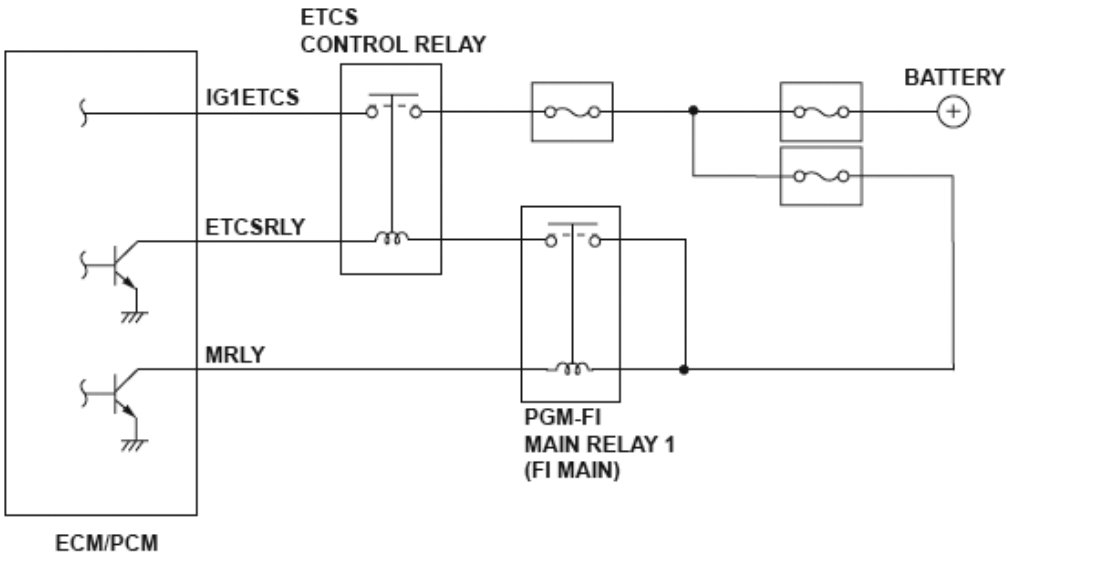

Fig. 12: Checking Continuity Between ECM/PCM Connector Terminal B37 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (B37) and the IMT actuator, then go to step 21.

NO - Go to step 13.

13. Check for continuity between ECM/PCM connector terminal B38 and body ground.

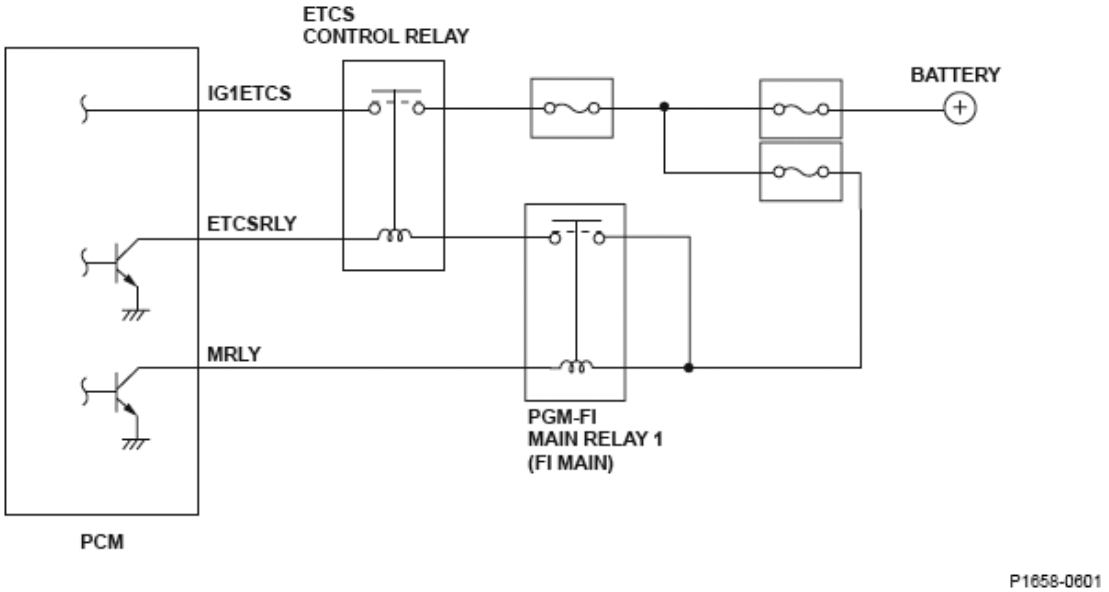

Fig. 13: Checking Continuity Between ECM/PCM Connector Terminal B38 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (B38) and the IMT actuator, then go to step 21.

NO - Go to step 14.

14. Check for continuity between IMT actuator 5P connector terminal No. 4 and ECM/PCM connector terminal B37.

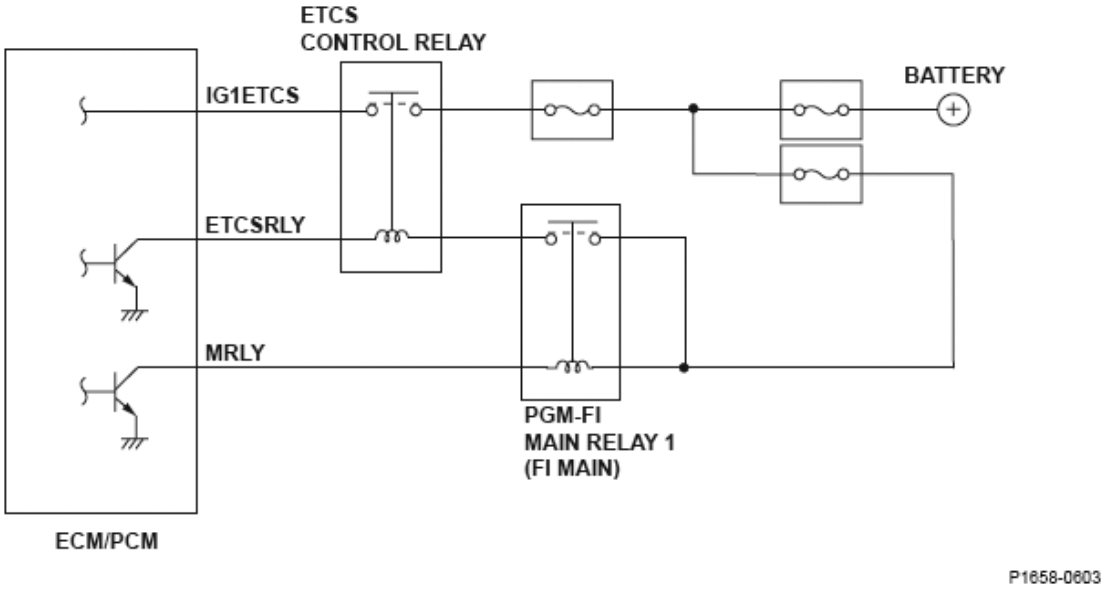

Fig. 14: Checking Continuity Between IMT Actuator 5P Connector Terminal No. 4 And ECM/PCM Terminal B37
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 15.

NO - Repair open in the wire between the ECM/PCM (B37) and the IMT actuator, then go to step 21.

15. Check for continuity between IMT actuator 5P connector terminal No. 5 and ECM/PCM connector terminal B38.

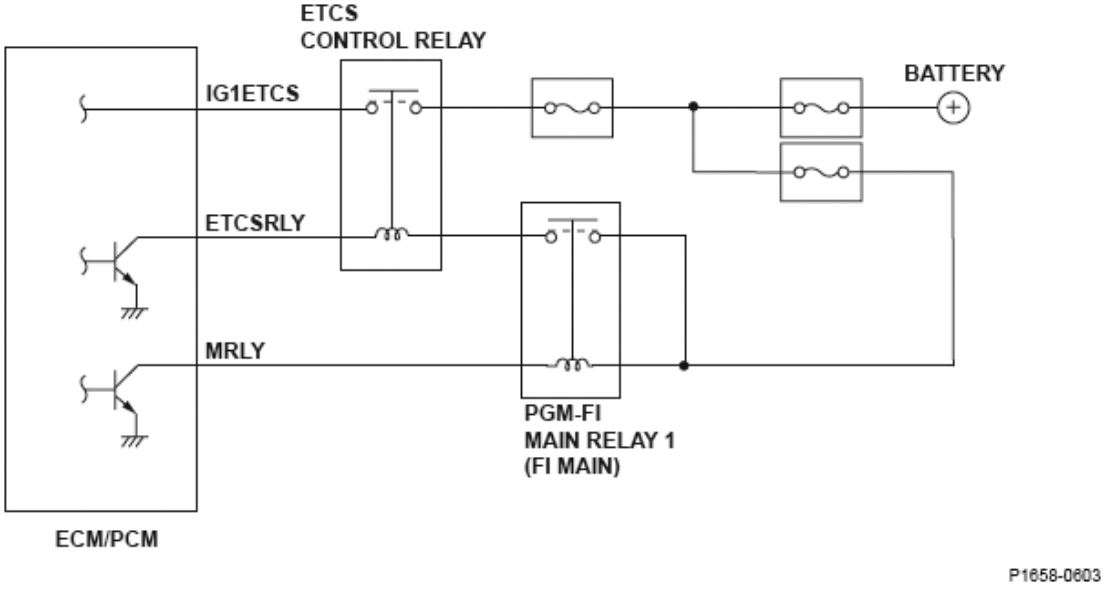

Fig. 15: Checking Continuity Between IMT Actuator 5P Connector Terminal No 5 And ECM/PCM Terminal B38
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 16.

NO - Repair open in the wire between the ECM/PCM (B38) and the IMT actuator, then go to step 21.

16. Remove the IMT actuator (see **IMT ACTUATOR REMOVAL/INSTALLATION**).
17. Move the IMT valve by hand.

Does it move smoothly?

YES - Go to step 18.

NO - Replace the IMT valve (see **IMT VALVE REPLACEMENT**), then go to step 21.

18. Substitute a known-good IMT actuator (see **IMT ACTUATOR REMOVAL/INSTALLATION**).
19. Turn the ignition switch ON (II).
20. Do the IMT TEST in the INSPECTION MENU with the HDS.

Is the result OK?

YES - Replace the original IMT actuator (see **IMT ACTUATOR REMOVAL/INSTALLATION**), then go to step 21.

NO - Go to step 29.

21. Reconnect all connectors.
22. Turn the ignition switch ON (II).
23. Reset the ECM/PCM with the HDS.
24. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
25. Do the IMT TEST in the INSPECTION MENU with the HDS.
26. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P1078 indicated?

YES - Check for poor connections or loose terminals at the IMT actuator and the ECM/PCM, then go to step 1.

NO - Go to step 27.

27. Monitor the OBD STATUS for DTC P1078 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 26, go to the indicated DTCs troubleshooting.

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the IMT

actuator and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 25.

28. Reconnect all connectors.
29. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
30. Do the IMT TEST in the INSPECTION MENU with the HDS.
31. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1078 indicated?

    YES - Check for poor connections or loose terminals at the IMT actuator and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 30. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 32.

32. Monitor the OBD STATUS for DTC P0128 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 31, go to the indicated DTCs troubleshooting.

    NO -If the screen indicates FAILED, check for poor connections or loose terminals at the IMT actuator and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 30. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, go to step 30.

THROTTLE BODY TEST

CARBON ACCUMULATION CHECK

NOTE: If the malfunction indicator lamp (MIL) has been reported on, check for diagnostic trouble codes (DTCs).

1. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

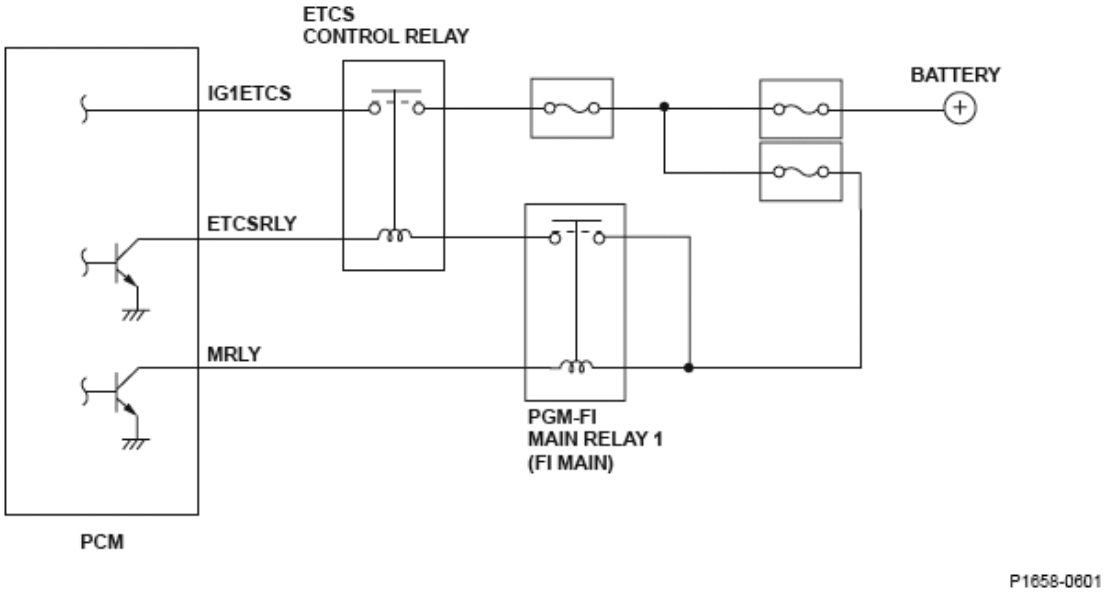

Fig. 16: Connecting HDS To DLC
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch ON (II).
3. Make sure the HDS communicates with the ECM/PCM and other vehicle systems. If it doesn't, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
5. Check the REL TP SENSOR in the DATA LIST with the HDS. The reading should be below 3 deg. If it is not, clean the throttle body (see **THROTTLE BODY CLEANING**).

THROTTLE POSITION LEARNING CHECK

NOTE: If the malfunction indicator lamp (MIL) has been reported on, check for diagnostic trouble codes (DTCs).

1. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

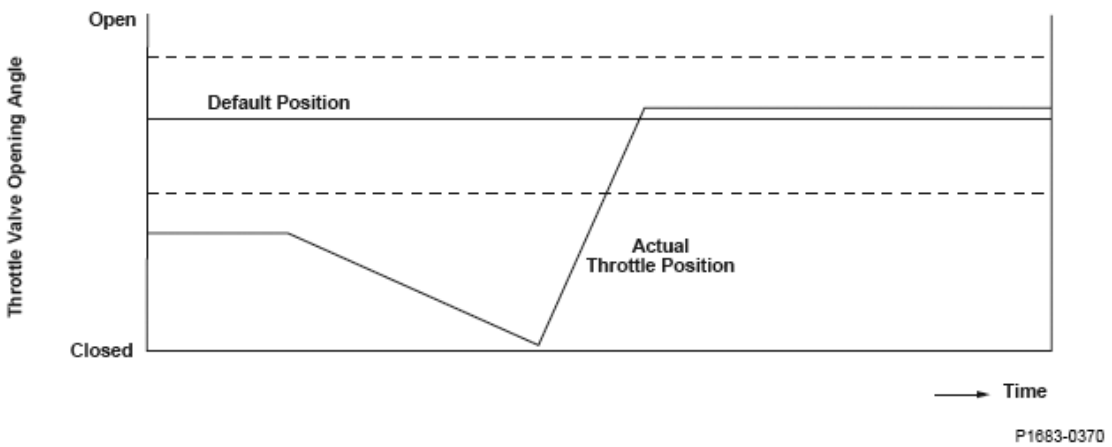

Fig. 17: Connecting HDS To DLC
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch ON (II).
3. Make sure the HDS communicates with the ECM/PCM and other vehicle systems. If it doesn't, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Select the INSPECTION MENU with the HDS.
5. Do the TP POSITION CHECK in the ETCS TEST. If needed, clean the throttle body (see **THROTTLE BODY CLEANING**).

THROTTLE BODY CLEANING

CAUTION: Do not insert your fingers into the installed throttle body when you turn the ignition switch ON (II) or while the ignition switch is ON (II). If you do, you will seriously injure your fingers if the throttle valve is activated.

1. Check for damage to the air cleaner. If the air cleaner is damaged, replace it (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**).
2. Remove the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
3. Clean off the carbon from the throttle valve and inside the throttle body with a paper towel soaked in throttle plate and induction cleaner.

NOTE:
- **Remove the throttle body to clean it.**
- **Be careful not to pinch your fingers.**
- **To avoid removing the molybdenum coating, do not clean the bearing area of the throttle shaft (A).**
- **Do not spray throttle plate and induction cleaner directly on the throttle body.**
- **Use Honda genuine throttle plate and induction cleaner.**

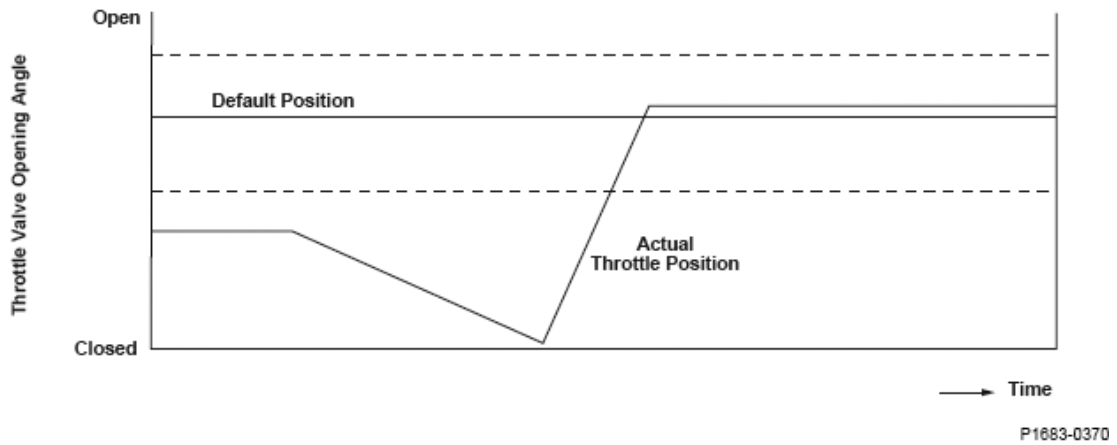

Fig. 18: Cleaning Off Carbon From Throttle Valve And Inside Throttle Body
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
5. Reset the ECM/PCM with the HDS (see **ECM/PCM RESET**).
6. Turn the ignition switch ON (II), and wait for 2 seconds.
7. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).

AIR CLEANER REMOVAL/INSTALLATION

1. Disconnect the MAF sensor/IAT sensor connector (A).

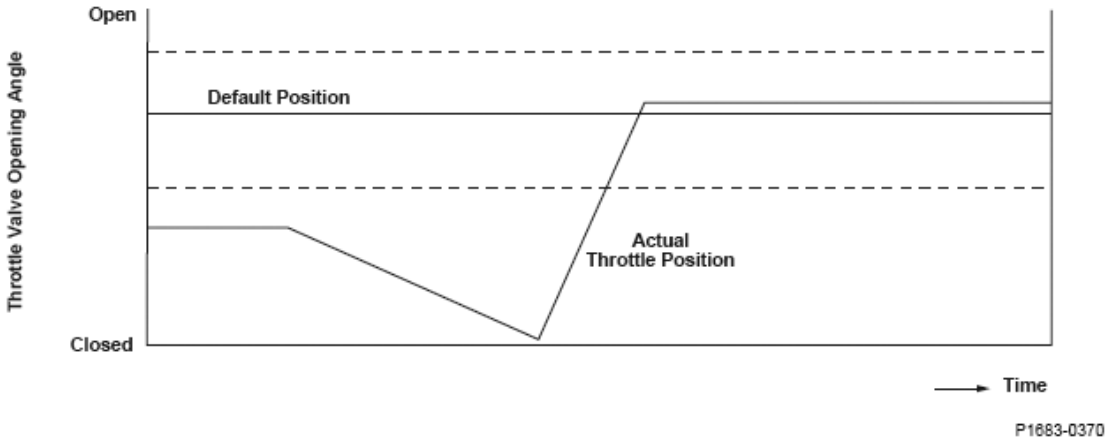

Fig. 19: Disconnecting MAF Sensor/IAT Sensor Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the air cleaner housing cover (B).
3. Remove the air cleaner element (C) from the air cleaner housing (D).
4. Loosen the bolt (E), and the pipe (F).
5. Remove the air cleaner housing.
6. Install the parts in the reverse order of removal.

AIR CLEANER ELEMENT INSPECTION/REPLACEMENT

1. Open the air cleaner housing cover (A).

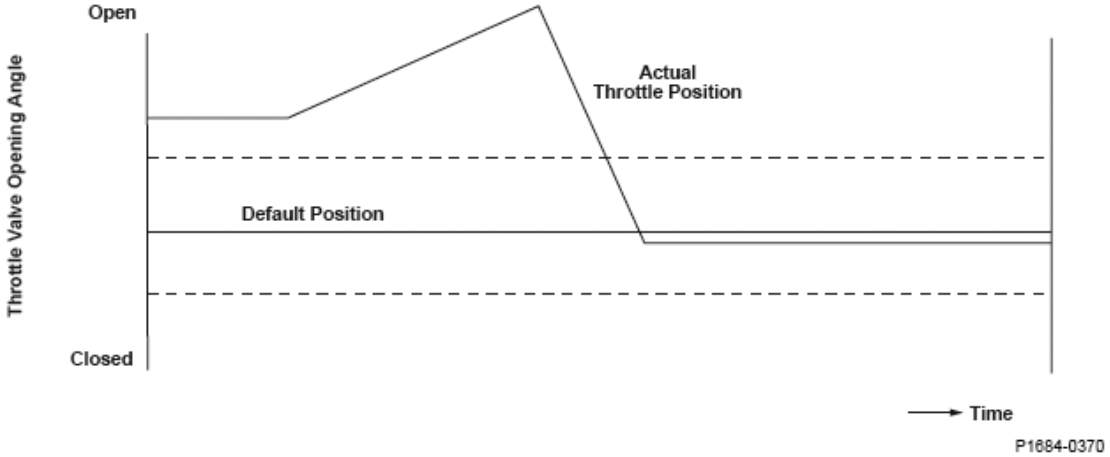

Fig. 20: Opening Air Cleaner Housing Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the air cleaner element (B) from the air cleaner housing (C).
3. Check the air cleaner element for damage or clogging. If there is damage or clogging, replace the air cleaner element.

NOTE: Do not use compressed air to clean the air cleaner element.

4. Install the parts in the reverse order of removal.
5. Install the parts in the reverse order of removal.
   - If you did not replace the air cleaner element, this procedure is complete.
   - If the maintenance minder required air cleaner element replacement, reset the maintenance minder.
   - If the idle speed fluctuates, do the idle speed inspection.

RESONATOR REMOVAL/INSTALLATION

1. Remove the front bumper (see **FRONT BUMPER REMOVAL/INSTALLATION**).
2. Remove the bolts (A), and the intake air ducts (B).

THROTTLE BODY REMOVAL/INSTALLATION

CAUTION: Do not insert your fingers into the installed throttle body when you turn the ignition switch ON (II) or while the ignition switch is ON (II). If you do, you will seriously injure your fingers if the throttle valve is activated.

NOTE: If you are replacing or cleaning the throttle body, start at step 1. If you are removing the throttle body, start at step 4.

1. Connect the HDS to the DLC while the engine is stopped.
2. USA, Canada models: Select the INSPECTION MENU on the HDS.
3. USA, Canada models: Do the TP POSITION CHECK in the ETCS TEST.
4. Remove the cowl cover and under-cowl panel (see **FRONT GRILLE COVER REPLACEMENT**).
5. Remove the air cleaner (see **THROTTLE BODY CLEANING**).
6. Disconnect the throttle body connector (A) and the EVAP purge control solenoid valve connector (B).

7. Disconnect the throttle body connector (B) and the EVAP purge control solenoid valve connector (C).
8. Disconnect and plug the water bypass hoses (C).
9. Disconnect the vacuum hose (D).
10. Remove the throttle body (E).
11. Install the parts in the reverse order of removal with a new gasket (F).

NOTE:

- **Do the ECM/PCM idle learn procedure (see ECM/PCM IDLE LEARN PROCEDURE) after replacing throttle body.**
- **Refill the radiator with engine coolant (see COOLANT REPLACEMENT).**

DTC TROUBLESHOOTING

DTC P0101: MAF SENSOR CIRCUIT RANGE/PERFORMANCE PROBLEM

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board**

snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

- **If DTC P1128, P1129, P2228, and/or P2229 are stored at the same time as DTC P0101, troubleshoot those DTCs first, then recheck for DTC P0101.**

1. Check for poor connections or damage to these parts:
   - PCV hose
   - Air intake duct
   - Air cleaner
   - Purge (PCS) line
   - Brake booster hose

   Are the parts OK?

   YES - GO to step 2.

   NO - Repair or replace the damaged parts, then go to step 17.

2. Check for damage or looseness at the air duct in the air cleaner.

   Is it OK?

   YES - Go to step 3.

   NO - Reconnect or replace the air duct in the air cleaner, then go to step 15.

3. Check for a dirty air cleaner element.

   Is it dirty?

   YES - Replace the air cleaner element (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**), then go to step 15.

   NO - Go to step 4.

4. Turn the ignition switch OFF.
5. Turn the ignition switch ON (II).
6. Check the MAF SENSOR in the DATA LIST with the HDS.

   Is there about 0.2 gm/s or 0.5 V?

   YES - Go to step 7.

   NO - Go to step 13.

7. Start the engine.
8. Vary the engine speed between 2,000 rpm and 3,000 rpm.

9. Check the MAF SENSOR in the DATA LIST with the HDS.

   Does the reading change?

   YES - Go to step 10.

   NO - Go to step 13.

10. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
11. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VSS
    - MAP SENSOR
    - MAF SENSOR
12. Monitor the OBD STATUS for DTC P0101 in the DTCs MENU with the HDS.

    Does the screen indicate FAILED?

    YES - Go to step 13.

    NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAF sensor and the ECM. If the screen indicates NOT COMPLETED, go to step 11 and recheck.

13. Turn the ignition switch OFF.
14. Replace the MAF sensor/IAT sensor (see **MAF SENSOR/IAT SENSOR REPLACEMENT**).
15. Turn the ignition switch ON (II).
16. Reset the ECM with the HDS.
17. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
18. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VSS
    - MAP SENSOR
    - MAF SENSOR
19. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0101 indicated?

    YES - Check for poor connections or loose terminals at the MAF sensor and the ECM, then go to step 1.

    NO - Go to step 20.

20. Monitor the OBD STATUS for DTC P0101 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 19, go to the indicated DTC's troubleshooting.

NO -If the screen indicates FAILED, check for poor connections or loose terminals at the MAF sensor and the ECM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 18.

DTC P0102: MAF SENSOR CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II), and wait 2 seconds.
2. Check the MAF SENSOR in the DATA LIST with the HDS.

   Is about 0 gm/s, or 0.1 V or less indicated?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAF sensor and the ECM.

3. Check the No. 3 ALTERNATOR (10 A) fuse in the under-dash fuse/relay box.

   Is the fuse OK?

   YES - Go to step 4.

   NO - Repair short in the wire between the MAF sensor and the No. 3 ALTERNATOR (10 A) fuse. Also replace the No. 3 ALTERNATOR (10 A) fuse, then go to step 20.

4. Turn the ignition switch OFF.
5. Disconnect the MAF sensor/IAT sensor 5P connector.
6. Turn the ignition switch ON (II).
7. Measure voltage between MAF sensor/IAT sensor 5P connector terminal No. 3 and body ground.

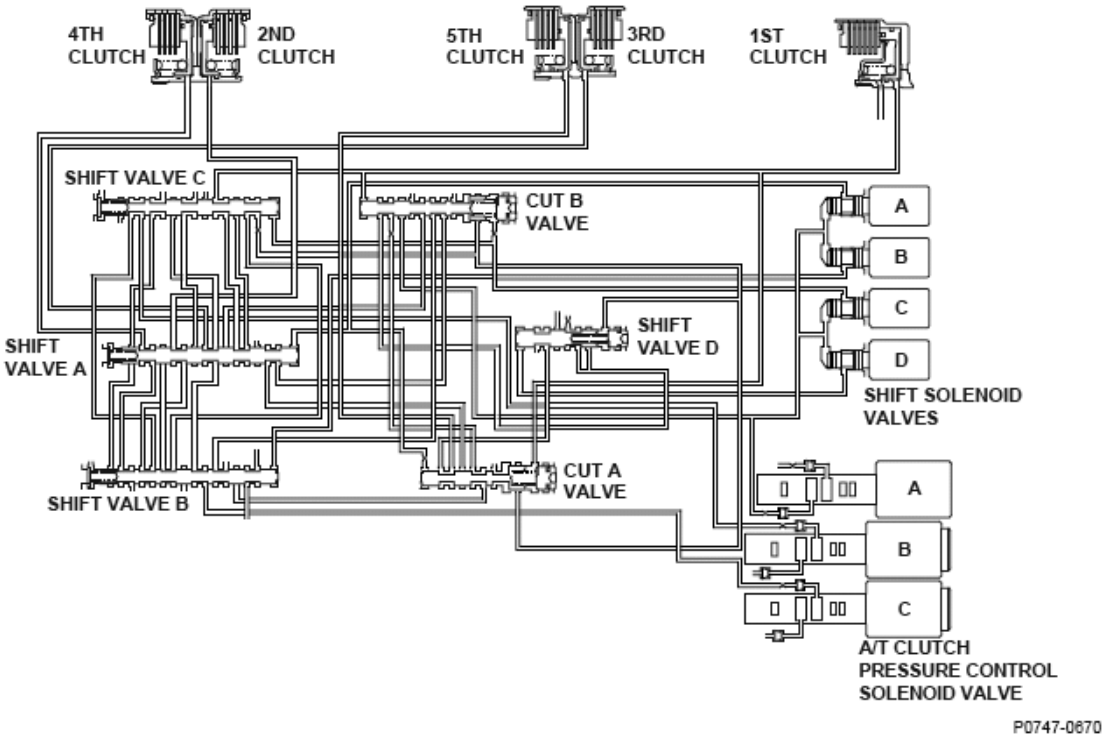

Fig. 3: Measuring Voltage Between MAF Sensor/IAT Sensor 5P Connector Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 8.

NO - Repair open in the wire between the No. 3 ALTERNATOR (10 A) fuse and the MAF sensor, then go to step 20.

8. Turn the ignition switch OFF.
9. Measure resistance between MAF sensor/IAT sensor 5P connector terminal No. 1 and body ground.

Is there 190-210 kohms?

YES - Go to step 14.

NO - Go to step 10.

10. Jump the SCS line with the HDS.
11. Disconnect ECM connector B (44P).
12. Check for continuity between ECM connector terminal B30 and body ground.

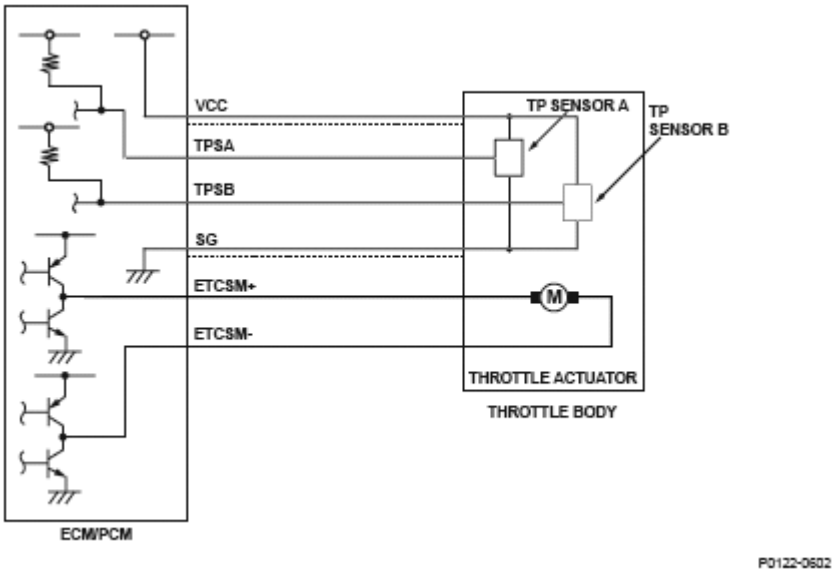

Fig. 5: Checking For Continuity Between ECM Connector Terminal B30 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM (B30) and the MAF sensor, then go to step 21.

NO - Go to step 13.

13. Check for continuity between MAF sensor/IAT sensor 5P connector terminal No. 1 and ECM connector terminal B30.

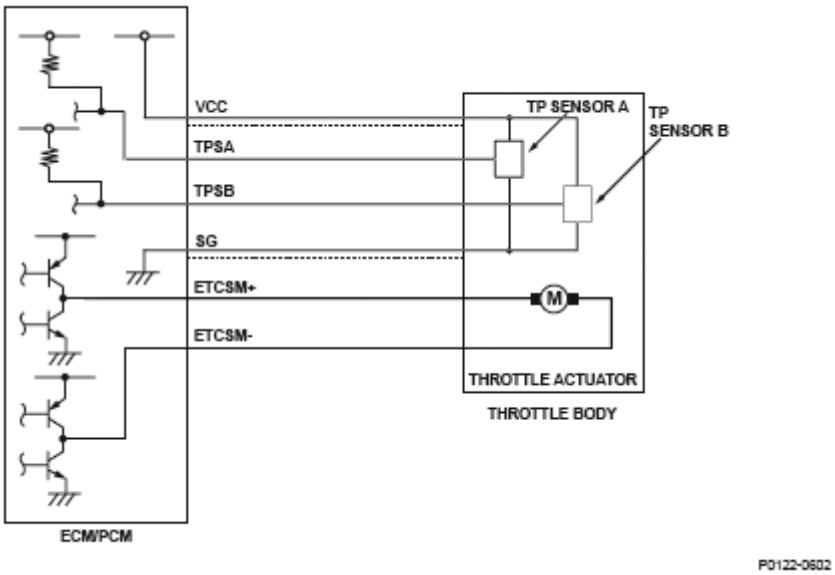

Fig. 6: Checking For Continuity Between MAF Sensor/IAT Sensor 5P Connector Terminal No. 1 And ECM Connector Terminal B30
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 26.

NO - Repair open in the wire between the ECM (B30) and the MAF sensor, then go to step 21.

14. Substitute a known-good MAF sensor/IAT sensor (see **MAF SENSOR/IAT SENSOR REPLACEMENT**).
15. Reconnect all connectors.
16. Turn the ignition switch ON (II).
17. Clear the DTC with the HDS.
18. Start the engine. Hold the engine speed at 2,000 rpm without load (in neutral).
19. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0102 indicated?

YES - Go to step 27.

NO - Replace the original MAF sensor/IAT sensor (see **MAF SENSOR/IAT SENSOR REPLACEMENT**), then go to step 20.

20. Turn the ignition switch OFF.
21. Reconnect all connectors.
22. Turn the ignition switch ON (II).
23. Reset the ECM with the HDS.
24. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
25. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0102 indicated?

YES - Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the ECM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

26. Reconnect all connectors.
27. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
28. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0102 indicated?

YES - Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0103: MAF SENSOR CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II), and wait 2 seconds.
2. Check the MAF SENSOR in the DATA LIST with the HDS.

Is about 202 gm/s, or 4.89 V or more indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAF sensor and the ECM.

3. Turn the ignition switch OFF.
4. Jump the SCS line with the HDS.
5. Disconnect the MAF sensor/IAT sensor 5P connector.
6. Disconnect ECM connector B (44P).
7. Check for continuity between MAF sensor/IAT sensor 5P connector terminal No. 2 and ECM connector terminal B32.

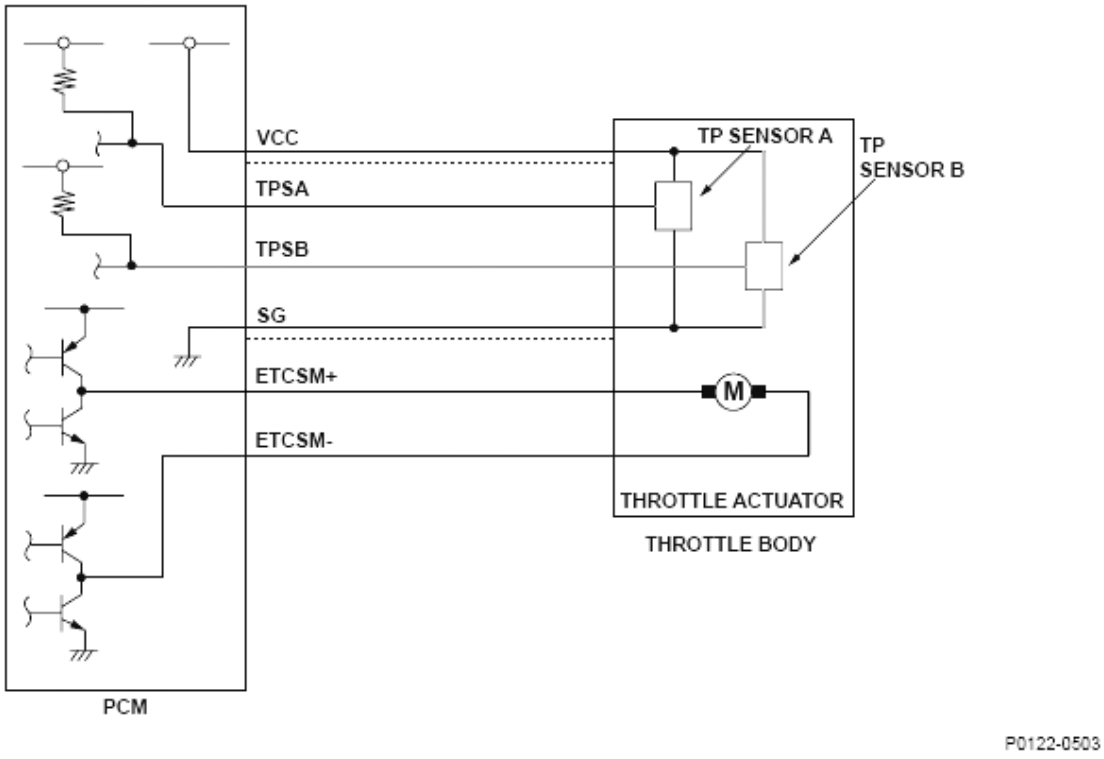

Fig. 7: Checking Continuity Between MAF Sensor/IAT Sensor 5P Connector Terminal No. 2 And ECM Terminal B32
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 8.

NO - Repair open in the wire between the ECM (B32) and the MAF sensor, then go to step 15.

8. Reconnect ECM connector B (44P).
9. Connect MAF sensor/IAT sensor 5P connector terminals No. 1 and No. 2 with a jumper wire.

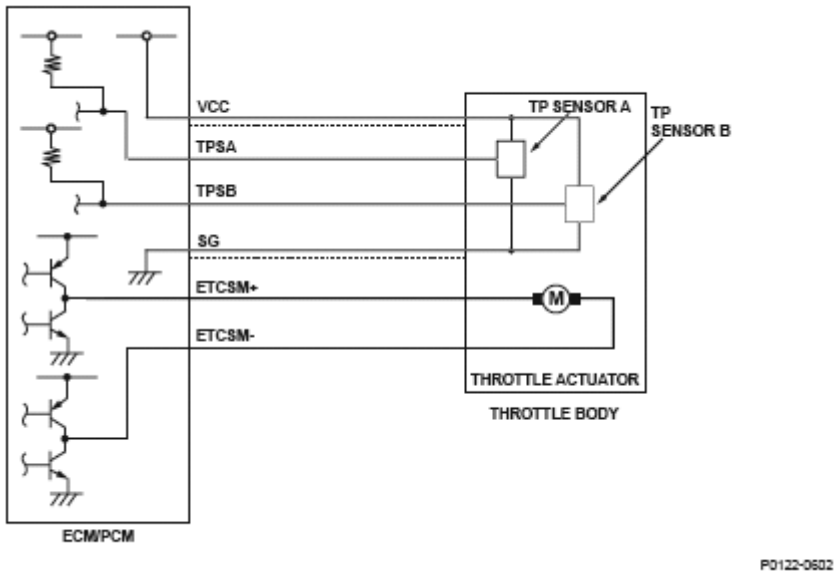

Fig. 8: Connecting MAF Sensor/IAT Sensor 5P Connector Terminals No. 1 And No. 2 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Turn the ignition switch ON (II).
11. Clear the DTC with the HDS.
12. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0103 indicated?

    YES - Go to step 20.

    NO - Go to step 13.

13. Turn the ignition switch OFF.
14. Replace the MAF sensor/IAT sensor (see **MAF SENSOR/IAT SENSOR REPLACEMENT**).
15. Reconnect all connectors.
16. Turn the ignition switch ON (II).
17. Reset the ECM with the HDS.
18. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
19. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0103 indicated?

    YES - Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the ECM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

20. Turn the ignition switch OFF.

21. Reconnect all connectors.
22. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
23. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0103 indicated?

    YES - Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0107: MAP SENSOR CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check the MAP SENSOR in the DATA LIST with the HDS.

   Is about 3 kPa (1.0 in.Hg, 26 mmHg), or 0.23 V or less indicated?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAP sensor and the ECM.

3. Turn the ignition switch OFF.
4. Disconnect the MAP sensor 3P connector.
5. Turn the ignition switch ON (II).
6. Check the MAP SENSOR in the DATA LIST with the HDS.

   Is about 3 kPa (1.0 in.Hg, 26 mmHg), or 0.23 V or less indicated?

   YES - Go to step 12.

   NO - Go to step 7.

7. Measure voltage between MAP sensor 3P connector terminals No. 1 and No. 3.

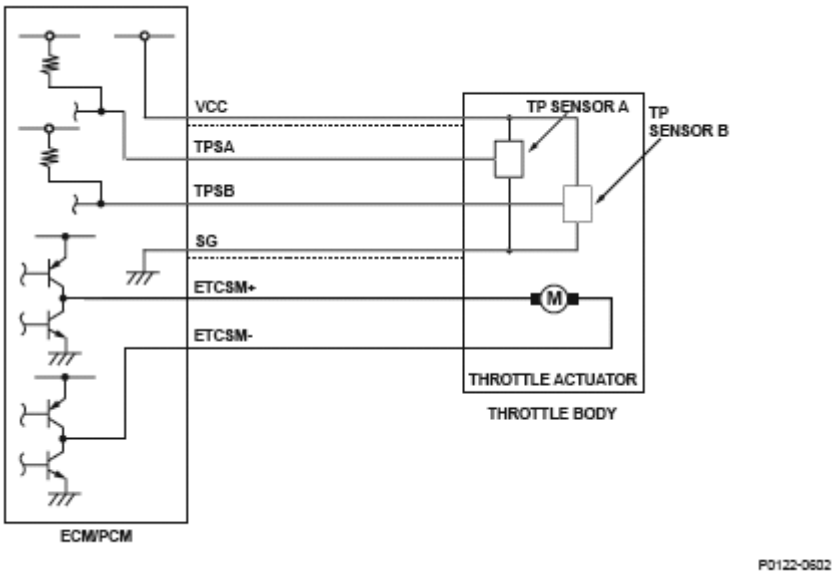

Fig. 9: Measuring Voltage Between MAP Sensor 3P Connector Terminals No. 1 And No. 3

Is there about 5 V?

YES - Go to step 16.

NO - Go to step 8.

8. Turn the ignition switch OFF.
9. Jump the SCS line with the HDS.
10. Disconnect ECM connector C (44P).
11. Check for continuity between ECM connector terminal C13 and MAP sensor 3P connector terminal No. 1.

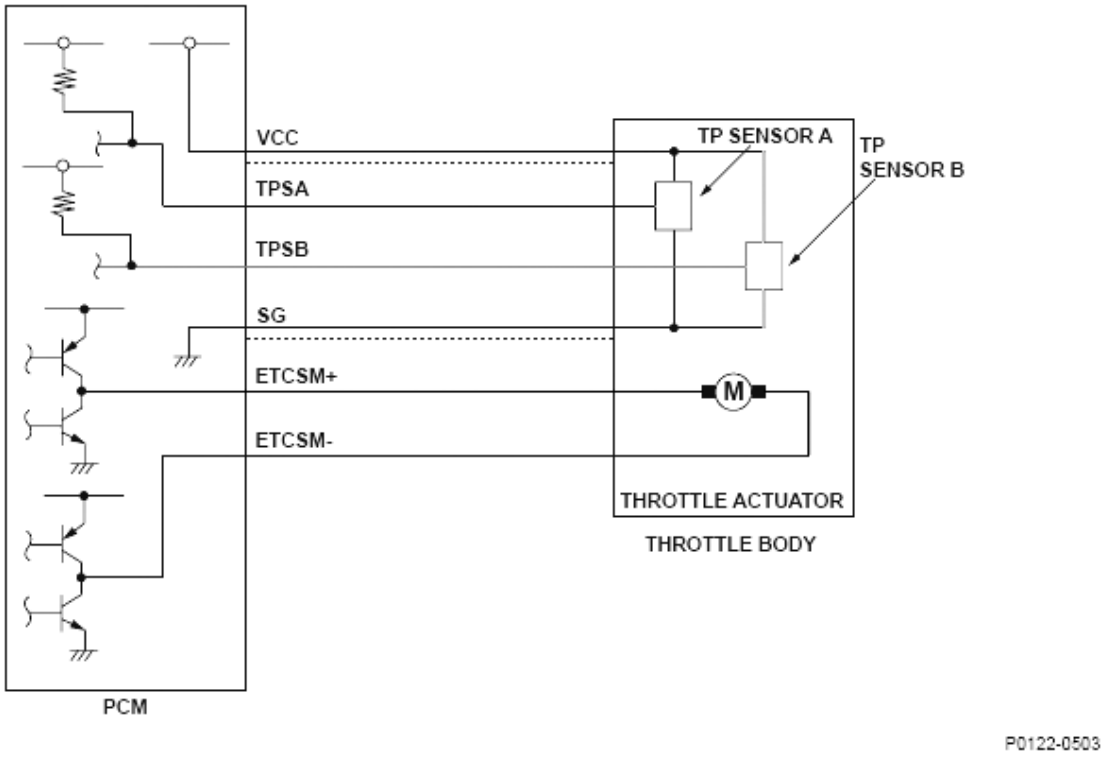

Fig. 10: Checking Continuity Between ECM Connector Terminal C13 And MAP Sensor 3P Connector Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 23.

NO - Repair open in the wire between the ECM (C13) and the MAP sensor, then go to step 18.

12. Turn the ignition switch OFF.
13. Jump the SCS line with the HDS.
14. Disconnect ECM connector C (44P).
15. Check for continuity between MAP sensor 3P connector terminal No. 2 and body ground.

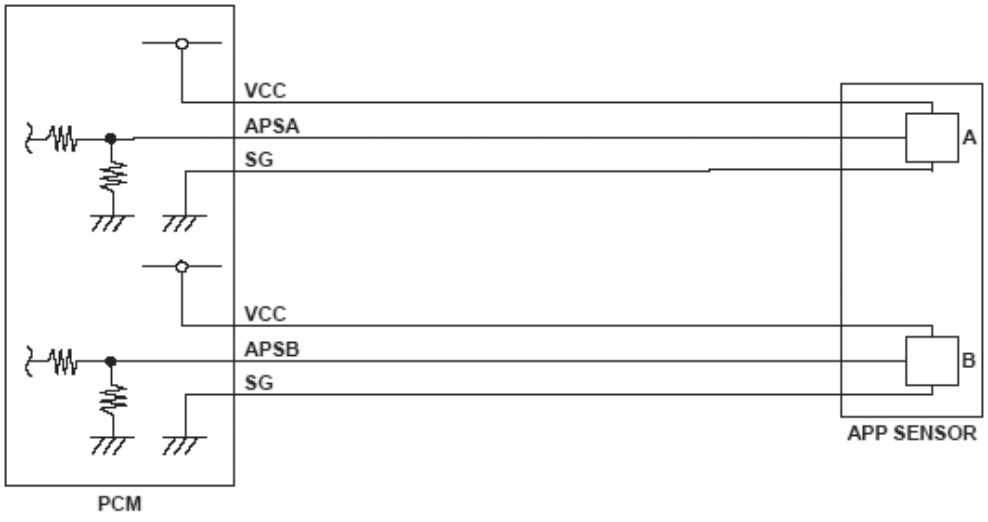

Fig. 11: Checking For Continuity Between MAP Sensor 3P Connector Terminal No. 2 And Body Ground

Is there continuity?

YES - Repair short in the wire between the ECM (C11) and the MAP sensor, then go to step 18.

NO - Go to step 23.

16. Turn the ignition switch OFF.
17. Replace the MAP sensor (see **MAP SENSOR REPLACEMENT**).
18. Reconnect all connectors.
19. Turn the ignition switch ON (II).
20. Reset the ECM with the HDS.
21. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
22. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0107 indicated?

    YES - Check for poor connections or loose terminals at the MAP sensor and the ECM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

23. Reconnect all connectors.
24. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
25. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0107 indicated?

YES - Check for poor connections or loose terminals at the MAP sensor and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0108: MAP SENSOR CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check the MAP SENSOR in the DATA LIST with the HDS.

   Is about 160 kPa (47.1 in.Hg, 1,197 mmHg), or 4.49 V or more indicated?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAP sensor and the ECM.

3. Turn the ignition switch OFF.
4. Disconnect the MAP sensor 3P connector.
5. Connect MAP sensor 3P connector terminals No. 2 and No. 3 with a jumper wire.

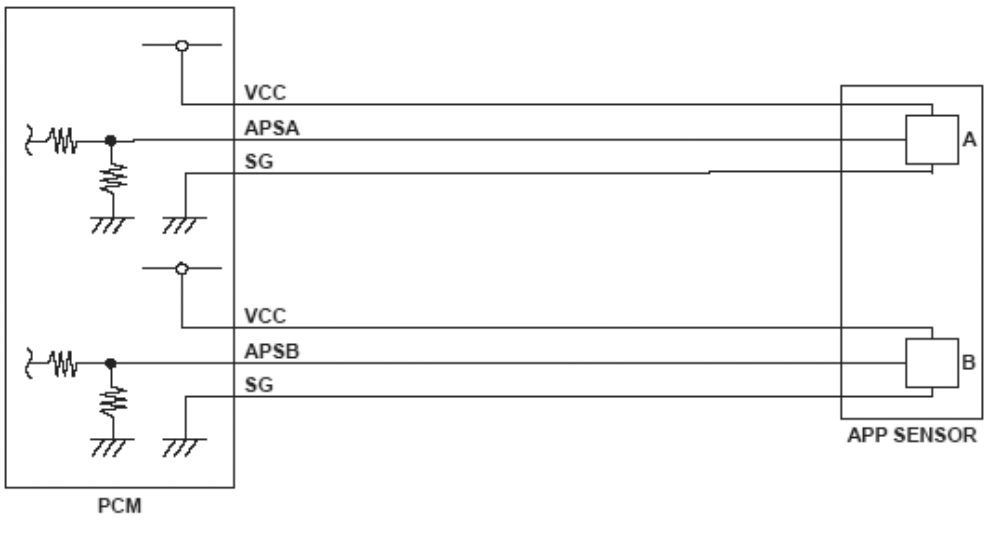

Fig. 12: Connecting MAP Sensor 3P Connector Terminals No. 2 And No. 3 With Jumper Wire

6. Turn the ignition switch ON (II).
7. Check the MAP SENSOR in the DATA LIST with the HDS.

Is about 160 kPa (47.1 in.Hg, 1,197 mmHg), or 4.49 V or more indicated?

YES - Go to step 8.

NO - Go to step 18.

8. Remove the jumper wire from the MAP sensor 3P connector.
9. Measure voltage between MAP sensor 3P connector terminals No. 1 and No. 3.

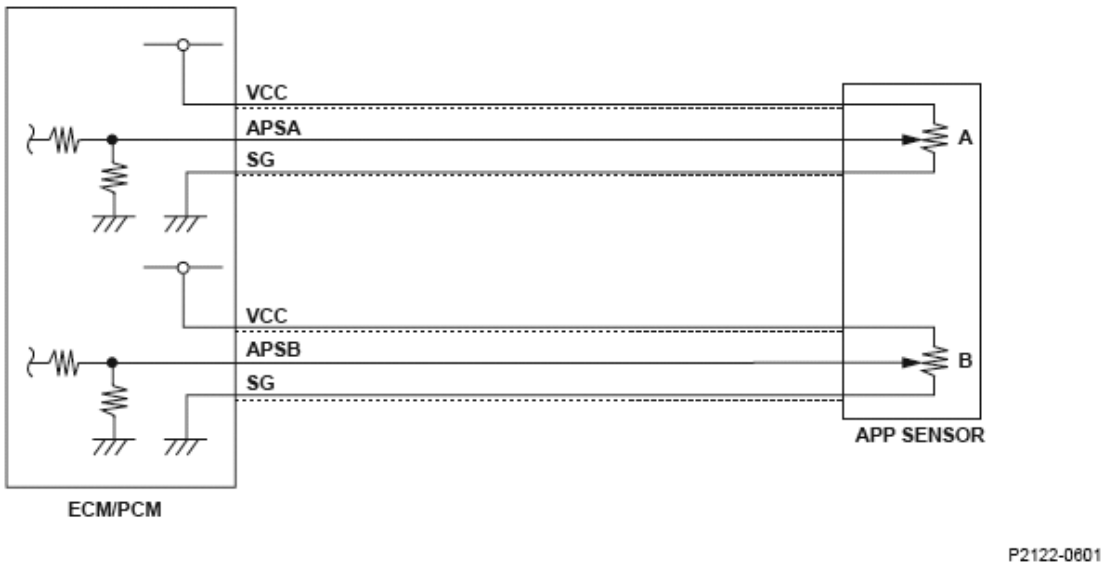

Fig. 13: Measuring Voltage Between MAP Sensor 3P Connector Terminals No. 1 And No. 3

Is there about 5 V?

YES - Go to step 14.

NO - Go to step 10.

10. Turn the ignition switch OFF.
11. Jump the SCS line with the HDS.
12. Disconnect ECM connector C (44P).
13. Check for continuity between ECM connector terminal C14 and MAP sensor 3P connector terminal No. 3.

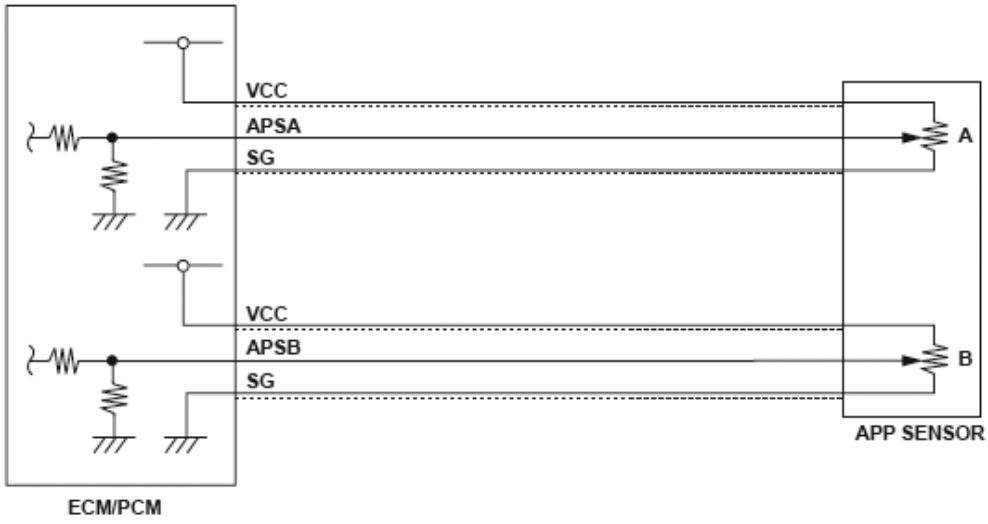

Fig. 14: Checking Continuity Between ECM Connector Terminal C14 And MAP Sensor 3P Connector Terminal No. 3

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the ECM (C14) and the MAP sensor, then go to step 20.

14. Turn the ignition switch OFF.
15. Jump the SCS line with the HDS.
16. Disconnect ECM connector C (44P).
17. Check for continuity between ECM connector terminal C11 and MAP sensor 3P connector terminal No. 2.

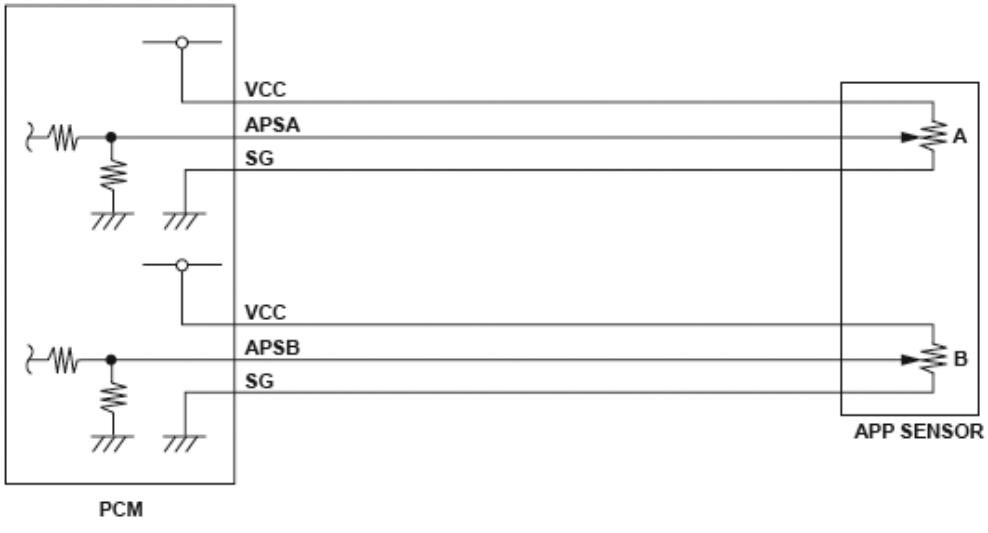

Fig. 15: Checking Continuity Between ECM Connector Terminal C11 And MAP Sensor 3P

Terminal No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the ECM (C11) and the MAP sensor, then go to step 20.

18. Turn the ignition switch OFF.
19. Replace the MAP sensor (see **MAP SENSOR REPLACEMENT**).
20. Reconnect all connectors.
21. Turn the ignition switch ON (II).
22. Reset the ECM with the HDS.
23. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
24. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0108 indicated?

YES - Check for poor connections or loose terminals at the MAP sensor and the ECM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

25. Reconnect all connectors.
26. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
27. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0108 indicated?

YES - Check for poor connections or loose terminals at the MAP sensor and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0111: IAT SENSOR CIRCUIT RANGE/PERFORMANCE PROBLEM

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Check for poor connections or loose terminals at ECT sensor 1/2 and the IAT sensor.

Are the connections and terminals OK?

YES - Go to step 2.

NO - Repair the connectors or terminals, then go to step 15.

2. Remove the MAF sensor/IAT sensor (see **MAF SENSOR/IAT SENSOR REPLACEMENT**).
3. Allow IAT sensor to cool to ambient temperature.
4. Note the ambient temperature.
5. Connect the MAF sensor/IAT sensor to the 5P connector, but do not install the sensor onto the air cleaner.
6. Turn the ignition switch ON (II).
7. Note the value of the IAT SENSOR quickly in the DATA LIST with the HDS.
8. Compare the value of IAT SENSOR and the ambient temperature.

Does the value of IAT SENSOR differ 5.4°F (3°C) or more?

YES - Go to step 13.

NO - Go to step 9.

9. Disconnect the MAF sensor/IAT sensor from the 5P connector.
10. Using a heat gun, blow hot air on the MAF sensor/IAT sensor for a few seconds. Do not apply the heat longer than a few seconds or you will damage the sensor.
11. Connect the MAF sensor/IAT sensor to the 5P connector, but do not install the sensor onto the air cleaner.
12. Check the IAT SENSOR in the DATA LIST with the HDS.

Does the IAT SENSOR change 59°F (33°C) or more?

YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the IAT sensor and the ECM.

NO - Go to step 13.

13. Turn the ignition switch OFF.
14. Replace the MAF sensor/IAT sensor (see **MAF SENSOR/IAT SENSOR REPLACEMENT**).
15. Turn the ignition switch ON (II).
16. Reset the ECM with the HDS.
17. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
18. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0111 indicated?

YES - Check for poor connections or loose terminals at the IAT sensor and the ECM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0112: IAT SENSOR CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check the IAT SENSOR in the DATA LIST with the HDS.

   Is about 356°F (180°C) or more, or 0.08 V or less indicated?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the IAT sensor and the ECM.

3. Turn the ignition switch OFF.
4. Disconnect the MAF sensor/IAT sensor 5P connector.
5. Turn the ignition switch ON (II).
6. Check the IAT SENSOR in the DATA LIST with the HDS.

   Is about 356°F (180°C) or more, or 0.08 V or less indicated?

   YES - Go to step 7.

   NO - Go to step 11.

7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Disconnect ECM connector B (44P).
10. Check for continuity between MAF sensor/IAT sensor 5P connector terminal No. 5 and body ground.

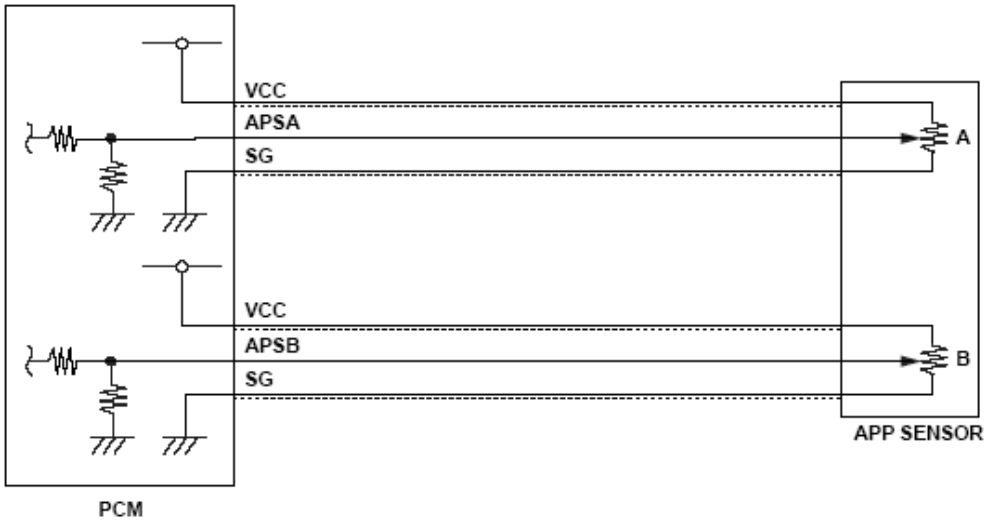

Fig. 16: Checking Continuity Between MAF Sensor/IAT Sensor 5P Connector Terminal No. 5 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the IAT sensor and the ECM (B31), then go to step 13.

NO - Go to step 18.

11. Turn the ignition switch OFF.
12. Replace the MAF sensor/IAT sensor (see **MAF SENSOR/IAT SENSOR REPLACEMENT**).
13. Reconnect all connectors.
14. Turn the ignition switch ON (II).
15. Reset the ECM with the HDS.
16. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
17. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0112 indicated?

YES - Check for poor connections or loose terminals at the IAT sensor and the ECM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

18. Reconnect all connectors.
19. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
20. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0112 indicated?

YES - Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0113: IAT SENSOR CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check the IAT SENSOR in the DATA LIST with the HDS.

   Is about -40°F (-40°C) or less, or 4.90 V or higher indicated?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the IAT sensor and the ECM.

3. Turn the ignition switch OFF.
4. Disconnect the MAF sensor/IAT sensor 5P connector.
5. Connect MAF sensor/IAT sensor 5P connector terminals No. 4 and No. 5 with a jumper wire.

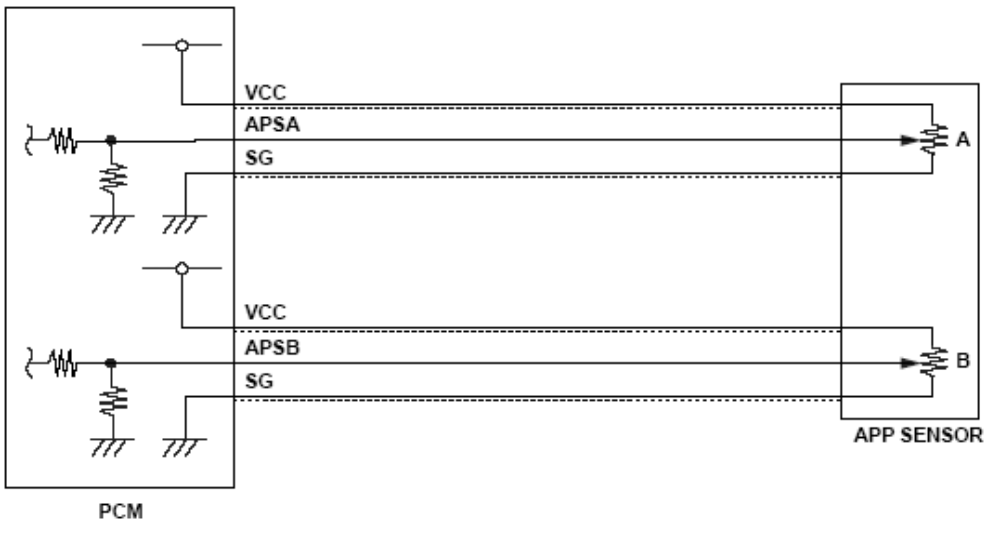

Fig. 17: Connecting MAF Sensor/IAT Sensor 5P Connector Terminals No. 4 And No. 5 With Jumper Wire

6. Turn the ignition switch ON (II).

7. Check the IAT SENSOR in the DATA LIST with the HDS.

   Is about -40°F (-40°C) or less, or 4.90 V or higher indicated?

   YES - Go to step 8.

   NO - Go to step 20

8. Turn the ignition switch OFF.
9. Remove the jumper wire from the MAF sensor/IAT sensor 5P connector.
10. Turn the ignition switch ON (II).
11. Measure voltage between MAF sensor/IAT sensor 5P connector terminal No. 5 and body ground.

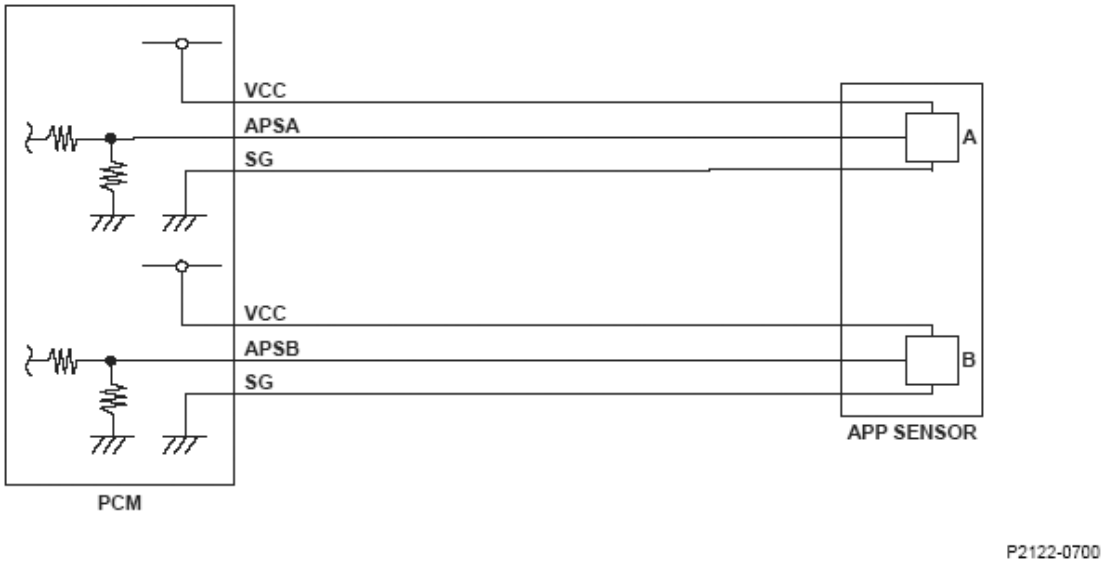

Fig. 18: Measuring Voltage Between MAF Sensor/IAT Sensor 5P Connector Terminal No. 5 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 12.

NO - Go to step 16.

12. Turn the ignition switch OFF.
13. Jump the SCS line with the HDS.
14. Disconnect ECM connector B (44P).
15. Check for continuity between MAF sensor/IAT sensor 5P connector terminal No. 4 and ECM connector terminal B33.

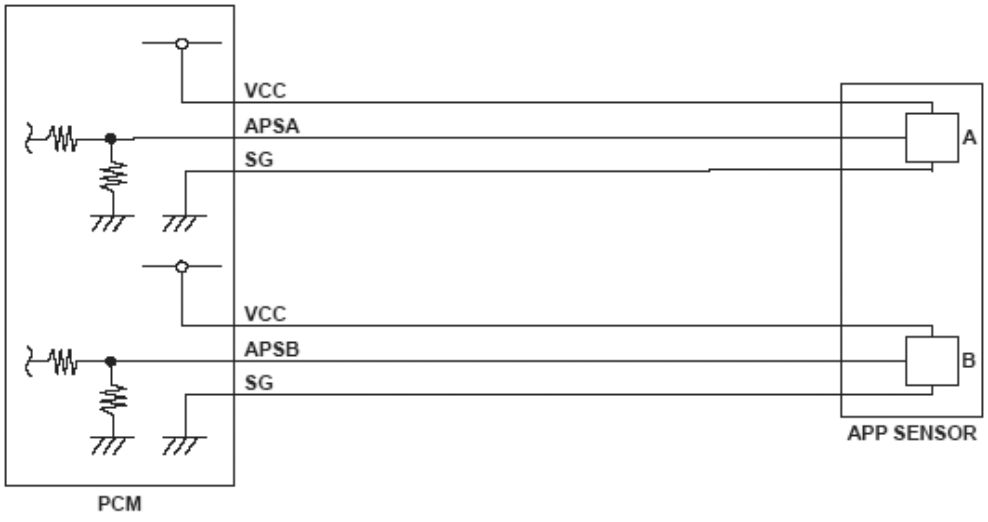

Fig. 19: Checking Continuity Between MAF Sensor/IAT Sensor 5P Connector Terminal No. 4 And Terminal B33
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 27.

NO - Repair open in the wire between the ECM (B33) and the IAT sensor, then go to step 22.

16. Turn the ignition switch OFF.
17. Jump the SCS line with the HDS.
18. Disconnect ECM connector B (44P).
19. Check for continuity between MAF sensor/IAT sensor 5P connector terminal No. 5 and ECM connector terminal B31.

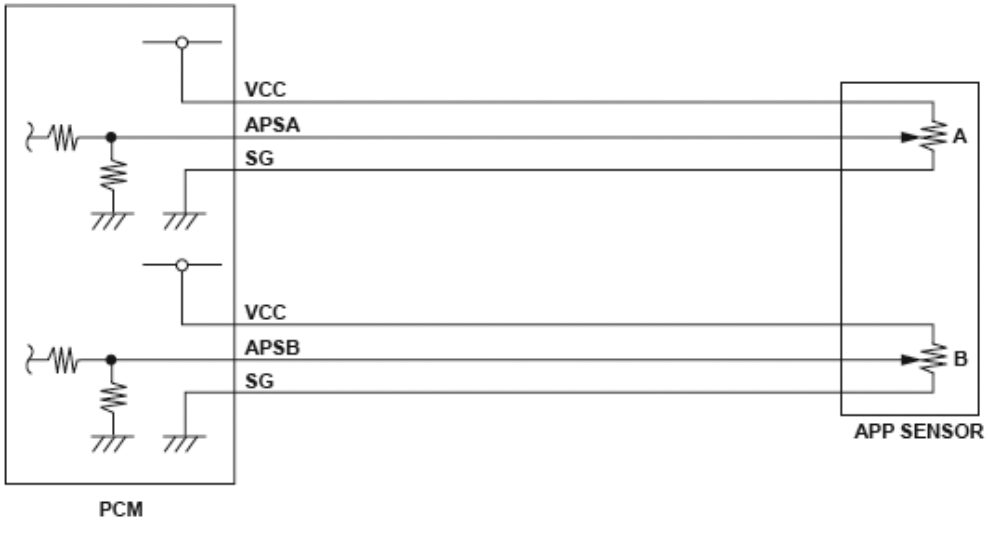

Fig. 20: Checking Continuity Between MAF Sensor/IAT Sensor 5P Connector Terminal No. 5

And B31
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 27.

NO - Repair open in the wire between the ECM (B31) and the IAT sensor, then go to step 22.

20. Turn the ignition switch OFF.
21. Replace the MAF sensor/IAT sensor (see **MAF SENSOR/IAT SENSOR REPLACEMENT**).
22. Reconnect all connectors.
23. Turn the ignition switch ON (II).
24. Reset the ECM with the HDS.
25. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
26. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0113 indicated?

YES - Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the ECM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

27. Reconnect all connectors.
28. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
29. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0113 indicated?

YES - Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0116: ECT SENSOR 1 CIRCUIT RANGE/PERFORMANCE PROBLEM

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check ECT SENSOR 1 in the DATA LIST with the HDS.

Is about 176°F (80°C) or more, or 0.78 V or less indicated?

YES - Go to step 6.

NO - Go to step 3.

3. Note the value of ECT SENSOR 1 in the DATA LIST with the HDS.
4. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
5. Check ECT SENSOR 1 in the DATA LIST with the HDS.

Does ECT SENSOR 1 change 18°F (10°C) or more?

YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1 and the ECM.

NO - Go to step 11.

6. Note the value of ECT SENSOR 1 in the DATA LIST with the HDS.
7. Turn the ignition switch OFF.
8. Open the hood, and let the engine cool for 3 hours.
9. Turn the ignition switch ON (II).
10. Check ECT SENSOR 1 in the DATA LIST with the HDS.

Does ECT SENSOR 1 change 18°F (10°C) or more?

YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1 and the ECM.

NO - Go to step 11.

11. Turn the ignition switch OFF.
12. Replace ECT sensor 1 (see **ECT SENSOR 1 REPLACEMENT**).
13. Turn the ignition switch ON (II).
14. Reset the ECM with the HDS.
15. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
16. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0116 indicated?

YES - Check for poor connections or loose terminals at ECT sensor 1 and the ECM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0117: ECT SENSOR 1 CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check ECT SENSOR 1 in the DATA LIST with the HDS.

   Is about 356°F (180°C) or more, or 0.08 V or less indicated?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1 and the ECM.

3. Turn the ignition switch OFF.
4. Disconnect the ECT sensor 12P connector.
5. Turn the ignition switch ON (II).
6. Check ECT SENSOR 1 in the DATA LIST with the HDS.

   Is about 356°F (180°C) or more, or 0.08 V or less indicated?

   YES - Go to step 7.

   NO - Go to step 11.

7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Disconnect ECM connector B (44P).
10. Check for continuity between ECT sensor 12P connector terminal No. 1 and body ground.

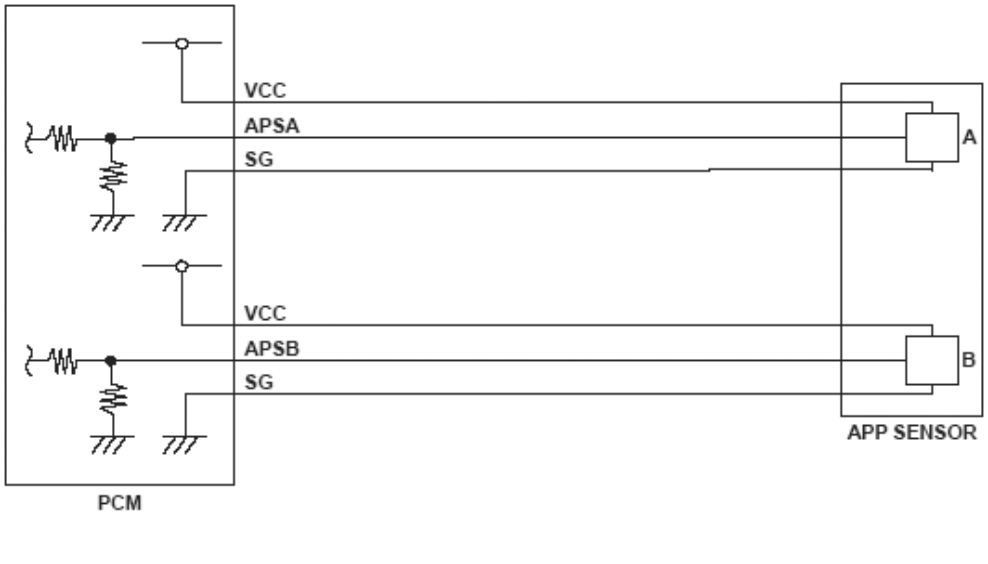

Fig. 21: Checking For Continuity Between ECT Sensor 12P Connector Terminal No. 1 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between ECT sensor 1 and the ECM (B23), then go to step 13.

NO - Go to step 18.

11. Turn the ignition switch OFF.
12. Replace ECT sensor 1 (see **ECT SENSOR 1 REPLACEMENT**).
13. Reconnect all connectors.
14. Turn the ignition switch ON (II).
15. Reset the ECM with the HDS.
16. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
17. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0117 indicated?

YES - Check for poor connections or loose terminals at ECT sensor 1 and the ECM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

18. Reconnect all connectors.
19. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
20. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0117 indicated?

YES - Check for poor connections or loose terminals at ECT sensor 1 and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0118: ECT SENSOR 1 CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check ECT SENSOR 1 in the DATA LIST with the HDS.

Is about -40°F (-40°C) or less, or 4.90 V or higher indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1 and the ECM.

3. Turn the ignition switch OFF.
4. Disconnect the ECT sensor 12P connector.
5. Connect ECT sensor 12P connector terminals No. 1 and No. 2 with a jumper wire.

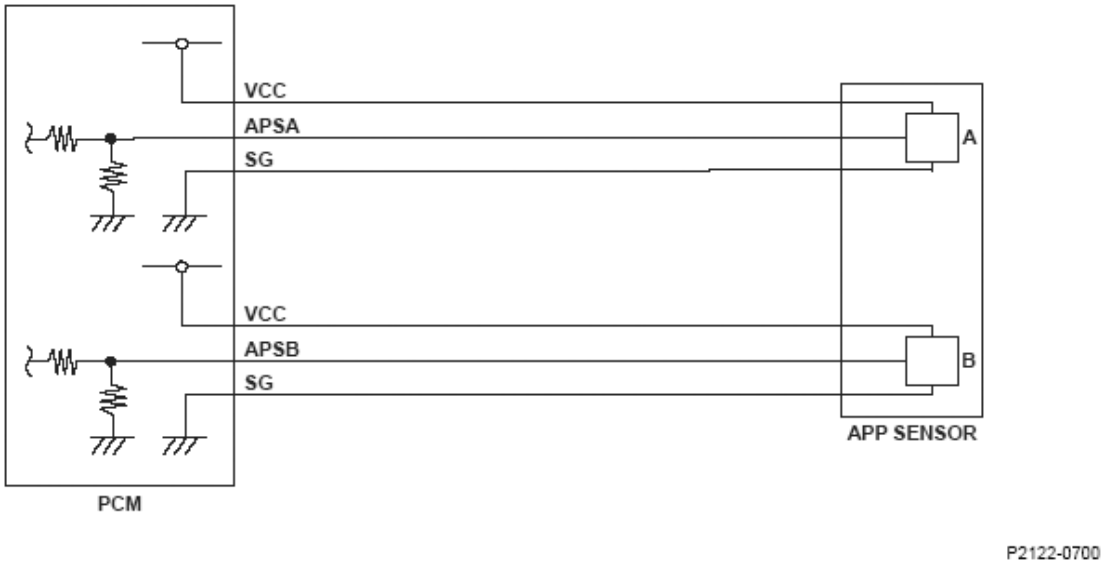

Fig. 22: Connecting ECT Sensor 12P Connector Terminals No. 1 And No. 2 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Turn the ignition switch ON (II).
7. Check ECT SENSOR 1 in the DATA LIST with the HDS.

Is about -40°F (-40°C) or less, or 4.90 V or higher indicated?

YES - Go to step 8.

NO - Go to step 20

8. Turn the ignition switch OFF.
9. Remove the jumper wire from the ECT sensor 12P connector.
10. Turn the ignition switch ON (II).
11. Measure voltage between ECT sensor 12P connector terminal No. 1 and body ground.

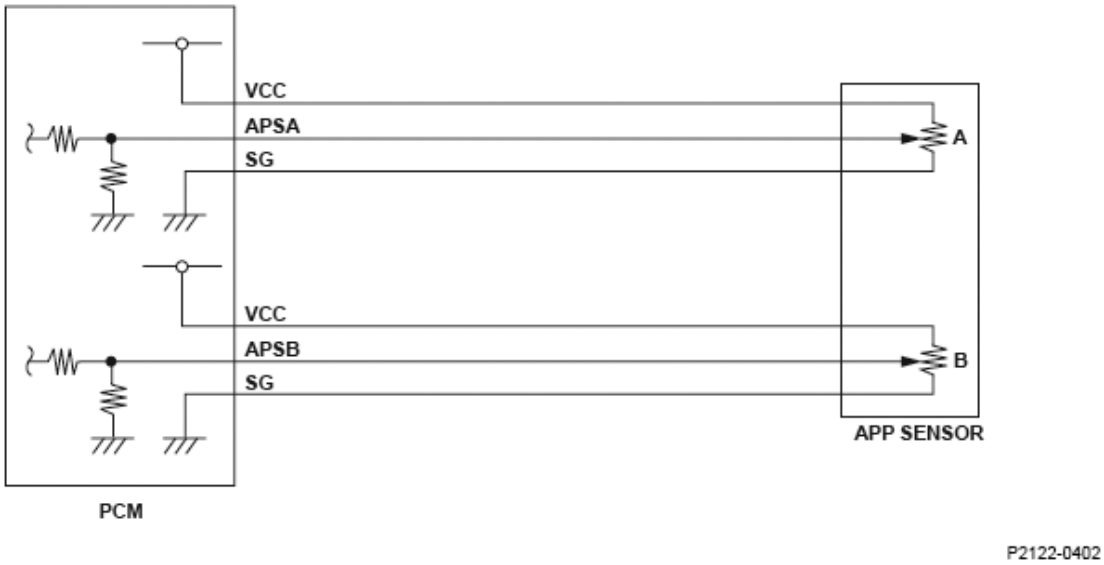

Fig. 23: Measuring Voltage Between ECT Sensor 12P Connector Terminal No. 1 And Body Ground

Is there about 5 V?

YES - Go to step 12.

NO - Go to step 16.

12. Turn the ignition switch OFF.
13. Jump the SCS line with the HDS.
14. Disconnect ECM connector B (44P).
15. Check for continuity between ECT sensor 12P connector terminal No. 2 and ECM connector terminal B33.

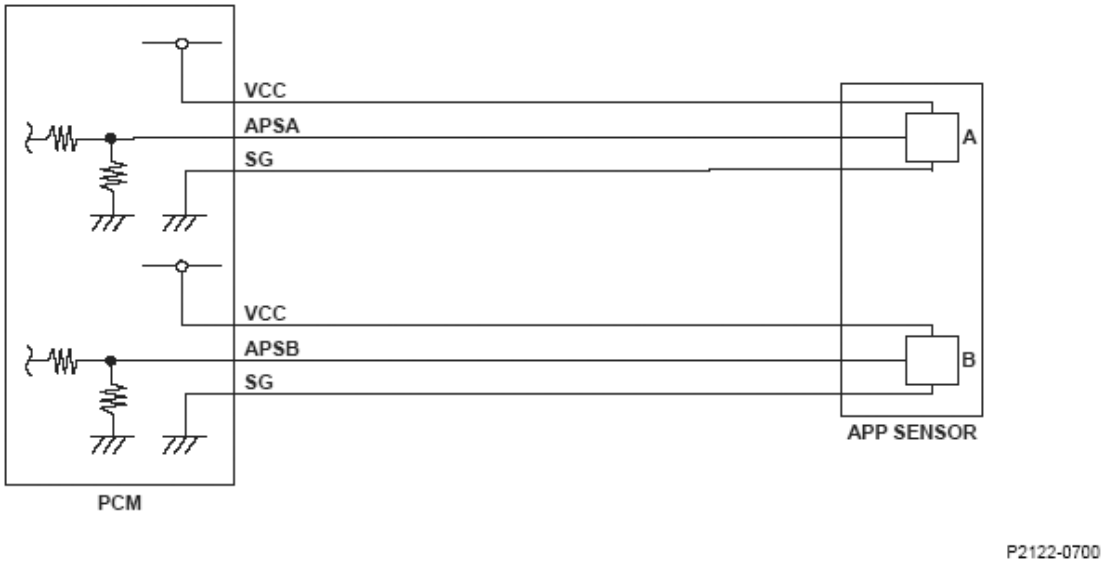

Fig. 24: Checking Continuity Between ECT Sensor 12P Connector Terminal No. 2 And ECM

Connector Terminal B33
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 27.

NO - Repair open in the wire between the ECM (B33) and ECT sensor 1, then go to step 22.

16. Turn the ignition switch OFF.
17. Jump the SCS line with the HDS.
18. Disconnect ECM connector B (44P).
19. Check for continuity between ECT sensor 12P connector terminal No. 1 and ECM connector terminal B23.

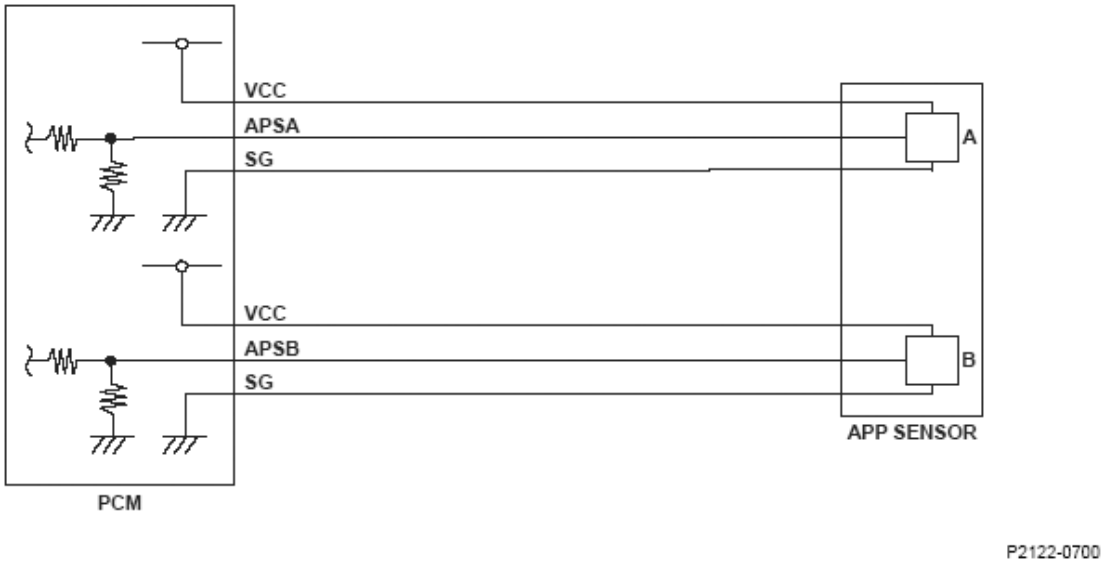

Fig. 25: Checking Continuity Between ECT Sensor 12P Connector Terminal No. 1 And ECM Connector Terminal B23
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 27.

NO - Repair open in the wire between the ECM (B23) and ECT sensor 1, then go to step 22.

20. Turn the ignition switch OFF.
21. Replace ECT sensor 1 (see **ECT SENSOR 1 REPLACEMENT**).
22. Reconnect all connectors.
23. Turn the ignition switch ON (II).
24. Reset the ECM with the HDS.
25. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
26. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0118 indicated?

YES - Check for poor connections or loose terminals at ECT sensor 1 and the ECM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

27. Reconnect all connectors.
28. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
29. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0118 indicated?

YES - Check for poor connections or loose terminals at ECT sensor 1 and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0125: ECT SENSOR 1 MALFUNCTION/SLOW RESPONSE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Start the engine, and let it idle for 5 minutes or more.
2. Check ECT SENSOR 1 in the DATA LIST with the HDS.

Is about 0°F (-18°C) or less indicated?

YES - Go to step 9.

NO - Go to step 3.

3. Allow the engine to cool to 104°F (40°C) or less.
4. Note the value of ECT SENSOR 1 and ECT SENSOR 2 in the DATA LIST with the HDS.
5. Start the engine, and let it idle.
6. Let the engine idle until ECT SENSOR 1 goes up 40°F (22°C) or more from the recorded temperature.
7. Note the value of ECT SENSOR 2 in the DATA LIST with the HDS.
8. Compare ECT SENSOR 2 and the recorded temperature.

Did ECT SENSOR 2 change 14°F (8°C) or more?

YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose

terminals at ECT sensor 1, ECT sensor 2, and the ECM.

NO - Check the thermostat (see **FAN MOTOR TEST**). If the thermostat is OK, go to step 9. If the thermostat is faulty, replace it (see **THERMOSTAT REPLACEMENT**), then go to step 11.

9. Turn the ignition switch OFF.
10. Replace ECT sensor 1 (see **ECT SENSOR 1 REPLACEMENT**).
11. Turn the ignition switch ON (II).
12. Reset the ECM with the HDS.
13. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
14. Allow the engine to cool to ambient temperature.
15. Start the engine, and let it idle for 20 minutes.
16. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0125 indicated?

    YES - Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM, then go to step 1.

    NO - Go to step 17.

17. Monitor the OBD STATUS for DTC P0125 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 16, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 14.

DTC P0128: COOLING SYSTEM MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Turn the blower switch OFF.
4. Check the FAN CTRL in the DATA LIST with the HDS.

   Is it OFF?

   YES - Go to step 5.

NO - Wait until the FAN CTRL is off, then go to step 5.

5. Check the radiator fan operation.

   Does the radiator fan keep running?

   YES - Check the radiator fan circuit (see **CIRCUIT DIAGRAM**), and the radiator fan relay (see **POWER RELAY TEST**). If the circuits and the relay are OK, go to step 19.

   NO - Go to step 6.

6. Let the engine cool until the coolant temperature is 104°F (40°C) or less.
7. Note the value of ECT SENSOR 1 and ECT SENSOR 2 in the DATA LIST with the HDS.
8. Start the engine, and let it idle.
9. Let the engine idle until ECT SENSOR 1 goes up 40°F (22°C) or more from the recorded temperature.
10. Check ECT SENSOR 2 in the DATA LIST with the HDS.
11. Compare the value of recorded ECT SENSOR 2 and the present value of ECT SENSOR 2.

    Did temperature rise 14°F (8°C) or more?

    YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM.

    NO - Test the thermostat (see **FAN MOTOR TEST**), then go to step 12.

12. Turn the ignition switch ON (II).
13. Reset the ECM with the HDS.
14. Let the engine cool until the coolant temperature is between 21°F (-6°C) and 104°F (40°C).
15. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
16. Test-drive at a steady speed between 15-75 mph (24-120 km/h) for 10 minutes.
17. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0128 indicated?

    YES - Check the cooling system, then go to step 1.

    NO - Go to step 18.

18. Monitor the OBD STATUS for DTC P0128 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 17, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check the cooling system, then go to step 1. If the screen indicates NOT COMPLETED, go to step 14.

19. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
20. Let the engine cool until the coolant temperature is between 21°F (-6°C) and 104°F (40°C).
21. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
22. Test-drive at a steady speed between 15-75 mph (24-120 km/h) for 10 minutes.
23. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0128 indicated?

    YES - Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 20. If the ECM was substituted, go to step 1.

    NO - Go to step 24.

24. Monitor the OBD STATUS for DTC P0128 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 23, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 20. If the ECM was substituted, go to step 1. If the screen indicates NOT COMPLETED, go to step 20.

DTC P0133: A/F SENSOR (SENSOR 1) MALFUNCTION/SLOW RESPONSE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
4. Test-drive under these conditions:
   - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
   - Transmission in 3rd or 4th gear
   - Drive the vehicle at 25 mph (40 km/h) or less for 5 minutes, then drive at a steady speed between 26-81 mph (41-130 km/h).
5. Monitor the OBD STATUS for DTC P0133 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

YES - Go to step 6.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 3 and recheck.

6. Turn the ignition switch OFF.
7. Replace the A/F sensor (Sensor 1) (see **A/F SENSOR REPLACEMENT**).
8. Turn the ignition switch ON (II).
9. Reset the ECM with the HDS.
10. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
11. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
12. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
    - Transmission in 3rd or 4th gear
    - Drive the vehicle at 25 mph (40 km/h) or less for 5 minutes, then drive at a steady speed between 26-81 mph (41-130 km/h).
13. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0133 indicated?

    YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM, then go to step 1.

    NO - Go to step 14.

14. Monitor the OBD STATUS for DTC P0133 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 13, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM, then go to step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 11.

DTC P0134: A/F SENSOR (SENSOR 1) HEATER SYSTEM MALFUNCTION

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If the vehicle was out of fuel and the engine stalled before this DTC was stored, refuel and clear the DTC with the HDS.**
- **If DTC P0135 is stored at the same time as DTC P0134, troubleshoot**

DTC P0135 first, then recheck for DTC P0134.

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle without load (in neutral) until the radiator fan comes on.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0134 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1), the PGM-FI subrelay, and the ECM.

5. Turn the ignition switch OFF.
6. Replace the A/F sensor (Sensor 1) (see **A/F SENSOR REPLACEMENT**).
7. Turn the ignition switch ON (II).
8. Reset the ECM with the HDS.
9. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
10. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0134 indicated?

    YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1), the PGM-FI subrelay, and the ECM, then go to step 1.

    NO - Go to step 11.

11. Monitor the OBD STATUS for DTC P0134 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 10, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1), the PGM-FI subrelay, and the ECM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P0135: A/F SENSOR (SENSOR 1) HEATER CIRCUIT MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.

3. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0135 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1), the PGM-FI subrelay, and the ECM.

5. Turn the ignition switch OFF.
6. Check the No. 11 FI SUB (15 A) fuse in the underhood fuse/relay box.

   Is the fuse OK?

   YES - Go to step 7.

   NO - Go to step 20.

7. Test the PGM-FI subrelay (E) in the under-hood fuse/relay box (see **POWER RELAY TEST**).

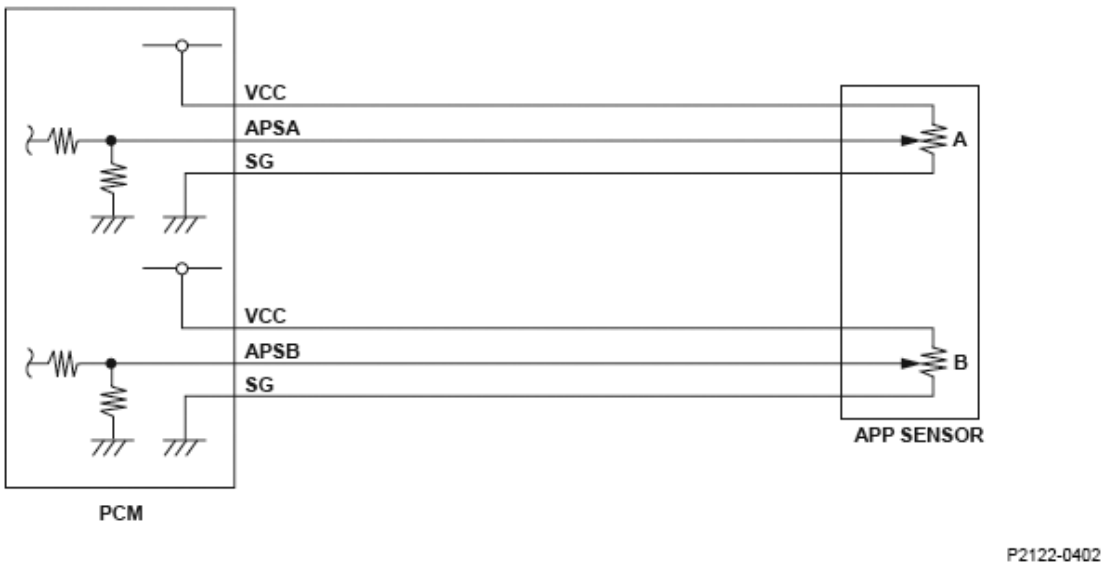

Fig. 26: Identifying PGM-FI Subrelay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the PGM-FI subrelay OK?

YES - Go to step 8.

NO - Replace the PGM-FI subrelay, then go to step 24.

8. Disconnect the A/F sensor (Sensor 1) 4P connector.
9. At the sensor side, measure resistance between A/F sensor (Sensor 1) 4P connector terminals No. 3

and No. 4.

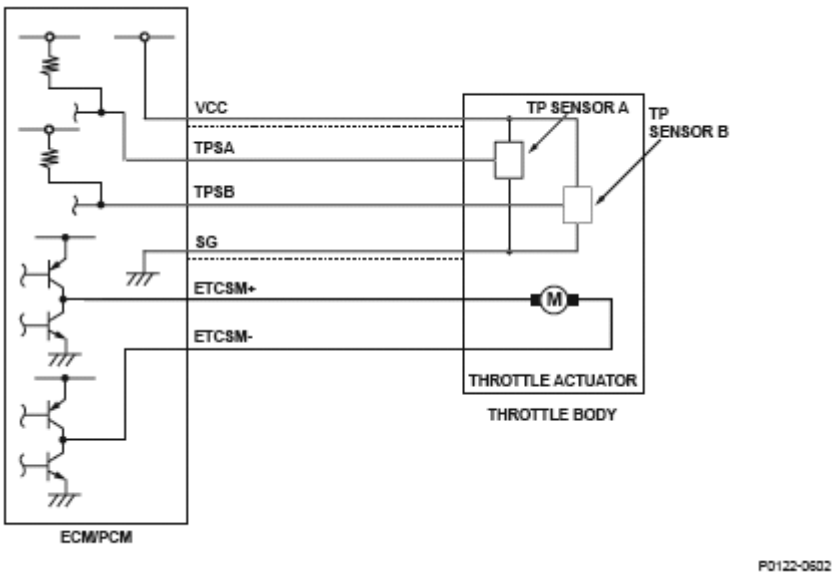

Fig. 27: Measuring Resistance Between A/F Sensor 4P Connector Terminals No. 3 And No. 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 2.0-2.7 ohms at room temperature?

YES - Go to step 10.

NO - Go to step 24.

10. At the sensor side, check for continuity between A/F sensor (Sensor 1) 4P connector terminals No. 1 and No. 3, and between terminals No. 1 and No. 4 individually.

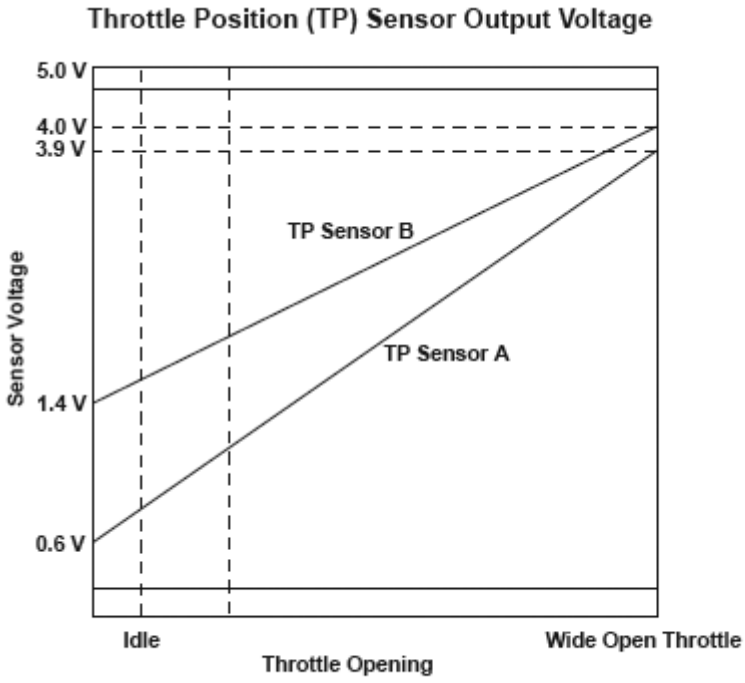

Fig. 28: Checking Continuity Between A/F Sensor 4P Connector Terminals No. 1 And No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 24.

NO - Go to step 11.

11. Jump the SCS line with the HDS.
12. Disconnect ECM connector C (44P).
13. Connect A/F sensor (Sensor 1) 4P connector terminal No. 3 to body ground with a jumper wire.

14. Check for continuity between ECM connector terminal C9 and body ground.

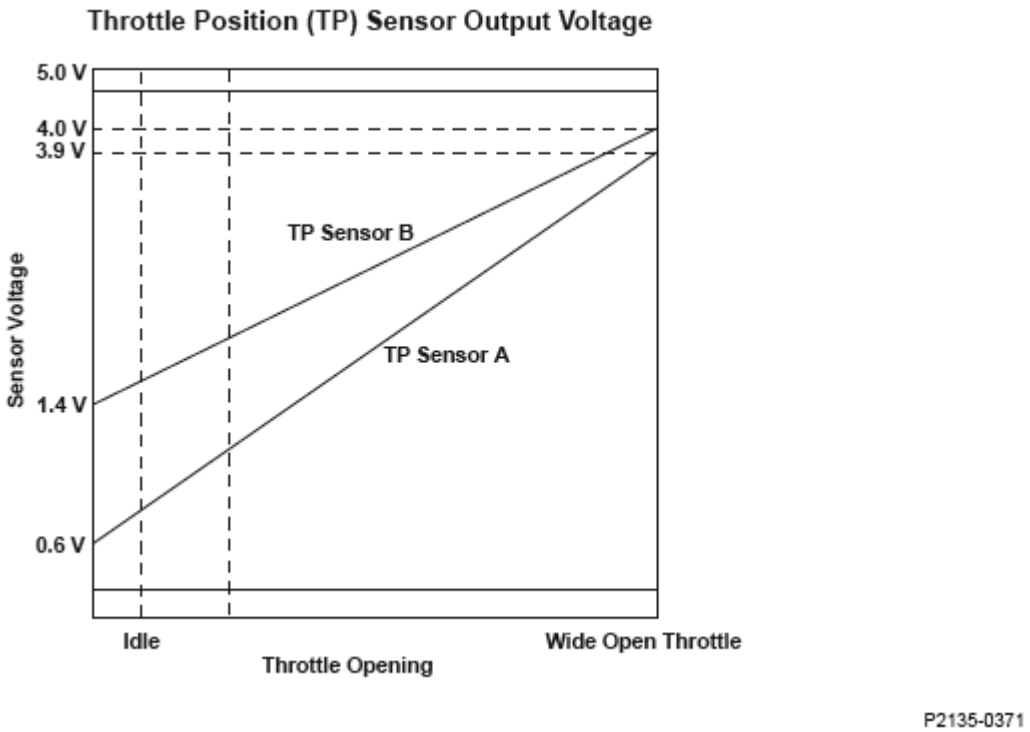

Fig. 30: Checking Continuity Between ECM Connector Terminal C9 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 15.

NO - Repair open in the wire between the ECM (C9) and the A/F sensor (Sensor 1), then go to step 25.

15. Remove the PGM-FI subrelay (E) from the under-hood fuse/relay box.

17. Check for continuity between PGM-FI subrelay 4P connector terminal No. 2 and body ground.

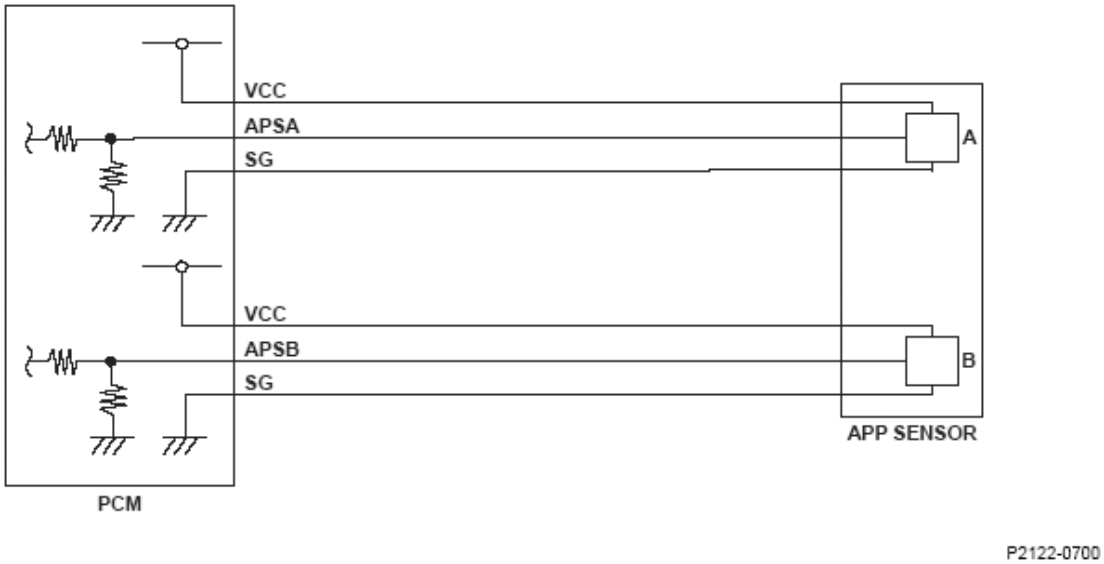

Fig. 33: Checking For Continuity Between PGM-FI Subrelay 4P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 18.

NO - Repair open in the wire between the A/F sensor (Sensor 1) and the PGM-FI subrelay, then go to step 25.

18. Disconnect ECM connector A (44P).
19. Check for continuity between PGM-FI subrelay 4P connector terminal No. 3 and ECM connector terminal A21.

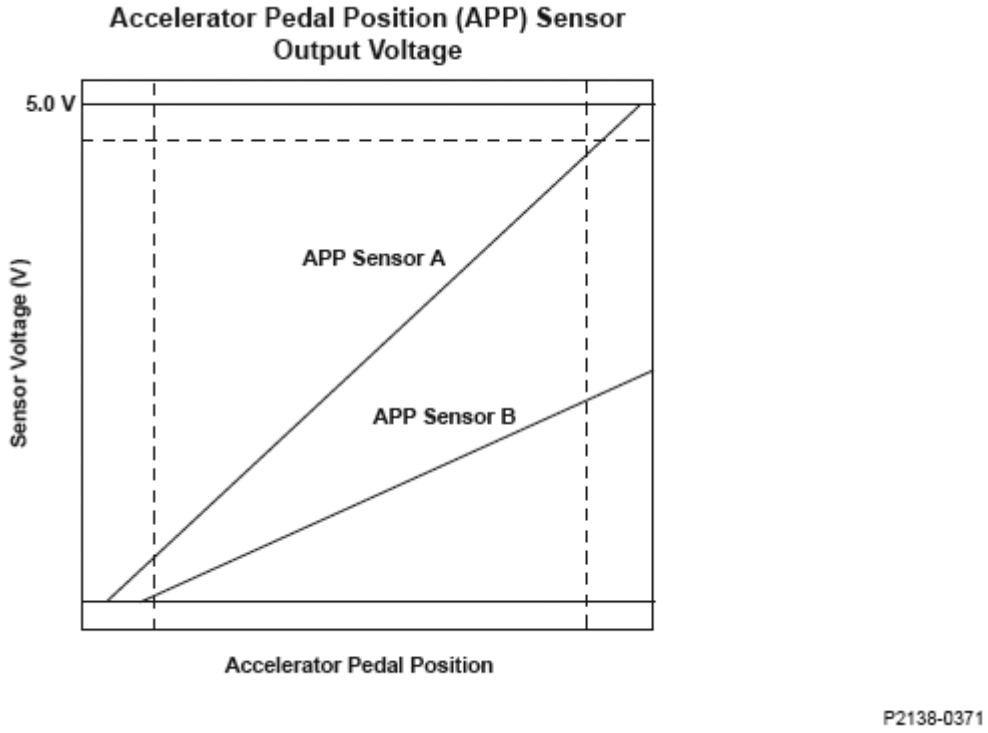

Fig. 34: Checking Continuity Between PGM-FI Subrelay 4P Connector Terminal No. 3 And ECM Connector Terminal A21
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 31.

NO - Repair open in the wire between the ECM (A21) and the PGM-FI subrelay, then go to step 25.

20. Remove the PGM-FI subrelay (E) from the underhood fuse/relay box.

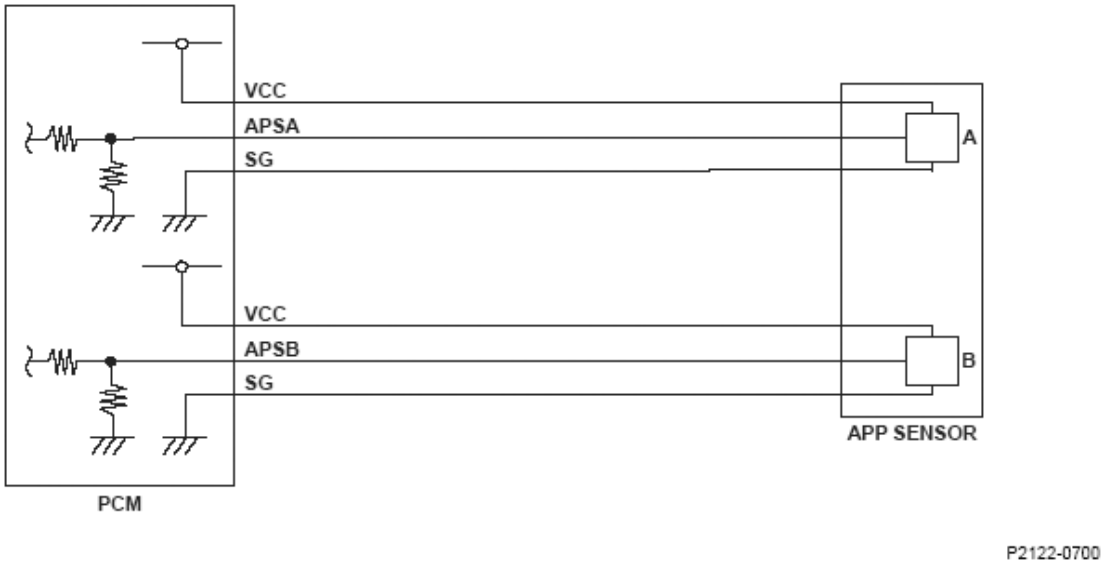

Fig. 35: Identifying PGM-FI Subrelay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Disconnect the A/F sensor (Sensor 1) 4P connector.
22. Disconnect the EVAP canister vent shut valve 2P connector.
23. Check for continuity between A/F sensor (Sensor 1) 4P connector terminal No. 4 and body ground.

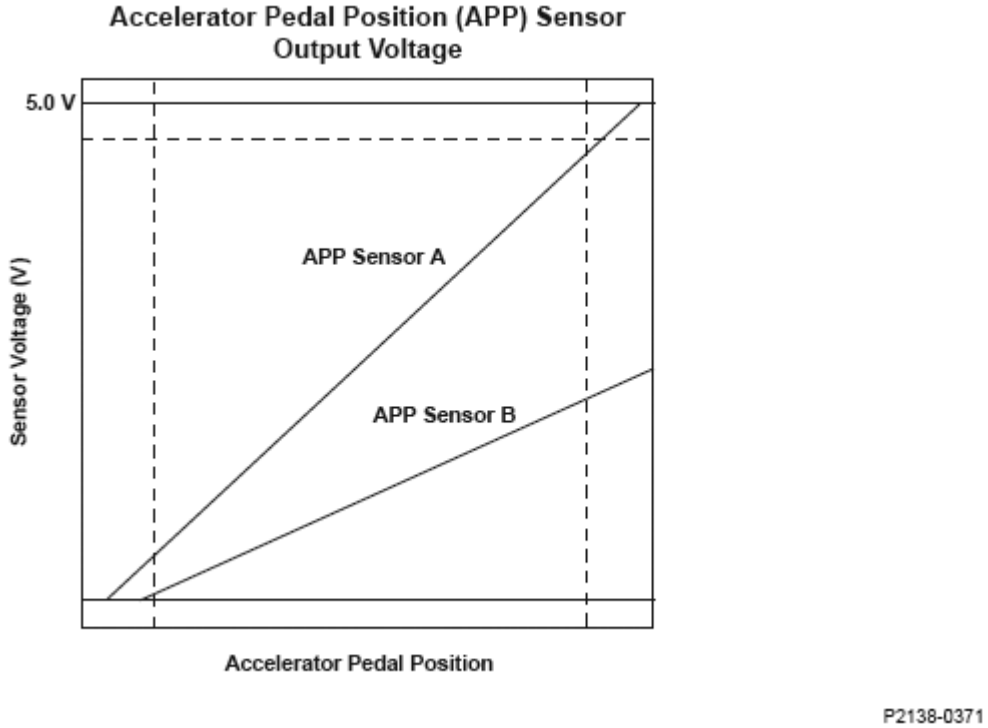

Fig. 36: Checking For Continuity Between A/F Sensor 4P Connector Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the PGM-FI subrelay, the EVAP canister vent shut valve, and the A/F sensor (Sensor 1). Also replace the No. 11 FI SUB (15 A) fuse, then go to step 25.

NO - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**), then go to step 25.

24. Replace the A/F sensor (Sensor 1) (see **A/F SENSOR REPLACEMENT**).
25. Reconnect all connectors.
26. Turn the ignition switch ON (II).
27. Reset the ECM with the HDS.
28. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
29. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0135 indicated?

    YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1), the PGM-FI subrelay, and the ECM, then go to step 1.

    NO - Go to step 30.

30. Monitor the OBD STATUS for DTC P0135 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 29, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1), the PGM-FI subrelay, and the ECM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

31. Reconnect all connectors.
32. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
33. Start the engine, and let it idle.
34. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0135 indicated?

    YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1), the PGM-FI subrelay, and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 33. If the ECM was substituted, go to step 1.

    NO - Go to step 35.

35. Monitor the OBD STATUS for DTC P0135 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

YES - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 34, go to the indicated DTC's troubleshooting.

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1), the PGM-FI subrelay, and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 33. If the ECM was substituted, go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P0137: SECONDARY HO2S (SENSOR 2) CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle without load (in neutral) until the radiator fan comes on.
4. Check the HO2S S2 in the DATA LIST with the HDS.

   Does the voltage stay at 0.29 V or less?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM.

5. Turn the ignition switch OFF.
6. Remove the center console (see **CENTER CONSOLE REMOVAL/INSTALLATION**).
7. Disconnect the secondary HO2S (Sensor 2) 4P connector.
8. Turn the ignition switch ON (II).
9. Check the HO2S S2 in the DATA LIST with the HDS.

   Does the voltage stay at 0.29 V or less?

   YES - Go to step 10.

   NO - Go to step 14.

10. Turn the ignition switch OFF.
11. Jump the SCS line with the HDS.
12. Disconnect ECM connector C (44P).
13. Check for continuity between secondary HO2S (Sensor 2) 4P connector terminal No. 2 and body ground.

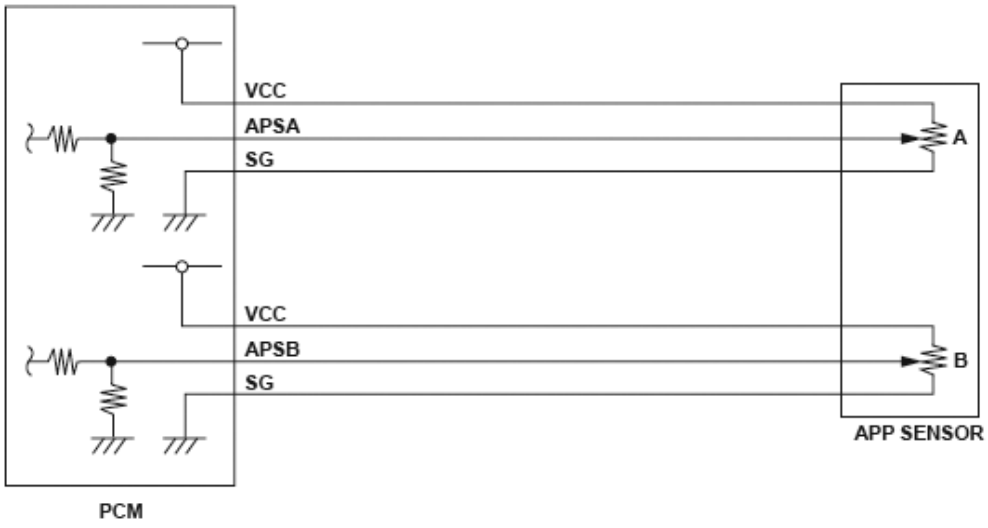

Fig. 37: Checking For Continuity Between Secondary HO2S 4P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM (C27) and the secondary HO2S (Sensor 2), then go to step 16.

NO - Go to step 24.

14. Turn the ignition switch OFF.
15. Replace the secondary HO2S (Sensor 2) (see **SECONDARY HO2S REPLACEMENT**).
16. Reconnect all connectors.
17. Turn the ignition switch ON (II).
18. Reset the ECM with the HDS.
19. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
20. Start the engine, and let it idle without load (in neutral) until the radiator fan comes on.
21. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
    - Transmission in 4th gear
    - Engine speed between 1,500-3,000 rpm
    - Drive about 1 minute or more
22. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0137 indicated?

YES - Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM, then go to step 1.

NO - Go to step 23.

23. Monitor the OBD STATUS for DTC P0137 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 22, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM, then go to step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 20.

24. Reconnect all connectors.
25. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
26. Start the engine, and let it idle without load (in neutral) until the radiator fan comes on.
27. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
    - Transmission in 4th gear
    - Engine speed between 1,500-3,000 rpm
    - Drive 1 minute or more
28. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0137 indicated?

    YES - Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 26. If the ECM was substituted, go to step 1.

    NO - Go to step 29.

29. Monitor the OBD STATUS for DTC P0137 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 28, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 26. If the ECM was substituted, go to step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 26.

DTC P0138: SECONDARY HO2S (SENSOR 2) CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL

TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle without load (in neutral) until the radiator fan comes on.
4. Check the HO2S S2 in the DATA LIST with the HDS.

   Does the voltage stay at 1.27 V or more?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM.

5. Turn the ignition switch OFF.
6. Remove the center console (see **CENTER CONSOLE REMOVAL/INSTALLATION**).
7. Disconnect the secondary HO2S (Sensor 2) 4P connector.
8. Connect secondary HO2S (Sensor 2) 4P connector terminals No. 1 and No. 2 with a jumper wire.

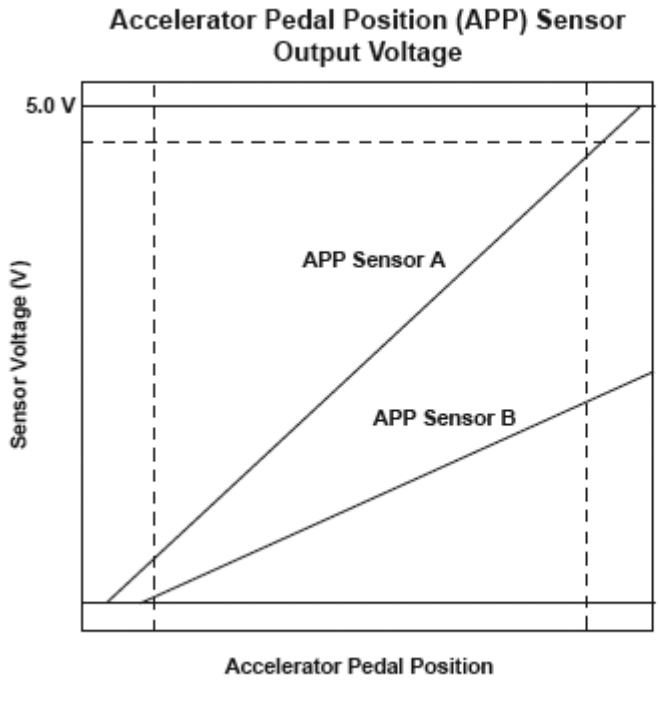

Fig. 38: Connecting Secondary HO2S 4P Connector Terminals No. 1 And No. 2 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Turn the ignition switch ON (II).
10. Check the HO2S S2 in the DATA LIST with the HDS.

    Does the voltage stay at 1.27 V or more?

YES - Go to step 11.

NO - Go to step 20.

11. Turn the ignition switch OFF.
12. Remove the jumper wire from the secondary HO2S (Sensor 2) 4P connector.
13. Connect secondary HO2S (Sensor 2) 4P connector terminal No. 2 to body ground with a jumper wire.

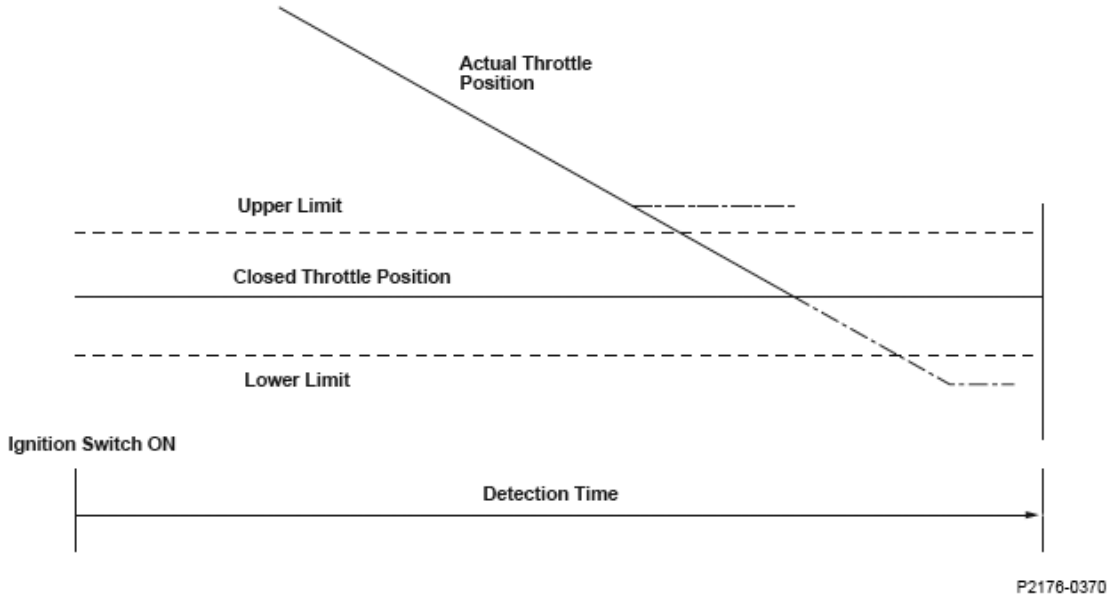

Fig. 39: Connecting Secondary HO2S 4P Connector Terminal No. 2 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Turn the ignition switch ON (II).
15. Check the HO2S S2 in the DATA LIST with the HDS.

Does the voltage stay at 1.27 V or more?

YES - Go to step 16.

NO - Repair open in the wire between the ECM (B33) and the secondary HO2S (Sensor 2), then go to step 22.

16. Turn the ignition switch OFF.
17. Jump the SCS line with the HDS.
18. Disconnect ECM connector C (44P).
19. Check for continuity between ECM connector terminal C27 and body ground.

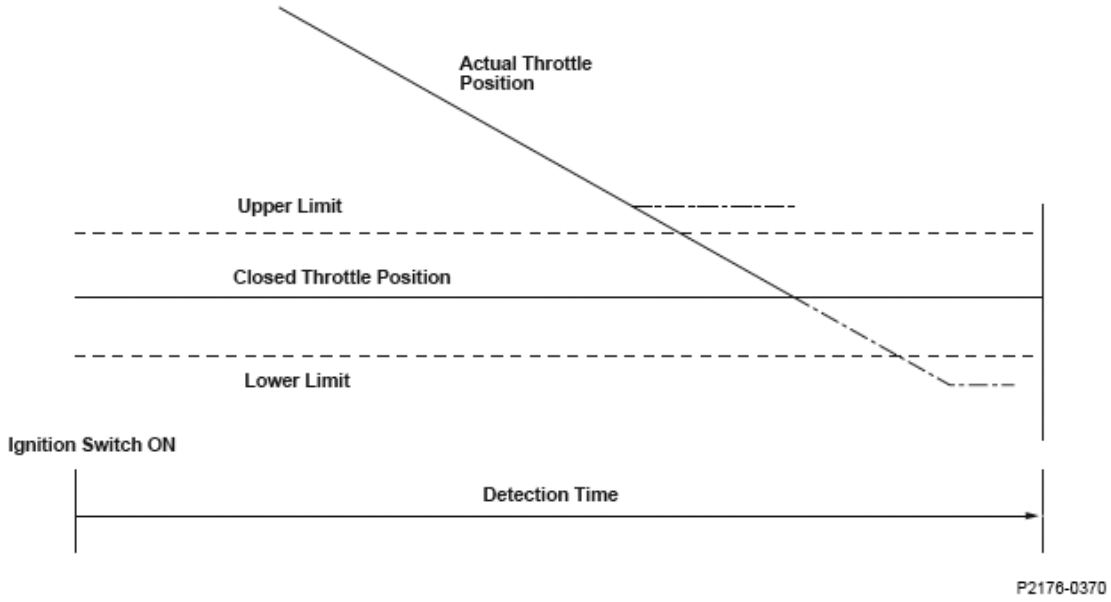

Fig. 40: Checking Continuity Between ECM Connector Terminal C27 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 30.

NO - Repair open in the wire between the ECM (C27) and the secondary HO2S (Sensor 2), then go to step 22.

20. Turn the ignition switch OFF.
21. Replace the secondary HO2S (Sensor 2) (see **SECONDARY HO2S REPLACEMENT**).
22. Reconnect all connectors.
23. Turn the ignition switch ON (II).
24. Reset the ECM with the HDS.
25. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
26. Start the engine, and let it idle without load (in neutral) until the radiator fan comes on.
27. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
    - Transmission in 4th gear
    - Engine speed between 1,500-3,000 rpm
    - Drive about 1 minute or more
28. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0138 indicated?

YES - Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM, then go to step 1.

NO - Go to step 29.

29. Monitor the OBD STATUS for DTC P0138 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 28, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM, then go to step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 26.

30. Reconnect all connectors.
31. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
32. Start the engine, and let it idle without load (in neutral) until the radiator fan comes on.
33. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
    - Transmission in 4th gear
    - Engine speed between 1,500-3,000 rpm
    - Drive about 1 minute or more
34. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0138 indicated?

    YES - Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 32. If the ECM was substituted, go to step 1.

    NO - Go to step 35.

35. Monitor the OBD STATUS for DTC P0138 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 34, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 32. If the ECM was substituted, go to step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 32.

DTC P0139: SECONDARY HO2S (SENSOR 2) SLOW RESPONSE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL

TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle without load (in neutral) until the radiator fan comes on.
4. Test-drive under these conditions:
   - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
   - Transmission in 4th gear
   - Vehicle speed at 35 mph (56 km/h) or more
   - Drive about 15 seconds
5. Monitor the OBD STATUS for DTC P0139 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 6.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 3 and recheck.

6. Turn the ignition switch OFF.
7. Replace the secondary HO2S (Sensor 2) (see **SECONDARY HO2S REPLACEMENT**).
8. Turn the ignition switch ON (II).
9. Reset the ECM with the HDS.
10. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
11. Start the engine, and let it idle without load (in neutral) until the radiator fan comes on.
12. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
    - Transmission in 4th gear
    - Vehicle speed at 35 mph (56 km/h) or more
    - Drive about 15 seconds
13. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0139 indicated?

    YES - Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM, then go to step 1.

    NO - Go to step 14.

14. Monitor the OBD STATUS for DTC P0139 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 13, go to the indicated DTC's troubleshooting.

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM, then go to step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 11.

DTC P0141: SECONDARY HO2S (SENSOR 2) HEATER CIRCUIT MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0141 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM.

5. Turn the ignition switch OFF.
6. Check the No. 3 ALTERNATOR (10 A) fuse in the under-dash fuse/relay box.

   Is the fuse OK?

   YES - Go to step 7.

   NO - Repair short in the wire between the secondary HO2S (Sensor 2) and the No. 3 ALTERNATOR (10 A) fuse. Also replace the No. 3 ALTERNATOR (10 A) fuse, then go to step 23.

7. Disconnect the secondary HO2S (Sensor 2) 4P connector.
8. At the secondary HO2S (Sensor 2) side, measure resistance between secondary HO2S (Sensor 2) 4P connector terminals No. 3 and No. 4.

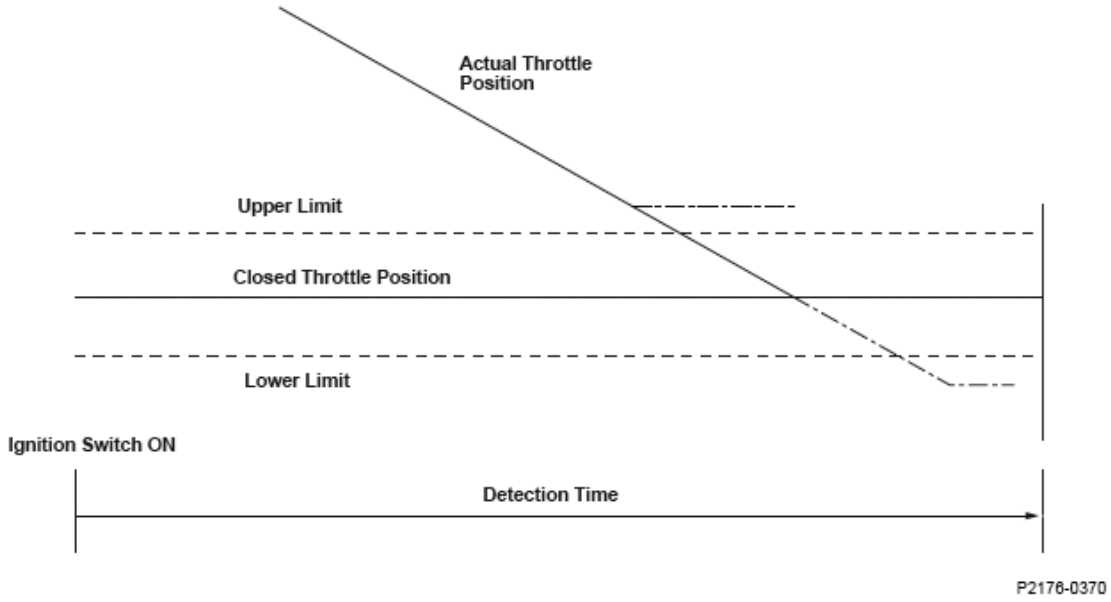

Fig. 41: Measuring Resistance Between Secondary HO2S 4P Connector Terminals No. 3 And No. 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 5.4-7.3 ohms at room temperature?

YES - Go to step 9.

NO - Go to step 22.

9. At the secondary HO2S (Sensor 2) side, check for continuity between body ground and secondary HO2S (Sensor 2) 4P connector terminals No. 3 and No. 4 individually.

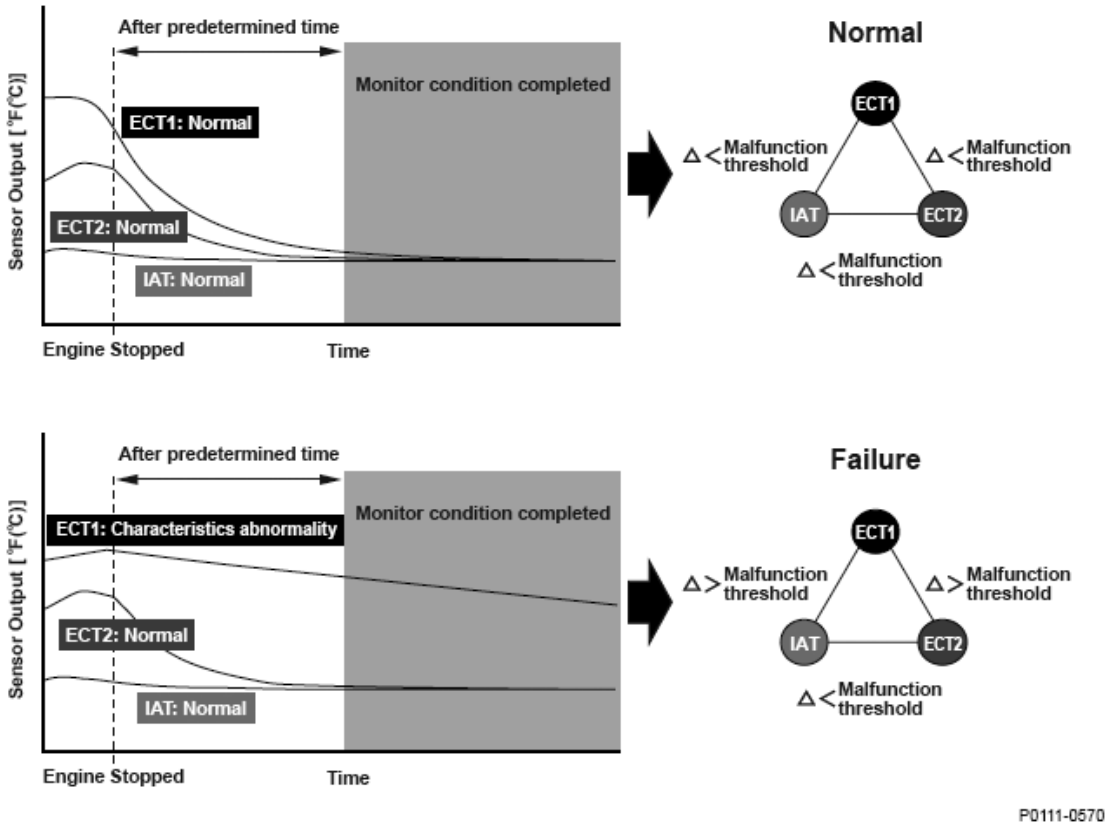

Fig. 42: Checking Continuity Between Body Ground And Secondary HO2S 4P Connector Terminals No. 3 And No. 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 22.

NO - Go to step 10.

10. Turn the ignition switch ON (II).
11. Measure voltage between secondary HO2S (Sensor 2) 4P connector terminals No. 3 and No. 4.

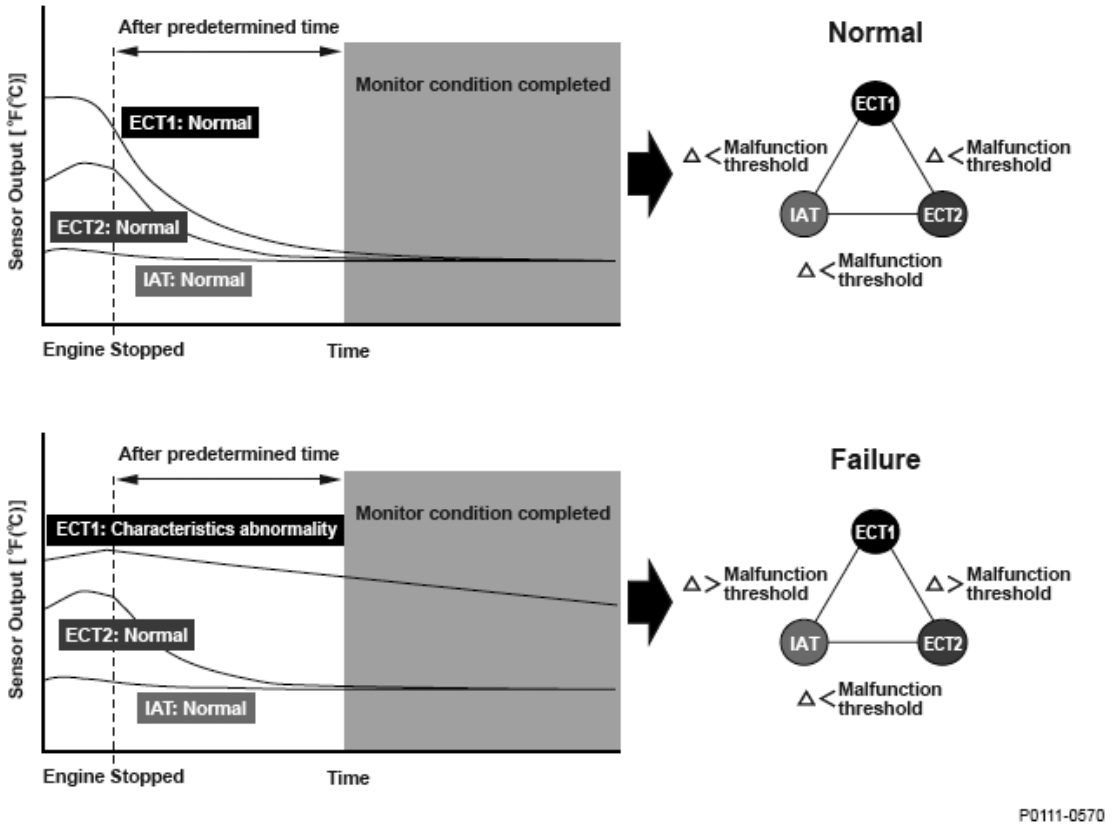

Fig. 43: Measuring Voltage Between Secondary HO2S 4P Connector Terminals No. 3 And No. 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 12.

NO - Go to step 16.

12. Turn the ignition switch OFF.
13. Jump the SCS line with the HDS.
14. Disconnect ECM connector B (44P).
15. Check for continuity between ECM connector terminal B4 and body ground.

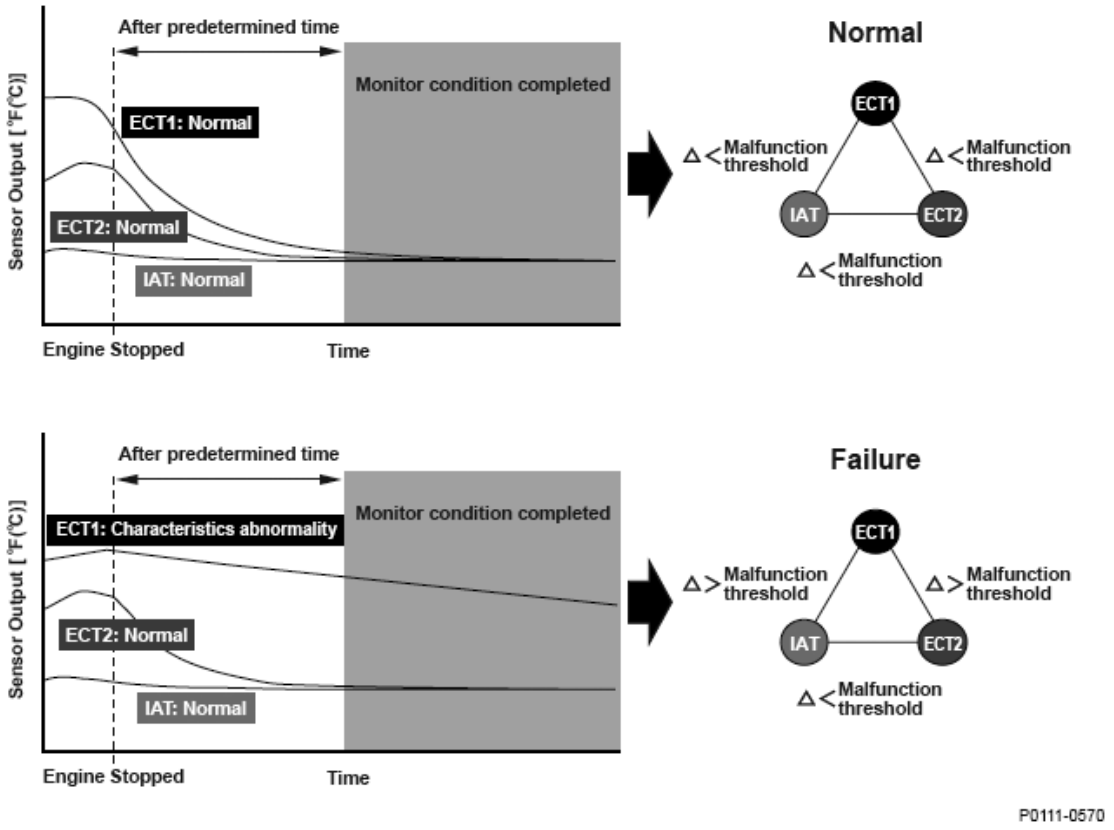

Fig. 44: Checking Continuity Between ECM Connector Terminal B4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM (B4) and the secondary HO2S (Sensor 2), then go to step 23.

NO - Go to step 29.

16. Measure voltage between secondary HO2S (Sensor 2) 4P connector terminal No. 4 and body ground.

Fig. 45: Measuring Voltage Between Secondary HO2S 4P Connector Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 17.

NO - Repair open in the wire between the secondary HO2S (Sensor 2) and the No. 3 ALTERNATOR (10 A) fuse, then go to step 23.

17. Turn the ignition switch OFF.
18. Jump the SCS line with the HDS.
19. Disconnect ECM connector B (44P).
20. Connect secondary HO2S (Sensor 2) 4P connector terminal No. 3 to body ground with a jumper wire.

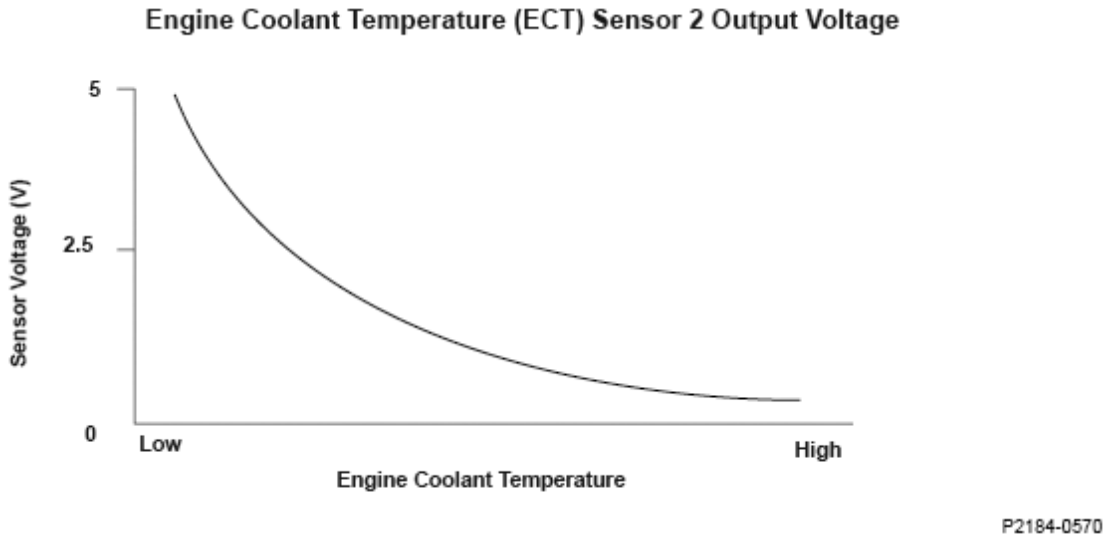

Fig. 46: Connecting Secondary HO2S 4P Connector Terminal No. 3 To Body Ground With Jumper Wire

21. Check for continuity between ECM connector terminal B4 and body ground.

Fig. 47: Checking For Continuity Between ECM Connector Terminal B4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 29.

NO - Repair open in the wire between the ECM (B4) and the secondary HO2S (Sensor 2), then go to step 23.

22. Replace the secondary HO2S (Sensor 2) (see **SECONDARY HO2S REPLACEMENT**).
23. Reconnect all connectors.
24. Turn the ignition switch ON (II).
25. Reset the ECM with the HDS.
26. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
27. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0141 indicated?

    YES - Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM, then go to step 1.

    NO - Go to step 28.

28. Monitor the OBD STATUS for DTC P0141 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 27, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

29. Reconnect all connectors.
30. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
31. Start the engine, and let it idle.
32. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0141 indicated?

    YES - Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 31. If the ECM was substituted, go to step 1.

    NO - Go to step 33.

33. Monitor the OBD STATUS for DTC P0141 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 32, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the secondary

HO2S (Sensor 2) and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 31. If the ECM was substituted, go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P0171: FUEL SYSTEM TOO LEAN; DTC P0172: FUEL SYSTEM TOO RICH

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If any of the DTCs listed below are indicated at the same time as DTC P0171 and/or P0172, troubleshoot those DTCs first, then recheck for P0171 and/or P0172.**

  P0101, P0102, P0103: Mass airflow (MAF) sensor

  P0107, P0108, P1128, P1129: Manifold absolute pressure (MAP) sensor

  P0133, P1172, P1157, P2195, P2238, P2252, P2A00: Air fuel ratio (A/F) sensor (Sensor 1)

  P0134, P0135: Airfuel ratio (A/F) sensor (Sensor 1) heater

  P0137, P0138, P0139, P2270, P2271: Secondary HO2S (Sensor 2)

  P0141: Secondary HO2S (Sensor 2) heater

  P2646, P2647, P2648, P2649: VTEC system

  P0443, P0496: EVAP canister purge valve

1. Check the fuel pressure (see **FUEL PRESSURE TEST**).

   Is the fuel pressure OK?

   YES - Go to step 2.

   NO -

   - If the pressure is too high, replace the fuel pressure regulator (see **FUEL PRESSURE REGULATOR REPLACEMENT**), then go to step 7.
   - If the pressure is too low, check the fuel pump, the fuel feed pipe and the fuel filter. If they are OK, replace the fuel pressure regulator (see **FUEL PRESSURE REGULATOR REPLACEMENT**), then go to step 7.
2. Check for vacuum leaks at these parts:
   - PCV valve
   - PCV hose
   - EVAP canister purge valve
   - Throttle body

- Intake manifold
- Brake booster
- Brake booster hose
- Air Intake duct

Are the parts OK?

YES - Go to step 3.

NO - Repair or replace parts with leaks, then go to step 7.

3. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
4. Check for these conditions:
   - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
   - Transmission in neutral
   - All electrical loads off
5. Monitor the ENGINE SPEED in the DATA LIST with the HDS, and hold the engine speed at 2,500 rpm. Once the engine speed is met, hold the accelerator pedal steady for more than 10 seconds.

   Did the engine speed vary more than 100 rpm from 2,500 rpm?

   YES - Repeat step 5.

   NO - Go to step 6.

6. While holding the engine speed at 4,500 rpm, check the MAF SENSOR in the DATA LIST with the HDS.

   Is there about 5.7-8.3 gm/s?

   YES - Check the engine valve clearances and adjust if necessary (see **VALVE CLEARANCE ADJUSTMENT**). If the valve clearances are OK, replace the injectors (see **INJECTOR REPLACEMENT**), then go to step 7.

   NO - Replace the MAF sensor/IAT sensor (see **MAF SENSOR/IAT SENSOR REPLACEMENT**), then go to step 7.

7. Turn the ignition switch ON (II).
8. Reset the ECM with the HDS.
9. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
10. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
11. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
    - Transmission in neutral

- All electrical loads off

NOTE: **DTC P0171 and/or P0172 may take up to 80 minutes of test driving to set. Using the HDS, monitor the air fuel feed back average (AF FB AVE). If the air fuel feed back average stays within 0.80-1.25, there is no problem at this time.**

12. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0171 or P0172 indicated?

    YES - Go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0300: RANDOM MISFIRE AND ANY COMBINATION OF THE FOLLOWING:; DTC P0301: NO. 1 CYLINDER MISFIRE DETECTED; DTC P0302: NO. 2 CYLINDER MISFIRE DETECTED; DTC P0303: NO. 3 CYLINDER MISFIRE DETECTED; DTC P0304: NO. 4 CYLINDER MISFIRE DETECTED

Special Tools Required

- Pressure gauge adapter 07NAJ-P07010A
- A/T low pressure gauge w/panel 07406-0070301
- A/T pressure hose 07406-0020201
- A/T pressure hose, 2,210 mm 07MAJ-PY4011A
- A/T pressure adapter 07MAJ-PY40120
- Oil pressure hose 07ZAJ-S5A0200

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If the misfire is frequent enough to trigger detection of increased emissions during two consecutive driving cycles, the MIL will come on, and DTC P0300 (and some of the combination of P0301 through P0304) will be stored.**
- **If the misfire is frequent enough to damage the catalyst, the MIL will flash whenever the misfire occurs, and DTC P0300 (and some of the combination of P0301 through P0304) will be stored. When the misfire stops, the MIL will remain on.**
- **If any of the DTCs listed below are indicated at the same time as the random misfire DTCs, troubleshoot those DTCs first, then recheck for random misfire DTCs:**

  P0101, P0102, P0103: Mass air flow (MAF) sensor

P0107, P0108: Manifold absolute pressure (MAP) sensor

P0171, P0172: Fuel system

P0335, P0339: Crankshaft position (CKP) sensor

P0365, P0369: Camshaft position (CMP) sensor B

P0506, P0507: Idle control system

P2646, P2647, P2648, P2649: VTEC sys

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle without load (in neutral).
4. Monitor the OBD STATUS for DTC P0301, P0302, P0303, or P0304 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 9.

   NO - If the screen indicates PASSED, go to step 5. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, wait for several minutes, then recheck.

5. Check the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE in the DATA LIST for 10 minutes with the HDS.

   Does the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE show misfire counts?

   YES - Go to step 9.

   NO - Go to step 6.

6. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
   - ENGINE SPEED
   - VSS
   - REL TP SENSOR
   - CLV (calculated load value)
   - APP SENSOR
7. Monitor the OBD STATUS for DTC P0301, P0302, P0303, or P0304 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 9.

NO - If the screen indicates PASSED, go to step 8. If the screen indicates EXECUTING, keep driving until a result comes on. if the screen indicates OUT OF CONDITION, go to step 6 and recheck.

8. Check the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE in the DATA LIST for 10 minutes with the HDS.

   Does the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE show misfire counts?

   YES - Go to step 9.

   NO - Intermittent failure, the system is OK at this time.

9. Turn the ignition switch OFF.
10. Check the fuel quality.

    Is the quality good?

    YES - Go to step 11.

    NO - Drain the tank and fill with a known-good fuel, then go to step 25.

11. Inspect the spark plugs (see **SPARK PLUG INSPECTION**). If the spark plugs are fouled or worn, replace them.
12. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VSS
    - REL TP SENSOR
    - CLV (calculated load value)
    - APP SENSOR
13. Check the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE in the DATA LIST for 10 minutes with the HDS.

    Does the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE show misfire counts?

    YES - Go to step 14.

    NO - Go to step 25.

14. Check the fuel pressure (see **FUEL PRESSURE TEST**).

    Is the fuel pressure OK?

    YES - Go to step 15.

    NO -

- If the fuel pressure is too high, replace the fuel pressure regulator (see **FUEL PRESSURE REGULATOR REPLACEMENT**), then go to step 25.
- If the fuel pressure is too low, check the fuel pump, the fuel feed pipe, and the fuel filter. If they are OK, replace the fuel pressure regulator (see **FUEL PRESSURE REGULATOR REPLACEMENT**), then go to step 25.

15. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
16. Check for these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 176°F (80°C)
    - Transmission in neutral
    - All electrical loads off
17. Monitor the ENGINE SPEED in the DATA LIST with the HDS, and hold the engine speed at 2,500 rpm. Once the engine speed is met, hold the accelerator pedal steady for more than 10 seconds.

    Did the engine speed vary more than 100 rpm from 2,500 rpm?

    YES - Repeat step 17.

    NO - Go to step 18.

18. While holding the engine speed at 2,500 rpm, check the MAF SENSOR in the DATA LIST with the HDS.

    Is there about 5.7-8.3 gm/s?

    YES - Go to step 19.

    NO - Replace the MAF sensor/IAT sensor (see **MAF SENSOR/IAT SENSOR REPLACEMENT**), then go to step 25.

19. Turn the ignition switch OFF.
20. Remove the cowl cover and under-cowl panel (see **FRONT GRILLE COVER REPLACEMENT**).
21. Remove the rocker arm oil pressure switch (A), and install the special tools as shown, then install the rocker arm oil pressure switch in the pressure gauge attachment (B).

NOTE: Install the rocker arm oil pressure switch in the reverse order of removal with a new O-ring.

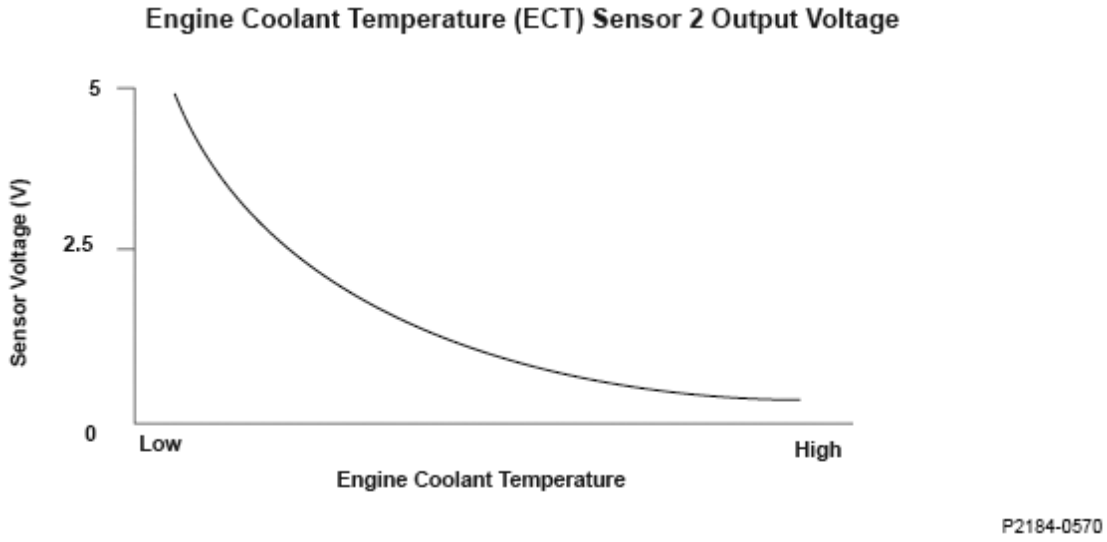

Fig. 48: Removing Rocker Arm Oil Pressure Switch (With Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

22. Reconnect the rocker arm oil pressure switch 2P connector.
23. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
24. Check the oil pressure at engine speeds of 1,000 rpm and 2,000 rpm.

    Is the oil pressure below 49 kPa (0.5 kgf/cm^2 , 7 psi)?

    YES - Check for air in the fuel line, then go to step 25.

    NO - Inspect the VTEC system, then go to step 25.

25. Turn the ignition switch ON (II).
26. Reset the ECM with the HDS.
27. Clear the CKP pattern with the HDS.
28. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
29. Do the CKP pattern learn procedure (see **CRANK (CKP) PATTERN CLEAR/CRANK (CKP) PATTERN LEARN**).
30. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VSS
    - REL TP SENSOR
    - CLV (calculated load value)
    - APP SENSOR
31. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0300, P0301, P0302, P0303, or P0304 indicated?

    YES - Check for a poor connections or loose terminals at the ignition coil, the injector, and the ECM,

then go to troubleshooting DTC P0301, P0302, P0303, or P0304 (see **DTC P0301: NO. 1 CYLINDER MISFIRE DETECTED; DTC P0302: NO. 2 CYLINDER MISFIRE DETECTED; DTC P0303: NO. 3 CYLINDER MISFIRE DETECTED; DTC P0304: NO. 4 CYLINDER MISFIRE DETECTED**).

NO - Go to step 32.

32. Monitor the OBD STATUS for DTC P0301, P0302, P0303, or P0304 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 31, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, go to step 1 and recheck. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 30.

DTC P0301: NO. 1 CYLINDER MISFIRE DETECTED; DTC P0302: NO. 2 CYLINDER MISFIRE DETECTED; DTC P0303: NO. 3 CYLINDER MISFIRE DETECTED; DTC P0304: NO. 4 CYLINDER MISFIRE DETECTED

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle without load (in neutral).
4. Monitor the OBD STATUS for DTC P0301, P0302, P0303, or P0304 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 9.

   NO - If the screen indicates PASSED, go to step 5. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, wait for several minutes, and recheck.

5. Check the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE in the DATA LIST for 10 minutes with the HDS.

   Does the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE show misfire counts?

   YES - Go to step 9.

   NO - Go to step 6.

6. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
   - ENGINE SPEED
   - VSS
   - REL TP SENSOR
   - CLV (calculated load value)
   - APP SENSOR
7. Monitor the OBD STATUS for DTC P0301, P0302, P0303, or P0304 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 9.

   NO - If the screen indicates PASSED, go to step 8. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 6 and recheck.

8. Check the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE in the DATA LIST for 10 minutes with the HDS.

   Does the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE show misfire counts?

   YES - Go to step 9.

   NO - Intermittent failure, the system is OK at this time. Check for loose wires or poor connections in the fuel system circuit.

9. Turn the ignition switch OFF.
10. Remove the intake manifold cover (see **INTAKE MANIFOLD AND EXHAUST SYSTEM (K20Z3)**).
11. Start the engine, and listen for a clicking sound at the injector of the problem cylinder.

    Does the injector click?

    YES - Go to step 12.

    NO - Go to step 42.

12. Turn the ignition switch OFF.
13. Exchange the ignition coil from the problem cylinder with one from another cylinder.
14. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VSS
    - REL TP SENSOR
    - CLV (calculated load value)
    - APP SENSOR

15. Check the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE in the DATA LIST for 10 minutes with the HDS.

    Does the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE show misfire counts?

    YES - Go to step 16.

    NO - Intermittent misfire due to poor contact at the ignition coil connector (no misfire at this time). Make sure the coil connections are secure.

16. Determine which cylinder had the misfire.

    Does the misfire occur in the cylinder where the ignition coil was exchanged?

    YES - Replace the faulty ignition coil (see **IGNITION COIL REMOVAL/INSTALLATION**), then go to step 60.

    NO - Go to step 17.

17. Turn the ignition switch OFF.
18. Exchange the spark plug from the problem cylinder with one from another cylinder.
19. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VSS
    - REL TP SENSOR
    - CLV (calculated load value)
    - APP SENSOR
20. Check the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE in the DATA LIST for 10 minutes with the HDS.

    Does the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE show misfire counts?

    YES - Go to step 21.

    NO - Intermittent misfire due to spark plug fouling (no misfire at this time).

21. Determine which cylinder had the misfire.

    Does the misfire occur in the cylinder where the spark plug was exchanged?

    YES - Replace the faulty spark plug, then go to step 60.

    NO - Go to step 22.

22. Turn the ignition switch OFF.
23. Exchange the injector from the problem cylinder with one from the another cylinder.

24. Start the engine, and let it idle for 2 minutes.
25. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VSS
    - REL TP SENSOR
    - CLV (calculated load value)
    - APP SENSOR
26. Check the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE in the DATA LIST for 10 minutes with the HDS.

    Does the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE show misfire counts?

    YES - Go to step 27.

    NO - Intermittent misfire due to bad contact at the injector connector (no misfire at this time). Check for poor connections or loose terminals at the injector.

27. Determine which cylinder had the misfire.

    Does the misfire occur in the cylinder where the injector was exchanged?

    YES - Replace the faulty injector (see **INJECTOR REPLACEMENT**), then go to step 60.

    NO - Go to step 28.

28. Turn the ignition switch OFF.
29. Disconnect the ignition coil 3P connector from the problem cylinder.
30. Turn the ignition switch ON (II).
31. Measure voltage between ignition coil 3P connector terminal No. 3 and body ground.

Fig. 49: Measuring Voltage Between Ignition Coil 3P Connector Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 32.

NO - Repair open in the wire between the ignition coil and the ignition coil relay, then go to step 60.

32. Turn the ignition switch OFF.
33. Check for continuity between ignition coil 3P connector terminal No. 2 and body ground.

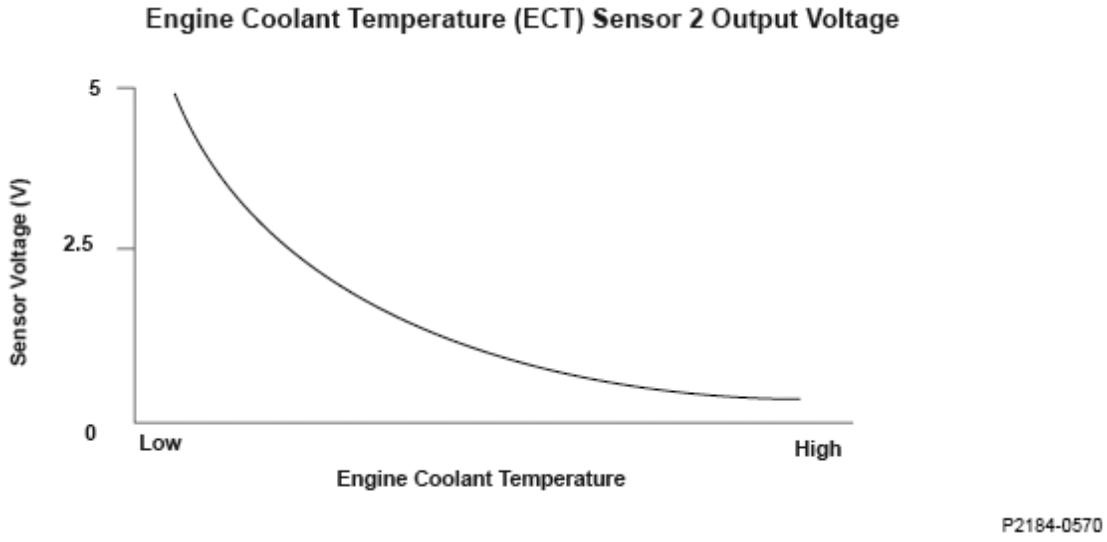

Fig. 50: Checking For Continuity Between Ignition Coil 3P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 34.

NO - Repair open in the wire between the ignition coil and G101 (see **CONNECTOR TO HARNESS INDEX**), then go to step 60.

34. Turn the ignition switch OFF.
35. Jump the SCS line with the HDS.
36. Disconnect ECM connector C (44P).
37. Check for continuity between body ground and the appropriate ECM connector terminal of the problem cylinder (see **BODY GROUND AND ECM CONNECTOR TERMINAL**).

Is there continuity?

YES - Go to step 39.

NO - Repair open in the wire between the ECM and the ignition coil, then go to step 60.

39. Reconnect all connectors.
40. Do an engine compression and a cylinder leakdown test (see **ENGINE COMPRESSION INSPECTION**).

    Did the engine pass both tests?

    YES - Go to step 41.

    NO - Repair the engine, then go to step 60.

41. Do the VTEC rocker arm test (see **VTEC ROCKER ARM TEST**). Did the engine pass the test?

    YES - Go to step 42.

    NO - Repair the VTEC rocker arm (see **ROCKER ARM AND SHAFT DISASSEMBLY/REASSEMBLY**), then go to step 60.

42. Turn the ignition switch OFF.
43. Jump the SCS line with the HDS.
44. Disconnect ECM connector C (44P).

Is there 10-13 ohms?

YES - Go to step 55.

NO - Replace the injector (see **INJECTOR REPLACEMENT**), then go to step 60.

55. Substitute a known-good injector into the problem cylinder.
56. Reconnect all connectors.
57. Start the engine, and let it idle for 2 minutes.
58. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VSS
    - REL TP SENSOR
    - CLV (calculated load value)
    - APP SENSOR
59. Check the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 69 MISFIRE, and/or CYL4 MISFIRE in the DATA LIST for 10 minutes with the HDS.

Does the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE show misfire

counts?

YES - Go to step 70.

NO - Replace the original injector (see **INJECTOR REPLACEMENT**), then go to step 60.

60. Turn the ignition switch OFF.
61. Reconnect all connectors.
62. Turn the ignition switch ON (II).
63. Reset the ECM with the HDS.
64. Clear the CKP pattern with the HDS.
65. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
66. Do the CKP pattern learn procedure (see **CRANK (CKP) PATTERN CLEAR/CRANK (CKP) PATTERN LEARN**).
67. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VSS
    - REL TP SENSOR
    - CLV (calculated load value)
    - APP SENSOR
68. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0301, P0302, P0303, or P0304 indicated?

    YES - Check for poor connections or loose terminals at the ignition coil, the injector, and the ECM, then go to troubleshooting DTC P0300, P0301, P0302, P0303, or P0304 (see **DTC P0300: RANDOM MISFIRE AND ANY COMBINATION OF THE FOLLOWING:; DTC P0301: NO. 1 CYLINDER MISFIRE DETECTED; DTC P0302: NO. 2 CYLINDER MISFIRE DETECTED; DTC P0303: NO. 3 CYLINDER MISFIRE DETECTED; DTC P0304: NO. 4 CYLINDER MISFIRE DETECTED**).

    NO - Go to step 69.

69. Monitor the OBD STATUS for DTC P0301, P0302, P0303, or P0304 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 68, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the ignition coil, the injector, and the ECM, then go to step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 67.

70. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).

71. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VSS
    - REL TP SENSOR
    - CLV (calculated load value)
    - APP SENSOR
72. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0301, P0302, P0303, or P0304 Indicated?

    YES - Check for poor connections or loose terminals at the ignition coil, the injector, and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 71. If the ECM was substituted, go to step 1.

    NO - Go to step 73.

73. Monitor the OBD STATUS for DTC P0301, P0302, P0303, or P0304 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 72, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the ignition coil, the injector, and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 71. If the ECM was substituted, go to step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 71.

DTC P0325: KNOCK SENSOR CIRCUIT MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed between 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
4. Hold the engine speed between 3,000-4,000 rpm for at least 10 seconds.
5. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0325 indicated?

   YES - Go to step 6.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the knock sensor and the ECM.

6. Turn the ignition switch OFF.
7. Jump the SCS line with the HDS.
8. Disconnect the knock sensor 1P connector (see **KNOCK SENSOR REPLACEMENT**).
9. Disconnect ECM connector C (44P).
10. Check for continuity between ECM connector terminal C42 and body ground.

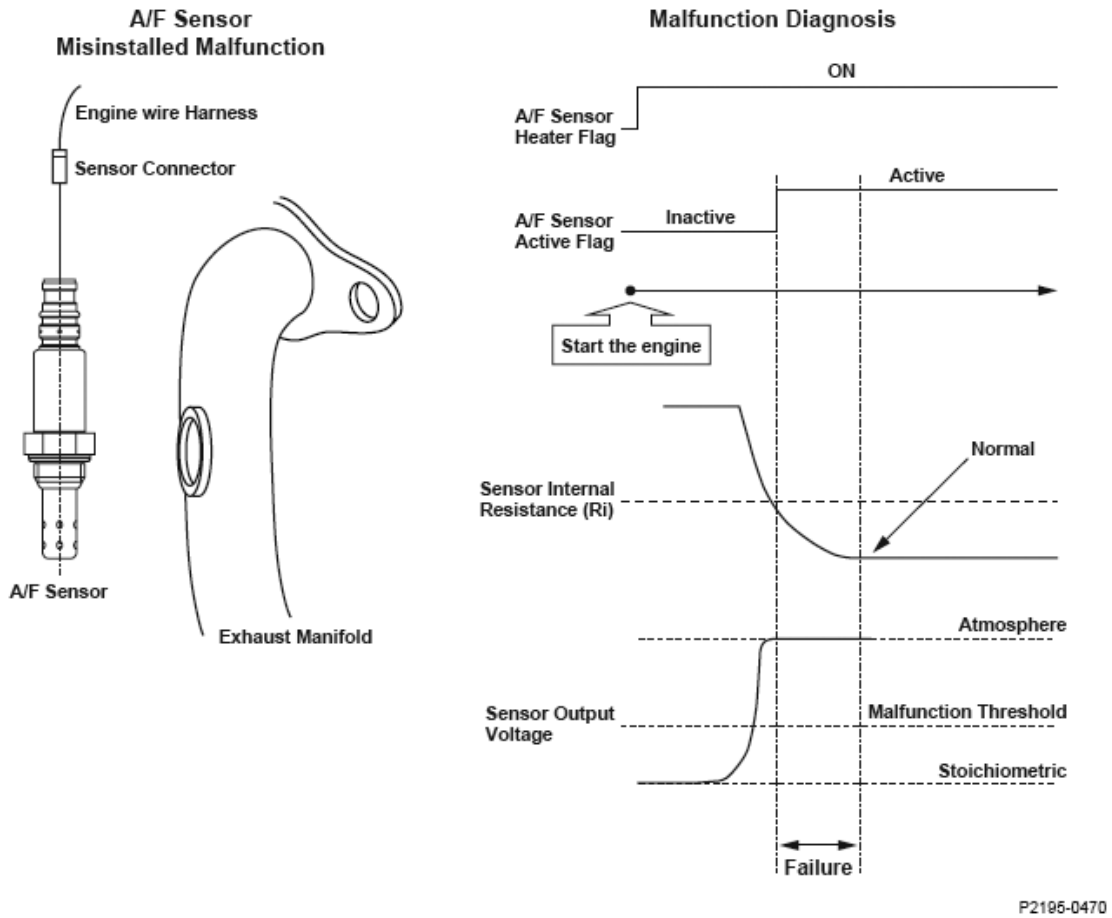

Fig. 58: Checking Continuity Between ECM Connector Terminal C42 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM (C42) and the knock sensor, then go to step 14.

NO - Go to step 11.

11. Connect the knock sensor 1P connector terminal to body ground with a jumper wire.

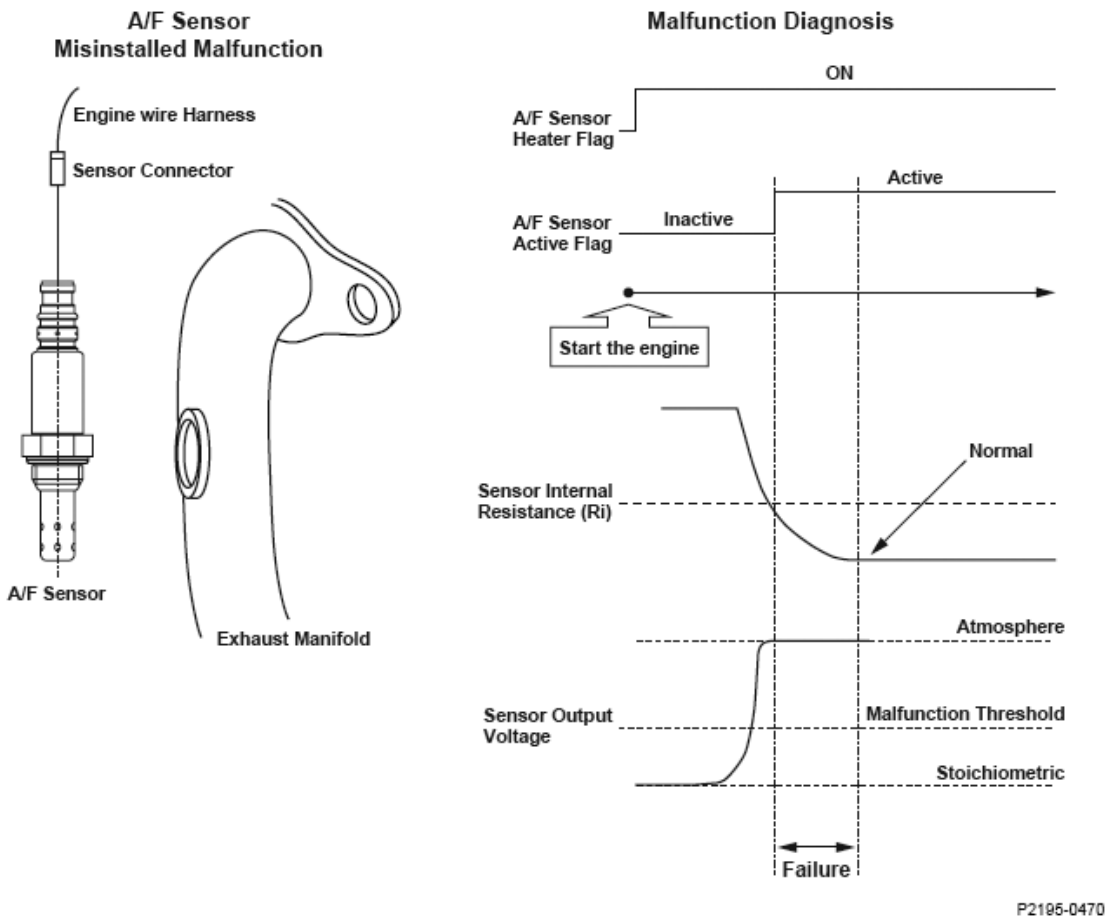

Fig. 59: Connecting Knock Sensor 1P Connector Terminal To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Check for continuity between ECM connector terminal C42 and body ground.

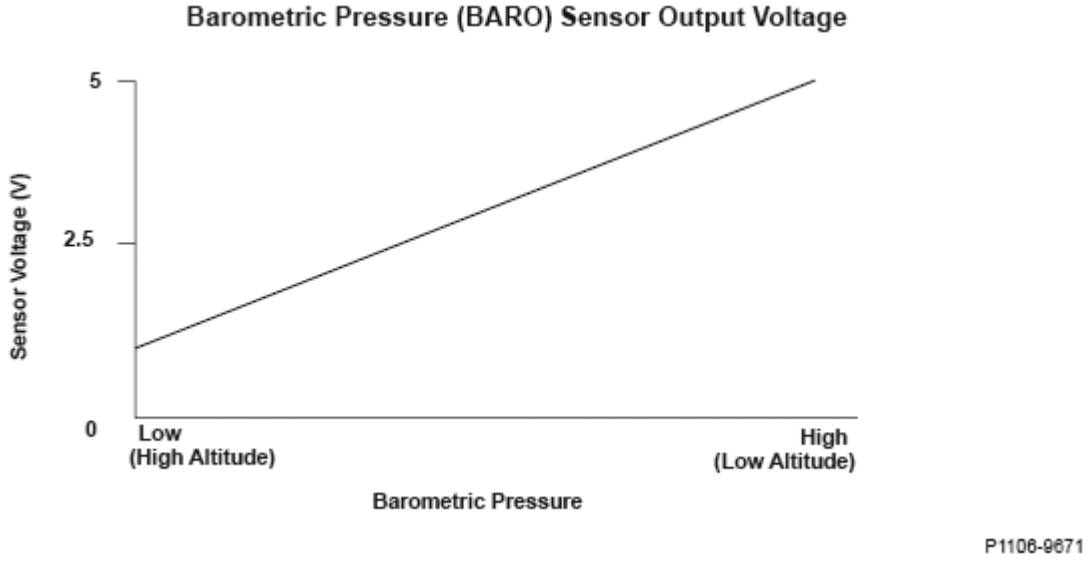

Fig. 60: Checking For Continuity Between ECM Connector Terminal C42 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 13.

NO - Repair open in the wire between the ECM (C42) and the knock sensor, then go to step 14.

13. Replace the knock sensor (see **KNOCK SENSOR REPLACEMENT**).
14. Reconnect all connectors.
15. Turn the ignition switch ON (II).
16. Reset the ECM with the HDS.
17. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
18. Hold the engine speed between 3,000-4,000 rpm for at least 10 seconds.
19. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0325 indicated?

YES - Go to step 21.

NO - Go to step 20.

20. Monitor the OBD STATUS for DTC P0325 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 19, go to the indicated DTC's troubleshooting.

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the knock sensor and the ECM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 17.

21. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
22. Hold the engine speed between 3,000-4,000 rpm for at least 10 seconds.
23. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0325 indicated?

YES - Check for poor connections or loose terminals at the knock sensor and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 22. If the ECM was substituted, go to step 1.

NO - Go to step 24.

24. Monitor the OBD STATUS for DTC P0325 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the

original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 23, go to the indicated DTC's troubleshooting.

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the knock sensor and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 22. If the ECM was substituted, go to step 1. If the screen indicates NOT COMPLETED, go to step 22.

DTC P0335: CKP SENSOR NO SIGNAL

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine.
4. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0335 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the CKP sensor and the ECM.

5. Turn the ignition switch OFF.
6. Disconnect the CKP sensor 3P connector.
7. Turn the ignition switch ON (II).
8. Measure voltage between CKP sensor 3P connector terminal No. 3 and body ground.

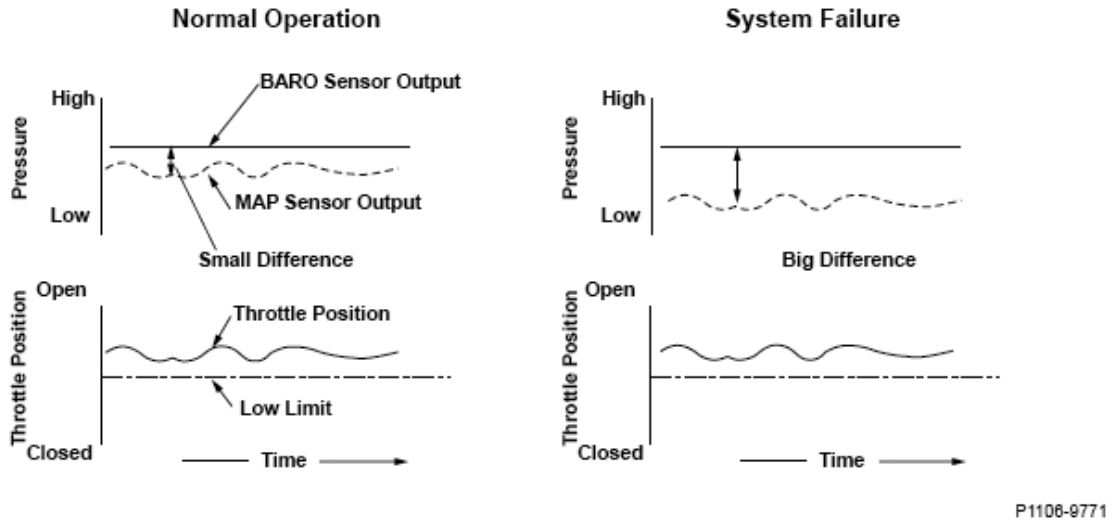

Fig. 61: Measuring Voltage Between CKP Sensor 3P Connector Terminal No. 3 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 9.

NO - Repair open in the wire between the CKP sensor and PGM-FI main relay 1, then go to step 19.

9. Measure voltage between CKP sensor 3P connector terminal No. 1 and body ground.

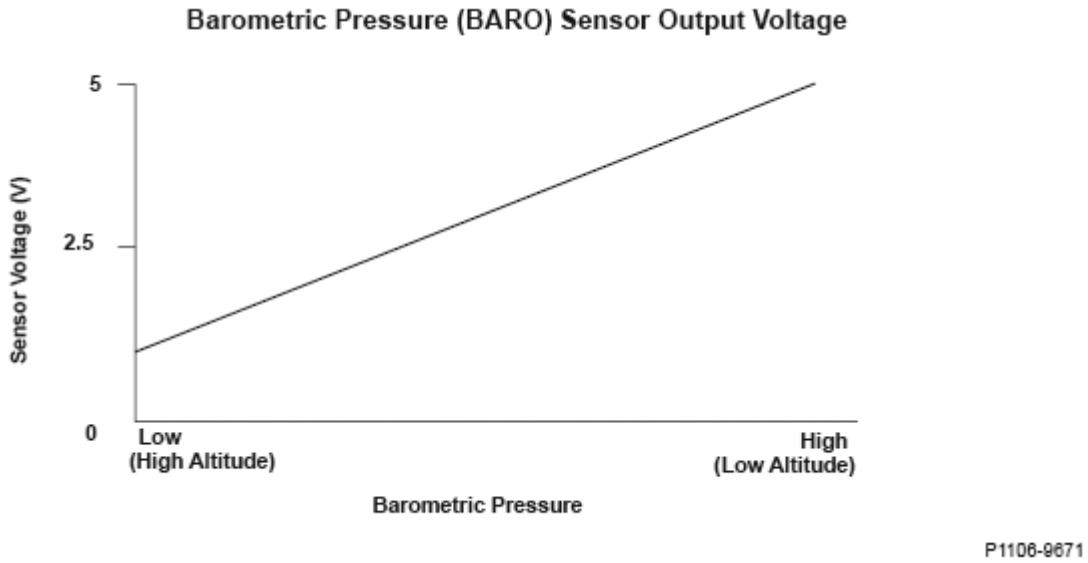

Fig. 62: Measuring Voltage Between CKP Sensor 3P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 10.

NO - Go to step 11.

10. Measure voltage between CKP sensor 3P connector terminals No. 2 and No. 3.

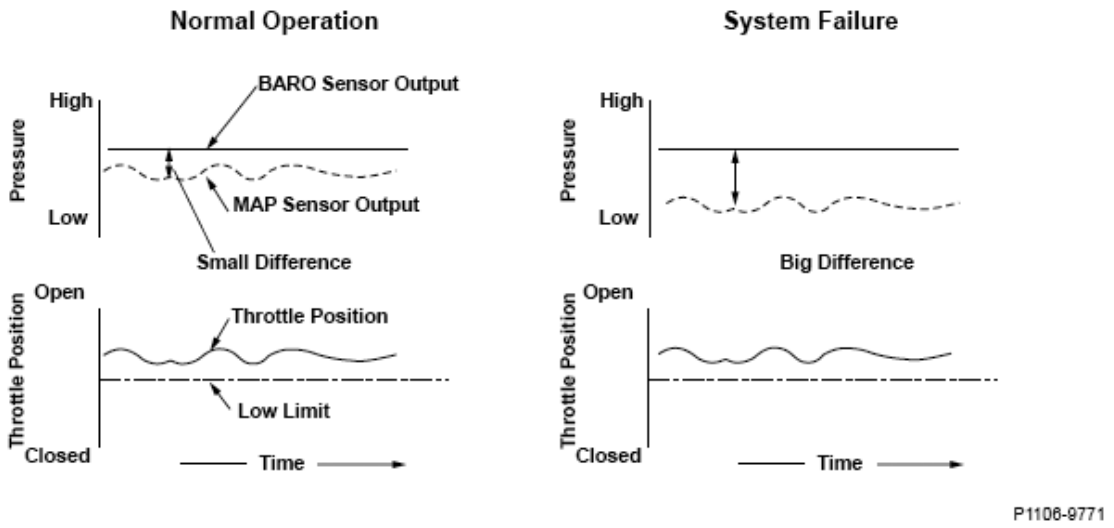

Fig. 63: Measuring Voltage Between CKP Sensor 3P Connector Terminals No. 2 And No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 17.

NO - Repair open in the wire between the CKP sensor and G101 (see **CONNECTOR TO HARNESS INDEX**), then go to step 19.

11. Turn the ignition switch OFF.
12. Jump the SCS line with the HDS.
13. Disconnect ECM connector C (44P).
14. Check for continuity between ECM connector terminal C32 and body ground.

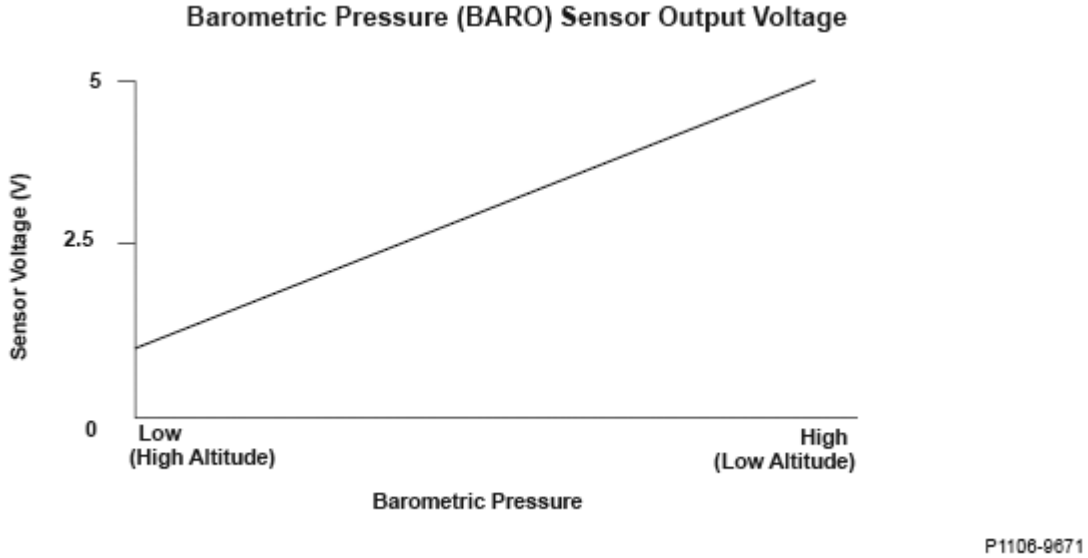

Fig. 64: Checking For Continuity Between ECM Connector Terminal C32 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM (C32) and the CKP sensor, then go to step 19.

NO - Go to step 15.

15. Connect CKP sensor 3P connector terminal No. 1 to body ground with a jumper wire.

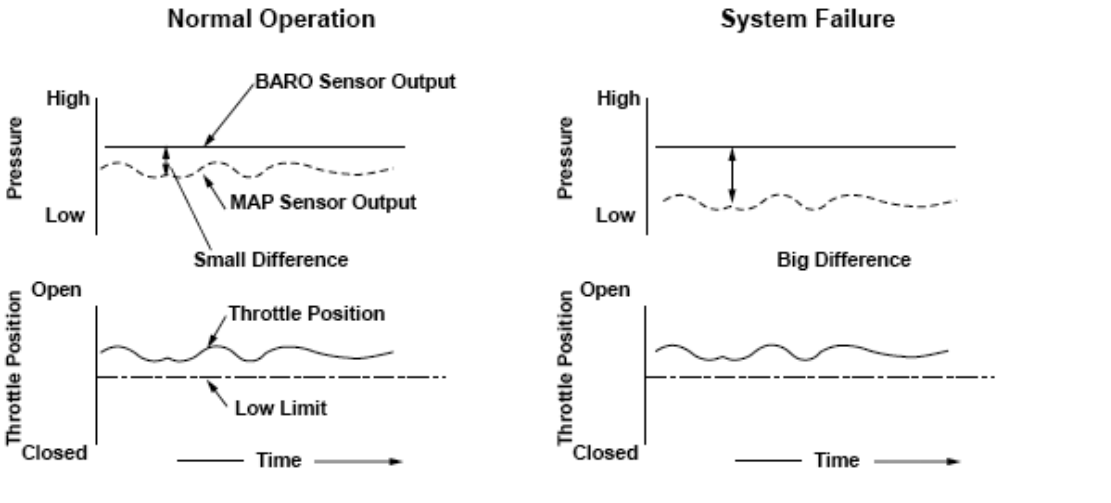

Fig. 65: Connecting CKP Sensor 3P Connector Terminal No. 1 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Check for continuity between ECM connector terminal C32 and body ground.

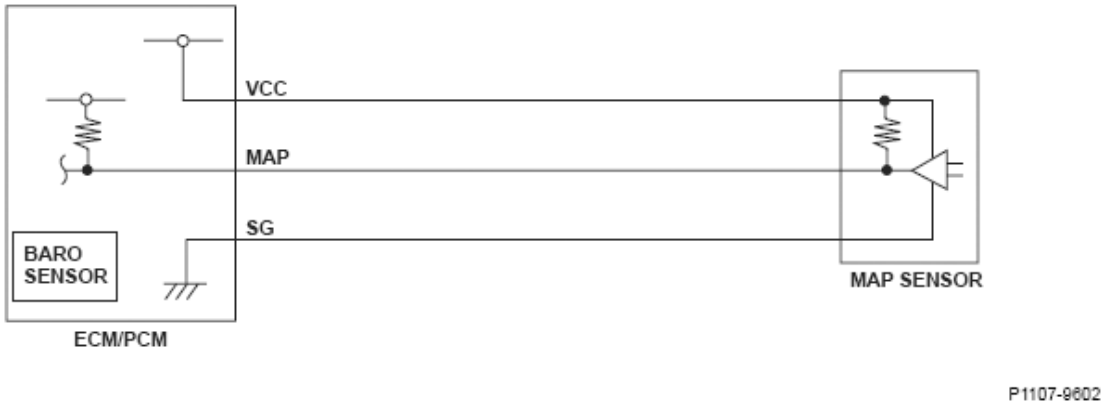

Fig. 66: Checking For Continuity Between ECM Connector Terminal C32 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 26.

NO - Repair open in the wire between the ECM (C32) and the CKP sensor, then go to step 19.

17. Turn the ignition switch OFF.
18. Replace the CKP sensor (see **CKP SENSOR REPLACEMENT**).
19. Reconnect all connectors.
20. Turn the ignition switch ON (II).
21. Reset the ECM with the HDS.
22. Clear the CKP pattern with the HDS.
23. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
24. Do the CKP pattern learn procedure (see **CRANK (CKP) PATTERN CLEAR/CRANK (CKP) PATTERN LEARN**).
25. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0335 indicated?

    YES - Check for poor connections or loose terminals at the CKP sensor and the ECM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

26. Reconnect all connectors.
27. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
28. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0335 indicated?

    YES - Check for poor connections or loose terminals at the CKP sensor and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0339: CKP SENSOR CIRCUIT INTERMITTENT INTERRUPTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle for 10 seconds.
4. Check the CKP NOISE count in the DATA LIST with the HDS.

   Are 0 counts indicated?

YES - Go to step 7.

NO - Go to step 5.

5. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
   - ENGINE SPEED
   - VSS
6. Check the CKP NOISE count in the DATA LIST with the HDS.

   Are 0 counts indicated?

   YES - Go to step 7.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the CKP sensor and the ECM.

7. Check for poor or loose connections and terminals at these locations:
   - CKP sensor
   - ECM
   - Engine ground
   - Body ground

   Are the connections and terminals OK?

   YES - Go to step 8.

   NO - Repair the connectors or terminals, then go to step 11.

8. Remove the cam chain case (see step 15 in **CAM CHAIN REMOVAL**), and check for damage on the CKP sensor pulser plate.

   Is the pulser plate damaged?

   YES - Replace the CKP sensor pulser plate (see **CKP PULSE PLATE REPLACEMENT**), then go to step 11.

   NO - Go to step 9.

9. Turn the ignition switch OFF.
10. Replace the CKP sensor (see **CKP SENSOR REPLACEMENT**).
11. Turn the ignition switch ON (II).
12. Reset the ECM with the HDS.
13. Clear the CKP pattern with the HDS.
14. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
15. Do the CKP pattern learn procedure (see **CRANK (CKP) PATTERN CLEAR/CRANK (CKP) PATTERN LEARN**).
16. Start the engine, and let it idle for 10 seconds.

17. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0339 indicated?

    YES - Check for poor connections or loose terminals at the CKP sensor and the ECM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0365: CMP SENSOR B CIRCUIT NO SIGNAL

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0365 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at CMP sensor B and the ECM.

5. Turn the ignition switch OFF.
6. Disconnect the CMP sensor B 3P connector.
7. Turn the ignition switch ON (II).
8. Measure voltage between CMP sensor B 3P connector terminal No. 3 and body ground.

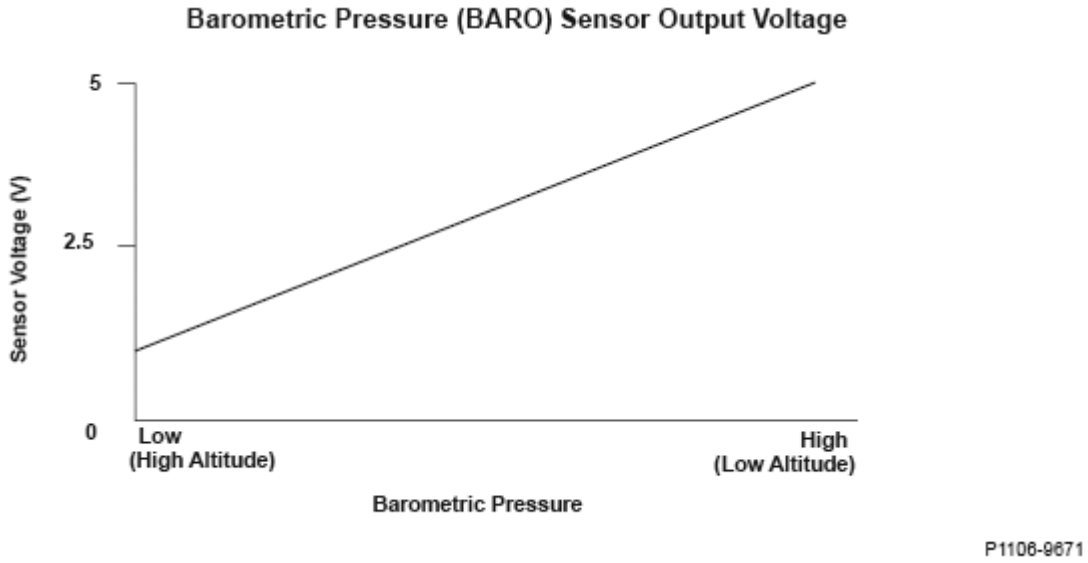

Fig. 67: Measuring Voltage Between CMP Sensor B 3P Connector Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 9.

NO - Repair open in the wire between CMP sensor B and PGM-FI main relay 1, then go to step 18.

9. Measure voltage between CMP sensor B 3P connector terminal No. 1 and body ground.

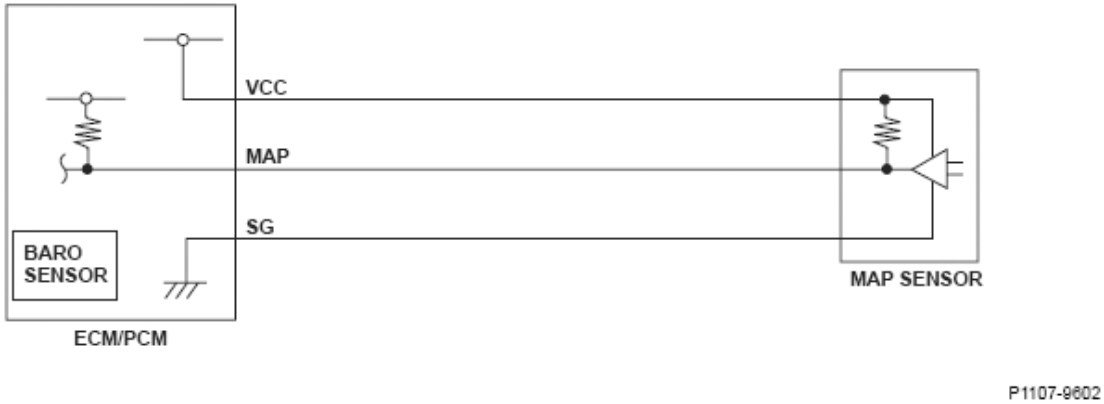

Fig. 68: Measuring Voltage Between CMP Sensor B 3P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 10.

NO - Go to step 11.

10. Measure voltage between CMP sensor 3P connector terminals No. 2 and No. 3.

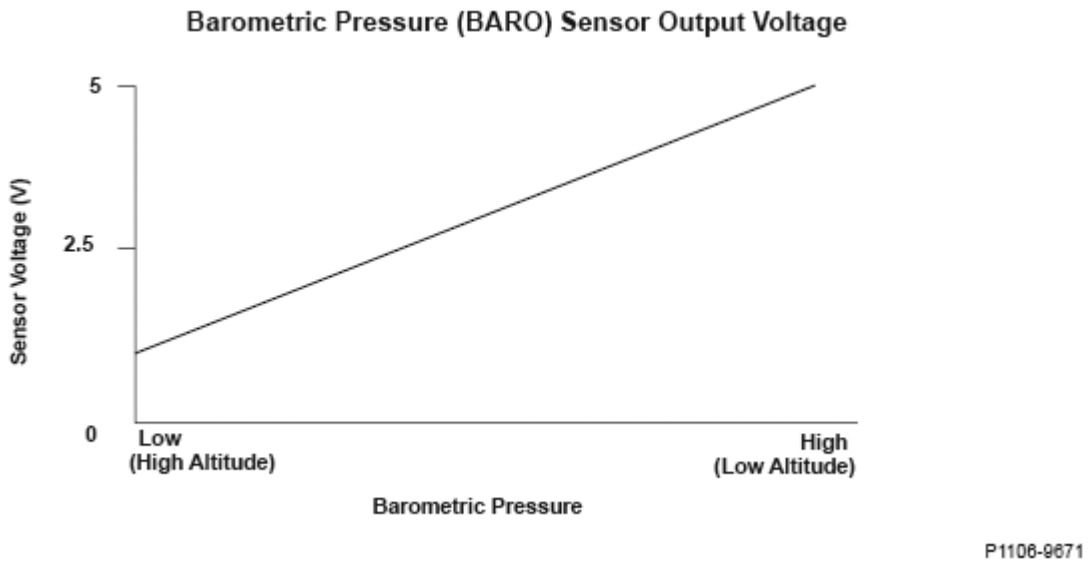

Fig. 69: Measuring Voltage Between CMP Sensor 3P Connector Terminals No. 2 And No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 16.

NO - Repair open in the wire between CMP sensor B and G101 (see **CONNECTOR TO HARNESS INDEX**), then go to step 18.

11. Turn the ignition switch OFF.
12. Jump the SCS line with the HDS.
13. Disconnect ECM connector C (44P).
14. Check for continuity between ECM connector terminal C31 and body ground.

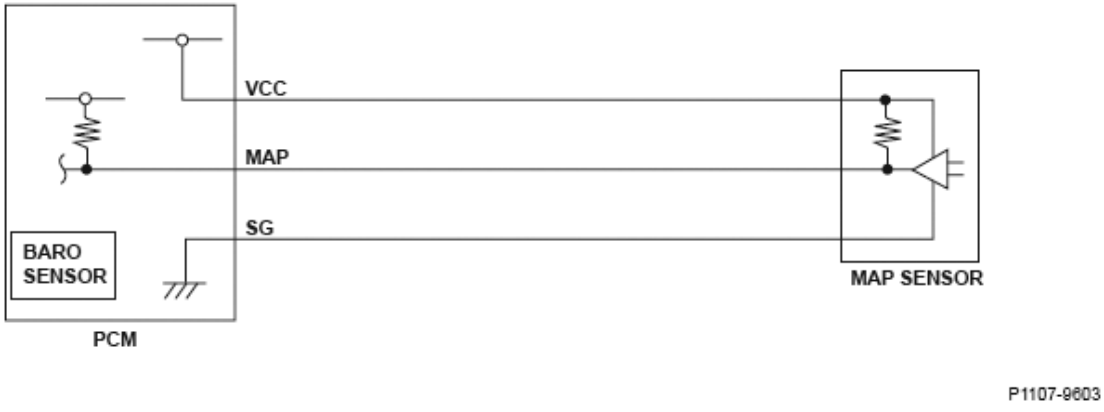

Fig. 70: Checking For Continuity Between ECM Connector Terminal C31 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM (C31) and CMP sensor B, then go to step 18.

NO - Go to step 15.

15. Check for continuity between CMP sensor B 3P connector terminal No. 1 and ECM connector terminal C31.

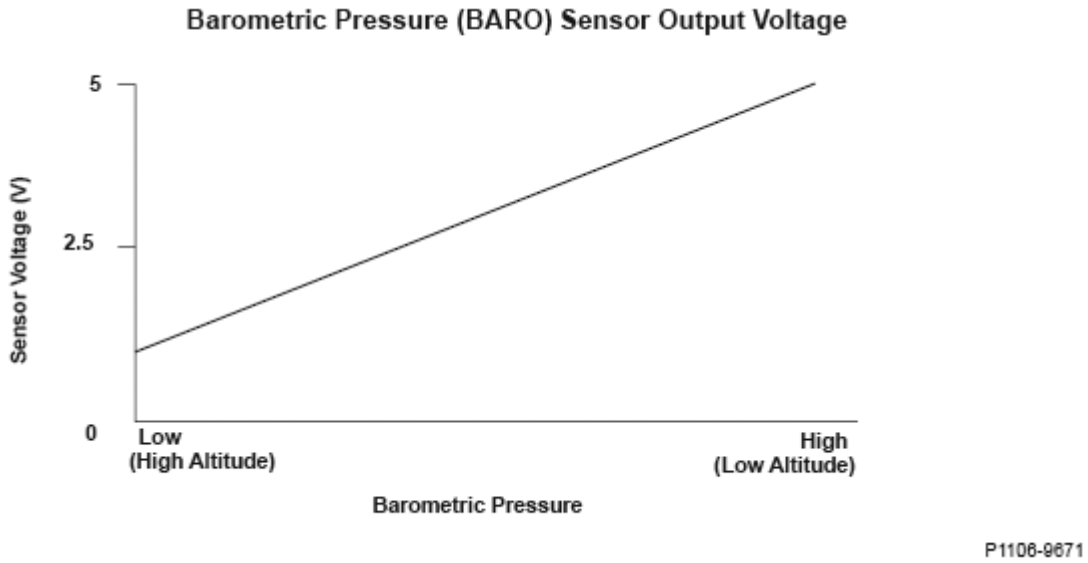

Fig. 71: Checking Continuity Between CMP Sensor B 3P Connector Terminal No. 1 And Connector Terminal C31
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 23.

NO - Repair open in the wire between the ECM (C31) and CMP sensor B, then go to step 18.

16. Turn the ignition switch OFF.
17. Replace CMP sensor B (see **CMP SENSOR B REPLACEMENT**).
18. Reconnect all connectors.
19. Turn the ignition switch ON (II).
20. Reset the ECM with the HDS.
21. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
22. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0365 indicated?

YES - Check for poor connections or loose terminals at CMP sensor B and the ECM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

23. Reconnect all connectors.
24. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
25. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0365 indicated?

    YES - Check for poor connections or loose terminals at CMP sensor B and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0369: CMP SENSOR B CIRCUIT INTERMITTENT INTERRUPTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle for 10 seconds.
4. Check the CMP NOISE B count in the DATA LIST with the HDS.

   Are 0 counts indicated?

   YES - Go to step 7.

   NO - Go to step 5.

5. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
   - ENGINE SPEED
   - VSS
6. Check the CMP NOISE B count in the DATA LIST with the HDS.

   Are 0 counts indicated?

   YES - Go to step 7.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at CMP sensor B and the ECM.

7. Check for poor or loose connections and terminals at these locations:
   - CMP sensor B
   - ECM

- Engine ground
- Body ground

Are the connections and terminals OK?

YES - Go to step 8.

NO - Repair the connectors or terminals, then go to step 11.

8. Check for damage on the CMP sensor B pulser plate (see **CMP PULSE PLATE A REPLACEMENT**).

   Is the pulser plate damaged?

   YES - Replace the CMP sensor B pulser plate (see **CMP PULSE PLATE A REPLACEMENT**), then go to step 11.

   NO - Go to step 9.

9. Turn the ignition switch OFF.
10. Replace CMP sensor B (see **CMP SENSOR B REPLACEMENT**).
11. Turn the ignition switch ON (II).
12. Reset the ECM with the HDS.
13. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
14. Start the engine, and let it idle for 10 seconds.
15. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0369 indicated?

    YES - Check for poor connections or loose terminals at CMP sensor B and the ECM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P050A: COLD START IDLE AIR CONTROL SYSTEM PERFORMANCE PROBLEM

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check for Temporary DTCs or DTCs with the HDS.

   Are any Temporary DTCs or DTCs other than P050A indicated?

   YES - Go to the indicated DTC's troubleshooting.

NO - Go to step 3.

3. Check for poor connections or blockage at the air intake duct.

   Is it OK?

   YES - Go to step 4.

   NO - Reconnect or repair the air intake duct, then go to step 20.

4. Check for damage at the air cleaner housing.

   Is it OK?

   YES - Go to step 5.

   NO - Replace the air cleaner housing (see **AIR CLEANER REMOVAL/INSTALLATION**), then go to step 20.

5. Check for dirt or debris in the air cleaner element.

   Is it dirty?

   YES - Replace the air cleaner element or remove the debris (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**), then go to step 20.

   NO - Go to step 6.

6. Let the engine cool until the value of ECT SENSOR 1 is 122°F (50°C) or less.
7. Clear the DTC with the HDS.
8. Start the engine, and let it idle 10 seconds or more.
9. Monitor the OBD STATUS for DTC P050A in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 10.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 6.

10. Do the ETCS TEST in the INSPECTION MENU with the HDS.

    Is the THROTTLE ACTUATOR CONTROL VALVE normal?

    YES - Go to step 11.

    NO - Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**), then go to step 20.

11. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
12. Monitor the ENGINE SPEED in the DATA LIST with the HDS, and hold the engine speed at 2,500 rpm for at least 30 seconds.
13. While holding the engine speed at 2,500 rpm, check the MAF SENSOR in the DATA LIST with the HDS.

    Is there about 5.7-8.3 gm/s?

    YES - Go to step 14.

    NO - Replace the MAF sensor/IAT sensor (see **MAF SENSOR/IAT SENSOR REPLACEMENT**), then go to step 20.

14. Turn the ignition switch OFF.
15. Allow the engine to cool to ambient temperature.
16. Note the ambient temperature.
17. Turn the ignition switch ON (II).
18. Note the value of IAT SENSOR quickly in the DATA LIST with the HDS.
19. Compare the value of the IAT SENSOR and the ambient temperature.

    Does the value of the IAT SENSOR differ 5.4°F (3°C) or more?

    YES - Replace the MAF sensor/IAT sensor (see **MAF SENSOR/IAT SENSOR REPLACEMENT**), then go to step 20.

    NO - Check for dirt, carbon, or damage in the throttle bore. If there is dirt or carbon, clean the throttle body (see **THROTTLE BODY CLEANING**), then go to step 20. If there is damage in the throttle bore, replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**), then go to step 20.

20. Turn the ignition switch ON (II).
21. Reset the ECM with the HDS.
22. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
23. Let the engine cool until the value of ECT SENSOR 1 is 122°F (50°C) or less.
24. Start the engine, and let it idle 10 seconds or more.
25. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P050A indicated?

    YES - Check for poor connections or loose terminals at the throttle body, the MAF sensor/IAT sensor, and the ECM, then go to step 1.

    NO - Go to step 26.

26. Monitor the OBD STATUS for DTC P050A in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 25, go to the indicated DTC's troubleshooting.

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the throttle body, the MAF sensor/IAT sensor, and the ECM, then go to step 1. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 23.

DTC P050B: COLD START IGNITION TIMING CONTROL SYSTEM PERFORMANCE PROBLEM

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check for Temporary DTCs or DTCs with the HDS.

   Are any Temporary DTCs or DTCs other than P050B indicated?

   YES - Go to the indicated DTC's troubleshooting.

   NO - Go to step 3.

3. Check for poor connections or blockage at the air intake duct.

   Is it OK?

   YES - Go to step 4.

   NO - Reconnect or repair the air intake duct, then go to step 25.

4. Check for damage at the air cleaner housing.

   Is it OK?

   YES - Go to step 5.

   NO - Replace the air cleaner housing (see **AIR CLEANER REMOVAL/INSTALLATION**), then go to step 25.

5. Check for dirt or debris in the air cleaner element.

   Is it dirty?

   YES - Replace the air cleaner element or remove the debris (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**), then go to step 25.

NO - Go to step 6.

6. Let the engine cool until the value of ECT SENSOR 1 is 122°F (50°C) or less.
7. Clear the DTC with the HDS.
8. Start the engine, and let it idle 10 seconds or more.
9. Monitor the OBD STATUS for DTC P050B in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 10.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 6.

10. Inspect the ignition timing (see **IGNITION TIMING INSPECTION**).

    Is the ignition timing OK?

    YES - Go to step 12.

    NO - Go to step 11.

11. Check for damage at the CKP sensor (see **CKP SENSOR REPLACEMENT**) and the CKP sensor pulser plate (see **CKP PULSE PLATE REPLACEMENT**).

    Is the CKP sensor and/or the CKP sensor pulser plate damaged?

    YES - Replace the CKP sensor (see **CKP SENSOR REPLACEMENT**) and/or the CKP sensor pulser plate (see **CKP PULSE PLATE REPLACEMENT**), then go to step 6.

    NO - Go to step 31.

12. Do the ETCS TEST in the INSPECTION MENU with the HDS.

    Is the THROTTLE ACTUATOR CONTROL VALVE normal?

    YES - Go to step 13.

    NO - Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**), then go to step 25.

13. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
14. Monitor the ENGINE SPEED in the DATA LIST with the HDS, and hold the engine speed at 2,500 rpm for at least 30 seconds.
15. While holding the engine speed at 2,500 rpm, check the MAF SENSOR in the DATA LIST with the HDS.

Is there about 5.7-8.3 gm/s?

YES - Go to step 16.

NO - Replace the MAF sensor/IAT sensor (see **MAF SENSOR/IAT SENSOR REPLACEMENT**), then go to step 25.

16. Turn the ignition switch OFF.
17. Drain the coolant (see **COOLANT REPLACEMENT**).
18. Remove ECT sensor 1 (see **ECT SENSOR 1 REPLACEMENT**), and ECT sensor 2 (see **ECT SENSOR 2 REPLACEMENT**).
19. Allow the sensors to cool to ambient temperature.
20. Note the ambient temperature.
21. Connect ECT sensor 1 to its 2P connector, and ECT sensor 2 to its 2P connector, but do not install them on the engine.
22. Turn the ignition switch ON (II).
23. Note the value of ECT SENSOR 1 and ECT SENSOR 2 quickly in the DATA LIST with the HDS.
24. Compare the value of ECT SENSOR 1 and the ambient temperature, and the value of ECT SENSOR 2 and the ambient temperature individually.

    Does either sensor differ more than 5.4°F (3°C) from the ambient temperature?

    YES - Replace the sensor that differed more than 5.4°F (3°C) from the ambient temperature, then go to step 25.

    NO - Check and repair any problems with the following items, then go to step 25.

    - Engine compression and cylinder leakdown
    - VTEC system
    - Engine oil
    - A/C system
    - Power steering
25. Turn the ignition switch ON (II).
26. Reset the ECM with the HDS.
27. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
28. Let the engine cool until the value of ECT SENSOR 1 is 122°F (50°C) or less.
29. Start the engine, and let it idle 10 seconds or more.
30. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P050B indicated?

    YES - Check for poor connections or loose terminals at the CKP sensor, the throttle body, the MAF sensor/IAT sensor, ECT sensor 1, ECT sensor 2, and the ECM, then go to step 1.

    NO - Go to step 31.

31. Monitor the OBD STATUS for DTC P050B in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 30, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the CKP sensor, the throttle body, the MAF sensor/IAT sensor, ECT sensor 1, ECT sensor 2, and the ECM, then go to step 1. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 28.

32. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
33. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
34. Let the engine cool until the value of ECT SENSOR 1 is 122°F (50°C) or less.
35. Start the engine, and let it idle 10 seconds or more.
36. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P050B indicated?

    YES - Check for poor connections or loose terminals at the CKP sensor, the throttle body, the MAF sensor/IAT sensor, ECT sensor 1, ECT sensor 2, and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 34. If the ECM was substituted, go to step 1.

    NO - Go to step 37.

37. Monitor the OBD STATUS for DTC P050B in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 36, go to the indicated DTC's troubleshooting.

    NO -If the screen indicates FAILED, check for poor connections or loose terminals at the CKP sensor, the throttle body, the MAF sensor/IAT sensor, ECT sensor 1, ECT sensor 2, and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 34. If the ECM was substituted, go to step 1. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 34.

DTC P0562: CHARGING SYSTEM LOW VOLTAGE

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If any high current load accessories are installed, this DTC can beset.**

- **If DTC P16BB and/or P16BC is stored at the same time as DTC P0562, troubleshoot DTC P16BB and/or P16BC first, then recheck for DTC P0562.**

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine.
4. Check under these conditions:
   - A/Con
   - Temperature control at maximum cool
   - Blower fan at maximum speed
   - Rear window defogger on
   - Headlights on high beam
5. Hold the engine speed at 2,000 rpm (in neutral) for 1 minute.
6. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0562 indicated?

   YES - Replace the alternator (see **ALTERNATOR REMOVAL AND INSTALLATION**), then go to step 7.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the alternator and the under-hood fuse/relay box, and check the battery performance (see **BATTERY TEST**).

7. Turn the ignition switch ON (II).
8. Reset the ECM with the HDS.
9. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
10. Start the engine.
11. Check under these conditions:
    - A/Con
    - Temperature control at maximum cool
    - Blower fan at maximum speed
    - Rear window defogger on
    - Headlights on high beam
12. Hold the engine speed at 2,000 rpm (in neutral) for 1 minute.
13. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0562 indicated?

    YES - Check for poor connections or loose terminals at the alternator and the under-hood fuse/relay box, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the

indicated DTC's troubleshooting.

DTC P0563: ECM POWER SOURCE CIRCUIT UNEXPECTED VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch OFF.
4. Wait 10 seconds.
5. Turn the ignition switch ON (II).
6. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0563 indicated?

   YES - Go to step 7.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at PGM-FI main relay 1 and the ECM.

7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Disconnect ECM connector A (44P).
10. Measure voltage between ECM connector terminal A6 and body ground.

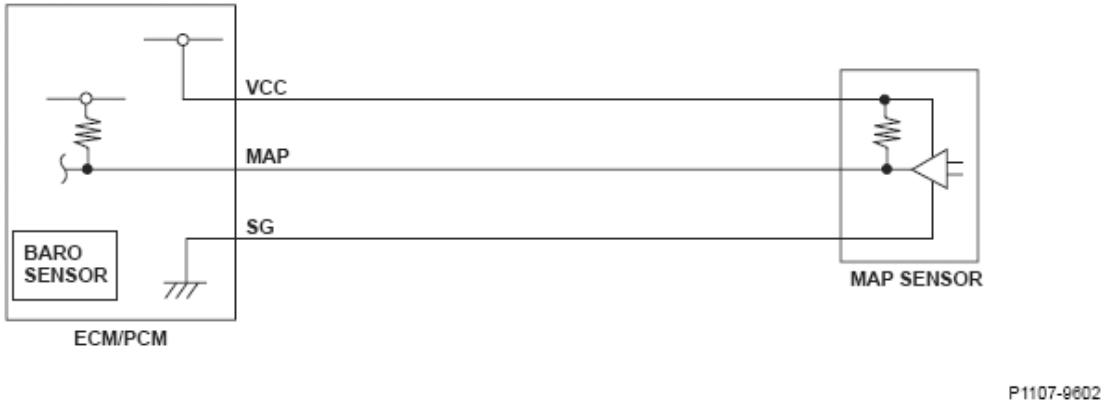

Fig. 72: Measuring Voltage Between ECM Connector Terminal A6 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 13.

NO - Go to step 11.

11. Remove PGM-FI main relay 1 (C) from the under-hood fuse/relay box.

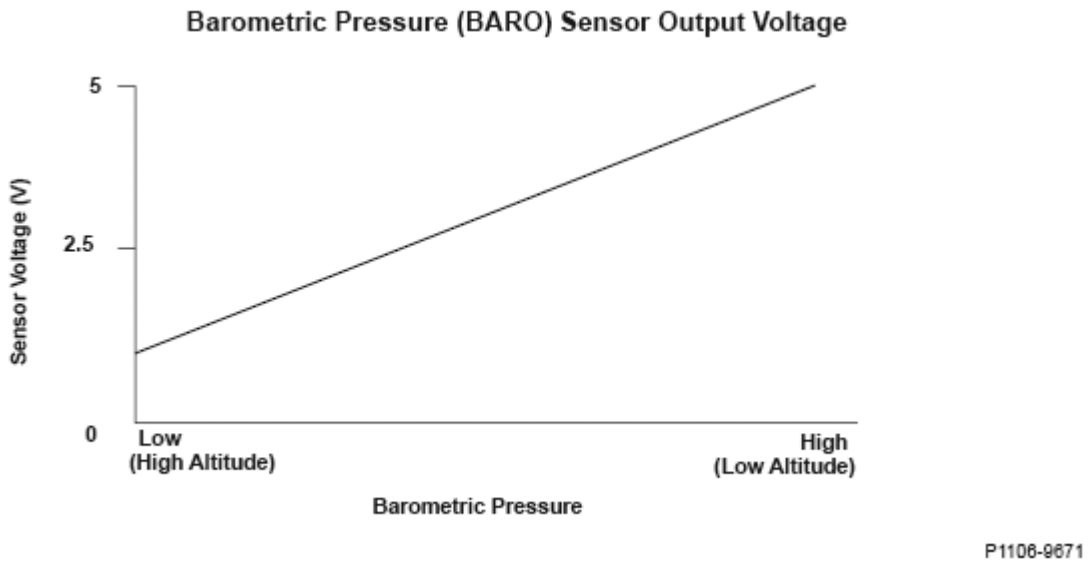

Fig. 73: Identifying PGM-FI Main Relay 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Check for continuity between ECM connector terminal A6 and body ground.

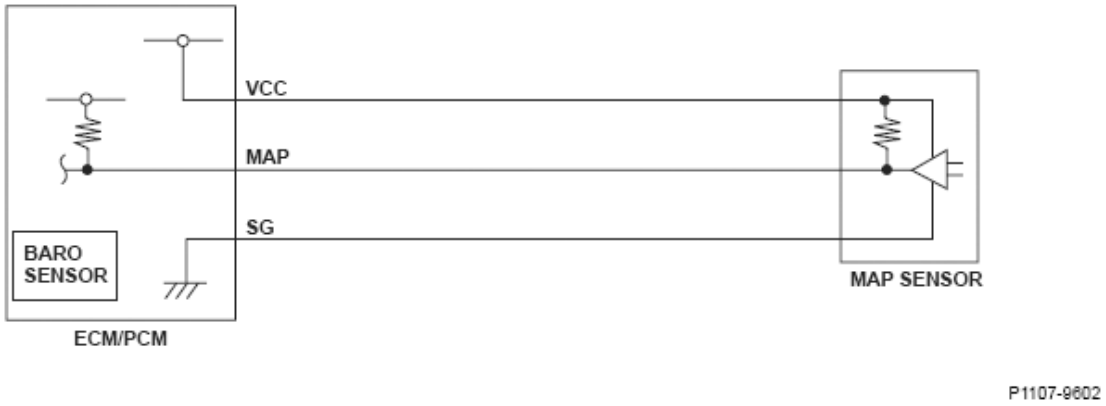

Fig. 74: Checking Continuity Between ECM Connector Terminal A6 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM (A6) and PGM-FI main relay 1, then go to step 16.

NO - Go to step 15.

13. Remove PGM-FI main relay 1 (C) from the under-hood fuse/relay box.

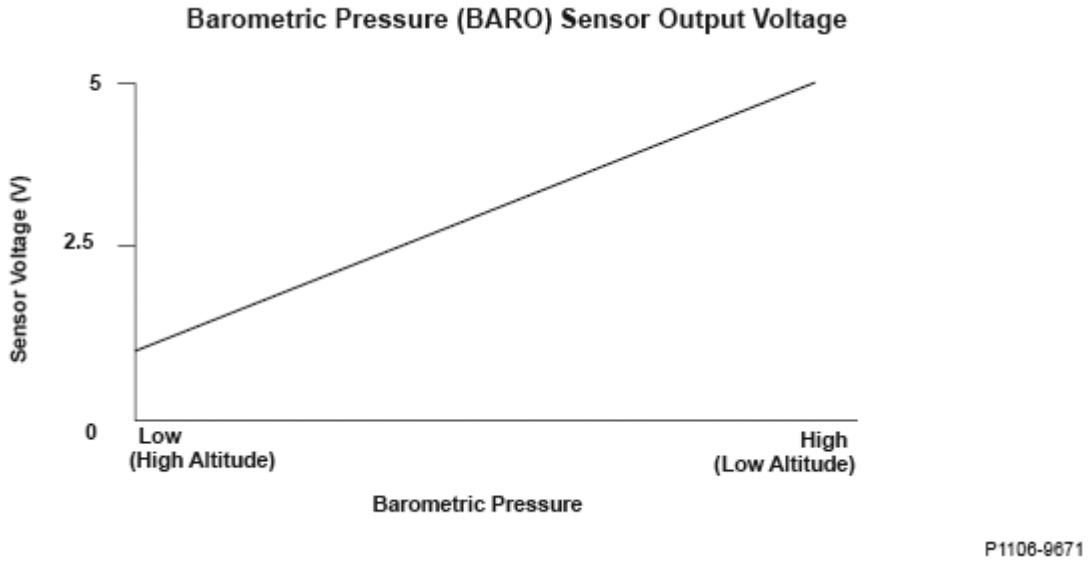

Fig. 75: Identifying PGM-FI Main Relay 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Measure voltage between ECM connector terminal A8 and body ground.

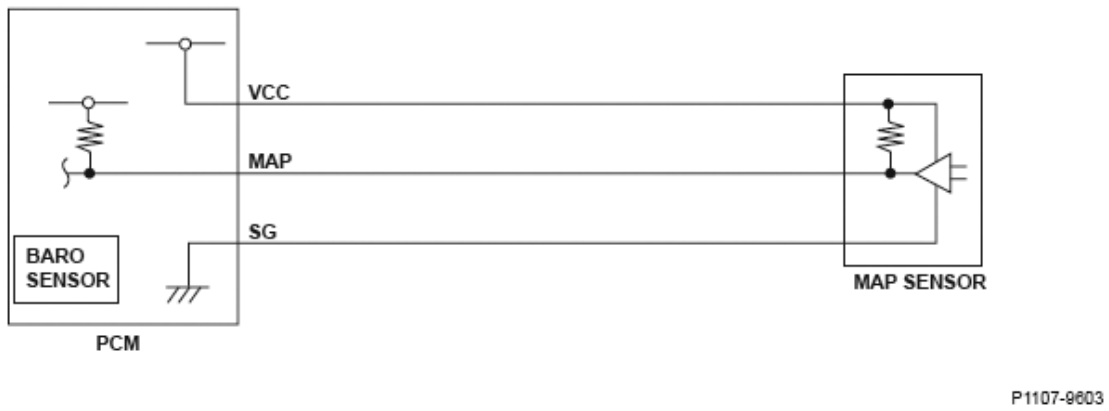

Fig. 76: Measuring Voltage Between ECM Connector Terminal A8 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Repair short to power in the wire between the ECM (A8) and PGM-FI main relay 1, then go to step 16.

NO - Go to step 15.

15. Test PGM-FI main relay 1 (see **POWER RELAY TEST**).

Is PGM-FI main relay 1 OK?

YES - Go to step 23.

NO - Replace PGM-FI main relay 1, then go to step 16.

16. Reconnect all connectors.
17. Turn the ignition switch ON (II).
18. Reset the ECM with the HDS.
19. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
20. Turn the ignition switch OFF.
21. Wait 10 seconds.
22. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0563 indicated?

    YES - Check for poor connections or loose terminals at PGM-FI main relay 1 and the ECM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

23. Reconnect all connectors.
24. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
25. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0563 indicated?

    YES - Check for poor connections or loose terminals at PGM-FI main relay 1 and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0602: ECM PROGRAMMING ERROR

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This DTC is indicated when a ECM update is not completed.**
- **Do not turn the ignition switch OFF while updating the ECM. If you turn the ignition switch OFF before completion, the ECM can be damaged.**

1. Do the ECM update procedure (see **UPDATING THE ECM**).
2. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0602 indicated?

   YES - Replace the original ECM (see **ECM REPLACEMENT**).

NO - Update is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0603: ECM INTERNAL CONTROL MODULE KEEP ALIVE MEMORY (KAM) ERROR

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check for Temporary DTCs or DTCs with the HDS.

   Are any Temporary DTCs or DTCs indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time.

4. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
5. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0603 indicated?

   YES - If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

   NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0606: ECM PROCESSOR MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch OFF.
4. Turn the ignition switch ON (II).
5. Wait 40 seconds.
6. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0606 indicated?

   YES - Go to step 7.

NO - Intermittent failure, the system is OK at this time.

7. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
8. Turn the ignition switch OFF.
9. Turn the ignition switch ON (II).
10. Wait 40 seconds.
11. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0606 indicated?

    YES - If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 8. If the ECM was substituted, go to step 1.

    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0630: VIN NOT PROGRAMMED OR MISMATCH

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This DTC is stored only when the ECM does not have the VIN information of the vehicle. Use the HDS to input the missing VIN information.**

1. Turn the ignition switch ON (II).
2. Check the VIN with the HDS.

   Does the HDS show the vehicle's VIN?

   YES - Go to step 5.

   NO - Go to step 3.

3. Input the VIN to the ECM with the HDS.

   Does the screen show COMPLETE?

   YES - Go to step 5.

   NO - Go to step 4.

4. Check for DTCs with the HDS.

   Is DTC P0603 indicated?

YES - Go to the **DTC P0603 troubleshooting**.

NO - Go to step 9.

5. Clear the DTC with the HDS.
6. Turn the ignition switch OFF.
7. Turn the ignition switch ON (II), and wait for 5 seconds.
8. Check for Temporary DTCs or DTCs with the HDS.

Are any Temporary DTCs or DTCs indicated?

YES - Go to step 9.

NO - Intermittent failure, the system is OK at this time.

9. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
10. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0630 indicated?

YES - If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0685: ECM POWER CONTROL CIRCUIT/INTERNAL CIRCUIT MALFUNCTION

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If the problem doesn't return after you clear the DTC, or it this DTC is stored intermittently, check for loose terminals at the IGP line connectors before replacing the ECM.**

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, then let it idle for 30 seconds.
4. Turn the ignition switch OFF.
5. Start the engine, then let it idle for 30 seconds.
6. Turn the ignition switch OFF.
7. Turn the ignition switch ON (II).
8. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0685 indicated?

YES - Go to step 9.

NO - Intermittent failure, the system is OK at this time.

9. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
10. Start the engine, then let it idle for 30 seconds.
11. Turn the ignition switch OFF.
12. Start the engine, then let it idle for 30 seconds.
13. Turn the ignition switch OFF.
14. Turn the ignition switch ON (II).
15. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0685 indicated?

YES - If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 10. If the ECM was substituted, go to step 1.

NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0720: OUTPUT SHAFT (COUNTERSHAFT) SPEED SENSOR CIRCUIT MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
2. Test-drive several minutes.
3. Check the C SHAFT SPD in the DATA LIST with the HDS.

Is any vehicle speed indicated?

YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the output shaft (countershaft) speed sensor and the ECM.

NO - Go to step 4.

4. Turn the ignition switch OFF.
5. Disconnect the output shaft (countershaft) speed sensor 3P connector.
6. Turn the ignition switch ON (II).
7. Measure voltage between output shaft (countershaft) speed sensor 3P connector terminal No. 1 and body ground.

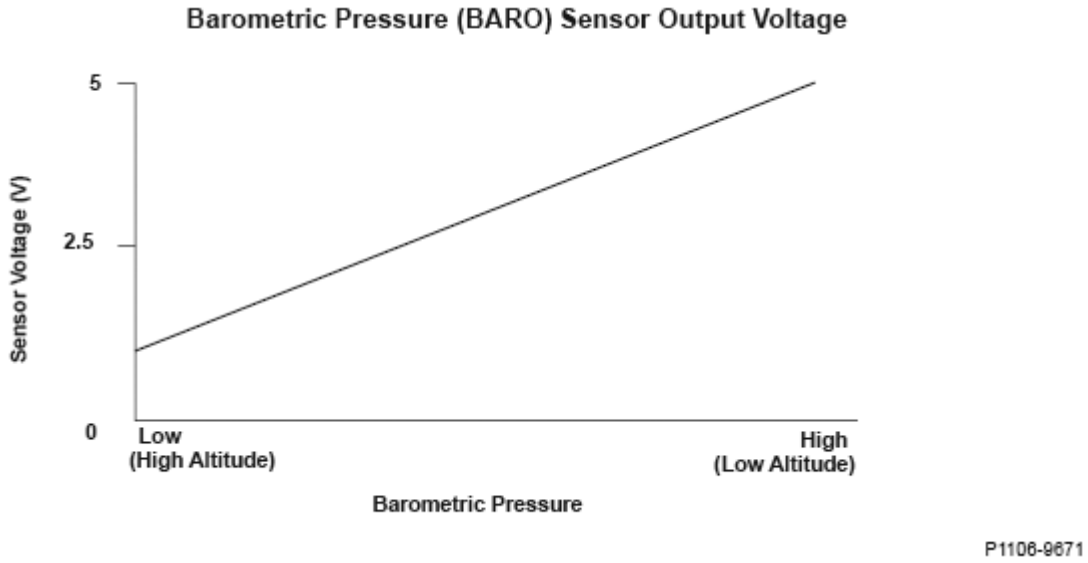

Fig. 77: Measuring Voltage Between Output Shaft Speed Sensor 3P Connector Terminal No. 1And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 8.

NO - Repair open in the wire between the ECM (B18) and the output shaft (countershaft) speed sensor, then go to step 18.

8. Measure voltage between output shaft (countershaft) speed sensor 3P connector terminal No. 2 and body ground.

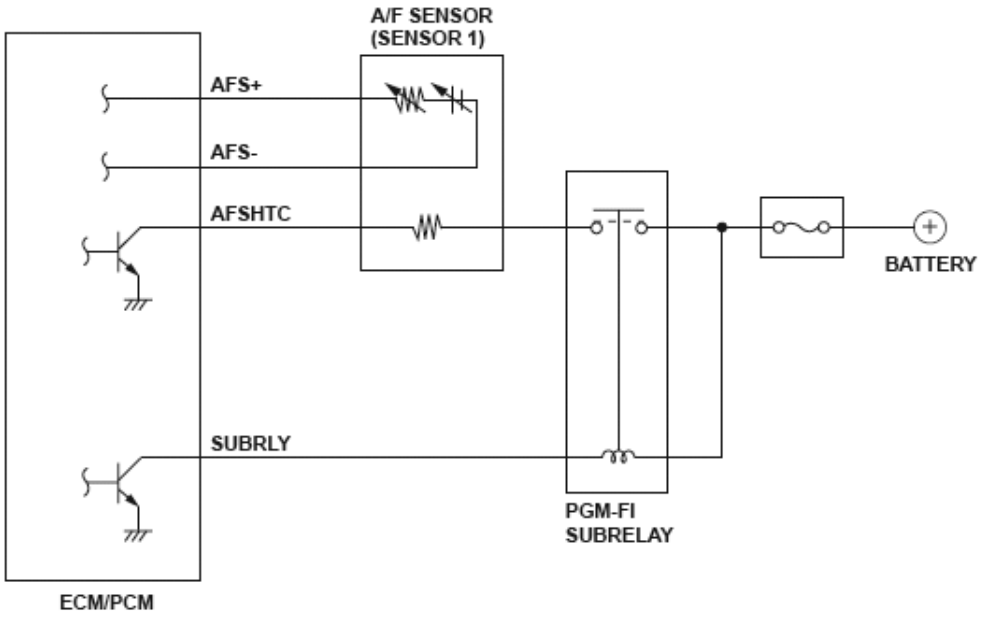

Fig. 78: Measuring Voltage Between Output Shaft Speed Sensor 3P Connector Terminal No. 2

And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 9.

NO - Go to step 10.

9. Measure voltage between output shaft (countershaft) speed sensor 3P connector terminals No. 1 and No. 3.

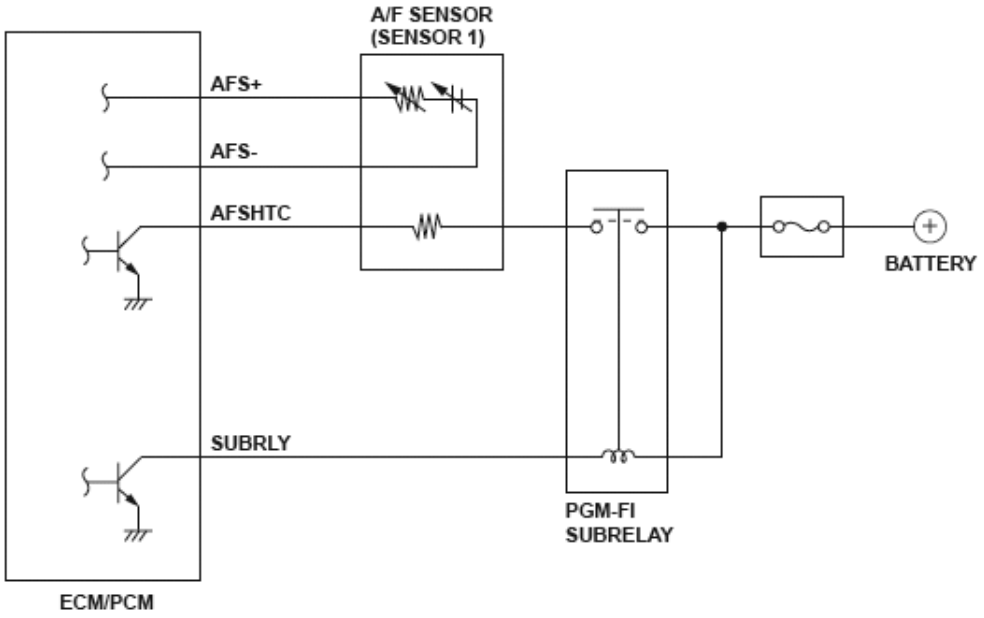

Fig. 79: Measuring Voltage Between Output Shaft Speed Sensor 3P Connector Terminals No. 1 And No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step l6.

NO - Repair open in the wire between the ECM (B33) and the output shaft (countershaft) speed sensor, then go to step 18.

10. Turn the ignition switch OFF.
11. Jump the SCS line with the HDS.
12. Disconnect ECM connector C (44P).
13. Check for continuity between ECM connector terminal C43 and body ground.

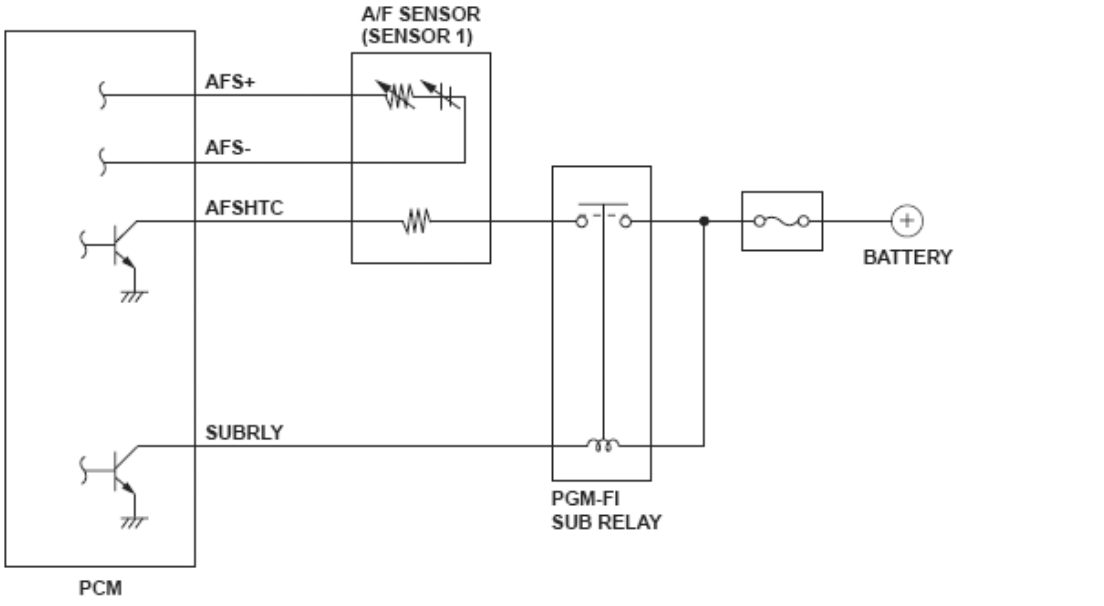

Fig. 80: Checking Continuity Between ECM Connector Terminal C43 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM (C43) and the output shaft (countershaft) speed sensor, then go to step 18.

NO - Go to step 14.

14. Connect output shaft (countershaft) speed sensor 3P connector terminal No. 2 to body ground with a jumper wire.

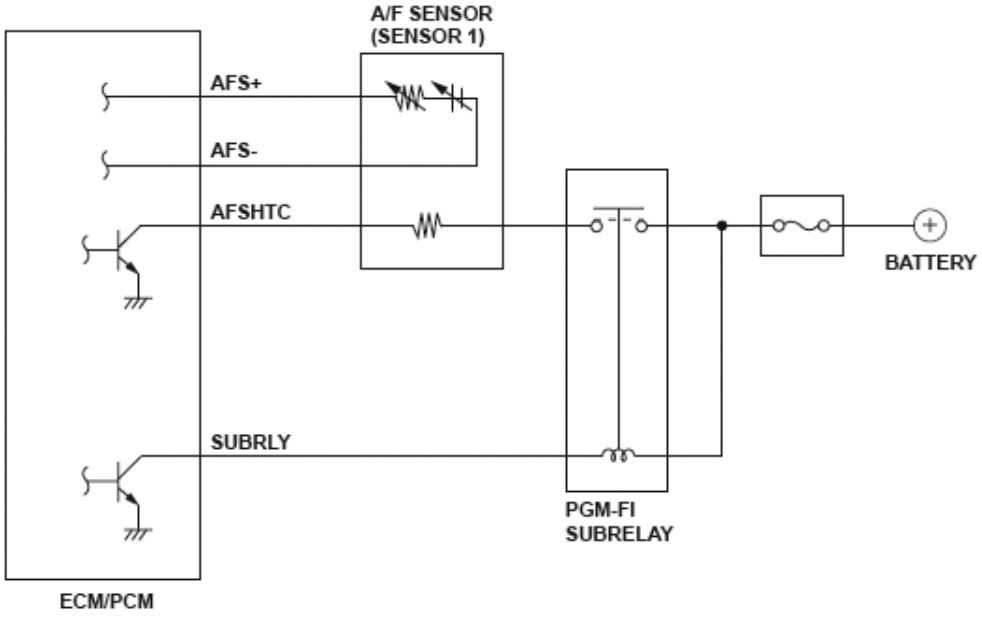

Fig. 81: Connecting Output Shaft Speed Sensor 3P Connector Terminal No. 2 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Check for continuity between ECM connector terminal C43 and body ground.

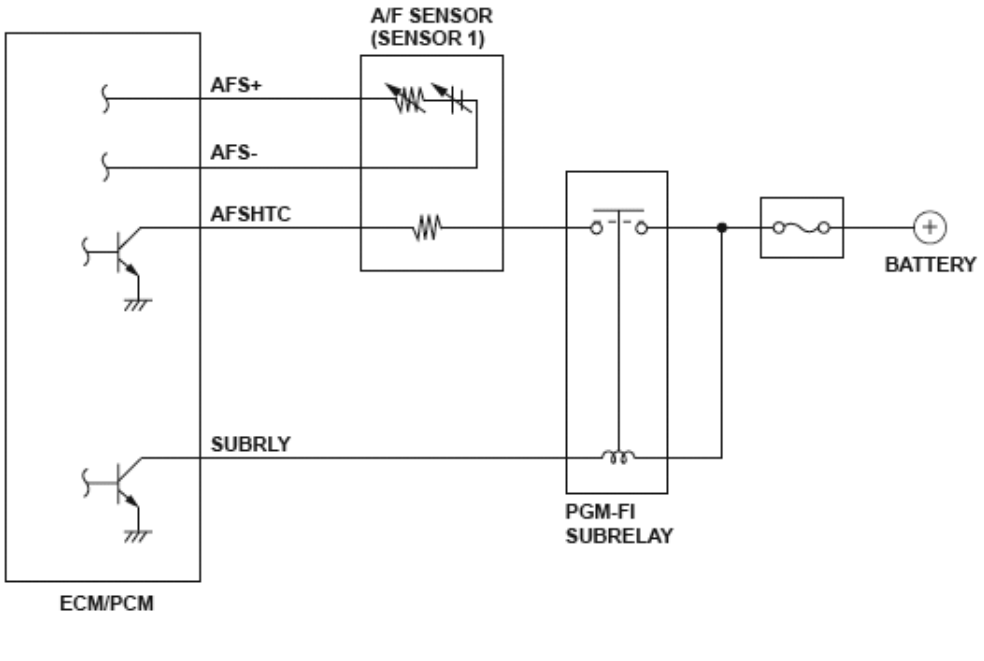

Fig. 82: Checking For Continuity Between ECM Connector Terminal C43 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the ECM (C43) and the output shaft (countershaft) speed sensor, then go to step 18.

16. Turn the ignition switch OFF.
17. Replace the output shaft (countershaft) speed sensor (see **KNOCK SENSOR REPLACEMENT**).
18. Reconnect all connectors.
19. Turn the ignition switch ON (II).
20. Reset the ECM with the HDS.
21. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
22. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 176°F (80°C)
    - Transmission in 5th gear
    - Engine speed between 2,000-3,000 rpm
    - Drive for several minutes, then decelerate (with the throttle fully closed) for 8 seconds
23. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0720 indicated?

YES - Check for poor connections or loose terminals at the output shaft (countershaft) speed sensor and the ECM, then go to step 1.

NO - Go to step 24.

24. Monitor the OBD STATUS for DTC P0720 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 23, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the output shaft (countershaft) speed sensor and the ECM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 22.

25. Reconnect all connectors.
26. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
27. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 176°F (80°C)
    - Transmission in 5th gear
    - Engine speed between 2,000-3,000 rpm
    - Drive for several minutes, then decelerate (with the throttle fully closed) for 8 seconds
28. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0720 indicated?

    YES - Check for poor connections or loose terminals at the output shaft (countershaft) speed sensor and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 27. If the ECM was substituted, go to step 1.

    NO - Go to step 29.

29. Monitor the OBD STATUS for DTC P0720 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 28, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the output shaft (countershaft) speed sensor and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 27. If the ECM was substituted, go to step 1. If the screen indicates NOT COMPLETED, go to step 27.

DTC P1109: BARO SENSOR CIRCUIT OUT OF RANGE HIGH

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Reset the ECM with the HDS.
2. Start the engine.
3. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P1109 indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time.

4. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
5. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P1109 indicated?

   YES - If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

   NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P1116: ECT SENSOR 1 CIRCUIT RANGE/PERFORMANCE PROBLEM

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P0111 is stored at the same time as DTC P1116, troubleshoot DTC P0111 first, then recheck for DTC P1116.**

1. Check for poor connections or loose terminals at ECT sensor 1 and ECT sensor 2.

   Are the connections and terminals OK?

   YES - Go to step 2.

   NO - Repair the connectors or terminals, then go to step 27.

2. Turn the ignition switch ON (II).
3. Check for Temporary DTCs or DTCs with the HDS.

Are DTC P1116 and P2183 indicated at the same time?

YES - Go to step 15.

NO - Go to step 4.

4. Start the engine, and let it idle 10 minutes.
5. Check ECT SENSOR 1 in the DATA LIST with the HDS.

Is about 117°F (47°C) or less indicated?

YES - Replace ECT sensor 1 (see **ECT SENSOR 1 REPLACEMENT**), then go to step 27.

NO - Go to step 6.

6. Turn the ignition switch OFF.
7. Drain the coolant (see **COOLANT REPLACEMENT**).
8. Remove ECT sensor 1 (see **ECT SENSOR 1 REPLACEMENT**).
9. Allow ECT sensor 1 to cool to ambient temperature.
10. Note the ambient temperature.
11. Connect ECT sensor 1 to the 2P connector, but do not install sensor on the engine.
12. Turn the ignition switch ON (II).
13. Note the value of ECT SENSOR 1 quickly in the DATA LIST with the HDS.
14. Compare the value of ECT SENSOR 1 and the ambient temperature.

Does the value of ECT SENSOR 1 differ 5.4°F (3°C) or more?

YES - Replace ECT sensor 1 (see **ECT SENSOR 1 REPLACEMENT**), then go to step 27.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM.

15. Start the engine, and let it idle 10 minutes.
16. Check ECT SENSOR 1 in the DATA LIST with the HDS.

Is about 117°F (47°C) or less indicated?

YES - Replace ECT sensor (see **ECT SENSOR 1 REPLACEMENT**), then go to step 27.

NO - Go to step 17.

17. Let the engine idle 10 minutes.
18. Check ECT SENSOR 2 in the DATA LIST with the HDS.

Is about 140°F (60°C) or less indicated?

YES - Replace ECT sensor 2 (see **ECT SENSOR 2 REPLACEMENT**), then go to step 27.

NO - Go to step 19.

19. Turn the ignition switch OFF.
20. Drain the coolant (see **COOLANT REPLACEMENT**).
21. Remove ECT sensor 1 (see **ECT SENSOR 1 REPLACEMENT**) and the ECT sensor 2 (see **ECT SENSOR 2 REPLACEMENT**).
22. Allow the sensors to cool to ambient temperature.
23. Note the ambient temperature.
24. Connect ECT sensor 1 to the 2P connector, and ECT sensor 2 to the 2P connector, but do not install them on the engine.
25. Note the value of ECT SENSOR 1 and ECT SENSOR 2 quickly in the DATA LIST with the HDS.
26. Compare the value of ECT SENSOR 1 and the ambient temperature, and the value of ECT SENSOR 2 and the ambient temperature individually.

    Does one of the sensors differ more than 5.4°F (3°C) from the ambient temperature?

    YES - Replace the sensor that differed more than 5.4°F (3°C) from the ambient temperature, then go to step 27.

    NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM.

27. Turn the ignition switch ON (II).
28. Reset the ECM with the HDS.
29. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
30. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1116 indicated?

    YES - Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P1128: MAP SENSOR SIGNAL LOWER THAN EXPECTED

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Before starting this troubleshooting check for poor connections or blockage at the air intake duct.**

1. Turn the ignition switch ON (II).
2. Check the MAP SENSOR in the DATA LIST with the HDS.

   Is less than 54.1 kPa (16.0 in.Hg, 406 mmHg) or 1.61 V held for more than 5 seconds?

YES - Go to step 7.

NO - Go to step 3.

3. Clear the DTC with the HDS.
4. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
5. Test-drive under these conditions:
   - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
   - Engine speed between 1,200-5,400 rpm
   - Transmission in 3rd gear
   - Vehicle speed accelerated from 16-31 mph (25-50 km/h) under half throttle
6. Monitor the OBD STATUS for DTC P1128 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 7.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAP sensor and the ECM. If the screen indicates NOT COMPLETED, go to step 4 and recheck.

7. Turn the ignition switch OFF.
8. Replace the MAP sensor (see **MAP SENSOR REPLACEMENT**).
9. Turn the ignition switch ON (II).
10. Reset the ECM with the HDS.
11. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
12. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
13. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
    - Engine speed between 1,200-5,400 rpm
    - Transmission in 3rd gear
    - Vehicle speed accelerated from 16-31 mph (25-50 km/h) under half throttle
14. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1128 indicated?

    YES - Check for poor connections or loose terminals at the MAP sensor and the ECM, then go to step 1.

    NO - Go to step 15.

15. Monitor the OBD STATUS for DTC P1128 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 14, go to the indicated DTC's troubleshooting.

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the MAP sensor and the ECM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 12.

DTC P1129: MAP SENSOR SIGNAL HIGHER THAN EXPECTED

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Check for vacuum leaks in these parts:
   - PCV valve
   - PCV hose
   - EVAP canister purge valve
   - Throttle body
   - Intake manifold
   - Brake booster
   - Brake booster hose

   Are there any vacuum leaks?

   YES - Repair or replace parts with vacuum leaks, then go to step 9.

   NO - Go to step 2.

2. Start the engine. Hold the engine speed at 3.000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
3. Check the MAP SENSOR in the DATA LIST with the HDS.

   Is more than 36.9 kPa (11.0 in.Hg, 277 mmHg) or 1.1 V held for more than for 5 seconds?

   YES - Go to step 7.

   NO - Go to step 4.

4. Clear the DTC with the HDS.
5. Test-drive under these conditions:
   - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
   - Transmission in 5th gear
   - Drive at a steady speed between 55-75 mph (88-120 km/h) for 10 seconds
   - During the drive, decelerate (with throttle fully closed) for at least 2 seconds
6. Monitor the OBD STATUS for DTC P1129 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

YES - Go to step 7.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAP sensor and the ECM. If the screen indicates NOT COMPLETED, go to step 5 and recheck.

7. Turn the ignition switch OFF.
8. Replace the MAP sensor (see **MAF SENSOR/IAT SENSOR REPLACEMENT**).
9. Turn the ignition switch ON (II).
10. Reset the ECM with the HDS.
11. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
12. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
13. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
    - Transmission in 5th gear
    - Drive at a steady speed between 55-75 mph (88-120 km/h) for 10 seconds
    - During the drive, decelerate (with throttle fully closed) for at least 2 seconds
14. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1129 indicated?

    YES - Check for poor connections or loose terminals at the MAP sensor and the ECM, then go to step 1.

    NO - Go to step 15.

15. Monitor the OBD STATUS for DTC P1129 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 14, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the MAP sensor and the ECM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 12.

DTC P1157: A/F SENSOR (SENSOR 1) AFS CIRCUIT MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and wait 1 minute.

4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P1157 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM.

5. Turn the ignition switch OFF.
6. Jump the SCS line with the HDS.
7. Disconnect the A/F sensor (Sensor 1) 4P connector.
8. Disconnect ECM connector C (44P).
9. Connect A/F sensor (Sensor 1) 4P connector terminals No. 1 and No. 2 with a jumper wire.

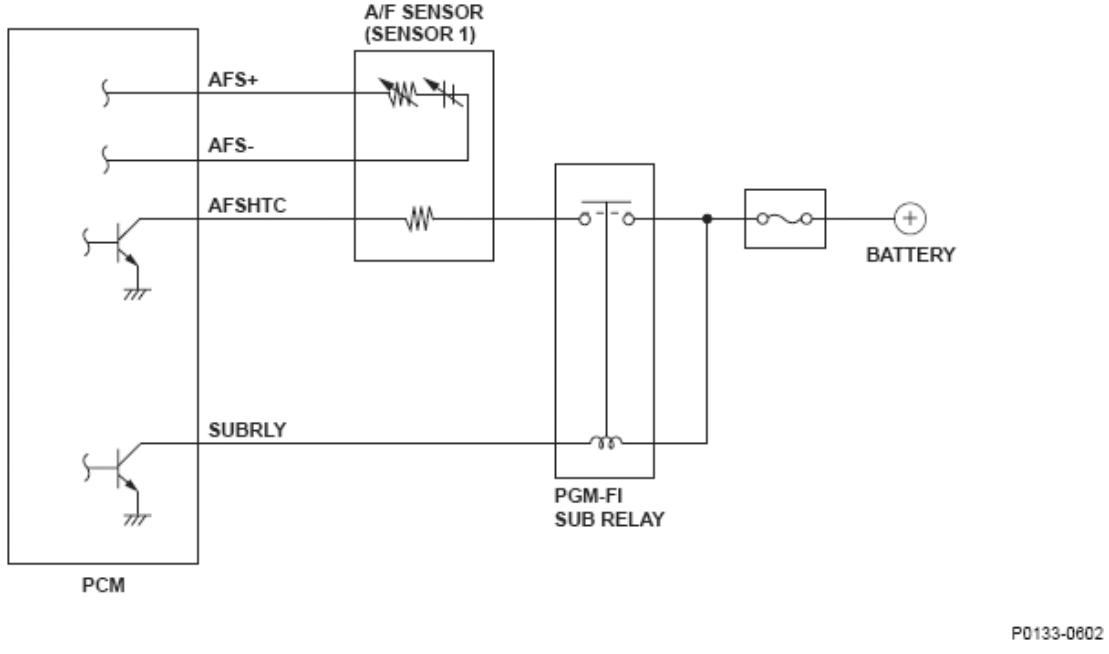

Fig. 83: Connecting A/F Sensor 4P Connector Terminals No. 1 And No. 2 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Check for continuity between ECM connector terminals C29 and C30.

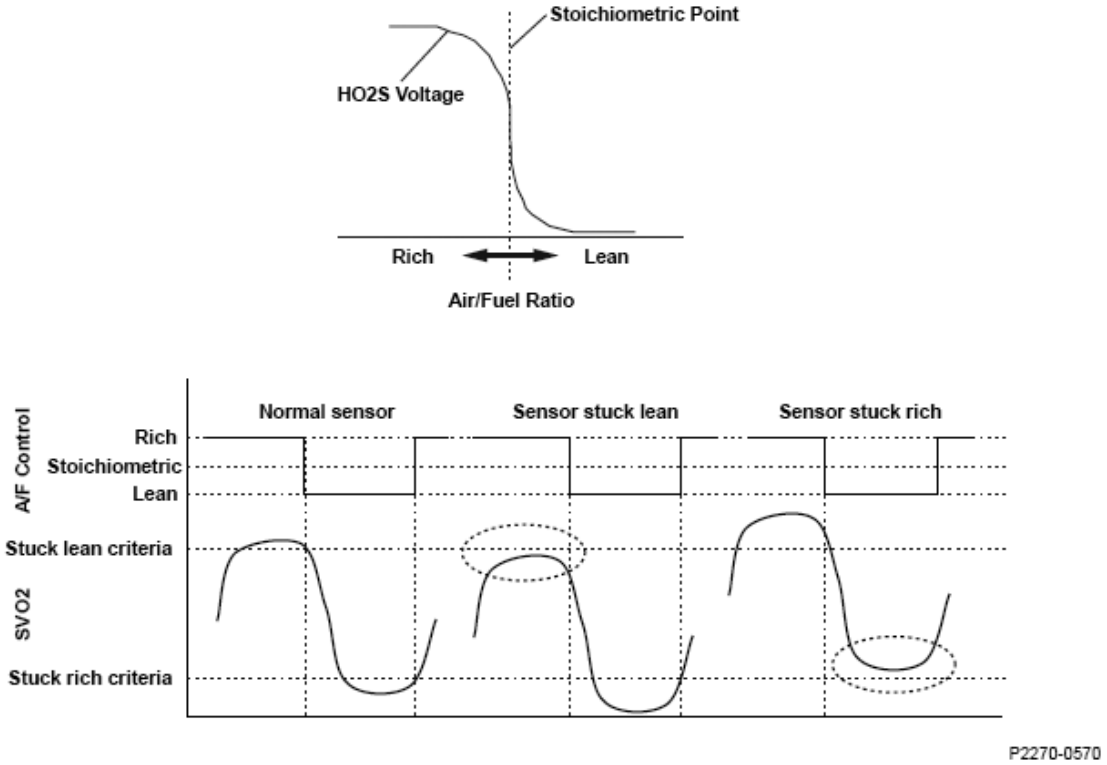

Fig. 84: Checking For Continuity Between ECM Connector Terminals C29 And C30
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 14.

NO - Go to step 11.

11. Remove the jumper wire from the A/F sensor (Sensor 1) 4P connector.
12. Connect A/F sensor (Sensor 1) 4P connector terminal No. 2 to body ground with a jumper wire.

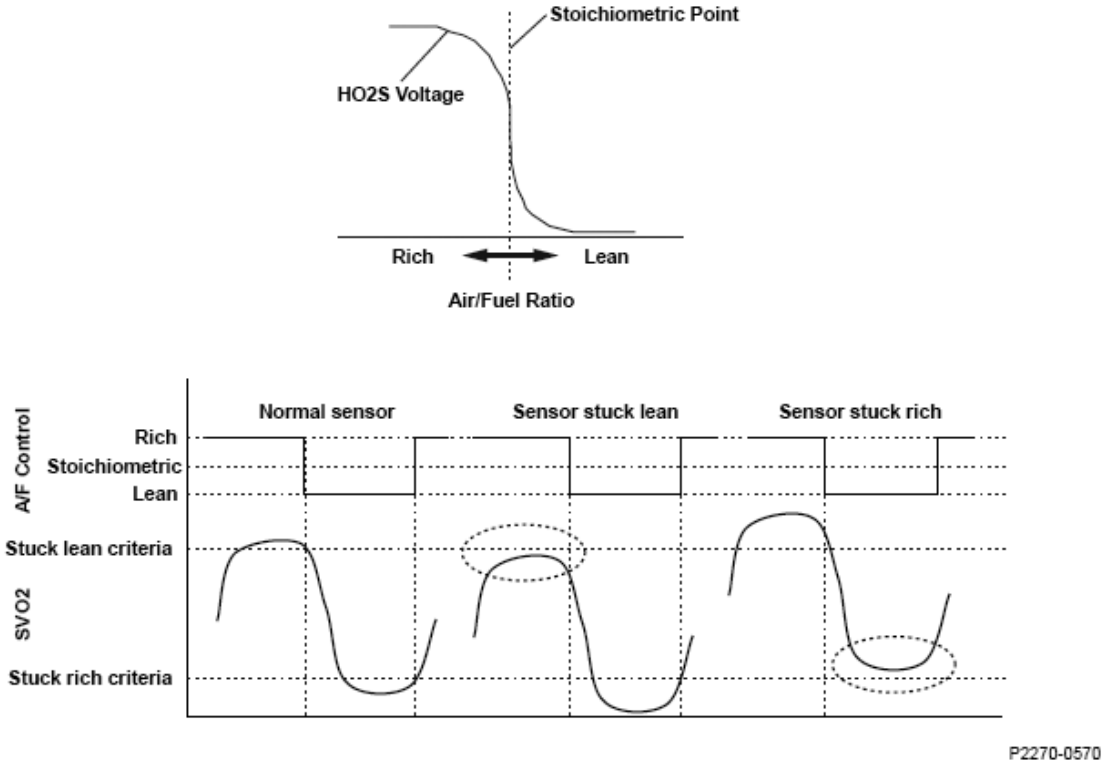

Fig. 85: Connecting A/F Sensor 4P Connector Terminal No. 2 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Check for continuity between ECM connector terminal C29 and body ground.

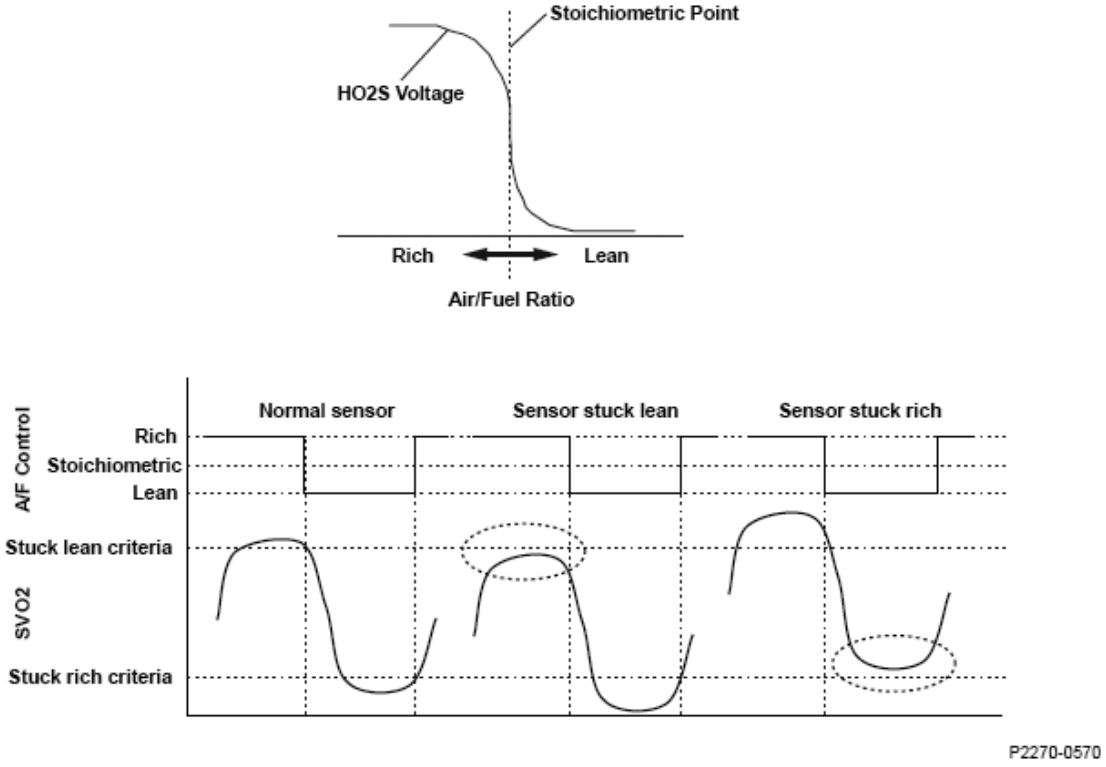

Fig. 86: Checking For Continuity Between ECM Connector Terminal C29 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair open in the wire between the ECM (C30) and the A/F sensor (Sensor 1), then go to step 15.

NO - Repair open in the wire between the ECM (C29) and the A/F sensor (Sensor 1), then go to step 15.

14. Replace the A/F sensor (Sensor 1) (see **A/F SENSOR REPLACEMENT**).
15. Reconnect all connectors.
16. Turn the ignition switch ON (II).
17. Reset the ECM with the HDS.
18. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
19. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P1157 indicated?

YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM, then go to step 1. If the connector and terminal fits are OK, go to step 21.

NO - Go to step 20.

20. Monitor the OBD STATUS for DTC P1157 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 19, go to the indicated DTC's troubleshooting.

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

21. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
22. Start the engine, and let it idle.
23. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P1157 indicated?

YES - If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 22. If the ECM was substituted, go to step 1.

NO - Go to step 24.

24. Monitor the OBD STATUS for DTC P1157 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 23, go to the indicated DTC's troubleshooting.

NO - If the screen indicates FAILED, go to step 1. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 22. If the ECM was substituted, go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P1172: A/F SENSOR (SENSOR 1) CIRCUIT OUT OF RANGE HIGH

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
4. Monitor the OBD STATUS for DTC P1172 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 5.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 3 and recheck.

5. Turn the ignition switch OFF.
6. Replace the A/F sensor (Sensor 1) (see **A/F SENSOR REPLACEMENT**).
7. Turn the ignition switch ON (II).
8. Reset the ECM with the HDS.
9. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
10. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
11. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1172 indicated?

    YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM, then go to step 1.

    NO - Go to step 12.

12. Monitor the OBD STATUS for DTC P1172 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 11, go to the indicated DTC's troubleshooting.

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM, then go to step 1. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 10.

DTC P1297: ELD CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check the ELD in the DATA LIST with the HDS.

   Is 72 A or more indicated?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the ELD and the ECM.

3. Turn the ignition switch OFF.
4. Disconnect the ELD 3P connector.
5. Turn the ignition switch ON (II).
6. Check the ELD in the DATA LIST with the HDS.

   Is 72 A or more indicated?

   YES - Go to step 7.

   NO - Go to step 11.

7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Disconnect ECM connector A (44P).
10. Check for continuity between ECM connector terminal A23 and body ground.

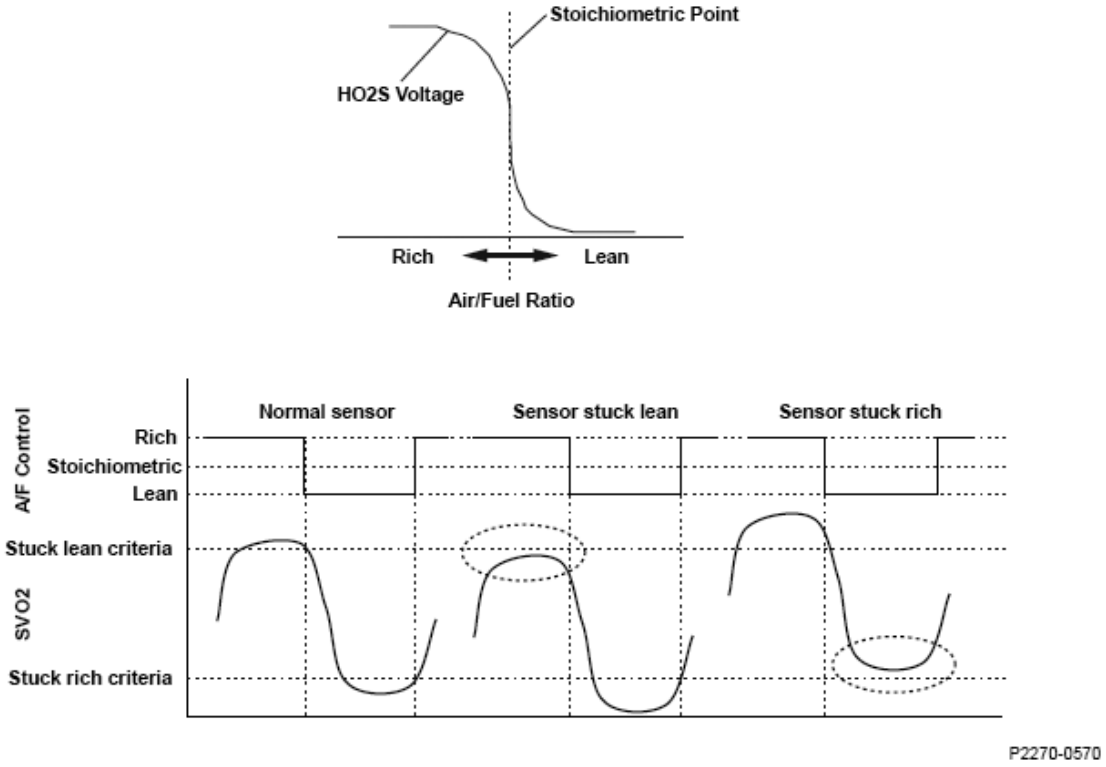

Fig. 87: Checking Continuity Between ECM Connector Terminal A23 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM (A23) and the ELD, then go to step 13.

NO - Go to step 20.

11. Turn the ignition switch OFF.
12. Replace the ELD (see **ELD REPLACEMENT**).
13. Reconnect all connectors.
14. Turn the ignition switch ON (II).
15. Reset the ECM with the HDS.
16. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
17. Start the engine.
18. Turn on the headlights.
19. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P1297 indicated?

YES - Check for poor connections or loose terminals at the ELD and the ECM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

20. Reconnect all connectors.
21. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
22. Start the engine.
23. Turn on the headlights.
24. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1297 indicated?

    YES - Check for poor connections or loose terminals at the ELD and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 22. If the ECM was substituted, go to step 1.

    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P1298: ELD CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check the ELD in the DATA LIST with the HDS.

   Is 0.2 A or less indicated?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the ELD and the ECM.

3. Turn the ignition switch OFF.
4. Disconnect the ELD 3P connector.
5. Turn the ignition switch ON (II).
6. Measure voltage between ELD 3P connector terminal No. 1 and body ground.

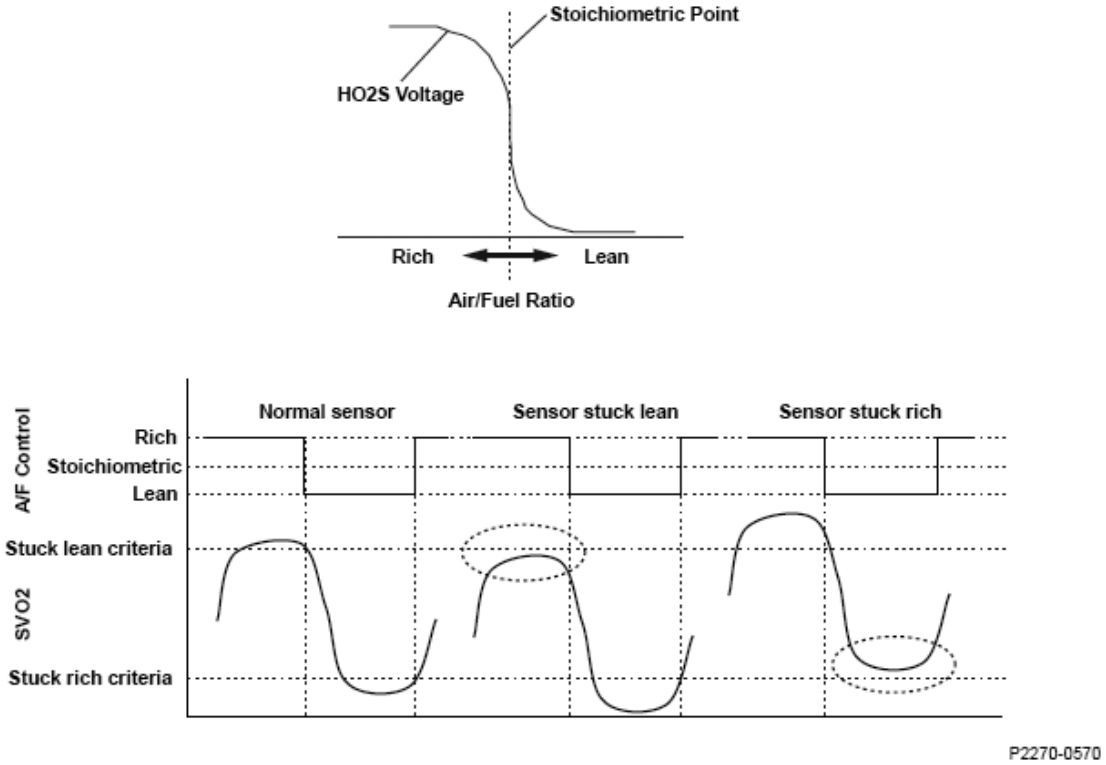

Fig. 88: Measuring Voltage Between ELD 3P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 7.

NO - Check the No. 3 ALTERNATOR (10 A) fuse in the under-dash fuse/relay box. If the fuse is OK, repair open in the wire between the No. 3 ALTERNATOR (10 A) fuse and the ELD, then go to step 12.

7. Jump the SCS line with the HDS.
8. Disconnect ECM connector A (44P).
9. Check for continuity between ELD 3P connector terminal No. 3 and ECM connector terminal A23.

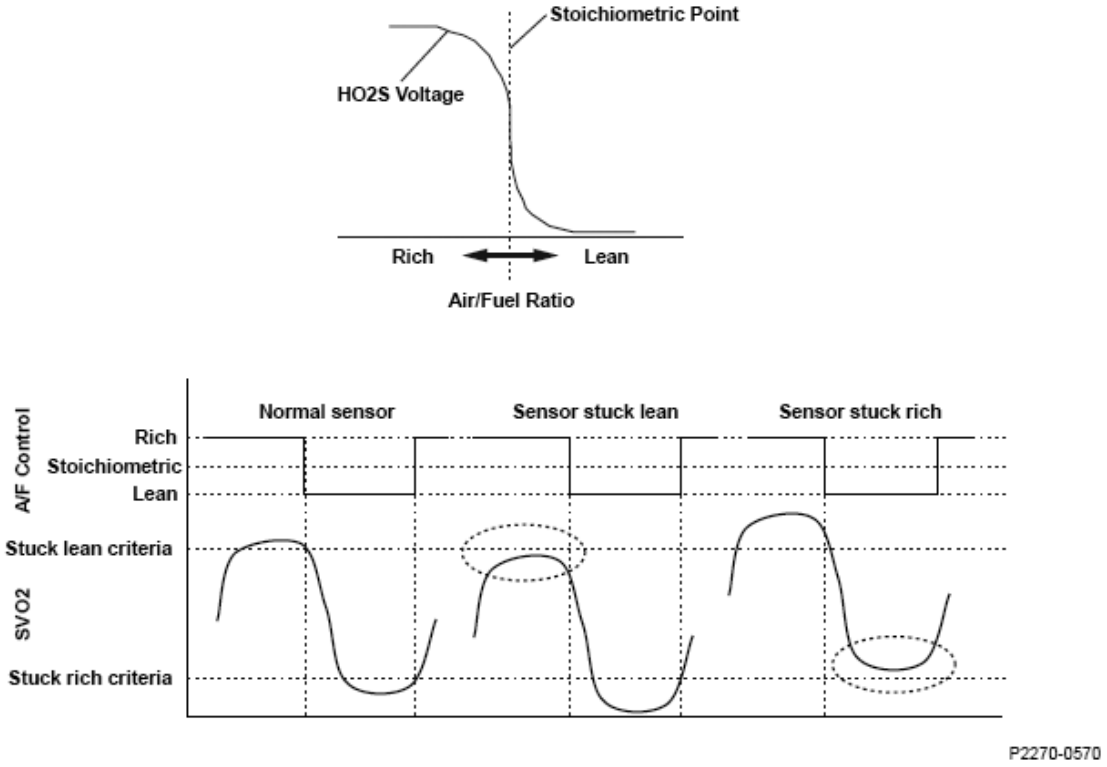

Fig. 89: Checking Continuity Between ELD 3P Connector Terminal No. 3 And ECM Connector Terminal A23
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Repair open in the wire between the ECM (A23) and the ELD, then go to step 12.

10. Check for continuity between ELD 3P connector terminal No. 2 and body ground.

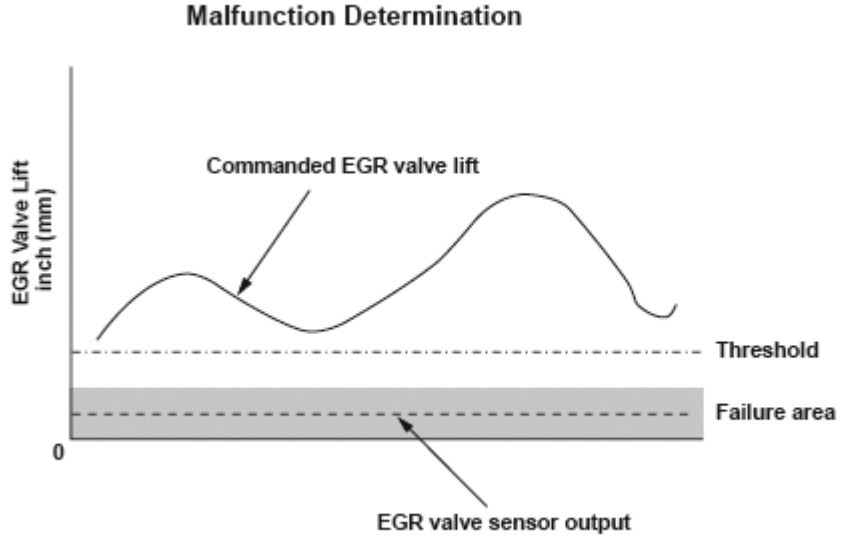

Fig. 90: Checking For Continuity Between ELD 3P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 11.

NO - Repair open in the wire between the ELD and G301 (see **CONNECTOR TO HARNESS INDEX**), then go to step 12.

11. Replace the ELD (see **ELD REPLACEMENT**).
12. Reconnect all connectors.
13. Turn the ignition switch ON (II).
14. Reset the ECM with the HDS.
15. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
16. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1298 indicated?

    YES - Go to step 17.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

17. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
18. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1298 indicated?

    YES - Check for poor connections or loose terminals at the ELD and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P1549: CHARGING SYSTEM HIGH VOLTAGE

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If a high voltage battery (24 V, etc.) connected to the vehicle, this DTC can be stored.**

1. Turn the ignition switch ON (II).

2. Clear the DTC with the HDS.
3. Start the engine.
4. Check under these conditions:
   - A/C off
   - Headlights off
   - Rear window defogger off
5. Hold the engine speed at 2,000 rpm (in neutral) for 1 minute.
6. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P1549 indicated?

   YES - Replace the alternator (see **ALTERNATOR REMOVAL AND INSTALLATION**), then go to step 7.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the alternator and the under-hood fuse/relay box.

7. Turn the ignition switch ON (II).
8. Reset the ECM with the HDS.
9. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
10. Start the engine.
11. Check under these conditions:
    - A/C off
    - Headlights off
    - Rear window defogger off
12. Hold the engine speed at 2,000 rpm (in neutral) for 1 minute.
13. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1549 indicated?

    YES - Check for poor connections or loose terminals at the alternator and the under-hood fuse/relay box, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P16BB: ALTERNATOR B TERMINAL CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with HDS.
3. Start the engine.

4. Check under these conditions:
   - A/Con
   - Temperature control at maximum cool
   - Blower fan at maximum speed
   - Rear window defogger on
   - Headlights on high beam
5. Hold the engine speed at 2,000 rpm (in neutral) for 1 minute.
6. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P16BB indicated?

   YES - Go to step 7.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the alternator and the under-hood fuse/relay box, and check the battery performance (see **BATTERY TEST**).

7. Check for poor connections or loose terminals at the alternator and the under-hood fuse/relay box (+B line).

   Are the connections and terminals OK?

   YES - Go to step 8.

   NO - Repair the connectors or terminals, then go to step 9.

8. Check for an open in the wire between the alternator and under-hood fuse/relay box at the starter subharness.

   Is the harness OK?

   YES - Replace the alternator (see **ALTERNATOR REMOVAL AND INSTALLATION**), then go to step 9.

   NO - Repair open in the wire between the alternator and the under-hood fuse/relay box, then go to step 9.

9. Turn the ignition switch ON (II).
10. Reset the ECM with the HDS.
11. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
12. Start the engine.
13. Check under these conditions:
    - A/Con
    - Temperature control at maximum cool
    - Blower fan at maximum speed
    - Rear window defogger on

- Headlights on high beam

14. Hold the engine speed at 2,000 rpm (in neutral) for 1 minute.
15. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P16BB indicated?

    YES - Check for poor connections or loose terminals at the alternator and the under-hood fuse/relay box, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P16BC: ALTERNATOR FR TERMINAL CIRCUIT/IGP CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Check for poor connections or loose terminals at the alternator 4P connector.

   Are the connections and terminals OK?

   YES - Go to step 2.

   NO - Repair the connector or terminals, then go to step 18.

2. Check the alternator mounting surface for corrosion.

   Is the mounting surface corroded?

   YES - Remove the alternator (see **ALTERNATOR REMOVAL AND INSTALLATION**). Clean all mounting surfaces, reinstall the alternator, then go to step 18.

   NO - Go to step 3.

3. Turn the ignition switch ON (II).
4. Clear the DTC with the HDS.
5. Start the engine.
6. Check under these conditions:
   - A/Con
   - Temperature control at maximum cool
   - Blower fan at maximum speed
   - Rear window defogger on
   - Headlights on high beam
7. Hold the engine speed 2,000 rpm (in neutral) for 1 minute.
8. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P16BC indicated?

YES - Go to step 9.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the alternator.

9. Turn the ignition switch OFF.
10. Disconnect the alternator 4P connector.
11. Turn the ignition switch ON (II).
12. Measure voltage between alternator 4P connector terminal No. 1 and body ground.

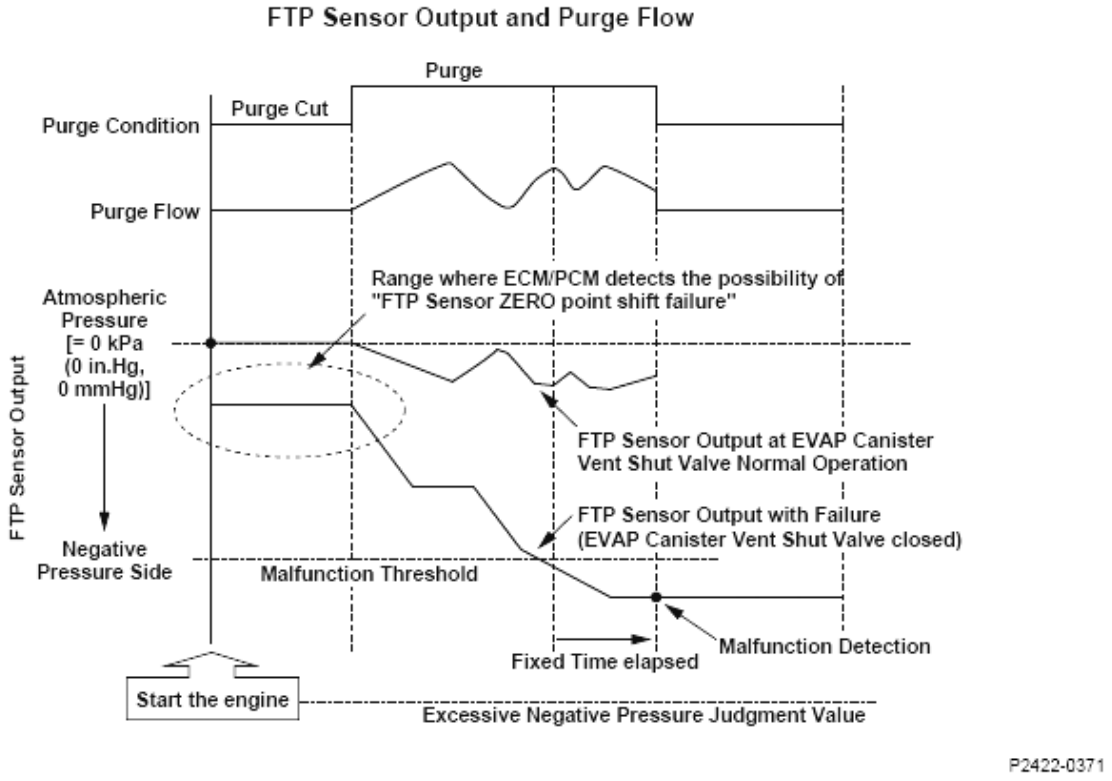

Fig. 91: Measuring Voltage Between Alternator 4P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 13.

NO - Repair open in the wire between the alternator (IG1 line) and the No. 3 ALTERNATOR (10 A) fuse in the under-dash fuse/relay box, then go to step 18.

13. Measure voltage between alternator 4P connector terminal No. 4 and body ground.

Malfunction Judgment Flowchart of FTP Sensor and EVAP Canister Vent Shut Valve

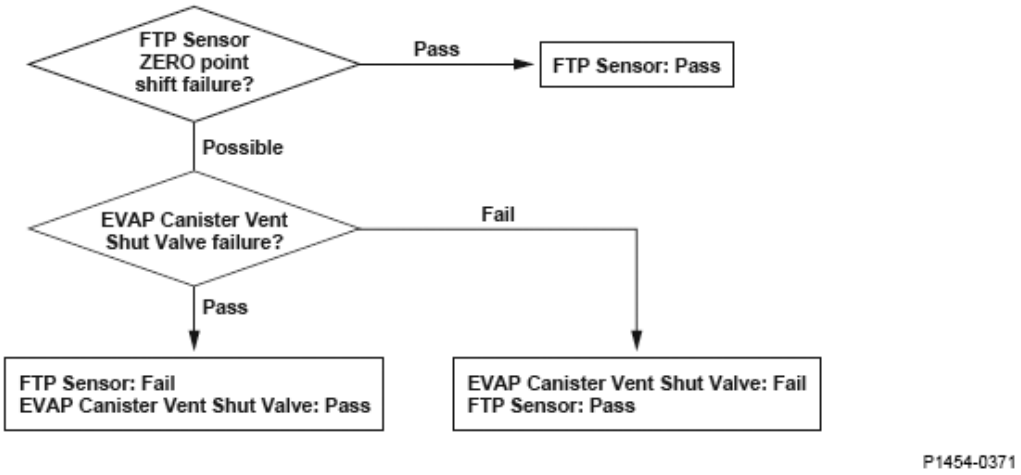

Fig. 92: Measuring Voltage Between Alternator 4P Connector Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Replace the alternator (see **ALTERNATOR REMOVAL AND INSTALLATION**), then go to step 18.

NO - Go to step 14.

14. Turn the ignition switch OFF.
15. Jump the SCS line with the HDS.
16. Disconnect ECM connector B (44P).
17. Check for continuity between alternator 4P connector terminal No. 4 and ECM connector terminal B43.

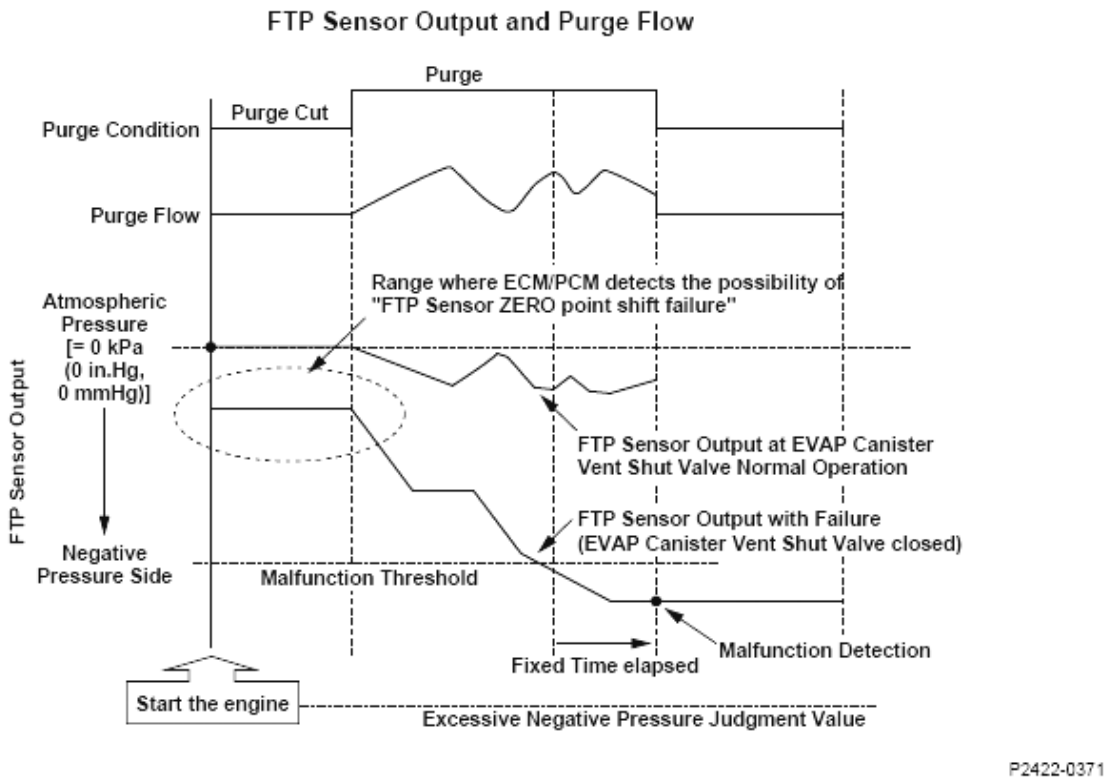

Fig. 93: Checking For Continuity Between Alternator 4P Connector Terminal No. 4 And ECM Connector Terminal B43
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 27.

NO - Repair open in the wire between the ECM (B43) and the alternator, then go to step 18.

18. Turn the ignition switch OFF.
19. Reconnect all connectors.
20. Turn the ignition switch ON (II).
21. Reset the ECM with the HDS.
22. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
23. Start the engine.
24. Check under these conditions:
    - A/C on
    - Temperature control at maximum cool
    - Blower fan at maximum speed
    - Rear window defogger on
    - Headlights on high beam
25. Hold the engine speed 2,000 rpm (in neutral) for 1 minute.
26. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P16BC indicated?

YES - Check for poor connections or loose terminals at the alternator and the ECM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

27. Reconnect all connectors.
28. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
29. Start the engine.
30. Check under these conditions:
    - A/Con
    - Temperature control at maximum cool
    - Blower fan at maximum speed
    - Rear window defogger on
    - Headlights on high beam
31. Hold the engine speed 2,000 rpm (in neutral) for 1 minute.
32. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P16BC indicated?

YES - Check for poor connections or loose terminals at the alternator and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 29. If the ECM was substituted, go to step 1.

NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P2183: ECT SENSOR 2 CIRCUIT RANGE/PERFORMANCE PROBLEM

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P0111 is stored at the same time as DTC P2183, troubleshoot DTC P0111 first, then recheck for DTC P2183.**

1. Check for poor connections or loose terminals at ECT sensor 1 and ECT sensor 2.

   Are the connections and terminals OK?

   YES - Go to step 2.

   NO - Repair the connectors or terminals, then go to step 27.

2. Turn the ignition switch ON (II).

3. Check for Temporary DTCs or DTCs with the HDS.

   Are DTC P1116 and P2183 indicated at the same time?

   YES - Go to step 15.

   NO - Go to step 4.

4. Start the engine, and let it idle 10 minutes.
5. Check ECT SENSOR 2 in the DATA LIST with the HDS.

   Is about 140°F (60°C) indicated?

   YES - Replace ECT sensor 2 (see **ECT SENSOR 2 REPLACEMENT**), then go to step 27.

   NO - Go to step 6.

6. Turn the ignition switch OFF.
7. Drain the coolant (see **COOLANT REPLACEMENT**).
8. Remove ECT sensor 2 (see **ECT SENSOR 2 REPLACEMENT**).
9. Allow ECT sensor 2 to cool to ambient temperature.
10. Note the ambient temperature.
11. Connect ECT sensor 2 to its 2P connector, but do not install it on the engine.
12. Turn the ignition switch ON (II).
13. Note the value of ECT SENSOR 2 quickly in the DATA LIST with the HDS.
14. Compare the value of ECT SENSOR 2 and the ambient temperature.

    Does ECT SENSOR 2 differ 5.4°F (3°C) or more?

    YES - Replace ECT sensor 2 (see **ECT SENSOR 2 REPLACEMENT**), then go to step 27.

    NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM.

15. Start the engine, and let it idle 10 minutes.
16. Check ECT SENSOR 1 in the DATA LIST with the HDS.

    Is about 117°F (47°C) or less indicated?

    YES - Replace ECT sensor 1 (see **ECT SENSOR 1 REPLACEMENT**), then go to step 27.

    NO - Go to step 17.

17. Let the engine idle 10 minutes.
18. Check ECT SENSOR 2 in the DATA LIST with the HDS.

    Is about 140°F (60°C) or less indicated?

YES - Replace ECT sensor 2 (see **ECT SENSOR 2 REPLACEMENT**), then go to step 27.

NO - Go to step 19.

19. Turn the ignition switch OFF.
20. Drain the coolant (see **COOLANT REPLACEMENT**).
21. Remove ECT sensor 1 (see **ECT SENSOR 1 REPLACEMENT**) and ECT sensor 2 (see **ECT SENSOR 2 REPLACEMENT**).
22. Allow the sensors to cool to ambient temperature.
23. Note the ambient temperature.
24. Connect ECT sensor 1 to its 2P connector, and ECT sensor 2 to its 2P connector, but do not install them on the engine.
25. Note the value of ECT SENSOR 1 and ECT SENSOR 2 quickly in the DATA LIST with the HDS.
26. Compare the value of ECT SENSOR 1 and the ambient temperature, and the value of ECT SENSOR 2 and the ambient temperature individually.

    Does one of the sensors differ more than 5.4°F (3°C) from the ambient temperature?

    YES - Replace the sensor that differed more than 5.4°F (3°C) from the ambient temperature, then go to step 27.

    NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM.

27. Turn the ignition switch ON (II).
28. Reset the ECM with the HDS.
29. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
30. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2183 indicated?

    YES - Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P2184: ECT SENSOR 2 CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check ECT SENSOR 2 in the DATA LIST with the HDS.

   Is about 356°F (180°C) or more, or 0.08 V or less indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 2 and the ECM.

3. Turn the ignition switch OFF.
4. Disconnect the ECT sensor 2 2P connector.
5. Turn the ignition switch ON (II).
6. Check ECT SENSOR 2 in the DATA LIST with the HDS.

Is about 356°F (180°C) or more, or 0.08 V or less indicated?

YES - Go to step 7.

NO - Go to step 11.

7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Disconnect ECM connector A (44P).
10. Check for continuity between ECT sensor 2 2P connector terminal No. 1 and body ground.

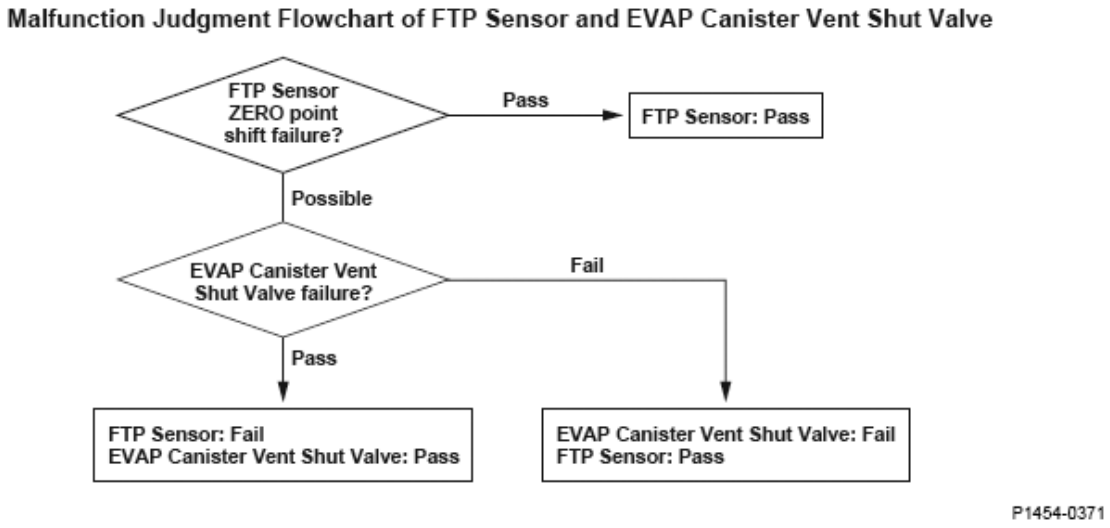

Fig. 94: Checking For Continuity Between ECT Sensor 2 2P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between ECT sensor 2 and the ECM (A33), then go to step 13.

NO - Go to step 18.

11. Turn the ignition switch OFF.
12. Replace ECT sensor 2 (see **ECT SENSOR 2 REPLACEMENT**).

13. Reconnect all connectors.
14. Turn the ignition switch ON (II).
15. Reset the ECM with the HDS.
16. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
17. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2184 indicated?

    YES - Check for poor connections or loose terminals at ECT sensor 2 and the ECM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

18. Reconnect all connectors.
19. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
20. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2184 indicated?

    YES - Check for poor connections or loose terminals at ECT sensor 2 and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P2185: ECT SENSOR 2 CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check ECT SENSOR 2 in the DATA LIST with the HDS.

   Is about -40°F (-40°C) or less, or 4.90 V or more indicated?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 2 and the ECM.

3. Turn the ignition switch OFF.
4. Disconnect the ECT sensor 2 2P connector.
5. Connect ECT sensor 2 2P connector terminals No. 1 and No. 2 with a jumper wire.

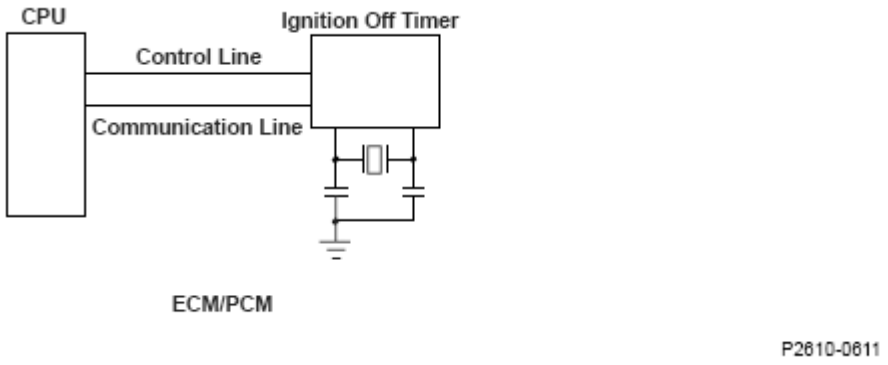

Fig. 95: Connecting ECT Sensor 2 2P Connector Terminals No. 1 And No. 2 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Turn the ignition switch ON (II).
7. Check ECT SENSOR 2 in the DATA LIST with the HDS.

   Is about -40°F (-40°C) or less, or 4.90 V or more indicated?

   YES - Go to step 8.

   NO - Go to step 20.

8. Turn the ignition switch OFF.
9. Remove the jumper wire from the ECT sensor 2 2P connector.
10. Turn the ignition switch ON (II).
11. Measure voltage between ECT sensor 2 2P connector terminal No. 1 and body ground.

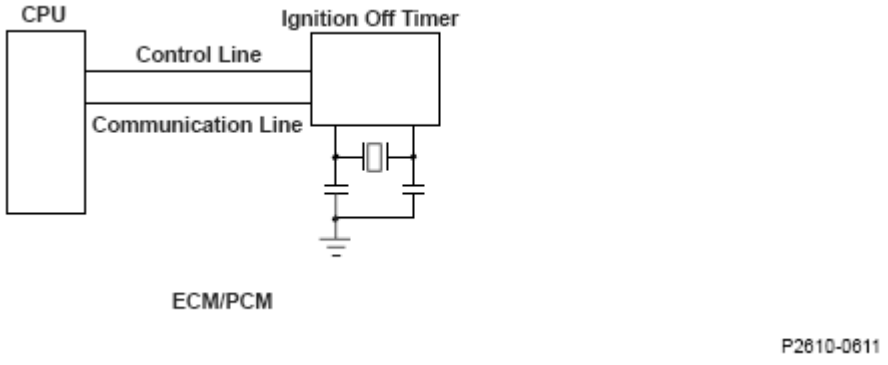

Fig. 96: Measuring Voltage Between ECT Sensor 2 2P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 12.

NO - Go to step 16.

12. Turn the ignition switch OFF.

13. Jump the SCS line with the HDS.
14. Disconnect ECM connector A (44P).
15. Check for continuity between ECT sensor 2 2P connector terminal No. 2 and ECM connector terminal A9.

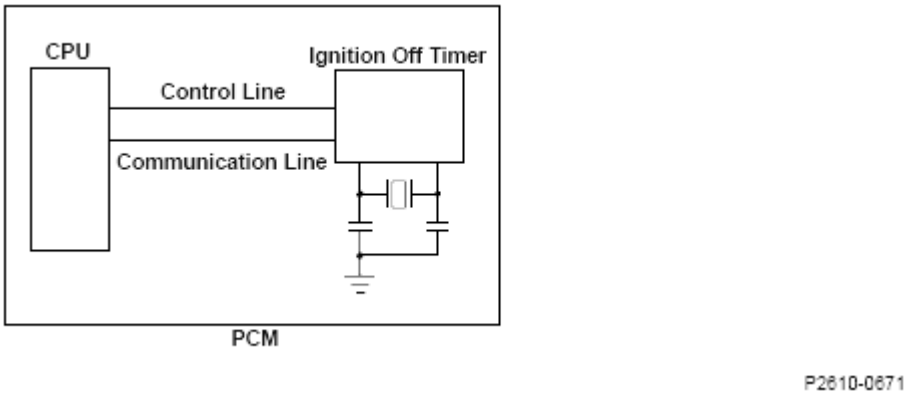

Fig. 97: Checking Continuity Between ECT Sensor 2 2P Connector Terminal No. 2 And ECM Connector Terminal A9
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 27.

NO - Repair open in the wire between the ECM (A9) and ECT sensor 2, then go to step 22.

16. Turn the ignition switch OFF.
17. Jump the SCS line with the HDS.
18. Disconnect ECM connector A (44P).
19. Check for continuity between ECT sensor 2 2P connector terminal No. 1 and ECM connector terminal A33.

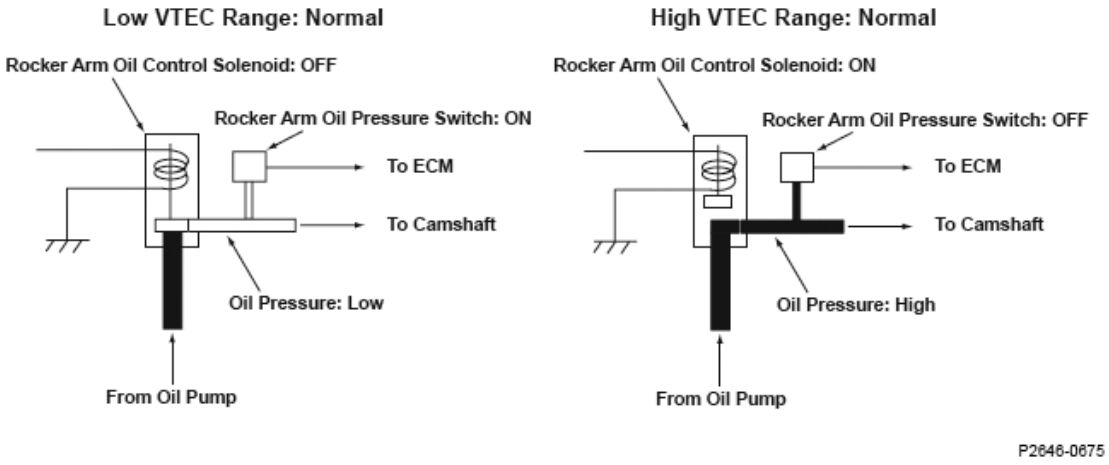

Fig. 98: Checking Continuity Between ECT Sensor 2 2P Connector Terminal No. 1 And ECM Connector Terminal A33
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 27.

NO - Repair open in the wire between the ECM (A33) and ECT sensor 2, then go to step 22.

20. Turn the ignition switch OFF.
21. Replace ECT sensor 2 (see **ECT SENSOR 2 REPLACEMENT**).
22. Reconnect all connectors.
23. Turn the ignition switch ON (II).
24. Reset the ECM with the HDS.
25. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
26. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P2185 indicated?

YES - Check for poor connections or loose terminals at ECT sensor 2 and the ECM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

27. Reconnect all connectors.
28. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
29. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P2185 indicated?

YES - Check for poor connections or loose terminals at ECT sensor 2 and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P2195: A/F SENSOR (SENSOR 1) SIGNAL STUCK LEAN

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If the vehicle was out of fuel and the engine stalled before this DTC was stored, refuel and clear the DTC with the HDS.**
- **If DTC P2101, P2118, P2135, P2138, P2176 or a combination of P2122 and P2127, P2122, and P2138, or P2127 and P2138 is stored at the same time, troubleshoot them first, then recheck for DTC P2195.**

1. Check the installation of the A/F sensor (Sensor 1).

   Is the A/F sensor loose or disconnected from the exhaust pipe?

   YES - Go to step 6.

   NO - Go to step 2.

2. Turn the ignition switch ON (II).
3. Clear the DTC with the HDS.
4. Start the engine, and let it idle without load (in neutral) until the radiator fan comes on.
5. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2195 indicated?

   YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM, then go to step 13.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

6. Turn the ignition switch OFF.
7. Reinstall the A/F sensor (Sensor 1) (see **A/F SENSOR REPLACEMENT**).
8. Turn the ignition switch ON (II).
9. Reset the ECM with the HDS.
10. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
11. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2195 indicated?

    YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM, then go to step 1.

    NO - Go to step 12.

12. Monitor the OBD STATUS for DTC P2195 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 11, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM, then go to step 1. If the screen indicated NOT COMPLETED, keep idling until a result comes on.

13. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a

known-good ECM (see **SUBSTITUTING THE ECM**).

14. Start the engine, and let it idle without load (in neutral) until the radiator fan comes on.
15. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2195 indicated?

    YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 14. If the ECM was substituted, go to step 1.

    NO - Go to step 16.

16. Monitor the OBD STATUS for DTC P2195 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 15, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 14. If the ECM was substituted, go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P2227: BARO SENSOR CIRCUIT RANGE/PERFORMANCE PROBLEM

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P0107, P0108, P1128, and/or P1129 are stored at the same time as DTC P2227, troubleshoot those DTCs first, then recheck for DTC P2227.**

1. Turn the ignition switch ON (II), and wait 2 seconds.
2. Check the BARO SENSOR in the DATA LIST with the HDS.

   Is about 101 kPa (29.9 in.Hg, 760 mmHg), or about 2.9 V at sea level indicated?

   YES - Go to step 3.

   NO - Go to step 7.

3. Clear the DTC with the HDS.
4. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
5. Test-drive under these conditions:
   - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)

- Transmission in 4th gear
- REL TP SENSOR between 12 deg and 20 deg for at least 2 seconds

6. Monitor the OBD STATUS for DTC P2227 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 7.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the screen indicates NOT COMPLETED, go to step 4 and recheck.

7. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
8. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
9. Test-drive under these conditions:
   - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
   - Transmission in 4th gear
   - REL TP SENSOR between 12 deg and 20 deg for at least 2 seconds
10. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2227 indicated?

    YES - Check for poor connections or loose terminals at the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 8. If the ECM was substituted, go to step 1.

    NO - Go to step 11.

11. Monitor the OBD STATUS for DTC P2227 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 10, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 8. If the ECM was substituted, go to step 1. If the screen indicates NOT COMPLETED, go to step 8.

DTC P2228: BARO SENSOR CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check the BARO SENSOR in the DATA LIST with the HDS.

   Is about 53 kPa (15.6 in.Hg, 397 mmHg), or 1.58 V or less indicated?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time.

3. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2228 indicated?

   YES - Check for poor connections or loose terminals at the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

   NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P2229: BARO SENSOR CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check the BARO SENSOR in the DATA LIST with the HDS.

   Is about 160 kPa (47.2 in.Hg, 1,200 mmHg), or 4.5 V or more indicated?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time.

3. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2229 indicated?

   YES - Check for poor connections or loose terminals at the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

   NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the

original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P2238: A/F SENSOR (SENSOR 1) AFS+ CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2238 indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM.

4. Turn the ignition switch OFF.
5. Jump the SCS line with the HDS.
6. Disconnect the A/F sensor (Sensor 1) 4P connector.
7. Disconnect ECM connector C (44P).
8. Check for continuity between ECM connector terminal C29 and body ground.

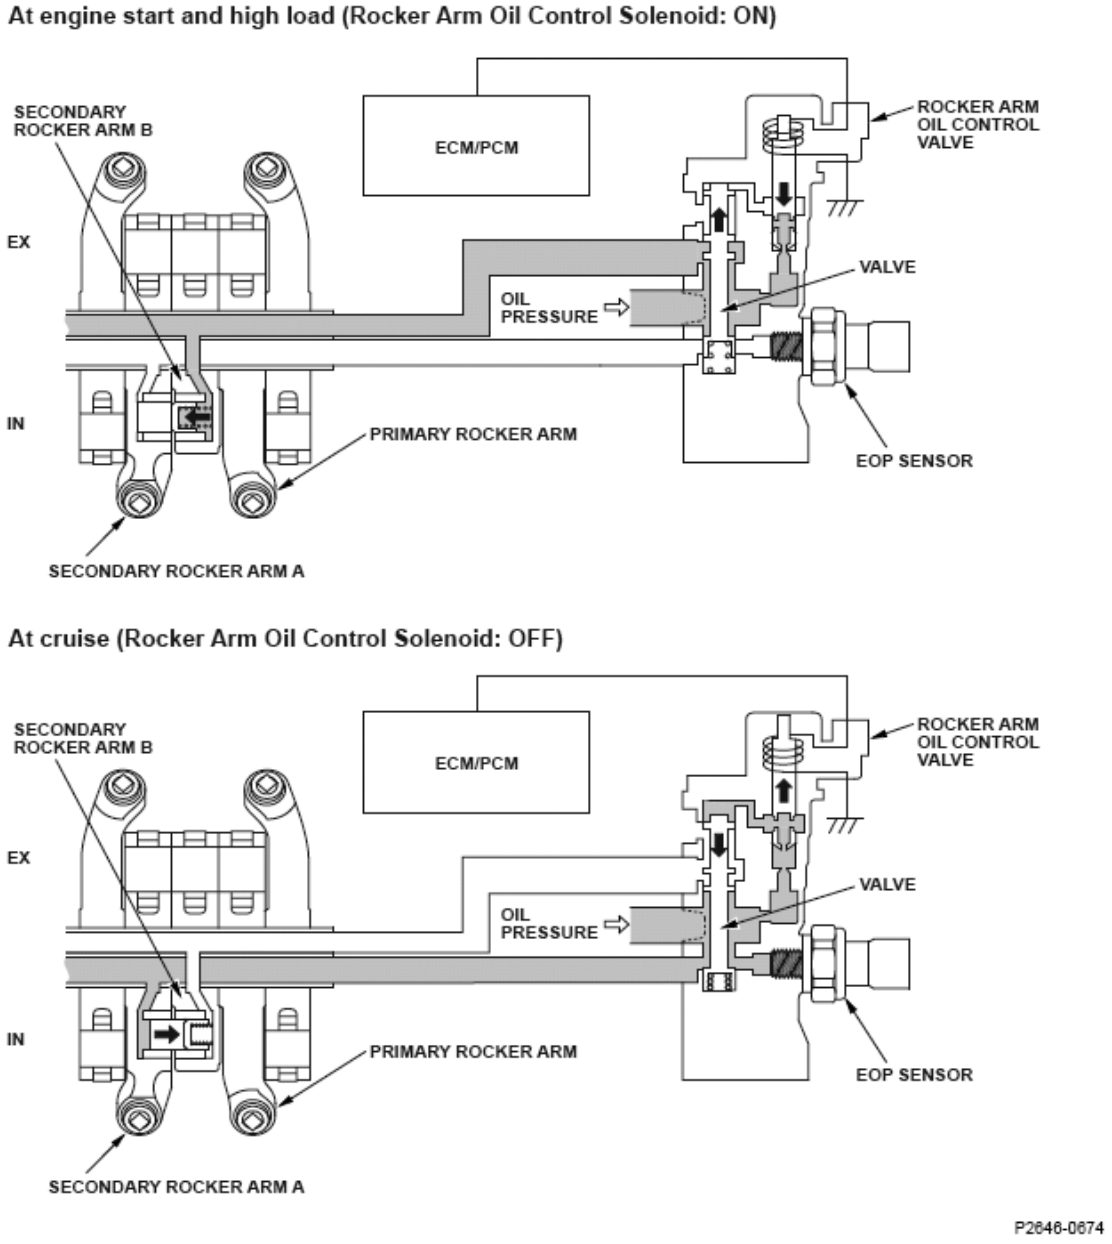

Fig. 99: Checking For Continuity Between ECM Connector Terminal C29 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM (C29) and the A/F sensor (Sensor 1), then go to step 10.

NO - Go to step 9.

9. Replace the A/F sensor (Sensor 1) (see **A/F SENSOR REPLACEMENT**).
10. Reconnect all connectors.
11. Turn the ignition switch ON (II).
12. Reset the ECM with the HDS.

13. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
14. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2238 indicated?

    YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM, then go to step 1. If the connector and terminal fits are OK, go to step 16.

    NO - Go to step 15.

15. Monitor the OBD STATUS for DTC P2238 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 14, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

16. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
17. Start the engine, and let it idle.
18. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2238 indicated?

    YES - If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 17. If the ECM was substituted, go to step 1.

    NO - Go to step 19.

19. Monitor the OBD STATUS for DTC P2238 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 18, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, go to step 1. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 17. If the ECM was substituted, go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P2252: A/F SENSOR (SENSOR 1) AFS-CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL

TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2252 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM.

5. Turn the ignition switch OFF.
6. Jump the SCS line with the HDS.
7. Disconnect the A/F sensor (Sensor 1) 4P connector.
8. Disconnect ECM connector C (44P).
9. Check for continuity between ECM connector terminal C30 and body ground.

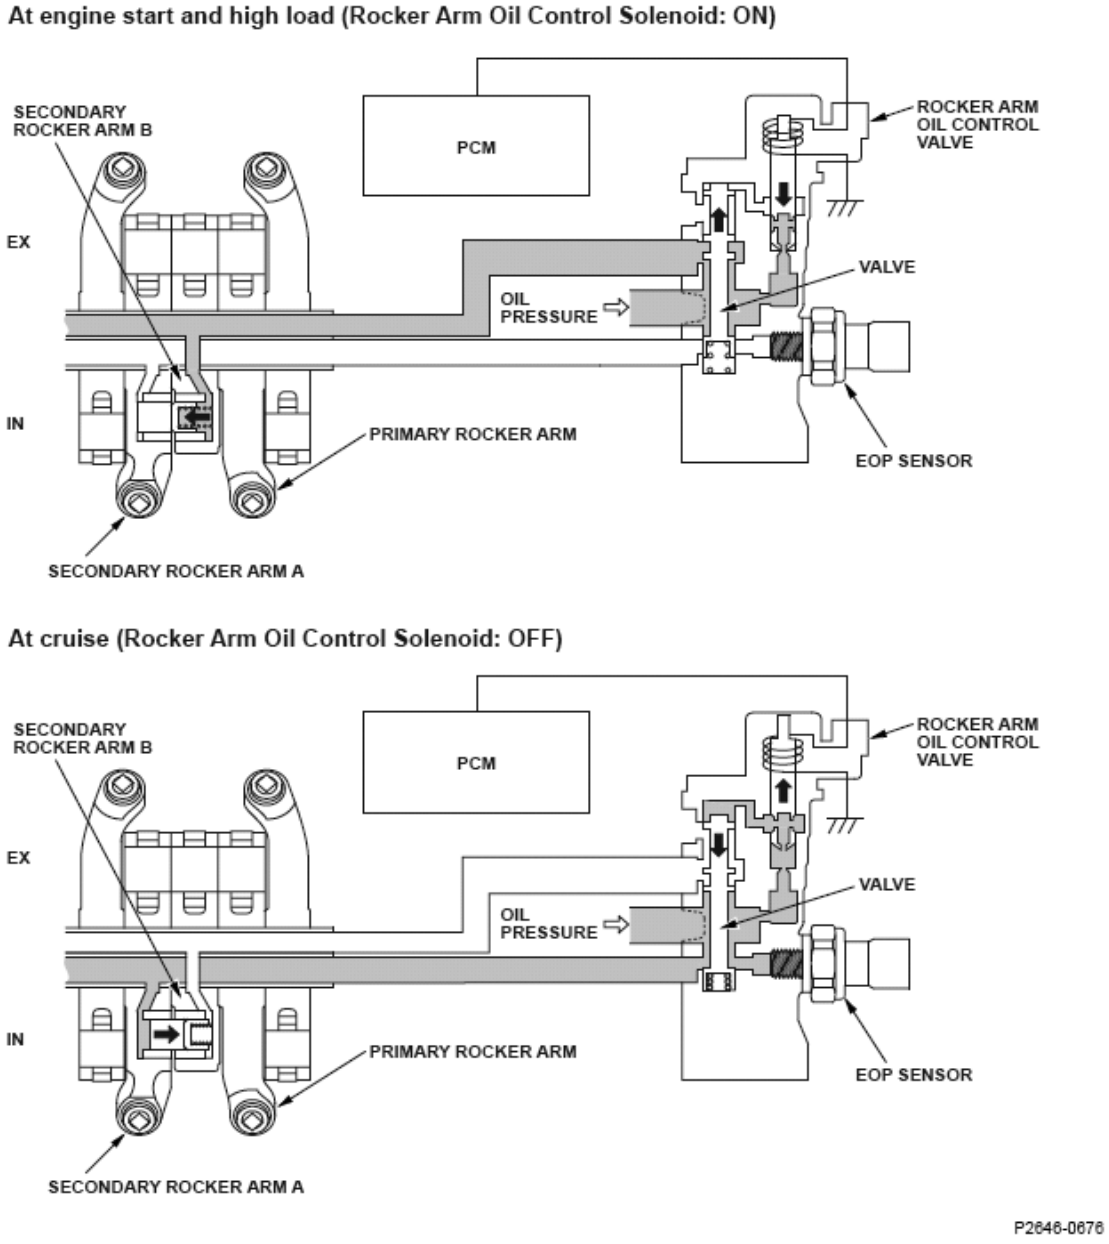

Fig. 100: Checking Continuity Between ECM Connector Terminal C30 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM (C30) and the A/F sensor (Sensor 1), then go to step 11.

NO - Go to step 10.

10. Replace the A/F sensor (Sensor 1) (see **A/F SENSOR REPLACEMENT**).
11. Reconnect all connectors.
12. Turn the ignition switch ON (II).
13. Reset the ECM with the HDS.

14. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
15. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2252 indicated?

    YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM, then go to step 1. If the connector and terminal fits are OK, go to step 17.

    NO - Go to step 16.

16. Monitor the OBD STATUS for DTC P2252 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 15, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

17. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
18. Start the engine, and let it idle.
19. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2252 indicated?

    YES - Go to step 1 and recheck.

    NO - Go to step 20.

20. Monitor the OBD STATUS for DTC P2252 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs was indicated in step 19, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, go to step 1. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 18. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P2270: SECONDARY HO2S (SENSOR 2) CIRCUIT SIGNAL STUCK LEAN; DTC P2271: SECONDARY HO2S (SENSOR 2) CIRCUIT SIGNAL STUCK RICH

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL

TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle without load (in neutral) until the radiator fan comes on.
4. Test-drive under these conditions:
   - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
   - Vehicle speed at 35 mph (56 km/h) or more for at least 20 seconds
5. Monitor the OBD STATUS for DTC P2270 or P2271 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 6.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 3 and recheck.

6. Turn the ignition switch OFF.
7. Replace the secondary HO2S (Sensor 2) (see **SECONDARY HO2S REPLACEMENT**).
8. Turn the ignition switch ON (II).
9. Reset the ECM with the HDS.
10. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
11. Start the engine, and let it idle without load (in neutral) until the radiator fan comes on.
12. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
    - Vehicle speed at 35 mph (56 km/h) or more for at least 20 seconds
13. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2270 or P2271 indicated?

    YES - Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM, then go to step 1.

    NO - Go to step 14.

14. Monitor the OBD STATUS for DTC P2270 or P2271 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 13, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM, then go to step 1. If the screen indicates EXECUTING, keep driving

until a result comes on. If the screen indicates OUT OF CONDITION, go to step 11.

DTC P2610: ECM IGNITION OFF INTERNAL TIMER MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2610 indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time.

4. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
5. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2610 indicated?

   YES - If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

   NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P2A00: A/F SENSOR (SENSOR 1) CIRCUIT RANGE/PERFORMANCE PROBLEM

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
4. Test-drive under these conditions:
   - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
   - Transmission in 3rd gear
   - Vehicle speed between 25-55 mph (40-88 km/h) for 5 minutes
   - Drive at a steady speed between 55-75 mph (88-120 km/h) for 10 seconds, then decelerate (with throttle fully closed) for 5 seconds

5. Monitor the OBD STATUS for DTC P2A00 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 6.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 3 and recheck.

6. Turn the ignition switch OFF.
7. Replace the A/F sensor (Sensor 1) (see **A/F SENSOR REPLACEMENT**).
8. Turn the ignition switch ON (II).
9. Reset the ECM with the HDS.
10. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
11. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
    - Transmission in 3rd gear
    - Vehicle speed between 25-55 mph (40-88 km/h) for 5 minutes
    - Drive at a steady speed between 55-75 mph (88-120 km/h) for 10 seconds, then decelerate (with throttle fully closed) for 5 seconds
12. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2A00 indicated?

    YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM, then go to step 1.

    NO - Go to step 13.

13. Monitor the OBD STATUS for DTC P2A00 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 12, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM, then go to step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 10.

DTC U0028: F-CAN MALFUNCTION (BUS-OFF)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC U0028 indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time.

4. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
5. Turn the ignition switch ON (II).
6. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC U0028 indicated?

   - **YES** - If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck . If the ECM was substituted, go to step 1.
   - **NO** - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM Replacement**). If any other Temporary DTCs or DTCs were indicated in step, go to the indicated DTC's troubleshooting

DTC U0122: F-CAN MALFUNCTION (ECM-VSA)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check for Temporary DTCs or DTCs with the HDS.

   Are DTC U0028 and U0122 indicated at the same time?

   YES - Go to the troubleshooting for DTC U0028.

   NO - Go to step 3.

3. Clear the DTC with the HDS.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC U0122 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the gauge control module (tach), the VSA modulator-control unit, and the ECM.

5. Check for communication to the VSA system with the HDS.

   Does the HDS communicate with the VSA modulator-control unit?

   YES - Go to step 6.

   NO - Go to the DLC circuit troubleshooting (see **DLC Circuit Troubleshooting**)..

6. Turn the ignition switch OFF.
7. Jump the SCS line with the HDS.
8. Disconnect the VSA modulator-control unit 37P connector.
9. Disconnect ECM connector A (44P).
10. Check for continuity between ECM connector terminal A36 and VSA modulator-control unit 37P connector terminal No. 15.

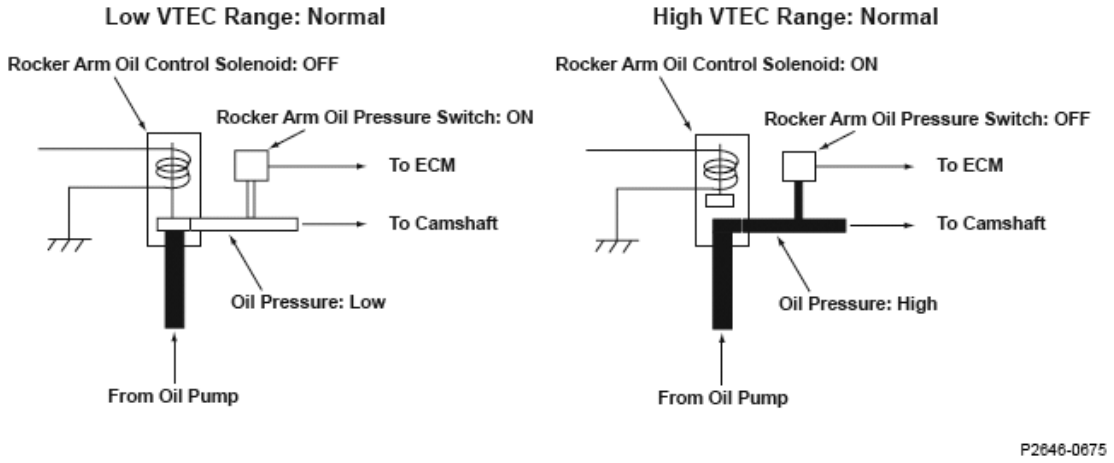

Fig. 101: Checking Continuity Between VSA Modulator-Control Unit 37P Connector Terminals No. 1 And No. 15
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 11.

NO - Repair open in the wire between the ECM (A36) and the VSA modulator-control unit, then go to step 12.

11. Check for continuity between ECM connector terminal A37 and VSA modulator-control unit 37P connector terminal No. 1.

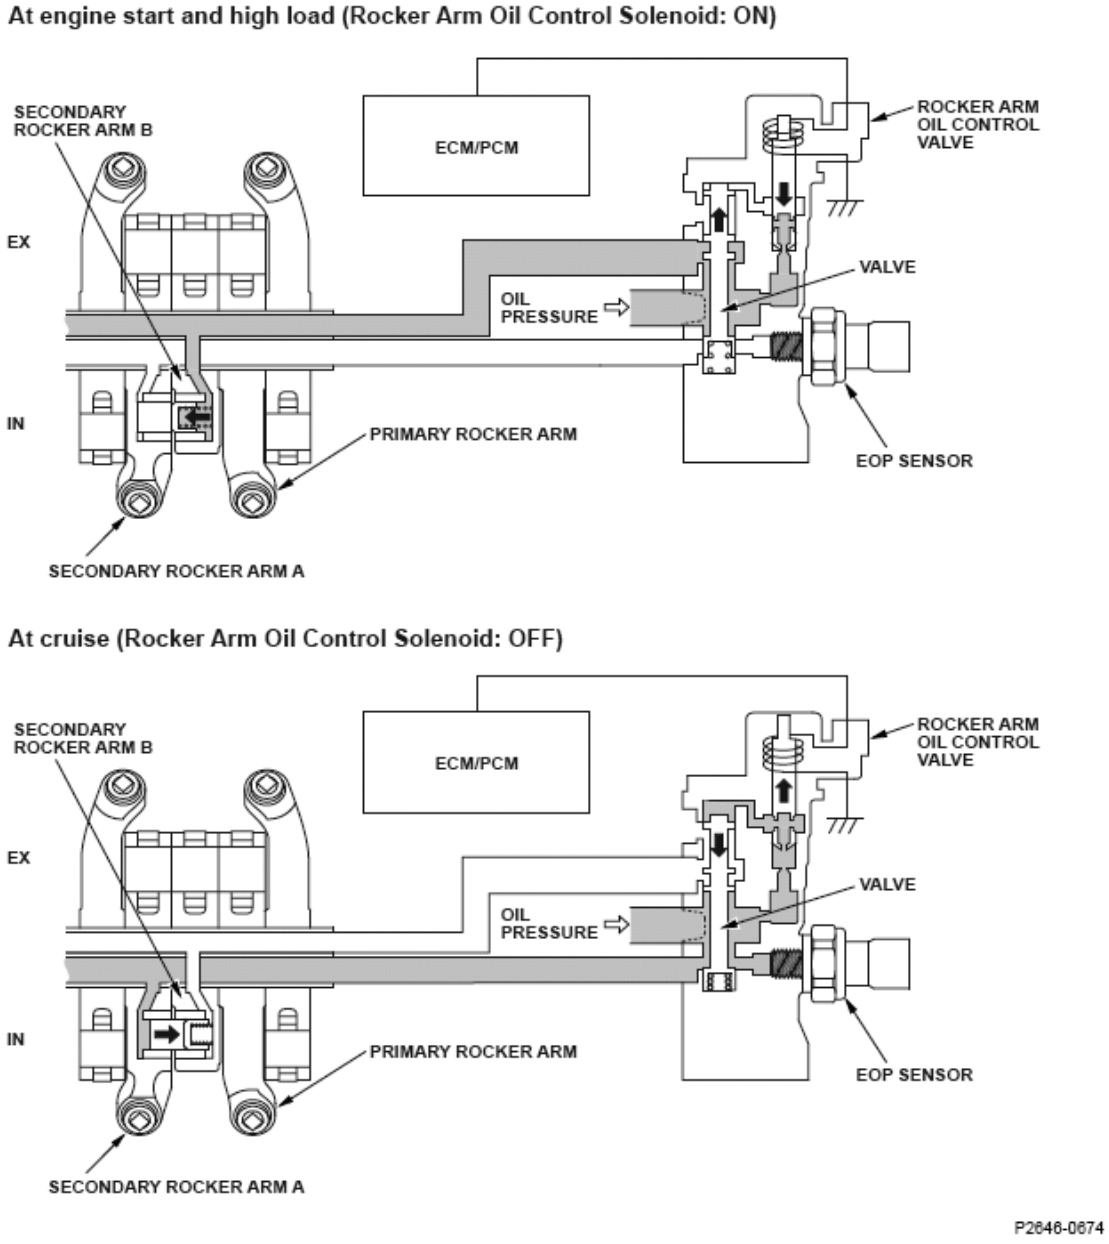

Fig. 102: Measuring Voltage Between VSA Modulator-Control Unit 37P Connector Terminal No. 28 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Substitute a known-good VSA modulator-control unit, then go to step 12 and recheck. If DTC U0122 is not indicated, replace the original VSA modulator-control unit, then go to step 12.

NO - Repair open in the wire between the ECM (A37) and the VSA modulator-control unit, then go to step 12.

12. Reconnect all connectors.
13. Turn the ignition switch ON (II).
14. Reset the ECM with the HDS.

15. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
16. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC U0122 indicated?

    YES - Check for poor connections or loose terminals at the gauge control module (tach), the VSA modulator-control unit, and the ECM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC U0131: F-CAN MALFUNCTION (ECM-EPS)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check for Temporary DTCs or DTCs with the HDS.

    Are DTC U0028 and U0131 indicated at the same time?

    YES - Go to **TROUBLESHOOTING DTC U0028**.

    NO - Go to step 3.

3. Clear the DTC with the HDS.
4. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC U0131 indicated?

    YES - Go to step 5.

    NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the gauge control module (tach), the EPS control unit, and the ECM.

5. Check that the HDS communicates with the EPS system.

    Does the HDS communicate with the EPS control unit?

    YES - Go to step 6.

    NO - Go to the **DLC circuit troubleshooting** (see).

6. Turn the ignition switch OFF.
7. Jump the SCS line with the HDS.
8. Disconnect EPS control unit connector D (28P).
9. Disconnect ECM connector A (44P).

10. Connect ECM connector terminal A36 to body ground with a jumper wire.

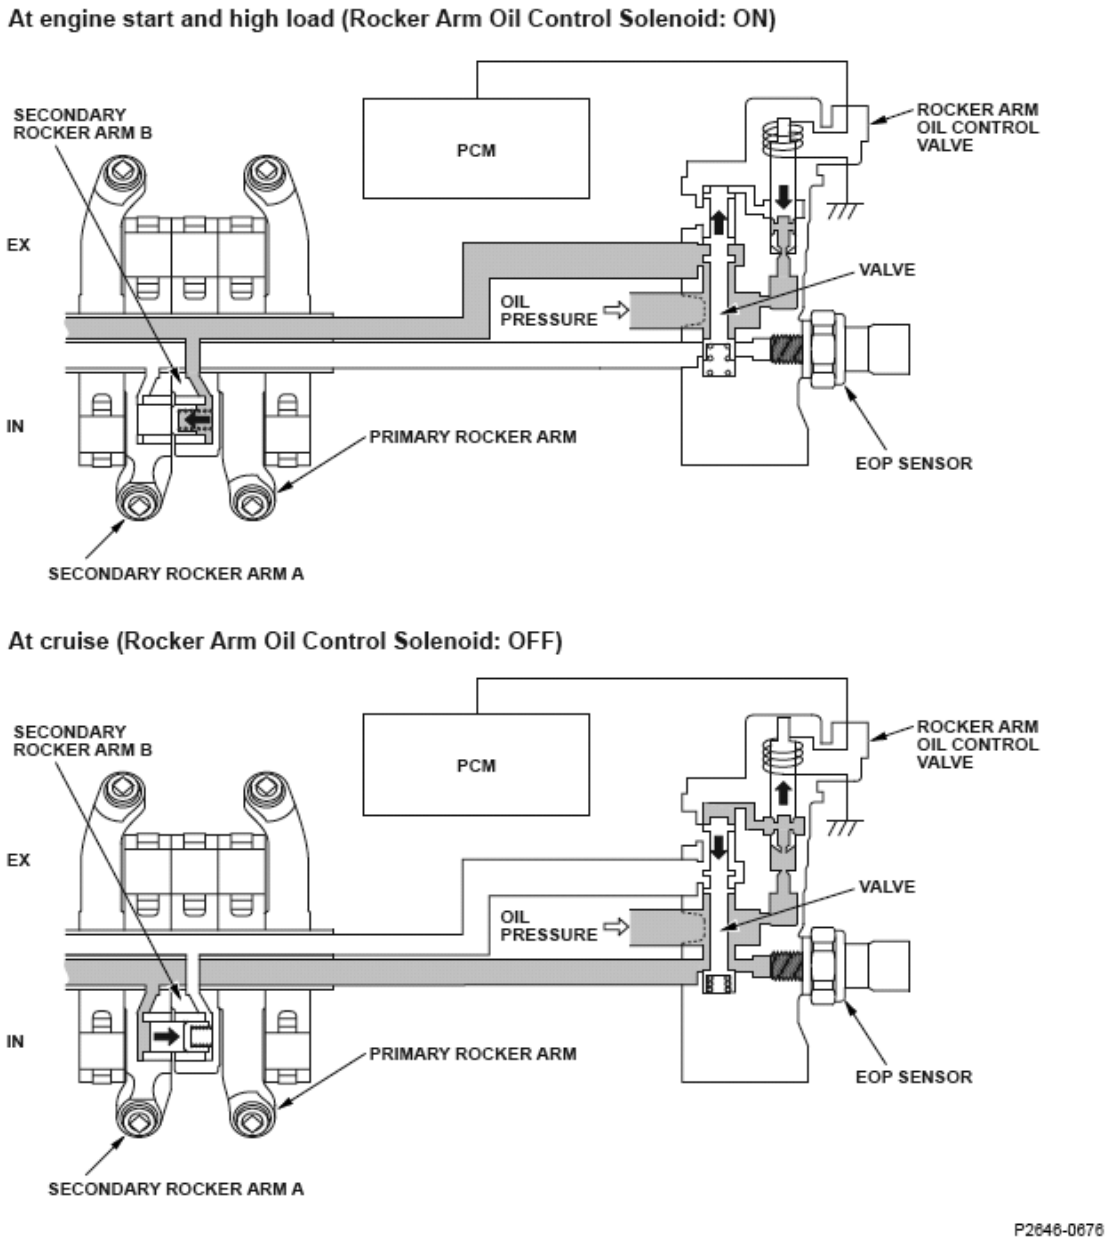

Fig. 103: Connecting ECM Connector Terminal A36 To Body Ground With Jumper Wire

11. Check for continuity between EPS control unit connector D (28P) terminal No. 1 and body ground.

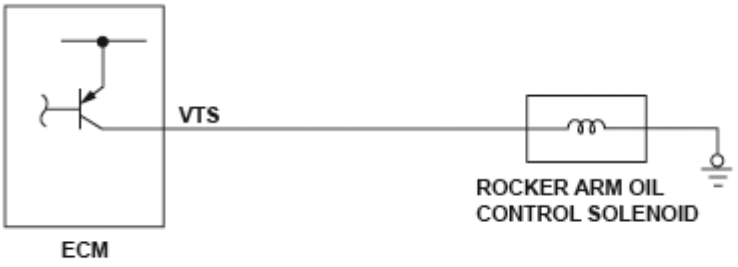

Fig. 104: Checking Continuity Between EPS Control Unit Connector D (28P) Terminal 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 12.

NO - Repair open in the wire between the ECM (A36) and the EPS control unit, then go to step 14.

12. Connect ECM connector terminal A37 to body ground with a jumper wire.

Fig. 105: Connecting ECM Connector Terminal A37 To Body Ground With Jumper Wire

13. Check for continuity between EPS control unit connector D (28P) terminal No. 15 and body ground.

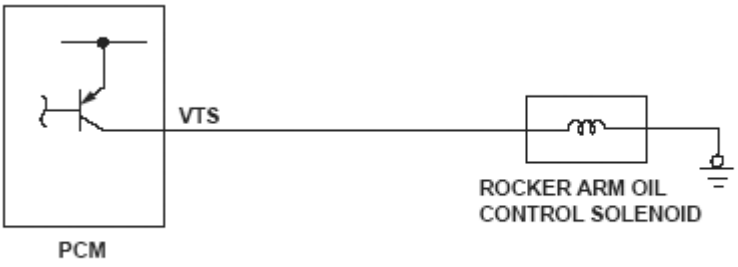

Fig. 106: Checking For Continuity Between EPS Control Unit Connector D (28P) Terminal No. 15 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Substitute a known-good EPS control unit, then go to step 14 and recheck. If no DTCs are indicated, replace the original EPS control unit, then go to step 14.

NO - Repair open in the wire between the ECM (A37) and the EPS control unit, then go to step 14.

14. Reconnect all connectors.
15. Turn the ignition switch ON (II).
16. Reset the ECM with the HDS.
17. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
18. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC U0131 indicated?

    YES - Check for poor connections or loose terminals at the gauge control module (tach), the EPS control unit, and the ECM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC U0155: F-CAN MALFUNCTION (ECM-GAUGE CONTROL MODULE)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC U0155 indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the gauge control module (tach) and the ECM.

4. Check for body electrical DTCs in the DTCs MENU with the HDS.

   Is DTC B1168, B1169, and/or B1178 indicated?

   YES - Go to step 5.

   NO - Do the gauge control module (tach) input test (see **CIRCUIT DIAGRAM - GAUGE CONTROL MODULE (TACH)**).

5. Turn the ignition switch OFF.
6. Jump the SCS line with the HDS.
7. Remove the gauge control module (tach) (see **TACHOMETER**).

8. Disconnect the gauge control module (tach) 36P connector.
9. Disconnect ECM connector A (44P).
10. Connect gauge control module (tach) 36P connector terminal No. 1 to body ground with a jumper wire.

11. Check for continuity between ECM connector terminal A36 and body ground.

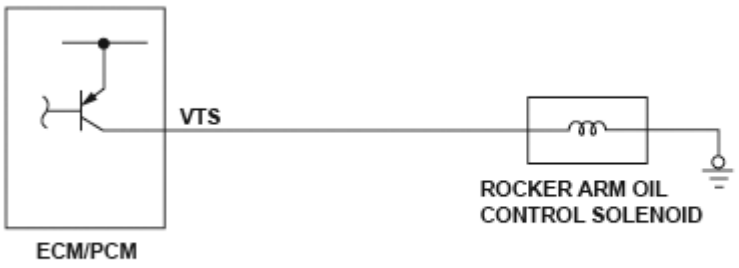

Fig. 108: Checking Continuity Between ECM Connector Terminal A36 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 12.

NO - Repair open in the wire between the ECM (A36) and the gauge control module (tach), then go to step 14.

12. Connect gauge control module (tach) 36P connector terminal No. 19 to body ground with a jumper wire.

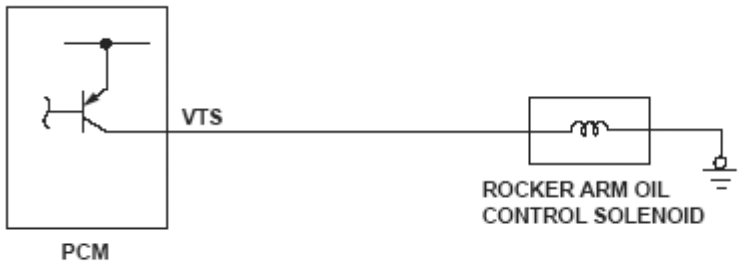

Fig. 109: Connecting Gauge Control Module 36P Connector Terminal No. 19 To Body Ground With Jumper Wire

13. Check for continuity between ECM connector terminal A37 and body ground.

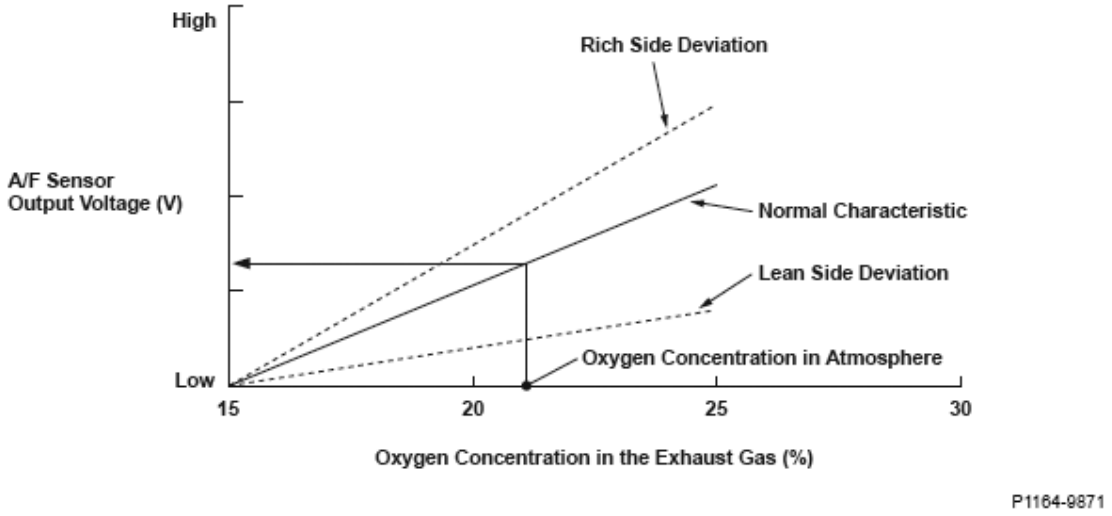

Fig. 110: Checking Continuity Between ECM Connector Terminal A37 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Substitute a known-good gauge control module (tach), then go to step 14 and recheck. If no DTCs are indicated, replace the original gauge control module (tach), then go to step 14.

NO - Repair open in the wire between the ECM (A37) and the gauge control module (tach), then go to step 14.

14. Reconnect all connectors.
15. Turn the ignition switch ON (II).
16. Reset the ECM with the HDS.
17. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
18. Check for Temporary DTCs or DTCs with the HDS.

Is DTC U0155 indicated?

YES - Check for poor connections or loose terminals at the gauge control module (tach) and the ECM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

F-CAN CIRCUIT TROUBLESHOOTING

NOTE: Information marked with an asterisk(*) applies to the CANL line.

1. Turn the ignition switch OFF.
2. Jump the SCS line with the HDS.
3. Disconnect ECM connector A (44P), then disconnect the HDS.
4. Measure resistance between ECM connector terminals A36 and A37.

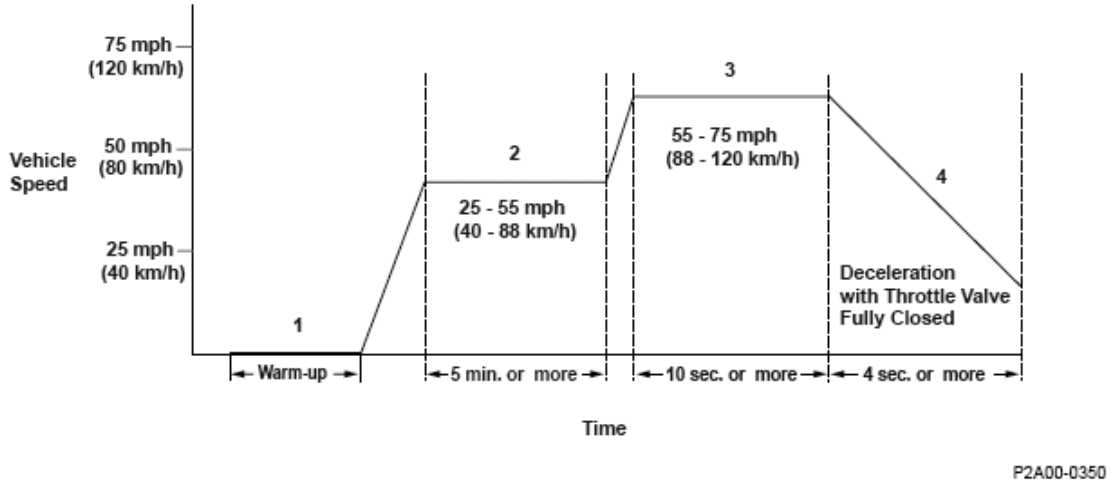

Fig. 111: Measuring Resistance Between ECM Connector Terminals A36 And A37
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 95 - 116 ohms (with ABS system), 91-111 ohms (with VSA system), or 88-107 ohms (with VSA system and TPMS)?

YES - Go to step 44.

NO - Go to step 5.

5. Disconnect the gauge control module (tach) 36P connector (see **TACHOMETER**).
6. Disconnect the ABS modulator-control unit 25P connector (see **ABS MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**) (or the VSA modulator-control unit 37P connector (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**) and the yaw rate/lateral acceleration sensor 4P connector (see **YAW RATE-LATERAL ACCELERATION SENSOR REPLACEMENT**)).
7. Disconnect the SRS unit 28P connector (see **SRS UNIT REPLACEMENT**).
8. Disconnect EPS control unit connector D (28P) (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

9. With TPMS: Disconnect the TPMS control unit 20P connector.
10. Check for continuity between ECM connector terminals A36 and A37.

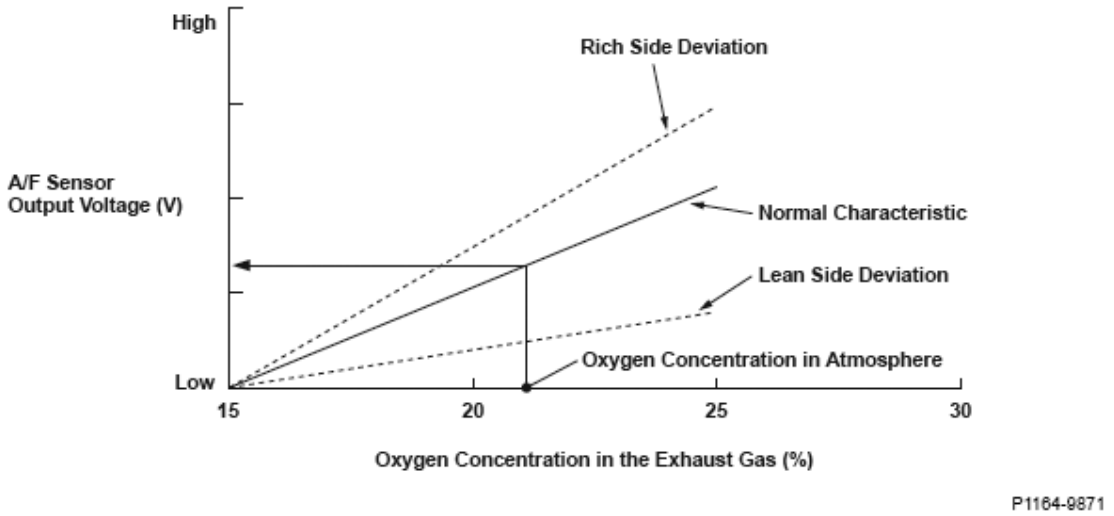

Fig. 112: Checking For Continuity Between ECM Connector Terminals A36 And A37
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wires between ECM connector terminals A36 and A37*.

NO - Go to step 11.

11. Connect ECM connector terminal A36 to body ground with a jumper wire.

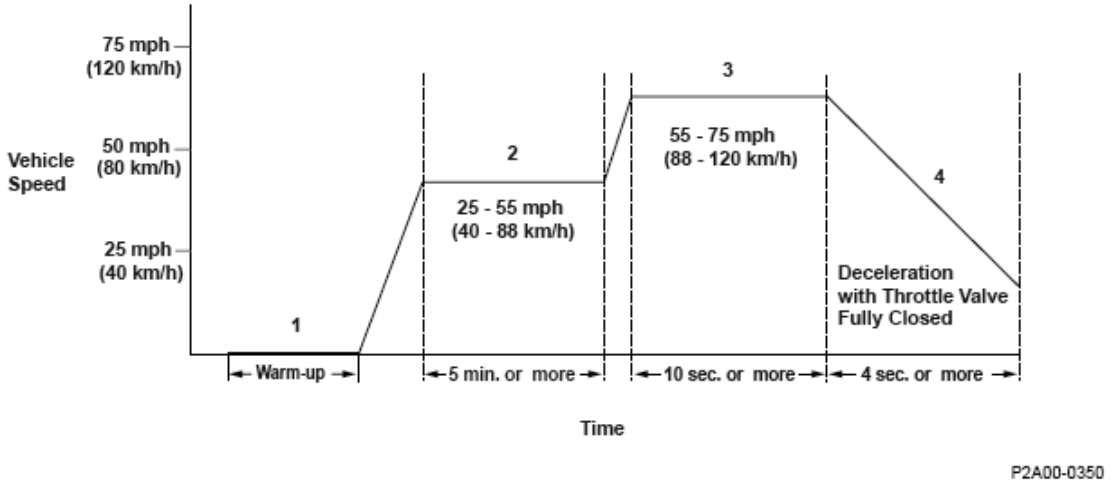

Fig. 113: Connecting ECM Connector Terminal A36 To Body Ground With Jumper Wire

12. Check for continuity between gauge control module (tach) 36P connector terminal No. 1 and body ground.

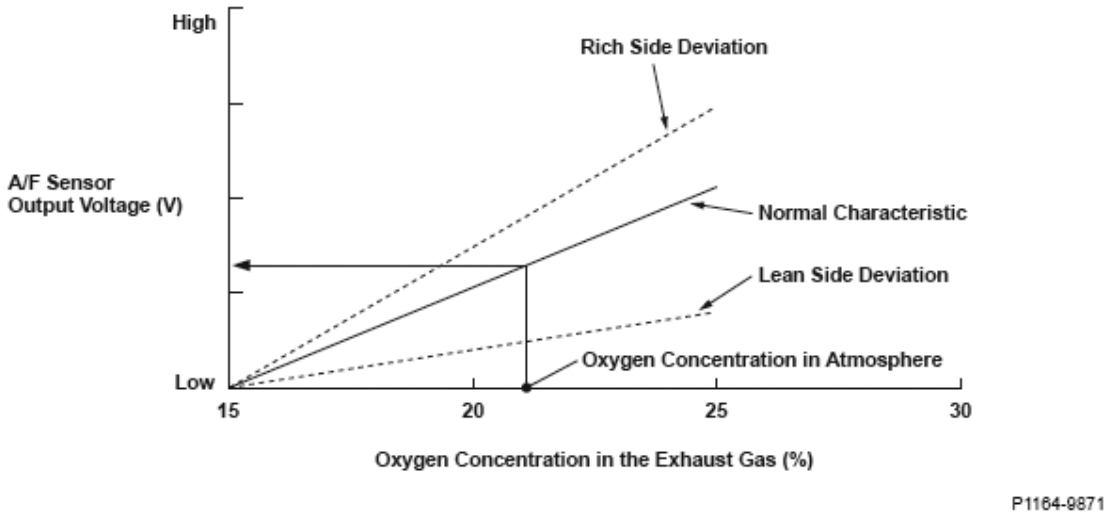

Fig. 114: Checking Continuity Between Gauge Control Module 36P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -

- With ABS system: Go to step 13.
- With VSA system: Go to step 14.

NO - Repair open in the wire between the ECM (A36) and the gauge control module (tach).

13. Check for continuity between ABS modulator-control unit 25P connector terminal No. 1 and body ground.

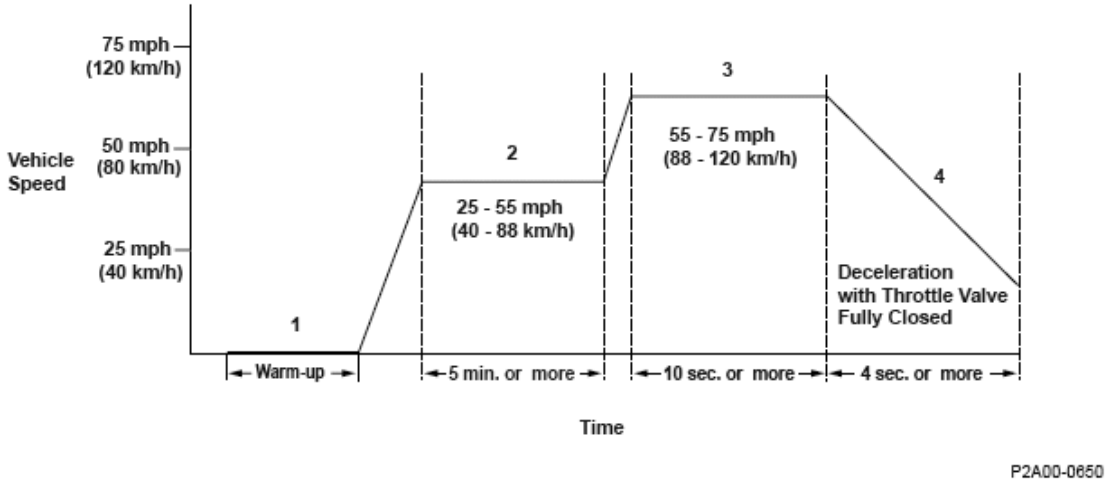

Fig. 115: Checking Continuity Between ABS Modulator-Control Unit 25P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 16.

NO - Repair open in the wire between the ECM (A36) and the ABS modulator-control unit.

14. Check for continuity between VSA modulator-control unit 37P connector terminal No. 15 and body ground.

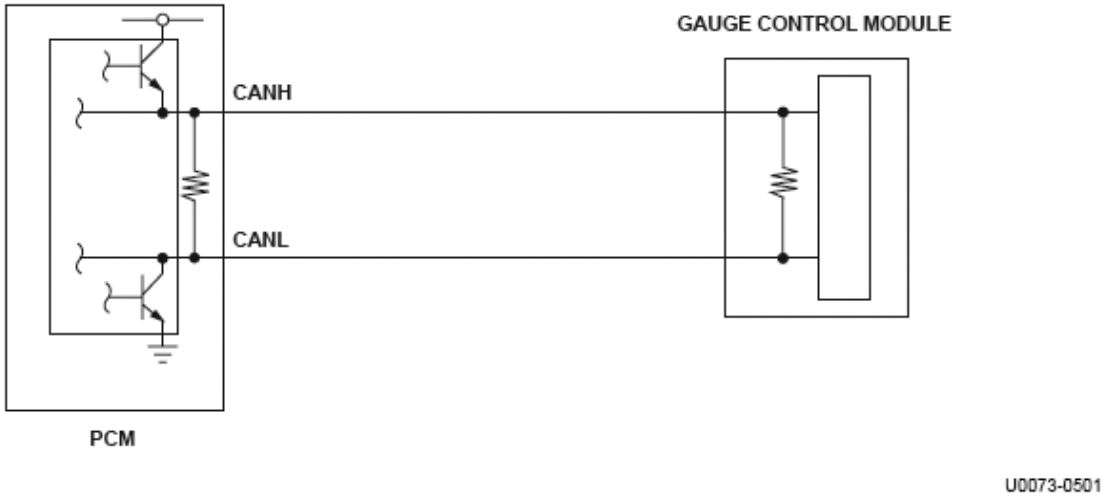

Fig. 116: Checking Continuity Between VSA Modulator-Control Unit 37P Connector Terminal No. 15 And Body Ground

Is there continuity?

YES - Go to step 15.

NO - Repair open in the wire between the ECM (A36) and the VSA modulator-control unit.

15. Check for continuity between yaw rate-lateral acceleration sensor 5P connector terminal No. 3 and body ground.

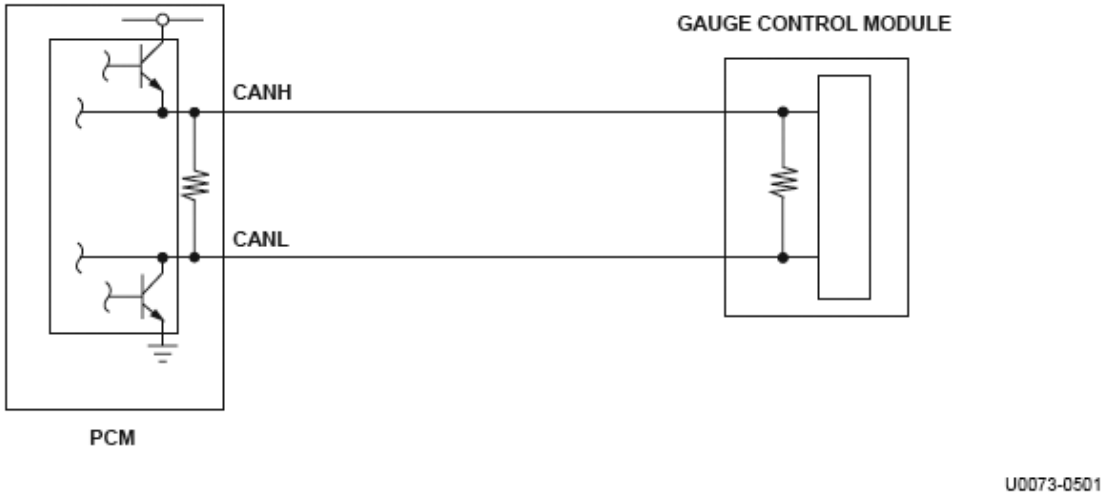

Fig. 117: Checking Between Yaw Rate-Lateral Acceleration Sensor 5P Connector Terminal No.

3 And Body Ground

Is there continuity?

YES - Go to step 15.

NO - Repair open in the wire between the ECM (A36) and the yaw rate-lateral acceleration sensor.

16. Check for continuity between SRS unit connector A (28P) terminal No. 11 and body ground.

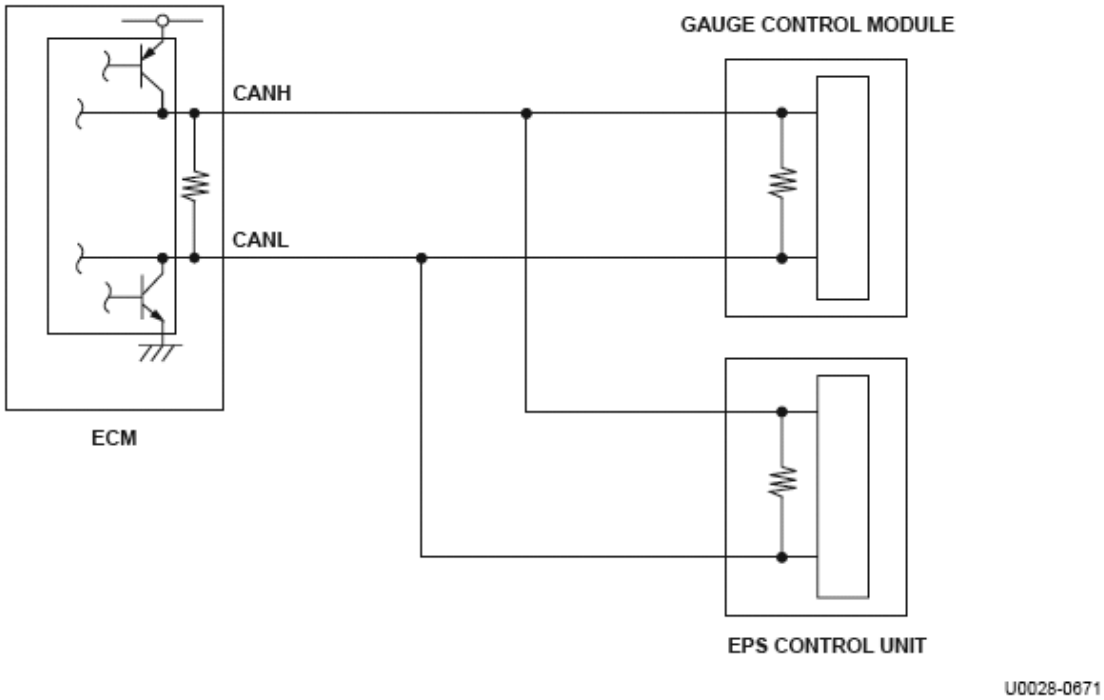

Fig. 118: Checking Continuity Between SRS Unit Connector (28P) Terminal No. 11 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 17.

NO - Repair open in the wire between the ECM (A36) and the SRS unit.

17. Check for continuity between EPS control unit connector D (28P) terminal No. 1 and body ground.

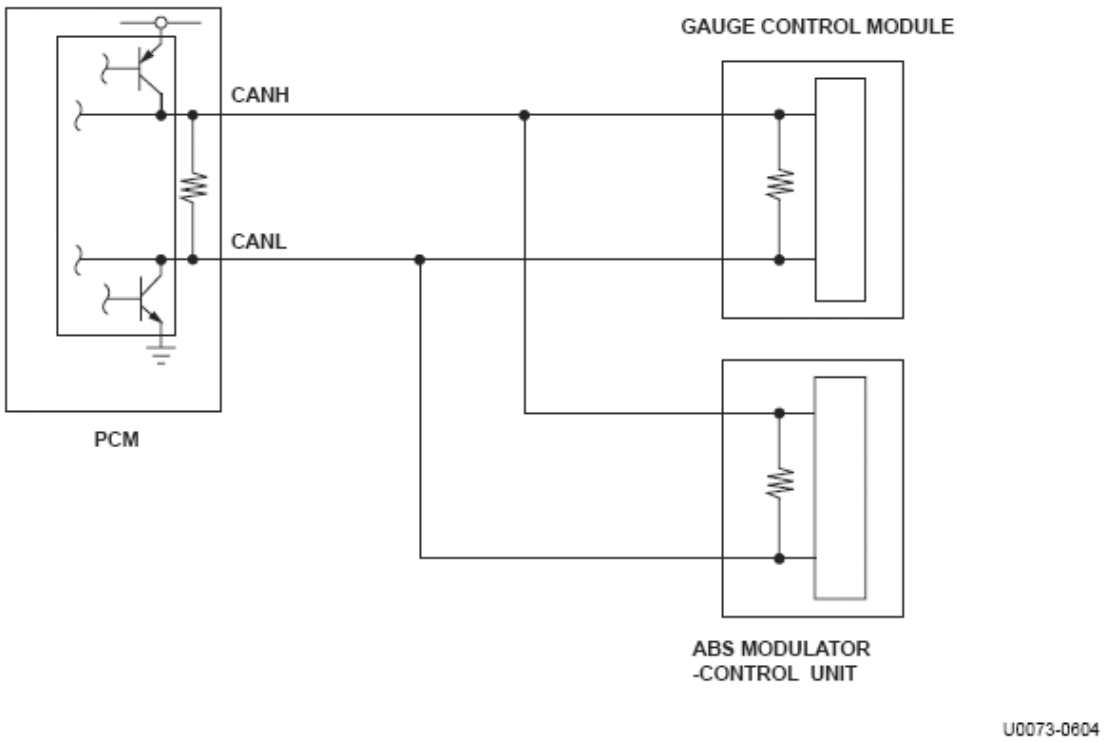

Fig. 119: Checking Continuity Between EPS Control Unit Connector D (28P) Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -

- With TPMS: Go to step 18.
- Without TPMS: Go to step 19.

NO - Repair open in the wire between the ECM (A36) and the EPS control unit.

18. Check for continuity between TPMS control unit 20P connector terminal No.2 and body ground.

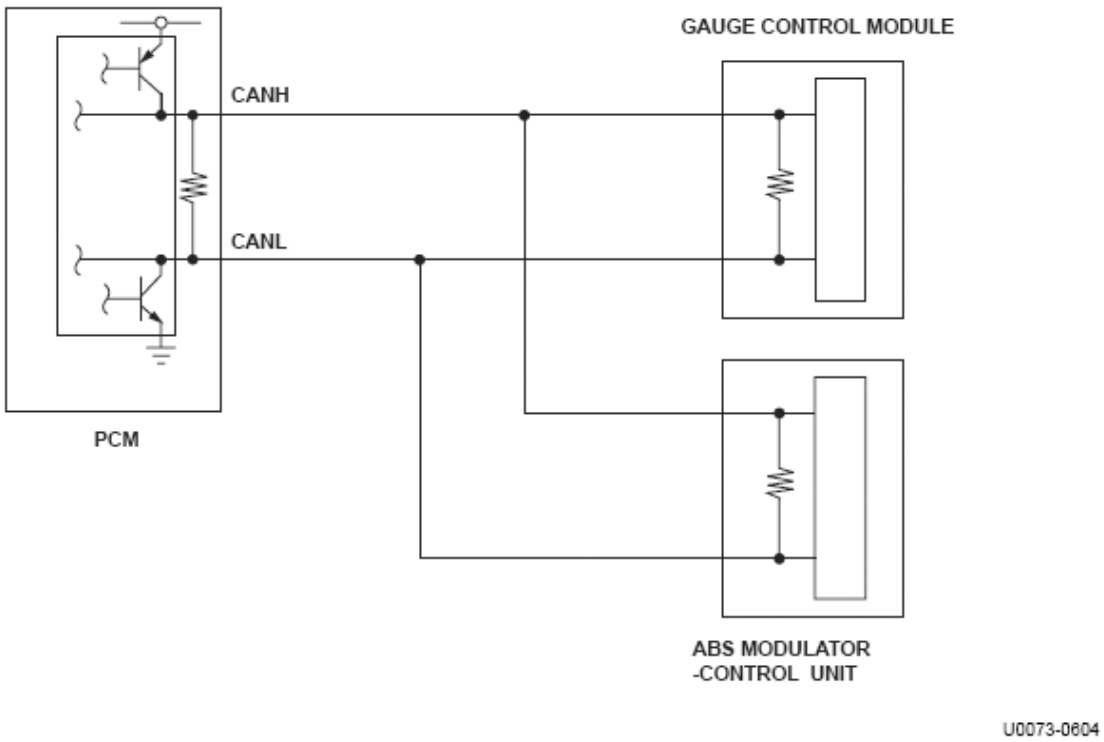

Fig. 120: Checking For Continuity Between TPMS Control Unit 20P Connector Terminal No.2 And Body Ground

Is there continuity?

