43. Attach the support eyelet (A) to the cylinder head with the support bolt (B). Tighten the bolt by hand.

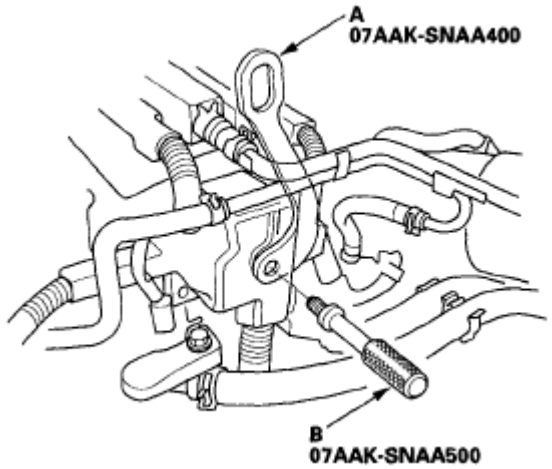

Fig. 19: Identifying Support Eyelet And Support Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

44. Install the front leg assembly (A), hook (B), and wing nut (C) from an A and Reds engine support hanger (AAR-T-12566) onto the engine hanger. Carefully position the engine hanger on the vehicle, and attach the hook to the slotted hole in the support eyelet (D). Tighten the wing nut by hand to lift and support the engine/transmission.

NOTE: Use care when working around the windshield.

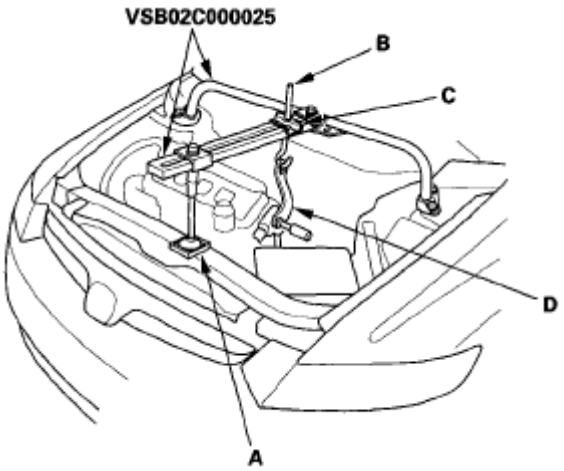

Fig. 20: Identifying Special Tools
Courtesy of AMERICAN HONDA MOTOR CO., INC.

45. Raise the vehicle on the lift to full height.
46. Remove the lower torque rod. M/T

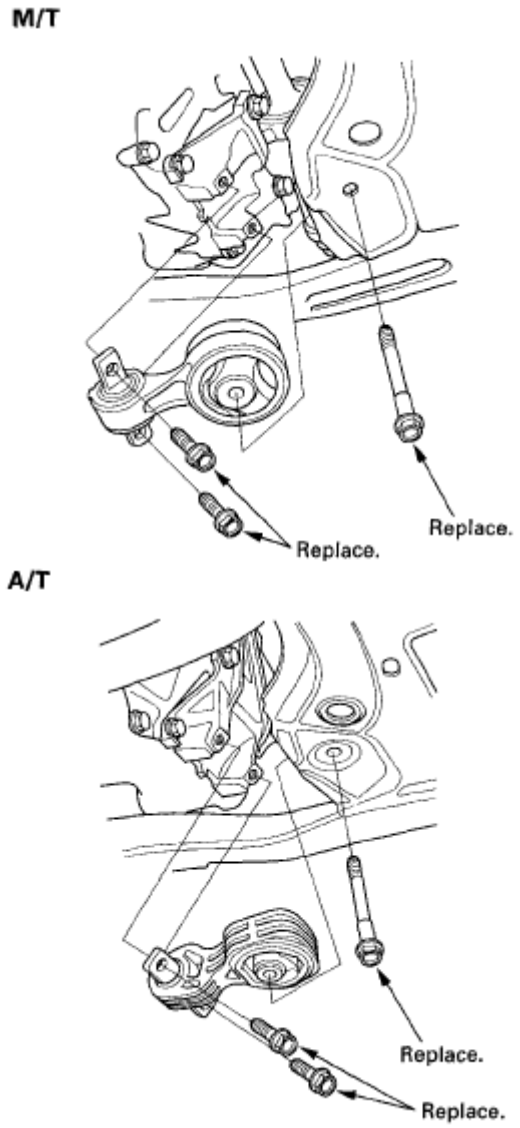

Fig. 21: Identifying Lower Torque Rod
Courtesy of AMERICAN HONDA MOTOR CO., INC.

47. Note the reference marks (A) on both sides of the front subframe that line up with the body (B).

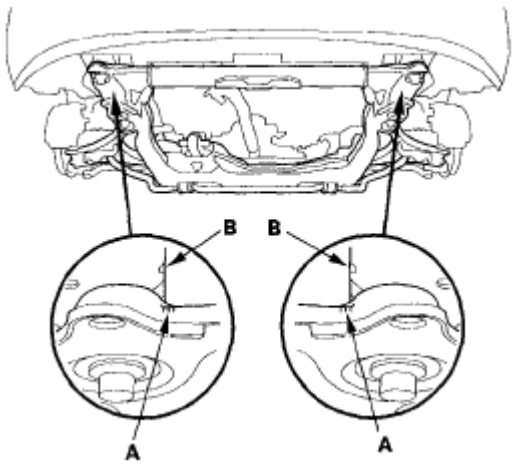

Fig. 22: Identifying Marks On Both Sides Of Front Subframe
Courtesy of AMERICAN HONDA MOTOR CO., INC.

48. Loosen the front subframe body mount bracket mounting bolts (A) on both sides.

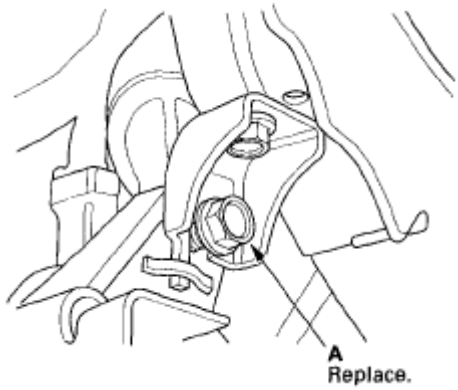

Fig. 23: Identifying Front Subframe Body Bracket Mounting Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

49. Attach the front subframe adapter (A) to the front subframe and hang the belt of the front subframe adapter over the front of the subframe, then secure the belt with its stop.

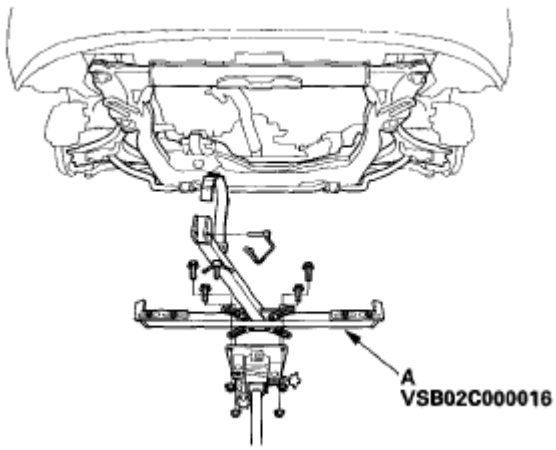

Fig. 24: Identifying Front Subframe Adapter
Courtesy of AMERICAN HONDA MOTOR CO., INC.

50. Raise the jack and line up the slots in the arms with the bolt holes on the corner of the jack base, then attach them with bolts securely.
51. Remove the front subframe.

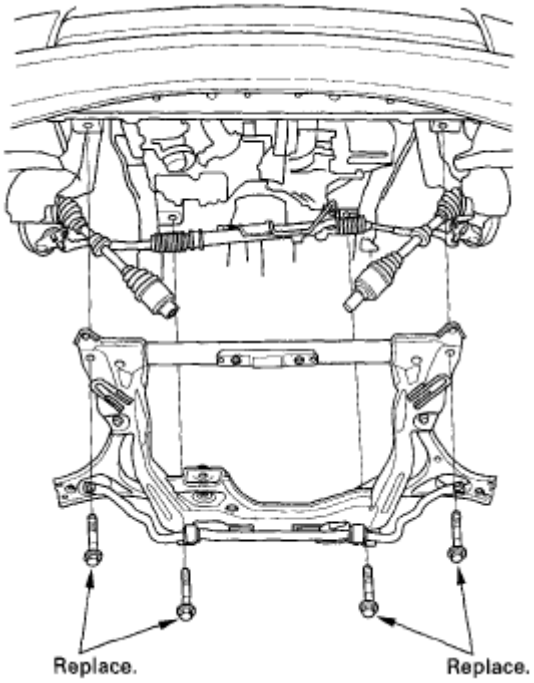

Fig. 25: Identifying Front Subframe Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

52. Lower the vehicle on the lift.
53. Remove the ground cable (A), then install the special tool with a 10 x 1.25 x 20 mm bolt (B).

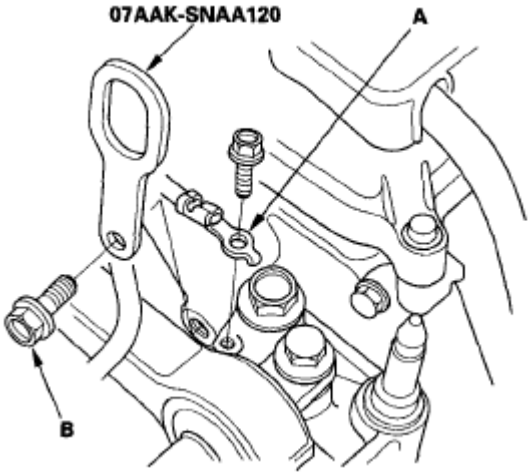

Fig. 26: Identifying Ground Cable
Courtesy of AMERICAN HONDA MOTOR CO., INC.

54. Attach a chain hoist (A) to the special tool (B) and transmission hook (C). Lift up on the engine/transmission until it's securely supported by the chain hoist, and remove the engine support hanger from the engine and vehicle.

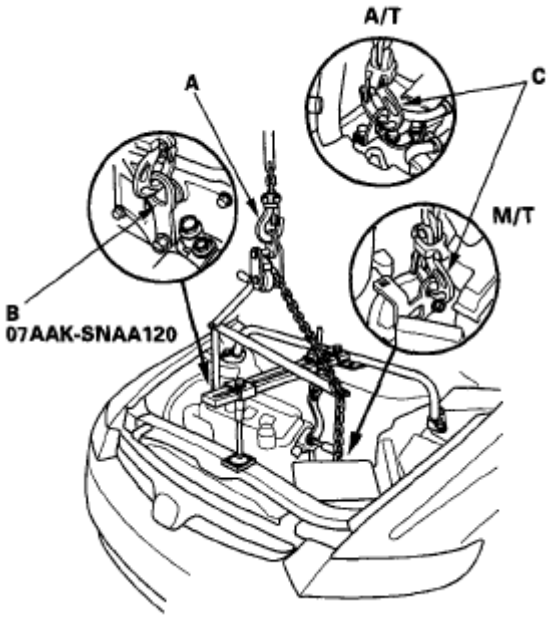

Fig. 27: Lifting Up On Engine/Transmission
Courtesy of AMERICAN HONDA MOTOR CO., INC.

55. Remove the side engine mount bracket mounting bolt and nut.

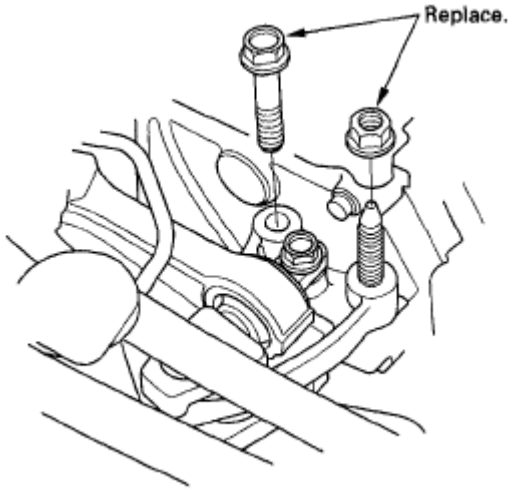

Fig. 28: Identifying Engine Mount Bracket Mounting Bolt And Nut
Courtesy of AMERICAN HONDA MOTOR CO., INC.

56. Remove the transmission mounting bolt and nuts (A).

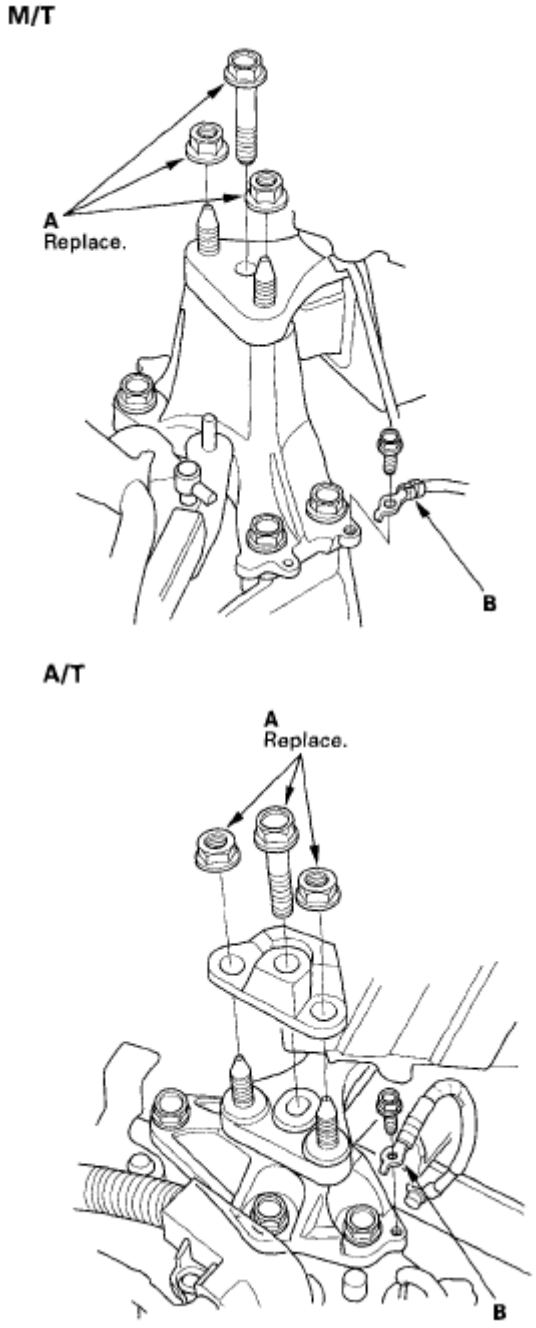

Fig. 29: Identifying Transmission Mounting Bolt And Nuts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

57. Remove the ground cable (B).
58. Check that the engine/transmission is completely free of vacuum hoses, fuel and coolant hoses, and electrical wiring.
59. Slowly lower the engine/transmission about 150 mm (6 in.). Check once again that all hoses and electrical wiring are disconnected and free from the engine/transmission, then lower it all the way.
60. Disconnect the chain hoist from the engine/transmission.
61. Raise the vehicle all the way, and remove the engine/transmission from under the vehicle.

ENGINE INSTALLATION

Special Tools Required

- Universal eyelet 07AAK-SNAA120
- 1.8 support eyelet 07AAK-SNAA400
- 1.8 support bolt 07AAK-SNAA500
- Front subframe adapter VSB02C000016 *
- 2006 Civic engine hanger VSB02C000025 *
- Engine support hanger, A and Reds AAR-T-12566 *

* : Available through Honda Tool and Equipment Program, 1-888-424-6857

1. Install the accessory brackets and tighten their bolts to the specified torques.

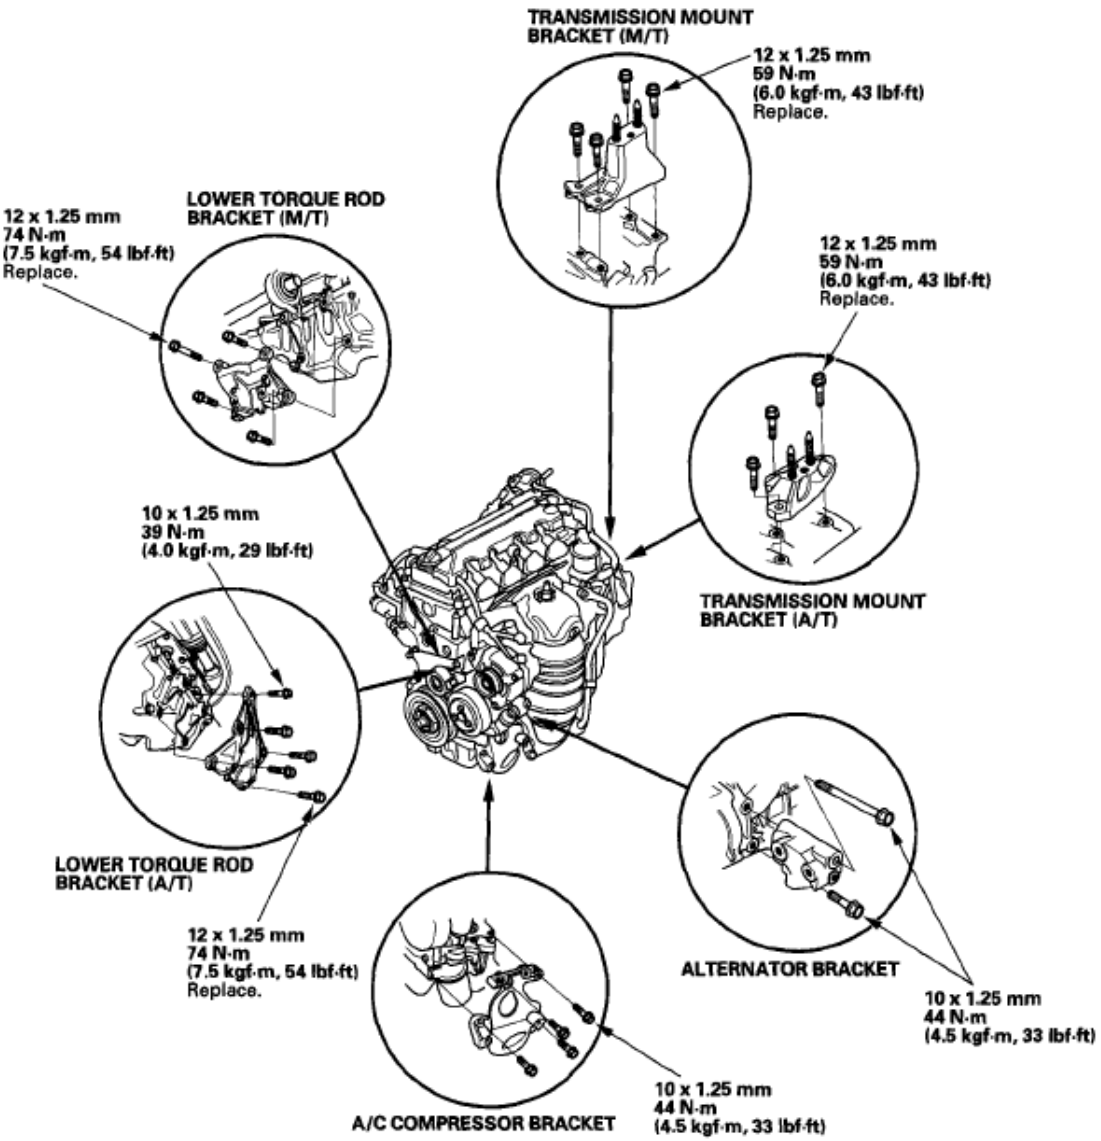

Fig. 30: Identifying Engine Components Location (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Position the engine/transmission under the vehicle. Be sure that they are properly aligned. Carefully

lower the vehicle until the engine and transmission are properly positioned in the engine compartment, Make sure the vehicle is not resting on any part of the engine or transmission. Lift and support the engine with a chain hoist and carefully raise the engine/transmission into place.

NOTE: Reinstall the mounting bolts/support nuts in the sequence given in the following steps. Failure to follow this sequence may cause excessive noise and vibration, and reduce engine mount life.

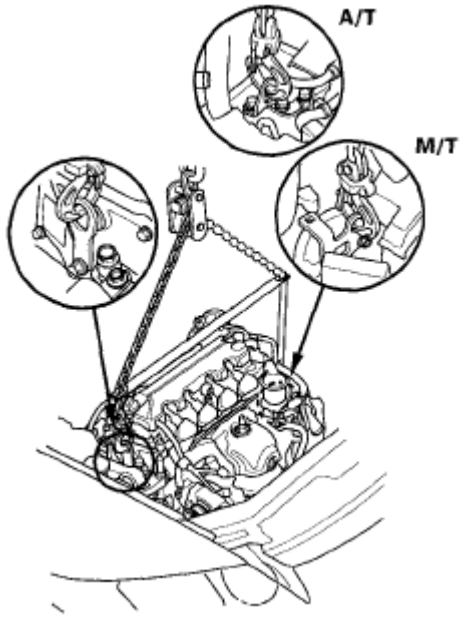

Fig. 31: Lifting Engine With Chain Hoist
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install support eyelet (A) behind the breather pipe (B) and down to the thread hole (C) on the cylinder head.

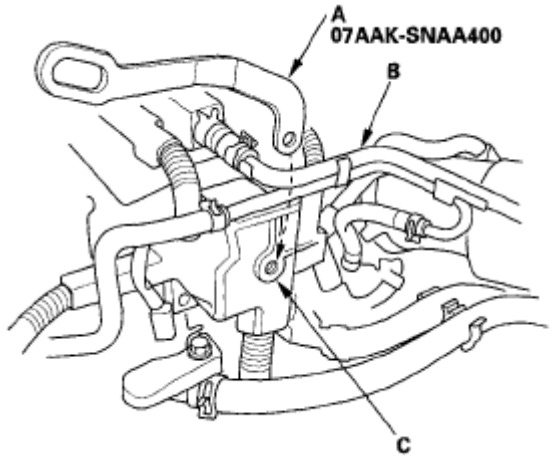

Fig. 32: Identifying Support Eyelet
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Attach the support eyelet (A) to the cylinder head with the support bolt (B). Tighten the bolt by hand.

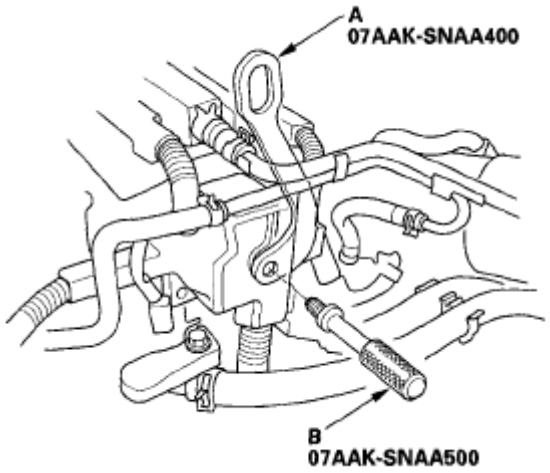

Fig. 33: Identifying Support Eyelet To Cylinder Head With Support Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the front leg assembly (A), hook (B), and wing nut (C) from an A and Reds engine support hanger (AAR-T-12566) onto the engine hanger. Carefully position the engine hanger on the vehicle, and attach the hook to the slotted hole in the support eyelet (D). Tighten the wing nut by hand to lift and support the engine/transmission.

NOTE: Use care when working around the windshield.

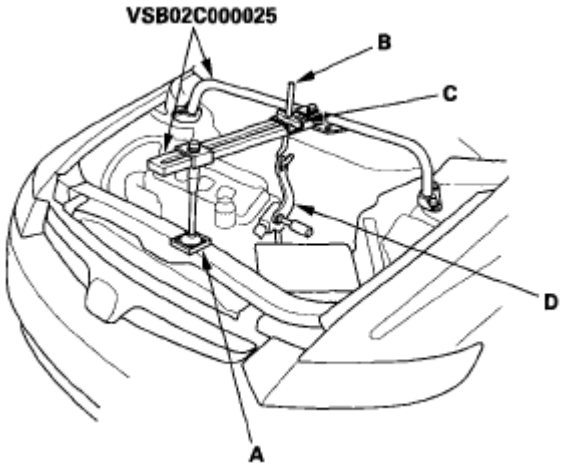

Fig. 34: Identifying Special Tools
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Loosen the upper torque rod mounting bolt (A).

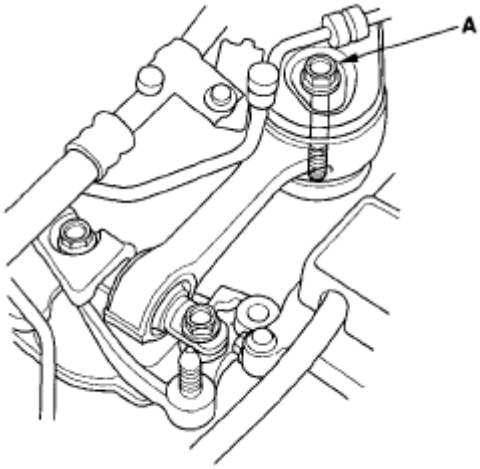

Fig. 35: Identifying Upper Torque Rod Mounting Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Tighten the new side engine mount bracket mounting bolt and nut.

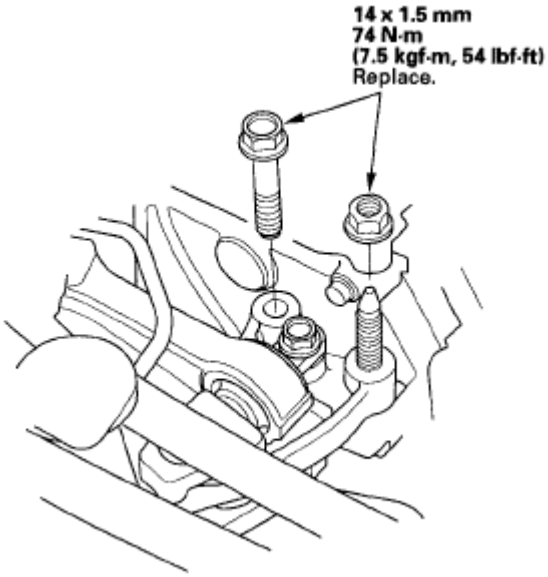

Fig. 36: Identifying Engine Mount Bracket Mounting Bolt And Nut (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Tighten the new transmission mounting bolt and nuts (A).

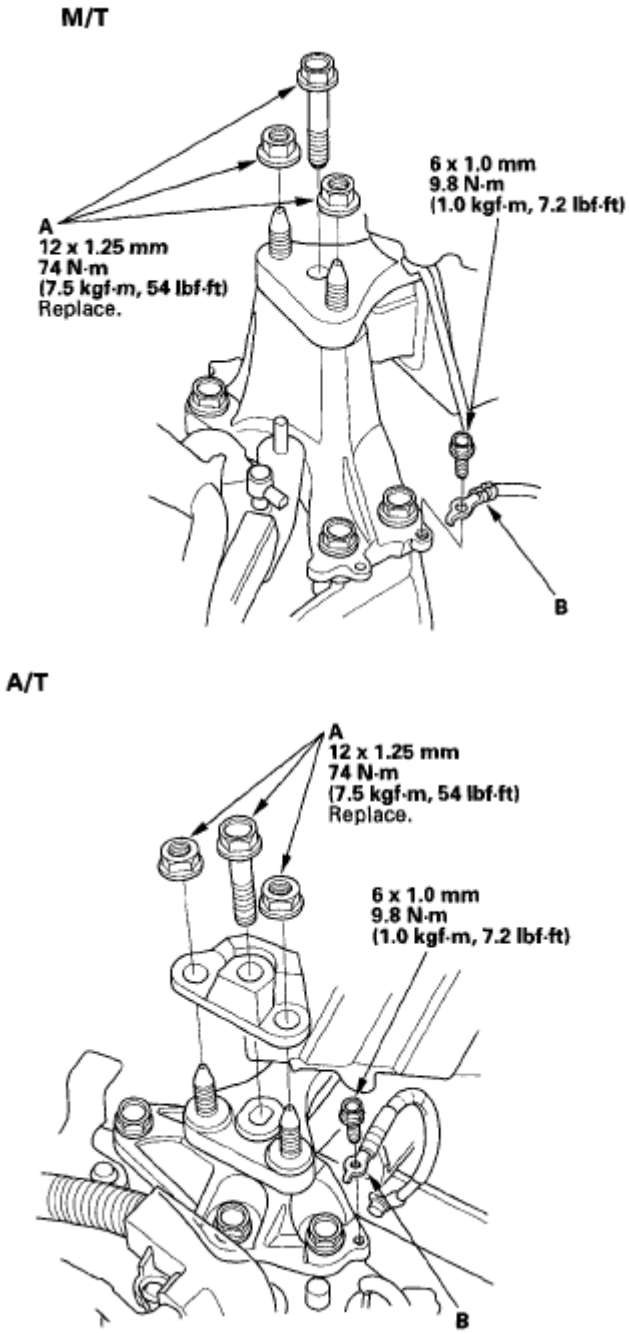

Fig. 37: Identifying Transmission Mounting Bolt And Nuts (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Install the ground cable (B).
10. Remove the chain hoist, then raise the vehicle on the hoist to full height.
11. Using the front subframe adapter (A) and a jack, raise the front subframe up to body.

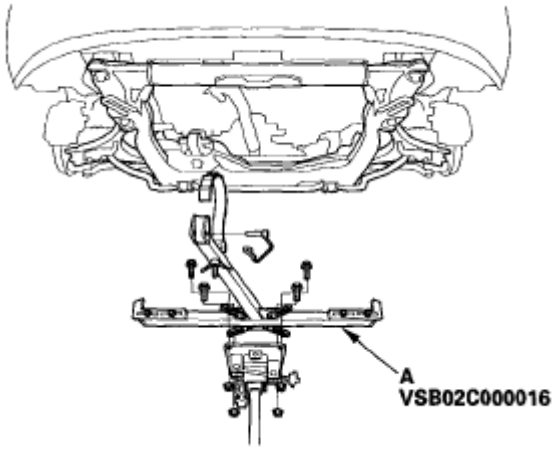

Fig. 38: Identifying Front Subframe Adapter
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Loosely install the new front subframe mounting bolts.

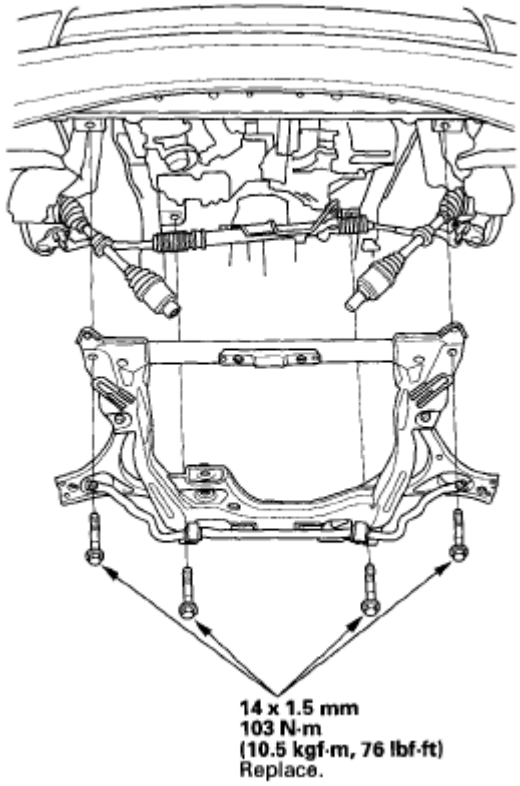

Fig. 39: Identifying Front Subframe Mounting Bolts (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Align the front subframe reference marks (A) to the body (B), as noted during removal. Tighten the subframe mounting bolts to the specified torque.

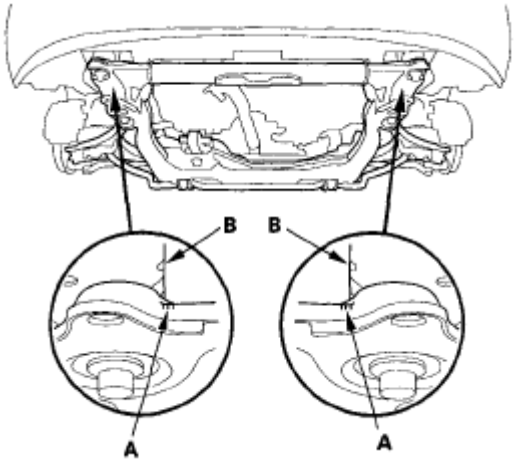

Fig. 40: Identifying Subframe Mark On Body
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Remove the jack and front subframe adapter.
15. Tighten the new front subframe body mount bracket mounting bolts on both sides.

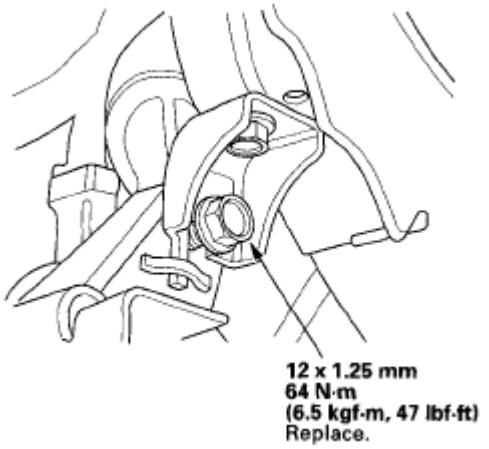

Fig. 41: Identifying Subframe Body Mount Bracket Mounting Bolts (With Torque Specifications)
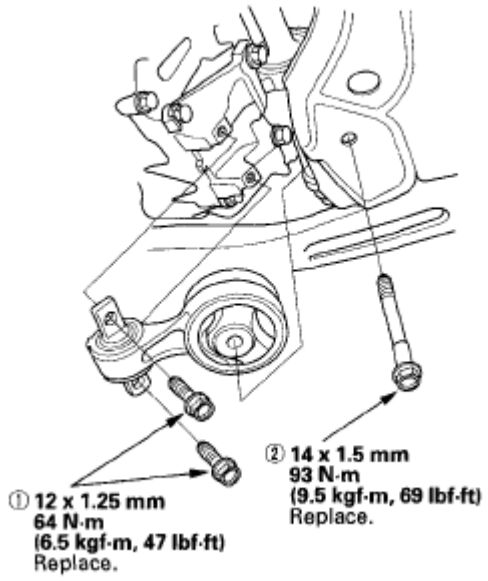
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Install the lower torque rod, then tighten the new lower torque rod mounting bolts in the numbered sequence shown.

M/T



A/T

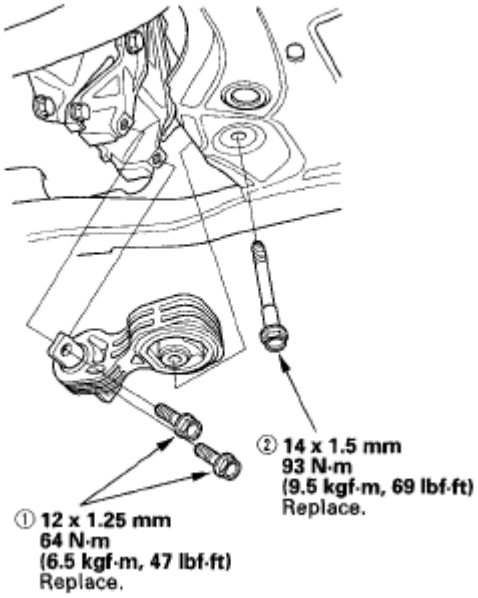


Fig. 42: Identifying Tightening Sequence For Lower Torque Rod Mounting Bolts (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Lower the vehicle on the lift, and remove the engine hanger, support eyelet, and bolt.
18. Tighten the upper torque rod mounting bolt.

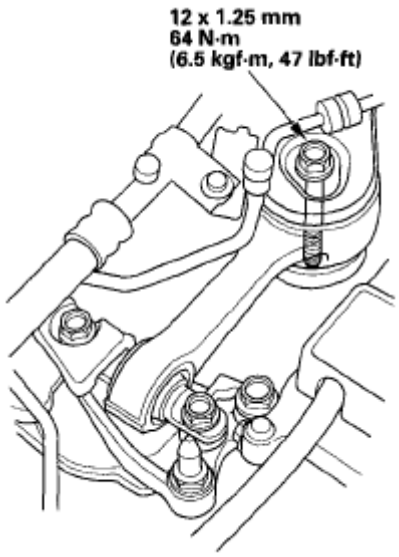

Fig. 43: Identifying Upper Torque Rod Mounting Bolt (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. Remove the special tool and bolt (A), then install the ground cable (B).

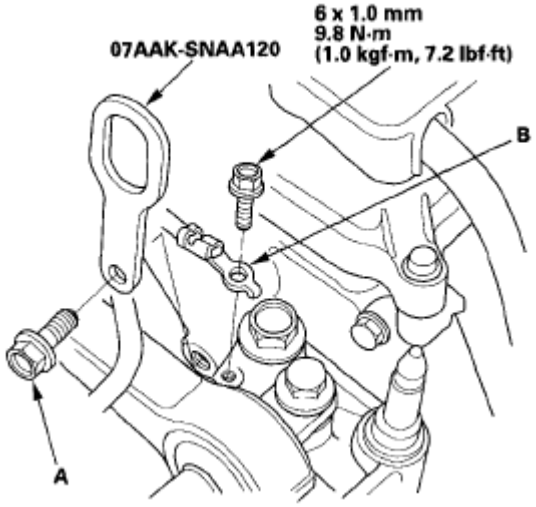

Fig. 44: Identifying Special Tool (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Raise the vehicle on the lift to full height.
21. Install the steering gearbox stiffener (A), then tighten the steering gearbox mounting bolt and stiffener bolt.

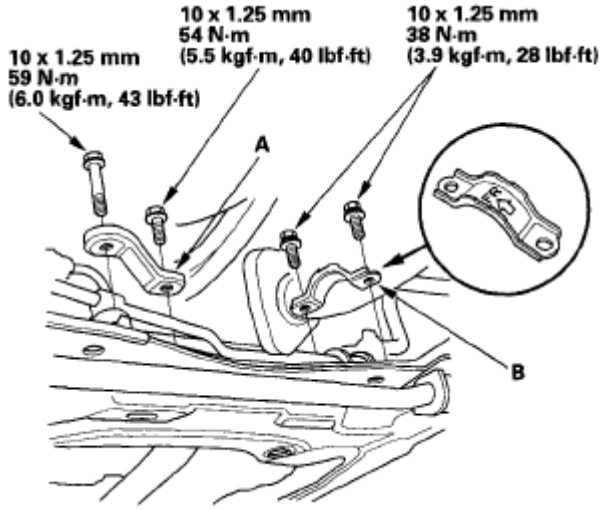

Fig. 45: Identifying Steering Gearbox Mounting Bolt (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

22. Position the "FR" mark to the front of the vehicle, then install the steering gearbox bracket (B).
23. Install the steering gearbox stiffener (A), then tighten the steering gearbox mounting bolt and stiffener bolt.

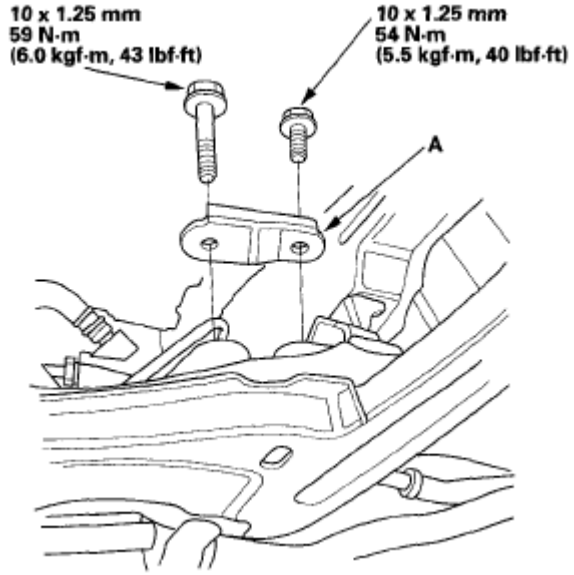

Fig. 46: Identifying Steering Gearbox Mounting And Stiffener Bolt (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

24. Install the power steering (P/S) line on the clamp (A), then install the P/S line brackets (B) on the subframe.

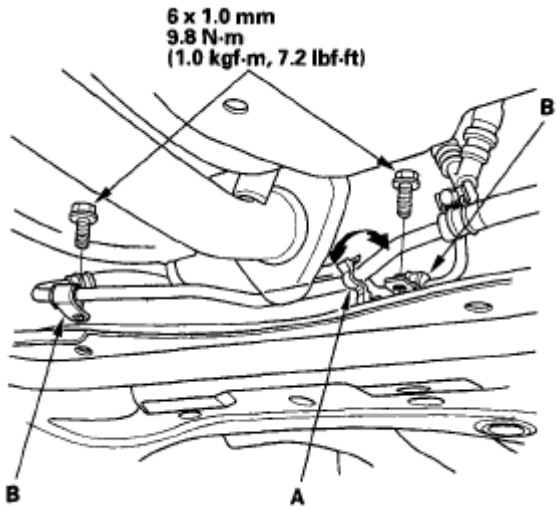

Fig. 47: Identifying P/S Line Brackets (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

25. Install the P/S pump.

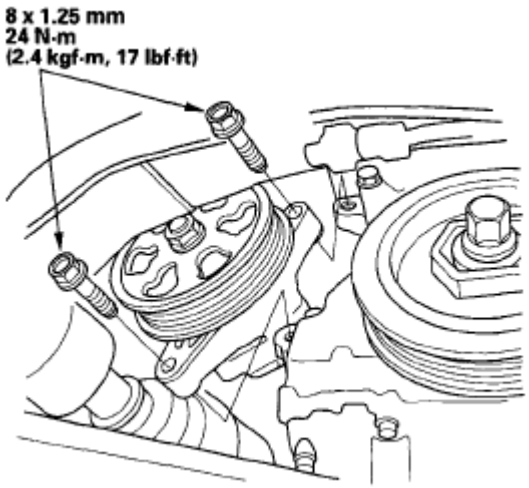

Fig. 48: Identifying P/S Pump Bolts (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

26. A/T model: Install the shift cable (see step 15 on **TRANSMISSION INSTALLATION**).
27. Install a new set ring on the end of each driveshaft, then install the driveshafts. Make sure each ring "clicks" into place in the differential and intermediate shaft.
28. Connect the lower arms to the knuckles (see step 5 on **LOWER ARM REMOVAL/INSTALLATION**).
29. Connect the stabilizer links (see **STABILIZER LINK REMOVAL/INSTALLATION**).
30. Install exhaust pipe A. Use new gaskets (B) and new self-locking nuts (C).

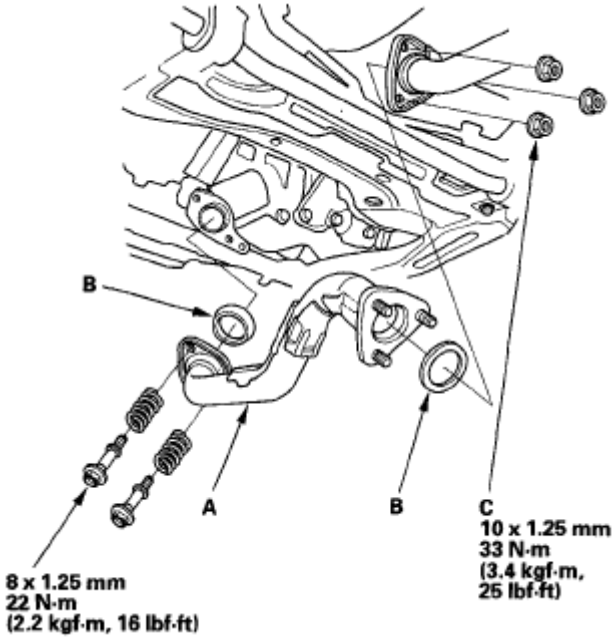

Fig. 49: Identifying Exhaust Pipe And Self-Locking Nuts (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

31. Install the splash shield

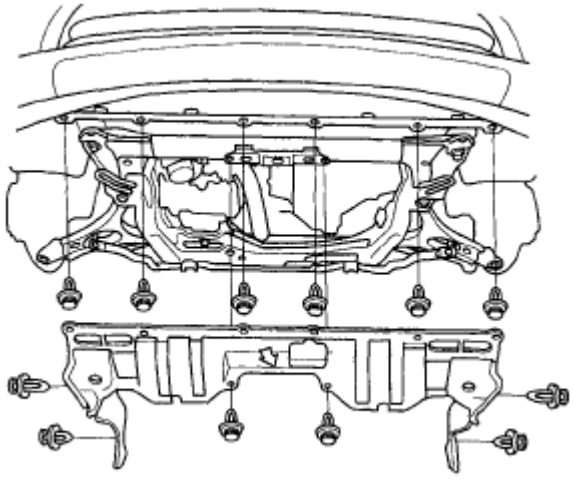

Fig. 50: Identifying Splash Shield
Courtesy of AMERICAN HONDA MOTOR CO., INC.

32. Lower the vehicle on the lift.
33. Install the heater hoses.

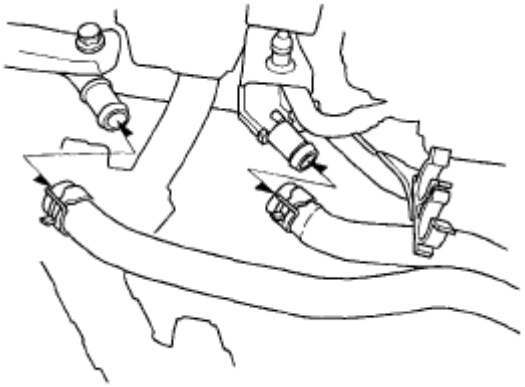

Fig. 51: Identifying Heater Hoses
Courtesy of AMERICAN HONDA MOTOR CO., INC.

34. Install the A/C compressor (A).

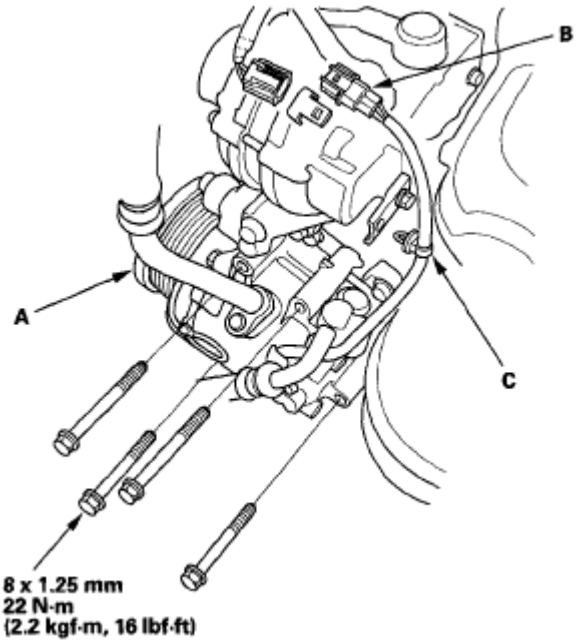

Fig. 52: Identifying A/C Compressor Clutch Connector (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

35. Connect the A/C compressor clutch connector (B), then install the harness clamp (C).
36. Install the drive belt (see **DRIVE BELT REMOVAL/INSTALLATION**).
37. Remove the bulkhead, then install the radiator (see **RADIATOR AND FAN REPLACEMENT**).
38. M/T model: Install the clutch slave cylinder and clutch line bracket mounting bolt (see step 33 on **TRANSMISSION INSTALLATION**).
39. M/T model: Install the shift cable (see step 31 on **TRANSMISSION INSTALLATION**).
40. M/T model: Install the harness holder (A) and harness clamp (B).

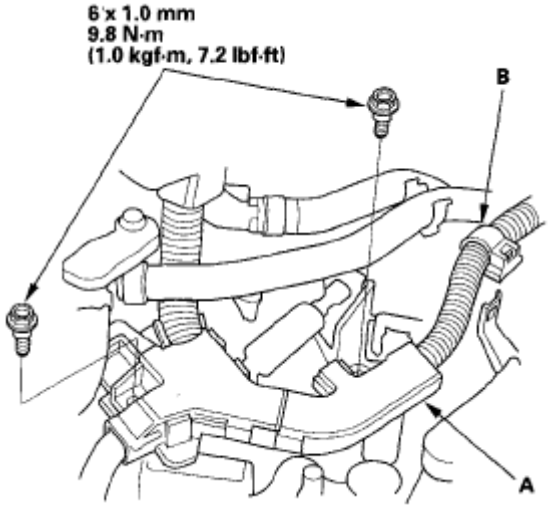

Fig. 53: Identifying Harness Holder And Harness Clamp (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

41. Connect the engine control module (ECM)/powertrain control module (PCM) connectors (A) and engine wire harness connectors (B).

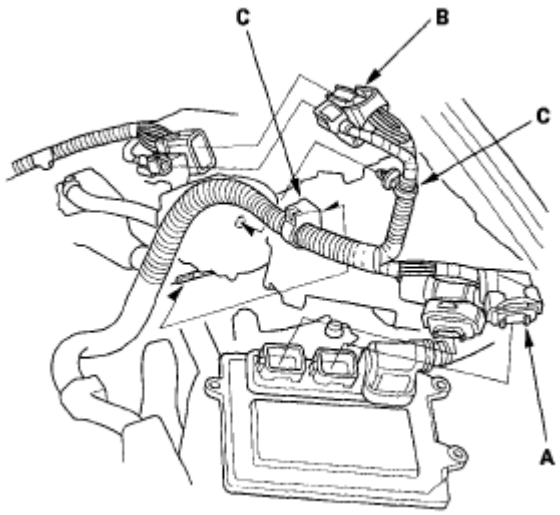

Fig. 54: Identifying Powertrain Control Module (PCM) Connectors
Courtesy of AMERICAN HONDA MOTOR CO., INC.

42. Install the harness clamps (C).
43. Install the ECM/PCM (A), then install the ECM/PCM cover (B).

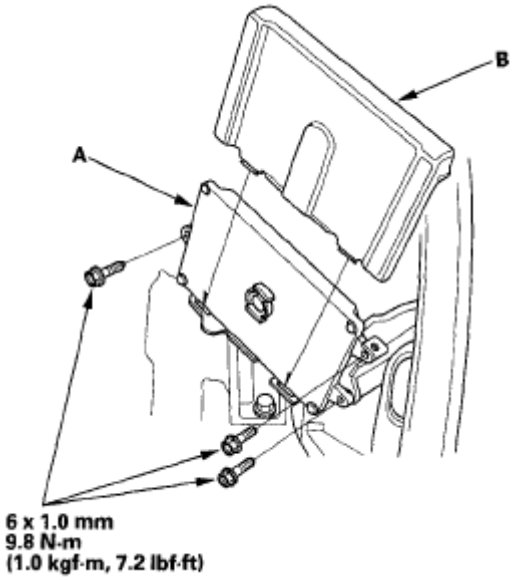

Fig. 55: Identifying ECM/PCM Cover And Bolts (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

44. Install the battery cables (A) to the under-hood fuse/relay box.

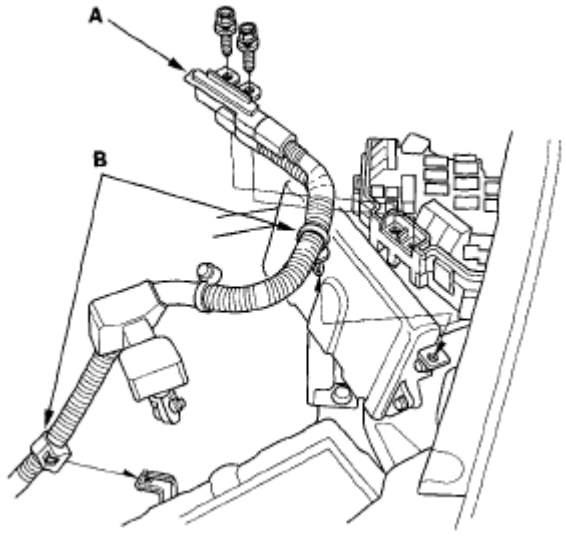

Fig. 56: Identifying Battery Cables And Harness Clamps
Courtesy of AMERICAN HONDA MOTOR CO., INC.

45. Install the harness clamps (B).
46. Install the evaporative emission (EVAP) canister hose (A), the brake booster vacuum hose (B), and the power steering (P/S) hose clamp (C).

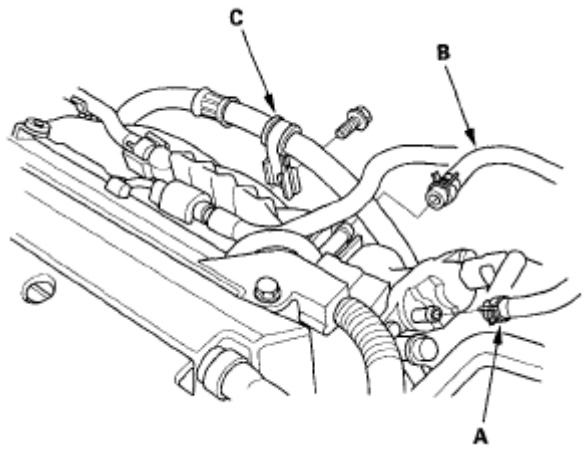

Fig. 57: Identifying Brake Booster Vacuum Hose And Power Steering (P/S) Hose Clamp
Courtesy of AMERICAN HONDA MOTOR CO., INC.

47. Connect the fuel feed hose (see **FUEL LINE/QUICK-CONNECT FITTING INSTALLATION**), then install the quick-connect fitting cover (A).

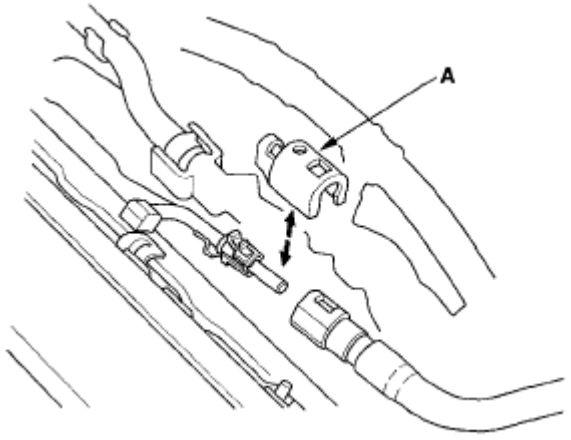

Fig. 58: Identifying Quick-Connect Fitting Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

48. Install the injector cover.

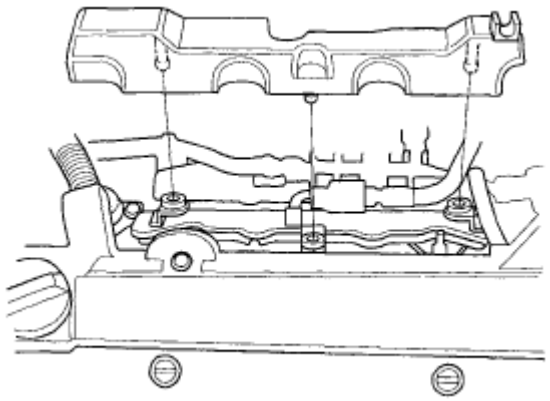

Fig. 59: Identifying Injector Cover

Courtesy of AMERICAN HONDA MOTOR CO., INC.

49. Install the under-cowl panel and cowl cover (see **FRONT GRILLE COVER REPLACEMENT**).
50. Install the air cleaner housing mounting bracket (A) on the cylinder head.

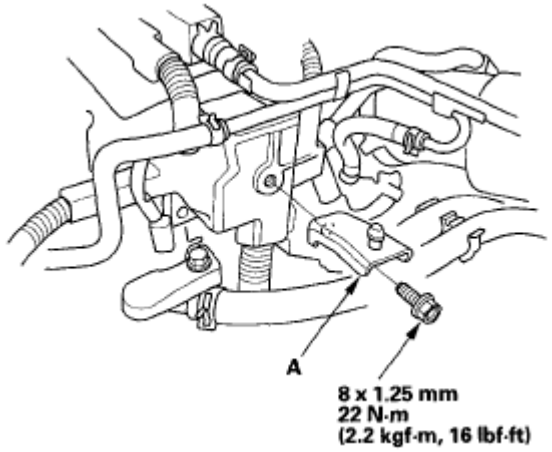

Fig. 60: Identifying Air Cleaner Housing Mounting Bracket (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

51. Install the air cleaner assembly (see **THROTTLE BODY CLEANING**).
52. Install the front wheels.
53. Install the battery. Clean the battery posts and cable terminals, then assemble them, and apply grease to prevent corrosion.
54. Inspect for fuel leaks: Turn the ignition switch ON (II) (do not operate the starter) so the fuel pump runs for about 2 seconds and pressurizes the fuel line. Repeat this operation two or three times, then check for fuel leakage at any point in the fuel line.
55. A/T model: Move the shift lever to each gear, and verify that the A/T gear position indicator follows the transmission range switch.
56. M/T model: Check that the transmission shifts into gear smoothly.
57. Refill the engine with engine oil (see step 4 on **ENGINE OIL REPLACEMENT**).
58. Refill the transmission with fluid:
    - Manual transmission (see **TRANSMISSION FLUID INSPECTION AND REPLACEMENT**)
    - Automatic transmission (see step 5 on **ATF REPLACEMENT**)
59. Refill the radiator with engine coolant, and bleed air from the cooling system with the heater valve open (see step 8 on **COOLANT REPLACEMENT**).
60. Do the ECM/PCM reset procedure (see **ECM/PCM RESET**).
61. Do the crankshaft position (CKP) pattern clear/CKP pattern learn procedure (see **ECM/PCM RESET**).
62. Inspect the idle speed (see **IDLE SPEED INSPECTION**).
63. Inspect the ignition timing (see **IGNITION TIMING INSPECTION**).
64. Check the wheel alignment (see **WHEEL ALIGNMENT**).
65. Enter the anti-theft code for the audio system and the navigation system (if equipped), then enter the audio presets.

66. Set the clock (on vehicles without navigation).

SIDE ENGINE MOUNT REPLACEMENT

1. Support the engine with a jack and a wood block under the oil pan.
2. Remove the bolt (A) securing the A/C line, then remove the upper torque rod (B).

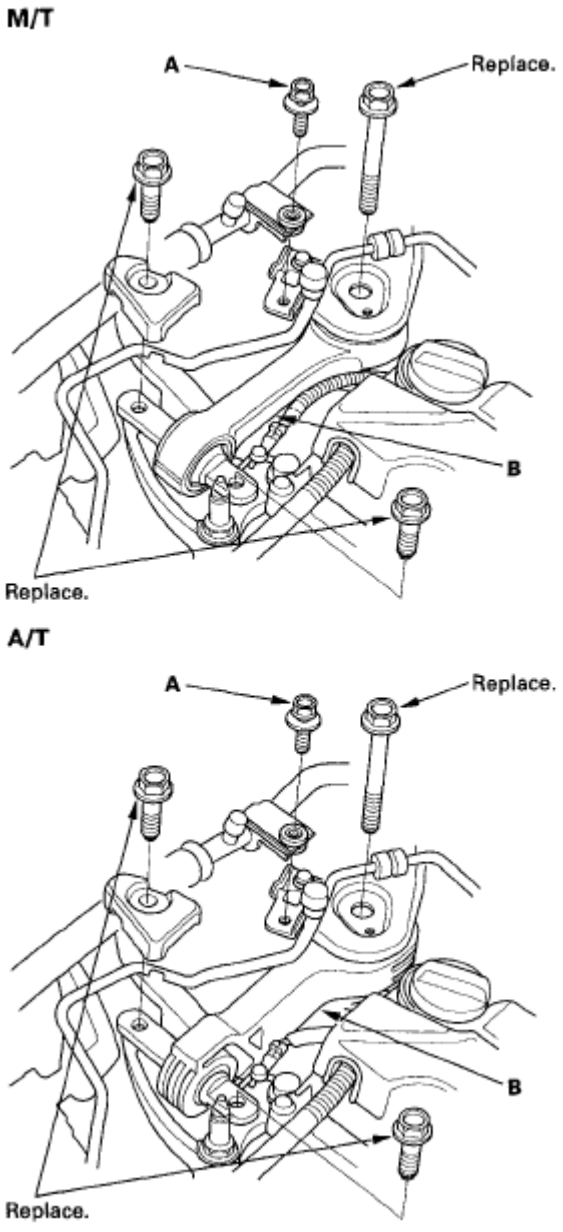

Fig. 61: Identifying Upper Torque Rod
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the ground cable (A), then remove the side engine mount bracket (B).

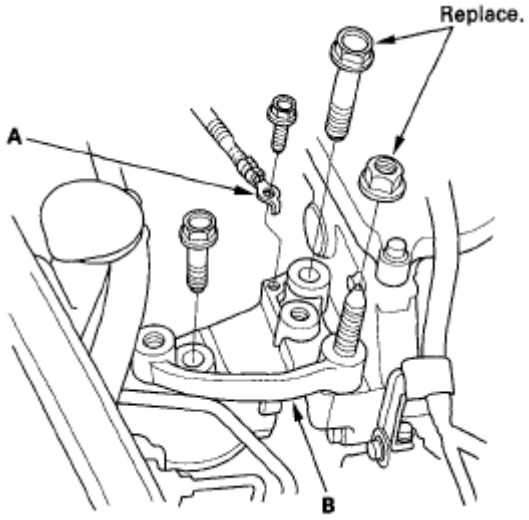

Fig. 62: Identifying Ground Cable And Side Engine Mount Bracket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the side engine mount stiffener (A), then remove the side engine mount (B).

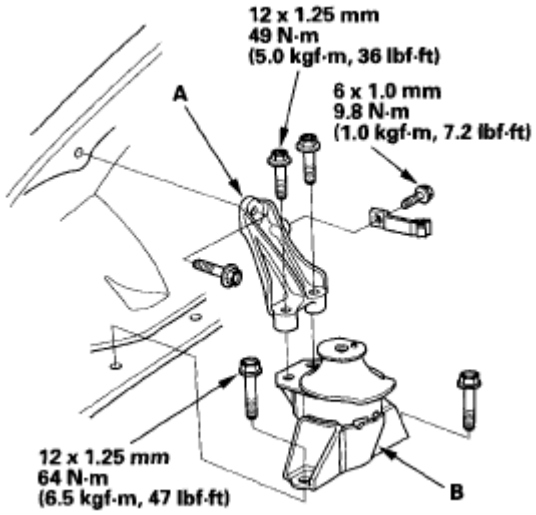

Fig. 63: Identifying Side Engine Mount Stiffener And Side Engine Mount (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the side engine mount, then install the side engine mount stiffener.
6. Install the side engine mount bracket (A), then loosely tighten the new bolt and nut (B). Loosely tighten the bolt (C).

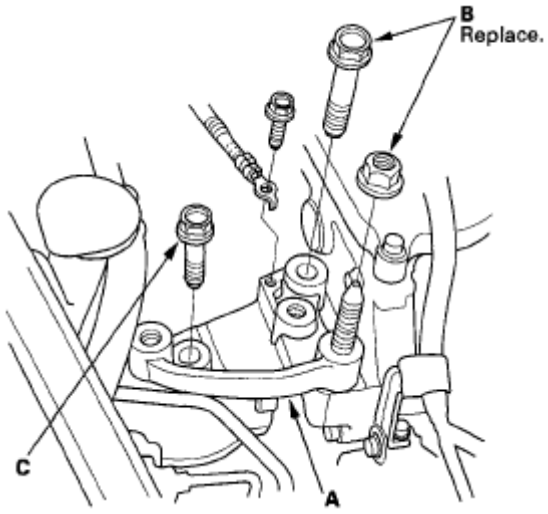

Fig. 64: Identifying Side Engine Mount Bracket
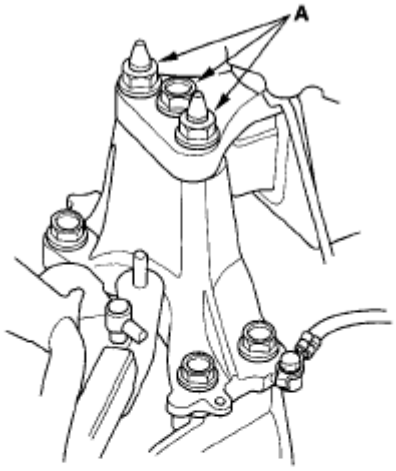
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the ground cable.
8. Remove the air cleaner assembly (see **THROTTLE BODY CLEANING**).
9. Loosen the transmission mounting bolt and nuts (A).

M/T



A/T

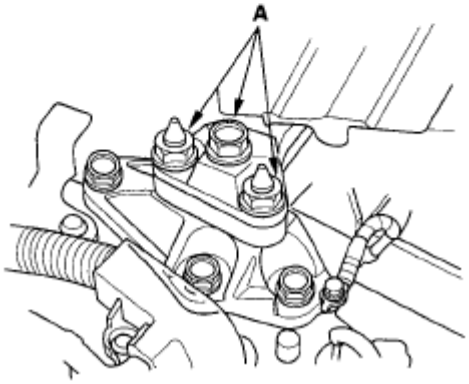


Fig. 65: Identifying Transmission Mounting Bolt And Nuts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Raise the vehicle on the lift to full height.
11. Loosen the lower torque rod mounting bolt (A).

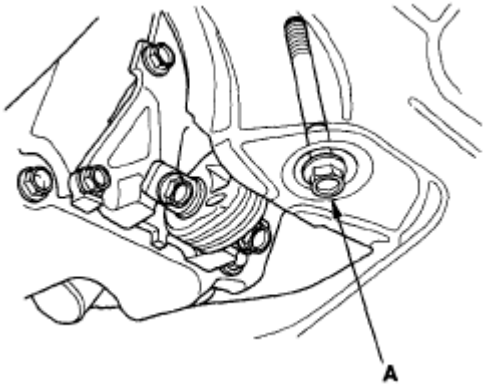

Fig. 66: Identifying Lower Torque Rod Mounting Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Lower the vehicle on the lift.
13. Tighten the side engine mount mounting bolts and nut.

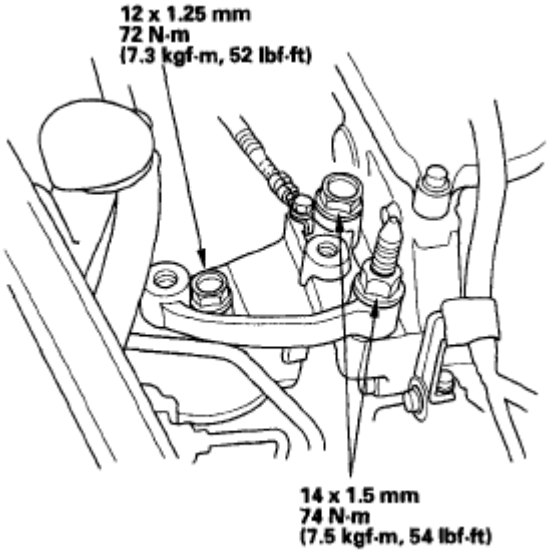

Fig. 67: Identifying Side Engine Mount Mounting Bolts And Nut (With Torque Specifications)
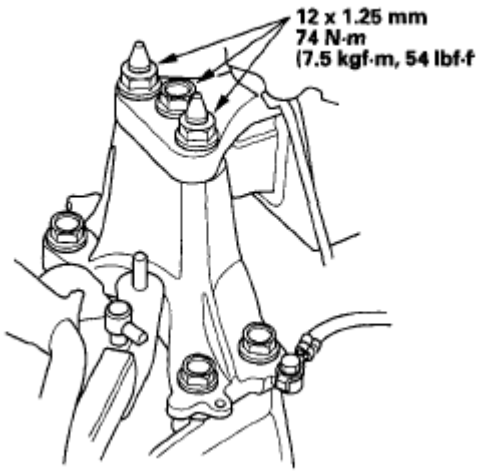
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Tighten the transmission mounting bolt and nuts.

M/T



A/T

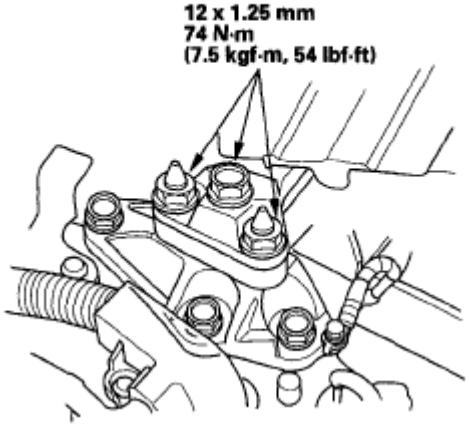


Fig. 68: Identifying Transmission Mounting Bolt And Nuts (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Raise the vehicle on the lift to full height.
16. Tighten the lower torque rod mounting bolt.

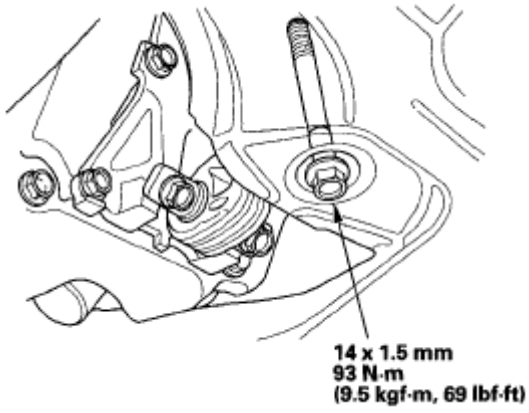

Fig. 69: Identifying Lower Torque Rod Mounting Bolt (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Lower the vehicle on the lift.
18. Install the air cleaner assembly (see **THROTTLE BODY CLEANING**).
19. Install the upper torque rod (A), then tighten the new upper torque rod mounting bolts in the numbered sequence shown.

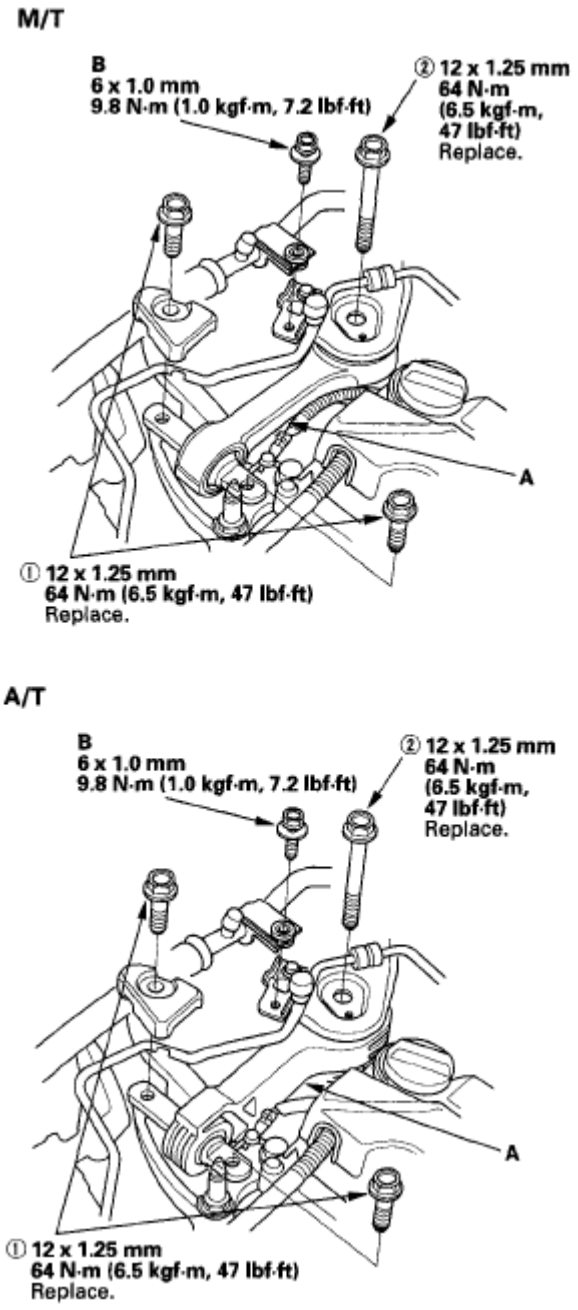

Fig. 70: Identifying Tightening Sequence For Upper Torque Rod Mounting Bolts (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Install the bolt (B) securing the A/C line.

TRANSMISSION MOUNT REPLACEMENT

1. Loosen the upper torque rod mounting bolt (A).

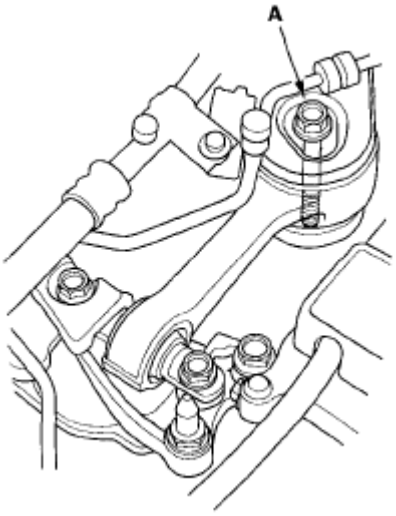

Fig. 71: Identifying Upper Torque Rod Mounting Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the air cleaner assembly (see **THROTTLE BODY CLEANING**).
3. Remove the engine control module (ECM)/ powertrain control module (PCM) cover, then remove the three bolts securing the ECM/PCM.
4. Remove the ECM/PCM bracket.
5. Remove the under-hood fuse/relay box from the bracket.
6. Support the transmission with a jack and a wood block under the transmission.
7. Remove the transmission mount stiffener (A), then remove the transmission mount (B).

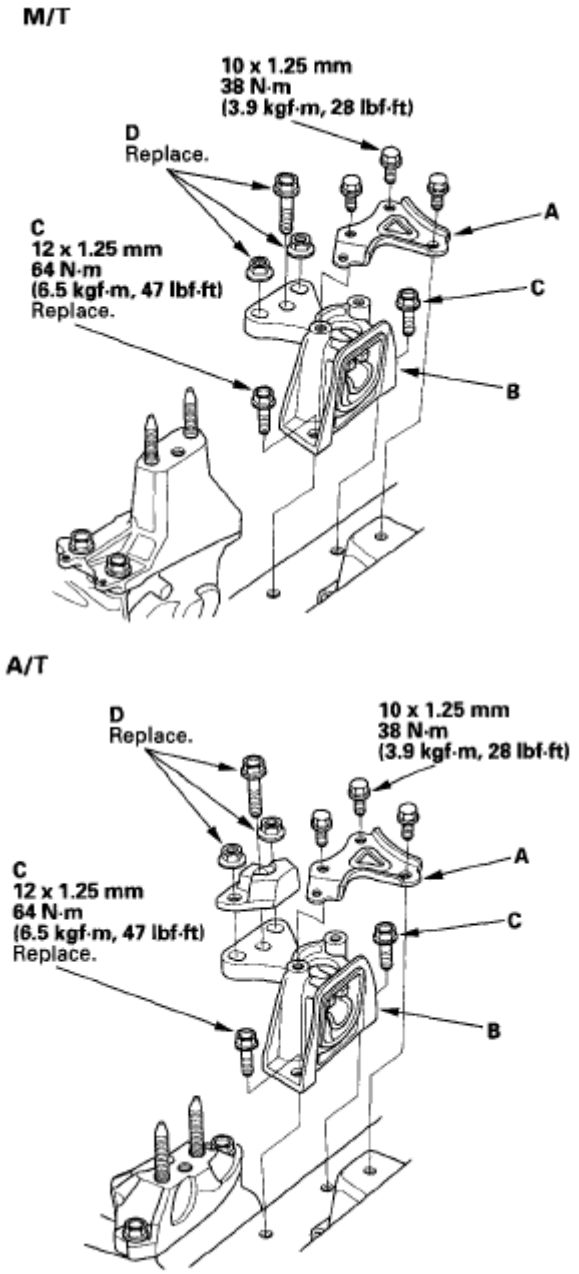

Fig. 72: Identifying Transmission Mount Stiffener And Transmission Mount (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Install the transmission mount with the new mounting bolts (C), then install the transmission mount stiffener.
9. Loosely tighten the new bolt and nuts (D).
10. Raise the vehicle on the lift to full height.
11. Loosen the lower torque rod mounting bolt (A).

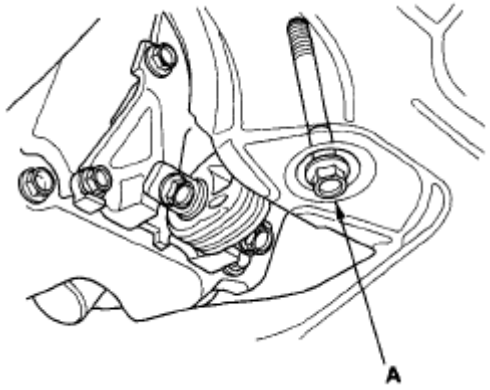

Fig. 73: Identifying Lower Torque Rod Mounting Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Lower the vehicle on the lift.
13. Tighten the transmission mounting bolt and nuts.

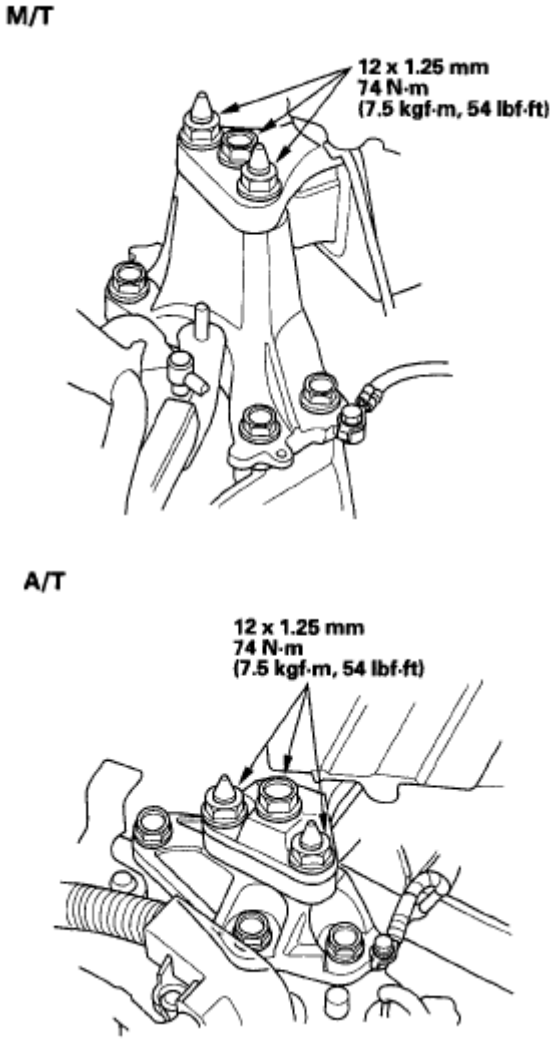

Fig. 74: Identifying Transmission Mounting Bolt And Nuts (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Raise the vehicle on the lift to full height.
15. Tighten the lower torque rod mounting bolt.

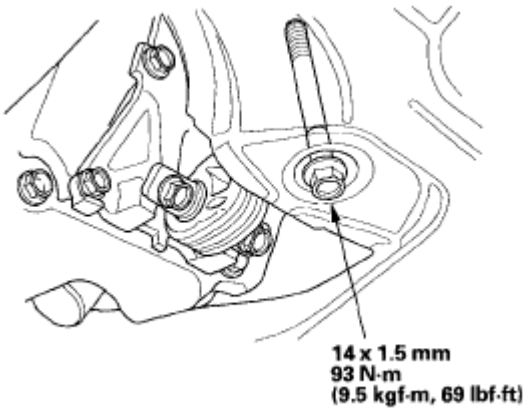

Fig. 75: Identifying Lower Torque Rod Mounting Bolt (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Lower the vehicle on the lift.
17. Tighten the upper torque rod mounting bolt.

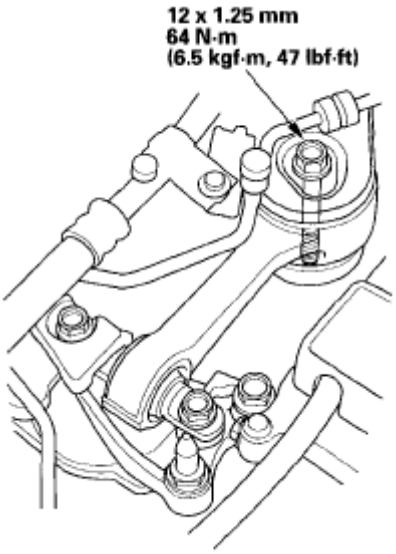

Fig. 76: Identifying Upper Torque Rod Mounting Bolt (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

18. Install the under-hood fuse/relay box to the bracket.
19. Install the ECM/PCM bracket.
20. Install the ECM/PCM, then install the ECM/PCM cover.
21. Install the air cleaner assembly (see **THROTTLE BODY CLEANING**).

LOWER TORQUE ROD REPLACEMENT

1. Loosen the upper torque rod mounting bolt (A).

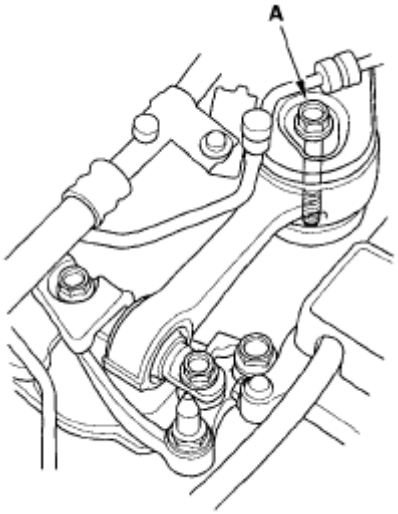

Fig. 77: Identifying Upper Torque Rod Mounting Bolt
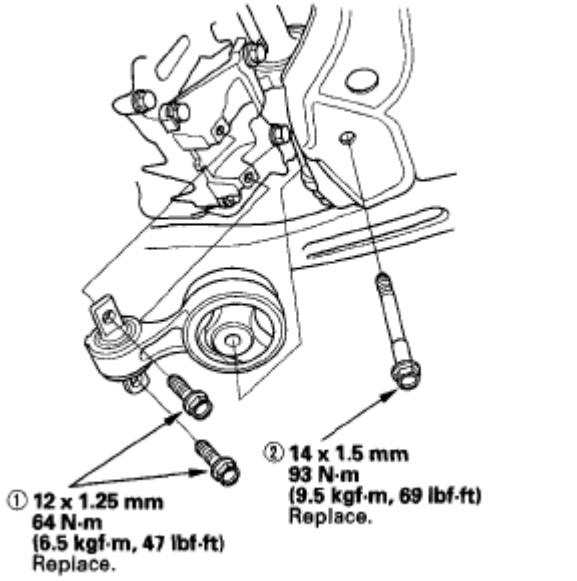
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Raise the vehicle on the lift to full height.
3. Remove the lower torque rod. M/T

M/T



A/T

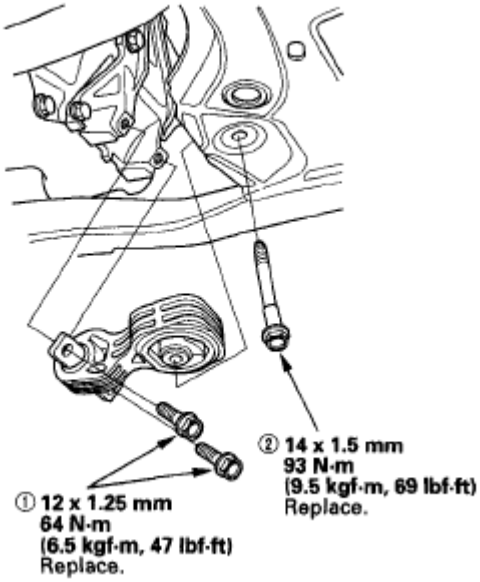


Fig. 78: Identifying Lower Torque Rod (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the lower torque rod, then tighten the new lower torque rod mounting bolts in the numbered sequence shown.
5. Lower the vehicle on the lift.
6. Tighten the upper torque rod mounting bolt.

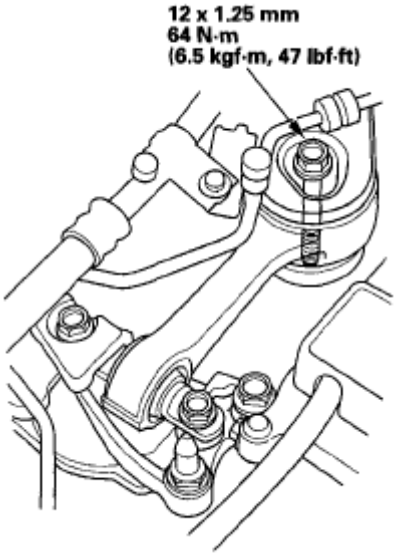

Fig. 79: Identifying Upper Torque Rod Mounting Bolt (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

UPPER TORQUE ROD REPLACEMENT

1. Remove the bolt (A) securing the A/C line, then remove the upper torque rod (B).

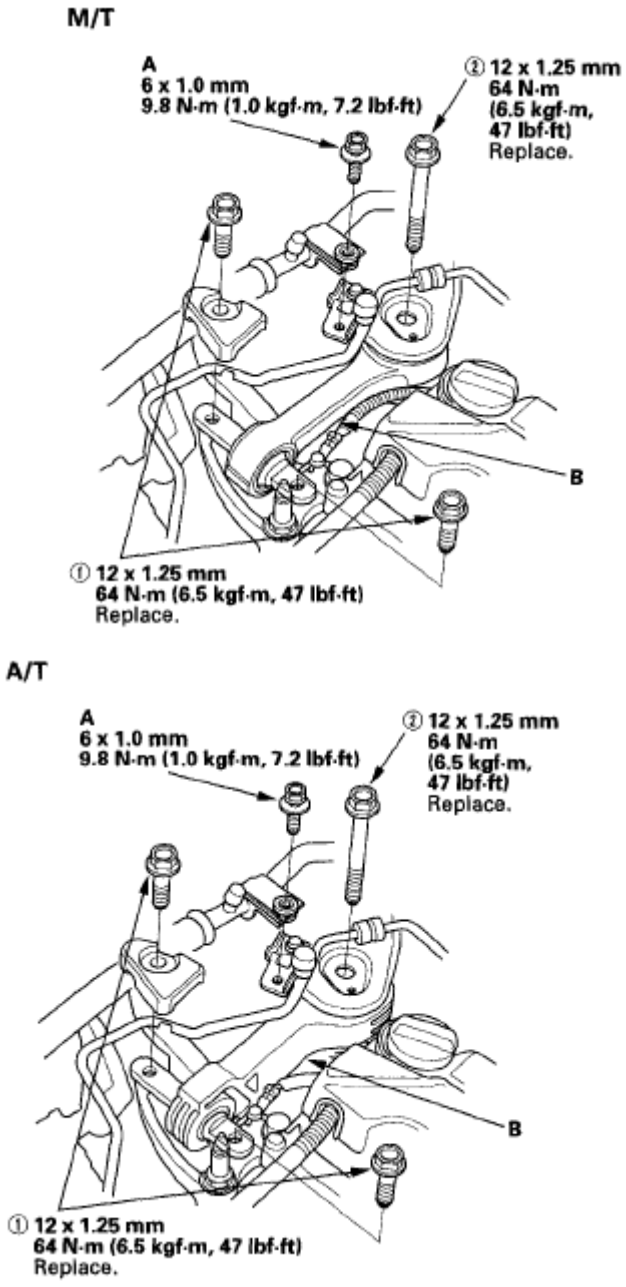

Fig. 80: Identifying Upper Torque Rod (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the upper torque rod, then tighten the new bolts in the numbered sequence shown.

SIDE ENGINE MOUNT BRACKET REPLACEMENT

1. Support the engine with a jack and a wood block under the oil pan.
2. Remove the bolt (A) securing the A/C line, then remove the upper torque rod (B).

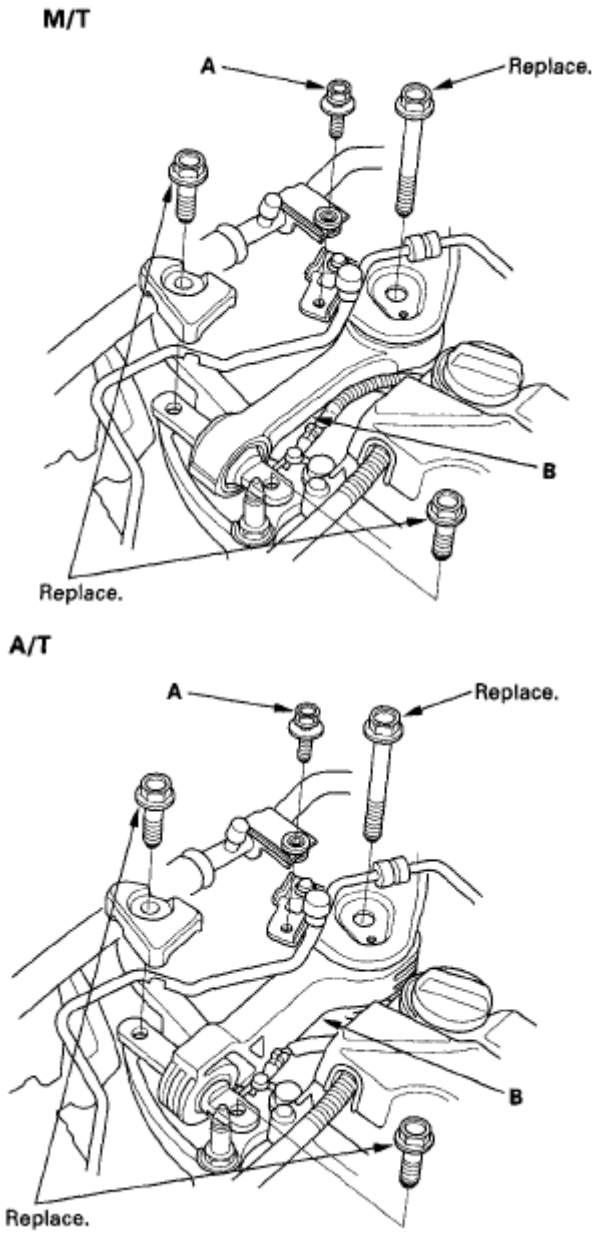

Fig. 81: Identifying Upper Torque Rod
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the ground cable (A), then remove the side engine mount bracket (B).

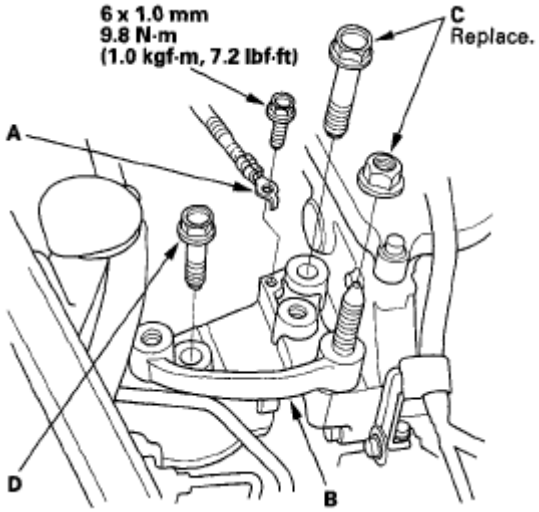

Fig. 82: Identifying Side Engine Mount Bracket And Ground Cable (With Torque Specifications)
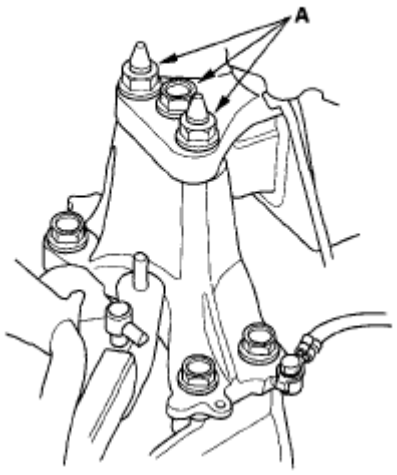
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the side engine mount bracket, then loosely tighten the new bolt and nut (C), and loosely tighten the bolt (D).
5. Install the ground cable.
6. Remove the air cleaner assembly (see **THROTTLE BODY CLEANING**).
7. Loosen the transmission mounting bolt and nuts (A).

M/T



A/T

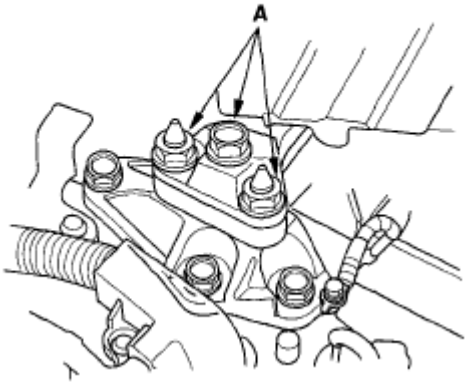


Fig. 83: Identifying Transmission Mounting Bolt And Nuts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Raise the vehicle on the lift to full height.
9. Loosen the lower torque rod mounting bolt (A).

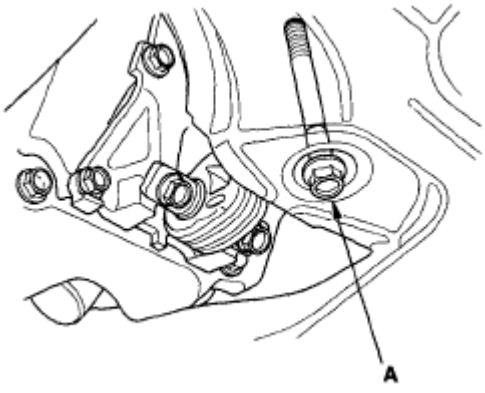

Fig. 84: Identifying Lower Torque Rod Mounting Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Lower the vehicle on the lift.

11. Tighten the side engine mount mounting bolts and nut.

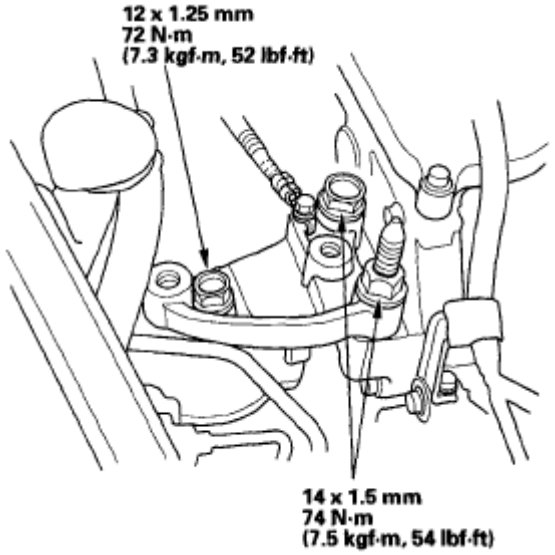

Fig. 85: Identifying Side Engine Mount Mounting Bolts And Nut (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Tighten the transmission mounting bolt and nuts.