YES - Go to step 19.

NO - Repair open in the wire between the ECM (A36) and the TPMS control unit.

19. Remove the jumper wire from ECM connector A (44P).
20. Connect ECM connector terminal A37 to body ground with a jumper wire.

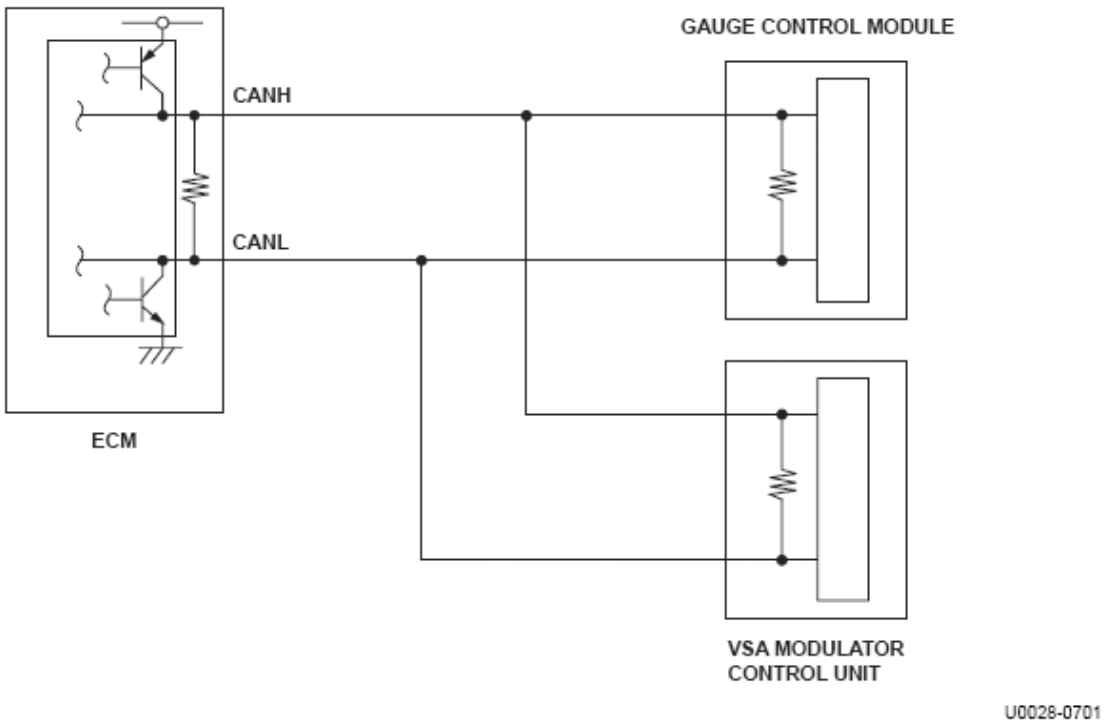

Fig. 121: Connecting ECM Connector Terminal A37 To Body Ground With Jumper Wire

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -

- With ABS system: Go to step 22.

- With VSA system: Go to step 23.

NO - Repair open in the wire between the ECM (A37) and the gauge control module (tach).

22. Check for continuity between ABS modulator-control unit 25P connector terminal No. 17 and body ground.

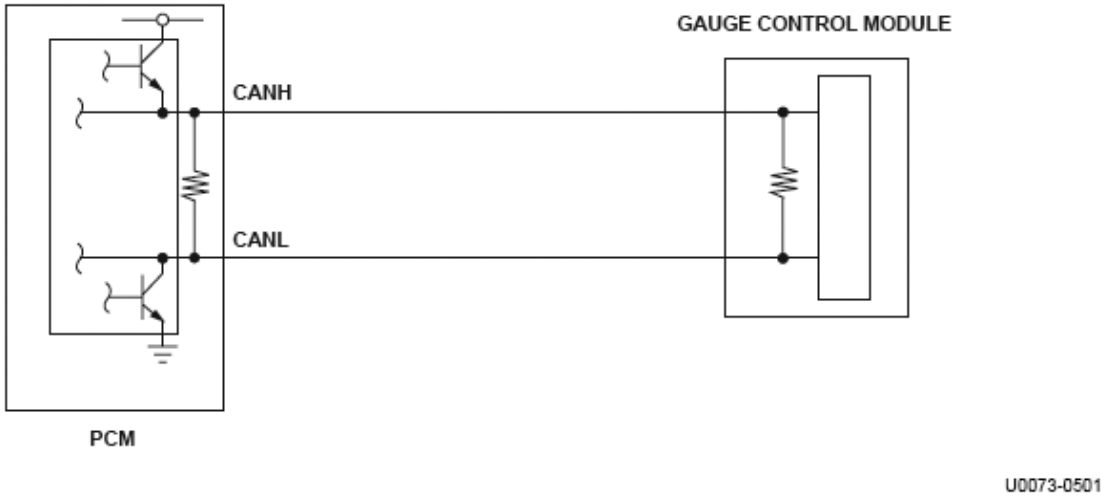

Fig. 123: Checking Continuity Between ABS Modulator-Control Unit 25P Connector Terminal No. 17 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the ECM (A37) and the ABS modulator-control unit.

23. Check for continuity between VSA modulator-control unit 37P connector terminal No. 1 and body ground.

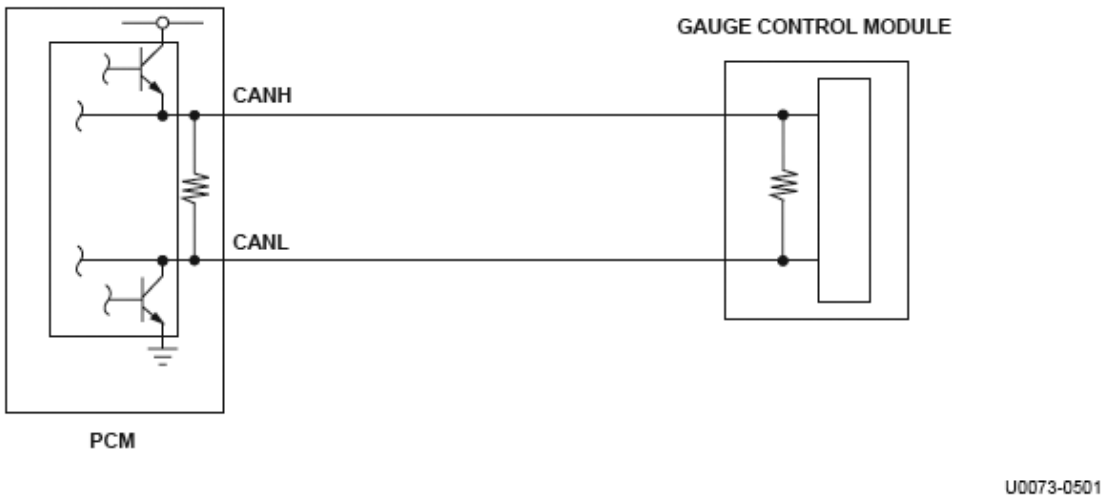

Fig. 124: Checking Continuity Between VSA Modulator-Control Unit 37P Connector Terminal

1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 24.

NO - Repair open in the wire between the ECM (A37) and the VSA modulator-control unit.

24. Check for continuity between yaw rate-lateral acceleration sensor 5P connector terminal No. 4 and body ground.

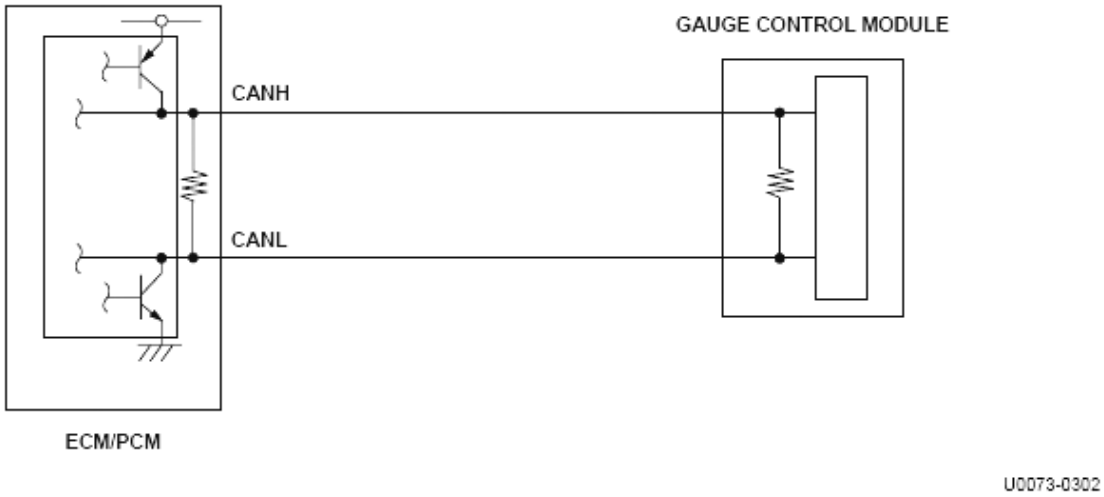

Fig. 125: Checking Continuity Between Yaw Rate-Lateral Acceleration Sensor 5P Connector Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the ECM (A37) and the yaw rate-lateral acceleration sensor.

25. Check for continuity between SRS unit connector A (28P) terminal No. 12 and body ground.

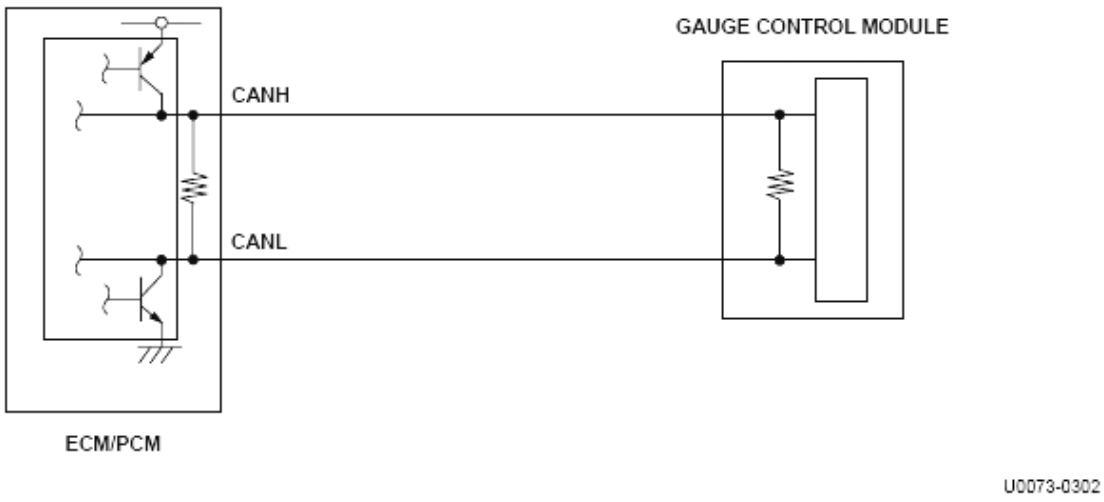

Fig. 126: Checking For Continuity Between SRS Unit Connector (28P) Terminal No. 12 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 26.

NO - Repair open in the wire between the ECM (A37) and the SRS unit.

26. Check for continuity between EPS control unit connector D (28P) terminal No. 15 and body ground.

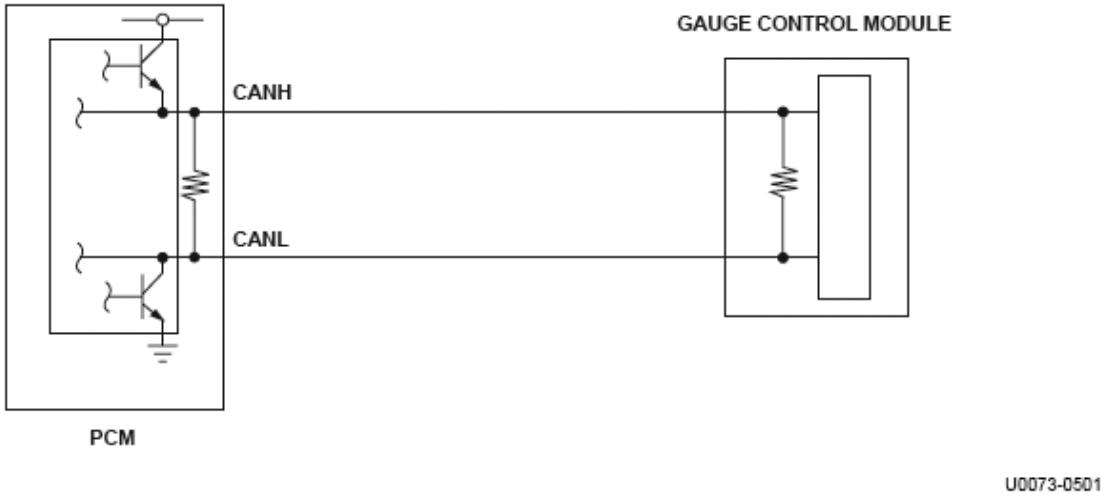

Fig. 127: Checking Continuity Between EPS Control Unit Connector D (28P) Terminal No. 15 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -

- With TPMS: Go to step 27.
- Without TPMS: Go to step 28.

NO - Repair open in the wire between the ECM (A37) and the EPS control unit.

27. Check for continuity between TPMS control unit 20P connector terminal No.11 and body ground.

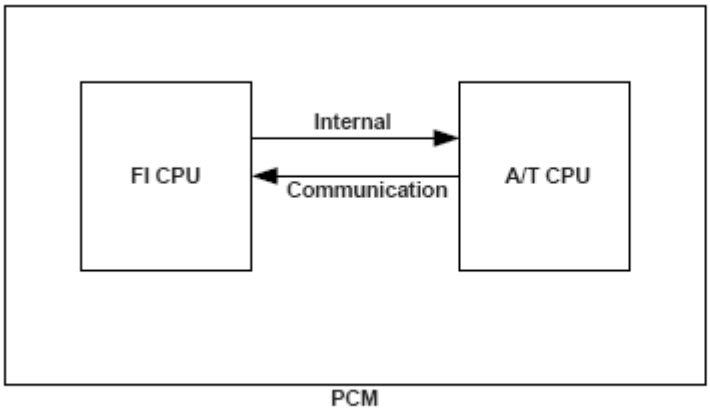

Fig. 128: Checking For Continuity Between TPMS Control Unit 20P Connector Terminal No.11 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 28.

NO - Repair open in the wire between the ECM (A37) and the TPMS control unit.

28. Remove the jumper wire from ECM connector A (44P).
29. Reconnect the gauge control module (tach) 36P connector.
30. Measure resistance between ECM connector terminals A36 and A37.

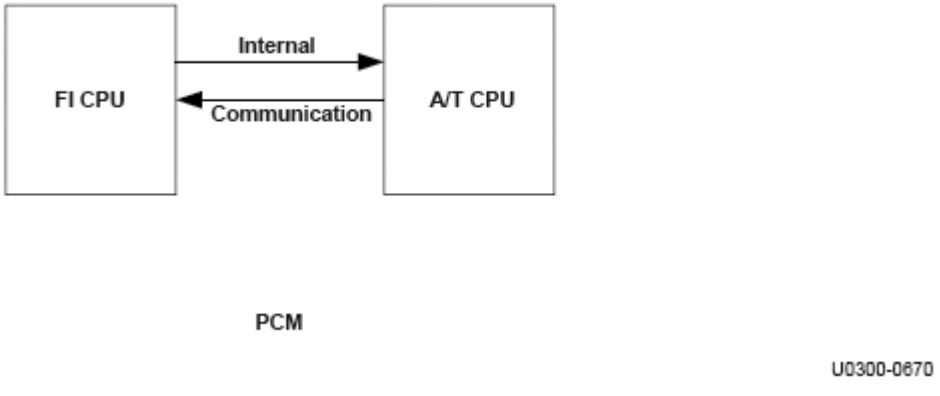

Fig. 129: Measuring Resistance Between ECM Connector Terminals A36 And A37
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 108-132 ohms ?

YES -

- With ABS system: Go to step 31.
- With VSA system: Go to step 34.

NO - Substitute a known-good gauge control module (tach) (see **TACHOMETER**). If the HDS communicate identify the vehicle, replace the original gauge control module (tach) (see **TACHOMETER**).

31. Disconnect the gauge control module (tach) 36P connector.
32. Reconnect the ABS modulator-control unit 25P connector.
33. Measure resistance between ECM connector terminals A36 and A37.

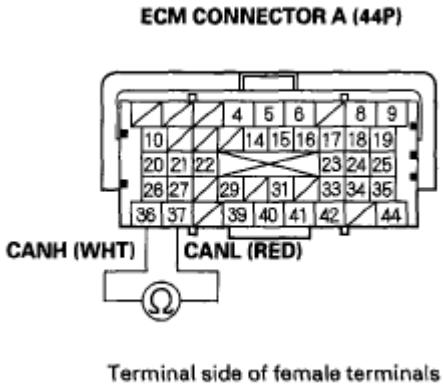

Fig. 130: Measuring Resistance Between ECM Connector Terminals A36 And A37
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 2.34-2.86 kohms?

YES - Go to step 40.

NO - Substitute a known-good ABS modulator-control unit (see **ABS MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**). If the HDS identify the vehicle, replace the original ABS modulator-control unit (see **ABS MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**).

34. Disconnect the gauge control module (tach) 36P connector.
35. Reconnect the VSA modulator-control unit 37P connector.
36. Measure resistance between ECM connector terminals A36 and A37.

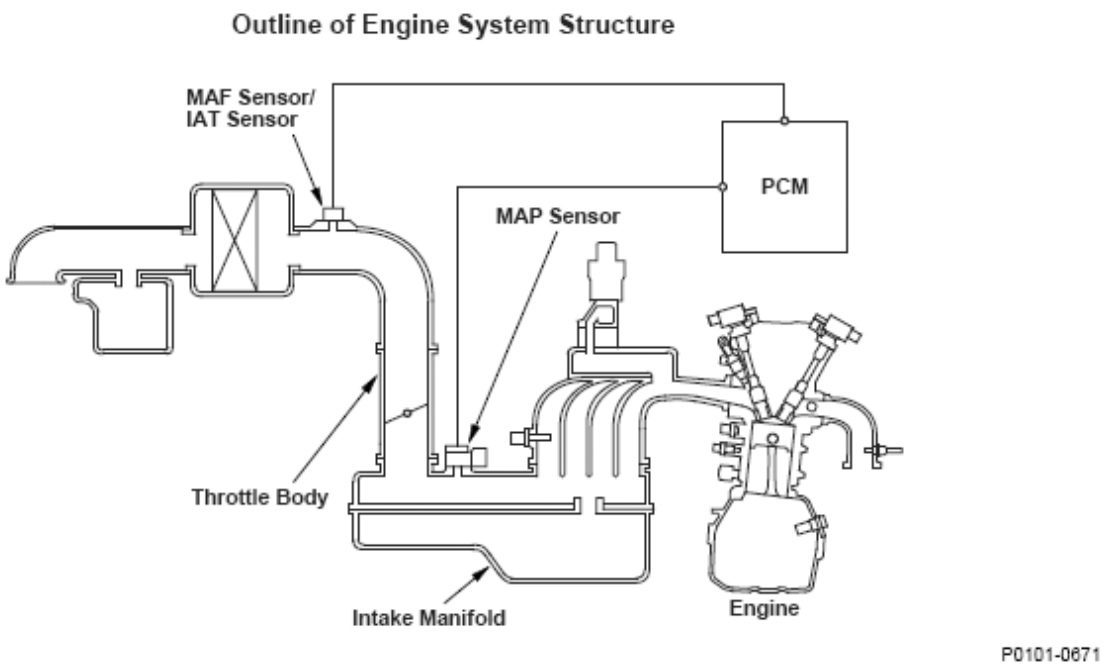

Fig. 131: Measuring Resistance Between ECM Connector Terminals A36 And A37

Is there about 2.34-2.86 kohms,?

YES - Go to step 37.

NO - Substitute a known-good VSA modulator-control unit (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**). If the HDS identify the vehicle, replace the original VSA modulator-control unit (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**).

37. Disconnect the VSA modulator-control unit 37P connector.
38. Reconnect the yaw rate/lateral acceleration sensor 5P connector.
39. Measure resistance between ECM connector terminals A36 and A37.

Is there about 2.34-2.86 kohms?

YES - Go to step 40.

NO - Substitute a known-good yaw rate/lateral acceleration sensor (see **YAW RATE-LATERAL ACCELERATION SENSOR REPLACEMENT**). If the HDS identify the vehicle, replace the original yaw rate/lateral acceleration sensor (see **YAW RATE-LATERAL ACCELERATION SENSOR REPLACEMENT**).

40. Disconnect ABS modulator-control unit 25P connector (or the yaw rate/lateral acceleration sensor 5P connector).
41. Reconnect the SRS unit connector A (28P).
42. Measure resistance between ECM connector terminals A36 and A37.

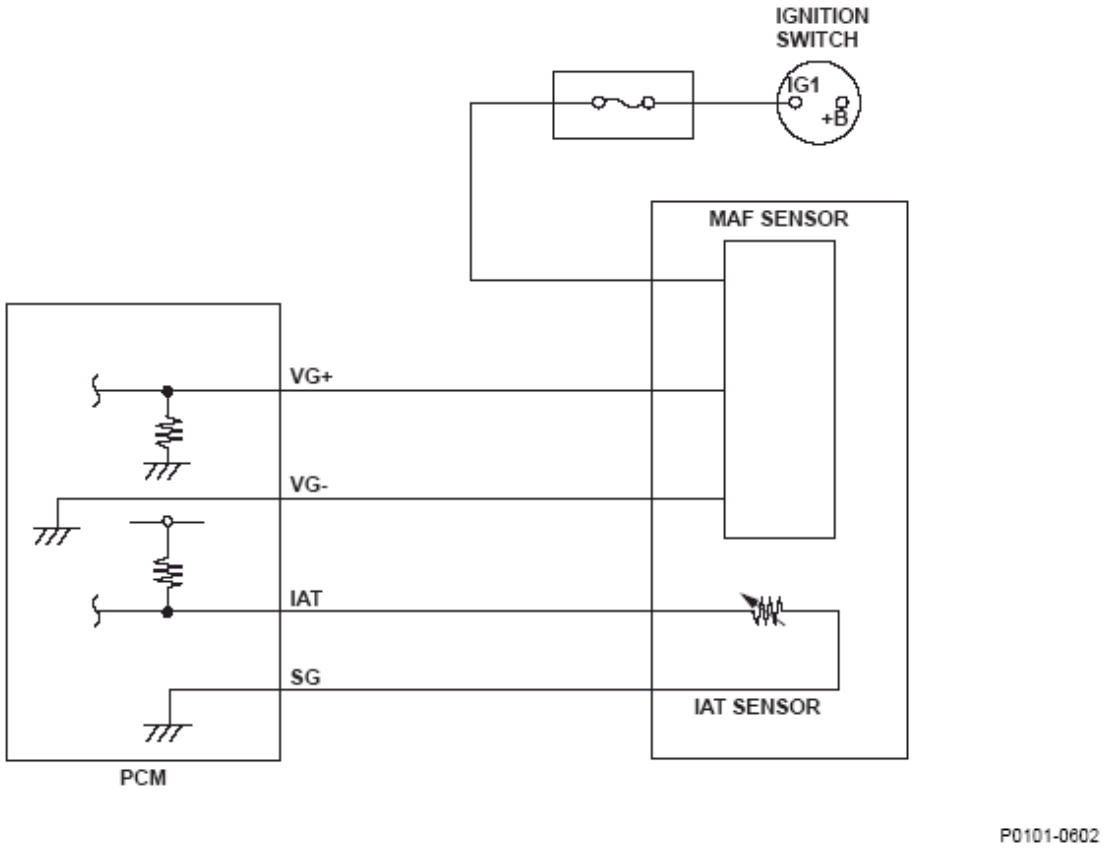

Fig. 133: Measuring Resistance Between ECM Connector Terminals A36 And A37
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 2.34-2.86 kohms 7

YES - Go to step 43.

NO - Substitute a known-good SRS unit (see **SRS UNIT REPLACEMENT**). If the HDS identify the vehicle, replace the original SRS unit (see **SRS UNIT REPLACEMENT**).

43. Disconnect SRS unit connector A (28P).
44. Reconnect EPS control unit connector D (28P).
45. Measure resistance between ECM connector terminals A36 and A37.

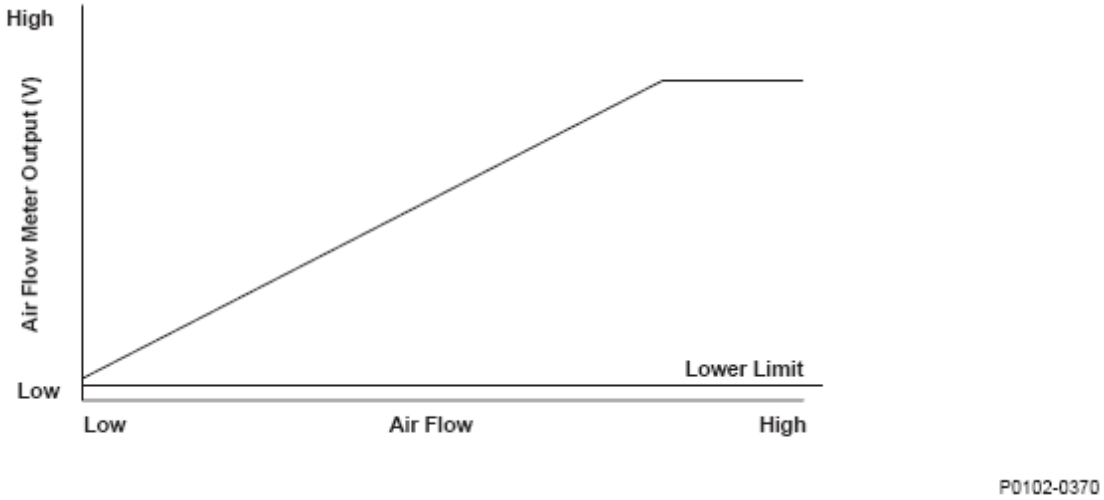

Fig. 134: Measuring Resistance Between ECM Connector Terminals A36 And A37
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 2.34-2.86 kohms?

YES -

- With TPMS: Go to step 46.
- Without TPMS: Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the symptom/indication goes away with a known-good ECM, replace the original ECM (see **ECM REPLACEMENT**).

NO - Substitute a known-good EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**). If the HDS identify the vehicle, replace the original EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

46. Disconnect EPS control unit connector D (28P).
47. Reconnect the TPMS control unit 20P connector.
48. Measure resistance between ECM connector terminals A36 and A37.

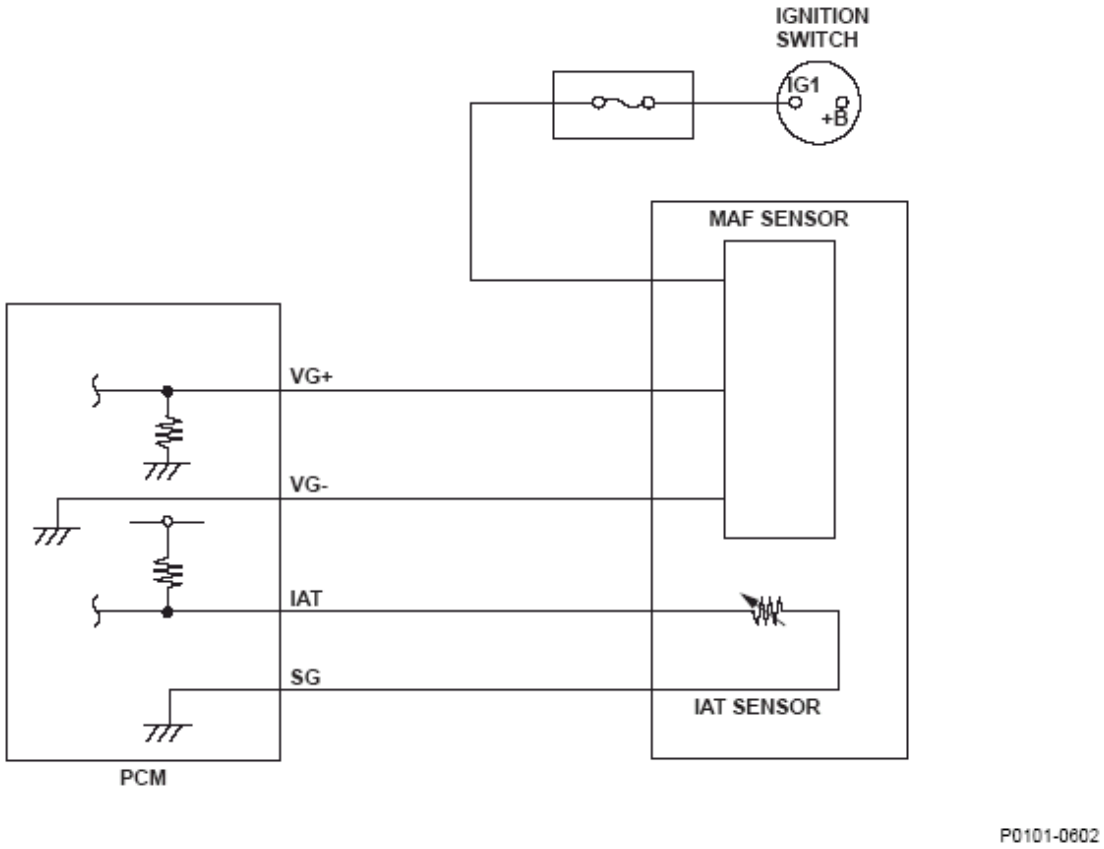

Fig. 135: Measuring Resistance Between ECM Connector Terminals A36 And A37
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 2.34-2.86k ohms ?

YES - Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the symptom/indication goes away with a known-good ECM, replace the original ECM (see **ECM REPLACEMENT**).

NO - Substitute a known-good TPMS control unit. If the HDS identifies the vehicle, replace the original TPMS control unit.

49. Disconnect the gauge control module (tach) 36P connector.
50. Disconnect the ABS modulator-control unit 25P connector (or the VSA modulator-control unit 37P connector and the yaw rate/lateral acceleration sensor 5P connector).
51. Disconnect SRS unit connector A (28P).
52. Disconnect EPS control unit connector D (28P).
53. With TPMS: Disconnect the TPMS control unit 20P connector.
54. Check for continuity between ECM connector terminal A36 and body ground.

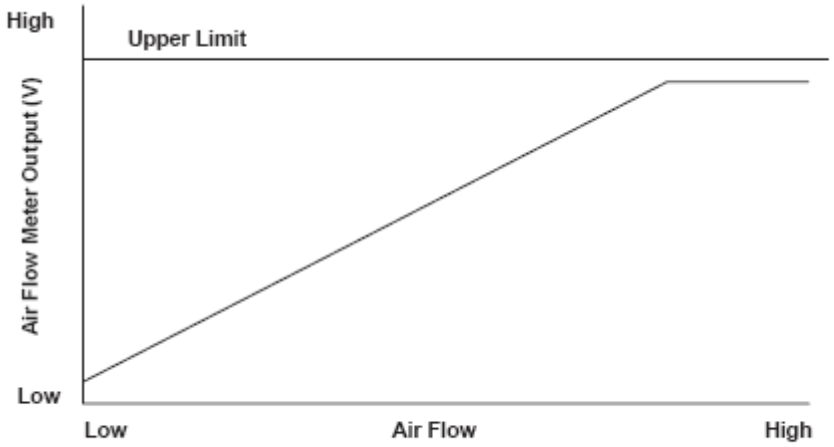

Fig. 136: Checking For Continuity Between ECM Connector Terminal A36 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between ECM connector terminal A36 and the gauge control module, the ABS modulator-control unit, the VSA modulator-control unit, the yaw rate/lateral acceleration sensor, the SRS unit, the EPS control unit, TPMS control unit (with TPMS), or the DLC.

NO - Go to step 55.

55. Check for continuity between ECM connector terminal A37 and body ground.

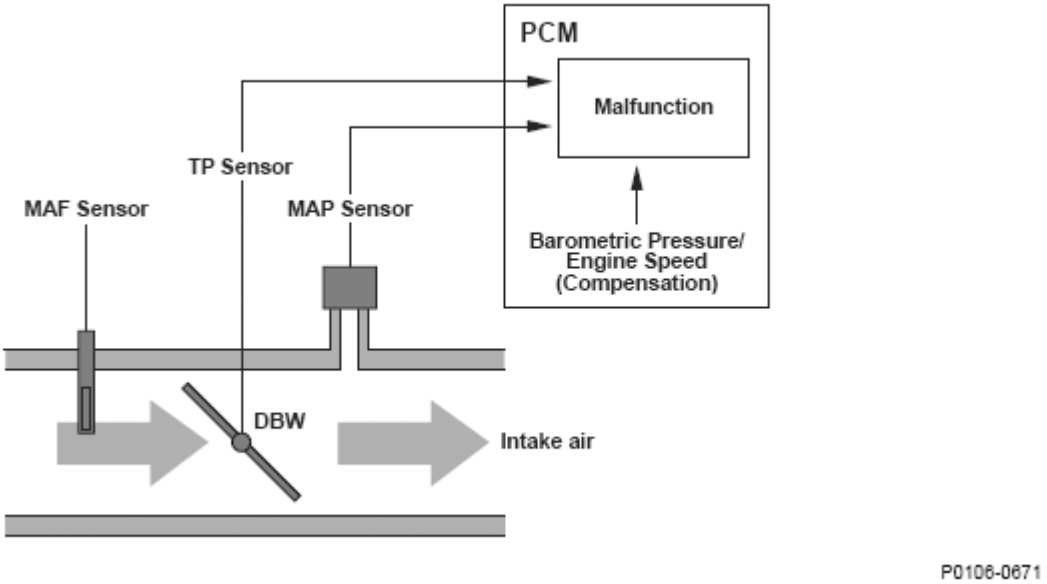

Fig. 137: Checking For Continuity Between ECM Connector Terminal A37 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between ECM connector terminal A37 and the gauge control module,

the ABS modulator-control unit, the VSA modulator-control unit, the yaw rate/lateral acceleration sensor, the SRS unit, the EPS control unit or the DLC.

NO - Go to step 56.

56. Reconnect all connectors.
57. Connect the HDS to the DLC (see **GENERAL TROUBLESHOOTING INFORMATION**).
58. Disconnect the gauge control module (tach) 36P connector.
59. Turn the ignition switch ON (II), and read the HDS.

Does the HDS identify the vehicle?

YES - Replace the gauge control module (tach) (see **TACHOMETER**).

NO -

- With ABS system: Go to step 52.
- With VSA system: Go to step 64.

60. Turn the ignition switch OFF.
61. Reconnect the gauge control module (tach) 36P connector.
62. Disconnect the ABS modulator-control unit 25P connector.
63. Turn the ignition switch ON (II), and read the HDS.

Does the HDS identify the vehicle?

YES - Replace the ABS modulator-control unit (see **ABS MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**).

NO - Go to step 72.

64. Turn the ignition switch OFF.
65. Reconnect the gauge control module (tach) 36P connector.
66. Disconnect the VSA modulator-control unit 37P connector.
67. Turn the ignition switch ON (II), and read the HDS.

Does the HDS identify the vehicle?

YES - Replace the VSA modulator-control unit (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**).

NO - Go to step 68.

68. Turn the ignition switch OFF.
69. Reconnect the VSA modulator-control unit 37P connector.
70. Disconnect the yaw rate/lateral acceleration sensor 5P connector.
71. Turn the ignition switch ON (II), and read the HDS.

Does the HDS identify the vehicle?

YES - Replace the yaw rate/lateral acceleration sensor (see **YAW RATE-LATERAL ACCELERATION SENSOR REPLACEMENT**).

NO - Go to step 72.

72. Turn the ignition switch OFF.
73. Reconnect the ABS modulator-control unit 25P connector (or yaw rate/lateral acceleration sensor 5P connector).
74. Disconnect SRS unit connector A (28P).
75. Turn the ignition switch ON (II), and read the HDS.

Does the HDS identify the vehicle?

YES - Replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Go to step 76.

76. Turn the ignition switch OFF.
77. Reconnect SRS unit connector A (28P).
78. Disconnect EPS control unit connector D (28P).
79. Turn the ignition switch ON (II), and read the HDS.

Does the HDS identify the vehicle?

YES - Replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

NO -

- With TPMS: Go to step 80.
- Without TPMS: Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the symptom/indication goes away with a known-good ECM, replace the original ECM (see **ECM REPLACEMENT**).

80. Turn the ignition switch OFF.
81. Reconnect EPS control unit connector D (28P).
82. Disconnect the TPMS control unit 20P connector.
83. Turn the ignition switch ON (II), and read the HDS.

Does the HDS identify the vehicle?

YES - Replace the TPMS control unit.

NO - Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the symptom/indication goes away with a known-good ECM, replace the original ECM (see **ECM REPLACEMENT**).

MIL CIRCUIT TROUBLESHOOTING

1. Turn the ignition switch ON (II).
2. Do the gauge self-diagnostic function (see **SELF-DIAGNOSTIC FUNCTION**).

   Does the MIL indicator flash?

   YES - Go to step 3.

   NO - Substitute a known-good gauge control module (tach), and recheck. If the MIL circuit is OK, replace the original gauge control module (tach) (see **TACHOMETER**).

3. Connect the HDS to the DLC (see **GENERAL TROUBLESHOOTING INFORMATION**).
4. Check the SCS in the DATA LIST with the HDS.

   Is a short indicated?

   YES - Go to step 5.

   NO - Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the symptom/indication goes away with a known-good ECM, replace the original ECM (see **ECM REPLACEMENT**).

5. Turn the ignition switch OFF.
6. Disconnect ECM connector A (44P), then disconnect the HDS.
7. Check for continuity between ECM connector terminal A31 and body ground.

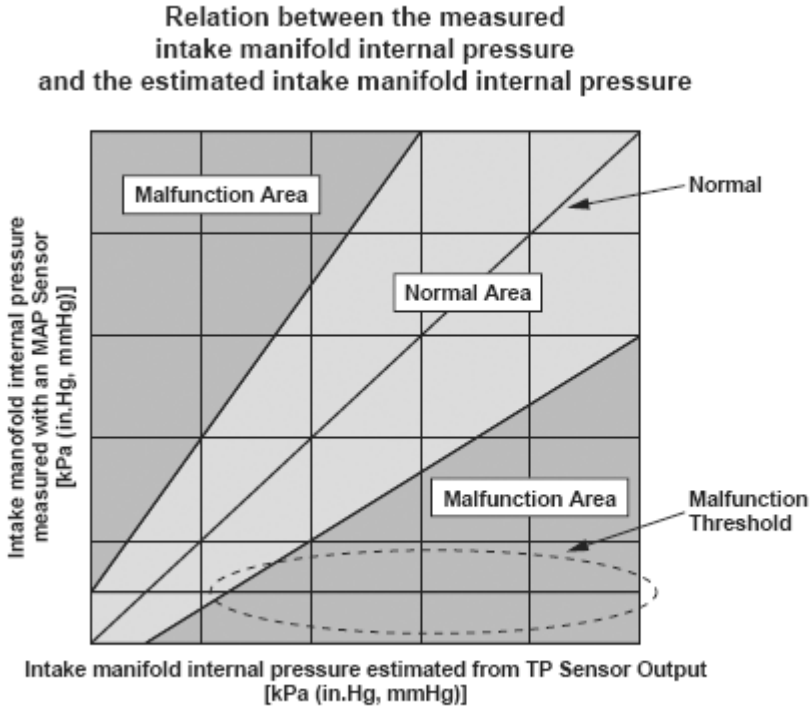

Fig. 138: Checking For Continuity Between ECM Connector Terminal A31 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM (A31) and the SRS unit, the DLC.

NO - Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the symptom/indication goes away with a known-good ECM, replace the original ECM (see **ECM REPLACEMENT**).

DLC CIRCUIT TROUBLESHOOTING

NOTE: Make sure the HDS and the DLC cable of the HDS is normal.

1. Turn the ignition switch OFF.
2. Connect the HDS to the DLC (see **GENERAL TROUBLESHOOTING INFORMATION**).

   NOTE: Make sure the HDS is properly connected to the DLC.

3. Turn the ignition switch ON (II), and read the HDS.

   Does the HDS identify the vehicle?

   YES - Go to step 4.

   NO - Go to step 25.

4. Check for Temporary DTCs or DTCs in the PGM-FI system with the HDS.

   Are any Temporary DTCs or DTCs indicated?

   YES - Go to the indicated DTC's troubleshooting.

   NO - Go to step 5.

5. Turn the ignition switch OFF.
6. Turn the ignition switch ON (II), and watch the SRS indicator.

   Does the SRS indicator stay on?

   YES - Go to the SRS system's general troubleshooting information (see **GENERAL TROUBLESHOOTING INFORMATION**).

   NO -

   - With ABS system: Go to step 7.
   - With VSA system: Go to step 9.

7. Turn the ignition switch OFF.
8. Turn the ignition switch ON (II), and watch the ABS indicator.

   Does the ABS indicator stay on?

   YES - Go to the ABS system's general troubleshooting information (see **GENERAL TROUBLESHOOTING INFORMATION**).

   NO - Go to step 11.

9. Turn the ignition switch OFF.
10. Turn the ignition switch ON (II), and watch the VSA indicator.

    Does the VSA indicator stay on?

    YES - Go to the VSA system's general troubleshooting information (see **GENERAL TROUBLESHOOTING INFORMATION**).

    NO - Go to step 11.

11. Turn the ignition switch OFF.
12. Start the engine, and watch the EPS indicator.

    Does the EPS indicator stay on?

    YES - Go to the EPS system's general troubleshooting information (see **GENERAL TROUBLESHOOTING INFORMATION**).

    NO - Go to step 13.

13. Turn the ignition switch OFF.
14. Turn the ignition switch ON (II), and watch the immobilizer indicator.

    Does the immobilizer indicator stay on or flash?

    YES - Go to the immobilizer system's troubleshooting (see **SYMPTOM TROUBLESHOOTING INFORMATION**).

    NO -

    - With TPMS: Go to step 15.
    - Without TPMS: Go to step 17.

15. Turn the ignition switch OFF.
16. Turn the ignition switch ON (II), and watch the TPMS indicator.

    Does the TPMS indicator stay on?

    YES - Go to the TPMS indicator system's troubleshooting.

NO - Go to step 17.

17. Do the gauge self-diagnostic function (see **SELF-DIAGNOSTIC FUNCTION**).
18. Check for B-CAN system DTCs without the HDS (see **GENERAL TROUBLESHOOTING INFORMATION**).

    Are any B-CAN DTCs indicated?

    YES - Go to the indicated DTC's troubleshooting.

    NO - Go to step 19.

19. Turn the ignition switch OFF.
20. Disconnect the HDS from the DLC.
21. Check for continuity between DLC terminal No. 7 and body ground.

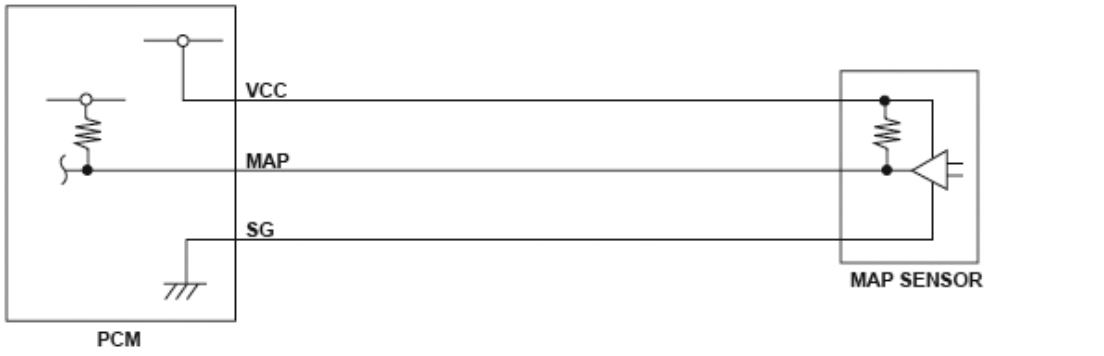

Fig. 139: Checking For Continuity Between DLC Terminal No. 7 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 5 ohms, or less?

YES - Go to step 22.

NO - Go to step 23.

22. Continue to check for continuity between DLC terminal No. 7 and body ground, while disconnecting these parts, one at a time:
    - SRS unit connector A (28P)
    - ABS modulator-control unit 25P connector (with ABS system)
    - VSA modulator-control unit 37P connector (with VSA system)
    - EPS control unit connector D (28P) (with electrical power steering)
    - Immobilizer-keyless control unit 7P connector
    - Audio unit 17P connector
    - Under-dash fuse/relay box (Q) (16P) connector

    Does continuity go away when one of the above components is disconnected?

YES - Replace the part that caused an open when it was disconnected.

NO - Repair short in the wire between the DLC (K-line) and the ABS modulator-control unit (with ABS system), the VSA modulator-control unit (with VSA system), the SRS unit, the EPS control unit, the immobilizer-keyless control unit, the audio unit, or the under-dash fuse/relay box.

23. Connect DLC terminal No. 7 to body ground with a jumper wire.

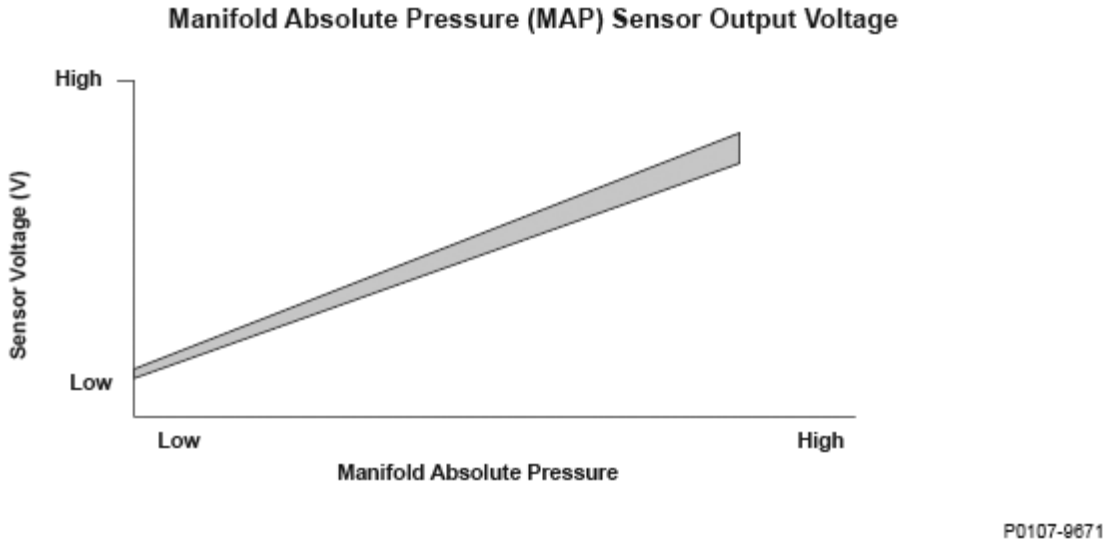

Fig. 140: Connecting DLC Terminal No. 7 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

24. Check for continuity between body ground and these connector terminals:

BODY GROUND AND CONNECTOR TERMINALS

Connector	Terminal
SRS unit A (28P)	No. 24 (LT BLU)
ABS modulator-control unit 25P (with ABS system)	No. 10 (LT BLU)
VSA modulator-control unit 37P (with VSA system)	No. 26 (LT BLU)
EPS control unit D (28P)	No. 17 (LT BLU)
Immobilizer-keyless control unit 7P	No. 5 (LT BLU)
TPMS control unit 20P	N0. 7 (LT BLU)
Audio unit 17P	No. 6 (LT BLU)
Under-dash fuse/relay box (Q) (16P)	No. 8 (LT BLU)

Is there continuity between the DLC terminal and each of the terminals in the chart?

YES -Replace the unit which cannot communicate with the HDS.

NO -Repair open in the wire between the DLC (K-line) and the appropriate connector.

25. Do the gauge self-diagnostic function (see **SELF-DIAGNOSTIC FUNCTION**).

26. Check for B-CAN system DTCs without the HDS (see **GENERAL TROUBLESHOOTING INFORMATION**).

    Is DTC B1168, B1169, and/or B1178 indicated?

    YES - Go to step 39.

    NO - Go to step 27.

27. Turn the ignition switch OFF.
28. Disconnect the HDS from the DLC.
29. Measure voltage between DLC terminal No. 16 and body ground.

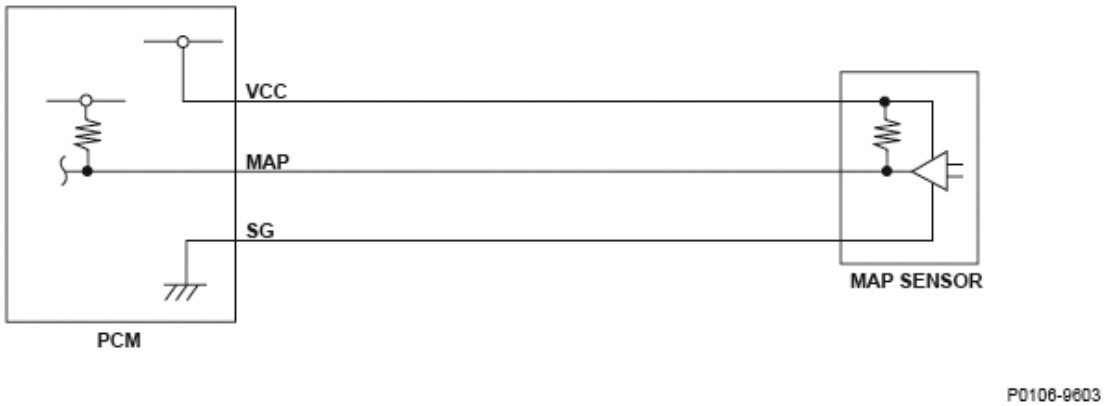

Fig. 141: Measuring Voltage Between DLC Terminal No. 16 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 30.

NO - Repair open in the wire between DLC terminal No. 16 and the No. 23 BACK UP (10 A) fuse in the under-hood fuse/relay box.

30. Measure voltage between DLC terminals No. 4 and No. 16.

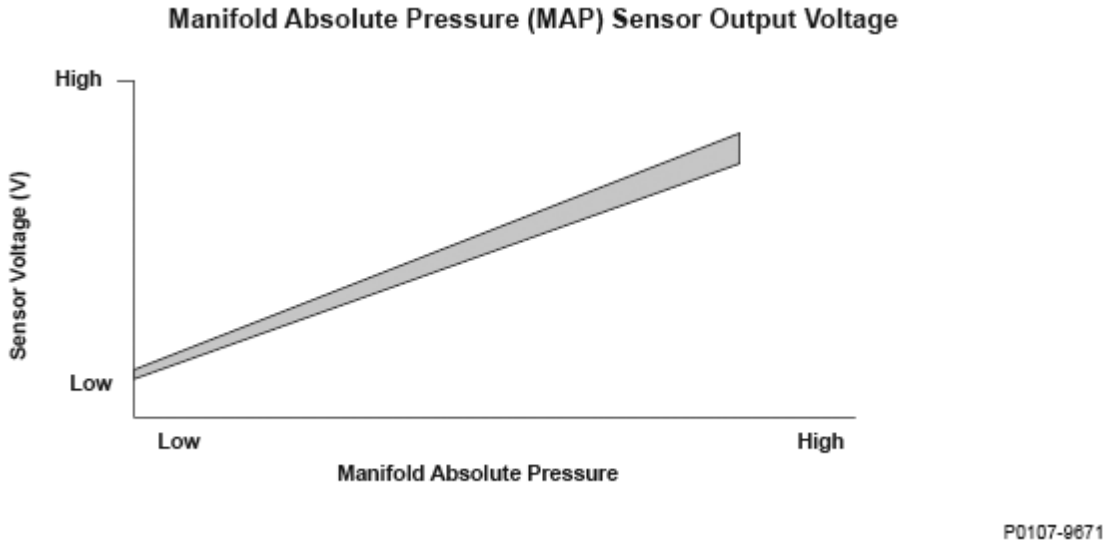

Fig. 142: Measuring Voltage Between DLC Terminals No. 4 And No. 16
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 31.

NO - Repair open in the wire between DLC terminal No. 4 and body ground (G502) (see **CONNECTOR TO HARNESS INDEX**).

31. Connect the HDS to the DLC (see **GENERAL TROUBLESHOOTING INFORMATION**).
32. Jump the SCS line with the HDS.
33. Disconnect ECM connector A (44P).
34. Disconnect the HDS from the DLC.
35. Connect DLC terminal No. 6 to body ground with a jumper wire.

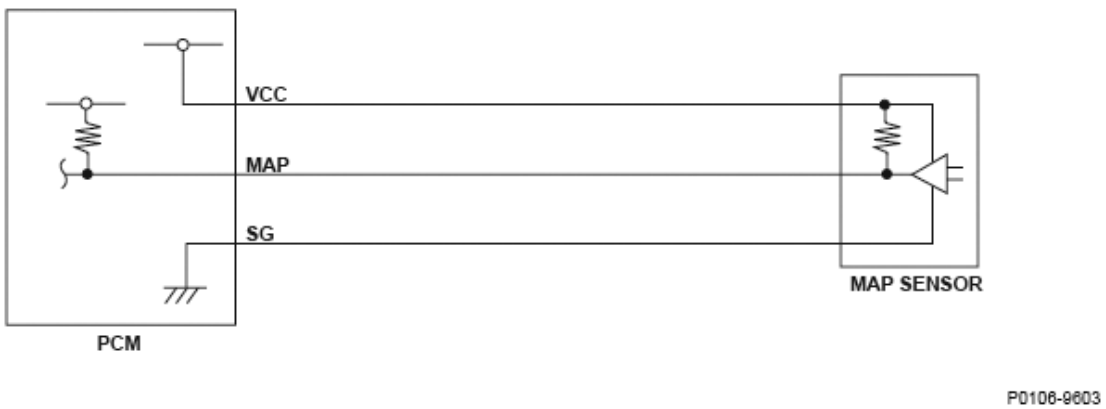

Fig. 143: Connecting DLC Terminal No. 6 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

36. Check for continuity between ECM connector terminal A36 and body ground.

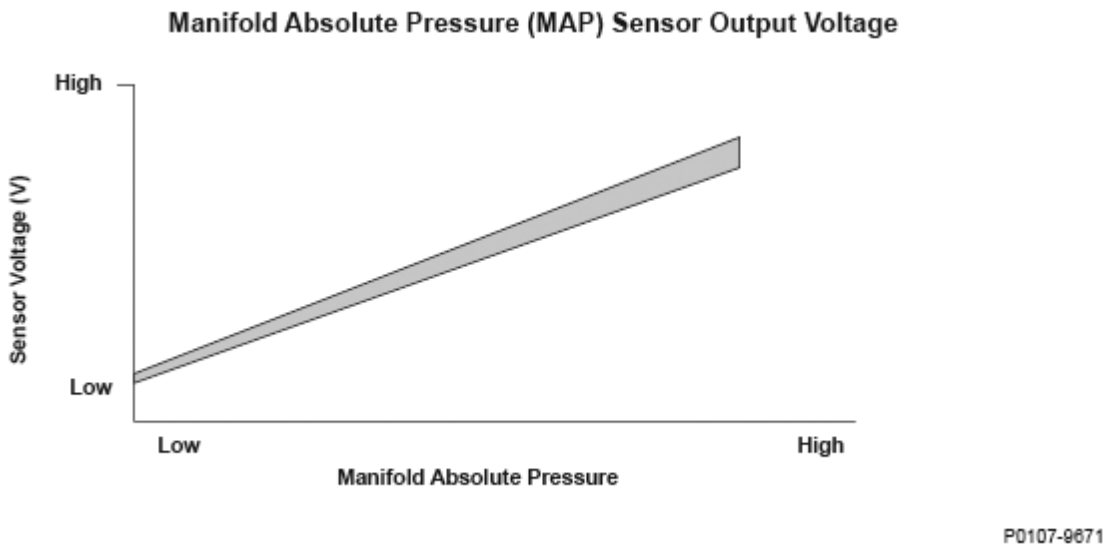

Fig. 144: Checking For Continuity Between ECM Connector Terminal A36 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 37.

NO - Repair open in the wire between the ECM (A36) and DLC terminal No. 6.

37. Connect DLC terminal No. 14 to body ground with a jumper wire.

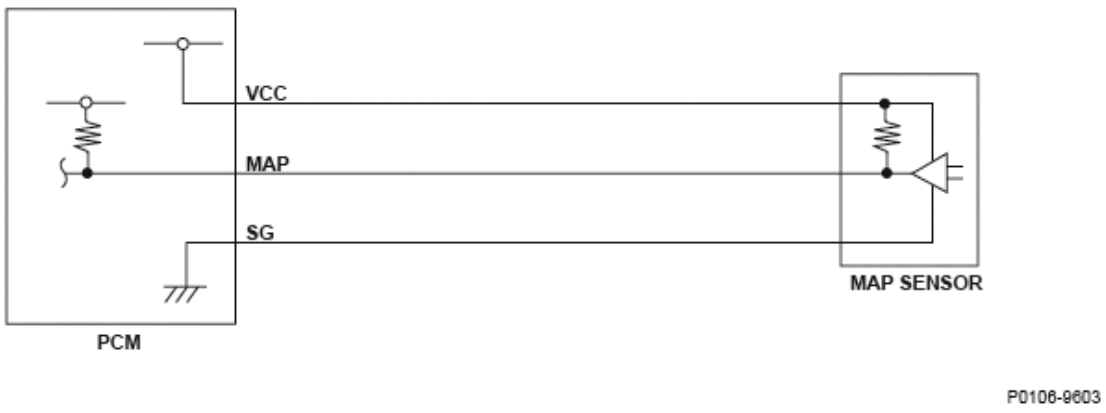

Fig. 145: Connecting DLC Terminal No. 14 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

38. Check for continuity between ECM connector terminal A37 and body ground.

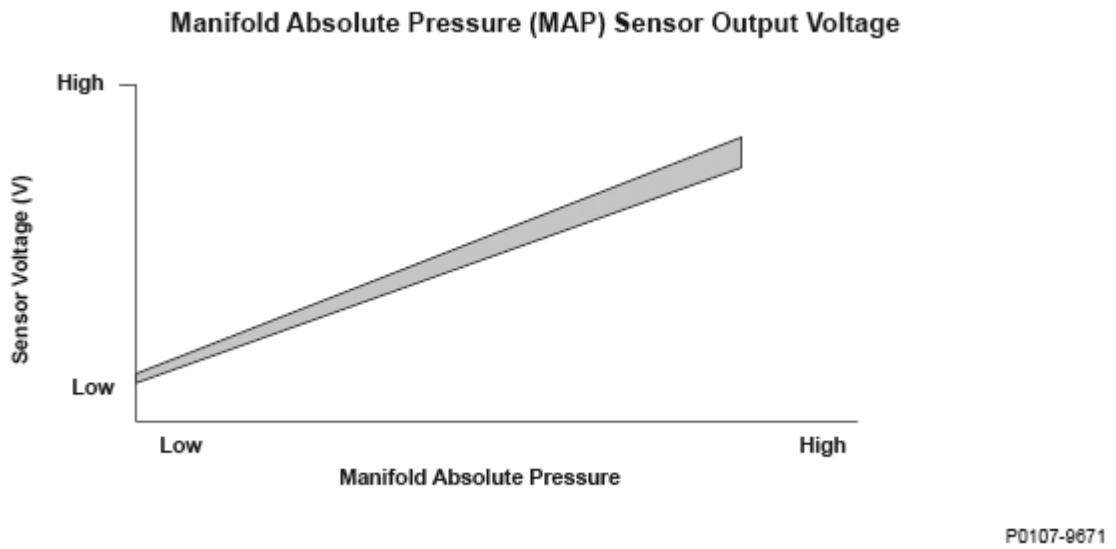

Fig. 146: Checking For Continuity Between ECM Connector Terminal A37 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the symptom/indication goes away with a known-good ECM, replace the original ECM (see **ECM REPLACEMENT**).

NO - Repair open in the wire between the ECM (A37) and DLC terminal No. 14.

39. Try to start the engine.

    Does the engine start and idle smoothly?

    YES - Go to **F-CAN CIRCUIT TROUBLESHOOTING** (see).

    NO - Go to step 40.

40. Turn the ignition switch OFF.
41. Check the No. 2 IG MAIN (50 A) fuse in the under-hood fuse/relay box.

    Is the fuse OK?

    YES - Repair open in the wire between the No. 2 IG MAIN (50 A) fuse and the ignition switch. If the wire is OK, go to step 42.

    NO - Repair short in the wire between the No. 2 IG MAIN (50 A) fuse and the under-hood fuse/relay box. Also replace the No. 2 IG MAIN (50 A) fuse.

42. Inspect the No. 19 Fl MAIN (15 A) fuse in the under-hood fuse/relay box.

    Is the fuse OK?

YES - Go to step 49.

NO - Go to step 43.

43. Remove the blown No. 19 Fl MAIN (15 A) fuse from the under-hood fuse/relay box.
44. Remove PGM-FI main relay 1 (C) from the under-hood fuse/relay box.

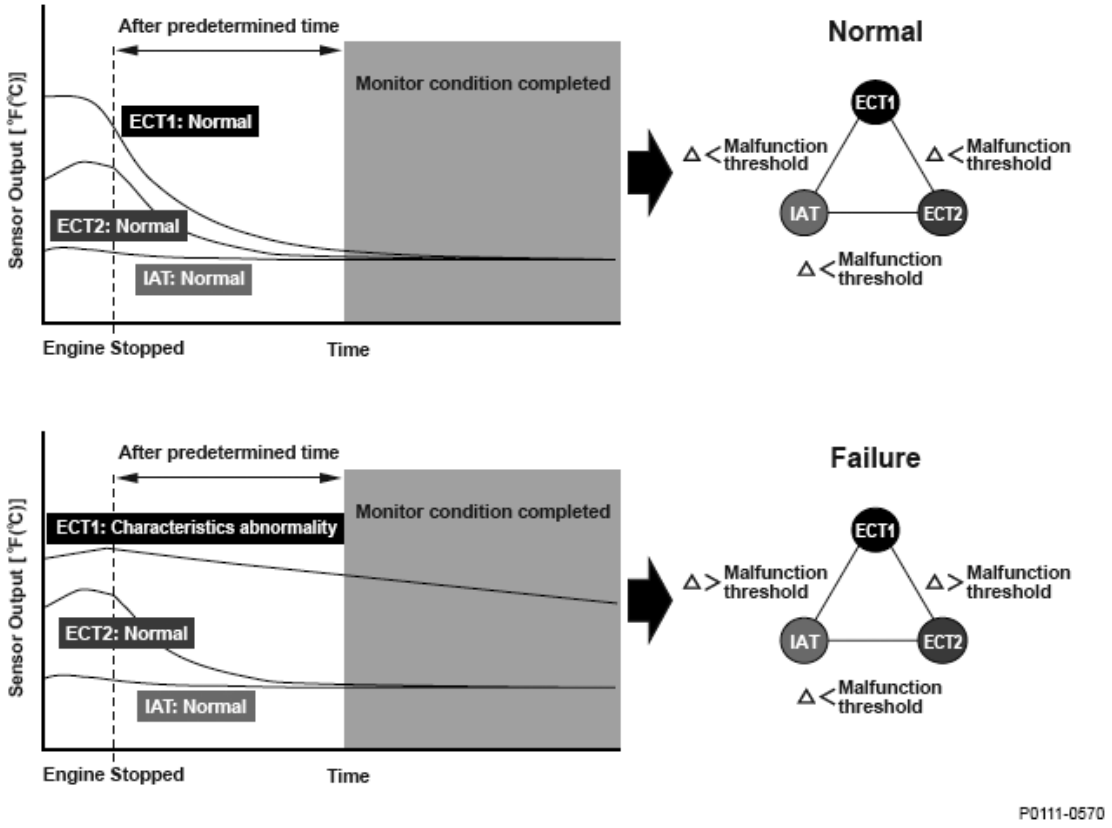

Fig. 147: Identifying PGM-FI Main Relay 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

45. Check for continuity between body ground and PGM-FI main relay 1 4P connector terminals No. 1 and No. 3 individually.

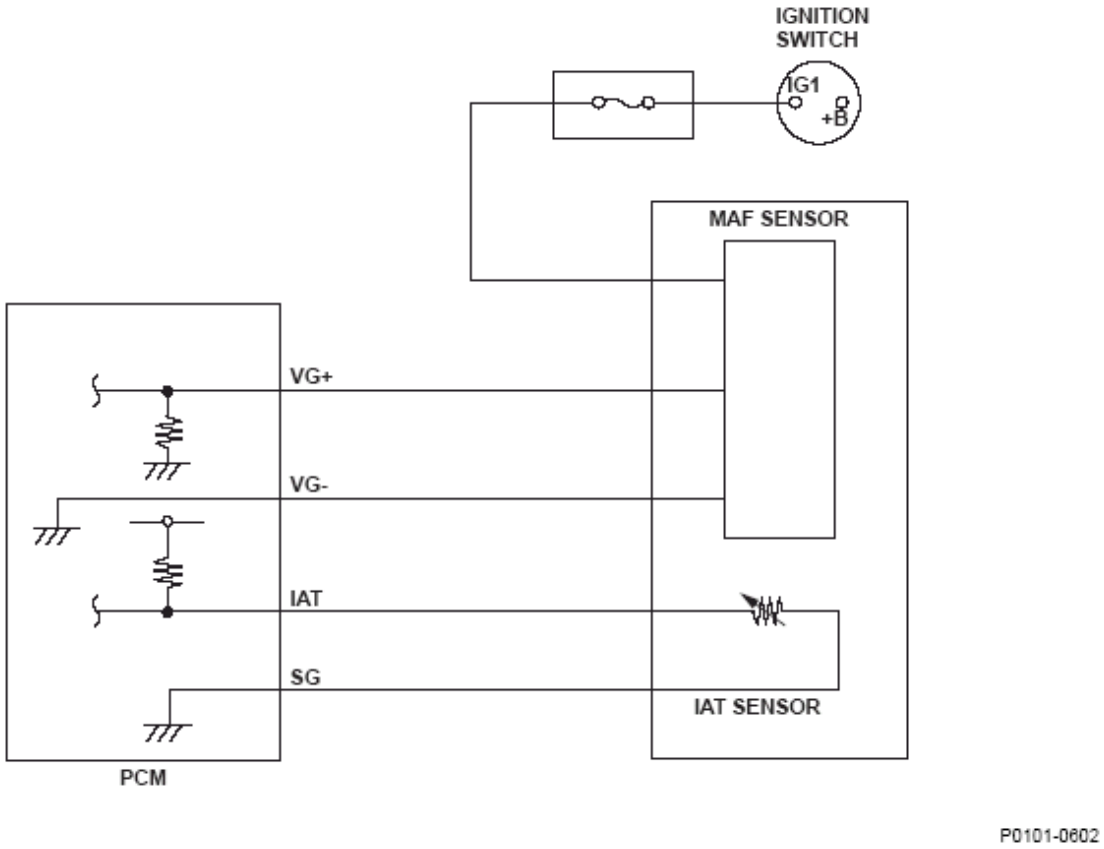

Fig. 148: Checking Continuity Between Body Ground And PGM-FI Main Relay 1 4P Connector Terminals No. 1 And No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**). Also replace the No. 19 Fl MAIN (15 A) fuse.

NO - Go to step 46.

46. Disconnect each of the components or connectors these components, one at a time, and check for continuity between PGM-FI main relay 1 4P connector terminal No. 2 and body ground.
    - PGM-FI main relay 2 (FUEL PUMP)
    - ECM connector A (44P)
    - Each injector 2P connector
    - Camshaft position (CMP) sensor B 3P connector
    - Crankshaft position (CKP) sensor 3P connector
    - Ignition coil relay
    - Electronic throttle control system (ETCS) control relay

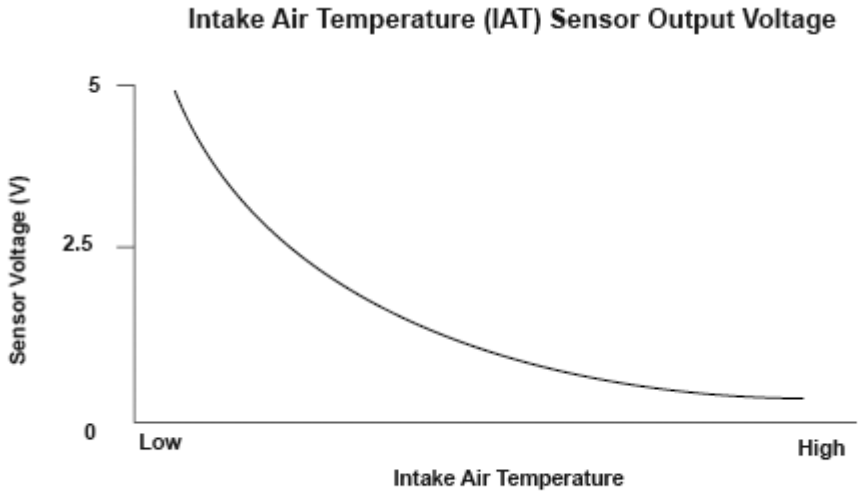

Fig. 149: Checking Continuity Between PGM-FI Main Relay 1 4P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Does continuity go away when one of the above components is disconnected?

YES - Replace the component that made the short to body ground go away when disconnected. If the item is the ECM, update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the symptom/indication goes away with a known-good ECM, replace the original ECM (see **ECM REPLACEMENT**). Also replace the No. 19 Fl MAIN (15 A) fuse.

NO - Go to step 47.

47. Disconnect the all connectors from these components:
    - PGM-FI main relay 2 (FUEL PUMP)
    - ECM connector A (44P)
    - Injectors
    - Camshaft position (CMP) sensor B
    - Crankshaft position (CKP) sensor
    - Ignition coil relay
    - Electronic throttle control system (ETCS) control relay
48. Check for continuity between PGM-FI main relay 1 4P connector terminal No. 2 and body ground.

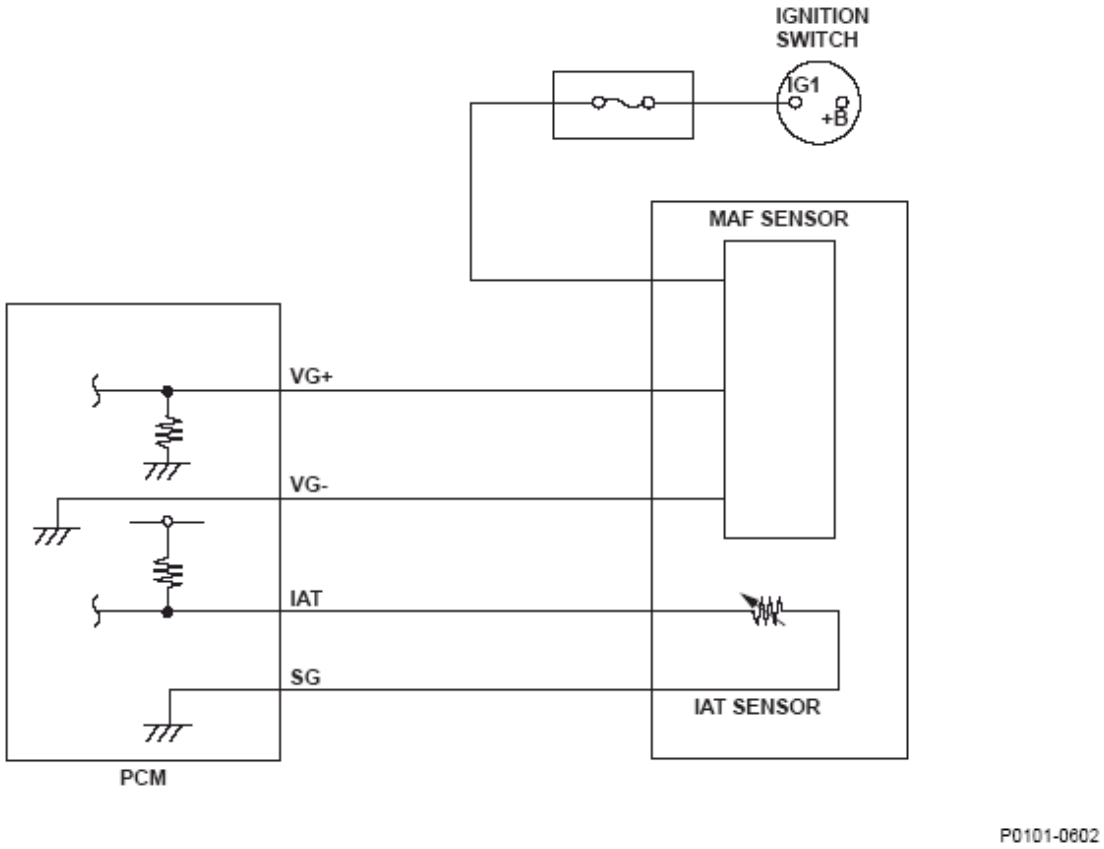

Fig. 150: Checking Continuity Between PGM-FI Main Relay 1 4P Connector Terminal 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between PGM-FI main relay 1 and each item. Also replace the No. 19 Fl MAIN (15 A) fuse.

NO - Replace PGM-FI main relay 1. Also replace the No. 19 Fl MAIN (15 A) fuse.

49. Inspect the No. 2 FUEL PUMP (15 A) fuse in the under-dash fuse/relay box.

    Is the fuse OK?

    YES - Go to step 62.

    NO - Go to step 50.

50. Remove the blown No. 2 FUEL PUMP (15 A) fuse in the under-dash fuse/relay box.
51. Jump the SCS line with the HDS.
52. Disconnect ECM connector C (44P).
53. Check for continuity between ECM connector terminal C36 and body ground.

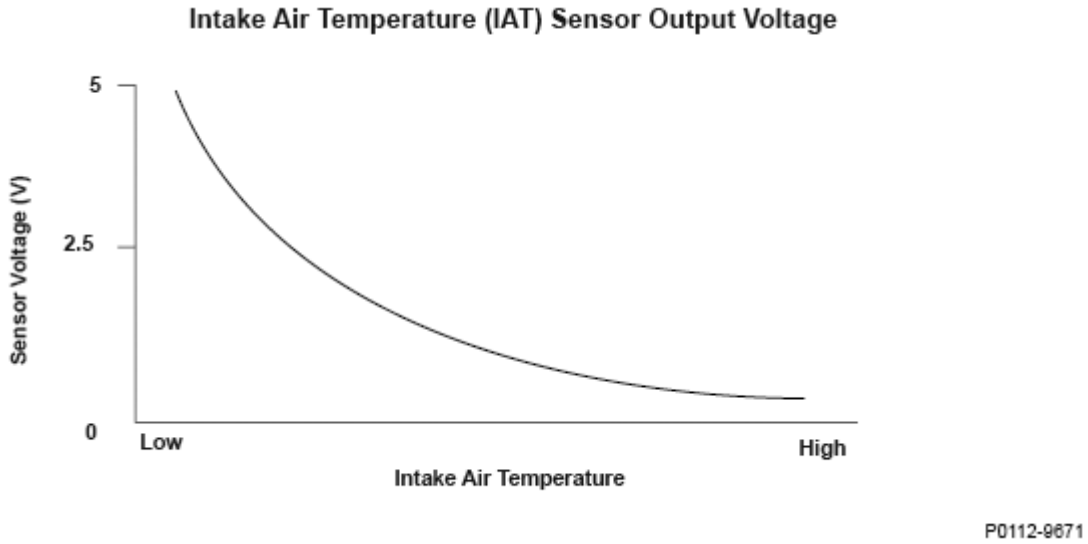

Fig. 151: Checking Continuity Between ECM Connector Terminal C36 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 54.

NO - Replace the No. 2 FUEL PUMP (15 A) fuse, and update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the symptom/indication goes away with a known-good ECM, replace the original ECM (see **ECM REPLACEMENT**).

54. Remove PGM-FI main relay 2 (FUEL PUMP) (A) from the under-dash fuse/relay box.

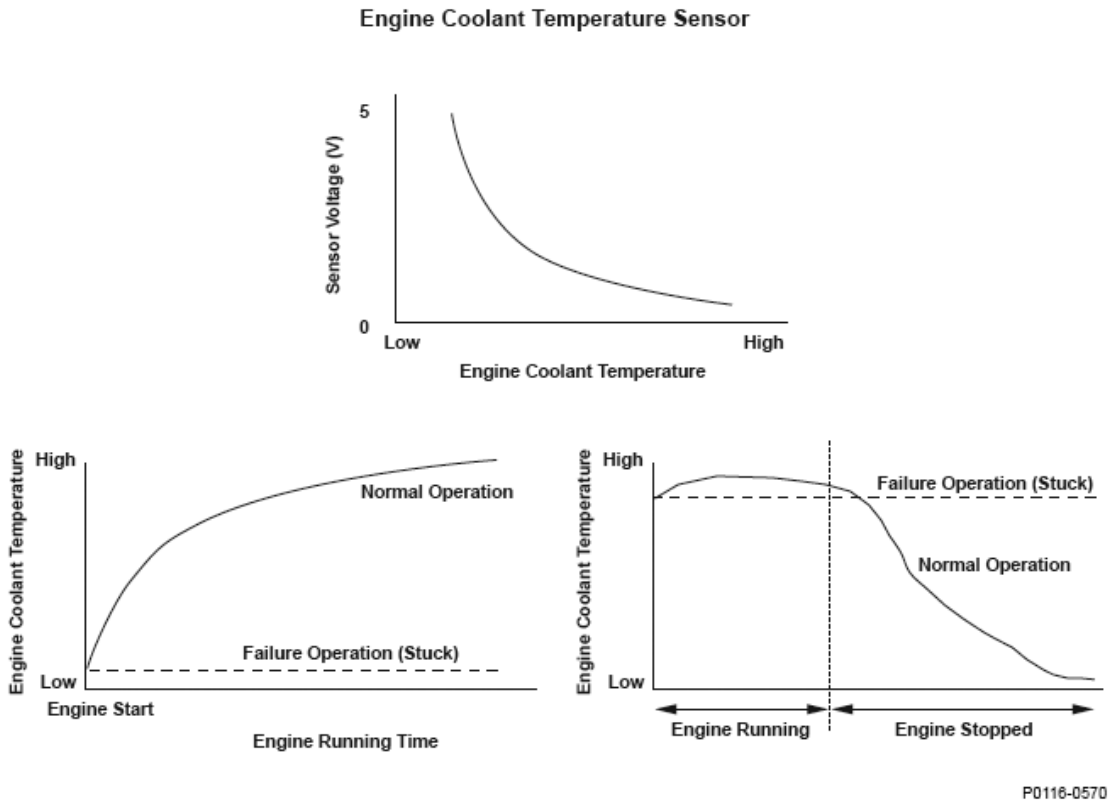

Fig. 152: Identifying PGM-FI Main Relay 2 (FUEL PUMP)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

55. Check for continuity between ECM connector terminal C36 and body ground.

Fig. 153: Checking For Continuity Between ECM Connector Terminal C36 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the No. 2 FUEL PUMP (15 A) fuse and the ECM (C36), between the No. 2 FUEL PUMP (15 A) fuse and PGM-FI main relay 2 (FUEL PUMP), or between the No. 2 FUEL PUMP (15 A) fuse and the immobilizer control unit. Also replace the No. 2 FUEL PUMP (15 A) fuse.

NO - Go to step 56.

56. Remove the rear cushion seat (see **SEAT CUSHION**).

57. Remove the rear floor upper cross-member, and the access panel from the floor (see step 5 in **FUEL TANK UNIT REMOVAL/INSTALLATION**).
58. Disconnect the fuel pump 4P connector.
59. Check for continuity between fuel pump 4P connector terminal No. 2 and body ground.

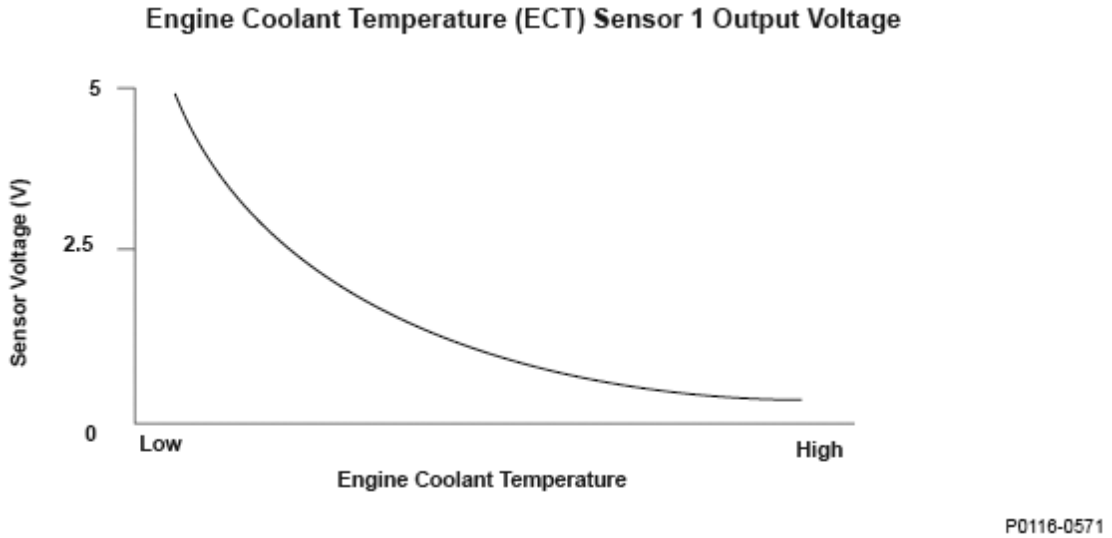

Fig. 154: Checking For Continuity Between Fuel Pump 4P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the fuel pump and PGM-FI main relay 2 (FUEL PUMP). Also replace the No. 2 FUEL PUMP (15 A) fuse.

NO - Go to step 60.

60. Reinstall PGM-FI main relay 2 (FUEL PUMP) (A).

Fig. 155: Identifying PGM-FI Main Relay 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

61. Check for continuity between fuel pump 4P connector terminal No. 2 and body ground.

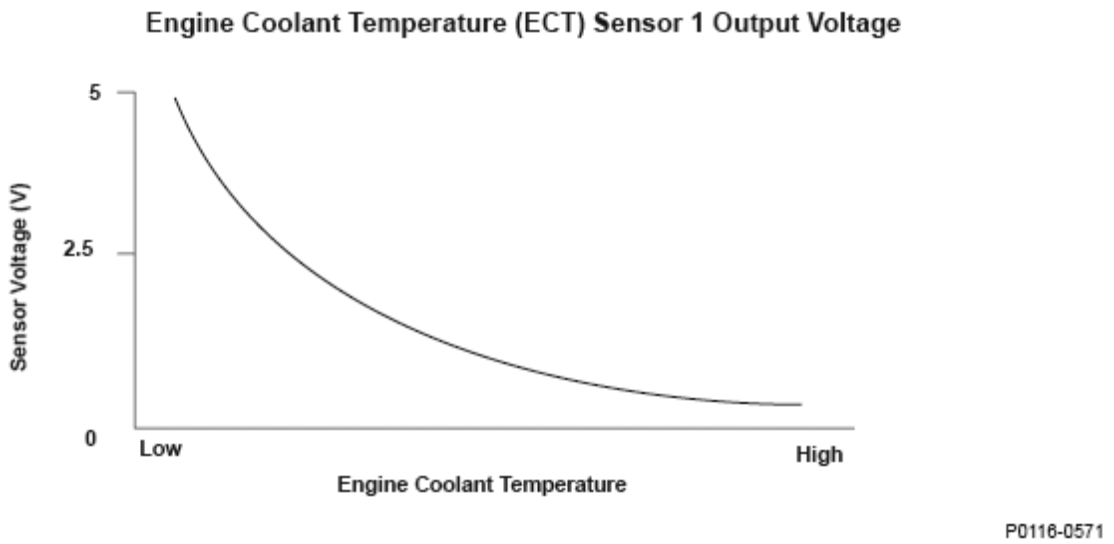

Fig. 156: Checking For Continuity Between Fuel Pump 4P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace PGM-FI main relay 2 (FUEL PUMP). Also replace the No. 2 FUEL PUMP (15 A) fuse.

NO - Check the fuel pump, and replace it if necessary (see **FUEL PUMP/FUEL GAUGE SENDING UNIT REPLACEMENT**). Also replace the No. 2 FUEL PUMP (15 A) fuse.

62. Jump the SCS line with the HDS.
63. Disconnect ECM connectors A (44P) and C (44P).
64. Turn the ignition switch ON (II).
65. Measure voltage between ECM connector terminal C36 and body ground.

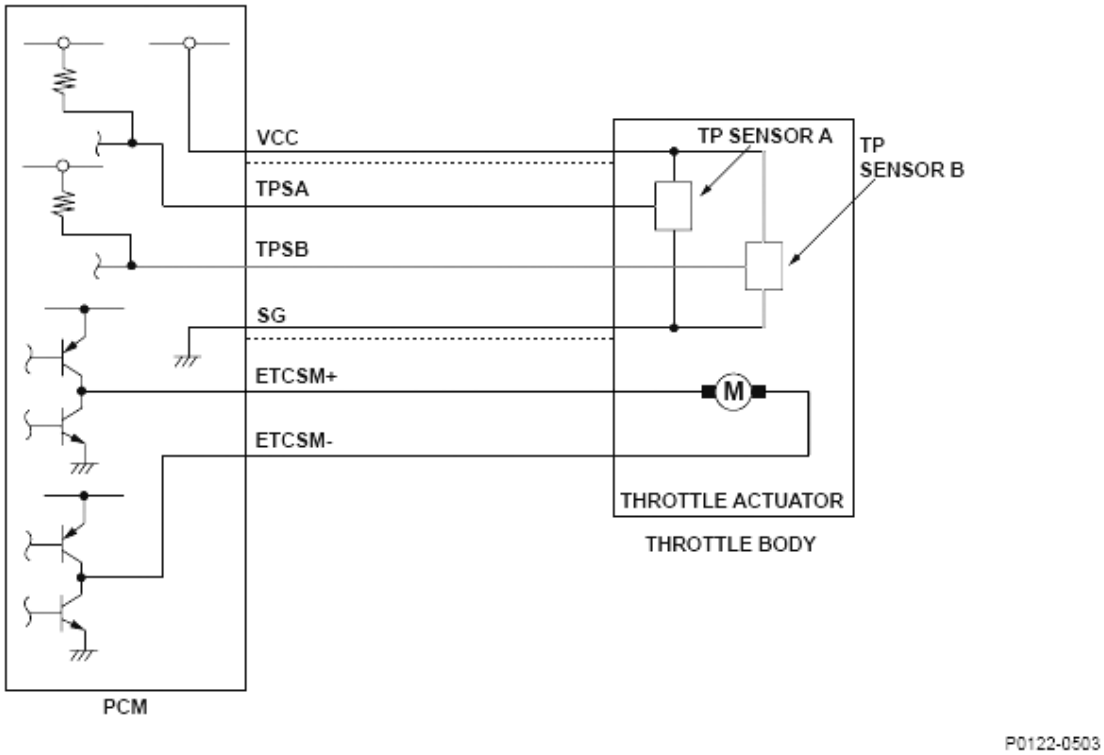

Fig. 157: Measuring Voltage Between ECM Connector Terminal C36 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 66.

NO - Repair open in the wire between the No. 2 FUEL PUMP (15 A) fuse and the ECM (C36).

66. Measure voltage between ECM connector terminal A6 and body ground.

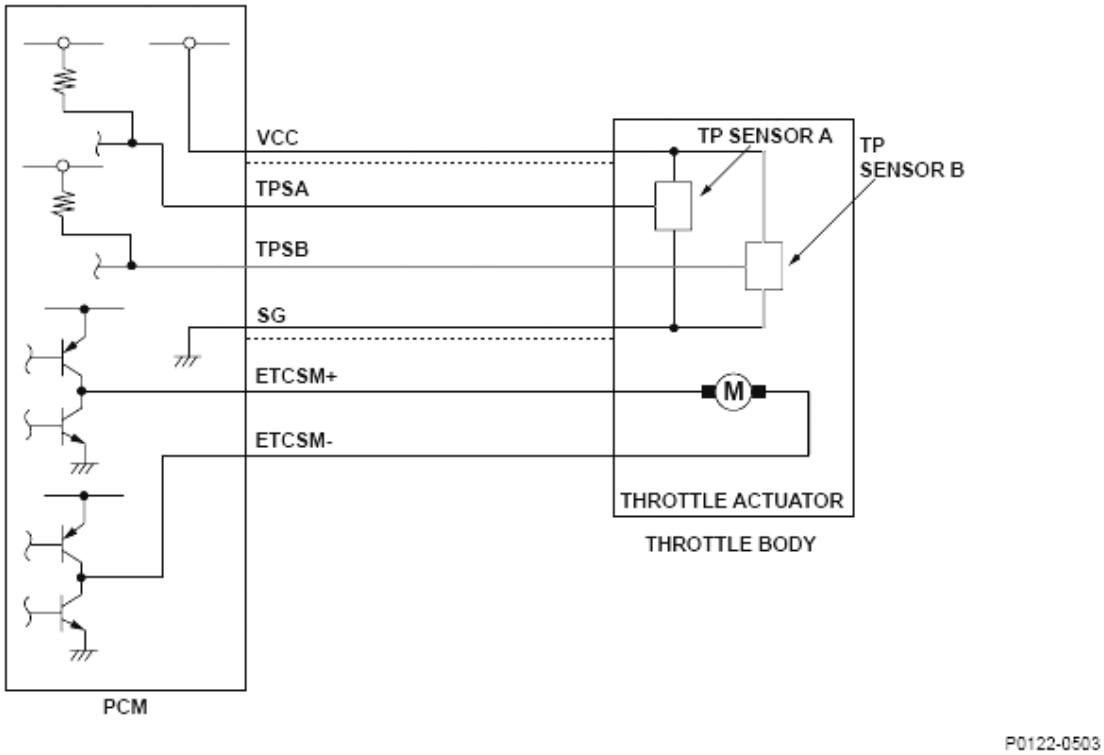

Fig. 158: Measuring Voltage Between ECM Connector Terminal A6 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 71.

NO - Go to step 67.

67. Turn the ignition switch OFF.
68. Remove PGM-FI main relay 1 (C) from the under-hood fuse/relay box.

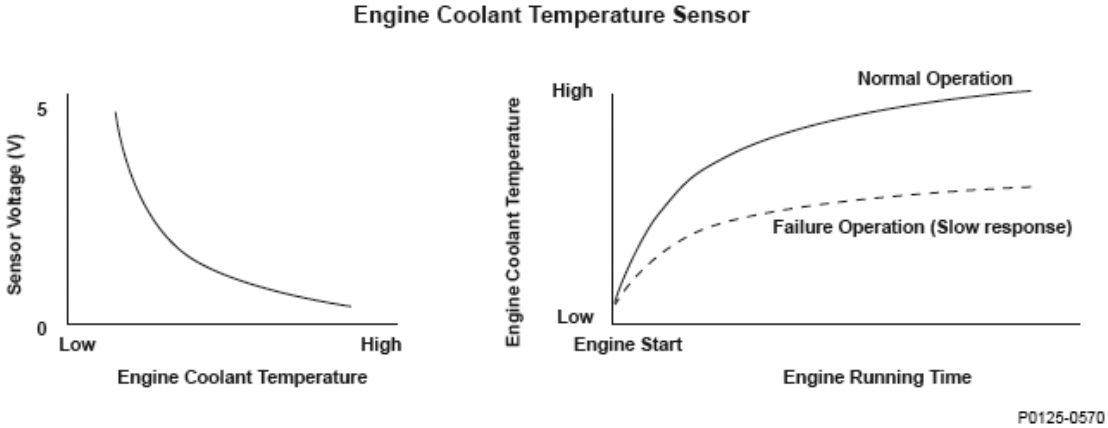

Fig. 159: Identifying PGM-FI Main Relay 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

69. Measure voltage between PGM-FI main relay 1 4P connector terminal No. 3 and body ground.

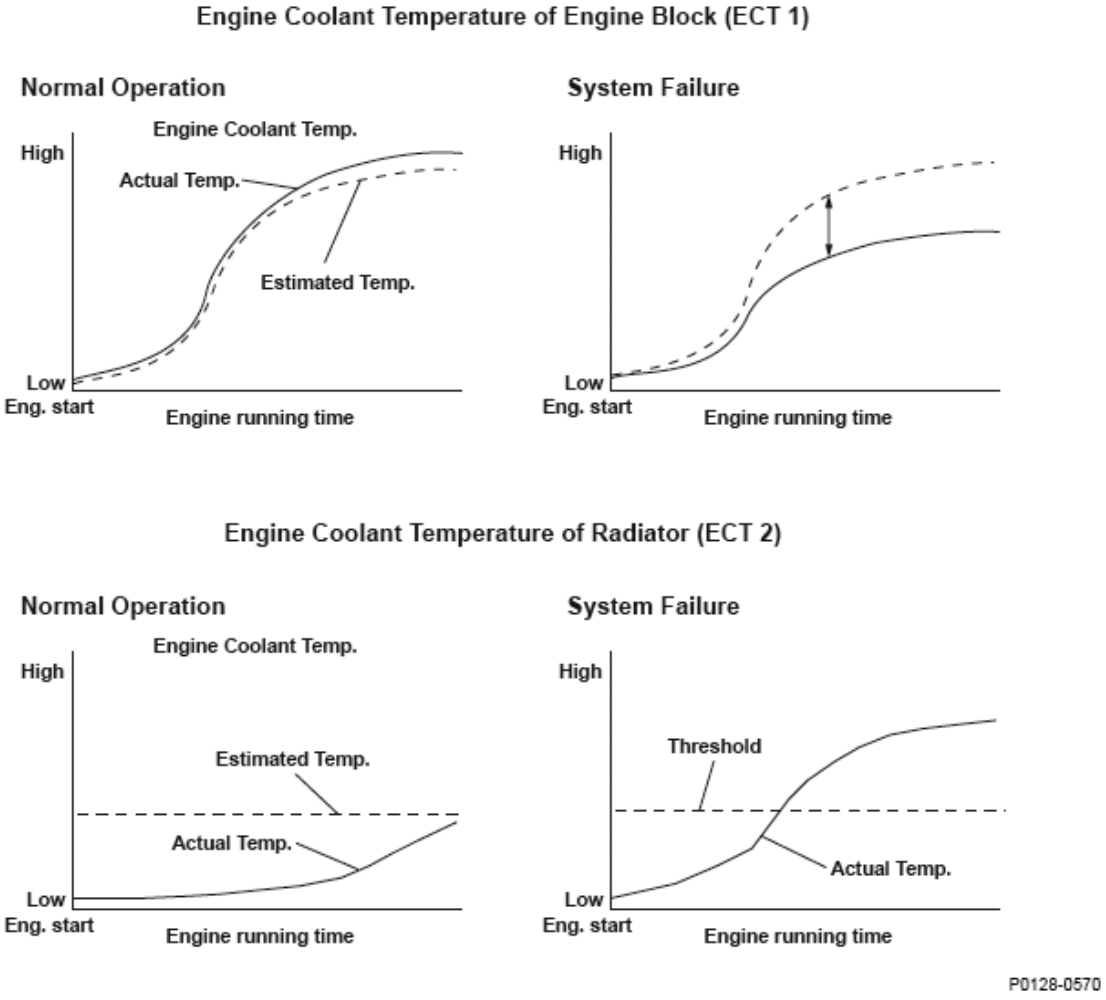

Fig. 160: Measuring Voltage Between PGM-FI Main Relay 1 4P Connector Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 70.

NO - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**).

70. Check for continuity between PGM-FI main relay 1 4P connector terminal No. 4 and ECM connector terminal A6.

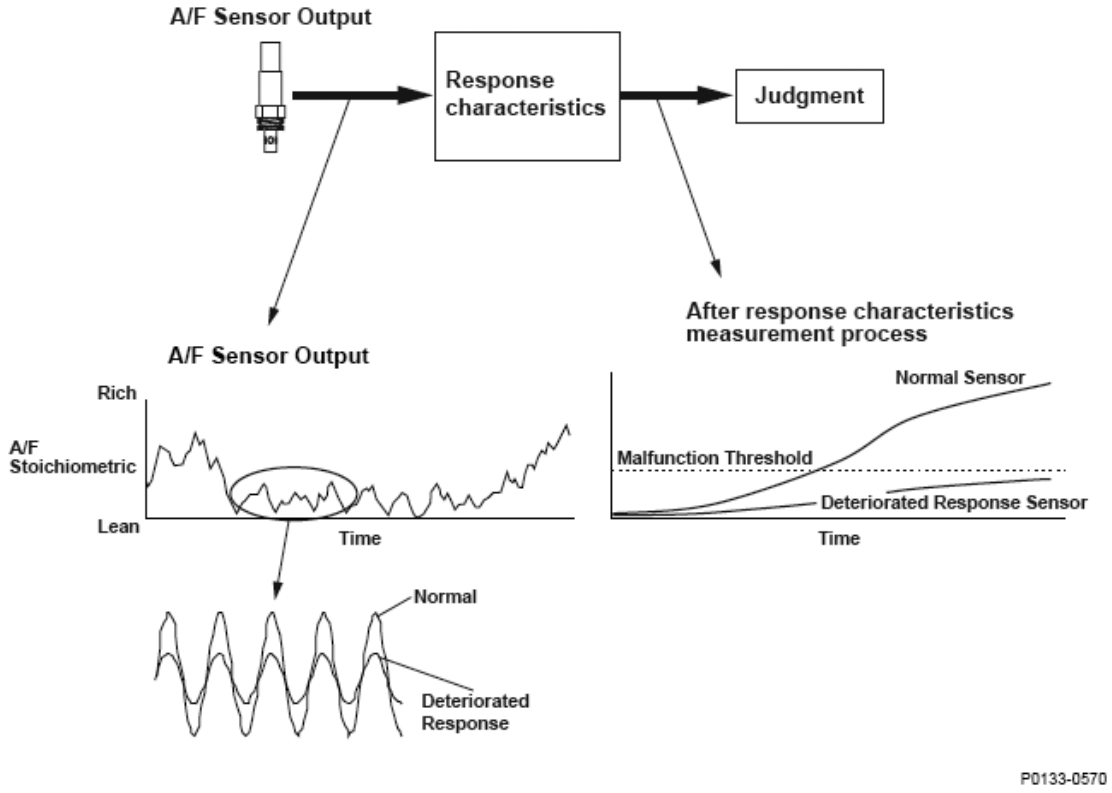

Fig. 161: Checking Continuity Between PGM-FI Main Relay 1 4P Connector Terminal No. 4 And Terminal A6
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Test PGM-FI main relay 1 (see **POWER RELAY TEST**). If the relay is OK, update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the symptom/indication goes away with a known-good ECM, replace the original ECM (see **ECM REPLACEMENT**).

NO - Repair open in the wire between the ECM (A6) and PGM-FI main relay 1.

71. Turn the ignition switch OFF.
72. Remove PGM-FI main relay 1 (C) from the under-hood fuse/relay box.

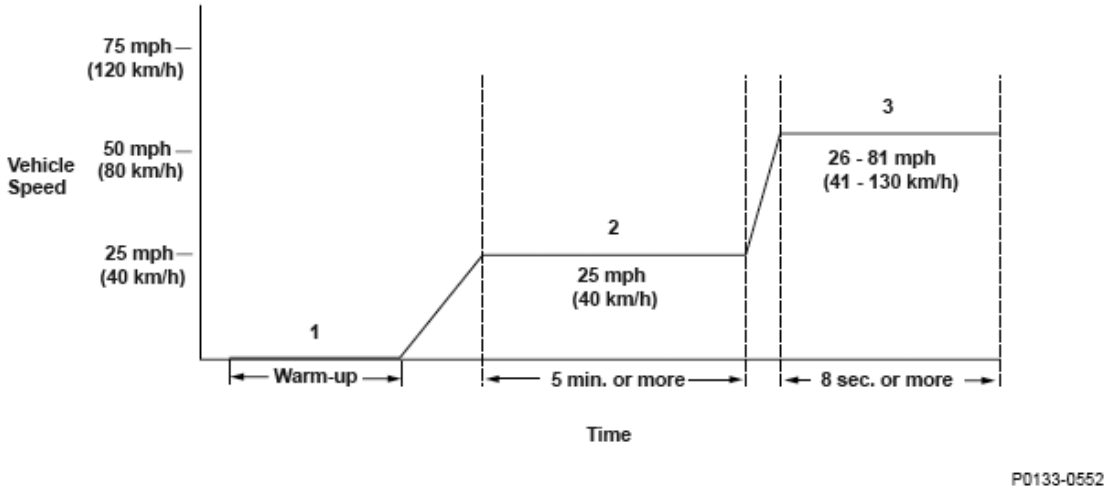

Fig. 162: Identifying PGM-FI Main Relay 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

73. Measure voltage between PGM-FI main relay 1 4P connector terminal No. 1 and body ground.

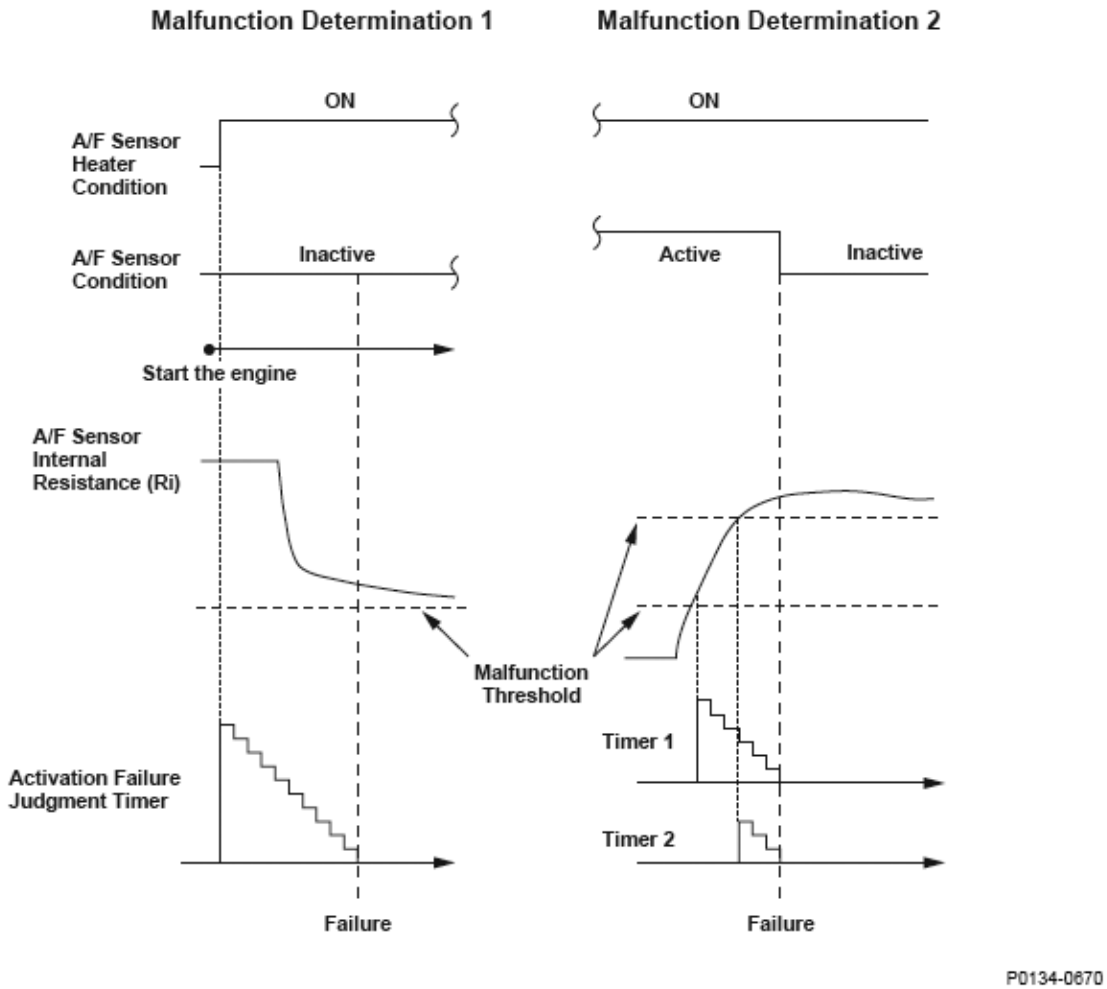

Fig. 163: Measuring Voltage Between PGM-FI Main Relay 1 4P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 74.

NO - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**).

74. Check for continuity between PGM-FI main relay 1 4P connector terminal No. 2 and ECM connector terminal A8.

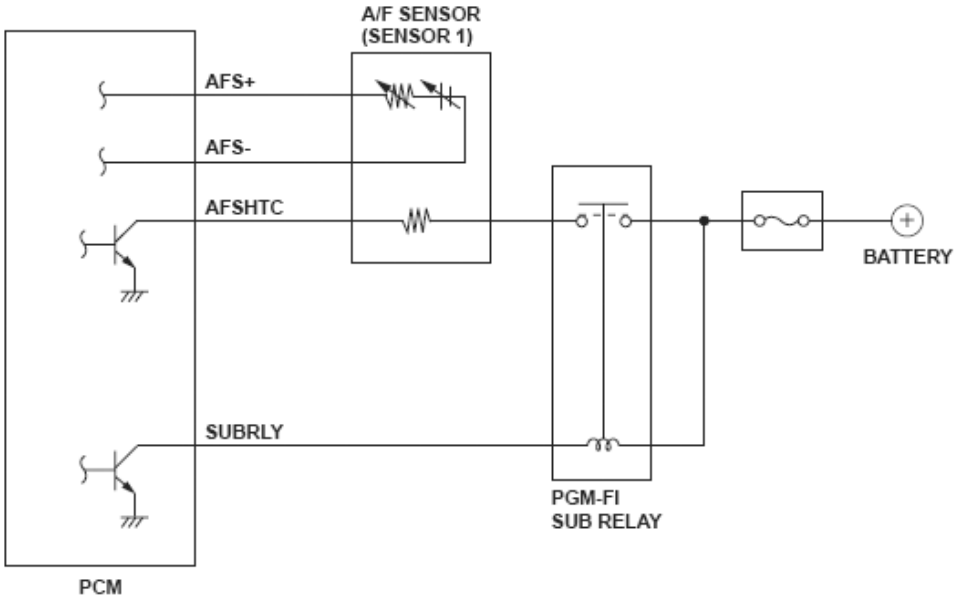

Fig. 164: Checking Continuity Between PGM-FI Main Relay 1 4P Connector Terminal 2 And Terminal A8
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 75.

NO - Repair open in the wire between the ECM (A8) and PGM-FI main relay 1.

75. Test PGM-FI main relay 1 (see **POWER RELAY TEST**).

Is PGM-FI main relay 1 OK?

YES - Go to step 76.

NO - Replace PGM-FI main relay 1.

76. Disconnect ECM connector B (44P).
77. Check for continuity between body ground and ECM connector terminals B1, B36, C2, C40, and C44 individually.

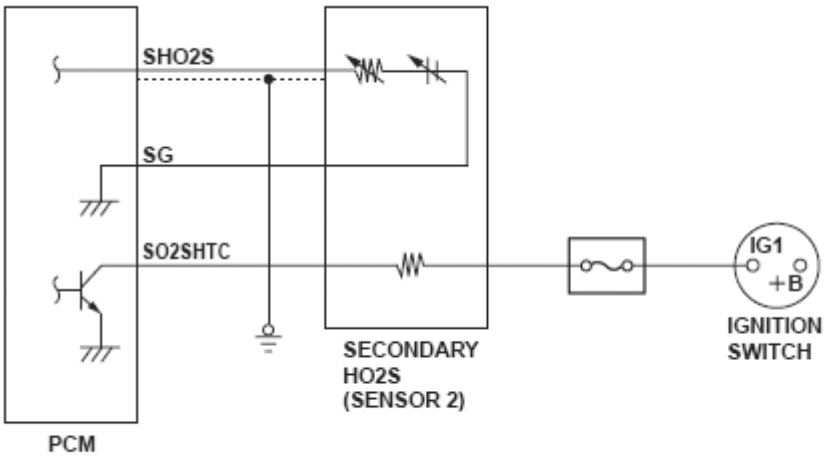

Fig. 165: Checking For Continuity Between Body Ground And ECM Connector Terminals B1, B36, C2, C40, And C44
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 78.

NO - Repair open in the wire between the ECM (B1, B36, C2, C40, C44) and G101 (see **CONNECTOR TO HARNESS INDEX**).

78. Check for continuity between ECM connector terminal C13 and body ground.

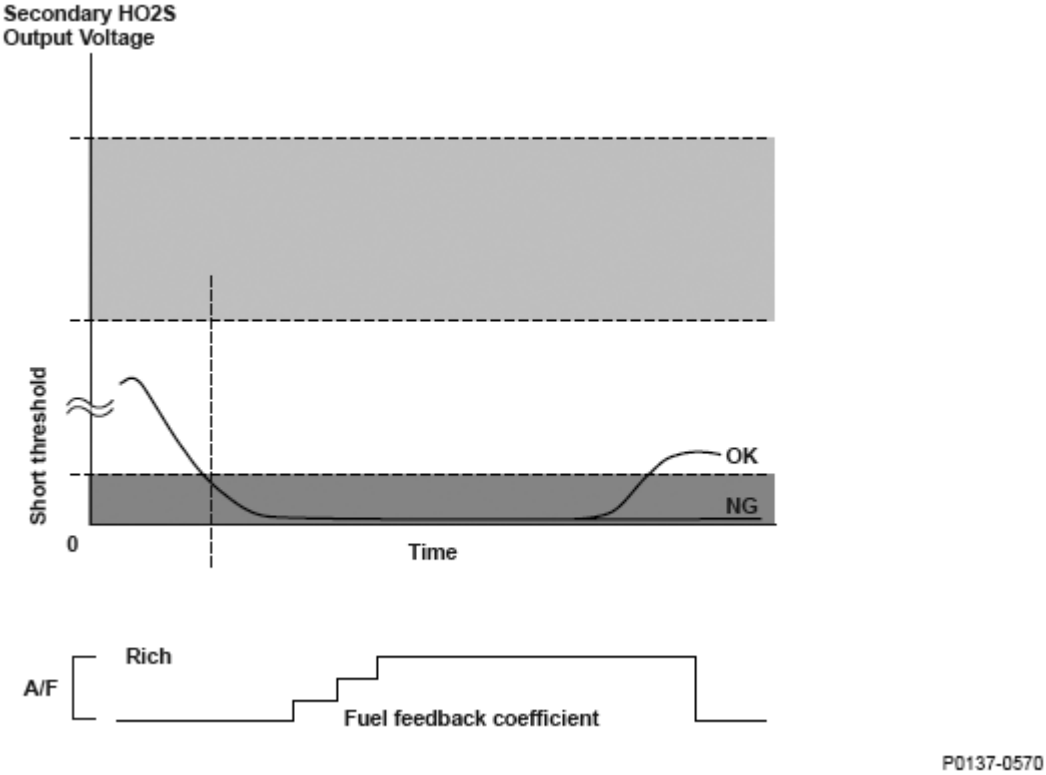

Fig. 166: Checking For Continuity Between ECM Connector Terminal C13 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 79.

NO - Go to step 80.

79. Continue to check for continuity between ECM connector terminal C13 and body ground, while disconnecting the MAP sensor 3P connector.

Is there continuity?

YES - Repair short in the wire between the ECM (C13) and the MAP sensor.

NO - Replace the MAP sensor (see **MAP SENSOR REPLACEMENT**).

80. Check for continuity between ECM connector terminal B18 and body ground.

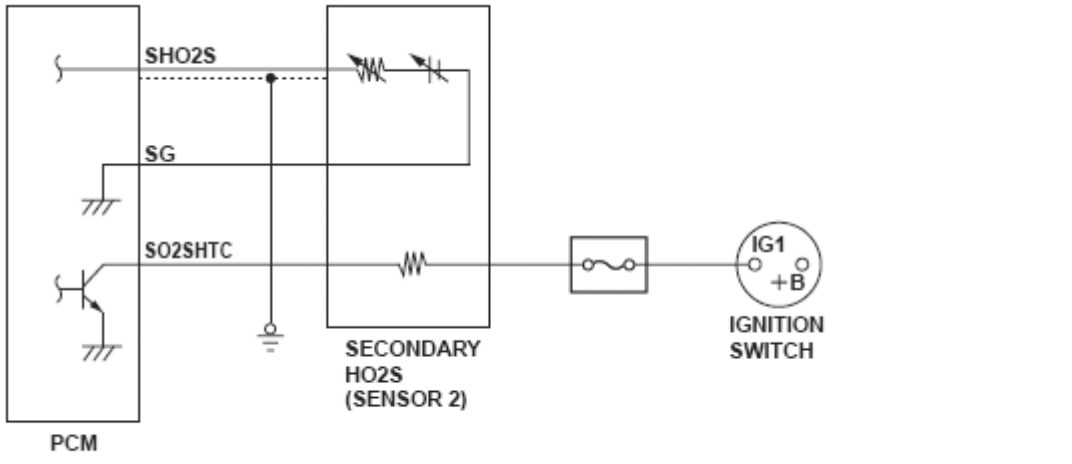

Fig. 167: Checking Continuity Between ECM Connector Terminal B18 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 81.

NO - Go to step 82.

81. Continue to check for continuity between ECM connector terminal B18 and body ground, while disconnecting the output shaft (countershaft) speed sensor 3P connector.

Is there continuity?

YES - Repair short in the wire between the ECM (B18) and the output shaft (countershaft) speed sensor.

NO - Replace the output shaft (countershaft) speed sensor (see **KNOCK SENSOR REPLACEMENT**).

82. Check for continuity between ECM connector terminal C12 and body ground.

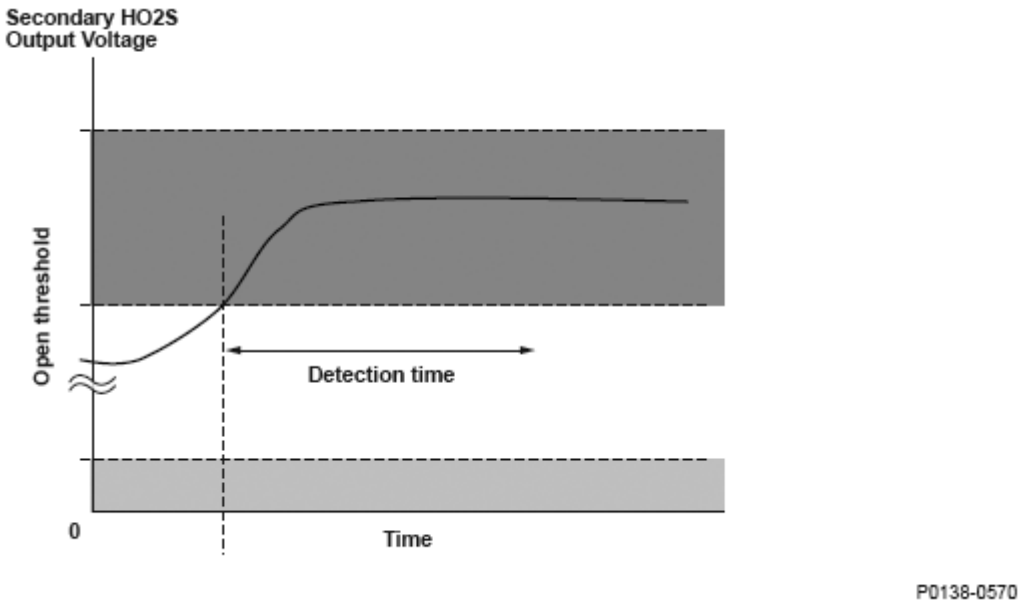

Fig. 168: Checking For Continuity Between ECM Connector Terminal C12 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 83.

NO - Go to step 84.

83. Continue to check for continuity between ECM connector terminal C12 and body ground, while disconnecting the throttle body 6P connector.

Is there continuity?

YES - Repair short in the wire between the ECM (C12) and the throttle body.

NO - Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).

84. Check for continuity between ECM connector terminal A25 and body ground.

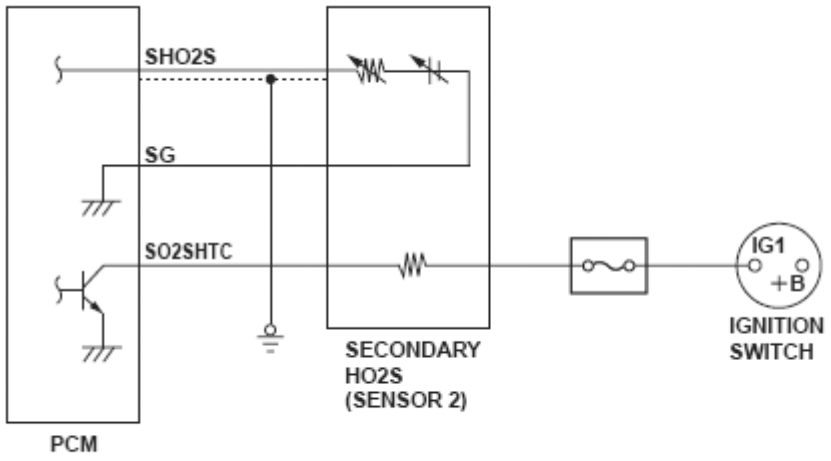

Fig. 169: Checking For Continuity Between ECM Connector Terminal A25 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 85.

NO - Go to step 86.

85. Continue to check for continuity between ECM connector terminal A25 and body ground, while disconnecting the APP sensor 6P connector.

    Is there continuity?

    YES - Repair short in the wire between the ECM (A25) and APP sensor A.

    NO - Replace the accelerator pedal module (see **ACCELERATOR PEDAL MODULE REMOVAL/INSTALLATION**).

86. Check for continuity between ECM connector terminal A24 and body ground.

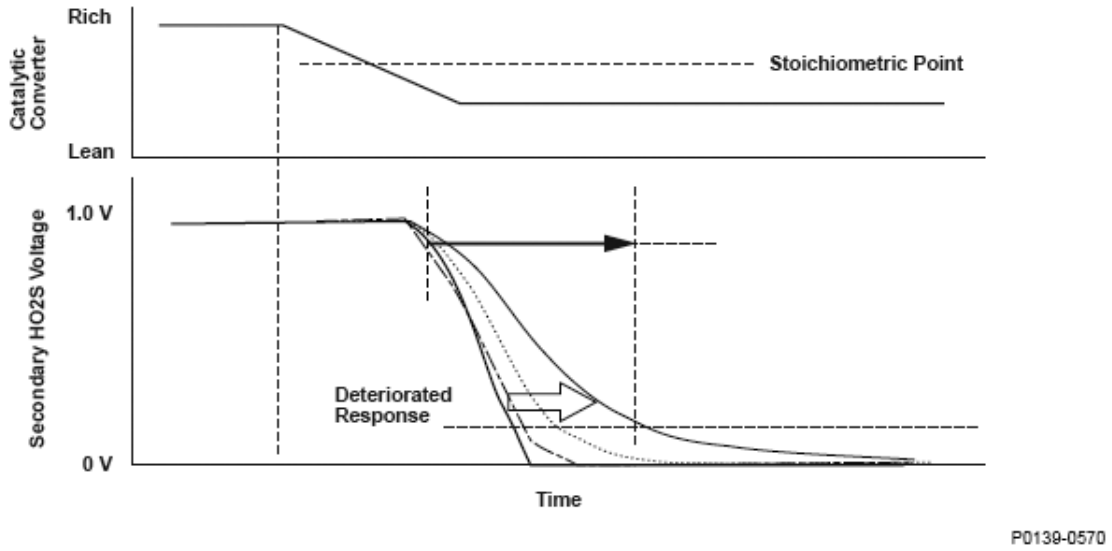

Fig. 170: Checking For Continuity Between ECM Connector Terminal A24 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 87.

NO - Go to step 88.

87. Continue to check for continuity between ECM connector terminal A24 and body ground, while disconnecting the APP sensor 6P connector.

    Is there continuity?

    YES - Repair short in the wire between the ECM (A24) and APP sensor B.

    NO - Replace the accelerator pedal module (see **ACCELERATOR PEDAL MODULE REMOVAL/INSTALLATION**).

88. Check for continuity between ECM connector terminal A19 and body ground.

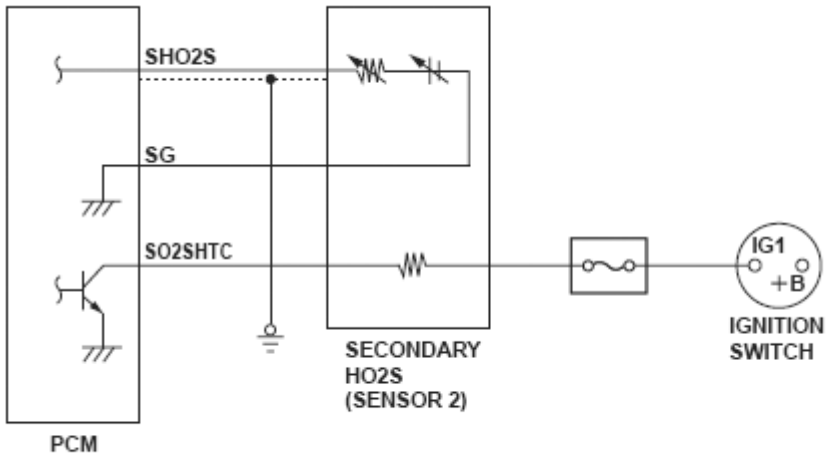

Fig. 171: Checking For Continuity Between ECM Connector Terminal A19 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 89.

NO - Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the symptom/indication goes away with a known-good ECM, replace the original ECM (see **ECM REPLACEMENT**).

89. Continue to check for continuity between ECM connector terminal A19 and body ground, while disconnecting these parts, one at a time:
    - A/C pressure sensor 3P connector
    - FTP sensor 3P connector

    Does continuity go away when one of the above components is disconnected?

    YES - Replace the part that caused an open when it was disconnected.

    NO - Repair short in the wire between the ECM (A19) and the A/C pressure sensor or the FTP sensor.

INJECTOR REPLACEMENT

1. Relieve fuel pressure (see **FUEL PRESSURE RELIEVING**).
2. Remove the engine cover.
3. Disconnect the connectors (A) from the injectors.

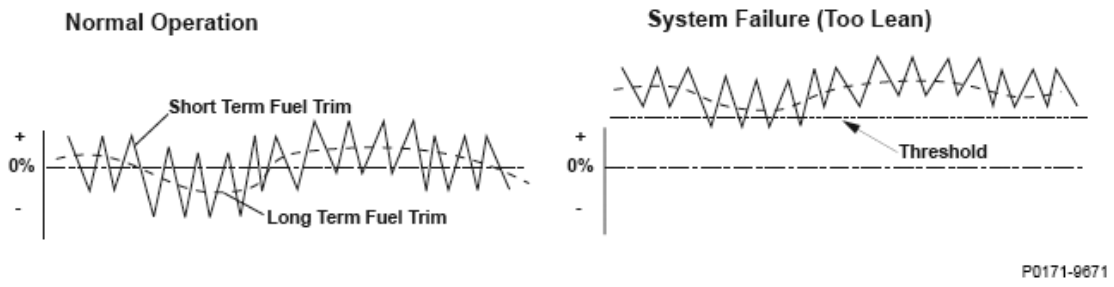

Fig. 172: Disconnecting Connector From Injectors
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the ground cable bolt (G101) (B).
5. Disconnect the quick-connect fitting (C).
6. Remove the fuel rail mounting nuts (D) from the fuel rail (E).
7. Remove the fuel rail and the injectors from the injector base.
8. Remove the injector clip (F) from the injector.
9. Remove the injector from the fuel rail.
10. Coat the new O-rings (A) with clean engine oil, and insert the injectors (B) into the fuel rail (C).

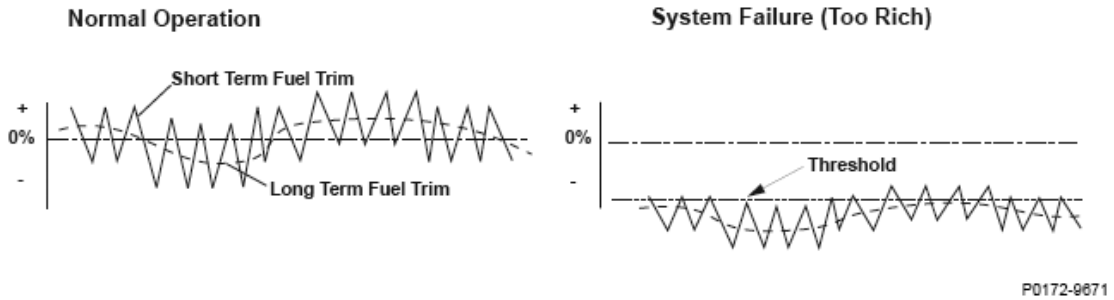

Fig. 173: Inserting Injectors Into Fuel Rail (With Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Install the injector clip (D).
12. Coat the injector O-rings (E) with clean engine oil.
13. Install the fuel rail and the injectors in the injector base (F).
14. Install the fuel rail mounting nuts (G).
15. Connect the connectors on the injectors, and reinstall the ground cable bolt(G101).
16. Connect the quick-connect fitting.
17. Turn the ignition switch ON (II), but do not operate the starter. After the fuel pump runs for about 2 seconds, the fuel rail is pressurized. Repeat this two or three times, then check for fuel leakage.
18. Install the engine cover.

A/F SENSOR REPLACEMENT

Special Tools Required

02 sensor wrench, Snap-on YA8875, SP Tools 93750, or equivalent, commercially available

1. Disconnect the A/F sensor 4P connector (A), then remove the A/F sensor (B).

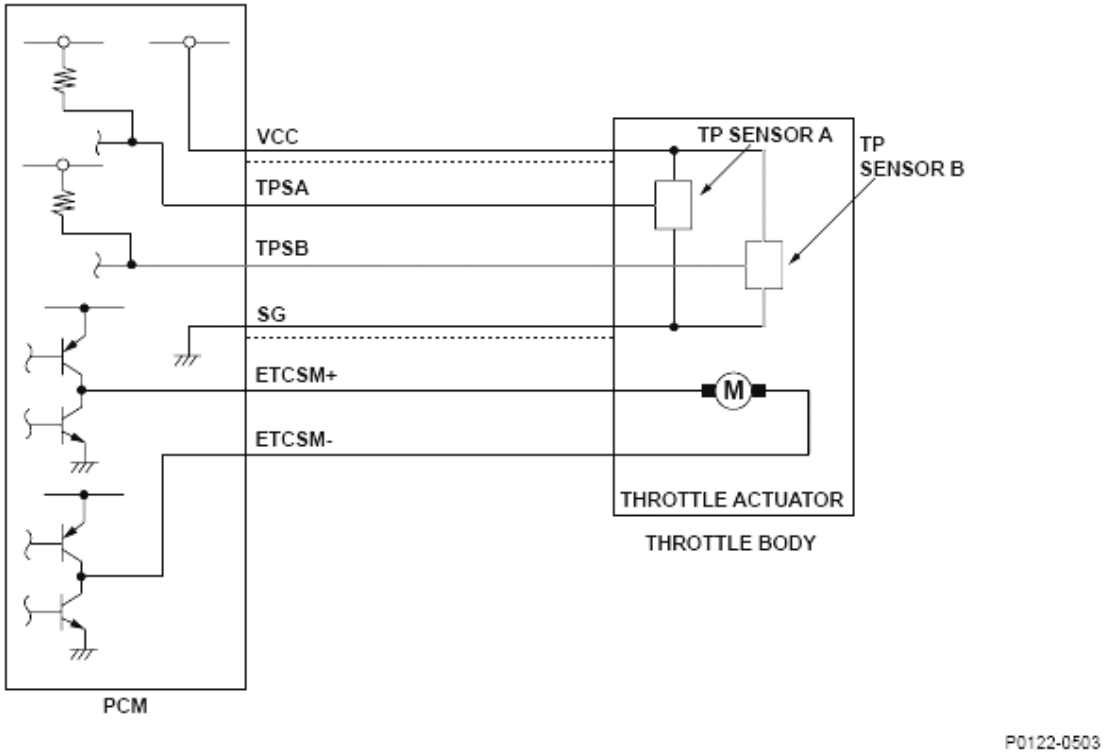

Fig. 174: Removing A/F Sensor (With Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the parts in the reverse order of removal.

SECONDARY HO2S REPLACEMENT

Special Tools Required

02 sensor wrench. Snap-on YA8875, SP Tools 93750, or equivalent, commercially available

1. Disconnect the secondary HO2S 4P connector (A), then remove the secondary HO2S (B).

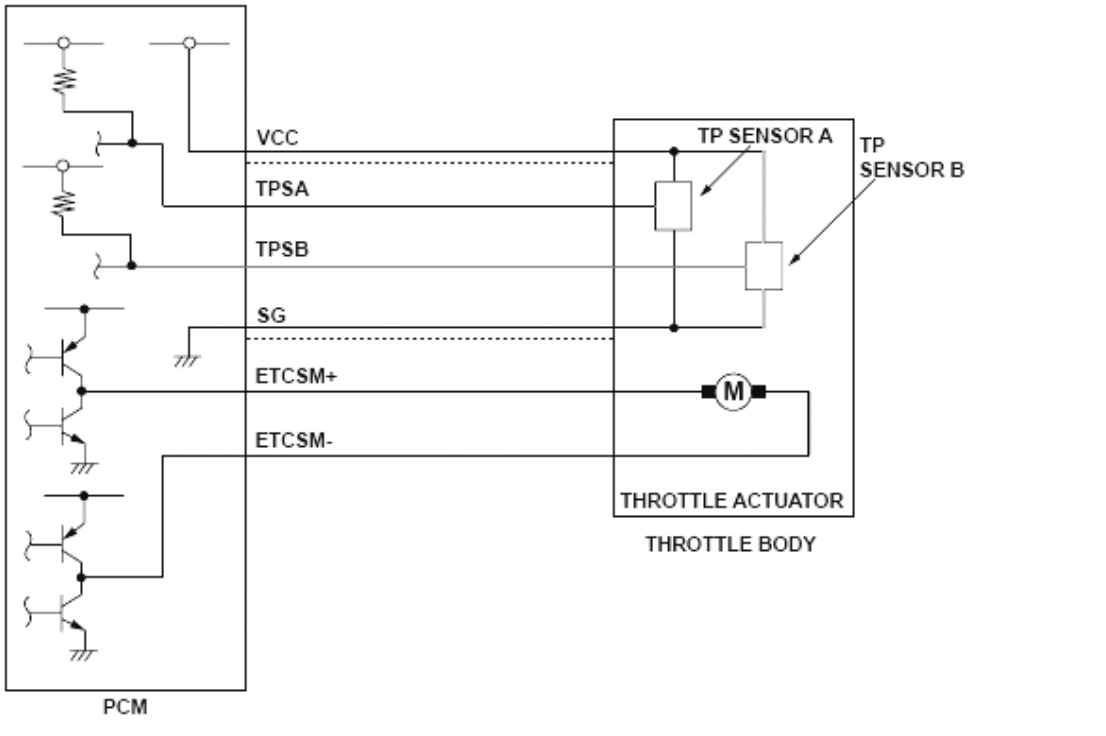

Fig. 175: Removing Secondary HO2S (With Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the parts in the reverse order of removal.

CMP SENSOR B REPLACEMENT

1. Remove the air cleaner (see **AIR CLEANER REMOVAL/INSTALLATION**).
2. Disconnect the CMP sensor B connector (A).

2. Remove the CKP sensor (B).
3. Install the parts in the reverse order of removal with a new O-ring (C).
4. Do the CKP pattern clear/CKP pattern learn procedure with the HDS (see **CRANK (CKP) PATTERN CLEAR/CRANK (CKP) PATTERN LEARN**).

OUTPUT SHAFT (COUNTERSHAFT) SPEED SENSOR REPLACEMENT

1. Disconnect the output shaft (countershaft) speed sensor 3P connector (A).

2. Remove the screws (B).
3. Remove the MAF sensor/IAT sensor (C).
4. Install the parts in the reverse order of removal with a new O-ring (D).

ECT SENSOR 1 REPLACEMENT

1. Drain the engine coolant (see **COOLANT REPLACEMENT**).
2. Remove the air cleaner (see **AIR CLEANER REMOVAL/INSTALLATION**).
3. Disconnect the CMP sensor A connector (A), and the CMP sensor B connector (B).

6. Remove ECT sensor 1 (B).
7. Install the parts in the reverse order of removal with a new O-ring (C), then refill the radiator with engine coolant (see **COOLANT REPLACEMENT**).

ECT SENSOR 2 REPLACEMENT

1. Drain the engine coolant (see **COOLANT REPLACEMENT**).
2. Remove the splash shield.
3. Disconnect the ECT sensor 2 connector (A), then remove ECT sensor 2 (B).

4. Install parts in the reverse order of removal with a new O-ring (C).
5. Install the splash shield.
6. Refill the radiator with engine coolant (see **COOLANT REPLACEMENT**).

ELD REPLACEMENT

1. Remove the ECM (see **ECM REPLACEMENT**).
2. Remove the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**).
3. Remove the screw (A).

7. Install the parts in the reverse order of removal.

ECM REPLACEMENT

NOTE:

- **Make sure the HDS is loaded with the latest software version.**
- **If you are replacing the ECM after substituting a known-good ECM, reinstall the original ECM, then do this procedure.**
- **During the procedure, if any READ DATA, WRITE DATA, or other data checks fail, note the failure, then continue.**

1. Make sure you have the anti-theft code for the audio system and the navigation system (if equipped).
2. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

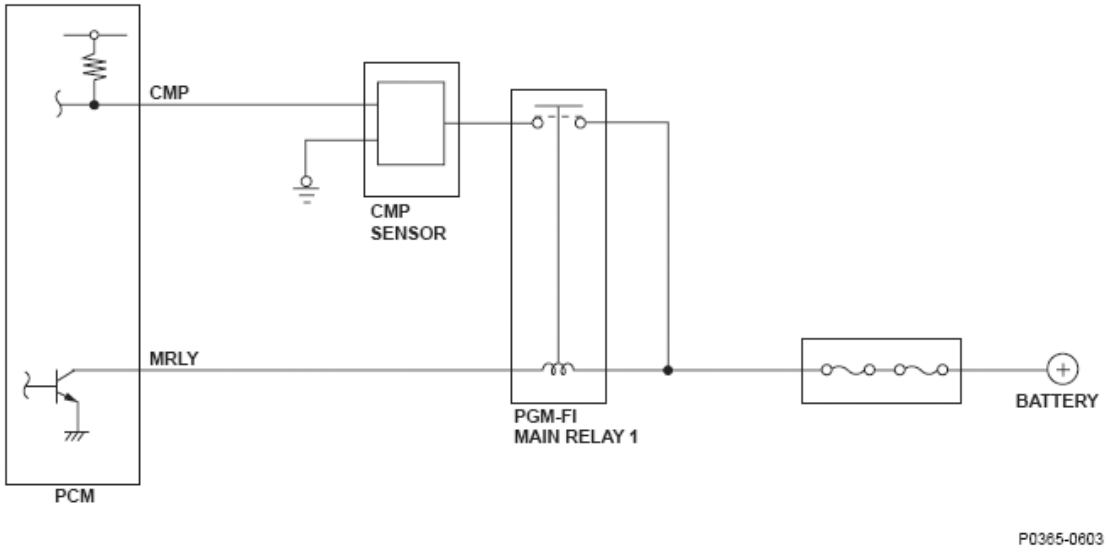

Fig. 189: Connecting HDS To DLC
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Turn the ignition switch ON (II).
4. Make sure the HDS communicates with the ECM. If it doesn't, go to the **DLC CIRCUIT TROUBLESHOOTING** . If you are returning from DLC circuit troubleshooting, skip steps 5 through 8, 17 through 19, 22, and 23, and do these procedures after replacing the ECM (USA, Canada models):
   - Replace the engine oil (see **ENGINE OIL REPLACEMENT**) and the engine oil filter (see **ENGINE OIL FILTER REPLACEMENT**).
   - Clean the throttle body (see **THROTTLE BODY CLEANING**).
5. USA, Canada models: Select the PGM-FI system with the HDS.
6. USA, Canada models: Select the INSPECTION MENU with the HDS.
7. USA, Canada models: Select the ETCS TEST, then select the TP POSITION CHECK, and follow the screen prompts.

   NOTE: If the TP POSITION CHECK indicates FAILED, continue with this procedure.

8. USA, Canada models: Select the REPLACE ECM MENU, then READ DATA, and follow the screen prompts.

NOTE:

- **Doing this step copies (READS) the engine oil life data from the original ECM so you can later download (WRITES) it into the new ECM.**
- **If READ DATA indicates FAILED, continue with this procedure.**

9. Turn the ignition switch OFF.
10. Remove the battery.
11. Remove the cover (A).

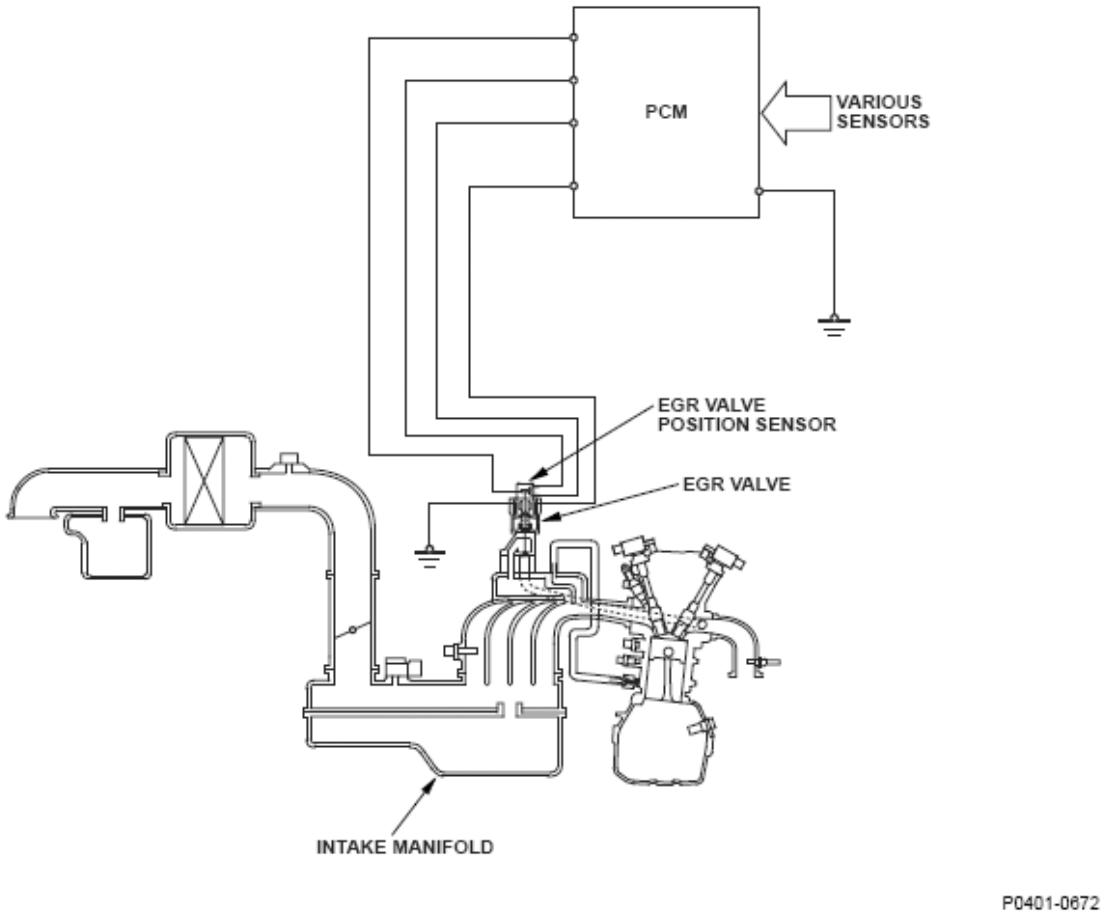

Fig. 190: Removing Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Remove the bolts (D), then remove the ECM (E).

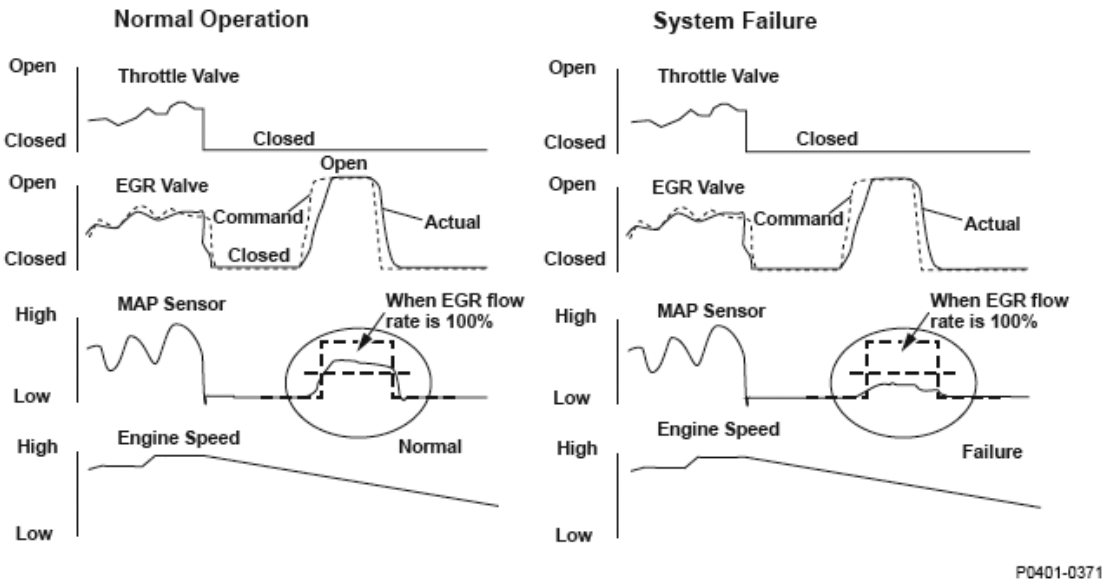

Fig. 191: Removing ECM (With Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Disconnect the ECM connectors A, B, and C.

NOTE: ECM connectors A, B, and C have symbols (A=[], B=delta, C=o) embossed on them for identification.

14. Install the ECM and the battery in the reverse order of removal.
15. Turn the ignition switch ON (II).
16. USA, Canada models: Manually input the VIN to the ECM with the HDS.

NOTE: DTC P0630 "VIN Not Programmed or Mismatch" may be stored because the VIN has not been programmed into the ECM; ignore it, and continue this procedure.

17. USA, Canada models: If the READ DATA (engine oil life) failed in step 8, go to step 20. Otherwise, go to step 18.
18. USA, Canada models: Select the PGM-FI system with the HDS.
19. USA, Canada models: Select the REPLACE ECM MENU, then WRITE DATA, and follow the screen prompts.

NOTE: If the WRITE DATA indicates FAILED, continue with this procedure.

20. Select IMMOBI system with the HDS.
21. Enter the immobilizer code with the ECM replacement procedure in the HDS; it allows you to start the engine.
22. USA, Canada models: If the TP POSITION CHECK failed in step 7 clean the throttle body (see **THROTTLE BODY CLEANING**), then go to step 23.
23. USA, Canada models: If the READ DATA failed in step 8 or the WRITE DATA failed in step 19, replace the engine oil (see **ENGINE OIL REPLACEMENT**) and engine oil filter (see **ENGINE**

OIL FILTER REPLACEMENT), then go to step 24.

24. Select PGM-FI system and reset the ECM with the HDS.
25. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**).
26. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
27. Do the CKP pattern learn procedure (see **CRANK (CKP) PATTERN CLEAR/CRANK (CKP) PATTERN LEARN**).
28. Enter the anti-theft code for the audio system and the navigation system (if equipped), then set the clock (if needed).

DTC TROUBLESHOOTING

DTC P0101: MAF SENSOR CIRCUIT RANGE/PERFORMANCE PROBLEM

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see**

GENERAL TROUBLESHOOTING INFORMATION).

- **If DTC P1128, P1129, P2228, and/or P2229 are stored at the same time as DTC P0101, troubleshoot those DTCs first, then recheck for DTC P0101.**

1. Check for poor connections or damage to these parts:
   - PCV hose
   - Intake air duct
   - Air cleaner
   - Purge (PCS) line
   - Brake booster hose

   Are the parts OK?

   YES - Go to step 2.

   NO - Repair or replace the damaged parts, then go to step 17.

2. Check for damage or looseness at the air duct in the air cleaner.

   Is it OK?

   YES - Go to step 3.

   NO - Reconnect or replace the air duct in the air cleaner, then go to step 15.

3. Check for a dirty air cleaner element.

   Is it dirty?

   YES - Replace the air cleaner element (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**), then go to step 15.

   NO - Go to step 4.

4. Turn the ignition switch OFF.
5. Turn the ignition switch ON (II).
6. Check the MAF SENSOR in the DATA LIST with the HDS.

   Is there about 0.2 gm/s or 0.5 V?

   YES - Go to step 7.

   NO - Go to step 13.

7. Start the engine.
8. Vary the engine speed between 2,000 rpm and 3,000 rpm.

9. Check the MAF SENSOR in the DATA LIST with the HDS.

   Does the reading change?

   YES - Go to step 10.

   NO - Go to step 13.

10. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
11. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VSS
    - MAP SENSOR
    - MAF SENSOR
12. Monitor the OBD STATUS for DTC P0101 in the DTCs MENU with the HDS.

    Does the screen indicate FAILED?

    YES - Go to step 13.

    NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAF sensor and the ECM/PCM. If the screen indicates NOT COMPLETED, go to step 11 and recheck.

13. Turn the ignition switch OFF.
14. Replace the MAF sensor/IAT sensor (see **MAF SENSOR/IAT SENSOR REPLACEMENT**).
15. Turn the ignition switch ON (II).
16. Reset the ECM/PCM with the HDS.
17. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
18. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VSS
    - MAP SENSOR
    - MAF SENSOR
19. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0101 indicated?

    YES - Check for poor connections or loose terminals at the MAF sensor and the ECM/PCM, then go to step 1.

    NO - Go to step 20.

20. Monitor the OBD STATUS for DTC P0101 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 19, go to the indicated DTC's troubleshooting.

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the MAF sensor and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 18.

DTC P0102: MAF SENSOR CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II), and wait 2 seconds.
2. Check the MAF SENSOR in the DATA LIST with the HDS.

   Is about 0 gm/s, or 0.1 V or less indicated?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAF sensor and the ECM/PCM.

3. Check the No. 3 ALTERNATOR (10 A) fuse in the under-dash fuse/relay box.

   Is the fuse OK?

   YES - Go to step 4.

   NO - Repair short in the wire between the MAF sensor and the No. 3 ALTERNATOR (10 A) fuse. Also replace the No. 3 ALTERNATOR (10 A) fuse, then go to step 20.

4. Turn the ignition switch OFF.
5. Disconnect the MAF sensor/IAT sensor 5P connector.
6. Turn the ignition switch ON (II).
7. Measure voltage between MAF sensor/IAT sensor 5P connector terminal No. 5 and body ground.

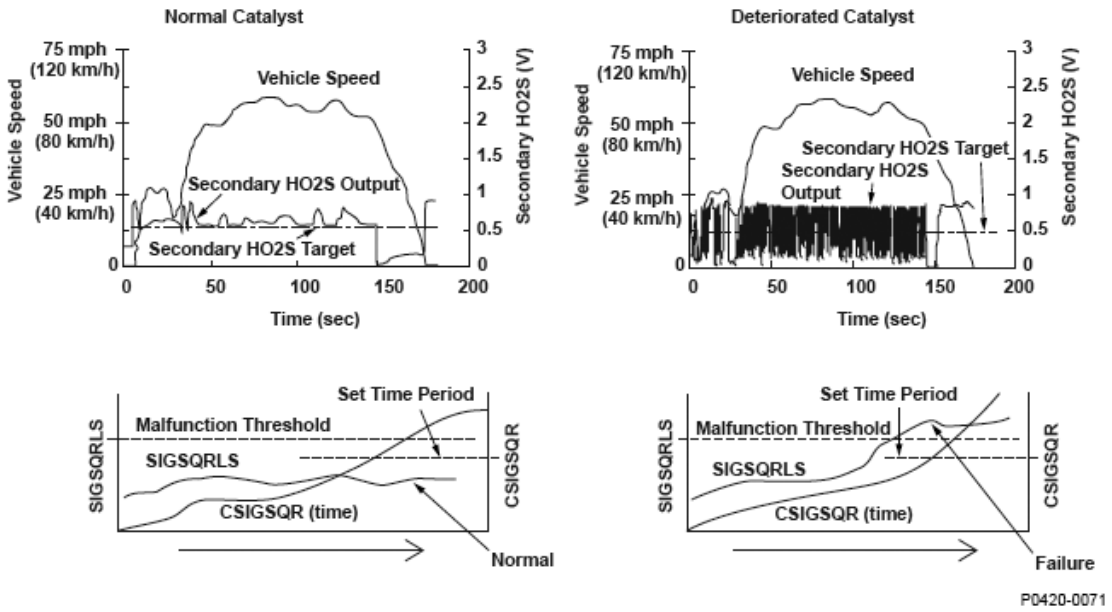

Fig. 3: Measuring Voltage Between MAF Sensor/IAT Sensor 5P Connector Terminal No. 5 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 8.

NO - Repair open in the wire between the No. 3 ALTERNATOR (10 A) fuse and the MAF sensor, then go to step 20.

8. Turn the ignition switch OFF.
9. Measure resistance between MAF sensor/IAT sensor 5P connector terminal No. 3 and body ground.

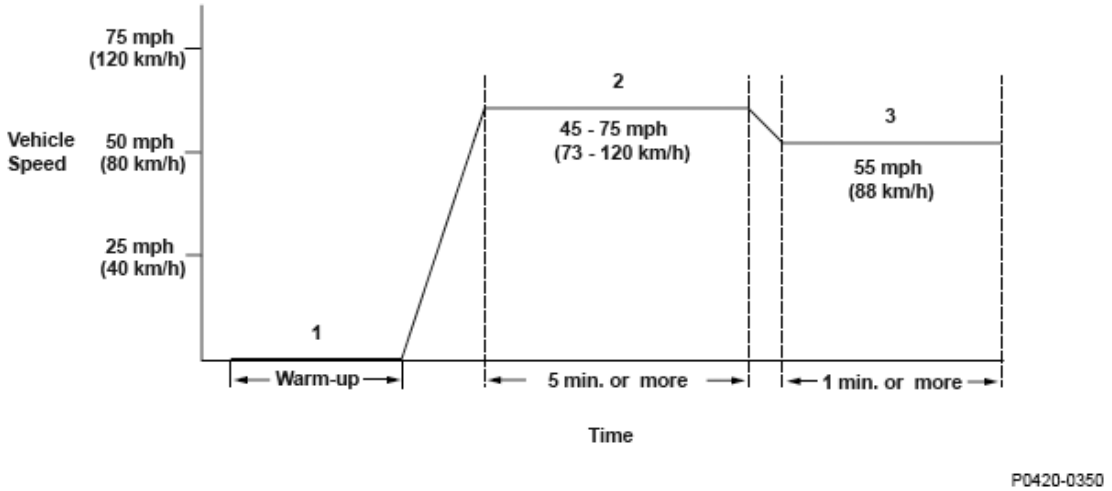

Fig. 4: Measuring Resistance Between MAF Sensor/IAT Sensor 5P Connector Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 190-210 kohms?

YES - Go to step 14.

NO - Go to step 10.

10. Jump the SCS line with the HDS.
11. Disconnect ECM/PCM connector B (44P).
12. Check for continuity between ECM/PCM connector terminal B30 and body ground.

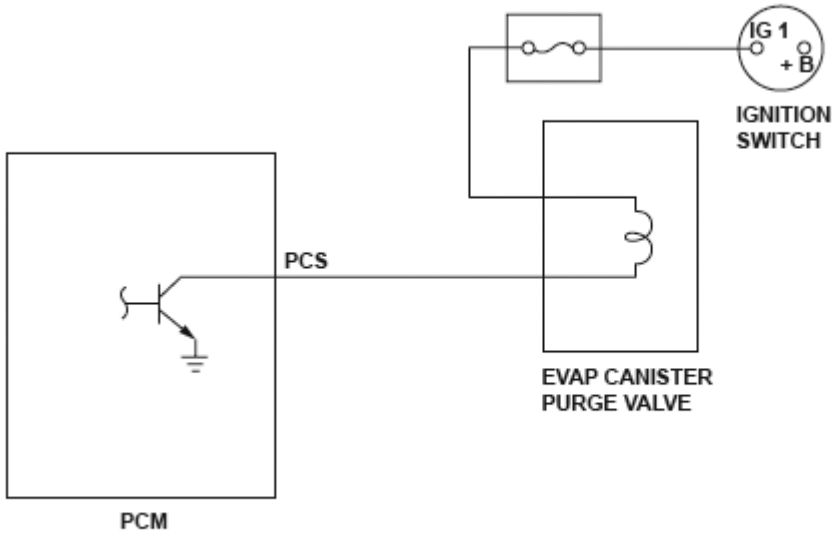

Fig. 5: Checking For Continuity Between ECM/PCM Connector Terminal B30 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair short in the wire between the ECM/PCM (B30) and the MAF sensor, then go to step 21.

NO -Go to step 13.

13. Check for continuity between MAF sensor/IAT sensor 5P connector terminal No. 3 and ECM/PCM connector terminal B30.

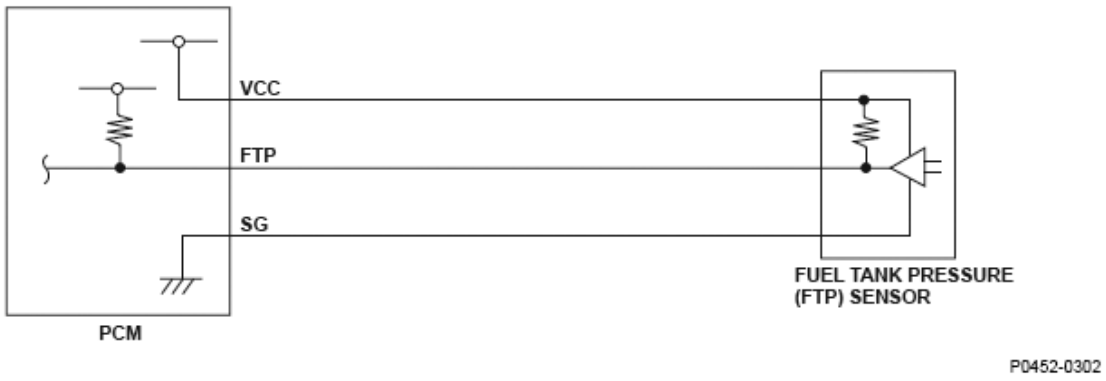

Fig. 6: Checking For Continuity Between MAF Sensor/IAT Sensor 5P Connector Terminal No. 3 And ECM/PCM Connector Terminal B30
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 26.

NO - Repair open in the wire between the ECM/PCM (B30) and the MAF sensor, then go to step 21.

14. Substitute a known-good MAF sensor/IAT sensor (see **MAF SENSOR/IAT SENSOR REPLACEMENT**).
15. Reconnect all connectors.
16. Turn the ignition switch ON (II).
17. Clear the DTC with the HDS.
18. Start the engine. Hold the engine speed at 2,000 rpm without load (in Park or neutral).
19. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0102 indicated?

YES - Go to step 27.

NO - Replace the original MAF sensor/IAT sensor (see **MAF SENSOR/IAT SENSOR REPLACEMENT**), then go to step 20.

20. Turn the ignition switch OFF.
21. Reconnect all connectors.
22. Turn the ignition switch ON (II).
23. Reset the ECM/PCM with the HDS.
24. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
25. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0102 indicated?

YES - Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

26. Reconnect all connectors.
27. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
28. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0102 indicated?

    YES - Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO -If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0103: MAF SENSOR CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II), and wait 2 seconds.
2. Check the MAF SENSOR in the DATA LIST with the HDS.

   Is about 202 gm/s, or 4.89 V or more indicated?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAF sensor and the ECM/PCM.

3. Turn the ignition switch OFF.
4. Jump the SCS line with the HDS.
5. Disconnect the MAF sensor/IAT sensor 5P connector.
6. Disconnect ECM/PCM connector B (44P).
7. Check for continuity between MAF sensor/IAT sensor 5P connector terminal No. 4 and ECM/PCM connector terminal B32.

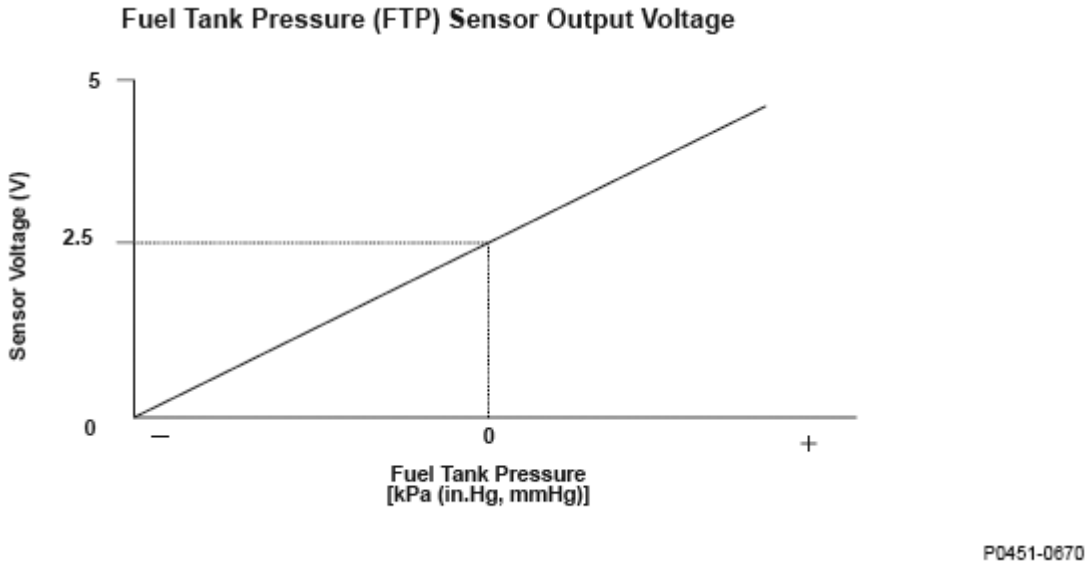

Fig. 7: Checking For Continuity Between MAF Sensor/IAT Sensor 5P Connector Terminal No. 4 And ECM/PCM Connector Terminal B32
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 8.

NO - Repair open in the wire between the ECM/PCM (B32) and the MAF sensor, then go to step 15.

8. Reconnect ECM/PCM connector B (44P).
9. Connect MAF sensor/IAT sensor 5P connector terminals No. 3 and No. 4 with a jumper wire.

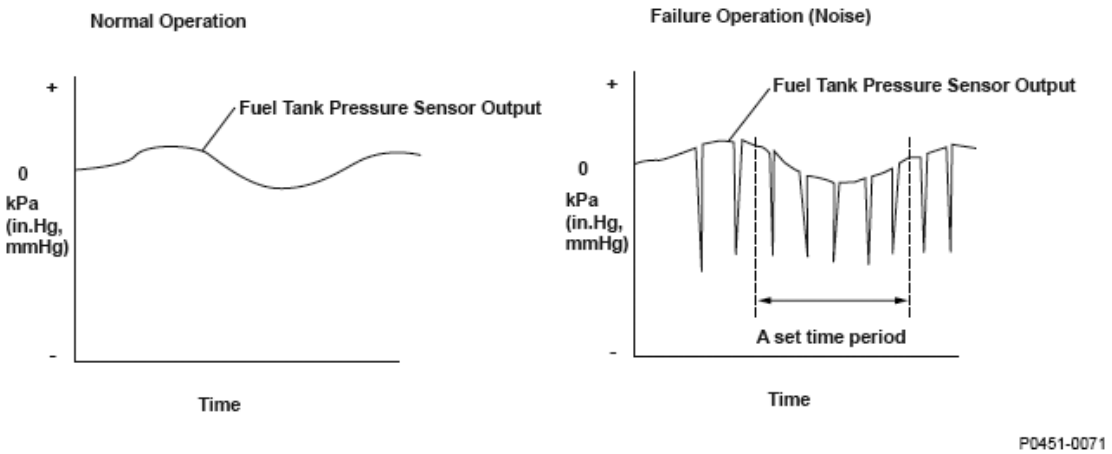

Fig. 8: Connecting MAF Sensor/IAT Sensor 5P Connector Terminals No. 3 And No. 4 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Turn the ignition switch ON (II).
11. Clear the DTC with the HDS.
12. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0103 indicated?

YES - Go to step 20.

NO - Go to step 13.

13. Turn the ignition switch OFF.
14. Replace the MAF sensor/IAT sensor (see **MAF SENSOR/IAT SENSOR REPLACEMENT**).
15. Reconnect all connectors.
16. Turn the ignition switch ON (II).
17. Reset the ECM/PCM with the HDS.
18. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
19. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0103 indicated?

YES - Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

20. Turn the ignition switch OFF.
21. Reconnect all connectors.
22. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
23. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0103 indicated?

YES - Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0107: MAP SENSOR CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check the MAP SENSOR in the DATA LIST with the HDS.

Is about 3 kPa (1.0 in.Hg, 26 mmHg), or 0.23 V or less indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAP sensor and the ECM/PCM.

3. Turn the ignition switch OFF.
4. Disconnect the MAP sensor 3P connector.
5. Turn the ignition switch ON (II).
6. Check the MAP SENSOR in the DATA LIST with the HDS.

   Is about 3 kPa (1.0 in.Hg, 26 mmHg), or 0.23 V or less indicated?

   YES - Go to step 12.

   NO - Go to step 7.

7. Measure voltage between MAP sensor 3P connector terminals No. 1 and No. 3.

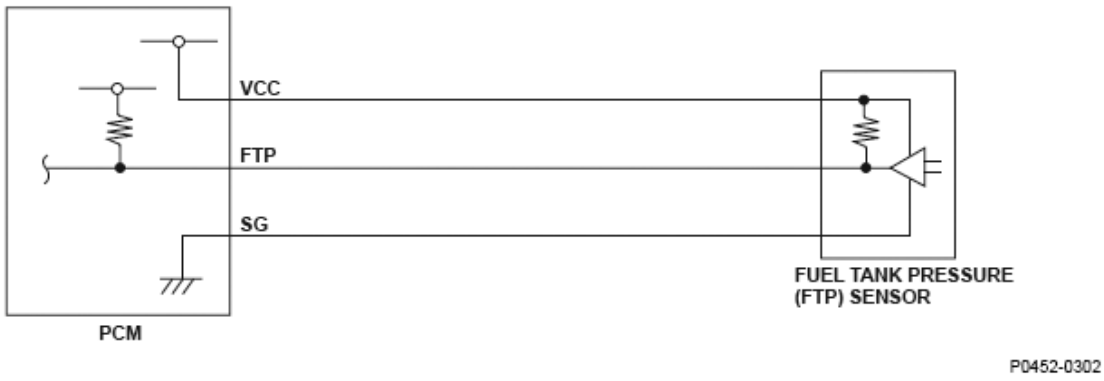

Fig. 9: Measuring Voltage Between Map Sensor 3P Connector Terminals No. 1 And No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there about 5 V?

   YES - Go to step 16.

   NO - Go to step 8.

8. Turn the ignition switch OFF.
9. Jump the SCS line with the HDS.
10. Disconnect ECM/PCM connector C (44P).
11. Check for continuity between ECM/PCM connector terminal C13 and MAP sensor 3P connector terminal No. 1.

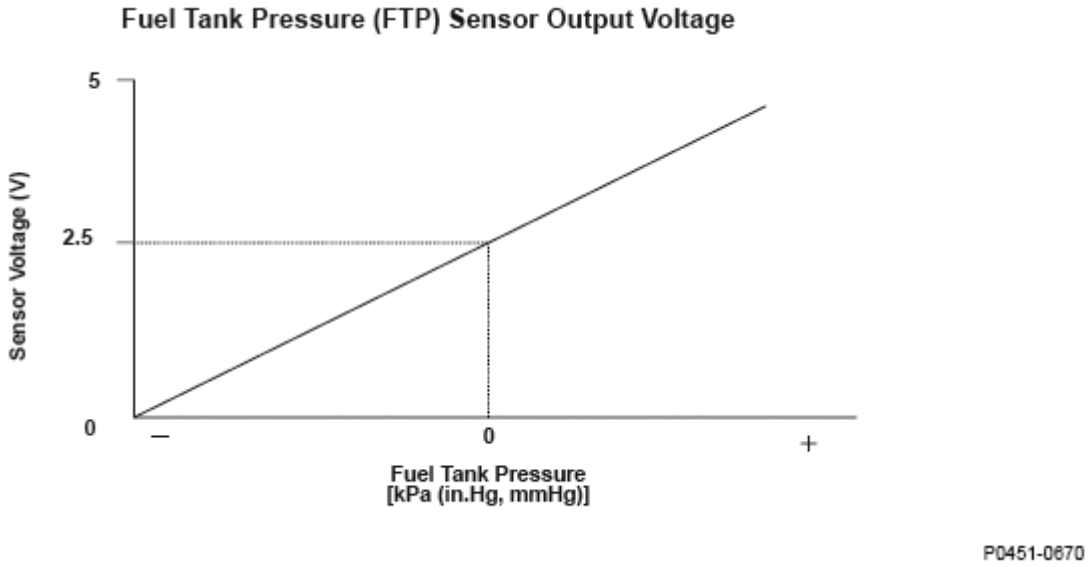

Fig. 10: Checking For Continuity Between ECM/PCM Connector Terminal C13 And Map Sensor 3P Connector Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 23.

NO - Repair open in the wire between the ECM/PCM (C13) and the MAP sensor, then go to step 18.

12. Turn the ignition switch OFF.
13. Jump the SCS line with the HDS.
14. Disconnect ECM/PCM connector C (44P).
15. Check for continuity between MAP sensor 3P connector terminal No. 2 and body ground.

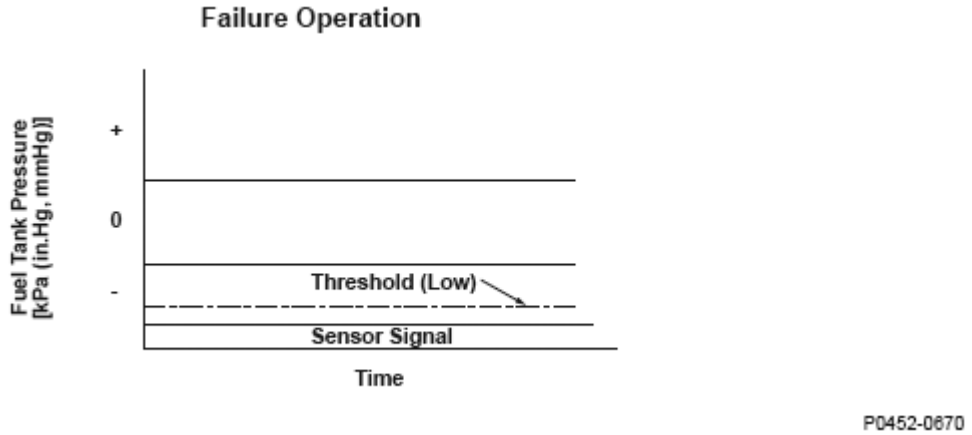

Fig. 11: Checking For Continuity Between Map Sensor 3P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (C11) and the MAP sensor, then go to step 18.

NO - Go to step 23.

16. Turn the ignition switch OFF.
17. Replace the MAP sensor (see **MAF SENSOR/IAT SENSOR REPLACEMENT**).
18. Reconnect all connectors.
19. Turn the ignition switch ON (II).
20. Reset the ECM/PCM with the HDS.
21. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
22. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0107 indicated?

    YES - Check for poor connections or loose terminals at the MAP sensor and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

23. Reconnect all connectors.
24. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
25. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0107 indicated?

    YES - Check for poor connections or loose terminals at the MAP sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0108: MAP SENSOR CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check the MAP SENSOR in the DATA LIST with the HDS.

   Is about 160 kPa (47.1 in.Hg, 1,197 mmHg), or 4.49 V or more indicated?

   YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAP sensor and the ECM/PCM.

3. Turn the ignition switch OFF.
4. Disconnect the MAP sensor 3P connector.
5. Connect MAP sensor 3P connector terminals No. 2 and No. 3 with a jumper wire.

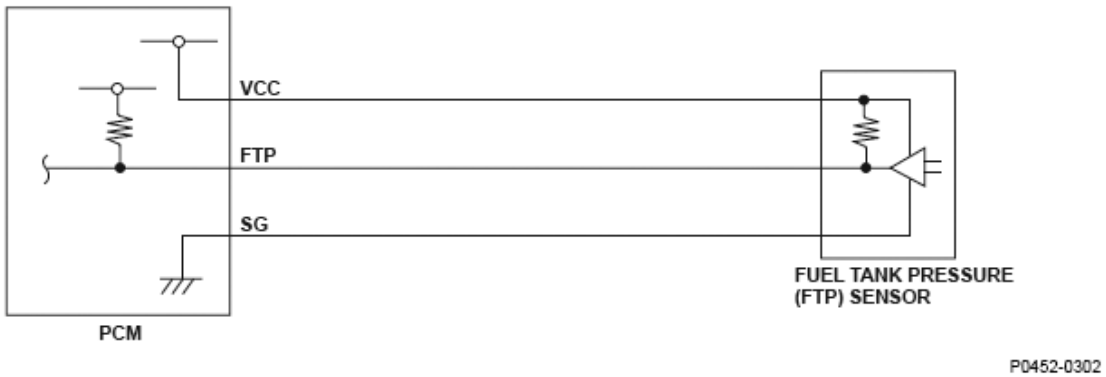

Fig. 12: Connecting Map Sensor 3P Connector Terminals No. 2 And No. 3 With A Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Turn the ignition switch ON (II).
7. Check the MAP SENSOR in the DATA LIST with the HDS.

Is about 160 kPa (47.1 in.Hg, 1,197 mmHg), or 4.49 V or more indicated?

YES - Go to step 8.

NO - Go to step 18.

8. Remove the jumper wire from the MAP sensor 3P connector.
9. Measure voltage between MAP sensor 3P connector terminals No. 1 and No. 3.

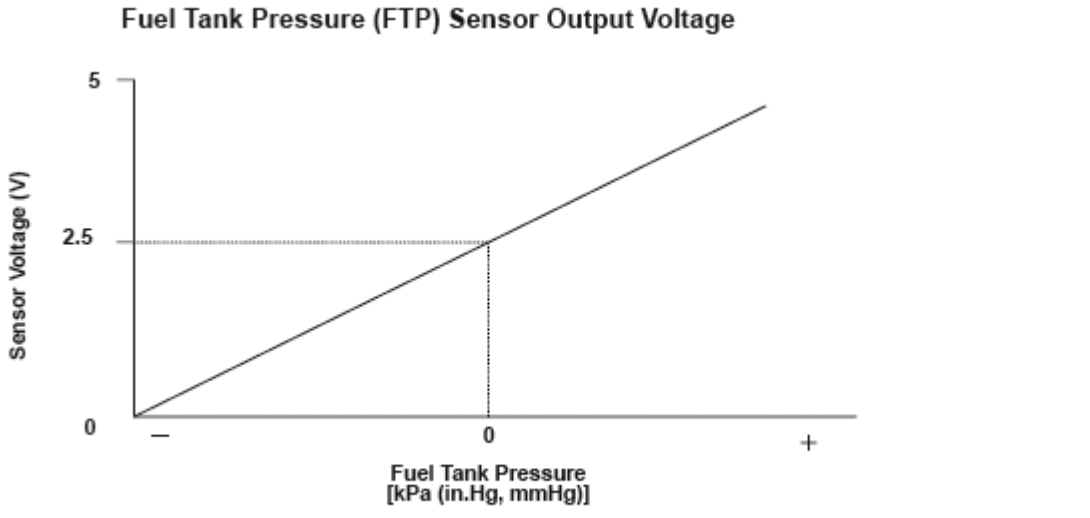

Fig. 13: Measuring Voltage Between Map Sensor 3P Connector Terminals No. 1 And No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 14.

NO - Go to step 10.

10. Turn the ignition switch OFF.
11. Jump the SCS line with the HDS.
12. Disconnect ECM/PCM connector C (44P).
13. Check for continuity between ECM/PCM connector terminal C14 and MAP sensor 3P connector terminal No. 3.

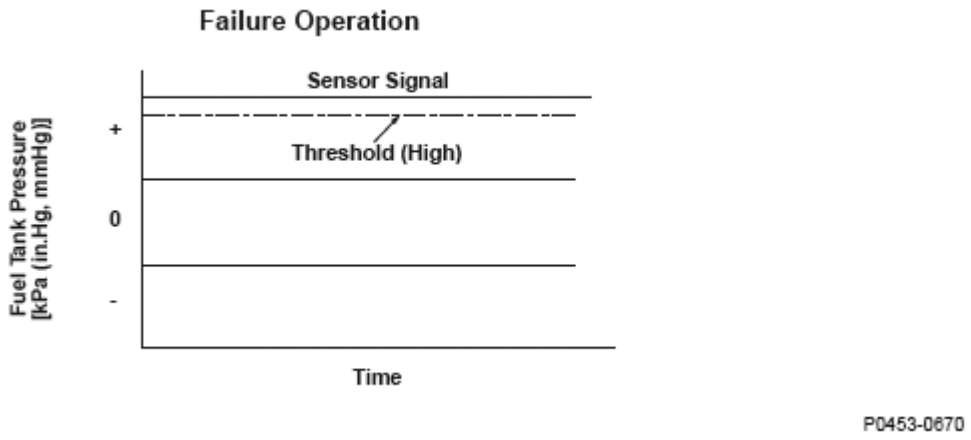

Fig. 14: Checking For Continuity Between ECM/PCM Connector Terminal C14 And Map Sensor 3P Connector Terminal No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the ECM/PCM (C14) and the MAP sensor, then go to step 20.

14. Turn the ignition switch OFF.
15. Jump the SCS line with the HDS.
16. Disconnect ECM/PCM connector C (44P).
17. Check for continuity between ECM/PCM connector terminal C11 and MAP sensor 3P connector terminal No. 2.

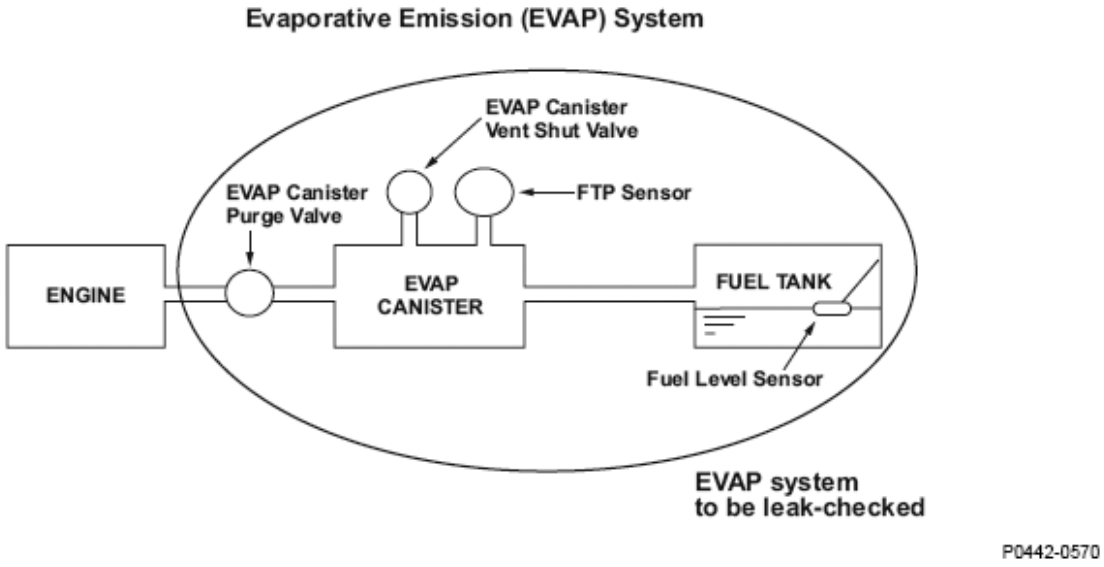

Fig. 15: Checking For Continuity Between ECM/PCM Connector Terminal C11 And Map Sensor 3P Connector Terminal No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the ECM/PCM (C11) and the MAP sensor, then go to step 20.

18. Turn the ignition switch OFF.
19. Replace the MAP sensor (see **MAF SENSOR/IAT SENSOR REPLACEMENT**).
20. Reconnect all connectors.
21. Turn the ignition switch ON (II).
22. Reset the ECM/PCM with the HDS.
23. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
24. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0108 indicated?

YES - Check for poor connections or loose terminals at the MAP sensor and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

25. Reconnect all connectors.
26. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
27. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0108 indicated?

YES - Check for poor connections or loose terminals at the MAP sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0111: IAT SENSOR CIRCUIT RANGE/PERFORMANCE PROBLEM

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Check for poor connections or loose terminals at the ECT sensor 1/2 and the IAT sensor.

   Are the connections and terminals OK?

   YES - Go to step 2.

   NO - Repair the connectors or terminals, then go to step 15.

2. Remove the MAF sensor/IAT sensor (see **MAF SENSOR/IAT SENSOR REPLACEMENT**).
3. Allow IAT sensor to cool to ambient temperature.
4. Note the ambient temperature.
5. Connect the MAF sensor/IAT sensor to the 5P connector, but do not install the sensor onto the air cleaner.
6. Turn the ignition switch ON (II).
7. Note the value of the IAT SENSOR quickly in the DATA LIST with the HDS.
8. Compare the value of IAT SENSOR and the ambient temperature.

   Does the value of IAT SENSOR differ 5.4°F (3°C) or more?

   YES - Go to step 13.

   NO - Go to step 9.

9. Disconnect the MAF sensor/IAT sensor from the 5P connector.
10. Using a heat gun, blow hot air on the MAF sensor/IAT sensor for a few seconds. Do not apply the heat longer than a few seconds or you will damage the sensor.
11. Connect the MAF sensor/IAT sensor to the 5P connector, but do not install the sensor onto the air cleaner.
12. Check the IAT SENSOR in the DATA LIST with the HDS.

    Does the IAT SENSOR change 81°F (45°C) or more?

    YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the IAT sensor and the ECM/PCM.

NO - Go to step 13.

13. Turn the ignition switch OFF.
14. Replace the MAF sensor/IAT sensor (see **MAF SENSOR/IAT SENSOR REPLACEMENT**).
15. Turn the ignition switch ON (II).
16. Reset the ECM/PCM with the HDS.
17. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
18. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0111 indicated?

YES - Check for poor connections or loose terminals at the IAT sensor and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0112: IAT SENSOR CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check the IAT SENSOR in the DATA LIST with the HDS.

Is about 356°F (180°C) or more, or 0.08 V or less indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the IAT sensor and the ECM/PCM.

3. Turn the ignition switch OFF.
4. Disconnect the MAF sensor/IAT sensor 5P connector.
5. Turn the ignition switch ON (II).
6. Check the IAT SENSOR in the DATA LIST with the HDS.

Is about 356°F (180°C) or more, or 0.08 V or less indicated?

YES - Go to step 7.

NO - Go to step 11.

7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Disconnect ECM/PCM connector B (44P).

10. Check for continuity between MAF sensor/IAT sensor 5P connector terminal No. 2 and body ground.

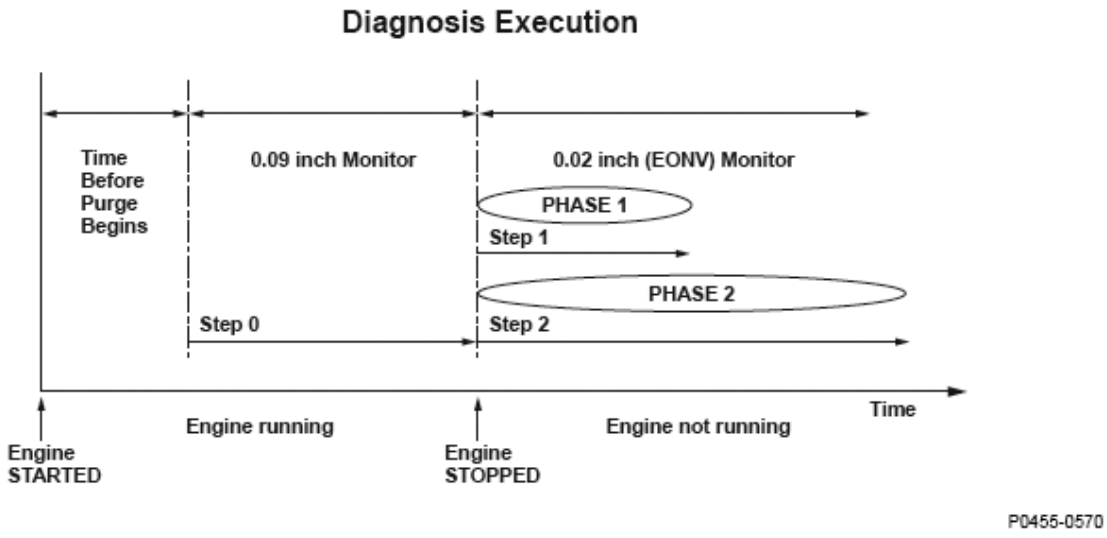

Fig. 16: Checking For Continuity Between MAF Sensor/IAT Sensor 5P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the IAT sensor and the ECM/PCM (B31), then go to step 13.

NO - Go to step 18.

11. Turn the ignition switch OFF.
12. Replace the MAF sensor/IAT sensor (see **MAF SENSOR/IAT SENSOR REPLACEMENT**).
13. Reconnect all connectors.
14. Turn the ignition switch ON (II).
15. Reset the ECM/PCM with the HDS.
16. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
17. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0112 indicated?

YES - Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

18. Reconnect all connectors.
19. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
20. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0112 indicated?

YES - Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0113: IAT SENSOR CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check the IAT SENSOR in the DATA LIST with the HDS.

   Is about -40°F (-40°C) or less, or 4.90 V or more indicated?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the IAT sensor and the ECM/PCM.

3. Turn the ignition switch OFF.
4. Disconnect the MAF sensor/IAT sensor 5P connector.
5. Connect MAF sensor/IAT sensor 5P connector terminals No. 1 and No. 2 with a jumper wire.

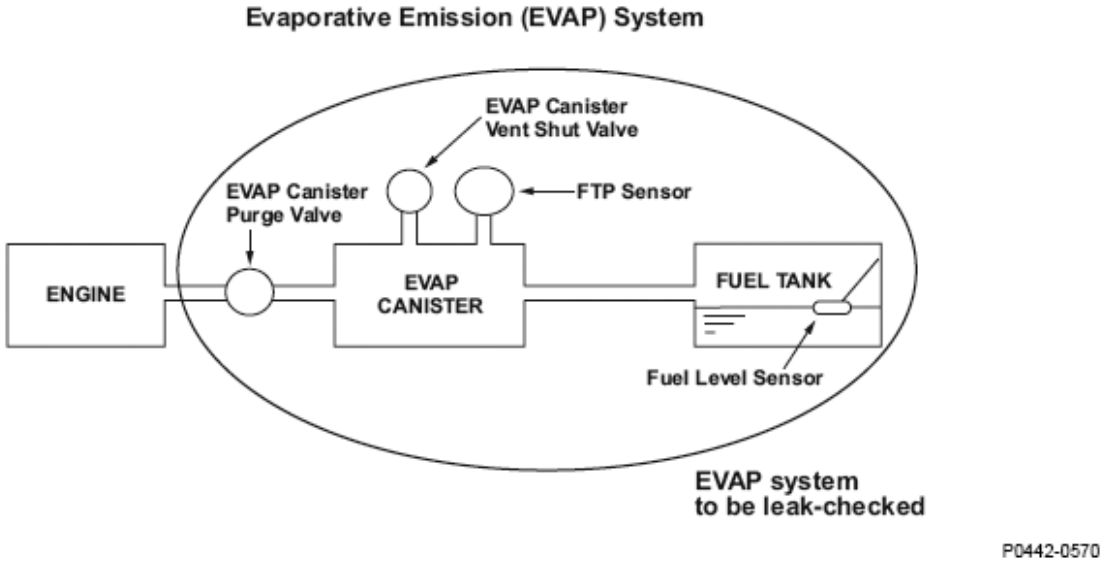

Fig. 17: Connecting MAF Sensor/IAT Sensor 5P Connector Terminals No. 1 And No. 2 With A Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Turn the ignition switch ON (II).
7. Check the IAT SENSOR in the DATA LIST with the HDS.

   Is about -40°F (-40°C) or less, or 4.90 V or more indicated?

   YES - Go to step 8.

   NO - Go to step 20.

8. Turn the ignition switch OFF.
9. Remove the jumper wire from the MAF sensor/IAT sensor 5P connector.
10. Turn the ignition switch ON (II).
11. Measure voltage between MAF sensor/IAT sensor 5P connector terminal No. 2 and body ground.

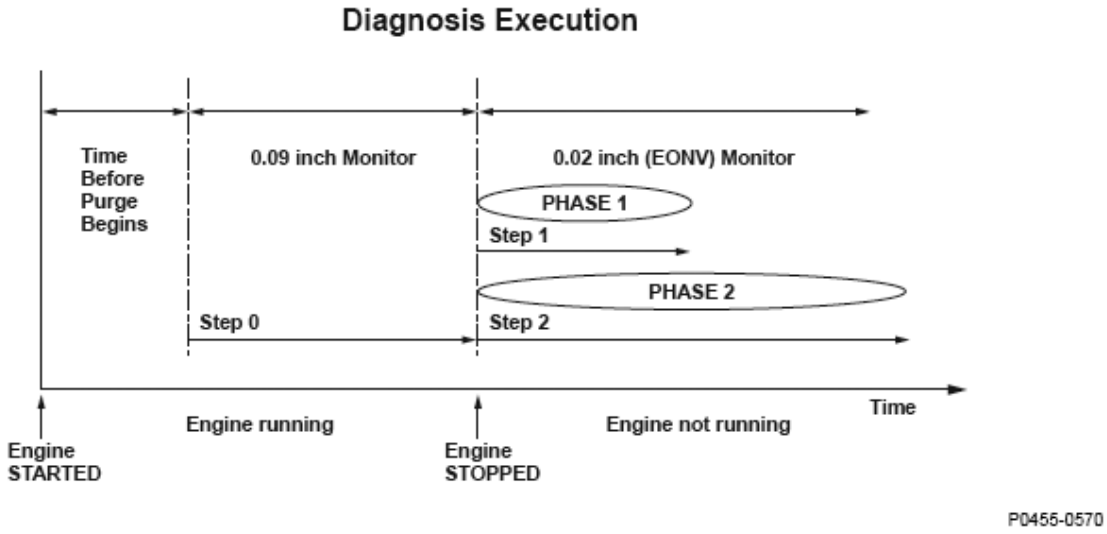

Fig. 18: Measuring Voltage Between MAF Sensor/IAT Sensor 5P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 12.

NO - Go to step 16.

12. Turn the ignition switch OFF.
13. Jump the SCS line with the HDS.
14. Disconnect ECM/PCM connector B (44P).
15. Check for continuity between MAF sensor/IAT sensor 5P connector terminal No. 1 and ECM/PCM connector terminal B33.

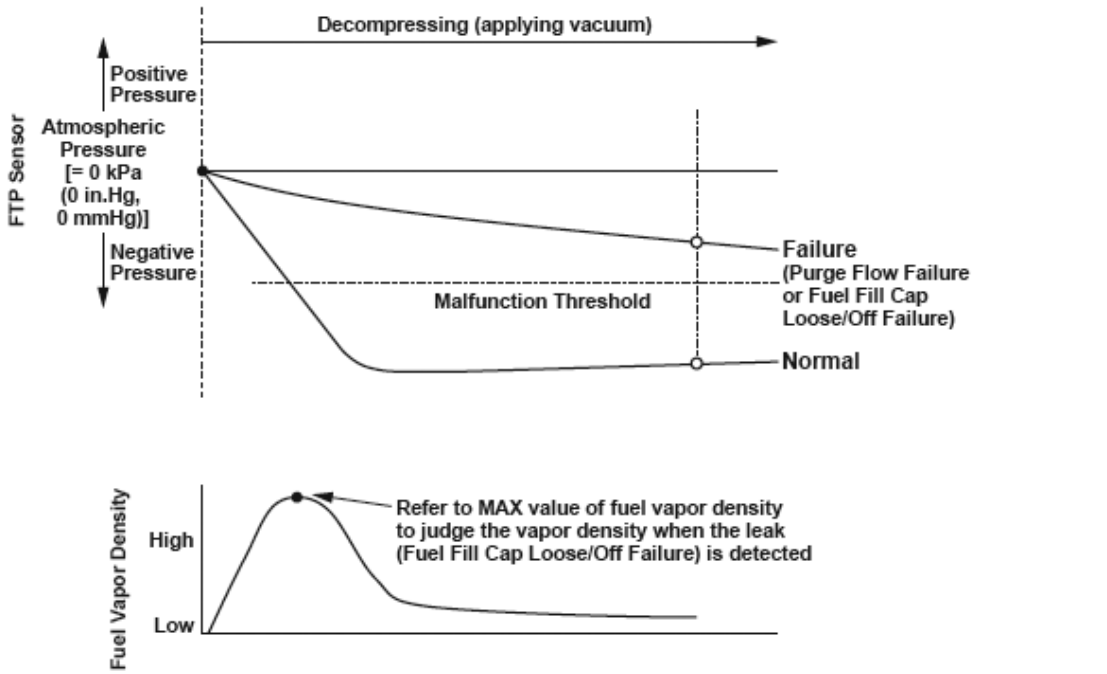

Fig. 19: Checking For Continuity Between MAF Sensor/IAT Sensor 5P Connector Terminal No. 1 And ECM/PCM Connector Terminal B33
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 27.

NO - Repair open in the wire between the ECM/PCM (B33) and the IAT sensor, then go to step 22.

16. Turn the ignition switch OFF.
17. Jump the SCS line with the HDS.
18. Disconnect ECM/PCM connector B (44P).
19. Check for continuity between MAF sensor/IAT sensor 5P connector terminal No. 2 and ECM/PCM connector terminal B31.

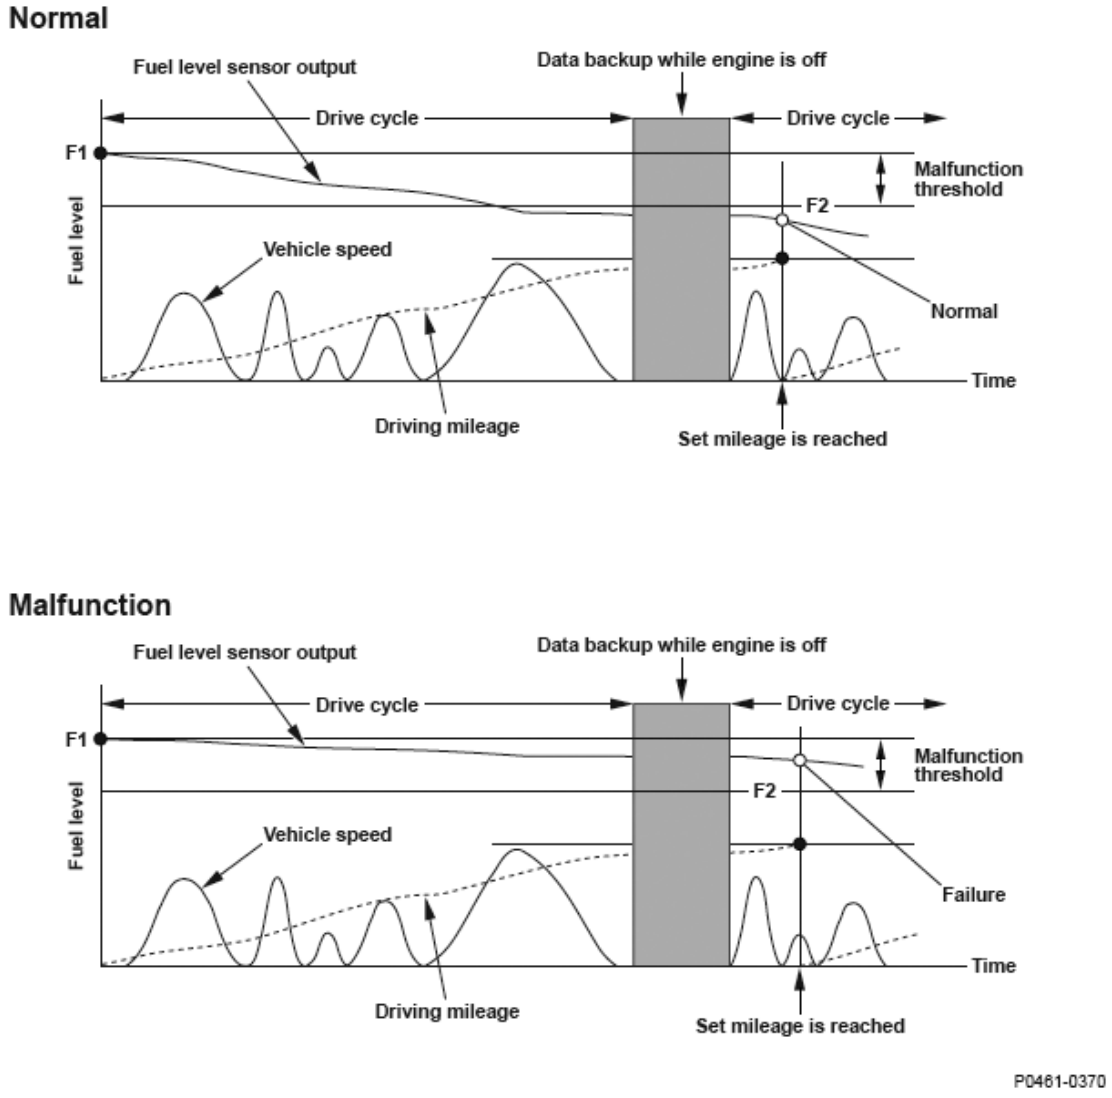

Fig. 20: Checking For Continuity Between MAF Sensor/IAT Sensor 5P Connector Terminal No. 2 And ECM/PCM Connector Terminal B31
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 27.

NO - Repair open in the wire between the ECM/PCM (B31) and the IAT sensor, then go to step 22.

20. Turn the ignition switch OFF.
21. Replace the MAF sensor/IAT sensor (see **MAF SENSOR/IAT SENSOR REPLACEMENT**).
22. Reconnect all connectors.
23. Turn the ignition switch ON (II).
24. Reset the ECM/PCM with the HDS.
25. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
26. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0113 indicated?

YES - Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

27. Reconnect all connectors.
28. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
29. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0113 indicated?

YES - Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0116: ECT SENSOR 1 CIRCUIT RANGE/PERFORMANCE PROBLEM

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check ECT SENSOR 1 in the DATA LIST with the HDS.

Is about 176°F (80°C) or more, or 0.78 V or less indicated?

YES - Go to step 6.

NO - Go to step 3.

3. Note the value of ECT SENSOR 1 in the DATA LIST with the HDS.
4. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
5. Check ECT SENSOR 1 in the DATA LIST with the HDS.

Does ECT SENSOR 1 change 18°F (10°C) or more?

YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1 and the ECM/PCM.

NO - Go to step 11.

6. Note the value of ECT SENSOR 1 in the DATA LIST with the HDS.
7. Turn the ignition switch OFF.
8. Open the hood, and let the engine cool for 3 hours.
9. Turn the ignition switch ON (II).
10. Check ECT SENSOR 1 in the DATA LIST with the HDS.

    Does ECT SENSOR 1 change 18°F (10°C) or more?

    YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1 and the ECM/PCM.

    NO - Go to step 11.

11. Turn the ignition switch OFF.
12. Replace ECT sensor 1 (see **ECT SENSOR 1 REPLACEMENT**).
13. Turn the ignition switch ON (II).
14. Reset the ECM/PCM with the HDS.
15. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
16. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0116 indicated?

    YES - Check for poor connections or loose terminals at ECT sensor 1 and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0117: ECT SENSOR 1 CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check ECT SENSOR 1 in the DATA LIST with the HDS.

    Is about 356°F (180°C) or more, or 0.08 V or less indicated?

    YES - Go to step 3.

    NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1 and the ECM/PCM.

3. Turn the ignition switch OFF.
4. Disconnect the ECT sensor 1 2P connector.
5. Turn the ignition switch ON (II).

6. Check ECT SENSOR 1 in the DATA LIST with the HDS.

   Is about 356°F (180°C) or more, or 0.08 V or less indicated?

   YES - Go to step 7.

   NO - Go to step 11.

7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Disconnect ECM/PCM connector B (44P).
10. Check for continuity between ECT sensor 1 2P connector terminal No. 2 and body ground.

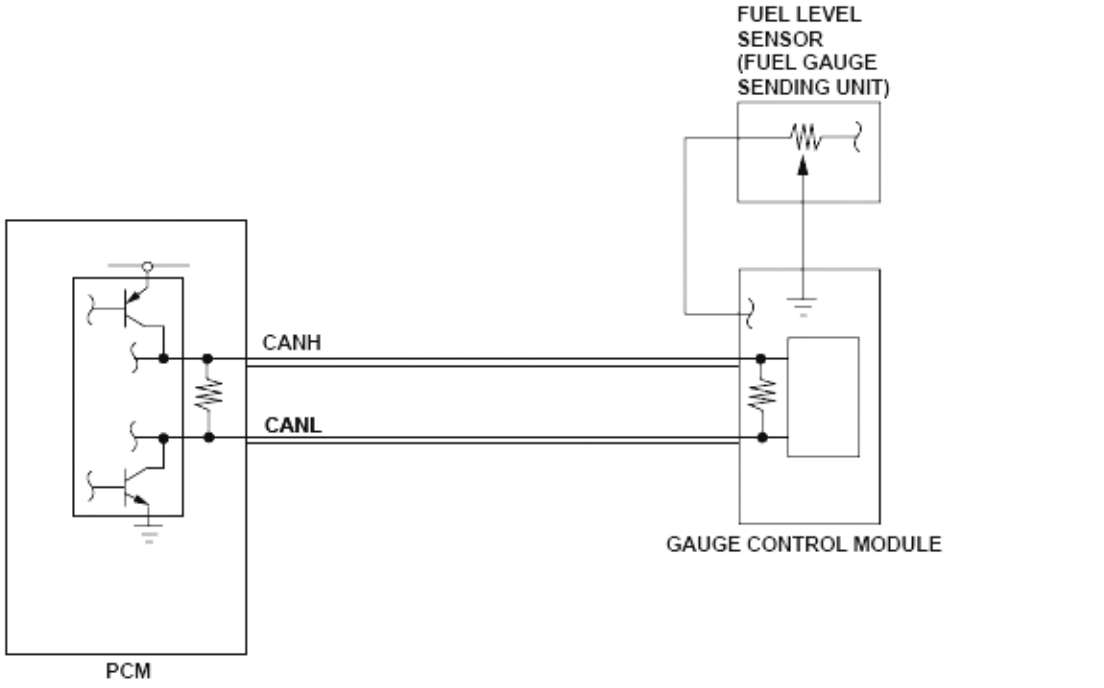

Fig. 21: Checking For Continuity Between ECT Sensor 1 2P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between ECT sensor 1 and the ECM/PCM (B23), then go to step 13.

NO - Go to step 18.

11. Turn the ignition switch OFF.
12. Replace ECT sensor 1 (see **ECT SENSOR 1 REPLACEMENT**).
13. Reconnect all connectors.
14. Turn the ignition switch ON (II).

15. Reset the ECM/PCM with the HDS.
16. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
17. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0117 indicated?

    YES - Check for poor connections or loose terminals at ECT sensor 1 and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

18. Reconnect all connectors.
19. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
20. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0117 indicated?

    YES - Check for poor connections or loose terminals at ECT sensor 1 and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0118: ECT SENSOR 1 CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check ECT SENSOR 1 in the DATA LIST with the HDS.

   Is about -40°F (-40°C) or less, or 4.90 V or more indicated?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1 and the ECM/PCM.

3. Turn the ignition switch OFF.
4. Disconnect the ECT sensor 1 2P connector.
5. Connect ECT sensor 1 2P connector terminals No. 1 and No. 2 with a jumper wire.

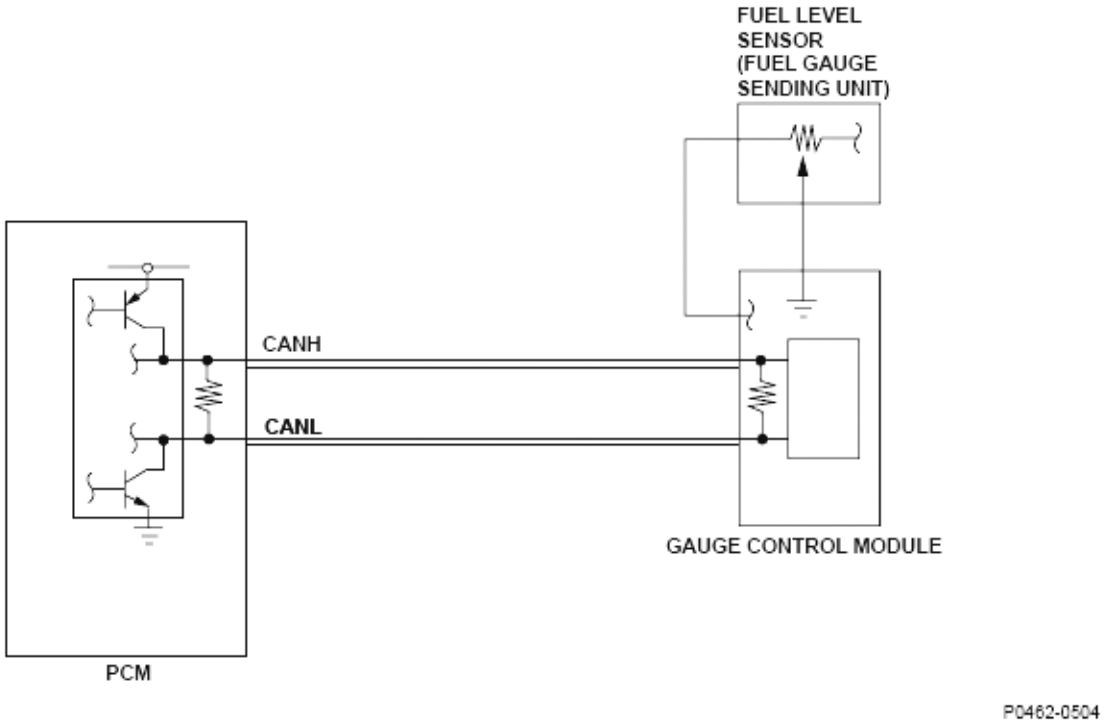

Fig. 22: Connecting ECT Sensor 1 2P Connector Terminals No. 1 And No. 2 With A Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Turn the ignition switch ON (II).
7. Check ECT SENSOR 1 in the DATA LIST with the HDS.

   Is about -40°F (-40°C) or less, or 4.90 V or more indicated?

   YES - Go to step 8.

   NO - Go to step 20

8. Turn the ignition switch OFF.
9. Remove the jumper wire from the ECT sensor 1 2P connector.
10. Turn the ignition switch ON (II).
11. Measure voltage between the ECT sensor 1 2P connector terminal No. 2 and body ground.

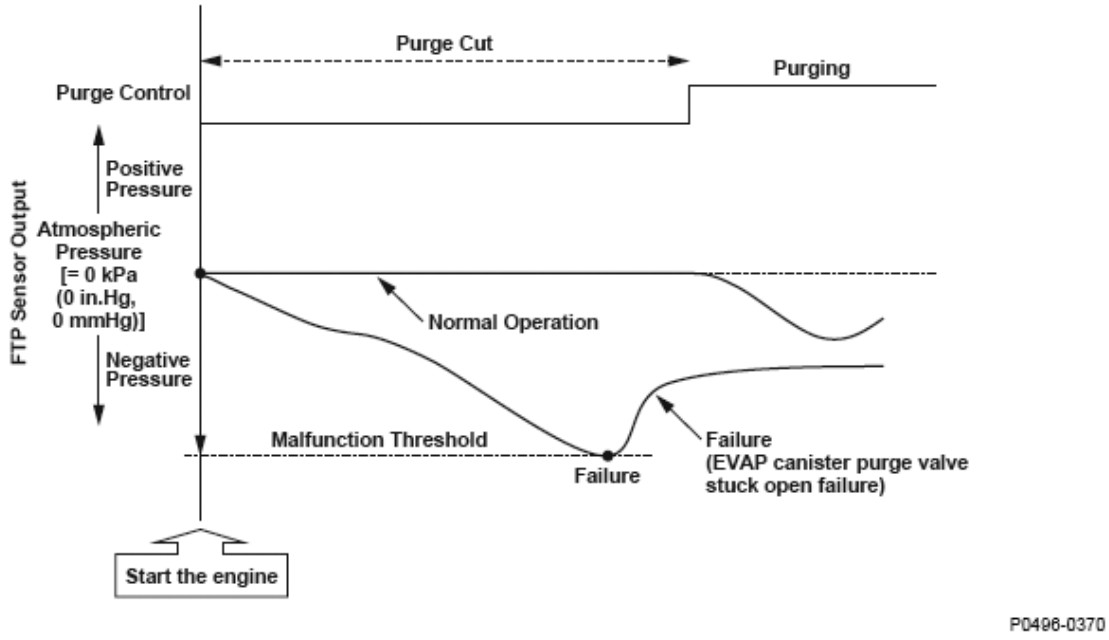

Fig. 23: Measuring Voltage Between ECT Sensor 1 2P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 12.

NO - Go to step 16.

12. Turn the ignition switch OFF.
13. Jump the SCS line with the HDS.
14. Disconnect ECM/PCM connector B (44P).
15. Check for continuity between ECT sensor 1 2P connector terminal No. 1 and ECM/PCM connector terminal B33.

Is there continuity?

YES - Go to step 27.

NO - Repair open in the wire between the ECM/PCM (B33) and ECT sensor 1, then go to step 22.

16. Turn the ignition switch OFF.
17. Jump the SCS line with the HDS.
18. Disconnect ECM/PCM connector B (44P).
19. Check for continuity between ECT sensor 1 2P connector terminal No. 2 and ECM/PCM connector terminal B23.

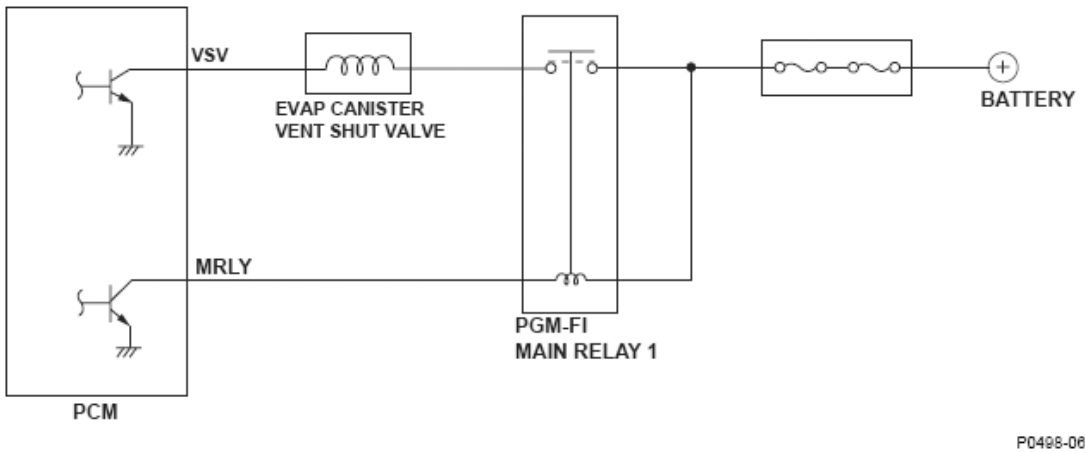

Fig. 25: Checking For Continuity Between ECT Sensor 1 2P Connector Terminal No. 2 And ECM/PCM Connector Terminal B23
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 27.

NO - Repair open in the wire between the ECM/PCM (B23) and ECT sensor 1, then go to step 22.

20. Turn the ignition switch OFF.
21. Replace ECT sensor 1 (see **ECT SENSOR 1 REPLACEMENT**).
22. Reconnect all connectors.
23. Turn the ignition switch ON (II).
24. Reset the ECM/PCM with the HDS.
25. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
26. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0118 indicated?

YES - Check for poor connections or loose terminals at ECT sensor 1 and the ECM/PCM, then go to

step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

27. Reconnect all connectors.
28. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
29. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0118 indicated?

    YES - Check for poor connections or loose terminals at ECT sensor 1 and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0125: ECT SENSOR 1 MALFUNCTION/SLOW RESPONSE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Start the engine, and let it idle for 5 minutes or more.
2. Check ECT SENSOR 1 in the DATA LIST with the HDS.

   Is about 0°F (-18°C) or less indicated?

   YES - Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM/PCM. If the connections and the terminals are OK, replace ECT sensor 1, then go to step8.

   NO - Go to step 3.

3. Turn the ignition switch to LOCK (0).
4. Allow the engine to cool to 104 °F (40 °C) or less.
5. Make sure the temperature difference between ECT SENSOR 1 and ECT SENSOR 2 is about 50 °F (10°C) in the DATA LIST with the HDS.
6. Start the engine, and let it idle until ECT SENSOR 1 goes up to about 158 °F (70 °C).

   Does ECT SENSOR 2 also read about 158 °F (70 °C)?

   YES - Go to step 6.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM/PCM.

7. Check the thermostat.

   Is the thermostat OK?

   YES - Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM/PCM. If the connections and the terminals are OK, replace ECT sensor 1, then go to step 7.

   NO - Replace the thermostat, then go to step 7.

8. Turn the ignition switch to ON (II).
9. Reset the ECM/PCM with the HDS.
10. Turn the ignition switch to LOCK (0).
11. Allow the engine to cool to 104 °F (40 °C) or less.
12. Start the engine, and let it idle until ECT SENSOR 1 goes up to about 158 °F (70 °C).

    Does ECT SENSOR 2 also read about 158 °F (70 °C)?

    YES - Go to step 1 and recheck.

    NO - Troubleshooting is complete.

DTC P0128: COOLING SYSTEM MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Turn the blower switch OFF.
4. Check the FAN CTRL in the DATA LIST with the HDS.

   Is it OFF?

   YES - Go to step 5.

   NO - Wait until the FAN CTRL is off, then go to step 6.

5. Check the radiator fan operation.

   Does the radiator fan keep running?

   YES - Check the radiator fan circuit (see **CIRCUIT DIAGRAM**), and the radiator fan relay (see **POWER RELAY TEST**). If the circuits and the relay is OK, go to step 19.

   NO - Go to step 6.

6. Let the engine cool until the coolant temperature is 104°F (40°C) or less.

7. Note the value of ECT SENSOR 1 and ECT SENSOR 2 in the DATA LIST with the HDS.
8. Start the engine, and let it idle.
9. Let the engine idle until ECT SENSOR 1 goes up 40°F (22°C) or more from the recorded temperature.
10. Check ECT SENSOR 2 in the DATA LIST with the HDS.
11. Compare the value of recorded ECT SENSOR 2 and the present value of ECT SENSOR 2.

    Did temperature rise 14°F (8°C) or more?

    YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM/PCM.

    NO - Test the thermostat (see **FAN MOTOR TEST**), then go to step 12.

12. Turn the ignition switch ON (II).
13. Reset the ECM/PCM with the HDS.
14. Let the engine cool until the coolant temperature is between 21°F (-6°C) and 104°F (40°C).
15. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
16. Test-drive at a steady speed between 15-75 mph (24-120 km/h) for 10 minutes.
17. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0128 indicated?

    YES - Check the cooling system, then go to step 1.

    NO - Go to step 18.

18. Monitor the OBD STATUS for DTC P0128 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 17, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check the cooling system, then go to step 1. If the screen indicates NOT COMPLETED, go to step 14.

19. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
20. Let the engine cool until the coolant temperature is between 21°F (-6°C) and 104°F (40°C).
21. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
22. Test-drive at a steady speed between 15-75 mph (24-120 km/h) for 10 minutes.
23. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0128 indicated?

YES - Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 20. If the ECM/PCM was substituted, go to step 1.

NO - Go to step 24.

24. Monitor the OBD STATUS for DTC P0128 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 23, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 20. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, go to step 20.

DTC P0133: A/F SENSOR (SENSOR 1) MALFUNCTION/SLOW RESPONSE

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P0139 is stored at the same time as DTC P0133, troubleshoot DTC P0139 first, then recheck for DTC P0133.**

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
4. Test-drive under these conditions:
   - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
   - A/T in D position (M/T in 3rd or 4th gear)
   - Drive the vehicle at 25 mph (40 km/h) or less for 5 minutes, then drive at a steady speed between 26-81 mph (41-130 km/h).
5. Monitor the OBD STATUS for DTC P0133 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 6.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 3 and recheck.

6. Turn the ignition switch OFF.
7. Replace the A/F sensor (Sensor 1) (see **A/F SENSOR REPLACEMENT**).
8. Turn the ignition switch ON (II).
9. Reset the ECM/PCM with the HDS.
10. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
11. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
12. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
    - A/T in D position (M/T in 3rd or 4th gear)
    - Drive the vehicle at 25 mph (40 km/h) or less for 5 minutes, then drive at a steady speed between 26-81 mph (41-130 km/h).
13. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0133 indicated?

    YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1.

    NO - Go to step 14.

14. Monitor the OBD STATUS for DTC P0133 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 13, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 11.

DTC P0134: A/F SENSOR (SENSOR 1) HEATER SYSTEM MALFUNCTION

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P0135 is stored at the same time as DTC P0134, troubleshoot DTC P0135 first, then recheck for DTC P0134.**

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle without load (in Park or neutral), until the radiator fan comes on.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0134 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1), the PGM-FI subrelay, and the ECM/PCM.

5. Turn the ignition switch OFF.
6. Replace the A/F sensor (Sensor 1) (see **A/F SENSOR REPLACEMENT**).
7. Turn the ignition switch ON (II).
8. Reset the ECM/PCM with the HDS.
9. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
10. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0134 indicated?

    YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1), the PGM-FI subrelay, and the ECM/PCM, then go to step 1.

    NO - Go to step 11.

11. Monitor the OBD STATUS for DTC P0134 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 10, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1), the PGM-FI subrelay, and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P0135: A/F SENSOR (SENSOR 1) HEATER CIRCUIT MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
4. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0135 indicated?

    YES - Go to step 5.

    NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1), the PGM-FI subrelay, and the ECM/PCM.

5. Turn the ignition switch OFF.
6. Check the No. 11 FI SUB (15 A) fuse in the underhood fuse/relay box.

   Is the fuse OK?

   YES - Go to step 7.

   NO - Go to step 18.

7. Test the PGM-FI subrelay (E) in the under-hood fuse/relay box (see **POWER RELAY TEST**).

Is the PGM-FI subrelay OK?

YES - Go to step 8.

NO - Replace the PGM-FI subrelay, then go to step 23.

8. Disconnect the A/F sensor (Sensor 1) 4P connector.
9. At the sensor side, measure resistance between A/F sensor (Sensor 1) 4P connector terminals No. 3 and No. 4.

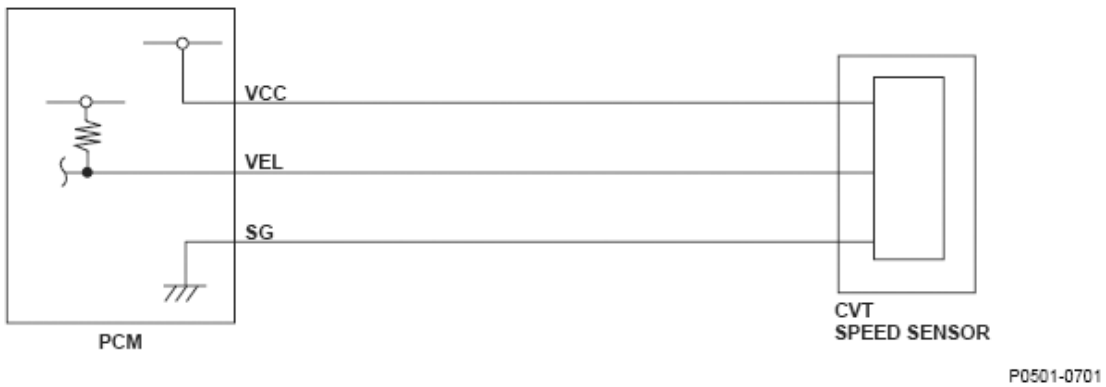

Fig. 27: Measuring Resistance Between A/F Sensor (Sensor 1) 4P Connector Terminals No. 3

And No. 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 2.0-2.7 ohms at room temperature?

YES - Go to step 10.

NO - Go to step 22.

10. At the sensor side, check for continuity between A/F sensor (Sensor 1) 4P connector terminals No. 1 and No. 3, and between terminals No. 1 and No. 4 individually.

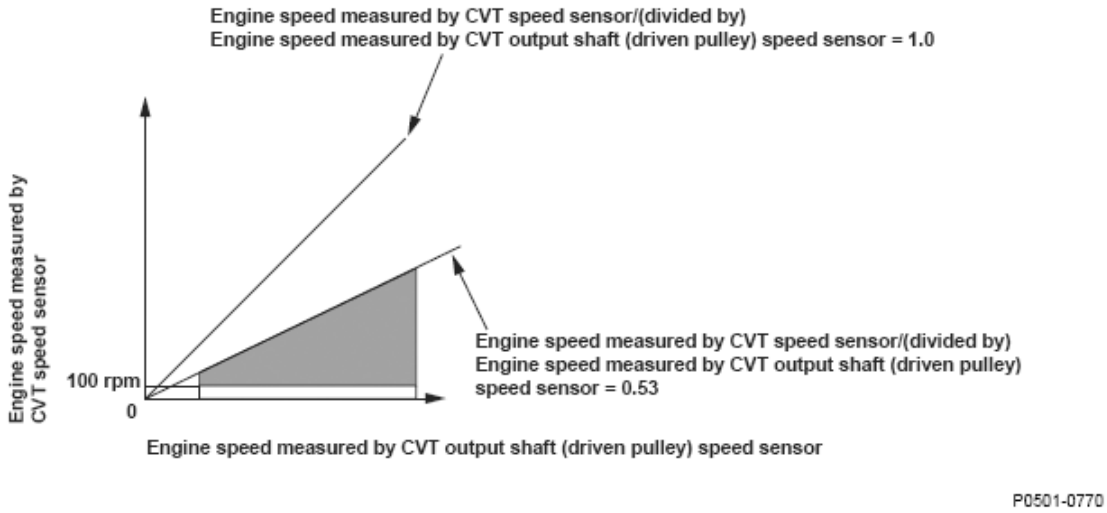

Fig. 28: Checking For Continuity Between A/F Sensor 4P Connector Terminals No. 1 & No. 3 And Between Terminals No. 1 & No. 4

Is there continuity?

YES - Go to step 22.

NO - Go to step 11.

11. Jump the SCS line with the HDS.
12. Disconnect ECM/PCM connector C (44P).
13. Check for continuity between A/F sensor (Sensor 1) 4P connector terminal No. 3 and ECM/PCM connector terminal C9.

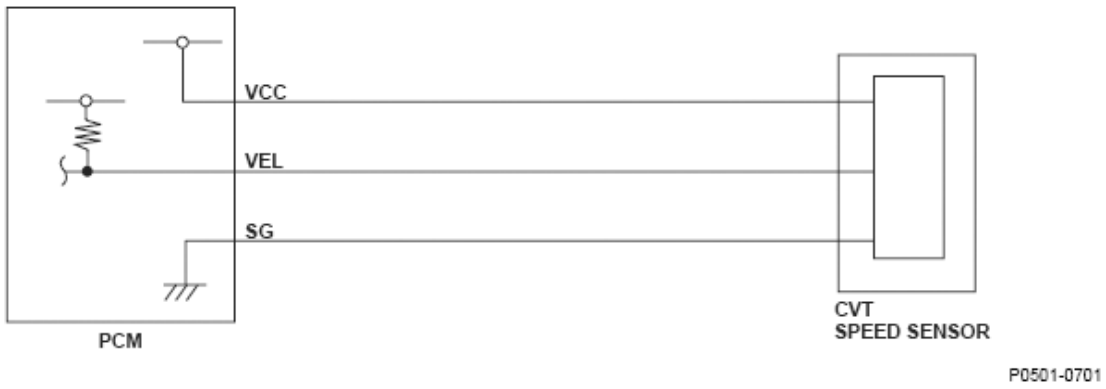

Fig. 29: Checking For Continuity Between A/F Sensor (Sensor 1) 4P Connector Terminal No. 3 And ECM/PCM Connector Terminal C9

Is there continuity?

YES - Go to step 14.

NO - Repair open in the wire between the ECM/PCM (C9) and the A/F sensor (Sensor 1), then go to step 23.

14. Remove the PGM-FI subrelay (E) from the underhood fuse/relay box.

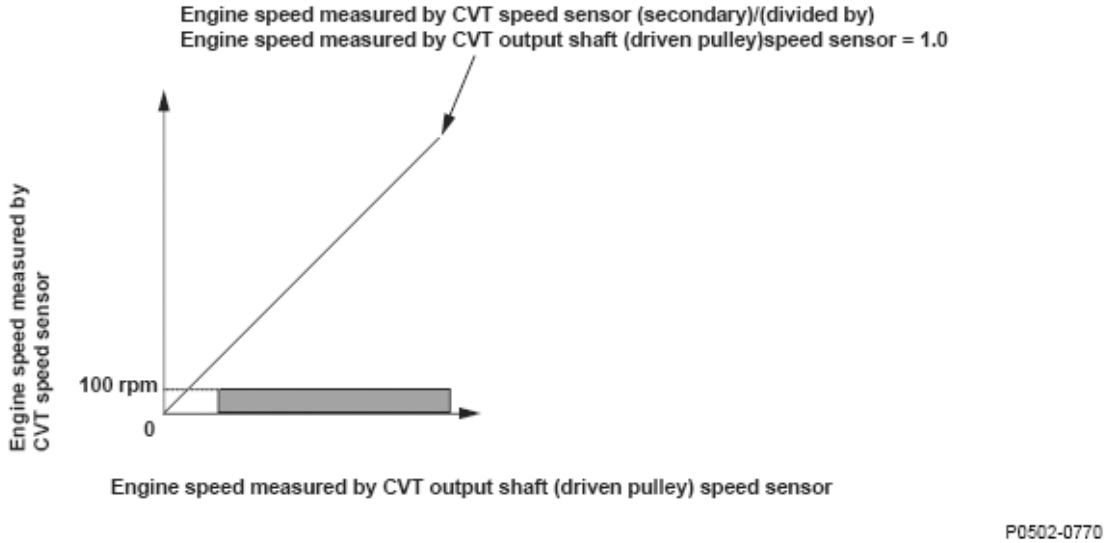

Fig. 30: Identifying PGM-FI Subrelay

Is there continuity?

YES - Go to step 16.

NO - Repair open in the wire between the A/F sensor (Sensor 1) and the PGM-FI subrelay, then go to step 23.

16. Disconnect ECM/PCM connector A (44P).
17. Check for continuity between PGM-FI subrelay 4P connector terminal No. 3 and ECM/PCM connector terminal A21.

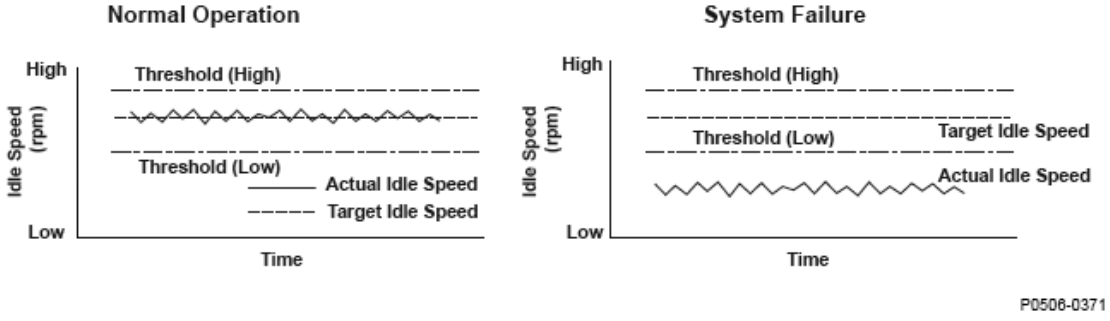

Fig. 32: Checking For Continuity Between PGM-FI Subrelay 4P Connector Terminal No. 3 And ECM/PCM Connector Terminal A21

Is there continuity?

YES - Go to step 29.

NO - Repair open in the wire between the ECM/PCM (A21) and the PGM-FI subrelay, then go to step 23.

18. Remove the PGM-FI subrelay (E) from the underhood fuse/relay box.

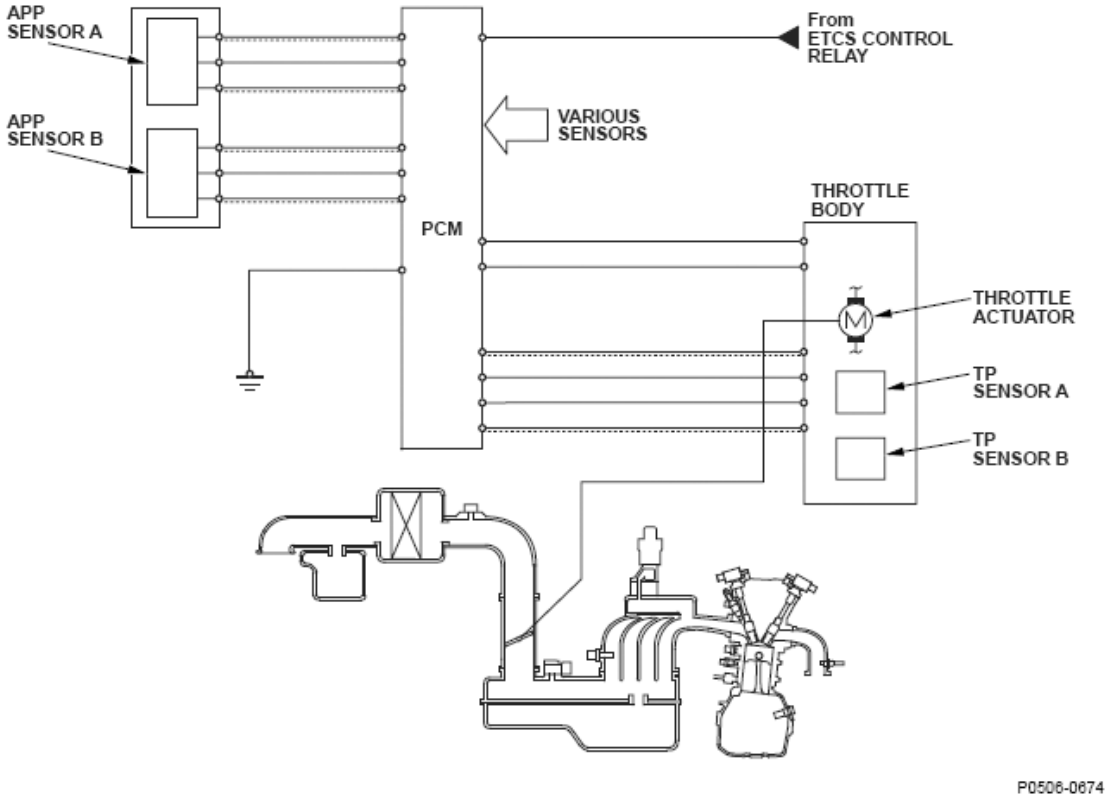

Fig. 33: Identifying PGM-FI Subrelay

19. Disconnect the A/F sensor (Sensor 1) 4P connector.
20. Disconnect the EVAP canister vent shut valve 2P connector.
21. Check for continuity between A/F sensor (Sensor 1) 4P connector terminal No. 4 and body ground.

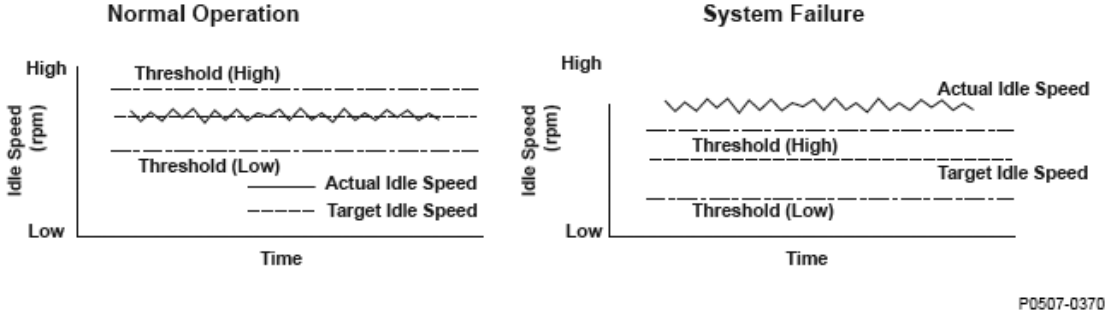

Fig. 34: Checking For Continuity Between A/F Sensor (Sensor 1) 4P Connector Terminal No. 4 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the PGM-FI subrelay and the A/F sensor (Sensor 1), and the EVAP canister vent shut valve. Also replace the No. 11 FI SUB (15 A) fuse, then go to step 23.

NO - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**), then go to step 23.

22. Replace the A/F sensor (Sensor 1) (see **A/F SENSOR REPLACEMENT**).
23. Reconnect all connectors.
24. Turn the ignition switch ON (II).
25. Reset the ECM/PCM with the HDS.
26. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
27. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0135 indicated?

YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1), the PGM-FI subrelay, and the ECM/PCM, then go to step 1.

NO - Go to step 28.

28. Monitor the OBD STATUS for DTC P0135 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 27, go to the indicated DTC's troubleshooting.

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1), the PGM-FI subrelay, and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

29. Reconnect all connectors.
30. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
31. Start the engine, and let it idle.
32. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0135 indicated?

YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1), the PGM-FI subrelay, and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 31. If the ECM/PCM was substituted, go to step 1.

NO - Go to step 33.

33. Monitor the OBD STATUS for DTC P0135 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 32, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1), the PGM-FI subrelay, and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 31. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P0137: SECONDARY HO2S (SENSOR 2) CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle without load (in Park or neutral) until the radiator fan comes on.
4. Check the HO2S S2 in the DATA LIST with the HDS.

   Does the voltage stay at 0.29 V or less?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM/PCM.

5. Turn the ignition switch OFF.
6. Disconnect the secondary HO2S (Sensor 2) 4P connector.
7. Turn the ignition switch ON (II).
8. Check the HO2S S2 in the DATA LIST with the HDS.

   Does the voltage stay at 0.29 V or less?

   YES - Go to step 9.

   NO - Go to step 13.

9. Turn the ignition switch OFF.
10. Jump the SCS line with the HDS.
11. Disconnect ECM/PCM connector C (44P).

12. Check for continuity between secondary HO2S (Sensor 2) 4P connector terminal No. 1 and body ground.

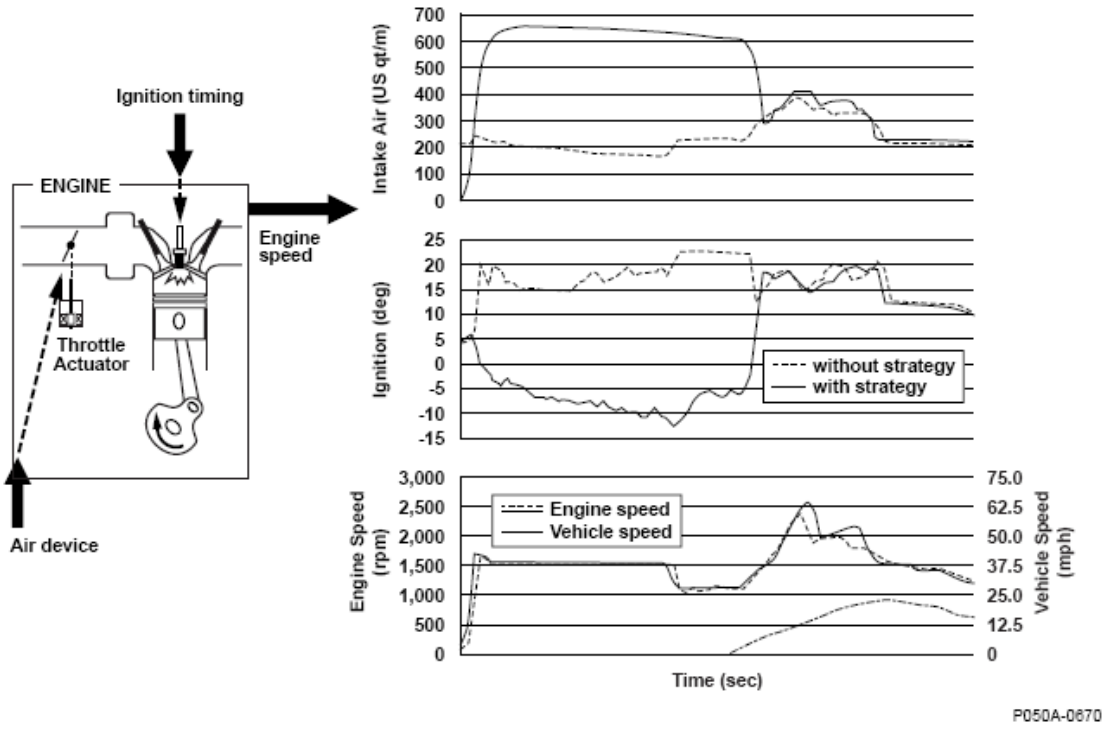

Fig. 35: Checking For Continuity Between Secondary HO2S (Sensor 2) 4P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (C27) and the secondary HO2S (Sensor 2), then go to step 15.

NO - Go to step 23.

13. Turn the ignition switch OFF.
14. Replace the secondary HO2S (Sensor 2) (see **A/F SENSOR REPLACEMENT**).
15. Reconnect all connectors.
16. Turn the ignition switch ON (II).
17. Reset the ECM/PCM with the HDS.
18. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
19. Start the engine, and let it idle without load (in Park or neutral) until the radiator fan comes on.
20. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
    - A/T in D position (M/T in 4th gear)
    - ENGINE SPEED between 1,500-3,000 rpm
    - Drive about 1 minute or more

21. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0137 indicated?

    YES - Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM/PCM, then go to step 1.

    NO - Go to step 22.

22. Monitor the OBD STATUS for DTC P0137 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 21, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM/PCM, then go to step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 19.

23. Reconnect all connectors.
24. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
25. Start the engine, and let it idle without load (in Park or neutral) until the radiator fan comes on.
26. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
    - A/T in D position (M/T in 4th gear)
    - ENGINE SPEED between 1,500-3,000 rpm
    - Drive 1 minute or more
27. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0137 indicated?

    YES - Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 25. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 28.

28. Monitor the OBD STATUS for DTC P0137 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 27, go to the indicated DTC's troubleshooting.

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 25. If the ECM/PCM was substituted, go to step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 25.

DTC P0138: SECONDARY HO2S (SENSOR 2) CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle without load (in Park or neutral) until the radiator fan comes on.
4. Check the HO2S S2 in the DATA LIST with the HDS.

   Does the voltage stay at 1.25 V or more?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM/PCM.

5. Turn the ignition switch OFF.
6. Disconnect the secondary HO2S (Sensor 2) 4P connector.
7. Connect secondary HO2S (Sensor 2) 4P connector terminals No. 1 and No. 2 with a jumper wire.

A Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Turn the ignition switch ON (II).
9. Check the HO2S S2 in the DATA LIST with the HDS.

   Does the voltage stay at 1.25 V or more?

   YES - Go to step 10.

   NO - Go to step 19.

10. Turn the ignition switch OFF.
11. Remove the jumper wire from the secondary HO2S (Sensor 2) 4P connector.
12. Connect secondary HO2S (Sensor 2) 4P connector terminal No. 1 to body ground with a jumper wire.

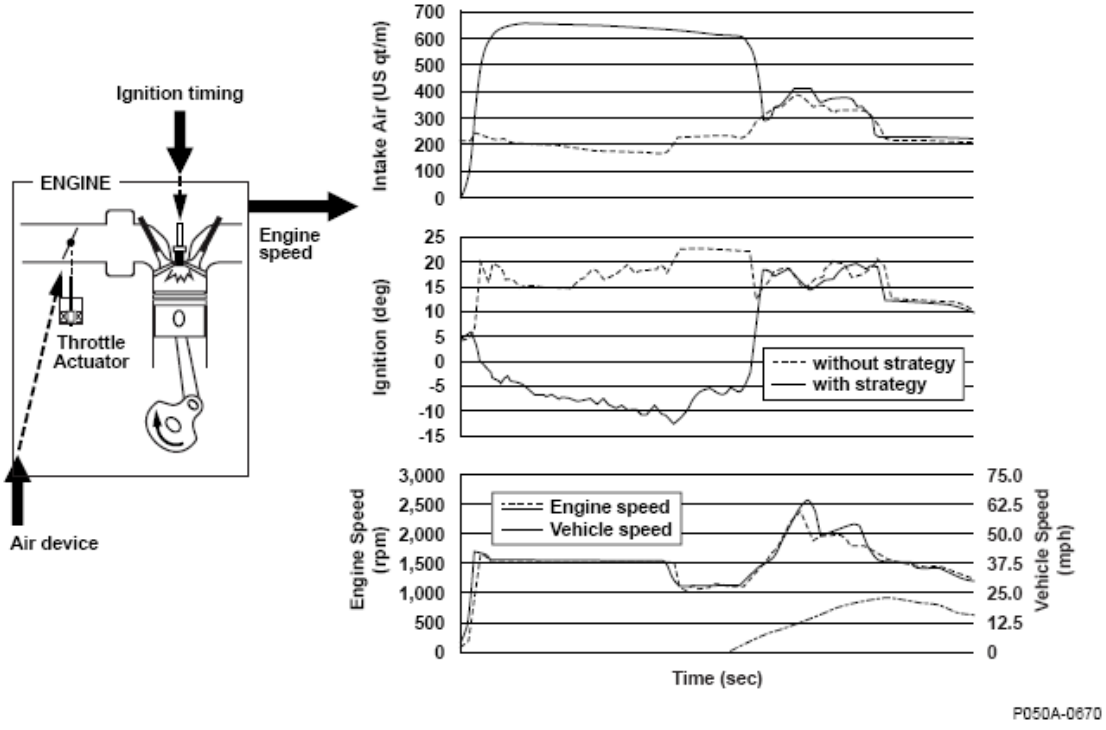

Fig. 37: Connecting Secondary HO2S (Sensor 2) 4P Connector Terminal No. 1 To Body Ground With A Jumper Wire

13. Turn the ignition switch ON (II).
14. Check the HO2S S2 in the DATA LIST with the HDS.

   Does the voltage stay at 1.25 V or more?

   YES - Go to step 15.

   NO - Repair open in the wire between the ECM/PCM (B33) and the secondary HO2S (Sensor 2), then go to step 21.

15. Turn the ignition switch OFF.
16. Jump the SCS line with the HDS.
17. Disconnect ECM/PCM connector C (44P).
18. Check for continuity between ECM/PCM connector terminal C27 and body ground.

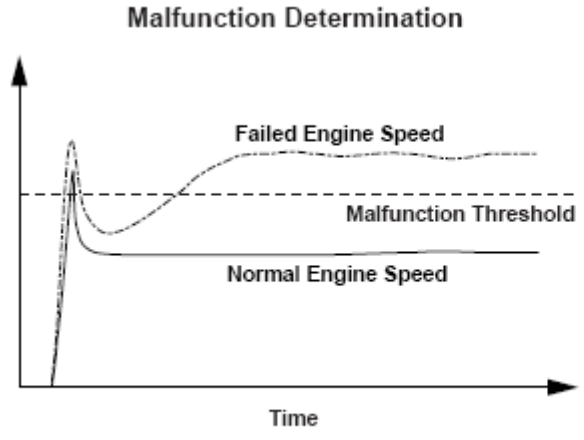

Fig. 38: Checking For Continuity Between ECM/PCM Connector Terminal C27 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 29.

NO - Repair open in the wire between the ECM/PCM (C27) and the secondary HO2S (Sensor 2), then go to step 21.

19. Turn the ignition switch OFF.
20. Replace the secondary HO2S (Sensor 2) (see **A/F SENSOR REPLACEMENT**).
21. Reconnect all connectors.
22. Turn the ignition switch ON (II).
23. Reset the ECM/PCM with the HDS.
24. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
25. Start the engine, and let it idle without load (in Park or neutral) until the radiator fan comes on.
26. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
    - A/T in D position (M/T in 4th gear)
    - Engine speed between 1,500-3,000 rpm
    - Drive about 1 minute or more
27. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0138 indicated?

YES - Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM/PCM, then go to step 1.

NO - Go to step 28.

28. Monitor the OBD STATUS for DTC P0138 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 27, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM/PCM, then go to step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 25.

29. Reconnect all connectors.
30. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
31. Start the engine, and let it idle without load (in Park or neutral) until the radiator fan comes on.
32. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
    - A/T in D position (M/T in 4th gear)
    - ENGINE SPEED between 1,500-3,000 rpm
    - Drive about 1 minute or more
33. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0138 indicated?

    YES - Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 30. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 34.

34. Monitor the OBD STATUS for DTC P0138 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 33, go to the indicated DTC's troubleshooting.

    NO -If the screen indicates FAILED, check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 31. If the ECM/PCM was substituted, go to step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 31.

DTC P0139: SECONDARY HO2S (SENSOR 2) SLOW RESPONSE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle without load (in Park or neutral) until the radiator fan comes on.
4. Test-drive under these conditions:
   - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
   - A/T in D position (M/T in 4th gear)
   - Vehicle speed at 35 mph (56 km/h) or more
   - Drive 20 seconds
5. Monitor the OBD STATUS for DTC P0139 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 6.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM/PCM. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 3 and recheck.

6. Turn the ignition switch OFF.
7. Replace the secondary HO2S (Sensor 2) (see **A/F SENSOR REPLACEMENT**).
8. Turn the ignition switch ON (II).
9. Reset the ECM/PCM with the HDS.
10. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
11. Start the engine, and let it idle without load (in Park or neutral) until the radiator fan comes on.
12. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
    - A/T in D position (M/T in 4th gear)
    - Vehicle speed at 35 mph (56 km/h) or more
    - Drive 20 seconds
13. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0139 indicated?

    YES - Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM/PCM, then go to step 1.

    NO - Go to step 14.

14. Monitor the OBD STATUS for DTC P0139 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 13, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM/PCM, then go to step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 11.

DTC P0141: SECONDARY HO2S (SENSOR 2) HEATER CIRCUIT MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0141 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM/PCM.

5. Turn the ignition switch OFF.
6. Check the No. 3 ALTERNATOR (10 A) fuse in the under-dash fuse/relay box.

   Is the fuse OK?

   YES - Go to step 7.

   NO - Repair short in the wire between the secondary HO2S (Sensor 2) and the No. 3 ALTERNATOR (10 A) fuse. Also replace the No. 3 ALTERNATOR (10 A) fuse, then go to step 22.

7. Disconnect the secondary HO2S (Sensor 2) 4P connector.
8. At the secondary HO2S (Sensor 2) side, measure resistance between secondary HO2S (Sensor 2) 4P connector terminals No. 3 and No. 4.

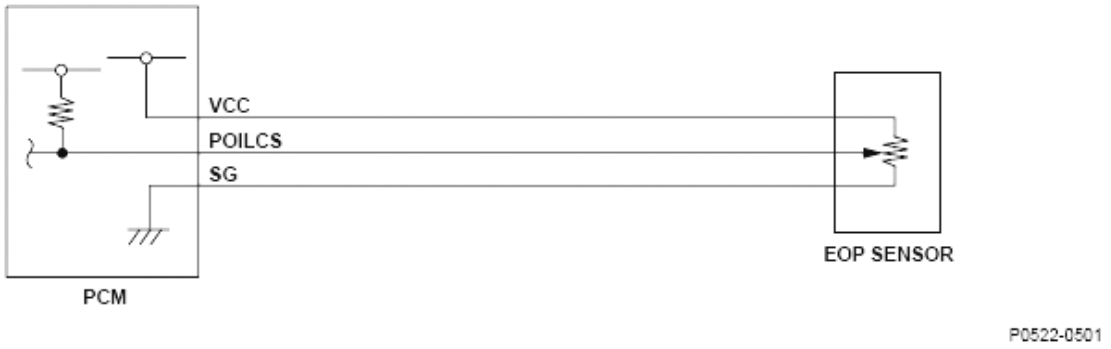

Fig. 39: Measuring Resistance Between Secondary HO2S (Sensor 2) 4P Connector Terminals No. 3 And No. 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 5.4-7.3 ohms at room temperature?

YES - Go to step 9.

NO - Go to step 21.

9. At the secondary HO2S (Sensor 2) side, check for continuity between body ground and secondary HO2S (Sensor 2) 4P connector terminals No. 3 and No. 4 individually.

Fig. 40: Checking For Continuity Between Body Ground And Secondary HO2S (Sensor 2) 4P Connector Terminals No. 3 And No. 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 21.

NO - Go to step 10.

10. Turn the ignition switch ON (II).
11. Measure voltage between secondary HO2S (Sensor 2) 4P connector terminals No. 3 and No. 4.

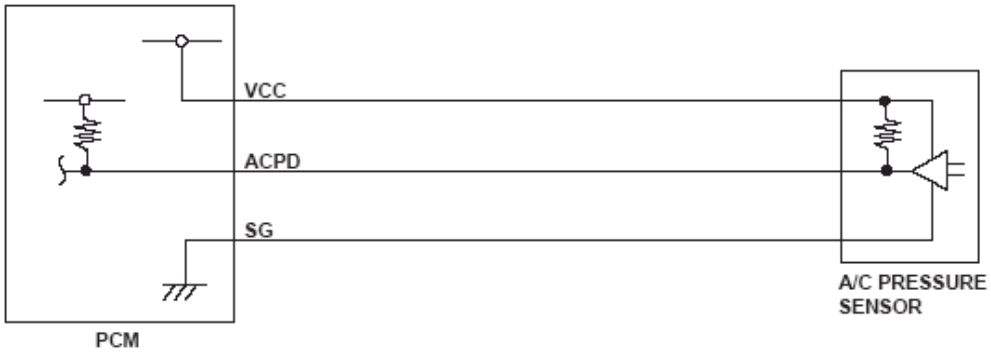

Fig. 41: Measuring Voltage Between Secondary HO2S (Sensor 2) 4P Connector Terminals No. 3 And No. 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 12.

NO - Go to step 16.

12. Turn the ignition switch OFF.
13. Jump the SCS line with the HDS.
14. Disconnect ECM/PCM connector B (44P).
15. Check for continuity between ECM/PCM connector terminal B4 and body ground.

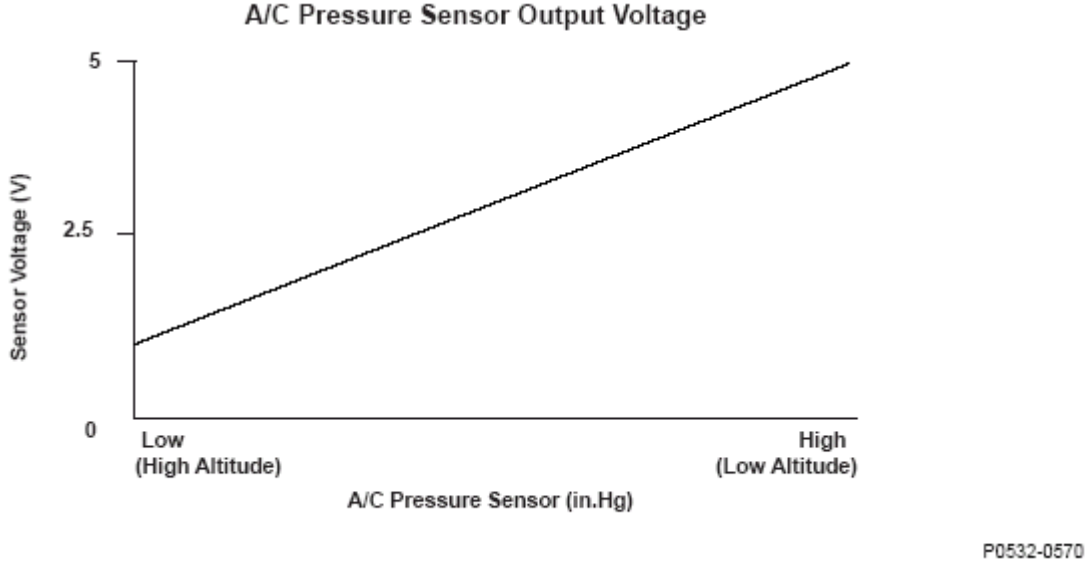

Fig. 42: Checking For Continuity Between ECM/PCM Connector Terminal B4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (B4) and the secondary HO2S (Sensor 2), then go to step 22.

NO - Go to step 28.

16. Measure voltage between secondary HO2S (Sensor 2) 4P connector terminal No. 3 and body ground.

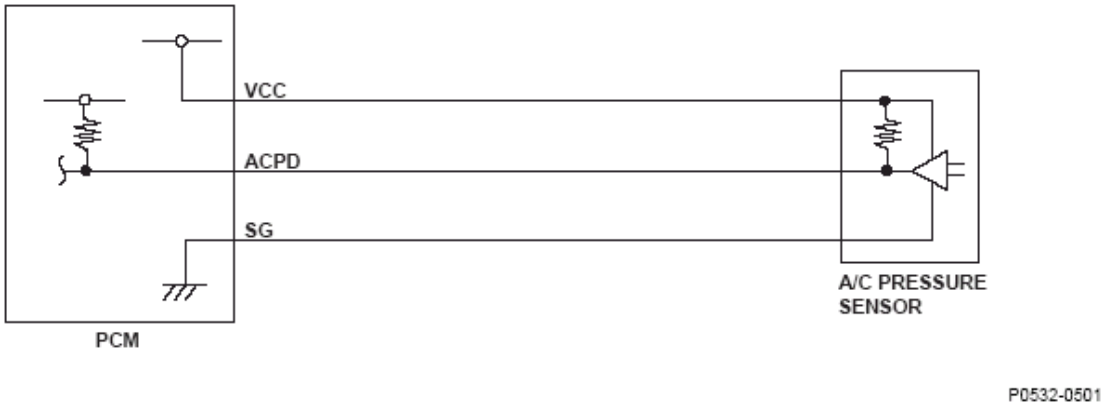

Fig. 43: Measuring Voltage Between Secondary HO2S (Sensor 2) 4P Connector Terminal No. 3 And Body Ground

Is there battery voltage?

YES - Go to step 17.

NO - Repair open in the wire between the secondary HO2S (Sensor 2) and the No. 3 ALTERNATOR (10 A) fuse, then go to step 22.

17. Turn the ignition switch OFF.
18. Jump the SCS line with the HDS.
19. Disconnect ECM/PCM connector B (44P).
20. Check for continuity between secondary HO2S (Sensor 2) 4P connector terminal No. 4 and ECM/PCM connector terminal B4.

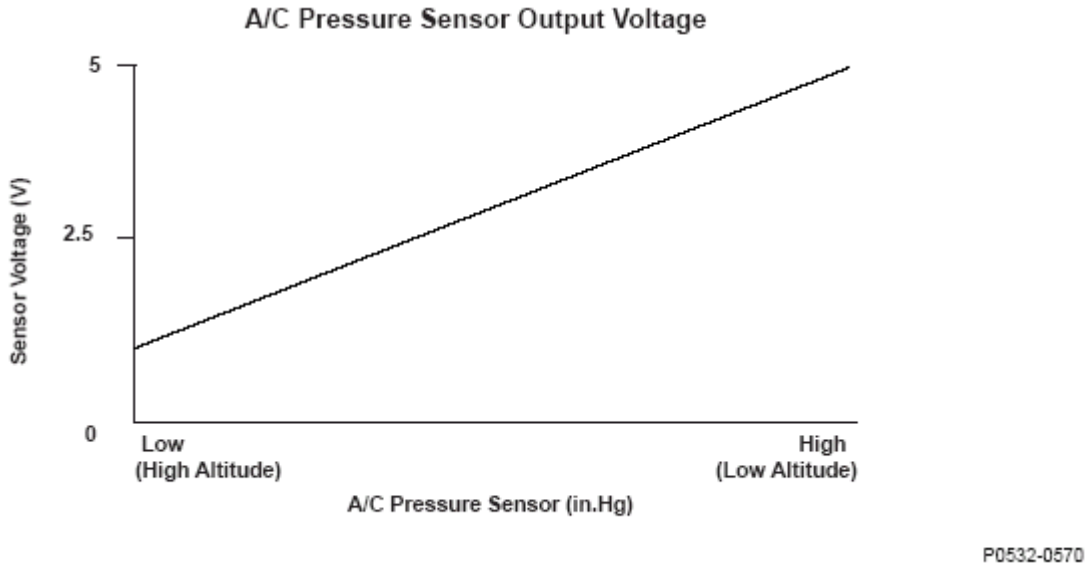

Fig. 44: Checking For Continuity Between Secondary HO2S (Sensor 2) 4P Connector Terminal No. 4 And ECM/PCM Connector Terminal B4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 28.

NO - Repair open in the wire between the ECM/PCM (B4) and the secondary HO2S (Sensor 2), then go to step 22.

21. Replace the secondary HO2S (Sensor 2) (see **A/F SENSOR REPLACEMENT**).
22. Reconnect all connectors.
23. Turn the ignition switch ON (II).
24. Reset the ECM/PCM with the HDS.
25. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
26. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0141 indicated?

YES - Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM/PCM, then go to step 1.

NO - Go to step 27.

27. Monitor the OBD STATUS for DTC P0141 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 26, go to the indicated DTC's troubleshooting.

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the secondary

HO2S (Sensor 2) and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

28. Reconnect all connectors.
29. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
30. Start the engine, and let it idle.
31. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0141 indicated?

    YES - Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM/PCM. If the ECM/PCM was update, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 30. If the ECM/PCM was substitute, go to step 1.

    NO - Go to step 32.

32. Monitor the OBD STATUS for DTC P0141 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 31, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 30. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P0171: FUEL SYSTEM TOO LEAN; DTC P0172: FUEL SYSTEM TOO RICH

NOTE: Refer to the PGM-FI SYSTEM (GX) (SUPPLEMENT) article for additional information for the GX model.

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If any of the DTCs listed below are indicated at the same time as DTC P0171 and/or P0172, troubleshoot those DTCs first, then recheck for P0171 and/or P0172.**

P0101, P0102, P0103: Mass air flow (MAF) sensor

P0107, P0108, P1128, P1129: Manifold absolute pressure (MAP) sensor

P0133, P1172, P1157, P2195, P2238, P2252, P2A00: Air fuel ratio (A/F) sensor (Sensor 1)

P0134, P0135: Air fuel ratio (A/F) sensor (Sensor 1) heater

P0137, P0138, P0139, P2270, P2271: Secondary HO2S (Sensor 2)

P0141: Secondary HO2S (Sensor 2) heater

P2646, P2647, P2648, P2649: VTEC system

P0400, P0401, P0404, P0406, P2413: Exhaust gas recirculation (EGR) system

P0443, P0496: EVAP canister purge valve

1. Check the fuel pressure (see **FUEL PRESSURE TEST**).

   Is the fuel pressure OK?

   YES - Go to step 2.

   NO -

   - If the pressure is too high, replace the fuel pressure regulator (see **FUEL PRESSURE REGULATOR REPLACEMENT**), then go to step 7.
   - If the pressure is too low, check the fuel pump, the fuel feed pipe, and the fuel filter. If they are OK, replace the fuel pressure regulator (see **FUEL PRESSURE REGULATOR REPLACEMENT**), then go to step 7.
2. Check for vacuum leaks at these parts:
   - PCV valve
   - PCV hose
   - EVAP canister purge valve
   - Throttle body
   - Intake manifold
   - Brake booster
   - Brake booster hose
   - Intake air duct

   Are the parts OK?

   YES - Go to step 3.

   NO - Repair or replace parts with leaks, then go to step 7.

3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
4. Check for these conditions:
   - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
   - A/T in Park or neutral (M/T in neutral)
   - All electrical loads off

5. Monitor the ENGINE SPEED in the DATA LIST with the HDS, and hold the engine speed at 2,500 rpm. Once the engine speed is met, hold the accelerator pedal steady for more than 10 seconds.

   Did the engine speed vary more than 100 rpm from 4,500 rpm?

   YES - Repeat step 5.

   NO - Go to step 6.

6. While holding the engine speed at 2,500 rpm, check the MAF SENSOR in the DATA LIST with the HDS.

   Is there about 5.4-7.8 (M/T model) or 5.9-8.5 (A/T model) gm/s?

   YES - Check the engine valve clearances and adjust if necessary (see **VALVE CLEARANCE ADJUSTMENT**). If the valve clearances are OK, replace the injectors (see **INJECTOR REPLACEMENT**), then go to step 7.

   NO - Replace the MAF sensor/IAT sensor (see **MAF SENSOR/IAT SENSOR REPLACEMENT**), then go to step 7.

7. Turn the ignition switch ON (II).
8. Reset the ECM/PCM with the HDS.
9. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
10. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
11. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
    - A/T in D position (M/T in 5th gear)
    - Drive at a steady speed between 15-75 mph (24-120 Km/h)

    NOTE: DTC P0171 and/or P0172 may take up to 80 minutes of test driving to set. Using the HDS, monitor the air fuel feed back average (AF FB AVE). If the long term fuel trim/air fuel feed back average stays within 0.80-1.25, there is no problem at this time.

12. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0171 or P0172 indicated?

    YES - If DTC P0171 or P0172 is indicated, go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0300: RANDOM MISFIRE AND ANY COMBINATION OF THE FOLLOWING: DTC P0301: NO. 1 CYLINDER MISFIRE DETECTED; DTC P0302: NO. 2 CYLINDER MISFIRE DETECTED; DTC P0303: NO. 3 CYLINDER MISFIRE DETECTED; DTC P0304: NO. 4 CYLINDER MISFIRE

DETECTED

NOTE: Refer to the PGM-FI SYSTEM (GX) (SUPPLEMENT) article for additional information for the GX model.

Special Tools Required

- Pressure gauge adapter 07NAJ-P07010A
- A/T low pressure gauge w/panel 07406-0070301
- A/T pressure hose 07406-0020201
- A/T pressure hose, 2,210 mm 07MAJ-PY4011A
- A/T pressure adapter 07MAJ-PY40120
- Oil pressure hose 07ZAJ-S5A0200

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If the misfire is frequent enough to trigger detection of increased emissions during two consecutive driving cycles, the MIL will come on, and DTC P0300 (and some of the combination of P0301 through P0304) will be stored.**
- **If the misfire is frequent enough to damage the catalyst, the MIL will flash whenever the misfire occurs, and DTC P0300 (and some of the combination of P0301 through P0304) will be stored. When the misfire stops, the MIL will remain on.**
- **If any of the DTCs listed below are indicated at the same time as the random misfire DTCs, troubleshoot those DTCs first, then recheck for random misfire DTCs:**

P0101, P0102, P0103: Mass air flow (MAF) sensor

P0107, P0108, P1128, P1129: Manifold absolute pressure (MAP) sensor

P0171, P0172: Fuel system

P0335, P0339: Crankshaft position (CKP) sensor

P0365, P0369: Camshaft position (CMP) sensor

P2646, P2647, P2648, P2649: VTEC system

P0351, P0352, P0353, P0354: Ignition coil

P0506, P0507: Idle control system

P0400, P0401, P0404, P0416, P2413: Exhaust gas recirculation (EGR) system

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle without load (in Park or neutral).
4. Monitor the OBD STATUS for DTC P0301, P0302, P0303, or P0304 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 9.

   NO - If the screen indicates PASSED, go to step 5. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, wait for several minutes, then recheck.

5. Check the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE in the DATA LIST for 10 minutes with the HDS.

   Does the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE show misfire counts?

   YES - Go to step 9.

   NO - Go to step 6.

6. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
   - ENGINE SPEED
   - VSS
   - REL TP SENSOR
   - CLV (calculated load value)
   - APP SENSOR
7. Monitor the OBD STATUS for DTC P0301, P0302, P0303, or P0304 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 9.

   NO - If the screen indicates PASSED, go to step 8. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 6 and recheck.

8. Check the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE in the DATA LIST for 10 minutes with the HDS.

   Does the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE show misfire counts?

   YES - Go to step 9.

NO - Intermittent failure, the system is OK at this time.

9. Turn the ignition switch OFF.
10. Check the fuel quality.

    Is the quality good?

    YES - Go to step 11.

    NO - Drain the tank and fill with a known-good fuel, then go to step 24.

11. Inspect the spark plugs (see **SPARK PLUG INSPECTION**). If the spark plugs are fouled or worn, replace them.
12. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VSS
    - REL TP SENSOR
    - CLV (calculated load value)
    - APP SENSOR
13. Check the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE in the DATA LIST for 10 minutes with the HDS.

    Does the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE show misfire counts?

    YES - Go to step 14.

    NO - Go to step 25.

14. Check the fuel pressure (see **FUEL PRESSURE TEST**).

    Is the fuel pressure OK?

    YES - Go to step 15.

    NO -

    - If the fuel pressure is too high, replace the fuel pressure regulator (see **FUEL PRESSURE REGULATOR REPLACEMENT**), then go to step 24.
    - If the fuel pressure is too low, check the fuel pump, the fuel feed pipe, and the fuel filter. If they are OK, replace the fuel pressure regulator (see **FUEL PRESSURE REGULATOR REPLACEMENT**), then go to step 24.
15. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
16. Check for these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 176°F (80°C)
    - M/T in neutral (A/T in Park or neutral)

- All electrical loads off

17. Monitor the ENGINE SPEED in the DATA LIST with the HDS, and hold the engine speed at 2,500 rpm. Once the engine speed is met, hold the accelerator pedal steady for more than 10 seconds.

    Did the engine speed vary more than 100 rpm from 2,500 rpm?

    YES - Repeat step 17.

    NO - Go to step 18.

18. While holding the engine speed at 2,500 rpm, check the MAF SENSOR in the DATA LIST with the HDS.

    Is there about 5.4-7.8 (M/T model) or 5.9-8.5 (A/T model) gm/s?

    YES - Go to step 19.

    NO - Replace the MAF sensor/IAT sensor (see **MAF SENSOR/IAT SENSOR REPLACEMENT**), then go to step 24.

19. Turn the ignition switch OFF.
20. Remove the EOP sensor (A), and install the special tools as shown, then install the EOP sensor in the pressure gauge adapter (B).

    NOTE: Install the EOP sensor in the reverse order of removal with a new O-ring.

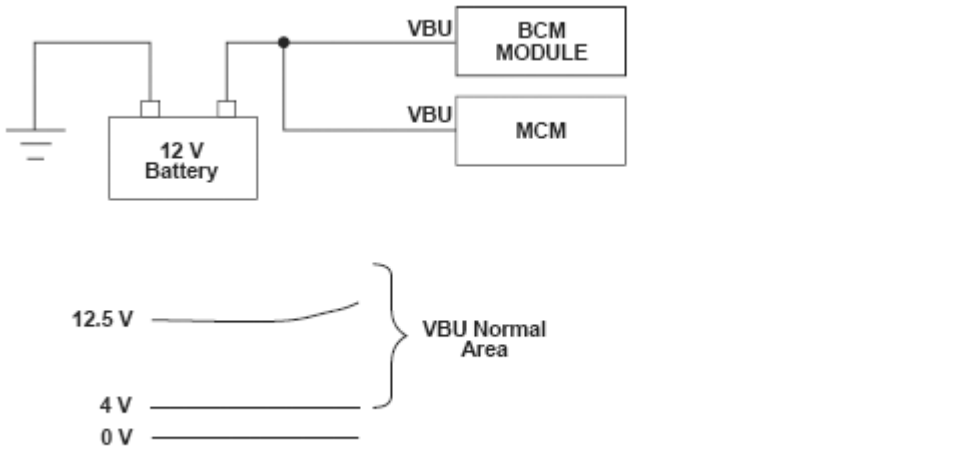

Fig. 45: Installing EOP Sensor In Pressure Gauge Adapter (With Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Reconnect the EOP sensor 3P connector.
22. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
23. Check the oil pressure at engine speeds of 1,000 rpm and 2,000 rpm.

Is the oil pressure below 49 kPa (0.5 kgf/cm^2 , 7 psi)?

YES - Check for air in the fuel line, then go to step 24.

NO - Inspect the VTEC system, then go to step 24.

24. Turn the ignition switch ON (II).
25. Reset the ECM/PCM with the HDS.
26. Clear the CKP pattern with the HDS.
27. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
28. Do the CKP pattern learn procedure (see **ECM/PCM RESET**).
29. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VSS
    - REL TP SENSOR
    - CLV (calculated load value)
    - APP SENSOR
30. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0300, P0301, P0302, P0303, or P0304 indicated?

    YES - Check for a poor connection or loose terminals at the ignition coil, the injector, and the ECM/PCM, then go to troubleshooting DTC P0301, P0302, P0303, or P0304 (see **DTC P0301: No. 1 Cylinder Misfire Detected; DTC P0302: No. 2 Cylinder Misfire Detected; DTC P0303: No. 3 Cylinder Misfire Detected; DTC P0304: No. 4 Cylinder Misfire Detected**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

    NO - Go to step 31.

31. Monitor the OBD STATUS for DTC P0301, P0302, P0303, or P0304 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 30, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, go to step 1 and recheck. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 29.

DTC P0301: NO. 1 CYLINDER MISFIRE DETECTED; DTC P0302: NO. 2 CYLINDER MISFIRE DETECTED; DTC P0303: NO. 3 CYLINDER MISFIRE DETECTED; DTC P0304: NO. 4 CYLINDER MISFIRE DETECTED

NOTE: Refer to the PGM-FI SYSTEM (GX) (SUPPLEMENT) article for additional information for the GX model.

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle without load (in Park or neutral).
4. Monitor the OBD STATUS for DTC P0301, P0302, P0303, or P0304 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 9.

   NO - If the screen indicates PASSED, go to step 5. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, wait for several minutes, and recheck.

5. Check the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE in the DATA LIST for 10 minutes with the HDS.

   Does the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE show misfire counts?

   YES - Go to step 9.

   NO - Go to step 6.

6. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
   - ENGINE SPEED
   - VSS
   - REL TP SENSOR
   - CLV (calculated load value)
   - APP SENSOR
7. Monitor the OBD STATUS for DTC P0301, P0302, P0303, or P0304 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 9.

   NO - If the screen indicates PASSED, go to step 8. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 6 and recheck.

8. Check the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE in the DATA LIST for 10 minutes with the HDS.

   Does the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE show misfire

counts?

YES - Go to step 9.

NO - Intermittent failure, the system is OK at this time. Check for loose wires or poor connections in the fuel system circuit.

9. Turn the ignition switch OFF.
10. Exchange the ignition coil from the problem cylinder with one from another cylinder.
11. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VSS
    - REL TP SENSOR
    - CLV (calculated load value)
    - APP SENSOR
12. Check the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE in the DATA LIST for 10 minutes with the HDS.

    Does the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE show misfire counts?

    YES - Go to step 13.

    NO - Intermittent misfire due to poor contact at the ignition coil connector (no misfire at this time). Check for poor connections or loose terminals at the ignition coil.

13. Determine which cylinder had the misfire.

    Does the misfire occur in the cylinder where the ignition coil was exchanged?

    YES - Replace the faulty ignition coil (see **IGNITION COIL REMOVAL/INSTALLATION**), then go to step 40.

    NO - Go to step 14.

14. Turn the ignition switch OFF.
15. Exchange the spark plug from the problem cylinder with one from another cylinder.
16. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VSS
    - REL TP SENSOR
    - CLV (calculated load value)
    - APP SENSOR
17. Check the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE in the DATA LIST for 10 minutes with the HDS.

Does the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE show misfire counts?

YES - Go to step 18.

NO - Intermittent misfire due to spark plug fouling (no misfire at this time).

18. Determine which cylinder had the misfire.

    Does the misfire occur in the cylinder where the spark plug was exchanged?

    YES - Replace the faulty spark plug, then go to step 40.

    NO - Go to step 19.

19. Turn the ignition switch OFF.
20. Exchange the injector from the problem cylinder with one from the another cylinder.
21. Start the engine, and let it idle for 2 minutes.
22. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VSS
    - REL TP SENSOR
    - CLV (calculated load value)
    - APP SENSOR
23. Check the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE in the DATA LIST for 10 minutes with the HDS.

    Does the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE show misfire counts?

    YES - Go to step 24.

    NO - Intermittent misfire due to bad contact at the injector connector (no misfire at this time). Check for poor connections or loose terminals at the injector.

24. Determine which cylinder had the misfire.

    Does the misfire occur in the cylinder where the injector was exchanged?

    YES - Replace the faulty injector (see **INJECTOR REPLACEMENT**), then go to step 40.

    NO - Go to step 25.

25. Do an engine compression and a cylinder leakdown test (see **ENGINE COMPRESSION INSPECTION**).

    Did the engine pass both tests?

YES - Go to step 26.

NO - Repair the engine, then go to step 40.

26. Do the VTEC rocker arm test (see **VTEC ROCKER ARM TEST**).

    Did the engine pass the test?

    YES - Go to step 27.

    NO - Repair the VTEC rocker arm (see **ROCKER ARM AND SHAFT DISASSEMBLY/REASSEMBLY**), then go to step 40.

27. Turn the ignition switch OFF.
28. Jump the SCS line with the HDS.
29. Disconnect ECM/PCM connector C (44P).
30. Turn the ignition switch ON (II).
31. Measure voltage between body ground and the appropriate ECM/PCM connector terminal of the problem cylinder (see **BODY GROUND AND APPROPRIATE ECM/PCM CONNECTOR TERMINAL**).

Is there battery voltage?

YES - Go to step 39.

NO - Go to step 32.

32. Turn the ignition switch OFF.
33. Disconnect the injector 2P connector from the problem cylinder.
34. Turn the ignition switch ON (II).
35. Measure voltage between injector 2P connector terminal No. 1 and body ground.

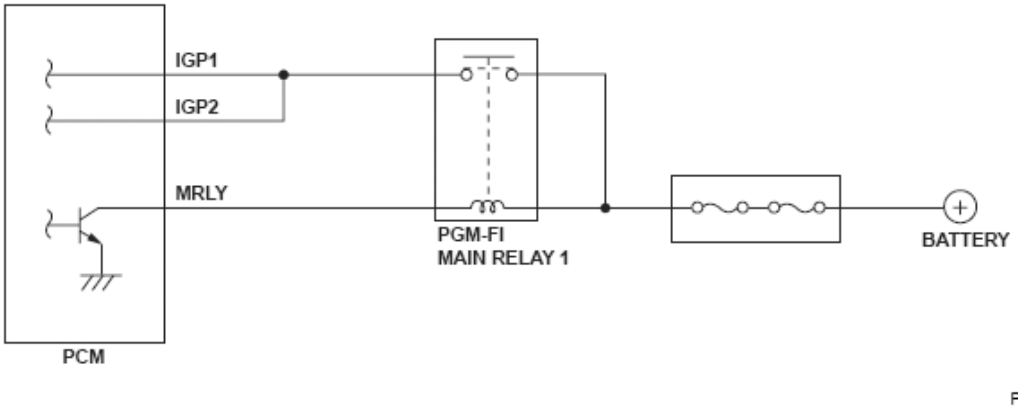

Fig. 47: Measuring Voltage Between Injector 2P Connector Terminal No. 1 And Body Ground

Is there battery voltage?

YES -Go to step 36.

NO -Repair open in the wire between the injector and PGM-FI main relay 1 C, then go to step 40.

36. Turn the ignition switch OFF.
37. Check for continuity between body ground and the appropriate ECM/PCM connector terminal of the problem cylinder (see **BODY GROUND AND APPROPRIATE ECM/PCM CONNECTOR TERMINAL**).

Is there continuity?

YES - Go to step 39.

NO - Repair open in the wire between the ECM/PCM and the injector, then go to step 40.

39. At injector side, measure resistance between injector 2P connector terminals No. 1 and No. 2.

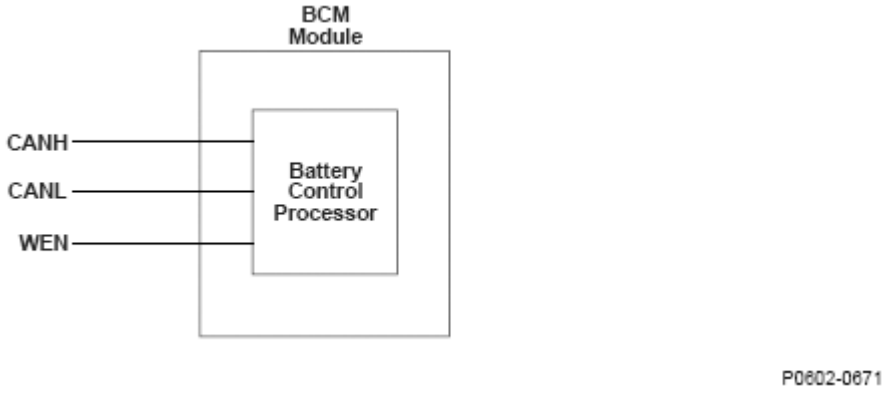

Fig. 50: Measuring Resistance Between Injector 2P Connector Terminals No. 1 And No. 2

Is there 10-13 ohms?

YES - Go to step 50.

NO - Replace the injector (see **INJECTOR REPLACEMENT**), then go to step 40.

40. Turn the ignition switch OFF.
41. Reconnect all connectors.
42. Turn the ignition switch ON (II).
43. Reset the ECM/PCM with the HDS.
44. Clear the CKP pattern with the HDS.
45. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
46. Do the CKP pattern learn procedure (see **CRANK (CKP) PATTERN CLEAR/CRANK (CKP) PATTERN LEARN**).
47. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VSS
    - REL TP SENSOR
    - CLV (calculated load value)
    - APP SENSOR
48. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0301, P0302, P0303, or P0304 indicated?

YES - Check for poor connections or loose terminals at the ignition coil, the injector, and the ECM/PCM, then go to troubleshooting DTC P0300, P0301, P0302, P0303, or P0304 (see **DTC P0300: Random Misfire and Any Combination of the Following: DTC P0301: No. 1 Cylinder Misfire Detected; DTC P0302: No. 2 Cylinder Misfire Detected; DTC P0303: No. 3 Cylinder Misfire Detected; DTC P0304: No. 4 Cylinder Misfire Detected**).

NO - Go to step 49.

49. Monitor the OBD STATUS for DTC P0301, P0302, P0303, or P0304 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 48, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the ignition coil, the injector, and the ECM/PCM, then go to step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 47.

50. Reconnect all connectors.
51. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
52. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VSS
    - REL TP SENSOR
    - CLV (calculated load value)
    - APP SENSOR
53. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0301, P0302, P0303, or P0304 indicated?

    YES - Check for poor connections or loose terminals at the ignition coil, the injector, and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 52. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 54.

54. Monitor the OBD STATUS for DTC P0301, P0302, P0303, or P0304 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 53, go to the indicated DTC's troubleshooting.

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the ignition coil, the injector, and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 52. If the ECM/PCM was substituted, go to step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 52.

DTC P0325: KNOCK SENSOR CIRCUIT MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
4. Hold the engine speed between 3,000-4,000 rpm for at least 10 seconds.
5. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0325 indicated?

   YES - Go to step 6.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the knock sensor and the ECM/PCM.

6. Turn the ignition switch OFF.
7. Jump the SCS line with the HDS.
8. Disconnect the knock sensor 1P connector (see **KNOCK SENSOR REPLACEMENT**).
9. Disconnect ECM/PCM connector C (44P).
10. Check for continuity between ECM/PCM connector terminal C42 and body ground.

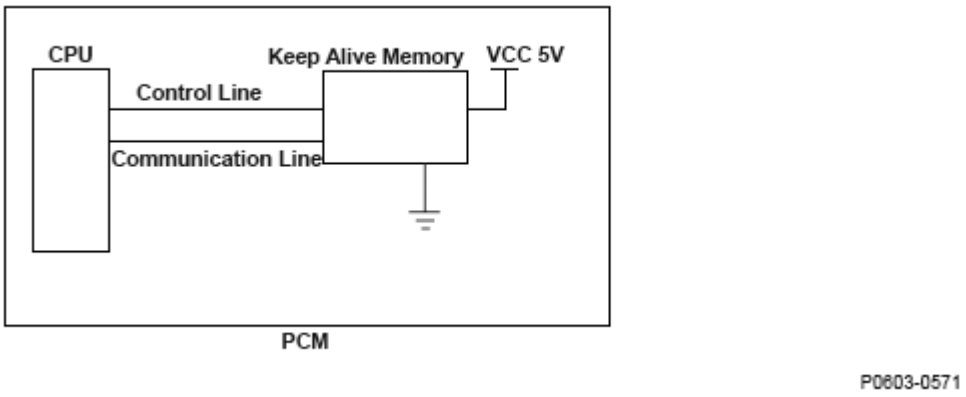

Fig. 51: Checking For Continuity Between ECM/PCM Connector Terminal C42 And Body Ground
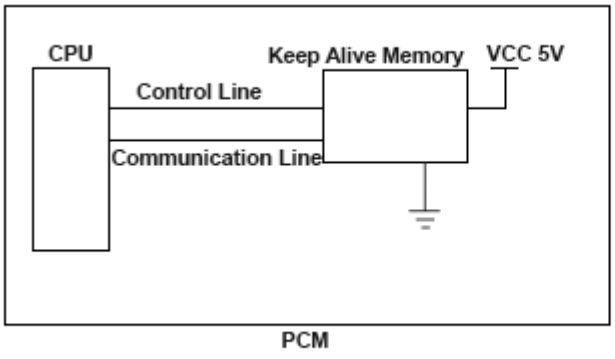
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (C42) and the knock sensor, then go to step 14.

NO - Go to step 11.

11. Connect the knock sensor 1P connector terminal to body ground with a jumper wire.



P0603-0571

Is there continuity?

YES - Go to step 13.

NO - Repair open in the wire between the ECM/PCM (C42) and the knock sensor, then go to step 14.

13. Replace the knock sensor (see **KNOCK SENSOR REPLACEMENT**).
14. Reconnect all connectors.

15. Turn the ignition switch ON (II).
16. Reset the ECM/PCM with the HDS.
17. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
18. Hold the engine speed between 3,000-4,000 rpm for at least 10 seconds.
19. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0325 indicated?

    YES - Go to step 21.

    NO - Go to step 20.

20. Monitor the OBD STATUS for DTC P0325 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 19, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the knock sensor and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 17.

21. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
22. Hold the engine speed between 3,000-4,000 rpm for at least 10 seconds.
23. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0325 indicated?

    YES - Check for poor connections or loose terminals at the knock sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 22. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 24.

24. Monitor the OBD STATUS for DTC P0325 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 23, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the knock sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 22. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, go to step 22.

DTC P0335: CKP SENSOR NO SIGNAL

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

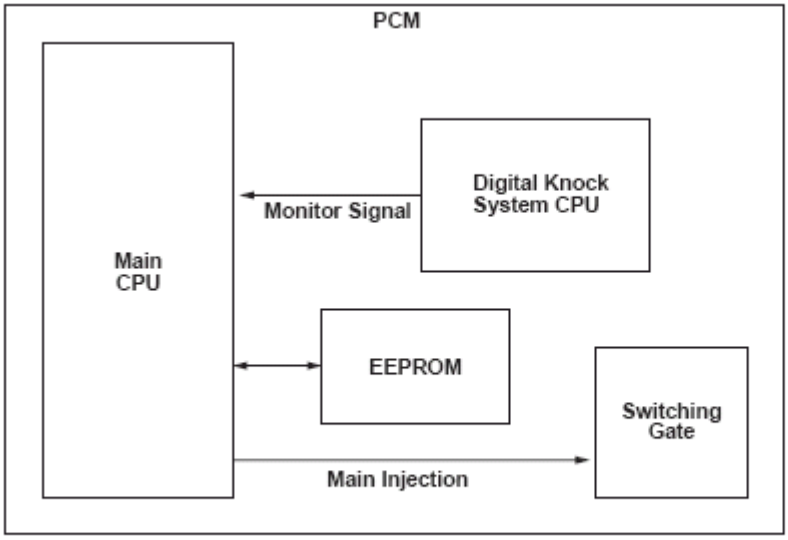
1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0335 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the CKP sensor and the ECM/PCM.

5. Turn the ignition switch OFF.
6. Disconnect the CKP sensor 3P connector.
7. Turn the ignition switch ON (II).
8. Measure voltage between CKP sensor 3P connector terminal No. 1 and body ground.



P0603-0671

Fig. 54: Measuring Voltage Between CKP Sensor 3P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 9.

NO - Repair open in the wire between the CKP sensor and PGM-FI main relay 1, then go to step 19.

9. Measure voltage between CKP sensor 3P connector terminal No. 2 and body ground.

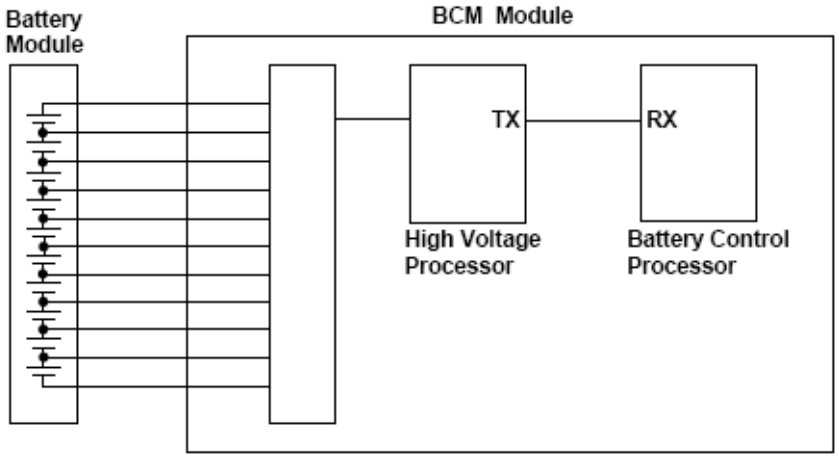


Fig. 55: Measuring Voltage Between CKP Sensor 3P Connector Terminal No. 2 And Body Ground

Is there about 5 V?

YES - Go to step 10.

NO - Go to step 11.

10. Measure voltage between CKP sensor 3P connector terminals No. 1 and No. 3.

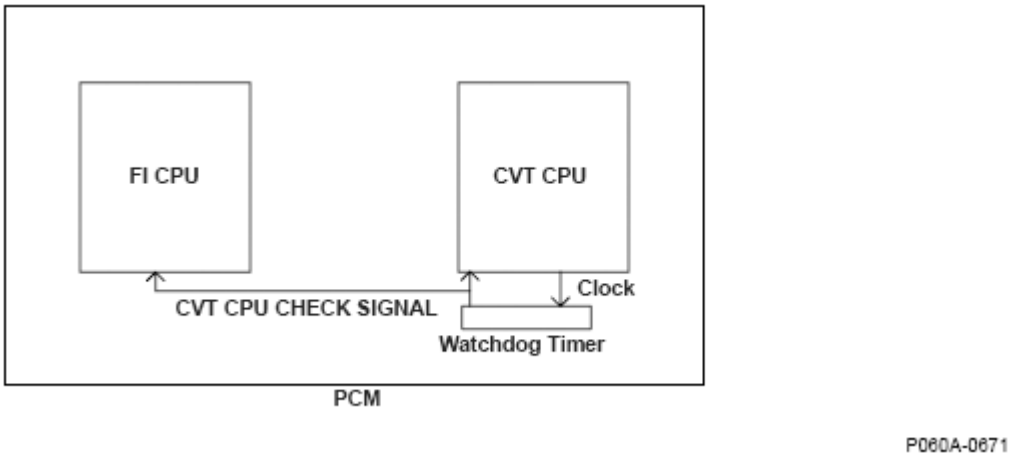

Fig. 56: Measuring Voltage Between CKP Sensor 3P Connector Terminals No. 1 And No. 3
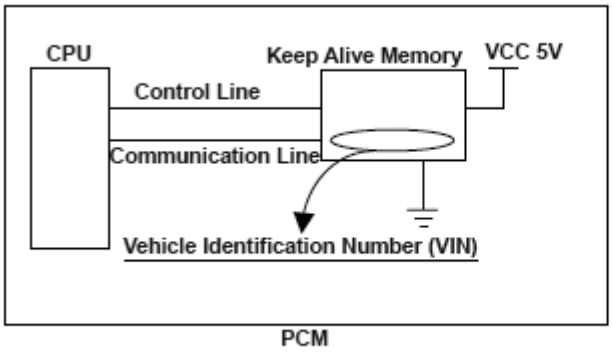
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 17.

NO - Repair open in the wire between the CKP sensor and G101; A/T model (see **CONNECTOR TO HARNESS INDEX**), M/T model (see **CONNECTOR TO HARNESS INDEX**), then go to step 19.

11. Turn the ignition switch OFF.
12. Jump the SCS line with the HDS.
13. Disconnect ECM/PCM connector C (44P).
14. Check for continuity between ECM/PCM connector terminal C32 and body ground.



P0630-0571

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (C32) and the CKP sensor, then go to step 19.

NO - Go to step 15.

15. Connect CKP sensor 3P connector terminal No. 2 to body ground with a jumper wire.

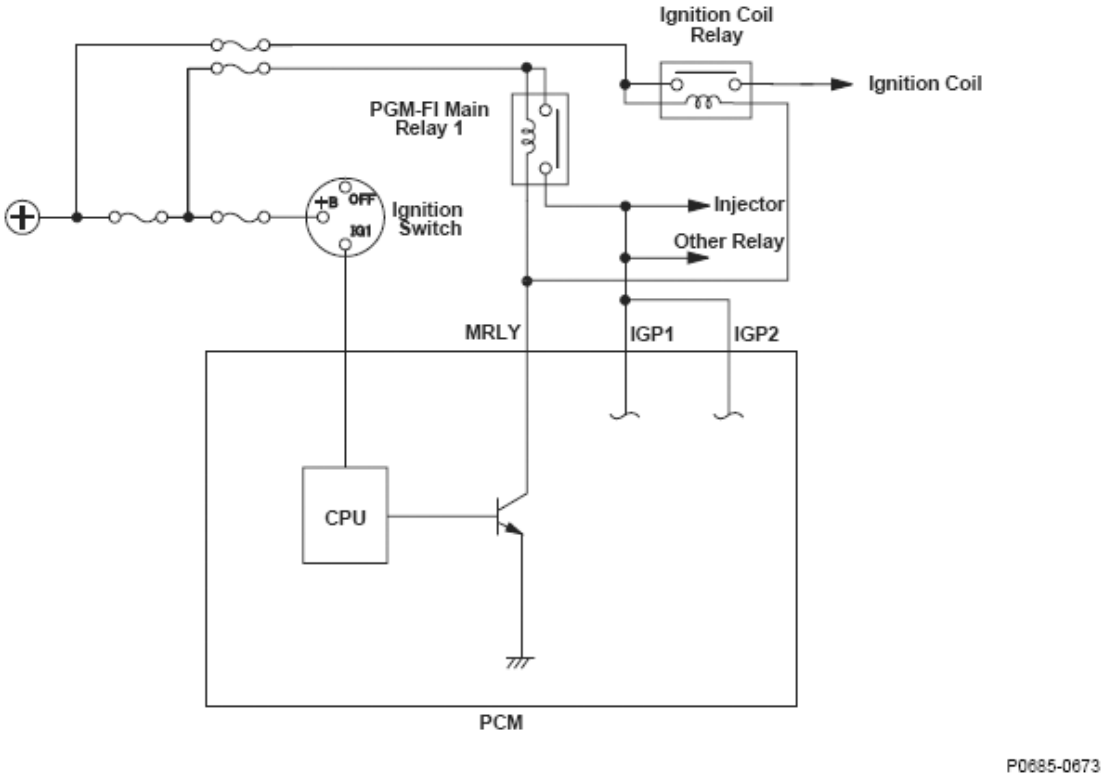

Fig. 58: Connecting CKP Sensor 3P Connector Terminal No. 2 To Body Ground With A Jumper Wire

16. Check for continuity between ECM/PCM connector terminal C32 and body ground.

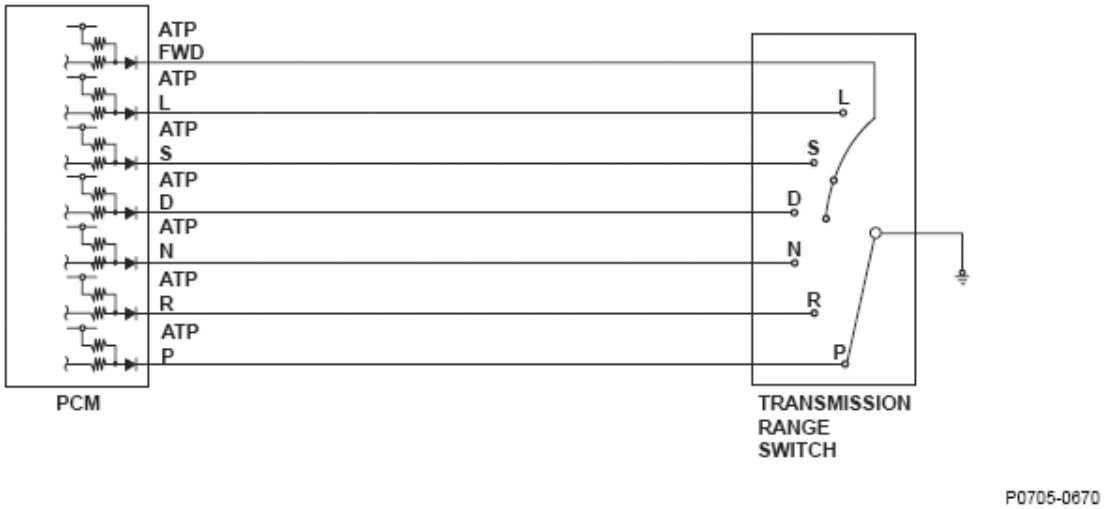

Fig. 59: Checking For Continuity Between ECM/PCM Connector Terminal C32 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 26.

NO - Repair open in the wire between the ECM/PCM (C32) and the CKP sensor, then go to step 19.

17. Turn the ignition switch OFF.
18. Replace the CKP sensor (see **CKP SENSOR REPLACEMENT**).
19. Reconnect all connectors.
20. Turn the ignition switch ON (II).
21. Reset the ECM/PCM with the HDS.
22. Clear the CKP pattern with the HDS.
23. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
24. Do the CKP pattern learn procedure (see **ECM/PCM RESET**).
25. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0335 indicated?

    YES - Check for poor connections or loose terminals at the CKP sensor and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

26. Reconnect all connectors.
27. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
28. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0335 indicated?

    YES - Check for poor connections or loose terminals at the CKP sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0339: CKP SENSOR INTERMITTENT INTERRUPTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle for 10 seconds.
4. Check the CKP NOISE count in the DATA LIST with the HDS.

   Are 0 counts indicated?

YES - Go to step 7.

NO - Go to step 5.

5. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
   - ENGINE SPEED
   - VSS
6. Check the CKP NOISE count in the DATA LIST with the HDS.

   Are 0 counts indicated?

   YES - Go to step 7.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the CKP sensor and the ECM/PCM.

7. Check for poor or loose connections and terminals at these locations:
   - CKP sensor
   - ECM/PCM
   - Engine ground
   - Body ground

   Are the connections and terminals OK?

   YES - Go to step 8.

   NO - Repair the connectors or terminals, then go to step 10.

8. Remove the oil pan (see **OIL PAN REMOVAL**), and check for damage to the CKP sensor pulser plate.

   Is the pulser plate damaged?

   YES - Replace the CKP sensor pulser plate, then go to step 10.

   NO - Go to step 9.

9. Replace the CKP sensor (see **CKP SENSOR REPLACEMENT**).
10. Turn the ignition switch ON (II).
11. Reset the ECM/PCM with the HDS.
12. Clear the CKP pattern with the HDS.
13. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
14. Do the CKP pattern learn procedure (see **CRANK (CKP) PATTERN CLEAR/CRANK (CKP) PATTERN LEARN**).
15. Start the engine, and let it idle for 10 seconds.
16. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0339 indicated?

YES - Check for poor connections or loose terminals at the CKP sensor and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0351: NO. 1 CYLINDER IGNITION COIL CIRCUIT MALFUNCTION; DTC P0352: NO. 2 CYLINDER IGNITION COIL CIRCUIT MALFUNCTION; DTC P0353: NO. 3 CYLINDER IGNITION COIL CIRCUIT MALFUNCTION; DTC P0354: NO. 4 CYLINDER IGNITION COIL CIRCUIT MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0351, P0352, P0353 and/or P0354 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the ignition coil and the ECM/PCM.

5. Turn the ignition switch OFF.
6. Exchange the ignition coil from the problem cylinder with one from another cylinder.
7. Start the engine.
8. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC indicated at the exchanged cylinder?

   YES - Replace the faulty ignition coil (see **IGNITION COIL REMOVAL/INSTALLATION**), then go to step 25.

   NO - Go to step 9.

9. Turn the ignition switch OFF.
10. Check the No. 18 IG COIL (15 A) fuse in the underhood fuse/relay box.

    Is the fuse OK?

    YES - Go to step 11.

NO - Go to step 12.

11. Test the ignition coil relay (B) in the under-hood fuse/relay box (see **POWER RELAY TEST**).

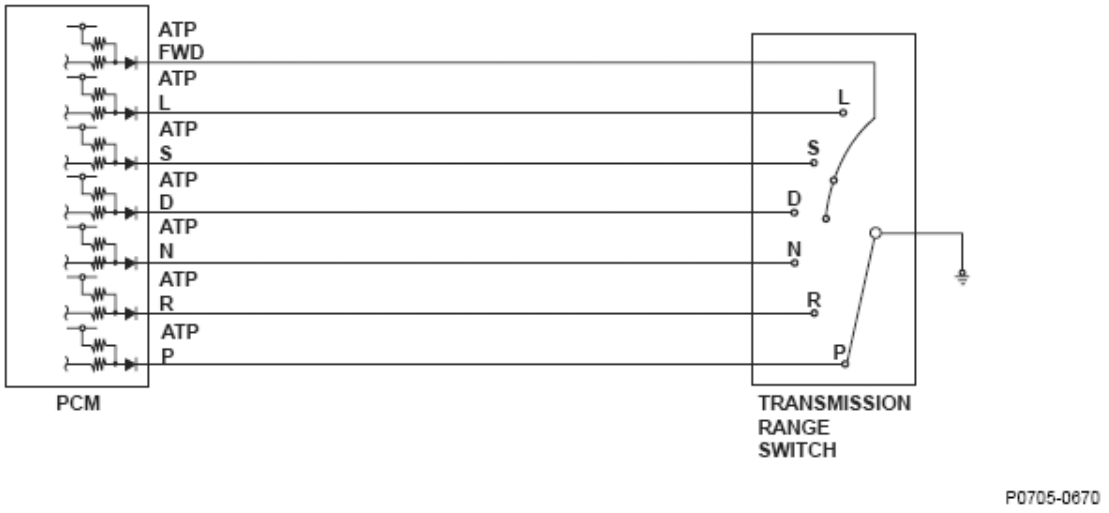

Fig. 60: Identifying Ignition Coil Relay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the ignition coil relay OK?

YES - Go to step 15.

NO - Replace the ignition coil relay, then go to step 25.

12. Remove the ignition coil relay (B) from the underhood fuse/relay box.

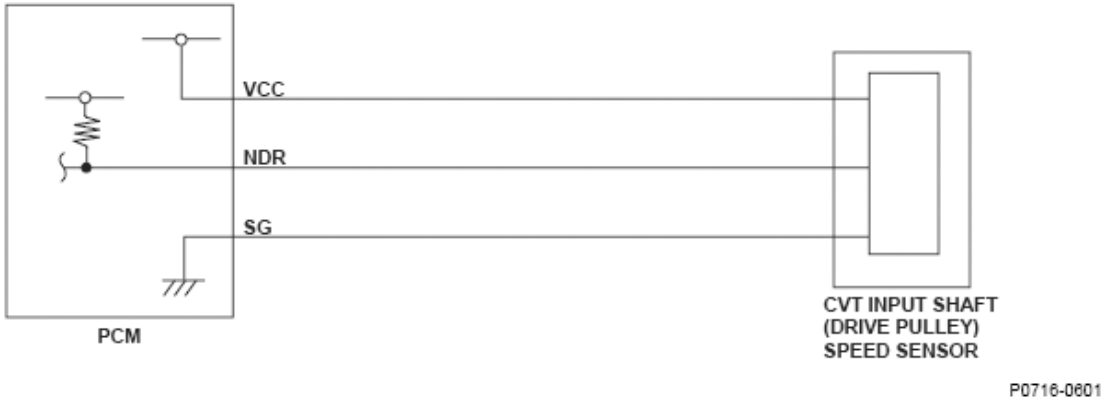

Fig. 61: Identifying Ignition Coil Relay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Disconnect all ignition coil 3P connectors.
14. Check for continuity between No. 1 ignition coil 3P connector terminal No. 3 and body ground.

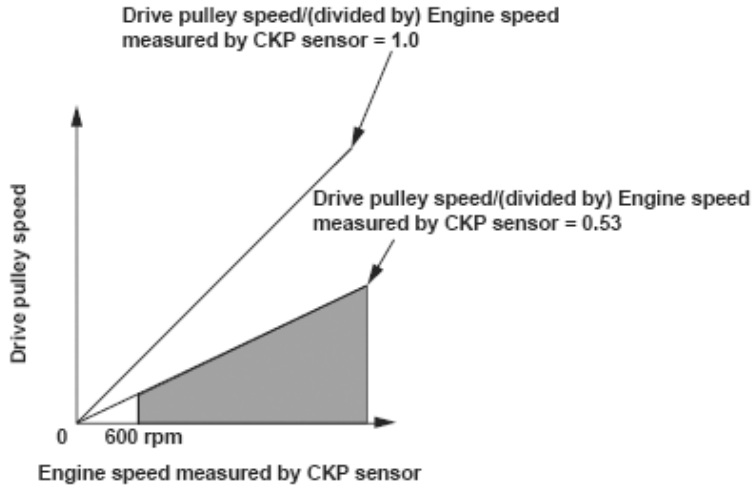

Fig. 62: Checking For Continuity Between No. 1 Ignition Coil 3P Connector Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ignition coils and the ignition coil relay. Also replace the No. 18 IG COIL (15 A) fuse, then go to step 25.

NO - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**), then go to step 25.

15. Reconnect the ignition coil relay.
16. Disconnect the ignition coil 3P connector from the problem cylinder.
17. Turn the ignition switch ON (II).
18. Measure voltage between ignition coil 3P connector terminal No. 3 of the problem cylinder and body ground (see **IGNITION COIL 3P CONNECTOR TERMINAL NO. 3 OF PROBLEM CYLINDER AND BODY GROUND**).

Is there battery voltage?

YES - Go to step 19.

NO - Repair open in the wire between the ignition coil and the ignition coil relay, then go to step 25.

19. Turn the ignition switch OFF.
20. Check for continuity between ignition coil 3P connector terminal No. 2 of the problem cylinder and body ground (see **IGNITION COIL 3P CONNECTOR TERMINAL NO. 2 OF PROBLEM CYLINDER AND BODY GROUND**).

Is there continuity?

YES - Go to step 31.

NO - Repair open in the wire between the ECM/PCM and the ignition coil, then go to step 25.

25. Turn the ignition switch OFF.
26. Reconnect all connectors.
27. Turn the ignition switch ON (II).
28. Reset the ECM/PCM with the HDS.
29. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
30. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0351, P0352, P0353, and/or P0354 indicated?

    YES - Check for poor connections or loose terminals at the ignition coil and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

31. Reconnect all connectors.
32. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
33. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0351, P0352, P0353, and/or P0354 indicated?

YES - Check for poor connections or loose terminals at the ignition coil and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0365: CMP SENSOR NO SIGNAL

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine.
4. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0365 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the CMP sensor and the ECM/PCM.

5. Turn the ignition switch OFF.
6. Disconnect the CMP sensor 3P connector.
7. Turn the ignition switch ON (II).
8. Measure voltage between CMP sensor 3P connector terminal No. 3 and body ground.

Is there continuity?

YES - Go to step 23.

NO - Repair open in the wire between the ECM/PCM (C31) and the CMP sensor, then go to step 18.

16. Turn the ignition switch OFF.
17. Replace the CMP sensor (see **CMP SENSOR REPLACEMENT**).
18. Reconnect all connectors.
19. Turn the ignition switch ON (II).
20. Reset the ECM/PCM with the HDS.
21. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
22. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0365 indicated?

YES - Check for poor connections or loose terminals at the CMP sensor and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

23. Reconnect all connectors.
24. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
25. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0365 indicated?

YES - Check for poor connections or loose terminals at the CMP sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0369: CMP SENSOR CIRCUIT INTERMITTENT INTERRUPTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle for 10 seconds.
4. Check the CMP NOISE count in the DATA LIST with the HDS.

Are 0 counts indicated?

YES - Go to step 7.

NO - Go to step 5.

5. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
   - ENGINE SPEED
   - VSS
6. Check the CMP NOISE count in the DATA LIST with the HDS.

Are 0 counts indicated?

YES - Go to step 7.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the CMP sensor and the ECM/PCM.

7. Check for poor or loose connections and terminals at these locations:
   - CMP sensor
   - ECM/PCM
   - Engine ground
   - Body ground

   Are the connections and terminals OK?

   YES - Go to step 8.

   NO - Repair the connectors or terminals, then go to step 11.

8. Check for damage to the CMP sensor pulser plate (see **CMP PULSE PLATE REMOVAL AND INSTALLATION**).

   Is the pulser plate damaged?

   YES - Replace the CMP sensor pulser plate (see **CMP PULSE PLATE REMOVAL AND INSTALLATION**), then go to step 11.

   NO - Go to step 9.

9. Turn the ignition switch OFF.
10. Replace the CMP sensor (see **CKP SENSOR REPLACEMENT**).
11. Turn the ignition switch ON (II).
12. Reset the ECM/PCM with the HDS.
13. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
14. Start the engine, and let it idle for 10 seconds.
15. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0369 indicated?

    YES - Check for poor connections or loose terminals at the CMP sensor and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P050A: COLD START IDLE AIR CONTROL SYSTEM PERFORMANCE PROBLEM

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check for Temporary DTCs or DTCs with the HDS.

   Are any Temporary DTCs or DTCs other than P050A indicated?

   YES - Go to the indicated DTC's troubleshooting.

   NO - Go to step 3.

3. Check for poor connections or blockage at the intake air duct.

   Is it OK?

   YES - Go to step 4.

   NO - Reconnect or repair the intake air duct, then go to step 20.

4. Check for damage at the air cleaner housing.

   Is it OK?

   YES - Go to step 5.

   NO - Replace the air cleaner housing (see **AIR CLEANER REMOVAL/INSTALLATION**), then go to step 20.

5. Check for dirt or debris in the air cleaner element.

   Is it dirty?

   YES - Replace the air cleaner element or remove the debris (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**), then go to step 20.

   NO - Go to step 6.

6. Let the engine cool until the value of ECT SENSOR 1 is 122°F (50°C) or less.
7. Clear the DTC with the HDS.
8. Start the engine, and let it idle 10 seconds or more.
9. Monitor the OBD STATUS for DTC P050A in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 10.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 6 and recheck.

10. Do the ETCS TEST in the INSPECTION MENU with the HDS.

Is the THROTTLE ACTUATOR CONTROL VALVE normal?

YES - Go to step 11.

NO - Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**), then go to step 20.

11. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
12. Monitor the ENGINE SPEED in the DATA LIST with the HDS, and hold the engine speed at 2,500 rpm for at least 30 seconds.
13. While holding the engine speed at 2,500 rpm, check the MAF SENSOR in the DATA LIST with the HDS.

Is there about 5.4-7.8 (M/T model) or 5.9-8.5 (A/T model) gm/s?

YES - Go to step 14.

NO - Replace the MAF sensor/IAT sensor (see **MAF SENSOR/IAT SENSOR REPLACEMENT**), then go to step 20.

14. Turn the ignition switch OFF.
15. Allow the engine to cool to ambient temperature.
16. Note the ambient temperature.
17. Turn the ignition switch ON (II).
18. Note the value of IAT SENSOR quickly in the DATA LIST with the HDS.
19. Compare the value of the IAT SENSOR and the ambient temperature.

Does the value of the IAT SENSOR differ 5.4°F (3°C) or more?

YES - Replace the MAF sensor/IAT sensor (see **MAF SENSOR/IAT SENSOR REPLACEMENT**), then go to step 20.

NO - Check for dirt, carbon, or damage in the throttle bore. If there is dirt or carbon, clean the throttle body (see **THROTTLE BODY CLEANING**), then go to step 20. If there is damage in the throttle bore, replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**), then go to step 20.

20. Turn the ignition switch ON (II).
21. Reset the ECM/PCM with the HDS.
22. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
23. Let the engine cool until the value of ECT SENSOR 1 is 122°F (50°C) or less.
24. Start the engine, and let it idle for 10 seconds or more.
25. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P050A indicated?

YES - Check for poor connections or loose terminals at the throttle body, the MAF sensor/IAT sensor, and the ECM/PCM, then go to step 1.

NO - Go to step 26.

26. Monitor the OBD STATUS for DTC P050A in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 25, go to the indicated DTC's troubleshooting.

    NO -If the screen indicates FAILED, check for poor connections or loose terminals at the throttle body, the MAF sensor/IAT sensor, and the ECM/PCM, then go to step 1. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 23.

DTC P050B: COLD START IGNITION TIMING CONTROL SYSTEM PERFORMANCE PROBLEM

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check for Temporary DTCs or DTCs with the HDS.

   Are any Temporary DTCs or DTCs other than P050B indicated?

   YES - Go to the indicated DTC's troubleshooting.

   NO - Go to step 3.

3. Check for poor connections or blockage at the intake air duct.

   Is it OK?

   YES - Go to step 4.

   NO - Reconnect or repair the intake air duct, then go to step 25.

4. Check for damage at the air cleaner housing.

   Is it OK?

   YES - Go to step 5.

   NO - Replace the air cleaner housing (see **AIR CLEANER REMOVAL/INSTALLATION**), then go to step 25.

5. Check for dirt or debris in the air cleaner element.

   Is it dirty?

   YES - Replace the air cleaner element or remove the debris (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**), then go to step 25.

   NO - Go to step 6.

6. Let the engine cool until the value of ECT SENSOR 1 is 122°F (50°C) or less.
7. Clear the DTC with the HDS.
8. Start the engine, and let it idle 10 seconds or more.
9. Monitor the OBD STATUS for DTC P050B in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 10.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 6 and recheck.

10. Inspect the ignition timing (see **IGNITION TIMING INSPECTION**).

    Is the ignition timing OK?

    YES - Go to step 12.

    NO - Go to step 11.

11. Check for damage at the CKP sensor (see **CKP SENSOR REPLACEMENT**) and the CKP sensor pulser plate (see **CRANKSHAFT INSTALLATION**).

    Is the CKP sensor and/or the CKP sensor pulser plate damaged?

    YES - Replace the CKP sensor (see **CKP SENSOR REPLACEMENT**) and/or the CKP sensor pulser plate (see **CRANKSHAFT INSTALLATION**), then go to step 6.

    NO - Go to step 31.

12. Do the ETCS TEST in the INSPECTION MENU with the HDS.

    Is the THROTTLE ACTUATOR CONTROL VALVE normal?

    YES - Go to step 13.

    NO - Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**), then go to step 25.

13. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
14. Monitor the ENGINE SPEED in the DATA LIST with the HDS, and hold the engine speed at 2,500 rpm for at least 30 seconds.
15. While holding the engine speed at 2,500 rpm, check the MAF SENSOR in the DATA LIST with the HDS.

    Is there about 5.4-7.8 (M/T model) or 5.9-8.5 (A/T model) gm/s?

    YES - Go to step 16.

    NO - Replace the MAF sensor/IAT sensor (see **MAF SENSOR/IAT SENSOR REPLACEMENT**), then go to step 25.

16. Turn the ignition switch OFF.
17. Drain the coolant (see **COOLANT REPLACEMENT**).
18. Remove ECT sensor 1 (see **ECT SENSOR 1 REPLACEMENT**), and ECT sensor 2 (see **ECT SENSOR 2 REPLACEMENT**).
19. Allow the sensors to cool to ambient temperature.
20. Note the ambient temperature.
21. Connect ECT sensor 1 to its 2P connector, and ECT sensor 2 to its 2P connector, but do not install them on the engine.
22. Turn the ignition switch ON (II).
23. Note the value of ECT SENSOR 1 and ECT SENSOR 2 quickly in the DATA LIST with the HDS.
24. Compare the value of ECT SENSOR 1 and the ambient temperature, and the value of ECT SENSOR 2 and the ambient temperature individually.

    Does either sensor differ more than 5.4°F (3°C) from the ambient temperature?

    YES - Replace the sensor that differed more than 5.4°F (3°C) from the ambient temperature, then go to step 25.

    NO - Check and repair any problems with the following items, then go to step 25.

    - Engine compression and cylinder leakdown
    - VTEC system
    - Engine oil
    - A/C system
    - Power steering
25. Turn the ignition switch ON (II).
26. Reset the ECM/PCM with the HDS.
27. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
28. Let the engine cool until the value of ECT SENSOR 1 is 122°F (50°C) or less.
29. Start the engine, and let it idle 10 seconds or more.
30. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P050B indicated?

YES - Check for poor connections or loose terminals at the CKP sensor, the throttle body, the MAF sensor/IAT sensor, ECT sensor 1, ECT sensor 2, and the ECM/PCM, then go to step 1.

NO - Go to step 31.

31. Monitor the OBD STATUS for DTC P050B in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 30, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the CKP sensor, the throttle body, the MAF sensor/IAT sensor, ECT sensor 1, ECT sensor 2, and the ECM/PCM, then go to step 1. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 28.

32. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
33. Let the engine cool until the value of ECT SENSOR 1 is 122°F (50°C) or less.
34. Start the engine, and let it idle 10 seconds or more.
35. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P050B indicated?

    YES - Check for poor connections or loose terminals at the CKP sensor, the throttle body, the MAF/IAT sensor, ECT sensor 1, ECT sensor 2, and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 33. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 36.

36. Monitor the OBD STATUS for DTC P050B in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 35, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the CKP sensor, the throttle body, the MAF/IAT sensor, ECT sensor 1, ECT sensor 2, and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 33. If the ECM/PCM was substituted, go to step 1. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 33.

DTC P0562: CHARGING SYSTEM LOW VOLTAGE

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If any high current load accessories are installed, this DTC can be set.**
- **If DTC P16BB and/or P16BC is stored at the same time as DTC P0562, troubleshoot DTC P16BB and/or P16BC first, then recheck for DTC P0562.**

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine.
4. Check under these conditions:
   - A/C on
   - Temperature control at maximum cool
   - Blower fan at maximum speed
   - Rear window defogger on
   - Headlights on high beam
5. Hold the engine speed at 2,000 rpm (in Park or neutral) for 1 minute.
6. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0562 indicated?

   YES - Replace the alternator (see **ALTERNATOR REMOVAL AND INSTALLATION**), then go to step 7.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the alternator and the under-hood fuse/relay box, and check the battery performance (see **BATTERY TEST**).

7. Turn the ignition switch ON (II).
8. Reset the ECM/PCM with the HDS.
9. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
10. Start the engine.
11. Check under these conditions:
    - A/C on
    - Temperature control at maximum cool
    - Blower fan at maximum speed
    - Rear window defogger on
    - Headlights on high beam
12. Hold the engine speed at 2,000 rpm (in Park or neutral) for 1 minute.
13. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0562 indicated?

YES - Check for poor connections or loose terminals at the alternator and the under-hood fuse/relay box, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0563: ECM/PCM POWER SOURCE CIRCUIT UNEXPECTED VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch OFF.
4. Wait 10 seconds.
5. Turn the ignition switch ON (II).
6. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0563 indicated?

   YES - Go to step 7.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at PGM-FI main relay 1 and the ECM/PCM.

7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Disconnect ECM/PCM connector A (44P).
10. Measure voltage between ECM/PCM connector terminal A6 and body ground.

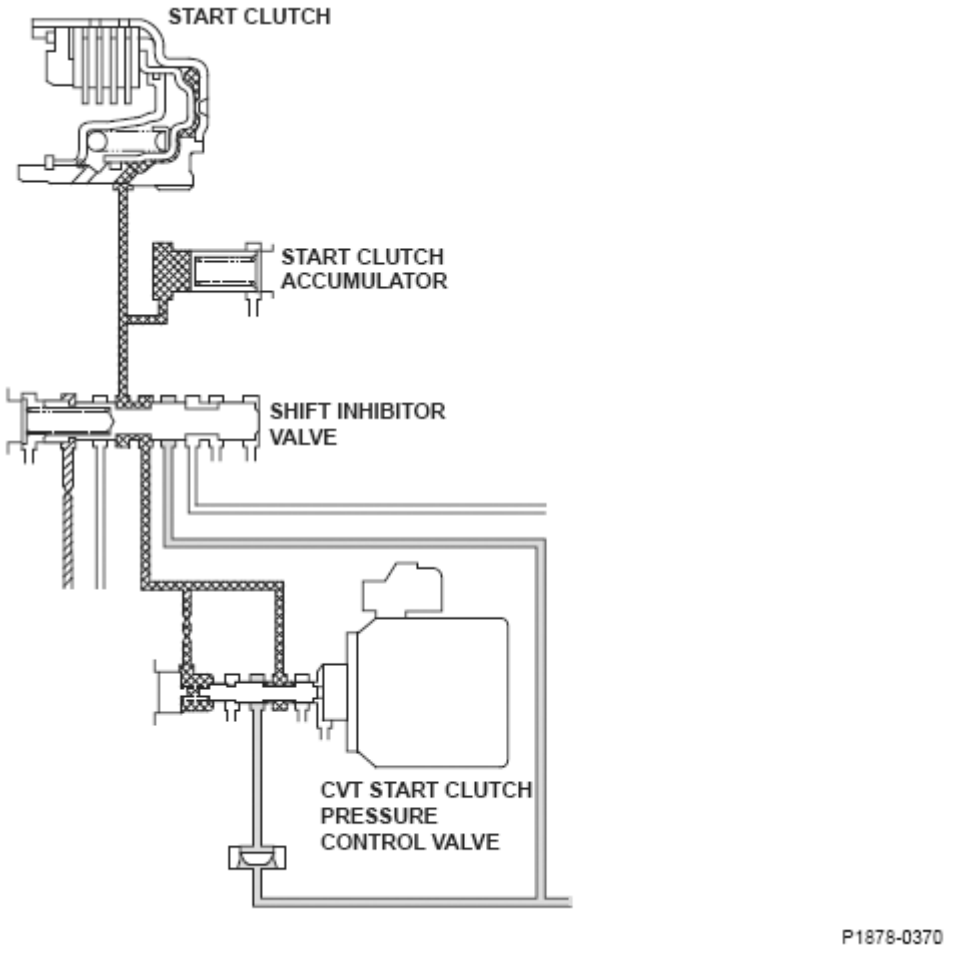

Fig. 72: Measuring Voltage Between ECM/PCM Connector Terminal A6 And Body Ground
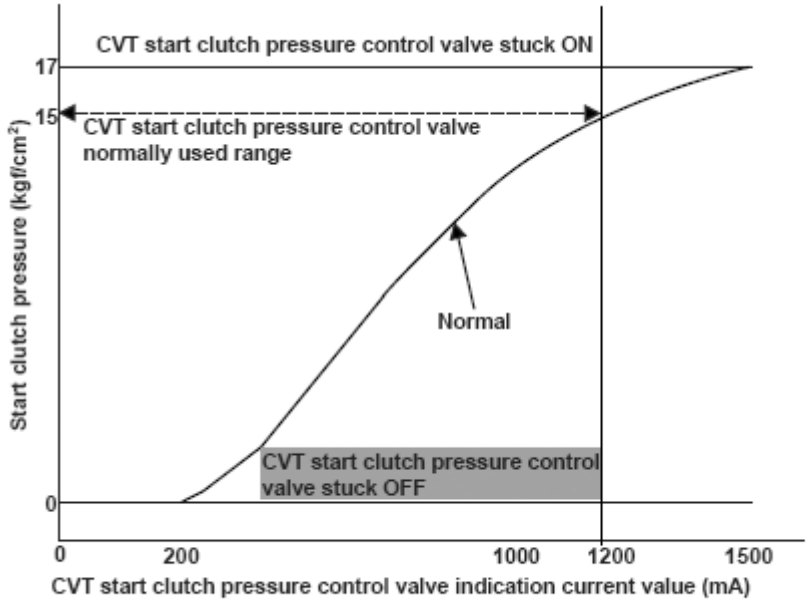
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 13.

NO - Go to step 11.

11. Remove PGM-FI main relay 1 (C) from the under-hood fuse/relay box.



P1878-0371

Fig. 73: Identifying PGM-FI Main Relay 1

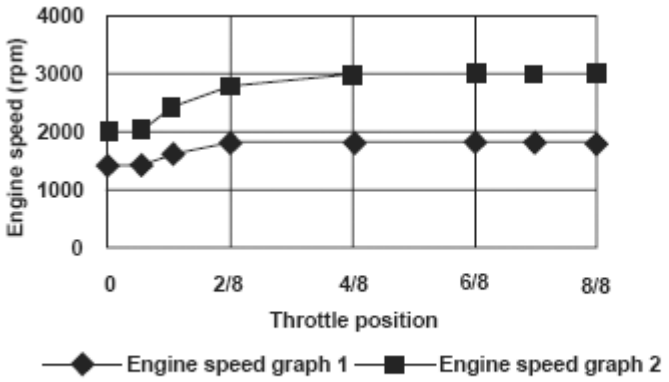
12. Check for continuity between ECM/PCM connector terminal A6 and body ground.



P1878-0372

Fig. 74: Checking For Continuity Between ECM/PCM Connector Terminal A6 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (A6) and PGM-FI main relay 1, then go to step 16.

NO - Go to step 15.

13. Remove PGM-FI main relay 1 (C) from the under-hood fuse/relay box.

Fig. 75: Identifying PGM-FI Main Relay 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Measure voltage between ECM/PCM connector terminal A8 and body ground.

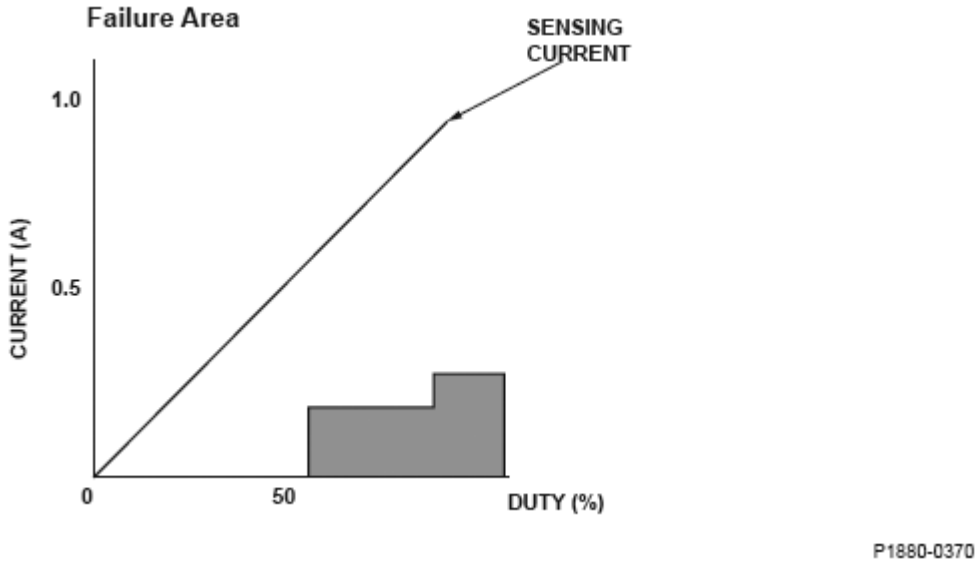


Fig. 76: Measuring Voltage Between ECM/PCM Connector Terminal A8 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Repair short to power in the wire between the ECM/PCM (A8) and PGM-FI main relay 1, then go to step 16.

NO - Go to step 15.

15. Test PGM-FI main relay 1 (see **POWER RELAY TEST**).

Is PGM-FI main relay 1 OK?

YES - Go to step 23.

NO - Replace PGM-FI main relay 1, then go to step 16.

16. Reconnect all connectors.
17. Turn the ignition switch ON (II).
18. Reset the ECM/PCM with the HDS.
19. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
20. Turn the ignition switch OFF.
21. Wait 10 seconds.
22. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0563 indicated?

    YES - Check for poor connections or loose terminals at PGM-FI main relay 1 and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

23. Reconnect all connectors.
24. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
25. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0563 indicated?

    YES - Check for poor connections or loose terminals at PGM-FI main relay 1 and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0602: ECM/PCM PROGRAMMING ERROR

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This DTC is indicated when a ECM/PCM update is not completed.**
- **Do not turn the ignition switch OFF while updating the ECM/PCM. If you turn the ignition switch OFF before completion, the ECM/PCM can be damaged.**

1. Do the ECM/PCM update procedure (see **UPDATING ECM/PCM**).
2. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0602 indicated?

   YES - Replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**).

NO - Update is complete.

DTC P0603: ECM/PCM INTERNAL CONTROL MODULE KEEP ALIVE MEMORY (KAM) ERROR; DTC P062F: ECM/PCM INTERNAL CONTROL MODULE KEEP ALIVE MEMORY (KAM) ERROR ('09 MODEL)

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Information marked with an asterisk (*) applies to the '06-08 models.**
- **Information marked with a double asterisk (**) applies to the '09-10 models.**

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check for Temporary DTCs or DTCs with the HDS.

   Are any Temporary DTCs or DTCs indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time.

4. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
5. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0603 indicated?

   YES - If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

   NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0606: ECM/PCM PROCESSOR MALFUNCTION

NOTE: **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch OFF.
4. Turn the ignition switch ON (II).
5. Wait 40 seconds.

6. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0606 indicated?

   YES - Go to step 7.

   NO - Intermittent failure, the system is OK at this time.

7. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
8. Turn the ignition switch OFF.
9. Turn the ignition switch ON (II).
10. Wait 40 seconds.
11. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0606 indicated?

    YES - If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 8. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P060A: PCM (A/T SYSTEM) INTERNAL CONTROL MODULE MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P060A indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time.

4. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
5. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P060A indicated?

   YES - If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0630: VIN NOT PROGRAMMED OR MISMATCH

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This DTC is stored only when the ECM/PCM does not have the VIN information of the vehicle. Use the HDS to input the missing VIN information.**
- **Information marked with an asterisk (*) applies to the '06-08 models.**
- **Information marked with a doulbe asterisk (**) applies to the '09 model.**

1. Turn the ignition switch ON (II).
2. Check the VIN with the HDS.

   Does the HDS show the vehicle's VIN?

   YES - Go to step 5.

   NO - Go to step 3.

3. Input the VIN to the ECM/PCM with the HDS.

   Does the screen show COMPLETE?

   YES - Go to step 5.

   NO - Go to step 4.

4. Check for DTCs with the HDS.

   Is DTC P0603 (P062F)** indicated?*

   YES - Go to the **DTC P0603: ** ECM/PCM INTERNAL CONTROL MODULE KEEP ALIVE MEMORY (KAM) ERROR** troubleshooting.

   NO - Go to step 9.

5. Clear the DTC with the HDS.
6. Turn the ignition switch OFF.
7. Turn the ignition switch ON (II), and wait for 5 seconds.
8. Check for Temporary DTCs or DTCs with the HDS.

   Are any Temporary DTCs or DTCs indicated?

YES - Go to step 9.

NO - Intermittent failure, the system is OK at this time.

9. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
10. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0630 indicated?

YES - If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0685: ECM/PCM POWER CONTROL CIRCUIT/INTERNAL CIRCUIT MALFUNCTION

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If the problem doesn't return after you clear the DTC, or it this DTC is stored intermittently, check for loose terminals at the IGP line connectors before replacing the ECM/PCM.**

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, then let it idle for 30 seconds.
4. Turn the ignition switch LOCK (0).
5. Start the engine, then let it idle for 30 seconds.
6. Turn the ignition switch LOCK (0).
7. Turn the ignition switch ON (II).
8. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0685 indicated?

YES - Go to step 9.

NO - Intermittent failure, the system is OK at this time.

9. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
10. Start the engine, then let it idle for 30 seconds.
11. Turn the ignition switch LOCK (0).
12. Start the engine, then let it idle for 30 seconds.

13. Turn the ignition switch LOCK (0).
14. Turn the ignition switch ON (II).
15. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0685 indicated?

    YES - If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 10. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0720: OUTPUT SHAFT (COUNTERSKHAFT) SPEED SENSOR CIRCUIT MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check for Temporary DTCs or DTCs in the A/T SYSTEM with the HDS.

   Is DTC P0722 indicated?

   YES - Troubleshoot for DTC P0722 in the A/T system (see **DTC P0721: PROBLEM IN OUTPUT SHAFT (COUNTERSHAFT) SPEED SENSOR CIRCUIT; DTC P0722: PROBLEM IN OUTPUT SHAFT (COUNTERSHAFT) SPEED SENSOR CIRCUIT (NO SIGNAL INPUT)**).

   NO - Go to step 3.

3. Update the PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE ECM/PCM**).
4. Test-drive under these conditions:
   - Engine coolant temperature (ECT SENSOR 1) above 176°F (80°C)
   - Transmission in D position
   - ENGINE SPEED between 2,000-4,500 rpm
   - Drive for several minutes, then decelerate (with throttle fully closed) for 5 seconds or more
5. Check for Temporary DTCs or DTCs in the PGM-FI SYSTEM with the HDS.

   Is DTC P0720 indicated?

   YES - Go to step 6.

   NO - Go to step 7.

6. Check for Temporary DTCs or DTCs in the A/T SYSTEM with the HDS.

Is DTC P0722 indicated?

YES - Troubleshoot for DTC P0722 in the AT system (see **DTC P0721: PROBLEM IN OUTPUT SHAFT (COUNTERSHAFT) SPEED SENSOR CIRCUIT; DTC P0722: PROBLEM IN OUTPUT SHAFT (COUNTERSHAFT) SPEED SENSOR CIRCUIT (NO SIGNAL INPUT)**).

NO - If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 4. If the PCM was substituted, check for poor connections or loose terminals at the output shaft (countershaft) speed sensor and the PCM, then go to step 1.

7. Monitor the OBD STATUS for DTC P0720 in the DTCs MENU with the HDS.

   Does the screen indicate PASSED?

   YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**).

   NO - If the screen indicates FAILED, check for poor connections or loose terminals at the output shaft (countershaft) speed sensor and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 4. If the PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, go to step 4.

DTC P0720: OUTPUT SHAFT (COUNTERSHAFT) SPEED SENSOR CIRCUIT MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
2. Test-drive several minutes.
3. Check the C SHAFT SPD in the DATA LIST with the HDS.

   Is any vehicle speed indicated?

   YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the output shaft (countershaft) speed sensor and the ECM.

   NO - Go to step 4.

4. Turn the ignition switch OFF.
5. Disconnect the output shaft (countershaft) speed sensor 3P connector.
6. Turn the ignition switch ON (II).
7. Measure voltage between output shaft (countershaft) speed sensor 3P connector terminal No. 1 and body ground.

Fig. 77: Measuring Voltage Between Output Shaft (Countershaft) Speed Sensor 3P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 8.

NO - Repair open in the wire between the ECM (C13) and the output shaft (countershaft) speed sensor, then go to step 18.

8. Measure voltage between output shaft (countershaft) speed sensor 3P connector terminal No. 2 and body ground.

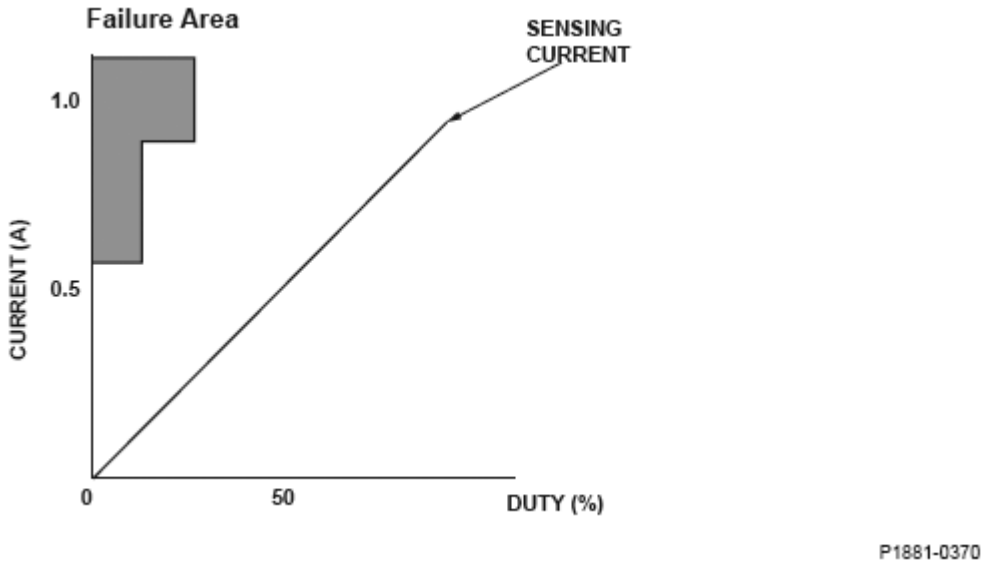

Fig. 78: Measuring Voltage Between Output Shaft (Countershaft) Speed Sensor 3P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 9.

NO - Go to step 10.

9. Measure voltage between output shaft (countershaft) speed sensor 3P connector terminals No. 1 and No. 3.

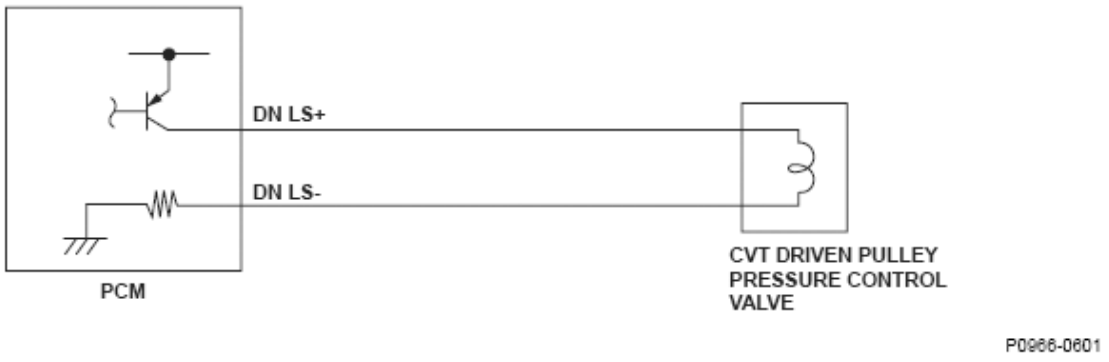

Fig. 79: Measuring Voltage Between Output Shaft (Countershaft) Speed Sensor 3P Connector Terminals No. 1 And No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 16.

NO - Repair open in the wire between the ECM (C14) and the output shaft (countershaft) speed sensor, then go to step 18.

10. Turn the ignition switch OFF.
11. Jump the SCS line with the HDS.
12. Disconnect ECM connector C (44P).
13. Check for continuity between ECM connector terminal C43 and body ground.

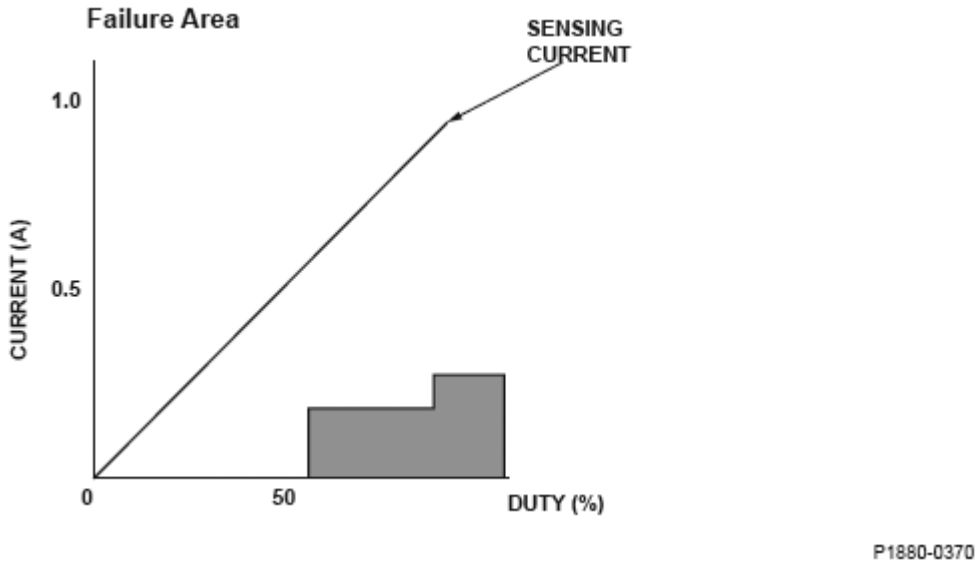

Fig. 80: Checking For Continuity Between ECM Connector Terminal C43 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM (C43) and the output shaft (countershaft) speed sensor, then go to step 18.

NO - Go to step 14.

14. Connect output shaft (countershaft) speed sensor 3P connector terminal No. 2 to body ground with a jumper wire.

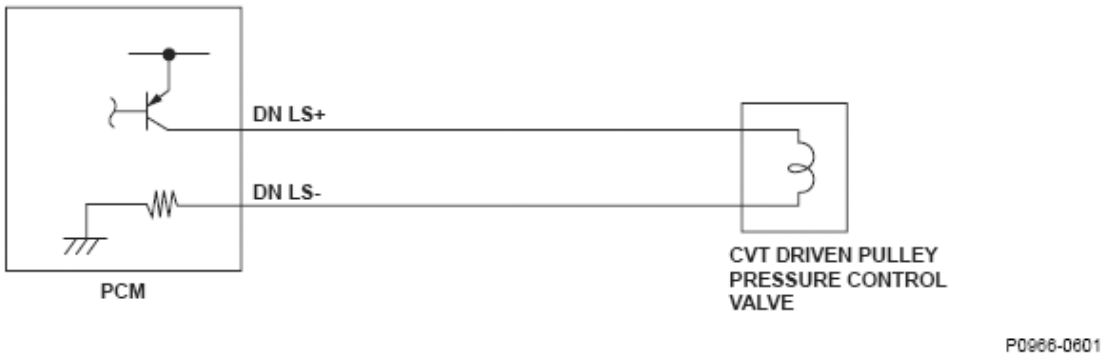

Fig. 81: Connecting Output Shaft (Countershaft) Speed Sensor 3P Connector Terminal No. 2 To Body Ground With A Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Check for continuity between ECM connector terminal C43 and body ground.

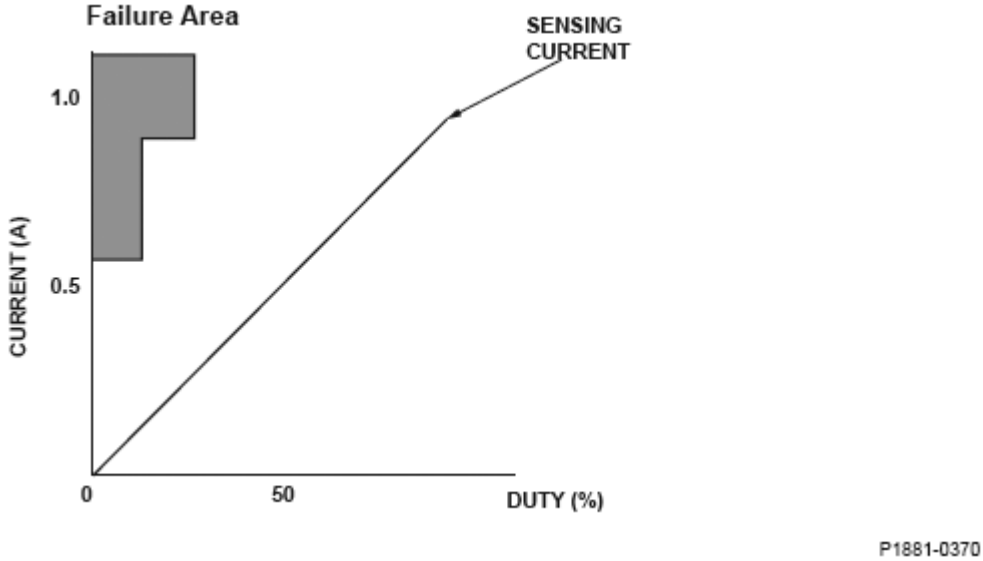

Fig. 82: Checking For Continuity Between ECM Connector Terminal C43 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the ECM (C43) and the output shaft (countershaft) speed sensor, then go to step 18.

16. Turn the ignition switch OFF.
17. Replace the output shaft (countershaft) speed sensor (see **OUTPUT SHAFT (COUNTERSHAFT) SPEED SENSOR REPLACEMENT**).
18. Reconnect all connectors.
19. Turn the ignition switch ON (II).
20. Reset the ECM with the HDS.
21. Do the ECM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
22. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 176°F (80°C)
    - Transmission in 5th gear
    - ENGINE SPEED between 2,000-3,000 rpm
    - Drive for several minutes, then decelerate (with the throttle fully closed) for 8 seconds
23. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0720 indicated?

    YES - Check for poor connections or loose terminals at the output shaft (countershaft) speed sensor and the ECM, then go to step 1.

    NO - Go to step 24.

24. Monitor the OBD STATUS for DTC P0720 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 23, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the output shaft (countershaft) speed sensor and the ECM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 22.

25. Reconnect all connectors.
26. Update the ECM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM/PCM**).
27. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 176°F (80°C)
    - Transmission in 5th gear
    - ENGINE SPEED between 2,000-3,000 rpm
    - Drive for several minutes, then decelerate (with the throttle fully closed) for 8 seconds
28. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0720 indicated?

YES - Check for poor connections or loose terminals at the output shaft (countershaft) speed sensor and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM/PCM**), then go to step 27. If the ECM was substituted, go to step 1.

NO - Go to step 29.

29. Monitor the OBD STATUS for DTC P0720 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 28, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the output shaft (countershaft) speed sensor and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM/PCM**), then go to step 27. If the ECM was substituted, go to step 1. If the screen indicates NOT COMPLETED, go to step 27.

DTC P1109: BARO SENSOR CIRCUIT OUT OF RANGE HIGH

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Reset the ECM/PCM with the HDS.
2. Start the engine.
3. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P1109 indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time.

4. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
5. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P1109 indicated?

   YES - If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

   NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P1116: ECT SENSOR 1 CIRCUIT RANGE/PERFORMANCE PROBLEM

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P0111 is stored at the same time as DTC P1116, troubleshoot DTC P0111 first, then recheck for DTC P1116.**

1. Check for poor connections or loose terminals at ECT sensor 1 and ECT sensor 2.

   Are the connections and terminals OK?

   YES - Go to step 2.

   NO - Repair the connectors or terminals, then go to step 25.

2. Turn the ignition switch ON (II).
3. Check for Temporary DTCs or DTCs with the HDS.

   Are DTC P1116 and P2183 indicated at the same time?

   YES - Go to step 13.

   NO - Go to step 4.

4. Start the engine, and let it idle for 10 minutes.
5. Check ECT SENSOR 1 in the DATA LIST with the HDS.

   Is about 95°F (35°C) or less indicated?

   YES - Replace ECT sensor 1 (see **ECT SENSOR 1 REPLACEMENT**), then go to step 25.

   NO - Go to step 6.

6. Turn the ignition switch OFF.
7. Drain the coolant (see **COOLANT REPLACEMENT**).
8. Remove ECT sensor 1 (see **ECT SENSOR 1 REPLACEMENT**), and reconnect ECT sensor 1 to the 2P connector, but do not install it on the engine.
9. Remove the air cleaner cover, but keep the MAF sensor/IAT sensor connector connected.
10. Cool the engine for 1 hour.
11. Turn the ignition switch ON (II).
12. Compare the value of ECT SENSOR 1 and the IAT SENSOR in the DATA LIST with the HDS.

    Does the value of ECT SENSOR 1 differ 5.4°F (3°C) or more?

    YES - Replace ECT sensor 1 (see **ECT SENSOR 1 REPLACEMENT**), then go to step 25.

    NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM/PCM.

13. Start the engine, and let it idle for 10 minutes.
14. Check ECT SENSOR 1 in the DATA LIST with the HDS.

    Is about 95°F (35°C) or less indicated?

    YES - Replace ECT sensor 1 (see **ECT SENSOR 1 REPLACEMENT**), then go to step 25.

    NO - Go to step 15.

15. Let the engine idle for 10 minutes.
16. Check ECT SENSOR 2 in the DATA LIST with the HDS.

    Is about 131°F (55°C) or less indicated?

    YES - Replace ECT sensor 2 (see **ECT SENSOR 2 REPLACEMENT**), then go to step 25.

    NO - Go to step 17.

17. Turn the ignition switch OFF.
18. Drain the coolant (see **COOLANT REPLACEMENT**).
19. Remove ECT sensor 1 (see **ECT SENSOR 1 REPLACEMENT**) and ECT sensor 2 (see **ECT SENSOR 2 REPLACEMENT**). Then reconnect the sensors to their connectors, but do not install them on the engine.
20. Remove the air cleaner cover, but keep the MAF sensor/IAT sensor connector connected.
21. Cool the engine for 1 hour.
22. Turn the ignition switch ON (II).
23. Note the value of ECT SENSOR 1, ECT SENSOR 2, and the IAT SENSOR quickly in the DATA LIST with the HDS.
24. Compare the value of ECT SENSOR 1 and the IAT SENSOR, and the value of ECT SENSOR 2 and the IAT SENSOR individually.

    Does either sensor differ more than 5.4°F (3°C) from the IAT SENSOR?

    YES - Replace the sensor that differed more than 5.4°F (3°C) from the IAT SENSOR, then go to step 25.

    NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM/PCM.

25. Turn the ignition switch ON (II).
26. Reset the ECM/PCM with the HDS.
27. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
28. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1116 indicated?

    YES - Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the

ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P1128: MAP SENSOR SIGNAL LOWER THAN EXPECTED

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Before starting this troubleshooting check for poor connections or blockage at the intake air duct.**

1. Turn the ignition switch ON (II).
2. Check the MAP SENSOR in the DATA LIST with the HDS.

   Is less than 54.1 kPa (16.0 in.Hg, 406 mmHg) or 1.61 V held for more than 5 seconds?

   YES - Go to step 7.

   NO - Go to step 3.

3. Clear the DTC with the HDS.
4. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
5. Test-drive under these conditions:
   - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
   - ENGINE SPEED between 1,200-5,400 rpm
   - A/T in D position (M/T in 3rd gear)
   - Vehicle speed accelerated from 16-31 mph (25-50 km/h) under half throttle
6. Monitor the OBD STATUS for DTC P1128 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 7.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAP sensor and the ECM/PCM. If the screen indicates NOT COMPLETED, go to step 4 and recheck.

7. Turn the ignition switch OFF.
8. Replace the MAP sensor (see **MAF SENSOR/IAT SENSOR REPLACEMENT**).
9. Turn the ignition switch ON (II).
10. Reset the ECM/PCM with the HDS.
11. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
12. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the

radiator fan comes on, then let it idle.

13. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
    - ENGINE SPEED between 1,200-5,400 rpm
    - A/T in D position (M/T in 3rd gear)
    - Vehicle speed accelerated from 16-31 mph (25-50 km/h) under half throttle
14. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1128 indicated?

    YES - Check for poor connections or loose terminals at the MAP sensor and the ECM/PCM, then go to step 1.

    NO - Go to step 15.

15. Monitor the OBD STATUS for DTC P1128 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 14, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the MAP sensor and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 12.

DTC P1129: MAP SENSOR SIGNAL HIGHER THAN EXPECTED

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Check for vacuum leaks in these parts:
    - PCV valve
    - PCV hose
    - EVAP canister purge valve
    - Throttle body
    - Intake manifold
    - Brake booster
    - Brake booster hose

    Are there any vacuum leaks?

    YES - Repair or replace parts with vacuum leaks, then go to step 9.

    NO - Go to step 2.

2. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
3. Check the MAP SENSOR in the DATA LIST with the HDS.

   Is more than 36.9 kPa (11.0 in.Hg, 277 mmHg) or 1.1 V held for more than for 5 seconds?

   YES - Go to step 7.

   NO - Go to step 4.

4. Clear the DTC with the HDS.
5. Test-drive under these conditions:
   - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
   - ENGINE SPEED between 1,200-5,400 rpm
   - A/T in D position (M/T in 5th gear)
   - Maintain a vehicle speed of 55-75 mph (88-121 km/h) for 10 seconds
   - During the drive, decelerate (with throttle fully closed) for at least 5 seconds
6. Monitor the OBD STATUS for DTC P1129 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 7.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAP sensor and the ECM/PCM. If the screen indicates NOT COMPLETED, go to step 5 and recheck.

7. Turn the ignition switch OFF.
8. Replace the MAP sensor (see **MAF SENSOR/IAT SENSOR REPLACEMENT**).
9. Turn the ignition switch ON (II).
10. Reset the ECM/PCM with the HDS.
11. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
12. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
13. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
    - ENGINE SPEED between 1,200-5,400 rpm
    - A/T in D position (M/T in 5th gear)
    - Maintain a vehicle speed of 55-75 mph (88-121 km/h) for 10 seconds
    - During the drive, decelerate (with throttle fully closed) for at least 5 seconds
14. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1129 indicated?

    YES - Check for poor connections or loose terminals at the MAP sensor and the ECM/PCM, then go

to step 1.

NO - Go to step 15.

15. Monitor the OBD STATUS for DTC P1129 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 14, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the MAP sensor and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 12.

DTC P1157: A/F SENSOR (SENSOR 1) AFS CIRCUIT MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and wait 1 minute.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P1157 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM.

5. Turn the ignition switch OFF.
6. Jump the SCS line with the HDS.
7. Disconnect the A/F sensor (Sensor 1) 4P connector.
8. Disconnect ECM/PCM connector C (44P).
9. Check for continuity between A/F sensor (Sensor 1) 4P connector terminal No. 2 and ECM/PCM connector terminal C29.

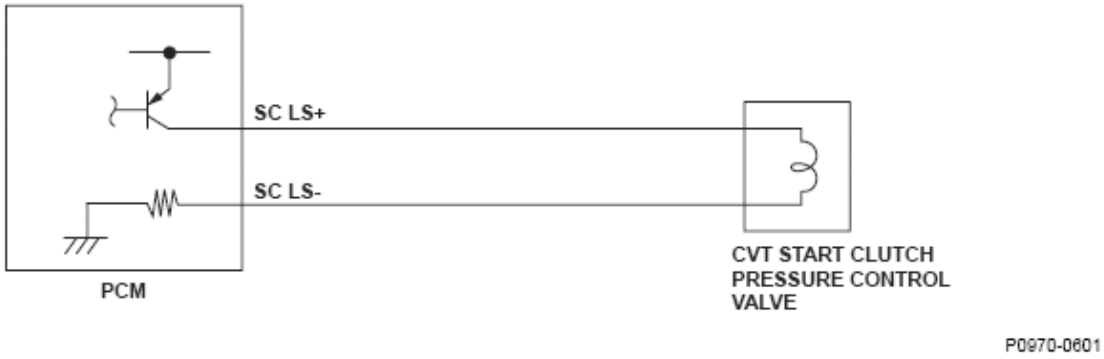

Fig. 83: Checking For Continuity Between A/F Sensor (Sensor 1) 4P Connector Terminal No. 2 And ECM/PCM Connector Terminal C29
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Repair open in the wire between the ECM/PCM (C29) and the A/F sensor (Sensor 1), then go to step 12.

10. Check for continuity between A/F sensor (Sensor 1) 4P connector terminal No. 1 and ECM/PCM connector terminal C30.

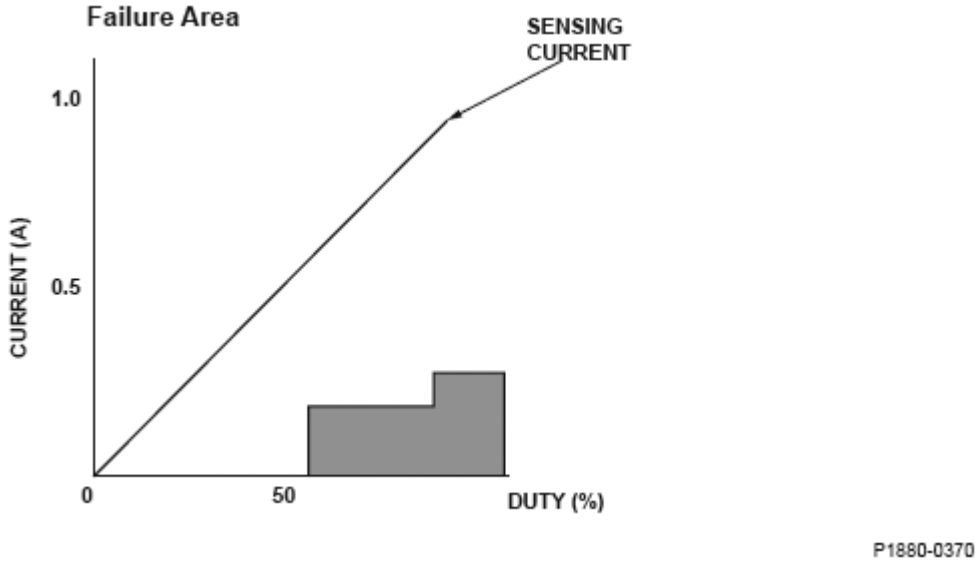

Fig. 84: Checking For Continuity Between A/F Sensor (Sensor 1) 4P Connector Terminal No. 1 And ECM/PCM Connector Terminal C30
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 11.

NO - Repair open in the wire between the ECM/PCM (C30) and the A/F sensor (Sensor 1), then go to

step 12.

11. Replace the A/F sensor (Sensor 1) (see **A/F SENSOR REPLACEMENT**).
12. Reconnect all connectors.
13. Turn the ignition switch ON (II).
14. Reset the ECM/PCM with the HDS.
15. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
16. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1157 indicated?

    YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If the connector and terminal fits are OK, go to step 18.

    NO - Go to step 17.

17. Monitor the OBD STATUS for DTC P1157 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 16, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

18. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
19. Start the engine, and let it idle.
20. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1157 indicated?

    YES - If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 19. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 21.

21. Monitor the OBD STATUS for DTC P1157 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 20, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, go to step 1. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 19. If the ECM/PCM

was substituted, go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P1172: A/F SENSOR (SENSOR 1) CIRCUIT OUT OF RANGE HIGH

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
4. Monitor the OBD STATUS for DTC P1172 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 5.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 3 and recheck.

5. Turn the ignition switch OFF.
6. Replace the A/F sensor (Sensor 1) (see **A/F SENSOR REPLACEMENT**).
7. Turn the ignition switch ON (II).
8. Reset the ECM/PCM with the HDS.
9. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
10. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
11. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1172 indicated?

    YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1.

    NO - Go to step 12.

12. Monitor the OBD STATUS for DTC P1172 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 11, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor

(Sensor 1) and the ECM/PCM, then go to step 1. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 10.

DTC P1297: ELD CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check the ELD in the DATA LIST with the HDS.

   Is 72 A or more indicated?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the ELD and the ECM/PCM.

3. Turn the ignition switch OFF.
4. Disconnect the ELD 3P connector.
5. Turn the ignition switch ON (II).
6. Check the ELD in the DATA LIST with the HDS.

   Is 72 A or more indicated?

   YES - Go to step 7.

   NO - Go to step 11.

7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Disconnect ECM/PCM connector A (44P).
10. Check for continuity between ECM/PCM connector terminal A23 and body ground.

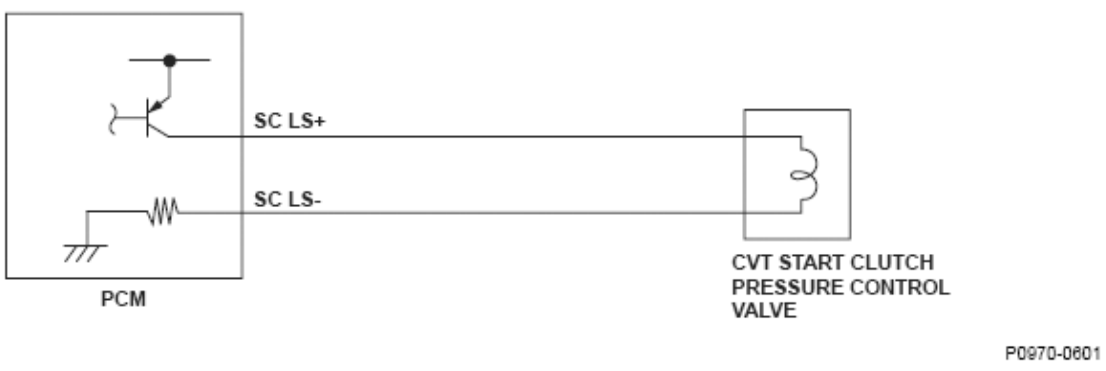

Fig. 85: Checking For Continuity Between ECM/PCM Connector Terminal A23 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (A23) and the ELD, then go to step 13.

NO - Go to step 20.

11. Turn the ignition switch OFF.
12. Replace the ELD (see **ELD REPLACEMENT**).
13. Reconnect all connectors.
14. Turn the ignition switch ON (II).
15. Reset the ECM/PCM with the HDS.
16. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
17. Start the engine.
18. Turn on the headlights.
19. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P1297 indicated?

YES - Check for poor connections or loose terminals at the ELD and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

20. Reconnect all connectors.
21. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
22. Start the engine.
23. Turn on the headlights.
24. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P1297 indicated?

YES - Check for poor connections or loose terminals at the ELD and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 22. If the ECM/PCM was substituted, go to step 1.

NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P1298: ELD CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL

TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check the ELD in the DATA LIST with the HDS.

   Is 0.2 A or less indicated?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the ELD and the ECM/PCM.

3. Turn the ignition switch OFF.
4. Disconnect the ELD 3P connector.
5. Turn the ignition switch ON (II).
6. Measure voltage between ELD 3P connector terminal No. 1 and body ground.

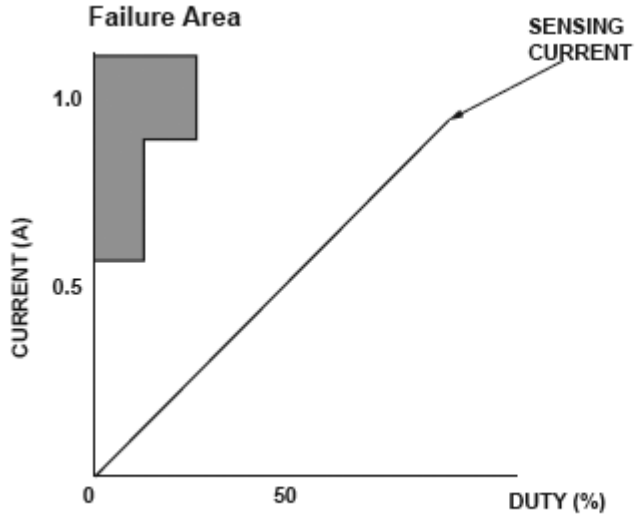

Fig. 86: Measuring Voltage Between ELD 3P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 7.

NO - Check the No. 3 ALTERNATOR (10 A) fuse in the under-dash fuse/relay box. If the fuse is OK, repair open in the wire between the No. 3 ALTERNATOR (10 A) fuse and the ELD, then go to step 12.

7. Jump the SCS line with the HDS.
8. Disconnect ECM/PCM connector A (44P).
9. Check for continuity between ELD 3P connector terminal No. 3 and ECM/PCM connector terminal A23.

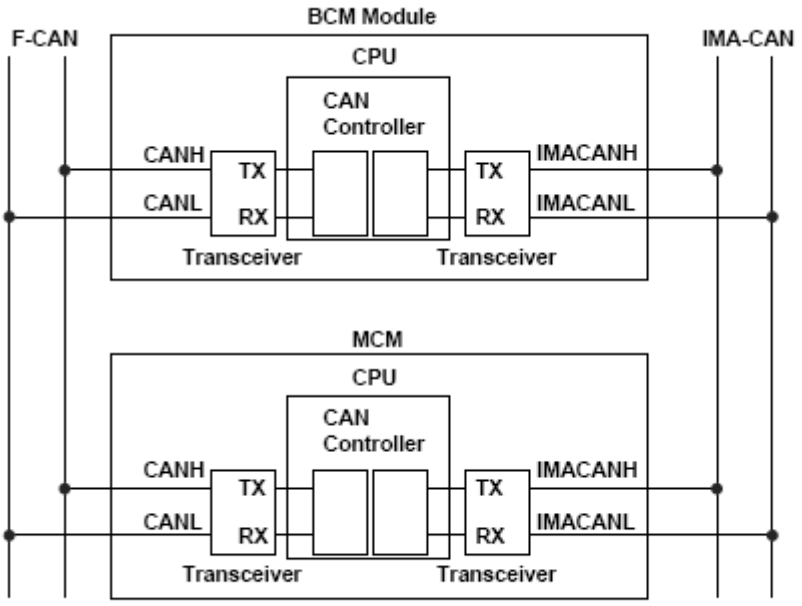

Fig. 87: Checking For Continuity Between ELD 3P Connector Terminal No. 3 And ECM/PCM Connector Terminal A23
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Repair open in the wire between the ECM/PCM (A23) and the ELD, then go to step 12.

10. Check for continuity between ELD 3P connector terminal No. 2 and body ground.

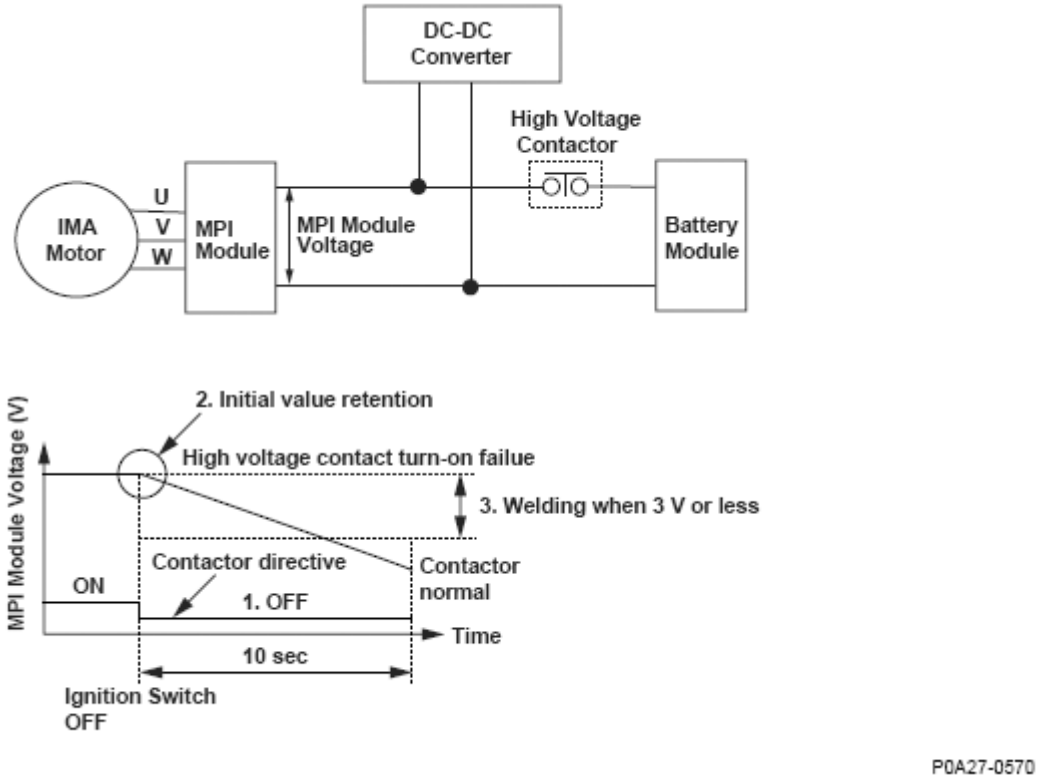

Fig. 88: Checking For Continuity Between ELD 3P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 11.