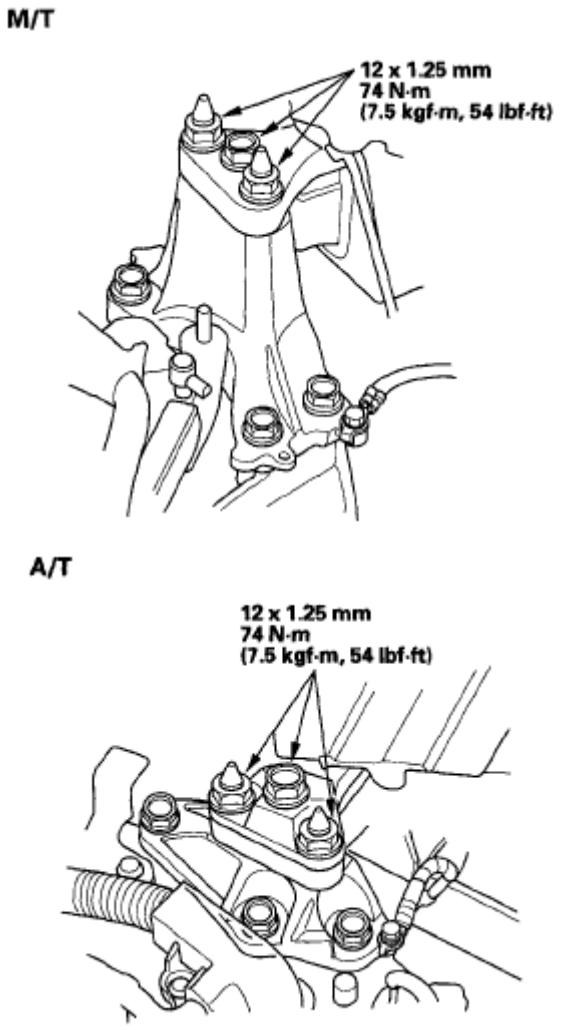

Fig. 86: Identifying Transmission Mounting Bolt And Nuts (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Raise the vehicle on the lift to full height.
14. Tighten the lower torque rod mounting bolt.

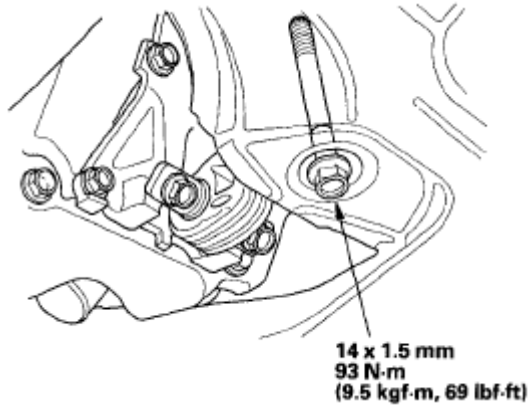

Fig. 87: Identifying Lower Torque Rod Mounting Bolt (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Lower the vehicle on the lift.
16. Install the air cleaner assembly (see **THROTTLE BODY CLEANING**).
17. Install the upper torque rod (A), then tighten the new upper torque rod mounting bolts in the numbered sequence shown.

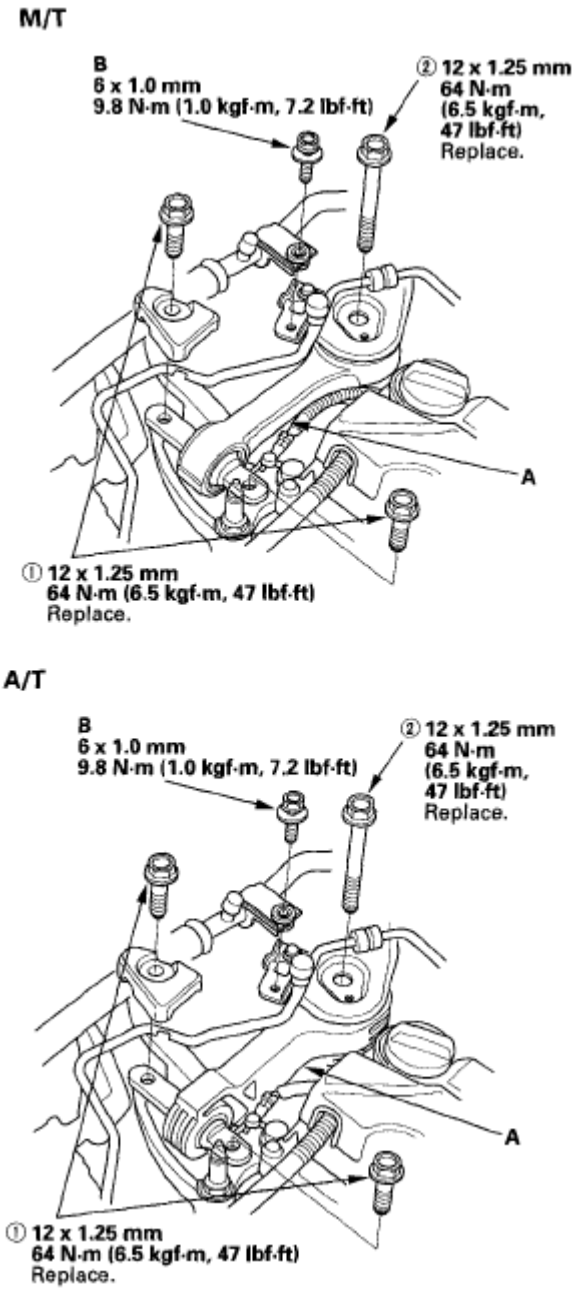

Fig. 88: Identifying Tightening Sequence For Upper Torque Rod Mounting Bolts (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

18. Install the bolt (B) securing the A/C line.

ENGINE ASSEMBLY (K20Z3)

SPECIAL TOOLS

Ref. No.	Tool Number	Description	Qty
①	07AAK-SNAA120	Engine Hanger Plate	1

①

Fig. 89: Identifying Special Tools
Courtesy of AMERICAN HONDA MOTOR CO., INC.

ENGINE REMOVAL

Special Tools Required

- Engine hanger plate 07AAK-SNAA120
- Engine hanger adapter VSB02C000015 *
- Front subframe adapter VSB02C000016 *
- 2006 Civic engine hanger VSB02C000025 *
- Engine support hanger, A and Reds AAR-T-12566 *

* : Available through Honda Tool and Equipment Program, 1-888-424-6857

NOTE:

- **Use fender covers to avoid damaging painted surfaces.**
- **To avoid damaging the wiring and terminals, unplug the wiring connectors carefully while holding the connector portion.**
- **Mark all wiring and hoses to avoid misconnection. Also, be sure that they do not contact other wiring or hoses, or interfere with other parts.**

1. Make sure you have the anti-theft code for the audio system and the navigation system (if equipped), then write down the audio presets.
2. Secure the hood in the wide open position (support rod in the lower hole).

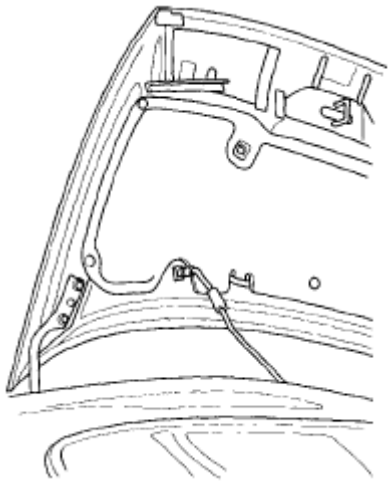

Fig. 90: Identifying Support Rod In Lower Hole
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Relieve the fuel pressure (see **FUEL PRESSURE RELIEVING**).
4. Disconnect the negative cable from the battery first, then disconnect the positive cable.
5. Remove the battery.
6. Remove the air cleaner assembly (see **AIR CLEANER REMOVAL/INSTALLATION**).
7. Remove the under-cowl panel (see **FRONT GRILLE COVER REPLACEMENT**).
8. Disconnect the connector (A), and remove the harness clamp (B), then remove the resonator (C).

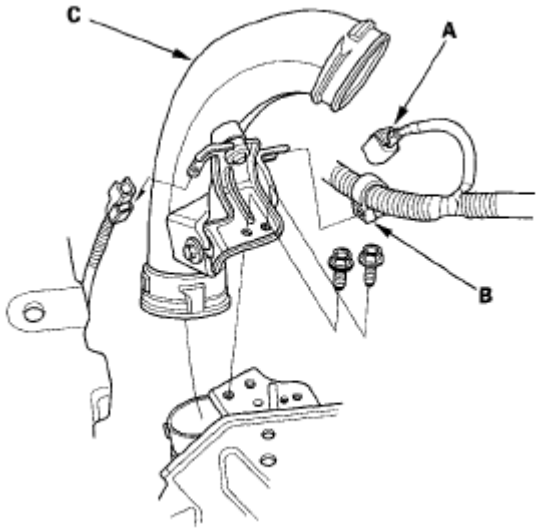

Fig. 91: Identifying Connector And Harness Clamp
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Remove the battery cables (A) from the under-hood fuse/relay box.

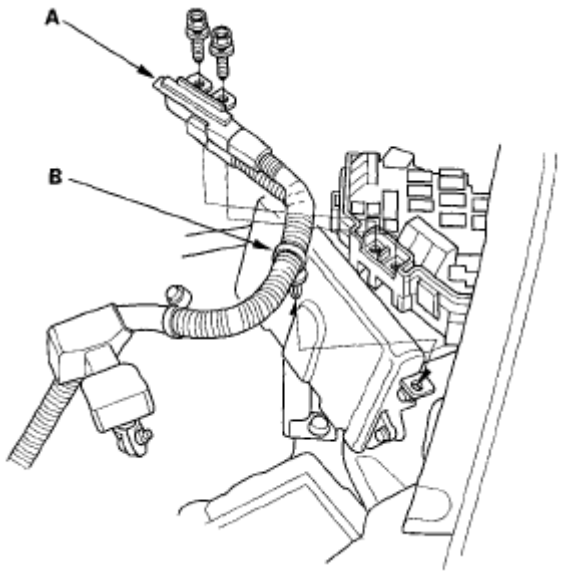

Fig. 92: Identifying Battery Cables And Harness Clamp
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Remove the harness clamp (B).
11. Remove the engine control module (ECM) cover (A), then remove the three bolts (B) securing the ECM.

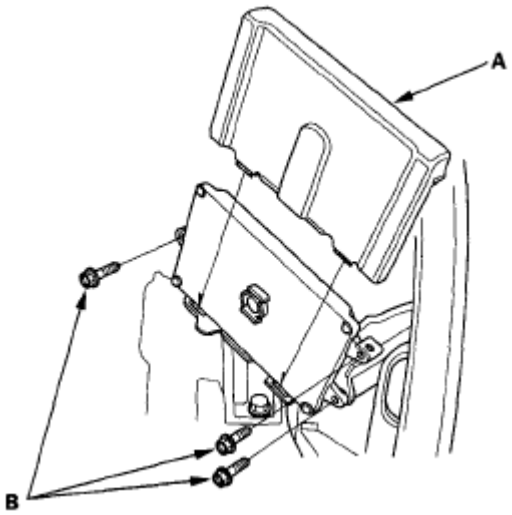

Fig. 93: Identifying Engine Control Module (ECM) Cover And Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Disconnect the ECM connectors (A) and the engine wire harness connector (B).

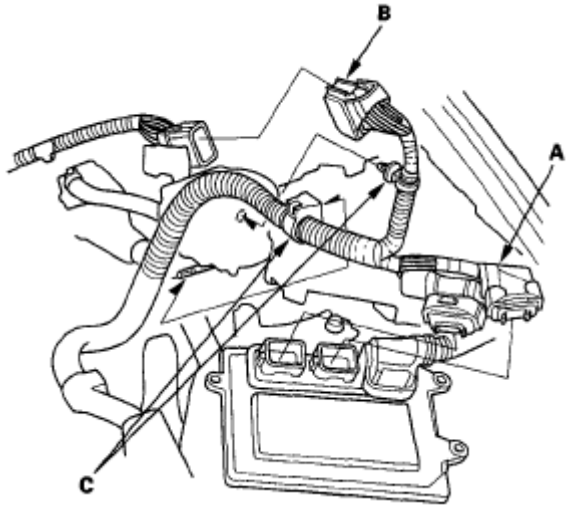

Fig. 94: Identifying ECM Connectors And Engine Wire Harness Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Remove the harness clamps (C).
14. Remove the engine cover.

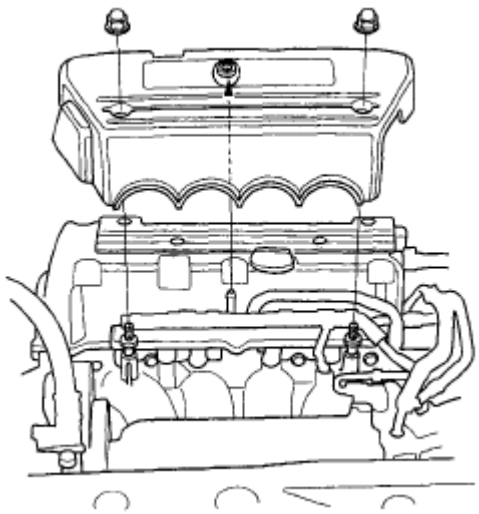

Fig. 95: Identifying Engine Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Remove the evaporative emission (EVAP) canister hose (A) and brake booster vacuum hose (B).

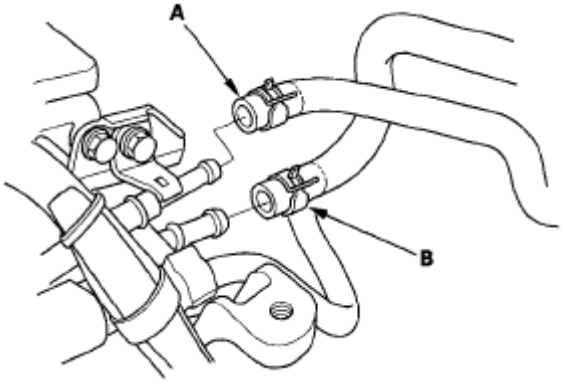

Fig. 96: Identifying Evaporative Emission (EVAP) Canister Hose And Brake Booster Vacuum Hose
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Remove the quick-connect fitting cover (A), then disconnect the fuel feed hose (see **FUEL LINE/QUICK-CONNECT FITTING REMOVAL**).

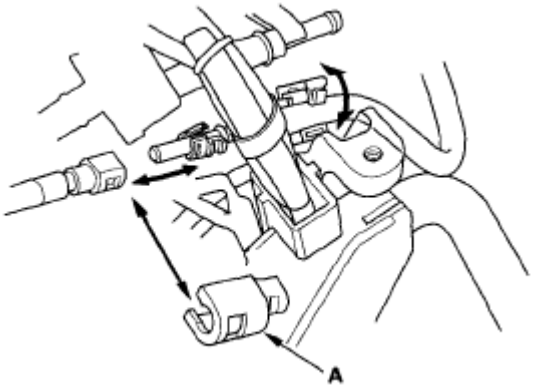

Fig. 97: Identifying Quick-Connect Fitting Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Remove the shift cable (see step 9 on **TRANSMISSION REMOVAL**).
18. Remove the clutch slave cylinder, and clutch line bracket mounting bolt (see step 7 on **TRANSMISSION REMOVAL**).
19. Remove the air cleaner housing bracket.

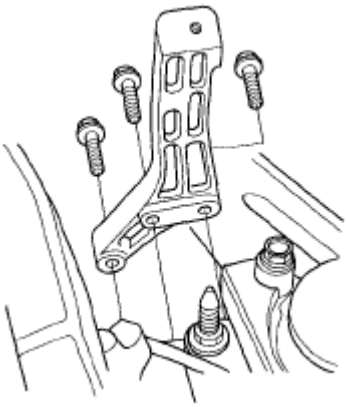

Fig. 98: Identifying Air Cleaner Housing Bracket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Remove the drive belt (see **DRIVE BELT INSPECTION**).
21. Remove the radiator cap.
22. Raise the vehicle on the lift to full height.
23. Remove the front wheels.
24. Remove the splash shield.

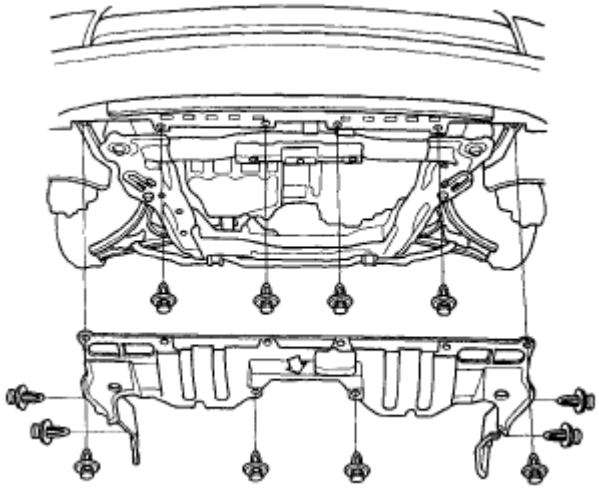

Fig. 99: Identifying Splash Shield
Courtesy of AMERICAN HONDA MOTOR CO., INC.

25. Loosen the drain plug in the radiator, and drain the engine coolant (see **COOLANT CHECK**).
26. Drain the engine oil (see **OIL PRESSURE TEST**).
27. Drain the transmission fluid (see **TRANSMISSION FLUID INSPECTION AND REPLACEMENT**).
28. Disconnect the air fuel ratio (A/F) sensor connector (A).

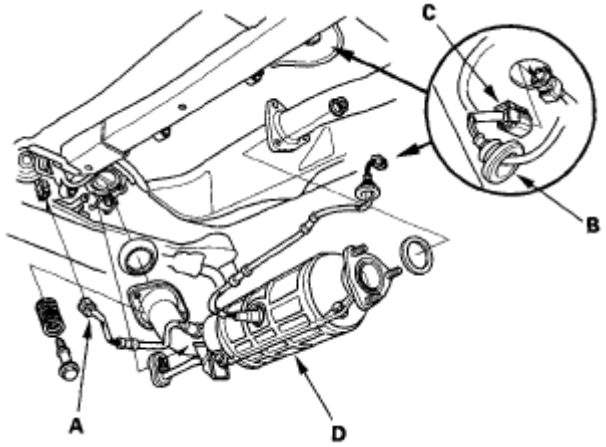

Fig. 100: Identifying (Secondary HO2S) Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

29. Remove the grommet (B), then disconnect the secondary heated oxygen sensor (secondary HO2S) connector (C).
30. Remove the three way catalytic converter (TWO (D).
31. Separate the stabilizer links (see **STABILIZER LINK REMOVAL/INSTALLATION**).
32. Separate the knuckles from the lower arms (see step 5 on **LOWER ARM REMOVAL/INSTALLATION**).
33. Remove the driveshafts (see step 8 on **DRIVESHAFT REMOVAL**). Coat all precision-finished surfaces with clean engine oil. Tie plastic bags over the driveshaft ends.
34. Remove the steering gearbox bracket (A).

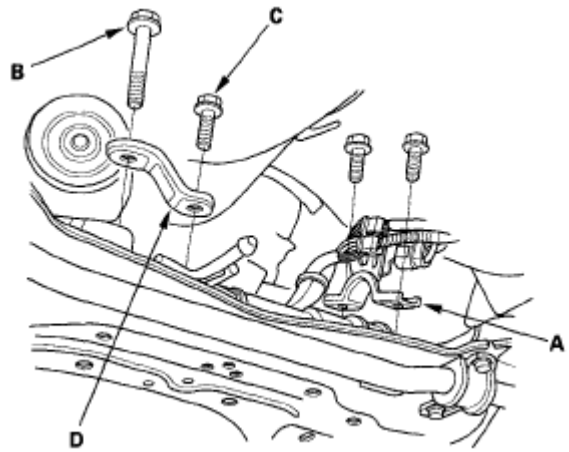

Fig. 101: Identifying Steering Gearbox Bracket And Mounting Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

35. Remove the steering gearbox mounting bolt (B), stiffener mounting bolt (C), and stiffener (D).
36. Remove the steering gearbox mounting bolt (A), stiffener mounting bolt (B), and stiffener (C).

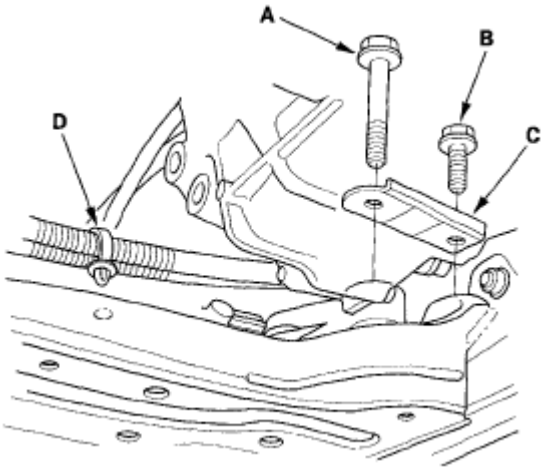

Fig. 102: Identifying Stiffener Mounting Bolt And Stiffener
Courtesy of AMERICAN HONDA MOTOR CO., INC.

37. Remove the harness clamp (D) from the subframe.
38. Disconnect the A/C compressor clutch connector (A), then remove the A/C compressor (B) without

disconnecting the A/C hoses.

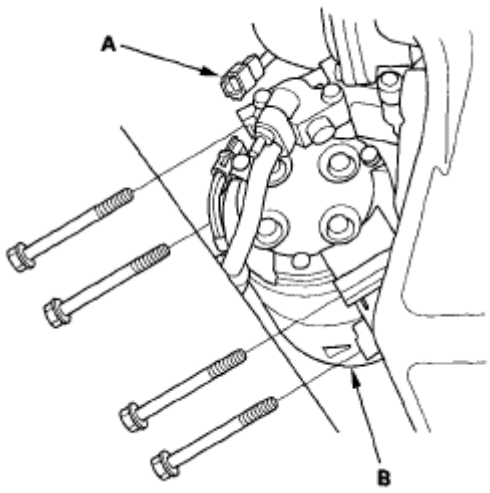

Fig. 103: Identifying A/C Compressor Clutch Connector And A/C Compressor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

39. Lower the vehicle on the lift.
40. Remove the radiator (see **RADIATOR AND FAN REPLACEMENT**).
41. Remove the heater hoses.

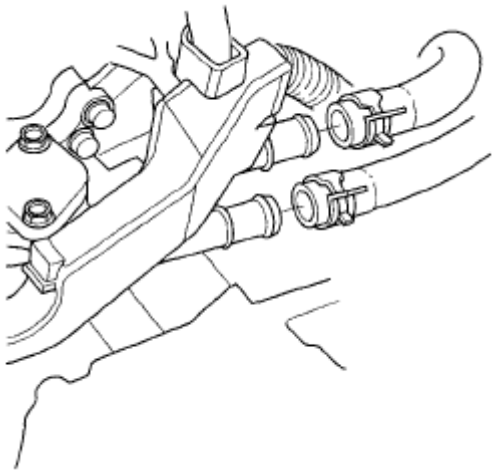

Fig. 104: Identifying Heater Hoses
Courtesy of AMERICAN HONDA MOTOR CO., INC.

42. Install the bulkhead, and tighten the mounting bolts to 9.8 N.m (1.0 kgf.m, 7.2 lbf.ft).
43. Attach the special tool to the threaded hole in the cylinder head.

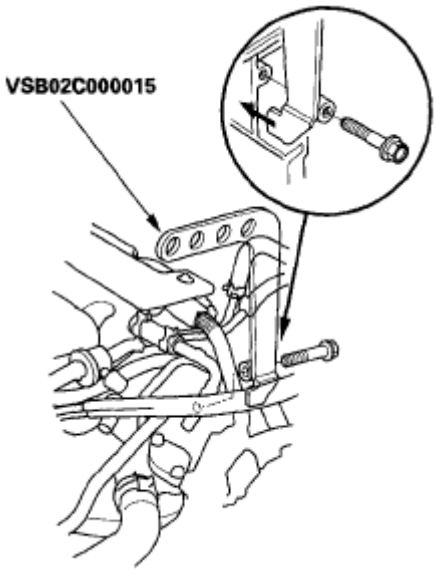

Fig. 105: Identifying Special Tool To Threaded Hole In Cylinder Head
Courtesy of AMERICAN HONDA MOTOR CO., INC.

44. Install the front leg assembly (A), hook (B), and wing nut (C) from an A and Reds engine support hanger (AAR-T-12566) onto the engine hanger. Carefully position the engine hanger on the vehicle, and attach the hook to the forward hole in the engine hanger adapter (D). Tighten the wing nut by hand to lift and support the engine/transmission.

NOTE: Be careful when working around the windshield.

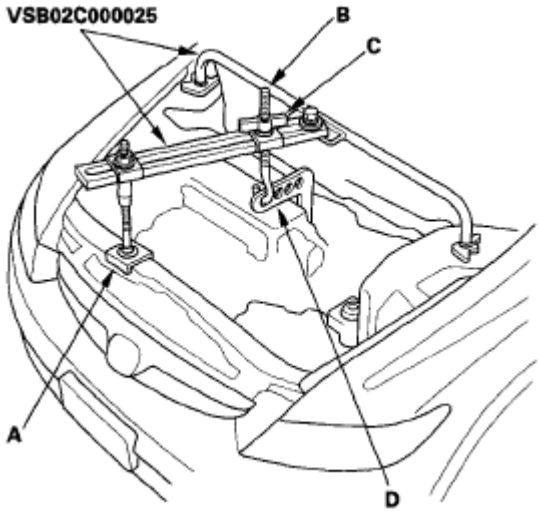

Fig. 106: Identifying Engine Support Hanger
Courtesy of AMERICAN HONDA MOTOR CO., INC.

45. Raise the vehicle on the lift to full height.
46. Remove the lower torque rod.

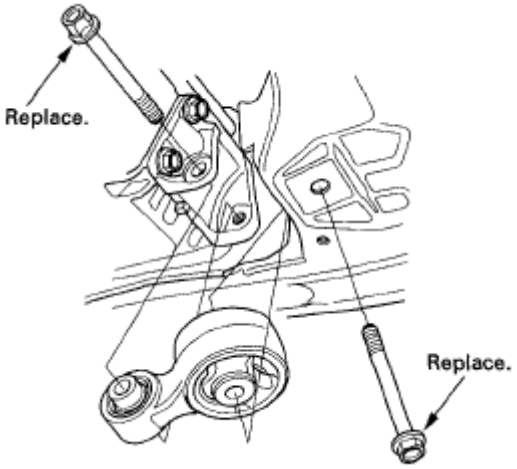

Fig. 107: Identifying Lower Torque Rod
Courtesy of AMERICAN HONDA MOTOR CO., INC.

47. Remove lower radiator hose from the clamp (A), then remove the front mount mounting bolt (B).

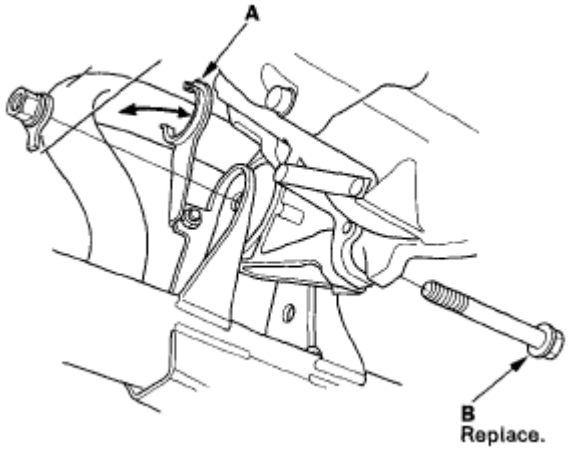

Fig. 108: Identifying Lower Radiator Hose Clamp And Mounting Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

48. Note the reference marks (A) on both sides of the front subframe that line up with the body (B).

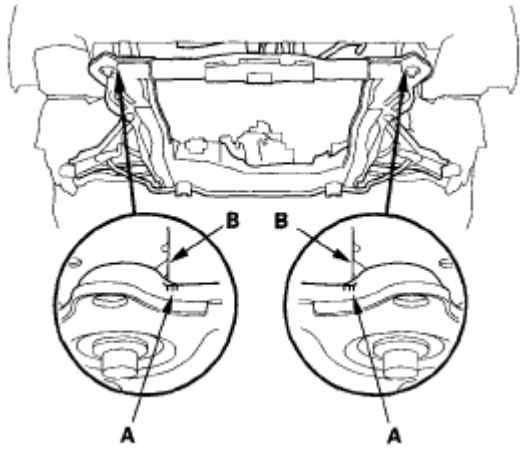

Fig. 109: Identifying Marks On Both Sides Of Front Subframe
Courtesy of AMERICAN HONDA MOTOR CO., INC.

49. Loosen the front subframe body mount bracket mounting bolts (A) on both side.

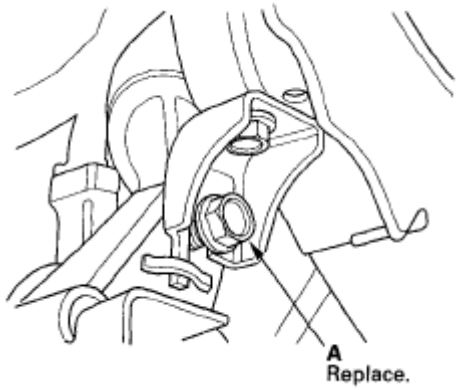

Fig. 110: Identifying Front Subframe Body Mount Bracket Mounting Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

50. Attach the front subframe adapter (A) to the front subframe and hang the belt of the front subframe adapter over the front of the front subframe, then secure the belt with its stop.

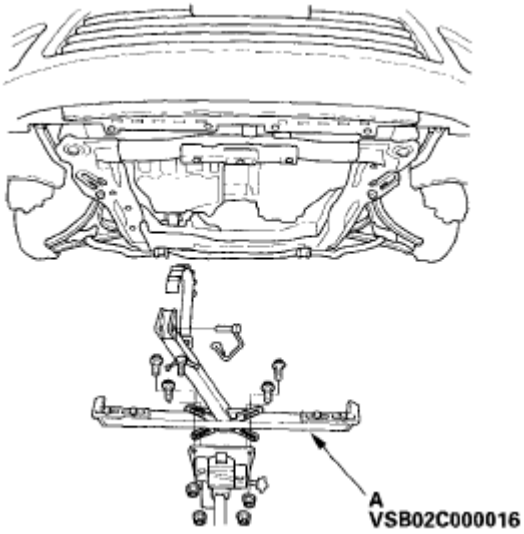

Fig. 111: Identifying Front Subframe Adapter (Special Tools)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

51. Raise the jack and line up the slots in the arms with the bolt holes on the corner of the jack base, then attach them with bolts securely.
52. Remove the front subframe.

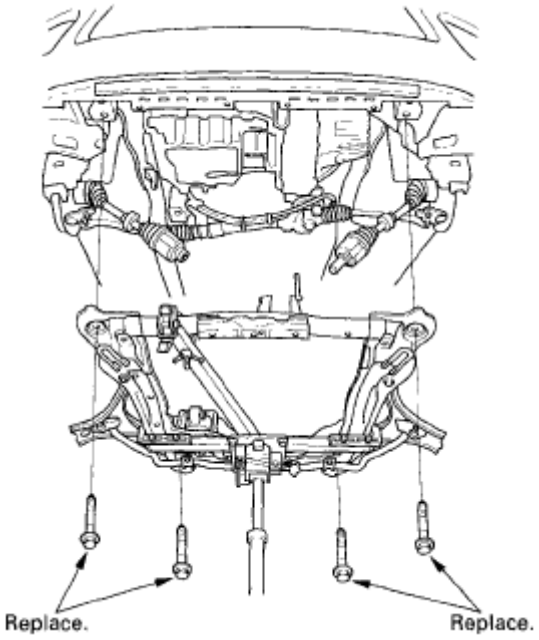

Fig. 112: Identifying Front Subframe And Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

53. Lower the vehicle on the lift.
54. Remove the idler pulley base (see step 2 on **DRIVE BELT AUTO-TENSIONER REMOVAL/INSTALLATION**).
55. Install the special tool.

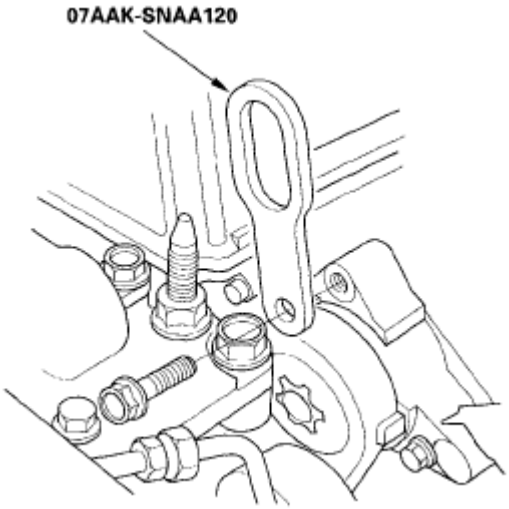

Fig. 113: Identifying Special Tool
Courtesy of AMERICAN HONDA MOTOR CO., INC.

56. Attach a chain hoist (A) to the special tool (B), and the transmission hook (C). Lift up on the engine/transmission until it's securely supported by the chain hoist, and remove the engine hanger.

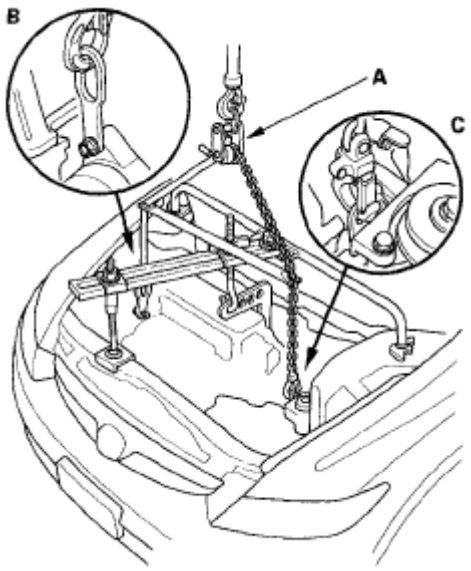

Fig. 114: Lifting Up On Engine/ Transmission
Courtesy of AMERICAN HONDA MOTOR CO., INC.

57. Remove the side engine mount bracket mounting bolt and nut.

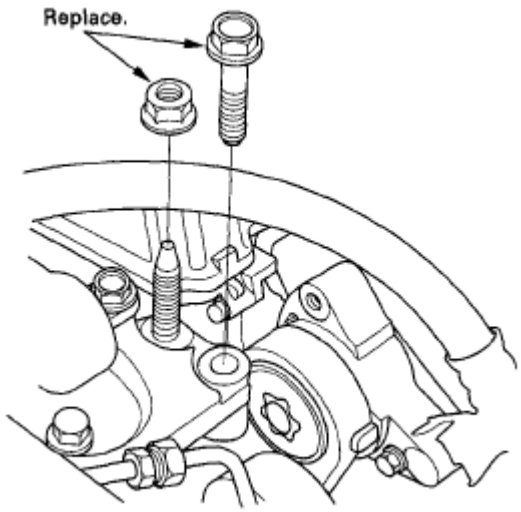

Fig. 115: Identifying Side Engine Mount Bracket Mounting Bolt And Nut
Courtesy of AMERICAN HONDA MOTOR CO., INC.

58. Remove the transmission mount bracket mounting bolt and nuts.

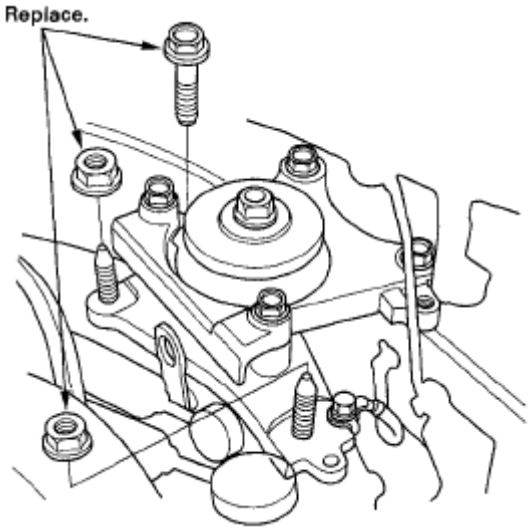

Fig. 116: Identifying Transmission Mount Bracket Mounting Bolt And Nuts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

59. Check that the engine/transmission is completely free of vacuum hoses, fuel and coolant hoses, and electrical wiring.
60. Slowly lower the engine/transmission about 150 mm (6 in.). Check once again that all hoses and electrical wiring are disconnected and free from the engine/transmission, then lower it all the way.
61. Disconnect the chain hoist from the engine/transmission.
62. Raise the vehicle all the way on the hoist, and remove the engine/transmission from under the vehicle.

ENGINE INSTALLATION

Special Tools Required

- Engine hanger plate 07AAK-SNAA120
- Engine hanger adapter VSB02C000015 *
- Front subframe adapter VSB02C000016 *
- 2006 Civic engine hanger VSB02C000025 *
- Engine support hanger, A and Reds AAR-T-12566 *

* : Available through Honda Tool and Equipment Program, 1-888-424-6857

1. Install the accessory brackets and tighten their bolts to the specified torques.

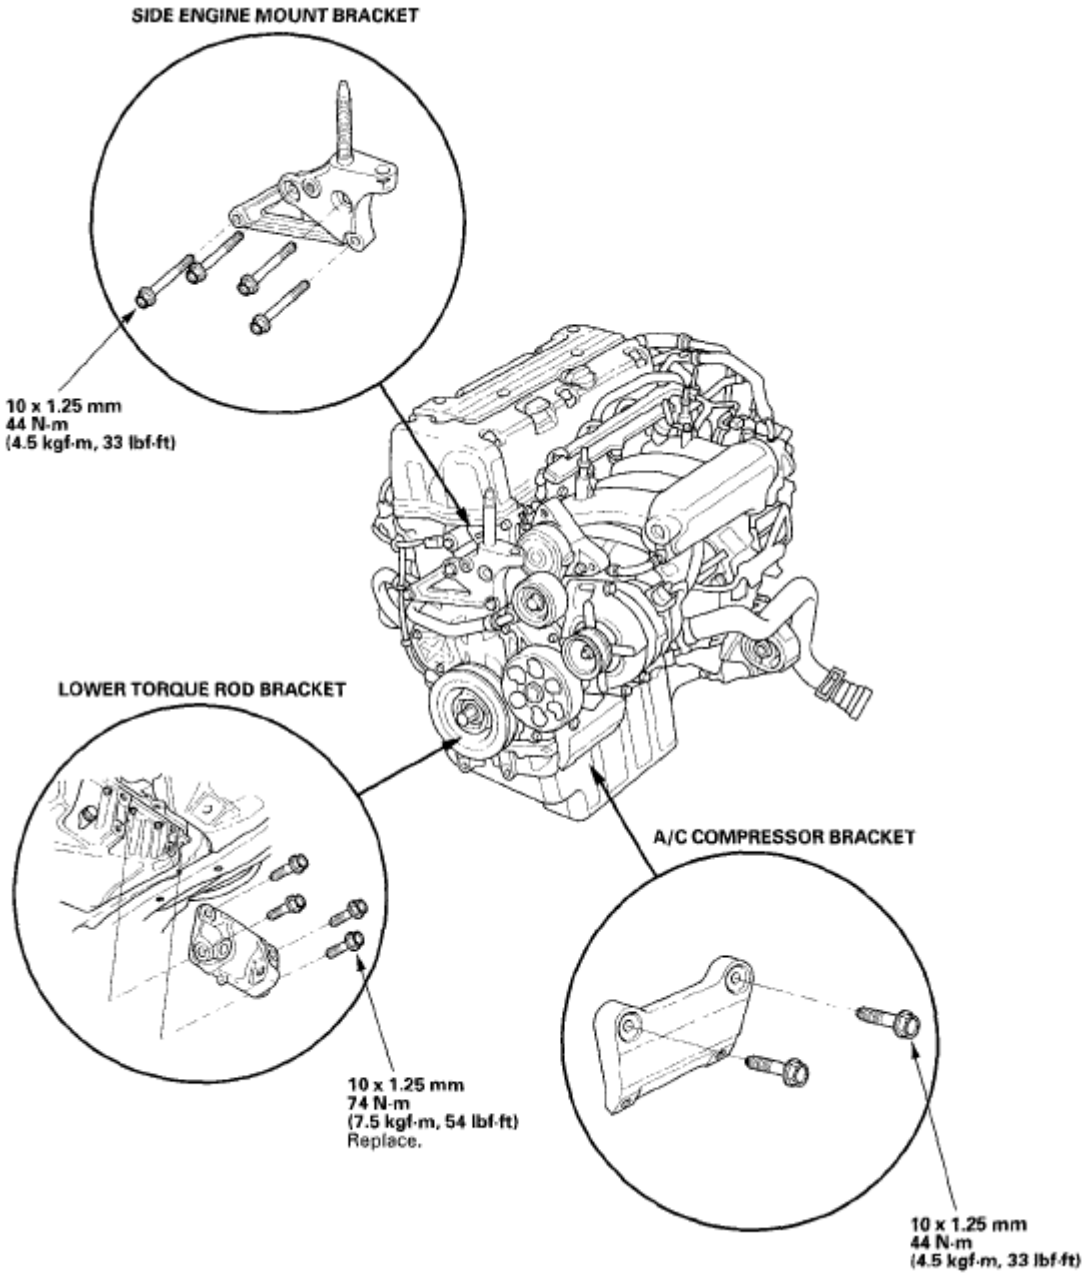

Fig. 117: Identifying Engine Brackets (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Raise the vehicle on the hoist, and position the engine/transmission under the vehicle. Lower the vehicle, and attach the special tool and chain hoist to the engine, then lift the engine into position in the vehicle.

NOTE: Reinstall the mounting bolts/support nuts in the sequence given in the following steps. Failure to follow this sequence may cause excessive noise and vibration, and reduce engine mount life.

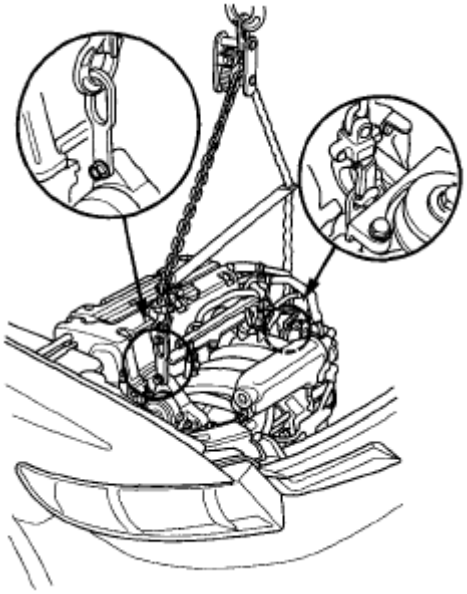

Fig. 118: Identifying Mounting Bolts/Support Nuts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Attach the special tool to the threaded hole in the cylinder head.

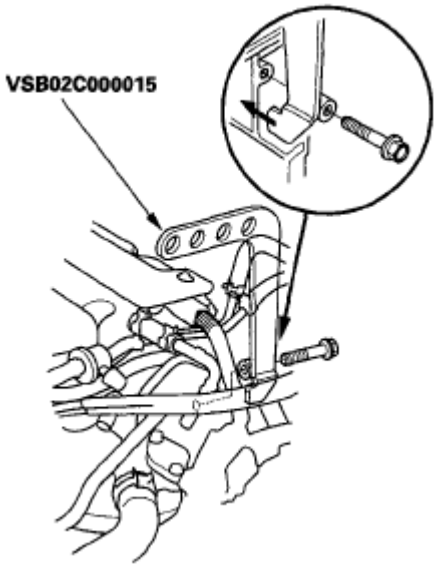

Fig. 119: Identifying Special Tool To Threaded Hole In Cylinder Head
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the front leg assembly (A), hook (B), and wing nut (C) from an A and Reds engine support hanger (AAR-T-12566) onto the engine hanger. Carefully position the engine hanger on the vehicle, and attach the hook to the forward hole in the engine hanger adapter (D). Tighten the wing nut by hand to lift and support the engine/transmission.

NOTE: Be careful when working around the windshield.

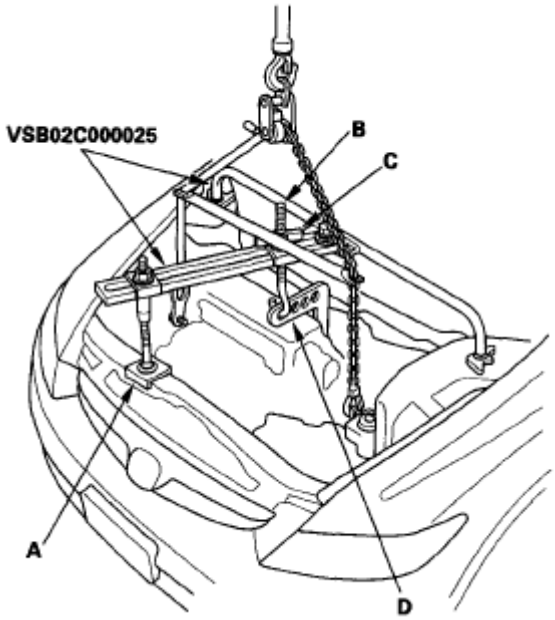

Fig. 120: Identifying Engine Hanger Adapter
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Loosen the upper torque rod mounting bolt (A).

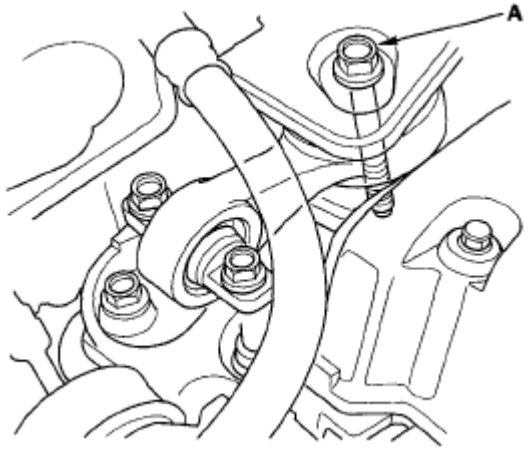

Fig. 121: Identifying Upper Torque Rod Mounting Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Tighten the new side engine mount bracket mounting bolt and nut.

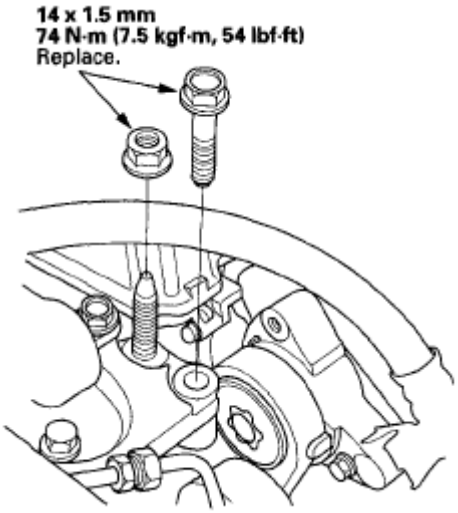

Fig. 122: Identifying Side Engine Mount Bracket Mounting Bolt And Nut (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Tighten the new transmission mounting bolt and nuts.

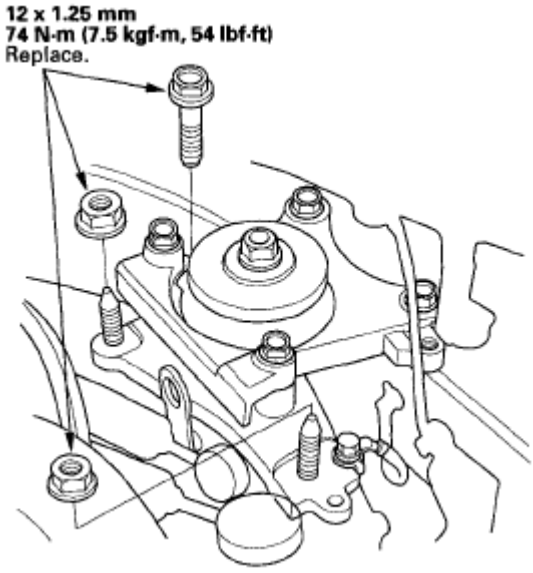

Fig. 123: Identifying Transmission Mounting Bolt And Nuts (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Remove the chain hoist.
9. Remove the special tool.

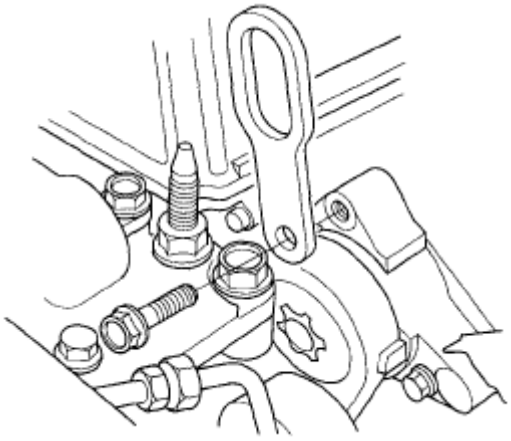

Fig. 124: Identifying Special Tool
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Raise the vehicle on the lift.
11. 11 Set the front subframe adapter (A) to the front subframe and hang the belt of the front subframe adapter over the front of the subframe, then secure the belt with its stop.

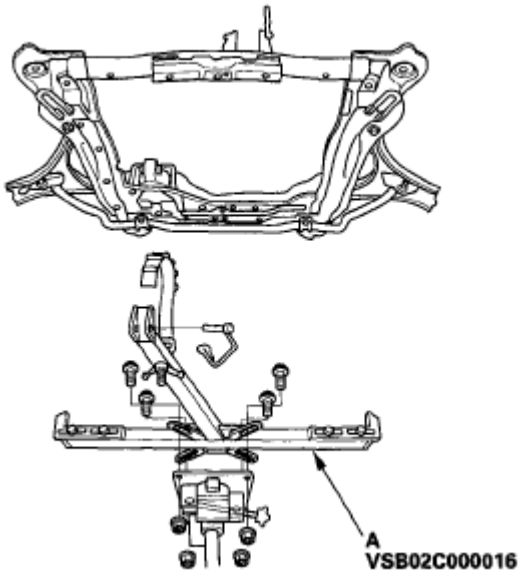

Fig. 125: Identifying Front Subframe Adapter
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Line up the slots in the arms with the bolt holes on the corner of the jack base, and tighten the bolts, then lift the front subframe up to the body.
13. Loosely install the new front subframe mounting bolts.

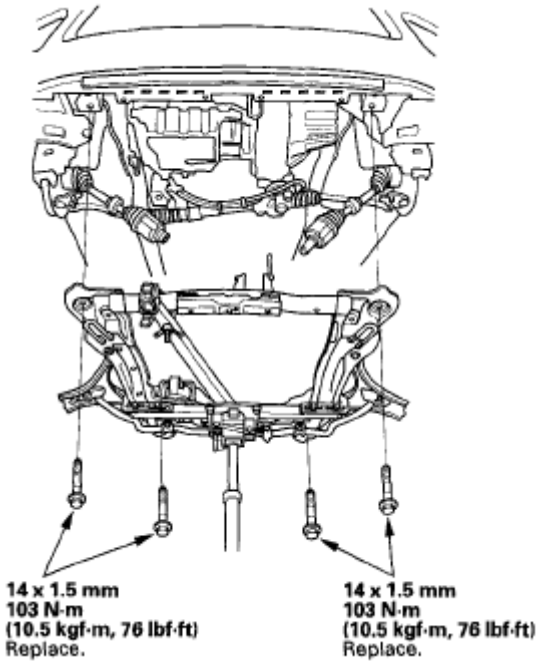

Fig. 126: Identifying Front Subframe Mounting Bolts (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Align the front subframe reference marks (A) to the body (B), as noted during removal. Tighten the bolts on the front subframe to the specified torque.

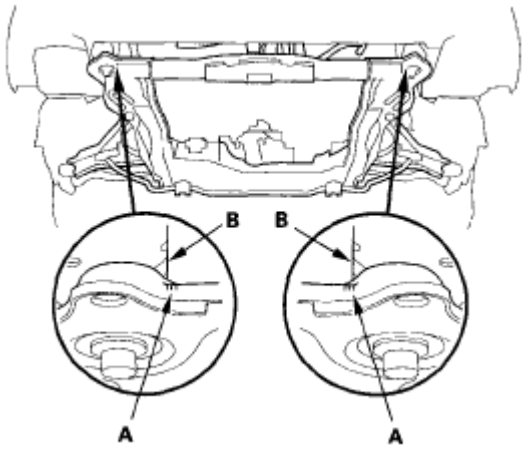

Fig. 127: Identifying Front Subframe Reference Marks To Body
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Remove the jack and front subframe adapter.
16. Tighten the new front subframe body mount bracket mounting bolts on both side.

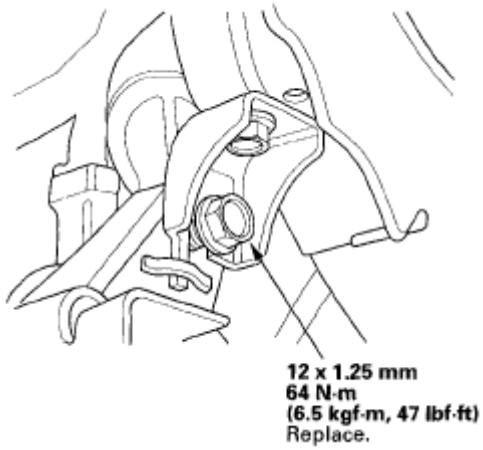

Fig. 128: Identifying Front Subframe Body Mount Bracket Mounting Bolts (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Install the lower torque rod, then tighten the new lower torque rod mounting bolts in the numbered sequence shown.

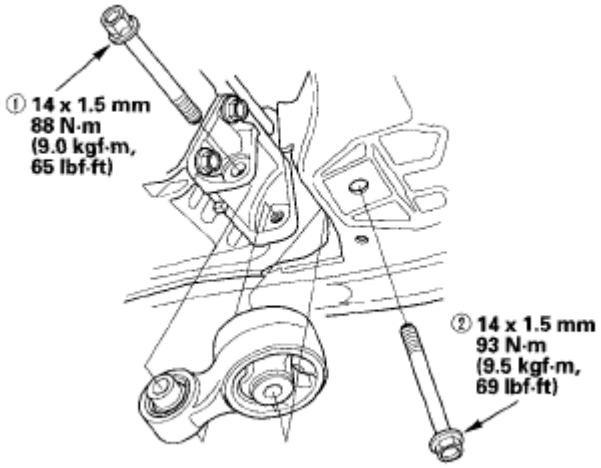

Fig. 129: Identifying Tightening Sequence For Lower Torque Rod Mounting Bolts (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

18. Loosely tighten the new front mount mounting bolt (A), then install the lower radiator hose to the clamp (B).

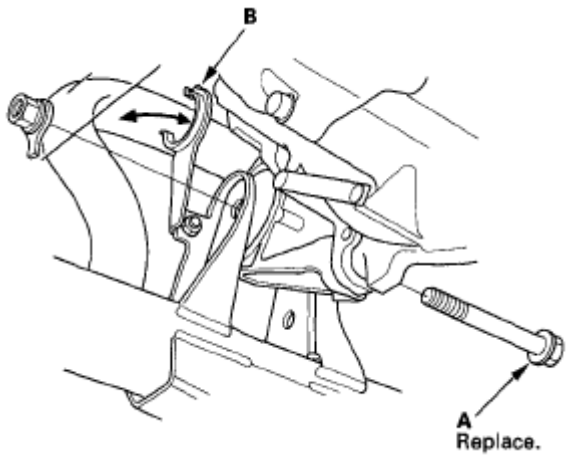

Fig. 130: Identifying Front Mount Mounting Bolt And Lower Radiator Hose Clamp
Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. Lower the vehicle on the lift.
20. Remove the special tools from the engine and vehicle.
21. Tighten the upper torque rod mounting bolt.

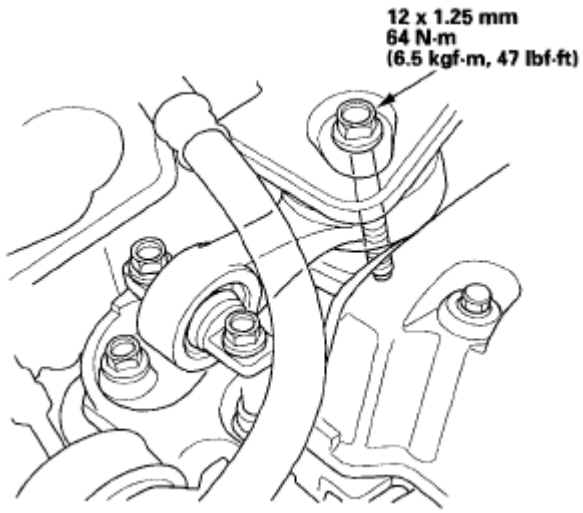

Fig. 131: Identifying Upper Torque Rod Mounting Bolt (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

22. Raise the vehicle on the lift to full height.
23. Tighten the front mount mounting bolt.

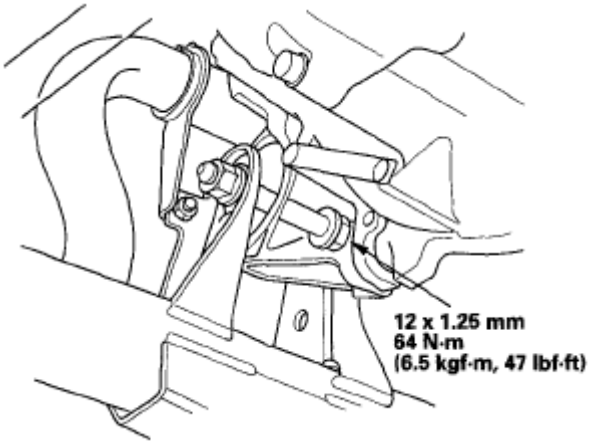

Fig. 132: Identifying Front Mount Mounting Bolt (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

24. Install the A/C compressor (A), then connect the A/C compressor clutch connector (B).

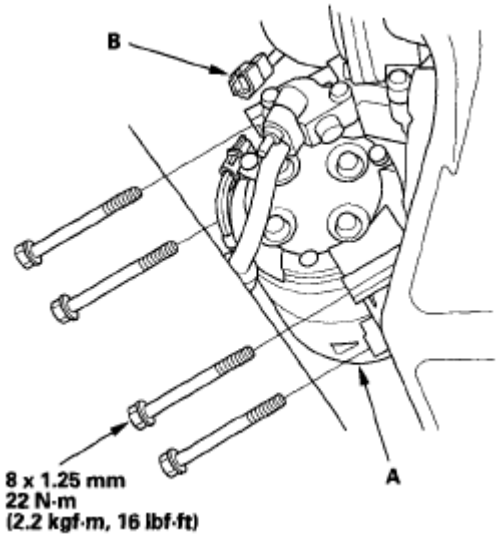

Fig. 133: Identifying A/C Compressor And Clutch Connector (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

25. Install the stiffener (A), then tighten the steering gearbox mounting bolt (B) and stiffener mounting bolt(C).

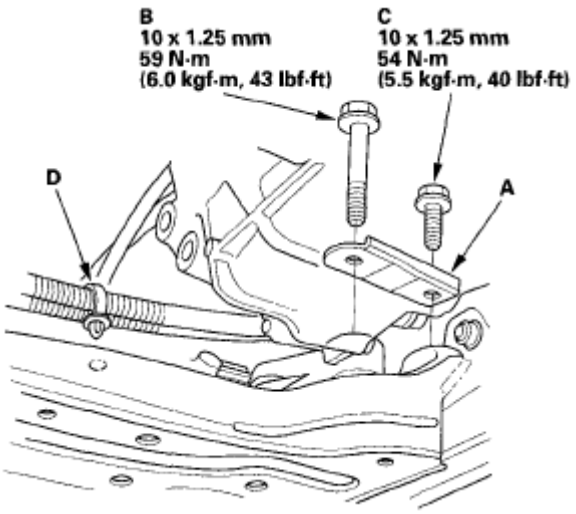

Fig. 134: Identifying Steering Gearbox Mounting Bolt (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

26. Install the harness clamp (D) to the subframe.
27. Install the steering gearbox bracket (A).

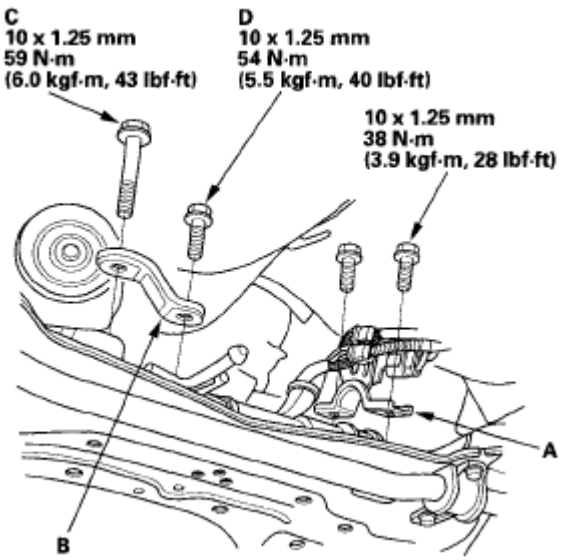

Fig. 135: Identifying Steering Gearbox Bracket (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

28. Install the stiffener (B), then tighten the steering gearbox mounting bolt (C) and stiffener mounting bolt(D).
29. Install a new set ring on the end of each driveshaft, then install the driveshafts. Make sure each ring "clicks" into place in the differential and intermediate shaft.
30. Connect the lower arms to the knuckles (see step 5 on **LOWER ARM REMOVAL/INSTALLATION**).
31. Connect the stabilizer links (see **STABILIZER LINK REMOVAL/INSTALLATION**).
32. Install the three way catalytic converter (TWC) (A). Use new gaskets (B) and new self-locking nuts (C).

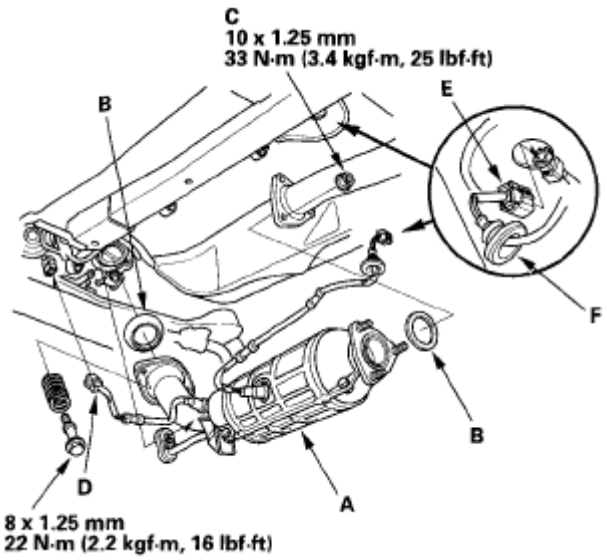

Fig. 136: Identifying (Secondary HO2S) Connector (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

33. Connect the air fuel ratio (A/F) sensor connector (D).
34. Connect the secondary heated oxygen sensor (secondary HO2S) connector (E), then install the grommet (F).
35. Install the splash shield.

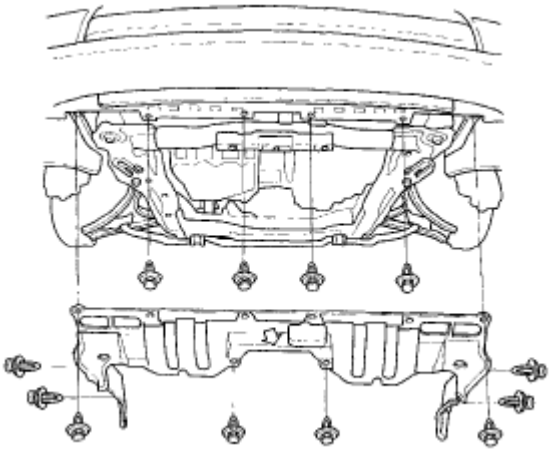

Fig. 137: Identifying Splash Shield
Courtesy of AMERICAN HONDA MOTOR CO., INC.

36. Lower the vehicle on the lift.
37. Install the heater hoses.

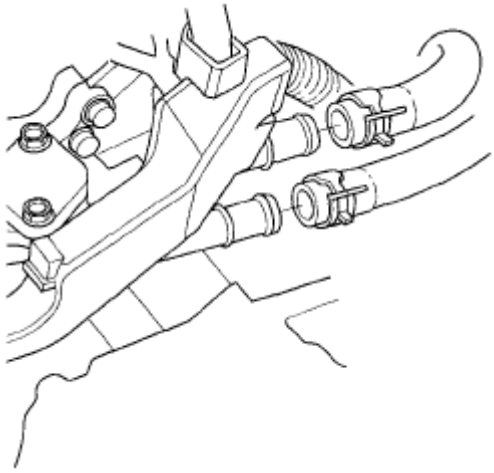

Fig. 138: Identifying Heater Hoses
Courtesy of AMERICAN HONDA MOTOR CO., INC.

38. Install the radiator (see **RADIATOR AND FAN REPLACEMENT**).
39. Install the idler pulley base (see **DRIVE BELT AUTO-TENSIONER REMOVAL/INSTALLATION**).
40. Install the drive belt (see **DRIVE BELT INSPECTION**).
41. Install the air cleaner housing bracket.

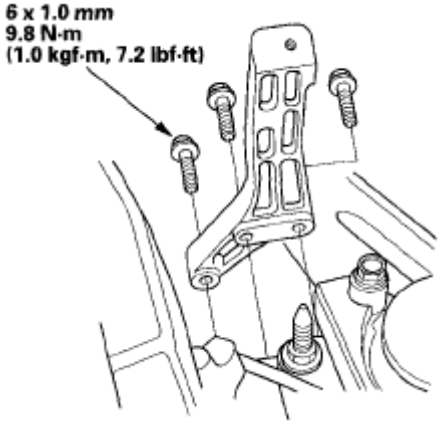

Fig. 139: Identifying Air Cleaner Housing Bracket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

42. Install the shift cable (see step 34 on **TRANSMISSION INSTALLATION**).
43. Install the clutch slave cylinder, and clutch line bracket mounting bolt (see step 37 on **TRANSMISSION INSTALLATION**).
44. Connect the fuel feed hose (see **FUEL LINE/QUICK-CONNECT FITTING INSTALLATION**), then install the quick-connect fitting cover (A).

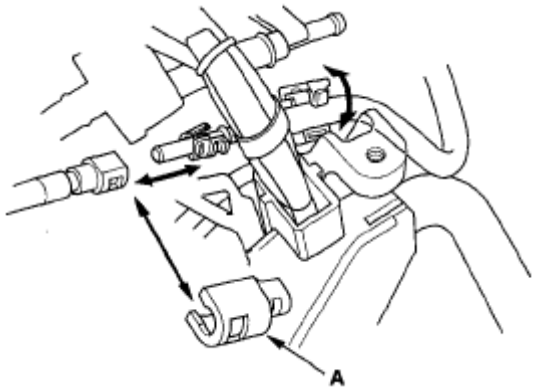

Fig. 140: Identifying Quick-Connect Fitting Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

45. Install the evaporative emission (EVAP) canister hose (A) and brake booster vacuum hose (B).

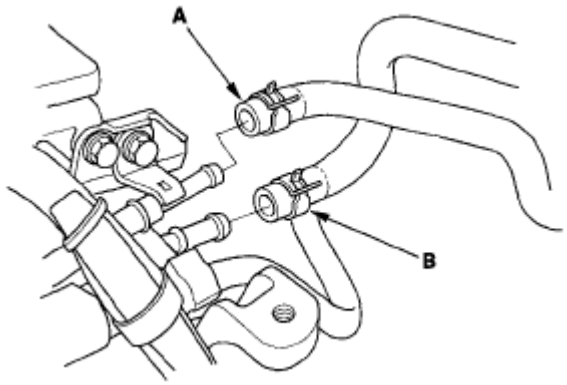

Fig. 141: Identifying Evaporative Emission (EVAP) Canister Hose And Brake Booster Vacuum Hose
Courtesy of AMERICAN HONDA MOTOR CO., INC.

46. Install the engine cover.

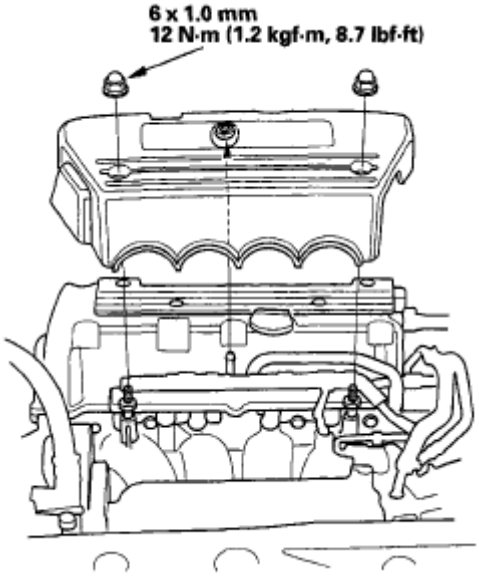

Fig. 142: Identifying Engine Cover (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

47. Connect the engine control module (ECM) connectors (A) and engine wire harness connector (B).

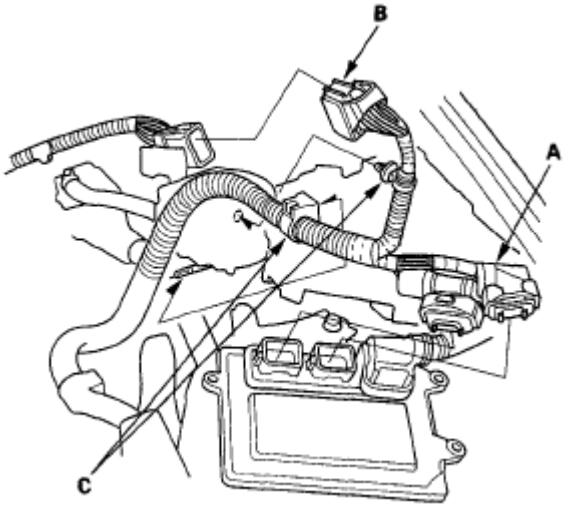

Fig. 143: Identifying Engine Control Module (ECM) Connectors And Engine Wire Harness Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

48. Install the harness clamps (C).
49. Install the ECM (A), then install the ECM cover (B).

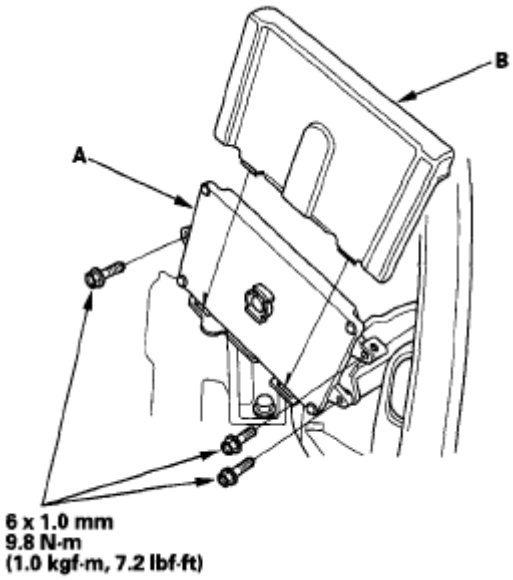

Fig. 144: Identifying ECM Cover (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

50. Install the battery cables (A) to the under-hood fuse/relay box.

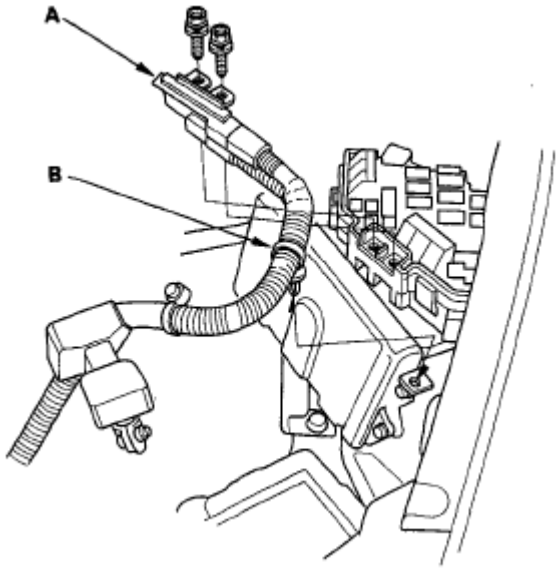

Fig. 145: Identifying Battery Cables And Harness Clamp
Courtesy of AMERICAN HONDA MOTOR CO., INC.

51. Install the harness clamp (B).
52. Install the resonator (A) A

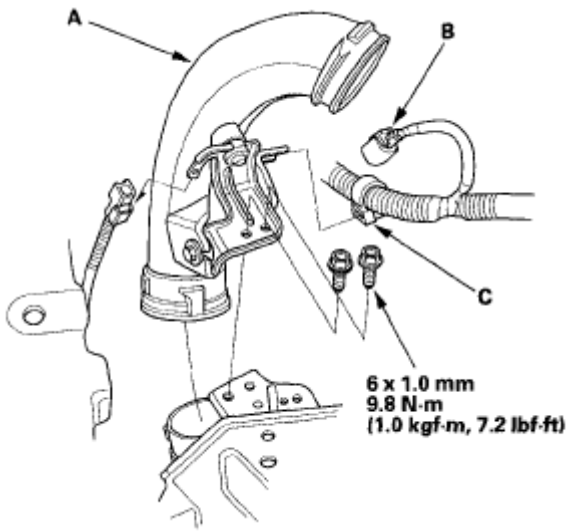

Fig. 146: Identifying Resonator And Harness Clamp
Courtesy of AMERICAN HONDA MOTOR CO., INC.

53. Connect the connector (B), and install the harness clamp (C).
54. Install the under-cowl panel (see **FRONT GRILLE COVER REPLACEMENT**).
55. Install the air cleaner assembly (see **AIR CLEANER REMOVAL/INSTALLATION**).
56. Install the front wheels.
57. Install the battery. Clean the battery posts and cable terminals, then assemble them, and apply grease to prevent corrosion.
58. Check that the transmission shifts into gear smoothly.
59. Inspect for fuel leaks: Turn the ignition switch ON (II) (do not operate the starter) so the fuel pump runs for about 2 seconds and pressurizes the fuel line. Repeat this operation two or three times, then check for fuel leakage at any point in the fuel line.
60. Refill the engine with engine oil (see step 4 on **ENGINE OIL REPLACEMENT**).
61. Refill the transmission with fluid (see **TRANSMISSION FLUID INSPECTION AND REPLACEMENT**).
62. Refill the radiator with engine coolant, and bleed air from the cooling system with the heater valve open (see step 6 on **COOLANT CHECK**).
63. Do the ECM reset procedure (see **HDS CLEAR COMMAND**).
64. Do the crankshaft position (CKP) pattern clear/CKP pattern learn procedure (see **HDS CLEAR COMMAND**).
65. Inspect the idle speed (see **IDLE SPEED INSPECTION**).
66. Inspect the ignition timing (see **IGNITION TIMING INSPECTION**).
67. Check the wheel alignment (see **WHEEL ALIGNMENT**).
68. Enter the anti-theft code for the audio system and the navigation system (if equipped), then enter the audio presets.
69. Set the clock (on vehicles without navigation).

SIDE ENGINE MOUNT REPLACEMENT

1. Support the engine with a jack and wood block under the oil pan.

2. Remove the upper torque rod.

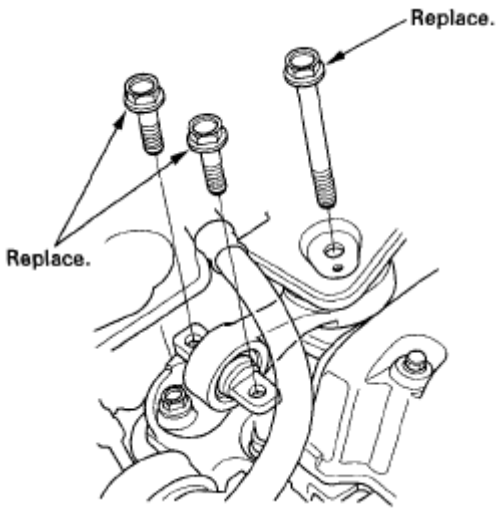

Fig. 147: Identifying Upper Torque Rod
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the ground cable (A), then remove the side engine mount bracket (B).

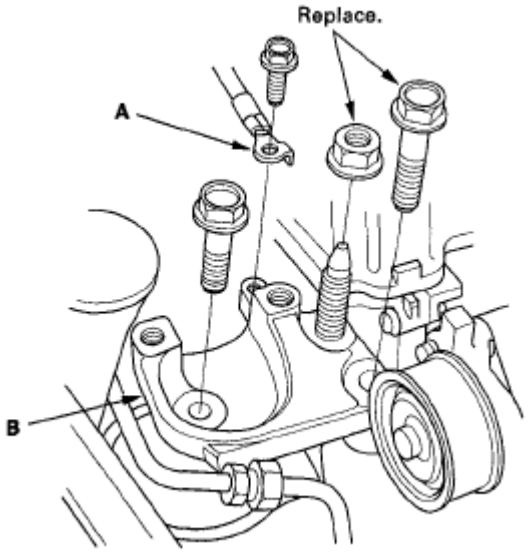

Fig. 148: Identifying Ground Cable And Side Engine Mount Bracket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the side engine mount stiffener (A), then remove the side engine mount (B).

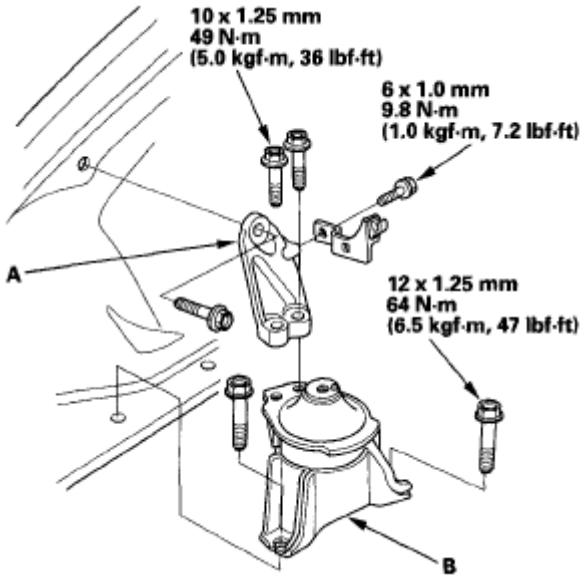

Fig. 149: Identifying Side Engine Mount (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the side engine mount, then install the side engine mount stiffener.
6. Install the side engine mount bracket (A), then loosely tighten the new bolt and nut (B), and loosely tighten the bolt (C).

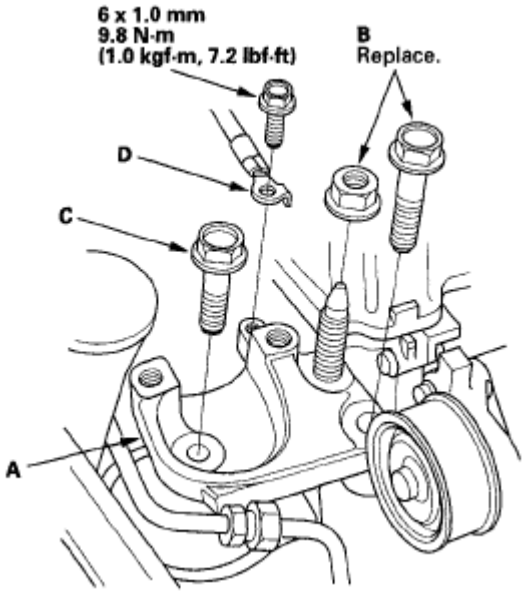

Fig. 150: Identifying Side Engine Mount Bracket (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the ground cable (D).
8. Remove the air cleaner assembly (see **AIR CLEANER REMOVAL/INSTALLATION**).
9. Loosen the transmission mounting bolt and nuts (A).

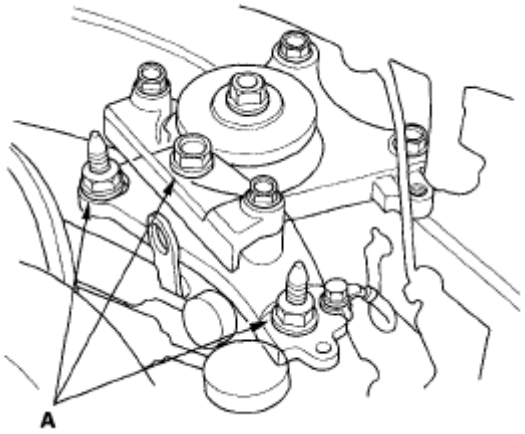

Fig. 151: Identifying Transmission Mounting Bolt And Nuts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Raise the vehicle on the lift to full height.
11. Remove the splash shield.
12. Loosen the lower torque rod mounting bolt (A).

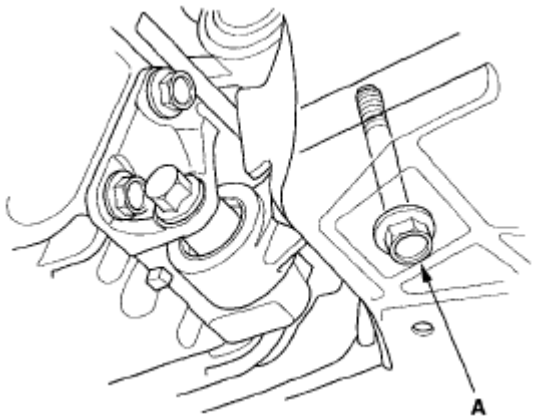

Fig. 152: Identifying Lower Torque Rod Mounting Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Loosen the front mount mounting bolt (A).

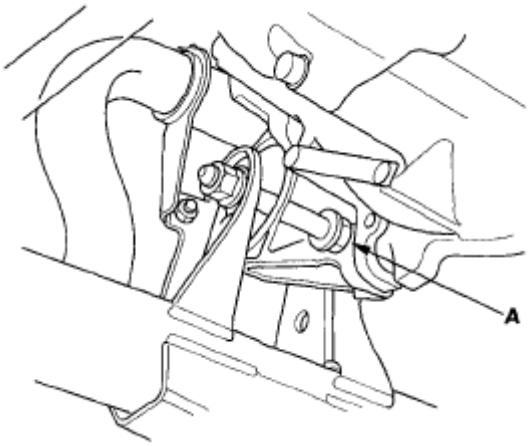

Fig. 153: Identifying Front Mount Mounting Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Lower the vehicle on the lift.
15. Tighten the side engine mount mounting bolts and nut.

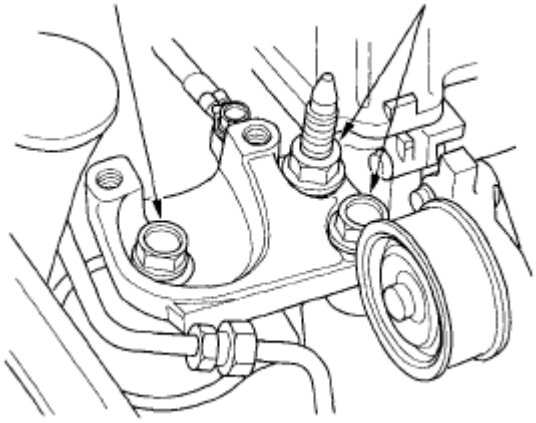

Fig. 154: Identifying Side Engine Mount Mounting Bolts And Nut
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Tighten the transmission mounting bolt and nuts.

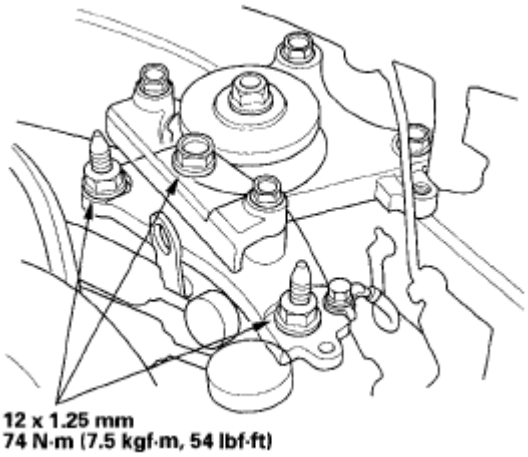

Fig. 155: Identifying Transmission Mounting Bolt And Nuts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Raise the vehicle on the lift to full height.
18. Tighten the lower torque rod mounting bolt.

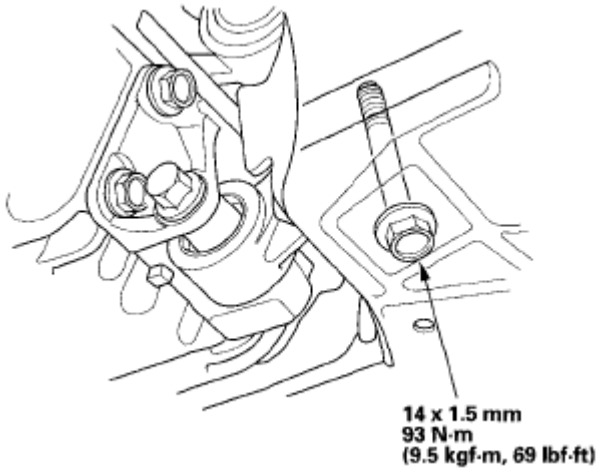

Fig. 156: Identifying Lower Torque Rod Mounting Bolt (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. Lower the vehicle on the lift.
20. Install the air cleaner assembly (see **AIR CLEANER REMOVAL/INSTALLATION**).
21. Install the upper torque rod, then tighten the new upper torque rod mounting bolts in the numbered sequence shown.

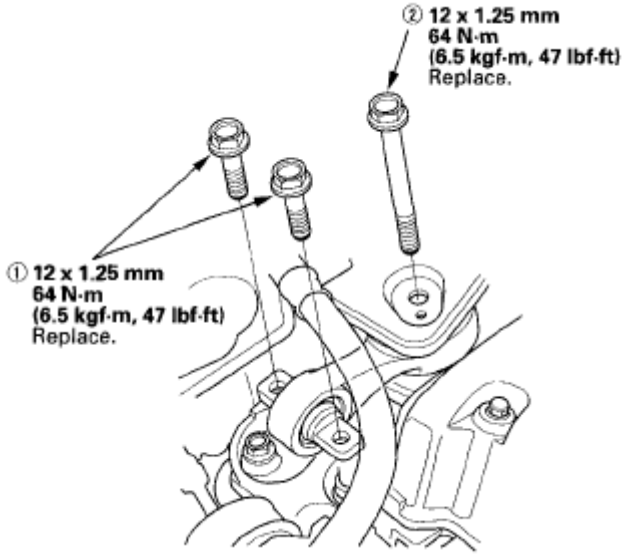

Fig. 157: Identifying Tightening Sequence For Upper Torque Rod Mounting Bolts (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

22. Raise the vehicle on the lift to full height, and tighten the front mount mounting bolt.

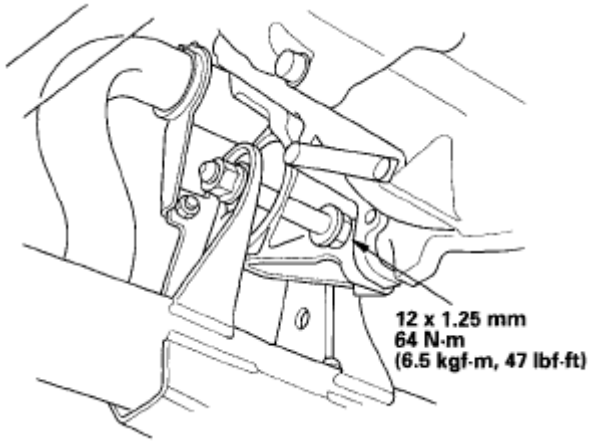

Fig. 158: Identifying Front Mount Mounting Bolt (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

23. Install the splash shield.

TRANSMISSION MOUNT REPLACEMENT

1. Loosen the upper torque rod mounting bolt (A).

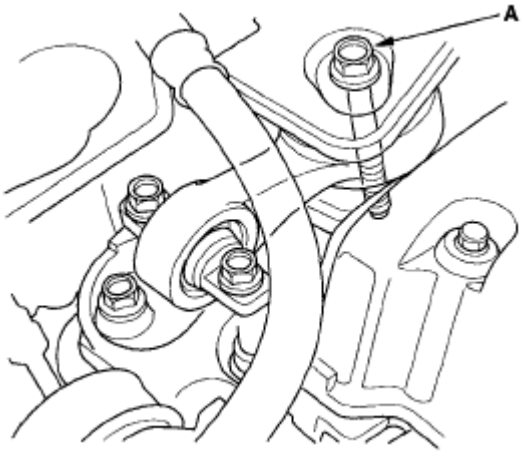

Fig. 159: Identifying Upper Torque Rod Mounting Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the air cleaner assembly (see **AIR CLEANER REMOVAL/INSTALLATION**).
3. Remove the engine control module (ECM) cover, then remove the three bolts securing the ECM.
4. Remove the ECM bracket.
5. Remove the under hood fuse/relay box from the bracket.
6. Support the transmission with a jack and wood block under the transmission.
7. Remove the transmission mount (A).

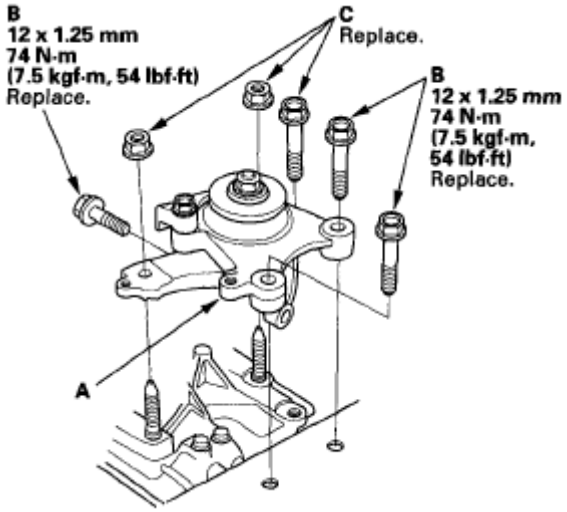

Fig. 160: Identifying Transmission Mount (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Install the transmission mount with the new mounting bolts (B).
9. Loosely tighten the new bolt and nuts (C).
10. Raise the vehicle on the lift to full height.
11. Remove the splash shield.
12. Loosen the lower torque rod mounting bolt (A).

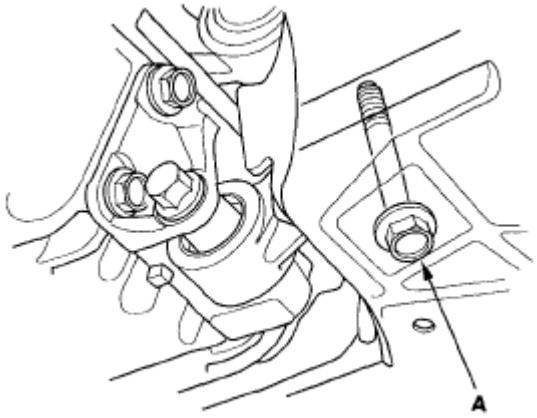

Fig. 161: Identifying Lower Torque Rod Mounting Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Loosen the front mount mounting bolt (A).

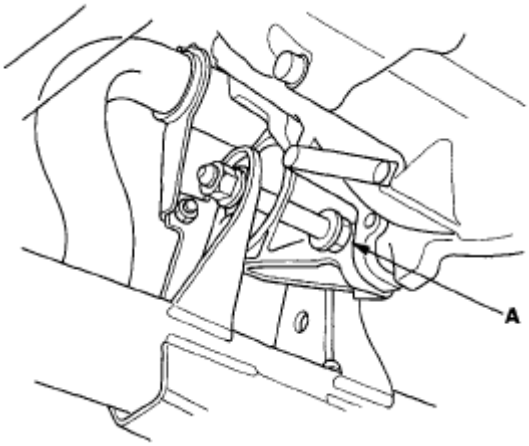

Fig. 162: Identifying Front Mount Mounting Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Lower the vehicle on the lift.
15. Tighten the transmission mounting bolt and nuts.

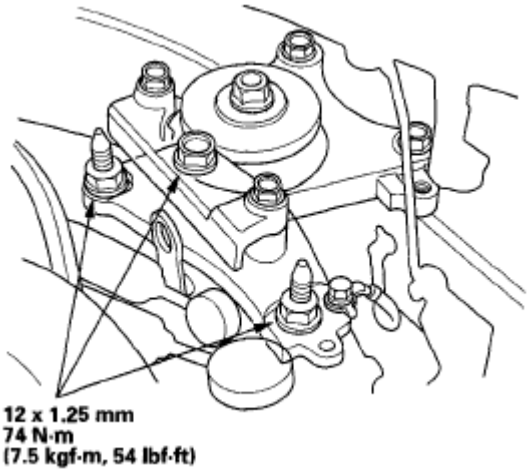

Fig. 163: Identifying Transmission Mounting Bolt And Nuts (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Raise the vehicle on the lift to full height.
17. Tighten the lower torque rod mounting bolt.