NO - Repair open in the wire between the ELD and G301 (see), then go to step 12.

11. Replace the ELD (see **ELD REPLACEMENT**).
12. Reconnect all connectors.
13. Turn the ignition switch ON (II).
14. Reset the ECM/PCM with the HDS.
15. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
16. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1298 indicated?

    YES - Go to step 17.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

17. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).

18. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1298 indicated?

    YES - Check for poor connections or loose terminals at the ELD and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P1549: CHARGING SYSTEM HIGH VOLTAGE

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If a high voltage battery (24 V, etc.) is connected to the vehicle, this DTC can be stored.**

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine.
4. Check under these conditions:
    - A/C off
    - Headlights off
    - Rear window defogger off
5. Hold the engine speed at 2,000 rpm (in Park or neutral) for 1 minute.
6. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1549 indicated?

    YES - Replace the alternator (see **ALTERNATOR REMOVAL AND INSTALLATION**), then go to step 7.

    NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the alternator and the under-hood fuse/relay box.

7. Turn the ignition switch ON (II).
8. Reset the ECM/PCM with the HDS.
9. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
10. Start the engine.
11. Check under these conditions:
    - A/C off
    - Headlights off

- Rear window defogger off

12. Hold the engine speed at 2,000 rpm (in Park or neutral) for 1 minute.
13. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P1549 indicated?

YES - Check for poor connections or loose terminals at the alternator and the under-hood fuse/relay box, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P16BB: ALTERNATOR B TERMINAL CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with HDS.
3. Start the engine.
4. Check under these conditions:
   - A/C on
   - Temperature control at maximum cool
   - Blower fan at maximum speed
   - Rear window defogger on
   - Headlights on high beam
5. Hold the engine speed at 2,000 rpm (in Park or neutral) for 1 minute.
6. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P16BB indicated?

YES - Go to step 7.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the alternator and the under-hood fuse/relay box, and check the battery performance (see **BATTERY TEST**).

7. Check for poor connections or loose terminals at the alternator and the under-hood fuse/relay box (+B line).

Are the connections and terminals OK?

YES - Go to step 8.

NO - Repair the connectors or terminals, then go to step 9.

8. Check for an open in the wire between the alternator and under-hood fuse/relay box at the starter subharness.

   Is the harness OK?

   YES - Replace the alternator (see **ALTERNATOR REMOVAL AND INSTALLATION**), then go to step 9.

   NO - Repair open in the wire between the alternator and the under-hood fuse/relay box, then go to step 9.

9. Turn the ignition switch ON (II).
10. Reset the ECM/PCM with the HDS.
11. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
12. Start the engine.
13. Check under these conditions:
    - A/C on
    - Temperature control at maximum cool
    - Blower fan at maximum speed
    - Rear window defogger on
    - Headlights on high beam
14. Hold the engine speed at 2,000 rpm (in Park or neutral) for 1 minute.
15. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P16BB indicated?

    YES - Check for poor connections or loose terminals at the alternator and the under-hood fuse/relay box, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P16BC: ALTERNATOR FR TERMINAL CIRCUIT/IGP CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Check for poor connections or loose terminals at the alternator 4P connector.

   Are the connections and terminals OK?

   YES - Go to step 2.

   NO - Repair the connectors or terminals, then go to step 18.

2. Check the alternator mounting surface for corrosion.

Is the mounting surface corroded?

YES - Remove the alternator (see **ALTERNATOR REMOVAL AND INSTALLATION**). Clean all mounting surface and reinstall the alternator, then go to step 18.

NO - Go to step 3.

3. Turn the ignition switch ON (II).
4. Clear the DTC with the HDS.
5. Start the engine.
6. Check under these conditions:
   - A/C on
   - Temperature control at maximum cool
   - Blower fan at maximum speed
   - Rear window defogger on
   - Headlights on high beam
7. Hold the engine speed at 2,000 rpm (in Park or neutral) for 1 minute.
8. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P16BC indicated?

YES - Go to step 9.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the alternator.

9. Turn the ignition switch OFF.
10. Disconnect the alternator 4P connector.
11. Turn the ignition switch ON (II).
12. Measure voltage between alternator 4P connector terminal No. 1 and body ground.

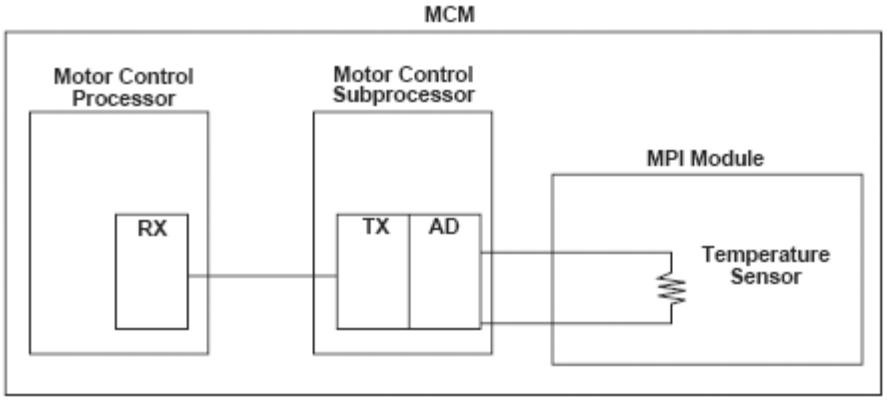

Fig. 89: Measuring Voltage Between Alternator 4P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 13.

NO - Repair open in the wire between the alternator (IG1 line) and the No. 3 ALTERNATOR (10 A) fuse in the under-dash fuse/relay box, then go to step 18.

13. Measure voltage between alternator 4P connector terminal No. 4 and body ground.

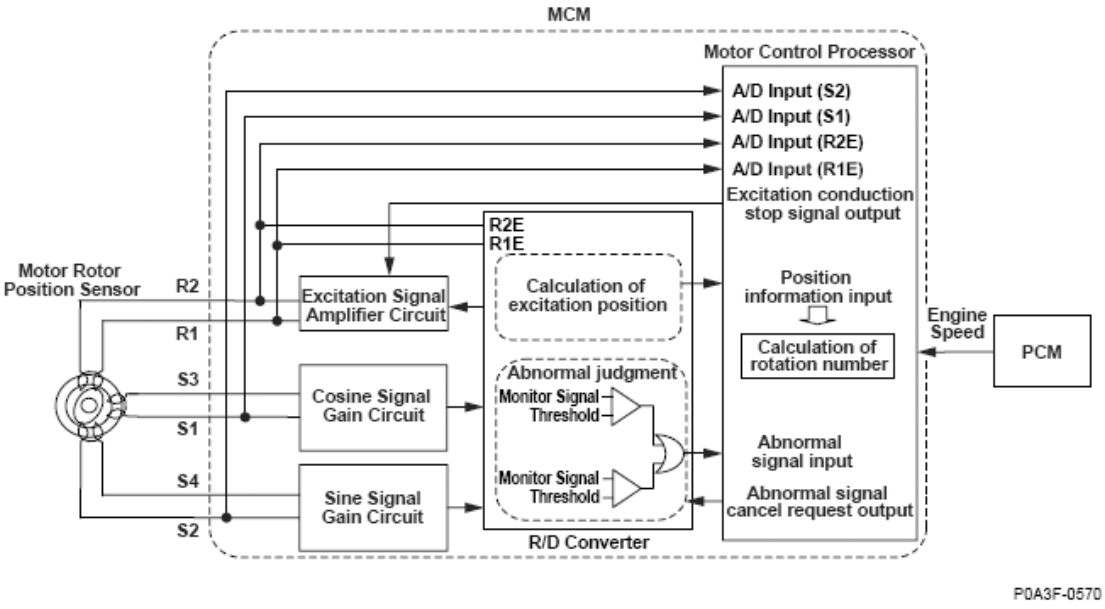

Fig. 90: Measuring Voltage Between Alternator 4P Connector Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Replace the alternator (see **ALTERNATOR REMOVAL AND INSTALLATION**), then go to step 18.

NO - Go to step 14.

14. Turn the ignition switch OFF.
15. Jump the SCS line with the HDS.
16. Disconnect ECM/PCM connector B (44P).
17. Check for continuity between alternator 4P connector terminal No. 4 and ECM/PCM connector terminal B43.

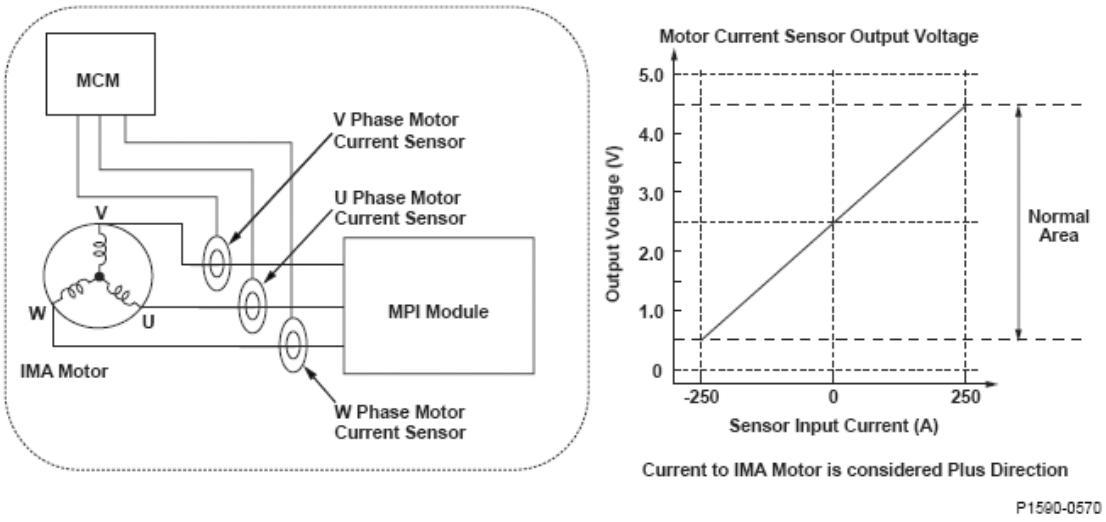

Fig. 91: Checking For Continuity Between Alternator 4P Connector Terminal No. 4 And ECM/PCM Connector Terminal B43
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 27.

NO - Repair open in the wire between the ECM/PCM (B43) and the alternator, then go to step 18.

18. Turn the ignition switch OFF.
19. Reconnect all connectors.
20. Turn the ignition switch ON (II).
21. Reset the ECM/PCM with the HDS.
22. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
23. Start the engine.
24. Check under these conditions:
    - A/C on
    - Temperature control at maximum cool
    - Blower fan at maximum speed
    - Rear window defogger on
    - Headlights on high beam
25. Hold the engine speed at 2,000 rpm (in Park or neutral) for 1 minute.
26. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P16BC indicated?

YES - Check for poor connections or loose terminals at the alternator and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

27. Reconnect all connectors.
28. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
29. Start the engine.
30. Check under these conditions:
    - A/C on
    - Temperature control at maximum cool
    - Blower fan at maximum speed
    - Rear window defogger on
    - Headlights on high beam
31. Hold the engine speed at 2,000 rpm (in Park or neutral) for 1 minute.
32. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P16BC indicated?

    YES - Check for poor connections or loose terminals at the alternator and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 29. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P2183: ECT SENSOR 2 CIRCUIT RANGE/PERFORMANCE PROBLEM

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P0111 is stored at the same time as DTC P2183, troubleshoot DTC P0111 first, then recheck for DTC P2183.**

1. Check for poor connections or loose terminals at ECT sensor 1 and ECT sensor 2.

   Are the connections and terminals OK?

   YES - Go to step 2.

   NO - Repair the connectors or terminals, then go to step 27.

2. Turn the ignition switch ON (II).
3. Check for Temporary DTCs or DTCs with the HDS.

   Are DTC P1116 and P2183 indicated at the same time?

   YES - Go to step 15.

NO - Go to step 4.

4. Start the engine, and let it idle for 10 minutes.
5. Check ECT SENSOR 2 in the DATA LIST with the HDS.

   Is about 131°F (55°C) or less indicated?

   YES - Replace ECT sensor 2 (see **ECT SENSOR 2 REPLACEMENT**), then go to step 27.

   NO - Go to step 6.

6. Turn the ignition switch to LOCK (0).
7. Drain the coolant (see **COOLANT REPLACEMENT**).
8. Remove ECT sensor 2 (see **ECT SENSOR 2 REPLACEMENT**), and reconnect ECT sensor 2 to the 2P connector, but do not install it on the engine.
9. Allow ETC sensor 2 to cool to ambient temperature.
10. Note the ambient temperature.
11. Connect ECT sensor 2 to its 2P connector, but do not install it on the radiator.
12. Turn the ignition switch to ON (II).
13. Note the value of ECT SENSOR 2 quickly in the DATA LIST with the HDS.
14. Compare the value of ECT SENSOR 2 and the IAT SENSOR in the DATA LIST with the HDS.

    Does ECT SENSOR 2 differ 5.4°F (3°C) or more?

    YES - Replace ECT sensor 2 (see **ECT SENSOR 2 REPLACEMENT**), then go to step 27.

    NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM/PCM.

15. Start the engine, and let it idle for 10 minutes.
16. Check ECT SENSOR 1 in the DATA LIST with the HDS.

    Is about 95°F (35°C) or less indicated?

    YES - Replace ECT sensor 1 (see **ECT SENSOR 1 REPLACEMENT**), then go to step 27.

    NO - Go to step 15.

17. Let the engine idle for 10 minutes.
18. Check ECT SENSOR 2 in the DATA LIST with the HDS.

    Is about 131°F (55°C) or less indicated?

    YES - Replace ECT sensor 2 (see **ECT SENSOR 2 REPLACEMENT**), then go to step 27.

    NO - Go to step 17.

19. Turn the ignition switch OFF.
20. Drain the coolant (see **COOLANT REPLACEMENT**).
21. Remove ECT sensor 1 (see **ECT SENSOR 1 REPLACEMENT**) and ECT sensor 2 (see **ECT SENSOR 2 REPLACEMENT**), and reconnect ECT sensor 1 to the 2P connector. Then reconnect the sensors to their connectors, but do not install them on the engine.
22. Remove the air cleaner cover, but keep the MAF sensor/IAT sensor connector connected.
23. Cool the engine for 1 hour.
24. Turn the ignition switch ON (II).
25. Note the value of ECT SENSOR 1, ECT SENSOR 2, and the IAT SENSOR quickly in the DATA LIST with the HDS.
26. Compare the value of ECT SENSOR 1 and the IAT SENSOR, and the value of ECT SENSOR 2 and the IAT SENSOR individually.

    Does either sensor differ more than 5.4°F (3°C) from the IAT SENSOR?

    YES - Replace the sensor that differed more than 5.4°F (3°C) from the IAT SENSOR.

    - ECT sensor 1 (see **ECT Sensor 1 Replacement**)
    - ECT sensor 2 (see **ECT Sensor 2 Replacement**)

    After replacing the sensor, go to step 29.

    NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM/PCM.

27. Turn the ignition switch ON (II).
28. Reset the ECM/PCM with the HDS.
29. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
30. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2183 indicated?

    YES - Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P2184: ECT SENSOR 2 CIRCUIT LOW VOLTAGE

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Information marked with an asterisk (*) applies to '07-08 models.**

1. Turn the ignition switch ON (II).

2. Check ECT SENSOR 2 in the DATA LIST with the HDS.

   Is about 356°F (180°C) or more, or 0.08 V or less indicated?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 2 and the ECM/PCM.

3. Turn the ignition switch OFF.
4. Disconnect the ECT sensor 2 2P connector.
5. Turn the ignition switch ON (II).
6. Check ECT SENSOR 2 in the DATA LIST with the HDS.

   Is about 356°F (180°C) or more, or 0.08 V or less indicated?

   YES - Go to step 7.

   NO - Go to step 11.

7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Disconnect ECM/PCM connector A (44P).
10. Check for continuity between ECT sensor 2 2P connector terminal No. 2 (No. 1)* and body ground.

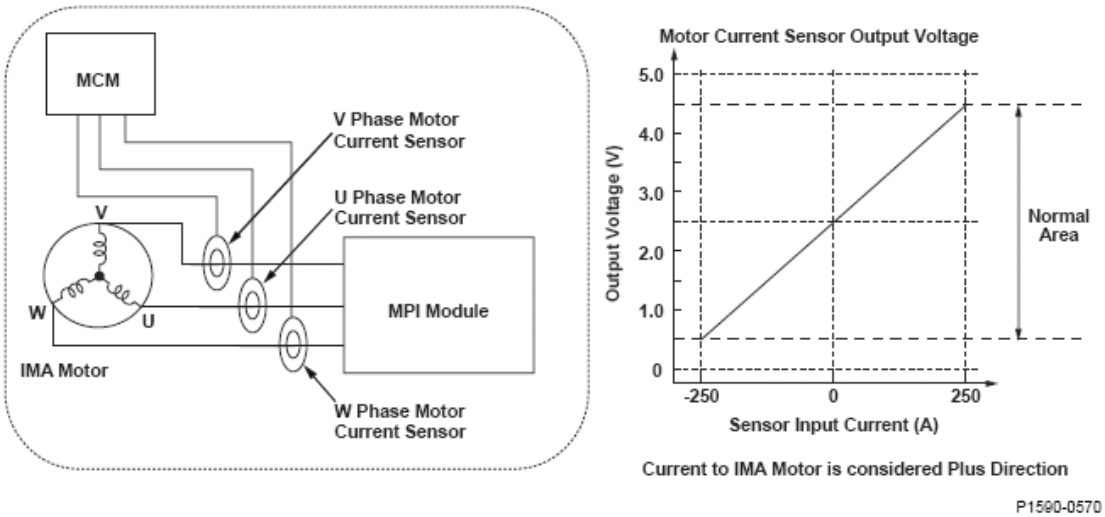

Fig. 92: Checking For Continuity Between ECT Sensor 2 2P Connector Terminal No. 2 And Body Ground ('06 model)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

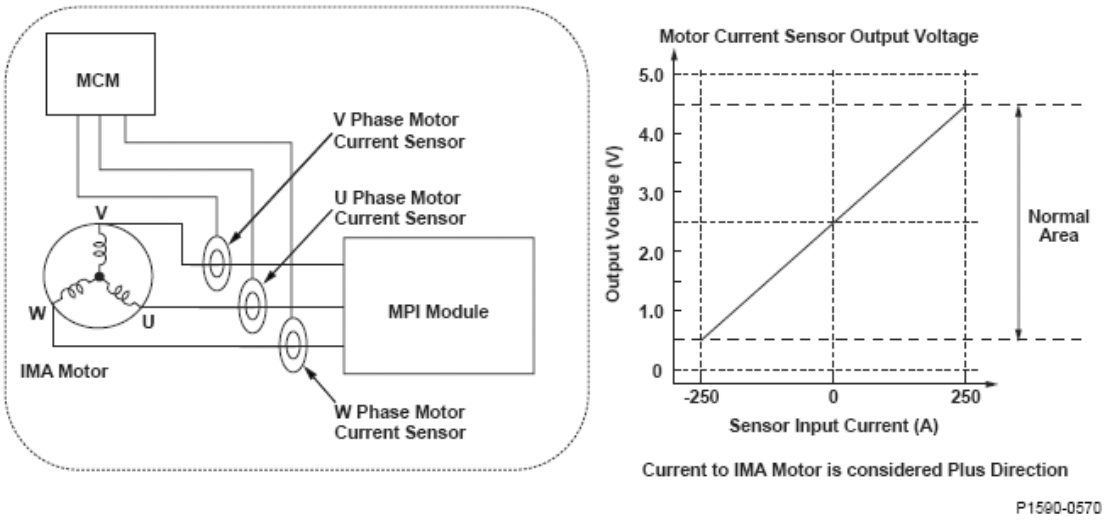

Fig. 93: Checking For Continuity Between ECT Sensor 2 2P Connector Terminal No. 1 And Body Ground ('07-09 models)

Is there continuity?

YES - Repair short in the wire between ECT sensor 2 and the ECM/PCM (A33), then go to step 13.

NO - Go to step 18.

11. Turn the ignition switch OFF.
12. Replace ECT sensor 2 (see **ECT SENSOR 2 REPLACEMENT**).
13. Reconnect all connectors.
14. Turn the ignition switch ON (II).
15. Reset the ECM/PCM with the HDS.
16. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
17. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2184 indicated?

    YES - Check for poor connections or loose terminals at ECT sensor 2 and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

18. Reconnect all connectors.
19. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
20. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2184 indicated?

YES - Check for poor connections or loose terminals at ECT sensor 2 and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P2185: ECT SENSOR 2 CIRCUIT HIGH VOLTAGE

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Information marked with an asterisk (*) applies to '07-09 models.**

1. Turn the ignition switch ON (II).
2. Check ECT SENSOR 2 in the DATA LIST with the HDS.

   Is about -40°F (-40°C) or less, or 4.90 V or more indicated?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 2 and the ECM/PCM.

3. Turn the ignition switch OFF.
4. Disconnect the ECT sensor 2 2P connector.
5. Connect ECT sensor 2 2P connector terminals No. 1 and No. 2 with a jumper wire.

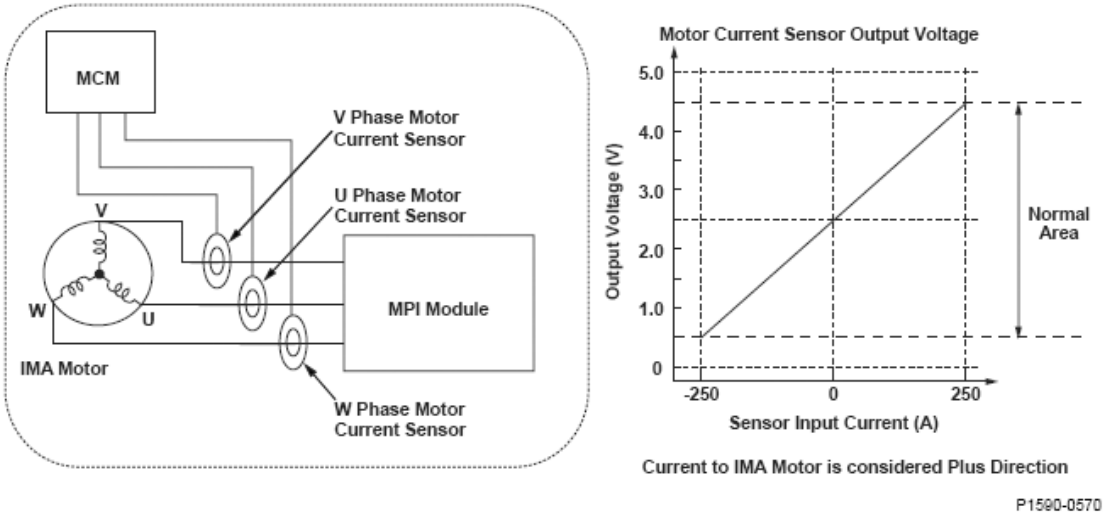

Fig. 94: Connecting ECT Sensor 2 2P Connector Terminals No. 1 And No. 2 With A Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Turn the ignition switch ON (II).

7. Check ECT SENSOR 2 in the DATA LIST with the HDS.

   Is about -40°F (-40°C) or less, or 4.90 V or more indicated?

   YES - Go to step 8.

   NO - Go to step 20.

8. Turn the ignition switch OFF.
9. Remove the jumper wire from the ECT sensor 2 2P connector.
10. Turn the ignition switch ON (II).
11. Measure voltage between ECT sensor 2 2P connector terminal No. 2 (No. 1)* and body ground.

Is there about 5 V?

YES - Go to step 12.

NO - Go to step 16.

12. Turn the ignition switch OFF.
13. Jump the SCS line with the HDS.
14. Disconnect ECM/PCM connector A (44P).
15. Check for continuity between ECT sensor 2 2P connector terminal No. 1 (No. 2)* and ECM/PCM connector terminal A9.

Is there continuity?

YES - Go to step 27.

NO - Repair open in the wire between the ECM/PCM (A9) and ECT sensor 2, then go to step 22.

16. Turn the ignition switch OFF.
17. Jump the SCS line with the HDS.
18. Disconnect ECM/PCM connector A (44P).
19. Check for continuity between ECT sensor 2 2P connector terminal No. 2 (No. 1)* and ECM/PCM connector terminal A33.

Is there continuity?

YES - Go to step 27.

NO - Repair open in the wire between the ECM/PCM (A33) and ECT sensor 2, then go to step 22.

20. Turn the ignition switch OFF.
21. Replace ECT sensor 2 (see **ECT SENSOR 2 REPLACEMENT**).
22. Reconnect all connectors.
23. Turn the ignition switch ON (II).
24. Reset the ECM/PCM with the HDS.
25. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
26. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P2185 indicated?

YES - Check for poor connections or loose terminals at ECT sensor 2 and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the

indicated DTC's troubleshooting.

27. Reconnect all connectors.
28. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
29. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2185 indicated?

    YES - Check for poor connections or loose terminals at ECT sensor 2 and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO -If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P2195: A/F SENSOR (SENSOR 1) SIGNAL STUCK LEAN

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If the vehicle was out of fuel and the engine stalled before this DTC was stored, refuel, then clear the DTC with the HDS.**
- **If DTC P2101, P2118, P2135, P2138, P2176 or a combination of P2122 and P2127, P2122 and P2138, or P2127 and P2138 is stored at the same time, troubleshoot them first, then recheck for DTC P2195.**

1. Check the installation of the A/F sensor (Sensor 1).

   Is the A/F sensor loose or disconnected from the exhaust pipe?

   YES - Go to step 6.

   NO - Go to step 2.

2. Turn the ignition switch ON (II).
3. clear the DTC with the HDS.
4. Start the engine, and let it idle without load (in Park or neutral) for 2 minutes.
5. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2195 indicated?

   YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 13.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. If any other Temporary DTCs or DTCs are indicated,

go to the indicated DTC's troubleshooting.

6. Turn the ignition switch OFF.
7. Reinstall the A/F sensor (Sensor 1) (see **A/F SENSOR REPLACEMENT**).
8. Turn the ignition switch ON (II).
9. Reset the ECM/PCM with the HDS.
10. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
11. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2195 indicated?

    YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1.

    NO - Go to step 12.

12. Monitor the OBD STATUS for DTC P2195 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 11, go to the indicated DTC's troubleshooting.

    NO -If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If the screen indicated NOT COMPLETED, keep idling until a result comes on.

13. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
14. Start the engine, and let it idle without load (in Park or neutral) for 2 minutes.
15. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2195 indicated?

    YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 14. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 16.

16. Monitor the OBD STATUS for DTC P2195 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 15, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor

(Sensor 1) and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P2227: BARO SENSOR CIRCUIT RANGE/PERFORMANCE PROBLEM

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P0107, P0108, P1128, and/or P1129 are stored at the same time as DTC P2227, troubleshoot those DTCs first, then recheck for DTC P2227.**

1. Turn the ignition switch ON (II), and wait 2 seconds.
2. Check the BARO SENSOR in the DATA LIST with the HDS.

   Is about 101 kPa (29.9 in.Hg, 760 mmHg), or about 2.9 V at sea level indicated?

   YES - Go to step 3.

   NO - Go to step 7.

3. clear the DTC with the HDS.
4. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
5. Test-drive under these conditions:
   - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
   - A/T in D position (M/T in 4th gear)
   - REL TP SENSOR between 12 deg and 20 deg for 5 seconds
6. Monitor the OBD STATUS for DTC P2227 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 7.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the screen indicates NOT COMPLETED, go to step 4 and recheck.

7. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
8. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
9. Test-drive under these conditions:
   - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
   - A/T in D position (M/T in 4th gear)
   - REL TP SENSOR between 12 deg and 20 deg for 5 seconds

10. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2227 indicated?

    YES - Check for poor connections or loose terminals at the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 8. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 11.

11. Monitor the OBD STATUS for DTC P2227 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 10, go to the indicated DTC's troubleshooting.

    NO -If the screen indicates FAILED, check for poor connections or loose terminals at the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 8. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, go to step 8.

DTC P2228: BARO SENSOR CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check the BARO SENSOR in the DATA LIST with the HDS.

   Is about 53 kPa (15.6 in.Hg, 397 mmHg), or 1.58 V or less indicated?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time.

3. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2228 indicated?

   YES - Check for poor connections or loose terminals at the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

   NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted,

replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P2229: BARO SENSOR CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check the BARO SENSOR in the DATA LIST with the HDS.

   Is about 160 kPa (47.2 in.Hg, 1,200 mmHg), or 4.5 V or more indicated?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time.

3. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2229 indicated?

   YES - Check for poor connections or loose terminals at the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

   NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P2238: A/F SENSOR (SENSOR 1) AFS+ CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. clear the DTC with the HDS.
3. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2238 indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM.

4. Turn the ignition switch OFF.
5. Jump the SCS line with the HDS.
6. Disconnect the A/F sensor (Sensor 1) 4P connector.
7. Disconnect ECM/PCM connector C (44P).
8. Check for continuity between ECM/PCM connector terminal C29 and body ground.

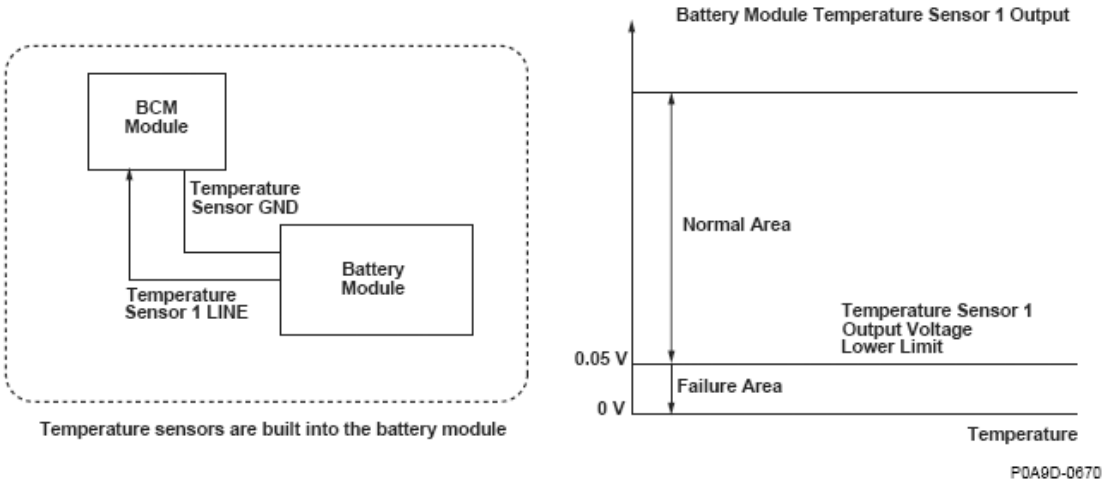

Fig. 101: Checking For Continuity Between ECM/PCM Connector Terminal C29 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (C29) and the A/F sensor (Sensor 1), then go to step 10.

NO - Go to step 9.

9. Replace the A/F sensor (Sensor 1) (see **A/F SENSOR REPLACEMENT**).
10. Reconnect all connectors.
11. Turn the ignition switch ON (II).
12. Reset the ECM/PCM with the HDS.
13. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
14. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P2238 indicated?

YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If the connector and terminal fits are OK, go to step 16.

NO - Go to step 15.

15. Monitor the OBD STATUS for DTC P2238 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 14, go to the indicated DTC's troubleshooting.

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

16. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
17. Start the engine, and let it idle.
18. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2238 indicated?

    YES - If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 17. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 19.

19. Monitor the OBD STATUS for DTC P2238 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 18, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, go to step 1. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 17. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P2252: A/F SENSOR (SENSOR 1) AFS-CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. clear the DTC with the HDS.
3. Start the engine.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2252 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM.

5. Turn the ignition switch OFF.
6. Jump the SCS line with the HDS.
7. Disconnect the A/F sensor (Sensor 1) 4P connector.
8. Disconnect ECM/PCM connector C (44P).
9. Check for continuity between ECM/PCM connector terminal C30 and body ground.

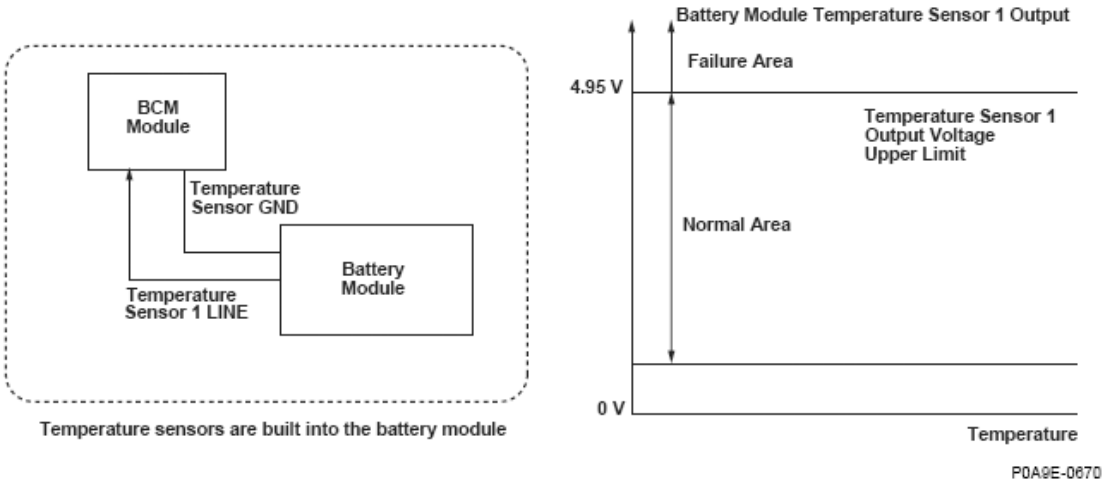

Fig. 102: Checking For Continuity Between ECM/PCM Connector Terminal C30 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (C30) and the A/F sensor (Sensor 1), then go to step 11.

NO - Go to step 10.

10. Replace the A/F sensor (Sensor 1) (see **A/F SENSOR REPLACEMENT**).
11. Reconnect all connectors.
12. Turn the ignition switch ON (II).
13. Reset the ECM/PCM with the HDS.
14. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
15. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P2252 indicated?

YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If the connector and terminal fits are OK, go to step 17.

NO - Go to step 16.

16. Monitor the OBD STATUS for DTC P2252 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 15, go to the indicated DTC's troubleshooting.

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

17. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
18. Start the engine, and let it idle.
19. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2252 indicated?

    YES - If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 18. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 20.

20. Monitor the OBD STATUS for DTC P2252 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 19, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, go to step 1. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 18. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P2270: SECONDARY HO2S (SENSOR 2) CIRCUIT SIGNAL STUCK LEAN; DTC P2271: SECONDARY HO2S (SENSOR 2) CIRCUIT SIGNAL STUCK RICH

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle without load (in Park or neutral) until the radiator fan comes on.
4. Test-drive under these conditions:
   - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
   - Vehicle speed above 35 mph (56 km/h)
   - Drive 20 seconds or more
5. Monitor the OBD STATUS for DTC P2270 or P2271 in the DTCs MENU with the HDS.

Does the screen indicate FAILED?

YES - Go to step 6.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM/PCM. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 3 and recheck.

6. Turn the ignition switch OFF.
7. Replace the secondary HO2S (Sensor 2) (see **A/F SENSOR REPLACEMENT**).
8. Turn the ignition switch ON (II).
9. Reset the ECM/PCM with the HDS.
10. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
11. Start the engine, and let it idle without load (in Park or neutral) until the radiator fan comes on.
12. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
    - Vehicle speed above 35 mph (56 km/h)
    - Drive 20 seconds or more
13. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2270 or P2271 indicated?

    YES - Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM/PCM, then go to step 1.

    NO - Go to step 14.

14. Monitor the OBD STATUS for DTC P2270 or P2271 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 13, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM/PCM, then go to step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 11.

DTC P2610: ECM/PCM IGNITION OFF INTERNAL TIMER MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. clear the DTC with the HDS.

3. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2610 indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time.

4. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
5. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2610 indicated?

   YES - If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

   NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P2A00: A/F SENSOR (SENSOR 1) CIRCUIT RANGE/PERFORMANCE PROBLEM

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
4. Test-drive under these conditions:
   - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
   - A/T in D position (M/T in 3rd gear)
   - Vehicle speed between 25-55 mph (40 - 88 km/h) for 5 minutes
   - Drive at a steady speed between 55-75 mph (88-120 km/h) for 10 seconds, then decelerate (with throttle fully closed) for 4 seconds
5. Monitor the OBD STATUS for DTC P2A00 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 6.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 3 and recheck.

6. Turn the ignition switch OFF.
7. Replace the A/F sensor (Sensor 1) (see **A/F SENSOR REPLACEMENT**).
8. Turn the ignition switch ON (II).
9. Reset the ECM/PCM with the HDS.
10. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
11. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
    - A/T in D position (M/T in 3rd gear)
    - Vehicle speed between 25-55 mph (40 - 88 km/h) for 5 minutes
    - Drive at a steady speed between 55-75 mph (88-120 km/h) for 10 seconds, then decelerate (with throttle fully closed) for 4 seconds
12. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2A00 indicated?

    YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1.

    NO - Go to step 13.

13. Monitor the OBD STATUS for DTC P2A00 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 12, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 10.

DTC U0028: F-CAN MALFUNCTION (BUS-OFF (ECM))

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC U0028 indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time.

4. Update the ECM if it does not have the latest software, or substitute a known-good ECM.
5. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC U0028 indicated?

   YES - If the ECM was updated, substitute a known-good ECM, then recheck. If the ECM was substituted, go to step 1.

   NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC U0122: F-CAN MALFUNCTION (ECM/PCM-VSA MODULATOR-CONTROL UNIT)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II).
2. Check for Pending or Confirmed DTCs with the HDS.

   Are DTC U0028 and U0122 indicated at the same time?

   YES - Go to the troubleshooting for DTC U0028.

   NO - Go to step 3.

3. Clear the DTC with the HDS.
4. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC U0122 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the VSA modulator-control unit and the ECM/PCM.

5. Check for communication to the VSA system with the HDS.

   Does the HDS communicate with the VSA modulator-control unit?

   YES - Go to step 6.

   NO - Go to the VSA system symptom troubleshooting for ABS indicator, brake system indicator, and VSA indicator do not go off.

6. Turn the ignition switch to LOCK (0).
7. Jump the SCS line with the HDS.

8. Disconnect the VSA modulator-control unit 37P connector.
9. Disconnect ECM/PCM connector A (44P).
10. Check for continuity between ECM/PCM connector terminal A36 and VSA modulator-control unit 37P connector terminal No. 15.

    Is there continuity?

    YES - Go to step 11.

    NO - Repair open in the wire between the ECM/PCM (A36) and the VSA modulator-control unit, then go to step 12.

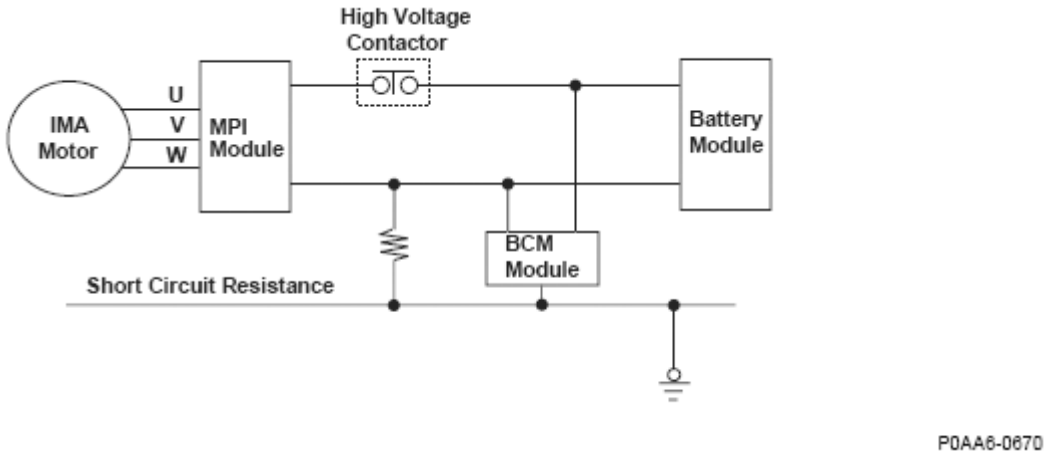

Fig. 103: VSA Modulator-Control Unit 37P Connector - White
Courtesy of TOYOTA

11. Check for continuity between ECM/PCM connector terminal A37 and VSA modulator-control unit 47P connector terminal No. 1.

    Is there continuity?

    YES - Substitute a known-good VSA modulator-control unit, then go to step 12 and recheck. If DTC U0122 is not indicated after substitution, replace the original VSA modulator-control unit, then go to step 12.

    NO - Repair open in the wire between the ECM/PCM (A37) and the VSA modulator-control unit, then go to step 12.

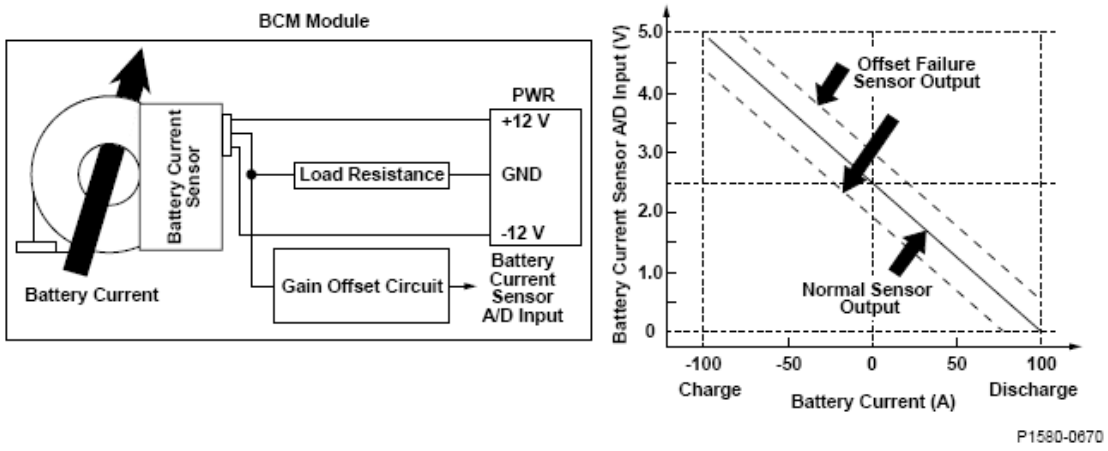

Fig. 104: VSA Modulator-Control Unit 37P Connector - Red
Courtesy of TOYOTA

12. Reconnect all connectors.
13. Turn the ignition switch to ON (II).
14. Reset the ECM/PCM with the HDS.
15. Do the ECM/PCM idle learn procedure.
16. Check for Pending or Confirmed DTCs with the HDS

    Is DTC U0122 indicated?

    YES - Check for poor connections or loose terminals at the VSA modulator unit and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC U0131: F-CAN MALFUNCTION (ECM-EPS CONTROL UNIT)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information.

1. Turn the ignition switch to ON (II).
2. Check for Pending or Confirmed DTCs with the HDS.

   Are DTC U0028 and U0131 indicated at the same time?

   YES - Go to troubleshooting for DTC U0028.

   NO - Go to step 3.

3. Clear the DTC with the HDS.
4. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC U0131 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EPS control unit and the ECM.

5. Check for communication between the HDS and the EPS system.

   Does the HDS communicate with the EPS control unit?

   YES - Go to step 6.

   NO - Go to the EPS system symptom troubleshooting for EPS indicator does not go off, and no DTCs are stored.

6. Turn the ignition switch to LOCK (0).
7. Jump the SCS line with the HDS.
8. Disconnect EPS control unit connector D (28P).
9. Disconnect ECM connector A (44P).
10. Check for continuity between ECM/PCM connector terminal A36 and EPS control unit connector D (28P) terminal No. 1.

    Is there continuity?

    YES - Go to step 11.

    NO - Repair open in the wire between the ECM/PCM (A36) and the EPS control unit, then go to step 12.

11. Check for continuity between ECM/PCM connector terminal A37 and EPS control unit connector D (28P) terminal No. 15.

    Is there continuity?

    YES - Substitute a known-good EPS control unit, then go to step 12 and recheck. If DTC U0131 is not indicated after substitution, replace the original EPS control unit, then go to step 12.

    NO - Repair open in the wire between the ECM/PCM (A37) and the EPS control unit, then go to step 12.

12. Reconnect all connectors.
13. Turn the ignition switch to ON (II).
14. Reset the ECM with the HDS.
15. Do the ECM idle learn procedure.
16. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC U0131 indicated?

    YES - Check for poor connections or loose terminals at the gauge control module, the EPS control

unit, and the ECM, then go to step 1.

NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC U0155: F-CAN MALFUNCTION (ECM/PCM-GAUGE CONTROL MODULE)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. clear the DTC with the HDS.
3. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC U0155 indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the gauge control module (tach) and the ECM/PCM.

4. Check for body electrical DTCs in the DTCs MENU with the HDS.

   Is DTC B1168, B1169, and/or B1178 indicated?

   YES - Go to step 5.

   NO - Do the gauge control module input test (see **GAUGE CONTROL MODULE (TACH) INPUT TEST**).

5. Turn the ignition switch LOCK (0).
6. Jump the SCS line with the HDS.
7. Remove the gauge control module (tach) (see **TACHOMETER**).
8. Disconnect ECM/PCM connector A (44P).
9. Connect gauge control module (tach) 36P connector terminal No. 1 to body ground with a jumper wire.

10. Check for continuity between ECM/PCM connector terminal A36 and body ground.

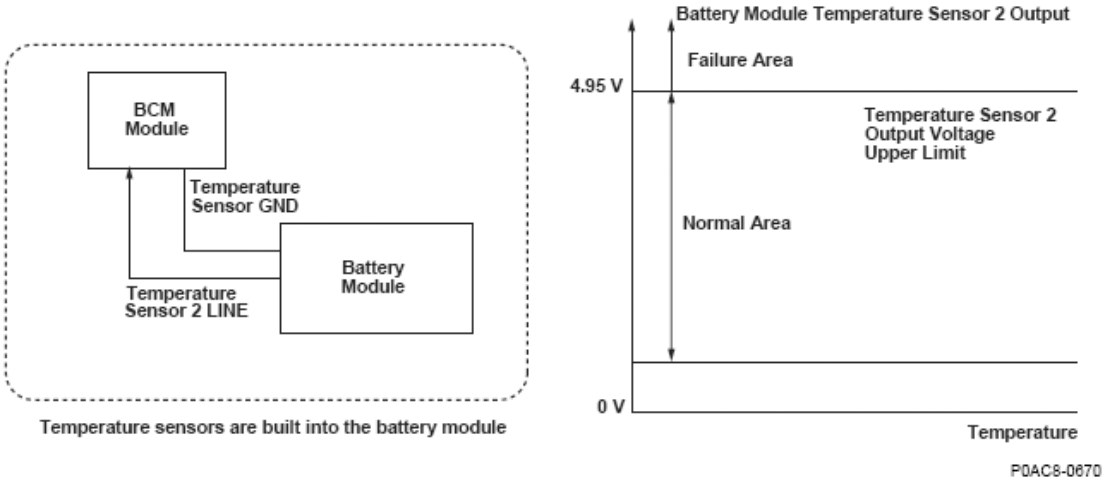

Fig. 106: Checking For Continuity Between ECM/PCM Connector Terminal A36 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 12.

NO - Repair open in the wire between the ECM/PCM (A36) and gauge control module (tach), then go to step 13.

11. Connect gauge control module (tach) 36P connector terminal No. 19 to body ground with a jumper wire.

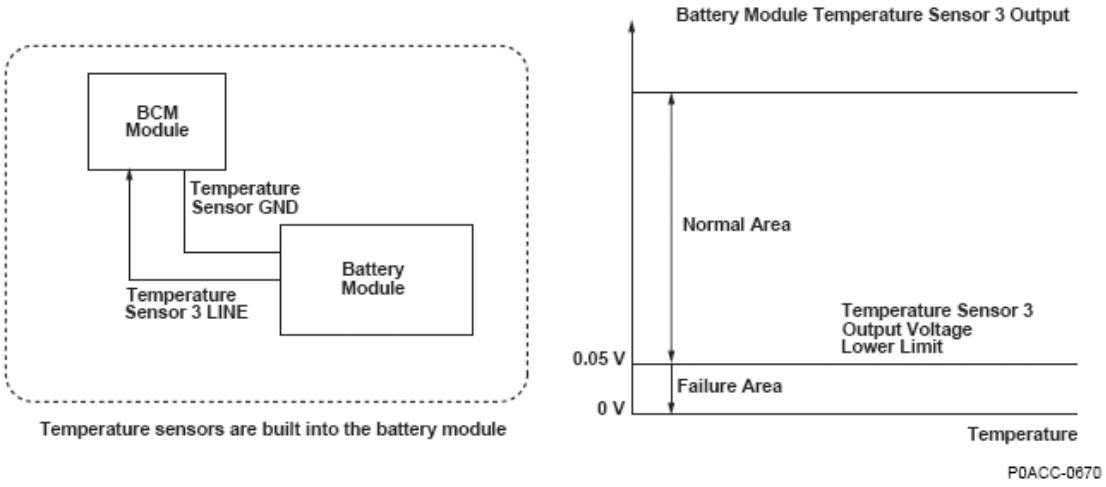

Fig. 107: Connecting Gauge Control Module (Tach) 36P Connector Terminal No. 19 To Body Ground With A Jumper Wire

12. Check for continuity between ECM/PCM connector terminal A37 and body ground.

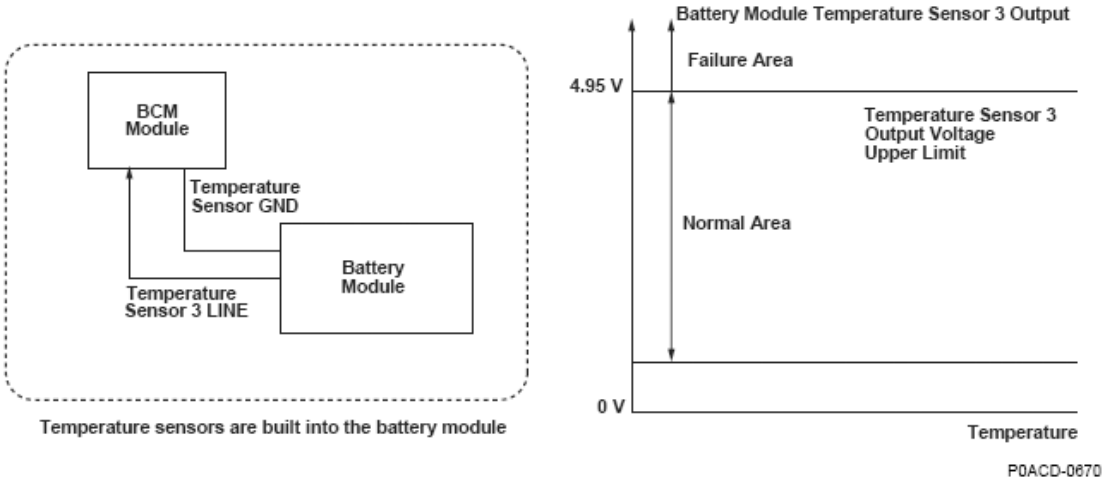

Fig. 108: Checking For Continuity Between ECM/PCM Connector Terminal A37 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Substitute a known-good gauge control module (tach), then go to step 14 and recheck. If no DTCs are indicated, replace the original gauge control module (tach), then go to step 14.

NO - Repair open in the wire between the ECM/PCM (A37) and the gauge control module (tach), then go to step 14.

13. Reconnect all connectors.
14. Turn the ignition switch ON (II).
15. Reset the ECM/PCM with the HDS.
16. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).

17. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC U0155 indicated?

    YES - Check for poor connections or loose terminals at the gauge control module (tach) and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC U0300: PGM-FI SYSTEM AND A/T SYSTEM PROGRAM VERSION MISMATCH

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Do not turn the ignition switch OFF while updating the PCM. If you turn the ignition switch OFF before completion, the PCM will be damaged.**

1. Do the PCM update procedure (PGM-FI system) (see **UPDATING ECM/PCM**).
2. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC U0300 indicated?

   YES - Replace the original PCM (see **ECM/PCM REPLACEMENT**).

   NO - The update is complete.

F-CAN CIRCUIT TROUBLESHOOTING

NOTE: Information marked with an asterisk (*) applies to the CANL line.

1. Turn the ignition switch OFF.
2. Jump the SCS line with the HDS.
3. Disconnect ECM/PCM connector A (44P), then disconnect the HDS.
4. Measure resistance between ECM/PCM connector terminals A36 and A37.

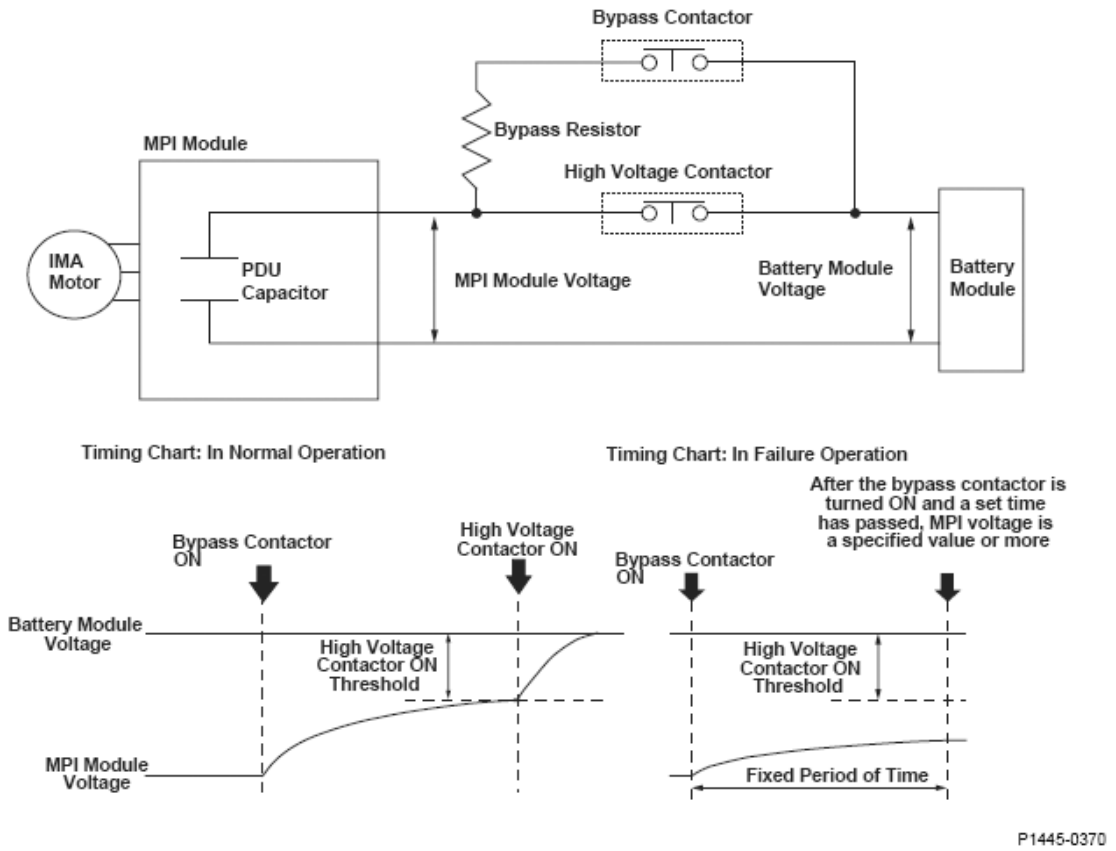

Fig. 109: Measuring Resistance Between ECM/PCM Connector Terminals A36 And A37
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 99-121 ohms?

YES - Go to step 33.

NO - Go to step 5.

5. Disconnect the gauge control module (tach) 36P connector (see **TACHOMETER**).
6. Disconnect the ABS modulator-control unit 25P connector (see **ABS MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**).
7. Disconnect SRS unit connector A (28P) (see **SRS UNIT REPLACEMENT**).
8. With TPMS: Disconnect TPMS control unit 20P connector.
9. Check for continuity between ECM/PCM connector terminals A36 and A37.

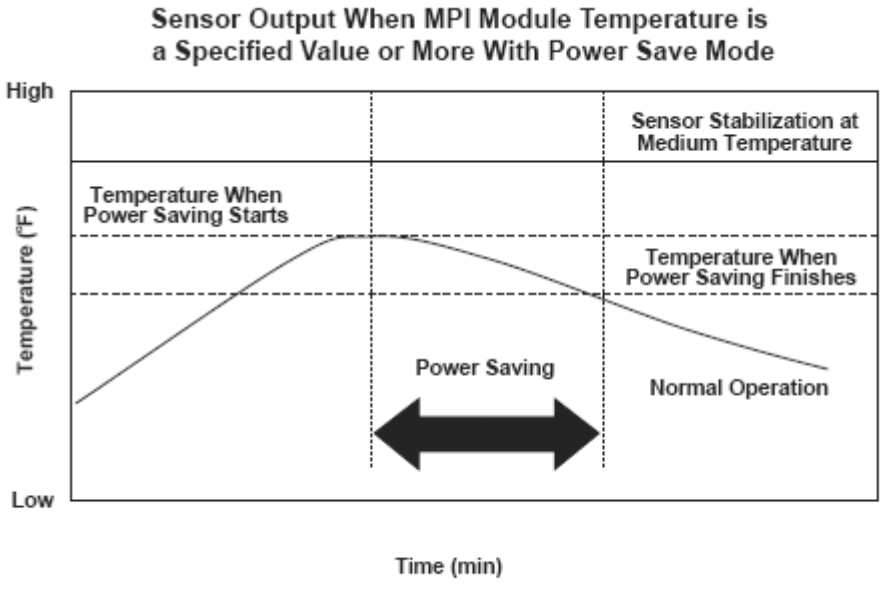

Fig. 110: Checking For Continuity Between ECM/PCM Connector Terminals A36 And A37
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wires between ECM/PCM connector terminals A36 and A37.

NO - Go to step 10.

10. Connect ECM/PCM connector terminal A36 to body ground with a jumper wire.

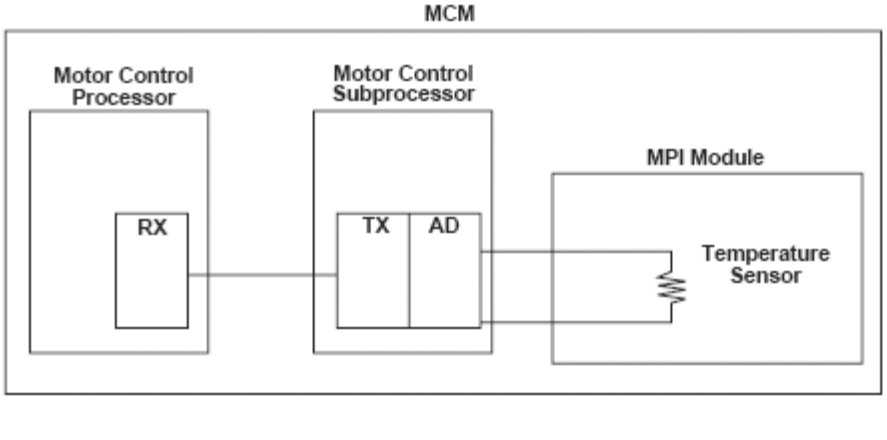

Fig. 111: Connecting ECM/PCM Connector Terminal A36 To Body Ground With A Jumper Wire

11. Check for continuity between gauge control module (tach) 36P connector terminal No. 1 and body ground.

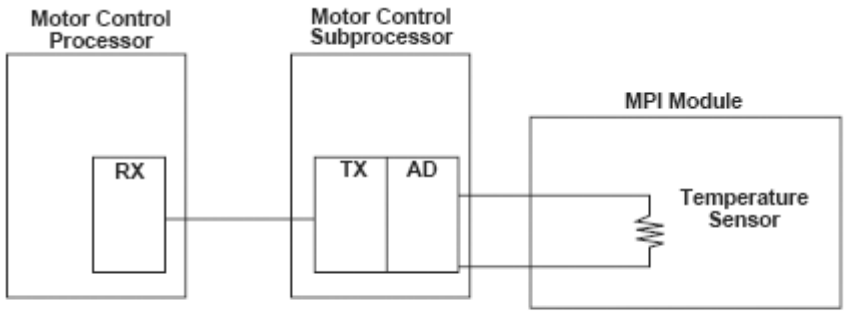

Fig. 112: Checking For Continuity Between Gauge Control Module (Tach) 36P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 12.

NO - Repair open in the wire between the ECM/PCM (A36) and the gauge control module (tach).

12. Check for continuity between ABS modulator-control unit 25P connector terminal No. 1 and body ground.

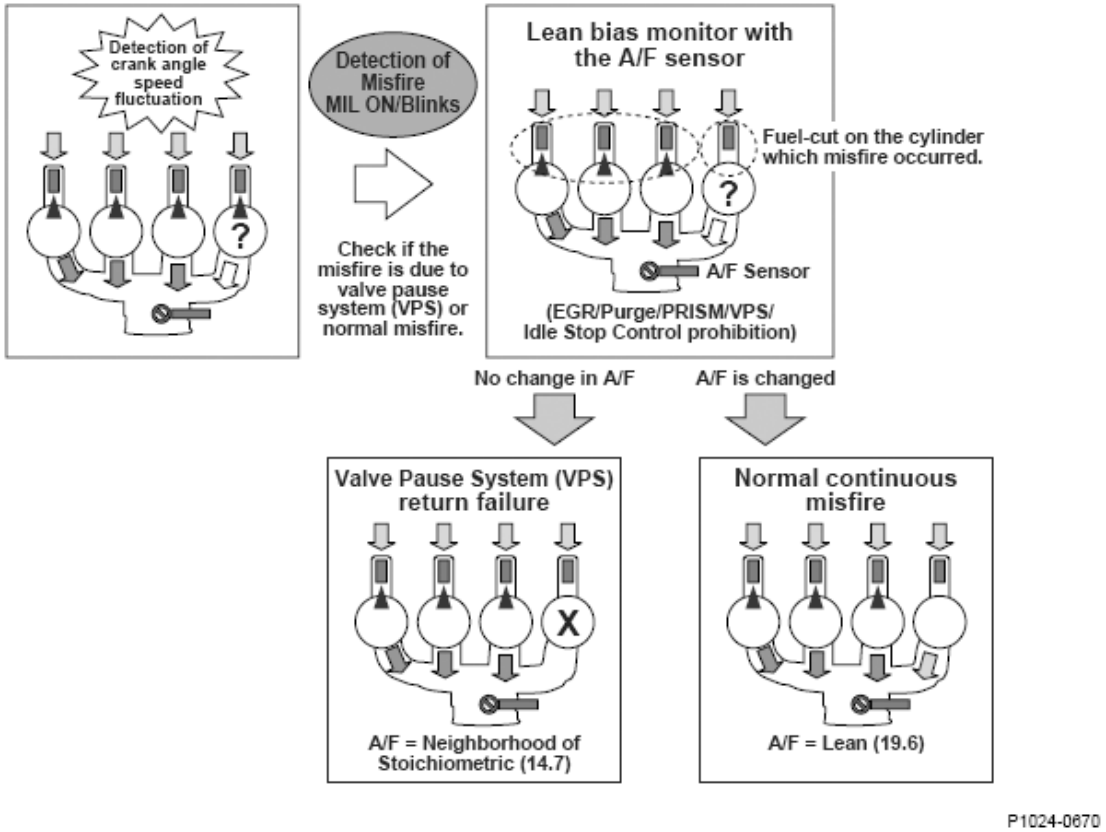

Fig. 113: Checking For Continuity Between ABS Modulator-Control Unit 25P Connector Terminal No. 1 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 13.

NO - Repair open in the wire between the ECM/PCM (A36) and the ABS modulator-control unit.

13. Check for continuity between SRS unit connector A (28P) terminal No. 11 and body ground.

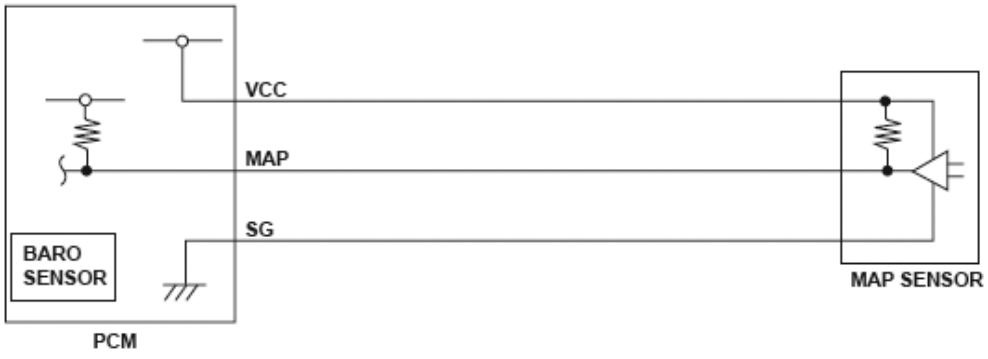

Fig. 114: Checking For Continuity Between SRS Unit Connector A (28P) Terminal No. 11 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 14.

NO - Repair open in the wire between the ECM/PCM (A36) and the SRS unit.

14. Check for continuity between TPMS control unit 20P connector terminal No. 2 and body ground.

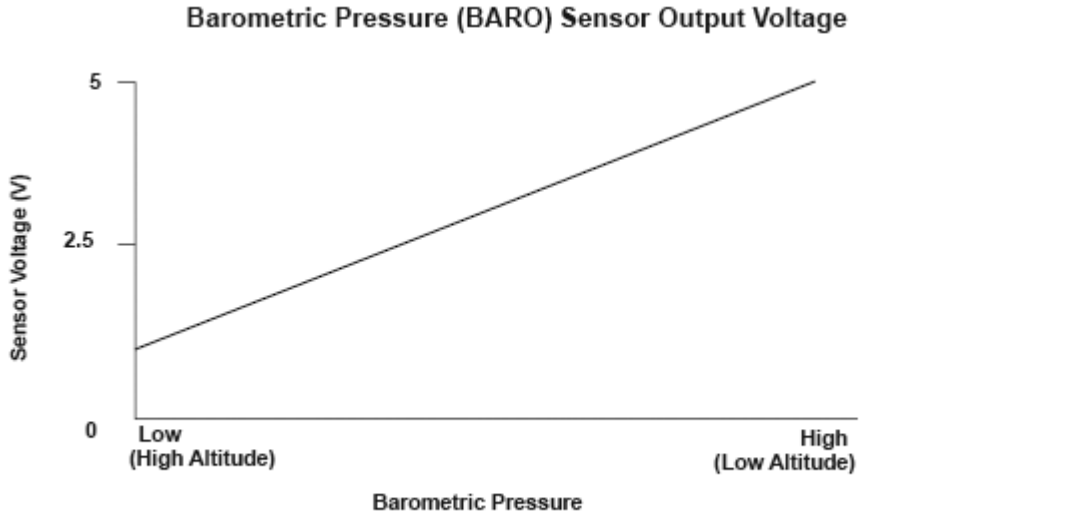

Fig. 115: Checking For Continuity Between TPMS Control Unit 20P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 15.

NO - Repair open in the wire between the ECM/PCM (A36) and the TPMS unit.

15. Remove the jumper wire from ECM/PCM connector A (44P).
16. Connect ECM/PCM connector terminal A37 to body ground with a jumper wire.

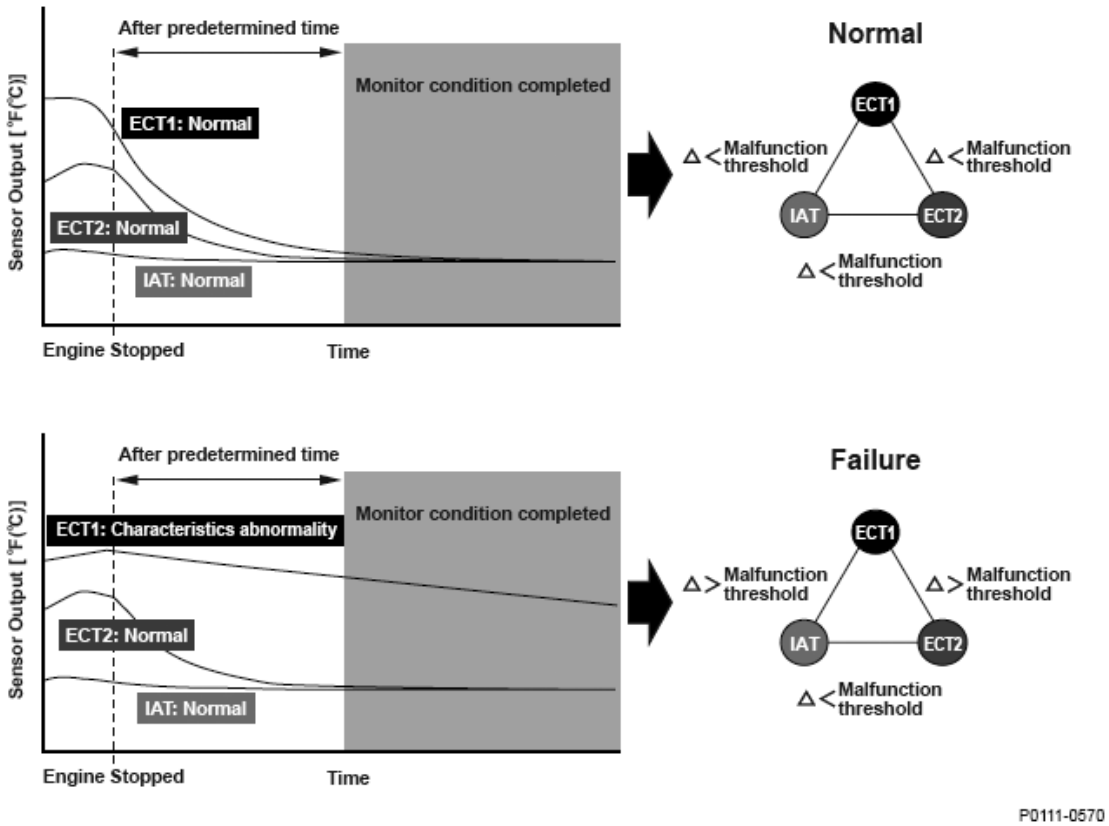

Fig. 116: Connecting ECM/PCM Connector Terminal A37 To Body Ground With A Jumper Wire

17. Check for continuity between gauge control module (tach) 36P connector terminal No. 19 and body ground.

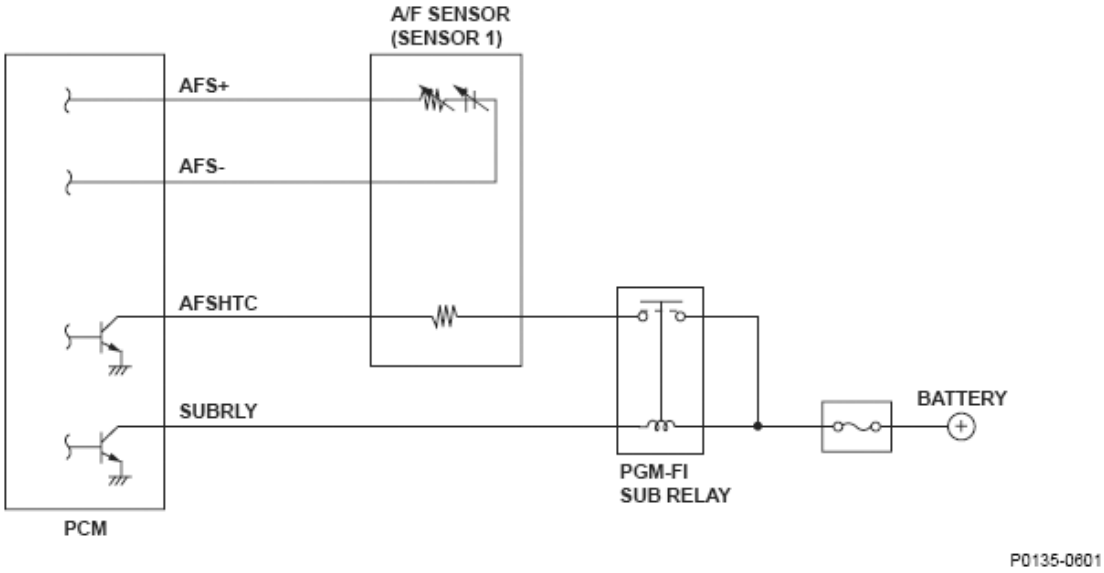

Fig. 117: Checking For Continuity Between Gauge Control Module (Tach) 36P Connector Terminal No. 19 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 18.

NO - Repair open in the wire between the ECM/PCM (A37) and the gauge control module (tach).

18. Check for continuity between ABS modulator-control unit 25P connector terminal No. 17 and body ground.

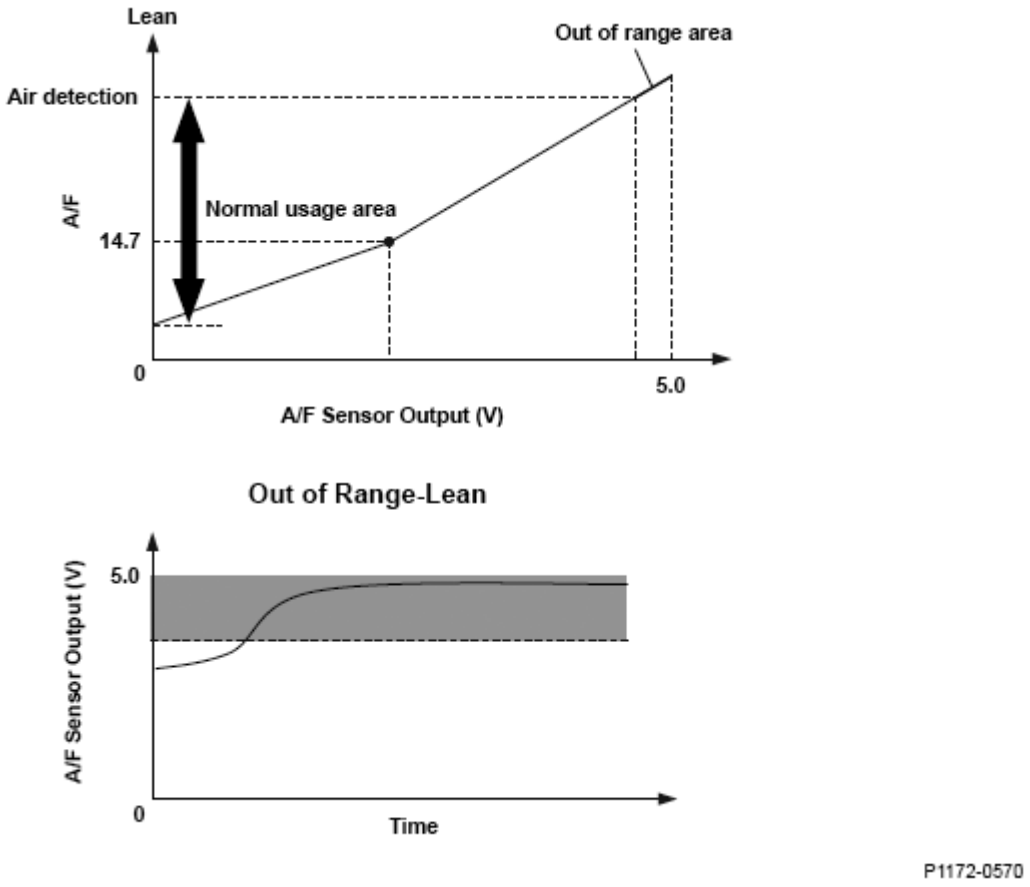

Fig. 118: Checking For Continuity Between ABS Modulator-Control Unit 25P Connector Terminal No. 17 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 17.

NO - Repair open in the wire between the ECM/PCM (A37) and the ABS modulator-control unit.

19. Check for continuity between SRS unit connector A (28P) terminal No. 12 and body ground.

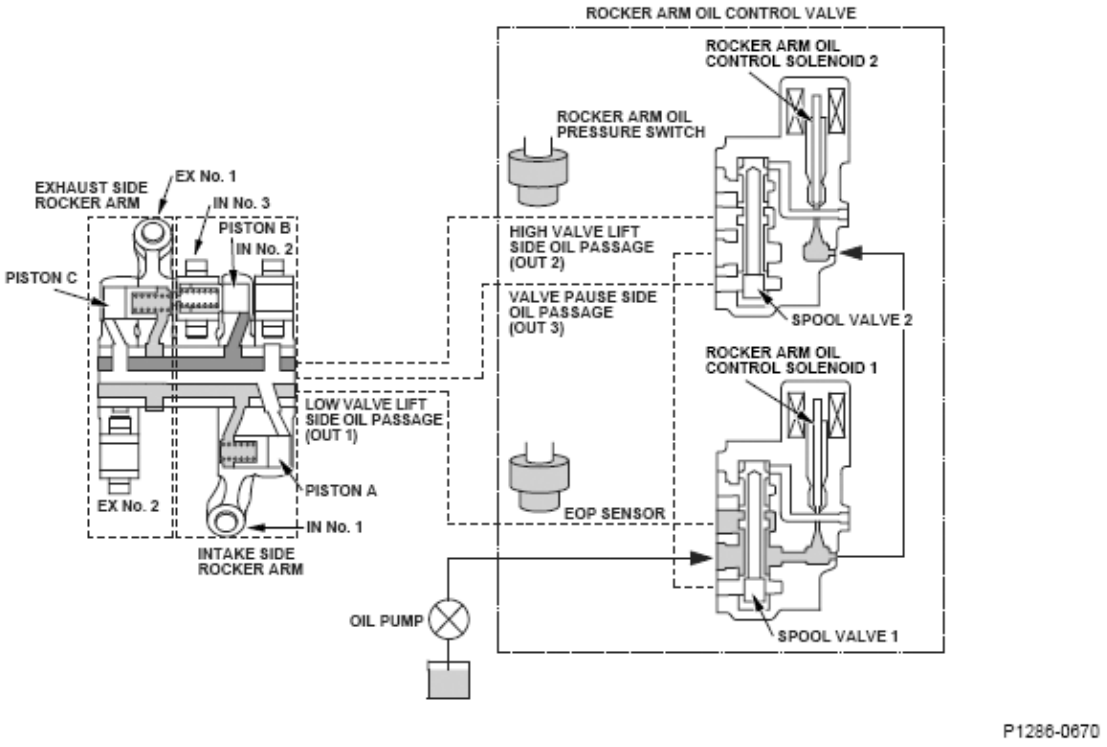

Fig. 119: Checking For Continuity Between SRS Unit Connector A (28P) Terminal No. 12 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -

- With TPMS: Go to step 20.
- Without TPMS: Go to step 21.

NO - Repair open in the wire between the ECM/PCM (A37) and the SRS unit.

20. Check for continuity between TPMS control unit 20P connector terminal No. 11 and body ground.

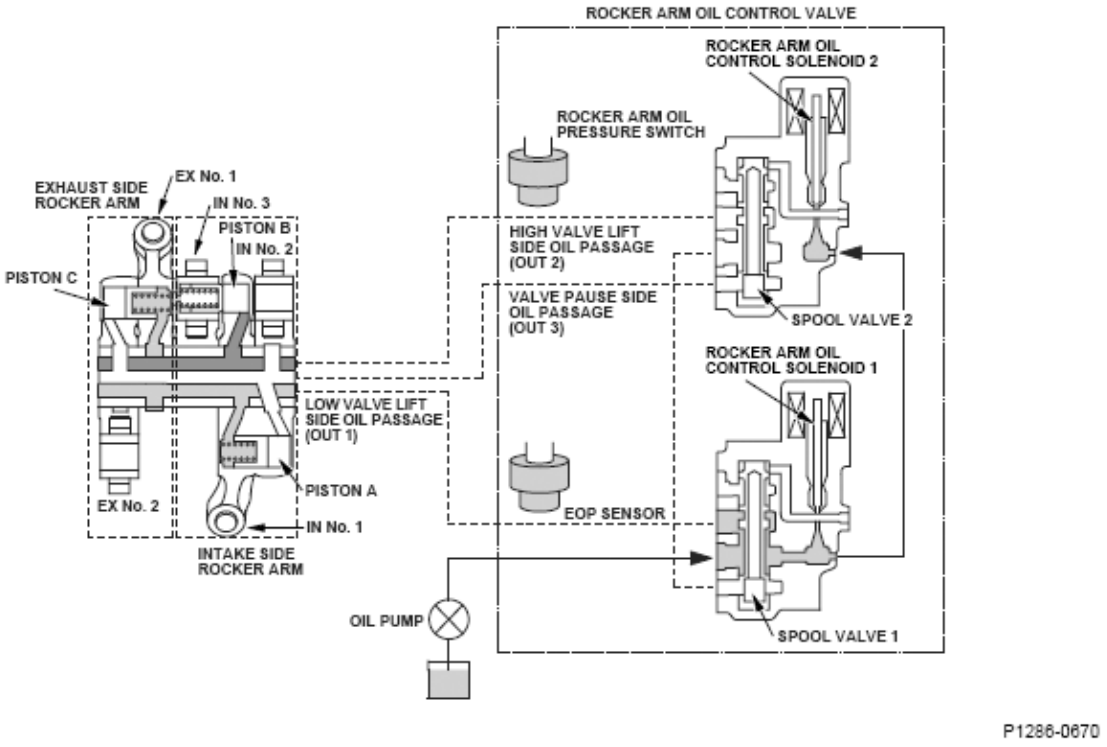

Fig. 120: Checking For Continuity Between TPMS Control Unit 20P Connector Terminal No. 11 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 21.

NO - Repair open in the wire between the ECM/PCM (A37) and the TPMS control unit.

21. Remove the jumper wire from ECM/PCM connector A (44P).
22. Reconnect the gauge control module (tach) 36P connector.
23. Measure resistance between ECM/PCM connector terminals A36 and A37.

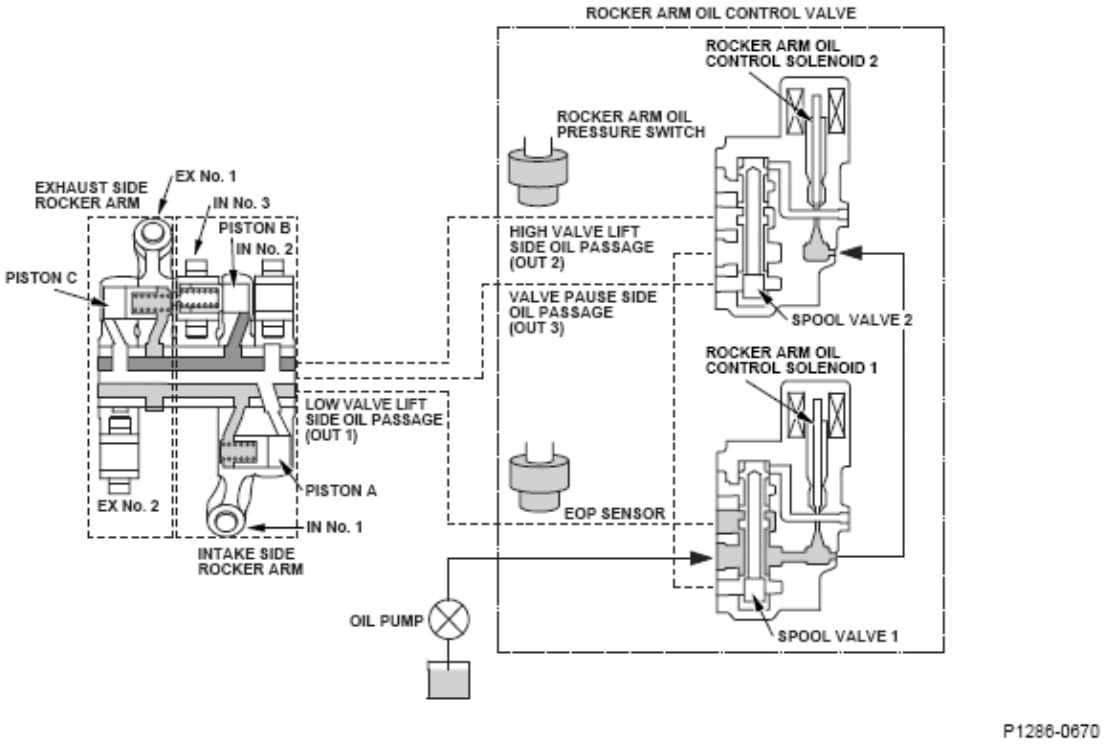

Fig. 121: Measuring Resistance Between ECM/PCM Connector Terminals A36 And A37
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 108-132 ohms ?

YES - Go to step 24.

NO - Substitute a known-good gauge control module (tach) (see **TACHOMETER**). If the HDS identifies the vehicle, replace the original gauge control module (tach) (see **TACHOMETER**).

24. Disconnect the gauge control module (tach) 36P connector.
25. Reconnect the ABS modulator-control unit 25P connector.
26. Measure resistance between ECM/PCM connector terminals A36 and A37.

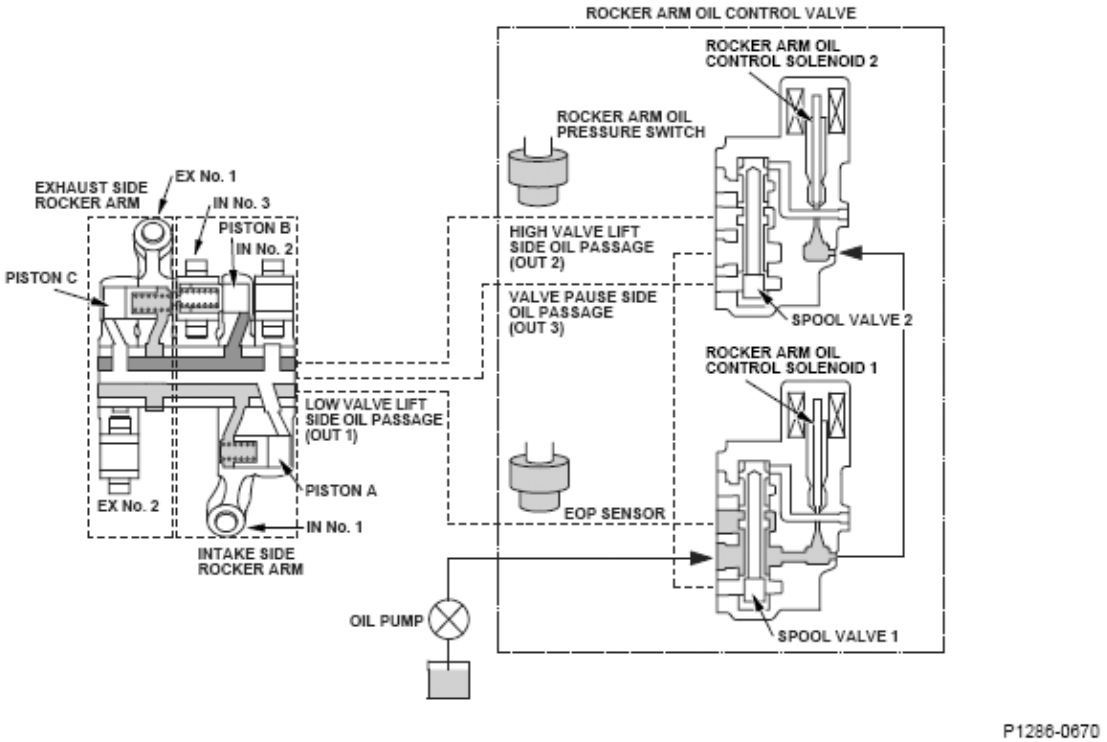

Fig. 122: Measuring Resistance Between ECM/PCM Connector Terminals A36 And A37
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 2.34-2.86 kohms?

YES - Go to step 27.

NO - Substitute a known-good ABS modulator-control unit (see **ABS MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**). If the HDS identifies the vehicle, replace the original ABS modulator-control unit (see **ABS MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**).

27. Disconnect the ABS modulator-control unit 25P connector.
28. Reconnect SRS unit connector A (28P).
29. Measure resistance between ECM/PCM connector terminals A36 and A37.

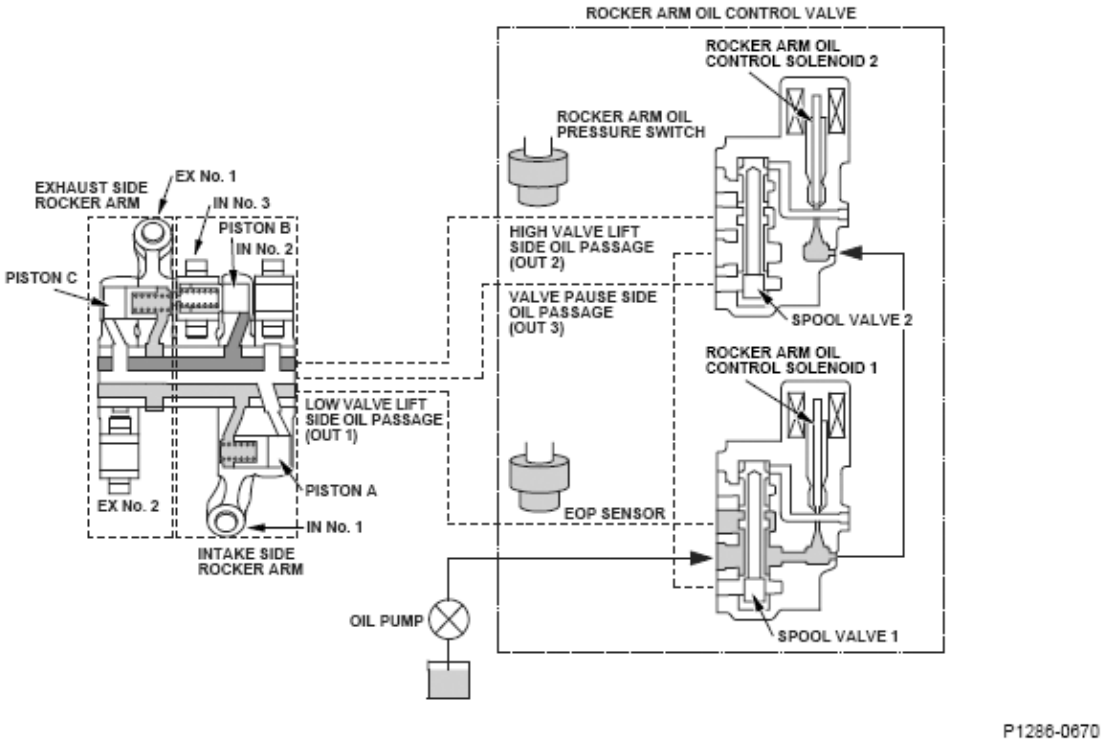

Fig. 123: Measuring Resistance Between ECM/PCM Connector Terminals A36 And A37
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 2.34-2.86 kohms?

YES -

- With TPMS: Go to step 30.
- Without TPMS: Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**).

NO - Substitute a known-good SRS unit (see **SRS UNIT REPLACEMENT**). If the HDS identifies the vehicle, replace the original SRS unit (see **SRS UNIT REPLACEMENT**).

30. Disconnect SRS unit connector A (28P).
31. Reconnect TPMS control unit 20P connector.
32. Measure resistance between ECM/PCM connector terminals A36 and A37.

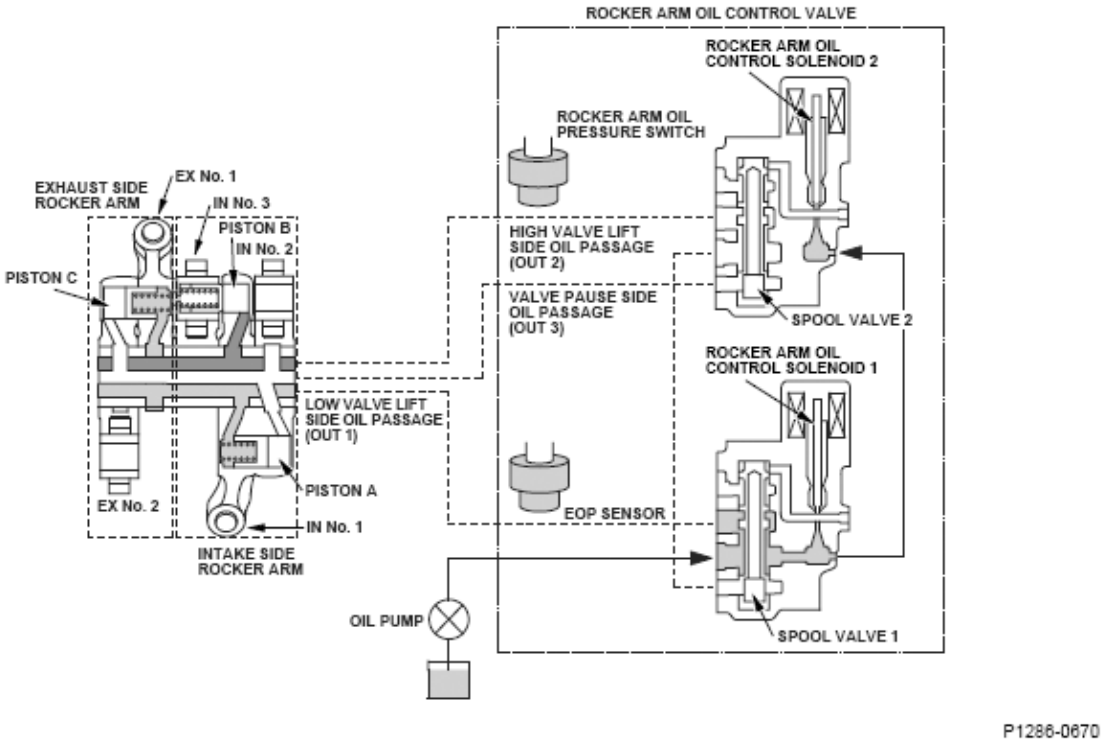

Fig. 124: Measuring Resistance Between ECM/PCM Connector Terminals A36 And A37
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 2.34 - 2.86 k ohms?

YES - Update the EMC/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good EMC/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**).

NO - Substitute a known-good TPMS control unit. If the HDS identifies the vehicle, replace the original TPMS control unit.

33. Disconnect the gauge control module (tach) 36P connector (see **TACHOMETER**).
34. Disconnect the ABS modulator-control unit 25P connector (see **ABS MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**).
35. Disconnect SRS unit connector A (28P) (see **SRS UNIT REPLACEMENT**).
36. With TPMS: Disconnect the TPMS control unit 20P connector.
37. Check for continuity between ECM/PCM connector terminal A36 and body ground.

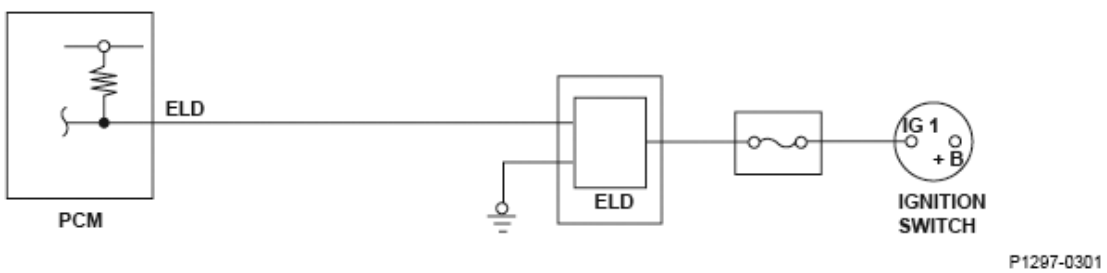

Fig. 125: Checking For Continuity Between ECM/PCM Connector Terminal A36 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between ECM/PCM connector terminal A36 and the gauge control module (tach), the ABS modulator-control unit, the SRS unit or the DLC.

NO - Go to step 38.

38. Check for continuity between ECM/PCM connector terminal A37 and body ground.

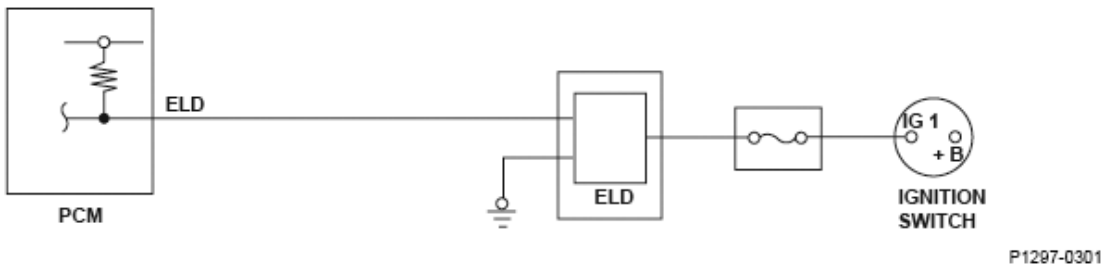

Fig. 126: Checking For Continuity Between ECM/PCM Connector Terminal A37 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between ECM/PCM connector terminal A37 and the gauge control module (tach), the ABS modulator-control unit, the SRS unit or the DLC.

NO - Go to step 39.

39. Reconnect all connectors.
40. Connect the HDS to the DLC (see **HOW TO USE THE HDS (HONDA DIAGNOSTIC SYSTEM)**).
41. Disconnect the gauge control module (tach) 36P connector.
42. Turn the ignition switch ON (II), and read the HDS.

Does the HDS identify the vehicle?

YES - Replace the gauge control module (tach) (see **TACHOMETER**).

NO - Go to step 43.

43. Turn the ignition switch OFF.
44. Reconnect the gauge control module (tach) 36P connector.
45. Disconnect the ABS modulator-control unit 25P connector.
46. Turn the ignition switch ON (II), and read the HDS.

Does the HDS identify the vehicle?

YES - Replace the ABS control unit (see **ABS MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**).

NO - Go to step 39.

47. Turn the ignition switch OFF.
48. Reconnect the ABS modulator-control unit 25P connector.
49. Disconnect SRS unit connector A (28P).
50. Turn the ignition switch ON (II), and read the HDS.

Does the HDS identify the vehicle?

YES - Replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO -

- With TPMS: Go to step 51.
- Without TPMS: Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**).

51. Turn the ignition switch OFF.
52. Reconnect SRS unit connector A (28P).
53. Disconnect the TPMS control unit 20P connector.
54. Turn the ignition switch ON (II), and read the HDS.

Does the HDS identify the vehicle?

YES - Replace the TPMS control unit.

NO - Update the EMC/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good EMC/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**).

MIL CIRCUIT TROUBLESHOOTING

1. Turn the ignition switch ON (II).
2. Do the gauge self-diagnostic function (see **SELF-DIAGNOSTIC FUNCTION**).

Does the MIL indicator flash?

YES - Go to step 3.

NO - Substitute a known-good gauge control module (tach), and recheck. If the MIL circuit is OK, replace the original gauge control module (tach) (see **TACHOMETER**).

3. Connect the HDS to the DLC (see **HOW TO USE THE HDS (HONDA DIAGNOSTIC SYSTEM)**).
4. Check the SCS in the DATA LIST with the HDS.

   Is a short indicated?

   YES - Go to step 5.

   NO - Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**).

5. Turn the ignition switch OFF.
6. Disconnect ECM/PCM connector A (44P), then disconnect the HDS.
7. Check for continuity between ECM/PCM connector terminal A31 and body ground.

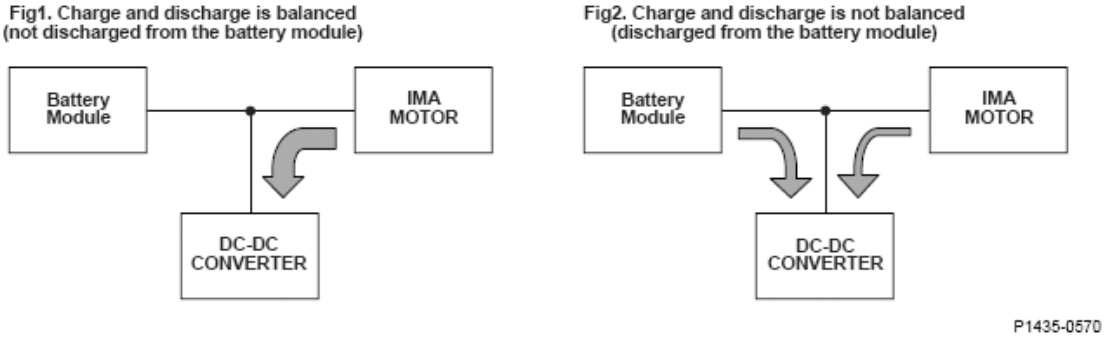

Fig. 127: Checking For Continuity Between ECM/PCM Connector Terminal A31 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (A31) and the SRS unit, the DLC.

NO - Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**).

DLC CIRCUIT TROUBLESHOOTING

NOTE: Make sure the HDS and the DLC cable of the HDS is normal.

1. Turn the ignition switch OFF.
2. Connect the HDS to the DLC (see **GENERAL TROUBLESHOOTING INFORMATION**).

NOTE: Make sure the HDS is properly connected to the DLC.

3. Turn the ignition switch ON (II), and read the HDS.

   Does the HDS identify the vehicle?

   YES - Go to step 4.

   NO - Go to step 21.

4. Check for Temporary DTCs or DTCs in the PGM-FI system with the HDS.

   Are any Temporary DTCs or DTCs indicated?

   YES - Go to the indicated DTC's troubleshooting.

   NO - Go to step 5.

5. Turn the ignition switch OFF.
6. Turn the ignition switch ON (II), and watch the SRS indicator.

   Does the SRS indicator stay on?

   YES - Go to the SRS system's general troubleshooting information (see **GENERAL TROUBLESHOOTING INFORMATION**).

   NO - Go to step 7.

7. Turn the ignition switch OFF.
8. Turn the ignition switch ON (II), and watch the ABS indicator.

   Does the ABS indicator stay on?

   YES - Go to the ABS system's general troubleshooting information (see **GENERAL TROUBLESHOOTING INFORMATION** .

   NO - Go to step 9.

9. Turn the ignition switch OFF.
10. Turn the ignition switch ON (II), and watch the immobilizer indicator.

    Does the immobilizer indicator stay on or flash?

    YES - Go to the immobilizer system's troubleshooting (see **SYMPTOM TROUBLESHOOTING INFORMATION**).

    NO -

    - With TPMS: Go to step 11.
    - Without TPMS: Go to step 13.

11. Turn the ignition switch OFF.

12. Turn the ignition switch ON (II), and watch the TPMS indicator.

    Does the TPMS indicator stay on?

    YES - Go to the TPMS indicator system's troubleshooting.

    NO - Go to step 13.

13. Do the gauge self-diagnostic function (see **SELF-DIAGNOSTIC FUNCTION**).
14. Check for B-CAN system DTCs without the HDS (see **GENERAL TROUBLESHOOTING INFORMATION**).

    Are any B-CAN DTCs indicated?

    YES - Go to the indicated DTC's troubleshooting.

    NO - Go to step 15.

15. Turn the ignition switch OFF.
16. Disconnect the HDS from the DLC.
17. Check for continuity between DLC terminal No. 7 and body ground.

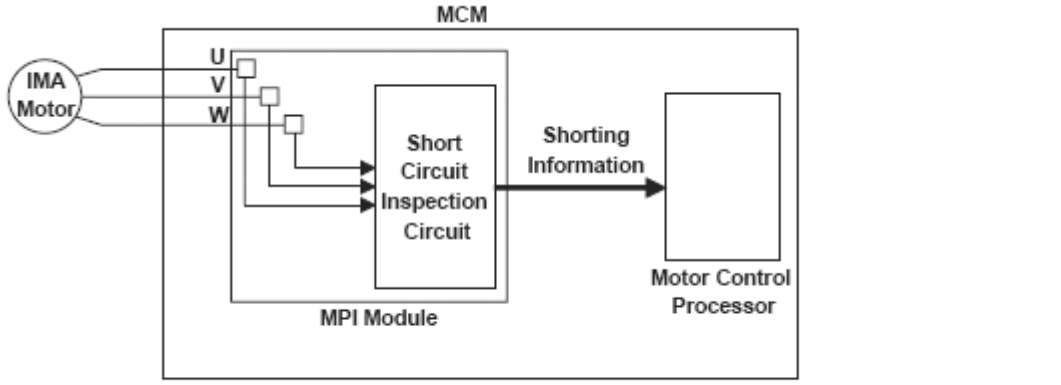

Fig. 128: Checking For Continuity Between DLC Terminal No. 7 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 5 ohms or less?

YES - Go to step 18.

NO - Go to step 19.

18. Continue to check for continuity between DLC terminal No. 7 and body ground, while disconnecting these parts, one at a time:
    - SRS unit connector A (28P)
    - ABS modulator-control unit 25P connector
    - Immobilizer-keyless control unit 7P connector

- Audio unit 17P connector
- Under-dash fuse/relay box Q 16P connector

Does continuity go away when one of the above components is disconnected?

YES - Replace the part that caused an open when it was disconnected.

NO - Repair short in the wire between the DLC (K-line) and the ABS modulator-control unit, the SRS unit, the immobilizer-keyless control unit, the audio unit, or the under-dash fuse/relay box.

19. Connect DLC terminal No. 7 to body ground with a jumper wire.

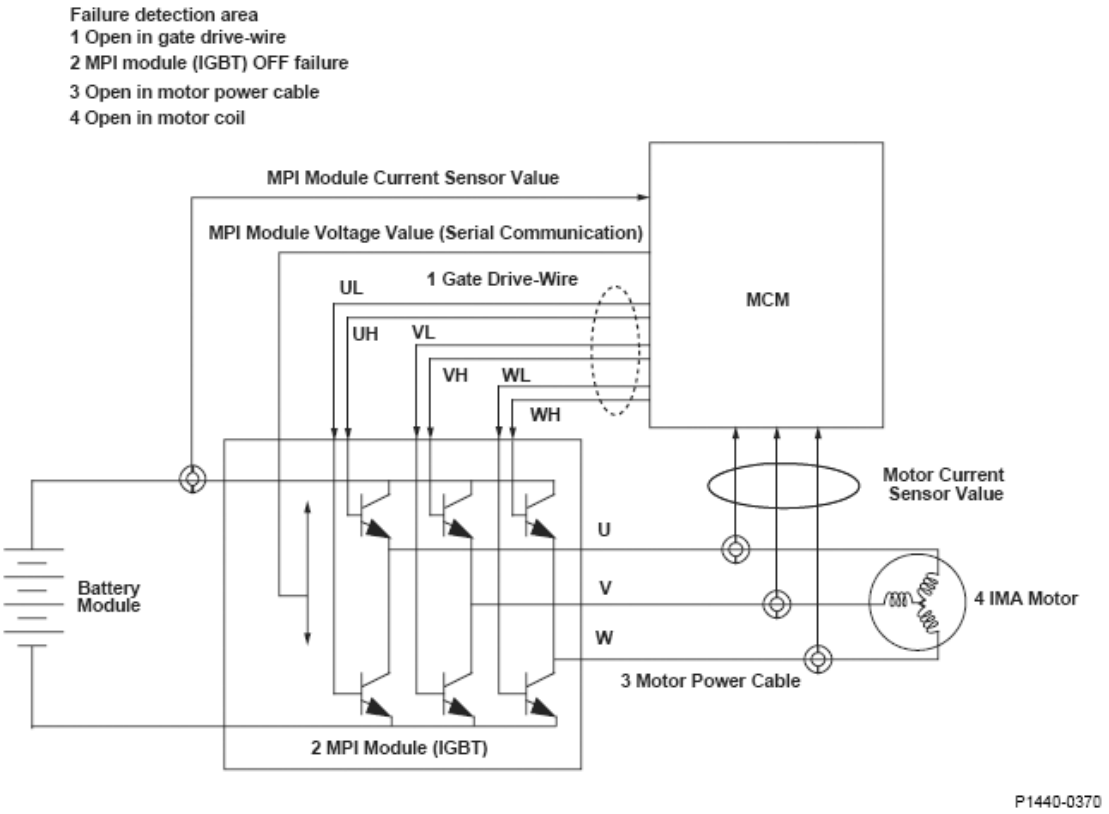

Fig. 129: Connecting DLC Terminal No. 7 To Body Ground With A Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Check for continuity between body ground and these connector terminals:

BODY GROUND AND CONNECTOR TERMINALS

Connector	Terminal
SRS unit A (28P)	No. 24 (LT BLU)
ABS modulator-control unit 25P	No. 10 (LT BLU)
Immobilizer-keyless control unit 7P	No. 5 (LT BLU)
Audio unit 17P	No. 6 (LT BLU)
Under-dash fuse/relay box Q 16P	No. 8 (LT BLU)

Is there continuity between the DLC terminal and each of the terminals in the chart?

YES - Replace the unit that does not communicate with the HDS.

NO - Repair open in the wire between the DLC (K-line) and the appropriate connector.

21. Do the gauge self-diagnostic function (see **SELF-DIAGNOSTIC FUNCTION**).
22. Check for B-CAN system DTCs without the HDS (see **GENERAL TROUBLESHOOTING INFORMATION**).

    Is DTC B1168, B1169, and/or B1178 indicated?

    YES - Go to step 35.

    NO - Go to step 21.

23. Turn the ignition switch OFF.
24. Disconnect the HDS from the DLC.
25. Measure voltage between DLC terminal No. 16 and body ground.

Fig. 1

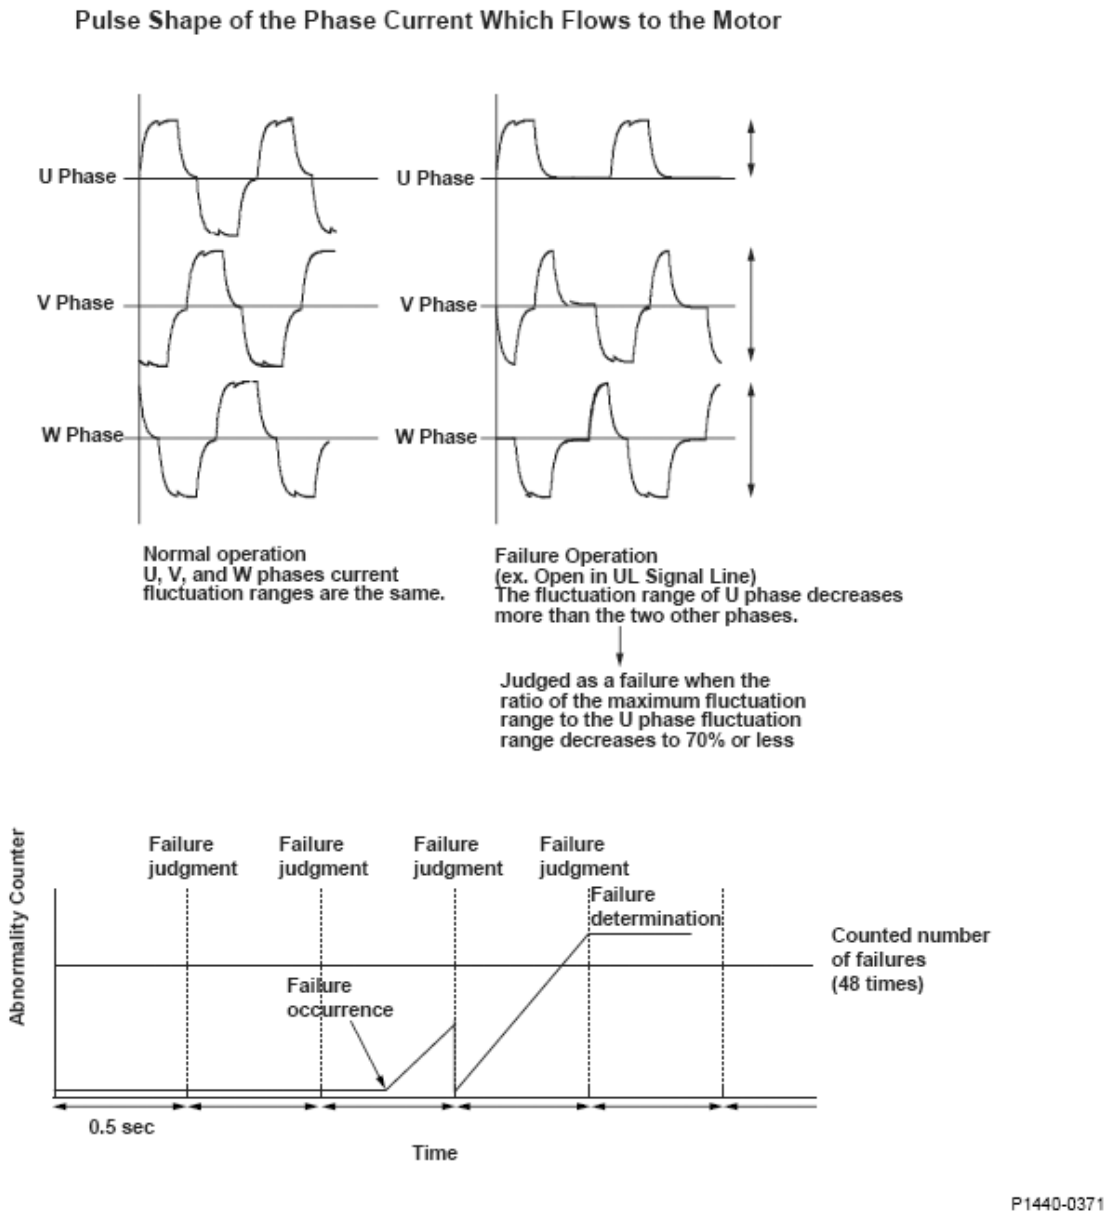

Fig. 130: Measuring Voltage Between DLC Terminal No. 16 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 26.

NO - Repair open in the wire between DLC terminal No. 16 and the No. 23 BACK UP (10 A) fuse in the under-hood fuse/relay box.

26. Measure voltage between DLC terminals No. 4 and No. 16.

Fig. 2

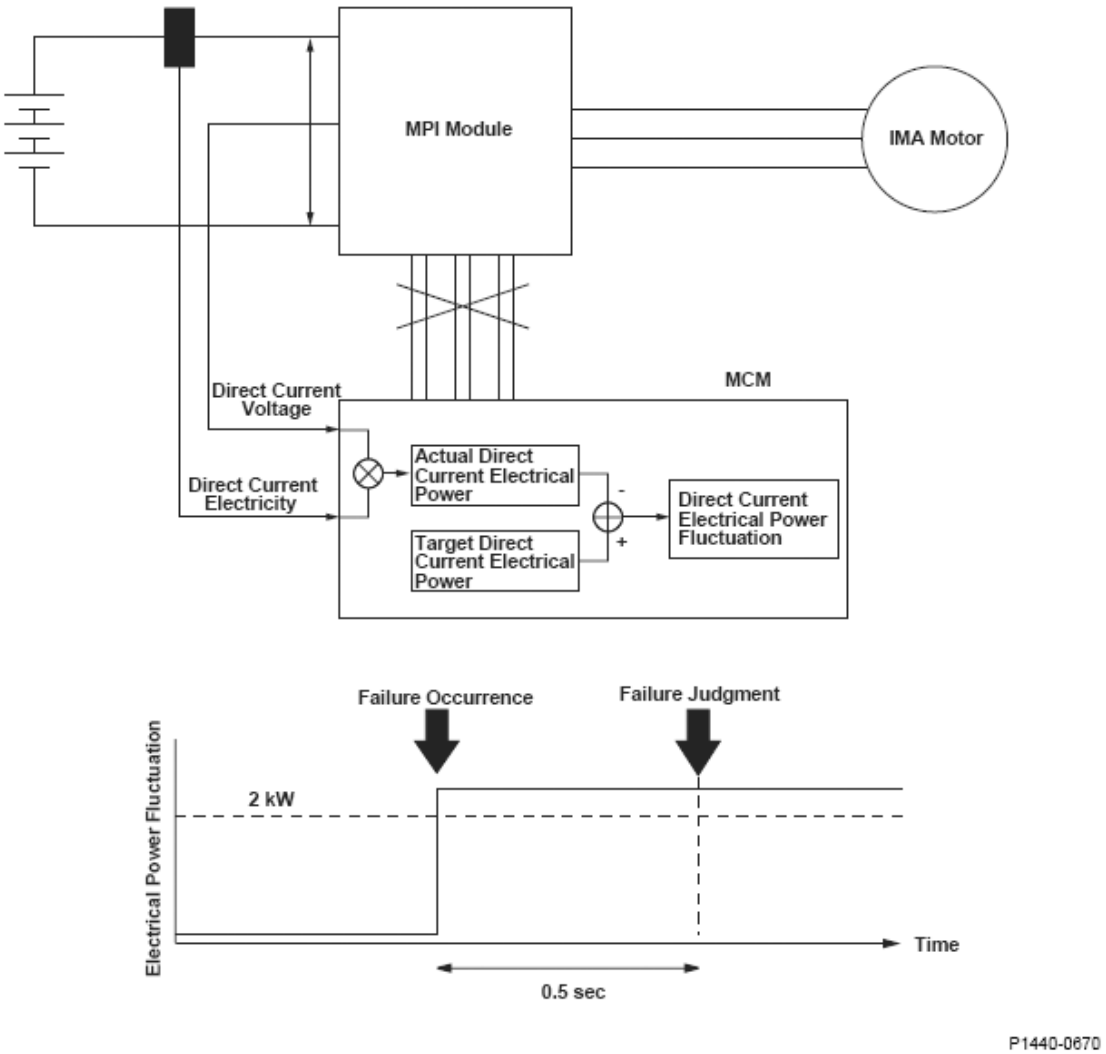

Fig. 131: Measuring Voltage Between DLC Terminals No. 4 And No. 16
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 25.

NO - Repair open in the wire between DLC terminal No. 4 and G502 (see **CONNECTOR TO HARNESS INDEX**).

27. Connect the HDS to the DLC (see **GENERAL TROUBLESHOOTING INFORMATION**).
28. Jump the SCS line with the HDS.
29. Disconnect ECM/PCM connector A (44P).
30. Disconnect the HDS from the DLC.
31. Connect DLC terminal No. 6 to body ground with a jumper wire.

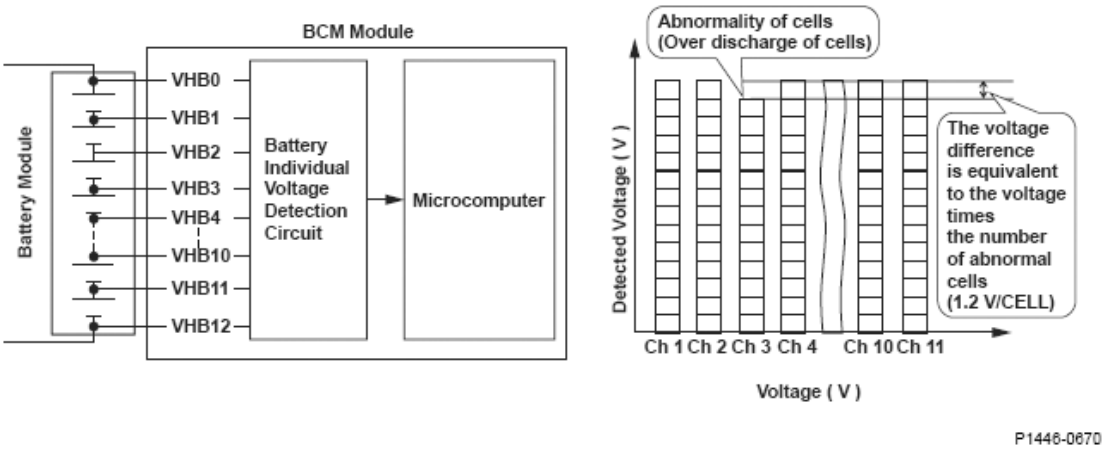

Fig. 132: Connecting DLC Terminal No. 6 To Body Ground With A Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

32. Check for continuity between ECM/PCM connector terminal A36 and body ground.

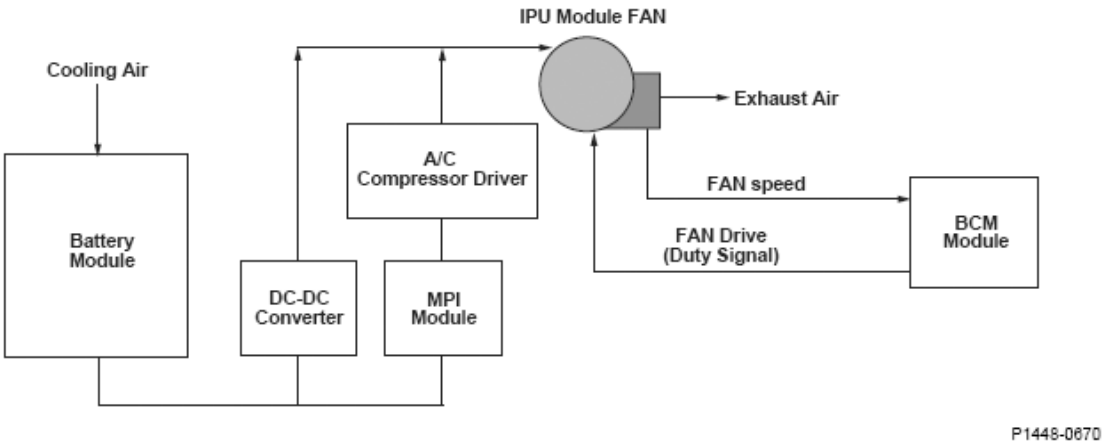

Fig. 133: Checking For Continuity Between ECM/PCM Connector Terminal A36 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 33.

NO - Repair open in the wire between the ECM/PCM (A36) and DLC terminal No. 6.

33. Connect DLC terminal No. 14 to body ground with a jumper wire.

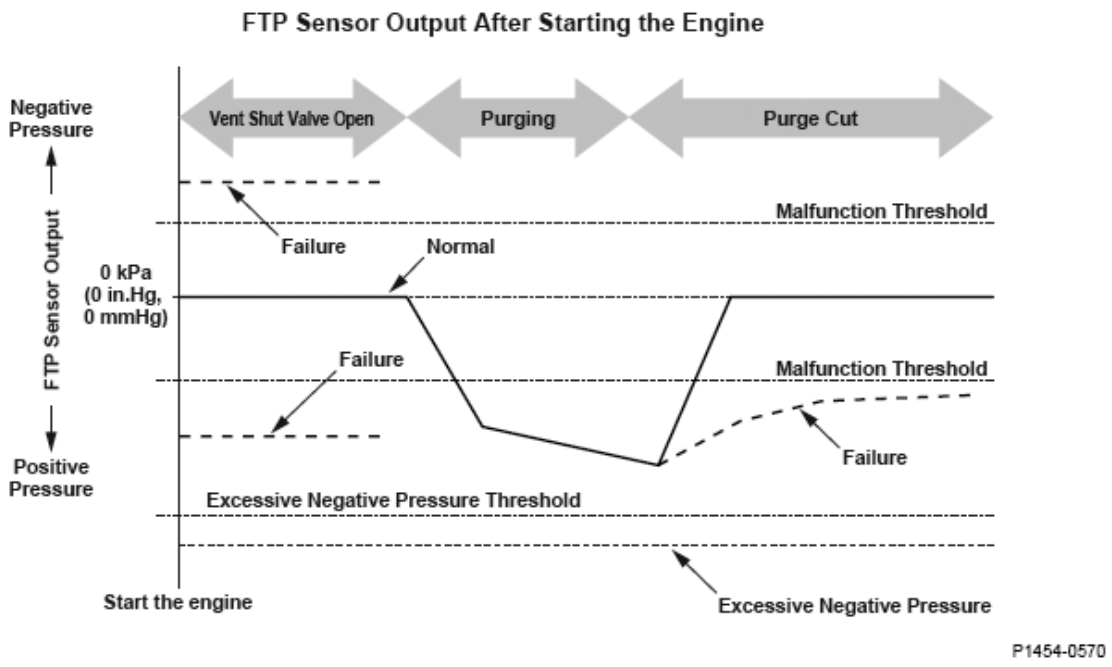

Fig. 134: Connecting DLC Terminal No. 14 To Body Ground With A Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

34. Check for continuity between ECM/PCM connector terminal A37 and body ground.

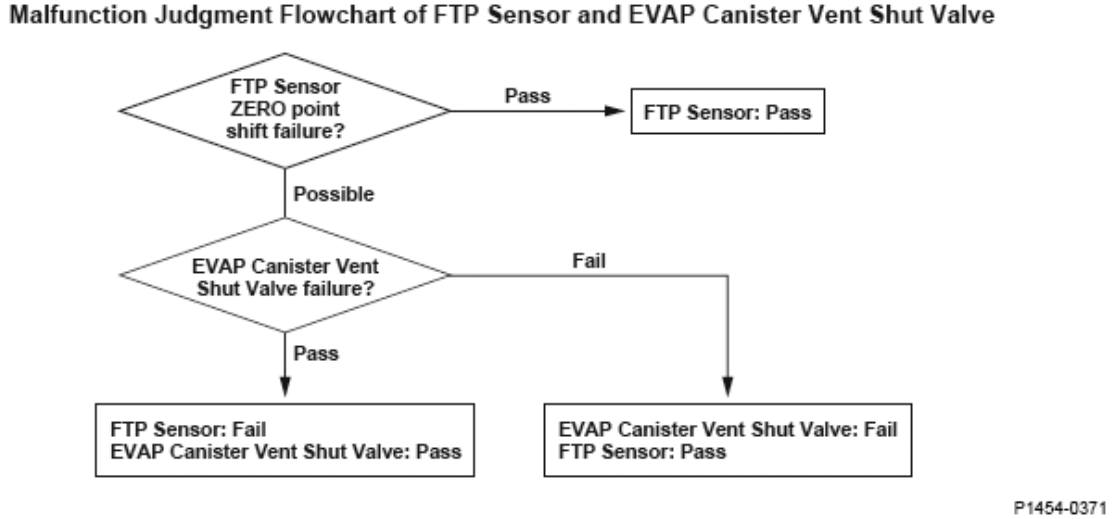

Fig. 135: Checking For Continuity Between ECM/PCM Connector Terminal A37 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**).

NO - Repair open in the wire between the ECM/PCM (A37) and DLC terminal No. 14.

35. Try to start the engine.

    Does the engine start and idle smoothly?

    YES - Go to F-CAN circuit troubleshooting (see **F-CAN CIRCUIT TROUBLESHOOTING**).

    NO - Go to step 36.

36. Turn the ignition switch OFF.
37. Check the No. 2 IG MAIN (50 A) fuse in the under-hood fuse/relay box.

    Is the fuse OK?

    YES - Repair open in the wire between the No. 2 IG MAIN (50 A) fuse and the ignition switch. If the wire is OK, go to step 36.

    NO - Repair short in the wire between the No. 2 IG MAIN (50 A) fuse and the under-hood fuse/relay box. Also replace the No. 2 B MAIN (50 A) fuse.

38. Inspect the No. 19 Fl MAIN (15 A) fuse in the under-hood fuse/relay box.

    Is the fuse OK?

    YES - Go to step 45.

    NO - Go to step 39.

39. Remove the blown No. 19 Fl MAIN (15 A) fuse from the under-hood fuse/relay box.
40. Remove PGM-FI main relay 1 (C) from the under-hood fuse/relay box.

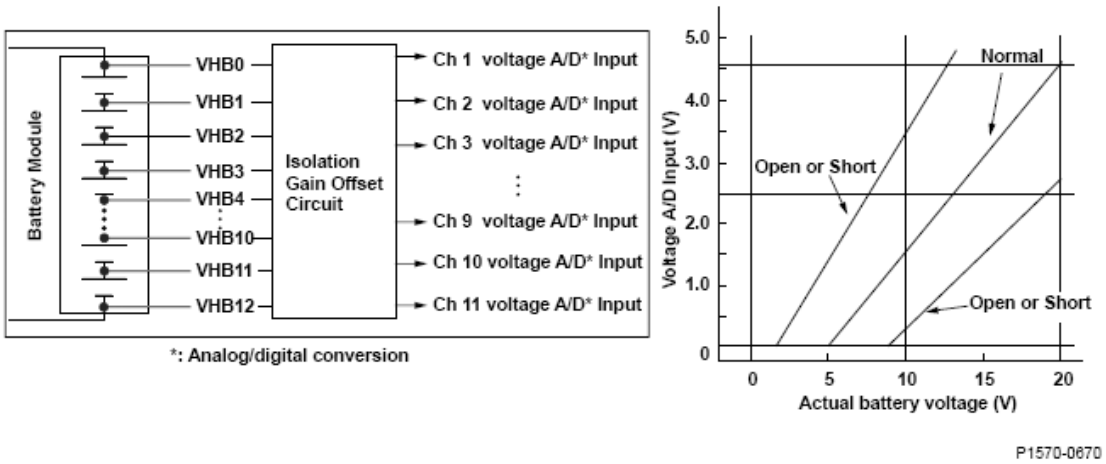

Fig. 136: Identifying PGM-FI Main Relay 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

41. Check for continuity between body ground and PGM-FI main relay 1 4P connector terminals No. 1

and No. 3 individually.

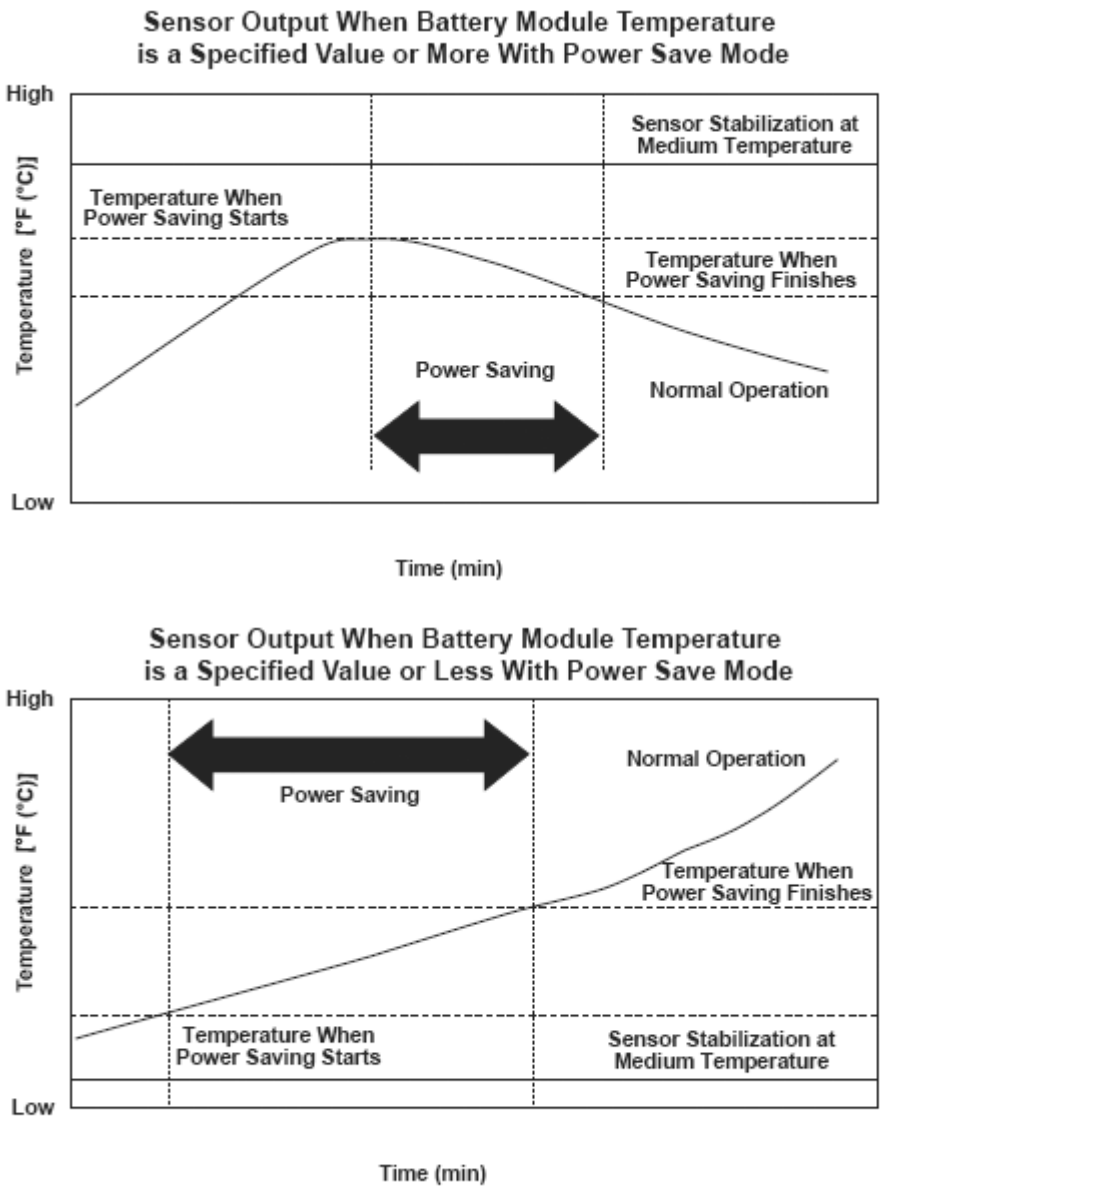

Fig. 137: Checking For Continuity Between Body Ground And PGM-FI Main Relay 1 4P Connector Terminals No. 1 And No. 3 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**). Also replace the No. 19 Fl MAIN (15 A) fuse.

NO - Go to step 42.

42. Disconnect each of the components or connectors below, one at a time, and check for continuity between PGM-FI main relay 1 4P connector terminal No. 2 and body ground.
    - PGM-FI main relay 2 (FUEL PUMP)

- ECM/PCM connector A (44P)
- Each injector 2P connector
- Camshaft position (CMP) sensor 3P connector
- Crankshaft position (CKP) sensor 3P connector
- Ignition coil relay
- Electronic throttle control system (ETCS) control relay

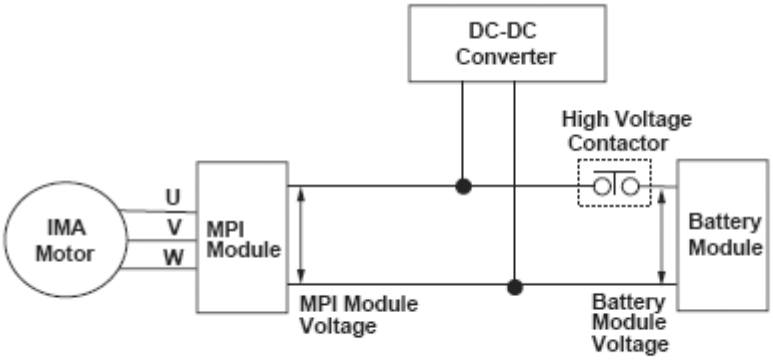

Fig. 138: Checking For Continuity Between PGM-FI Main Relay 1 4P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Does continuity go away when one of the above components is disconnected?

YES - Replace the component that made the short to body ground go away when disconnected. If the item is the ECM/PCM, update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). Also replace the No. 19 FI MAIN (15 A) fuse.

NO - Go to step 43.

43. Disconnect the all connectors from these components:
    - PGM-FI main relay 2 (FUEL PUMP)
    - ECM/PCM connector A (44P)
    - Injectors
    - Camshaft position (CMP) sensor
    - Crankshaft position (CKP) sensor
    - Ignition coil relay
    - Electronic throttle control system (ETCS) control relay
44. Check for continuity between PGM-FI main relay 1 4P connector terminal No. 2 and body ground.

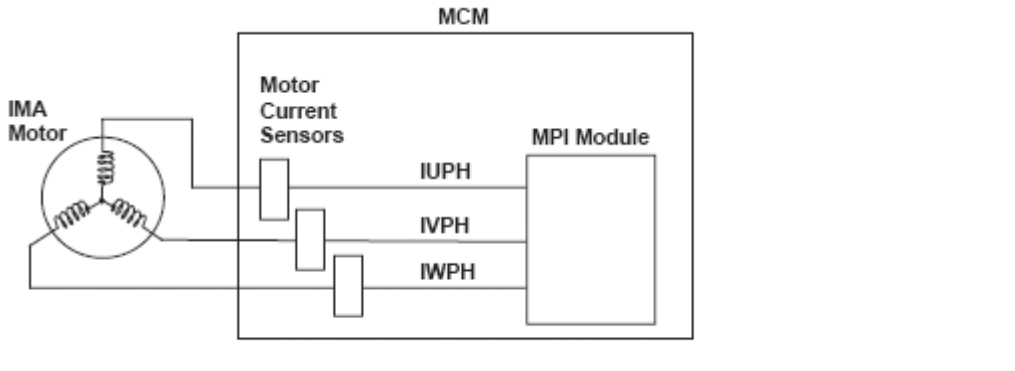

Fig. 139: Checking For Continuity Between PGM-FI Main Relay 1 4P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between PGM-FI main relay 1 and each item. Also replace the No. 19 FI MAIN (15 A) fuse.

NO - Replace PGM-FI main relay 1. Also replace the No. 19 FI MAIN (15 A) fuse.

45. Inspect the No. 2 FUEL PUMP (15 A) fuse in the under-dash fuse/relay box.

    Is the fuse OK?

    YES - Go to step 58.

    NO - Go to step 46.

46. Remove the blown No. 2 FUEL PUMP (15 A) fuse in the under-dash fuse/relay box.
47. Jump the SCS line with the HDS.
48. Disconnect ECM/PCM connector C (44P).
49. Check for continuity between ECM/PCM connector terminal C36 and body ground.

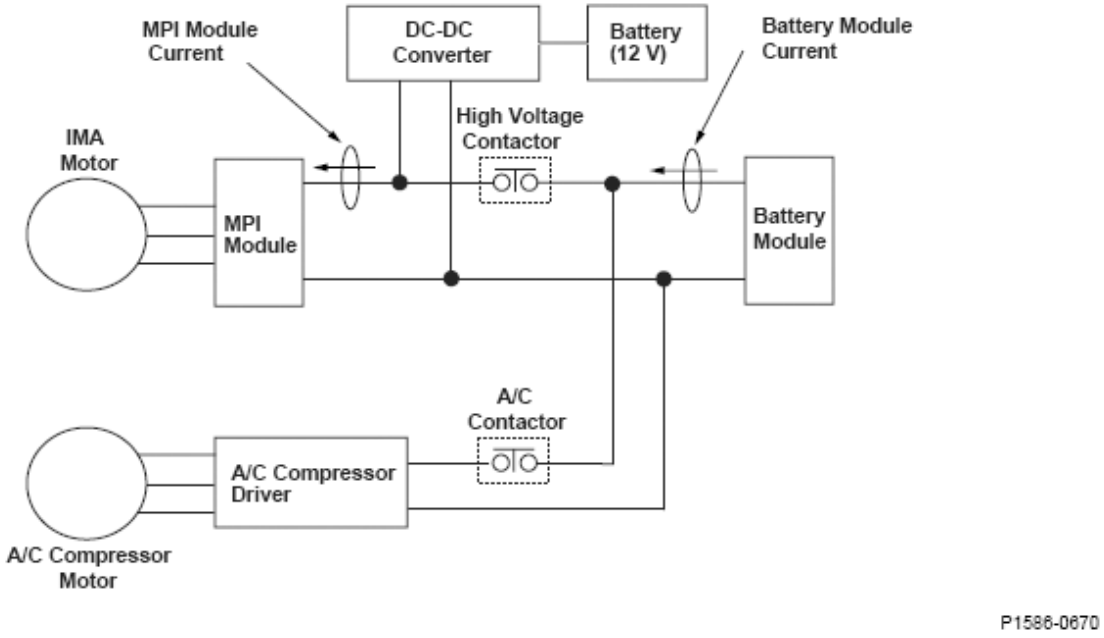

Fig. 140: Checking For Continuity Between ECM/PCM Connector Terminal C36 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 48.

NO - Replace the No. 2 FUEL PUMP (15 A) fuse, and update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**).

50. Remove PGM-FI main relay 2 (FUEL PUMP) (A) from the under-dash fuse/relay box.

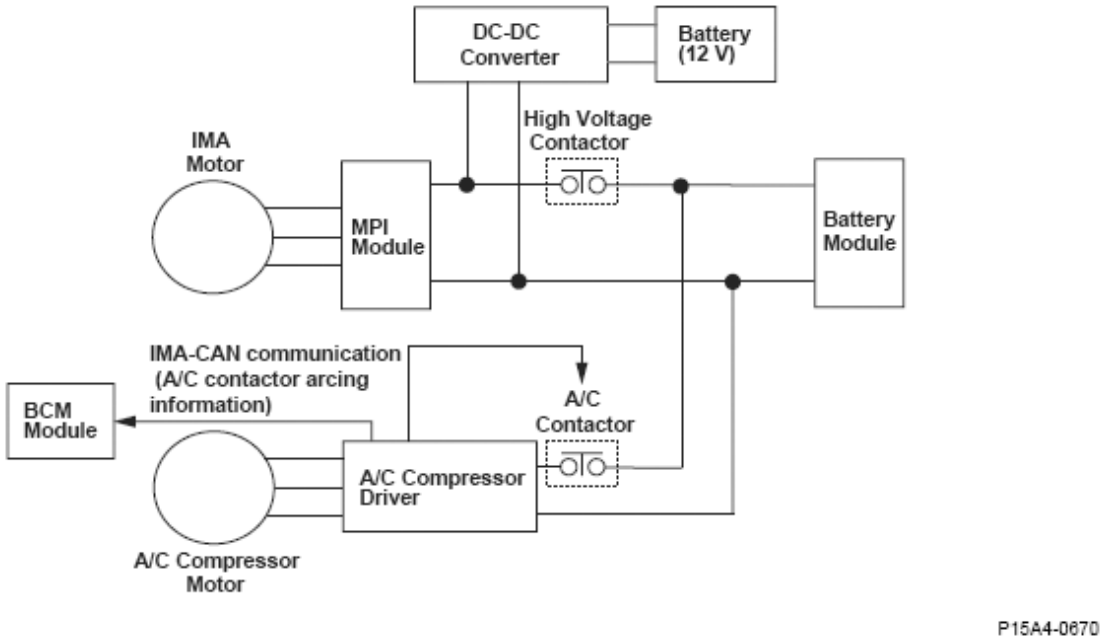

Fig. 141: Identifying PGM-FI Main Relay 2 (Fuel Pump)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

51. Check for continuity between ECM/PCM connector terminal C36 and body ground.

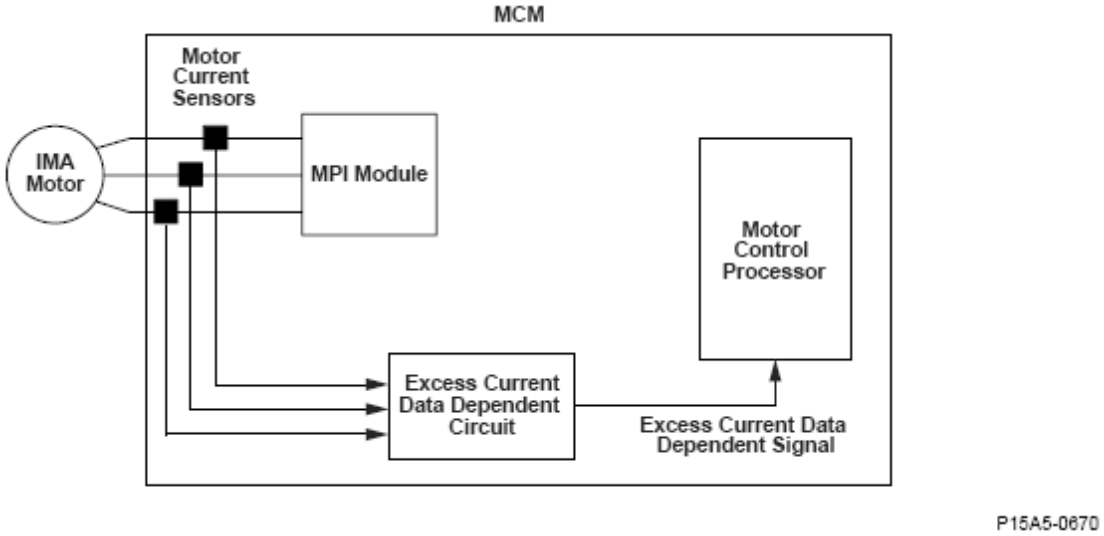

Fig. 142: Checking For Continuity Between ECM/PCM Connector Terminal C36 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the No. 2 FUEL PUMP (15 A) fuse and the ECM/PCM (C36), between the No. 2 FUEL PUMP (15 A) fuse and PGM-FI main relay 2 (FUEL PUMP), or between the No. 2 FUEL PUMP (15 A) fuse and the immobilizer control unit. Also replace the No. 2 FUEL PUMP (15 A) fuse.

NO - Go to step 52.

52. Remove the rear seat cushion (see **REAR SEAT REMOVAL/INSTALLATION**).
53. Remove the rear floor upper cross-member and the access panel from the floor (see **FUEL TANK UNIT REMOVAL/INSTALLATION**).
54. Disconnect the fuel pump 4P connector.
55. Check for continuity between fuel pump 4P connector terminal No. 2 and body ground.

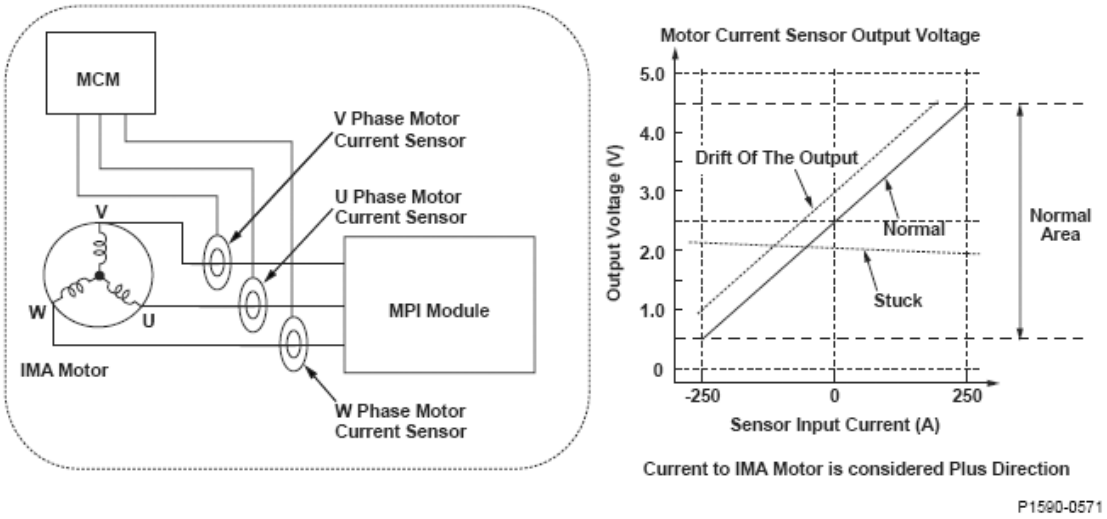

Fig. 143: Checking For Continuity Between Fuel Pump 4P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the fuel pump and PGM-FI main relay 2 (FUEL PUMP). Also replace the No. 2 FUEL PUMP (15 A) fuse.

NO - Go to step 54.

56. Reinstall PGM-FI main relay 2 (FUEL PUMP) (A).

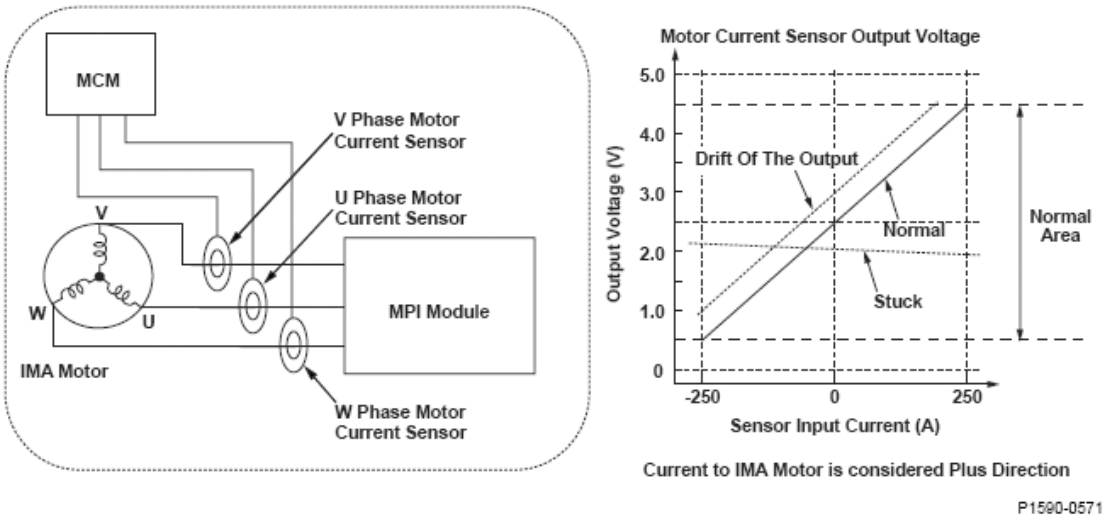

Fig. 144: Identifying PGM-FI Main Relay 2 (Fuel Pump)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

57. Check for continuity between fuel pump 4P connector terminal No. 2 and body ground.

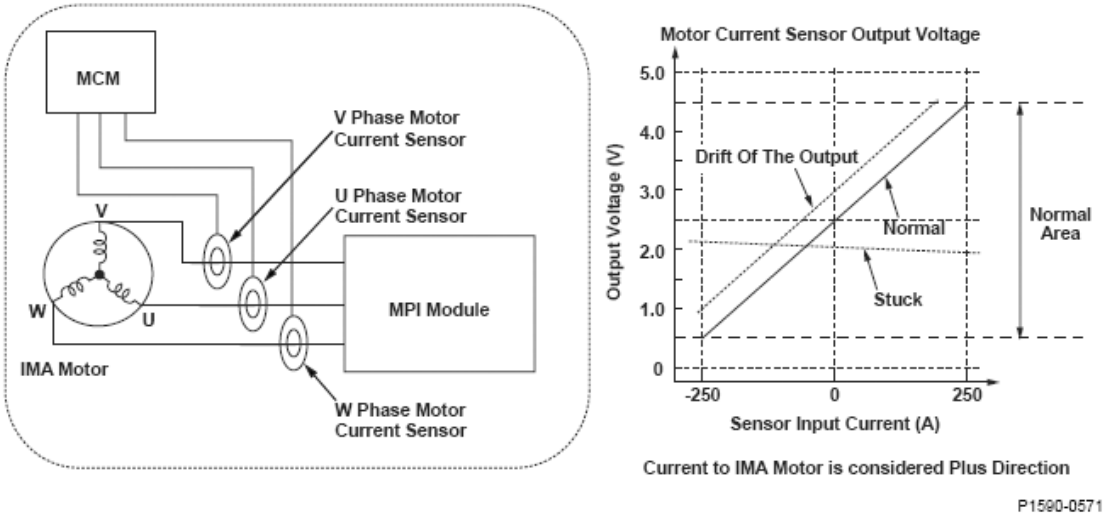

Fig. 145: Checking For Continuity Between Fuel Pump 4P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace PGM-FI main relay 2 (FUEL PUMP). Also replace the No. 2 FUEL PUMP (15 A) fuse.

NO - Check the fuel pump, and replace it if necessary (see **FUEL PUMP/FUEL GAUGE SENDING UNIT REPLACEMENT**). Also replace the No. 2 FUEL PUMP (15 A) fuse.

58. Jump the SCS line with the HDS.
59. Disconnect ECM/PCM connectors A (44P) and C (44P).
60. Turn the ignition switch ON (II).

61. Measure voltage between ECM/PCM connector terminal C36 and body ground.

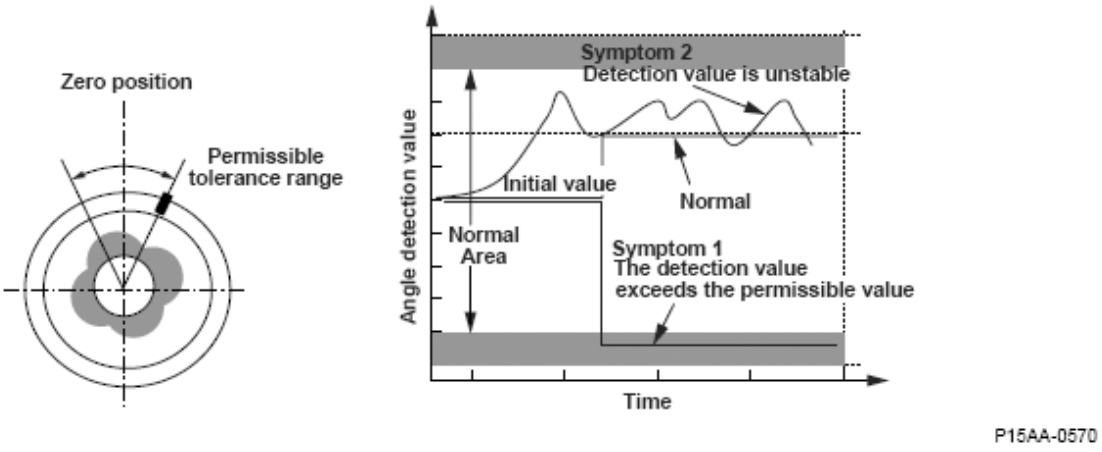

Fig. 146: Measuring Voltage Between ECM/PCM Connector Terminal C36 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 62.

NO - Repair open in the wire between the No. 2 FUEL PUMP (15 A) fuse and the ECM/PCM (C36).

62. Measure voltage between ECM/PCM connector terminal A6 and body ground.

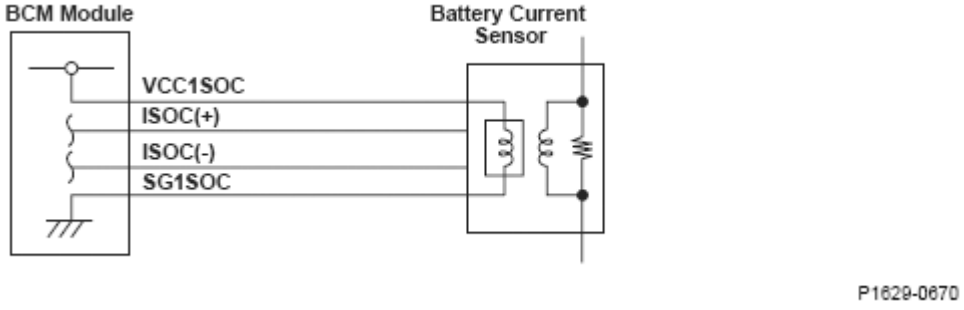

Fig. 147: Measuring Voltage Between ECM/PCM Connector Terminal A6 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 67.

NO - Go to step 63.

63. Turn the ignition switch OFF.
64. Remove PGM-FI main relay 1 (C) from the under-hood fuse/relay box.

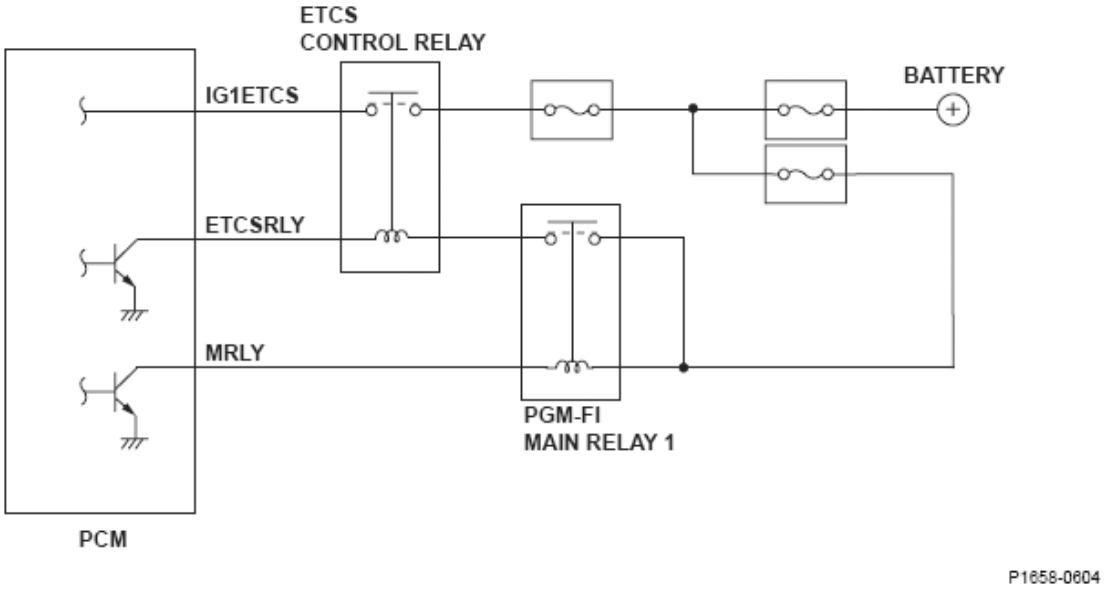

Fig. 148: Identifying PGM-FI Main Relay 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

65. Measure voltage between PGM-FI main relay 1 4P connector terminal No. 3 and body ground.

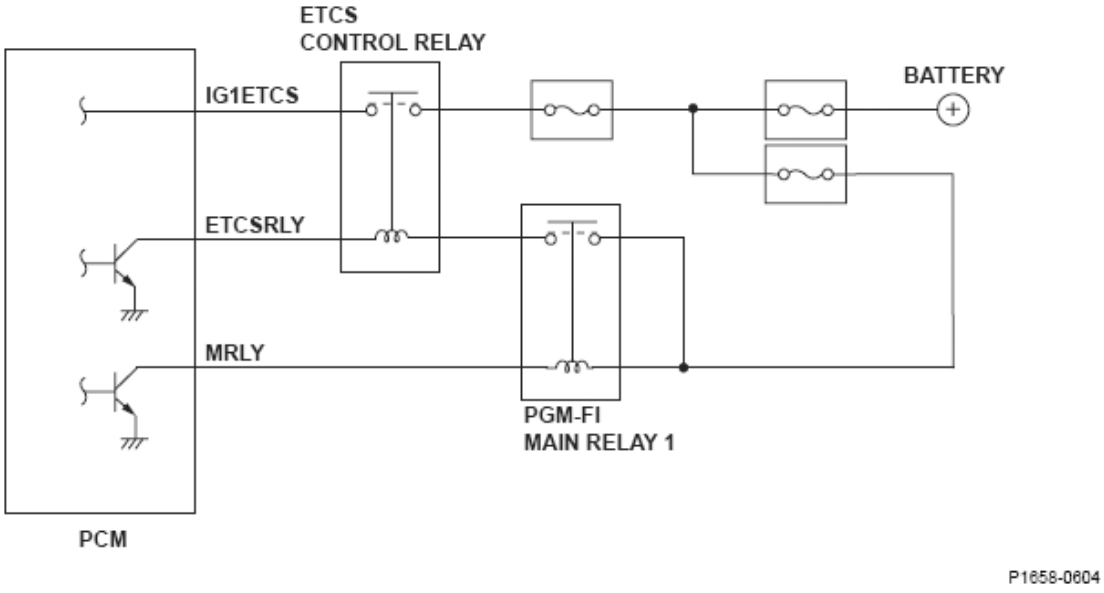

Fig. 149: Measuring Voltage Between PGM-FI Main Relay 1 4P Connector Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 66.

NO - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**).

66. Check for continuity between PGM-FI main relay 1 4P connector terminal No. 4 and ECM/PCM

connector terminal A6.

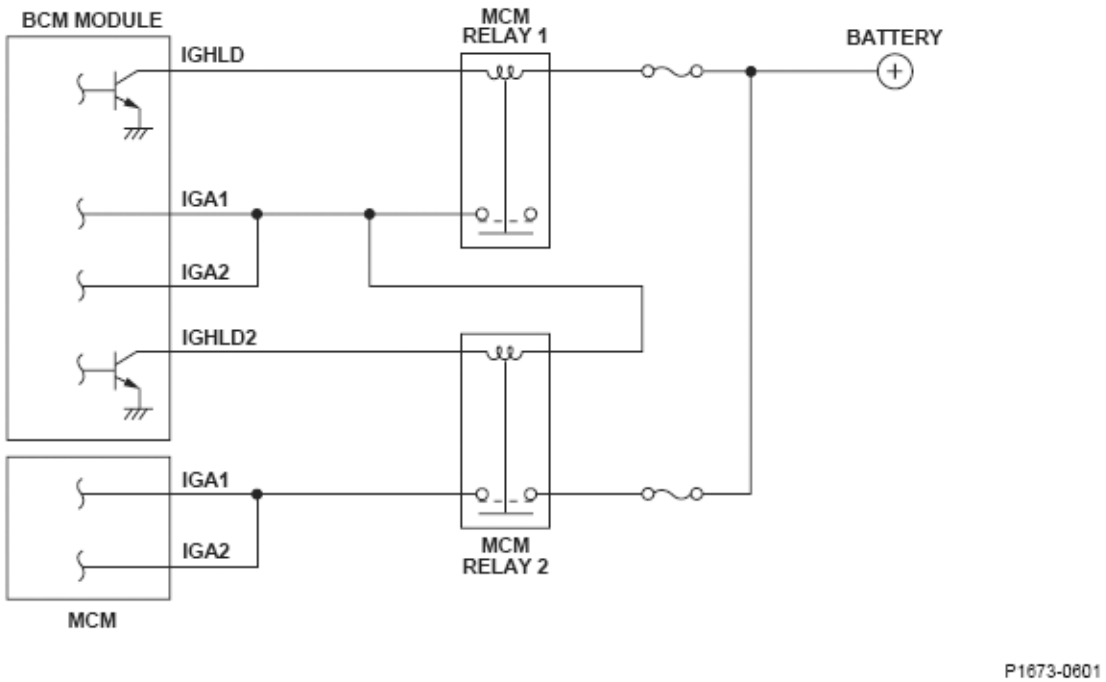

Fig. 150: Checking For Continuity Between PGM-FI Main Relay 1 4P Connector Terminal No. 4 And ECM/PCM Connector Terminal A6
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Test PGM-FI main relay 1 (see **POWER RELAY TEST**). If the relay is OK, update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**).

NO - Repair open in the wire between the ECM/PCM (A6) and PGM-FI main relay 1.

67. Turn the ignition switch OFF.
68. Remove PGM-FI main relay 1 (C) from the under-hood fuse/relay box.

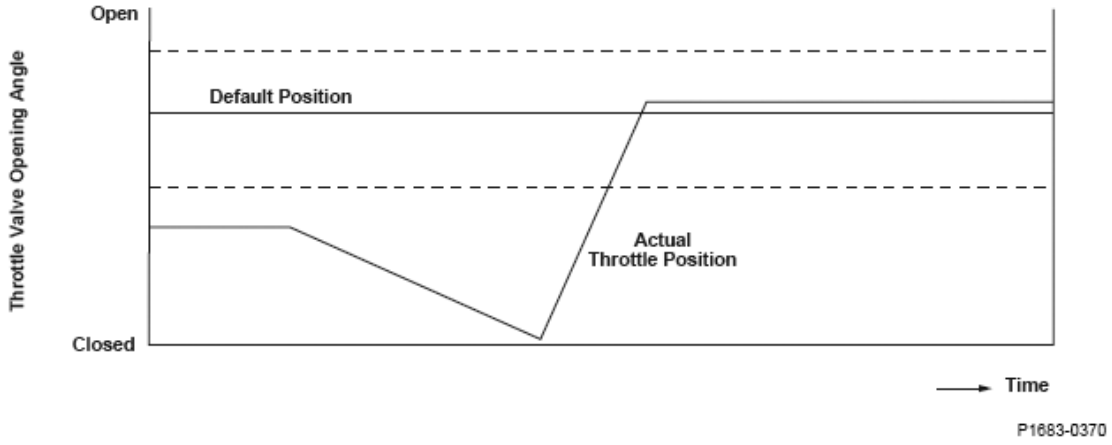

Fig. 151: Identifying PGM-FI Main Relay 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

69. Measure voltage between PGM-FI main relay 1 4P connector terminal No. 1 and body ground.

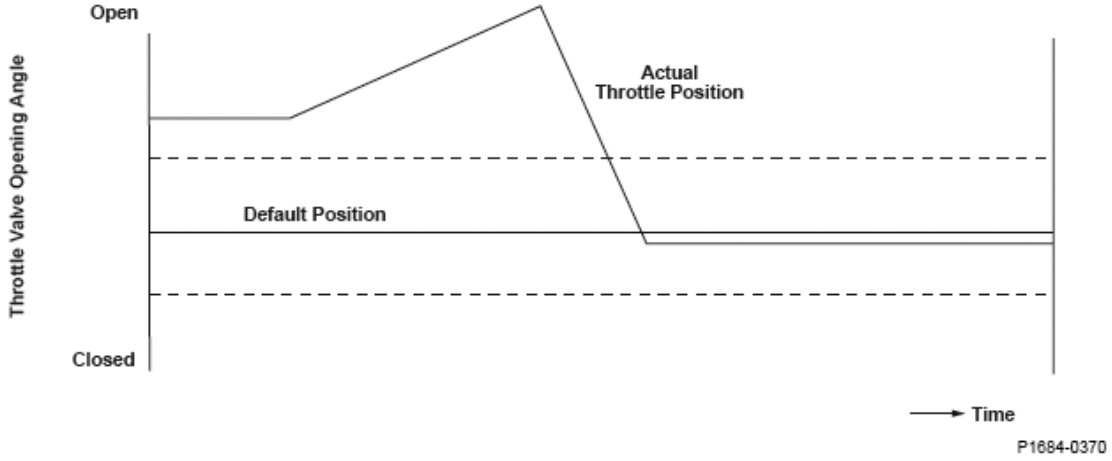

Fig. 152: Measuring Voltage Between PGM-FI Main Relay 1 4P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 68.

NO - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**).

70. Check for continuity between PGM-FI main relay 1 4P connector terminal No. 2 and ECM/PCM connector terminal A8.

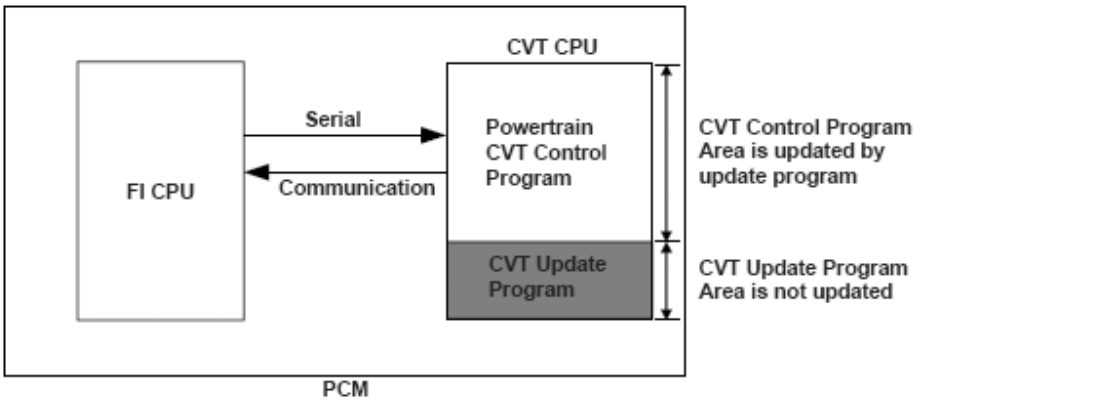

Fig. 153: Checking For Continuity Between PGM-FI Main Relay 1 4P Connector Terminal No. 2 And ECM/PCM Connector Terminal A8
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 71.

NO - Repair open in the wire between the ECM/PCM (A8) and PGM-FI main relay 1.

71. Test PGM-FI main relay 1 (see **POWER RELAY TEST**).

    Is PGM-FI main relay 1 OK?

    YES - Go to step 72.

    NO - Replace PGM-FI main relay 1.

72. Disconnect ECM/PCM connector B (44P).
73. Check for continuity between body ground and ECM/PCM connector terminals B1, B36, C2, C40, and C44 individually.

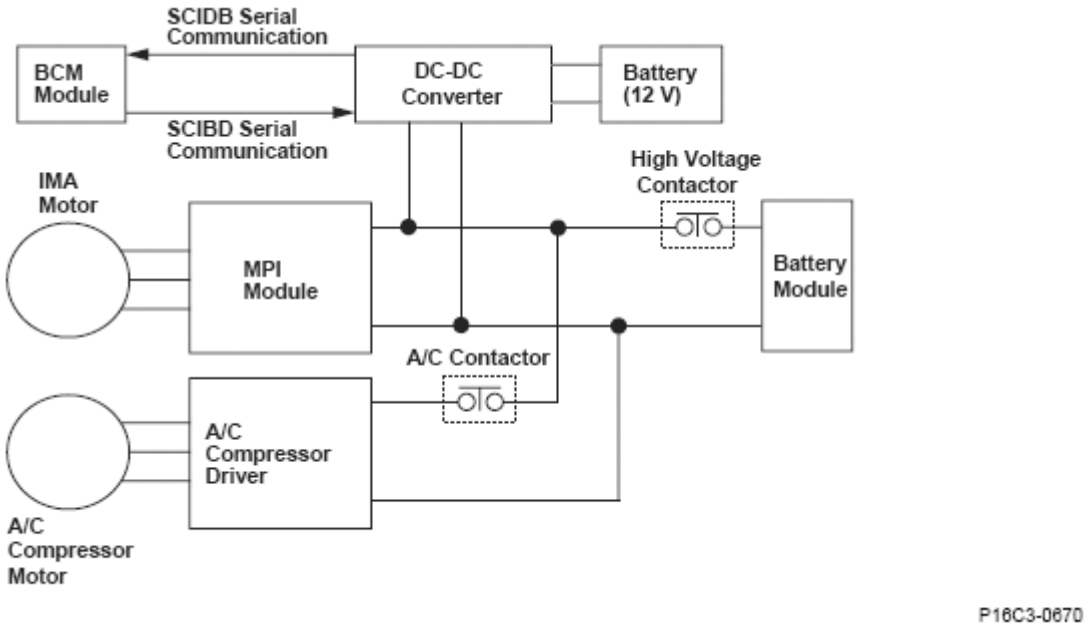

Fig. 154: Checking For Continuity Between Body Ground And ECM/PCM Connector Terminals B1, B36, C2, C40 And C44 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 74.

NO - Repair open in the wire between the ECM/PCM (B1, B36, C2, C40, C44) and G101; A/T model (see **CONNECTOR TO HARNESS INDEX**), M/T model (see **CONNECTOR TO HARNESS INDEX**).

74. Check for continuity between ECM/PCM connector terminal C13 and body ground.

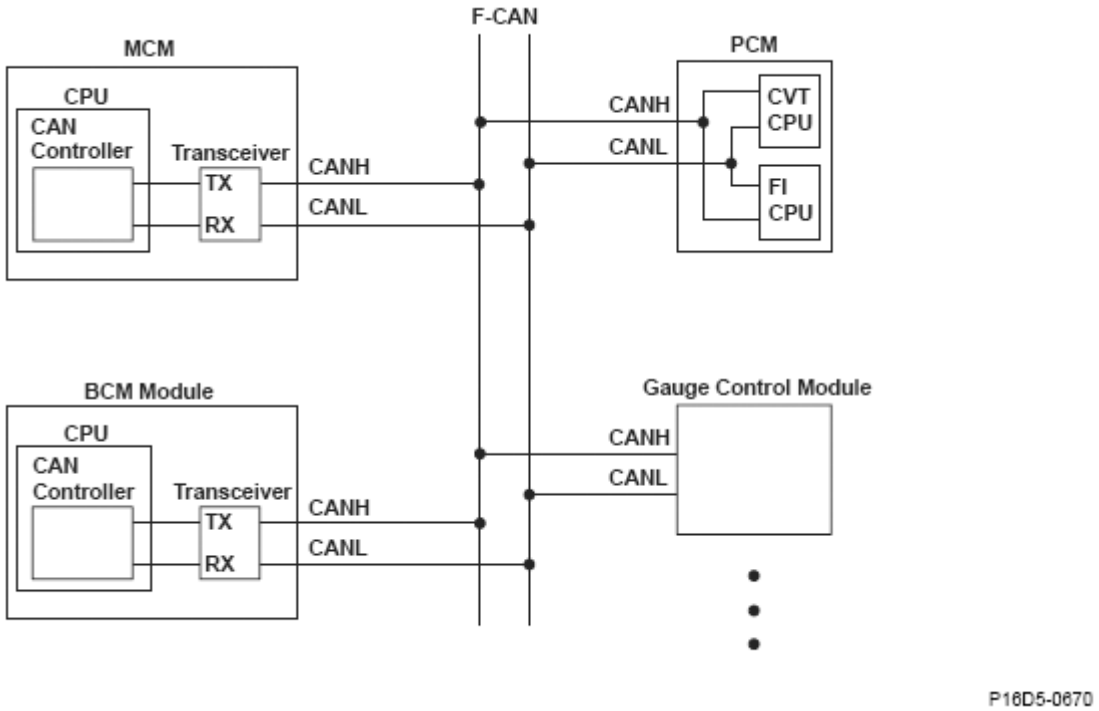

Fig. 155: Checking For Continuity Between ECM/PCM Connector Terminal C13 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 75.

NO - Go to step 76.

75. Continue to check for continuity between ECM/PCM connector terminal C13 and body ground, while disconnecting these parts, one at a time:
    - MAP sensor 3P connector
    - EOP sensor 3P connector ('06 model)
    - Output shaft (countershaft) speed sensor 3P connector

    Does continuity go away when one of the above components is disconnected?

    YES - Replace the part that caused an open when it was disconnected.

    NO - Repair short in the wire between the ECM/PCM (C13) and the MAP sensor, the EOP sensor ('06 model) or the output shaft (countershaft) speed sensor.

76. Check for continuity between ECM/PCM connector terminal B18 and body ground.

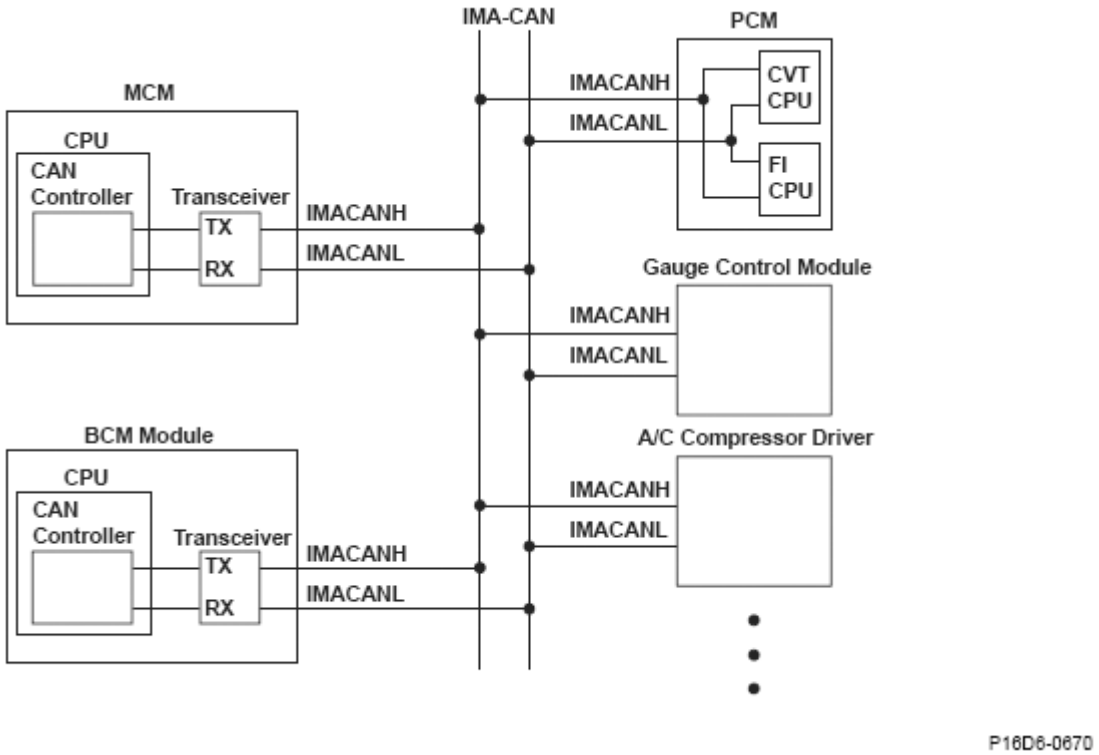

Fig. 156: Checking For Continuity Between ECM/PCM Connector Terminal B18 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 77.

NO - Go to step 78.

77. Continue to check for continuity between ECM/PCM connector terminal B18 and body ground, while disconnecting these parts, one at a time:
    - IMT actuator 5P connector
    - EGR valve 6P connector
    - EOP sensor 3P connector ('07 model)
    - Input shaft (mainshaft) speed sensor 3P connector

    Does continuity go away when one of the above components is disconnected?

    YES - Replace the part that caused an open when it was disconnected.

    NO - Repair short in the wire between the ECM/PCM (B18) and the IMT actuator, the EGR valve, the EOP sensor ('07 model) or the input shaft (mainshaft) speed sensor.

78. Check for continuity between ECM/PCM connector terminal C12 and body ground.

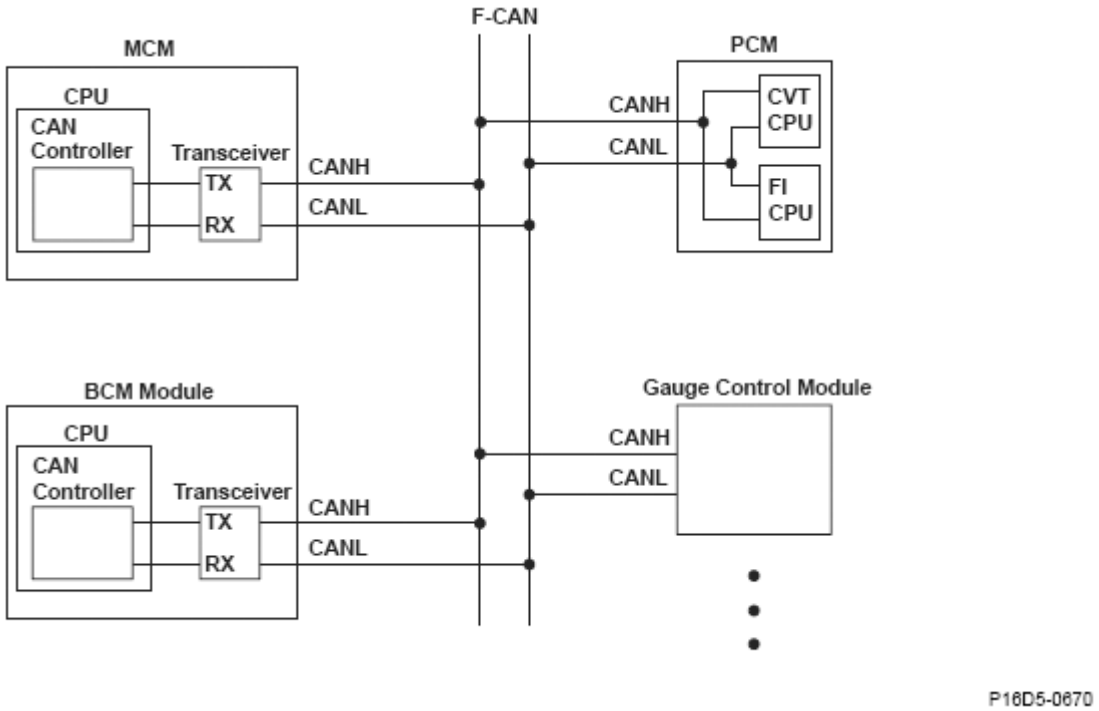

Fig. 157: Checking For Continuity Between ECM/PCM Connector Terminal C12 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 79.

NO - Go to step 80.

79. Continue to check for continuity between ECM/PCM connector terminal C12 and body ground, while disconnecting the throttle body 6P connector.

    Is there continuity?

    YES - Repair short in the wire between the ECM/PCM (C12) and the throttle body.

    NO - Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).

80. Check for continuity between ECM/PCM connector terminal A25 and body ground.

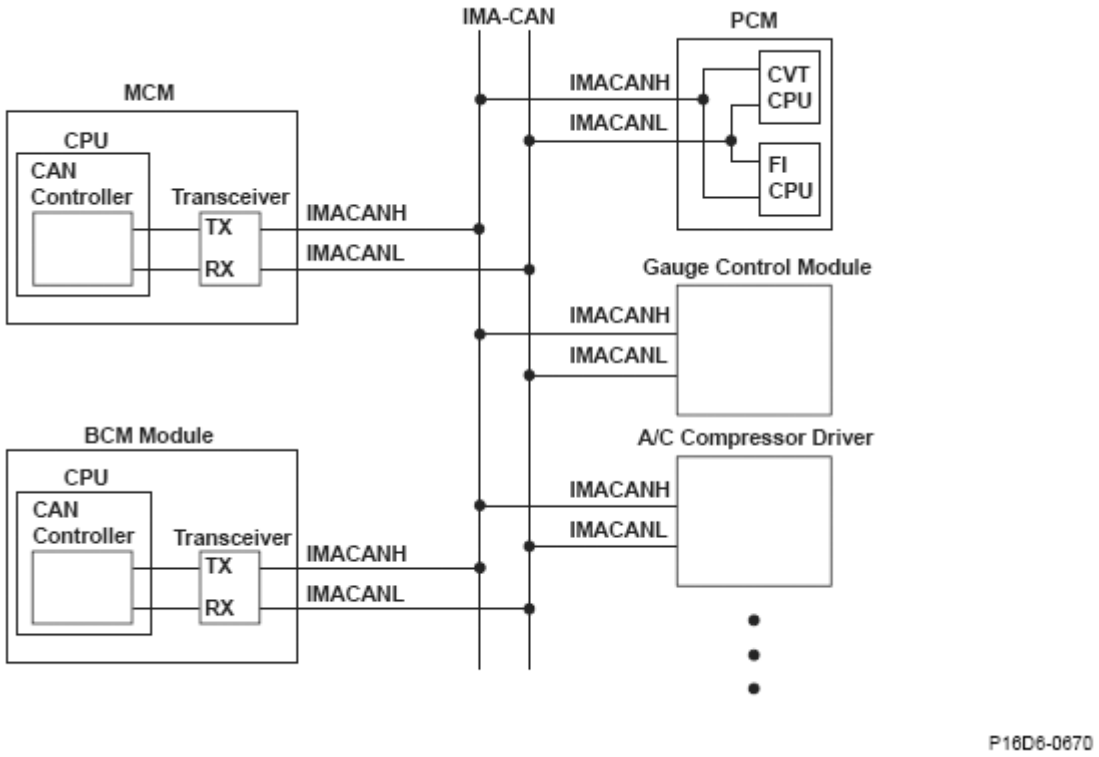

Fig. 158: Checking For Continuity Between ECM/PCM Connector Terminal A25 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 81.

NO - Go to step 82.

81. Continue to check for continuity between ECM/PCM connector terminal A25 and body ground, while disconnecting the APP sensor 6P connector.

    Is there continuity?

    YES - Repair short in the wire between the ECM/PCM (A25) and APP sensor A.

    NO - Replace the accelerator pedal module (see **ACCELERATOR PEDAL MODULE REMOVAL/INSTALLATION**).

82. Check for continuity between ECM/PCM connector terminal A24 and body ground.

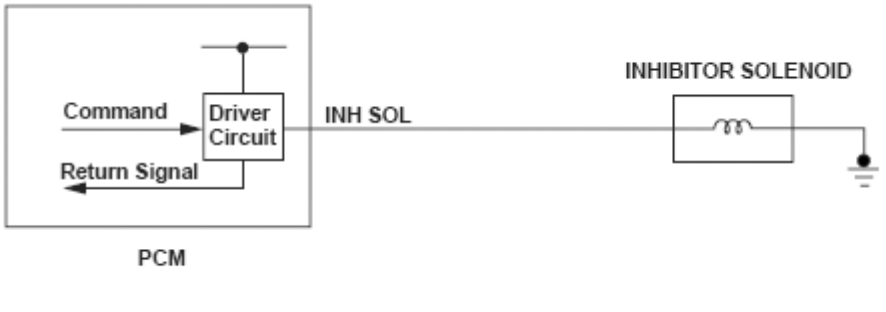

Fig. 159: Checking For Continuity Between ECM/PCM Connector Terminal A24 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 83.

NO - Go to step 84.

83. Continue to check for continuity between ECM/PCM connector terminal A24 and body ground, while disconnecting the APP sensor 6P connector.

    Is there continuity?

    YES - Repair short in the wire between the ECM/PCM (A24) and APP sensor B.

    NO - Replace the accelerator pedal module (see **ACCELERATOR PEDAL MODULE REMOVAL/INSTALLATION**).

84. Check for continuity between ECM/PCM connector terminal A19 and body ground.

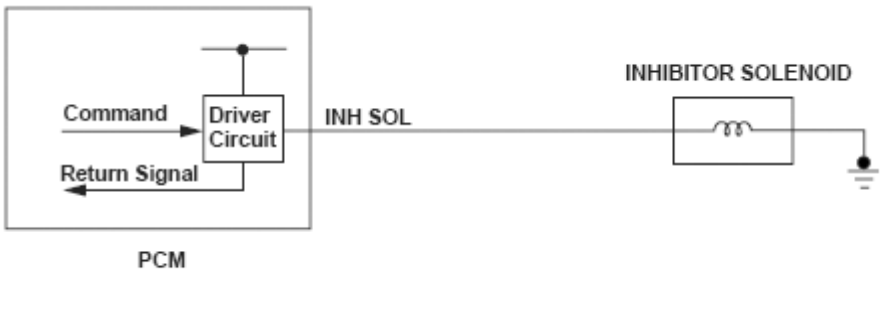

Fig. 160: Checking For Continuity Between ECM/PCM Connector Terminal A19 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 85.

NO - Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or

substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**).

85. Continue to check for continuity between ECM/PCM connector terminal A19 and body ground, while disconnecting these parts, one at a time:
    - A/C pressure sensor 3P connector
    - FTP sensor 3P connector

    Did either part cause an open when it was disconnected?

    YES - Replace the part that caused an open when it was disconnected.

    NO - Repair short in the wire between the ECM/PCM (A19) and the A/C pressure sensor or the FTP sensor.

INJECTOR REPLACEMENT

1. Relieve fuel pressure (see **FUEL PRESSURE RELIEVING**).
2. Remove the cowl cover and under-cowl panel (see **COWL COVER REPLACEMENT**).
3. Remove the fuel line cover (A).

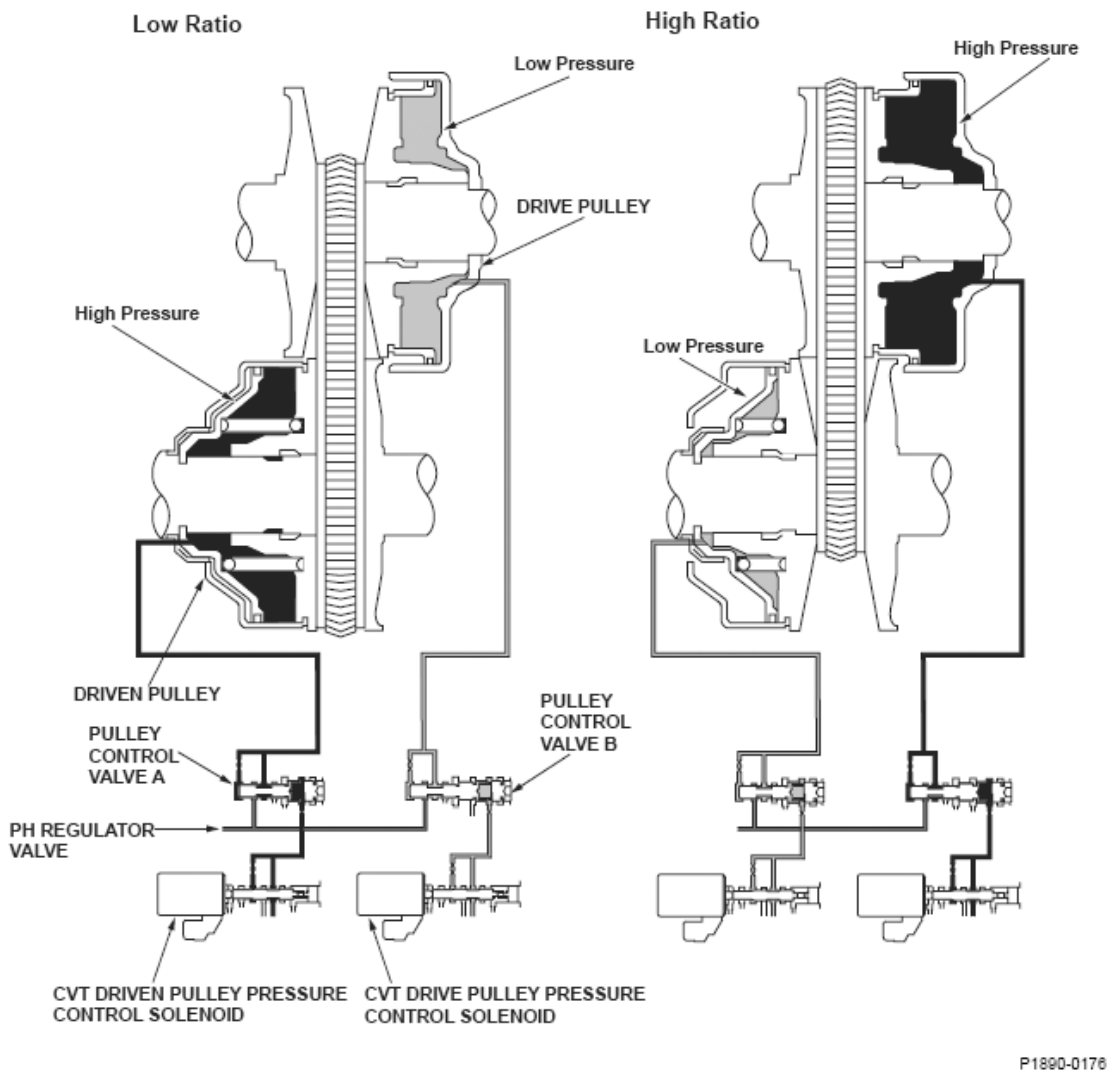

Fig. 161: Removing Fuel Line Cover (With Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Disconnect the connectors (B) from the injectors and the rocker arm oil control valve.
5. Disconnect the quick-connect fitting (C).
6. Remove the fuel rail mounting nuts (D) from the fuel rail (E).
7. Remove the injector clip (F) from the injector.
8. Remove the injector from the fuel rail.
9. Coat the new O-rings (A) with clean engine oil, and insert the injectors (B) into the fuel rail (C).

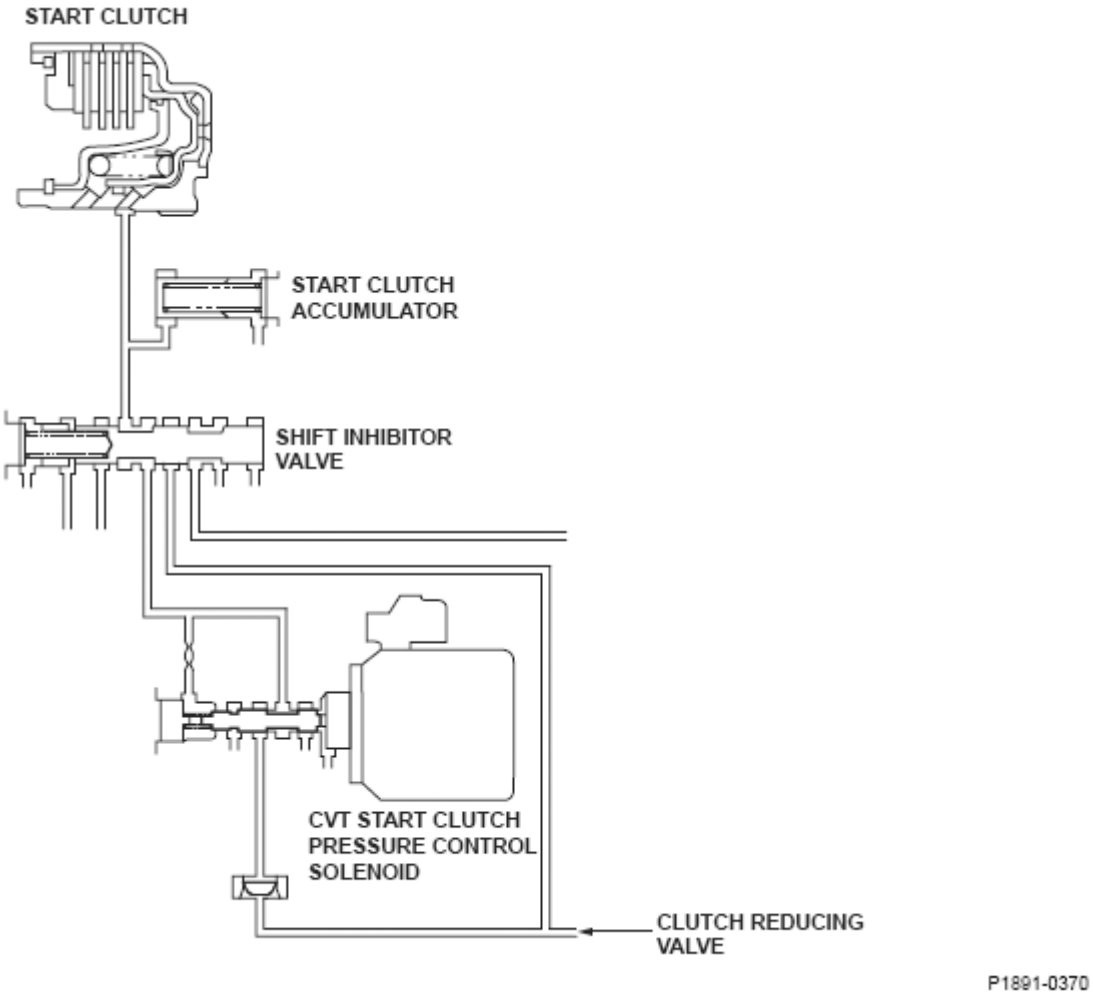

Fig. 162: Inserting Injectors Into Fuel Rail (With Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Install the injector clip (D).
11. Coat the injector O-ring (E) with clean engine oil.
12. Install the fuel rail and the injector into the cylinder head (F).
13. Install the fuel rail mounting nuts.
14. Connect the connectors on the injectors.
15. Connect the quick-connect fittings.
16. Turn the ignition switch ON (II), but do not operate the starter. After the fuel pump runs for about 2 seconds, the fuel rail is pressurized. Repeat this two or three times, then check for fuel leakage.
17. Install the fuel line cover.
18. Install the cowl cover and under-cowl panel (see **COWL COVER REPLACEMENT**).

A/F SENSOR REPLACEMENT

Special Tools Required

O2 sensor wrench, Snap-on S6176, or equivalent, commercially available

1. Disconnect the A/F sensor 4P connector (A), then remove the A/F sensor (B).

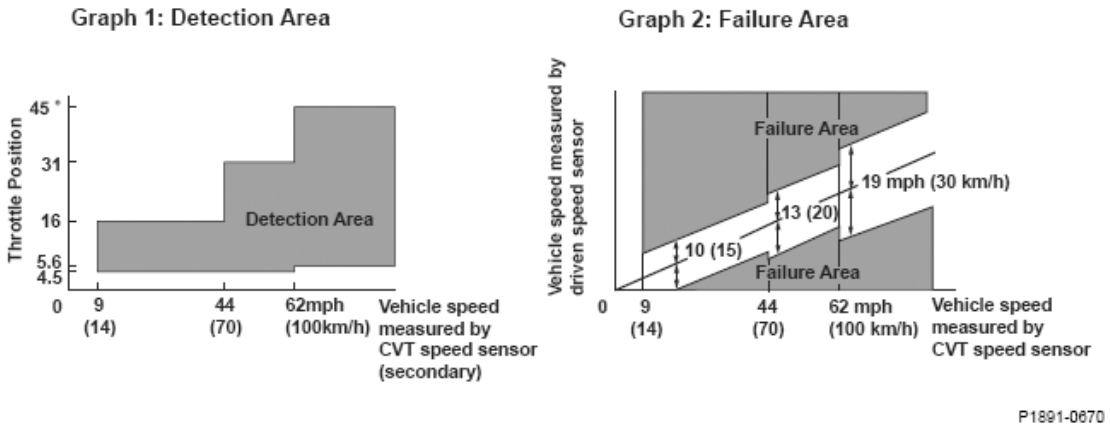

Fig. 163: Removing A/F Sensor (With Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the parts in the reverse order of removal.

SECONDARY HO2S REPLACEMENT

Special Tools Required

O2 sensor wrench, Snap-on YA8875, SP Tools 93750, or equivalent, commercially available

1. Disconnect the secondary HO2S 4P connector (A), then remove the secondary HO2S (B).

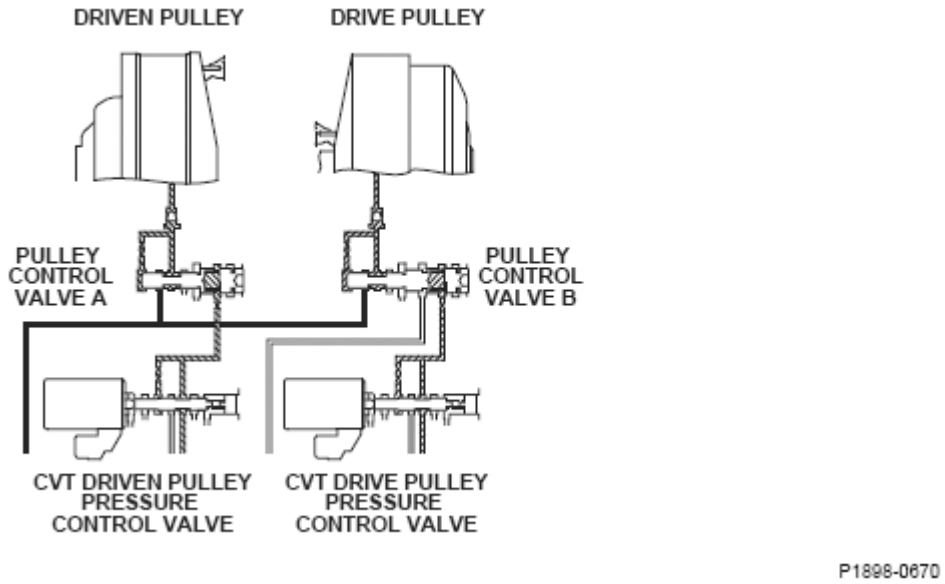

Fig. 164: Removing Secondary HO2S (With Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the parts in the reverse order of removal.

CKP SENSOR REPLACEMENT

1. Remove the cowl cover and under-cowl panel (see **COWL COVER REPLACEMENT**).
2. Disconnect the CMP sensor connector (A).

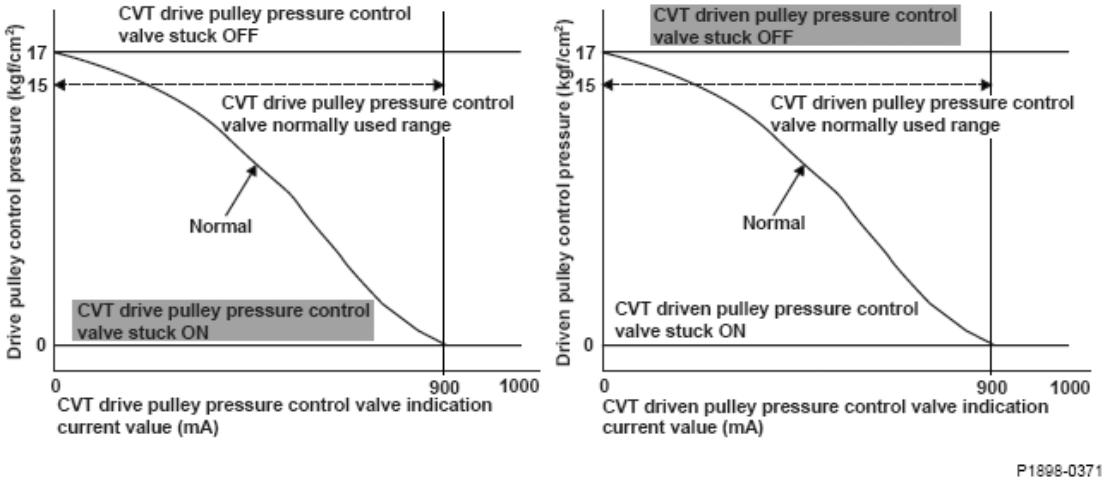

Fig. 165: Disconnecting CMP Connector (With Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the CMP sensor (B).
4. Install the parts in the reverse order of removal with a new O-ring (C).

CMP SENSOR REPLACEMENT

1. Remove the splash shield; 2-door (see **2-DOOR**), 4-door (see **4-DOOR**).
2. Disconnect the CKP sensor connector (A).

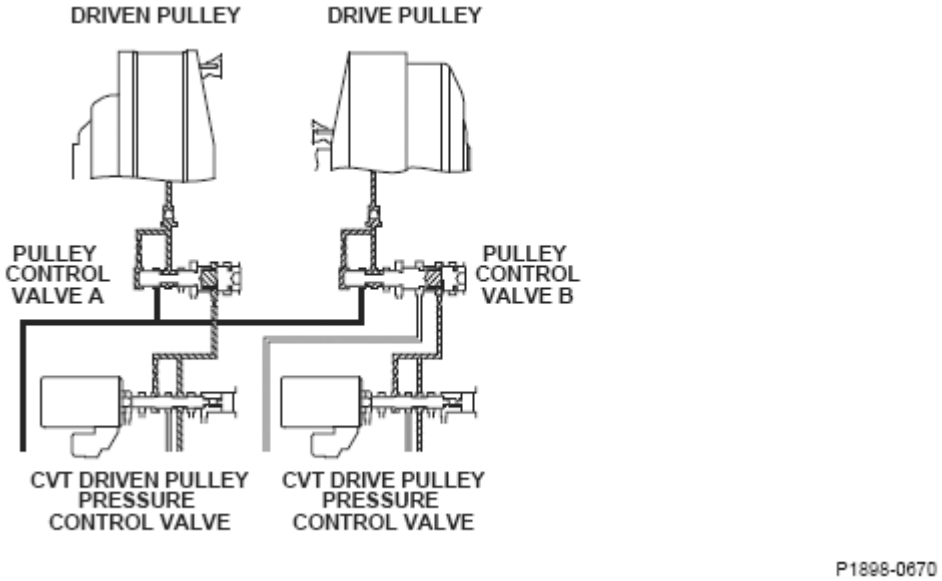

Fig. 166: Disconnecting CKP Sensor Connector (With Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the CKP sensor (B).
4. Install the parts in the reverse order of removal with a new O-ring (C).
5. Do the CKP pattern clear/CKP pattern learn procedure (see **CRANK (CKP) PATTERN CLEAR/CRANK (CKP) PATTERN LEARN**).

OUTPUT SHAFT (COUNTERSHAFT) SPEED SENSOR REPLACEMENT

1. Remove the air cleaner (see **AIR CLEANER REMOVAL/INSTALLATION**).
2. Disconnect the output shaft (countershaft) speed sensor 3P connector (A).

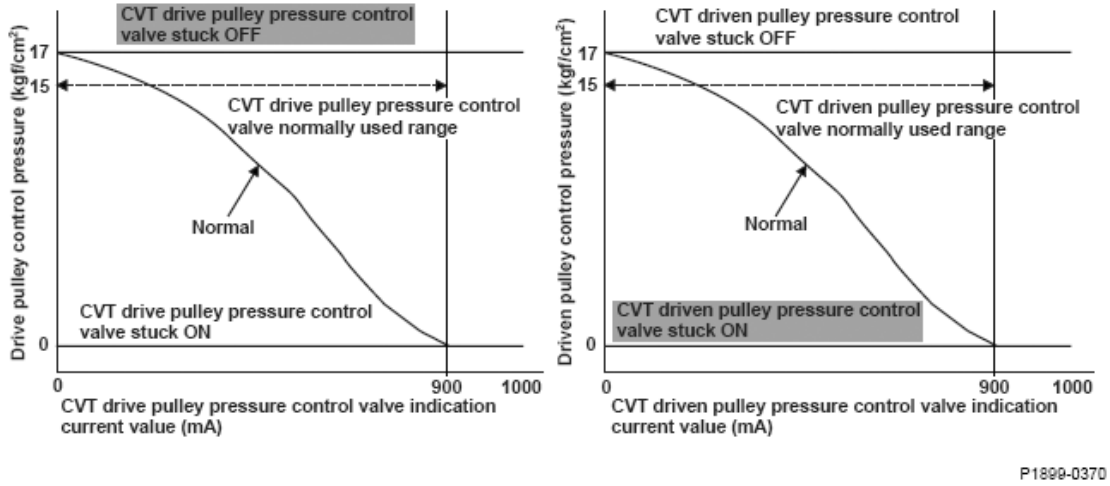

Fig. 167: Disconnecting Output Shaft (Countershaft Speed Sensor 3P Connector (With Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the output shaft (countershaft) speed sensor (B).
4. Install the parts in the reverse order of removal with a new O-ring (C).

KNOCK SENSOR REPLACEMENT

1. Remove the intake manifold (see **REMOVAL**).
2. Disconnect the knock sensor connector (A).

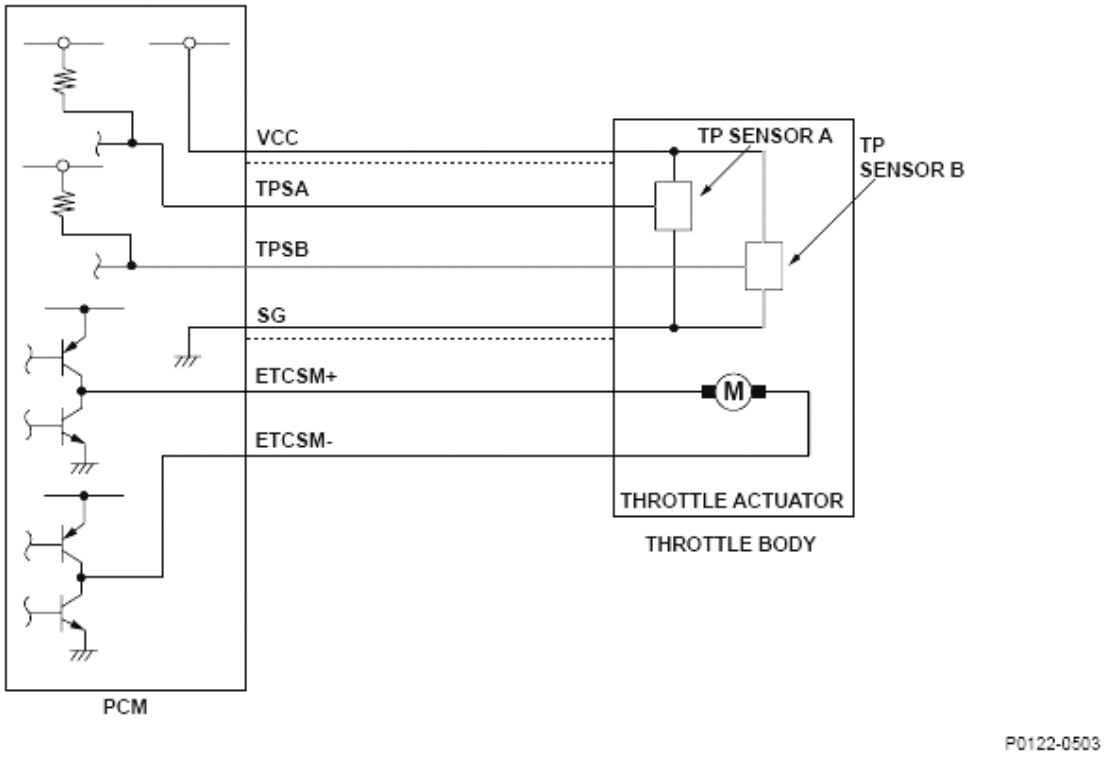

Fig. 168: Disconnecting Knock Sensor Connector (With Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the knock sensor (B).
4. Install the parts in the reverse order of removal.

MAP SENSOR REPLACEMENT

1. Remove the cowl cover and under-cowl panel (see **COWL COVER REPLACEMENT**).
2. Disconnect the MAP sensor connector (A).

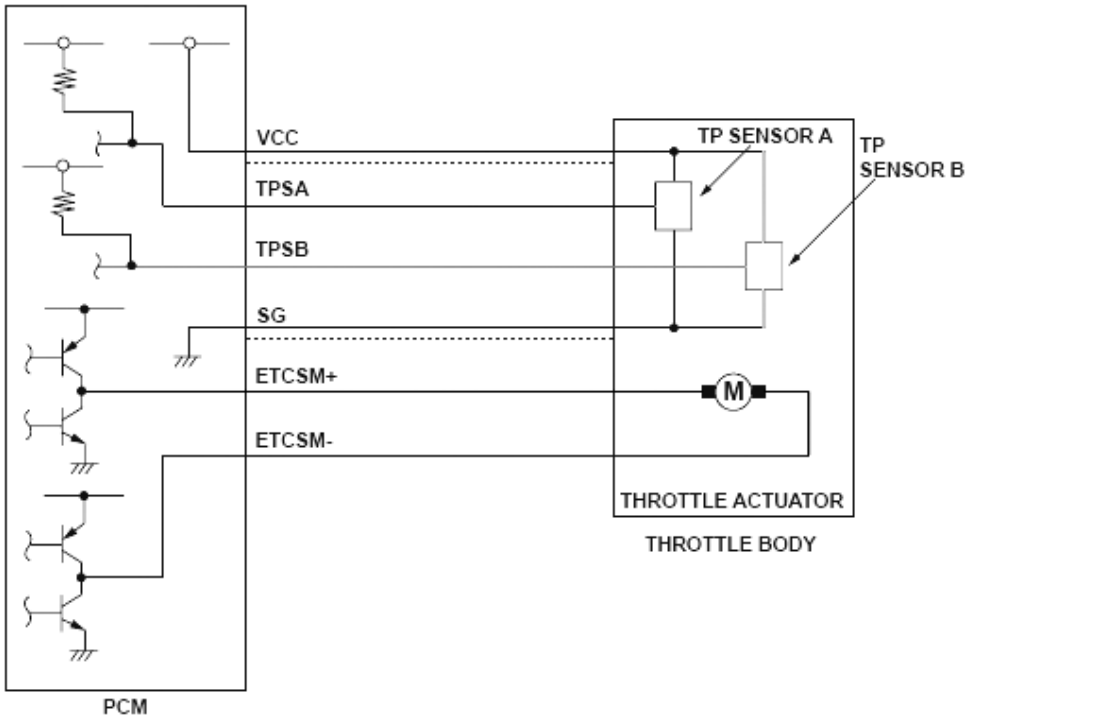

Fig. 169: Disconnecting MAP Sensor Connector (With Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the MAP sensor (B).
4. Install the parts in the reverse order of removal with a new O-ring (C).

MAF SENSOR/IAT SENSOR REPLACEMENT

1. Disconnect the MAF sensor/IAT sensor connector (A).

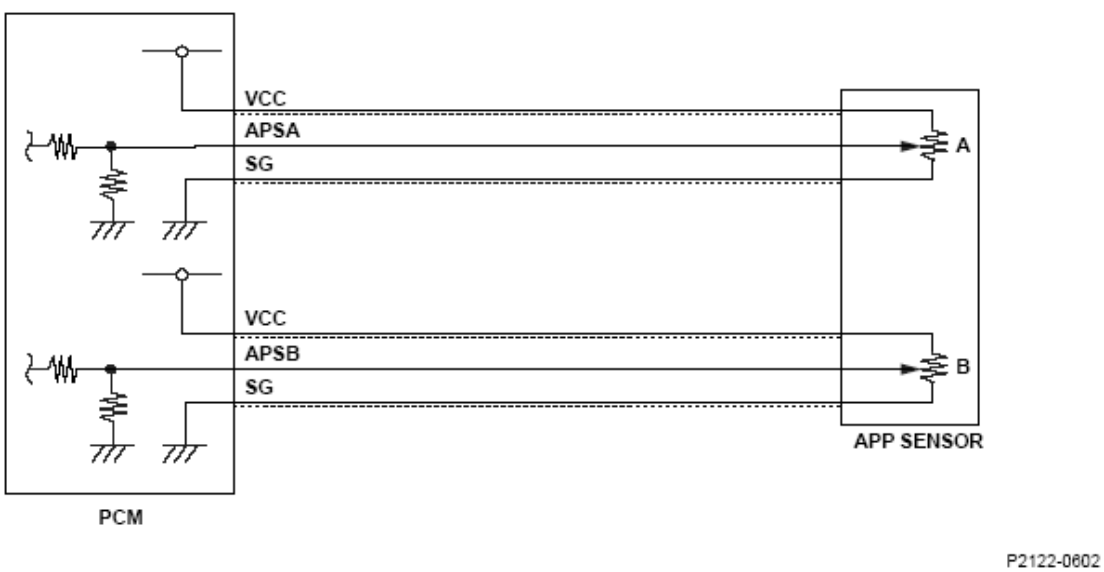

Fig. 170: Disconnecting MAF Sensor/IAT Sensor Connector (With Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the bolts (B).
3. Remove the MAF sensor/IAT sensor (C).
4. Install the parts in the reverse order of removal with a new O-ring (D).

ECT SENSOR 1 REPLACEMENT

1. Drain the engine coolant (see **COOLANT REPLACEMENT**).
2. Disconnect the ECT sensor 1 connector (A).

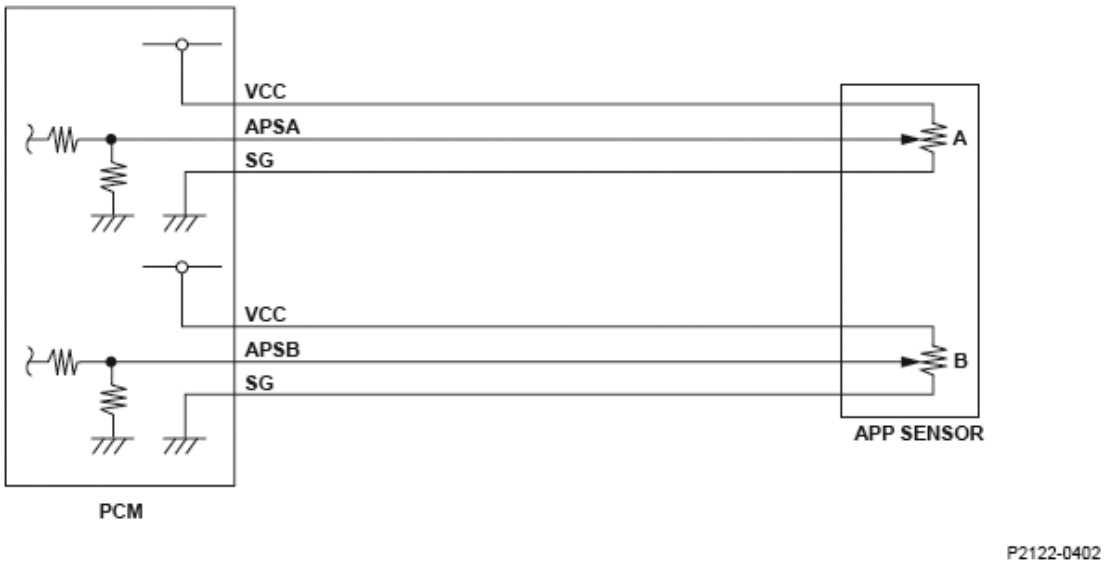

Fig. 171: Disconnecting ECT Sensor 1 Connector (With Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove ECT sensor 1 (B).
4. Install the parts in the reverse order of removal with a new O-ring (C), then refill the radiator with engine coolant (see **COOLANT REPLACEMENT**).

ECT SENSOR 2 REPLACEMENT

1. Drain the engine coolant (see **COOLANT REPLACEMENT**).
2. Remove the splash shield.
3. Disconnect the ECT sensor 2 connector (A).

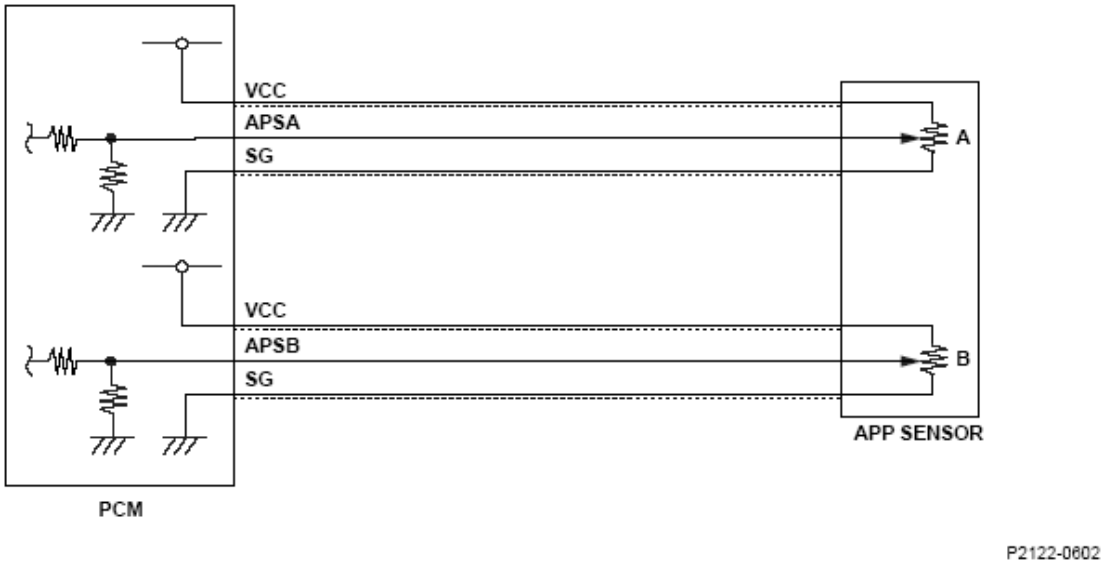

Fig. 172: Disconnecting ECT Sensor 2 Connector (With Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove ECT sensor 2 (B).
5. Install the parts in the reverse order of removal with a new O-ring (C), then refill the radiator with engine coolant (see **COOLANT REPLACEMENT**).
6. Install the splash shield.

ELD REPLACEMENT

1. Remove the ECM/PCM (see **ECM/PCM REPLACEMENT**).
2. Remove the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**).
3. Remove the screw (A).

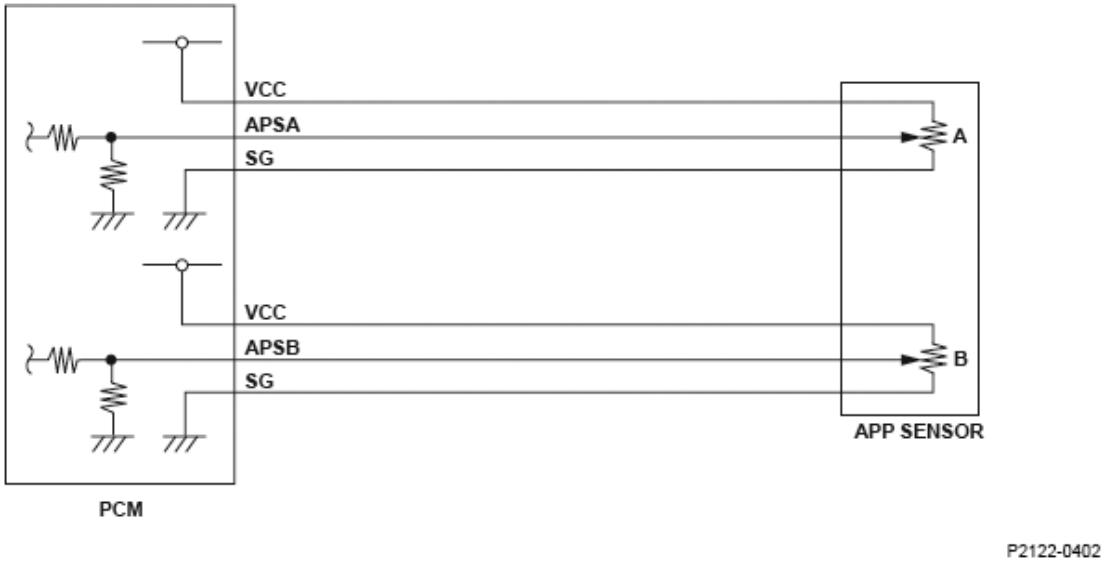

Fig. 173: Removing ELD Screw
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Turn the housing over, then remove the screw (A).

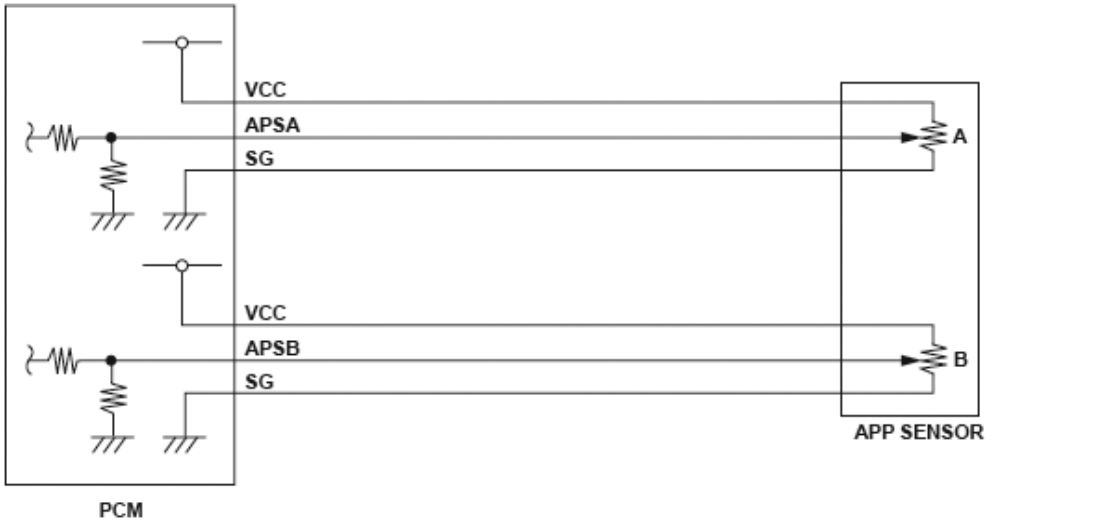

Fig. 174: Removing ELD Screw Turning Housing Over
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Turn the housing over again. Using two flat-tip screwdrivers, release the tabs (A), and pry up the fuse/relay box base (B) from the fuse/relay box housing (C).

NOTE: Make sure the terminals (D) are not bent or damaged.

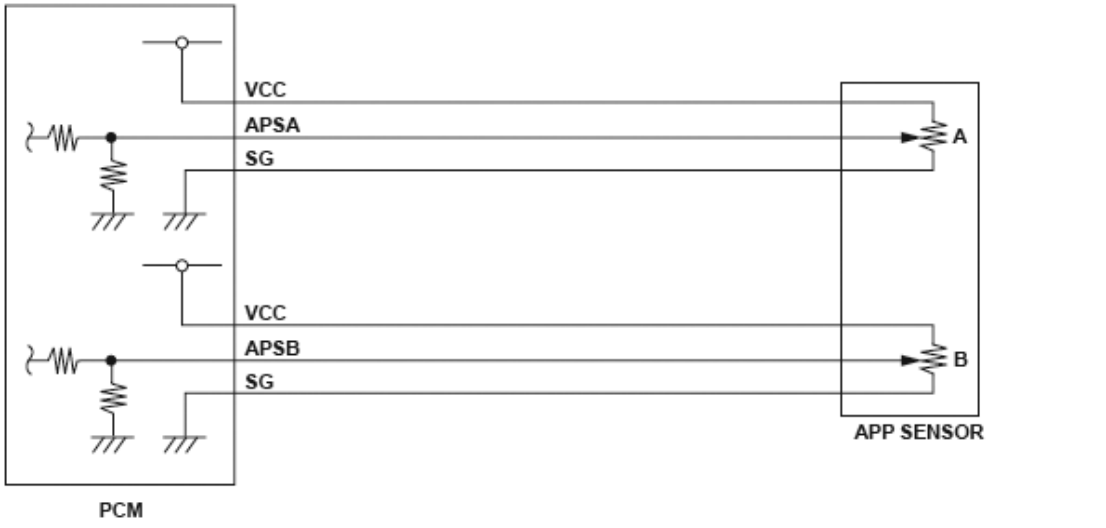

Fig. 175: Prying Fuse/Relay Box Base
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Remove the ELD (A).

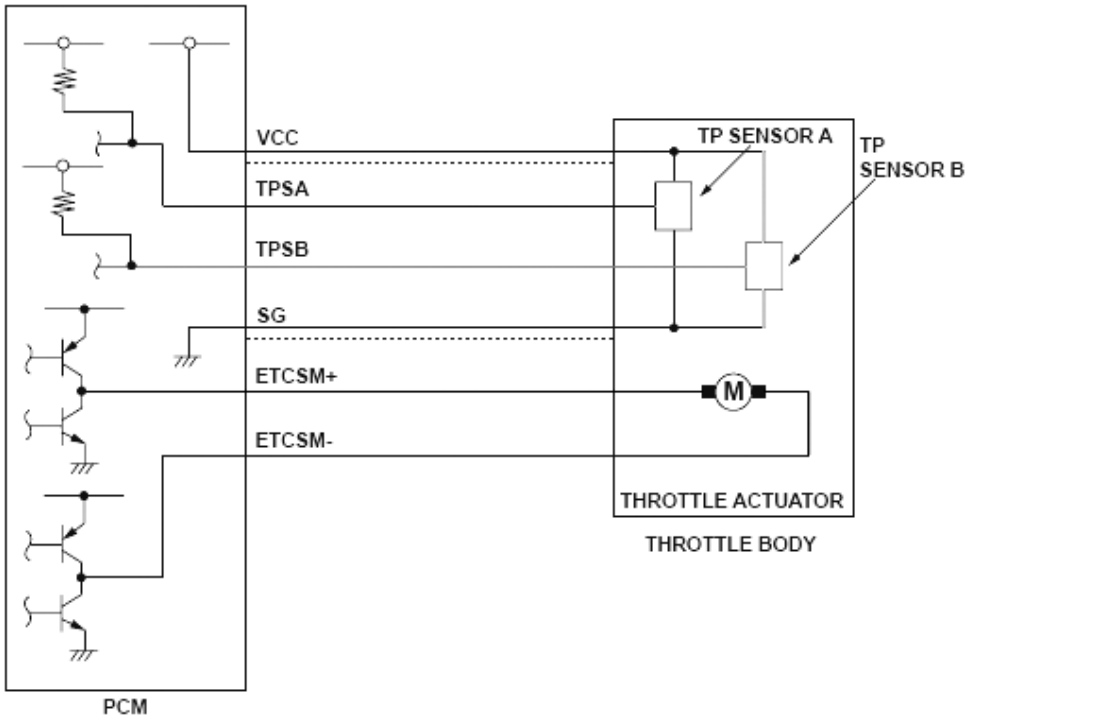

Fig. 176: Removing ELD
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the parts in the reverse order of removal.

ECM/PCM REPLACEMENT

Special Tools Required

- Honda diagnostic system (HDS) tablet tester
- Honda interface module (HIM) and an iN workstation with the latest HDS software version
- HDS pocket tester
- GNA-600 and an iN workstation with HDS and CM update software

  Any one of the above updating tools can be used.

1. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.
2. Turn the ignition switch to ON (II).

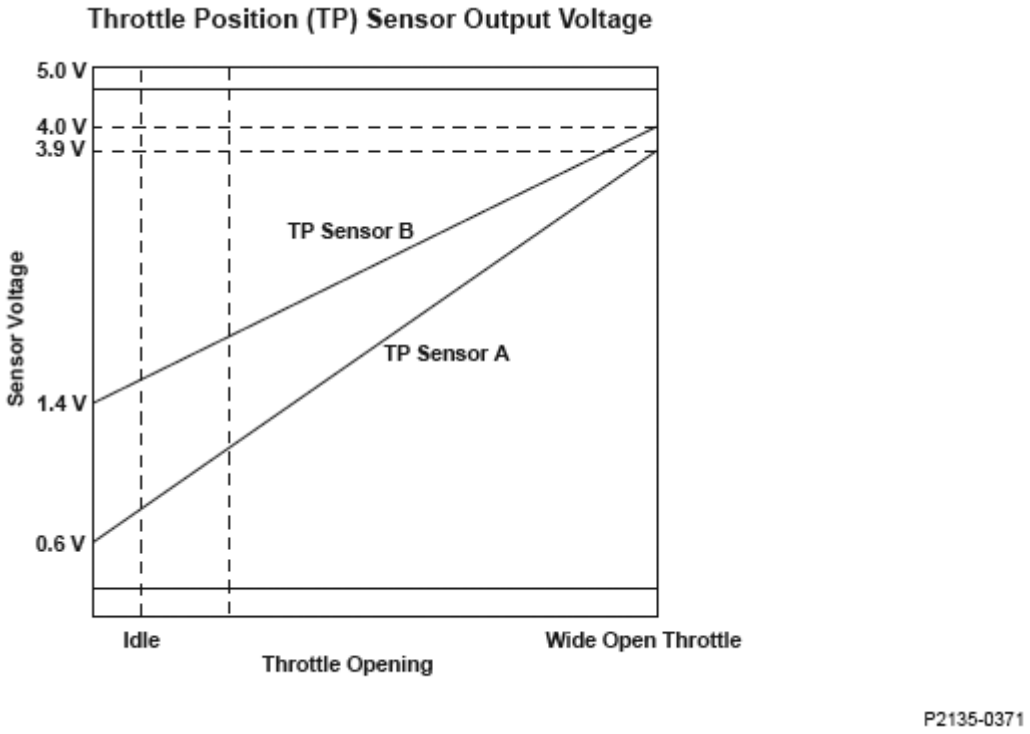

Fig. 177: Connecting HDS To DLC
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Make sure the HDS communicates with the ECM/PCM and other vehicle systems. If it doesn't, go to the DLC circuit troubleshooting. If you are returning from DLC circuit troubleshooting, skip steps 4 through 9, 20 through 25, and 28 through 30, and do this after replacing the ECM/PCM:
   - Replace the engine oil and the engine oil filter. (See **ENGINE OIL FILTER REPLACEMENT**).
   - Replace the ATF (A/T). (See **ATF REPLACEMENT**).
   - Clean the throttle body. (See **THROTTLE BODY CLEANING**).
4. Select the PGM-FI system with the HDS.
5. Select the INSPECTION MENU with the HDS.
6. Select the ETCS TEST, then select the TP POSITION CHECK, and follow the screen prompts.

NOTE: **If the TP POSITION CHECK indicates FAILED, continue with this procedure.**

7. Select the REPLACE ECM/PCM MENU, then select READ DATA, and follow the screen prompts.

NOTE:
- **Doing this step copies (READS) the engine oil life data from the original ECM/PCM so you can later download (WRITES) it into the new ECM/PCM.**
- **If READ DATA indicates FAILED, continue with this procedure.**

8. A/T: Select the A/T system with the HDS.

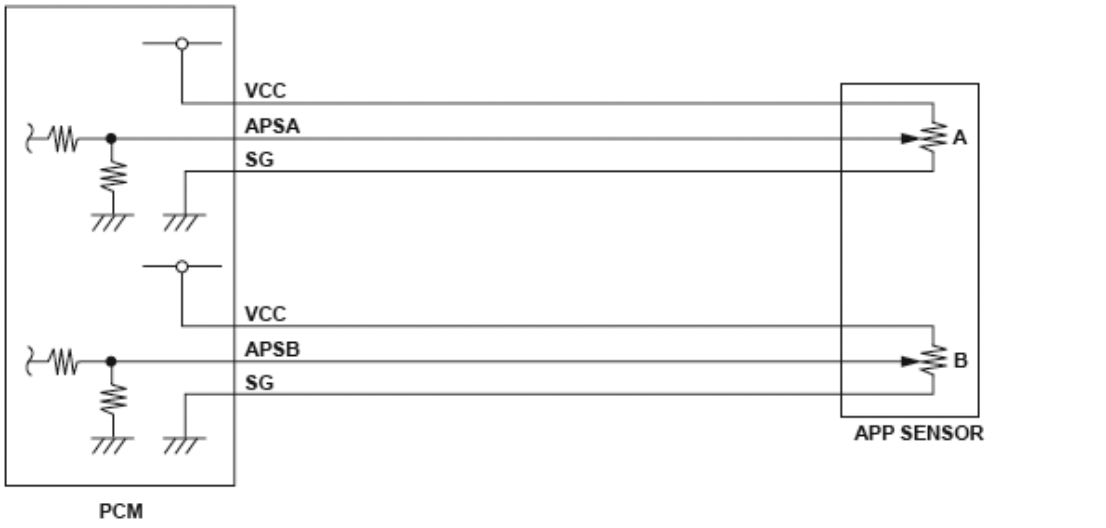

Fig. 178: Removing Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. A/T: Select the REPLACE TCM/PCM MENU, then select READ DATA, and follow the screen prompts.
    - Doing this step copies (READS) the ATF life data from the original PCM so you can later download (WRITES) it into the new PCM.
    - If READ DATA indicates FAILED, continue with this procedure.
10. Turn the ignition switch to LOCK (0).
11. Jump the SCS line with the HDS.
12. Do the battery removal procedure. (See **BATTERY REMOVAL AND INSTALLATION**).
13. Remove the cover (A).

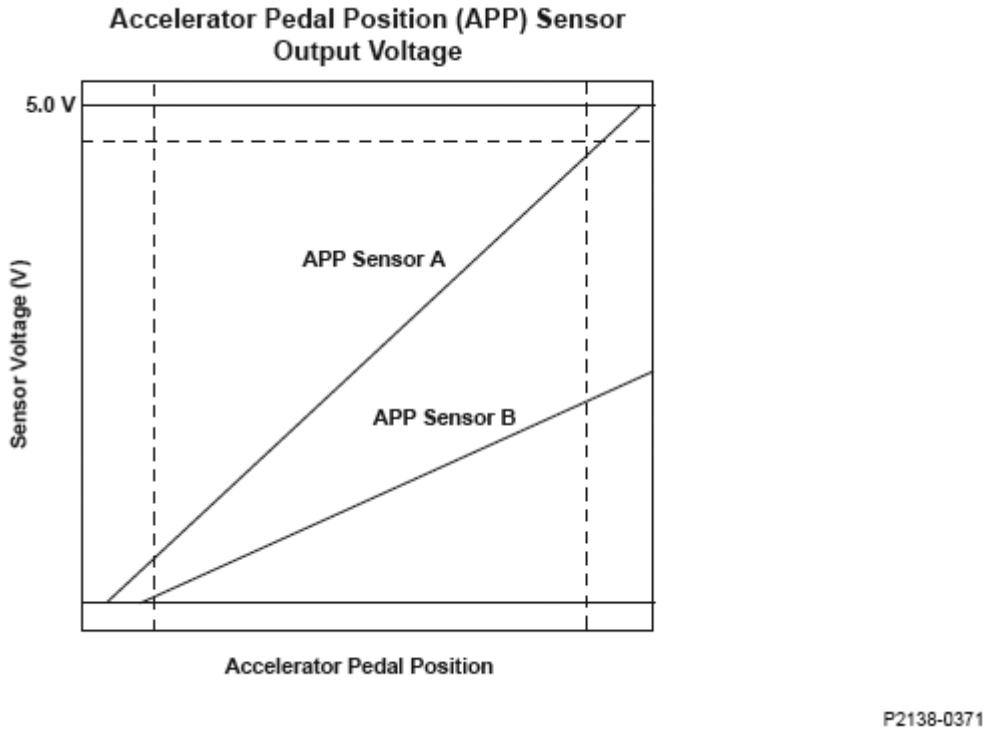

Fig. 179: Removing ECM/PCM (With Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Remove the bolts (D), then remove the ECM/PCM (E).
15. Disconnect ECM/PCM connectors A, B, and C.

NOTE: ECM/PCM connectors A, B, and C have symbols (A=?, B=? , C=?) embossed on them for identification.

16. Install the ECM/PCM in the reverse order of removal.
17. Do the battery installation procedure.
18. Turn the ignition switch to ON (II).
19. Manually input the VIN to the ECM/PCM with the HDS.

NOTE: DTC P0630 VIN Not Programmed or Mismatch may be stored because the VIN has not been programmed into the ECM/PCM; ignore it, and continue this procedure.

20. If the READ DATA (engine oil life) failed in step 7, go to step 23 (A/T) or step 26 (M/T). Otherwise, go to step 21.
21. Select the PGM-FI system with the HDS.
22. Select the REPLACE ECM/PCM MENU, then select WRITE DATA, and follow the screen prompts.

NOTE: If the WRITE DATA indicates FAILED, continue with this procedure.

23. A/T: If the READ DATA (ATF life) failed in step 9, go to step 26. Otherwise go to step 24.
24. A/T: Select the A/T SYSTEM with the HDS.

25. A/T: Select the REPLACE TCM/PCM MENU, then select WRITE DATA, and follow the screen prompts.

NOTE: If the WRITE DATA indicates FAILED, continue with this procedure.

26. Select IMMOBI system with the HDS.
27. Enter the immobilizer ECM/PCM code that you got from the iN, and use the ECM/PCM replacement procedure in the IMMOBI MENU of the HDS; it allows you to start the engine.
28. If the TP POSITION CHECK failed in step 6, clean the throttle body, then go to step 29.
29. If the READ DATA failed in step 7 or the WRITE DATA failed in step 22, replace the engine oil and engine oil filter, then go to step 30 (A/T) or step 31 (M/T).
30. A/T: If the READ DATA failed in step 9 or the WRITE DATA failed in step 25, replace the ATF, then go to step 31.
31. Select PGM-FI system, and reset the ECM/PCM with the HDS.
32. Update the ECM/PCM if it does not have the latest software. (See **ECM/PCM Replacement**).
33. Do the CKP pattern clear/CKP pattern learn procedure. (See **CRANK (CKP) PATTERN CLEAR/CRANK (CKP) PATTERN LEARN**).

DTC TROUBLESHOOTING

DTC P0522: EOP SENSOR CIRCUIT LOW VOLTAGE

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Information marked with an asterisk (*) applies to '07-08 model.**

1. Turn the ignition switch ON (II).
2. Check the OIL PRESSURE SENSOR in the DATA LIST with the HDS.

   Is there about 0.18 V or less?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EOP sensor and the ECM/PCM.

3. Turn the ignition switch OFF.
4. Disconnect the EOP sensor 3P connector.
5. Turn the ignition switch ON (II).
6. Check the OIL PRESSURE SENSOR in the DATA LIST with the HDS.

   Is there about 0.18 V or less?

   YES - Go to step 8.

NO - Go to step 7.

7. Measure voltage between EOP sensor 3P connector terminals No. 1 and No. 3.

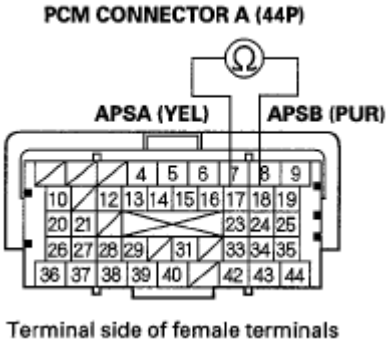

Fig. 2: Measuring Voltage Between EOP Sensor 3P Connector Terminals No. 1 And No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 16.

NO - Go to step 12.

8. Turn the ignition switch OFF.
9. Jump the SCS line with the HDS.
10. Disconnect ECM/PCM connector C (44P).
11. Check for continuity between EOP sensor 3P connector terminal No. 2 and body ground.

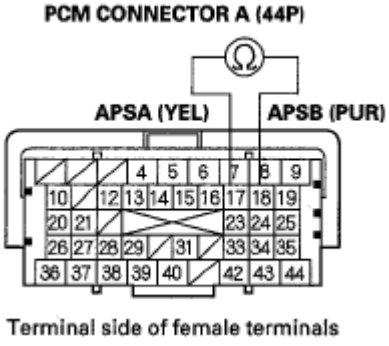

Fig. 3: Checking Continuity Between EOP Sensor 3P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (C22) and the EOP sensor, then go to step 18.

NO - Go to step 24.

12. Turn the ignition switch OFF.

13. Jump the SCS line with the HDS.
14. Disconnect ECM/PCM connector C (44P) (B (44P))\
15. Check for continuity between ECM/PCM connector terminal C13 (B18)* and EOP sensor 3P connector terminal No. 1.

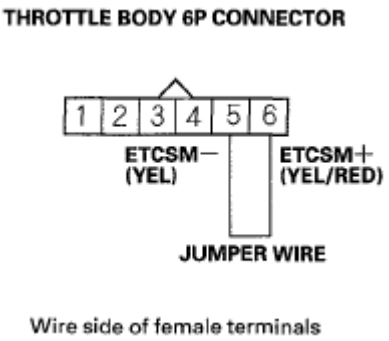

Fig. 4: Checking Continuity Between ECM/PCM Connector Terminal C13 (B18)* And EOP Sensor Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 24.

NO - Repair open in the wire between the ECM/PCM (C13) (B18)* and the EOP sensor, then go to step 18.

16. Turn the ignition switch OFF.
17. Replace the EOP sensor (see **EOP SENSOR REMOVAL/INSTALLATION**).
18. Reconnect all connectors.
19. Turn the ignition switch ON (II).
20. Reset the ECM/PCM with the HDS.
21. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
22. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0522 indicated?

YES - Check for poor connections or loose terminals at the EOP sensor and the ECM/PCM, then go to step 1.

NO - Go to step 23.

23. Monitor the OBD STATUS for DTC P0522 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 22, go to the indicated DTCs troubleshooting.

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the EOP sensor and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

24. Reconnect all connectors.
25. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
26. Start the engine, and let it idle.
27. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0552 indicated?

    YES - Check for poor connections or loose terminals at the EOP sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 26. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 28.

28. Monitor the OBD STATUS for DTC P0522 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 27, go to the indicated DTCs troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the EOP sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 26. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P0523: EOP SENSOR CIRCUIT HIGH VOLTAGE

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Information marked with an asterisk (*) applies to '07-08 model.**

1. Turn the ignition switch ON (II).
2. Check the OIL PRESSURE SENSOR in the DATA LIST with the HDS.

   Is there about 4.79 V or more?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EOP sensor and the ECM/PCM.

3. Turn the ignition switch OFF.

4. Disconnect the EOP sensor 3P connector.
5. Connect EOP sensor 3P connector terminals No. 2 and No. 3 with a jumper wire.

Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Turn the ignition switch ON (II).
7. Check the OIL PRESSURE SENSOR in the DATA LIST with the HDS.

   Is there about 4.79 V or more?

   YES - Go to step 8.

   NO - Go to step 18.

8. Remove the jumper wire.
9. Measure voltage between EOP sensor 3P connector terminals No. 1 and No. 3.

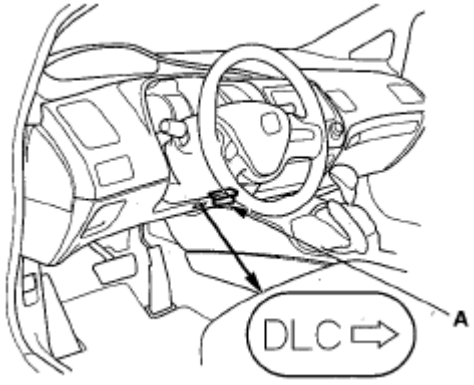

Fig. 6: Checking Voltage Between EOP Sensor 3P Connector Terminals No 1 And 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 14.

NO - Go to step 10.

10. Turn the ignition switch OFF.
11. Jump the SCS line with the HDS.
12. Disconnect ECM/PCM connector C (44P) (B (44P))*.
13. Check for continuity between ECM/PCM connector terminal C14 (B33)* and EOP sensor 3P connector terminal No. 3.

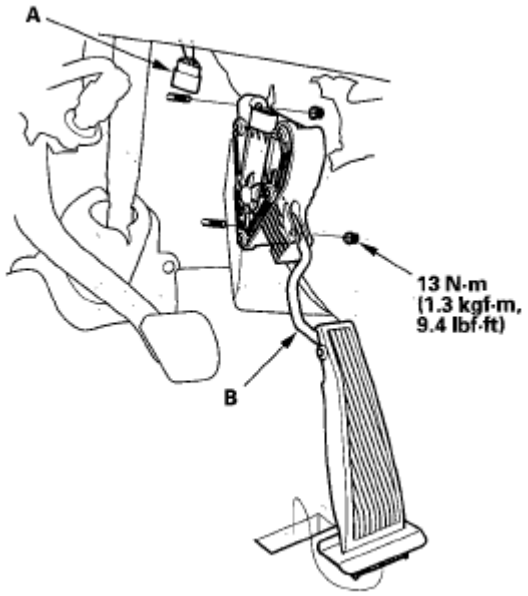

Fig. 7: Checking Continuity Between ECM/PCM Connector Terminal C14 (B33)* And EOP Sensor 3P Terminal No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 26.

NO - Repair open in the wire between the ECM/PCM (C14) (B33) * and the EOP sensor, then go to step 20.

14. Turn the ignition switch OFF.
15. Jump the SCS line with the HDS.
16. Disconnect ECM/PCM connector C (44P).
17. Check for continuity between ECM/PCM connector terminal C22 and EOP sensor 3P connector terminal No. 2.

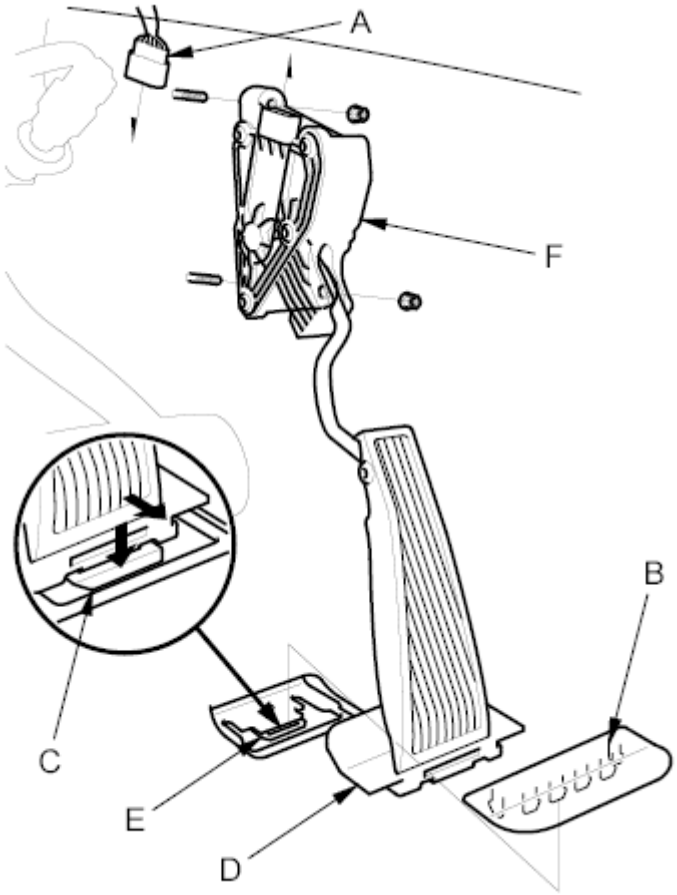

Fig. 8: Checking Continuity Between ECM/PCM Connector Terminal C22 And EOP Sensor 3P Terminal No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 26.

NO - Repair open in the wire between the ECM/PCM (C22) and the EOP sensor, then go to step 20.

18. Turn the ignition switch OFF.
19. Replace the EOP sensor (see **EOP SENSOR REMOVAL/INSTALLATION**).
20. Reconnect all connectors.
21. Turn the ignition switch ON (II).
22. Reset the ECM/PCM with the HDS.
23. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
24. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0523 indicated?

YES - Check for poor connections or loose terminals at the EOP sensor and the ECM/PCM, then go to step 1.

NO - Go to step 25.

25. Monitor the OBD STATUS for DTC P0523 in the DTCs MENU with the HDS.

    Does the screen indicated PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 24, go to the indicated DTCs troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the EOP sensor and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

26. Reconnect all connectors.
27. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
28. Start the engine, and let it idle.
29. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0523 indicated?

    YES - Check for poor connections or loose terminals at the EOP sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 28. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 30.

30. Monitor the OBD STATUS for DTC P0523 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 29, go to the indicated DTCs troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the EOP sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 28. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P2646: VTEC SYSTEM STUCK OFF

Special Tools Required

- Pressure gauge adapter 07NAJ-P07010A
- A/T low pressure gauge w/panel 07406-0070301
- A/T pressure hose 07406-0020201
- A/T pressure hose, 2,210 mm 07MAJ-PY4011A
- A/T pressure adapter 07MAJ-PY40120

- Oil pressure hose 07ZAJ-S5AA200

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Check the engine oil level.

   Is the engine oil level OK?

   YES - Go to step 2.

   NO - Adjust the engine oil to the proper level, then go to step 12.

2. Turn the ignition switch ON (II).
3. Clear the DTC with the HDS.
4. Do the VTEC TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EOP sensor, the rocker arm oil control solenoid, and the ECM/PCM.

   NO - Go to step 5.

5. Turn the ignition switch OFF.
6. Remove the EOP sensor (A), install the special tools as shown, then attach the EOP sensor to the oil pressure gauge adapter (B).

   NOTE: Install the sensor in the reverse order of removal with a new O-ring.

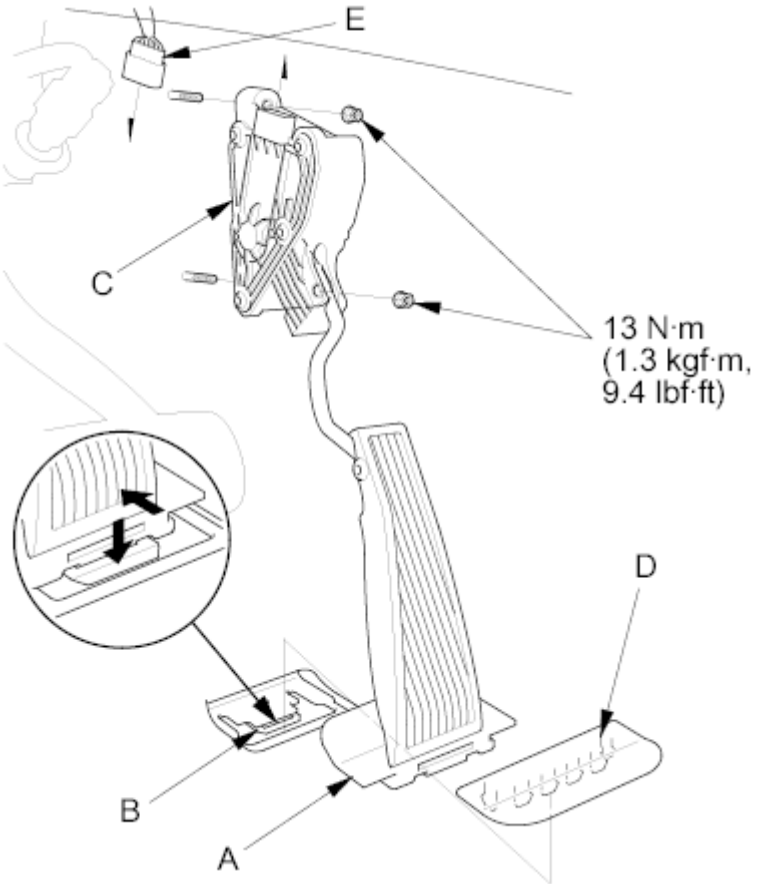

Fig. 9: Attaching EOP Sensor To Oil Pressure Gauge Adapter (With Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle for 2 minutes.
8. Do the VTEC TEST in the INSPECTION MENU with the HDS.
9. Check the oil pressure.

   Does the oil pressure increase to at least 30 kPa (4.3 psi, 0.3 kgf/cm^2)?

   YES - Replace the EOP sensor (see **EOP SENSOR REMOVAL/INSTALLATION**), then go to step 10.

   NO - Replace the rocker arm oil control valve (see **EOP SENSOR REMOVAL/INSTALLATION**), then go to step 10.

10. Turn the ignition switch OFF.
11. Reconnect all connectors.
12. Turn the ignition switch ON (II).
13. Reset the ECM/PCM with the HDS.
14. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
15. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 167°F (75°C)

- A/T in D position (M/T in 3rd gear)
- ENGINE SPEED at 1,100-3,300 rpm

16. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2646 indicated?

    YES - Check for poor connections or loose terminals at the rocker arm oil control solenoid, the EOP sensor, and the ECM/PCM, then go to step 1.

    NO - Go to step 17.

17. Monitor the OBD STATUS for DTC P2646 in the DTCs MENU with the HDS.

    Does the screen Indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 16, go to the indicated DTCs troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the rocker arm oil control solenoid, the EOP sensor, and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 15.

DTC P2647: VTEC SYSTEM STUCK ON

Special Tools Required

- Pressure gauge adapter 07NAJ-P07010A
- A/T low pressure gauge w/panel 07406-0070301
- A/T pressure hose 07406-0020201
- A/T pressure hose, 2,210 mm 07MAJ-PY4011A
- A/T pressure adapter 07MAJ-PY40120
- Oil pressure hose 07ZAJ-S5AA200

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Check the engine oil level.

   Is the engine oil level OK?

   YES - Go to step 2.

   NO - Adjust the engine oil to the proper level, then go to step 12.

2. Turn the ignition switch ON (II).
3. Clear the DTC with the HDS.

4. Do the VTEC TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EOP sensor, the rocker arm oil control solenoid, and the ECM/PCM.

   NO - Go to step 5.

5. Turn the ignition switch OFF.
6. Remove the EOP sensor (A), install the special tools as shown, then install the EOP sensor in the oil pressure gauge adapter (B).

   NOTE: Install the sensor in the reverse order of removal with a new O-ring.

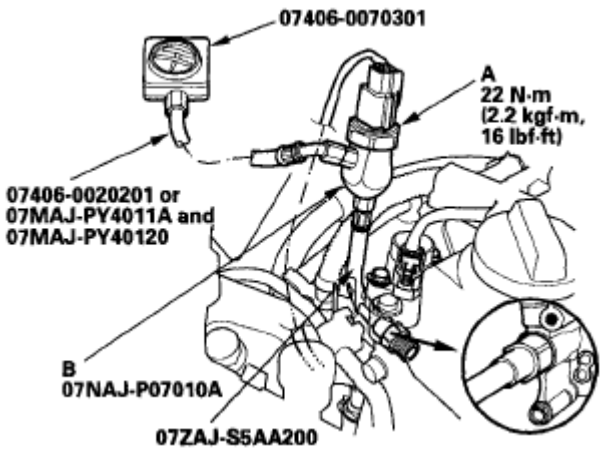

Fig. 10: Installing EOP Sensor In Oil Pressure Gauge Adapter (With Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle for 2 minutes.
8. Do the VTEC TEST in the INSPECTION MENU with the HDS.
9. Check the oil pressure.

   Does the oil pressure increase to 392 kPa (56.9psi, 4.0 kgf/cm^2)?

   YES - Replace the EOP sensor (see **EOP SENSOR REMOVAL/INSTALLATION**), then go to step 10.

   NO - Replace the rocker arm oil control valve (see **EOP SENSOR REMOVAL/INSTALLATION**), then go to step 10.

10. Turn the ignition switch OFF.
11. Reconnect all connectors.
12. Turn the ignition switch ON (II).
13. Reset the ECM/PCM with the HDS.

14. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
15. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle for 2 minutes.
16. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2647 indicated?

    YES - Check for poor connections or loose terminals at the rocker arm oil control solenoid, the EOP sensor, and the ECM/PCM, then go to step 1.

    NO - Go to step 17.

17. Monitor the OBD STATUS for DTC P2647 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 16, go to the indicated DTCs troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the rocker arm oil control solenoid, the EOP sensor, and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 15.

DTC P2648: ROCKER ARM OIL CONTROL SOLENOID CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Do the VTEC TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the rocker arm oil control solenoid and the ECM/PCM.

   NO - Go to step 4.

4. Turn the ignition switch OFF.
5. Disconnect the rocker arm oil control solenoid 2P connector.
6. At the solenoid side, measure resistance between rocker arm oil control solenoid 2P connector terminals No. 1 and No. 2.

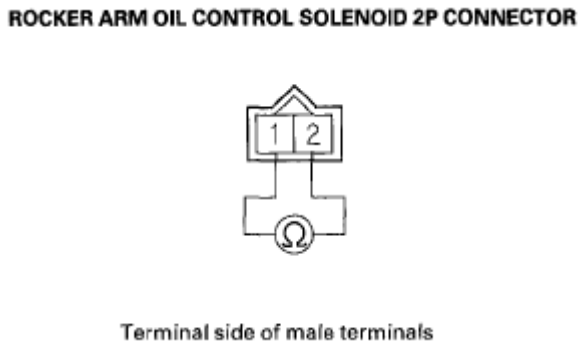

Fig. 11: Measuring Resistance Between Rocker Arm Oil Control Solenoid 2P Connector Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 14- 30 ohms at room temperature?

YES -Go to step 7.

NO -Go to step 10.

7. Jump the SCS line with the HDS.
8. Disconnect ECM/PCM connector B (44P).
9. Check for continuity between ECM/PCM connector terminal B34 and body ground.

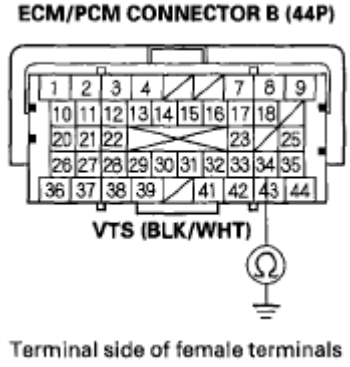

Fig. 12: Checking Continuity Between ECM/PCM Connector Terminal B34 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (B34) and the rocker arm oil control solenoid, then go to step 11.

NO - Go to step 18.

10. Replace the rocker arm oil control valve (see **EOP SENSOR REMOVAL/INSTALLATION**).
11. Reconnect all connectors.
12. Turn the ignition switch ON (II).
13. Reset the ECM/PCM with the HDS.

14. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
15. Do the VTEC TEST in the INSPECTION MENU with the HDS.
16. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2648 indicated?

    YES - Check for poor connections or loose terminals at the rocker arm oil control solenoid and the ECM/PCM, then go to step 1.

    NO - Go to step 17.

17. Monitor the OBD STATUS for DTC P2648 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 16, go to the indicated DTCs troubleshooting.

    NO - If the screen indicates FAILED, go to step 1. If the screen indicates NOT COMPLETED, go to step 15.

18. Reconnect all connectors.
19. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
20. Do the VTEC TEST in the INSPECTION MENU with the HDS.
21. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2648 indicated?

    YES - Check for poor connections or loose terminals at the rocker arm oil control solenoid and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 20. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 22.

22. Monitor the OBD STATUS for DTC P2648 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 21, go to the indicated DTCs troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the rocker arm oil control solenoid and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 20. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, go to step 20.

DTC P2649: ROCKER ARM OIL CONTROL SOLENOID CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2649 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the rocker arm oil control solenoid and the ECM/PCM.

5. Turn the ignition switch OFF.
6. Disconnect the rocker arm oil control solenoid 2P connector.
7. At the solenoid side, measure resistance between rocker arm oil control solenoid 2P connector terminals No. 1 and No. 2.

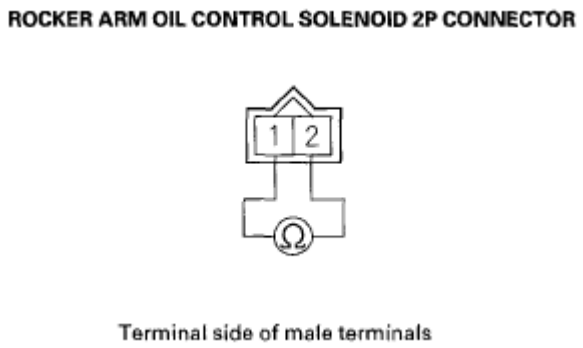

Fig. 13: Measuring Resistance Between Rocker Arm Oil Control Solenoid 2P Connector Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there 14-30 ohms, at room temperature?

   YES - Go to step 8.

   NO - Go to step 11.

8. Check for continuity between rocker arm oil control solenoid 2P connector terminal No. 2 and body ground.

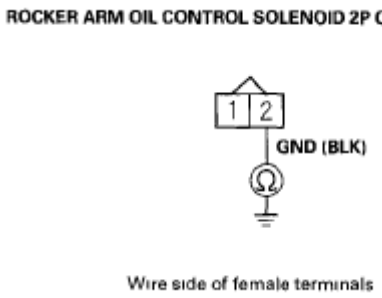

Fig. 14: Checking Continuity Between Rocker Arm Oil Control Solenoid Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 9.

NO - Repair open in the wire between the rocker arm oil control solenoid and G101; A/T model (see **CONNECTOR TO HARNESS INDEX**), M/T model (see **CONNECTOR TO HARNESS INDEX**), then go to step 13.

9. Jump the SCS line with the HDS.
10. Disconnect ECM/PCM connector B (44P).
11. Check for continuity between ECM/PCM connector terminal B34 and rocker arm oil control solenoid 2P connector terminal No. 1.

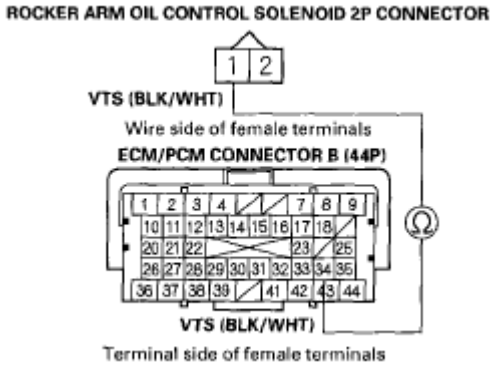

Fig. 15: Checking Continuity Between ECM/PCM Connector And Rocker Arm Oil Control Solenoid 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 19.

NO - Repair open in the wire between the ECM/PCM (B34) and the rocker arm oil control solenoid, then go to step 13.

12. Replace the rocker arm oil control valve (see **EOP SENSOR REMOVAL/INSTALLATION**).
13. Reconnect all connectors.

14. Turn the ignition switch ON (II).
15. Reset the ECM/PCM with the HDS.
16. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
17. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2649 indicated?

    YES - Check for poor connections or loose terminals at the rocker arm oil control solenoid and the ECM/PCM, then go to step 1.

    NO - Go to step 18.

18. Monitor the OBD STATUS for DTC P2649 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 17, go to the indicated DTCs troubleshooting.

    NO - If the screen indicates FAILED, go to step 1 and recheck. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

19. Reconnect all connectors.
20. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
21. Start the engine, and let it idle.
22. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2649 indicated?

    YES - Check for poor connections or loose terminals at the rocker arm oil control solenoid and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 21. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 23.

23. Monitor the OBD STATUS for DTC P2649 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 21, go to the indicated DTCs troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the rocker arm oil control solenoid and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 21. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes

on.

ROCKER ARM OIL CONTROL VALVE REMOVAL/INSTALLATION

1. Remove the cowl cover and under-cowl panel (see **COWL COVER REPLACEMENT**).
2. Disconnect the rocker arm oil control valve connector (A) and the EOP sensor connector (B).

DTC TROUBLESHOOTING

DTC P0010: VTC OIL CONTROL SOLENOID VALVE MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
4. Do the VTC TEST in the INSPECTION MENU with the HDS.

5. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0010 indicated?

   YES - Go to step 6.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the VTC oil control solenoid valve and the ECM.

6. Turn the ignition switch OFF.
7. Disconnect the VTC oil control solenoid valve 2P connector.
8. At the solenoid valve side, measure resistance between VTC oil control solenoid valve 2P connector terminals No. 1 and No. 2.

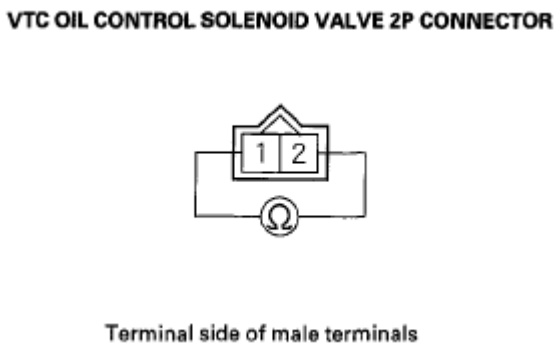

Fig. 2: Measuring Resistance Between VTC Oil Control Solenoid Valve 2P Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 6.75-8.25 ohms at room temperature?

YES - Go to step 9.

NO - Go to step 14.

9. Check for continuity between VTC oil control solenoid valve 2P connector terminal No. 1 and body ground.

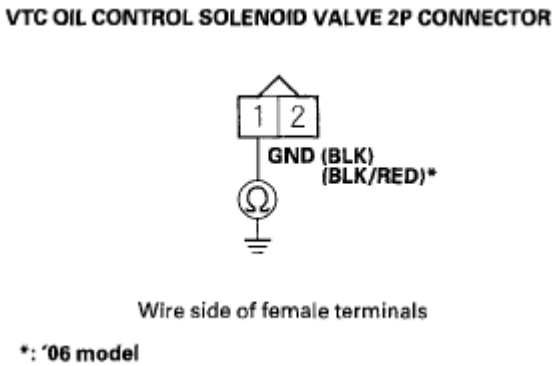

Fig. 3: Checking Continuity Between VTC Oil Control Solenoid Valve 2P Terminal No. 1 And

Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Repair open in the wire between the VTC oil control solenoid valve and G101 (see **CONNECTOR TO HARNESS INDEX**), then go to step 15.

10. Jump the SCS line with the HDS.
11. Disconnect ECM connector C (44P).
12. Check for continuity between ECM connector terminal C23 and body ground.

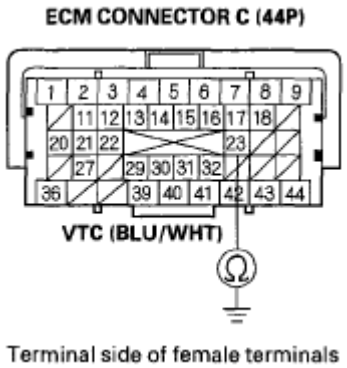

Fig. 4: Checking Continuity Between ECM Connector Terminal C23 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM (C23) and the VTC oil control solenoid valve, then go to step 15.

NO - Go to step 13.

13. Check for continuity between VTC oil control solenoid valve 2P connector terminal No. 2 and ECM connector terminal C23.

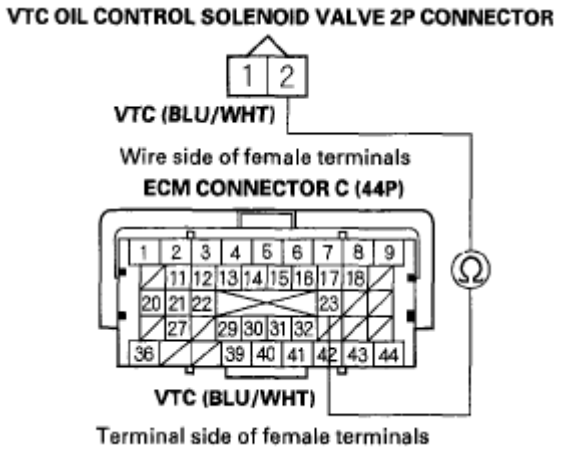

Fig. 5: Checking Continuity Between VTC Oil Control Solenoid Valve 2P Connector Terminal No. 2 And ECM Connector Terminal C23
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 22.

NO - Repair open in the wire between the ECM (C23) and the VTC oil control solenoid valve, then go to step 15.

14. Replace the VTC oil control solenoid valve (see **VTC OIL CONTROL SOLENOID VALVE REMOVAL/TEST/INSTALLATION**).
15. Reconnect all connectors.
16. Turn the ignition switch ON (II).
17. Reset the ECM with the HDS.
18. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
19. Do the VTC TEST in the INSPECTION MENU with the HDS.
20. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0010 indicated?

YES - Check for poor connections or loose terminals at the VTC oil control solenoid valve and the ECM, then go to step 1.

NO - Go to step 21.

21. Monitor the OBD STATUS for DTC P0010 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 20, go to the indicated DTCs troubleshooting.

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the VTC oil control solenoid valve and the ECM, then go to step 1. If the screen indicates NOT COMPLETED, go

to step 19.

22. Reconnect all connectors.
23. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
24. Do the VTC TEST in the INSPECTION MENU with the HDS.
25. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0010 indicated?

    YES - Check for poor connections or loose terminals at the VTC oil control solenoid valve and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 24. If the ECM was substituted, go to step 1.

    NO - Go to step 26.

26. Monitor the OBD STATUS for DTC P0010 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 25, go to the indicated DTCs troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the VTC oil control solenoid valve and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 24. If the ECM was substituted, go to step 1. If the screen indicates NOT COMPLETED, go to step 24.

DTC P0011: VTC SYSTEM MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine.
4. Watch the low oil pressure indicator with the engine running.

   Is the low oil pressure indicator on?

   YES - Check the oil pressure (see **OIL PRESSURE SWITCH TEST**), then go to step 15.

   NO - Go to step 5.

5. Do the VTC TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

YES - Go to step 6.

NO - Go to step 9.

6. Test-drive at a steady speed between 19-38 mph (30-60 km/h) for 10 minutes.
7. Check the VTC STATUS in the DATA LIST with the HDS.

   Does it indicate ON?

   YES - Go to step 8.

   NO - Go to step 6 and recheck.

8. Monitor the OBD STATUS for DTC P0011 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 9.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the screen indicates NOT COMPLETED, go to step 5 and recheck.

9. Turn the ignition switch OFF.
10. Remove the auto-tensioner (see **DRIVE BELT AUTO-TENSIONER REMOVAL/INSTALLATION**).
11. Remove the VTC strainer (A), and check it for clogging.

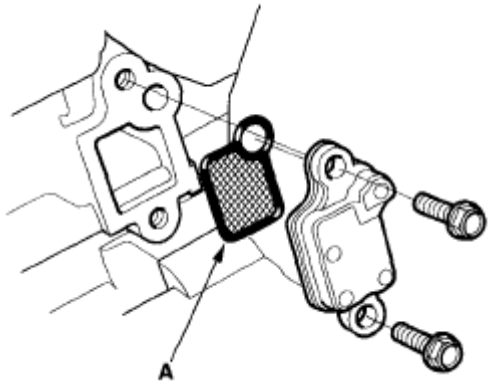

Fig. 6: Removing VTC Strainer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the strainer OK?

YES - Go to step 12.

NO - Clean the VTC strainer, replace the engine oil filter and the engine oil, then go to step 14.

12. Test the VTC oil control solenoid valve (see **VTC OIL CONTROL SOLENOID VALVE REMOVAL/TEST/INSTALLATION**).

Is the VTC oil control solenoid valve OK?

YES - Go to step 13.

NO - Replace the VTC oil control solenoid valve (see **VTC OIL CONTROL SOLENOID VALVE REMOVAL/TEST/INSTALLATION**), then go to step 14.

13. Inspect the VTC actuator (see **VTC ACTUATOR INSPECTION**).

    Is the VTC actuator OK?

    YES - Check the VTC system oil passages, then go to step 14.

    NO - Replace the VTC actuator (see **VTC ACTUATOR, EXHAUST CAMSHAFT SPROCKET REPLACEMENT**), then go to step 14.

14. Turn the ignition switch ON (II).
15. Reset the ECM with the HDS.
16. Clear the CKP pattern with the HDS.
17. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
18. Do the CKP pattern learn procedure (see **CRANK (CKP) PATTERN CLEAR/CRANK (CKP) PATTERN LEARN**).
19. Do the VTC TEST in the INSPECTION MENU with the HDS.
20. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0011 indicated?

    YES - Check for poor connections or loose terminals at the VTC oil control solenoid valve and the ECM, then go to step 1.

    NO - Go to step 21.

21. Monitor the OBD STATUS for DTC P0011 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 20, go to the indicated DTCs troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the VTC oil control solenoid valve and the ECM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 19.

DTC P0340: CMP SENSOR A NO SIGNAL

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0340 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at CMP sensor A and the ECM.

5. Turn the ignition switch OFF.
6. Disconnect the CMP sensor A 3P connector.
7. Turn the ignition switch ON (II).
8. Measure voltage between CMP sensor A 3P connector terminal No. 3 and body ground.

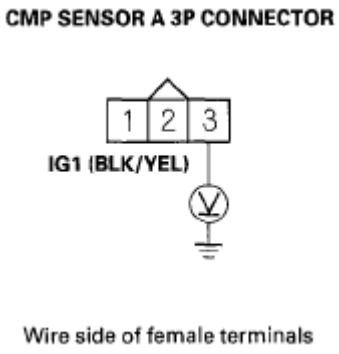

Fig. 7: Measuring Voltage Between CMP Sensor A 3P Connector Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 9.

NO - Repair open in the wire between CMP sensor A and the No. 3 ALTERNATOR (10 A) fuse, then go to step 18.

9. Measure voltage between CMP sensor A 3P connector terminal No. 1 and body ground.

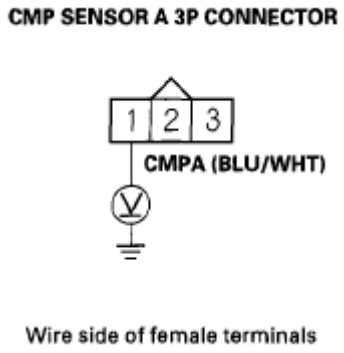

Fig. 8: Measuring Voltage Between CMP Sensor A 3P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 10.

NO - Go to step 11.

10. Measure voltage between CMP sensor A 3P connector terminals No. 2 and No. 3.

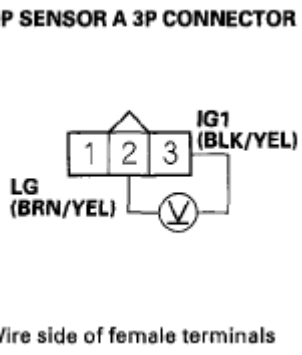

Fig. 9: Measuring Voltage Between CMP Sensor A 3P Connector Terminals No. 2 And No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 16.

NO - Repair open in the wire between CMP sensor A and G101 (see), then go to step 18.

11. Turn the ignition switch OFF.
12. Jump the SCS line with the HDS.
13. Disconnect ECM connector C (44P).
14. Check for continuity between ECM connector terminal C41 and body ground.

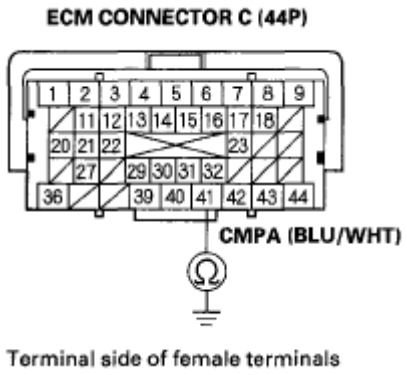

Fig. 10: Checking Continuity Between ECM Connector Terminal C41 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM (C41) and CMP sensor A, then go to step 18.

NO - Go to step 15.

15. Check for continuity between CMP sensor A 3P connector terminal No. 1 and ECM connector terminal C41.

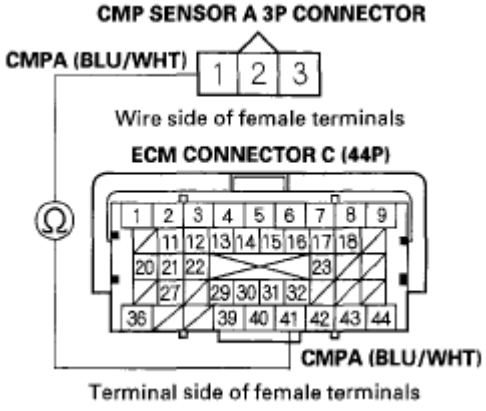

Fig. 11: Checking Continuity Between CMP Sensor A 3P Terminal No. 1 And ECM Terminal C41
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 23.

NO - Repair open in the wire between the ECM (C41) and CMP sensor A, then go to step 18.

16. Turn the ignition switch OFF.
17. Replace CMP sensor A (see **CMP SENSOR A REPLACEMENT**).
18. Reconnect all connectors.
19. Turn the ignition switch ON (II).

20. Reset the ECM with the HDS.
21. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
22. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0340 indicated?

    YES - Check for poor connections or loose terminals at CMP sensor A and the ECM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

23. Reconnect all connectors.
24. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
25. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0340 indicated?

    YES - Check for poor connections or loose terminals at CMP sensor A and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P0341: CMP SENSOR A AND CKP SENSOR INCORRECT PHASE DETECTED

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Test-drive at a steady speed between 19-38 mph (30-60 km/h) for 10 minutes.
4. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0341 indicated?

    YES - Go to step 9.

    NO - Go to step 5.

5. Do the VTC TEST in the INSPECTION MENU with the HDS.

    Is the result OK?

YES - Go to step 6.

NO - Go to step 9.

6. Test-drive at a steady speed between 19-38 mph (30-60 km/h) for 10 minutes.
7. Check the VTC STATUS in the DATA LIST with the HDS.

   Does it indicate ON?

   YES - Go to step 8.

   NO - Go to step 6 and recheck.

8. Monitor the OBD STATUS for DTC P0341 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 9.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the VTC oil control solenoid valve and the ECM. If the screen indicates NOT COMPLETED, go to step 6 and recheck.

9. Turn the ignition switch OFF.
10. Test the VTC oil control solenoid valve (see **VTC OIL CONTROL SOLENOID VALVE REMOVAL/TEST/INSTALLATION**).

    Is the VTC oil control solenoid valve OK?

    YES - Go to step 11.

    NO - Replace the VTC oil control solenoid valve (see **VTC OIL CONTROL SOLENOID VALVE REMOVAL/TEST/INSTALLATION**), then go to step 14.

11. Check the camshaft timing (see step 6 in **CAM CHAIN REMOVAL**).

    Is the camshaft timing OK?

    YES - Go to step 12.

    NO - Reset the camshaft timing (see step 6 in **CAM CHAIN REMOVAL**), then go to step 14.

12. Check for damage or stretch at the cam chain (see **CAM CHAIN INSPECTION**).

    Is the cam chain damaged?

    YES - Replace the cam chain and auto-tensioner (see **AUTO-TENSIONER REMOVAL AND INSTALLATION**), then go to step 14.

    NO - Go to step 13.

13. Inspect the VTC actuator (see **VTC ACTUATOR INSPECTION**).

    Is the actuator OK?

    YES - Go to step 14.

    NO - Replace the VTC actuator (see **VTC ACTUATOR, EXHAUST CAMSHAFT SPROCKET REPLACEMENT**), then go to step 14.

14. Turn the ignition switch ON (II).
15. Reset the ECM with the HDS.
16. Clear the CKP pattern with the HDS.
17. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
18. Do the CKP pattern learn procedure (see **CRANK (CKP) PATTERN CLEAR/CRANK (CKP) PATTERN LEARN**).
19. Test-drive at a steady speed between 19-38 mph (30-60 km/h) for 10 minutes.
20. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0341 indicated?

    YES - Check for poor connections or loose terminals at the VTC oil control solenoid valve and the ECM, then go to step 1.

    NO - Go to step 21.

21. Monitor the OBD STATUS for DTC P0341 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 20, go to the indicated DTCs troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the VTC oil control solenoid valve and the ECM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 19.

DTC P0344: CMP SENSOR A CIRCUIT INTERMITTENT INTERRUPTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle for 10 seconds.
4. Check the CMP NOISE A count in the DATA LIST with the HDS.

Are 0 counts indicated?

YES - Go to step 7.

NO - Go to step 5.

5. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
   - ENGINE SPEED
   - VSS
6. Check the CMP NOISE A count in the DATA LIST with the HDS.

   Are 0 counts indicated?

   YES - Go to step 7.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at CMP sensor A and the ECM.

7. Check for poor or loose connections and terminals at these locations:
   - CMP sensor A
   - ECM
   - Engine ground
   - Body ground

   Are the connections and terminals OK?

   YES - Go to step 8.

   NO - Repair the connectors or terminals, then go to step 11.

8. Check for damage on the CMP sensor A pulser plate (see **CMP PULSE PLATE A REPLACEMENT**),

   Is the pulser plate damaged?

   YES - Replace the CMP sensor A pulser plate (see **CMP PULSE PLATE A REPLACEMENT**), then go to step 11.

   NO - Go to step 9.

9. Turn the ignition switch OFF.
10. Replace CMP sensor A (see **CMP SENSOR A REPLACEMENT**).
11. Turn the ignition switch ON (II).
12. Reset the ECM with the HDS.
13. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
14. Start the engine, and let it idle for 10 seconds.
15. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0344 indicated?

YES - Check for poor connections or loose terminals at CMP sensor A and the ECM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P1009: VTC ADVANCE MALFUNCTION

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P0341 is stored at the same time as DTC P1009, troubleshoot DTC P1009 first, then recheck for DTC P0341.**

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine.
4. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P1009 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time.

5. Turn the ignition switch OFF.
6. Remove the auto-tensioner (see **DRIVE BELT AUTO-TENSIONER REMOVAL/INSTALLATION**).
7. Remove the VTC strainer (A), and check it for clogging.

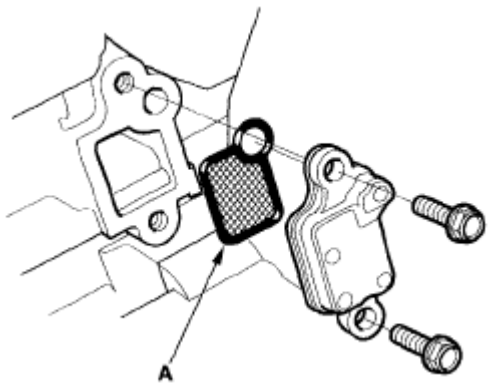

Fig. 12: Removing VTC Strainer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the strainer OK?

YES - Go to step 8.

NO - Clean the VTC strainer, replace the engine oil filter and the engine oil, then go to step 10.

8. Test the VTC oil control solenoid valve (see **VTC OIL CONTROL SOLENOID VALVE REMOVAL/TEST/INSTALLATION**).

   Is the valve OK?

   YES - Go to step 9.

   NO - Replace the VTC oil control solenoid valve (see **VTC OIL CONTROL SOLENOID VALVE REMOVAL/TEST/INSTALLATION**), then go to step 10.

9. Inspect the VTC actuator (see **VTC ACTUATOR INSPECTION**).

   Is the actuator OK?

   YES - Check the VTC system oil passages, then go to step 10.

   NO - Replace the VTC actuator (see **VTC ACTUATOR, EXHAUST CAMSHAFT SPROCKET REPLACEMENT**), then go to step 10.

10. Turn the ignition switch ON (II).
11. Reset the ECM with the HDS.
12. Clear the CKP pattern with the HDS.
13. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
14. Do the CKP pattern learn procedure (see **CRANK (CKP) PATTERN CLEAR/CRANK (CKP) PATTERN LEARN**).
15. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1009 indicated?

    YES - Check the oil passages at the VTC system, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P2646: ROCKER ARM OIL PRESSURE SWITCH CIRCUIT LOW VOLTAGE

Special Tools Required

- Pressure gauge adapter 07NAJ-P07010A
- A/T low pressure gauge w/panel 07406-0070301
- A/T pressure hose 07406-0020201
- A/T pressure hose, 2,210 mm 07MAJ-PY4011A
- A/T pressure adapter 07MAJ-PY40120
- Oil pressure hose 07ZAJ-S5AA200

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information {see GENERAL TROUBLESHOOTING INFORMATION).

1. Check the engine oil level.

   Is the level OK?

   YES - Go to step 2.

   NO - Adjust the engine oil to the proper level, then go to step 21.

2. Turn the ignition switch ON (II).
3. Clear the DTC with the HDS.
4. Do the VTEC TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the rocker arm oil pressure switch, the rocker arm oil control solenoid, and the ECM.

   NO - Go to step 5.

5. Turn the ignition switch OFF.
6. Disconnect the rocker arm oil pressure switch 2P connector.
7. Turn the ignition switch ON (II).
8. Check the VTEC PRES SW in the DATA LIST with the HDS.

   Is SWITCH ON indicated?

   YES - Go to step 16.

   NO - Go to step 9.

9. Turn the ignition switch OFF.
10. Remove the cowl cover and under-cowl panel (see **COWL COVER REPLACEMENT**).
11. Remove the rocker arm oil pressure switch (A), and install the special tools as shown, then install the rocker arm oil pressure switch in the oil pressure gauge attachment (B).

NOTE: Install the switch in the reverse order of removal with a new O-ring.

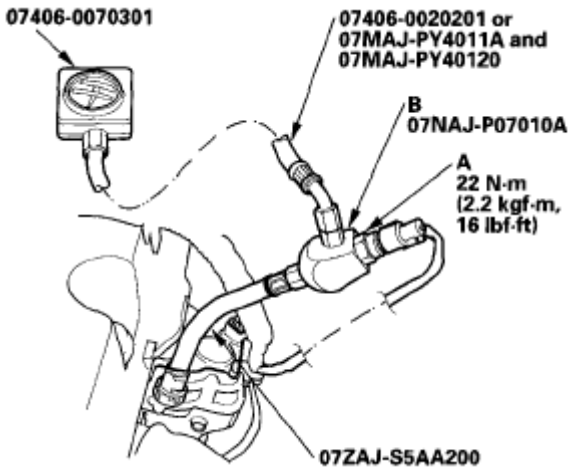

Fig. 13: Removing Rocker Arm Oil Pressure Switch (With Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Reconnect the rocker arm oil pressure switch 2P connector.
13. Start the engine.
14. Do the VTEC TEST in the INSPECTION MENU with the HDS.
15. Check the oil pressure.

    Does the oil pressure increase to at least 392 kPa (4.0 kgf/cm^2 , 56.9psi)?

    YES - Replace the rocker arm oil pressure switch (see **ROCKER ARM OIL CONTROL VALVE REMOVAL/INSTALLATION**), then go to step 20.

    NO - Inspect the VTEC system. If it is OK, replace the rocker arm oil control valve (see **ROCKER ARM OIL CONTROL VALVE REMOVAL/INSTALLATION**), then go to step 20.

16. Turn the ignition switch OFF.
17. Jump the SCS line with the HDS.
18. Disconnect ECM connector C (44P).
19. Check for continuity between ECM connector terminal C22 and body ground.

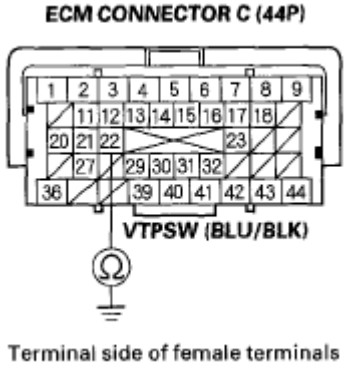

Fig. 14: Checking Continuity Between ECM Connector Terminal C22 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM (C22) and the rocker arm oil pressure switch, then go to step 19.

NO - Go to step 27.

20. Reconnect all connectors.
21. Turn the ignition switch ON (II).
22. Reset the ECM with the HDS.
23. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
24. Do the VTEC TEST in the INSPECTION MENU with the HDS.
25. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P2646 indicated?

YES - Check for poor connections or loose terminals at the rocker arm oil pressure switch, the rocker arm oil control solenoid and the ECM, then go step 1.

NO - Go to step 25.

26. Monitor the OBD STATUS for DTC P2646 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 25, go to the indicated DTCs troubleshooting.

NO - If the screen indicates FAILED, go to step 1 and recheck. If the screen indicates NOT COMPLETED, go to step 24.

27. Reconnect all connectors.
28. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
29. Do the VTEC TEST in the INSPECTION MENU with the HDS.
30. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P2646 indicated?

YES - Check for poor connections or loose terminals at the rocker arm oil pressure switch, the rocker arm oil control solenoid and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 29. If the ECM was substituted, go to step 1.

NO - Go to step 30.

31. Monitor the OBD STATUS for DTC P2646 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 30, go to the indicated DTCs troubleshooting.

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the rocker arm oil pressure switch, the rocker arm oil control solenoid, and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 29. If the ECM was substituted, go to step 1. If the screen indicates NOT COMPLETED, go to step 29.

DTC P2647: ROCKER ARM OIL PRESSURE SWITCH CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Check the engine oil level.

   Is the level OK?

   YES - Go to step 2.

   NO - Adjust the engine oil to the proper level, then go to step 17.

2. Turn the ignition switch ON (II).
3. Clear the DTC with the HDS.
4. Do the VTEC TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the rocker arm oil pressure switch, the rocker arm oil control solenoid, and the ECM.

   NO - Go to step 5.

5. Check the result of step 4.
   - VTEC Switch Failure
   - VTEC Switch Open
   - VTEC Switch SIG Line Open
   - VTEC Switch GND Line Open

   Is the test result any of above?

   YES - Go to step 6.

   NO - Check for poor connections or loose terminals at the rocker arm oil pressure switch. If it is OK, replace the rocker arm oil control valve (see **ROCKER ARM OIL CONTROL VALVE REMOVAL/INSTALLATION**), then, go to step 15.

6. Turn the ignition switch OFF.

7. Disconnect the rocker arm oil pressure switch 2P connector.
8. At the rocker arm oil pressure switch side, check for continuity between rocker arm oil pressure switch 2P connector terminals No. 1 and No. 2.

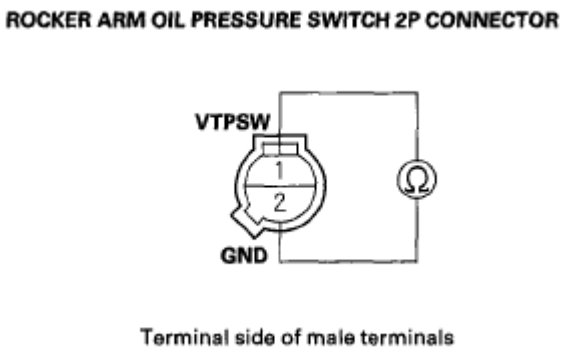

Fig. 15: Checking Continuity Between Rocker Arm Oil Pressure Switch 2P Connector Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 9.

NO - Replace the rocker arm oil pressure switch (see **ROCKER ARM OIL CONTROL VALVE REMOVAL/INSTALLATION**), then go to step 16.

9. Turn the ignition switch ON (II).
10. Measure voltage between rocker arm oil pressure switch 2P connector terminal No. 1 and body ground.

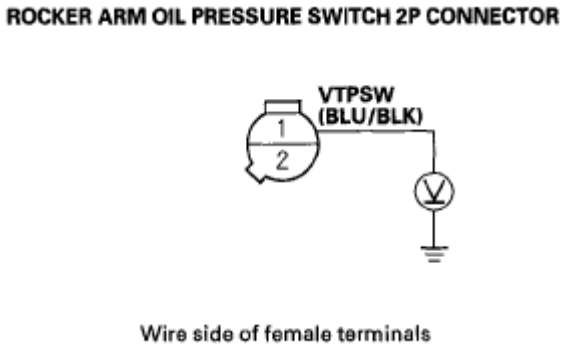

Fig. 16: Measuring Voltage Between Rocker Arm Oil Pressure Switch 2P Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Repair open in the wire between the rocker arm oil pressure switch and G101 (see **CONNECTOR TO HARNESS INDEX**), then go to step 15.

NO - Go to step 11.

11. Turn the ignition switch OFF.
12. Jump the SCS line with the HDS.
13. Disconnect ECM connector C (44P).
14. Check for continuity between rocker arm oil pressure switch 2P connector terminal No. 1 and ECM connector terminal C22.

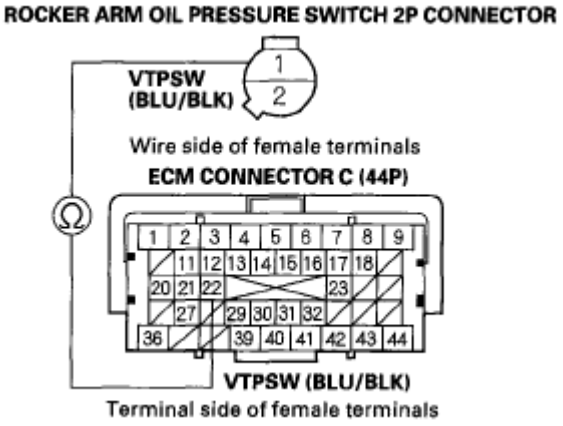

Fig. 17: Checking Continuity Between Rocker Arm Oil Pressure Switch 2P Terminal No. 1 And ECM Terminal C22
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 22.

NO - Repair open in the wire between the ECM (C22) and the rocker arm oil pressure switch, then go to step 22.

15. Turn the ignition switch OFF.
16. Reconnect all connectors.
17. Turn the ignition switch ON (II).
18. Reset the ECM with the HDS.
19. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
20. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P2647 indicated?

YES - Check for poor connections or loose terminals at the rocker arm oil pressure switch, the rocker arm oil control solenoid and the ECM, then go to step 1.

NO - Go to step 21.

21. Monitor the OBD STATUS for DTC P2647 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 20, go to the indicated DTCs troubleshooting.

NO - If the screen indicates FAILED, go to step 1 and recheck. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

22. Reconnect all connectors.
23. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
24. Start the engine, and let it idle.
25. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2647 indicated?

    YES - Check for poor connections or loose terminals at the rocker arm oil pressure switch, the rocker arm oil control solenoid and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 24. If the ECM was substituted, go to step 1.

    NO - Go to step 26.

26. Monitor the OBD STATUS for DTC P2647 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 25, go to the indicated DTCs troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the rocker arm oil pressure switch and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 24. If the ECM was substituted, go to step 1. If the screen indicates (MOT COMPLETED, keep idling until a result comes on.

DTC P2648: ROCKER ARM OIL CONTROL SOLENOID CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Do the VTEC TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the rocker arm oil control solenoid and the ECM.

   NO - Go to step 4.

4. Turn the ignition switch OFF.
5. Disconnect the rocker arm oil control solenoid 2P connector.
6. At the solenoid side, measure resistance between rocker arm oil control solenoid 2P connector terminals No. 1 and No. 2.

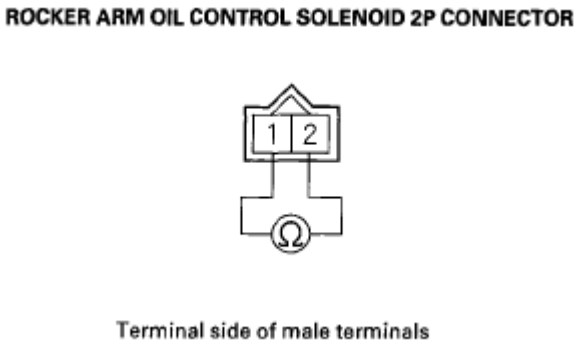

Fig. 18: Measuring Resistance Between Rocker Arm Oil Control Solenoid 2P Connector Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 14-30 ohms, at room temperature?

YES - Go to step 7.

NO - Go to step 10.

7. Jump the SCS line with the HDS.
8. Disconnect ECM connector B (44P).
9. Check for continuity between ECM connector terminal B34 and body ground.

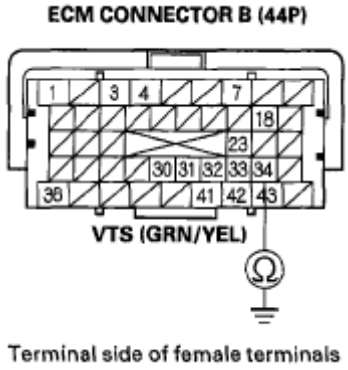

Fig. 19: Checking Continuity Between ECM Connector Terminal B34 And Body Ground

Is there continuity?

YES - Repair short in the wire between the ECM (B34) and the rocker arm oil control solenoid, then go to step 11.

NO - Go to step 18.

10. Replace the rocker arm oil control valve (see **ROCKER ARM OIL CONTROL VALVE REMOVAL/INSTALLATION**).
11. Reconnect all connectors.
12. Turn the ignition switch ON (II).
13. Reset the ECM with the HDS.
14. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
15. Do the VTEC TEST in the INSPECTION MENU with the HDS.
16. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2648 indicated?

    YES - Check for poor connections or loose terminals at the rocker arm oil control solenoid and the ECM, then go to step 1.

    NO - Go to step 17.

17. Monitor the OBD STATUS for DTC P2648 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 16, go to the indicated DTCs troubleshooting.

    NO - If the screen indicates FAILED, go to step 1 and recheck. If the screen indicates NOT COMPLETED, go to step 15.

18. Reconnect all connectors.
19. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
20. Do the VTEC TEST in the INSPECTION MENU with the HDS.
21. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2648 indicated?

    YES - Check for poor connections or loose terminals at the rocker arm oil control solenoid and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 20. If the ECM was substituted, go to step 1.

    NO - Go to step 22.

22. Monitor the OBD STATUS for DTC P2648 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 21, go to the indicated DTCs troubleshooting.

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the rocker arm oil control solenoid and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 20. If the ECM was substituted, go to step 1. If the screen indicates NOT COMPLETED, go to step 20.

DTC P2649: ROCKER ARM OIL CONTROL SOLENOID CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2649 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the rocker arm oil control solenoid and the ECM.

5. Turn the ignition switch OFF.
6. Disconnect the rocker arm oil control solenoid 2P connector.
7. At the solenoid side, measure resistance between rocker arm oil control solenoid 2P connector terminals No. 1 and No. 2.

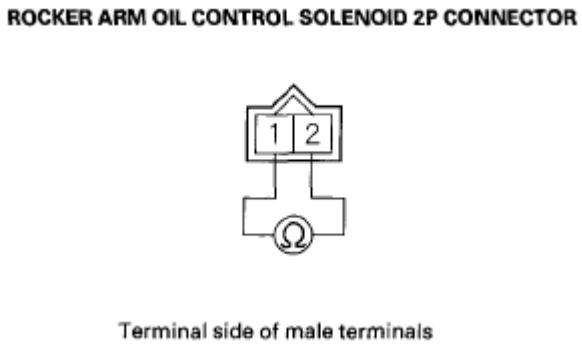

Fig. 20: Measuring Resistance Between Rocker Arm Oil Control Solenoid 2P Connector Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 14-30 ohms at room temperature?

YES - Go to step 8.

NO - Go to step 12.

8. Check for continuity between rocker arm oil control solenoid 2P connector terminal No. 1 and body ground.

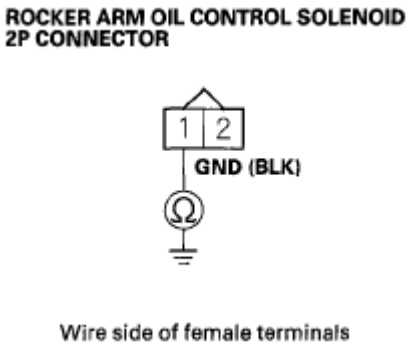

Fig. 21: Checking Continuity Between Rocker Arm Oil Control Solenoid 2P Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 9.

NO - Repair open in the wire between the rocker arm oil control solenoid and G101 (see **CONNECTOR TO HARNESS INDEX**), then go to step 13.

9. Jump the SCS line with the HDS.
10. Disconnect ECM connector B (44P).
11. Check for continuity between ECM connector terminal B34 and rocker arm oil control solenoid 2P connector terminal No. 2.

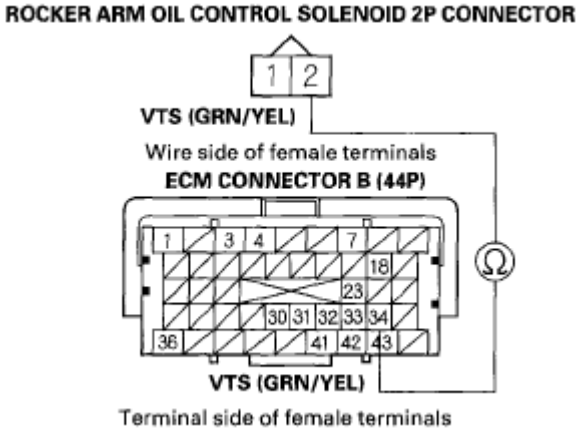

Fig. 22: Checking Continuity Between ECM Terminal B34 And Rocker Arm Oil Control Solenoid 2P Terminal No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 19.

NO - Repair open in the wire between the ECM (B34) and the rocker arm oil control solenoid, then go to step 13.

12. Replace the rocker arm oil control valve (see **ROCKER ARM OIL CONTROL VALVE REMOVAL/INSTALLATION**).
13. Reconnect all connectors.
14. Turn the ignition switch ON (II).
15. Reset the ECM with the HDS.
16. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
17. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2649 indicated?

    YES - Check for poor connections or loose terminals at the rocker arm oil control solenoid and the ECM, then go to step 1.

    NO - Go to step 18.

18. Monitor the OBD STATUS for DTC P2649 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 17, go to the indicated DTCs troubleshooting.

    NO - If the screen indicates FAILED, go to step 1 and recheck. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

19. Reconnect all connectors.
20. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
21. Start the engine, and let it idle.
22. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2649 indicated?

    YES - Check for poor connections or loose terminals at the rocker arm oil control solenoid and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 21. If the ECM was substituted, go to step 1.

    NO - Go to step 23.

23. Monitor the OBD STATUS for DTC P2649 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated

in step 22, go to the indicated DTCs troubleshooting.

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the rocker arm oil control solenoid and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 21. If the ECM was substituted, go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

VTC OIL CONTROL SOLENOID VALVE REMOVAL/TEST/INSTALLATION

1. Disconnect the VTC oil control solenoid valve 2P connector.
2. Remove the ground wire (A).

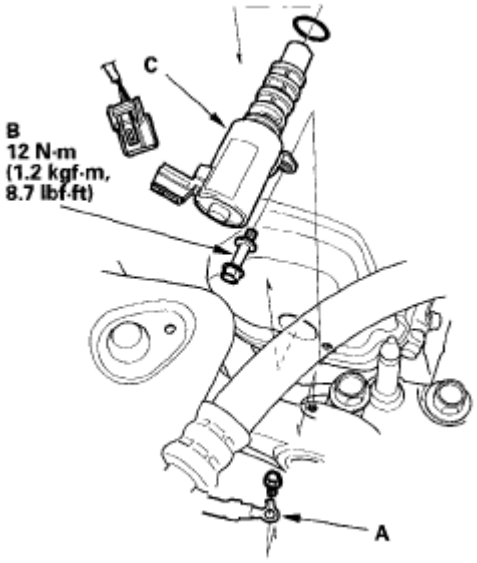

Fig. 23: Removing Ground Wire (With Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the bolt (B) and the VTC oil control solenoid valve (C).
4. Check the VTC oil control solenoid valve strainer for clogging. If the strainer is clogged, replace the VTC oil control solenoid valve.
5. Note the amount of valve opening by observing the position of the piston shoulder (A) through the valve retard drain port. If you see the shoulder of the piston, the valve is open and must be replaced.

Closed

8. Remove the VTC valve O-ring (A).

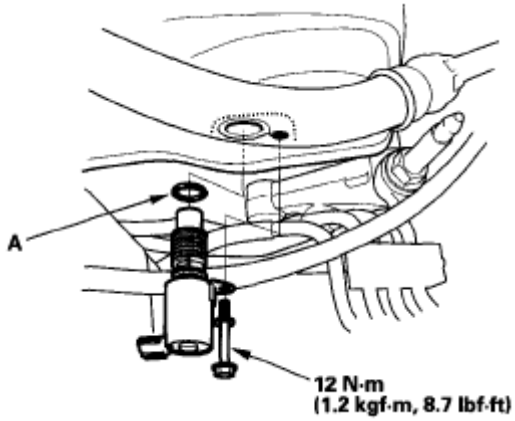

Fig. 27: Removing VTC Valve O-Ring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Coat a new O-ring (A) with engine oil, then install it on the valve.
10. Clean and dry the mating surface of the valve.
11. Install the valve.

NOTE: Do not install the valve while wearing cloth fibrous gloves. Be careful not to contaminate the cylinder head opening.

CMP SENSOR A REPLACEMENT

1. Remove the air cleaner (see **AIR CLEANER REMOVAL/INSTALLATION**).
2. Disconnect the CMP sensor A 3P connector (A).

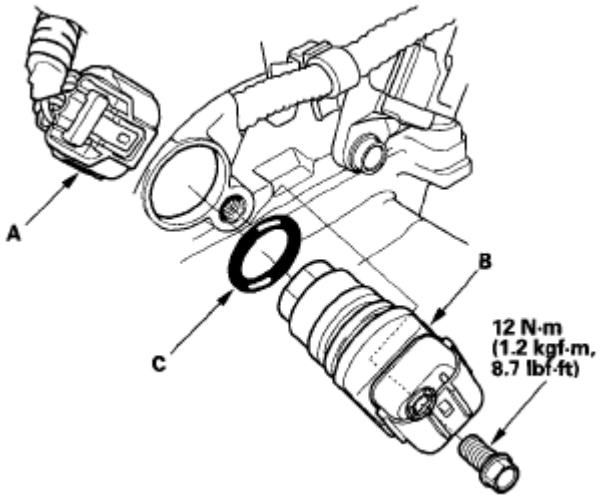

Fig. 28: Disconnecting CMP Sensor A 3P Connector (With Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove CMP sensor A (B) from the intake camshaft side of the cylinder head.
4. Install the parts in the reverse order of removal with a new O-ring (C).

ROCKER ARM OIL CONTROL VALVE REMOVAL/INSTALLATION

1. Remove the cowl cover and under-cowl panel (see **COWL COVER REPLACEMENT**).
2. Disconnect the rocker arm oil control valve connector (A) and the rocker arm oil pressure switch connector (B).

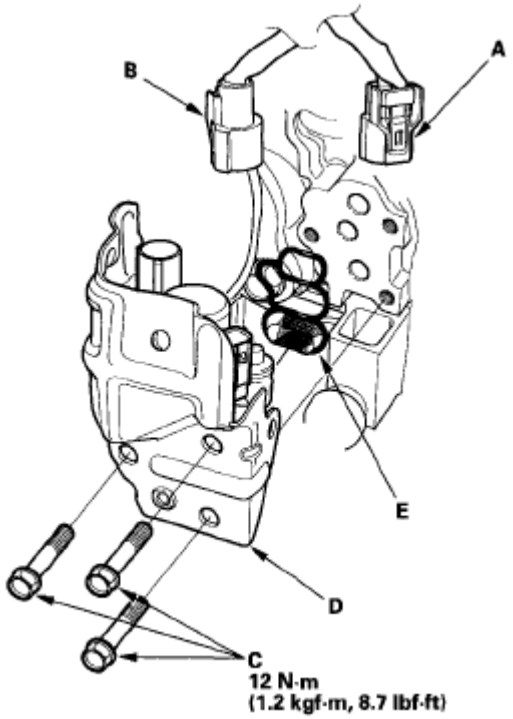

Fig. 29: Disconnecting Rocker Arm Oil Control Valve And Rocker Arm Oil Pressure Switch Connector

3. Remove the bolts (C).
4. Remove the rocker arm oil control valve (D).
5. Install the parts in the reverse order of removal with a new rocker arm oil control valve filter (E).

ROCKER ARM OIL PRESSURE SWITCH REMOVAL/INSTALLATION

1. Remove the rocker arm oil control valve (see **ROCKER ARM OIL CONTROL VALVE REMOVAL/INSTALLATION**).
2. Remove the cover (A).

3. Remove the rocker arm oil pressure switch (B).
4. Install the parts in the reverse order of removal with a new O-ring (C).

CABIN AIR FILTERS

Dust & Pollen Filter - Civic, Civic Hybrid, CR-V

REMOVAL & INSTALLATION

NOTE: Manufacturer's terminology for this filter is dust and pollen filter.

CABIN AIR FILTER

Removal & Installation

1. Open the glove box. Remove the glove box stop (B) on each side, then let the glove box hang down. See **Fig. 1**.

GENERAL TROUBLESHOOTING INFORMATION

HOW TO USE THE SELF-DIAGNOSTIC FUNCTION

The heater control panel has a self-diagnostic function for heating and ventilation system. To run the self-diagnostic function, do the following:

1. Turn the ignition switch to LOCK (0).
2. Press and hold the recirculation control and rear window defogger buttons, and turn the ignition switch ON (II).
3. Recirculation indicator turns on for 2 seconds, then self-diagnostic function begins.

NOTE:

- **The blower motor will run at any speed regardless of the dial positioning.**
- **In the case of multiple problems, the recirculation indicator will blink the lowest number DTC only.**
- **If no DTCs are found, the indicator will not blink.**

DETECTION ITEM REFERENCE

DTC (Recirculation Indicator Blinks)	Detection Item
1	An open in the air mix control motor circuit (see **DTC INDICATOR 1: AN OPEN IN THE AIR MIX CONTROL MOTOR CIRCUIT**)
2	A short in the air mix control motor circuit (see **DTC INDICATOR 2: A SHORT IN THE AIR MIX CONTROL MOTOR CIRCUIT**)
3	A problem in the air mix control linkage, door, or motor (see **DTC INDICATOR 3: A PROBLEM IN THE AIR MIX CONTROL**

	LINKAGE, DOOR, OR MOTOR)
4	An open or short in the mode control motor circuit (see **DTC INDICATOR 4: AN OPEN OR SHORT IN THE MODE CONTROL MOTOR CIRCUIT**)
5	A problem in the mode control linkage, doors, or motor (see **DTC INDICATOR 5: A PROBLEM IN THE MODE CONTROL LINKAGE, DOORS, OR MOTOR**)
6	A problem in the blower motor circuit (see **DTC INDICATOR 6: A PROBLEM IN THE BLOWER MOTOR CIRCUIT**)
7	Heater control panel internal error (see **DTC INDICATOR 7: HEATER CONTROL PANEL INTERNAL ERROR**)

Clear the DTCs

When the problem is repaired, DTCs will automatically clear.

DTC TROUBLESHOOTING

DTC INDICATOR 1: AN OPEN IN THE AIR MIX CONTROL MOTOR CIRCUIT

1. Clear the DTC (see **CLEAR THE DTCS**).
2. Turn the ignition switch to LOCK (0), and then ON (II).
3. Do the self-diagnostic with the heater control panel (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION**).

4. Check for DTCs.

   Is DTC 1 indicated?

   YES -Go to step 5.

   NO -Intermittent failure, check for loose wires or poor connections on the air mix control motor circuit.

5. Turn the ignition switch to LOCK (0).
6. Test the air mix control motor (see **AIR MIX CONTROL MOTOR TEST**).

   Is the air mix control motor OK?

   YES -Go to step 7.

   NO -Replace the air mix control motor (see **AIR MIX CONTROL MOTOR TEST**).

7. Disconnect the air mix control motor 7P connector.
8. Disconnect the heater control panel 24P connector.
9. Check for continuity between the following terminals of the heater control panel 24P connector and the air mix control motor 7P connector.

Is there continuity?

YES -Check for loose wires or poor connections at the heater control panel 24P connector and at the air mix control motor 7P connector. If the connections are good, substitute a known-good heater control panel and recheck. If the symptom/indication goes away, replace the original heater control panel.

NO -Repair any open in the wires between the heater control panel and the air mix control motor.

DTC INDICATOR 2: A SHORT IN THE AIR MIX CONTROL MOTOR CIRCUIT

1. Turn the ignition switch to LOCK (0), and then ON (II).
2. Do the self-diagnostic with the heater control panel (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION**).
3. Check for DTCs.

Is DTC 2 indicated?

YES -Go to step 5.

NO -Intermittent failure.

4. Turn the ignition switch to LOCK (0).
5. Test the air mix control motor (see **AIR MIX CONTROL MOTOR TEST**).

   Is the air mix control motor OK?

   YES -Go to step 7.

   NO -Replace the air mix control motor (see **AIR MIX CONTROL MOTOR TEST**).

6. Disconnect the air mix control motor 7P connector.
7. Disconnect the heater control panel 24P connector.
8. Check for continuity between body ground and the heater control panel 24P connector terminals No. 1, 13 and 18 individually.

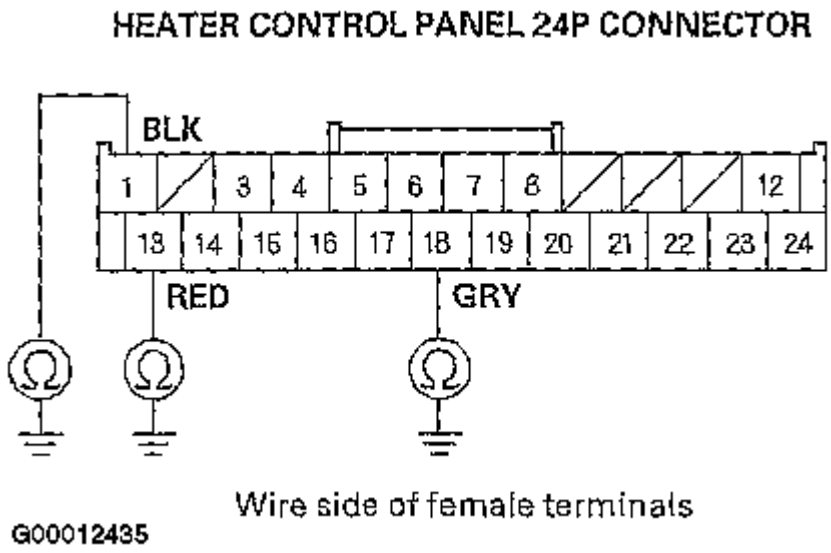

Fig. 8: Checking Continuity Between Ground & Heater Control Panel Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair any short to body ground in the wires between the heater control panel and the air mix control motor.

NO -Go to step 10.

9. Check for continuity between the heater control panel 24P connector terminals as follows.

TERMINALS REFERENCE

From terminal	To terminals
1	13,18
13	18

Is there continuity between any of the terminals?

YES -Repair the short in the wires.

NO -Go to step 11.

10. Turn the ignition switch ON (II), and check the same terminals for voltage to body ground. See **Fig. 8**.

    Is there battery voltage?

    YES -Repair any short to power in the wires between the heater control panel and the air mix control motor. This short may also damage the heater control panel. Repair the short to power before replacing the heater control panel.

    NO -Substitute a known-good heater control panel, and recheck. If the symptom/indication goes away, replace the original heater control panel.

DTC INDICATOR 3: A PROBLEM IN THE AIR MIX CONTROL LINKAGE, DOOR, OR MOTOR

1. Turn the ignition switch to LOCK (0), and then ON (II).
2. Do the self-diagnostic with the heater control panel (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION**).
3. Check for DTCs.

   Is DTC 3 indicated?

   YES -Go to step 5.

   NO -Intermittent failure.

4. Turn the ignition switch to LOCK (0).
5. Test the air mix control motor (see **AIR MIX CONTROL MOTOR TEST**).

   Is the air mix control motor OK?

   YES -Substitute a known-good heater control panel, and recheck. If the symptom/indication goes away, replace the original heater control panel.

   NO -Replace the air mix control motor (see **AIR MIX CONTROL MOTOR TEST**), or repair the air mix control linkage or door.

6. Disconnect the air mix control motor 7P connector.
7. Disconnect the heater control motor 24P connector.
8. Check for continuity between the following terminals of the heater control panel 24P connector and the air mix control motor 7P connector.

Is there continuity?

YES -Repair short to body ground in the wires between the heater control panel and the air mix control motor.

NO -Substitute a known-good heater control panel, and recheck. If the symptom/indication goes away, replace the original heater control panel.

DTC INDICATOR 4: AN OPEN OR SHORT IN THE MODE CONTROL MOTOR CIRCUIT

1. Turn the ignition switch to LOCK (0), and then ON (II).
2. Do the self-diagnostic with the heater control panel (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION**).
3. Check for DTCs.

   Is DTC 4 indicated?

   YES -Go to step 5.

   NO -Intermittent failure, check for loose wires or poor connections on the mode control motor circuit.

4. Turn the ignition switch to LOCK (0).

5. Test the mode control motor (see **MODE CONTROL MOTOR TEST**).

   Is the mode control motor OK?

   YES -Go to step 7.

   NO -Replace the mode control motor (see **MODE CONTROL MOTOR TEST**).

6. Disconnect the mode control motor 7P connector.

11. Turn the ignition switch ON (II), and check the same terminals for voltage to body ground. See **Fig. 12**.

    Is there any voltage?

    YES -Repair any short to power in the wires between the heater control panel and the mode control motor. This short may also damage the heater control panel. Repair the short to power before replacing the heater control panel.

    NO -Check for loose wires or poor connections at the heater control panel 24P connector and at the mode control motor 7P connector. If the connections are good, substitute a known-good heater control panel, and recheck. If the symptom/indication goes away, replace the original heater control panel.

DTC INDICATOR 5: A PROBLEM IN THE MODE CONTROL LINKAGE, DOORS, OR MOTOR

1. Turn the ignition switch to LOCK (0), and then ON (II).
2. Do the self-diagnostic with the heater control panel (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION**).
3. Check for DTCs.

   Is DTC 5 indicated?

DTC INDICATOR 6: A PROBLEM IN THE BLOWER MOTOR CIRCUIT

1. Turn the ignition switch to LOCK (0), and then ON (II).
2. Do the self-diagnostic with the heater control panel (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION**).
3. Check for DTCs.

   Is DTC 6 indicated?

   YES -Go to step 5.

   NO -Intermittent failure, check for loose wires or poor connections on the blower motor circuit.

4. Turn the ignition switch to LOCK (0).
5. Check the No. 9 (40 A) fuse in the under-hood fuse/relay box, and the No. 36 (10 A) fuse in the under-dash fuse/relay box.

   Are the fuses OK?

   YES -Go to step 7.

   NO -Replace the fuses, and recheck.

6. Connect the blower motor 2P connector terminal No. 2 to body ground with a jumper wire.

9. Disconnect the jumper wire.
10. Disconnect the power transistor 4P connector.
11. Check for continuity between the power transistor 4P connector terminal No. 2 and body ground.

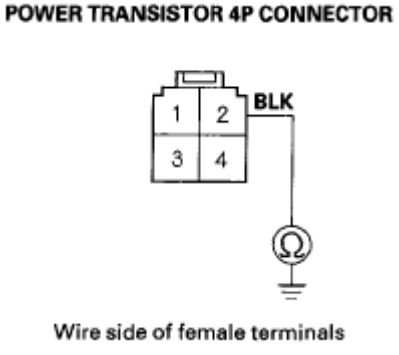

Fig. 16: Checking Continuity Between Power Transistor 4P Connector Terminal No 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 13.

NO -Check for an open in the wire between the power transistor and body ground. If the wire is OK, check for poor ground at G401 (see **CONNECTOR TO HARNESS INDEX**).

12. Connect the power transistor 4P connector terminals No. 2 and No. 4 with a jumper wire.

13. Turn the ignition switch ON (II).

    Does the blower motor run at high speed?

    YES -Go to step 15.

    NO -Repair open in the GRN wire between the power transistor and the blower motor.

14. Turn the ignition switch to LOCK (0).
15. Disconnect the jumper wire.
16. Disconnect the heater control panel 24P connector.
17. Check for continuity between body ground and the heater control panel 24P connector terminals No. 7 and No. 8 individually.

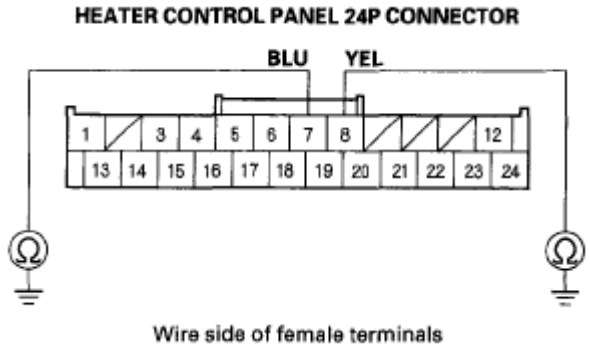

Fig. 18: Checking Continuity Between Body Ground And Heater Control Panel 24P Terminals No 7 And 8
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair any short to body ground in the wires between the heater control panel and the power transistor.

NO -Go to step 19.

18. Check for continuity between the following terminals of the heater control panel 24P connector and the power transistor 4P connector.

Is there continuity?

YES -Go to step 20.

NO -Repair any open in the wires between the heater control panel and the power transistor.

19. Turn the ignition switch ON (II).
20. Measure the voltage between body ground and the heater control panel 24P connector terminals No. 7 and No. 8 individually.

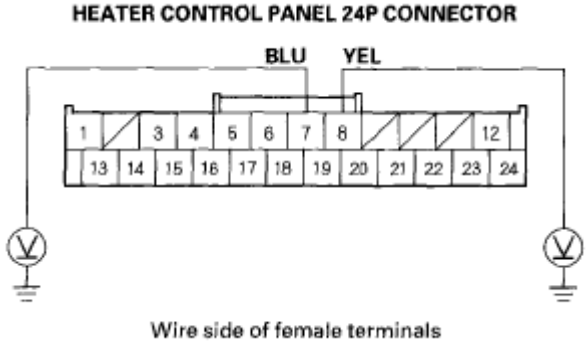

Fig. 20: Measuring Voltage Between Body Ground And Heater Control Panel 24P Connector Terminals No 7 And 8

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there voltage?

YES -Repair short to power in the wires.

NO -Go to step 22.

21. Turn the ignition switch to LOCK (0).
22. Reconnect the heater control panel 24P connector.
23. Test the power transistor (see **POWER TRANSISTOR TEST**).

Is the power transistor OK?

YES -Check for loose wires or poor connections at the heater control panel 24P connector and at the power transistor 4P connector. If the connections are good, substitute a known-good heater control panel, and recheck. If the symptom/indication goes away, replace the original heater control panel.

NO -Replace the power transistor.

24. Turn the ignition switch to LOCK (0).
25. Disconnect the jumper wire.
26. Disconnect the blower motor 2P connector.
27. Turn the ignition switch ON (II).
28. Measure the voltage between the blower motor 2P connector terminal No. 1 and body ground.

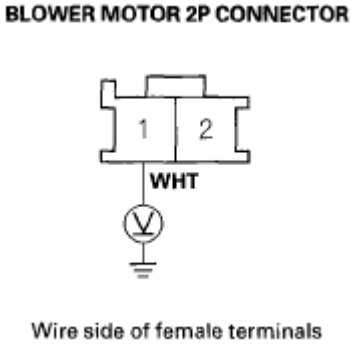

Fig. 21: Measuring Voltage Between Blower Motor 2P Connector Terminal No 1 And Body Ground

Is there battery voltage?

YES -Replace the blower motor.

NO -Go to step 30.

29. Turn the ignition switch to LOCK (0).
30. Remove the blower motor relay from the under-hood fuse/relay box, and test it (see **POWER**

RELAY TEST).

Is the relay OK?

YES -Go to step 32.

NO -Replace the blower motor relay.

31. Measure the voltage between the blower motor relay 4P socket terminal No. 1 and body ground.

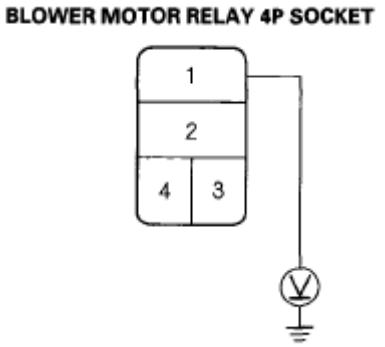

Fig. 22: Measuring Voltage Between Blower Motor Relay 4P Socket Terminal No 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 33.

NO -Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**).

32. Turn the ignition switch ON (II).
33. Measure the voltage between the blower motor relay 4P socket terminal No. 3 and body ground.

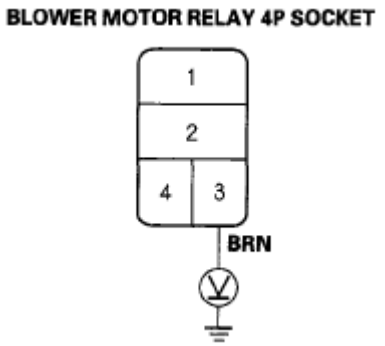

Fig. 23: Measuring Voltage Between Blower Motor Relay 4P Socket Terminal No 3 And Body Ground

Is there battery voltage?

YES -Go to step 35.

NO -Repair open in the wire between the No. 36 (10 A) fuse in the under-dash fuse/relay box and the blower motor relay.

34. Turn the ignition switch to LOCK (0).
35. Check for continuity between the blower motor relay 4P socket terminal No. 4 and body ground.

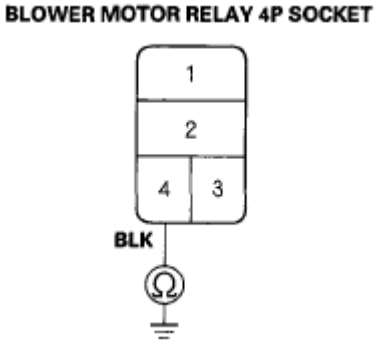

Fig. 24: Checking Continuity Between Blower Motor Relay 4P Socket Terminal No 4 And Body Ground

Is there continuity?

YES -Repair open in the WHT wire between the blower motor relay and the blower motor.

NO -Check for an open in the wire between the blower motor relay and body ground. If the wire is OK, check for poor ground at G301 (see **CONNECTOR TO HARNESS INDEX**).

DTC INDICATOR 7: HEATER CONTROL PANEL INTERNAL ERROR

NOTE: Check the battery condition (see BATTERY TEST) and the charging system (see CHARGING SYSTEM INDICATOR CIRCUIT TROUBLESHOOTING).

1. Turn the ignition switch to LOCK (0), and then ON (II).
2. Do the self-diagnostic with the heater control panel (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION**).
3. Check for DTCs.

Is DTC 7 indicated?

YES -The heater control panel is faulty, replace the heater control panel (see **HEATER CONTROL PANEL REMOVAL AND INSTALLATION**).

NO -Intermittent failure, the heater control panel is OK at this time.

RECIRCULATION CONTROL MOTOR CIRCUIT TROUBLESHOOTING

1. Check the No. 36 (10 A) fuse in the under-dash fuse/relay box.

Is the fuse OK?

YES -Go to step 2.

NO -Replace the fuse, and recheck. If the fuse blows again, check for a short in the No. 36 (10 A) fuse circuit.

2. Disconnect the recirculation control motor 7P connector.
3. Turn the ignition switch ON (II).
4. Measure the voltage between the recirculation control motor 7P connector terminal No. 1 and body ground.

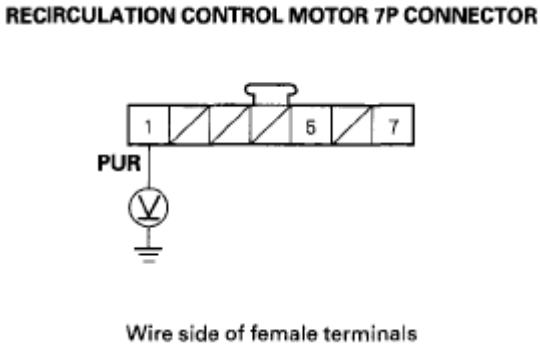

Fig. 25: Measuring Voltage Between Recirculation Control Motor 7P Connector Terminal No 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 5.

NO -Repair open in the wire between the No. 36 (10 A) fuse in the under-dash fuse/relay box and the recirculation control motor.

5. Turn the ignition switch to LOCK (0).
6. Test the recirculation control motor (see **RECIRCULATION CONTROL MOTOR TEST**).

Is the recirculation control motor OK?

YES -Go to step 7.

NO -Replace the recirculation control motor (see **RECIRCULATION CONTROL MOTOR TEST**), or repair the recirculation control linkage or door.

7. Disconnect the heater control panel 24P connector.
8. Check for continuity between body ground and the heater control panel 24P connector terminals No. 16 and No. 17 individually.

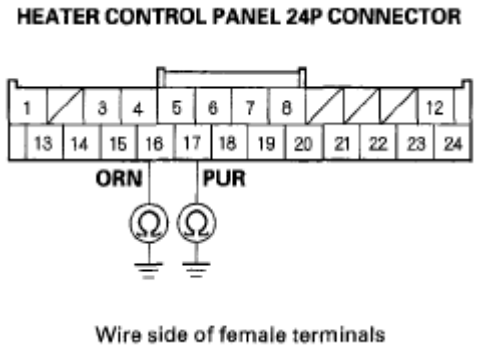

Fig. 26: Checking Continuity Between Body Ground And Heater Control Panel 24P Connector Terminals No 16 And 17
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair any short to body ground in the wires between the heater control panel and the recirculation control motor.

NO -Go to step 9.

9. Turn the ignition switch ON (II), and check the same terminals for voltage to body ground.

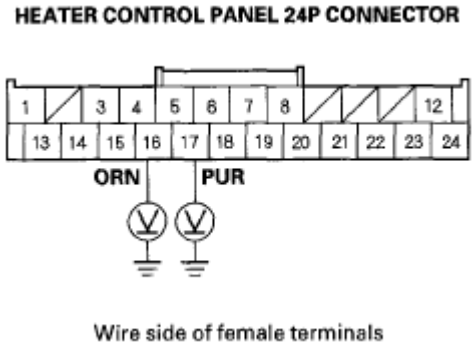

Fig. 27: Checking Voltage Between Body Ground And Heater Control Panel 24P Connector Terminals No 16 And 17
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there any voltage?

YES -Repair any short to power in the wires between the heater control panel and the recirculation control motor. This short may also damage the heater control panel. Repair the short to power before replacing the heater control panel.

NO -Go to step 10.

10. Turn the ignition switch to LOCK (0).
11. Check for continuity between the following terminals of the heater control panel 24P connector and the recirculation control motor IP connector.

CONTINUITY CHECK INDEX

24P	7P
16	7
17	5

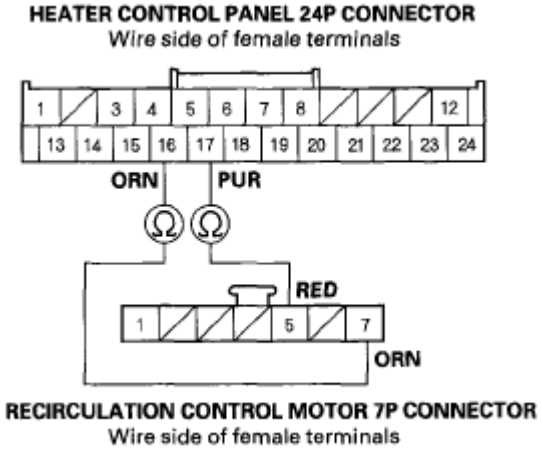

Fig. 28: Checking Continuity Between Heater Control Panel 24P And Recirculation Control Motor IP Connector Terminals

YES -Check for loose wires or poor connections at the heater control panel 24P connector and at the recirculation control motor 7P connector. If the connections are good, substitute a known-good heater control panel, and recheck. If the symptom/indication goes away, replace the original heater control panel.

NO -Repair any open in the wires between the heater control panel and the recirculation control motor.

HEATER CONTROL POWER AND GROUND CIRCUIT TROUBLESHOOTING

1. Check the No. 36 (10 A) fuse in the under-dash fuse/relay box.

   Is the fuse OK?

   YES -Go to step 2.

   NO -Replace the fuse, and recheck. If the fuse blows again, check for a short in the No. 36 (10 A) fuse circuit.

2. Disconnect the heater control panel 24P connector.
3. Turn the ignition switch ON (II).
4. Measure the voltage between the heater control panel 24P connector terminal No. 23 and body ground.

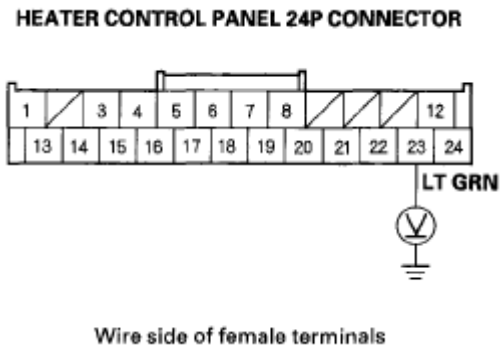

Fig. 29: Measuring Voltage Between Heater Control Panel 24P Connector Terminal No 23 And Body Ground

Is there battery voltage?

YES -Go to step 5.

NO -Repair open in the wire between the No. 36 (10 A) fuse in the under-dash fuse/relay box and the heater control panel.

5. Turn the ignition switch to LOCK (0).
6. Check for continuity between the heater control panel 24P connector terminal No. 21 and body ground.

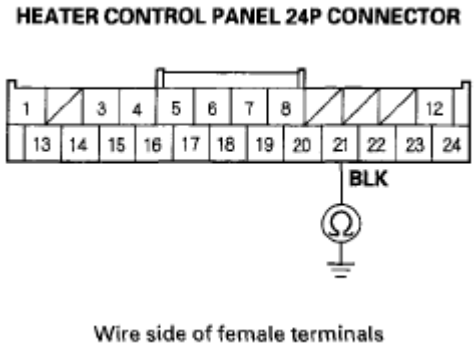

Fig. 30: Checking Continuity Between Heater Control Panel 24P Connector Terminal No 21 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Check for loose wires or poor connections at the heater control panel 24P connector. If the connections are good, substitute a known-good heater control panel, and recheck.

NO -Check for an open in the wire between the heater control panel and body ground. If the wire is OK, check for poor ground at G504 (see **CONNECTOR TO HARNESS INDEX**).

POWER TRANSISTOR TEST

1. Remove the passenger's dashboard undercover (see **PASSENGER's DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
2. Disconnect the 4P connector from the power transistor.
3. Measure the resistance between the No. 3 and No. 4 terminals of the power transistor. It should be about 1.5 kohms.
   - If the resistance is within the specifications, go to step 4.
   - If the resistance is not within the specifications, replace the power transistor.

NOTE: Also check the blower motor. Power transistor failure can be caused by a defective blower motor.

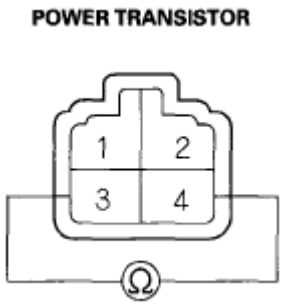

Fig. 31: Measuring Resistance Between No 3 And No 4 Terminals Of Power Transistor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Carefully release the lock tab on the No. 1 terminal (YEL) (A) in the 4P connector, then remove the terminal and insulate it from body ground.

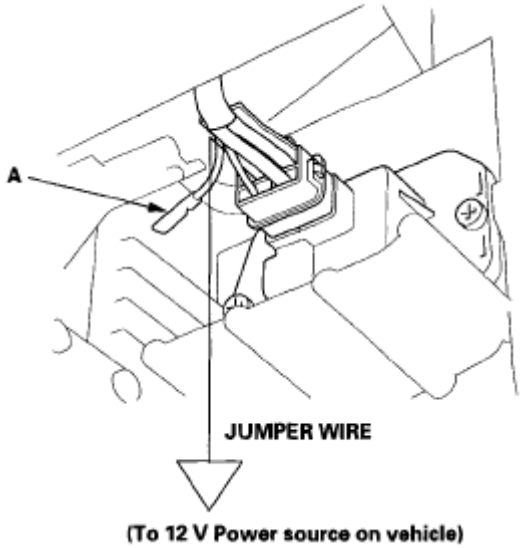

Fig. 32: Identifying 4P Connector Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Reconnect the 4P connector to the power transistor.
6. Make sure the YEL wire is completely isolated, then supply 12 V to the No. 1 cavity with a jumper wire.

7. Turn the ignition switch ON (II), and check that the blower motor runs.
   - If the blower motor does not run, replace the power transistor.
   - If the blower motor runs, the power transistor is OK.

AIR MIX CONTROL MOTOR TEST

NOTE: Before testing, check for HVAC DTCs (see HOW TO USE THE SELF-DIAGNOSTIC FUNCTION).

1. Disconnect the 7P connector from the air mix control motor.

   NOTE: Incorrectly applying power and ground to the air mix control motor will damage it. Follow the instructions carefully.

2. Connect battery power to the No. 1 terminal of the air mix control motor, and ground the No. 2 terminal; the air mix control motor should run, and stop at Max Hot. If it doesn't, reverse the connections; the air mix control motor should run, and stop at Max Cool. When the air mix control motor stops running, disconnect battery power immediately.

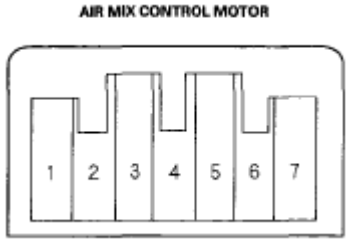

Fig. 33: Identifying Air Mix Control Motor Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. If the air mix control motor did not run in step 2, remove it, then check the air mix control linkage and door for smooth movement.
   - If the linkage and door move smoothly, replace the air mix control motor (see **AIR MIX CONTROL MOTOR TEST**).
   - If the linkage or door sticks or binds, repair them as needed.
   - If the air mix control motor runs smoothly, go to step 4.
4. Measure the resistance between the No. 5 and No. 7 terminals. It should be between 4.2 to 7.8 kohms.
5. Reconnect the air mix control motor 7P connector, then turn the ignition switch ON (II).
6. Using the backprobe set. Measure the voltage between the No. 3 and No. 7 terminals.

   Max Cool: about 0.5 V

   Max Hot: about 4.5 V

7. If either the resistance or voltage readings are not as specified, replace the air mix control motor (see **AIR MIX CONTROL MOTOR TEST**).

AIR MIX CONTROL MOTOR REPLACEMENT

1. Remove the driver's dashboard undercover (see **DRIVER's DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
2. Disconnect the 7P connector (A) from the air mix control motor (B). Remove the self-tapping screws and the air mix control motor from the heater unit.

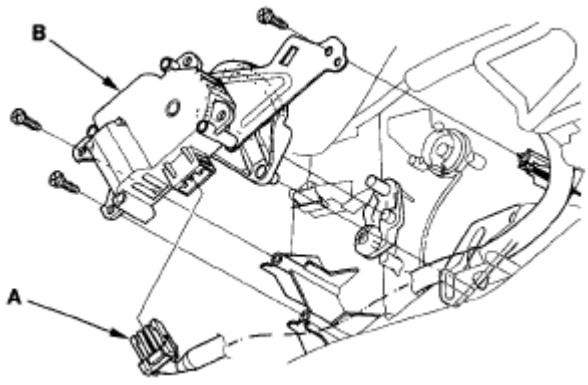

Fig. 34: Identifying 7P Connector And Air Mix Control Motor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the motor in the reverse order of removal. Make sure the pin on the motor is properly engaged with the linkage. After installation, make sure the motor runs smoothly.

MODE CONTROL MOTOR TEST

NOTE: Before testing, check for HVAC DTCs (see HOW TO USE THE SELF-DIAGNOSTIC FUNCTION).

1. Disconnect the 7P connector from the mode control motor.

NOTE: Incorrectly applying power and ground to the mode control motor will damage it. Follow the instructions carefully.

2. Connect battery power to the No. 1 terminal of the mode control motor, and ground the No. 2 terminal; the mode control motor should run smoothly, and stop at Vent. If it doesn't, reverse the connections; the mode control motor should run smoothly, and stop at Defrost. When the mode control motor stops running, disconnect battery power immediately.

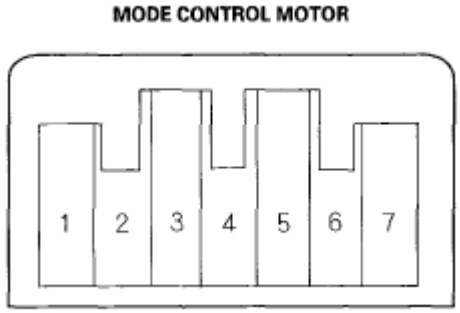

Fig. 35: Identifying Mode Control Motor Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. If the mode control motor did not run in step 2, remove it, then check the mode control linkage and doors for smooth movement.
   - If the linkage and doors move smoothly, replace the mode control motor (see **MODE CONTROL MOTOR TEST**).
   - If the linkage or doors stick or bind, repair them as needed.
   - If the mode control motor runs smoothly, go to step 4.
4. Use a digital multimeter with an output of 1 mA or less at the 20 k ohms range. With the mode control motor running as in step 2, check for continuity between the No. 3, 4, 5, and 6 terminals and the No. 7 terminal individually. There should be continuity for a moment at each terminal as the motor moves past the switch's terminal.
5. If there is no continuity for a moment at each terminal, replace the mode control motor (see **MODE CONTROL MOTOR TEST**).

MODE CONTROL MOTOR REPLACEMENT

1. Remove the glove box (see **PASSENGER's DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
2. Remove the wire harness clip (A), the self-tapping screws, and the passenger's heater duct (B).

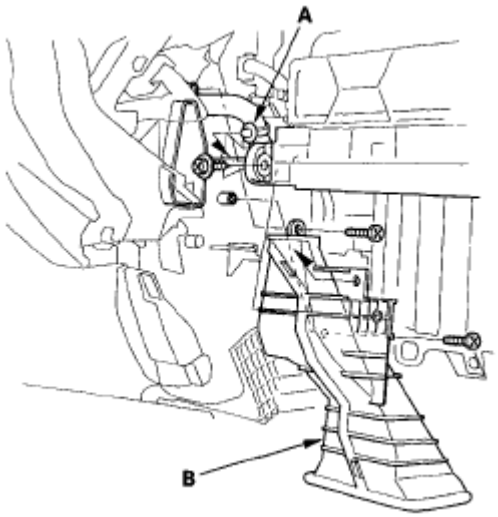

Fig. 36: Identifying Wire Harness Clip And Passenger's Heater Duct
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Disconnect the 7P connector (A) from the mode control motor (B). Remove the self-tapping screws and the mode control motor from the heater unit.

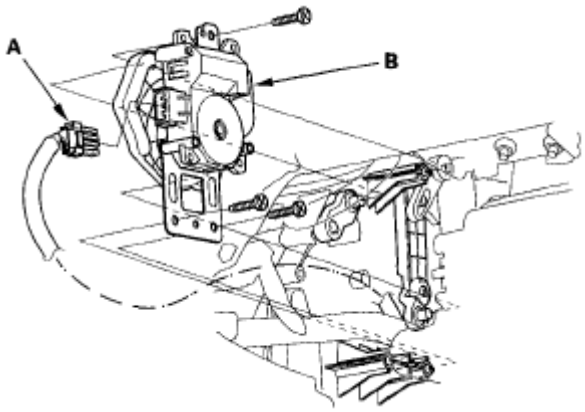

Fig. 37: Identifying 7P Connector And Mode Control Motor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the motor in the reverse order of removal. Make sure the pin on the motor is properly engaged with the linkage. After installation, make sure the motor runs smoothly.

RECIRCULATION CONTROL MOTOR TEST

NOTE: Before testing, check for HVAC DTCs (see HOW TO USE THE SELF-DIAGNOSTIC FUNCTION).

1. Disconnect the 7P connector from the recirculation control motor.

NOTE: Incorrectly applying power and ground to the recirculation control motor will damage it. Follow the instructions carefully.

2. Connect battery power to the No. 1 terminal of the recirculation control motor, and ground the No. 5 and No. 7 terminals; the recirculation control motor should run smoothly. To avoid damaging the recirculation control motor, do not reverse power and ground. Disconnect the No. 5 or No. 7 terminals from ground; the recirculation control motor should stop at Fresh (when the No. 5 terminal is disconnected) or Recirculate (when the No. 7 terminal is disconnected). Don't cycle the recirculation control motor for a long time.

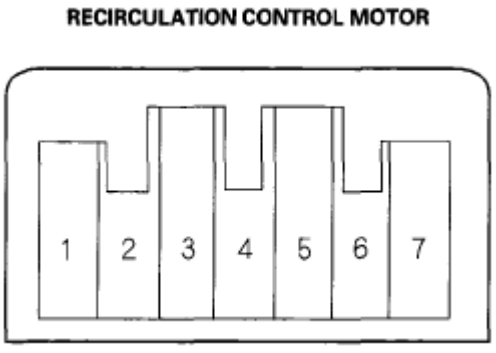

Fig. 38: Identifying Recirculation Control Motor Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. If the recirculation control motor did not run in step 2, remove it, then check the recirculation control

linkage and door for smooth movement.

- If the linkage and door move smoothly, replace the recirculation control motor (see **RECIRCULATION CONTROL MOTOR TEST**).
- If the linkage or door stick or bind, repair them as needed.

RECIRCULATION CONTROL MOTOR REPLACEMENT

1. Remove the glove box (see **PASSENGER's DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**) and the passenger's kick panel, 2-door (see **TRIM REMOVAL/INSTALLATION - DOOR AREAS**), 4-door (see **FRONT DOOR SILL AREA - 4-DOOR**).
2. Disconnect the 7P connector (A) from the recirculation control motor (B). Remove the self-tapping screws and the recirculation control motor from the blower unit.

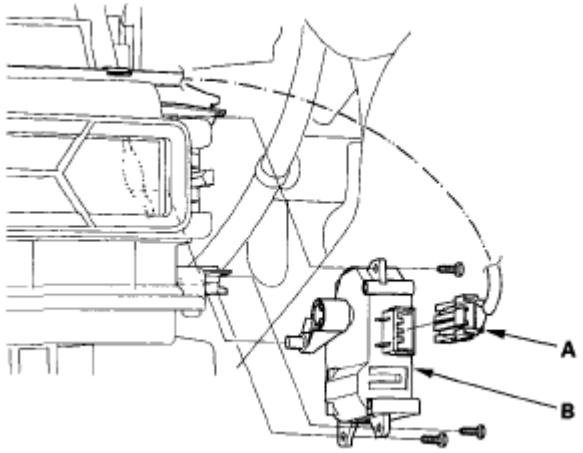

Fig. 39: Identifying 7P Connector And Recirculation Control Motor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the motor in the reverse order of removal. Make sure the pin on the motor is properly engaged with the linkage. After installation, make sure the motor runs smoothly.

HEATER CONTROL PANEL REMOVAL AND INSTALLATION

1. Remove the center panel (see **AUDIO UNIT REMOVAL/INSTALLATION**).
2. Remove the dials (A), the self-tapping screws, and the heater control panel (B).

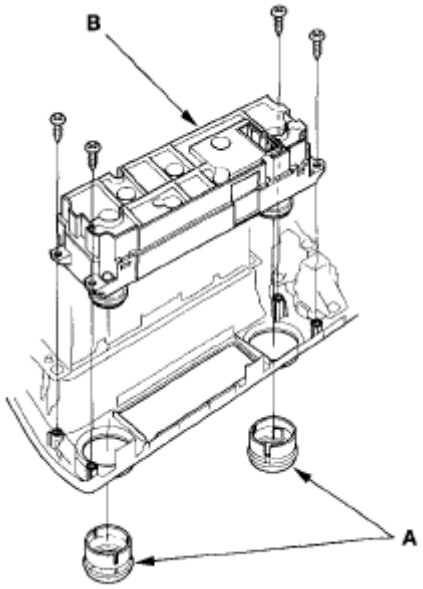

Fig. 40: Identifying Dials And Heater Control Panel
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the control panel in the reverse order of removal. After installation, operate the various functions to make sure they work properly.
4. Run the self-diagnosis function to confirm that there are no problems in the system (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION**).

DUST AND POLLEN FILTER REPLACEMENT

1. Open the glove box. Remove the glove box stop on each side, then let the glove box hang down (see **PASSENGER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
2. Remove the dust and pollen filter assembly (A) from the evaporator.

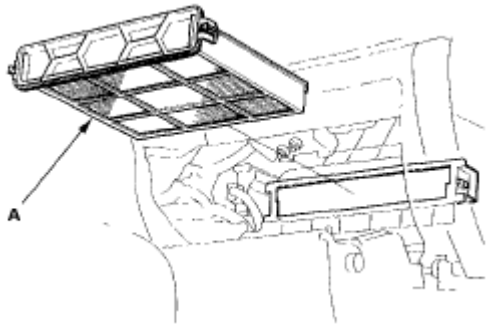

Fig. 41: Identifying Dust And Pollen Filter Assembly
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the filter (A) from the housing (B), and replace the filter.

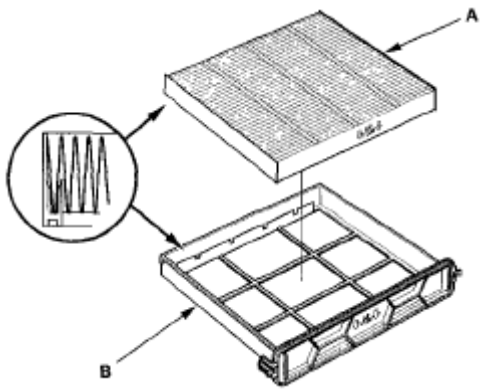

Fig. 42: Identifying Filter And Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the filter in the reverse order of removal. Make sure that there is no air leaking out of the evaporator.

BLOWER UNIT REMOVAL AND INSTALLATION

1. Remove the glove box (see **PASSENGER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
2. Cut the plastic cross brace (A) in the glove box opening with diagonal cutters in the area shown, and discard it.

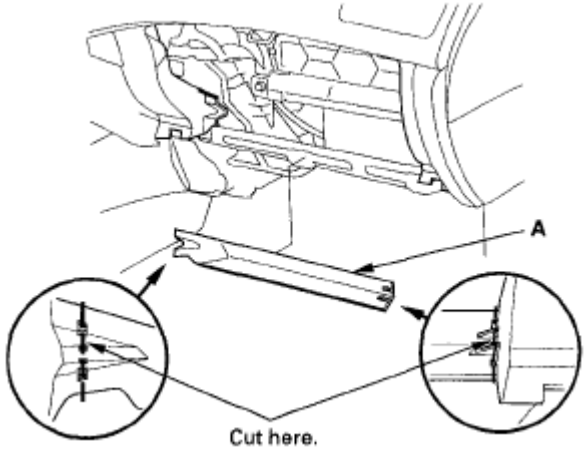

Fig. 43: Identifying Plastic Cross Brace
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the bolts and the glove box frame (A).

7. Install the unit in the reverse order of removal. Make sure that there is no air leakage.

BLOWER UNIT COMPONENT REPLACEMENT

Note these items when overhauling the blower unit:

- The recirculation control motor (A), blower motor (B) and the dust and pollen filter (C) can be replaced without removing the blower unit.
- Before reassembly, make sure that the recirculation control linkage and door move smoothly without binding.

- After reassembly, make sure the recirculation control motor runs smoothly (see **RECIRCULATION CONTROL MOTOR TEST**).

HEATER UNIT/CORE REPLACEMENT

SRS components are located in this area. Review the SRS component locations (see **COMPONENT LOCATION INDEX**) and the precautions and procedures (see **PRECAUTIONS AND PROCEDURES**) in the SRS before doing repairs or service.

1. Make sure you have the anti-theft code for the audio or navigation system, then write down the audio presets.
2. Make sure the ignition is OFF, then disconnect the negative cable from the battery.
3. Remove the air cleaner housing assembly (see **THROTTLE BODY CLEANING**).
4. When the engine is cool, drain the engine coolant from the radiator (see **COOLANT REPLACEMENT**).
5. From under the hood, slide the hose clamps (A) back. Disconnect the inlet heater hose (B) and the outlet heater hose (C) from the heater unit. Note the orientation of the hoses.

   Engine coolant will run out when the hoses are disconnected; drain it into a clean drip pan. Be sure not to let coolant spill on the electrical parts or the painted surfaces. If any coolant spills, rinse it off immediately.

Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Install the heater core in the reverse order of removal.
15. Install the heater unit in the reverse order of removal, and note these items:
    - Do not interchange the inlet and outlet heater hoses, and install the hose clamps securely.
    - Refill the cooling system with engine coolant (see **COOLANT REPLACEMENT**).
    - Make sure that there is no coolant leakage.
    - Make sure that there is no air leakage.
    - Enter the anti-theft code for the audio or navigation system, then enter the audio presets.
    - Set the clock.

A/C SERVICE TIPS AND PRECAUTIONS

WARNING:

- **Compressed air mixed with the R-134a forms a combustible vapor.**
- **The vapor can burn or explode causing serious injury.**
- **Never use compressed air to pressure test R-134a service equipment or vehicle air conditioning systems.**

CAUTION:

- **Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.**
- **Be careful when connecting service equipment.**
- **Do not breathe refrigerant or vapor.**

The air conditioning system uses HFC-134a (R-134a) refrigerant and polyalkyleneglycol (PAG) refrigerant

oil, which are not compatible with CFC-12 (R-12) refrigerant and mineral oil. Do not use R-12 refrigerant or mineral oil in this system, and do not attempt to use R-12 servicing equipment; damage to the air conditioning system or your servicing equipment will result. Use only service equipment that is U.L.-listed and is certified to meet the requirements of SAE J2210 to remove R-134a from the air conditioning system.

If accidental system discharge occurs, ventilate work area before resuming service.

R-134a service equipment or vehicle air conditioning systems should not be pressure tested or leak tested with compressed air.

Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.

- Always disconnect the negative cable from the battery whenever replacing air conditioning parts.
- Keep moisture and dirt out of the system. When disconnecting any lines, plug or cap the fittings immediately; don't remove the caps or plugs until just before you reconnect each line.
- Before connecting any hose or line, apply a few drops of refrigerant oil to the O-ring.
- When tightening or loosening a fitting, use a second wrench to support the matching fitting.
- When discharging the system, use an R-134a refrigerant recovery/recycling/charging station; don't release refrigerant into the atmosphere.

A/C REFRIGERANT OIL REPLACEMENT

Recommended PAG oil: SP-10

- P/N 38897-P13-A01AH: 120 mL (4 fl-oz)
- P/N 38899-P13-A01: 40 mL (1 1/3 fl-oz)

Add the recommended refrigerant oil in the amount listed if you replace any of the following parts.

- To avoid contamination, do not return the oil to the container once dispensed, and never mix it with other refrigerant oils.
- Immediately after using the oil, reinstall the cap on the container, and seal it to avoid moisture absorption.
- Do not spill the refrigerant oil on the vehicle; it may damage the paint; if it gets on the paint, wash it off immediately.

A/C condenser	50 mL (1 2/3 fl-oz)
Evaporator	40 mL (1 1/3 fl-oz)
Line or hose	10 mL (1/3 fl-oz)
Receiver/Dryer	10 mL (1/3 fl-oz)
Leakage repair	25 mL (5/6 fl-oz)
A/C compressor	Since the oil separator is equipped inside the compressor for this vehicle, oil drainage is unnecessary at the time of compressor replacement.

A/C compressor.....Since the oil separator is equipped inside the compressor for this vehicle, oil drainage is unnecessary at the time of compressor replacement.

GENERAL TROUBLESHOOTING INFORMATION

How to Use the Self-diagnostic Function

The HVAC control unit has a self-diagnostic function for heating, ventilation, and air conditioning system. To run the self-diagnostic function, do the following:

1. Turn the ignition switch to LOCK (0).
2. Press and hold the recirculation control and rear window defogger buttons, turn the ignition switch

ON (II).

3. Recirculation indicator turns on for 2 seconds, then self-diagnostic function begins.

NOTE:

- **The blower motor will run at any speed regardless of the dial positioning.**
- **In the case of multiple problems, the recirculation indicator will blink the lowest number DTC only.**
- **If no DTCs are found, the indicator will not blink.**

1	An open in the air mix control motor circuit (see **DTC INDICATOR 1: AN OPEN IN THE AIR MIX CONTROL MOTOR CIRCUIT**)
2	A short in the air mix control motor circuit (see **DTC INDICATOR 2: A SHORT IN THE AIR MIX CONTROL MOTOR CIRCUIT**)
3	A problem in the air mix control linkage, door, or motor (see **DTC INDICATOR 3: A PROBLEM IN THE AIR MIX CONTROL LINKAGE, DOOR, OR MOTOR**)
4	An open or short in the mode control motor circuit (see **DTC INDICATOR 4: AN OPEN OR SHORT IN THE MODE CONTROL MOTOR CIRCUIT**)
5	A problem in the mode control linkage, doors, or motor (see **DTC INDICATOR 5: A PROBLEM IN THE MODE CONTROL LINKAGE, DOORS, OR MOTOR**)

6	A problem in the blower motor circuit (see **DTC INDICATOR 6: A PROBLEM IN THE BLOWER MOTOR CIRCUIT**)
7	HVAC control unit internal error (see **DTC INDICATOR 7: HVAC CONTROL UNIT INTERNAL ERROR**)
8	An open in the evaporator temperature sensor circuit (see **DTC INDICATOR 8: AN OPEN IN THE EVAPORATOR TEMPERATURE SENSOR CIRCUIT**)
9	A short in the evaporator temperature sensor circuit (see **DTC INDICATOR 9: A SHORT IN THE EVAPORATOR TEMPERATURE SENSOR CIRCUIT**)

CLEAR THE DTCS

When the problem is repaired, DTCs will automatically clear.

MAX COOL POSITION FUNCTION

When the mode control button is in the MAX A/C position, the HVAC control unit will automatically select the recirculation mode and turn the A/C on. If the recirculation switch is pressed when in MAX A/C, MAX A/C turns off. If A/C is pressed when in MAX A/C, the A/C turns off.

SYSTEM DESCRIPTION

The air conditioning system removes heat from the passenger compartment by circulating refrigerant through the system.

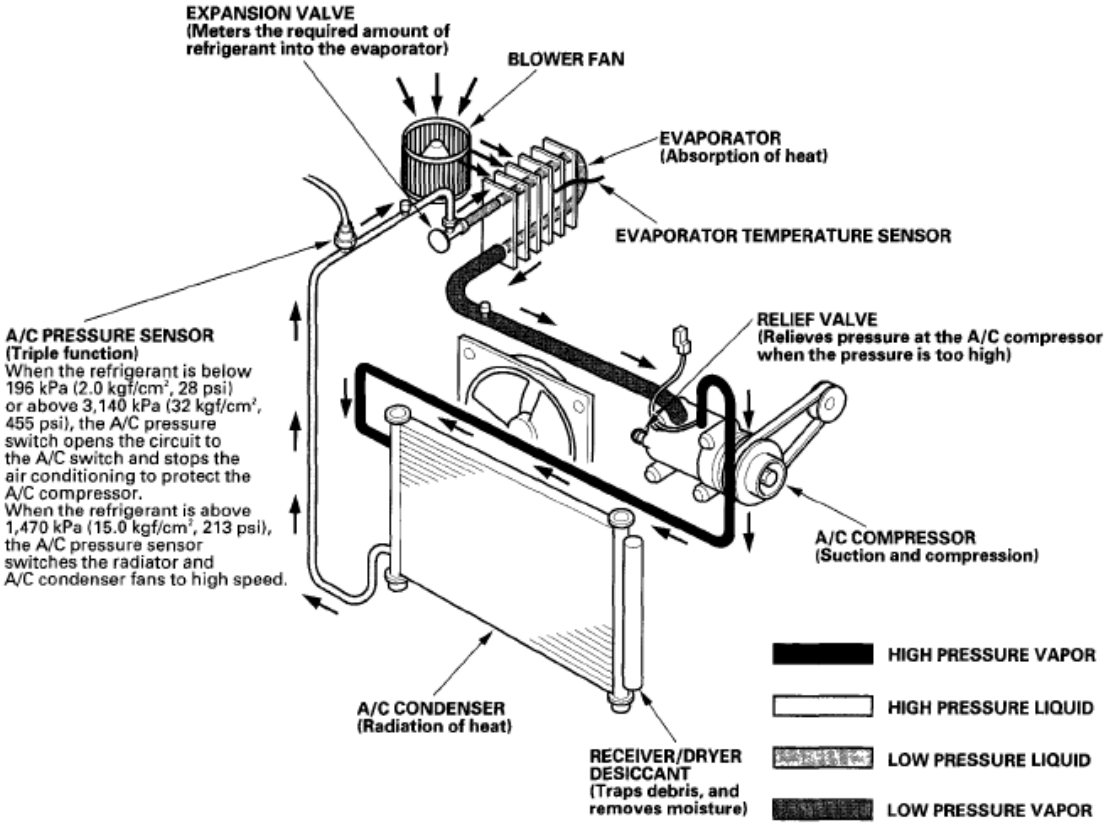

Fig. 7: Heating/Air Conditioning System Description

This vehicle uses HFC-134a (R-134a) refrigerant, which does not contain chlorofluorocarbons. Pay attention to the following service items:

- Do not mix refrigerants CFC-12 (R-12) and HFC-134a (R-134a). They are not compatible.
- Use only the recommended polyalkyleneglycol (PAG) refrigerant oil (SP-10) designed for the R-134a A/C compressor. Intermixing the recommended (PAG) refrigerant oil with any other refrigerant oil will result in A/C compressor failure.
- All A/C system parts (A/C compressor, discharge line, suction line, evaporator, A/C condenser, receiver/dryer, expansion valve, O-rings for joints) are designed for refrigerant R-134a. Do not exchange with R-12 parts.
- Use a halogen gas leak detector designed for refrigerant R-134a.
- R-12 and R-134a refrigerant servicing equipment are not interchangeable. Use only a recovery/recycling/charging station that is U.L.-listed and is certified to meet the requirements of SAE J2210 to service the R-134a air conditioning systems.
- Always recover refrigerant R-134a with an approved recovery/recycling/charging station before disconnecting any A/C fitting.