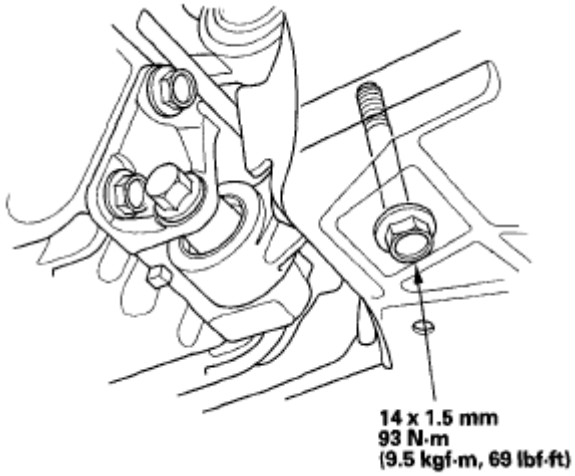

Fig. 164: Identifying Lower Torque Rod Mounting Bolt (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

18. Lower the vehicle on the lift.
19. Tighten the upper torque rod mounting bolt.

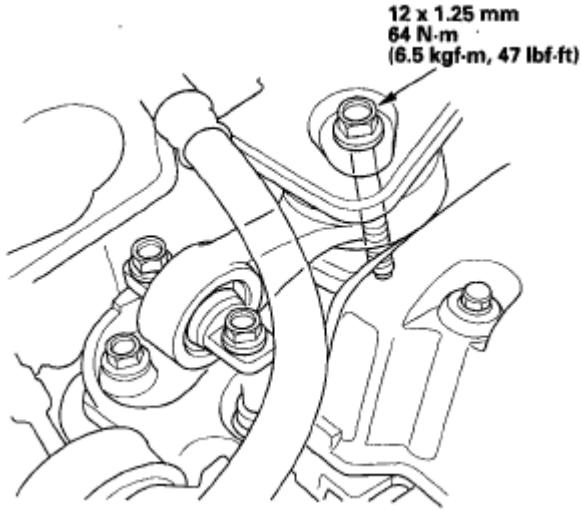

Fig. 165: Identifying Upper Torque Rod Mounting Bolt (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Install the under-hood fuse/relay box to the bracket.
21. Install the ECM bracket.
22. Install the ECM, then install the ECM cover.
23. Install the air cleaner assembly (see **AIR CLEANER REMOVAL/INSTALLATION**).
24. Raise the vehicle on the lift to full height, and tighten the front mount mounting bolt.

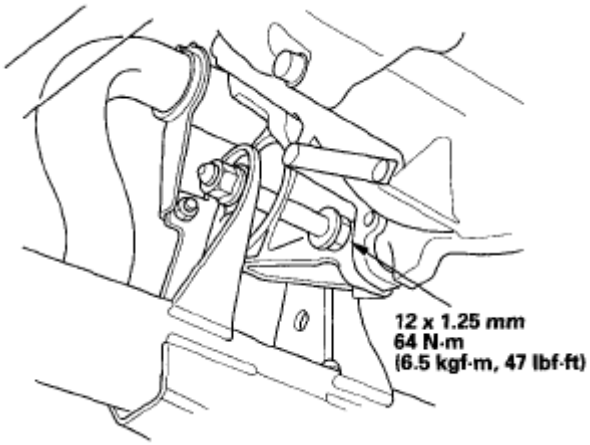

Fig. 166: Identifying Front Mount Mounting Bolt (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

25. Install the splash shield.

LOWER TORQUE ROD REPLACEMENT

1. Loosen the upper torque rod mounting bolt (A).

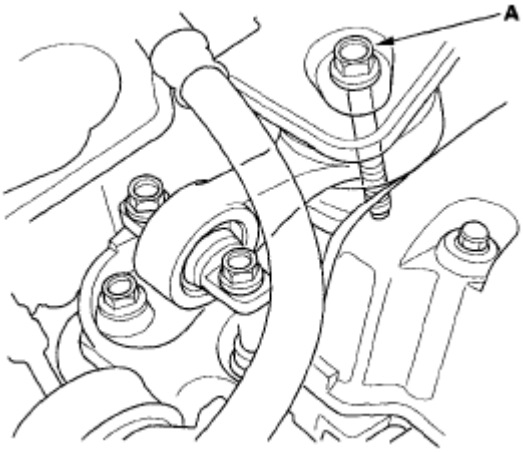

Fig. 167: Identifying Upper Torque Rod Mounting Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Raise the vehicle on the lift to full height.
3. Remove the splash shield.
4. Loosen the front mount mounting bolt (A).

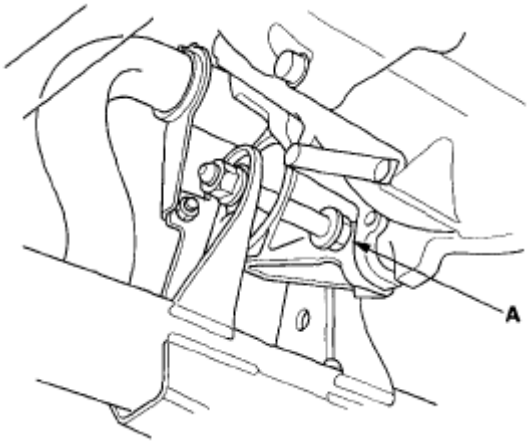

Fig. 168: Identifying Front Mount Mounting Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Remove the lower torque rod (A).

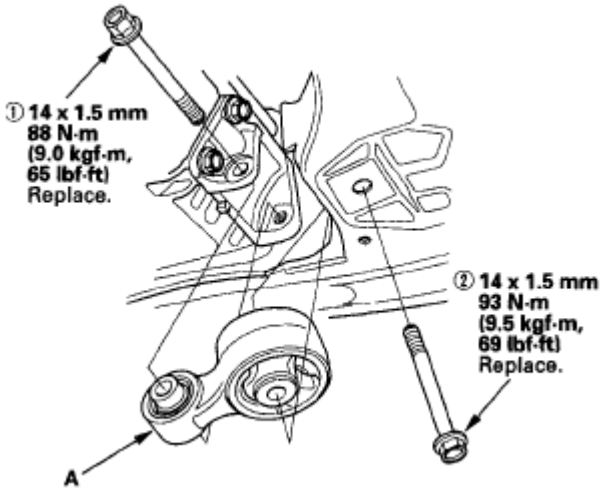

Fig. 169: Identifying Lower Torque Rod (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Install the lower torque rod, then tighten the new lower torque rod mounting bolts in the numbered sequence shown.
7. Lower the vehicle on the lift.
8. Tighten the upper torque rod mounting bolt.

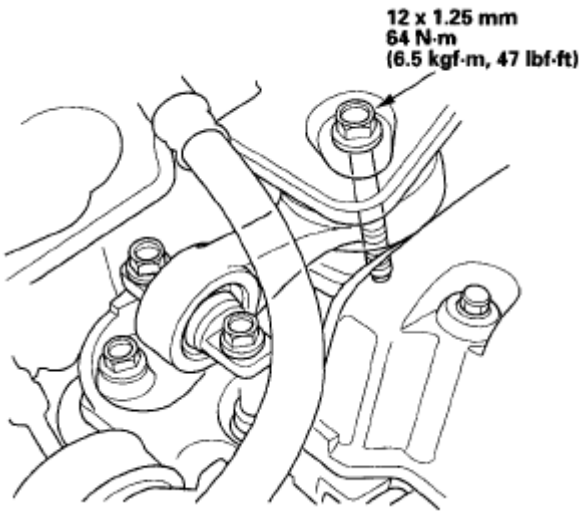

Fig. 170: Identifying Upper Torque Rod Mounting Bolt (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Raise the vehicle on the lift to full height, and tighten the front mount mounting bolt.

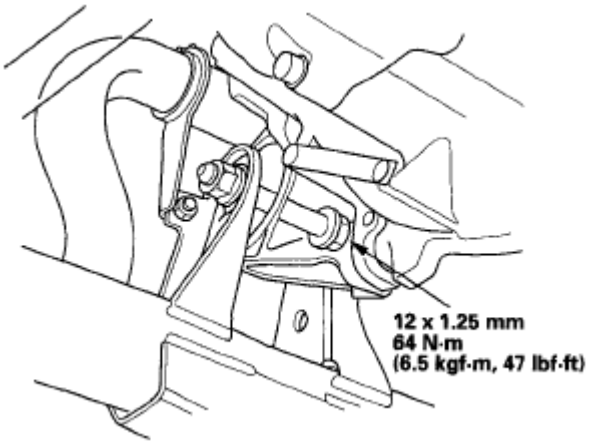

Fig. 171: Identifying Front Mount Mounting Bolt (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Install the splash shield.

UPPER TORQUE ROD REPLACEMENT

1. Raise the vehicle on the lift to full height.
2. Remove the splash shield.
3. Loosen the front mount mounting bolt (A).

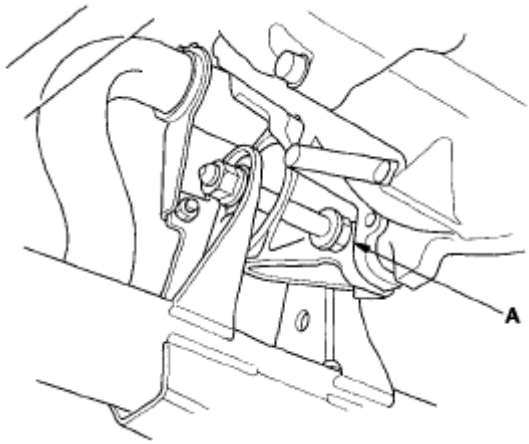

Fig. 172: Identifying Front Mount Mounting Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the upper torque rod (A).

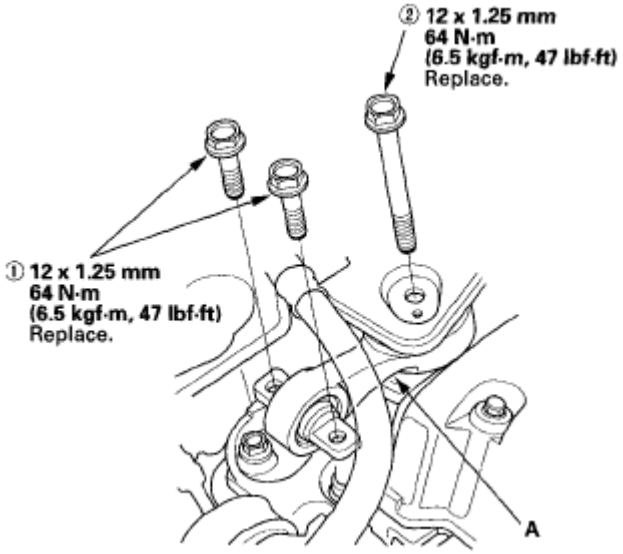

Fig. 173: Identifying Upper Torque Rod (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the upper torque rod, then tighten the new bolts in the numbered sequence shown.
6. Raise the hoist to full height, and tighten the front mount mounting bolt.

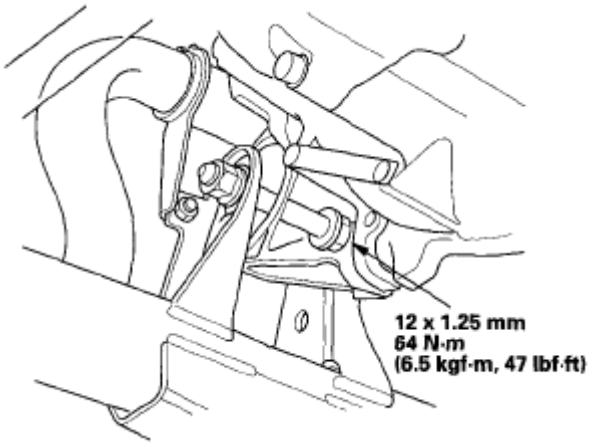

Fig. 174: Identifying Front Mount Mounting Bolt (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the splash shield.

SIDE ENGINE MOUNT BRACKET REPLACEMENT

1. Support the engine with a jack and wood block under the oil pan.
2. Remove the upper torque rod.

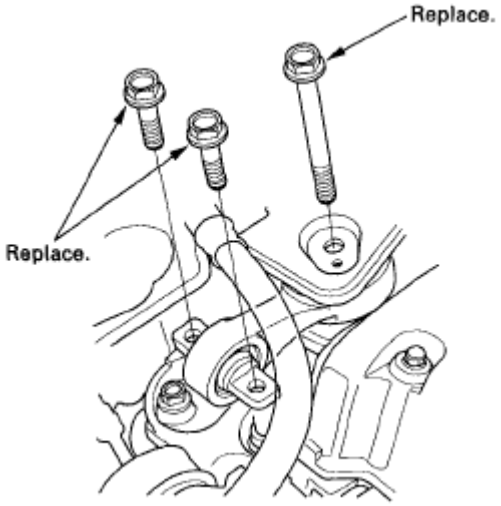

Fig. 175: Identifying Upper Torque Rod
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the ground cable (A), then remove the side engine mount bracket (B).

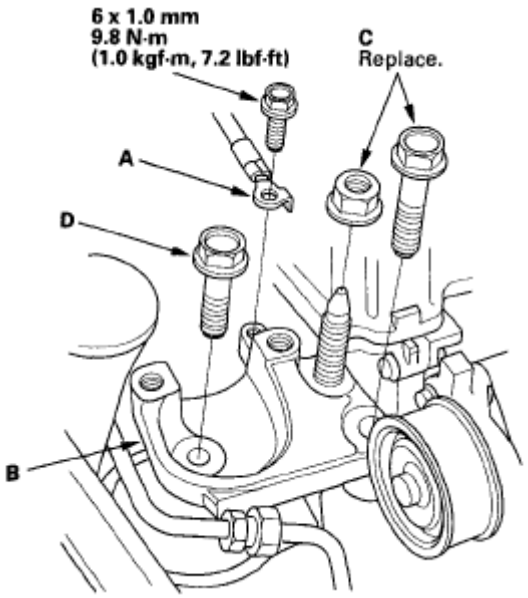

Fig. 176: Identifying Ground Cable (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the side engine mount bracket, then loosely tighten the new bolt and nut (C), and loosely tighten the bolt (D).
5. Install the ground cable.
6. Remove the air cleaner assembly (see **AIR CLEANER REMOVAL/INSTALLATION**).
7. Loosen the transmission mounting bolt and nuts (A).

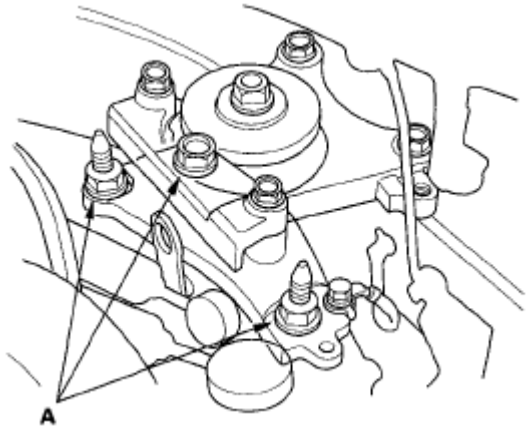

Fig. 177: Identifying Transmission Mounting Bolt And Nuts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Raise the vehicle on the lift to full height.
9. Remove the splash shield.
10. Loosen the lower torque rod mounting bolt (A).

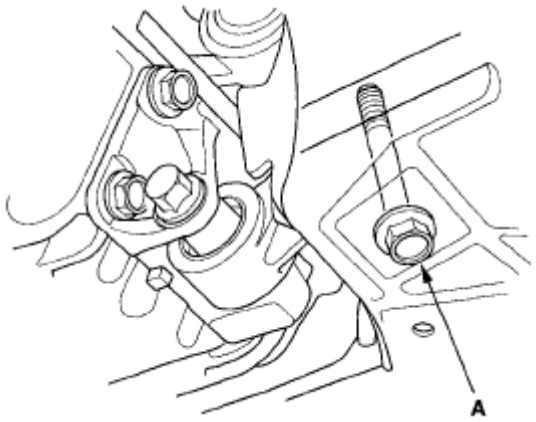

Fig. 178: Identifying Lower Torque Rod Mounting Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Loosen the front mount mounting bolt (A).

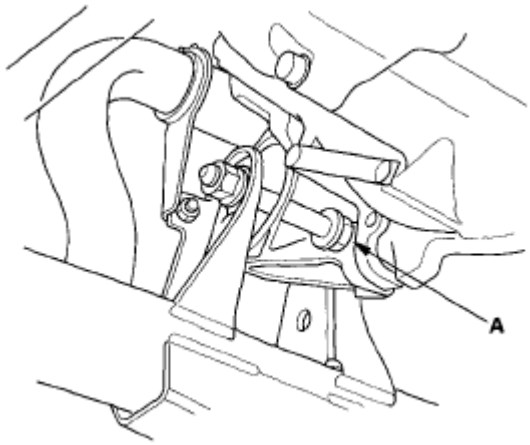

Fig. 179: Identifying Front Mount Mounting Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Lower the vehicle on the lift.
13. Tighten the side engine mount mounting bolts and nut.

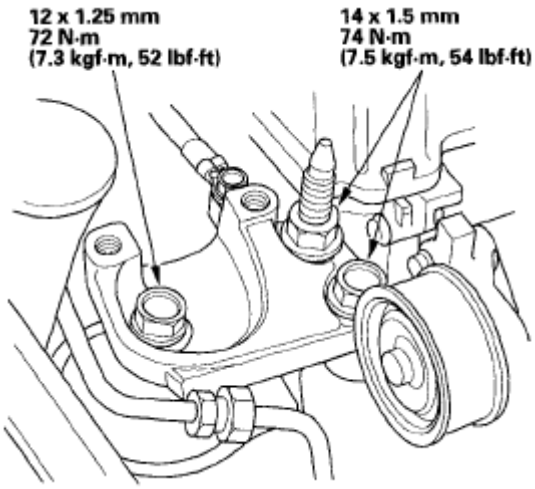

Fig. 180: Identifying Side Engine Mount Mounting Bolts And Nut (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Tighten the transmission mounting bolt and nuts.

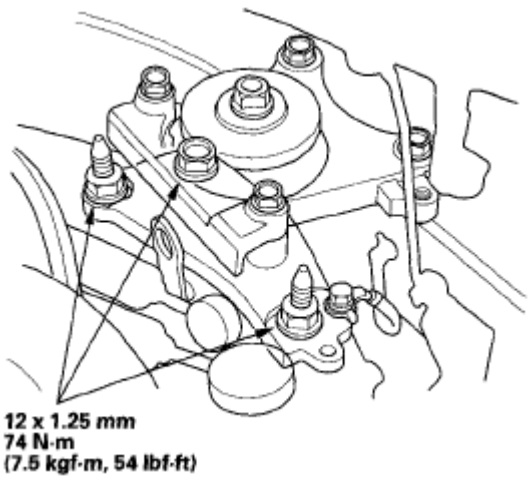

Fig. 181: Identifying Transmission Mounting Bolt And Nuts (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Raise the vehicle on the lift to full height.
16. Tighten the lower torque rod mounting bolt.

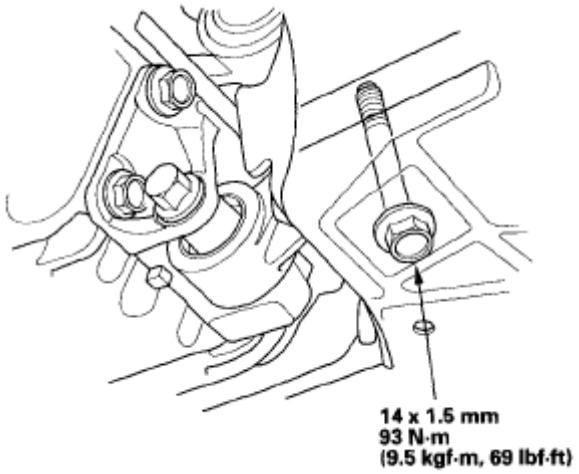

Fig. 182: Identifying Lower Torque Rod Mounting Bolt (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Lower the vehicle on the lift.
18. Install the air cleaner assembly (see **AIR CLEANER REMOVAL/INSTALLATION**).
19. Install the upper torque rod, then tighten the new upper torque rod mounting bolts in the numbered sequence shown.

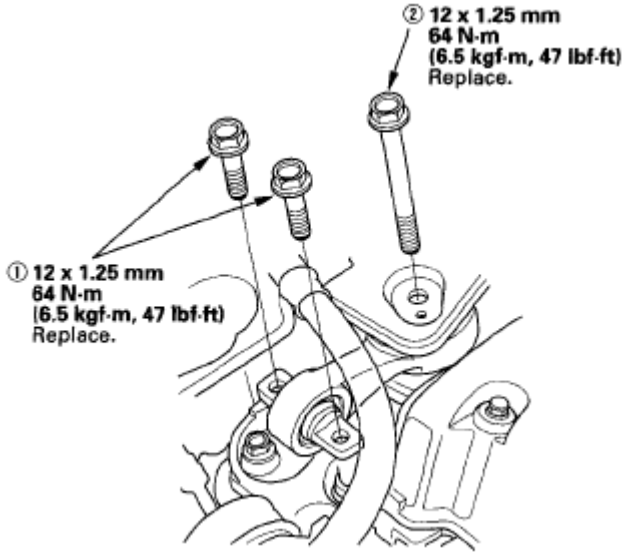

Fig. 183: Identifying Tightening Sequence For Upper Torque Rod Mounting Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Raise the vehicle on the lift to full height, and tighten the front mount mounting bolt.

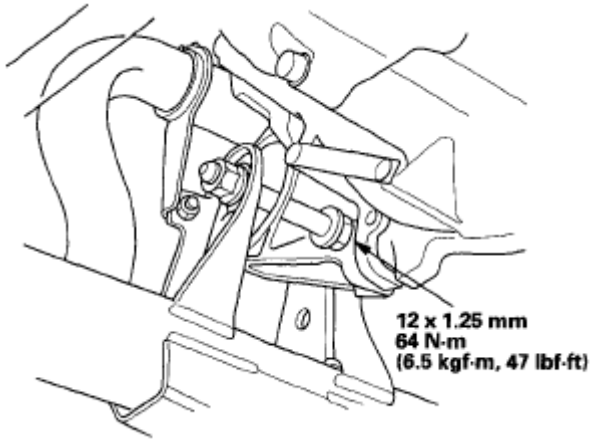

Fig. 184: Identifying Front Mount Mounting Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Install the splash shield.

FRONT ENGINE MOUNT REPLACEMENT

1. Raise the lift to full height.
2. Remove the splash shield.
3. Remove the front mount (A).

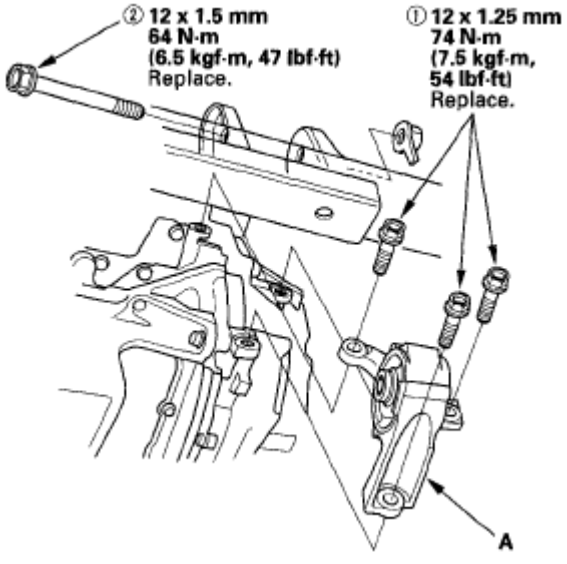

Fig. 185: Identifying Front Mount (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the front mount, then tighten the new front mount mounting bolts in the numbered sequence shown.
5. Install the splash shield.

2006-08 ENGINE

Engine Block - Civic (Except Hybrid)

ENGINE BLOCK (R18A1)

NOTE: Refer to the ENGINE BLOCK (GX) (SUPPLEMENT) article for additional information for the GX model.

SPECIAL TOOLS

Ref. No.	Tool Number	Description	Qty
①	07LAD-PT3010A	Oil Seal Driver	1
②	07ZAD-PNAA100	Oil Seal Driver Attachment 96	1
③	07746-0010700	Attachment, 24 x 26 mm	1
④	07749-0010000	Driver	1

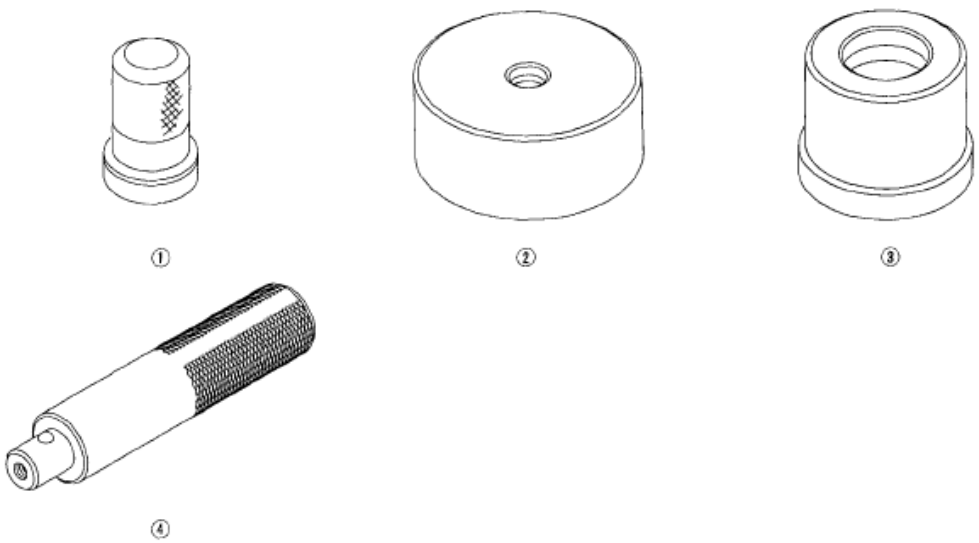

Fig. 1: Identifying Special Tools
Courtesy of AMERICAN HONDA MOTOR CO., INC.

COMPONENT LOCATION INDEX

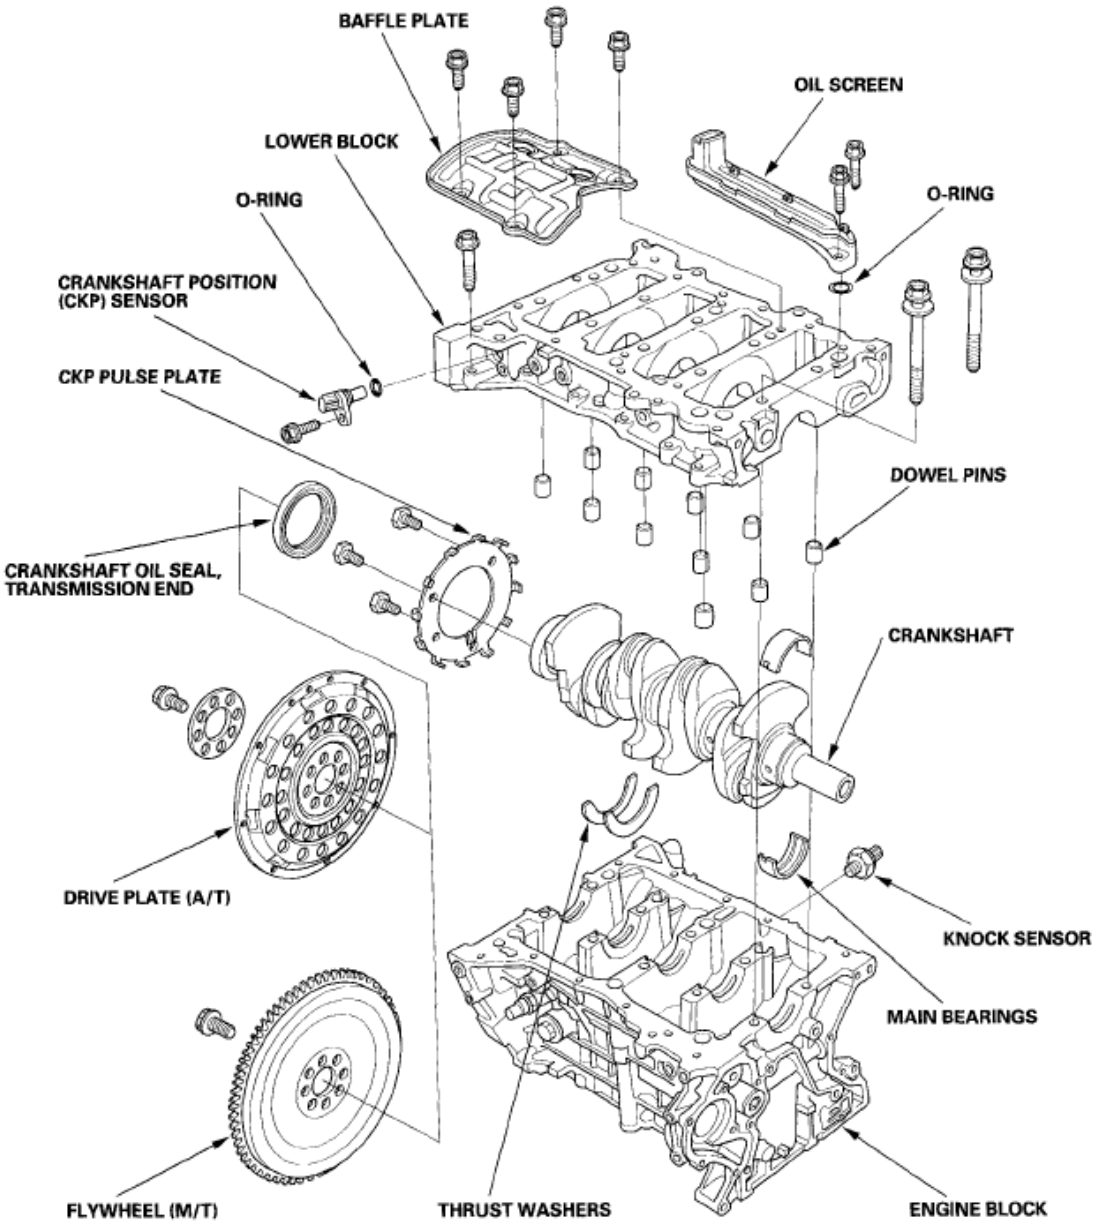

Fig. 2: Identifying Engine Block, Flywheel And Crankshaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

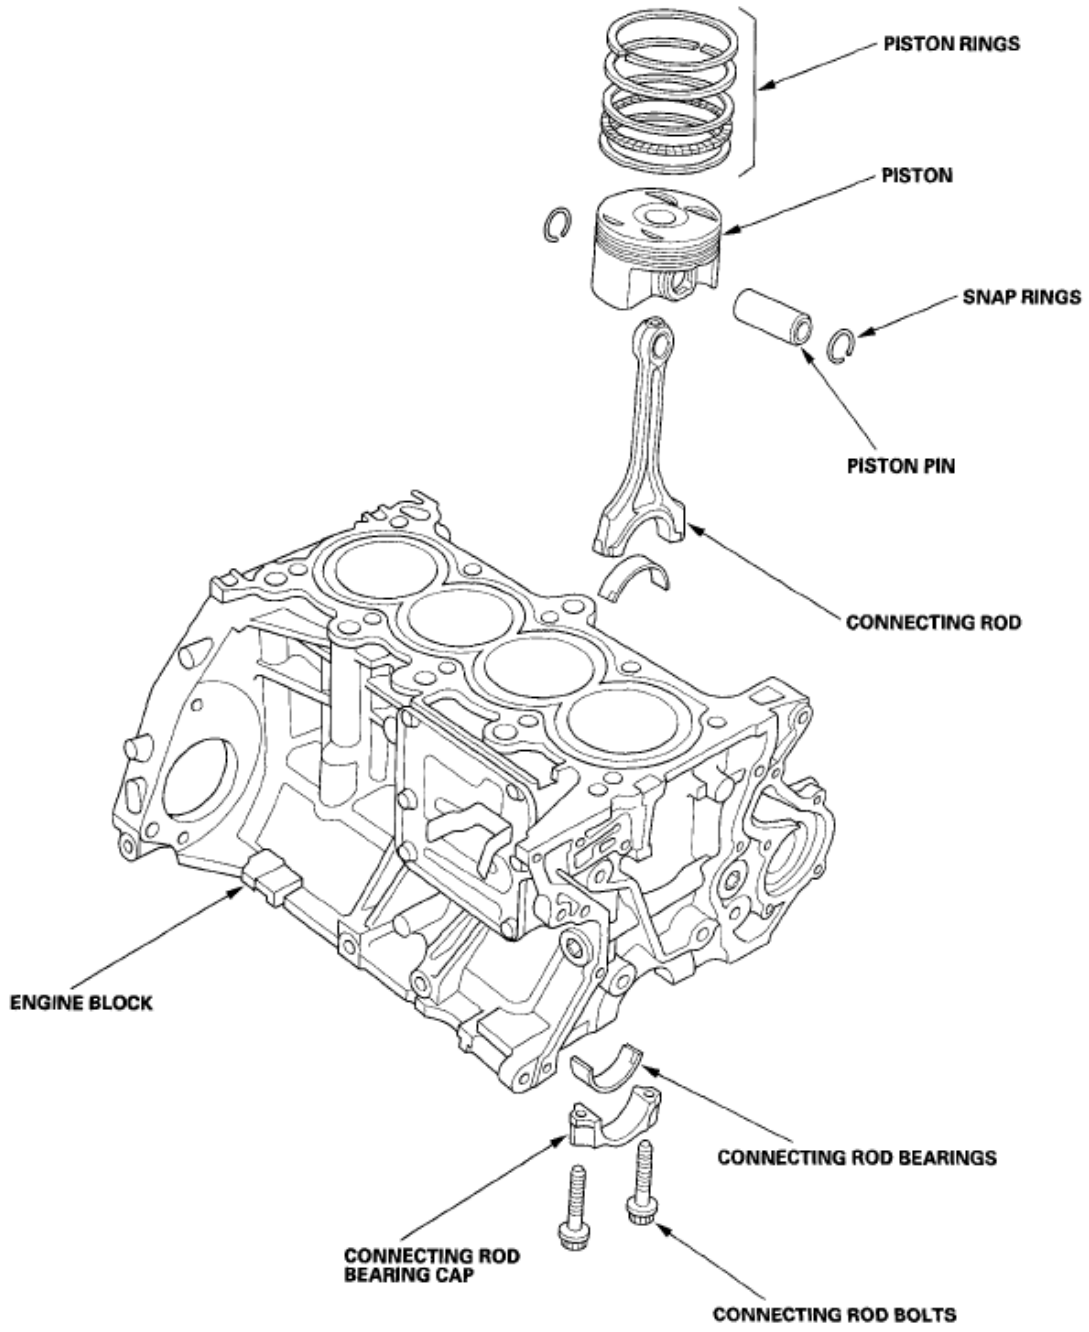

Fig. 3: Identifying Engine Block , Piston And Connecting Rod
Courtesy of AMERICAN HONDA MOTOR CO., INC.

CONNECTING ROD AND CRANKSHAFT END PLAY INSPECTION

1. Remove the oil pan (see **OIL PAN REMOVAL**).
2. Remove the oil screen and baffle plate (see step 8).
3. Measure the connecting rod end play with a feeler gauge between the connecting rod and crankshaft.

   Connecting Rod End Play

   Standard (New): 0.15-0.35 mm (0.006-0.014 in.)

Service Limit: 0.45 mm (0.018 in.)

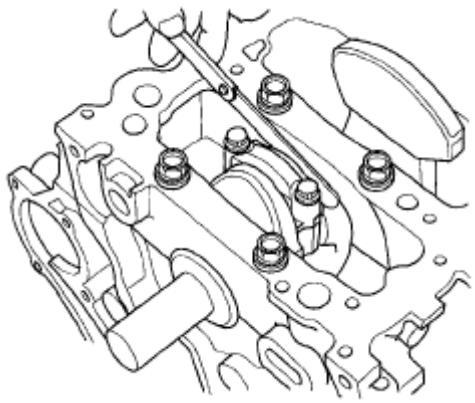

Fig. 4: Measuring Connecting Rod End Play
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. If the connecting rod end play is beyond the service limit, install a new connecting rod, and recheck. If it is still beyond the service limit; replace the crankshaft (see **CRANKSHAFT AND PISTON REMOVAL**).
5. Push the crankshaft firmly away from the dial indicator, and zero the dial against the end of the crankshaft. Then pull the crankshaft firmly back toward the indicator; the dial reading should not exceed the service limit.

   Crankshaft End Play

   Standard (New): 0.10-0.35 mm (0.004-0.014 in.)

   Service Limit: 0.45 mm (0.018 in.)

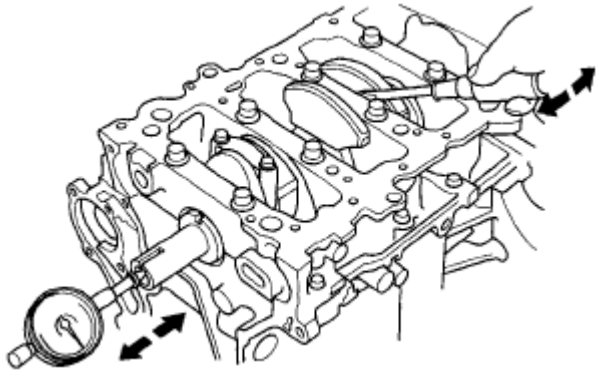

Fig. 5: Pushing Crankshaft Firmly Away From Dial Indicator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. If the end play is beyond the service limit, replace the thrust washers and recheck, if it is still beyond the service limit, replace the crankshaft (see **CRANKSHAFT AND PISTON REMOVAL**).

CRANKSHAFT MAIN BEARING REPLACEMENT

Main Bearing Clearance Inspection

1. To check the main bearing-to-journal oil clearance, remove the lower block and bearing halves (see **CRANKSHAFT AND PISTON REMOVAL**).
2. Clean each main journal and bearing half with a clean shop towel.
3. Place one strip of plastigage across each main journal.
4. Reinstall the bearings and lower block, then torque the bolts to 25 N-m (2.5 kgf-m, 18 lbf-ft) + 57 degrees in the proper sequence (see step 19).

NOTE: Do not rotate the crankshaft during inspection.

5. Remove the lower block and bearings again, and measure the widest part of the plastigage.

   Main Bearing-to-Journal Oil Clearance

   Standard (New): 0.018 - 0.034 mm (0.0007 - 0.0013 in.)

   Service Limit: 0.045 mm (0.0018 in.)

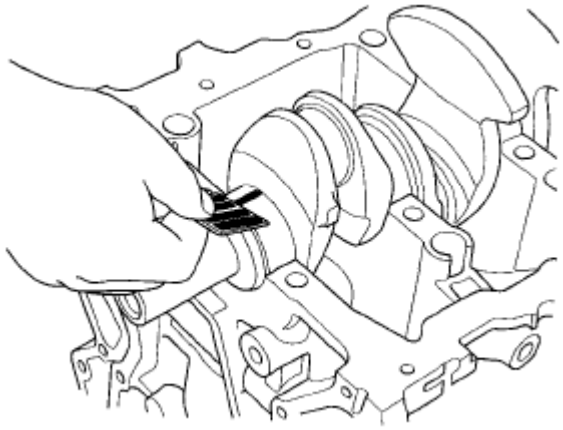

Fig. 6: Measuring Widest Part Of Plastigage
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. If the plastigage measures too wide or too narrow, remove the crankshaft, and remove the upper half of the bearing. Install a new, complete bearing with the same color code(s), and recheck the clearance. Do not file, shim, or scrape the bearings or the caps to adjust clearance.
7. If the plastigage shows the clearance is still incorrect, try the next larger or smaller bearing (the color listed above or below the current one), and check again. If the proper clearance cannot be obtained by using the appropriate larger or smaller bearings, replace the crankshaft, and start over.

Main Bearing Selection

Crankshaft Bore Code Location

1. Numbers, letters or bars have been stamped on the either side of the block end as a code for the size of each of the five main journal bores. Write down the crank bore codes.

   If you can't read the codes because of accumulated dirt and dust, do not scrub them with a wire brush or scraper. Clean them only with solvent or detergent.

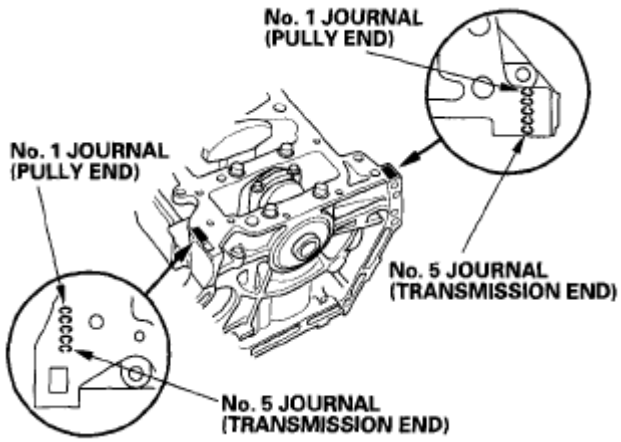

Fig. 7: Identifying Crankshaft Bore Code Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Main Journal Code Location

2. The main journal codes are stamped on the crankshaft.

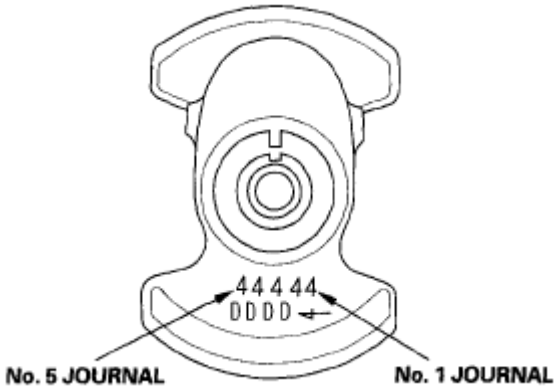

Fig. 8: Identifying Main Journal Code Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Use the crank bore codes and crank journal codes to select the appropriate replacement bearings from the following table.

NOTE:

- **Color code is on the edge of the bearing.**
- **When using bearing halves of different colors, it does not matter which color is used in the top or bottom.**

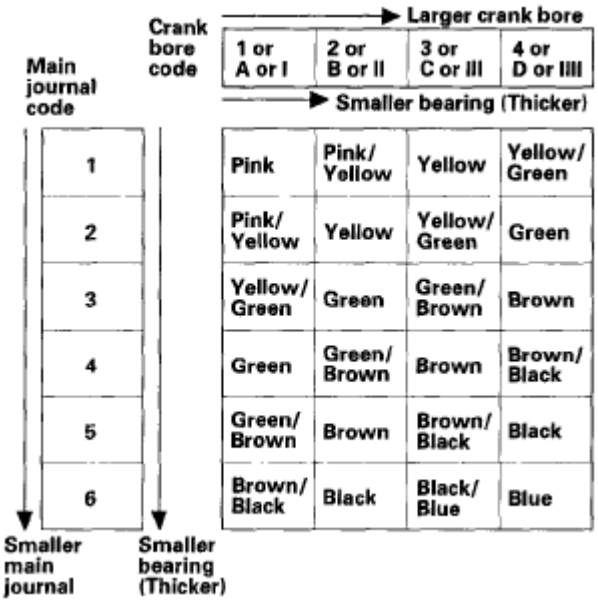

Fig. 9: Identifying Crank Bore Codes And Crank Journal Codes Reference
Courtesy of AMERICAN HONDA MOTOR CO., INC.

CONNECTING ROD BEARING REPLACEMENT

Rod Bearing Clearance Inspection

1. Remove the oil pan (see **OIL PAN REMOVAL**).
2. Remove the oil screen and baffle plate (see step 8).
3. Remove the connecting rod cap and bearing half.
4. Clean the crankshaft rod journal and bearing half with a clean shop towel.
5. Place plastigage across the rod journal.
6. Reinstall the bearing half and cap, and torque the bolts to 20 N.m (2.0 kgf.m, 14 lbf.ft) + 90 degrees using a commercially available torque angle gauge.

NOTE: Do not rotate the crankshaft during inspection.

7. Remove the rod cap and bearing half, and measure the widest part of the plastigage.

Connecting Rod Bearing-to-Journal Oil Clearance

Standard (New): 0.024-0.042 mm (0.0009-0.0017 in.)

Service Limit: 0.055 mm (0.0022 in.)

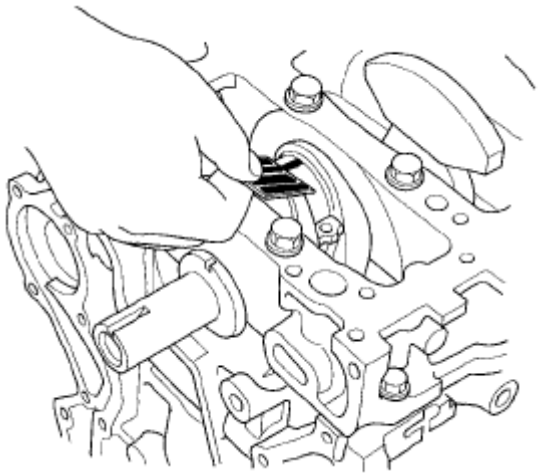

Fig. 10: Measuring Widest Part Of Plastigage
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. If the plastigage measures too wide or too narrow, remove the upper half of the bearing, install a new, complete bearing with the same color code(s), and recheck the clearance. Do not file, shim, or scrape the bearings or the caps to adjust clearance.
9. If the plastigage shows the clearance is still incorrect, try the next larger or smaller bearing (the color listed above or below the current one), and check clearance again. If the proper clearance cannot be obtained by using the appropriate larger or smaller bearing, replace the crankshaft, and start over.

Rod Bearing Selection

1. Inspect each connecting rod for cracks and heat damage.

   Connecting Rod Big End Bore Code Locations

2. Each rod has a tolerance range from 0 to 0.024 mm (0.0009 in.), in 0.006 mm (0.0002 in.) increments, depending on the size of its big end bore. It is then stamped with a number or bar (1, 2, 3 or 4/I, II, III, or MM) indicating the range. You may find any combination of numbers and bars in any engine. (Half the number or bar is stamped on the bearing cap, the other half is on the rod.)

   If you can't read the code because of an accumulation of oil and varnish, do not scrub it with a wire brush or scraper. Clean it only with solvent or detergent.

   Normal Bore Size: 48.0 mm (1.89 in.)

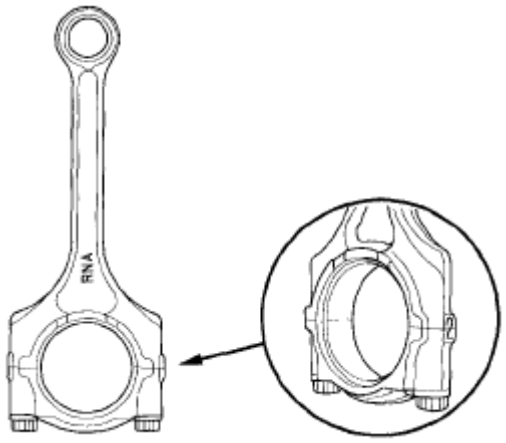

Fig. 11: Identifying Connecting Rod Big End Bore Code Locations
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Connecting Rod Journal Code Location

3. The connecting rod journal codes are stamped on the crankshaft.

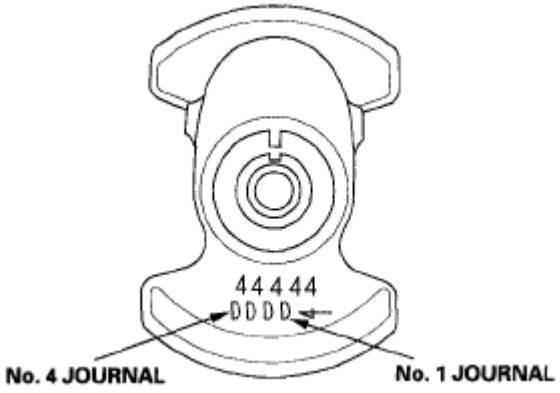

Fig. 12: Identifying Connecting Rod Journal Code Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Use the big end bore codes and rod journal codes to select the appropriate replacement bearings from the following table.