OIL SEPARATOR

Oil emission from the A/C compressor to the A/C line is reduced by placing the oil separator in the A/C compressor. This results in a thinner oil film inside of the heat exchanger (A/C condenser and evaporator). Air conditioning efficiency is increased without sacrificing engine performance.

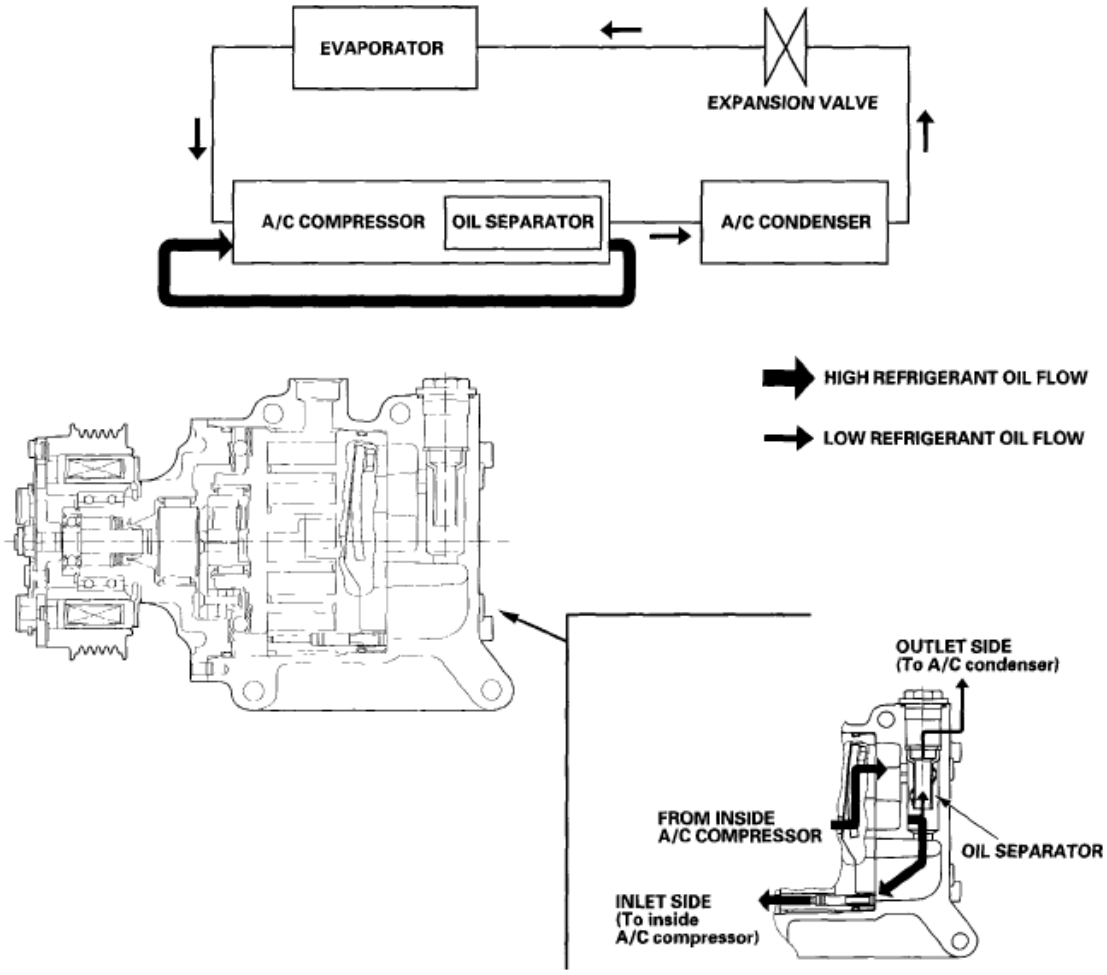

Fig. 8: Oil Separator System Description

A/C PRESSURE SENSOR

The A/C pressure sensor converts A/C pressure into electrical signals to the ECM/PCM.

The response of the A/C pressure sensor is shown in **Fig. 10** .

DTC TROUBLESHOOTING

DTC INDICATOR 1: AN OPEN IN THE AIR MIX CONTROL MOTOR CIRCUIT

1. Clear the DTC (see **CLEAR THE DTCS**).
2. Turn the ignition switch to LOCK (0), and then ON (II).
3. Do the self-diagnostic with the HVAC control unit (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION**).
4. Check for DTCs.

Is DTC 1 indicated?

YES - Go to step 5.

NO - Intermittent failure, check for loose wires or poor connections on the air mix control motor circuit.

5. Turn the ignition switch to LOCK (0).
6. Test the air mix control motor (see **AIR MIX CONTROL MOTOR TEST**).

Is the air mix control motor OK?

YES - Go to step 7.

NO - Replace the air mix control motor (see **AIR MIX CONTROL MOTOR TEST**).

7. Disconnect the air mix control motor 7P connector.
8. Disconnect the HVAC control unit 24P connector.
9. Check for continuity between the following terminals of the HVAC controlpanel 24P connector and the air mix control motor 7P connector.

Is there continuity?

YES -Check for loose wires or poor connections at the HVAC control panel 24P connector and at the air mix control motor 7P connector. If the connections are good, substitute a known-good HVAC control panel and recheck. If the symptom/indication goes away, replace the original HVAC control panel.

NO -Repair any open in the wires between the HVAC control panel and the air mix control motor.

DTC INDICATOR 2: A SHORT IN THE AIR MIX CONTROL MOTOR CIRCUIT

1. Clear the DTC (see **CLEAR THE DTCS**).
2. Turn the ignition switch to LOCK (0), and then ON (II).
3. Do the self-diagnostic with the HVAC control unit (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION**).
4. Check for DTCs.

   Is DTC 2 indicated?

   YES - Go to step 5.

   NO - Intermittent failure.

5. Turn the ignition switch to LOCK (0).
6. Test the air mix control motor (see **AIR MIX CONTROL MOTOR TEST**).

   Is the air mix control motor OK?

   YES - Go to step 7.

   NO - Replace the air mix control motor (see **AIR MIX CONTROL MOTOR TEST**).

7. Disconnect the air mix control motor 7P connector.
8. Disconnect the HVAC control unit 24P connector.
9. Check for continuity between body ground and the HVAC control panel 24P connector terminals No. 1, 13 and 18 individually.

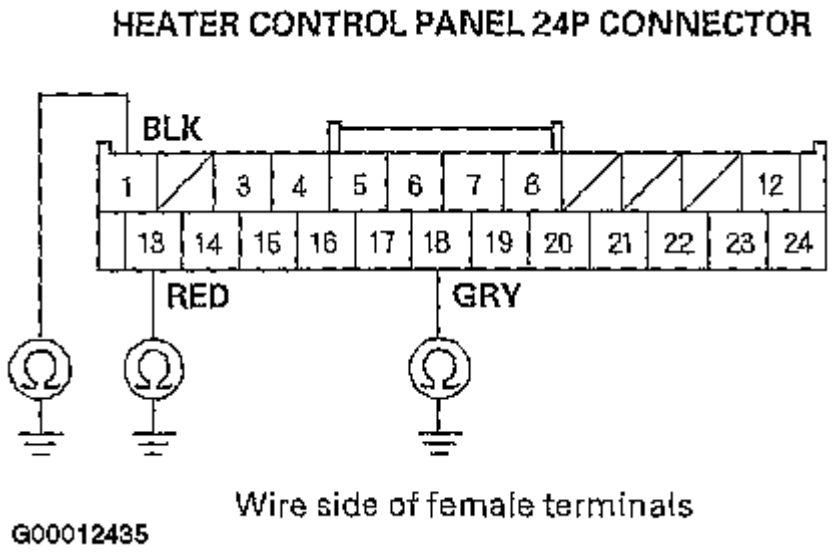

Fig. 17: Checking Continuity Between Ground & HVAC Control Panel Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair any short to body ground in the wires between the HVAC control panel and the air mix control motor.

NO -Go to step 10.

10. Check for continuity between the HVAC control panel 24P connector terminals as follows.

TERMINALS REFERENCE

From terminal	To terminals
1	13,18
13	18

Is there continuity between any of the terminals?

YES -Repair the short in the wires.

NO -Go to step 11.

11. Turn the ignition switch ON (II), and check the same terminals for voltage to body ground. See **Fig. 17**.

Is there battery voltage?

YES - Repair any short to power in the wires between the HVAC control unit and the air mix control motor. This short may also damage the HVAC control unit. Repair the short to power before replacing the HVAC control unit.

NO - Substitute a known-good HVAC control unit, and recheck. If the symptom/indication goes

away, replace the original HVAC control unit.

DTC INDICATOR 3: A PROBLEM IN THE AIR MIX CONTROL LINKAGE, DOOR, OR MOTOR

1. Clear the DTC (see **CLEAR THE DTCS**).
2. Turn the ignition switch to LOCK (0), and then ON (II).
3. Do the self-diagnostic with the HVAC control unit (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION**).
4. Check for DTCs.

   Is DTC 3 indicated?

   YES - Go to step 5.

   NO - Intermittent failure.

5. Turn the ignition switch to LOCK (0).
6. Test the air mix control motor (see **AIR MIX CONTROL MOTOR TEST**).

   Is the air mix control motor OK?

   YES - Go to step 7.

   NO - Replace the air mix control motor (see **AIR MIX CONTROL MOTOR TEST**), or repair the air mix control linkage or door.

7. Check for continuity between the following terminals of the HVAC control panel 24P connector and the air mix control motor 7P connector.

Is there continuity?

YES -Repair short to body ground in the wires between the HVAC control panel and the air mix control motor.

NO -Substitute a known-good HVAC control panel, and recheck. If the symptom/indication goes away, replace the original HVAC control panel.

DTC INDICATOR 4: AN OPEN OR SHORT IN THE MODE CONTROL MOTOR CIRCUIT

1. Clear the DTC (see **CLEAR THE DTCS**).
2. Turn the ignition switch to LOCK (0), and then ON (II).
3. Do the self-diagnostic with the HVAC control unit (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION**).
4. Check for DTCs.

Is DTC 4 indicated?

YES - Go to step 5.

NO - Intermittent failure, check for loose wires or poor connections on the mode control motor circuit.

5. Turn the ignition switch to LOCK (0).
6. Test the mode control motor (see **MODE CONTROL MOTOR TEST**).

   Is the mode control motor OK?

   YES - Go to step 7.

   NO - Replace the mode control motor (see **AIR MIX CONTROL MOTOR REPLACEMENT**).

7. Disconnect the mode control motor 7P connector.
8. Disconnect the HVAC control unit 24P connector.

YES - Repair the short in the wires.

NO - Go to step 12.

12. Turn the ignition switch ON (II), and check the same terminals for voltage to body ground. See **Fig. 21**.

    Is there any voltage?

    YES -Repair any short to power in the wires between the HVAC control panel and the mode control motor. This short may also damage the HVAC control panel. Repair the short to power before replacing the HVAC control panel.

    NO -Check for loose wires or poor connections at the HVAC control panel 24P connector and at the mode control motor 7P connector. If the connections are good, substitute a known-good HVAC control panel, and recheck. If the symptom/indication goes away, replace the original HVAC control panel.

DTC INDICATOR 5: A PROBLEM IN THE MODE CONTROL LINKAGE, DOORS, OR MOTOR

1. Clear the DTC (see **CLEAR THE DTCS**).
2. Turn the ignition switch to LOCK (0), and then ON (II).
3. Do the self-diagnostic with the HVAC control unit (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION**).
4. Check for DTCs.

YES -Repair short to body ground in the wires between the HVAC control panel and the mode control motor.

NO -Substitute a known-good HVAC control panel, and recheck. If the symptom/indication goes away, replace the original HVAC control panel.

DTC INDICATOR 6: A PROBLEM IN THE BLOWER MOTOR CIRCUIT

1. Clear the DTC (see **CLEAR THE DTCS**).
2. Turn the ignition switch to LOCK (0), and then ON (II).
3. Do the self-diagnostic with the HVAC control unit (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION**).
4. Check for DTCs.

   Is DTC 6 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, check for loose wires or poor connections on the blower motor circuit.

5. Turn the ignition switch to LOCK (0).
6. Check the No. 9 (40 A) fuse in the under-hood fuse/relay box, and the No. 36 (10 A) fuse in the under-dash fuse/relay box.

   Are the fuses OK?

   YES - Go to step 7.

NO - Replace the fuses, and recheck. If the fuses blow again, check for a short in the No. 9 (40 A) and No. 36 (10 A) fuses circuit.

7. Connect the blower motor 2P connector terminal No. 2 to body ground with a jumper wire.

14. Turn the ignition switch ON (II).

    Does the blower motor run at high speed?

    YES - Go to step 15.

    NO - Repair open in the GRN wire between the power transistor and the blower motor.

15. Turn the ignition switch to LOCK (0).
16. Disconnect the jumper wire.
17. Disconnect the HVAC control unit 24P connector.
18. Check for continuity between body ground and the HVAC control unit 24P connector terminals No. 7 and No. 8 individually.

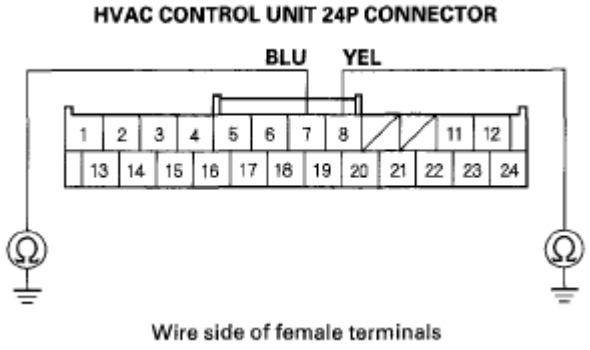

Fig. 27: Checking Continuity Between Body Ground And HVAC Control Unit 24P Connector Terminals No. 7 And No. 8

Is there continuity?

YES - Repair any short to body ground in the wires between the HVAC control unit and the power transistor.

Is there voltage?

YES - Repair short to power in the wires.

NO - Go to step 22.

22. Turn the ignition switch to LOCK (0).
23. Reconnect the HVAC control unit 24P connector.
24. Test the power transistor (see **POWER TRANSISTOR TEST**).

Is the power transistor OK?

YES - Check for loose wires or poor connections at the HVAC control unit 24P connector and at the power transistor 4P connector. If the connections are good, substitute a known-good HVAC control unit, and recheck. If the symptom/indication goes away, replace the original HVAC control unit.

NO - Replace the power transistor (see **POWER TRANSISTOR TEST**).

25. Turn the ignition switch to LOCK (0).
26. Disconnect the jumper wire.
27. Disconnect the blower motor 2P connector.
28. Turn ignition ON (II).
29. Measure the voltage between the blower motor 2P connector terminal No. 1 and body ground.

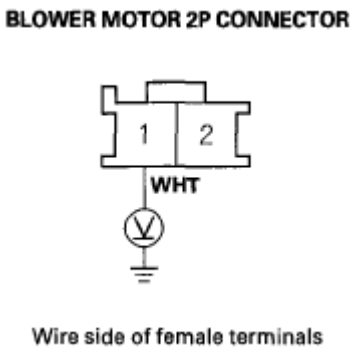

Fig. 30: Measuring Voltage Between Blower Motor 2P Connector Terminal No. 1 And Body Ground

Is there battery voltage?

YES - Replace the blower motor (see **BLOWER UNIT COMPONENT REPLACEMENT**).

NO - Go to step 27.

30. Turn the ignition switch to LOCK (0).
31. Remove the blower motor relay from the under-hood fuse/relay box, and test it (see **POWER RELAY TEST**).

Is the relay OK?

YES - Go to step 29.

NO - Replace the blower motor relay.

32. Measure the voltage between the blower motor relay 4P socket terminal No. 1 and body ground.

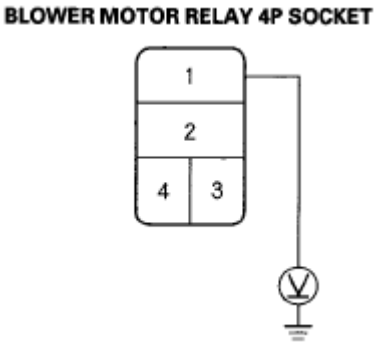

Fig. 31: Measuring Voltage Between Blower Motor Relay 4P Socket Terminal No. 1 And Body Ground

Is there battery voltage?

YES - Go to step 30.

NO - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**).

33. Turn the ignition switch ON (II).
34. Measure the voltage between the blower motor relay 4P socket terminal No. 3 and body ground.

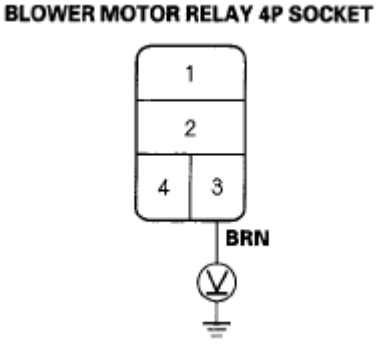

Fig. 32: Measuring Voltage Between Blower Motor Relay 4P Socket Terminal No. 3 And Body Ground

Is there battery voltage?

YES - Go to step 32.

NO - Repair open in the wire between the No. 36 (10 A) fuse in the under-dash fuse/relay box and the blower motor relay.

35. Turn the ignition switch to LOCK (0).

36. Check for continuity between the blower motor relay 4P socket terminal No. 4 and body ground.

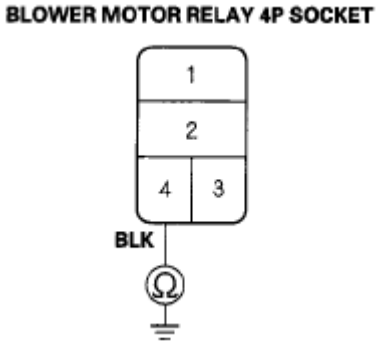

Fig. 33: Checking Continuity Between Blower Motor Relay 4P Socket Terminal No. 4 And Body Ground

Is there continuity?

YES - Repair open in the WHT wire between the blower motor relay and the blower motor.

NO - Check for an open in the wire between the blower motor relay and body ground. If the wire is OK, check for poor ground at G301 (see **CONNECTOR TO HARNESS INDEX**).

DTC INDICATOR 7: HVAC CONTROL UNIT INTERNAL ERROR

NOTE: Check the battery condition (see BATTERY TEST) and the charging system (see CHARGING SYSTEM INDICATOR CIRCUIT TROUBLESHOOTING).

1. Clear the DTC. (see **CLEAR THE DTCS**).
2. Turn the ignition switch to LOCK (0), and then ON (II).
3. Do the self-diagnostic with the HVAC control unit. (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION**).
4. Check for DTCs.

Is DTC 7 indicated?

YES - The HVAC control unit is faulty, replace the HVAC control unit (see **HVAC CONTROL UNIT REMOVAL AND INSTALLATION**).

NO - Intermittent failure, the HVAC control unit is OK at this time.

DTC INDICATOR 8: AN OPEN IN THE EVAPORATOR TEMPERATURE SENSOR CIRCUIT

1. Clear the DTC (see **CLEAR THE DTCS**).
2. Turn the ignition switch to LOCK (0), and then ON (II).
3. Do the self-diagnostic with the HVAC control unit. (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION**).
4. Check for DTCs.

Is DTC 8 indicated?

YES - Go to step 5.

NO - Intermittent failure, check for loose wires or poor connections on the evaporator temperature sensor circuit.

5. Turn the ignition switch to LOCK (0).
6. Remove the evaporator temperature sensor (see **EVAPORATOR CORE REPLACEMENT**) and test it (see **EVAPORATOR TEMPERATURE SENSOR TEST**).

Is the evaporator temperature sensor OK?

YES - Go to step 7.

NO - Replace the evaporator temperature sensor (see **EVAPORATOR CORE REPLACEMENT**).

7. Disconnect the HVAC control unit 24P connector.
8. Check for continuity between the HVAC control unit 24P connector terminal No. 2 and the evaporator temperature sensor 2P connector terminal No. 2.

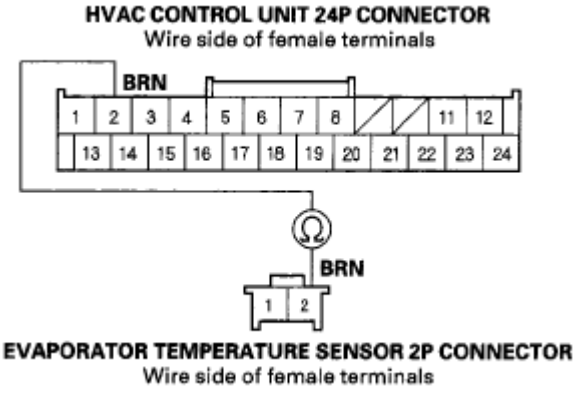

Fig. 34: Checking Continuity Between HVAC Control Unit 24P Terminal No. 2 And Evaporator Temperature Sensor 2P Terminal No. 2

Is there continuity?

YES - Go to step 9.

NO - Repair open in the wire between the HVAC control unit and the evaporator temperature sensor.

9. Check for continuity between the HVAC control unit 24P connector terminal No. 13 and the evaporator temperature sensor 2P connector terminal No. 1.

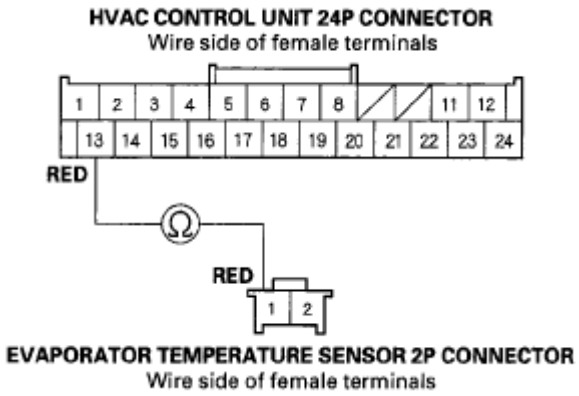

Fig. 35: Checking Continuity Between HVAC Control Unit 24P Terminal No. 13 And Evaporator Temperature Sensor 2P Terminal No. 1

Is there continuity?

YES - Check for loose wires or poor connections at the HVAC control unit 24P connector and at the evaporator temperature sensor 2P connector. If the connections are good, substitute a known-good HVAC control unit, and recheck. If the symptom/indication goes away, replace the original HVAC control unit.

NO - Repair open in the wire between the HVAC control unit and the evaporator temperature sensor.

DTC INDICATOR 9: A SHORT IN THE EVAPORATOR TEMPERATURE SENSOR CIRCUIT

1. Clear the DTC (see **CLEAR THE DTCS**).
2. Turn the ignition switch to LOCK (0), and then ON (II).
3. Do the self-diagnostic with the HVAC control unit (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION**).
4. Check for DTCs.

   Is DTC 9 indicated?

   YES - Go to step 4.

   NO - Intermittent failure.

5. Turn the ignition switch to LOCK (0).
6. Remove the evaporator temperature sensor (see **EVAPORATOR CORE REPLACEMENT**) and test it (see **EVAPORATOR TEMPERATURE SENSOR TEST**).

   Is the evaporator temperature sensor OK?

   YES - Go to step 7.

   NO - Replace the evaporator temperature sensor (see **EVAPORATOR CORE REPLACEMENT**).

7. Disconnect the HVAC control unit 24P connector.

8. Check for continuity between body ground and the HVAC control unit 24P connector terminals No. 2 and No. 13 individually.

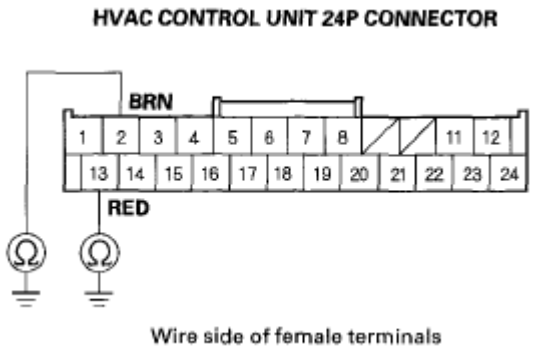

Fig. 36: Checking Continuity Between Body Ground And HVAC Control Unit 24P Connector Terminals No. 2 And No. 13

Is there continuity?

YES - Repair short to body ground in the wires between the HVAC control unit and the evaporator temperature sensor.

NO - Go to step 9.

9. Check for continuity between the HVAC control unit 24P connector terminals No. 2 and No. 13.

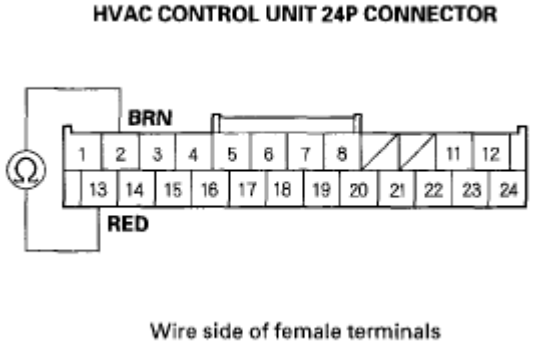

Fig. 37: Checking Continuity Between HVAC Control Unit 24P Connector Terminals No. 2 And No. 13

Is there continuity?

YES - Repair short in the wires between the HVAC control unit and the evaporator temperature sensor.

NO - Substitute a known-good HVAC control unit, and recheck. If the symptom/indication goes away, replace the original HVAC control unit.

RECIRCULATION CONTROL MOTOR CIRCUIT TROUBLESHOOTING

1. Check the No. 36 (10 A) fuse in the under-dash fuse/relay box.

Is the fuse OK?

YES - Go to step 2.

NO - Replace the fuse, and recheck. If the fuse blows again, check for a short in the No. 36 (10 A) fuse circuit.

2. Disconnect the recirculation control motor 7P connector.
3. Turn the ignition switch ON (II).
4. Measure the voltage between the recirculation control motor 7P connector terminal No. 1 and body ground.

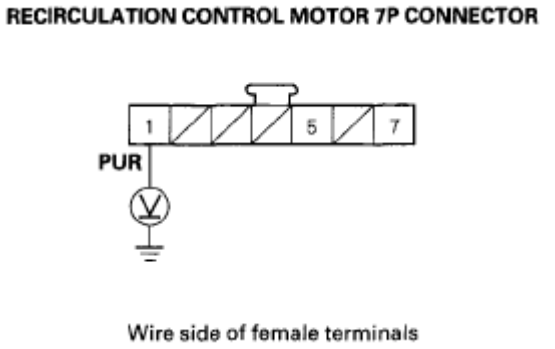

Fig. 38: Measuring Voltage Between Recirculation Control Motor 7P Connector Terminal No. 1 And Body Ground

Is there battery voltage?

YES - Go to step 5.

NO - Repair open in the wire between the No. 36 (10 A) fuse in the under-dash fuse/relay box and the recirculation control motor.

5. Turn the ignition switch to LOCK (0).
6. Test the recirculation control motor (see **RECIRCULATION CONTROL MOTOR TEST**).

Is the recirculation control motor OK?

YES - Go to step 7.

NO - Replace the recirculation control motor (see **RECIRCULATION CONTROL MOTOR REPLACEMENT**), or repair the recirculation control linkage or door.

7. Disconnect the HVAC control unit 24P connector.
8. Check for continuity between body ground and the HVAC control unit 24P connector terminals No. 16 and No. 17 individually.

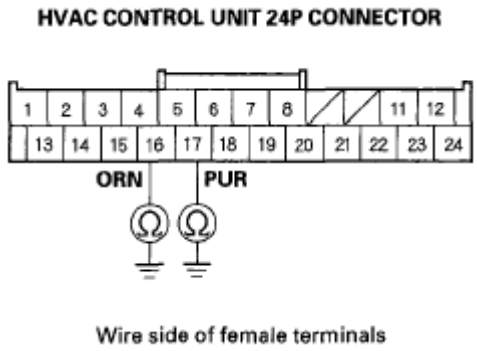

Fig. 39: Checking Continuity Between Body Ground And HVAC Control Unit 24P Connector Terminals No. 16 And No. 17

Is there continuity?

YES - Repair any short to body ground in the wires between the HVAC control unit and the recirculation control motor.

NO - Go to step 9.

9. Turn the ignition switch ON (II), and check the same terminals for voltage to body ground.

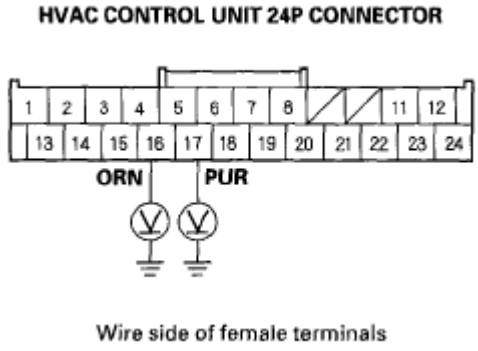

Fig. 40: Checking Voltage Between Body Ground And HVAC Control Unit 24P Connector Terminals No. 16 And No. 17

Is there any voltage?

YES - Repair any short to power in the wires between the HVAC control unit and the recirculation control motor. This short may also damage the HVAC control unit. Repair the short to power before replacing the HVAC control unit.

NO - Go to step 10.

10. Turn the ignition switch to LOCK (0).
11. Check for continuity between the following terminals of the HVAC control unit 24P connector and the recirculation control motor 7P connector.

HVAC CONTROL UNIT 24P CONNECTOR AND RECIRCULATION CONTROL MOTOR 7P CONNECTOR

24P	7P
No. 16	No. 7
No. 17	No. 5

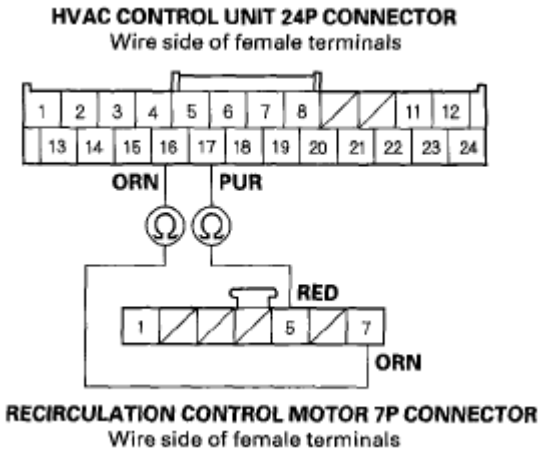

Fig. 41: Checking Continuity Between HVAC Control Unit 24P And Recirculation Control Motor 7P Connector

Is there continuity?

YES - Check for loose wires or poor connections at the HVAC control unit 24P connector and at the recirculation control motor 7P connector. If the connections are good, substitute a known-good HVAC control unit, and recheck. If the symptom/indication goes away, replace the original HVAC control unit.

NO - Repair any open in the wires between the HVAC control unit and the recirculation control motor.

HVAC CONTROL POWER AND GROUND CIRCUIT TROUBLESHOOTING

1. Check the No. 36 (10 A) fuse in the under-dash fuse/relay box.

   Is the fuse OK?

   YES - Go to step 2.

   NO - Replace the fuse, and recheck. If the fuse blows again, check for a short in the No. 36 (10 A) fuse circuit.

2. Disconnect the HVAC control unit 24P connector.
3. Turn the ignition switch ON (II).
4. Measure the voltage between the HVAC control unit 24P connector terminal No. 23 and body ground.

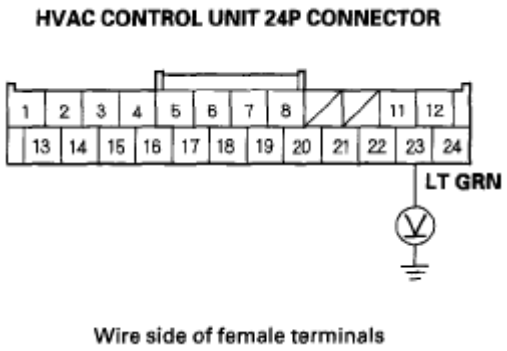

Fig. 42: Measuring Voltage Between HVAC Control Unit 24P Connector Terminal No. 23 And Body Ground

Is there battery voltage?

YES - Go to step 5.

NO - Repair open in the wire between the No. 36 (10 A) fuse in the under-dash fuse/relay box and the HVAC control unit.

5. Turn the ignition switch to LOCK (0).
6. Check for continuity between the HVAC control unit 24P connector terminal No. 21 and body ground.

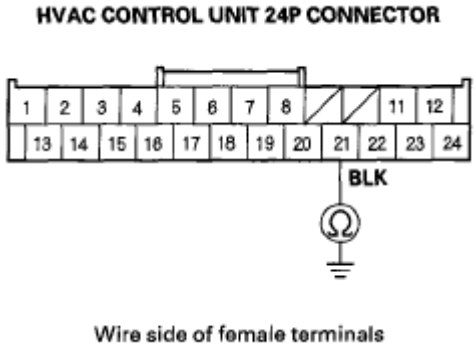

Fig. 43: Checking Continuity Between HVAC Control Unit 24P Connector Terminal No. 21 And Body Ground

Is there continuity?

YES - Check for loose wires or poor connections at the HVAC control unit 24P connector. If the connections are good, substitute a known-good HVAC control unit, and recheck.

NO - Check for an open in the wire between the HVAC control unit and body ground. If the wire is OK, check for poor ground at G504 (see **CONNECTOR TO HARNESS INDEX**).

RADIATOR AND A/C CONDENSER FAN LOW SPEED CIRCUIT TROUBLESHOOTING

NOTE:

- **Do not use this troubleshooting procedure if the A/C compressor is inoperative. Refer to the SYMPTOM TROUBLESHOOTING INDEX.**
- **Before performing symptom troubleshooting, check for powertrain DTCs, R18A1 engine (see GENERAL TROUBLESHOOTING INFORMATION), K20Z3 engine (see GENERAL TROUBLESHOOTING INFORMATION).**

1. Check the No. 7 (20 A: M/T) or (30 A: A/T) fuse in the under-hood fuse/relay box, and the No. 36 (10 A) fuse in the under-dash fuse/relay box.

   Are the fuses OK?

   YES - Go to step 2.

   NO - Replace the fuses, and recheck. If the fuses blow again, check for a short in the No. 7 (20 A: M/T) or (30 A: A/T) and No. 36 (10 A) fuses circuit.

2. Remove the radiator fan relay from the under-hood fuse/relay box, and test it (see **REMOVAL AND INSTALLATION**).

   Is the relay OK?

   YES - Go to step 3.

   NO - Replace the radiator fan relay.

3. Connect the HDS to the DLC.
4. Turn the ignition switch ON (II).
5. Turn on the A/C on the HVAC control unit.
6. Check the FAN LOW CTRL in the PGM-FI Data List with the HDS.

   Is the FAN LOW CTRL on?

   YES - Go to step 7.

   NO - Substitute a known-good ECM/PCM, R18A1 engine (see **SUBSTITUTING THE ECM/PCM**), K20Z3 engine (see **SUBSTITUTING THE ECM**), and retest. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM, R18A1 engine (see **ECM/PCM REPLACEMENT**), K20Z3 engine (see **ECM REPLACEMENT**).

7. Measure the voltage between the radiator fan relay 4P socket terminal No. 1 and body ground.

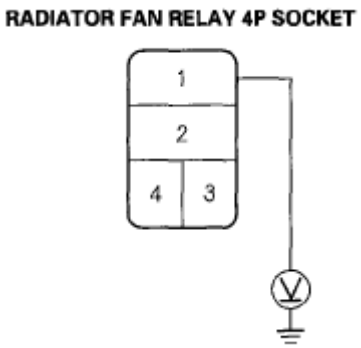

Fig. 44: Measuring Voltage Between Radiator Fan Relay 4P Socket Terminal No. 1 And Body Ground

Is there battery voltage?

YES - Go to step 8.

NO - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**).

8. Connect the radiator fan relay 4P socket terminals No. 1 and No. 2 with a jumper wire.

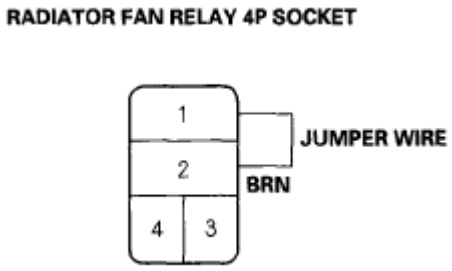

Fig. 45: Connecting Radiator Fan Relay 4P Socket Terminals No. 1 And No. 2 With Jumper Wire

Do the A/C condenser and radiator fans run on low?

YES - Go to step 9.

NO - Go to step 20.

9. Turn the ignition switch to LOCK (0).
10. Disconnect the jumper wire.
11. Turn the ignition switch ON (II).
12. Measure the voltage between the radiator fan relay 4P socket terminal No. 3 and body ground.

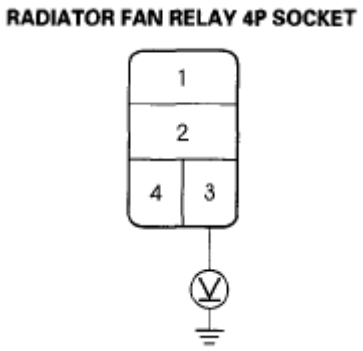

Fig. 46: Measuring Voltage Between Radiator Fan Relay 4P Socket Terminal No. 3 And Body Ground

Is there battery voltage?

YES - Go to step 12.

NO - Go to step 38.

13. Turn the ignition switch to LOCK (0).
14. Reinstall the radiator fan relay.
15. Jump the SCS line with the HDS.

NOTE: This step must be done to protect the engine control module (ECM)/powertrain control module (PCM) from damage.

16. Disconnect ECM/PCM connector A (44P).
17. Connect the ECM/PCM connector A (44P) terminal No. 4 to body ground with a jumper wire.

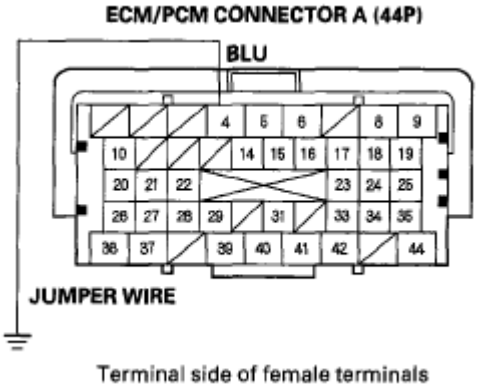

Fig. 47: Connecting ECM/PCM Connector A (44P) Terminal No. 4 To Body Ground With Jumper Wire

18. Turn the ignition switch ON (II).

Do the A/C condenser and radiator fans run on low?

YES - Check for loose wires or poor connections at ECM/PCM connector A (44P) terminal No. 4. If

the connections are good, substitute a known-good ECM/PCM, and recheck. If the symptom/indication goes away, replace the original ECM/PCM, R18A1 engine (see **ECM/PCM REPLACEMENT**), K20Z3 engine (see **ECM REPLACEMENT**).

NO - Repair open in the wire between the radiator fan relay and the ECM/PCM.

19. Turn the ignition switch to LOCK (0).
20. Disconnect the jumper wire.
21. Reinstall the radiator fan relay.
22. Disconnect the radiator fan 2P connector.
23. Turn the ignition switch ON (II), then set the A/C button and fan control dial ON.
24. Measure the voltage between the radiator fan 2P connector terminal No. 2 and body ground.

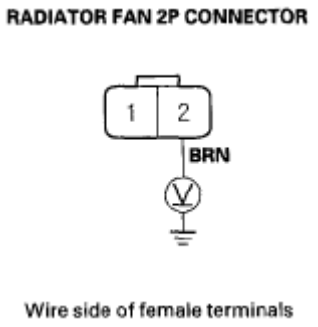

Fig. 48: Measuring Voltage Between Radiator Fan 2P Connector Terminal No. 2 And Body Ground

Is there battery voltage?

YES - Go to step 23.

NO - Repair open in the wire between the radiator fan relay and the radiator fan.

25. Set the A/C button and fan control dial OFF, then turn the ignition switch to LOCK (0).
26. Reconnect the radiator fan 2P connector.
27. Connect the radiator fan 2P connector terminal No. 1 to body ground with a jumper wire.

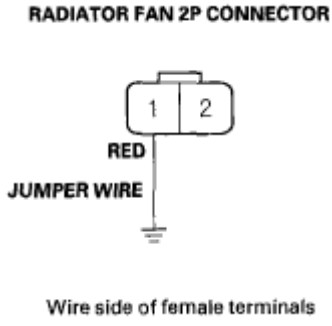

Fig. 49: Connecting Radiator Fan 2P Connector Terminal No. 1 To Body Ground With Jumper Wire

28. Turn the ignition switch ON (II), then set the A/C button and fan control dial ON.

    Does the radiator fan run?

    YES - Go to step 27.

    NO - Replace the radiator fan motor, R18A1 engine (see **RADIATOR AND FAN REPLACEMENT**), K20Z3 engine (see **RADIATOR AND FAN REPLACEMENT**).

29. Set the A/C button and fan control dial OFF, then turn the ignition switch to LOCK (0).
30. Disconnect the jumper wire.
31. Remove the fan control relay from the under-hood relay box, and test it (see **REMOVAL AND INSTALLATION**).

    Is the relay OK?

    YES - Go to step 30.

    NO - Replace the fan control relay.

32. Turn the ignition switch ON (II), then set the A/C button and fan control dial ON.
33. Measure the voltage between the fan control relay 5P socket terminal No. 1 and body ground.

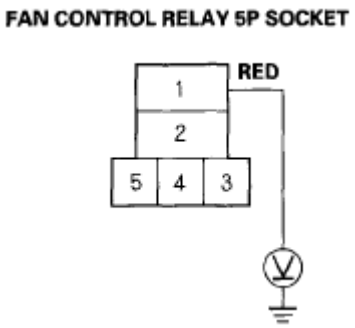

Fig. 50: Measuring Voltage Between Fan Control Relay 5P Socket Terminal No. 1 And Body Ground

    Is there battery voltage?

    YES - Go to step 32.

    NO - Repair open in the wire between the radiator fan and the fan control relay.

34. Set the A/C button and fan control dial OFF, then turn the ignition switch to LOCK (0).
35. Disconnect the A/C condenser fan 2P connector.
36. Check for continuity between the fan control relay 5P socket terminal No. 4 and the A/C condenser fan 2P connector terminal No. 2.

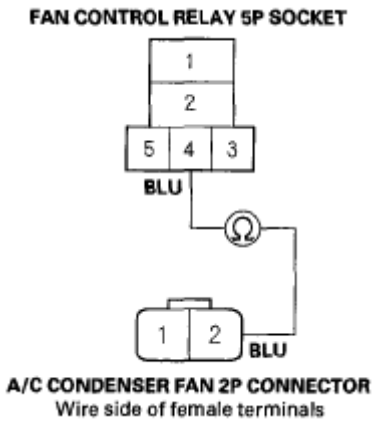

Fig. 51: Checking Continuity Between Fan Control Relay 5P Socket Terminal No. 4 And A/C Condenser Fan 2P Terminal No. 2

Is there continuity?

YES - Go to step 35.

NO - Repair open in the wire between the fan control relay and the A/C condenser fan.

37. Check for continuity between the A/C condenser fan 2P connector terminal No. 1 and body ground.

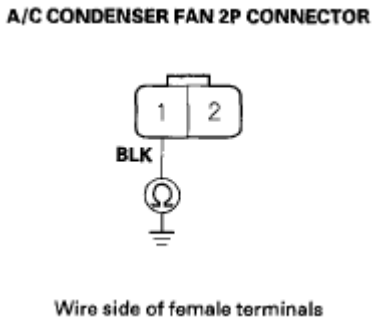

Fig. 52: Checking Continuity Between A/C Condenser Fan 2P Connector Terminal No. 1 And Body Ground

Is there continuity?

YES - Replace the A/C condenser fan motor, R18A1 engine (see **RADIATOR AND FAN REPLACEMENT**), K20Z3 engine (see **RADIATOR AND FAN REPLACEMENT**).

NO - Check for an open in the wire between the A/C condenser fan and body ground. If the wire is OK, check for poor ground at G301 (see **CONNECTOR TO HARNESS INDEX**).

38. Turn the ignition switch to LOCK (0).
39. Remove A/C diode A from the under-hood fuse/relay box.
40. Using the diode setting on a DVOM, check for current flow in both directions between the A/C diode A terminals No. 1 and No. 2.

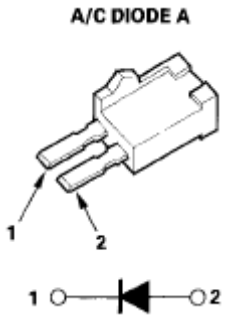

Fig. 53: Checking Current Flow In Both Directions Between A/C Diode A Terminals No. 1 And No. 2

Is there current flow in only one direction?

YES - Go to step 39.

NO - Replace A/C diode A.

41. Turn the ignition switch ON (II).
42. Measure the voltage between the A/C diode A 2P socket terminal No. 2 and body ground.

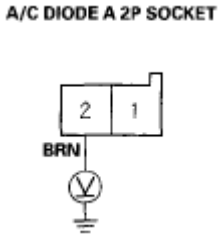

Fig. 54: Measuring Voltage Between A/C Diode A 2P Socket Terminal No. 2 And Body Ground

Is there battery voltage?

YES - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**).

NO - Repair open in the wire between the No. 36 (10 A) fuse in the under-dash fuse/relay box and A/C diode A.

A/C CONDENSER FAN HIGH SPEED CIRCUIT TROUBLESHOOTING

NOTE:

- **Do not use this troubleshooting procedure if the A/C compressor is inoperative. Refer to the SYMPTOM TROUBLESHOOTING INDEX.**
- **Before performing symptom troubleshooting, check for powertrain DTCs, R18A1 engine (see GENERAL TROUBLESHOOTING INFORMATION), K20Z3 engine (see GENERAL TROUBLESHOOTING INFORMATION).**

1. Check the No. 6 (20 A) and No. 15 (7.5 A) fuses in the under-hood fuse/relay box.

Are the fuses OK?

YES - Go to step 2.

NO - Replace the fuses, and recheck. If the fuses blow again, check for a short in the No. 6 (20 A) and No. 15 (7.5 A) fuses circuit.

2. Remove the A/C condenser fan relay from the under-hood fuse/relay box, and test it (see **POWER RELAY TEST**).

   Is the relay OK?

   YES - Go to step 3.

   NO - Replace the A/C condenser fan relay.

3. Measure the voltage between the A/C condenser fan relay 4P socket terminal No. 1 and body ground.

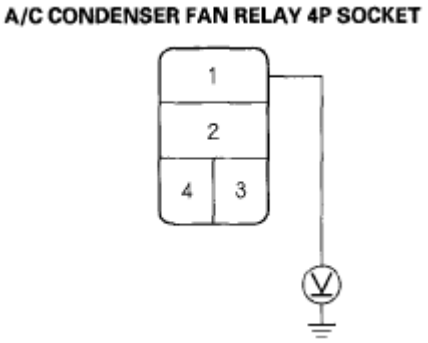

Fig. 55: Measuring Voltage Between A/C Condenser Fan Relay 4P Socket Terminal No. 1 And Body Ground

Is there battery voltage?

YES - Go to step 4.

NO - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**).

4. Connect the A/C condenser fan relay 4P socket terminals No. 1 and No. 2 with a jumper wire.

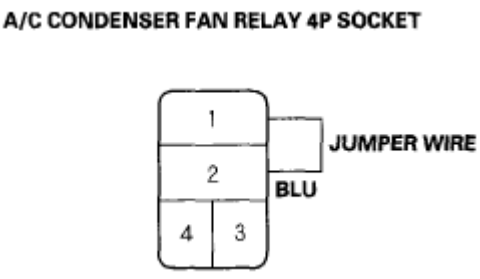

Fig. 56: Connecting A/C Condenser Fan Relay 4P Socket Terminals No. 1 And No. 2 With Jumper Wire

Does the A/C condenser fan run on high?

YES - Go to step 5.

NO - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**).

5. Disconnect the jumper wire.
6. Turn the ignition switch ON (II).
7. Measure the voltage between the A/C condenser fan relay 4P socket terminal No. 4 and body ground.

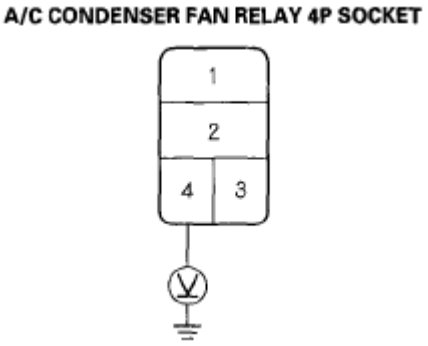

Fig. 57: Measuring Voltage Between A/C Condenser Fan Relay 4P Socket Terminal No. 4 And Body Ground

Is there battery voltage?

YES - Go to step 8.

NO - Go to step 16.

8. Turn the ignition switch to LOCK (0).
9. Check for continuity between the fan control relay 5P socket No. 2 terminal and body ground.

Is there continuity?

YES - Go to step 10.

NO - Check for an open in the wire between the fan control relay and body ground. If the wire is OK, check for poor ground at G301.

10. Reinstall the A/C condenser fan relay.
11. Jump the SCS line with the HDS.

NOTE: This step must be done to protect the engine control module (ECM)/powertrain control module (PCM) from damage.

12. Disconnect ECM/PCM connector A (44P).
13. Connect the ECM/PCM connector A (44P) terminal No. 5 to body ground with a jumper wire.

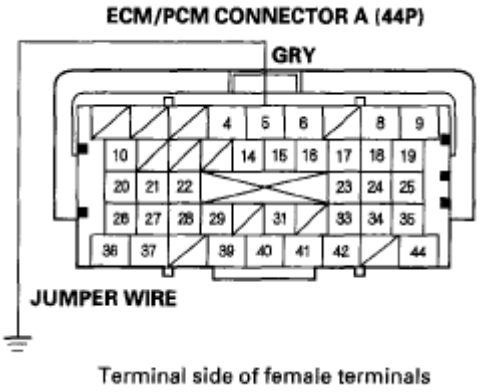

Fig. 58: Connecting ECM/PCM Connector A (44P) Terminal No. 5 To Body Ground With Jumper Wire

14. Turn the ignition switch ON (II).

    Does the A/C condenser fan run on high?

    YES - Check for loose wires or poor connections at ECM/PCM connector A (44P) terminal No. 5. If the connections are good, substitute a known-good ECM/PCM, and recheck. If the symptom/indication goes away, replace the original ECM/PCM, R18A1 engine (see **ECM/PCM REPLACEMENT**), K20Z3 engine (see **ECM REPLACEMENT**).

    NO - Repair open in the wire between the A/C condenser fan relay and the ECM/PCM.

15. Turn the ignition switch to LOCK (0).
16. Remove A/C diode B from the under-hood fuse/relay box.
17. Turn the ignition switch ON (II).
18. Measure the voltage between the A/C diode B 2P socket terminal No. 2 and body ground.

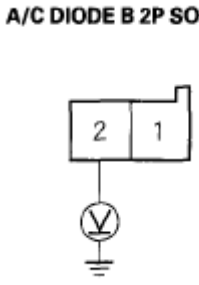

Fig. 59: Measuring Voltage Between A/C Diode B 2P Socket Terminal No. 2 And Body Ground

Is there battery voltage?

YES - Go to step 19.

NO - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**).

19. Using the diode setting on a DVOM, check for current flow in both directions between the A/C diode B terminals No. 1 and No. 2.

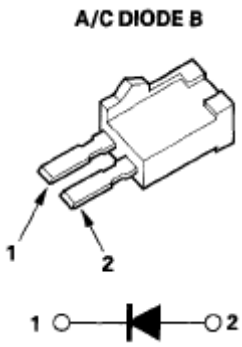

Fig. 60: Checking Current Flow In Both Directions Between A/C Diode B Terminals No. 1 And No. 2

Is there current flow in only one direction?

YES - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**).

NO - Replace A/C diode B.

A/C COMPRESSOR CLUTCH CIRCUIT TROUBLESHOOTING

NOTE:

- **It is normal for the A/C compressor to turn off under certain conditions, such as low idle, high engine coolant temperature, or hard acceleration.**
- **Do not use this troubleshooting procedure if the fans are also inoperative with the A/C on. Refer to the SYMPTOM TROUBLESHOOTING INDEX.**
- **Before doing any symptom troubleshooting, check for powertrain DTCs, R18A1 engine (see GENERAL TROUBLESHOOTING INFORMATION), K20Z3 engine (see GENERAL TROUBLESHOOTING INFORMATION).**

1. Check the No. 20 (7.5 A) fuse in the under-hood fuse/relay box, and the No. 36 (10 A) fuse in the under-dash fuse/relay box.

   Are the fuses OK?

   YES - Go to step 2.

   NO - Replace the fuses and recheck. If the fuses blow again, check for a short in the No. 20 (7.5 A) and No. 36 (10 A) fuses circuit.

2. Connect the HDS to the DLC.
3. Start the engine.
4. Turn on the A/C on the HVAC control unit.
5. Check the A/C CLUTCH in the PGM-FI Data List with the HDS at idle.

HDS A/C VALUES

ECT sensor 2	176-212 °F (80-100 °C)

TP sensor	About 0.5 V at idle
RPM	More than 670
A/C Switch	ON
A/C Clutch	ON

Are all the values within specifications?

YES - Go to step 6.

NO - Troubleshoot the value that is not within the specfications.

6. Turn the ignition switch to LOCK (0).
7. Remove the A/C compressor clutch relay from the under-hood fuse/relay box, and test it (see **POWER RELAY TEST**).

   Is the relay OK?

   YES - Go to step 8.

   NO - Replace the A/C compressor clutch relay.

8. Measure the voltage between the A/C compressor clutch relay 4P socket terminal No. 1 and body ground.

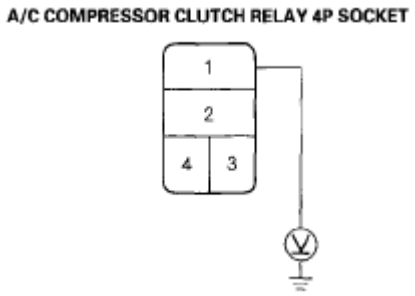

Fig. 61: Measuring Voltage Between A/C Compressor Clutch Relay 4P Socket Terminal No. 1 And Body Ground

Is there battery voltage?

YES - Go to step 9.

NO - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**).

9. Connect the A/C compressor clutch relay 4P socket terminals No. 1 and No. 2 with a jumper wire.

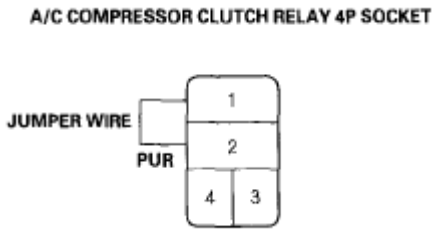

Fig. 62: Connecting A/C Compressor Clutch Relay 4P Socket Terminals No. 1 And No. 2 With Jumper Wire

Does the A/C compressor clutch click?

YES - Go to step 10.

NO - Go to step 19.

10. Disconnect the jumper wire.
11. Turn the ignition switch ON (II).
12. Measure the voltage between the A/C compressor clutch relay 4P socket terminal No. 3 and body ground.

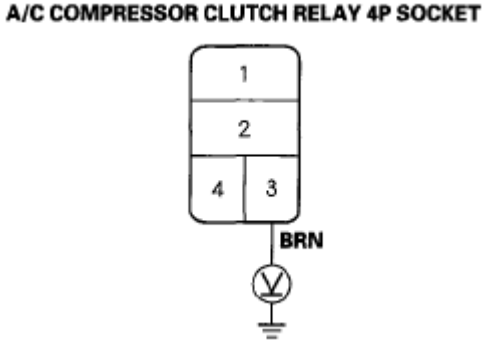

Fig. 63: Measuring Voltage Between A/C Compressor Clutch Relay 4P Socket Terminal No. 3 And Body Ground

Is there battery voltage?

YES - Go to step 13.

NO - Repair open in the wire between the No. 36 (10 A) fuse in the under-dash fuse/relay box and the A/C compressor clutch relay.

13. Turn the ignition switch to LOCK (0).
14. Reinstall the A/C compressor clutch relay.
15. Jump the SCS line with the HDS.

NOTE: This step must be done to protect the engine control module (ECM)/powertrain control module (PCM) from damage.

16. Disconnect ECM/PCM connector A (44P).
17. Connect the ECM/PCM connector A (44P) terminal No. 14 to body ground with a jumper wire.

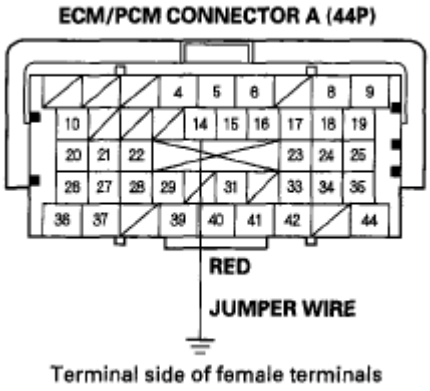

Fig. 64: Connecting ECM/PCM Connector A (44P) Terminal No. 14 To Body Ground With Jumper Wire

18. Turn the ignition switch ON (II).

    Does the A/C compressor click?

    YES - Check for loose wires or poor connections at ECM/PCM connector A (44P). If the connections are good, check the ECM/PCM grounds. If the grounds are good, substitute a known-good ECM/PCM, and recheck. If the symptom/indication goes away, replace the original ECM/PCM, R18A1 engine (see **ECM/PCM REPLACEMENT**), K20Z3 engine (see **ECM REPLACEMENT**).

    NO - Repair open in the wire between the A/C compressor clutch relay and the ECM/PCM.

19. Disconnect the jumper wire.
20. Disconnect the A/C compressor clutch 3P connector.
21. Check for continuity between the A/C compressor clutch relay 4P socket terminal No. 2 and the A/C compressor clutch 3P connector terminal No. 2.

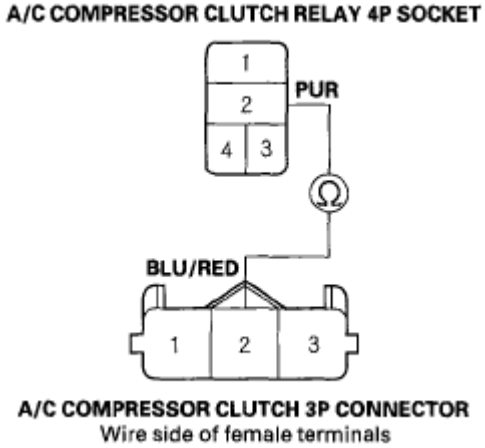

Fig. 65: Checking Continuity Between A/C Compressor Clutch Relay 4P Socket Terminal No. 2 And A/C Compressor Clutch 3P Terminal

Is there continuity?

YES - Check the A/C compressor clutch clearance, and the compressor clutch field coil (see **A/C COMPRESSOR CLUTCH CHECK**). Repair as needed.

NO - Repair open in the wire between the A/C compressor clutch relay and the A/C compressor clutch.

A/C SIGNAL CIRCUIT TROUBLESHOOTING

NOTE:

- **Do not use this troubleshooting procedure if any of the following items are operative; A/C condenser fan, radiator fan, A/C compressor. Refer to the SYMPTOM TROUBLESHOOTING INDEX.**
- **Before performing symptom troubleshooting, check for powertrain DTCs, R18A1 engine (see GENERAL TROUBLESHOOTING INFORMATION), K20Z3 engine (see GENERAL TROUBLESHOOTING INFORMATION).**

1. Turn the ignition switch to LOCK (0).
2. Disconnect the HVAC control unit 24P connector.
3. Turn the ignition switch ON (II).
4. Measure the voltage between the HVAC control unit 24P connector terminal No. 11 and body ground.

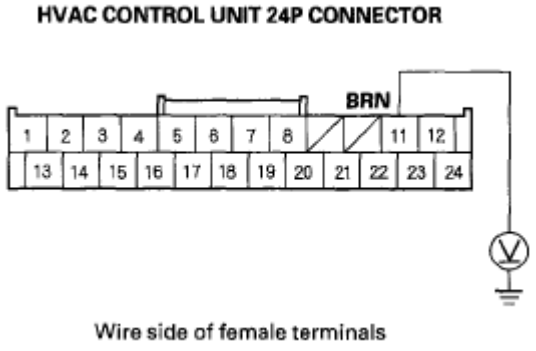

Fig. 66: Measuring Voltage Between HVAC Control Unit 24P Terminal No. 11 And Body Ground

Is there voltage?

YES - Go to step 11.

NO - Go to step 5.

5. Turn the ignition switch to LOCK (0).
6. Disconnect the A/C compressor clutch 3P connector.
7. Turn the ignition switch ON (II).
8. R18A1 engine: Measure the voltage between the A/C compressor clutch 3P connector terminal No. 3 and body ground.

K20Z3 engine: Measure the voltage between the A/C compressor clutch 3P connector terminal No. 1 and body ground.

R18A1 engine

K20Z3 engine

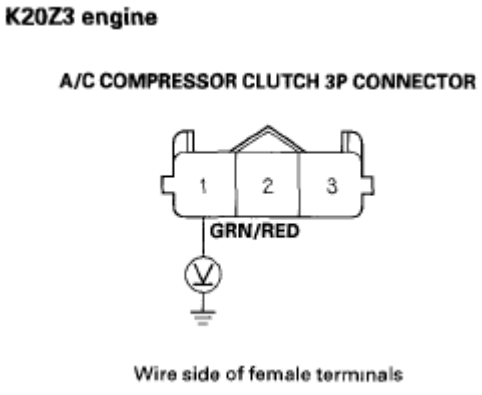

Fig. 68: Measuring Voltage Between A/C Compressor Clutch 3P Terminal No. 1 And Body Ground (K20Z3 Engine)

Is there battery voltage?

YES - Go to step 9.

NO - Repair open in the wire between the A/C compressor and the MICU. If the wire is OK, substitute a known-good MICU and recheck. If the symptom goes away, replace the original MICU.

9. Test the A/C compressor thermal protector (see **A/C COMPRESSOR CLUTCH CHECK**).

Is the A/C compressor thermal protector OK?

YES - Go to step 10.

NO - Replace the A/C compressor thermal protector (see **A/C COMPRESSOR THERMAL**

PROTECTOR REPLACEMENT).

10. R18A1 engine: Check for continuity between the HVAC control unit 24P connector terminal No. 11 and the A/C compressor clutch 3P connector terminal No. 1.

    K20Z3 engine: Check for continuity between the HVAC control unit 24P connector terminal No. 11 and the A/C compressor clutch 3P connector terminal No. 3.

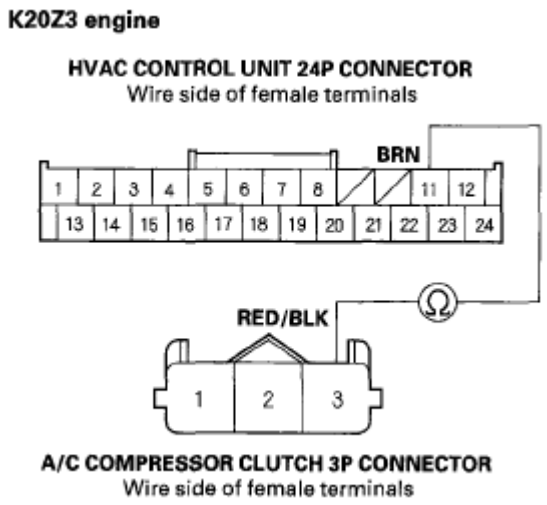

Fig. 70: Checking Continuity Between HVAC Control Unit 24P Terminal No. 11 And A/C Compressor Clutch 3P Terminal No. 3 (K20Z3 Engine)

    Is there continuity?

    YES - Check for loose wires or poor connections at the HVAC control unit 24P connector and at the

A/C compressor clutch 3P connector.

NO - Repair open in the wire between the HVAC control unit and A/C compressor.

11. Turn the ignition switch to LOCK (0).
12. Measure the evaporator temperature sensor resistance between the HVAC control unit 24P connector terminals No. 2 and No. 13.

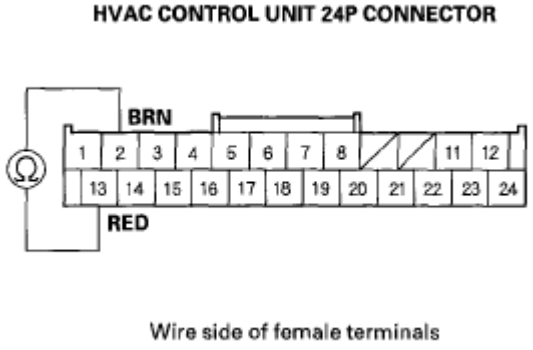

Fig. 71: Measuring Evaporator Temperature Sensor Resistance Between HVAC Control Unit 24P Connector Terminals No. 2 And No. 13

Is resistance less than 24 kohms ?

YES - Go to step 13.

NO - Test the evaporator temperature sensor (see **EVAPORATOR TEMPERATURE SENSOR TEST**).

13. Reconnect the HVAC control unit 24P connector.
14. Turn the ignition switch ON (II).
15. Check if the blower motor operates at all speeds.

Does the blower motor operates at all speeds?

YES - Check for loose wires or poor connections at the HVAC control unit 24P connector. If the connections are good, substitute a known-good HVAC control unit and recheck. If the symptom goes away, replace the original HVAC control unit.

NO - Repair the problem in the blower motor circuit.

EVAPORATOR TEMPERATURE SENSOR TEST

1. Remove the evaporator core and the evaporator temperature sensor (see **EVAPORATOR CORE REPLACEMENT**).
2. Dip the sensor in ice water, and measure the resistance between its terminals.

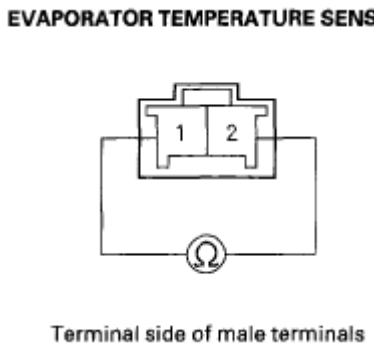

Fig. 72: Measuring Resistance Between Evaporator Temperature Sensor Terminals

3. Then pour warm water on the sensor, and check for a change in resistance.
4. Compare the resistance readings with the specifications shown in **Fig. 73** ; the resistance should be within the specifications.

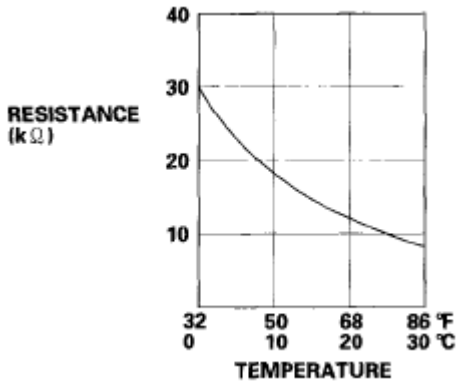

Fig. 73: Resistance To Temperature Graph

5. If the resistance is not as specified, replace the evaporator temperature sensor (see **EVAPORATOR CORE REPLACEMENT**).

HVAC CONTROL UNIT REMOVAL AND INSTALLATION

1. Remove the center panel (see **AUDIO UNIT REMOVAL/INSTALLATION**).
2. Remove the dials (A), the self-tapping screws, and the HVAC control unit (B).

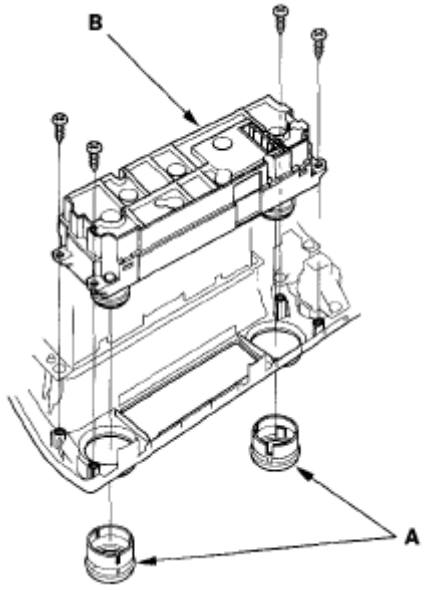

Fig. 74: Removing Dials, Self-Tapping Screws And HVAC Control Unit

3. Install the control unit in the reverse order of removal. After installation, operate the various functions to make sure they work properly.
4. Run the self-diagnostic function to confirm that there are no problems in the system (see **GENERAL TROUBLESHOOTING INFORMATION**).

EVAPORATOR CORE REPLACEMENT

1. Recover the refrigerant with a recovery/recycling/charging station (see **REFRIGERANT RECOVERY**).
2. Remove the bolt.

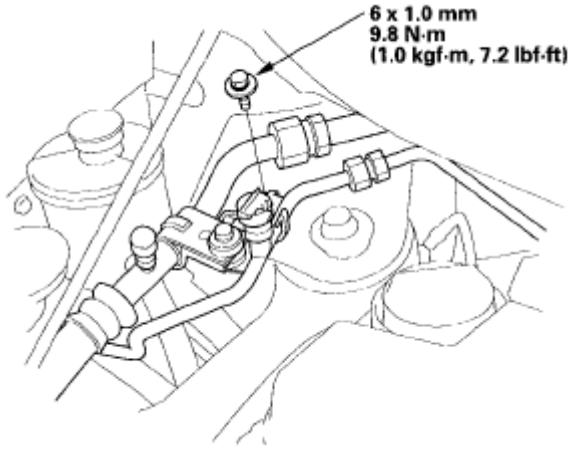

Fig. 75: Removing Evaporator Core Bolt (With Specifications)

3. Remove the nut, then disconnect the A/C lines (A) from the evaporator core.

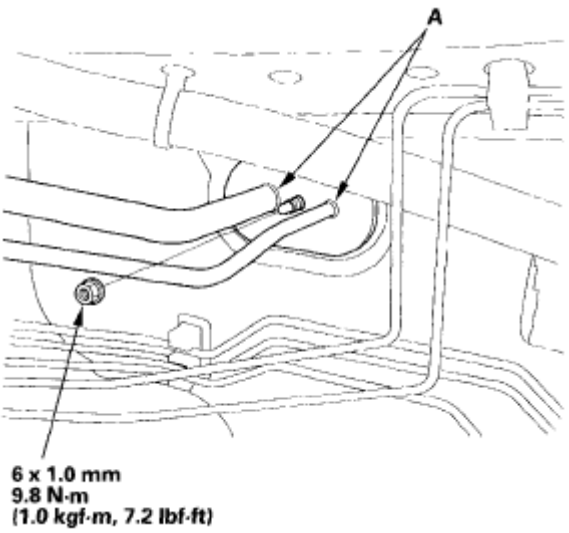

Fig. 76: Disconnecting A/C Lines From Evaporator Core (With Specifications)

4. Remove the stud bolt.

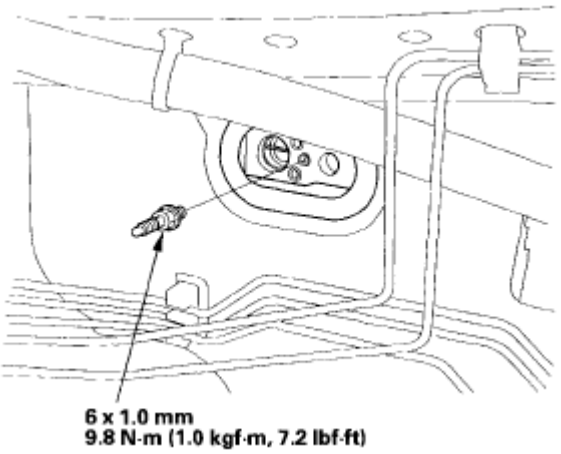

Fig. 77: Removing Stud Bolt (With Specifications)

5. Remove the blower unit (see **BLOWER UNIT REMOVAL AND INSTALLATION**).
6. Disconnect the connectors (A) from the evaporator temperature sensor and the power transistor, then remove the connector clip (B). Remove the self-tapping screws, the expansion valve cover (C), and the seal (D).

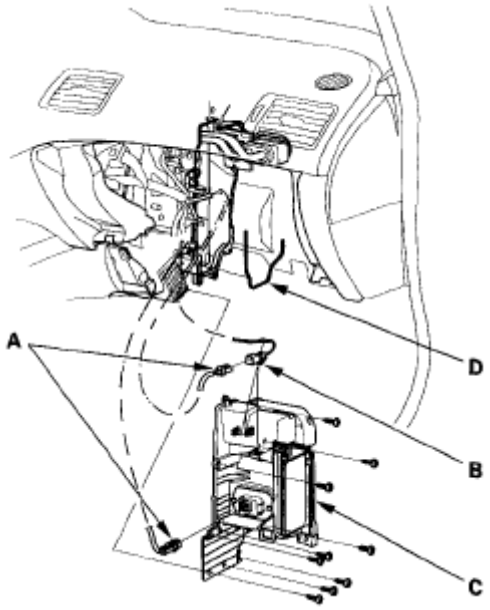

Fig. 78: Disconnecting Connectors From Evaporator Temperature Sensor And Power Transistor

7. Carefully pull out the evaporator core (A) without bending the lines, then remove the plate (B).

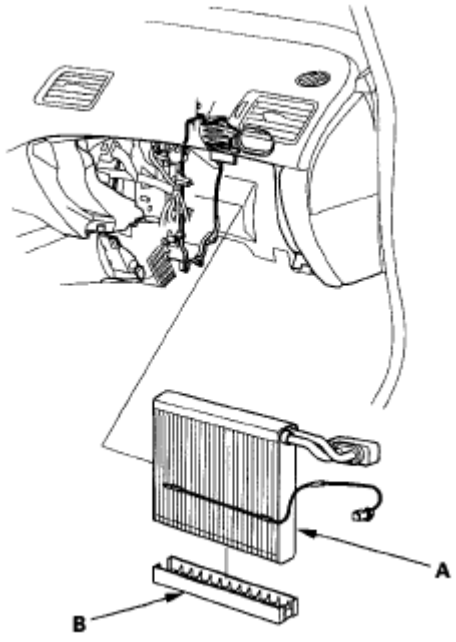

Fig. 79: Removing Evaporator Core Without Bending Lines

8. Remove the clips (A) and the evaporator temperature sensor (B).

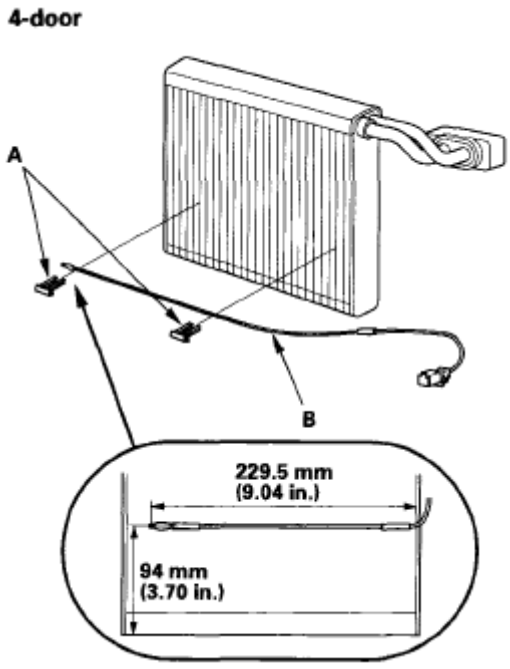

Fig. 80: Removing Clips And Evaporator Temperature Sensor (4-Door)

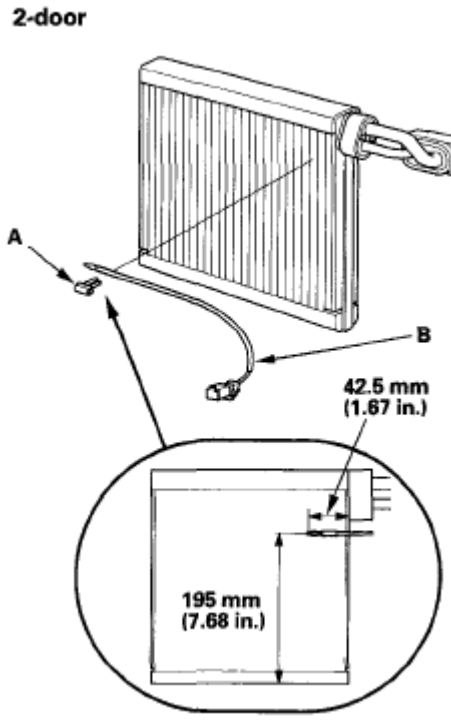

Fig. 81: Removing Clips And Evaporator Temperature Sensor (2-Door)

9. Install the core in the reverse order of removal and note these items:
   - If you're installing a new evaporator core, add refrigerant oil (SP-10) (see **A/C REFRIGERANT OIL REPLACEMENT**).
   - Replace the O-rings with new ones at each fitting, and apply a thin coat of refrigerant oil before installing them. Be sure to use the correct O-rings for HFC-134a (R-134a) to avoid leakage.
   - Immediately after using the oil, reinstall the cap on the container, and seal it to avoid moisture

absorption.

- Do not spill the refrigerant oil on the vehicle; it may damage the paint; if the refrigerant oil contacts the paint, wash it off immediately.
- Make sure that there is no air leakage.
- Charge the system (see **SYSTEM CHARGING**).

HEATER UNIT/CORE REPLACEMENT

SRS components are located in this area. Review the SRS component locations (see **COMPONENT LOCATION INDEX**) and the precautions and procedures (see **PRECAUTIONS AND PROCEDURES**) in the SRS before doing repairs or service.

1. Make sure you have the anti-theft code for the audio or the navigation system, then write down the audio presets.
2. Make sure the ignition is OFF, then disconnect the negative cable from the battery.
3. Disconnect the A/C line from the evaporator core (see **EVAPORATOR CORE REPLACEMENT**).
4. Remove the air cleaner housing assembly, R18A1 engine (see **THROTTLE BODY CLEANING**), K20Z3 engine (see **AIR CLEANER REMOVAL/INSTALLATION**).
5. When the engine is cool, drain the engine coolant from the radiator, R18A1 engine (see **COOLANT REPLACEMENT**), K20Z3 engine (see **COOLANT CHECK**).
6. From under the hood, slide the hose clamps (A) back. Disconnect the inlet heater hose (B) and the outlet heater hose (C) from the heater unit. Note the orientation of the hose.

   Engine coolant will run out when the hoses are disconnected; drain it into a clean drip pan. Be sure not to let coolant spill on the electrical parts or the painted surfaces. If any coolant spills, rinse it off immediately.

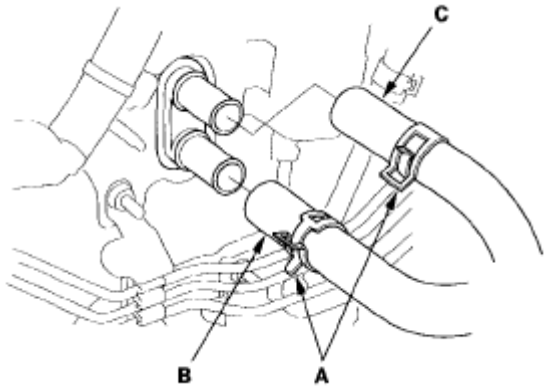

Fig. 82: Disconnecting Inlet And Outlet Heater Hose

7. Remove the mounting nut from the heater unit. Take care not to damage or bend the fuel lines or brake lines, etc.

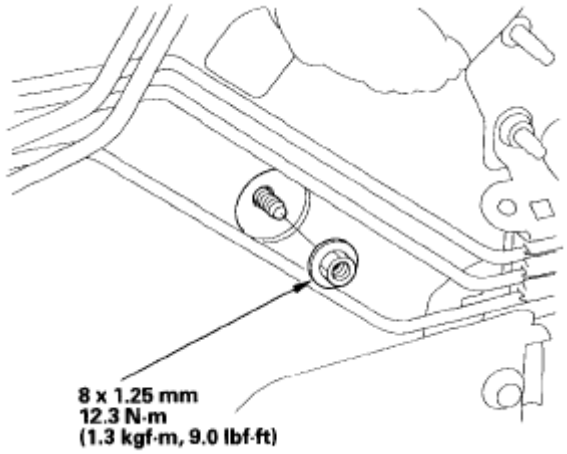

Fig. 83: Removing Heater Unit Nut (With Specifications)

8. Remove the dashboard (see **DASHBOARD/STEERING HANGER BEAM REMOVAL/INSTALLATION**).
9. Disconnect the connector (A) from the blower motor. Remove the wire harness clip (B).

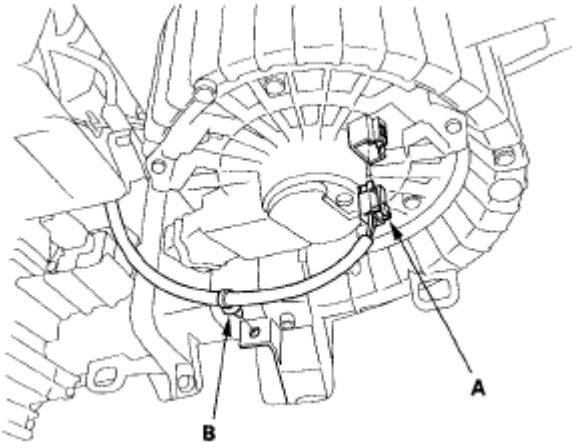

Fig. 84: Disconnecting Connector From Blower Motor

10. Disconnect the connector (A) from the recirculation control motor.

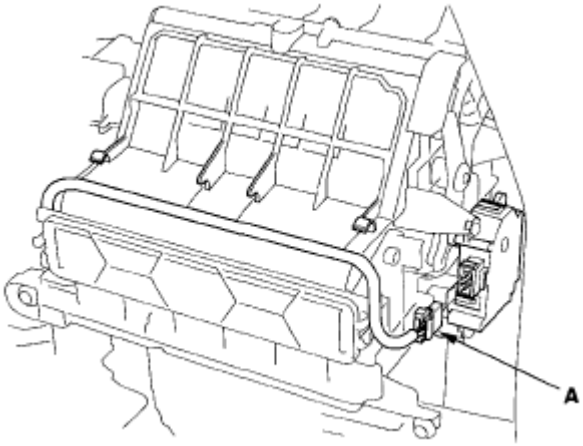

Fig. 85: Disconnecting Connector From Recirculation Control Motor

11. Disconnect the connectors (A) from the mode control motor, the evaporator temperature sensor, and the power transistor. Remove the wire harness clips (B).

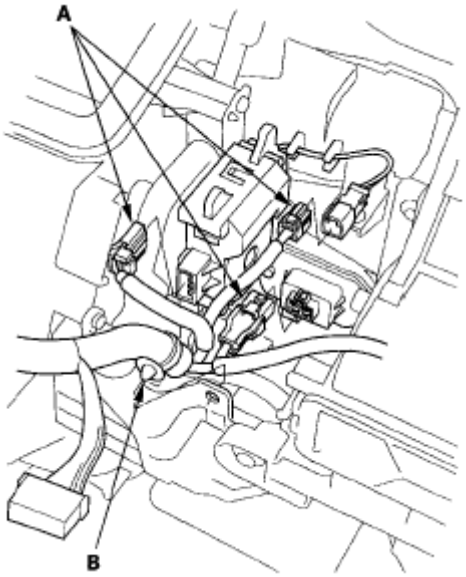

Fig. 86: Disconnecting Connector From Mode Control Motor

12. Disconnect the connectors (A) from the air mix control motor and A/C wire harness. Remove the connector clip (B), the wire harness clips (C), and the wire harness (D).

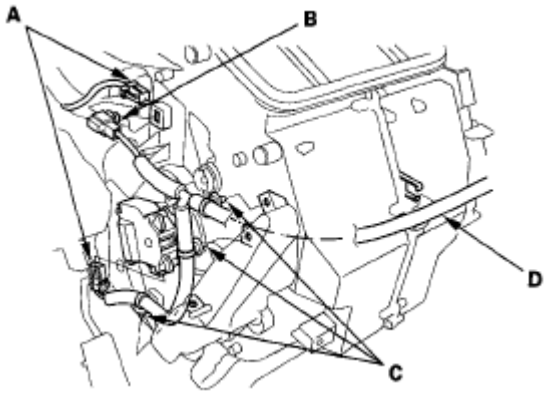

Fig. 87: Disconnecting Connectors From Air Mix Control Motor And A/C Wire Harness

13. Remove the mounting bolt, mounting nuts, and blower-heater unit (A).

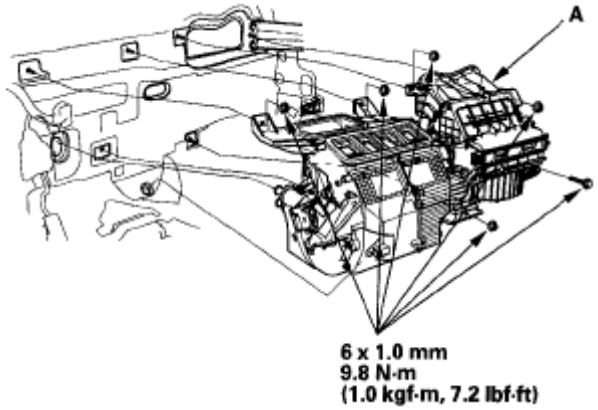

Fig. 88: Removing Blower-Heater Unit (With Specifications)

14. Remove the self-tapping screws, the heater core cover (A), the grommet (B), and carefully pull out the heater core (C).

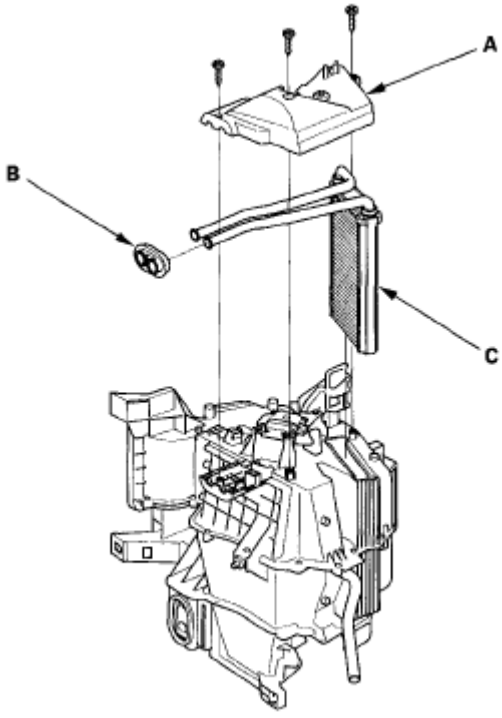

Fig. 89: Removing Heater Core Cover

15. Install the heater core and the evaporator core in the reverse order of removal.
16. Install the heater unit in the reverse order of removal, and note these items:
    - Do not interchange the inlet and outlet heater hoses, and install the hose clamps securely.
    - Refill the cooling system with engine coolant, R18A1 engine (see **COOLANT REPLACEMENT**), K20Z3 engine (see **COOLANT REPLACEMENT**).
    - Make sure that there is no coolant leakage.
    - Make sure that there is no air leakage.
    - Refer to **EVAPORATOR CORE REPLACEMENT** .
    - Enter the anti-theft code for the audio or navigation system, then enter the audio presets.

- Set the clock.

A/C COMPRESSOR REPLACEMENT

R18A1 ENGINE

NOTE: Do not install an A/C compressor into a system unless you are completely sure that the system is free of contamination. Installing the A/C compressor into a contaminated system can result in premature A/C compressor failure.

1. If the A/C compressor is marginally operable, run the engine at idle speed, and let the air conditioning work for a few minutes, then shut the engine off.
2. Recover the refrigerant with a recovery/recycling/charging station (see **REFRIGERANT RECOVERY**).
3. Make sure you have the anti-theft code for the audio or navigation system, then write down the audio presets.
4. Remove the front grille cover (see **FRONT GRILLE COVER REPLACEMENT**) and the alternator (see **ALTERNATOR REMOVAL AND INSTALLATION**).
5. Disconnect the connector (A) from the A/C condenser fan motor. Remove the wire harness clip (B) and the connector clip (C). Remove the upper mounting bolts, and the A/C condenser fan shroud (D). Be careful not to damage the radiator fins when removing the A/C condenser fan shroud.

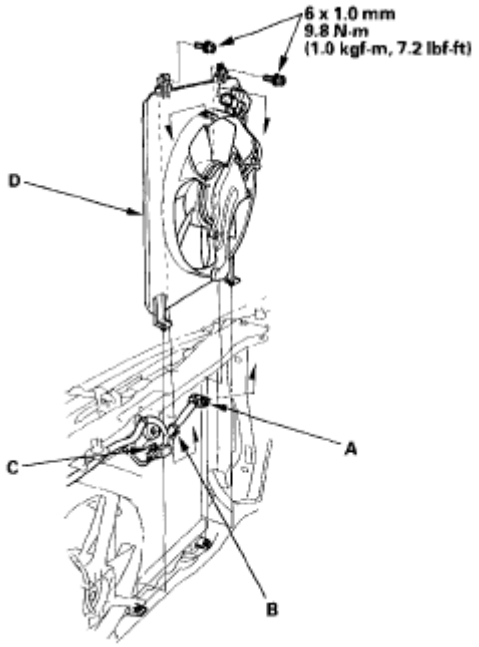

Fig. 90: Removing A/C Condenser Fan Shroud (With Specifications)

6. Remove the bolt and the nut, then disconnect the suction hose (A) and discharge hose (B) from the A/C compressor. Plug or cap the lines immediately after disconnecting them to avoid moisture and dust contamination.

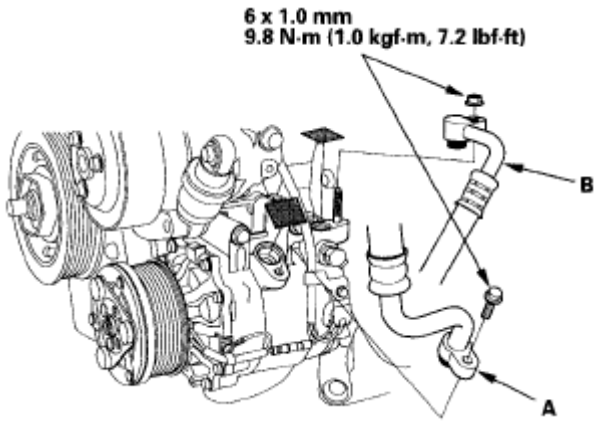

Fig. 91: Disconnecting Suction Hose And Discharge Hose (With Specifications)

7. Remove the mounting bolts and the A/C compressor (A). Be careful not to damage the radiator fins when removing the A/C compressor.

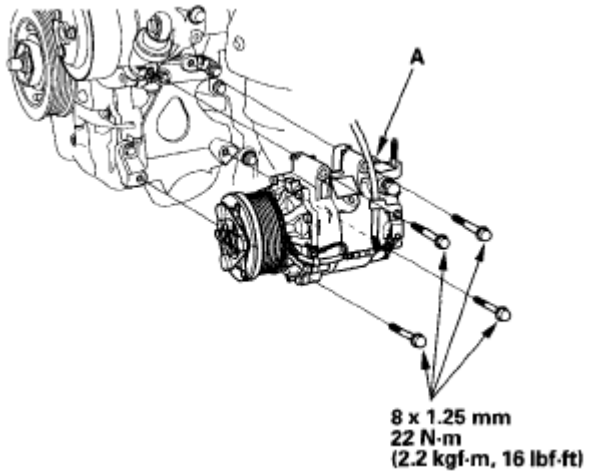

Fig. 92: Removing A/C Compressor (With Specifications)

8. Install the compressor in the reverse order of removal, and note these items:
   - Inspect the A/C lines for any signs of contamination.
   - If you're installing a new A/C compressor, you must calculate the amount of refrigerant oil to be removed from it (see **A/C REFRIGERANT OIL REPLACEMENT**). A new A/C compressor comes with a full charge of oil.
   - Replace the O-rings with new ones at each fitting, and apply a thin coat of refrigerant oil before installing them. Be sure to use the correct O-rings for HFC-134a (R-134a) to avoid leakage.
   - Use refrigerant oil (SP-10) for HFC-134a spiral type A/C compressor only.
   - To avoid contamination, do not return the oil to the container once dispensed, and never mix it with other refrigerant oils.
   - Immediately after using the oil, reinstall the cap on the container, and seal it to avoid moisture absorption.
   - Do not spill the refrigerant oil on the vehicle; it may damage the paint; if the refrigerant oil contacts the paint, wash it off immediately.
   - Charge the system (see **SYSTEM CHARGING**).

- Enter the anti-theft code for the audio or navigation system, then enter the audio presets.
- Set the clock.

K20Z3 ENGINE

NOTE: Do not install an A/C compressor into a system unless you are completely sure that the system is free of contamination. Installing the A/C compressor into a contaminated system can result in premature A/C compressor failure.

1. If the A/C compressor is marginally operable, run the engine at idle speed, and let the air conditioning work for a few minutes, then shut the engine off.
2. Recover the refrigerant with a recovery/recycling/charging station (see **REFRIGERANT RECOVERY**).
3. Remove the front grille cover (see **FRONT GRILLE COVER REPLACEMENT**) and the drive belt (see **DRIVE BELT INSPECTION**).
4. Remove the clips (A) and the bolts.

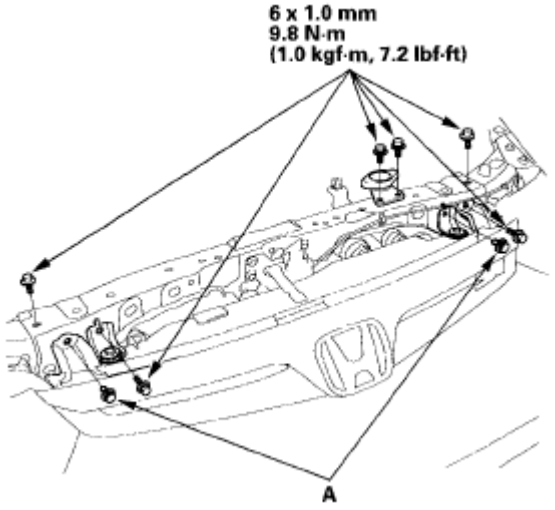

Fig. 93: Removing Clips And Bolts (With Specifications)

5. Remove the bolts, the connector (A), wire harness clips (B), and the bulkhead (C).

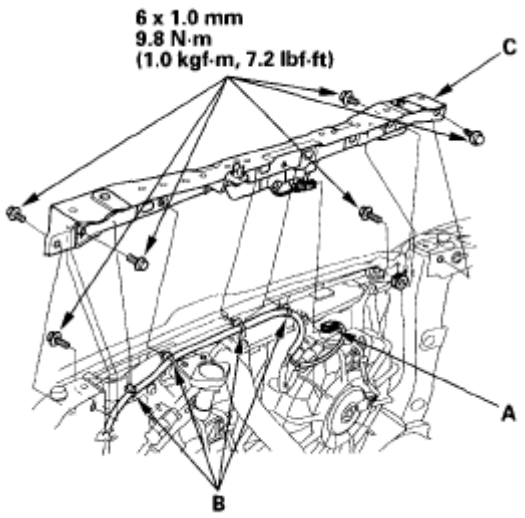

Fig. 94: Removing Bulkhead (With Specifications)

6. Disconnect the connector (A) from the A/C condenser fan motor. Remove the wire harness clip (B), the upper mounting bolts, and the A/C condenser fan shroud (C). Be careful not to damage the radiator fins when removing the A/C condenser fan shroud.

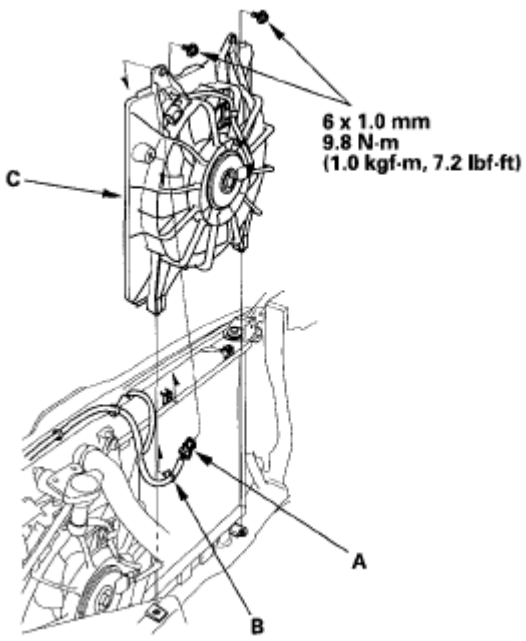

Fig. 95: Removing A/C Condenser Fan Shroud (With Specifications)

7. Remove the bolt.

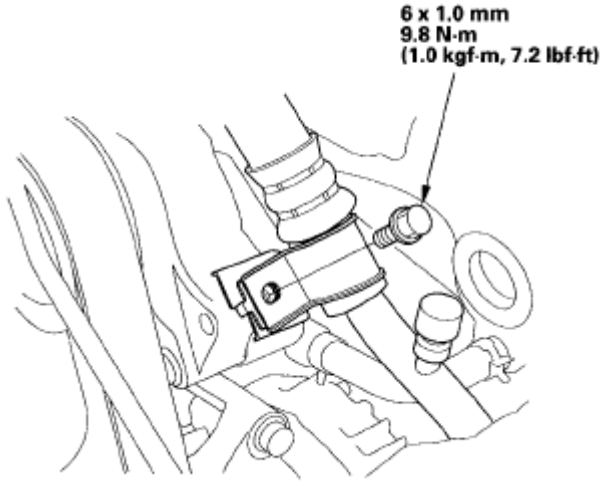

Fig. 96: Removing Bolt (With Specifications)

8. Remove the splash shield (see **FRONT SPLASH SHIELD REPLACEMENT**).
9. Disconnect the connector (A). Remove the bolt and the nut, then disconnect the suction hose (B) and discharge hose (C) from the A/C compressor. Plug or cap the lines immediately after disconnecting them to avoid moisture and dust contamination.

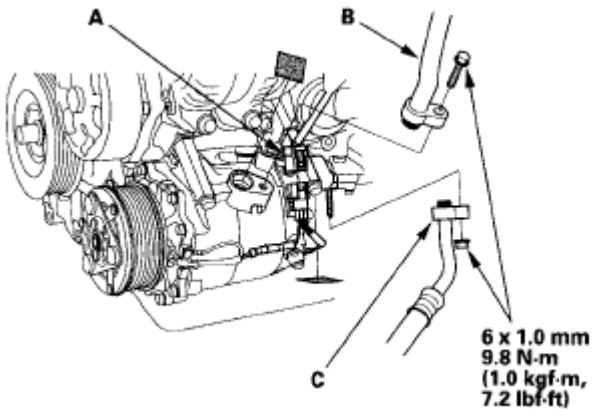

Fig. 97: Disconnecting Suction Hose And Discharge Hose From A/C Compressor (With Specifications)

10. Remove the mounting bolts and the A/C compressor (A). Be careful not to damage the radiator fins when removing the A/C compressor.

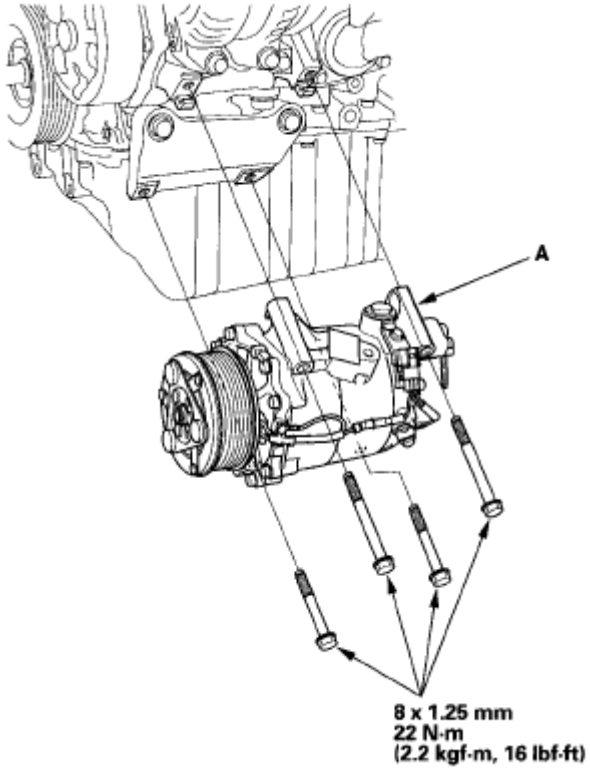

Fig. 98: Removing A/C Compressor (With Specifications)

11. Install the compressor in the reverse order of removal, and note these items:
    - Inspect the A/C lines for any signs of contamination.
    - Replace the O-rings with new ones at each fitting, and apply a thin coat of refrigerant oil before installing them. Be sure to use the correct O-rings for HFC-134a (R-134a) to avoid leakage.
    - Use refrigerant oil (SP-10) for HFC-134a SANDEN spiral type A/C compressor only.
    - To avoid contamination, do not return the oil to the container once dispensed, and never mix it with other refrigerant oils.
    - Immediately after using the oil, reinstall the cap on the container, and seal it to avoid moisture absorption.
    - Do not spill the refrigerant oil on the vehicle; it may damage the paint; if the refrigerant oil contacts the paint, wash it off immediately.
    - Charge the system (see **SYSTEM CHARGING**).

A/C COMPRESSOR CLUTCH CHECK

1. Check the armature plate for discoloration, peeling, or other damage. If there is damage, replace the clutch set (see **A/C COMPRESSOR CLUTCH OVERHAUL**).
2. Check the rotor pulley bearing play and drag by rotating the rotor pulley by hand. Replace the clutch set with a new one if it is noisy or has excessive play/drag (see **A/C COMPRESSOR CLUTCH OVERHAUL**).

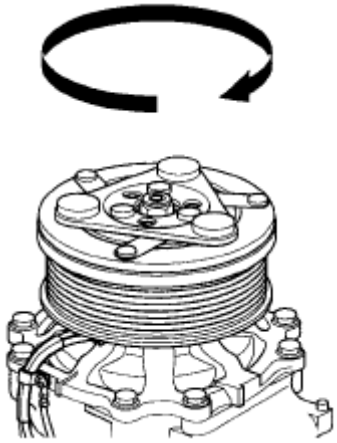

Fig. 99: Checking Rotor Pulley Bearing Play And Drag Rotating Rotor Pulley

3. Measure the clearance between the rotor pulley (A) and the armature plate (B) all the way around. If the clearance is not within specified limits, remove the armature plate (see **A/C COMPRESSOR CLUTCH OVERHAUL**) and add or remove shims as needed to increase or decrease clearance.

   Clearance: 0.35-0.65 mm (0.014-0.026 in.)

   NOTE: The shims are available in four thicknesses: 0.1 mm, 0.2 mm, 0.4 mm, and 0.5 mm.

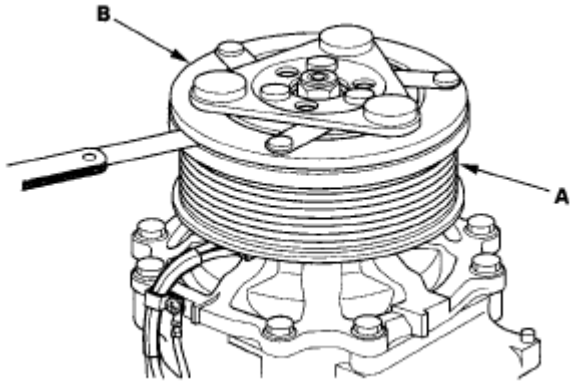

Fig. 100: Measuring Clearance Between Rotor Pulley And Armature Plate

4. Check for continuity between the A/C compressor clutch connector No. 1 and No. 3. If there is no continuity, replace the thermal protector (see **A/C COMPRESSOR THERMAL PROTECTOR REPLACEMENT**).

   NOTE: The thermal protector will have no continuity above about 252 to 262°F (122 to 128°C). When the temperature drops below about 241 to 219°F (116 to 104°C), the thermal protector will have continuity.

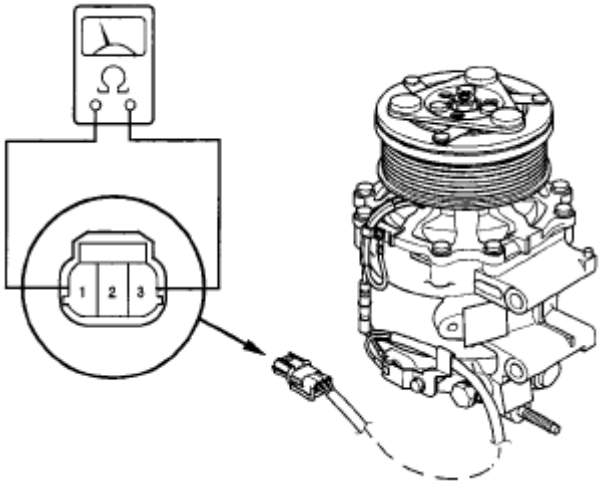

Fig. 101: Checking Continuity Between A/C Compressor Clutch Connector No. 1 And No. 3

5. Disconnect the field coil connector (A). Check resistance of the field coil. If resistance is not within specifications, replace the field coil (see **A/C COMPRESSOR CLUTCH OVERHAUL**).

   Field Coil Resistance: 3.15-3.45 ohms 68°F (20°C)

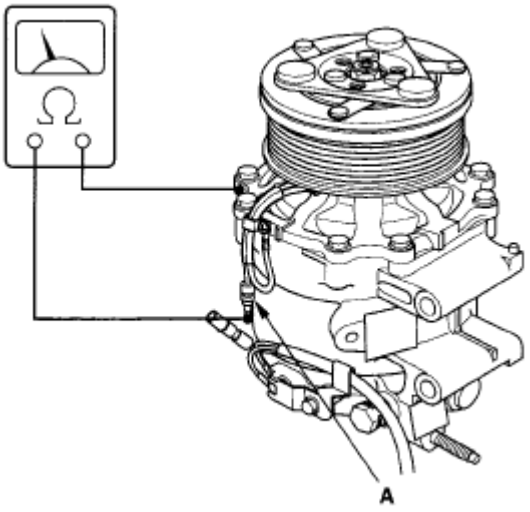

Fig. 102: Checking Resistance Of Field Coil

A/C COMPRESSOR CLUTCH OVERHAUL

Special Tools Required

A/C clutch holder, Robinair 10204 or Kent-Moore J37872, or Honda Tool and Equipment KMT-J33939, commercially available

1. Remove the center nut while holding the armature plate (A) with a commercially available A/C clutch holder (B).

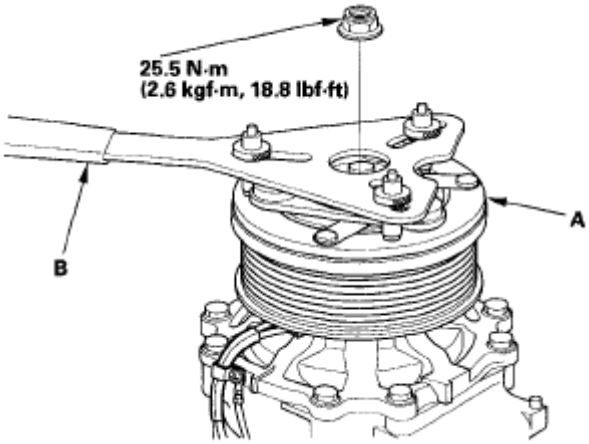

Fig. 103: Removing Center Nut Holding Armature Plate (With Specifications)

2. Remove the armature plate (A) and shim(s) (B), taking care not to lose the shim(s). If the clutch needs adjustment, increase or decrease the number and thickness of shims as necessary, then reinstall the armature plate, and recheck its clearance (see **A/C COMPRESSOR CLUTCH OVERHAUL**).

NOTE: The shims are available in four thicknesses: 0.1 mm, 0.2 mm, 0.4 mm, and 0.5 mm.

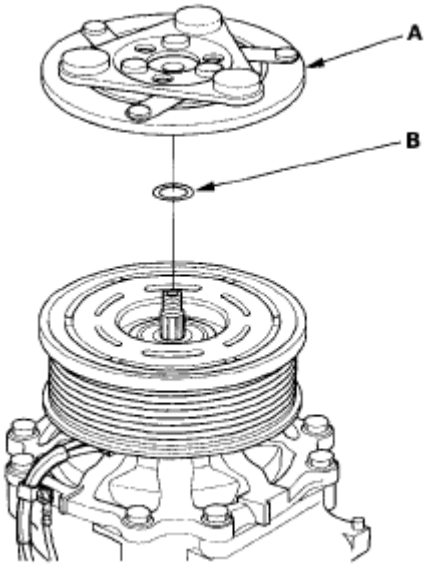

Fig. 104: Removing Armature Plate and Shim(s)

3. If you are replacing the field coil, remove the snap ring (A) with snap ring pliers, then remove the rotor pulley (B). Be careful not to damage the rotor pulley and A/C compressor.

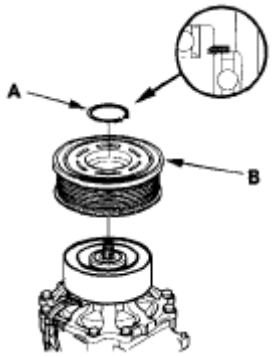

Fig. 105: Removing Snap Ring And Rotor Pulley

4. Remove the bolt and holder (A), then disconnect the field coil connector (B). Remove the snap ring (C) with snap ring pliers, then remove the field coil (D). Be careful not to damage the field coil and A/C compressor.

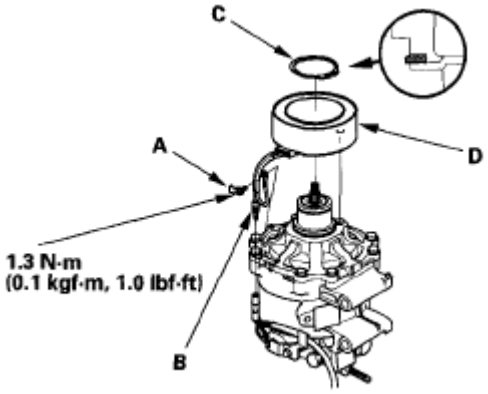

Fig. 106: Removing Field Coil (With Specifications)

5. Reassemble the clutch in the reverse order of disassembly, and note these items:
   - Install the field coil with the wire side facing down, and align the boss on the field coil with the hole in the A/C compressor.
   - Clean the rotor pulley and A/C compressor sliding surfaces with contact cleaner or other non-petroleum solvent.
   - Install new snap rings, note the installation direction, and make sure they are fully seated in the groove.
   - Make sure that the rotor pulley turns smoothly after it's reassembled.
   - Route and clamp the wires properly or they can be damaged by the rotor pulley.

A/C COMPRESSOR THERMAL PROTECTOR REPLACEMENT

1. Remove the bolt and the holder (A). Disconnect the field coil connector (B), then remove the thermal protector (C).

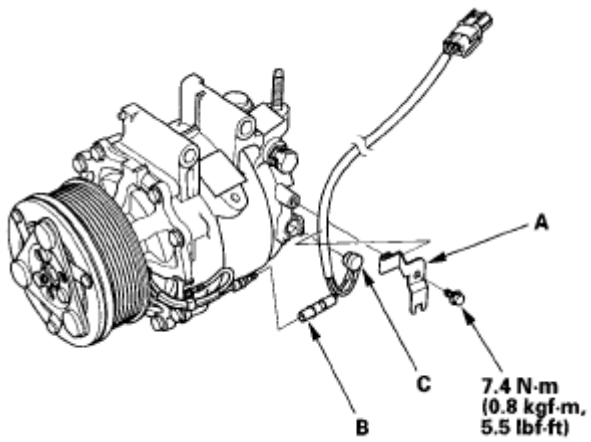

Fig. 107: Removing Thermal Protector (With Specifications)

2. Replace the thermal protector (A) with a new one, and apply silicone sealant (B) to the bottom of the thermal protector.

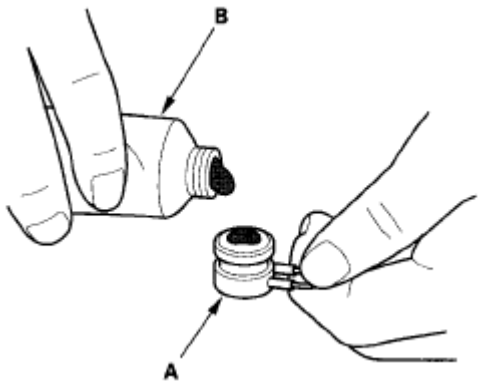

Fig. 108: Applying Silicone Sealant To Bottom Of Thermal Protector

3. Install the thermal protector in the reverse order of removal.

A/C COMPRESSOR RELIEF VALVE REPLACEMENT

1. Recover the refrigerant with a recovery/recycling/charging station (see **REFRIGERANT RECOVERY**).
2. Remove the relief valve cover (A), the relief valve (B), and the O-ring (C). Plug the opening to keep foreign matter from entering the system and the A/C compressor oil from running out.

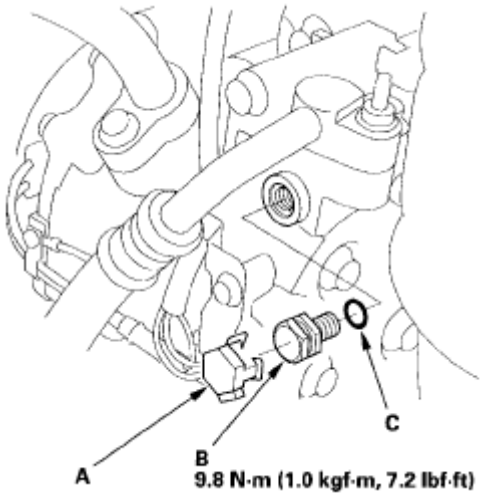

Fig. 109: Removing Relief Valve Cover, Relief Valve And O-Ring (With Specifications)

3. Clean the mating surfaces.
4. Replace the O-ring with a new one at the relief valve, and apply a thin coat of refrigerant oil before installing it.
5. Remove the plug, and install and tighten the relief valve.
6. Charge the system (see **SYSTEM CHARGING**).

A/C CONDENSER REPLACEMENT

1. Recover the refrigerant with a recovery/recycling/charging station (see **REFRIGERANT RECOVERY**).
2. Remove the front bumper (see **FRONT BUMPER REMOVAL/INSTALLATION**).
3. Remove the bolts, then disconnect the discharge hose (A) from the A/C condenser.

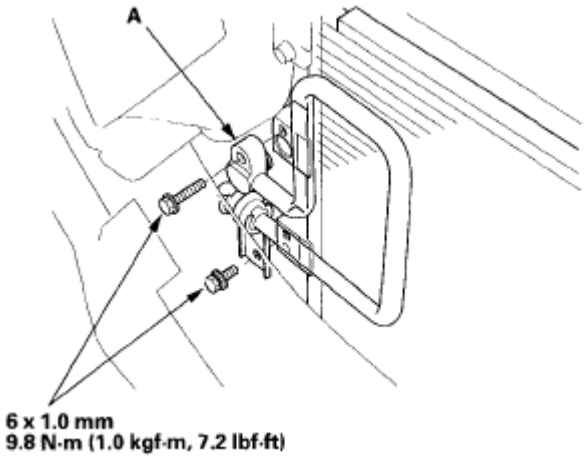

Fig. 110: Disconnecting Discharge Hose (With Specifications)

4. Remove the bolt, then disconnect the receiver line (A) from the A/C condenser.

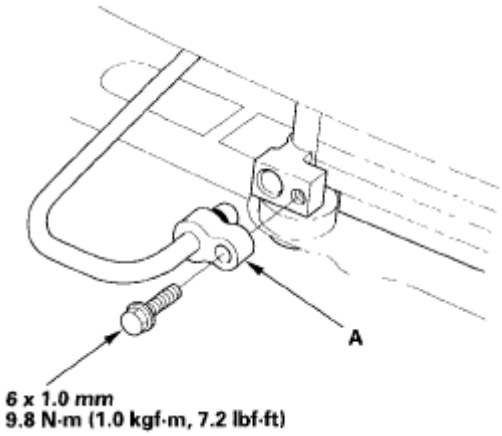

Fig. 111: Disconnecting Receiver Line (With Specifications)

5. Remove the bolts and the A/C condenser upper mount brackets (A).

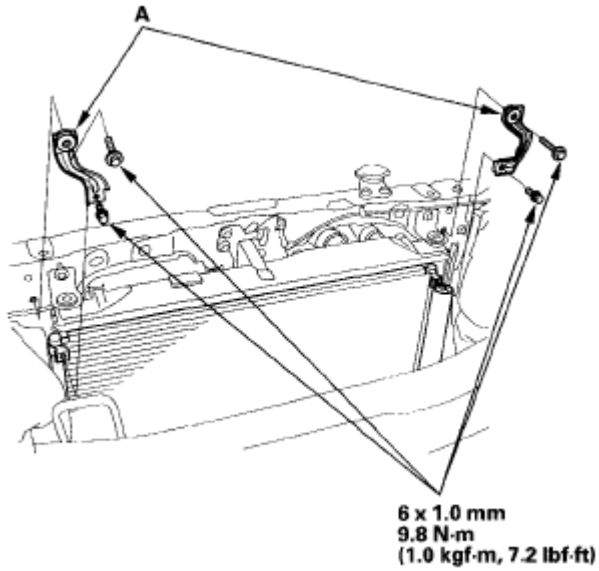

Fig. 112: Removing A/C Condenser Upper Mount Brackets (With Specifications)

6. Lift the tab (A) to release the lock, then remove the outside air temperature sensor (B) from the receiver/dryer desiccant bracket. Disconnect the 2P connector (C) then remove the clip (D).

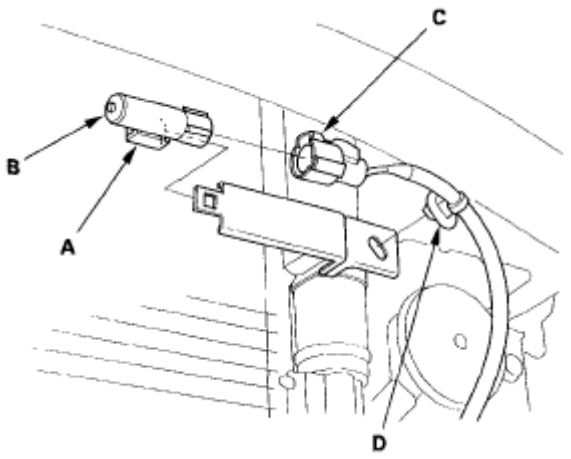

Fig. 113: Disconnecting 2P Connector And Removing Clip

7. Remove the A/C condenser (A). Be careful not to damage the radiator and A/C condenser fins when removing the A/C condenser.

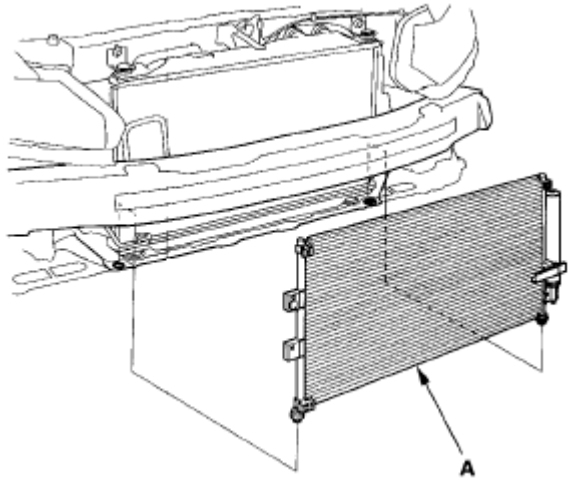

Fig. 114: Removing A/C Condenser

8. Install the A/C condenser in the reverse order of removal, and note these items:
   - If you're installing a new A/C condenser, add refrigerant oil (SP-10) (see **A/C REFRIGERANT OIL REPLACEMENT**).
   - Replace the O-rings with new ones at each fitting, and apply a thin coat of refrigerant oil before installing them. Be sure to use the correct O-rings for HFC-134a (R-134a) to avoid leakage.
   - Immediately after using the oil, reinstall the cap on the container, and seal it to avoid moisture absorption.
   - Do not spill the refrigerant oil on the vehicle; it may damage the paint; if the refrigerant oil contacts the paint, wash it off immediately.
   - Charge the system (see **SYSTEM CHARGING**).

RECEIVER/DRYER DESICCANT REPLACEMENT

4-DOOR

NOTE: Install the receiver/dryer as quickly as possible to prevent the system from absorbing moisture from the air.

1. Remove the A/C condenser (see **A/C CONDENSER REPLACEMENT**).
2. Remove the bolts from the A/C condenser, then remove the receiver/dryer (A), the bracket (B), and the O-rings (C).

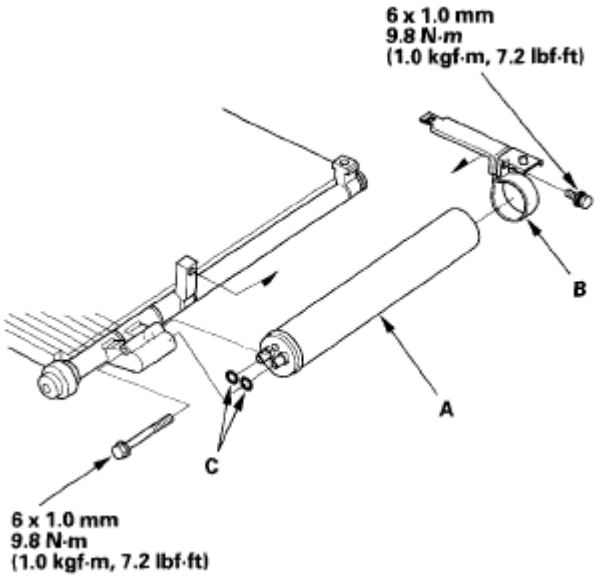

Fig. 115: Removing Receiver/Dryer, Bracket And O-Rings (With Specifications)

3. Install the receiver/dryer in the reverse order of removal. Replace the O-rings with new ones, and apply a thin coat of refrigerant oil (SP-10) before installing them. Be sure to use the correct O-rings for HFC-134a (R-134a) to avoid leakage.

2-DOOR

NOTE: Install the receiver/dryer as quickly as possible to prevent the system from absorbing moisture from the air.

1. Remove the A/C condenser (see **A/C CONDENSER REPLACEMENT**).
2. Remove the cap (A) from the bottom of the A/C condenser. Remove the O-rings (B) and the desiccant (C).

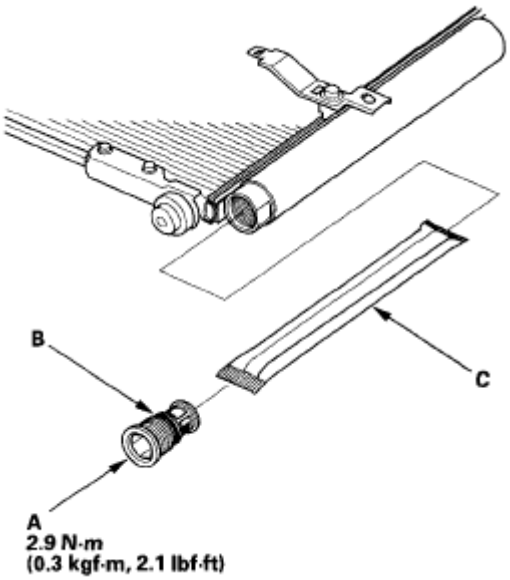

Fig. 116: Removing O-Rings And Desiccant (With Specifications)

3. Install the receiver/dryer in the reverse order of removal, and note these items:
   - Replace the O-rings with new ones, and apply a thin coat of refrigerant oil (SP-10) before installing them. Be sure to use the correct O-rings for HFC-134a (R-134a) to avoid leakage.
   - Install the cap to the specified torque. It is made of resin a can be easily stripped.

REFRIGERANT RECOVERY

CAUTION:
- **Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.**
- **Be careful when connecting service equipment.**
- **Do not breathe refrigerant or vapor.**

NOTE:
- **If accidental system discharge occurs, ventilate work area before resuming service.**
- **Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.**

1. Connect an R-134a refrigerant recovery/recycling/charging station (A) to the high-pressure service port (B) and the low-pressure service port (C), as shown, following the equipment manufacturer's instructions.

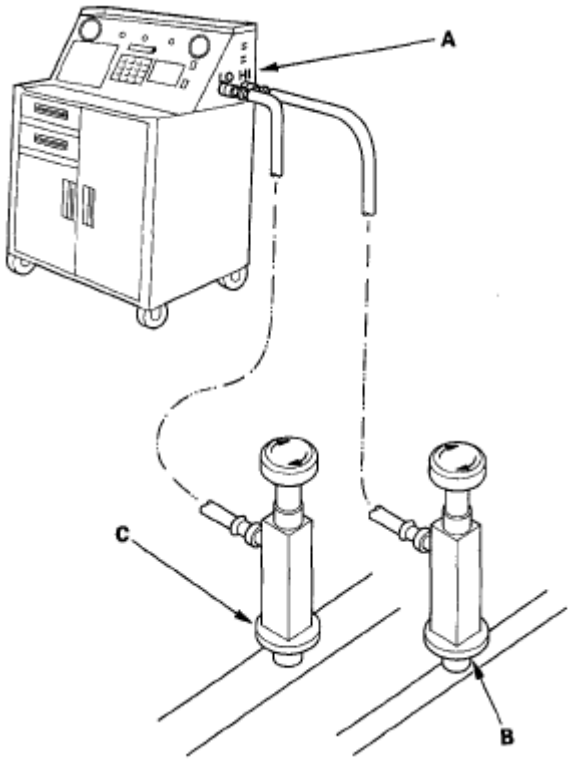

Fig. 117: Connecting Refrigerant Recovery/Recycling/Charging Station To High-Pressure And Low-Pressure Service Port

2. Measure the amount of refrigerant oil removed from the A/C system after the recovery process is completed. Be sure to put the same amount of new refrigerant oil back into the A/C system before charging.

SYSTEM EVACUATION

CAUTION:

- **Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.**
- **Be careful when connecting service equipment.**
- **Do not breathe refrigerant or vapor.**

NOTE:

- **If accidental system discharge occurs, ventilate work area before resuming service.**
- **Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.**

1. When an A/C System has been opened to the atmosphere, such as during installation or repair, it must be evacuated using an R-134a refrigerant recovery/recycling/charging station. If the system has been open for several days, the receiver/dryer should be replaced, and the system should be evacuated for several hours.
2. Connect an R-134a refrigerant recovery/recycling/charging station (A) to the high-pressure service port (B) and the low-pressure service port (C), as shown, following the equipment manufacturer's instructions. Evacuate the system.

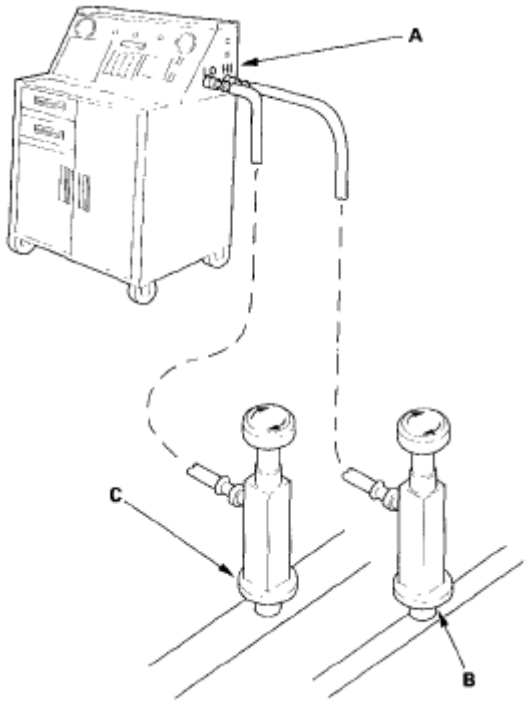

Fig. 118: Connecting Refrigerant Recovery/Recycling/Charging Station To High-Pressure And Low-Pressure Service Port

3. If the low-pressure does not reach more than 93.3 kPa (700 mmHg, 27.6 in.Hg) in 15 minutes, there is probably a leak in the system. Partially charge the system, and check for leaks (see step 3 in **REFRIGERANT LEAK TEST**).

SYSTEM CHARGING

CAUTION:
- **Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.**
- **Be careful when connecting service equipment.**
- **Do not breathe refrigerant or vapor.**

NOTE:
- **If accidental system discharge occurs, ventilate work area before resuming service.**
- **Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.**

1. Connect an R-134a refrigerant recovery/recycling/charging station (A) to the high-pressure service port (B) and the low-pressure service port (C), as shown, following the equipment manufacturer's instructions.

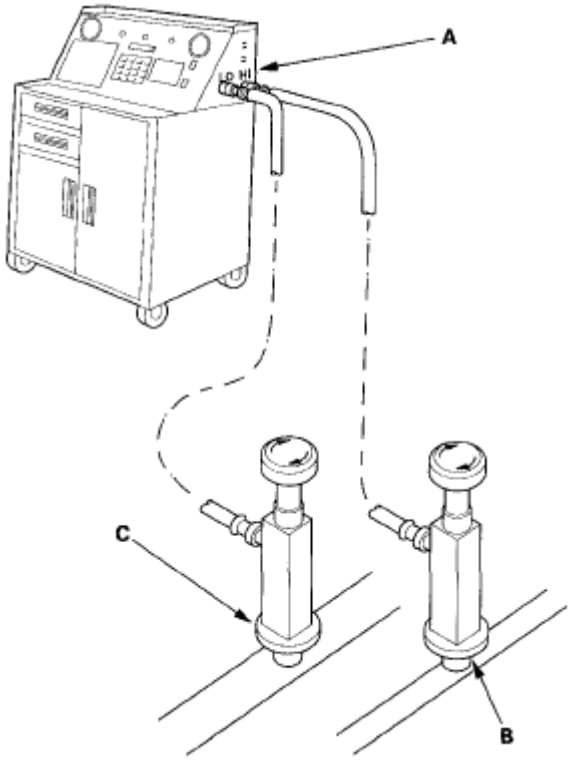

Fig. 119: Connecting Refrigerant Recovery/Recycling/Charging Station To High-Pressure And Low-Pressure Service Port

2. Evacuate the system (see **SYSTEM EVACUATION**).
3. Add the same amount of new refrigerant oil to the system that was removed during recovery. Use only SP-10 refrigerant oil.
4. Charge the system with the specified amount of R-134a refrigerant. Do not overcharge the system; the A/C compressor will be damaged.

   Select the appropriate units of measure for your refrigerant charging station.

   Refrigerant Capacity:

   400 to 450 g
   0.40 to 0.45 kg
   0.9 to 1.0 lbs
   14.1 to 15.9 oz
5. Check for refrigerant leaks (see **REFRIGERANT LEAK TEST**).
6. Check the system performance (see **A/C SYSTEM TEST**).

REFRIGERANT LEAK TEST

Special Tools Required

Leak detector, Honda Tool and Equipment YGK-H-10PM or commercially available

CAUTION:

- **Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.**
- **Be careful when connecting service equipment.**
- **Do not breathe refrigerant or vapor.**

NOTE:

- **If accidental system discharge occurs, ventilate work area before resuming service.**
- **Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.**

1. Connect an R-134a refrigerant recovery/recycling/charging station (A) to the high-pressure service port (B) and the low-pressure service port (C), as shown, following the equipment manufacturer's instructions.

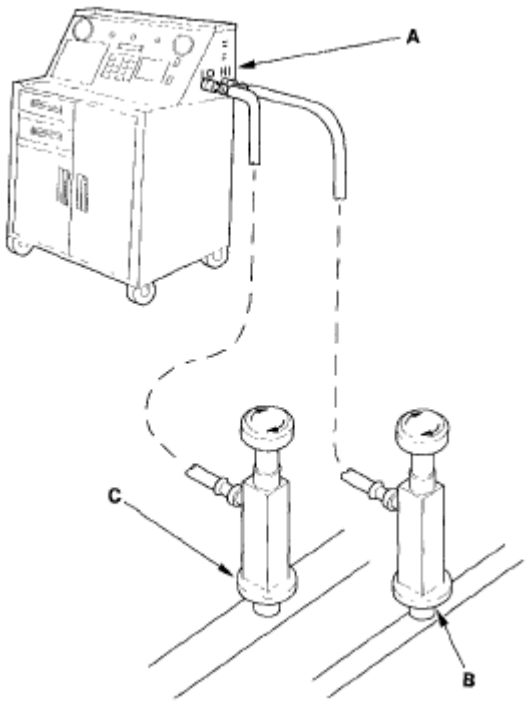

Fig. 120: Connecting Refrigerant Recovery/Recycling/Charging Station To High-Pressure And Low-Pressure Service Port

2. Open high pressure valve to charge the system to the specified capacity, then close the supply valve, and disconnect the charging station fittings.

   Select the appropriate units of measure for your refrigerant charging station.

   Refrigerant Capacity:

   400 to 450 g
   0.40 to 0.45 kg
   0.9 to 1.0 lbs

14.1 to 15.9 oz

3. Check the system for leaks using an R-134a refrigerant leak detector with an accuracy of 14 g (0.5 oz) per year or better.
4. If you find leaks that require the system to be opened (to repair or replace hoses, fittings, etc.), recover the system.
5. After checking and repairing leaks, the system must be evacuated.

A/C SYSTEM TEST

PERFORMANCE TEST

CAUTION:

- **Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.**
- **Be careful when connecting service equipment.**
- **Do not breathe refrigerant or vapor.**

The performance test will help determine if the A/C system is operating within specifications.

NOTE:

- **If accidental system discharge occurs, ventilate work area before resuming service.**
- **Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.**

1. Connect an R-134a refrigerant recovery/recycling/charging station to the high-pressure service port and the low-pressure service port, following the equipment manufacturer's instructions.
2. Determine the relative humidity and air temperature.
3. Open the glove box. Remove the glove box stop on each side, then let the glove box hang down (see **GLOVE BOX REMOVAL/INSTALLATION**).
4. Insert a thermometer (A) in the center vent.

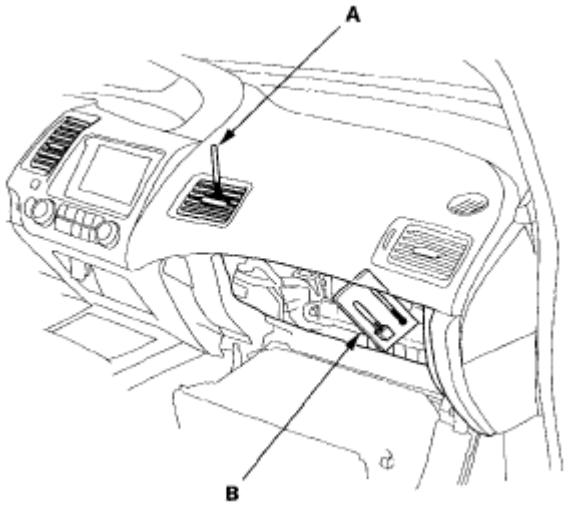

Fig. 121: Inserting Thermometer In Center Vent

5. Place a thermometer (B) near the blower unit's recirculation inlet duct.
6. Test conditions:
   - Avoid direct sunlight.
   - Open hood.
   - Open front doors.
   - Set the temperature control dial to Max Cool, the mode control switch to Vent, and the recirculation control switch to Recirculate.
   - Turn the A/C switch ON and the fan switch to Max.
   - Hold the engine speed at 1,500 rpm.
   - No driver or passengers in vehicle.
7. After running the air conditioning for 10 minutes under the above test conditions, read the delivery temperature from the thermometer in the center vent, the intake temperature near the blower unit, and the discharge (high) and suction (low) pressures on the A/C gauges.
8. To complete the charts:
   - Mark the delivery temperature along the vertical line.
   - Mark the intake temperature (ambient air temperature) along the bottom line.
   - Draw a line straight up from the air temperature to the humidity.
   - From each point, draw a horizontal line across the delivery temperature.
   - The delivery temperature should fall between the two lines.
   - Complete the low-side pressure test and high-side pressure test in the same way.
   - Any measurements outside the line may indicate the need for further inspection.

   Example

   Intake temperature (dry): 86°F (30°C) Humidity level 70%
   Intake temperature (wet): 77.9°F (25.5°C)
   Delivery temperature: 61°F (15.9°C)
   Intake pressure: 261 kPa (2.7 kgf/cm^2 (38psi)
   Delivery pressure: 1,780 kPa (18.2 kgf/cm^2 (258 psi)

   Results: Within normal range

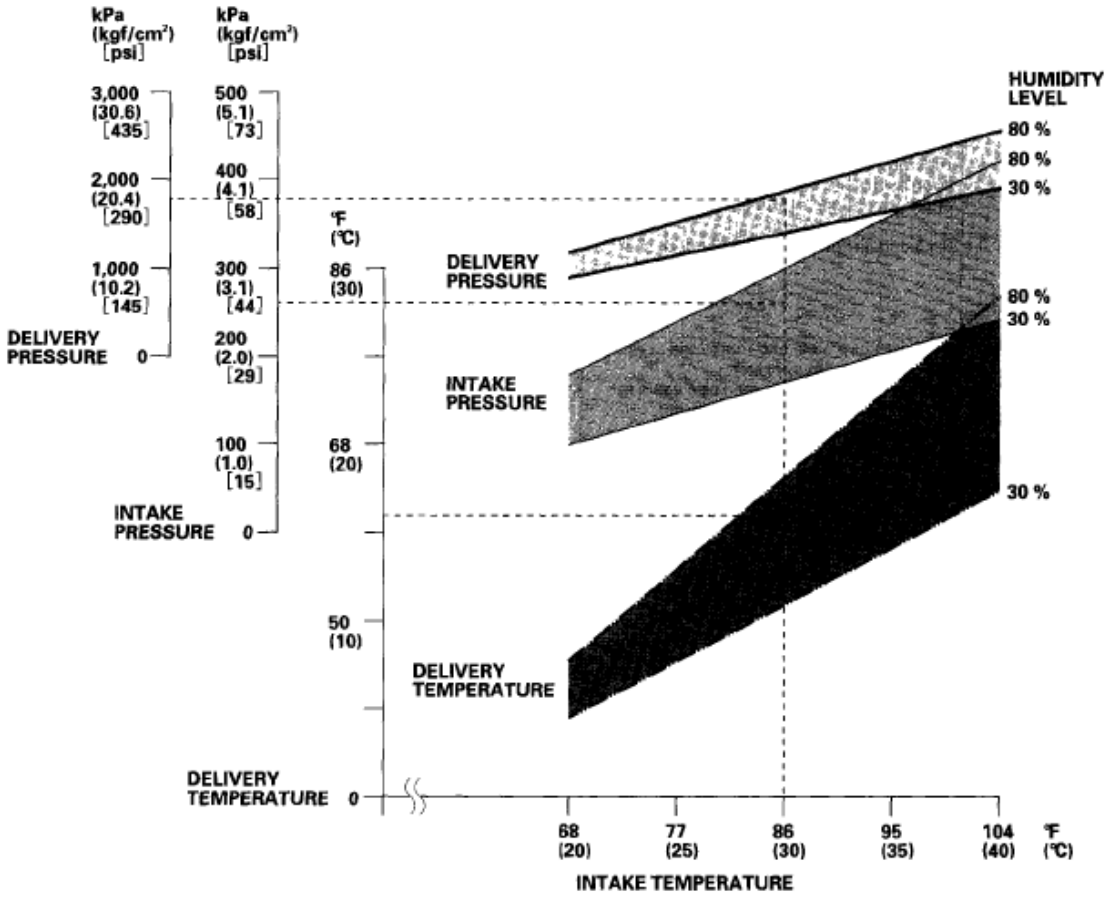

Fig. 122: A/C System Test Graph

PRESSURE TEST

PRESSURE TEST DESCRIPTION

Test results	Related symptoms	Probable cause	Remedy
Discharge (high) pressure abnormally high	After stopping A/C compressor, pressure drops about 196 kPa (2.0 kgf/cm^2 ,28 psi) quickly, and then falls gradually.	Air in system	Recover, evacuate (see **REFRIGERANT RECOVERY**), and recharge with specified amount (see **SYSTEM CHARGING**).
	Reduced or no airflow through A/C condenser.	• Clogged condenser or radiator fins • A/C condenser or radiator fan not working properly	• Clean • Check voltage and fan rpm. • Check fan direction.
	Line to A/C condenser is excessively hot.	Restricted flow of refrigerant in system	Restricted lines.
	High and low-pressures are balanced soon after stopping A/C compressor. Low side	• Faulty A/C compressor discharge valve	Replace the A/C compressor.

Discharge pressure abnormally low	is higher than normal.	• Faulty A/C compressor seal	
	Outlet of expansion valve is not frosted, low-pressure gauge indicates vacuum.	• Faulty expansion valve • Moisture in system	• Replace. • Recover, evacuate, and recharge with specified amount.
Suction (low) pressure abnormally low	Expansion valve is not frosted, and low-pressure line is not cold. Low-pressure gauge indicates vacuum.	• Frozen expansion valve (Moisture in system) • Faulty expansion valve	• Recover, evacuate, and recharge with specified amount. • Replace the expansion valve.
	Discharge temperature is low, and the airflow from vents is restricted.	Frozen evaporator	Run the fan with A/C compressor off, then check evaporator temperature sensor.
	Expansion valve is frosted.	Clogged expansion valve	Clean or replace.
Suction pressure abnormally high	Low-pressure hose and check joint are cooler than the temperature around evaporator.	Expansion valve open too long	Repair or replace.
	Suction pressure is lowered when A/C condenser is cooled by water.	Excessive refrigerant in system	Recover, evacuate, and recharge with specified amount.
	High and low-pressures are equalized as soon as the A/C compressor is stopped, and both gauges fluctuate while running.	• Faulty gasket • Faulty high-pressure valve • Foreign particle stuck in high-pressure valve	Replace the A/C compressor.
Suction and discharge pressures abnormally high	Reduced airflow through A/C condenser.	• Clogged A/C condenser or radiator fins • A/C condenser or radiator fan not working properly	• Clean • Check voltage and fan rpm. • Check fan direction.
Suction and discharge pressures abnormally low	Low-pressure hose and metal end areas are cooler than evaporator.	Clogged or kinked low-pressure hose parts	Repair or replace.
	Temperature around expansion valve is too low compared with that around receiver/dryer.	Clogged high-pressure line	Repair or replace.
	A/C compressor clutch is dirty.	A/C compressor shaft seal leaking	Replace the A/C compressor.

Refrigerant leaks	A/C compressor bolt(s) are dirty.	Leaking around bolt(s)	Tighten bolt(s) or replace A/C compressor.
	A/C compressor gasket is wet with oil.	Gasket leaking	Replace the A/C compressor.
	A/C fitting is dirty.	Leaking O-ring	Clean the A/C fitting and replace the O-ring.

DTC TROUBLESHOOTING

DTC B1078: DAYTIME RUNNING LIGHTS SIGNAL ERROR (CANADA); DTC B1079: DAYTIME RUNNING LIGHTS SIGNAL ERROR (USA)

NOTE: **If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN**

SYSTEM DIAGNOSIS TEST MODE A).

1. Turn the ignition switch ON (II).
2. Pull the parking brake lever.
3. Clear the DTCs with the HDS.
4. Release the parking brake lever.
5. Turn the ignition switch OFF, and then back ON (II).
6. Check for DTCs with the HDS.

   Is DTC B1078 indicated?

   YES - Go to step 7.

   NO - Intermittent failure. The daytime running lights system is OK at this time. Check for loose or poor connections.

7. Turn the headlight switch ON (high beam).

   Do both headlights (high beam) come on?

   YES - Go to step 8.

   NO - Go to step 10.

8. Turn the ignition switch OFF.
9. Check the voltage between the No. 6 and No. 33 terminals of the under-dash fuse/relay box connector E (42P) and body ground, and between the No. 20 terminal of the under-dash fuse/relay box connector F (34P) and body ground individually.

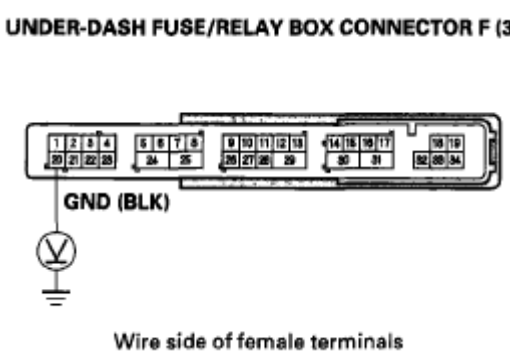

Fig. 12: Checking Voltage Between No. 20 Terminal Of Under-Dash Fuse/Relay Box Connector F (34P) And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.5 V?

YES - Faulty MICU; replace the under-dash fuse/relay box.

NO - Repair an open in the BLK wire or poor ground (G401, G501, G601, G602).

10. Turn the ignition and headlight switches OFF.
11. Check the No. 12, No. 13, and No. 18 fuses in the under-dash fuse/relay box.

    Are all fuses OK?

    YES - Go to step 12.

    NO - Replace the blown fuse and recheck. If the No. 18 (30 A) fuse is blown again, replace the under-dash fuse/relay box. If the No. 12(10 A) or No. 13 (10 A) fuse is blown again, repair a short in the wire between the under-dash fuse/relay box and appropriate headlight (high beam).

12. Check the headlight bulbs.

    Are the headlight bulbs OK?

    YES - Go to step 13.

    NO - Replace the faulty bulb.

13. Disconnect the under-dash fuse/relay box connectors F (34P) and G (21P).
14. Disconnect both of the headlight (high beam) 2P connectors.
15. Check for continuity between the No. 2 terminal of the right headlight (high beam) 2P connector and No. 22 terminal of the under-dash fuse/relay box connector F (34P).

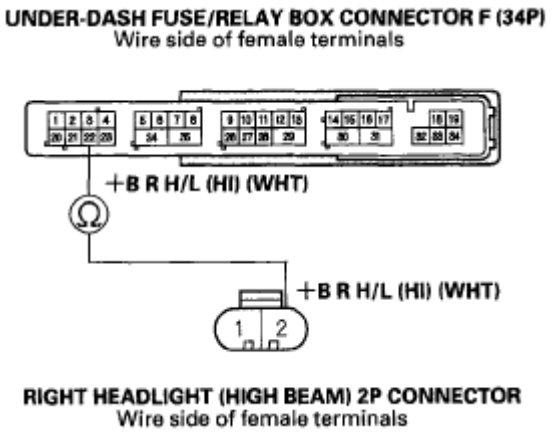

Fig. 13: Checking Continuity Between Right Headlight 2P Connector Terminal And Under-Dash Fuse/Relay Box Connector F Terminal (34P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 16.

NO - Repair an open in the wire between the right headlight (high beam) and the under-dash fuse/relay box.

16. Check for continuity between the No. 2 terminal of the left headlight (high beam) 2P connector and No. 15 terminal of the under-dash fuse/relay box connector G (21P).

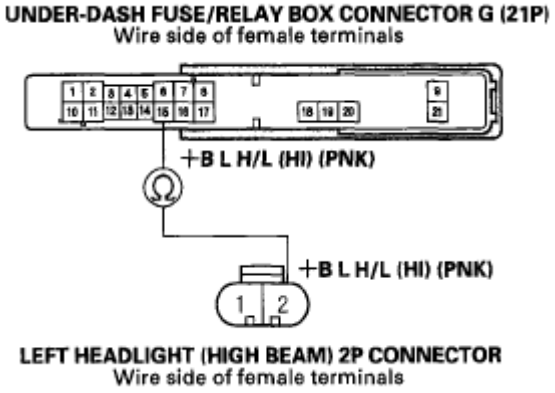

Fig. 14: Checking Continuity Between Left Headlight 2P Connector Terminal And Under-Dash Fuse/Relay Box Connector G Terminal (21P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 17.

NO - Repair an open in the wire between the left headlight (high beam) and the under-dash fuse/relay box.

17. Check for continuity between the No. 1 terminal of each headlight (high beam) 2P connector and

body ground.

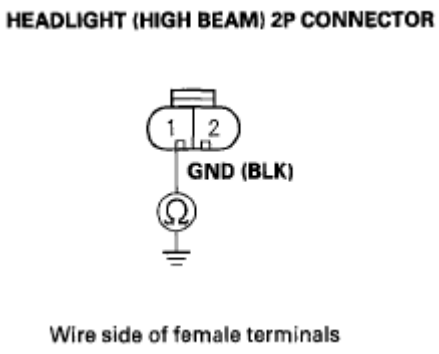

Fig. 15: Checking Continuity Between No 1 Terminal Of Headlight (High Beam) 2P Connector And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Faulty MICU; replace the under-dash fuse/relay box.

NO - Repair an open in the BLK wire or poor ground (G201-right side, G301-left side).

MICU INPUT TEST

NOTE:

- **The MICU turns on the headlights (high beams) in a dimming mode for the Daytime Running Lights under the following conditions:**
  - **With the ignition switch ON (II)**
  - **The headlight switch OFF**
  - **The parking brake is released (parking brake switch OFF)**
- **The DRL indicator will come when one of the headlight (high beams) bulbs is blown, or if the high beam wiring has an open circuit with the daytime running lights ON.**
- **For Canada models: If the vehicle is equipped with an optional remote control engine start system, the daytime running lights will not function when started with the remote start.**

1. Before troubleshooting the lighting system, troubleshoot the B-CAN System Diagnosis Test Mode A (see **TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A**).
2. Check the No. 12 (10 A), No. 13 (10 A), No. 15 (7.5 A), No. 16 (10 A), No. 17 (10 A), No. 18 (20 A), No. 19 (15 A), and No. 21 (20 A), and No. 37 (7.5 A) fuses in the under-dash fuse/relay box. If any fuse is blown, replace it and go to step 3.
3. Disconnect the under-dash fuse/relay box connectors E, F, G, S, and T.

NOTE: All connector views are shown from wire side of female terminals.

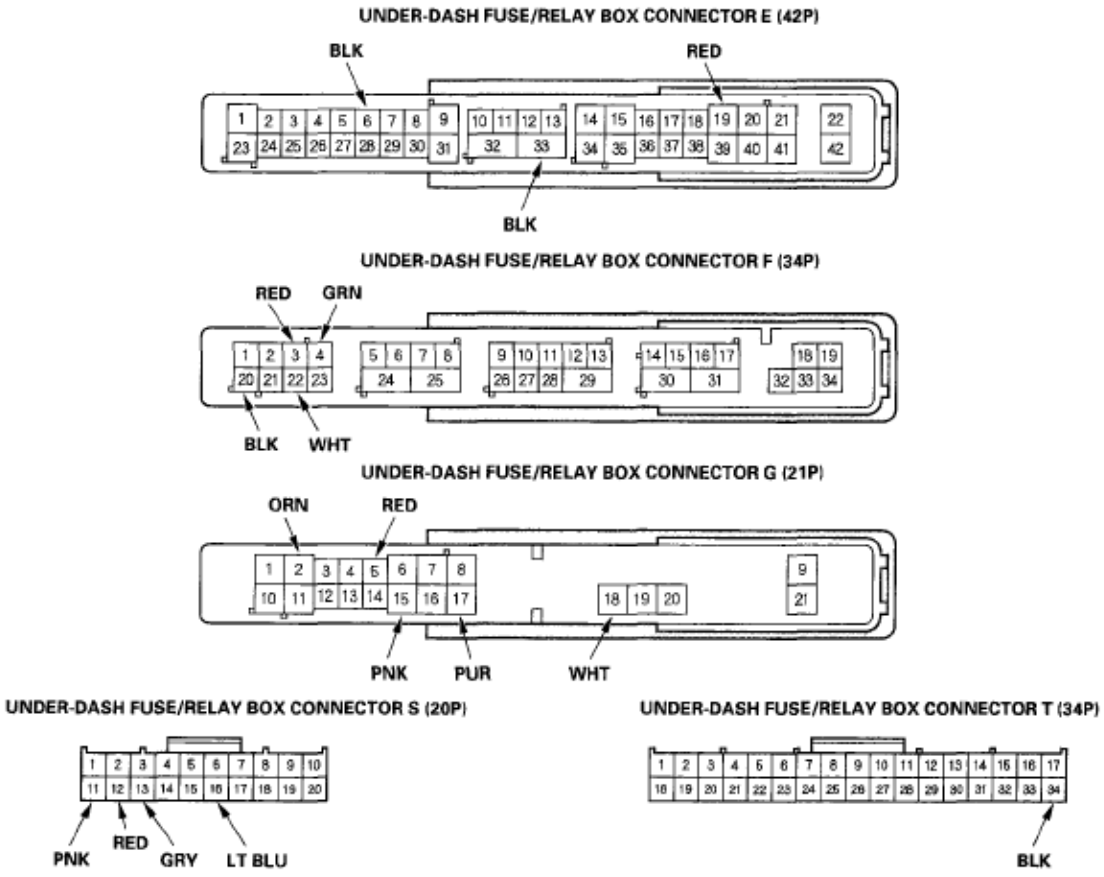

Fig. 16: Identifying Under-Dash Fuse/Relay Box Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary and recheck the system.
   - If the terminals look OK, go to step 5.
5. With the connector still disconnected, make these input tests at the appropriate connector.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to step 6.

MICU INPUT TEST (CONNECTOR DISCONNECTED)

Cavity	Wire	Test condition	Test: Desired result	Possible cause if result is not obtained
E19	RED	Under all conditions	Connect battery power to the E19 terminal: The taillights, rear side marker lights, and license plate lights should come on.	• Poor ground (G701) • Blown bulb • An open in the wire
F3	RED	Under all conditions	Connect battery power to the F3 terminal: The right front side marker/parking light should come on.	• Poor ground (G201) • Blown bulb

				• An open in the wire
F4	GRN	Under all conditions	Connect battery power to the F4 terminal: The right headlight (high beam) should come on.	• Poor ground (G201) • Blown bulb • An open in the wire
F22	WHT	Under all conditions	Connect battery power to the F22 terminal: The right headlight (low beam) should come on.	• Poor ground (G201) • Blown bulb • An open in the wire
G5	RED	Under all conditions	Connect battery power to the G5 terminal: The left front side marker/parking light should come on.	• Poor ground (G301) • Blown bulb • An open in the wire
G15	PNK	Under all conditions	Connect battery power to the G15 terminal: The left headlight (high beam) should come on.	• Poor ground (G301) • Blown bulb • An open in the wire
G17	PUR	Under all conditions	Connect battery power to the G17 terminal: The left headlight (low beam) should come on.	• Poor ground (G301) • Blown bulb • An open in the wire

6. Reconnect the connectors to the under-dash fuse/relay box, and make these input tests at the connectors.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, the MICU must be faulty; replace the under-dash fuse/relay box.

MICU INPUT TEST (CONNECTORS DISCONNECTED)

Cavity	Wire	Test condition	Test: Desired result	Possible cause if result is not obtained
G2	ORN	Under all conditions	Check for voltage between G2 terminal and body ground: There should be battery voltage.	• Blown No. 23 (10 A) fuse in the under-hood fuse/relay box • An open in the wire
G18	WHT	Under all conditions	Check for voltage between G18 terminal and body ground: There should be battery voltage.	• Blown No. 4 (50 A) fuse in the under-hood fuse/relay box

				• An open in the wire
C3	ORN	Ignition switch ON (II)	Check for voltage between C3 and body ground there should be battery voltage.	• Faulty ignition switch • An open in the wire
E6	BLK	Under all conditions	Check for voltage to ground: There should be less than 0.5 V.	• Poor ground (G602) • An open in the wire
E33	BLK	Under all conditions	Check for voltage to ground: There should be less than 0.5 V.	• Poor ground (G601) • An open in the wire
F20	BLK	Under all conditions	Check for voltage to ground: There should be less than 0.5 V.	• Poor ground (G401) • An open in the wire
T34	BLK	Under all conditions	Check for voltage to ground: There should be less than 0.5 V.	• Poor ground (G501) • An open in the wire
S1	ORN	Combination light switch OFF	Check for voltage between S1 and S5 terminals: There should be less than 1 V.	• Faulty combination light switch • An open in the wire
		Combination light switch in any other position than OFF	Check for voltage between S1 and S5 terminals: There should be 5 V or more.	• Faulty combination light switch • Short to ground in the wire
S11	PNK	Combination light switch (Headlight position) ON	Check for voltage between S11 and S5 terminals: There should be less than 1 V.	• Faulty combination light switch • An open in the wire
		Combination light switch OFF	Check for voltage between S11 and S5 terminals: There should be 5 V or more.	• Faulty combination light switch • Short to ground in the wire
S12	RED	Combination light switch lever pulled (Passing)	Check for voltage between S12 and S5 terminals: There should be less than 1 V.	• Faulty combination light switch • An open in the wire
		Combination light switch lever released from passing position	Check for voltage between S12 and S5 terminals: There should be 5 V or more.	• Faulty combination light switch • Short to ground in the wire
S13	GRY	Combination light switch (SMALL position) ON	Check for voltage between S13 and S5 terminals: There should be less than 1 V.	• Faulty combination light switch • An open in the wire
		Combination light switch OFF	Check for voltage between S13 and S5 terminals: There should be 5 V or more.	• Faulty combination light switch • Short to ground in the wire

S16	LT BLU	Combination light switch (Dimmer) in high beam position	Check for voltage between S16 and S5 terminals: There should be less than 1 V.	• Faulty combination light switch • An open in the wire
		Combination light switch (Dimmer) in low beam position	Check for voltage between S16 and S5 terminals: There should be 5 V or more.	• Faulty combination light switch • Short to ground in the wire

COMBINATION LIGHT SWITCH TEST/REPLACEMENT

1. Remove the dashboard lower cover (see **DRIVER'S DASHBOARD LOWER COVER REMOVAL/INSTALLATION**).
2. Remove the steering column covers (see **STEERING COLUMN REMOVAL AND INSTALLATION**).
3. Disconnect the 12P connector (A) from the combination light switch (B).

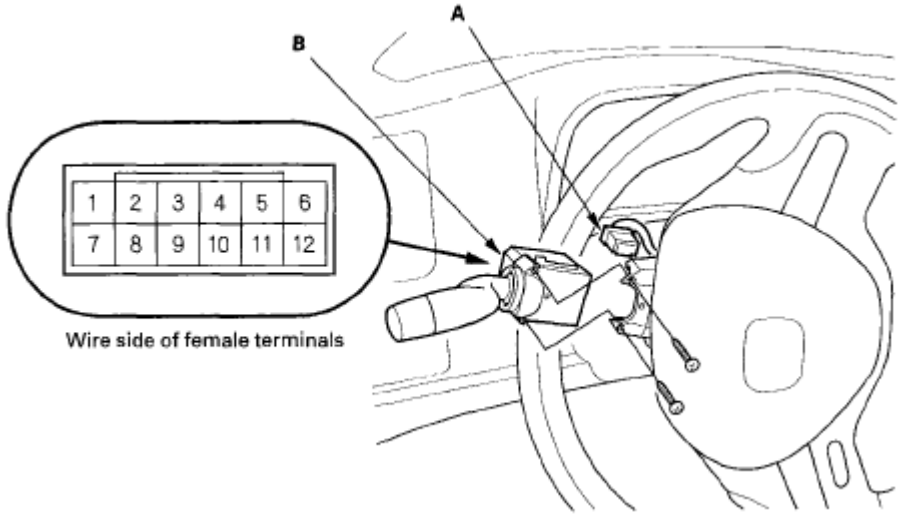

Fig. 17: Disconnecting 12P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the two screws, then slide out the combination light switch.
5. Inspect the connector terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals look OK, check for continuity between the terminals in each switch position according to the tables.
     - If the continuity is not as specified, replace the switch.

HEADLIGHT ADJUSTMENT

CAUTION: Headlights become very hot during use; do not touch them or any attaching hardware immediately after they have been turned off.

Before adjusting the headlights:

- Park the vehicle on a level surface.
- Make sure the tire pressures are correct.
- The driver or someone who weighs the same should sit in the driver's seat.

1. Clean the outer lens so that you can see the center (A) of the headlights.

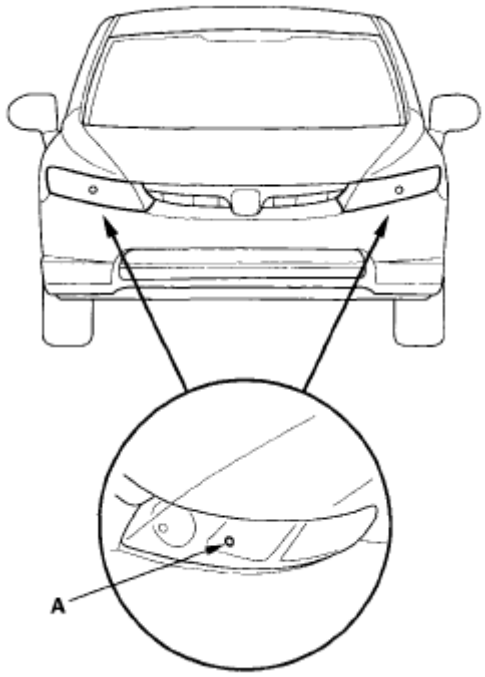

Fig. 20: Cleaning Outer Lens Of Headlights
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Park the vehicle in front of a wall or a screen (A).

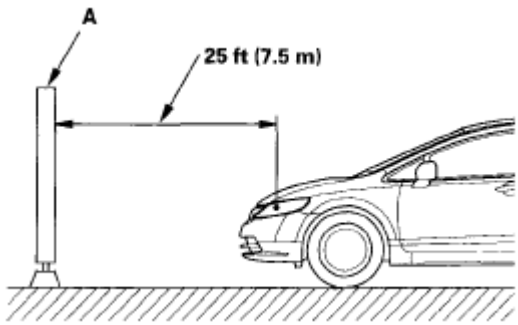

Fig. 21: Parking Vehicle In Front Of Wall Or Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Turn the low beams on.
4. Determine if the headlights are aimed properly.

Vertical adjustment:

Measure the height of the headlights (A). Adjust the cut line (B) to the lights height.

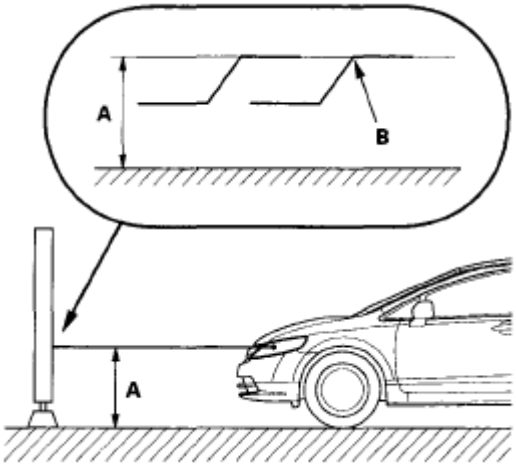

Fig. 22: Measuring Headlights
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. If necessary, open the hood and adjust the headlights to local requirements by turning the vertical adjuster.

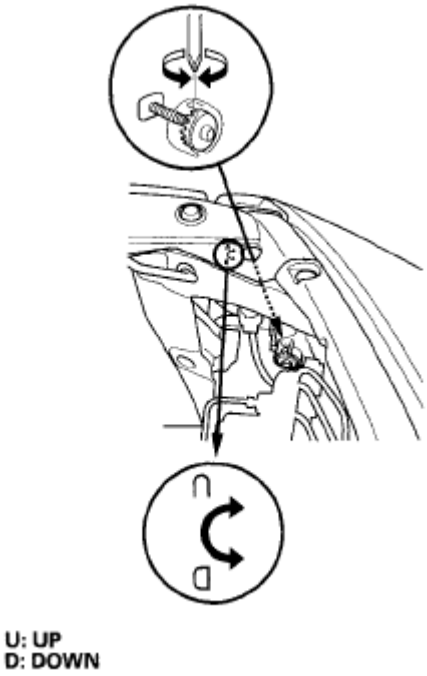

Fig. 23: Adjusting Vertically
Courtesy of AMERICAN HONDA MOTOR CO., INC.

HEADLIGHT REPLACEMENT

1. Remove the front bumper (see **FRONT BUMPER REMOVAL/INSTALLATION**).
2. Remove the connectors (A) from the headlight assembly (B).

NOTE: 4-door shown, the 2-door is similar.

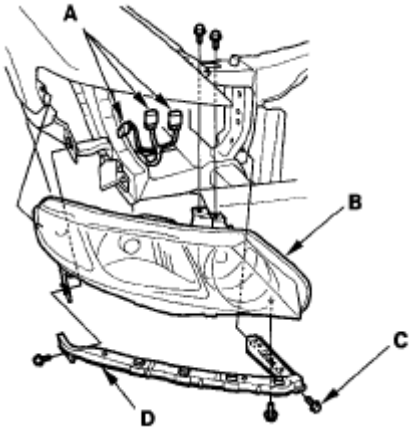

Fig. 24: Removing Connectors From Headlight Assembly
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the four bolts, then remove the headlight.
4. Remove the bolt (C) and the corner upper beam (D) from the headlight.
5. Install the headlight in the reverse order of removal.
6. After replacement, adjust the headlight to local requirement.

BULB REPLACEMENT

HEADLIGHT

1. For low beam: Remove the inner fender.
   - 2-door (see **FRONT INNER FENDER REPLACEMENT**)
   - 4-door (see **4-DOOR**)
2. Disconnect the 2P connector (A) from the headlight.

   Headlight (high beam): 60 W
   Headlight (low beam): 51 W

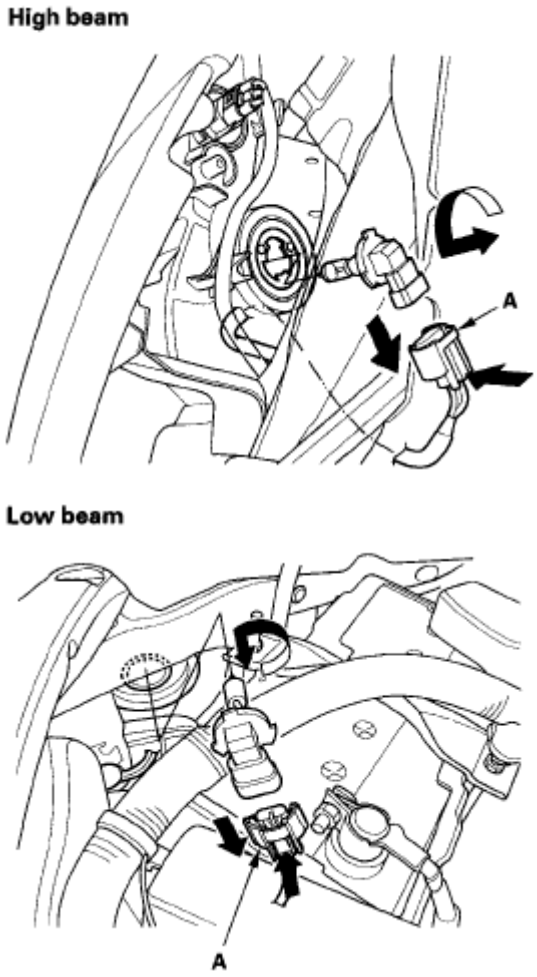

Fig. 25: Disconnecting 2P Connector From Headlight
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Turn the bulb socket 45° counterclockwise to remove the bulb.
4. Install a new bulb in the reverse order of removal.

FRONT SIDE MARKER/PARKING/TURN SIGNAL LIGHTS

1. Remove the inner fender.
   - 2-door (see **FRONT INNER FENDER REPLACEMENT**)
   - 4-door (see **4-DOOR**)
2. Disconnect the 3P connector (A) from the front side marker/parking/turn signal light.

Front Side Marker/Parking/Turn Signal Lights:

21/5 W (4-door)
28/8 W (2-door)

3. Turn the bulb socket 45° counterclockwise to remove the bulb.
4. Install a new bulb in the reverse order of removal.

TAILLIGHT REPLACEMENT

4-DOOR

1. Remove the rear bumper (see **REAR BUMPER REMOVAL/INSTALLATION**).
2. Disconnect the connectors (A) from the taillights (B).

Brake Lights/Taillights: 21/5 W
Rear Turn Signal Light: 21 W
Back-up Light: 21 W
Rear Side Maker Light: 5 W

3. Turn the bulb sockets 45° counterclockwise to remove the bulbs.
4. Remove the nuts and screws, then remove the taillight.
5. Install the light in the reverse order of removal.

2-DOOR

1. Remove the rear bumper (see **REAR BUMPER REMOVAL/INSTALLATION**).
2. Disconnect the connectors (A) from the taillights (B).

   Brake Lights/Taillights: 21/5W
   Rear Turn Signal Light: 21 W
   Back-up Light: 21 W
   Rear Side Marker Light: 5 W

3. Turn the bulb sockets 45° counterclockwise to remove the bulbs.
4. Remove the nuts and screws, then remove the taillight.
5. Install the light in the reverse order of removal.

INNER TAILLIGHT REPLACEMENT

4-DOOR

1. Open the trunk lid, and remove the rear license trim (see **4-DOOR**).
2. Disconnect the connector (A) from the inner taillight (B).

Taillight: 5W

3. Turn the bulb socket 45° counterclockwise to remove the bulb.
4. Remove the nuts, then remove the taillight.
5. Install the light in the reverse order of removal.

LICENSE PLATE LIGHT REPLACEMENT

1. Open the trunk lid, and remove the rear license trim (see **SIDE SILL PROTECTION TAPE REPLACEMENT**).
2. Disconnect the 2P connector (A) from the license plate light.

NOTE: 4-door shown, the 2-door is similar.

License Plate Light: 5 W (4-door) 3 CP (2-door)

3. Release the bulb socket (B) from the lens (C) by pressing on the tabs.
4. Remove the lens from the trunk lid by pressing on the tabs.
5. Install the light in the reverse order of removal.

HIGH MOUNT BRAKE LIGHT REPLACEMENT

EXCEPT SI MODELS

1. Open the trunk lid.
2. Disconnect the 2P connector (A) from the high mount brake light.

Bulb: 21 W

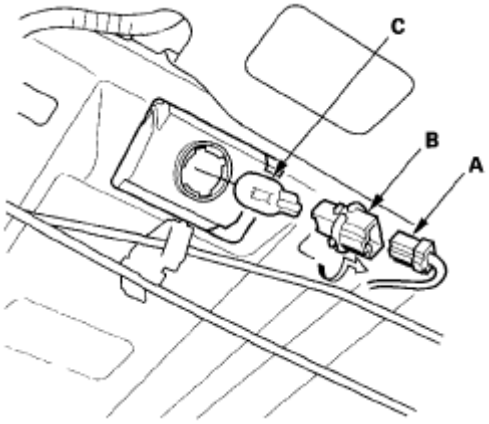

Fig. 31: Disconnecting 2P Connector From High Mount Brake Light
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Turn the bulb socket (B) 45° counterclockwise to remove the bulb (C).
4. Remove the rear shelf.
   - 2-door (see **TRIM REMOVAL/INSTALLATION - REAR SHELF AREA**)
   - 4-door (see **REAR SHELF EXTENSION - 2-DOOR**)
5. Remove the high mount brake light (A).

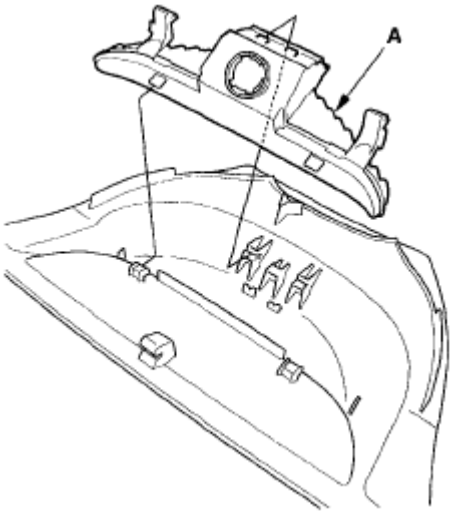

Fig. 32: Removing High Mount Brake Light

6. Install the light in the reverse order of removal.

SI MODEL

1. Remove the two screws from the high mount brake light (A).

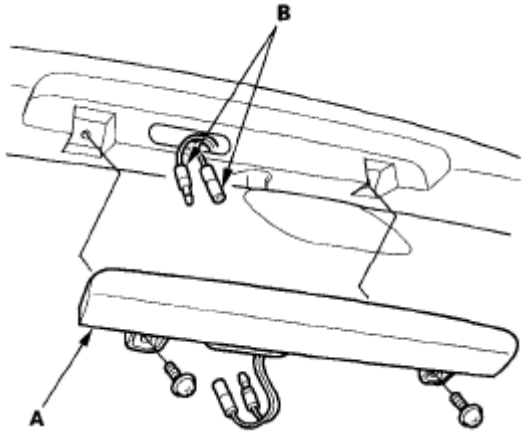

Fig. 33: Removing Hight Mount Brake Light Screws
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Disconnect the terminals (B) and remove the high mount brake light.

BRAKE PEDAL POSITION SWITCH TEST

1. Disconnect the 4P connector (A) from the brake pedal position switch (B).

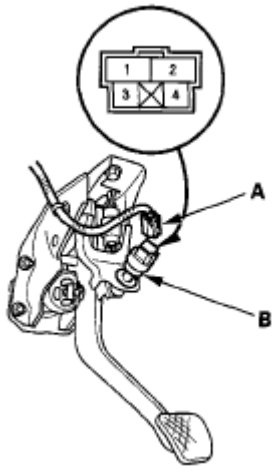

Fig. 34: Disconnecting 4P Connector And Brake Pedal Position Switch
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Check for continuity between the No. 1 and No. 2 terminals.
   - There should be continuity when the brake pedal is pressed.
   - There should be no continuity when the brake pedal is released.
3. Check for continuity between the No. 3 and No. 4 terminals (with cruise control).
   - There should be no continuity when the brake pedal is pressed.
   - There should be continuity when the brake pedal is released.
4. If necessary, adjust or replace the switch, or adjust the pedal height (see **BRAKE PEDAL AND BRAKE PEDAL POSITION SWITCH ADJUSTMENT**).

DTC B1280: TURN SIGNAL SWITCH CIRCUIT MALFUNCTION

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A.

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II).
3. Operate the turn signal switch in left and right positions, and wait for 6 seconds or more.
4. Check for DTCs with the HDS.

   Is DTC B1280 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.

5. Select LIGHTING from the BODY ELECTRICAL system select menu, then enter DATA LIST.
6. Check each turn signal switch position value with the DATA LIST menu.

When the turn signal switch is in left position

Data List	Value
Turn Signal Switch (LEFT)	ON
Turn Signal Switch (RIGHT)	OFF

When the turn signal switch is in right position

Data List	Value
Turn Signal Switch (LEFT)	OFF
Turn Signal Switch (RIGHT)	ON

Are all data list values correct?

YES - Faulty MICU; replace**REMOVAL AND INSTALLATION** .

NO - Go to step 7.

7. Turn the ignition switch to LOCK (0).
8. Disconnect the combination light switch 12P connector.
9. Turn the ignition switch to ON (II).
10. Select LIGHTING from the BODY ELECTRICAL system select menu, then enter DATA LIST.
11. Check each turn signal switch position value with the DATA LIST menu.

When the turn signal switch is in left position

Data List	Value
Turn Signal Switch (LEFT)	ON
Turn Signal Switch (RIGHT)	OFF

When the turn signal switch is in right position

Data List	Value
Turn Signal Switch (LEFT)	OFF
Turn Signal Switch (RIGHT)	ON

Are both values now showing OFF?

YES - Go to step 15.

NO - Go to step 12.

12. Turn the ignition switch to LOCK (0).
13. Disconnect under-dash fuse/relay box connector S (20P).
14. Check for continuity between body ground and under-dash fuse/relay box connector S (20P) terminals No. 18 and No. 19 individually.

Is there continuity?

YES - Repair a short to ground in the wire.

NO - Faulty MICU; replace the under-dash fuse/relay box.

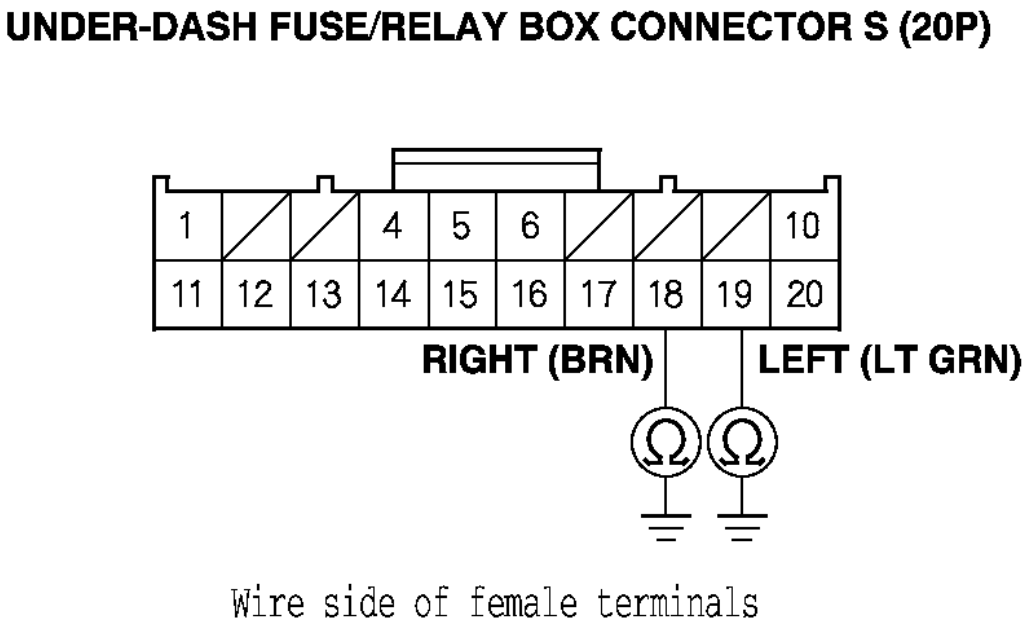

Fig. 4: Under-Dash Fuse/Relay Box Connector S (20P) - Brown
Courtesy of HONDA

15. Turn the ignition switch to LOCK (0).
16. Do the combination light switch test.

Is the combination light switch OK?

Yes - Go to step 17.

NO - Replace the combination light switch.

17. Disconnect under-dash fuse/relay box connector S (20P).
18. Check for continuity between under-dash fuse/relay box connector S (20P) terminals and combination light switch 12P connector terminals as shown:

Under-dash fuse/relay box connector S (20P)	Combination light switch 12P connector
5 (BLK)	12 (BLK)
18 (BRN)	1 (BRN)
19 (LT GRN)	2 (LT GRN)

Is there continuity?

Yes - Go to step 19.

NO - Repair an open in the wire.

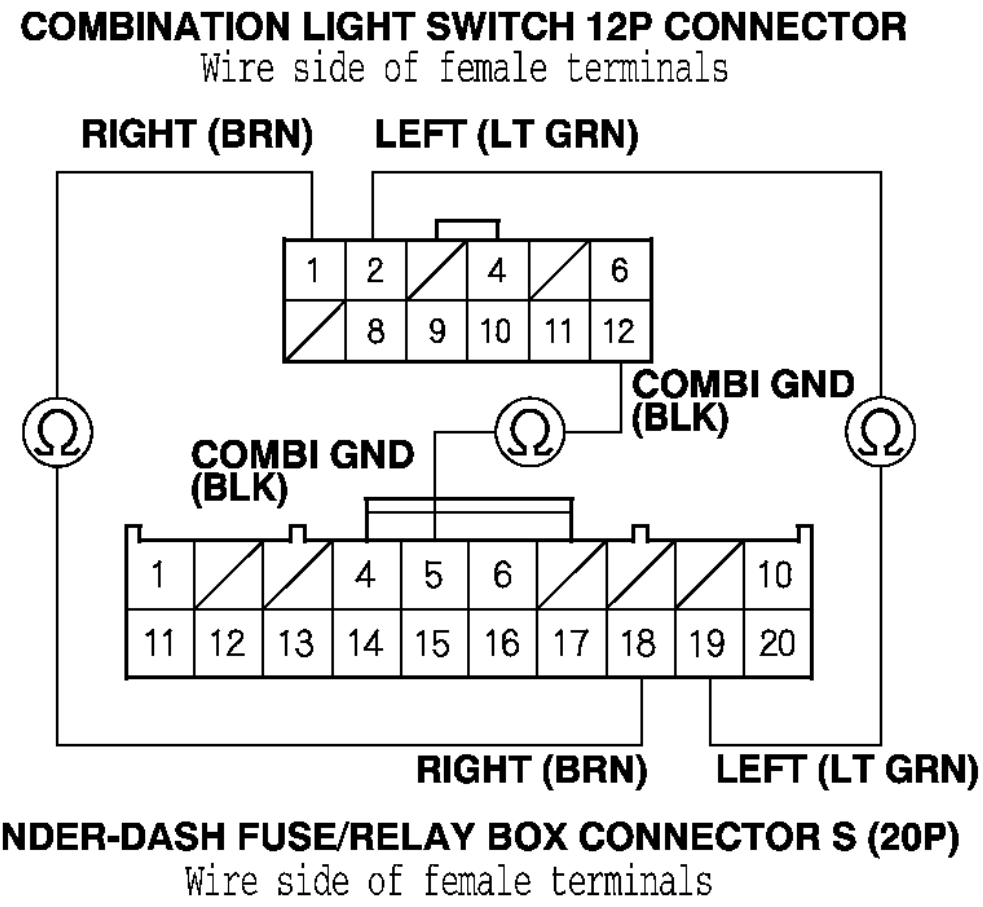

Fig. 5: Combination Light Switch 12P Connector - Brown/Green
Courtesy of HONDA

19. Check for continuity between under-dash fuse/relay box connector S (20P) terminals No. 5 and No. 18, and between connector S (20P) terminals No. 5 and No. 19 respectively.

Is there continuity?

Yes - Repair a short between the wires.

NO - Faulty MICU; replace the under-dash fuse/relay box.

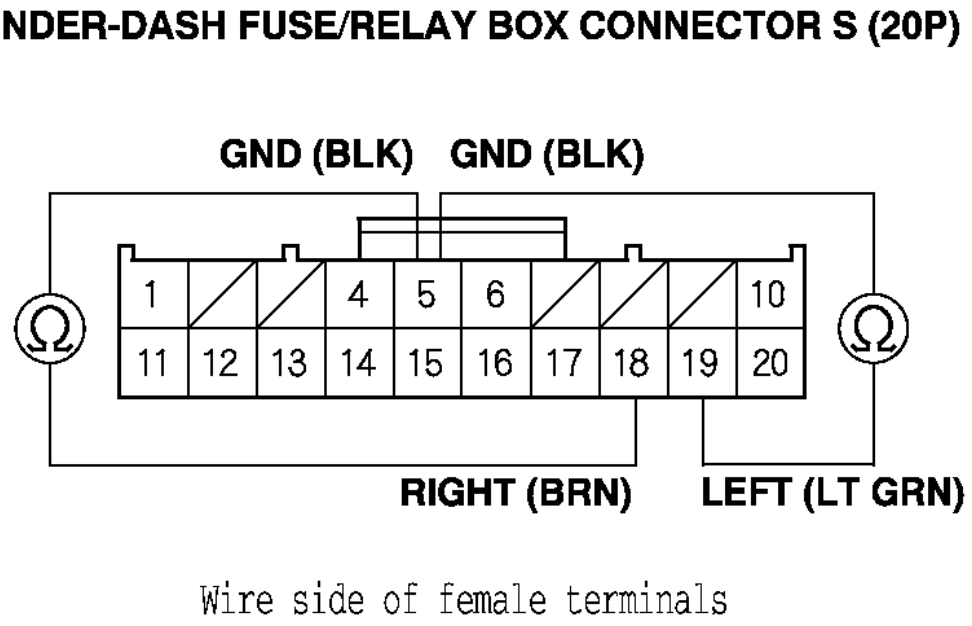

Fig. 6: Under-Dash Fuse/Relay Box Connector S (20P) - Black
Courtesy of HONDA

MICU INPUT TEST

1. Before troubleshooting the turn signal/hazard flasher system, troubleshoot the B-CAN System Diagnosis Test Mode A (see **TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A**).
2. Check the No. 10 (7.5 A) fuse in the under-dash fuse/relay box. If the fuse is blown, replace it and go to step 3.
3. Disconnect the under-dash fuse/relay box connectors E, F, G, P, Q, R, S, and T.

NOTE: All connector views are wire side of female terminals.

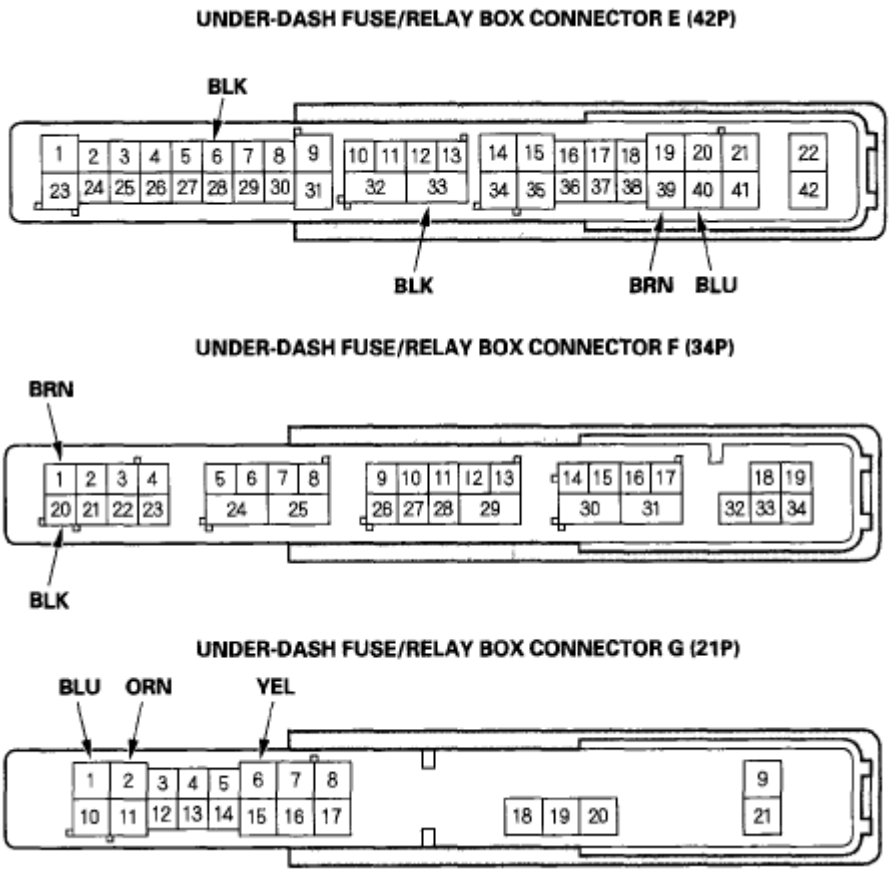

Fig. 7: Identifying Under-Dash Fuse/Relay Box Connectors (1 Of 2)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

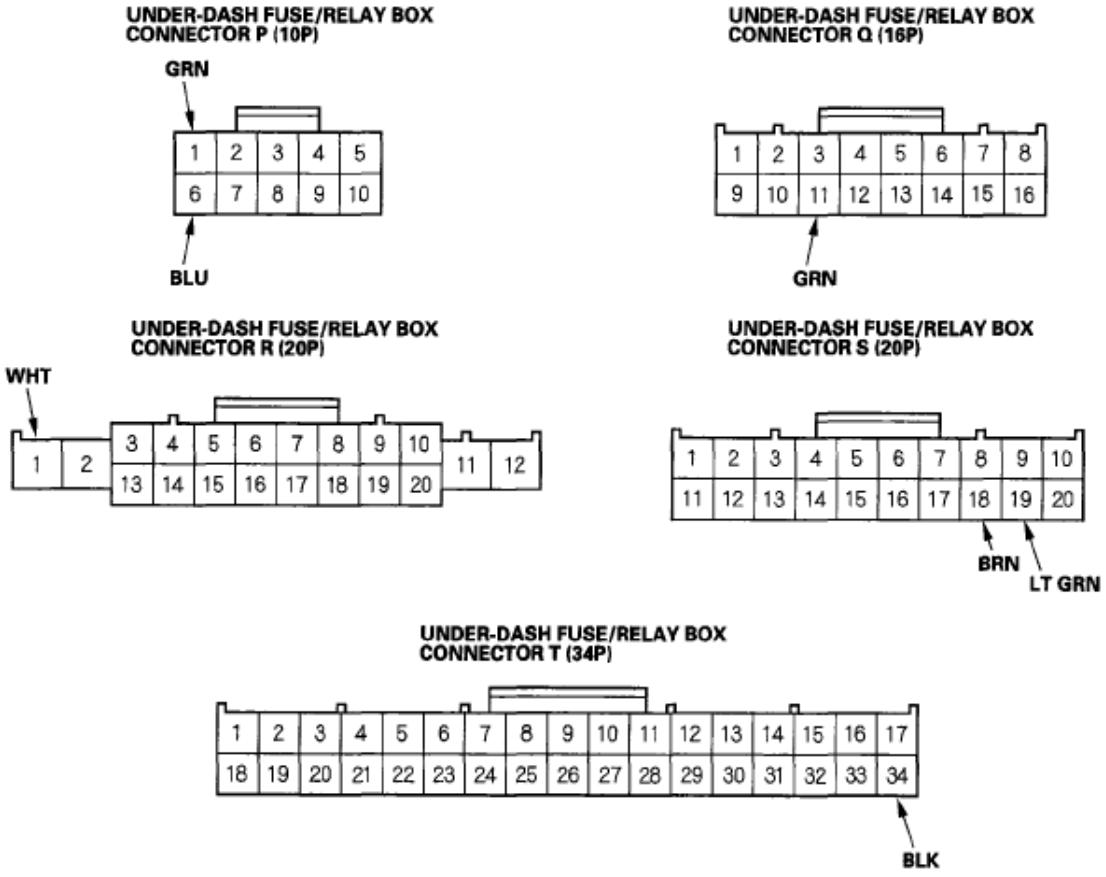

Fig. 8: Identifying Under-Dash Fuse/Relay Box Connectors (2 Of 2)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary and recheck the system.
   - If the terminals look OK, go to step 5.
5. With the connectors still disconnected, make these input tests at the appropriate connector.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to step 6.

MICU INPUT TEST (CONNECTORS DISCONNECTED)

Cavity	Wire	Test condition	Test: Desired result	Possible cause if result is not obtained
E39	BRN	Under all conditions	Connect G2 and E39 terminals with a jumper wire: The right rear turn signal light should come on.	• Poor ground (G701) • Blown bulb • An open in the wire

F1	BRN	Under all conditions	Connect G2 and F1 terminals with a jumper wire: The right front turn signal light should come on.	• Poor ground (G201) • Blown bulb • An open in the wire
G1	BLU	Under all conditions	Connect G2 and G1 terminals with a jumper wire: The left front turn signal light should come on.	• Poor ground (G301) • Blown bulb • An open in the wire
P1	GRN	Under all conditions	Connect G2 and P1 terminals with a jumper wire: The right turn signal indicator should come on.	• Faulty gauge control module (speedo) • Faulty indicator • An open in the wire
P6	BLU	Under all conditions	Connect G2 and P6 terminals with a jumper wire: The left turn signal indicator should come on.	• Faulty gauge control module (speedo) • Faulty indicator • An open in the wire

6. Reconnect the connectors to the under-dash fuse/relay box, and make these input tests at the connectors.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, the MICU must be faulty; replace the under-dash fuse/relay box.

MICU INPUT TEST (CONNECTORS RECONNECTED)

Cavity	Wire	Test condition	Test: Desired result	Possible cause if result is not obtained

MICU INPUT TEST

1. Before troubleshooting the entry lights control system, troubleshoot the B-CAN System Diagnosis Test Mode A (see **TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A**).
2. Check the No. 10 (7.5 A) fuse in the under-dash fuse/relay box. If any fuse is blown, replace it and go to step 3.
3. Disconnect the under-dash fuse/relay box connectors E, F, G, K, Q, and T.

NOTE: All connector views are shown from wire side of female terminals.

Courtesy of AMERICAN HONDA MOTOR CO., INC.

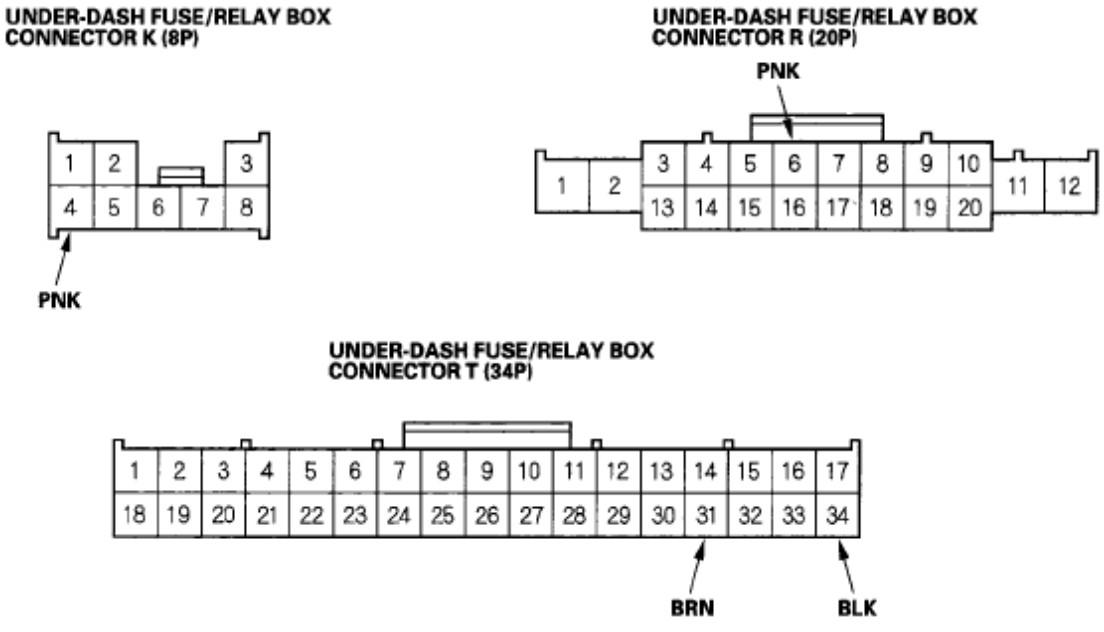

Fig. 5: Identifying Under-Dash Fuse/Relay Box Connectors (2 Of 2)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary and recheck the system.
   - If the terminals look OK, go to step 5.
5. With the connectors still disconnected, make these input tests at the appropriate connector.
   - If any test indicates a problem, find and correct the cause, then recheck the system.

- If all the input tests prove OK, go to step 6.

MICU INPUT TEST CHART (CONNECTORS DISCONNECTED)

Cavity	Wire	Test condition	Test: Desired result	Possible cause if result is not obtained
K4	PNK	Under all conditions With moonroof: select the interior light switch in DOOR position	Attach to ground: The ceiling light and map lights should come on.	• Blown No. 22 (7.5 A) fuse in the under-hood fuse/relay box • Blown bulb(s) • Faulty ceiling light • Faulty map light • Faulty interior light switch (with moonroof) • An open in the wire

6. Reconnect the connectors to the under-dash fuse/relay box, and make these input tests at the connectors.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, the MICU must be faulty; replace the under-dash fuse/relay box.

IGNITION KEY SWITCH TEST

1. Remove the steering column upper and lower covers (see **STEERING COLUMN REMOVAL AND INSTALLATION**).
2. Disconnect the 6P connector.

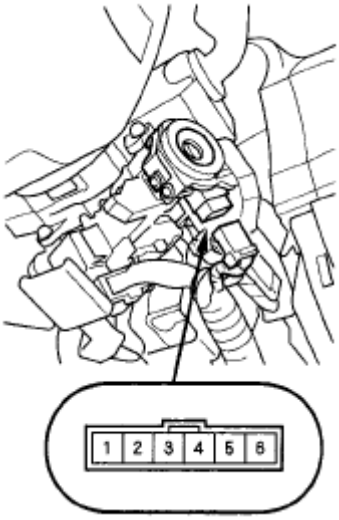

Fig. 6: Locating 6P Connector

3. Check for continuity between the No. 1 and No. 2 terminals.
    - There should be continuity with the key in the ignition switch.
    - There should be no continuity with the key removed.
4. If the continuity is not as specified, replace the ignition switch.

3. Remove the screws, then remove the front individual map lights (B) and moonroof switch or navigation microphone (C).
4. Disconnect the 3P connector from the map lights and the 10P [12P] connector from the moonroof switch or navigation microphone.
5. Check for continuity between the terminals in each switch position according to the table.

Position \ Terminal		1		3	Body ground
RIGHT	ON	○	○		○
	OFF	○	○	○	
LEFT	ON	○	○		○
	OFF	○	○	○

3. Remove the screws, then remove the ceiling light (B).
4. Disconnect the 3P connector (C) from the ceiling light.
5. Check for continuity between the terminals.
   - There should be continuity between terminals No. 1 and No. 2 with the switch in the MIDDLE (DOOR) position.
   - There should be continuity between terminals No. 2 and No. 3 (body ground) with the switch in the ON position.
   - There should be no continuity between terminals No. 1 and No. 2, or between terminal No. 2 and body ground with the switch in the OFF position.
6. If the continuity is not as specified, check the bulb. If the bulb is OK, replace the light.
7. Install in the reverse order of removal.

TRUNK LIGHT TEST/REPLACEMENT

1. Open the trunk lid.
2. Carefully pry out the trunk light (A).

Trunk Light: 5 W

3. Disconnect the 2P connector (B) from the light.
4. Check for continuity between the No. 1 (+) and No. 2 (-) terminals. There should be continuity. If there is no continuity, check the bulb. If the bulb is OK, replace the trunk light assembly.
5. Install in the reverse order of removal.

TRUNK LID LATCH SWITCH TEST

1. Open the trunk lid.
2. Disconnect the connector (A) from the trunk lid latch assembly (B).

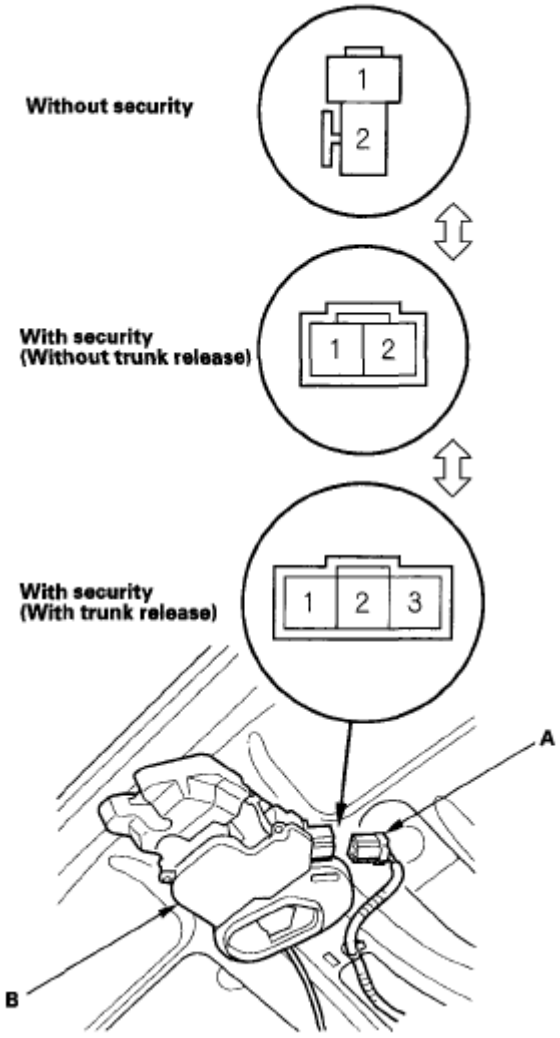

Fig. 9: Identifying Trunk Lid Latch Assembly Connector

3. Check for continuity between the No. 1 [No. 3] and No. 2 terminals.

   [ ] : With trunk release

   - There should be continuity with the trunk lid open.
   - There should be no continuity with the trunk lid closed.
4. If the continuity is not as specified, replace the trunk lid latch assembly.

INTERIOR LIGHT SWITCH TEST/REPLACEMENT

WITH MOONROOF

NOTE: The interior light switch is built into the moonroof switch, and it switches the front individual map lights between the OFF and DOOR positions.

1. Remove the front individual map lights (see **FRONT INDIVIDUAL MAP LIGHT TEST/REPLACEMENT**).

2. Disconnect the moonroof switch 10P connector (A) and map light 3P connector (B).

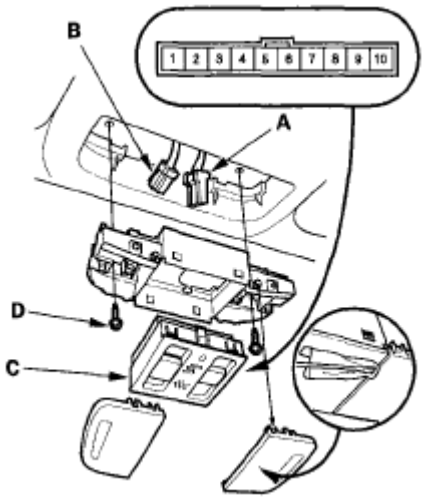

Fig. 10: Identifying Moonroof Switch 10P Connector And Map Light 3P Connector

3. Remove the moonroof switch (C).
4. Check for continuity between moonroof switch 10P [12P] connector terminals No. 1 [No. 7] and No. 8 [No. 9].
   - There should be continuity when the interior light switch is in the DOOR position.
   - There should be no continuity when the interior light switch is in the OFF position.
5. If the continuity check is not as specified, replace the illumination bulb (D) or the switch.
6. Install the switch and light in the reverse order of removal.

AMBIENT LIGHT REPLACEMENT

NOTE: The ambient light is built into the moonroof switch.

2-DOOR WITH MOONROOF

1. Remove the front individual map lights (see **FRONT INDIVIDUAL MAP LIGHT TEST/REPLACEMENT**).
2. Disconnect the moonroof switch 10P connector (A) and map light 3P connector (B).

Maintenance - Civic (Exept GX & Hybrid))

LUBRICANTS AND FLUIDS

For details of lubrication points and type of lubricants to be applied, refer to **LUBRICANT OR FLUID REFERENCE** and various work procedures (such as Assembly/Reassembly, Replacement, Overhaul, Installation, etc.) .

LUBRICANT OR FLUID REFERENCE

Application		Lubricant or Fluid
A	Engine	Honda Motor Oil: American Honda P/N 08798-9023 (5W-20), Honda Canada P/N CA66806 (5W-20) Look for the API certification seal on the oil container as shown in **Fig. 1**. Make sure it says "For Gasoline Engines." SAE viscosity .
B	Manual transmission	Honda Manual Transmission Fluid (MTF): P/N 08798-9016 Always use Honda MTF. Using motor oil can cause stiffer shifting because it does not contain the proper additives.
	Automatic transmission	Honda Automatic Transmission Fluid (ATF-Z1): American Honda P/N 08200-9001, Honda Canada P/N CA66689 Always use Honda ATF-Z1. Using a non-Honda ATF can affect shift quality.
C	Brake system (including ABS/VSA line)	Honda DOT 3 Brake Fluid: P/N 08798-9008 Always use Honda DOT 3 Brake Fluid. Using a non-Honda brake fluid can cause corrosion and decrease the life of the system.
D	Clutch system (manual transmission)	Honda DOT 3 Brake Fluid: P/N 08798-9008 Always use Honda DOT 3 Brake Fluid. Using a non-Honda brake fluid can cause corrosion and decrease the life of the system.
E F	Brake booster clevis Clutch master cylinder clevis (manual transmission)	Multipurpose Grease

G	Release fork (manual transmission)	
H	Battery terminals	
I	Fuel fill door	
J	Hood hinges	
K	Trunk hinges and trunk latch	
L	Rear brake shoe linkage (rear drum brake model)	Rubber Grease
M	Shift cable ends	Honda Silicone Grease: P/N 08C30-B0234M
N	Caliper piston boots, caliper piston seals, caliper pins, and boots	
O	Power steering system	Honda Power Steering Fluid: P/N 08206-9002 Always use Honda Power Steering Fluid. Using any other type of power steering fluid or automatic transmission fluid can cause increased wear and poor steering in cold weather.
P	Air conditioning compressor	Compressor Oil: SP-10 (P/N 38897-P13-A01AH or 38899-P13-A01) for refrigerant HFC-134a (R-134a)
Q	Cooling System	Honda Long Life Antifreeze/Coolant Type 2: P/N OL999-9001

MAINTENANCE MINDER

GENERAL INFORMATION

Maintenance Display

The Maintenance Minder is an important feature of the information display. The Civic's onboard computer (ECM/PCM) calculates the remaining engine oil life and automatic transmission fluid life. The system also displays the code for other scheduled maintenance items needing service.

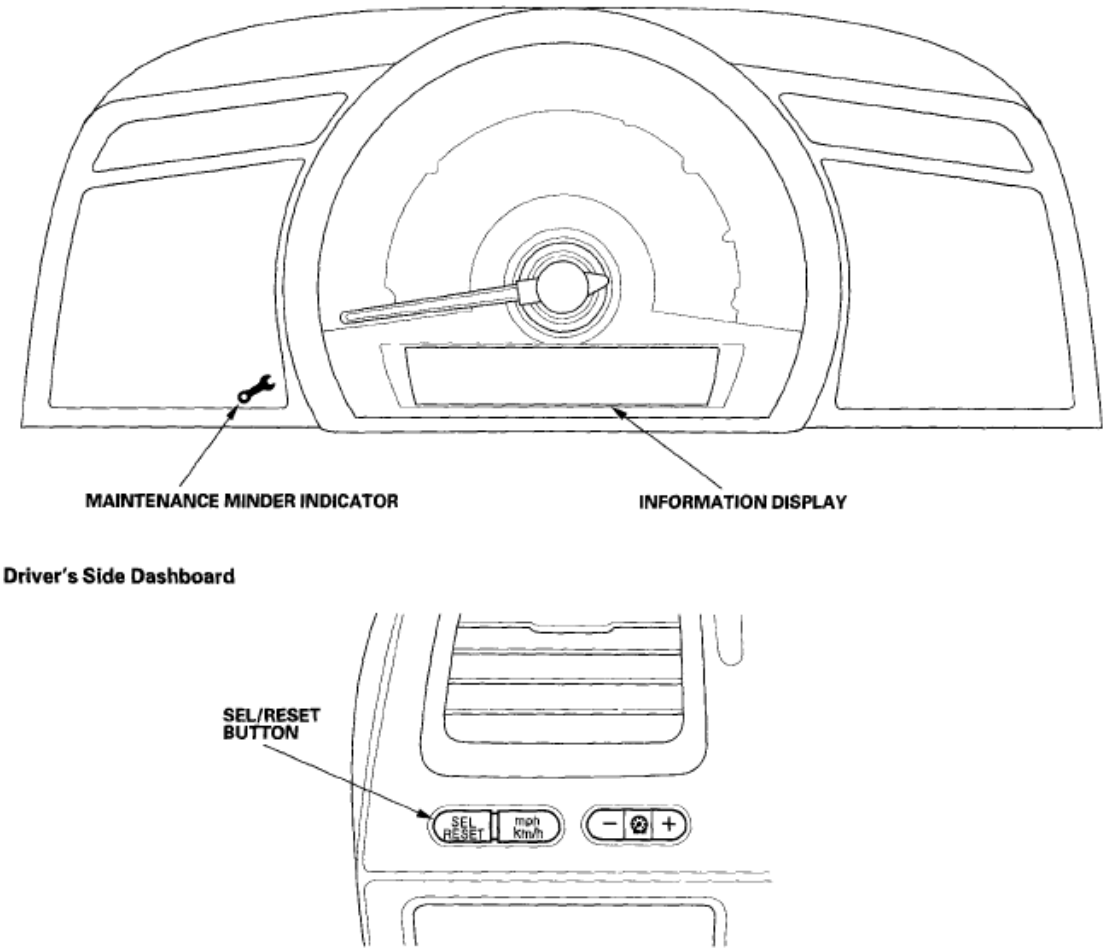

Fig. 3: Identifying Maintenance Minder Display And Driver's Side Dashboard
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Service Information

1. The remaining engine oil life (A) is shown as a percentage in the information display. To see the current engine oil life , turn the ignition switch to the ON (II) position, then push and release the SEL/RESET button repeatedly until the engine oil life displays.

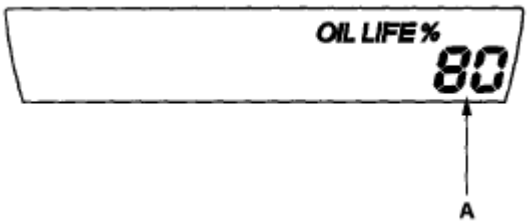

Fig. 4: Engine Oil Life At 80 Percent Displayed
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. When the ignition switch is in the ON (II) position, and the remaining engine oil life is 6% to 15%, the remaining engine oil life (A) and other scheduled maintenance item(s) needing service are displayed. The maintenance minder indicator (B) also comes on when the engine oil life is 15% or less. To cancel the display and the indicator, press the SEL/RESET button.

- Complete list of maintenance main items (C) (see **MAINTENANCE MAIN ITEMS**).
- Complete list of maintenance sub items (D) (see **MAINTENANCE SUB ITEMS**).

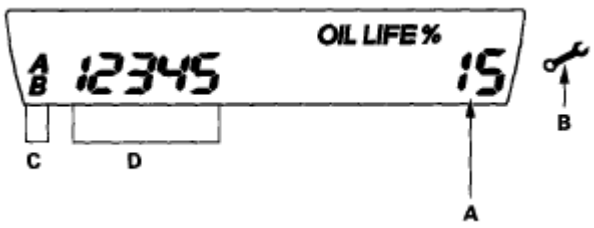

Fig. 5: Engine Oil Life At 15 Percent Displayed
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. When the ignition switch in the ON (II) position, and the remaining engine oil life is 1% to 5%, the message "SERVICE" (A) is displayed along with engine oil life and the same maintenance item code (s).

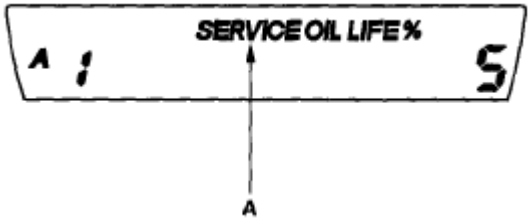

Fig. 6: Service Oil Life At 5 Percent Displayed
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. When the ignition switch is in the ON (II) position, and the remaining engine oil life is 0%, the engine oil life indicator (A) blinks. Pressing the SEL/RESET button cancels the display, but the maintenance minder indicator stays on.

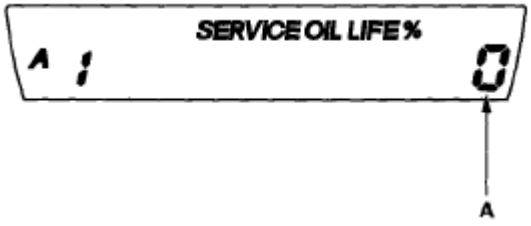

Fig. 7: Service Oil Life At 0 Percent Displayed
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. If the indicated maintenance is not done, the engine oil life indicator shows a negative mileage, for example "-10,", on the display. If the negative mileage is between 0 and -9, the indicator is displayed for only a few seconds when the ignition switch is turned to the ON (II) position. The negative mileage remains displayed after the vehicle is driven more than 10 miles (for USA models) or 10 km (for Canada models) after 0% oil life is reached. This means the indicated maintenance item(s) should have been done more than 10 miles (or 10 km) ago.

Fig. 8: Service Oil Life At Negative 10 Miles
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Resetting the Maintenance Information Display

NOTE:

- **The vehicle must be stopped to reset the display.**
- **If a required service is done and the display is not reset, or if the maintenance display is reset without doing the service, the system will not show the proper maintenance timing. This can lead to serious mechanical problems because there will be no accurate record of when the required maintenance is needed.**

1. Turn the ignition switch to the ON (II) position.
2. Press the SEL/RESET button repeatedly until the engine oil life indicator is displayed.
3. Press and release and hold the SEL/RESET button for about 10 seconds. The engine oil life indicator and the maintenance item code(s) will blink.

NOTE: **If you are resetting the display when the engine oil life is more than 15%, make sure any maintenance item(s) requiring service are done before resetting the display.**

4. Press and hold the SEL/RESET button for another 5 seconds. The maintenance item code(s) will disappear, and the engine oil life will reset to "100."

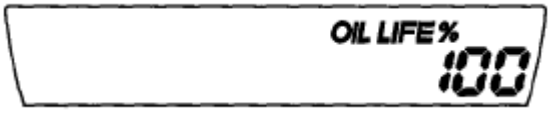

Fig. 9: Oil Life At 100 Percent
Courtesy of AMERICAN HONDA MOTOR CO., INC.

MAINTENANCE MAIN ITEMS

If the message "SERVICE" does not appear more than 12 months after the display is reset, change the engine oil every year.

NOTE:

- **Replace the brake fluid every 3 years (Independent of the maintenance messages in the information display).**
- **Inspect idle speed every 160,000 miles (256,000 km).**
- **Adjust the valves during services A, B, 1,2 or 3, only if they are noisy.**

MAINTENANCE MAIN ITEMS DESCRIPTION

Symbol	Maintenance Main Items

A	Replace engine oil R18A1 (see **OIL PRESSURE TEST**), K20Z3 (see **OIL PRESSURE TEST**). Engine oil capacity without oil filter: R18A1 3.5 L (3.7 US qt), K20Z3 4.2L (4.4 US qt).
B	Replace engine oil and oil filter R18A1 (see **ENGINE OIL FILTER REPLACEMENT**), K20Z3 (see **ENGINE OIL FILTER REPLACEMENT**). Engine oil capacity with oil filter: R18A1 3.7 L (3.9 US qt), K20Z3 4.4 L (4.6 US qt).
	Inspect front and rear brakes (see **COMPONENT LOCATION INDEX**). • Check pads and discs for wear (thickness), damage, and cracks. • Check calipers for damage, leaks, and tightness of mounting bolts. • Check the wheel cylinder for leaks. • Check the brake linings for craking, glazing, wear, or contamination.
	Check parking brake adjustment (see **PARKING BRAKE INSPECTION AND ADJUSTMENT**). Check the number of clicks (8 to 10) when the parking brake lever is pulled with 196 N (20 kgf, 44 lbf) of force.
	Inspect tie-rod ends, steering gearbox, and gearbox boots (see **COMPONENT LOCATION INDEX**). • Check rack grease and steering linkage. • Check boots for damage and leaking grease. • Check fluid lines for damage and leaks.
	Inspect suspension components (see **COMPONENT LOCATION INDEX**). • Check bolts for tightness. • Check condition of ball joint boots for deterioration and damage.
	Inspect driveshaft boots (see **DRIVESHAFT INSPECTION**). Check boots for cracks and boot bands for tightness.
	Inspect brake hoses and lines including ABS/VSA (see **BRAKE HOSE AND LINE INSPECTION**). Check the master cylinder and ABS/VSA modulator-control unit for damage or leakage.
	Inspect all fluid levels and condition of fluids. • Engine coolant R18A1 (see **COOLANT CHECK**), K20Z3 (see **COOLANT CHECK**). • Automatic transmission fluid (ATF-Z1) (see **ATF LEVEL CHECK**). • Manual transmission fluid (MTF) SPFM (see **TRANSMISSION FLUID INSPECTION AND REPLACEMENT**), PNN3, PNN4 (see **TRANSMISSION FLUID INSPECTION AND REPLACEMENT**). • Clutch fluid (see **CLUTCH MASTER CYLINDER REPLACEMENT**). • Power steering fluid (see **STEERING COLUMN/TILT/TELESCOPIC INSPECTION**). • Brake fluid (see **BRAKE FLUID LEVEL SWITCH TEST**). • Windshield washer fluid.
	Inspect exhaust system* R18A1 (see **INTAKE MANIFOLD AND EXHAUST SYSTEM (R18A1)**), K20Z3 (see **INTAKE MANIFOLD AND EXHAUST SYSTEM (K20Z3)**).

	Check catalytic converter heat shields, exhaust pipes, and muffler for damage, leaks, and tightness.
	Inspect fuel lines* and connections* R18A1 (see **FUEL LINE INSPECTION**), K20Z3 (see **FUEL LINE INSPECTION**). Check for loose connections, cracks, and deterioration; retighten loose connections and replace damaged parts.

NOTE: According to state and federal regulations, failure to do the maintenance items marked with an asterisk (*) will not void the customer's emissions warranties. However, Honda recommends that all maintenance services be done at the recommended interval, to ensure long-term reliability.

MAINTENANCE SUB ITEMS

MAINTENANCE SUB ITEMS DESCRIPTION

Number	Maintenance Sub Items
1	Rotate tires, and check tire inflation and condition. Follow the pattern shown in the Owner's Manual.
2	Replace air cleaner element R18A1 (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**), K20Z3 (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**). Replace every 15,000 miles (24,000 km), if the vehicle is driven primaly in dusty conditions.
	Replace dust and pollen filter (see **DUST AND POLLEN FILTER REPLACEMENT**). • Replace the filter at 15,000 miles (24,000 km) intervals if the vehicle is driven mostly in urban areas that have high concentrations of soot in the air from industry and diesel-powered vehicles. • Replace the filter whenever airflow from the heating and cooling system is less than normal.
	Inspect drive belt R18A1 (see **DRIVE BELT AUTO-TENSIONER INSPECTION**), K20Z3 (see **DRIVE BELT INSPECTION**). Look for cracks and damage, then check the position of the drive belt auto-tensioner indicator.
3	Replace automatic transmission fluid (see **ATF REPLACEMENT**). Capacity: 2.4 L (2.5 US qt); use Honda ATF-Z1.
	Replace manual transmission fluid SPFM (see **TRANSMISSION FLUID INSPECTION AND REPLACEMENT**), PNN3, PNN4 (see **TRANSMISSION FLUID INSPECTION AND REPLACEMENT**). Capacity: SPFM 1.4 L (1.5 US qt), PNN3 1.5 L (1.6 US qt); use Honda MTF.
4	Replace spark plugs R18A1 (see **SPARK PLUG INSPECTION**), K20Z3 (see **SPARK PLUG INSPECTION**). Use R18A1 IZFR6K1 IS (NGK) or SKJ20DR-M11S (DENSO), K20Z3 IFR7G11KS (NGK) or SK22PR-MIIS(DENSO).
	Inspect the valve clearance (cold) R18A1 (see **VALVE CLEARANCE ADJUSTMENT**), K20Z3 (see **VALVE CLEARANCE ADJUSTMENT**). R18A1 Intake: 0.18-0.22 mm (0.007-0.009 in.), Exhaust: 0.23-0.27 mm (0.009-0.011 in.), K20Z3 engine Intake 0.21-0.25 mm (0.008-0.010 in.), Exhaust: 0.25-0.29 mm (0.010-0.011 in.).

5	Replace engine coolant R18A1 (see **COOLANT REPLACEMENT**), K20Z3 (see **COOLANT REPLACEMENT**). Capacity (including the reservoir): 4-door model (except Si): 5.2 L (1.37 US gal), 2-door model (except Si): 5.2 L (1.37 US gal). Si: 4.5 L (1.19 US gal); use Honda Long Life Antifreeze/Coolant Type 2.

ENGINE OIL LIFE INDICATOR - PROCEDURE 1

1. Turn ignition switch to ON (II). Press SELECT/RESET knob until engine oil life indicator is displayed.
2. Press SELECT/RESET knob for 10 seconds. Engine oil life indicator and the maintenance item code

(s) will blink. Press SELECT/RESET knob for more than 5 seconds. Maintenance items code(s) will disappear and engine oil life indicator will reset to "100."

ENGINE OIL LIFE INDICATOR - PROCEDURE 2

1. Turn ignition switch to ON (II). Press SELECT/RESET knob until engine oil life indicator is displayed.
2. Press the SELECT/RESET knob for about 10 seconds. The information display shows the reset mode initial display as shown.
3. Select the "OIL LIFE" indicator by turning the SELECT/RESET knob. The display begins to blink. Push the same knob to enter this setting.
4. The engine oil life and maintenance item code(s) will begin blink. Push the SELECT/RESET knob to reset.
5. The maintenance item code(s) will disappear, and engine oil life will reset to "100".

ENGINE OIL LIFE INDICATOR - PROCEDURE 3

1. Turn ignition switch to ON (II). Press SELECT/RESET button on steering wheel until engine oil life is displayed.
2. Press SELECT/RESET knob in instrument panel for 10 seconds. Display will change to "CUSTOM SETUP" mode. Press SELECT/RESET button on steering wheel. Maintenance item code(s) will disappear and engine oil life will reset to "100."
3. To cancel resetting press INFO button on steering wheel. Press SELECT/RESET button. This cancels resetting procedure and normal display mode returns. Select "RESET" button and press SELECT/RESET button multi-information will.

ENGINE OIL LIFE INDICATOR - PROCEDURE 4

1. Turn ignition switch to ON (II) position.
2. Press SELECT button repeatedly until engine oil life display or service message is displayed.
3. Press the RESET button for about 10 seconds. A "MAINT RESET" message will appear.
4. Select appropriate answer - "MAINT RESET >N" (NO) or "MAINT RESET >Y" (YES) by pressing the select button. ">N" or ">Y" is displayed on the outside temperature display.
5. Select the "MAINT RESET >Y" (YES), and press and hold RESET button again to reset engine oil life to "100".

ENGINE OIL LIFE INDICATOR - PROCEDURE 5

1. Turn ignition switch to ON (II). Press TRIP button until engine oil life indicator is displayed.
2. Press TRIP knob for 10 seconds. Engine oil life indicator and the maintenance item code(s) will blink. Press TRIP knob for more than 5 seconds. Maintenance items code(s) will disappear and engine oil life indicator will reset to "100."

To reset MAINT REQ'D indicator light, turn ignition switch to OFF position. Push and hold the SELECT/RESET button and turn ignition switch to ON (II) position. Continue to hold button for more than 10 seconds or until MAINT REQ'D light goes out.

MAINTENANCE REQUIRED REMINDER LIGHT/ENGINE OIL LIFE INDICATOR RESET - PROCEDURE 3

1. For the first 8000 miles after maintenance required indicator is reset, the MAINT REQ'D indicator light illuminates when the ignition is turned on, then will go out after 2 seconds. When mileage is 8000-10,000 miles, the MAINT REQ'D reminder light will illuminate for 2 seconds, then blink for 10 seconds, and then go out. When mileage exceeds 10,000 miles, MAINT REQ'D indicator light illuminates and stays on while ignition switch is in ON (II) position.
2. To reset the MAINT REQ'D indicator light, turn ignition switch to OFF position. Press and hold the SELECT/RESET button. While still holding button, turn ignition switch to ON position, with engine off. Hold SELECT/RESET button for about 10 seconds until indicator resets.
3. If MAINT REQ'D reminder light does not reset, ensure headlights, parking lights, or both are turned off when resetting reminder light. The MAINT REQ'D indicator cannot be reset if any of these lights are on. If vehicle is equipped with daytime running lights and lights come on when ignition switch is turned to ON (II) position, daytime running lights must be disabled before indicator light can be reset.

MAINTENANCE REQUIRED REMINDER LIGHT/ENGINE OIL LIFE INDICATOR RESET - PROCEDURE 4

1. When distance driven since maintenance required indicator was reset is 6000 miles, the MAINT REQ'D reminder light will start to blink. After exceeding 7500 miles without having scheduled maintenance performed and MAINT REQ'D reminder light reset, light will remain on until it is reset.
2. To reset the light, turn ignition switch to OFF position. Press and hold TRIP button, located on lower right side of instrument cluster. While still holding TRIP button, turn ignition switch to ON position with engine off. Hold button for about 10 seconds until indicator resets.

OXYGEN SENSOR WARNING LIGHT RESET - PROCEDURE 1

1. Heated Oxygen Sensor (HO2S) must be replaced every 90,000 miles. When odometer reaches 90,000 miles, O2S indicator light on dash will illuminate, and then every subsequent 90,000 miles. After servicing, turn off or reset warning light.

NOTE: Reset procedure is for first 90,000 mile reset. At every subsequent 90,000 mile reset, move screw back to previous hole.

2. To reset warning light, remove instrument cluster. Remove masking tape from hole "B". See **Fig. 2** or **Fig. 3** . Remove screw from hole "A" and insert into hole "B". Apply new masking tape to hole "A".

NOTE: **If a flat tire is replaced with the spare tire, and the flat tire is stored in the cargo area, the low pressure indicator will stay on but the appropriate tire indicator will go off. This prevents the customer from thinking there is a problem with the spare tire. When the flat tire is taken out of the vehicle for repair, the TPMS indicator will come on because the system is no longer receiving the signal from the tire's transmitter.**

NOTE: **When a tire pressure sensor is replaced or tires are rotated, the sensor ID must be memorized by the TPMS control unit. See TIRE PRESSURE SENSOR REGISTRATION in appropriate manufacturer service information.**

TPMS RESET - PROCEDURE 2

NOTE: **If a flat tire is replaced with the spare tire, and the flat tire is stored in the cargo area, the low pressure indicator will stay on but the appropriate tire indicator will go off. This prevents the customer from thinking there is a problem with the spare tire. When the flat tire is taken out of the vehicle for repair, the TPMS indicator will come on because the system is no longer receiving the signal from the tire's transmitter.**

NOTE: **When a tire pressure sensor is replaced or tires are rotated, the sensor ID must be memorized by the TPMS control unit. See TIRE PRESSURE SENSOR REGISTRATION in appropriate manufacturer service information.**

NOTE: **On models equipped with PAX tire systems, if a tire is repaired or replaced, the warning indicator (and the mileage counter that supports it) must be reset, no matter how far the vehicle was driven in the run flat mode.**

1. To put the gauge control module into the self-diagnostic mode, perform the following:
   - Turn the headlight switch to ON.
   - Press and hold the SELECT/RESET (Instrument panel brightness) knob.
   - Turn the ignition switch to ON (II).
   - Within 5 seconds, turn the headlights to AUTO, then to ON, and then to AUTO again.
   - Within 5 seconds, release the SELECT/RESET knob, then push and release the knob three times.
2. Once the gauge control module is in the self-diagnostic mode, press and hold the INFO button on the steering wheel for 5 seconds to get to the CUSTOMIZE MENU.
3. Use the INFO button to scroll through to the PAX RESET screen, then press the SEL/RESET button on the steering wheel.
4. Use the INFO button to scroll to the appropriate wheel, and then press the SEL/RESET button on the steering wheel to reset the PAX warning system display. The screen should read "PAX RESET COMPLETED". Repeat this step for each wheel that needs to be reset.
5. Use the INFO button to scroll through to EXIT, then press the SEL/RESET button.
6. Turn the ignition switch to OFF to exit the self-diagnostic mode.

FRONT SEAT BELT REPLACEMENT

SRS components are located in this area. Review the SRS component locations (see **COMPONENT LOCATION INDEX**) and the precautions and procedures (see **PRECAUTIONS AND PROCEDURES**) in the SRS before doing repairs or service.

NOTE: Check the front seat belts for damage (see INSPECTION), and replace them if necessary. Be careful not to damage them during removal and installation.

FRONT SEAT BELT - 2-DOOR

1. Make sure you have the anti-theft codes for the audio or the navigation system, then write down the audio presets.
2. Slide the front seat forward fully.
3. Disconnect the negative cable from the battery, and wait at least 3 minutes before beginning work.
4. Remove the seat belt lower anchor.
   - Driver's seat belt: Remove the lower anchor cap (A), and remove the lower anchor bolt (B).
   - Passenger's seat belt: Carefully insert the tip of a small screwdriver (C) through the hole in the back of the front seat belt lower anchor cover (D) and into the hole in the front seat belt lower anchor (E).

Unlock the lower anchor by pushing in on the screwdriver. Remove the screwdriver, and then detach the front seat belt anchor plate (F) and anchor cover from the lower anchor.

5. Remove these items:
   - Door sill trim (see step 4 on **TRIM REMOVAL/INSTALLATION - DOOR AREAS**)
   - Rear side trim panel (see **2-DOOR**)
6. Remove the bolts (A) and the seat belt guide (B).

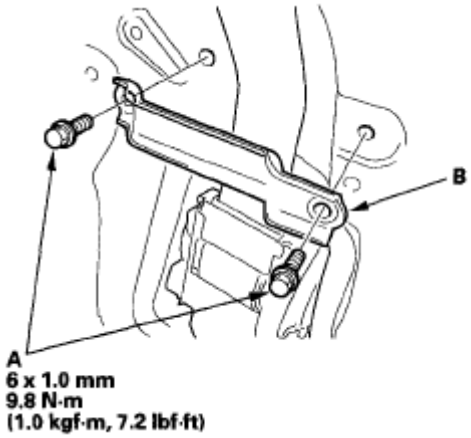

Fig. 4: Identifying Seat Belt Guide Bolts (With Torque Specifications)

9. If necessary, remove the front seat belt protector (F).
10. Install the belt in the reverse order of removal, and note these items:
    - Check that the retractor locking mechanism functions (see **INSPECTION**).
    - Assemble the washers, collars, and bushings on the upper and lower anchor bolts as shown.
    - If the seat belt tensioner has been deployed, replace the front seat belt protector with a new one.
    - Apply medium strength type liquid thread lock to the anchor bolts before reinstallation.
    - Before installing the anchor bolts, make sure there are no twists or kinks in the front seat belt.
    - Make sure the seat belt tensioner connector is plugged in properly.
    - Passenger's seat belt: Before attaching the front seat belt lower anchor, make sure there are no twists or kinks in the belts.
    - Passenger's seat belt: Triangle marks (A) on the anchor plate (B) and on the lower anchor (C) must face the same side.
    - Passenger's seat belt: Insert the hook on the anchor plate into the lower anchor, and be sure that the lower anchor is locked securely.
    - Reconnect the negative cable to the battery.
    - Enter the anti-theft codes for the audio or the navigation system, then enter the audio presets.
    - Set the clock.
    - Check for any DTCs that may have been set during repairs, and clear them.

10. Install the seat belt in the reverse order of removal, and note these items:
    - Apply medium strength type liquid thread lock to the anchor bolts before reinstallation.
    - Tighten the bolts by hand first, then tighten to the specified torque.
    - Check that the retractor locking mechanism functions as described (see **INSPECTION**).
    - Assemble the washer, collar, and bushing on the upper anchor bolt as shown.
    - If the seat belt tensioner has been deployed, replace the front seat belt protector with a new one.
    - Before installing the anchor bolts, make sure there are no twists or kinks in the seat belt.
    - Make sure the seat belt tensioner is properly plugged in.
    - Reconnect the negative cable to the battery.
    - Enter the anti-theft codes for the audio or the navigation system, then enter the audio presets.
    - Set the clock.
    - Check for any DTCs that may have been set during repairs, and clear them.

FRONT SEAT BELT BUCKLE

1. Make sure you have the anti-theft code for the audio or the navigation system, then write down the

audio presets.

2. Disconnect the negative cable from the battery, and wait at least 3 minutes before beginning work.
3. Remove the front seat (see **FRONT SEAT REMOVAL/INSTALLATION**).
4. Lift up the front seat, then detach the seat belt switch connector (A) and seat belt buckle tensioner connector (B), and on the driver's seat, detach the harness clip (C).

6. 2-door Passenger's seat: Release the hook strips (D) and pull back the seat cushion cover.
7. Pull the seat belt switch harness (E) out through the space between the seat cushion and the seat track (driver's seat), or through the hole in the seat track (passenger's seat).
8. Install the buckle in the reverse order of removal, and note these items:
    - Assemble the washers on the center anchor bolt as shown.
    - Apply medium strength type liquid thread lock to the center anchor bolt before reinstallation.
    - Tighten the bolts by hand first, then tighten to specification with a torque wrench.
    - Make sure the seat belt switch connector and seat belt buckle tensioner connector are plugged in properly.
    - Reconnect the negative cable to the battery.
    - Enter the anti-theft codes for the audio or the navigation system, then enter the audio presets.
    - Set the clock.
    - Check for any DTCs that may have been set during repairs, and clear them.

REAR SEAT BELT REPLACEMENT

NOTE: Check the second row seat belts for damage, and replace them if necessary. Be careful not to damage them during removal and installation.

Rear Seat Belt

1. Remove the rear seat cushion (see **SEAT CUSHION**).
2. Remove the lower anchor bolt (A).

5. Install the rear seat belt and retractor in the reverse order of removal, and note these items:
   - Apply medium strength type liquid thread lock to the anchor bolts before reinstallation.
   - Check that the retractor locking mechanism functions as described (see **INSPECTION**).
   - Before installing the anchor bolt, make sure there are no twists or kinks in the rear seat belt.

CENTER SEAT BELT AND SEAT BELT BUCKLES

1. Remove the rear seat cushion (see **SEAT CUSHION**).
2. Remove the center anchor bolts (A), then remove the right seat belt buckle (B), center seat belt buckle (C), and left seat belt buckle (D).

6. Remove the rear center seat belt protector (E).
7. Install the seat belt and buckles in the reverse order of removal, and note these items:
   - Apply medium strength type liquid thread lock to the center anchor bolts before reinstallation.
   - Tighten the bolts by hand first, then tighten to the specified torque.
   - Check that the retractor locking mechanism functions (see **INSPECTION**).
   - Assemble the washers on the center anchor bolt as shown.

- Before installing the center anchor bolt, make sure there are no twists or kinks in the center belt.
- Make sure the rear center ELR (emergency locking retractor) is pointing straightforward.

INSPECTION

OUT OF VEHICLE

SRS components are located in this area. Review the SRS component locations (see **COMPONENT LOCATION INDEX**) and the precautions and procedures (see **PRECAUTIONS AND PROCEDURES**) in the SRS before doing repairs or service.

Retractor

1. Before installing the retractor, check that the seat belt can be pulled out freely.
2. Make sure that the seat belt does not lock when the retractor (A) is leaned slowly up to 15 "from the mounted position. The seat belt should lock when the retractor is leaned over 40°. Do not attempt to disassemble the retractor.

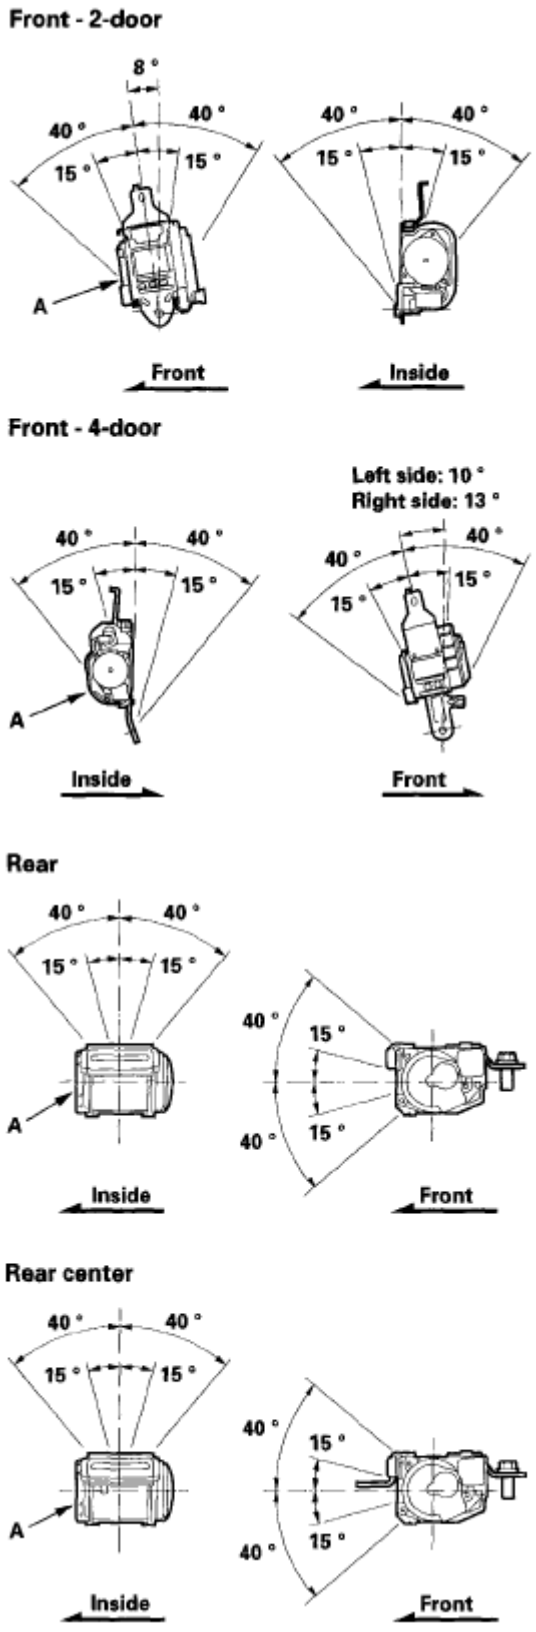

Fig. 24: Identifying Retractor Position
Courtesy of HONDA

3. Replace the seat belt with a new assembly if there is any abnormality. Do not disassemble any part of the seat belt for any reason.

IN-VEHICLE

1. Check that the seat belt is not twisted or caught on anything.
2. After installing the anchors, check for free movement on the anchor bolts. If necessary, remove the anchor bolts and check that the washers and other parts are not damaged or improperly installed.
3. Check the seat belts for damage or discoloration. Clean with a shop towel if necessary. Use only soap and water to clean.

NOTE: Dirt build-up in the loops of the upper anchors can cause the seat belts to retract slowly. Wipe the inside of the loops with a clean cloth dampened in isopropyl alcohol.

4. Check that the seat belt does not lock when pulled out slowly. The seat belt is designed to lock only during a sudden stop or impact.
5. Make sure that the seat belt will retract automatically when released.
6. For front passenger's seat belt and all rear seat belts, check the seat belt retractor locking mechanism ALR (automatic locking retractor). This function is for securing child seats.
    - 1 Pull the seat belt all the way out to engage the ALR. The seat belt should retract with a ratcheting sound, but not extend. This is normal.
    - 2 To disengage the ALR, release the seat belt and allow it to fully retract, then pull the seat belt out part-way. The seat belt should retract and extend normally.
7. Replace the seat belt with a new assembly if there is any abnormality. Do not disassemble any part of the seat belt for any reason.

EPS System - Civic (All Except Hybrid & Si)

COMPONENT LOCATION INDEX

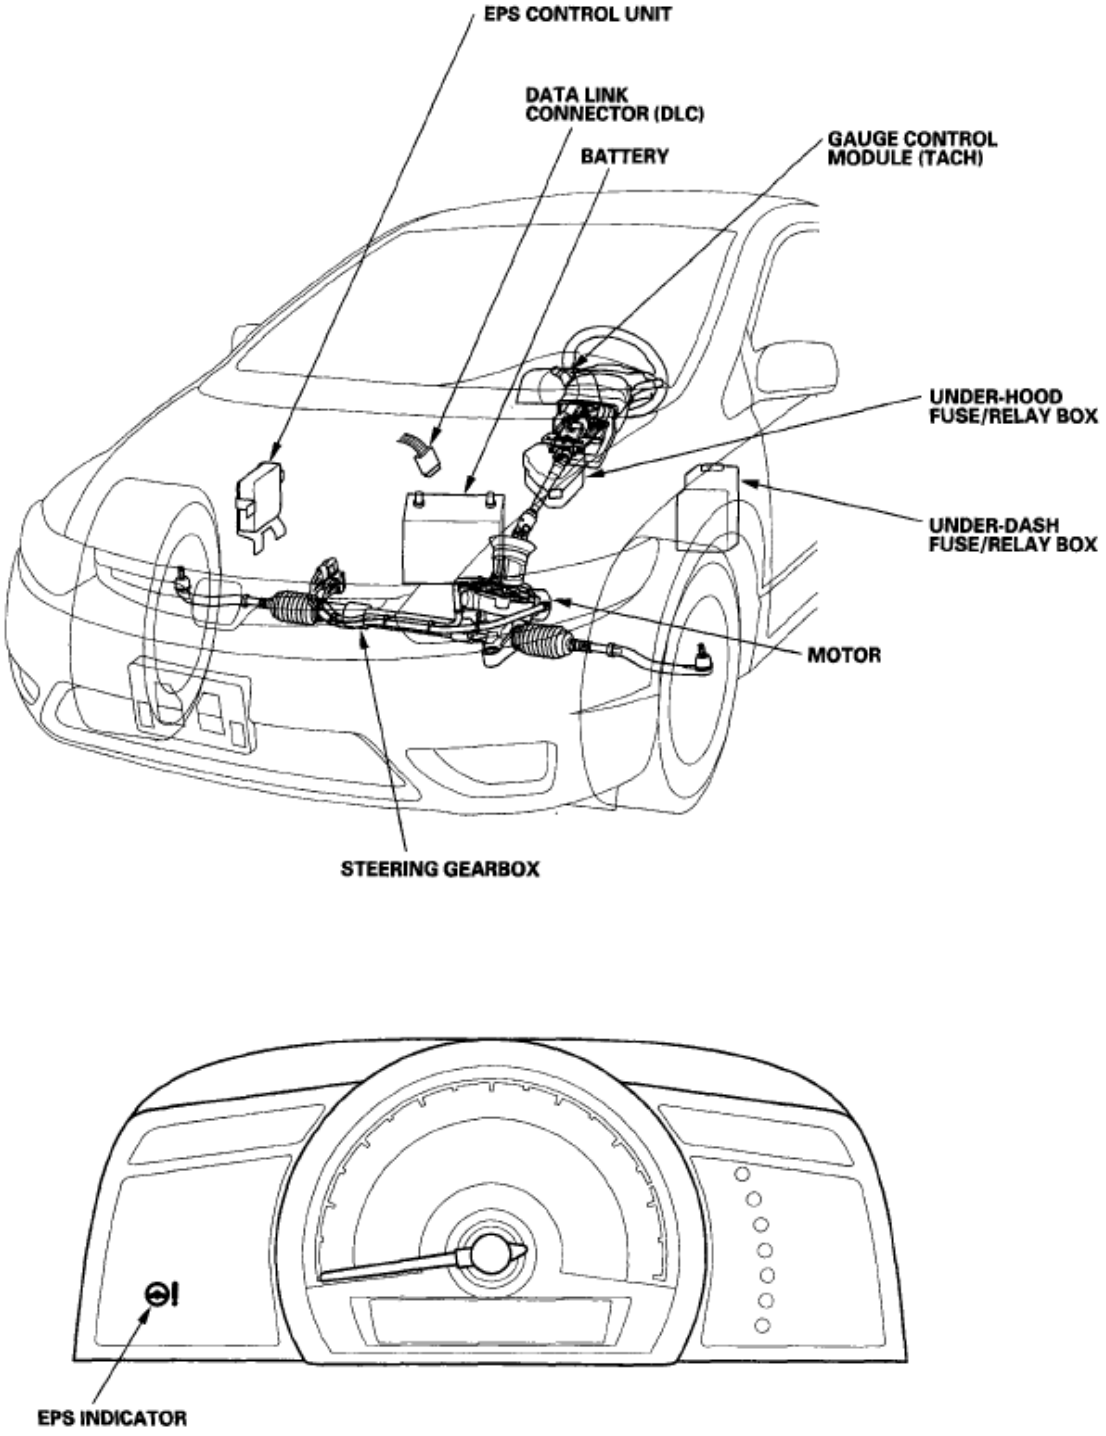

Fig. 1: Locating EPS Components

GENERAL TROUBLESHOOTING INFORMATION

EPS INDICATOR

Under normal conditions, the EPS indicator comes on when the ignition switch is turned to the ON (II) position, then goes off after the engine is started. This indicates that the LED and its circuit are operating correctly. If there is a failure in the system after the engine is started, the EPS indicator will stay on, and the power assist is turned off.

When the EPS indicator comes on, the control unit memorizes the DTC. In this case, the control unit will not activate the EPS system after the engine starts again, but it keeps the EPS indicator on.

When DTC 51-01, 51-02 or 51-06 is stored in the control unit, the EPS indicator will stay on until the DTC is erased. When a problem is detected and the EPS indicator comes on, there are cases when the indicator stays on until the ignition switch is turned OFF, and cases when the indicator goes off automatically when the system returns to normal. Even though the system is operating normally, the EPS indicator will come on under the following conditions:

- The vehicle speed decreases abruptly from 12mph (20 km/h) or more (by applying brake), and it is less than 1 mph (1 km/h) and engine speed is 2,000 rpm or above for 5 seconds (continuously) after the abrupt deceleration.
- While turning the steering wheel with the vehicle speed of 1 mph (1 km/h) or less for 20 seconds, and the engine speed is 2,000 rpm or above for at least 10 seconds.
- When the engine speed is 500 rpm or less, and the vehicle is travelling at a speed of 6 mph (10 km/h) or more for about 3 seconds.

To determine the actual cause of the problem, question the customer about the conditions during which the problem occured, taking the above conditions into consideration.

DIAGNOSTIC TROUBLE CODE (DTC)

- If the CPU cannot be activated, or it fails, the EPS indicator comes on, but the DTC is not memorized.
- The memory can hold any number of DTCs. However, when the same DTC is detected more than once, the most recent DTC is written over the prior DTC, therefore only one occurance is memorized.
- The lowest DTC is indicated first. The DTCs are indicated in ascending order, not in the order that they occurred.
- The DTCs are memorized in the EEPROM (nonvolatile memory) therefore the memorized DTCs cannot be erased by disconnecting the battery. Perform the specified procedures to clear DTCs.

SELF-DIAGNOSIS

Self-diagnosis can be classified into three categories:

- Initial diagnosis: Done right after the engine starts and until the EPS indicator goes off.
- Regular diagnosis: Done right after the initial diagnosis until the ignition switch is turned OFF.
- Steering diagnosis: Done during regular diagnosis while turning steering wheel.

The EPS control unit performs the following functions when a problem is detected by self-diagnosis:

1. Turns on the EPS indicator.
2. Memorizes the DTC.

3. Stops power assist and manual steering operation resumes.

NOTE: For DTCs 11-01, 11-02, 12-01,21-01,21-02, 22-01 and 35-04 the EPS indicator will go off automatically, and the system returns to normal.

RESTRICTION ON POWER ASSIST OPERATION

Repeated extreme steering force, such as turning the steering wheel continuously back-and-forth with the vehicle stopped, causes an increase of power consumption in the EPS motor. The increase of electric current causes the motor to heat up. Because this heat adversely affects the system, the control unit monitors the electric current of the motor.

When the control unit detects heat build-up in the motor, it reduces the electric current to the motor gradually to protect the system, and it restricts the power assist operation. The EPS indicator does not come on during this function.

When steering torque is not applied to the steering wheel, or when the ignition is turned off and the motor cools, the control unit will restore the power assist gradually until it's fully restored (after about 8 minutes).

TORQUE SENSOR NEUTRAL POSITION

The EPS control unit stores the torque sensor neutral position in the EEPROM. The torque sensor neutral position must be memorized whenever the gearbox, the motor, or the EPS control unit is replaced.

NOTE: The torque sensor neutral position is not effected when erasing the DTCs.

HOW TO TROUBLESHOOT DTCS

The troubleshooting procedures assume that the cause of the problem is still present and the EPS indicator is still on. Following the procedure when the EPS indicator does not come on can result in incorrect diagnosis.

1. Question the customer about the conditions when the problem occured, and try to reproduce the same conditions for troubleshooting. Find out when the EPS indicator came on, such as during EPS control, after EPS control, when the vehicle was at a certain speed, etc.
2. When the EPS indicator does not come on during the test-drive, but troubleshooting is done based on the DTC, check for loose connectors, poor terminal contact, etc., in the affected circuit before you start troubleshooting.
3. After troubleshooting, clear the DTC and test-drive the vehicle. Be sure the EPS indicator does not come on.

HOW TO RETRIEVE DTCS

1. With the ignition switch to LOCK (0), connect the HDS (Honda diagnostic system) to the data link connector (DLC) (A) located under the driver's side of the dashboard.

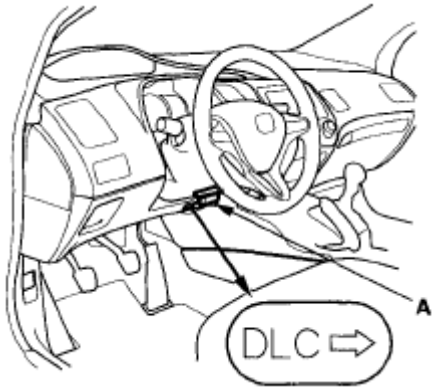

Fig. 2: Identifying DLC Connector

2. Turn the ignition switch ON (II).
3. Make sure the HDS communicates with the vehicle and the EPS control unit. If it doesn't, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Follow the prompts on the HDS to display the DTC(s) on the screen. After determining the DTC, refer to the **DTC TROUBLESHOOTING**.

NOTE: See the HDS Help menu for specific instructions.

5. Turn the ignition switch to LOCK (0).

HOW TO CLEAR DTCS

1. With the ignition switch in LOCK (0) position, connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

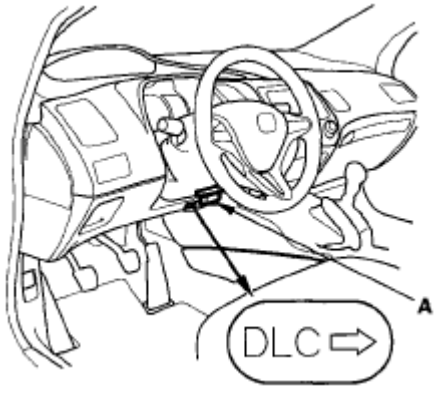

Fig. 3: Identifying DLC Connector

2. Turn the ignition switch ON (II).
3. Make sure the HDS communicates with the vehicle and the EPS control unit. If it doesn't, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Clear the DTC(s) by following the screen prompts on the HDS.

NOTE: See the HDS Help menu for specific instructions.

5. Turn the ignition switch to LOCK (0).

MEMORIZING THE TORQUE SENSOR NEUTRAL POSITION

The torque sensor neutral position must be memorized whenever the gearbox, the motor, or the EPS control unit is replaced. Note that the torque sensor neutral position is not affected when erasing the DTC.

NOTE: The torque sensor is sensitive to temperature. This procedure should be performed within the range of 68°F ± 50°F (20°C ± 10°C).

1. With the ignition switch in LOCK (0) position, connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

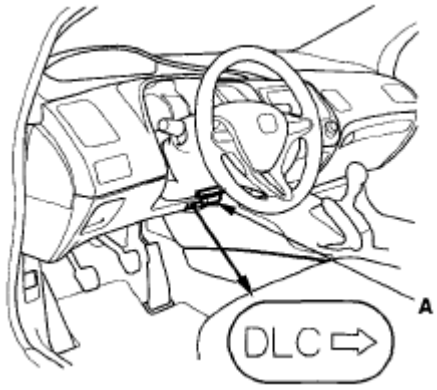

Fig. 4: Identifying DLC Connector

2. Turn the ignition switch ON (II).
3. Make sure the HDS communicates with the vehicle and the EPS control unit. If it doesn't, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).
4. From the EPS MENU, select MISCELLANEOUS TEST then TORQUE SENSOR LEARN and follow the screen prompts on the HDS.

NOTE: See the HDS Help menu for specific instructions.

5. Turn the ignition switch to LOCK (0).

61-04	Open/short in the motor harness (Steering diagnosis)

71-01	Motor angle sensor (SIN/COS signals) (Steering diagnosis)
71-02	Motor angle sensor (neutral position learning of SIN/COS) (Initial diagnosis)
71-03	Motor angle sensor (SIN/COS signals) (Steering diagnosis)
71-04	Motor angle sensor (check signal) (Regular diagnosis)
71-05	Motor angle sensor (SIN/COS signals changing amount) (Steering diagnosis)
71-06	Motor angle sensor (neutral position of SIN/COS) (Initial diagnosis)

NOTE:

- **Initial diagnosis: Done right after the engine starts and until the EPS indicator goes off.**
- **Regular diagnosis: Done right after the initial diagnosis until the ignition switch is turned off.**
- **Steering diagnosis: Done during regular diagnosis while turning steering wheel.**

SYMPTOM TROUBLESHOOTING INDEX

SYMPTOM TROUBLESHOOTING INDEX

Symptom	Diagnostic procedure
EPS indicator does not come on	Symptom Troubleshooting (see **EPS INDICATOR DOES NOT COME ON**)
EPS indicator does not go off, and no DTCs are stored	Symptom Troubleshooting (see **EPS INDICATOR DOES NOT GO OFF, AND NO DTCS ARE STORED**)
EPS indicator is not on, no DTCs are stored, but there is no power assist or power assist is down	1. Check the motor power wires between the EPS control unit and the motor for a short to body ground. Repair as needed. 2. If the motor power wires are OK, replace the motor (short in the motor) (see **MOTOR REMOVAL AND INSTALLATION**). 3. Check the power and ground connections at the EPS control unit.
HDS does not communicate with the EPS control unit or the vehicle	Troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).

DTC TROUBLESHOOTING

DTC 11-01: LOW/HIGH IG1-TERMINAL VOLTAGE (INITIAL DIAGNOSIS)

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0).
3. Start the engine.
4. Wait at least 60 seconds.

Does the EPS indicator come on?

YES -Go to step 5.

NO -Check for loose wires or poor connections. If the connections are good, the system is OK at this time.

5. Turn the ignition switch to LOCK (0).
6. Disconnect EPS control connector D (28P).
7. Turn the ignition switch ON (II).
8. Wait at least 60 seconds.
9. Measure voltage between EPS control unit connector D (28P) terminal No. 16 and body ground.

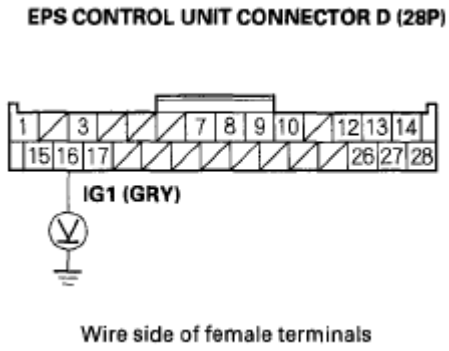

Fig. 12: Measuring Voltage Between EPS Control Unit Connector D (28P) Terminal No. 16 And Body Ground

Is the voltage between 9.63-16.6 V?

YES -Check for loose terminals in the EPS control unit connectors and repair if necessary. If no poor connections are found, replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

NO -If there is no voltage, or the voltage is lower than specified, repair an open or high resistance in the wire between the No. 4 (7.5 A) fuse in the under-dash fuse/relay box and EPS control unit. If the wire checks OK, check the battery (see **BATTERY TEST**), and troubleshoot the alternator regulator circuit (see **ALTERNATOR AND REGULATOR CIRCUIT TROUBLESHOOTING**).

DTC 11-02: LOW/HIGH ID-TERMINAL VOLTAGE (REGULAR DIAGNOSIS)

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0).
3. Start the engine.
4. Wait at least 60 seconds.

Does the EPS indicator come on?

YES -Go to step 5.

NO -Check for loose wires or poor connections. If the connections are good, the system is OK at this time.

5. Turn the ignition switch to LOCK (0).
6. Disconnect EPS control connector D (28P).
7. Turn the ignition switch ON (II).
8. Wait at least 60 seconds.
9. Measure voltage between EPS control unit connector D (28P) terminal No. 16 and body ground.

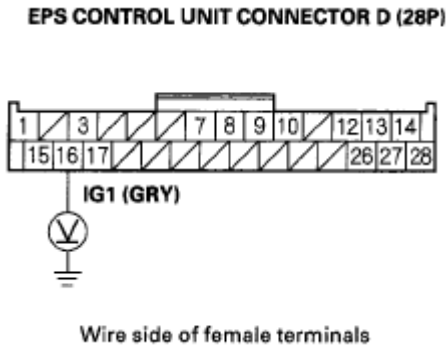

Fig. 13: Measuring Voltage Between EPS Control Unit Connector D (28P) Terminal No. 16 And Body Ground

Is the voltage between 9.20-17.4 V?

YES -Check for loose terminals in the EPS control unit connectors and repair if necessary. If no poor connections are found, replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

NO -If there is no voltage, or the voltage is lower than specified, repair an open or high resistance in the wire between the No. 4 (7.5 A) fuse in the under-dash fuse/relay box and EPS control unit. If the wire checks OK, check the battery (see **BATTERY TEST**), and troubleshoot the alternator regulator circuit (see **ALTERNATOR AND REGULATOR CIRCUIT TROUBLESHOOTING**).

DTC 12-01: LOW/HIGH VBU VOLTAGE (REGULAR DIAGNOSIS)

1. Turn the ignition switch to LOCK (0).
2. Connect the HDS to the data link connector (DLC).
3. Turn the ignition switch ON (II).
4. Check the BATTERY in the DATA LIST with the HDS.

Is the voltage at 9.2-17.4 V?

YES -Check for loose wires or poor connections. If the connections are good, the system is OK at this time.

NO -Go to step 5.

5. Turn the ignition switch to LOCK (0).

6. Check the No. 1 (70 A) fuse in the under-hood fuse/relay box.

   Is the fuse OK?

   YES -Reinstall the fuse, and go to step 7.

   NO-Replace the fuse, and recheck. If the fuse is blown, check for a short to body ground in this fuse circuit.

7. Disconnect EPS control unit connector A (2P) and connector D (28P).
8. Measure voltage between EPS control unit connector A (2P) terminal No. 2 and body ground.

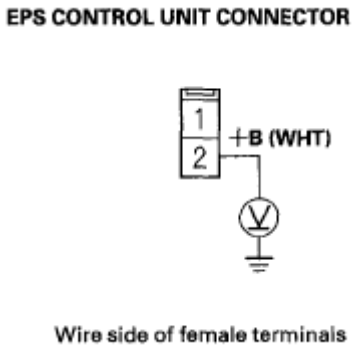

Fig. 14: Measuring Voltage Between EPS Control Unit Connector A (2P) Terminal No. 2 And Body Ground

Is there battery voltage?

YES -Check for loose terminals in the EPS control unit connectors, and repair if necessary. If no poor connections are found, replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

NO -Repair open in the wire between the EPS control unit and No. 1 (70 A) fuse in the under-hood fuse/relay box.

DTC 21-01: EXCESSIVE CHANGE OF THE VEHICLE SPEED SIGNAL (REGULAR DIAGNOSIS); DTC 21-02: COMPARISON BETWEEN THE VEHICLE SPEED AND THE ENGINE SPEED SIGNAL (REGULAR DIAGNOSIS)

NOTE:

- **If the MIL indicator is on, troubleshoot the fuel and emissions systems first.**
- **Even though the system is operating normally, the EPS indicator will come on caused by the detecting condition of DTC 21-01 or DTC 21-02.**

1. Turn the ignition switch to LOCK (0).
2. Raise the vehicle, and support it with safety stands in the proper locations (see **LIFT AND SUPPORT POINTS**), and allow all wheels to rotate freely.
3. Connect the HDS to the data link connector (DLC).
4. Start the engine, run the vehicle in 4th gear.

5. Check the VEHICLE SPEED in the DATA LIST with the HDS.

   Is the vehicle speed indicated?

   YES -The system is OK at this time.

   NO -Go to step 6.

6. Check for DTCs in the fuel and emissions systems with the HDS.

   Is DTC P0720 indicated?

   YES -Troubleshoot the indicated DTC.

   NO -Go to step 7.

7. Start the engine and check the tachometer.

   Is the tachometer working correctly?

   YES -Go to step 8.

   NO -Troubleshoot the gauge control module (tach) (see **SELF-DIAGNOSTIC FUNCTION**).

8. Turn the ignition switch to LOCK (0).
9. Short the SCS line with the HDS.
10. Disconnect ECM connector A (44P) and EPS control unit connector D (28P).
11. Check for continuity between EPS control unit connector D (28P) terminals No. 1 and ECM connector A (44P) terminals No. 36.

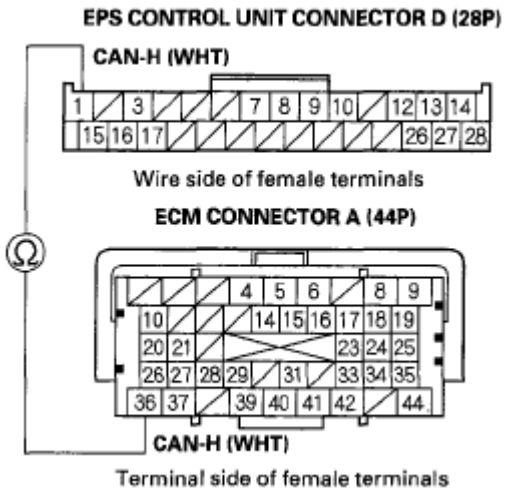

Fig. 15: Checking Continuity Between EPS Control Unit Connector D (28P) Terminals No. 1 And ECM Connector A (44P) Terminals No. 36

Is there continuity?

YES -Go to step 12.

NO -Repair open in the wire between the EPS control unit and the ECM.

12. Check for continuity between EPS control unit connector D (28P) terminals No. 15 and ECM connector A (44P) terminals No. 37.

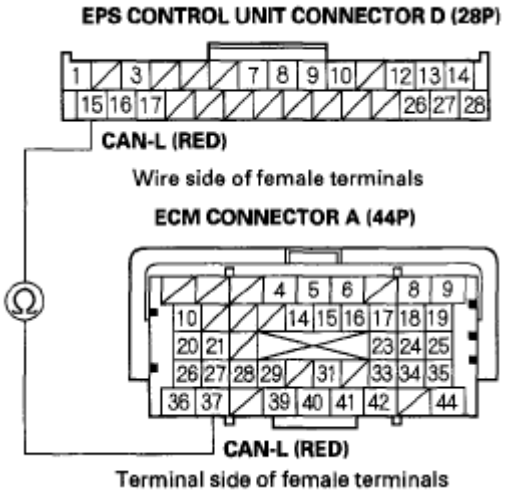

Fig. 16: Checking Continuity Between EPS Control Unit Connector D (28P) Terminals No. 15 And ECM Connector A (44P) Terminals No. 37

Is there continuity?

YES -Check for loose terminals in the EPS control unit connectors, and repair if necessary. If no poor connections are found, replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

NO -Repair open in the wire between the EPS control unit and the ECM.

DTC 22-01: ENGINE SPEED SIGNAL (INITIAL DIAGNOSIS)

NOTE: If the MIL indicator is on, troubleshoot the fuel and emissions systems first.

1. Turn the ignition switch to LOCK (0).
2. Connect the HDS to the data link connector (DLC).
3. Start the engine.
4. Check the ENGINE SPEED in the DATA LIST with the HDS.

Is there 0 rpm at idle?

YES -Go to step 5.

NO -The system is OK at this time.

5. Turn the ignition switch to LOCK (0).

6. Disconnect EPS control unit connector D (28P).
7. Start the engine.
8. Measure voltage between EPS control unit connector D (28P) terminal No. 3 and body ground.

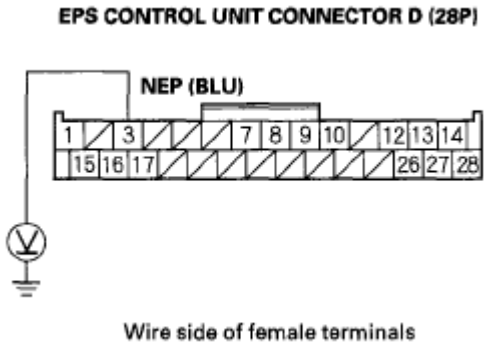

Fig. 17: Measuring Voltage Between EPS Control Unit Connector D (28P) Terminal No. 3 And Body Ground

Is there any voltage?

YES -Check for loose terminals in the EPS control unit connectors, and repair if necessary. If no poor connections are found, replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

NO -Go to step 9.

9. Turn the ignition switch to LOCK (0).
10. Check for continuity between EPS control unit connector D (28P) terminal No. 3 and body ground.

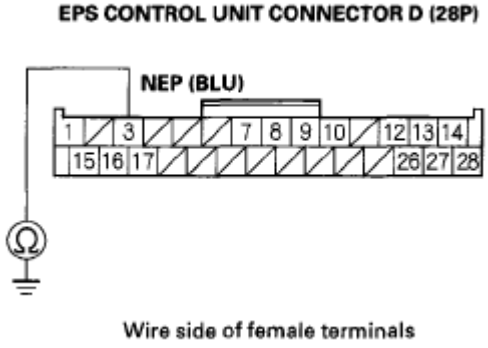

Fig. 18: Checking Continuity Between EPS Control Unit Connector D (28P) Terminal No. 3 And Body Ground

Is there continuity?

YES -Repair short to body ground in the wire between the EPS control unit and the ECM.

NO -Go to step 11.

11. Short the SCS line with the HDS.

12. Disconnect ECM connector A (44P).
13. Check for continuity between EPS control unit connector D (28P) terminals No. 3 and ECM connector A (44P) terminals No. 28.

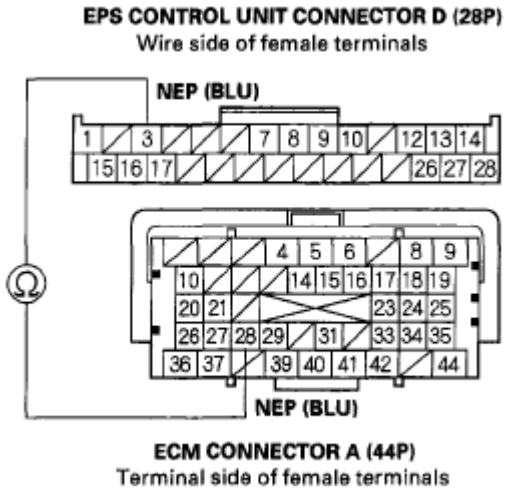

Fig. 19: Checking Continuity Between EPS Control Unit Connector D (28P) Terminals No. 3 And ECM Connector A (44P) Terminals No. 28

Is there continuity?

YES -Check for loose terminals in the ECM connector A (44P), and repair if necessary. If no poor connections are found replace the ECM (see **ECM REPLACEMENT**).

NO -Repair open in the wire between the EPS control unit and the ECM.

DTC 32-01: EPS CONTROL UNIT INTERNAL CIRCUIT (CURRENT SENSOR) (INITIAL DIAGNOSIS); DTC 32-02: EPS CONTROL UNIT INTERNAL CIRCUIT (CURRENT SENSOR) (REGULAR DIAGNOSIS); DTC 35-01: EPS CONTROL UNIT INTERNAL CIRCUIT (CPU) (INITIAL DIAGNOSIS/REGULAR DIAGNOSIS); DTC 35-02: EPS CONTROL UNIT INTERNAL CIRCUIT (EEPROM) (INITIAL DIAGNOSIS); DTC 35-04: EPS CONTROL UNIT INTERNAL CIRCUIT (CPU COMMUNICATION) (REGULAR DIAGNOSIS); DTC 35-06: EPS CONTROL UNIT INTERNAL CIRCUIT (ITN COMMUNICATION) (REGULAR DIAGNOSIS); DTC 35-07: EPS CONTROL UNIT INTERNAL CIRCUIT (INHL/INHR PORTS) (INITIAL DIAGNOSIS/REGULAR DIAGNOSIS); DTC 36-02: EPS CONTROL UNIT INTERNAL CIRCUIT (INH OUTPUT CIRCUIT) (INITIAL DIAGNOSIS); DTC 37-01: EPS CONTROL UNIT INTERNAL CIRCUIT (STEP-UP CIRCUIT) (INITIAL DIAGNOSIS)

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0).
3. Start the engine.

Does the EPS indicator come on?

YES -Go to step 4.

NO -Check for loose terminals or poor connections. If the connections are good, the system is OK at

this time.

4. Check for DTCs with the HDS.

   Is DTC 32-01, 32-02, 35-01, 35-02, 35-04, 35-06, 35-07, 36-02, or 37-01?

   YES -Check for loose terminals in the EPS control unit connectors, and repair if necessary. If no poor connections are found, replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

   NO -Troubleshoot the indicated DTC. If there are no DTCs, the system is OK at this time.

DTC 32-07: EPS CONTROL UNIT INTERNAL CIRCUIT (CURRENT SENSOR) (STEERING DIAGNOSIS)

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0).
3. Start the engine.
4. Turn the steering wheel to the right or left, and wait 10 seconds or more.

   Does the EPS indicator come on?

   YES -Go to step 5.

   NO -Check for loose terminals or poor connections. If the connections are good, the system is OK at this time.

5. Check for DTCs with the HDS.

   Is DTC 32-07 indicated?

   YES -Check for loose terminals in the EPS control unit connectors, and repair if necessary. If no poor connections are found, replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

   NO -Troubleshoot the indicated DTC. If there are no DTCs, the system is OK at this time.

DTC 32-08: CURRENT SENSOR (REGULAR DIAGNOSIS); DTC 32-09: CURRENT SENSOR (INITIAL DIAGNOSIS)

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0).
3. Start the engine.
4. Turn the steering wheel to the right or left, and wait 10 seconds or more.

   Does the EPS indicator come on?

   YES -Go to step 5.

NO -Check for loose terminals or poor connections. If the connections are good, the system is OK at this time.

5. Check for DTCs with the HDS.

   Is DTC 32-08 or DTC 32-09 indicated?

   YES -Go to step 6.

   NO -Troubleshoot the indicated DTC. If there are no DTCs, the system is OK at this time.

6. Turn the ignition switch to LOCK (0).
7. Disconnect EPS control unit connector B (2P) and connector C(2P).
8. Check for continuity between the following terminals of the EPS control unit connector B (2P) and connector C (2P).

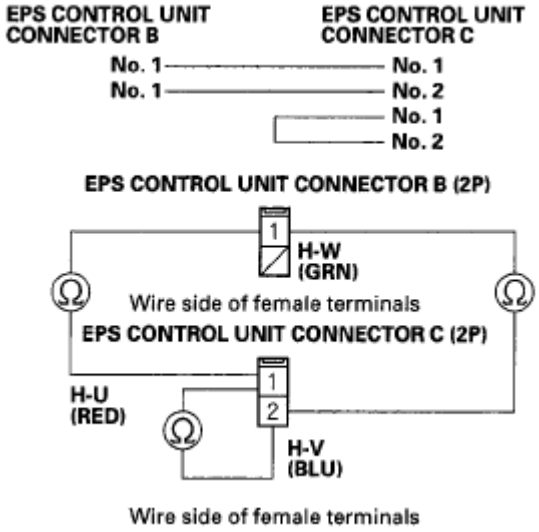

Fig. 20: Checking Continuity Between Following Terminals Of EPS Control Unit Connector B (2P) And Connector C (2P)

Is there continuity?

YES -Check for loose terminals in the EPS control unit connectors and motor connectors, and repair if necessary. If no poor connections are found, replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

NO -Go to step 9.

9. Disconnect the motor 1P connector and motor 2P connector.
10. On the motor side, check for continuity between the following terminals of the motor 1P and motor 2P connector.

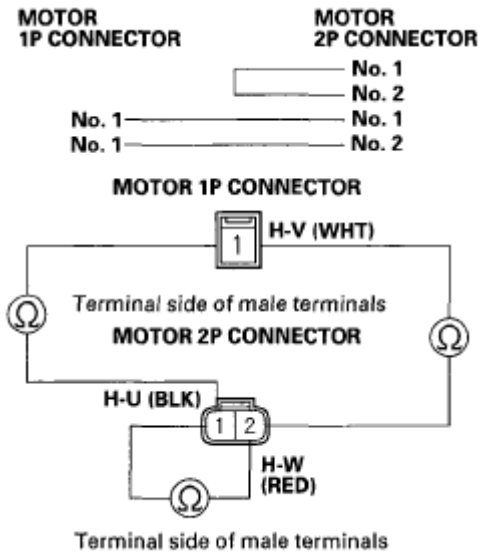

Fig. 21: Checking Continuity Between Following Terminals Of Motor 1P And Motor 2P Connector

Is there continuity?

YES -Repair open in the wire harness between the EPS control unit and motor.

NO -Open in the motor wire harness, or motor internal circuit, replace the motor (see **MOTOR REMOVAL AND INSTALLATION**).

DTC 33-01: LOWER FET STUCK ON (INITIAL DIAGNOSIS); DTC 33-06: LOWER FET STUCK ON (REGULAR DIAGNOSIS)

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0).
3. Start the engine.

   Does the EPS indicator come on?

   YES -Go to step 4.

   NO -Check for loose terminals or poor connections. If the connections are good, the system is OK at this time.

4. Check for DTCs with the HDS.

   Is DTC 33-01 or DTC 33-06 indicated?

   YES -Go to step 5.

   NO -Troubleshoot the indicated DTC. If there are no DTCs, the system is OK at this time.

5. Turn the ignition switch to LOCK (0).

6. Disconnect EPS control unit connector B (2P) and connector C(2P).
7. Check for continuity between body ground and EPS control unit connector B (2P) No. 1 terminal, connector C (2P) No. 1 terminal, connector C (2P) No. 2 terminal individually.

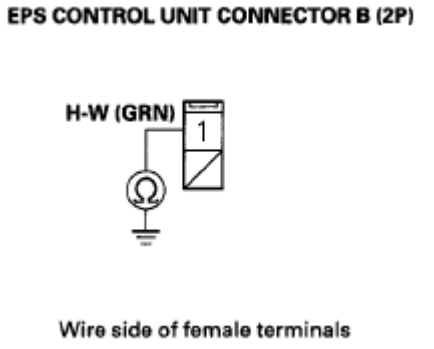

Fig. 22: Checking Continuity Between Body Ground And EPS Control Unit Connector B (2P) No. 1 Terminal

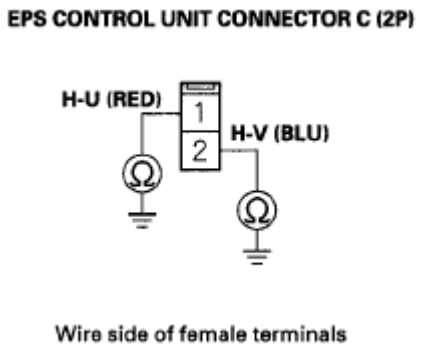

Fig. 23: Checking Continuity Between Connector C (2P) No. 1 Terminal, Connector C (2P) No. 2

Is there continuity?

YES -Go to step 8.

NO -Check for loose terminals in the EPS control unit connectors, and repair if necessary. If no poor connections are found, replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

8. Disconnect the motor 1P connector and motor 2P connector.
9. Check for continuity between body ground and EPS control unit connector B (2P) No. 1 terminal, connector C (2P) No. 1 terminal, connector C (2P) No. 2 terminal individually.

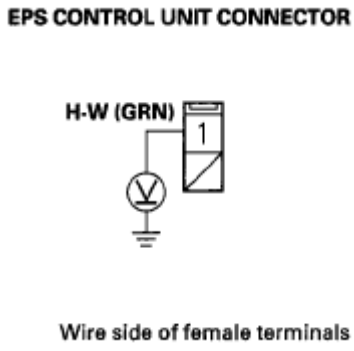

Fig. 24: Checking Continuity Between Body Ground And EPS Control Unit Connector B (2P) No. 1 Terminal

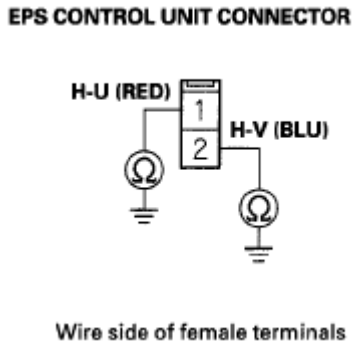

Fig. 25: Checking Continuity Connector C (2P) No. 1 Terminal Connector C (2P) No. 2 Terminal

Is there continuity?

YES -Repair short to body ground in the wire between the EPS control unit and motor.

NO -Short in the motor wire harness, or motor internal circuit, replace the motor (see **MOTOR REMOVAL AND INSTALLATION**).

DTC 33-02: UPPER FET STUCK ON (INITIAL DIAGNOSIS); DTC 33-07: UPPER FET STUCK ON (REGULAR DIAGNOSIS)

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0).
3. Start the engine.

   Does the EPS indicator come on?

   YES -Go to step 4.

   NO -Check for loose terminals or poor connections. If the connections are good, the system is OK at this time.

4. Check for DTCs with the HDS.

Is DTC 33-02 or DTC 33-07 indicated?

YES -Go to step 5.

NO -Troubleshoot the indicated DTC. If there are no DTCs, the system is OK at this time.

5. Turn the ignition switch to LOCK (0).
6. Disconnect EPS control unit connector B (2P) and connector C (2P).
7. Turn the ignition switch ON (II).
8. Measure voltage between body ground and EPS control unit connector B (2P) No. 1 terminal, connector C (2P) No. 1 terminal, and connector C (2P) Non terminal individually.

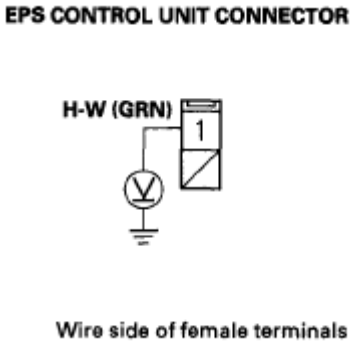

Fig. 26: Measuring Voltage Between Body Ground And EPS Control Unit Connector B (2P) No. 1 Terminal

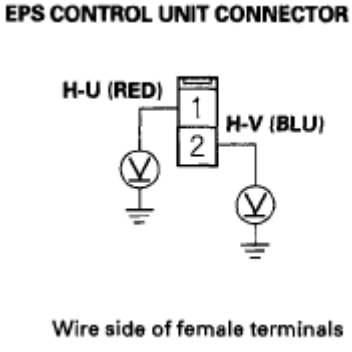

Fig. 27: Measuring Voltage Between Connector C (2P) No. 1 Terminal And Connector C (2P) Non Terminal

Is there battery voltage?

YES -Go to step 9.

NO -Check for loose terminals in the EPS control unit connectors and motor connectors, and repair if necessary. If no poor connections are found, replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

9. Turn the ignition switch to LOCK (0).
10. Disconnect the motor 1P connector and motor 2P connector.

11. Turn the ignition switch ON (II).
12. Measure voltage between body ground and EPS control unit connector B (2P) No. 1 terminal, connector C (2P) No. 1 terminal, and connector C (2P) No. 2 terminal individually.

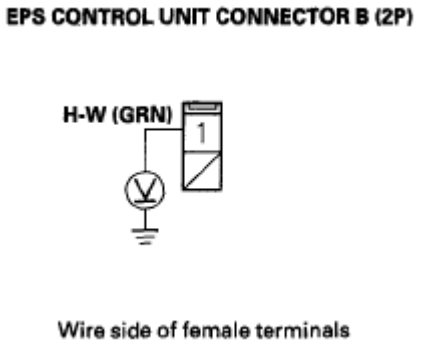

Fig. 28: Measuring Voltage Between Body Ground And EPS Control Unit Connector B (2P) No. 1 Terminal

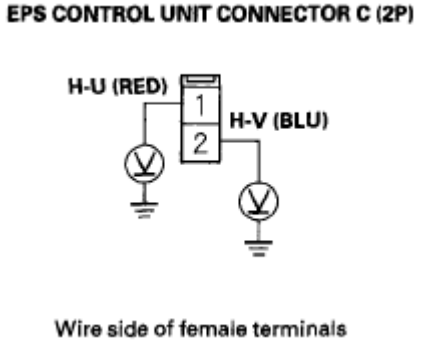

Fig. 29: Measuring Voltage Between Connector C (2P) No. 1 Terminal And Connector C (2P) No. 2 Terminal

Is there battery voltage?

YES - Repair short to power in the wire between the EPS control unit and motor.

NO - Short to power in the motor wire harness, or motor internal circuit, replace the motor (see **MOTOR REMOVAL AND INSTALLATION**).

DTC 34-01: POWER RELAY STUCK ON (IGNITION SWITCH IS OFF)

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0).
3. Turn the ignition switch ON (II).

Does the EPS indicator come on?

YES - Go to step 4.

NO - Check for loose terminals or poor connections. If the connections are good, the system is OK at this time.

4. Check for DTCs with the HDS.

   Is DTC 34-01 indicated?

   YES -Check for loose terminals in the EPS control unit connectors, and repair if necessary. If no poor connections are found, replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

   NO -Troubleshoot the indicated DTC. If there are no DTCs, the system is OK at this time.

DTC 34-02: FAIL-SAFE RELAY STUCK ON (INITIAL DIAGNOSIS)

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0).
3. Turn the ignition switch ON (II).

   Does the EPS indicator come on?

   YES -Go to step 4.

   NO -Check for loose terminals or poor connections. If the connections are good, the system is OK at this time.

4. Check for DTCs with the HDS.

   Is DTC 34-02 indicated?

   YES -Go to step 5.

   NO -Troubleshoot the indicated DTC. If there are no DTCs, the system is OK at this time.

5. Turn the ignition switch to LOCK (0).
6. Disconnect EPS control unit connector B (2P) and connector C (2P).
7. Turn the ignition switch ON (II).
8. Measure voltage between body ground and EPS control unit connector B (2P) No. 1 terminal, connector C (2P) No. 1 terminal, and connector C (2P) No. 2 terminal individually.

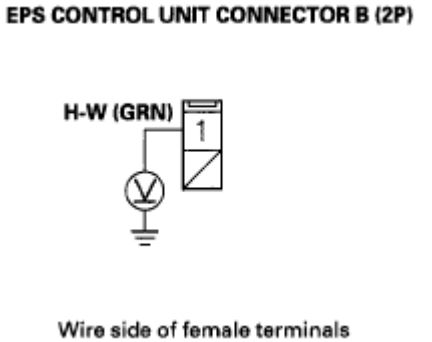

Fig. 30: Measuring Voltage Between Body Ground And EPS Control Unit Connector B (2P) No.

1 Terminal

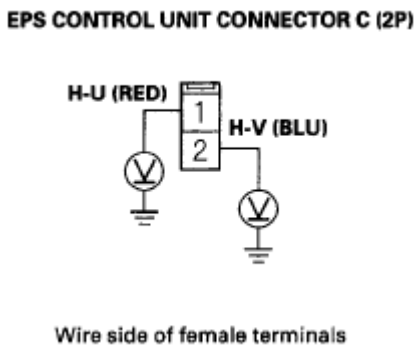

Fig. 31: Measuring Voltage Between Connector C (2P) No. 1 Terminal And Connector C (2P) No. 2 Terminal

Is there battery voltage?

YES -Repair short to power in the wire between the EPS control unit and the motor.

NO -Replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

DTC 35-03: EPS CONTROL UNIT INTERNAL CIRCUIT (EPS CPU) (INITIAL DIAGNOSIS); DTC 35-05: EPS CONTROL UNIT INTERNAL CIRCUIT (MOTOR/EPS CPU) (INITIAL DIAGNOSIS)

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0).
3. Turn the ignition switch ON (II).

Does the EPS indicator come on?

YES -Go to step 4.

NO -Check for loose terminals or poor connections. If the connections are good, the system is OK at this time.

4. Start the engine.
5. Wait 10 seconds or more.
6. Check for DTCs with the HDS.

Is DTC 35-03 or DTC 35-05 indicated?

YES -Check for loose terminals in the EPS control unit connectors, and repair if necessary. If no poor connections are found, replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

NO -Troubleshoot the indicated DTC. If there are no DTCs, the system is OK at this time.

DTC 51-01: LOW/HIGH VOLTAGE FOR THE TORQUE SENSOR (VT1 AND VT2) (REGULAR DIAGNOSIS)

1. Turn the ignition switch to LOCK (0).
2. Connect the HDS to the data link connector (DLC).
3. Turn the ignition switch ON (II).
4. Check the ADVT1 in the DATA LIST with the HDS.

   Is the voltage at 0.90-3.55 V?

   YES -Go to step 5.

   NO -Go to step 6.

5. Check the ADVT2 in the DATA LIST with the HDS.

   Is the voltage at 1.02-3.73 V?

   YES -Check for loose wires or poor connections. If the connections are good, the system is OK at this time.

   NO -Go to step 6.

6. Turn the ignition switch to LOCK (0).
7. Disconnect EPS control unit connector D (28P).
8. Measure resistance between EPS control unit connector D (28P) terminals No. 9 and No. 10.

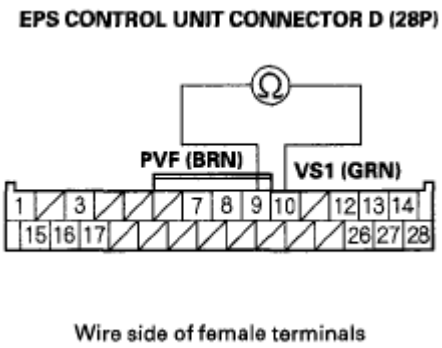

Fig. 32: Measuring Resistance Between EPS Control Unit Connector D (28P) Terminals No. 9 And No. 10

Is the resistance between 12-15 ohms?

YES -Go to step 9.

NO -Go to step 13.

9. Measure resistance between EPS control unit connector D (28P) terminals No. 8 and No. 9.

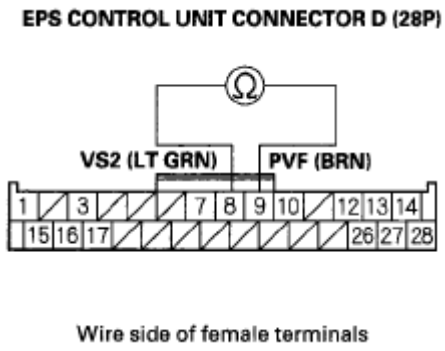

Fig. 33: Measuring Resistance Between EPS Control Unit Connector D (28P) Terminals No. 8 And No. 9

Is the resistance between 12-15 ohms?

YES -Go to step 10.

NO -Go to step 15.

10. Check for continuity between EPS control unit connector D (28P) terminal No. 9 and body ground.

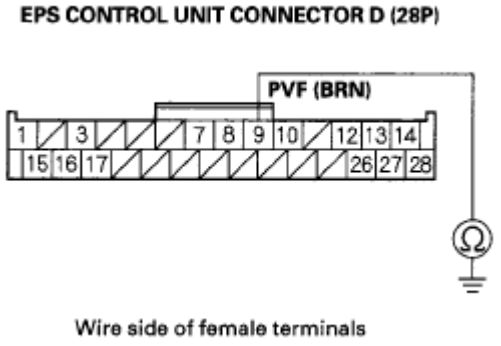

Fig. 34: Checking Continuity Between EPS Control Unit Connector D (28P) Terminal No. 9 And Body Ground

Is there continuity?

YES -Go to step 11.

NO -Check for loose terminals in the EPS control unit connectors, and repair if necessary. If no poor connections are found, replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

11. Disconnect the torque sensor 3P connector from the steering gearbox.
12. Check for continuity between EPS control unit connector D (28P) terminal No. 9 and body ground.

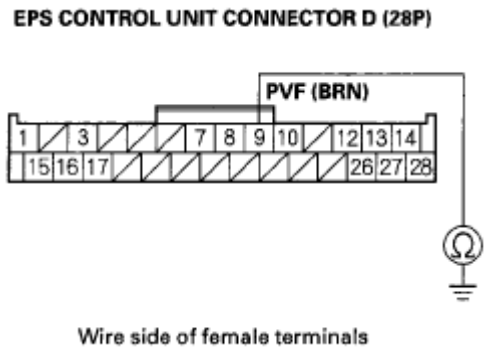

Fig. 35: Checking Continuity Between EPS Control Unit Connector D (28P) Terminal No. 9 And Body Ground

Is there continuity?

YES -Repair short to ground in the wire between the torque sensor and the EPS control unit.

NO -Faulty torque sensor (short in the sensor internal circuit), replace the steering gearbox (see **STEERING GEARBOX REMOVAL AND INSTALLATION**).

13. Disconnect the torque sensor 3P connector from the steering gearbox.
14. On the sensor side, measure the resistance between torque sensor terminals No. 1 and No. 2.

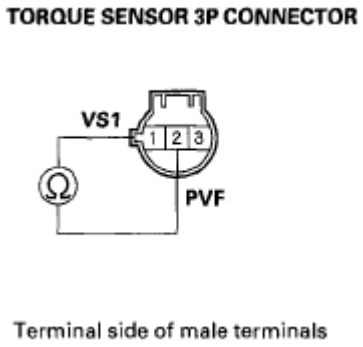

Fig. 36: Measuring Resistance Between Torque Sensor Terminals No. 1 And No. 2

Is the resistance between 12-15 ohms?

YES -Repair open or short between the PNK and BLU/RED wires in the torque sensor circuit between the torque sensor and the EPS control unit.

NO -Faulty torque sensor (short or open in the internal circuit), replace the steering gearbox (see **STEERING GEARBOX REMOVAL AND INSTALLATION**).

15. Disconnect the torque sensor 3P connector from the steering gearbox.
16. On the sensor side, measure the resistance between torque sensor terminals No. 2 and No. 3.

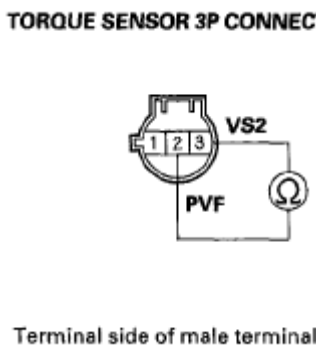

Fig. 37: Measuring Resistance Between Torque Sensor Terminals No. 2 And No. 3

Is the resistance between 12-15 ohms?

YES -Repair open or short between the WHT/GRN and BLU/RED wires in the torque sensor circuit between the torque sensor and the EPS control unit.

NO -Faulty torque sensor (short or open in the internal circuit), replace the steering gearbox (see **STEERING GEARBOX REMOVAL AND INSTALLATION**).

DTC 51-02: TORQUE SENSOR (VT3 DIFFERENTIAL-AMPLIFICATION FUNCTION) (REGULAR DIAGNOSIS); DTC 51-03: TORQUE SENSOR (VT1, VT2 RAPID-CHANGE) (REGULAR DIAGNOSIS); DTC 51-06: TORQUE SENSOR (VT1, VT2 AVERAGE) (REGULAR DIAGNOSIS); DTC 51-07: TORQUE SENSOR (VT1, VT2 INITIAL CHECK) (INITIAL DIAGNOSIS)

1. Clear the DTC with the HDS
2. Turn the ignition switch to LOCK (0).
3. Start the engine.

   Does the EPS indicator come on?

   YES -Go to step 4.

   NO -Check for loose terminals or poor connections. If the connections are good, the system is OK at this time.

4. Check for DTCs with the HDS.

   Is DTC 51-02, 51-03, 51-06 or 51-07 indicated?

   YES -Go to step 5.

   NO -Troubleshoot the indicated DTC. If there are no DTCs, the system is OK at this time.

5. Turn the ignition switch to LOCK (0).
6. Disconnect EPS control unit connector D (28P).
7. Measure the resistance between EPS control unit connector D (28P) terminals No. 9 and No. 10.

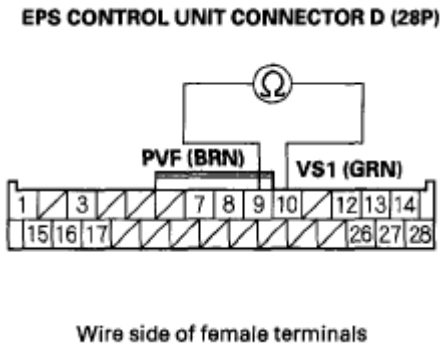

Fig. 38: Measuring Resistance Between EPS Control Unit Connector D (28P) Terminals No. 9 And No. 10

Is the resistance between 12-15 ohms?

YES -Go to step 8.

NO -Go to step 12.

8. Measure resistance between EPS control unit connector D (28P) terminals No. 8 and No. 9.

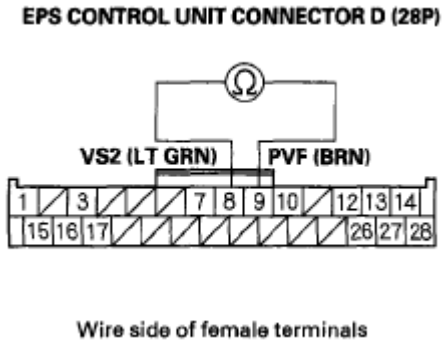

Fig. 39: Measuring Resistance Between EPS Control Unit Connector D (28P) Terminals No. 8 And No. 9

Is the resistance between 12-15 ohms?

YES -Go to step 9.

NO -Go to step 14.

9. Check for continuity between EPS control unit connector D (28P) terminal No. 9 and body ground.

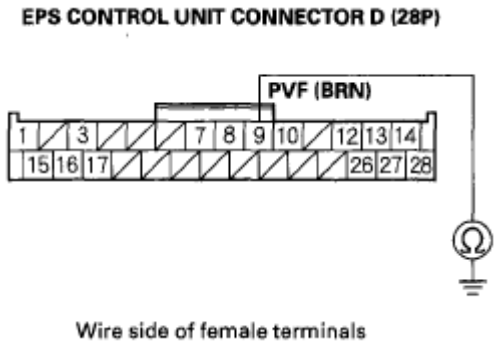

Fig. 40: Checking Continuity Between EPS Control Unit Connector D (28P) Terminal No. 9 And Body Ground

Is there continuity?

YES -Go to step 10.

NO -Check for loose terminals in the EPS control unit connectors, and repair if necessary. If no poor connections are found, replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

10. Disconnect the torque sensor 3P connector from the steering gearbox.
11. Check for continuity between EPS control unit connector D (28P) terminal No. 9 and body ground.

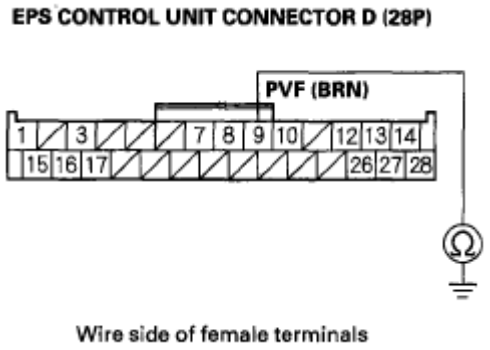

Fig. 41: Checking Continuity Between EPS Control Unit Connector D (28P) Terminal No. 9 And Body Ground

Is there continuity?

YES -Repair short to body ground in the wire between the torque sensor and the EPS control unit.

NO -Faulty torque sensor (short in the sensor internal circuit), replace the steering gearbox (see **STEERING GEARBOX REMOVAL AND INSTALLATION**).

12. Disconnect the torque sensor 3P connector from the steering gearbox.
13. On the sensor side, measure the resistance between torque sensor terminals No. 1 and No. 2.

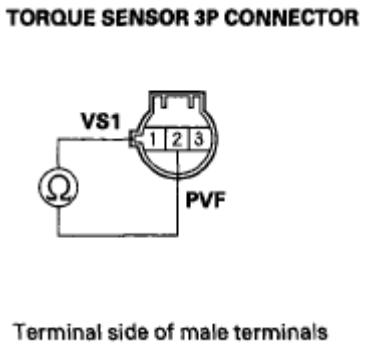

Fig. 42: Measuring Resistance Between Torque Sensor Terminals No. 1 And No. 2

Is the resistance between 12-15 ohms?

YES -Repair open or short between the PNK and BLU/RED wires in the torque sensor circuit between the torque sensor and the EPS control unit.

NO -Faulty torque sensor (short or open in the internal circuit), replace the steering gearbox (see **STEERING GEARBOX REMOVAL AND INSTALLATION**).

14. Disconnect the torque sensor 3P connector from the steering gearbox.
15. On the sensor side, measure the resistance between torque sensor terminals No. 2 and No. 3.

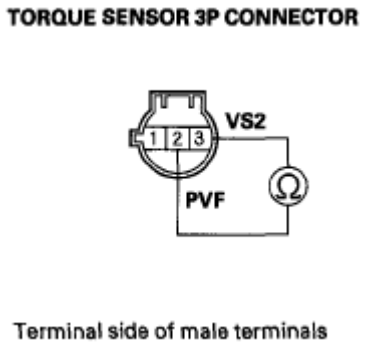

Fig. 43: Measuring Resistance Between Torque Sensor Terminals No. 2 And No. 3

Is the resistance between 12-15 ohms?

YES -Repair open or short between the BLU/RED and WHT/GRN wires in the torque sensor circuit between the torque sensor and the EPS control unit.

NO -Faulty torque sensor (short or open in the internal circuit), replace the steering gearbox (see **STEERING GEARBOX REMOVAL AND INSTALLATION**).

DTC 61-04: OPEN/SHORT IN THE MOTOR HARNESS (STEERING DIAGNOSIS)

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0).
3. Start the engine.
4. Turn the steering wheel to the right or left, and wait 10 seconds or more.

Does the EPS indicator come on?

YES -Go to step 5.

NO -Check for loose terminals or poor connections. If the connections are good, the system is OK at this time.

5. Check for DTCs with the HDS.

   Is DTC 61-04 indicated?

   YES -Go to step 6.

   NO -Troubleshoot the indicated DTC. If there are no DTCs, the system is OK at this time.

6. Turn the ignition switch to LOCK (0).
7. Disconnect EPS control unit connector B (2P) and connector C(2P).
8. Check for continuity between the following terminals of the EPS control unit connector B (2P) and connector C(2P).

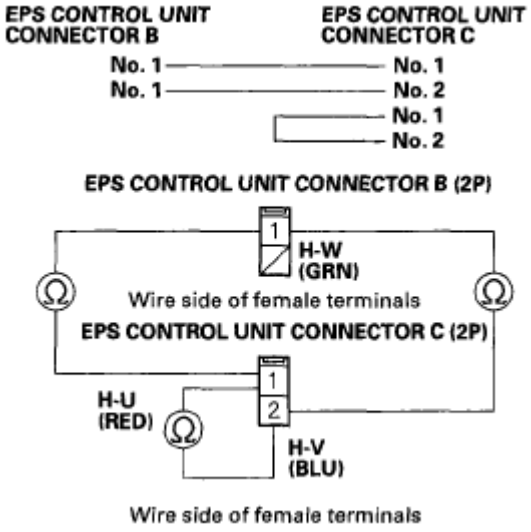

Fig. 44: Checking Continuity Between Following Terminals Of EPS Control Unit Connector B (2P) And Connector C(2P)

Is there continuity?

YES -Go to step 9.

NO -Go to step 12.

9. Check for continuity between body ground and EPS control unit connector B (2P) No. 1 terminal, connector C (2P) No. 1 terminal, and connector C (2P) No. 2 terminal individually.

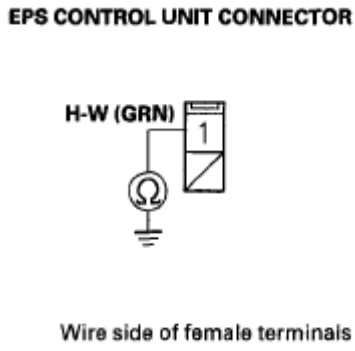

Fig. 45: Checking Continuity Between Body Ground And EPS Control Unit Connector B (2P) No. 1 Terminal

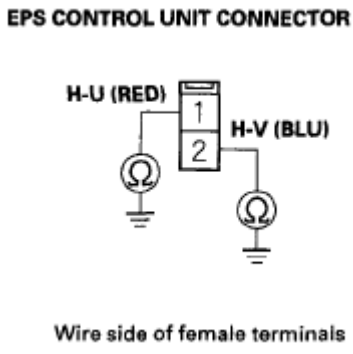

Fig. 46: Checking Continuity Connector C (2P) No. 1 Terminal And Connector C (2P) No. 2 Terminal

Is there continuity?

YES -Go to step 10.

NO -Check for loose terminals in the EPS control unit connectors, and repair if necessary. If no poor connections are found, replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

10. Disconnect the motor 1P connector and the motor 2P connector.
11. Check for continuity between body ground and EPS control unit connector B (2P) No. 1 terminal, connector C (2P) No. 1 terminal, and connector C (2P) No. 2 terminal individually.

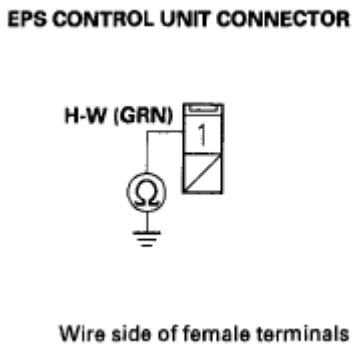

Fig. 47: Checking Continuity Between Body Ground And EPS Control Unit Connector B (2P)

No. 1 Terminal

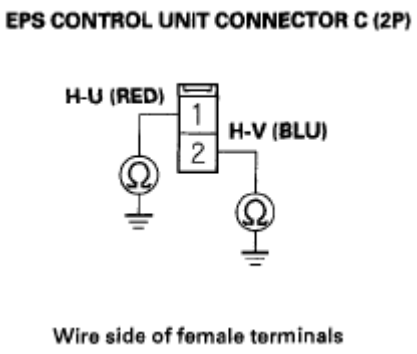

Fig. 48: Checking Continuity Connector C (2P) No. 1 Terminal And Connector C (2P) No. 2 Terminal

Is there continuity?

YES -Repair short to body ground in the wire harness between the EPS control unit and the motor.

NO -Short to the body ground in the motor wire harness, or motor internal circuit, replace the motor (see **MOTOR REMOVAL AND INSTALLATION**).

12. Disconnect the motor 1P connector and the motor 2P connector.
13. On the motorside, check for continuity between the following terminals of the motor 1P and the motor 2P connector.

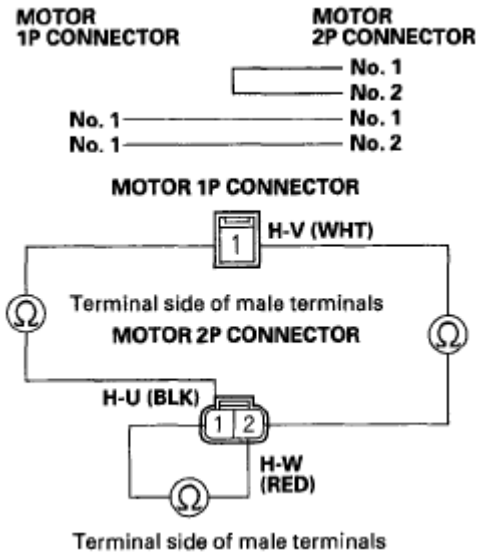

Fig. 49: Checking Continuity Between Terminals Of Motor 1P And Motor 2P Connector

Is there continuity?

YES -Repair open in the wire harness between the EPS control unit and the motor.

NO -Open in the motor wire harness, or motor internal circuit, replace the motor (see **MOTOR**

REMOVAL AND INSTALLATION).

DTC 71-01: MOTOR ANGLE SENSOR (SIN/COS SIGNALS) (STEERING DIAGNOSIS); DTC 71-02: MOTOR ANGLE SENSOR (NEUTRAL POSITION LEARNING OF SIN/COS) (INITIAL DIAGNOSIS); DTC 71-03: MOTOR ANGLE SENSOR (SIN/COS SIGNALS) (STEERING DIAGNOSIS); DTC 71-05: MOTOR ANGLE SENSOR (SIN/COS SIGNALS CHANGING AMOUNT) (STEERING DIAGNOSIS); DTC 71-06: MOTOR ANGLE SENSOR (NEUTRAL POSITION OF SIN/COS) (INITIAL DIAGNOSIS)

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0).
3. Start the engine.
4. Turn the steering wheel to the right or left, and wait 10 seconds or more.

   Does the EPS indicator come on?

   YES -Go to step 5.

   NO -Check for loose terminals or poor connections. If the connections are good, the system is OK at this time.

5. Check for DTCs with the HDS.

   Is DTC 71-01, 71-02, 71-03, 71-05 or 71-06 indicated?

   YES -Go to step 6.

   NO -Troubleshoot the indicated DTC. If there are no DTCs, the system is OK at this time.

6. Turn the ignition switch to LOCK (0).
7. Disconnect EPS control unit connector D (28P).
8. Measure the resistance between the following terminals of EPS control unit connector D (28P).

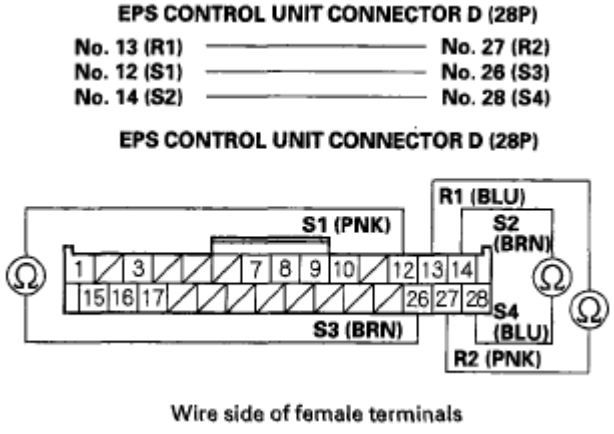

Fig. 50: Measuring Resistance Between Following Terminals Of EPS Control Unit Connector D (28P)

Is the resistance between R1-R2 13-25 ohms, S1-S3 26-49 ohms, and S2-S4 26-49 ohms?

YES -Go to step 9.

NO -Go to step 12.

9. Check for continuity between body ground and EPS control unit connector D (28P) No. 12 terminal, No. 13 terminal, No. 14 terminal, No. 26 terminal, No. 27 terminal, and No. 28 terminal individually.

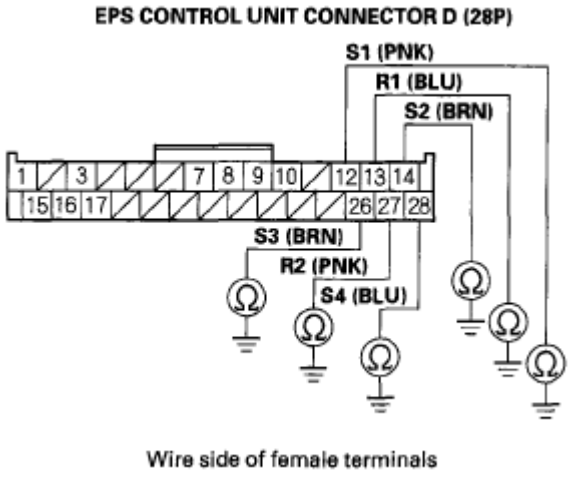

Fig. 51: Checking Continuity Between Body Ground And EPS Control Unit Connector D (28P) No. 12 Terminal, No. 13 Terminal

Is there continuity?

YES -Go to step 10.

NO -Check for loose terminals in the EPS control unit connectors, and repair if necessary. If no poor connections are found, replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

10. Disconnect the motor angle sensor 6P connector.
11. Check for continuity between body ground and motor angle sensor 6P connector No. 1 terminal, No. 2 terminal, No. 3 terminal, No. 4 terminal, No. 5 terminal, and No. 6 terminal individually.

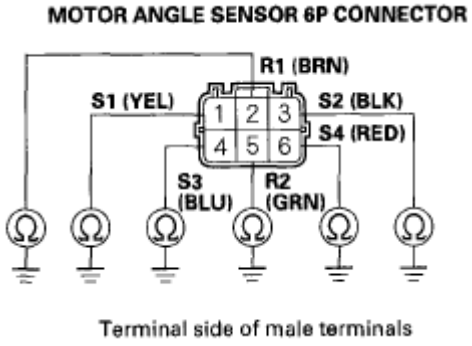

Fig. 52: Checking Continuity Between Body Ground And Motor Angle Sensor 6P Connector No. 1 Terminal, No. 2 Terminal, No. 3 Terminal

Is there continuity?

YES -Faulty motor angle sensor (internal failure), or short to body ground in the wire (sensor side), replace the motor (see **MOTOR REMOVAL AND INSTALLATION**).

NO -Repair short to body ground in the wire between the motor angle sensor 6P connector and the EPS control unit.

12. Disconnect the motor angle sensor 6P connector.
13. Measure resistance between the following terminals of the motor angle sensor 6P connector.

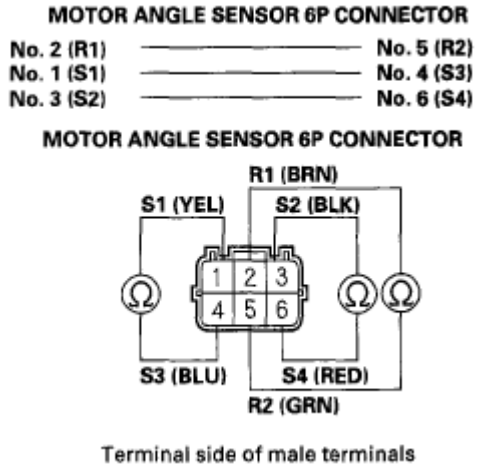

Fig. 53: Measuring Resistance Between Following Terminals Of Motor Angle Sensor 6P Connector

Is the resistance between R1-R2 13-25 ohms, S1-S3 26-49 ohms, and S2-S4 26-49 ohms?

YES -Open, or short to body ground in the wire between the motor angle sensor 6P connector and the EPS control unit.

NO -Faulty motor angle sensor (internal failure), or short to body ground in the wire (sensor side), replace the motor (see **MOTOR REMOVAL AND INSTALLATION**).

DTC 71-04: MOTOR ANGLE SENSOR (CHECK SIGNALS) (REGULAR DIAGNOSIS)

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0).
3. Start the engine.
4. Turn the steering wheel to the right or left, and wait 10 seconds or more.

Does the EPS indicator come on?

YES -Go to step 5.

NO -Check for loose terminals or poor connections. If the connections are good, the system is OK at this time.

5. Check for DTCs with the HDS.

   Is DTC 71-04 indicated?

   YES -Go to step 6.

   NO -Troubleshoot the indicated DTC. If there are no DTCs, the system is OK at this time.

6. Turn the ignition switch to LOCK (0).
7. Disconnect EPS control unit connector D (28P).
8. Measure the resistance between the EPS control unit connector D (28P) terminal No. 13 and No. 27.

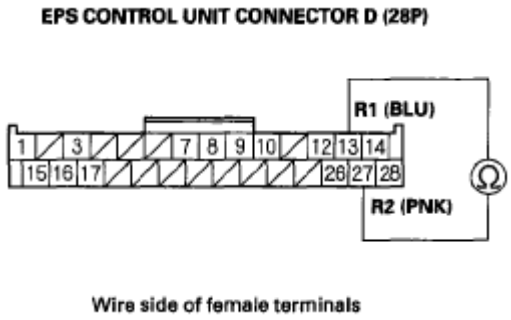

Fig. 54: Measuring Resistance Between EPS Control Unit Connector D (28P) Terminal No. 13 And No. 27

Is the resistance between 13-25 ohms?

YES -Go to step 9.

NO -Go to step 12.

9. Check for continuity between body ground and the EPS control unit connector D (28P) No. 13 terminal and the No. 27 terminal individually.

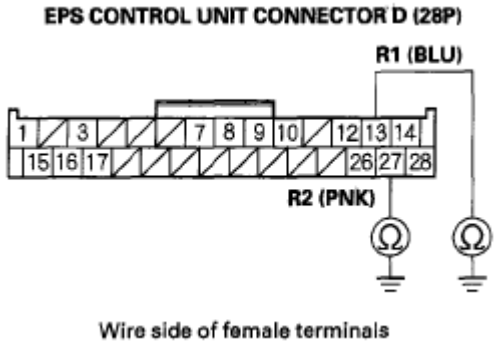

Fig. 55: Checking Continuity Between Body Ground And EPS Control Unit Connector D (28P) No. 13 Terminal And No. 27 Terminal

Is there continuity?

YES -Go to step 10.

NO -Check for loose terminals in the EPS control unit connectors, and repair if necessary. If no poor connections are found, replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

10. Disconnect the motor angle sensor 6P connector.
11. Check for continuity between body ground and motor angle sensor 6P connector No. 2 terminal and the No. 5 terminal individually.

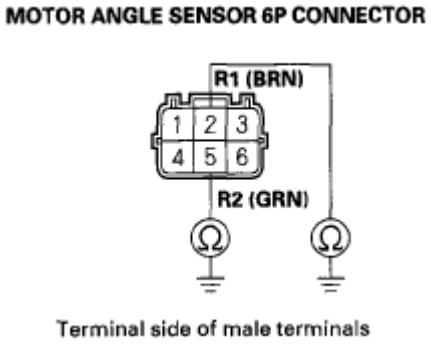

Fig. 56: Checking Continuity Between Body Ground And Motor Angle Sensor 6P Connector No. 2 Terminal

Is there continuity?

YES -Faulty motor angle sensor (internal failure), or short to body ground in the wire (sensor side), replace the motor (see **MOTOR REMOVAL AND INSTALLATION**).

NO -Repair short to body ground in the wire harness between the motor angle sensor 6P connector and the EPS control unit.

12. Disconnect the motor angle sensor 6P connector.
13. Measure the resistance between the motor angle sensor 6P connector terminals No. 2 and No. 5.

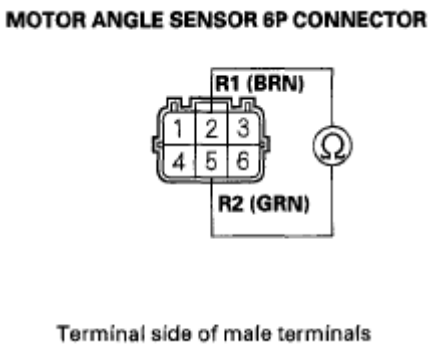

Fig. 57: Measuring Resistance Between Motor Angle Sensor 6P Connector Terminals No. 2 And No. 5

Is the resistance between 13-25 ohms?

YES -Open, or short to body ground in the wire harness between the motor angle sensor 6P connector and EPS control unit.

NO -Faulty motor angle sensor (internal failure), or short to body ground in the wire (sensor side), replace the motor (see **MOTOR REMOVAL AND INSTALLATION**).

SYMPTOM TROUBLESHOOTING

EPS INDICATOR DOES NOT COME ON

1. Turn the ignition switch ON (II), and watch the EPS indicator.

   Does the EPS indicator come on?

   YES -The system is OK at this time.

   NO -Troubleshoot the gauge control module (tach) (see **SELF-DIAGNOSTIC FUNCTION**).

EPS INDICATOR DOES NOT GO OFF, AND NO DTCS ARE STORED

1. Turn the ignition switch to LOCK (0).
2. Connect the HDS to the data link connector (DLC).
3. Turn the ignition switch ON (II).
4. Check for DTCs with the HDS.

   Are any DTCs indicated?

   YES -Troubleshooting the indicated DTC.

   NO -Go to step 5.

5. Turn the ignition switch to LOCK (0).
6. Check the No. 4 (7.5 A) fuse in the under-dash fuse/relay box.

   Is the fuse OK?

   YES -Reinstall the fuse, and go to step 7.

   NO -Replace the fuse, and recheck. If the fuse is blown, check for a short to body ground in this fuse circuit.

7. Disconnect EPS control unit connector D (28P).
8. Turn the ignition switch ON (II).
9. Measure voltage between EPS control unit connector D (28P) terminal No. 16 and body ground.

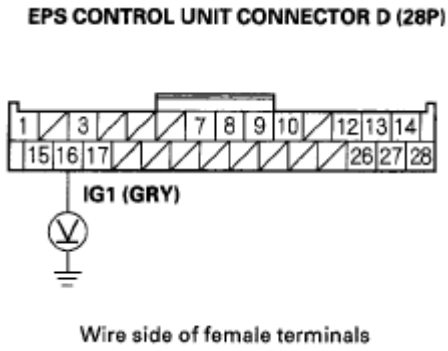

Fig. 58: Measuring Voltage Between EPS Control Unit Connector D (28P) Terminal No. 16 And Body Ground

Is the voltage between 9.20-17.4 V?

YES -Go to step 10.

NO -Repair open in the wire between the EPS control unit and under-dash fuse/relay box.

10. Turn the ignition switch to LOCK (0).
11. Disconnect EPS control unit connector A (2P).
12. Check for continuity between EPS control unit connector A (2P) terminal No. 1 and body ground.

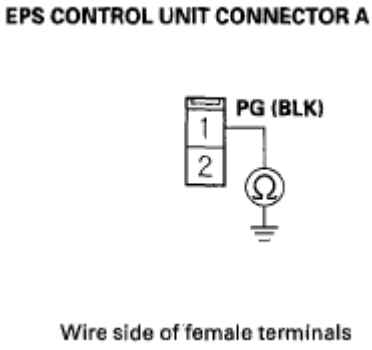

Fig. 59: Checking Continuity Between EPS Control Unit Connector A (2P) Terminal No. 1 And Body Ground

Is there continuity?

YES -Go to step 13.

NO -Repair open in the wire between the EPS control unit and body ground (G402).

13. Disconnect the gauge control module (tach) 36P connector and EPS control unit connector D (28P).
14. Check for continuity between EPS control unit connector D (28P) terminal No. 1 and gauge control module (tach) 36P connector terminal No. 1.

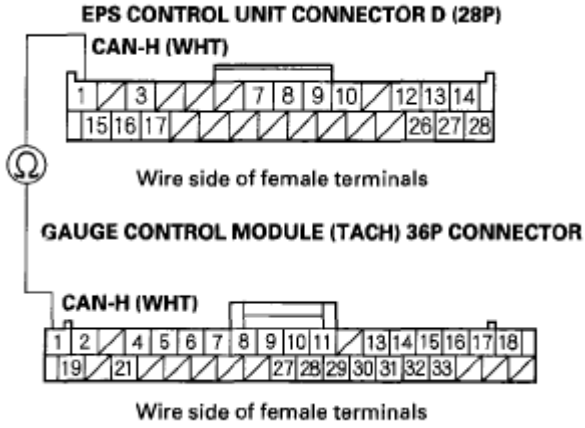

Fig. 60: Checking Continuity Between EPS Control Unit Connector D (28P) Terminal No. 1 And Gauge Control Module

Is there continuity?

YES -Go to step 15.

NO -Repair open in the wire between the EPS control unit and the gauge control module (tach).

15. Check for continuity between EPS control unit connector D (28P) terminal No. 15 and gauge control module (tach) 36P connector terminal No. 19.

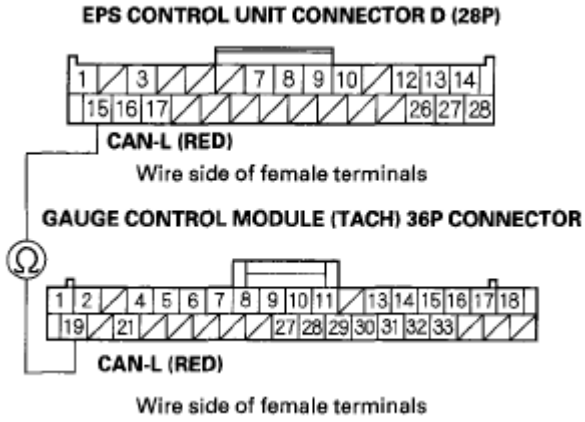

Fig. 61: Check For Continuity Between EPS Control Unit Connector D (28P) Terminal No. 15

Is there continuity?

YES -Check for loose terminals in the EPS control unit connectors, and repair if necessary. If no poor connections are found, replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

NO -Repair open in the wire between the EPS control unit and the gauge control module (tach).

MOTOR REMOVAL AND INSTALLATION

REMOVAL

NOTE: Do not allow dust, dirt, or other foreign materials to enter the steering gearbox.

1. Remove the steering gearbox (see **STEERING GEARBOX REMOVAL AND INSTALLATION**).
2. Disconnect the torque sensor 3P connector (A) from the steering gearbox, then remove the harness clamp bolts and the ground terminal (B).

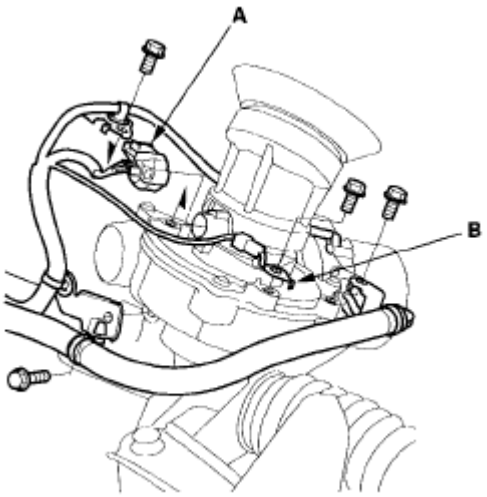

Fig. 62: Identifying Steering Gearbox And Harness Clamp Bolts

3. Remove the motor (A) from the steering gearbox, then remove the O-ring (B) and discard it.

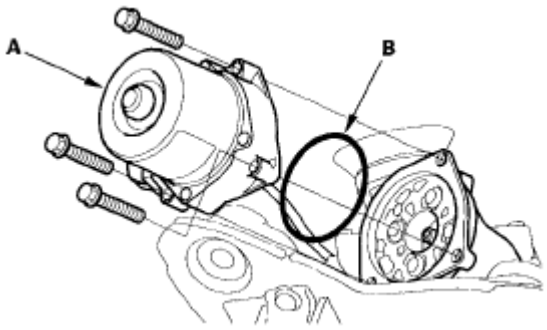

Fig. 63: Identifying Motor (A) From Steering Gearbox And O-Ring

INSTALLATION

1. Clean the mating surface of the motor (A) and the steering gearbox.

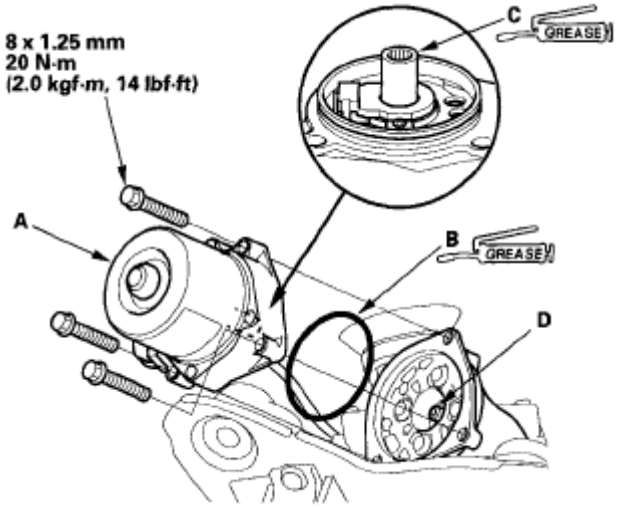

Fig. 64: Identifying Mating Surface Of Motor (A) And Steering Gearbox

2. Apply a thin coat of silicone grease to the new O-ring (B), and carefully fit it on the motor.
3. Apply grease (Shell steering gear grease or Honda's equivalent steering gear grease) into the motor shaft (C).
4. Install the motor on the steering gearbox by engaging the motor shaft and the worm shaft (D).
5. Before tightening the bolts, turn the motor two or three times to the right and left about 45 degrees. Make sure the motor is evenly seated on the steering gearbox, and that the O-ring is not pinched between the mating surfaces.
6. Connect the torque sensor 3P connector (A) to the steering gearbox, then install the harness clamp bolts and the ground terminal (B).

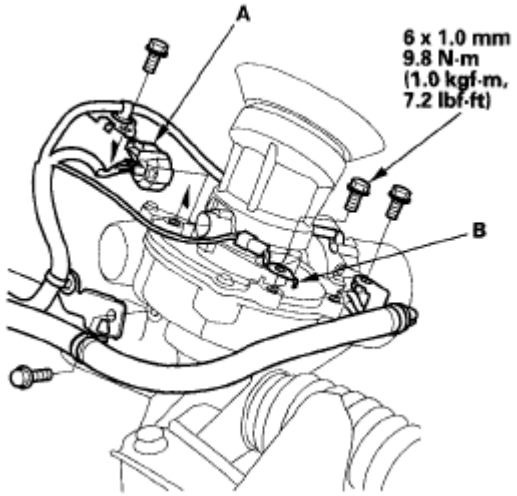

Fig. 65: Identifying Steering Gearbox Harness Clamp Bolts (With Torque Specifications)

7. Finish the installation, and note these items:
   - Make sure the torque sensor 3P connector is properly connected.
   - Make sure the motor and the EPS wires are not caught or pinched by any parts.
8. Install the steering gearbox (see **INSTALLATION**).

STEERING GEARBOX REMOVAL AND INSTALLATION

Special Tools Required

- Ball joint remover, 28 mm 07MAC-SL0A202
- Engine hanger/adaptor VSB02C000015 *
- Front subframe adaptor VSB02C000016 *
- 2006 Civic engine hanger VSB02C000025 *
- Engine support hanger, A and Reds AAR-T-12566 *

* Available through the American Honda Tool and Equipment program, 1-888-424-6857.

REMOVAL

Note these items during removal:

- Use solvent and a brush to wash any oil and dirt off the end of the steering gearbox. Avoid any electrical parts. Blow dry with compressed air.
- Make sure to remove the steering wheel before disconnecting the steering joint to avoid damaging the cable reel.

1. Make sure you have the anti-theft code for the audio or navigation system, then write down the audio presets.
2. Make sure the ignition switch is OFF, then disconnect the negative cable from the battery.
3. Raise the front of the vehicle, and support it with safety stands in the proper locations (see **LIFT AND SUPPORT POINTS**).
4. Remove the front wheels.
5. Remove the steering wheel (see **STEERING WHEEL REMOVAL**).
6. Remove the driver's dashboard under cover (see **DRIVER's DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
7. Remove the steering joint cover (A).

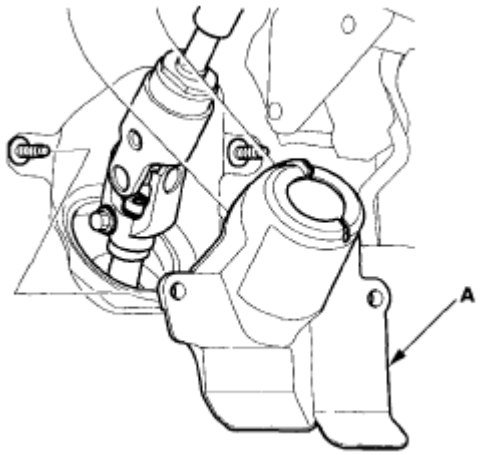

Fig. 66: Identifying Steering Joint Cover (A)

8. Hold the lower slide shaft (A) on the column with a piece of wire (B) between the joint yoke (C) of the lower slide shaft and joint yoke (D) of the upper shaft to prevent the slider shaft from pulling out.

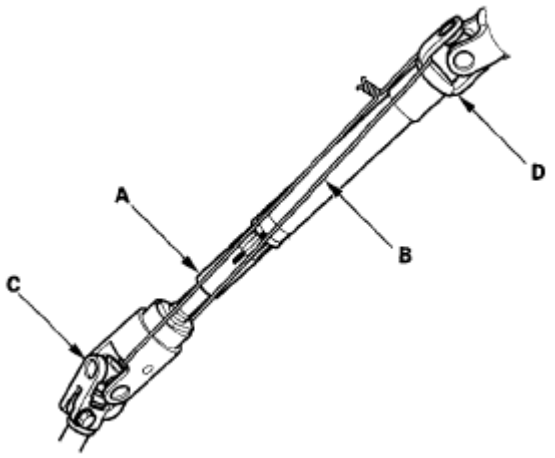

Fig. 67: Identifying Lower Slide Shaft With Wire Between Joint Yokes

9. Release the lock lever, and adjust the steering column to the full telescopic out position, then tighten the lock lever.
10. Remove the steering joint bolt (A), and disconnect the steering joint by moving the steering joint (B) toward the column..

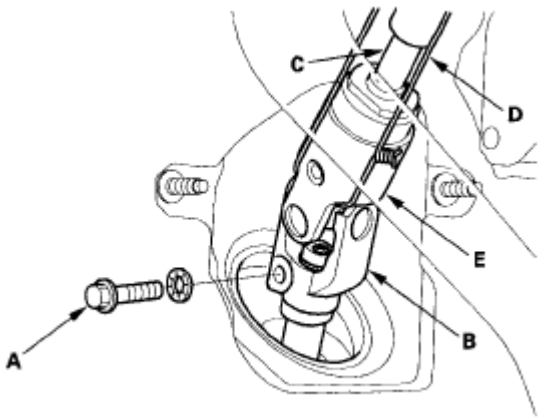

Fig. 68: Identifying Steering Joint Moving Steering Joint Toward Column

11. Remove the center guide (A) (if equipped), and discard it. The center guide is for factory assembly only.

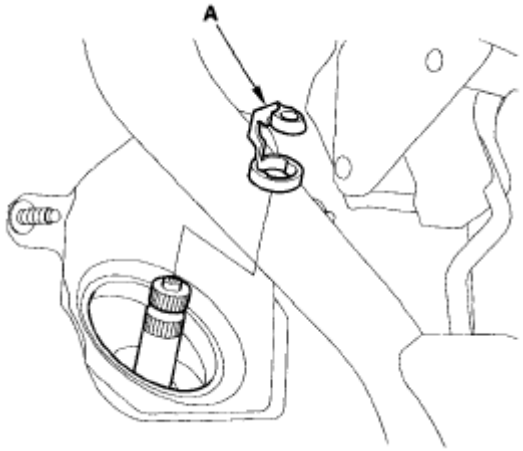

Fig. 69: Identifying Center Guide

12. Remove the under cowl panel (see **FRONT GRILLE COVER REPLACEMENT**).
13. Remove the air cleaner housing.
    - For R18A1 engine (see **THROTTLE BODY CLEANING**)
    - For K20Z3 engine (see **AIR CLEANER REMOVAL/INSTALLATION**)
14. Attach the engine hanger adapter to the threaded hole in the cylinder head.

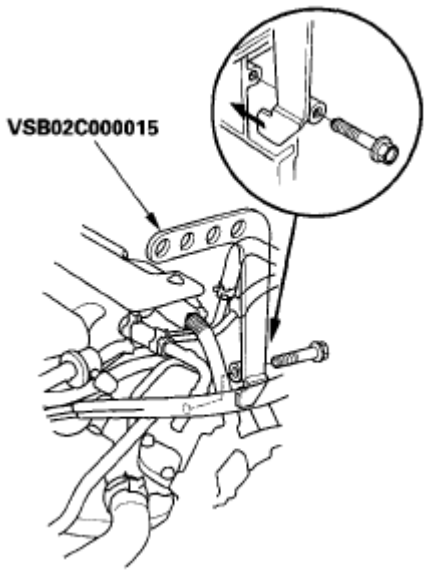

Fig. 70: Identifying Cylinder Head

15. Install the front leg assembly (A), hook (B), and wing nut (C) from an A and Reds engine support hanger (AAR-T-12566) onto the engine hanger. Carefully position the engine hanger on the vehicle, and attach the hook to the forward hole in the engine hanger/adapter (D). Tighten the wing nut by hand to lift and support the engine/transmission assembly.

NOTE: Be careful when working around the windshield.

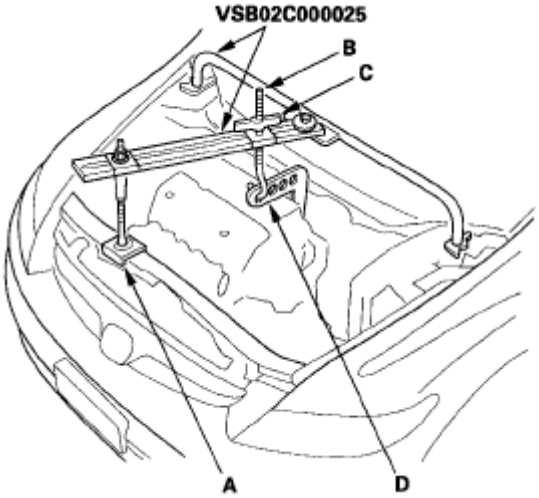

Fig. 71: Identifying Front Leg Assembly (A)

16. Remove the cotter pin (A) from the 12 mm nut (B), and loosen the nut.

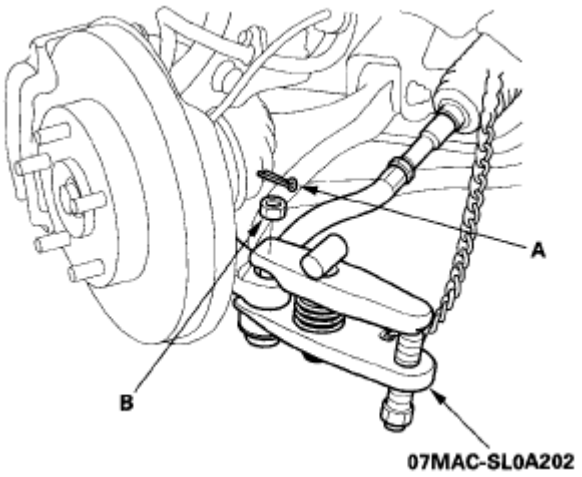

Fig. 72: Identifying Cotter Pin (A)

17. Separate the tie-rod ball joint and the knuckle using the ball joint remover (see **BALL JOINT REMOVAL**).
18. Remove the front splash shield (see **FRONT SPLASH SHIELD REPLACEMENT**).
19. Disconnect the torque sensor 4P connector (A), motor angle sensor 6P connector (B), motor IP connector (C), and motor 2P connector (D) from the right side of the steering gearbox. Wrap the connectors with vinyl tape to avoid contamination from grease or water.

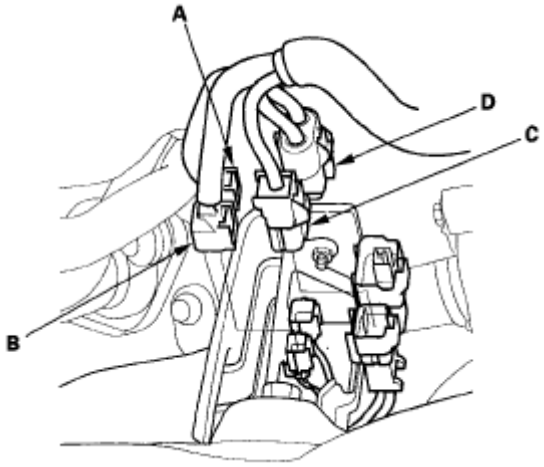

Fig. 73: Identifying Motor Angle Sensor 6P Connector (B)

20. Remove the lower ball joint mounting bolt (A) and the flange nuts (B) from the lower arm.

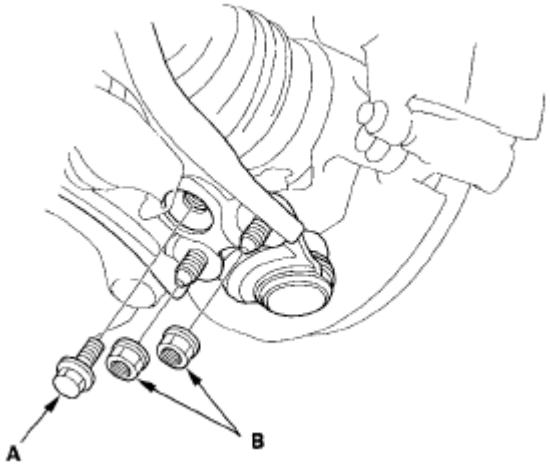

Fig. 74: Identifying Lower Ball Joint Mounting Bolt

21. Disconnect the lower arm from the lower ball housing.
22. Remove the exhaust hanger (A) from the three way catalytic converter (TWC) (B).

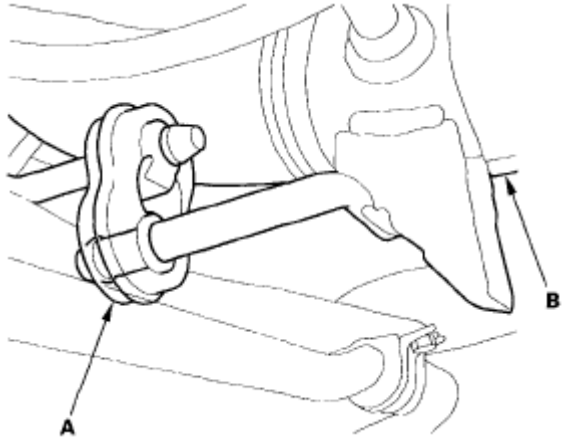

Fig. 75: Identifying Exhaust Hanger (A) From Three Way Catalytic Converter (TWC)

23. Note the reference marks (A) on both sides of the subframe that line up with the body (B).

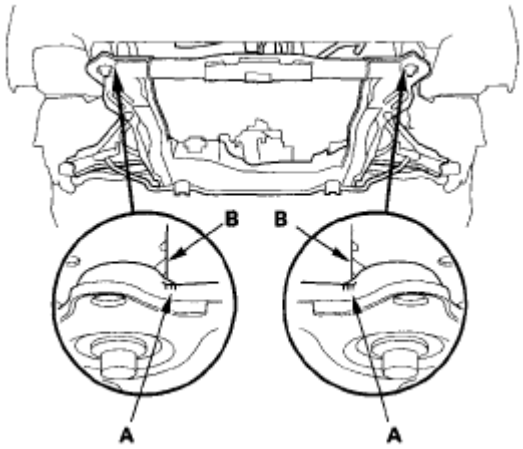

Fig. 76: Identifying Subframe Line Up With Body (B)

24. Attach the front subframe adaptor (A) to the front subframe (B) and the transmission jack (model number LSL-W9371) or the powertrain lift (model number OTC-1585), then tighten the front subframe adaptor screw.

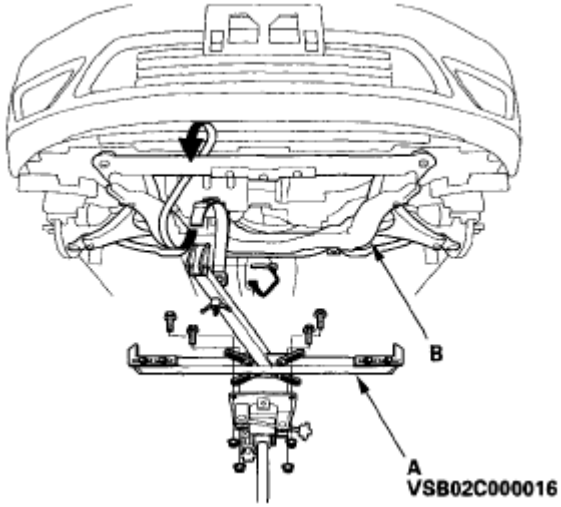

Fig. 77: Identifying Front Subframe Adaptor To Front Subframe

25. Make sure the front subframe is securely supported by the jack with the front subframe adaptor.
26. Remove the front subframe middle mount bolt (A) from the left side.

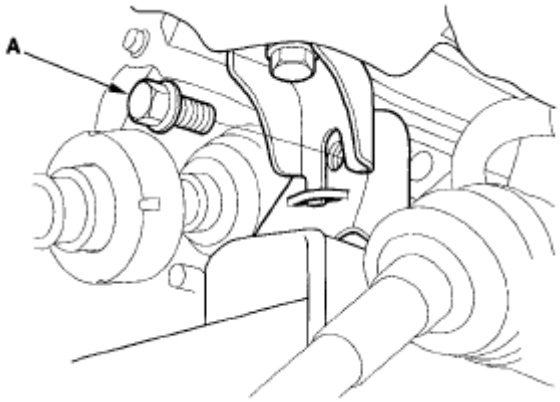

Fig. 78: Identifying Front Subframe Middle Mount Bolt (A) From Left Side

27. Remove the front subframe middle mount bolt (A) from the right side.

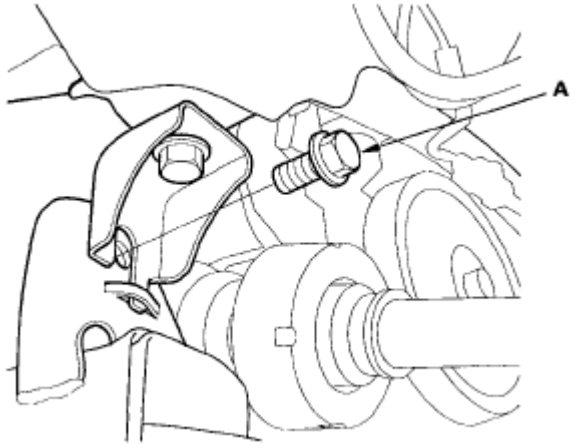

Fig. 79: Identifying Front Subframe Middle Mount Bolt (A) From Right Side

28. Remove the lower torque rod mounting bolt (A) and discard it.

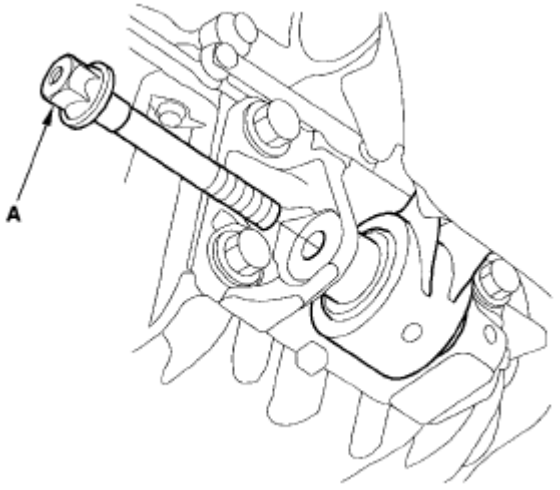

Fig. 80: Identifying Lower Torque Rod Mounting Bolt

29. Remove the lower radiator hose (A) from the radiator hose stay (B).

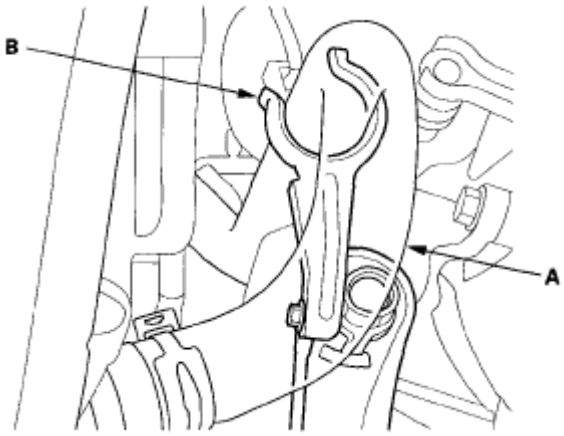

Fig. 81: Identifying Lower Radiator Hose From Radiator Hose Stay

30. Remove the lower engine mounting bolt (A) while holding the nut (B) with a wrench and discard it.

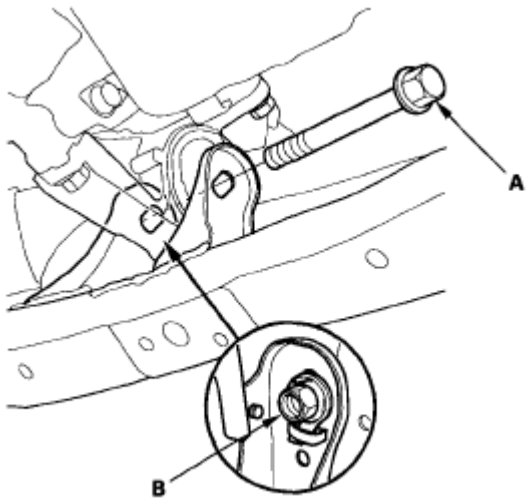

Fig. 82: Identifying Lower Engine Mounting Bolt

31. Remove the front subframe front mounting bolts (A) from the right and left sides of the vehicle, and discard them.

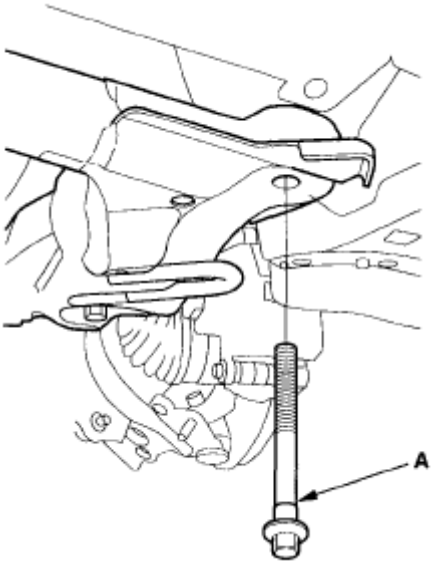

Fig. 83: Identifying Front Subframe Front Mounting Bolts

32. Remove the front subframe rear mounting bolts (A) from the right and left sides of the vehicle, and discard them.

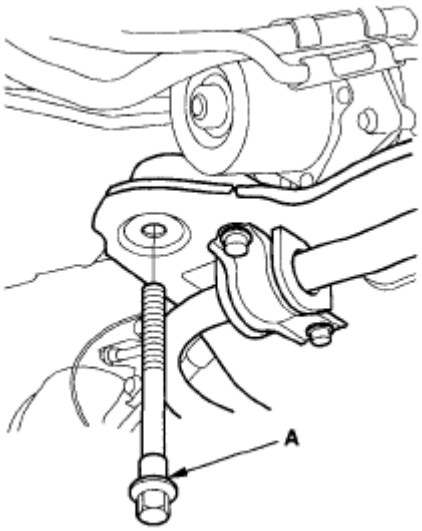

Fig. 84: Identifying Front Subframe Rear Mounting Bolts From Right And Left Sides Of Vehicle

33. Lower the front subframe and steering gearbox as an assembly by lowering the jack slowly.
34. Remove the harness clamp bracket (A) from the front subframe, then remove the harness clips (B).

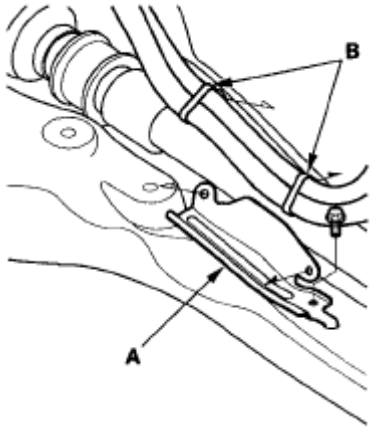

Fig. 85: Identifying Harness Clamp Bracket From Front Subframe

35. Remove the torque sensor 4P connector (A), motor angle sensor 6P connector (B), motor 1P connector (C) and motor 2P connector (D) from the right side of the gearbox mounting bracket (E).

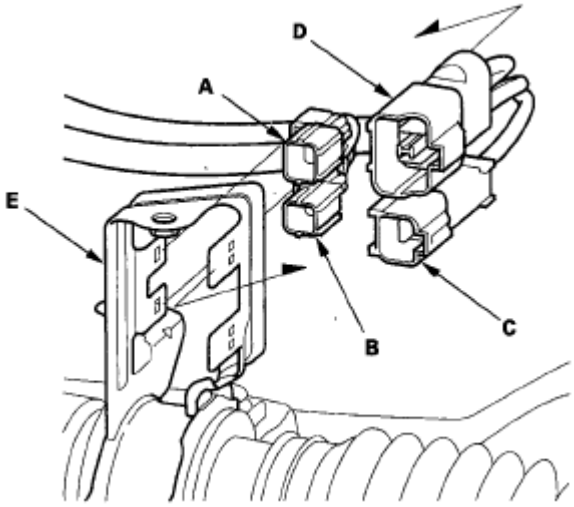

Fig. 86: Identifying Torque Sensor 4P Connector Motor Angle Sensor 6P Connector

36. Remove the pinion shaft grommet (A) from the top of the torque sensor.

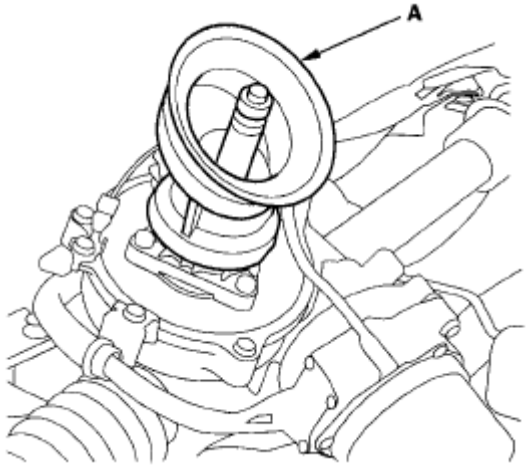

Fig. 87: Identifying Pinion Shaft Grommet (A) From Top Of Torque Sensor

37. Remove the two 10 mm bolts from the right side of the steering gearbox, then remove the gearbox mounting bracket (A) and the mounting cushion (B).

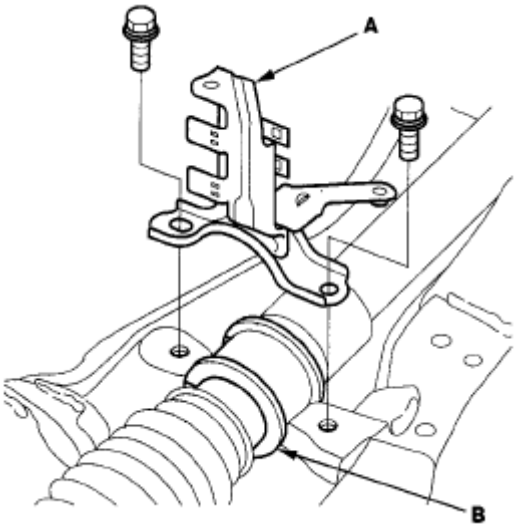

Fig. 88: Identifying Steering Gearbox

38. Remove the four 10 mm flange bolts from the left side of the steering gearbox, then remove the stiffener plates (A).

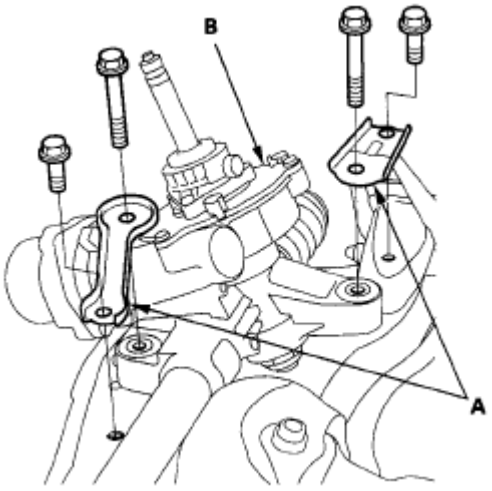

Fig. 89: Identifying Steering Gearbox

39. Remove the steering gearbox (B) from the front subframe.

Installation

1. Place the steering gearbox in position on the front subframe.
2. Loosely install the stiffener plates (A) and the gearbox mounting bolts on the left side of the steering gearbox.

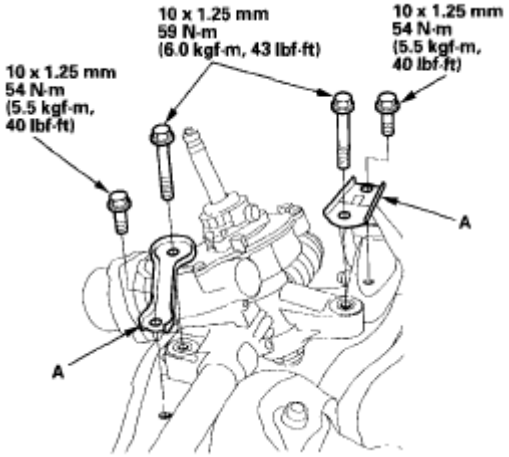

Fig. 90: Identifying Stiffener Plates (A) And Gearbox Mounting Bolts (With Torque Specifications)

3. Position the cutout (A) on the mounting cushion (B) as shown, and install it on the right side of the steering gearbox securely.

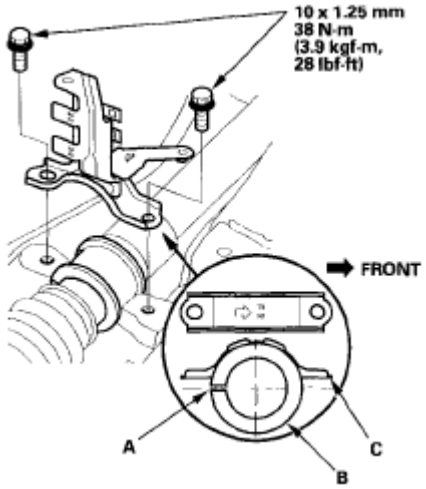

Fig. 91: Identifying Cutout (A) On Mounting Cushion (With Torque Specifications)

4. Install the gearbox mounting bracket (C) over the mounting cushion, and loosely install the two 10 mm bolts.
5. Tighten the 10 mm bolts on both sides of the steering gearbox to the specified torque alternately in two or more steps.
6. Install the pinion shaft grommet (A). Align the slot in the pinion shaft grommet with the lug portion (B) on the torque sensor. The grommet must not have a gap at the mating surface of the grommet and the torque sensor.

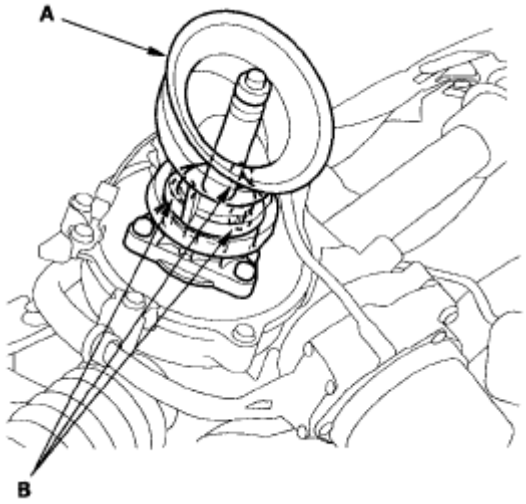

Fig. 92: Identifying Pinion Shaft Grommet (A)

7. Install the torque sensor 4P connector (A), motor angle sensor 6P connector (B), motor 1P connector (C), and motor 2P connector (D) on the right side of the gearbox mounting bracket (E).

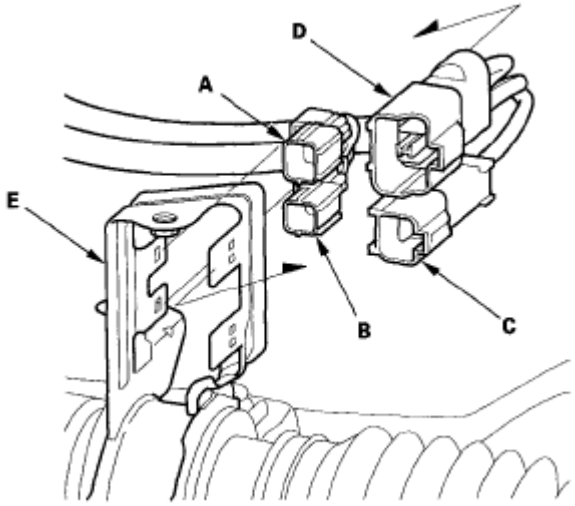

Fig. 93: Identifying Gearbox Mounting Bracket

8. Install the harness clips (A) to the harness clamp bracket (B), then install the harness clamp bracket to the front subframe.

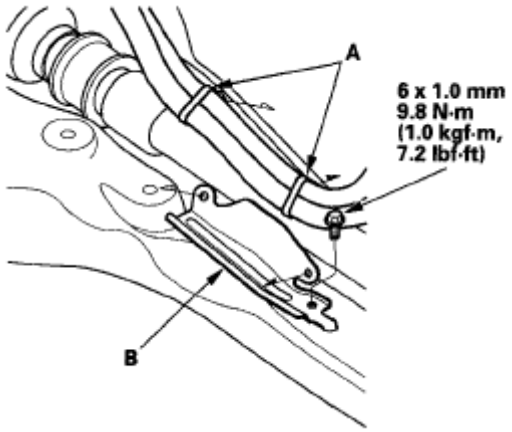

Fig. 94: Identifying Harness Clamp Bracket (With Torque Specifications)

9. Carefully raise the front subframe with the front subframe adapter and the transmission jack or the powertrain lift until the subframe is in position, then loosely install new subframe mounting bolts.

NOTE: Be sure that the pinion shaft grommet is in place securely. Check whether the pinion shaft grommet is not turning up. Incorrect installation can cause leakage of water, mud, and noise.

10. Align the front subframe reference marks (A) to the body (B), as noted during removal.

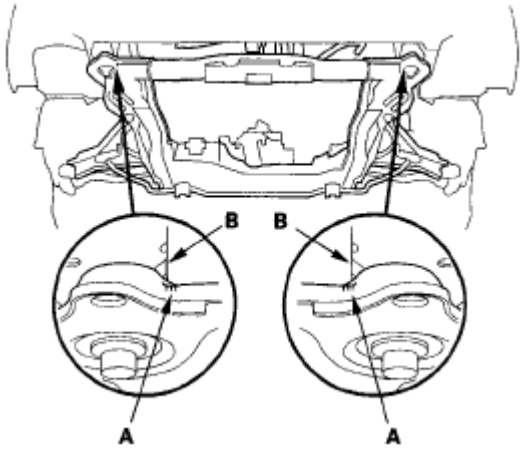

Fig. 95: Identifying Front Subframe Reference Marks To Body

11. Tighten the new front subframe rear mounting bolts (A) to the specified torque.

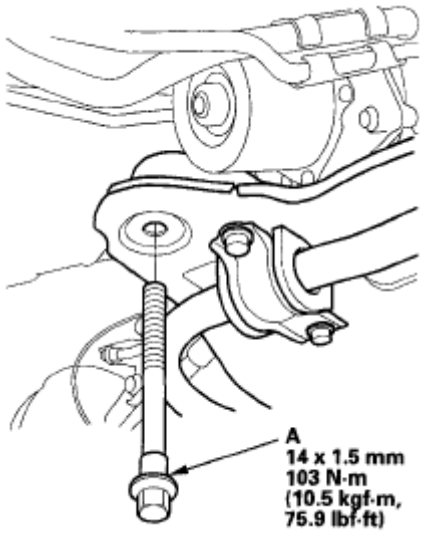

Fig. 96: Identifying Front Subframe Rear Mounting Bolts (With Torque Specifications)

12. Tighten the new front subframe front mounting bolts (A) to the specified torque.

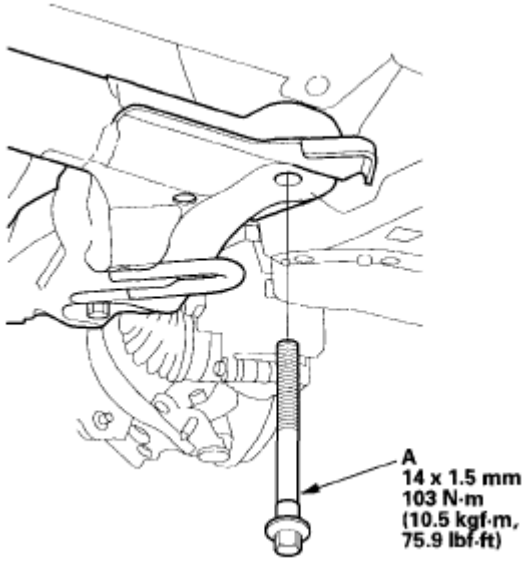

Fig. 97: Identifying Front Subframe Front Mounting Bolts (With Torque Specifications)

13. Install the new lower engine mounting bolt (A) while holding the nut (B) with a wrench.

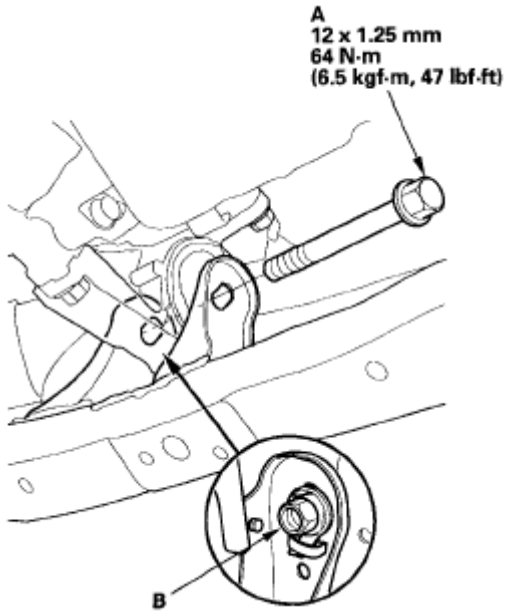

Fig. 98: Identifying Lower Engine Mounting Bolt (With Torque Specifications)

14. Install the lower radiator hose (A) to the radiator hose stay (B).

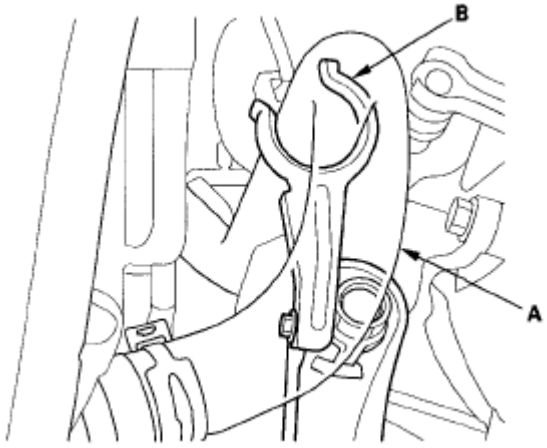

Fig. 99: Identifying Lower Radiator Hose (A) To Radiator Hose Stay

15. Install the new lower torque rod bracket bolt (A) and tighten it to the specified torque.

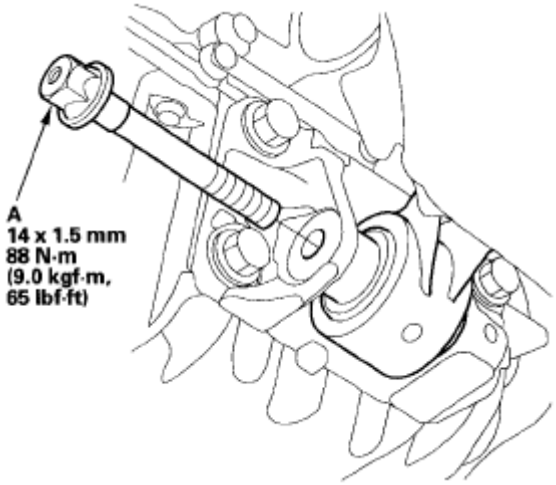

Fig. 100: Identifying Lower Torque Rod Bracket Bolt (With Torque Specifications)

16. Install the new front subframe middle mount bolt (A) on the left side, and tighten it to the specified torque.

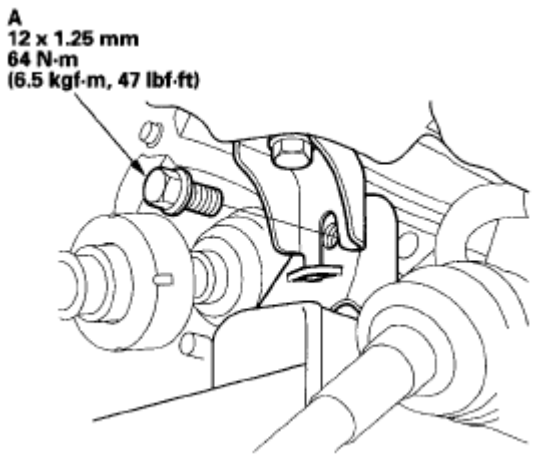

Fig. 101: Identifying Front Subframe Middle Mount Bolt (A) On Left Side (With Torque Specifications)

17. Install the new front subframe middle mount bolt (A) on the right side, and tighten it to the specified torque.

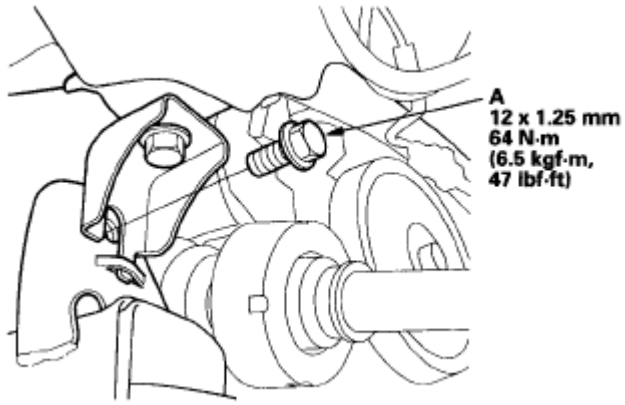

Fig. 102: Identifying Front Subframe Middle Mount Bolt (With Torque Specifications)

18. Install the exhaust hanger (A) to the three way catalytic converter (TWO (B).

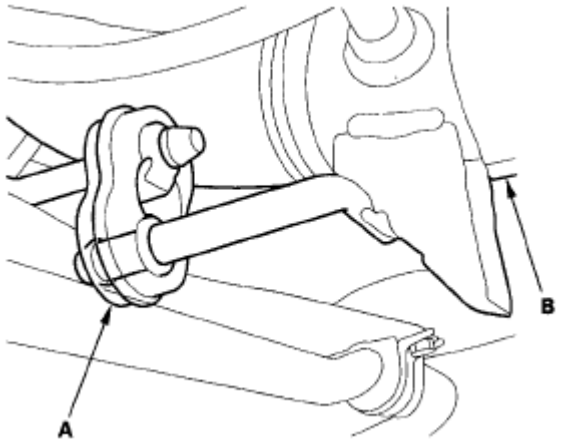

Fig. 103: Identifying Exhaust Hanger (A) To Three Way Catalytic Converter

19. Connect the lower arm (A) to the lower ball joint (B).

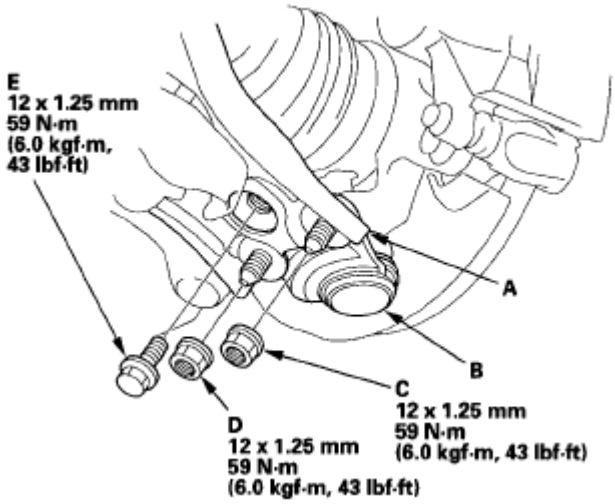

Fig. 104: Identifying Lower Arm (A) To Lower Ball (With Torque Specifications)

20. Install a new flange bolt and the new flange nuts. After lightly tightening all three fasteners, tighten them to the specified torque in the following order; the flange nut on the front (C), the flange nut on the rear (D), then the flange bolt (E).
21. Remove the vinyl tape, then connect the torque sensor 4P connector (A), motor angle sensor 6P connector (B), motor 1P connector (C), and motor 2P connector (D) to the steering gearbox. Make sure to push these connectors until you hear a click so that the connectors are secured.

Fig. 105: Connecting Torque Sensor 4P Connector

22. Install the front splash shield (see **FRONT SPLASH SHIELD REPLACEMENT**).
23. Wipe off any grease contamination from the ball joint tapered section and the threads. Reconnect the tie-rod ends (A) to the steering knuckles. Install the 12 mm nut (B), and tighten it.

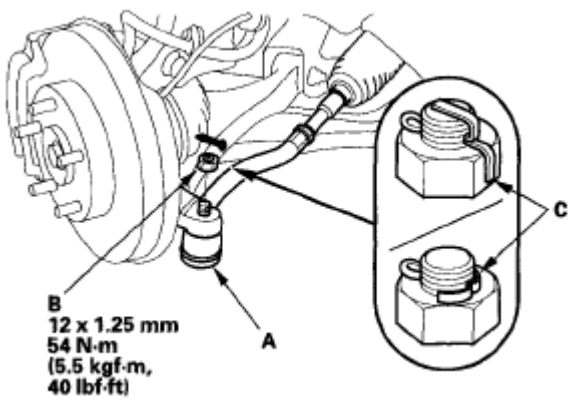

Fig. 106: Identifying Front Splash Shield

24. Install the new cotter pin (C), and bend it as shown.
25. Center the steering rack within its stroke in the steering joint connection.
26. With the rack in the straight ahead driving position, cut the wire (A) and slip the lower end of the steering joint onto the pinion shaft (B) in the range shown.

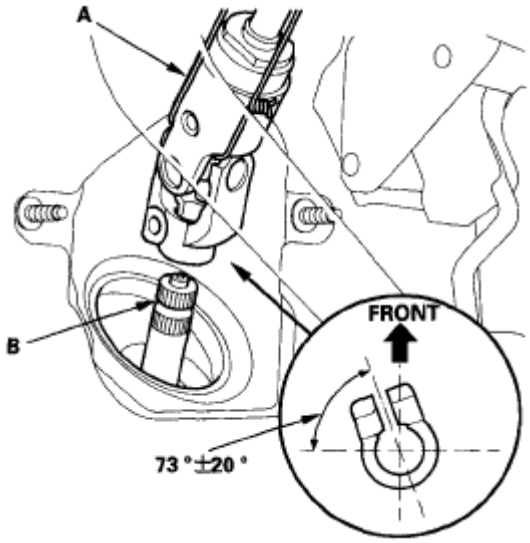

Fig. 107: Identifying Center Steering Rack

27. Align the bolt hole (A) on the steering joint with the groove (B) around the pinion shaft, and loosely install the joint bolt (C). Be sure that the joint bolt is securely in the groove in the pinion shaft. Pull on the steering joint to make sure that the steering joint is fully seated. Tighten the steering joint bolt to the specified torque.

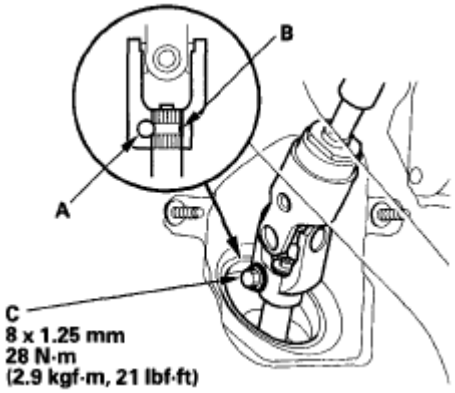

Fig. 108: Identifying Steering Joint With Groove (B) Around Pinion Shaft (With Torque Specifications)

28. Install the steering joint cover (A).

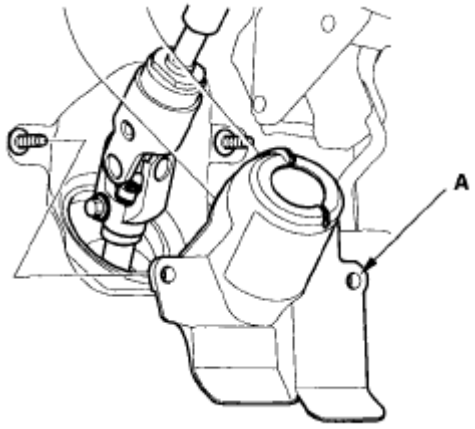

Fig. 109: Identifying Steering Joint Cover (A)

29. Install the driver's dashboard under cover (see **DRIVER's DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
30. Install the front wheel, then set the wheels in the straight ahead position.
31. Install the steering wheel (see **STEERING WHEEL INSTALLATION**).
32. Holding the tires raised off the ground (lifted up), check for the following symptoms by turning the steering wheel fully to the right and left several times.

SYMPTOM PROBABLE CAUSE REFERENCE

Symptom	Probable cause
Rubbing sound coming from the lower steering column area.	Steering column joint is contacting the cover.
Grating sound from the lower steering column area, or a rough feeling during steering.	Poor engagement of the pinion shaft serrations.
Noise from around the steering wheel during steering.	Poor engagement of the SRS cable reel with the steering wheel, or a damaged cable reel.

33. Install the air cleaner housing (see **AIR CLEANER REMOVAL/INSTALLATION**).
34. Install the under cowl panel (see **FRONT GRILLE COVER REPLACEMENT**).
35. Reconnect the negative cable to the battery and do these items:
    - Turn the ignition switch ON (II); the SRS indicator should come on for about 6 seconds and then go off.
    - Enter the anti-theft code for the audio or navigation system, then enter the audio presets.
    - Set the clock.
    - Make sure the horn and turn signal switch work properly.
    - Make sure the steering wheel switches work properly.
    - Make sure the steering wheel is centered.
    - Do the memorizing the torque sensor neutral position (see **MEMORIZING THE TORQUE SENSOR NEUTRAL POSITION**).
36. After installation, do the following checks:
    - Start the engine, and let it idle. Turn the steering wheel from lock-to-lock several times. Check that the EPS indicator does not come on.

- Check the steering wheel spoke angle. If steering spoke angles to the right and left are not equal (steering wheel and rack are not centered), correct the engagement of the joint/pinion shaft serrations, then adjust the front toe by turning the tie-rod ends, if necessary.
- Check the front toe inspection (see **FRONT TOE INSPECTION/ADJUSTMENT**).

RACK END REMOVAL AND INSTALLATION

EXPLODED VIEW

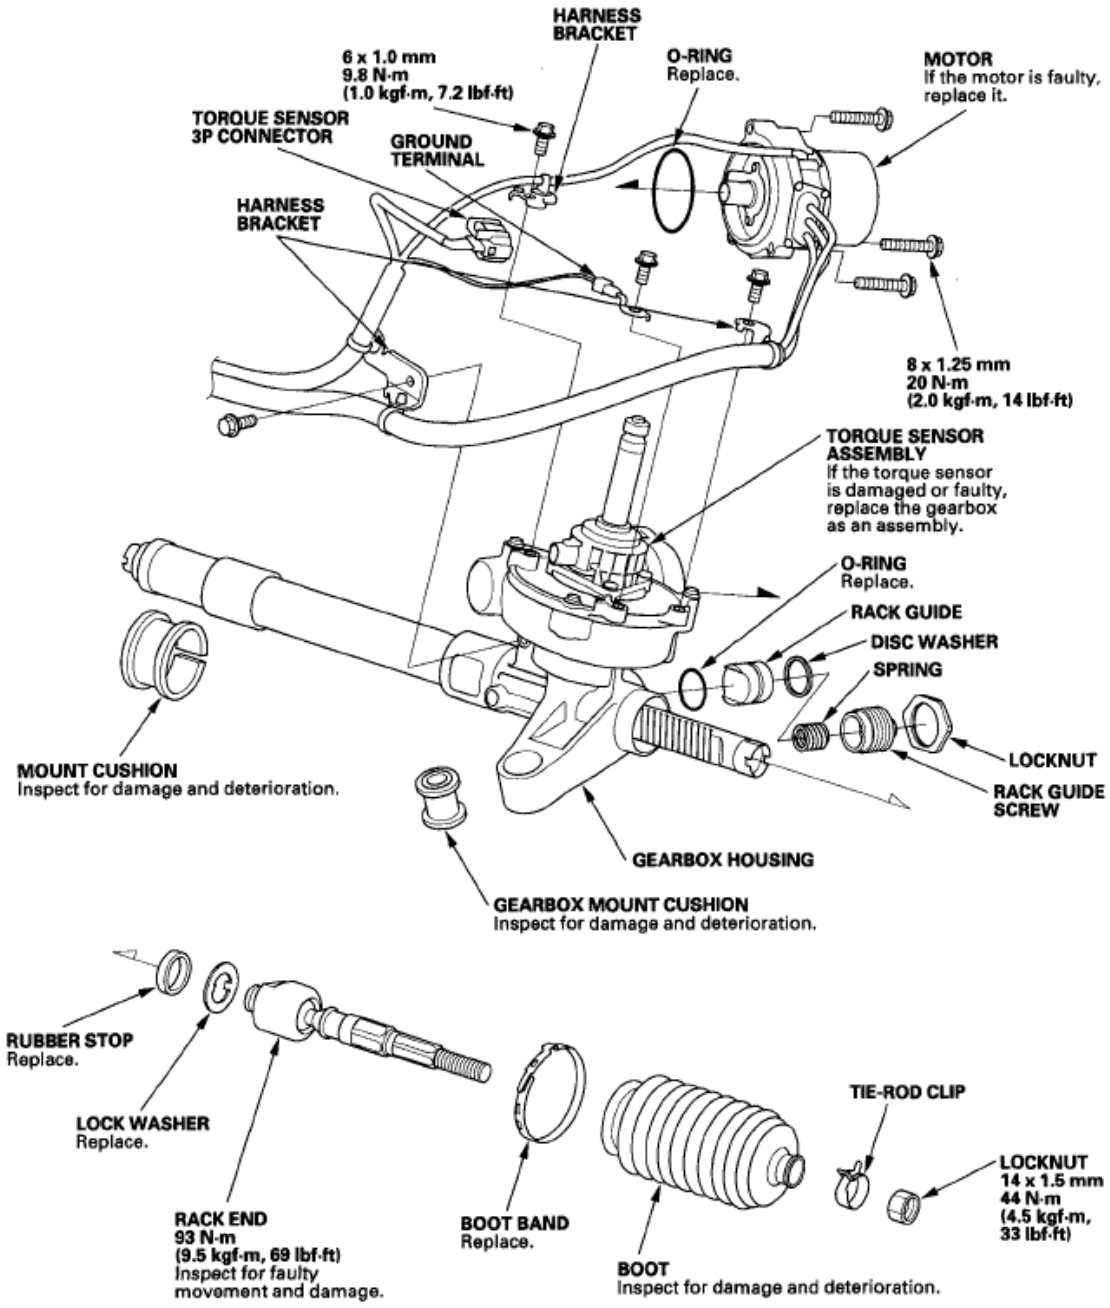

Fig. 110: Exploded View Of Rack End Components (With Torque Specifications)

Removal

NOTE: Do not allow dust, dirt, or other foreign materials to enter the steering gearbox.

1. Remove the boot bands (A) and discard them. Remove the tie-rod clips (B), and pull the boots away from the ends of the steering gearbox.

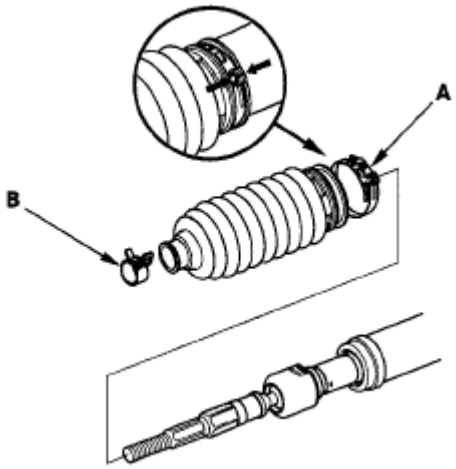

Fig. 111: Identifying Boot Bands

2. Unbend the lock washer (A).

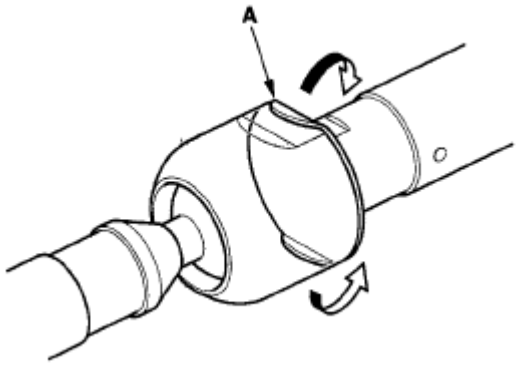

Fig. 112: Identifying Unbend Lock Washer (A)

3. Unscrew both rack ends (A) with a wrench. Be careful not to damage the rack shaft surface with the wrench. Remove the lock washer (B) and rubber stop (C) and discard them.

NOTE: Hold the flat surfaces of the rack shaft on the pinion shaft side with another wrench.

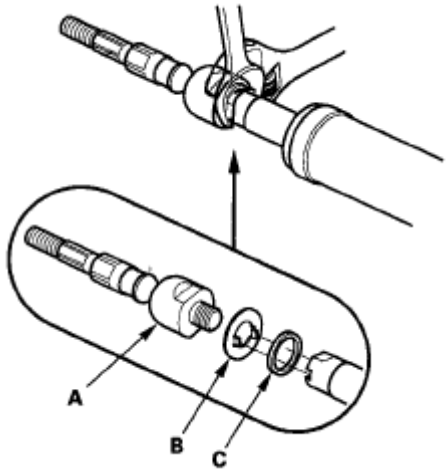

Fig. 113: Identifying Rack Shaft On Pinion Shaft

Installation

1. Install the new rubber stop (A) and lock washer (B) on the rack shaft. Align the lock washer tabs (C) with the slots (D) in the rack shaft. Install the rack end (E) while holding the lock washer in place. Repeat this step for the other side of the rack shaft.

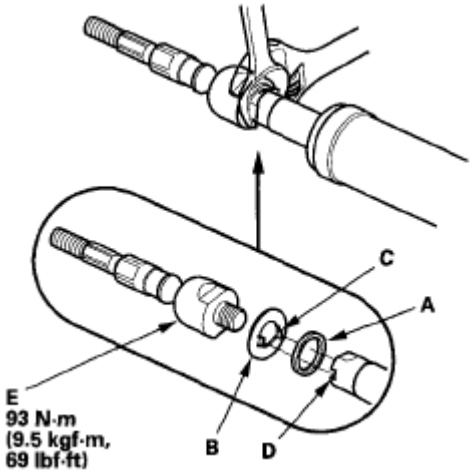

Fig. 114: Identifying Rubber Stop (A) And Lock Washer (B) On Rack Shaft (With Torque Specifications)

2. Tighten both rack ends. Be careful not to damage the rack shaft surface with the wrench.
3. Bend the lock washer (A) back against the flat spots (B) on the rack end ball joint housing.

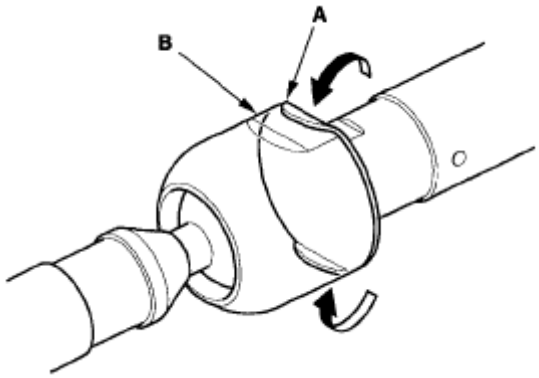

Fig. 115: Identifying Lock Washer (A) Back Against Flat Spots (B) On Rack End Ball Joint Housing

4. Apply multipurpose grease to the circumference of the rack end joint housing (A) and lock washer.

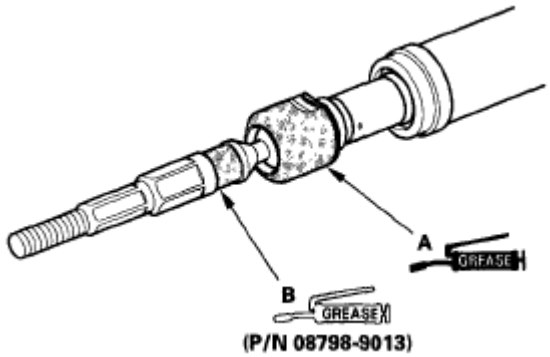

Fig. 116: Identifying Multipurpose Grease To Circumference Of Rack End Joint Housing (A) And Lock Washer

5. Apply a light coat of silicone grease (P/N 08798-9013) to the boot fitting grooves (B) on the rack ends.
6. Center the steering rack within its stroke.
7. Clean off any grease or contamination from the boot installation grooves (A) on the gearbox housing. Install the boots (B) on the rack ends with the tie-rod clips (C), and fit the boot end in the installation grooves in the housing properly.

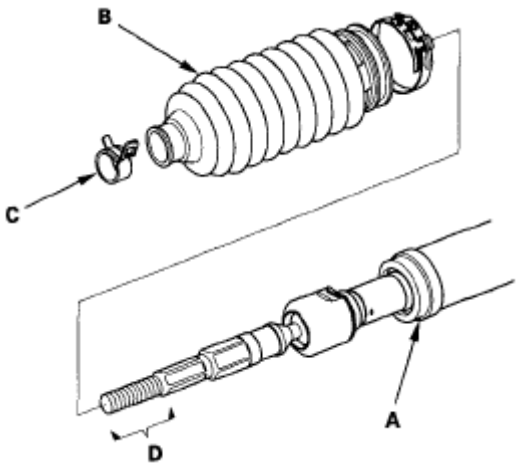

Fig. 117: Identifying Steering Boot

8. After installing the boots, wipe the grease off the thread section (D) of the rack end.
9. Install the new boot bands by aligning the tabs (A) with the holes (B) of the band.

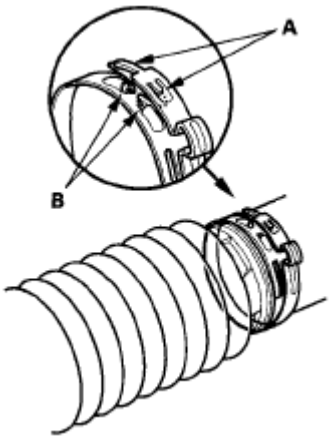

Fig. 118: Identifying Boot Bands

10. Close the ear portion (A) of the band (B) with commercially available pincers, Oetiker 1098 or equivalent (C).

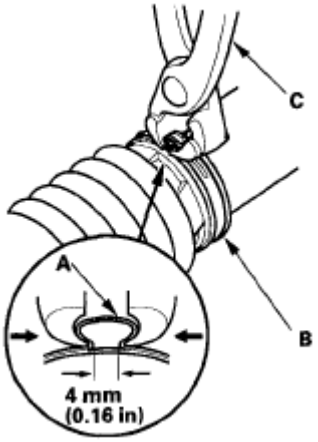

Fig. 119: Identifying Pincers

11. Slide the rack shaft right and left to be certain that the boots are not deformed or twisted.

GEARBOX MOUNT CUSHION REPLACEMENT

1. Remove the steering gearbox (see **STEERING GEARBOX REMOVAL AND INSTALLATION**).
2. Position the 34 mm socket wrench (A) on the flange part of the gearbox housing with a washer (B), 10 x 105 mm flange bolt (C) and the 10 mm nut (D) as shown.

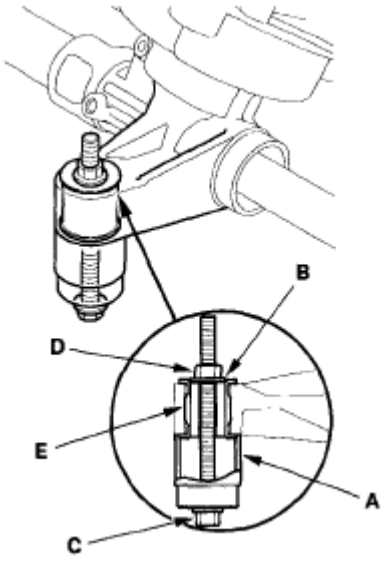

Fig. 120: Identifying Steering Gearbox

3. Hold the 10 mm nut with a wrench, and tighten the 10 x 105 mm flange bolt with another wrench. Remove the gearbox mount cushion (E).
4. Apply a mild soap and water solution to the new gearbox mount cushion surface (A), then place the mount cushion on the gearbox mounting cushion hole.

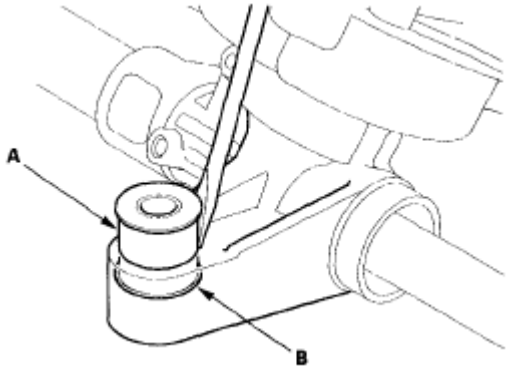

Fig. 121: Identifying Water Solution To Gearbox Mount Cushion Surface

5. Using a flat-tipped screwdriver, push the edge of the mount cushion (B) until it is about 1/3 of the way into the gearbox housing.

NOTE: Be careful not to damage the surface of the mount cushion when pushing it with the flat-tipped screwdriver.

6. Position the 34 mm socket wrench on the flange part of the gearbox housing with a washer, flange bolt, and the nut as shown.
7. Install the gearbox mount cushion by tightening the nut until the mount cushion edges (A) properly fit on the gearbox flange surface.

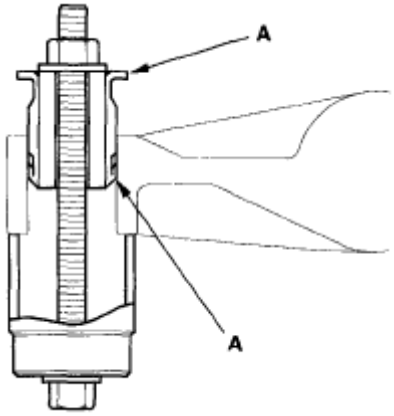

Fig. 122: Identifying Gearbox Mount Cushion

8. Install the steering gearbox (see **INSTALLATION**).
9. Check the wheel alignment, and adjust it if necessary (see **WHEEL ALIGNMENT**).

RACK GUIDE REMOVAL/INSTALLATION

Note these items during removal/installation: Do not allow dust, dirt, or other foreign materials to enter the steering gearbox.

1. Remove the steering gearbox (see **STEERING GEARBOX REMOVAL AND INSTALLATION**).
2. Loosen the locknut (A), then remove the rack guide screw (B), spring (C), disc washer (D), and rack guide (E).

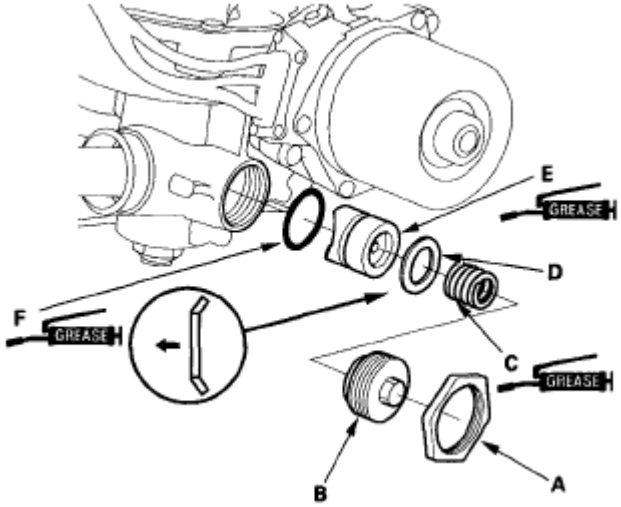

Fig. 123: Identifying Steering Gearbox Components

3. Remove the O-ring (F) from the rack guide. Wipe the grease off the sliding surface of the rack guide.
4. Apply multipurpose grease to the new O-ring, then install it to the rack guide.
5. Apply multipurpose grease to the sliding surface and the circumference of the rack guide, and install it onto the gearbox housing. Wipe the grease off the threaded section of the housing,
6. Apply multipurpose grease to both ends of the spring, and install it onto the gearbox housing.
7. Install the disc washer with its convex side facing the rack guide.
8. Remove the old sealant from the rack guide screw and apply new sealant (Three Bond 1215 or Loctite 5699) to the middle of the threads. Loosely install the rack guide screw on the steering gearbox.
9. Loosely install the locknut.
10. Adjust the rack guide screw (see **EPS TYPE**). After adjusting, check that the rack moves smoothly by sliding the rack right and left.

EPS CONTROL UNIT REMOVAL/INSTALLATION

1. Make sure you have the anti-theft codes for the audio or navigation system, then write down the audio presets.
2. Make sure the ignition switch is OFF, then disconnect the negative cable from the battery.
3. Remove the passenger's dashboard under cover (see **PASSENGER's DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
4. Remove the passenger's side kick panel: 2-door (see **TRIM REMOVAL/INSTALLATION - DOOR AREAS**), 4-door (see **FRONT DOOR SILL AREA - 4-DOOR**).
5. Disconnect EPS control unit connector A (2P), connector B (2P), connector C (2P), and connector D (28P).

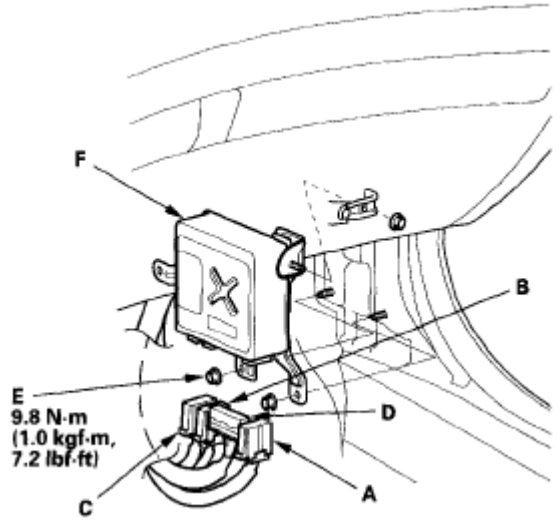

Fig. 124: Identifying EPS Control Unit Connector

6. Remove the nuts (E) from the EPS control unit (F).
7. Remove the EPS control unit.
8. Install the EPS control unit in the reverse order of removal.

9. Reconnect the negative cable to the battery and do these items:
    - Enter the anti-theft code for the audio or navigation system, then enter the audio presets.
    - Set the clock.
    - If the EPS control unit is replaced, the EPS control unit must memorize the torque sensor neutral position (see **MEMORIZING THE TORQUE SENSOR NEUTRAL POSITION**).
10. After installation, start the engine, and let it idle. Turn the steering wheel from lock-to-lock several times. Check that the EPS indicator does not come on.

SYMPTOM TROUBLESHOOTING INDEX

Find the symptom in the chart below, and do the related procedures in the order listed until you find the cause.

SYMPTOM TROUBLESHOOTING INDEX

Symptom	Procedure(s)	Also check for
Hard steering	Troubleshoot the system (see **Symptom Troubleshooting**).	• Modified suspension • Damaged suspension • Tire sizes, tire varieties, and air pressure

Assist (excessively light steering at high speed)	Check the rack guide adjustment (see **RACK GUIDE ADJUSTMENT**).	Front wheel alignment (see **WHEEL ALIGNMENT**)
Shock or vibration when the steering wheel is turned to full lock	1. Check the rack guide adjustment (see **RACK GUIDE ADJUSTMENT**). 2. Check the drive belt for slippage (see **DRIVE BELT INSPECTION**). 3. Check the power steering pump fluid pressure with T/N 07406-0010001 (see **PUMP PRESSURE TEST WITH T/N 07406-0010001**) or T/N 07406-001000A (see **PUMP PRESSURE TEST WITH T/N 07406-001000A**). 4. Overhaul the steering gearbox (see step 2).	
Steering wheel will not return smoothly	1. Check cylinder lines for deformation. 2. Check the ball joints for binding. 3. Check wheel alignment (see **WHEEL ALIGNMENT**). 4. Overhaul the steering gearbox (see step 2).	
Uneven or rough steering	1. Check the rack guide adjustment (see **RACK GUIDE ADJUSTMENT**). 2. Check the drive belt (see **DRIVE BELT INSPECTION**). 3. Check for low or erratic engine idle speed (see **IDLE SPEED INSPECTION**). 4. Check for air in the power steering system due to air entering inlet side of pump. 5. Check for low fluid level in the power steering reservoir due to possible leaks in system (see **FLUID REPLACEMENT**). 6. Overhaul the steering gearbox (see step 2).	
Steering wheel kicks back during wide turns	1. Check the drive belt (see **DRIVE BELT INSPECTION**). 2. Check the power steering pump fluid pressure with T/N 07406-0010001 (see **PUMP PRESSURE TEST WITH T/N 07406-0010001**) or T/N 07406-001000A (see **PUMP PRESSURE TEST WITH T/N 07406-001000A**).	
Humming noise from	1. Check when the noise occurs: • If the noise is heard up to 2-3 minutes after starting the engine in cold weather, this is normal. • If the noise is heard when the wheel is turned with the vehicle stopped, this is normal due to the fluid pulsation.	

the power steering system	2. Check for the high-pressure hose touching the subframe or body. 3. Check for automatic transmission converter noise (A/T). 4. Check for air bubbles in the power steering fluid, leak on inlet side of pump. 5. Check for particle contamination of fluid and restricted filter in the reservoir.	Pump pressure
Power steering rack rattle or chattering	1. Check for loose steering components (tie-rod and ball joints). Tighten or replace as necessary. 2. Check the steering column shaft for wobbling. If the steering column wobbles, replace the steering column assembly (see **STEERING COLUMN REMOVAL AND INSTALLATION**). 3. Check the rack guide adjustment (see **RACK GUIDE ADJUSTMENT**). 4. Check the power steering pump pulley: • If the pulley is loose, tighten it (see step 46). • If the pump shaft is loose, replace the pump (see **PUMP REPLACEMENT**).	
Hissing from the power steering system/foaming fluid	• Check the fluid level. If low, fill the reservoir to the proper level and check for leaks (see **FLUID LEAKAGE INSPECTION**). • Check the reservoir for leaks. • Check for crushed inlet hose or loose hose clamp allowing air into the suction side of the system (see **FLUID LEAKAGE INSPECTION**). • Check the power steering pump shaft oil seal for leaks.	Air in the P/S fluid
Noise from the power steering pump	• Compare the pump noise at normal operating temperature to another like vehicle (pump noise for 2-3 minutes after starting the engine in cold weather is normal). • Remove and inspect the pump for wear and damage (see **PUMP REPLACEMENT**).	• P/S pump pressure • Air in the P/S fluid
Squeaking from the power steering pump	Check the drive belt (see **DRIVE BELT INSPECTION**).	
Fluid leaks from the	• Fluid leaks from the top of the valve body unit. Overhaul the valve body unit (see step 19 on page 17-51). • Fluid leaks from the driver's side boot. Replace the valve oil seal on the pinion shaft. Replace the cylinder end seal on the gearbox side. • Fluid leaks from the passenger's side boot. Replace	

steering gearbox	the cylinder end seal on the cylinder side. • Fluid leaks from pinion shaft near the lower steering joint bolt. Overhaul the valve body unit (see step 19 on page 17-51). • Fluid leaks from the steering damping valve covers on the valve body unit. Replace the valve housing.	
Fluid leaks from the power steering line	• Fluid leaks from the cylinder line connections (flare nuts). Tighten the connection and retest (see **POWER STEERING HOSE, LINE, AND PRESSURE SWITCH REPLACEMENT**). • Fluid leaks from a damaged cylinder lines. Replace the cylinder line (see **POWER STEERING HOSE, LINE, AND PRESSURE SWITCH REPLACEMENT**). • Fluid leaks from the pump outlet hose or return line fitting on the valve body unit (flare nuts). Tighten the fitting and retest. If it still leaks, replace the hose, the line, or valve body unit as necessary.	
Fluid leaks from the power steering pump	• Fluid leaks from the front oil seal. Replace the front oil seal. • Fluid leaks from the power steering pump housing. Replace the leaking O-rings or seals (see **FLUID LEAKAGE INSPECTION**), and if necessary replace the power steering pump (see **PUMP REPLACEMENT**).	
Fluid leaks from the power steering reservoir	• Fluid leaks from around the reservoir cap because fluid level is too high. Drain the reservoir to the proper level. If the fluid is aerated check for an air leak on the inlet side of pump. • Fluid leaks from reservoir. Check for reservoir for cracks and replace as necessary.	
Fluid leaks from the power steering pump outlet hose (high-pressure)	• Check the fitting for loose bolts. If the bolts are tight, replace the fitting O-ring. • Fluid leaks at the swagged joint. Replace the pump outlet hose.	
Fluid leaks from the power steering pump inlet hose (low-pressure)	Check the hose for damage, deterioration, or improper assembly. Replace or repair as necessary.	

SYMPTOM TROUBLESHOOTING

HARD STEERING

1. Check the power assist (see **STEERING WHEEL ROTATIONAL PLAY CHECK**).

Is the initial turning load more than 34 N (3.5 kgf, 7.7 lbf)?

YES -Go to step 2.

NO -Power assist is OK.

2. Connect the P/S joint adapter (pump), P/S joint adapter (hose), and P/S pressure gauge T/N 07406-0010001 (see **PUMP PRESSURE TEST WITH T/N 07406-0010001**), or T/N 07406-001000A (see **PUMP PRESSURE TEST WITH T/N 07406-001000A**) to the pump.
3. Measure steady-state fluid pressure from the pump at idle.

   Is the pressure 1,470 kPa (15 kgf/cm^2 , 213 psi) or less?

   YES -Go to step 4.

   NO -Go to step 8.

4. Measure the pump relief pressure at idle.

   Is the pressure 7,850-8,550 kPa (80-87 kgf/cm^2 , 1,140-1,240 psi) or more?

   YES -Go to step 5.

   NO -Go to step 9.

5. With a spring scale, measure the power assist in both directions, to the left and to the right.

   Are the two measurements within 5.0 N (0.51 kgf, 1.12 lbf) of each other?

   YES -Go to step 6.

   NO -Go to step 11.

6. Measure the fluid pressure with both pressure gauge valves open (if so equipped), while turning the steering wheel fully to the left and fully to the right.

   Is the pressure 7,850-8,550 kPa (80-87 kgf/cm^2 , 1,140-1,240 psi) or more?

   YES -Go to step 7.

   NO -Faulty steering gearbox.

7. Adjust the rack guide (see **RACK GUIDE ADJUSTMENT**), and retest.

   Is the steering OK?

   YES -Repair is completed.

   NO -Faulty steering gearbox.

8. Check the outlet and return hoses and lines between the pump and the steering gearbox for clogging and deformation.

   Are the lines clogged or deformed?

   YES -Repair or replace the lines.

   NO -Faulty valve body unit.

9. Disassemble the pump (see **PUMP OVERHAUL**).
10. Check the pressure control valve for smooth movement and leaks (see step 16).

    Is the pressure control valve OK?

    YES -Faulty pump assembly.

    NO -Faulty pressure control valve.

11. Check the cylinder lines for deformation (see **POWER STEERING HOSE, LINE, AND PRESSURE SWITCH REPLACEMENT**).

    Are any of the lines deformed?

    YES -Replace the deformed line.

    NO -Go to step 12.

12. Check for a bent rack shaft or misadjusted rack guide (too tight).

    Is the rack shaft bent or the rack guide adjusted too tight?

    YES -Replace the rack shaft, or readjust the rack guide.

    NO -Faulty valve body unit.

PUMP PRESSURE TEST WITH T/N 07406-0010001

Special Tools Required

- P/S joint adapter (pump) 07RAK-S040111
- P/S joint adapter (hose) 07RAK-S040122
- P/S pressure gauge 07406-0010001

Check the fluid pressure as follows to determine whether the trouble is in the pump or the steering gearbox.

1. Check the power steering fluid level (see **FLUID REPLACEMENT**).
2. Remove the cowl cover and under-cowl panel (see **FRONT GRILLE COVER REPLACEMENT**).
3. Remove the pump outlet hose clamp (A) from the intake manifold.

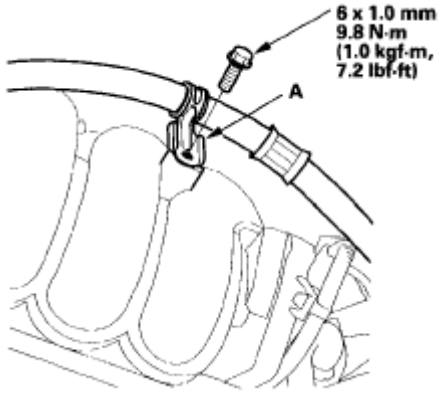

Fig. 2: Identifying Pump Outlet Hose Clamp (With Torque Specifications)

4. Disconnect the pump outlet hose, then install the P/S joint adapter (pump) on the pump (A). Take care so as not to spill the power steering fluid on the frame and other parts.

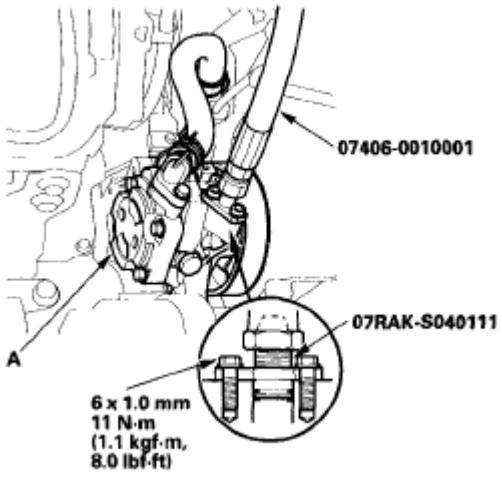

Fig. 3: Identifying P/S Joint Adapter (Pump) On Pump (With Torque Specifications)

5. Install the P/S pressure gauge to the P/S joint adapter (pump).
6. Connect the P/S joint adapter (hose) to the P/S pressure gauge.
7. Connect the pump outlet hose (A) to the P/S joint adapter (hose).

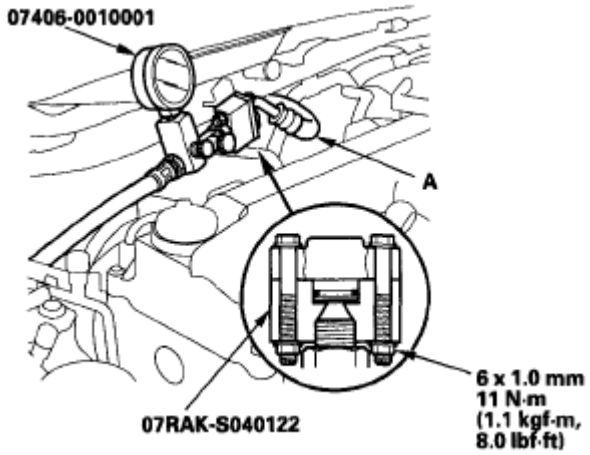

Fig. 4: Identifying Pump Outlet Hose To P/S Joint Adapter (Hose) (With Torque Specifications)

8. Fully open the shut-off valve (A).

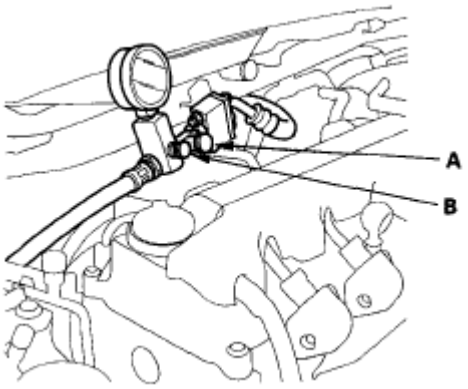

Fig. 5: Identifying Pressure Control Valve

9. Fully open the pressure control valve (B).
10. Start the engine, and let it idle.
11. Turn the steering wheel from lock-to-lock several times to warm the fluid to operating temperature at 158°F (70°C).
12. Measure steady-state fluid pressure while the engine is idling. If the pump is in good condition, the gauge should be no more than 1,470 kPa (15 kgf/cm^2 , 213 psi). If it reads higher, check for:
    - Clogged or deformed pump outlet or return line between the pump and the steering gearbox.
    - Clogged valve body unit.
13. Raise the engine speed to 3,000 rpm, and measure the fluid pressure. If the pump is in good condition, the gauge should read at least 1,470 kPa (15 kgf/cm^2 , 213 psi). If it reads higher, repair or replace the pump.
14. Lower the engine speed, and let it idle. Close the shut-off valve, then close the pressure control valve gradually until the pressure gauge needle is stable. Read the pressure.

NOTE: Do not keep the shut-off valve closed more than 5 seconds or the pump could be damaged by overheating.

15. Immediately open the shut-off valve fully.

    If the pump is in good condition, the gauge should read at least 7,850-8,550 kPa (80-87 kgf/cm^2 , 1,140-1,240 psi). A low reading means pump output is too low for full assist. Repair or replace the pump.

16. Reinstall all removed parts.

PUMP PRESSURE TEST WITH T/N 07406-001000A

Special Tools Required

- P/S joint adapter (pump) 07RAK-S040111

- P/S joint adapter (hose) 07RAK-S040122
- P/S pressure gauge 07406-001000A

Check the fluid pressure as follows to determine whether the trouble is in the pump or the steering gearbox.

1. Check the power steering fluid level (see **FLUID REPLACEMENT**).
2. Remove the cowl cover and under-cowl panel (see **FRONT GRILLE COVER REPLACEMENT**).
3. Remove the pump outlet hose clamp (A) from the intake manifold.

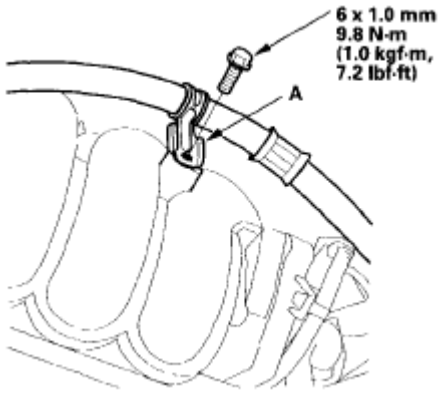

Fig. 6: Identifying Pump Outlet Hose Clamp (With Torque Specifications)

4. Disconnect the pump outlet hose, then install the P/S joint adapter (pump) on the pump (A). Take care so as not to spill the power steering fluid on the frame and other parts.

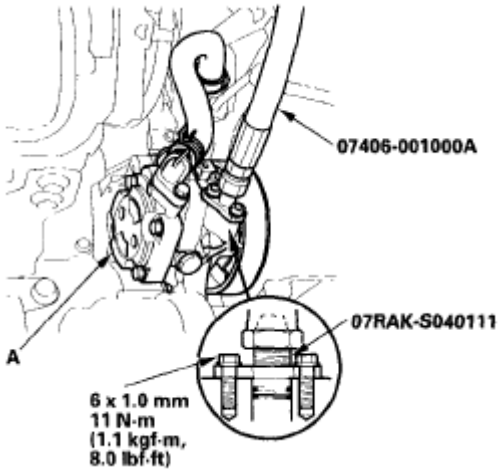

Fig. 7: Identifying P/S Joint Adapter (Pump) On Pump (With Torque Specifications)

5. Install the P/S pressure gauge to the P/S joint adapter (pump).
6. Connect the P/S joint adapter (hose) to the P/S pressure gauge.
7. Connect the pump outlet hose (A) to the P/S joint adapter (hose).

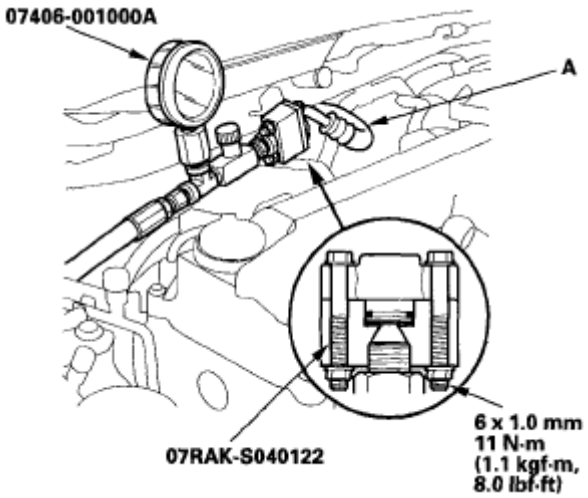

Fig. 8: Identifying P/S Pressure Gauge To P/S Joint Adapter (Pump) (With Torque Specifications)

8. Open the shut-off valve (A) fully.

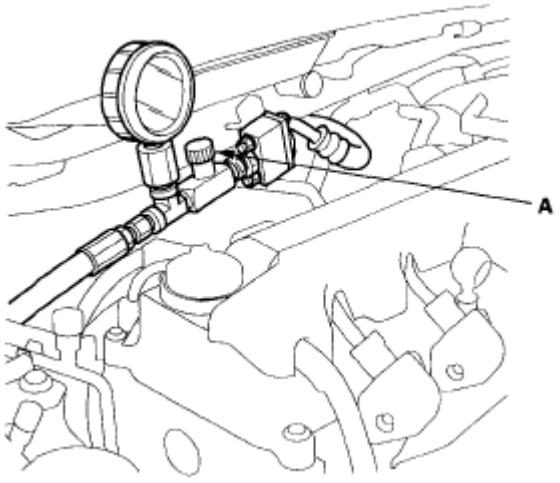

Fig. 9: Identifying Shut-Off Valve - P/S Pressure Gauge

9. Start the engine, and let it idle.
10. Turn the steering wheel from lock-to-lock several times to warm the fluid to operating temperature at 158°F (70°C).
11. Measure steady-state fluid pressure while the engine is idling. If the pump is in good condition, the gauge should be no more than 1,470 kPa (15 kgf/cm^2 , 213 psi). If it reads higher, check for:
    - Clogged or deformed pump outlet or return line between the pump and the steering gearbox.
    - Clogged valve body unit.
12. Raise the engine speed to 3,000 rpm, and measure the fluid pressure. If the pump is in good condition, the gauge should read at least 1,470 kPa (15 kgf/cm^2 , 213 psi). If it reads higher, repair or replace the pump.
13. Lower the engine speed, and let it idle. Close the shut-off valve gradually until the pressure gauge needle is stable. Read the pressure.

NOTE: Do not keep the shut-off valve closed more than 5 seconds or the pump could be damaged by overheating.

14. Immediately open the shut-off valve fully. If the pump is in good condition, the gauge should read at least 7,850-8,550 kPa (80-87 kgf/cm^2 , 1,140-1,240 psi). A low reading means pump output is too low for full assist. Repair or replace the pump.
15. Reinstall all removed parts.

FLUID LEAKAGE INSPECTION

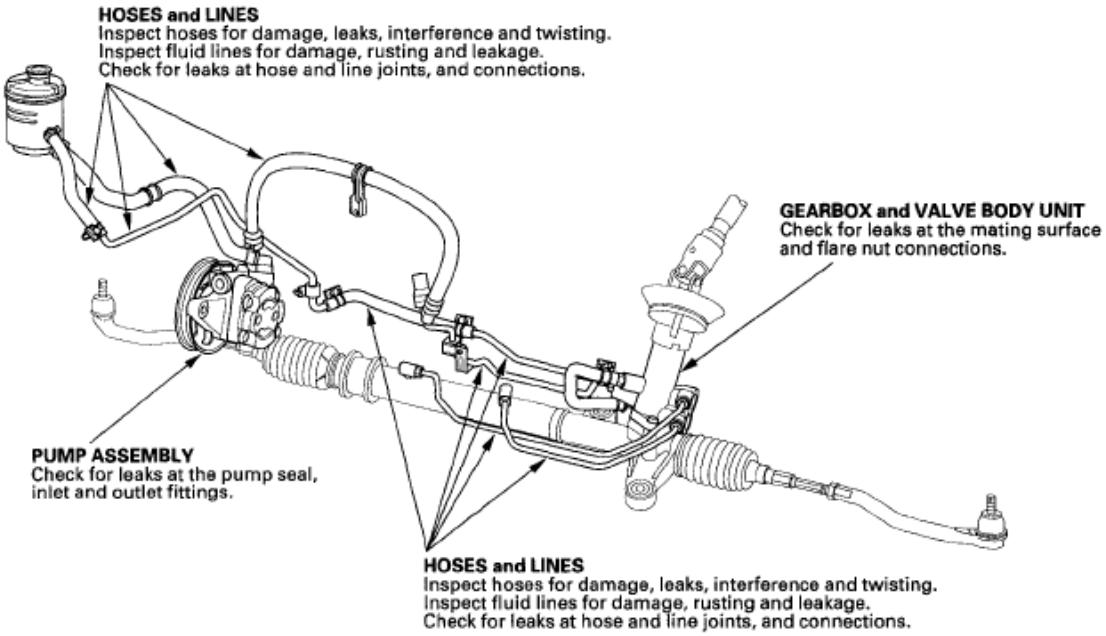

Fig. 10: Identifying Fluid Leakage Components Location

FLUID REPLACEMENT

Check the reservoir (A) at regular intervals, and add the recommended fluid as necessary. Always use Honda Power Steering Fluid. Use of any other type of power steering fluid or automatic transmission fluid can cause increased wear and poor steering in cold weather.

NOTE: If the fluid is contaminated, the screen in the reservoir may be partially blocked. Replace the reservoir if necessary.

System capacity:
0.8 L (0.85 US. qt) at disassembly
Reservoir capacity:
0.26 L (0.27 US. qt)

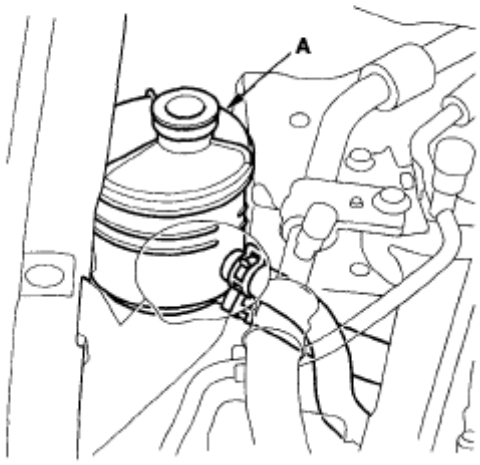

Fig. 11: Identifying Fluid Reservoir

1. Remove the reservoir from its holder. Raise the reservoir, then disconnect the return hose (A) to drain the reservoir. Take care not to spill the fluid on the body and parts. Wipe off any spilled fluid at once.

NOTE: Inspect the reservoir screen for any debris. If the reservoir screen is clogged, replace the reservoir.

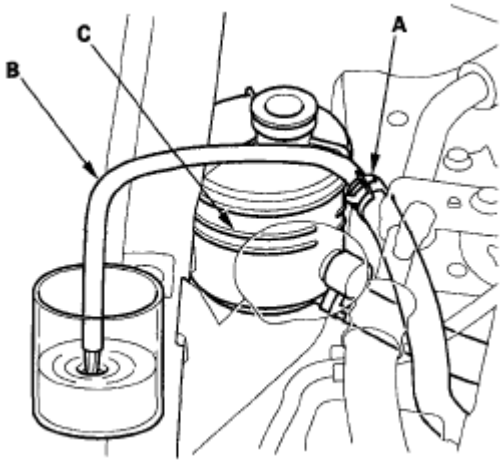

Fig. 12: Identifying Reservoir Tank Specified Level - Upper Level Line

2. Connect a hose (B) of suitable diameter to the disconnected return hose, and put the hose end in a suitable container.
3. Start the engine, let it run at idle, and turn the steering wheel from lock-to-lock several times. When fluid stops running out of the hose, shut off the engine. Discard the fluid.
4. Reinstall the return hose on the reservoir.
5. Fill the reservoir to the upper level line (C).
6. Start the engine and run it at fast idle, then turn the steering from lock-to-lock several times to bleed air from the system.

7. Recheck the fluid level and add some if necessary. Do not fill the reservoir beyond the upper level line.
8. If the fluid is contaminated, dark, or discolored, repeat the procedure as necessary.

POWER STEERING HOSE, LINE, AND PRESSURE SWITCH REPLACEMENT

Note these items during installation:

- Connect each hose to the corresponding line securely until it contacts the stop on the line. Install the clamp or adjustable clamp at the specified distance from the hose end as shown.
- Check all clamps for deterioration or deformation; replace the clamps with new ones if necessary.
- Add the recommended power steering fluid to the specified level on the reservoir and check for leaks.

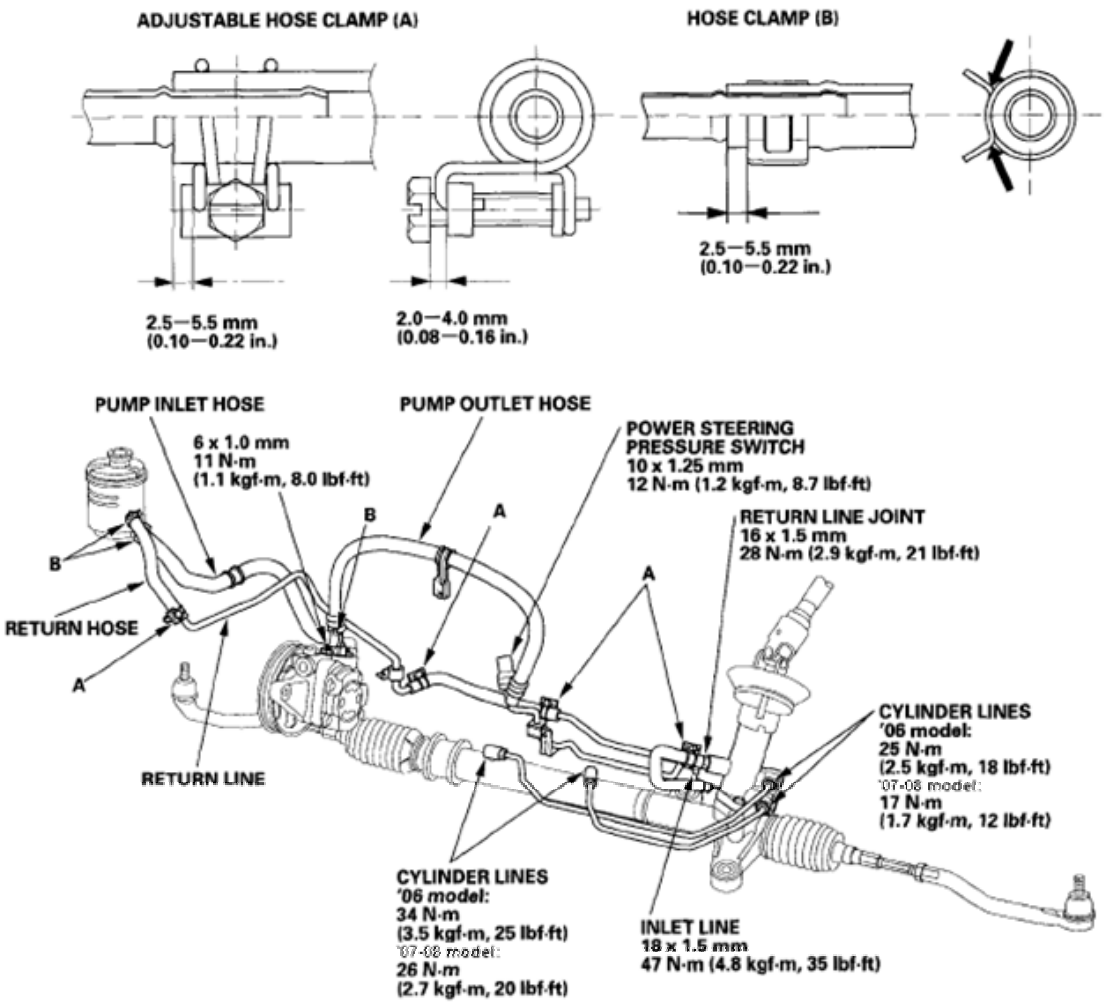

Fig. 13: Identifying Specified Distance From Hose (With Torque Specifications)

PUMP REPLACEMENT

1. Place a suitable container under the vehicle.
2. Drain the power steering fluid from the reservoir (see **FLUID REPLACEMENT**).

3. Remove the cowl cover and under-cowl panel (see **FRONT GRILLE COVER REPLACEMENT**).
4. Remove the air cleaner (see **THROTTLE BODY CLEANING**).
5. Remove the front splash shield, 2-door (see **FRONT SPLASH SHIELD REPLACEMENT**), 4-door (see **4-DOOR**).
6. M/T model: Remove the shift cable bracket (A).

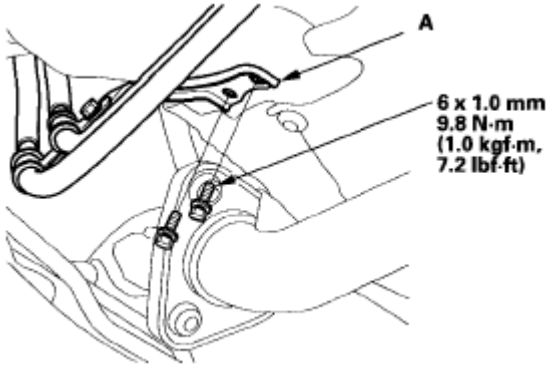

Fig. 14: Identifying Shift Cable Bracket (With Torque Specifications)

7. A/T model: Disconnect the shift cable from the control lever (see **SHIFT CABLE REPLACEMENT**).
8. Remove the upper torque rod mounting bolts (A) from the body.

NOTE: During installation, install new mounting bolts.

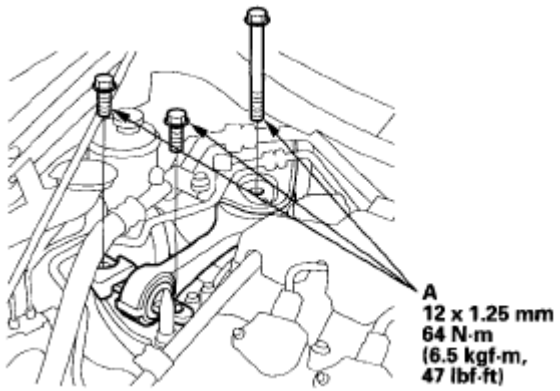

Fig. 15: Identifying Upper Torque Rod Mounting Bolts (With Torque Specifications)

9. Remove the drive belt (A) from the pump pulley (see **DRIVE BELT INSPECTION**).

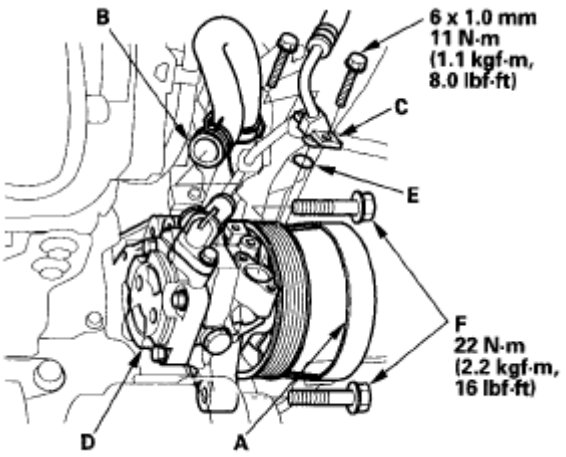

Fig. 16: Identifying Pump Outlet Hose, O-Ring And Pump Mounting Bolts (With Torque Specifications)

10. Cover the parts around the power steering pump with several shop towels to protect them from spilled power steering fluid.
11. Disconnect the pump inlet hose (B) and pump outlet hose (C) from the pump (D), and plug them. Take care not to spill the fluid on the body or on any parts. Wipe off any spilled fluid at once. Do not turn the steering wheel with the pump removed.
12. Remove the pump outlet hose O-ring (E), and discard it.
13. Remove the pump mounting bolts (F).
14. Cover the opening of the pump with a piece of tape to prevent foreign material from entering the pump.
15. Move the power steering pump toward the driver's side, then raise it.

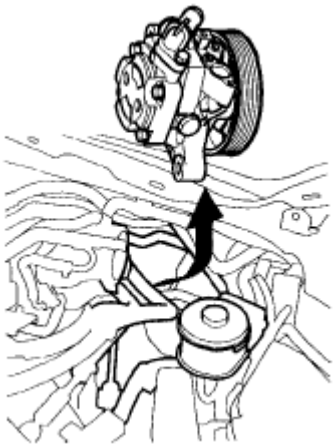

Fig. 17: Identifying Power Steering Pump

16. Connect the pump inlet hose and pump outlet hose onto the new pump with new a O-ring.
17. Loosely install the pump in the pump bracket with the mounting bolts, then tighten the pump fittings securely.
18. Tighten the pump mounting bolts to the specified torque.
19. Install the drive belt (A).

Note these items during belt installation:

- Make sure that the belt is properly positioned on the pulleys (B).
- Do not get power steering fluid or grease on any parts around the power steering pump, drive belt, or pulley faces. Clean off any fluid or grease before installation.

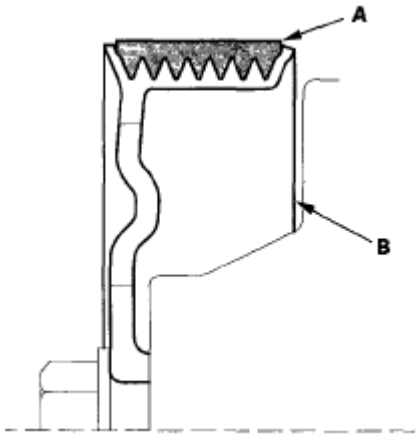

Fig. 18: Identifying Drive Belt

20. Reinstall all removed parts.
21. Fill the reservoir to the upper level line (see **FLUID REPLACEMENT**).

PUMP OVERHAUL

EXPLODED VIEW

Replace the pump as an assembly if the parts indicated with an asterisk (*) are worn or damaged.

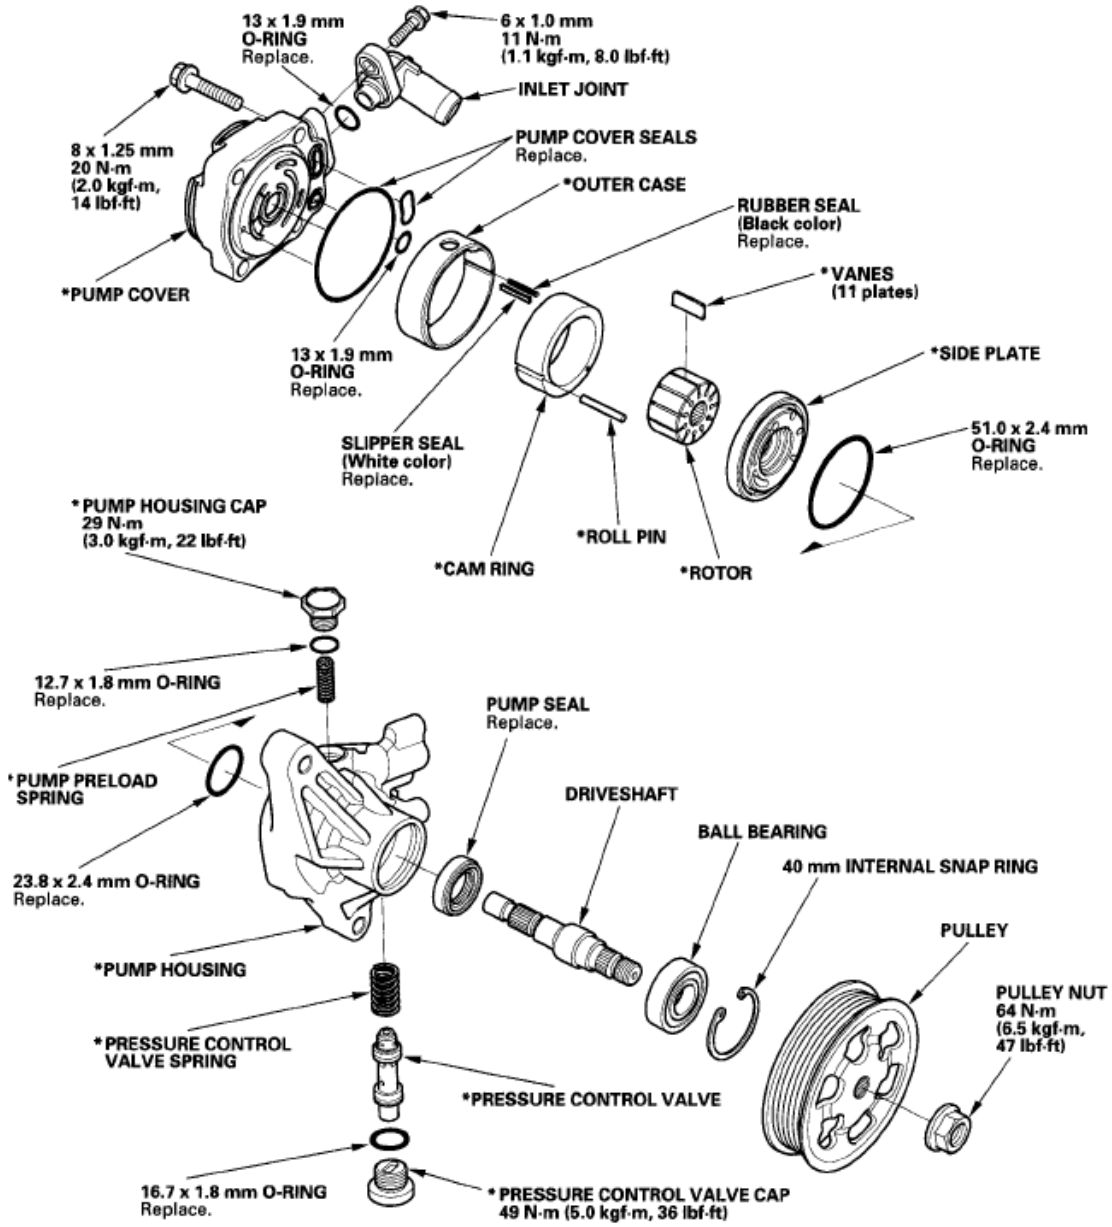

Fig. 19: Exploded View Of Power Steering Pump (With Torque Specifications)

Special Tools Required

- Attachment, 32 x 35 mm 07746-0010100
- Driver 07749-0010000
- Pulley holder 07ZAB-S5A0100

Disassembly

NOTE: Refer to the Fig. 19 as needed during the following procedure.

1. Drain the fluid from the pump (see **FLUID REPLACEMENT**).
2. Remove the power steering pump (see **PUMP REPLACEMENT**).

3. Hold the steering pump (A) in a vise with soft jaws (B), hold the pulley (C) with the pulley holder (D), and remove the pulley nut (E) and pulley. Be careful not to damage the pump housing with the jaws of the vise.

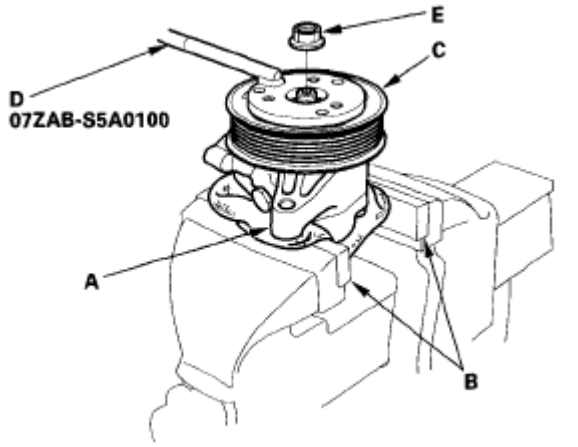

Fig. 20: Identifying Steering Pump In Vise

4. Remove the inlet joint and O-ring.
5. Remove the pressure control valve cap, O-ring, valve spring, and pressure control valve.
6. Remove the pump housing cap, O-ring, and pump preload spring.
7. Remove the pump cover, O-ring, and pump cover seals.
8. Pull out the roll pin.
9. Remove the outer case, cam ring, rotor, vanes, and side plate.
10. Remove the rubber seal and slipper seal from the outer case.
11. Remove the O-rings from the bottom of the housing.
12. Remove the 40 mm internal snap ring, then remove the driveshaft by tapping the shaft end with a plastic hammer.
13. Remove the seal from the pump housing.

Inspection

14. Check the pressure control valve for wear, burrs, and other damage to the edges of the grooves in the valve.

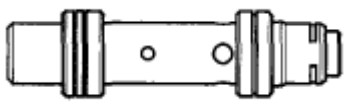

Fig. 21: Identifying Pressure Control Valve

15. Inspect the bore of the pressure control valve on the pump housing for scratches and wear.
16. Slip the pressure control valve back in the pump housing, and check that it moves in and out smoothly. If OK, go to step 17; if not, replace the pump as an assembly. The pressure control valve is not available separately.

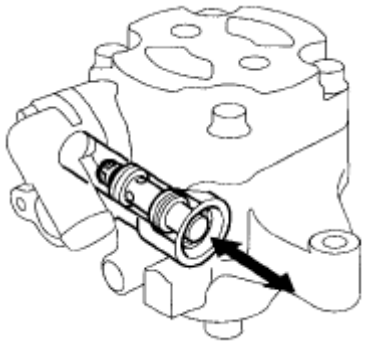

Fig. 22: Identifying Pressure Control Valve On Pump Housing

17. Attach a hose (A) to the end of the pressure control valve (B) as shown. Then submerge the pressure control valve in a container of power steering fluid or solvent (C), and blow in the hose.
    - If air bubbles leak through the valve at less than 98 kPa (1.0 kgf/cm^2 , 14.2 psi), replace the pump as an assembly. The pressure control valve is not available separately.
    - If the pressure control valve is OK, set it aside for reassembly later.

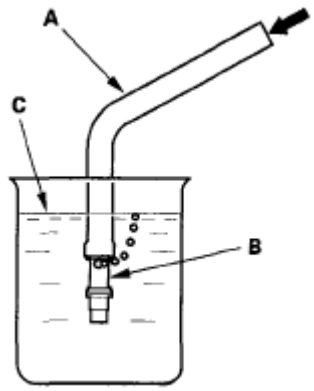

Fig. 23: Checking Pressure Control Valve

18. Inspect the ball bearing by rotating the outer race slowly. If you feel any play (axial or radial) or roughness, remove the faulty ball bearing (A), and install a new one (B).

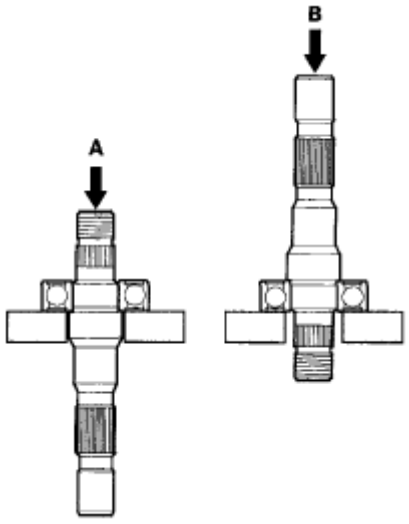

Fig. 24: Locating Ball Bearing

19. Inspect each part shown with an asterisk in the Exploded View; if any of them are worn or damaged, replace the pump as an assembly.

Reassembly

20. Install the new pump seal (A) (with its grooved side facing in) into the pump housing (B) by hand, then drive it in using the driver and the attachment until the seal is fully seated in the pump housing. Do not apply more than 1,370 N (140 kgf, 308 lbf) of pressure.

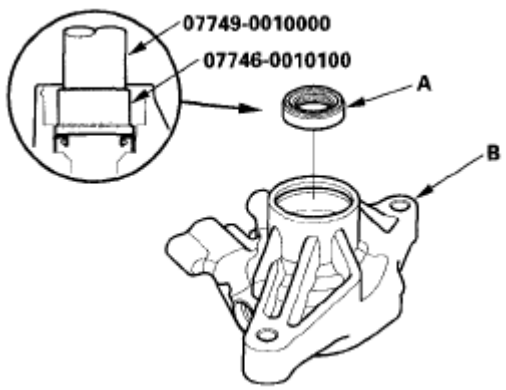

Fig. 25: Identifying Pump Seal On Pump Housing

21. Position the pump driveshaft (A) in the pump housing, then press it in with the appropriate size socket wrench (B) as shown.

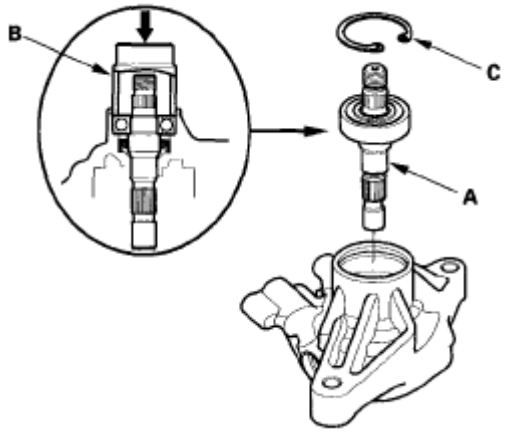

Fig. 26: Identifying Pump Driveshaft Position In Pump Housing

22. Install the 40 mm internal snap ring (C) with its radiused edge facing out.
23. Coat the new 23.8 mm O-ring (A) with power steering fluid, then position it on the bottom (B) of the pump housing.

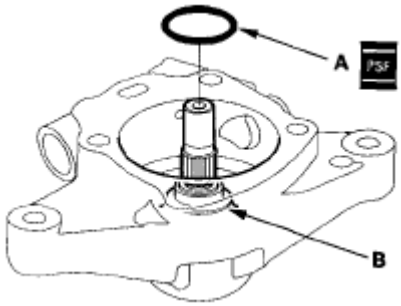

Fig. 27: Identifying O-Ring

24. Coat the new cover seals (A) and new 13.0 mm O-ring (B) with power steering fluid, then position them into the grooves on the cover (C).

NOTE: Be careful not to install the inlet joint O-ring because they are same size.

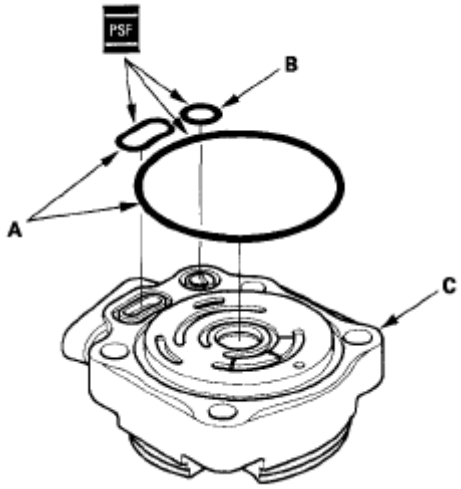

Fig. 28: Identifying O-Ring Position Into Grooves On Cover

25. Install the outer case (A) by aligning the slot (B) inside the outer case with the cover roll pin hole (C). Be sure that the tapered side (D) of outer case is facing up.

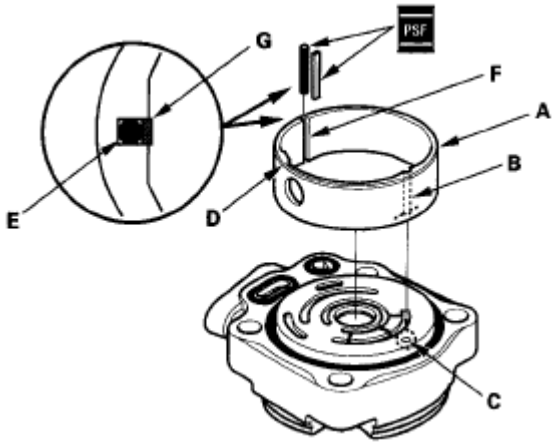

Fig. 29: Identifying Area Applying Rubber Seal

26. Apply power steering fluid to the rubber seal (E) (black), and install it in the slot (F) of the outer case.
27. Apply power steering fluid to the slipper seal (G) (white), and install it on top of the rubber seal you just installed.
28. Install the cam ring (A) by aligning the slot (B) with the slot (C) in the outer case.

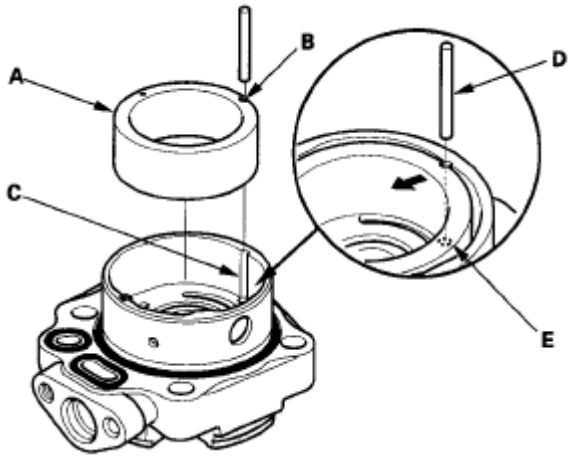

Fig. 30: Locating Slot In Outer Case

29. Insert the roll pin (D) into the slots between the cam ring and outer case, then push the roll pin into the set hole (E).
30. Install the rotor (A) in the cam ring (B).

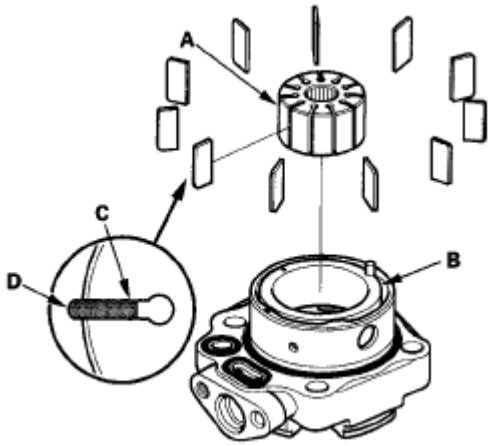

Fig. 31: Identifying Rotor And Cam Ring

31. Set the 11 vanes (C) in the grooves in the rotor. Make sure that the round ends (D) of the vanes are in contact with the sliding surface of the cam ring.
32. Place the side plate (A) on the cam ring, and align the roll pin set hole (B) with the roll pin (C).

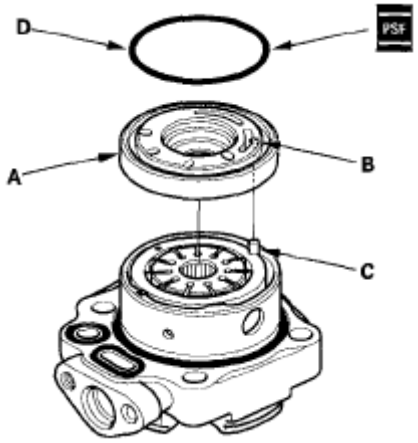

Fig. 32: Identifying Align Roll Pin Set Hole With Roll Pin

33. Coat the new O-ring (D) with power steering fluid, then position it into the groove on the side plate.
34. Install the pump housing (A) over the cover assembly (B).

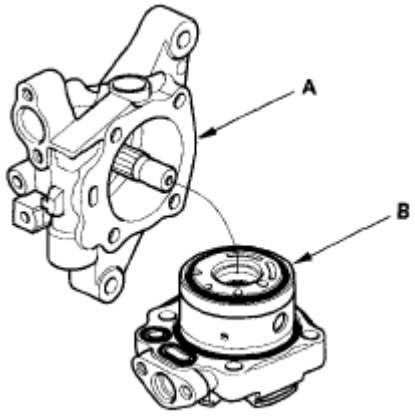

Fig. 33: Identifying Pump Housing And Cover Assembly

35. Align the bolt holes in the cover (A) with the threaded holes in the pump housing. Install the flange bolts loosely first, then torque the flange bolts in a criss-cross pattern in two or more steps.

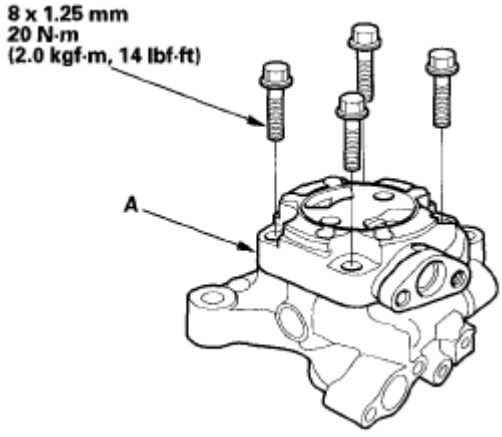

Fig. 34: Identifying Align Bolt Holes In Cover (With Torque Specifications)

36. Push in the cam ring (A) from the pump housing cap hole (B) with a flat-tip screwdriver to make sure the cam ring is fully seated against the outer case.

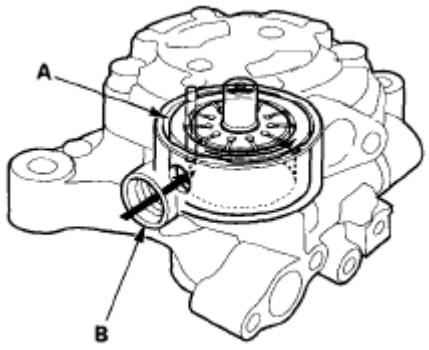

Fig. 35: Locating Push Cam Ring From Pump Housing Cap Hole

37. Install the pump preload spring (A) in the pump housing.

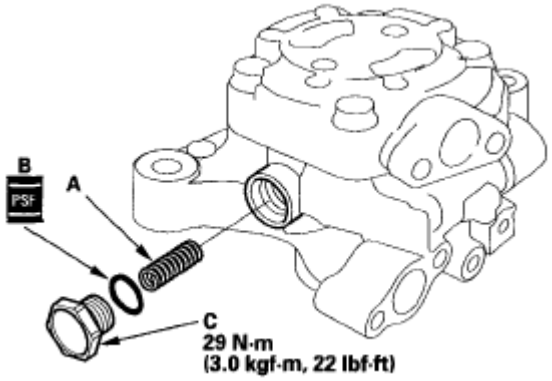

Fig. 36: Identifying Pump Preload Spring (With Torque Specifications)

38. Coat the new 12.7 mm O-ring (B) with power steering fluid, and install it on the pump housing cap (C).
39. Install the pump housing cap on the pump housing, and tighten it to the specified torque.
40. Install the pressure control valve spring (A) in the pump housing.

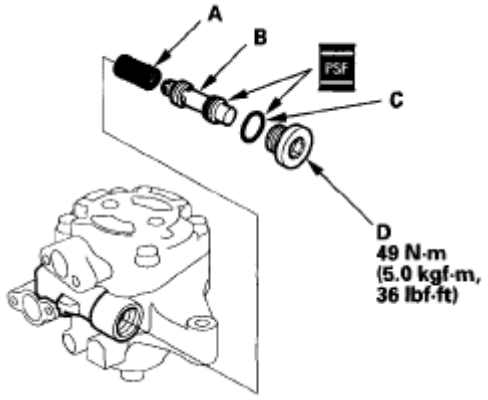

Fig. 37: Identifying Pressure Control Valve Spring (With Torque Specifications)

41. Coat the pressure control valve (B) with power steering fluid, and install it in the pump housing.
42. Coat the new 16.7 mm O-ring (C) with power steering fluid, and install it on the pressure control valve cap (D).
43. Install the pressure control valve cap on the pump housing, and tighten it to the specified torque.
44. Coat the new O-ring (A) with power steering fluid, and install it on the inlet joint (B).

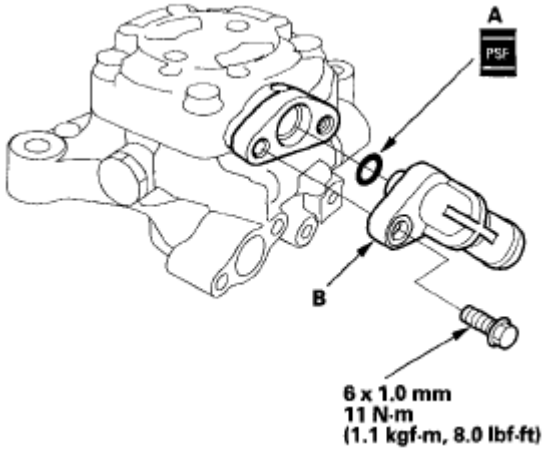

Fig. 38: Identifying Power Steering Fluid O-Ring (With Torque Specifications)

45. Install the inlet joint on the pump housing.
46. Install the pulley (A), then loosely install the pulley nut (B). Hold the steering pump in a vise with soft jaws (C). Be careful not to damage the pump housing with the jaws of the vise.

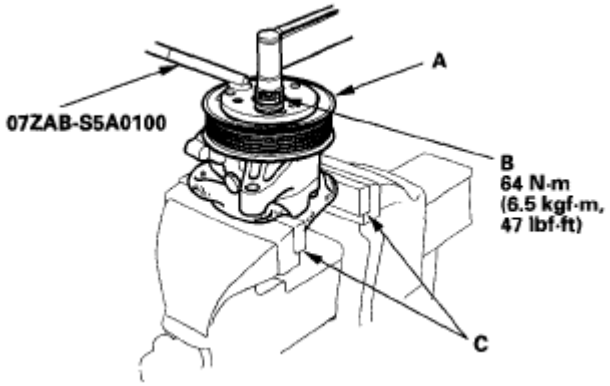

Fig. 39: Identifying Steering Pump In Vise (With Torque Specifications)

47. Hold the pulley with the pulley holder, and tighten the pulley nut to the specified torque.
48. Check that the pump turns smoothly by turning the pulley. If it is hard to turn, loosen the four flange bolts on the cover, then retighten them as in step 35, and check the pump again.

STEERING GEARBOX REMOVAL

Special Tools Required

- 1.8 Support eyelet 07AAK-SNAA400

- 1.8 Support bolt 07AAK-SNAA500
- Ball joint remover, 28 mm 07MAC-SLOA202
- Front subframe adaptor VSB02C000016 *
- 2006 Civic engine hanger VSB02C000025 *
- Engine support hanger, A and Reds AAR-T-12566 *

Available through the American Honda Tool and Equipment program, 1-888-424-6857.

Note these items during removal:

- Using solvent and a brush, wash any oil and dirt off the valve body unit, it's lines, and the end of the steering gearbox. Blow dry with compressed air.
- Be sure to remove the steering wheel before disconnecting the steering joint. Damage to the cable reel can occur.

1. Drain the power steering fluid (see **FLUID REPLACEMENT**).
2. Make sure you have the anti-theft code for the audio or navigation system, then write down the audio presets.
3. Make sure the ignition switch is in LOCK (0), then disconnect the negative cable from the battery.
4. Remove the steering wheel (see **STEERING WHEEL REMOVAL**).
5. Remove the driver's dashboard undercover (see **DRIVER's DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
6. Remove the steering joint cover (A).

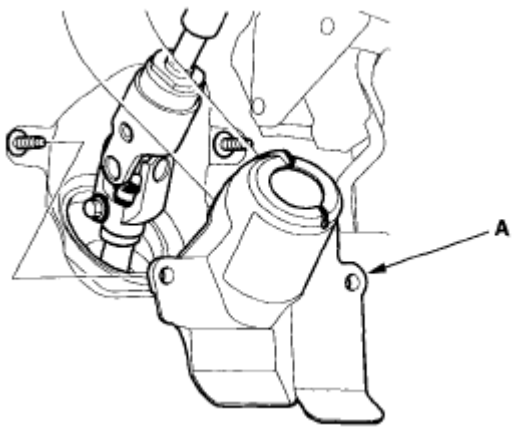

Fig. 40: Identifying Steering Joint Cover

7. Hold the lower slide shaft (A) on the column with a piece of wire (B) between the joint yoke (C) of the lower slide shaft and joint yoke (D) of the upper shaft to prevent the slider shaft from pulling out.

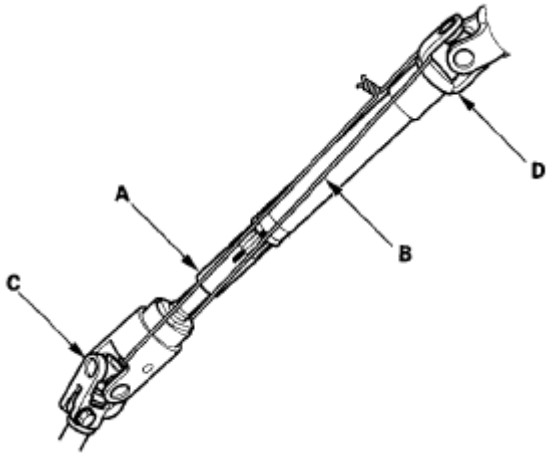

Fig. 41: Identifying Lower Slide Shaft With Wire Between Joint Yokes

8. Release the lock lever, and adjust the steering column to the full telescopic out position, then tighten the lock lever.
9. Remove the steering joint bolt (A), and disconnect the steering joint by moving the steering joint (B) toward the column..

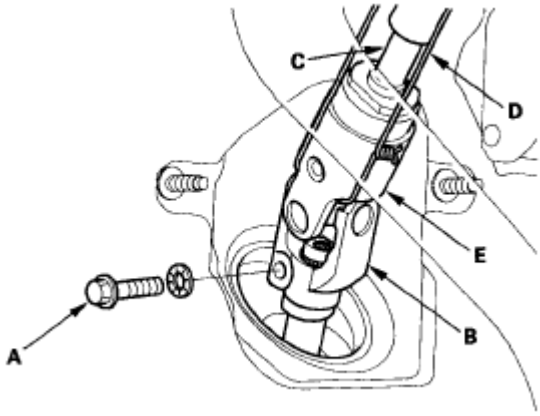

Fig. 42: Identifying Steering Joint Bolt

10. Remove the center guide (A) (if equipped), and discard it. The center guide is for factory assembly only.

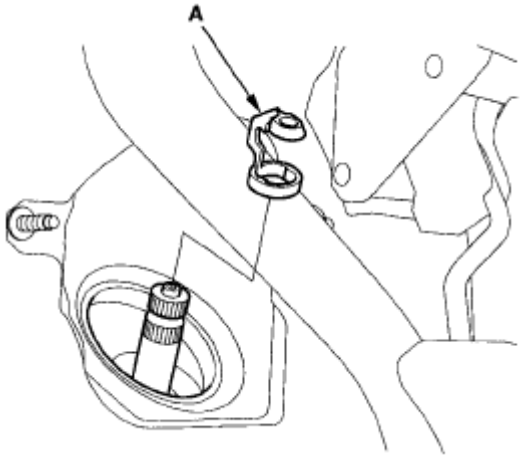

Fig. 43: Identifying Center Guide

11. Remove the cowl cover and under-cowl panel (see **FRONT GRILLE COVER REPLACEMENT**).
12. Remove the air cleaner housing (see **THROTTLE BODY CLEANING**).
13. Remove the air cleaner housing mounting bracket (A), and install support eyelet (B) behind the breather pipe (C) and down to the threaded hole (D) on the cylinder head.

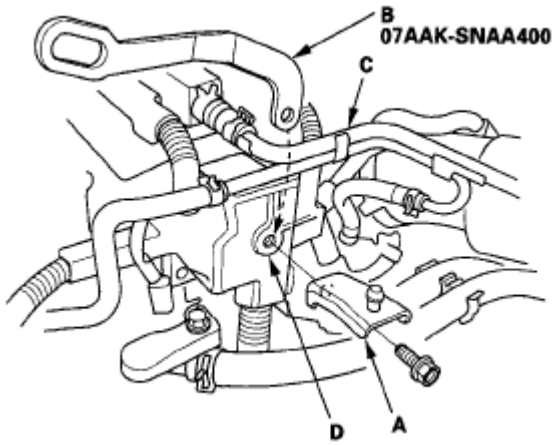

Fig. 44: Identifying Mounting Bracket And Support Eyelet

14. Attach the support eyelet (A) to the cylinder head with the support bolt (B). Tighten the bolt by hand.

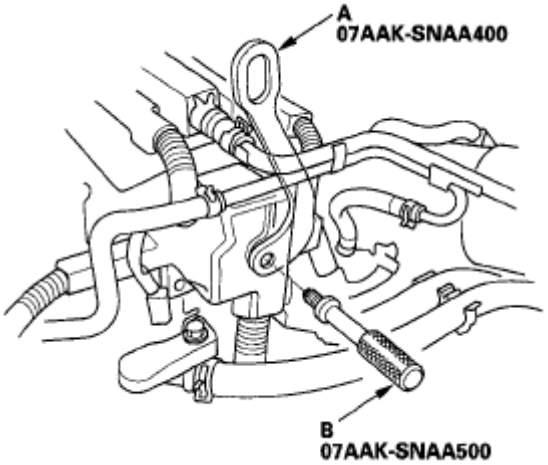

Fig. 45: Identifying Support Eyelet And Support Bolt

15. Install the front leg assembly (A), hook (B), and wing nut (C) from an A and Reds engine support hanger (AAR-T-12566) onto the engine hanger. Carefully position the engine hanger on the vehicle, and attach the hook to the slotted hole in the support eyelet (D). Tighten the wing nut by hand to lift and support the engineltransmission assembly.

NOTE: Use care when working around the windshield.

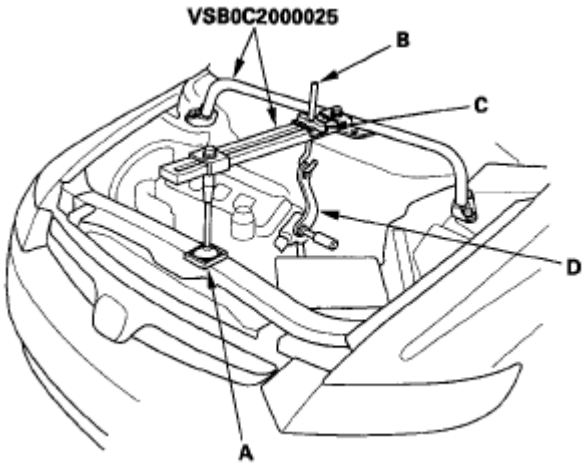

Fig. 46: Identifying Special Tool

16. Remove the pump outlet hose clamp (A) from the intake manifold.

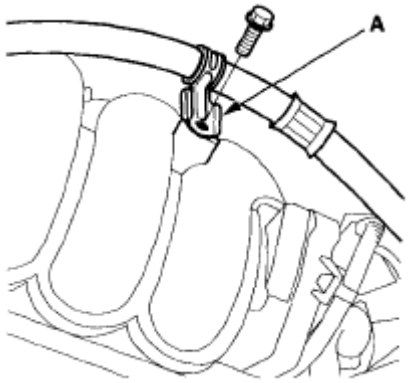

Fig. 47: Identifying Steering Joint Cover

17. Raise the front of vehicle, and support it with safety stands in the proper locations (see **LIFT AND SUPPORT POINTS**).
18. Remove the front wheels.
19. Remove the cotter pin (A) from the 12 mm nut (B), and loosen the nut.

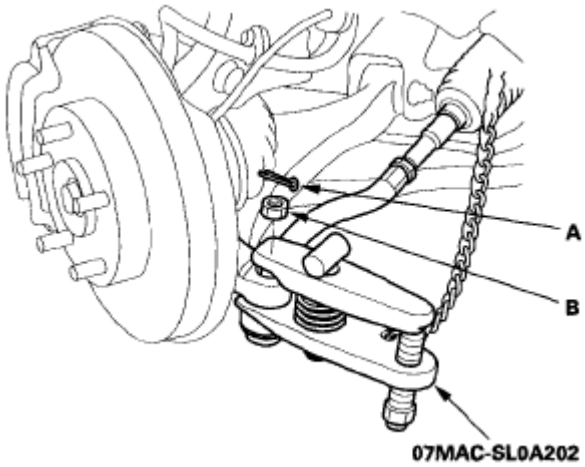

Fig. 48: Identifying Tie-Rod Cotter Pin And Nut

20. Separate the tie-rod ball joint and knuckle using the ball joint remover (see **BALL JOINT REMOVAL**).
21. Remove the inlet line clamp bolt (A).

    Open the return line holder (B), and remove the return line clamp bolt (C).

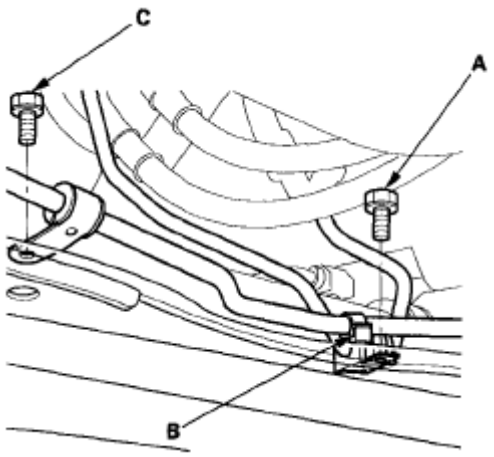

Fig. 49: Identifying Inlet Line Clamp Bolt And Return Line Clamp Bolt

22. Loosen the adjustable hose clamp (A), and disconnect the return hose (B).

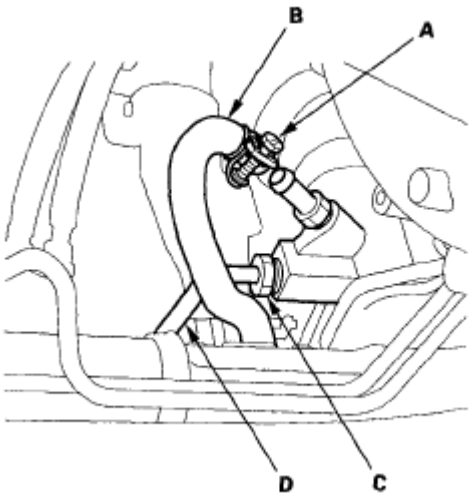

Fig. 50: Identifying Adjustable Hose Clamp

23. Loosen the 18 mm flare nut (C), and disconnect the inlet line (0).
24. Remove the front splash shield, 2-door (see **FRONT SPLASH SHIELD REPLACEMENT**), 4-door (see **4-DOOR**).
25. Remove the lower ball joint mounting bolt (A) and flange nuts (B) from the lower arm.

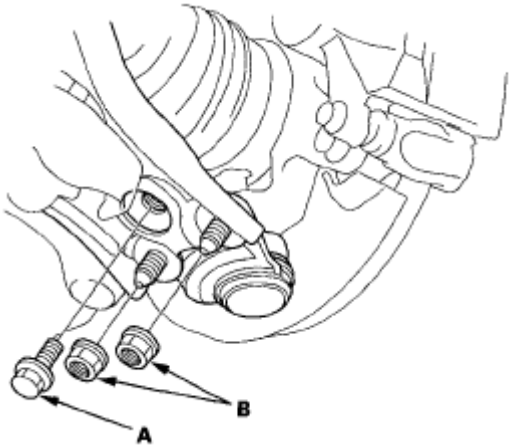

Fig. 51: Identifying Lower Ball Joint Mounting Bolt And Flange Nuts

26. Disconnect the lower arm from the lower ball housing.
27. Note the reference marks (A) on both sides of the subframe that line up with the body (B).

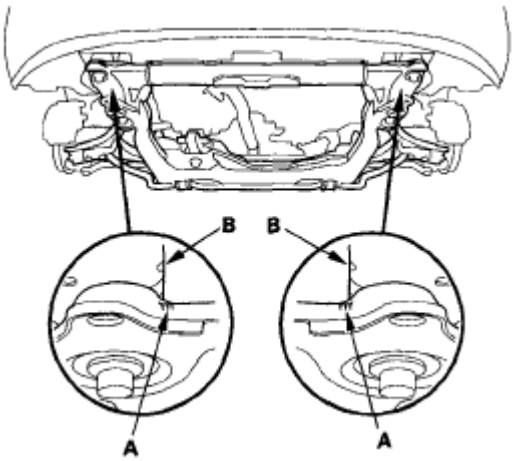

Fig. 52: Identifying Mark On Lower Arm

28. Attach the front subframe adaptor (A) to the front subframe (B) and the transmission jack (model number LSL-W9371) or the powertrain lift (model number OTC-1585), then tighten the front subframe adaptor screw.

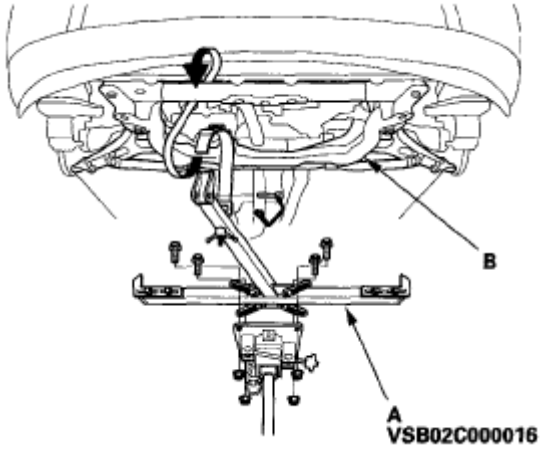

Fig. 53: Locating Jack

29. Make sure the front subframe is securely supported by the jack with the front subframe adaptor.
30. Remove the front subframe middle mount bolt (A) from the left side.

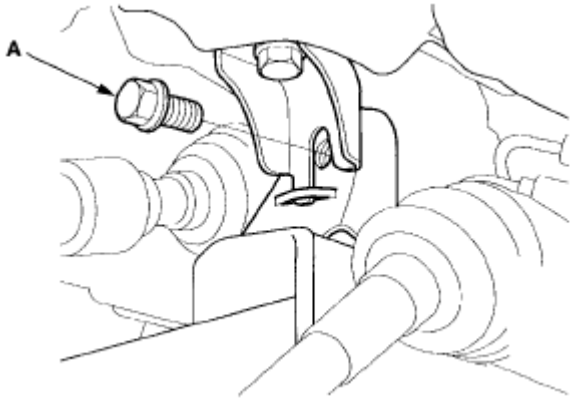

Fig. 54: Locating Front Subframe Middle Mount Bolt - Left Side

31. Remove the front subframe middle mount bolt (A) from the right side.

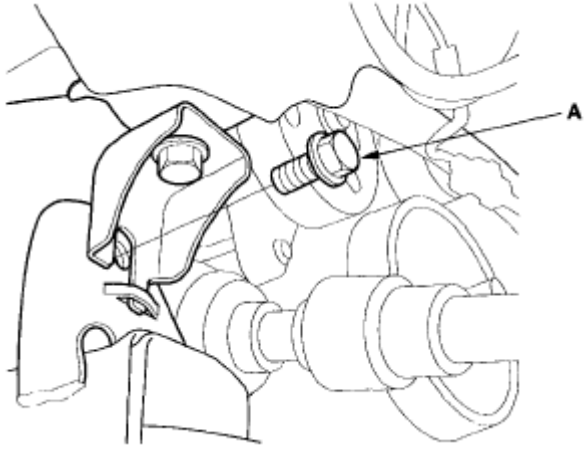

Fig. 55: Locating Front Subframe Middle Mount Bolt - Right Side

32. Remove the two 12 mm flange bolts (A) from the lower torque rod bracket.

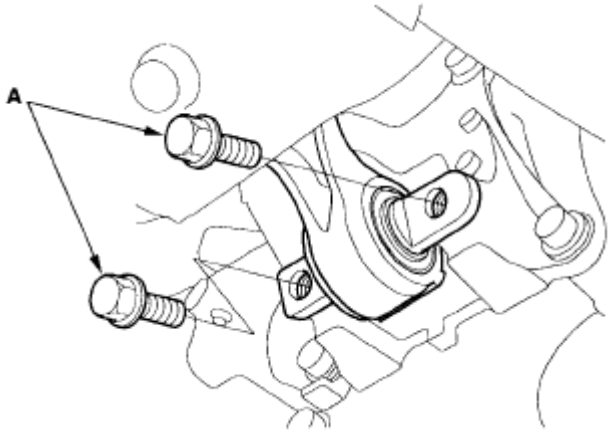

Fig. 56: Identifying Lower Torque Rod Bracket Flange Bolts

33. Remove the front subframe front mounting bolts (A) from the right and left sides of the vehicle and discard them.

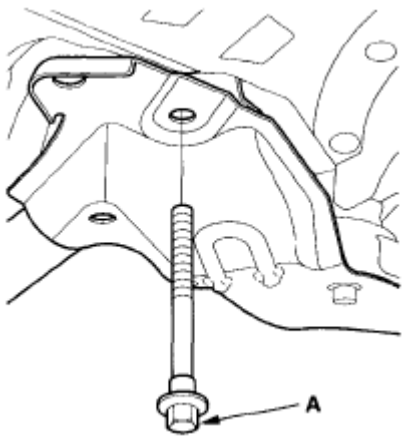

Fig. 57: Identifying Front Subframe Front Mounting Bolts

34. Remove the front subframe rear mounting bolts (A) from the right and left sides of the vehicle and discard them.

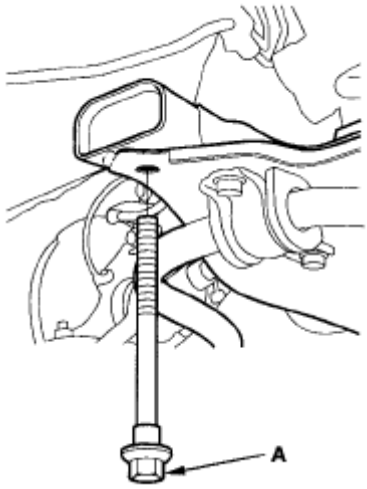

Fig. 58: Identifying Front Subframe Rear Mounting Bolts

35. Lower the front subframe and steering gearbox as an assembly by lowering the jack slowly.
36. Remove the pinion shaft grommet (A) from the top of the valve body unit.

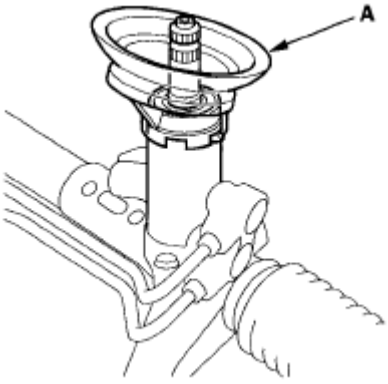

Fig. 59: Identifying Pinion Shaft Grommet

37. Remove the two 10 mm bolts from the right side of the steering gearbox, then remove the gearbox mounting bracket (A) and mounting cushion (B).

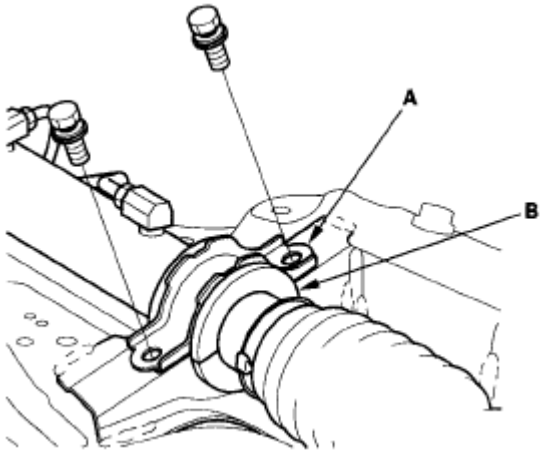

Fig. 60: Identifying Gearbox Mounting Bracket And Mounting Cushion

38. Remove the four 10 mm flange bolts from the left side of the steering gearbox, then remove the stiffener plates (A).

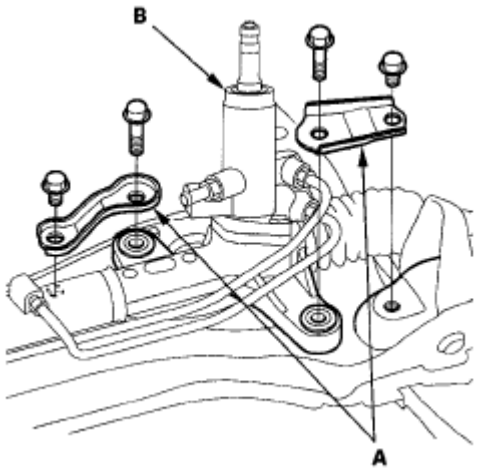

Fig. 61: Identifying Stiffener Plates

39. Remove the steering gearbox (B) from the front subframe.

STEERING GEARBOX OVERHAUL

EXPLODED VIEW

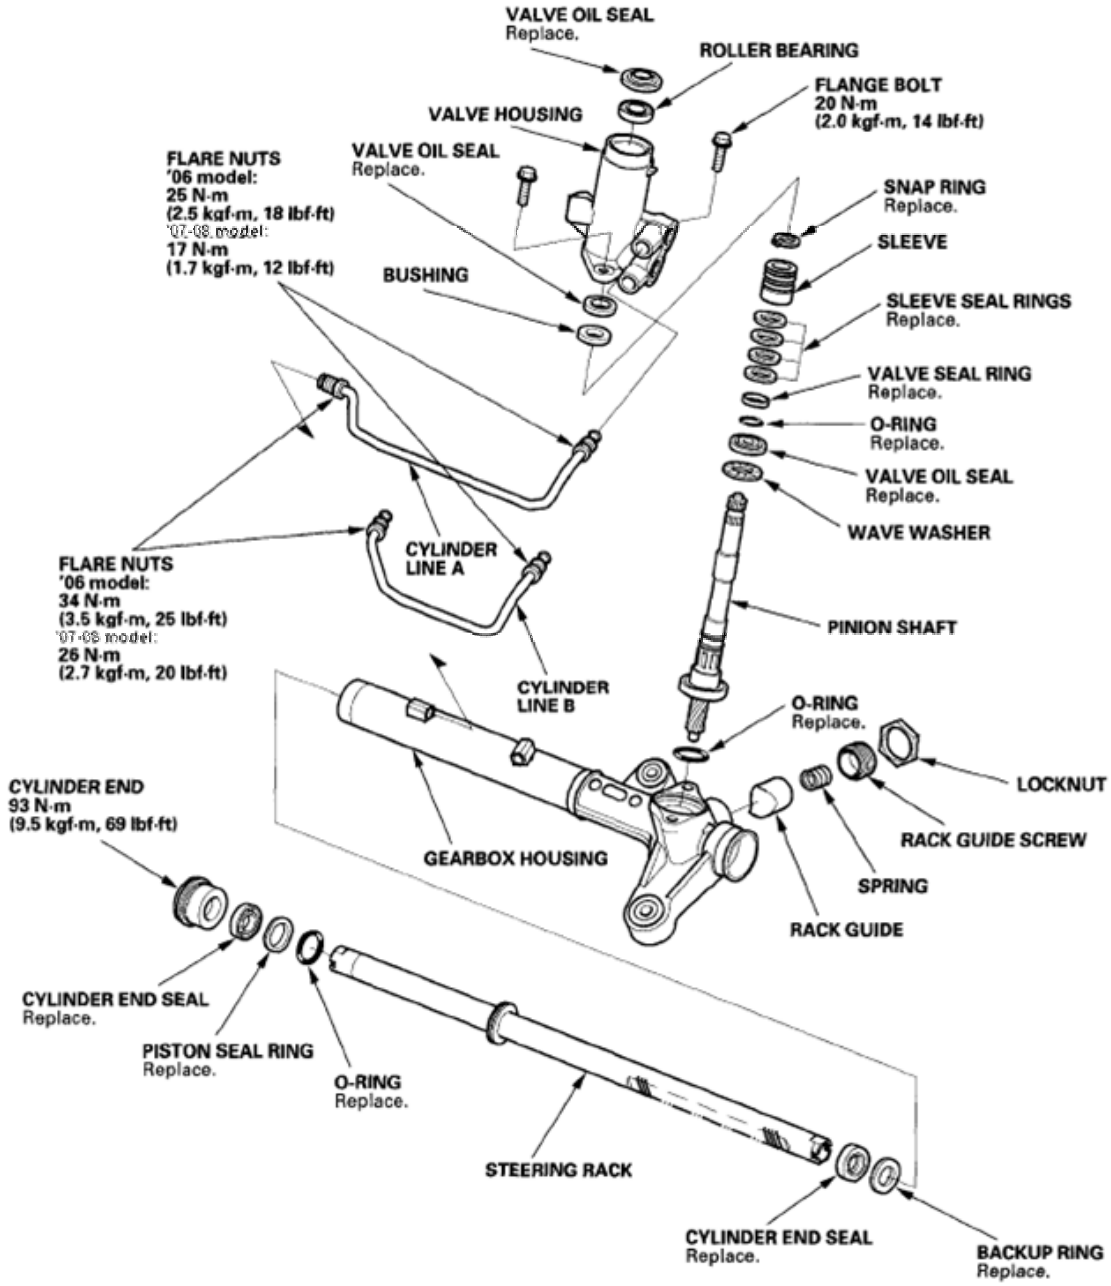

Fig. 62: Exploded View Of Steering Gearbox (With Torque Specifications)

Special Tools Required

- Cylinder end seal remover attachment 07NAD-SR3020A
- Valve seal ring sizing tool 07NAG-SR3090A
- Sleeve seal ring guide 07YAG-S2X0100
- Sleeve seal ring sizing tool, 36 mm 07ZAG-S5A0100
- Attachment, 32 x 35 mm 07746-0010100
- Attachment, 42 x 47 mm 07746-0010300
- Driver 07749-0010000
- Piston seal ring guide 07HAG-SF10100

- Piston seal ring sizing tool 07HAG-SF1020A or 07HAG-SF10200
- Cylinder end seal slider 07ZAG-S5A0300
- Pincers Oetiker 1098 or equivalent, commercially available

NOTE: Refer to the Fig. 62 as needed during this procedure.

Removal

1. Remove the steering gearbox (see **STEERING GEARBOX OVERHAUL**).

Disassembly

2. Remove the boot bands (A) and tie-rod clips (B). Pull the boot away from the ends of the steering gearbox.

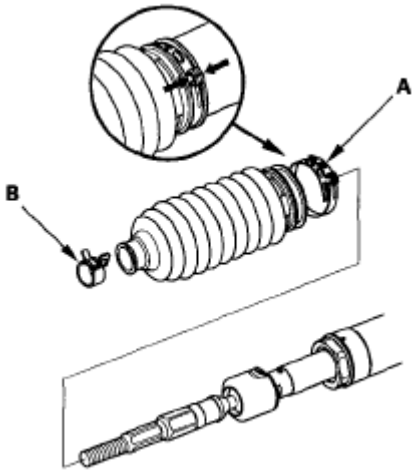

Fig. 63: Identifying Boot Bands And Tie-Rod Clips

3. Unbend the lock washers (A).

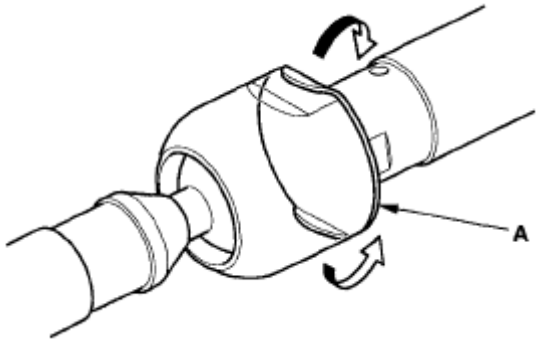

Fig. 64: Identifying Lock Washers

4. Hold the flat surface sections (A) of the steering rack with a wrench (B), and unscrew both rack ends (C) with a wrench (D). Be careful not to damage the rack surface with the wrench.

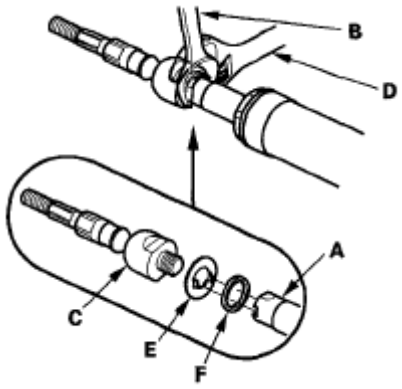

Fig. 65: Identifying Lock Washer And Rubber Stop

5. Remove the lock washer (E) and rubber stop (F).
6. Loosen the locknut (A), then remove the rack guide screw (B).

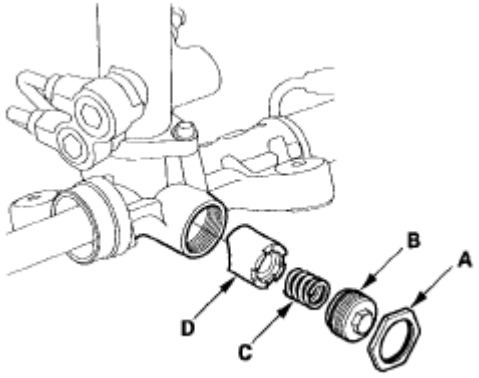

Fig. 66: Identifying Locknut, Rack Guide Screw, Spring And Rack Guide

7. Remove the spring (C) and the rack guide (D) from the gearbox housing.
8. Remove the cylinder line A and B from the steering gearbox.

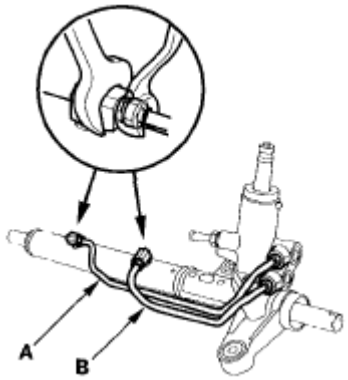

Fig. 67: Identifying Cylinder Line A And B

9. Drain the fluid from the cylinder fittings by slowly moving the steering rack back and forth.
10. Remove the two flange bolts, then remove the valve body unit (A) from the steering gearbox (B). Remove the O-ring (C), and discard it.

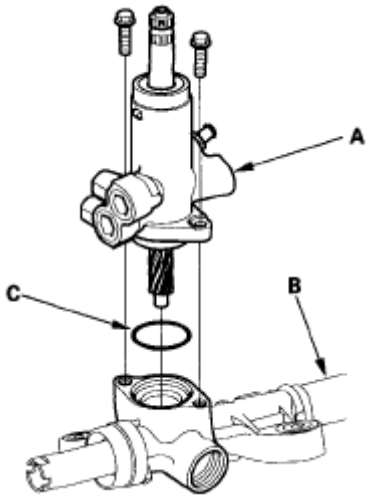

Fig. 68: Identifying Valve Body Unit Components

11. Drill a 3 mm (0.12 in.) diameter hole about 2.5-3.0 mm (0.10-0.12 in.) in depth in the staked point (A) on the cylinder. Do not allow metal shavings to enter the cylinder side on the gearbox housing. After removing the cylinder end (B), remove any burrs at the staked point.

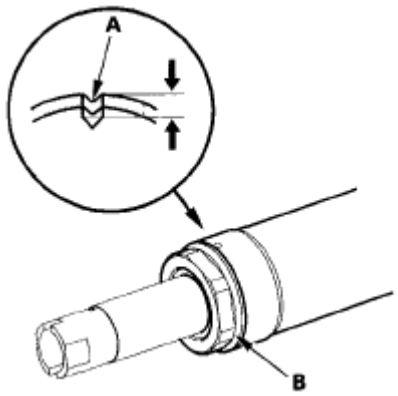

Fig. 69: Identifying Depth In Staked Point On Cylinder

12. Hold the gearbox housing using a C-clamp (commercially available) (A) and the wooden blocks (B) as shown. Do not clamp the cylinder part of the gearbox housing in the vise. Then remove the cylinder end (C).

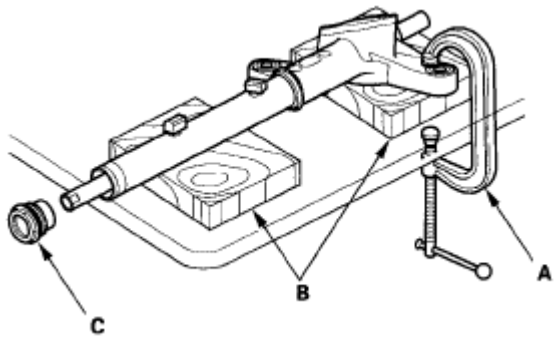

Fig. 70: Identifying Gearbox Housing

13. Install a commercially available bearing separator (A) in the gearbox housing as shown.

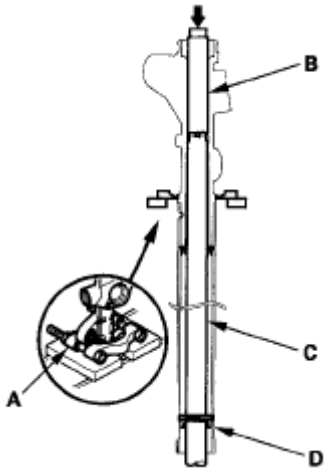

Fig. 71: Identifying Gearbox Housing

14. Place an appropriate size deep socket wrench (B) on the steering rack (C).
15. Set the steering gearbox in a press so the gearbox housing side points upward, then press the cylinder end seal (D) and steering rack out of the steering gearbox. Hold the steering rack to keep it from falling when pressed clear. Be careful not to damage the inner surface of the cylinder side on the gearbox housing with the tool.
16. Install the seal remover on a 24 "long 3/8" drive extension (A). Insert the tools in the gearbox housing. Make sure the seal remover is securely positioned on the backup ring edges. Be careful not to damage the inner surface of the cylinder with the seal remover.

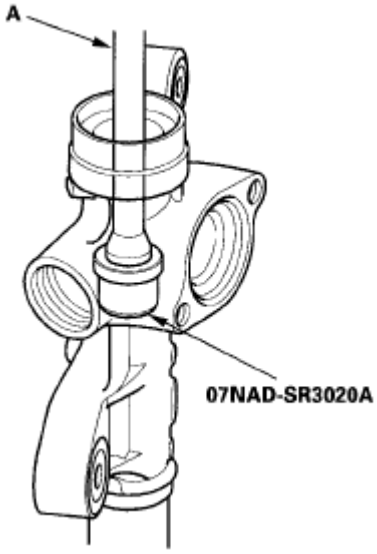

Fig. 72: Inserting Tools In Gearbox Housing

17. Place the steering gearbox in a press, then remove the cylinder end seal (A) and backup ring (B) from the steering gearbox by pressing on the 24 "long, 3/8" drive extension.

    Note these items when pressing the cylinder end seal:

- Keep the tool straight to avoid damaging the cylinder wall. Check the tool angle, and correct it if necessary, when removing the cylinder end seal.
- Use a press to remove the cylinder end seal. Do not try to remove the seal by striking the tool; striking the tool would break the backup ring, and the cylinder end seal would remain in the steering gearbox.

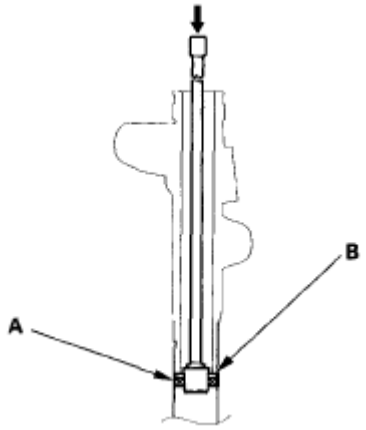

Fig. 73: Identifying Cylinder Seal And Backup Ring

18. Carefully pry the piston seal ring (A) and O-ring (B) off the rack piston. Be careful not to damage the inside of the seal ring groove and piston edges when removing the seal ring.

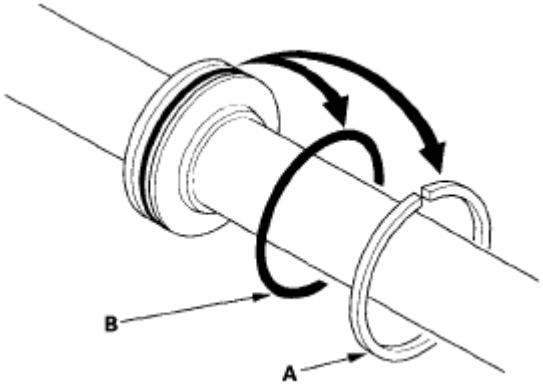

Fig. 74: Locating Piston Seal Ring And O-Ring

19. Before removing the valve housing (A), apply vinyl tape (B) to the splines on the pinion shaft.

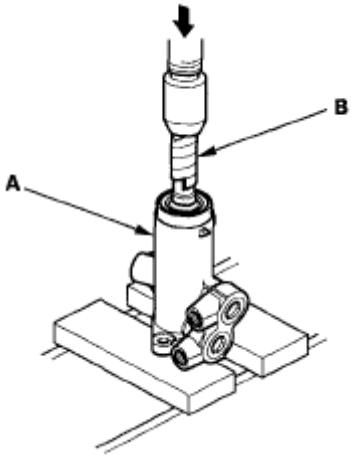

Fig. 75: Identifying Vinyl Of Splines On Pinion Shaft

20. Separate the valve housing from the pinion shaft/valve using a press.
21. Loosen the 16 mm flange nut (A), and remove the return line joint (B).

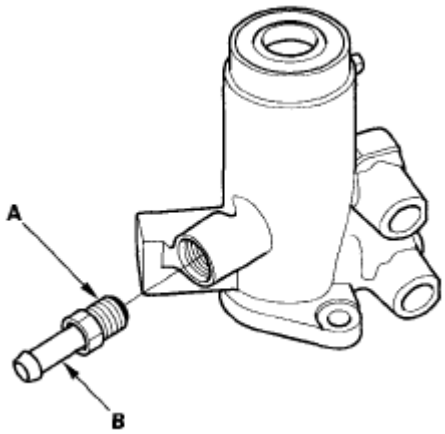

Fig. 76: Identifying Flange Nut And Return Line Joint

22. With your finger, check the inner wall of the valve housing where the seal ring slides. If there is a step in the wall, the housing is worn. Replace it.

NOTE: There may be sliding marks from the seal ring on the wall of the valve housing. Replace the valve housing only if the wall is stepped.

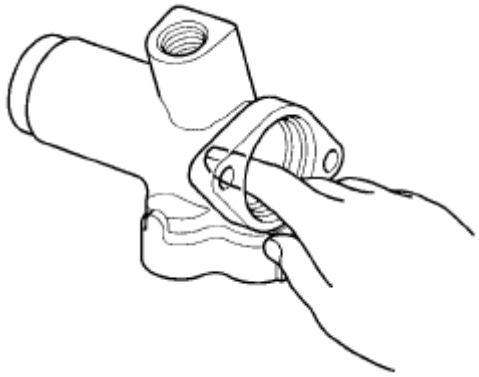

Fig. 77: Identifying Inner Wall Of Valve Housing With Your Finger

23. Check for wear, burrs, and other damage to the edges of the grooves in the sleeve.

NOTE: The pinion shaft and sleeve are a precision matched set. If either the pinion shaft or sleeve must be replaced, replace both parts as a set.

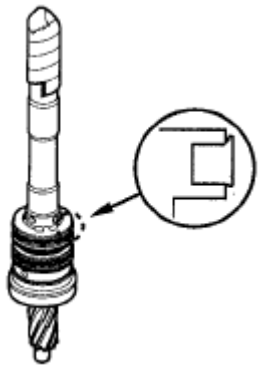

Fig. 78: Identifying Pinion Shaft And Sleeve

24. Remove the snap ring (A) and sleeve (B) from the pinion shaft.

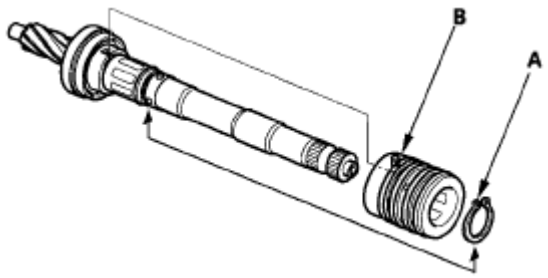

Fig. 79: Identifying Snap Ring And Sleeve

25. Using a cutter or an equivalent tool, cut and remove the four seal rings from the sleeve. Be careful not to damage the edges of the sleeve grooves and outer surface when removing the seal rings.

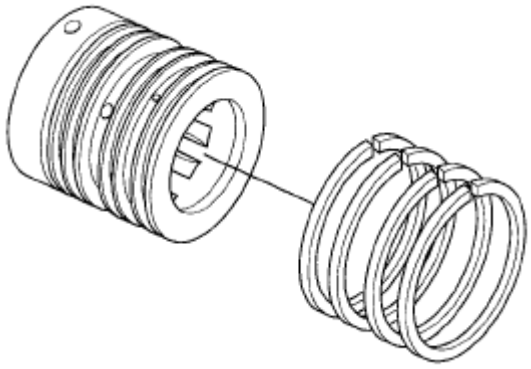

Fig. 80: Identifying Seal Rings

26. Using a cutter or an equivalent tool, cut the valve seal ring (A) and O-ring (B) at the cutting groove position (C) in the pinion shaft. Remove the valve seal ring and O-ring. Be careful not to damage the edges of the pinion shaft groove and outer surface when removing the valve seal ring and O-ring.

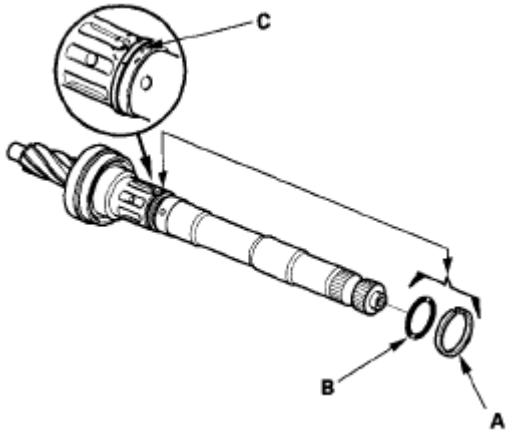

Fig. 81: Identifying Valve Seal Ring And O-Ring

27. Remove the valve oil seal (A) and wave washer (B) from the pinion shaft.

    Note these items during disassembly:

    - Inspect the ball bearing (C) by rotating the outer race slowly. If there is any excessive play or wear, replace the pinion shaft and sleeve as an assembly.
    - The pinion shaft and sleeve are a precise fit; do not intermix old and new pinion shafts and sleeves.

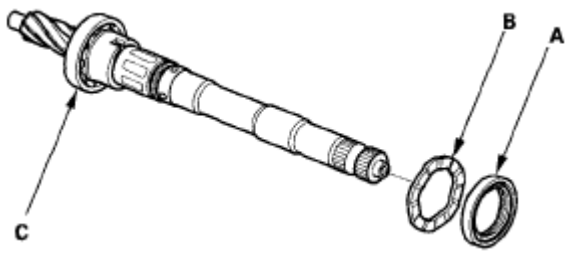

Fig. 82: Identifying Valve Oil Seal And Wave Washer

28. Remove the valve oil seal (A) and roller bearing (B) from the valve housing using a flat-tipped screw driver.

NOTE: Be careful not to damage the inner wall of the valve housing when removing by the flat-tipped screw driver.

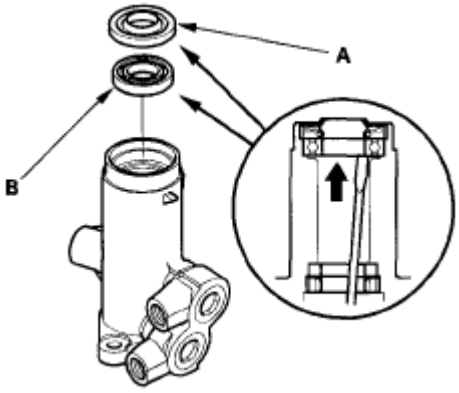

Fig. 83: Identifying Valve Oil Seal And Roller Bearing From Valve Housing

29. Remove the valve oil seal (A) and bushing (B) out of the valve housing using a hydraulic press and an appropriate size socket wrench.

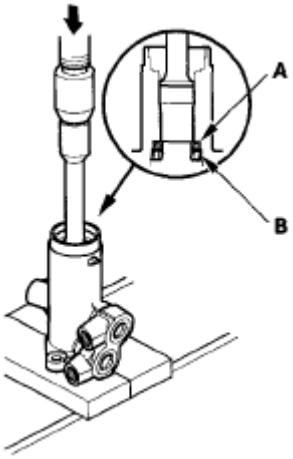

Fig. 84: Identifying Valve Oil Seal And Bushing Out Of Valve Housing

30. Clean the disassembled parts with solvent, and dry them with compressed air. Do not dip rubber parts in the solvent.

Reassembly

31. Apply vinyl tape (A) to the stepped portion of the pinion shaft, and coat the surface of the vinyl tape with power steering fluid.

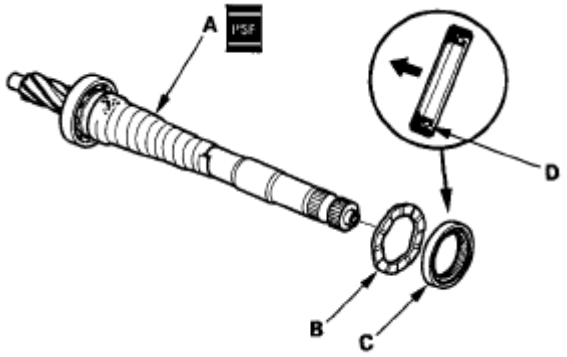

Fig. 85: Identifying Area Applying Vinyl Tape To Pinion Shaft

32. Install the wave washer (B).
33. Coat the inside surface of the new valve oil seal (C) with power steering fluid, and install the seal with its grooved side facing opposite the bearing, then slide it over the pinion shaft, being careful not to damage its sealing lip (D).
34. Apply vinyl tape (A) to the splines and stepped portion of the shaft, and coat the surface of the vinyl tape with power steering fluid.

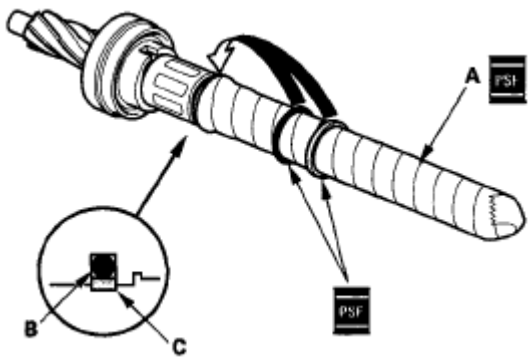

Fig. 86: Identifying Area Applying Vinyl Tape To Splines

35. Fit the new O-ring (B) in the groove of the pinion shaft. Then slide the new valve seal ring (C) over the shaft and in the groove on the pinion shaft.
36. Remove the tape, and apply power steering fluid to the surface of the valve seal ring (A).

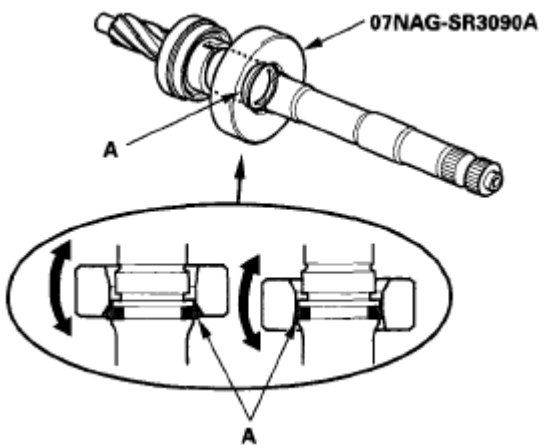

Fig. 87: Identifying Area Applying Power Steering Fluid To Surface Of Valve Seal Ring

37. Apply power steering fluid to the inside of the valve seal ring sizing tool. Set the larger diameter end of the sizing tool over the valve seal ring, and move the sizing tool up and down several times to make the valve seal ring fit in the pinion shaft groove.
38. Remove the sizing tool, turn it over, slide the smaller diameter end over the valve seal ring. Move it up and down several times to make the valve seal ring fit snugly in the pinion shaft groove.
39. Apply power steering fluid to the surface of the sleeve seal ring guide. Slip two new seal rings (A) over the ring guide from the smaller diameter end, and expand them. Install only two rings at a time from each end of the pinion shaft sleeve (B).

    Note these items when installing the seal ring:

    - Do not over-expand the seal ring. Install the resin seal rings with care so as not to damage them. After installation, make sure you contract the seal rings using the sizing tool.
    - There are two types of sleeve seal rings; black and brown. Do not mix the different types of rings as they are not compatible.

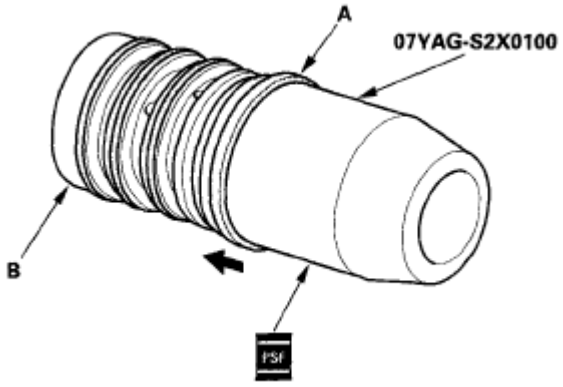

Fig. 88: Identifying Area Applying Power Steering Fluid To Surface Of Sleeve Seal Ring Guide

40. Align the ring guide with each groove in the sleeve, and slide a sleeve seal ring into each groove. After installation, compress the seal rings with your fingers temporarily.
41. Apply power steering fluid to the seal rings on the sleeve, and to the entire inside surface of the sleeve seal ring sizing tool, then slowly insert the sleeve into the sizing tool.

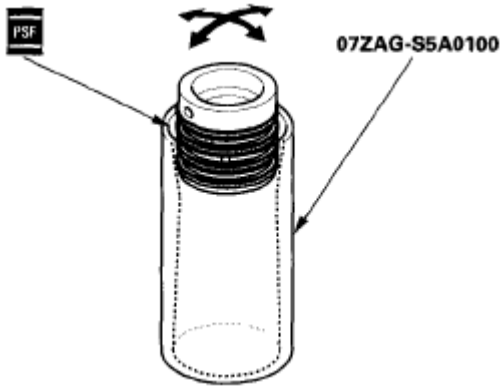

Fig. 89: Identifying Area Applying Power Steering Fluid On Sleeve

42. Move the sleeve back and forth several times to make the seal rings snugly fit in the sleeve. Make sure the seal rings are not twisted.
43. Apply power steering fluid to the surface of the pinion shaft (A). Slide the sleeve (B) onto the pinion shaft by aligning the locating pin (C) on the inside of the sleeve with the cutout (D) in the shaft. Then install the new snap ring (E) securely in the pinion shaft groove. Be careful not to damage the valve seal ring when inserting the sleeve.

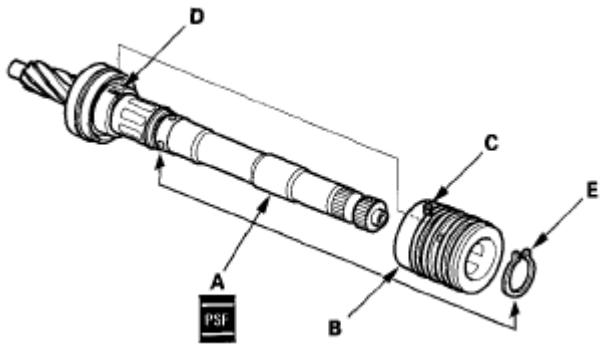

Fig. 90: Identifying Area Applying Power Steering Fluid To Surface Of Pinion Shaft

44. Apply power steering fluid to the seal ring lip of the new valve oil seal (A), then install the seal and bushing (B) in the valve housing (C) using a hydraulic press, driver, and attachment. Install the seal with its grooved side facing the tool.

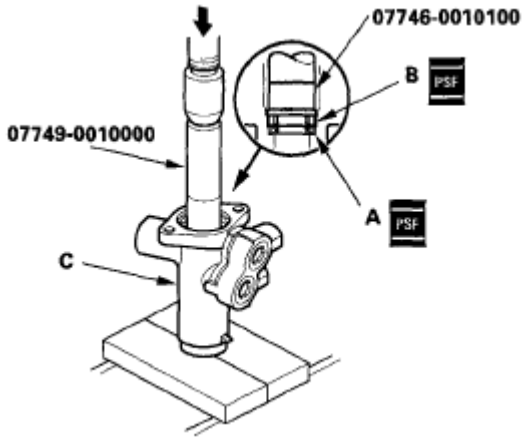

Fig. 91: Identifying Area Applying Power Steering Fluid To Seal Ring Lip

45. Press the roller bearing (A) into the valve housing (B) with a hydraulic press, driver, and attachment.

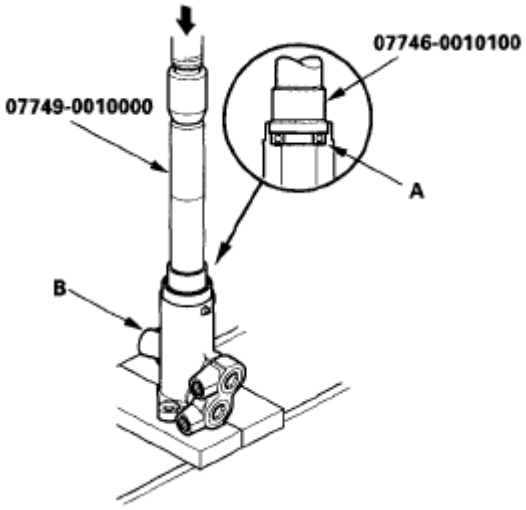

Fig. 92: Identifying Roller Bearing Into Valve Housing

46. Apply power steering fluid to the seal ring lip of the new valve oil seal (A), then install the seal in the valve housing (B) using a hydraulic press, driver, and attachment. Install the seal with its grooved side facing the tool.

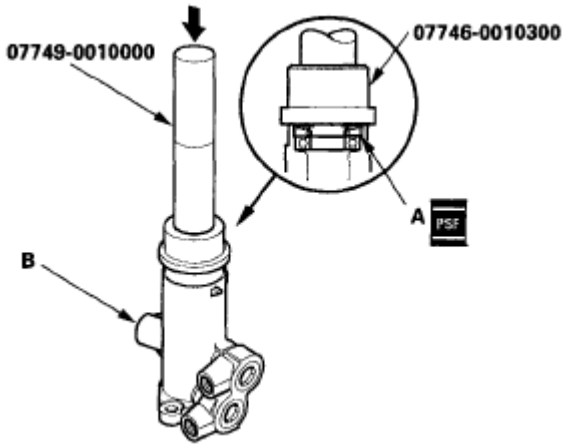

Fig. 93: Identifying Area Applying Power Steering Fluid To Seal Ring Lip

47. Apply vinyl tape (A) to the pinion shaft, then coat the vinyl tape with power steering fluid.

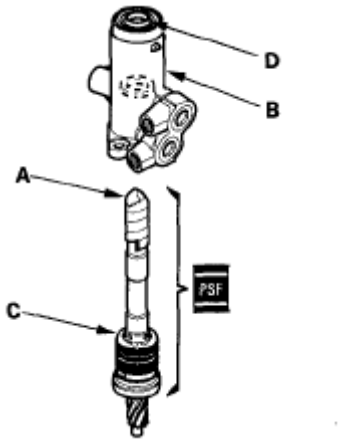

Fig. 94: Identifying Area Applying Vinyl Tape To Pinion Shaft

48. Insert the pinion shaft into the valve housing (B). Be careful not to damage the valve seal rings (C) and valve oil seal sealing lip (D).
49. Remove the vinyl tape from the pinion shaft, then remove any residue from the tape adhesive.
50. Press the pinion shaft/sleeve into the valve housing with a hydraulic press. Check that the pinion shaft/sleeve turns smoothly by hand after installing it.

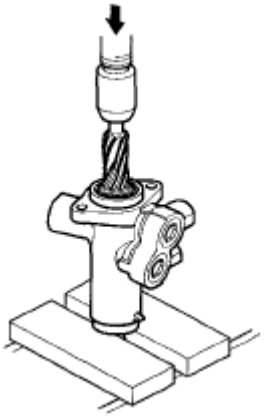

Fig. 95: Identifying Pinion Shaft/Sleeve Into Valve Housing

51. Coat the piston seal ring guide with power steering fluid, then slide it onto the rack, big end first.
52. Position the new O-ring (A) and new piston seal ring (B) on the piston seal ring guide, then slide them down toward the big end of the tool.

    Note these items during reassembly:

    - Do not over expand the resin seal rings. Install the resin seal rings with care so as not to damage them. After installation, make sure you contract the seal ring using the sizing tool.
    - Replace piston's O-ring and seal ring as a set.

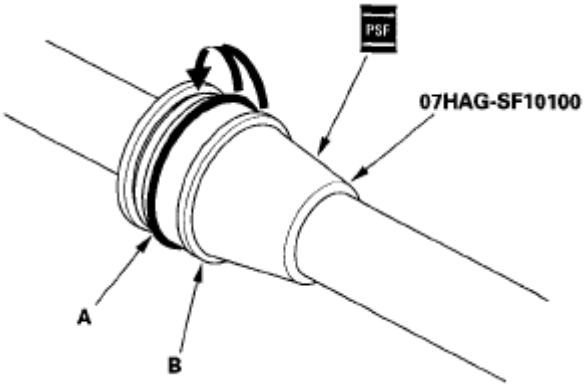

Fig. 96: Identifying O-Ring And Piston Seal Ring

53. Pull the O-ring off into the piston groove, then pull the piston seal ring off into the piston groove on top of the O-ring.
54. Coat the piston seal ring (A) and the inside of the piston seal ring sizing tool with power steering fluid, then carefully slide the tool onto the rack and over the piston seal ring.

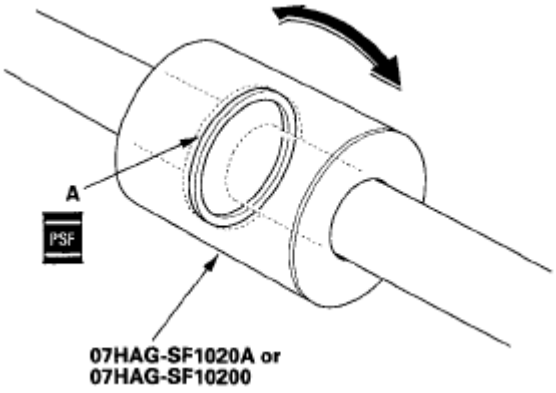

Fig. 97: Identifying Piston Seal Ring

55. Move the sizing tool back and forth several times to make the piston seal ring fit snugly in the piston.
56. Coat the sliding surface of the cylinder end seal slider (A) and new cylinder end seal (B) with power steering fluid. Place the seal on the seal slider with its grooved side (C) facing opposite the seal slider.

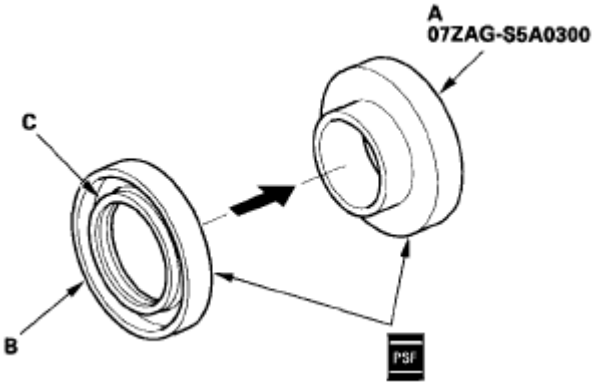

Fig. 98: Identifying Seal On Seal Slider With Grooved Side

57. Coat the surface of the steering rack (A) with power steering fluid.

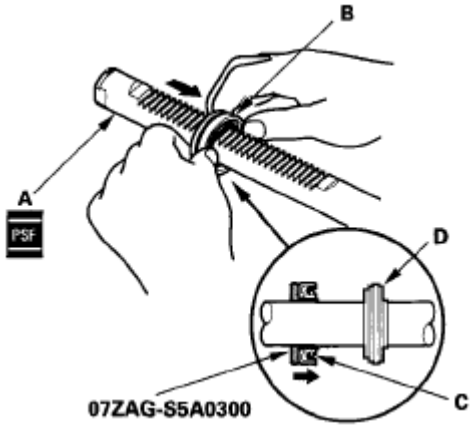

Fig. 99: Identifying Cylinder Seal Onto Steering Rack With Grooved Side

58. Install the cylinder end seal (B) onto the steering rack with its grooved side (C) toward the piston (D).
59. Separate the cylinder end seal from the cylinder end seal slider, then remove the seal slider.
60. Install the new backup ring (A) on the steering rack, then place the backup ring and cylinder end seal (B) against the piston (C).

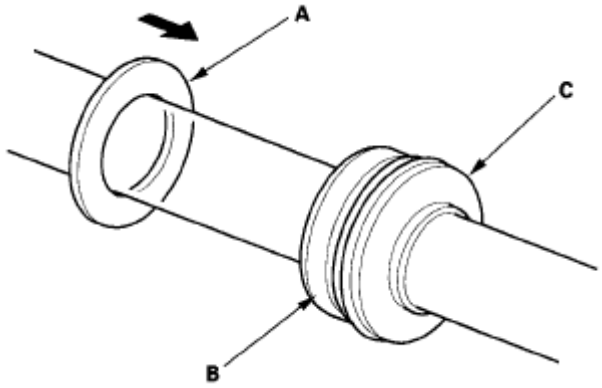

Fig. 100: Identifying Backup Ring And Cylinder End Seal

61. Apply steering grease to the steering rack teeth, then insert the steering rack into the gearbox housing. Be careful not to damage the inner surface of the cylinder wall with the rack edges.

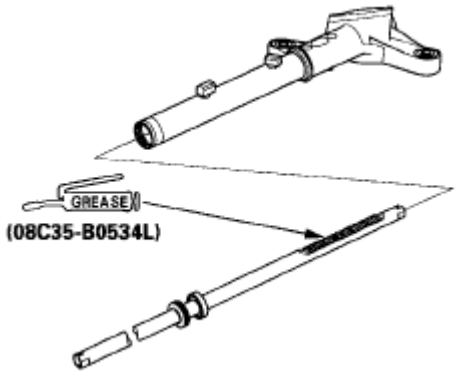

Fig. 101: Identifying Area Applying Steering Grease To Steering Rack Teeth

62. Insert an appropriate size deep socket wrench (A) onto the steering rack as shown.

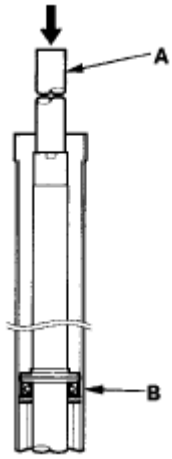

Fig. 102: Identifying Socket Wrench Onto Steering Rack

63. Install the cylinder end seal (B) into the bottom of the cylinder by pressing on the tool with a press. Do not push on the tool with excessive force as it may damage the cylinder end seal.
64. Remove the tool, and center the steering rack.
65. Coat the sliding surface of the cylinder end seal slider (A) and new cylinder end seal (B) with power steering fluid. Place the seal on the seal slider with its grooved side (C) facing opposite the seal slider.

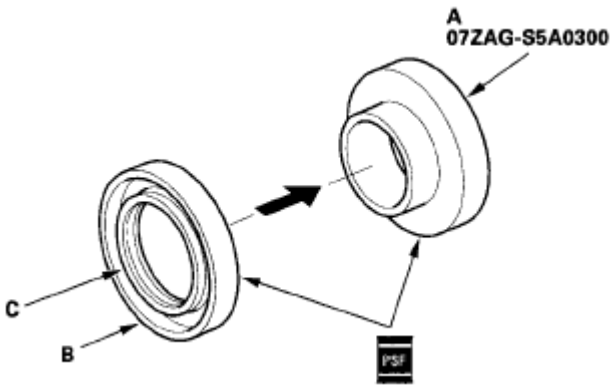

Fig. 103: Identifying Seal On Seal Slider With Grooved Side

66. Coat the inside surface of the cylinder end seal slider and steering rack with power steering fluid, then install the cylinder end seal (A) onto the steering rack with its grooved side toward the cylinder.

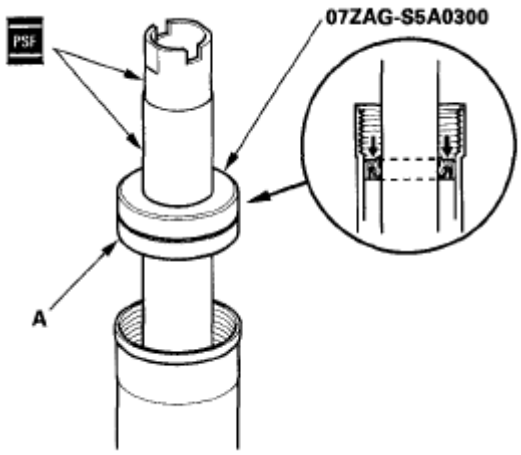

Fig. 104: Identifying Cylinder End Seal Slider And Steering Rack

67. Separate the cylinder end seal from the cylinder end seal slider, then remove the seal slider.
68. Push in the cylinder end seal with your finger. Be careful not to damage the face of the seal with the threads and burrs at the staked position of the cylinder housing.
69. Hold the gearbox housing using a C-clamp (commercially available) (A) and wooden blocks (B). Do not clamp the cylinder part of the gearbox housing in the vise.

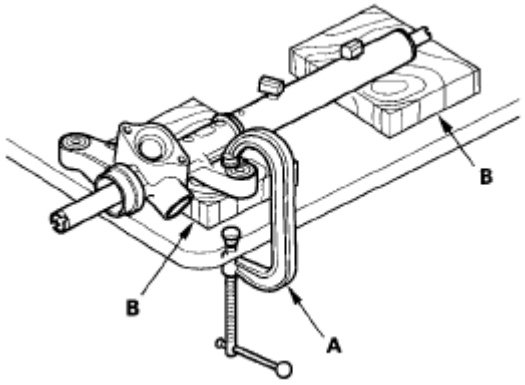

Fig. 105: Identifying Gearbox Housing Using C-Clamp (Commercially Available)

70. Coat the inside surface of the cylinder end (A) with power steering fluid, then install the cylinder end by screwing it into the cylinder (B). Tighten the cylinder end to the specified torque.

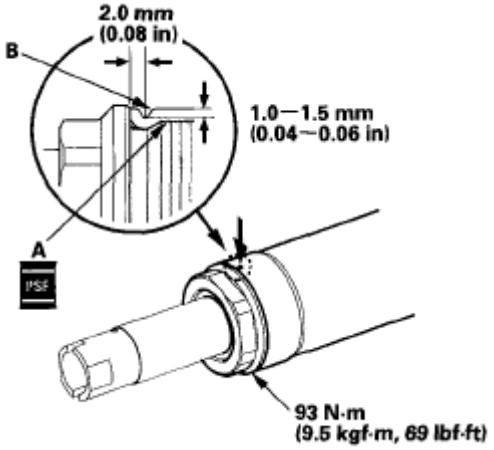

Fig. 106: Identifying Cylinder Screw (With Torque Specifications)

71. Stake the point of the cylinder shown (opposite from where the stake was removed during disassembly).
72. Install the return line joint (A), and tighten the 16 mm flare nut (B).

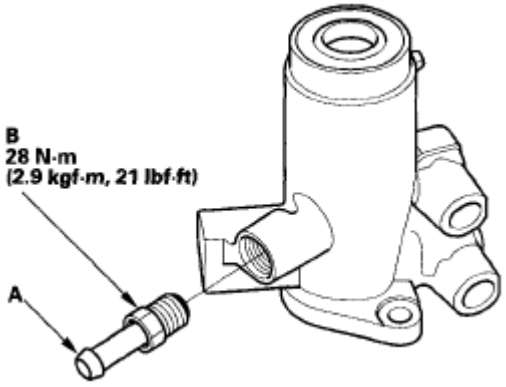

Fig. 107: Identifying Return Line Joint And Flare Nut (With Torque Specifications)

73. Coat the new O-ring (A) with steering grease, and carefully fit it on the valve housing.

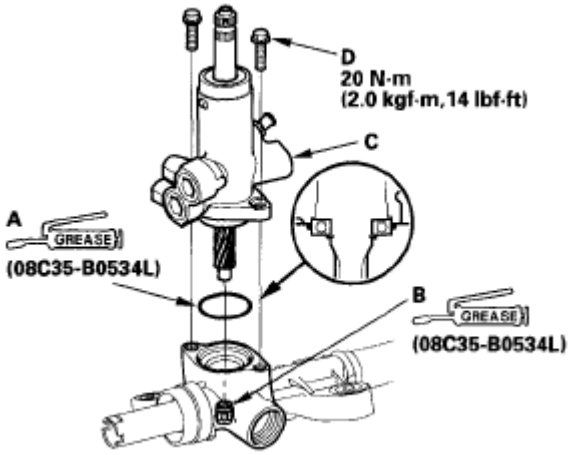

Fig. 108: Identifying Area Applying Steering Grease (With Torque Specifications)

74. Apply steering grease to the needle bearing (B) in the gearbox housing, then install the valve body unit (C) by engaging the gears. Note the valve body unit installation position (direction of the line connections).
75. Tighten the flange bolts (D) to the specified torque.
76. Install the cylinder lines.

    Note these items during reassembly:

    - Thoroughly clean the joints of the cylinder lines. The joints must be free of foreign material.
    - Install the cylinder lines by tightening the flare nuts by hand first, then tighten the flare nuts to the specified torque.

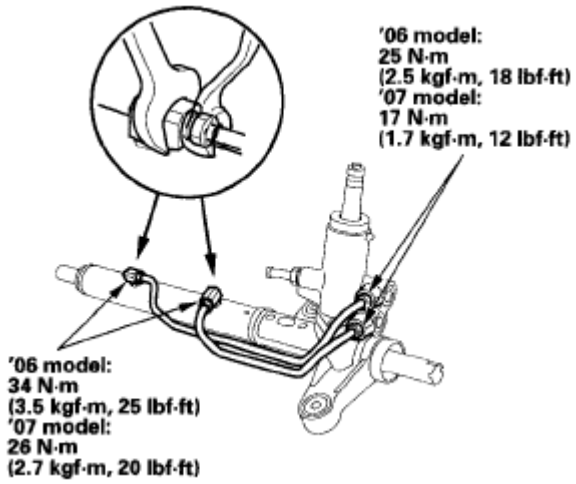

Fig. 109: Identifying Flange Bolts (With Torque Specifications)

77. Apply steering grease to the sliding surface of the rack guide (A), and install it onto the gearbox housing.

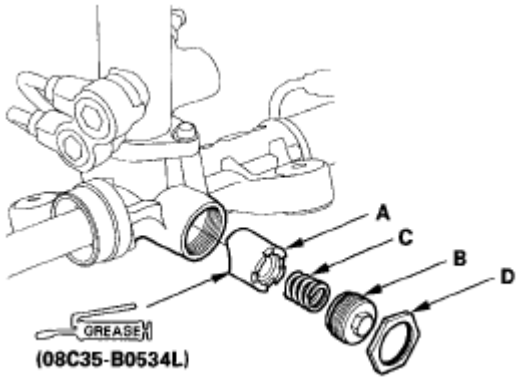

Fig. 110: Identifying Gearbox Housing Components

78. Remove the old sealant from the rack guide screw (B), then apply new sealant (Three Bond 1215 or Loctite 5699) to the middle of the threads. Install the spring (C), rack guide screw and locknut (D).
79. Adjust the rack guide screw (see **RACK GUIDE ADJUSTMENT**). After adjusting, check that the rack moves smoothly by sliding it right and left.

80. Install a new rubber stop (A) and a new lock washer (B). Align the lock washer tabs (C) with the slots (D) on the rack end (E) while holding the lock washer in place. Repeat this step for the other side of the rack.

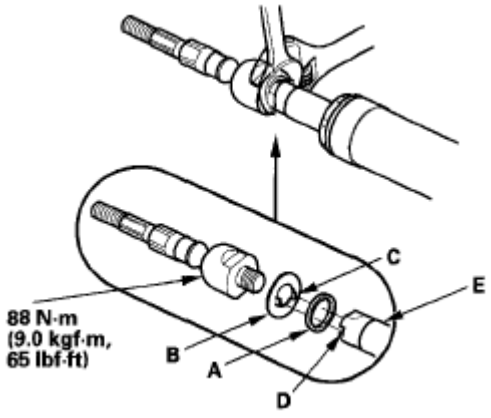

Fig. 111: Identifying Rubber Stop, Lock Washer With Slots (With Torque Specifications)

81. Hold the flat surface sections of the steering rack with a wrench, and tighten both rack ends. Be careful not to damages the rack surface with the wrench.
82. Bend the lock washer (A) back against the flat spots on the rack end joint housing.

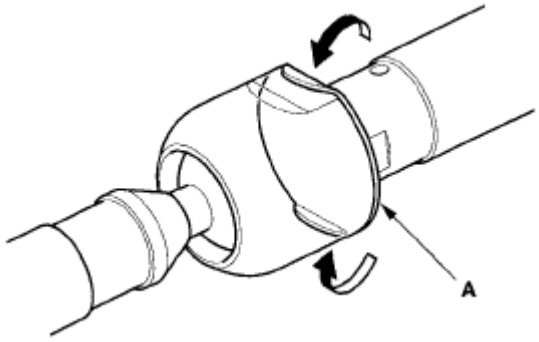

Fig. 112: Locating Lock Washer

83. Apply multipurpose grease to the circumference of the rack end joint housing (A).

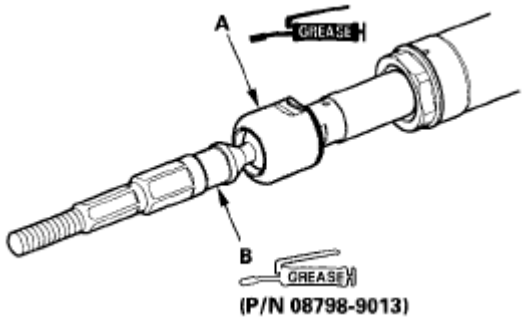

Fig. 113: Identifying Area Applying Grease

84. Apply a light coat of silicone grease (P/N 08798-9013) to the boot grooves (B) on the rack end.

85. Center the steering rack within its stroke.
86. Clean off the any grease or contamination from the boot installation grooves (A) around on the gearbox housing. Install the boots (B) on the rack ends with the tie-rod clips (C), and fit the boot end in the installation grooves in the housing properly.

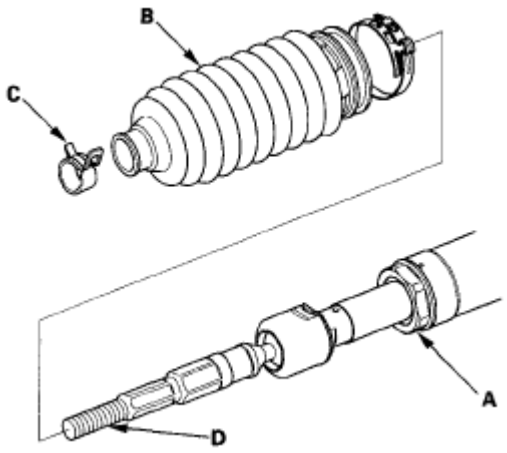

Fig. 114: Identifying Boots Tie-Rod Clips

87. After installing the boots, wipe the grease off the threaded section (D) of the rack end.
88. Install the new boot bands by aligning the tabs (A) with the holes (B) of the band.

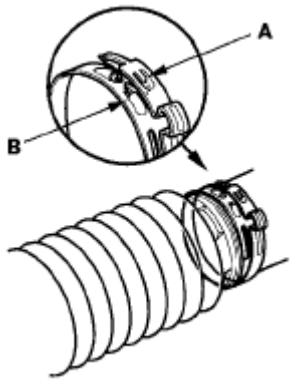

Fig. 115: Aligning Tabs With Holes Of Band

89. Close the ear portion (A) of the band (B) with commercially available pincers, Oetiker 1098 or equivalent (C).

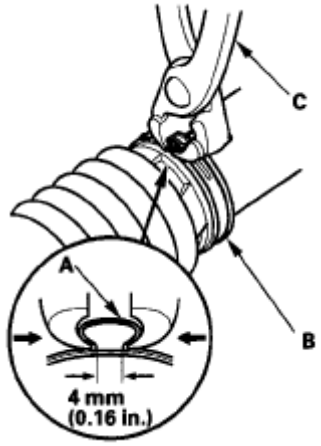

Fig. 116: Identifying Twisted Band

90. Slide the rack right and left to be certain that the boots are not deformed or twisted.
91. Reinstall the steering gearbox (see **STEERING GEARBOX INSTALLATION**).
92. Adjust the rack guide screw (see **RACK GUIDE ADJUSTMENT**). After adjusting, check that the rack moves smoothly by sliding it right and left.

STEERING GEARBOX INSTALLATION

1. Place the gearbox in position on the front subframe.
2. Loosely install the stiffener plates (A) and gearbox mounting bolts on the leftside of the steering gearbox.

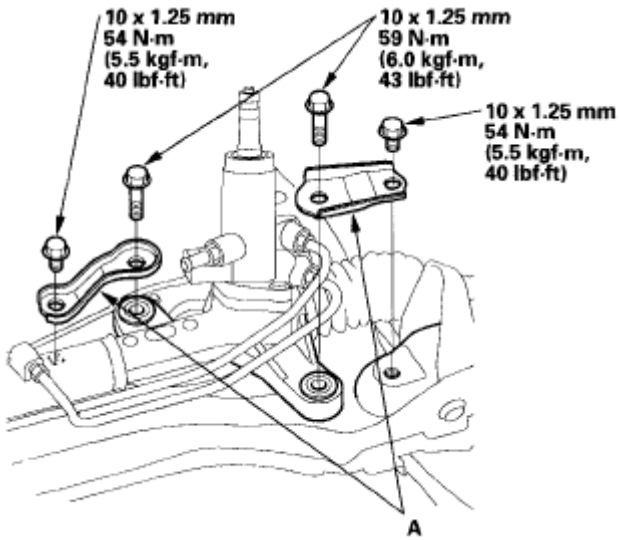

Fig. 117: Identifying Stiffener Plates And Gearbox Mounting Bolts (With Torque Specifications)

3. Position the cutout (A) on the mounting cushion (B) as shown, and install it on the right side of the steering gearbox securely.

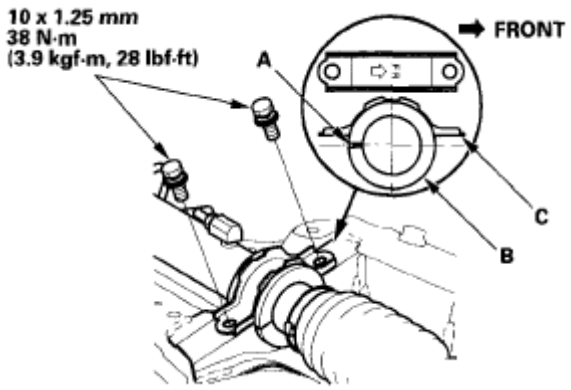

Fig. 118: Identifying Cutout On Mounting Cushion (With Torque Specifications)

4. Install the gearbox mounting bracket (C) over the mounting cushion, and loosely install the two 10 mm bolts.
5. Tighten the 10 mm bolts on the both sides of the steering gearbox to specified torque alternately in two or more steps.
6. Install the pinion shaft grommet (A). Align the slot in the pinion shaft grommet with the lug portion (B) on the valve housing. The grommet must not have a gap at the mating surface of the grommet and valve housing.

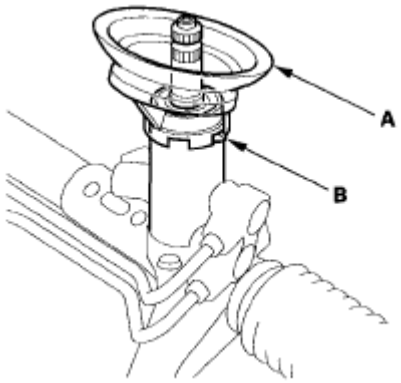

Fig. 119: Identifying Slot In Pinion Shaft Grommet With Lug Portion

7. Carefully raise the front subframe with the front subframe adaptor and the transmission jack or the powertrain lift until the subframe is in position, then loosely install new subframe mounting bolts.

NOTE: Be sure that the pinion shaft grommet is in place securely. Make sure the pinion shaft grommet is not turned up. Incorrect installation can cause leakage of water, mud, and noise.

8. Align the front subframe reference marks (A) to the body (B), as noted during removal.

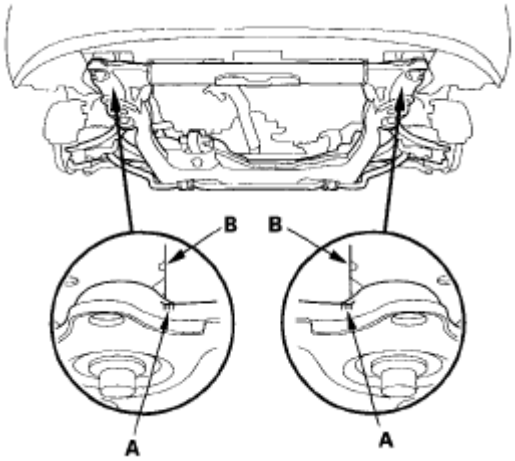

Fig. 120: Identifying Marks To Body

9. Tighten the new front subframe rear mounting bolts (A) to the specified torque.

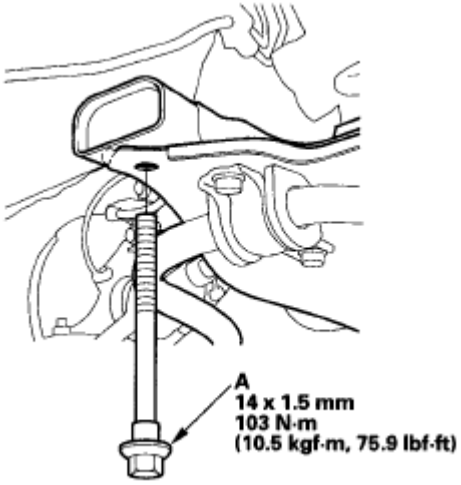

Fig. 121: Identifying Front Subframe Rear Mounting Bolts (With Torque Specifications)

10. Tighten the new front subframe front mounting bolts (A) to the specified torque.

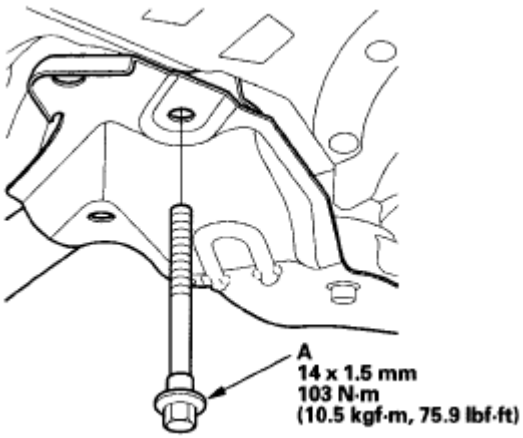

Fig. 122: Identifying Front Subframe Front Mounting Bolts (With Torque Specifications)

11. Install the new lower torque rod bracket bolts (A), and tighten to the specified torque.

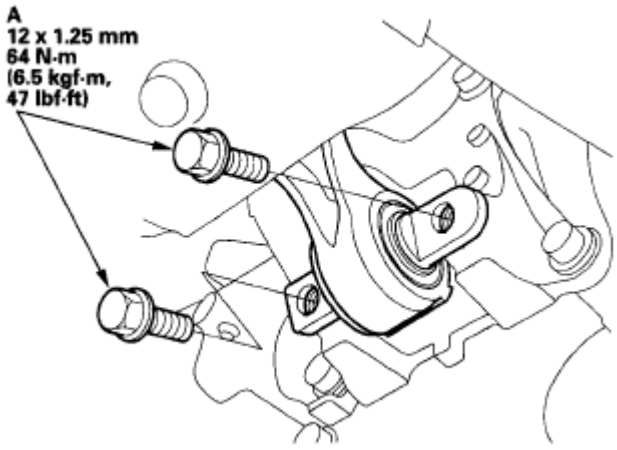

Fig. 123: Identifying Lower Torque Rod Bracket Bolts (With Torque Specifications)

12. Install the new front subframe middle mount bolt (A) on the left side, and tighten it to the specified torque.

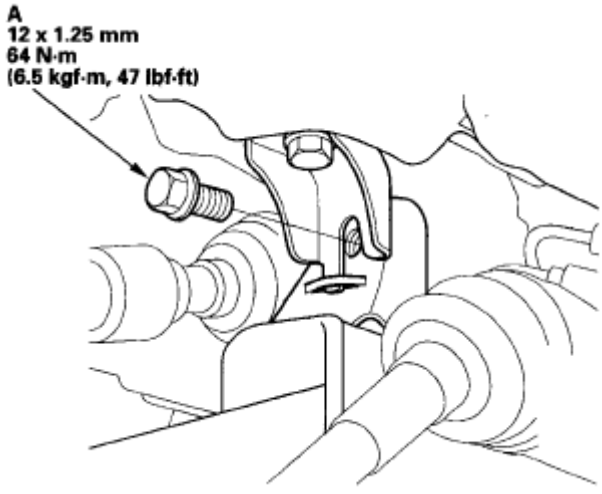

Fig. 124: Identifying Front Subframe Middle Mount Bolt On Left Side - Specified Torque

13. Install the new front subframe middle mount bolt (A) on the right side, and tighten it to the specified torque.

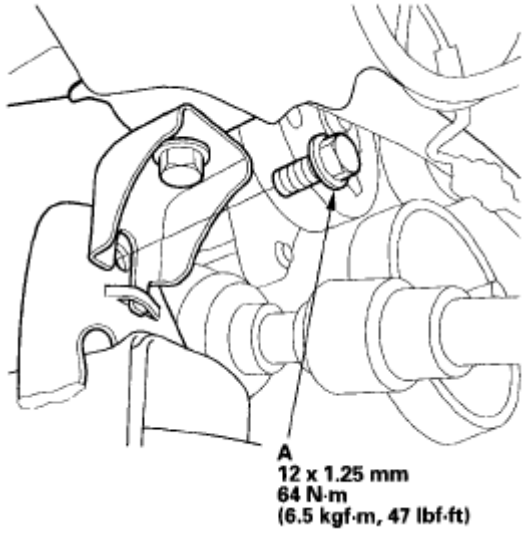

Fig. 125: Identifying Front Subframe Middle Mount Bolt On Right Side (With Torque Specifications)

14. Lower the transmission jack supporting the front subframe.
15. Connect the lower arm (A) to the lower ball joint (B).

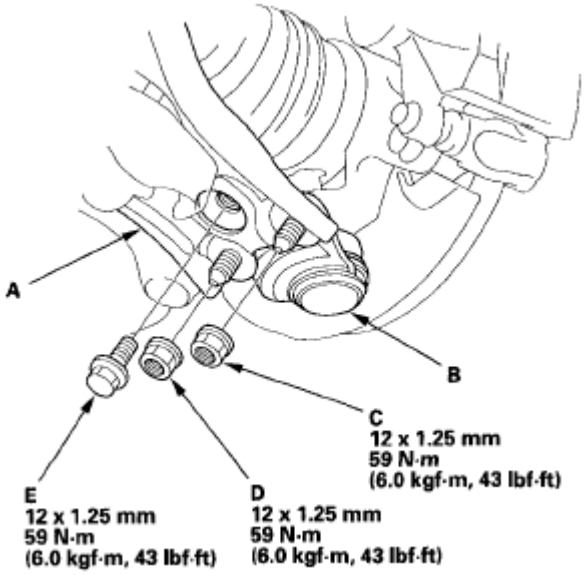

Fig. 126: Identifying Lower Arm To Lower Ball Joint (With Torque Specifications)

16. Install a new flange bolt and the new flange nuts. After lightly tightening all three fasteners, tighten them to the specified torque in the following order; the flange nut on the front (C), the flange nut on the rear (D), then the flange bolt (E).
17. Connect the inlet line (A), and loosely install the 18 mm flare nut (B). Do not tighten the flare nut to the specified torque yet.

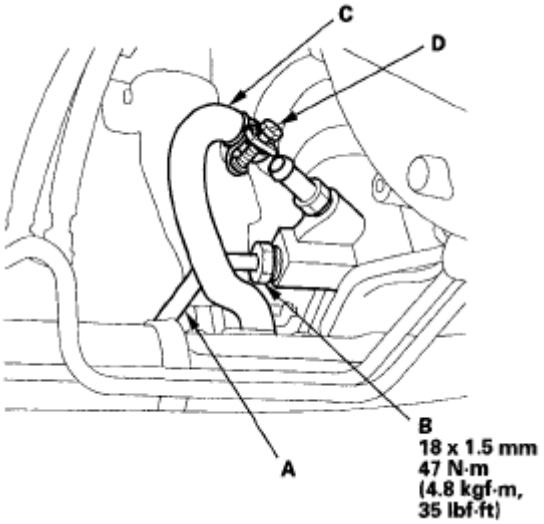

Fig. 127: Identifying Flare Nut (With Torque Specifications)

18. Connect the return hose (C) securely, and tighten the adjustable hose clamp (D) (see **POWER STEERING HOSE, LINE, AND PRESSURE SWITCH REPLACEMENT**).
19. Install the inlet line clamp bolt (A). Install the return line holder (B), and the return line clamp bolt (C) on the front subframe.

NOTE: Make sure that there is no interference between the inlet line, the return line, and any other parts.

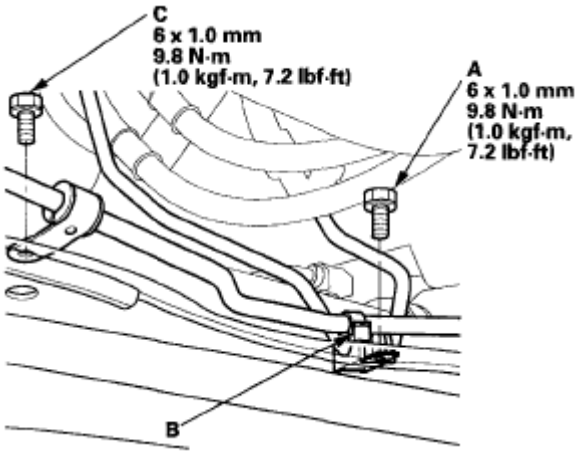

Fig. 128: Identifying Return Line Clamp Bolt (With Torque Specifications)

20. Retighten the inlet line 18 mm flare nut to the specified torque value.
21. Install the front splash shield, 2-door (see **FRONT SPLASH SHIELD REPLACEMENT**), 4-door (see **4-DOOR**).
22. Wipe off any grease contamination from the ball joint tapered section and threads. Reconnect the tie-rod ends (A) to the steering knuckles. Install the 12 mm nut (B), and tighten it.

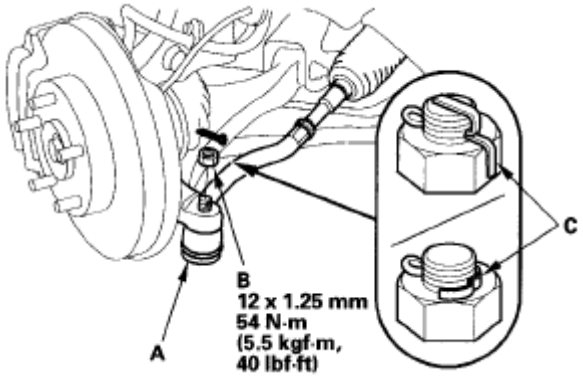

Fig. 129: Identifying Tie-Rod Cotter Pin (With Torque Specifications)

23. Install the new cotter pin (C), and bend it as shown.
24. Install the pump outlet hose clamp (A).

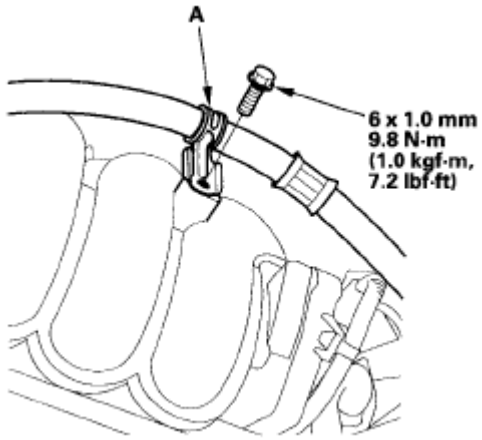

Fig. 130: Identifying Pump Outlet Hose Clamp (With Torque Specifications)

25. Remove the engine hanger, support bolt, and support hanger from the vehicle.
26. Center the steering rack within its stroke in the steering joint connection.
27. With the rack in the straight ahead driving position, cut the wire (A) and slip the lower end of the steering joint onto the pinion shaft (B) in the range shown.

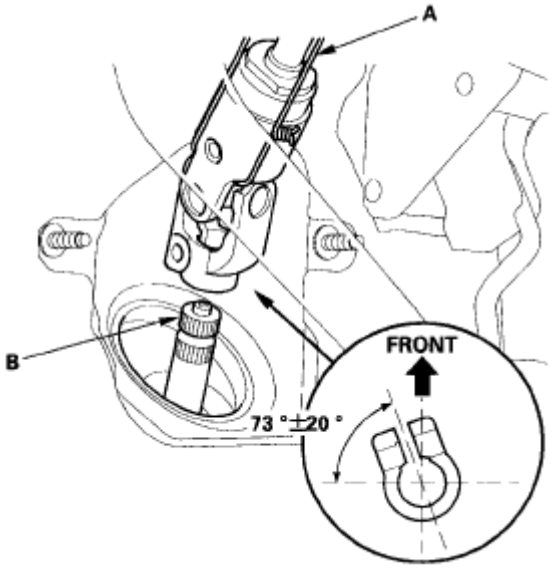

Fig. 131: Identifying Steering Joint Onto Pinion Shaft

28. Align the bolt hole (A) on the steering joint with the groove (B) around the pinion shaft, and loosely install the joint bolt (C). Be sure that the joint bolt is securely in the groove in the pinion shaft. Pull on the steering joint to make sure that the steering joint is fully seated. Tighten the steering joint bolt to the specified torque.

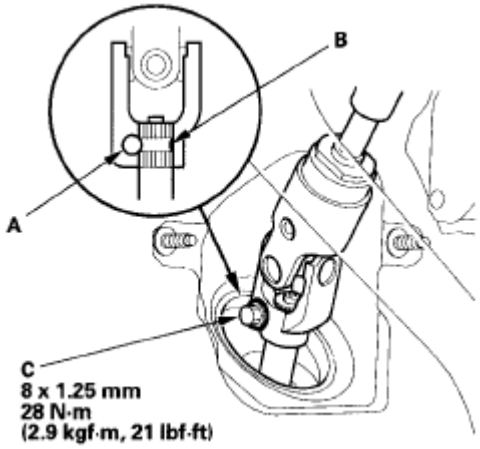

Fig. 132: Aligning Bolt Hole On Steering Joint (With Torque Specifications)

29. Install the steering joint cover (A).

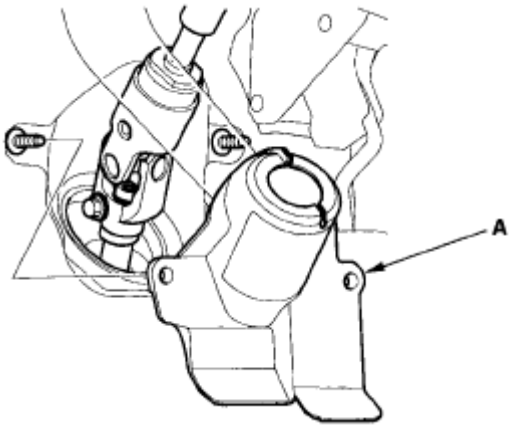

Fig. 133: Identifying Steering Joint Cover

30. Install the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
31. Install the front wheel, then set the front wheels in the straight ahead position.
32. Install the steering wheel (see **STEERING WHEEL INSTALLATION**).
33. Install the air cleaner housing mounting bracket (A) on the cylinder head.

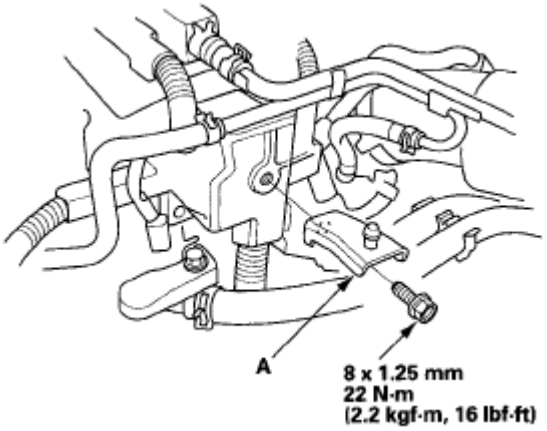

Fig. 134: Identifying Air Cleaner Housing Mounting Bracket (With Torque Specifications)

34. Install the air cleaner housing (see **THROTTLE BODY CLEANING**).
35. Install the under-cowl panel and cowl cover (see **FRONT GRILLE COVER REPLACEMENT**).
36. Reconnect the negative cable to the battery and do these items:
    - Turn the ignition switch ON (II); the SRS indicator should come on for about 6 seconds and then go off.
    - Enter the anti-theft code for the audio or navigation system, then enter the audio presets.
    - Set the clock.
    - Make sure the horn and turn signal switch work properly.
    - Make sure the steering wheel switches work properly.
    - Make sure the steering wheel is centered.
37. Fill the system with power steering fluid, and bleed air from the system (see **FLUID REPLACEMENT**).

38. After installation, do the following checks:
    - Start the engine, and let it idle. Turn the steering wheel from lock-to-lock several times to warm up to the fluid. Check the steering gearbox for leaks (see **FLUID LEAKAGE INSPECTION**).
    - Check the steering wheel spoke angle.

      IF steering spoke angles to the right and left are not equal (steering wheel and rack are not centered), correct the engagement of the joint/pinion shaft serrations, then adjust the front toe by turning the tie-rod ends, if necessary.

    - Check the front toe inspection (see **FRONT TOE INSPECTION/ADJUSTMENT**).

GEARBOX MOUNT CUSHION REPLACEMENT

1. Remove the steering gearbox (see **STEERING GEARBOX OVERHAUL**).
2. Position the 34 mm socket wrench (A) on the flange part of the gearbox housing with a washer (B), 10 x 105 mm flange bolt (C) and the 10 mm nut (D) as shown.

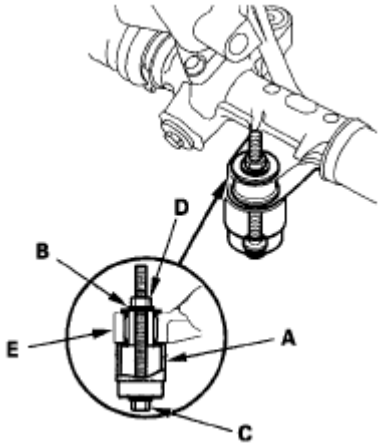

Fig. 135: Identifying Gearbox Flange Bolt And Nut

3. Hold the 10 mm nut with a wrench, and tighten the 10 x 105 mm flange bolt with another wrench. Remove the gearbox mount cushion (E).
4. Apply a mild soap and water solution to the new gearbox mount cushion surface (A), then place the mount cushion on the gearbox mounting cushion hole.

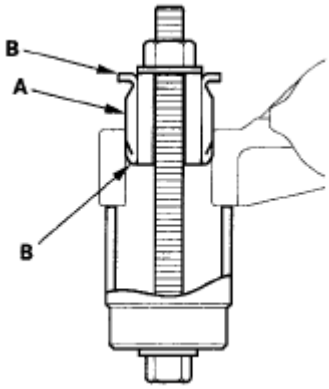

Fig. 136: Identifying Gearbox Housing, Washer, Flange Bolt And Nut

5. Position the 34 mm socket wrench on the flange part of the gearbox housing with a washer, flange bolt, and the nut as shown.
6. Install the gearbox mount cushion by tightening the nut until the mount cushion edges (B) properly fit on the gearbox flange surface.
7. Install the steering gearbox (see **STEERING GEARBOX INSTALLATION**).
8. Check the wheel alignment, and adjust it if necessary (see **WHEEL ALIGNMENT**).

STEERING WHEEL ROTATIONAL PLAY CHECK

1. Turn the front wheels to the straight ahead position.
2. Measure how far you can turn the steering wheel left and right without moving the front wheels.
   - If the play is within the limit, the gearbox and linkages are OK.
   - If the play exceeds the limit, adjust the rack guide: power steering type (see **HYDRAULIC POWER STEERING TYPE**), EPS type (see **EPS TYPE**). If the play is still excessive after rack guide adjustment, inspect the steering linkage and gearbox (see **STEERING LINKAGE AND GEARBOX INSPECTION**).

Rotational play: 0-10 mm (0-0.39 in.)

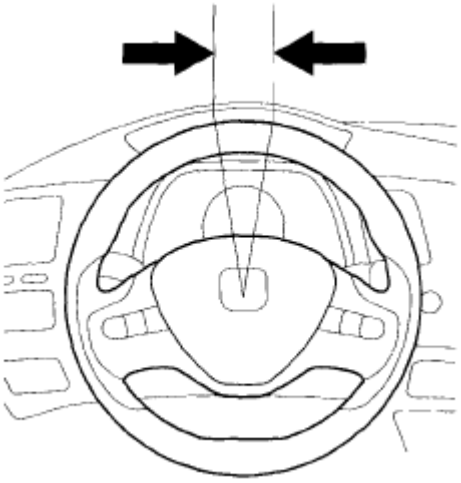

Fig. 4: Identifying Steering Wheel Rotational Play

POWER ASSIST CHECK

NOTE: This test should be done with original equipment tires and wheels at the correct tire pressure.

1. For the power steering type, check the power steering fluid level (see **FLUID REPLACEMENT**).
2. Start the engine, let it idle, and turn the steering wheel from lock-to-lock several times to warm up the component and the fluid (power steering type).
3. Attach a commercially available spring scale to the steering wheel. With the engine idling and the vehicle on a clean, dry floor, pull the scale as shown and read it as soon as the tires begin to turn.
   - If the scale reads no more than the specification, the steering gearbox and pump are OK.
   - For the power steering type, if the scale reads more than specifications, troubleshoot the steering system (see **SYMPTOM TROUBLESHOOTING**)
   - For the EPS type, if the scale reads more than specifications, check for steering linkage (see **STEERING LINKAGE AND GEARBOX INSPECTION**), and check the rack guide adjustment (see **EPS TYPE**).

STEERING WHEEL REMOVAL

SRS components are located in this area. Review the SRS component locations (see **COMPONENT LOCATION INDEX**) and the precautions and procedures (see **PRECAUTIONS AND PROCEDURES**) in the SRS before doing repairs or service.

1. Make sure you have the anti-theft code for the audio or navigation system, then write down the audio presets.

2. Make sure the ignition switch at LOCK (0), then disconnect the negative cable from the battery.
3. Align the front wheels straight ahead, then remove the driver's airbag from the steering wheel (see **DRIVER'S AIRBAG REPLACEMENT**).
4. Disconnect the cable reel subharness connector (A).

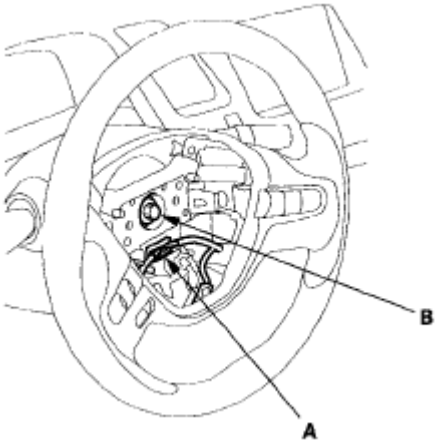

Fig. 7: Identifying Cable Reel Subharness Connector And Steering Wheel Bolt

5. Loosen the steering wheel bolt (B).
6. Install a commercially available steering wheel puller (A) on the steering wheel (B). Free the steering wheel from the steering column shaft by turning the pressure bolt (C) of the puller.

   Note these items when removing the steering wheel:

   - Do not tap on the steering wheel or the steering column shaft when removing the steering wheel.
   - If you thread the puller bolts (D) into the wheel hub more than five threads, the bolts will hit the cable reel and damage it. To prevent this, install a pair of jam nuts five threads up on each puller bolt.

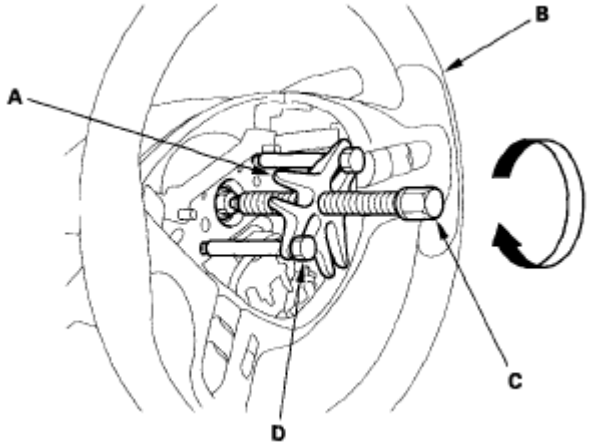

Fig. 8: Identifying Steering Wheel Puller On Steering Wheel & Bolts

7. Remove the steering wheel puller, then remove the steering wheel bolt and steering wheel from the steering column.

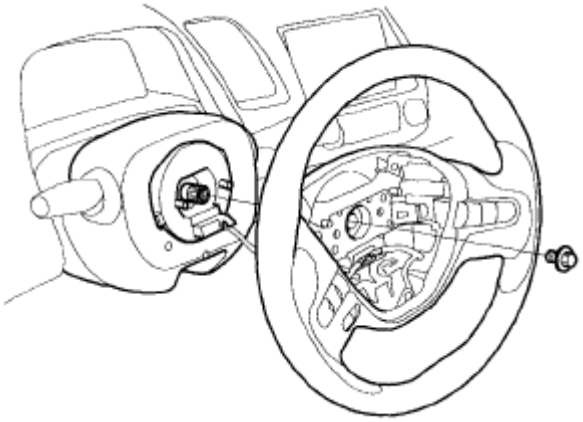

Fig. 9: Identifying Steering Wheel And Bolt

STEERING WHEEL DISASSEMBLY/REASSEMBLY

Except Si model

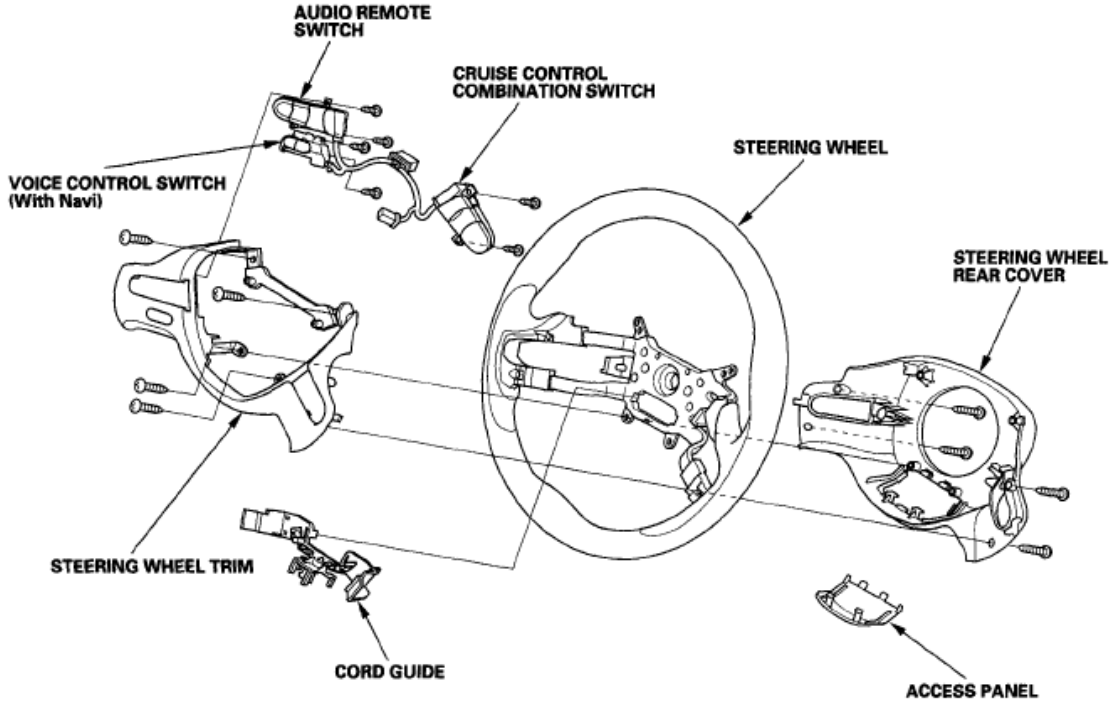

Fig. 10: Exploded View Of Steering Wheel - Except Si Model

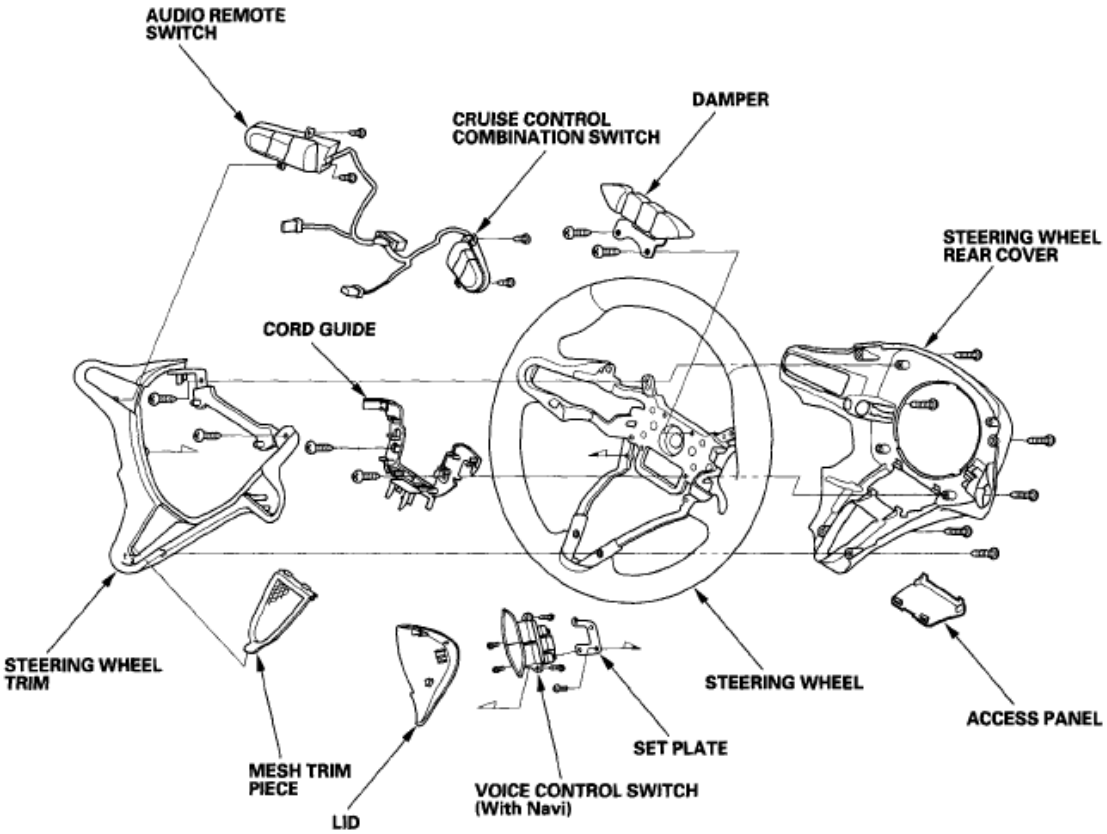

Fig. 11: Exploded View Of Steering Wheel - Si Model

STEERING WHEEL INSTALLATION

1. Before installing the steering wheel, make sure the front wheels are aligned straight ahead, then center the cable reel (A). Do this by first rotating the cable reel clockwise until it stops. Then rotate it counterclockwise about three full turns. The arrow mark (B) on the cable reel label should point straight up.

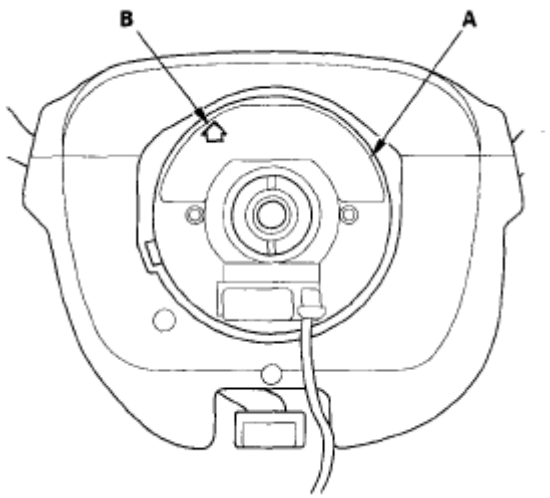

Fig. 12: Identifying Arrow Mark On Cable Reel Label

2. Position the two tabs (A) of the turn signal cancelling sleeve (B) as shown. Install the steering wheel

on to the steering column shaft, making sure the steering wheel hub (C) engages the pins (D) of the cable reel and tabs of the turn signal canceling sleeve. Do not tap on the steering wheel or steering column shaft when installing the steering wheel.

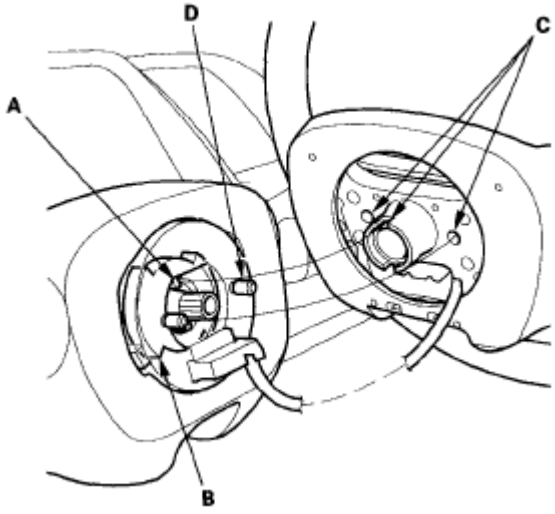

Fig. 13: Identifying Steering Wheel On Steering Column Shaft

3. Install the steering wheel bolt (A), and tighten it to the specified torque. Connect the cable reel subharness connector (B). Make sure the wire harness is routed and fastened properly.

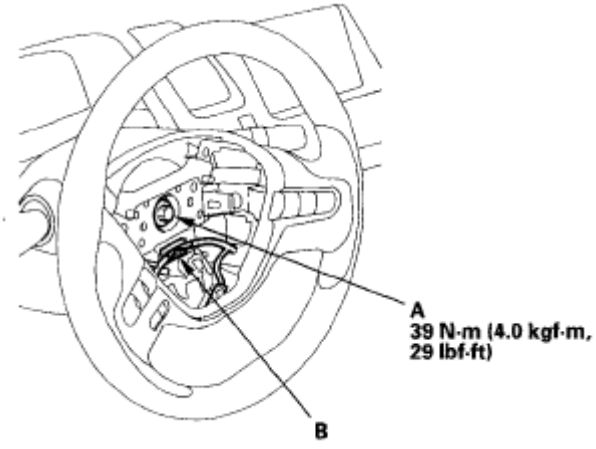

Fig. 14: Identifying Steering Wheel Bolt - Specified Torque

4. Install the driver's airbag, and confirm that the system is operating properly (see **DRIVER'S AIRBAG REPLACEMENT**).
5. Reconnect the negative cable to the battery and do these items:
   - Turn the ignition switch ON (II); the SRS indicator should come on for about 6 seconds and then go off.
   - Enter the anti-theft code for the audio or navigation system, then enter the audio presets.
   - Set the clock.
   - Make sure the horn and turn signal switch work properly.
   - Make sure the steering wheel switches work properly.

- Make sure the steering wheel is centered.

6. After installation, do these checks.
   - Check the steering wheel spoke angle. If the steering spoke angles to the right and left are not equal (steering wheel is not centered), correct the engagement of the wheel/column shaft serrations.
   - Set the steering column to the center tilt position, and to the center telescopic position, then do the front toe inspection (see **FRONT TOE INSPECTION/ADJUSTMENT**).

COLUMN COVER REMOVAL AND INSTALLATION

NOTE:

- **Take care not to scratch or damage the column covers.**
- **Do not pry the cover surface with any tools.**

1. Release the lock lever (A), and adjust the steering column to full tilt down position and to the full telescopic pull position.

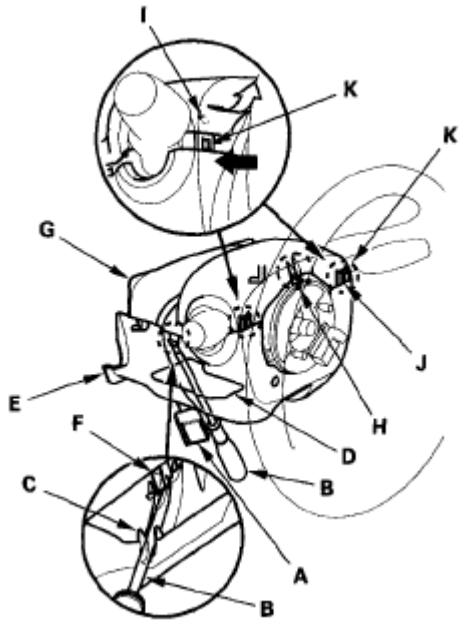

Fig. 15: Identifying Column Cover Remove/Install Components

2. Insert a suitable sized screwdriver or equivalent tool (B) along the guide rib (C) into the lever hole (D) in the lower column cover (E).
3. Release the hook (F) locating on the left side of the upper column cover (G). A right side hook (H) of the upper column cover can't be released from the inside.
4. Turn the steering wheel to left, and release the left pawl (I) of the upper column cover while pushing the lower column cover from the front side.
5. Turn the steering wheel to right, and release the right pawl (J) of the upper column cover is in the same as the step 4.
6. Remove the cover by lightly pulling it up by releasing the right side hook (H) of the upper column cover.

NOTE: Carefully release the pawls, note the hooks (K) may break when upper column cover is pulled up too hard.

7. Remove the three screws, then remove the lower column cover (A).

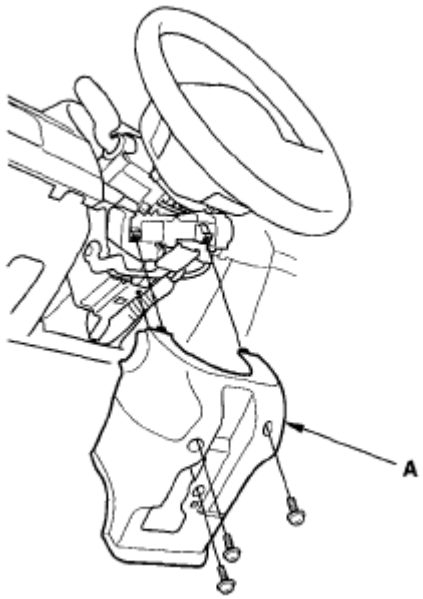

Fig. 16: Identifying Lower Column Cover And Screws

8. Install the upper and lower column cover in the reverse order of removal, and push the hooks into place securely.

STEERING COLUMN REMOVAL AND INSTALLATION

SRS components are located in this area. Review the SRS component locations (see **COMPONENT LOCATION INDEX**) and the precautions and procedures (see **PRECAUTIONS AND PROCEDURES**) in the SRS before doing repairs or service.

REMOVAL

NOTE: Be careful not to pull the bracket (A) on the front side of steering column out of its normal position. If the bracket accidentally comes out, replace the steering column as an assembly.

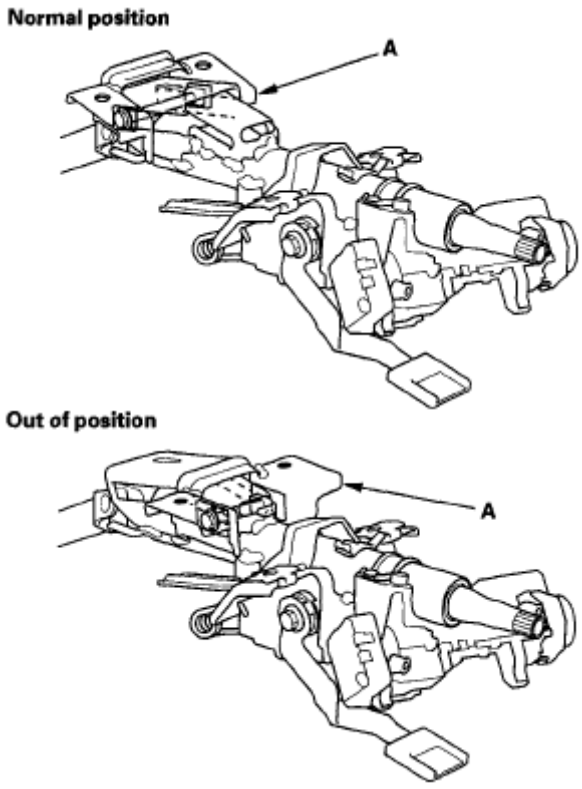

Fig. 17: Identifying Steering Column Bracket Removal Position

1. Make sure you have the anti-theft code for the audio or navigation system, then write down the audio presets.
2. Make sure the ignition switch is OFF, then disconnect the negative cable from the battery.
3. Remove the driver's airbag assembly and the steering wheel (see **STEERING WHEEL REMOVAL**).
4. Remove the driver's dashboard undercover (see **DRIVER's DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
5. Remove the column covers (see **COLUMN COVER REMOVAL AND INSTALLATION**).
6. Remove the steering joint cover (A).

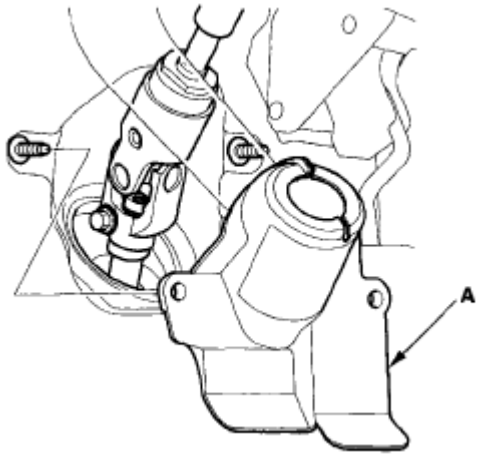

Fig. 18: Identifying Steering Joint Cover

7. Release the lock lever, and adjust the steering column to full tilt up position, and to the full telescopic in position.
8. Tighten the lock lever.
9. Hold the lower slide shaft (A) on the column with a piece of wire (B) between the joint yoke (C) of the lower slide shaft and joint yoke (D) of the upper shaft to prevent the slider shaft from pulling out.

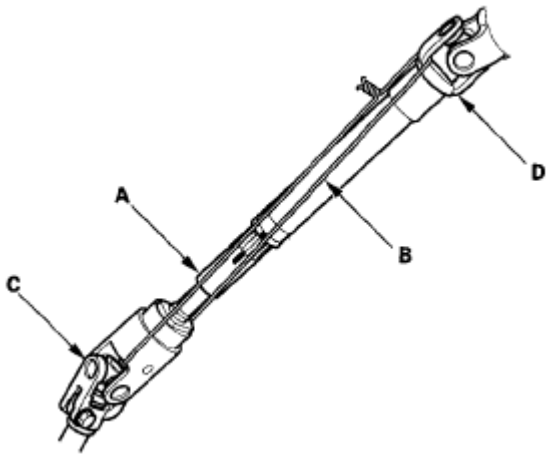

Fig. 19: Identifying Lower Slide Shaft With Wire Between Joint Yokes

10. Release the lock lever, and adjust the steering column to the full telescopic out position, then tighten the lock lever.

NOTE: Do not release lock lever when removing the steering column from the frame.

11. Disconnect the wire harness connectors from the combination switch assembly and cable reel (A).

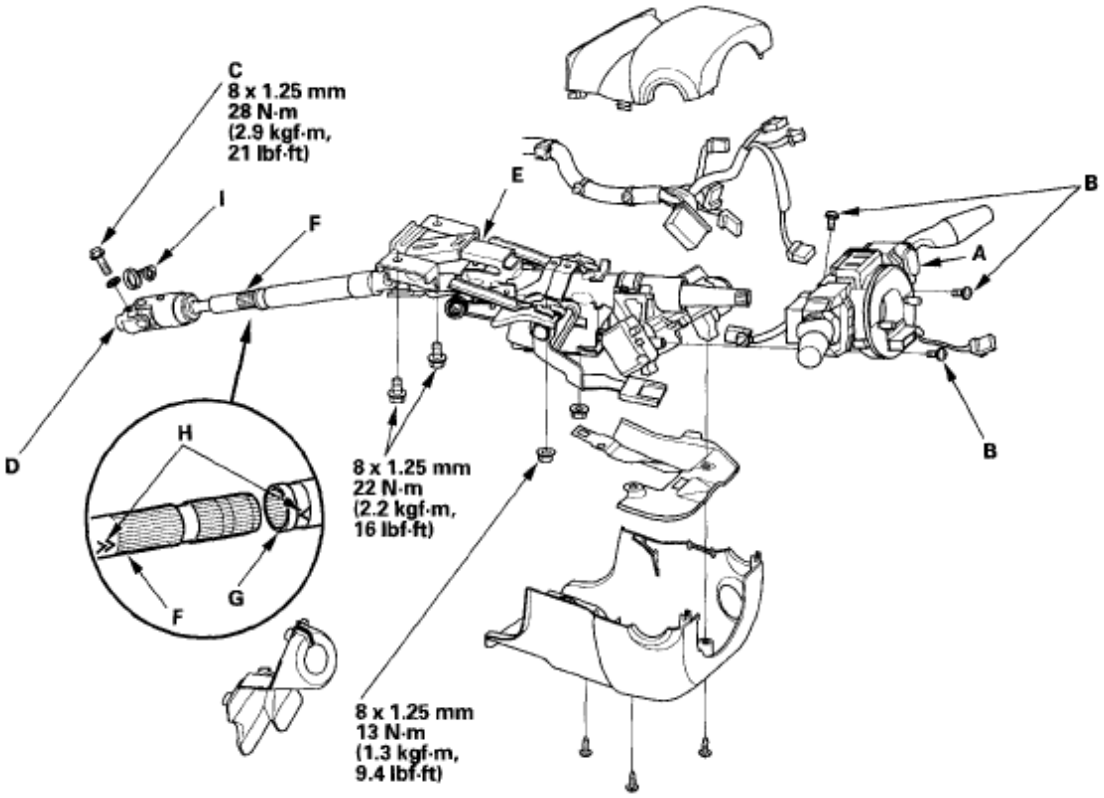

Fig. 20: Identifying Steering Column Components With Torque Specifications

12. Remove the combination switch assembly from the steering column shaft by removing the three screws (B).
13. Disconnect the connectors from the ignition switch, and release the wire harness clips from the steering column.
14. Remove the steering joint bolt (C), then disconnect the steering joint (D) from the pinion shaft.
15. Remove the steering column (E) by removing the attaching nuts and bolts. If the lower slide shaft (F) is removed, slip it into the upper shaft (G) by aligning the paint or stamped marks (H).
16. Remove the center guide (I) (if equipped), and discard it. The center guide is for factory assembly only.

INSTALLATION

1. Install the steering column in the reverse order of removal, and note these items:
   - Make sure the wires are not caught or pinched by any parts.
   - Take care not to let the sliding capsules fall out of position during column installation.
2. Center the steering rack within its stroke in steering joint connection.
3. With the rack in the straight ahead driving position, cut the wire (A) and slip the lower end of the steering joint onto the pinion shaft (B) in the range shown.

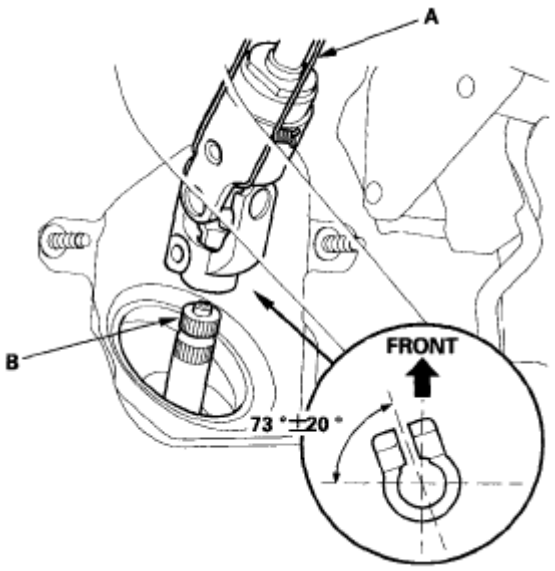

Fig. 21: Cutting Wire & Slipping Lower End Of Steering Joint Into Pinion Shaft

4. Align the bolt hole (A) on the steering joint with the groove (B) around the pinion shaft, and loosely install the joint bolt (C). Be sure that the joint bolt is securely in the groove in the pinion shaft. Pull on the steering joint to make sure that the steering joint is fully seated. Tighten the steering joint bolt to the specified torque.

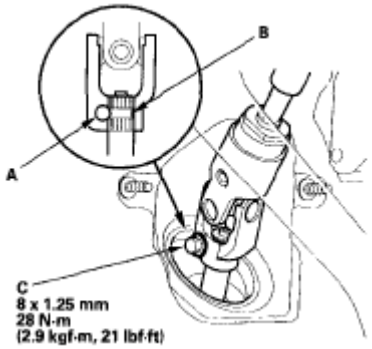

Fig. 22: Identifying Bolt Hole, Steering Joint With Groove & Steering Joint Bolt With Torque Specifications

5. Install the steering joint cover (A).

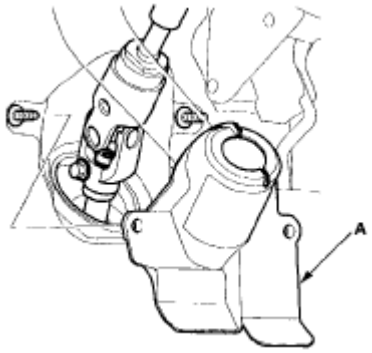

Fig. 23: Identifying Steering Joint Cover

6. Install the steering wheel (see **STEERING WHEEL INSTALLATION**).
7. Install the column covers.
8. Install the driver's dashboard undercover.
9. Reconnect the negative cable to the battery and do these items:
   - Turn the ignition switch ON (II); the SRS indicator should come on for about 6 seconds and then go off.
   - Enter the anti-theft code for the audio or navigation system, then enter the audio presets.
   - Set the clock.
   - Make sure the horn and turn signal switch work properly.
   - Make sure the steering wheel switches work properly.
   - Make sure the steering wheel is centered.
10. After installation, do these checks.
    - Check the steering wheel spoke angle. If the steering spoke angles to the right and left are not equal (steering wheel is not centered), correct the engagement of the wheel/column shaft serrations.
    - Set the steering column to the center tilt position, and to the center telescopic position, then do the front toe inspection (see **FRONT TOE INSPECTION/ADJUSTMENT**).

STEERING COLUMN/TILT/TELESCOPIC INSPECTION

- Check the steering column ball bearing (A) and the steering joint bearings (B) for play and proper movement. If any bearing is noisy or has excessive play, replace the steering column as an assembly.
- Check the lower slide shaft (C) for smooth movement in and out. If the lower slide shaft is removed, slip it into the upper shaft by aligning the paint or stamped marks (D). If it sticks or binds, replace the steering column as an assembly.
- Check the sliding capsules (E) for distortion or breakage. If there is distortion or breakage, replace the steering column as an assembly.
- Check the tilt mechanism and telescopic mechanism for movement and damage.
- Check the absorbing plates (F) for distortion or breakage. If there is distortion or breakage, replace the steering column as an assembly.

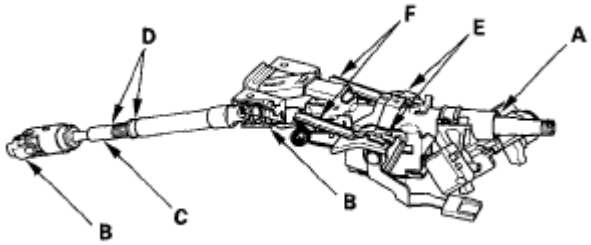

Fig. 24: Identifying Steering Column/Tilt/Telescopic Components

STEERING LOCK REPLACEMENT

1. Remove the steering column (see **STEERING COLUMN REMOVAL AND INSTALLATION**).
2. Center-punch each of the two shear bolts, and drill the heads of the bolts off with a 5 mm (3/16 in.) drill bit. Be careful not to damage the switch body when removing the shear bolts.

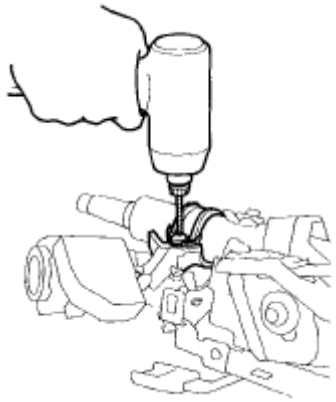

Fig. 25: Removing Shear Bolts

3. Remove the shear bolts from the switch body.
4. Install the switch body without the key inserted.
5. Loosely tighten the new shear bolts.
6. Insert the ignition key, and make sure the steering wheel lock works properly and that the ignition key turns freely.
7. Tighten the shear bolts (A) until the hex heads (B) twist off.

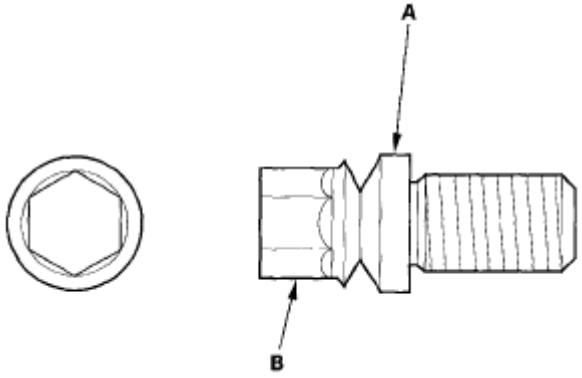

Fig. 26: Identifying Shear Bolts And Hex Heads

8. Rewrite the new immobilizer control unit-receiver (see **COMPONENT LOCATION INDEX**), and make sure the immobilizer system works properly.

RACK GUIDE ADJUSTMENT

Special Tools Required

- Locknut wrench, 40 mm 07MAA-SL00100 or 07916-SA50001
- Locknut wrench, 43 mm 07MAA-SL0020A

HYDRAULIC POWER STEERING TYPE

1. Set the wheels in the straight ahead position.
2. Loosen the rack guide screw locknut (A) with the locknut wrench, then remove the rack guide screw

(B).

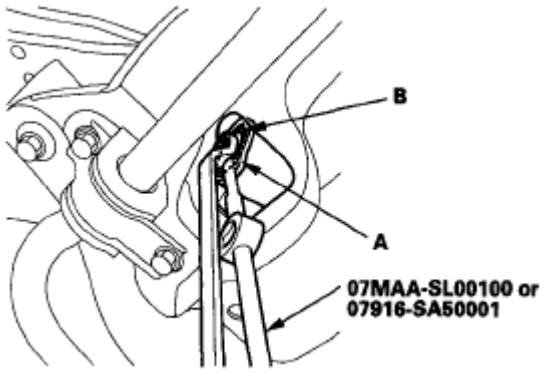

Fig. 27: Identifying Rack Guide Screw Locknut, Locknut Wrench & Rack Guide Screw

3. Remove the old sealant from the rack guide screw (A), and apply new sealant (Three Bond 1215 or Loctite 5699) to the middle of the threads (B). Loosely install the rack guide screw on the steering gearbox.

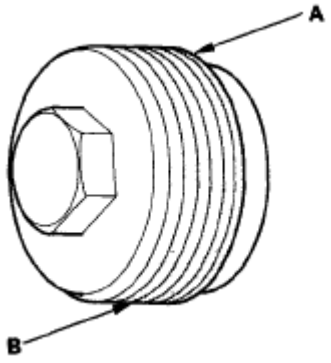

Fig. 28: Identifying Rack Guide Screw

4. Tighten the rack guide screw (A) to 25 N.m (2.5 kgf.m, 18 lbf.ft), then loosen it.

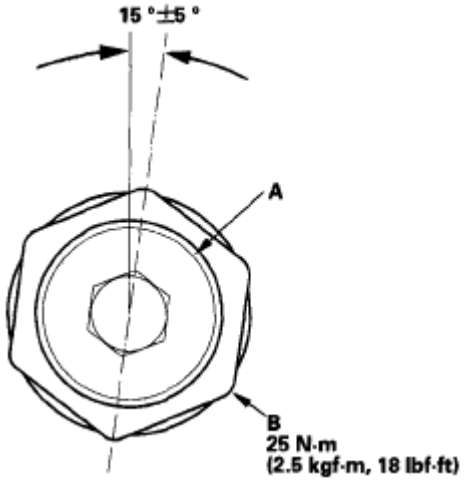

Fig. 29: Identifying Rack Guide Screw Torque Specifications

5. Retighten the rack guide screw to 5.9 N.m (0.6 kgf.m, 4.0 lbf.ft), then back it off to the specified angle.

   Specified return angle:

   '06 model: 15° ± 5°

   '07-08 model: 10° ± 5°

6. Hold the rack guide screw stationary with a wrench, and install the locknut (B) by hand until it's fully seated.
7. Install the locknut wrench on the locknut, and hold the rack guide screw stationary with a wrench. Tighten the locknut to the specified torque.
8. Check for unusual steering effort through the complete turning travel.
9. Check the steering wheel rotational play (see **STEERING WHEEL ROTATIONAL PLAY CHECK**), and the power assist (see **STEERING WHEEL ROTATIONAL PLAY CHECK**).

EPS TYPE

1. Set the wheels in the straight ahead position.
2. Loosen the rack guide screw locknut (A) with the locknut wrench, then remove the rack guide screw (B).

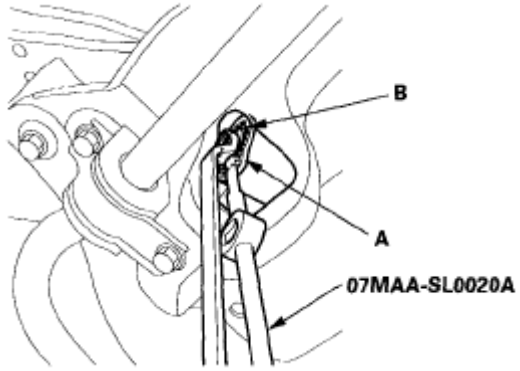

Fig. 30: Identifying Rack Guide Screw Locknut, Locknut Wrench & Rack Guide Screw

3. Remove the old sealant from the rack guide screw (A), and apply new sealant (Three Bond 1215 or Loctite 5699) to the middle of the threads (B). Loosely install the rack guide screw on the steering gearbox.

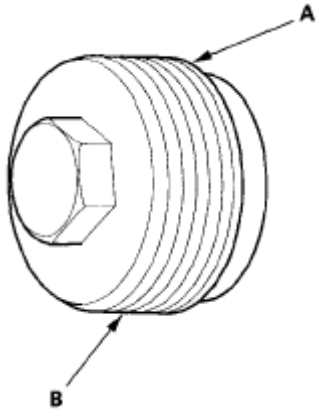

Fig. 31: Identifying Rack Guide Screw

4. Tighten the rack guide screw (A) to 25 N.m (2.5 kgf.m, 18 lbf.ft), then loosen it.

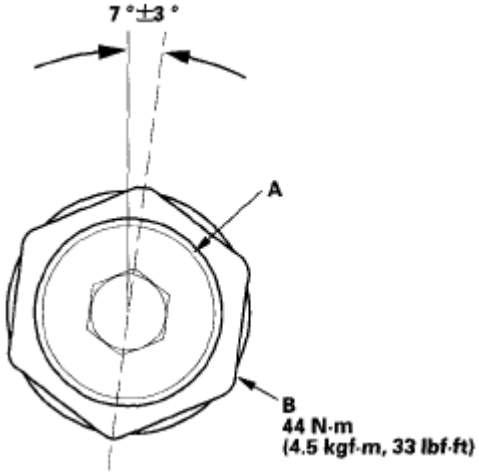

Fig. 32: Identifying Rack Guide Screw Torque Specifications

5. Retighten the rack guide screw to 3.9 N.m (0.4 kgf.m, 2.9 lbf.ft), then back it off to the specified angle.

   Specified return angle: 7° ± 3°

6. Hold the rack guide screw stationary with a wrench, and install the locknut (B) by hand until it's fully seated.
7. Install the locknut wrench on the locknut, and hold the rack guide screw stationary with a wrench. Tighten the locknut to the specified torque.
8. Check for unusual steering effort through the complete turning travel.
9. Check the steering wheel rotational play (see **STEERING WHEEL ROTATIONAL PLAY CHECK**), and the power assist (see **STEERING WHEEL ROTATIONAL PLAY CHECK**).

TIE-ROD BALL JOINT BOOT REPLACEMENT

Special Tools Required

Bushing Base 07JAF-SH20330

1. Remove the boot from the tie-rod end, and wipe the old grease off the ball pin.
2. Pack the lower area of the ball pin (A) with fresh multipurpose grease.

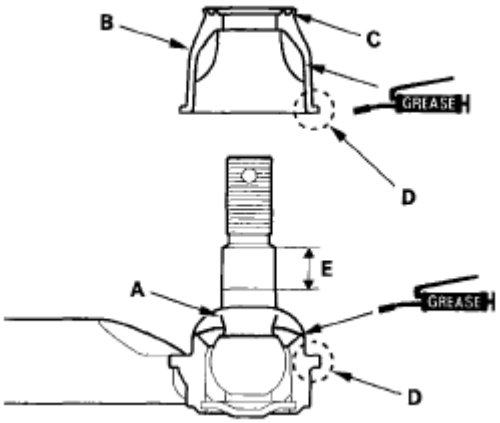

Fig. 33: Identifying Areas For Applying Multipurpose Grease

3. Pack the interior of the new boot (B) and lip (C) with fresh multipurpose grease.

   Note these items when installing new grease:

   - Keep grease off the boot mounting area (D) and the tapered section (E) of the ball pin.
   - Do not allow dust, dirt, or other foreign materials to enter the boot.
4. Install the new boot (A) using the bushing base. The boot must not have a gap at the boot installation sections (B). After installing the boot, check the ball pin tapered section for grease contamination, and wipe it if necessary.

- Attachment, 96 mm 07948-SB00101
- Support base 07965-SD90100

KNUCKLE/HUB REPLACEMENT

1. Raise the front of the vehicle, and support it with safety stands in the proper locations (see **LIFT AND SUPPORT POINTS**).
2. Remove the wheel nuts (A) and the front wheel.

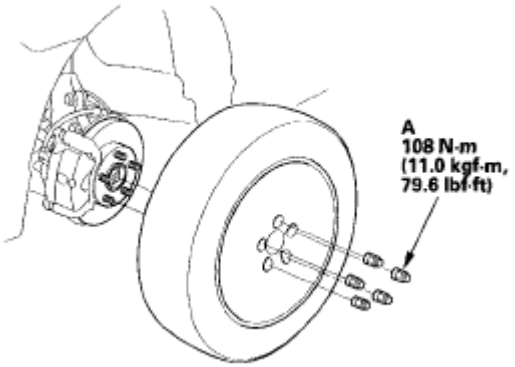

Fig. 2: Identifying Front Wheel And Nut (With Torque Specifications)

3. Remove the brake hose mounting bolt (A).

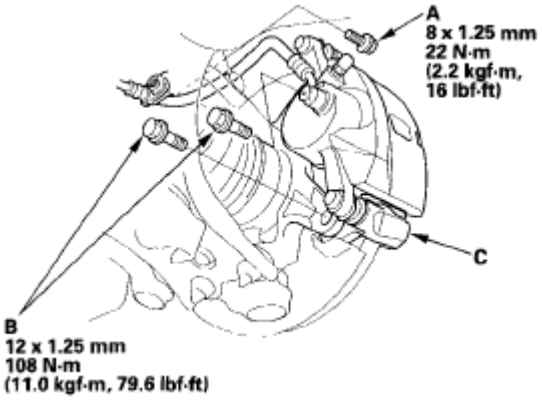

Fig. 3: Identifying Brake Hose Mounting Bolt (With Torque Specifications)

4. Remove the brake caliper bracket mounting bolts (B), and remove the caliper assembly (C) from the knuckle. To prevent damage to the caliper assembly or brake hose, use a short piece of wire to hang the caliper assembly from the undercarriage. Do not twist the brake hose excessively.
5. Remove the wheel sensor (A) from the knuckle (B). Do not disconnect the wheel sensor connector.

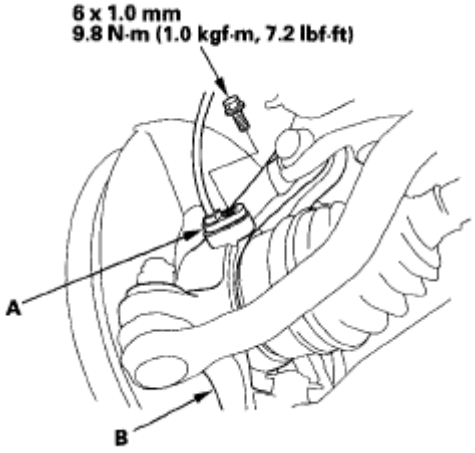

Fig. 4: Identifying Wheel Sensor And Knuckle (With Torque Specifications)

6. Raise the stake (A), then remove the spindle nut (B).

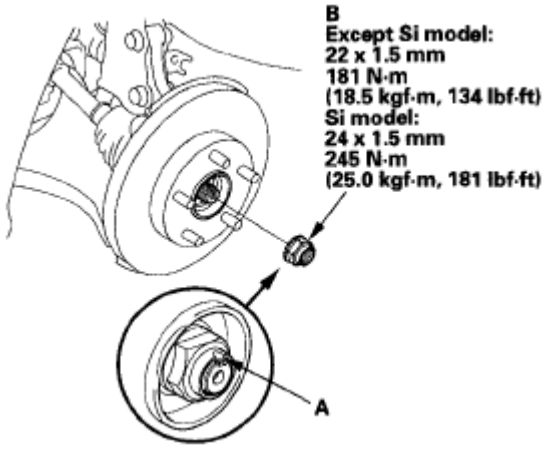

Fig. 5: Identifying Spindle Nut (With Torque Specifications)

7. Remove the 6 mm brake disc retaining screws (A).

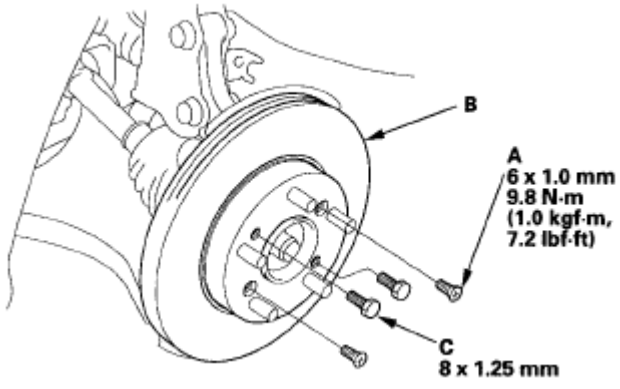

Fig. 6: Identifying Brake Disc Retaining Screws (With Torque Specifications)

8. Remove the brake disc (B) from the hub.

NOTE: If the brake disc has clung to the hub. Screw two 8 x 1.25 mm bolts (C) into the brake disc to push it away from the hub. Turn each bolt 90 degrees to prevent the brake disc from binding.

9. Check the front hub for damage and cracks.
10. Remove the cotter pin (A) from the tie-rod end ball joint, then remove the nut (B).

NOTE: During installation, install the new cotter pin after tightening the nut, and bend its end as shown.

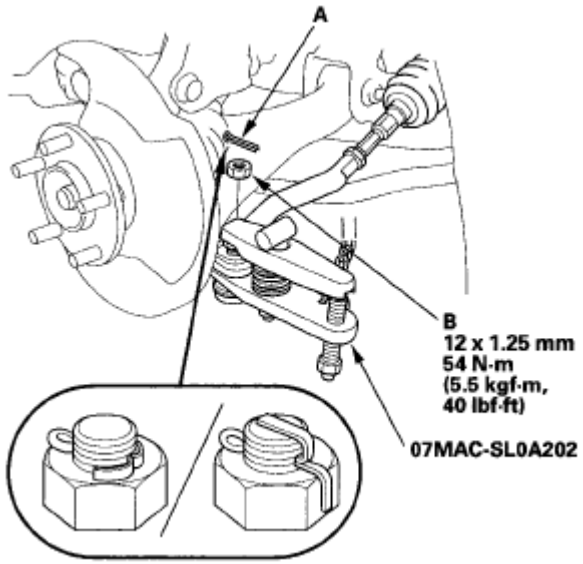

Fig. 7: Identifying Cotter Pin Position (With Torque Specifications)

11. Disconnect the tie-rod ball joint from the knuckle using the ball joint remover (see **BALL JOINT REMOVAL**).
12. Remove the flange bolt and flange nuts from the lower arm (A).

NOTE: During installation, install a new flange bolt and new flange nuts. After lightly tightening all three fasteners, tighten them to the specified torque in the following order; the nut on the front (B), the nut on the rear (C), then the bolt (D).

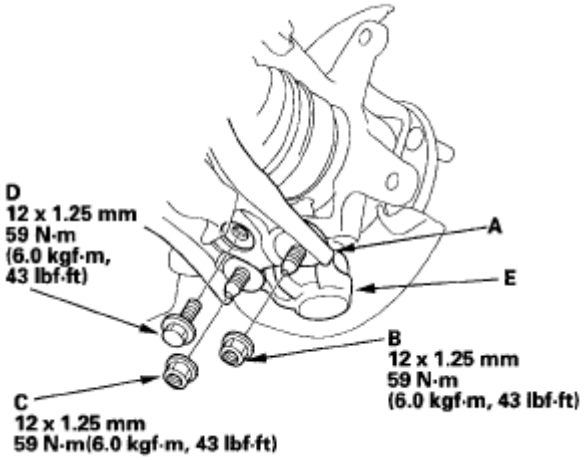

Fig. 8: Identifying Lower Ball Joint (With Torque Specifications)

13. Disconnect the lower ball joint (E) from the lower arm.
14. Remove the damper pinch bolts (A) and the self-locking nuts (B) from the damper.

NOTE: During installation, install the new damper pinch bolts and the new self-locking nuts.

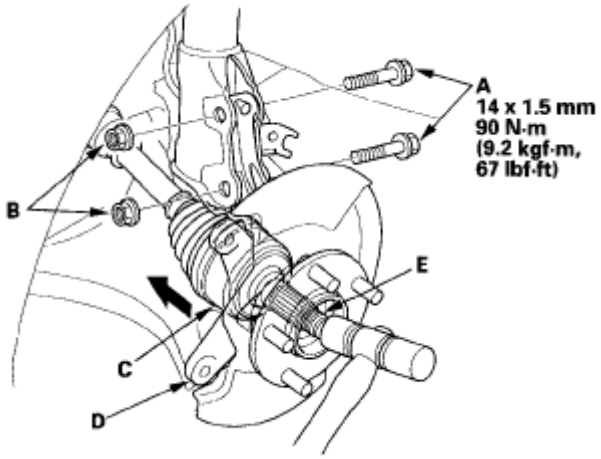

Fig. 9: Identifying Damper Pinch Bolts (With Torque Specifications)

15. Remove the driveshaft outboard joint (C) from the knuckle (D) by tapping the driveshaft end (E) with a plastic hammer while drawing the hub outward, then remove the knuckle.

NOTE:

- **Do not pull the driveshaft end outward. The inner driveshaft joint may come apart.**
- **During installation, apply grease to the mating surface of the wheel bearing and driveshaft outboard joint (see DRIVESHAFT INSTALLATION).**

16. Remove the lock pin (A) from the lower ball joint pin (B), then remove the nut (C).

NOTE: During installation, install a lock pin after tightening the new castle nut.

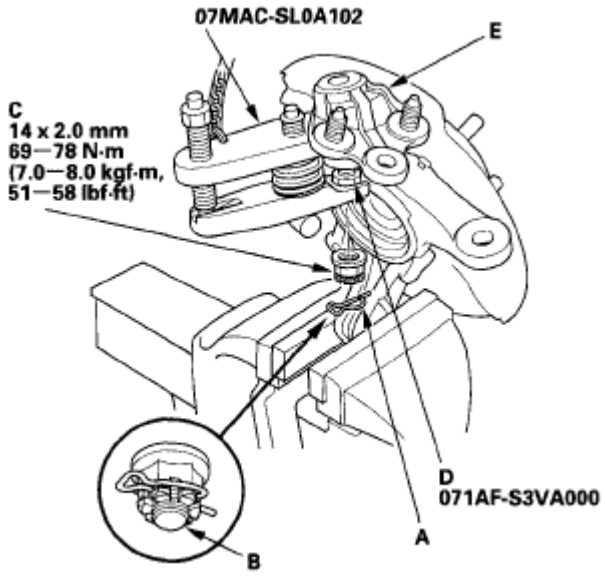

Fig. 10: Identifying Lower Ball Joint Pin (With Torque Specifications)

17. Install the ball joint thread protector (D).
18. Disconnect the lower ball joint (E) from the knuckle using the ball joint remover (see **BALL JOINT REMOVAL**).
19. Install the knuckle/hub in the reverse order of removal, and note these items:
    - Be careful not to damage the ball joint boot when installing the knuckle.
    - Tighten all mounting hardware to the specified torque values.
    - Before connecting the lower ball joint to the knuckle, degrease the threaded section and tapered portion of the ball joint pin, the knuckle connecting hole, the threaded section, and mating surface of the castle nut.
    - First install all the components, and lightly tighten the bolts and nuts, then raise the suspension to load it with the vehicle's weight before fully tightening to the specified torque values.
    - Torque the castle nut to the lower torque specification, then tighten it only far enough to align the slot with the ball joint pin hole. Do not align the castle nut by loosening it.
    - Use a new spindle nut during reassembly.
    - Before installing the spindle nut, apply a small amount of engine oil to the seating surface of the nut. After tightening, use a drift to stake the spindle nut shoulder against the driveshaft.
    - Before installing the brake disc, clean the mating surface of the front hub and the inside of the brake disc.
    - Before installing the wheel, clean the mating surface of the brake disc and the inside of the wheel.
    - Check the wheel alignment, and adjust it if necessary (see **WHEEL ALIGNMENT**).

WHEEL BEARING REPLACEMENT

1. Separate the hub (A) from the knuckle (B) using the hub dis/assembly tool and a hydraulic press. Hold the knuckle with the attachment (C) of the hydraulic press or equivalent tool. Be careful not to deform

the splash guard. Hold onto the hub to keep it from falling when pressed clear.

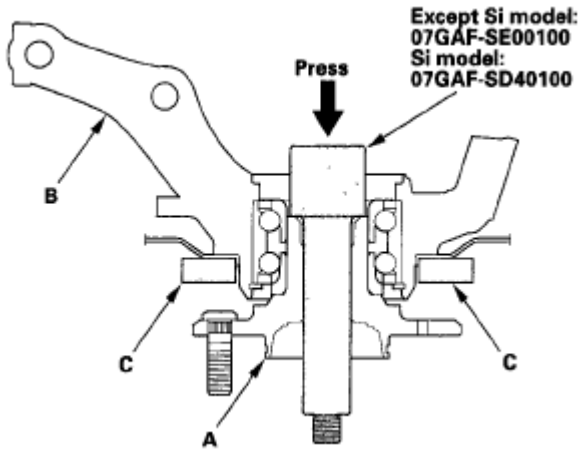

Fig. 11: Separating Hub From Knuckle

2. Press the wheel bearing inner race (A) off of the hub (B) using the hub dis/assembly tool, a commercially available bearing separator (C), and a press.

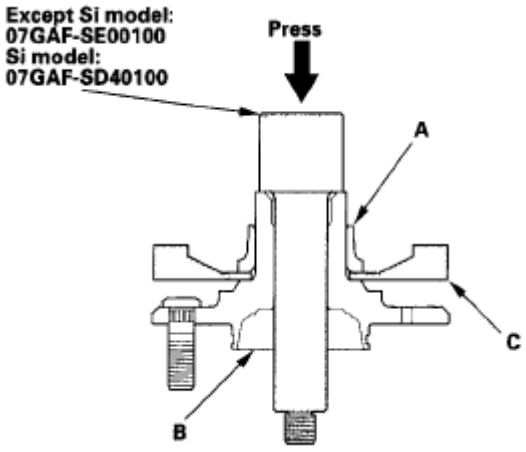

Fig. 12: Pressing Wheel Bearing Inner Race

3. Remove the splash guard (A) and the snap ring (B) from the knuckle (C).

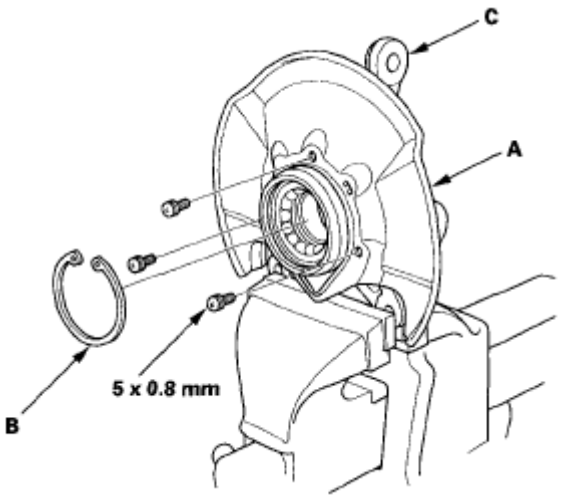

Fig. 13: Identifying Splash Guard And Snap Ring

4. Press the wheel bearing (A) out of the knuckle (B) using the attachment, the driver, and a press.

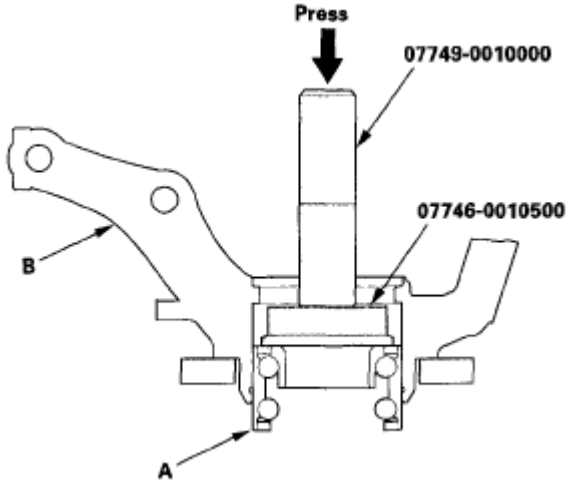

Fig. 14: Pressing Wheel Bearing Out Of Knuckle

5. Wash the knuckle and hub thoroughly in high flashpoint solvent before reassembly.
6. Press a new wheel bearing (A) into the knuckle (B) using the old bearing (C), a steel plate (D), the attachment, the support base, and a press.

NOTE:

- **Install the wheel bearing with the wheel sensor magnetic encoder (E) (brown color), toward the inside of the knuckle.**
- **Remove any oil, grease, dust, metal debris, and other foreign material from the encoder surface.**
- **Keep all magnetic tools away from the encoder surface.**
- **Be careful not to damage the encoder surface when you insert the wheel bearing.**

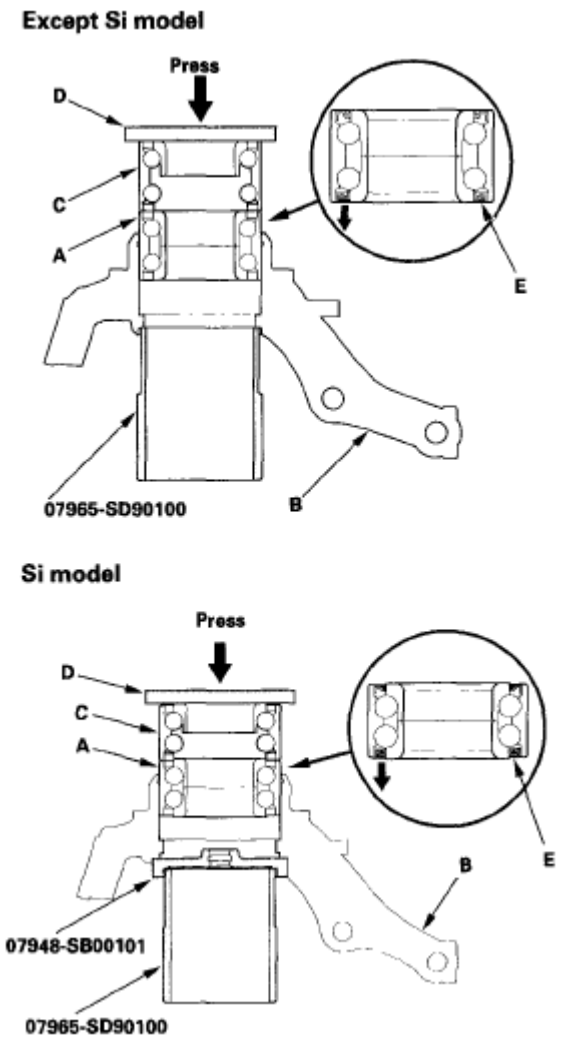

Fig. 15: Pressing Wheel Bearing Into Knuckle

7. Install the snap ring (A) securely in the knuckle (B).

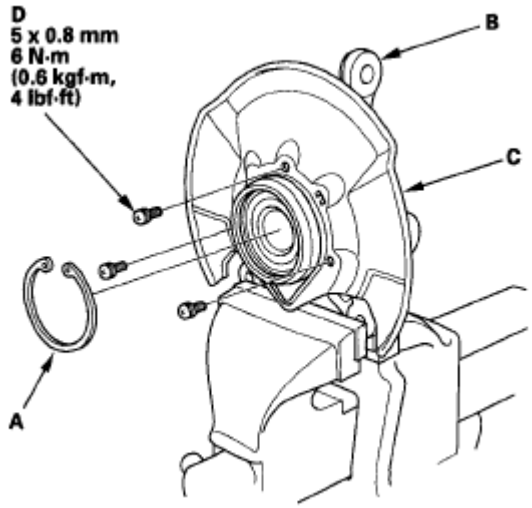

Fig. 16: Identifying Snap Ring In Knuckle (With Torque Specifications)

8. Install the splash guard (C), and tighten the screws (D) to the specified torque value.
9. Install the hub (A) onto the knuckle (B) using the attachment, the driver, the support base, and a hydraulic press. Be careful not to distort the splash guard (C).

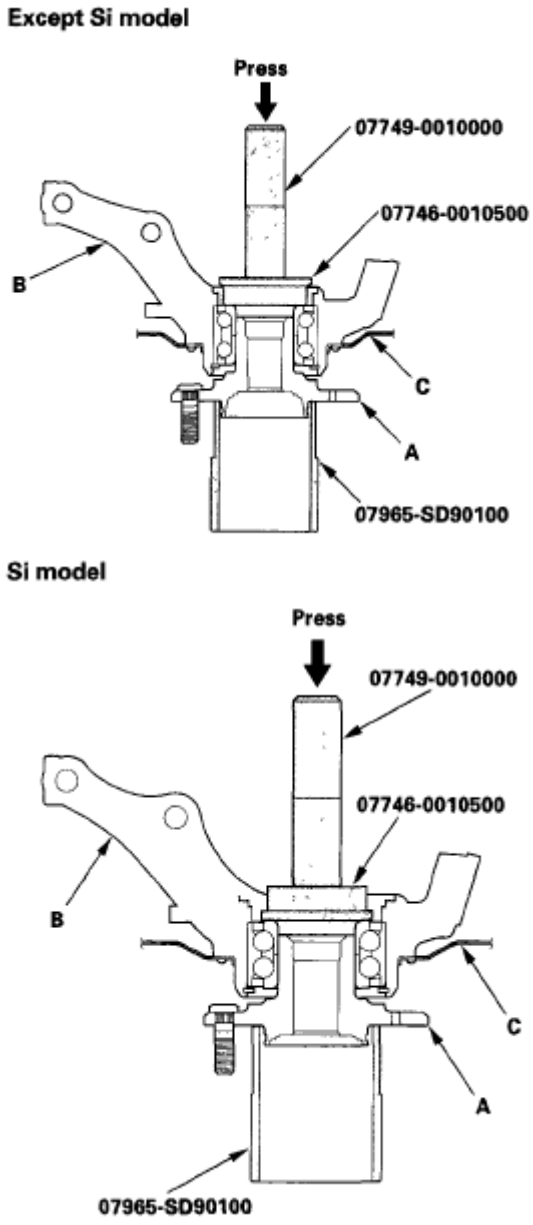

Fig. 17: Installing Hub Onto Knuckle

LOWER BALL JOINT REPLACEMENT

Special Tools Required

- Ball joint remover, 32 mm 07MAC-SL0A102
- Ball joint thread protector, 14 mm 071AF-S3VA000

1. Remove the front wheel (see **KNUCKLE/HUB REPLACEMENT**).

2. Remove the flange bolt and flange nuts from the lower arm (A).

NOTE: During installation, install a new flange bolt and new flange nuts. After lightly tightening all three fasteners, tighten them to the specified torque in the following order; the nut on the front (B), the nut on the rear (C), then the bolt (D).

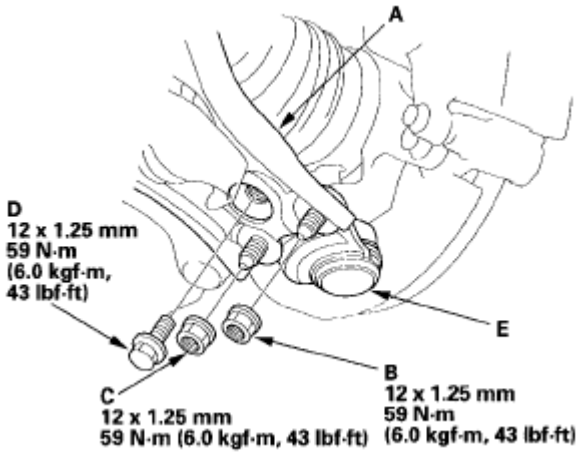

Fig. 18: Tightening Bolts (With Torque Specifications)

3. Disconnect the lower ball joint (E) from the lower arm.
4. Remove the spindle nut (see step 6), and remove the outboard joint (A) from the knuckle (B) by tapping the driveshaft end (C) with a plastic hammer while drawing the hub outward.

NOTE:

- **Do not pull the driveshaft end outward. The inner driveshaft joint may come apart.**
- **During installation, apply grease to the mating surface of the wheel bearing and driveshaft outboard joint (see DRIVESHAFT INSTALLATION).**

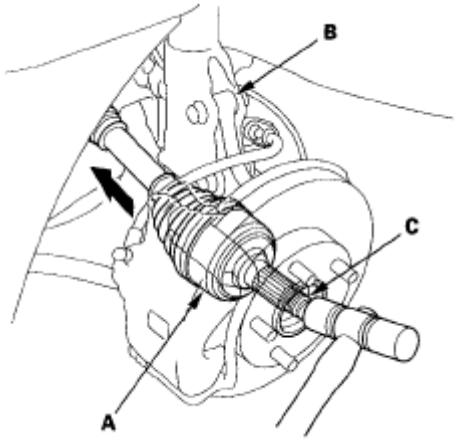

Fig. 19: Tapping Driveshaft

5. Remove the lock pin (A) from the lower ball joint pin (B), then remove the castle nut (C).

NOTE: During installation, install a lock pin after tightening the new castle nut.

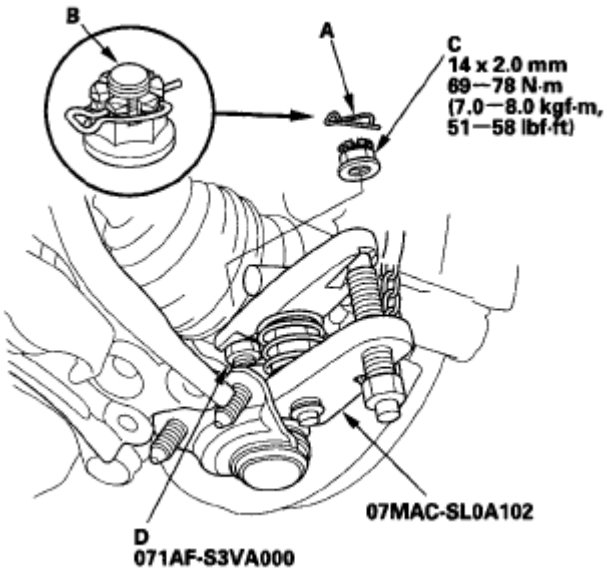

Fig. 20: Identifying Lock Pin And Lower Ball Joint Pin (With Torque Specifications)

6. Install the ball joint thread protector (D).
7. Disconnect the lower ball joint from the knuckle using the ball joint remover (see **BALL JOINT REMOVAL**), then remove the lower ball joint.
8. Install the lower ball joint in the reverse order of removal, and note these items:
   - First install all the components, and lightly tighten the bolts and nuts, then tighten the lower ball joint to the lower arm to the specified torque. Raise the suspension to load it with the vehicle's weight before fully tightening the lower ball joint to the knuckle to the specified torque values.
   - Tighten all mounting hardware to the specified torque values.
   - Use a new spindle nut during reassembly.
   - Before installing the wheel, clean the mating surface of the brake disc and inside of the wheel.
   - Check the wheel alignment, and adjust it if necessary (see **WHEEL ALIGNMENT**).

BALL JOINT BOOT REPLACEMENT

Special Tools Required

Attachment, 40 mm 07GAF-SE00200

1. Remove the lower ball joint (see **LOWER BALL JOINT REPLACEMENT**).
2. Remove the boot clip and the boot.
3. Pack the interior and lip (A) of a new boot with grease. Keep the grease off of the boot-to-lower ball housing mating surfaces (B).

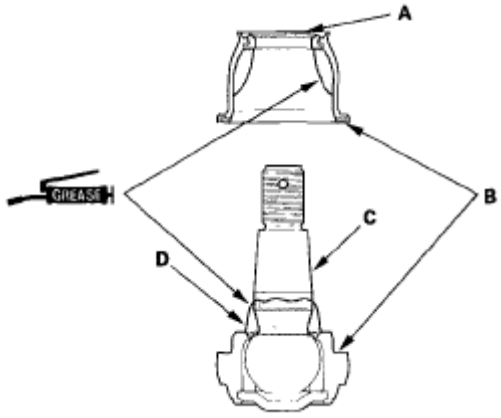

Fig. 21: Identifying Area Applying Grease

4. Wipe the grease off the tapered portion of the pin (C), and pack fresh grease into the base (D). Do not let dirt or other foreign materials get into the boot.
5. Install the boot on the ball joint, then squeeze it gently to force out any air.
6. Press the boot with the attachment until the bottom seats on the lower ball housing (A) all the way around.

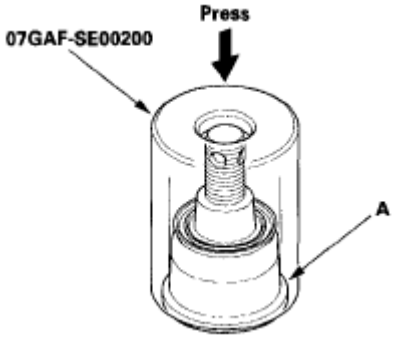

Fig. 22: Pressing Boot With Attachment Until Bottom Seats On Lower Ball Housing

7. After installing a boot, wipe any grease off the exposed portion of the ball joint pin.
8. Install the lower ball joint (see **LOWER BALL JOINT REPLACEMENT**).

LOWER ARM REMOVAL/INSTALLATION

Special Tools Required

- Bushing driver 07AAF-SVAA100
- Receiver set 07AAF-SVAA200

REMOVAL/INSTALLATION

1. Raise the front of the vehicle, and support it with safety stands in the proper locations (see **LIFT AND SUPPORT POINTS**).
2. Remove the center cap and front wheel.
3. Remove the flange nut (A) while holding the respective joint pin (B) with a hex wrench (C), then

disconnect the stabilizer links from the lower arm (D).

NOTE: Use a new flange nut during reassembly.

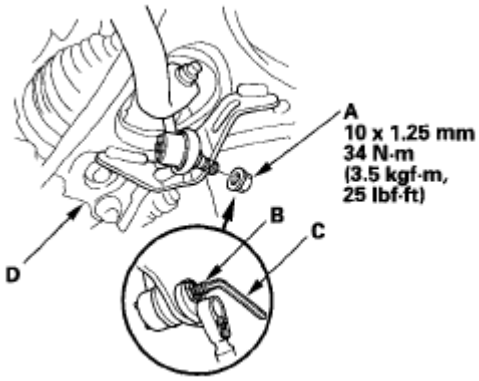

Fig. 23: Identifying Respective Joint Pin With Hex Wrench (With Torque Specifications)

4. Turn the stabilizer bar backward to gain easier access to the front side of the lower arm mounting bolt.
5. Remove the flange bolt and flange nuts from the lower arm (A).

NOTE: During installation, install a new flange bolt and new flange nuts. After lightly tightening all three fasteners, tighten them to the specified torque in the following order; the nut on the front (B), the nut on the rear (C), then the bolt (D).

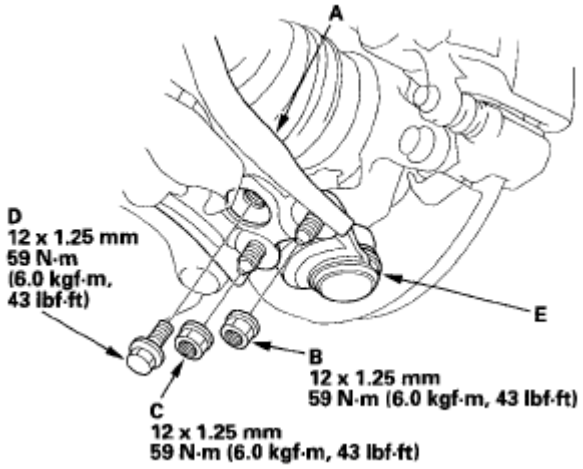

Fig. 24: Identifying Lower Arm Bolts (With Torque Specifications)

6. Disconnect the lower ball joint (E) from the lower arm.
7. Remove the lower arm mounting bolt (A).

NOTE: During installation, install a new mounting bolt.

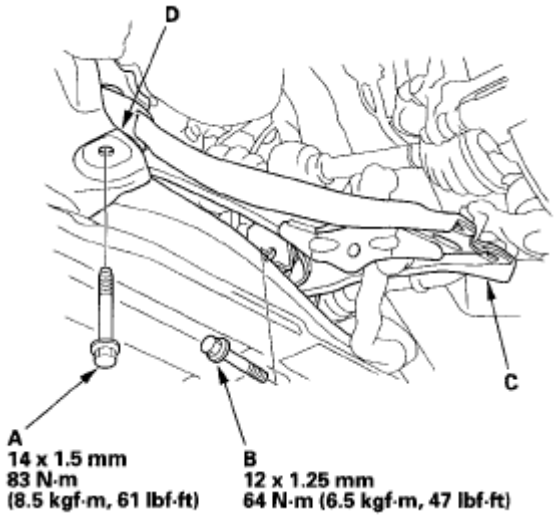

Fig. 25: Identifying Lower Arm Mounting Bolt (With Torque Specifications)

8. Remove the lower arm mounting bolt (B), then remove the lower arm (C) from the front suspension subframe (D).

NOTE: During installation, install a new mounting bolt.

9. Install the lower arm in the reverse order of removal, and note these items:
   - First install all the components, and lightly tighten the bolts and nuts, then tighten the lower ball joint to the lower arm to the specified torque. Raise the suspension the lower ball joint to the knuckle and the lower arm to the subframe to load it with the vehicle's weight before fully tightening to the specified torque.
   - Tighten all mounting hardware to the specified torque values.
   - Before installing the wheel, clean the mating surface of the brake disc and the inside of the wheel.
   - Check the wheel alignment, and adjust it if necessary (see **WHEEL ALIGNMENT**).

BUSHING REPLACEMENT

NOTE: Replace the lower arm (A) as an assembly if the lower arm has the paint mark (B) around the hole near the front bushing. The paint mark can also be seen around a hole on the bottom side of the lower arm in the same area. Paint marks indicate a oversize bushing has been installed.

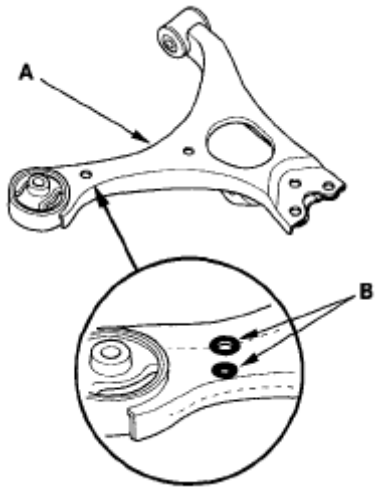

Fig. 26: Identifying Paint Mark On Lower Arm

1. Press out the bushing (A) with the bushing driver, receiver set (attachment A) and a hydraulic press, and remove the bushing from the lower arm (B).

NOTE: Be careful not to damage the inside of the bushing hole when pressing on the bushing.

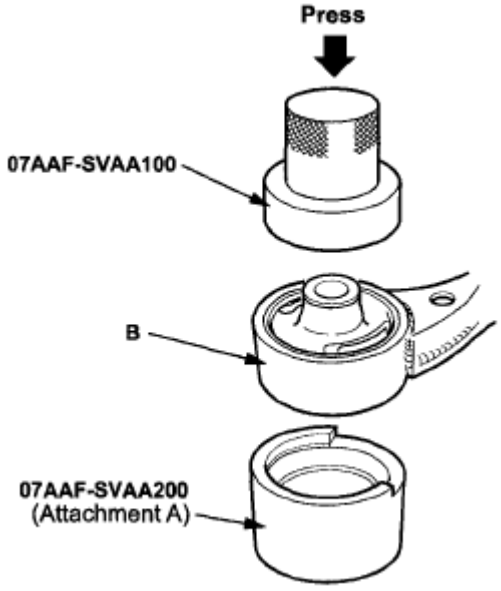

Fig. 27: Pressing Out Bushing

2. Clean the mating surface of the new bushing and the lower arm.
3. Position the tab (A) of the bushing (B) with the lower arm (C) as shown.

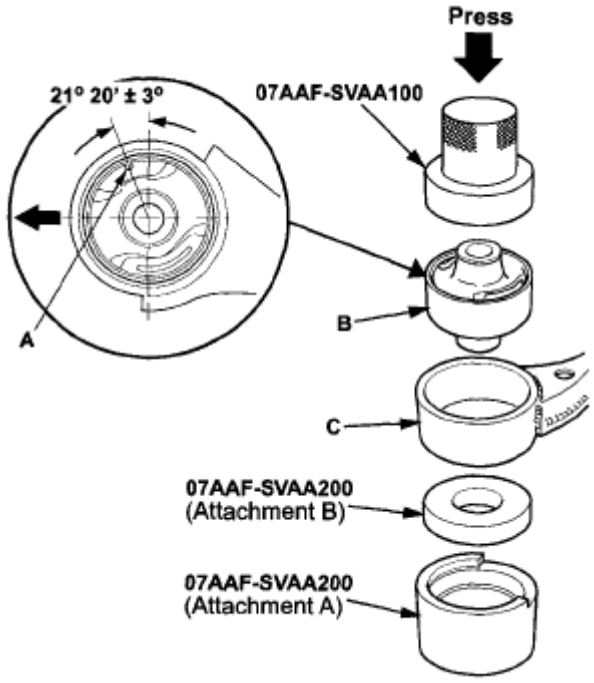

Fig. 28: Identifying Tab Position

4. Using a hydraulic press, bushing driver, and receiver set attachments, press in the bushing into the lower arm.
5. Using a yellow oil-based paint marker, paint a mark (A) around the hole (B) near the front bushing (C). Also paint a mark around the hole on the bottom side of the lower arm in the same area.

NOTE: These marks are used to identify a lower control arm that has had the bushing replaced. Do not replace the bushing in a lower arm with there paint marks; you must replace the lower arm.

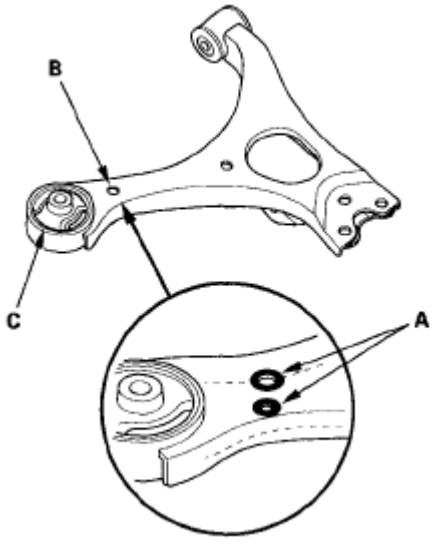

Fig. 29: Identifying Paint Marks On Lower Arm

STABILIZER LINK REMOVAL/INSTALLATION

1. Raise the front of the vehicle, and support it with safety stands in the proper locations (see **LIFT AND SUPPORT POINTS**).
2. Remove the front wheel.
3. Remove the self-locking nut (A) and the flange nut (B) while holding the respective joint pin (C) with a hex wrench (D), then remove the stabilizer link (E).

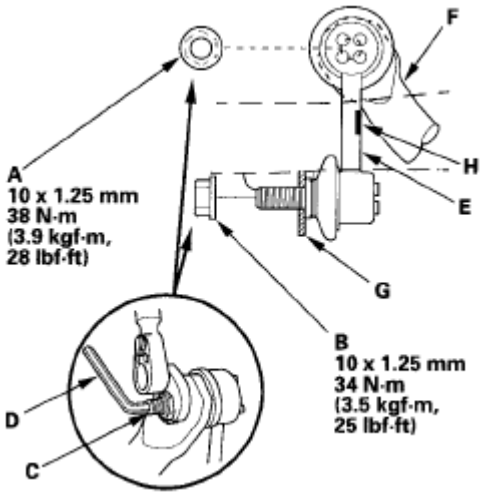

Fig. 30: Identifying Self-Locking Nut (With Torque Specifications)

4. Install the stabilizer link on the stabilizer bar (F) and lower arm (G) with the joint pins set at the center of their range of movement.

NOTE: The stabilizer link has a paint mark (H). Align the paint mark on the stabilizer link facing rearward.

5. Install a new self-locking nut and a new flange nut, and lightly tighten them.
6. Place a jack under the lower arm, and raise the suspension to load it with the vehicle's weight.
7. Tighten the self-locking nut and flange nut to the specified torque values while holding the respective joint pin with a hex wrench.
8. Reinstall all removed parts and test-drive the vehicle.
9. After 5 minutes of driving, torque the self-locking nut again to the specified torque value.

STABILIZER BAR REPLACEMENT

1. Raise the front of the vehicle, and support it with safety stands in the proper locations (see **LIFT AND SUPPORT POINTS**).
2. Remove the front wheels.
3. Disconnect both stabilizer links from the stabilizer bar (see **STABILIZER LINK REMOVAL/INSTALLATION**).
4. Remove the flange bolts (A) and the bushing holders (B), then remove the bushings (C) and the stabilizer bar (D) from the front suspension subframe (E).

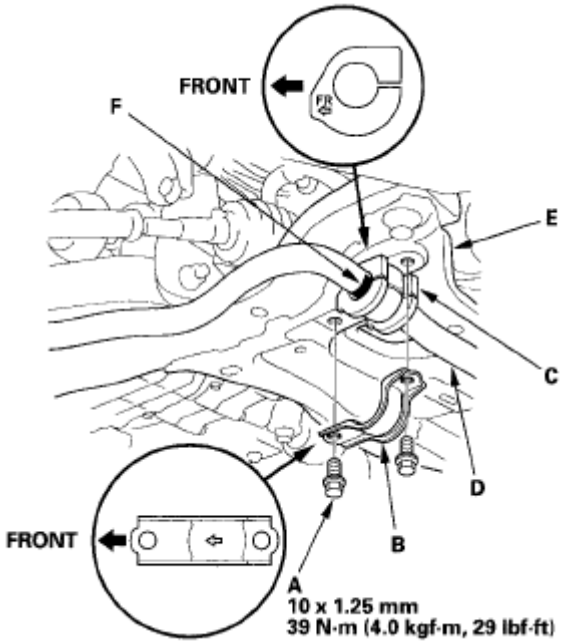

Fig. 31: Identifying Flange Bolts And Bushing Holders

5. Install the stabilizer bar in the reverse order of removal, and note these items:
   - Note the right and left direction of the stabilizer bar.
   - Align the paint marks (F) on the stabilizer bar with the sides of the bushings.
   - Note the fore/aft direction of the bushing holders.
   - Refer to **STABILIZER LINK REMOVAL/INSTALLATION** to connect the stabilizer bar to the links .
   - Before installing the wheel, clean the mating surface of the brake disc and inside of the wheel.
   - Check the wheel alignment, and adjust it if necessary (see **WHEEL ALIGNMENT**).

DAMPER/SPRING REMOVAL AND INSTALLATION

REMOVAL

1. Turn the ignition switch ON (II), then turn on the windshield wipers. Turn the ignition switch off when the wipers are near the A-pillars.
2. Raise the front of the vehicle, and support it with safety stands in the proper locations (see **LIFT AND SUPPORT POINTS**).
3. Remove the front wheel.
4. Remove the wheel sensor harness clip (A) and the brake hose bracket (B) from the damper. Do not disconnect the wheel sensor connector.

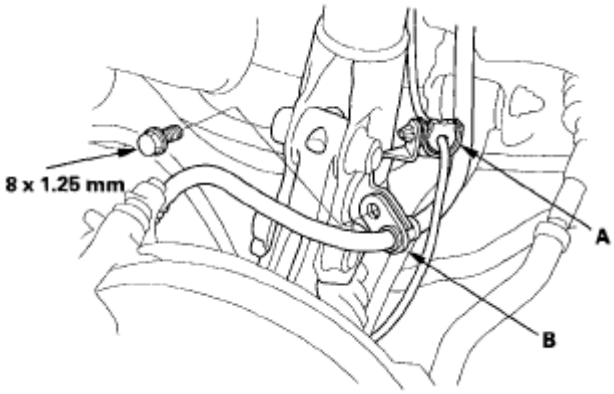

Fig. 32: Identifying Wheel Sensor Harness Clip And Brake Hose Bracket

5. Remove the damper pinch bolts (A) and self-locking nuts (B) from the damper.

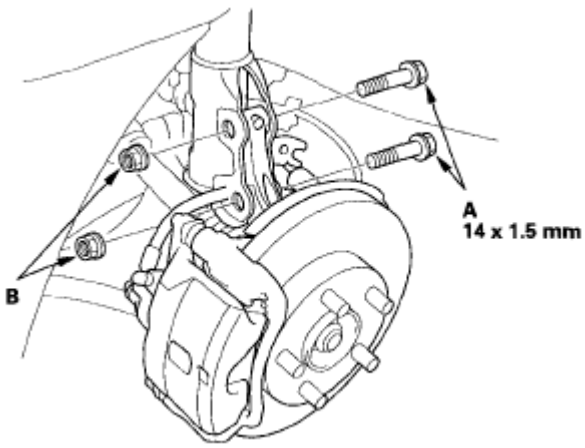

Fig. 33: Identifying Damper Pinch Bolts And Self-Locking Nuts

6. Remove the service cap (A) and the lid (B).

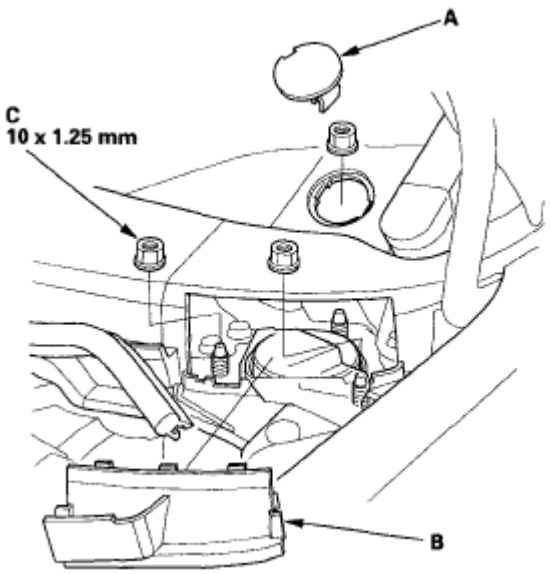

Fig. 34: Identifying Service Cap And Lid

7. Remove the three flange nuts (C) from the top of the damper.

NOTE:

- **Damper springs are different, left and right. Mark the springs L and R before you continue.**
- **Be careful not to damage the body.**

8. Remove the damper assembly (A).

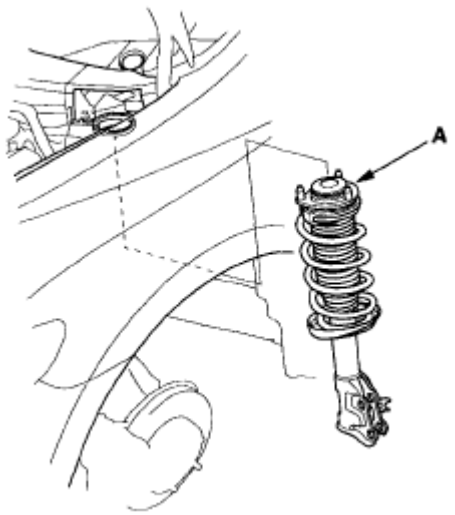

Fig. 35: Identifying Damper Assembly

INSTALLATION

1. Install the damper assembly (A) onto the frame.

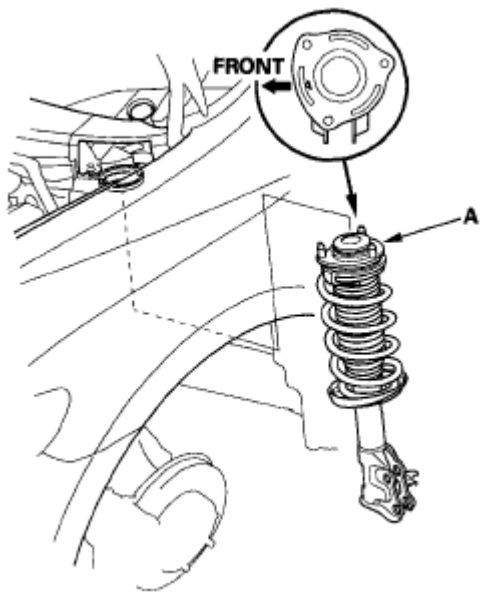

Fig. 36: Identifying Damper Assembly

2. Loosely install the new flange nuts (A).

NOTE: Install the service cap (B) and the lid (C) after tightening the flange nuts to the specified torque value.

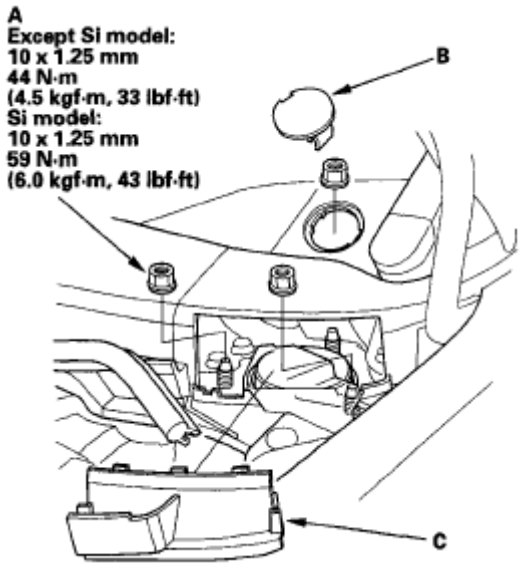

Fig. 37: Identifying Flange Nuts (With Torque Specifications)

3. Loosely install new damper pinch bolts (A) and new self-locking nuts (B) to the damper (C).

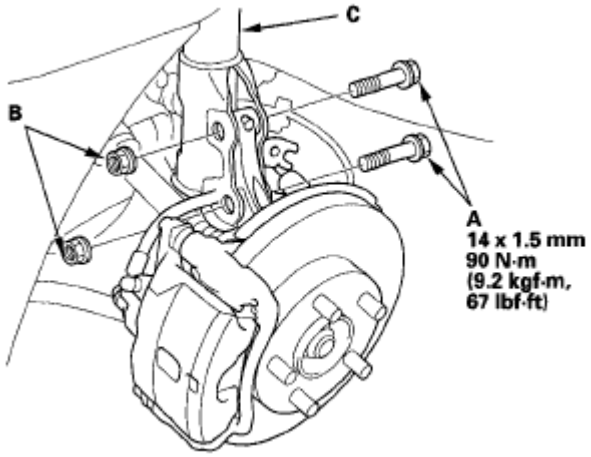

Fig. 38: Identifying Damper Pinch Bolts (With Torque Specifications)

4. Install the wheel sensor harness clip (A) and the brake hose bracket (B) to the damper (C).

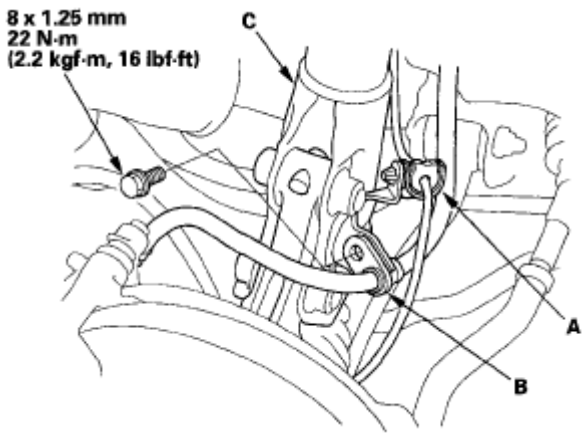

Fig. 39: Identifying Wheel Sensor Harness Clip And Brake Hose Bracket (With Torque Specifications)

5. Raise the front suspension with a floor jack to load the suspension with the vehicle's weight.
6. Tighten the damper pinch bolts to the specified torque value.
7. Tighten the flange nuts on top of the damper to the specified torque value.
8. Install the service cap and the lid.
9. Clean the mating surface of the brake disc and the inside of the wheel, then install the front wheel.
10. Check the wheel alignment, and adjust it if necessary (see **WHEEL ALIGNMENT**).
11. Turn the ignition switch to ON (II), then turn the windshield wipers to the default positions, and turn the ignition switch to LOCK (0).

DAMPER/SPRING DISASSEMBLY, INSPECTION, AND REASSEMBLY

EXPLODED VIEW

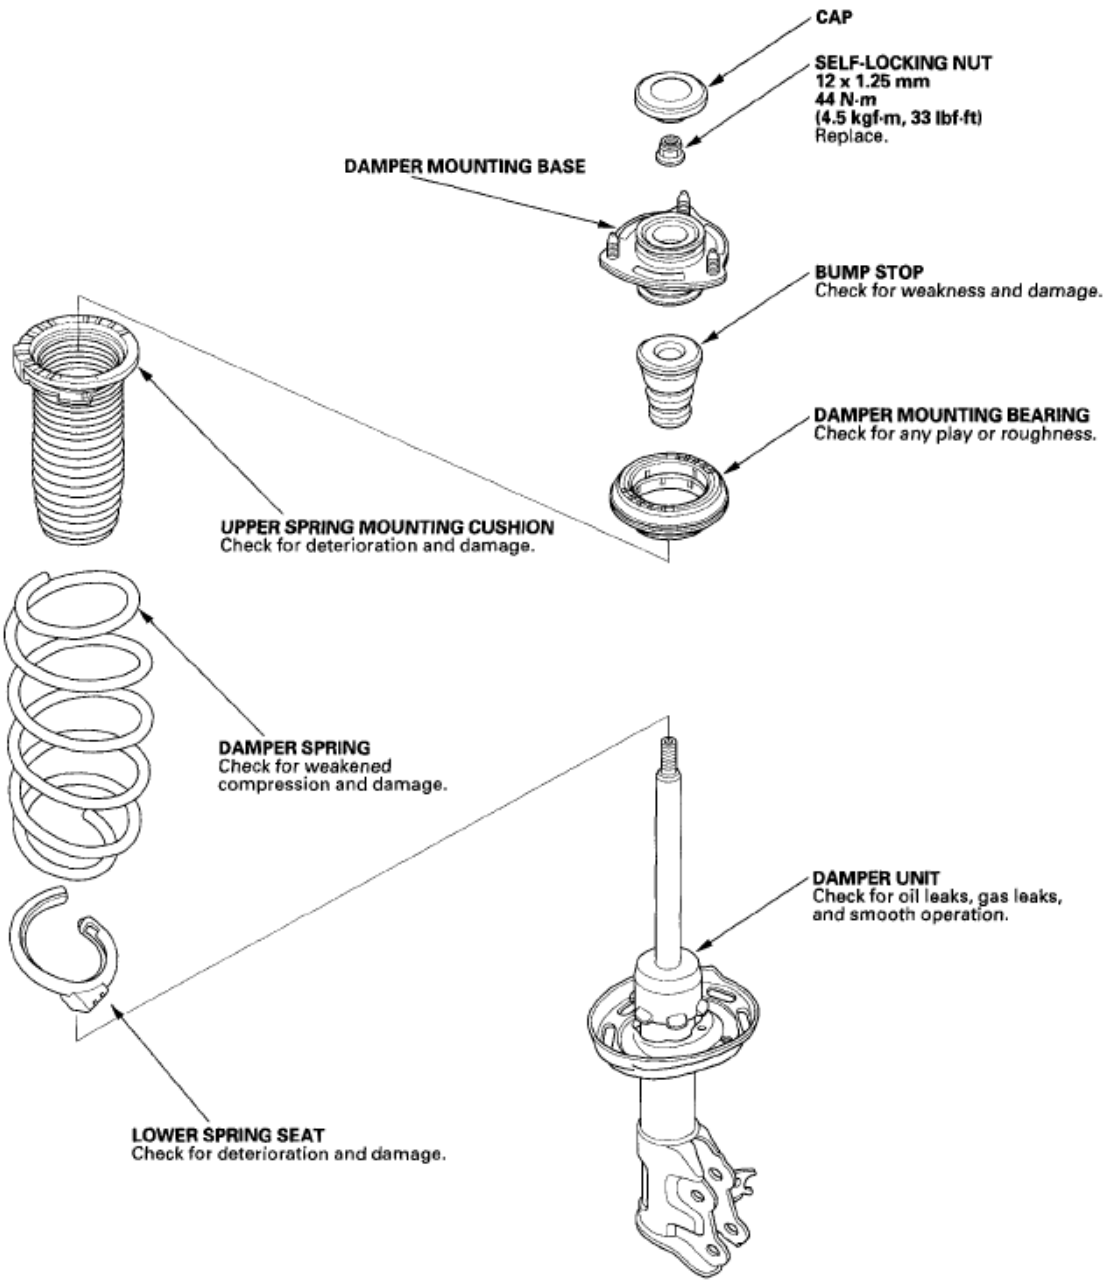

Fig. 40: Exploded View Of Damper/Spring (With Torque Specifications)

Special Tools Required

Strut nut adapter 07AAA-SVAA100

NOTE: When compressing the damper spring, use a commercially available strut spring compressor (Branick MST-580A or Model 7200, or equivalent) according to the manufacturer's instructions.

DISASSEMBLY

1. Remove the cap (A) from the top of the damper.

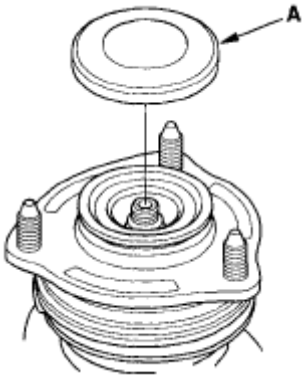

Fig. 41: Identifying Damper Cap

2. Compress the damper spring, then remove the self-locking nut (A) using the strut nut adapter (B) while holding the damper shaft with a hex wrench (C). Do not compress the spring more than necessary to remove the nut.

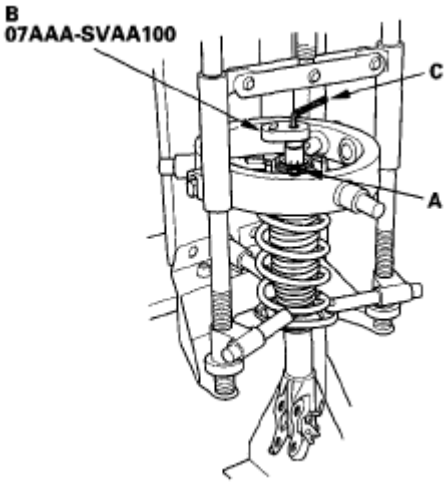

Fig. 42: Identifying Compress Damper Spring

3. Release the pressure from the strut spring compressor, then disassemble the damper as shown in the Exploded View.

INSPECTION

1. Reassemble all the parts, except for the upper spring mounting cushion, the bump stop, and the damper spring.
2. Compress the damper assembly by hand, and check for smooth operation through a full stroke, both compression and extension. The damper should extend smoothly and constantly when compression is released. If it does not, the gas is leaking and the damper should be replaced.

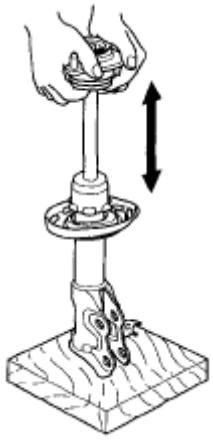

Fig. 43: Identifying Compress Damper Assembly By Hand

3. Check for oil leaks, abnormal noises, or binding during these tests.

REASSEMBLY

1. Install the damper spring (A) on the upper spring mounting cushion (B) by aligning the ledge portion (C).

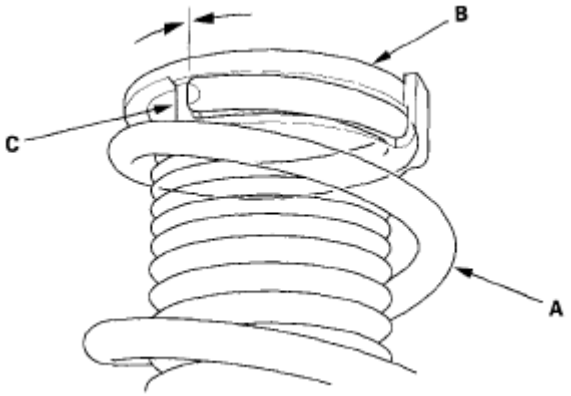

Fig. 44: Aligning Ledge Portion

2. Compress the damper spring.
3. Install all the parts except the damper mounting washer and self-locking nut onto the damper unit (A) by referring to the Exploded View.

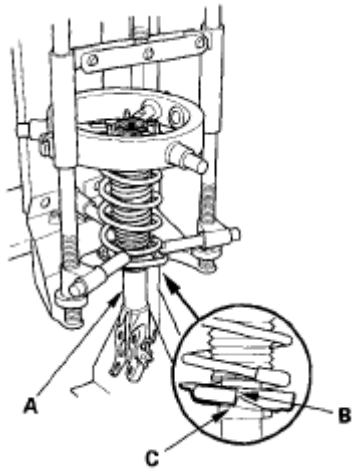

Fig. 45: Exploded View Of Damper

4. Align the bottom of the spring (B) and the stepped part of the lower spring seat (C).
5. Align the damper bracket (A) and the damper mounting base (B) so that the "delta" stamp (C) points toward the front.

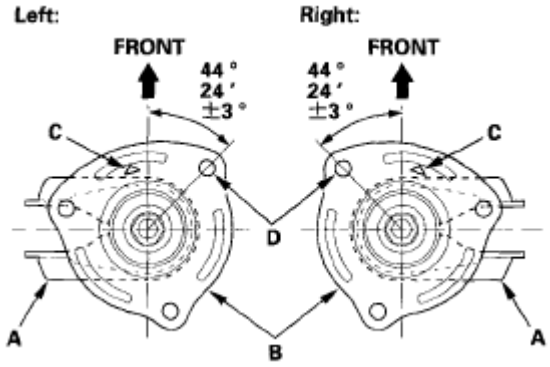

Fig. 46: Aligning Angle Of Strut Bolt On Damper Bracket

6. Align the angle of the strut bolt (D) on the damper bracket as shown.
7. Install a new self-locking nut (A).

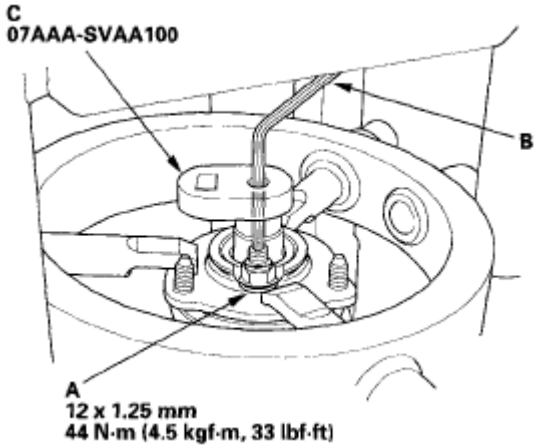

Fig. 47: Identifying Self-Locking Nut (With Torque Specifications)

8. Hold the damper shaft using a hex wrench (B), and tighten the new self-locking nut using the strut nut adapter (C) to the specified torque value.
9. Install the cap.

HUB BEARING UNIT REPLACEMENT-DISC BRAKE TYPE

1. Raise the rear of the vehicle, and support it with safety stands in the proper locations (see **LIFT AND SUPPORT POINTS**).
2. Remove the wheel nuts (A) and the rear wheel.

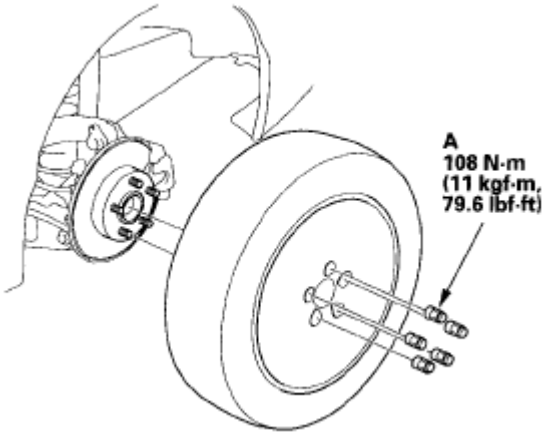

Fig. 3: Identifying Wheel Nuts And Rear Wheel (With Torque Specifications)

3. Remove the brake hose bracket mounting bolt (A) from the knuckle.

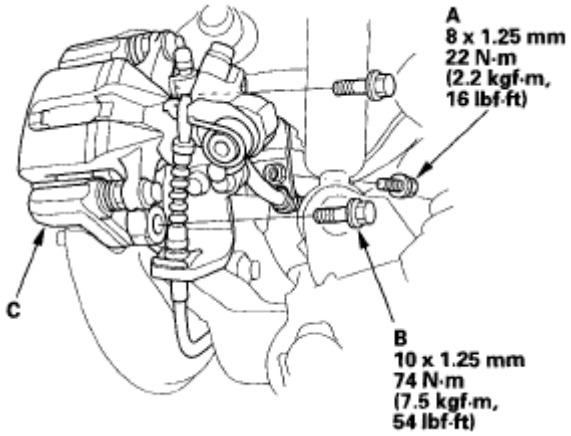

Fig. 4: Identifying Brake Hose Bracket Mounting Bolt From Knuckle (With Torque Specifications)

4. Remove the brake caliper bracket mounting bolts (B), and remove the caliper assembly (C) from the knuckle. To prevent damage to the caliper assembly or brake hose, use a short piece of wire to hang the caliper assembly from the undercarriage. Do not twist the brake hose excessively.
5. Remove the two washers (A).

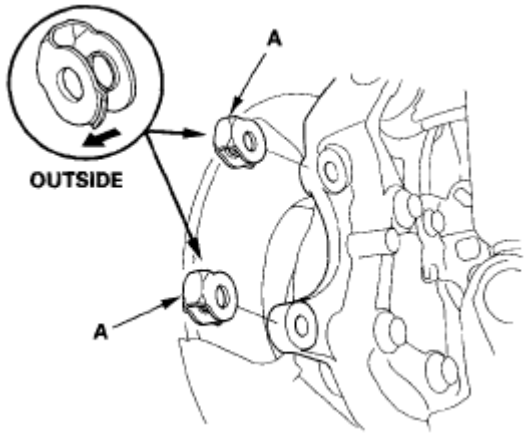

Fig. 5: Identifying Two Washers

6. Remove the 6 mm brake disc retaining screws (A).

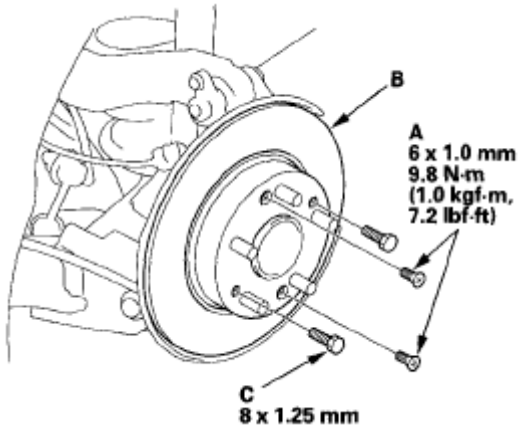

Fig. 6: Identifying Brake Disc Retaining Screws (With Torque Specifications)

7. Remove the brake disc (B) from the hub bearing unit.

NOTE: If the brake disc has clung to the hub bearing unit. Screw two 8 x 1.25 mm bolts (C) into the brake disc to push it away from the hub bearing unit. Turn each bolt 90 degrees at a time to prevent cocking the brake disc.

8. Remove the hub bearing unit (A) and the O-ring (B).

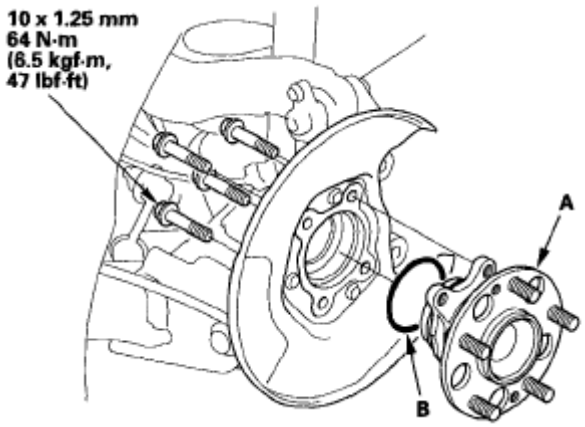

Fig. 7: Identifying Hub Bearing Unit And O-Ring (With Torque Specifications)

9. Check the hub bearing unit for damage and cracks.
10. Install the hub bearing unit in the reverse order of removal, and note these items:
    - Use a new O-ring during reassembly.
    - Tighten all mounting hardware to the specified torque values.
    - Before installing the brake disc, Clean the matching surface of the hub bearing unit and inside of the brake disc.
    - Before installing the wheel, clean the mating surface of the brake disc and the inside of the wheel.
    - Check the wheel alignment, and adjust it if necessary (see **WHEEL ALIGNMENT**).

HUB BEARING UNIT REPLACEMENT-DRUM BRAKE TYPE

1. Raise the rear of the vehicle, and support it with safety stands in the proper locations (see **LIFT AND SUPPORT POINTS**).
2. Remove the wheel nuts (A) and the rear wheel.

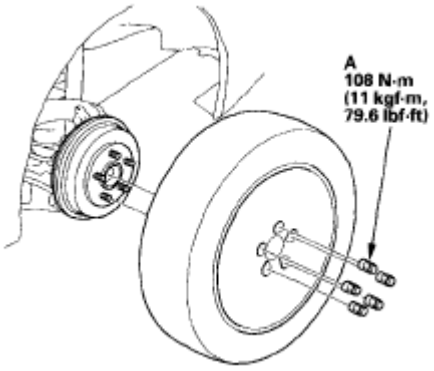

Fig. 8: Identifying Wheel Nuts And Rear Wheel (With Torque Specifications)

3. Release the parking brake, and remove the brake drum (A) from the hub bearing unit.

NOTE:

- **If necessary, turn the adjuster bolt (B) with a flat-tip screwdriver until the shoes become loose.**
- **If the brake drum has clung to the hub bearing unit. Screw two 8 x 1.25 mm bolts (C) into the brake drum to push it away from the hub bearing unit. Turn each bolt 90 degrees at a time to prevent cocking the brake drum.**
- **After installation, press the brake pedal several times to make sure the brakes work and self adjust the brake shoes.**

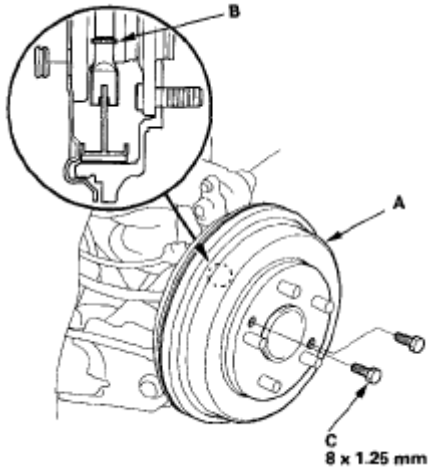

Fig. 9: Identifying Brake Drum And Adjuster Bolt

4. Remove the hub bearing unit (A) and the O-ring (B).

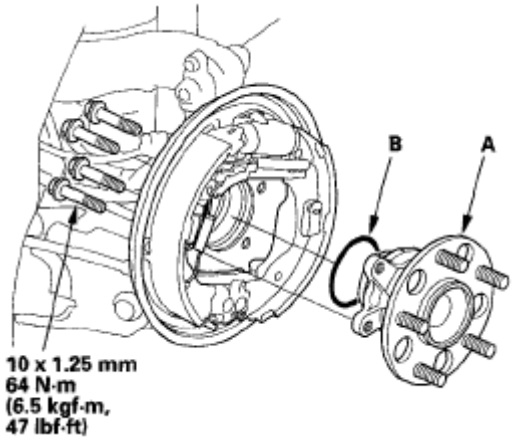

Fig. 10: Identifying Hub Bearing Unit And O-Ring (With Torque Specifications)

5. Check the hub bearing unit for damage and cracks.
6. Install the hub bearing unit in the reverse order of removal, and note these items:
   - Use a new O-ring during reassembly.
   - Tighten all mounting hardware to the specified torque values.
   - Before installing the brake drum, clean the matching surface of the hub bearing unit and inside of the brake drum.
   - Before installing the wheel, clean the mating surface of the brake drum and the inside of the wheel.
   - Check the wheel alignment, and adjust it if necessary (see **WHEEL ALIGNMENT**).

KNUCKLE REPLACEMENT-DISC BRAKE TYPE

1. Remove the hub bearing unit.
2. Remove the splash guard (A).

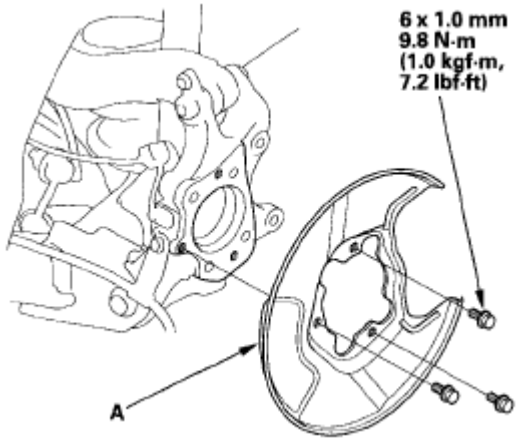

Fig. 11: Identifying Splash Guard (With Torque Specifications)

3. Remove the wheel sensor (A), and the brake hose mounting bracket (B) from the knuckle (C). Do not disconnect the wheel sensor connector.

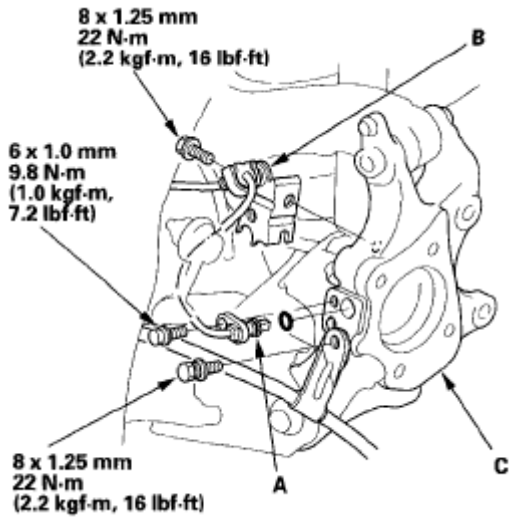

Fig. 12: Identifying Wheel Sensor And Brake Hose Mounting Bracket From Knuckle (With Torque Specifications)

4. Place a floor jack under the trailing arm to support it.

NOTE: Do not place the jack against the plate section of the lower arm. Be careful not to damage any suspension components.

5. Remove the upper arm mounting bolt (A), and disconnect the upper arm (B) from the knuckle.

NOTE: Use the new upper arm mounting bolt during reassembly.

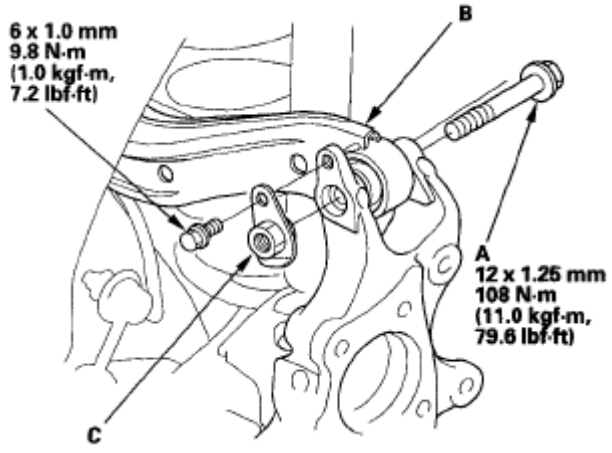

Fig. 13: Identifying Mounting Bolt (With Torque Specifications)

6. Remove the rear knuckle upper bracket (C).
7. Mark the cam positions of the adjusting bolt (A) and the adjusting cam (B), then remove the self-locking nut (C), the adjusting cam, and the adjusting bolt. Discard the self-locking nut.

NOTE: Use a new self-locking nut during reassembly.

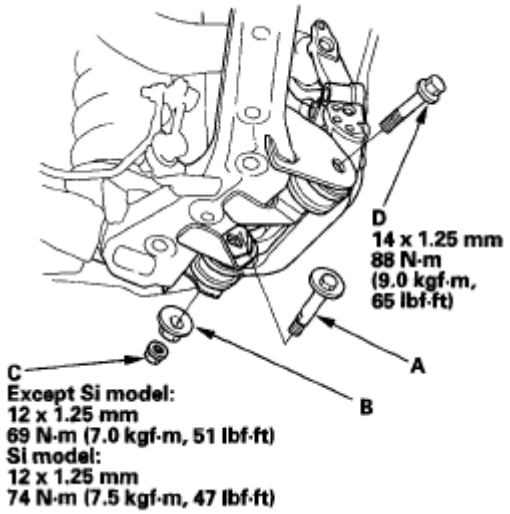

Fig. 14: Identifying Adjusting Bolt, Cam And Self Locking Nut (With Torque Specifications)

8. Remove the flange bolt (D) and remove the knuckle.

NOTE: Use a new flange bolt during reassembly.

9. Install the knuckle in the reverse order of removal, and note these items:
   - First install all the suspension components, and lightly tighten the bolts and nuts, then place a floor jack under the lower arm, and raise the suspension to load it with the vehicle's weight before fully tightening the bolts and nuts to the specified torque values.
   - Align the cam positions of the adjusting bolt and the adjusting cam with the marked positions when tightening.
   - Before installing the brake disc, clean the mating surface of the hub bearing unit and the inside of the brake disc.
   - Before installing the wheel, clean the mating surface of the brake disc and the inside of the wheel.
   - Check the wheel alignment, and adjust it if necessary (see **WHEEL ALIGNMENT**).

KNUCKLE REPLACEMENT-DRUM BRAKE TYPE

1. Remove the hub bearing unit.
2. Disconnect the brake line (A) from the wheel cylinder (B). Remove the rear brake assembly (C) from the knuckle.

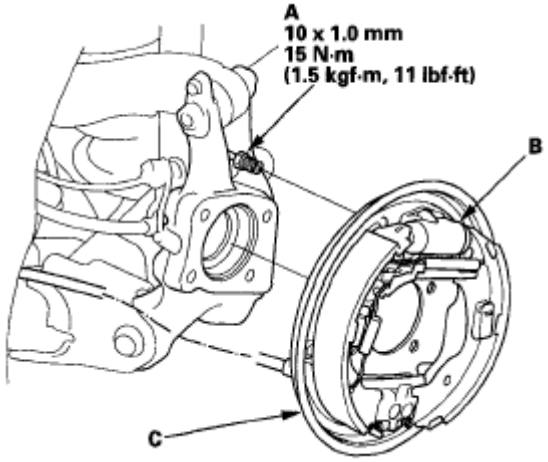

Fig. 15: Identifying Rear Brake Assembly From Knuckle (With Torque Specifications)

3. Remove the wheel sensor (A), and the brake hose mounting bracket (B) from the knuckle (C). Do not disconnect the wheel sensor connector.

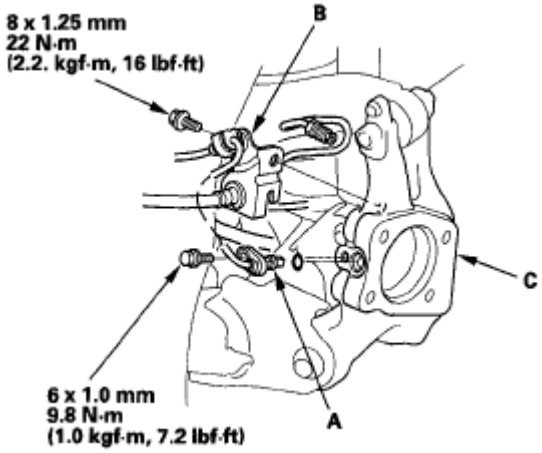

Fig. 16: Identifying Wheel Sensor, Brake Hose Mounting Bracket From Knuckle (With Torque Specifications)

4. Place a floor jack under the trailing arm to support it.

NOTE: Do not place the jack against the plate section of the lower arm. Be careful not to damage any suspension components.

5. Remove the upper arm mounting bolt (A), and disconnect the upper arm (B) from the knuckle.

NOTE: Use a new upper arm mounting bolt during reassembly.

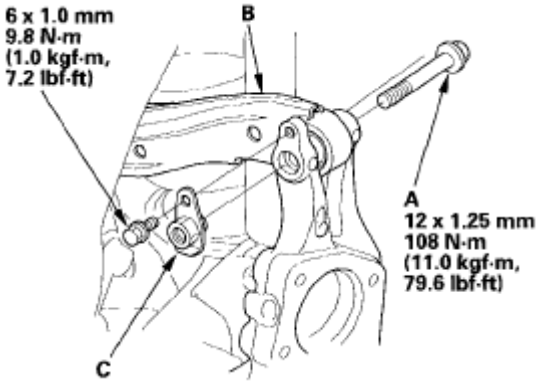

Fig. 17: Identifying Upper Arm Mounting Bolt (With Torque Specifications)

6. Remove the rear knuckle upper bracket (C).
7. Mark the cam positions of the adjusting bolt (A) and the adjusting cam (B), then remove the self-locking nut (C), the adjusting cam, and the adjusting bolt. Discard the self-locking nut.

NOTE: Use a new self-locking nut during reassembly.

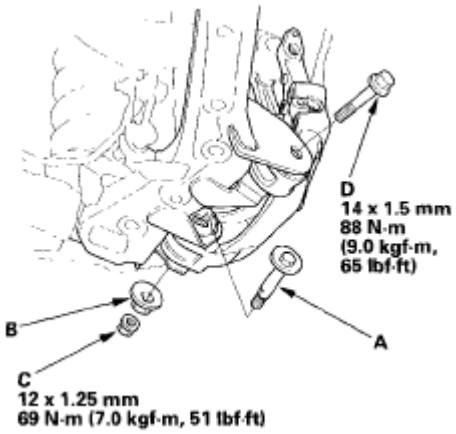

Fig. 18: Identifying Adjusting Bolt, Cam And Self Locking Nut (With Torque Specifications)

8. Remove the flange bolt (D) and remove the knuckle.

NOTE: Use a new flange bolt during reassembly.

9. Install the knuckle in the reverse order of removal, and note these items:
   - First install all the suspension components, and lightly tighten the bolts and nuts, then place a floor jack under the lower arm, and raise the suspension to load it with the vehicle's weight before fully tightening the bolts and nuts to the specified torque values.
   - Align the cam positions of the adjusting bolt and the adjusting cam with the marked positions when tightening.
   - Before installing the brake drum, clean the mating surface of the hub bearing unit and the inside of the brake drum.
   - Before installing the wheel, clean the mating surface of the brake drum and the inside of the wheel.

- Fill the master cylinder reservoir to the MAX (upper) level line, and bleed the brake system (see **BRAKE SYSTEM BLEEDING**). Check for a leak at the brake line to the wheel cylinder, and retighten it if necessary.
- Check the wheel alignment, and adjust it if necessary (see **WHEEL ALIGNMENT**).

UPPER ARM REMOVAL/INSTALLATION

1. Raise the rear of the vehicle, and support it with safety stands in the proper locations (see **LIFT AND SUPPORT POINTS**).
2. Remove the rear wheel.
3. Position a floorjack at the connecting point of the trailing arm (A) and the knuckle (B).

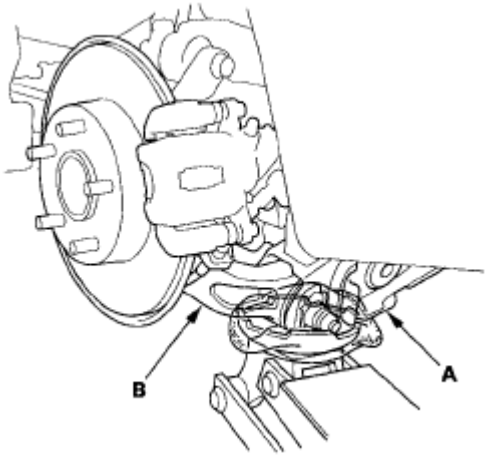

Fig. 19: Identifying Trailing Arm And Knuckle

4. Remove the flange bolts (A) from the vehicle.

NOTE: Use the new flange bolts during reassembly.

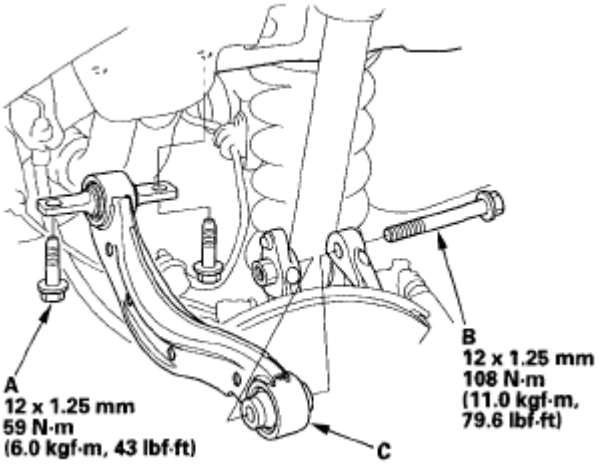

Fig. 20: Identifying Flange Bolts From Vehicle (With Torque Specifications)

5. Remove the flange bolt (B) from the knuckle, and remove the upper arm (C).

NOTE: Use the new flange bolt during reassembly.

6. Install the upper arm in the reverse order of removal, and note these items:
   - Tighten all mounting hardware to the specified torque values.
   - First install all the components, and lightly tighten the bolts, then raise the suspension to load it with the vehicle's weight before fully tightening to the specified torque values.
   - Before installing the wheel, clean the mating surface of the brake disc or the brake drum and the inside of the wheel.
   - Check the wheel alignment, and adjust it if necessary (see **WHEEL ALIGNMENT**).

TRAILING ARM REMOVAL/INSTALLATION

1. Raise the rear of the vehicle, and support it with safety stands in the proper locations (see **LIFT AND SUPPORT POINTS**).
2. Remove the rear wheel.
3. Remove the rear under cover (see **MIDDLE FLOOR UNDERCOVER REPLACEMENT**).
4. Remove the parking brake cable (A) from the trailing arm (B).

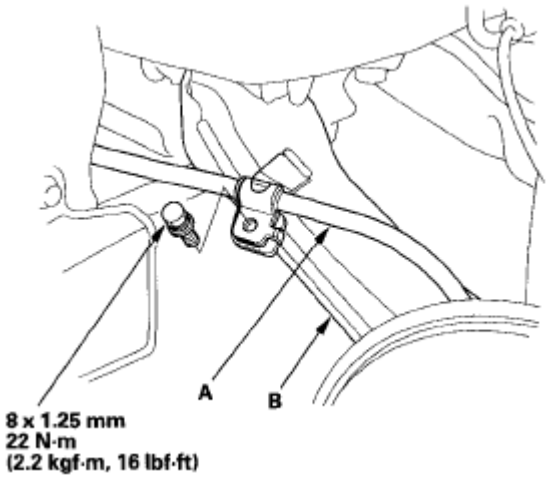

Fig. 21: Identifying Parking Brake Cable From Trailing Arm (With Torque Specifications)

5. Position a floor jack at the connecting point of the trailing arm.

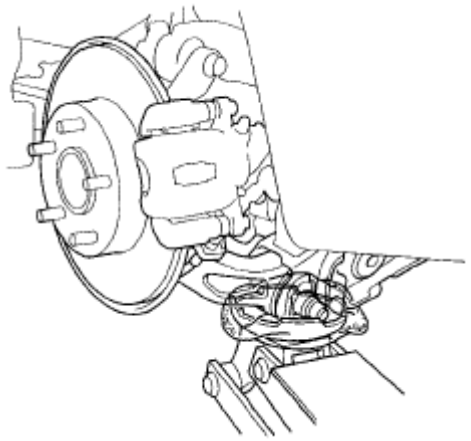

Fig. 22: Identifying Trailing Arm

6. Remove the knuckle, disc type (see **KNUCKLE REPLACEMENT-DISC BRAKE TYPE**), drum type (see **KNUCKLE REPLACEMENT-DRUM BRAKE TYPE**).
7. Remove the stabilizer link from the trailing arm (see **STABILIZER LINK REMOVAL/INSTALLATION**).
8. Remove the spring (see **SPRING REPLACEMENT**).
9. Remove the trailing arm rear mounting bolt (A).

NOTE: Use a new mounting bolt during reassembly.

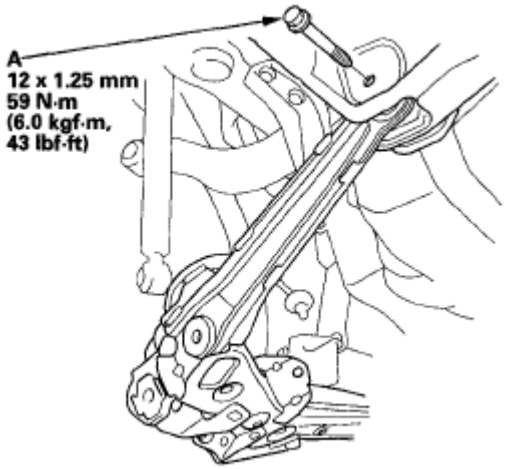

Fig. 23: Identifying Trailing Arm Rear Mounting Bolt (With Torque Specifications)

10. Lower the jack, and remove the trailing arm.
11. Install the trailing arm in the reverse order of removal, and note these items:
    - Tighten all mounting hardware to the specified torque values.
    - First install all the components, and lightly tighten the bolts, then raise the suspension to load it with the vehicle's weight before fully tightening to the specified torque values.
    - Check the brake hose for interference and twisting.
    - Before installing the wheel, clean the mating surface of the brake disc or the brake drum and the inside of the wheel.

- Check the wheel alignment, and adjust it if necessary (see **WHEEL ALIGNMENT**).

STABILIZER LINK REMOVAL/INSTALLATION

1. Raise the rear of the vehicle, and support it with safety stands in the proper locations (see **LIFT AND SUPPORT POINTS**).
2. Remove the rear wheel.
3. Remove the self-locking nut (A) and the flange nut (B) while holding the respective joint pin (C) with a hex wrench (D), then remove the stabilizer link (E).

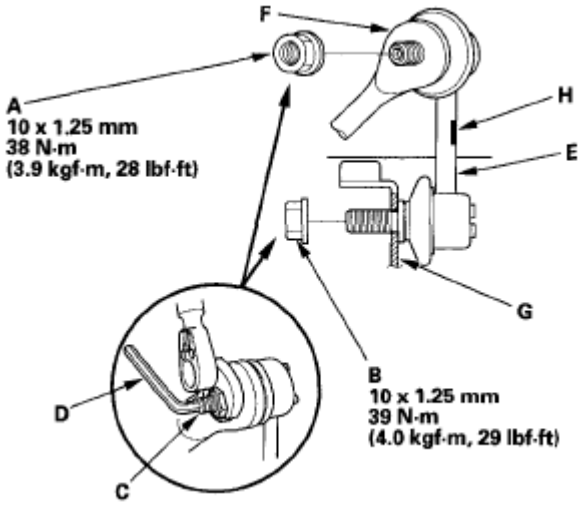

Fig. 24: Identifying Self-Locking Nut And Flange Nut (With Torque Specifications)

4. Install the stabilizer link on the stabilizer bar (F) and trailing arm (G) with the joint pins set at the center of their range of movement.

NOTE: The stabilizer link has a paint mark (H). Align the paint mark on the stabilizer link facing rearward.

5. Install a new self-locking nut and a new flange nut, and lightly tighten them.
6. Place a floor jack under the trailing arm, and raise the suspension to load it with the vehicle's weight.
7. Tighten the self-locking nut and flange nut to the specified torque values while holding the respective joint pins with a hex wrench.
8. Reinstall all removed parts and test-drive the vehicle.
9. After 5 minutes of driving, torque the self-locking nut again to the specified torque value.

STABILIZER BAR REPLACEMENT

1. Raise the rear of the vehicle, and support it with safety stands in the proper locations (see **LIFT AND SUPPORT POINTS**).
2. Remove the rear wheels.
3. Disconnect both stabilizer links from the stabilizer bar (see **STABILIZER LINK REMOVAL/INSTALLATION**).

4. Remove the flange bolts (A) and the bushing holders (B), then remove the bushings (C) and the stabilizer bar (D).

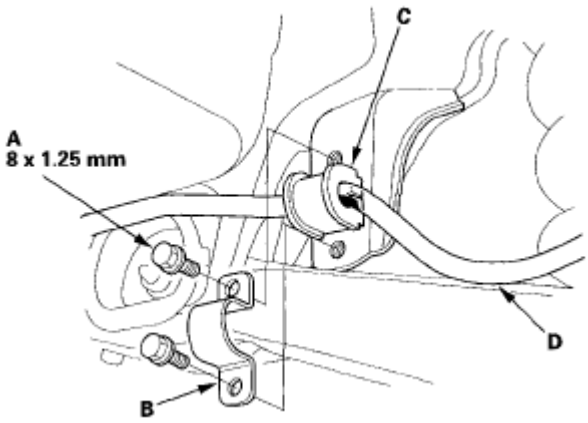

Fig. 25: Identifying Flange Bolts And Bushing Holders

5. Remove the flange bolts (A) and the stabilizer bar bracket (B) if necessary.

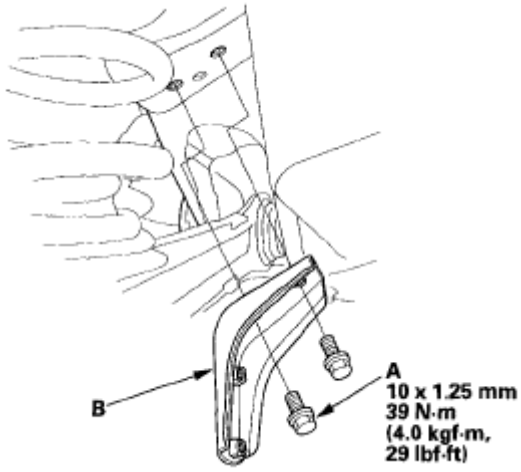

Fig. 26: Identifying Flange Bolts And Stabilizer Bar Bracket (With Torque Specifications)

6. Install the stabilizer bar in the reverse order of removal, and note these items:
   - Note the right and left direction of the stabilizer bar.
   - Align the paint marks (A) on the stabilizer bar with the sides of the bushings.
   - Refer to stabilizer link removal/installation to connect the stabilizer bar to the links (see **STABILIZER LINK REMOVAL/INSTALLATION**).
   - Before installing the wheel, clean the mating surfaces on the brake disc or the brake drum and inside of the wheel.
   - Check the wheel alignment, and adjust it if necessary (see **WHEEL ALIGNMENT**).

DAMPER REPLACEMENT

EXPLODED VIEW

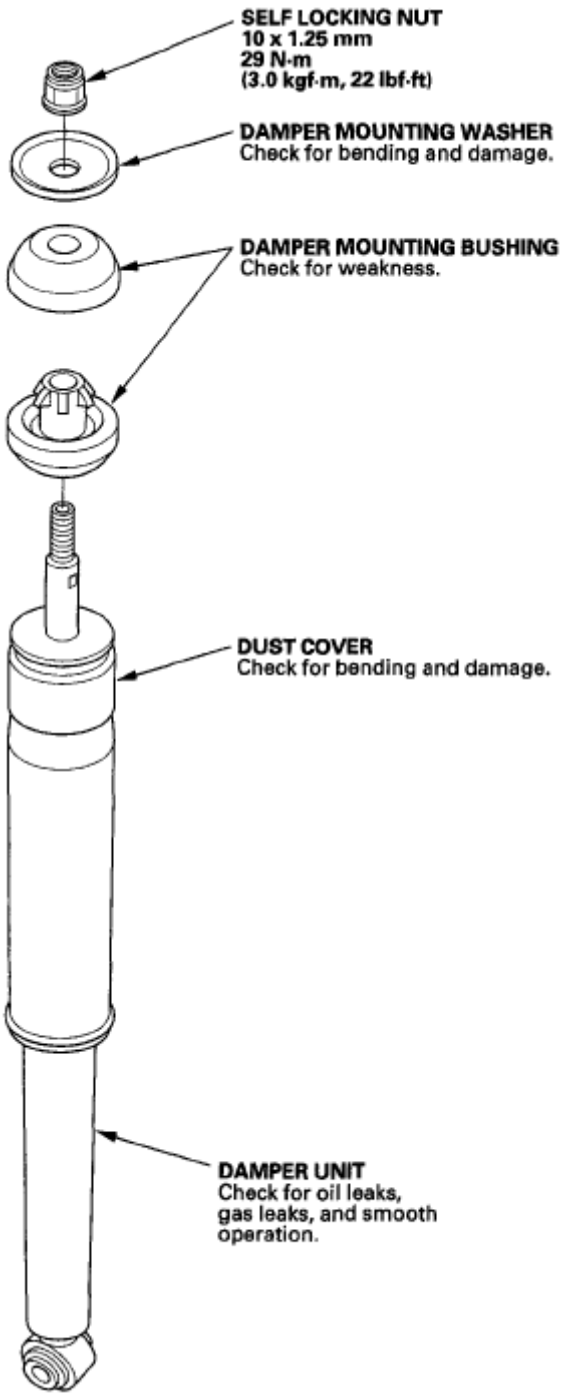

Fig. 28: Exploded View Of Damper Components (With Torque Specifications)

REMOVAL

1. Raise the rear of the vehicle, and support it with safety stands in the proper locations (see **LIFT AND SUPPORT POINTS**).
2. Remove the rear wheel.
3. Position a floor jack at the connecting point of the trailing arm (A) and the knuckle (B). Raise the floor jack until the suspension begins to compress.

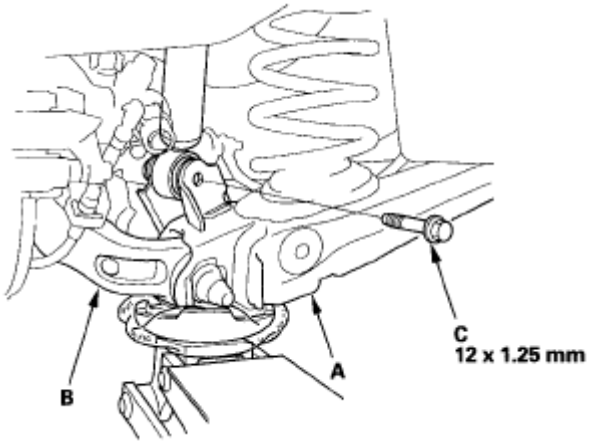

Fig. 29: Identifying Flange Bolt

4. Remove the flange bolt (C) from the bottom of the damper.
5. Remove the trunk side trim panel, 2-door (see **TRIM REMOVAL/INSTALLATION - TRUNK AREA**), 4-door (see **4-DOOR**).
6. Remove the self-locking nut (A) while holding the damper shaft (B) with a hex wrench (C).

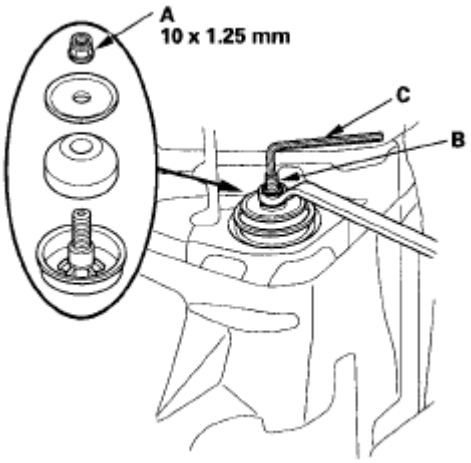

Fig. 30: Identifying Self-Locking Nut

7. Compress the damper unit (A) by hand, and remove it from the vehicle.

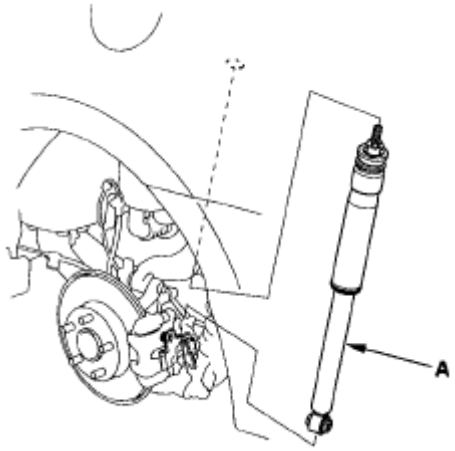

Fig. 31: Identifying Compress Damper Unit By Hand

INSPECTION

1. Push on the damper as shown.

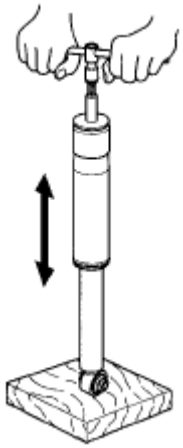

Fig. 32: Pushing On Damper

2. Compress the damper assembly by hand, and check for smooth operation through a full stroke, both compression and extension. The damper should extend smoothly and constantly when compression is released. If it does not, the gas is leaking and the damper should be replaced.
3. Check for oil leaks, abnormal noises, or binding during these tests.

INSTALLATION

1. Install the damper mounting bushing (A) onto the damper unit. Position the damper assembly (B) between the body and trailing arm. Be careful not to damage the body.

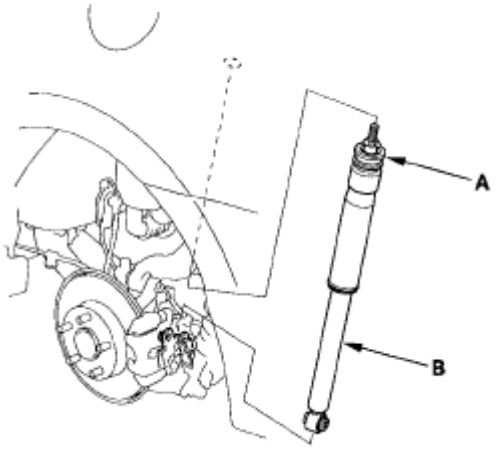

Fig. 33: Identifying Damper Mounting Bushing Onto Damper Unit

2. Position a jack under the trailing arm to support the suspension, then install a new damper mounting bolt (A).

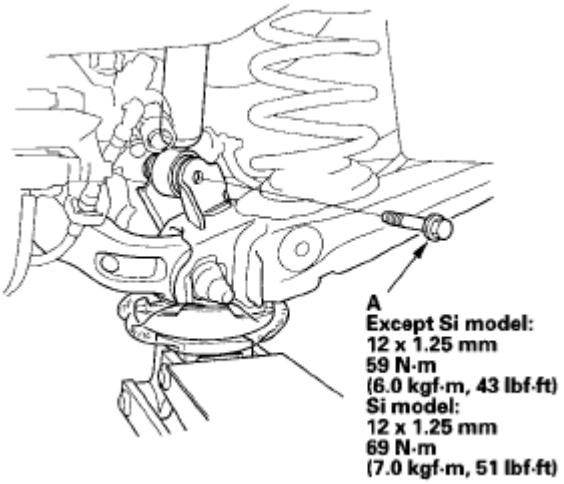

Fig. 34: Identifying Damper Mounting Bolt (With Torque Specifications)

3. Loosely tighten the damper mounting bolt.
4. Raise the rear suspension with the jack until the vehicle just lifts off the safety stands, then tighten the damper mounting bolt to the specified torque value.
5. Install the damper mounting bushing (A), the damper mounting washer (B), and a new self-locking nut (C) on the damper shaft.

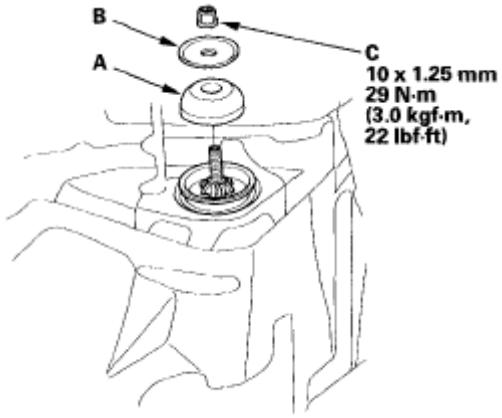

Fig. 35: Identifying Damper Mounting Bushing (With Torque Specifications)

6. Tighten the self-locking nut to the specified torque value while holding the damper shaft (A) with a hex wrench (B).

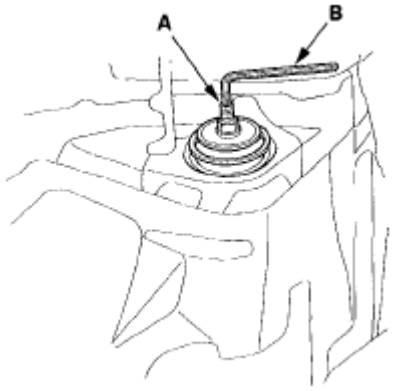

Fig. 36: Tightening Self-Locking Nut (With Torque Specifications)

7. Install the trunk side trim panel, 2-door (see **TRIM REMOVAL/INSTALLATION - TRUNK AREA**), 4-door (see **4-DOOR**).
8. Install the rear wheel.

NOTE: Before installing the wheel, clean the mating surface of the brake disc or brake drum and the inside of the wheel.

9. Check the wheel alignment, and adjust it if necessary (see **WHEEL ALIGNMENT**).

SPRING REPLACEMENT

EXPLODED VIEW

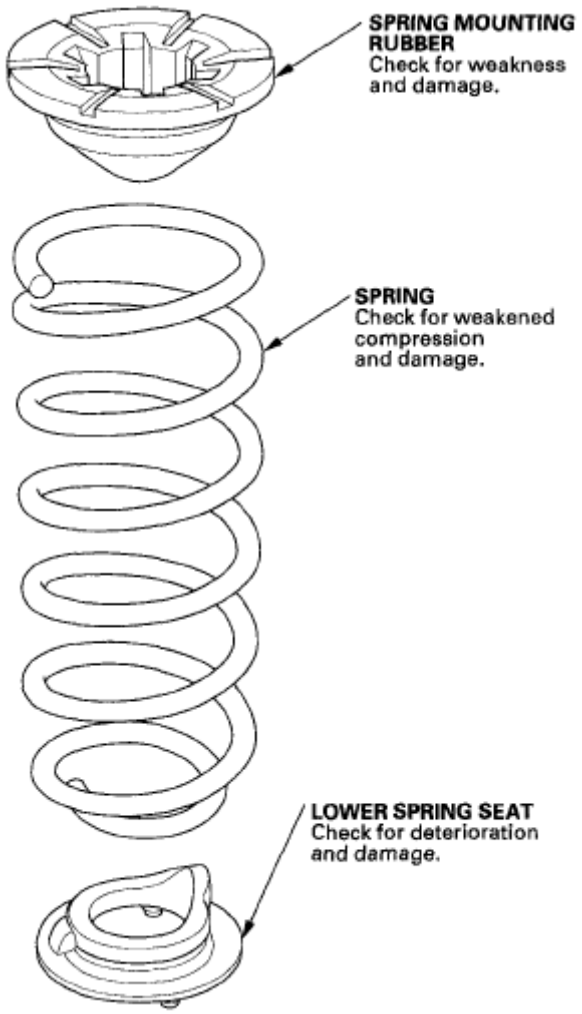

Fig. 37: Exploded View Of Spring Replacement

REMOVAL

1. Raise the rear of the vehicle, and support it with safety stands in the proper locations (see **LIFT AND SUPPORT POINTS**).
2. Remove the rear wheel.
3. Remove the wheel sensor (A) from the knuckle (B). Do not disconnect the wheel sensor connector.

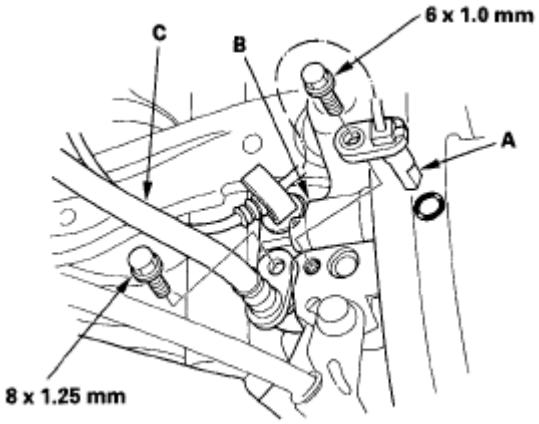

Fig. 38: Identifying Wheel Sensor And O-Ring

4. Remove the brake hose (C).
5. Position a floor jack at the connecting point of the trailing arm and the knuckle.
6. Remove the flange bolt (A) that connects the trailing arm (B) and the damper (C).

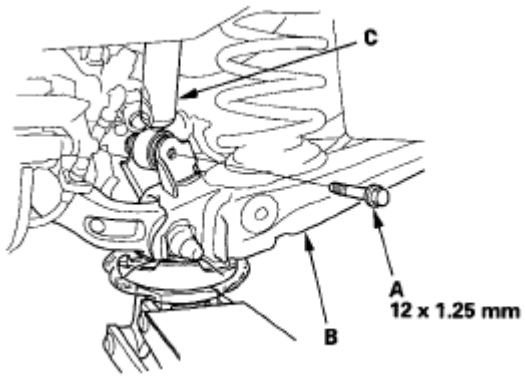

Fig. 39: Identifying Flange Bolt

7. Remove the stabilizer link from the trailing arm (see **STABILIZER LINK REMOVAL/INSTALLATION**).
8. Remove the flange bolt (A) that connects the knuckle (B) and the upper arm (C).

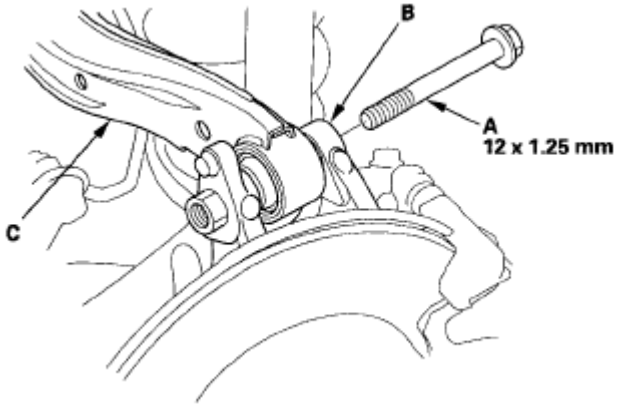

Fig. 40: Identifying Flange Bolt

9. Remove the trailing arm front mounting bolts (A).

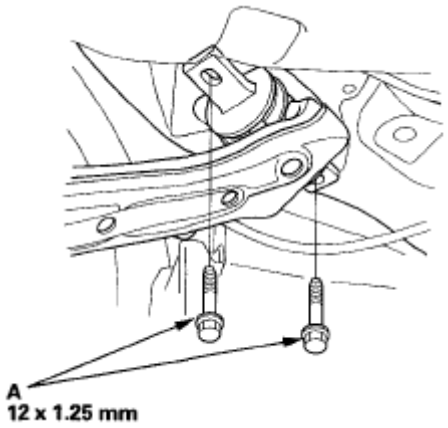

Fig. 41: Identifying Trailing Arm Front Mounting Bolts

10. Lower the floor jack gradually.
11. Remove the spring mounting rubber (A), the spring (B) and the lower spring seat (C).

NOTE: If the clip is installed inside the spring mounting rubber, discard it.

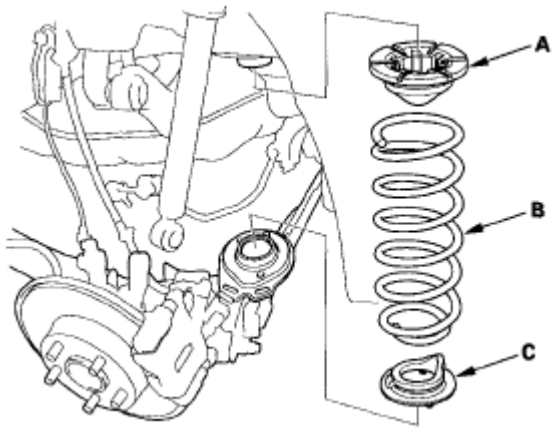

Fig. 42: Identifying Spring Mounting Rubber

INSTALLATION

1. Install the spring mounting rubber (A), the spring (B) and the lower spring seat (C).

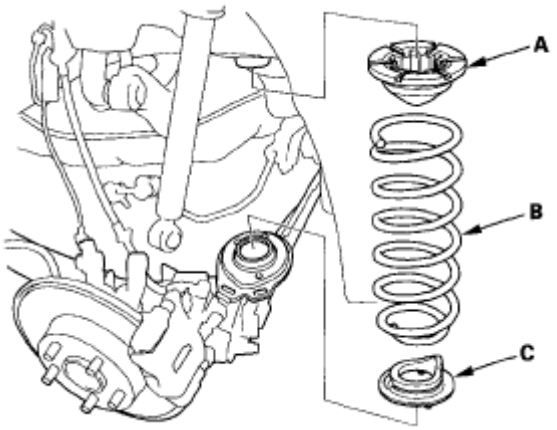

Fig. 43: Identifying Spring Mounting Rubber

2. Align the bottom of the spring (A) and the lower spring seat (B) with the trailing arm (C) as shown.

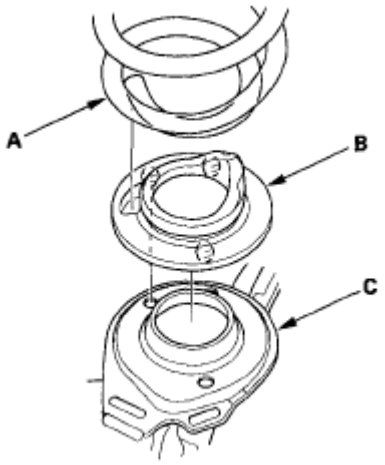

Fig. 44: Aligning Bottom Of Spring

3. Loosely install the new trailing arm front mounting bolts (A).

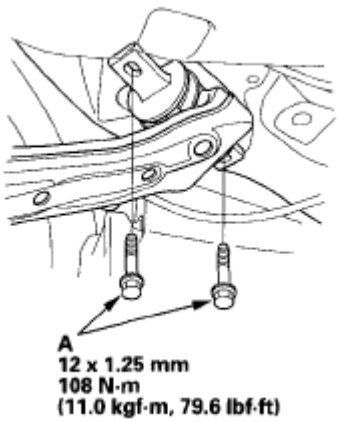

Fig. 45: Identifying Trailing Arm Front Mounting Bolts (With Torque Specifications)

4. Loosely install a new flange bolt (A) on the knuckle (B) and the upper arm (C).

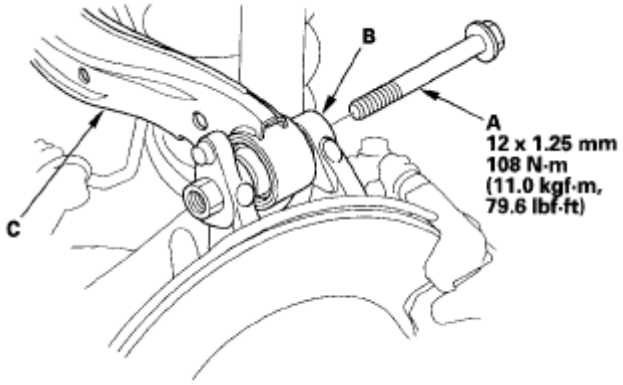

Fig. 46: Identifying Flange Bolt (With Torque Specifications)

5. Slowly raise the jack until you can align the bolt hole with the holes in the trailing arm (A) and the damper (B), and install a new flange bolt (C).

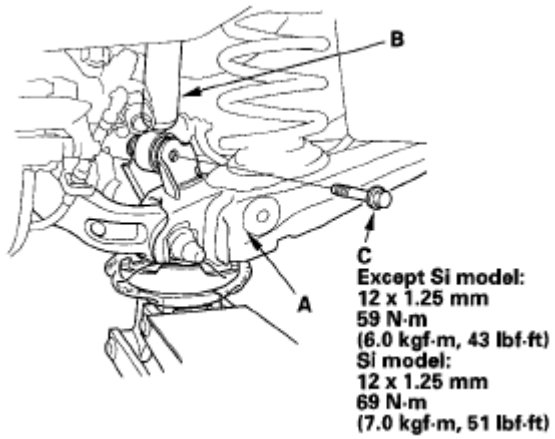

Fig. 47: Identifying Flange Bolt (With Torque Specifications)

6. Install the stabilizer link on the trailing arm with a new self-locking nut, and lightly tighten both nuts.
7. Raise the rear suspension with a floor jack to load the vehicle weight.
8. Tighten all mounting hardware to the specified torque values. For stabilizer link torque specifications (see **STABILIZER LINK REMOVAL/INSTALLATION**).
9. Install the wheel sensor (A) and the brake hose (B).

NOTE: Apply multipurpose grease to the mating surfaces on the knuckle and the O-ring (C).

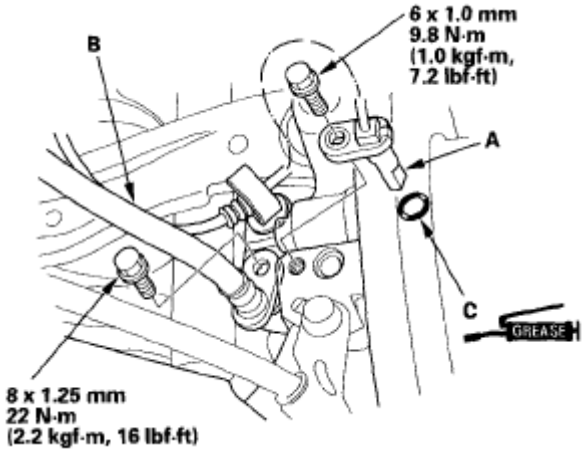

Fig. 48: Identifying Wheel Sensor And Brake Hose (With Torque Specifications)

10. Install the rear wheel.

NOTE: Before installing the wheel, clean the mating surface of the brake disc or the brake drum and inside of the wheel.

11. Check the wheel alignment, and adjust it if necessary (see **WHEEL ALIGNMENT**).

WHEEL ALIGNMENT

The suspension can be adjusted for front camber, front toe, and rear toe. However, each of these adjustments are related to each other. For example, when you adjust camber, the toe will change. Therefore, you must adjust the front wheel alignment whenever you adjust camber or toe.

PRE-ALIGNMENT CHECKS

For proper inspection and adjustment of the wheel alignment, do these checks:

1. Release the parking brake to avoid an incorrect measurement.
2. Make sure the suspension is not modified.

3. Check the tire size and pressure.

   Tire size:

   Front/Rear:

   DX, DX-G and GX models: P195/65R 15 89H

   LX and EX models: P205/55R 16 89H

   Si model: P215/45R 17 87V

   215/45ZR 17 91W (optional)

   Tire pressure:

   Front/Rear:

   DX, DX-G and GX models:

   210 kPa (2.1kgf/m^2 , 30psi)

   LX and EX (L) models: 220 kPa (2.2 kgf/m^2 , 32 psi)

   Tire pressure (4-door Si model):

   Si model: 230 kPa (2.3 kgf/m^2 , 33 psi)

4. Check the runout of the wheels and tires (see **WHEEL RUNOUT INSPECTION**).
5. Check the suspension ball joints. (Hold a tire with your hands, and move it up and down and right and left to check for wobbling.)

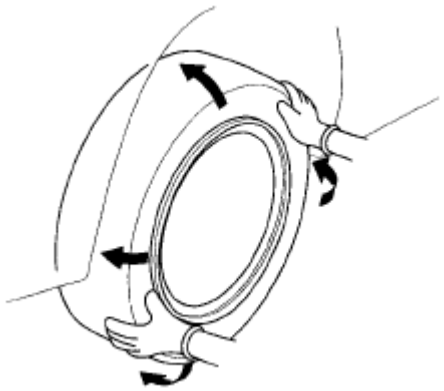

Fig. 5: Identifying Suspension Ball Joints (Hold Tire With Your Hands)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Bounce the vehicle up and down several times to settle the suspension.

CASTER INSPECTION

Use commercially available computerized four wheel alignment equipment to measure wheel alignment (caster, camber, toe, and turning angle). Follow the equipment manufacturer's instructions.

Check the caster angle.

Caster angle: 7° 00'±1°

- If the measurement is within specifications, measure the camber angle.
- If the measurement is not within specifications, check for bent or damaged suspension components.

CAMBER INSPECTION

Except GX Model

Use commercially available computerized four wheel alignment equipment to measure wheel alignment (caster, camber, toe, and turning angle). Follow the equipment manufacturer's instructions.

Check the camber angle.

Camber angle:

Front: 0°00'±30' (Maximum difference between the front right and left side: 0° 35')

Rear: -1 °30' (+1°05 ' -0° 45')

- If the measurement for the front camber is outside the specification, go to front camber adjustment.
- If the measurement for the rear camber is outside the specification, check for bent or damaged suspension components.

GX Model

Use commercially available computerized four wheel alignment equipment to measure wheel alignment (caster, camber, toe, and turning angle). Follow the equipment manufacturer's instructions.

Check the camber angle.

NOTE:

- **There are upper arms with "C" marks (A) and without "C" marks.**
- **"C" marks are in both faces of both arms.**
- **Rear camber angle is different based on with or without "C" marks.**

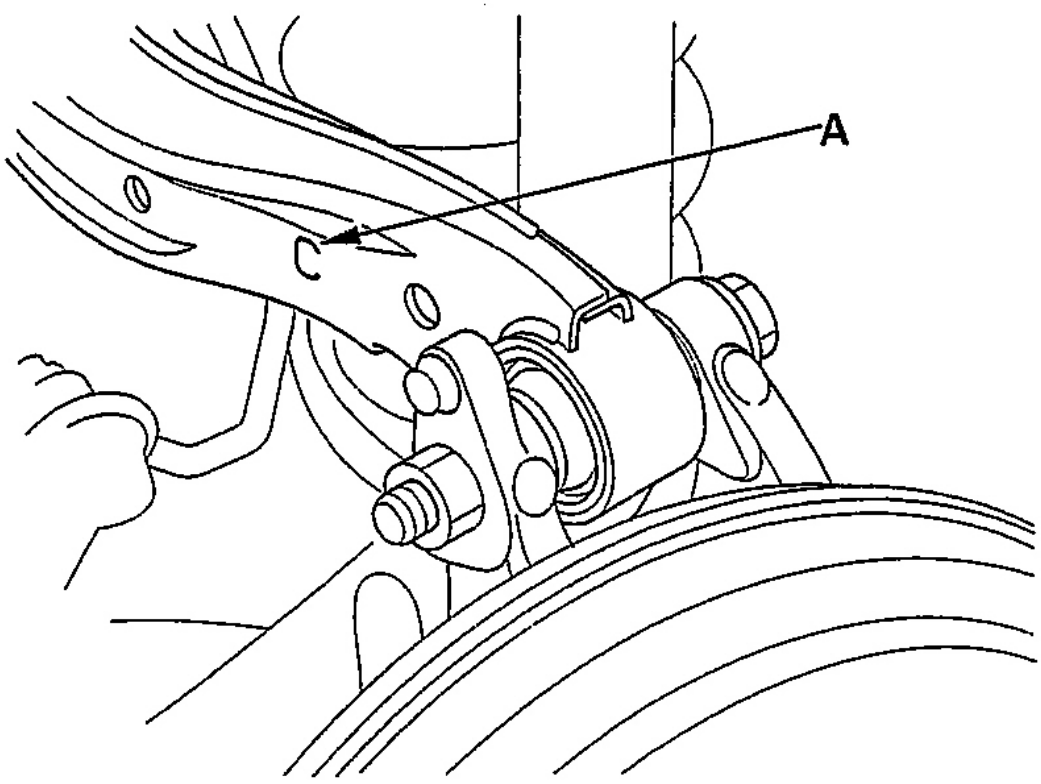

Fig. 6: Identifying "C" Marking On Upper Arm
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Camber angle:

Front: 0°00'±30' (Maximum difference between the front right and left side: 0° 35')

Rear (without "C" marks on the upper arm): -1 °30' (+1°05 ' -0° 45')

Rear (with "C" marks on the upper arm): -0 °45' (+1°05 ' -0° 45')

- If the measurement for the front camber is outside the specification, go to front camber adjustment.
- If the measurement for the rear camber is outside the specification, check for bent or damaged suspension components.

FRONT CAMBER ADJUSTMENT

The front camber can be adjusted by exchanging one or both of the damper pinch bolts with a smaller diameter adjusting bolt. The difference between the adjusting bolt diameter and the pinch bolt hole diameter allows for a small range of adjustment.

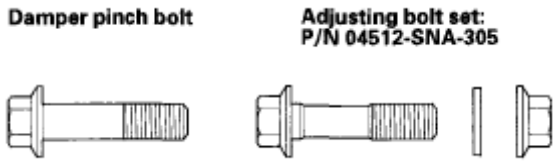

Fig. 7: Identifying Damper Pinch Bolts With Smaller Diameter Adjusting Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

1. Raise the front of the vehicle, and support it with safety stands in the proper locations (see **LIFT AND SUPPORT POINTS**).
2. Remove the front wheels.
3. Loosen the damper pinch bolts (A), and adjust the camber by moving the bottom of the damper within the range of the damper pinch bolt free play.

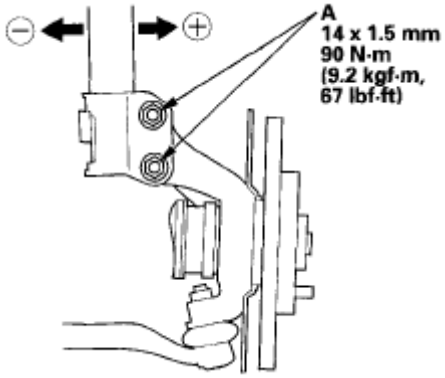

Fig. 8: Identifying Damper Pinch Bolts (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Tighten the damper pinch bolts to the specified torque.
5. Reinstall the front wheels. Lower the front of the vehicle to the ground, and bounce the front of the vehicle up and down several times to settle the suspension.
6. Measure the camber angle.
   - If the measurement is within specification, measure the toe-in.
   - If the measurement is not within specification, go to step 7.
7. Raise the front of the vehicle, and support it with safety stands in the proper locations (see **LIFT AND SUPPORT POINTS**).
8. Remove the front wheels.
9. Replace the damper pinch bolts with the adjusting bolts (A), and adjust the camber angle.

NOTE:

- **Install the washers (B) included adjusting bolt set between the front damper and self-locking nut.**
- **The camber angle can be adjusted up to ±25' (center of tolerance) by replacing one damper pinch bolt with the adjusting bolt.**
- **The camber angle can be adjusted up to 50' by replacing both damper pinch bolts with the adjusting bolts.**

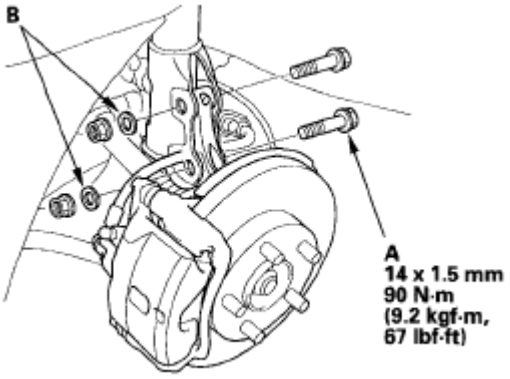

Fig. 9: Identifying Damper Pinch Bolts With Adjusting Bolts (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Tighten the adjusting bolts to the specified torque value.
11. Install the front wheels.
12. Lower the vehicle to the ground, and bounce the front of the vehicle up and down several times to settle the suspension.
13. Measure the camber angle. If the camber angle is not within specification, repeat steps 7 through 12 to readjust the camber angle. If the camber measurement is correct, measure toe-in, and adjust it if necessary.