NOTE:

- **Color code is on the edge of the bearing.**
- **When using bearing halves of different colors, it does not matter which color is used in the top or bottom.**

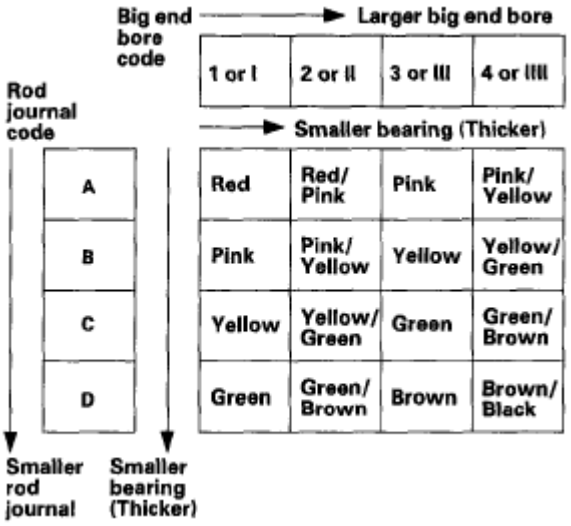

Fig. 13: Identifying Big End Bore Codes And Rod Journal Codes Reference
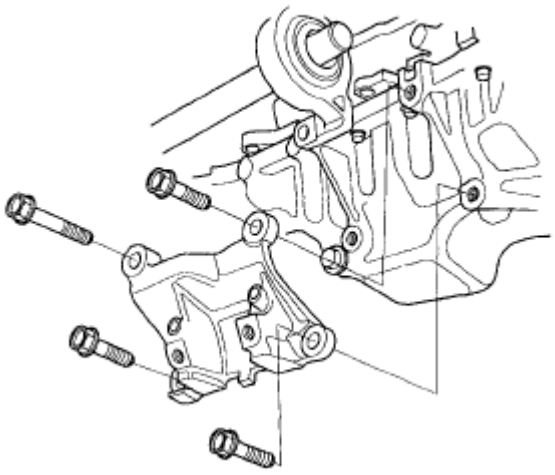
Courtesy of AMERICAN HONDA MOTOR CO., INC.

OIL PAN REMOVAL

1. If the engine is already out of the vehicle, go to step 12.
2. Remove the drive belt (see **DRIVE BELT INSPECTION**).
3. Remove the A/C condenser fan shroud (see **A/C COMPRESSOR REPLACEMENT**).
4. Disconnect the A/C compressor clutch connector, then remove the harness clamp. Remove the A/C compressor without disconnecting the A/C hoses (see step 39 on **ENGINE REMOVAL**).
5. Raise the vehicle on the hoist to full height.
6. Remove the splash shield (see step 23 on **ENGINE REMOVAL**).
7. Drain the engine oil (see **ENGINE OIL REPLACEMENT**).
8. Remove exhaust pipe A (see step 27 on **ENGINE REMOVAL**).
9. Support the oil pan with a jack.
10. Remove the lower torque rod (see step 46 on **ENGINE REMOVAL**).
11. Remove the jack.
12. Remove the lower torque rod bracket.

M/T



A/T

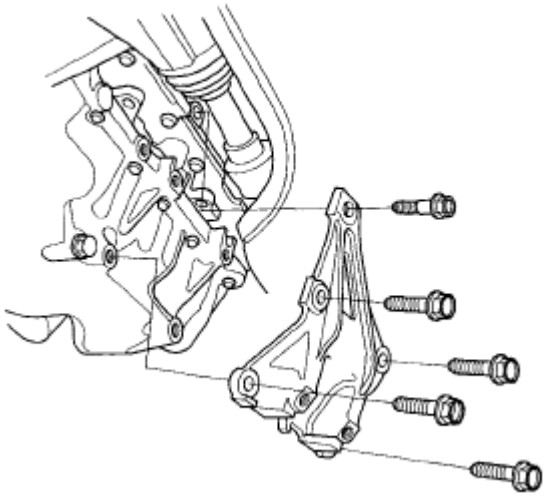


Fig. 14: Identifying Lower Torque Rod Bracket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Remove the A/C compressor bracket.

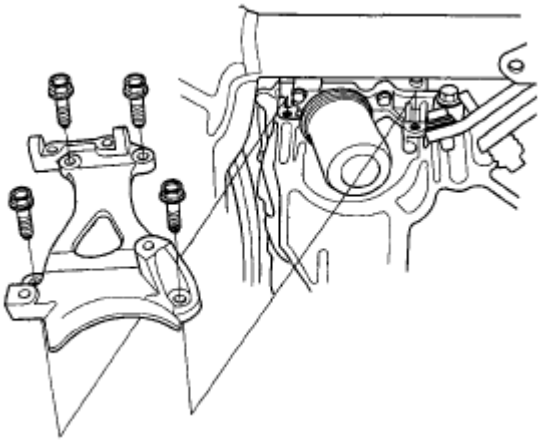

Fig. 15: Identifying A/C Compressor Bracket

Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. A/T model: Remove the shift cable cover.

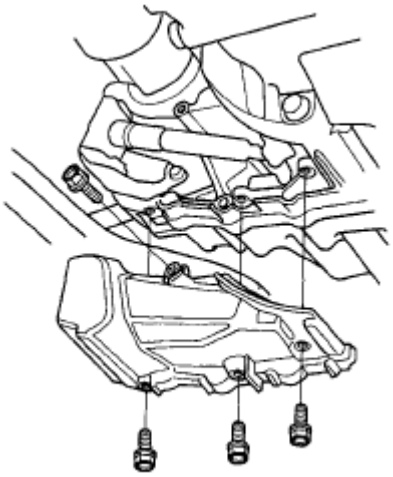

Fig. 16: Identifying Shift Cable Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Remove the clutch cover/torque converter cover (A), and remove the two bolts securing the transmission.

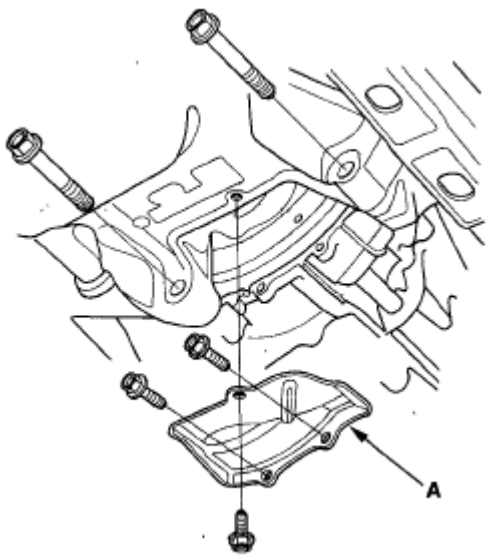

Fig. 17: Identifying Clutch Cover/Torque Converter Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Remove the bolts securing the oil pan.
17. Using a flat blade screwdriver, separate the oil pan from the block in the places shown.

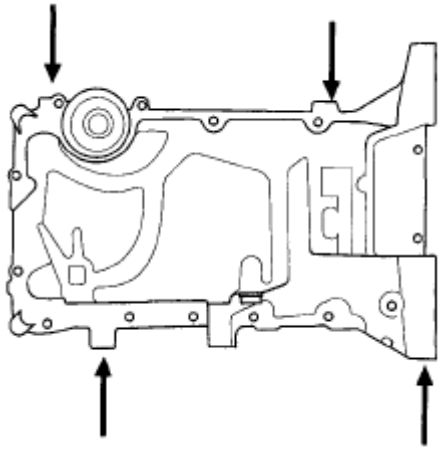

Fig. 18: Identifying Oil Pan From Block
Courtesy of AMERICAN HONDA MOTOR CO., INC.

18. Remove the oil pan.

CRANKSHAFT AND PISTON REMOVAL

1. Remove the engine assembly (see **ENGINE REMOVAL**).
2. Remove the transmission:
   - Manual transmission (see **TRANSMISSION REMOVAL**)
   - Automatic transmission (see **TRANSMISSION REMOVAL**)
3. M/T model: Remove the pressure plate, clutch disc and flywheel (see **PRESSURE PLATE AND CLUTCH DISC REMOVAL (5-SPEED MODEL)**).
4. A/T model: Remove the drive plate (see **DRIVE PLATE REMOVAL AND INSTALLATION**).
5. Remove the oil pan (see **OIL PAN REMOVAL**).
6. Remove the oil pump (see **REMOVAL**).
7. Remove the cylinder head (see **CYLINDER HEAD REMOVAL**).
8. Remove the oil screen (A) and baffle plate (B).

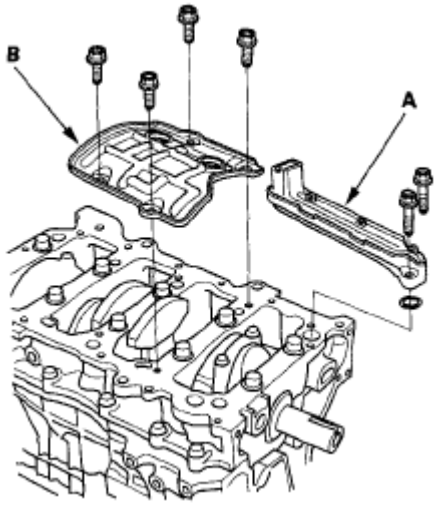

Fig. 19: Identifying Oil Screen And Baffle Plate

Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Remove the 8 mm bolts.

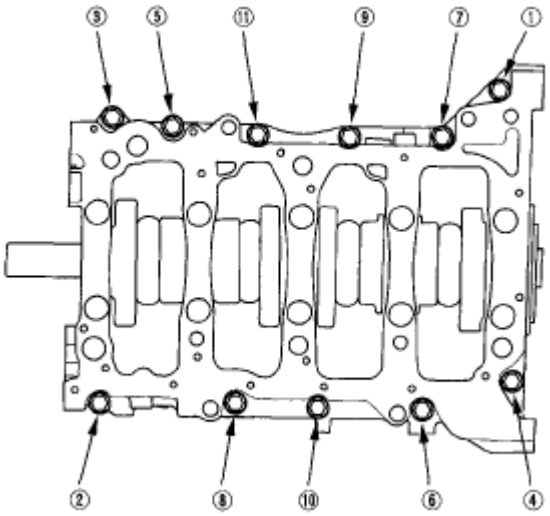

Fig. 20: Identifying Baffle Plate And Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Remove the bearing cap bolts. To prevent warpage, unscrew the bolts in sequence 1/3 turn at a time; repeat the sequence until all bolts are loosened.

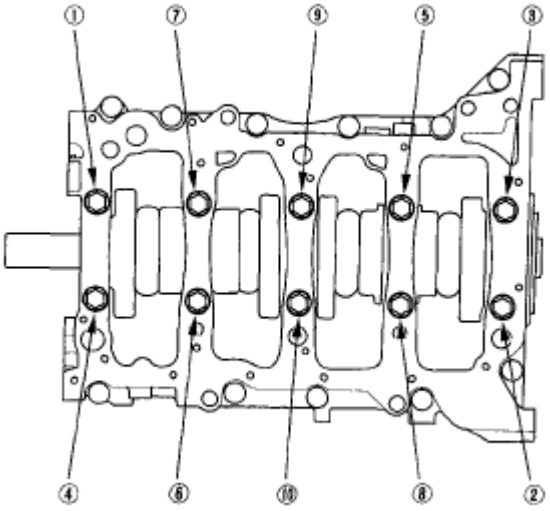

Fig. 21: Identifying Bearing Cap Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Using a flat blade screwdriver, separate the lower block from the engine block in the places shown.

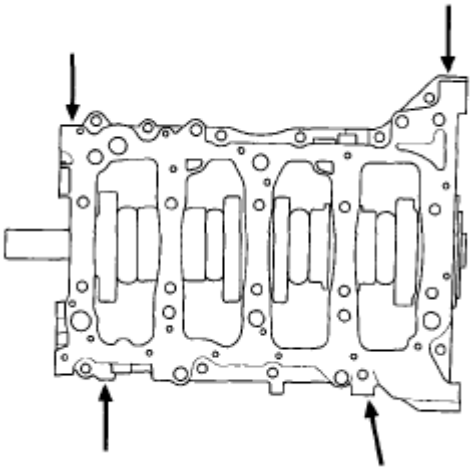

Fig. 22: Identifying Lower Block From Engine Block
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Remove the lower block and bearings. Keep all the bearings in order.
13. Remove the rod caps/bearings. Keep all caps/bearings in order.
14. Lift the crankshaft (A) out of the engine. Be careful not to damage the journals and the crankshaft position (CKP) pulse plate (B).

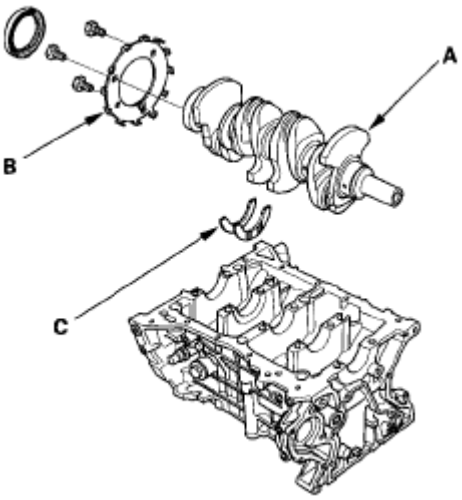

Fig. 23: Identifying Crankshaft Position (CKP) Pulse Plate And Crankshaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Remove the CKP pulse plate (B).
16. Remove the thrust washers (C).
17. Remove the upper bearing halves from the connecting rods, and set them aside with their respective caps.
18. If you can feel a ridge of metal or hard carbon around the top of each cylinder, remove it with a ridge reamer (A). Follow the reamer manufacturer's instructions. If the ridge is not removed, it may damage the pistons as they are pushed out.

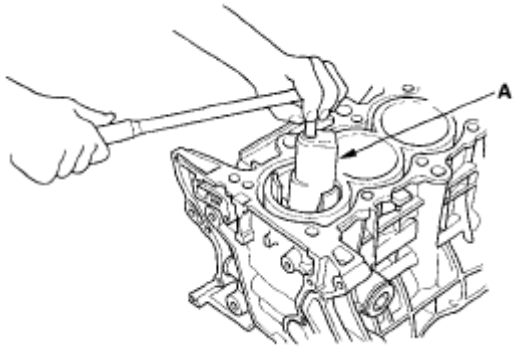

Fig. 24: Removing Upper Bearing Halves From Connecting Rods
Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. Use the wooden handle of a hammer (A) to drive out the piston/connecting rod assembly (B). Take care not to damage the oil jets or cylinder with the connecting rod.

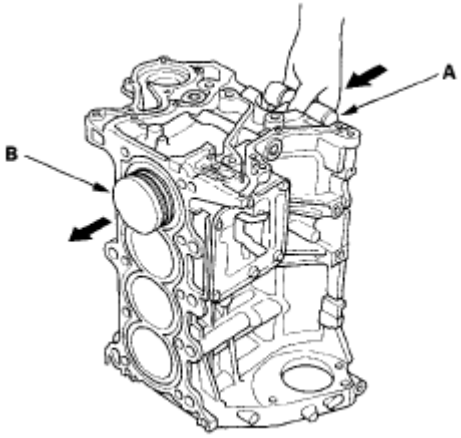

Fig. 25: Driving Out Piston/Connecting Rod Assembly
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Reinstall the lower block and the bearings on the engine in the proper order.
21. Reinstall the connecting rod bearings and caps after removing each piston/connecting rod assembly.
22. Mark each piston/connecting rod assembly with its cylinder number to make sure they are reused in the original order.

NOTE: The existing number on the connecting rod does not indicate its position in the engine, it indicates the rod bore size.

CRANKSHAFT INSPECTION

Out-of-Round and Taper

1. Remove the crankshaft from the engine block (see **CRANKSHAFT AND PISTON REMOVAL**).
2. Clean the crankshaft oil passages with pipe cleaners or a suitable brush.
3. Clean the keyway and the threads.
4. Measure the out-of-round at the middle of each rod and main journal in two places. The difference

between measurements on each journal must not be more than the service limit.

Journal Out-of-Round

Standard (New): 0.005 mm (0.0002 in.) max.

Service Limit: 0.010 mm (0.0004 in.)

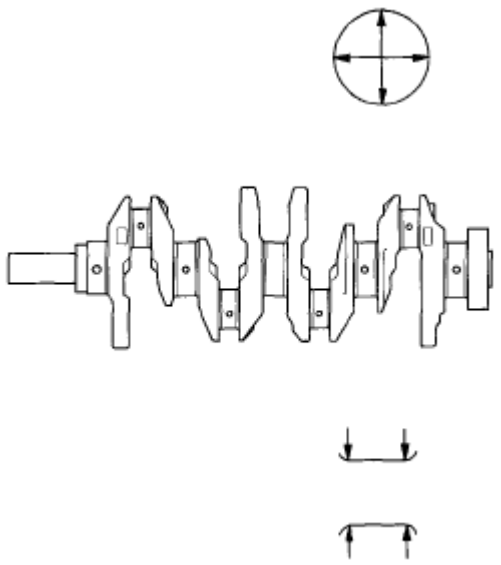

Fig. 26: Identifying Crankshaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Measure the taper at the edges of each rod and main journal. The difference between measurements on each journal must not be more than the service limit.

   Journal Taper

   Standard (New): 0.005 mm (0.0002 in.) max.

   Service Limit: 0.010 mm (0.0004 in.)

   Straightness

6. Place the engine block on the surface plate.
7. Clean and install the bearings on the No. 1 and No. 5 journals of the engine block.
8. Lower the crankshaft into the block.
9. Measure the runout on all of the main journals. Rotate the crankshaft two complete revolutions. The difference between measurements on each journal must not be more than the service limit.

   Crankshaft Total Runout

   Standard (New): 0.03 mm (0.0012 in.) max.

   Service Limit: 0.04 mm (0.0016 in.)

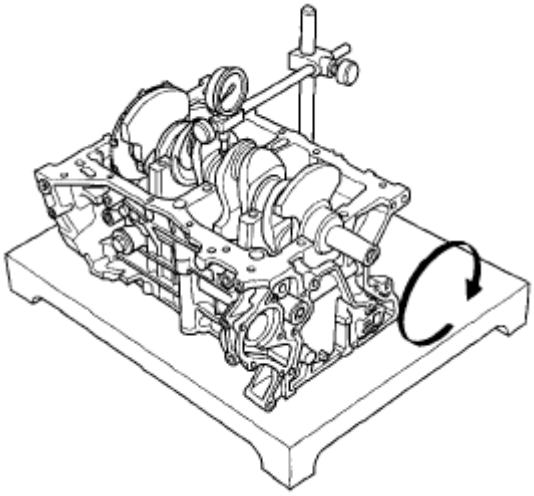

Fig. 27: Measuring Runout On Of Main Journals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

BLOCK AND PISTON INSPECTION

1. Remove the crankshaft and pistons (see **CRANKSHAFT AND PISTON REMOVAL**).
2. Check the piston for distortion or cracks.
3. Measure the piston diameter at a point 14 mm (0.55 in.) from the bottom of the skirt.

Piston Diameter

Standard (New): 80.980-80.990 mm (3.1881-3.1886 in.)

Service Limit: 80.93 mm (3.186 in.)

Oversize Piston Diameter

0.25: 81.230-81.240 mm (3.1980-3.1984 in.)

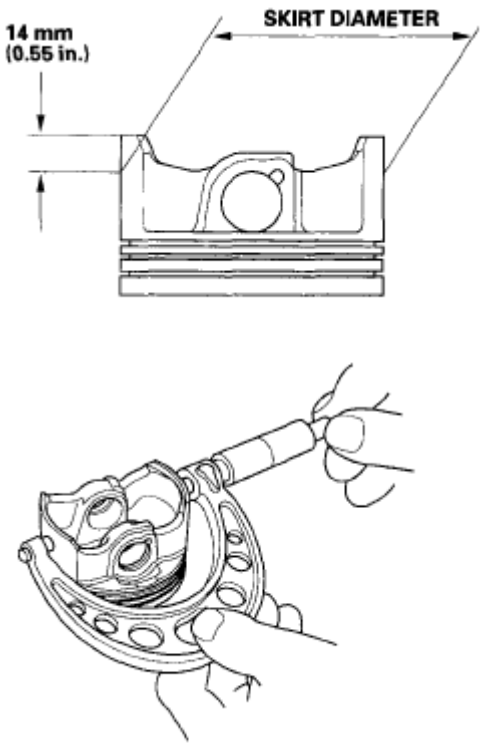

Fig. 28: Measuring Piston Diameter Point From Bottom Of Skirt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Measure the wear and taper Y at three levels inside each cylinder as shown. If the measurements in any cylinder are beyond the Oversize Bore Service Limit, replace the engine block. If the engine block is being rebored, refer to step 7 after reboring.

   Cylinder Bore Size

   Standard (New): 81.000-81.015 mm (3.1890-3.1896 in.)

   Service Limit: 81.070 mm (3.1917 in.)

   Oversize Bore

   0.25: 81.250-81.265 mm (3.1988-3.1994 in.)

   Reboring limit: 0.25 mm (0.01 in.) max.

   Bore Taper

   Limit: (Difference between first and third measurement) 0.05 mm (0.002 in.)

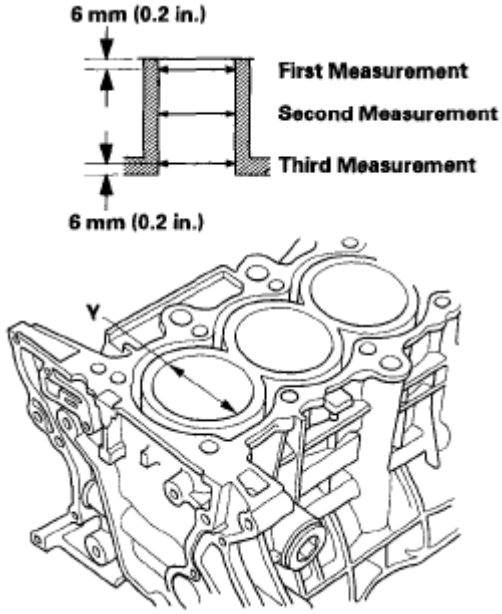

Fig. 29: Identifying Wear And Taper At Three Levels Inside Each Cylinder
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Scored or scratched cylinder bores must be honed.
6. Check the top of the engine block for warpage. Measure along the edges, and across the center as shown.

Engine Block Warpage

Standard (New): 0.07 mm (0.003 in.) max.

Service Limit: 0.10 mm (0.004 in.)

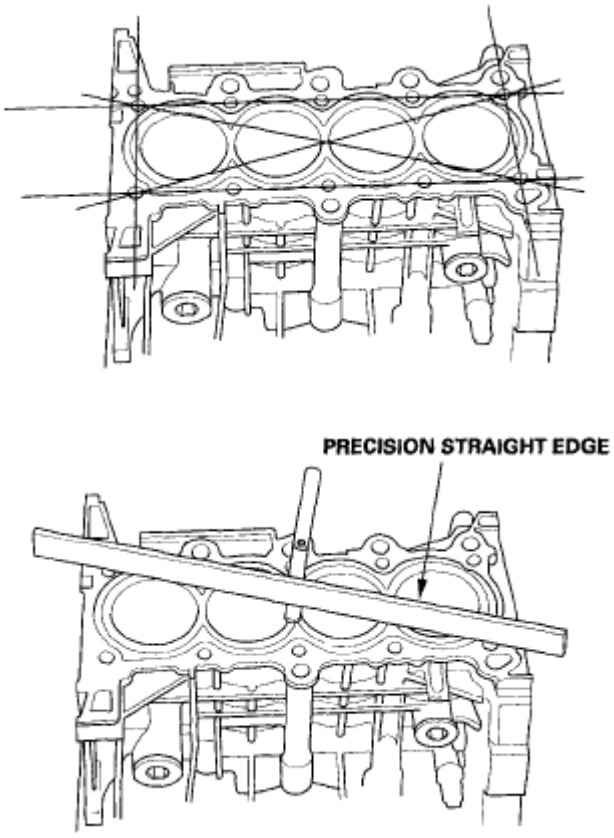

Fig. 30: Identifying Top Of Engine Block For Warpage
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Calculate the difference between the cylinder bore diameter and the piston diameter. If the clearance is near, or exceeds the service limit, inspect the piston and engine block for excessive wear.

   Piston-to-Cylinder Bore Clearance

   Standard (New): 0.010-0.035 mm (0.0004-0.0014 in.)

   Service Limit: 0.05 mm (0.002 in.)

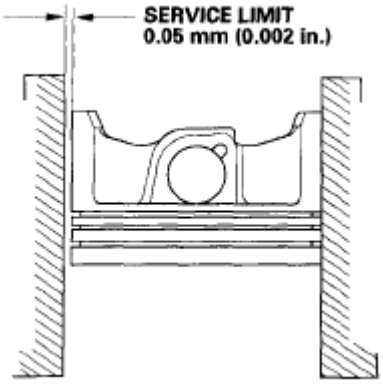

Fig. 31: Identifying Calculate Difference Between Cylinder Bore Diameter And Piston Diameter
Courtesy of AMERICAN HONDA MOTOR CO., INC.

CYLINDER BORE HONING

Only a scored or scratched cylinder bore must be honed.

1. Measure the cylinder bores (see **BLOCK AND PISTON INSPECTION**). If the engine block is to be reused, hone the cylinders, and remeasure the bores.
2. Remove and replace the oil jets (see **OIL JET REPLACEMENT**).
3. Hone the cylinder bores with honing oil and a fine (400 grit) stone.

   Honing Pattern: Within 30-60 degree cross-hatch pattern (A)

   NOTE: Use only a rigid hone with 400 grit or finer stone such as Sunnen, Ammco, or equivalent. Do not use stones that are worn or broken.

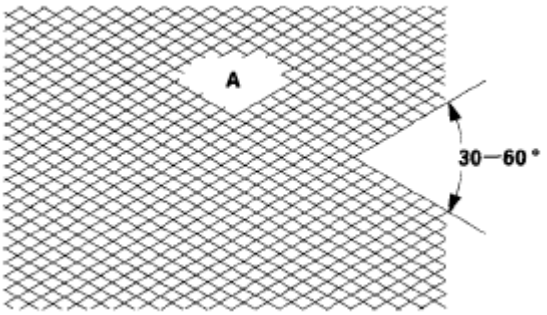

Fig. 32: Identifying Honing Pattern
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. When honing is complete, thoroughly clean the engine block of all metal particles. Wash the cylinder bores with hot soapy water, then dry and oil them immediately to prevent rusting. Never use solvent, it will only redistribute the grit on the cylinder walls.
5. If scoring or scratches are still present in the cylinder bores after honing the engine block to the service limit, rebore the engine block. Some light vertical scoring and scratching is acceptable if it is not deep enough to catch your fingernail, and does not run the full length of the bore.
6. Install the new oil jets (see **OIL JET REPLACEMENT**).

PISTON, PIN, AND CONNECTING ROD REPLACEMENT

Disassembly

1. Remove the piston from the engine block (see **CRANKSHAFT AND PISTON REMOVAL**).
2. Apply new engine oil to the piston pin snap rings (A), and turn them in the ring grooves until the end gaps are lined up with the cutouts in the piston pin bores (B).

   NOTE: Take care not to damage the ring grooves.

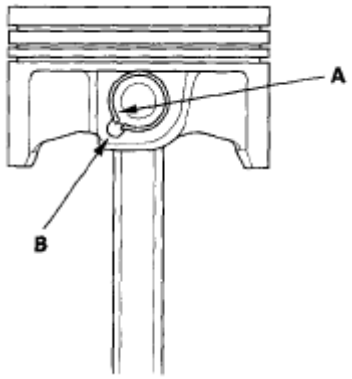

Fig. 33: Identifying Piston Pin Snap Rings And Piston Pin Bores
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove both snap rings (A). Start at the cutout in the piston pin bore. Remove the snap rings carefully so they do not go flying or get lost. Wear eye protection.

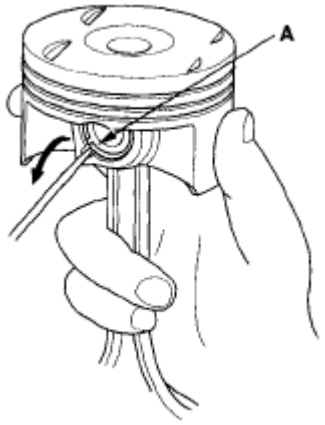

Fig. 34: Removing Both Snap Rings
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Heat the piston and connecting rod assembly to about 158°F (70°C), then remove the piston pin.

Fig. 35: Heating Piston And Connecting Rod Assembly
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Inspection

NOTE: Inspect the piston, piston pin, and connecting rod when they are at room temperature.

1. Measure the diameter of the piston pin.

   Piston Pin Diameter

   Standard (New): 19.960-19.964 mm (0.7858-0.7860 in.)

   Service Limit: 19.960 mm (0.7858 in.)

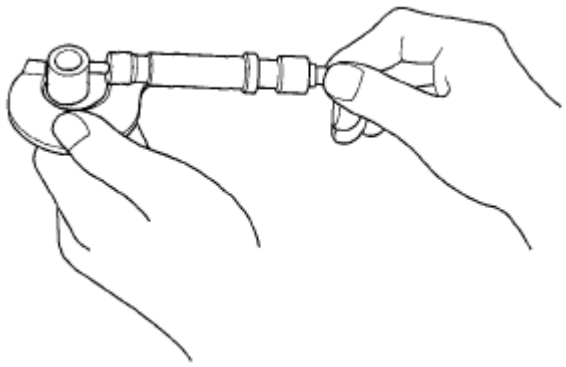

Fig. 36: Measuring Diameter Of Piston Pin
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Zero the dial indicator to the piston pin diameter.

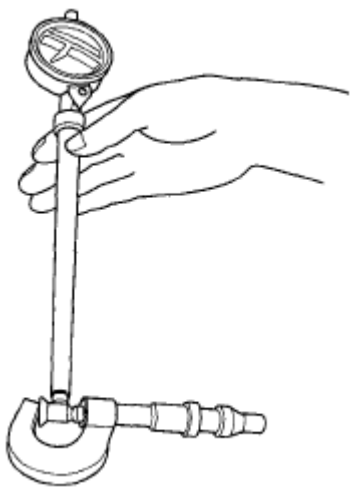

Fig. 37: Identifying Piston Pin Diameter
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Check the difference between the piston pin diameter and piston pin hole diameter in the piston.

   Piston Pin-to-Piston Clearance

Standard (New): -0.004 to +0.003 mm (-0.00016 to +0.00012 in.)

Service Limit: 0.006 mm (0.0002 in.)

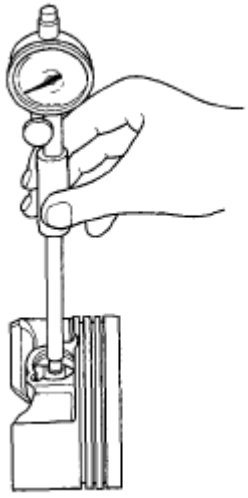

Fig. 38: Checking Difference Between Piston Pin Diameter And Piston Pin Hole Diameter In Piston
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Measure the piston pin-to-connecting rod clearance.

   Piston Pin-to-Connecting Rod Clearance

   Standard (New): 0.005-0.015 mm (0.0002-0.0006 in.)

   Service Limit: 0.02 mm (0.0008 in.)

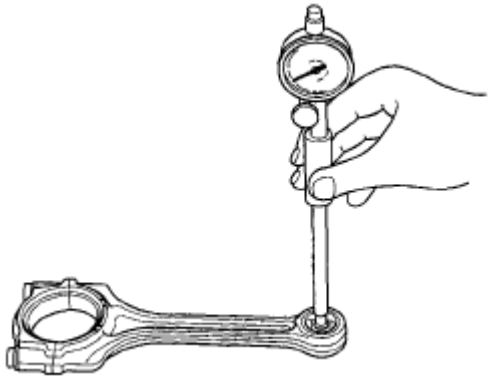

Fig. 39: Measuring Piston Pin-To-Connecting Rod Clearance
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Reassembly

1. Install one piston pin snap ring (A).

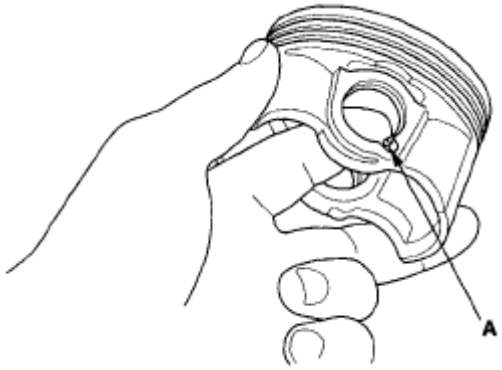

Fig. 40: Installing Piston Pin Snap Ring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Coat the piston pin bore, the bore in the connecting rod, and the piston pin with new engine oil.
3. Heat the piston to about 158°F (70°C).

Fig. 41: Heating Piston
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Assemble the piston (A) and connecting rod (B) with the mark (C) and the embossed mark (D) on the same side. Install the piston pin (E).

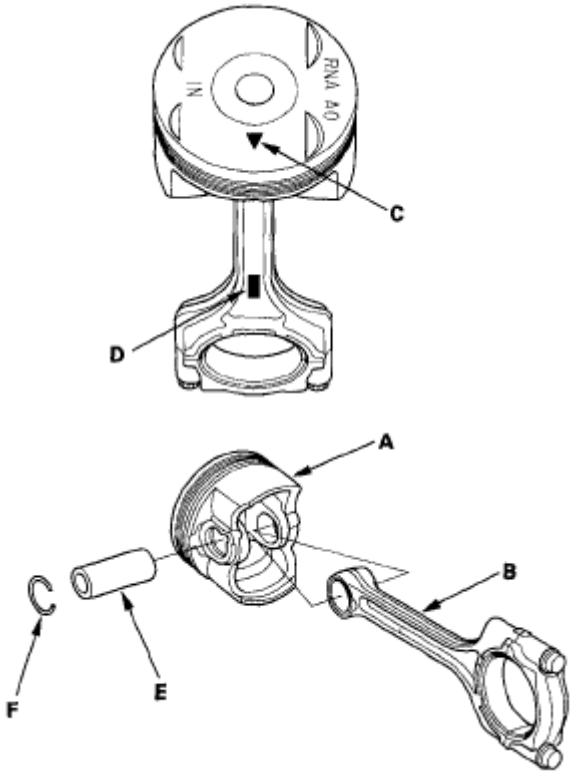

Fig. 42: Identifying Piston And Connecting Rod With Mark
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the remaining snap ring (F).
6. Turn the snap rings until the end gaps are positioned at the bottom of the piston.

PISTON RING REPLACEMENT

1. Remove the piston from the engine block (see **CRANKSHAFT AND PISTON REMOVAL**).
2. Using a ring expander (A), remove the old piston rings (B).

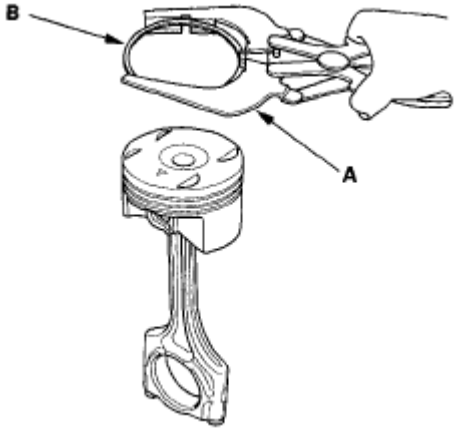

Fig. 43: Removing Old Piston Rings
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Clean all ring grooves thoroughly with a squared-off broken ring or ring groove cleaner with a blade

to fit the piston grooves.

The top and 2nd ring grooves are 1.2 mm (0.05 in.) wide. The oil ring groove is 2.0 mm (0.08 in.) wide. File down a blade if necessary. Do not use a wire brush to clean the ring grooves, or cut the ring grooves deeper with the cleaning tools.

NOTE: If the piston is to be separated from the connecting rod, do not install new rings yet.

4. Using a piston that has its rings removed, push a new ring (A) into the cylinder bore 15-20 mm (0.6-0.8 in.) from the bottom.

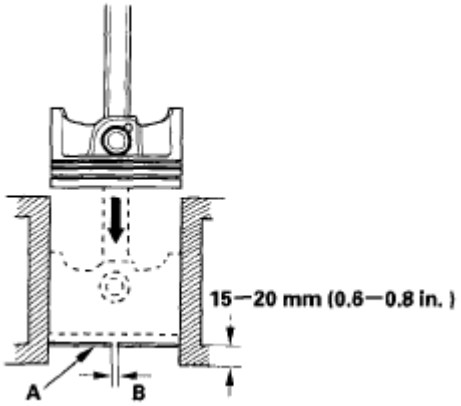

Fig. 44: Pushing Ring Into Cylinder Bore
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Measure the piston ring end-gap (B) with a feeler gauge:
   - If the gap is too small, check to see if you have the proper rings for your engine.
   - If the gap is too large, recheck the cylinder bore diameter against the wear limits (see **BLOCK AND PISTON INSPECTION**). If the bore is beyond the service limit, the engine block must be rebored.

Piston Ring End-Gap

Top Ring:

Standard (New): 0.20-0.35 mm (0.008-0.014 in.)

Service Limit: 0.60 mm (0.024 in.)

Second Ring:

Standard (New): 0.40-0.55 mm (0.016-0.022 in.)

Service Limit: 0.70 mm (0.028 in.)

Oil Ring:

Standard (New): 0.20-0.70 mm (0.008-0.028 in.)

Service Limit: 0.80 mm (0.031 in.)

6. Install the top ring and the second ring as shown. The top ring (A) has a 1T, 1A, or 1R mark, and the second ring (B) has a 2T, 2A, or 2R mark. The manufacturing marks (C) must be facing upward.

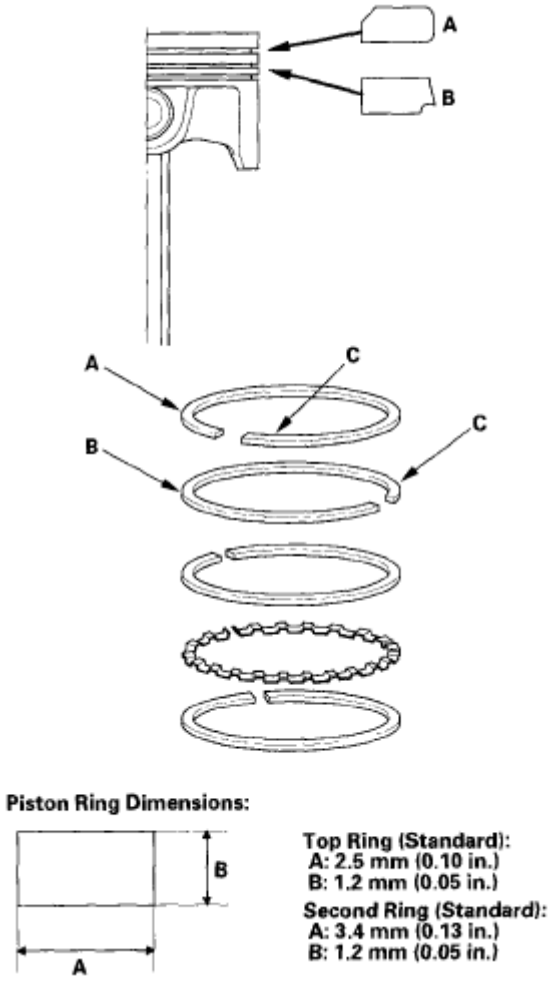

Fig. 45: Identifying Top Ring And Second Ring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Rotate the rings in their grooves to make sure they do not bind.
8. Position the ring end gaps as shown:

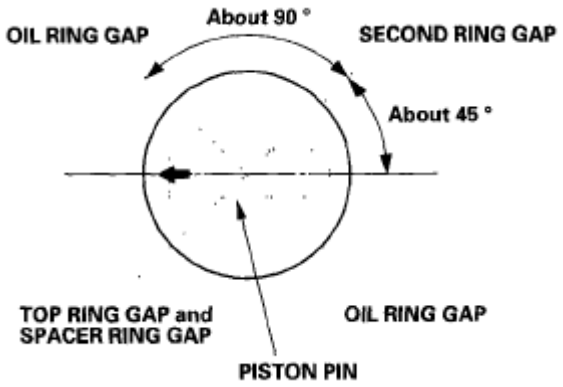

Fig. 46: Positioning Ring End Gaps
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. After installing a new set of rings, measure the ring-to-groove clearances:

   Top Ring Clearance

   Standard (New): 0.045-0.070 mm (0.0018-0.0028 in.)

   Service Limit: 0.13 mm (0.005 in.)

   Second Ring Clearance

   Standard (New): 0.035-0.060 mm (0.0014-0.0024 in.)

   Service Limit: 0.13 mm (0.005 in.)

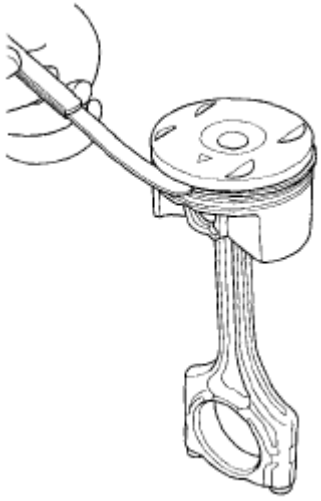

Fig. 47: Measuring Ring-To-Groove Clearances
Courtesy of AMERICAN HONDA MOTOR CO., INC.

PISTON INSTALLATION

If the Crankshaft is Already Installed

1. Set the crankshaft to bottom dead center (BDC) for each cylinder as its piston is installed.
2. Remove the connecting rod caps, then install the ring compressor. Check that the bearing is securely in place.
3. Apply new engine oil to the piston, inside of the ring compressor, and the cylinder bore, then attach the ring compressor to the piston/connecting rod assembly.
4. Position the mark (A) to face the cam chain side of the engine.

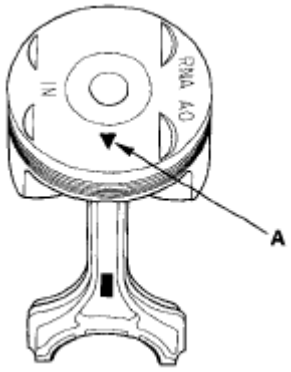

Fig. 48: Identifying Mark To Face Cam Chain Side Of Engine
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Position the piston in the cylinder, and tap it in using the wooden handle of a hammer (A). Push down on the ring compressor (B) to prevent the rings from expanding before entering the cylinder bore.

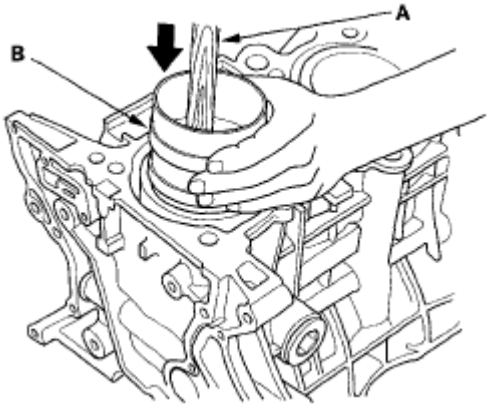

Fig. 49: Positioning Piston In Cylinder
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Stop after the ring compressor pops free, and check the connecting rod-to-crank journal alignment before pushing the piston into place.
7. Check the connecting rod bearing clearance with plastigage (see **CONNECTING ROD BEARING REPLACEMENT**).
8. Inspect the connecting rod bolts (see **CONNECTING ROD BOLT INSPECTION**).
9. Apply new engine oil to the bolt threads, then install the rod caps with bearings. Torque the bolts to 20 N.m (2.0 kgf.m, 14 lbf.ft).
10. Tighten the connecting rod bolts an additional 90 °.

NOTE: Remove the connecting rod bolt if you tightened it beyond the specified angle, and go back to step 8 of the procedure. Do not loosen it back to the specified angle.

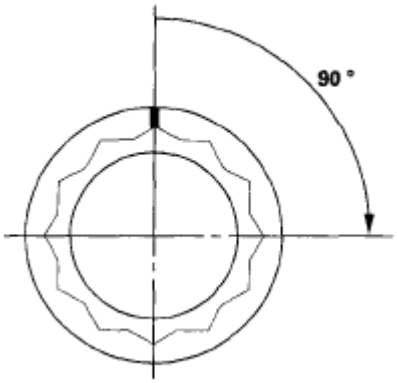

Fig. 50: Identifying Connecting Rod Bolt Tightening Angle
Courtesy of AMERICAN HONDA MOTOR CO., INC.

If the Crankshaft is Not Installed

1. Remove the connecting rod caps, then install the ring compressor, and check that the bearing is securely in place.
2. Apply new engine oil to the piston, inside of the ring compressor, and the cylinder bore, then attach the ring compressor to the piston/connecting rod assembly.
3. Position the mark (A) to face the cam chain side of the engine.

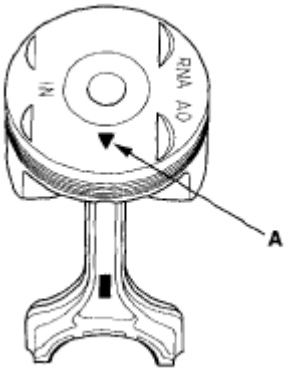

Fig. 51: Identifying Mark To Face Cam Chain Side Of Engine
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Position the piston in the cylinder, and tap it in using the wooden handle of a hammer (A). Push down on the ring compressor (B) to prevent the rings from expanding before entering the cylinder bore.

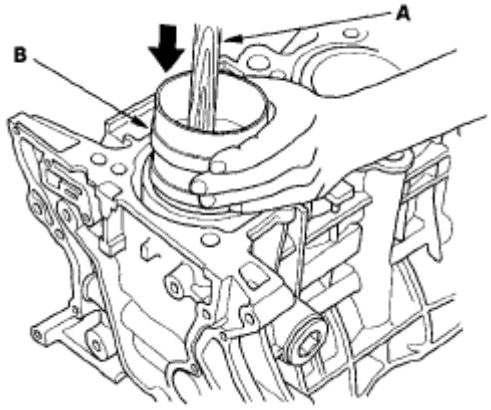

Fig. 52: Positioning Piston In Cylinder
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Position all pistons at top dead center (TDC).

CONNECTING ROD BOLT INSPECTION

1. Measure the diameter of each connecting rod bolt at point A and point B.

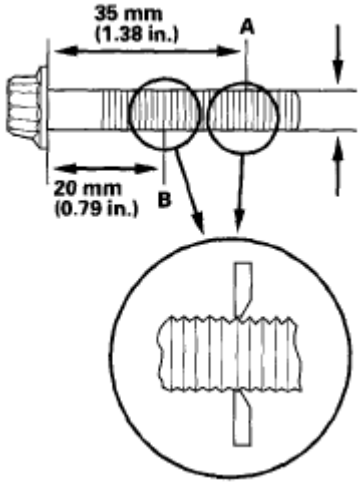

Fig. 53: Identifying Diameter Of Each Connecting Rod Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Calculate the difference in diameter between point A and point B.