FRONT TOE INSPECTION/ADJUSTMENT

Use commercially available computerized four wheel alignment equipment to measure wheel alignment (caster, camber, toe, and turning angle). Follow the equipment manufacturer's instructions.

1. Center the steering wheel spokes, and install a steering wheel holder tool.
2. Check the toe with the wheels pointed straight ahead.

   Front toe-in: 0±2 mm (0±0.08 in.)

   - If adjustment is required, go to step 3.
   - If no adjustment is required, go to rear toe inspection/adjustment.
3. Loosen the tie-rod locknuts (A) while holding the flat surface sections (B) of the tie-rod end with a wrench, and turn both tie-rods (C) until the front toe is within specifications.

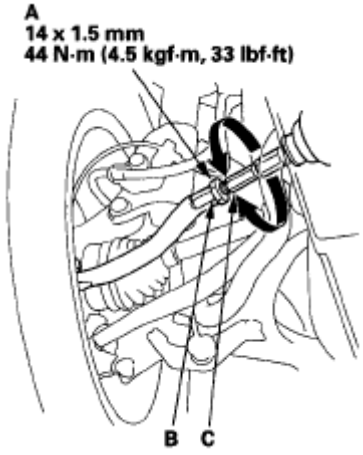

Fig. 10: Identifying Tie-Rod Locknuts (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. After adjusting, tighten the tie-rod locknuts. Reposition the rack-end boot if it is twisted or displaced.
5. Go to rear toe inspection/adjustment.

REAR TOE INSPECTION/ADJUSTMENT

Use commercially available computerized four wheel alignment equipment to measure wheel alignment (caster, camber, toe, and turning angle). Follow the equipment manufacturer's instructions.

1. Release the parking brake to avoid an incorrect measurement.
2. Check the toe.

   Rear toe-in: 2^{+2} -1 mm ($0.08^{+0.08}$ -0.04 in.)

   - If adjustment is required, go to step 3.
   - If no adjustment is required, remove the alignment equipment.
3. Hold the adjusting bolt (A) on the trailing arm (B), and remove the self-locking nut (C).

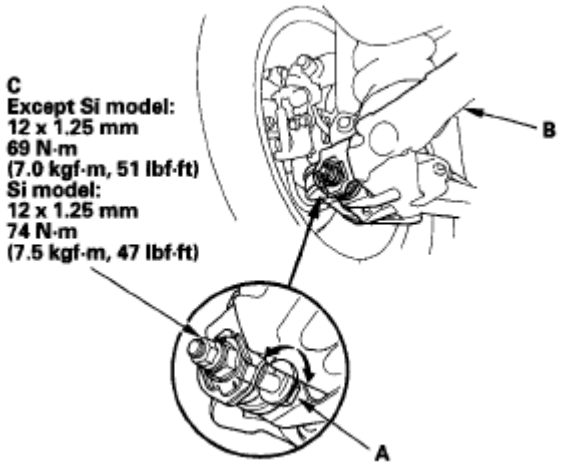

Fig. 11: Identifying Adjusting Bolt (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Replace the self-locking nut with a new one, and lightly tighten it.

NOTE:

- **Always use a new self-locking nut whenever it has been loosened.**
- **Reassemble the adjusting bolt and cam plate with the eccentric facing up.**

5. Adjust the rear toe by turning the adjusting bolt until the toe is correct.
6. Tighten the new self-locking nut while holding the adjusting bolt.

TURNING ANGLE INSPECTION

Use commercially available computerized four wheel alignment equipment to measure wheel alignment (caster, camber, toe, and turning angle). Follow the equipment manufacturer's instructions.

1. Turn the wheel right and left while applying the brake, and measure the turning angle of both wheels.

   Turning angle:

   DX, DX-G and GX models:

   Inward wheel: 40° 06'±2°

   Outward wheel: 31 °55' (reference)

   Except DX and DX-G models:

   Inward wheel: 38 ° 46' ±2 °

   Outward wheel: 31 ° 14' (reference)

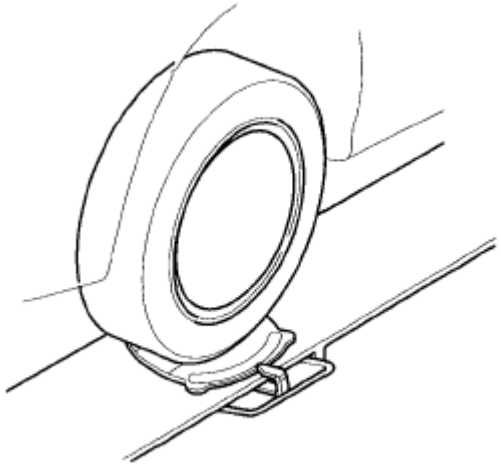

Fig. 12: Measuring Wheel Turning Angle
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. If the turning angle is not within the specifications, check for bent or damaged suspension components.

WHEEL BEARING END PLAY INSPECTION

1. Raise the vehicle, and support it with safety stands in the proper locations (see **LIFT AND SUPPORT POINTS**).
2. Remove the wheels.
3. Install suitable flat washers (A) and the wheel nuts. Tighten the nuts to the specified torque to hold the brake disc or brake drum securely against the hub.

Front

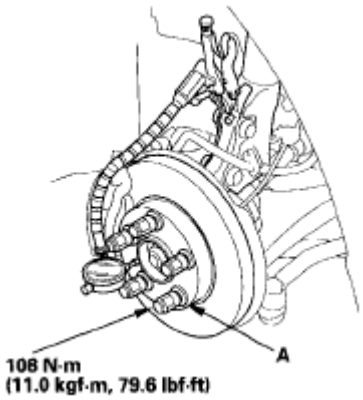

Fig. 13: Measure Bearing End Play (Front Brake Disc) (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Rear

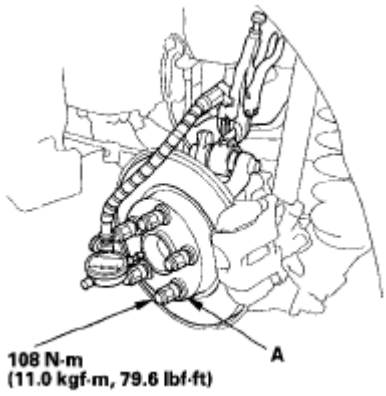

Fig. 14: Measure Bearing End Play (Rear Brake Disc) (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Attach the dial gauge. Place the dial gauge against the hub flange.
5. Measure the bearing end play by moving the brake disc or the brake drum inward and outward.

Front/Rear:

Standard: 0-0.05 mm (0-0.002 in.)

6. If the bearing end play measurement is more than the standard, replace the wheel bearing or the hub

bearing unit.

WHEEL RUNOUT INSPECTION

NOTE: When measuring the front wheel runout, turn the back side of the wheel slowly by hand.

1. Raise the vehicle, and support it with safety stands in the proper locations (see **LIFT AND SUPPORT POINTS**).
2. Check for bent or deformed wheels.
3. Set up the dial gauge as shown, and measure axial runout by turning the wheel.

   Front and rear wheel axial runout:

   Standard:

   Steel wheel: 0-1.0 mm (0-0.04 in.)

   Aluminum wheel: 0-0.7 mm (0-0.03 in.)

   Service limit: 2.0 mm (0.08 in.)

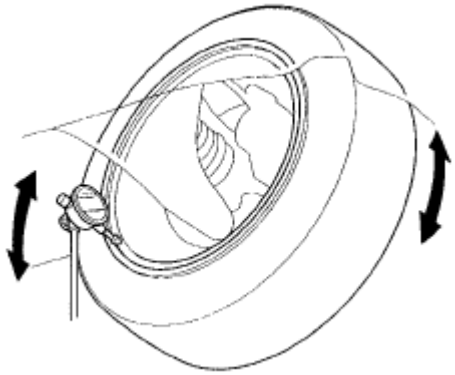

Fig. 15: Measuring Wheel Axial Runout
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Reset the dial gauge to the position shown, and measure the radial runout.

   Front and rear wheel radial runout:

   Standard:

   Steel wheel: 0-1.0 mm (0-0.04 in.)

   Aluminum wheel: 0-0.7 mm (0-0.03 in.)

   Service limit: 1.5 mm (0.06 in.)

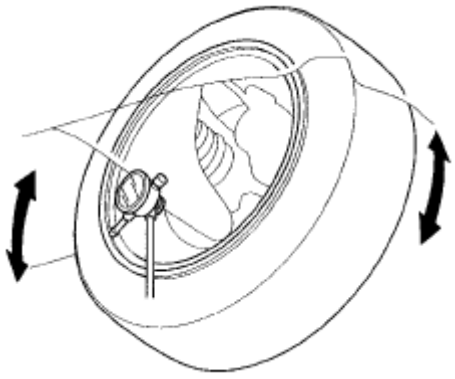

Fig. 16: Measuring Wheel Radial Runout
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. If the wheel runout is not within the specification, check the wheel bearing end play (see **WHEEL BEARING END PLAY INSPECTION**), and make sure the mating surfaces on the brake disc or the brake drum and the inside of the wheel are clean.
6. If the bearing end play is within the specification but the wheel runout is more than the service limit, replace the wheel.

WHEEL BOLT REPLACEMENT

Special Tools Required

Ball joint remover, 28 mm 07MAC-SL0A202

NOTE:

- **Do not use a hammer or air or electric impact tools to remove and install the wheel bolts.**
- **Be careful not to damage the threads of the wheel bolts,**

FRONT (EXCEPT SI MODEL) AND REAR

1. Raise the vehicle, and support it with safety stands in the proper locations (see **LIFT AND SUPPORT POINTS**).
2. Remove the brake disc or drum: front (see **KNUCKLE/HUB REPLACEMENT**), rear disc brake (see **HUB BEARING UNIT REPLACEMENT-DISC BRAKE TYPE**), rear drum brake (see **HUB BEARING UNIT REPLACEMENT-DRUM BRAKE TYPE**).
3. Separate the wheel bolt (A) from the hub (B) using the ball joint remover (C), and keep the jaw (D) of ball joint remover vertical against the wheel bolt (see **BALL JOINT REMOVAL**).

NOTE:

- **If the angle of the remover against the wheel bolt is not square, readjust the ball joint remover by turning the head (E) of the adjusting bolt (F).**
- **Before installing the new wheel bolt, clean the mating surface on the bolt and the hub.**

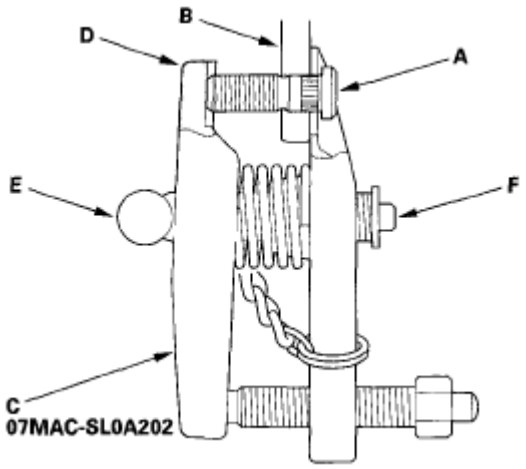

Fig. 17: Identifying Special Tools
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Insert the new wheel bolt (A) into the hub (B) while aligning the splined surfaces (C) on the hub hole with the wheel bolt. Adjust the measurement (D) with washers (P/N 94101-12800 or equivalent) (E), then install a nut (P/N 90304-SC2-000 or equivalent) (F) hand-tight.

NOTE:

- **Degrease all around the wheel bolt and the threaded section of the nut.**
- **Make sure the wheel bolt is installed vertically in relation to the hub disc surface.**
- **Do not install the nut and washers that have been used as tools on a vehicle.**

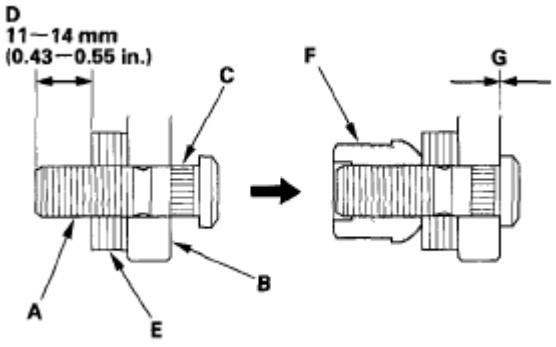

Fig. 18: Identifying Wheel Bolt Dimension
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Tighten the nut until the wheel bolts is drawn fully into the hub. Do not exceed the maximum torque limit. Make sure there is no gap (G) between the bolt and the hub.

   Limited torque: 108 N.m (11.0 kgf.m, 79.6 lbf.ft) max.

6. Install the brake disc or disc/drum: front (see **KNUCKLE/HUB REPLACEMENT**), rear disc brake (see **HUB BEARING UNIT REPLACEMENT-DISC BRAKE TYPE**), rear drum brake (see **HUB BEARING UNIT REPLACEMENT-DRUM BRAKE TYPE**).

NOTE:

- **If you can not tighten the wheel nut to the specified torque value when installing the wheel, replace the front hub or rear hub bearing unit as an assembly.**
- **Before installing the wheel, clean the mating surfaces of the brake disc and the inside of the wheel.**

FRONT (SI MODEL)

1. Remove the front hub (see **KNUCKLE/HUB REPLACEMENT**).
2. Separate the wheel bolt (A) from the hub (B) using a hydraulic press. Support the hub with hydraulic press attachments (C) or equivalent tools.

NOTE:

- **Before installing the new wheel bolt, clean the mating surface on the bolt and the hub.**
- **The illustration shows a front hub.**

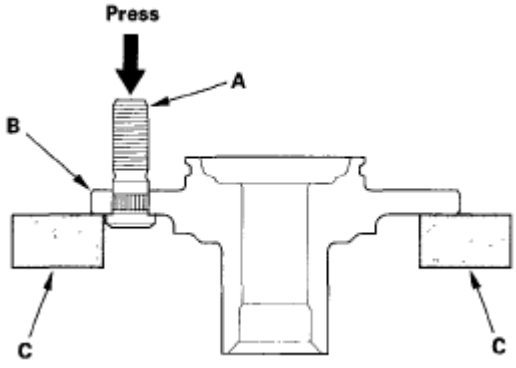

Fig. 19: Identifying Illustration Wheel Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Insert the new wheel bolt into the hub while aligning the splined surfaces on the hub hole with the wheel bolt.

NOTE:

- **Degrease all around the wheel bolt and the threaded section of the nut.**
- **Make sure the wheel bolt is installed vertically in relation to the hub disc surface.**

4. Install the wheel bolt using a hydraulic press until the wheel bolt shoulder is fully seated.
5. Install the front hub (see **KNUCKLE/HUB REPLACEMENT**).

NOTE: **If you can not tighten the wheel nut to the specified torque value when installing the wheel, replace the front hub or rear hub bearing unit as an assembly.**

BALL JOINT REMOVAL

Special Tools Required

- Ball joint remover, 32 mm 07MAC-SL0A102
- Ball joint remover, 28 mm 07MAC-SL0A202

NOTE: Always use a ball joint remover to disconnect a ball joint. Do not strike the housing or any other part of the ball joint connection to disconnect it.

07MAC-SL0A102 OR 07MAC-SL0A202

1. Install a hex nut (A) onto the threads of the ball joint (B). Make sure the nut is flush with the ball joint pin end to prevent damage to the thread end of the ball joint pin.

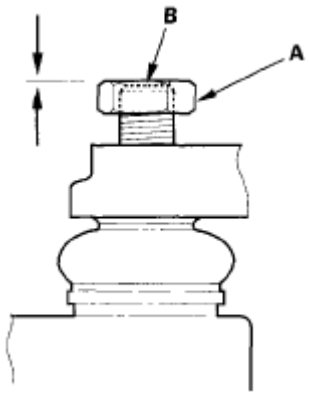

Fig. 20: Identifying Hex Nut
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Apply grease to the ball joint remover on the areas shown (A). This will ease installation of the tool and prevent damage to the pressure bolt (B) threads.

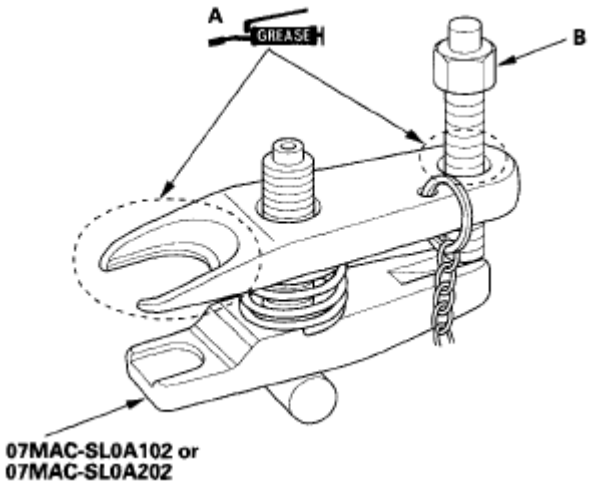

Fig. 21: Identifying Area Applying Grease
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Loosen the pressure bolt (A), and install the ball joint remover as shown. Insert the jaws carefully, making sure not to damage the ball joint boot. Adjust the jaw spacing by turning the adjusting bolt

(B).

NOTE: Fasten the safety chain (C) securely to a suspension arm or the subframe (D). Do not fasten it to a brake line or wire harness.

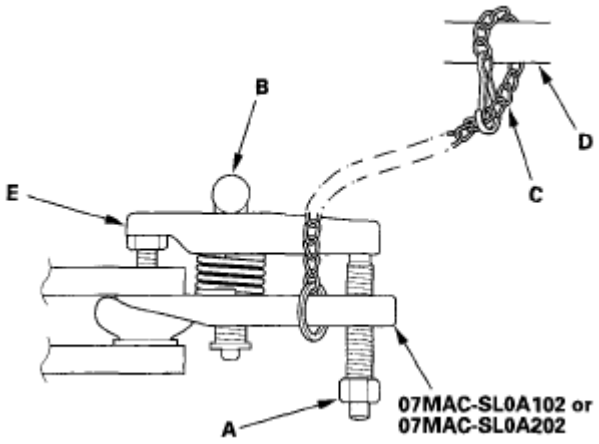

Fig. 22: Identifying Ball Joint Remover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. After adjusting the adjusting bolt, make sure the head of the adjusting bolt is in the position shown to allow the jaw (E) to pivot.
5. With a wrench, tighten the pressure bolt until the ball joint pin pops loose from the ball joint pin hole. If necessary, apply penetrating type lubricant to loosen the ball joint pin.

NOTE: Do not use pneumatic or electric tools on the pressure bolt.

6. Remove the ball joint remover, then remove the nut from the end of the ball joint pin, and pull the ball joint out of the ball joint pin hole. Inspect the ball joint boot, and replace it if damaged.

GENERAL TROUBLESHOOTING INFORMATION

How to Check for DTCs with the Honda Diagnostic System (HDS)

When the powertrain control module (PCM) senses an abnormality in the input or output system, the D indicator (A) in the gauge control module (tach) (B) will usually blink.

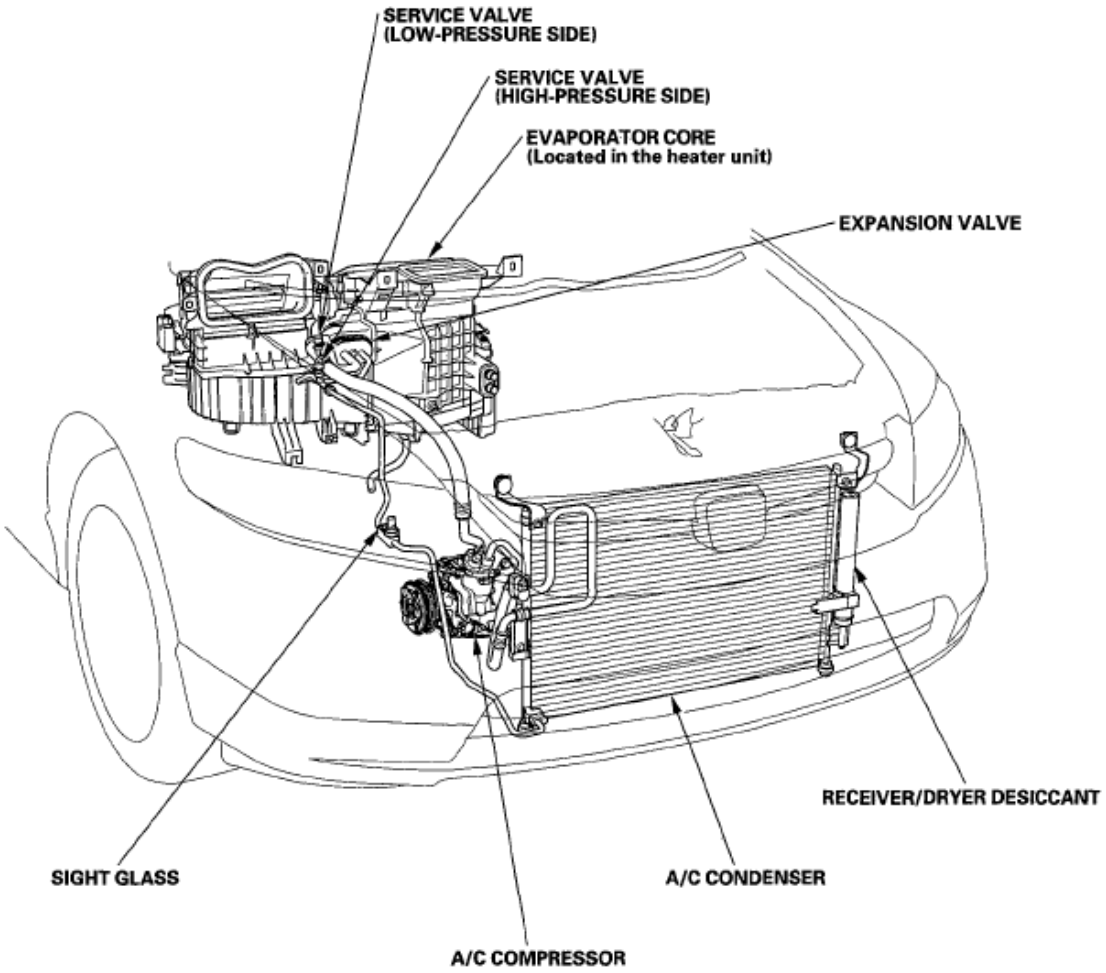

Fig. 2: Identifying D Indicator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

When the Honda Diagnostic System (HDS) is connected to the data link connector (DLC) (A) located behind the driver's dashboard lower cover and the SCS mode is selected, it will indicate the diagnostic trouble code (DTC) when the ignition switch is turned to ON (II) and the appropriate menu is selected.

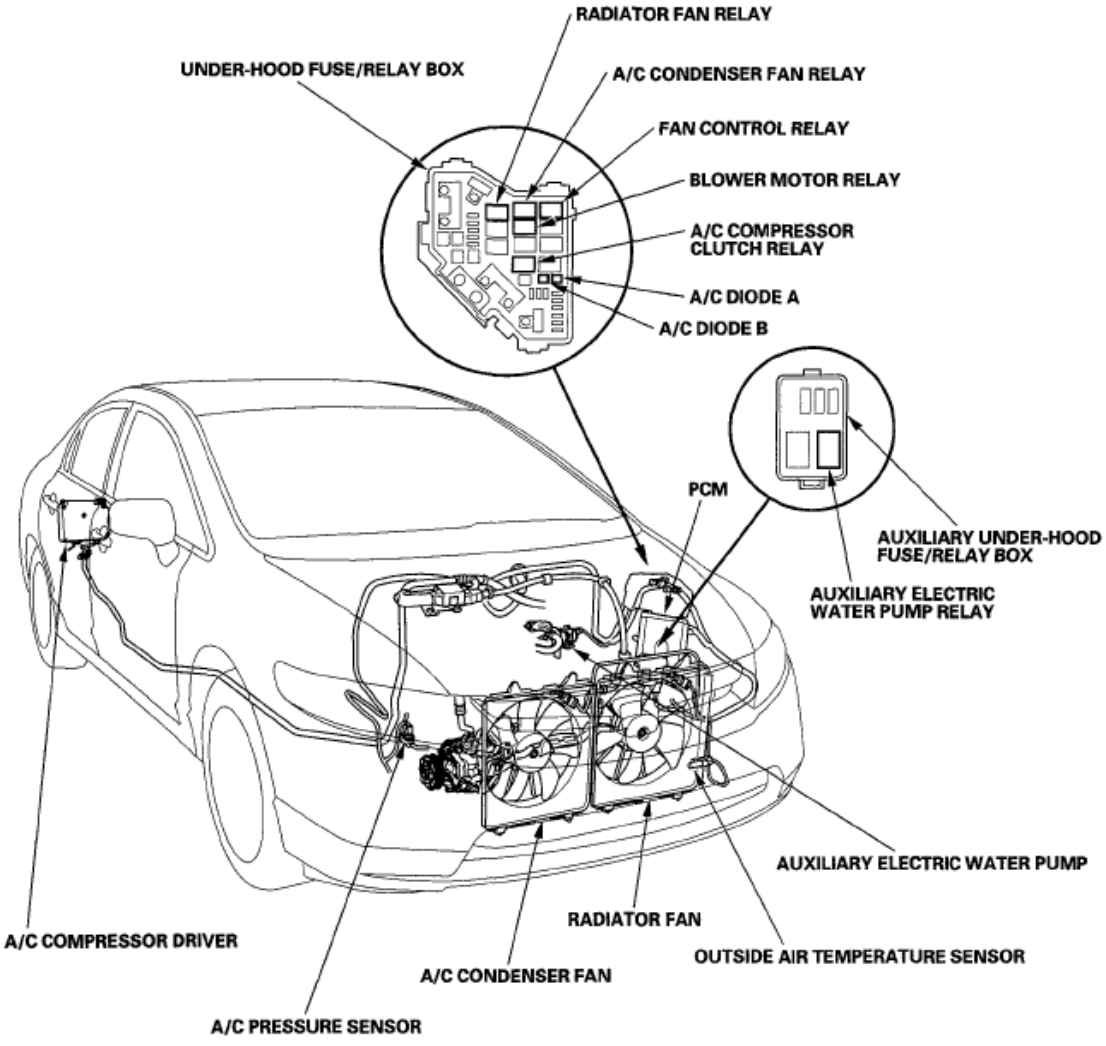

Fig. 3: Identifying Data Link Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

If the D indicator or the malfunction indicator lamp (MIL) has been reported on, or if a driveability problem is suspected, do this:

1. Connect the HDS to the DLC. (See the HDS user's manual for specific instructions.)
2. Turn the ignition switch to ON (II). Make sure the HDS communicates with the PCM. If it does not, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
3. Select A/T system, and observe the DTC in the DTCs MENU on the HDS screen.
4. Record the freeze data and on-board snapshots for all fuel and emissions DTCs and A/T DTCs.
5. If there is a fuel and emissions DTC, first check the fuel and emissions system as indicated by the DTC.
6. Clear the DTC and data.
7. Drive the vehicle for several minutes under the same conditions as those indicated by the freeze data, and then recheck for a DTC. If the A/T DTC returns, go to the **INDICATED DTC'S TROUBLESHOOTING**. If the DTC does not return, there was an intermittent problem within the circuit. Make sure all pins and terminals in the circuit are tight.

Symptom Troubleshooting Versus DTC Troubleshooting

Some symptoms will not trigger diagnostic trouble codes (DTCs) or cause the D indicator to blink. If the malfunction indicator lamp (MIL) was reported on or the D indicator has been blinking, check for DTCs. If the vehicle has an abnormal symptom, and there are no DTCs stored, do the symptom troubleshooting. Check the list of probable cause(s) for the symptom, in the sequence listed, until you find the problem.

How to Check for DTCs with the SCS Mode (retrieving the flash codes)

NOTE: The preferred method is to use the HDS to retrieve the P-code.

When the PCM senses an abnormality in the input or output system, the D indicator (A) in the gauge control module (tach) (B) will usually blink.

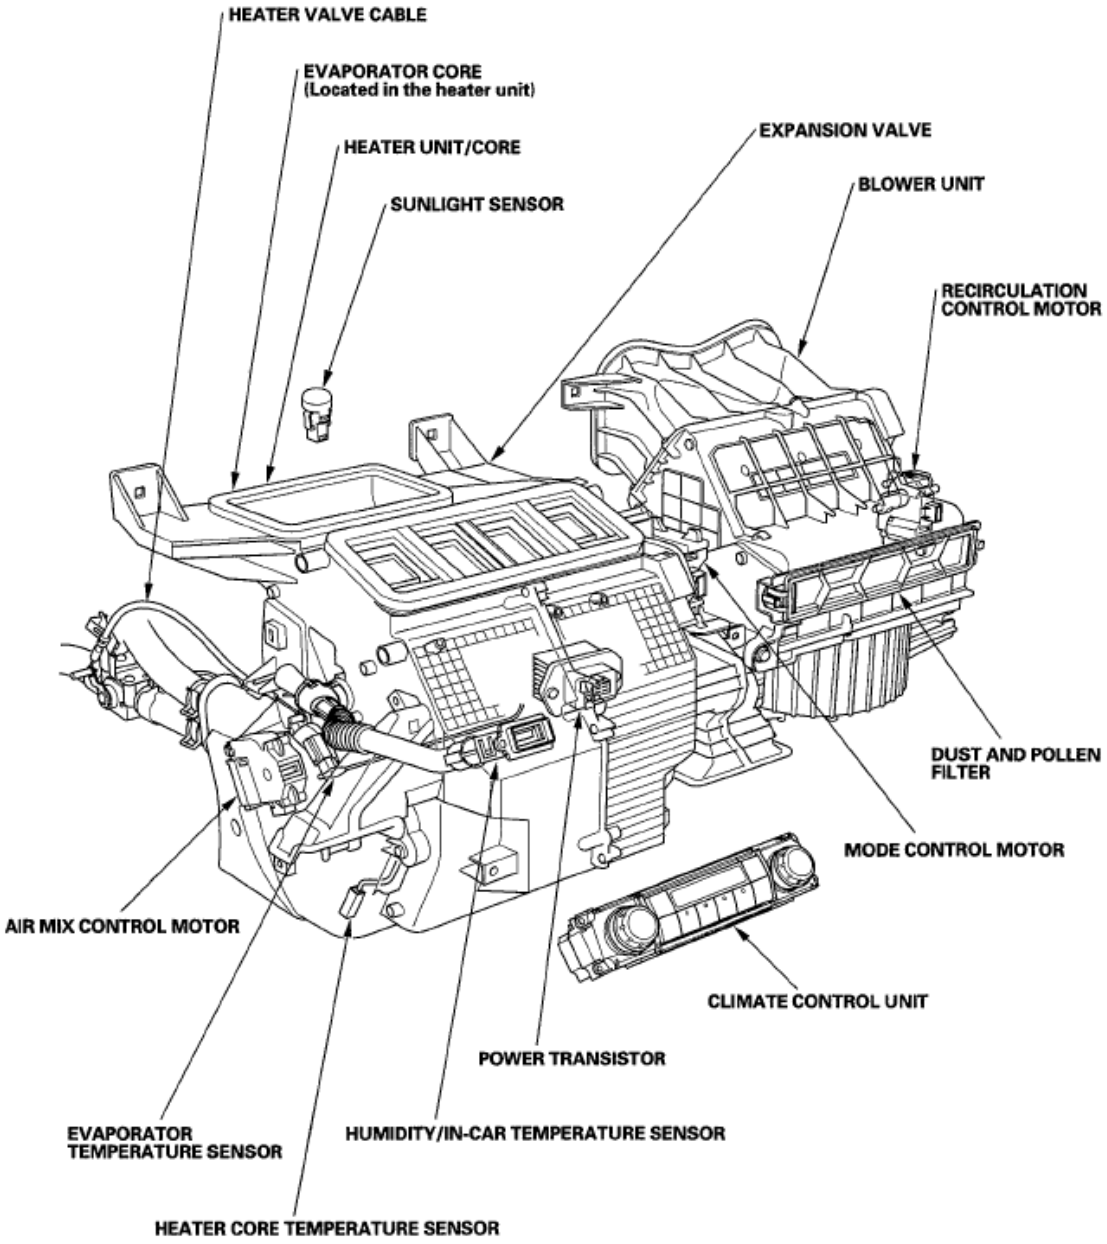

Fig. 4: Identifying D Indicator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

When the D indicator has been reported on, connect the HDS to the DLC (A) located behind the driver's dashboard lower cover. Turn the ignition switch to ON (II), select SCS mode, then the D indicator will indicate flash the DTC.

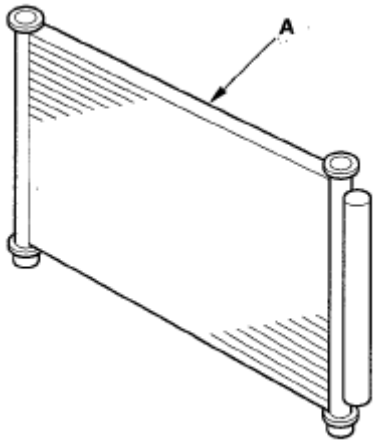

Fig. 5: Identifying Data Link Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

If the D indicator and the MIL come on at the same time, or if a driveability problem is suspected, do this:

1. Connect the HDS to the DLC. (See the HDS user's manual for specific instructions.)
2. Turn the ignition switch to ON (II). Make sure the HDS communicates with the PCM. If it does not, go to **DLC CIRCUIT TROUBLESHOOTING** . .
3. Select SCS mode, then observe the D indicator in the gauge control module. Codes 1 through 9 are indicated by individual short blinks. Code 10 and above are indicated by a series of long and short blinks. One long blink equals 10 short blinks. Add the long and short blinks together to determine the code.

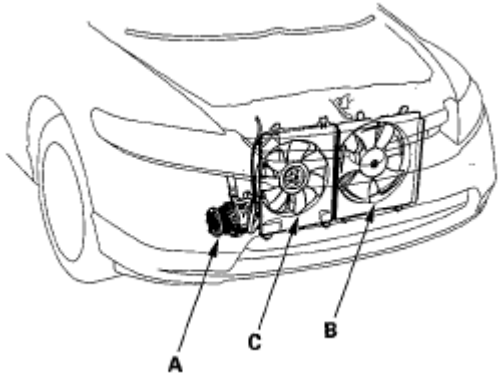

Fig. 6: D Indicator - Blinking Pattern
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Record all fuel and emissions DTCs and A/T DTCs.
5. If there is a fuel and emissions DTC, first check the fuel and emissions system as indicated by the DTC.
6. Clear the DTC and data.
7. Drive the vehicle for several minutes under the same conditions as those indicated by the freeze data,

and then recheck for DTCs. If the A/T DTC returns, go to the **INDICATED DTC'S TROUBLESHOOTING**. If the DTC does not return, there was an intermittent problem within the circuit. Make sure all pins and terminals in the circuit are tight.

How to Troubleshoot Circuits at the PCM Connectors

NOTE: The PCM overwrites data and monitors the EVAP system for up to 15 minutes after the ignition switch is turned to LOCK (0). Jumping the SCS line after turning the ignition switch to LOCK (0) cancels this function. Disconnecting the PCM during this function, without jumping the SCS line first, can damage the PCM.

1. Jump the SCS line with the HDS.
2. Remove the PCM cover (A).

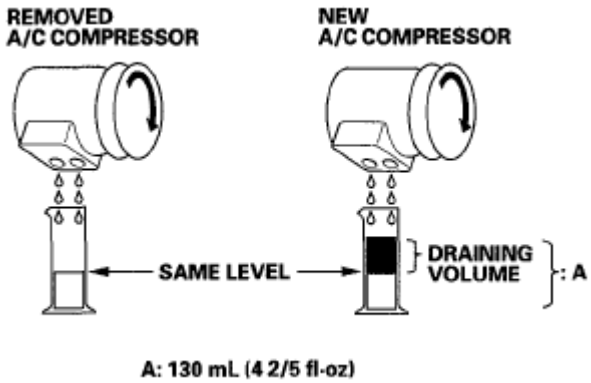

Fig. 7: Identifying PCM Cover

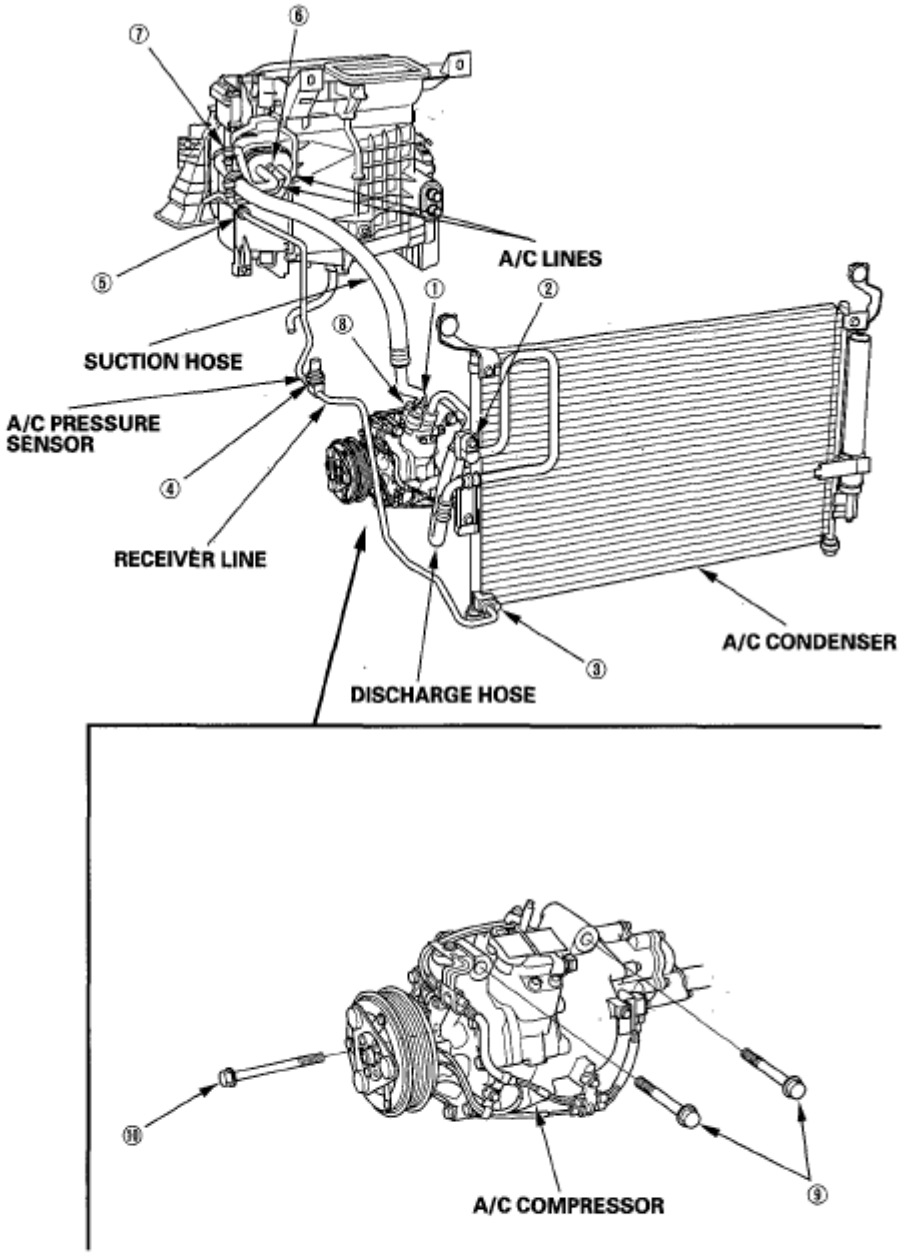
3. Remove the mounting bolts, disconnect the PCM connectors, and probe the terminals in the inspection port on the terminal side of the connectors.

NOTE: PCM connectors A, B, and C have symbols (A=[], B= triangle symbol , C=o) embossed on them for identification.



① Discharge hose to the A/C compressor (6 x 1.0 mm): 9.8 N·m (1.0 kgf·m, 7.2 lbf·ft)
② Discharge hose to the A/C condenser (6 x 1.0 mm): 9.8 N·m (1.0 kgf·m, 7.2 lbf·ft)
③ Receiver line to the A/C condenser (6 x 1.0 mm): 9.8 N·m (1.0 kgf·m, 7.2 lbf·ft)
④ A/C pressure sensor to the receiver line (11 x 1.0 mm): 11.8 N·m (1.2 kgf·m, 8.7 lbf·ft)
⑤ Receiver line to the A/C line (16 x 1.5 mm): 13.7 N·m (1.4 kgf·m, 10.1 lbf·ft)
⑥ A/C lines to the evaporator (6 x 1.0 mm): 9.8 N·m (1.0 kgf·m, 7.2 lbf·ft)
⑦ A/C line to the suction hose (24 x 1.5 mm): 31.4 N·m (3.2 kgf·m, 23.1 lbf·ft)
⑧ Suction hose to the A/C compressor (6 x 1.0 mm): 9.8 N·m (1.0 kgf·m, 7.2 lbf·ft)
⑨ A/C compressor to the engine block (10 x 1.25 mm): 45 N·m (4.6 kgf·m, 33.2 lbf·ft)

4. Check the connector inspection port (A) size, and select a suitable pin probe.

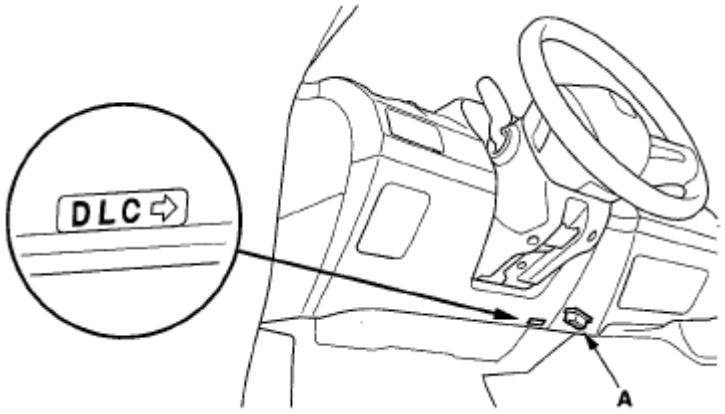

Fig. 9: Identifying Connector Inspection Port
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect one end of the patch cords (A) terminal to a digital multimeter (B), and connect the other side of the patch cord terminal to a commercially available banana jack (Pomona Electronics Tool No. 3563 or equivalent) (C).

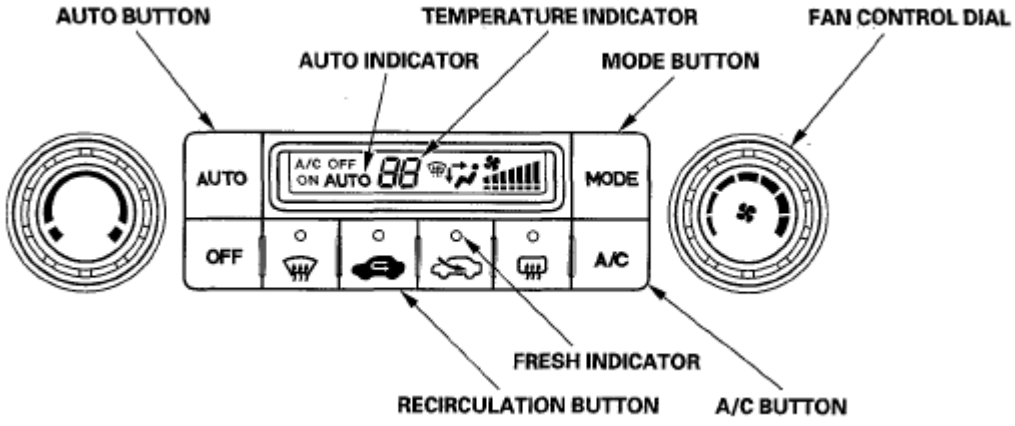

Fig. 10: Checking Connector Terminal Port
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Gently slide the pin probe into the inspection port at the connector terminal side. Always use the inspection port. Do not slide the probe into the connector terminals.

NOTE:

- **For accurate result, always use the pin probe (male)**
- **To prevent damage to the connector terminals, do not insert test equipment probes, paper clips, or other substitutes as they can damage the terminals. Damaged terminals cause a poor connection and an incorrect measurement.**
- **Do not puncture the insulation on a wire. Punctures can cause poor or intermittent electrical connections.**

Clear A/T DTCs Procedures

1. Connect the HDS to the DLC (A) located behind the driver's dashboard lower cover.

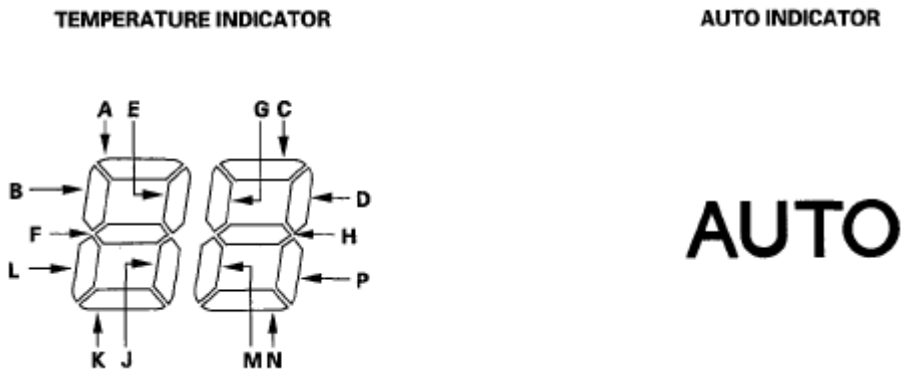

Fig. 11: Identifying Data Link Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch to ON (II).
3. Make sure the HDS communicates with the PCM. If it does not, go to **DLC CIRCUIT TROUBLESHOOTING** .
4. Clear the DTC(s) on the HDS screen.

OBD Status

The OBD status shows the current system status of each DTC and all of the parameters. This function is used to see if the technician's repair was successfully completed. The results of diagnostic tests for the DTC are displayed as:

- PASSED: The On-board diagnosis is successfully completed.
- FAILED: The On-board diagnosis has finished but failed.
- NOT COMPLETED: The On-board diagnosis was running but is out of the enable conditions of the DTC.

How to End a Troubleshooting Session

This procedure must be done after any troubleshooting.

NOTE: Reset the PCM with the HDS while the engine is stopped.

1. Turn the ignition switch to LOCK (0).
2. Turn the ignition switch to ON (II), and wait for 30 seconds.
3. Turn the ignition switch to LOCK (0), and disconnect the HDS from the DLC.
4. Do the PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
5. Start the engine with the shift lever in P or N, and warm it up to normal operating temperature (the radiator fan comes on).
6. To verify that the problem is repaired, test-drive the vehicle for several minutes at speeds over 31 mph (50 km/h) or under the same conditions as those indicated by the freeze data.

Updating the PCM

Special Tools Required

- Honda diagnostic system (HDS) tablet tester
- Honda interface module (HIM) and an iN workstation with HDS and CM update software
- HDS pocket tester
- GNA600 and an iN workstation with HDS and CM update software

NOTE:

- **Use this procedure when you need to update the PCM during troubleshooting procedures.**
- **Make sure HDS/HIM has the latest software version downloaded from the iN (interactive network).**
- **To ensure the latest program is installed, do a PCM update whenever the PCM is substituted or replaced.**
- **You cannot update a PCM with the program it already has. It will only accept a new program.**
- **Before you update the PCM, make sure the battery is fully charged, and connect a jumper battery (not a battery charger) to maintain system voltage.**
- **Never turn the ignition switch to LOCK (0) while updating the PCM. If you turn the ignition switch to LOCK (0) before completion, the PCM can be damaged.**
- **To prevent PCM damage, do not operate anything electrical (audio system, brakes, A/C, power windows, moonroof (if equipped), door locks, etc.) during the update.**
- **If you need to diagnose the Honda interface module (HIM) because the HIM's red (#3) light came on or was flashing during the update, leave the ignition switch in the ON (II) position when you disconnect the HIM from the data link connector (DLC). This will prevent PCM damage.**
- **High temperature in the engine compartment might cause the PCM to become too hot to run the update. If the engine has been running before this procedure, open the hood and cool the engine compartment.**

1. Turn the ignition switch to ON (II), but do not start the engine.
2. Connect the HDS to the DLC (A) located behind the driver's dashboard lower cover.

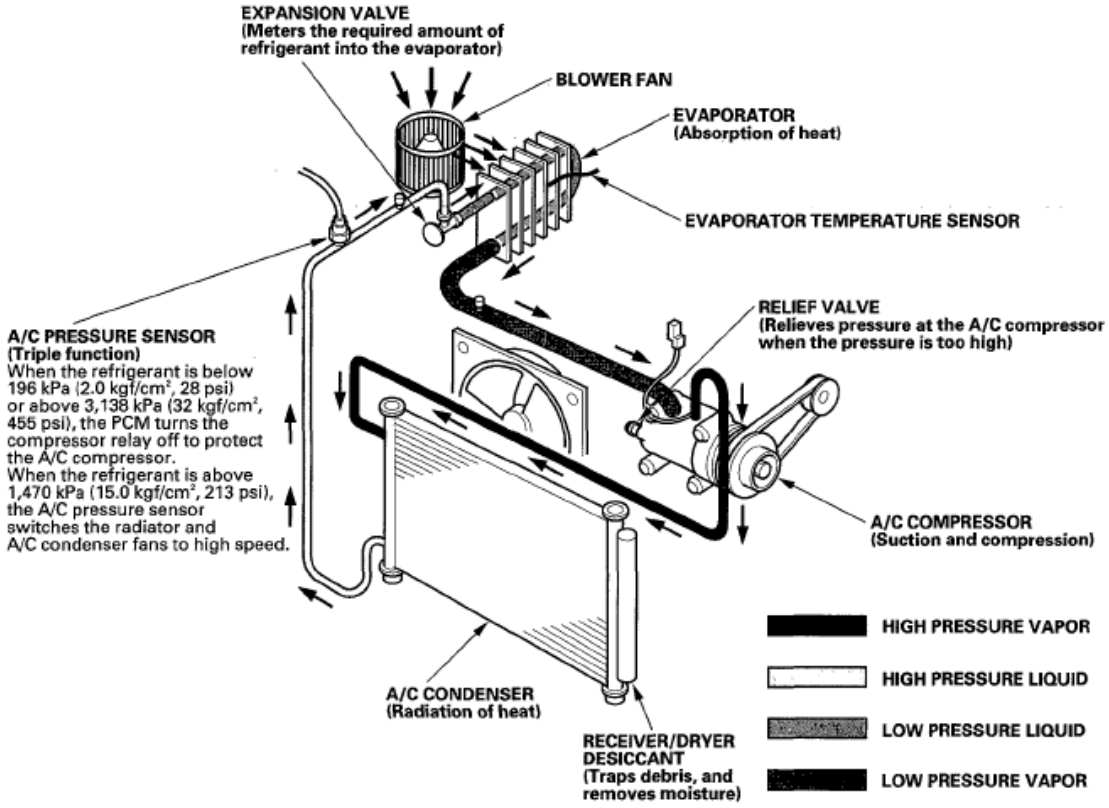

Fig. 12: Identifying Data Link Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Make sure the HDS communicates with the PCM. if it does not, go to **DLC CIRCUIT TROUBLESHOOTING** .
4. Select the INSPECTION MENU with the HDS.
5. Select the ETCS TEST, then select the TP POSITION CHECK, and follow the HDS screen prompts.

NOTE: If the TP POSITION CHECK indicates FAILED, continue this procedure.

6. Exit the HDS, then select the CM update, and follow the screen prompts to update the PCM.
7. If the PCM has the latest software, disconnect the HDS/HIM from the DLC, and go back to the procedure that you were doing. If the software in the PCM is not the latest, follow the instructions on the screen. If prompted to choose the PGM-FI system or the A/T system, make sure you update both.

NOTE: If the PCM update procedure requires you to cool the PCM, follow the screen prompts. If you run into a problem (programming takes over 15 minutes, status bar goes over 100%, D or immobilizer indicator flashes, HDS tablet freezes, etc.) during the update procedure, follow these steps to minimize the chance of damaging the PCM:

- **Leave the ignition switch in the "ON (II)" position.**
- **Connect a jumper battery (do not connect a battery charger).**
- **Shut down the HDS.**
- **Disconnect the HDS from the DLC.**

- **Reboot the HDS.**
- **Reconnect the HDS to the DLC, and try the update procedure again.**

8. If the TP POSITION CHECK failed in step 5, clean the throttle body (see **THROTTLE BODY CLEANING**).
9. Do the PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
10. Do the crank (CKP) learn procedure (see **CRANK (CKP) PATTERN CLEAR/CRANK (CKP) PATTERN LEARN**).

Substituting the PCM

Special Tools Required

- Honda diagnostic system (HDS) tablet tester
- Honda interface module (HIM) and an iN workstation with HDS and CM update software
- HDS pocket tester
- GNA600 and an iN workstation with HDS and CM update software

Use this procedure when you need to substitute a known-good PCM during troubleshooting procedures.

1. Make sure you have the anti-theft code for the audio system or the navigation system (if equipped), then write down the audio presets.
2. Connect the HDS to the DLC (A) located behind the driver's dashboard lower cover.

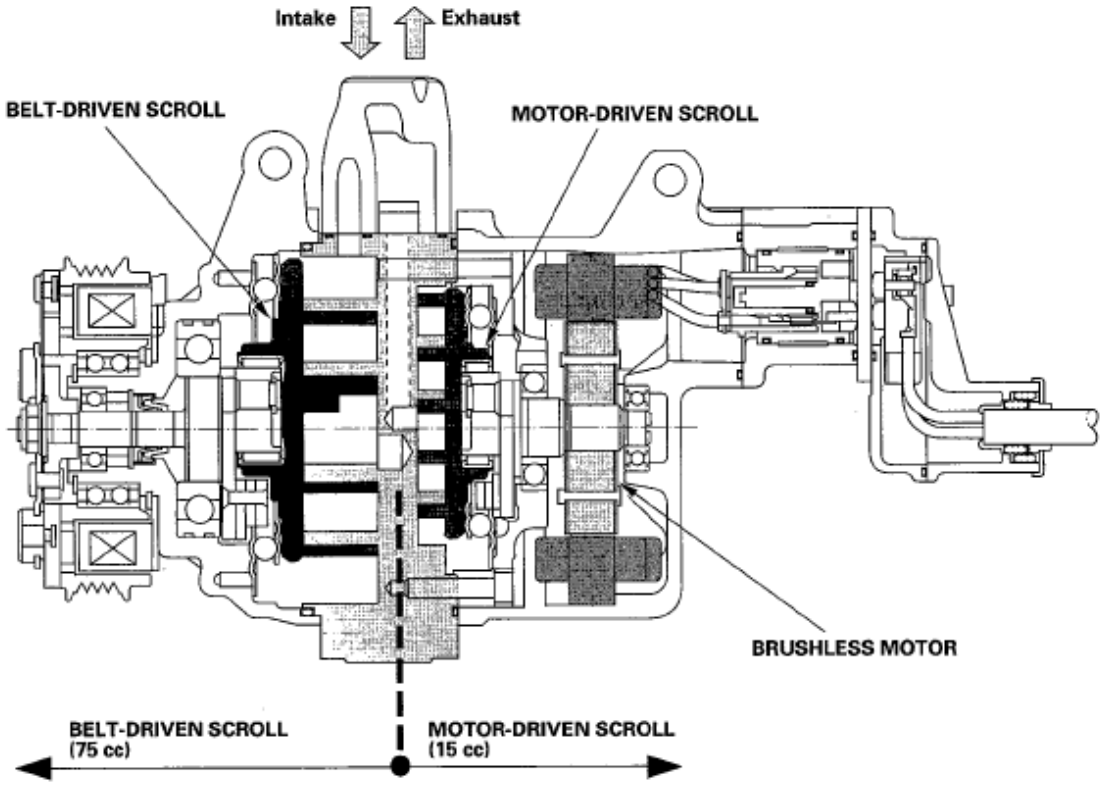

Fig. 13: Identifying Data Link Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Turn the ignition switch to ON (II).
4. Make sure the HDS communicates with the PCM. If it does not, go to **DLC CIRCUIT TROUBLESHOOTING** . If you did the DLC circuit troubleshooting, skip steps 5 thru 9, then clean the throttle body (see **THROTTLE BODY CLEANING**) after substituting the PCM.
5. Select the INSPECTION MENU with the HDS.
6. Select the TP POSITION CHECK in the ETCS TEST with the HDS.

NOTE: If the TP POSITION CHECK indicates FAILED, continue this procedure.

7. Turn the ignition switch to LOCK (0).
8. Remove the battery.
9. Remove the PCM cover (A).

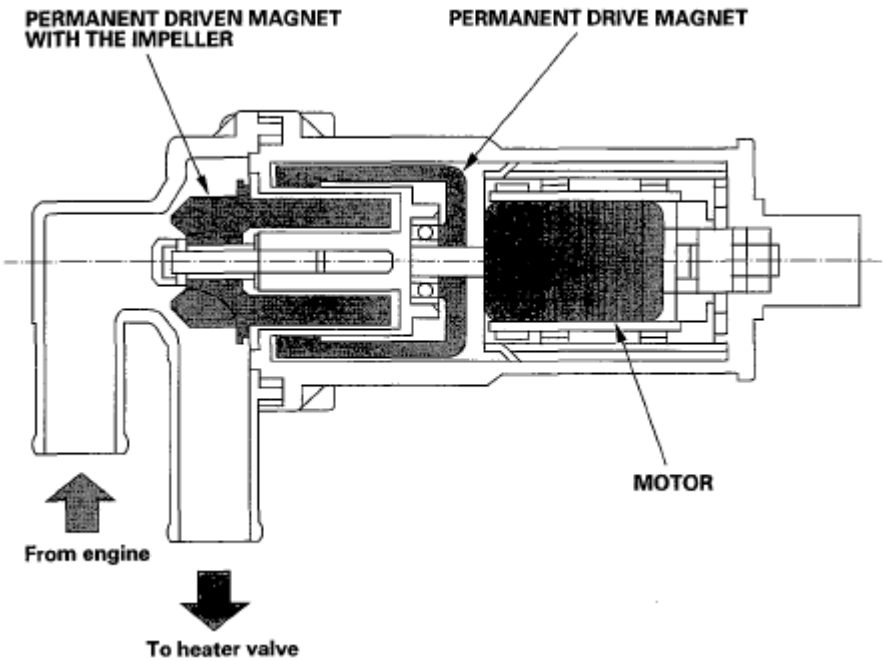

Fig. 14: Identifying PCM Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Remove the bolts (D), and remove the PCM (E).

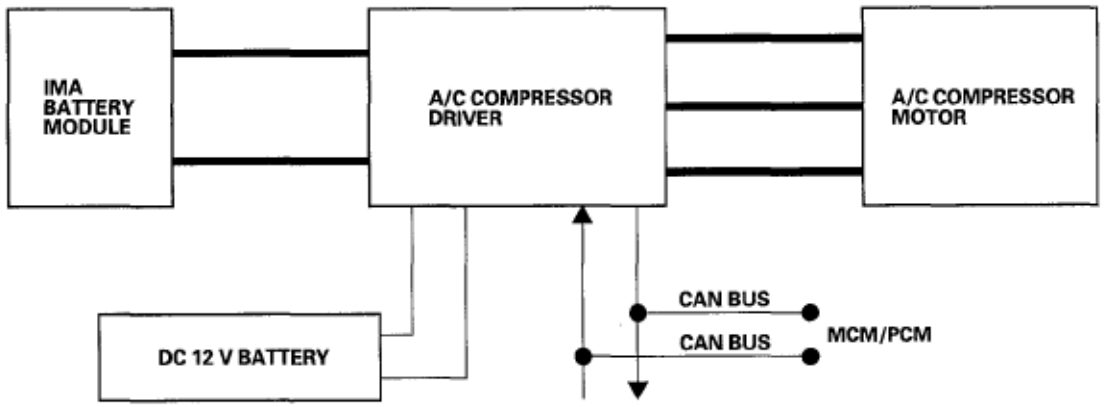

Fig. 15: Identifying PCM Connectors
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Disconnect PCM connectors A, B, and C.

NOTE: PCM connectors A, B, and C have symbols (A=[], B= triangle symbol , C=o) embossed on them for identification.

12. Install the PCM and the battery in the reverse order of removal.
13. Turn the ignition switch to ON (II).

NOTE: DTC P0630 "VIN not Programmed or Mismatch" will be stored because VIN has not been programmed into the PCM. Ignore it, and continue this procedure.

14. Input the VIN to the PCM with the HDS.
15. Update the PCM if it does not have the latest software.
16. Select the IMMOBILIZER SYSTEM with the HDS.
17. Enter the immobilizer code with the PCM replacement procedure in the HDS; this allows you to start the engine.
18. Reset the PCM with the HDS.
19. If the TP POSITION CHECK indicates FAILED in step 6, clean the throttle body (see **THROTTLE BODY CLEANING**).
20. Do the PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
21. Do the crank (CKP) learn procedure (see **CRANK (CKP) PATTERN CLEAR/CRANK (CKP) PATTERN LEARN**).
22. Enter the anti-theft code for the audio system or the navigation system (if equipped), enter the audio presets. Set the clock (on vehicles without navigation).

(1) The DTC in parentheses is the flash code. The D indicator indicates when the data link connector (DLC) is connected to the HDS, and in the SCS mode.

(2) This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

(3) The MIL comes on when the PGM-FI system detects the same failure.

SYMPTOM TROUBLESHOOTING INDEX

TROUBLESHOOTING CHART

Symptom	Probable cause(s)	Notes
When you turn the ignition switch to ON (II), the D indicator comes on and stays on in all shift lever positions, or it never comes on at all	• F-CAN communication line error • Gauge control module defective • PCM defective	• Check the F-CAN communication line for a DTC (see **DTC B1168: GAUGE CONTROL MODULE LOST COMMUNICATION WITH ECM/PCM (ENGINE MESSAGES); DTC B1169: GAUGE CONTROL MODULE LOST COMMUNICATION WITH THE PCM (A/T MESSAGES); DTC B1170: GAUGE CONTROL MODULE LOST COMMUNICATION WITH THE ABS/VSA MODULATOR-**

		CONTROL UNIT ( ). • Check the indicator drive circuit in the gauge control module by using the gauge control module self-diagnostic function (see **THE INDICATOR DRIVE CIRCUIT CHECK**).
A/T gear position indicator does not come on while the shift lever is in that position	• F-CAN communication line error • Gauge control module defective • PCM defective • Transmission range switch defective	• Check the F-CAN communication line for a DTC (see **DTC B1168: GAUGE CONTROL MODULE LOST COMMUNICATION WITH ECM/PCM (ENGINE MESSAGES); DTC B1169: GAUGE CONTROL MODULE LOST COMMUNICATION WITH THE PCM (A/T MESSAGES); DTC B1170: GAUGE CONTROL MODULE LOST COMMUNICATION WITH THE ABS/VSA MODULATOR-CONTROL UNIT (**). • Check the indicator drive circuit in the gauge control module by using the gauge control module self-diagnostic function (see **THE INDICATOR DRIVE CIRCUIT CHECK**). • Inspect the transmission range switch (see **TRANSMISSION RANGE SWITCH TEST**).
Shift lever cannot be moved from P while you are pressing on the brake pedal	• Accelerator pedal position sensor circuit • Accelerator pedal position sensor defective • Brake switch circuit • Brake switch defective • Shift lock solenoid defective • Shift lock solenoid control circuit • Shift lock mechanism defective • Throttle body defective • Transmission range switch ATP P switch stuck OFF	• Inspect the APP Sensor signal (see **APP SENSOR SIGNAL INSPECTION**). • Troubleshoot the shift lock system circuit (see **SHIFT LOCK SYSTEM CIRCUIT TROUBLESHOOTING**). • Test the shift lock solenoid (see **SHIFT LOCK SOLENOID TEST**). • Inspect the transmission range switch (see **TRANSMISSION RANGE SWITCH TEST**).

	• Transmission range switch ATP P switch line opened	
Ignition switch cannot be moved from ACCESSORY (1) to LOCK (0) (key is pushed in, the shift lever in P)	• Interlock control system circuit • Key interlock solenoid stuck ON • Park pin switch stuck OFF • Transmission range switch	• Troubleshoot the key interlock system circuit (see **KEY INTERLOCK SYSTEM CIRCUIT TROUBLESHOOTING**). • Inspect the transmission range switch (see **TRANSMISSION RANGE SWITCH TEST**).
HDS does not communicate with the PCM or the vehicle	DLC circuit error	Troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).
Engine runs, but vehicle does not move in any gear	1. Low ATF level 2. Shift cable broken or out of adjustment 3. Connection between shift cable and transmission or body is worn 4. ATF pump worn or binding 5. Regulator valve stuck or spring worn 6. ATF strainer clogged 7. Mainshaft worn or damaged 8. Final gears worn or damaged 9. Transmission-to-engine assembly error 10. Axle disengaged	• Check the ATF level, and check the ATF cooler lines for leakage and loose connections. If necessary, clean the ATF cooler lines. • Check for a loose shift cable at the shift lever and the transmission control lever. • Check for a stored DTC, and check for loose connections. • Check the line pressure. • Improper alignment of ATF pump and torque converter housing may cause the ATF pump to seize. The symptoms are mostly an rpm-related ticking noise or a high pitched squeak. • Be careful not to damage the torque converter housing when replacing the main ball bearing. You may also damage the ATF pump when you torque down the main valve body. This will cause the ATF pump seize. • Install the main seal flush with the torque converter housing when replacing the main seal. If you push it into the torque converter housing until it bottoms out, it will block the fluid return passage and result in damage. • Check the ATF strainer for debris. If the strainer is clogged, find the damaged components that caused the debris. • Inspect the differential pinion gears for wear. If the differential pinion

		gears are worn, replace the differential assembly, replace the ATF strainer, thoroughly clean the transmission, and clean the ATF cooler and the cooler lines. • Replace the torque converter. • Inspect the countershaft and the secondary shaft for wear and damage.
Vehicle moves in 2 and R, but not in D, D3, or 1	1. 1st accumulator defective 2. 1st gears worn or damaged 3. 1st clutch defective	• Inspect the 1st accumulator piston, the O-ring, and the spring for wear and damage in the servo body. • Inspect the countershaft, the secondary shaft, and the 1st clutch for wear and damage. • Check the 1st clutch pressure. • Inspect the clutch piston, the clutch piston check valve, and the O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and the plates for wear and damage, and inspect the clutch wave-plate height. If the discs and the plates are worn or damaged, replace them as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If they are OK, adjust the clearance with the clutch end-plate.
Vehicle moves in D, 1, and R, but not in 2	1. 2nd accumulator defective 2. 2nd gears worn or damaged 3. 2nd clutch defective	• Inspect the 2nd accumulator piston, the O-ring, and the spring for wear and damaged in the servo body. • Check the 2nd clutch pressure. • Inspect the countershaft, the secondary shaft, and the 2nd clutch for wear and damage. • Inspect the clutch piston, the clutch piston check valve, and the O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and the plates for wear and damage, and inspect the clutch wave-plate height. If the discs and the plates are worn or damaged, replace them as a set. If the wave-plate height is out of tolerance, replace the

		wave-plate. If they are OK, adjust the clearance with the clutch end-plate. • Inspect the 2nd clutch feed pipe. If the 2nd clutch feed pipe is scored, replace the end cover. • Replace the secondary shaft if the bushing for the 2nd clutch feed pipe is loose or damaged.
Vehicle moves in D, D3, 2, and 1, but not in R	1. Shift solenoid valve D defective 2. Shift fork shaft stuck 3. Shift valve D defective 4. 5th/reverse accumulator defective 5. 5th clutch defective 6. Reverse gears worn or damaged	• Check for a stored DTC, and check for loose connections. • Test the shift solenoid valve function with the HDS. • Inspect the O-rings, and check the shift solenoid valve for seizure. • Check for a missing shift fork bolt on the shift fork shaft. • Inspect the servo valve O-ring. • Check the shift fork shaft detent for wear and damage. • Inspect the 5th accumulator piston, the O-ring, and the spring for wear and damage in the servo body. • Check the 5th clutch pressure. • Inspect the mainshaft and the 5th clutch for wear and damage. • Inspect the clutch piston, the clutch piston check valve, and the O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and the plates for wear and damage, and inspect the clutch wave-plate height. If the discs and the plates are worn or damaged, replace them as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If they are OK, adjust the clearance with the clutch end-plate. • Inspect the reverse selector gear teeth chamfers, and inspect the engagement teeth chamfers of the countershaft 5th gear and the reverse gear. Replace the reverse gears and the reverse selector if they are worn or damaged. If the transmission makes clicking, grinding, whirring noise, also replace the

		mainshaft 5th gear, the reverse idler gear, and the countershaft 5th gear.
Poor acceleration	1. Shift solenoid valve A defective 2. Shift solenoid valve B defective 3. Shift solenoid valve C defective	• Check for a stored DTC, and check for loose connections. • Test the shift solenoid valve function with the HDS.
Poor acceleration; flares when starting off in D, D3, and R; stall speed high in 2 and 1, and in D and D3 in 1st and 2nd	1. Low ATF level 2. Shift cable broken or out of adjustment 3. ATF pump worn or binding 4. Regulator valve stuck or spring worn 5. ATF strainer clogged 6. Torque converter check valve defective	• Check the ATF level and check the ATF lines for leakage and loose connections. If necessary, clean the ATF lines. • Check for a loose shift cable at the shift lever and the transmission control lever. • Check the line pressure. • Improper alignment of the ATF pump and the torque converter housing may cause the ATF pump to seize. The symptoms are mostly an rpm-related ticking noise or a high pitched squeak. • Be careful not to damage the torque converter housing when replacing the main ball bearing. You may also damage the ATF pump when you torque down the main valve body. This will cause the ATF pump to seize. • Install the main seal flush with the torque converter housing when replacing the main seal. If you push it into the torque converter housing until it bottoms out, it will block the fluid return passage and result in damage. • Check the ATF strainer for debris. If the strainer is clogged, find the damaged components that caused the debris. • Inspect the differential pinion gears for wear. If the differential pinion gears are worn, replace the differential assembly, replace the ATF strainer, thoroughly clean the transmission, and clean the ATF warmer and the ATF lines. • Replace the torque converter.
Poor acceleration; flares	2nd clutch defective	• Check the 2nd clutch pressure.

when starting off in D, D3, and R; stall speed high when starting off in 2		• Inspect the secondary shaft and the 2nd clutch for wear and damage. • Inspect the clutch piston, the clutch piston check valve, and the O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and the plates for wear and damage, and inspect the clutch wave-plate height. If the discs and the plates are worn or damaged, replace them as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If they are OK, adjust the clearance with the clutch end-plate. • Inspect the 2nd clutch feed pipe. If the 2nd clutch feed pipe is scored, replace the end cover. • Replace the secondary shaft if the bushing for the 2nd clutch feed pipe is loose or damaged.
Poor acceleration; flares when starting off in D, D3, and R; stall speed high in R	1. Shift cable broken or out of adjustment 2. 5th clutch defective	• Check for a loose shift cable at the shift lever and the transmission control lever. • Check the 5th clutch pressure. • Inspect the mainshaft and the 5th clutch for wear and damage. • Inspect the clutch piston, the clutch piston check valve, and the O-rings: Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and the plates for wear and damage, and inspect the clutch wave-plate height. If the discs and the plates are worn or damaged, replace them as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If they are OK, adjust the clearance with the clutch end-plate.
Poor acceleration; stall speed low in 2 and 1, and in D and D3 in 1st and 2nd	1. Shift solenoid valve D defective 2. Torque converter one-way clutch defective 3. Engine output low	• Check for a stored DTC, and check for loose connections. • Test the shift solenoid valve function with the HDS. • Inspect the O-rings, and check the shift solenoid valve for seizure.

	4. Torque converter clutch piston defective 5. Lock-up shift valve defective	• Replace the torque converter assembly. • Check the lock-up shift valve in the regulator valve body. • Check the engine control system.
Poor acceleration; stall speed low in R	1. Engine output low 2. Torque converter clutch piston defective 3. Lock-up shift valve defective	• Check the engine control system. • Replace the torque converter assembly. • Check the lock-up shift valve in the regulator valve body.
Engine idle vibration	1. Low ATF level 2. Shift solenoid valve D defective 3. Drive plate defective or transmission misassembled 4. Engine output low 5. Torque converter clutch piston defective 6. ATF pump worn or damaged 7. Lock-up shift valve defective 8. Misassembled engine and transmission mount	• Check the ATF level and check the ATF lines for leakage and loose connections. If necessary, clean the ATF lines. • Check for a stored DTC, and check for loose connections. • Test the shift solenoid valve function with the HDS. • Inspect the O-rings, and check the shift solenoid valve for seizure. • Check the transmission and the drive plate installation. • Check the drive plate for wear and damage, if the drive plate is worn or damaged, replace the drive plate. • Check the engine control system. • Replace the torque converter assembly. • Check the line pressure. • Improper alignment of the ATF pump and the torque converter housing may cause the ATF pump to seize. The symptoms are mostly an rpm-related ticking noise or a high pitched squeak. • Be careful not to damage the torque converter housing when replacing the main ball bearing. You may also damage the ATF pump when you torque down the main valve body. This will cause ATF pump to seize. • Install the main seal flush with the torque converter housing when replacing the main seal. If you push it into the torque converter housing until it bottoms out, it will block the fluid return passage and result in damage.

		• Check the lock-up shift valve in the regulator valve body. • Adjust the transmission and engine mounts by loosening and retightening the mount bolts.
Vehicle moves in N	1. Excessive ATF 2. Foreign material in separator plate orifice 3. Relief valve defective 4. 1st clutch defective 5. 2nd clutch defective 6. 3rd clutch defective 7. 4th clutch defective 8. 5th clutch defective 9. Clearance between clutch end-plate and top disc incorrect 10. Needle bearing seized, worn, or damaged 11. Thrust washer seized, worn, or damaged	• Check the ATF level, and drain the ATF if it is overfilled. • Check for a clogged orifice in the separator plate. If the orifice is clogged, remove it and clean the separator plate orifice. • Check the ATF strainer for debris. If the strainer is clogged with particles of steel or aluminum, inspect the ATF pump. If the ATF pump is OK, find the damaged components that caused the debris. If no cause for contamination is found, replace the torque converter. • Check the relief valve in the main valve body. • Check the 1st, 2nd, 3rd, 4th, and 5th clutch pressures. • Inspect the mainshaft, the secondary shaft, the 1st, 2nd, 3rd, 4th, and 5th clutches for wear and damage. • Inspect the clutch piston, the clutch piston check valve, and the 0-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and the plates for wear and damage, and inspect the clutch wave-plate height. If the discs and the plates are worn or damaged, replace them as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If they are OK, adjust the clearance with the clutch end-plate. • Inspect the 2nd, 3rd, and 4th clutch feed pipes. • If the 2nd clutch feed pipe is scored, replace the end cover. • If the 3rd or 4th clutch feed pipe is scored, replace it and the O-rings under the feed pipe flange.

		• Replace the secondary shaft if the bushing for the 2nd clutch feed pipe or the 4th clutch feed pipe is loose or damaged. • Replace the mainshaft if the bushing for the 3rd clutch feed pipe is loose or damaged.

If the orifice is clogged, remove it and clean the separator plate orifice. • Check the ATF strainer for debris. If the strainer is clogged with particles of steel or aluminum, inspect the ATF pump. If the ATF pump is OK, find the damaged components that caused the debris. If no cause for contamination is found, replace the torque converter. • Check the servo control valve in the main valve body. • Inspect the 1st accumulator piston, the O-ring, and the spring for wear and damage in the regulator valve body. • Check that the 1st check ball is not stuck in the main valve body. • Check the lock-up shift valve in the regulator valve body. • Check the 1st clutch pressure.

		• Inspect the secondary shaft and the 1st clutch for wear and damage. • Inspect the clutch piston, the clutch piston check valve, and the O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and the plates for wear and damage, and inspect the clutch wave-plate height. If the discs and the plates are worn or damaged, replace them as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If they are OK, adjust the clearance with the clutch end-plate.

SYSTEM DESCRIPTION

General Operation

The automatic transmission is a combination of a three-element torque converter and triple-shaft electronically controlled unit which provides five speeds forward and one in reverse. The entire unit is positioned in line with the engine.

Torque Converter, Shafts, Gears, and Clutches

The torque converter consists of a pump, turbine, and stator assembly in a single unit. The converter housing (pump) is connected to the engine crankshaft and turns as the engine runs. Around the outside of the torque converter is a ring gear which meshes with the starter drive gear when the engine is being started. The entire torque converter assembly serves as a flywheel while transmitting power to the transmission mainshaft. The transmission has three parallel shafts; the mainshaft, the countershaft, and the secondary shaft. The mainshaft is in line with the engine crankshaft, and includes the 3rd and 5th clutches, and gears for 3rd, 5th, reverse, and idler. The mainshaft reverse gear is integral with the mainshaft 5th gear. The countershaft includes the gears for 1st, 2nd, 3rd, 4th-5th, reverse, park, and the final drive. The countershaft 4th-5th gear enables the shared use of the secondary shaft 4th gear and the mainshaft 5th gear. The countershaft 4th-5th gear and the countershaft reverse gear can be locked to the countershaft providing the 4th, 5th or reverse gear, depending on which way the selector is moved. The final drive gear is integral with the countershaft. The secondary shaft includes the 1st, 2nd, and 4th clutches, and gears for 1st, 2nd, 4th, and idler. The idler gear shaft is located between the mainshaft and the secondary shaft, and the idler gear transmits power between the mainshaft and the secondary shaft. The gears on the mainshaft and the secondary shaft are in constant mesh with those on the countershaft. When certain combinations of gears in the transmission are engaged by the clutches, power is transmitted through the mainshaft, then to the secondary shaft to the countershaft, or through the mainshaft to the countershaft to provide drive.

Electronic Control

The electronic control system consists of the powertrain control module (PCM), sensors, and seven solenoid valves. Shifting and lock-up are electronically controlled for comfortable driving under all conditions. The PCM is located in the engine compartment.

Hydraulic Control

The valve bodies include the main valve body, the regulator valve body, and the servo body. They are bolted to the torque converter housing. The main valve body contains the manual valve, cut valve B, shift valves A, C, and D, the relief valve, the lock-up control valve, the cooler check valve, the servo control valve, and the ATF pump gears. The regulator valve body contains the regulator valve, the torque converter check valve, the lock-up shift valve, the 1st accumulator, and the 3rd accumulator. The servo body contains the servo valve, shift valve B, cut valve A, the accumulators for 2nd, 4th, and 5th, and shift solenoid valves A, B, C, and D. Fluid from the regulator passes through the manual valve to the various control valves. The 2nd, 3rd, and 4th clutches receive fluid from their respective feed pipes, and the 1st and the 5th clutches receive fluid from the internal hydraulic circuit.

Shift Control Mechanism

To shift gears, the PCM controls shift solenoid valves A, B, C, and D, and A/T clutch pressure control solenoid valves A, B, and C, while receiving input signals from various sensors and switches located throughout the vehicle. The shift solenoid valves shift the positions of the shift valves to switch the port to send hydraulic pressure to the clutch. A/T clutch pressure control solenoid valves A, B, and C regulate their respective pressure, and pressurize the clutches to engage them and their corresponding gears.

Lock-up Mechanism

The lock-up mechanism operates in D (1st, 2nd, 3rd, 4th, and 5th gears), and D3 (1st, 2nd and 3rd gears). The pressurized fluid is drained from the back of the torque converter through a fluid passage, causing the torque converter clutch piston to be held against the torque converter cover. As this takes place, the mainshaft rotates at the same speed as the engine crankshaft. Together with the hydraulic control, the PCM optimizes the timing and the volume of the lock-up mechanism. When shift solenoid valve D is turned on by the PCM, shift solenoid valve D pressure switches the lock-up shift valve lock-up on and off. A/T clutch pressure control solenoid valve A and the lock-up control valve control the volume of the lock-up conditions.

Gear Selection

The shift lever has seven positions; P: PARK, R: REVERSE, N: NEUTRAL, D: DRIVE 1st through 5th gear ranges, D3: DRIVE 1st through 3rd gear ranges, 2: 2nd gear, and 1: 1st gear.

SHIFT LEVER GEAR POSITION

Position	Description
P: PARK	Front wheels locked; park pawl engaged with park gear on countershaft. All clutches are released.
R: REVERSE	Reverse; reverse selector engaged with countershaft reverse gear and 5th clutch engaged.
N: NEUTRAL	All clutches are released.
D: DRIVE (1st through 5th)	General driving; starts off in 1st, shifts automatically to 2nd, 3rd, 4th, then 5th, depending

	on vehicle speed and throttle position. Downshifts through 4th, 3rd, 2nd, and 1st on deceleration to stop. The lock-up mechanism operates in 1st, 2nd, 3rd, 4th, and 5th gears.
D3: DRIVE (1st through 3rd)	Used for rapid acceleration at highway speeds and general driving, up-hill and down-hill driving; starts off in 1st, shifts automatically to 2nd, then 3rd, depending on vehicle speed and throttle position. Downshifts through 2nd to 1st on deceleration to stop. The lock-up mechanism operates in 1st, 2nd, and 3rd gears.
2: SECOND	Used for engine braking or better traction starting off on loose or slippery surfaces; stays in 2nd gear; does not shift up and down.
1: FIRST	Used for engine braking; stays in 1st gear; does not upshift.

Starting the engine is possible only in P and N because of a slide-type neutral-safety switch.

Automatic Transmission Gear Position Indicator

The A/T gear position indicator in the gauge control module shows which shift lever position has been selected without having look down at the shift lever.

Clutches and Gears

The five-speed automatic transmission uses hydraulically-actuated clutches to engage or disengage the transmission gears. When hydraulic pressure is introduced into the clutch drum, the clutch piston moves. This presses the friction discs and the steel plates together, locking them so they do not slip. Power is then transmitted through the engaged clutch pack to its hub-mounted gear. Likewise, when the hydraulic pressure is bled from the clutch pack, the piston releases the friction discs and the steel plates, and they are free to slide past each other. This allows the gear to spin independently on its shaft, transmitting no power.

1st Clutch

The 1st clutch engages/disengages 1st gear, and is located at the right end of the secondary shaft, opposite

the end cover. The 1st clutch is supplied hydraulic pressure by a circuit connected to the internal hydraulic circuit.

2nd Clutch

The 2nd clutch engages/disengages 2nd gear, and is located at the middle of the secondary shaft. The 2nd clutch is joined back-to-back to the 4th clutch, and is supplied hydraulic pressure by its ATF feed pipe within the secondary shaft.

3rd Clutch

The 3rd clutch engages/disengages 3rd gear, and is located at the middle of the mainshaft. The 3rd clutch is joined back-to-back to the 5th clutch, and is supplied hydraulic pressure by a circuit connected to the internal hydraulic circuit.

4th Clutch

The 4th clutch engages/disengages 4th gear, and is located at the middle of the secondary shaft. The 4th clutch is joined back-to-back to the 2nd clutch, and is supplied hydraulic pressure by its ATF feed pipe within the secondary shaft.

5th Clutch

The 5th clutch engages/disengages 5th gear, as well as reverse gear, and is located at the middle of the mainshaft. The 5th clutch is joined back-to-back to the 3rd clutch, and is supplied hydraulic pressure by a circuit connected to the internal hydraulic circuit.

Gear Operation

Gears on the mainshaft:

- 3rd gear is engages/disengages with the mainshaft by the 3rd clutch.
- 5th gear is engaged/disengages with the mainshaft by the 5th clutch.
- Reverse gear is engaged/disengaged with the mainshaft by the 5th clutch.
- Idler gear is splined with the mainshaft, and rotates with the mainshaft.

Gears on the countershaft:

- Final drive gear is integral with the countershaft.
- 1st, 2nd, 3rd, and park gears are splined with the countershaft, and rotate with the countershaft.
- 4th-5th gear and reverse gear rotate freely from the countershaft. The reverse selector engages 4th-5th gear and reverse gear with the reverse selector hub. The reverse selector hub is splined to the countershaft so 4th-5th gear and reverse gear engage with the countershaft.

Gears on the secondary shaft:

- 1st gear is engaged/disengaged with the secondary shaft by the 1st clutch.
- 2nd gear is engaged/disengaged with the secondary shaft by the 2nd clutch.
- 4th gear is engages/disengages with the secondary shaft by the 4th clutch.

- Idler gear is splined with the secondary shaft, and rotates with the secondary shaft.

The idler gear on the idler gear shaft transmits power between the mainshaft and the secondary shaft.

The reverse idler gear transmits power from the mainshaft reverse gear to the countershaft reverse gear, and change rotational direction of the countershaft to reverse.

Power Flow

P Position

Hydraulic pressure is not applied to the clutches. Power is not transmitted to the countershaft. The countershaft is locked by the park pawl interlocking the park gear.

N Position

Engine power transmitted from the torque converter drives the mainshaft idler gear, the idler gear shaft idler gear, and the secondary shaft idler gear, but hydraulic pressure is not applied to the clutches. Power is not transmitted to the countershaft. In this position, the position of the reverse selector differs according to whether the shift lever shifted from D or R:

- When shifted from D, the reverse selector engages with the countershaft 4th-5th gear and the reverse selector hub, and the 4th-5th gear engages with the countershaft.
- When shifted from R, the reverse selector engages with the countershaft reverse gear and the reverse selector hub, and the reverse gear engages with the countershaft.

D, D3 Position

In D and D3, the optimum gear is automatically selected from 1st, 2nd, 3rd, and 5th gears in D; 1st, 2nd, and 3rd gears in D3 according to conditions such as the balance between the throttle opening (engine loading) and the vehicle speed.

In 1st Gear and 1 Position

- Hydraulic pressure is applied to the 1st clutch, then the 1st clutch engages the secondary shaft 1st gear with the secondary shaft.
- The mainshaft idler gear drives the secondary shaft via the idler gear shaft idler gear and the

secondary shaft idler gear.

- The secondary shaft 1st gear drives the countershaft 1st gear and the countershaft.
- Power is transmitted to the final drive gear, which in turn drives the final driven gear.

In 2nd Gear and 2 Position

- Hydraulic pressure is applied to the 2nd clutch, then the 2nd clutch engages the secondary shaft 2nd gear with the secondary shaft.
- The mainshaft idler gear drives the secondary shaft via the idler gear shaft idler gear and the secondary shaft idler gear.
- The secondary shaft 2nd gear drives the countershaft 2nd gear and the countershaft.
- Power is transmitted to the final drive gear, which in turn drives the final driven gear.

In 3rd Gear

- Hydraulic pressure is applied to the 3rd clutch, then the 3rd clutch engages the mainshaft 3rd gear with the mainshaft.
- The mainshaft 3rd gear drives the countershaft 3rd gear and the countershaft.

- Power is transmitted to the final drive gear, which in turn drives the final driven gear.

In 4th Gear

- Hydraulic pressure is applied to the 4th clutch, then the 4th clutch engages the secondary shaft 4th gear with the secondary shaft.
- The mainshaft idler gear drives the secondary shaft via the idler gear shaft idler gear and the secondary shaft idler gear.
- The secondary shaft 4th gear drives the countershaft 4th-5th gear.
- The countershaft 4th-5th gear drives the countershaft via the reverse selector, which drives the reverse selector hub.
- Power is transmitted to the final drive gear, which in turn drives the final driven gear.

In 5th Gear

- Hydraulic pressure is applied to the servo valve to engage the reverse selector with the countershaft 4th-5th gear and the reverse selector hub while the shift lever is in forward range; D, D3, 2, and 1.
- Hydraulic pressure is also applied to the 5th clutch, then the 5th clutch engages the mainshaft 5th gear with the mainshaft.
- The mainshaft 5th gear drives the countershaft 4th-5th gear.
- The countershaft 4th-5th gear drives the countershaft via the reverse selector, which drives the reverse

selector hub.

- Power is transmitted to the final drive gear, which in turn drives the final driven gear.

R Position

- Hydraulic pressure is applied to the servo valve to engage the reverse selector with the countershaft reverse gear and the reverse selector hub while the shift lever is in R.
- Hydraulic pressure is also applied to the 5th clutch, then the 5th clutch engages the mainshaft reverse gear with the mainshaft.
- The mainshaft reverse gear drives the countershaft reverse gear via the reverse idler gear.

- The rotational direction of the countershaft reverse gear is changed by the reverse idler gear.
- The countershaft reverse gear drives the countershaft via the reverse selector, which drives the reverse selector hub.
- Power is transmitted to the final drive gear, which in turn drives the final driven gear.

Electronic Control System

Electronic Control

The electronic control system consists of the powertrain control module (PCM), sensors, and seven solenoid

valves. Shifting and lock-up are electronically controlled for comfortable driving under all conditions.

The PCM receives input signals from the sensors, switches, and other control units, processes data, and outputs signals for the engine control system and A/T control system. The A/T control system includes shift control, grade logic control, clutch pressure control, and lock-up control. The PCM switches the shift solenoid valves and the A/T clutch pressure control solenoid valves to control shifting transmission gears and lock-up torque converter clutch.

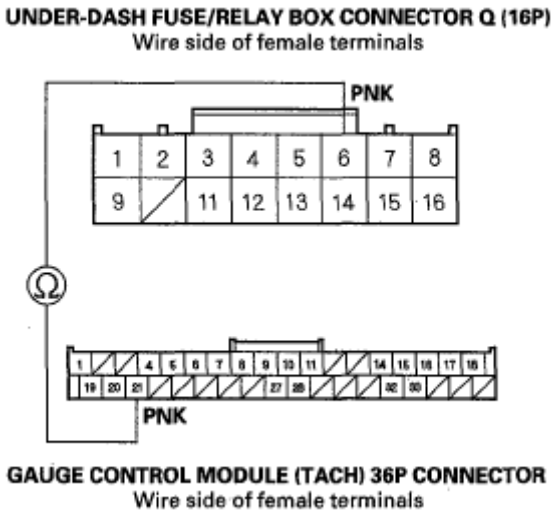

Fig. 25: Electronic Control System Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Shift Control

The PCM instantly determines which gear should be selected by various signals sent from the sensors and the switches, and actuates shift solenoid valves A, B, C, and D to control gear selection.

The shift solenoid valves are a normally closed type. When a shift solenoid valve is turned ON by the PCM, its port opens and the pressure from the shift solenoid valve(s) moves to the shift valves. When a shift solenoid valve is turned OFF by the PCM, its port closes, cutting off the pressure to the shift valves.

The combination of driving signals to shift solenoid valves A, B, C, and D and their respective gear position are shown in the table.

Shift Control - Grade Logic Control

The grade logic control system has been adopted to control shifting in D. To control shifting while the vehicle is ascending or descending a slope, the PCM compares actual driving conditions with programmed driving conditions, based on the input from the accelerator pedal position sensor, the throttle position sensor, the engine coolant temperature sensor, the barometric pressure sensor, the brake pedal position switch signal, and the shift lever position signal.

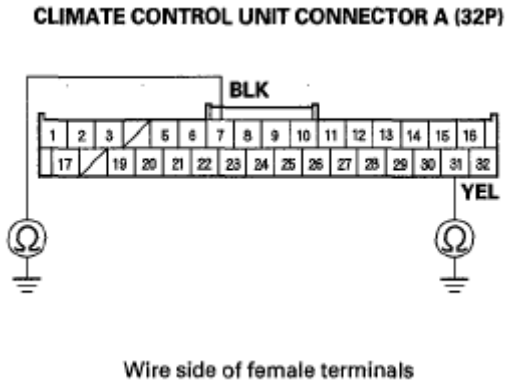

Fig. 26: Shift Control - Grade Logic Control System Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Grade Logic Control: Ascending Control

When the PCM determines that the vehicle is climbing a hill in D, the PCM extends the engagement area of 2nd gear, 3rd gear, and 4th gear to prevent the transmission from frequently shifting between 2nd and 3rd gears, between 3rd and 4th gears, and between 4th and 5th gears, so the vehicle can run smooth and have more power when needed.

NOTE: Shift commands stored in the PCM between 2nd and 3rd gears, between 3rd and 4th gears, and between 4th and 5th gears, enable the PCM to automatically select the most suitable gear according to the magnitude of a gradient.

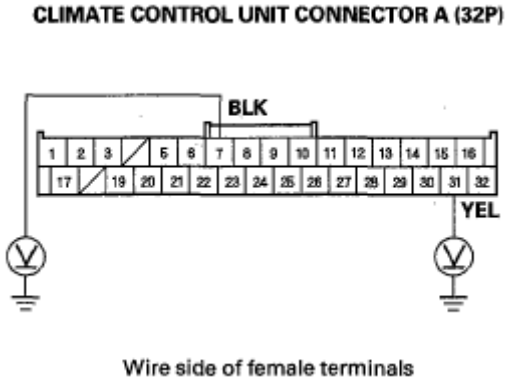

Fig. 27: Grade Logic Control - Ascending Control Graph
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Grade Logic Control: Descending Control

When the PCM determines that the vehicle is going down a hill in D, the shift-up speed from 4th to 5th gear, 3rd to 4th gear, and from 2nd to 3rd (when the throttle is closed) becomes faster than the set speed for flat road driving to extend the 4th gear, 3rd gear, and 2nd gear engagement areas. This, in combination with engine braking from the deceleration lock-up, achieves smooth driving when the vehicle is descending. There are three descending modes with different 4th gear driving areas, 3rd gear driving areas and 2nd gear driving areas according to the magnitude of a gradient stored in the PCM. When the vehicle is in 5th or 4th gear and you are decelerating while applying the brakes on a steep hill, the transmission will downshift to a lower gear. When you accelerate, the transmission will then return to a higher gear.

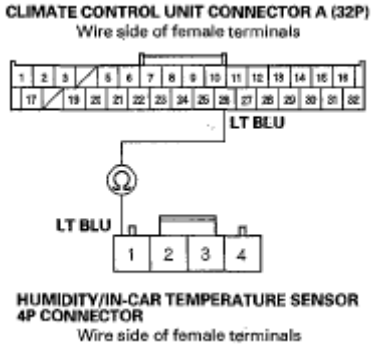

Fig. 28: Grade Logic Control - Descending Control Graph
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Clutch Pressure Control

The PCM actuates A/T clutch pressure control solenoid valves A, B, and C to control the clutch pressure. When shifting between gears, the clutch pressure regulated by A/T clutch pressure control solenoid valves A, B, and C engages and disengages the clutch smoothly.

The PCM receives input signals from the various sensors and switches, processes data, and outputs current

to A/T clutch pressure control solenoid valves A, B, and C.

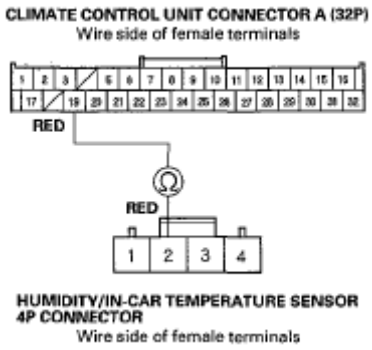

Fig. 29: Clutch Pressure Control System Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Lock-up Control

Shift solenoid valve D controls the hydraulic pressure to switch the lock-up shift valve and lock-up ON and OFF. The PCM actuates shift solenoid valve D and A/T clutch pressure control solenoid valve A to start lock-up. A/T clutch pressure control solenoid valve A applies and regulates hydraulic pressure to the lock-up control valve to control the volume of the lock-up. The lock-up mechanism operates in D (1st, 2nd, 3rd, 4th, and 5th gears) and in D3 (1st, 2nd, and 3rd gears).

Hydraulic Controls

The valve body includes the main valve body, the regulator valve body, and the servo body. The ATF pump is driven by splines on the end of the torque converter which is attached to the engine. Fluid flows through the regulator valve to maintain specified pressure through the main valve body to the manual valve, directing pressure to each of the clutches. Shift solenoid valves A, B, C, and D are mounted on the servo body. A/T clutch pressure control solenoid valves A, B, and C are mounted on the transmission housing.

Main Valve Body

The main valve body contains the manual valve, cut valve B, shift valves A, C, and D, the relief valve, the lock-up control valve, the cooler check valve, the servo control valve, and the ATF pump gears. The primary function of the main valve body is to switch fluid pressure on and off to control hydraulic pressure going to the hydraulic control system.

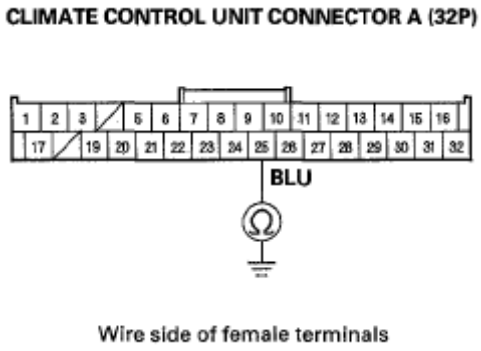

Fig. 34: Identifying Main Valve Body Components

Regulator Valve Body

The regulator valve body is located on the main valve body. The regulator valve body contains the regulator valve, the torque converter check valve, the lock-up shift valve, the 1st accumulator, and the 3rd accumulator.

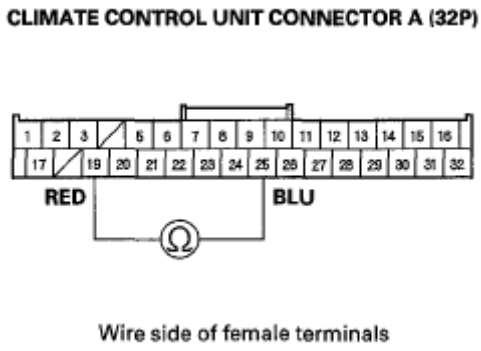

Fig. 35: Identifying Regulator Valve Body Components

Regulator Valve

The regulator valve maintains constant hydraulic pressure from the ATF pump to the hydraulic control system. While also furnishing fluid to the lubrication system and the torque converter. Fluid from the ATF pump flows through B and B'. Fluid entering from B flows through the valve orifice to the A cavity. This pressure of the A cavity pushes the regulator valve toward the spring, and this movement of the regulator valve uncovers the fluid port to the torque converter and the relief valve. The fluid flows out to the torque converter and the relief valve, and the regulator valve returns under spring force. According to the level of the hydraulic pressure through B, the position of the regulator valve changes, and the amount of fluid from B' through the torque converter changes. This operation is continued, maintaining the line pressure.

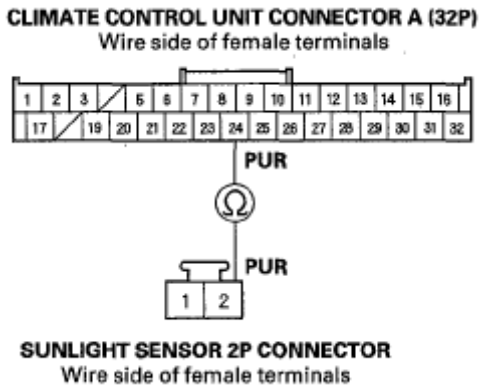

Fig. 36: Regulator Valve Operation Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Increases in hydraulic pressure according to torque are regulated by the regulator valve using stator torque reaction. The stator shaft is splined to the stator in the torque converter, and its arm end contacts the regulator spring cap. When the vehicle is accelerating or climbing (torque converter range), stator torque reaction acts on the stator shaft, and the stator arm pushes the regulator spring cap in the direction of the arrow in proportion to the reaction. The stator reaction spring compresses, and the regulator valve moves to increase the line pressure which is regulated by the regulator valve. The line pressure reaches its maximum when the stator torque reaction reaches its maximum.

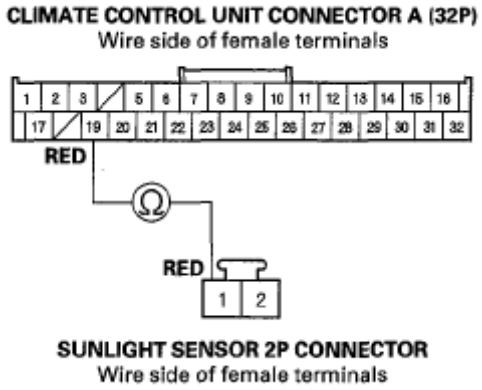

Fig. 37: Identifying Regulator Spring Cap

Servo Body

The servo body is on the main valve body. The servo body contains the servo valve, shift valve B, cut valve A, the accumulators for 2nd, 4th, and 5th, and shift solenoid valves A, B, C, and D.

Accumulator

The accumulators are located in the regulator valve body and the servo body. The regulator valve body contains the 1st and 3rd accumulators, and the servo body contains the 2nd, 4th, and 5th accumulators.

Hydraulic Flow

Distribution of Hydraulic Pressure

As the engine turns, the ATF pump starts to operate. Automatic transmission fluid (ATF) is drawn through the ATF strainer (filter) and discharged into the hydraulic circuit. Then, ATF flowing from the ATF pump becomes line pressure that is regulated by the regulator valve. Torque converter pressure from the regulator valve enters the torque converter through the lock-up shift valve, and it is discharged from the torque converter. The torque converter check valve prevents torque converter pressure from rising.

The PCM turns the shift solenoid valves ON and OFF. The shift solenoid valve controls line pressure from the ATF pump via the manual valve when the shift solenoid valve is OFF. When the shift solenoid valve is turned ON by the PCM, line pressure changes to shift solenoid valve pressure at the shift solenoid valve, then the shift solenoid valve pressure flows to the shift valve. Applying shift solenoid pressure to the shift valve moves the position of the shift valve, and switches the port of the hydraulic circuit. The PCM also controls A/T clutch pressure control solenoid valves A, B, and C. The A/T clutch pressure control solenoid valves regulate hydraulic pressure, and apply the pressure to the clutches to engage smoothly. The clutches receive optimum clutch pressure which is regulated by the A/T clutch pressure control solenoid valves for comfortable driving and shifting under all conditions.

N Position

The PCM controls the shift solenoid valves. The conditions of the shift solenoid valves and positions of the shift valve are as follows:

- Shift solenoid valve A is turned OFF, shift valve A remains on the right side, and cut valve A remains on the left side.
- Shift solenoid valve B is turned OFF, and shift valve B remains on the right side.
- Shift solenoid valve C is turned OFF, and shift valve C remains on the right side.

Line pressure (1) passes through the manual valve and stops at cut valve B. Line pressure (1) also flows to shift solenoid valves, and A/T clutch pressure control solenoid valve A. Under this condition, hydraulic pressure is not applied to the clutches.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

D Position: 1st gear shifting from the N position

The shift solenoid valves and the shift valves remain the same position when shifting from D to N. The PCM actuates A/T clutch pressure control solenoid valve A to regulate the line pressure. Line pressure (1) becomes A/T clutch pressure control solenoid valve A pressure (55), and A/T clutch pressure control solenoid valve A pressure flows to the lock-up shift valve, shift valve B, the manual valve, and shift valve

A. Also solenoid valve A pressure becomes 1st clutch pressure (10) at shift valve C, and 1st clutch pressure (10) flows to the 1st clutch. The 1st clutch is engaged by A/T clutch pressure control solenoid valve A pressure mode when shifting to D from N.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

D Position: Driving in 1st gear

The PCM turns shift solenoid valve B ON, and shift solenoid valves A and C remain OFF. Shift solenoid valve B pressure (SB) is applied to the right side of shift valve B. Shift valve B then moves to the left side, causing the line pressure port leading to the 1st clutch to be uncovered, and the A/T clutch pressure control solenoid valve A pressure port to be covered. Line pressure (1B) passed through shift valve B flows to the manual valve, shift valve A, and shift valve C, and becomes 1st clutch pressure (10). 1st clutch pressure is applied to the 1st clutch, and the 1st clutch is engaged by the line pressure mode.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

D Position: Shifting between 1st gear and 2nd gear

As the speed of the vehicle reaches the programmed value, the PCM turns shift solenoid valve A ON, shift solenoid valve B remains ON, and C remains OFF. Shift solenoid valve A pressure (SA) is applied to the

right end of shift valve A and to the left side of cut valve A. Cut valve A is moved to the right side to release 1st clutch pressure in line pressure mode, and shift valve A is moved to the left side to switch line pressure (5A) port to A/T clutch pressure control solenoid valve C pressure (5C) port leading to the 1st clutch. Also shift valve A uncovers 2nd clutch pressure (20) port leading A/T clutch pressure control solenoid valve B pressure (56) to the 2nd clutch. The 1st clutch and the 2nd clutch are engaged by the A/T clutch pressure control solenoid valve pressure mode.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

D Position: Driving in 2nd gear

The PCM turns shift solenoid valve B OFF, shift solenoid valve A remains ON, and C remains OFF. Shift solenoid valve B is turned OFF, and shift solenoid valve B pressure (SB) in the right end of shift valve B and in the left end of the servo control valve is released. Cut valve B and servo control valve are kept in the right side by line pressure (4) even though releasing hydraulic pressure in the left end. Shift valve B is moved to the right side to switch A/T clutch pressure control solenoid valve B pressure (5F) port to line pressure (5D) port leading to the 2nd clutch. 2nd clutch pressure (20) is applied to the 2nd clutch, and the 2nd clutch is engaged by the line pressure mode.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

D Position: Shifting between 2nd gear and 3rd gear

As the speed of the vehicle reaches the programmed value, the PCM turns shift solenoid valve A OFF, while shift solenoid valve B and C remain OFF. Shift solenoid valve A is turned OFF, and shift solenoid valve A pressure (SA) in the right end of shift valve A and in the left end of cut valve A is released. Even though shift solenoid valve A pressure is released, cut valve A is kept on the right side by line pressure (4). Shift valve A is moved to the right side to switch to the line pressure (5G) port to the A/T clutch pressure control solenoid valve B pressure (5E) port leading to the 2nd clutch. Also shift valve A uncovers 3rd clutch pressure (30) port leading A/T clutch pressure control solenoid valve C pressure (5L) to the 3rd clutch. The 2nd and 3rd clutch are engaged by the A/T clutch pressure control solenoid valve pressure mode.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

D Position: Driving in 3rd gear

The PCM turns shift solenoid valve CON, and shift solenoid valve A and B remain OFF. Shift solenoid valve C pressure (SC) is applied to the right side of shift valve C and cut valve B. Shift valve C is then moved to the left side to releasing the 2nd clutch pressure. The 3rd clutch keeps on engaging with the A/T clutch pressure control solenoid valve C pressure mode.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

D Position: Shifting between 3rd gear and 4th gear

As the speed of the vehicle reaches the programmed value, the PCM turns shift solenoid valve A ON. Shift solenoid valve B remains OFF, and C remains ON. Shift solenoid valve A pressure (SA) is applied to the right end of shift valve A and the left end of cut valve A. Shift valve A is moved to the left side, switching the line pressure (5L) port to the A/T clutch pressure control solenoid valve C pressure (5K) port leading to the 3rd clutch. Also shift valve A uncovers the 4th clutch pressure (40) port leading A/T clutch pressure control solenoid valve B pressure (5H) to the 4th clutch. The 3rd and 4th clutches are engaged by the A/T clutch pressure control solenoid valve pressure mode.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

D Position: Driving in 4th gear

The PCM turns shift solenoid valve B ON, and shift solenoid valve A and B remain ON. Shift solenoid valve B pressure (SB) is applied to the right side of shift valve B and the left side of the servo control valve. Shift valve B then moves to the left side releasing the 3rd clutch pressure. The 4th clutch is engaged by the A/T clutch pressure control solenoid valve B pressure mode.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

D Position: Shifting between 4th gear and 5th gear

As the speed of the vehicle reaches the programmed value, the PCM turns shift solenoid valve A OFF while shift solenoid valve B and C remain ON. As a result, the pressure in the right end of shift valve A is released. Even though shift solenoid valve A pressure (SA) is released, cut valve A is kept on the right side by the line pressure (4). Shift valve A is moved to the right side to uncover A/T clutch pressure control solenoid valve C pressure (5T) (5J) port leading to the 4th clutch. The 4th and 5th clutches are engaged by the A/T clutch pressure control solenoid valve pressure mode.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

D Position: Driving in 5th gear

The PCM turns shift solenoid valve C OFF, shift solenoid valve A remains OFF, and B remains ON. Shift solenoid valve C pressure (SC) is then released to the right side of shift valve C. This causes shift valve C to

move to the right side, releasing the 4th clutch pressure. The 5th clutch is engaged by the A/T clutch pressure control solenoid valve C pressure mode.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

2 Position

The PCM controls the shift solenoid valves and the A/T clutch pressure control solenoid valves. The conditions of the shift solenoid valves and the position of the shift valves are as follows:

- Shift solenoid valve A is turned ON, causing shift valve A to move to the left side.
- Shift solenoid valve B is turned OFF, keeping shift valve B on the right side.
- Shift solenoid valve C is turned OFF, keeping shift valve C on the left side.

Line pressure travels up and through shift valve C (5D), through shift valve B (5G), and then up to shift valve A (20) to become 2nd clutch pressure. The 2nd clutch is engages by the 2nd clutch pressure.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

1 Position

The PCM controls the shift solenoid valves and the A/T clutch pressure control solenoid valves. The conditions of the shift solenoid valves and the position of the shift valves are as follows:

- Shift solenoid valve A is turned OFF, keeping shift valve A on the right side.
- Shift solenoid valve B is turned ON, causing shift valve B move to the left side.
- Shift solenoid valve C is turned OFF, keeping shift valve C on the right side.

Line pressure (1) from the manual valve flows to cut valve B, cut valve A, shift valve B, and becomes line pressure (5A) at the manual valve. Line pressure (5A) passes through shift valve A, flows to shift valve C, and becomes 1st clutch pressure (10). 1st clutch pressure (10) is applied to the 1st clutch, and the 1st clutch is engaged.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

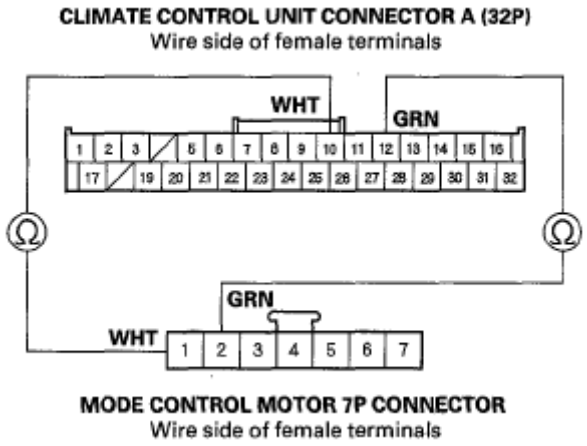

Fig. 52: Hydraulic Fuel Pressure Flow Diagram (1 Position)

R Position: Shifting to the R position from the P or N position

The manual valve is moved into the R position. This causes line pressure (1) to become line pressure (1), (3), and (7) at the manual valve. The PCM turns shift solenoid valves C and D ON, and shift solenoid valves A and B remain OFF. Shift solenoid valve D pressure (SD) is applied to the left end of shift valve D, causing shift valve D to move to the right side, uncovering the line pressure (3) port leading to the servo valve. Line pressure (3') from shift valve D flows to the servo valve, and pushes the servo valve to the reverse position. The PCM controls A/T clutch pressure control solenoid valve A to regulate A/T clutch pressure control solenoid valve A pressure (55), and A/T clutch pressure control solenoid valve A pressure (55) flows to the lock-up shift valve, shift valve B, the manual valve, the servo valve, shift valve D, and cut valve A. A/T clutch pressure control solenoid valve A pressure (3C) becomes 5th clutch pressure (50) at cut valve A. 5th clutch pressure (50) is applied to the 5th clutch, and the 5th clutch is engaged by the A/T clutch pressure control solenoid valve A pressure mode.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

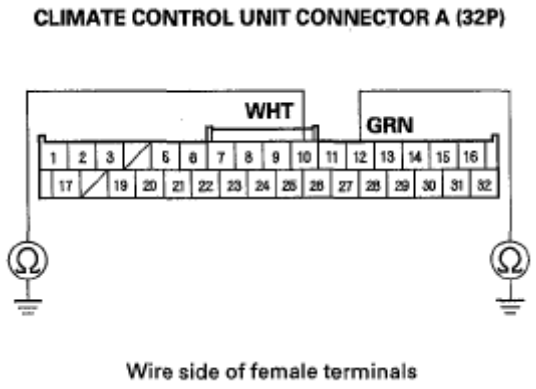

Fig. 53: Hydraulic Fuel Pressure Flow Diagram (R Position - Shifting To R Position From P Or N Position)

R Position: Driving in reverse gear

When starting off in reverse gear, the PCM turns shift solenoid valves B and C ON. Shift solenoid valve A remains OFF, and D remains ON. Shift solenoid valve B is turned ON, and shift solenoid valve B pressure (SB) is applied to the right end of shift valve B. Shift valve B is moved to the right side to switch A/T clutch pressure control solenoid valve A pressure (55') port to line pressure (1B) port leading to the 5th clutch. The 5th clutch is engaged with the line pressure mode.

Reverse Inhibitor Control

When R is selected while the vehicle is moving forward at speeds over 6 mph (10 km/h), the PCM turns shift solenoid valves A and C ON, and shift solenoid valves B and D OFF. Shift solenoid valve D is kept OFF, and shift valve D is kept in the left side to cover line pressure (3) port leading to the servo valve. The servo valve is kept in the forward position. Shift solenoid valve A is turned ON, shift valve A is moved to the right side and covers the port to stop line pressure (1 A) leading to the 5th clutch. The servo valve is not applied line pressure, the 5th clutch is not applied 5th clutch pressure, as a result, power is not transmitted to the reverse direction.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

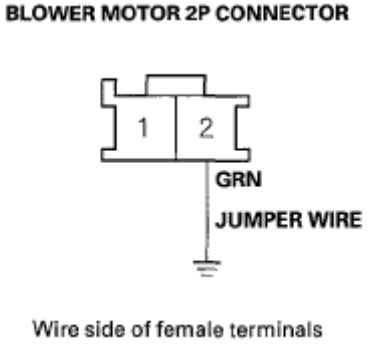

Fig. 54: Hydraulic Fuel Pressure Flow Diagram (R Position - Driving In Reverse Gear)

P Position

The manual valve is moved into the P position, line pressure (1) becomes line pressure (1), (3), and (7) at the manual valve. The PCM turns shift solenoid valve D ON, and shift solenoid valves A, B, and C OFF. Shift solenoid valve D pressure (SD) is applied to the left end of shift valve D, and shift valve D is moved to the right side to uncover line pressure (3) port leading to the servo valve. Line pressure (3') from shift valve D flows to the servo valve, and pushes the servo valve to the reverse position. Line pressure (1) is intercepted at cut valve B, line pressure (1B) is intercepted at shift valve B, and hydraulic pressure is not applied to the clutches.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

Lock-up System

The lock-up mechanism of the torque converter clutch operates in D (2nd, 3rd, 4th, and 5th gears) and D3 (2nd and 3rd gears). The pressurized fluid is drained from the back of the torque converter through a fluid passage, causing the torque converter clutch piston to be held against the torque converter cover. As this takes place, the mainshaft rotates at the same speed as the engine crankshaft. Together with the hydraulic control, the PCM optimizes the timing and the amount of ATF the lock-up mechanism receives. When shift solenoid valve D is turned on by the PCM, shift solenoid valve D pressure turns the lock-up shift valve lock-up on and off. A/T clutch pressure control solenoid valve A and the lock-up control valve control the volume of lock-up.

Torque Converter Clutch Lock-up ON (Engaging Torque Converter Clutch)

Fluid in the chamber between the torque converter cover and the torque converter clutch piston is drained off, and fluid entering from the chamber between the pump and the stator exerts pressure through the torque converter clutch piston against the torque converter cover. The torque converter clutch piston engages with the torque converter cover; the torque converter clutch locks-up, and the mainshaft rotates at the same as the engine.

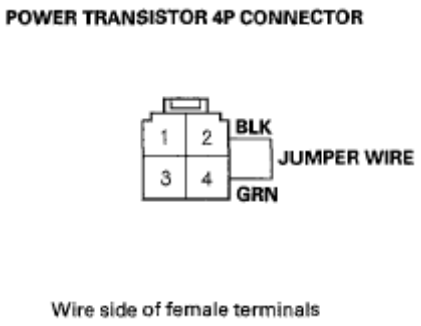

Fig. 56: Torque Converter Clutch Lock-Up On Diagram (Engaging Torque Converter Clutch)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Torque Converter Clutch Lock-up OFF (Disengaging Torque Converter Clutch)

Fluid entered from the chamber between the torque converter cover and the torque converter clutch piston passes through the torque converter and goes out from the chambers between the turbine and the stator, and the pump and the stator. As a result, the torque converter clutch piston moves away from the torque converter cover, and the torque converter clutch lock-up is released.

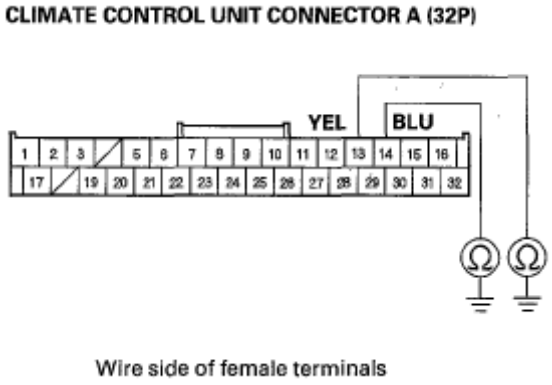

Fig. 57: Torque Converter Clutch Lock-Up Off Diagram (Disengaging Torque Converter Clutch)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

No Lock-up

The PCM turns shift solenoid valve D OFF. The lock-up shift valve is on the right side, and uncovers the torque converter pressure port leading to the back of the torque converter. Torque converter pressure (92) regulated by the regulator valve flows to the lock-up shift valve, and becomes torque converter pressure (94). Torque converter pressure (94) enters into the back of the torque converter, and discharges into the circuit from the front of the torque converter. When the hydraulic pressure flow enters the torque converter from the rear and discharges it from the front, the torque converter clutch piston and cover become disengaged. This is called the non lock-up condition.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

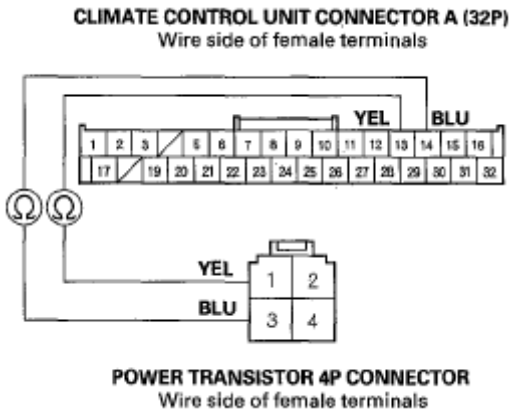

Fig. 58: Hydraulic Fuel Pressure Flow Diagram (No Lock-Up)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Partial Lock-up

As the speed of the vehicle reaches the programmed value, the PCM turns shift solenoid valve D ON. Shift solenoid valve D pressure (SD) is applied to the right end of the lock-up shift valve, which switches the pressure over to the torque converter pressure port leading to the front of the torque converter. Torque converter pressure (91) enters into the front of the torque converter to engage the torque converter clutch piston. The PCM also controls A/T clutch pressure control solenoid valve A to regulate A/T clutch pressure control solenoid valve A pressure (55), and A/T clutch pressure control solenoid valve A pressure (55) is applied to the lock-up control valve. Torque converter pressure (94) drained from the back of the torque converter is applied to the right side of the lock-up control valve, and torque converter pressure (90) is applied to the left side of the lock-up control valve. The lock-up control valve controls the lock-up volume, by receiving these pressures. The torque converter clutch is engaged partially during torque converter pressure (90) in the left side of the lock-up control valve is higher, and the torque converter clutch is engaged securely according to the volume of pressure in the right side of the lock-up control valve. Under this condition, the torque converter clutch is engaged by pressure entering into the front side of the torque converter; this condition is partial lock-up.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

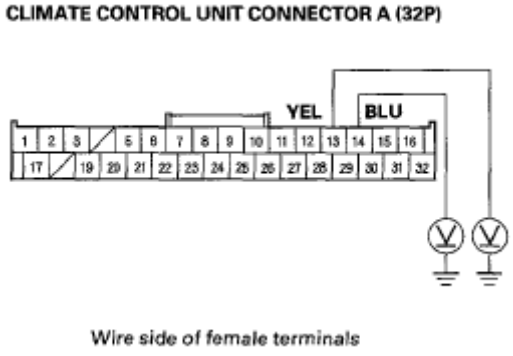

Fig. 59: Hydraulic Fuel Pressure Flow Diagram (Partial Lock-Up)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Full Lock-up

When the vehicle speed increases, the PCM controls A/T clutch pressure control solenoid valve A to

increase A/T clutch pressure control solenoid valve A pressure (55). A/T clutch pressure control solenoid valve A pressure (55) is applied to the lock-up control valve, and the lock-up control valve is moved to the left side to release torque converter back pressure (94). Torque converter pressure (91) enters into the front of the torque converter, and the torque converter clutch piston is engaged with the torque converter cover securely by torque converter pressure. Under this condition, torque converter back pressure is released fully, causing the torque converter clutch to be fully engaged; this condition is full lock-up.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

DTC TROUBLESHOOTING

DTC P0107: Manifold Absolute Pressure (MAP) Sensor Circuit Low Voltage Input; DTC P0108: Manifold Absolute Pressure (MAP) Sensor Circuit High Voltage Input

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Check for Temporary DTCs or DTCs in the PGM-FI SYSTEM with the HDS.

   Is DTC P0107 or P0108 indicated in the PGM-FI SYSTEM?

   YES -Go to the **INDICATED DTC'S TROUBLESHOOTING** in the PGM-FI system:

   - P0107 (see **DTC P0107: MAP SENSOR CIRCUIT LOW VOLTAGE**)
   - P0108 (see **DTC P0108: MAP SENSOR CIRCUIT HIGH VOLTAGE**)

   NO -Go to step 5.

5. Check for DTCs in the A/T SYSTEM with the HDS.

   Is DTC P0107 or P0108 indicated in the A/T SYSTEM?

   YES -Go to step 6.

   NO -Intermittent failure, the system is OK at this time. If any other DTCs were indicated, go to the **INDICATED DTC'S TROUBLESHOOTING**.

6. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
7. Start the engine, and wait for at least 2 minutes.
8. Check for DTCs in the A/T SYSTEM with the HDS.

   Is DTC P0107 or P0108 indicated in the A/T SYSTEM?

   YES -Check for poor connections or loose terminals at the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 7. If the PCM was substituted, go to step 1.

   NO -Go to step 9.

9. Monitor the OBD STATUS for P0107 or P0108 in the DTCs MENU with the HDS.

   Does the HDS indicate PASSED?

YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 8, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO -If the HDS indicates FAILED, check for poor connections or loose terminals at the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 7. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 7.

DTC P0335: Crankshaft Position (CKP) Sensor No Signal; DTC P0365: Camshaft Position (CMP) Sensor No Signal

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Start the engine.
4. Check for Temporary DTCs or DTCs in the PGM-FI SYSTEM with the HDS.

   Is DTC P0335 or P0365 indicated in the PGM-FI SYSTEM?

   YES -Go to the **INDICATED DTC'S TROUBLESHOOTING** in the PGM-FI system:

   - P0335 (see **DTC P0335: CKP SENSOR NO SIGNAL**)
   - P0365 (see **DTC P0365: CMP SENSOR NO SIGNAL**)

   NO -Go to step 5.

5. Check for DTCs in the A/T SYSTEM with the HDS.

   Is DTC P0335 or P0365 indicated in the A/T SYSTEM?

   YES -Go to step 6.

   NO -Intermittent failure, the system is OK at this time. If any other DTCs were indicated, go to the **INDICATED DTC'S TROUBLESHOOTING**.

6. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
7. Start the engine, and wait for at least 2 minutes.
8. Check for DTCs in the A/T SYSTEM with the HDS.

   Is DTC P0335 or P0365 indicated in the A/T SYSTEM?

   YES -Check for poor connections or loose terminals at the PCM, If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 7. If the PCM was substituted, go to step 1.

NO -Go to step 9.

9. Monitor the OBD STATUS for P0335 or P0365 in the DTCs MENU with the HDS.

   Does the HDS indicate PASSED?

   YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 8, go to the **INDICATED DTC'S TROUBLESHOOTING**.

   NO -If the HDS indicates FAILED, check for poor connections or loose terminals at the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 7. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 7.

DTC P0339: Crankshaft Position (CKP) Sensor Intermittent Interruption; DTC P0369: Camshaft Position (CMP) Sensor Intermittent Interruption

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and raise the engine speed to at least 2,000 rpm.
4. Check for Temporary DTCs or DTCs in the PGM-FI SYSTEM with the HDS.

   Is DTC P0339 or P0369 indicated in the PGM-FI SYSTEM?

   YES -Go to the **INDICATED DTC'S TROUBLESHOOTING** in the PGM-FI system:

   - P0339 (see **DTC P0339: CKP SENSOR INTERMITTENT INTERRUPTION**)
   - P0369 (see **DTC P0369: CMP SENSOR CIRCUIT INTERMITTENT INTERRUPTION**)

   NO -Go to step 5.

5. Check for DTCs in the A/T SYSTEM with the HDS.

   Is DTC P0339 or P0369 indicated in the A/T SYSTEM?

   YES -Go to step 6.

   NO -Intermittent failure, the system is OK at this time. If any other DTCs were indicated, go to the **INDICATED DTC'S TROUBLESHOOTING**.

6. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
7. Start the engine, and wait for at least 2 minutes.
8. Check for DTCs in the A/T SYSTEM with the HDS.

Is DTC P0339 or P0369 indicated in the A/T SYSTEM?

YES -Check for poor connections or loose terminals at the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 7. If the PCM was substituted, go to step 1.

NO -Go to step 9.

9. Monitor the OBD STATUS for P0339 or P0369 in the DTCs MENU with the HDS.

   Does the HDS indicate PASSED?

   YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 8, go to the **INDICATED DTC'S TROUBLESHOOTING**.

   NO -If the HDS indicates FAILED, check for poor connections or loose terminals at the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 7. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 7.

DTC P0603: PCM Internal Control Module Keep Alive Memory (KAM) Error

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Check for Temporary DTCs or DTCs in the PGM-FI SYSTEM with the HDS.

   Is DTC P0603 indicated in the PGM-FI SYSTEM?

   YES -Go to **DTC P0603: ECM/PCM INTERNAL CONTROL MODULE KEEP ALIVE MEMORY (KAM) ERROR** in the PGM-FI system .

   NO -Go to step 4.

4. Check for DTCs in the A/T SYSTEM with the HDS.

   Is DTC P0603 indicated in the A/T SYSTEM?

   YES -Go to step 5.

   NO -Intermittent failure, the system is OK at this time. If any other DTCs were indicated, go to the **INDICATED DTC'S TROUBLESHOOTING**.

5. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).

6. Turn the ignition switch to ON (II).
7. Check for DTCs in the A/T SYSTEM with the HDS.

   Is DTC P0603 indicated in the A/T SYSTEM?

   YES -Check for poor connections or loose terminals at the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 6. If the PCM was substituted, go to step 1.

   NO -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated, go to the **INDICATED DTC'S TROUBLESHOOTING**.

DTC P0705: Short in Transmission Range Switch Circuit (Multiple Shift-position Input)

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Start the engine.
4. With the brake pedal pressed, move the shift lever through all positions. Stop for at least 1 second in each position.
5. Monitor the OBD STATUS for P0705 in the DTCs MENU with the HDS.

   Does the HDS indicate FAILED?

   YES -Go to step 6.

   NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for intermittent short to body ground in the wires between the transmission range switch and the PCM. If the HDS indicates NOT COMPLETED, go to step 3.

6. Turn the ignition switch to LOCK (0).
7. Inspect the transmission range switch (see **TRANSMISSION RANGE SWITCH TEST**).

   Is the switch OK?

   YES -With the switch connector disconnected, go to step 8.

   NO -Replace the transmission range switch (see **TRANSMISSION RANGE SWITCH REPLACEMENT**), then go to step 50.

8. Turn the ignition switch to ON (II).
9. Measure the voltage between transmission range switch connector terminals No. 6 and No. 10.

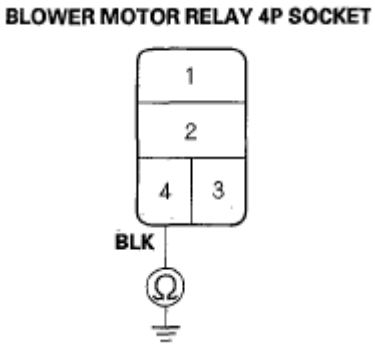

Fig. 63: Measuring Voltage Between Transmission Range Switch Connector Terminals No. 6 And No. 10
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES -Go to step 15.

NO -Go to step 10.

10. Turn the ignition switch to LOCK (0).
11. Jump the SCS line with the HDS.
12. Disconnect PCM connector B (44P).
13. Check for continuity between PCM connector terminal B13 and body ground.

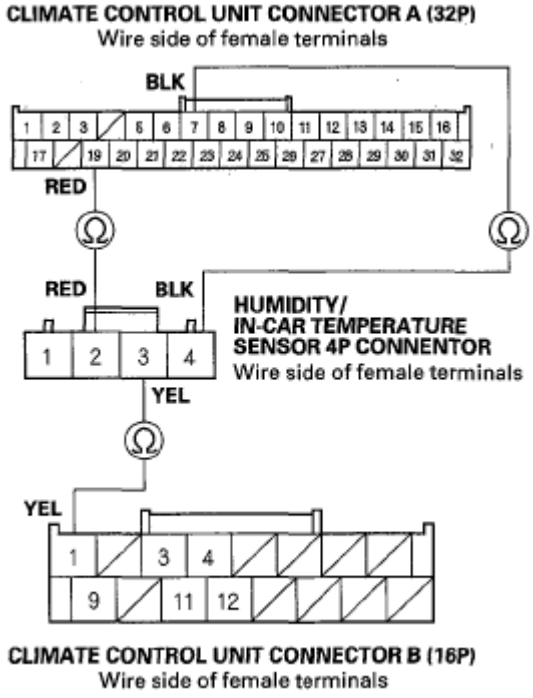

Fig. 64: Checking Continuity Between PCM Connector Terminal B13 And Body Ground

Is there continuity?

YES -Repair short to body ground in the wire between PCM connector terminal B13 and the transmission range switch, then go to step 50.

NO -Go to step 14.

14. Check for continuity between transmission range switch connector terminal No. 10 and body ground.

Is there continuity?

YES -Go to step 57.

NO -Repair open in the wire between transmission range switch connector terminal No. 10 and ground (G101) (see **CONNECTOR TO HARNESS INDEX**), or repair poor ground (G101), then go to step 50.

15. Measure the voltage between transmission range switch connector terminals No. 7 and No. 10.

Is there about 5 V?

YES -Go to step 20.

NO -Go to step 16.

16. Turn the ignition switch to LOCK (0).
17. Jump the SCS line with the HDS.
18. Disconnect PCM connector B (44P).
19. Check for continuity between PCM connector terminal B14 and body ground.

Is there about 5 V?

YES -Go to step 25.

NO -Go to step 21.

21. Turn the ignition switch to LOCK (0).
22. Jump the SCS line with the HDS.
23. Disconnect PCM connector B (44P).
24. Check for continuity between PCM connector terminal B12 and body ground.

Is there battery voltage?

YES -Go to step 30.

NO -Go to step 26.

26. Turn the ignition switch to LOCK (0).
27. Jump the SCS line with the HDS.
28. Disconnect PCM connector B (44P).
29. Check for continuity between PCM connector terminal B21 and body ground.

Is there battery voltage?

YES -Go to step 35.

NO -Go to step 31.

31. Turn the ignition switch to LOCK (0).
32. Jump the SCS line with the HDS.
33. Disconnect PCM connector B (44P).
34. Check for continuity between PCM connector terminal B15 and body ground.

Is there battery voltage?

YES -Go to step 57.

NO -Go to step 46.

46. Turn the ignition switch to LOCK (0).
47. Jump the SCS line with the HDS.
48. Disconnect PCM connector B (44P).
49. Check for continuity between PCM connector terminal B22 and body ground.

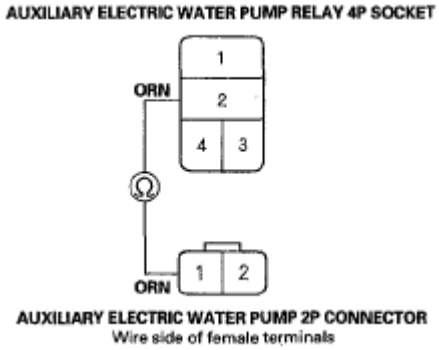

Fig. 79: Checking Continuity Between PCM Connector Terminal B22 And Body Ground

Is there continuity?

YES -Repair short to body ground in the wire between PCM connector terminal B22 and the transmission range switch, then go to step 50.

NO -Go to step 57.

50. Reconnect all connectors.
51. Turn the ignition switch to ON (II).
52. Clear the DTC with the HDS.

53. Start the engine.
54. With the brake pedal pressed, move the shift lever through all positions. Stop for at least 1 second in each position.
55. Check for DTCs with the HDS.

    Is DTC P0705 indicated?

    YES -Check for intermittent short to body ground in the wire between the transmission range switch and the PCM, then go to step 1.

    NO -Go to step 56.

56. Monitor the OBD STATUS for P0705 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 55, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for intermittent short to body ground in the wire between the transmission range switch and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, go to step 53.

57. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
58. Start the engine.
59. With the brake pedal pressed, move the shift lever through all positions. Stop for at least 1 second in each position.
60. Check for DTCs with the HDS.

    Is DTC P0705 indicated?

    YES -Check for intermittent short to body ground in the wire between the transmission range switch and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 58. If the PCM was substituted, go to step 1.

    NO -Go to step 61.

61. Monitor the OBD STATUS for P0705 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 60, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for intermittent short to body ground in the wire between the transmission range switch and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 58. If the PCM was substituted, go to step 1. If

the HDS indicates NOT COMPLETED, go to step 58.

DTC P0706: Open in Transmission Range Switch Circuit

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Raise the front of the vehicle, make sure it is securely supported, and allow the front wheels to rotate freely. Or raise the vehicle on a lift.
4. Start the engine, run the vehicle with the shift lever in D until the vehicle speed reaches 25 mph (40 km/h), then slow down and stop the wheels.
5. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 4, then go to step 6.
6. Monitor the OBD STATUS for P0706 in the DTCs MENU with the HDS.

   Does the HDS indicate FAILED?

   YES -Go to step 7.

   NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between the transmission range switch and the PCM. If the HDS indicates NOT COMPLETED, go to step 4.

7. Turn the ignition switch to LOCK (0).
8. Inspect the transmission range switch (see **TRANSMISSION RANGE SWITCH TEST**).

   Is the switch OK?

   YES -Go to step 9.

   NO -Replace the transmission range switch (see **TRANSMISSION RANGE SWITCH REPLACEMENT**), then go to step 30.

9. Adjust the shift cable (see **SHIFT CABLE ADJUSTMENT**).
10. Turn the ignition switch to ON (II).
11. Clear the DTC with the HDS.
12. Start the engine, run the vehicle with the shift lever in D until the vehicle speed reaches 25 mph (40 km/h), then slow down and stop the wheels.
13. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 12, then go to step 14.
14. Monitor the OBD STATUS for P0706 in the DTCs MENU with the HDS.

    Does the HDS indicate FAILED?

YES -Go to step 15.

NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between the transmission range switch and the PCM. If the HDS indicates NOT COMPLETED, go to step 12.

15. Shift to D, and check the ATP FWD and ATP D in the DATA LIST with the HDS.

    Are ATP FWD and ATP D ON?

    YES -Go to step 16.

    NO -Go to step 22.

16. Shift to D3, and check the ATP FWD and ATP D3 in the DATA LIST with the HDS.

    Are ATP FWD and ATP D3 ON?

    YES -Go to step 17.

    NO -Go to step 22.

17. Shift to 2, and check the ATP FWD and ATP 2-1 in the DATA LIST with the HDS.

    Are ATP FWD and ATP 2-1 ON?

    YES -Go to step 18.

    NO -Go to step 22.

18. Clear the DTC with the HDS.
19. Start the engine, run the vehicle with the shift lever in D until the vehicle speed reaches 25 mph (40 km/h), then slow down and stop the wheels.
20. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 19, then go to step 21.
21. Monitor the OBD STATUS for P0706 in the DTCs MENU with the HDS.

    Does the HDS indicate FAILED?

    YES -Go to step 22.

    NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between the transmission range switch and the PCM. If the HDS indicates NOT COMPLETED, go to step 19.

22. Turn the ignition switch to LOCK (0).
23. Disconnect the transmission range switch connector.
24. Check for continuity between transmission range switch connector terminal No. 10 and body ground.

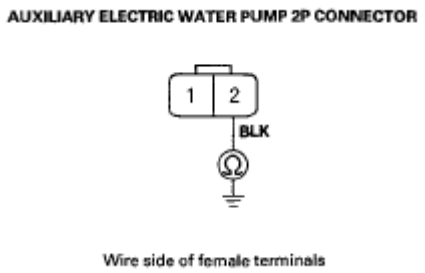

Fig. 80: Checking Continuity Between Transmission Range Switch Connector Terminal No. 10 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 25.

NO -Repair open in the wire between the transmission range switch and ground (G101) (see **CONNECTOR TO HARNESS INDEX**), or repair poor ground (G101), then go to step 30.

25. Turn the ignition switch to ON (II).
26. Measure the voltage between transmission range switch connector terminals No. 5 and No. 10.

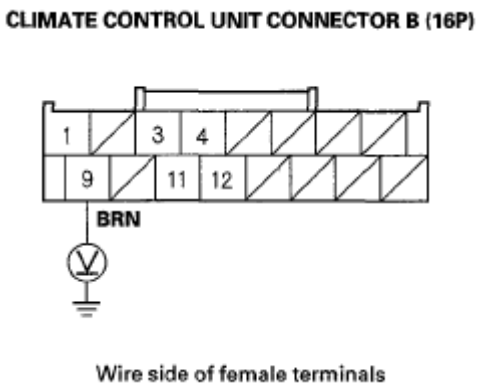

Fig. 81: Measuring Voltage Between Transmission Range Switch Connector Terminals No. 5 And No. 10
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 27.

NO -Repair open in the wire between the transmission range switch and PCM connector terminal B28, then go to step 30.

27. Measure the voltage between transmission range switch connector terminals No. 8 and No. 10.

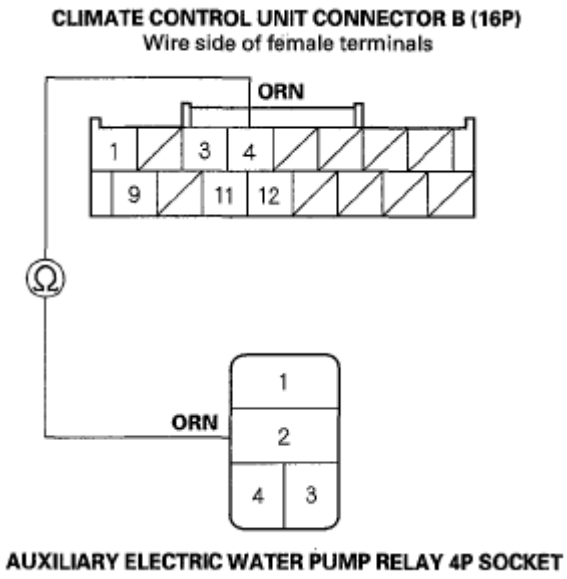

Fig. 82: Measuring Voltage Between Transmission Range Switch Connector Terminals No. 8 And No. 10
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 28.

NO -Repair open in the wire between the transmission range switch and PCM connector terminal B21, then go to step 30.

28. Measure the voltage between transmission range switch connector terminals No. 3 and No. 10.

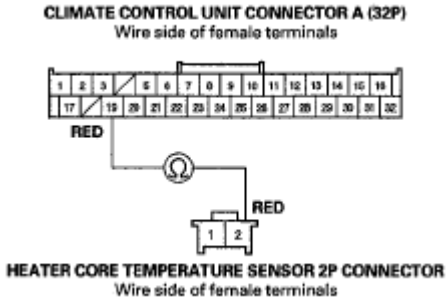

Fig. 83: Measuring Voltage Between Transmission Range Switch Connector Terminals No. 3 And No. 10
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 29.

NO -Repair open in the wire between the transmission range switch and PCM connector terminal B15, then go to step 30.

29. Measure the voltage between transmission range switch connector terminals No. 9 and No. 10.

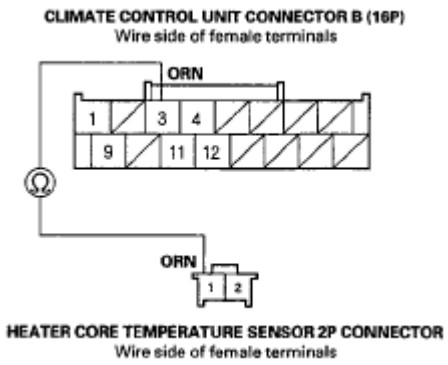

Fig. 84: Measuring Voltage Between Transmission Range Switch Connector Terminals No. 9 And No. 10
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 37.

NO -Repair open in the wire between the transmission range switch and PCM connector terminal B16, then go to step 30.

30. Reconnect all connectors.
31. Turn the ignition switch to ON (II).
32. Clear the DTC with the HDS.
33. Start the engine, run the vehicle with the shift lever in D until the vehicle speed reaches 30 mph (48 km/h), then slow down and stop the wheels.
34. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 33, then go to step 35.
35. Check for DTCs with the HDS.

Is DTC P0706 indicated?

YES -Check for poor connections or loose terminals between the transmission range switch and the PCM, then go to step 1.

NO -Go to step 36.

36. Monitor the OBD STATUS for P0706 in the DTCs MENU with the HDS.

Does the HDS indicate PASSED?

YES -Troubleshooting is complete. If any other DTCs were indicated in step 35, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO -If the HDS indicates FAILED, check for poor connections or loose terminals between the transmission range switch and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, go to step 33.

37. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
38. Start the engine, run the vehicle with the shift lever in D until the vehicle speed reaches 30 mph (48 km/h), then slow down and stop the wheels.
39. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 38, then go to step 40.
40. Check for DTCs with the HDS.

    Is DTC P0706 indicated?

    YES -Check for poor connections or loose terminals between the transmission range switch and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 38. If the PCM was substituted, go to step 1.

    NO -Go to step 41.

41. Monitor the OBD STATUS for P0706 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 40, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for poor connections or loose terminals between the transmission range switch and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 38. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 38.

DTC P0711: Problem in ATF Temperature Sensor Circuit

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II).
2. Check the ATF TEMP SENSOR in the DATA LIST with the HDS.

   Does the ATF temperature exceed the ambient air temperature?

   YES -Record the ATF temperature. Leave the engine off for at least 30 minutes, then go to step 3.

   NO -Record the ATF temperature. Test the stall speed RPM (see **STALL SPEED TEST**) three times, then go to step 3.

3. Check the ATF TEMP SENSOR in the DATA LIST with the HDS.

Did the ATF temperature change?

YES -Leave the engine off for at least 30 minutes, then go to step 4.

NO -Replace the ATF temperature sensor (see **ATF TEMPERATURE SENSOR TEST/REPLACEMENT**), then go to step 6.

4. Check the ECT SENSOR in the DATA LIST with the HDS.

   Does the ECT SENSOR read about the same as the ambient air temperature?

   YES -Go to step 5.

   NO -Leave the engine off until ECT SENSOR reads the same as the ambient air temperature, then go to step 5.

5. Check the ATF TEMP SENSOR in the DATA LIST with the HDS.

   Does the ATF temperature read about the same as ECT SENSOR?

   YES -Go to step 12.

   NO -Replace the ATF temperature sensor (see **ATF TEMPERATURE SENSOR TEST/REPLACEMENT**), then go to step 6.

6. Clear the DTC with the HDS.
7. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).
8. Allow the engine coolant temperature to cool to the ambient air temperature.
9. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on), and wait for at least 20 seconds, then drive the vehicle at speeds over 19 mph (31 km/h) for at least 5 minutes.
10. Check for DTCs with the HDS.

    Is DTC P0711 indicated?

    YES -Check for poor connections or loose terminals between the ATF temperature sensor and the PCM, then go to step 1.

    NO -Go to step 11.

11. Monitor the OBD STATUS for P0711 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 10, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for poor connections or loose terminals between the ATF temperature sensor and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, go to step 7.

12. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
13. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).
14. Allow the engine coolant temperature to cool to the ambient air temperature.
15. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on), and wait for at least 20 seconds, then drive the vehicle at speeds over 19 mph (31 km/h) for at least 5 minutes.
16. Check for DTCs with the HDS.

    Is DTC P0711 indicated?

    YES -Check for poor connections or loose terminals between the ATF temperature sensor and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 13. If the PCM was substituted, go to step 1.

    NO -Go to step 17.

17. Monitor the OBD STATUS for P0711 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 16, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for poor connections or loose terminals between the ATF temperature sensor and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 13. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 13.

DTC P0712: Short in ATF Temperature Sensor Circuit

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II).
2. Check the ATF TEMP SENSOR voltage in the DATA LIST with the HDS.

   Is the ATF TEMP SENSOR voltage 0.07 V or less?

   YES -Go to step 3.

   NO -Intermittent failure, the system is OK at this time. Check for an intermittent short to body ground in the ATFT wire between the ATF temperature sensor and the PCM.

3. Turn the ignition switch to LOCK (0).

4. Disconnect the shift solenoid harness connector.
5. Turn the ignition switch to ON (II).
6. Check the ATF TEMP SENSOR voltage in the DATA LIST with the HDS.

   Is the ATF TEMP SENSOR voltage 0.07 V or less?

   YES -Go to step 7.

   NO -Replace the ATF temperature sensor (see **ATF TEMPERATURE SENSOR TEST/REPLACEMENT**), then go to step 12.

7. Turn the ignition switch to LOCK (0).
8. Jump the SCS line with the HDS.
9. Disconnect PCM connector B (44P).
10. Check for continuity between shift solenoid harness connector terminal No. 6 and body ground.

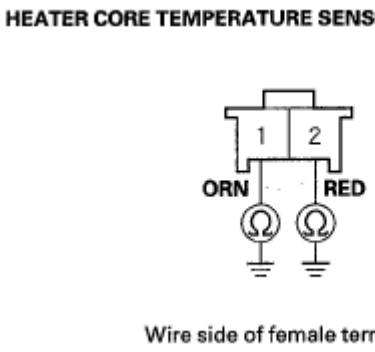

Fig. 85: Checking Continuity Between Shift Solenoid Harness Connector Terminal No. 6 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair short to body ground in the wire between PCM connector terminal B27 and shift solenoid harness connector terminal No. 6, then go to step 12.

NO -Go to step 11.

11. Check for continuity between shift solenoid harness connector terminal No. 6 and body ground.

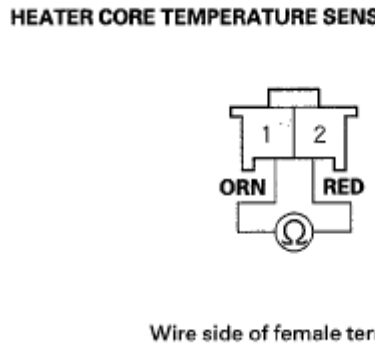

Fig. 86: Checking Continuity Between Shift Solenoid Harness Connector Terminal No. 6 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Replace the ATF temperature sensor (see **ATF TEMPERATURE SENSOR TEST/REPLACEMENT**), then go to step 12.

NO -Go to step 18.

12. Reconnect all connectors.
13. Turn the ignition switch to ON (II).
14. Clear the DTC with the HDS.
15. Start the engine with the shift lever in P, and wait for at least 20 seconds.
16. Check for DTCs with the HDS.

    Is DTC P0712 indicated?

    YES -Check for intermittent short to body ground in the wire between the ATF temperature sensor and the PCM, then go to step 1.

    NO -Go to step 17.

17. Monitor the OBD STATUS for P0712 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 16, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for intermittent short to body ground in the wire between the ATF temperature sensor and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, go to step 15.

18. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
19. Start the engine with the shift lever in P, and wait for at least 20 seconds.
20. Check for DTCs with the HDS.

Is DTC P0712 indicated?

YES -Check for intermittent short to body ground in the wire between the ATF temperature sensor and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 19. If the PCM was substituted, go to step 1.

NO -Go to step 21.

21. Monitor the OBD STATUS for P0712 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 20, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for intermittent short to body ground in the wire between the ATF temperature sensor and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 19. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 19.

DTC P0713: Open in ATF Temperature Sensor Circuit

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II).
2. Check the ATF TEMP SENSOR voltage in the DATA LIST with the HDS.

   Does the ATF TEMP SENSOR voltage exceed 4.93 V?

   YES -Go to step 3.

   NO -Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between the ATF temperature sensor and the PCM.

3. Turn the ignition switch to LOCK (0).
4. Disconnect the shift solenoid harness connector.
5. Connect shift solenoid harness connector terminals No. 6 and No. 7 with a jumper wire.

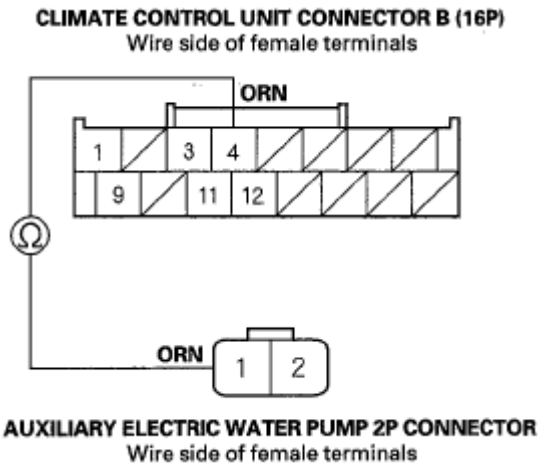

Fig. 87: Connecting Shift Solenoid Harness Connector Terminals 6 And 7 With A Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Turn the ignition switch to ON (II).
7. Check the ATF TEMP SENSOR voltage in the DATA LIST with the HDS.

   Does the ATF TEMP SENSOR voltage exceed 4.93 V?

   YES -Go to step 8.

   NO -Replace the ATF temperature sensor (see **ATF TEMPERATURE SENSOR TEST/REPLACEMENT**), then go to step 21.

8. Turn the ignition switch to LOCK (0).
9. Remove the jumper wire from the shift solenoid harness connector.
10. Turn the ignition switch to ON (II).
11. Measure the voltage between shift solenoid harness connector terminal No. 6 and body ground.

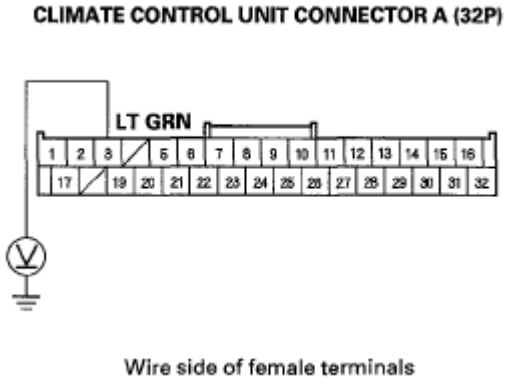

Fig. 88: Measuring Voltage Between Shift Solenoid Harness Connector Terminal 6 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES -Go to step 12.

NO -Go to step 17.

12. Turn the ignition switch to LOCK (0).
13. Jump the SCS line with the HDS.
14. Disconnect PCM connector B (44P).
15. Connect shift solenoid harness connector terminal No. 7 and body ground with a jumper wire.

16. Check for continuity between PCM connector terminal B33 and body ground.

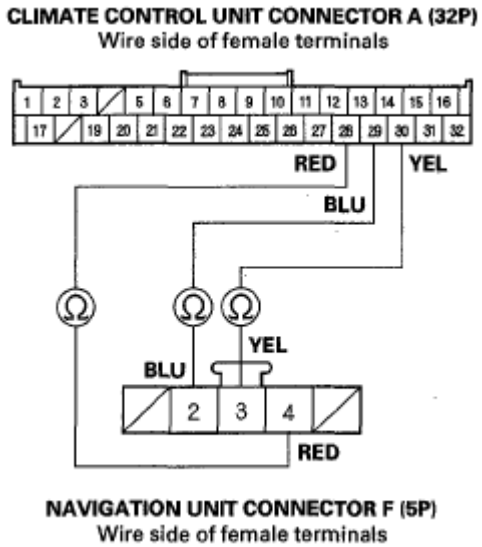

Fig. 90: Checking Continuity Between PCM Connector Terminal B33 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 27.

NO -Repair open in the wire between PCM connector terminal B33 and the ATF temperature sensor, then go to step 21.

17. Turn the ignition switch to LOCK (0).
18. Jump the SCS line with the HDS.
19. Disconnect PCM connector B (44P).
20. Check for continuity between PCM connector terminal B27 and shift solenoid harness connector terminal No. 6.

Is there continuity?

YES -Go to step 27.

NO -Repair open in the wire between PCM connector terminal B27 and the ATF temperature sensor, then go to step 21.

21. Reconnect all connectors.
22. Turn the ignition switch to ON (II).
23. Clear the DTC with the HDS.

24. Start the engine with the shift lever in P, and wait for at least 20 seconds.
25. Check for DTCs with the HDS.

    Is DTC P0713 indicated?

    YES -Check for poor connections or loose terminals between the ATF temperature sensor and the PCM, then go to step 1.

    NO -Go to step 26.

26. Monitor the OBD STATUS for P0713 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 25, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for poor connections or loose terminals between the ATF temperature sensor and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, go to step 24.

27. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
28. Start the engine with the shift lever in P, and wait for at least 20 seconds.
29. Check for DTCs with the HDS.

    Is DTC P0713 indicated?

    YES -Check for poor connections or loose terminals between the ATF temperature sensor and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 28. If the PCM was substituted, go to step 1.

    NO -Go to step 30.

30. Monitor the OBD STATUS for P0713 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 29, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for poor connections or loose terminals between the ATF temperature sensor and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 28. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 28.

DTC P0716: Problem in Input Shaft (Mainshaft) Speed Sensor Circuit; DTC P0717: Problem in Input Shaft (Mainshaft) Speed Sensor Circuit (No Signal Input)

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Check for proper input shaft (mainshaft) speed sensor installation (see **INPUT SHAFT (MAINSHAFT) SPEED SENSOR REPLACEMENT**).
2. Turn the ignition switch to ON (II).
3. Clear the DTC with the HDS.
4. Raise the front of the vehicle, make sure it is securely supported, and allow the front wheels to rotate freely. Or raise the vehicle on a lift.
5. Test-drive the vehicle with the shift lever in D, and keep the vehicle at speeds over 12 mph (20 km/h) for at least 10 seconds. Slow down and stop the wheels.
6. Monitor the OBD STATUS for P0716 or P0717 in the DTCs MENU with the HDS.

   Does the HDS indicate FAILED?

   YES -Go to step 7.

   NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between the input shaft (mainshaft) speed sensor and the PCM. If the HDS indicates NOT COMPLETED, go to step 5.

7. Turn the ignition switch to LOCK (0).
8. Jump the SCS line with the HDS.
9. Disconnect PCM connector C (44P).
10. Check for continuity between PCM connector terminal C40 and body ground, and between terminal C44 and body ground.

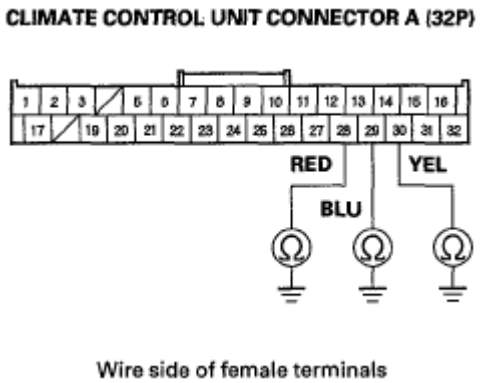

Fig. 92: Checking Continuity Between PCM Connector Terminal C40 And C44 Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 11.

NO -Repair open in the wires between PCM connector terminals C40, C44, and ground (G101) (see**CONNECTOR TO HARNESS INDEX**), or repair poor ground (G101), then go to step 32.

11. Connect PCM connector C (44P).
12. Disconnect the input shaft (mainshaft) speed sensor connector.
13. Turn the ignition switch to ON (II).
14. Measure the voltage between input shaft (mainshaft) speed sensor connector terminal No. 1 and body ground.

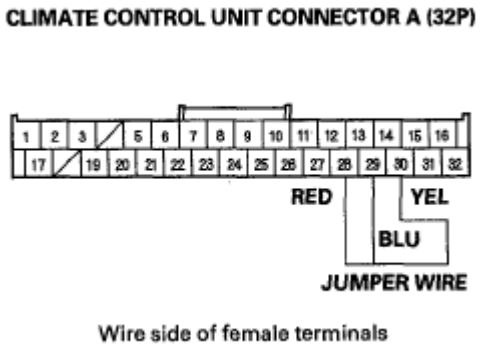

Fig. 93: Measuring Voltage Between Input Shaft (Mainshaft) Speed Sensor Connector Terminal No. 1 And Body Ground

Is there about 5 V?

YES -Go to step 18.

NO -Go to step 15.

15. Turn the ignition switch to LOCK (0).
16. Disconnect PCM connector B (44P).
17. Check for continuity between PCM connector terminal B18 and input shaft (mainshaft) speed sensor connector terminal No. 1.

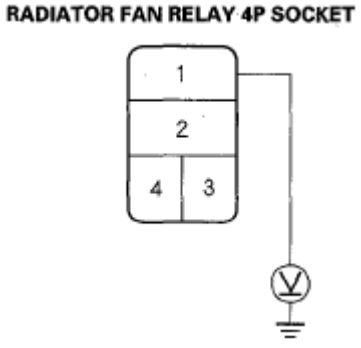

Fig. 94: Checking Continuity Between PCM Connector Terminal B18 And Input Shaft (Mainshaft) Speed Sensor Connector Terminal 1

Is there continuity?

YES -Go to step 20.

NO -Repair open in the wire between PCM connector terminal B18 and the input shaft {mainshaft) speed sensor, then go to step 32.

18. Turn the ignition switch to LOCK (0).
19. Disconnect PCM connector B (44P).
20. Check for continuity between input shaft (mainshaft) speed sensor connector terminal No. 2 and body ground.

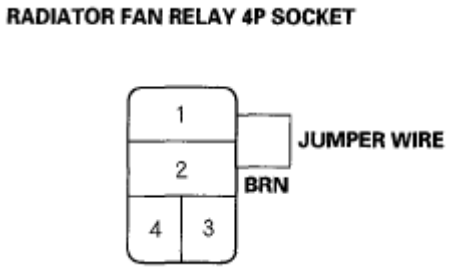

Fig. 95: Checking Continuity Between Input Shaft (Mainshaft) Speed Sensor Connector Terminal 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair short to body ground in the wire between PCM connector terminal B17 and the input shaft (mainshaft) speed sensor, then go to step 32.

NO -Go to step 21.

21. Check for continuity between PCM connector, terminal B33 and input shaft (mainshaft) speed sensor connector terminal No. 3.

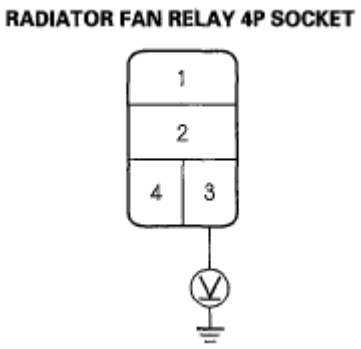

Fig. 96: Checking Continuity Between PCM Connector, Terminal B33 And Input Shaft (Mainshaft) Speed Sensor Connector Terminal 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 22.

NO -Repair open in the wire between PCM connector terminal B33 and the input shaft (mainshaft) speed sensor, then go to step 32.

22. Connect PCM connector B (44P).
23. Turn the ignition switch to ON (II).
24. Measure the voltage between input shaft (mainshaft) speed sensor connector terminals No. 2 and No. 3.

Is there about 5 V?

YES -Go to step 28.

NO -Go to step 25.

25. Turn the ignition switch to LOCK (0).
26. Disconnect PCM connector B (44P).
27. Check for continuity between PCM connector terminal B17 and input shaft (mainshaft) speed sensor connector terminal No. 2.

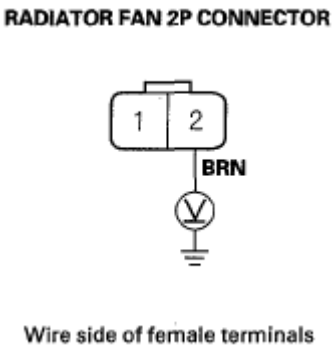

Fig. 98: Checking Continuity Between PCM Connector Terminal B17 And Input Shaft (Mainshaft) Speed Sensor Connector Terminal 2

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 38.

NO -Repair open in the wire between PCM connector terminal B17 and the input shaft (mainshaft) speed sensor, then go to step 32.

28. Connect the input shaft (mainshaft) speed sensor connector.
29. Clear the DTC with the HDS.
30. Test-drive the vehicle with the shift lever in D, and keep the vehicle at speeds over 12 mph (20 km/h) for at least 10 seconds. Slow down and stop the wheels.
31. Monitor the OBD STATUS for P0716 or P0717 in the DTCs MENU with the HDS.

Does the HDS indicate FAILED?

YES -Replace the input shaft (mainshaft) speed sensor (see **INPUT SHAFT (MAINSHAFT) SPEED SENSOR REPLACEMENT**), then go to step 32.

NO -Go to step 38.

32. Reconnect all connectors.
33. Turn the ignition switch to ON (II).
34. Clear the DTC with the HDS.
35. Test-drive the vehicle with the shift lever in D, and keep the vehicle at speeds over 12 mph (20 km/h) for at least 10 seconds. Slowdown and stop the wheels.
36. Check for DTCs with the HDS.

Is DTC P0716 or P0717 indicated?

YES -Check for poor connections or loose terminals between the input shaft (mainshaft) speed sensor and the PCM, then go to step 1.

NO -Go to step 37.

37. Monitor the OBD STATUS for P0716 or P0717 in the DTCs MENU with the HDS.

Does the HDS indicate PASSED?

YES -Troubleshooting is complete. If any other DTCs were indicated in step 36, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO -If the HDS indicates FAILED, check for poor connections or loose terminals between the input shaft (mainshaft) speed sensor and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, go to step 35.

38. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).

39. Test-drive the vehicle with the shift lever in D, and keep the vehicle at speeds over 12 mph (20 km/h) for more than 10 seconds. Slow down and stop the wheels.
40. Check for DTCs with the HDS.

    Is DTC P0716 or P0717 indicated?

    YES -Check for poor connections or loose terminals between the input shaft (mainshaft) speed sensor and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 39. If the PCM was substituted, go to step 1.

    NO -Go to step 41.

41. Monitor the OBD STATUS for P0716 or P0717 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 40, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for poor connections or loose terminals between the input shaft (mainshaft) speed sensor and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 39. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 39.

DTC P0718: Input Shaft (Mainshaft) Speed Sensor Intermittent Failure

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears at speeds over 12 mph (20 km/h).
4. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 3, then go to step 5.
5. Monitor the OBD STATUS for P0718 in the DTCs MENU with the HDS.

    Does the HDS indicate FAILED?

    YES -Go to step 6.

    NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between the input shaft (mainshaft) speed sensor and the PCM. If the HDS indicates NOT COMPLETED, go to step 3.

6. Turn the ignition switch to LOCK (0).
7. Disconnect the input shaft (mainshaft) speed sensor connector, and inspect the connector and connector terminals to be sure they are making good contact.

   Are the connector terminals OK?

   YES -Go to step 8.

   NO -Repair the connector terminals, then go to step 8.

8. Connect the input shaft (mainshaft) speed sensor connector.
9. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears at speeds over 12 mph (20 km/h).
10. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 9, then go to step 11.
11. Monitor the OBD STATUS for P0718 in the DTCs MENU with the HDS.

    Does the HDS indicate FAILED?

    YES -Go to step 12.

    NO -If the HDS indicates PASSED, troubleshooting is complete. If the HDS indicates NOT COMPLETED, go to step 9.

12. Turn the ignition switch to LOCK (0).
13. Jump the SCS line with the HDS.
14. Disconnect PCM connector C (44P).
15. Check for continuity between PCM connector terminal C40 and body ground, and between terminal C44 and body ground.

Is there continuity?

YES -Go to step 16.

NO -Repair open in the wires between PCM connector terminals C40, C44, and ground (G101) (see **CONNECTOR TO HARNESS INDEX**), or repair poor ground (G101), then go to step 32.

16. Connect PCM connector C (44P).
17. Disconnect the input shaft (mainshaft) speed sensor connector.
18. Turn the ignition switch to ON (II).
19. Measure the voltage between input shaft (mainshaft) speed sensor connector terminal No. 1 and body ground.

Is there about 5 V?

YES -Go to step 20.

NO -Go to step 29.

20. Turn the ignition switch to LOCK (0).
21. Disconnect PCM connector B (44P).
22. Check for continuity between input shaft (mainshaft) speed sensor connector terminal No. 2 and body ground.

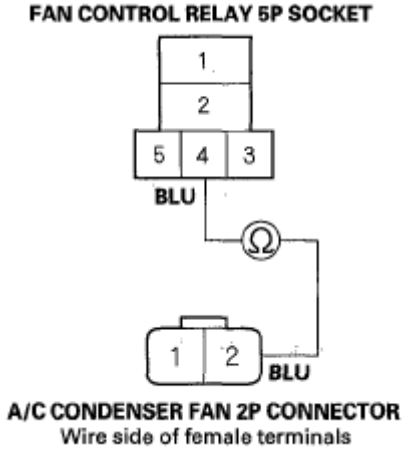

Fig. 101: Checking Continuity Between Input Shaft (Mainshaft) Speed Sensor Connector Terminal 2 And Body Ground

Is there continuity?

YES -Repair short to body ground in the wire between PCM connector terminal B17 and the input shaft (mainshaft) speed sensor, then go to step 32.

NO -Go to step 23.

23. Connect PCM connector B (44P).
24. Turn the ignition switch to ON (II).
25. Measure the voltage between input shaft (mainshaft) speed sensor connector terminal No. 2 and body ground.

Is there about 5 V?

YES -Replace the input shaft (mainshaft) speed sensor (see **INPUT SHAFT (MAINSHAFT) SPEED SENSOR REPLACEMENT**), then go to step 32.

NO -Go to step 26.

26. Turn the ignition switch to LOCK (0).
27. Disconnect PCM connector B (44P).
28. Check for continuity between PCM connector terminal B17 and input shaft (mainshaft) speed sensor connector terminal No. 2.

Is there continuity?

YES -Go to step 39.

NO -Repair open in the wire between PCM connector terminal B17 and the input shaft (mainshaft) speed sensor, then go to step 32.

29. Turn the ignition switch to LOCK (0).
30. Disconnect PCM connector B (44P).
31. Check for continuity between PCM connector terminal B18 and input shaft (mainshaft) speed sensor connector terminal No. 1.

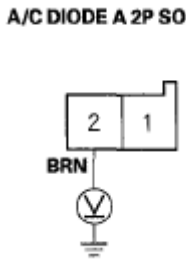

Fig. 104: Checking Continuity Between PCM Connector Terminal B18 And Input Shaft (Mainshaft) Speed Sensor Connector Terminal 1

Is there continuity?

YES -Go to step 32.

NO -Repair open in the wire between PCM connector terminal B18 and the input shaft (mainshaft) speed sensor, then go to step 32.

32. Reconnect all connectors.
33. Turn the ignition switch to ON (II).
34. Clear the DTC with the HDS.
35. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears at speeds over 12 mph (20 km/h).
36. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 35, then go to step 37.
37. Check for DTCs with the HDS.

Is DTC P0718 indicated?

YES -Check for poor connections or loose terminals between the input shaft (mainshaft) speed sensor and the PCM, then go to step 1.

NO -Go to step 38.

38. Monitor the OBD STATUS for P0718 in the DTCs MENU with the HDS.

Does the HDS indicate PASSED?

YES -Troubleshooting is complete. If any other DTCs were indicated in step 37, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO -If the HDS indicates FAILED, check for poor connections or loose terminals between the input shaft (mainshaft) speed sensor and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, go to step 35.

39. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
40. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears at speeds over 12 mph (20 km/h).
41. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 40, then go to step 42.
42. Check for DTCs with the HDS.

    Is DTC P0718 indicated?

    YES -Check for poor connections or loose terminals between the input shaft (mainshaft) speed sensor and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 40. If the PCM was substituted, go to step 1.

    NO -Go to step 43.

43. Monitor the OBD STATUS for P0718 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 42, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for poor connections or loose terminals between the input shaft (mainshaft) speed sensor and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 40. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 40.

DTC P0721: Problem in Output Shaft (Countershaft) Speed Sensor Circuit; DTC P0722: Problem in Output Shaft (Countershaft) Speed Sensor Circuit (No Signal Input)

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Check for proper output shaft (countershaft) speed sensor installation (see **OUTPUT SHAFT (COUNTERSHAFT) SPEED SENSOR REPLACEMENT**).

4. Raise the front of the vehicle, make sure it is securely supported, and allow the front wheels to rotate freely. Or raise the vehicle on a lift.
5. Test-drive the vehicle with the shift lever in D and the engine speed 2,000 rpm or higher, for at least 10 seconds. Slow down and stop the wheels.
6. Monitor the OBD STATUS for P0721 or P0722 in the DTCs MENU with the HDS.

   Does the HDS indicate FAILED?

   YES -Go to step 7.

   NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between the output shaft (countershaft) speed sensor and the PCM. If the HDS indicates NOT COMPLETED, go to step 5.

7. Turn the ignition switch to LOCK (0).
8. Jump the SCS line with the HDS.
9. Disconnect PCM connector C (44P).
10. Check for continuity between PCM connector terminal C40 and body ground, and between terminal C44 and body ground.

Is there continuity?

YES -Go to step 38.

NO -Repair open in the wire between PCM connector terminal C43 and the output shaft (countershaft) speed sensor, then go to step 32.

28. Connect the output shaft (countershaft) speed sensor connector.
29. Clear the DTC with the HDS.
30. Test-drive the vehicle with the shift lever in D and the engine speed 2,000 rpm or higher, for at least

10 seconds. Slow down and stop the wheels.

31. Monitor the OBD STATUS for P0721 or P0722 in the DTCs MENU with the HDS.

    Does the HDS indicate FAILED?

    YES -Replace the output shaft (countershaft) speed sensor (see **OUTPUT SHAFT (COUNTERSHAFT) SPEED SENSOR REPLACEMENT**), then go to step 32.

    NO -Go to step 38.

32. Reconnect all connectors.
33. Turn the ignition switch to ON (II).
34. Clear the DTC with the HDS.
35. Test-drive the vehicle with the shift lever in D at speeds over 12 mph (20 km/h), for at least 10 seconds. Slow down and stop the wheels.
36. Check for DTCs with the HDS.

    Is DTC P0721 or P0722 indicated?

    YES -Check for poor connections or loose terminals between the output shaft (countershaft) speed sensor and the PCM, then go to step 1.

    NO -Go to step 37.

37. Monitor the OBD STATUS for P0721 or P0722 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 36, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for poor connections or loose terminals between the output shaft (countershaft) speed sensor and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, go to step 35.

38. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
39. Test-drive the vehicle with the shift lever in D at speeds over 12 mph (20 km/h), for at least 10 seconds. Slow down and stop the wheels.
40. Check for DTCs with the HDS.

    Is DTC P0721 or P0722 indicated?

    YES -Check for poor connections or loose terminals between the output shaft (countershaft) speed sensor and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 39. If the PCM was substituted, go to step 1.

    NO -Go to step 41.

41. Monitor the OBD STATUS for P0721 or P0722 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 40, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for poor connections or loose terminals between the output shaft (countershaft) speed sensor and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 39. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 39.

DTC P0723: Output Shaft (Countershaft) Speed Sensor Intermittent Failure

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Test-drive the vehicle with the shift lever in D with engine speed 2,000 rpm or higher, and let the transmission shift through all five gears.
4. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 3, then go to step 5.
5. Monitor the OBD STATUS for P0723 in the DTCs MENU with the HDS.

   Does the HDS indicate FAILED?

   YES -Go to step 6.

   NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between the output shaft (countershaft) speed sensor and the PCM. If the HDS indicates NOT COMPLETED, go to step 3.

6. Turn the ignition switch to LOCK (0).
7. Disconnect the output shaft (countershaft) speed sensor connector, and inspect the connector and connector terminals to be sure they are making good contact.

   Are the connector terminals OK?

   YES -Go to step 8.

   NO -Repair the connector terminals, then go to step 8.

8. Connect the output shaft (countershaft) speed sensor connector.
9. Test-drive the vehicle with the shift lever in D with engine speed 2,000 rpm or higher, and let the

transmission shift through all five gears.

10. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 9, then go to step 11.
11. Monitor the OBD STATUS for P0723 in the DTCs MENU with the HDS.

    Does the HDS indicate FAILED?

    YES -Go to step 12.

    NO -If the HDS indicates PASSED, troubleshooting is complete. If the HDS indicates NOT COMPLETED, go to step 9.

12. Turn the ignition switch to LOCK (0).
13. Jump the SCS line with the HDS.
14. Disconnect PCM connector C (44P).
15. Check for continuity between PCM connector terminal C40 and body ground, and between terminal C44 and body ground.

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 16.

NO -Repair open in the wires between PCM connector terminals C40, C44, and ground (G101) (see **CONNECTOR TO HARNESS INDEX**), or repair poor ground (G101), then go to step 32.

16. Connect PCM connector C (44P).
17. Disconnect the output shaft (countershaft) speed sensor connector.
18. Turn the ignition switch to ON (II).
19. Measure the voltage between output shaft (countershaft) speed sensor connector terminal No. 1 and body ground.

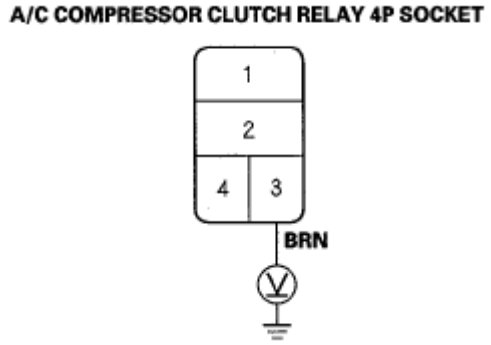

Fig. 113: Measuring Voltage Between Output Shaft (Countershaft) Speed Sensor Connector Terminal 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES -Go to step 20.

NO -Go to step 29.

20. Turn the ignition switch to LOCK (0).
21. Disconnect PCM connector C (44P).
22. Check for continuity between output shaft (countershaft) speed sensor connector terminal No. 2 and body ground.

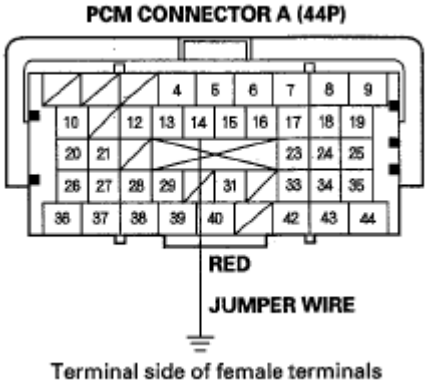

Fig. 114: Checking Continuity Between Output Shaft (Countershaft) Speed Sensor Connector Terminal 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair short to body ground in the wire between PCM connector terminal C43 and the output shaft (countershaft) speed sensor, then go to step 32.

NO -Go to step 23.

23. Connect PCM connector C (44P).
24. Turn the ignition switch to ON (II).

25. Measure the voltage between output shaft (countershaft) speed sensor connector terminal No. 2 and body ground.

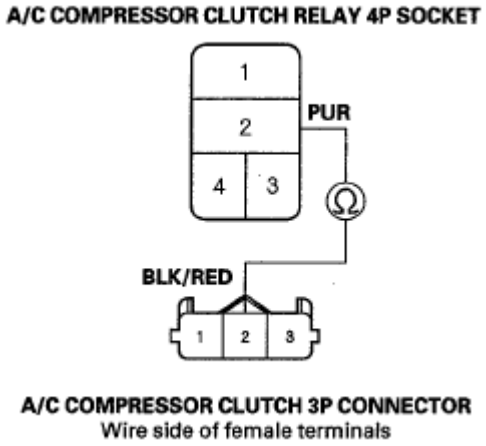

Fig. 115: Measuring Voltage Between Output Shaft (Countershaft) Speed Sensor Connector Terminal 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES -Replace the output shaft (countershaft) speed sensor (see **OUTPUT SHAFT (COUNTERSHAFT) SPEED SENSOR REPLACEMENT**), then go to step 32.

NO -Go to step 26.

26. Turn the ignition switch to LOCK (0).
27. Disconnect PCM connector C (44P).
28. Check for continuity between PCM connector terminal C43 and output shaft (countershaft) speed sensor connector terminal No. 2.

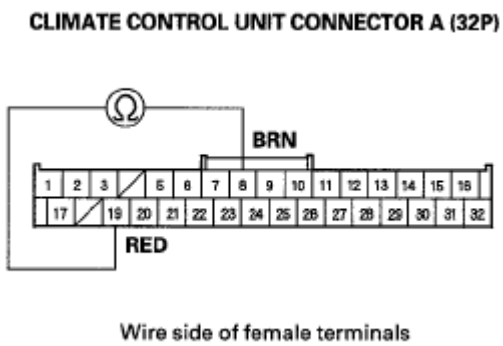

Fig. 116: Checking Continuity Between PCM Connector Terminal C43 And Output Shaft (Countershaft) Speed Sensor Connector Terminal 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 39.

NO -Repair open in the wire between PCM connector terminal C43 and the output shaft (countershaft) speed sensor, then go to step 32.

29. Turn the ignition switch to LOCK (0).
30. Disconnect PCM connector C (44P).
31. Check for continuity between PCM connector terminal C13 and output shaft (countershaft) speed sensor connector terminal No. 1.

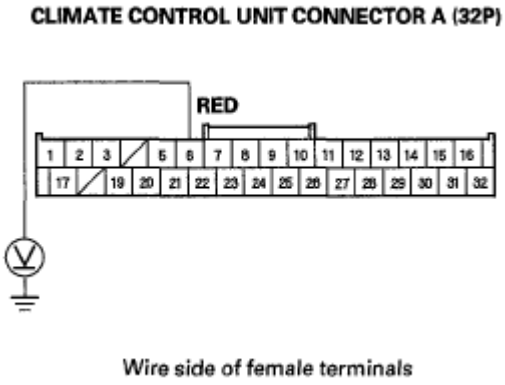

Fig. 117: Checking Continuity Between PCM Connector Terminal C13 And Output Shaft (Countershaft) Speed Sensor Connector Terminal 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 32.

NO -Repair open in the wire between PCM connector terminal C13 and the output shaft (countershaft) speed sensor, then go to step 32.

32. Reconnect all connectors.
33. Turn the ignition switch to ON (II).
34. Clear the DTC with the HDS.
35. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears at speeds over 12 mph (20 km/h).
36. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 35, then go to step 37.
37. Check for DTCs with the HDS.

Is DTC P0723 indicated?

YES -Check for poor connections or loose terminals between the output shaft (countershaft) speed sensor and the PCM, then go to step 1.

NO -Go to step 38.

38. Monitor the OBD STATUS for P0723 in the DTCs MENU with the HDS.

Does the HDS indicate PASSED?

YES -Troubleshooting is complete. If any other DTCs were indicated in step 37, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO -If the HDS indicates FAILED, check for poor connections or loose terminals between the output shaft (countershaft) speed sensor and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, go to step 35.

39. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
40. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears at speeds over 12 mph (20 km/h).
41. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 40, then go to step 42.
42. Check for DTCs with the HDS.

    Is DTC P0723 indicated?

    YES -Check for poor connections or loose terminals between the output shaft (countershaft) speed sensor and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 40. If the PCM was substituted, go to step 1.

    NO -Go to step 43.

43. Monitor the OBD STATUS for P0723 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 42, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for poor connections or loose terminals between the output shaft (countershaft) speed sensor and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 40. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 40.

DTC P0731: Problem in 1st Clutch and 1st Clutch Hydraulic Circuit (1st gear incorrect ratio)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 3) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?

   YES -Replace the transmission, then go to step 13.

NO -Replace the ATF (see step 5), then go to step 4.

4. Measure the line pressure (see **PRESSURE TEST**).

   Is the line pressure within service limit?

   YES -Go to step 5.

   NO -Repair the ATF pump and the regulator valve, or replace the transmission, then go to step 13.

5. Measure the 1st clutch pressure (see **PRESSURE TEST**).

   Is the 1st clutch pressure within service limits?

   YES -Go to step 6.

   NO -Shift valves B and C are stuck. Repair these valves and the hydraulic circuit, or replace the transmission, then go to step 13.

6. Test stall speed with the shift lever in 1 (see **STALL SPEED TEST**).

   Is the stall speed within service limits?

   YES -Go to step 7.

   NO -Shift valves A and D are stuck. Repair these valves and the hydraulic circuit, or replace the transmission, then go to step 13.

7. Turn the ignition switch to ON (II).
8. Clear the DTC with the HDS.
9. Test-drive the vehicle in 1st gear with the shift lever in D at speeds over 7 mph (12 km/h) and the engine speed above 1,000 rpm, for at least 12 seconds.
10. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 9, then go to step 11.
11. Check for DTCs with the HDS.

    Is DTC P0731 indicated?

    YES -Repair the 1st clutch, or replace the transmission, then go to step 13.

    NO -Go to step 12.

12. Monitor the OBD STATUS for P0731 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 11, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, repair the 1st clutch, or replace the transmission. If the HDS

indicates NOT COMPLETED, go to step 9.

13. Test-drive the vehicle in 1st gear with the shift lever in D at speeds over 7 mph (12 km/h) and the engine speed above 1,000 rpm, for at least 12 seconds.
14. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 13, then go to step 15.
15. Check for DTCs with the HDS.

    Is DTC P0731 indicated?

    YES -Check for poor connections or loose terminals at the input shaft (mainshaft) speed sensor and the output shaft (countershaft) speed sensor and the PCM, then go to step 4.

    NO -Go to step 16.

16. Monitor the OBD STATUS for P0731 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 15, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for poor connections or loose terminals at the input shaft (mainshaft) speed sensor and the output shaft (countershaft) speed sensor and the PCM, then go to step 4. If the HDS indicates NOT COMPLETED, go to step 13.

DTC P0732: Problem in 2nd Clutch and 2nd Clutch Hydraulic Circuit (2nd gear incorrect ratio)

NOTE: Before you troubleshoot, record all freeze data and Any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 3) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

    Does the strainer have metal debris or excessive clutch material?

    YES -Replace the transmission, then go to step 13.

    NO -Replace the ATF (see step 5), then go to step 4.

4. Measure the line pressure (see **PRESSURE TEST**).

    Is the line pressure within service limit?

    YES -Go to step 5.

    NO -Repair the ATF pump and the regulator valve, or replace the transmission, then go to step 13.

5. Measure the 2nd clutch pressure (see **PRESSURE TEST**).

   Is the 2nd clutch pressure within service limits?

   YES -Go to step 6.

   NO -Shift valves A and 6 are stuck. Repair these valves and the hydraulic circuit, or replace the transmission, then go to step 13.

6. Test stall speed with the shift lever in 2 (see **STALL SPEED TEST**).

   Is the stall speed within service limits?

   YES -Go to step 7.

   NO -Shift valve C is stuck. Repair the shift valve C and the hydraulic circuit, or replace the transmission, then go to step 13.

7. Turn the ignition switch to ON (II).
8. Clear the DTC with the HDS.
9. Test-drive the vehicle in 2nd gear with the shift lever in D at speeds over 7 mph (12 km/h) and the engine speed above 1,000 rpm, for at least 12 seconds.
10. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 9, then go to step 11.
11. Check for DTCs with the HDS.

    Is DTC P0732 indicated?

    YES -Repair the 2nd clutch, or replace the transmission, then go to step 13.

    NO -Go to step 12.

12. Monitor the OBD STATUS for P0732 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 11, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, repair the 2nd clutch, or replace the transmission. If the HDS indicates NOT COMPLETED, go to step 9.

13. Test-drive the vehicle in 2nd gear with the shift lever in D at speeds over 7 mph (12 km/h) and the engine speed above 1,000 rpm, for at least 12 seconds.
14. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 13, then go to step 15.
15. Check for DTCs with the HDS.

    Is DTC P0732 indicated?

    YES -Check for poor connections or loose terminals at the input shaft (mainshaft) speed sensor and

the output shaft (countershaft) speed sensor and the PCM, then go to step 4.

NO -Go to step 16.

16. Monitor the OBD STATUS for P0732 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 15, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for poor connections or loose terminals at the input shaft (mainshaft) speed sensor and the output shaft (countershaft) speed sensor and the PCM, then go to step 4. If the HDS indicates NOT COMPLETED, go to step 13.

DTC P0733: Problem in 3rd Clutch and 3rd Clutch Hydraulic Circuit (3rd gear incorrect ratio)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 3) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?

   YES -Replace the transmission, then go to step 12.

   NO -Replace the ATF (see step 5), then go to step 4.

4. Measure the line pressure (see **PRESSURE TEST**).

   Is the line pressure within service limits?

   YES -Go to step 5.

   NO -Repair the ATF pump and the regulator valve, or replace the transmission, then go to step 12.

5. Measure the 3rd clutch pressure (see **PRESSURE TEST**).

   Is the 3rd clutch pressure within service limits?

   YES -Go to step 6.

   NO -Shift valves A and D are stuck. Repair these valves and the hydraulic circuit, or replace the transmission, then go to step 12.

6. Turn the ignition switch to ON (II).

7. Clear the DTC with the HDS.
8. Test-drive the vehicle in 3rd gear with the shift lever in D at speeds over 7 mph (12 km/h) and the engine speed above 1,000 rpm, for at least 12 seconds.
9. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 8, then go to step 10.
10. Check for DTCs with the HDS.

    Is DTC P0733 indicated?

    YES -Repair the 3rd clutch, or replace the transmission, then go to step 12.

    NO -Go to step 11.

11. Monitor the OBD STATUS for P0733 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 10, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, repair the 3rd clutch, or replace the transmission. If the HDS indicates NOT COMPLETED, go to step 8.

12. Test-drive the vehicle in 3rd gear with the shift lever in D at speeds over 7 mph (12 km/h) and the engine speed above 1,000 rpm, for at least 12 seconds.
13. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 12, then go to step 14.
14. Check for DTCs with the HDS.

    Is DTC P0733 indicated?

    YES -Check for poor connections or loose terminals at the input shaft (mainshaft) speed sensor and the output shaft (countershaft) speed sensor and the PCM, then go to step 4.

    NO -Go to step 15.

15. Monitor the OBD STATUS for P0733 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 15, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for poor connections or loose terminals at the input shaft (mainshaft) speed sensor and the output shaft (countershaft) speed sensor and the PCM, then go to step 4. If the HDS indicates NOT COMPLETED, go to step 12.

DTC P0734: Problem in 4th Clutch and 4th Clutch Hydraulic Circuit (4th gear incorrect ratio)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see

GENERAL TROUBLESHOOTING INFORMATION).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 3) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?

   YES -Replace the transmission, then go to step 12.

   NO -Replace the ATF (see step 5), then go to step 4.

4. Measure the line pressure (see **PRESSURE TEST**).

   Is the line pressure within service limits?

   YES -Go to step 5.

   NO -Repair the ATF pump and the regulator valve, or replace the transmission, then go to step 12.

5. Measure the 4th clutch pressure (see **PRESSURE TEST**).

   Is the 4th clutch pressure within service limits?

   YES -Go to step 6.

   NO -Shift valves A, B, C, and/or D are stuck. Repair these valves and the hydraulic circuit, or replace the transmission, then go to step 12.

6. Turn the ignition switch to ON (II).
7. Clear the DTC with the HDS.
8. Test-drive the vehicle in 4th gear with the shift lever in D at speeds over 7 mph (12 km/h) and the engine speed above 1,000 rpm, for at least 12 seconds.
9. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 8, then go to step 10.
10. Check for DTCs with the HDS.

    Is DTC P0734 indicated?

    YES -Repair the 4th clutch, or replace the transmission, then go to step 12.

    NO -Go to step 11.

11. Monitor the OBD STATUS for P0734 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 10, go to the

INDICATED DTC'S TROUBLESHOOTING.

NO -If the HDS indicates FAILED, repair the 4th clutch, or replace the transmission. If the HDS indicates NOT COMPLETED, go to step 8.

12. Test-drive the vehicle in 4th gear with the shift lever in D at speeds over 7 mph (12 km/h) and the engine speed above 1,000 rpm, for at least 12 seconds.
13. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 12, then go to step 14.
14. Check for DTCs with the HDS.

    Is DTC P0734 indicated?

    YES -Check for poor connections or loose terminals at the input shaft (mainshaft) speed sensor and the output shaft (countershaft) speed sensor and the PCM, then go to step 4.

    NO -Go to step 15.

15. Monitor the OBD STATUS for P0734 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 14, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for poor connections or loose terminals at the input shaft (mainshaft) speed sensor and the output shaft (countershaft) speed sensor and the PCM, then go to step 4. If the HDS indicates NOT COMPLETED, go to step 12.

DTC P0735: Problem in 5th Clutch and 5th Clutch Hydraulic Circuit (5th gear incorrect ratio)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 3) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?

   YES -Replace the transmission, then go to step 12.

   NO -Replace the ATF (see step 5), then go to step 4.

4. Measure the line pressure (see **PRESSURE TEST**).

   Is the line pressure within service limits?

YES -Go to step 5.

NO -Repair the ATF pump and the regulator valve, or replace the transmission, then go to step 12.

5. Measure the 5th clutch pressure (see **PRESSURE TEST**).

   Is the 5th clutch pressure within service limits?

   YES -Go to step 6.

   NO -Shift valves A, B, C, and/or D are stuck. Repair these valves and the hydraulic circuit, or replace the transmission, then go to step 12.

6. Turn the ignition switch to ON (II).
7. Clear the DTC with the HDS.
8. Test-drive the vehicle in 5th gear with the shift lever in D at speeds over 7 mph (12 km/h) and the engine speed above 1,000 rpm, for at least 12 seconds.
9. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 8, then go to step 10.
10. Check for DTCs with the HDS.

    Is DTC P0735 indicated?

    YES -Repair the 5th clutch, or replace the transmission, then go to step 12.

    NO -Go to step 11.

11. Monitor the OBD STATUS for P0735 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 10, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, repair the 5th clutch, or replace the transmission. If the HDS indicates NOT COMPLETED, go to step 8.

12. Test-drive the vehicle in 5th gear with the shift lever in D at speeds over 7 mph (12 km/h) and the engine speed above 1,000 rpm, for at least 12 seconds.
13. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 12, then go to step 14.
14. Check for DTCs with the HDS.

    Is DTC P0735 indicated?

    YES -Check for poor connections or loose terminals at the input shaft (mainshaft) speed sensor and the output shaft (countershaft) speed sensor and the PCM, then go to step 4.

    NO -Go to step 15.

15. Monitor the OBD STATUS for P0735 in the DTCs MENU with the HDS.

Does the HDS indicate PASSED?

YES -Troubleshooting is complete. If any other DTCs were indicated in step 14, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO -If the HDS indicates FAILED, check for poor connections or loose terminals at the input shaft (mainshaft) speed sensor and the output shaft (countershaft) speed sensor and the PCM, then go to step 4. If the HDS indicates NOT COMPLETED, go to step 12.

DTC P0741: Torque Converter Clutch Hydraulic Circuit Stuck OFF

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 3) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?

   YES -Replace the transmission, then go to step 15.

   NO -Replace the ATF (see step 5), then go to step 4.

4. Turn the ignition switch to ON (II).
5. Clear the DTC with the HDS.
6. Select Shift Solenoid Valve D in the Miscellaneous Test Menu, and check that shift solenoid valve D operates with the HDS.

   Is a clicking sound heard?

   YES -Go to step 7.

   NO -Replace shift solenoid valve D (see **SHIFT SOLENOID VALVE AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**), then go to step 12.

7. Run the engine until the ECT SENSOR temperature reaches 176 °F (80 °C).
8. Select Clutch Pressure Control (Linear) Solenoid Valve A in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve A with the HDS.

   Does the HDS indicate NORMAL?

   YES -Go to step 9.

   NO -Follow the instructions indicated on the HDS by the test result. Go to step 12 if any part is replaced.

9. Test-drive the vehicle on a level road with a steady throttle at 60 mph (96 km/h) for at least 20 seconds.
10. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 9, then go to step 11.
11. Monitor the OBD STATUS for P0741 in the DTCs MENU with the HDS.

    Does the HDS indicate FAILED?

    YES -Repair the faulty torque converter clutch mechanism, the torque converter clutch hydraulic circuit, the lock-up shift valve, or the lock-up control valve, or replace the transmission, then go to step 15.

    NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, go to step 9.

12. Reconnect all connectors.
13. Turn the ignition switch to ON (II).
14. Clear the DTC with the HDS.
15. Test-drive the vehicle on a level road with a steady throttle at 60 mph (96 km/h) for at least 20 seconds, or test-drive the vehicle for several minutes under the same condition as those indicated by the freeze data.
16. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 15, then go to step 17.
17. Check for DTCs with the HDS.

    Is DTC P0741 indicated?

    YES -Go to step 5.

    NO -Go to step 18.

18. Monitor the OBD STATUS for P0741 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 17, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, go to step 5. If the HDS indicates NOT COMPLETED, go to step 15.

DTC P0746: A/T Clutch Pressure Control Solenoid Valve A Stuck OFF

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 3) through a strainer. Inspect the strainer for metal debris or excessive clutch

material.

Does the strainer have metal debris or excessive clutch material?

YES -Replace the transmission, then go to step 14.

NO -Replace the ATF (see step 5), then go to step 4.

4. Turn the ignition switch to ON (II).
5. Clear the DTC with the HDS.
6. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears, then slow down to a stop. Shift to R, and drive the vehicle for at least 2 seconds.
7. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 6, then go to step 8.
8. Monitor the OBD STATUS for P0746 in the DTCs MENU with the HDS.

   Does the HDS indicate FAILED?

   YES -Go to step 9.

   NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, go to step 6.

9. Clear the DTC with the HDS.
10. Select Clutch Pressure Control (Linear) Solenoid valve A in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve A with the HDS.

    Does the HDS indicate NORMAL?

    YES -Intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, retest A/T clutch pressure control solenoid valve A with the HDS.

    NO -Follow the instructions indicated on the HDS by the test result. If the HDS has not determined the cause of the failure, go to step 11. If any part is replaced, go to step 12.

11. Inspect A/T clutch pressure control solenoid valve A (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A TEST**).

    Does A/T clutch pressure control solenoid valve A operate properly?

    YES -Repair the hydraulic system related with shift valve A, or replace the transmission, then go to step 14.

    NO -Replace A/T clutch pressure control solenoid valve A (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A REPLACEMENT**), then go to step 12.

12. Turn the ignition switch to ON (II).
13. Clear the DTC with the HDS.
14. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears, then slow down to a stop. Shift to R, and drive the vehicle for at least 2 seconds.

15. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 14, then go to step 16.
16. Check for DTCs with the HDS.

    Is DTC P0746 indicated?

    YES -Go to step 9.

    NO -Go to step 17.

17. Monitor the OBD STATUS for P0746 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 16, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, go to step 9. If the HDS indicates NOT COMPLETED, go to step 14.

DTC P0747: A/T Clutch Pressure Control Solenoid Valve A Stuck ON

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 3) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?

   YES -Replace the transmission, then go to step 14.

   NO -Replace the ATF (see step 5), then go to step 4.

4. Turn the ignition switch to ON (II).
5. Clear the DTC with the HDS.
6. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears.
7. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 6, then go to step 8.
8. Monitor the OBD STATUS for P0747 in the DTCs MENU with the HDS.

   Does the HDS indicate FAILED?

   YES -Go to step 9.

   NO -lf the HDS indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, go to step 6.

9. Clear the DTC with the HDS.
10. Select Clutch Pressure Control (Linear) Solenoid valve A in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve A with the HDS.

    Does the HDS indicate NORMAL?

    YES -Intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, retest A/T clutch pressure control solenoid valve A with the HDS.

    NO -Follow the instructions indicated on the HDS by the test result. If the HDS has not determined the cause of the failure, go to step 11. If any part is replaced, go to step 12.

11. Inspect A/T clutch pressure control solenoid valve A (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A TEST**).

    Does A/T clutch pressure control solenoid valve A operate properly?

    YES -Repair the hydraulic system related with shift valve A, or replace the transmission, then go to step 14.

    NO -Replace A/T clutch pressure control solenoid valve A (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A REPLACEMENT**), then go to step 12.

12. Turn the ignition switch to ON (II).
13. Clear the DTC with the HDS.
14. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears.
15. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 14, then go to step 16.
16. Check for DTCs with the HDS.

    Is DTC P0747 indicated?

    YES -Go to step 9.

    NO -Go to step 17.

17. Monitor the OBD STATUS for P0747 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 16, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, go to step 9. If the HDS indicates NOT COMPLETED, go to step 14.

DTC P0751: Shift Solenoid Valve A Stuck OFF; DTC P0752: Shift Solenoid Valve A Stuck ON

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see

GENERAL TROUBLESHOOTING INFORMATION).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 3) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?

   YES -Replace the transmission, then go to step 12.

   NO -Replace the ATF (see step 5), then go to step 4.

4. Turn the ignition switch to ON (II).
5. Clear the DTC with the HDS.
6. Select Shift Solenoid Valve A in the Miscellaneous Test Menu, and check it operates with the HDS.

   Is a clicking sound heard?

   YES -Go to step 7.

   NO -Replace shift solenoid valve A (see **SHIFT SOLENOID VALVE AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**), then go to step 10.

7. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears.
8. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 7, then go to step 9.
9. Monitor the OBD STATUS for P0751 or P0752 in the DTCs MENU with the HDS.

   Does the HDS indicate FAILED?

   YES -Repair shift valve A, or replace the transmission, then go to step 12.

   NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, go to step 7.

10. Turn the ignition switch to ON (II).
11. Clear the DTC with the HDS.
12. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears.
13. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 12, then go to step 14.
14. Check for DTCs with the HDS.

    Is DTC P0751 or P0752 indicated?

    YES -Go to step 5.

    NO -Go to step 15.

15. Monitor the OBD STATUS for P0751 or P0752 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 14, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, go to step 5. If the HDS indicates NOT COMPLETED, go to step 12.

DTC P0756: Shift Solenoid Valve B Stuck OFF; DTC P0757: Shift Solenoid Valve B Stuck ON

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 3) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?

   YES -Replace the transmission, then go to step 12.

   NO -Replace the ATF (see step 5), then go to step 4.

4. Turn the ignition switch to ON (II).
5. Clear the DTC with the HDS.
6. Select Shift Solenoid Valve B in the Miscellaneous Test Menu, and check it operates with the HDS.

   Is a clicking sound heard?

   YES -Go to step 7.

   NO -Replace shift solenoid valve B (see **SHIFT SOLENOID VALVE AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**), then go to step 10.

7. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears.
8. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 7, then go to step 9.
9. Monitor the OBD STATUS for P0756 or P0757 in the DTCs MENU with the HDS.

   Does the HDS indicate FAILED?

   YES -Repair shift valve B, or replace the transmission, then go to step 12.

   NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, go to step 7.

10. Turn the ignition switch to ON (II).
11. Clear the DTC with the HDS.
12. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears.
13. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 12, then go to step 14.
14. Check for DTCs with the HDS.

    Is DTC P0756 or P0757 indicated?

    YES -Go to step 5.

    NO -Go to step 15.

15. Monitor the OBD STATUS for P0756 or P0757 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 14, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, go to step 5. If the HDS indicates NOT COMPLETED, go to step 12.

DTC P0761: Shift Solenoid Valve C Stuck OFF; DTC P0762: Shift Solenoid Valve C Stuck ON

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 3) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

    Does the strainer have metal debris or excessive clutch material?

    YES -Replace the transmission, then go to step 12.

    NO -Replace the ATF (see step 5), then go to step 4.

4. Turn the ignition switch to ON (II).
5. Clear the DTC with the HDS.
6. Select Shift Solenoid Valve C in the Miscellaneous Test Menu, and check it operates with the HDS.

    Is a clicking sound heard?

    YES -Go to step 7.

    NO -Replace shift solenoid valve C (see **SHIFT SOLENOID VALVE AND SHIFT SOLENOID**

WIRE HARNESS REPLACEMENT), then go to step 10.

7. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears.
8. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 7, then go to step 9.
9. Monitor the OBD STATUS for P0761 or P0762 in the DTCs MENU with the HDS.

   Does the HDS indicate FAILED?

   YES -Repair shift valve C, or replace the transmission, then go to step 12.

   NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, go to step 7.

10. Turn the ignition switch to ON (II).
11. Clear the DTC with the HDS.
12. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears.
13. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 12, then go to step 14.
14. Check for DTCs with the HDS.

    Is DTC P0761 or P0762 indicated?

    YES -Go to step 5.

    NO -Go to step 15.

15. Monitor the OBD STATUS for P0761 or P0762 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 14, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, go to step 5. If the HDS indicates NOT COMPLETED, go to step 12.

DTC P0766: Shift Solenoid Valve D Stuck OFF

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 3) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?

YES -Replace the transmission, then go to step 12.

NO -Replace the ATF (see step 5), then go to step 4.

4. Turn the ignition switch to ON (II).
5. Clear the DTC with the HDS.
6. Select Shift Solenoid Valve D in the Miscellaneous Test Menu, and check it operates with the HDS.

   Is a clicking sound heard?

   YES -Go to step 7.

   NO -Replace shift solenoid valve D (see **SHIFT SOLENOID VALVE AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**), then go to step 10.

7. Start the engine, and shift to N. Then shift to R and drive the vehicle for at least 2 seconds. Slow the vehicle down to a stop. Then drive the vehicle in D, and let the transmission shift through all five gears.
8. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 7, then go to step 9.
9. Monitor the OBD STATUS for P0766 in the DTCs MENU with the HDS.

   Does the HDS indicate FAILED?

   YES -Repair shift valve D, or replace the transmission, then go to step 12.

   NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, go to step 7.

10. Turn the ignition switch to ON (II).
11. Clear the DTC with the HDS.
12. Start the engine, and shift to N. Then shift to R and drive the vehicle for at least 2 seconds. Slow the vehicle down to a stop. Then drive the vehicle in D, and let the transmission shift through all five gears.
13. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 12, then go to step 14.
14. Check for DTCs with the HDS.

    Is DTC P0766 indicated?

    YES -Go to step 5.

    NO -Go to step 15.

15. Monitor the OBD STATUS for P0766 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 14, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO -If the HDS indicates FAILED, go to step 5. If the HDS indicates NOT COMPLETED, go to step 12.

DTC P0767: Shift Solenoid Valve D Stuck ON

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 3) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?

   YES -Replace the transmission, then go to step 12.

   NO -Replace the ATF (see step 5), then go to step 4.

4. Turn the ignition switch to ON (II).
5. Clear the DTC with the HDS.
6. Select Shift Solenoid Valve D in the Miscellaneous Test Menu, and check it operates with the HDS.

   Is a clicking sound heard?

   YES -Go to step 7.

   NO -Replace shift solenoid valve D (see **SHIFT SOLENOID VALVE AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**), then go to step 10.

7. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears, then slow down to a stop. Shift to R, and drive the vehicle for at least 3 seconds.
8. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 7, then go to step 9.
9. Monitor the OBD STATUS for P0767 in the DTCs MENU with the HDS.

   Does the HDS indicate FAILED?

   YES -Repair shift valve D, or replace the transmission, then go to step 12.

   NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, go to step 7.

10. Turn the ignition switch to ON (II).
11. Clear the DTC with the HDS.
12. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears, then slow down to a stop. Shift to R, and drive the vehicle for at least 3 seconds.
13. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 12, then go to step 14.

14. Check for DTCs with the HDS.

    Is DTC P0767 indicated?

    YES -Go to step 5.

    NO -Go to step 15.

15. Monitor the OBD STATUS for P0767 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 14, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, go to step 5. If the HDS indicates NOT COMPLETED, go to step 12.

DTC P0776: A/T Clutch Pressure Control Solenoid Valve B Stuck OFF; DTC P0777: A/T Clutch Pressure Control Solenoid Valve B Stuck ON

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 3) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?

   YES -Replace the transmission, then go to step 14.

   NO -Replace the ATF (see step 5), then go to step 4.

4. Turn the ignition switch to ON (II).
5. Clear the DTC with the HDS.
6. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears.
7. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 6, then go to step 8.
8. Monitor the OBD STATUS for P0776 or P0777 in the DTCs MENU with the HDS.

   Does the HDS indicate FAILED?

   YES -Go to step 9.

   NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, go to step 6.

9. Clear the DTC with the HDS.
10. Select Clutch Pressure Control (Linear) Solenoid Valve B in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve B with the HDS.

    Does the HDS indicate NORMAL?

    YES -Intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, retest A/T clutch pressure control solenoid valve B with the HDS.

    NO -Follow the instructions indicated on the HDS by the test result. If the HDS has not determined the cause of the failure, go to step 11. If any part is replaced, go to step 12.

11. Inspect A/T clutch pressure control solenoid valve B (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE B TEST**).

    Does A/T clutch pressure control solenoid valve B work properly?

    YES -Repair the hydraulic system related with shift valve B, or replace the transmission, then go to step 14.

    NO -Replace A/T clutch pressure control solenoid valve B (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE B AND C REPLACEMENT**), then go to step 12.

12. Turn the ignition switch to ON (II).
13. Clear the DTC with the HDS.
14. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears.
15. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 14, then go to step 16.
16. Check for DTCs with the HDS.

    Is DTC P0776 or P0777 indicated?

    YES -Go to step 9.

    NO -Go to step 17.

17. Monitor the OBD STATUS for P0776 or P0777 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 16, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, go to step 9. If the HDS indicates NOT COMPLETED, go to step 14.

DTC P0796: A/T Clutch Pressure Control Solenoid Valve C Stuck OFF; DTC P0797: A/T Clutch Pressure Control Solenoid Valve C Stuck ON

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot

with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 3) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?

   YES -Replace the transmission, then go to step 14.

   NO -Replace the ATF (see step 5), then go to step 4.

4. Turn the ignition switch to ON (II).
5. Clear the DTC with the HDS.
6. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears.
7. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 6, then go to step 8.
8. Monitor the OBD STATUS for P0796 or P0797 in the DTCs MENU with the HDS.

   Does the HDS indicate FAILED?

   YES -Go to step 9.

   NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, go to step 6.

9. Clear the DTC with the HDS.
10. Select Clutch Pressure Control (Linear) Solenoid Valve C in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve C with the HDS.

    Does the HDS indicate NORMAL?

    YES -Intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, retest A/T clutch pressure control solenoid valve C with the HDS.

    NO -Follow the instructions indicated on the HDS by the test result, If the HDS has not determined the cause of the failure, go to step 11. If any part is replaced, go to step 12.

11. Inspect A/T clutch pressure control solenoid valve C (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE C TEST**).

    Does A/T clutch pressure control solenoid valve C work properly?

    YES -Repair the hydraulic system related with shift valve C, or replace the transmission, then go to step 14.

    NO -Replace A/T clutch pressure control solenoid valve C (see **A/T CLUTCH PRESSURE**

CONTROL SOLENOID VALVE B AND C REPLACEMENT), then go to step 12.

12. Turn the ignition switch to ON (II).
13. Clear the DTC with the HDS.
14. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears.
15. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 14, then go to step 16.
16. Check for DTCs with the HDS.

    Is DTC P0796 or P0797 indicated?

    YES -Go to step 9.

    NO -Go to step 17.

17. Monitor the OBD STATUS for P0796 or P0797 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 16, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, go to step 9. If the HDS indicates NOT COMPLETED, go to step 14.

DTC P0812: Open in Transmission Range Switch ATP R Switch Circuit

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II).
2. Shift to R, and check the A/T R SWITCH in the DATA LIST with the HDS.

   Is the A/T R SWITCH ON?

   YES -Intermittent failure, the system is OK at this time.

   NO -Go to step 3.

3. Turn the ignition switch to LOCK (0).
4. Disconnect the transmission range switch connector.
5. Check for continuity between transmission range switch connector terminal No. 10 and body ground.

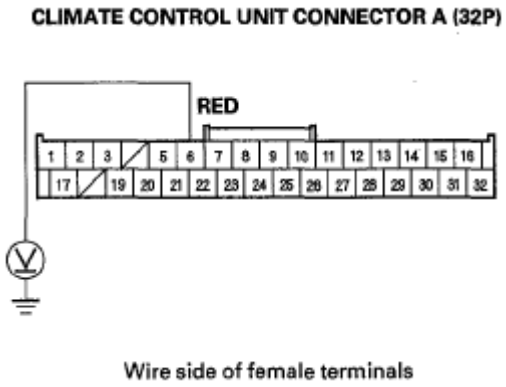

Fig. 118: Checking Continuity Between Transmission Range Switch Connector Terminal 10 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 6.

NO -Repair open in the wire between transmission range switch connector terminal No. 10 and ground (G101) (see **CONNECTOR TO HARNESS INDEX**), or repair poor ground (G101), then go to step 9.

6. Turn the ignition switch to ON (II).
7. Measure the voltage between transmission range switch connector terminals No. 7 and No. 10.

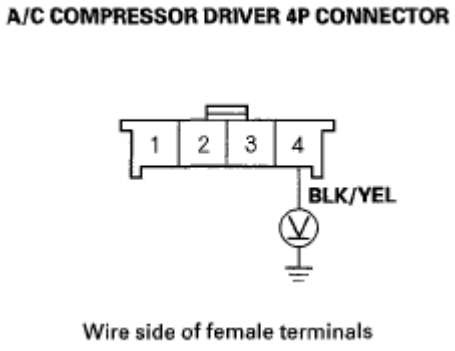

Fig. 119: Measuring Voltage Between Transmission Range Switch Connector Terminals 7 And 10
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES -Go to step 8.

NO -Repair open in the wire between PCM connector terminal B14 and the transmission range switch, then go to step 9.

8. Check for continuity between transmission range switch connector terminals No. 7 and No. 10 while the shift lever is in R, and when the shift lever is shifted to any position other than R.

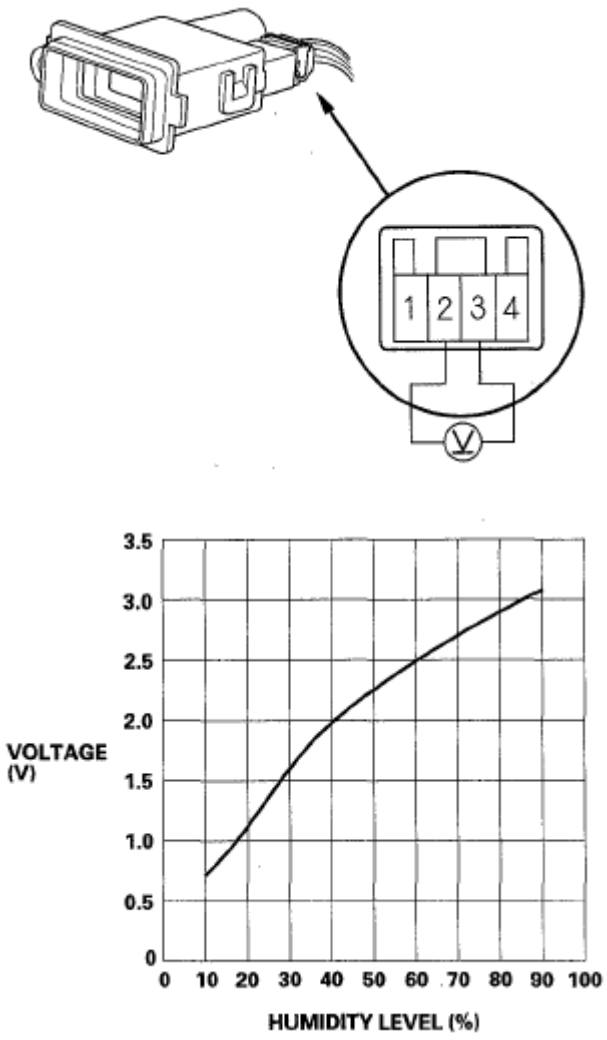

Fig. 120: Checking Continuity Between Transmission Range Switch Connector Terminals 7 And 10
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity while the shift lever is in R, and no continuity when the shift lever is shifted to any position other than R?

YES -Go to step 16.

NO -Replace the transmission range switch (see **TRANSMISSION RANGE SWITCH REPLACEMENT**), then go to step 9.

9. Reconnect all connectors.
10. Turn the ignition switch to ON (II).
11. Clear the DTC with to the HDS.
12. Test-drive the vehicle with the shift lever in R at speeds below 3 mph (5 km/h) for at least 2 seconds. Then increase the speed and drive over 3 mph (5 km/h) for at least 2 seconds.
13. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 12, then go to step 14.
14. Check for DTCs with the HDS.

Is DTC P0812 indicated?

YES -Check for poor connections or loose terminals between the transmission range switch and the PCM, then go to step 1.

NO -Go to step 15.

15. Monitor the OBD STATUS for P0812 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 14, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for poor connections or loose terminals between the transmission range switch and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, go to step 12.

16. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
17. Test-drive the vehicle with the shift lever in R at speeds below 3 mph (5 km/h) for at least 2 seconds. Then increase the speed and drive over 3 mph (5 km/h) for at least 2 seconds.
18. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 17, then go to step 19.
19. Check for DTCs with the HDS.

    Is DTC P0812 indicated?

    YES -Check for poor connections or loose terminals between the transmission range switch and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 17. If the PCM was substituted, go to step 1.

    NO -Go to step 20.

20. Monitor the OBD STATUS for P0812 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 19, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for poor connections or loose terminals between the transmission range switch and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 17. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 17.

DTC P0842: Short in 2nd Clutch Transmission Fluid Pressure Switch Circuit, or 2nd Clutch Transmission Fluid Pressure Switch Stuck ON

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Check the 2nd PRESSURE SWITCH in the DATA LIST with the HDS when not in 2nd gear.

   Is the 2nd PRESSURE SWITCH OFF?

   YES -Go to step 4.

   NO -Go to step 7.

4. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).
5. Test-drive the vehicle in 3rd gear with the shift lever in D, for at least 2 seconds.
6. Monitor the OBD STATUS for P0842 in the DTCs MENU with the HDS.

   Does the HDS indicate FAILED?

   YES -Go to step 7.

   NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for intermittent short to body ground in the wire between the 2nd clutch transmission fluid pressure switch and the PCM. If the HDS indicates NOT COMPLETED, go to step 4.

7. Turn the ignition switch to LOCK (0).
8. Disconnect the 2nd clutch transmission fluid pressure switch connector.
9. Turn the ignition switch to ON (II).
10. Check the 2nd PRESSURE SWITCH in the DATA LIST with the HDS.

    Is the 2nd PRESSURE SWITCH OFF?

    YES -Replace the 2nd clutch transmission fluid pressure switch (see **2ND CLUTCH TRANSMISSION FLUID PRESSURE SWITCH REPLACEMENT**), then go to step 15.

    NO -Go to step 11.

11. Turn the ignition switch to LOCK (0).
12. Jump the SCS line with the HDS.
13. Disconnect PCM connector B (44P).
14. Check for continuity between PCM connector terminal B8 and body ground.

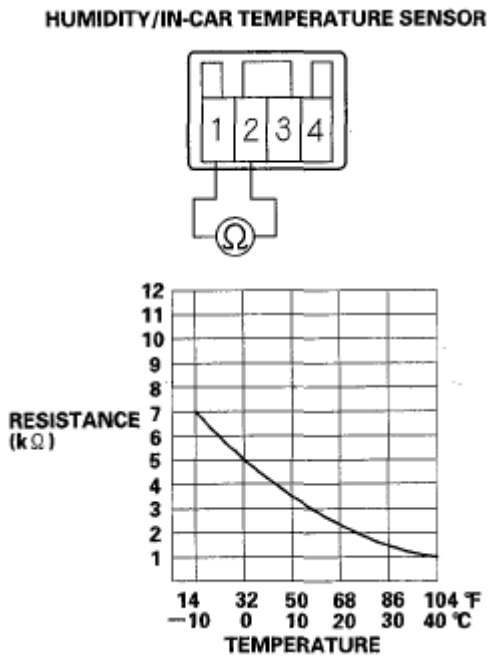

Fig. 121: Checking Continuity Between PCM Connector Terminal B8 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair short to body ground in the wire between PCM connector terminal B8 and the 2nd clutch transmission fluid pressure switch, then go to step 15.

NO -Go to step 22.

15. Reconnect all connectors.
16. Turn the ignition switch to ON (II).
17. Clear the DTC with the HDS.
18. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).
19. Test-drive the vehicle with the shift lever in 2 for at least 2 seconds, then shift to D, and drive in 3rd gear for at least 2 seconds. Then drive in 4th gear for at least 2 seconds.
20. Check for DTCs with the HDS.

    Is DTC P0842 indicated?

    YES -Check for intermittent short to body ground in the wire between the 2nd clutch transmission fluid pressure switch and the PCM, then go to step 1.

    NO -Go to step 21.

21. Monitor the OBD STATUS for P0842 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 20, go to the

INDICATED DTC'S TROUBLESHOOTING.

NO -If the HDS indicates FAILED, check for intermittent short to body ground in the wire between the 2nd clutch transmission fluid pressure switch and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, go to step 18.

22. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
23. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).
24. Test-drive the vehicle with the shift lever in 2 for at least 2 seconds, then shift to D, and drive in 3rd gear for at least 2 seconds. Then drive in 4th gear for at least 2 seconds.
25. Check for DTCs with the HDS.

    Is DTC P0842 indicated?

    YES -Check for intermittent short to body ground in the wire between the 2nd clutch transmission fluid pressure switch and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 23. If the PCM was substituted, go to step 1.

    NO -Go to step 26.

26. Monitor the OBD STATUS for P0842 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 25, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for intermittent short to body ground in the wire between the 2nd clutch transmission fluid pressure switch and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 23. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 23.

DTC P0843: Open in 2nd Clutch Transmission Fluid Pressure Switch Circuit, or 2nd Clutch Transmission Fluid Pressure Switch Stuck OFF

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).
4. Shift the shift lever into 2.
5. Check the 2nd PRESSURE SWITCH in the DATA LIST with the HDS.

Is the 2nd PRESSURE SWITCH ON?

YES -Go to step 6.

NO -Go to step 8.

6. Test-drive the vehicle with the shift lever in 2 for at least 2 seconds.
7. Monitor the OBD STATUS for P0843 in the DTCs MENU with the HDS.

Does the HDS indicate FAILED?

YES -Go to step 8.

NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between the 2nd clutch transmission fluid pressure switch and the PCM. If the HDS indicates NOT COMPLETED, go to step 6.

8. Turn the ignition switch to LOCK (0).
9. Disconnect the 2nd clutch transmission fluid pressure switch connector.
10. Turn the ignition switch to ON (II).
11. Measure the voltage between the 2nd clutch transmission fluid pressure switch connector terminal and body ground.

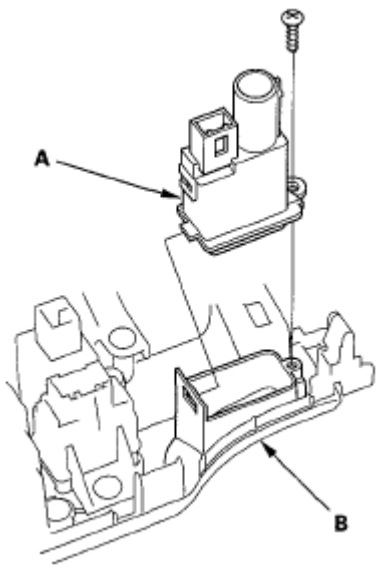

Fig. 122: Measuring Voltage Between 2nd Clutch Transmission Fluid Pressure Switch Connector Terminal And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES -Replace the 2nd clutch transmission fluid pressure switch (see **2ND CLUTCH TRANSMISSION FLUID PRESSURE SWITCH REPLACEMENT**), then go to step 16.

NO -Go to step 12.

12. Turn the ignition switch to LOCK (0).
13. Jump the SCS line with the HDS.
14. Disconnect PCM connector B (44P).
15. Check for continuity between PCM connector terminal B8 and the 2nd clutch transmission fluid pressure switch connector terminal.

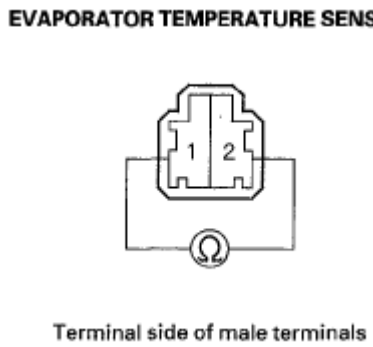

Fig. 123: Checking Continuity Between PCM Terminal B8 And 2nd Clutch Transmission Fluid Pressure Switch Terminal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 23.

NO -Repair open in the wire between PCM connector terminal B8 and the 2nd clutch transmission fluid pressure switch, then go to step 16.

16. Reconnect all connectors.
17. Turn the ignition switch to ON (II).
18. Clear the DTC with the HDS.
19. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).
20. Drive the vehicle with the shift lever in 2 for at least 2 seconds, then shift to D, and drive in 4th gear for at least 2 seconds.
21. Check for DTCs with the HDS.

Is DTC P0843 indicated?

YES -Check for poor connections or loose terminals between the 2nd clutch transmission fluid pressure switch and the PCM, then go to step 1.

NO -Go to step 22.

22. Monitor the OBD STATUS for P0843 in the DTCs MENU with the HDS.

Does the HDS indicate PASSED?

YES -Troubleshooting is complete. If any other DTCs were indicated in step 21, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO -If the HDS indicates FAILED, check for poor connections or loose terminals between the 2nd clutch transmission fluid pressure switch and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, go to step 19.

23. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
24. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).
25. Drive the vehicle with the shift lever in 2 for at least 2 seconds, then shift to D, and drive in 4th gear for at least 2 seconds.
26. Check for DTCs with the HDS.

    Is DTC P0843 indicated?

    YES -Check for poor connections or loose terminals between the 2nd clutch transmission fluid pressure switch and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 24. If the PCM was substituted, go to step 1.

    NO -Go to step 27.

27. Monitor the OBD STATUS for P0843 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 26, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for poor connections or loose terminals between the 2nd clutch transmission fluid pressure switch and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 24. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 24.

DTC P0847: Short in 3rd Clutch Transmission Fluid Pressure Switch Circuit, or 3rd Clutch Transmission Fluid Pressure Switch Stuck ON

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Check the 3rd PRESSURE SWITCH in the DATA LIST with the HDS when not in 3rd gear.

   Is the 3rd PRESSURE SWITCH OFF?

   YES -Go to step 4.

NO -Go to step 7.

4. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).
5. Drive the vehicle in 4th gear with the shift lever in D, for at least 2 seconds.
6. Monitor the OBD STATUS for P0847 in the DTCs MENU with the HDS.

Does the HDS indicate FAILED?

YES -Go to step 7.

NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for intermittent short to body ground in the wire between the 3rd clutch transmission fluid pressure switch and the PCM. If the HDS indicates NOT COMPLETED, go to step 4.

7. Turn the ignition switch to LOCK (0).
8. Disconnect the 3rd clutch transmission fluid pressure switch connector.
9. Turn the ignition switch to ON (II).
10. Check the 3rd PRESSURE SWITCH in the DATA LIST with the HDS.

Is the 3rd PRESSURE SWITCH OFF?

YES -Replace the 3rd clutch transmission fluid pressure switch (see **3RD CLUTCH TRANSMISSION FLUID PRESSURE SWITCH REPLACEMENT**), then go to step 15.

NO -Go to step 11.

11. Turn the ignition switch to LOCK (0).
12. Jump the SCS line with the HDS.
13. Disconnect PCM connector B (44P).
14. Check for continuity between PCM connector terminal B9 and body ground.

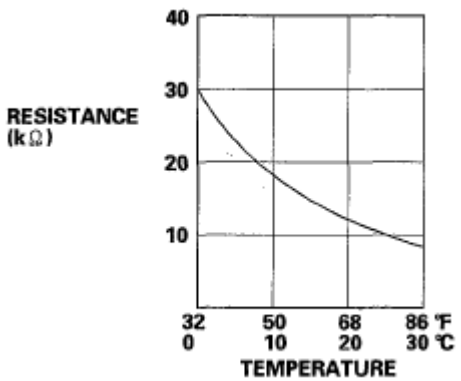

Fig. 124: Checking Continuity Between PCM Connector Terminal B9 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair short to body ground in the wire between PCM connector terminal B9 and the 3rd clutch

transmission fluid pressure switch, then go to step 15.

NO -Go to step 22.

15. Reconnect all connectors.
16. Turn the ignition switch to ON (II).
17. Clear the DTC with the HDS.
18. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).
19. Drive the vehicle in 3rd gear with the shift lever in D3, for at least 2 seconds. Then shift to D, and drive in 4th gear for at least 2 seconds.
20. Check for DTCs with the HDS.

    Is DTC P0847 indicated?

    YES -Check for intermittent short to body ground in the wire between the 3rd clutch transmission fluid pressure switch and the PCM, then go to step 1.

    NO -Go to step 21.

21. Monitor the OBD STATUS for P0847 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 20, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for intermittent short to body ground in the wire between the 3rd clutch transmission fluid pressure switch and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, go to step 18.

22. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
23. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).
24. Drive the vehicle in 3rd gear with the shift lever in D3, for at least 2 seconds. Then shift to D, and drive in 4th gear for at least 2 seconds.
25. Check for DTCs with the HDS.

    Is DTC P0847 indicated?

    YES -Check for intermittent short to body ground in the wire between the 3rd clutch transmission fluid pressure switch and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 23. If the PCM was substituted, go to step 1.

    NO -Go to step 26.

26. Monitor the OBD STATUS for P0847 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 25, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO -If the HDS indicates FAILED, check for intermittent short to body ground in the wire between the 3rd clutch transmission fluid pressure switch and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 23. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 23.

DTC P0848: Open in 3rd Clutch Transmission Fluid Pressure Switch Circuit, or 3rd Clutch Transmission Fluid Pressure Switch Stuck OFF

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).
4. Drive the vehicle in 3rd gear with the shift lever in D3, and check that the SHIFT COMMAND indicates 3rd in the DATA LIST with the HDS.
5. Check the 3rd PRESSURE SWITCH in the DATA LIST with the HDS.

   Is the 3rd PRESSURE SWITCH ON?

   YES -Go to step 6.

   NO -Go to step 8.

6. Test-drive the vehicle in 3rd gear with the shift lever in D3, for at least 2 seconds.
7. Monitor the OBD STATUS for P0848 in the DTCs MENU with the HDS.

   Does the HDS indicate FAILED?

   YES -Go to step 8.

   NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between the 3rd clutch transmission fluid pressure switch and the PCM. If the HDS indicates NOT COMPLETED, go to step 6.

8. Turn the ignition switch to LOCK (0).
9. Disconnect the 3rd clutch transmission fluid pressure switch connector.
10. Turn the ignition switch to ON (II).
11. Measure the voltage between the 3rd clutch transmission fluid pressure switch connector terminal and body ground.

Is there about 5 V?

YES -Replace the 3rd clutch transmission fluid pressure switch (see **3RD CLUTCH TRANSMISSION FLUID PRESSURE SWITCH REPLACEMENT**), then go to step 16.

NO -Go to step 12.

12. Turn the ignition switch to LOCK (0).
13. Jump the SCS line with the HDS.
14. Disconnect PCM connector B (44P).
15. Check for continuity between PCM connector terminal B9 and 3rd clutch transmission fluid pressure switch connector terminal.

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 23.

NO -Repair open in the wire between PCM connector terminal B9 and the 3rd clutch transmission fluid pressure switch, then go to step 16.

16. Reconnect all connectors.
17. Turn the ignition switch to ON (II).
18. Clear the DTC with the HDS.
19. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).
20. Test-drive the vehicle in 3rd gear with the shift lever in D3, for at least 2 seconds. Then shift to D, and drive in 4th gear for at least 2 seconds.
21. Check for DTCs with the HDS.

    Is DTC P0848 indicated?

    YES -Check for poor connections or loose terminals between the 3rd clutch transmission fluid pressure switch and the PCM, then go to step 1.

    NO -Go to step 22.

22. Monitor the OBD STATUS for P0848 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 21, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for poor connections or loose terminals between the 3rd clutch transmission fluid pressure switch and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, go to step 19.

23. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
24. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).
25. Test-drive the vehicle in 3rd gear with the shift lever in D3, for at least 2 seconds. Then shift to D, and drive in 4th gear for at least 2 seconds.
26. Check for DTCs with the HDS.

    Is DTC P0848 indicated?

    YES -Check for poor connections or loose terminals between the 3rd clutch transmission fluid pressure switch and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 24. If the PCM was substituted, go to step 1.

NO -Go to step 27.

27. Monitor the OBD STATUS for P0848 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 26, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for poor connections or loose terminals between the 3rd clutch transmission fluid pressure switch and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 24. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 24.

DTC P0962: Problem in A/T Clutch Pressure Control Solenoid Valve A Circuit

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and wait for at least 1 second.
4. Check for DTCs with the HDS.

   Is DTC P0962 indicated?

   YES -Go to step 8.

   NO -Go to step 5.

5. Select Clutch Pressure Control Solenoid Valve A in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve A with the HDS.

   Does the HDS indicate NORMAL?

   YES -Go to step 6.

   NO -Go to step 8.

6. In the Clutch Pressure Control Solenoid Valve Control menu, select A/T clutch pressure control solenoid valve A at 1.0 A.
7. Monitor the OBD STATUS for P0962 in the DTCs MENU with the HDS.

   Does the HDS indicate FAILED?

YES -Go to step 8.

NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between A/T clutch pressure control solenoid valve A and the PCM. If the HDS indicates NOT COMPLETED, go to step 5.

8. Turn the ignition switch to LOCK (0).
9. Disconnect the A/T clutch pressure control solenoid valve A connector.
10. Measure the resistance between A/T clutch pressure control solenoid valve A connector terminals No. 1 and No. 2.

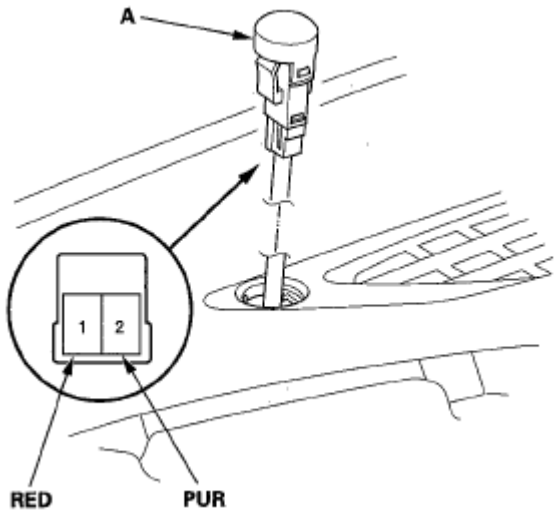

Fig. 127: Measuring Resistance Between A/T Clutch Pressure Control Solenoid Valve A Connector Terminals 1 And 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 3-10 ohms?

YES -Go to step 11.

NO -Replace A/T clutch pressure control solenoid valve A (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A REPLACEMENT**), then go to step 16.

11. Check for continuity between A/T clutch pressure control solenoid valve A connector terminal No. 2 and body ground.

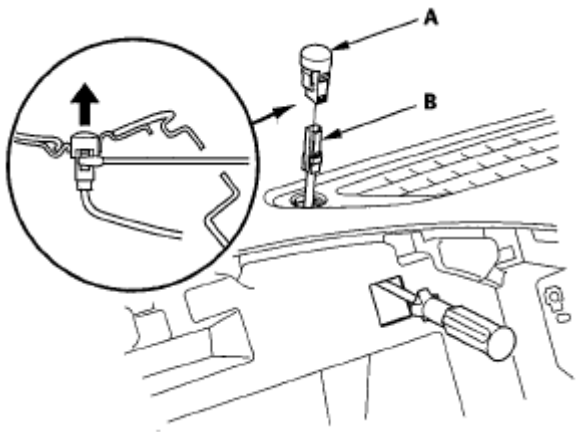

Fig. 128: Checking Continuity Between A/T Clutch Pressure Control Solenoid Valve A Connector Terminal 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 12.

NO -Repair open in the wire between A/T clutch pressure control solenoid valve A and ground (G101) (see **CONNECTOR TO HARNESS INDEX**), or repair poor ground (G101), then go to step 16.

12. Jump the SCS line with the HDS.
13. Disconnect PCM connector B (44P).
14. Check for continuity between A/T clutch pressure control solenoid valve A connector terminal No. 1 and body ground.

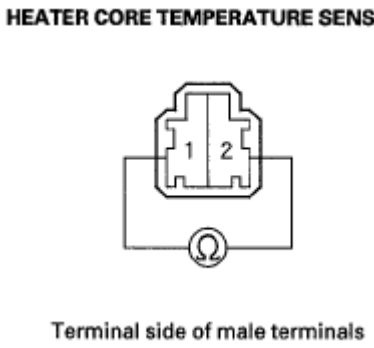

Fig. 129: Checking Continuity Between A/T Clutch Pressure Control Solenoid Valve A Connector Terminal 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair short to body ground in the wire between A/T clutch pressure control solenoid valve A connector terminal No. 1 and body ground, then go to step 16.

NO -Go to step 15.

15. Check for continuity between A/T clutch pressure control solenoid valve A connector terminal No. 1 and PCM connector terminals B35.

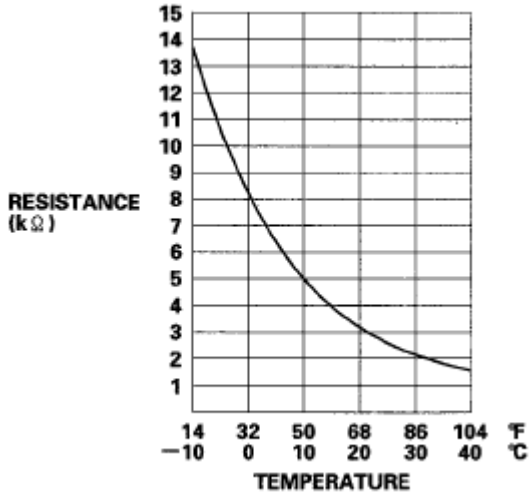

Fig. 130: Checking Continuity Between A/T Clutch Pressure Control Solenoid Valve A Terminal 1 And PCM Terminals B35
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 22.

NO -Repair open in the wire between A/T clutch pressure control solenoid valve A connector terminal No. 1 and PCM connector terminal B35, then go to step 16.

16. Reconnect all connectors.
17. Turn the ignition switch to ON (II).
18. Clear the DTC with the HDS.
19. Start the engine, and wait for at least 1 second.
20. Check for DTCs with the HDS.

Is DTC P0962 indicated?

YES -Check for poor connections or loose terminals between A/T clutch pressure control solenoid valve A and the PCM, then go to step 1.

NO -Go to step 21.

21. Monitor the OBD STATUS for P0962 in the DTCs MENU with the HDS.

Does the HDS indicate PASSED?

YES -Troubleshooting is complete. If any other DTCs were indicated in step 20, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO -If the HDS indicates FAILED, check for poor connections or loose terminals between A/T clutch pressure control solenoid valve A and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, go to step 19.

22. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
23. Start the engine, and wait for at least 1 second.
24. Check for DTCs with the HDS.

    Is DTC P0962 indicated?

    YES -Check for poor connections or loose terminals between A/T clutch pressure control solenoid valve A and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 23. If the PCM was substituted, go to step 1.

    NO -Go to step 25.

25. Monitor the OBD STATUS for P0962 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 24, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for poor connections or loose terminals between A/T clutch pressure control solenoid valve A and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 23. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 23.

DTC P0963: Problem in A/T Clutch Pressure Control Solenoid Valve A

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and wait for at least 1 second.
4. Check for DTCs with the HDS.

   Is DTC P0963 indicated?

   YES -Go to step 8.

   NO -Go to step 5.

5. Select Clutch Pressure Control Solenoid Valve A in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve A with the HDS.

   Does the HDS indicate NORMAL?

   YES -Go to step 6.

   NO -Go to step 8.

6. In the Clutch Pressure Control Solenoid Valve Control menu, select A/T clutch pressure control solenoid valve A at 0.2 A.
7. Monitor the OBD STATUS for P0963 in the DTCs MENU with the HDS.

   Does the HDS indicate FAILED?

   YES -Go to step 8.

   NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between A/T clutch pressure control solenoid valve A and the PCM. If the HDS indicates NOT COMPLETED, go to step 5.

8. Turn the ignition switch to LOCK (0).
9. Disconnect the A/T clutch pressure control solenoid valve A connector.
10. Measure the resistance between A/T clutch pressure control solenoid valve A connector terminals No. 1 and No. 2.

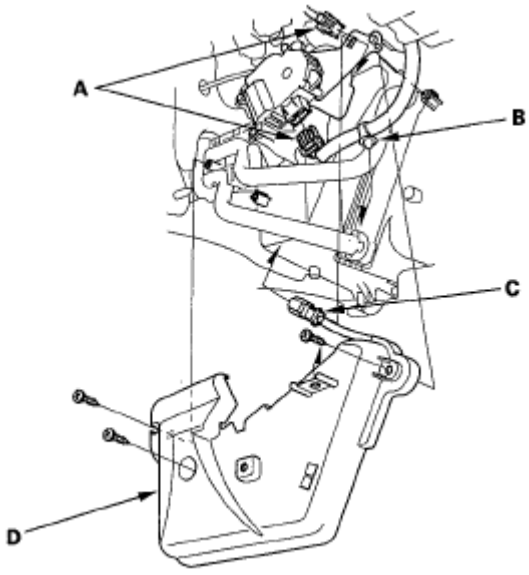

Fig. 131: Measuring Resistance Between A/T Clutch Pressure Control Solenoid Valve A Terminals 1 And 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 3-10 ohms?

YES -Go to step 11.

NO -Replace A/T clutch pressure control solenoid valve A (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A REPLACEMENT**), then go to step 12.

11. Check for continuity between A/T clutch pressure control solenoid valve A connector terminal No. 2 and body ground.

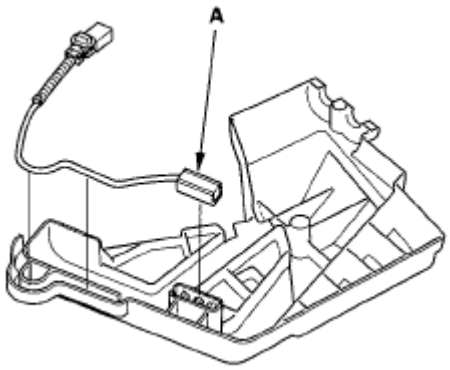

Fig. 132: Checking Continuity Between A/T Clutch Pressure Control Solenoid Valve A Terminal 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 18.

NO -Repair open in the wire between A/T clutch pressure control solenoid valve A and ground (G101) (see **CONNECTOR TO HARNESS INDEX**), or repair poor ground (G101), then go to step 12.

12. Reconnect all connectors.
13. Turn the ignition switch to ON (II).
14. Clear the DTC with the HDS.
15. Start the engine, and wait for at least 1 second.
16. Check for DTCs with the HDS.

Is DTC P0963 indicated?

YES -Check for poor connections or loose terminals between A/T clutch pressure control solenoid valve A and the PCM, then go to step 1.

NO -Go to step 17.

17. Monitor the OBD STATUS for P0963 in the DTCs MENU with the HDS.

Does the HDS indicate PASSED?

YES -Troubleshooting is complete. If any other DTCs were indicated in step 16, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO -If the HDS indicates FAILED, check for poor connections or loose terminals between A/T clutch pressure control solenoid valve A and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, go to step 15.

18. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
19. Start the engine, and wait for at least 1 second.
20. Check for DTCs with the HDS.

    Is DTC P0963 indicated?

    YES -Check for poor connections or loose terminals between A/T clutch pressure control solenoid valve A and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 19. If the PCM was substituted, go to step 1.

    NO -Go to step 21.

21. Monitor the OBD STATUS for P0963 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 20, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for poor connections or loose terminals between A/T clutch pressure control solenoid valve A and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 19. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 19.

DTC P0966: Problem in A/T Clutch Pressure Control Solenoid Valve B Circuit

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and wait for at least 1 second.
4. Check for DTCs with the HDS.

   Is DTC P0966 indicated?

   YES -Go to step 8.

   NO -Go to step 5.

5. Select Clutch Pressure Control Solenoid Valve B in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve B with the HDS.

   Does the HDS indicate NORMAL?

   YES -Go to step 6.

   NO -Go to step 8.

6. In the Clutch Pressure Control Solenoid Valve Control menu, select A/T clutch pressure control solenoid valve B at 1.0 A.
7. Monitor the OBD STATUS for P0966 in the DTCs MENU with the HDS.

   Does the HDS indicate FAILED?

   YES -Go to step 8.

   NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between A/T clutch pressure control solenoid valve B and the PCM. If the HDS indicates NOT COMPLETED, go to step 5.

8. Turn the ignition switch OFF.
9. Disconnect the A/T clutch pressure control solenoid valve B connector.
10. Measure the resistance between A/T clutch pressure control solenoid valve B connector terminals No. 1 and No. 2.

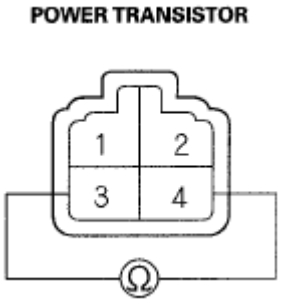

Fig. 133: Measuring Resistance Between A/T Clutch Pressure Control Solenoid Valve B Terminals 1 And 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 3-10 ohms?

YES -Go to step 11.

NO -Replace A/T clutch pressure control solenoid valve B (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE B AND C REPLACEMENT**), then go to step 16.

11. Check for continuity between A/T clutch pressure control solenoid valve B connector terminal No. 2 and body ground.

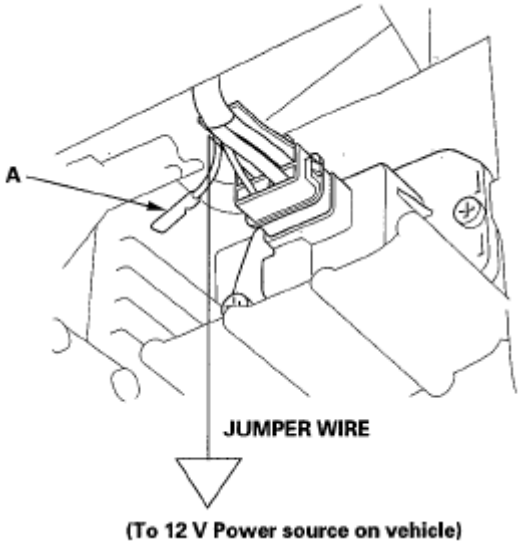

Fig. 134: Checking Continuity Between A/T Clutch Pressure Control Solenoid Valve B Terminal 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 12.

NO -Repair open in the wire between A/T clutch pressure control solenoid valve B and ground (G101) (see **CONNECTOR TO HARNESS INDEX**), or repair poor ground (G101), then go to step 16.

12. Jump the SCS line with the HDS.
13. Disconnect PCM connector B (44P).
14. Check for continuity between A/T clutch pressure control solenoid valve B connector terminal No. 1 and body ground.

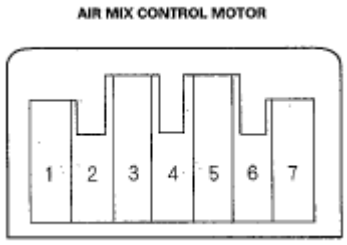

Fig. 135: Checking Continuity Between A/T Clutch Pressure Control Solenoid Valve B Terminal 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair short to body ground in the wire between A/T clutch pressure control solenoid valve B connector terminal No. 1 and body ground, then go to step 16.

NO -Go to step 15.

15. Check for continuity between A/T clutch pressure control solenoid valve B connector terminal No. 1 and PCM connector terminals B44.

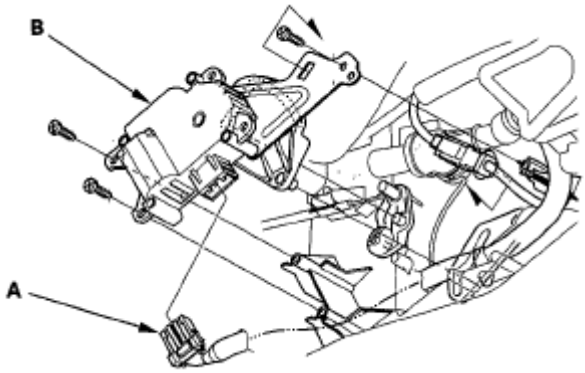

Fig. 136: Checking Continuity Between A/T Clutch Pressure Control Solenoid Valve B Terminal 1 And PCM Terminals B44
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 22.

NO -Repair open in the wire between A/T clutch pressure control solenoid valve B connector terminal No. 1 and PCM connector terminal B44, then go to step 16.

16. Reconnect all connectors.
17. Turn the ignition switch to ON (II).
18. Clear the DTC with the HDS.
19. Start the engine, and wait for at least 1 second.
20. Check for DTCs with the HDS.

Is DTC P0966 indicated?

YES -Check for poor connections or loose terminals between A/T clutch pressure control solenoid valve Band the PCM, then go to step 1.

NO -Go to step 21.

21. Monitor the OBD STATUS for P0966 in the DTCs MENU with the HDS.

Does the HDS indicate PASSED?

YES -Troubleshooting is complete. If any other DTCs were indicated in step 20, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO -If the HDS indicates FAILED, check for poor connections or loose terminals between A/T clutch pressure control solenoid valve B and the PCM, then go to step 1. If the HDS indicates NOT

COMPLETED, go to step 19.

22. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
23. Start the engine, and wait for at least 1 second.
24. Check for DTCs with the HDS.

    Is DTC P0966 indicated?

    YES -Check for poor connections or loose terminals between A/T clutch pressure control solenoid valve B and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 23. If the PCM was substituted, go to step 1.

    NO -Go to step 25.

25. Monitor the OBD STATUS for P0966 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 24, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for poor connections or loose terminals between A/T clutch pressure control solenoid valve B and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 23. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 23.

DTC P0967: Problem in A/T Clutch Pressure Control Solenoid Valve B

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and wait for at least 1 second.
4. Check for DTCs with the HDS.

    Is DTC P0967 indicated?

    YES -Go to step 8.

    NO -Go to step 5.

5. Select Clutch Pressure Control Solenoid Valve B in the Miscellaneous Test Menu, and test A/T clutch

pressure control solenoid valve B with the HDS.

Does the HDS indicate NORMAL?

YES -Go to step 6.

NO -Go to step 8.

6. In the Clutch Pressure Control Solenoid Valve Control menu, select A/T clutch pressure control solenoid valve B at 0.2 A.
7. Monitor the OBD STATUS for P0967 in the DTCs MENU with the HDS.

Does the HDS indicate FAILED?

YES -Go to step 8.

NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between A/T clutch pressure control solenoid valve B and the PCM. If the HDS indicates NOT COMPLETED, go to step 5.

8. Turn the ignition switch to LOCK (0).
9. Disconnect the A/T clutch pressure control solenoid valve B connector.
10. Measure the resistance between A/T clutch pressure control solenoid valve B connector terminals No. 1 and No. 2.

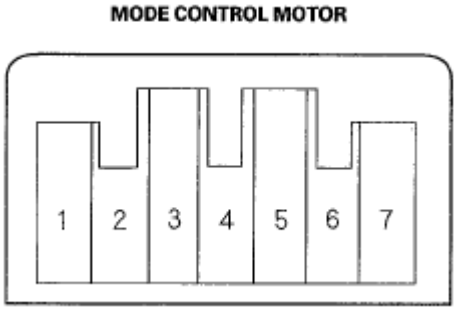

Fig. 137: Measuring Resistance Between A/T Clutch Pressure Control Solenoid Valve B Terminals 1 And 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 3-10 ohms?

YES -Go to step 11.

NO -Replace A/T clutch pressure control solenoid valve B (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE B AND C REPLACEMENT**), then go to step 12.

11. Check for continuity between A/T clutch pressure control solenoid valve B connector terminal No. 2 and body ground.

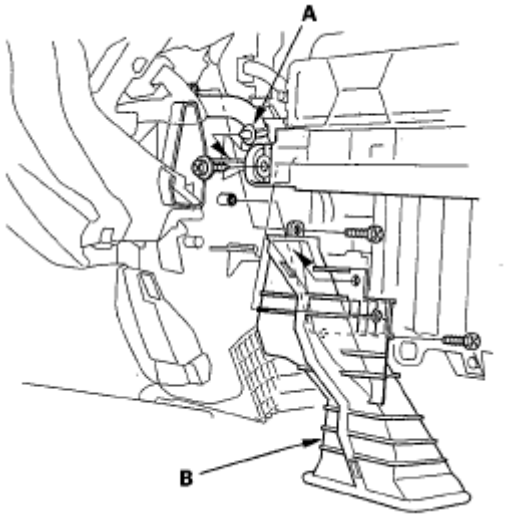

Fig. 138: Checking Continuity Between A/T Clutch Pressure Control Solenoid Valve B Terminal 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 18.

NO -Repair open in the wire between A/T clutch pressure control solenoid valve B and ground (G101) (see **CONNECTOR TO HARNESS INDEX**), or repair poor ground (G101), then go to step 12.

12. Reconnect all connectors.
13. Turn the ignition switch to ON (II).
14. Clear the DTC with the HDS.
15. Start the engine, and wait for at least 1 second.
16. Check for DTCs with the HDS.

Is DTC P0967 indicated?

YES -Check for poor connections or loose terminals between A/T clutch pressure control solenoid valve B and the PCM, then go to step 1.

NO -Go to step 17.

17. Monitor the OBD STATUS for P0967 in the DTCs MENU with the HDS.

Does the HDS indicate PASSED?

YES -Troubleshooting is complete. If any other DTCs were indicated in step 16, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO -If the HDS indicates FAILED, check for poor connections or loose terminals between A/T clutch pressure control solenoid valve B and the PCM, then go to step 1. If the HDS indicates NOT

COMPLETED, go to step 15.

18. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
19. Start the engine, and wait for at least 1 second.
20. Check for DTCs with the HDS.

    Is DTC P0967 indicated?

    YES -Check for poor connections or loose terminals between A/T clutch pressure control solenoid valve B and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 19. If the PCM was substituted, go to step 1.

    NO -Go to step 21.

21. Monitor the OBD STATUS for P0967 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 20, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for poor connections or loose terminals between A/T clutch pressure control solenoid valve B and the PCM. DTC P0970: Problem in A/T Clutch Pressure Control Solenoid Valve C Circuit

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and wait for at least 1 second.
4. Check for DTCs with the HDS.

    Is DTC P0970 indicated?

    YES -Go to step 8.

    NO -Go to step 5.

5. Select Clutch Pressure Control Solenoid Valve C in the Miscellaneous Test Menu, and test A/T clutch

pressure control solenoid valve C with the HDS.

Does the HDS indicate NORMAL?

YES -Go to step 6.

NO -Go to step 8.

6. In the Clutch Pressure Control Solenoid Valve Control menu, select A/T clutch pressure control solenoid valve C at 1.0 A.
7. Monitor the OBD STATUS for P0970 in the DTCs MENU with the HDS.

Does the HDS indicate FAILED?

YES -Go to step 8.

NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between A/T clutch pressure control solenoid valve C and the PCM. If the HDS indicates NOT COMPLETED, go to step 5.

8. Turn the ignition switch OFF.
9. Disconnect the A/T clutch pressure control solenoid valve C connector.
10. Measure the resistance between A/T clutch pressure control solenoid valve C connector terminals No. 1 and No. 2.

Is there 3-10 ohms?

YES -Go to step 11.

NO -Replace A/T clutch pressure control solenoid valve C (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE B AND C REPLACEMENT**), then go to step 16.

11. Check for continuity between A/T clutch pressure control solenoid valve C connector terminal No. 2

and body ground.

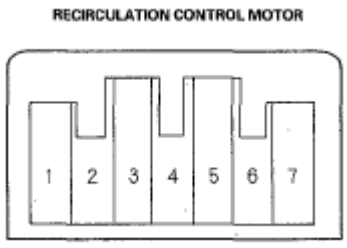

Fig. 140: Checking Continuity Between A/T Clutch Pressure Control Solenoid Valve C Terminal 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 12.

NO -Repair open in the wire between A/T clutch pressure control solenoid valve C and ground (G101) (see **CONNECTOR TO HARNESS INDEX**), or repair poor ground (G101), then go to step 16.

12. Jump the SCS line with the HDS.
13. Disconnect PCM connector B (44P).
14. Check for continuity between A/T clutch pressure control solenoid valve C connector terminal No. 1 and body ground.

Is there continuity?

YES -Repair short to body ground in the wire between A/T clutch pressure control solenoid valve C connector terminal No. 1 and body ground, then go to step 16.

NO -Go to step 15.

15. Check for continuity between A/T clutch pressure control solenoid valve C connector terminal No. 1 and PCM connector terminal B25.

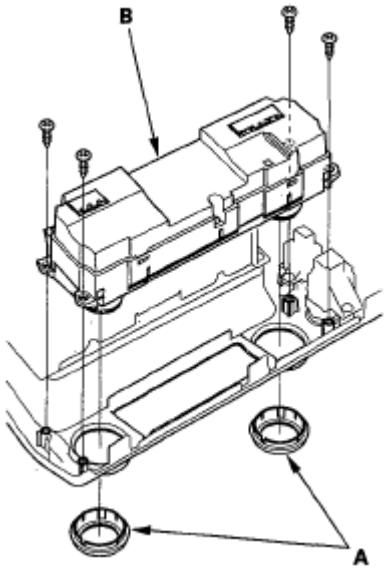

Fig. 142: Checking Continuity Between A/T Clutch Pressure Control Solenoid Valve C Terminal 1 And PCM Connector Terminal B25
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 22.

NO -Repair open in the wire between A/T clutch pressure control solenoid valve C connector terminal No. 1 and PCM connector terminal B25, then go to step 16.

16. Reconnect all connectors.
17. Turn the ignition switch to ON (II).
18. Clear the DTC with the HDS.
19. Start the engine, and wait for at least 1 second.
20. Check for DTCs with the HDS.

Is DTC P0970 indicated?

YES -Check for poor connections or loose terminals between A/T clutch pressure control solenoid valve C and the PCM, then go to step 1.

NO -Go to step 21.

21. Monitor the OBD STATUS for P0970 in the DTCs MENU with the HDS.

Does the HDS indicate PASSED?

YES -Troubleshooting is complete. If any other DTCs were indicated in step 20, go to the

INDICATED DTC'S TROUBLESHOOTING.

NO -If the HDS indicates FAILED, check for poor connections or loose terminals between A/T clutch pressure control solenoid valve C and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, go to step 19.

22. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
23. Start the engine, and wait for at least 1 second.
24. Check for DTCs with the HDS.

Is DTC P0970 indicated?

YES -Check for poor connections or loose terminals between A/T clutch pressure control solenoid valve C and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 23. If the PCM was substituted, go to step 1.

NO -Go to step 25.

25. Monitor the OBD STATUS for P0970 in the DTCs MENU with the HDS.

Does the HDS indicate PASSED?

YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 24, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO -If the HDS indicates FAILED, check for poor connections or loose terminals between A/T clutch pressure control solenoid valve C and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 23. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 23.

DTC P0971: Problem in A/T Clutch Pressure Control Solenoid Valve C

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and wait for at least 1 second.
4. Check for DTCs with the HDS.

Is DTC P0971 indicated?

YES -Go to step 8.

NO -Go to step 5.

5. Select Clutch Pressure Control Solenoid Valve C in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve C with the HDS.

   Does the HDS indicate NORMAL?

   YES -Go to step 6.

   NO -Go to step 8.

6. In the Clutch Pressure Control Solenoid Valve Control menu, select A/T clutch pressure control solenoid valve C at 0.2 A.
7. Monitor the OBD STATUS for P0971 in the DTCs MENU with the HDS.

   Does the HDS indicate FAILED?

   YES -Go to step 8.

   NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between A/T clutch pressure control solenoid valve C and the PCM. If the HDS indicates NOT COMPLETED, go to step 5.

8. Turn the ignition switch to LOCK (0).
9. Disconnect the A/T clutch pressure control solenoid valve C connector.
10. Measure the resistance between A/T clutch pressure control solenoid valve C connector terminals No. 1 and No. 2.

Is there 3-10 ohms?

YES -Go to step 11.

NO -Replace A/T clutch pressure control solenoid valve C (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE B AND C REPLACEMENT**), then go to step 12.

11. Check for continuity between A/T clutch pressure control solenoid valve C connector terminal No. 2 and body ground.

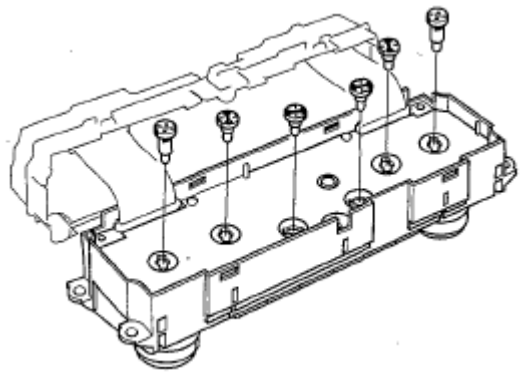

Fig. 144: Checking Continuity Between A/T Clutch Pressure Control Solenoid Valve C Terminal 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 18.

NO -Repair open in the wire between A/T clutch pressure control solenoid valve C and ground (G101) (see **CONNECTOR TO HARNESS INDEX**), or repair poor ground (G101), then go to step 12.

12. Reconnect all connectors.
13. Turn the ignition switch to ON (II).
14. Clear the DTC with the HDS.
15. Start the engine, and wait for at least 1 second.
16. Check for DTCs with the HDS.

Is DTC P0971 indicated?

YES -Check for poor connections or loose terminals between A/T clutch pressure control solenoid valve C and the PCM, then go to step 1.

NO -Go to step 17.

17. Monitor the OBD STATUS for P0971 in the DTCs MENU with the HDS.

Does the HDS indicate PASSED?

YES -Troubleshooting is complete. If any other DTCs were indicated in step 16, go to the

INDICATED DTC'S TROUBLESHOOTING.

NO -If the HDS indicates FAILED, check for poor connections or loose terminals between A/T clutch pressure control solenoid valve C and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, go to step 15.

18. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
19. Start the engine, and wait for at least 1 second.
20. Check for DTCs with the HDS.

    Is DTC P0971 indicated?

    YES -Check for poor connections or loose terminals between A/T clutch pressure control solenoid valve C and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 19. If the PCM was substituted, go to step 1.

    NO -Go to step 21.

21. Monitor the OBD STATUS for P0971 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 20, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for poor connections or loose terminals between A/T clutch pressure control solenoid valve C and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 19. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 19.

DTC P0973: Short in Shift Solenoid Valve A Circuit

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Test-drive the vehicle in 2nd gear with the shift lever in D, for at least 1 second.
4. Check for DTCs with the HDS.

   Is DTC P0973 indicated?

   YES -Go to step 8.

NO -Go to step 5.

5. Select Shift Solenoid Valve A in the Miscellaneous Test Menu, and test shift solenoid valve A with the HDS.

   Is a clicking sound heard?

   YES -Go to step 6.

   NO -Go to step 8.

6. Test-drive the vehicle in 2nd gear with the shift lever in D, for at least 1 second.
7. Monitor the OBD STATUS for P0973 in the DTCs MENU with the HDS.

   Does the HDS indicate FAILED?

   YES -Go to step 8.

   NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for intermittent short to body ground in the wire between shift solenoid valve A and the PCM. If the HDS indicates NOT COMPLETED, go to step 5.

8. Turn the ignition switch to LOCK (0).
9. Jump the SCS line with the HDS.
10. Disconnect PCM connectors B (44P) and C (44P).
11. Measure the resistance between PCM connector terminals B10 and C40.

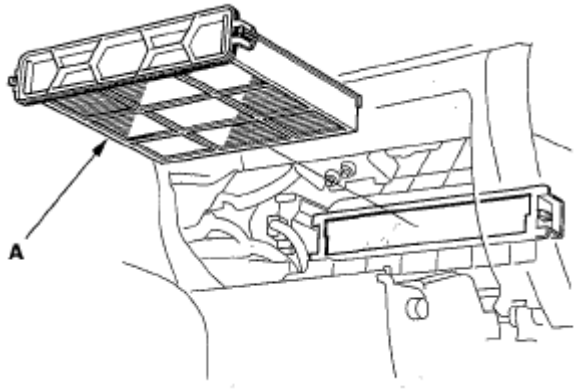

Fig. 145: Measuring Resistance Between PCM Connector Terminals B10 And C40
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 12 ohms?

YES -Go to step 12.

NO -Go to step 21.

12. Disconnect the shift solenoid harness connector.

13. Check for continuity between PCM connector terminals B10 and C40.

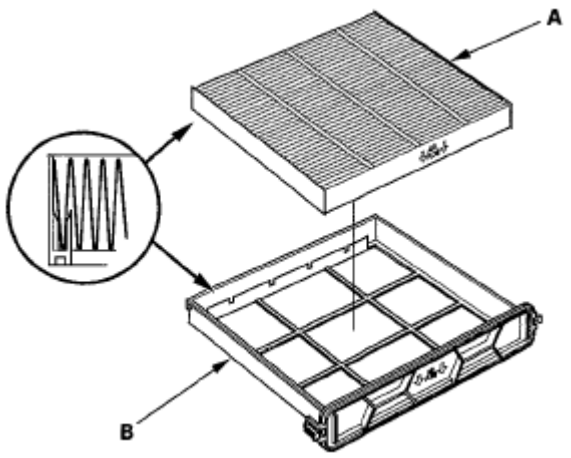

Fig. 146: Checking Continuity Between PCM Connector Terminals B10 And C40
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair short to body ground in the wire between PCM connector terminal B10 and the shift solenoid harness connector, then go to step 15.

NO -Go to step 14.

14. Inspect shift solenoid valve A and the shift solenoid harness (see **SHIFT SOLENOID VALVE TEST**).

Is shift solenoid valve A and the harness OK?

YES -Go to step 21.

NO -Replace shift solenoid valve A or the shift solenoid harness (see **SHIFT SOLENOID VALVE AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**), then go to step 15.

15. Reconnect all connectors.
16. Turn the ignition switch to ON (II).
17. Clear the DTC with the HDS.
18. Start the engine with the shift lever in P, and wait for at least 1 second. Then drive the vehicle in 2nd gear in D, for at least 1 second.
19. Check for DTCs with the HDS:

Is DTC P0973 indicated?

YES -Check for intermittent short to body ground in the wire between shift solenoid valve A and the PCM, then go to step 1.

NO -Go to step 20.

20. Monitor the OBD STATUS for P0973 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 19, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for intermittent short to body ground in the wire between shift solenoid valve A and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, go to step 18.

21. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
22. Start the engine with the shift lever in P, and wait for at least 1 second. Then drive the vehicle in 2nd gear in D, for at least 1 second.
23. Check for DTCs with the HDS.

    Is DTC P0973 indicated?

    YES -Check for intermittent short to body ground in the wire between shift solenoid valve A and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 22. If the PCM was substituted, go to step 1.

    NO -Go to step 24.

24. Monitor the OBD STATUS for P0973 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 23, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for intermittent short to body ground in the wire between shift solenoid valve A and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 22. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 22.

DTC P0974: Open in Shift Solenoid Valve A Circuit

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.

3. Start the engine with the shift lever in P, and wait for at least 1 second.
4. Check for DTCs with the HDS.

   Is DTC P0974 indicated?

   YES -Go to step 8.

   NO -Go to step 5.

5. Select Shift Solenoid Valve A in the Miscellaneous Test Menu, and test shift solenoid valve A with the HDS.

   Is a clicking sound heard?

   YES -Go to step 6.

   NO -Go to step 8.

6. Start the engine with the shift lever in P, and wait for at least 1 second.
7. Monitor the OBD STATUS for P0974 in the DTCs MENU with the HDS.

   Does the HDS indicate FAILED?

   YES -Go to step 8.

   NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between shift solenoid valve A and the PCM. If the HDS indicates NOT COMPLETED, go to step 5.

8. Turn the ignition switch to LOCK (0).
9. Jump the SCS line with the HDS.
10. Disconnect PCM connectors B (44P) and C (44P).
11. Measure the resistance between PCM connector terminals B10 and C40.

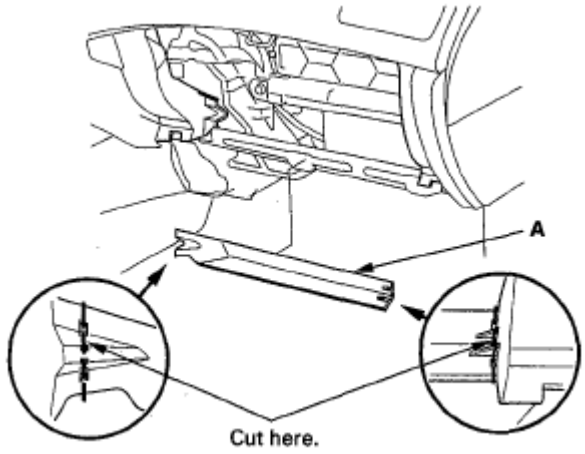

Fig. 147: Measuring Resistance Between PCM Connector Terminals B10 And C40

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 12-25 ohms?

YES -Go to step 22.

NO -Go to step 12.

12. Disconnect the shift solenoid harness connector.
13. Check for continuity between PCM connector terminal B10 and shift solenoid harness connector terminal No. 5.

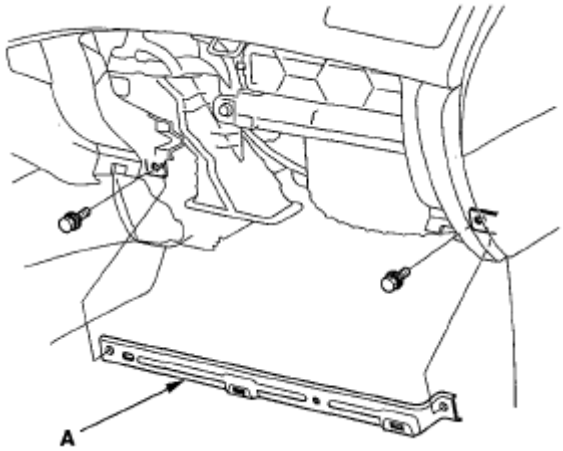

Fig. 148: Checking Continuity Between PCM Connector Terminal B10 And Shift Solenoid Harness Connector Terminal 5
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 14.

NO -Repair open in the wire between PCM connector terminal B10 and the shift solenoid harness connector, then go to step 16.

14. Remove the shift solenoid harness (see **SHIFT SOLENOID VALVE AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**).
15. Check for continuity between shift solenoid harness connector terminal No. 5 and the shift solenoid valve A connector terminal.

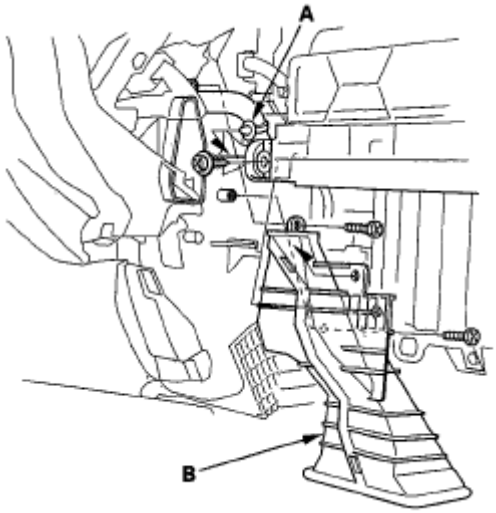

Fig. 149: Checking Continuity Between Shift Solenoid Harness Terminal 5 And Shift Solenoid Valve A Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Replace shift solenoid valve A (see **SHIFT SOLENOID VALVE AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**), then go to step 16.

NO -Replace the shift solenoid harness (see **SHIFT SOLENOID VALVE AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**), then go to step 16.

16. Reconnect all connectors.
17. Turn the ignition switch to ON (II).
18. Clear the DTC with the HDS.
19. Start the engine with the shift lever in P, and wait for at least 1 second. Then drive the vehicle in 2nd gear in D, for at least 1 second.
20. Check for DTCs with the HDS.

    Is DTC P0974 indicated?

    YES -Check for poor connections or loose terminals between shift solenoid valve A and the PCM, then go to step 1.

    NO -Go to step 21.

21. Monitor the OBD STATUS for P0974 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 20, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for poor connections or loose terminals between shift

solenoid valve A and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, go to step 19.

22. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
23. Start the engine with the shift lever in P, and wait for at least 1 second. Then drive the vehicle in 2nd gear in D, for at least 1 second.
24. Check for DTCs with the HDS.

    Is DTC P0974 indicated?

    YES -Check for poor connections or loose terminals between shift solenoid valve A and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 23. If the PCM was substituted, go to step 1.

    NO -Go to step 25.

25. Monitor the OBD STATUS for P0974 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 24, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for poor connections or loose terminals between shift solenoid valve A and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 23. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 23.

DTC P0976: Short in Shift Solenoid Valve B Circuit

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Test-drive the vehicle in 1st gear with the shift lever in D, for at least 1 second.
4. Check for DTCs with the HDS.

   Is DTC P0976 indicated?

   YES -Go to step 8.

   NO -Go to step 5.

5. Select Shift Solenoid Valve B in the Miscellaneous Test Menu, and test shift solenoid valve B with the HDS.

   Is a clicking sound heard?

   YES -Go to step 6.

   NO -Go to step 8.

6. Test-drive the vehicle in 1st gear with the shift lever in D, for at least 1 second.
7. Monitor the OBD STATUS for P0976 in the DTCs MENU with the HDS.

   Does the HDS indicate FAILED?

   YES -Go to step 8.

   NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for intermittent short to body ground in the wire between shift solenoid valve B and the PCM. If the HDS indicates NOT COMPLETED, go to step 5.

8. Turn the ignition switch to LOCK (0).
9. Jump the SCS line with the HDS.
10. Disconnect PCM connectors B (44P) and C (44P).
11. Measure the resistance between PCM connector terminals B26 and C40.

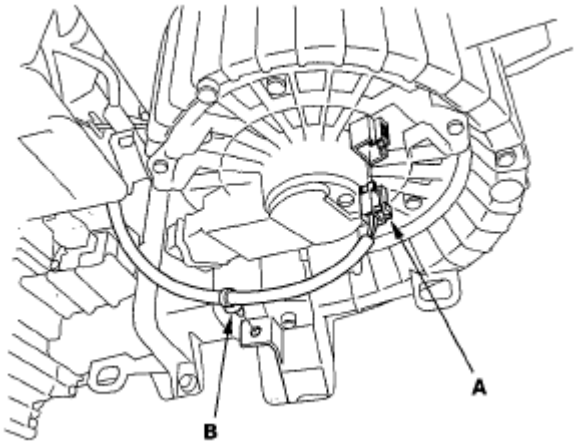

Fig. 150: Measuring Resistance Between PCM Connector Terminals B26 And C40
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 12 ohms?

YES -Go to step 12.

NO -Go to step 21.

12. Disconnect the shift solenoid harness connector.
13. Check for continuity between PCM connector terminals B26 and C40.

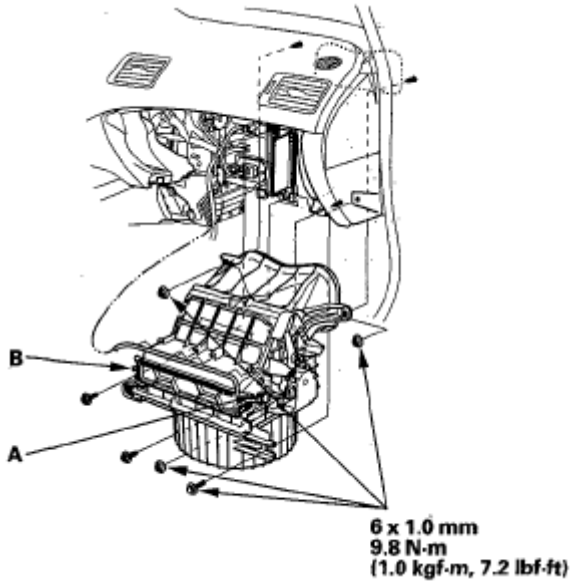

Fig. 151: Checking Continuity Between PCM Connector Terminals B26 And C40
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair short to body ground in the wire between PCM connector terminal B26 and the shift solenoid harness connector, then go to step 15.

NO -Go to step 14.

14. Inspect shift solenoid valve B and the shift solenoid harness (see **SHIFT SOLENOID VALVE TEST**).

    Is shift solenoid valve B and the harness OK?

    YES -Go to step 21.

    NO -Replace shift solenoid valve B or the shift solenoid harness (see **SHIFT SOLENOID VALVE AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**), then go to step 15.

15. Reconnect all connectors.
16. Turn the ignition switch to ON (II).
17. Clear the DTC with the HDS.
18. Test-drive the vehicle in 1st gear with the shift lever in D, for at least 1 second. Then drive in 3rd gear for at least 1 second.
19. Check for DTCs with the HDS.

    Is DTC P0976 indicated?

    YES -Check for intermittent short to body ground in the wire between shift solenoid valve B and the PCM, then go to step 1.

NO -Go to step 20.

20. Monitor the OBD STATUS for P0976 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 19, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for intermittent short to body ground in the wire between shift solenoid valve B and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, go to step 18.

21. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
22. Test-drive the vehicle in 1st gear with the shift lever in D, for at least 1 second. Then drive in 3rd gear for at least 1 second.
23. Check for DTCs with the HDS.

    Is DTC P0976 indicated?

    YES -Check for intermittent short to body ground in the wire between shift solenoid valve B and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 22. If the PCM was substituted, go to step 1.

    NO -Go to step 24.

24. Monitor the OBD STATUS for P0976 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 23, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for intermittent short to body ground in the wire between shift solenoid valve B and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 22. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 22.

DTC P0977: Open in Shift Solenoid Valve B Circuit

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II).

2. Clear the DTC with the HDS.
3. Test-drive the vehicle in 3rd gear with the shift lever in D, for at least 1 second.
4. Check for DTCs with the HDS.

   Is DTC P0977 indicated?

   YES -Go to step 8.

   NO -Go to step 5.

5. Select Shift Solenoid Valve B in the Miscellaneous Test Menu, and test shift solenoid valve B with the HDS.

   Is a clicking sound heard?

   YES -Go to step 6.

   NO -Go to step 8.

6. Test-drive the vehicle in 3rd gear with the shift lever in D, for at least 1 second.
7. Monitor the OBD STATUS for P0977 in the DTCs MENU with the HDS.

   Does the HDS indicate FAILED?

   YES -Go to step 8.

   NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between shift solenoid valve B and the PCM. If the HDS indicates NOT COMPLETED, go to step 5.

8. Turn the ignition switch to LOCK (0).
9. Jump the SCS line with the HDS.
10. Disconnect PCM connectors B (44P) and C (44P).
11. Measure the resistance between PCM connector terminals B26 and C40.

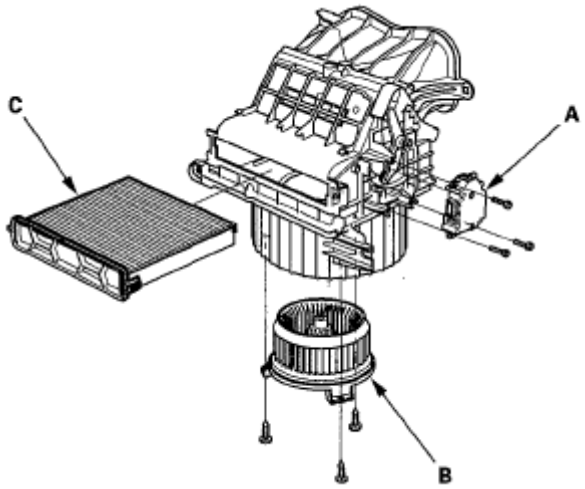

Fig. 152: Measuring Resistance Between PCM Connector Terminals B26 And C40
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 12-25 ohms?

YES -Go to step 22.

NO -Go to step 12.

12. Disconnect the shift solenoid harness connector.
13. Check for continuity between PCM connector terminal B26 and shift solenoid harness connector terminal No. 2.

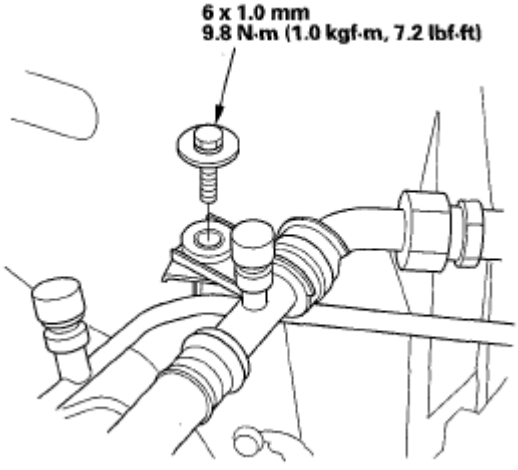

Fig. 153: Checking Continuity Between PCM Terminal B26 And Shift Solenoid Harness Terminal 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 14.

NO -Repair open in the wire between PCM connector terminal B26 and the shift solenoid harness

connector, then go to step 16.

14. Remove the shift solenoid harness (see **SHIFT SOLENOID VALVE AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**).
15. Check for continuity between shift solenoid harness connector terminal No. 2 and the shift solenoid valve B connector terminal.

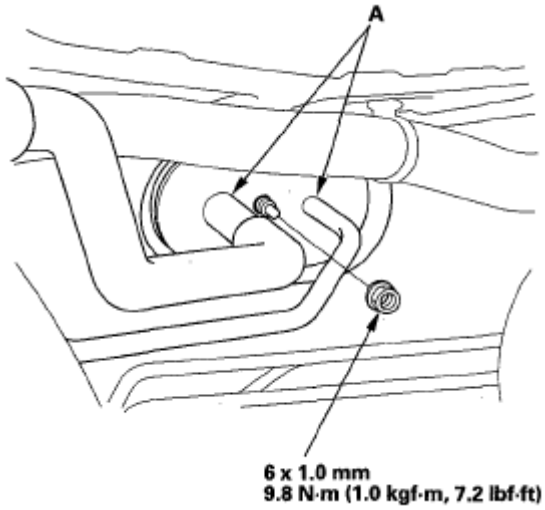

Fig. 154: Checking Continuity Between Shift Solenoid Harness Terminal 2 And Shift Solenoid Valve B Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Replace shift solenoid valve B (see **SHIFT SOLENOID VALVE AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**), then go to step 16.

NO -Replace the shift solenoid harness (see **SHIFT SOLENOID VALVE AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**), then go to step 16.

16. Reconnect all connectors.
17. Turn the ignition switch to ON (II).
18. Clear the DTC with the HDS.
19. Test-drive the vehicle in 1st gear with the shift lever in D, for at least 1 second. Then drive in 3rd gear for at least 1 second.
20. Check for DTCs with the HDS.

Is DTC P0977 indicated?

YES -Check for poor connections or loose terminals between shift solenoid valve B and the PCM, then go to step 1.

NO -Go to step 21.

21. Monitor the OBD STATUS for P0977 in the DTCs MENU with the HDS.

Does the HDS indicate PASSED?

YES -Troubleshooting is complete. If any other DTCs were indicated in step 20, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO -If the HDS indicates FAILED, check for poor connections or loose terminals between shift solenoid valve B and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, go to step 19.

22. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
23. Test-drive the vehicle in 1st gear with the shift lever in D, for at least 1 second. Then drive in 3rd gear for at least 1 second.
24. Check for DTCs with the HDS.

Is DTC P0977 indicated?

YES -Check for poor connections or loose terminals between shift solenoid valve B and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 23. If the PCM was substituted, go to step 1.

NO -Go to step 25.

25. Monitor the OBD STATUS for P0977 in the DTCs MENU with the HDS.

Does the HDS indicate PASSED?

YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 24, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO -If the HDS indicates FAILED, check for poor connections or loose terminals between shift solenoid valve B and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 23. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 23.

DTC P0979: Short in Shift Solenoid Valve C Circuit

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Test-drive the vehicle in 3rd gear with the shift lever in D, for at least 1 second.
4. Check for DTCs with the HDS.

Is DTC P0979 indicated?

YES -Go to step 8.

NO -Go to step 5.

5. Select Shift Solenoid Valve C in the Miscellaneous Test Menu, and test shift solenoid valve C with the HDS.

   Is a clicking sound heard?

   YES -Go to step 6.

   NO -Go to step 8.

6. Test-drive the vehicle in 3rd gear with the shift lever in D, for at least 1 second.
7. Monitor the OBD STATUS for P0979 in the DTCs MENU with the HDS.

   Does the HDS indicate FAILED?

   YES -Go to step 8.

   NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for intermittent short to body ground in the wire between shift solenoid valve C and the PCM. If the HDS indicates NOT COMPLETED, go to step 5.

8. Turn the ignition switch to LOCK (0).
9. Jump the SCS line with the HDS.
10. Disconnect PCM connectors B (44P) and C (44P).
11. Measure the resistance between PCM connector terminals B20 and C40.

Is there less than 12 ohms?

YES -Go to step 12.

NO -Go to step 21.

12. Disconnect the shift solenoid harness connector.
13. Check for continuity between PCM connector terminals B20 and C40.

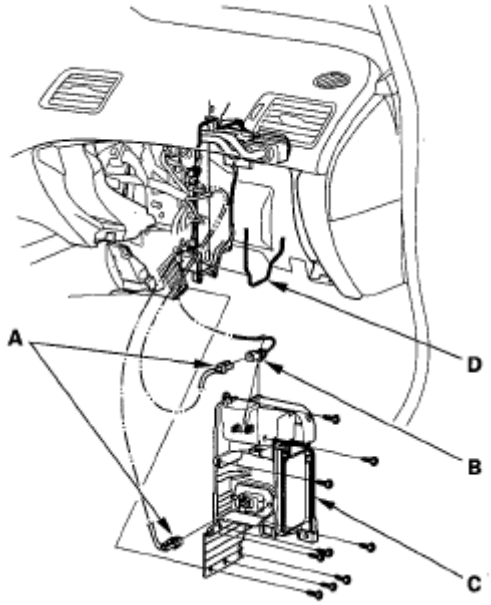

Fig. 156: Checking Continuity Between PCM Connector Terminals B20 And C40
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair short to body ground in the wire between PCM connector terminal B20 and the shift solenoid harness connector, then go to step 15.

NO -Go to step 14.

14. Inspect shift solenoid valve C and the shift solenoid harness (see **SHIFT SOLENOID VALVE TEST**).

Is shift solenoid valve C and the harness OK?

YES -Go to step 21.

NO -Replace shift solenoid valve C or the shift solenoid harness (see **SHIFT SOLENOID VALVE AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**), then go to step 15.

15. Reconnect all connectors.
16. Turn the ignition switch to ON (II).
17. Clear the DTC with the HDS.
18. Start the engine with the shift lever in P, and wait for at least 1 second. Then drive the vehicle in 3rd gear in D, for at least 1 second.

19. Check for DTCs with the HDS.

    Is DTC P0979 indicated?

    YES -Check for intermittent short to body ground in the wire between shift solenoid valve C and the PCM, then go to step 1.

    NO -Go to step 20.

20. Monitor the OBD STATUS for P0979 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 19, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for intermittent short to body ground in the wire between shift solenoid valve C and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, go to step 18.

21. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
22. Start the engine with the shift lever in P, and wait for at least 1 second. Then drive the vehicle in 3rd gear in D, for at least 1 second.
23. Check for DTCs with the HDS.

    Is DTC P0979 indicated?

    YES -Check for intermittent short to body ground in the wire between shift solenoid valve C and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 22. If the PCM was substituted, go to step 1.

    NO -Go to step 24.

24. Monitor the OBD STATUS for P0979 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 23, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for intermittent short to body ground in the wire between shift solenoid valve C and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 22. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 22.

DTC P0980: Open in Shift Solenoid Valve C Circuit

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Start the engine with the shift lever in P, and wait for at least 1 second.
4. Check for DTCs with the HDS.

   Is DTC P0980 indicated?

   YES -Go to step 8.

   NO -Go to step 5.

5. Select Shift Solenoid Valve C in the Miscellaneous Test Menu, and test shift solenoid valve C with the HDS.

   Is a clicking sound heard?

   YES -Go to step 6.

   NO -Go to step 8.

6. Start the engine with the shift lever in P, and wait for at least 1 second.
7. Monitor the OBD STATUS for P0980 in the DTCs MENU with the HDS.

   Does the HDS indicate FAILED?

   YES -Go to step 8.

   NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between shift solenoid valve C and the PCM. If the HDS indicates NOT COMPLETED, go to step 5.

8. Turn the ignition switch to LOCK (0).

Is there continuity?

YES -Go to step 14.

NO -Repair open in the wire between PCM connector terminal B20 and the shift solenoid harness connector, then go to step 16.

14. Remove the shift solenoid harness (see **SHIFT SOLENOID VALVE AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**).
15. Check for continuity between shift solenoid harness connector terminal No. 1 and the shift solenoid valve C connector terminal.

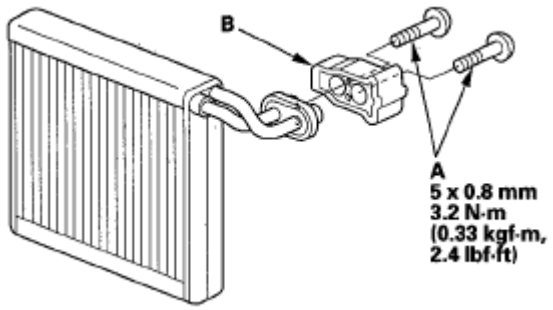

Fig. 159: Checking Continuity Between Shift Solenoid Harness Terminal 1 And Shift Solenoid Valve C Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Replace shift solenoid valve C (see **SHIFT SOLENOID VALVE AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**), then go to step 16.

NO -Replace the shift solenoid harness (see **SHIFT SOLENOID VALVE AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**), then go to step 16.

16. Reconnect all connectors.
17. Turn the ignition switch to ON (II).
18. Clear the DTC with the HDS.
19. Start the engine with the shift lever in P, and wait for at least 1 second. Then drive in 3rd gear in D, for at least 1 second.
20. Check for DTCs with the HDS.

Is DTC P0980 indicated?

YES -Check for poor connections or loose terminals between shift solenoid valve C and the PCM, then go to step 1.

NO -Go to step 21.

21. Monitor the OBD STATUS for P0980 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 20, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for poor connections or loose terminals between shift solenoid valve C and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, go to step 19.

22. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
23. Start the engine with the shift lever in P, and wait for at least 1 second. Then drive in 3rd gear in D, for at least 1 second.
24. Check for DTCs with the HDS.

    Is DTC P0980 indicated?

    YES -Check for poor connections or loose terminals between shift solenoid valve C and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 23. If the PCM was substituted, go to step 1.

    NO -Go to step 25.

25. Monitor the OBD STATUS for P0980 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 24, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for poor connections or loose terminals between shift solenoid valve C and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 23. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 23.

DTC P0982: Short in Shift Solenoid Valve D Circuit

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.

3. Start the engine with the shift lever in P, and wait for at least 1 second.
4. Check for DTCs with the HDS.

   Is DTC P0982 indicated?

   YES -Go to step 8.

   NO -Go to step 5.

5. Select Shift Solenoid Valve D in the Miscellaneous Test Menu, and test shift solenoid valve D with the HDS.

   Is a clicking sound heard?

   YES -Go to step 6.

   NO -Go to step 8.

6. Start the engine with the shift lever in P, and wait for at least 1 second.
7. Monitor the OBD STATUS for P0982 in the DTCs MENU with the HDS.

   Does the HDS indicate FAILED?

   YES -Go to step 8.

   NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for intermittent short to body ground in the wire between shift solenoid valve D and the PCM. If the HDS indicates NOT COMPLETED, go to step 5.

8. Turn the ignition switch to LOCK (0).
9. Jump the SCS line with the HDS.
10. Disconnect PCM connectors B (44P) and C (44P).
11. Measure the resistance between PCM connector terminals B11 and C40.

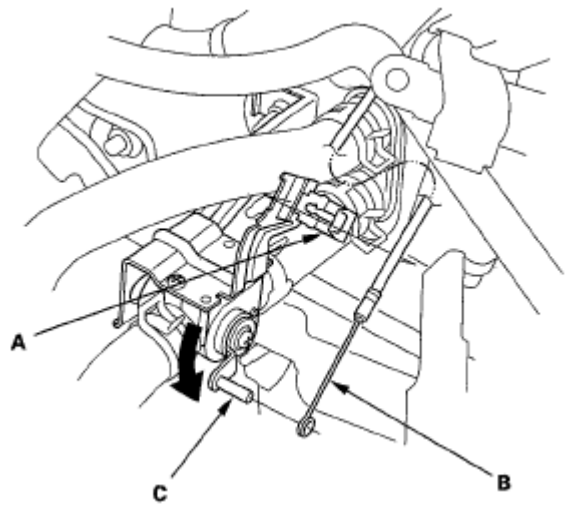

Fig. 160: Measuring Resistance Between PCM Connector Terminals B11 And C40
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 12 ohms?

YES -Go to step 12.

NO -Go to step 21.

12. Disconnect the shift solenoid harness connector.
13. Check for continuity between PCM connector terminals B11 and C40.

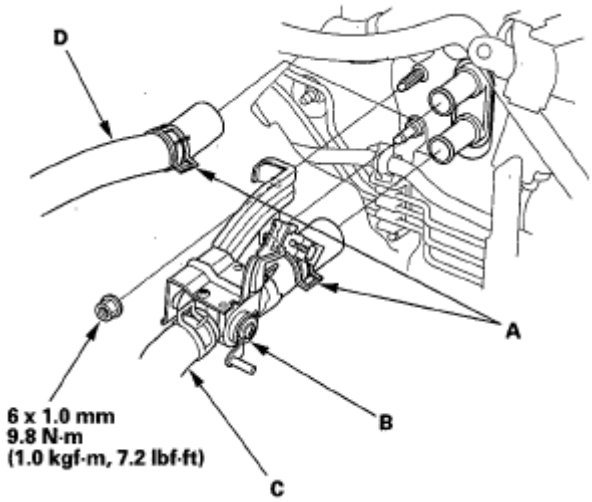

Fig. 161: Checking Continuity Between PCM Connector Terminals B11 And C40
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair short to body ground in the wire between PCM connector terminal B11 and the shift solenoid harness connector, then go to step 15.

NO -Go to step 14.

14. Inspect shift solenoid valve D and the shift solenoid harness (see **SHIFT SOLENOID VALVE TEST**).

Is shift solenoid valve D and the harness OK?

YES -Go to step 21.

NO -Replace shift solenoid valve D or the shift solenoid harness (see **SHIFT SOLENOID VALVE AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**), then go to step 15.

15. Reconnect all connectors.
16. Turn the ignition switch to ON (II).
17. Clear the DTC with the HDS.

18. Start the engine with the shift lever in P, and wait for at least 1 second.
19. Check for DTCs with the HDS.

    Is DTC P0982 indicated?

    YES -Check for intermittent short to body ground in the wire between shift solenoid valve D and the PCM, then go to step 1.

    NO -Go to step 20.

20. Monitor the OBD STATUS for P0982 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 19, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for intermittent short to body ground in the wire between shift solenoid valve D and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, go to step 18.

21. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
22. Start the engine with the shift lever in P, and wait for at least 1 second.
23. Check for DTCs with the HDS.

    Is DTC P0982 indicated?

    YES -Check for intermittent short to body ground in the wire between shift solenoid valve D and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 22. If the PCM was substituted, go to step 1.

    NO -Go to step 24.

24. Monitor the OBD STATUS for P0982 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 23, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for intermittent short to body ground in the wire between shift solenoid valve D and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 22. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 22.

DTC P0983: Open in Shift Solenoid Valve D Circuit

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, then shift to N while pressing the brake pedal, and wait for at least 1 second.
4. Check for DTCs with the HDS.

   Is DTC P0983 indicated?

   YES -Go to step 8.

   NO -Go to step 5.

5. Select Shift Solenoid Valve D in the Miscellaneous Test Menu, and test shift solenoid valve D with the HDS.

   Is a clicking sound heard?

   YES -Go to step 6.

   NO -Go to step 8.

6. Start the engine, then shift to N while pressing the brake pedal, and wait for at least 1 second.
7. Monitor the OBD STATUS for P0983 in the DTCs MENU with the HDS.

   Does the HDS indicate FAILED?

   YES -Go to step 8.

   NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between shift solenoid valve D and the PCM. If the HDS indicates NOT COMPLETED, go to step 5.

8. Turn the ignition switch to LOCK (0).
9. Jump the SCS line with the HDS.
10. Disconnect PCM connectors B (44P) and C (44P).
11. Measure the resistance between PCM connector terminals B11 and C40.

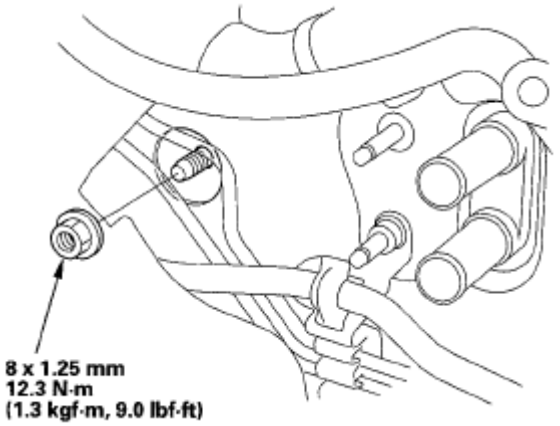

Fig. 162: Measuring Resistance Between PCM Connector Terminals B11 And C40
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 12-25 ohms?

YES -Go to step 22.

NO -Go to step 12.

12. Disconnect the shift solenoid harness connector.
13. Check for continuity between PCM connector terminal B11 and shift solenoid harness connector terminal No. 8.

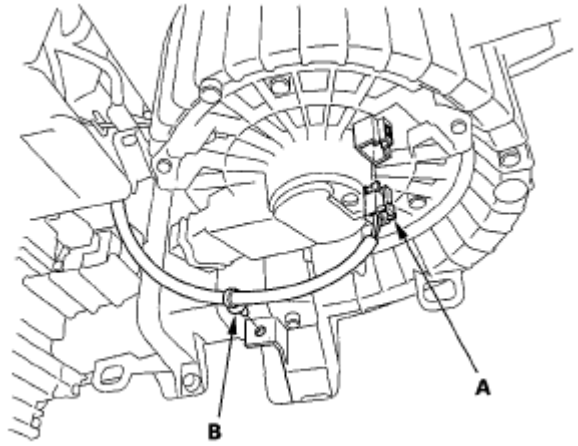

Fig. 163: Checking Continuity Between PCM Terminal B11 And Shift Solenoid Harness Connector Terminal 8
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 14.

NO -Repair open in the wire between PCM connector terminal B11 and the shift solenoid harness connector, then go to step 16.

14. Remove the shift solenoid harness (see **SHIFT SOLENOID VALVE AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**).
15. Check for continuity between shift solenoid harness connector terminal No. 8 and the shift solenoid valve D connector terminal.

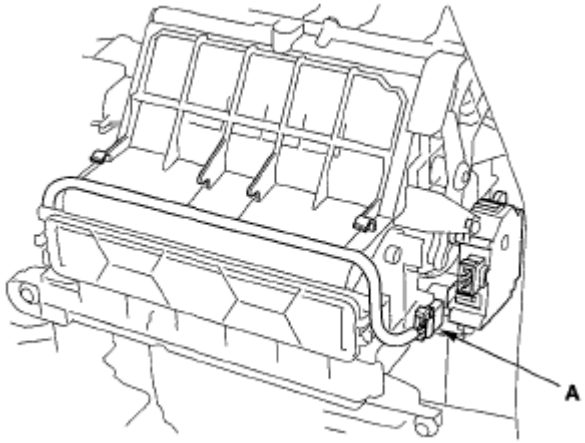

Fig. 164: Checking Continuity Between Shift Solenoid Harness Connector Terminal 8 And Shift Solenoid Valve D Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Replace shift solenoid valve D (see **SHIFT SOLENOID VALVE AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**), then go to step 16.

NO -Replace the shift solenoid harness (see **SHIFT SOLENOID VALVE AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**), then go to step 16.

16. Reconnect all connectors.
17. Turn the ignition switch to ON (II).
18. Clear the DTC with the HDS.
19. Start the engine, then shift to N while pressing the brake pedal, and wait for at least 1 second.
20. Check for DTCs with the HDS.

Is DTC P0983 indicated?

YES -Check for poor connections or loose terminals between shift solenoid valve D and the PCM, then go to step 1.

NO -Go to step 21.

21. Monitor the OBD STATUS for P0983 in the DTCs MENU with the HDS.

Does the HDS indicate PASSED?

YES -Troubleshooting is complete. If any other DTCs were indicated in step 20, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO -If the HDS indicates FAILED, check for poor connections or loose terminals between shift solenoid valve D and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, go to step 19.

22. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
23. Start the engine, then shift to N while pressing the brake pedal, and wait for at least 1 second.
24. Check for DTCs with the HDS.

    Is DTC P0983 indicated?

    YES -Check for poor connections or loose terminals between shift solenoid valve D and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 23. If the PCM was substituted, go to step 1.

    NO -Go to step 25.

25. Monitor the OBD STATUS for P0983 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 24, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for poor connections or loose terminals between shift solenoid valve D and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 23. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 23.

DTC P16C0: PCM A/T Control System Incomplete Update

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is indicated when PCM updating is incomplete.**
- **Do not turn the ignition switch to LOCK (0) while updating the PCM. If you turn the ignition switch to LOCK (0) before completion, the PCM can be damaged.**

1. Update the PCM (see **UPDATING THE PCM**).
2. Check for DTCs with the HDS.

   Is DTC P16C0 indicated?

   YES -Replace the PCM (see **ECM/PCM REPLACEMENT**).

   NO -PCM updating is complete.

DTC P1717: Open in Transmission Range Switch ATP RVS Switch Circuit

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II).
2. Shift to R, and check the A/T R SWITCH in the DATA LIST with the HDS.

   Is the A/T R SWITCH ON?

   YES -Go to step 3.

   NO -Check for proper transmission range switch installation (see **TRANSMISSION RANGE SWITCH REPLACEMENT**), adjust the shift cable (see **SHIFT CABLE ADJUSTMENT**), then recheck.

3. Check the REVERSE SWITCH in the DATA LIST with the HDS.

   Is the REVERSE SWITCH ON?

   YES -Intermittent failure, the system is OK at this time.

   NO -Go to step 4.

4. Turn the ignition switch to LOCK (0).
5. Disconnect the transmission range switch connector.
6. Check for continuity between transmission range switch connector terminal No. 10 and body ground.

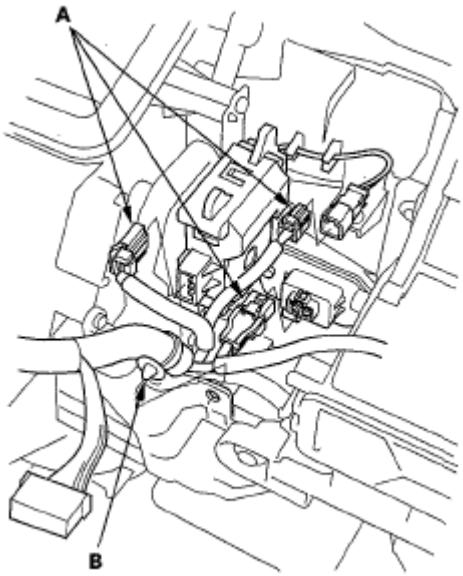

Fig. 165: Checking Continuity Between Transmission Range Switch Connector Terminal 10

And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 7.

NO -Repair open in the wire between transmission range switch connector terminal No. 10 and ground (G101) (see **CONNECTOR TO HARNESS INDEX**), or repair poor ground (G101), then go to step 10.

7. Turn the ignition switch to ON (II).
8. Measure the voltage between transmission range switch connector terminals No. 1 and No. 10.

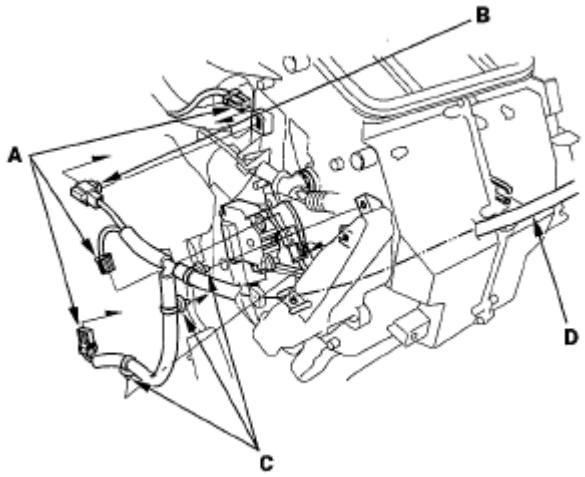

Fig. 166: Measuring Voltage Between Transmission Range Switch Connector Terminals 1 And 10
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 9.

NO -Repair open in the wire between PCM connector terminal B22 and the transmission range switch, then go to step 10.

9. Check for continuity between transmission range switch connector terminals No. 1 and No. 10 while the shift lever is in R, and when the shift lever is shifted to any position other than R.

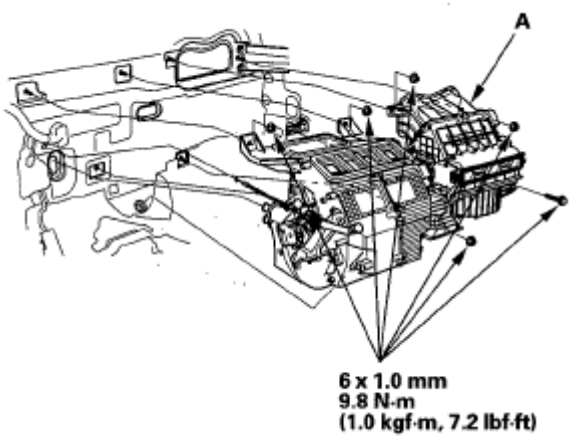

Fig. 167: Checking Continuity Between Transmission Range Switch Connector Terminals 1 And 10
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity while the shift lever is in R, and no continuity when the shift lever is shifted to any position other than R?

YES -Go to step 16.

NO -Replace the transmission range switch (see **TRANSMISSION RANGE SWITCH REPLACEMENT**), then go to step 10.

10. Reconnect all connectors.
11. Turn the ignition switch to ON (II).
12. Clear the DTC with the HDS.
13. Test-drive the vehicle with the shift lever in R at speeds below 3 mph (5 km/h) for at least 2 seconds. Then increase the speed and drive at speeds over 3 mph (5 km/h) for at least 2 seconds.
14. Check for DTCs with the HDS.

    Is DTC P1717 indicated?

    YES -Check for poor connections or loose terminals between the transmission range switch and the PCM, then go to step 1.

    NO -Go to step 15.

15. Monitor the OBD STATUS for P1717 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 14, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for poor connections or loose terminals between the transmission range switch and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, go to step 13.

16. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
17. Test-drive the vehicle with the shift lever in R at speeds below 3 mph (5 km/h) for at least 2 seconds. Then increase the speed and drive at speeds over 3 mph (5 km/h) for at least 2 seconds.
18. Check for DTCs with the HDS.

    Is DTC P1717 indicated?

    YES -Check for poor connections or loose terminals between the transmission range switch and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 17. If the PCM was substituted, go to step 1.

    NO -Go to step 19.

19. Monitor the OBD STATUS for P1717 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 18, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for poor connections or loose terminals between the transmission range switch and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 17. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 17.

DTC P1746: Problem in Shift Control System; Cut Valve A Stuck OFF, or Cut Valve B Stuck ON

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 3) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?

   YES -Replace the transmission, then go to step 9.

   NO -Replace the ATF (see step 5), then go to step 4.

4. Turn the ignition switch to ON (II).
5. Clear the DTC with the HDS.
6. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears.
7. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 6, then go to step 8.

8. Monitor the OBD STATUS for P1746 in the DTCs MENU with the HDS.

   Does the HDS indicate FAILED?

   YES -Repair cut valve A in the servo body (see **SERVO BODY DISASSEMBLY, INSPECTION, AND REASSEMBLY**), cut valve B in the main valve body (see **MAIN VALVE BODY DISASSEMBLY, INSPECTION, AND REASSEMBLY**), replace the main valve body or the servo body, or replace the transmission, then go to step 9.

   NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, go to step 6.

9. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears.
10. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 9, then go to step 11.
11. Check for DTCs with the HDS.

    Is DTC P1746 indicated?

    YES -Go to step 4.

    NO -Go to step 12.

12. Monitor the OBD STATUS for P1746 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 11, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, go to step 4. If the HDS indicates NOT COMPLETED, go to step 9.

DTC P1747: Problem in Shift Control System; Cut Valve A Stuck ON, or Cut Valve B Stuck OFF

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 3) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?

   YES -Replace the transmission, then go to step 9.

   NO -Replace the ATF (see step 5), then go to step 4.

4. Turn the ignition switch to ON (II).
5. Clear the DTC with the HDS.
6. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears.
7. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 6, then go to step 8.
8. Monitor the OBD STATUS for P1747 in the DTCs MENU with the HDS.

   Does the HDS indicate FAILED?

   YES -Repair cut valve A in the servo body (see **SERVO BODY DISASSEMBLY, INSPECTION, AND REASSEMBLY**), cut valve B in the main valve body (see **MAIN VALVE BODY DISASSEMBLY, INSPECTION, AND REASSEMBLY**), replace the main valve body or the servo body, or replace the transmission, then go to step 9.

   NO -If the HDS indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, go to step 6.

9. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears.
10. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 9, then go to step 11.
11. Check for DTCs with the HDS.

    Is DTC P1747 indicated?

    YES -Go to step 4.

    NO -Go to step 12.

12. Monitor the OBD STATUS for P1747 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -Troubleshooting is complete. If any other DTCs were indicated in step 11, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, go to step 4. If the HDS indicates NOT COMPLETED, go to step 9.

DTC P1780: Problem in Shift Control System

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears.
4. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 3, then go to step 5.
5. Check for other DTCs indicated along with DTC P1780 with the HDS.

NOTE: DTC P1780 means there is one or more A/T DTCs regarding the shift control system.

Are there other DTCs?

YES -Go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO -Go to step 6.

6. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
7. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears.
8. Turn the ignition switch to LOCK (0). Repeat the test-drive in step 7, then go to step 9.
9. Check for DTCs with the HDS.

Is DTC P1780 indicated?

YES -Check for poor connections or loose terminals at the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 7. If the PCM was substituted, go to step 1.

NO -Go to step 10.

10. Monitor the OBD STATUS for P1780 in the DTCs MENU with the HDS.

Does the HDS indicate PASSED?

YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 9, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO -If the HDS indicates FAILED, check for poor connections or loose terminals at the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 7. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 7.

DTC P2122: Accelerator Pedal Position (APP) Sensor A (Throttle Position Sensor D) Circuit Low Voltage Input

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Check for Temporary DTCs or DTCs in the PGM-FI SYSTEM with the HDS.

Is DTC P2122 indicated in the PGM-FI SYSTEM?

YES -Go to the DTC P2122 troubleshooting in the electronic throttle control system (ETCS) (see **DTC P2122: APP SENSOR A (THROTTLE POSITION SENSOR D) CIRCUIT LOW VOLTAGE**).

NO -Go to step 4.

4. Check for DTCs in the A/T SYSTEM with the HDS.

   Is DTC P2122 indicated in the A/T SYSTEM?

   YES -Go to step 5.

   NO -Intermittent failure, the system is OK at this time. If any other DTCs were indicated, go to the **INDICATED DTC'S TROUBLESHOOTING**.

5. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
6. Turn the ignition switch to ON (II).
7. Clear the DTC with the HDS.
8. Start the engine, and wait for at least 2 minutes.
9. Check for DTCs the A/T SYSTEM with the HDS.

   Is DTC P2122 indicated in the A/T SYSTEM?

   YES -Check for poor connections or loose terminals at the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 8. If the PCM was substituted, go to step 1.

   NO -Go to step 10.

10. Monitor the OBD STATUS for P2122 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 9, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for poor connections or loose terminals at the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 8. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 8.

DTC P2123: Accelerator Pedal Position (APP) Sensor A (Throttle Position Sensor D) Circuit High Voltage Input

NOTE: Before you troubleshoot, record all freeze data and any on-board snap shot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Check for Temporary DTCs or DTCs in the PGM-FI SYSTEM with the HDS.

   Is DTC P2123 indicated in the PGM-FI SYSTEM?

   YES -Go to the DTC P2123 troubleshooting in the electronic throttle control system (ETCS) (see **DTC P2123: APP SENSOR A (THROTTLE POSITION SENSOR D) CIRCUIT HIGH VOLTAGE**).

   NO -Go to step 4.

4. Check for DTCs in the A/T SYSTEM with the HDS.

   Is DTC P2123 indicated in the A/T SYSTEM?

   YES -Go to step 5.

   NO -Intermittent failure, the system is OK at this time. If any other DTCs were indicated, go to the **INDICATED DTC'S TROUBLESHOOTING**.

5. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
6. Turn the ignition switch to ON (II).
7. Clear the DTC with the HDS.
8. Start the engine, and wait for at least 2 minutes.
9. Check for DTCs the A/T SYSTEM with the HDS.

   Is DTC P2123 indicated in the A/T SYSTEM?

   YES -Check for poor connections or loose terminals at the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 8. If the PCM was substituted, go to step 1.

   NO -Go to step 10.

10. Monitor the OBD STATUS for P2123 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 9, go to the **INDICATED DTC'S TROUBLESHOOTING**.

    NO -If the HDS indicates FAILED, check for poor connections or loose terminals at the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 8. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 8.

DTC U0028: F-CAN Malfunction (BUS-OFF (PCM))

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Check for Temporary DTCs or DTCs in the PGM-FI SYSTEM with the HDS.

   Is DTC U0155 indicated in the PGM-FI SYSTEM?

   YES -Go to the DTC U0155 troubleshooting in the PGM-FI system (see **DTC U0155: F-CAN MALFUNCTION (ECM/PCM-GAUGE CONTROL MODULE)**).

   NO -Go to step 4.

4. Check for DTCs in the A/T SYSTEM with the HDS.

   Is DTC U0028 indicated in he A/T SYSTEM?

   YES -Go to step 5.

   NO -Intermittent failure, the system is OK at this time. If any other DTCs were indicated, go to the **INDICATED DTC'S TROUBLESHOOTING**.

5. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
6. Start the engine, and wait for at least 2 minutes.
7. Check for DTCs in the A/T SYSTEM with the HDS.

   Is DTC U0028 indicated in the A/T SYSTEM?

   YES -Check for poor connections or loose terminals at the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 6. If the PCM was substituted, go to step 1.

   NO -Go to step 8.

8. Monitor the OBD STATUS for U0028 in the DTCs MENU with the HDS.

   Does the HDS indicate PASSED?

   YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 7, go to the **INDICATED DTC'S TROUBLESHOOTING**.

   NO -If the HDS indicates FAILED, check for poor connections or loose terminals at the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to

step 6. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 6.

DTC U0121: F-CAN Malfunction (PCM-ABS)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Check for Temporary DTCs or DTCs in the PGM-FI SYSTEM with the HDS.

   Is DTC U0155 indicated in the PGM-FI SYSTEM?

   YES -Go to the DTC U0155 troubleshooting in the PGM-FI system (see **DTC U0155: F-CAN MALFUNCTION (ECM/PCM-GAUGE CONTROL MODULE)**).

   NO -Go to step 4.

4. Check for DTCs in the A/T SYSTEM with the HDS.

   Is DTC U0121 indicated in the A/T SYSTEM?

   YES -Go to step 5.

   NO -Intermittent failure, the system is OK at this time. If any other DTCs were indicated, go to the **INDICATED DTC'S TROUBLESHOOTING**.

5. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
6. Start the engine, and wait for at least 2 minutes.
7. Check for DTCs in the A/T SYSTEM with the HDS.

   Is DTC U0121 indicated in the A/T SYSTEM?

   YES -Check for poor connections or loose terminals at the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 6. If the PCM was substituted, go to step 1.

   NO -Go to step 8.

8. Monitor the OBD STATUS for U0121 in the DTCs MENU with the HDS.

   Does the HDS indicate PASSED?

   YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 7, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO -If the HDS indicates FAILED, check for poor connections or loose terminals at the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 6. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 6.

DTC U0155: F-CAN Malfunction (PCM-Gauge Control Module)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Check for Temporary DTCs or DTCs in the PGM-FI SYSTEM with the HDS.

   Is DTC U0155 indicated in the PGM-FI SYSTEM?

   YES -Go to the DTC U0155 troubleshooting in the PGM-FI system (see **DTC U0155: F-CAN MALFUNCTION (ECM/PCM-GAUGE CONTROL MODULE)**).

   NO -Go to step 4.

4. Check for DTCs in the A/T SYSTEM with the HDS.

   Is DTC U0155 indicated in the A/T SYSTEM?

   YES -Go to step 5.

   NO -Intermittent failure, the system is OK at this time. If any other DTCs were indicated, go to the **INDICATED DTC'S TROUBLESHOOTING**.

5. Update the PCM if it does not have the latest software (see **UPDATING THE PCM**), or substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
6. Start the engine, and wait for at least 2 minutes.
7. Check for DTCs in the A/T SYSTEM with the HDS.

   Is DTC U0155 indicated in the A/T SYSTEM?

   YES -Check for poor connections or loose terminals at the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 6. If the PCM was substituted, go to step 1.

   NO -Go to step 8.

8. Monitor the OBD STATUS for U0151 in the DTCs MENU with the HDS.

   Does the HDS indicate PASSED?

   YES -If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the

original PCM (see **ECM/PCM REPLACEMENT**). If any other DTCs were indicated in step 7, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO -If the HDS indicates FAILED, check for poor connections or loose terminals at the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE PCM**), then go to step 6. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 6.

ROAD TEST

1. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).
2. Apply the parking brake, and block both rear wheels.
3. Shift to D while pressing the brake pedal. Press the accelerator pedal, and release it suddenly. The engine should not stall.
4. Repeat step 3 in all shift lever positions.
5. Connect the HDS to the DLC (A) located behind the driver's dashboard lower cover, and go to the A/T Mode Menu.

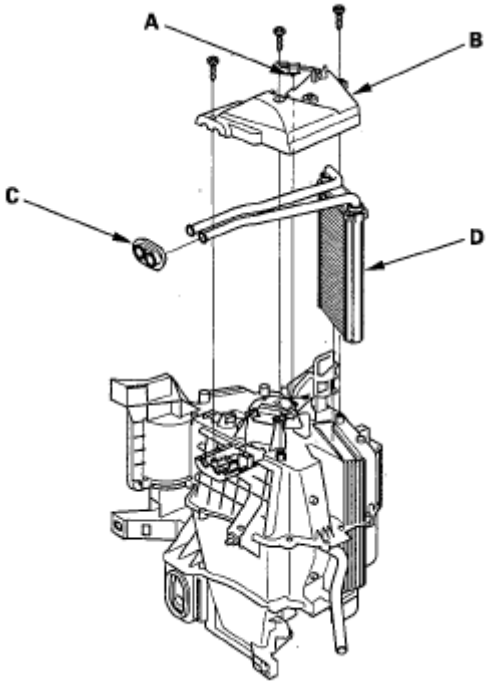

Fig. 168: Identifying Data Link Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Make sure the HDS communicates with the PCM. If it does not, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
7. Prepare the HDS to take a HIGH SPEED SNAPSHOT (Refer to the HDS user's guide for more details if needed):
    - Select High Speed Snapshot.
    - Select these parameters:
        - Vehicle Speed

    - Output Shaft (Countershaft) Speed
    - Input Shaft (Mainshaft) Speed (rpm)
    - Engine Speed
    - Relative TP Sensor
    - APP Sensor A (V)
    - ATF Temp Sensor
    - Battery Voltage
    - Shift Control
    - Brake Switch
  - Set the Trigger Type to Parameter.
  - Adjust the Parameter setting to APP Sensor A (V) above 1.3 V.
  - Set the recording time to 60 seconds.
  - Set the Trigger point to -30 seconds.
8. Find a suitable level road. When you are ready to do the test, press OK on the HDS.
9. Monitor the HDS and accelerate quickly until the APP Sensor A reads 1.3 V. Maintain a steady throttle until the transmission shifts to 5th gear, then slow the vehicle and come to a stop.
10. Save the snapshot if the entire event was recorded or increase the recording time setting as necessary and repeat step 9.
11. Adjust the Parameter setting to 2.5 V. Retest-drive the vehicle. While monitoring the HDS accelerate quickly until the APP Sensor A reads 2.5 V.

    Maintain a steady throttle until the transmission shifts to 5th gear (or reasonable speed), then slow the vehicle and come to a stop.

12. Save the snapshot if the entire event was recorded or increase the recording time setting as necessary and repeat step 11.
13. Accelerate quickly until the accelerator pedal is to the floor. Maintain a steady pedal until the transmission shifts to 3rd gear, then slow to a stop, and save the snap shot.
14. Review each snapshot individually and compare the Shift Command, APP Sensor A (V), and the Vehicle Speed to the table below.

    Upshift: D Position

    VEHICLE SPEED REFERENCE - UPSHIFT D POSITION

APP Sensor A voltage: 1.3 V	
1st-->2nd	9-12 mph (15-19 km/h)
2nd-->3rd	17-21 mph (28-33 km/h)
3rd-->4th	26-30 mph (42-49 km/h)
4th-->5th	35-41 mph (57-66 km/h)
Lock-->up ON	31-37 mph (50-60 km/h)
APP Sensor A voltage: 2.5 V	
1st-->2nd	18-22 mph (29-35 km/h)
2nd-->3rd	34-39 mph (54-62 km/h)
3rd-->4th	50-55 mph (80-89 km/h)

4th-->5th	75-86 mph (121-138 km/h)
Lock-->up ON	93-104 mph (150-167 km/h)
Fully-opened throttle APP Sensor A voltage: 4.4 V	
1st-->2nd	35-40 mph (57-65 km/h)
2nd-->3rd	64-72 mph (103-116 km/h)
3rd-->4th	102-112 mph (164-181 km/h)

Downshift: D Position

VEHICLE SPEED REFERENCE - DOWNSHIFT D POSITION

APP Sensor A voltage: 1.3 V	
Lock-up OFF	30-37 mph (49-59 km/h)
5th-->4th	30-35 mph (49-57 km/h)
4th-->3rd	22-25 mph (36-41 km/h)
3rd-->2nd	5-8 mph (8-13 km/h)
2nd-->1st	5-8 mph (8-13 km/h)
APP sensor A voltage: 2.5 V	
Lock-up OFF	60-68 mph (97-110 km/h)
Fully-opened throttle APP Sensor A voltage: 4.4 V	
Lock-up OFF	119-129 mph (191-208 km/h)
4th-->3rd	82-92 mph (132-148 km/h)
3rd-->2nd	54-61 mph (87-98 km/h)
2nd-->1st	26-31 mph (42-50 km/h)

15. Drive the vehicle in 4th or 5th gear in D, then shift to 2, the vehicle should immediately begin to slow down from engine braking.
16. Shift to 1, accelerate from a stop at full throttle, and check for abnormal noise and clutch slippage. Upshifts should not occur in this position.
17. Shift to 2, accelerate from a stop at full throttle, and check for abnormal noise and clutch slippage. Upshifts and downshifts should not occur in this position.
18. Shift to R, accelerate from a stop at full throttle, and check for abnormal noise and clutch slippage.
19. Park the vehicle on a slope (about 16-degrees), apply the brake, and shift into P. Release the brake; the vehicle should not move.

NOTE: Always use the parking brake to hold the vehicle, when stopped on an incline in gear. Depending on the grade of the incline, the vehicle could roll backwards if the brake is released.

STALL SPEED TEST

1. Make sure the transmission fluid is filled to the proper level (see **ATF LEVEL CHECK**).
2. Apply the parking brake, and block all four wheels.
3. Connect the HDS to the DLC (A) located behind the driver's dashboard lower cover, and go to the A/T DATA LIST.

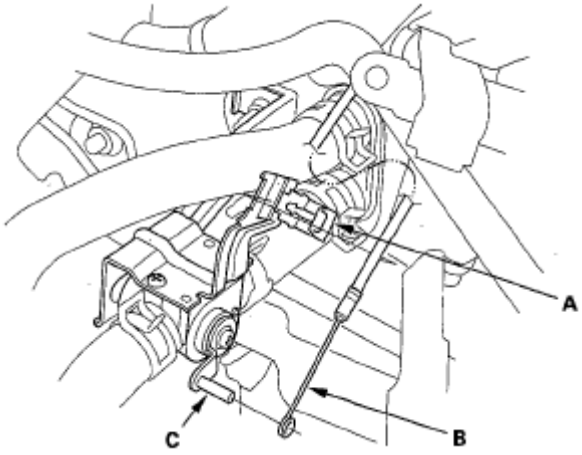

Fig. 169: Identifying Data Link Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Make sure the HDS communicates with the PCM. If it does not, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
5. Make sure the A/C switch is OFF.
6. After the engine has warmed up to normal operating temperature (the radiator fan comes on), shift to 2.
7. Firmly press the brake pedal and accelerator pedal for 6 to 8 seconds, and note engine speed. Do not move the shift lever while raising the engine speed.
8. Allow 2 minutes for cooling, then repeat the test in the D, 1, and R.

NOTE:

- **Do not test stall speed for more than 10 seconds at a time.**
- **Stall speed tests should be used for diagnostic purposes only.**
- **Stall speed tests should be the same in D, 2, 1, and R.**
- **Do not test stall speed with the A/T oil pressure gauges installed.**

Stall Speed rpm:

Specification: 2,670 rpm

Service Limit: 2,520-2,820 rpm

9. If the stall speeds are out of the service limit, problems and probable causes are listed in the table.

PROBLEMS AND PROBABLE CAUSES

Problem	Probable causes
Stall speed rpm high in the D, 2, 1, and R positions	• ATF pump output low • Clogged ATF strainer • Regulator valve stuck • Slipping clutch
Stall speed rpm high in the 1 position	Slippage of 1st clutch

Stall speed rpm high in the 2 position	Slippage of 2nd clutch
Stall speed rpm high in the R position	Slippage of 5th clutch
Stall speed rpm low in the D, 2, 1, and R positions	• Engine output low • Engine throttle valve closed • Torque converter one-way clutch slipping

PRESSURE TEST

Special Tools Required

- A/T oil pressure gauge set w/panel 07406-0020400 or 07406-0020401
- A/T pressure hose, 2,210 mm 07MAJ-PY4011A
- A/T pressure hose adapter 07MAJ-PY40120

NOTE: There may come ABS DTC(s) during the pressure test. If the ABS DTC(s) comes on, clear the ABS DTC(s) with the HDS.

1. Make sure the transmission fluid is filled to the proper level (see **ATF LEVEL CHECK**).
2. Raise the vehicle on a lift, or apply the parking brake, block rear wheels, and raise the front of the vehicle. Make sure it is securely supported.
3. Allow the front wheels to rotate freely.
4. Remove the splash shield.
5. Connect the HDS to the DLC (A) located behind the driver's dashboard lower cover, and go to the A/T Mod Menu.

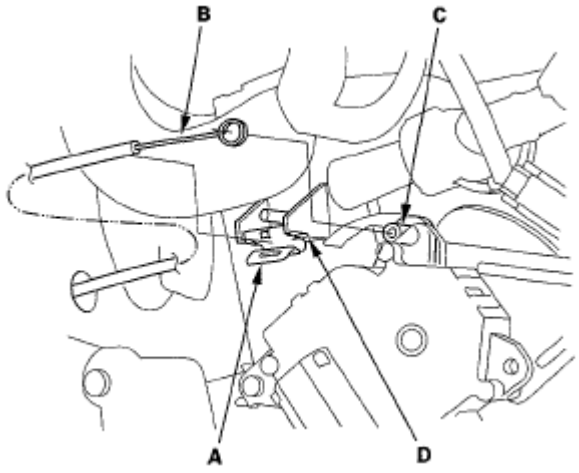

Fig. 170: Identifying Data Link Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Make sure the HDS communicates with the PCM. If it does not, go to the DLC circuit troubleshooting

(see **DLC CIRCUIT TROUBLESHOOTING**).

7. Connect the A/T oil pressure gauge to the line pressure inspection port (A). Do not allow dust or other foreign particles to enter the ports while connecting the gauges.

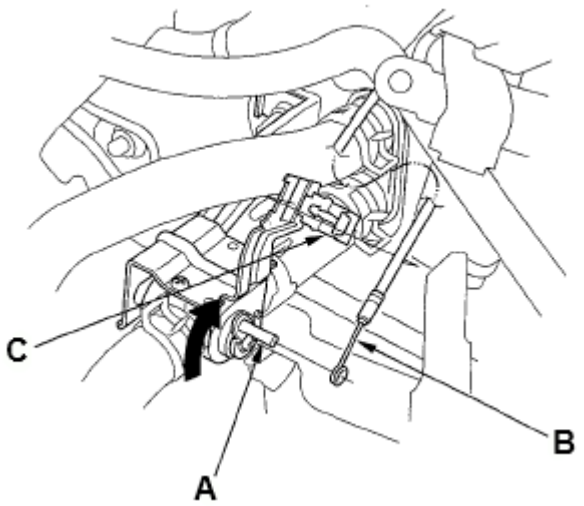

Fig. 171: Identifying Line Pressure Inspection Port
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).
9. Measure the line pressure at the line pressure inspection port in P or N while holding the engine speed at 2,000 rpm.

NOTE: Higher pressure may be indicated if measurements are made in shift lever position other than P or N.

FLUID PRESSURE REFERENCE

Pressure	Fluid Pressure	
	Standard	Service Limit
Line	900-960 kPa (9.2-9.8 kgf/cm^2 , 130-140 psi)	850 kPa (8.7 kgf/cm^2 , 120 psi)

10. Turn the engine off, then disconnect the A/Toil pressure gauge from the line pressure inspection port.
11. Install the sealing bolt to the line pressure inspection port with a new sealing washer, and tighten the bolt to 18 N.m (1.8 kgf.m, 13 lbf.ft). Do not reuse the old sealing washer.
12. Remove the air cleaner assembly (see **AIR CLEANER REMOVAL/INSTALLATION**) and the intake air duct.
13. Connect the A/Toil pressure gauge to the 1st clutch pressure inspection port (B). Then temporarily install the air cleaner assembly and the intake air duct.

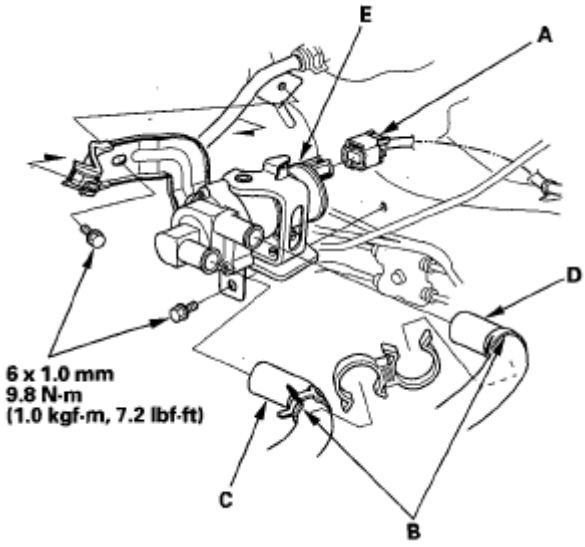

Fig. 172: Identifying 1st Clutch Pressure Inspection Port
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Connect the A/Toil pressure gauge to the 2nd clutch pressure inspection port (C).

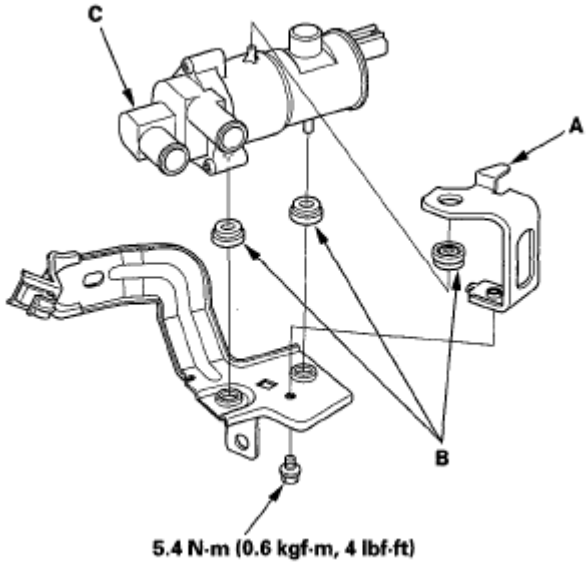

Fig. 173: Identifying 2nd Clutch Pressure Inspection Port
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Start the engine, and shift to 1.
16. Measure the 1st clutch pressure at the 1st clutch pressure inspection port (B) while holding the engine speed at 2,000 rpm.
17. Shift to 2, and measure the 2nd clutch pressure at the 2nd clutch pressure inspection port (C) while holding the engine speed at 2,000 rpm.

FLUID PRESSURE REFERENCE

Pressure	Fluid Pressure	
	Standard	Service Limit

1st clutch (B) 2nd clutch (C)	890-970 kPa (9.1-9.9 kgf/cm^2 , 130-140 psi)	840 kPa (8.6 kgf/cm^2 , 120 psi)

18. Turn the engine off, remove the air cleaner assembly and the intake air duct, then disconnect the A/T oil pressure gauges from the 1st clutch pressure and the 2nd clutch pressure inspection ports.
19. Install the sealing bolts to the 1st clutch pressure and the 2nd clutch pressure inspection ports with new sealing washers, and tighten the bolts to 18 N.m (1.8 kgf.m, 13 lbf.ft). Do not reuse the old sealing washer.
20. Install the intake air duct and the air cleaner assembly (see **AIR CLEANER REMOVAL/INSTALLATION**).
21. Connect the A/T oil pressure gauge to the 3rd clutch pressure inspection port (D) and the 4th clutch pressure inspection port (E).

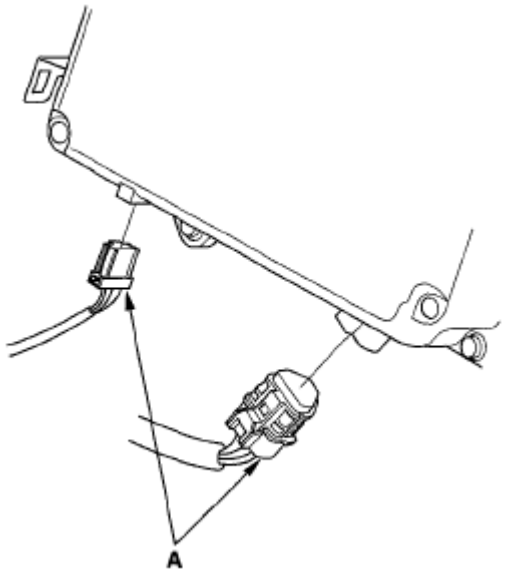

Fig. 174: Identifying 3rd Clutch Pressure Inspection Port And 4th Clutch Pressure Inspection Port
Courtesy of AMERICAN HONDA MOTOR CO., INC.

22. Connect the A/T oil pressure gauge to the 5th clutch pressure inspection port (F).

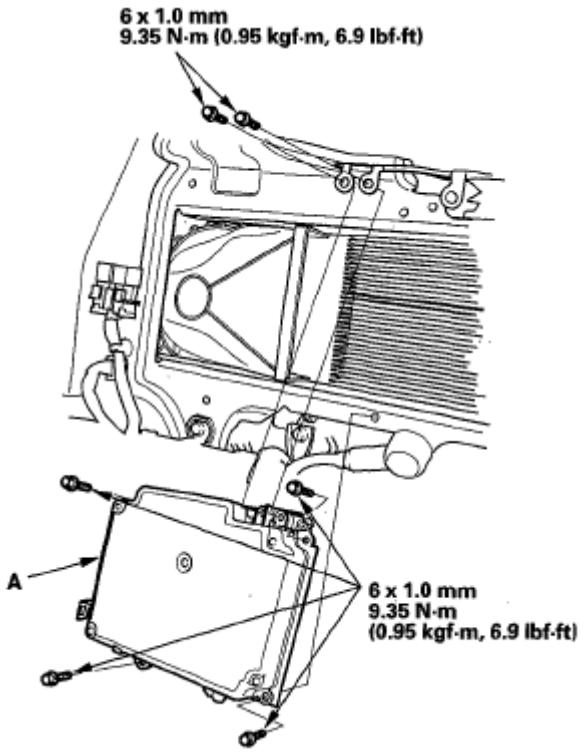

Fig. 175: Identifying 5th Clutch Pressure Inspection Port
Courtesy of AMERICAN HONDA MOTOR CO., INC.

23. Select Pressure Test Assistance Mode in the Miscellaneous Test Menu of the A/T Mode Menu.
24. Start the engine, and shift to D3.
25. Measure the 3rd clutch pressure at the 3rd clutch pressure inspection port (D) while holding the engine speed at 2,000 rpm.
26. Shift to D, and measure the 4th clutch pressure at the 4th clutch pressure inspection port (E) and the 5th clutch pressure at the 5th clutch pressure inspection port (F) while holding the engine speed at 2,000 rpm.

FLUID PRESSURE REFERENCE

Pressure	Fluid Pressure	
	Standard	Service Limit
3rd clutch (D) 4th clutch (E) 5th clutch (F)	890-970 kPa (9.1-9.9 kgf/cm^2 , 130-140 psi)	840 kPa (8.6 kgf/cm^2 , 120 psi)

27. Bring the engine back to an idle, then apply the brake to stop the wheels from rotating.
28. Shift to R, then release the brake pedal. Raise the engine speed to 2,000 rpm, and measure the 5th clutch pressure at the 5th clutch pressure inspection port (F).

FLUID PRESSURE REFERENCE

Pressure	Fluid Pressure	
	Standard	Service Limit
5th clutch (F) in R	890-970 kPa (9.1-	840 kPa (8.6

	9.9 kgf/cm^2 , 130-140 psi)	kgf/cm^2 , 120 psi)

29. Turn the engine off, then disconnect the A/T oil pressure gauges from the 3rd, 4th, and 5th clutch pressure inspection ports.
30. Install the sealing bolts in the 3rd, 4th, and 5th clutch pressure inspection ports with new sealing washers, and tighten the bolts to 18 N.m (1.8 kgf.m, 13 lbf.ft). Do not reuse the old sealing washer.
31. If the pressures are out of the service limit, problems and probable causes are listed in the table.

PROBLEMS AND PROBABLE CAUSES

Problem	Probable causes
No or low line pressure	• Torque converter • ATF pump • Regulator valve • Torque converter check valve • Clogged ATF strainer
No or low 1st clutch pressure	• 1st clutch • O-rings
No or low 2nd clutch pressure	• 2nd clutch • O-rings
No or low 3rd clutch pressure	• 3rd clutch • O-rings
No or low 4th clutch pressure	• 4th clutch • O-rings
No or low 5th clutch pressure	• 5th clutch • O-rings
No or low 5th clutch pressure in the R position	• Servo valve • 4th clutch • O-rings

32. Install the splash shield.

SHIFT SOLENOID VALVE TEST

1. Connect the HDS to the DLC (A) located behind the driver's dashboard lower cover.

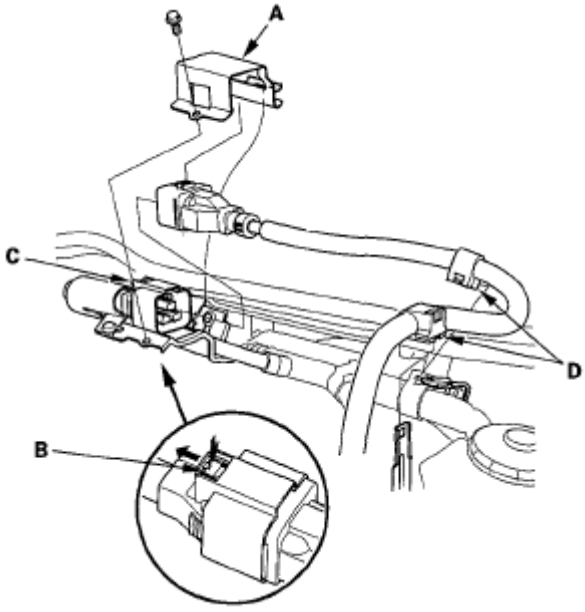

Fig. 176: Identifying Data Link Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Make sure the HDS communicates with the PCM. If it does not, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
3. Select Shift Solenoid Valve A, B, C, and D Test in the Miscellaneous Test Menu on the HDS.
4. Check that shift solenoid valve A, B, C, and D operate with the HDS. A clicking sound should be heard.
    - If a clicking sound is heard, the valves are OK.

      The test is complete, disconnect the HDS.

    - If no clicking sound is heard, go to step 5, and test the solenoid valves.
5. Raise the vehicle on a lift, or apply the parking brake, block rear wheels, and raise the front of the vehicle. Make sure it is securely supported.
6. Remove the splash shield.
7. Disconnect the shift solenoid harness connector.

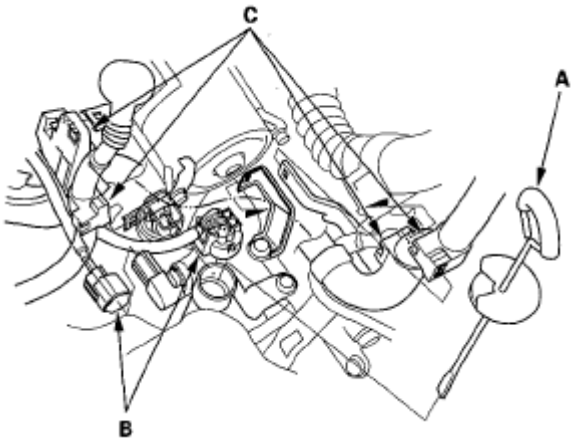

Fig. 177: Identifying Shift Solenoid Harness Connector Terminal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Measure the shift solenoid valve resistance between the shift solenoid harness connector terminals below and body ground:
   - No. 1: Shift solenoid valve C
   - No. 2: Shift solenoid valve B
   - No. 5: Shift solenoid valve A
   - No. 8: Shift solenoid valve D

   Standard: 12-25 ohms

   - If the resistance is within the standard, go to step 9 and check solenoid valve for a clicking sound.
   - If the resistance is out of standard, go to step 10.
9. Connect a jumper wire from the battery positive terminal to each shift solenoid harness connector terminals individually. A clicking sound should be heard.
   - If a clicking sound is heard, the valves are OK.

     The test is complete, connect the connector.

   - If no clicking sound is heard, go to step 10 and test the shift solenoid harness.
10. Remove the drain plug (A), and drain the automatic transmission fluid (ATF).

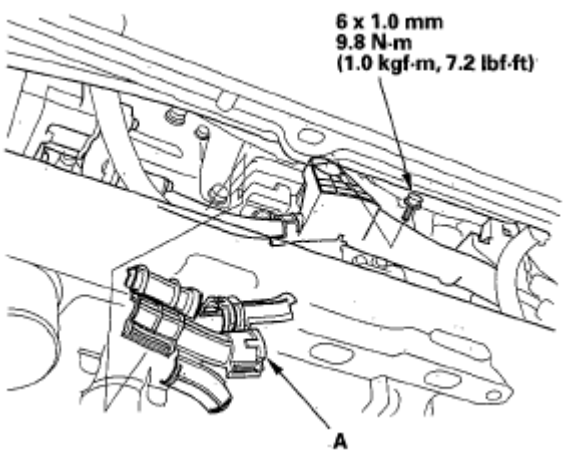

Fig. 178: Identifying Drain Plug w/Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Reinstall the drain plug with a new sealing washer (B).
12. Remove the shift solenoid valve cover (A), the dowel pins (B), the gasket (C), and the harness clamp bracket (D).

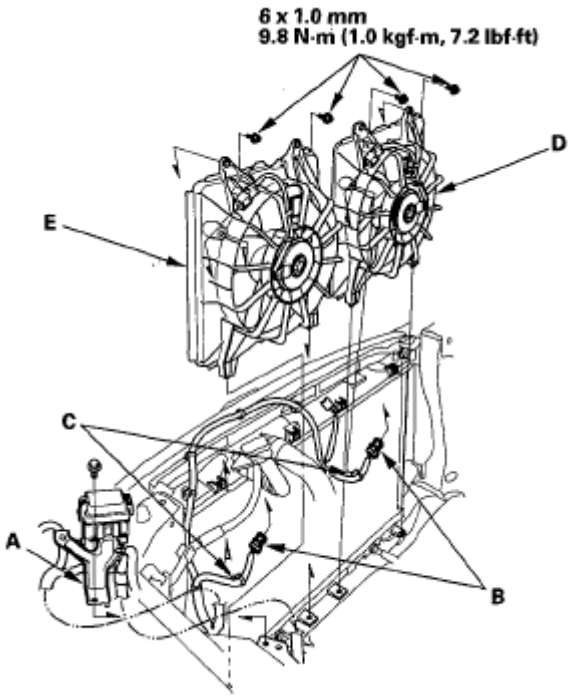

Fig. 179: Identifying Shift Solenoid Valve Cover, Dowel Pins, Gasket, Harness Clamp Bracket & Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Disconnect the connectors from shift solenoid valve A, shift solenoid valve B, shift solenoid valve C, and shift solenoid valve D.

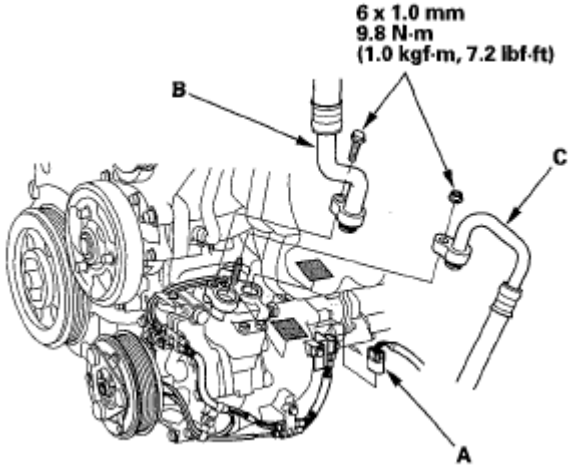

Fig. 180: Identifying Shift Solenoid Valve
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Measure the resistance of each solenoid valve between the connector terminal and body ground.

Standard: 12-25 ohms

- If the resistance is out of standard, go to step 17 and replace the shift solenoid valve.
- If the resistance is within the standard, go to step 15 and check the solenoid valve for a clicking

sound.

15. Connect a jumper wire from the positive battery terminal to each solenoid terminal individually.
    - If a clicking sound is heard, go to step 16 and replace the solenoid harness.
    - If no clicking sound is heard, go to step 17 and replace shift solenoid valve.
16. Remove the shift solenoid harness connector (A), and replace it. Install a new O-ring (B) on the shift solenoid harness connector, and install the connector in the transmission housing, then go to step 22.

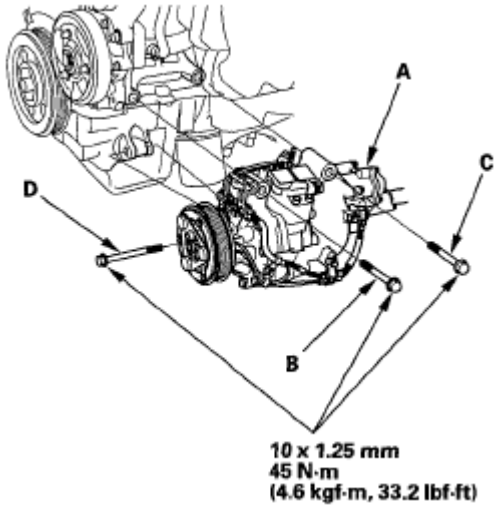

Fig. 181: Identifying Shift Solenoid Harness Connector, O-Ring w/Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Remove the mounting bolts, then hold the shift solenoid valve body and remove the solenoid valves. Do not hold the connector to remove the solenoid valve.

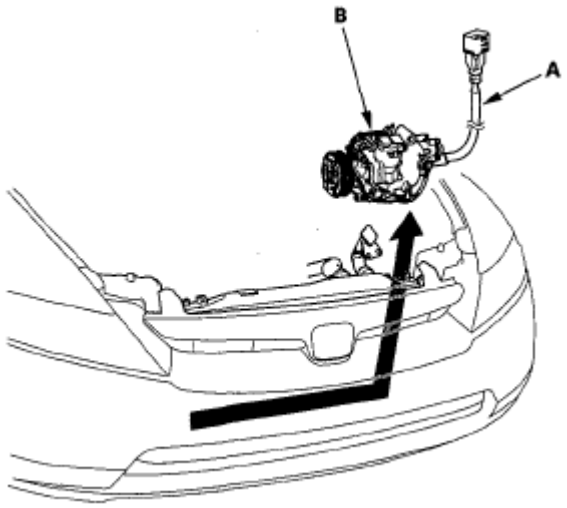

Fig. 182: Identifying Shift Solenoid Valve, O-Ring & Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

18. Install new O-rings (two O-rings per solenoid valve) (E) on the reused solenoid valve.

NOTE: A new solenoid valve comes with new O-rings. If you install a new

solenoid valve, use the O-rings provided on it.

19. Install shift solenoid valve D (black connector) and shift solenoid valve C (brown connector) by holding the shift solenoid valve body; make sure the mounting bracket contacts the servo body.

NOTE: Do not hold the solenoid valve by the connector when installing the solenoid valve. Be sure to hold the solenoid valve body.

20. Install shift solenoid valve B (black connector) by holding the shift solenoid valve body; make sure the mounting bracket contacts the servo body.
21. Install shift solenoid valve A (brown connector) by holding the shift solenoid valve body; make sure the mounting bracket contacts the bracket of shift solenoid valve B.

NOTE: Do not install shift solenoid valve A before installing shift solenoid valve B. If shift solenoid valve A is installed before installing shift solenoid valve B, it may damage to hydraulic control system.

22. Connect the shift solenoid harness connectors:
    - BLU wire to shift solenoid valve A.
    - ORN, WHT, and WHT wires to shift solenoid valve B.
    - GRN wire to shift solenoid valve C.
    - YEL wire to shift solenoid valve D.
23. Install the shift solenoid valve cover, the dowel pins, a new gasket, and the harness clamp bracket.
24. Check the connector for rust, dirt, or oil, then connect the connector securely.
25. Refill the transmission with ATF (see step 5).
26. Install the splash shield.

SHIFT SOLENOID VALVE AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT

1. Raise the vehicle on a lift, or apply the parking brake, block rear wheels, and raise the front of the vehicle. Make sure it is securely supported.
2. Remove the splash shield.
3. Remove the drain plug (A), and drain the automatic transmission fluid (ATF).

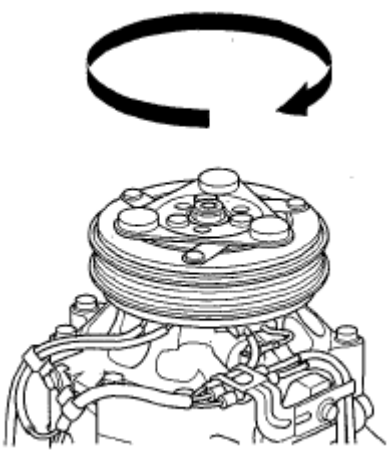

Fig. 183: Identifying Drain Plug, Sealing Washer & Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Reinstall the drain plug with a new sealing washer (B).
5. Remove the shift solenoid valve cover (A), the dowel pins (B), the gasket (C), and the harness clamp bracket (D).

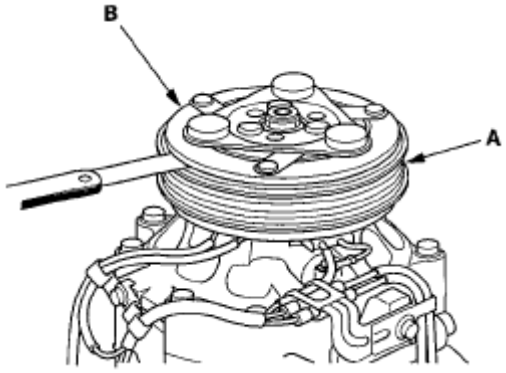

Fig. 184: Identifying Shift Solenoid Valve Cover, Dowel Pins, Gasket, Harness Clamp Bracket & Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Disconnect the shift solenoid valve connectors.
   - If replacing shift solenoid valve(s), go to step 7.
   - If replacing the shift solenoid harness, remove the shift solenoid harness connector (A), and replace it. Install a new O-ring (B) on the new shift solenoid harness connector, and install it in the transmission housing, then go to step 12.

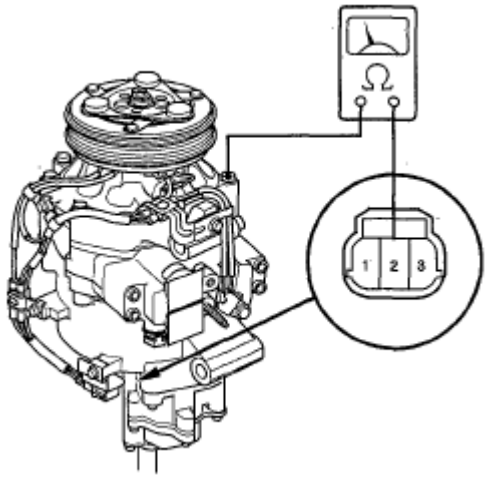

Fig. 185: Identifying Shift Solenoid Harness Connector, O-Ring & Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Remove the mounting bolts, then hold the shift solenoid valve body and remove the solenoid valves. Do not hold the connector to remove the solenoid valve.

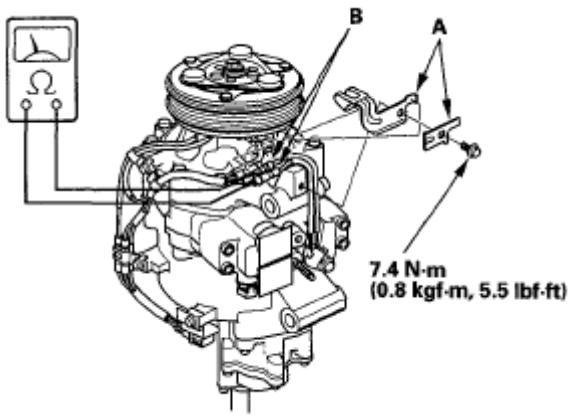

Fig. 186: Identifying Shift Solenoid Valve, O-Ring & Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Install new O-rings (two O-rings per solenoid valve) (E) on the solenoid valve.

NOTE: A new solenoid valve comes with new O-rings. If you install a new solenoid valve, use the O-rings provided on it.

9. Install shift solenoid valve D (black connector) and shift solenoid valve C (brown connector) by holding the shift solenoid valve body; make sure the mounting bracket contacts the servo body.

NOTE: Do not hold the solenoid valve by the connector when installing the solenoid valve. Be sure to hold the solenoid valve body.

10. Install shift solenoid valve B (black connector) by holding the shift solenoid valve body; make sure the mounting bracket contacts the servo body.
11. Install shift solenoid valve A (brown connector) by holding the shift solenoid valve body; make sure the mounting bracket contacts the bracket of shift solenoid valve B.

NOTE: Do not install shift solenoid valve A before installing shift solenoid valve B. If shift solenoid valve A is installed before installing shift solenoid valve B, it may damage to hydraulic control system.

12. Connect the shift solenoid harness connectors:
    - BLU wire to shift solenoid valve A.
    - ORN, WHT, and WHT wires to shift solenoid valve B.
    - GRN wire to shift solenoid valve C.
    - YEL wire to shift solenoid valve D.
13. Install the shift solenoid valve cover, the dowel pins, a new gasket, and the harness clamp bracket.
14. Check the connector for rust, dirt, or oil, then connect the connector securely.
15. Refill the transmission with ATF (see step 5).
16. Install the splash shield.

A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A TEST

1. Connect the HDS to the DLC (A) located behind the driver's dashboard lower cover.

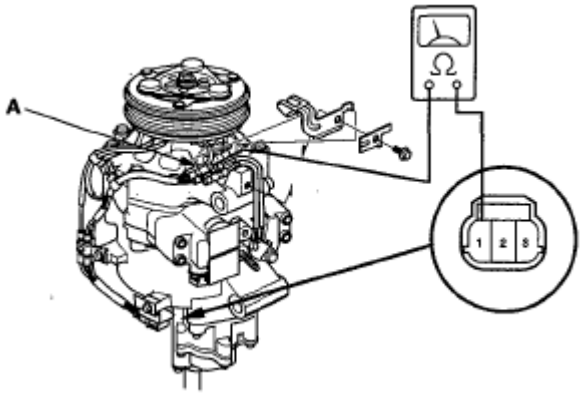

Fig. 187: Identifying Data Link Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch to ON (II). Make sure the HDS communicates with the PCM. If it does not, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**)
3. Select Clutch Pressure Control (Linear) Solenoid Valve A in the Miscellaneous Test Menu with the HDS.
4. Test A/T clutch pressure control solenoid valve A with the HDS.
   - If the valve tests OK, the test is complete. Disconnect the HDS.
   - If the valve does not test OK, follow the instructions on the HDS.
   - If the valve does not test OK, and the HDS does not determine the cause, go to step 5.
5. Remove the air cleaner assembly (see **AIR CLEANER REMOVAL/INSTALLATION**) and the intake air duct.
6. Remove the mounting bolts securing the harness cover (A), and remove the harness clamp (B).

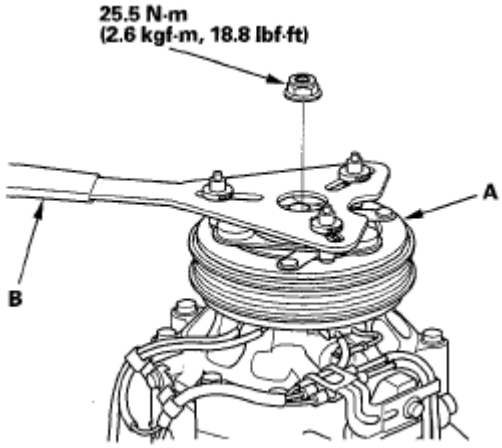

Fig. 188: Identifying Harness Cover, Harness Clamp & Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Disconnect the A/T clutch pressure control solenoid valve A connector (A)

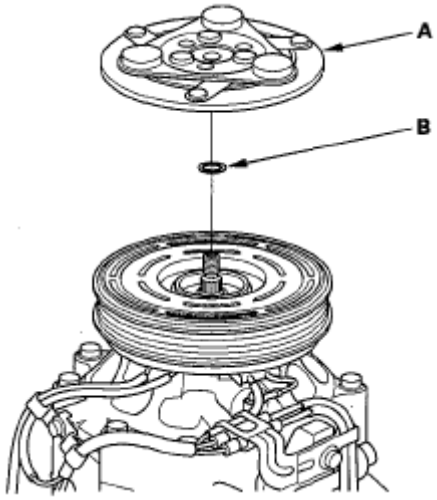

Fig. 189: Identifying A/T Clutch Pressure Control Solenoid Valve A Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Measure the A/T clutch pressure control solenoid valve A resistance at the connector terminals.

   Standard: 3-10 ohms

   - If the resistance is out of standard, replace A/T clutch pressure control solenoid valve A (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A REPLACEMENT**).
   - If the resistance is within the standard, go to step 9.
9. Connect a jumper wire from the negative battery terminal to A/T clutch pressure control solenoid valve A connector terminal No. 2, and connect another jumper wire from the positive battery terminal to connector terminal No. 1.
   - If a clicking sound is heard, the valve is OK. Reconnect the connector, and install all removed parts.
   - If no clicking sound is heard, go to step 10.
10. Remove the mounting bolts and A/T clutch pressure control solenoid valve A.

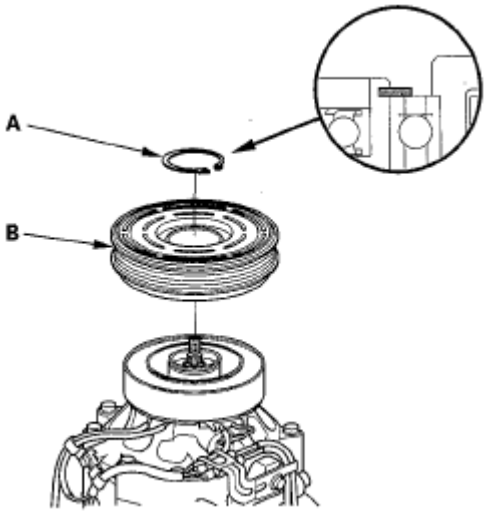

Fig. 190: Identifying ATF Pipe, ATF Joint Pipes, O-Rings, Gasket & Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Remove the ATF pipe (B), the ATF joint pipes (C), the O-rings (D), and the gasket (E).
12. Check the fluid passage of the solenoid valve for contamination.
13. Connect a jumper wire from the negative battery terminal to A/T clutch pressure control solenoid valve A connector terminal No. 2, and connect another jumper wire from the positive battery terminal to connector terminal No. 1. Make sure A/T clutch pressure control solenoid valve A moves.

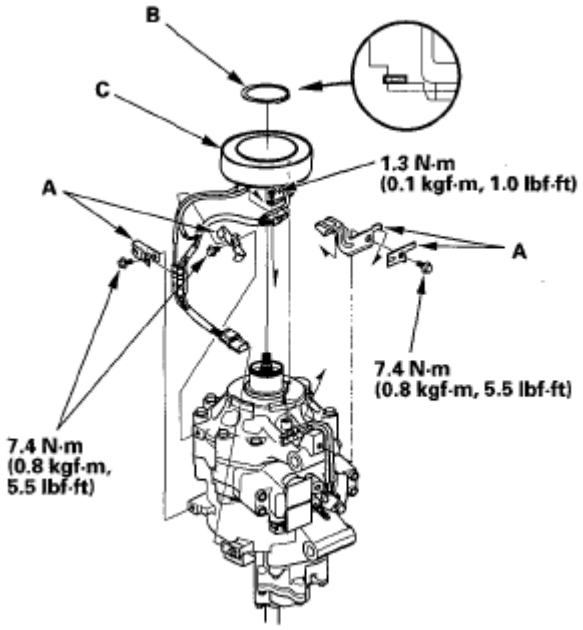

Fig. 191: Checking A/T Clutch Pressure Control Solenoid Valve A
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Disconnect one of the jumper wires and check the valve movement at the fluid passage in the valve body mounting surface. If the valve binds or moves sluggishly, or if the solenoid valve does not operate, replace A/T clutch pressure control solenoid valve A.
15. Clean the mounting surfaces and fluid passages of the solenoid valve body and the transmission housing.
16. Install a new gasket with the blue side down and the white side up on the transmission housing, and install the ATF pipe and the ATF joint pipes.
17. Install new O-rings over the ATF joint pipes.
18. Install A/T clutch pressure control solenoid valve A.
19. Check the connectors for rust, dirt, or oil, clean or repair if necessary, then connect the connectors securely.
20. Secure the harness cover with the mounting bolts, and install the harness clamp.
21. Install the intake air duct and the air cleaner assembly (see **AIR CLEANER REMOVAL/INSTALLATION**)

A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A REPLACEMENT

1. Remove the air cleaner assembly (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**) and the intake air duct.

2. Remove the mounting bolts securing the harness cover (A), and remove the harness clamp (B).

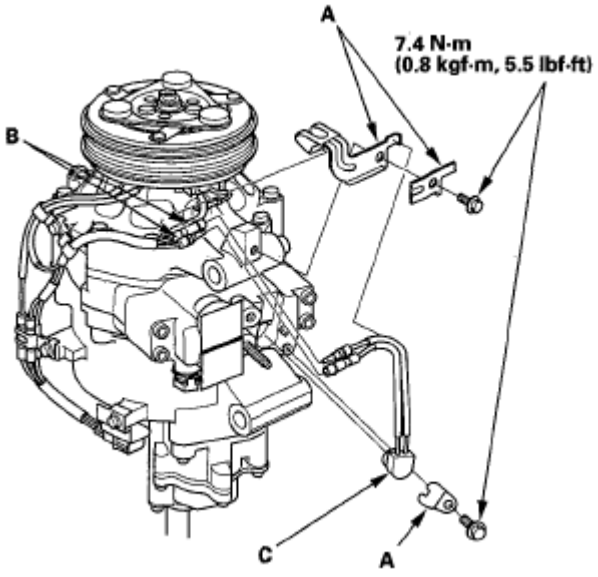

Fig. 192: Identifying Harness Cover, Harness Clamp & Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Disconnect the A/T clutch pressure control solenoid valve A connector.
4. Remove the mounting bolts and A/T clutch pressure control solenoid valve A.

5. Remove the ATF pipe (B), the ATF joint pipes (C), the O-rings (D), and the gasket (E).
6. Check the fluid passage of the transmission housing for dust or dirt, and clean the passage.
7. Install a new gasket with the blue side down and the white side up on the transmission housing, and install the ATF pipe and the ATF joint pipes.
8. Install new O-rings over the ATF joint pipes.
9. Install a new A/T clutch pressure control solenoid valve A.
10. Check the A/T clutch pressure control solenoid valve A connector for rust, dirt, or oil, then connect the connector securely.
11. Secure the harness cover with the mounting bolts, and install the harness clamp.

12. Install the intake air duct and the air cleaner assembly (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**)

A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE B TEST

1. Connect the HDS to the DLC (A) located behind the driver's dashboard lower cover.

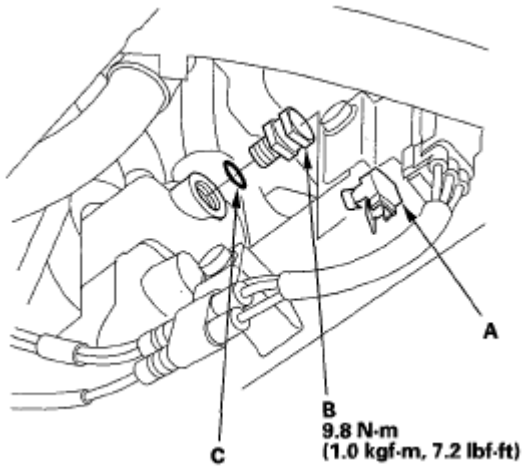

Fig. 194: Identifying Data Link Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch to ON (II). Make sure the HDS communicates with the PCM. If it does not, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
3. Select Clutch Pressure Control (Linear) Solenoid Valve B in the Miscellaneous Test Menu with the HDS.
4. Test A/T clutch pressure control solenoid valve B with the HDS.
   - If the valve tests OK, the test is complete. Disconnect the HDS.
   - If the valve does not test OK, follow the instructions on the HDS.
   - If the valve does not test OK, and the HDS does not determine the cause, go to step 5.
5. Remove the air cleaner assembly (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**) and the intake air duct.
6. Remove the mounting bolts securing the harness cover (A), and remove the harness clamp (B).

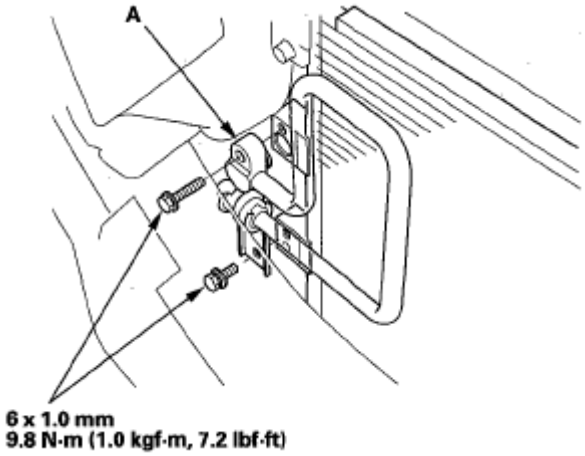

Fig. 195: Identifying Harness Cover, Harness Clamp & Torque Specification

7. Disconnect the A/T clutch pressure control solenoid valve B connector (A).

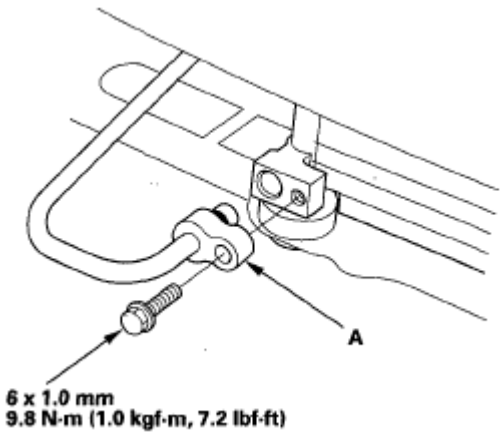

Fig. 196: Identifying A/T Clutch Pressure Control Solenoid Valve B Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Measure the A/T clutch pressure control solenoid valve B resistance at the connector terminals.

   Standard: 3-10 ohms

   - If the resistance is out of standard, replace A/T clutch pressure control solenoid valve B (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE B AND C REPLACEMENT**).
   - If the resistance is within the standard, go to step 9.
9. Connect a jumper wire from the negative battery terminal to A/T clutch pressure control solenoid valve B connector terminal No. 2, and connect another jumper wire from the positive battery terminal to connector terminal No. 1.
   - If a clicking sound is heard, the valve is OK. Reconnect the connector, and install all removed parts.
   - If no clicking sound is heard, go to step 10.
10. Remove A/T clutch pressure control solenoid valve B and C.

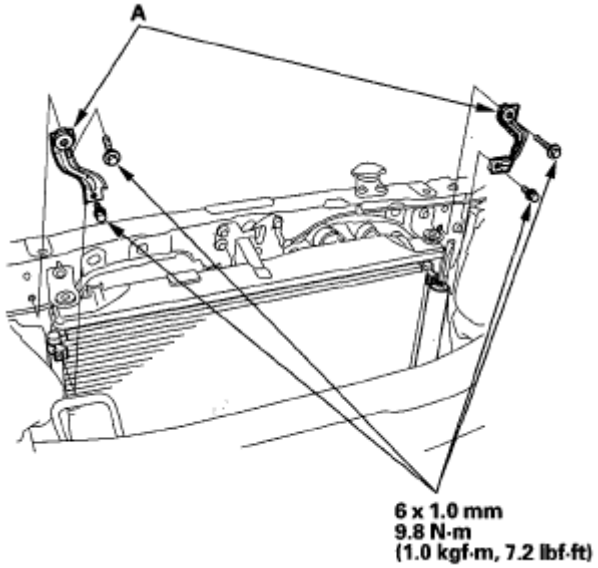

Fig. 197: Identifying ATF Pipe, ATF Joint Pipes, O-Rings, Gasket & Torque Specification

11. Remove the ATF pipe (A), the ATF joint pipes (D), the O-rings (E), and the gasket (F).
12. Check the fluid passage of the solenoid valve for contamination.
13. Connect a jumper wire from the negative battery terminal to A/T clutch pressure control solenoid valve B connector terminal No. 2, and connect another jumper wire from the positive battery terminal to connector terminal No. 1. Make sure A/T clutch pressure control solenoid valve B moves.

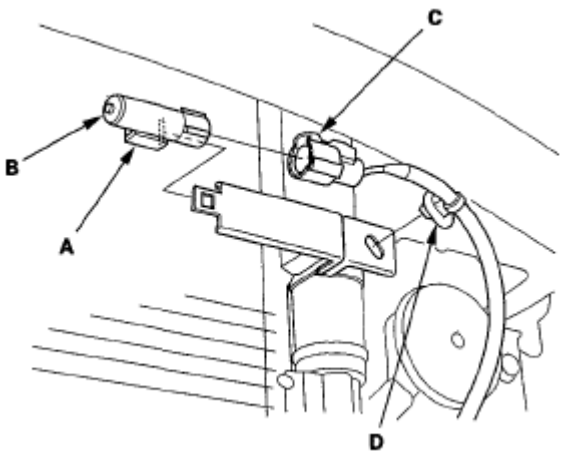

Fig. 198: Checking A/T Clutch Pressure Control Solenoid Valve B
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Disconnect one of the jumper wires and check the valve movement at the fluid passage in the valve body mounting surface. If the valve binds or moves sluggishly, or if the solenoid valve does not operate, replace A/T clutch pressure control solenoid valves B and C.
15. Clean the mounting surfaces and fluid passages of the solenoid valve body and the transmission housing.
16. Install a new gasket with the blue side down and the white side up on the transmission housing.
17. Install the ATF pipe and the ATF joint pipes, and install new O-rings over the ATF joint pipes.

18. Install A/T clutch pressure control solenoid valves B and C.
19. Check the A/T clutch pressure control solenoid valve B and C connectors for rust, dirt, or oil, then connect the connectors securely.
20. Secure the harness cover with the mounting bolts, and install the harness clamp.
21. Install the intake air duct and the air cleaner assembly (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**).

A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE C TEST

1. Connect the HDS to the DLC (A) located behind the driver's dashboard lower cover.

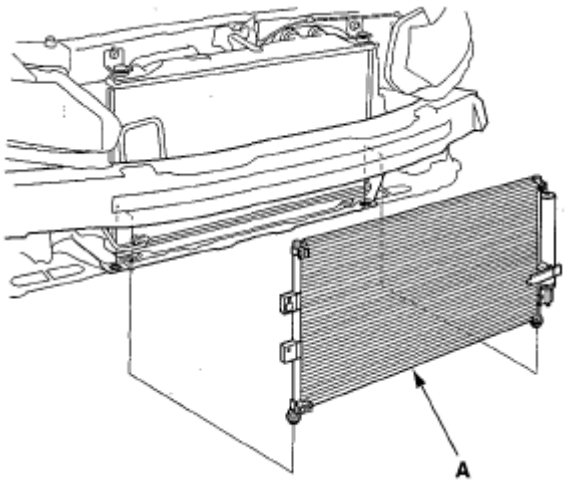

Fig. 199: Identifying Data Link Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch to ON (II). Make sure the HDS communicates with the PCM. If it does not, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
3. Select Clutch Pressure Control (Linear) Solenoid Valve C in the Miscellaneous Test Menu on the HDS.
4. Test A/T clutch pressure control solenoid valve C with the HDS.
   - If the valve tests OK, the test is complete. Disconnect the HDS.
   - If the valve does not test OK, follow the instructions on the HDS.
   - If the valve does not test OK, and the HDS does not determine the cause, go to step 5.
5. Remove the air cleaner assembly (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**) and the intake air duct.
6. Remove the mounting bolts securing the harness cover (A), and remove the harness clamp (B).

7. Disconnect the A/T clutch pressure control solenoid valve C connector (A).

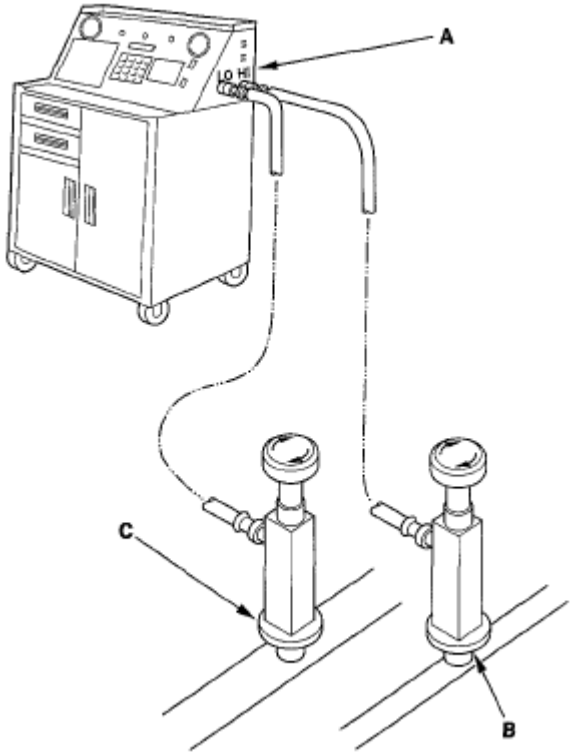

Fig. 201: Identifying A/T Clutch Pressure Control Solenoid Valve C Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Measure the A/T clutch pressure control solenoid valve C resistance at the connector terminals.

   Standard: 3-10 ohms

- If the resistance is out of standard, replace A/T clutch pressure control solenoid valve C (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE B AND C REPLACEMENT**).
- If the resistance is within the standard, go to step 9.

9. Connect a jumper wire from the negative battery terminal to A/T clutch pressure control solenoid valve C connector terminal No. 2, and connect another jumper wire from the positive battery terminal to connector terminal No. 1.
   - If a clicking sound is heard, the valve is OK. Reconnect the connector, and install all removed parts.
   - If no clicking sound is heard, go to step 10.
10. Remove A/T clutch pressure control solenoid valve B and C.

14. Disconnect one of the jumper wires and check the valve movement at the fluid passage in the valve body mounting surface. If the valve binds or moves sluggishly, or if the solenoid valve does not operate, replace A/T clutch pressure control solenoid valves B and C.
15. Clean the mounting surfaces and fluid passages of the solenoid valve body and the transmission housing.
16. Install a new gasket with the blue side down and the white side up on the transmission housing.
17. Install the ATF pipe and the ATF joint pipes, and install new O-rings over the ATF joint pipes.
18. Install A/T clutch pressure control solenoid valves B and C.
19. Check the A/T clutch pressure control solenoid valve B and C connectors for rust, dirt, or oil, then connect the connectors securely.
20. Secure the harness cover with the mounting bolts, and install the harness clamp.
21. Install the intake air duct and the air cleaner assembly (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**).

A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE B AND C REPLACEMENT

1. Remove the air cleaner assembly (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**) and the intake air duct.
2. Remove the mounting bolts securing the harness cover (A), and remove the harness clamp (D).

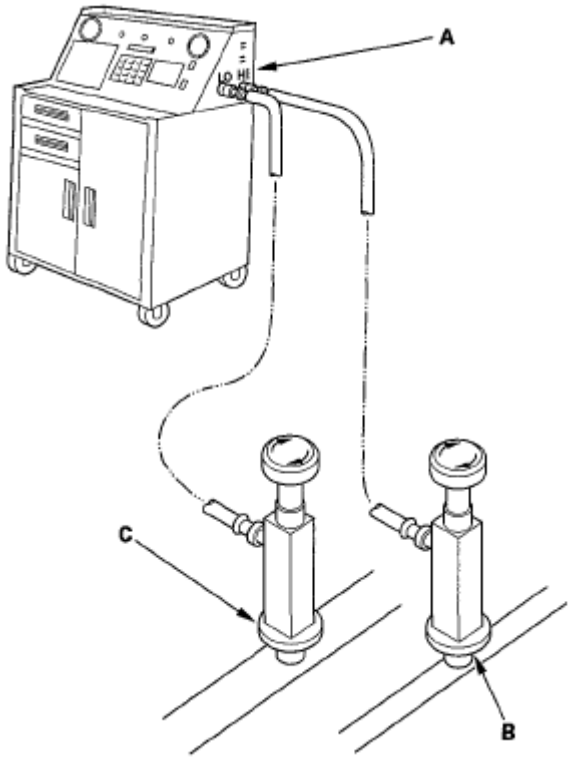

Fig. 204: Identifying Harness Cover, Clamp & Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Disconnect the connectors from A/T clutch pressure control solenoid valve B and C.
4. Remove A/T clutch pressure control solenoid valve B and C.

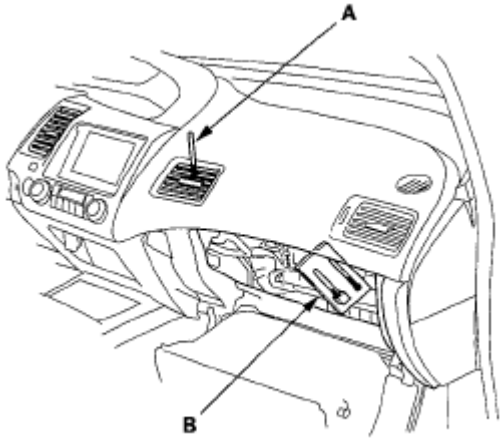

Fig. 205: Identifying ATF Pipe, ATF Joint Pipes, O-Rings, Gasket & Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Remove the ATF pipe (A), the ATF joint pipes (D), the O-rings (E), and the gasket (F).
6. Clean the mounting surface and the fluid passages of the transmission housing.
7. Install a new gasket with the blue side down and the white side up on the transmission housing.
8. Install the ATF pipe and the ATF joint pipes, and install new O-rings over the ATF joint pipes.

9. Install a new A/T clutch pressure control solenoid valve B and C.
10. Check the A/T clutch pressure control solenoid valve B and C connectors for rust, dirt, or oil, then connect the connectors securely.
11. Secure the harness cover with the mounting bolts, and install the harness clamp.
12. Install the intake air duct and the air cleaner assembly (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**)

INPUT SHAFT (MAINSHAFT) SPEED SENSOR REPLACEMENT

1. Remove the air cleaner assembly (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**) and the intake air duct.
2. Remove the harness clamp (A) from its bracket, and remove the air cleaner housing bracket (B).

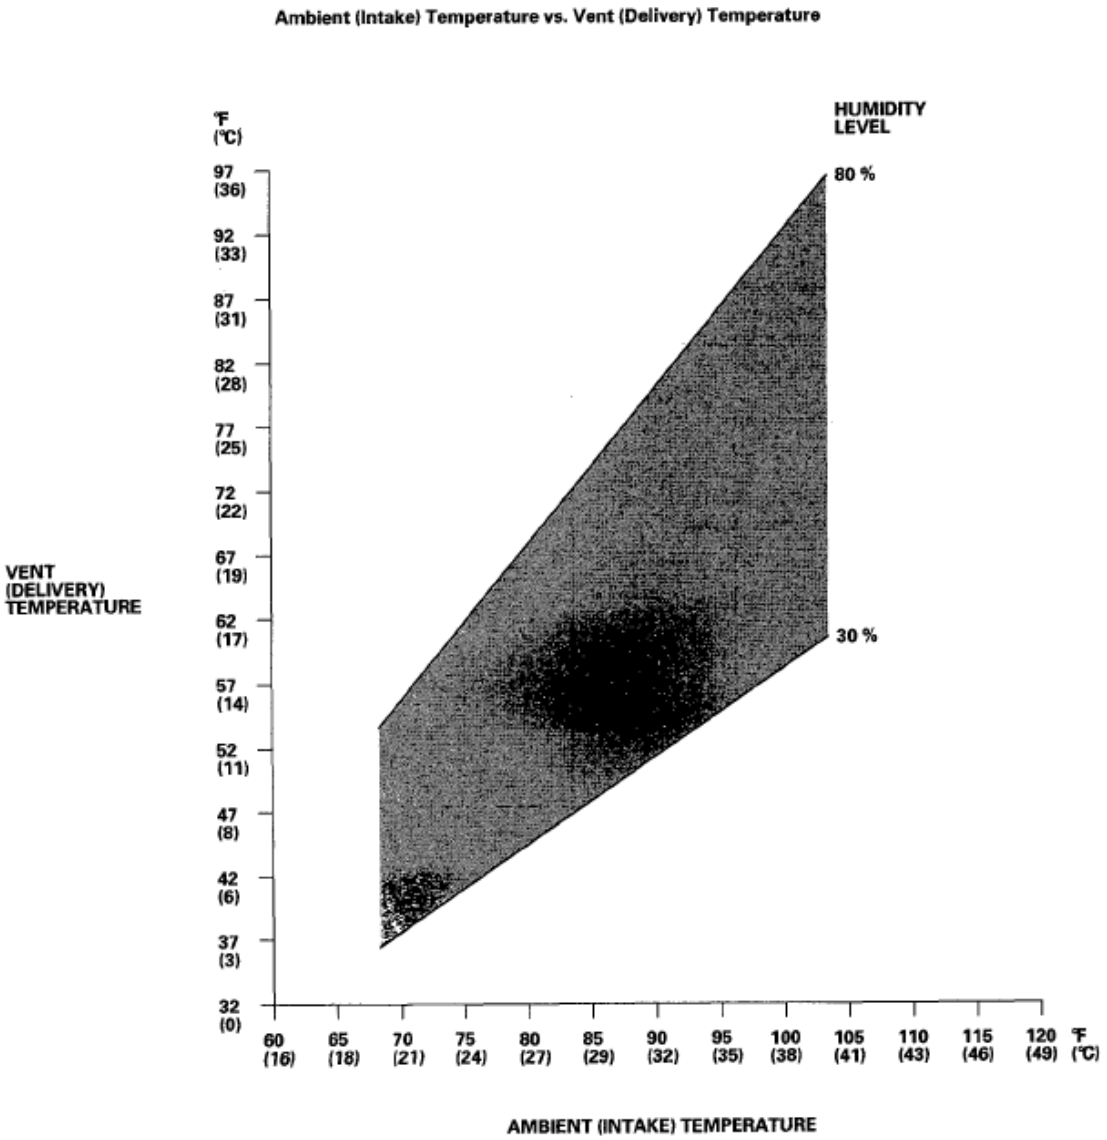

Fig. 206: Identifying Harness Clamp, Torque Specification And Air Cleaner Housing Bracket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Disconnect the input shaft (mainshaft) speed sensor connector, and remove the input shaft (mainshaft)

speed sensor (A).

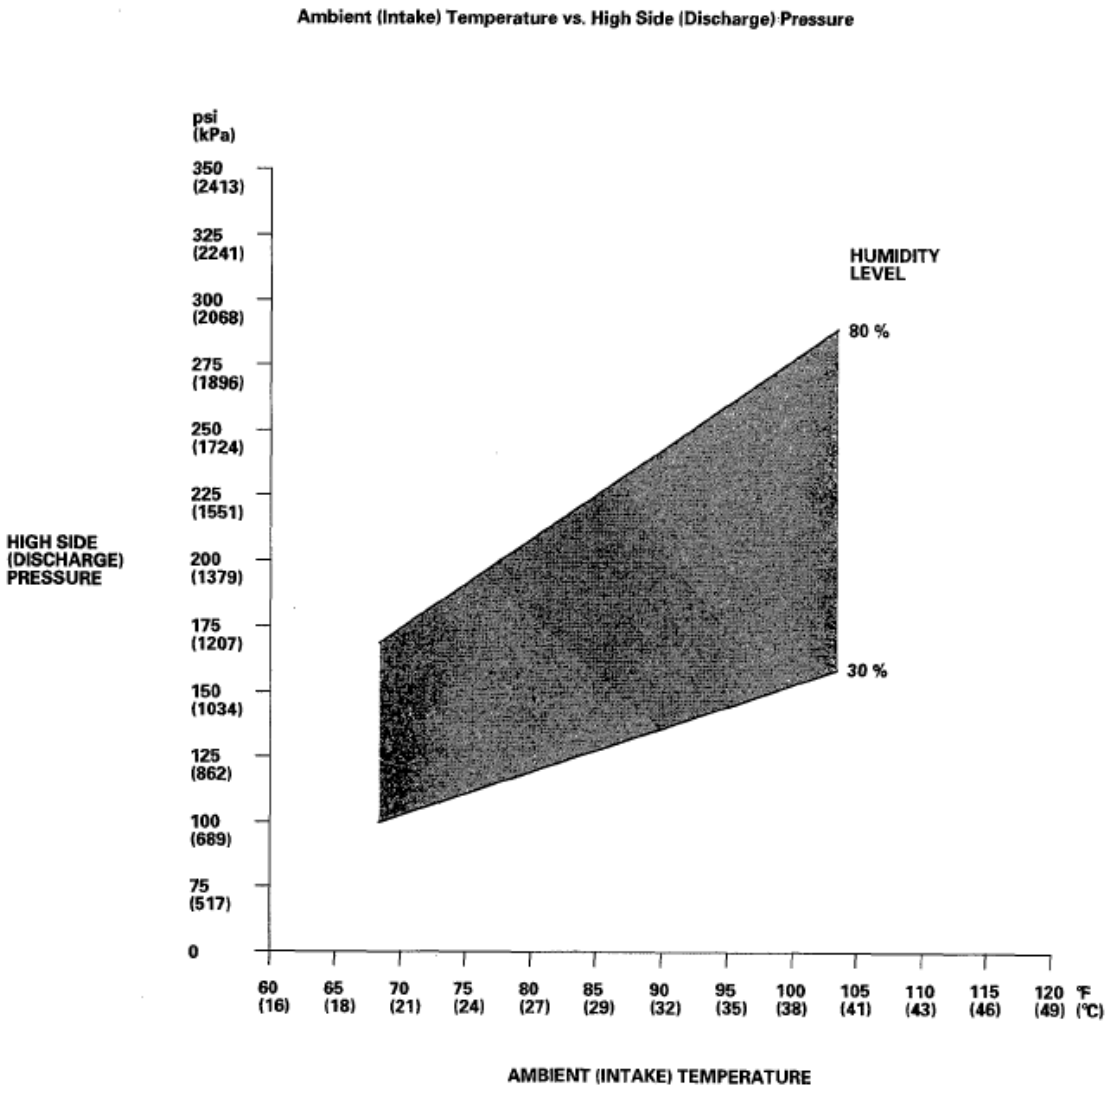

Fig. 207: Identifying Input Shaft (Mainshaft) Speed Sensor, O-Ring & Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install a new O-ring (B) on the new input shaft (mainshaft) speed sensor, then install the input shaft (mainshaft) speed sensor in the transmission housing.
5. Check the connector for rust, dirt, or oil, then connect the connector securely.
6. Install the air cleaner housing bracket, and install the harness clamp on its bracket.
7. Install the intake air duct and the air cleaner assembly (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**)

OUTPUT SHAFT (COUNTERSHAFT) SPEED SENSOR REPLACEMENT

1. Remove the air cleaner assembly (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**) and the intake air duct.
2. Disconnect the output shaft (countershaft) speed sensor connector, and remove the output shaft (countershaft) speed sensor (A).

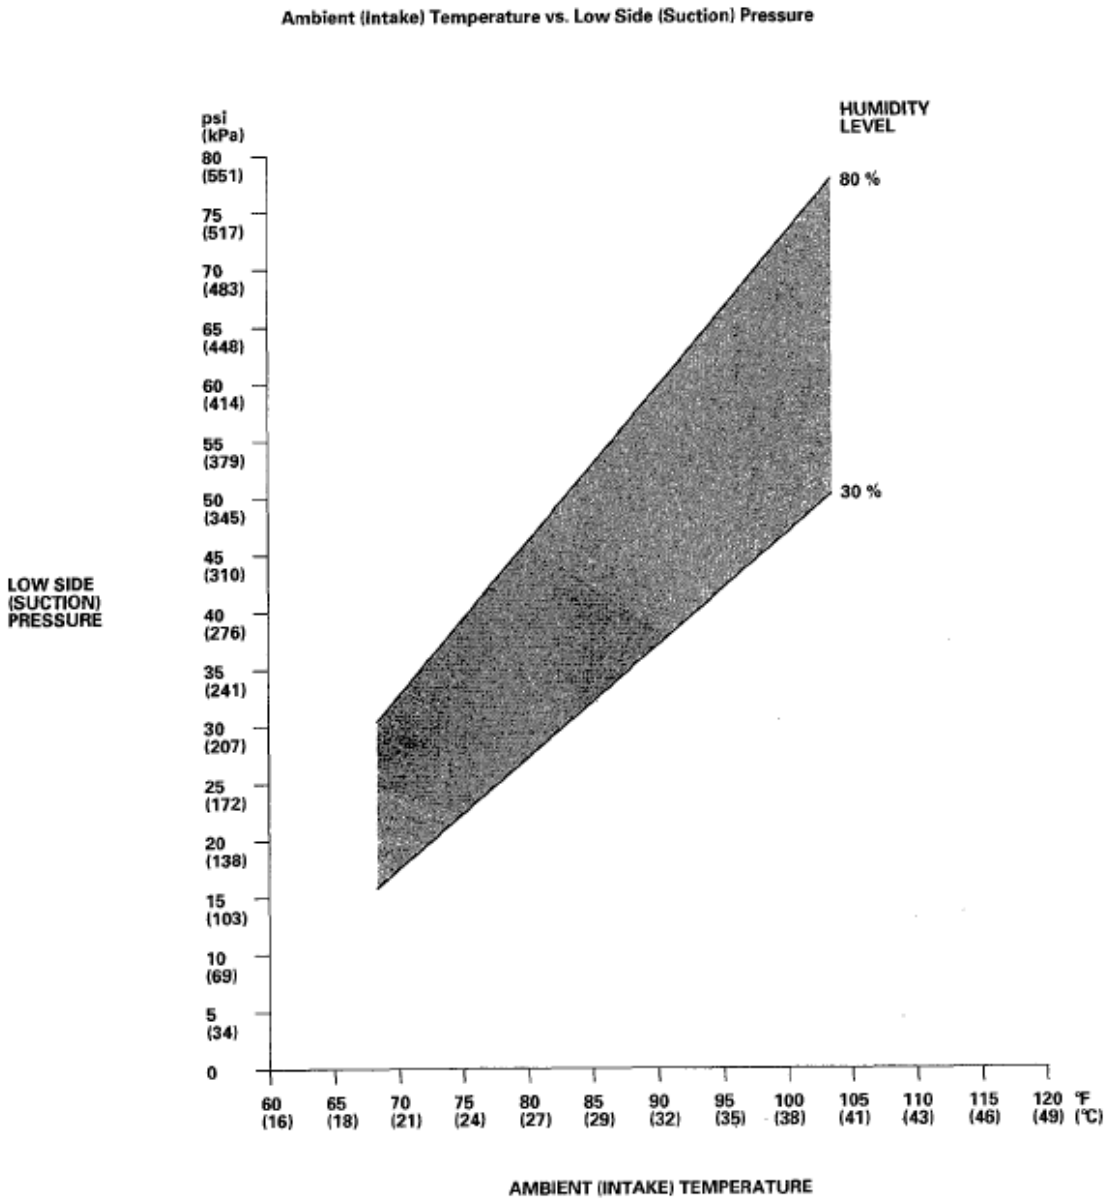

Fig. 208: Identifying Output Shaft (Countershaft) Speed Sensor, O-Ring & Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install a new O-ring (B) on a new output shaft (countershaft) speed sensor, then install the output shaft (countershaft) speed sensor in the transmission housing.
4. Check the connector for rust, dirt, or oil, then connect the connector securely.
5. Install the intake air duct and the air cleaner assembly (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**).

2ND CLUTCH TRANSMISSION FLUID PRESSURE SWITCH REPLACEMENT

1. Remove the air cleaner assembly (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**) and the intake air duct.
2. Remove the harness clamp (A) from its bracket, and remove the air cleaner housing bracket (B).

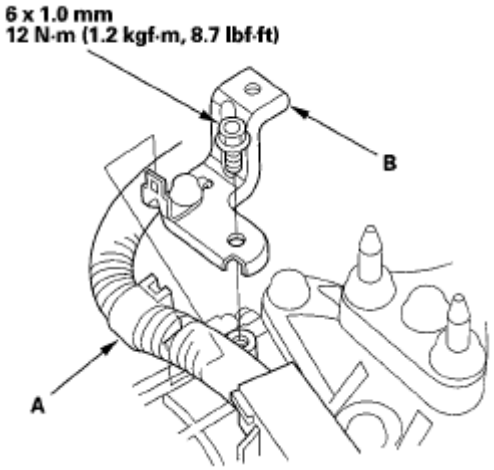

Fig. 209: Identifying Harness Clamp, Air Cleaner Housing Bracket & Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Disconnect the 2nd clutch transmission fluid pressure switch connector, and remove the 2nd clutch transmission fluid pressure switch (A).

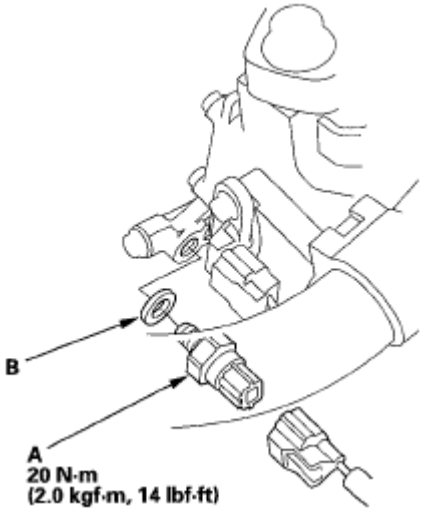

Fig. 210: Identifying 2nd Clutch Transmission Fluid Pressure Switch, Sealing Washer & Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Make sure there is no water, oil, dust, or foreign particles inside the connectors.
5. Install a new 2nd clutch transmission fluid pressure switch with a new sealing washer (B), and tighten the switch to the specified torque by turning the metal part, not the plastic part.
6. Connect the connector securely.
7. Install the air cleaner housing bracket, and install the harness clamp on its bracket.
8. Install the intake air duct and the air cleaner assembly (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**).

3RD CLUTCH TRANSMISSION FLUID PRESSURE SWITCH REPLACEMENT

1. Raise the vehicle on a lift, or apply the parking brake, block the rear wheels, and raise the front of the vehicle. Make sure it is securely supported.
2. Remove the splash shield.
3. Disconnect the 3rd clutch transmission fluid pressure switch connector, then remove the 3rd clutch transmission fluid pressure switch (A).

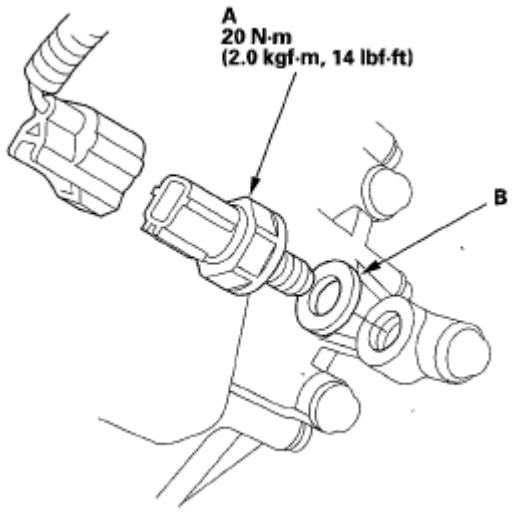

Fig. 211: Identifying 3rd Clutch Transmission Fluid Pressure Switch, Sealing Washer & Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Make sure there is no water, oil, dust, or foreign particles inside the connector.
5. Install a new 3rd clutch transmission fluid pressure switch with a new sealing washer (B), and tighten the switch to the specified torque by turning the metal part, not the plastic part.
6. Connect the connector securely.
7. Install the splash shield.

ATF TEMPERATURE SENSOR TEST/REPLACEMENT

1. Raise the vehicle on a lift, or apply the parking brake, block the rear wheels, and raise the front of the vehicle. Make sure it is securely supported.
2. Remove the splash shield.
3. Disconnect the shift solenoid harness connector.

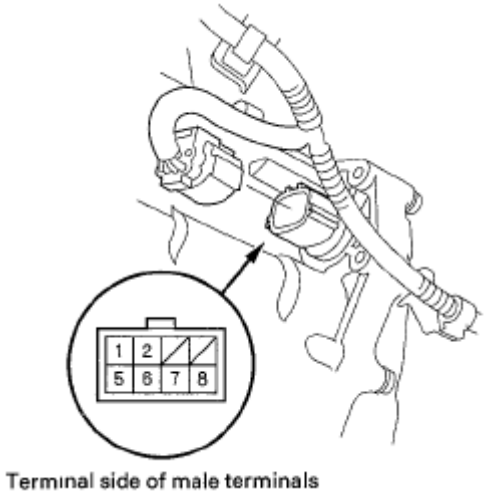

Fig. 212: Identifying Shift Solenoid Harness Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Measure the ATF temperature sensor resistance between shift solenoid harness connector terminals No. 6 and No. 7.

   Standard: 50 ohms-25 kohms

5. If the resistance is out of standard, go to step 6, and replace the ATF temperature sensor and solenoid harness. The ATF temperature sensor is not available separately from the shift solenoid harness.

   If the resistance is within the standard, the test is complete, connect the connector securely, and install the splash shield.

6. Remove the drain plug (A), and drain the automatic transmission fluid (ATF).

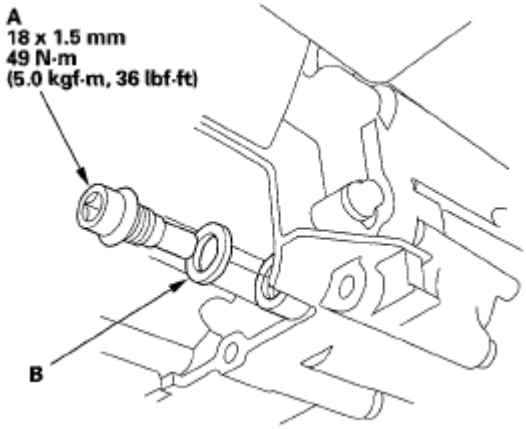

Fig. 213: Identifying Drain Plug, Sealing Washer & Torque Specification
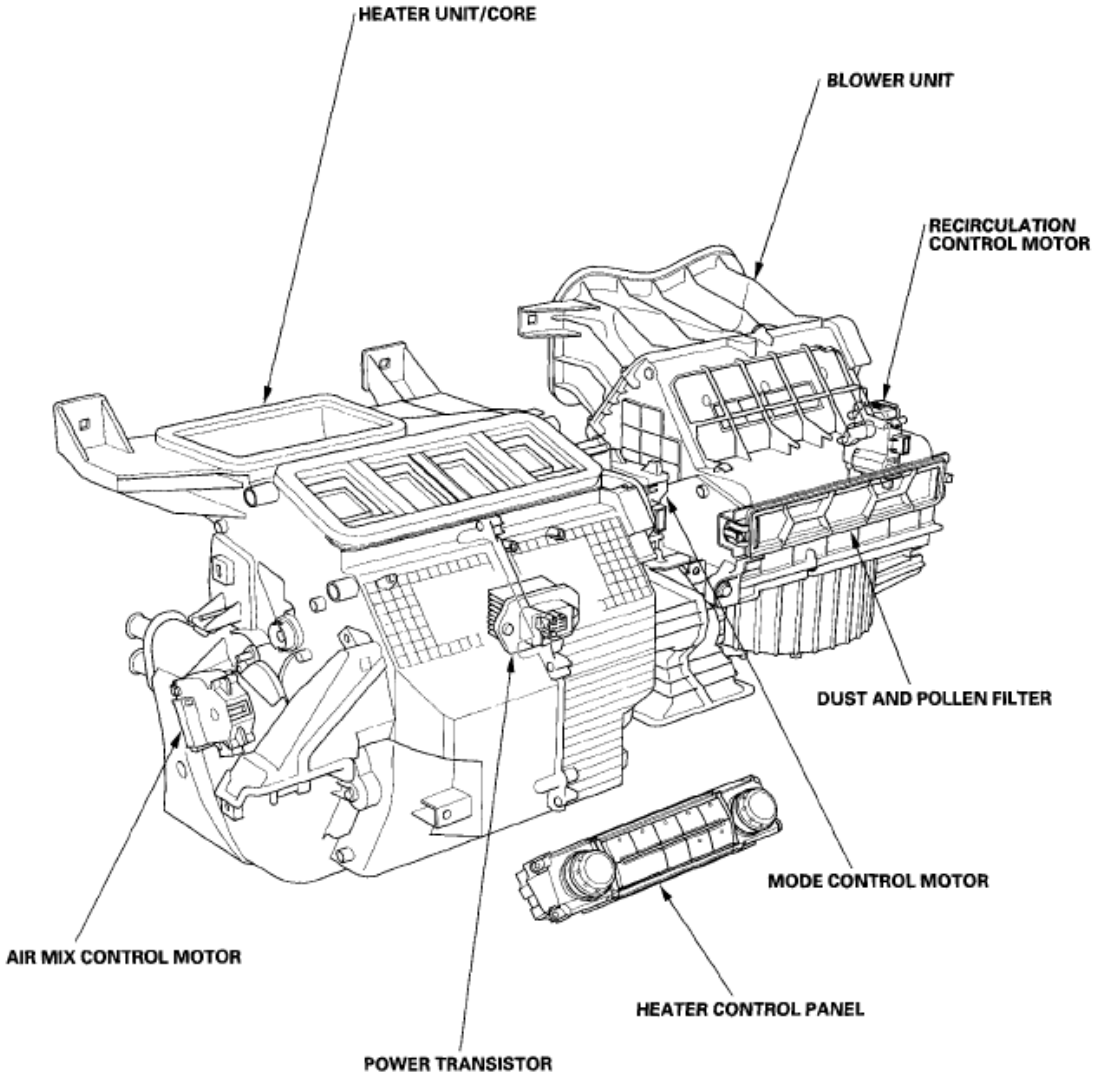
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Reinstall the drain plug with a new sealing washer (B).
8. Remove the shift solenoid valve cover (A), the dowel pins (B), the gasket (C), and the harness clamp bracket (D).



4-door is shown, 2-door is similar.

Fig. 214: Identifying Shift Solenoid Valve Cover, Dowel Pins, Gasket, Harness Clamp Bracket & Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Remove the shift solenoid harness connector (E), and replace it.

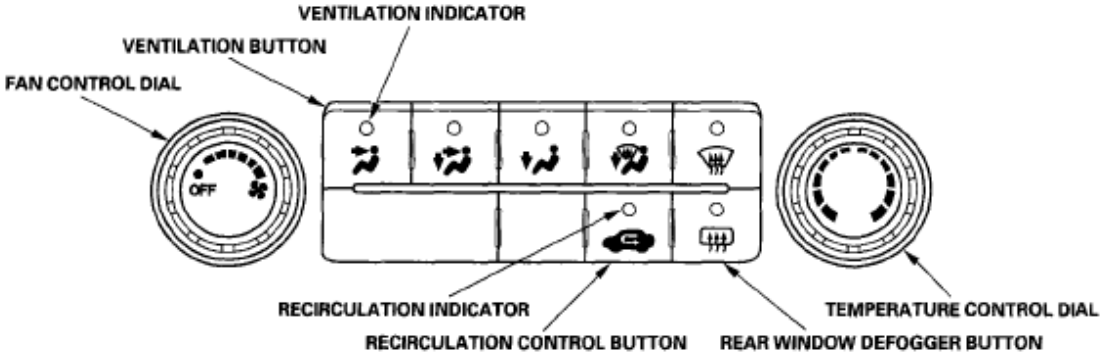


Fig. 215: Identifying Shift Solenoid Harness Connector, O-Ring & Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Install a new O-ring (F) on a new shift solenoid harness connector, and install the connector in the transmission housing.
11. Connect WHT harnesses and ORN harness connector to shift solenoid valve B. ATF temperature sensor is assembled in the connector with WHT harnesses.
12. Connect the shift solenoid harness connectors:
    - BLU wire to shift solenoid valve A.
    - GRN wire to shift solenoid valve C.
    - YEL wire to shift solenoid valve D.
13. Install the shift solenoid valve cover, the dowel pins, a new gasket, and the harness clamp bracket.
14. Check the connector for rust, dirt, or oil, then connect the connector securely.
15. Refill the transmission with ATF (see step 5).
16. Install the splash shield.

ATF LEVEL CHECK

NOTE: Keep all foreign particles out of the transmission.

1. Park the vehicle on the level ground.
2. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on), and turn the engine off. Do not allow the engine to warm up more than two cycles of the cooling fan.

NOTE: Check the fluid level within 60-90 seconds after turning the engine off. Higher fluid level may be indicated if the radiator fan comes on twice or more.

3. Remove the dipstick (yellow loop) (A), and wipe it with a clean cloth.

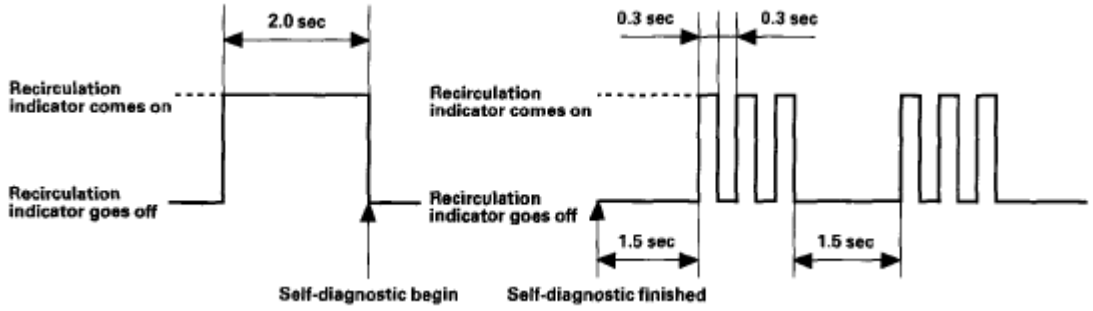

Fig. 216: Identifying Dipstick (Yellow Loop)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Insert the dipstick into the transmission.
5. Remove the dipstick and check the fluid level. It should be between the upper mark (A) and the lower mark (B).

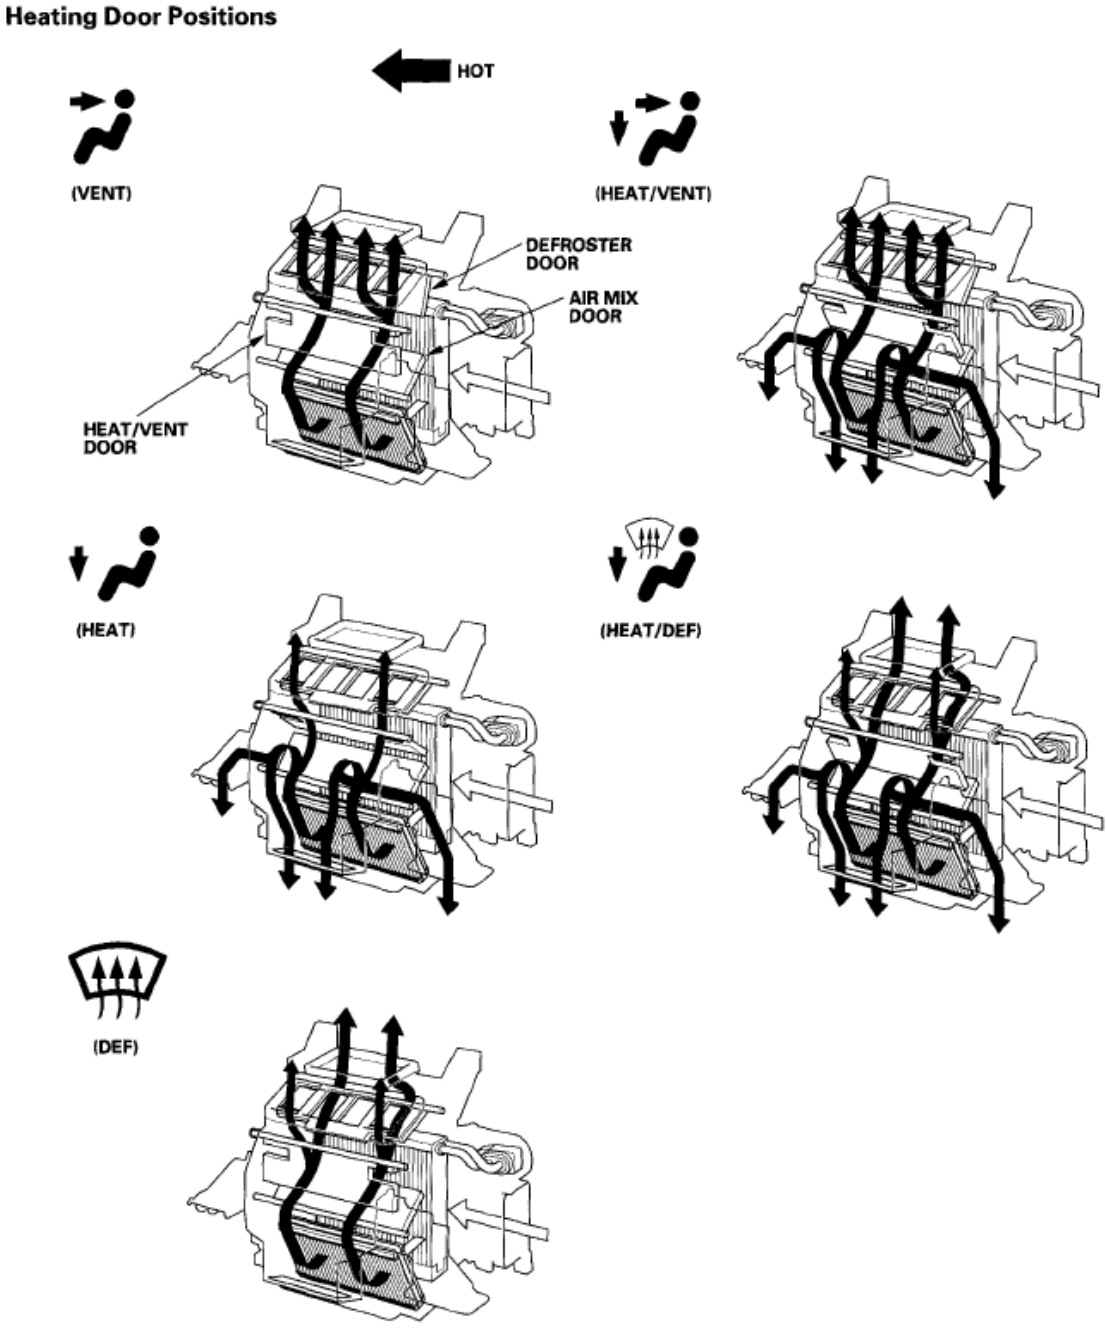

Fig. 217: Identifying Upper Mark And Lower Mark On Dipstick
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. If the level is below the lower mark, check for fluid leaks at the transmission, the hoses, and the line joints. If a problem is found, fix it before filling the transmission with ATF.

NOTE: If the vehicle is driven when the ATF level is below the lower mark:

- **Transmission damage will result.**
- **The vehicle might not move in any gear.**
- **The vehicle may accelerate poorly, and flare when starting off in D and R.**

- **The engine may vibrate at idle.**

7. If the level is above the upper mark, drain the ATF to proper level (see step 3).

NOTE: If the vehicle is driven when the ATF level is above the upper mark, the vehicle may creep forward while in N, or have problems shifting.

8. If necessary, fill the transmission with ATF through the dipstick hole (A) to bring the fluid level between the upper mark and the lower mark of the dipstick. Do not fill the fluid above the upper mark. Always use genuine Honda ATF-Z1 automatic transmission fluid (ATF). Using a non-Honda ATF can affect shift quality.

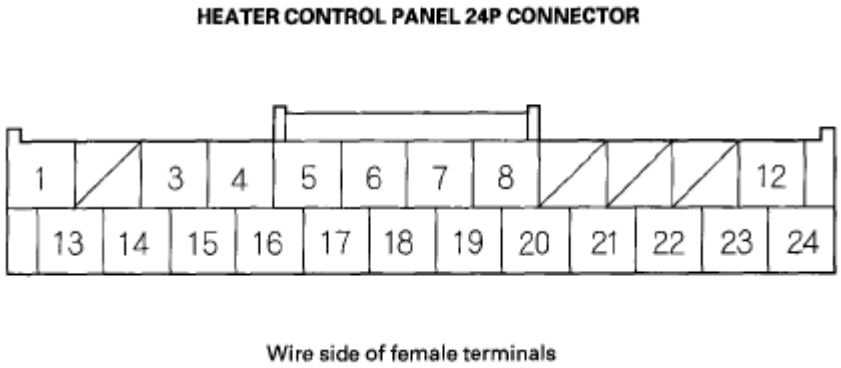

Fig. 218: Identifying Dipstick Hole
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Insert the dipstick back into the transmission.

ATF REPLACEMENT

NOTE: Keep all foreign particles out of the transmission.

1. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).
2. Park the vehicle on the level ground, and turn the engine off.
3. Remove the drain plug (A), and drain the automatic transmission fluid (ATF).

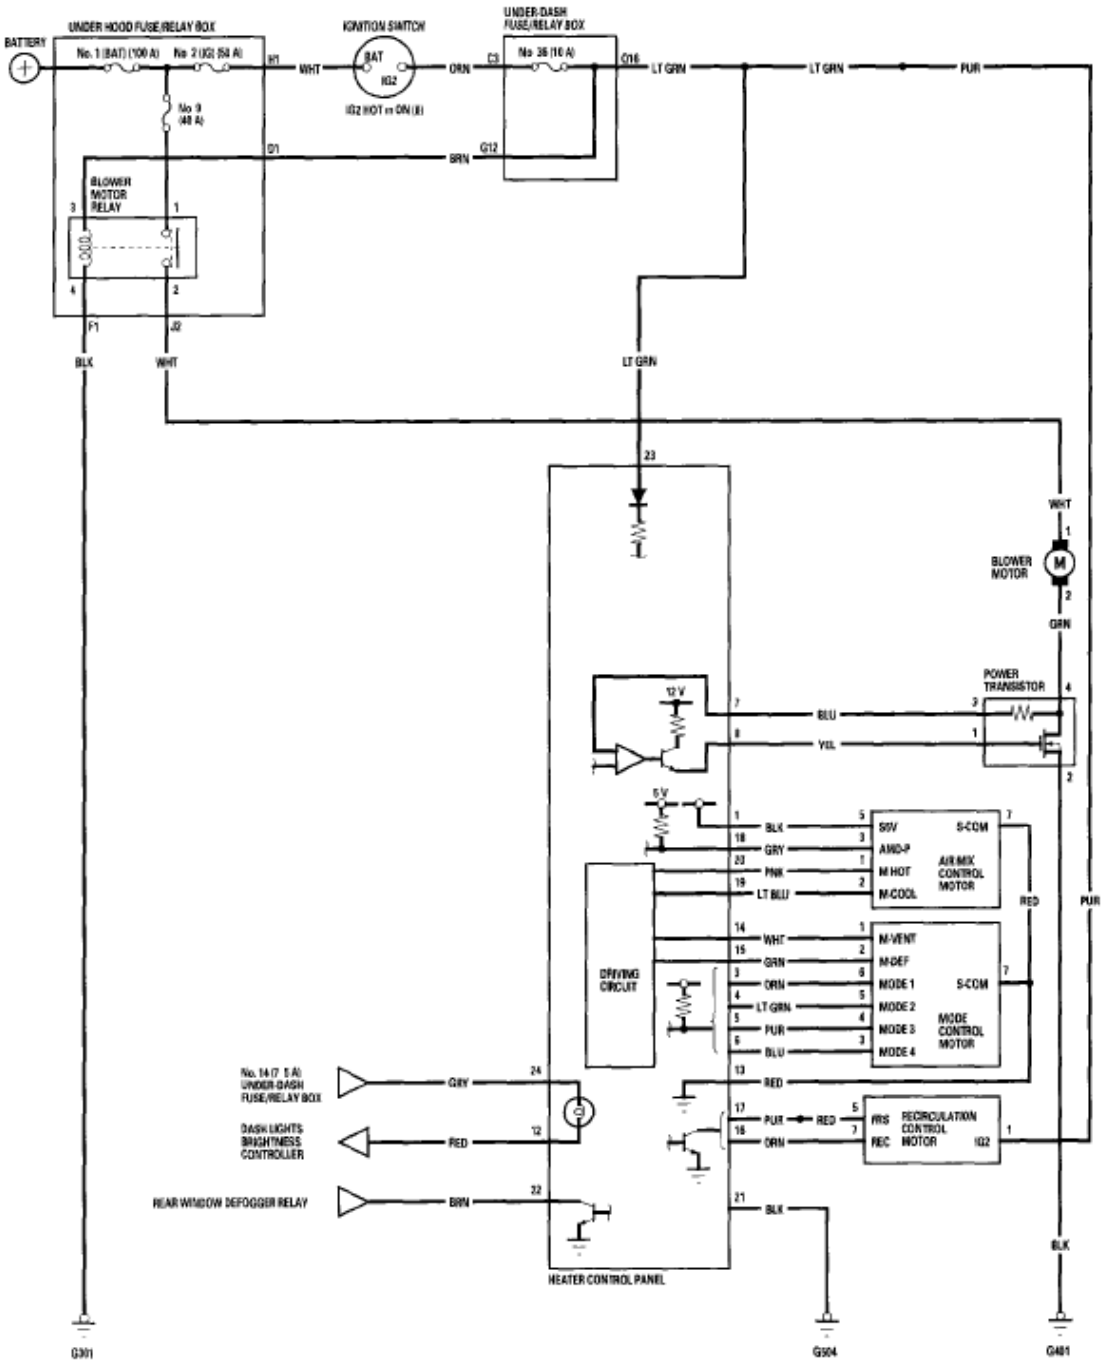

Fig. 219: Identifying Drain Plug, Sealing Washer & Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Reinstall the drain plug with a new sealing washer (B).
5. Refill the transmission with the recommended fluid into the dipstick hole to bring the fluid level between the upper mark and the lower mark of the dipstick. Always use Honda ATF-Z1 automatic transmission fluid (ATF). Using a non-Honda ATF can affect shift quality.

Automatic Transmission Fluid Capacity:

2.4 L (2.5 US qt, 2.1 Imp qt) at change

5.9 L (6.2 US qt, 5.2 Imp qt) at overhaul

6. Check that the fluid level is between the upper mark and the lower mark of the dipstick.
7. Insert the dipstick back into the transmission.
8. Connect the HDS to the DLC (A) located behind the driver's dashboard lower cover.

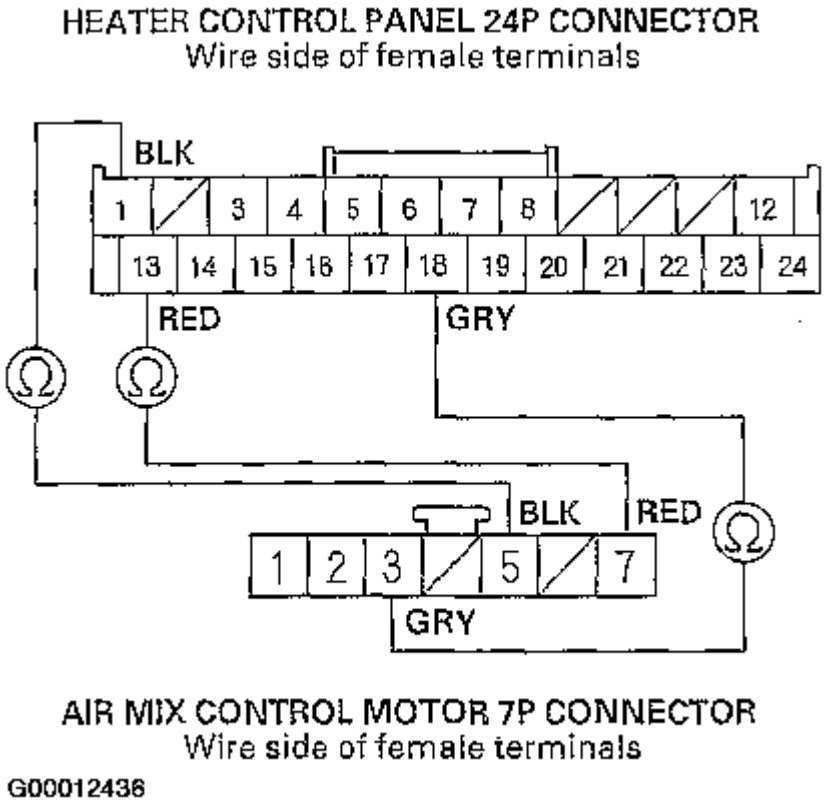

Fig. 220: Identifying Data Link Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Make sure the HDS communicates with the PCM. If it does not, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
10. Turn the ignition switch to ON (II), and reset the ATF life with the HDS.
11. '06 4-door model and '07-08 2 and 4 door models: If the maintenance minder recommends replacing the ATF, reset the maintenance minder (see **RESETTING THE MAINTENANCE INFORMATION DISPLAY**), and this procedure is complete. If the maintenance minder did not recommend replacing the ATF, go to step 12.

    '06 2-door model: If the maintenance minder recommends replacing the ATF, reset the maintenance minder (see **RESETTING THE MAINTENANCE INFORMATION DISPLAY**), and this procedure is complete. If the maintenance minder did not recommend replacing the ATF, notify the customer that the maintenance minder service interval has not been reached and the maintenance minder will still be on the same interval as before.

12. Select BODY ELECTRICAL with the HDS.
13. Select ADJUSTMENT in the GAUGES MENU with the HDS.

14. Select RESET in the MAINTENANCE MINDER with the HDS.
15. Select RESETTING THE ATF with the HDS.

NOTE: If you changed the engine oil at the same time with the ATF, select RESETTING THE ENGINE OIL LIFE AND ATF with the HDS instead.

TRANSMISSION REMOVAL

Special Tools Required

- 1.8 support eyelet 07AAK-SNAA400
- 1.8 support bolt 07AAK-SNAA500
- 2006 Civic engine hanger VSB02C000025 *
- Engine support hanger, A and Reds AAR-T-12566 *
- Front subframe adapter VSB02C000016 *
- * These special tools are available through the Honda Tool and Equipment Program 1-888-424-6857.

NOTE:

- **Use fender covers to avoid damaging painted surfaces.**
- **Special tool engine hanger must be used with the side engine mount installed.**

1. Make sure you have the anti-theft code for the audio system or the navigation system (if equipped), then write down the audio presets.
2. Remove the cowl cover (see **COWL COVER REPLACEMENT**) and the under-cowl panel.
3. Remove the front grille cover (see **FRONT GRILLE COVER REPLACEMENT**).
4. Make sure the ignition switch is in LOCK (0).

   Disconnect the negative cable from the battery, then disconnect the positive cable.

5. Remove the battery hold-down bracket, and remove the battery and the battery tray.
6. Remove the air cleaner assembly (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**) and the intake air duct.
7. Remove the battery base and the resonator.
8. Raise the vehicle on a lift, make sure it is securely supported, and remove the wheels.
9. Remove the splash shield (see step 23 on **ENGINE REMOVAL**).
10. Remove the drain plug (A), and drain the automatic transmission fluid (ATF).

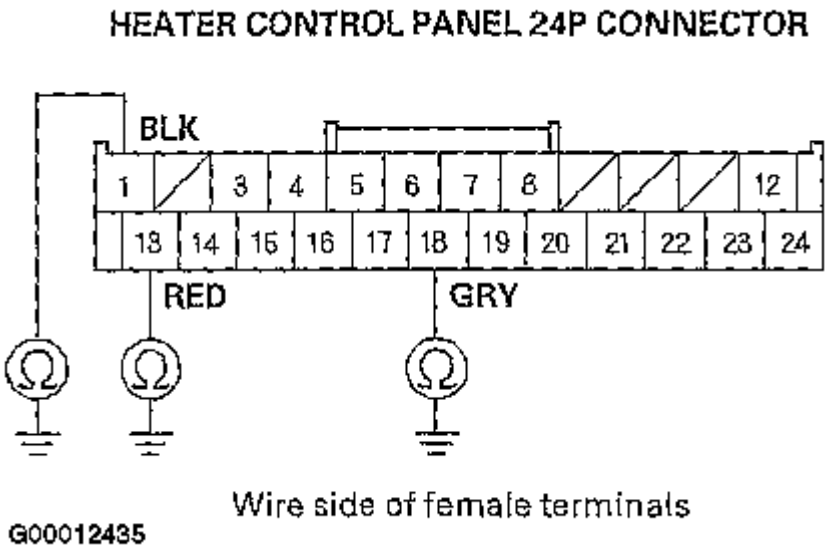

Fig. 221: Identifying Drain Plug, Sealing Washer & Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Reinstall the drain plug with a new sealing washer (B).
12. Secure the hood in the vertical position.
13. Remove the mounting bolts securing the harness cover (A), and remove the harness clamp (B).

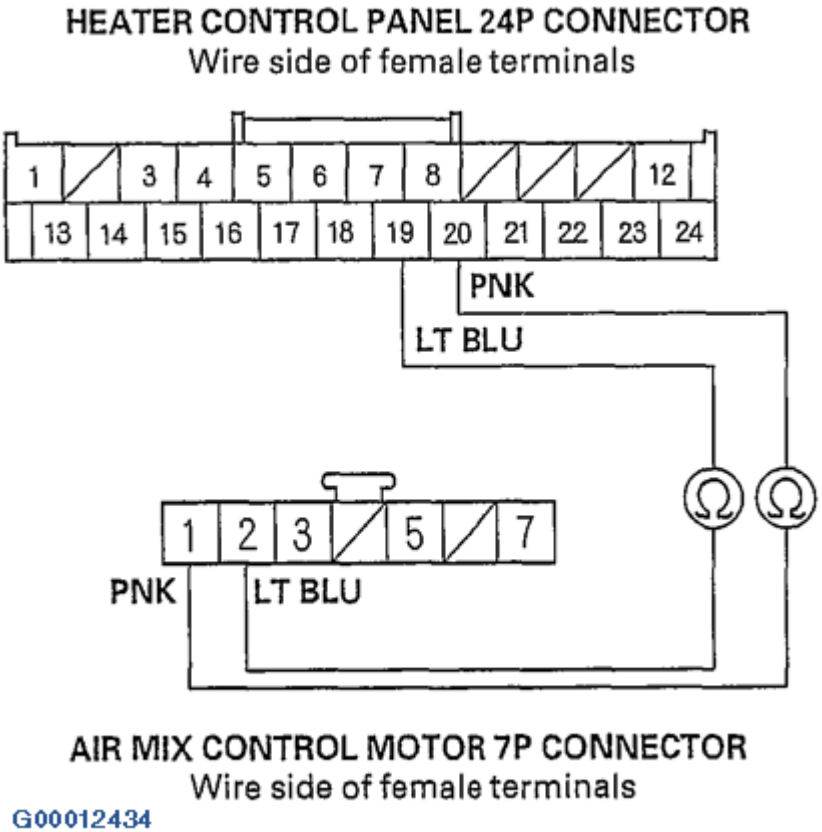

Fig. 222: Identifying Harness Cover And Clamp

Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Disconnect the A/T clutch pressure control solenoid valve A connector (C), the A/T clutch pressure control solenoid valve B connector (D), and the A/T clutch pressure control solenoid valve C connector (E).
15. Remove the harness clamp (A) from its bracket, and remove the air cleaner housing mounting bracket (B).

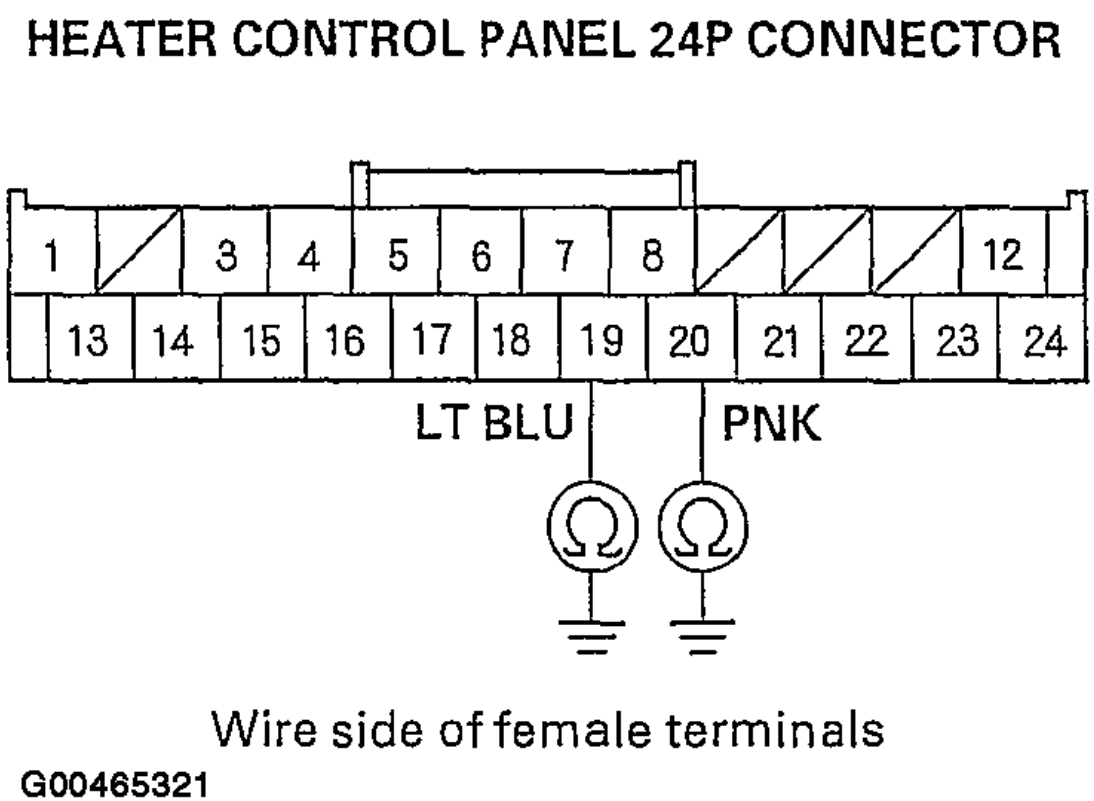

Fig. 223: Identifying Air Cleaner Housing Mounting Bracket And Harness Clamp

17. Disconnect the output shaft (countershaft) speed sensor connector (B), and remove the harness clamps (C) from the clamp brackets (D).
18. Disconnect the input shaft (mainshaft) speed sensor connector (A) and the 2nd clutch transmission fluid pressure switch connector (B).

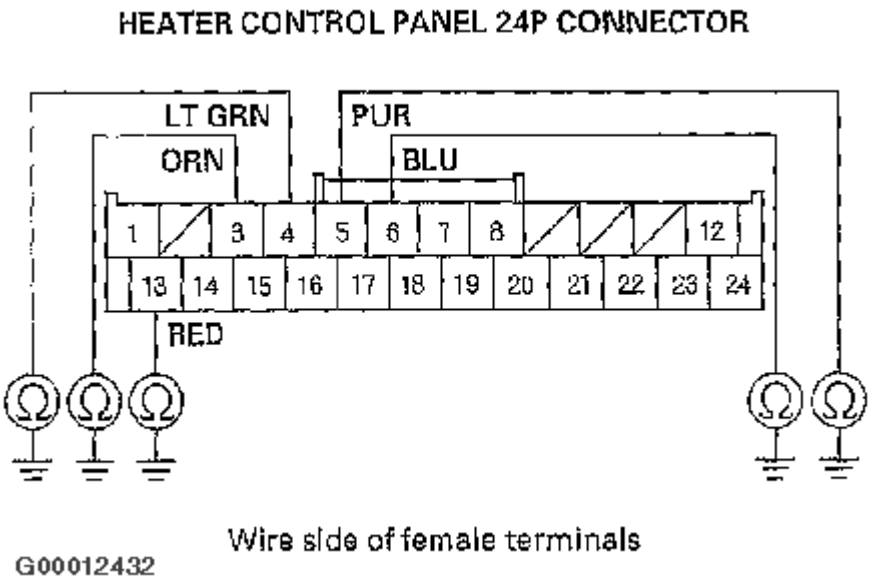

Fig. 225: Identifying Input Shaft (Mainshaft) Speed Sensor And 2nd Clutch Transmission Fluid Pressure Switch Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. Disconnect the ATF warmer hoses (A) from the ATF lines (B). Turn the end of the ATF warmer hoses up to prevent ATF from flowing out, then plug the hoses and lines.

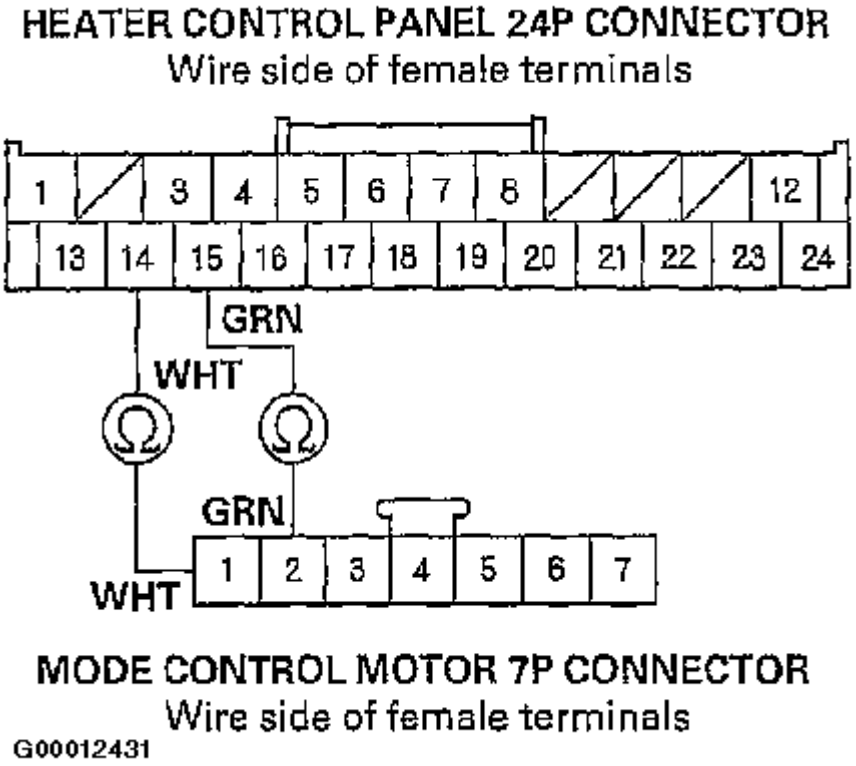

Fig. 226: Identifying ATF Warmer Hoses And ATF Lines
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Remove the bolts securing the ATF warmer. Do not disconnect the ATF hoses and water by-pass hoses from the ATF warmer.

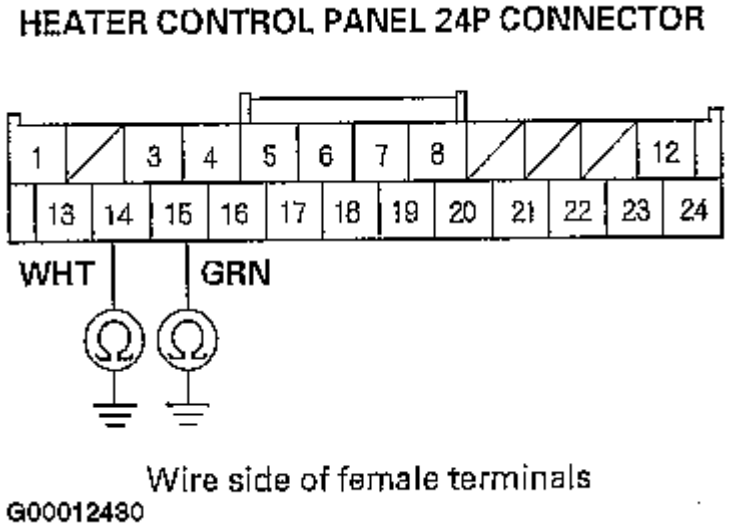

Fig. 227: Identifying ATF Hoses And Water By-Pass Hoses With Bolts

24. Install the support eyelet behind the breather pipe (A) and down to the threaded hole (B) on the cylinder head.

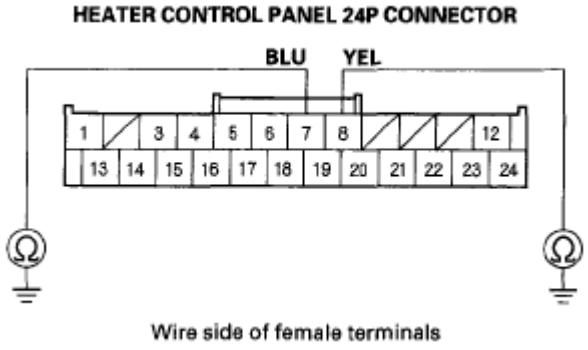

Fig. 231: Identifying Breather Pipe And Threaded Hole
Courtesy of AMERICAN HONDA MOTOR CO., INC.

25. Attach the support eyelet to the cylinder head with the support bolt. Tighten the bolt by hand.

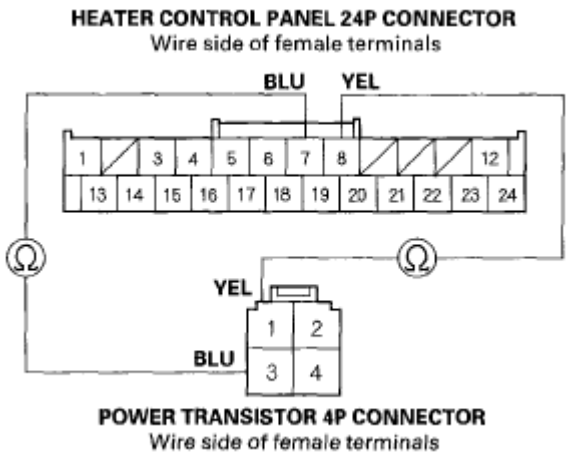

Fig. 232: Identifying Support Eyelet And Support Bolt

Courtesy of AMERICAN HONDA MOTOR CO., INC.

26. Install the front leg assembly (A), hook (B), and wing nut (C) from an A and Reds engine support hanger (AAR-T-12566) onto the engine hanger (VSB02C000025). Carefully position the engine hanger on the vehicle, and attach the hook to the slotted hole in the support eyelet (D). Tighten the wing nut by hand to lift and support the engine/transmission assembly.

NOTE: Use care when working around the windshield.

35. Make reference marks (A) on both sides of the front subframe that line up with the body (B).

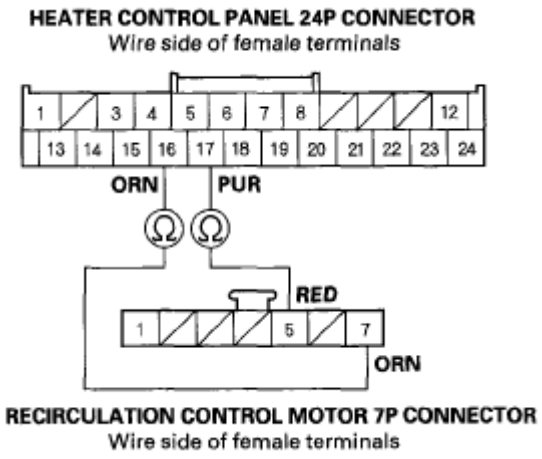

Fig. 241: Identifying Reference Marks On Both Sides Of Front Subframe Line Up With Body
Courtesy of AMERICAN HONDA MOTOR CO., INC.

36. Attach the front subframe adapter (VSB02C000016) to the front subframe by looping the strap (A) over the front of the subframe, then secure the strap with the stop (B), then tighten the wing nut (C).

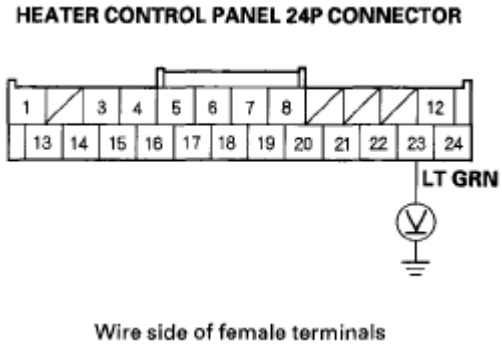

Fig. 242: Attaching Front Subframe Adapter (VSB02C000016) To Front Subframe
Courtesy of AMERICAN HONDA MOTOR CO., INC.

37. Raise the jack and line up the slots in the arms with the bolt holes on the corner of the jack base, then tighten the bolts.
38. Remove the four bolts securing the front subframe, and lower the front subframe.

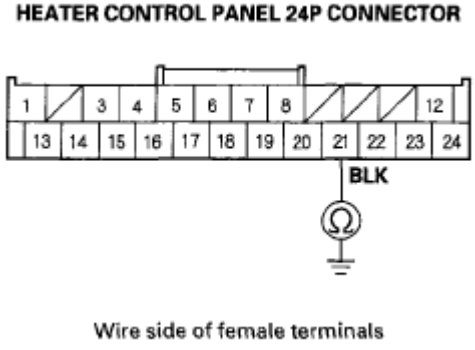

Fig. 243: Lifting Front Subframe
Courtesy of AMERICAN HONDA MOTOR CO., INC.

39. Hang the steering gearbox to the body with a rope.
40. Remove the driveshafts from the differential. Coat all precision machined surfaces with clean engine oil, then put plastic bags over the driveshaft ends.

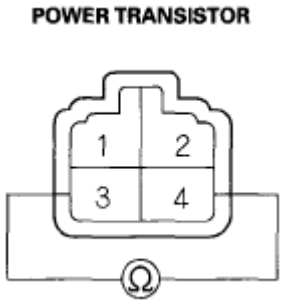

Fig. 244: Identifying Driveshafts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

41. Remove the shift cable cover (A), and remove the three bolts securing the shift cable holder (B).

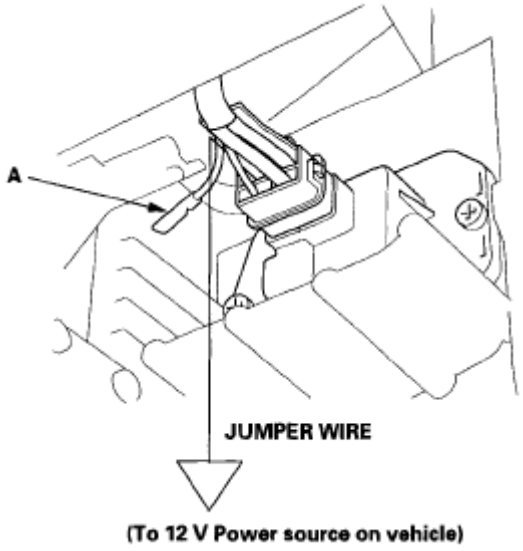

Fig. 245: Identifying Shift Cable Cover And Shift Cable Holder
Courtesy of AMERICAN HONDA MOTOR CO., INC.

42. Pry up the lock tab of the lock washer (C), and remove the lock bolt (D) and the lock washer, then separate the shift cable (E) from the control shaft (F). Do not bend the shift cable excessively.
43. Remove the shift cable holder bracket from the transmission.

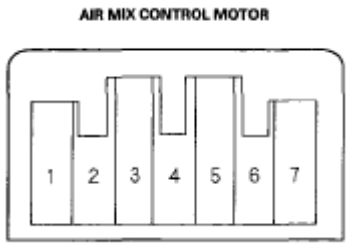

Fig. 246: Identifying Shift Cable Holder Bracket

Courtesy of AMERICAN HONDA MOTOR CO., INC.

44. Remove the torque converter cover (A), and remove the drive plate bolts (B) (8) while rotating the crankshaft pulley.

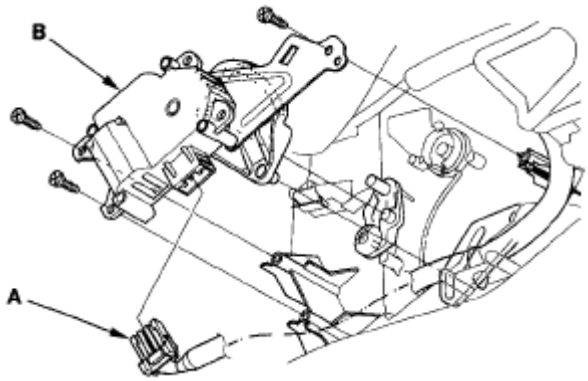

Fig. 247: Identifying Torque Converter Cover And Drive Plate Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

45. Remove the upper transmission housing mounting bolts.

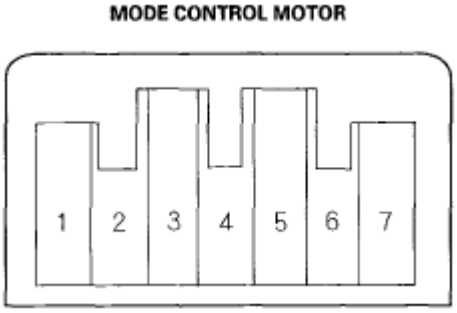

Fig. 248: Identifying Upper Transmission Housing Mounting Bolts

Courtesy of AMERICAN HONDA MOTOR CO., INC.

48. Remove the rear transmission housing mounting bolts.

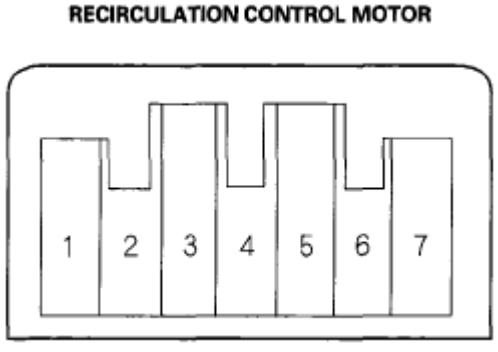

Fig. 251: Identifying Rear Transmission Housing Mounting Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

49. Lower the transmission by loosening the wing nut of the engine support hanger, and tilt the engine just enough for the transmission to clear the side frame.
50. Place a jack under the transmission.
51. Remove the lower transmission housing mounting bolts.

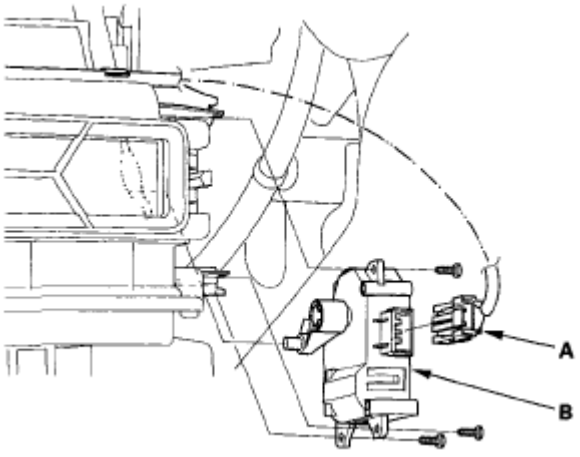

Fig. 252: Identifying Lower Transmission Housing Mounting Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

52. Slide the transmission away from the engine to remove it from the vehicle.
53. Remove the torque converter, the O-ring, and the dowel pins.

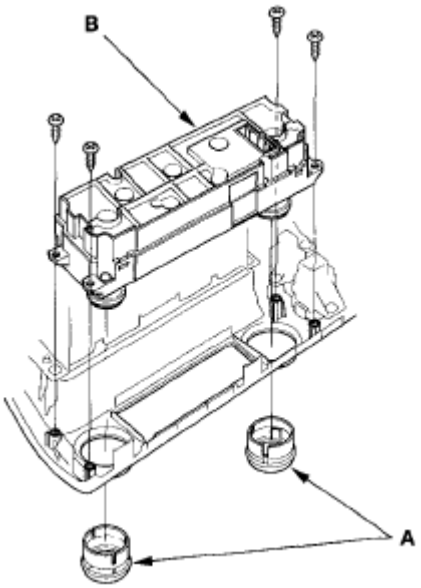

Fig. 253: Identifying Torque Converter, O-Ring And Dowel Pins

NOTE: Use fender covers to avoid damaging painted surfaces.

1. Install the torque converter (A) on the mainshaft (B) with a new O-ring (C).

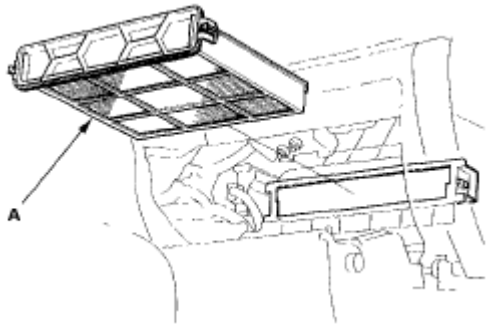

Fig. 254: Identifying Torque Converter On Mainshaft With O-Ring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the 14 x 20 mm dowel pins (D) in the torque converter housing.
3. Place the transmission on a jack, and raise the transmission to the engine level.
4. Install the lower transmission housing mounting bolt (A) part-way in the bolt hole on the engine, then attach the transmission to the engine.

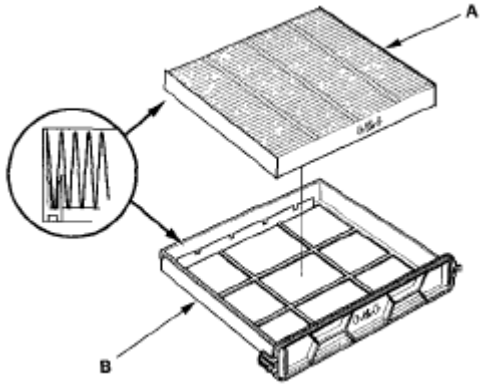

Fig. 255: Identifying Lower Transmission Housing Mounting Bolt w/Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the lower transmission housing mounting bolt (B), and tighten the bolts.
6. Install the rear transmission housing mounting bolts.

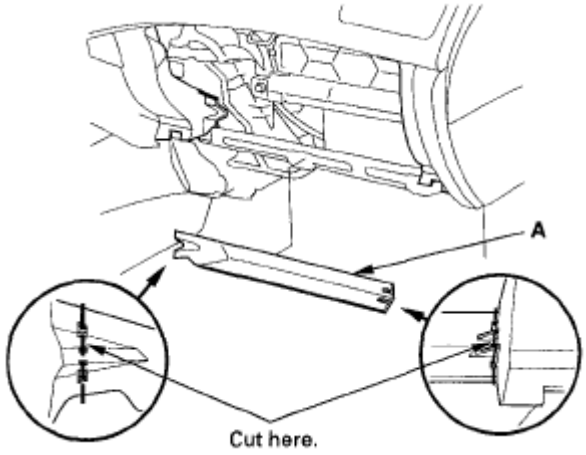

Fig. 256: Identifying Rear Transmission Housing Mounting Bolts w/Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the front transmission housing mounting bolts.

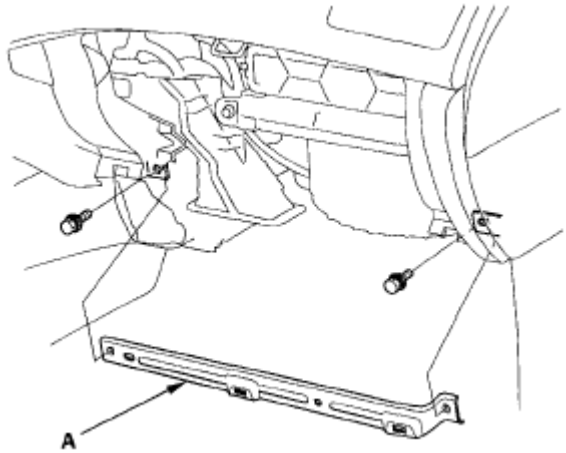

Fig. 257: Identifying Front Transmission Housing Mounting Bolts w/Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Install the upper transmission housing mounting bolts.

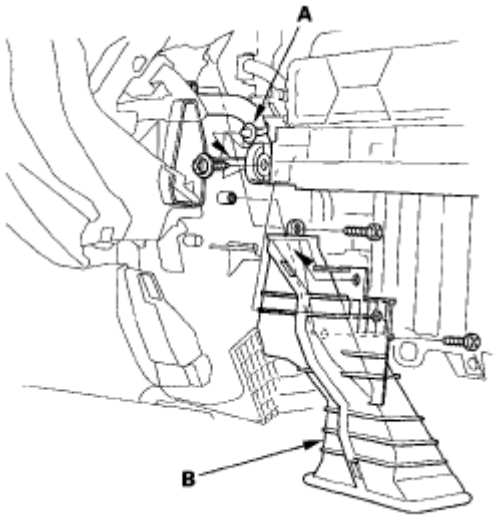

Fig. 258: Identifying Upper Transmission Housing Mounting Bolts w/Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Secure the transmission mount bracket on the transmission housing with new mounting bolts.

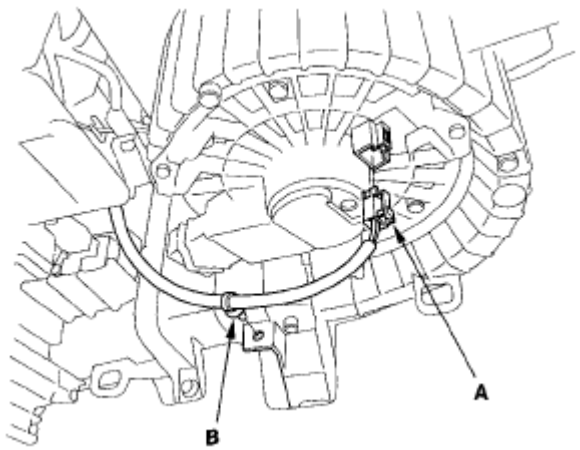

Fig. 259: Identifying Transmission Mount Bracket & Mounting Bolts w/Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Install a new set ring (A) on both driveshafts (B).

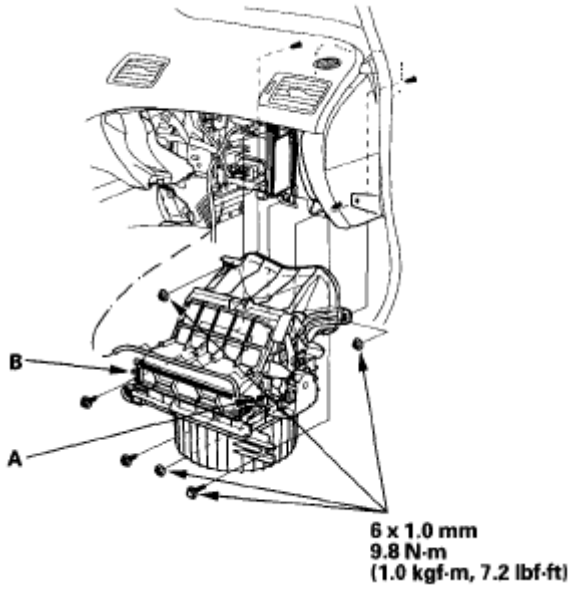

Fig. 260: Identifying Set Ring On Driveshafts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Clean the areas where the driveshaft contacts the transmission (differential) with solvent, and dry with compressed air. Then install the driveshaft, be sure not to allow dust or other foreign particles to enter the transmission. Turn the steering knuckle fully outward, and slide the driveshaft into the differential until you feel its set ring fully engage the side gear.
12. Attach the torque converter to the drive plate with the eight bolts (A). Rotate the crankshaft pulley as necessary to tighten the bolts to 1/2 of the specified torque, then to the final torque, in a crisscross pattern. After tightening the last bolt, check that the crankshaft rotate freely.

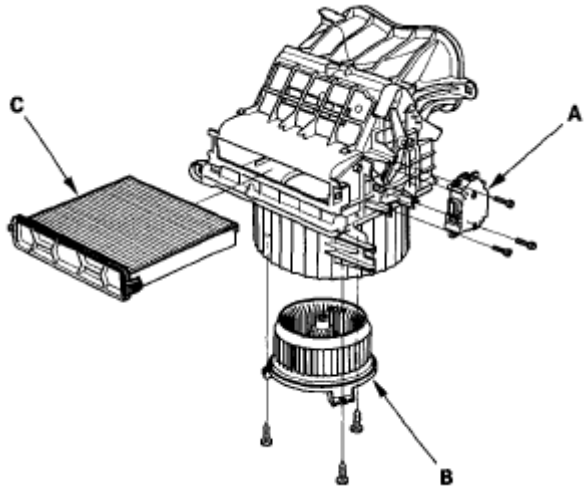

Fig. 261: Identifying Torque Converter Cover And Bolts w/Torque Specifications

13. Install the torque converter cover.
14. Install the shift cable holder bracket.

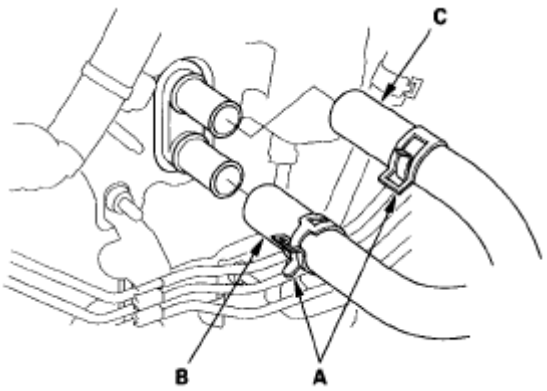

Fig. 262: Identifying Shift Cable Holder Bracket And Bolts w/Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Install the control lever (A) over the control shaft (B).

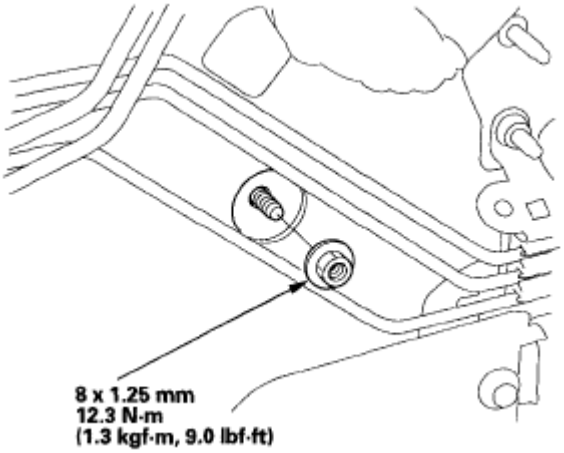

Fig. 263: Identifying Control Lever, Control Shaft, Shift Cable Holder & Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Install the shift cable holder (C) on the holder bracket (D) with tightening bolts loosely. Tighten the bolts (E) in the lateral position to the specified torque, then tighten the bolt (F) in the vertical position.
17. Secure the control lever with a new lock washer (G) and the lock bolt (H), then bend the lock tab of the lock washer against the bolt head.
18. Install the shift cable cover (I).
19. Set the front subframe adapter (VSB02C000016) to the front subframe by looping the strap (A) over the front of the front subframe, then secure the strap with the stop (B), then tighten the wing nut (C).

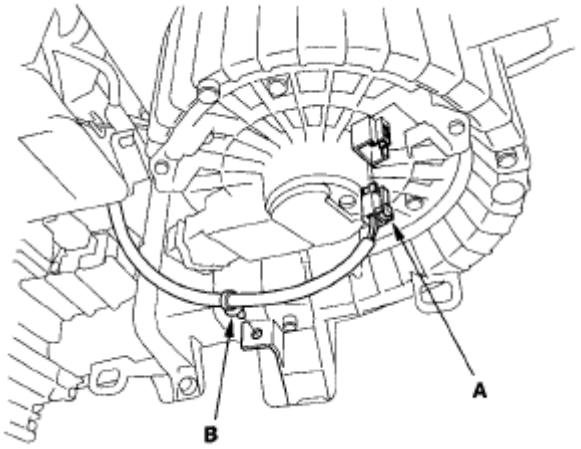

Fig. 264: Setting Front Subframe Adapter (VSB02C000016) To Front Subframe
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Line up the slots in the arms with the bolt holes on the corner of the jack base, and tighten the bolts, then lift the front subframe up to the body.
21. Loosely install the new front subframe mounting bolts.

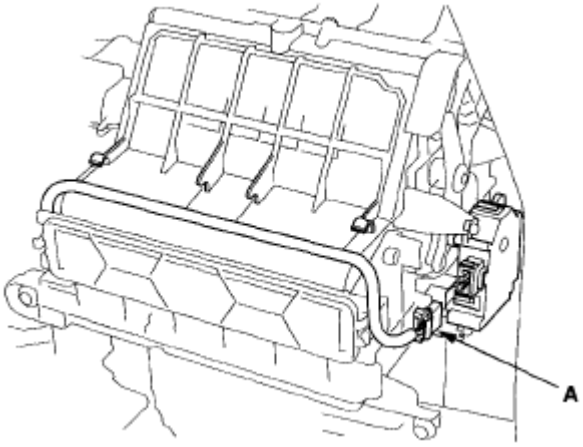

Fig. 265: Lifting Front Subframe Up To Body, Bolts & Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

22. Align the front subframe reference marks (A) to the body (B), as noted during removal. Tighten the front subframe mounting bolts to the specified torque.

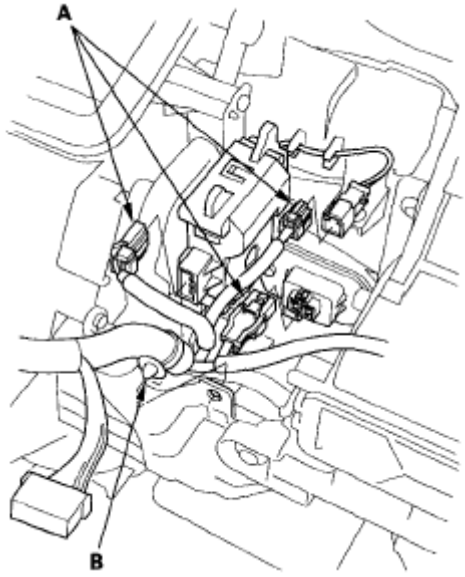

Fig. 266: Aligning Front Subframe Reference Marks To Body
Courtesy of AMERICAN HONDA MOTOR CO., INC.

23. Secure the lower torque rod with new bolts.

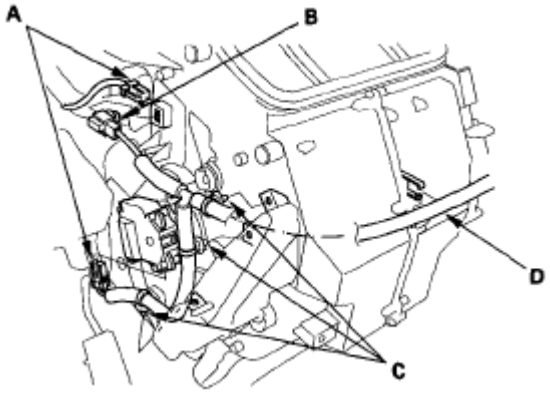

Fig. 267: Identifying Lower Torque Rod, Bolts & Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

24. Remove the engine support hanger, support bolt, and support eyelet from the vehicle.
25. Position the steering gearbox on the gearbox mounting bracket of the front subframe.
26. Install the gearbox stiffener (A) and the bolts, and tighten the bolts loosely.

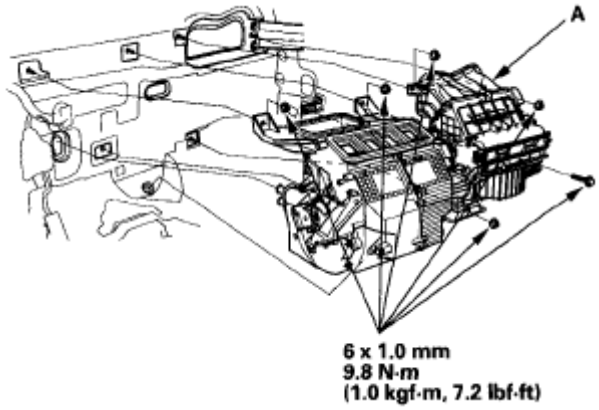

Fig. 268: Identifying Gearbox Stiffener And Bolts w/Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

27. Install the gearbox stiffener (A) and the bolts, and tighten the bolts loosely.

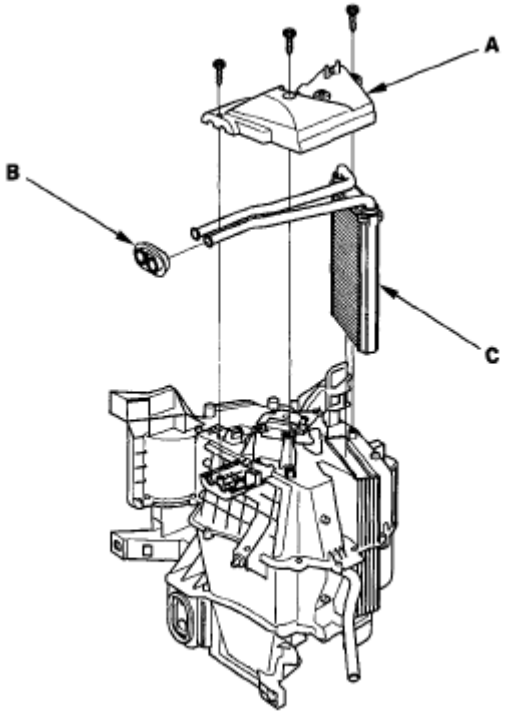

Fig. 269: Identifying Gearbox Stiffener, Power Steering Fluid Line Clamp Bracket, Bolts & Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

28. Secure the power steering fluid line clamp bracket (B) with the bolt.
29. Align the slit (A) of the gearbox mounting rubber (B) with the rear bracket surface (C), and install the steering gearbox mounting bracket (D) with pointing the arrow (E) up.

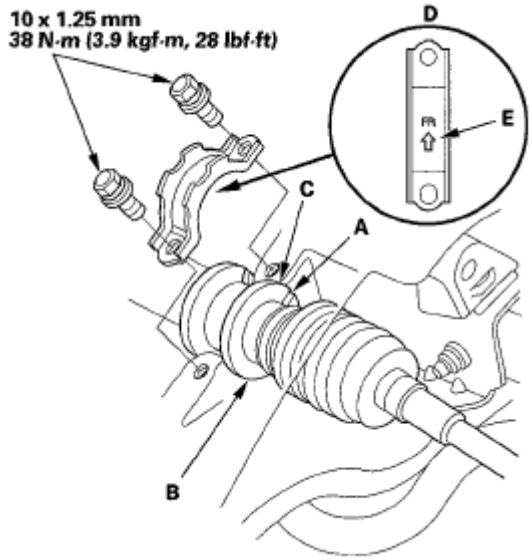

Fig. 270: Aligning Slit Of Gearbox Mounting Rubber, Rear Bracket Surface, And Bolts w/Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

30. Tighten the steering gearbox mounting bolts and the stiffener mounting bolts to the specified torque.
31. Secure the power steering fluid line bracket (A) with the bolt, and secure the line (B) with the clamp (C).

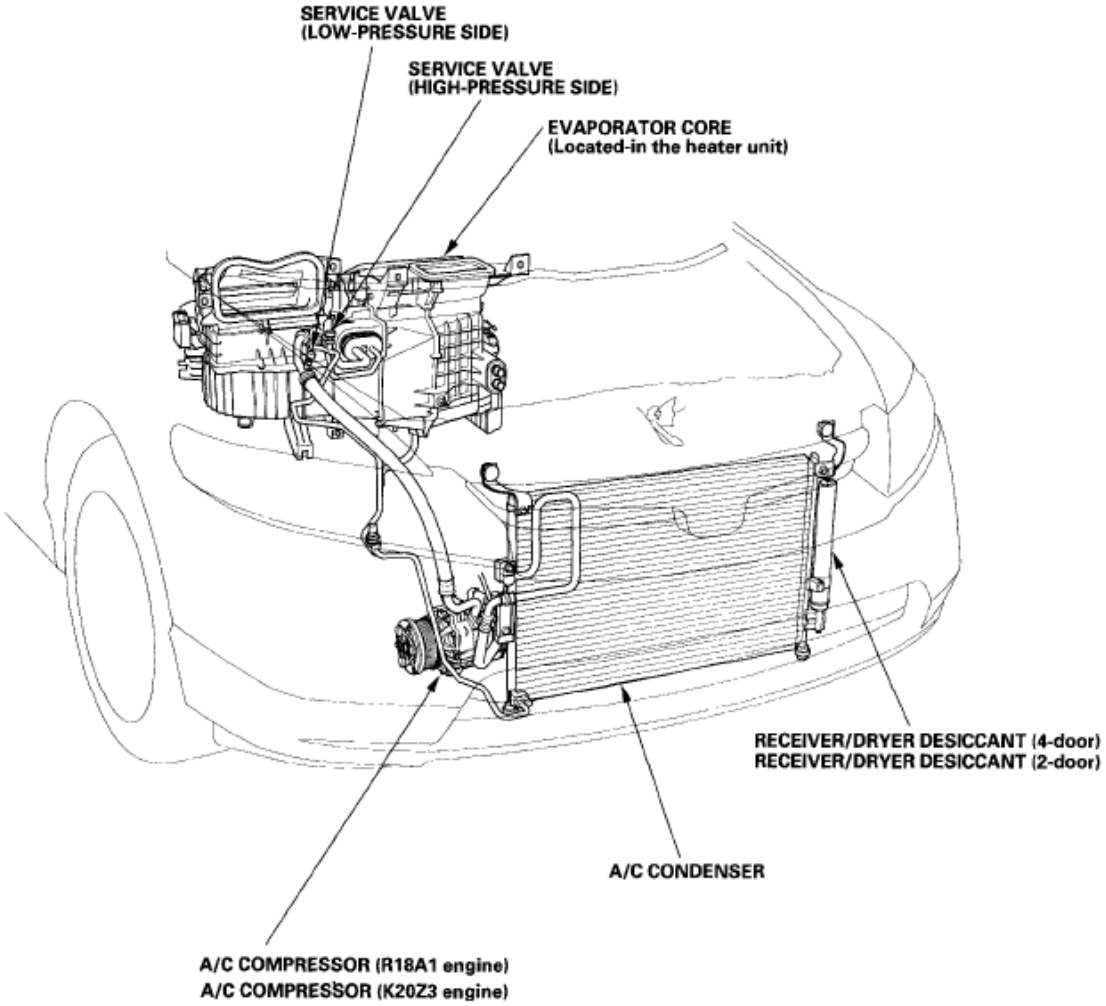

Fig. 271: Identifying Power Steering Fluid Line Bracket With Line, Clamp, Bolts & Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

32. Install both body mount brackets with new bolts.

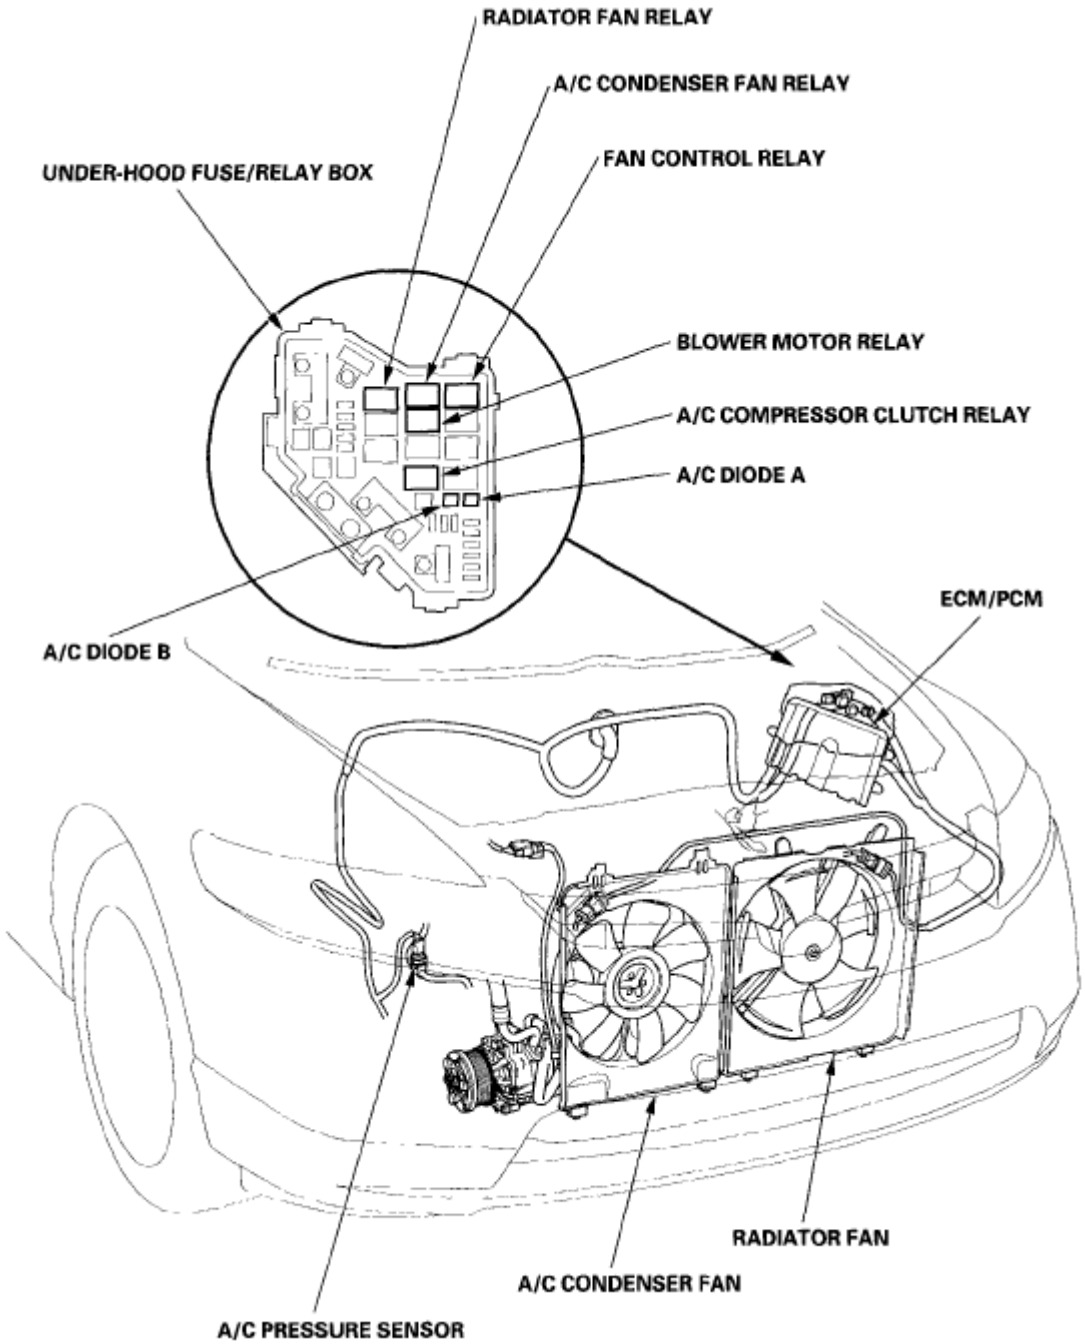

Fig. 272: Identifying Body Mount Brackets & Bolts w/Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

33. Install both of the lower arms (A) to the ball joints (B), and loosely install new mounting nuts and bolts.

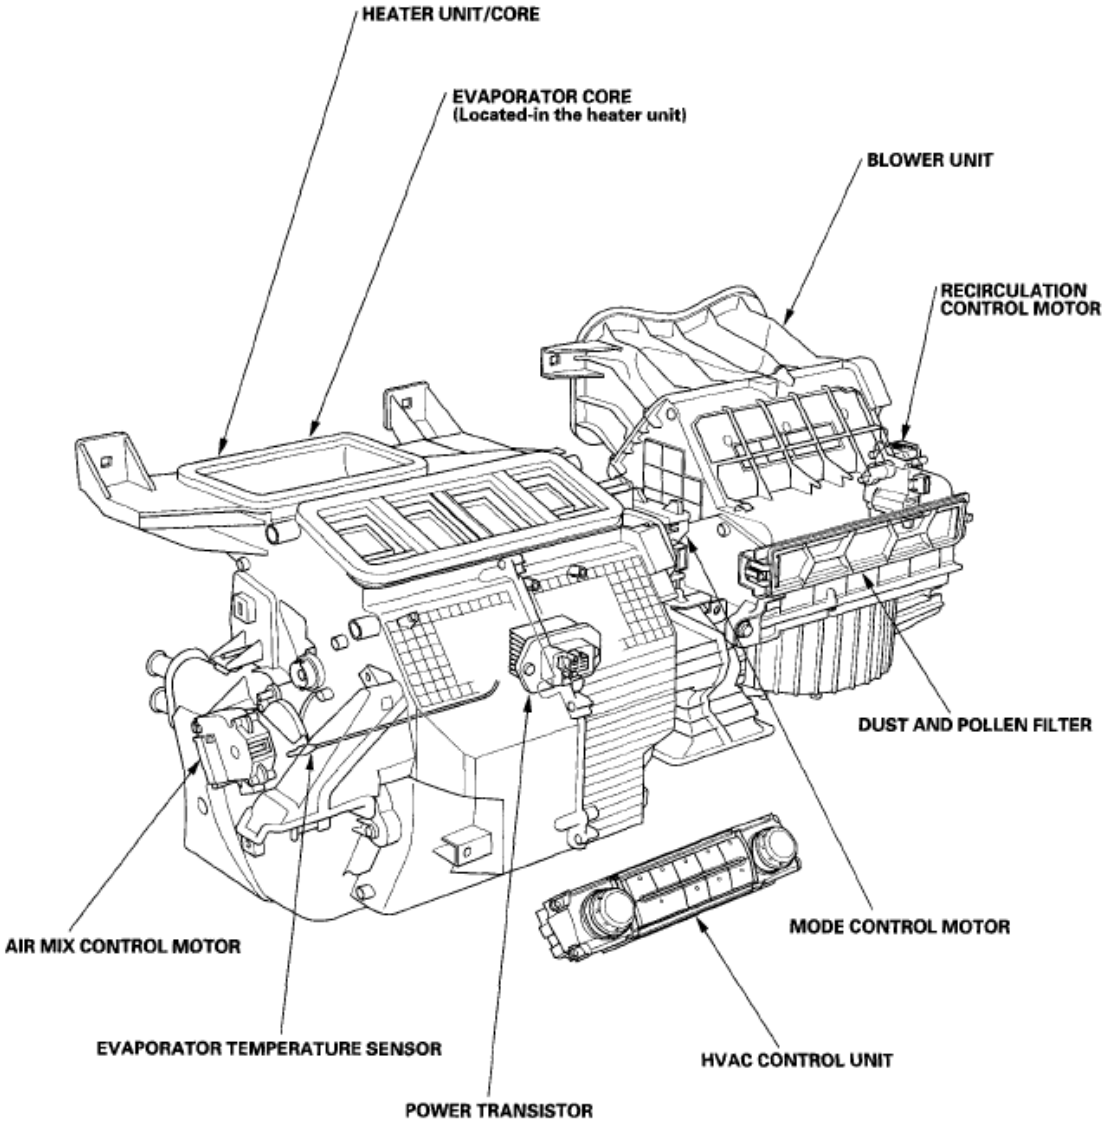

Fig. 273: Identifying Lower Arms, Ball Joints & Bolts w/Torque Specifications
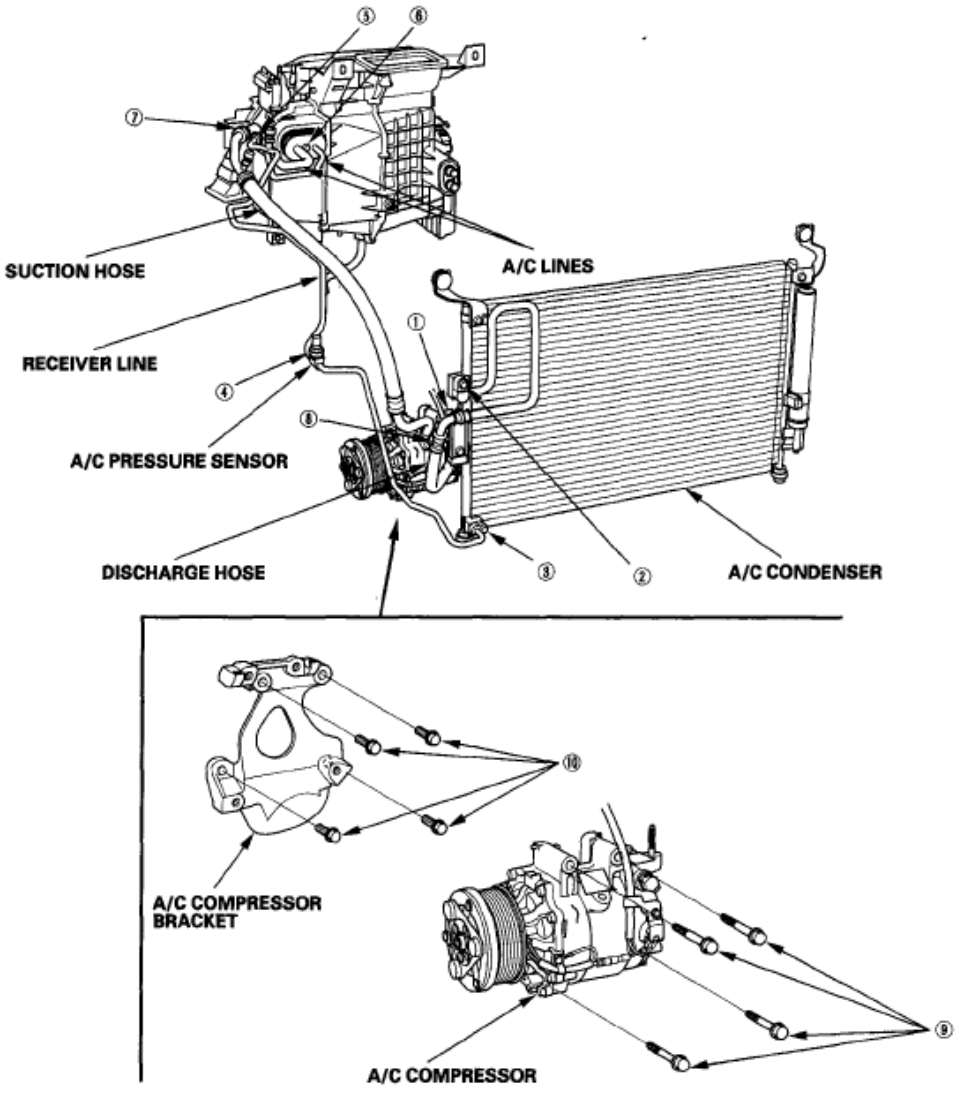
Courtesy of AMERICAN HONDA MOTOR CO., INC.

34. Tighten the nuts and the bolts to 59 N.m (6.0 kgf.m, 43 lbf.ft) in the following order; (C), (D), then (E).
35. Remove the support bolt and support eyelet from the cylinder head.



① Discharge hose to the A/C compressor (6 x 1.0 mm): 9.8 N·m (1.0 kgf·m, 7.2 lbf·ft)
② Discharge hose to the A/C condenser (6 x 1.0 mm): 9.8 N·m (1.0 kgf·m, 7.2 lbf·ft)
③ Receiver line to the A/C condenser (6 x 1.0 mm): 9.8 N·m (1.0 kgf·m, 7.2 lbf·ft)
④ A/C pressure sensor to receiver line (11 x 1.0 mm): 11.3 N·m (1.2 kgf·m, 8.3 lbf·ft)
⑤ Receiver line to the A/C line (16 x 1.5 mm): 13.3 N·m (1.4 kgf·m, 9.8 lbf·ft)
⑥ A/C lines to the evaporator (6 x 1.0 mm): 9.8 N·m (1.0 kgf·m, 7.2 lbf·ft)
⑦ A/C line to the suction hose (24 x 1.5 mm): 31.9 N·m (3.2 kgf·m, 23.5 lbf·ft)
⑧ Suction hose to the A/C compressor (6 x 1.0 mm): 9.8 N·m (1.0 kgf·m, 7.2 lbf·ft)
⑨ A/C compressor to the A/C compressor bracket (8 x 1.25 mm): 22 N·m (2.2 kgf·m, 16 lbf·ft)
⑩ A/C compressor bracket to the engine block (8 x 1.25 mm): 24 N·m (2.4 kgf·m, 17.7 lbf·ft)

36. Install the air cleaner housing mounting bracket (A) on the cylinder head.

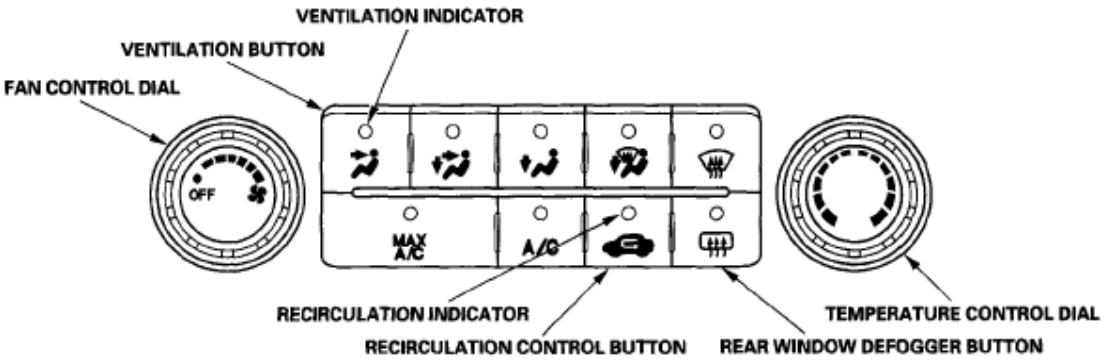

Fig. 275: Identifying Air Cleaner Housing Mounting Bracket & Bolt w/Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

37. Connect the shift solenoid harness connector (A) and the 3rd clutch transmission fluid pressure switch connector (B), and install the harness clamps (C) on the clamp brackets (D).

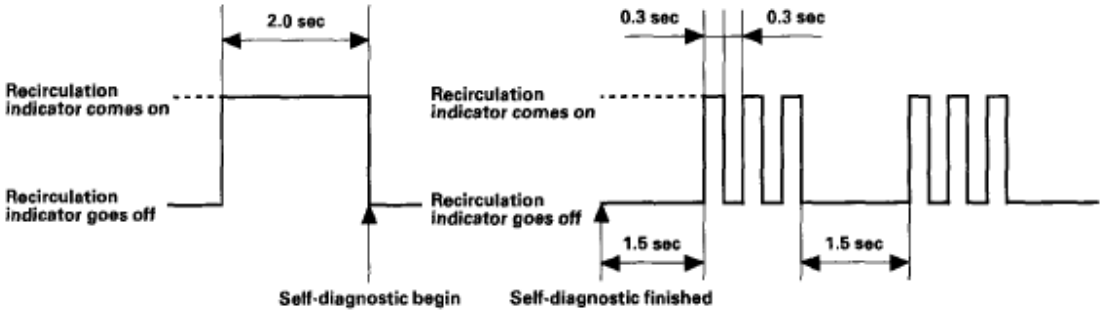

Fig. 276: Identifying Shift Solenoid Connector, 3rd Clutch Transmission Fluid Pressure Switch Connector, Clamps And Clamp Brackets

38. Install the harness clamp (A) in its bracket (B), and install the radiator hose (C) in the clamp (D).

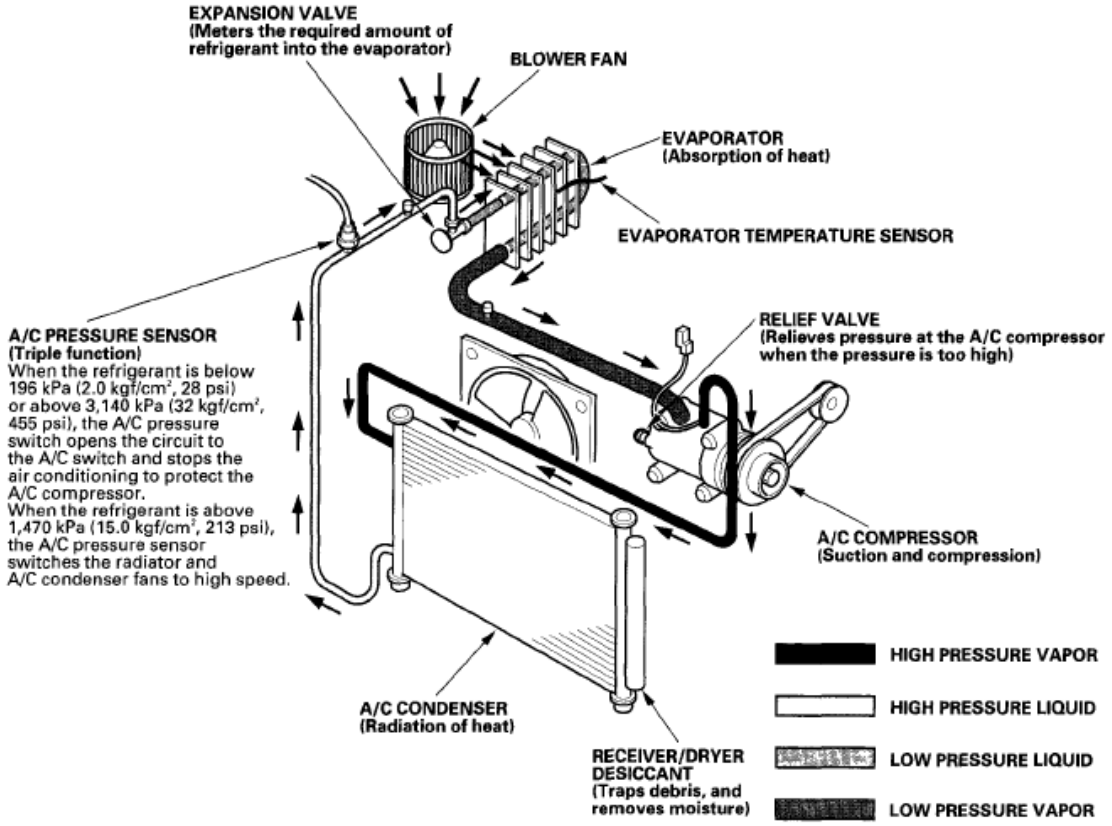

Fig. 277: Identifying Harness Clamp, Bracket, Radiator Hose And Clamp
Courtesy of AMERICAN HONDA MOTOR CO., INC.

39. Install the ATF warmer (A) on the bracket (B).

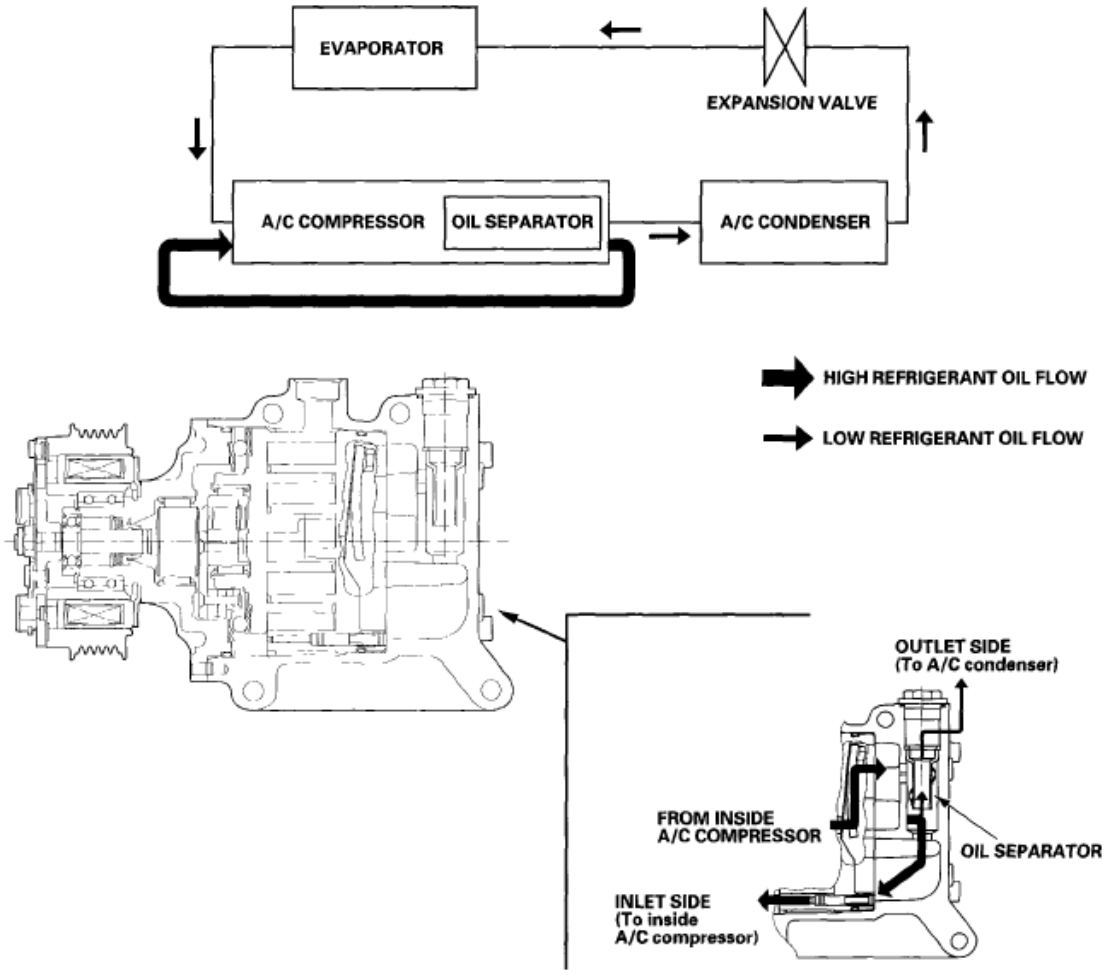

Fig. 278: Identifying ATF Warmer, Bracket & Bolts w/Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

40. Connect the ATF warmer hoses (A) to the ATF lines (B), and secure the hoses with the clips (C) (see **DRIVE PLATE REMOVAL AND INSTALLATION**).

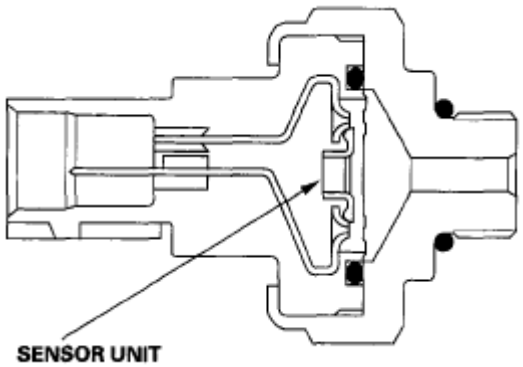

Fig. 279: Identifying ATF Warmer Hoses, ATF Lines, Hoses And Clips
Courtesy of AMERICAN HONDA MOTOR CO., INC.

41. Connect the input shaft (mainshaft) speed sensor connector (A) and the 2nd clutch transmission fluid pressure switch connector (B).

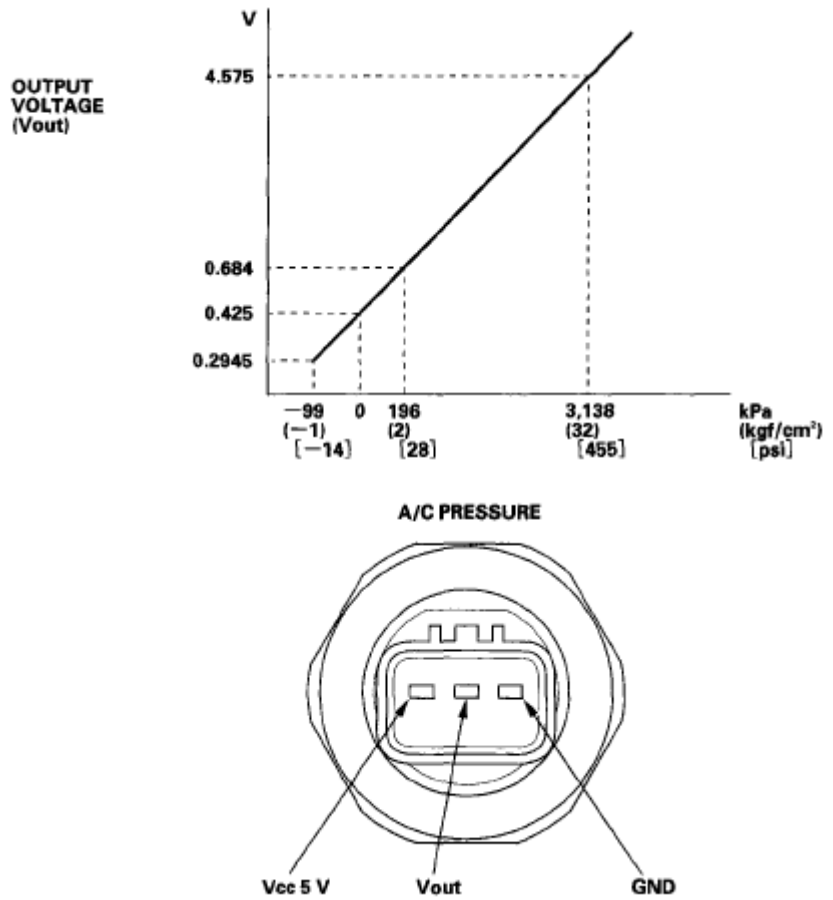

Fig. 280: Identifying Input Shaft (Mainshaft) Speed Sensor Connector And 2nd Clutch Transmission Fluid Pressure Switch Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

42. Connect the transmission range switch connector (A) and the output shaft (countershaft) speed sensor connector (B), and install the harness clamps (C) on the brackets (D).

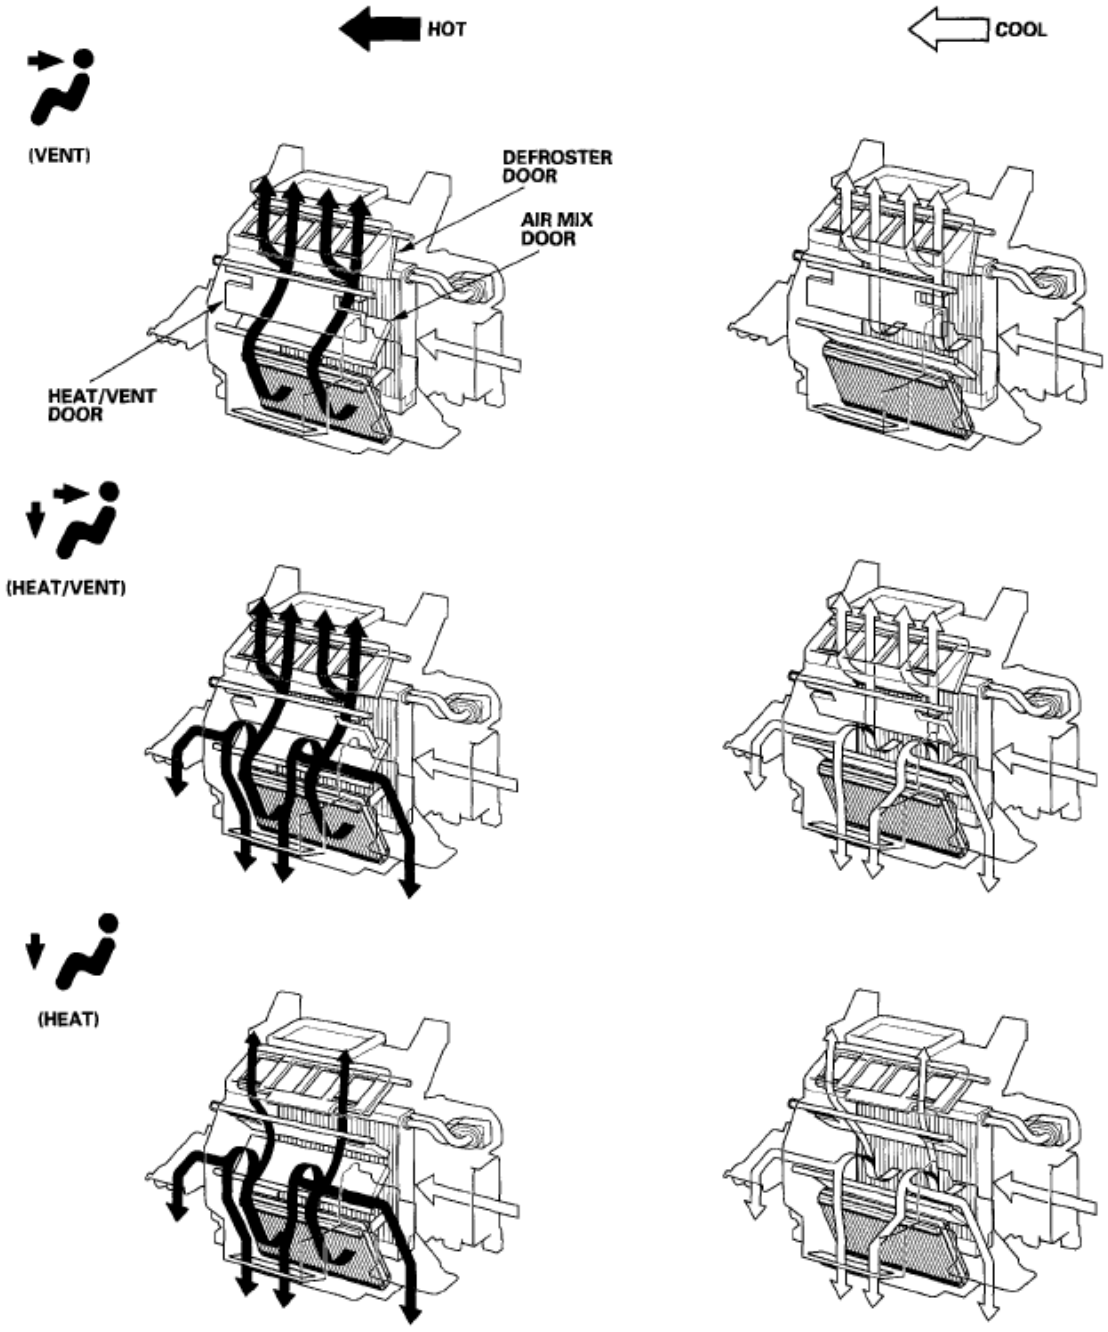

Fig. 281: Identifying Transmission Range Switch Connector And Output Shaft (Countershaft) Speed Sensor Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

43. Install the air cleaner housing mounting bracket (A), and install the harness clamp (B) on its bracket (C).

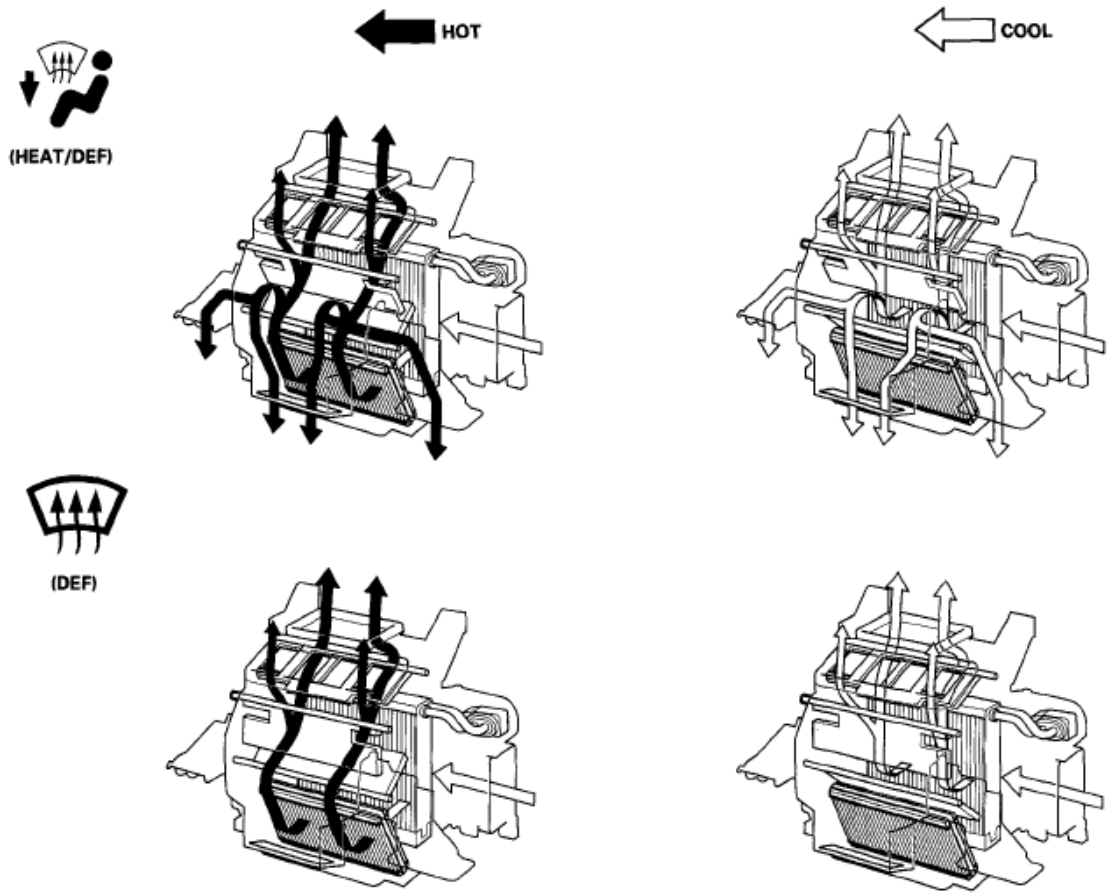

Fig. 282: Identifying Air Cleaner Housing Mounting Bracket w/Torque Specification And Harness Clamp
Courtesy of AMERICAN HONDA MOTOR CO., INC.

44. Connect the A/T clutch pressure control solenoid valve A connector (A), the A/T clutch pressure control solenoid valve B connector (B), and the A/T clutch pressure control solenoid valve C connector (C).

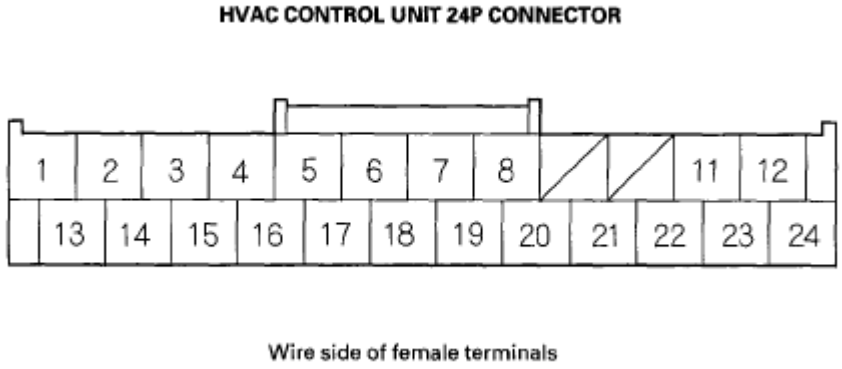

Fig. 283: Identifying A/T Clutch Pressure Control Solenoid Valve A Connector And A/T Clutch Pressure Control Solenoid Valve B Connector w/Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

45. Secure the harness cover (D) with the mounting bolts, and install the harness clamp (E) on its bracket (F).

46. Loosen the upper torque rod bolt (A).

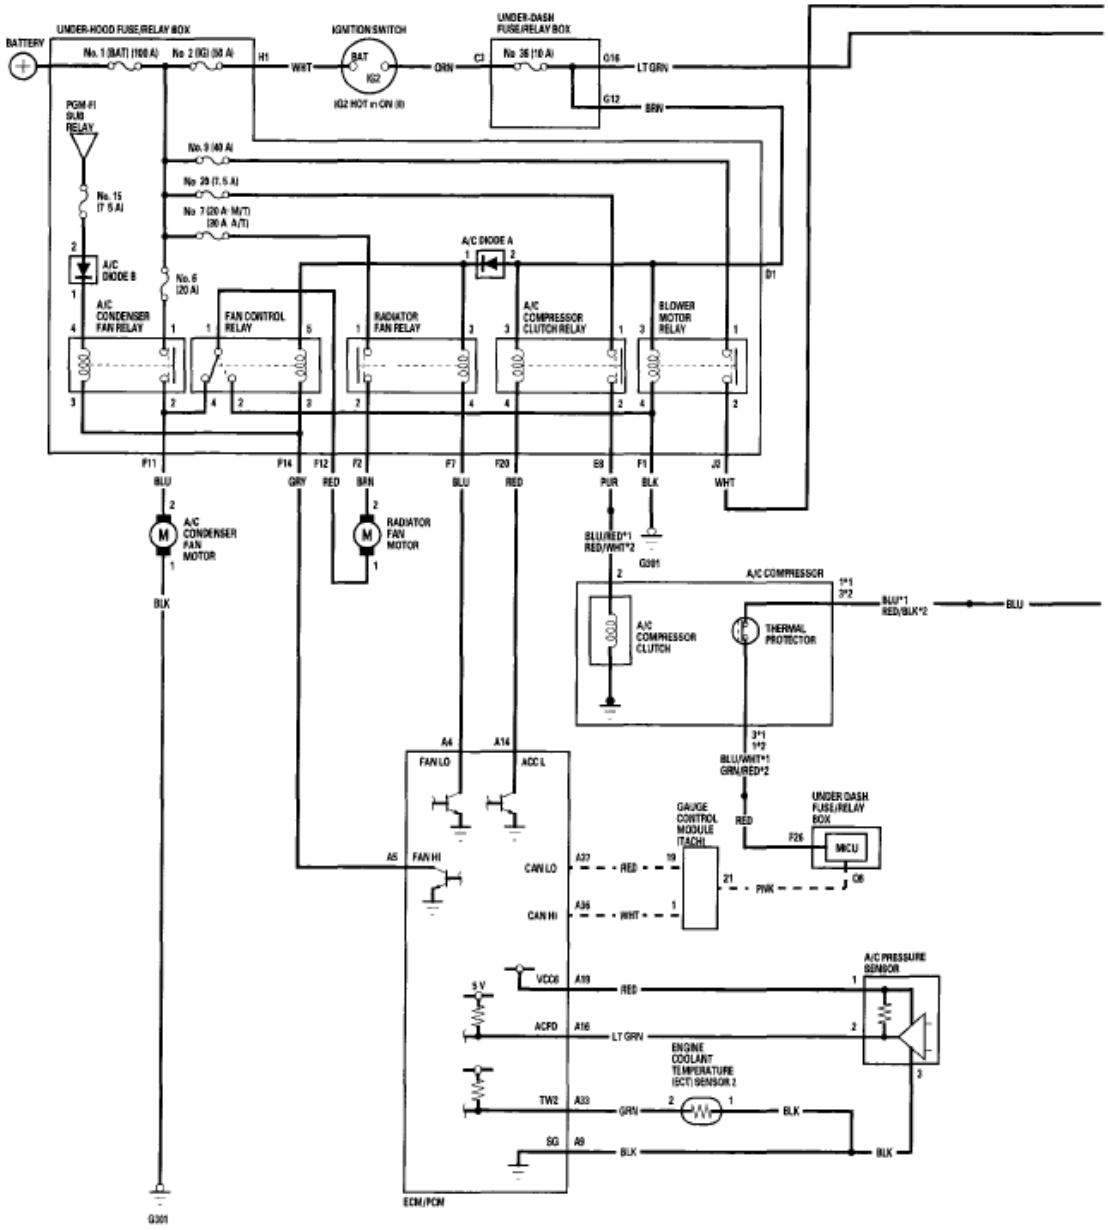

Fig. 284: Identifying Upper Torque Rod Bolt w/Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

47. Loosen the transmission mounting bolt (A) and the nuts (B).

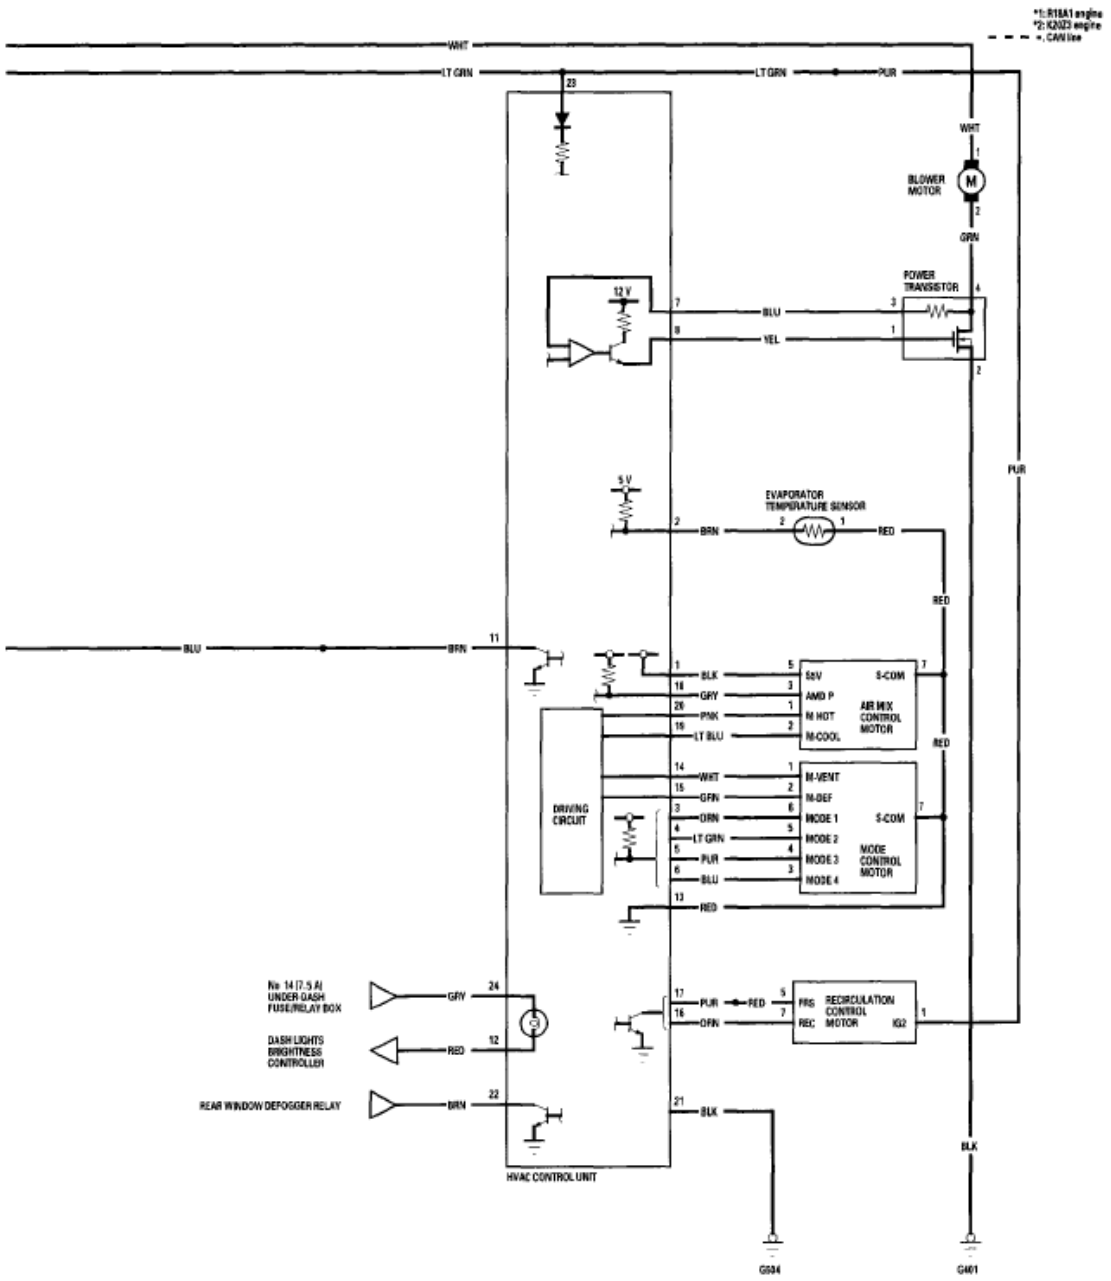

Fig. 285: Identifying Transmission Mounting Bolt, Nuts & Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

48. Loosen the lower torque rod bolt (A).

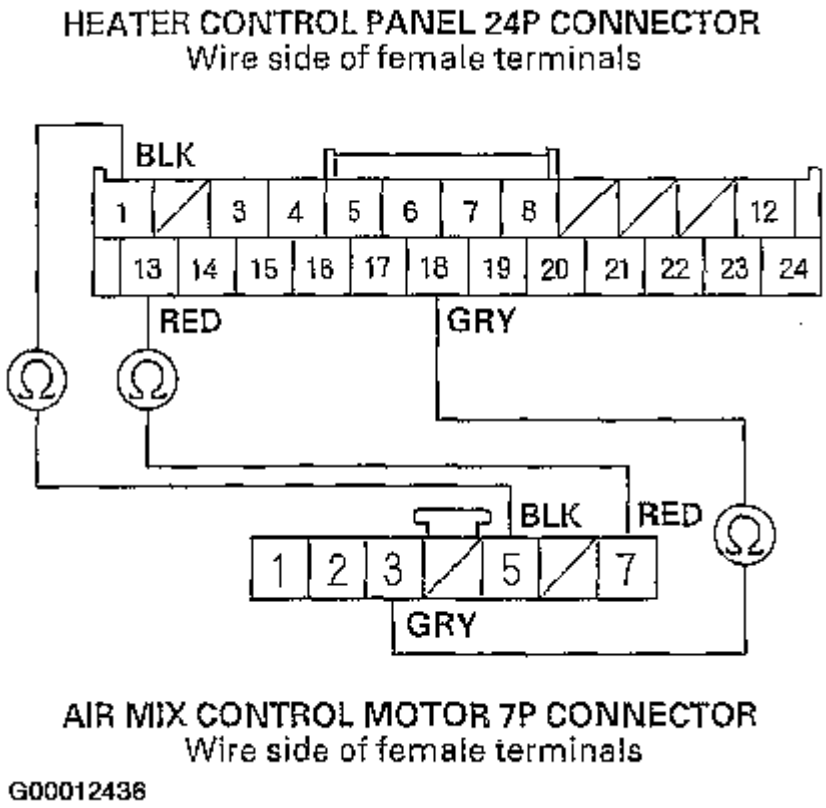

Fig. 286: Identifying Lower Torque Rod Bolt w/Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

49. Tighten the lower torque rod bolt.
50. Tighten the transmission mounting bolt and the nuts.
51. Tighten the upper torque rod bolt.
52. Refill the transmission with ATF (see step 5).
53. Install the battery base and the resonator.
54. Install the intake air duct and the air cleaner assembly (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**).
55. Install the grille cover (see **FRONT GRILLE COVER REPLACEMENT**).
56. Install the under-cowl panel and the cowl cover (see **COWL COVER REPLACEMENT**).
57. Install the battery tray and the battery, then secure the battery with its hold-down bracket.
58. Install the wheels.
59. Reconnect the positive cable to the battery, then connect the negative cable.
60. Set the parking brake. Start the engine, and shift the transmission through all positions three times.
61. Check the shift lever operation, the A/T gear position indicator operation, and the shift cable adjustment.
62. Check and adjust the front wheel alignment (see **WHEEL ALIGNMENT**).
63. Install the splash shield.
64. Start the engine in P or N, and warm it up to normal operating temperature (the radiator fan comes on). Turn off the engine, and check the ATF level (see **ATF LEVEL CHECK**).
65. Enter the anti-theft code for the audio system or the navigation system (if equipped), then enter the

audio presets. Set the clock (on vehicles without navigation).

66. Do the road test (see **ROAD TEST**).

DRIVE PLATE REMOVAL AND INSTALLATION

1. Remove the transmission assembly (see **TRANSMISSION REMOVAL**).
2. Remove the drive plate (A) and the washer (B) from the engine.

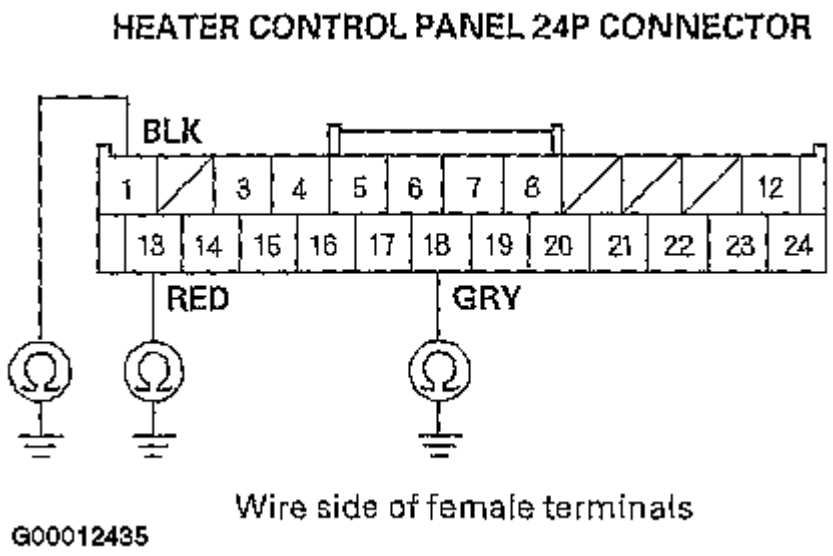

Fig. 287: Identifying Drive Plate, Washer & Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the drive plate and the washer on the engine crankshaft, and tighten the eight bolts in a crisscross pattern in two or more steps.
4. Install the transmission assembly (see **TRANSMISSION INSTALLATION**).

ATF WARMER HOSE REPLACEMENT

1. Slide the ATF warmer hoses (A) on the ATF filter (B) until the hose ends contact the filter housing, and secure the hoses with the clips (C) at 6-8 mm (0.24-0.31 in.) (D) from the filter housing.

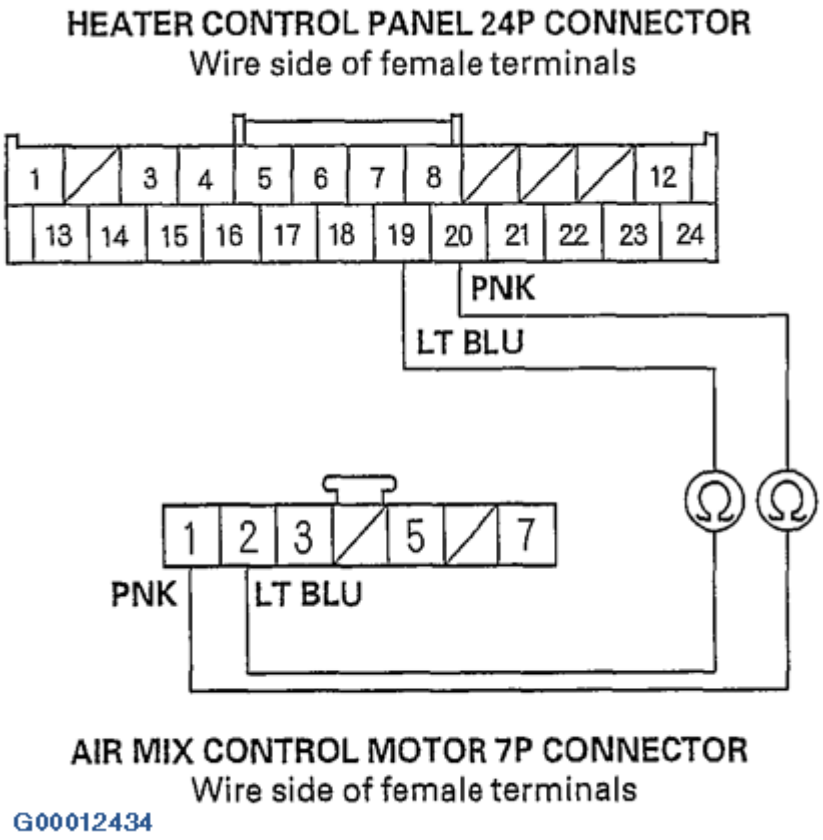

Fig. 288: Identifying ATF Warmer Hoses And ATF Filter
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Slide the ATF warmer hoses (E) over the ATF lines (F) until the hoses stop, and secure the hoses with the clip (G) at 6-8 mm (0.24-0.31 in.) (H) from the hose end.
3. Slide the ATF warmer hoses (I) over the ATF warmer lines (J) until the hose ends contact the bulge (K), and secure the hoses with the clip (L) at 6-8 mm (0.24-0.31 in.) (M) from the hose end.

ATF WARMER REPLACEMENT

1. Remove the splash shield.
2. Drain the engine coolant (see **COOLANT REPLACEMENT**).
3. Make sure you have the anti-theft code for the audio system or the navigation system (if equipped), then write down the audio presets.
4. Disconnect the negative cable from the battery, then disconnect the positive cable.
5. Remove the battery hold-down bracket, and remove the battery and the battery tray.
6. Remove the air cleaner assembly (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**) and the intake air duct.
7. Remove the battery base and the resonator.
8. Disconnect the water by-pass hoses (A) and the ATF warmer hoses (B) from the ATF warmer (C), and turn the hose ends up to prevent fluid from flowing out.

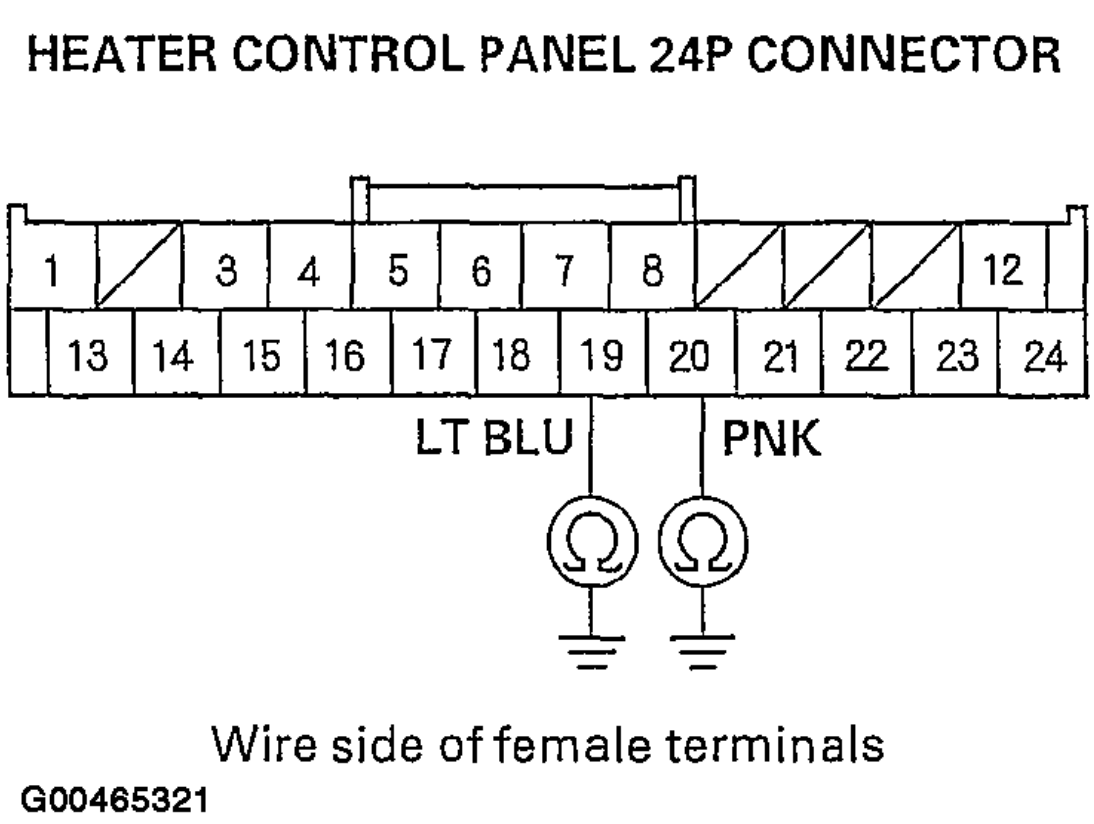

Fig. 289: Identifying Water By-Pass Hoses, ATF Warmer Hoses & Bolts w/Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Remove the ATF warmer, and replace it with new one.
10. Install a new ATF warmer on its bracket (D).
11. Slide the water by-pass hoses to the ATF warmer, and secure the hoses with the clips.
12. Slide the ATF warmer hoses over the ATF warmer lines (E) until the hose ends contact the bulge (F), and secure the hoses with the clip (G) at 6-8 mm (0.24-0.31 in.) (H) from the hose end.
13. Install the battery base and the resonator.
14. Install the intake air duct and the air cleaner assembly (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**).
15. Install the battery tray and the battery, then secure the battery with its hold-down bracket.
16. Reconnect the positive cable to the battery, then connect the negative cable.
17. Install the splash shield.
18. Check the ATF level, and add ATF to proper level if necessary (see **ATF LEVEL CHECK**).
19. Fill the engine cooling system with recommended coolant (see step 9 on **COOLANT REPLACEMENT**).
20. Start the engine in P or N, and warm it up to normal operating temperature (the radiator fan comes on). Turn off the engine, and recheck the ATF level (see **ATF LEVEL CHECK**).
21. Enter the anti-theft code for the audio system or the navigation system (if equipped), then enter the audio presets. Set the clock (on vehicles without navigation).

ATF FILTER REPLACEMENT

1. Remove the air cleaner assembly (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**) and the intake air duct.
2. Disconnect the ATF warmer hose (A) from the ATF filter (B).

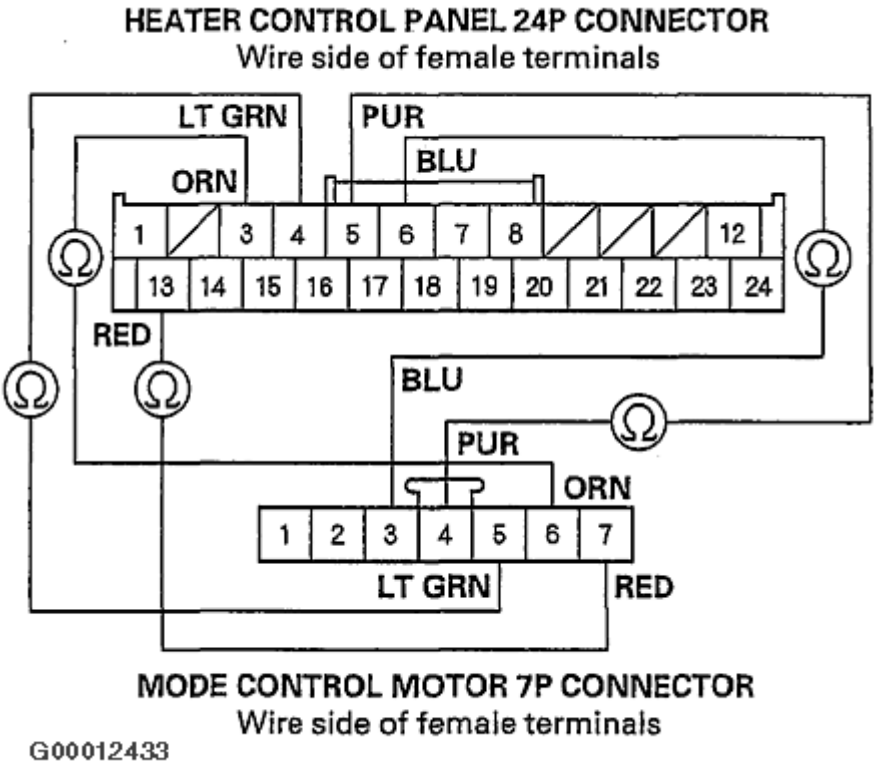

Fig. 290: Identifying ATF Warmer Hose, ATF Filter & Bolts w/Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the ATF filter holder (C).
4. Remove the bolt (D) securing the ATF inlet line (E).
5. Remove the joint bolt (F) from the ATF inlet line.
6. Disconnect the ATF filter from the ATF warmer hose (G), and replace it with new one.
7. Slide the ATF warmer hose (A) on the new ATF filter until the hose end contacts the filter housing, and secure the hose with the clip (H) at 6-8 mm (0.24-0.31 in.) (I) from the filter housing.
8. Install the ATF filter and the ATF inlet line/hose with the joint bolt and new sealing washers (J).
9. Secure the ATF filter with the ATF filter holder and the bolt.
10. Slide the ATF warmer hose (G) on the ATF filter until the hose end contacts the filter housing, and secure the hose with the clip (K) at 6-8 mm (0.24-0.31 in.) (L) from the filter housing.
11. Install the intake air duct and the air cleaner assembly (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**).

SHIFT LEVER REMOVAL

1. Remove the center console (see **CENTER CONSOLE REMOVAL/INSTALLATION**).
2. Shift the shift lever into R.

3. Pry the socket holder lock (A) up using a screwdriver.

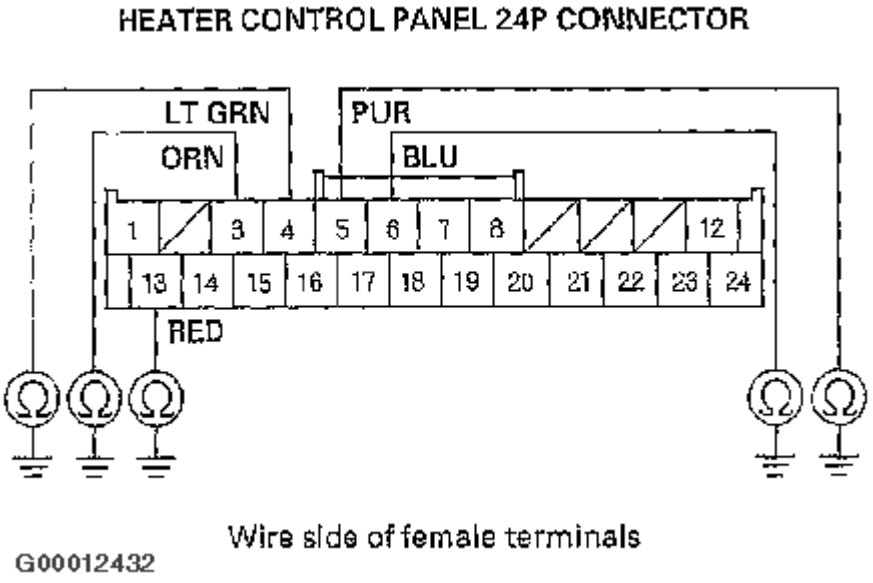

Fig. 291: Prying Socket Holder Lock
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the nut securing the shift cable end.

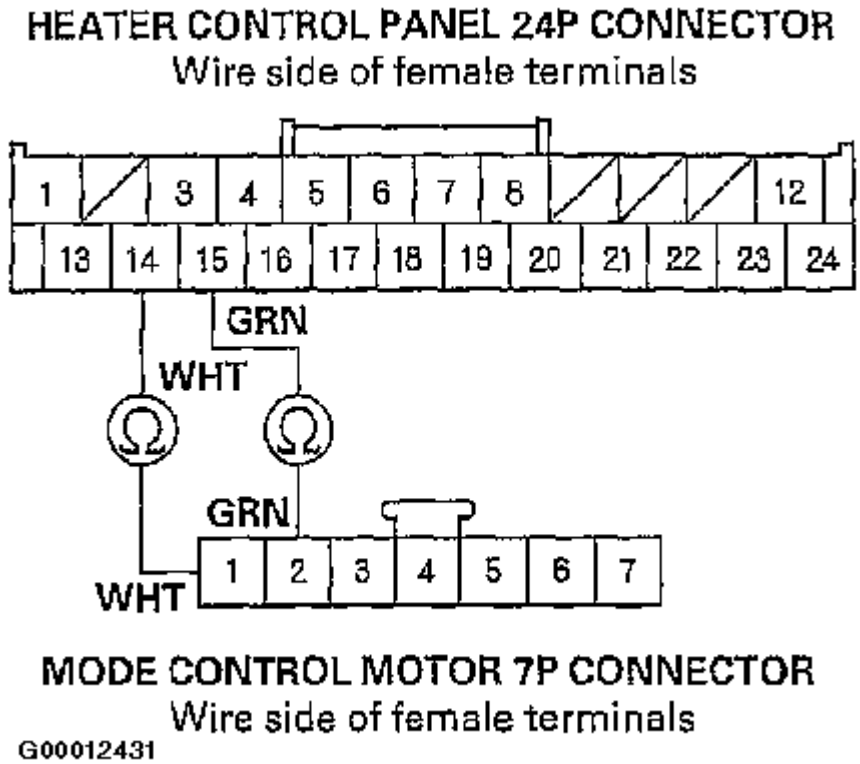

Fig. 292: Identifying Shift Cable Nut
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Rotate the socket holder retainer (A) counterclockwise, push it against the socket holder bracket (B), then slide the socket holder to remove the shift cable (C) from the bracket.

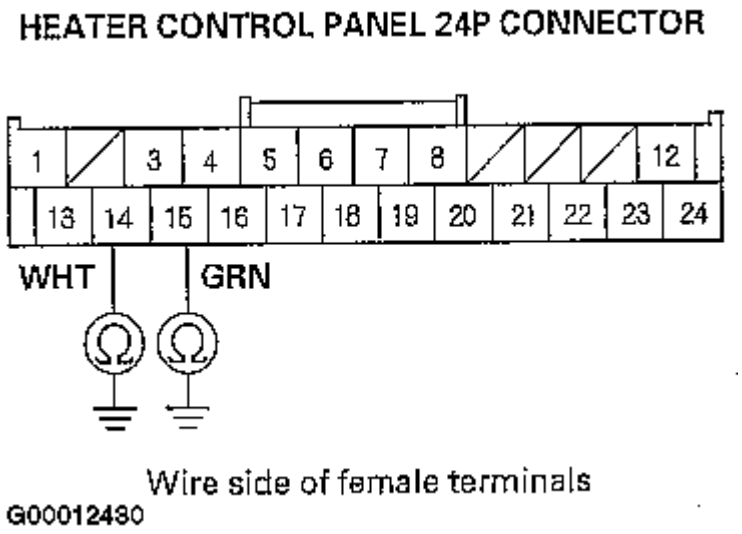

Fig. 293: Identifying Socket Holder Retainer, Socket Holder Bracket And Shift Cable
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Disconnect the shift lock solenoid connector (A) and the park pin switch/A/T gear position indicator panel light connector (B).

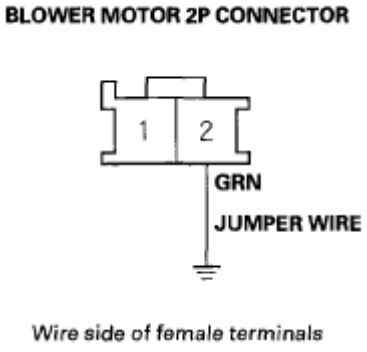

Fig. 294: Identifying Shift Lock Solenoid Connector And Park Pin Switch/A/T Gear Position Indicator Panel Light Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Remove the shift lever assembly.

SHIFT LEVER INSTALLATION

1. Install the shift lever assembly.

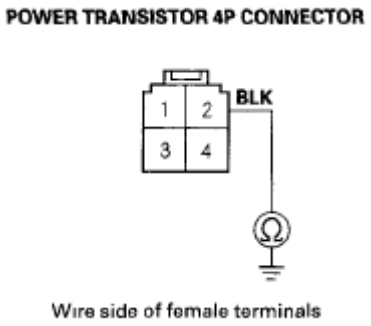

Fig. 295: Identifying Shift Lock Solenoid Connector, Park Pin Switch/A/T Gear Position Indicator Panel Light Connector & Bolts w/Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Connect the shift lock solenoid connector (A) and the park pin switch/A/T gear position indicator panel light connector (B).
3. Install the shift cable on the shift lever, and adjust the cable (see **SHIFT CABLE ADJUSTMENT**).

SHIFT LEVER DISASSEMBLY/REASSEMBLY

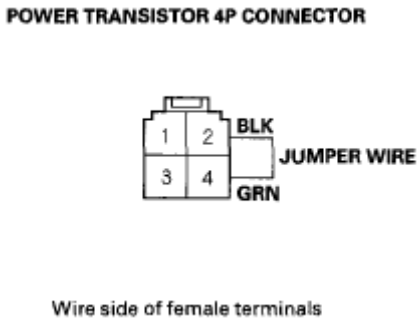

Fig. 296: Disassembling Shift Lever & Screws w/Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SHIFT CABLE REPLACEMENT

1. Raise the vehicle on a lift or apply the parking brake, block rear wheels, and raise the front of the vehicle. Make sure it is securely supported.
2. Remove the center console (see **CENTER CONSOLE REMOVAL/INSTALLATION**).
3. Pry the socket holder lock (A) up using a screwdriver.

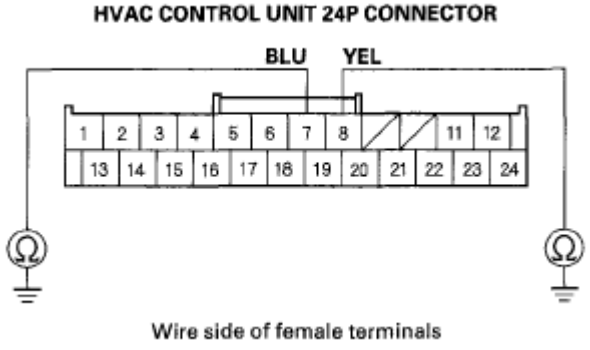

Fig. 297: Prying Socket Holder Lock
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the nut securing the shift cable end.

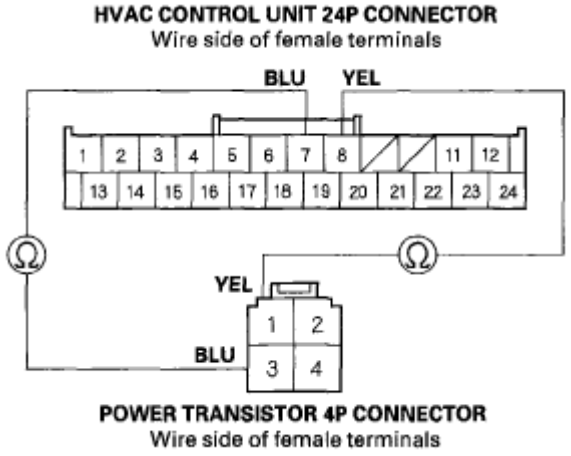

Fig. 298: Identifying Shift Cable Nut
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Rotate the socket holder retainer (A) counterclockwise, push it against the socket holder bracket (B), then slide the socket holder to remove the shift cable (C) from the bracket.

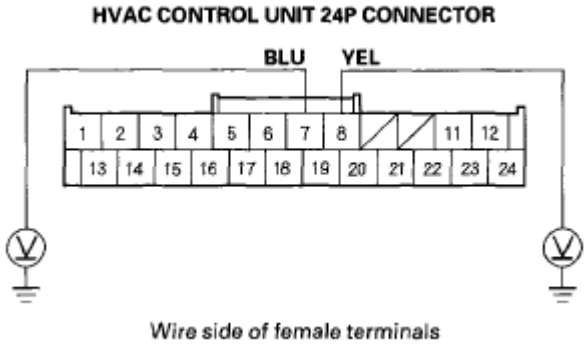

Fig. 299: Identifying Socket Holder Retainer, Socket Holder Bracket And Shift Cable
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Remove the shift cable cover (A), and remove the three bolts securing the shift cable holder (B).

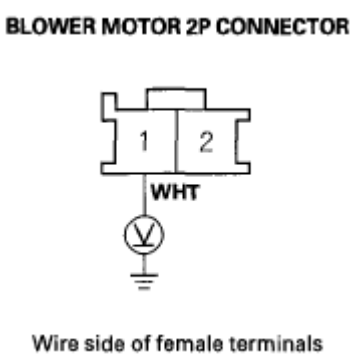

Fig. 300: Identifying Shift Cable Cover And Shift Cable Holder
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Pry up the lock tab of the lock washer (C), and remove the lock bolt (D) and the lock washer, then separate the shift cable (E) from the control shaft (F).
8. Remove the nuts securing the shift cable bracket (A) and the grommet (B).

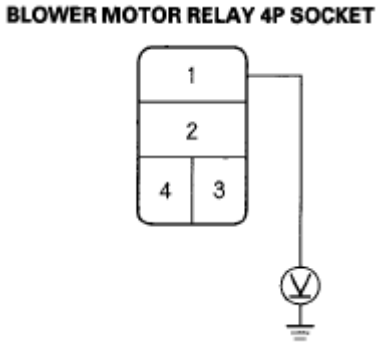

Fig. 301: Identifying Shift Cable Bracket, Grommet & Bolts w/Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Remove the shift cable grommet, and pull out the shift cable (C).
10. Insert a new shift cable through the grommet hole (D), and install the grommet in its hole. Do not bend the shift cable excessively.
11. Secure the shift cable bracket and the grommet with the nuts.
12. Make sure that the transmission is in the R position at the selector control shaft.
13. Install the control lever (A) over the control shaft (B).

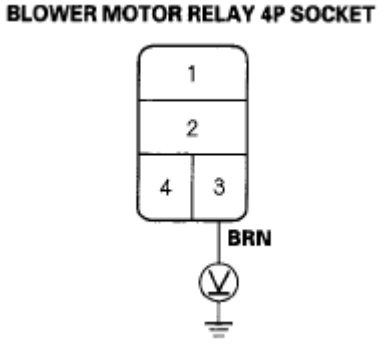

Fig. 302: Identifying Control Lever, Control Shaft, Shift Cable Holder & Bolts w/Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Install the shift cable holder (C) on the holder bracket (D) and tighten the bolts loosely. Tighten the bolts (E) in the lateral position to the specified torque, then tighten the bolt (F) in the vertical position.
15. Secure the control lever with a new lock washer (G) and the lock bolt (H), then bend the lock tab of the lock washer against the bolt head.
16. Install the shift cable cover (I).
17. Install the shift cable on the shift lever, and adjust the cable (see step 5).

SHIFT CABLE ADJUSTMENT

1. Remove the center console (see **CENTER CONSOLE REMOVAL/INSTALLATION**).
2. Pry the socket holder lock (A) up with a screwdriver.

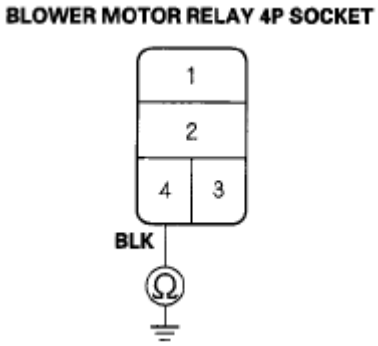

Fig. 303: Prying Socket Holder Lock
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the nut securing the shift cable end.

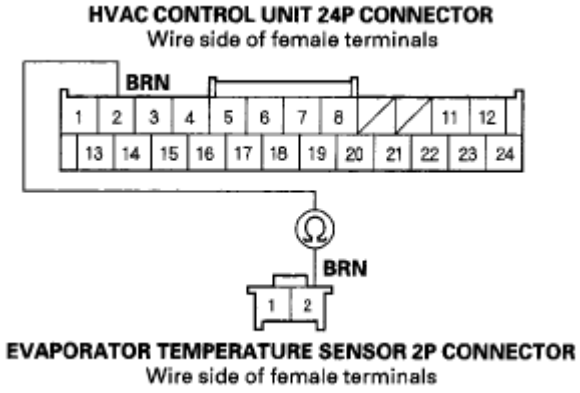

Fig. 304: Identifying Shift Cable Nut
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Rotate the socket holder retainer (A) counterclockwise, push it against the socket holder bracket (B), then slide the socket holder to remove the shift cable (C) from the bracket.

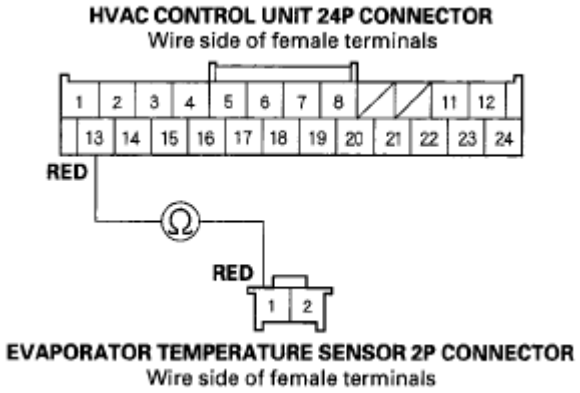

Fig. 305: Identifying Socket Holder Retainer And Socket Holder Bracket With Shift Cable
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. While holding the socket holder (A), rotate the socket holder retainer (B) fully counterclockwise, and press in the socket holder lock (C) between the holder and retainer.

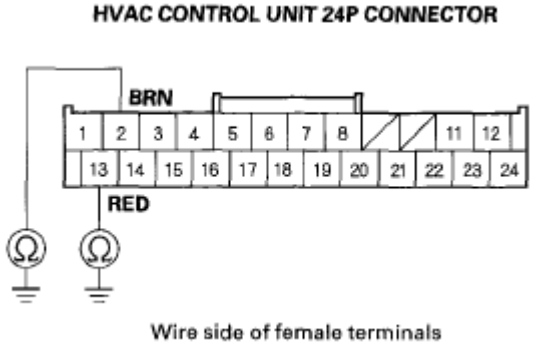

Fig. 306: Pressing Socket Holder Lock Between Holder And Retainer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Align the socket holder (A) with the slot (B) in the socket holder bracket (C), then slide the holder into the bracket.

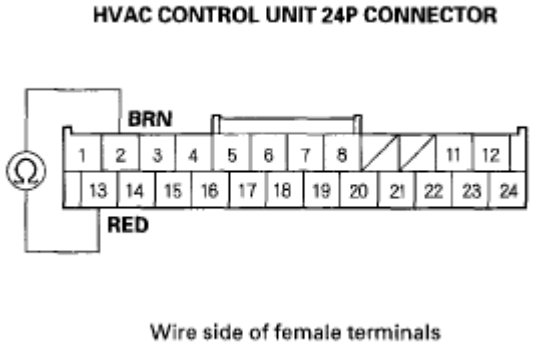

Fig. 307: Identifying Socket Holder And Socket Holder Bracket With Slot
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Rotate the socket holder retainer (A) clockwise, and push the socket holder lock (B). Rotate the holder retainer counterclockwise until the retainer stops at the stop (C) of the holder lock to secure the shift cable.

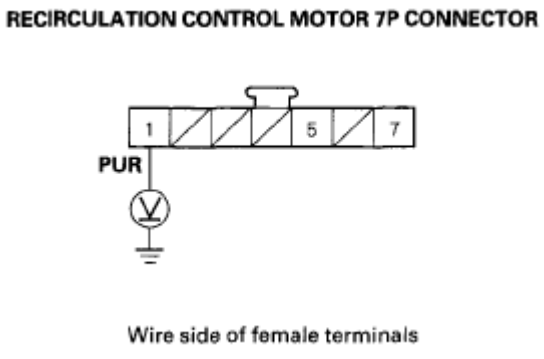

Fig. 308: Pushing Socket Holder Lock
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Push the shift cable (A) until it stops, then release it. Pull the shift cable back one step so that the shift position is in R. Do not hold the shift cable guide (B) to adjust the shift cable.

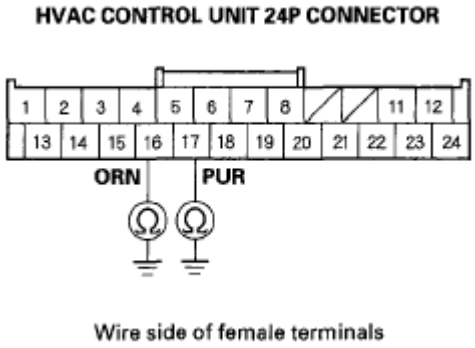

Fig. 309: Pushing Shift Cable
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Turn the ignition switch to ON (II), and check that the R indicator comes on.

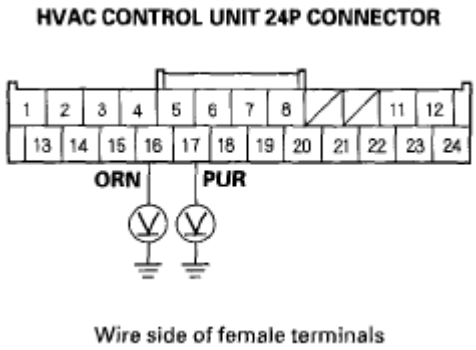

Fig. 310: Identifying R Indicator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Turn the ignition switch to LOCK (0).
11. Place the shift lever in R, then insert a 6.0 mm (0.24 in.) pin (A) into the positioning hole (B) on the shift lever bracket, through the positioning hole on the shift lever, and into the positioning hole on the bracket. Use only a 6.0 mm pin that is free any burns.

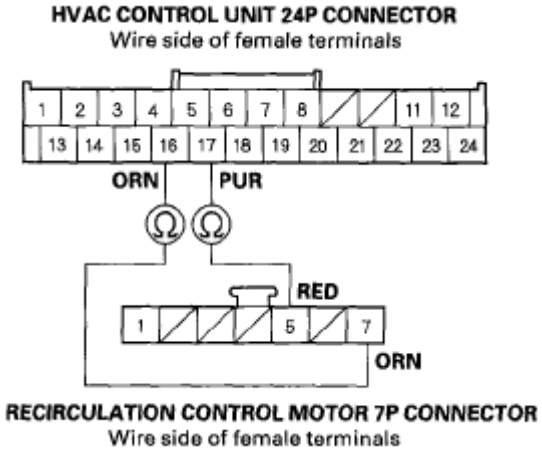

Fig. 311: Inserting Pin Into Hole On Shift Lever Bracket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Check that the shift lever is secured in R.
13. Install the shift cable end (A) over the mounting stud (B) by aligning its square hole (C) with the square fitting (D) at the bottom of the stud. Do not install the shift cable by holding the shift cable guide (E).

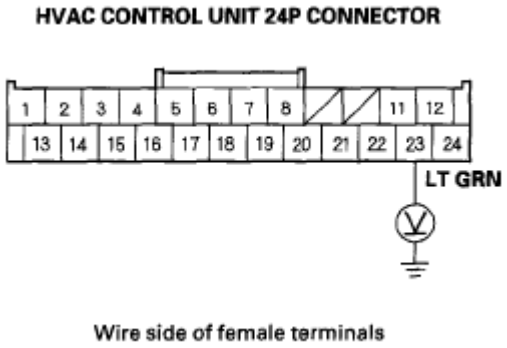

Fig. 312: Aligning Square Hole With Square Fitting
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Check that the shift cable end (A) is properly installed on the mounting stud (B).

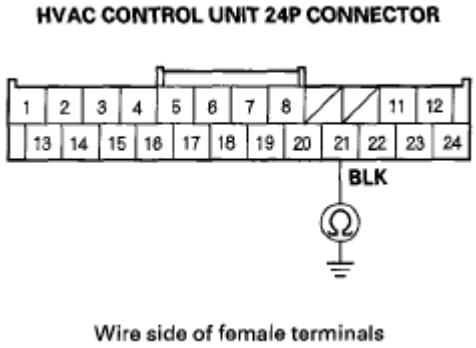

Fig. 313: Identifying Shift Cable Properly And Improperly Installation Position
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. If improperly installed, align the square fitting with the square hole by rotating the mounting stud.
16. Install and tighten the nut.

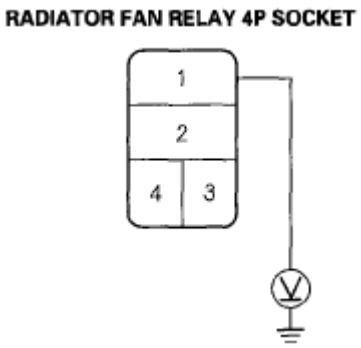

Fig. 314: Identifying Shift Cable Nuts w/Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Remove the 6.0 mm (0.24 in.) pin that was installed to hold the shift lever.
18. Turn the ignition switch to ON (II). Move the shift lever to each position, and check that the A/T gear position indicator follows the transmission range switch.
19. Shift to P, and check that the shift lock works properly. Push the shift lock release, and check that the shift lever releases.
20. Install the center console (see **CENTER CONSOLE REMOVAL/INSTALLATION**).

TRANSMISSION RANGE SWITCH TEST

1. Remove the air cleaner assembly (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**) and the intake air duct.
2. Disconnect the transmission range switch harness connector (A).

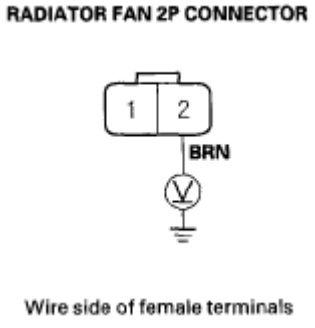

Fig. 317: Identifying Transmission Range Switch Harness Connector Terminal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Check for continuity between terminals at the harness connector. There should be continuity between the terminals in the following table for each switch position.

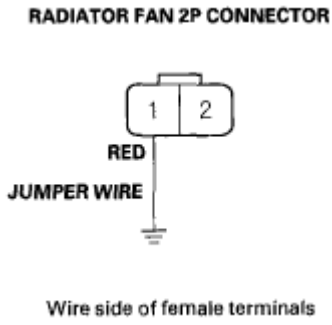

Fig. 318: Transmission Range Switch Harness Connector Continuity Chart
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Transmission range switch test is completed if the test results are OK.

   If there is no continuity between any terminals, go to step 5.

5. Raise the vehicle on a lift, or apply the parking brake, block the rear wheels, and raise the front of the vehicle. Make sure it is securely supported.
6. Remove the transmission range switch cover.

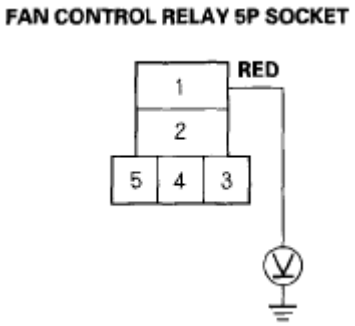

Fig. 319: Identifying Transmission Range Switch Cover & Bolts w/Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Disconnect the transmission range switch connector.

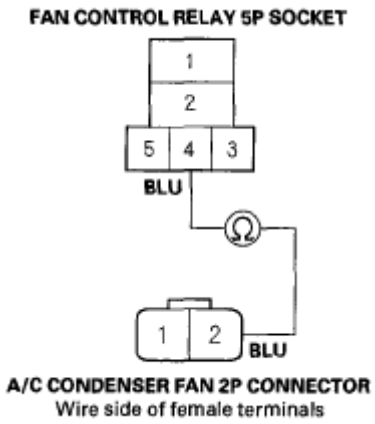

Fig. 320: Identifying Transmission Range Switch Connector Terminal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Check for continuity between terminals at the switch connector. There should be continuity between the terminals in the following table for each switch position.

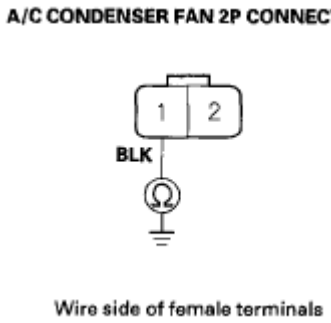

Fig. 321: Transmission Range Switch Connector Continuity Chart
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. If the transmission range switch test is OK, replace the faulty transmission range switch harness. If there is no continuity between any terminals, go to step 10.
10. Remove the transmission range switch, and check the end of the selector control shaft (A).

Selector Control Shaft Specification:

Width (B): 6.1-6.2 mm (0.240-0.244 in.)

End Gap (C): 1.8-2.0 mm (0.07-0.08 in.)

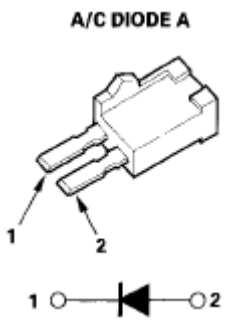

Fig. 322: Identifying Transmission Range Switch Gap
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. If the measurement at the end of the selector control shaft end is within the standard, replace the transmission range switch. If the measurement is out of the standard, repair the selector control shaft end, and recheck the transmission range switch continuity.

TRANSMISSION RANGE SWITCH REPLACEMENT

1. Raise the vehicle on a lift, or apply the parking brake, block the rear wheels, and raise the front of the vehicle. Make sure it is securely supported.
2. Shift the shift lever to N.
3. Remove the transmission range switch cover.

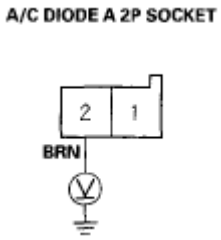

Fig. 323: Identifying Transmission Range Switch Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the transmission range switch.

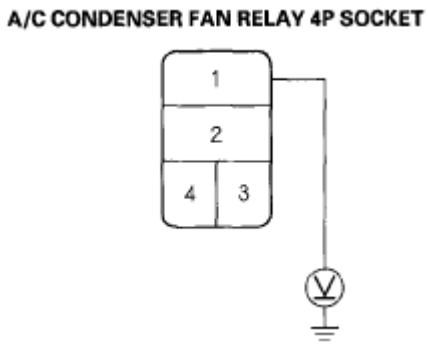

Fig. 324: Identifying Transmission Range Switch Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Make sure the selector control shaft is in the N position. If necessary, move the shift lever to the N position from the P position.

NOTE: Do not use the selector control shaft to adjust the shift position. If the selector control shaft tips are squeezed together it will cause a faulty signal or position due to play between the selector control shaft and switch.

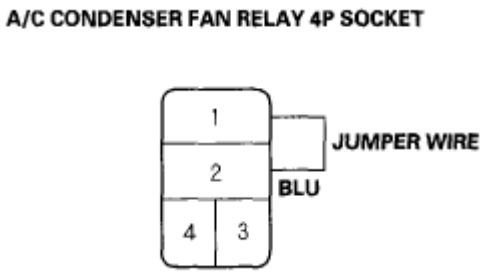

Fig. 325: Identifying Shift Lever Position
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Align the cutouts (A) on the rotary-frame with the neutral positioning cutouts (B) on the transmission range switch (C), then put a 2.0 mm (0.08 in.) feeler gauge blade (D) in the cutouts to hold the switch in the N position.

NOTE: Be sure to use a 2.0 mm (0.08 in.) blade or equivalent to hold the switch in the N position.

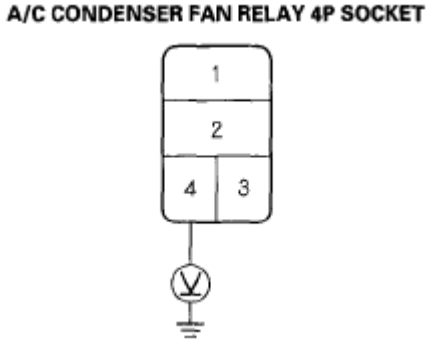

Fig. 326: Aligning Cutouts On Rotary-Frame With Neutral Positioning Cutouts On Transmission Range Switch
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the transmission range switch (A) gently on the selector control shaft (B) while holding it in the N position with the 2.0 mm (0.08 in.) blade (C).

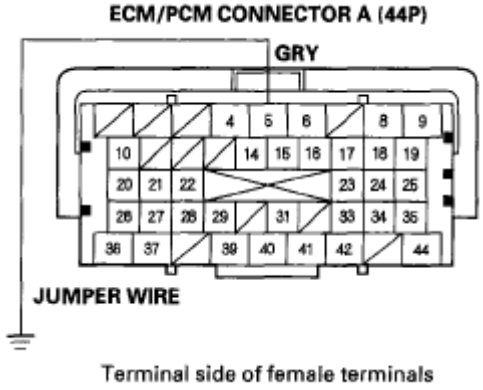

Fig. 327: Holding Transmission Range Switch N Position With Blade
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Tighten the bolts on the transmission range switch while you continue holding the N position. Do not move the transmission range switch when tightening the bolts. Remove the feeler gauge.

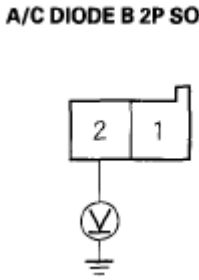

Fig. 328: Moving Transmission Range Switch & Bolts w/Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Check the connectors for rust, dirt, or oil, clean or repair if necessary, then connect the connector securely.
10. Turn the ignition switch to ON (II). Move the shift lever through all positions, and check the transmission range switch synchronization with the A/T gear position indicator.
11. Check that the engine will start in P and N, and will not start in any other shift lever position.
12. Check that the back-up lights come on when the shift lever is in R.
13. Allow the front wheels to rotate freely, then start the engine, and check the shift lever operation.
14. Install the transmission range switch cover.

A/T GEAR POSITION INDICATOR PANEL LIGHT HARNESS/PARK PIN SWITCH REPLACEMENT

NOTE: The A/T gear position indicator light and the park pin switch are not available separately. Replace the A/T gear position indicator light and the park pin switch as a set.

1. Remove the shift lever assembly (see **SHIFT LEVER REMOVAL**).
2. Loosen the A/T gear position indicator panel (see **SHIFT LEVER DISASSEMBLY/REASSEMBLY**).
3. Remove the park pin switch (A) while pressing the park pin switch lock (B).

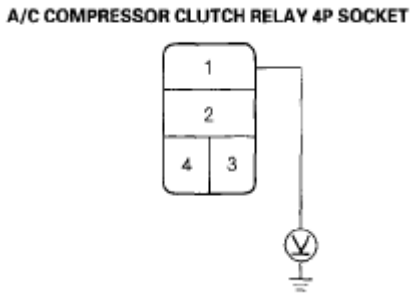

Fig. 330: Pressing Park Pin Switch Lock
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the A/T gear position indicator panel light and socket (A) from the indicator panel (B), and remove the light bulb (C) from the socket.

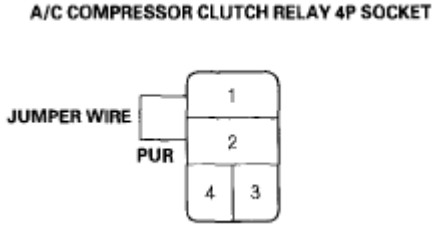

Fig. 331: Identifying A/T Gear Position Indicator Panel Light, Socket, Indicator Panel And Light Bulb
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Remove the harness clamp (D), and remove the park pin switch/A/T gear position indicator panel light connector (E) from the shift lever assembly/ bracket base (F).
6. Install a new park pin switch (G) on the shift lever.
7. Install the A/T gear position indicator panel light bulb in the new socket, and install it in the indicator panel.
8. Clamp the harnesses together with the harness clamp, then install the harness clamp on the shift lever bracket base.
9. Route the harnesses along the harness guides, and install the new connector in the bracket base.
10. Install the A/T gear position indicator panel (see **SHIFT LEVER DISASSEMBLY/REASSEMBLY**).
11. Install the shift lever assembly (see **SHIFT LEVER INSTALLATION**).
12. Install the center console (see **CENTER CONSOLE REMOVAL/INSTALLATION**).

SHIFT LOCK SYSTEM CIRCUIT TROUBLESHOOTING

1. Connect the HDS tot he DLC located behind the driver's dashboard lower cover.
2. Turn the ignition switch to ON (II). Make sure the HDS communicates with the PCM. If it does not, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
3. Select Shift Lock Solenoid Test in the Miscellaneous Test Menu, and check that the shift lock solenoid operates with the HDS.

   Does the shift lock solenoid work properly?

   YES -Go to step 15.

   NO -Go to step 4.

4. Remove the center console (see **CENTER CONSOLE REMOVAL/INSTALLATION**).
5. Disconnect the shift lock solenoid connector.
6. Turn the ignition switch to ON (II).
7. Measure the voltage between shift lock solenoid connector terminal No. 1 and body ground.

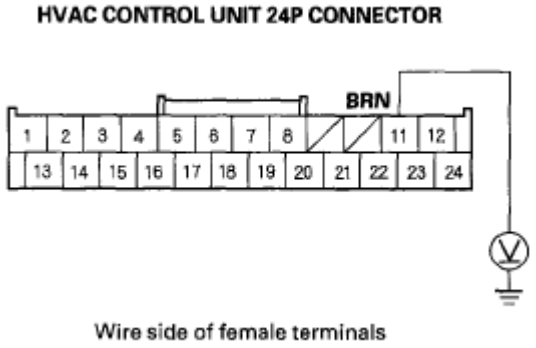

Fig. 334: Measuring Voltage Between Shift Lock Solenoid Connector Terminal 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 8.

NO -Check for a blown No. 10 (7.5 A) fuse in the under-dash fuse/relay box. If the fuse is OK, repair open or short to body ground in the wire between the shift lock solenoid connector and the under-dash fuse/relay box.

8. Shift to P, and press the brake pedal. Do not press the accelerator.
9. Measure the voltage between shift lock solenoid connector terminals No. 1 and No. 2 while pressing the brake pedal.

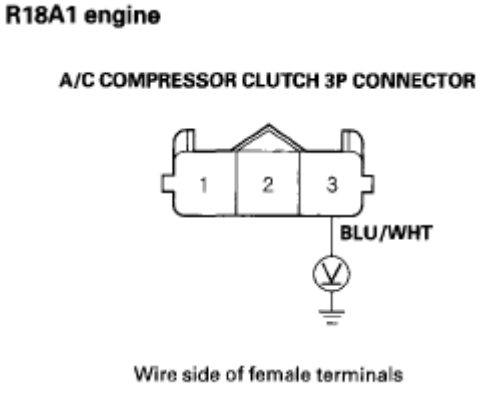

Fig. 335: Measuring Voltage Between Shift Lock Solenoid Connector Terminals 1 And 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 10.

NO -Go to step 11.

10. Release the brake pedal, and measure the voltage between shift lock solenoid connector terminals No. 1 and No. 2. The shift lever must be in P.

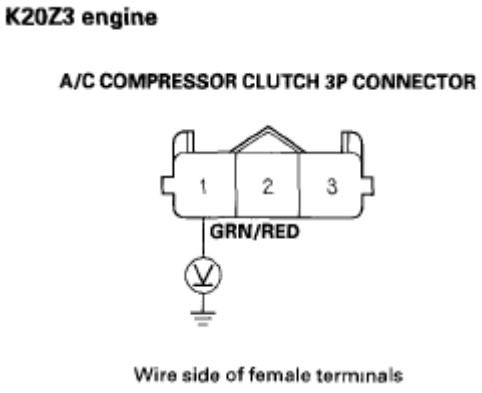

Fig. 336: Measuring Voltage Between Shift Lock Solenoid Connector Terminals 1 And 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Repair short to body ground in the wire between PCM connector terminal A27 and the shift lock solenoid.

NO -Check the shift lock mechanism. If the mechanism is OK, replace the shift lock solenoid (see **SHIFT LOCK SOLENOID REPLACEMENT**).

11. Turn the ignition switch to LOCK (0).
12. Jump the SCS line with the HDS.
13. Disconnect PCM connector A (44P).
14. Check for continuity between PCM connector terminal A27 and shift lock solenoid connector terminal No. 2.

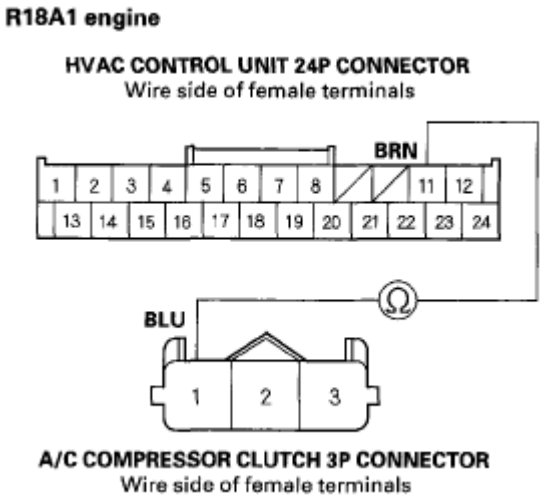

Fig. 337: Checking Continuity Between PCM Connector Terminal A27 And Shift Lock Solenoid

Connector Terminal 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Substitute a known-good PCM (see **SUBSTITUTING THE PCM**) and recheck.

NO -Repair open in the wire between PCM connector terminal A27 and the shift lock solenoid connector.

15. Press the brake pedal.

    Are the brake lights ON?

    YES -Go to step 16.

    NO -Repair faulty brake light circuit.

16. Turn the ignition switch to LOCK (0).
17. Jump the SCS line with the HDS.
18. Disconnect PCM connector A (44P).
19. Measure the voltage between PCM connector terminal A40 and body ground while pressing the brake pedal and when the brake pedal is released.

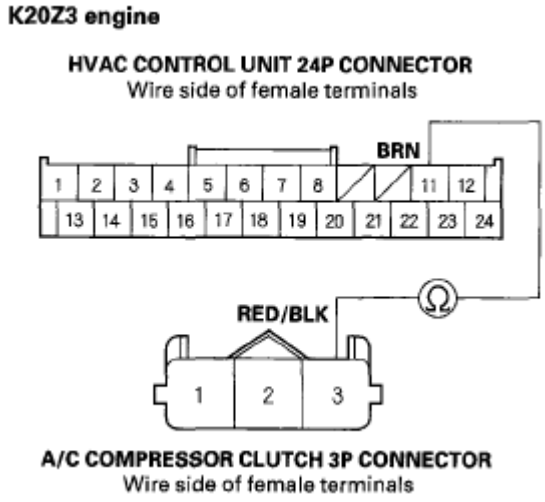

Fig. 338: Measuring Voltage Between PCM Connector Terminal A40 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage while the brake pedal is pressed, and no voltage when the pedal is released?

YES -Go to step 21.

NO -Go to step 20.

20. Check for continuity between PCM connector terminal A40 and brake pedal position switch 4P connector terminal No. 2.

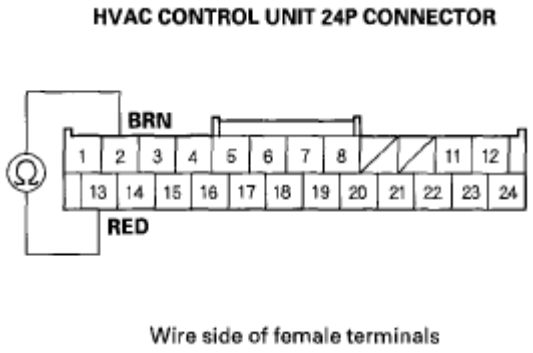

Fig. 339: Checking Continuity Between PCM Terminal A40 And Brake Pedal Position Switch 4P Terminal 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Substitute a known-good PCM (see **SUBSTITUTING THE PCM**) and recheck.

NO -Repair open in the wire between PCM connector terminal A40 and the brake pedal position switch.

21. Connect PCM connector A (44P).
22. Disconnect the transmission range switch connector.
23. Turn the ignition switch to ON (II).
24. Measure the voltage between transmission range switch connector terminals No. 6 and No. 10.

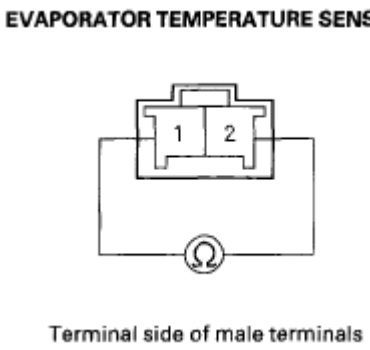

Fig. 340: Measuring Voltage Between Transmission Range Switch Connector Terminals 6 And 10
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES -Go to step 30.

NO -Go to step 25.

25. Turn the ignition switch to LOCK (0).
26. Disconnect PCM connector B (44P).

27. Check for continuity between PCM connector : terminal B13 and body ground.

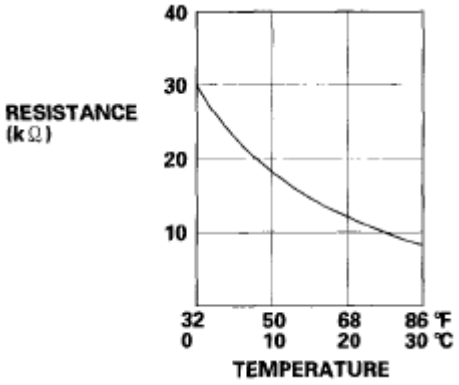

Fig. 341: Checking Continuity Between PCM Connector Terminal B13 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair short to body ground in the wire between PCM connector terminal B13 and the transmission range switch.

NO -Go to step 28.

28. Check for continuity between PCM connector terminal B13 and transmission range switch connector terminal No. 6.

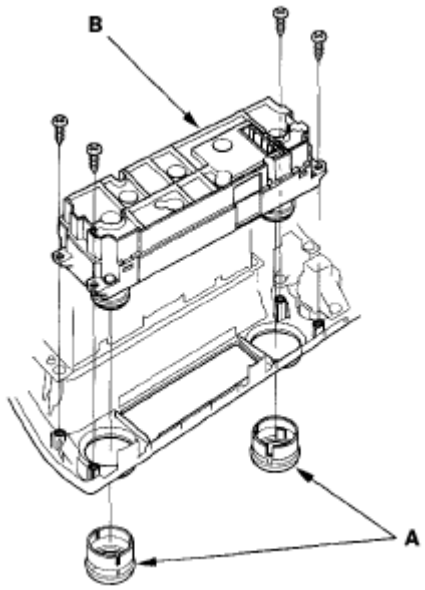

Fig. 342: Checking Continuity Between PCM Connector Terminal B13 And Transmission Range Switch Connector Terminal 6
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 29.

NO -Repair open in the wire between PCM connector terminal B13 and the transmission range switch.

29. Check for continuity between transmission range switch connector terminal No. 10 and body ground.

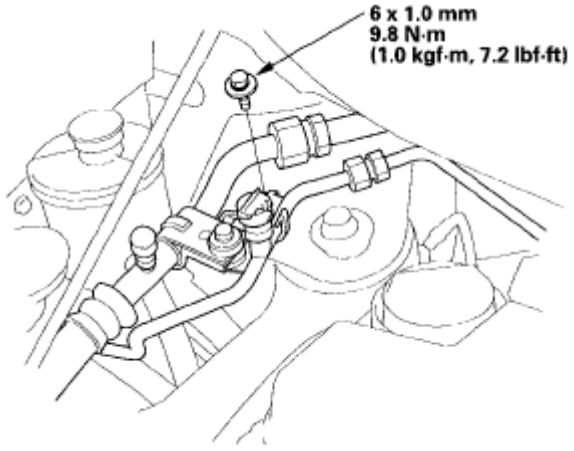

Fig. 343: Checking Continuity Between Transmission Range Switch Connector Terminal 10 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Substitute a known-good PCM (see **SUBSTITUTING THE PCM**) and recheck

NO -Repair open in the wire between transmission range switch connector terminal No. 10 and ground (G101) (see **CONNECTOR TO HARNESS INDEX**), or repair poor ground (G101).

30. Test the transmission range switch (see **TRANSMISSION RANGE SWITCH TEST**).

Is the switch OK?

YES -Go to step 30.

NO -Replace the transmission range switch (see **TRANSMISSION RANGE SWITCH REPLACEMENT**).

31. Connect the HDS to the DLC.
32. Check the accelerator pedal position sensor 1 in the DATA LIST with the HDS. Do not press the accelerator.

Is the accelerator pedal position sensor 1 opening 11 % and above, or the sensor 1 voltage 0.90 V and above?

YES -Check the APP Sensor (see **APP SENSOR SIGNAL INSPECTION**).

NO -Substitute a known-good PCM (see **SUBSTITUTING THE PCM**) and recheck.

KEY INTERLOCK SYSTEM CIRCUIT TROUBLESHOOTING

SRS components are located in this area. Review the SRS component locations, 4-door (see **COMPONENT LOCATION INDEX**), 2-door (see **COMPONENT LOCATION INDEX**), and the precautions and procedures (see **PRECAUTIONS AND PROCEDURES**) before doing repair or service.

1. Turn the ignition switch to ACCESSORY (I). The shift lever must be in P.
2. Disconnect the steering lock assembly connector.
3. Check if the ignition switch can be turned to the LOCK (0) position.

   Can the ignition switch be turned the LOCK (0) position?

   YES -Go to step 4.

   NO -Replace the ignition key cylinder/steering lock assembly (see **STEERING COLUMN REMOVAL AND INSTALLATION**).

4. Turn the ignition switch to LOCK (0).
5. Move the shift lever out of P.
6. Check for continuity between steering lock assembly connector terminal No. 3 and body ground.

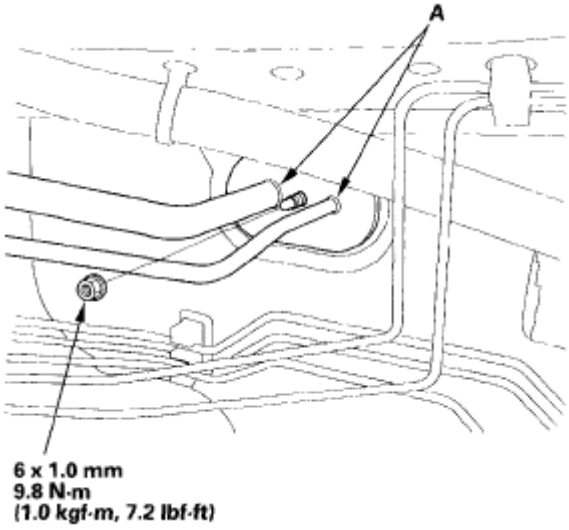

Fig. 344: Checking Continuity Between Steering Lock Assembly Connector Terminal 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair short to body ground in the wire between the key interlock solenoid and the MICU.

NO -Go to step 7.

7. Remove the center console (see **CENTER CONSOLE REMOVAL/INSTALLATION**).
8. Check for continuity between park pin switch/A/T gear position indicator panel light connector terminal No. 3 and body ground.

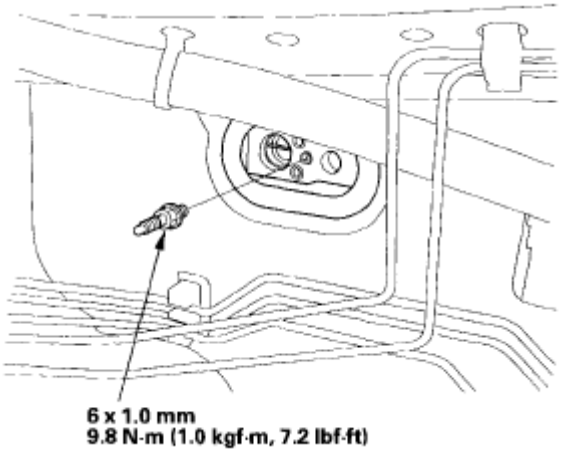

Fig. 345: Checking Continuity Between Park Pin Switch/A/T Gear Position Indicator Panel Light Connector Terminal 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair short to body ground in the wire between park pin switch/A/T gear position indicator panel light connector terminal No. 3 and the MICU.

NO -Go to step 9.

9. Shift to P.
10. Check for continuity between park pin switch/A/T gear position indicator panel light connector terminals No. 3 and No. 4. Do not push the shift lever button.

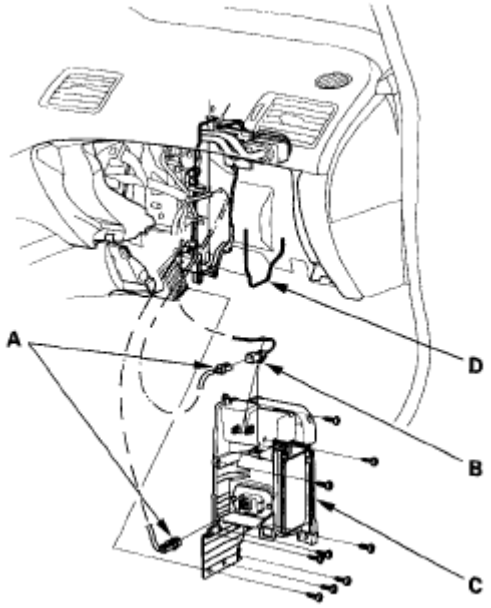

Fig. 346: Checking Continuity Between Park Pin Switch/A/T Gear Position Indicator Panel Light Connector Terminals 3 And 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Replace the park pin switch (see **A/T GEAR POSITION INDICATOR PANEL LIGHT HARNESS/PARK PIN SWITCH REPLACEMENT**).

NO -Substitute 8 known-good MICU and recheck.

SHIFT LOCK SOLENOID TEST

1. Connect the HDS to the DLC (A) located behind the driver's dashboard lower cover.

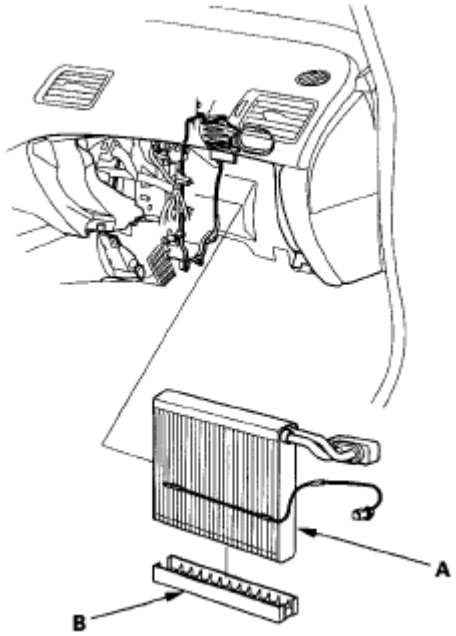

Fig. 347: Identifying Data Link Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch to ON (II). Make sure the HDS communicates with the PCM. If it does not, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
3. Select Shift Lock Solenoid Test in the Miscellaneous Test Menu, and check that the shift lock solenoid operates with the HDS.
4. Make sure that the shift lever can be moved out of P when Shift Lock Solenoid is ON. Move the shift lever back in P, and make sure it locks when Shift Lock Solenoid is OFF.
5. Make sure that the shift lock releases when the shift lock release is pushed, and check that it locks when the shift lock release is released.
6. If the shift lock solenoid does not work properly, go to the shift lock system troubleshooting (see **SHIFT LOCK SYSTEM CIRCUIT TROUBLESHOOTING**).

SHIFT LOCK SOLENOID REPLACEMENT

1. Remove the shift lever assembly (see **SHIFT LEVER REMOVAL**).
2. Remove the shift lock solenoid connector.
3. Release the shift lock solenoid lock (A), then remove the shift lock solenoid (B).

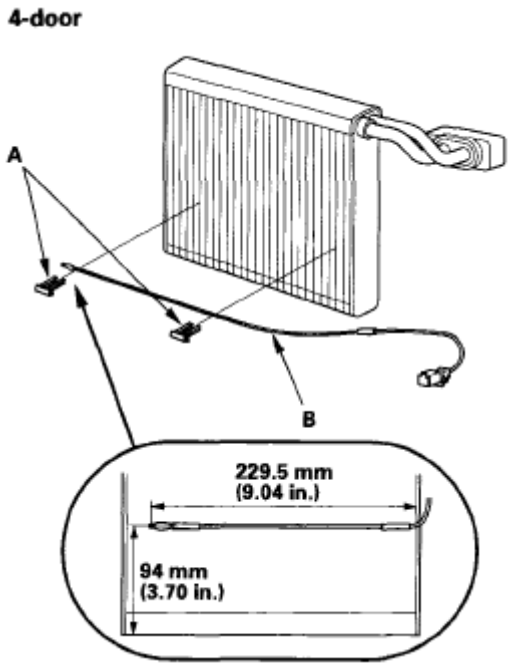

Fig. 348: Removing Shift Lock Solenoid Lock
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Replace the shift lock solenoid (A), solenoid plunger (B), and plunger spring (C) assembly.

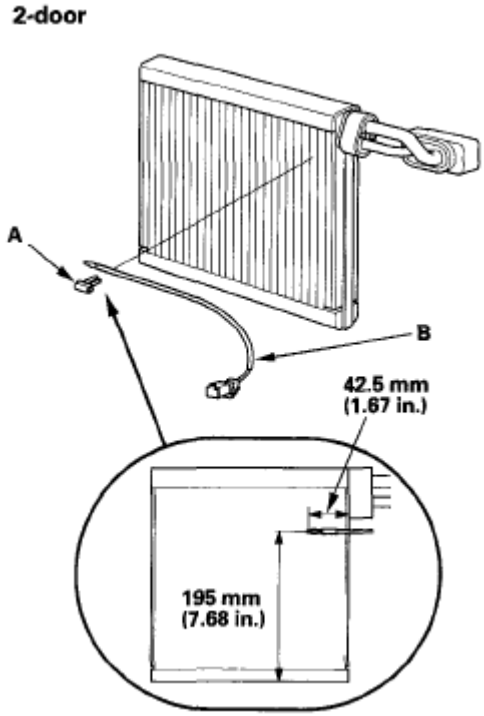

Fig. 349: Identifying Shift Lock Solenoid, Solenoid Plunger And Plunger Spring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Apply silicone grease to the tip (D) of the shift lock stop (E), and install a new shift lock solenoid assembly by aligning the joint of the shift lock solenoid plunger with the tip of the shift lock stop.

6. Route the shift lock solenoid harness in the guide, and install the connector (F) on the bracket base.
7. Install the shift lever assembly (see **SHIFT LEVER INSTALLATION**).

SHIFT LOCK STOP, SHIFT LOCK STOP CUSHION REPLACEMENT

1. Remove the shift lever assembly (see **SHIFT LEVER REMOVAL**).
2. Release the shift lock solenoid lock (A), then remove the shift lock solenoid (B).

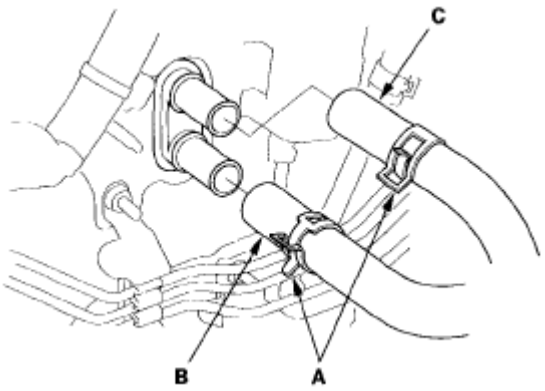

Fig. 350: Removing Shift Lock Solenoid Lock
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the shift lock release (A) and release the spring (B).

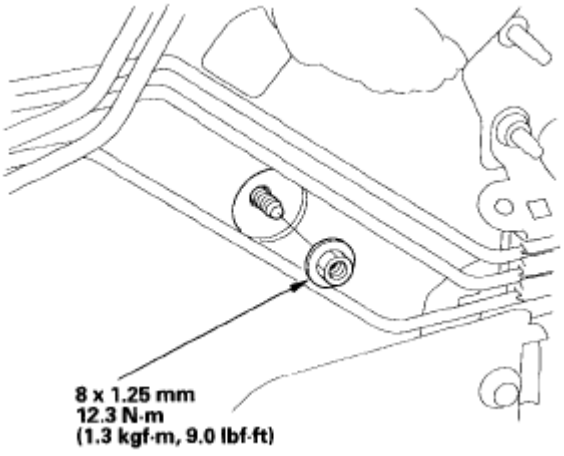

Fig. 351: Identifying Shift Lock Stop And Stop Cushion
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the shift lock stop (C) and the stop cushion (D), and replace the shift lock stop or the stop cushion.
5. Install the shift lock stop cushion on the shift lock stop.
6. Apply silicone grease to the pin on the shift lever bracket base, and install the shift lock stop over the pin.
7. Install the shift lock release spring and the shift lock release, apply silicone grease to the shift lock release mounting tip if necessary.

8. Apply silicone grease to the tip of the shift lock stop, and install the shift lock solenoid assembly by aligning the joint of the shift lock solenoid plunger with the tip of the shift lock stop.
9. Route the shift lock solenoid harness in the guide.
10. Install the shift lever assembly (see **SHIFT LEVER INSTALLATION**).

PARK PIN SWITCH TEST

1. Remove the center console (see **CENTER CONSOLE REMOVAL/INSTALLATION**).
2. Move the shift lever into P, and check for continuity between park pin switch/A/T gear position indicator panel light connector terminals No. 3 and No. 4. There should be no continuity.

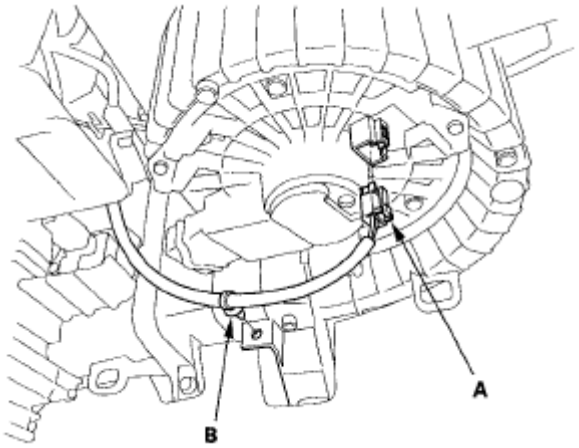

Fig. 352: Identifying A/T Gear Position Indicator Panel Light Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Shift out of P, and check for continuity between connector terminals No. 3 and No. 4. There should be continuity.
4. If the park pin switch tests OK, install the center console (see **CENTER CONSOLE REMOVAL/INSTALLATION**).

   If the park pin switch fails the test, replace the park pin switch (see **A/T GEAR POSITION INDICATOR PANEL LIGHT HARNESS/PARK PIN SWITCH REPLACEMENT**).

TRANSMISSION END COVER

END COVER REMOVAL

Special Tools Required

Mainshaft holder 07GAB-PF50101 or 07GAB-PF50100

1. Remove the ATF dipstick.
2. Remove the five bolts (D) securing the ATF inlet line brackets, the ATF filter bracket bolts (E), the line bolt and the sealing washers, and remove the ATF inlet line, the ATF hose, and the ATF filter (F).

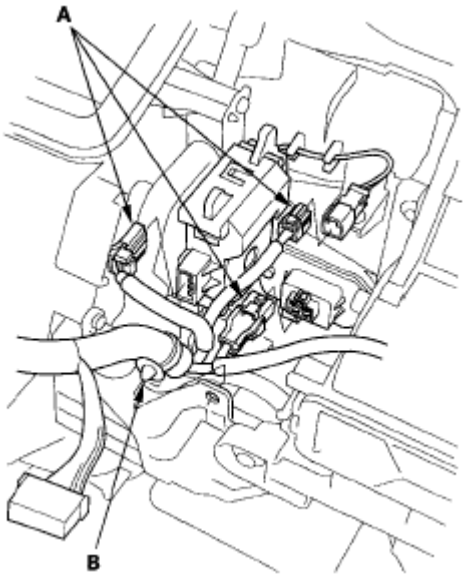

Fig. 353: Disassembling Transmission
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the ATF outlet line bolt, the line mounting bolt, the sealing washers, and the ATF outlet line (G).
4. Remove A/T clutch pressure control solenoid valve A, the ATF joint pipes, the O-rings, the ATF pipe, and the gasket.
5. Remove A/T clutch pressure control solenoid valves B and C, the O-rings, the ATF pipe, the ATF joint pipes, and the gasket.
6. Remove the input shaft (mainshaft) speed sensor (H) and the output shaft (countershaft) speed sensor (I).
7. Remove the ATF warmer bracket (J).
8. Remove the transmission range switch cover (K).
9. Remove the transmission range switch harness clamps (L) from the clamp bracket (M), then remove the transmission range switch (N).
10. Remove the clamp bracket from the end cover (O).
11. Remove the end cover, the dowel pins, the O-rings, and the end cover gasket.
12. Remove the ATF lubrication pipe (P) from the idler gear shaft.
13. Slip the mainshaft holder onto the mainshaft.

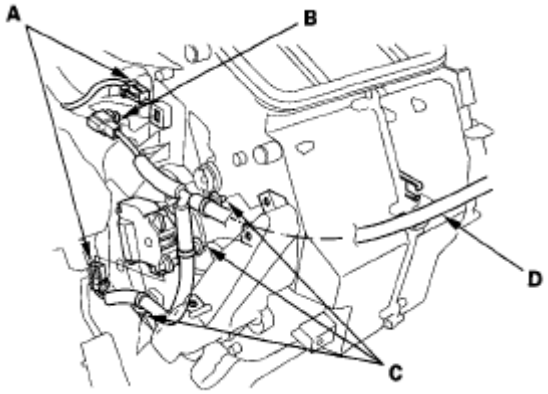

Fig. 354: Identifying Mainshaft Holder
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Engage the park pawl with the park gear.
15. Cut the lock tab (A) of the each shaft locknut (B) using a chisel (C). Then remove the locknuts and conical spring washers from each shaft.

NOTE:

- **Countershaft and secondary shaft locknuts have left-hand threads.**
- **Keep all of the chiseled particles out of the transmission.**
- **Clean the old locknuts; they are used to install the press fit idler gears and park gear.**

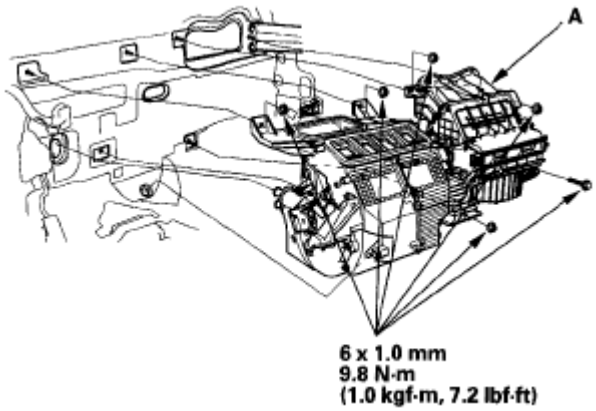

Fig. 355: Cutting Lock Tab
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Remove the snap ring securing the idler gear to the idler gear shaft.
17. Install 6 x 1.0 mm bolts (A) on the idler gear shaft idler gear (B). Set a puller (C) on the idler gear shaft (D) with putting a spacer (E) between the puller and the idler gear shaft, then remove the idler gear shaft idler gear.

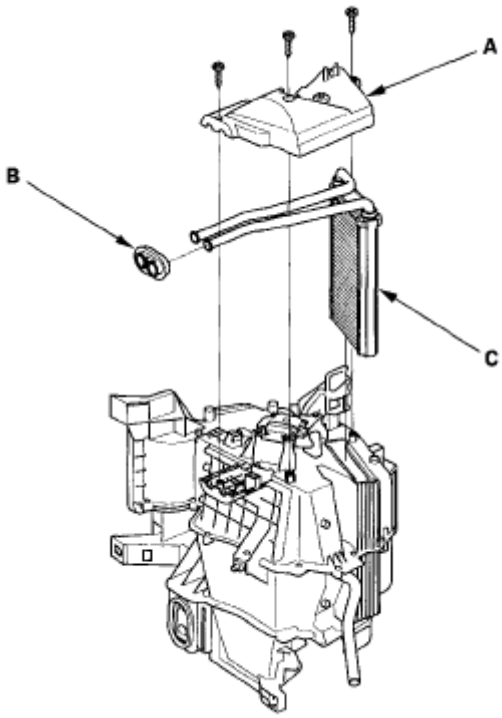

Fig. 356: Removing Idler Gear Shaft Idler Gear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

18. Set the puller, 6 x 1.0 mm bolts, and spacer on the secondary shaft idler gear (F), and remove the secondary shaft idler gear from the secondary shaft in the same manner as the removal of the idler gear shaft idler gear.
19. Set the puller, 6 x 1.0 mm bolts, and spacer on the mainshaft idler gear (G), and remove the mainshaft idler gear from the mainshaft in the same manner as the removal of the idler gear shaft idler gear.
20. Set the puller, 6 x 1.0 mm bolts, and spacer on the park gear (H), and remove the park gear from the countershaft in the same manner as the removal of the idler gear shaft idler gear.
21. Remove the park pawl, the park pawl spring, the park pawl shaft, and the stop shaft.
22. Remove the park lever from the selector control shaft.

PARK LEVER STOP INSPECTION AND ADJUSTMENT

1. Set the park lever in the P position.
2. Measure the distance (A) between the park pawl shaft center (B) and the extension line (C) connected centers of the park lever roller pin (D) and the control shaft (E) in the vertical direction from the extension line.

Standard: 46.8-47.8 mm (1.84-1.88 in.)

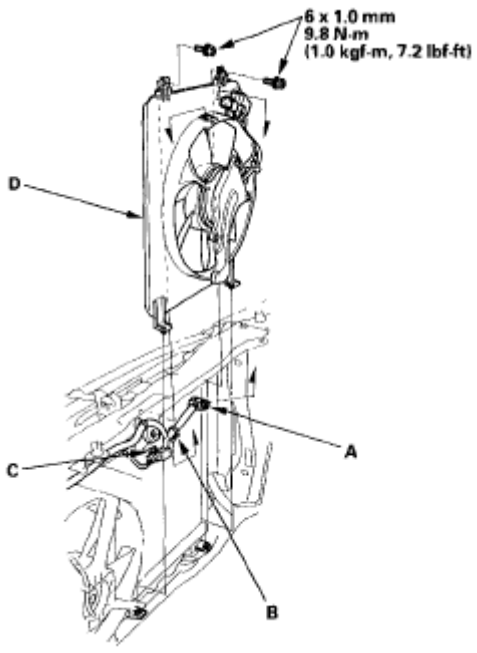

Fig. 357: Measuring Distance Between Park Pawl Shaft Center And Extension Line
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. If the measurement is out of standard, select and install the appropriate park lever stop (A) from the table.

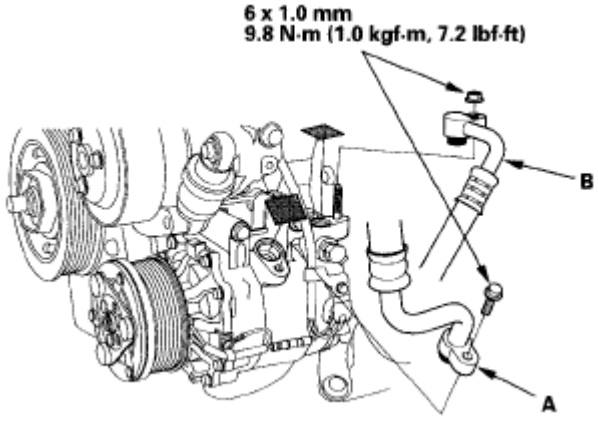

Fig. 358: Identifying Park Lever Stop Measurement
Courtesy of AMERICAN HONDA MOTOR CO., INC.

PARK LEVER STOP

PART NUMBER REFERENCE

Mark	Part Number	B	C
1	24537-PA9-003	11.00 mm (0.433 in.)	11.00 mm (0.433 in.)
2	24538-PA9-003	10.80 mm (0.425 in.)	10.65 mm (0.419 in.)
3	24539-PA9-	10.60 mm	10.30 mm

	003	(0.417 in.)	(0.406 in.)

4. After replacing the park lever stop, make sure the distance is within tolerance.

IDLER GEAR SHAFT BEARING REPLACEMENT

Special Tools Required

- Adjustable bearing puller, 25-40 mm 07736-A01000B or 07736-A01000A
- Driver 07749-0010000
- Attachment, 52 x 55 mm 07746-0010400

1. Remove the idler gear shaft bearing from the end cover using the adjustable bearing puller and a commercially available 3/8"-16 slide hammer (A).

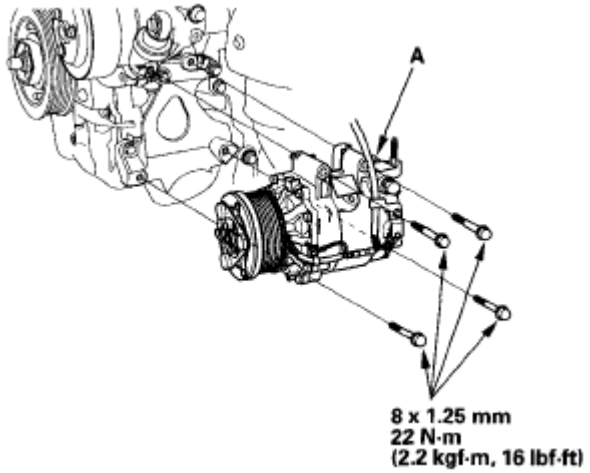

Fig. 359: Identifying Idler Gear Shaft Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install a new bearing in the end cover using the driver and the 52 x 55 mm attachment.

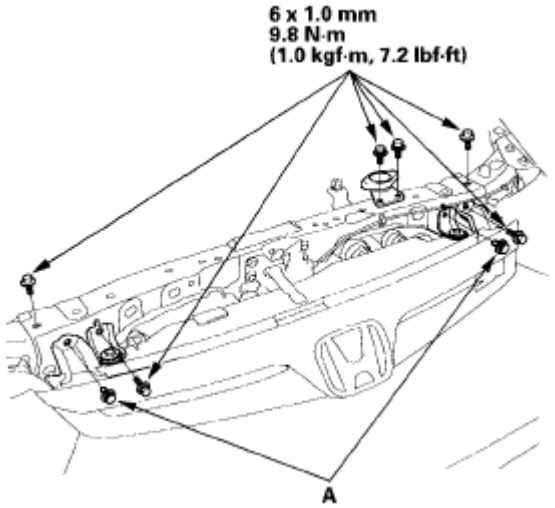

Fig. 360: Tapping Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SELECTOR CONTROL SHAFT OIL SEAL REPLACEMENT

Special Tools Required

- Driver 07749-0010000
- Attachment, 22 x 24 mm 07746-0010800

1. Remove the oil seal from the end cover.

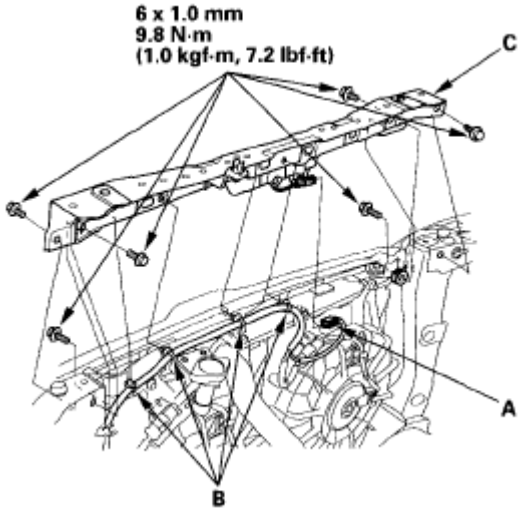

Fig. 361: Identifying Oil Seal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install a new oil seal flush to the end cover using the driver and the 22 x 24 mm attachment.

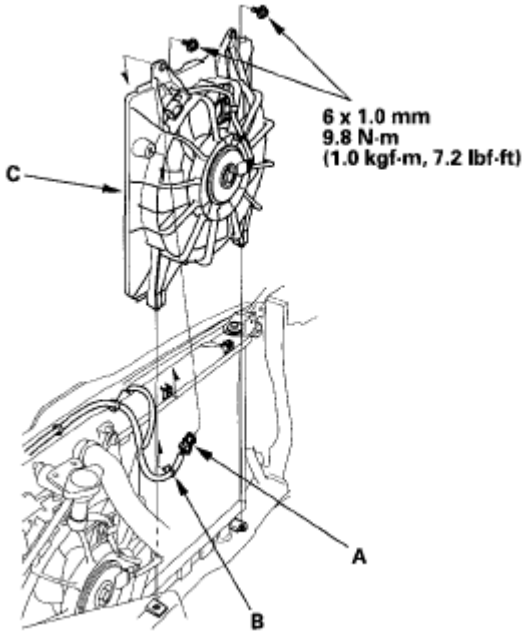

Fig. 362: Pressing Oil Seal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SELECTOR CONTROL SHAFT BEARING REPLACEMENT

Special Tools Required

- Driver 07749-0010000
- Attachment, 22 x 24 mm 07746-0010800

1. Remove the oil seal from the end cover.

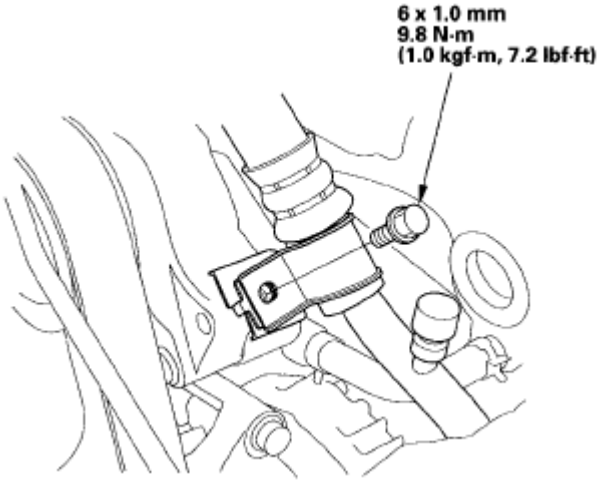

Fig. 363: Identifying Oil Seal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the selector control shaft bearing from the end cover.

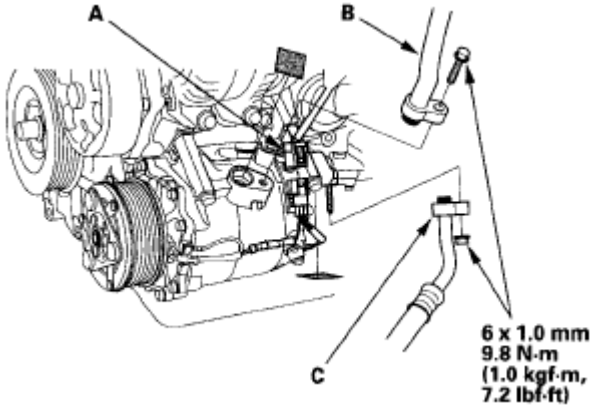

Fig. 364: Tapping Selector Control Shaft Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install a new bearing flush to the end cover using the driver and the 22 x 24 mm attachment.

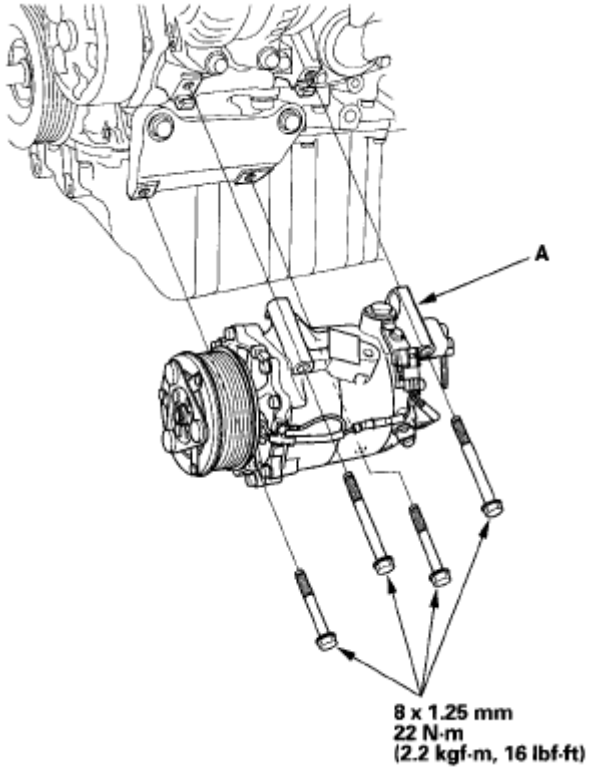

Fig. 365: Pressing Bearing Flush
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install a new oil seal flush to the end cover using the driver and the 22 x 24 mm attachment.

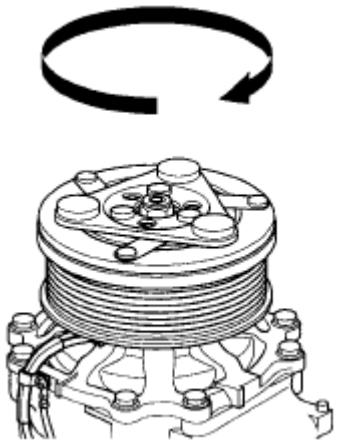

Fig. 366: Pressing Oil Seal Flush
Courtesy of AMERICAN HONDA MOTOR CO., INC.

ATF FEED PIPE REPLACEMENT

1. Remove the snap ring (A), the 3rd clutch feed pipe (B), and the feed pipe flange (C) from the end cover (D).

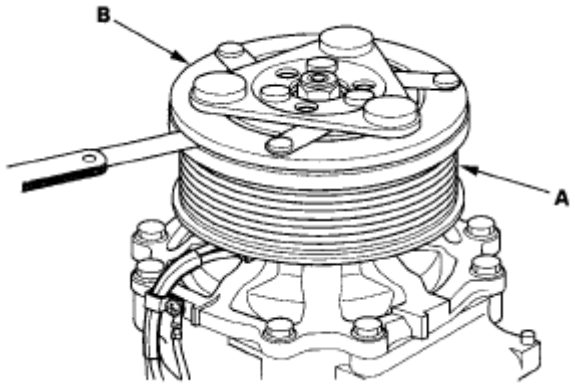

Fig. 367: Identifying Snap Ring, 3rd Clutch Feed Pipe And Feed Pipe Flange
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install a new O-ring (E) over a new 3rd clutch feed pipe.
3. Install the 3rd clutch feed pipe in the end cover by aligning the feed pipe tabs (F) with the indentations in the end cover.
4. Install a new O-ring (G) in the end cover, then install the feed pipe flange over the 3rd clutch feed pipe.
5. Secure the 3rd clutch feed pipe and the feed pipe flange with the snap ring.
6. Remove the snap ring (H) and feed pipe flange (I).
7. Check the 4th clutch feed pipe (J) and 2nd clutch feed pipe (K) for scoring and damage. Replace the end cover, if the feed pipes are scored or damaged.
8. Install a new O-ring (L) over a new 4th clutch feed pipe.
9. Install a new O-ring (M) in the end cover, then install the feed pipe flange over the 4th clutch feed pipe.
10. Secure the 4th clutch feed pipe and feed pipe flange with the snap ring.

TRANSMISSION FLUID PRESSURE SWITCH REPLACEMENT

1. Remove the 2nd clutch transmission fluid pressure switch (A).

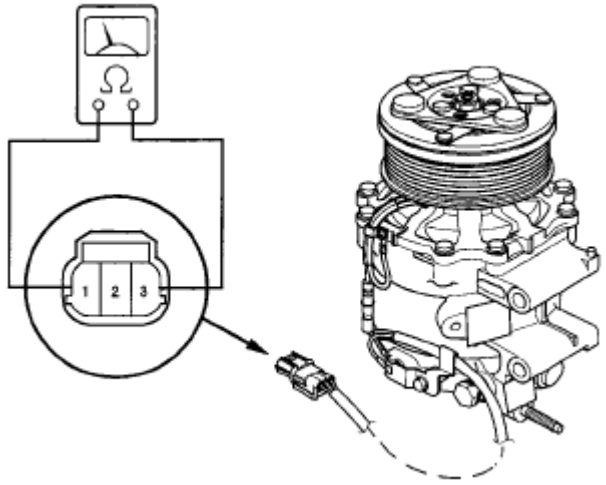

Fig. 368: Identifying 2nd Clutch Transmission Fluid Pressure Switch, 3rd Clutch Transmission Fluid Pressure Switch & Bolts w/Torque Specifications

Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Make sure there is no water, oil, dust, or foreign particles inside the connector.
3. Install a new 2nd clutch transmission fluid pressure switch and a new sealing washer (B), then tighten the switch to the specified torque on the metal part, not the plastic part.
4. Remove the 3rd clutch transmission fluid pressure switch (C).
5. Make sure there is no water, oil, dust, or foreign particles inside the connector.
6. Install a new 3rd clutch transmission fluid pressure switch and a new sealing washer (D), then tighten the switch to the specified torque on the metal part, not the plastic part.

AIR CHECK VALVE INSPECTION AND REPLACEMENT

1. Check the air check valve filter for clogging. If the filter is clogged, remove the air check valve (A), and clean the filter thoroughly by pouring clean ATF. Do not blow out the filter with compressed air. Replace the air check valve, if the filter or check valve (ball) is clogged or damaged.

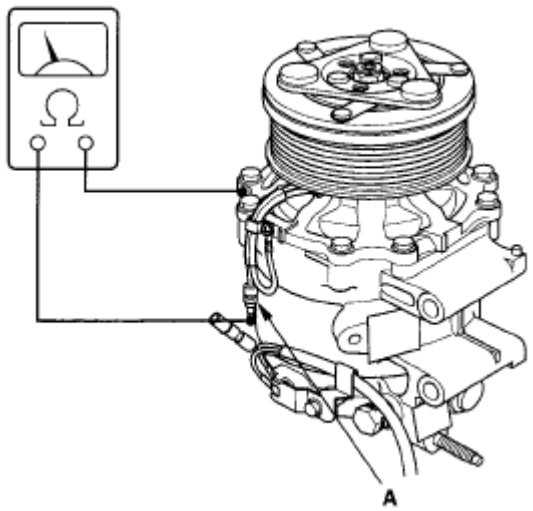

Fig. 369: Identifying Air Check Valve, Sealing Washer & Bolts w/Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the air check valve and a new sealing washer (B).

TRANSMISSION HOUSING

HOUSING AND SHAFT ASSEMBLY REMOVAL

Special Tools Required

Housing puller 07HAC-PK40102

1. Remove the shift solenoid valve cover (A), the dowel pins (B), the gasket (C), and the harness clamp bracket (D).

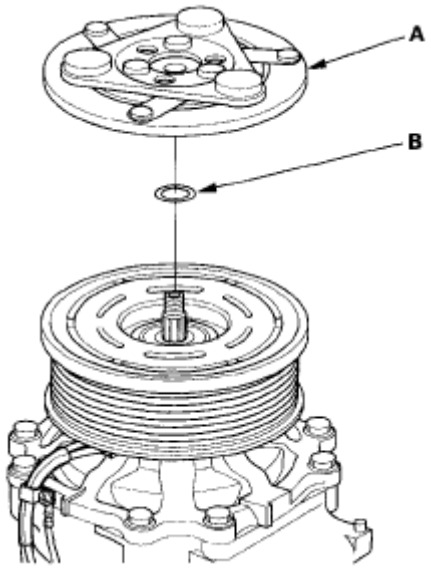

Fig. 370: Disassembling Transmission Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Disconnect the connectors from the shift solenoid valves, and remove the solenoid harness connector (E).
3. Remove the transmission housing mounting bolts (F) (19).
4. Align the spring pin (A) on the selector control shaft (B) with the transmission housing groove (C) by turning the selector control shaft with the detent plate.

NOTE: Do not squeeze the end of the selector control shaft tips together when turning the control shaft.

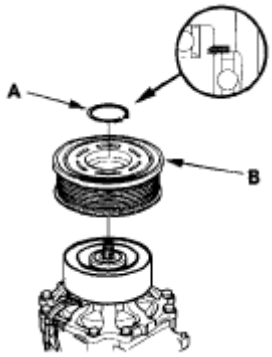

Fig. 371: Aligning Spring Pin On Selector Control Shaft With Transmission Housing Groove
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the housing puller over the countershaft, then remove the transmission housing.

NOTE: If the top arm of your housing puller is too short, replace it with housing puller arm, 205 mm 07SAC-P0Z0101.

6. Remove the countershaft reverse gear and the needle bearing.
7. Remove the lock bolt securing the shift fork, then remove the shift fork with the reverse selector together.
8. Remove the mainshaft subassembly (A), the countershaft subassembly (B), and the secondary shaft subassembly (C) together. If the reverse selector hub is removed by hand, remove the 4th-5th gear and the needle bearings, and remove the mainshaft subassembly. Then remove the countershaft subassembly and the secondary shaft subassembly together.

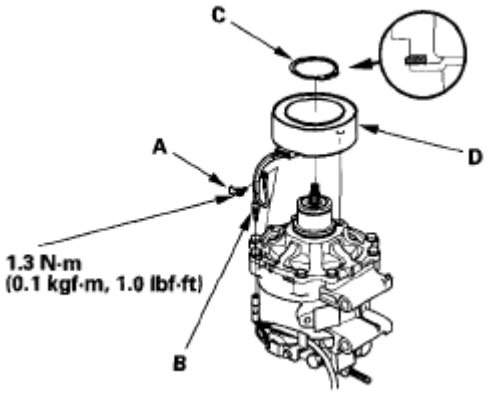

Fig. 372: Identifying Mainshaft Subassembly, Countershaft Subassembly And Secondary Shaft Subassembly
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Remove the differential assembly.

BEARING REMOVAL

Special Tools Required

- Attachment, 72 x 75 mm 07746-0010600

- Attachment, 78 x 80 mm 07NAD-PX40100
- Attachment, 62 x 68 mm 07746-0010500
- Driver 07749-0010000

1. Remove the snap ring (A), the cotter retainer (B), and the cotters (C) from the idler gear shaft (D), then remove the idler gear shaft. Do not distort the snap ring.

NOTE: If you are not removing the idler gear shaft bearing, idler gear shaft removal is not needed.

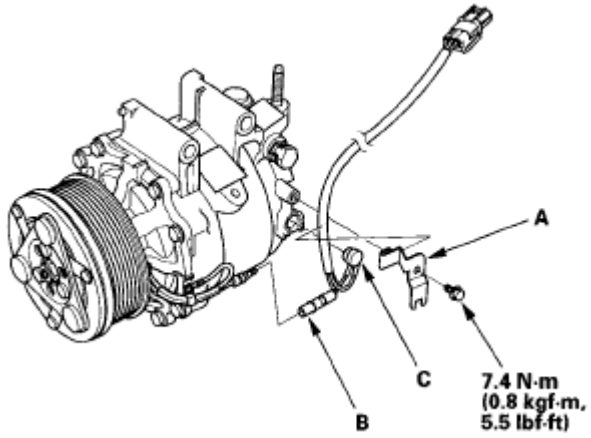

Fig. 373: Identifying Snap Ring, Cotter Retainer And Cotters
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. To remove the mainshaft bearing (A), the countershaft bearing (B), the secondary shaft bearing (C), and the idler gear shaft bearing (D) from the transmission housing, expand each snap ring using snap ring pliers, then push the bearing out using the driver and the attachment.

NOTE: Do not remove the snap ring unless it is necessary to clean the grooves in the housing.

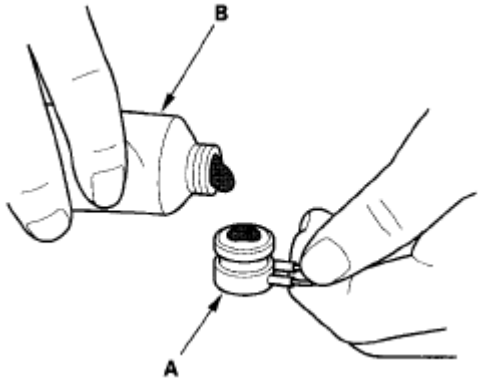

Fig. 374: Removing Mainshaft Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

BEARING INSTALLATION

Special Tools Required

- Attachment, 72 x 75 mm 07746-0010600
- Attachment, 78 x 80 mm 07NAD-PX40100
- Attachment, 62 x 68 mm 07746-0010500
- Driver 07749-0010000

1. Install the mainshaft bearing (A), the countershaft bearing (B), the secondary shaft bearing (C), and the idler gear shaft bearing (D) in the transmission housing in the direction shown.

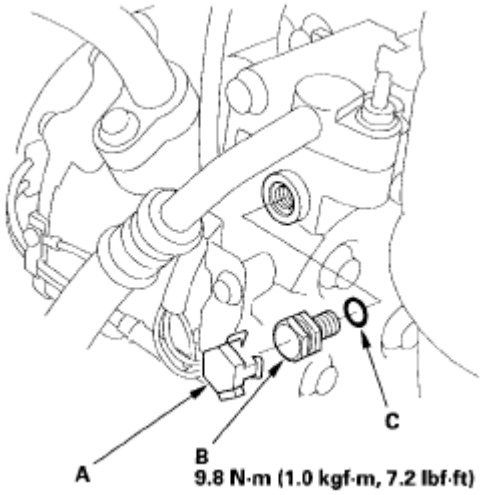

Fig. 375: Installing Mainshaft Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Expand each snap ring using snap ring pliers, and install the bearing part-way into the housing.
3. Release the pliers, then push the beating down into the housing using the driver and the attachment until the snap ring snaps in place around it.
4. After installing the bearings check that the snap rings (A) are seated in the bearing and housing grooves, and that the ring end gaps (B) are 0-7 mm (0-0.28 in.)

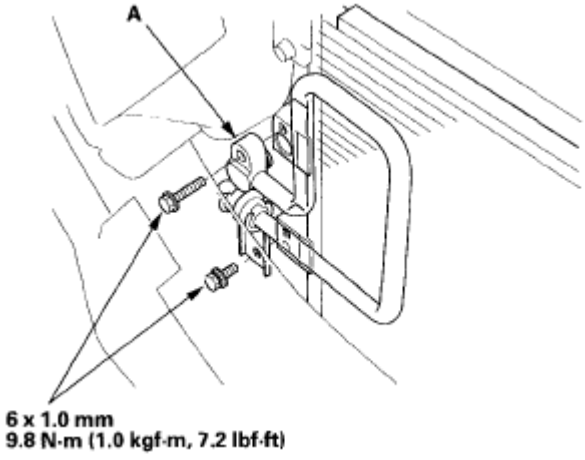

Fig. 376: Identifying Snap Ring Gap
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the idler gear shaft (A) in the idler gear shaft bearing.

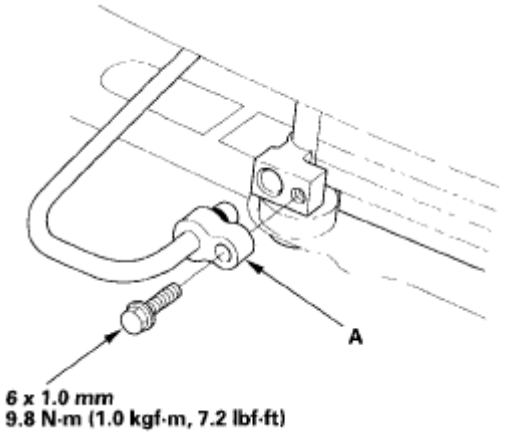

Fig. 377: Identifying Idler Gear Shaft, Cotters And Cotter Retainer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Install the cotters (B) and the cotter retainer (C), and secure the idler gear shaft with the snap ring (D).

REVERSE IDLER GEAR REMOVAL

1. Remove the bolts (A) securing the reverse idler gear shaft holder (B).

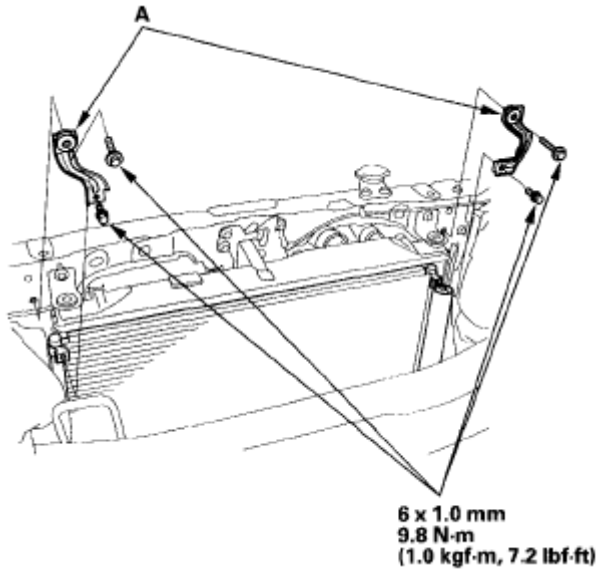

Fig. 378: Identifying Idler Gear Shaft Holder And Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install a 5 x 0.8 mm bolt (C) in the reverse gear shaft, and pull it to remove the reverse idler gear shaft (D) and the reverse idler gear shaft holder together.
3. Remove the reverse idler gear.

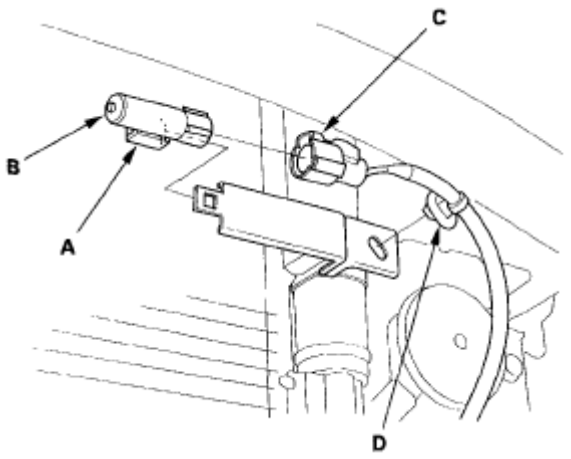

Fig. 379: Removing Reverse Idler Gear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

REVERSE IDLER GEAR INSTALLATION

1. Lightly coat the reverse idler gear shaft (A), the needle bearing (B), and new O-rings (C) with lithium grease.

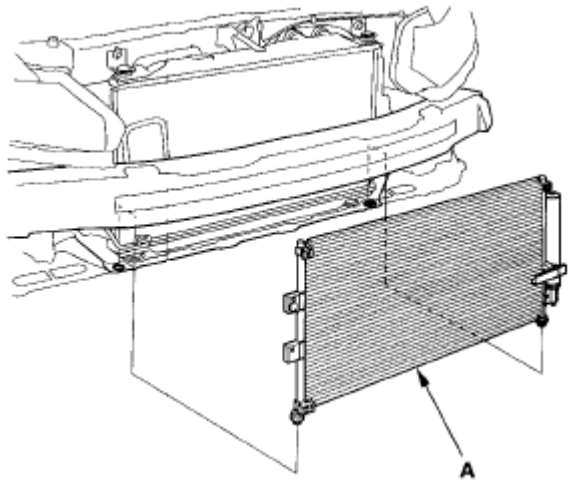

Fig. 380: Identifying Reverse Idler Gear Shaft, Needle Bearing And O-Rings
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Assemble new O-rings and needle bearing on the reverse idler gear shaft, then install the reverse idler gear shaft in the reverse idler gear shaft holder (D). Align the D-shaped (E) cutout of the shaft with the D-shaped area (F) of the holder.
3. Install the reverse idler gear in the transmission housing in the direction shown.

5. Secure the holder with the bolts.

IDLER GEAR SHAFT REMOVAL AND INSTALLATION

1. Remove the snap ring (A), the cotter retainer (B), and the cotters (C) from the idler gear shaft (D), then remove the idler gear shaft. Do not distort the snap ring.

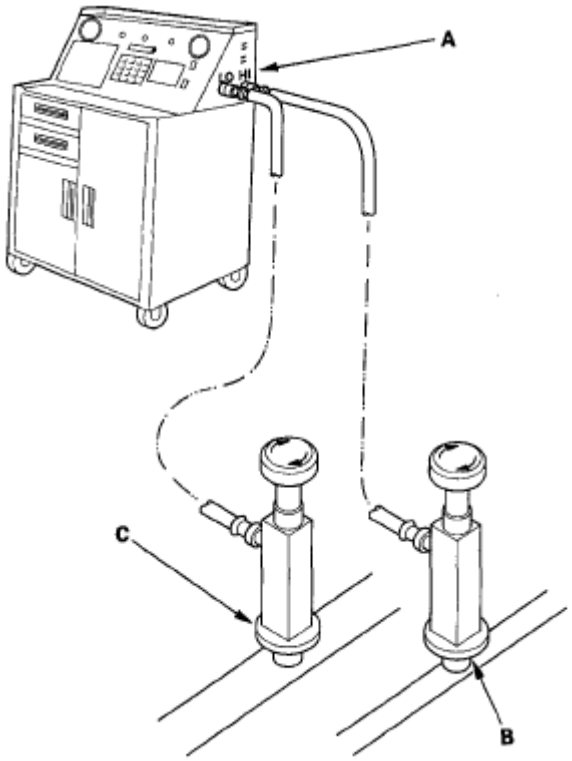

Fig. 383: Identifying Snap Ring, Cotter Retainer, Cotters And Idler Gear Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Check the snap ring and the cotter retainer for wear and damage. Replace the snap ring and/or the cotter retainer if the snap ring or the cotter retainer is worn, distorted, or damaged.
3. Install the idler gear shaft in the idler gear shaft bearing.
4. Install the cotters and the cotter retainer, and secure the idler gear shaft with the snap ring.

VALVE BODY

VALVE BODY AND ATF STRAINER REMOVAL

1. Remove the ATF feed pipe (A) from the regulator valve body (B).

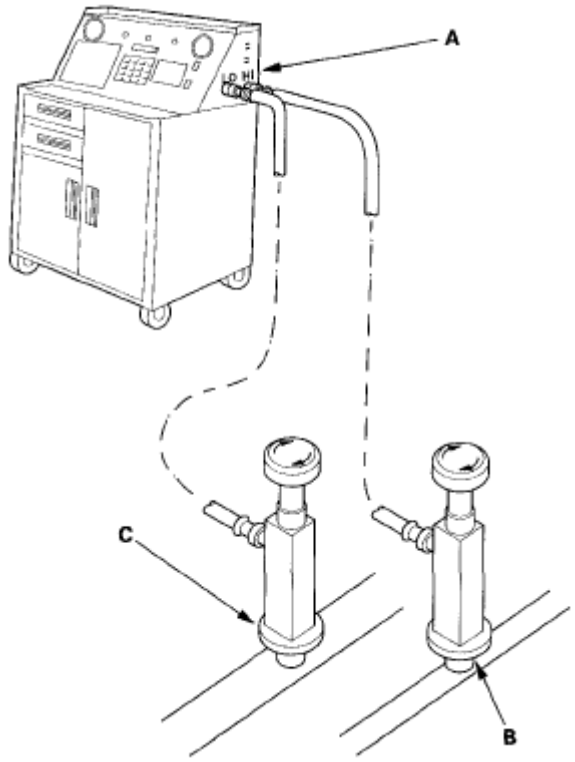

Fig. 384: Disassembling Valve Body And ATF Strainer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the ATF feed pipes (C) (D) from the servo body (E).
3. Remove the ATF strainer (F) (two bolts).
4. Unhook the detent spring (G) from the detent arm (H), and remove the selector control shaft (I).
5. Remove the regulator valve body (10 bolts).
6. Remove the stator shaft (J) and the stator shaft stop (K), then remove the regulator separator plate (L) and the two dowel pins (M).
7. Remove the servo body (13 bolts), then remove the separator plate (N) and the two dowel pins (O).
8. Remove the ATF joint pipes (P) (Q).
9. Remove the cooler check valve spring (R) and the cooler check valve (S), then remove the main valve body (T) (three bolts). Do not let the check balls (U) fall out.
10. Remove the ATF pump driven gear shaft (V), then remove the ATF pump gears (W).
11. Remove the main separator plate (X) and the two dowel pins (Y).
12. Remove the ATF magnet (Z), clean and reinstall it in the torque converter housing (AA).
13. Remove the O-ring (BB) from the stator shaft, and remove the O-ring (CC) from the ATF strainer. Install new ones when installing the valve bodies.
14. Clean the inlet opening (A) of the ATF strainer (B) thoroughly with compressed air, then check that it

is in good condition and that the inlet opening is not clogged.

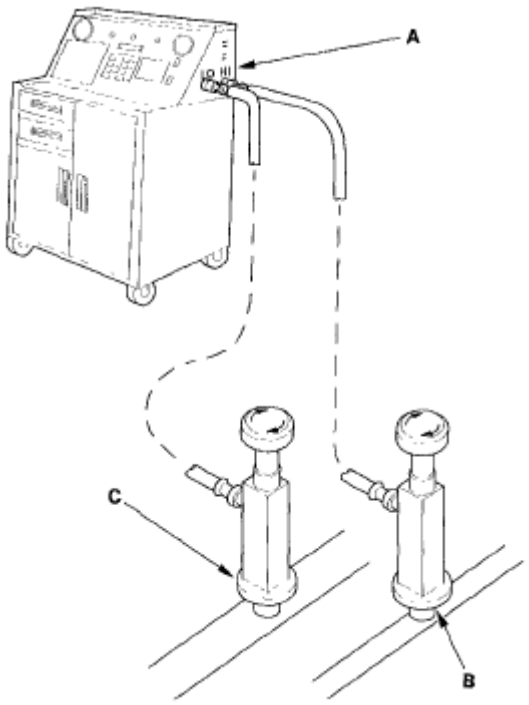

Fig. 385: Identifying Inlet Opening Of ATF Strainer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Test the ATF strainer by pouring clean ATF through the inlet opening, and replace it if it is clogged or damaged.

VALVE BODY REPAIR

NOTE: Valve body repair is only necessary if one or more of the valves in a valve body do not slide smoothly in their bores. Use this procedure to free the valves.

1. Soak a sheet of #600 abrasive paper in ATF for about 30 minutes.
2. Carefully tap the valve body so the sticking valve drops out of its bore. It may be necessary to use a small screwdriver to pry the valve free. Be careful not to scratch the bore with the screwdriver.
3. Inspect the valve for any scuff marks. Use the ATF-soaked #600 paper to polish off any burrs that are on the valve, then wash the valve in solvent and dry it with compressed air.
4. Roll up half of the ATF-soaked #600 paper and insert it in the valve bore of the sticking valve. Twist the paper slightly, so that it unrolls and fits the bore tightly, then polish the bore by twisting the paper as you push it in and out.

NOTE: The valve body is aluminum and does not require much polishing to remove any burrs.

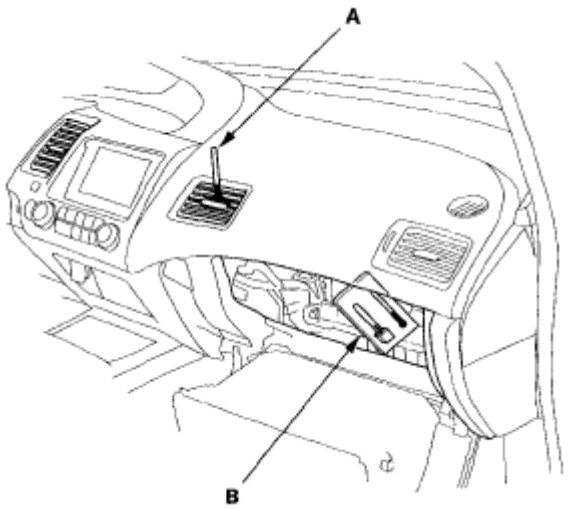

Fig. 386: Inspecting Valve
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Remove the #600 paper. Thoroughly wash the entire valve body in solvent, then dry it with compressed air.
6. Coat the valve with ATF, then drop it into its bore. It should drop to the bottom of the bore under its own weight. If not, repeat steps 4 and 5, then retest. If the valve still sticks, replace the valve body.

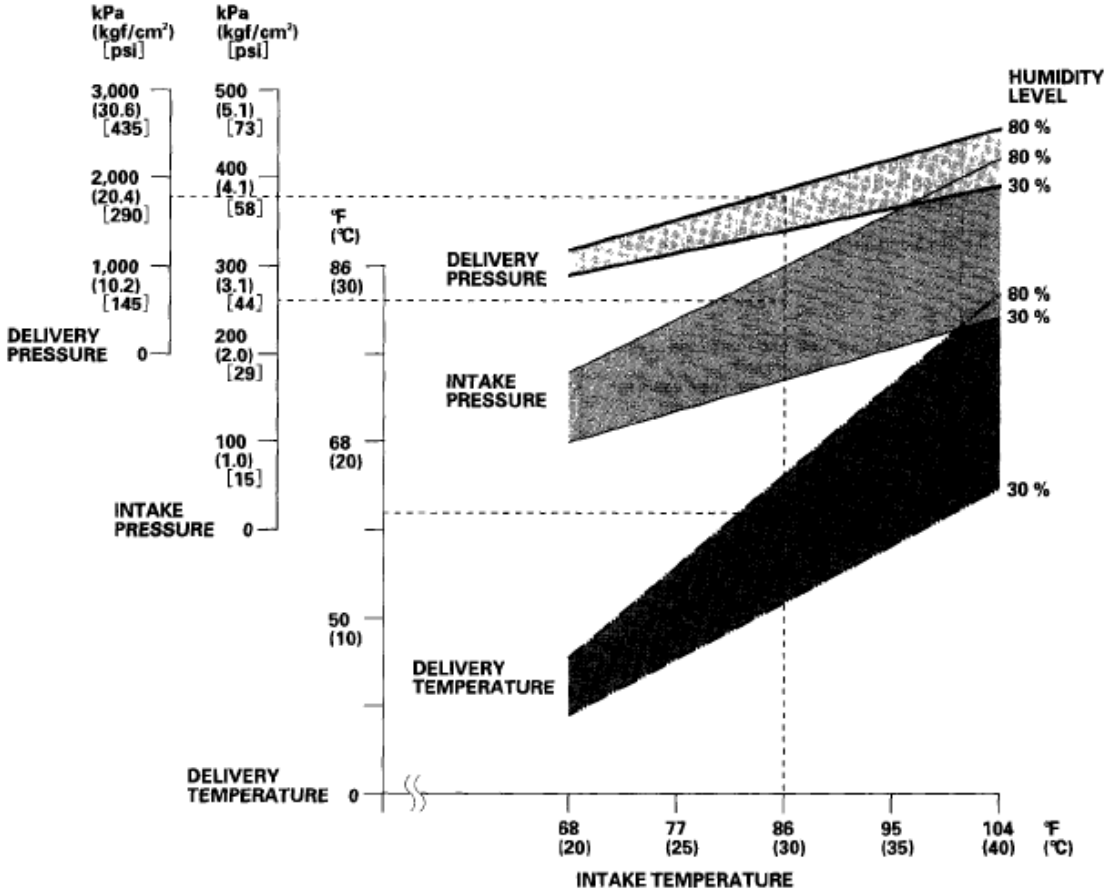

Fig. 387: [Identifying Valve]
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Remove the valve, and thoroughly clean it and the valve body with solvent. Dry all parts with compressed air, then reassemble using ATF as a lubricant.

VALVE BODY VALVE INSTALLATION

1. Coat all parts with ATF before assembly.
2. Install the valves and springs in the sequence shown for the main valve body (see **MAIN VALVE BODY DISASSEMBLY, INSPECTION, AND REASSEMBLY**), the regulator valve body (see **REGULATOR VALVE BODY DISASSEMBLY, INSPECTION, AND REASSEMBLY**), and the servo body (see **SERVO BODY DISASSEMBLY, INSPECTION, AND REASSEMBLY**). Refer to the following valve cap illustrations, and install the each valve cap so the end shown facing up will be facing the outside of the valve body, then secure the valve cap with the valve cap clip.

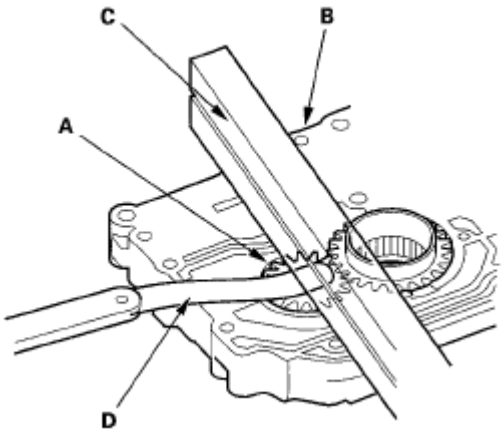

Fig. 388: Identifying Valves And Springs
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the valve and the valve spring (A) in the valve body (B). Push the valve spring in with a screwdriver, then install the spring seat (C).

MAIN VALVE BODY DISASSEMBLY, INSPECTION, AND REASSEMBLY

1. Clean all parts thoroughly in solvent, and dry them with compressed air. Blow out all passages.
2. Do not use a magnet to remove the check balls, it may magnetize the check balls.
3. Inspect the main valve body for scoring and damage.
4. Check all valves for free movement. If any fail to slide freely, refer to **VALVE BODY REPAIR** .
5. Coat all parts with ATF during assembly.

ATF PUMP INSPECTION

1. Install the ATF pump drive gear (A), the ATF pump driven gear (B), and the ATF pump driven gear shaft (C) in the main valve body (D). Lubricate all parts with ATF, and install the ATF pump driven gear with its grooved and chamfered side facing up.

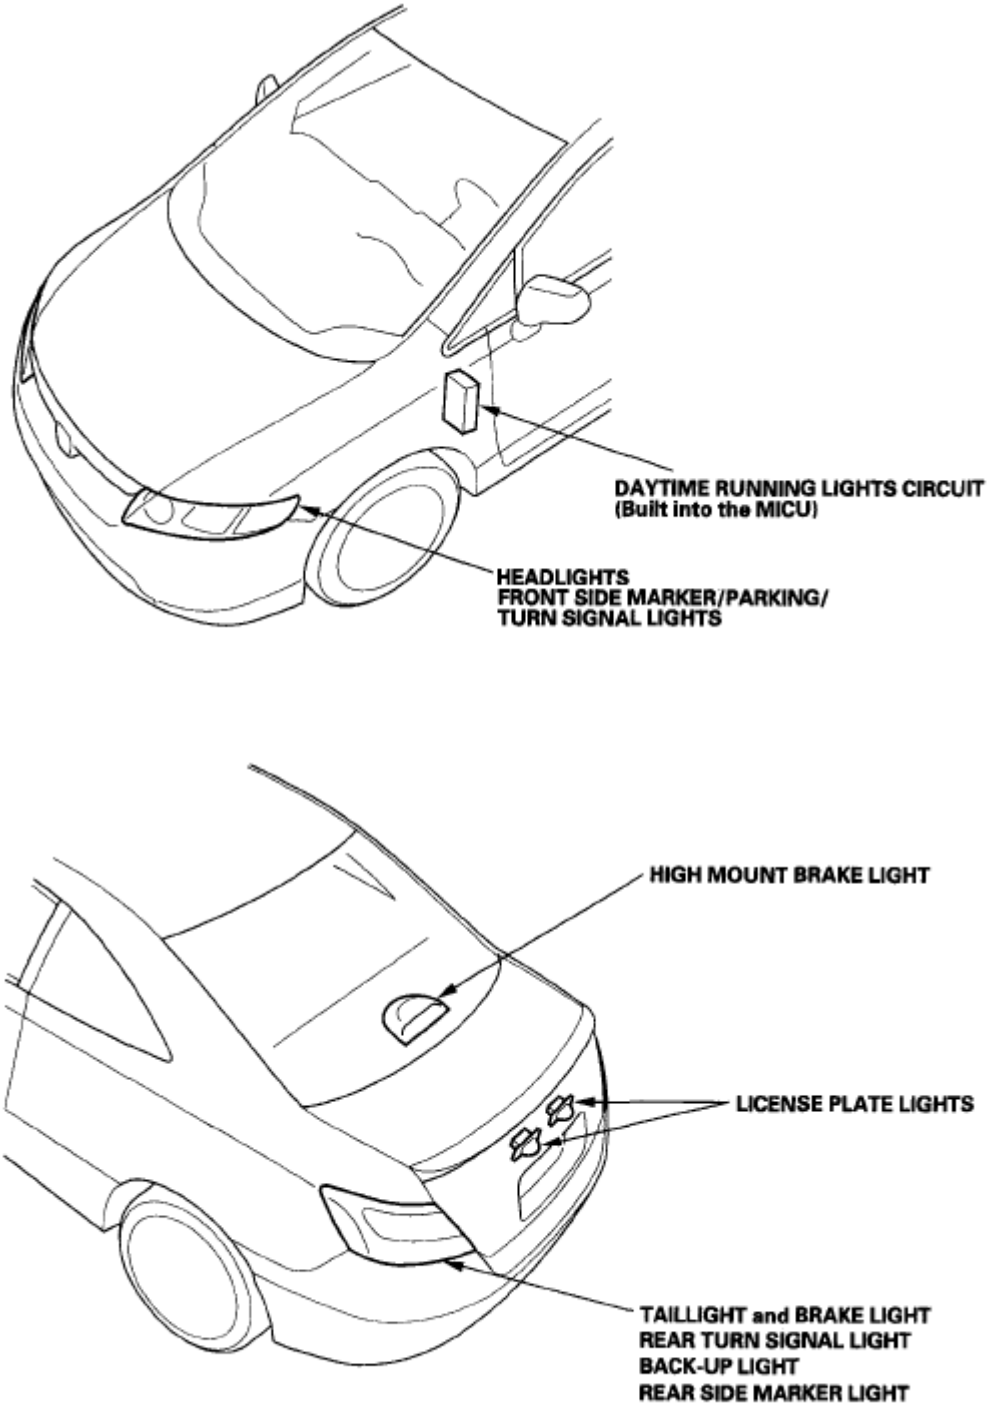

Fig. 391: Identifying ATF Pump Drive Gear, ATF Pump Driven Gear, ATF Pump Driven Gear Shaft And Main Valve Body

REGULATOR VALVE BODY DISASSEMBLY, INSPECTION, AND REASSEMBLY

1. Clean all parts thoroughly in solvent, and dry them with compressed air. Blow out all passages except the air check valve filter.

2. Inspect the regulator valve body for scoring and damage.
3. Hold the regulator spring cap in place while removing the stop bolt. The regulator spring cap is spring loaded. Once the stop bolt is removed, release the spring cap slowly so it does not pop out.
4. Check all valves for free movement. If any fail to slide freely, refer to **VALVE BODY REPAIR** .
5. Check the air check valve filter for clogging. If the filter is clogged, remove the air check valve, and clean the filter thoroughly by pouring clean ATF. Do not blow out the filter with compressed air. Replace the air check valve, if the filter or check valve (ball) is clogged or damaged.
6. Coat all parts with ATF during assembly.
7. Align the hole in the regulator spring cap with the stop bolt hole, then press the spring cap into the valve body, and tighten the stop bolt.

SHIFT SOLENOID VALVE REMOVAL AND INSTALLATION

NOTE: Do not hold the solenoid valve connector to remove and install the solenoid valves. Be sure to hold the solenoid valve body.

1. Remove the mounting bolts, then remove the solenoid valves by holding the solenoid valve body.
2. Install new O-rings (E) on each solenoid valve.

NOTE: A new shift solenoid valve comes with new O-rings. If you install a new solenoid valve, use the O-rings provided on it.

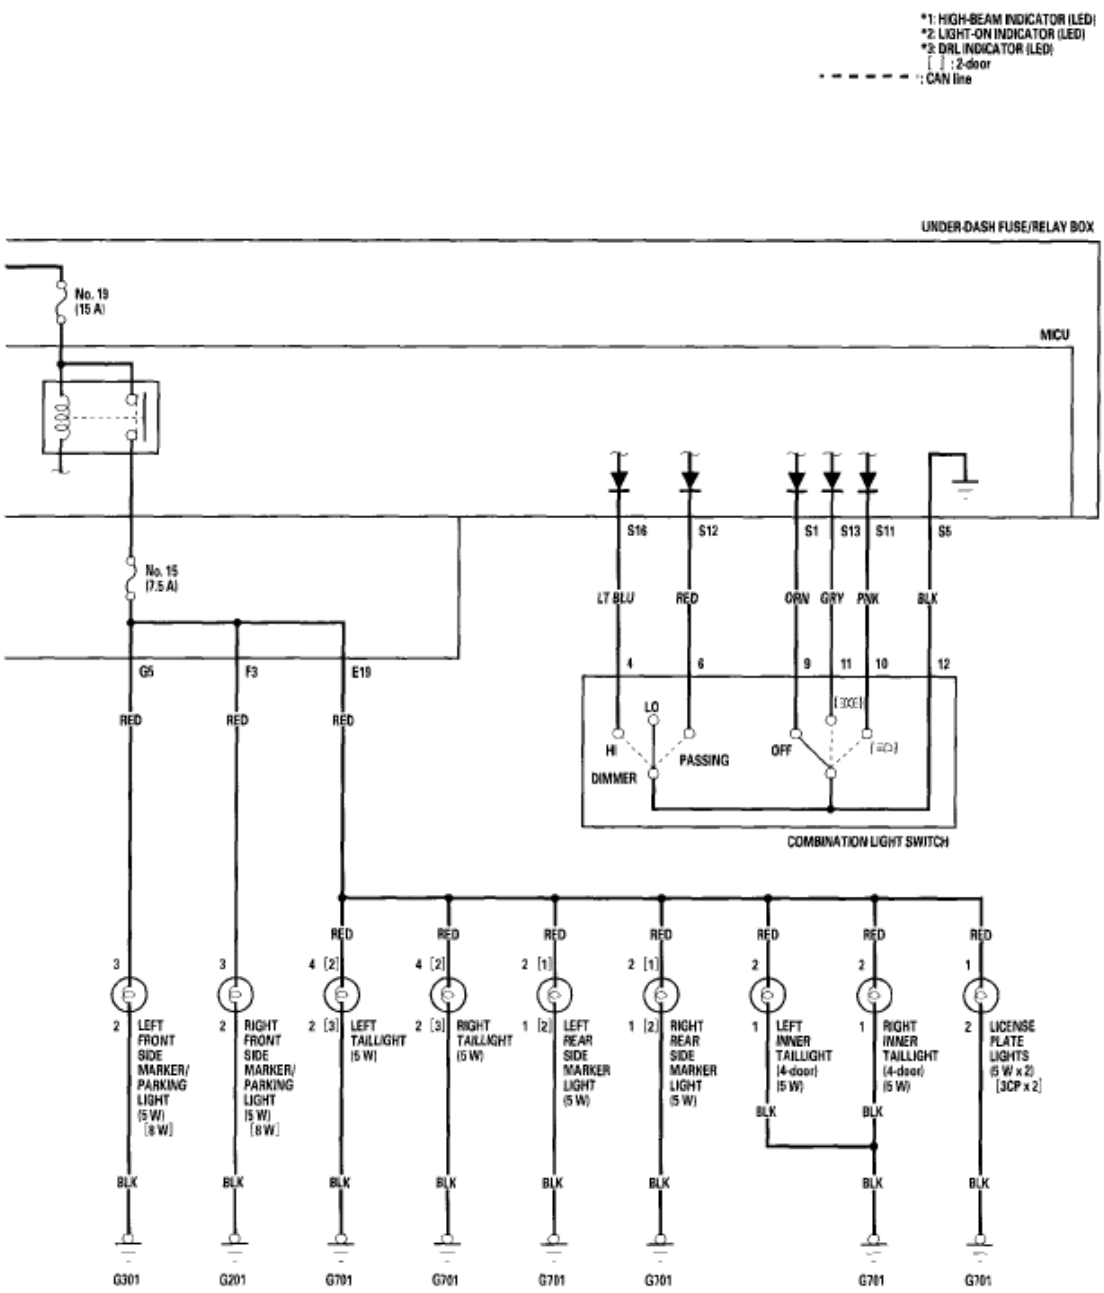

Fig. 396: Identifying Shift Solenoid Valve, O-Ring & Bolts w/Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install shift solenoid valve D (black connector) by holding the shift solenoid valve body; be sure to install the mounting bracket contacts to the servo body.
4. Install shift solenoid valve C (brown connector) by holding the shift solenoid valve body; be sure to install the mounting bracket contacts to the servo body.
5. Install shift solenoid valve B (black connector) by holding the shift solenoid valve body; be sure to install the mounting bracket Contacts to the servo body.
6. Install shift solenoid valve A (brown connector) by holding the shift solenoid valve body; be sure to install the mounting bracket contacts to the bracket of shift solenoid valve B.

NOTE: Do not install shift solenoid valve A before installing shift solenoid

valve B. If shift solenoid valve A is installed before installing shift solenoid valve B, it may damage to hydraulic control system.

TORQUE CONVERTER HOUSING

MAINSHAFT BEARING AND OIL SEAL REPLACEMENT

Special Tools Required

- Adjustable bearing puller, 25-40 mm 07736-A01000B or 07736-A01000A
- Driver 07749-0010000
- Attachment, 62 x 68 mm 07746-0010500
- Attachment, 72 x 75 mm 07746-0010600

1. Remove the mainshaft bearing and oil seal using the adjustable bearing puller and a commercially available 3/8"-16 slide hammer (A).

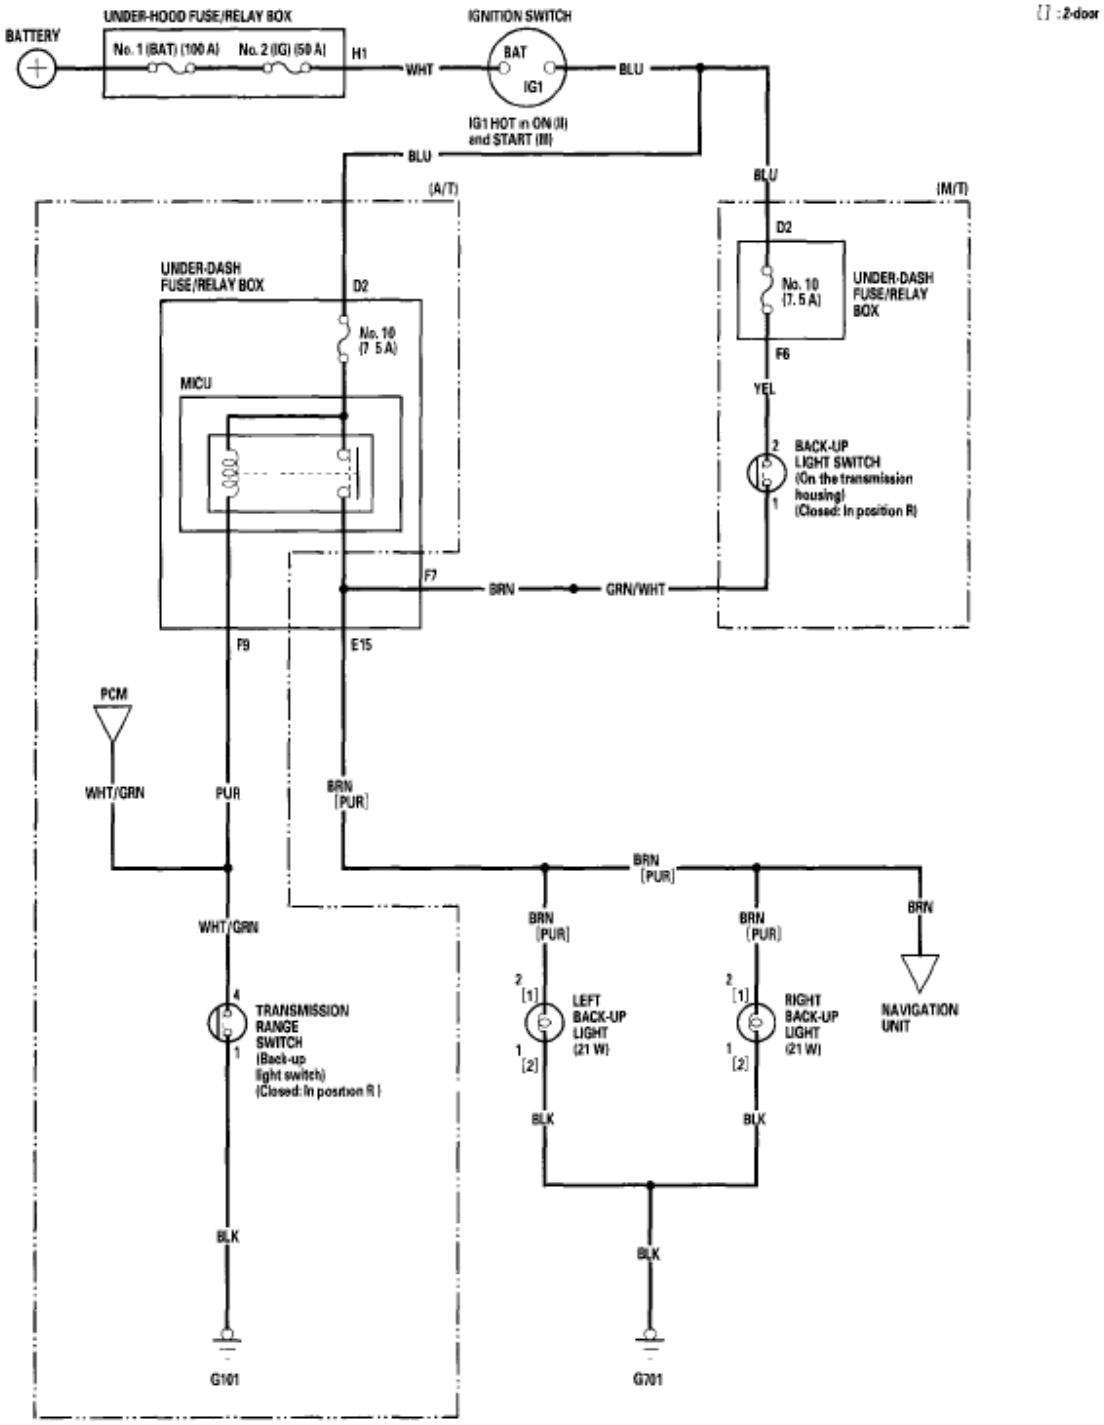

Fig. 397: Removing Mainshaft Bearing And Oil Seal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install a new mainshaft bearing until it bottoms in the torque converter housing using the driver and the 62 x 68 mm attachment.

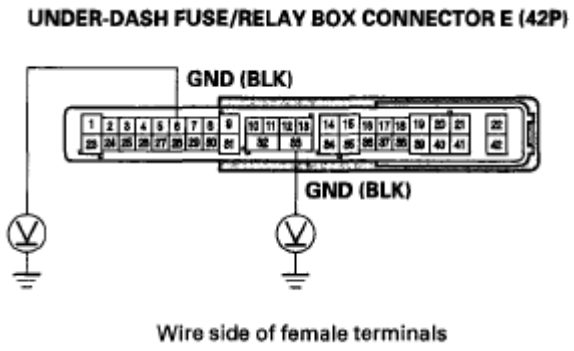

Fig. 398: Tapping Mainshaft Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install a new oil seal flush with the housing using the driver and the 72 x 75 mm attachment.

COUNTERSHAFT BEARING REPLACEMENT

Special Tools Required

- Adjustable bearing puller, 25-40 mm 07736-A01000B or 07736-A01000A
- Driver 07749-0010000
- Attachment, 62 x 68 mm 07746-0010500

1. Remove the countershaft bearing using the adjustable bearing puller and a commercially available 3/8"-16 slide hammer (A).

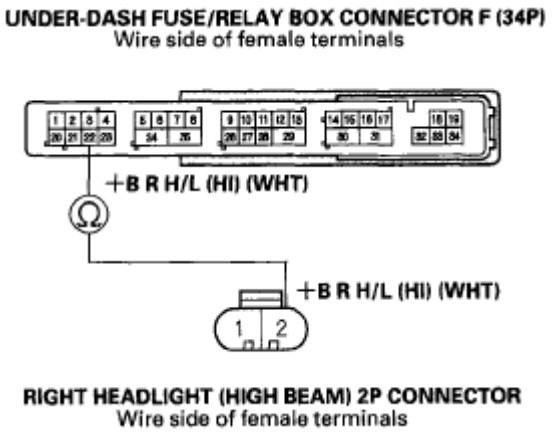

Fig. 400: Removing Countershaft Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the ATF guide plate (A).

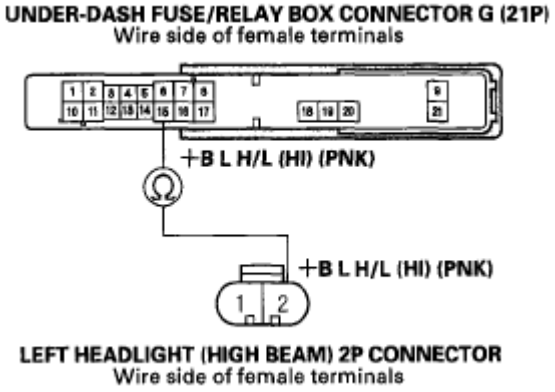

Fig. 401: Tapping ATF Guide Plate
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install a new countershaft bearing (B) in the housing using the driver and the 62 x 68 mm attachment; install the bearing outer race surface in height (C) of 0-0.03 mm (0-0.001 in.) above the housing surface (D). Do not install the bearing exceeding 0.03 mm (0.001 in.) high from housing surface.

SECONDARY SHAFT BEARING REPLACEMENT

Special Tools Required

- Driver 07749-0010000
- Attachment, 62 x 68 mm 07746-0010500

1. Remove the bolt, then remove the lock washer (A) and the bearing set plate (B).

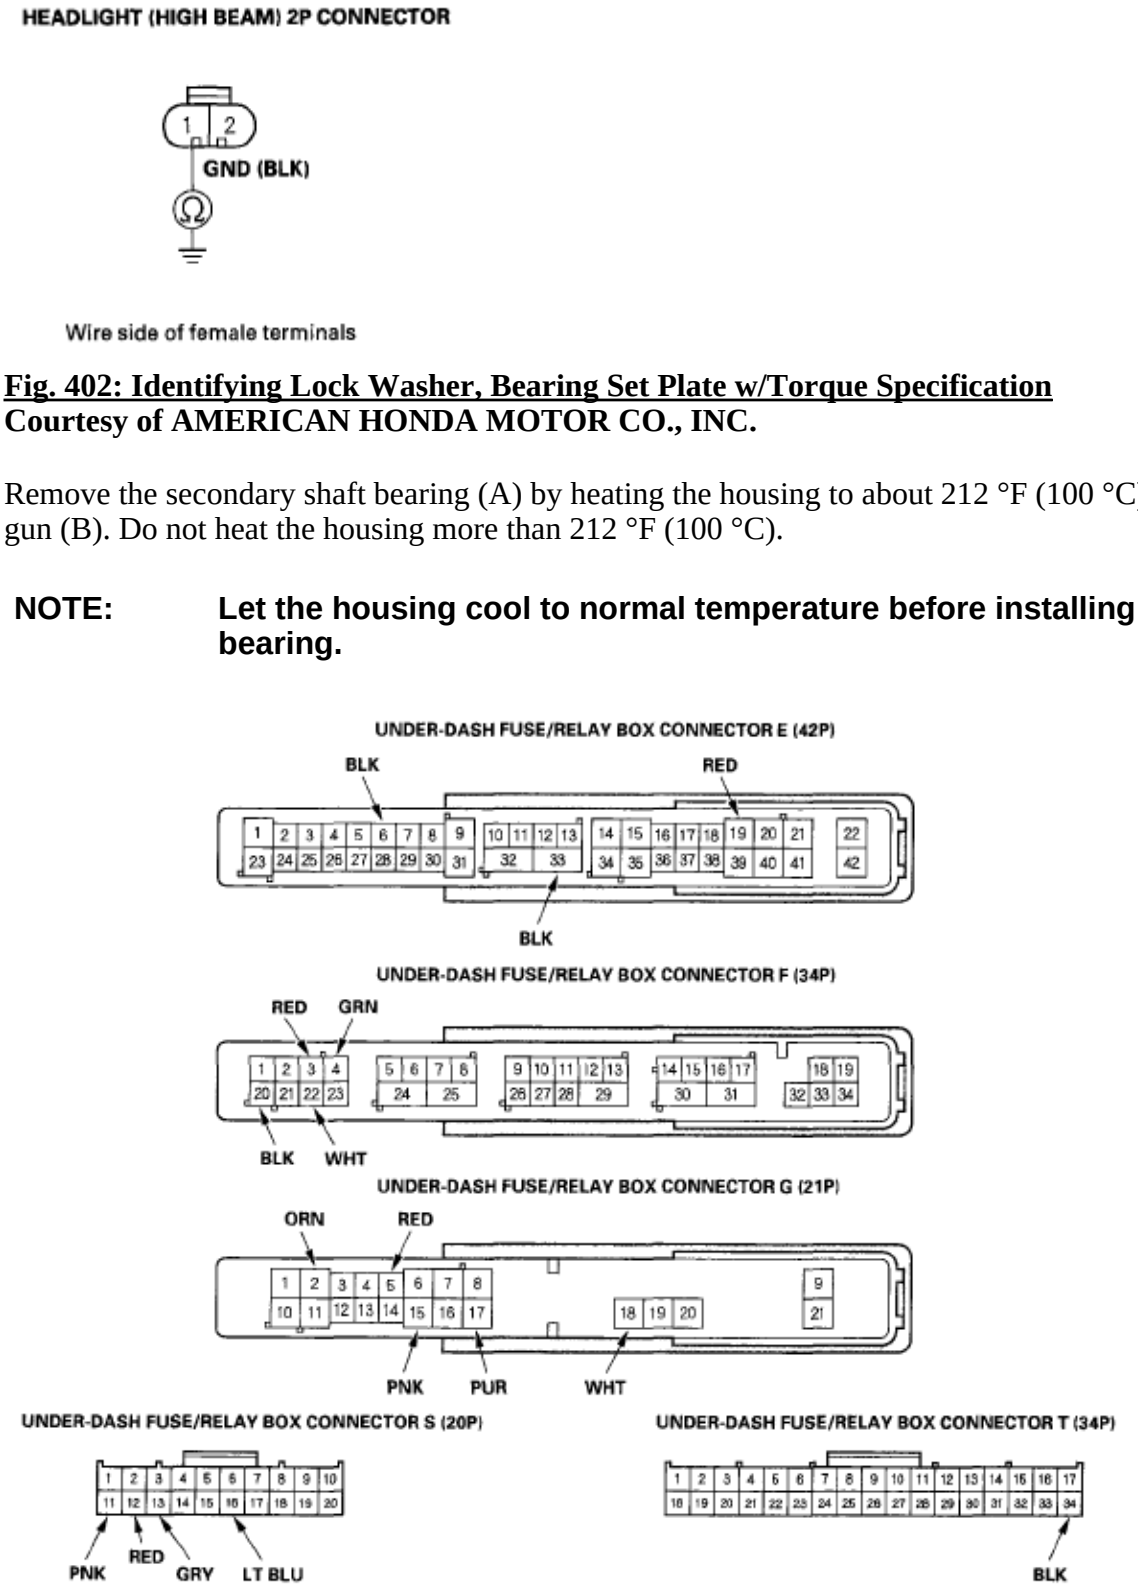

Fig. 402: Identifying Lock Washer, Bearing Set Plate w/Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the secondary shaft bearing (A) by heating the housing to about 212 °F (100 °C) with a heat gun (B). Do not heat the housing more than 212 °F (100 °C).

NOTE: Let the housing cool to normal temperature before installing the bearing.

Fig. 403: Heating Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install new O-rings (A) on the ATF guide collar (B), then install the ATF guide collar in the housing.

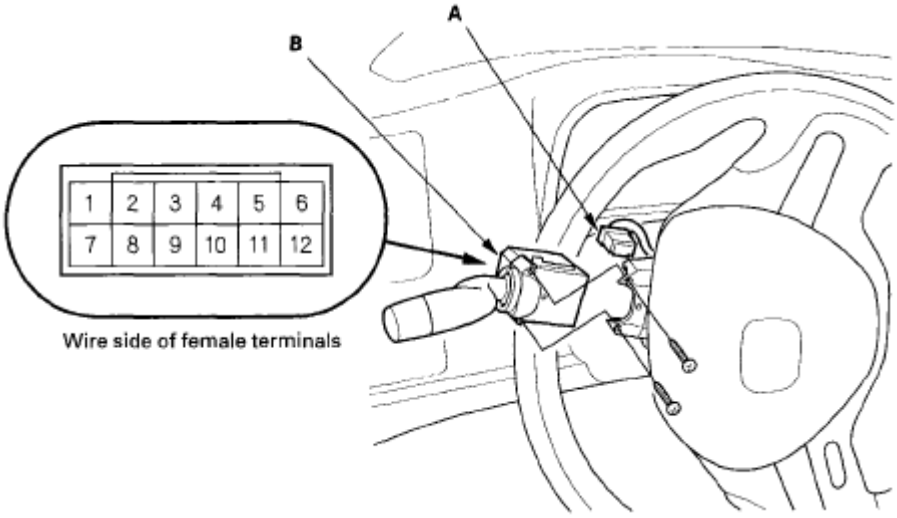

Fig. 404: Identifying O-Rings And ATF Guide Collar
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install a new secondary shaft bearing (C) in the direction shown.
5. Install the secondary shaft bearing using the driver and the 62 x 68 mm attachment securely in the housing.

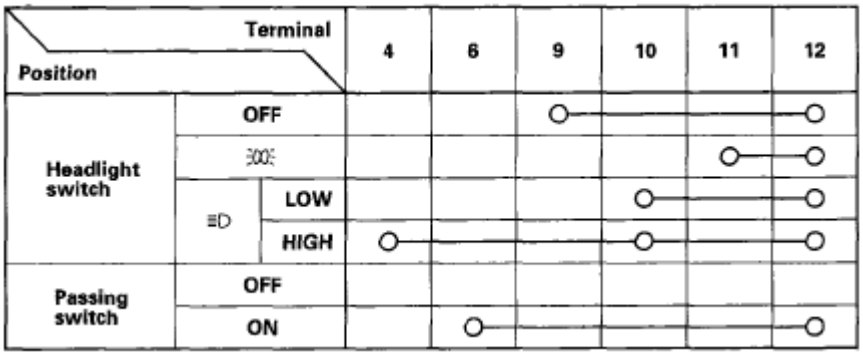

Fig. 405: Tapping Secondary Shaft Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Check that the bearing groove aligns with the housing surface, then install the bearing set plate aligned with the bearing groove.
7. Install a new lock washer and the bolt, then bend the lock tab of the lock washer against the bolt head.

LUBRICATION CHECK VALVE REPLACEMENT

1. Remove the sealing bolt (A) and the sealing washer (B).

3. Install a new lubrication check valve, a new sealing washer, and the sealing bolt.

SELECTOR CONTROL SHAFT OIL SEAL REPLACEMENT

Special Tools Required

- Driver 07749-0010000
- Oil seal driver attachment 07947-ZV00100

1. Remove the oil seal from the torque converter housing.

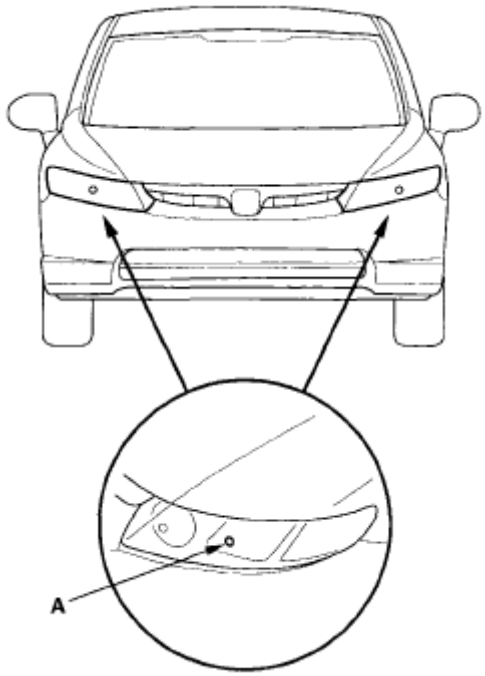

Fig. 407: Identifying Oil Seal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. install a new oil seal (A) in the torque converter housing to a depth (B) of 0.5-1.5 mm (0.02-0.06 in.) below the housing surface using the driver and the oil seal driver attachment.

2. Inspect the splines for excessive wear and damage.
3. Check the shaft bearing surface for scoring and excessive wear.
4. Before installing the O-rings, wrap the shaft splines with tape to prevent O-ring damage.
5. Lubricate all parts with ATF during assembly.
6. Install the conical spring washer, the 40 x 63 mm thrust washer in the direction shown.
7. Replace the locknut and the conical spring washer with new ones when assembling the transmission.
8. Check the axial clearance of 3rd gear (see **MAINSHAFT 3RD GEAR AXIAL CLEARANCE INSPECTION**).

MAINSHAFT 3RD GEAR AXIAL CLEARANCE INSPECTION

1. Remove the mainshaft transmission housing bearing (see **BEARING REMOVAL**).
2. Install the thrust needle bearing (A), 3rd gear (B), the needle bearing (C), the thrust needle bearing (D), the 40 x 63 mm thrust washer (E), the 3rd/5th clutch (F), the 5th gear collar (G), and the transmission housing bearing (H) on the mainshaft (I). Do not install the O-rings during inspection.

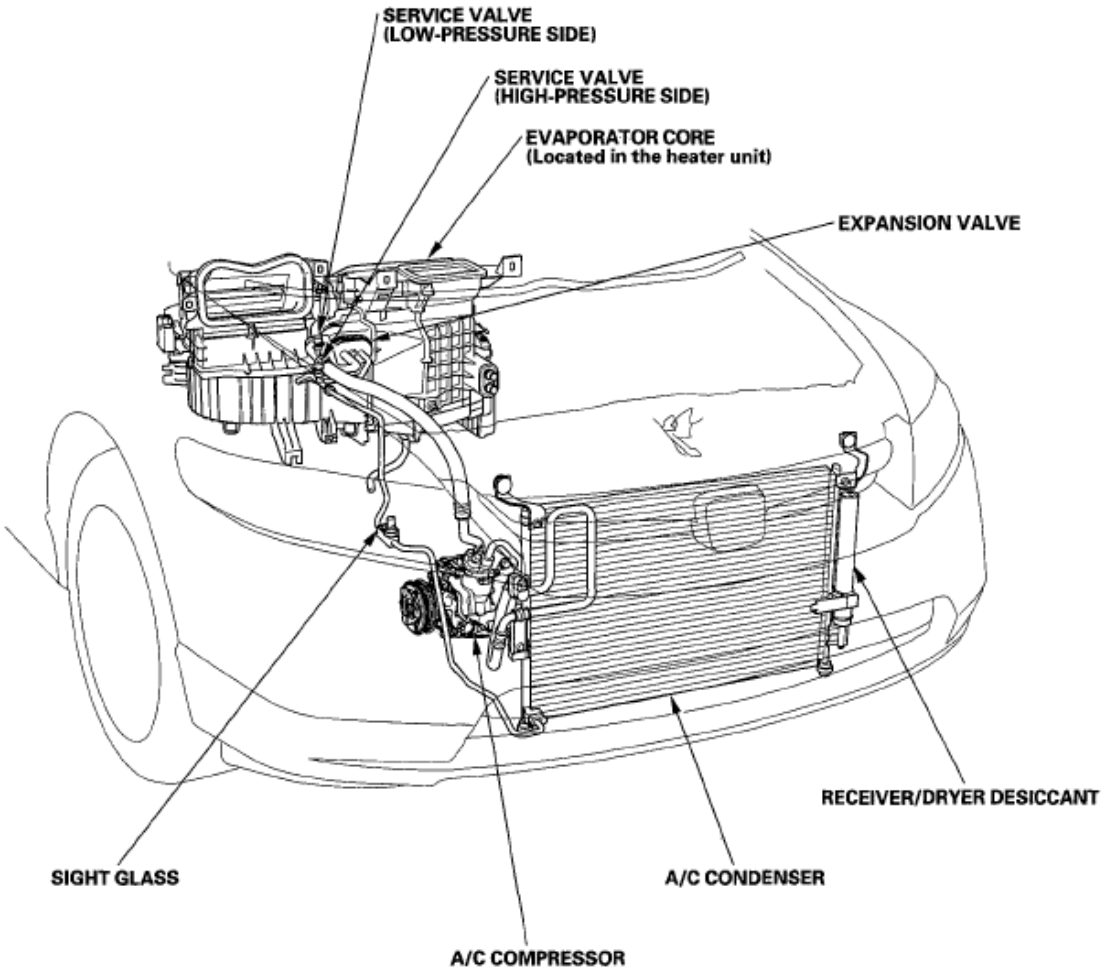

Fig. 410: Identifying Thrust Needle Bearing, 3rd Gear, Needle Bearing And Thrust Needle Bearing

3. Install the idler gear (J) on the mainshaft by a press, then install the conical spring washer (K) and the locknut (L).
4. Tighten the locknut to 29 N.m (3.0 kgf.m, 22 lbf.ft).
5. Set the dial indicator (A) on 3rd gear (B).

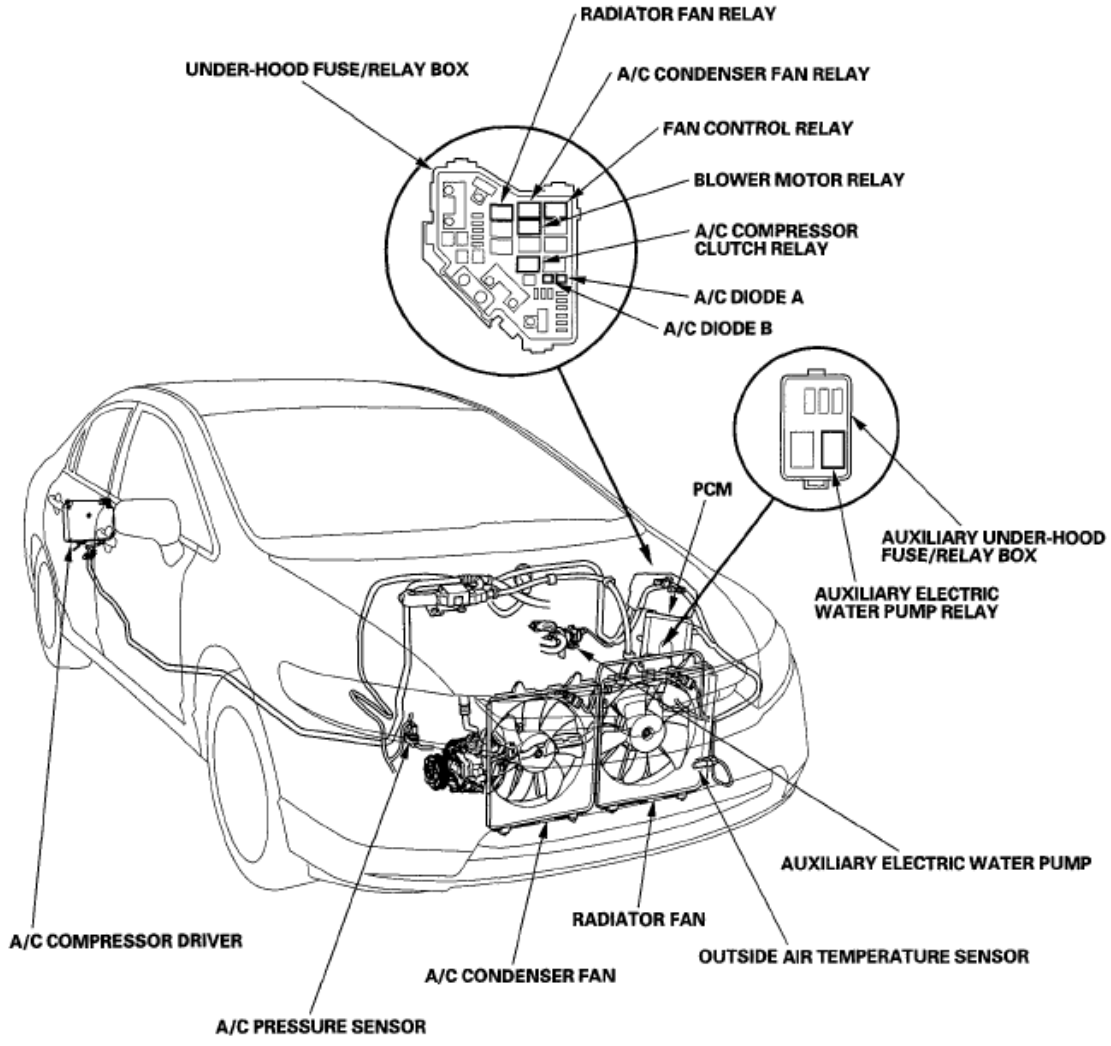

Fig. 411: Setting Dial Indicator On 3rd Gear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Lift 3rd gear (A) up while holding the mainshaft, and use the dial indicator (B) to read the 3rd gear axial clearance.

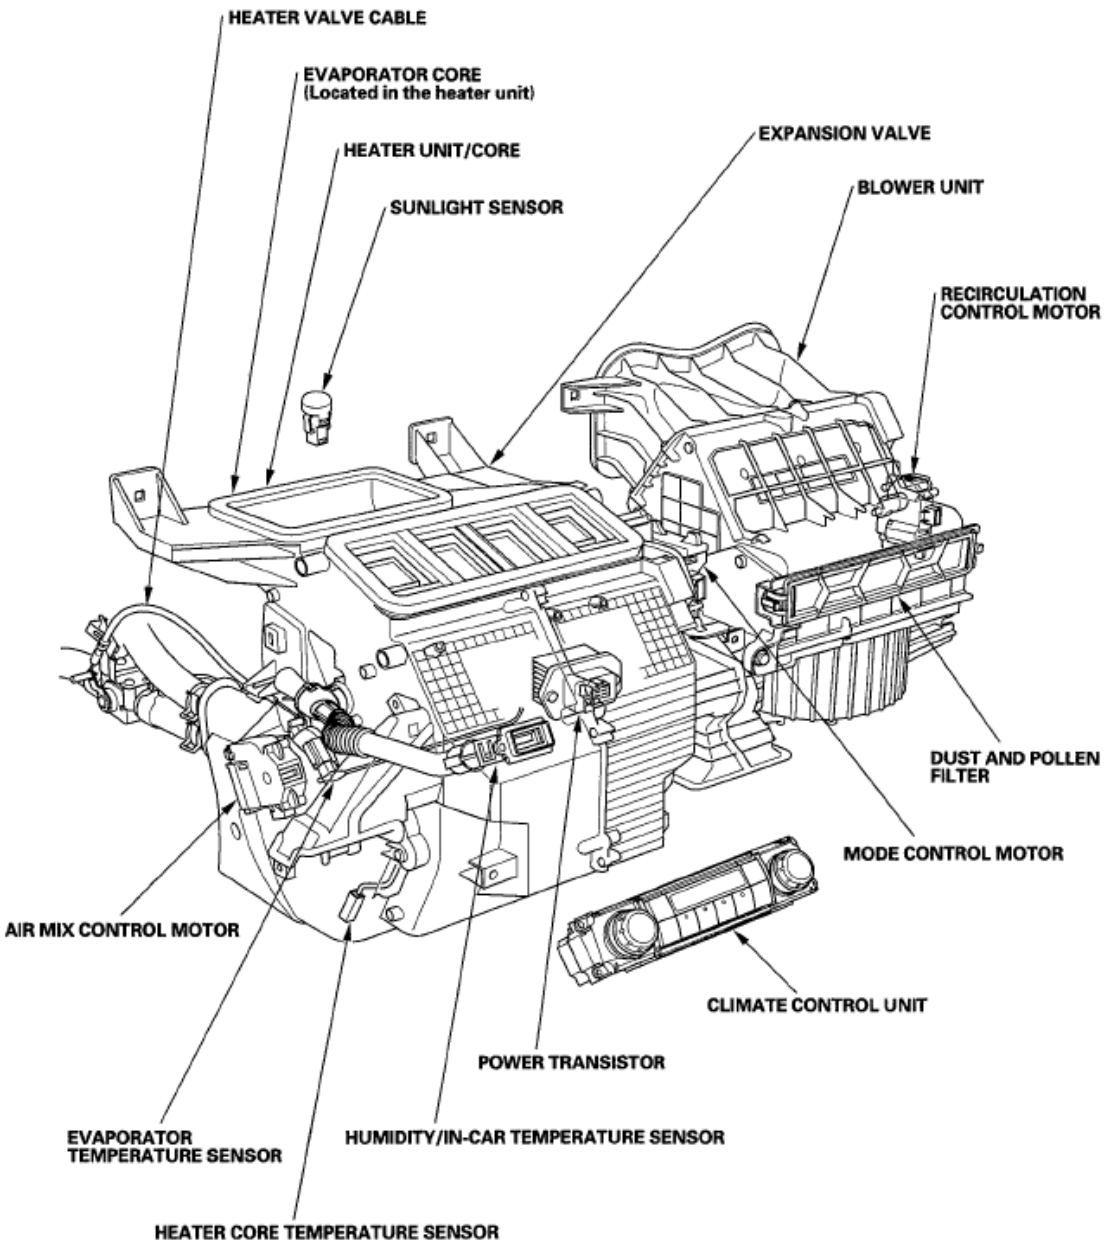

Fig. 412: Measuring 3rd Gear Axial Clearance
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Measure the 3rd gear axial clearance in at least three places while moving 3rd gear. Use the average as the actual clearance.

   Standard: 0.04-0.10 mm (0.002-0.004 in.)

8. If the clearance is out of standard, remove the 40 x 63 mm thrust washer and measure its thickness (A).

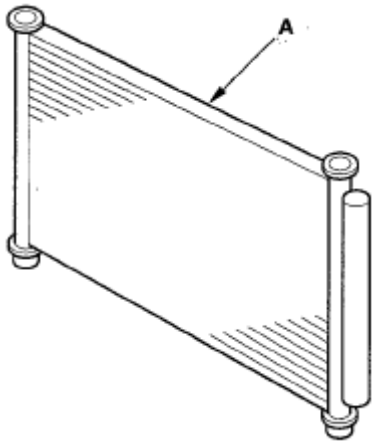

Fig. 413: Identifying Thrust Washer Thickness
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Select and install a new thrust washer, then recheck.

10. After replacing the thrust washer, make sure the clearance is within standard.
11. Disassemble the installed parts from the mainshaft.
12. Reinstall the bearing in the transmission housing (see **BEARING INSTALLATION**).

COUNTERSHAFT DISASSEMBLY, INSPECTION, AND REASSEMBLY

1. Inspect the thrust needle bearing and the needle bearing for galling and rough movement.

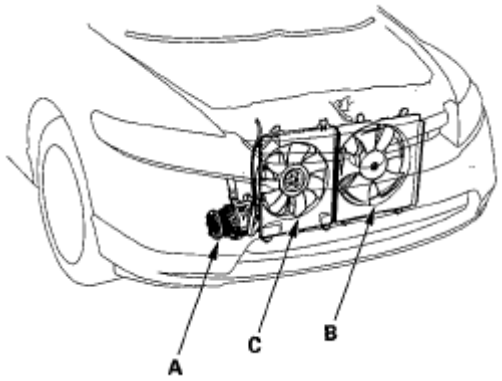

Fig. 414: Exploded View Of Countershaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Inspect the splines for excessive wear and damage.
3. Check the shaft bearing surface for scoring and excessive wear.
4. Lubricate all parts with ATF during assembly.
5. Install the conical spring washer, the park gear, the reverse selector, the 33 x 45 x 7.8 mm collar, and gears in the direction shown.
6. Replace the locknut and the conical spring washer with new ones when assembling the transmission. The countershaft locknut has left-hand threads.
7. Some reverse selector hubs are press-fitted to the countershaft; remove the hubs with a press (see **COUNTERSHAFT REVERSE SELECTOR HUB REMOVAL**), and install them with the special tool and a press (see **COUNTERSHAFT REVERSE SELECTOR HUB REMOVAL**).

COUNTERSHAFT REVERSE SELECTOR HUB REMOVAL

1. Remove the reverse selector hub from the countershaft by hand. If the reverse selector hub (A) cannot be removed by hand, it is press-fitted to the countershaft (B), and remove it from the countershaft with a press. Place 4th-5th gear (C) on press bases (D), and place a shaft protector (E) between the countershaft and press to prevent damaging the countershaft.

NOTE: Some reverse selector hubs are not press-fitted, and can be removed without using a press.

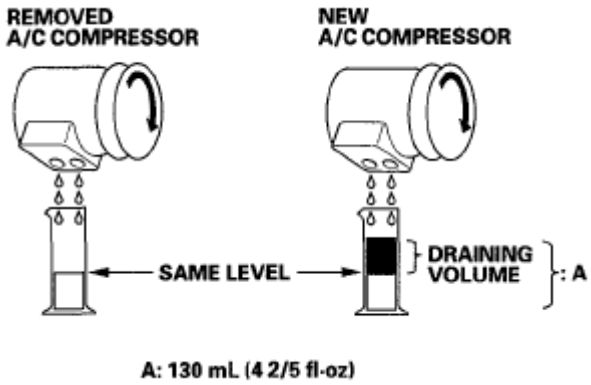

Fig. 415: Removing Countershaft Reverse Selector Hub
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Support the bottom of the countershaft with one hand, then press the countershaft out of the press-fitted reverse selector hub, and remove the countershaft while holding the underside the countershaft. The countershaft will drop down after pressing it out of the press-fitted reverse selector hub.
3. Remove the remaining parts from the countershaft, if necessary.

COUNTERSHAFT REVERSE SELECTOR HUB INSTALLATION

Special Tools Required

Driver, 40 mm I.D. 07746-0030100

1. Install 1st gear, 2nd gear, 3rd gear, the 33.2 x 40 x 26 mm collar, the 29 mm cotters, and the 33 x 45 x 7.8 mm collar on the countershaft, and secure them with the snap ring.
2. Install the needle bearings and 4th-5th gear.
3. Slide the reverse selector hub (A) over the countershaft (B), then press it in place using the 40 mm I.D. driver and a press.

NOTE: Some reverse selector hubs are not press-fitted, and can be installed without using the special tool and a press.

2. Inspect the splines for excessive wear and damage.
3. Check the shaft bearing surface for scoring and excessive wear.
4. Before installing the O-rings, wrap the shaft splines with tape to prevent O-ring damage.
5. Lubricate all parts with ATF during assembly.
6. Install the conical spring washer, the idler gear, and the 31 x 54 mm thrust washer in the direction shown.
7. Replace the locknut and the conical spring washer with new ones when assembling the transmission. The locknut has left-hand threads.
8. Check the axial clearance of 1st gear (see **SECONDARY SHAFT 1ST GEAR AXIAL CLEARANCE INSPECTION**) and 2nd gear (see **SECONDARY SHAFT 2ND GEAR AXIAL CLEARANCE INSPECTION**).
9. Inspect the condition of the sealing rings. If the sealing rings are worn, distorted, or damaged, replace them (see **SECONDARY SHAFT SEALING RING REPLACEMENT**).

SECONDARY SHAFT 1ST GEAR AXIAL CLEARANCE INSPECTION

1. Install the thrust needle bearing (A), 1st gear (B), the needle bearing (C), the thrust needle bearing (D), the 31 x 54 mm thrust washer (E), and the 1st clutch (F) on the secondary shaft (G), then secure them with the snap ring (H).

5. After replacing the thrust washer, make sure the clearance is within standard.
6. Disassemble the installed parts from the secondary shaft.

SECONDARY SHAFT 2ND GEAR AXIAL CLEARANCE INSPECTION

1. Install the thrust needle bearing (A), the needle bearing (B), 2nd gear (C), the thrust needle bearing

(D), the 43 x 54.5 mm thrust washer (E), the 39 mm cotters (F), and the cotter retainer (G) on the secondary shaft (H), then secure them with the snap ring (I).

7. After replacing the thrust washer, make sure the clearance is within standard.
8. Disassemble the installed parts from the secondary shaft.

SECONDARY SHAFT SEALING RING REPLACEMENT

The sealing rings are synthetic resin with chamfered ends. Check the condition of the sealing rings, and replace them only if they are worn, distorted, or damaged.

1. For a better fit, squeeze sealing rings together slightly before installing them.

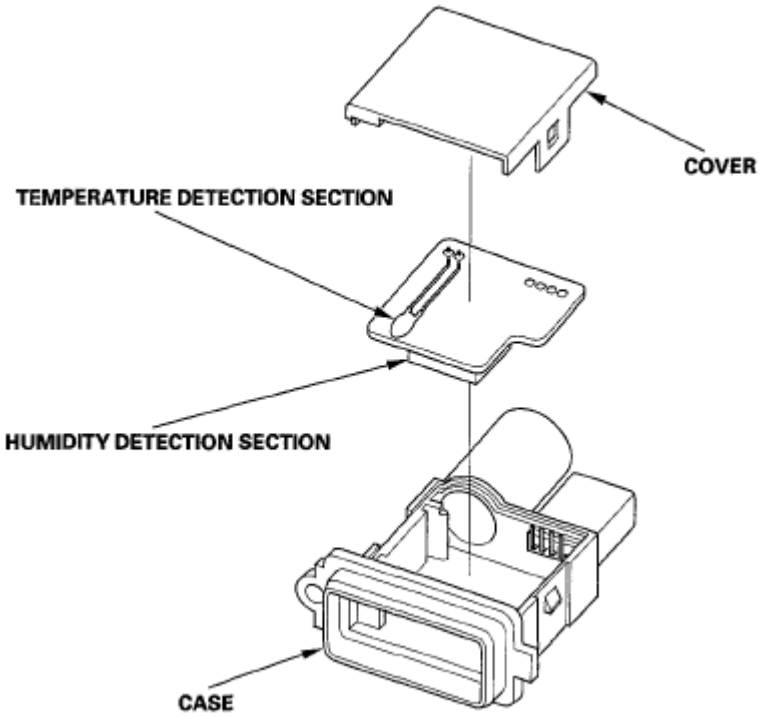

Fig. 424: Identifying Sealing Rings
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Apply ATF to new sealing rings, then install them on the mainshaft.

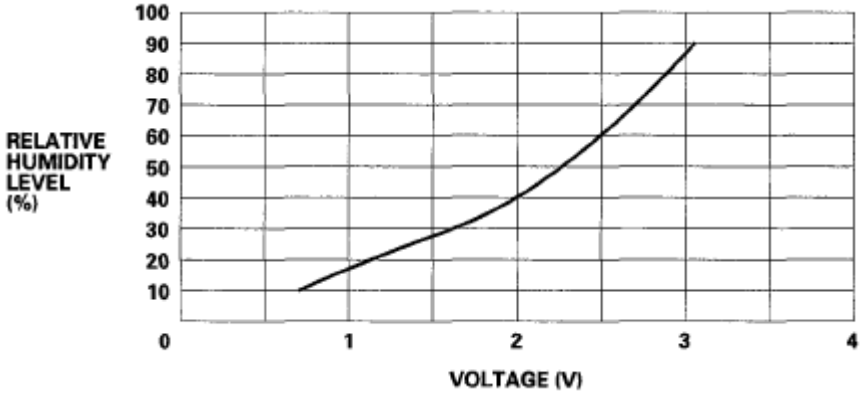

Fig. 425: Identifying Sealing Rings On Mainshaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. After installing the sealing rings, check the following:
   - The rings are fully seated in the groove.
   - The rings are not twisted.
   - The chamfered ends of the rings are properly joined.

CLUTCH DISASSEMBLY

Special Tools Required

- Clutch spring compressor attachment 07LAE-PX40100 or 07HAE-PL50101
- Clutch spring compressor bolt assembly 07GAE-PG40200 or 07GAE-PG4020A

1. Remove the snap ring using a screwdriver.

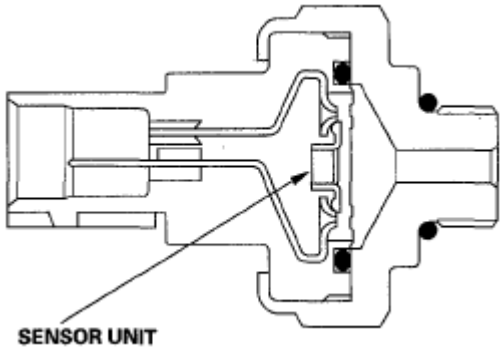

Fig. 426: Removing Snap Ring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the clutch end-plate (A), the clutch discs (B) (6), the clutch wave-plates (C) (6), and the waved spring (D) from the 1st clutch drum (E)

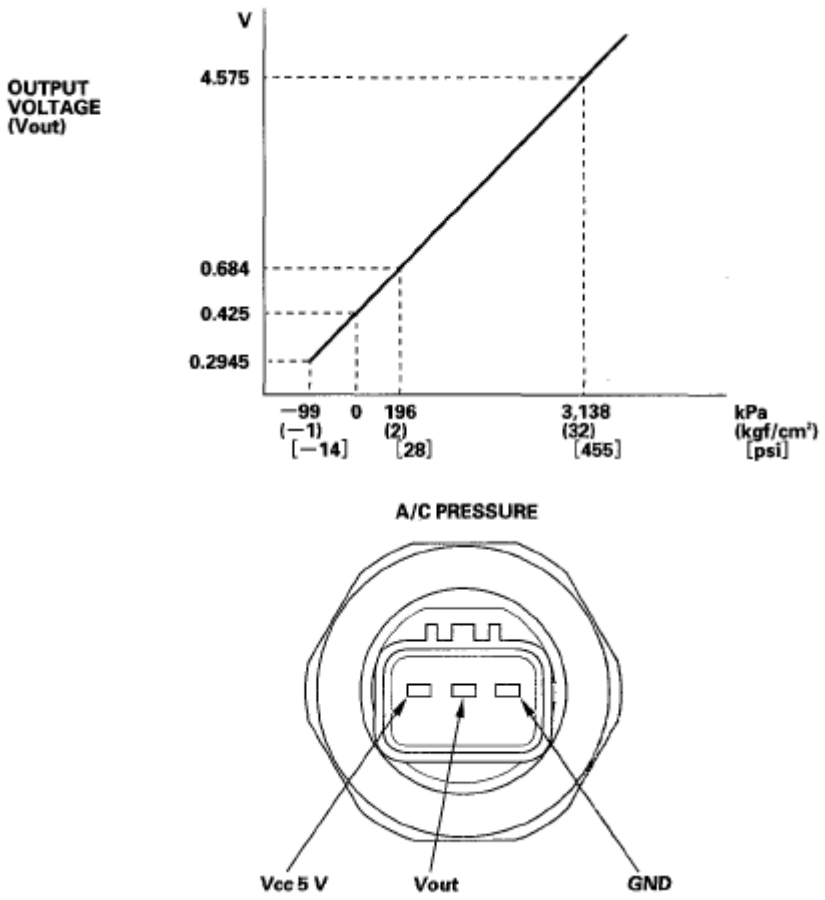

Fig. 427: Identifying Clutch End-Plate, Clutch Discs, Clutch Wave-Plates, Waved Spring And 1st Clutch Drum

3. Remove the clutch end-plate (A), the clutch discs (B) (4), the clutch flat-plates (C) (4), and the waved spring (D) from the 2nd clutch drum (E).

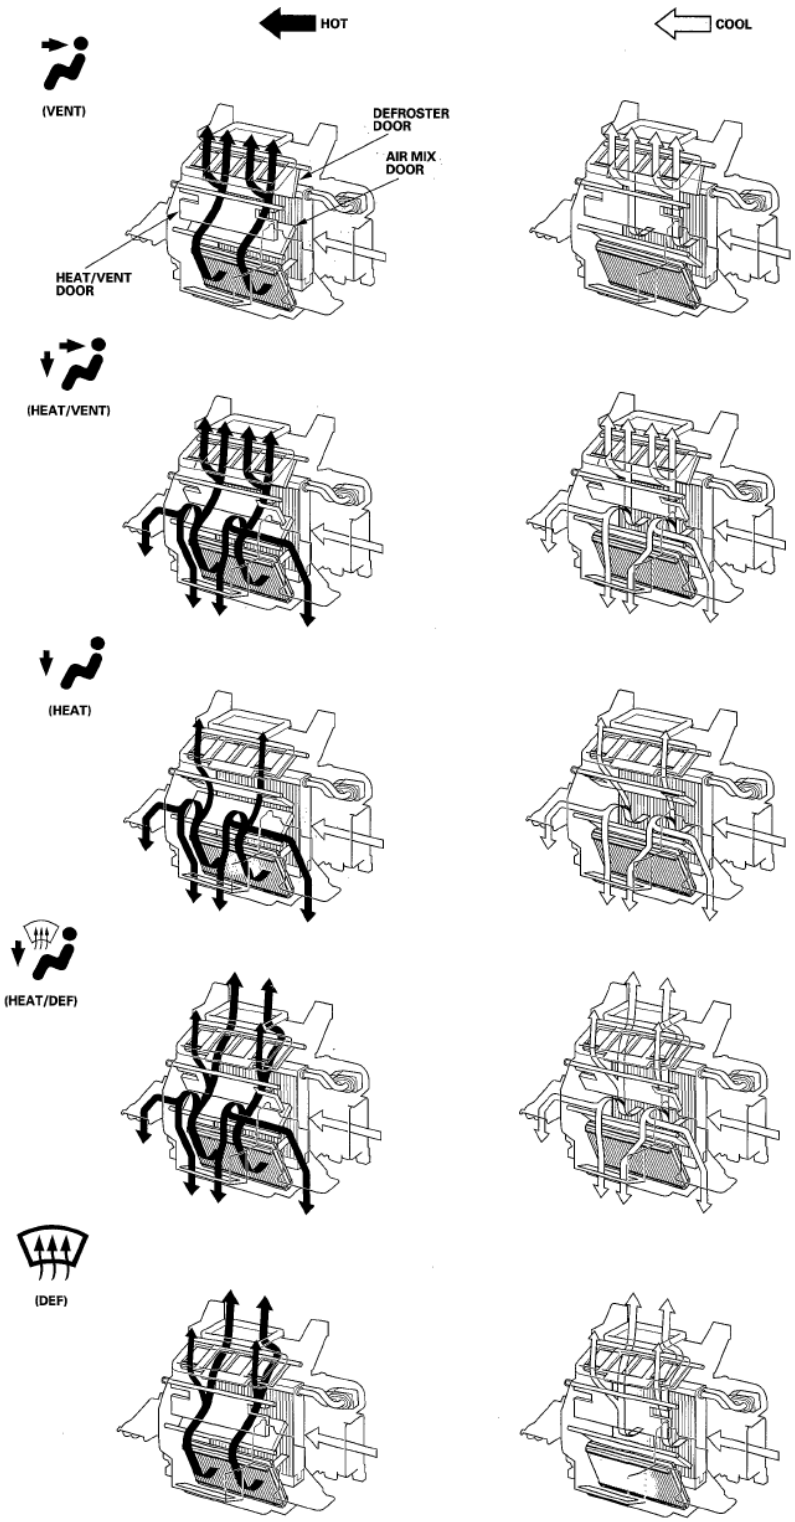

Fig. 428: Disassembling 2nd Clutch Drum
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the clutch end-plate (A), the clutch discs (B) (4), the clutch flat-plates (C) (4), and the waved spring (D) from the 4th clutch drum (E).

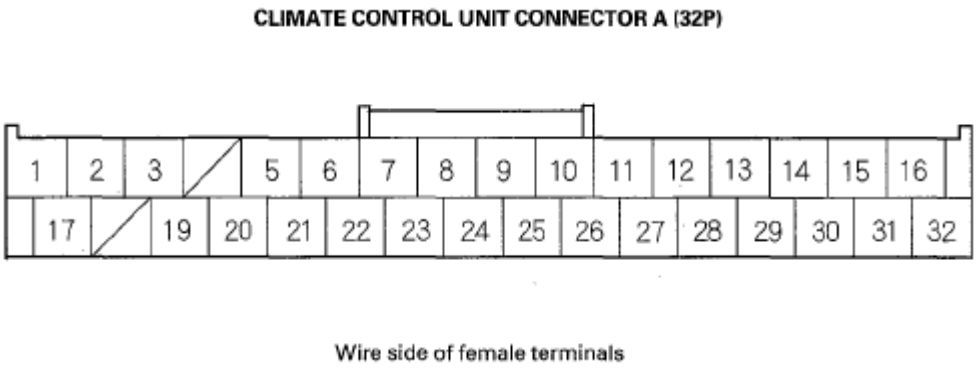

Fig. 429: Disassembling 4th Clutch Drum

5. Remove the clutch end-plate (A), the clutch discs (B) (4), the clutch wave-plates (C) (4), and the waved spring (D) from the 3rd clutch drum (E).

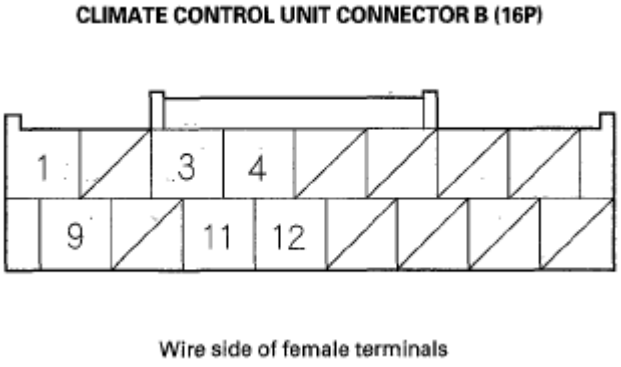

Fig. 430: Disassembling 3rd Clutch Drum
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Remove the clutch end-plate (A), the clutch discs (B) (4), the clutch wave-plates (C) (4), and the waved spring (D) from the 5th clutch drum (E).

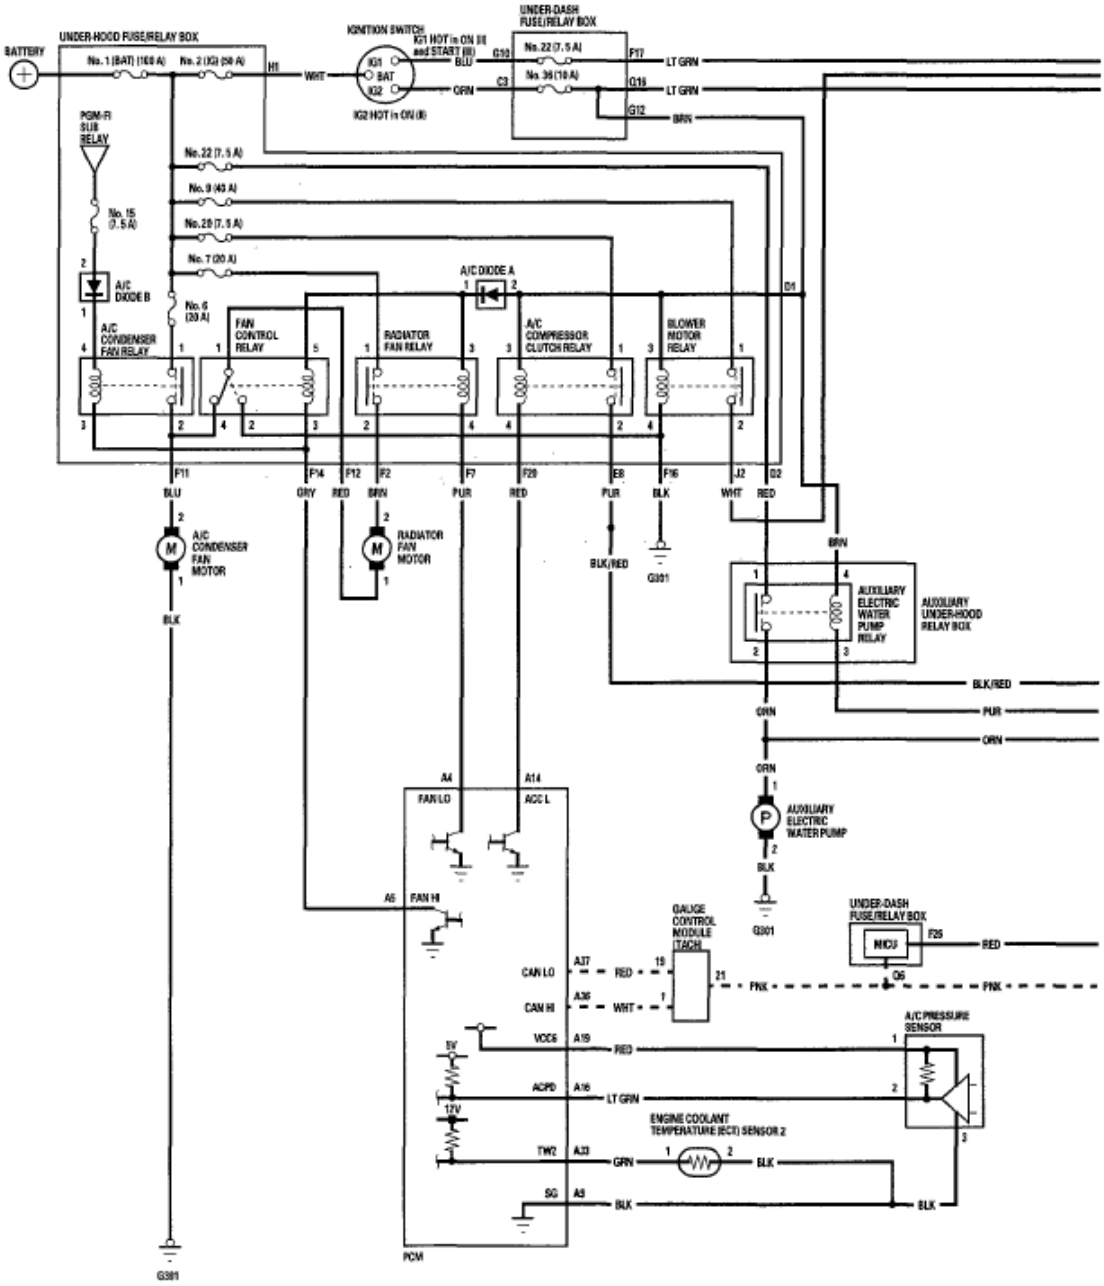

Fig. 431: Disassembling 5th Clutch Drum
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the clutch spring compressor attachment and the clutch spring compressor bolt assembly.

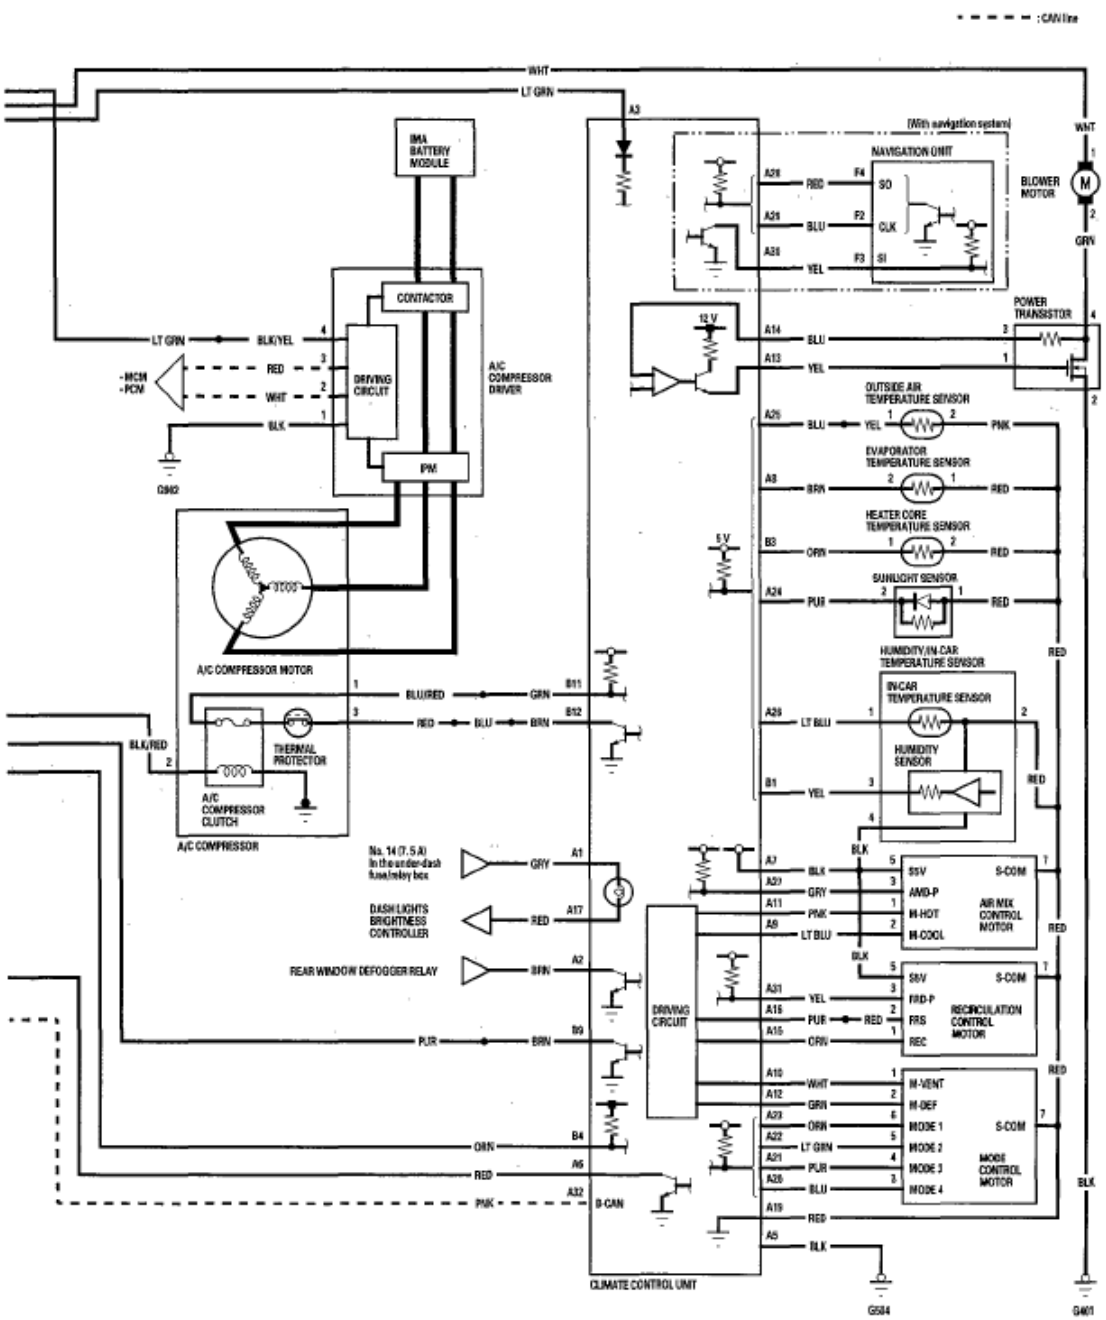

Fig. 432: Identifying Clutch Spring Compressor Attachment And Clutch Spring Compressor Bolt Assembly
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Set the clutch spring compressor attachment (A) on the spring retainer (B) of the 1st clutch in such a way that it works on the clutch return spring (C).

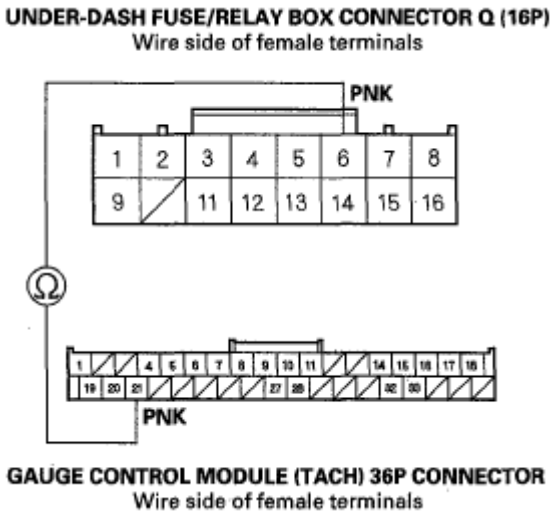

Fig. 433: Setting Clutch Spring Compressor Attachment On Spring Retainer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Be sure the clutch spring compressor attachment (A) is adjusted to have full contact with the return spring retainer (B).

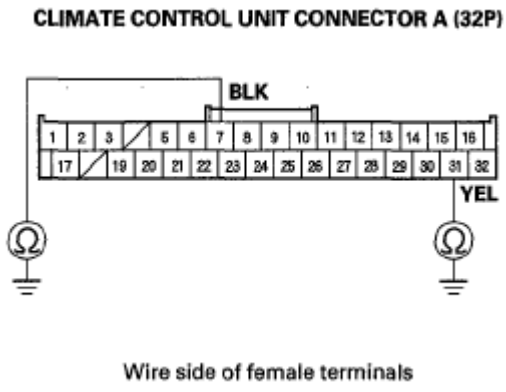

Fig. 434: Identifying Clutch Spring Compressor Attachment And Return Spring Retainer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Check the placement of the clutch spring compressor attachment. If either end of the clutch spring compressor attachment is set over an area of the spring retainer that is unsupported by the return spring, the retainer may be damaged.

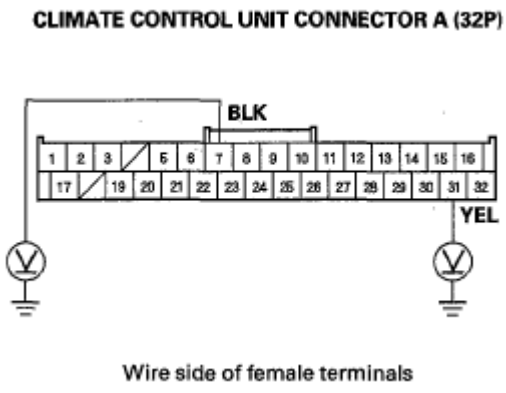

Fig. 435: Identifying Clutch Spring Compressor Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Compress the return spring until the snap ring can be removed.

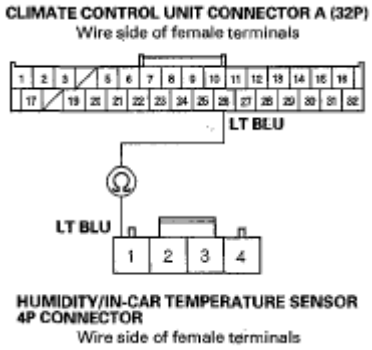

Fig. 436: Compressing Return Spring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Remove the snap ring using snap ring pliers.

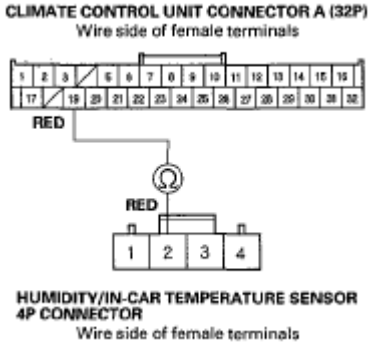

Fig. 437: Removing Snap Ring

15. Wrap a shop rag around the clutch drum, and apply air pressure to the fluid passage to remove the piston. Place a finger tip on the other passage while applying air pressure.

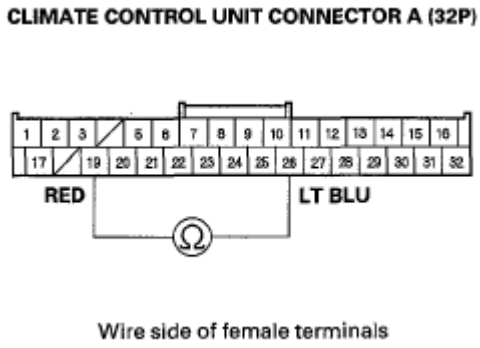

Fig. 439: Applying Air Pressure To Fluid Passage
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Remove the clutch piston (A), and remove the outer O-ring (B) and the inner O-ring (C) from the piston.

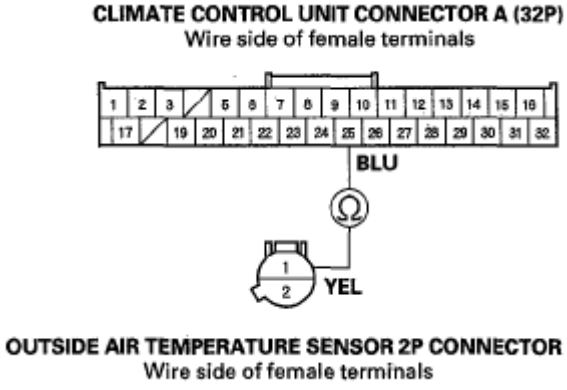

Fig. 440: Identifying Clutch Piston, Outer O-Ring And Inner O-Ring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

CLUTCH INSPECTION

1. Inspect the 4th and 5th clutch pistons and the clutch piston check valves (A).

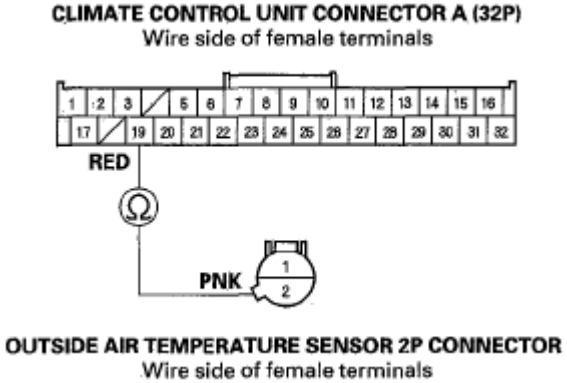

Fig. 441: Identifying Clutch Piston Check Valves

Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. If the clutch piston check valve is loose or damaged, replace the clutch piston.
3. Check the spring retainer for wear and damage.
4. Check the oil seal (A) on the spring retainer of the 1st, 2nd, and 3rd clutches for wear, damage, and peeling.