   Point A-Point B = Difference in Diameter

   Difference in Diameter:

   Specification: 0-0.1 mm (0-0.004 in.)

3. If the difference in diameter is out of specification, replace the connecting rod bolt.

CRANKSHAFT INSTALLATION

Special Tools Required

- Driver 07749-0010000
- Attachment, 24 x 26 mm 07746-0010700
- Oil seal driver attachment 96 07ZAD-PNAA100

1. With a manual transmission, install the crankshaft end bushing when replacing the crankshaft. Using the special tools, drive in the crankshaft end bushing until the special tools bottom against the crankshaft.

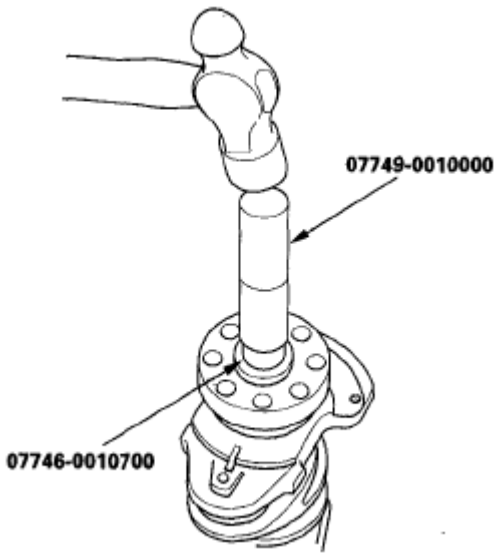

Fig. 54: Identifying Special Tool
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Check the connecting rod bearing clearance with plastigage (see **CONNECTING ROD BEARING REPLACEMENT**).
3. Check the main bearing clearance with plastigage (see **CRANKSHAFT MAIN BEARING REPLACEMENT**).
4. Install the bearing halves in the engine block and connecting rods.
5. Apply a coat of new engine oil to the main bearings and rod bearings.
6. Install the crankshaft position (CKP) pulse plate (A) to the crankshaft (B).

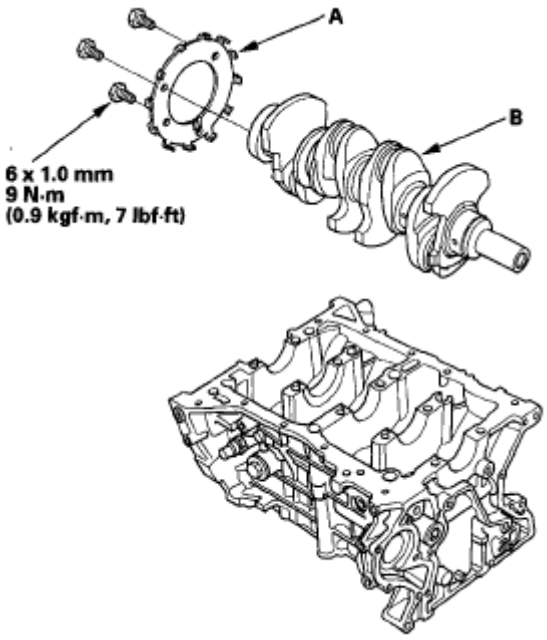

Fig. 55: Identifying Crankshaft Position (CKP) Pulse Plate To Crankshaft (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Hold the crankshaft so that rod journal No. 2 and rod journal No. 3 are straight up, and lower the crankshaft into the engine block.
8. Apply new engine oil to the thrust washer surfaces. Install the thrust washers (A) in the No. 4 journal of the engine block.

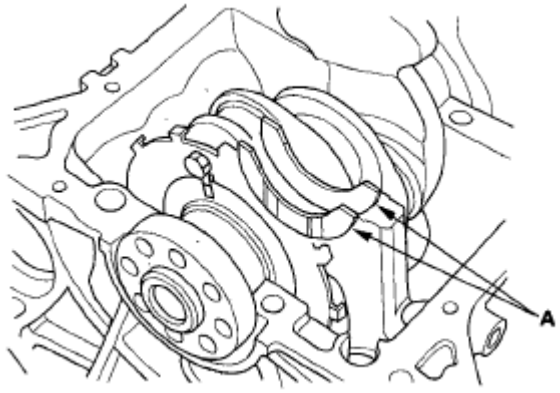

Fig. 56: Identifying Thrust Washers
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Inspect the connecting rod bolts (see **CONNECTING ROD BOLT INSPECTION**).
10. Seat the rod journals into connecting rod No. 1 and connecting rod No. 4. Line up the mark (A) on the connecting rod and cap, then install the caps and bolts finger-tight.

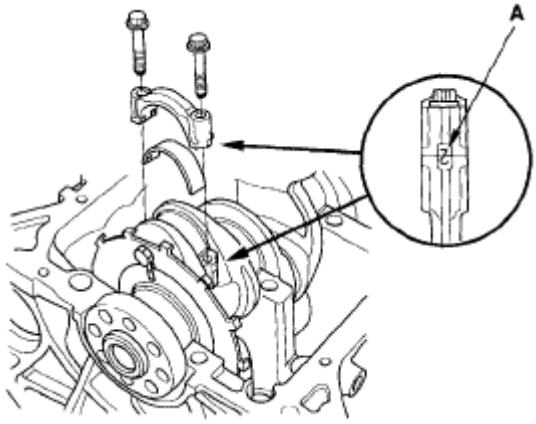

Fig. 57: Identifying Mark On Connecting Rod And Cap
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Rotate the crankshaft clockwise, and seat the journals into connecting rod No. 2 and connecting rod No. 3. Line up the mark on the connecting rod and cap, then install the caps and bolts finger-tight.
12. Tighten the connecting rod bolts to 20 N.m (2.0 kgf.m, 14 lbf.ft).
13. Tighten the connecting rod bolts an additional 90 °.

NOTE: Remove the connecting rod bolt if you tightened it beyond the specified angle, and go back to step 9 of the procedure. Do not loosen it back to the specified angle.

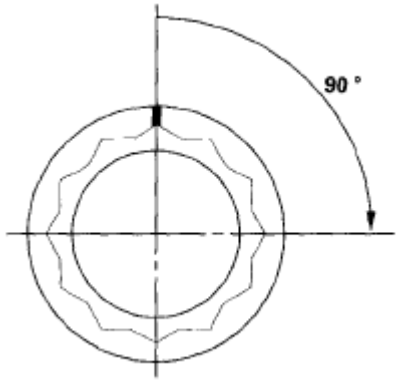

Fig. 58: Identifying Connecting Rod Bolt Tightening Angle
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Remove any old liquid gasket from the lower block mating surfaces, bolts, and bolt holes.
15. Clean, and dry the lower block mating surfaces.
16. Apply liquid gasket, P/N 08717-0004,08718-0001, 08718-0002, 08718-0003, or 08718-0009, evenly to the engine block mating surface of the lower block.

NOTE: Do not install components if too much time has passed after applying the liquid gasket (for P/N 08718-0002, no more than 4 minutes, for all others, no more than 5 minutes). Instead, remove the old residue and reapply the liquid gasket.

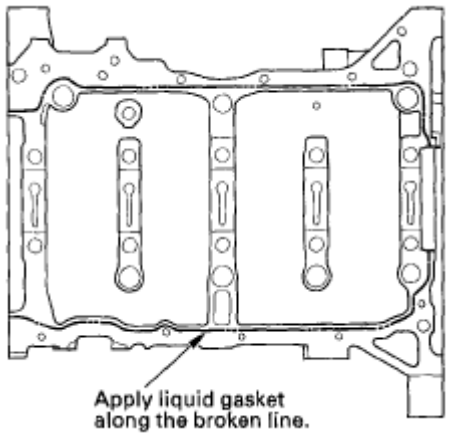

Fig. 59: Identifying Lower Block Mating Surfaces
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Put the lower block on the engine block.

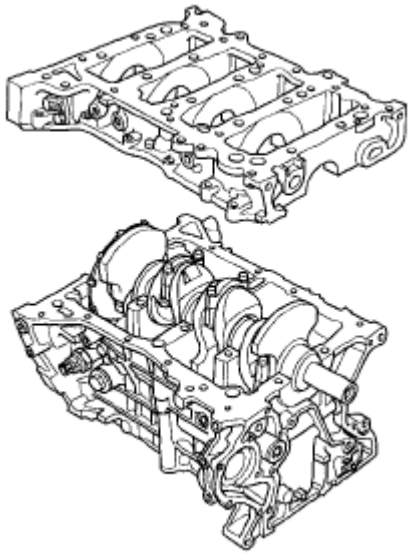

Fig. 60: Identifying Lower Block On Engine Block
Courtesy of AMERICAN HONDA MOTOR CO., INC.

18. Apply new engine oil to the threads and flange of the bearing cap bolts.
19. Tighten the bearing cap bolts, in sequence, to 25 N.m (2.5 kgf.m, 18 lbf.ft).

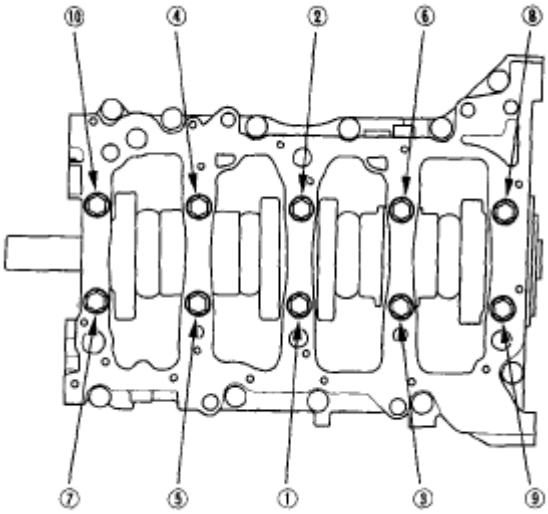

Fig. 61: Identifying Bearing Cap Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Tighten the bearing cap bolts an additional 57 degrees.

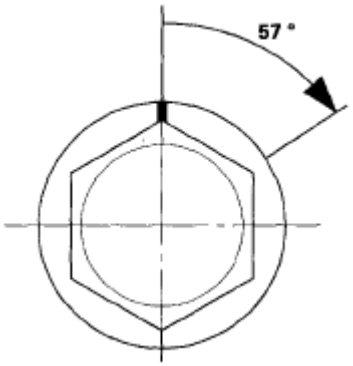

Fig. 62: Identifying Bearing Cap Bolts Tightening Angle
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Tighten the 8 mm bolts, in sequence, to 24 N.m (2.4 kgf.m, 17 lbf-ft).

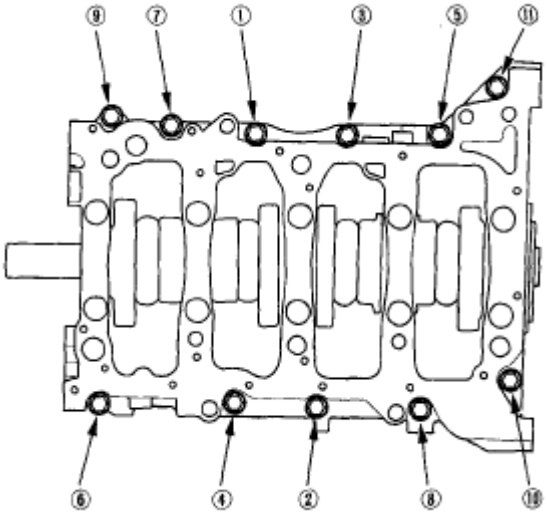

Fig. 63: Identifying Bearing Cap Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

22. Use the special tools to drive a new oil seal squarely into the engine block to the specified installed height.

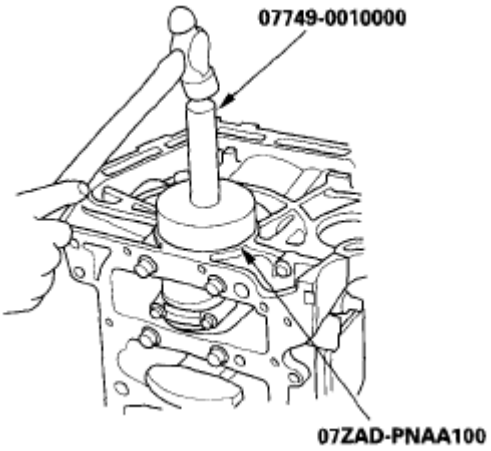

Fig. 64: Identifying Special Tool
Courtesy of AMERICAN HONDA MOTOR CO., INC.

23. Measure the distance between the engine block (A) and oil seal (B).

Oil Seal Installed Height: 0.2-1.2 mm (0.001-0.047 in.)

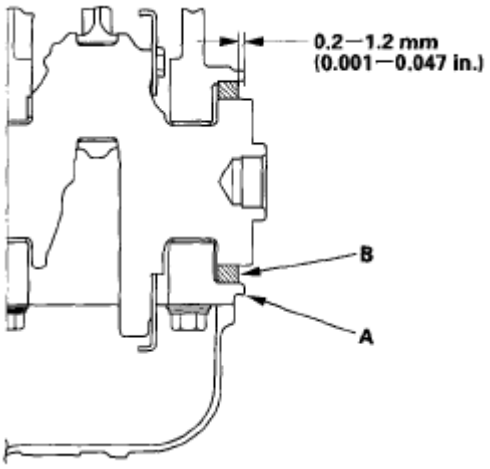

Fig. 65: Identifying Distance Between Engine Block And Oil Seal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

24. Install the baffle plate (A), then install the oil screen (B) with a new O-ring (C).

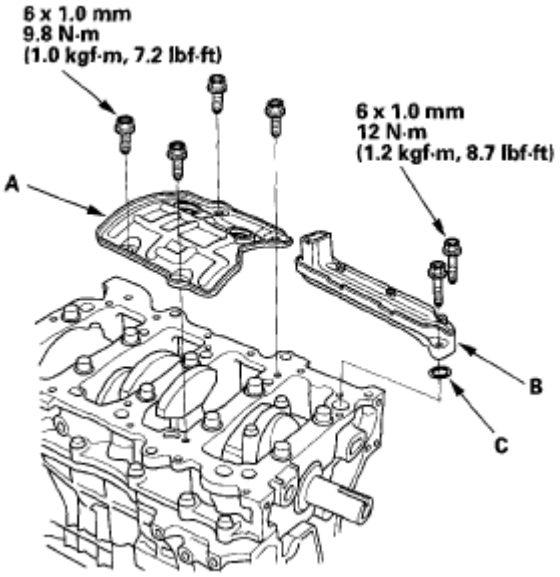

Fig. 66: Identifying Baffle Plate Oil Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

25. Install the oil pump (see **INSTALLATION**).
26. Install the oil pan (see **OIL PAN INSTALLATION**).
27. Install the cylinder head (see **CYLINDER HEAD INSTALLATION**).
28. M/T model: Install the flywheel, clutch disc and pressure plate (see **PRESSURE PLATE AND CLUTCH DISC REMOVAL (5-SPEED MODEL)**).
29. A/T model: Install the drive plate (see **DRIVE PLATE REMOVAL AND INSTALLATION**).
30. Install the transmission:
    - Manual transmission (see **TRANSMISSION INSTALLATION**)
    - Automatic transmission (see **TRANSMISSION INSTALLATION**)
31. Install the engine assembly (see **ENGINE INSTALLATION**).

NOTE: Whenever any crankshaft or connecting rod bearing is replaced, it is necessary after reassembly to run the engine at idle speed until it reaches normal operating temperature, then continue running it for about 15 minutes.

OIL PAN INSTALLATION

1. Remove all of the old liquid gasket from the oil pan mating surfaces, bolts, and bolt holes.
2. Clean, and dry the oil pan mating surfaces.
3. Apply liquid gasket, P/N 08717-00004, 08718-0001, 08718-0002, 08718-0003, or 08718-0009, evenly to the engine block mating surface of the oil pan.

NOTE: Do not install components if too much time has passed after applying the liquid gasket (for P/N 08718-0002, no more than 4 minutes, for all others, no more than 5 minutes). Instead, remove the old residue and reapply the liquid gasket.

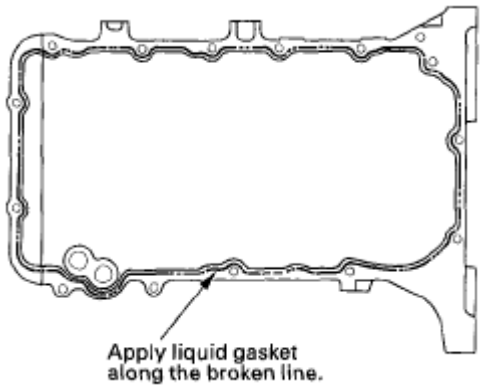

Fig. 67: Identifying Oil Pan Mating Surfaces
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the dowel pins (A), then install the oil pan (B) with new O-rings (C).

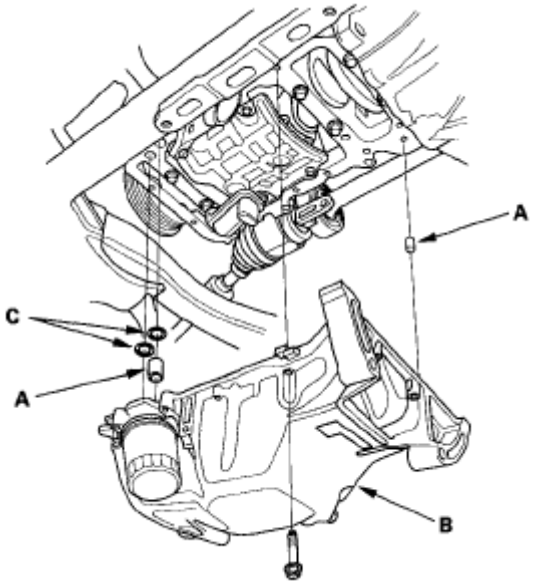

Fig. 68: Identifying Dowel Pins, Oil Pan And O-Rings
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Tighten the bolts in two or three steps. In the final step, tighten all bolts, in sequence, to 18 N.m (1.8 kgf.m, 13 lbf.ft). Wipe off the excess liquid gasket on the each side of crankshaft pulley and flywheel/drive plate.

NOTE:

- **Wait at least 30 minutes to allow liquid gasket to cure before filling the engine with oil.**
- **Do not run the engine for at least 3 hours to allow liquid gasket to cure after installing the oil pan.**

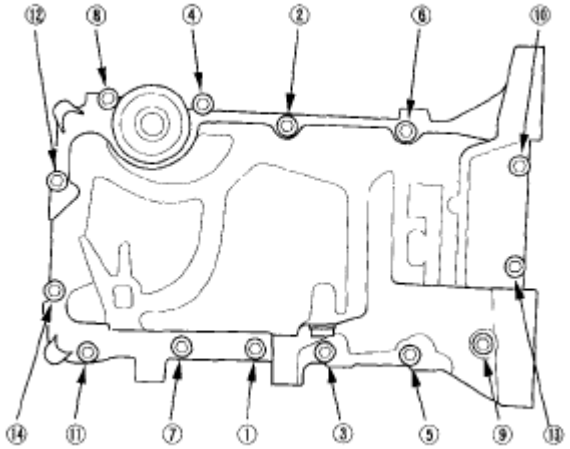

Fig. 69: Identifying Oil Pan Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Install the clutch cover/torque converter cover (A), and install the two bolts securing the transmission.

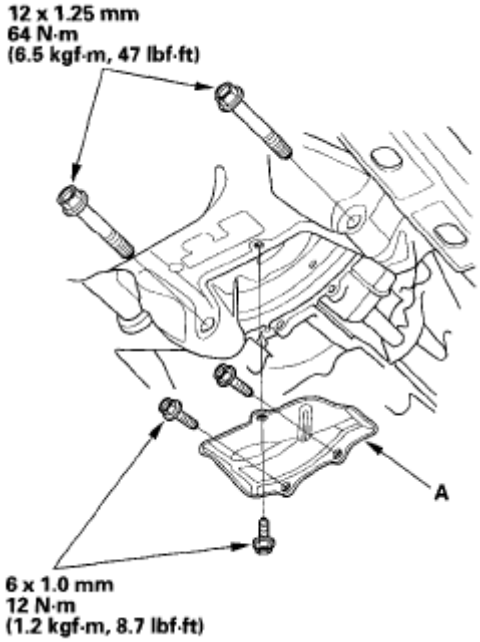

Fig. 70: Identifying Torque Converter Cover And Bolts (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. A/T model: Install the shift cable cover.

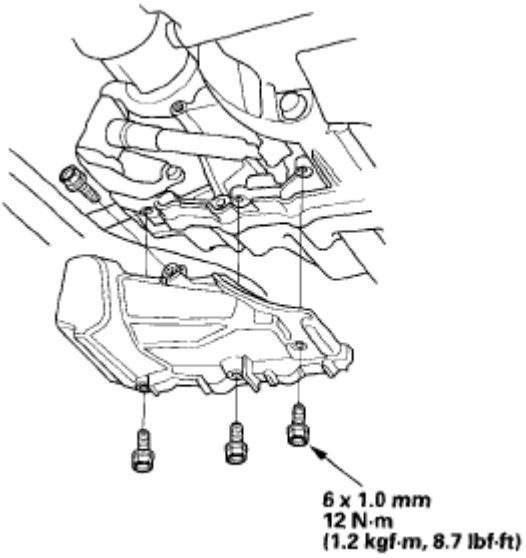

Fig. 71: Identifying Shift Cable Cover (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Install the A/C compressor bracket.

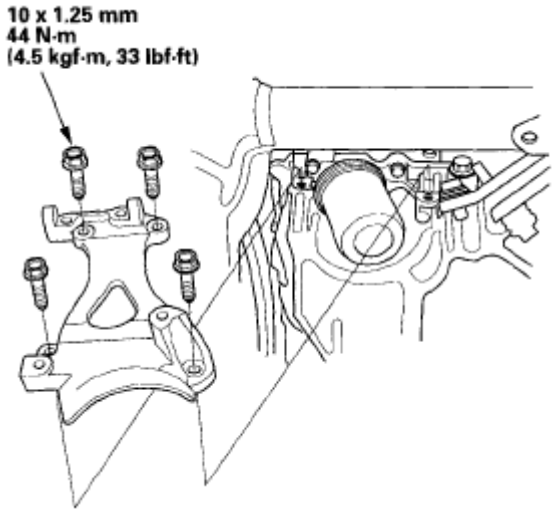

Fig. 72: Identifying A/C Compressor Bracket (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Remove the lower torque rod bracket. M/T

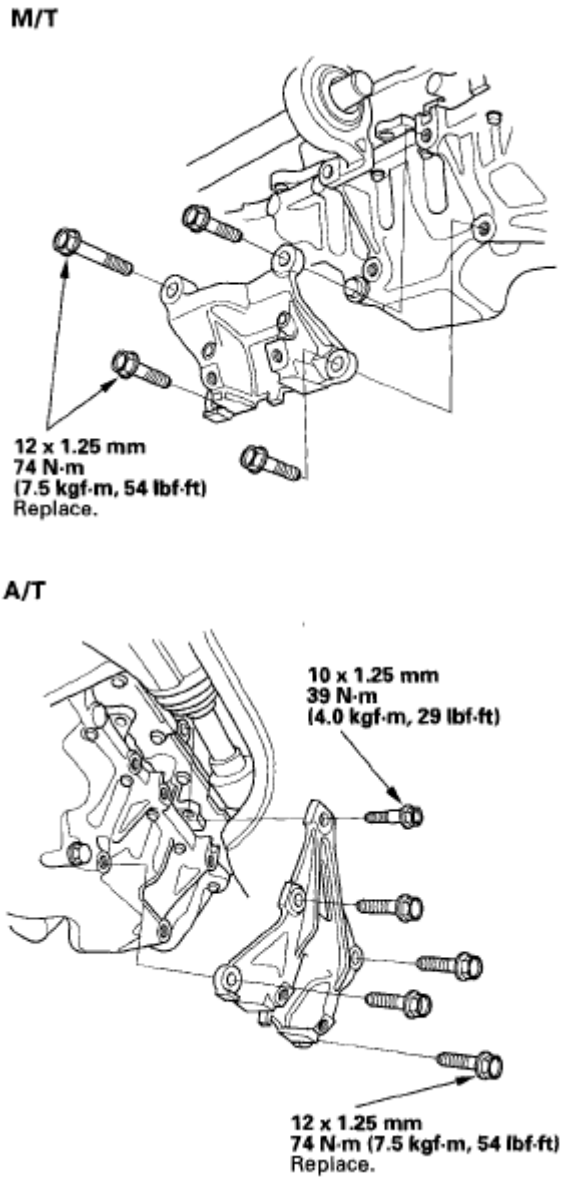

Fig. 73: Identifying Lower Torque Rod Bracket (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. If the engine is still in the vehicle, do the following steps.
11. Lower the vehicle on the lift.
12. Loosen the upper torque rod mounting bolt (see step 6 on **ENGINE INSTALLATION**).
13. Raise the vehicle on the lift to full height.
14. Install the lower torque rod (see step 16 on **ENGINE INSTALLATION**).
15. Lower the vehicle on the lift.
16. Tighten the upper torque rod mounting bolt (see step 18 on **ENGINE INSTALLATION**).
17. Raise the vehicle on the lift to full height.
18. Install exhaust pipe A (see step 30 on **ENGINE INSTALLATION**).
19. Lower the vehicle on the lift.
20. Install the A/C compressor. Install the harness clamp, then connect the A/C compressor clutch

connector (see step 34 on **ENGINE INSTALLATION**).

21. Install the A/C condenser fan shroud (see step 5 on **A/C CONDENSER REPLACEMENT**).
22. Install the drive belt (see **DRIVE BELT INSPECTION**).
23. Refill the engine with engine oil (see step 4 on **ENGINE OIL REPLACEMENT**).
24. Install the splash shield (see step 31 on **ENGINE INSTALLATION**).

PULLEY END CRANKSHAFT OIL SEAL INSTALLATION - IN CAR

Special Tools Required

Oil seal driver 07LAD-PT3010A

1. Remove the crankshaft pulley (see **CRANKSHAFT PULLEY REMOVAL AND INSTALLATION**).
2. Remove the pulley end crankshaft oil seal.
3. Clean, and dry the crankshaft oil seal housing.
4. Apply a light coat of multipurpose grease to the crankshaft and to the lip of the seal.
5. Using the seal driver, drive in the crankshaft oil seal until the driver bottoms against the oil pump. When the seal is in place, clean any excess grease off the crankshaft, and check that the oil seal lip is not distorted.

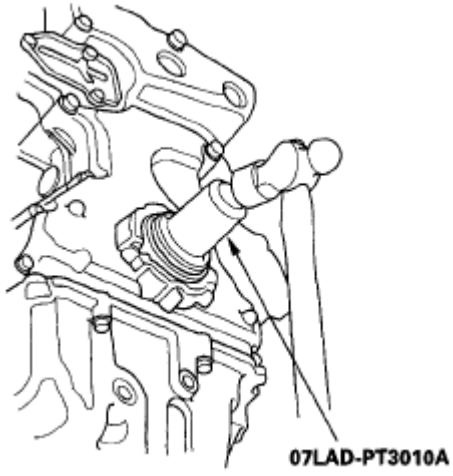

Fig. 74: Identifying Special Tool
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Install the crankshaft pulley (see **INSTALLATION**).

TRANSMISSION END CRANKSHAFT OIL SEAL INSTALLATION - IN CAR

Special Tools Required

- Driver 07749-0010000
- Oil seal driver attachment 96 07ZAD-PNAA100

1. Remove the transmission:

- Manual transmission (see **TRANSMISSION REMOVAL**)
- Automatic transmission (see **TRANSMISSION REMOVAL**)

2. M/T model: Remove the pressure plate, clutch disc and flywheel (see **PRESSURE PLATE AND CLUTCH DISC REMOVAL (5-SPEED MODEL)**).
3. A/T model: Remove the drive plate (see **DRIVE PLATE REMOVAL AND INSTALLATION**).
4. Remove the transmission end crankshaft oil seal.
5. Clean, and dry the crankshaft oil seal housing.
6. Apply a light coat of multipurpose grease to the crankshaft and to the lip of the seal.
7. Use the special tools to drive a new oil seal squarely into the engine block to the specified installed height.

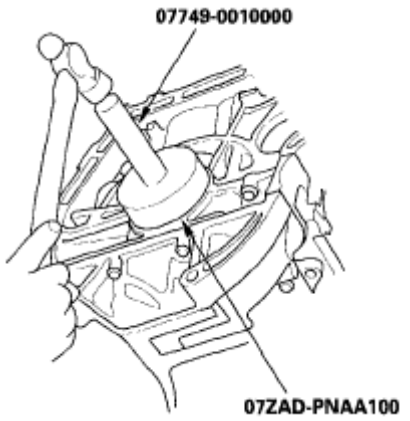

Fig. 75: Identifying Special Tool
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Measure the distance between the engine block (A) and oil seal (B).

   Oil Seal Installed Height: 0.2-1.2 mm (0.001-0.047 in.)

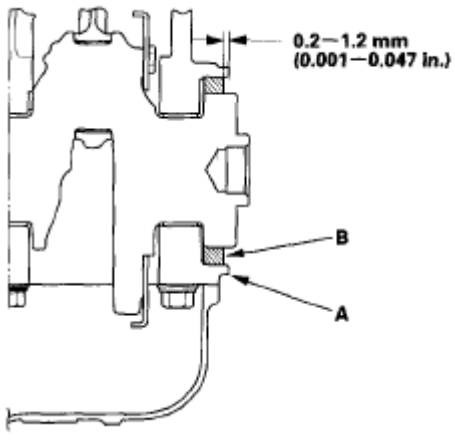

Fig. 76: Identifying Distance Between Engine Block And Oil Seal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. M/T model: Install the flywheel , clutch disc and pressure plate (see **PRESSURE PLATE AND CLUTCH DISC REMOVAL (5-SPEED MODEL)**).

10. A/T model: Install the drive plate (see **DRIVE PLATE REMOVAL AND INSTALLATION**).
11. Install the transmission:
    - Manual transmission (see **TRANSMISSION INSTALLATION**)
    - Automatic transmission (see **TRANSMISSION INSTALLATION**)

DRAIN BOLT/SEALING BOLT INSTALLATION

NOTE: When installing the drain bolt and/or sealing bolt, always use a new washer.

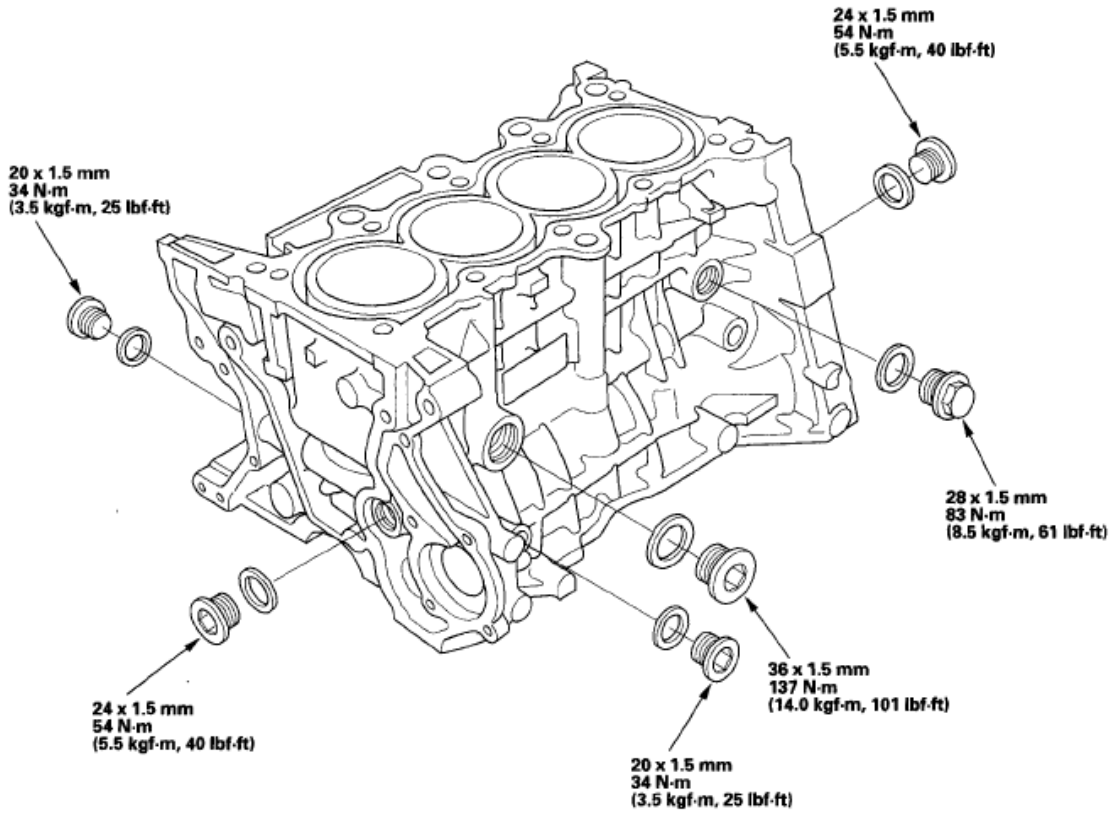

Fig. 77: Identifying Drain Bolt/Sealing Bolt (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

ENGINE BLOCK (K20Z3)

SPECIAL TOOLS

Ref. No.	Tool Number	Description	Qty
①	07ZAD-PNAA100	Oil Seal Driver Attachment 96	1
②	07746-0010700	Attachment, 24 x 26 mm	1
③	07749-0010000	Driver	1

COMPONENT LOCATION INDEX

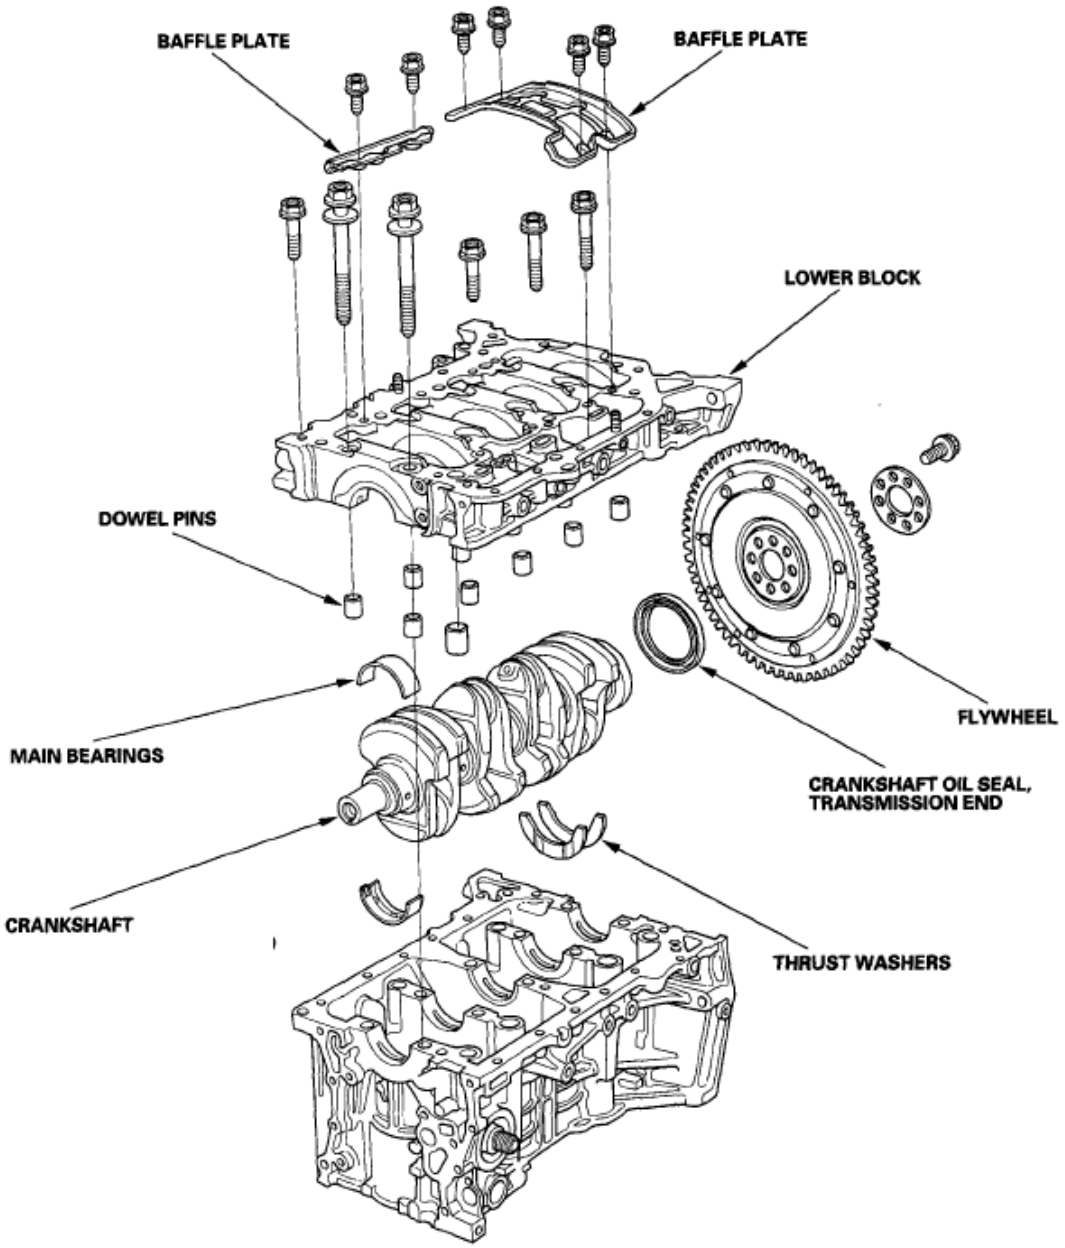

Fig. 79: Identifying Flywheel, Lower Block And Crankshaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

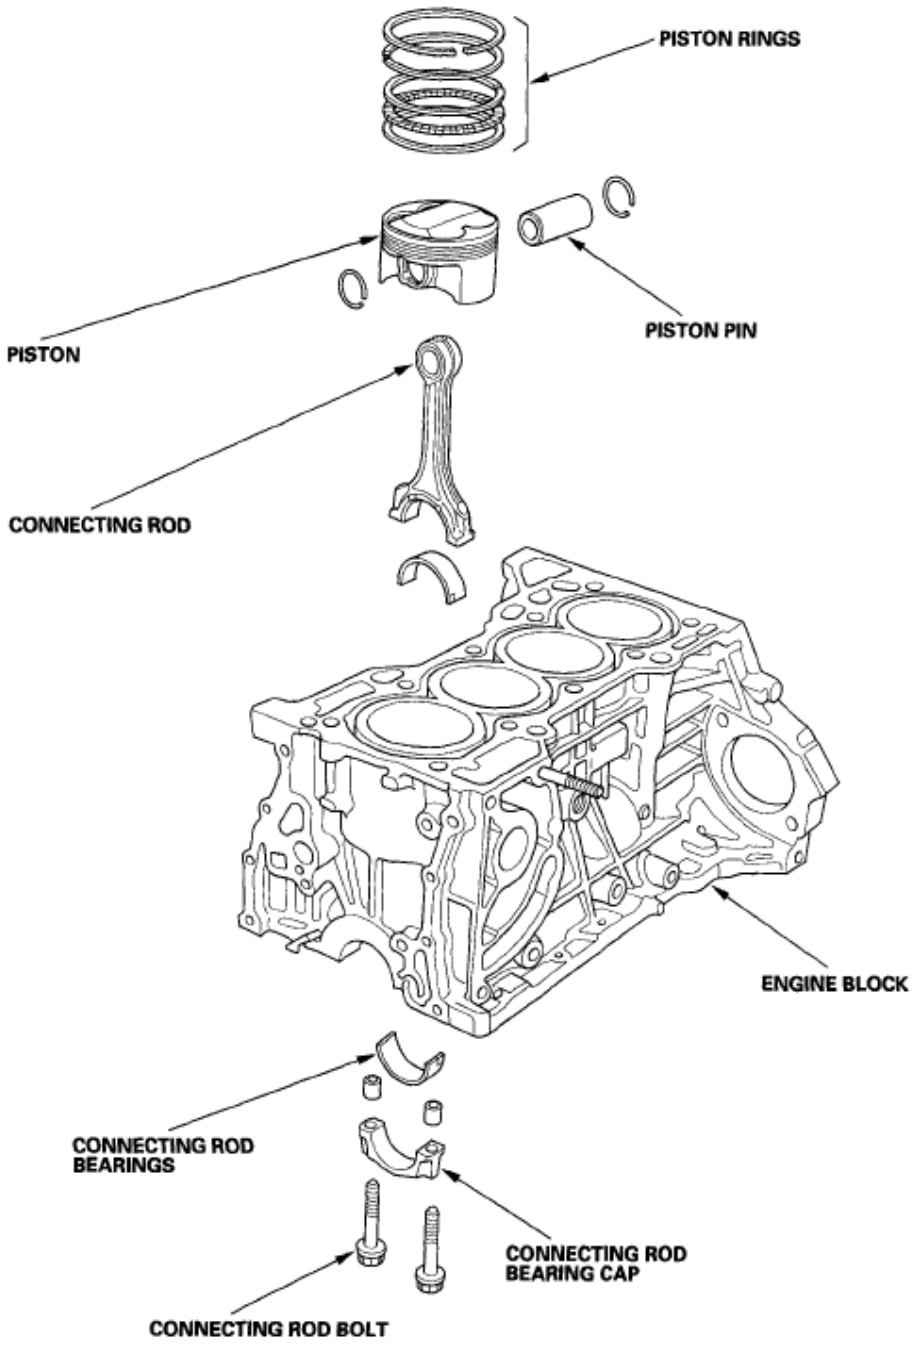

Fig. 80: Identifying Engine Block, Piston And Connecting Rod
Courtesy of AMERICAN HONDA MOTOR CO., INC.

CONNECTING ROD AND CRANKSHAFT END PLAY INSPECTION

1. Remove the oil pump (see **OIL PUMP REMOVAL**).
2. Remove the baffle plates (see step 7).
3. Measure the connecting rod end play with a feeler gauge between the connecting rod and crankshaft.

Connecting Rod End Play

Standard (New): 0.15-0.30 mm (0.006-0.012 in.)

Service Limit: 0.40 mm (0.016 in.)

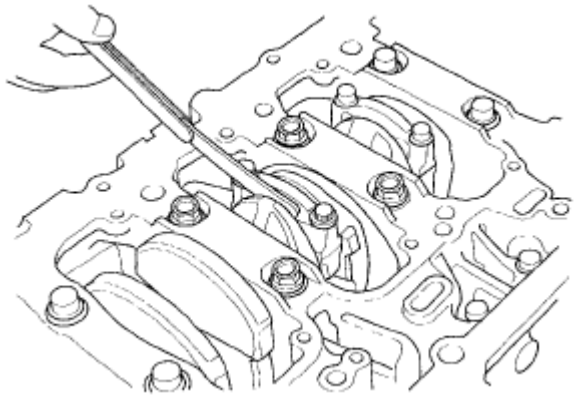

Fig. 81: Measuring Connecting Rod End Play
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. If the connecting rod end play is beyond service limit, install a new connecting rod, and recheck. If it is still beyond service limit; replace the crankshaft (see **CRANKSHAFT AND PISTON REMOVAL**).
5. Push the crankshaft firmly away from the dial indicator, and zero the dial against the end of the crankshaft. Then pull the crankshaft firmly back toward the indicator; the dial reading should not exceed the service limit.

Crankshaft End Play

Standard (New): 0.10-0.35 mm (0.004-0.014 in.)

Service Limit: 0.45 mm (0.018 in.)

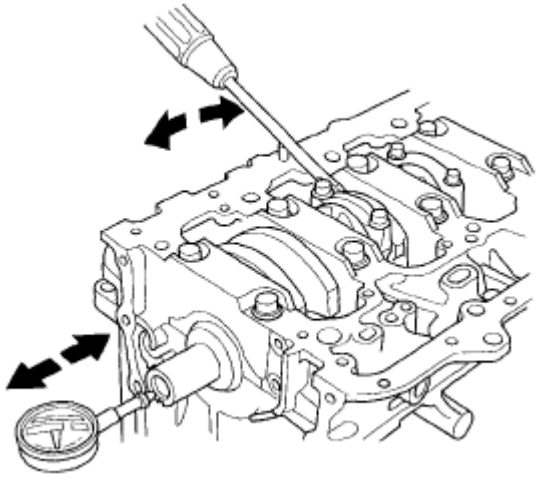

Fig. 82: Identifying Crankshaft Firmly Away From Dial Indicator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. If the end play is beyond service limit, replace the thrust washers and recheck, if it is still beyond

service limit, replace the crankshaft (see **CRANKSHAFT AND PISTON REMOVAL**).

CRANKSHAFT MAIN BEARING REPLACEMENT

Main Bearing Clearance Inspection

1. To check main bearing-to-journal oil clearance, remove the lower block and bearing halves (see **CRANKSHAFT AND PISTON REMOVAL**).
2. Clean each main journal and bearing half with a clean shop towel.
3. Place one strip of plastigage across each main journal.
4. Reinstall the bearings and lower block, then torque the bolts to 29 N.m (3.0 kgf.m, 22 lbf.ft) + 56 ° in the proper sequence (see step 19).

NOTE: Do not rotate the crankshaft during inspection.

5. Remove the lower block and bearings again, and measure the widest part of the plastigage.

   Main Bearing-to-Journal Oil Clearance

   No. 1, 2, 4, 5 Journals:

   Standard (New): 0.017 - 0.041 mm (0.0007 - 0.0016 in.)

   Service Limit: 0.050 mm (0.0020 in.) No. 3 Journal:

   Standard (New): 0.025 - 0.049 mm (0.0010 - 0.0019 in.)

   Service Limit: 0.055 mm (0.0022 in.)

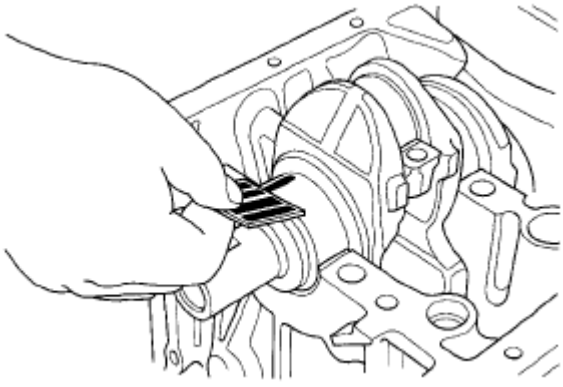

Fig. 83: Identifying Widest Part Of Plastigage
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. If the plastigage measures too wide or too narrow, remove the crankshaft, and remove the upper half of the bearing. Install a new, complete bearing with the same color code(s), and recheck the clearance. Do not file, shim, or scrape the bearings or the caps to adjust clearance.
7. If the plastigage shows the clearance is still incorrect, try the next larger or smaller bearing (the color listed above or below the current one), and check again. If the proper clearance cannot be obtained by using the appropriate larger or smaller bearings, replace the crankshaft and start over.

Main Bearing Selection

Crankshaft Bore Code Location

1. Numbers, letters or bars have been stamped on the end of the block as a code for the size of each of the five main journal bores. Write down the crank bore codes.