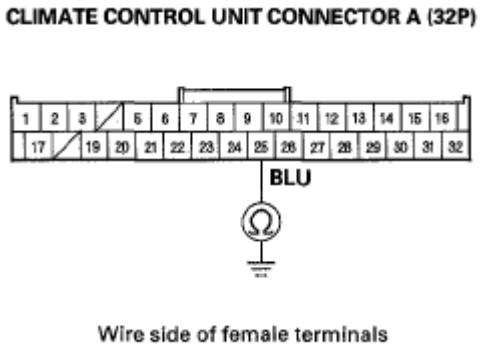

Fig. 442: Identifying Oil Seal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. If the oil seal is worn, damaged, or peeling, replace the spring retainer.
6. Inspect the clutch discs, the clutch plates, and the clutch end-plate for wear, damage, and discoloration.

Clutch Discs Standard Thickness:

1st Clutch: 1.94 mm (0.076 in.)

2nd Clutch: 1.96 mm (0.077 in.)

3rd Clutch: 1.94 mm (0.076 in.)

4th Clutch: 1.96 mm (0.077 in.)

5th Clutch: 1.94 mm (0.076 in.)

Clutch Plates Standard Thickness:

1st Clutch (wave-plates): 1.6 mm (0.063 in.)

2nd Clutch (flat-plates): 2.0 mm (0.079 in.)

3rd Clutch (wave-plates): 1.6 mm (0.063 in.)

4th Clutch (flat-plates): 1.6 mm (0.063 in.)

5th Clutch (wave-plates): 1.6 mm (0.063 in.)

7. If the clutch discs are worn or damaged, replace them as a set. If the clutch discs are replaced, inspect

the clearance between the clutch end-plate and the top disc.

8. If any plate is worn, damaged, or discolored, replace the damaged plate with a new plate, and inspect the other wave-plates for a phase difference. If the clutch plate is replaced, inspect the clearance between the clutch end-plate and the top disc.
9. If the clutch end-plate is worn, damaged, or discolored, inspect the clearance between the clutch end-plate and the top disc, then replace the clutch end-plate.

CLUTCH WAVE-PLATE PHASE DIFFERENCE INSPECTION

1. Place the clutch wave-plate (A) on a surface plate, and set a dial indicator (B) on the wave-plate.

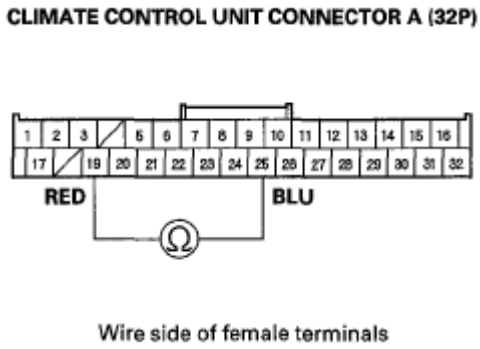

Fig. 443: Checking Clutch Wave-Plate Surface
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Find the bottom (C) of a phase difference of the wave-plate, zero the dial indicator and make a reference mark on the bottom of the wave-plate.
3. Rotate the 1st clutch wave-plate about 56-degrees or 67-degrees apart from the bottom while holding the wave-plate by its circumference, and rotate the 3rd and 5th clutch wave-plate about 60-degrees apart from the bottom while holding the wave-plate by its circumference. The dial indicator should be at the top (D) of a phase difference. Do not rotate the wave-plate while holding its surface, always rotate it by holding its circumference.
4. Read the dial indicator. The dial indicator reads the phase difference (E) of the wave-plate between the bottom and top.

   Standard: 0.07-0.20 mm (0.003-0.008 in.)

5. Rotate the 1st clutch wave-plate about 67-degrees or 56-degrees from the top, and rotate the 3rd and 5th clutch wave-plate about 60-degrees. The dial indicator should be at the bottom of a phase difference (F and G), and zero the dial indicator.
6. Measure the phase difference at the other two tops (H and I) of the wave-plate by following steps 3 thru 5.
7. If the two values of the three measurements are within the standard, the wave-plate is OK. If the two values of the three measurements are out of the standard, replace the wave-plate.

CLUTCH CLEARANCE INSPECTION

Special Tools Required

Clutch compressor attachment 07ZAE-PRP0100

1. Inspect the clutch piston, discs, plates, and the end-plate for wear and damage (see **CLUTCH INSPECTION**), and inspect the clutch wave-plate phase difference (see **CLUTCH WAVE-PLATE PHASE DIFFERENCE INSPECTION**), if necessary.
2. Install the clutch pistons in the clutch drums. Do not install the O-rings during inspection.

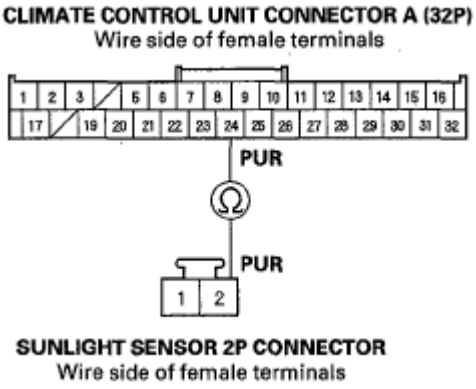

Fig. 444: Identifying Clutch Pistons
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the waved spring (A) in the 1st clutch drum (B). Starting with the clutch wave-plate, alternately install the wave-plates (C) (6) and the discs (D) (6). Install the clutch end-plate (E) with the flat side down on the top disc.

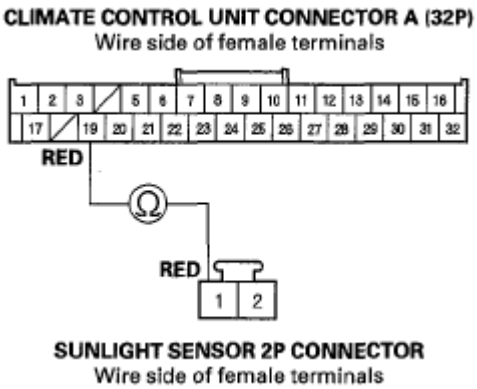

Fig. 445: Disassembling 1st Clutch Drum
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the waved spring (A) in the 2nd clutch drum (B). Starting with the clutch flat-plate, alternately install the flat-plates (C) (4) and the discs (D) (4). Install the clutch end-plate (E) with the flat side down on the top disc.

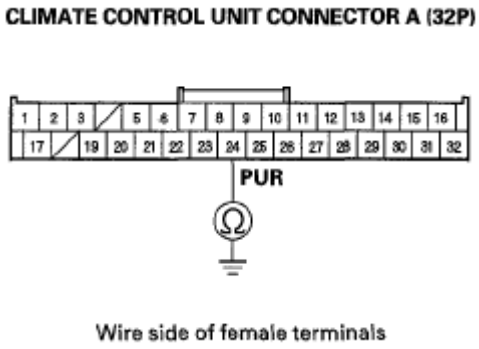

Fig. 446: Disassembling 2nd Clutch Drum
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the waved spring (A) in the 4th clutch drum (B). Starting with the clutch flat-plate, alternately install the flat-plates (C) (4) and the discs (D) (4). Install the clutch end-plate (E) with the flat side down on the top disc.

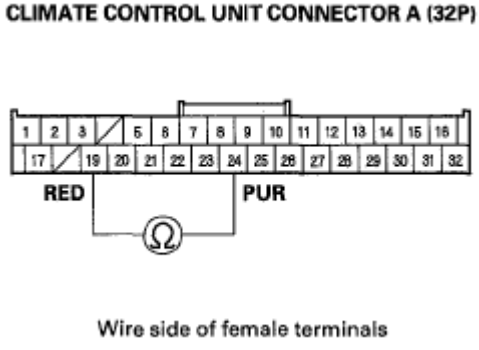

Fig. 447: Disassembling 4th Clutch Drum
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Install the waved spring (A) in the 3rd clutch drum (B). Starting with the clutch wave-plate, alternately install the wave-plates (C) (4) and the discs (D) (4). Install the clutch end-plate (E) with the flat side down on the top disc.

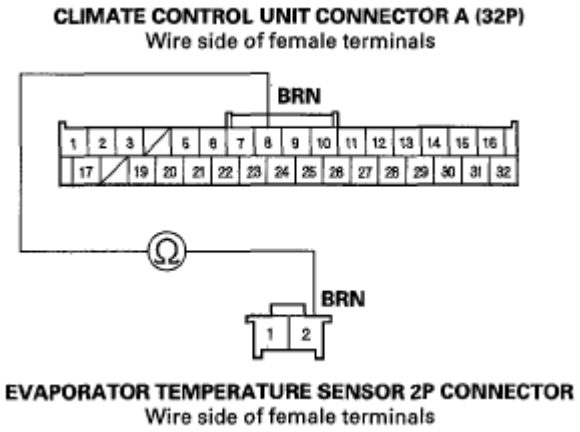

Fig. 448: Disassembling 3rd Clutch Drum
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the waved spring (A) in the 5th clutch drum (B). Starting with the clutch wave-plate, alternately install the wave-plates (C) (4) and the discs (D) (4). Install the clutch end-plate (E) with the flat side down on the top disc.

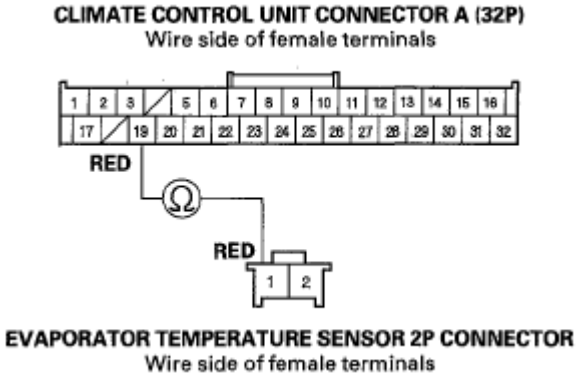

Fig. 449: Disassembling 5th Clutch Drum
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Install the snap ring using a screwdriver to secure the clutch end-plate.

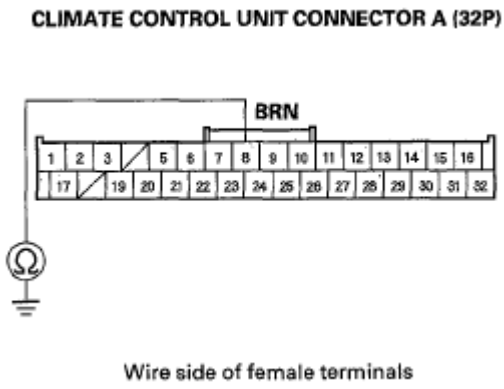

Fig. 450: Installing Snap Ring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Set a dial indicator (A) on the clutch end-plate (B).

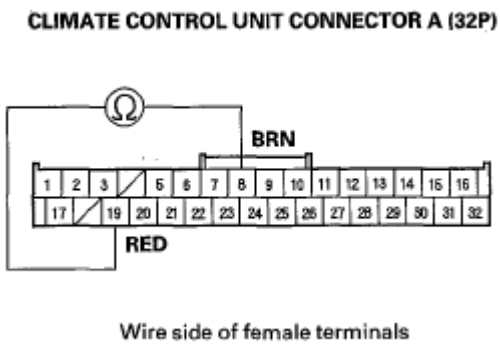

Fig. 451: Setting Dial Indicator On Clutch End-Plate
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Zero the dial indicator with the clutch end-plate lifted up to the snap ring (C).
11. Release the clutch end-plate to lower the clutch end-plate, then put the clutch compressor attachment on the end-plate (A).

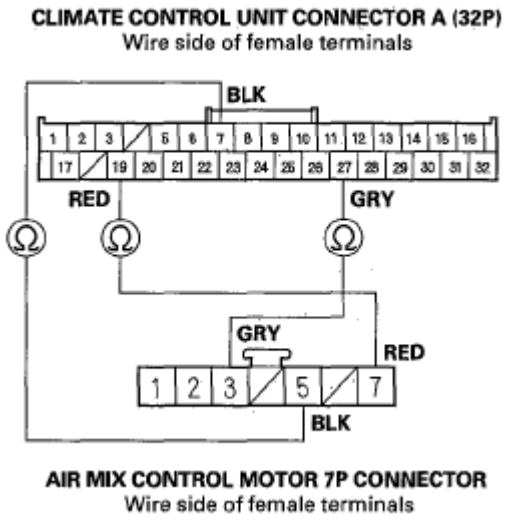

Fig. 452: Pressing Clutch Compressor Attachment Down
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. For the 1st, 3rd, and 5th clutches: Press the clutch compressor attachment down with 150-160 N (15-16 kgf, 33-35 lbf) (B) using a force gauge, and read the dial indicator (C). The dial indicator reads the clearance (D) between the clutch end-plate and top disc (E). Take measurements in at least three places, and use the average as the actual clearance.
13. For 2nd and 4th clutches: Press the clutch compressor attachment down with 39 N (4 kgf, 9 lbf) (B) using a force gauge, and read the dial indicator (C). The dial indicator reads the clearance (D) between the clutch end-plate and top disc (E). Take measurements in at least three places, and use the average as the actual clearance.

Clearance between Clutch End-Plate and Top Disc Service Limit:

1st Clutch: 1.62-1.82 mm (0.064-0.072 in.)

2nd Clutch: 0.7-0.9 mm (0.028-0.035 in.)

3rd Clutch: 0.93-1.13 mm (0.037-0.044 in.)

4th Clutch: 0.7-0.9 mm (0.028-0.035 in.)

5th Clutch: 0.93-1.13 mm (0.037-0.044 in.)

14. If the clearance of the 1st, 3rd, or 5th clutch is out of the service limit, select a new clutch end-plate from the following table.

1ST CLUTCH REASSEMBLY

Special Tools Required

- Clutch spring compressor attachment 07LAE-PX40100 or 07HAE-PL50101
- Clutch spring compressor bolt assembly 07GAE-PG40200 or 07GAE-PG4020A

NOTE:

- **Hold the spring compressor attachment in a vise with soft jaws. Be careful not to damage the clutch drum.**
- **Insert the spring retainer can be adjusted (center of tolerance) to prevent damaging the spring retainer oil seal.**

1. Soak the clutch discs thoroughly in ATF for a minimum of 30 minutes.
2. Install a new O-ring (A) in the 1st clutch piston (B), and install a new O-ring (C) on the clutch drums (D).

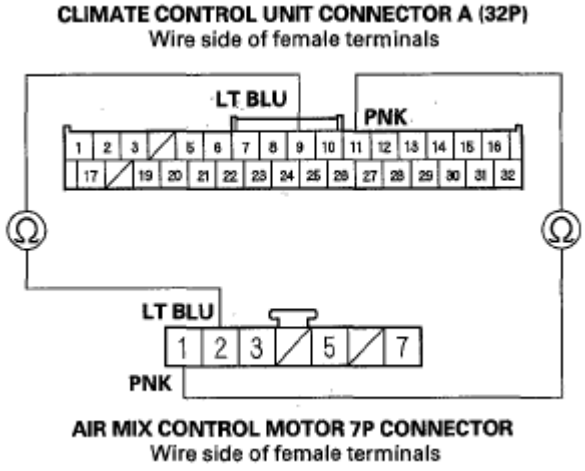

Fig. 455: Installing O-Ring In 1st Clutch Piston
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the clutch piston (A) in the clutch drum (B). Apply pressure and rotate to ensure proper seating. Lubricate the piston O-ring with ATF before installing. Do not pinch the O-ring by installing the piston with too much force.

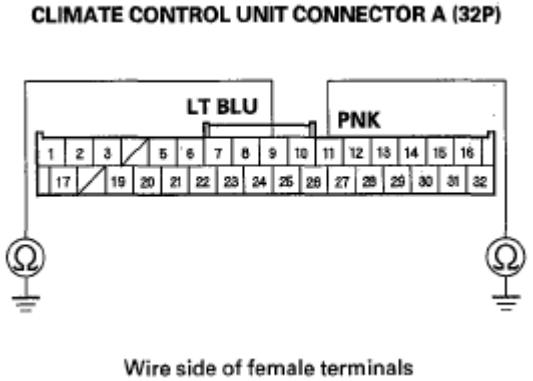

Fig. 456: Installing Clutch Piston In Clutch Drum

6. Set the clutch spring compressor attachment (A) on the spring retainer (B) so that it compresses the clutch return spring (C).

NOTE: Coat the circumference of the spring retainer and the areas where the spring retainer contacts the clutch piston with ATF before installation.

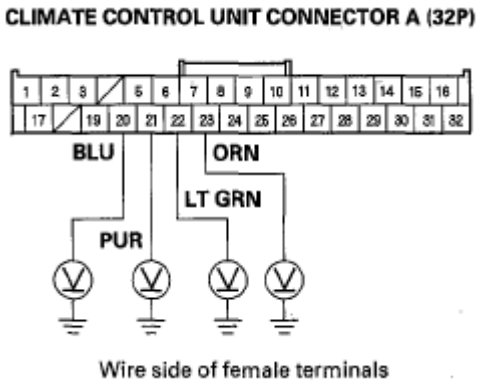

Fig. 459: Setting Clutch Spring Compressor Attachment On Spring Retainer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Compress the return spring carefully until the snap ring can be installed. Check that the spring retainer (A) is properly installed on the clutch hub (B). If improperly installed, change the position of the spring compressor attachment and the spring retainer.

12. Check that the clutch piston moves by applying air pressure into fluid passage.

2ND, 3RD, 4TH, AND 5TH CLUTCH REASSEMBLY

Special Tools Required

- Clutch spring compressor attachment 07LAE-PX40100 or 07HAE-PL50101
- Clutch spring compressor bolt assembly 07GAE-PG40200 or 07GAE-PG4020A

1. Soak the clutch discs thoroughly in ATF for a minimum of 30 minutes.
2. Install new O-rings (A) on the clutch piston (B).

12. Install the waved spring (A) in the 4th clutch drum (B). Starting with the clutch flat-plate, alternately install the flat-plates (C) (4) and the discs (D) (4). Install the clutch end-plate (E) with the flat side down on the top disc.

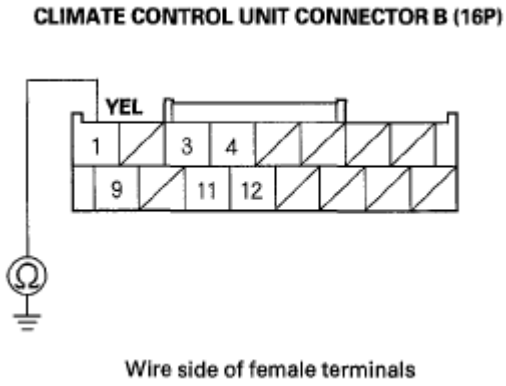

Fig. 474: Disassembling 4th Clutch Drum
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Install the waved spring (A) in the 3rd clutch drum (B). Starting with the clutch wave-plate, alternately install the wave-plates (C) (4) and the discs (D) (4). Install the clutch end-plate (E) with the flat side down on the top disc.

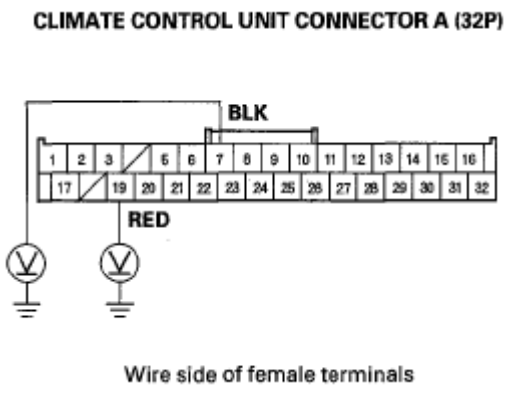

Fig. 475: Disassembling 3rd Clutch Drum
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Install the waved spring (A) in the 5th clutch drum (B). Starting with the clutch wave-plate, alternately install the wave-plates (C) (4) and the discs (D) (4). Install the clutch end-plate (E) with the flat side down on the top disc.

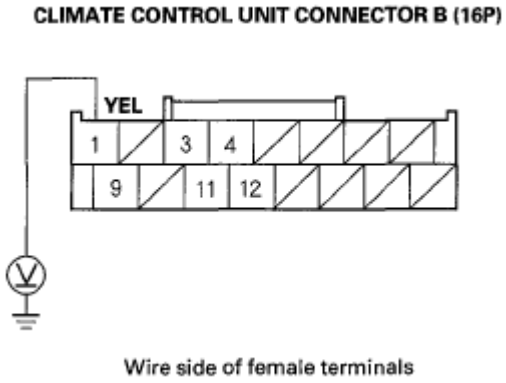

Fig. 476: Disassembling 5th Clutch Drum

16. Check that the clutch piston moves by applying air pressure into fluid passage.

VALVE BODY AND ATF STRAINER INSTALLATION

1. Make sure that the ATF magnet is cleaned and installed in the torque converter housing.

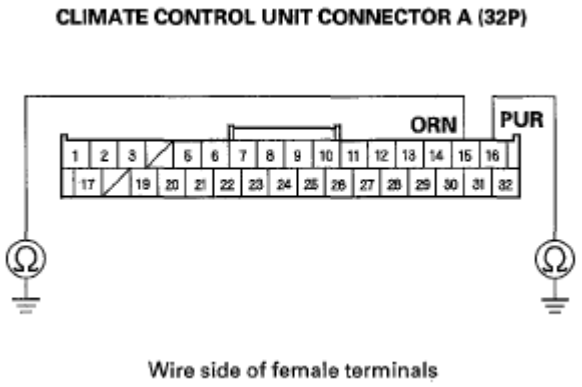

Fig. 478: Exploded View Of Valve Body And ATF Strainer w/Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the main separator plate and the two dowel pins on the torque converter housing.
3. Install the ATF pump drive gear (A), the ATF pump driven gear (B), and the ATF pump driven gear shaft (C). Install the ATF pump driven gear with its grooved and chamfered side facing down.

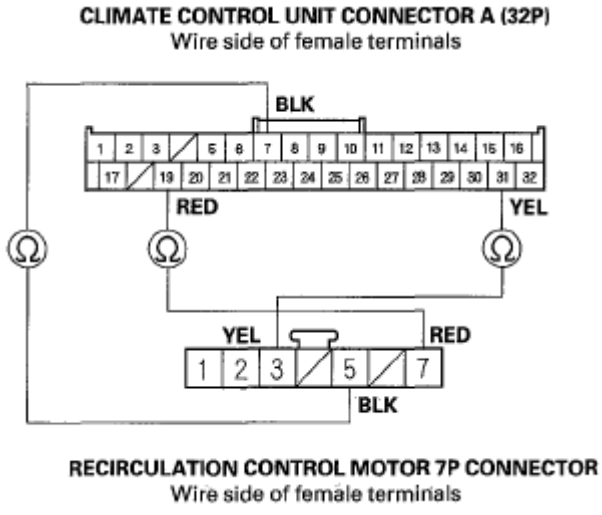

Fig. 479: Identifying ATF Pump Drive Gear, ATF Pump Driven Gear And ATF Pump Driven Gear Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the main valve body.
5. Make sure the ATF pump drive gear (A) rotates smoothly in the normal operating direction, and the ATF pump driven gear shaft (B) moves smoothly in the axial and normal operating direction.

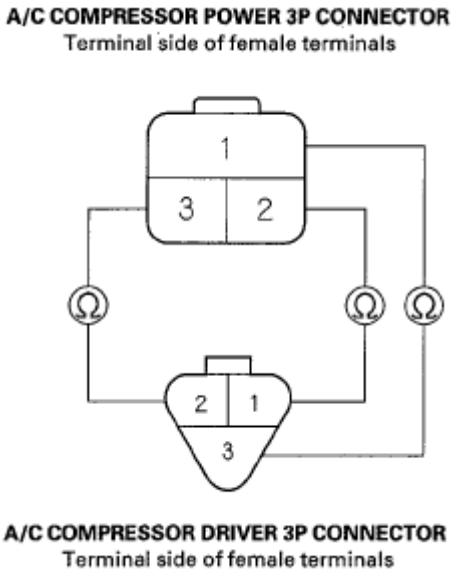

Fig. 480: Checking ATF Pump Drive Gear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. If the ATF pump drive gear and the ATF pump driven gear shaft do not move smoothly, loosen the main valve body bolts. Realign the ATF pump driven gear shaft, and retighten the bolts to the specified torque, then recheck. Failure to align the ATF pump driven gear shaft correctly will result in a seized ATF pump drive gear or ATF pump driven gear shaft.
7. Make sure that the three check balls and the cooler check valve are in the main valve body, then install the cooler check valve spring in the cooler check valve.
8. Install the ATF joint pipes between the main valve body and the torque converter housing.
9. Install the regulator separator plate and the two dowel pins on the main valve body.
10. Install a new O-ring on the stator shaft, and install the stator shaft and the stator shaft stop.
11. Install the regulator valve body (10 bolts).
12. Install the servo separator plate and the two dowel pins on the main valve body.
13. Install the servo body (13 bolts).
14. If the detent arm was removed, install the detent arm (A) with arm collar (B) on the servo body (C), and install a new lock washer (D) by aligning its cutout (E) with the projection (F) of the servo body. Install and tighten the bolt, then bend the lock tab (G) of the lock washer against the bolt head.

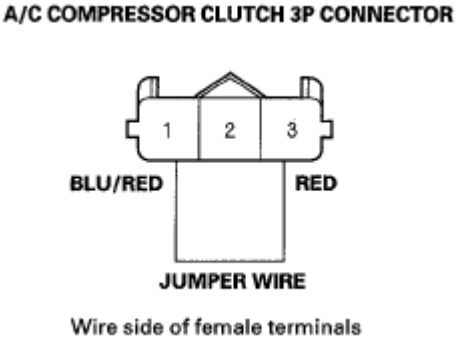

Fig. 481: Aligning Cutout With Projection Of Servo Body & Bolt w/Torque Specification

16. Hook the detent arm spring (A) to the detent arm (B).

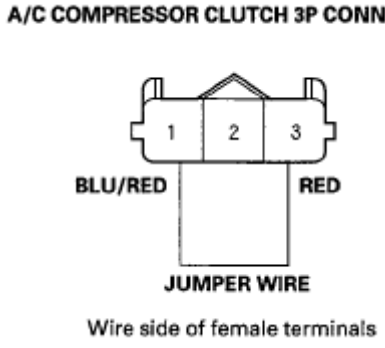

Fig. 483: Hooking Detent Arm Spring To Detent Arm
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Install a new O-ring on the ATF strainer, and install the ATF strainer (two bolts).
18. Install the 8 x 180.5 mm ATF feed pipe in the regulator valve body.
19. Install the 8 x 192.5 mm ATF feed pipe and the 8 x 180.5 mm ATF feed pipe in the servo body.

SHAFT ASSEMBLY AND HOUSING INSTALLATION

1. Install the spacer in the torque converter housing with the spacer tab into the guide of the torque converter housing. Do not mix-up the spacers from the transmission housing and the torque converter housing. Install the differential assembly in the torque converter housing, and put the spacer on the differential.

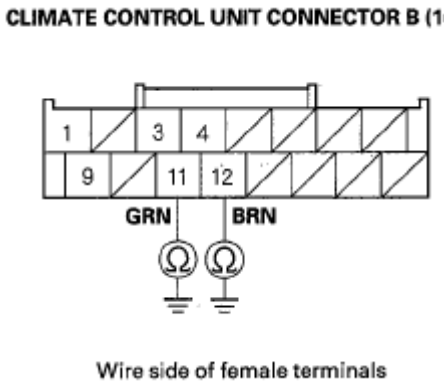

Fig. 484: Exploded View Of Shaft Assembly, Housing & Bolt Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the differential assembly securely in the torque converter housing so there is no clearance.
3. Install the 90 mm thrust shim in the transmission housing.
4. Assemble the mainshaft, the countershaft, and the secondary shaft.
   - Countershaft reverse selector hub is press-fitted type, go to step 5.
   - Countershaft reverse selector hub is not press-fitted type, go to step 6.
5. Join the mainshaft subassembly (A), the countershaft subassembly (B), and the secondary shaft subassembly (C) together, and install them in the torque converter housing.

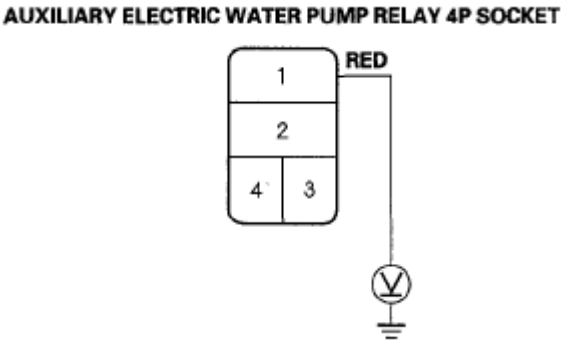

Fig. 485: Identifying Mainshaft Subassembly, Countershaft Subassembly And Secondary Shaft Subassembly
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Join the countershaft subassembly and the secondary shaft subassembly together, then install them in the torque converter housing, and install the mainshaft subassembly. Install the needle bearings, 4th-5th gear, and the reverse selector hub over the countershaft.
7. Turn the shift fork shaft (A) so the large chamfered hole (B) is facing the fork bolt hole (C) of the shift fork (D).

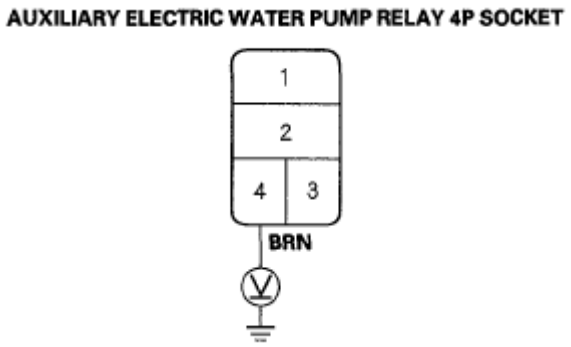

Fig. 486: Identifying Shift Fork Shaft, Shift Fork, Lock Washer & Bolt Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Install the shift fork and the reverse selector together on the shift fork shaft and the countershaft. Secure the shift fork to the shift fork shaft with the lock bolt and a new lock washer (E), then bend the lock tab of the lock washer against the bolt head.
9. Install the needle bearing and the countershaft reverse gear on the countershaft.
10. Install the reverse idler gear in the transmission housing (see **REVERSE IDLER GEAR INSTALLATION**).
11. Install the three dowel pins (A) and a new gasket (B) on the torque converter housing (C).

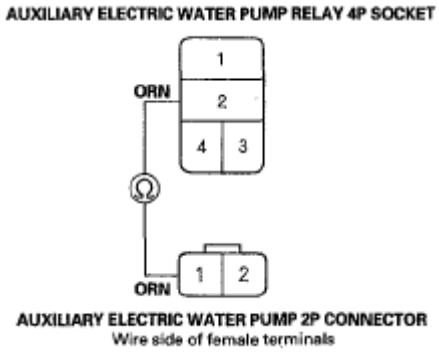

Fig. 487: Disassembling Torque Converter Housing & Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Align the spring pin (D) of the control shaft (E) with the transmission housing groove (F) by turning the selector control shaft detent plate. Do not squeeze the end of the selector control shaft tips together when turning the shaft. If the tips are squeezed together, it will causes a faulty shift position signal or position due to the play between the selector control shaft and the switch.
13. Place the transmission housing (G) on the torque converter housing. Do not install the input shaft (mainshaft) speed sensor and the output shaft (countershaft) speed sensor before installing the transmission housing on the torque converter housing.
14. Wrap a screwdriver tip with tape to prevent damage to the reverse idler gear teeth. Engage the reverse idler gear with the reverse gears by rotating the idler gear using the screwdriver.

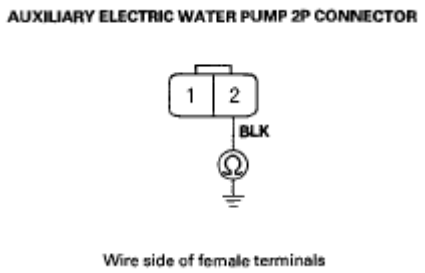

Fig. 488: Engaging Reverse Idler Gear With Reverse Gears
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Install the transmission housing mounting bolts, and tighten the 19 bolts to 44 N.m (4.5 kgf.m, 33 lbf.ft) in two or more steps in a crisscross pattern.
16. Install the shift solenoid harness connector (E) in the transmission housing with a new O-ring (F).

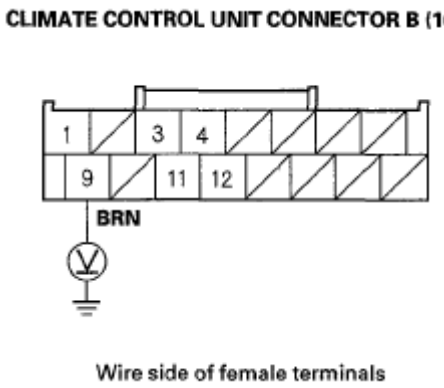

Fig. 489: Identifying Shift Solenoid Harness Connector, Transmission Housing, O-Ring & Bolt Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Connect WHT harnesses and ORN harness connector to shift solenoid valve B. ATF temperature sensor is assembled in the connector with WHT harnesses.
18. Connect the shift solenoid harness connectors:
    - BLU wire to shift solenoid valve A.
    - GRN wire to shift solenoid valve C.
    - YEL wire to shift solenoid valve D.
19. Install the shift solenoid valve cover (A), the two dowel pins (B), a new gasket (C), and the harness clamp bracket (D).

END COVER INSTALLATION

Special Tools Required

- Mainshaft holder 07GAB-PF50101 or 07GAB-PF50100
- Gear installer set 070AC-XFD0100

1. Install the mainshaft holder onto the mainshaft.

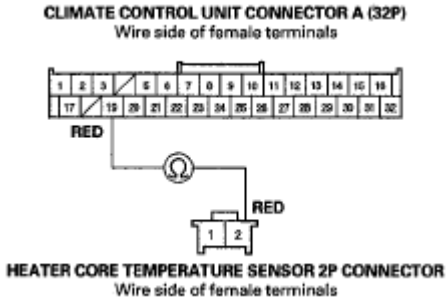

Fig. 491: Identifying Mainshaft Holder Onto Mainshaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Lubricate the following parts with ATF:
   - Splines and threads of the mainshaft.
   - Splines of the mainshaft idler gear.
   - Old conical spring washer and old locknut.
3. Install the mainshaft idler gear (A), the old conical spring washer (B), and the old locknut (C) on the mainshaft (D), and tighten the locknut to 216 N.m (22.0 kgf.m, 159 lbf.ft).

NOTE:

- **Do not tap the idler gear to install.**
- **Use a torque wrench to tighten the locknut. Do not use an impact wrench.**

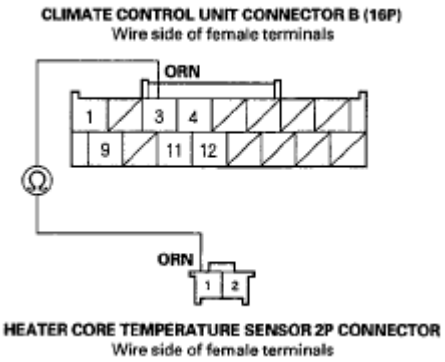

Fig. 492: Identifying Mainshaft Idler Gear, Old Conical Spring Washer, Old Locknut And Mainshaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Lubricate the following parts with ATF:
   - Splines and threads of the secondary shaft and the idler gear shaft.
   - Splines of the secondary shaft idler gear.
   - Old conical spring washer and old locknut.
5. Install the secondary shaft idler gear (A) on the secondary shaft (B), and install the idler gear shaft idler gear (C) on the idler gear shaft (D).

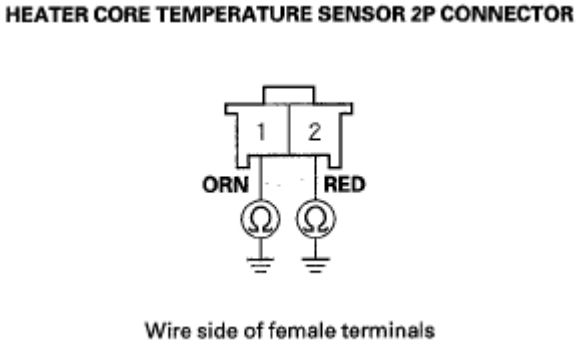

Fig. 493: Identifying Secondary Shaft Idler Gear, Secondary Shaft, Idler Gear Shaft Idler Gear And Idler Gear Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Set the gear installer set on the idler gear shaft and the idler gear, and tighten the installer nut to install the idler gear part-way.

NOTE: **The installer nut has left-hand threads.**

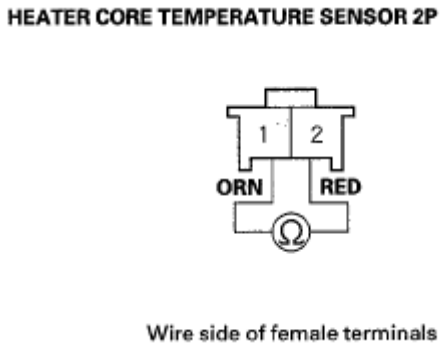

Fig. 494: Tightening Installer Nut
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the old conical spring washer (A) and the old locknut (B) on the secondary shaft (C), and tighten the locknut to 226 N.m (23.0 kgf.m, 166 lbf.ft).

NOTE:

- **Do not tap the idler gear to install.**
- **Use a torque wrench to tighten the locknut. Do not use an impact wrench.**
- **Secondary shaft locknut has left-hand threads.**

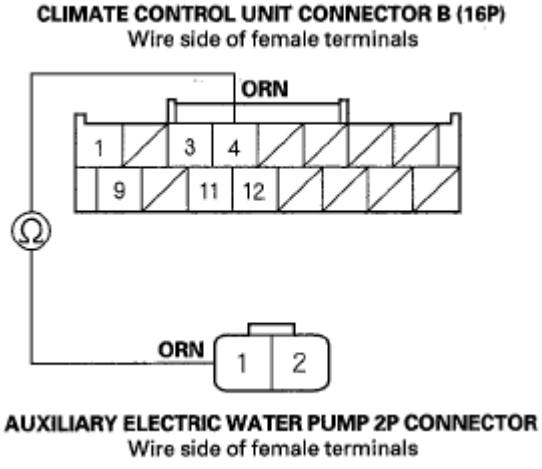

Fig. 495: Identifying Conical Spring Washer, Locknut And Secondary Shaft

8. Retighten the installer nut to seat the idler gear in the idler gear shaft until it stops. Remove the gear installer set from the idler gear shaft.

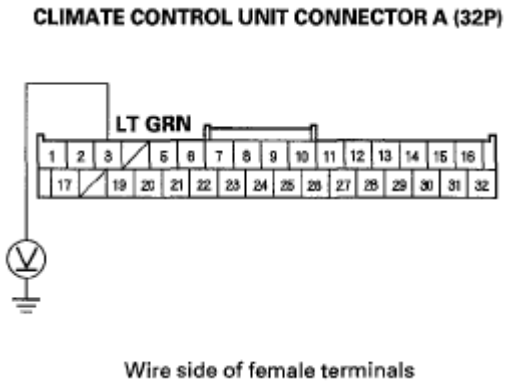

Fig. 496: Tightening Installer Nut
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Install a new snap ring (A) on the idler gear shaft (B), and check that the snap ring is seated securely into the groove.

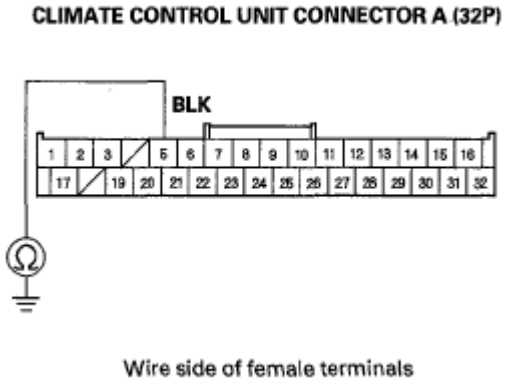

Fig. 497: Identifying Snap Ring And Idler Gear Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Install the park lever (A) and the park lever stop (B) on the selector control shaft (C), then install the lock bolt and a new lock washer (D). Do not bend the lock tab of the lock washer until step 23.

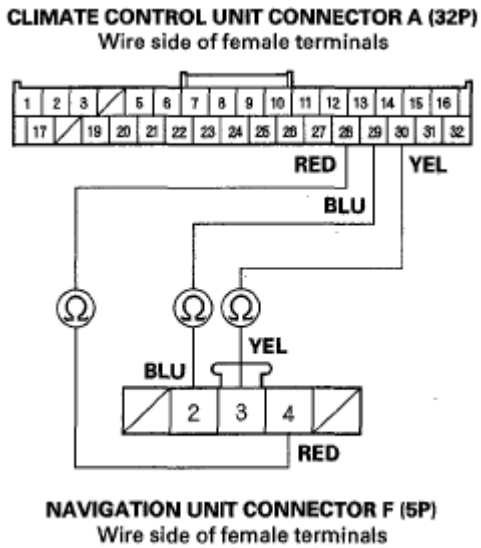

Fig. 498: Identifying Park Lever, Park Lever Stop, Selector Control Shaft & Screw w/Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Install the park pawl shaft (E), the park pawl spring (F), the park pawl (G), and the stop shaft (H) on the transmission housing.
12. Lubricate the following parts with ATF:
    - Threads and splines of the countershaft.
    - Old conical spring washer and old locknut.
    - Areas where the park gear contacts the conical spring washer.
13. Install the park gear (I), the old conical spring washer (J), and the old locknut (K) on the countershaft.
14. Lift the park pawl up, and engage it with the park gear, then tighten the locknut to 226 N.m (23.0kgf.m, 166 lbf.ft).

NOTE:
- **Do not tap the park gear to install.**
- **Use a torque wrench to tighten the locknut. Do not use an impact wrench.**
- **Countershaft locknut has left-hand threads.**

15. Remove the locknuts and the conical spring washers from the mainshaft, the countershaft, and the secondary shaft.
16. Lubricate the threads of the shafts, the new locknuts and the new conical spring washers with ATF.
17. Install new conical spring washers (A) (B) with facing stamped mark side up in the direction shown, and install a new mainshaft locknut (C), a new countershaft locknut (D), and a new secondary shaft locknut (E).

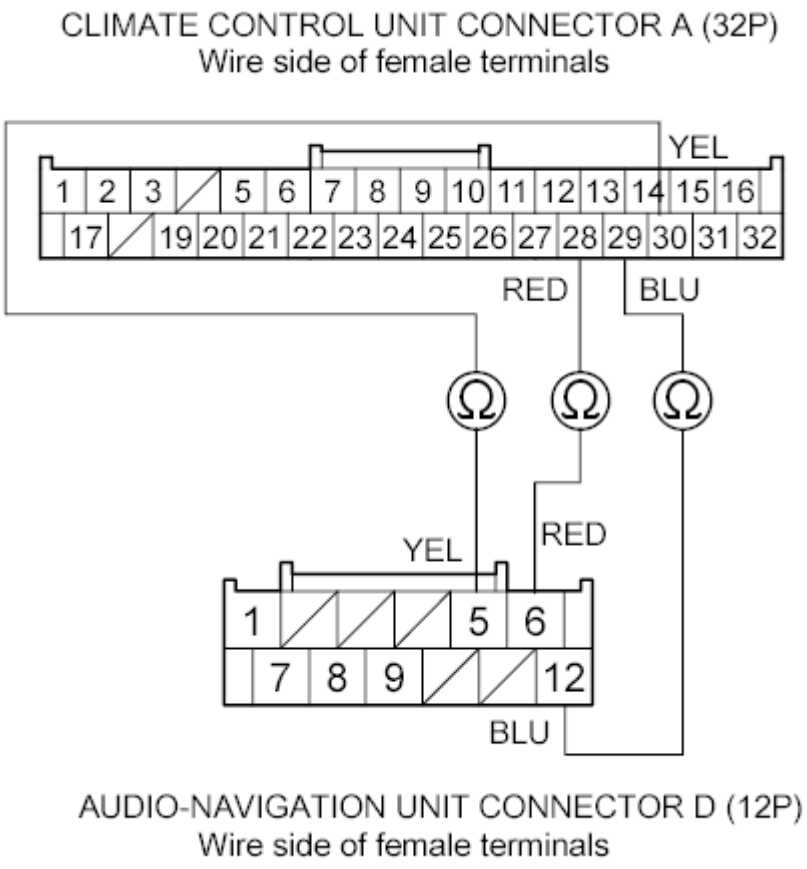

Fig. 499: Identifying Conical Spring Washers, Mainshaft Locknut And Countershaft Locknut
Courtesy of AMERICAN HONDA MOTOR CO., INC.

18. Tighten the countershaft locknut and the secondary shaft locknut to 167 N.m (17.0 kgf.m, 123 lbf.ft), and tighten the mainshaft locknut to 155 N.m (15.8 kgf.m, 114 lbf.ft).

NOTE:

- **Be sure to install the conical spring washers in the direction shown.**
- **Use a torque wrench to tighten the locknut. Do not use an impact wrench.**
- **Countershaft and secondary shaft locknuts have left-hand threads.**

19. Remove the mainshaft holder from the mainshaft.
20. Stake the locknuts into the shafts to a depth (A) of 0.7-1.3 mm (0.03-0.05 in.) using a 3.5 mm punch (B).

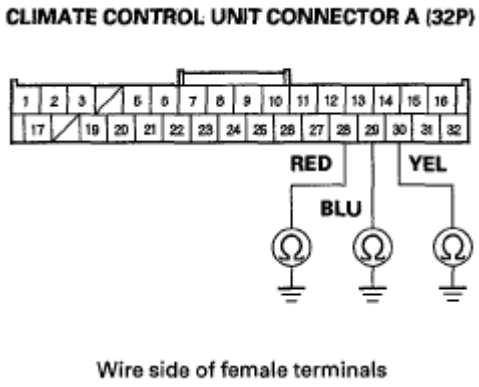

Fig. 500: Staking Locknuts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Set the park pawl (A) in the P position, then check that the park pawl engages with the park gear (B).

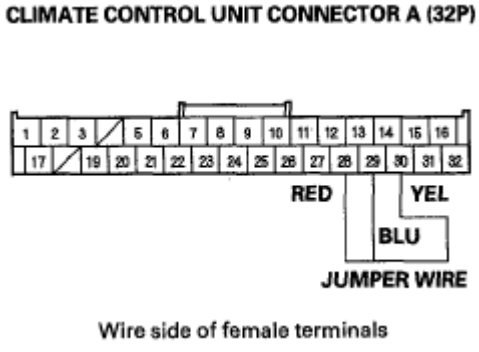

Fig. 501: Identifying Distance Between Park Pawl Shaft, Extension Line & Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

22. If the park pawl does not engage fully, check the distance (C) between the park pawl shaft and the extension line connected centers of the park lever roller pin and the selector control shaft (see **PARK LEVER STOP INSPECTION AND ADJUSTMENT**).
23. Tighten the lock bolt (D), and bend the lock tab of the lock washer (E) against the bolt head.
24. Install the ATF lubrication pipe (A) into the idler gear shaft (B).

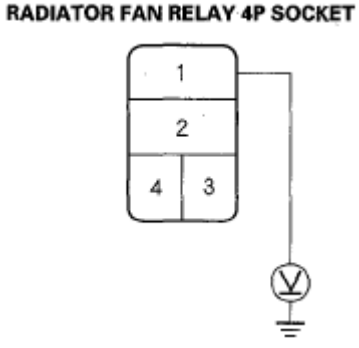

Fig. 502: Identifying ATF Lubrication Pipe, Idler Gear Shaft, Gasket, Dowel Pins & Bolts w/Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

25. Install a new gasket (C) on the transmission housing, and install the two dowel pins (D) and new O-rings (E) over the top of the ATF feed pipes (F).
26. Install the end cover (G), and tighten the 17 bolts.
27. Set the selector control shaft (A) to the N position by turning the selector control shaft on the torque converter side.

NOTE: Do not squeeze the end of the selector control shaft tips together when turning the shaft. If the selector control shaft tips are squeezed together it will cause a faulty signal or position due to play between the selector control shaft and the transmission range switch.

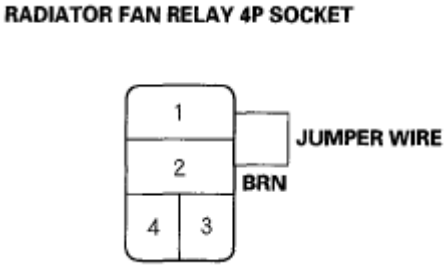

Fig. 503: Setting Selector Control Shaft To N Position
Courtesy of AMERICAN HONDA MOTOR CO., INC.

28. Align the cutouts (A) on the rotary-frame with the neutral positioning cutouts (B) on the transmission range switch (C), then put a 2.0 mm (0.08 in.) feeler gauge blade (D) in the cutouts to hold the switch in the N position.

NOTE: Be sure to use a 2.0 mm (0.08 in.) blade or equivalent to hold the switch in the N position.

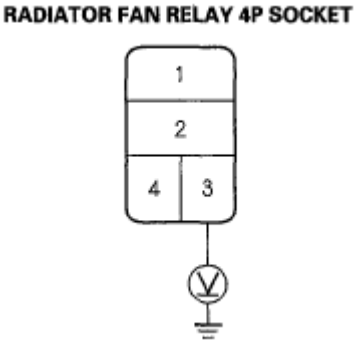

Fig. 504: Aligning Cutouts On Rotary-Frame With Neutral Positioning Cutouts On Transmission Range Switch

29. Install the transmission range switch (A) gently on the selector control shaft (B) while holding it in the N position with the 2.0 mm (0.08 in.) blade (C).

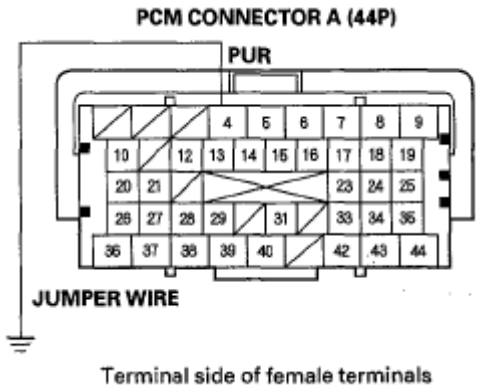

Fig. 505: Holding N Position With Blade
Courtesy of AMERICAN HONDA MOTOR CO., INC.

30. Tighten the bolts on the transmission range switch while you continue to hold it in the N position. Do not move the transmission range switch while tightening the bolts. Remove the feeler gauge.

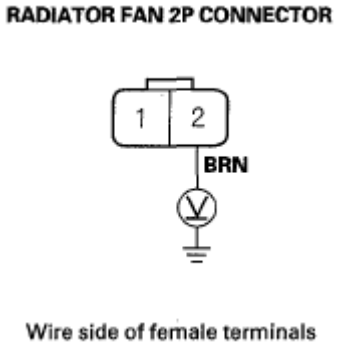

Fig. 506: Tightening Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

31. Install the harness clamp bracket (A) on the end cover (B).

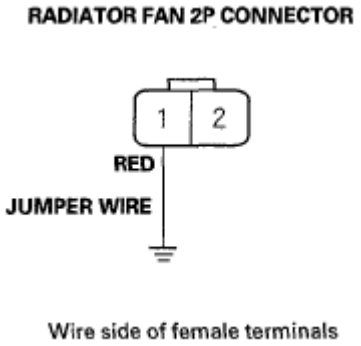

Fig. 507: Identifying Transmission Range Switch Cover, Harness Clamp Bracket, Cover & Bolts w/Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

32. Connect the transmission range switch connector (C) securely, then install the harness clamps (D) on the clamp bracket.
33. Install the transmission range switch cover (E).

34. Install a new O-ring (A) on the input shaft (mainshaft) speed sensor (B), then install the input shaft (mainshaft) speed sensor.

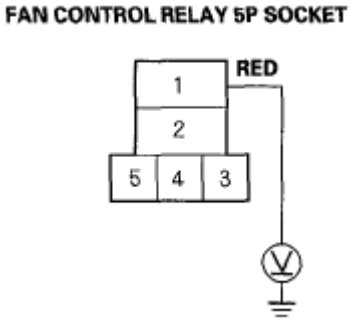

Fig. 508: Identifying Input Shaft (Mainshaft) Speed Sensor, O-Ring & Bolts w/Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

35. Install a new O-ring (C) on the output shaft (countershaft) speed sensor (D), then install the output shaft (countershaft) speed sensor.
36. Install a new gasket (B) on the transmission housing, and install the ATF pipe (C) and the ATF joint pipes (D).

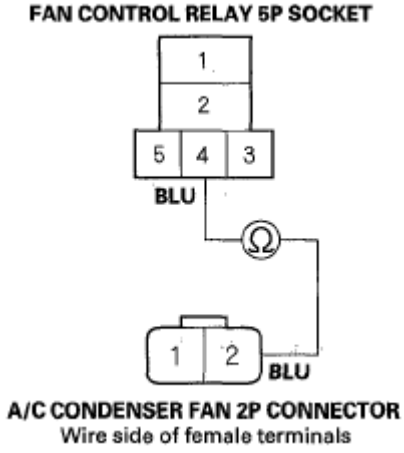

Fig. 509: Identifying ATF Pipe, ATF Joint Pipes, Gasket, O-Ring & Bolts w/Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

37. Install new O-rings (E) over the ATF joint pipes, and install A/T clutch pressure control solenoid valve A.
38. Install a new gasket (A) with facing the blue side to the transmission housing and the white side faces to the A/T clutch pressure control solenoid valve body.

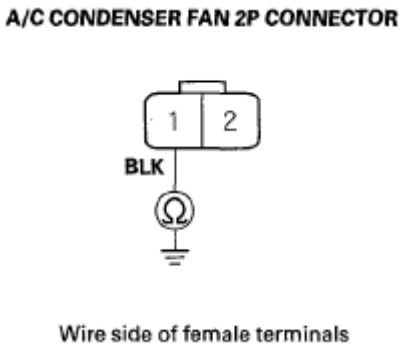

Fig. 510: Identifying ATF Pipe, ATF Joint Pipes, O-Ring & Bolts w/Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

39. Install the ATF pipe (D) and the ATF joint pipes (E), and install new O-rings (F) over the ATF joint pipes.
40. Install A/T clutch pressure control solenoid valves B and C.
41. Install the ATF warmer bracket.

Courtesy of AMERICAN HONDA MOTOR CO., INC.

42. Install the ATF outlet line (A) on the torque converter housing, and secure it with the line bolt (B) and new sealing washers (C).

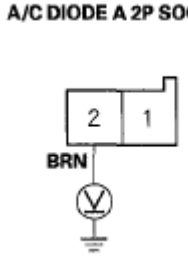

Fig. 512: Identifying ATF Outlet Line, Sealing Washers & Bolts w/ Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

43. Secure the ATF outlet line with the bracket bolt.
44. Install the transmission hanger (A).

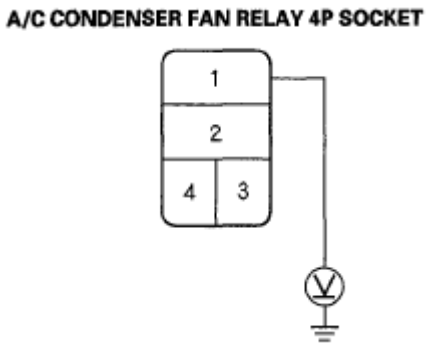

Fig. 513: Identifying Transmission Hanger, ATF Filter Bracket, Line Brackets & Bolts w/Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

45. Install the ATF filter bracket (B).
46. Install the ATF inlet line and the hose (C) on the torque converter housing, and secure it with the line bolt (D) and new sealing washers (E).
47. Put the ATF filter (F) on its bracket, and secure with the bracket (G) and the bolt.
48. Secure the line brackets (H) with the bolts on the transmission hanger and the torque converter housing.
49. Install the breather cap on the breather pipe.
50. Install the ATF dipstick.

BACKLASH INSPECTION

1. Install both axles into the differential, and place the axles on V-blocks (A).

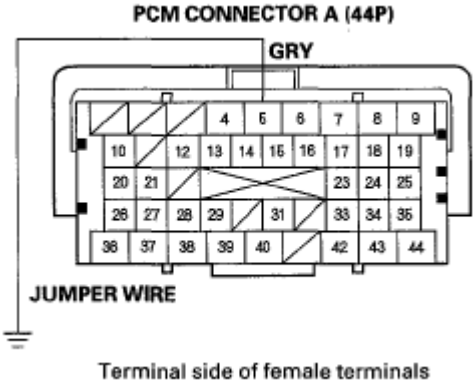

Fig. 515: Measuring Backlash Of Pinion Gears
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Measure the backlash of the pinion gears (B) using a dial indicator (C).

   Standard: 0.05-0.15 mm (0.002-0.006 in.)

3. If the backlash is out of standard, replace the differential carrier (see **DIFFERENTIAL CARRIER AND FINAL DRIVEN GEAR REPLACEMENT**).

DIFFERENTIAL CARRIER AND FINAL DRIVEN GEAR REPLACEMENT

1. Remove the final driven gear (A) from the differential carrier (B). The final driven gear bolts have left-hand threads.

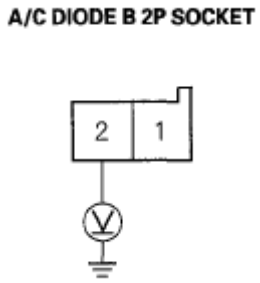

Fig. 516: Identifying Final Driven Gear, Differential Carrier & Bolts w/Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install a new final driven gear on the differential carrier in the direction shown. Tighten the bolts to 101 N.m (10.3 kgf.m, 74.5 lbf.ft) in a crisscross pattern in two or more steps.

CARRIER BEARING REPLACEMENT

Special Tools Required

Driver, 40 mm I.D. 07746-0030100

NOTE: Check the bearing for wear and rough rotation. If the bearing is OK, removal is not necessary.

1. Place a collar (A) on the differential carrier, and remove the carrier bearing (B) using the commercially available bearing puller (C).

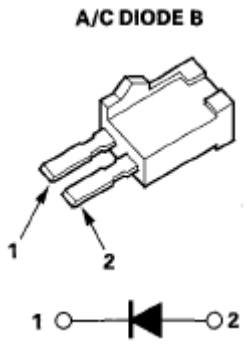

Fig. 517: Removing Carrier Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install a new bearing using the 40 mm I.D. driver and a press. Press the bearing on until it bottoms.

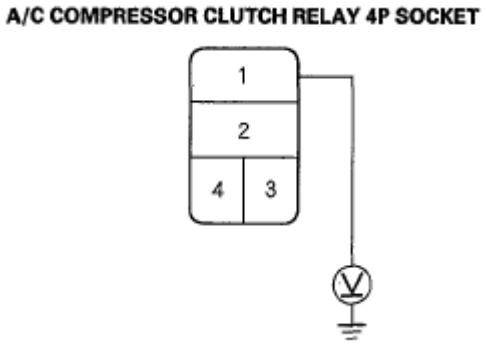

Fig. 518: Pressing Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

OIL SEAL REPLACEMENT

Special Tools Required

- Driver 07749-0010000
- Oil seal driver attachment 07JAD-PH80101

1. Remove the oil seal from the transmission housing.

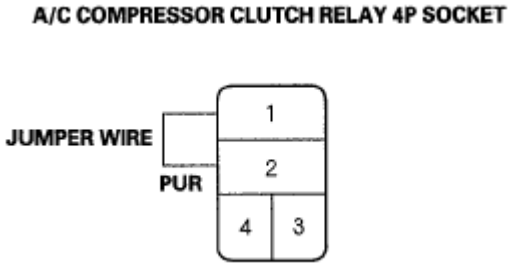

Fig. 519: Identifying Oil Seal From Transmission Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the oil seal from the torque converter housing.

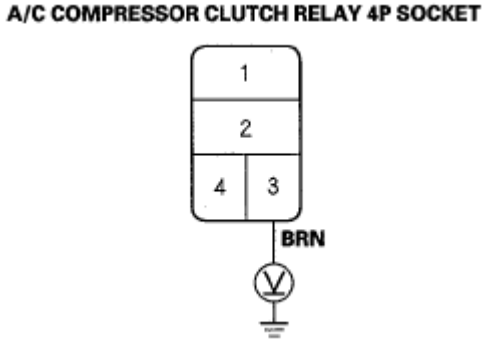

Fig. 520: Identifying Oil Seal From Torque Converter Housing

CARRIER BEARING SIDE CLEARANCE INSPECTION

Special Tools Required

- Driver, 40 mm I.D. 07746-0030100
- Attachment, 30 mm I.D. 07746-0030300

1. Install the spacer (A) in the torque converter housing with the spacer tab (B) into the guide. Do not install the spacers mix-up in the transmission housing and the torque converter housing.

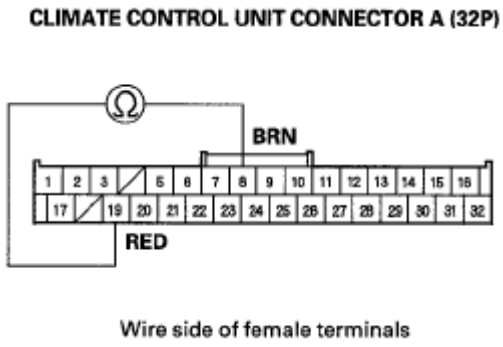

Fig. 523: Identifying Differential Assembly, Spacer And Spacer Tab
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the differential assembly (C) in the torque converter housing, and put the spacer (D) on the differential.
3. Install the differential assembly securely using the 40 mm I.D. driver and the 30 mm I.D. attachment in the torque converter housing, so there is no clearance between the bearing, the spacer, and the torque converter housing.

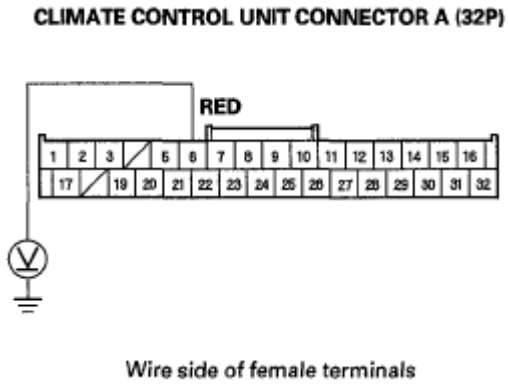

Fig. 524: Identifying Differential Assembly In Torque Converter Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the 90 mm thrust shim (A) in the transmission housing (B).

   If you replace the 90 mm thrust shim with a new one, use the same thickness as the old one.

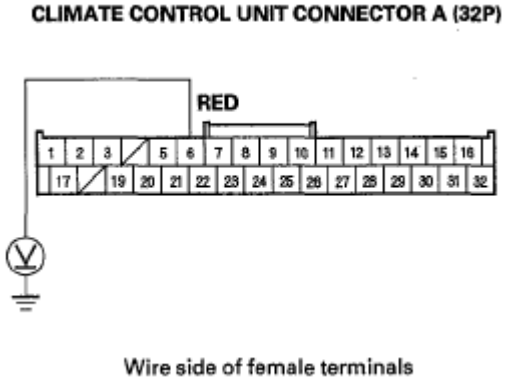

Fig. 525: Installing Thrust Shim

Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Align the spring pin (A) on the selector control shaft (B) with the transmission housing groove (C) by turning the control shaft with the detent plate (D).

NOTE: Do not squeeze the end of the selector control shaft tips together when turning the control shaft.

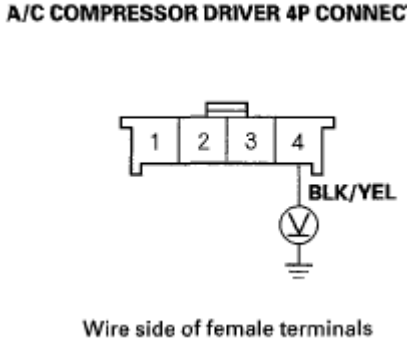

Fig. 526: Disassembling Torque Converter Housing & Bolts w/Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Install the gasket (E) and the three dowel pins (F) on the torque converter housing (G).
7. Place the transmission housing (H), and install the mounting bolts (19 bolts). Tighten the bolts to 44 N.m (4.5 kgf.m, 33 lbf.ft) in a crisscross pattern in two or more steps.
8. Measure the clearance between the 90 mm thrust shim and the spacer using a feeler gauge.

Standard: 0-0.07 mm (0-0.003 in.)

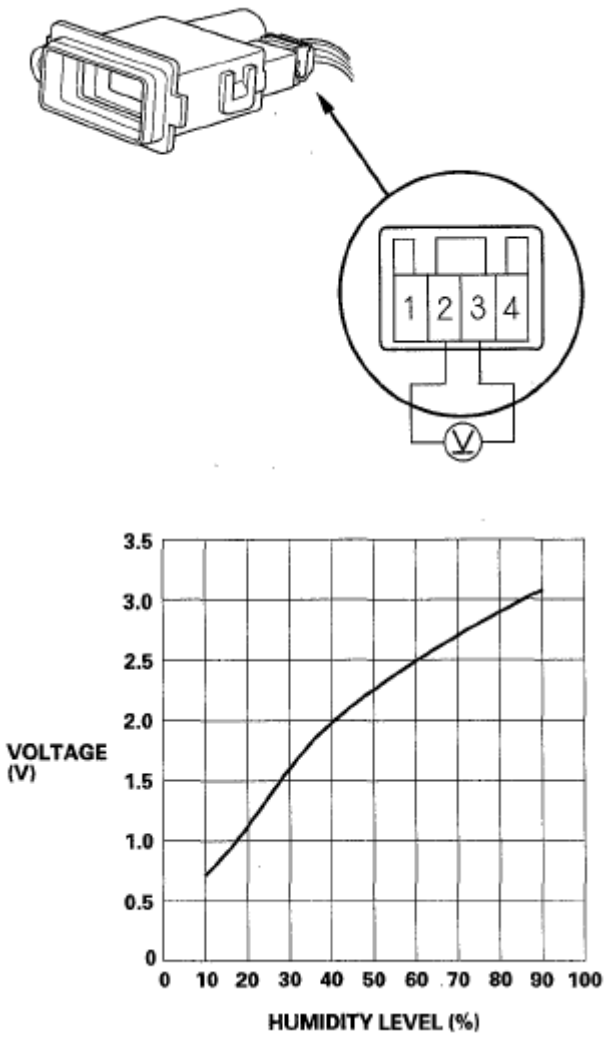

Fig. 527: Measuring Clearance Between Thrust Shim And Spacer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. If the clearance is out of standard, remove the 90 mm thrust shim, and measure its thickness.
10. Select and install a new thrust shim. Recheck the clearance and make sure it is within the standard.

SYSTEM DESCRIPTION

6-SPEED MODEL

Delay Orifice Mechanism

Function

The delay orifice mechanism improves clutch operation by delaying the slave cylinder release speed when

the clutch pedal is suddenly released. The delay orifice mechanism is built into the slave cylinder.

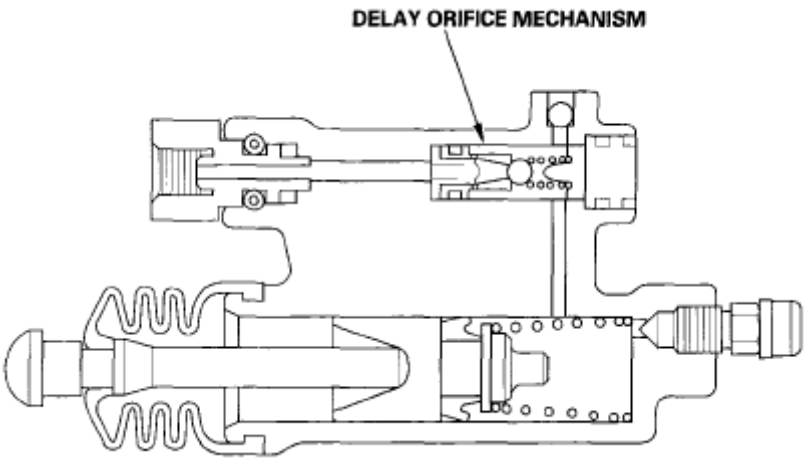

Fig. 4: Identifying Delay Orifice Mechanism Operation
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Operation

When the clutch pedal is pressed, the fluid pressure from the master cylinder moves the one-way valve in the direction shown in the illustration. The fluid flows through two passages: the orifice part and the filter part. It then flows out to the slave cylinder to release the pressure plate and clutch disc joint.

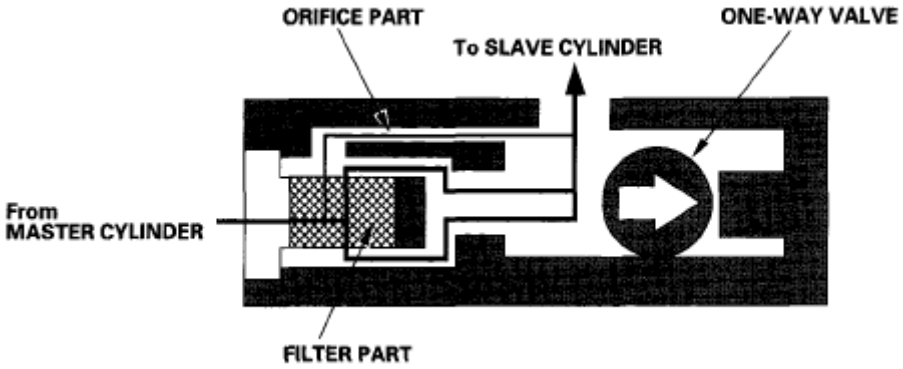

Fig. 5: Master Cylinder Moves One-Way Valve In Direction
Courtesy of AMERICAN HONDA MOTOR CO., INC.

When the clutch pedal is released, the fluid pressure from the slave cylinder moves the one-way valve in the direction shown in the illustration. The one-way valve blocks the filter-part passage and delays the clutch release speed by returning the fluid to the master cylinder through only the orifice-part passage.

CLUTCH HYDRAULIC SYSTEM BLEEDING

NOTE:

- **Do not reuse the drained fluid. Always use Honda DOT 3 Brake Fluid from an unopened container. Using a non-Honda brake fluid can cause corrosion and shorten the life of the system.**
- **Do not mix different brands of brake fluid; they may not be compatible.**
- **Make sure dirt or other foreign matter is not allowed to contaminate the brake fluid.**
- **Do not spill brake fluid on the vehicle it may damage the paint. If brake fluid does contact the paint, wash it off immediately with water.**
- **It may be necessary to limit the movement of the release for with a block of wood to remove all the air from the system.**
- **Use fender covers to avoid damaging painted surfaces.**

1. Make sure the brake fluid level in the reservoir is at the MAX (upper) level line (A).

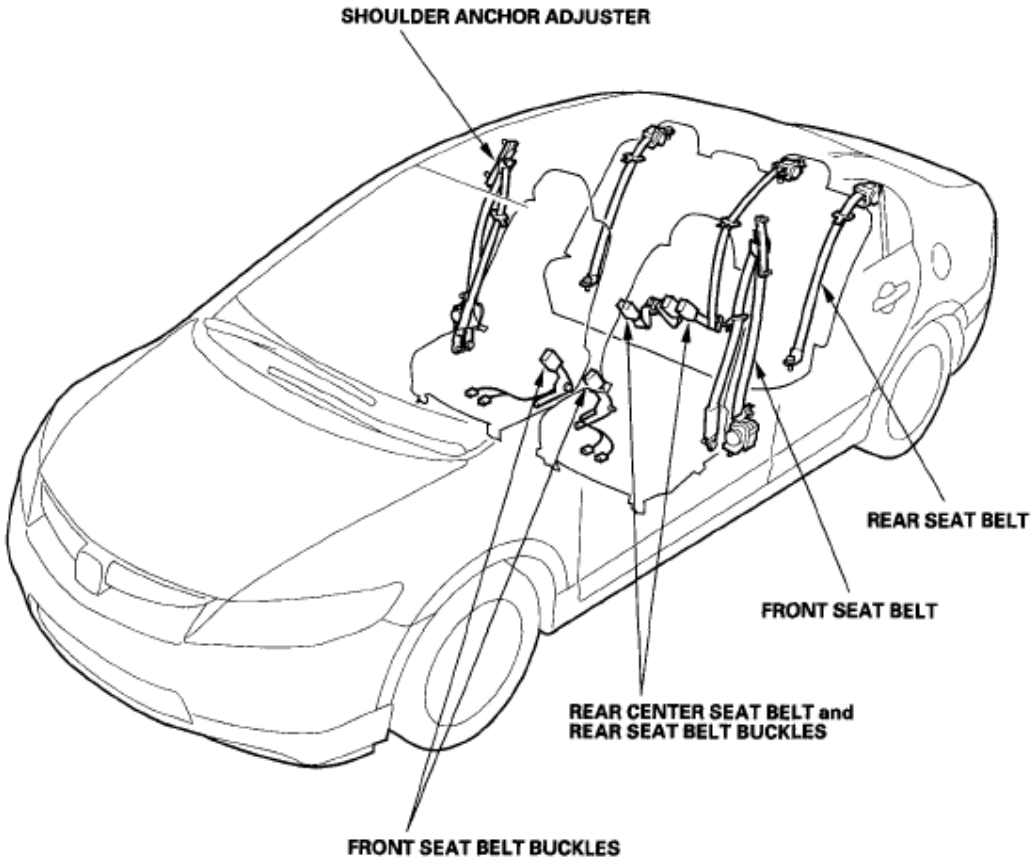

Fig. 7: Identifying Brake Fluid In Reservoir To MAX (Upper) Level
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Attack the one end of the clear tube to the bleeder screw (A), and the other end to the container of brake fluid. Loosen the bleeder screw to allow air to escape from the system.

3. Make sure there is an adequate supply of fluid in the reservoir, then slowly pump the clutch pedal until no more bubbles appear in the clear tube.

4. Tighten the bleeder screw securely.
5. Refill the brake fluid in the reservoir to the MAX (upper) level line.

CLUTCH PEDAL, CLUTCH PEDAL POSITION SWITCH, AND CLUTCH INTERLOCK SWITCH ADJUSTMENT

NOTE:

- **Check the clutch pedal position switch; 5-speed model (see CLUTCH PEDAL POSITION SWITCH TEST), 6-speed model (see CLUTCH PEDAL POSITION SWITCH TEST).**
- **Check the clutch interlock switch; 5-speed model (see CLUTCH INTERLOCK SWITCH TEST), 6-speed model (see CLUTCH INTERLOCK SWITCH TEST).**
- **The clutch is self-adjusting to compensate for wear.**
- **If there is no clearance between the master cylinder piston and pushrod, the release bearing will be held against the diaphragm spring, which can result in clutch slippage or other clutch problems.**

1. Lift up the carpet (A). At the insulator cutout, measure the pedal height from the right side of the pedal pad (B).

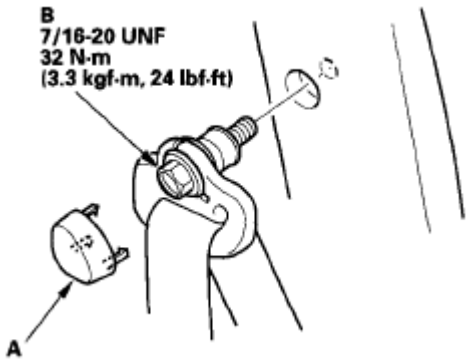

Fig. 10: Identifying Pedal Height From Right Side Of Pedal Pad
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Loosen the clutch pedal position switch locknut (A), and back off the clutch pedal position switch (B) until it no longer touches the clutch pedal (C).

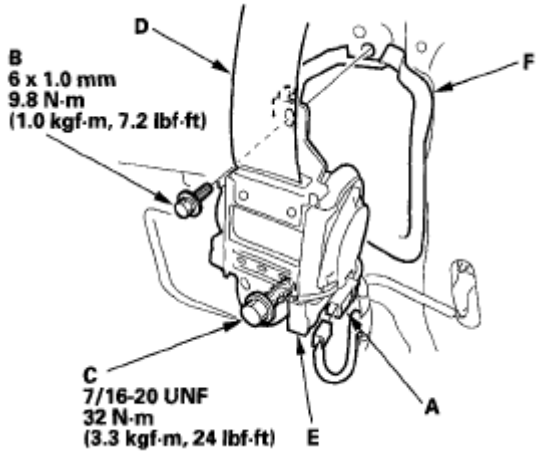

Fig. 11: Identifying Area Applying Grease (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Loosen the clutch pushrod locknut (D), and turn the pushrod (E) in or out to get the specified height (F), stroke (G), free play (H), and disengagement height (I) at the clutch pedal.

   Clutch Pedal Stroke: 130-140 mm (5.12-5.51 in.)

   Clutch Pedal Free

   Play: 10-18 mm (0.39-0.71 in.)

   Clutch Pedal Height: 157 mm (6.18 in.)

   Clutch Pedal

   Disengagement

   Height: 77 mm (3.03 in.)

4. Tighten the clutch pushrod locknut.
5. With the clutch pedal released, turn in the clutch pedal position switch until it contacts the clutch pedal.
6. Turn in the clutch pedal position switch an additional 3/4 to 1 turn.
7. Tighten the clutch pedal position switch locknut.
8. Loosen the clutch interlock switch locknut (J).
9. Press the clutch pedal to the floor.
10. Release the clutch pedal 9-12 mm (0.35-0.47 in.) from the fully pressed position, and hold it there. Adjust the position of the clutch interlock switch (K) so the engine will start with the clutch pedal in this position.
11. Tighten the clutch interlock switch locknut.
12. Check the clutch operation.

CLUTCH PEDAL ASSEMBLY REPLACEMENT

1. Disconnect the clutch pedal position switch connector (A) and clutch interlock switch connector (B).

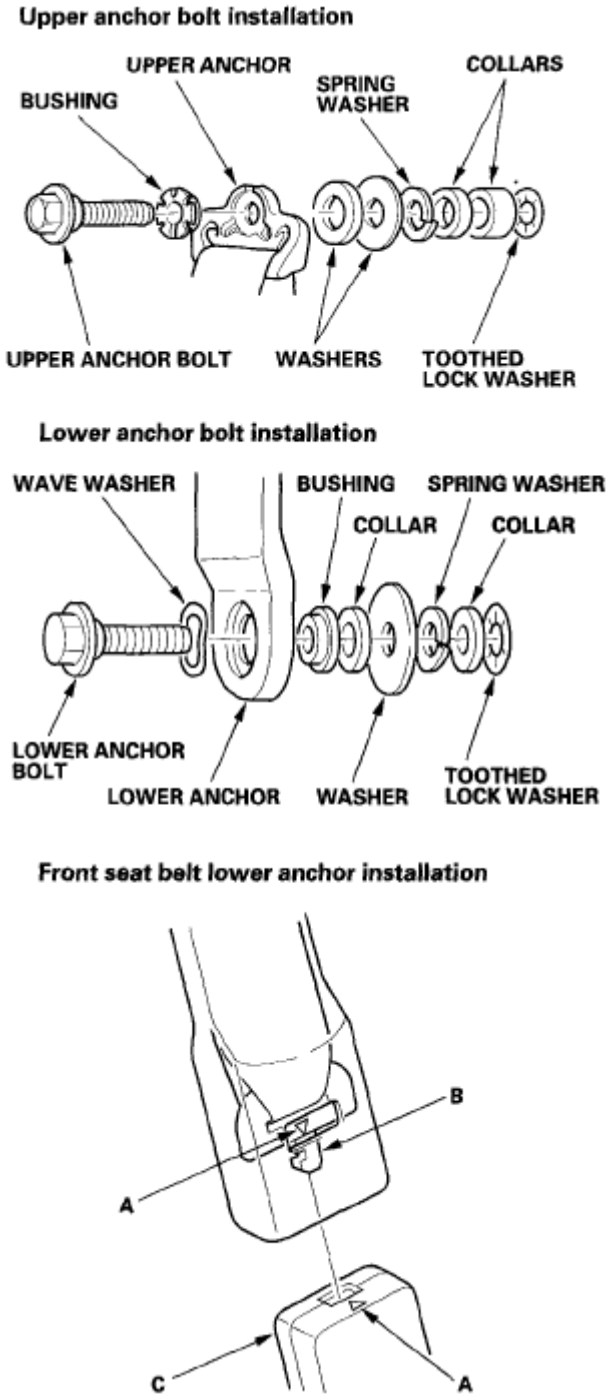

Fig. 12: Identifying Clutch Pedal Position Switch Connector And Clutch Interlock Switch Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Pry out the lock pin (C), and pull the pedal pin (D) out of the yoke.
3. Remove the master cylinder mounting nuts (E) and clutch pedal mounting bolt (F).
4. Remove the clutch pedal (A).

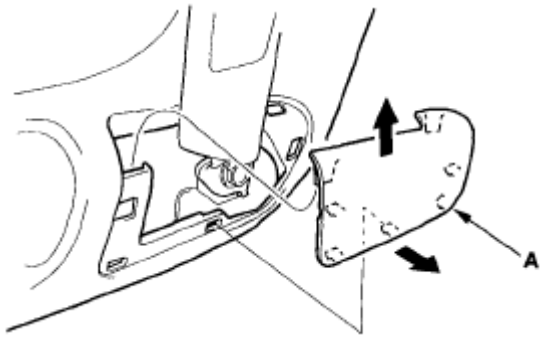

Fig. 13: Removing The Clutch Pedal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the clutch pedal (A).

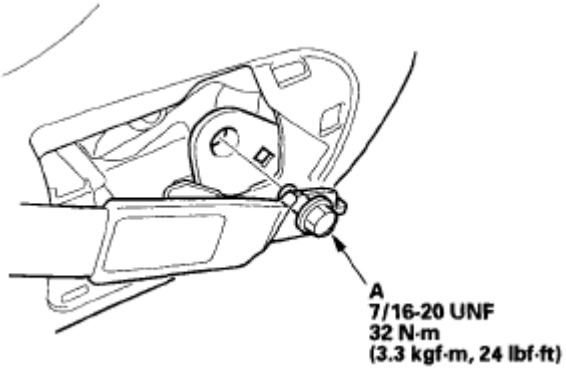

Fig. 14: Identifying Clutch Pedal Components (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Install the clutch pedal mounting bolt (B) and master cylinder mounting nuts (C).
7. Apply grease to the pedal pin (D), and slide it into the yoke, then install a new lock pin (E).
8. Connect the clutch pedal position switch connector (F) and clutch interlock switch connector (G).
9. Adjust the clutch pedal, clutch pedal position switch, and clutch interlock switch (see **CLUTCH PEDAL, CLUTCH PEDAL POSITION SWITCH, AND CLUTCH INTERLOCK SWITCH ADJUSTMENT**).
10. Check the clutch operation.

CLUTCH MASTER CYLINDER REPLACEMENT

NOTE:

- **Use fender covers to avoid damaging painted surfaces.**
- **Do not spill brake fluid on the vehicle; it may damage the paint. If brake fluid does contact the paint, wash it off immediately with water.**

1. Remove the brake fluid from the clutch master cylinder reservoir with a syringe.
2. Make sure you have the anti-theft code for the audio unit or the navigation system, then write down the audio presets.
3. Disconnect the negative cable from the battery, then disconnect the positive cable.

4. Remove the battery.
5. Remove the driver's dashboard undercover (see **DRIVER's DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
6. Remove the air cleaner assembly; 5-speed model (see **THROTTLE BODY CLEANING**), 6-speed model (see **AIR CLEANER REMOVAL/INSTALLATION**)
7. Remove the battery base; 5-speed model (see step 6 on **TRANSMISSION REMOVAL**), 6-speed model (see step 6 on **TRANSMISSION REMOVAL**)
8. Pry out the lock pin (A), and pull the pedal pin (B) out of the yoke. Remove the master cylinder mounting nuts (C).

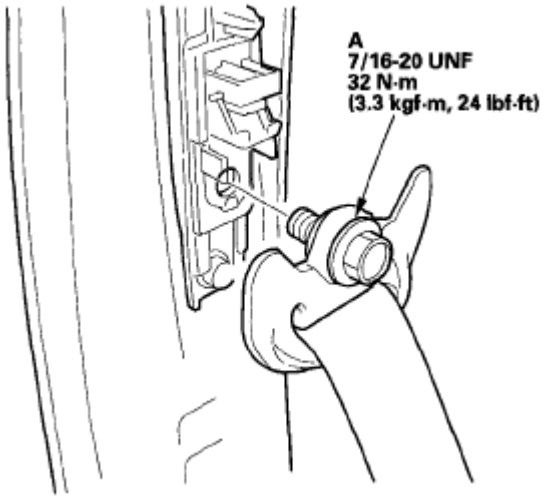

Fig. 15: Identifying Master Cylinder Mounting Nuts, Lock Pin And Pedal Pin
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Remove the cowl cover and under-cowl panel (see **FRONT GRILLE COVER REPLACEMENT**).
10. Remove the clutch line bracket (A).

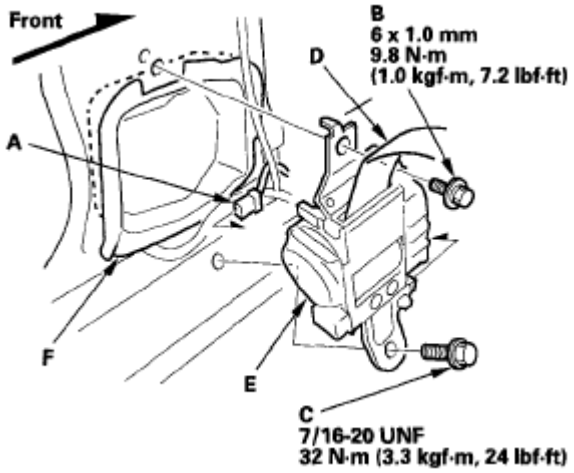

Fig. 16: Identifying Clutch Line Bracket And Clamps
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Remove the clutch line from the clamps (B).

12. Remove the clutch master cylinder (A) with the clutch line (B) and the reservoir hose (C).

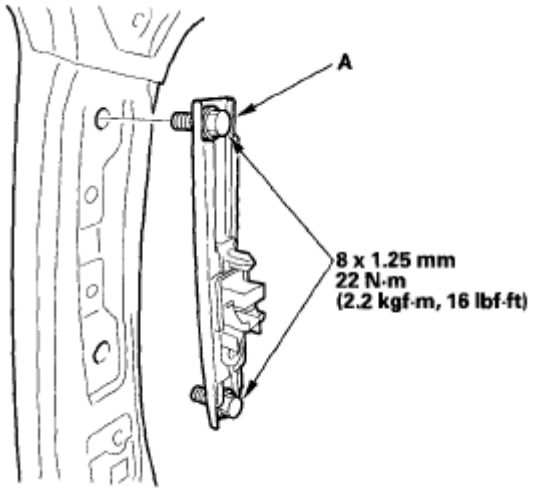

Fig. 17: Identifying Clutch Master Cylinder, Clutch Line And Reservoir Hose
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Disconnect the reservoir hose (A), then remove the retaining clip (B), and the clutch line (C) from the clutch master cylinder (D). Plug or wrap the end of the reservoir hose and the clutch line with a shop towel to prevent brake fluid from coming out.

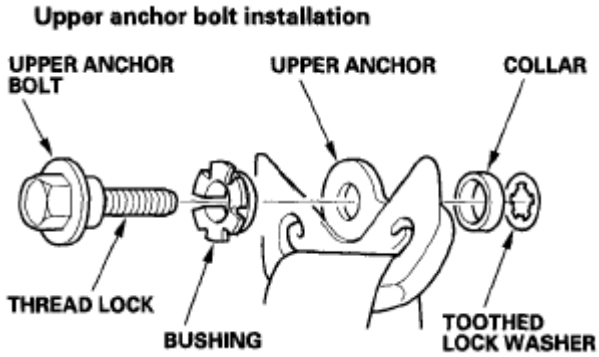

Fig. 18: Identifying Reservoir Hose, Retaining Clip And Clutch Line
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Remove the O-ring (E) and clutch master cylinder seal (F) from the clutch master cylinder.
15. Install the new O-ring (A) and clutch master cylinder seal (B) to the clutch master cylinder (C).

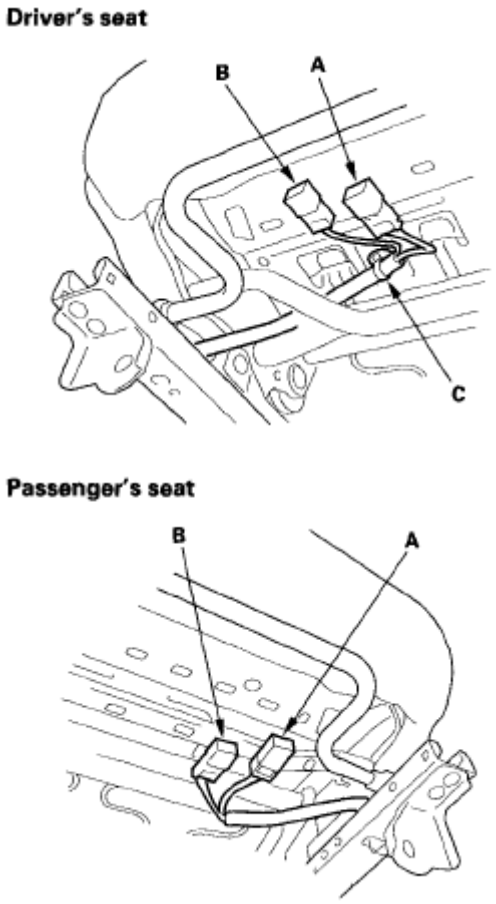

Fig. 19: Identifying Clutch Master Cylinder Seal And Clutch Master Cylinder
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Install the clutch line (D), then install the new retaining clip (E). Connect the reservoir hose (F).
17. To prevent the retaining clip (A) from coming off, pry apart the tip of the retaining clip (B) with a screwdriver.

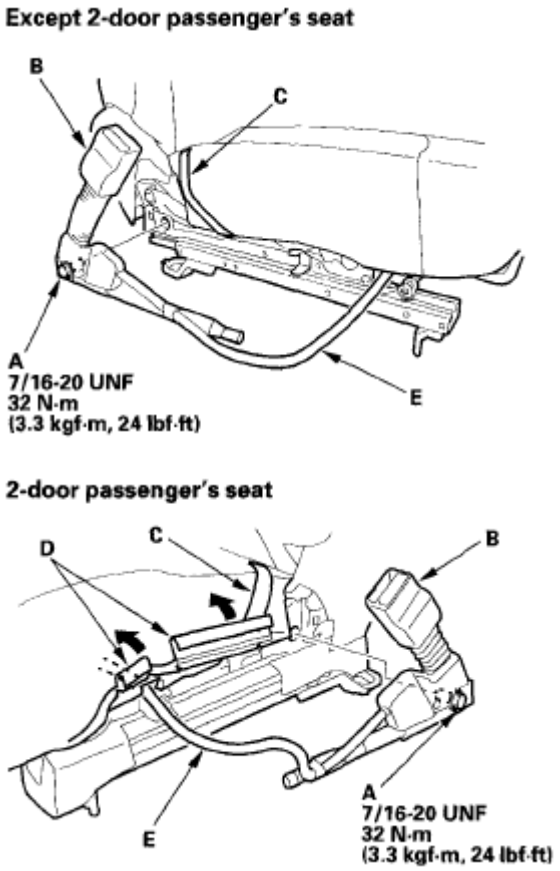

Fig. 20: Identifying Retaining Clip
Courtesy of AMERICAN HONDA MOTOR CO., INC.

18. Install the clutch master cylinder (A) with the clutch line (B) and the reservoir hose (C).

19. Install the clutch line to the clamps (A).

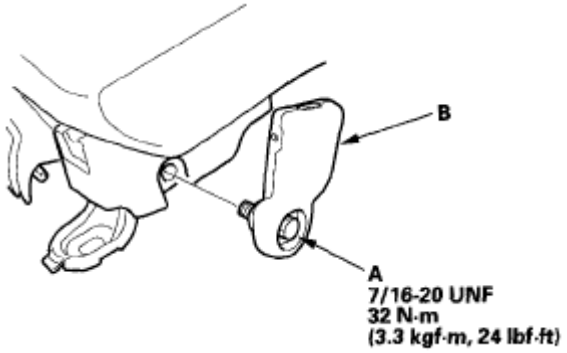

Fig. 22: Identifying Clutch Line Clamps And Bracket (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Install the clutch line bracket (B).
21. Make sure the hose clamps (A) are positioned on the master cylinder (B) and reservoir (C) as shown.

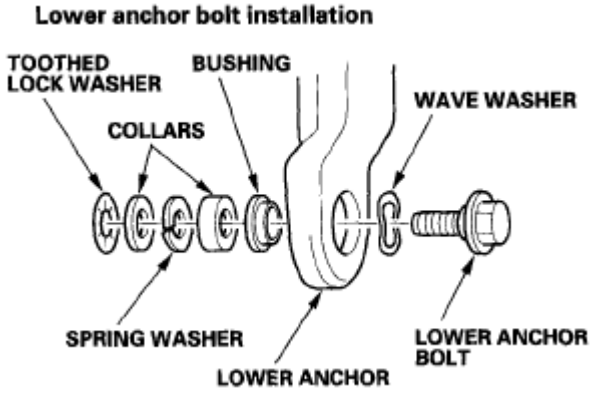

Fig. 23: Identifying Master Cylinder And Reservoir
Courtesy of AMERICAN HONDA MOTOR CO., INC.

22. Install the cowl cover and under-cowl panel (see **FRONT GRILLE COVER REPLACEMENT**).
23. Install the master cylinder mounting nuts (A).

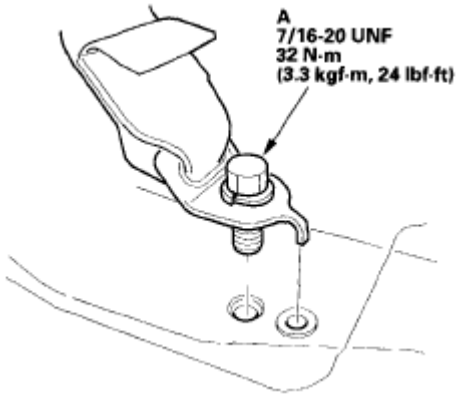

Fig. 24: Identifying Master Cylinder Mounting Nuts - Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

24. Apply grease to the pedal pin (B), and slide it into the yoke, then install a new lock pin (C).
25. Adjust the clutch pedal, clutch pedal position switch, and clutch interlock switch (see **CLUTCH PEDAL, CLUTCH PEDAL POSITION SWITCH, AND CLUTCH INTERLOCK SWITCH ADJUSTMENT**).
26. Do the clutch hydraulic system bleeding (see **Clutch Hydraulic System Bleeding**).
27. Install the battery base; 5-speed model (see step 34 on **TRANSMISSION INSTALLATION**), 6-speed model (see step 38 on **TRANSMISSION INSTALLATION**).
28. Install the air cleaner assembly; 5-speed model (see **THROTTLE BODY CLEANING**), 6-speed model (see **AIR CLEANER REMOVAL/INSTALLATION**).
29. Install the driver's dashboard undercover (see **DRIVER's DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
30. Install the battery. Clean the posts and cable terminals. Connect the positive cable to the battery, then connect the negative cable, and apply multipurpose grease to prevent corrosion.
31. Enter the anti-theft code for the audio unit or the navigation system, then enter the audio presets, and set the clock.
32. Do the power window control unit reset procedure (see **RESETTING THE POWER WINDOW CONTROL UNIT**).
33. Check the clutch operation, and check for leaks.
34. Test-drive the vehicle.

SLAVE CYLINDER REPLACEMENT

NOTE:

- **Use fender covers to avoid damaging painted surfaces.**
- **Do not spill brake fluid on the vehicle; it may damage the paint. If brake fluid does contact the paint, wash it off immediately with water.**

5-SPEED MODEL

1. Remove the clutch line bracket (A), the mounting bolts (B) and the slave cylinder (C).

2. Remove the roll pins (A). Disconnect the clutch line (B), and remove the O-ring (C). Plug or wrap the end of the clutch line with a shop towel to prevent brake fluid from coming out.

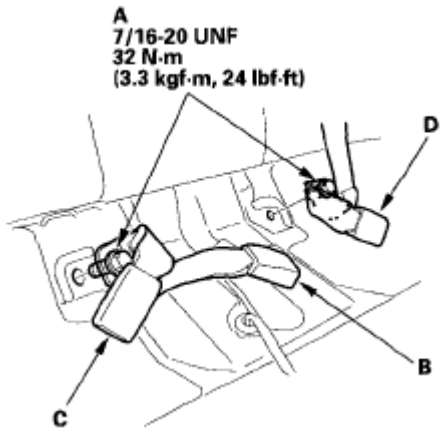

Fig. 26: Identifying Clutch Line And O-Ring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the slave cylinder in the reverse order of removal. Install the new O-ring (A).

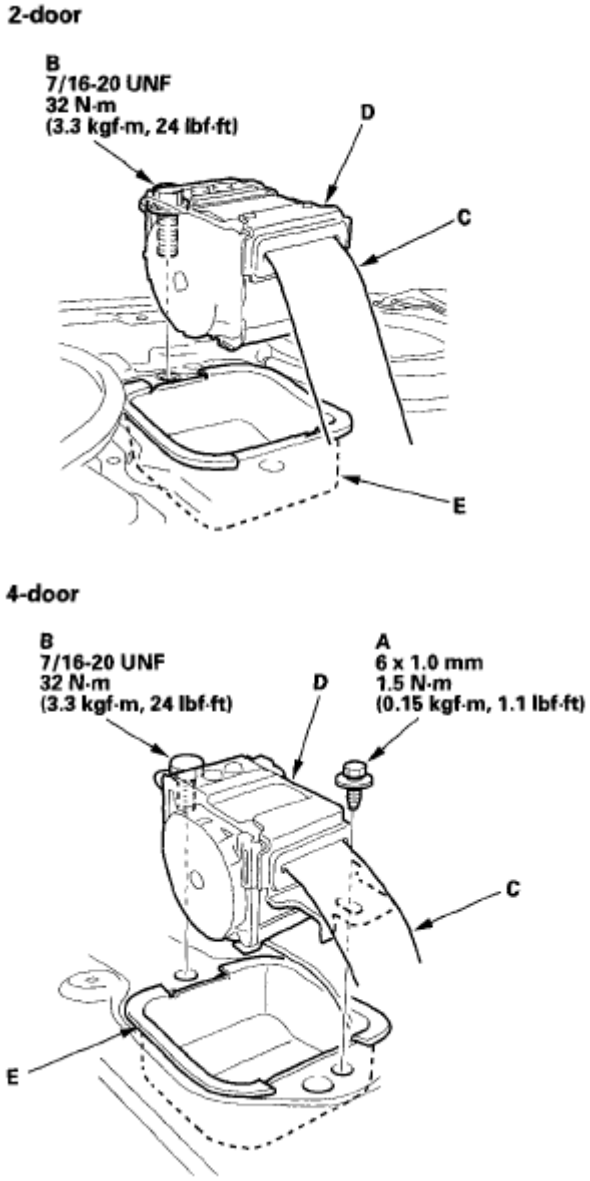

Fig. 27: Identifying O-Ring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Pull back the boot (A), and apply brake assembly lube to the boot and slave cylinder rod (B). Reinstall the boot.

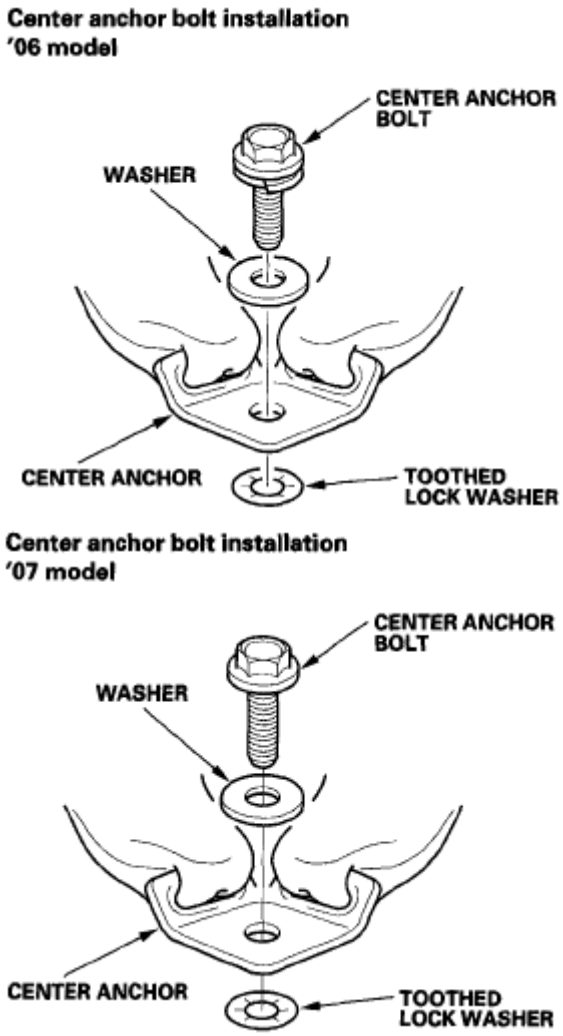

Fig. 28: Identifying Area Applying Grease
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Apply super high temp area grease (P/N 08798-9002) to the pushrod of the slave cylinder and the release fork. Tighten the slave cylinder mounting bolts to 22 N.m (2.2 kgf.m, 16 lbf.ft).
6. Do the clutch hydraulic system bleeding (see **Clutch Hydraulic System Bleeding**).
7. Check the clutch operation, and check for leaks.
8. Test-drive the vehicle.

6-SPEED MODEL

1. Remove the clutch line bracket (A), the mounting bolts (B), and the slave cylinder (C).

5. Apply super high temp area grease (P/N 08798-9002) to the pushrod of the slave cylinder and the release fork. Tighten the slave cylinder mounting bolts to 22 N.m (2.2 kgf.m, 16 lbf.ft).
6. Do the clutch hydraulic system bleeding (see **Clutch Hydraulic System Bleeding**).
7. Check the clutch operation, and check for leaks.
8. Test-drive the vehicle.

CLUTCH HOSE REPLACEMENT

NOTE:

- **Replace the clutch hose if the hose is twisted, cracked, or if it leaks.**
- **Use fender covers to avoid damaging painted surfaces.**
- **Do not spill brake fluid on the vehicle; it may damage the paint. If brake fluid does contact the paint, wash it off immediately water.**

1. Remove the brake fluid from the clutch master cylinder reservoir with a syringe.
2. Disconnect the clutch hose (A) from the clutch line (B).

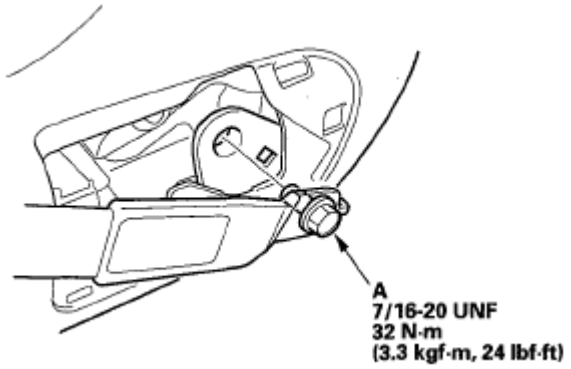

Fig. 33: Identifying Clutch Hose And Clutch Line
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the clutch hose clips (A) from the clutch hose (B).

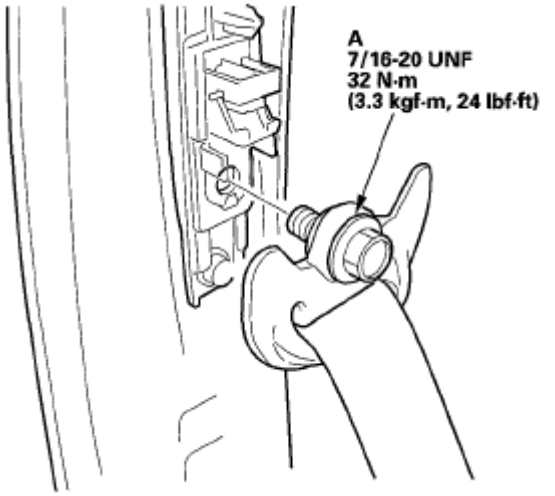

Fig. 34: Identifying Clutch Hose Clips And Clutch Hose Bracket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the clutch hose from the body (C) and clutch hose bracket (D).
5. Install the clutch hose (A) on the body (B) and clutch hose bracket (C) with the new clutch hose clips (D).

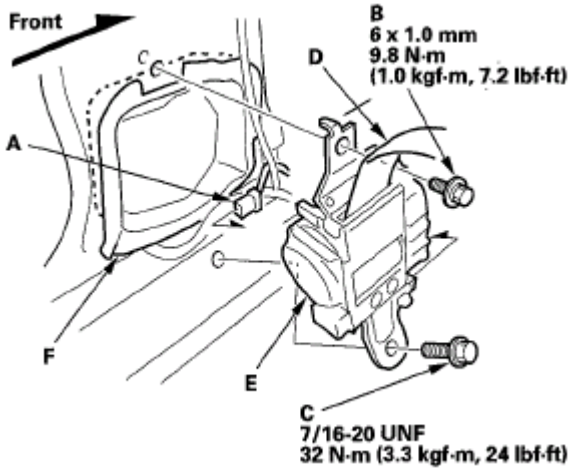

Fig. 35: Identifying Clutch Hose, Clutch Hose Bracket And Clutch Hose Clips

Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Do the clutch hydraulic system bleeding (see **Clutch Hydraulic System Bleeding**).
8. Check the clutch operation, and check for leaks.
9. Test-drive the vehicle.

CLUTCH PEDAL COVER REPLACEMENT

NOTE: This procedure is for models equipped with a metal clutch pedal plate model.

1. Cover the carpet under the clutch pedal to prevent metal shavings from getting on the carpet.
2. Center-punch each of the rivets (A), and drill their heads off with a 3 mm (0.12 in.) drill bit (B).

NOTE: Do not drill the clutch pedal pad (C).

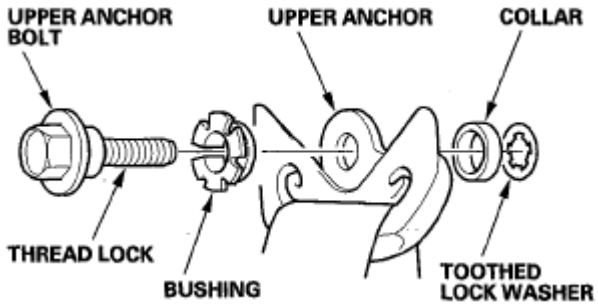

Fig. 37: Identifying Rivets, Heads And Drill Bit
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the clutch pedal plate (A) and the clutch pedal cover (B) from the clutch pedal pad (C).

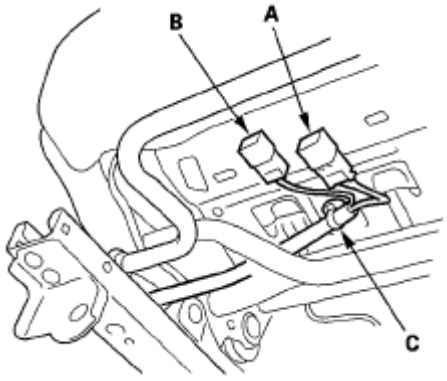

Fig. 38: Identifying Clutch Pedal Plate, Clutch Pedal Cover And Clutch Pedal Pad
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Set the clutch pedal cover to the clutch pedal plate.
5. Install the clutch pedal plate (A) with the rivets (B) firmly.

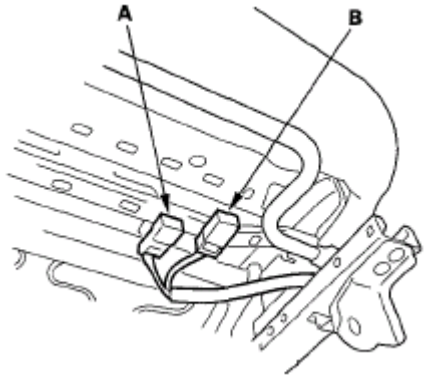

Fig. 39: Identifying Clutch Pedal Plate With The Rivets
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Using your hand, make sure the clutch pedal cover is firmly fastened to the pedal.
7. Check the clutch pedal height (see **Clutch Pedal, Clutch Pedal Position Switch, and Clutch Interlock Switch Adjustment**).

CLUTCH REPLACEMENT

Special Tools Required

- Clutch alignment disc 07JAF-PM7011A
- Ring gear holder 07LAB-PV00100 or 07924-PD20003
- Clutch alignment shaft 07LAF-PT00110
- Slide hammer weight 07741-0010201
- Attachment, 22 x 24 mm 07746-0010800
- Driver 07749-0010000
- Remover handle 07936-3710100
- Bearing remover shaft 07936-KC10500

PRESSURE PLATE AND CLUTCH DISC REMOVAL (5-SPEED MODEL)

1. Transmission removal (see **TRANSMISSION REMOVAL**).
2. Check the height of the diaphragm spring fingers using the clutch alignment disc (A), clutch alignment shaft (B), remover handle (C), and a feeler gauge (D). If the height is more than the service limit, replace the pressure plate.

   Standard (New): 0.6 mm (0.02 in.) max.

   Service Limit: 0.8 mm (0.03 in.)

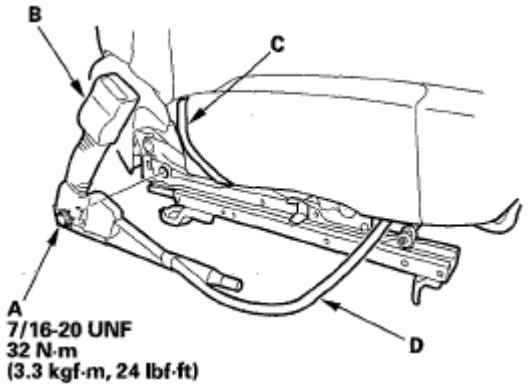

Fig. 40: Checking Height Of Diaphragm Spring Fingers
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the ring gear holder (A), clutch alignment shaft (B), and remover handle (C).

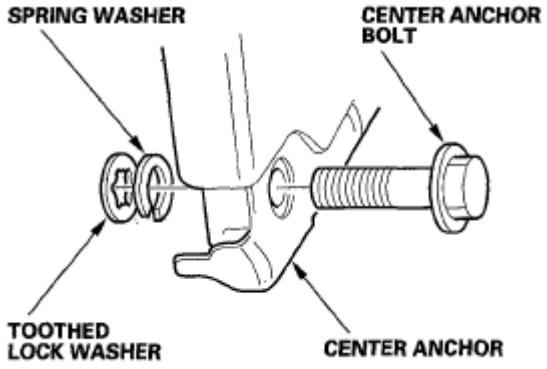

Fig. 41: Identifying Ring Gear Holder And Clutch Alignment Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. To prevent warping, unscrew the pressure plate mounting bolts (D) in a crisscross pattern in several steps, then remove the pressure plate (E).
5. Inspect the fingers of the diaphragm spring (A) for wear at the release bearing contact area.

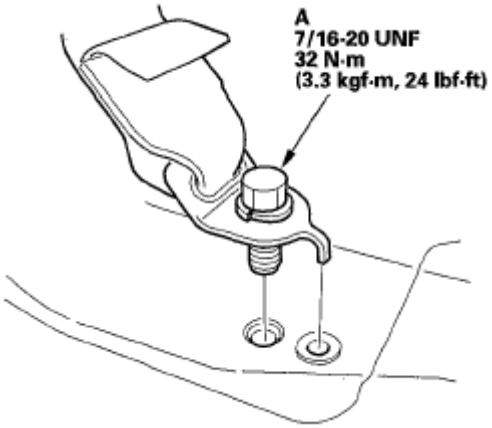

Fig. 42: Identifying Diaphragm Spring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Inspect the pressure plate surface (A) for wear, cracks, and burning.

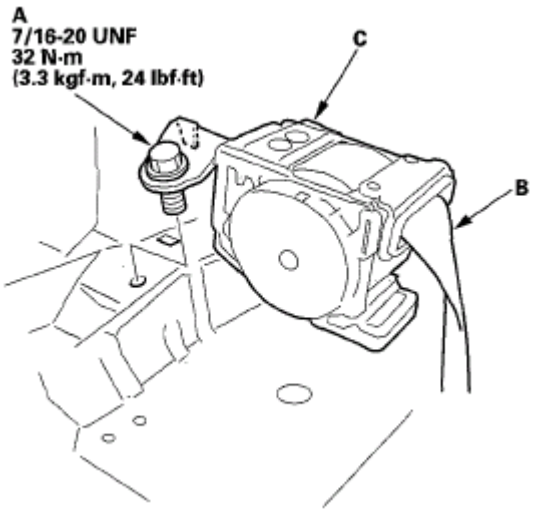

Fig. 43: Identifying Pressure Plate Surface
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Inspect for warpage using a straight edge (A) and a feeler gauge (B). Measure across the pressure plate (C). If the warpage is more than the service limit, replace the pressure plate.

   Standard (New): 0.03 mm (0.001 in.) max.

   Service Limit: 0.15 mm (0.006 in.)

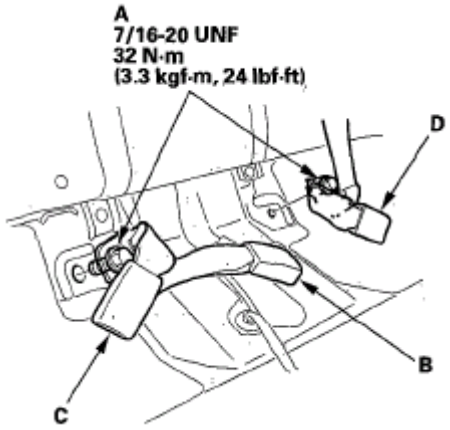

Fig. 44: Inspecting Warpage
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Clutch Disc Removal and Inspection

8. Remove the clutch disc (A), clutch alignment shaft (B), and remover handle (C).

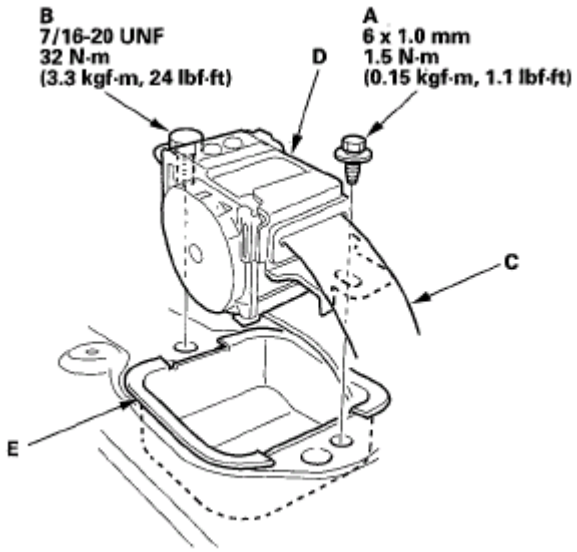

Fig. 45: Identifying Clutch Disc And Clutch Alignment Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Inspect the lining of the clutch disc for signs of slippage or oil. If the clutch disc looks burnt or is oil soaked, replace it and the pressure plate as a set. Find and repair the source of the oil leak, if the clutch disc is soaked.
10. Measure clutch disc thickness. If the thickness is less than the service limit, replace the clutch disc.

Standard (New): 7.8-8.4 mm (0.30-0.33 in.)

Service Limit: 6.0 mm (0.24 in.)

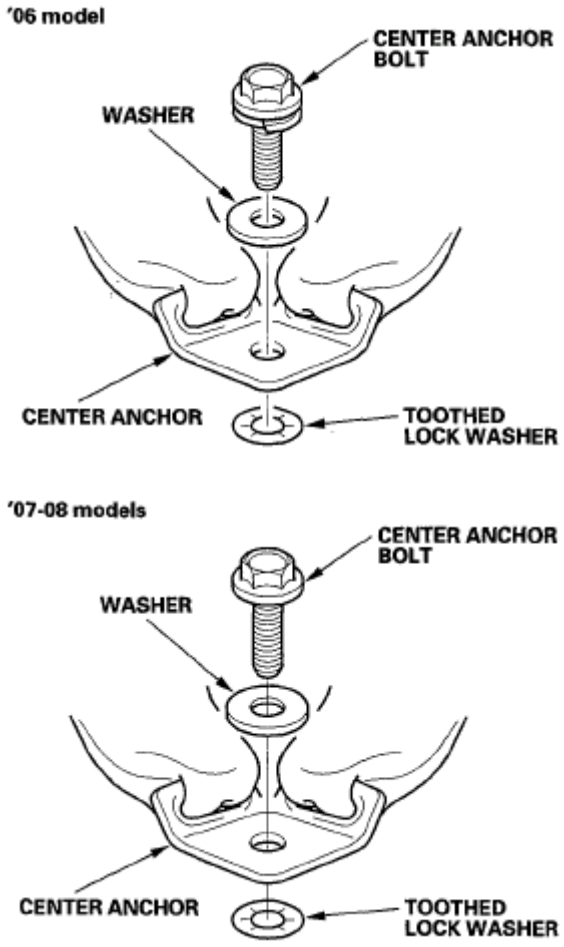

Fig. 46: Measuring Clutch Disc Thickness
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Measure rivet depth from the clutch disc lining surface (A) to the rivets (B) on both sides. If the rivet depth is less than the service limit, replace the clutch disc.

    Standard (New): 1.35-1.95 mm (0.053-0.077 in.)

    Service Limit: 0.2 mm (0.008 in.)

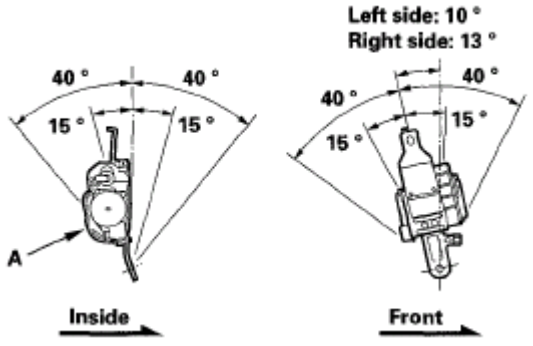

Fig. 47: Measuring Rivet Depth From Clutch Disc Lining Surface

12. Remove the ring gear holder.

Crankshaft Pilot Bushing Inspection

13. Inspect the crankshaft pilot bushing for wear and damage.
14. Inspect the inside surface of the crankshaft pilot bushing with your finger. If the crankshaft pilot bushing is not smooth, replace it.

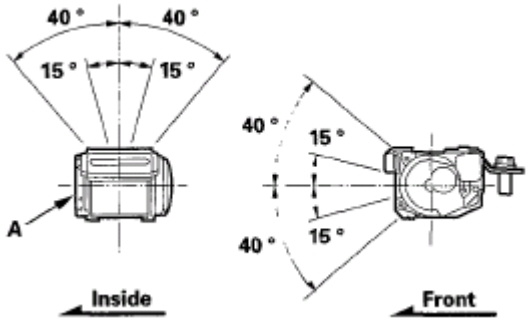

Fig. 48: Identifying Crankshaft Pilot Bushing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Crankshaft Pilot Bushing Replacement

15. Remove the crankshaft pilot bushing (A) using the bearing remover shaft (B) and the slide hammer (C).

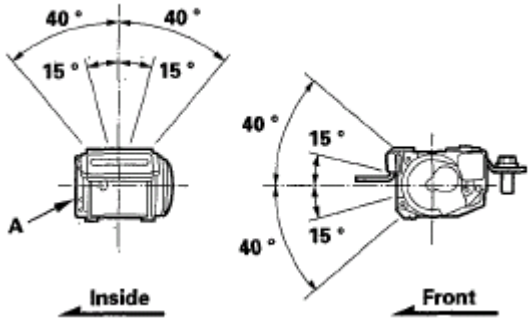

Fig. 49: Identifying Crankshaft Pilot Bushing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Install the new crankshaft pilot bushing (A) into the crankshaft using the driver (B) and 22 x 24 mm attachment (C). Apply a light coat of super high temp area grease (P/N 08798-9002) to the crankshaft pilot bushing surface.

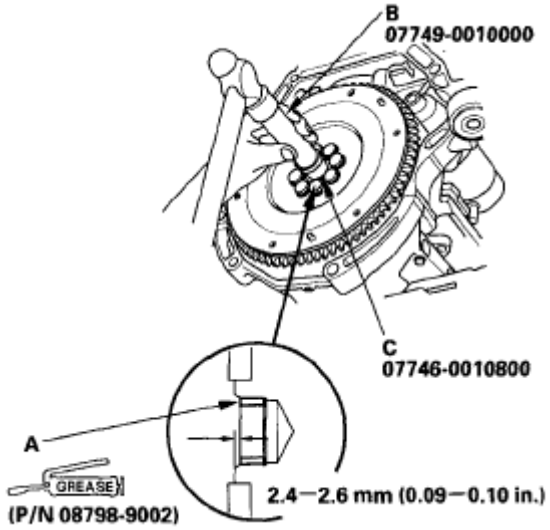

Fig. 50: Identifying Area Applying Grease
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Flywheel Inspection

17. Inspect the ring gear teeth for wear and damage.
18. Inspect the clutch disc mating surface on the flywheel for wear, cracks, and burning.
19. Measure flywheel (A) runout using a dial indicator (B) through at least two full turns with the engine installed. Push against the flywheel each time you turn it to take up the crankshaft thrust washer clearance. If the runout is more than the service limit, replace the flywheel, and recheck the runout. Resurfacing the flywheel is not recommended.

Standard (New): 0.05 mm (0.002 in.) max.

Service Limit: 0.15 mm (0.006 in.)

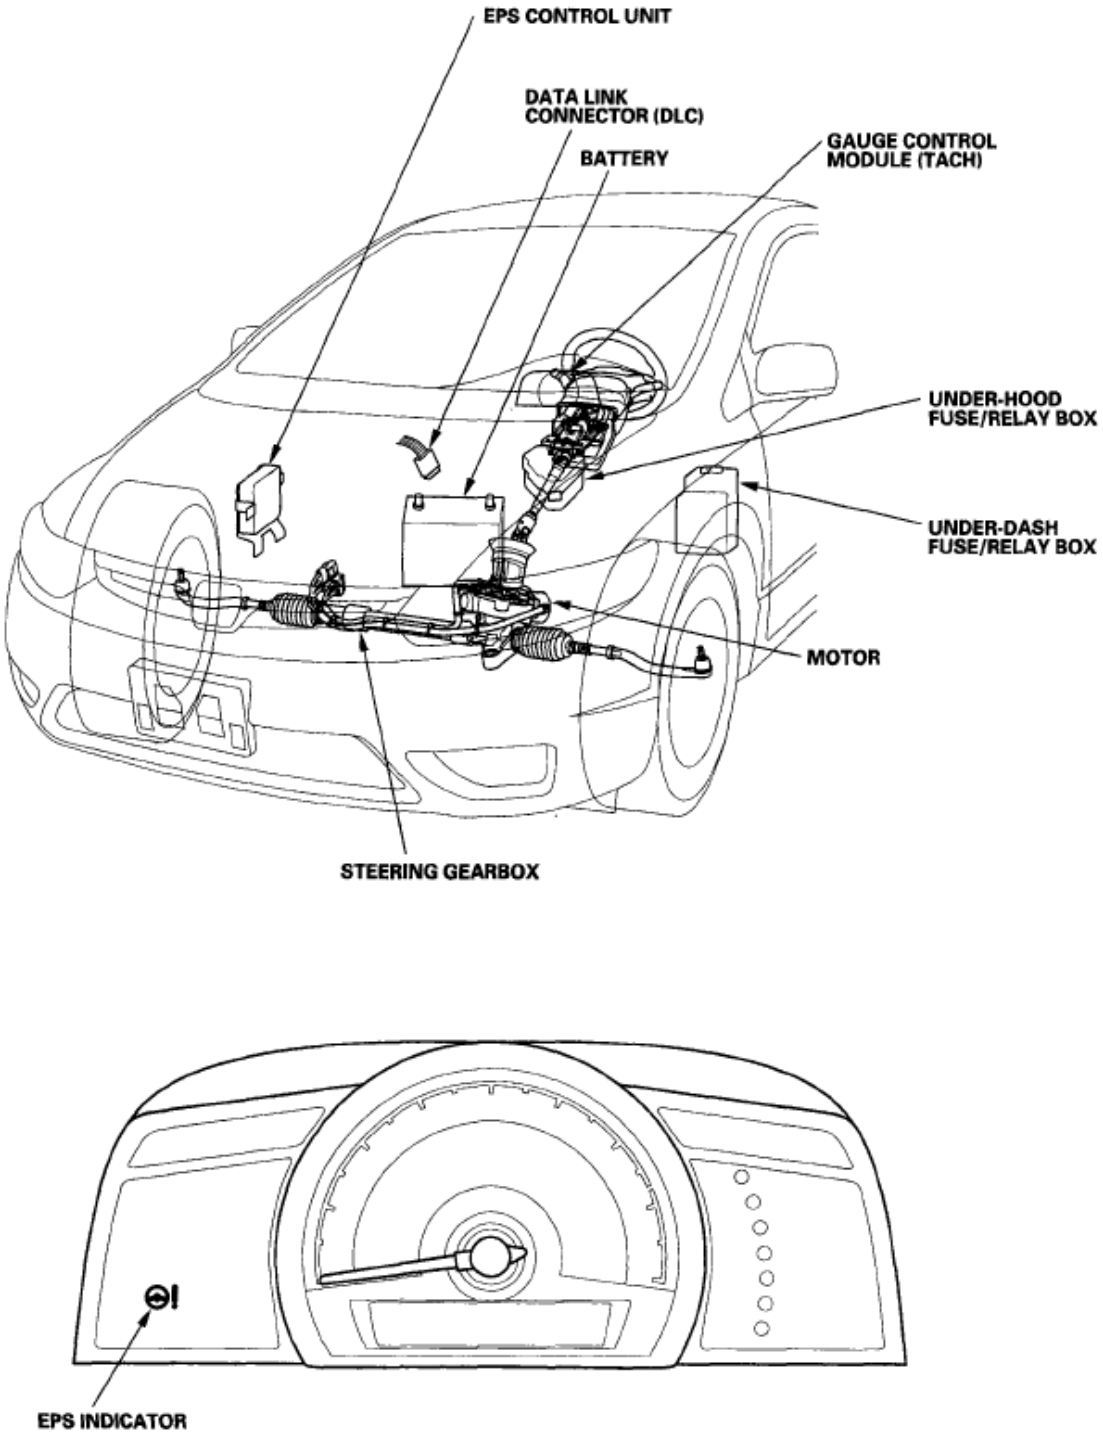

Fig. 51: Inspecting Clutch Disc Mating Surface
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Flywheel Replacement

20. Install the ring gear holder (A).

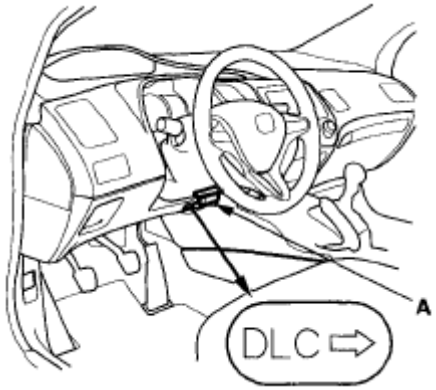

Fig. 52: Identifying Ring Gear Holder
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Remove the flywheel mounting bolts in a crisscross pattern in several steps, then remove the flywheel and ring gear holder.
22. Install the flywheel on the crankshaft, and install the mounting bolts finger-tight.
23. Install the ring gear holder (A), then torque the flywheel mounting bolts (B) in a crisscross pattern in several steps.

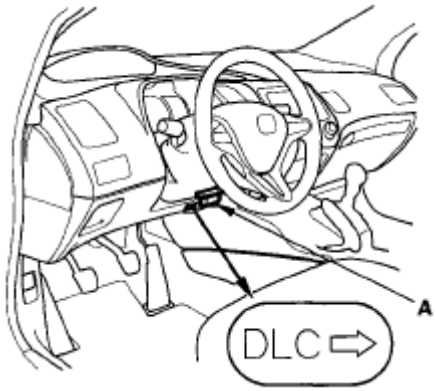

Fig. 53: Identifying Flywheel Mounting Bolts - Specified Torque
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Clutch Disc and Pressure Plate Installation

24. Temporarily install the clutch disc onto the splines of the transmission mainshaft. Make sure the clutch disc slides freely on the mainshaft.
25. Apply a light coat of super high temp urea grease (P/N 08798-9002) to the crankshaft pilot bushing (A).

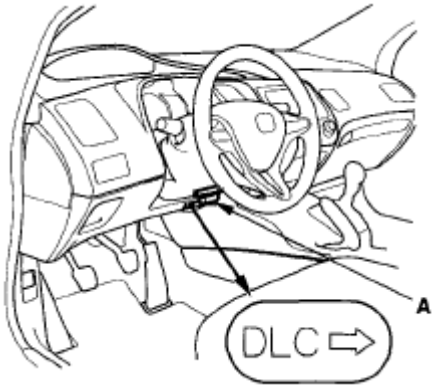

Fig. 54: Identifying Clutch Disc Onto Splines Of Transmission Mainshaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

26. Apply super high temp area grease (P/N 08798-9002) to the splines (B) of the clutch disc (C), then install the clutch disc using the clutch alignment shaft (D) and remover handle (E).
27. Install the pressure plate (A) and the mounting bolts (B) finger-tight.

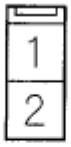

Fig. 55: Identifying Pressure Plate And Mounting Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

28. Torque the mounting bolts in a crisscross pattern. Tighten the bolts in several steps to prevent warping the diaphragm spring.

Specified Torque: 25 N.m (2.6 kgf.m, 19 lbf.ft)

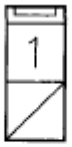

Fig. 56: Identifying Mounting Bolts - Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

29. Remove the ring gear holder (A), clutch alignment shaft (B), and remover handle (C).
30. Make sure the diaphragm spring fingers are all the same height.

Release Bearing Replacement

31. Remove the release fork boot (A) from the clutch housing (B).

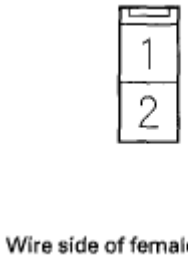

Fig. 57: Identifying Fork Set Spring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

32. Remove the release fork (C) from the clutch housing by squeezing the release fork set spring (D) with pliers. Remove the release bearing (E).
33. Check the play of the release bearing by spinning it with your hand. If there is excessive play or noise, replace the release bearing.

NOTE: The release bearing is packed with grease. Do not wash it in solvent.

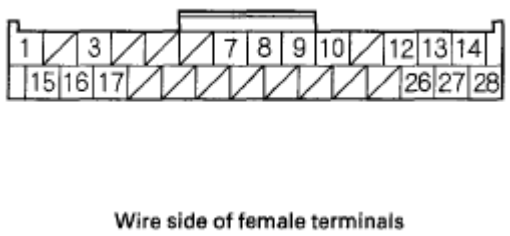

Fig. 58: Identifying Play Of Release Bearing With Your Hand
Courtesy of AMERICAN HONDA MOTOR CO., INC.

34. Apply super high temp area grease (P/N 08798-9002) to the release fork (A), the release fork bolt (B), the release bearing (C), and the release bearing guide (D) in the shaded areas.

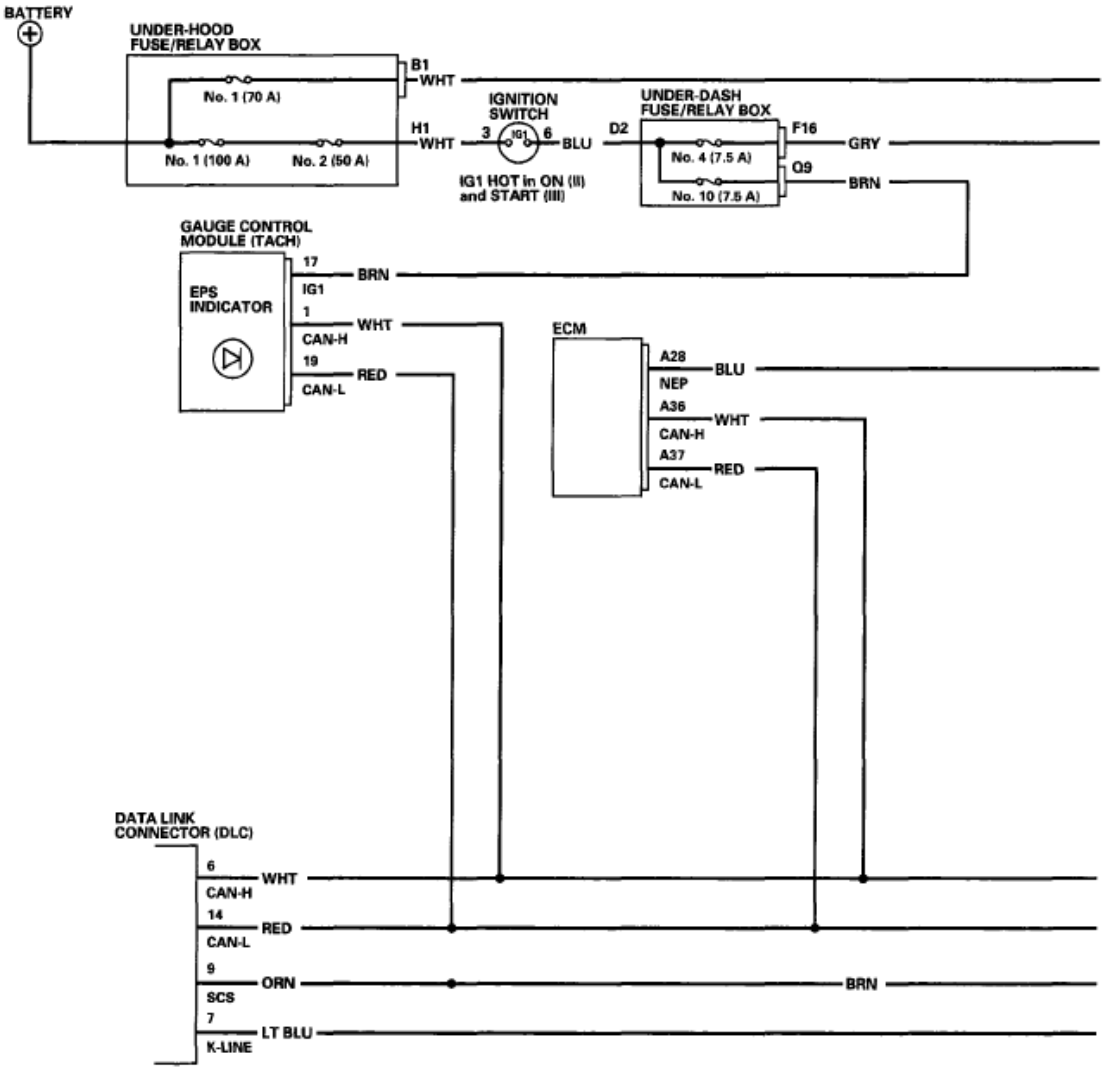

Fig. 59: Identifying Area Applying Grease
Courtesy of AMERICAN HONDA MOTOR CO., INC.

35. With the release fork slid between the release bearing pawls, install the release bearing on the mainshaft while inserting the release fork through the hole in the clutch housing.
36. Align the detent of the release fork with the release fork bolt, then squarely press the release fork over the release fork bolt.
37. Install the release fork boot (E). Make sure the boot seals around the release fork and clutch housing.
38. Move the release fork (A) right and left to make sure that it fits properly against the release bearing (B) and that the release bearing slides smoothly.

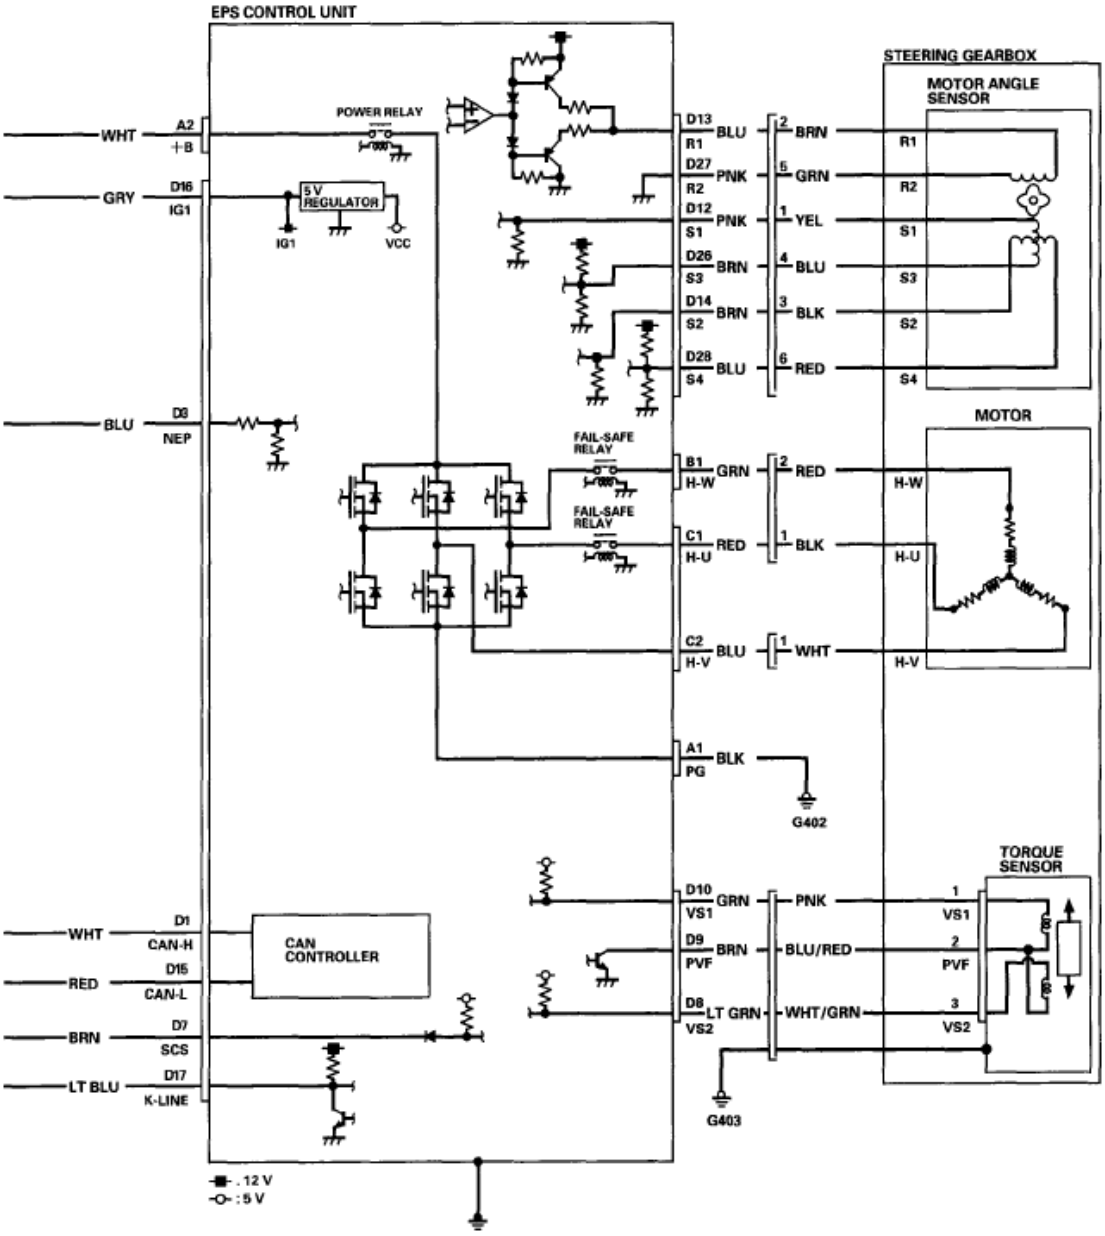

Fig. 60: Identifying Move Release Fork Right And Left

39. Install the transmission (see **TRANSMISSION INSTALLATION**).

PRESSURE PLATE AND CLUTCH DISC REMOVAL (6-SPEED MODEL)

Special Tools Required

- Clutch alignment disc 07JAF-PM7011A
- Ring gear holder 07LAB-PV00100 or 07924-PD20003
- Clutch alignment shaft 07ZAF-PR8A100
- Bearing remover shaft 07936-KC10500
- Attachment, 22 x 24 mm 07746-0010800

- Driver 07749-0010000
- Remover handle 07936-3710100
- Slide hammer, 3/8"-16 UNF commercially available

1. Transmission removal (see **TRANSMISSION REMOVAL**).
2. Check the height of the diaphragm spring fingers using the clutch alignment disc (A), clutch alignment shaft (B), remover handle (C), and a feeler gauge (D). If the height is more than the service limit, replace the pressure plate.

   Standard (New): 0.6 mm (0.02 in.) max.

   Service Limit: 0.8 mm (0.03 in.)

4. To prevent warping, unscrew the pressure plate mounting bolts (D) in a crisscross pattern in several steps, then remove the pressure plate (E).
5. Inspect the fingers of the diaphragm spring (A) for wear at the release bearing contact area.

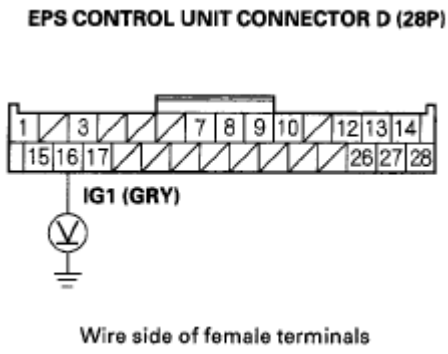

Fig. 63: Identifying Diaphragm Spring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Inspect the pressure plate surface (A) for wear, cracks, and burning.

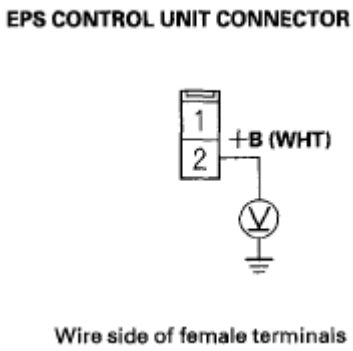

Fig. 64: Identifying Pressure Plate Surface
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Inspect for warpage using a straight edge (A) and a feeler gauge (B). Measure across the pressure plate (C). If the warpage is more than the service limit, replace the pressure plate.

Standard (New): 0.03 mm (0.001 in.) max.

Service Limit: 0.15 mm (0.006 in.)

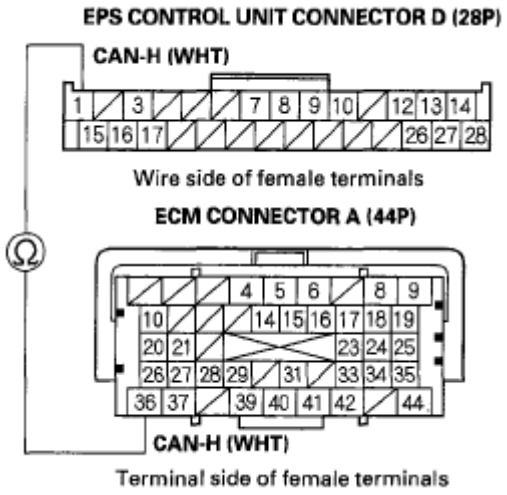

Fig. 65: Inspecting Warpage
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Remove the clutch disc (A), clutch alignment shaft (B), and remover handle (C).

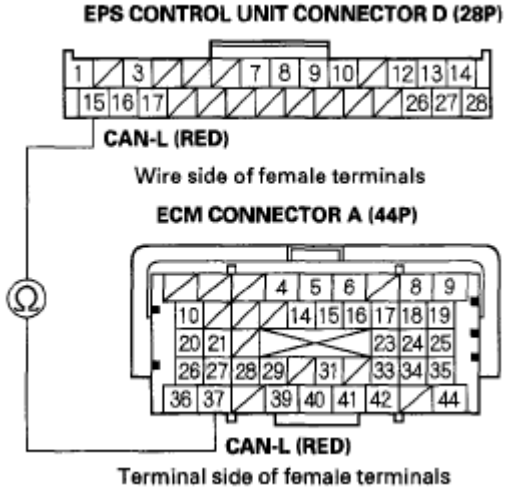

Fig. 66: Identifying Clutch Disc And Clutch Alignment Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Inspect the lining of the clutch disc for signs of slippage or oil. If the clutch disc looks burnt or is oil soaked, replace it and the pressure plate as a set. Find and repair the source of the oil leak, if the clutch disc is soaked.
10. Measure clutch disc thickness. If the thickness is less than the service limit, replace the clutch disc.

Standard (New): 8.3-8.9 mm (0.33-0.35 in.)

Service Limit: 6.0 mm (0.24 in.)

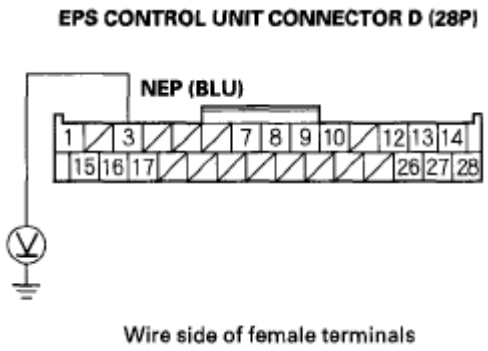

Fig. 67: Measuring Clutch Disc Thickness
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Measure rivet depth from the clutch disc lining surface (A) to the rivets (B) on both sides. If the rivet depth is less than the service limit, replace the clutch disc.

    Standard (New): 1.65-2.25 mm (0.065-0.089 in.)

    Service Limit: 0.7 mm (0.03 in.)

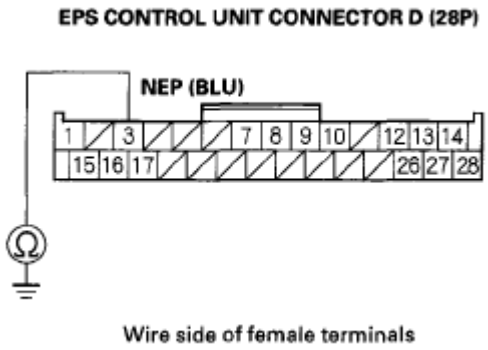

Fig. 68: Measuring Rivet Depth From Clutch Disc Lining Surface

12. Remove the ring gear holder.

    Crankshaft Pilot Bushing Inspection

13. Inspect the crankshaft pilot bushing for wear and damage.
14. Inspect the inside surface of the crankshaft pilot bushing with your finger. If the crankshaft pilot bushing is not smooth, replace it.

Flywheel Inspection

17. Inspect the ring gear teeth for wear and damage.
18. Inspect the clutch disc mating surface on the flywheel for wear, cracks, and burning.
19. Measure flywheel (A) runout using a dial indicator (B) through at least two full turns with pushing against the flywheel each time you turn it to take up the crankshaft thrust washer clearance. If the runout is more than the service limit, replace the flywheel, go to step 20, and recheck the runout.

Standard (New): 0.05 mm (0.002 in.) max.

Service Limit: 0.15 mm (0.006 in.)

Clutch Disc and Pressure Plate Installation

24. Temporarily install the clutch disc onto the splines of the transmission mainshaft. Make sure the clutch disc slides freely on the mainshaft.
25. Apply a light coat of super high temp area grease (P/N 08798-9002) to the crankshaft pilot bushing (A).

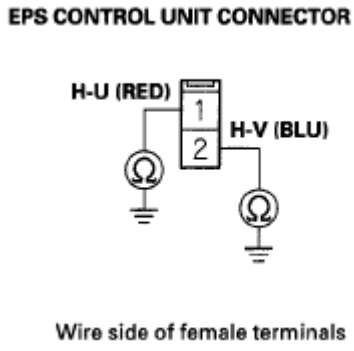

Fig. 75: Identifying Clutch Disc Onto Splines Of Transmission Mainshaft

26. Apply super high temp area grease (P/N 08798-9002) to the splines (B) of the clutch disc (C), then install the clutch disc using the clutch alignment shaft (D) and remover handle (E).
27. Install the pressure plate (A) and the mounting bolts (B) finger-tight.

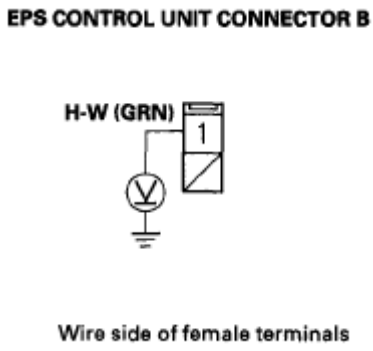

Fig. 76: Identifying Pressure Plate And Mounting Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

28. Torque the mounting bolts in a crisscross pattern. Tighten the bolts in several steps to prevent warping the diaphragm spring.

Specified Torque: 25 N.m (2.6 kgf.m, 19 lbf.ft)

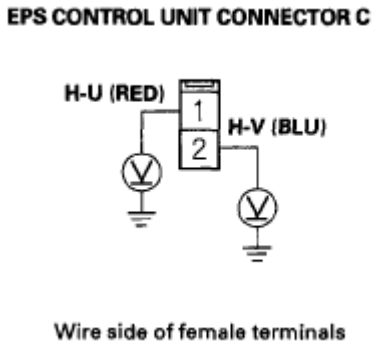

Fig. 77: Identifying Mounting Bolts - Torque Specifications

29. Remove the ring gear holder (A), clutch alignment shaft (B), and remover handle (C).
30. Make sure the diaphragm spring fingers are all the same height.

Release Bearing Replacement

31. Remove the release fork boot (A) from the clutch housing (B).

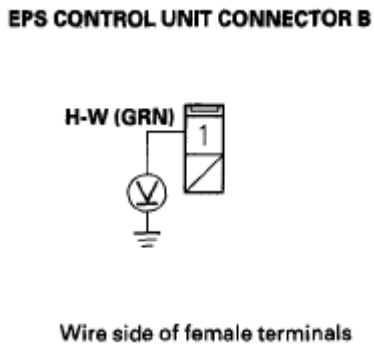

Fig. 78: Identifying Fork Set Spring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

32. Remove the release fork (C) from the clutch housing by squeezing the release fork set spring (D) with pliers. Remove the release bearing (E).
33. Check the play of the release bearing by spinning it with your hand. If there is excessive play or noise, replace the release bearing.

NOTE: The release bearing is packed with grease. Do not wash it in solvent.

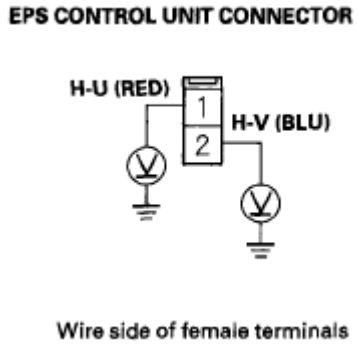

Fig. 79: Identifying Play Of Release Bearing With Your Hand
Courtesy of AMERICAN HONDA MOTOR CO., INC.

34. Apply super high temp area grease (P/N 08798-9002) to the release fork (A), the release fork bolt (B), the release bearing (C), and the release bearing guide (D) in the shaded areas.

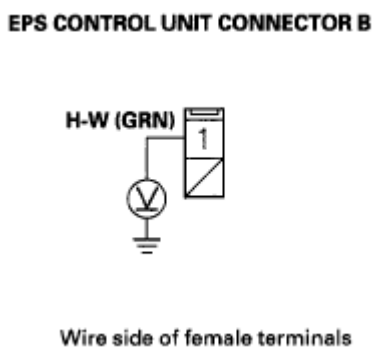

Fig. 80: Identifying Area Applying Grease
Courtesy of AMERICAN HONDA MOTOR CO., INC.

35. With the release fork slid between the release bearing pawls, install the release bearing on the mainshaft while inserting the release fork through the hole in the clutch housing.
36. Align the detent of the release fork with the release fork bolt, then squarely press the release fork over the release fork bolt.
37. Install the release fork boot (E). Make sure the boot seals around the release fork and clutch housing.
38. Move the release fork (A) right and left to make sure that it fits properly against the release bearing (B), and that the release bearing slides smoothly.

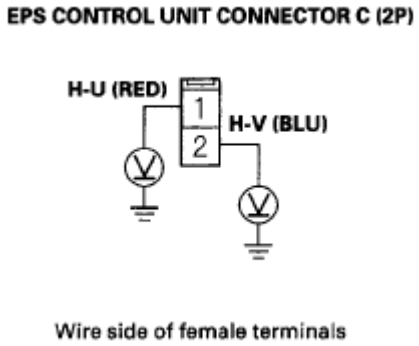

Fig. 81: Identifying Move Release Fork

REVERSE LOCKOUT SYSTEM

GENERAL TROUBLESHOOTING INFORMATION

How to Troubleshoot Circuits at the ECM Connectors

NOTE: The ECM overwrites data and monitors the EVAP system for up to 15 minutes after the ignition switch is turned to OFF. Jumping the SCS line after turning the ignition switch to LOCK (0) cancels this function. Disconnecting the ECM during this function, without jumping the SCS line first, can damage the ECM.

1. Jump the SCS line with the HDS.
2. Remove the cover (A).

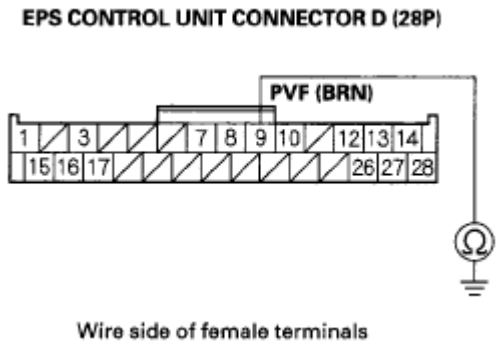

Fig. 2: Identifying Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Lift up the under-hood fuse/relay box (D).

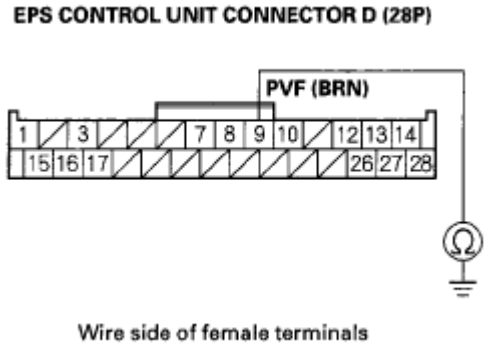

Fig. 3: Identifying Under-Hood Fuse/Relay Box And ECM Connectors
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the coolant reservoir (E). Disconnect ECM connectors A, B, and C.

NOTE: ECM connectors A, B and C have a symbols (A = [], B = triangle symbol , C = o) embossed on them for identification.

5. When diagnosis/troubleshooting is done at the ECM connector, use the terminal test port (A) above the terminal you need to check.

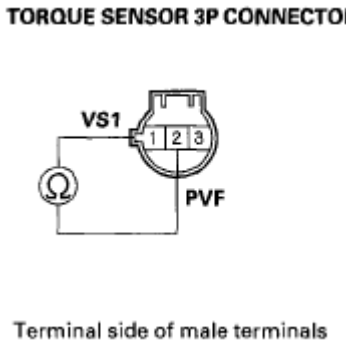

Fig. 4: Identifying Terminal Test Port
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Connect one side of the patch cord (A) terminals to a commercially available digital multimeter (B), and connect the other side of the patch cord terminals to a commercially available banana jack (Pomona Electronics Tool No. 3563 or equivalent) (C).

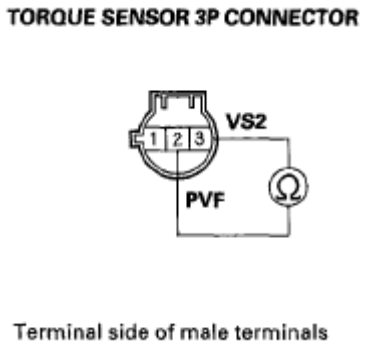

Fig. 5: Connecting Patch Cord Terminals To Digital Multimeter
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Gently contact the pin probe (male) at the terminal test port from the terminal side. Do not force the tips into the terminals.

NOTE:

- **For accurate results, always use the pin probe (male).**
- **To prevent damage to the connector terminals, do not insert test equipment probes, paper clips, or other substitutes as they can damage the terminals. Damaged terminals cause a poor connection and an incorrect measurement.**
- **Do not puncture the insulation on a wire. Punctures can cause poor or intermittent electrical connections.**

COMPONENT LOCATION INDEX

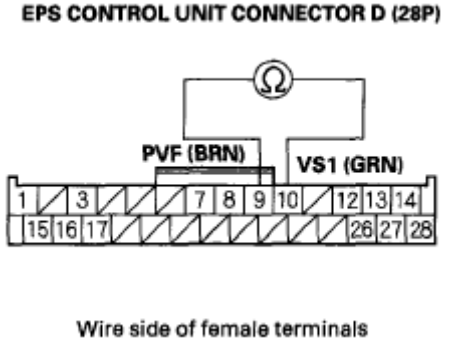

Fig. 6: Identifying Reverse Lockout System Component Location Index

SYSTEM DESCRIPTION

At a vehicle speed of 12 mph (20 km/h) or more, the ECM receives a signal from the output shaft (countershaft) speed sensor and activates the reverse lockout solenoid, which pushes select lock cam B into the locked position. As a result, the select lever can not rotate to the reverse select position, making it impossible to engage reverse gear. At a vehicle speed of 9 mph (15 km/h) or less, the signal from the output shaft (countershaft) speed sensor is interrupted, the ECM turns off the reverse lockout solenoid. The select lock return spring pulls back select lock cam B, enabling the select lever to move freely so the reverse gear can be selected.

VEHICLE SPEED CHART

Vehicle speed	Inhibitor	Reverse selection
Above 12 mph (20 km/h)	ON	Not allowed
Below 9 mph (15 km/h)	OFF	Allowed
Ignition switch LOCK (0)	OFF	Allowed

CIRCUIT TROUBLESHOOTING

1. Check the No. 3 (10 A) fuse in the under-dash fuse/relay box.

   Is the fuse OK?

   YES -Go to step 2.

   NO -Replace the fuse, and recheck.

2. Start the engine, and check the Malfunction Indicator Lamp (MIL).

   Does the MIL come on?

   YES -Troubleshoot the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**), and

recheck.

NO -Go to step 3.

3. Turn the ignition switch to LOCK (0).
4. Shift into reverse.

Can you shift the transmission into reverse?

YES -Go to step 5.

NO -Repair the transmission, and recheck.

5. Raise the vehicle on the lift, make sure it is securely supported, and allow the front wheels to rotate freely.
6. Start the engine. With the vehicle moving slowly (vehicle speed below 9 mph (15 km/h), shift the transmission into reverse, but do not release the clutch pedal.

Can you shift the transmission into reverse?

YES -Go to step 7.

NO -Turn the ignition switch to LOCK (0), then go to step 20.

7. Shift the transmission into 1st gear, and lightly press the throttle until the speedometer reads above 12 mph (20 km/h). Try to the shift the transmission into reverse.

Can you shift the transmission into reverse?

YES -Go to step 8.

NO -Intermittent failure, system is OK at this time.

8. Turn the ignition switch to LOCK (0).
9. Disconnect the reverse lockout solenoid 2P connector (A).

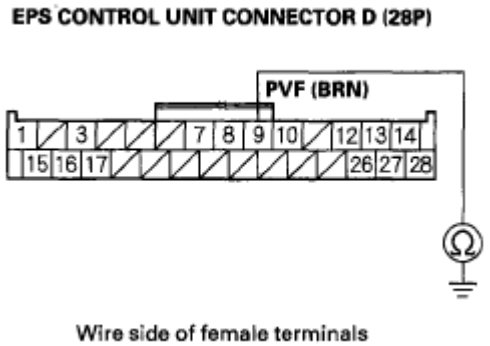

Fig. 9: Identifying Reverse Lockout Solenoid 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Turn the ignition switch to ON (II).
11. Measure the voltage between the reverse lockout solenoid 2P connector terminal No. 2 and body ground.

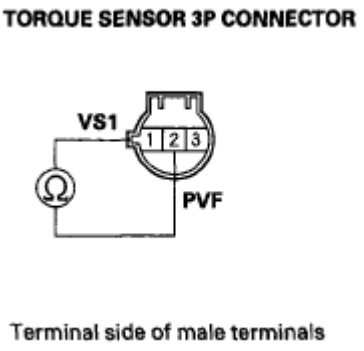

Fig. 10: Measuring Voltage Between Reverse Lockout Solenoid 2P Connector Terminal And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 12.

NO -Check for loose terminals or poor connections at connector. If the connections are OK, repair open or short in the wire between No. 3 (10 A) fuse in the under-dash fuse/relay box and the reverse lockout solenoid.

12. Turn the ignition switch to LOCK (0).
13. Remove the reverse lockout solenoid (see **REVERSE LOCKOUT SOLENOID TEST**).
14. At the reverse lockout solenoid side, connect the reverse lockout solenoid 2P connector terminal No.2 to the battery positive terminal, and connect the terminal No. 1 to the battery negative terminal. Make sure the reverse lockout solenoid works.

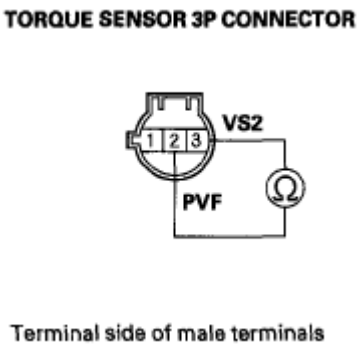

Fig. 11: Connecting Reverse Lockout Solenoid 2P Connector Terminal To Battery Positive Terminal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Does the reverse lockout solenoid work properly?

YES -Go to step 15.

NO -Replace the reverse lockout solenoid (see **REVERSE LOCKOUT SOLENOID TEST**).

15. Reinstall the reverse lockout solenoid, and reconnect the reverse lockout solenoid 2P connector.
16. Jump the SCS line with the HDS.
17. Disconnect ECM connector A (44P).
18. Turn the ignition switch to ON (II).
19. Measure the voltage between ECM connector A27 and body ground.

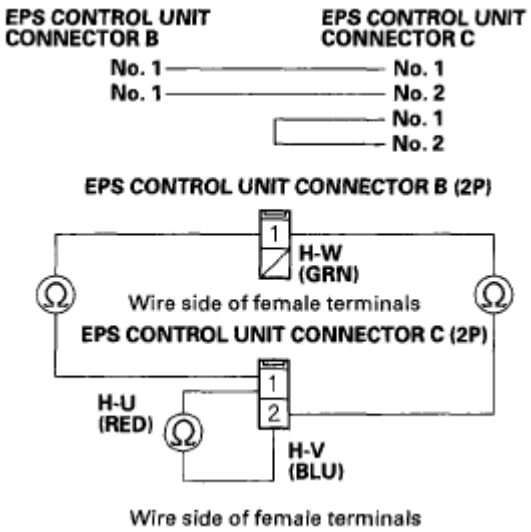

Fig. 12: Measuring Voltage Between ECM Connector Terminals A27 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Check for loose terminals or poor connections at ECM connector A (44P). If necessary, update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the symptom/indication goes away with a known-good ECM, replace the original ECM (see **ECM REPLACEMENT**).

NO -Repair open in the wire between the reverse lockout solenoid and ECM (A27).

20. Jump the SCS line with the HDS.
21. Disconnect ECM connector A (44P).
22. Disconnect the reverse lockout solenoid 2P connector.
23. Check for continuity between the reverse lockout solenoid 2P connector terminal No. 1 and body ground.

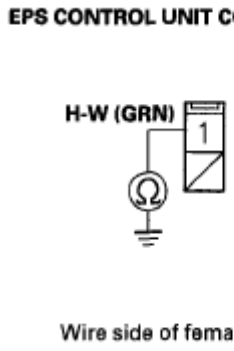

Fig. 13: Checking Continuity Between Reverse Lockout Solenoid 2P Connector Terminal And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair short to body ground in the wire between the reverse lockout solenoid and the ECM (A27).

NO -Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the symptom/indication goes away with a known-good ECM, replace the original ECM (see **ECM REPLACEMENT**).

REVERSE LOCKOUT SOLENOID TEST

1. Remove the reverse lockout solenoid (see **REVERSE LOCKOUT SOLENOID TEST**).
2. Connect battery positive terminal to the reverse lockout solenoid 2P connector No. 2 terminal, and connect the battery negative terminal to the No. 1 terminal.

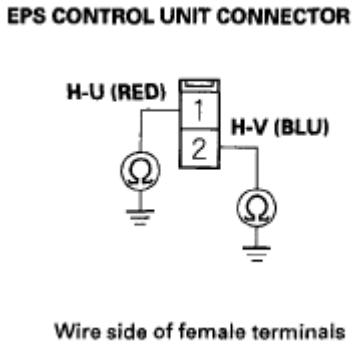

Fig. 14: Connecting Reverse Lockout Solenoid 2P Connector Terminal To Battery Positive Terminal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Make sure the reverse lockout solenoid works. If the reverse lockout solenoid does not work, replace it.

REVERSE LOCKOUT SOLENOID DISASSEMBLY/REASSEMBLY

1. Make sure you have the anti-theft code for the audio system or the navigation system (if equipped), then write down the audio presets.
2. Disconnect the negative cable from the battery, then disconnect the positive cable.
3. Remove the battery.
4. Remove the air cleaner assembly (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**).
5. Remove the battery base (see step 6).
6. Disconnect the output shaft (countershaft) speed sensor connector, back-up light switch connector, and reverse lockout solenoid connector (see step 8).
7. Carefully remove the shift cables, and cable bracket together to avoid bending the shift cables (see step 9).
8. Remove the three bolts (A) and reverse lockout solenoid (B).

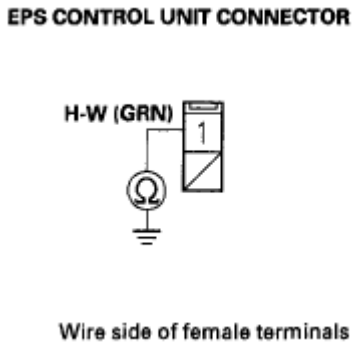

Fig. 15: Identifying Reverse Lockout Solenoid And Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Remove the roller (A), the select lock return spring (C), and select lock cam B.

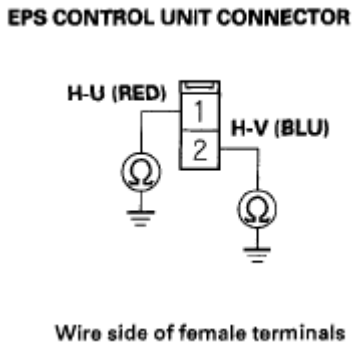

Fig. 16: Identifying Roller And Select Lock Return Spring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Install the components in the reverse order of removal.
11. Clean any the dirt and oil from the sealing surface.
12. Apply liquid gasket, P/N 08718-0001 evenly to the transmission housing mating surface of the reverse lockout solenoid. Install the component within 5 minutes of applying the liquid gasket.

NOTE:

- **If apply liquid gasket P/N 08718-0012, the component must be**

installed within 4 minutes.

- **If too much time has passed after applying the liquid gasket, remove the old liquid gasket and residue, then reapply new liquid gasket.**

13. Install the reverse lockout solenoid.

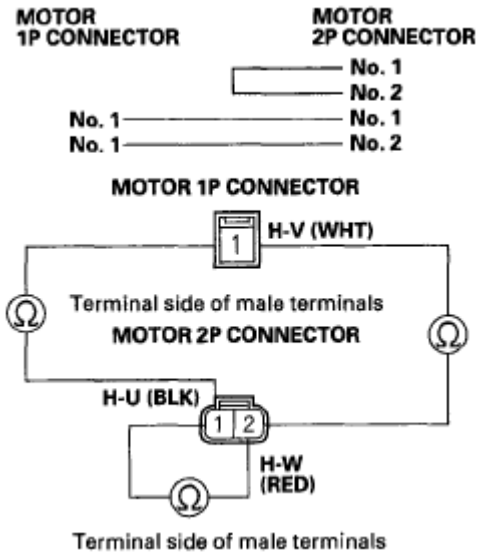

Fig. 17: Identifying Reverse Lockout Solenoid And Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Install the cable bracket and shift cables (see step 37).
15. Connect the reverse lockout solenoid connector, back-up light switch connector, and output shaft (countershaft) speed sensor connector (see step 39).
16. Install the battery base (see step 41).
17. Install the air cleaner assembly (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**).
18. Install the battery. Clean the battery posts and cable terminals. Connect the positive cable to the battery, then connect the negative cable, and apply multipurpose grease to prevent corrosion.
19. Enter the anti-theft code for the audio system or the navigation system (if equipped), then enter the audio presets. Set the clock (on vehicles without navigation).
20. Do the power window control unit reset procedure (see **RESETTING THE POWER WINDOW CONTROL UNIT**).

SYMPTOM TROUBLESHOOTING INDEX

SYMPTOM TROUBLESHOOTING INDEX

Symptom	Probable cause(s)	Diagnostic procedure
	1. 1st synchro ring defective.	• Check the 1st synchro ring (see **SYNCHRO RING AND GEAR INSPECTION**).

Hard to shift into 1st gear	2. 1st/2nd synchro sleeve and hub defective. 3. 1st gear defective. 4. Change lever assembly defective.	• Check the 1st/2nd synchro sleeve and hub (see **SYNCHRO SLEEVE AND HUB INSPECTION AND REASSEMBLY**). • Check 1st gear (see **SYNCHRO RING AND GEAR INSPECTION**). • Check the change lever assembly (see **CHANGE LEVER ASSEMBLY DISASSEMBLY/REASSEMBLY**).
Hard to shift into 2nd gear	1. 2nd synchro ring defective. 2. 1st/2nd synchro sleeve and hub defective. 3. 2nd gear defective. 4. Change lever assembly defective.	• Check the 2nd synchro ring (see **SYNCHRO RING AND GEAR INSPECTION**). • Check the 1st/2nd synchro sleeve and hub (see **SYNCHRO SLEEVE AND HUB INSPECTION AND REASSEMBLY**). • Check 2nd gear (see **SYNCHRO RING AND GEAR INSPECTION**). • Check the change lever assembly (see **CHANGE LEVER ASSEMBLY DISASSEMBLY/REASSEMBLY**).
Hard to shift into 3rd gear	1. 3rd synchro ring defective. 2. 3rd/4th synchro sleeve and hub defective. 3. 3rd gear defective. 4. Change lever assembly defective.	• Check the 3rd synchro ring (see **SYNCHRO RING AND GEAR INSPECTION**). • Check the 3rd/4th synchro sleeve and hub (see **SYNCHRO SLEEVE AND HUB INSPECTION AND REASSEMBLY**). • Check 3rd gear (see **SYNCHRO RING AND GEAR INSPECTION**). • Check the change lever assembly (see **CHANGE LEVER ASSEMBLY DISASSEMBLY/REASSEMBLY**).
Hard to shift into 4th gear	1. 4th synchro ring defective. 2. 3rd/4th synchro sleeve and hub defective. 3. 4th gear defective. 4. Change lever assembly defective.	• Check the 4th synchro ring (see **SYNCHRO RING AND GEAR INSPECTION**). • Check the 3rd/4th synchro sleeve and hub (see **SYNCHRO SLEEVE AND HUB INSPECTION AND REASSEMBLY**). • Check 4th gear (see **SYNCHRO RING AND GEAR INSPECTION**). • Check the change lever assembly (see **CHANGE LEVER ASSEMBLY DISASSEMBLY/REASSEMBLY**).
Hard to shift into 5th gear	1. 5th synchro ring defective. 2. 5th/6th synchro sleeve defective. 3. 5th gear defective. 4. Change lever	• Check the 5th synchro ring (see **SYNCHRO RING AND GEAR INSPECTION**). • Check the 5th/6th synchro sleeve and hub (see **SYNCHRO SLEEVE AND HUB INSPECTION AND REASSEMBLY**). • Check 5th gear (see **SYNCHRO RING AND GEAR INSPECTION**).

	assembly defective.	• Check the change lever assembly (see **CHANGE LEVER ASSEMBLY DISASSEMBLY/REASSEMBLY**).
Hard to shift into 6th gear	1. 6th synchro ring defective. 2. 5th/6th synchro sleeve defective. 3. 6th gear defective. 4. Change lever assembly defective.	• Check the 6th synchro ring (see **SYNCHRO RING AND GEAR INSPECTION**). • Check the 5th/6th synchro sleeve and hub (see **SYNCHRO SLEEVE AND HUB INSPECTION AND REASSEMBLY**). • Check 6th gear (see **SYNCHRO RING AND GEAR INSPECTION**). • Check the change lever assembly (see **CHANGE LEVER ASSEMBLY DISASSEMBLY/REASSEMBLY**).
Hard to shift into reverse	1. Reverse shift fork defective. 2. Reverse idler gear defective. 3. Reverse gear defective. 4. Change lever assembly defective. 5. Reverse lockout system defective.	• Check the reverse shift fork (see **REVERSE SHIFT FORK CLEARANCE INSPECTION**). • Check the reverse idler gear (see **REVERSE SHIFT FORK CLEARANCE INSPECTION**). • Check reverse gear. • Check the change lever assembly (see **CHANGE LEVER ASSEMBLY DISASSEMBLY/REASSEMBLY**). • Check the reverse lockout system (see **CIRCUIT TROUBLESHOOTING**).
Noise from the transmission	1. Low transmission fluid level. 2. Worn or damaged transmission gears. 3. Worn or damaged transmission bearings.	• Check the transmission fluid level (see **TRANSMISSION FLUID INSPECTION AND REPLACEMENT**). • Check the transmission gears. • Check the transmission bearings.
Shift lever does not operate smoothly	1. Shift cable defective. 2. Joint in shift cable and transmission or body.	• Check the shift cables. • Check the joint in the shift cables (see **GEARSHIFT MECHANISM REPLACEMENT**).
Transmission jumps out of gear	1. Detent ball springs defective. 2. Worn synchro teeth.	• Check the detent ball springs. • Check the synchro teeth.

TRANSMISSION FLUID INSPECTION AND REPLACEMENT

1. Raise the vehicle on a lift.
2. Remove the filler plug (A) and sealing washer (B), check the condition of the fluid, and make sure it is at the proper level (C).

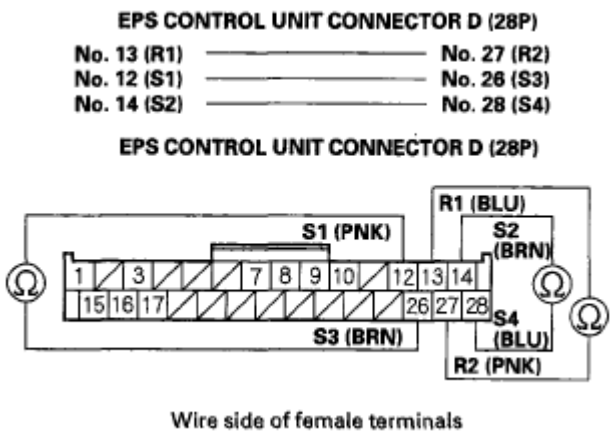

Fig. 18: Identifying Filler Plug And Sealing Washer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. If the fluid is dirty, remove the drain plug (A), and sealing washer (B) drain it.

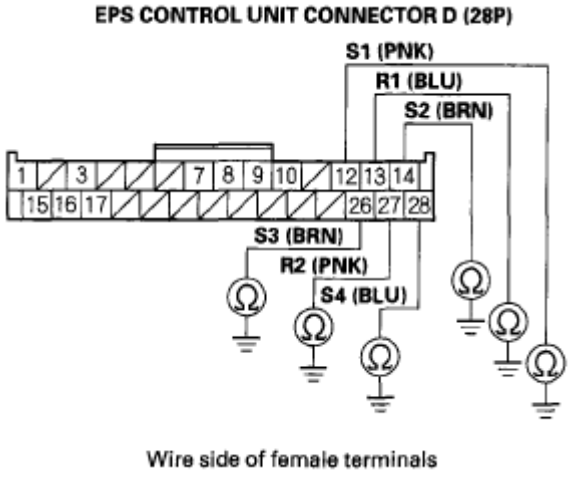

Fig. 19: Identifying Drain Plug And Sealing Washer w/Torque Spec.
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the drain plug with a new sealing washer, and refill the transmission fluid to the proper level.

Fluid Capacity

1.5 L (1.6 US qt) at fluid change

1.7 L (1.8 US qt) at overhaul

Always use Honda Manual Transmission Fluid (MTF). Using engine oil can cause stiffer shifting because it does not contain the proper additives.

5. Install the filler plug (C) with a new sealing washer (D).
6. If the maintenance minder required to replace the fluid, reset the maintenance minder (see **MAINTENANCE MINDER**).

   If it did not reset, select BODY ELECTRICAL, GAUGES, ADJUSTMENT, MAINTENANCE MINDER, RESET, MAINTENANCE SUB ITEM 3 with the HDS.

BACK-UP LIGHT SWITCH TEST

1. Disconnect the back-up light switch connector (A).

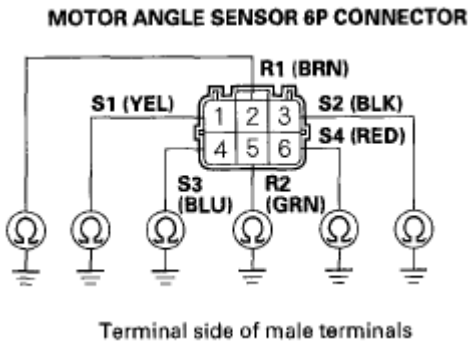

Fig. 20: Identifying Back-Up Light Switch Connector w/Torque Spec.
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Check for continuity between the back-up light switch 2P connector terminals No. 1 and No. 2. There should be continuity when the change lever is only in reverse.
3. If necessary, replace the back-up light switch. Apply liquid gasket (P/N 08718-0001) evenly to the threads of the transmission housing. Install the switch within 5 minutes of applying the liquid gasket. Tighten the back-up light switch to the specified torque.

NOTE:

- **If you apply liquid gasket P/N 08718-0012, the component must be installed within 4 minutes.**
- **If too much time has passed after applying the liquid gasket, remove the old liquid gasket and residue, then reapply new liquid gasket.**

TRANSMISSION REMOVAL

Special Tools Required

- Engine hanger/adapter VSB02C000015
- Engine support hanger, A & Reds AAR-T-12566
- Front subframe adapter VSB02C000016
- 2006 Civic engine hanger VSB02C000025

These special tools are available through the Honda Tool and Equipment Program 1-888-424-6857.

NOTE: Use fender covers to avoid damaging painted surfaces.

1. Make sure you have the anti-theft code for the audio system or the navigation system (if equipped), then write down the audio presets.
2. Remove the cowl cover and under-cowl panel (see **COWL COVER REPLACEMENT**).
3. Disconnect the negative cable from the battery, then disconnect the positive cable.
4. Remove the battery.
5. Remove the air cleaner assembly (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**).
6. Remove the harness clips (A) and the intake air duct (B), then remove the battery base (C) with the coolant reservoir (D).

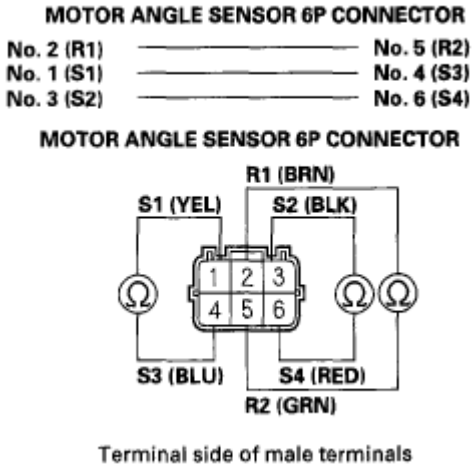

Fig. 21: Identifying Intake Air Duct And Clips
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Remove the clutch line bracket (A), then carefully remove the slave cylinder (B) to avoid bending the clutch line.

NOTE: Do not press the clutch pedal after the slave cylinder has been removed.

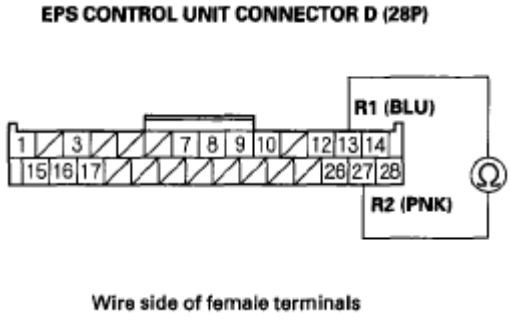

Fig. 22: Identifying Clutch Line Bracket And Slave Cylinder

13. Attach the engine hanger (A) to the threaded holes in the cylinder head.

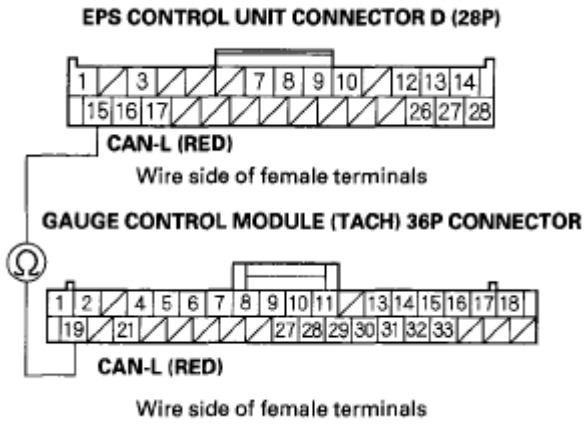

Fig. 29: Identifying Engine Hanger
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Install the front leg assembly (A), hook (B), and wingnut (C) from an A and Reds engine support hanger (AAR-T-12566) onto the 2006 Civic engine hanger. Carefully position the engine hanger on the vehicle, and attach the hook to the forward hole in the engine hanger/adapter (D). Tighten the wingnut by hand to lift and support the engine/transmission assembly.

NOTE: Use care when working around the windshield.

30. Attach the front subframe adapter to the front subframe by wrapping the band over the front subframe and attaching the end of the band to the front subframe adapter with the pin (A).

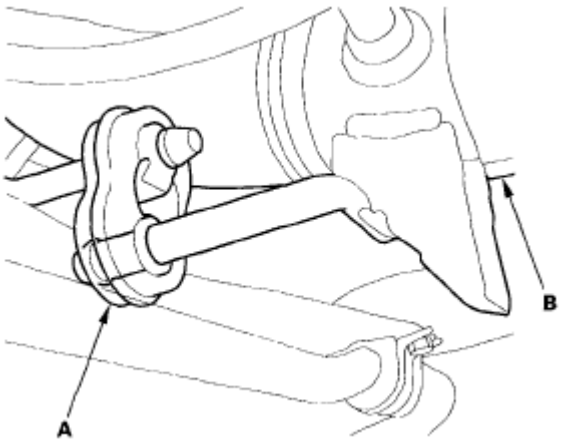

Fig. 43: Identifying Front Subframe Adapter With Pin
Courtesy of AMERICAN HONDA MOTOR CO., INC.

31. Raise the jack, and line up the slots in the arms with the bolt holes on the corner of the jack base (B), then attach them securely.
32. Remove the front subframe mounting bolts (A) and front subframe (B).

NOTE: Suspend the steering gearbox with an appropriate size wire.

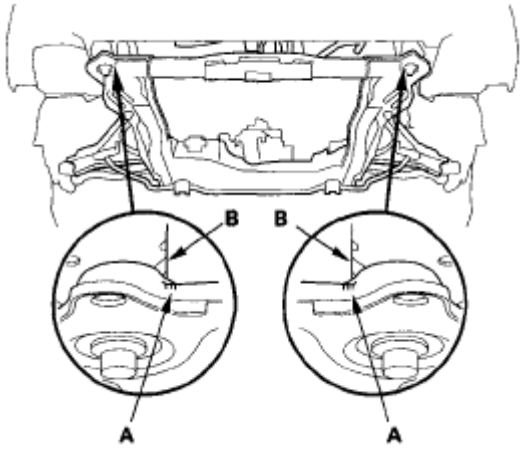

Fig. 44: Identifying Front Subframe Mounting Bolts

36. Support the transmission with the transmission jack.
37. Remove the transmission mounting bolts.

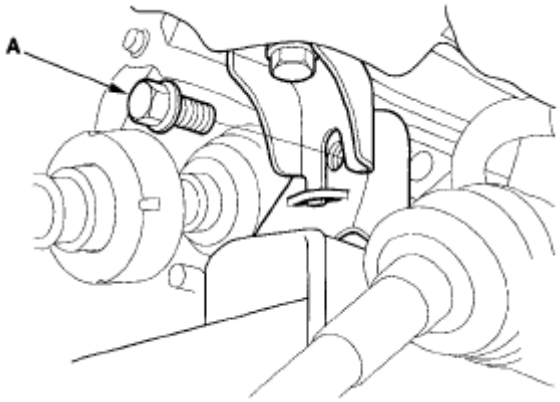

Fig. 46: Identifying Transmission Mounting Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

38. Pull the transmission away from the engine until the transmission mainshaft clears the clutch pressure plate.
39. Slowly lower the transmission about 150 mm (6 in). Check once again that all hoses and electrical wiring are disconnected and free from the transmission, then lower it all the way.
40. Remove the release fork boot (A) from the clutch housing (B).

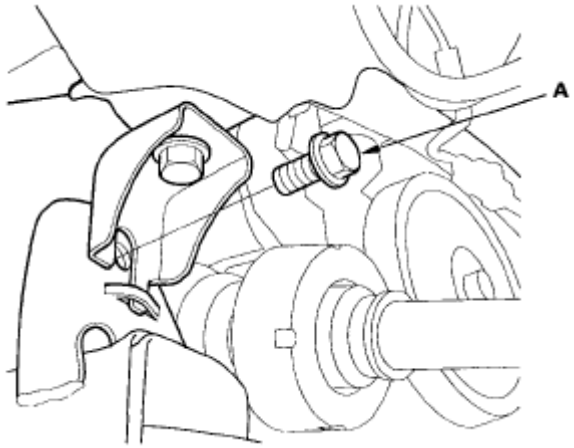

Fig. 47: Identifying Release Fork Boot From Clutch Housing

42. Install the harness clips (C) and the intake air duct (D).
43. Install the air cleaner assembly (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**).
44. Install the battery. Clean the battery posts and cable terminals. Connect the positive cable to the battery, then connect the negative cable, and apply multipurpose grease to prevent corrosion.
45. Install the under-cowl panel and cowl cover (see **COWL COVER REPLACEMENT**).
46. Check the change lever and the clutch operation.
47. Check the front wheel alignment (see **WHEEL ALIGNMENT**).
48. Test-drive the vehicle.
49. Enter the anti-theft code for the audio system or the navigation system (if equipped), then enter the audio presets. Set the clock (on vehicles without navigation).
50. Do the power window control unit reset procedure (see **RESETTING THE POWER WINDOW CONTROL UNIT**).

REVERSE SHIFT FORK CLEARANCE INSPECTION

1. Measure the clearance between the reverse idler gear (A) and the reverse shift fork (B) with a feeler gauge (C). If the clearance is more than the service limit, go to step 2.

   Standard: 0.20-0.59 mm (0.007-0.024 in.) Service Limit: 1.3 mm (0.051 in.)

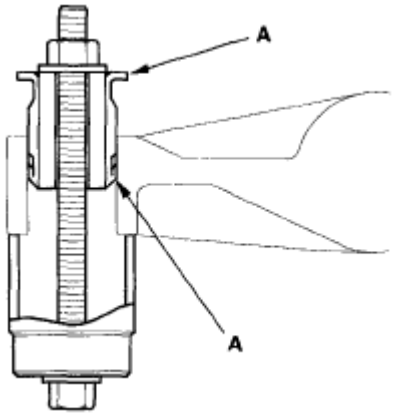

Fig. 90: Identifying Reverse Idler Gear, Reverse Shift Fork And Feeler Gauge
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Measure the width of the reverse shift fork.
   - If the width is not within the standard, replace the reverse shift fork.
   - If the width is within the standard, replace reverse idler gear.

   Standard: 13.4-13.7 mm (0.527-0.539 in.)

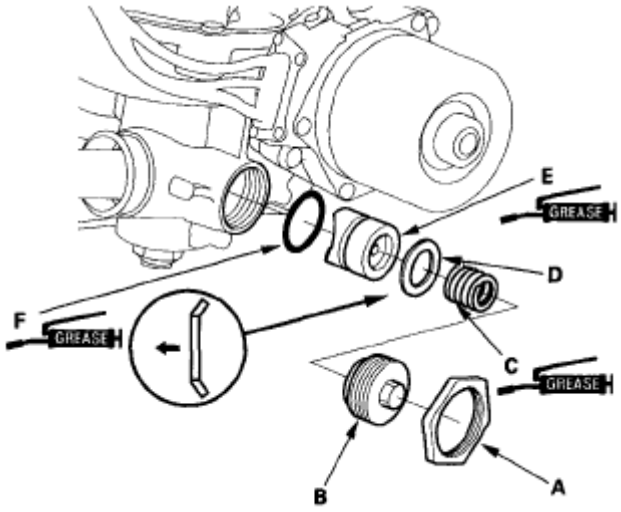

Fig. 91: Identifying Width Of Reverse Shift Fork
Courtesy of AMERICAN HONDA MOTOR CO., INC.

CHANGE LEVER CLEARANCE INSPECTION

1. Measure the clearance between the change lever (A) and the select lever (B) with a feeler gauge (C). If the clearance is more than the service limit, go to step 2.

   Standard: 0.05-0.25 mm (0.002-0.010 in.) Service Limit: 0.50 mm (0.020 in.)

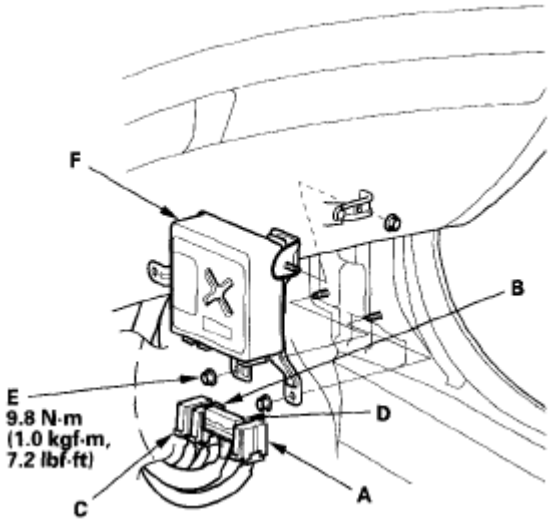

Fig. 92: Identifying Lever, Select Lever And Feeler Gauge
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Measure the groove of the change lever.
   - If the groove is not within the standard, replace the shift lever.
   - If the groove is within the standard, replace the select lever.

   Standard: 15.00-15.10 mm (0.591-0.594 in.)

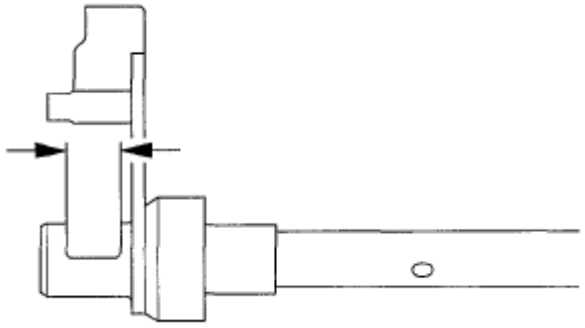

Fig. 93: Identifying Groove Of Change Lever

CHANGE LEVER ASSEMBLY DISASSEMBLY/REASSEMBLY

NOTE:

- **If 5 minutes have passed after applying liquid gasket, reapply it, and assemble the shift arm cover.**
- **Prior to reassembling, clean all parts in solvent, dry them, and apply grease to the contact surfaces as shown.**

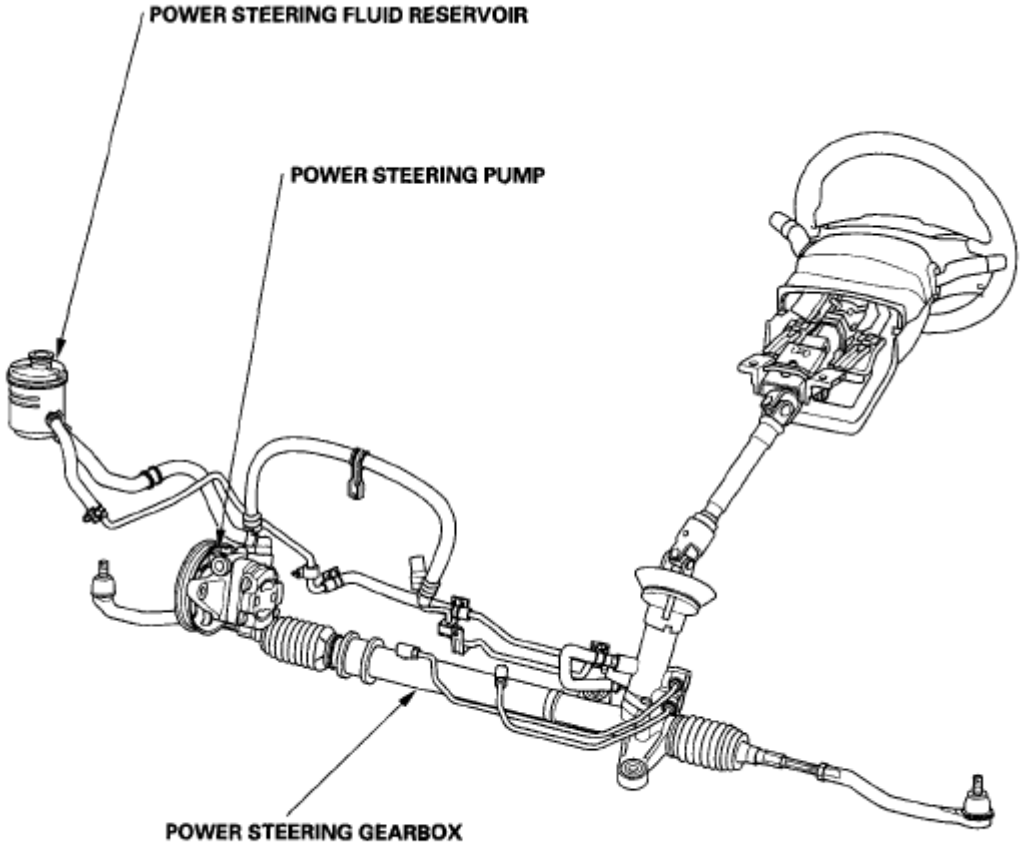

Fig. 94: Exploded View Of Change Lever Assembly & Torque Specs.

SHIFT FORK CLEARANCE INSPECTION

NOTE: The synchro sleeve and synchro hub should be replaced as a set.

1. Measure the clearance between each shift fork (A) and its matching synchro sleeve (B). If the clearance exceeds the service limit, go to step 2.

   Standard: 0.35-0.65 mm (0.014-0.026 in.) Service Limit: 1.0 mm (0.039 in.)

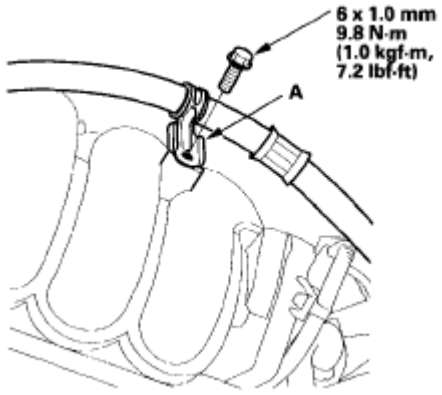

Fig. 95: Identifying Shift Fork And Synchro Sleeve
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Measure the thickness of the shift fork fingers.
   - If the thickness is not within the standard, replace the shift fork.
   - If the thickness is within the standard, replace the synchro sleeve and synchro hub as a set.
   - If one arm of the shift fork shows more wear than others, the fork may be bent and needs to be replaced.

   Standard: 7.4-7.6 mm (0.29-0.30 in.)

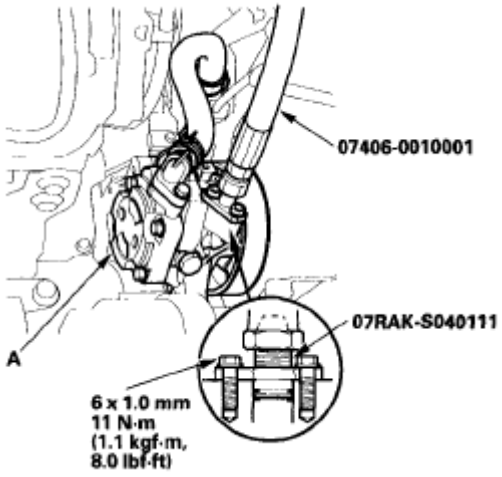

Fig. 96: Identifying Thickness Of Shift Fork Fingers
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Measure the clearance between the shift fork (A) and the shift arm (B). If the clearance exceeds the service limit, go to step 4.

   Standard: 0.2-0.5 mm (0.007-0.020 in.) Service Limit: 0.62 mm (0.024 in.)

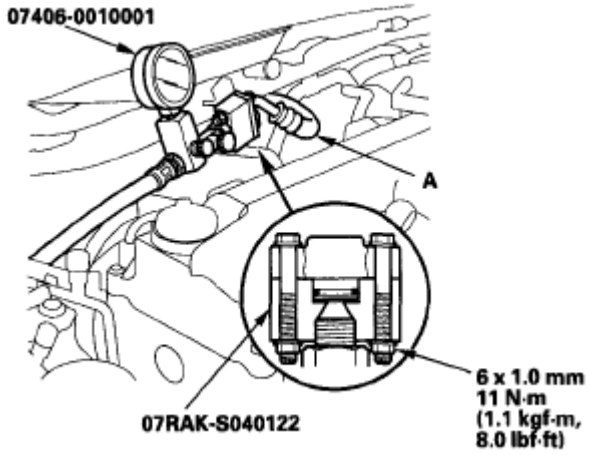

Fig. 97: Identifying Shift Fork And Shift Arm
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Measure the width of the shift arm.
   - If the width is not within the standard, replace the shift arm.
   - If the width is within the standard, replace the shift fork or reverse shift piece.

   Standard: 16.9-17.0 mm (0.665-0.669 in.)

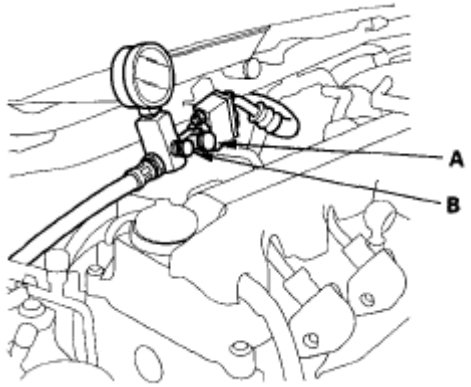

Fig. 98: Identifying Width Of Shift Arm

MAINSHAFT ASSEMBLY CLEARANCE INSPECTION

NOTE: If replacement is required, always replace the synchro sleeve and synchro hub as a set.

1. Support the bearing inner race with an appropriate sized socket (A), and push down on the mainshaft (B).

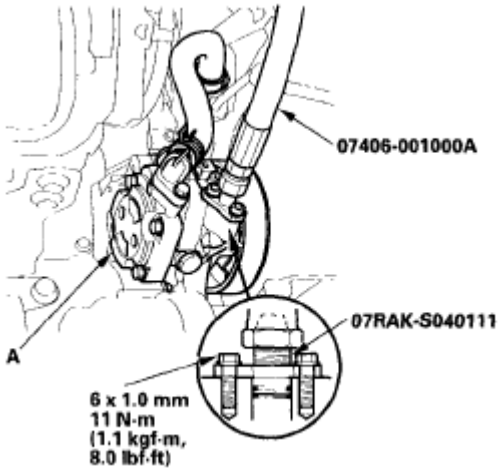

Fig. 100: Identifying Socket And Mainshaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Measure the clearance between 2nd gear (C) and 3rd gear (D) with a feeler gauge (E).
   - If the clearance is more than the service limit, go to step 3.
   - If the clearance is within the service limit, go to step 4.

   Standard: 0.06-0.16 mm (0.002-0.006 in.) Service Limit: 0.25 mm (0.010 in.)

3. Measure the thickness of 3rd gear.
   - If the thickness is less than the service limit, replace 3rd gear.
   - If the thickness is within the service limit, replace the 3rd/4th synchro hub and 3rd/4th synchro

sleeve as a set.

Standard: 23.92-23.97 mm (0.941-0.944 in.) Service Limit: 23.80 mm (0.937 in.)

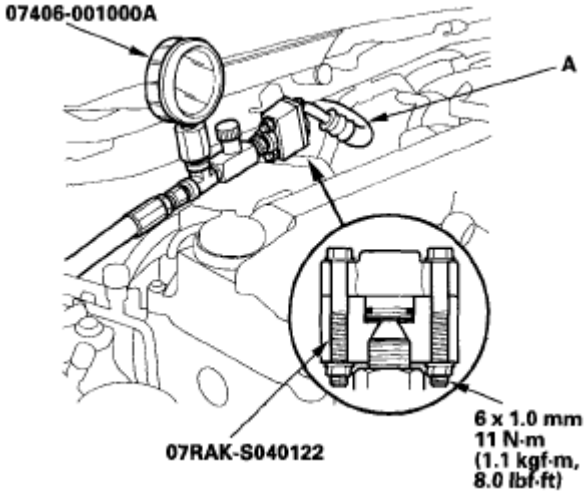

Fig. 101: Identifying Thickness Of 3rd Gear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Measure the clearance between 4th gear (A) and the distance collar (B) with a dial indicator (C).
   - If the clearance is more than the service limit, go to step 5.
   - If the clearance is within the service limit, go to step 7.

Standard: 0.06-0.16 mm (0.002-0.006 in.) Service Limit: 0.25 mm (0.010 in.)

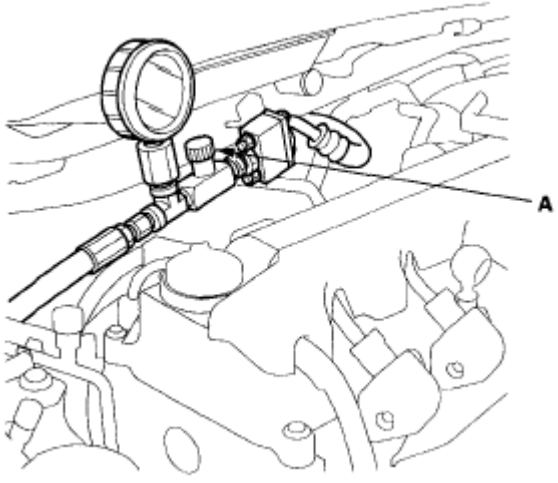

Fig. 102: Identifying 4th Gear, Distance Collar And Dial Indicator

5. Measure the length (1) of the distance collar as shown.
   - If the length (1) is not within the standard, replace the distance collar.
   - If the length (1) is within the standard, go to step 6.

Standard: 24.03-24.08 mm (0.946-0.948 in.)

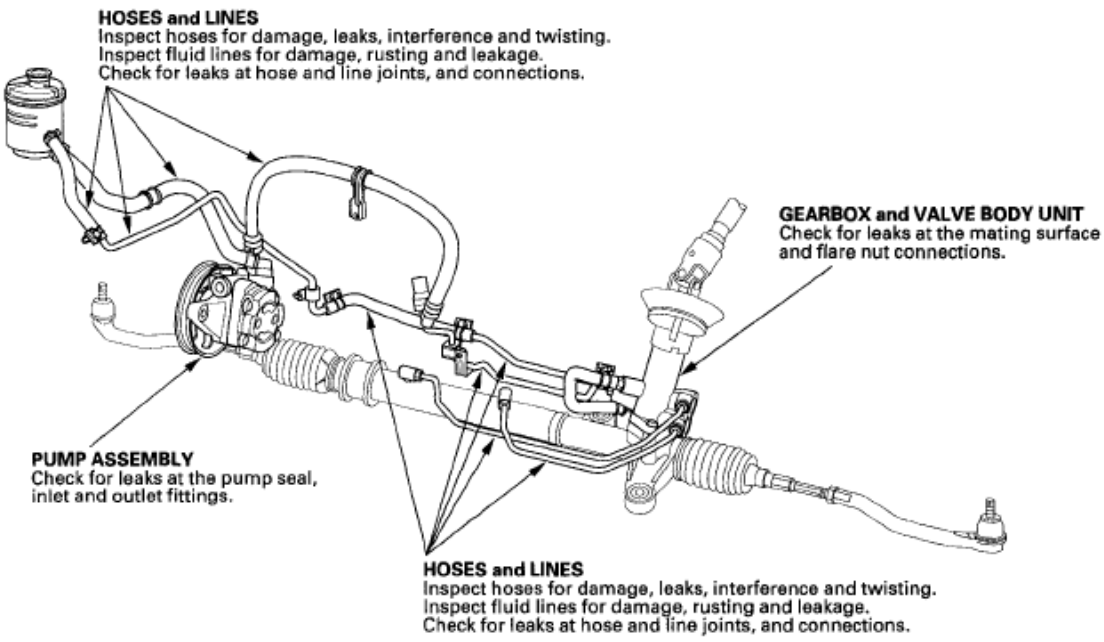

Fig. 103: Identifying Length Of Distance Collar
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Measure the thickness of 4th gear.
   - If the thickness is less than the service limit, replace 4th gear.
   - If the thickness is within the service limit, replace the 3rd/4th synchro hub and 3rd/4th synchro sleeve as a set.

Standard: 23.92-23.97 mm (0.941-0.944 in.) Service Limit: 23.80 mm (0.937 in.)

System capacity:
0.8 L (0.85 US. qt) at disassembly
Reservoir capacity:
0.26 L (0.27 US. qt)

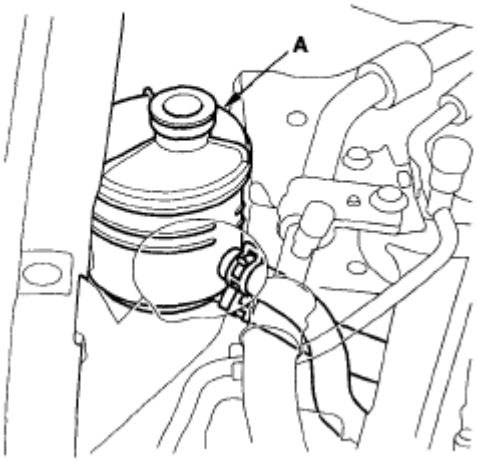

Fig. 104: Identifying Thickness Of 4th Gear

7. Measure the clearance between the distance collar (A) and 5th gear (B) with a dial indicator (C).
   - If the clearance is more than the service limit, go to step 8.
   - If the clearance is within the service limit, go to step 10.

   Standard: 0.06-0.16 mm (0.002-0.006 in.) Service Limit: 0.25 mm (0.010 in.)

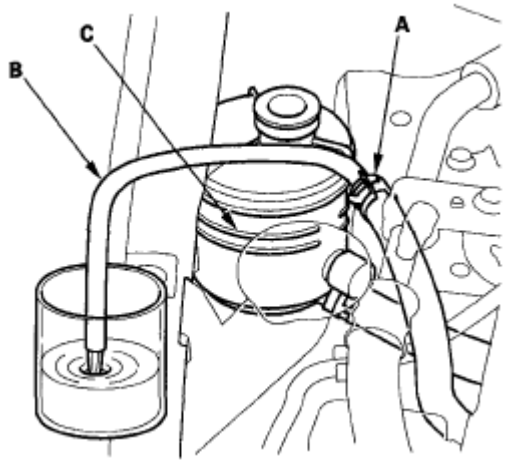

Fig. 105: Identifying Distance Collar, 5th Gear And Dial Indicator

8. Measure the length (2) of the distance collar as shown.
   - If the length (2) is not within the standard, replace the distance collar.
   - If the length (2) is within the standard, go to step 9.

   Standard: 24.03-24.08 mm (0.946-0.948 in.)

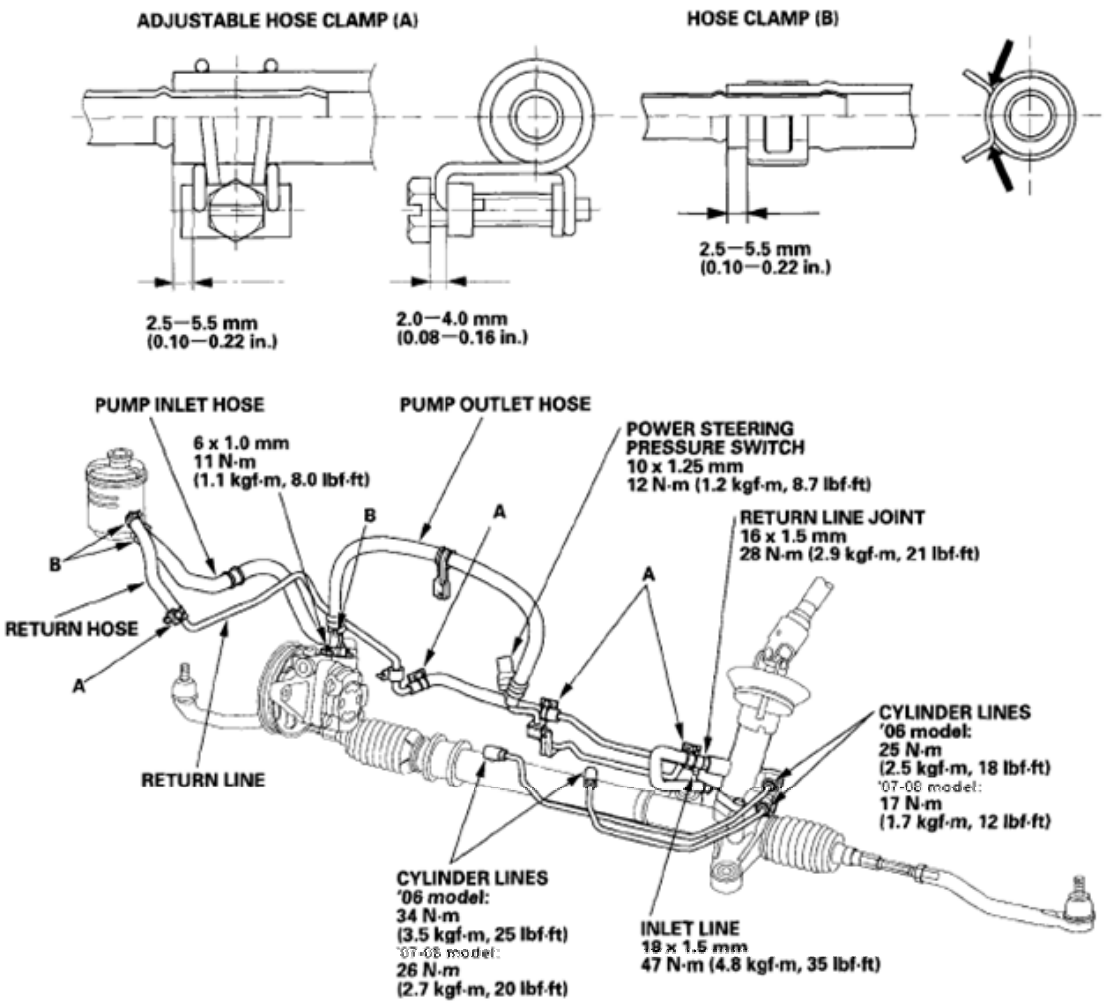

Fig. 106: Identifying Length Of Distance Collar
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Measure the thickness of 5th gear.
    - If the thickness is less than the service limit, replace 5th gear.
    - If the thickness, is within the service limit, replace the 5th/6th synchro hub and 5th/6th synchro sleeve as a set.

Standard: 23.92-23.97 mm (0.941-0.944 in.) Service Limit: 23.80 mm (0.937 in.)

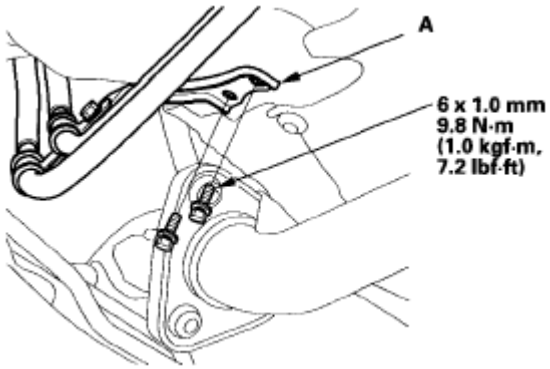

Fig. 107: Identifying Thickness Of 5th Gear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Measure the clearance between 6th gear (A) and the angular ball bearing (B) with a feeler gauge (C). If the clearance is more than the service limit, go to step 11.

Standard: 0.06-0.16 mm (0.002-0.006 in.) Service Limit: 0.25 mm (0.010 in.)

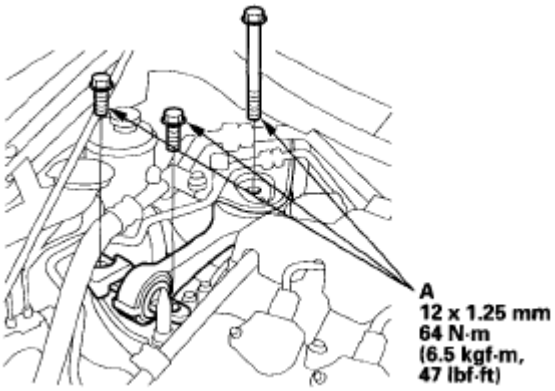

Fig. 108: Identifying 6th Gear, Angular Ball Bearing And Feeler Gauge

11. Measure the length of the 6th gear distance collar.
    - If the length is not within the standard, replace the 6th gear distance collar.
    - If the length is within the standard, go to step 12.

Standard: 24.03-24.08 mm (0.946-0.948 in.)

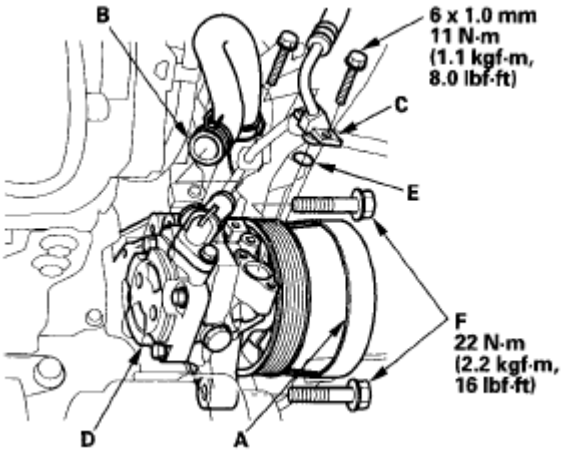

Fig. 109: Identifying Length Of 6th Gear Distance Collar
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Measure the thickness of 6th gear.
    - If the thickness is less than the service limit, replace 6th gear.
    - If the thickness is within the service limit, replace the 5th/6th synchro hub and 5th/6th synchro sleeve as a set.

Standard: 23.92-23.97 mm (0.941-0.944 in.) Service Limit: 23.80 mm (0.937 in.)

MAINSHAFT DISASSEMBLY

1. Remove the angular ball bearing (A) using a commercially available bearing separator (B) and bearing puller (C).

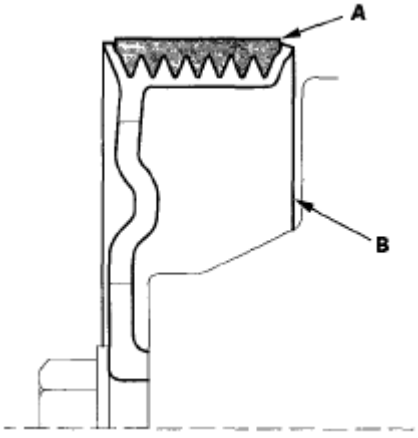

Fig. 111: Identifying Angular Ball Bearing, Bearing Separator And Bearing Puller
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Support 5th gear (A) on steel blocks, and press the mainshaft out of the 5th/6th synchro hub (B).

NOTE: Do not use a jaw-type puller; it can damage the gear teeth.

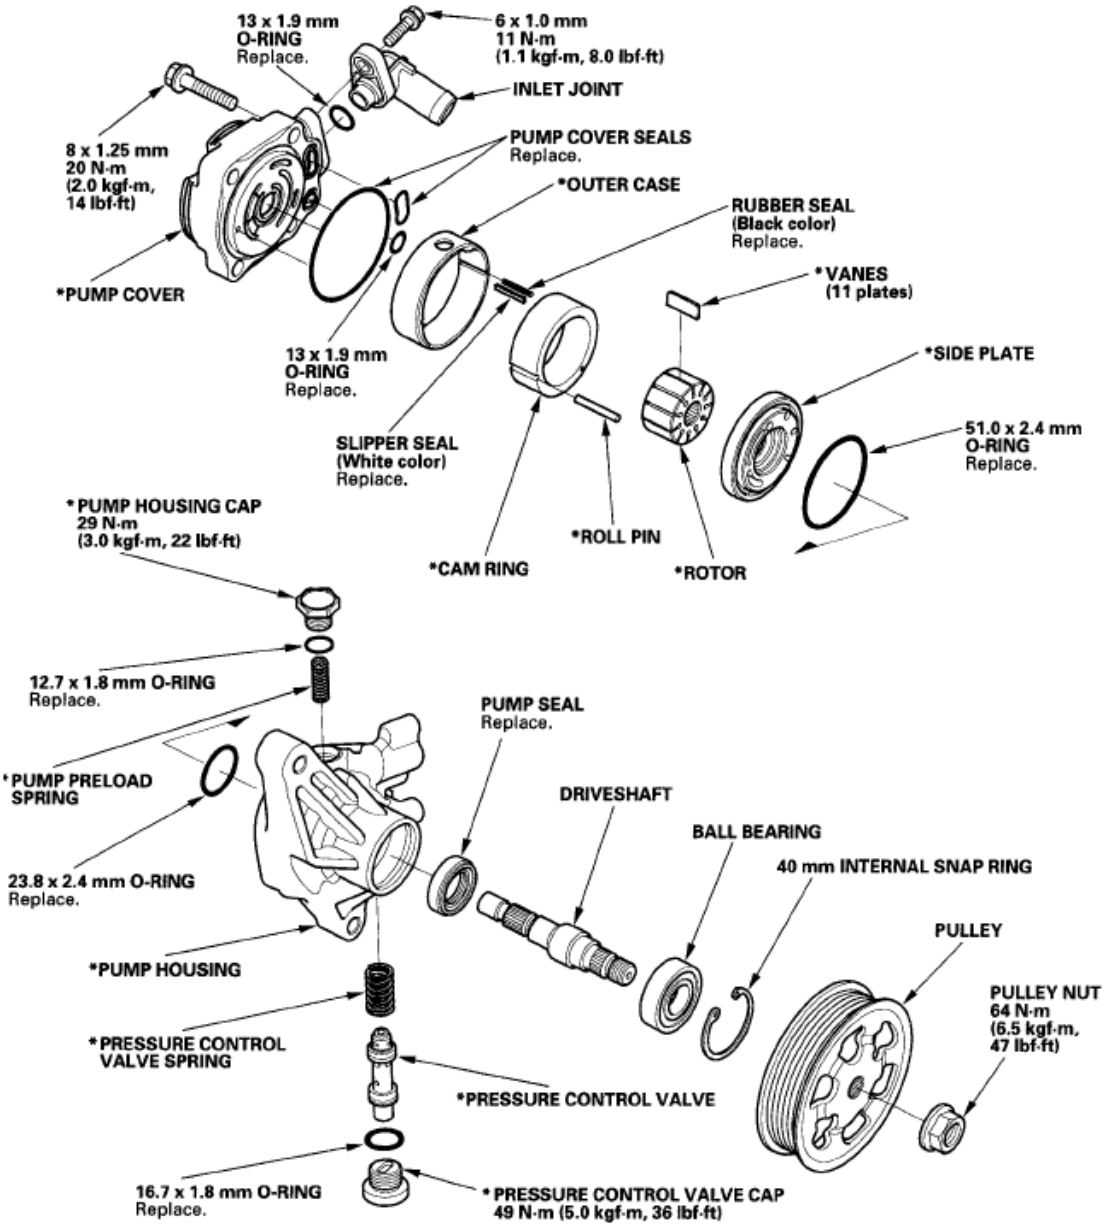

Fig. 112: Identifying 5th Gear And 5th/6th Synchro Hub

MAINSHAFT INSPECTION

1. Inspect the gear and bearing contact areas for wear and damage, then measure the mainshaft at points A, B, C, D, and E. If any part of the mainshaft is less than the service limit, replace it.

   Standard:

   A Ball Bearing Contact Area (Transmission Housing Side): 27.987-28.000 mm (1.1019-1.1024 in.)

   B Distance Collar Contact Area: 31.984-32.000 mm (1.2594-1.2598 in.)

   C Needle Bearing Contact Area: 38.984-39.000 mm (1.5348-1.5354 in.)

   D Ball Bearing Contact Area (Clutch Housing Side): 27.977-27.990 mm (1.1015-1.1020 in.)

   E Bushing Contact Area: 20.80-20.85 mm (0.819-0.821 in.)

   Service Limit:

   A: 27.93 mm (1.100 in.)

   B: 31.93 mm (1.257 in.)

   C: 38.93 mm (1.533 in.)

   D: 27.92 mm (1.099 in.)

   E: 20.75 mm (0.817 in.)

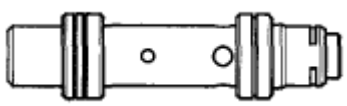

Fig. 114: Inspecting Gear And Bearing Contact Areas

Special Tools Required

- Driver, 40 mm I.D. 07746-0030100
- Attachment, 30 mm I.D. 07746-0030300

NOTE: Refer to the EXPLODED VIEW, as needed, during this procedure.

1. Clean all the parts in solvent, dry them, and apply manual transmission fluid (MTF) to all contact surfaces except the 3rd/4th and 5th/6th synchro hubs.
2. Install the needle bearing and 3rd gear on the mainshaft.
3. Install the double cone synchro assembly (A) by aligning the synchro cone fingers (B) with the holes in 3rd gear (C), then install the synchro spring (D).

COUNTERSHAFT ASSEMBLY CLEARANCE INSPECTION

1. Measure the clearance between 1st gear (A) and the distance collar (B) with a feeler gauge (C).
   - If the clearance is more than the service limit, go to step 2.
   - If the clearance is within the service limit, go to step 4.

   Standard: 0.06-0.16 mm (0.002-0.006 in.)

   Service Limit: 0.25 mm (0.010 in.)

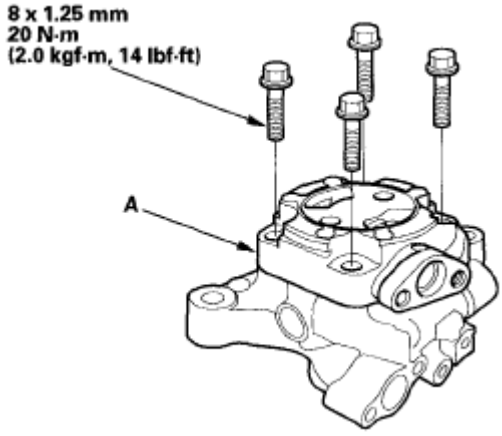

Fig. 127: Identifying 1st Gear, Distance Collar And Feeler Gauge
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Measure the length of the distance collar as shown.
   - If the length is not within the standard, replace the distance collar.
   - If the length is within the standard, go to step 3.

   Standard: 23.03-23.08 mm (0.907-0.909 in.)

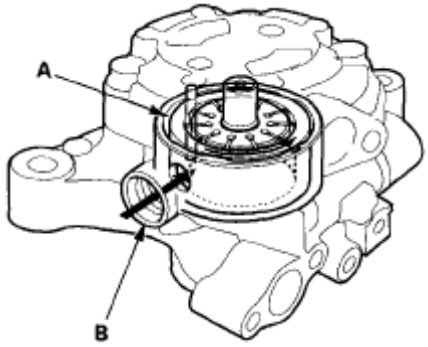

Fig. 128: Identifying Length Of Distance Collar
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Measure the thickness of 1st gear.
   - If the thickness is less than the service limit, replace 1st gear.
   - If the thickness is within the service limit, replace the 1st/2nd synchro hub and reverse gear as a set.

   Standard: 22.92-22.97 mm (0.902-0.904 in.)

   Service Limit: 22.87 mm (0.900 in.)

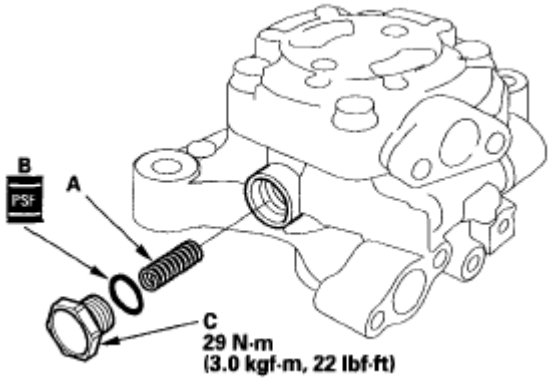

Fig. 129: Identifying Thickness Of 1st Gear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Measure the clearance between 2nd gear (A) and 3rd gear (B) with a feeler gauge (C). If the clearance is more than the service limit, go to step 5.

   Standard: 0.06-0.16 mm (0.002-0.006 in.)

   Service Limit: 0.25 mm (0.010 in.)

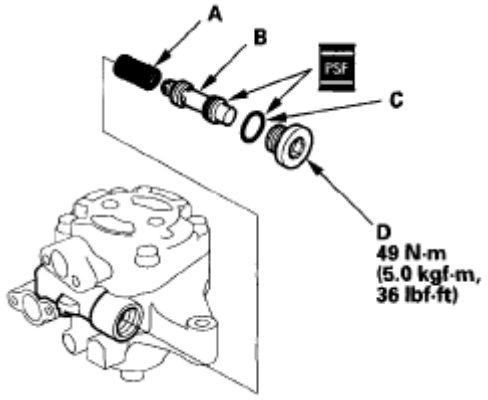

Fig. 130: Identifying 1st Gear, Distance Collar And Feeler Gauge

5. Measure the length of the distance collar.
   - If the length is not within the standard, replace the distance collar.
   - If the length is within the standard, go to step 6.

   Standard: 28.03-28.08 mm (1.104-1.106 in.)

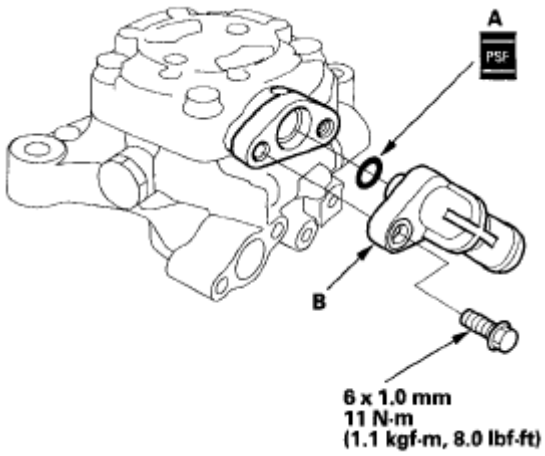

Fig. 131: Identifying Length Of Distance Collar
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Measure the thickness of 2nd gear.
   - If the thickness is less than the service limit, replace 2nd gear.
   - If the thickness is within the service limit, replace the 1st/2nd synchro hub and reverse gear as a set.

   Standard: 27.92-27.97 mm (1.099-1.101 in.)

   Service Limit: 27.87 mm (1.097 in.)

COUNTERSHAFT DISASSEMBLY

1. Securely clamp the countershaft assembly in a bench vise with wood blocks.

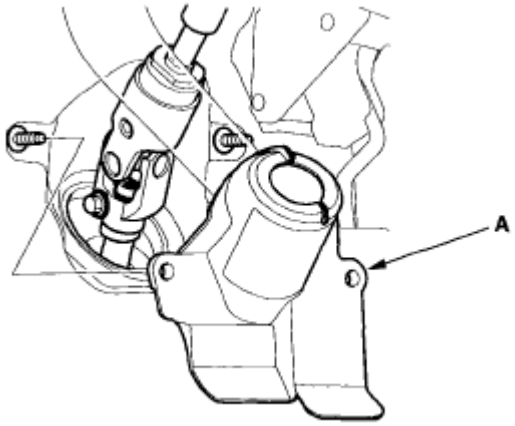

Fig. 133: Identifying Countershaft Assembly In Bench Vise
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the special bolt (left-hand threads).
3. Support 6th gear (A) on steel blocks (B), then use a press (C) and an attachment (D) to press the countershaft out of the ball bearing.

COUNTERSHAFT INSPECTION

1. Inspect the gear and bearing contact areas for wear and damage, then measure the countershaft at points A, B, and C. If any part of the countershaft is less than the service limit, replace it.

   Standard:

   A Ball Bearing Contact Area (Transmission Housing Side):

   30.020-30.033 mm (1.1819-1.1824 in.)

   B Distance Collar Contact Area:

   39.937-39.950 mm (1.5723-1.5728 in.)

   C Needle Bearing Contact Area (Clutch Housing Side):

   35.000-35.015 mm (1.3780-1.3785 in.)

   Service Limit:

   A: 29.97 mm (1.180 in.)

   B: 39.883 mm (1.5702 in.)

   C: 34.95 mm (1.3760 in.)

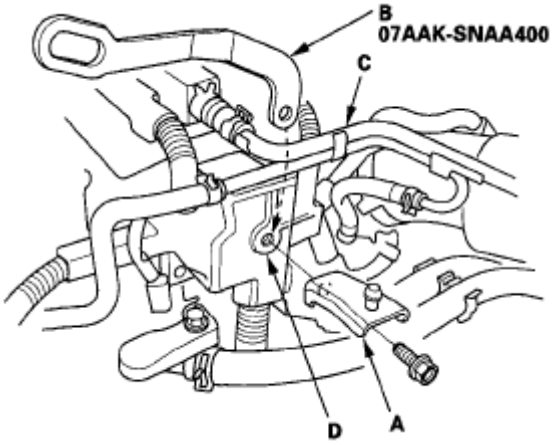

Fig. 137: Inspecting Gear And Bearing Contact Areas
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Inspect the runout by supporting both ends of the countershaft. Then rotate the countershaft two complete turns while measuring with a dial gauge. If the runout is more than the service limit, replace the countershaft.

   Standard: 0.02 mm (0.001 in.) max.

   Service Limit: 0.05 mm (0.002 in.)

Special Tools Required

- Driver, 40 mm I.D. 07746-0030100
- Attachment, 30 mm I.D. 07746-0030300

NOTE: Refer to the EXPLODED VIEW, as needed, during this procedure.

1. Clean all parts in solvent, dry them, and apply manual transmission fluid (MTF) to all contact surfaces.
2. Install the distance collar and needle bearing onto the countershaft.
3. Install 1st gear.
4. Install the triple cone synchro assembly (A) by aligning the synchro ring fingers (B) with the grooves in 1st gear (C), then install the synchro spring (D).

24. Tighten the new special bolt (B) (left-hand threads).

SYNCHRO SLEEVE AND HUB INSPECTION AND REASSEMBLY

1. Inspect gear teeth on all synchro hubs and synchro sleeves for rounded off corners, which indicate wear.
2. Install each synchro hub (A) in its mating synchro sleeve (B), and check for free movement. Make sure to match the three sets of longer teeth (C) (120 degrees apart) on the synchro sleeve with the three sets of deeper grooves (D) in the synchro hub.

NOTE:

- **Do not install the synchro sleeve with its longer teeth in the synchro hub slots (E) because it will damage the spring ring.**
- **If replacement is required, always replace the synchro sleeve and synchro hub as a set.**

SYNCHRO RING AND GEAR INSPECTION

1. Inspect the inside of each synchro ring (A) for wear. Inspect the teeth (B) on each synchro ring for wear (rounded off).

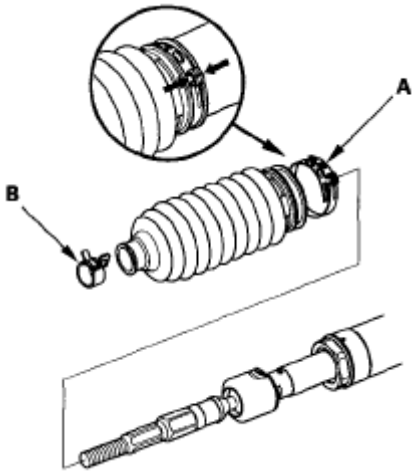

Fig. 156: Identifying Synchro Ring And Teeth
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Inspect the teeth (A) on each synchro sleeve and matching teeth on each gear for wear (rounded off).

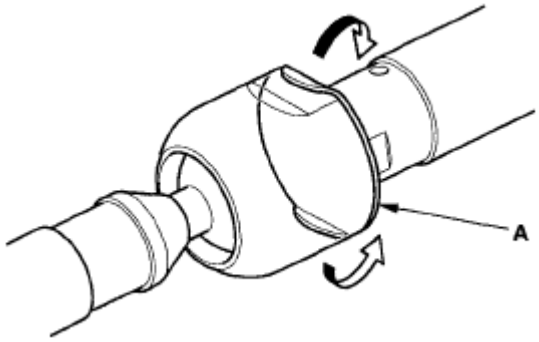

Fig. 157: Inspecting Teeth On Synchro Sleeve

3. Inspect the thrust surface (A) on each gear hub for wear.

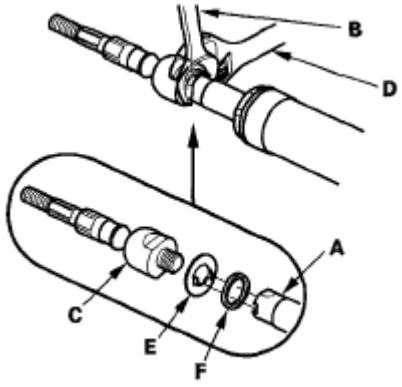

Fig. 158: Identifying Thrust Surface, Cone Surface And Gears
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Inspect the cone surface (B) on each gear hub for wear and roughness.

5. Inspect the teeth on all gears (C) for uneven wear, scoring, and cracks.
6. Coat the cone surface of each gear with manual transmission fluid (MTF), and place its synchro ring on it. Rotate the synchro ring, making sure that it does not slip.
7. Measure the clearance between each gear (A) and its synchro ring (B) all around the gear. Hold the synchro ring against the gear evenly while measuring the clearance. If the clearance is less than the service limit, replace the synchro ring and gear.

   Synchro-Ring-to-Gear Clearance

   Standard: 0.70-1.49 mm (0.028-0.059 in.)

   Service Limit: 0.4 mm (0.016 in.)

   Double Cone Synchro-to-Gear Clearance Standard:

   (1): Outer Synchro Ring (B) to Synchro Cone (C)

   0.70-1.19 mm (0.028-0.047 in.)

   (2): Synchro Cone (C) to Gear (A)

   0.50-1.04 mm (0.020-0.041 in.)

   (3): Outer Synchro Ring (B) to Gear (A)

MAINSHAFT BEARING AND OIL SEAL REPLACEMENT

Special Tools Required

- Oil seal driver 07JAD-PL90100
- Adjustable bearing puller, 20-40 mm 07736-A01000B
- Attachment, 42 x 47 mm 07746-0010300
- Driver 07749-001000
- Slide hammer, 3/8"-16 UNF commercially available

1. Remove the ball bearing (A) from the clutch housing (B) using the 20-40 mm adjustable bearing puller (C) and a commercially available 3/8"-16 UNF slide hammer (D).

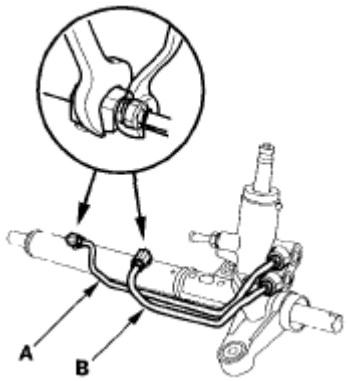

Fig. 160: Identifying Ball Bearing, Clutch Housing And Adjustable Bearing Puller

COUNTERSHAFT BEARING REPLACEMENT

Special Tools Required

- Oil seal driver 07JAD-PL90100
- Adjustable bearing puller, 20-40 mm 07736-A01000B
- Slide hammer, 3/8"-16 UNF commercially available.

1. Remove the bearing set plate (A) from the clutch housing (B).

MAINSHAFT THRUST CLEARANCE ADJUSTMENT

Special Tools Required

- Mainshaft holder 07GAJ-PG20110
- Mainshaft base 07GAJ-PG20130

NOTE:

- **Take measurement at normal room temperature.**
- **Clean all the parts thoroughly before installation.**

1. Remove the 72 mm shim (A) and oil guide plate M from the transmission housing (B).

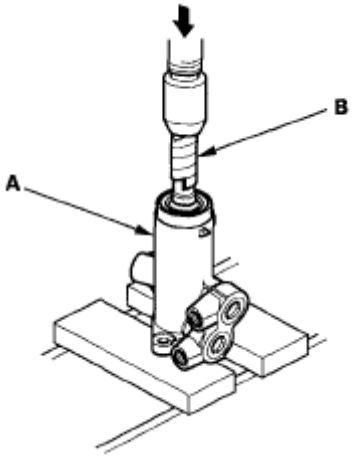

Fig. 168: Identifying Shim And Transmission Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Thoroughly clean the 28 mm spring washer (A) and 28 mm washer (B) before installing them on the clutch housing side ball bearing (C).

NOTE: Install the spring washer in the direction shown.

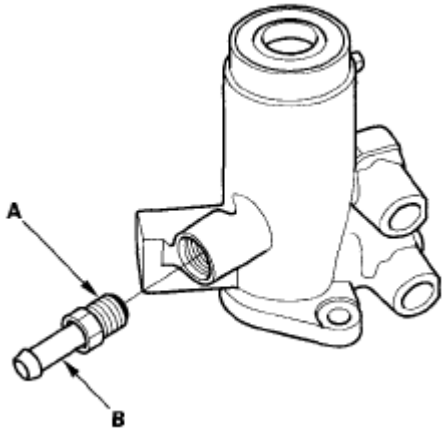

Fig. 169: Identifying Spring Washer, Washer And Clutch Housing Side Ball Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the 3rd/4th synchro hub, the distance collar, the 5th/6th synchro hub, the distance collar, and the angular ball bearing on the mainshaft.

NOTE: Refer to the MAINSHAFT REASSEMBLY Exploded View .

4. Install the mainshaft in the clutch housing.
5. Place the transmission housing over the mainshaft and onto the clutch housing.
6. Tighten the clutch and transmission housings with several 8 mm bolts.

NOTE: It is not necessary to use sealing agent between the housing for this procedure.

7. Lightly tap on the mainshaft with a plastic hammer.
8. Attach the mainshaft holder (A) and mainshaft base (B) to the mainshaft as follows:
   - Backout the mainshaft holder bolt (C), and loosen the two hex bolts (D).
   - Fit the holder over the mainshaft so its lip is towards the transmission.
   - Align the mainshaft holder lip around the groove at the inside of the mainshaft splines, then tighten the hex bolts.

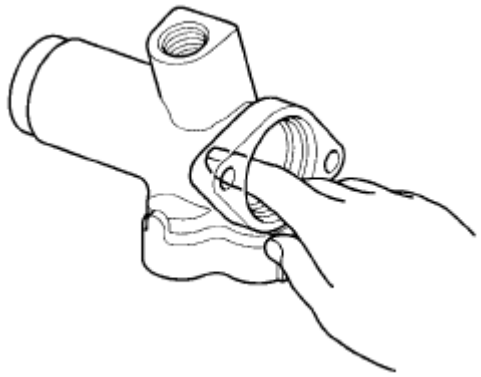

Fig. 170: Identifying Mainshaft Holder And Mainshaft Base
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Fully seat the mainshaft by tapping its end with a plastic hammer.
10. Thread the mainshaft holder bolt in until it just contacts the wide surface of the mainshaft base.
11. Zero a dial gauge (A) on the end of the mainshaft.

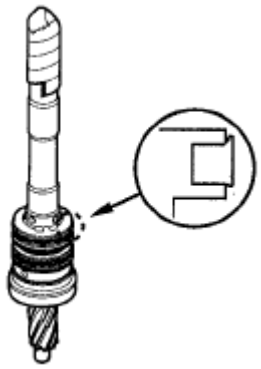

Fig. 171: Identifying Dial Gauge
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Turn the mainshaft holder bolt (B) clockwise; stop turning when the dial gauge has reached its maximum movement. The reading on the dial gauge is the amount of mainshaft thrust clearance.

NOTE: Do not turn the mainshaft holder bolt more than 60 degrees after the needle of the dial gauge stops moving. Applying more pressure with the mainshaft holder bolt could damage the transmission.

13. If the reading is within the standard, the clearance is correct. If the reading is not within the standard, select the appropriate shim needed from the table, and recheck the thrust clearance.

Standard: 0.11-0.17 mm (0.004-0.007 in.)

(Example)

Measure reading: 1.93 mm (0.0759 in.)

Subtract the total clearance measurement from the middle of the clearance standard 0.14 mm (0.0056 in.).

1.93 - 0.14 = 1.79 mm (0.0704 in.)

Select the shim closest to the amount calculated. For this example, the 1.80 mm (0.0709 in.) shim is best.

14. With oil guide plate M and the appropriate size shim installed in the transmission housing, check the thrust clearance again to make sure the clearance is within the standard.

TRANSMISSION REASSEMBLY

NOTE:

- **Prior to reassembling, clean all the parts in solvent, dry them, and apply manual transmission fluid (MTF) to any contact surfaces.**
- **Place the clutch housing on two pieces of wood thick enough to keep the mainshaft from hitting the workbench.**

1. Install the magnet (A) and the differential assembly (B).

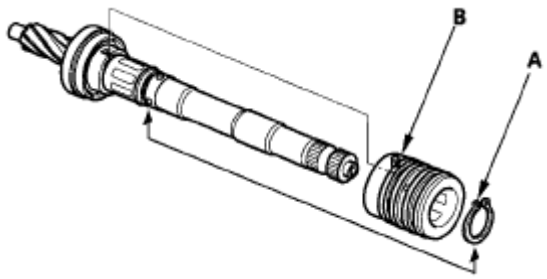

Fig. 172: Identifying Magnet And Differential Assembly
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the 28 mm spring washer (A) and the 28 mm washer (B) over the ball bearing (C).

NOTE: Install the spring washer in the direction shown.

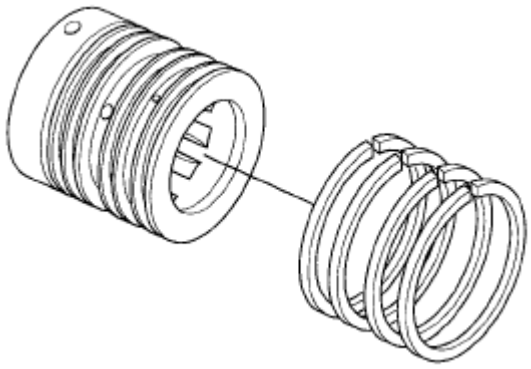

Fig. 173: Identifying Spring Washer, Washer And Ball Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Apply tape to the mainshaft (D) splines to protect the seal. Install the mainshaft assembly and the countershaft (E) into the shift forks (F), and install them as an assembly.
4. Install the reverse shift fork.

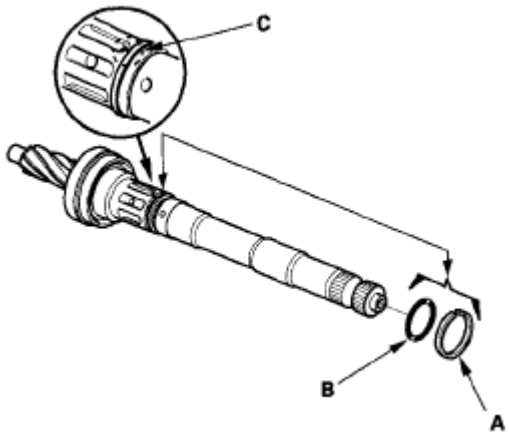

Fig. 174: Identifying Mainshaft, Countershaft & Torque Spec.
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the reverse idler gear (A) and the reverse gear shaft (B) by aligning the mark (C) with the reverse gear shaft hole (D).

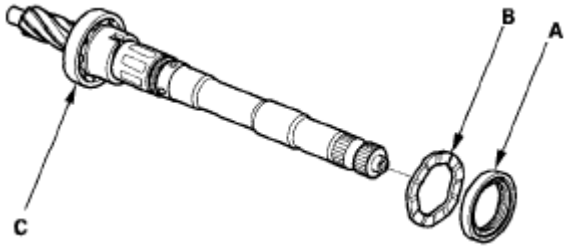

Fig. 175: Identifying Reverse Idler Gear, Reverse Gear Shaft And Mark
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Select the proper size 72 mm shim (A) according to the measurements made during the Mainshaft Thrust Clearance Adjustment (see **MAINSHAFT THRUST CLEARANCE ADJUSTMENT**). Install the oil gutter plate (B), the oil guide plate M, and the 72 mm shim into the transmission housing (C).

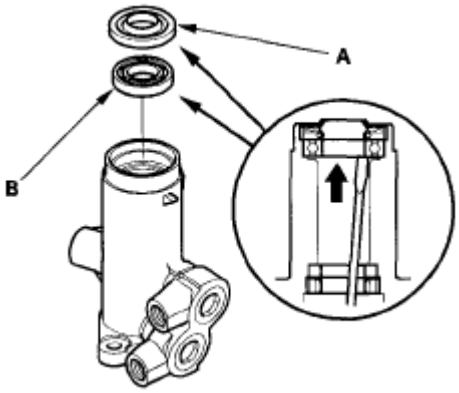

Fig. 176: Identifying Oil Gutter Plate And Transmission Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Clean any dirt and oil from the transmission housing sealing surface.
8. Apply liquid gasket, P/N 08718-0001, evenly to the mating surface of the transmission housing and the clutch housing. Install the component within 5 minutes of applying the liquid gasket.

NOTE:

- **If you apply liquid gasket P/N 08718-0012, the component must be installed within 4 minutes.**
- **If too much time has passed after applying the liquid gasket, remove the old liquid gasket and residue, then reapply new liquid gasket.**

9. Install the three 14 x 20 mm dowel pins (A).

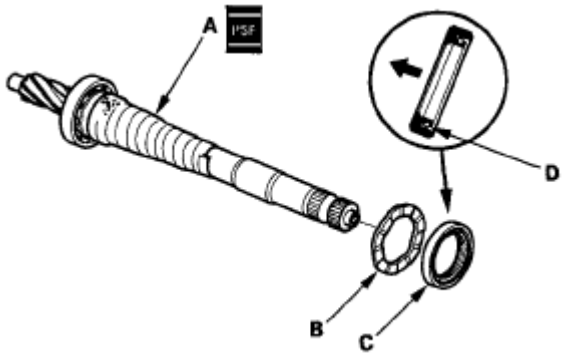

Fig. 178: Identifying Dowel Pins w/Torque Spec.
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Place the transmission housing over the clutch housing, being careful to line up the shafts.
11. Lower the transmission housing the rest of the way as you expand the 72 mm snap ring (B). Release the snap ring so it seats in the groove of the countershaft bearing.
12. Make sure the 72 mm snap ring is securely seated in the groove of the countershaft bearing.

Dimension (1) as installed: 3.3-6.0 mm (0.13-0.24 in.)

13. Apply liquid gasket, P/N 08718-0001, evenly to the threads of the 32 mm searing cap (C) mating surface of the transmission housing. Install the component within 5 minutes of applying the liquid gasket.

NOTE:

- **If you apply liquid gasket P/N 08718-0012, the component must be installed within 4 minutes.**
- **If too much time has passed after applying the liquid gasket, remove the old liquid gasket and residue, then reapply new liquid**

gasket.

14. Install the transmission hanger A, the transmission hanger B, the harness bracket (C), and the 8 mm flange bolts finger-tight.

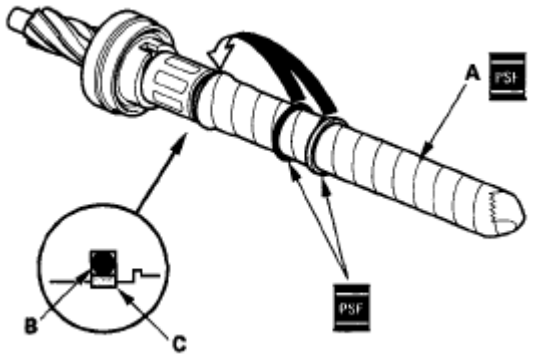

Fig. 179: Identifying Transmission Hanger A, Transmission Hanger B And Harness Bracket

16. Clean any dirt or oil from the change lever assembly sealing surface.
17. Apply liquid gasket, P/N 08718-0001, evenly to the mating surface of the charge lever assembly and the transmission housing. Install the component within 5 minutes of applying the liquid gasket.

NOTE:

- **If you apply liquid gasket P/N 08718-0012, the component must be installed within 4 minutes.**

- **If too much time has passed after applying the liquid gasket, remove the old liquid gasket and residue, then reapply new liquid gasket.**
- **Allow it to cure at least 30 minutes after assembly before filling the transmission with MTF.**

19. Apply liquid gasket, P/N 08718-0001, evenly to the mating surface of the threads of the inter lock bolt (D) and transmission housing. Install the component within 5 minutes of applying the liquid gasket.

NOTE:

- **If you apply liquid gasket P/N 08718-0012, the component must be installed within 4 minutes.**
- **If too much time has passed after applying the liquid gasket, remove the old liquid gasket and residue, then reapply new liquid gasket.**

20. Install the drain plug (A) and 10 mm flange bolt (B) with new sealing washers (C). Install the filler

plug (D) finger-tight.

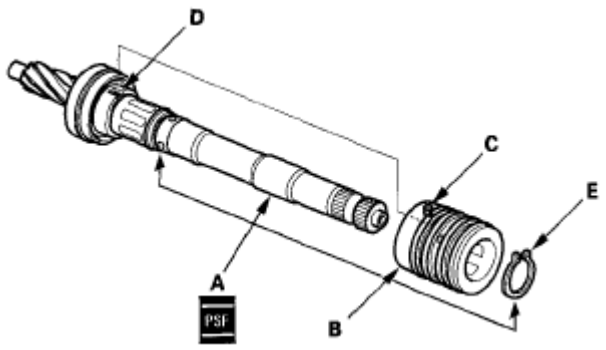

Fig. 183: Identifying Drain Plug, Flange Bolt, Sealing Washers & Torque Specs.
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Apply MTF to the new O-ring (E). Then install the new O-ring, and output shaft (countershaft) speed sensor (F).
22. Install the detent bolts (A), the springs, and steel balls with new washers (B). Then install the transmission hanger (C).

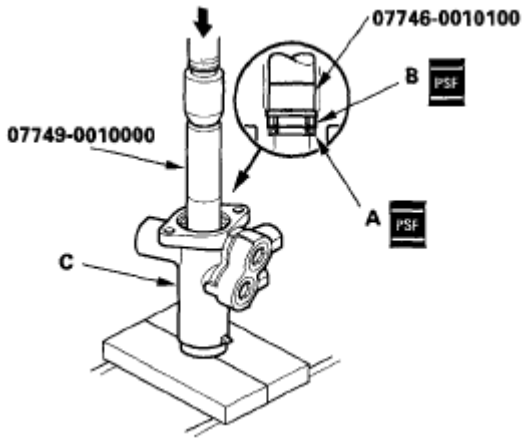

Fig. 184: Identifying Detent Bolts, Springs, Steel Balls, New Washers & Torque Specs.
Courtesy of AMERICAN HONDA MOTOR CO., INC.

23. Apply liquid gasket, P/N 08718-0001 evenly to the threads of the back-up light switch (D) mating surface of the transmission housing. Install the component within 5 minutes of applying the liquid gasket.

NOTE:

- **If you apply liquid gasket P/N 08718-0012, the component must be installed within 4 minutes.**
- **If too much time has passed after applying the liquid gasket, remove the old liquid gasket and residue, then reapply new liquid gasket.**

24. Install the 20 mm bolt (A) and new 20 mm washer (B).

DIFFERENTIAL CARRIER, FINAL DRIVEN GEAR REPLACEMENT

1. Remove the bolts in a crisscross pattern in several steps, then remove the final driven gear (A) from the differential carrier (B).

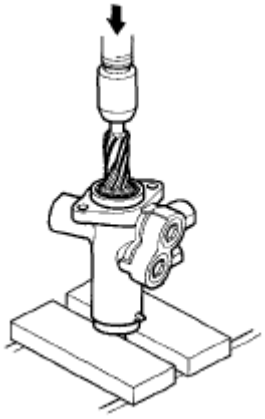

Fig. 188: Identifying Final Driven Gear, Differential Carrier & Torque Spec.
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the final driven gear with the chamfer on the inside diameter facing the carrier. Tighten the bolts in a crisscross pattern in several steps.

CARRIER BEARING REPLACEMENT

Special Tools Required

Driver, 40 mm I.D. 07746-0030100

1. Check the carrier bearings for wear and rough rotation. If they rotate smoothly and their rollers show no signs of wear, the bearings are OK.
2. Remove the carrier bearings (A) with a commercially available bearing puller (B).

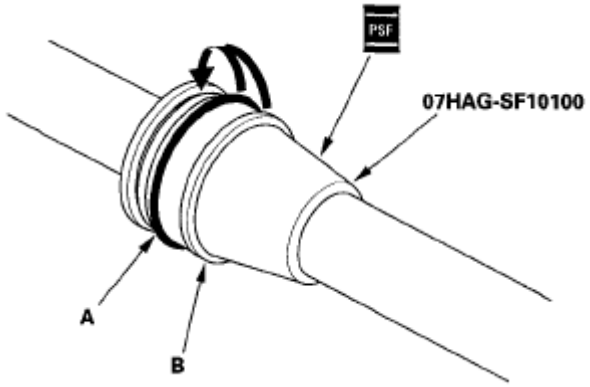

Fig. 189: Identifying Carrier Bearings And Bearing Puller
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the new bearings (A) with the 40 mm I.D. driver (B) and a press. Press each bearing on until it bottoms. There should be no clearance between the bearings and the carrier.

NOTE: Place the seal (C) part of the bearing towards the outside of the differential, and install it.

OIL SEAL REPLACEMENT

Special Tools Required

- Oil seal driver attachment 07NAD-P20A100
- Driver 07749-0010000

1. Remove the oil seal (A) from the transmission housing (B).

DIFFERENTIAL THRUST CLEARANCE ADJUSTMENT

Special Tools Required

Driver, 40 mm I.D. 07746-0030100

1. If you removed the 80 mm shim from the transmission housing, reinstall the same sized shim.

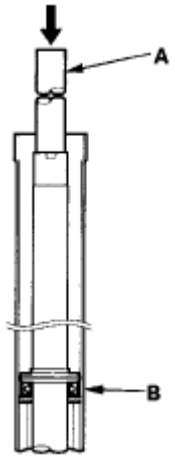

Fig. 195: Identifying Shim
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the differential assembly into the clutch housing.

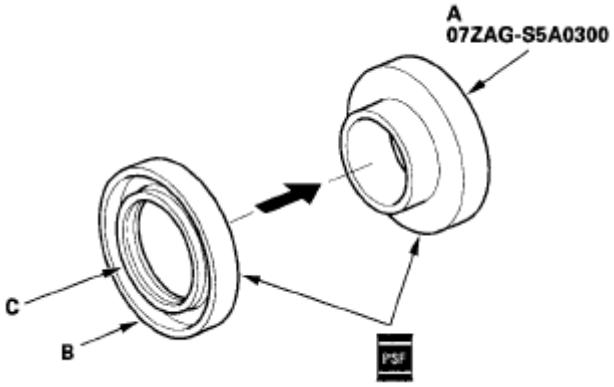

Fig. 196: Identifying Differential Assembly
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the transmission housing onto the clutch housing, then tighten the 8 mm flange bolts in a crisscross pattern in several steps (see step 15).

   Specified Torque

   8 x 1.25 mm

   27 N.m (2.8 kgf.m, 20 lbf.ft)

4. Use the 40 mm I.D. driver (A) to bottom the differential assembly in the clutch housing.

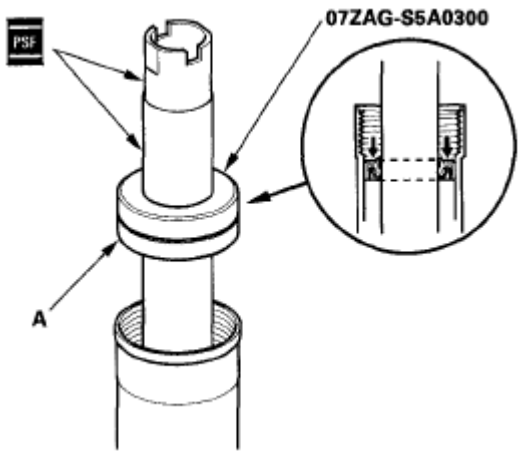

Fig. 197: Identifying I.D. Driver
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Measure the clearance between the 80 mm shim and the bearing outer race in transmission housing.

   Standard: 0-0.10 mm (0-0.004 in.)

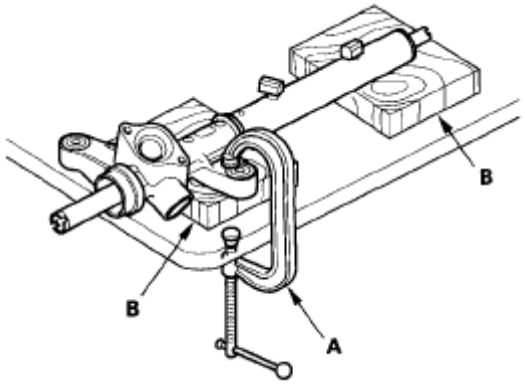

Fig. 198: Measuring Clearance Between Shim And Bearing Outer Race In Transmission Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. If the clearance is more than the standard, select a new 80 mm shim from the following table. If the clearance measured in step 5 is within the standard, go to step 9.

80 mm Shim

Q	41455-PL3-B00	1.55 mm (0.0610 in.)
R	41456-PL3-B00	1.65 mm (0.0650 in.)
S	41457-PL3-B00	1.75 mm (0.0689 in.)

7. Remove the bolts and transmission housing.
8. Replace the thrust shim selected in step 6, then recheck the clearance.
9. Reinstall the transmission housing.

REVERSE LOCKOUT SYSTEM

SYSTEM DESCRIPTION

The reverse lockout system prevents mis-shifting from 5th gear to reverse.

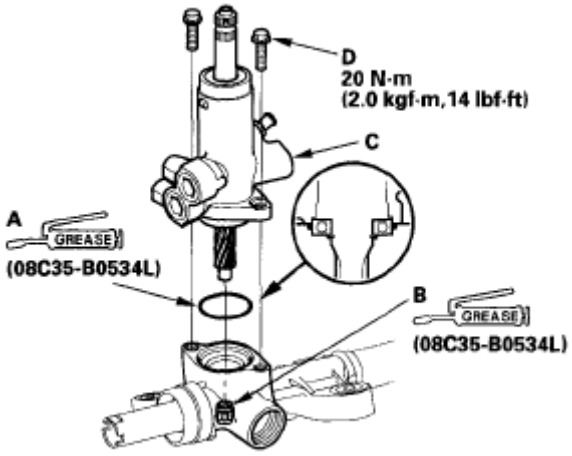

Fig. 2: Identifying Reverse Lockout System Prevents Mis-Shifting From 5Th Gear To Reverse
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Shifting to 5th gear or reverse gear

When the shift lever is moved to the 5th gear-reverse plane, the shift piece pushes and turns the reverse lock cam. When the shift lever is shifted to 5th gear or reverse, the shift fork moves and completes the gear change. When the shift to 5th gear or reverse is completed, the reverse lock cam is turned back to a neutral

position by the return spring.

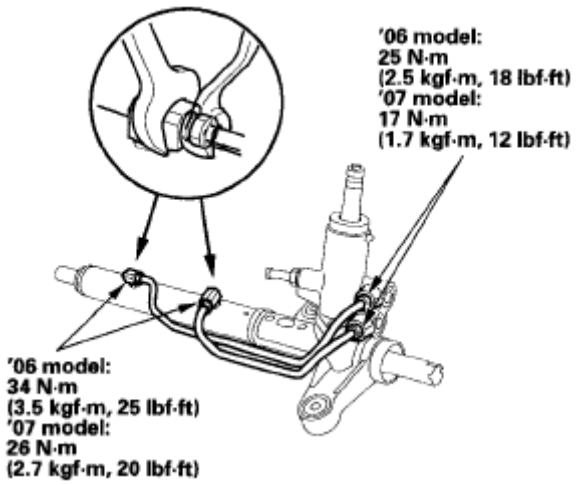

Fig. 3: Identifying 5th Gear Or Reverse Gear Position
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Shifting from 5th gear to reverse

When shifting out of 5th gear, the shift piece is stopped by the notch in the reverse lock cam, thus preventing a mis-shift from 5th gear to reverse.

SYMPTOM TROUBLESHOOTING INDEX

SYMPTOM TROUBLESHOOTING INDEX

Symptom	Probable cause(s)	Diagnostic procedure
Hard to shift into 1st gear	1. 1st synchro ring defective. 2. 1st/2nd synchro sleeve and hub defective.	• Check the 1st synchro ring (see **SYNCHRO SLEEVE AND HUB INSPECTION AND REASSEMBLY**). • Check the 1st/2nd synchro sleeve and hub (see

		SYNCHRO SLEEVE AND HUB INSPECTION AND REASSEMBLY).
	3. 1st gear defective.	• Check 1st gear (see **SYNCHRO SLEEVE AND HUB INSPECTION AND REASSEMBLY**).
	4. Change lever assembly defective.	• Check the change lever assembly (see **CHANGE LEVER ASSEMBLY DISASSEMBLY/REASSEMBLY**).
Hard to shift into 2nd gear	1. 2nd synchro ring defective.	• Check the 2nd synchro ring (see **SYNCHRO SLEEVE AND HUB INSPECTION AND REASSEMBLY**).
	2. 1st/2nd synchro sleeve and hub defective.	• Check the 1st/2nd synchro sleeve and hub (see **SYNCHRO SLEEVE AND HUB INSPECTION AND REASSEMBLY**).
	3. 2nd gear defective.	• Check 2nd gear (see **SYNCHRO SLEEVE AND HUB INSPECTION AND REASSEMBLY**).
	4. Change lever assembly defective.	• Check the change lever assembly (see **CHANGE LEVER ASSEMBLY DISASSEMBLY/REASSEMBLY**).
Hard to shift into 3rd gear	1. 3rd synchro ring defective.	• Check the 3rd synchro ring (see **SYNCHRO SLEEVE AND HUB INSPECTION AND REASSEMBLY**).
	2. 3rd/4th synchro sleeve and hub defective.	• Check the 3rd/4th synchro sleeve and hub (see **SYNCHRO SLEEVE AND HUB INSPECTION AND REASSEMBLY**).
	3. 3rd gear defective.	• Check 3rd gear (see **SYNCHRO SLEEVE AND HUB INSPECTION AND REASSEMBLY**).
	4. Change lever assembly defective.	• Check the change lever assembly (see **CHANGE LEVER ASSEMBLY DISASSEMBLY/REASSEMBLY**).
Hard to shift into 4th gear	1. 4th synchro ring defective.	• Check the 4th synchro ring (see **SYNCHRO SLEEVE AND HUB INSPECTION AND REASSEMBLY**).
	2. 3rd/4th synchro sleeve and hub defective.	• Check the 3rd/4th synchro sleeve and hub (see **SYNCHRO SLEEVE AND HUB INSPECTION AND REASSEMBLY**).
	3. 4th gear defective.	• Check 4th gear (see **SYNCHRO SLEEVE AND HUB INSPECTION AND REASSEMBLY**).
	4. Change lever assembly defective.	• Check the change lever assembly (see **CHANGE LEVER ASSEMBLY DISASSEMBLY/REASSEMBLY**).
Hard to shift	1. 5th synchro ring defective.	• Check the 5th synchro ring (see **SYNCHRO**

into 5th gear	2. 5th synchro sleeve defective. 3. 5th gear defective. 4. Change lever assembly defective.	**SLEEVE AND HUB INSPECTION AND REASSEMBLY**). • Check the 5th synchro sleeve and hub (see **SYNCHRO SLEEVE AND HUB INSPECTION AND REASSEMBLY**). • Check 5th gear (see **SYNCHRO SLEEVE AND HUB INSPECTION AND REASSEMBLY**). • Check the change lever assembly (see **CHANGE LEVER ASSEMBLY DISASSEMBLY/REASSEMBLY**).
Hard to shift into reverse	1. Reverse shift fork defective. 2. Reverse idler gear defective. 3. Reverse gear defective. 4. Change lever assembly defective. 5. Reverse lockout system defective.	• Check the reverse shift fork (see **REVERSE SHIFT FORK CLEARANCE INSPECTION**). • Check the reverse idler gear (see **REVERSE SHIFT FORK CLEARANCE INSPECTION**). • Check reverse gear. • Check the change lever assembly (see **CHANGE LEVER ASSEMBLY DISASSEMBLY/REASSEMBLY**). • Check the reverse lockout system.
Noise from the transmission	1. Low transmission fluid level. 2. Worn or damaged transmission gears. 3. Worn or damaged transmission bearings.	• Check the transmission fluid level (see **TRANSMISSION FLUID INSPECTION AND REPLACEMENT**). • Check the transmission gears. • Check the transmission bearings.
Shift lever does not operate smoothly	1. Shift cable defective. 2. Joint in shift cable and transmission or body.	• Check the change wires. • Check joint in the change wires (see **GEARSHIFT MECHANISM REPLACEMENT**).
Transmission jumps out of gear	1. Detent ball springs defective. 2. Worn synchro teeth.	• Check the detent ball springs. • Check the synchro teeth.

TRANSMISSION FLUID INSPECTION AND REPLACEMENT

1. Raise the vehicle on the lift.
2. Remove the filler plug (A) and washer (B), check the condition of the fluid, and make sure it is at the proper level (C).

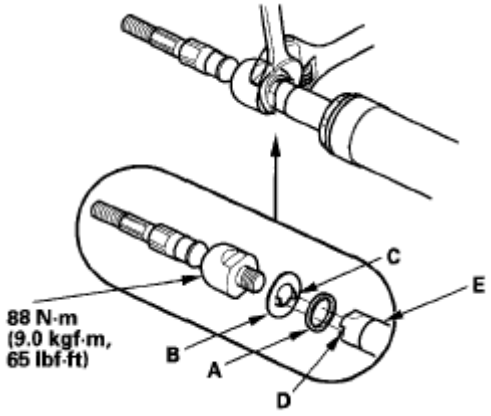

Fig. 5: Identifying Filler Plug And Washer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. If the fluid is dirty, remove the drain plug (A), and drain it.

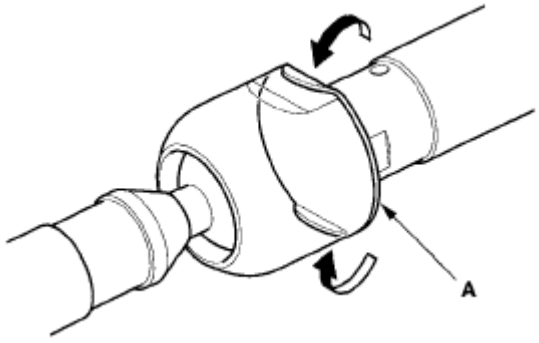

Fig. 6: Identifying Drain Plug (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the drain plug with a new washer, and refill the transmission fluid to the proper level.

   Fluid Capacity

   1.4 L (1.5 US qt) at fluid change

   1.6 L (1.7 US qt) at overhaul

   Always use Honda Manual Transmission Fluid (MTF). Using engine oil can cause stiffer shifting because it does not contain the proper additives.

5. Install the filler plug (B) with a new washer.
6. If the maintenance minder required to replace the fluid, reset the maintenance minder (see **MAINTENANCE MINDER**). If it did not, select BODY ELECTRICAL, GAUGES, ADJUSTMENT, MAINTENANCE MINDER, RESET, MAINTENANCE SUB ITEM 3 with the HDS.

BACK-UP LIGHT SWITCH TEST

1. Disconnect the back-up light switch connector (A).

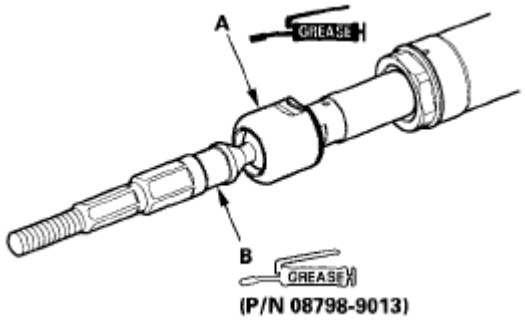

Fig. 7: Identifying Back-Up Light Switch Connector (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Check for continuity between the back-up light switch 2P connector terminals No. 1 and No. 2. There should be continuity when the change lever is only in reverse.
3. If necessary, replace the back-up light switch. Install the new washer and back-up light switch on the transmission housing.

TRANSMISSION REMOVAL

Special Tools Required

- 1.8 Support eyelet 07AAK-SNAA400
- 1.8 Support bolt 07AAK-SNAA500
- Engine support hanger, A & Reds AAR-T-12566 *
- Subframe adapter VSB02C000016 *
- 2006 Civic engine hanger VSB02C000025 *

* These special tools are available through the Honda Tool and Equipment program.

NOTE: Use fender covers to avoid damaging painted surfaces.

1. Make sure you have the anti-theft code for the audio unit and or the navigation system, then write down the audio presets.
2. Disconnect the negative cable from the battery, then disconnect the positive cable.
3. Remove the battery.
4. Remove the cowl cover and under-cowl panel (see **FRONT GRILLE COVER REPLACEMENT**).
5. Remove the air cleaner assembly (see **THROTTLE BODY CLEANING**).
6. Remove the harness clips (A) and the intake air duct (B), then remove the battery base (C) with the coolant reservoir (D).

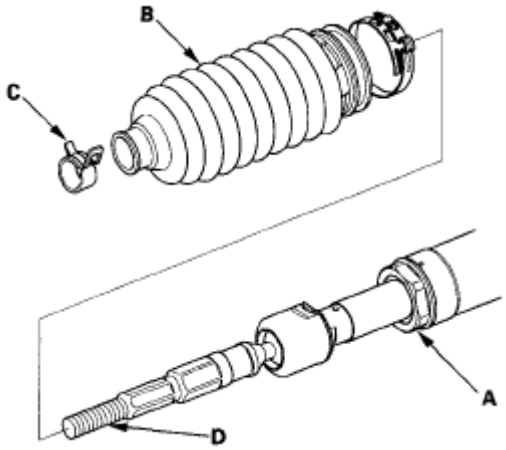

Fig. 8: Identifying Harness Clips And Intake Air Duct
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Remove the clutch line bracket (A), then carefully remove the slave cylinder (B) to avoid bending the clutch line.

NOTE: Do not press the clutch pedal after the slave cylinder has been removed.

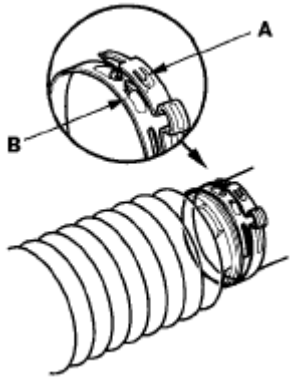

Fig. 9: Identifying Clutch Line Bracket And Slave Cylinder
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Disconnect the back-up light switch connector (A), then remove the engine harness cover (B) and the harness clips (C).

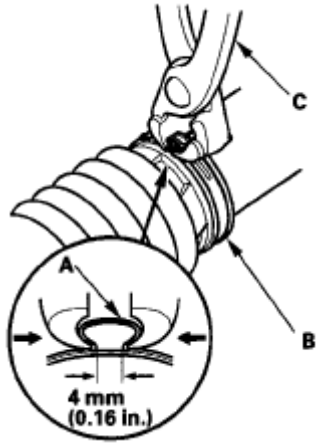

Fig. 10: Identifying Back-Up Light Switch Connector And Engine Harness Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Remove the cable bracket (A), then disconnect the cables (B) from the top of the transmission housing. Carefully remove both cables and the bracket together to avoid bending the cables.

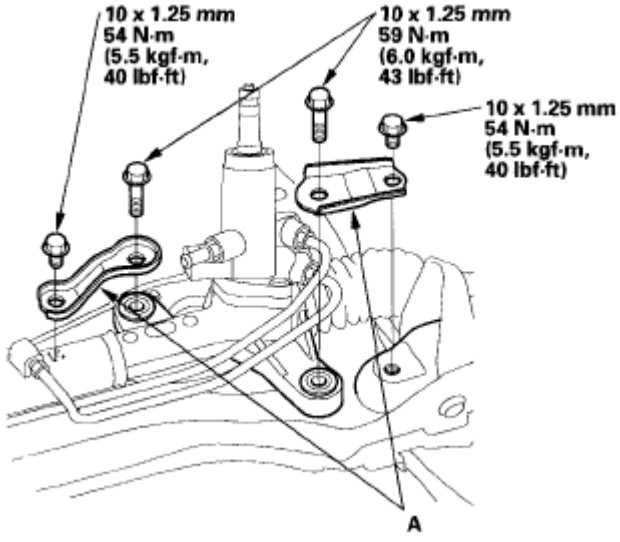

Fig. 11: Identifying Cable Bracket And Cables
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Disconnect the output shaft (countershaft) speed sensor connector (A).

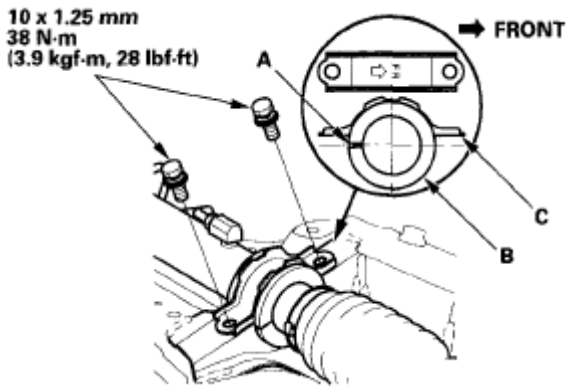

Fig. 12: Identifying Output Shaft (Countershaft) Speed Sensor Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Remove the air cleaner housing bracket (A), and install support eyelet (B) behind the breather pipe (C) and down to the threaded hole (D) on the cylinder head.

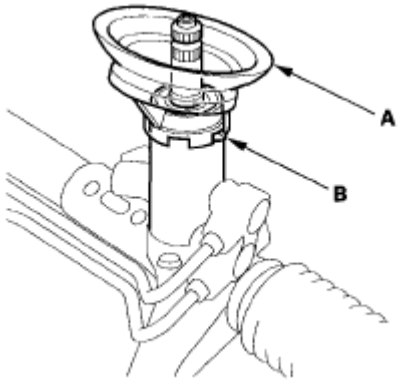

Fig. 13: Identifying Air Cleaner Housing Bracket And Support Eyelet
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Attach the support eyelet (A) to the cylinder head with the support bolt (B). Tighten the bolt by hand.

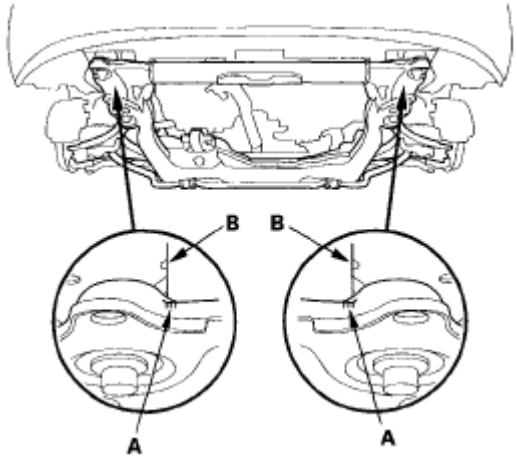

Fig. 14: Identifying Support Eyelet To Cylinder Head
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Install the front leg assembly (A), hook (B), and wingnut (C) from an A and Reds engine support hanger (AAR-T-12566) onto the engine hanger. Carefully position the engine hanger on the vehicle, and attach the hook to the slotted hole in the support eyelet (D). Tighten the wingnut by hand to lift and support the engine/transmission assembly.

NOTE: Use care when working around the windshield.

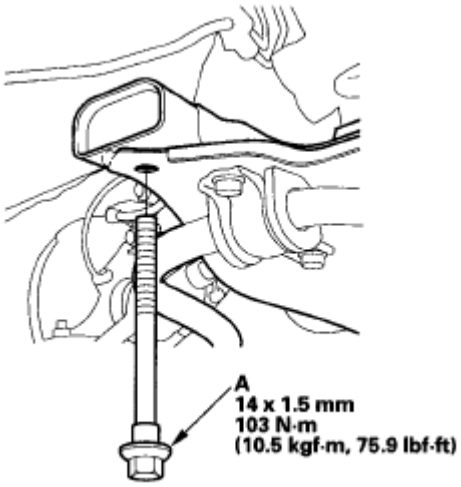

Fig. 15: Identifying Front Leg Assembly Hook And Wingnut

14. Remove the upper transmission mounting bolt.

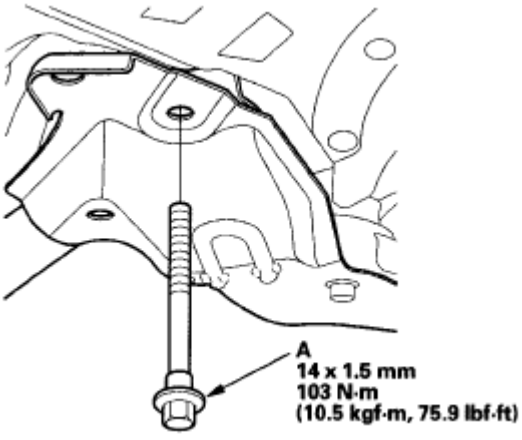

Fig. 16: Identifying Upper Transmission Mounting Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Remove the transmission mounting bolt (A) and nuts (B), then remove the ground cable (C). Remove the transmission mounting bracket base bolts (D).

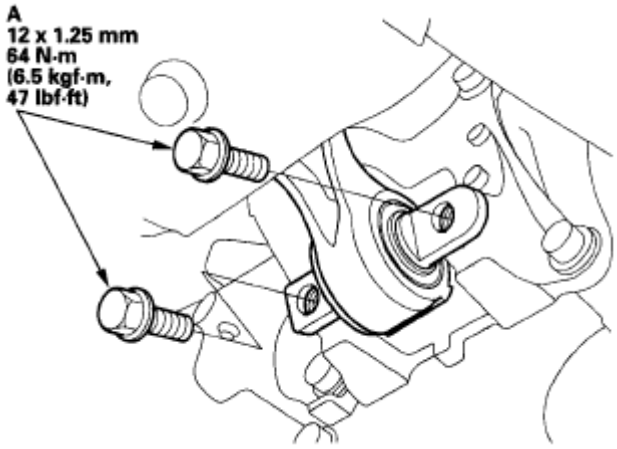

Fig. 17: Identifying Transmission Mounting Bolt And Nuts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Remove the stud bolts (A) and the transmission mounting bracket base (B).

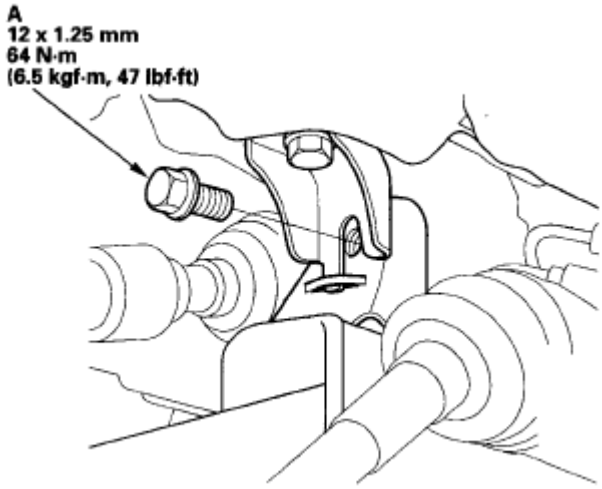

Fig. 18: Identifying Stud Bolts And Transmission Mounting Bracket Base
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Raise the vehicle, on the lift.
18. Remove the splash shield.

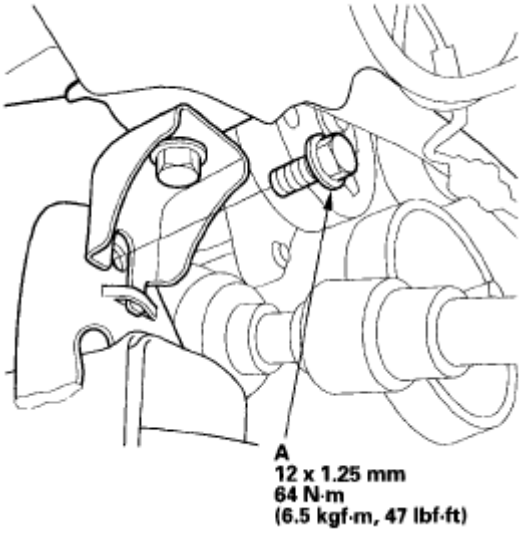

Fig. 19: Identifying Splash Shield
Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. Drain the transmission fluid. Reinstall the drain plug with a new washer (see **TRANSMISSION FLUID INSPECTION AND REPLACEMENT**).
20. Separate the lower arm (see step 6 on **DRIVESHAFT REMOVAL**).
21. Remove the stiffner plates (A) and mounting bracket (B) from the steering gearbox.

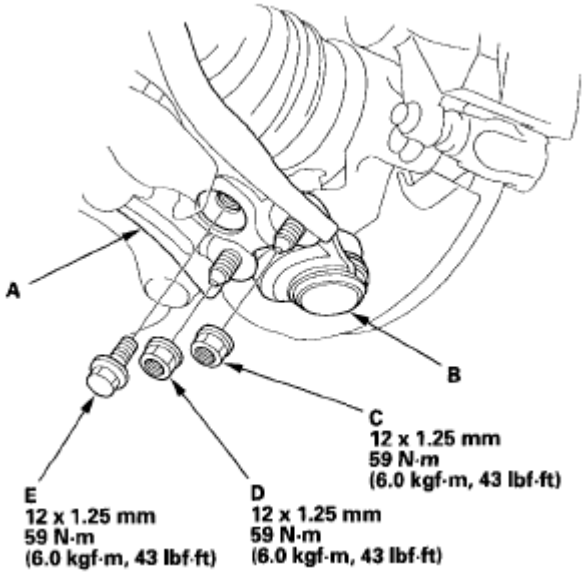

Fig. 20: Identifying Stiffner Plates And Mounting Bracket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

22. Remove the steering line brackets (A) and clip (B).

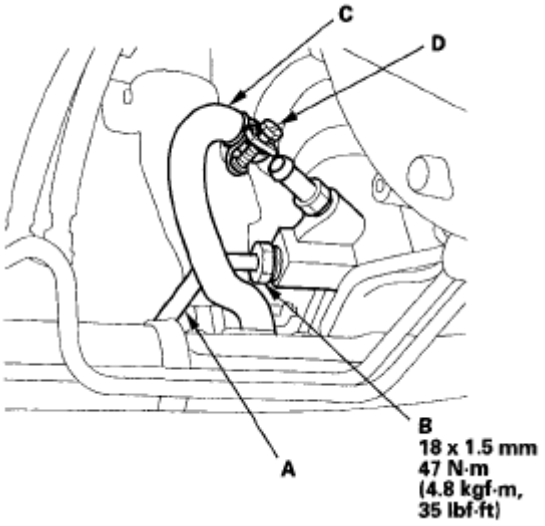

Fig. 21: Identifying Steering Line Brackets And Clip
Courtesy of AMERICAN HONDA MOTOR CO., INC.

23. Remove the middle subframe mounting bolts (A).

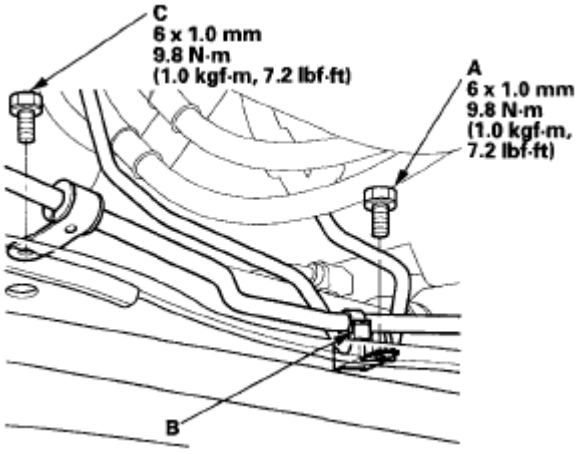

Fig. 22: Identifying Subframe Mounting Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

24. Remove the lower torque rod mounting bolts.

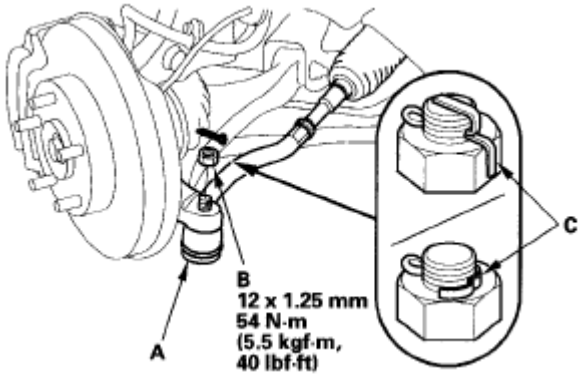

Fig. 23: Identifying Lower Torque Rod Mounting Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

25. Note the reference marks (A) on both sides of the subframe that line up with the body (B).

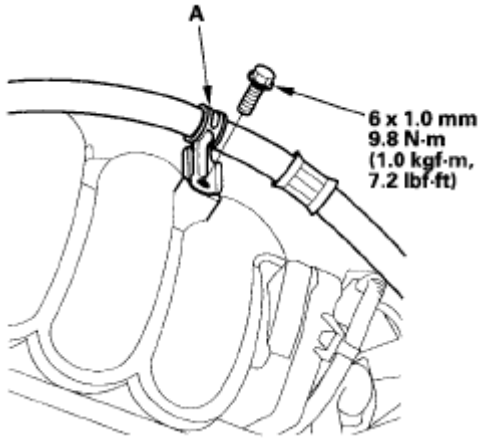

Fig. 24: Locating Subframe Marks
Courtesy of AMERICAN HONDA MOTOR CO., INC.

26. Attach the front subframe adapter to the front subframe by wrapping the band over the front subframe and attaching the end of the band to the front subframe adapter with the pin (A).

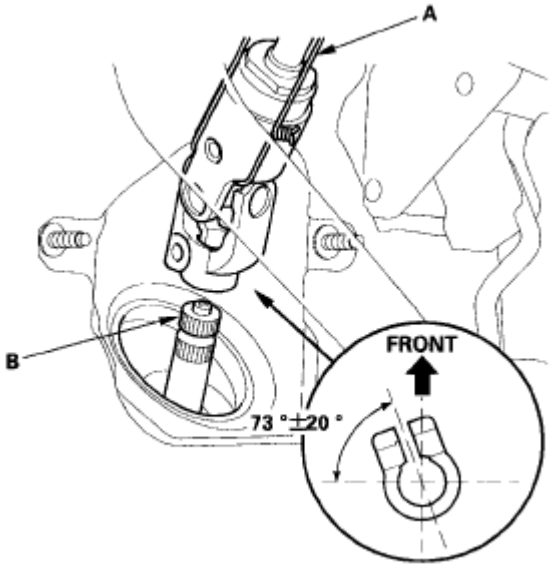

Fig. 25: Attaching Front Subframe Adapter To Front Subframe By Wrapping Band
Courtesy of AMERICAN HONDA MOTOR CO., INC.

27. Raise the jack, and line up the slots in the arms with the bolt holes on the corner of the jack base (B), then attach them securely.
28. Remove the front subframe mounting bolts (A) and front subframe (B).

NOTE: Suspend the steering gearbox with an appropriate size wire.

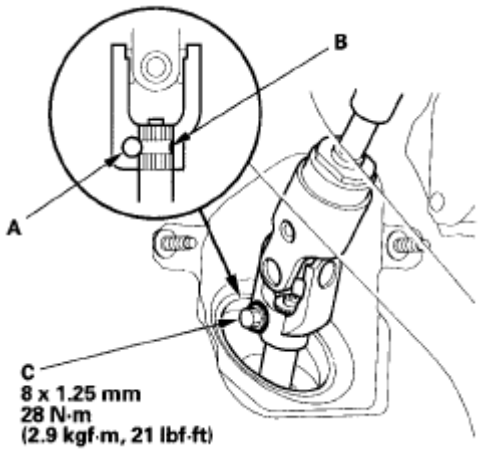

Fig. 26: Identifying Front Subframe Mounting Bolts And Front Subframe
Courtesy of AMERICAN HONDA MOTOR CO., INC.

29. Pry the driveshafts inboard joint (see step 8 on **DRIVESHAFT REMOVAL**).
30. Remove the intermediate shaft (see **INTERMEDIATE SHAFT REMOVAL**).
31. Remove the clutch cover (A).

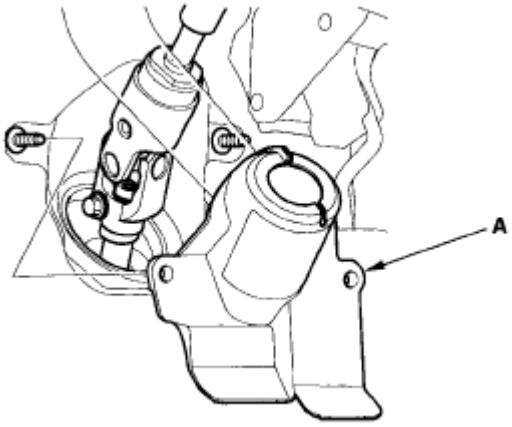

Fig. 27: Identifying Clutch Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

32. Support the transmission with the transmission jack.
33. Remove the lower transmission mounting bolts.

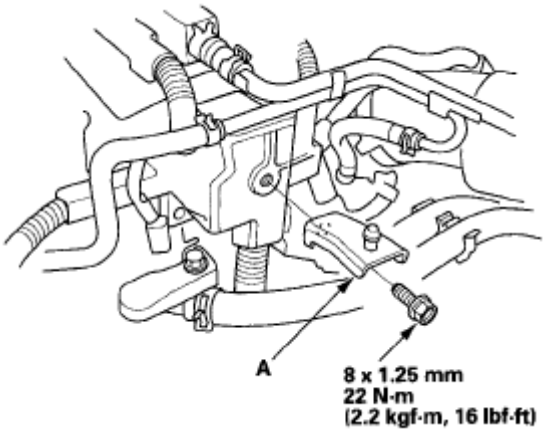

Fig. 28: Identifying Lower Transmission Mounting Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

34. Pull the transmission away from the engine until the transmission mainshaft clears the clutch pressure plate.
35. Slowly lower the transmission about 150 mm (6 in.) Check once again that all hoses and electrical wiring are disconnected and free from the transmission, then lower it all the way.
36. Remove the release fork boot (A) from the clutch housing (B).

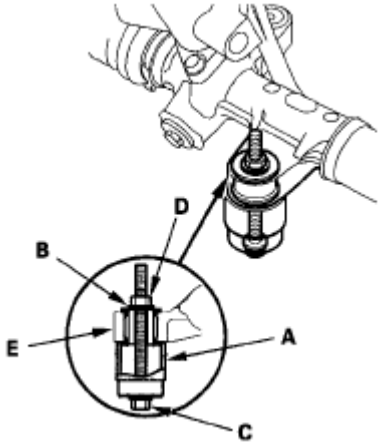

Fig. 29: Identifying Release Fork Boot From Clutch Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

37. Remove the release fork (C) from the clutch housing by squeezing the release fork set spring (D) with pliers. Remove the release bearing (E).

35. Install the harness clips (C) and the intake air duct (D).
36. Install the air cleaner assembly (see **THROTTLE BODY CLEANING**).
37. Install the battery. Clean the battery posts and cable terminals. Connect the positive cable to the battery first, then connect the negative cable, and apply multipurpose grease to prevent corrosion.
38. Install the under-cowl panel and cowl cover (see **FRONT GRILLE COVER REPLACEMENT**).
39. Test-drive the vehicle.
40. Check the change lever and the clutch operation.
41. Check the front wheel alignment (see **WHEEL ALIGNMENT**).
42. Enter the anti-theft code for the audio unit or the navigation system, then enter the audio presets. Set the clock.
43. Do the power window control unit reset procedure (see **RESETTING THE POWER WINDOW CONTROL UNIT**).

REVERSE SHIFT FORK CLEARANCE INSPECTION

1. Measure clearance between the reverse idler gear (A) and the reverse shift fork (B) with a feeler gauge (C). If the clearance is more than the service limit, go to step 2.

   Standard: 0.20-0.60 mm (0.007-0.024 in.)

   Service Limit: 1.2 mm (0.047 in.)

Ref. No.	Tool Number	Description	Qty
①	07AAF-SDAA100	Ball Joint Thread Protector, 12 mm	1
②	07AAK-SNAA120	Universal Eyelet	1
③	07JAF-SH20330	Bushing Base	1
④	07MAA-SL0020A	Locknut Wrench, 43 mm	1
⑤	07MAC-SL0A202	Ball Joint Remover, 28 mm	1

2. Measure width of the reverse shift fork.
   - If the width is not within the standard, replace the reverse shift fork.
   - If the width is within the standard, replace the reverse idler gear.

   Standard: 14.7-14.9 mm (0.579-0.587 in.)

SHIFT ARM CLEARANCE INSPECTION

1. Measure clearance between the shift arm (A) and shift piece (B) with a feeler gauge (C). If the clearance exceeds the service limit, go to step 2.

   Standard: 0.20-0.61 mm (0.008-0.024 in.)

   Service Limit: 0.7 mm (0.028 in.)

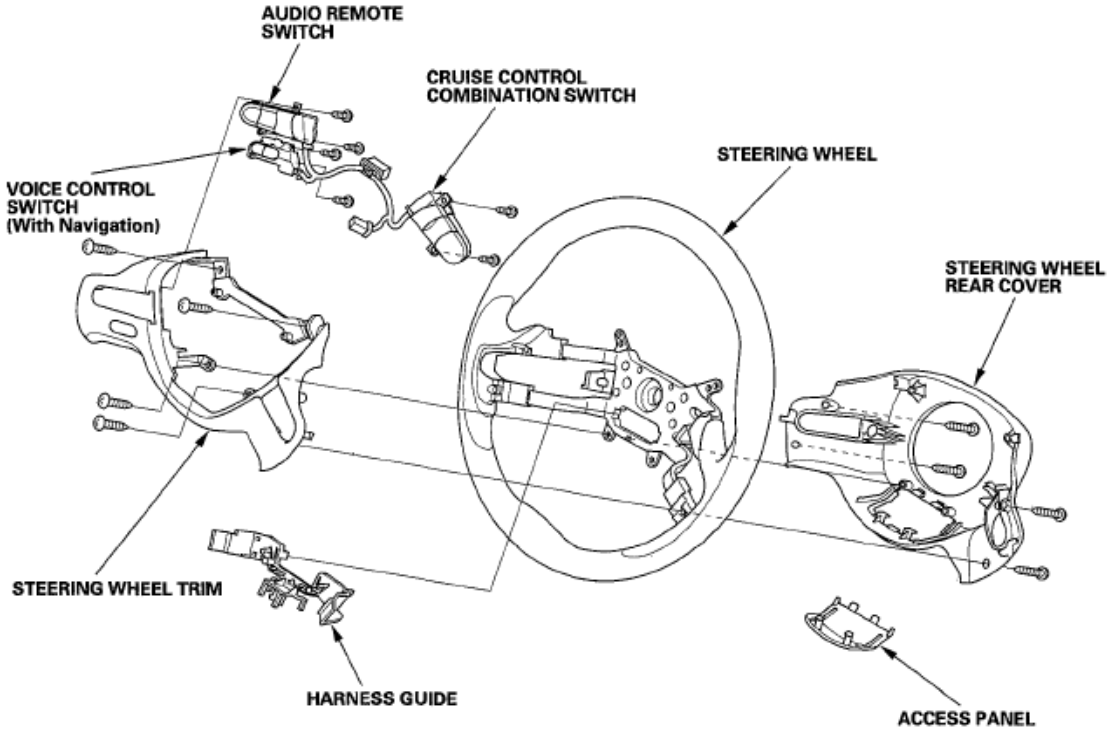

Fig. 75: Measuring Clearance Between Shift Arm And Shift Piece
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Measure groove of the shift piece.
   - If the groove is not within the standard, replace the shift piece.

- If the groove is within the standard, replace the shift arm.

Standard: 16.00-16.20 mm (0.630-0.638 in.)

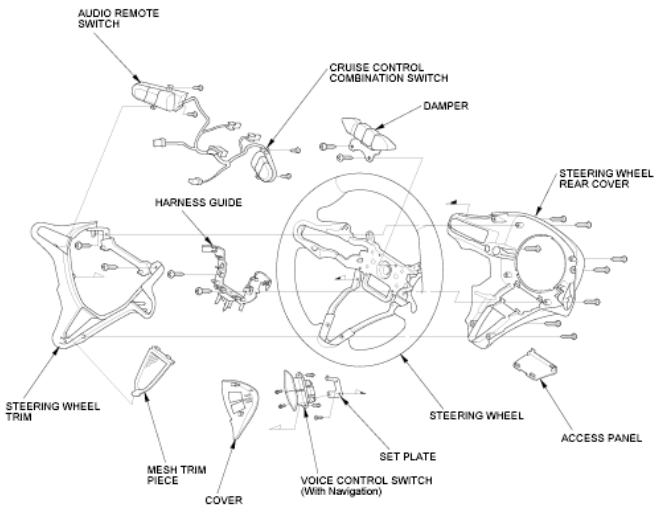

Fig. 76: Identifying Groove Of Shift Piece
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SHIFT FORK CLEARANCE INSPECTION

NOTE: The synchro sleeve and synchro hub should be replaced as a set.

1. Measure clearance between each shift fork (A) and its matching synchro sleeve (B). If the clearance exceeds the service limit, go to step 2.

   Standard: 0.35-0.65 mm (0.014-0.026 in.)

   Service Limit: 1.0 mm (0.039 in.)

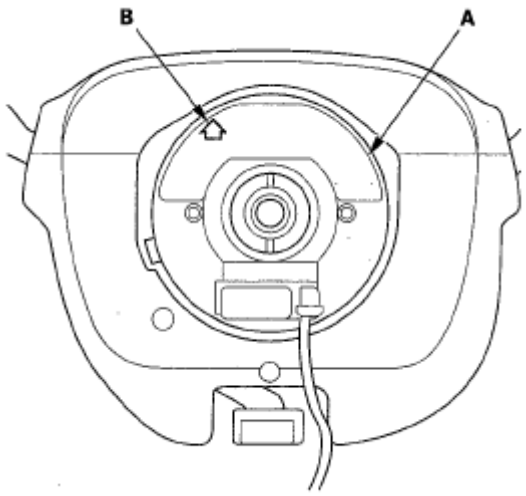

Fig. 77: Measuring Clearance Between Shift Fork And Matching Synchro Sleeve

2. Measure thickness of the shift fork fingers.
   - If the thickness is not within the standard, replace the shift fork.
   - If the thickness is within the standard, replace the synchro sleeve and synchro hub as a set.

   Standard:

   1st/2nd shift fork: 6.7-6.9 mm (0.26-0.27 in.)

   3rd/4th, 5th shift fork: 7.4-7.6 mm (0.29-0.30 in.)

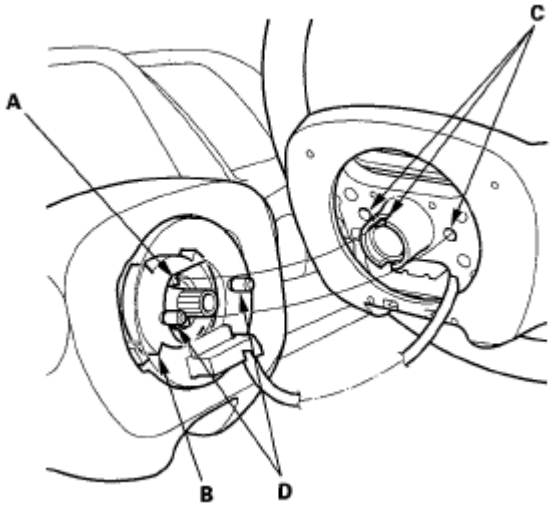

Fig. 78: Identifying Thickness Of Shift Fork Fingers

3. Measure clearance between the shift fork (A) and the shift piece (B). If the clearance exceeds the standard, go to step 4.

   Standard: 0.2-0.5 mm (0.008-0.020 in.)

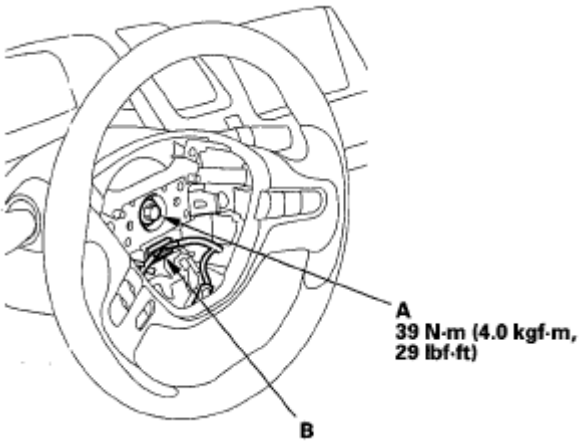

Fig. 79: Measuring Clearance Between Shift Fork And Shift Piece
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Measure width of the shift piece.
   - If the width is not within the standard, replace the shift piece.
   - If the width is within the standard, replace the shift fork.

   Standard: 15.9-16.0 mm (0.626-0.630 in.)

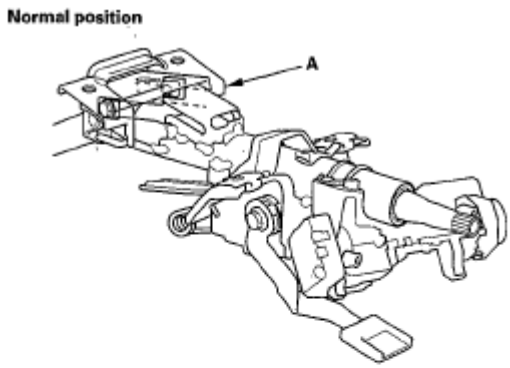
MAINSHAFT ASSEMBLY CLEARANCE INSPECTION

NOTE: If replacement is required, always replace the synchro sleeve and synchro hub as a set.

1. Support the bearing inner race with an appropriate sized socket (A), and push down on the mainshaft (B).



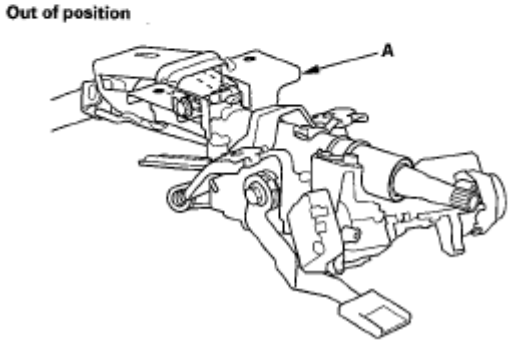


Fig. 82: Identifying Bearing Inner Race
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Measure clearance between 2nd gear (C) and 3rd gear (D) with a feeler gauge (E).
   - If the clearance is more than the service limit, go to step 3.
   - If the clearance is within the service limit, go to step 4.

   Standard: 0.06-0.21 mm (0.002-0.008 in.)

   Service Limit: 0.30 mm (0.012 in.)

3. Measure thickness of 3rd gear.
   - If the thickness is less than the service limit, replace 3rd gear.
   - If the thickness is within the service limit, replace the 3rd/4th synchro hub and 3rd/4th synchro sleeve as a set.

   Standard: 27.02-27.07 mm (1.064-1.066 in.)

   Service Limit: 26.95 mm (1.061 in.)

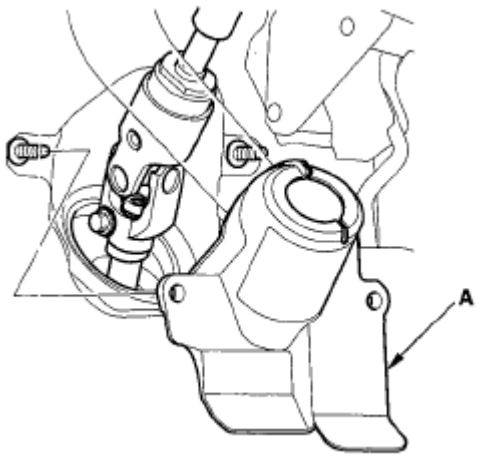

Fig. 83: Identifying Thickness Of 3rd Gear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Measure clearance between 4th gear (A) and the distance collar (B) with a dial indicator (C). If the clearance is more than the service limit, go to step 5.

   Standard: 0.06-0.19 mm (0.002-0.007 in.)

   Service Limit: 0.28 mm (0.011 in.)

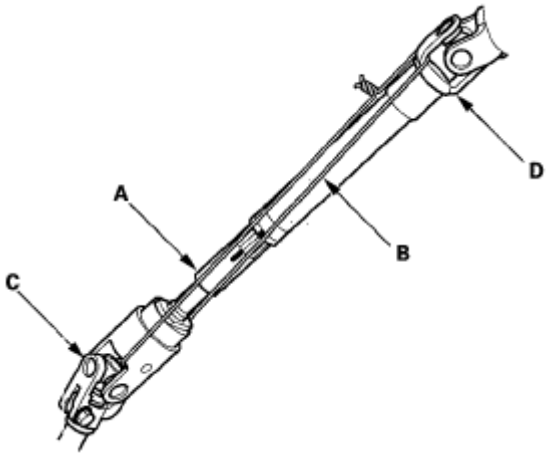

Fig. 84: Identifying Clearance Between 4th Gear And Distance Collar

5. Measure length (1) of the distance collar as shown
   - If the length (1) is not within the standard, replace the distance collar.
   - If the length (1) is within the standard, go to step 6.

Standard: 22.53-22.56 mm (0.887-0.888 in.)

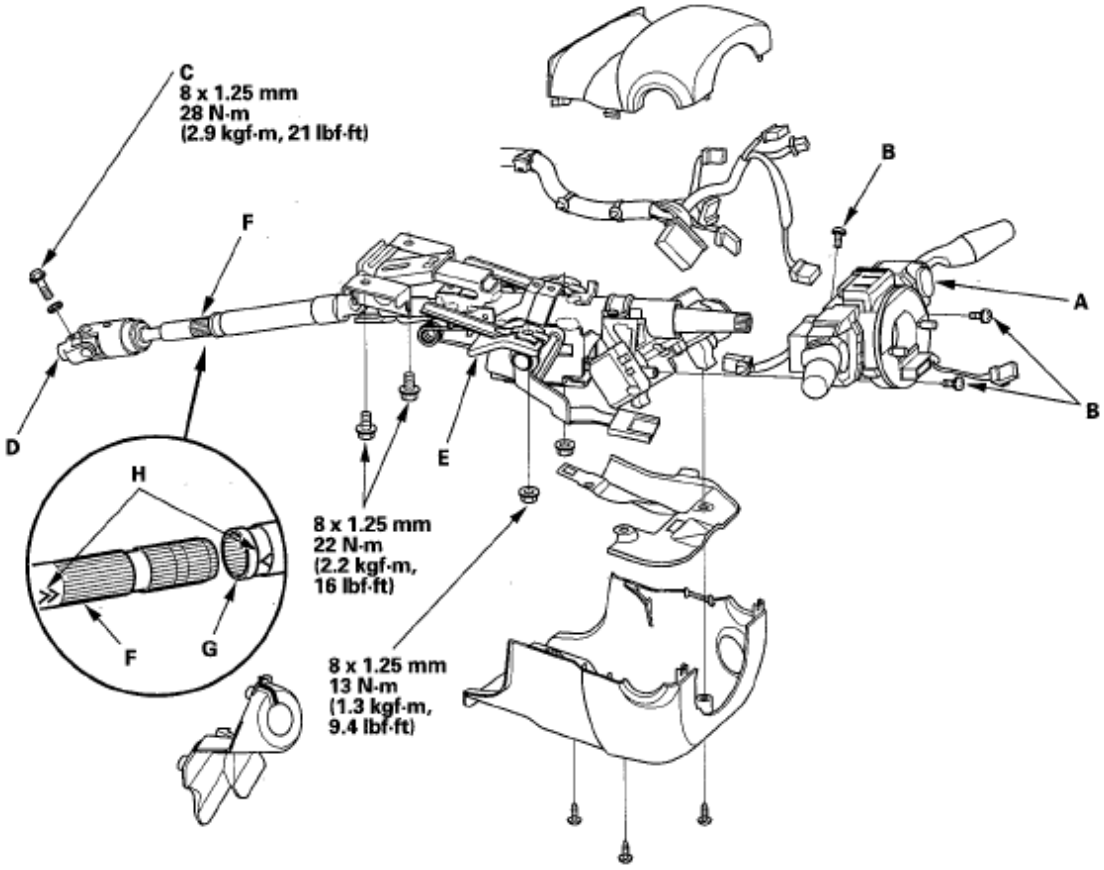

Fig. 85: Identifying Length Of Distance Collar
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Measure thickness of 4th gear.
   - If the thickness is less than the service limit, replace 4th gear.
   - If the thickness is within the service limit, replace the 3rd/4th synchro hub and 3rd/4th synchro sleeve as a set.

   Standard: 25.52-25.57 mm (1.005-1.007 in.)

   Service Limit: 25.45 mm (1.002 in.)

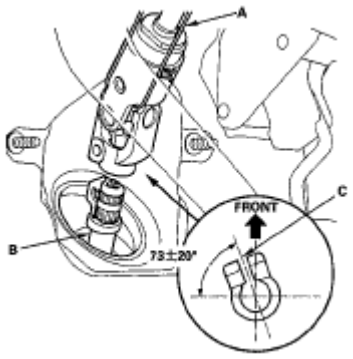

Fig. 86: Identifying Thickness Of 4th Gear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Measure clearance between the distance collar (A) and 5th gear (B) with a dial indicator (C). If the clearance is more than the service limit, go to step 8.

   Standard: 0.06-0.14 mm (0.002-0.006 in.)

   Service Limit: 0.23 mm (0.009 in.)

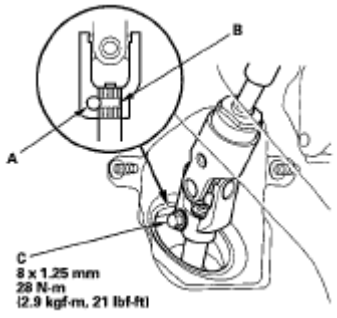

Fig. 87: Identifying Clearance Between Distance Collar And 5th Gear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Measure length (1) of the distance collar as shown
   - If the length (1) is not within the standard, replace the distance collar.
   - If the length (2) is within the standard, go to step 9.

   Standard: 22.53-22.56 mm (0.887-0.888 in.)

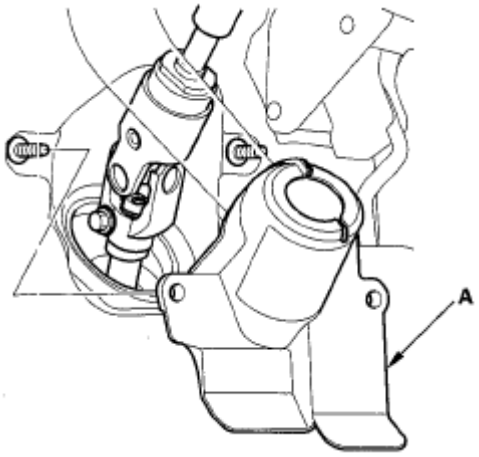

Fig. 88: Identifying Length Of Distance Collar
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Measure thickness of 5th gear.
   - If the thickness is less than the service limit, replace 5th gear.
   - If the thickness is within the service limit, replace the 5th synchro hub and 5th synchro sleeve as a set.

   Standard: 22.42-22.47 mm (0.883-0.885 in.)

   Service Limit: 22.35 mm (0.880 in.)

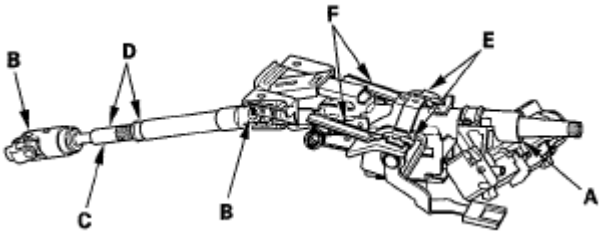

Fig. 89: Identifying Thickness Of 5th Gear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Measure length of the MBS distance collar.

    If the length is not within the standard, replace the MBS distance collar.

    Standard: 24.03-24.08 mm (0.946-0.948 in)

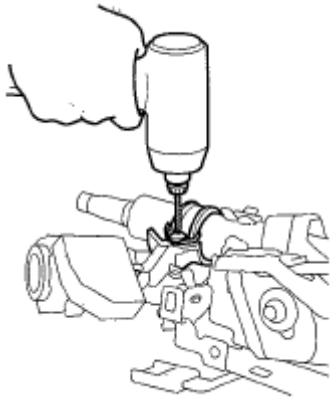

Fig. 90: Identifying Length Of MBS Distance Collar

MAINSHAFT INSPECTION

1. Inspect the gear and bearing contact areas for wear and damage, then measure the mainshaft at points A, B, C, D, and E. If any part of the mainshaft is less than the service limit, replace it.

   Standard:

   A. **Ball Bearing Contact Area (Transmission Housing Side): 24.987-25.000 mm (0.9837-0.9843 in.)**
   B. **Distance Collar Contact Area: 28.992-29.005 mm (1.1414-1.1419 in.)**
   C. **Needle Bearing Contact Area: 34.984-35.000 mm (1.3773-1.3780 in.)**
   D. **Ball Bearing Contact Area (Clutch Housing Side): 25.977-25.990 mm (1.0227-1.0232 in.)**
   E. **Bushing Contact Area: 18.800-18.850 mm (0.7402-0.7421 in.)**

   Service Limit:

   A. **24.93 mm (0.981 in.)**
   B. **28.93 mm (1.139 in.)**
   C. **34.93 mm (1.375 in.)**
   D. **25.92 mm (1.020 in.)**
   E. **18.75 mm (0.738 in.)**

COUNTERSHAFT ASSEMBLY CLEARANCE INSPECTION

1. Measure clearance between 1st gear (A) and the distance collar (B) with a feeler gauge (C). If the clearance is more than the service limit, go to step 2.

   Standard: 0.06-0.21 mm (0.002-0.008 in.)

   Service Limit: 0.25 mm (0.010 in.)

Wire side of female terminals

Fig. 100: Measuring Clearance Between 1st Gear And Distance Collar

2. Measure length of the distance collar as shown.
   - If the length is not within than the standard, replace the distance collar.
   - If the length is within the standard, go to step 3.

Standard: 21.53-21.58 mm (0.843-0.849 in.)

Wire side of female terminals

Fig. 101: Identifying Length Of Distance Collar

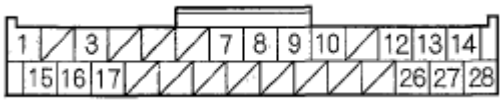
3. Measure thickness of 1st gear.
   - If the thickness is less than the service limit, replace 1st gear.
   - If the thickness is within the service limit, replace the 1st/2nd synchro hub and reverse gear as a set.

   Standard: 27.42-27.47 mm (1.080-1.081 in.)



Wire side of female terminals

5. Measure length of the distance collar.
   - If the length is not within the standard, replace the distance collar.
   - If the length is within the standard, go to step 6.

Standard: 26.53-26.56 mm (1.044-1.046 in.)

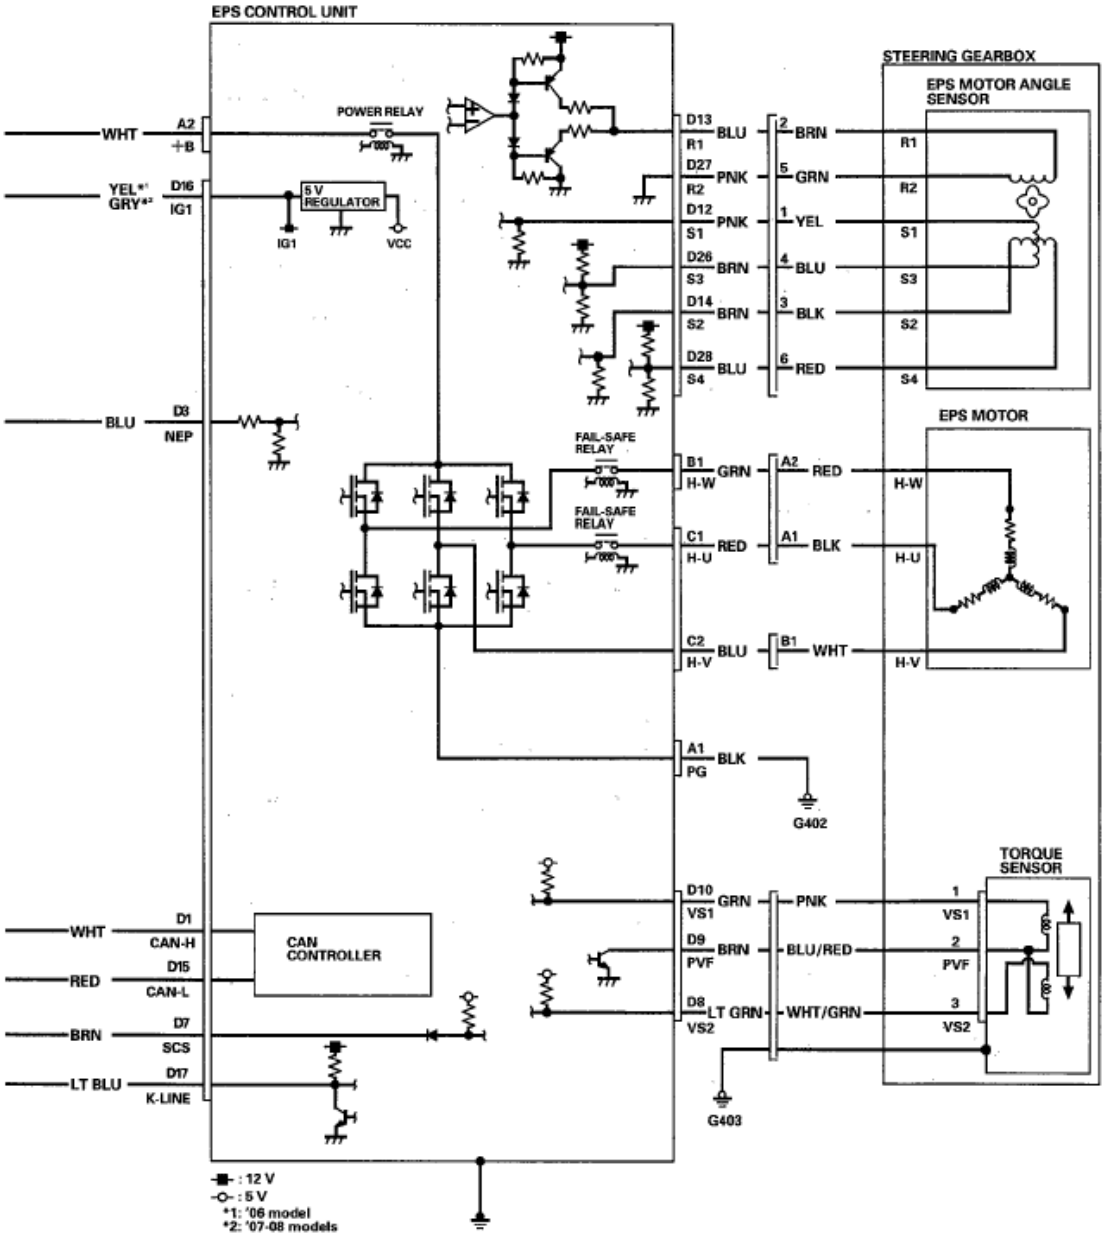

Fig. 104: Identifying Length Of Distance Collar
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Measure thickness 2nd gear.
   - If the thickness is less than the service limit, replace 2nd gear.
   - If the thickness is within the service limit, replace the 1st/2nd synchro hub and reverse gear as a set.

Standard: 26.42-26.47 mm (1.040-1.042 in.)

COUNTERSHAFT INSPECTION

1. Inspect the gear and bearing contact areas for wear and damage, then measure countershaft at points A, B, and C. If any part of the countershaft is less than the service limit, replace it.

   Standard:

   A. **Ball Bearing Contact Area (Transmission Housing Side): 26.020-26.033 mm (1.0244-1.0249 in.)**

B. **Distance Collar Contact Area: 38.987-39.000 mm (1.5349-1.5354 in.)**
C. **Needle Bearing Contact Area (Clutch Housing Side): 34.000-34.015 mm (1.3386-1.3392 in.)**

Service Limit:

A. **25.97 mm (1.022 in.)**
B. **38.94 mm (1.533 in.)**
C. **33.95 mm (1.337 in.)**

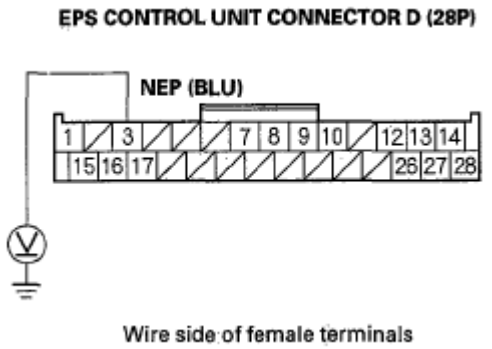

Fig. 111: Identifying Countershaft

Special Tools Required

- Driver, 40 mm I.D. 07746-0030100
- Attachment, 30 mm I.D. 07746-0030300

NOTE: Refer to the Exploded View, as needed, during this procedure.

1. Clean all parts in solvent, dry them, and apply MTF to all contact surfaces.
2. Install the distance collar and the needle bearing onto the countershaft.
3. Install the 1st gear synchro ring (A), synchro spring (B) and the friction damper (C) on the 1st/2nd synchro hub (D).

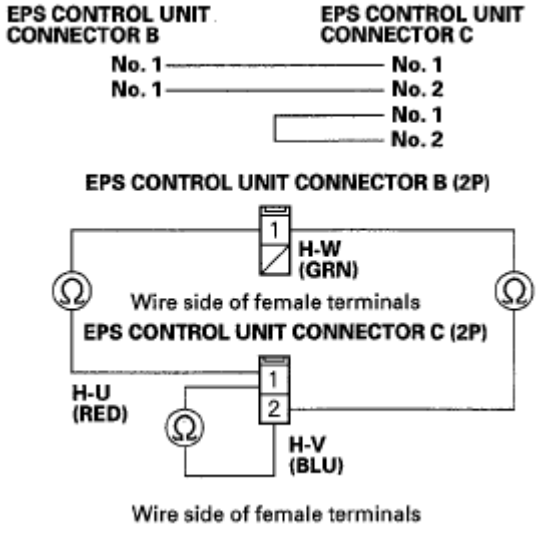

Fig. 114: Installing 1st Gear Synchro Ring

4. Align the fingers (E) on the friction damper with the grooves (F) on the 1st/2nd synchro hub, then

install the 1st gear (G) onto the 1st/2nd synchro hub.

5. Supporting by hand, turn the 1st/2nd synchro hub side upward, then install the 1st/2nd synchro hub with 1st gear on to the counter shaft.
6. Support the countershaft (A) on steel blocks, then install the 1st/2nd synchro hub (B) with 1st gear (C) using the 40 mm I.D. driver (D), 30 mm I.D. attachment (E), and a press (F).

NOTE: Do not exceed the maximum pressure.

15. Measure clearance between the old bearing (A) and the 32 mm shim (B) with a feeler gauge (C).

Standard: 0.04-0.10 mm (0.0016-0.0039 in.)

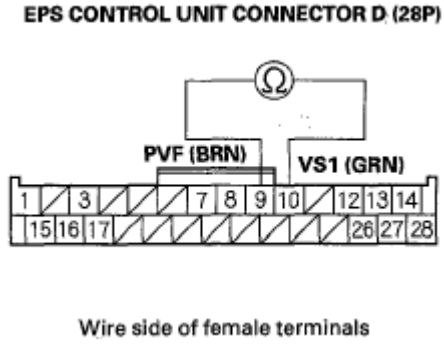

Fig. 121: Measuring Clearance Between Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. If the clearance is more than the standard, select a new shim from the following table. If the clearance measured in step 15 is within the standard, replace only the new ball bearing.

SHIM SPECIFICATION 32 MM

	Part Number	Thickness
A	23971-RPF-000	1.56 mm (0.061 in.)
B	23972-RPF-000	1.60 mm (0.063 in.)

C	23973-RPF-000	1.64 mm (0.065 in.)
D	23974-RPF-000	1.68 mm (0.066 in.)
E	23975-RPF-000	1.72 mm (0.068 in.)
F	23976-RPF-000	1.76 mm (0.069 in.)
G	23977-RPF-000	1.80 mm (0.071 in.)
H	23978-RPF-000	1.84 mm (0.072 in.)
J	23979-RPF-000	1.88 mm (0.074 in.)
K	23980-RPF-000	1.92 mm (0.076 in.)

21. Tighten the new special bolt (B) (left-hand threads).

SYNCHRO SLEEVE AND HUB INSPECTION AND REASSEMBLY

1. Inspect gear teeth on all synchro hubs and synchro sleeves for rounded off corners, which indicate wear.
2. Install each synchro hub (A) in its mating synchro sleeve (B), and check for free movement. Make sure to match the three sets of longer teeth (C) (120 degrees apart) on the synchro sleeve with the three sets of deeper grooves (D) in the synchro hub.

NOTE:

- **Do not install the synchro sleeve with its longer teeth in the synchro hub slots (E) because it will damage the spring ring.**
- **If replacement is required, always replace the synchro sleeve and synchro hub as a set.**

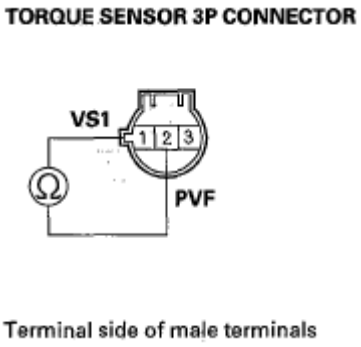

Fig. 125: Inspecting Gear Teeth On Synchro Hubs And Synchro Sleeves

SYNCHRO RING AND GEAR INSPECTION

1. Inspect the inside of each synchro ring (A) for wear. Inspect the teeth (B) on each synchro ring for wear (rounded off).

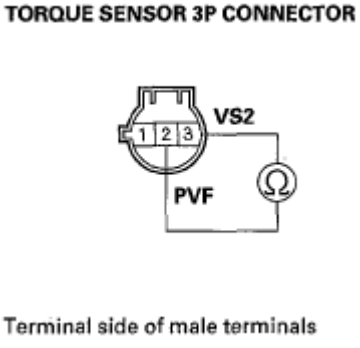

Fig. 126: Locating Synchro Ring Teeth
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Inspect the teeth (A) on each synchro sleeve and matching teeth on each gear for wear (rounded off).

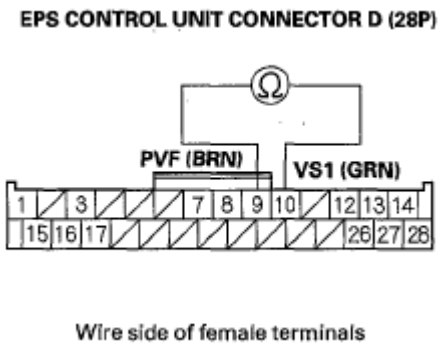

Fig. 127: Locating Synchro Sleeve And Matching Teeth
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Inspect the thrust surface (A) on each gear hub for wear.

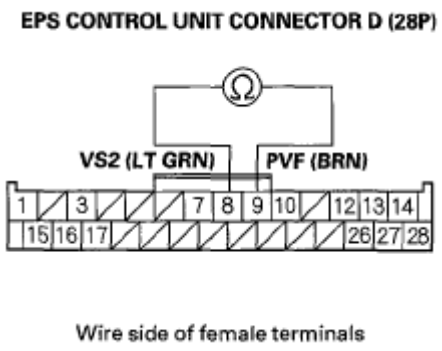

Fig. 128: Locating Thrust Surface On Gear Hub For Wear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Inspect the cone surface (B) on each gear hub for wear and roughness.
5. Inspect the teeth on all gears (C) for uneven wear, scoring, and cracks.
6. Coat the cone surface of each gear with MTF, and place its synchro ring on it. Rotate the synchro ring, making sure that it does not slip.
7. Measure clearance between each gear (A) and its synchro ring (B) all around the gear. Hold the synchro ring against the gear evenly while measuring clearance. If the clearance is less than the service limit, replace the synchro ring and gear.

   Synchro Ring-to-Gear Clearance

   Standard: 0.655-1.334 mm (0.026-0.053 in.)

   Service Limit: 0.4 mm (0.016 in.)

MAINSHAFT BEARING AND OIL SEAL REPLACEMENT

Special Tools Required

- Oil seal driver 07JAD-PL90100
- Adjustable bearing puller, 20-40 mm 07736-A01000B
- Attachment, 42x47 mm 07746-0010300
- Driver 07749-0010000

- Slide hammer, 3/8-16 UNF commercially available

1. Remove the ball bearing (A) from the clutch housing (B) using the 20-40 mm adjustable bearing puller (C) and a commercially available 3/8"-16 UNF slide hammer (D).

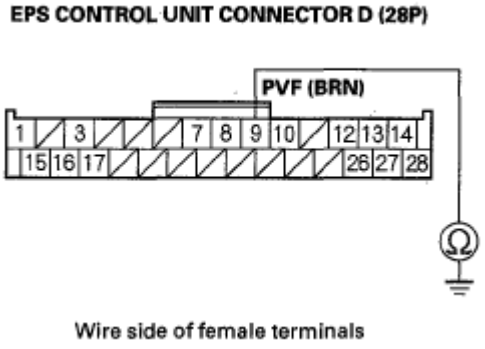

Fig. 130: Removing Ball Bearing From Clutch Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the oil seal (A) from the clutch side. Be careful when removing the oil seal so the clutch housing is not damaged.

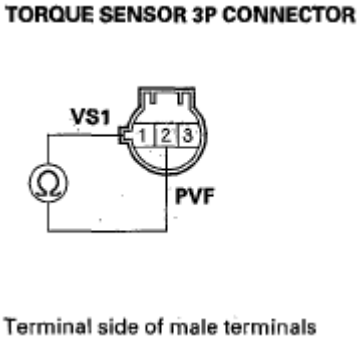

Fig. 131: Locating Oil Seal From Clutch Side

COUNTERSHAFT BEARING REPLACEMENT

Special Tools Required

- Oil seal driver 07JAD-PL90100
- Adjustable bearing puller, 20-40 mm 07736-A01000B
- Slide hammer, 3/8"-16 UNF commercially available

1. Remove the needle bearing (A) using the 20-40 mm adjustable bearing puller (B) and a commercially available 3/8"-16 UNF slide hammer (D), then remove oil guide plate C.

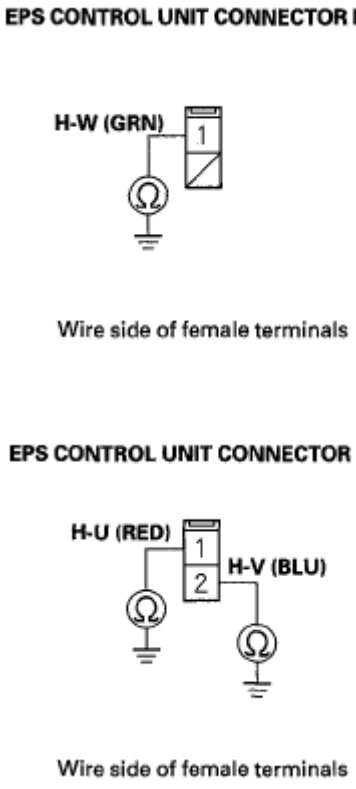

Fig. 134: Removing Needle Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Position oil guide plate C and new needle bearing (A) in the bore of the clutch housing (B).

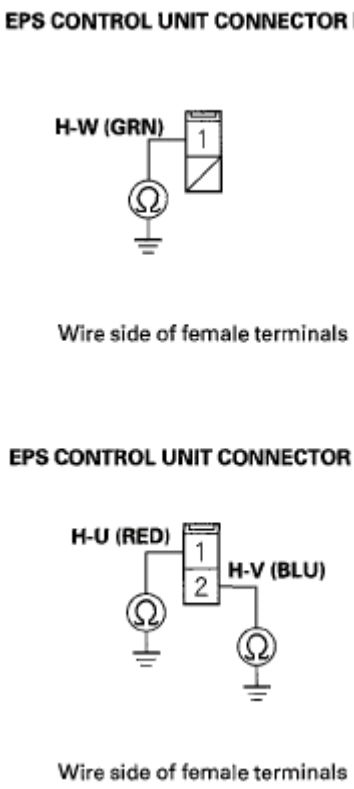

Fig. 135: Installing Needle Bearing

3. Install the needle bearing using the oil seal driver (D).

MAINSHAFT THRUST CLEARANCE ADJUSTMENT

Special Tools Required

- Mainshaft holder 07GAJ-PG20110
- Mainshaft base 07GAJ-PG20130

1. Remove the 52 x 62 mm shim (A) and oil guide plate M from the transmission housing (B).

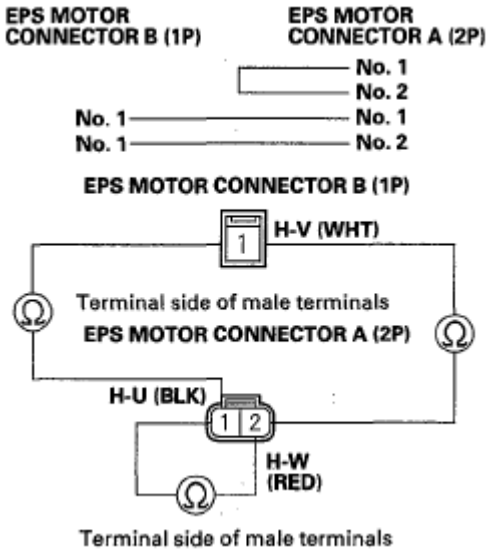

Fig. 136: Identifying Shim And Oil Guide Plate
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Thoroughly clean the 36 mm spring washer (A) and 26 mm washer (B) before installing them on the clutch housing side ball bearing (C). Note the installation direction of the spring washer.

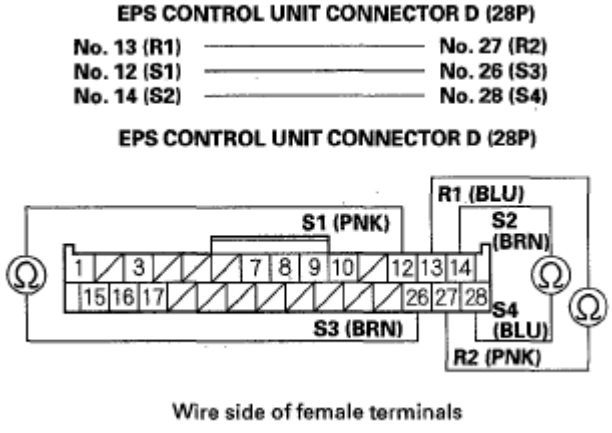

Fig. 137: Identifying Spring Washer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the 3rd/4th synchro hub, the 4th/5th gear distance collar, the 5th synchro hub, the MBS distance collar, and angular ball bearing on the mainshaft.

NOTE: Refer to the MAINSHAFT REASSEMBLY EXPLODED VIEW .

4. Install the mainshaft in the clutch housing.
5. Place the transmission housing over the mainshaft and onto the clutch housing.
6. Tighten the clutch and transmission housings with several 8 mm bolts.

NOTE: It is not necessary to use sealing agent between the housings for this procedure.

7. Lightly tap on the mainshaft with a plastic hammer.
8. Attach the mainshaft holder (A) and mainshaft base (B) to the mainshaft as follows:
   - Backout the mainshaft holder bolt (C), and loosen the two hex bolts (D).
   - Fit the holder over the mainshaft so its lip is toward the transmission.
   - Align the mainshaft holder lip around the groove at the inside of the mainshaft splines, then tighten the hex bolts.

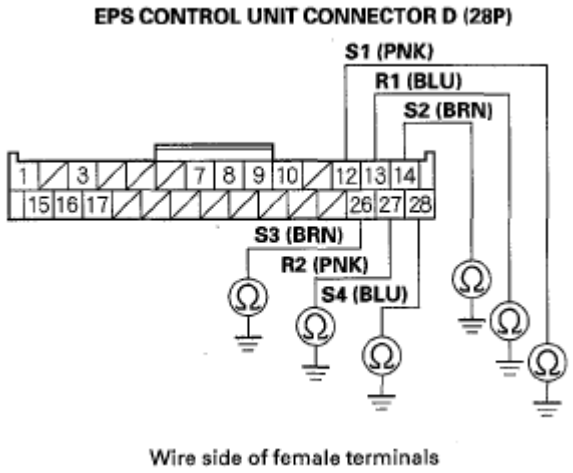

Fig. 138: Identifying Mainshaft Holder And Mainshaft Base
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Fully seat the mainshaft by tapping its end with a plastic hammer.
10. Thread the mainshaft holder bolt in until it just contacts the wide surface of the mainshaft base.
11. Zero a dial gauge (A) on the end of the mainshaft.

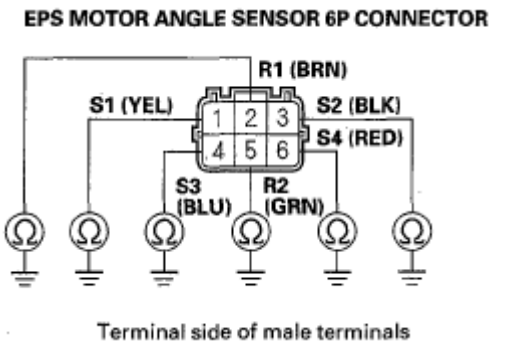

Fig. 139: Identifying Dial Gauge On End Of Mainshaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Turn the mainshaft holder bolt (B) clockwise; stop turning when the dial gauge has reached its maximum movement. The reading on the dial gauge is the amount of mainshaft thrust clearance.

NOTE: Do not turn the mainshaft holder bolt more than 60 degrees after the needle of the dial gauge stops moving. Applying more pressure with the mainshaft holder bolt could damage the transmission.

13. If the reading is with in the standard, the clearance is correct. If the reading is not within the standard, select the appropriate shim needed from the table, and recheck the thrust clearance.

Standard: 0.11-0.18 mm (0.004-0.007 in.)

(Example)

Measure reading: 1.93 mm (0.0759 in.)

Subtract the total clearance measurement from the middle of the clearance standard 0.14 mm (0.0055 in.)

1.93 - 0.14 = 1.79 mm (0.0705 in.)

Select the shim closest to the amount calculated, for example the 1.78 mm (0.0701 in.) shim.

14. With oil guide plate M and the appropriate size shim installed in the transmission housing, check the thrust clearance again to verify the clearance is within the standard.

TRANSMISSION REASSEMBLY

NOTE:

- **Prior to reassembling, clean all the parts in solvent, dry them, and apply MTF to any contact surfaces.**
- **Place the clutch housing on two pieces of wood thick enough to keep the mainshaft from hitting the workbench.**

1. Install the magnet (A) and differential assembly (B).

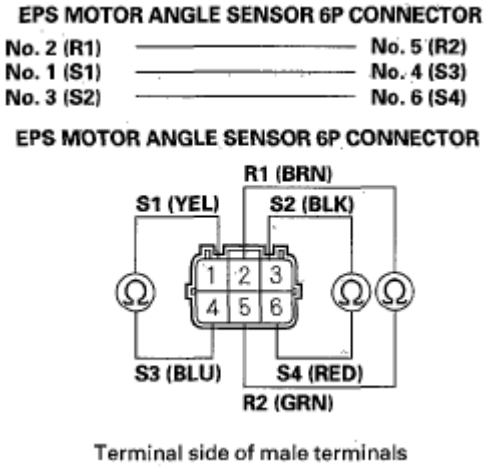

Fig. 140: Identifying Magnet And Differential Assembly
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the 36 mm spring washer (A) and 26 mm washer (B) over the ball bearing (C). Note the installation direction of the spring washer.

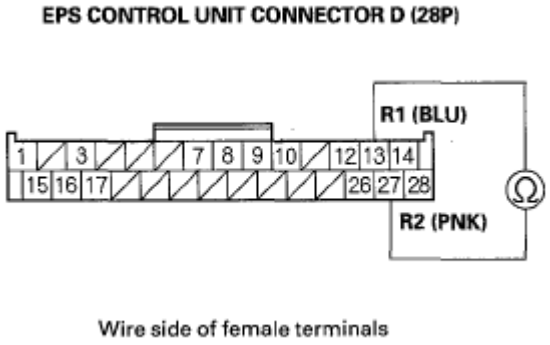

Fig. 141: Identifying Spring Washer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Apply tape on the mainshaft (D) spline to protect the seal. Install the mainshaft assembly and countershaft assembly (E) into the shift forks (F), and install them as an assembly.
4. Install the reverse idler gear (A) and the reverse gear shaft (B).

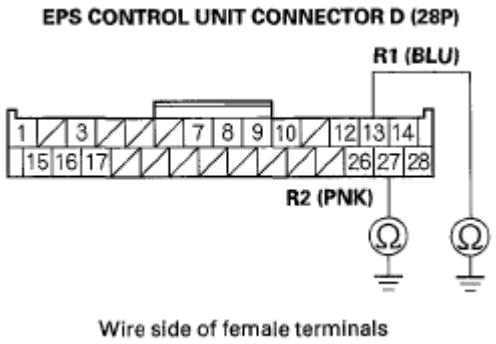

Fig. 142: Identifying Reverse Idler Gear And Reverse Gear Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the reverse shift fork.

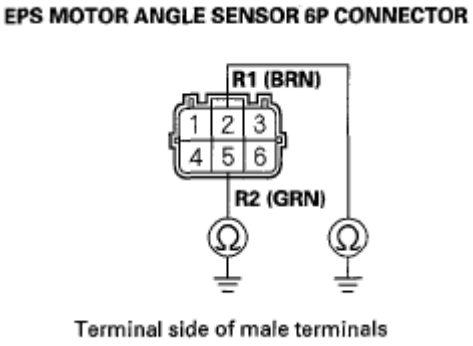

Fig. 143: Identifying Reverse Shift Fork (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Select the proper size 52 x 62 mm shim (A) according to the measurements made during the Mainshaft Thrust Clearance Adjustment (see **MAINSHAFT THRUST CLEARANCE ADJUSTMENT**). Install the oil gutter plate (B), oil guide plate M, and the 52 x 62 mm shim into the transmission housing (C).

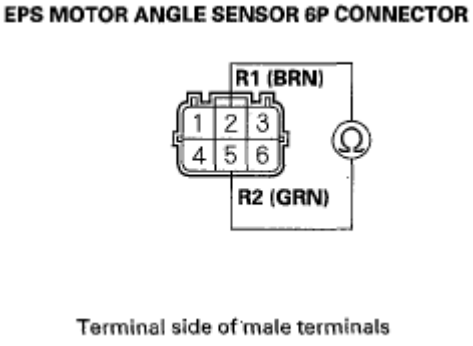

Fig. 144: Identifying Oil Gutter Plate
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Clean any dirt or oil from the transmission housing sealing surface.
8. Apply liquid gasket (P/IM 08718-0002) evenly to the mating surface of the transmission housing and clutch housing. Install the component within 5 minutes of applying the liquid gasket.

NOTE:

- **If you apply liquid gasket P/N 08718-0012, the component must be installed within 4 minutes.**
- **If too much time has passed after applying the liquid gasket, remove the old liquid gasket residue, then reapply new liquid gasket.**

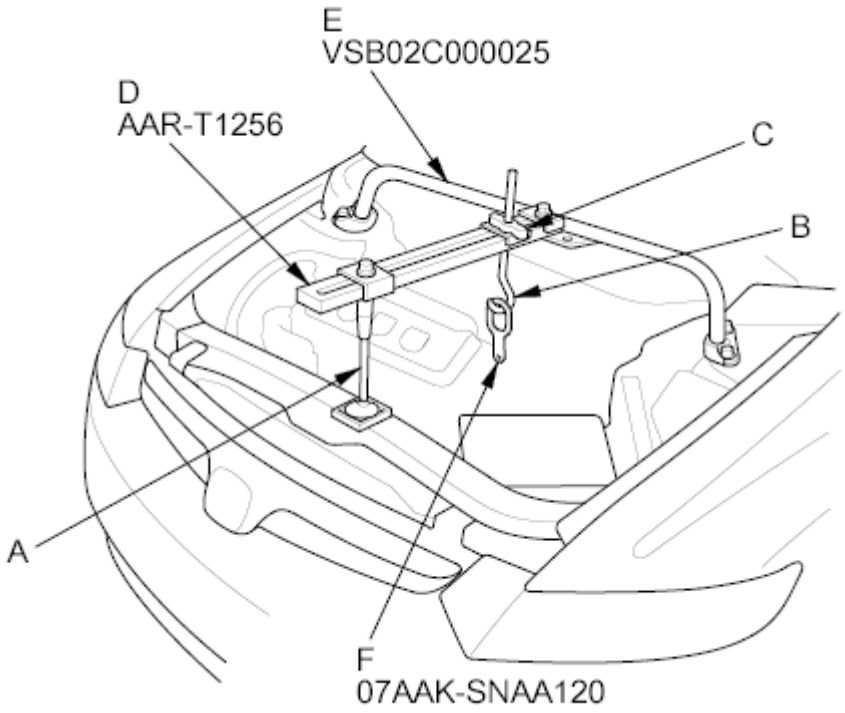

Fig. 145: Identifying Liquid Gasket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Install the two 14 x 20 mm dowel pins (A).

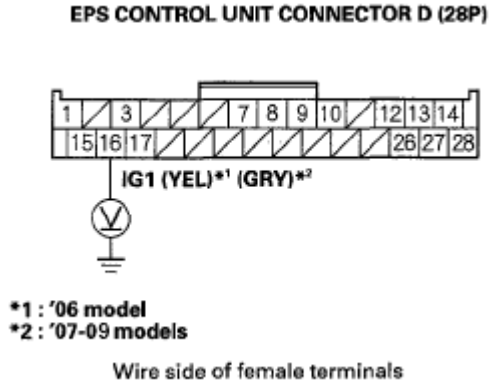

Fig. 146: Identifying Dowel Pins
Courtesy of AMERICAN HONDA MOTOR CO., INC.

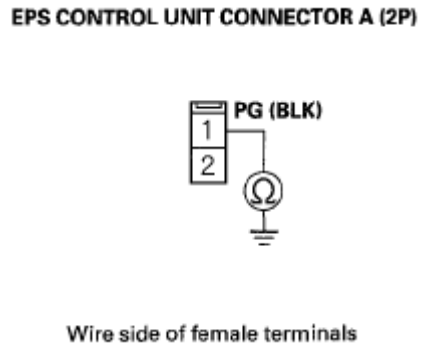

Fig. 147: Identifying Snap Ring Groove Dimension
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Set the tapered cone ring (B) as shown. Place the transmission housing over the clutch housing, being careful to line up the shafts.
11. Lower the transmission housing the rest of the way as you expand the 69 mm snap ring (C). Release the snap ring so it seats in the groove of the countershaft bearing.
12. Make sure the 69 mm snap ring is securely seated in the groove of the countershaft bearing.

Dimension (1) as installed: 3.3-6.5 mm (0.13-0.25 in.)

13. Apply liquid gasket (P/N 08718-0002) evenly to the threads of the 32 mm sealing cap (D), and install it on the transmission housing. Install the component within 5 minutes of applying the liquid gasket.

NOTE:

- **If you apply liquid gasket P/N 08718-0012, the component must be installed within 4 minutes.**
- **If too much time has passed after applying the liquid gasket, remove the old liquid gasket residue, then reapply new liquid gasket.**

14. Install the 8 mm flange bolts finger-tight.

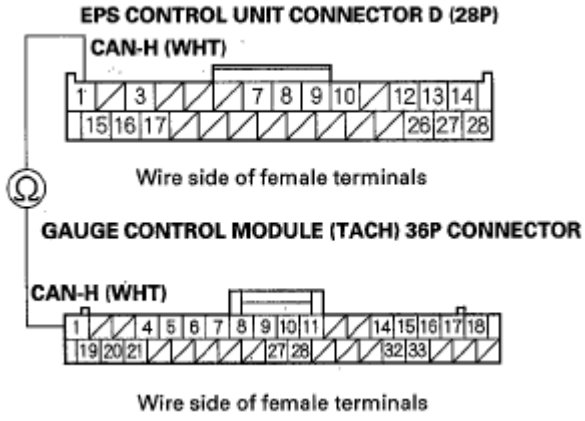

Fig. 148: Identifying Flange Bolts Finger-Tight
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Tighten the 8 mm flange bolts in a crisscross pattern in several steps.

Specified Torque:

8x1.25 mm

27 N.m (2.8 kgf.m, 20 lbf.ft)

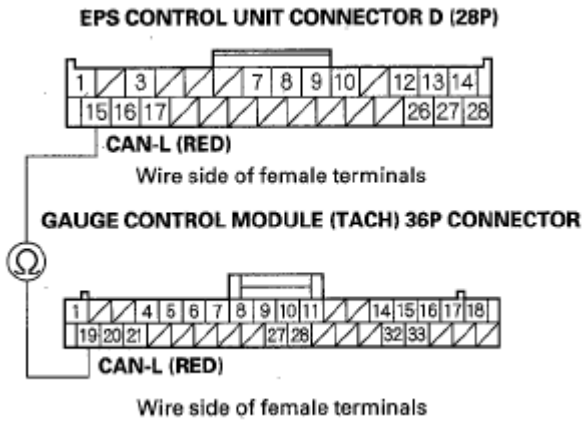

Fig. 149: Identifying Tightening Flange Bolts In Crisscross Pattern

16. Clean any dirt or oil from the change lever assembly sealing surface.
17. Apply liquid gasket (P/N 08718-0002) evenly to the mating surface of the change lever assembly and the transmission housing. Install the component within 5 minutes of applying the liquid gasket.

NOTE:

- **If you apply liquid gasket P/N 08718-0012, the component must be installed within 4 minutes.**
- **If too much time has passed after applying the liquid gasket, remove the old liquid gasket residue, then reapply new liquid gasket.**
- **Allow it to cure at least 30 minutes after assembly before filling the transmission with MRF.**

BACKLASH INSPECTION

1. Place the differential assembly on V-blocks (A), and install the intermediate shaft (B) and the left driveshaft (C).

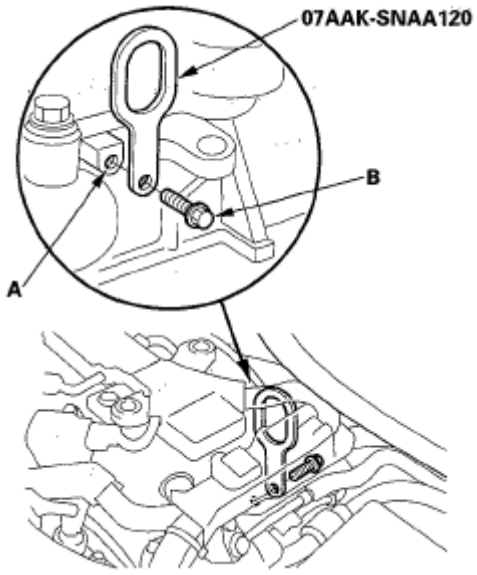

Fig. 158: Placing Differential Assembly On V-Blocks
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Measure backlash of both pinion gears (D) with a dial indicator (E). If the backlash is not within the standard, replace the differential carrier.

   Standard (New): 0.05-0.15 mm (0.002-0.006 in.)

DIFFERENTIAL CARRIER, FINAL DRIVEN GEAR REPLACEMENT

1. Remove the bolts (left-hand threads) in a crisscross pattern in several steps, then remove the final driven gear (A) from the differential carrier (B).

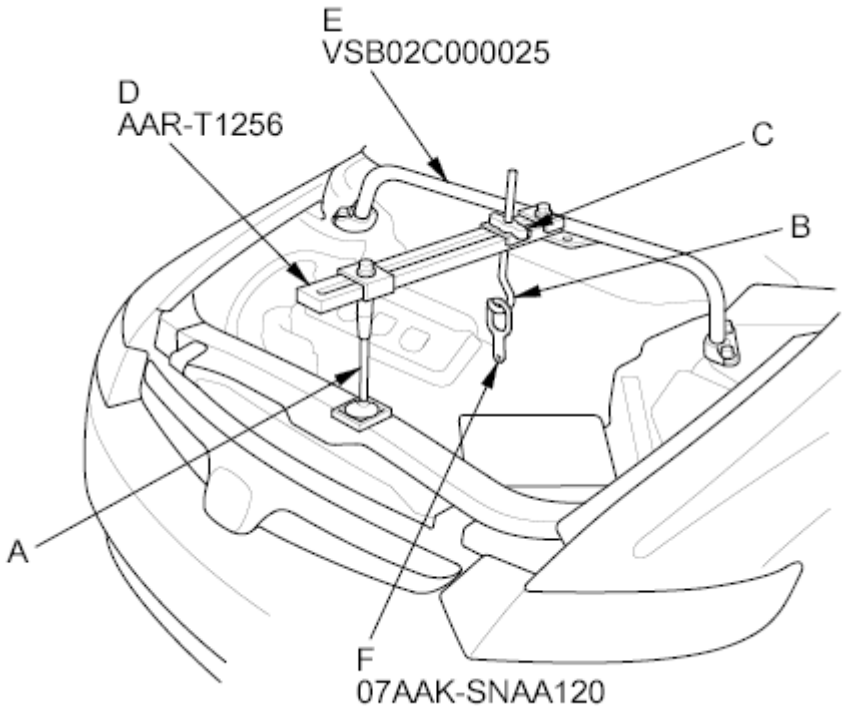

Fig. 159: Identifying Driven Gear From Differential Carrier (With Torque Specifications) Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the final driven gear with the chamfer on the inside diameter facing the carrier. Tighten the bolts in a crisscross pattern in several steps.

CARRIER BEARING REPLACEMENT

Special Tool Required

Driver, 40 mm I.D. 07746-0030100

1. Check the carrier bearings for wear and rough rotation. If they rotate smoothly and their rollers show no signs of wear, the bearings are OK.
2. Remove the carrier bearings (A) with a commercially available bearing puller (B).

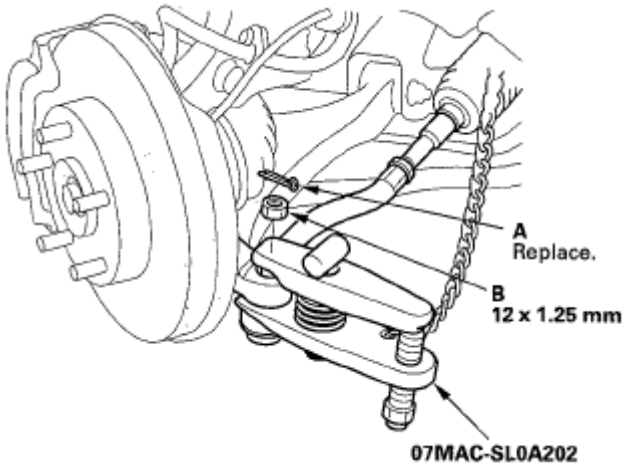

Fig. 160: Identifying Special Tool
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the new bearings (A) with the 40 mm I.D. driver (B) and a press. Press on each bearing until it bottoms. There should be no clearance between the bearings and the carrier.

NOTE: Place the seal (C) part of the bearing towards the outside of the differential, and install it.

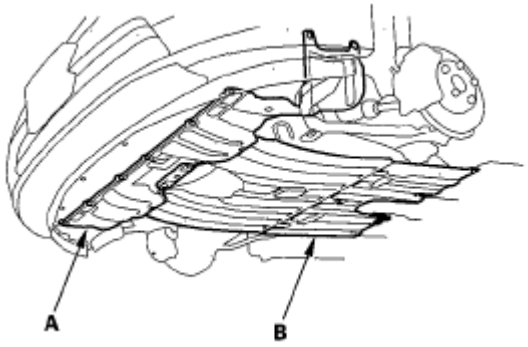

Fig. 161: Identifying Special Tool

OIL SEAL REPLACEMENT

Special Tools Required

- Oil seal driver 07JAD-PL90100
- Oil seal driver attachment 07NAD-P20A100
- Driver 07749-0010000

1. Remove the oil seal (A) from the transmission housing (B).

DIFFERENTIAL THRUST CLEARANCE ADJUSTMENT

Special Tool Required

Driver, 40 mm I.D. 07746-0030100

1. If you removed the 80 mm shim from the transmission housing, reinstall the same size shim.

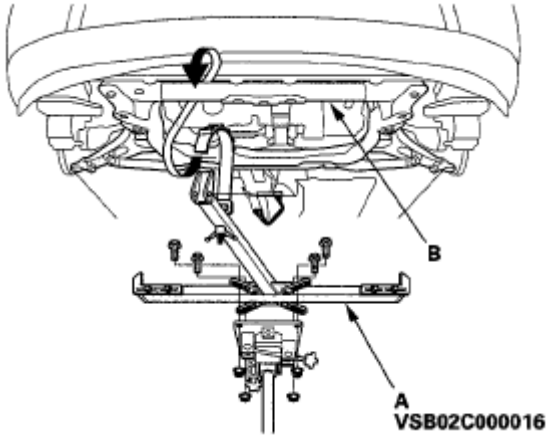

Fig. 166: Identifying Transmission Housing Shim
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the differential assembly into the clutch housing.

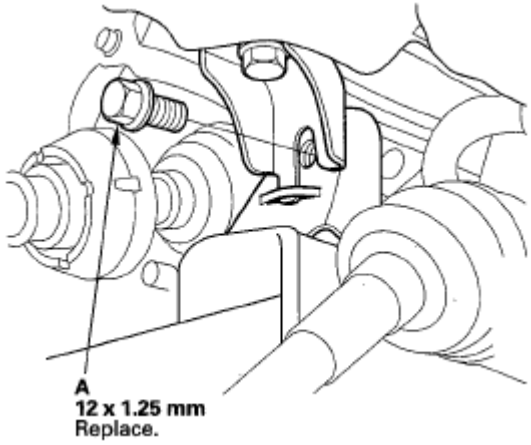

Fig. 167: Identifying Differential Assembly Into Clutch Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the transmission housing onto the clutch housing, then tighten the 8 mm flange bolts in a crisscross pattern in several steps (see step 15).

   Specified Torque

   8x1.25 mm

   27 N.m (2.8 kgf.m, 20 lbf.ft)

4. Use the 40 mm I.D. driver (A) to bottom the differential assembly in the clutch housing.

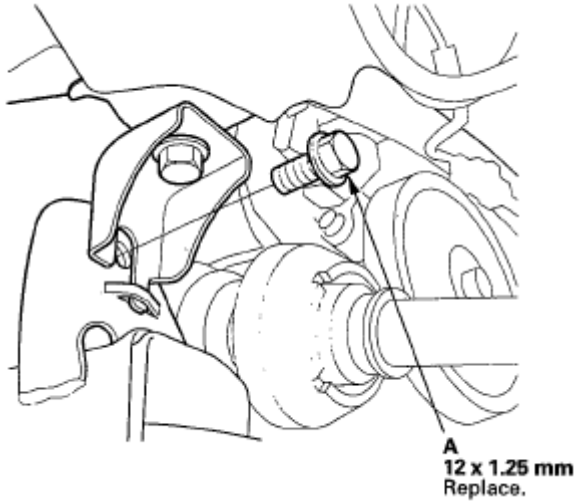

Fig. 168: Installing Differential Assembly In Clutch Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Measure clearance between 80 mm shim and bearing outer race in transmission housing.

   Standard: 0-0.10 mm (0-0.0039 in.)

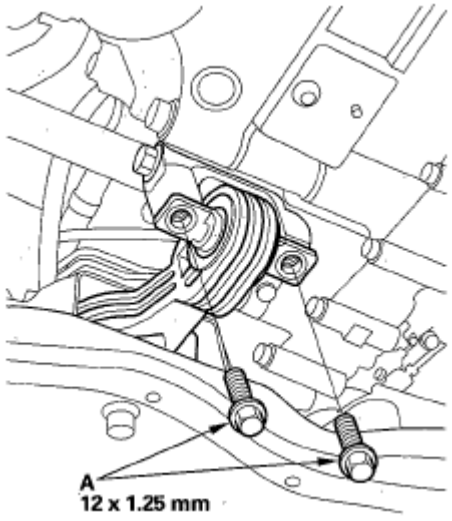

Fig. 169: Measuring Clearance Between Shim And Bearing Outer Race In Transmission Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. If the clearance is more than the standard, select a new 80 mm shim from the following table. If the clearance measured in step 5 is within the standard, go to step 9.

SHIM SPECIFICATION 80 MM

	Part Number	Thickness
A	41441-PL3-B00	1.0 mm (0.039 in.)
B	41442-PL3-B00	1.1 mm (0.043 in.)
C	41443-PL3-B00	1.2 mm (0.047 in.)

R	41456-PL3-B00	1.65 mm (0.065 in.)
S	41457-PL3-B00	1.75 mm (0.069 in.)

7. Remove the bolts and transmission housing.
8. Replace the thrust shim selected in step 6, then recheck the clearance.
9. Reinstall the transmission housing.