   If you can't read the codes because of accumulated dirt and dust, do not scrub them with a wire brush or scraper. Clean them only with solvent or detergent.

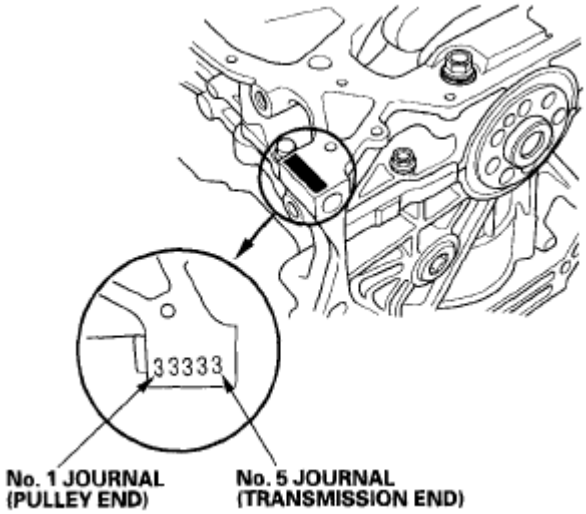

Fig. 84: Identifying Crankshaft Bore Code Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Main Journal Code Location

2. The main journal codes are stamped on the crankshaft in either location.

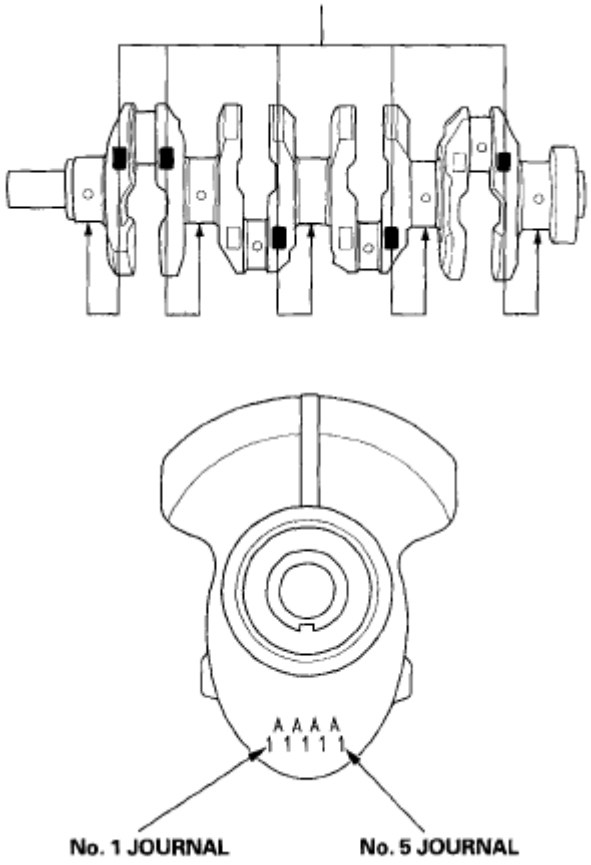

Fig. 85: Identifying Main Journal Code Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Use the crank bore codes and crank journal codes to select the appropriate replacement bearings from the following table.

NOTE:

- **The color code is on the edge of the bearing.**
- **When using bearing halves of different colors, it does not matter which color is used in the top or bottom.**

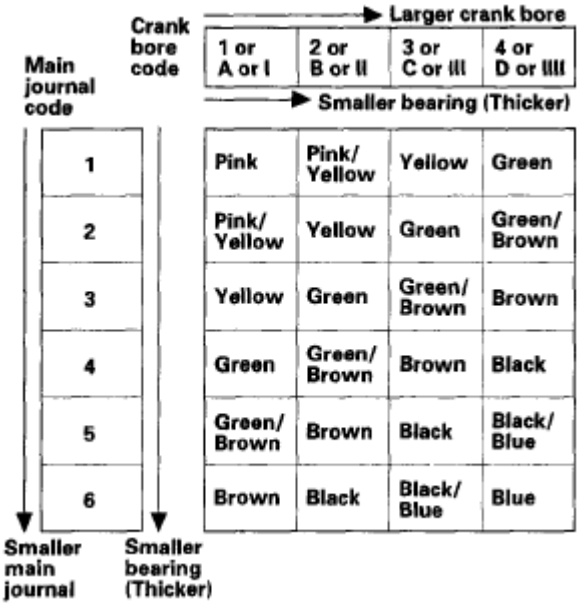

Fig. 86: Identifying Crank Bore Codes And Crank Journal Codes
Courtesy of AMERICAN HONDA MOTOR CO., INC.

CONNECTING ROD BEARING REPLACEMENT

Rod Bearing Clearance Inspection

1. Remove the oil pump (see **OIL PUMP REMOVAL**).
2. Remove the baffle plates (see step 7).
3. Remove the connecting rod cap and bearing half.
4. Clean the crankshaft rod journal and bearing half with a clean shop towel.
5. Place plastigage across the rod journal.
6. Reinstall the bearing half and cap, and torque the bolts to 29 N.m (3.0 kgf.m, 22 lbf.ft) + 90 °

NOTE: Do not rotate the crankshaft during inspection.

7. Remove the rod cap and bearing half, and measure the widest part of the plastigage.

Connecting Rod Bearing-to-Journal Oil Clearance

Standard (New): 0.032-0.066 mm (0.0013-0.0026 in.)

Service Limit: 0.077 mm (0.0030 in.)

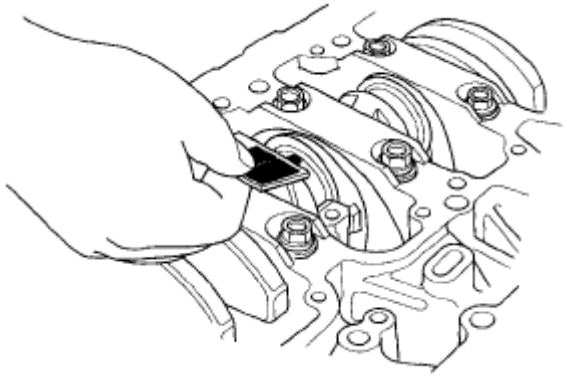

Fig. 87: Identifying Widest Part Of Plastigage
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. If the plastigage measures too wide or too narrow, remove the upper half of the bearing, install a new, complete bearing with the same color code(s), and recheck the clearance. Do not file, shim, or scrape the bearings or the caps to adjust clearance.
9. If the plastigage shows the clearance is still incorrect, try the next larger or smaller bearing (the color listed above or below the current one), and check clearance again. If the proper clearance cannot be obtained by using the appropriate larger or smaller bearing, replace the crankshaft and start over.

Rod Bearing Selection

1. Inspect each connecting rod for cracks and heat damage.

   Connecting Rod Big End Bore Code Locations

2. Each rod has a tolerance range from 0 to 0.024 mm (0.0009 in.), in 0.006 mm (0.0002 in.) increments, depending on the size of its big end bore. It's then stamped with a number or bar (1,2,3, or 4/I, II, III, or Mil) indicating the range. You may find any combination of numbers and bars in any engine. (Half the number or bar is stamped on the bearing cap, the other half is on the rod.)

   If you can't read the code because of an accumulation of oil and varnish, do not scrub it with a wire brush or scraper. Clean it only with solvent or detergent.

   Normal Bore Size: 51.0 mm (2.01 in.)

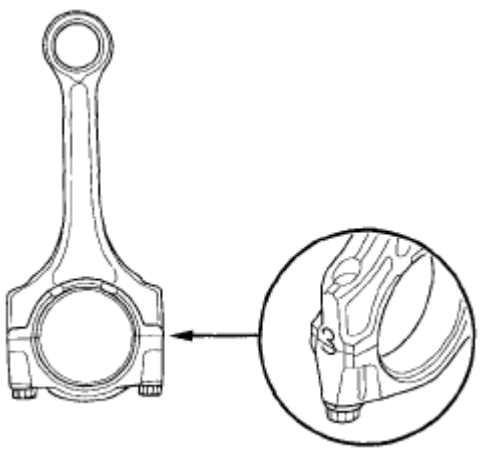

Fig. 88: Identifying Connecting Rod Big End Bore Code Locations
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Connecting Rod Journal Code Location

3. The connecting rod journal codes are stamped on the crankshaft in either location.

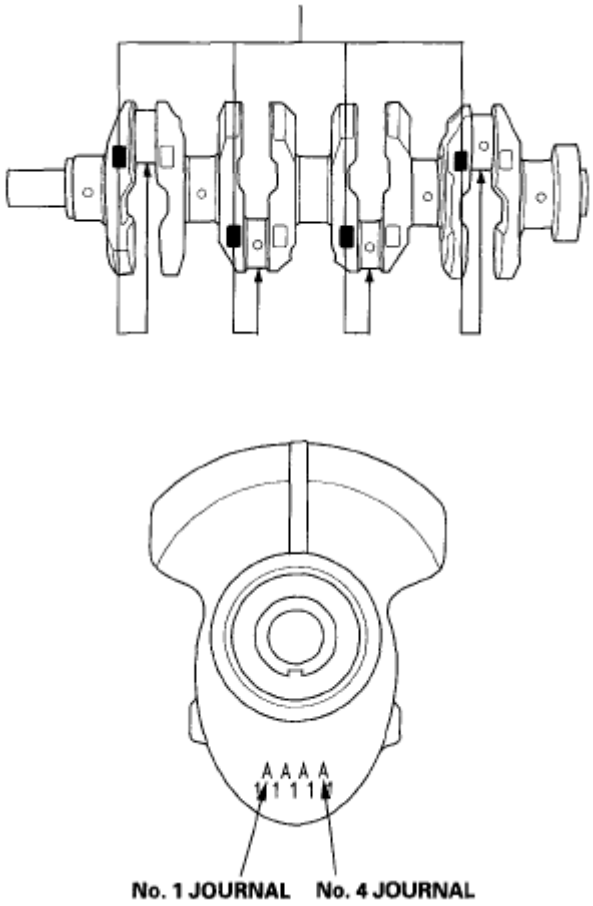

Fig. 89: Identifying Connecting Rod Journal Code Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Use the big end bore codes and rod journal codes to select appropriate replacement bearings from the following table.

NOTE:

- **The color code is on the edge of the bearing.**
- **When using bearing halves of different colors, it does not matter which color is used in the top or bottom.**

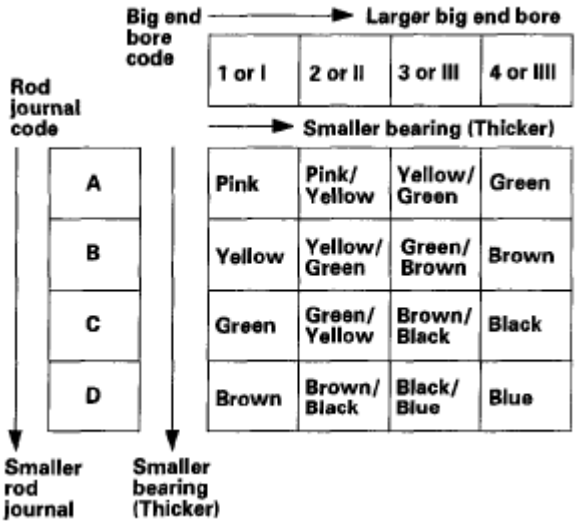

Fig. 90: Identifying Big End Bore Codes And Rod Journal Codes
Courtesy of AMERICAN HONDA MOTOR CO., INC.

OIL PAN REMOVAL

- Engine hanger adapter VSB02C000015
- Engine support hanger, A and Reds AAR-T1256
- 2006 Civic engine hanger VSB02C000025
- Front Subframe adapter VSB02C000016

These special tools are available through Honda Tool and Equipment Program, 888-424-6857

1. If the engine is out of the vehicle, go to step 16.
2. Raise the vehicle on the lift.
3. Drain the engine oil (see **OIL PRESSURE TEST**).
4. Remove the front wheels.
5. Remove the splash shield (see step 24 on **ENGINE REMOVAL**).
6. Separate the stabilizer links (see **STABILIZER LINK REMOVAL/INSTALLATION**).
7. Separate the knuckles from the lower arms (see step 5 on **LOWER ARM REMOVAL/INSTALLATION**).
8. Remove the steering gearbox bracket. Remove the steering gearbox mounting bolt, stiffener mounting bolt, and stiffener (see step 34 on **ENGINE REMOVAL**).
9. Remove the steering gearbox mounting bolt, stiffener mounting bolt, and stiffener. Remove the harness clamp from the front subframe (see step 36 on **ENGINE REMOVAL**).
10. Attach the engine hanger adapter (VSB02C000015) to the treated hole in the cylinder head (see step 42**ENGINE REMOVAL**).
11. Install the front leg assembly, the hook, and the wing nut to an A and Reds engine support hanger (AAR-T1256) on to the 2006 civic engine hanger (VSB02C000025). Carefully position the engine hanger on the vehicle, and attach the hook to the slotted hole in the support eyelet. Tighten the wing nut by hand to lift and support the engine/transmission (see step 43 **ENGINE REMOVAL**).
12. Remove the lower torque rod (See step 45**ENGINE REMOVAL**).

13. Remove the frotn mount mounting bolt (see step 46**ENGINE REMOVAL**).
14. Mark the appropriate reference line at both sides of the front subfraem that line up with the edges on the body (see step 47**ENGINE REMOVAL**).
15. Loosen the mid-stiffener mounting bolts on both sides (see step 48**ENGINE REMOVAL**).
16. Attach the front subframe adapter (VSB02C000016) to the front subframe, and hang the belt of the front subframe adapter over the front of the subframe. Secure the belt with its stop, then tighten the wing nut (See step 49 **ENGINE REMOVAL**).

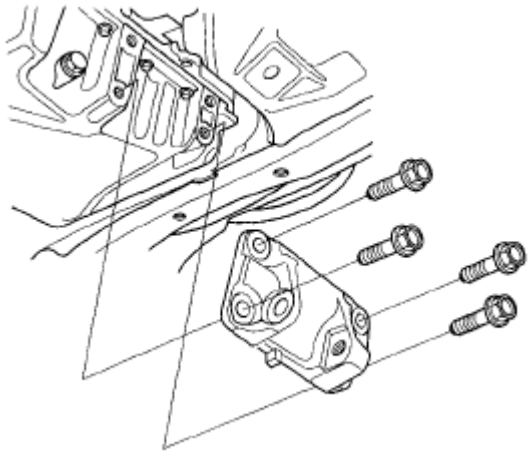

Fig. 91: Identifying Lower Torque Rod Bracket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Remove the front subframe (see step 51 **ENGINE REMOVAL**).
18. Remove the lower torque rod bracket.
19. Remove the clutch cover (A) and the transmission moutning bolts (B).

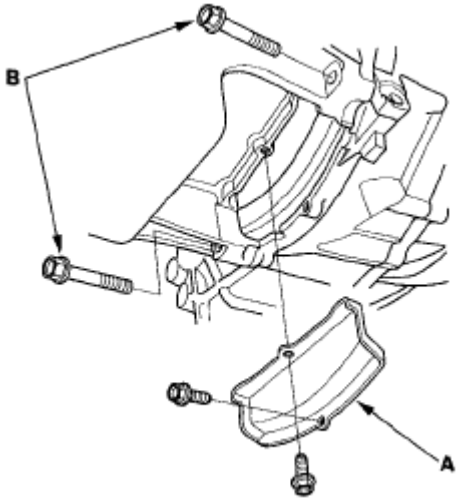

Fig. 92: Identifying Clutch Cover And Transmission Mounting Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Remove the bolts securing the oil pan.
21. Using a flat blade screwdriver, seperate the oil pan from the lower block in the places shown.

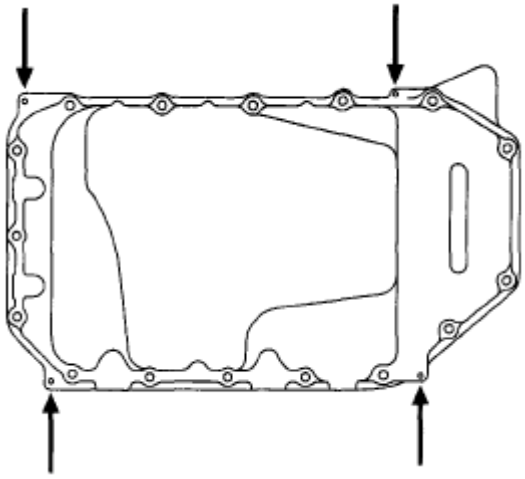

Fig. 93: Identifying Oil Pan From Block
Courtesy of AMERICAN HONDA MOTOR CO., INC.

22. Remove the oil pan.

CRANKSHAFT AND PISTON REMOVAL

1. Remove the engine assembly (see **ENGINE REMOVAL**).
2. Remove the transmission (see **TRANSMISSION REMOVAL**).
3. Remove the pressure plate , clutch disc and flywheel (see **PRESSURE PLATE AND CLUTCH DISC REMOVAL (5-SPEED MODEL)**).
4. Remove the oil pan (see **OIL PAN REMOVAL**).
5. Remove the oil pump (see **OIL PUMP REMOVAL**).
6. Remove the cylinder head (see **CYLINDER HEAD REMOVAL**).
7. Remove the baffle plates.

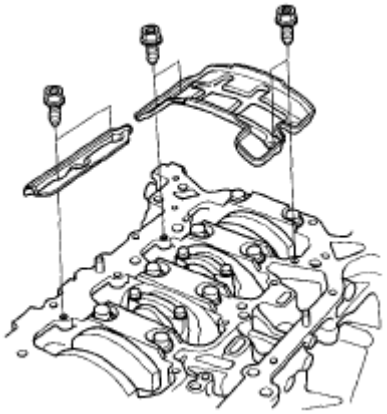

Fig. 94: Identifying Baffle Plates
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Remove the 8 mm bolts in sequence.

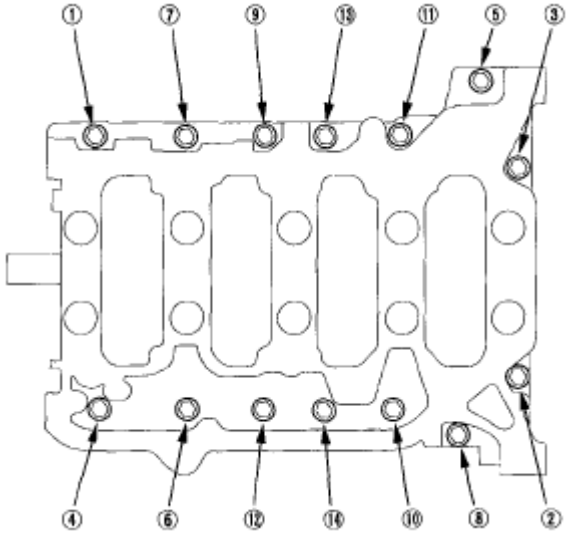

Fig. 95: Identifying Bolts In Sequence Position
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Remove the bearing cap bolts. To prevent warpage, unscrew the bolts in sequence 1/3 turn at a time; repeat the sequence until all bolts are loosened.

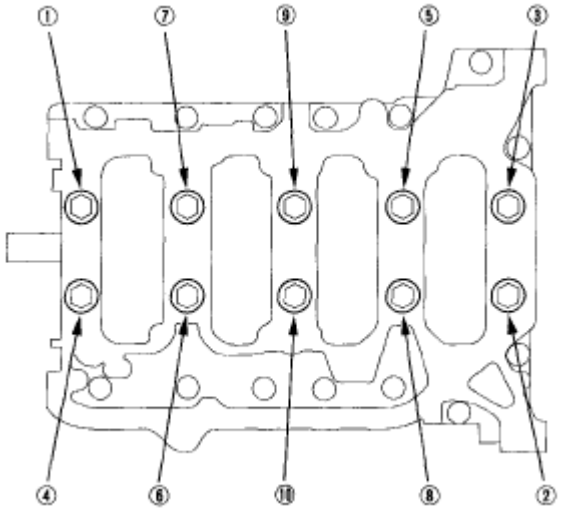

Fig. 96: Identifying Bearing Cap Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Remove the lower block and bearings. Keep all the bearings in order.

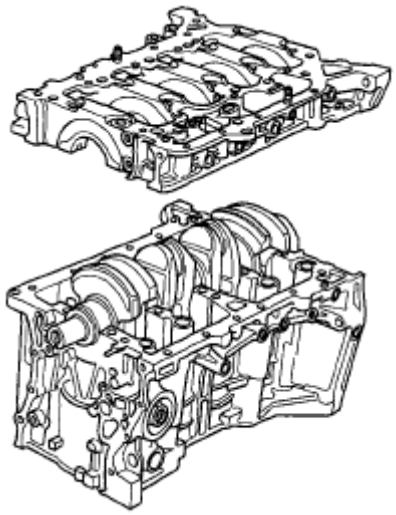

Fig. 97: Identifying Lower Block And Bearings
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Remove the rod caps/bearings. Keep all caps/bearings in order.
12. Lift the crankshaft out of the engine. Being careful not to damage the journals.

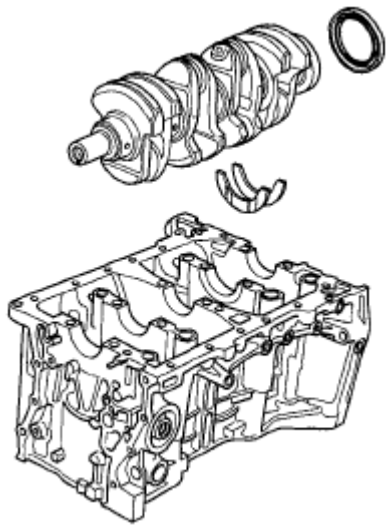

Fig. 98: Identifying Crankshaft Out Of Engine
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Remove the upper bearing halves from the connecting rods, and set them aside with their respective caps.
14. If you can feel a ridge of metal or hard carbon around the top of each cylinder, remove it with a ridge reamer (A). Follow the reamer manufacturer's instructions. If the ridge is not removed, it may damage the pistons as they are pushed out.

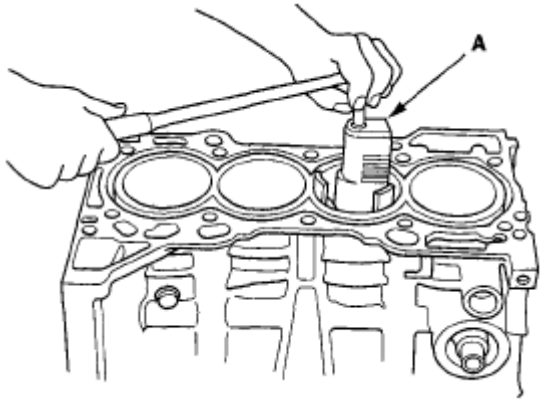

Fig. 99: Identifying Hard Carbon Around Top Of Each Cylinder
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Use the wooden handle of a hammer (A) to drive out the piston/connecting rod assembly (B).

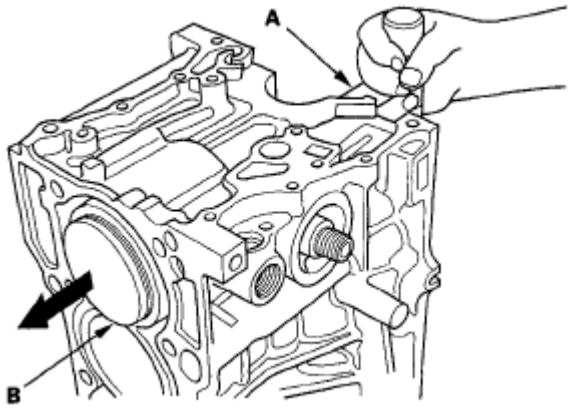

Fig. 100: Driving Out Piston/Connecting Rod Assembly
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Reinstall the lower block and bearings on the engine in the proper order.
17. Reinstall the connecting rod bearings and caps after removing each piston/connecting rod assembly.
18. Mark each piston/connecting rod assembly with its cylinder number to make sure they are reused in the original order.

NOTE: The existing number on the connecting rod does not indicate its position in the engine, it indicates the rod bore size.

CRANKSHAFT INSPECTION

Out-of-Round and Taper

1. Remove the crankshaft from the engine block (see **CRANKSHAFT AND PISTON REMOVAL**).
2. Clean the crankshaft oil passages with pipe cleaners or a suitable brush.
3. Clean the keyway and threads.
4. Measure the out-of-round at the middle of each rod and main journal in two places. The difference between measurements on each journal must not be more than the service limit.

Journal Out-of-Round

Standard (New): 0.005 mm (0.0002 in.) max.

Service Limit: 0.010 mm (0.0004 in.)

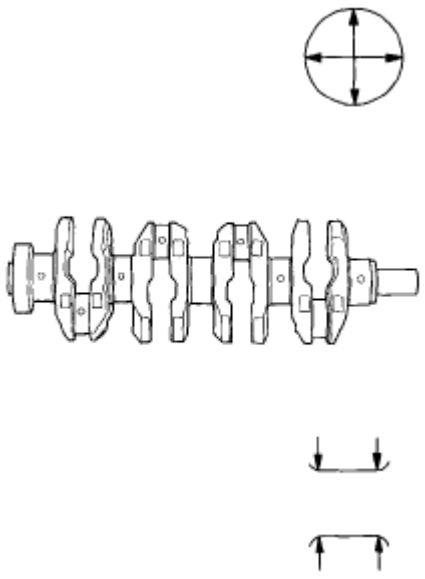

Fig. 101: Identifying Crankshaft Journal Out-Of-Round
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Measure the taper at the edges of each rod and main journal. The difference between measurements on each journal must not be more than the service limit.

Journal Taper

Standard (New): 0.005 mm (0.0002 in.) max.

Service Limit: 0.010 mm (0.0004 in.)

Straightness

6. Place the engine block on the surface plate.
7. Clean and install the bearings on the No. 1 and No. 5 journals of the engine block.
8. Measure runout on all main journals. Rotate the crankshaft two complete revolutions. The difference between measurements on each journal must not be more than the service limit.

Crankshaft Total Runout

Standard (New): 0.03 mm (0.0012 in.) max.

Service Limit: 0.04 mm (0.0016 in.)

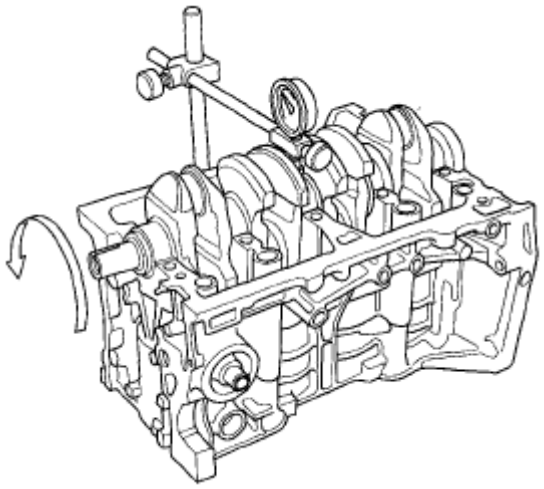

Fig. 102: Measuring Runout On Main Journals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

BLOCK AND PISTON INSPECTION

1. Remove the crankshaft and pistons (see **CRANKSHAFT AND PISTON REMOVAL**).
2. Check the piston for distortion or cracks.
3. Measure the piston diameter at a point 11 mm (0.4 in.) from the bottom of the skirt. There are two standard-size pistons (No Letter or A, and B). The letter is stamped on the top of the piston. Letters are also stamped on the block as cylinder bore sizes.

   Piston Diameter

   Standard (New):

   No Letter (or A): B: 85.980-85.990 mm (3.3850-3.3854 in.)

   B: 85.970-85.980 mm (3.3846-3.3850 in.)

   Service Limit:

   No Letter (or A): 85.930 mm (3.3831 in.) 85.920 mm (3.3827 in.)

   Oversize Piston Diameter

   0.25: 86.230-86.240 mm (3.3949-3.3953 in.)

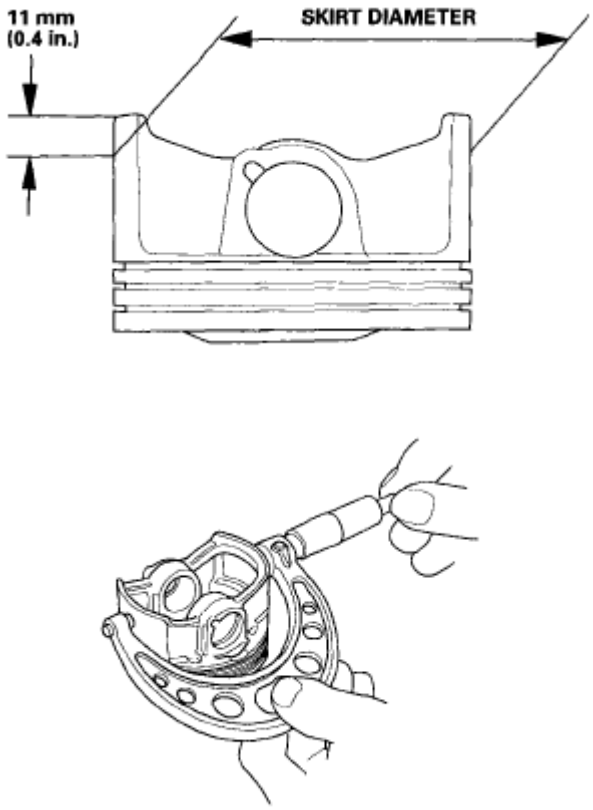

Fig. 103: Measuring Piston Diameter Point From Bottom Of Skirt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Measure the wear and taper in direction X and Y at three levels in each cylinder as shown. If the measurements in any cylinder are beyond the Oversize Bore Service Limit, replace the engine block. If the engine block is being rebored, refer to step 7 after reboring.

   Cylinder Bore Size

   Standard (New):

   A or I: 86.010-86.020 mm (3.3862-3.3866 in.)

   B or II: 86.000-86.010 mm (3.3858-3.3862 in.)

   Service Limit: 86.070 mm (3.3886 in.

   Oversize

   0.25: 86.250-86.260 mm (3.3957-3.3961 in.)

   Reboring Limit: 0.25 mm (0.01 in.) max.

   Bore Taper

   Limit: (Difference between first and third measurement) 0.05 mm (0.002 in.)

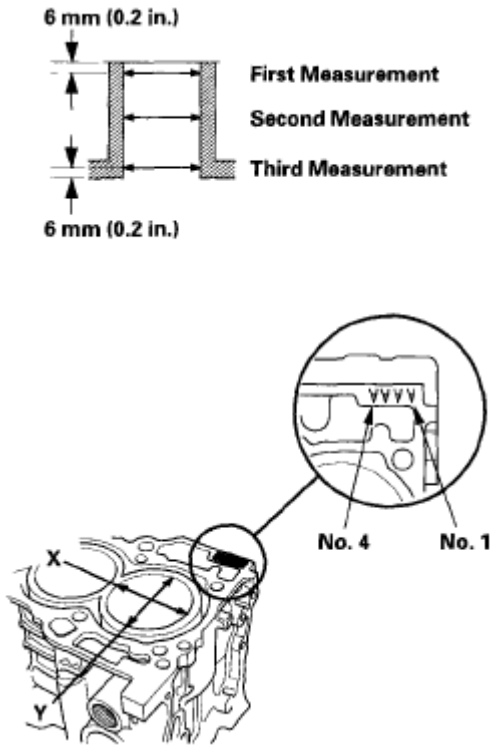

Fig. 104: Identifying Wear And Taper Direction X And Y Three Levels In Each Cylinder
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Scored or scratched cylinder bores must be honed.
6. Check the top of the engine block for warpage. Measure along the edges, and across the center as shown.

Engine Block Warpage

Standard (New): 0.07 mm (0.003 in.) max.

Service Limit: 0.10 mm (0.004 in.)

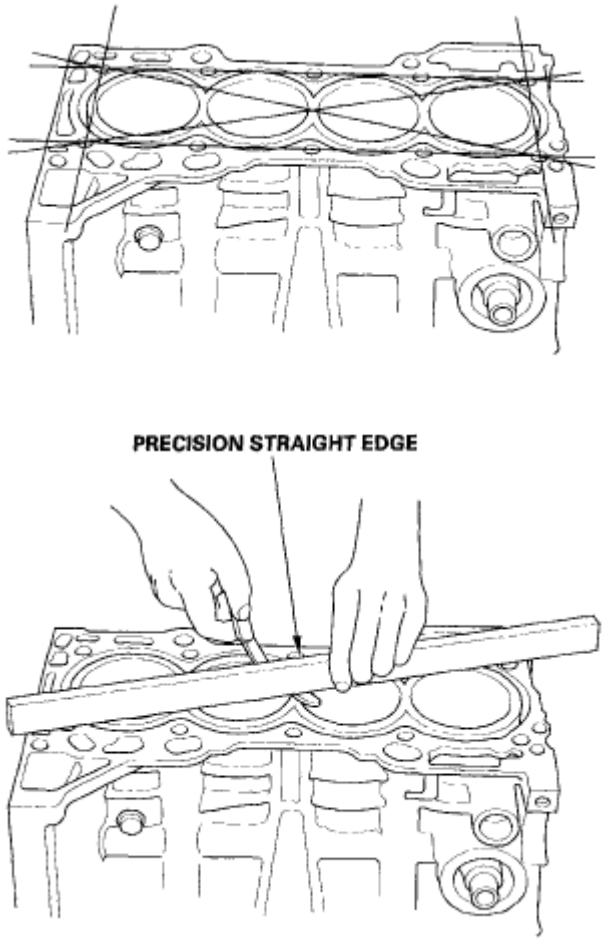

Fig. 105: Identifying Top Of Engine Block For Warpage
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Calculate the difference between the cylinder bore diameter and the piston diameter. If the clearance is near or exceeds the service limit, inspect the piston and cylinder bore for excessive wear.

   Piston-to-Cylinder Bore Clearance

   Standard (New): 0.020-0.040 mm (0.0008-0.0016 in.)

   Service Limit: 0.05 mm (0.002 in.)

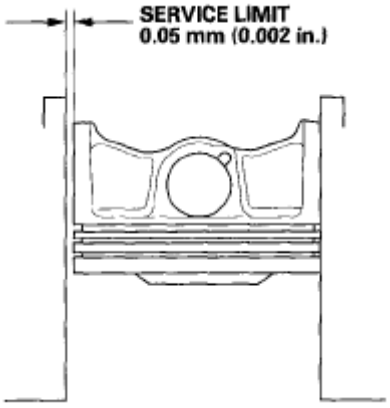

Fig. 106: Identifying Difference Between Cylinder Bore Diameter And Piston Diameter
Courtesy of AMERICAN HONDA MOTOR CO., INC.

CYLINDER BORE HONING

Only a scored or scratched cylinder bore must be honed.

1. Measure the cylinder bores (see **BLOCK AND PISTON INSPECTION**). If the engine block is to be reused, hone the cylinders, and remeasure the bores.
2. Remove the oil jets.
3. Hone the cylinder bores with honing oil and a fine (400 grit) stone in a 60 degree cross-hatch pattern (A). Use only a rigid hone with 400 grit or finer stone such as Sunnen, Ammco, or equivalent. Do not use stones that are worn or broken.

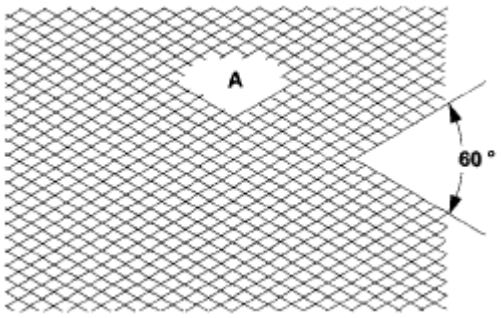

Fig. 107: Identifying Cross-Hatch Pattern
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. When honing is complete, thoroughly clean the engine block of all metal particles. Wash the cylinder bores with hot soapy water, then dry and oil them immediately to prevent rusting. Never use solvent, it will only redistribute the grit on the cylinder walls.
5. If scoring or scratches are still present in the cylinder bores after honing the engine block to the service limit, rebore the engine block. Some light vertical scoring and scratching is acceptable if it is not deep enough to catch your fingernail, and does not run the full length of the bore.
6. Install the oil jets.

PISTON, PIN, AND CONNECTING ROD REPLACEMENT

Disassembly

1. Remove the piston from the engine block (see **CRANKSHAFT AND PISTON REMOVAL**).
2. Apply new engine oil to the piston pin snap rings (A), and turn them in the ring grooves until the end gaps are lined up with the cutouts in the piston pin bores (B).

NOTE: Take care not to damage the ring grooves.

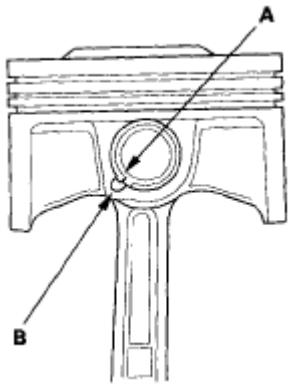

Fig. 108: Identifying Piston Pin Snap Rings And Piston Pin Bores
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove both snap rings (A). Start at the cutout in the piston pin bore. Remove the snap rings carefully so they do not go flying or get lost. Wear eye protection.

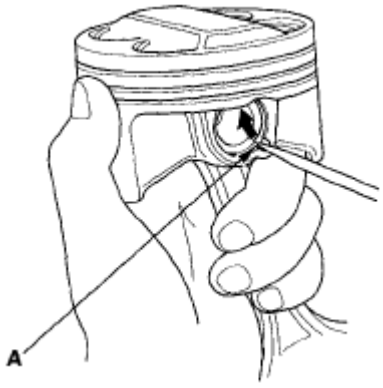

Fig. 109: Identifying Snap Rings
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Heat the piston and connecting rod assembly to about 158°F (70°C), then remove the piston pin.

Fig. 110: Heating Piston And Connecting Rod Assembly
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Inspection

NOTE: Inspect the piston, piston pin, and connecting rod when they are at room temperature.

1. Measure the diameter of the piston pin.

   Piston Pin Diameter

   Standard (New): 21.961-21.965 mm (0.8646-0.8648 in.)

   Service Limit: 21.953 mm (0.8643 in.)

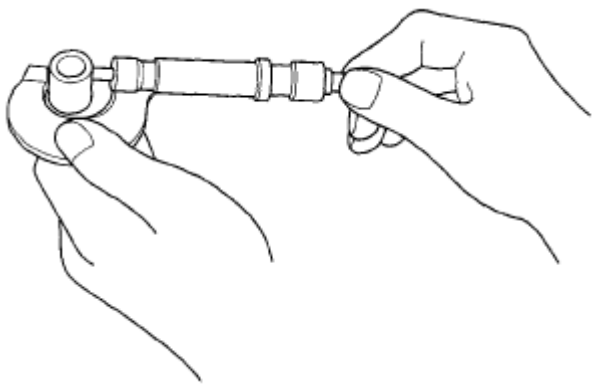

Fig. 111: Measuring Diameter Of Piston Pin
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Zero the dial indicator to the piston pin diameter.

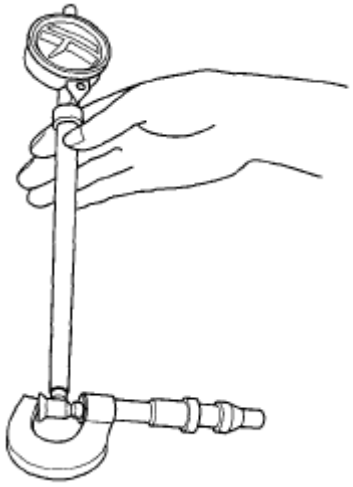

Fig. 112: Seating Dial Indicator To Piston Pin Diameter
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Check the difference between the piston pin diameter and piston pin hole diameter in the piston.

   Piston Pin-to-Piston Clearance

   Standard (New): -0.005 to +0.002 mm (-0.00020 to +0.00008 in.)

   Service Limit: 0.005 mm (0.0002 in.)

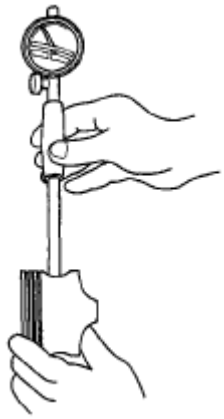

Fig. 113: Checking Difference Between Piston Pin Diameter And Piston Pin Hole Diameter In Piston
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Measure the piston pin-to-connecting rod clearance.

   Piston Pin-to-Connecting Rod Clearance

   Standard (New): 0.005-0.015 mm (0.0002-0.0006 in.)

   Service Limit: 0.02 mm (0.0008 in.)

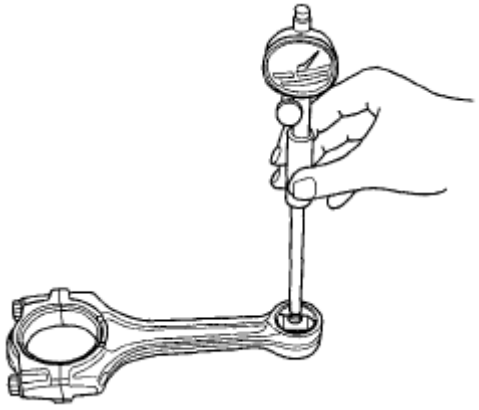

Fig. 114: Measuring Piston Pin-To-Connecting Rod Clearance
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Reassembly

1. Install a piston pin snap ring (A).

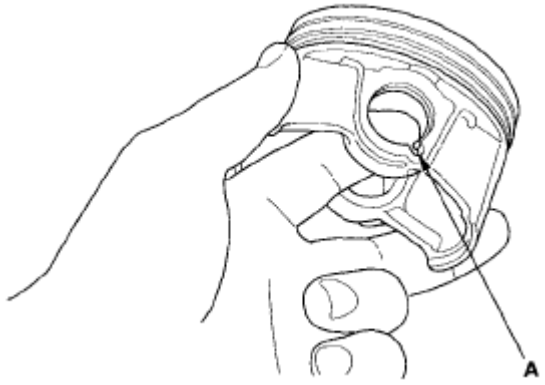

Fig. 115: Identifying Piston Pin Snap Ring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Coat the piston pin bore in the piston, the bore in the connecting rod, and the piston pin with new engine oil.
3. Heat the piston to about 158°F (70°C).

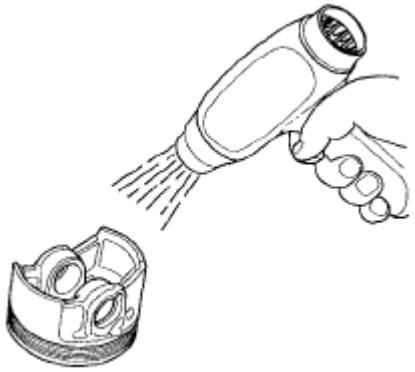

Fig. 116: Heating Piston

Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Assemble the piston (A) and connecting rod (B) with the arrow (C) and the embossed mark (D) on the same side. Install the piston pin (E).

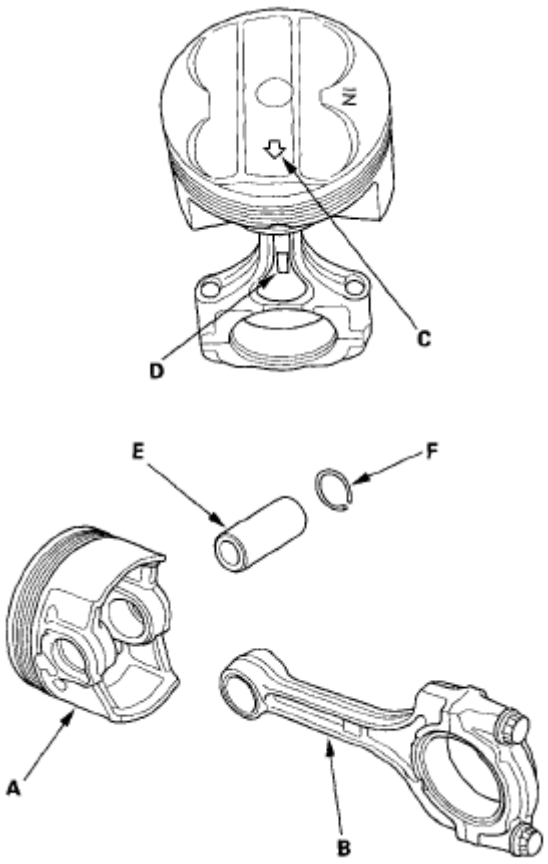

Fig. 117: Identifying Piston , Connecting Rod And Piston Pin
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the remaining snap ring (F).
6. Turn the snap rings in the ring grooves until the end gaps are positioned at the bottom of the piston.

PISTON RING REPLACEMENT

1. Remove the piston from the engine block (see **CRANKSHAFT AND PISTON REMOVAL**).
2. Using a ring expander (A), remove the old piston rings (B).

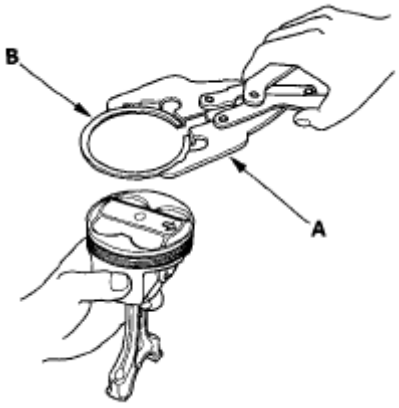

Fig. 118: Removing Piston Rings
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Clean all ring grooves thoroughly with a squared-off broken ring or ring groove cleaner with a blade to fit the piston grooves.

   The top and 2nd ring grooves are 1.2 mm (0.05 in.) wide. The oil ring groove is 2.0 mm (0.08 in.) wide. File down a blade if necessary.

   Do not use a wire brush to clean the ring grooves, or cut the ring grooves deeper with the cleaning tools.

   NOTE: If the piston is to be separated from the connecting rod, do not install new rings yet.

4. Using a piston that has its rings removed, push a new ring (A) into the cylinder bore 15-20 mm (0.6-0.8 in.) from the bottom.

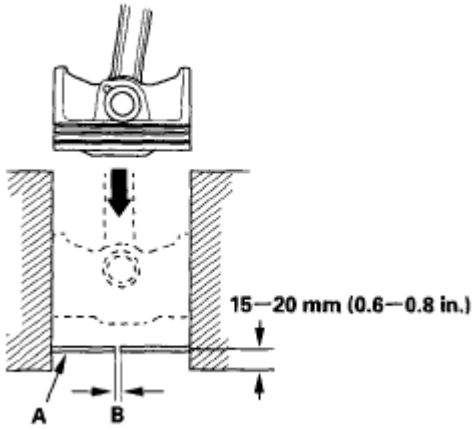

Fig. 119: Pushing Ring Into Cylinder Bore
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Measure the piston ring end-gap (B) with a feeler gauge:
   - If the gap is too small, check to see if you have the proper rings for your engine.
   - If the gap is too large, recheck the cylinder bore diameter against the wear limits (see **BLOCK AND PISTON INSPECTION**). If the bore is beyond the service limit, the engine block must

be rebored.

Piston Ring End-Gap

Top Ring:

Standard (New): 0.20-0.35 mm (0.008-0.014 in.)

Service Limit: 0.60 mm (0.024 in.)

Second Ring:

Standard (New): 0.50-0.65 mm (0.020-0.026 in.)

Service Limit: 0.75 mm (0.030 in.)

Oil Ring:

Standard (New): 0.20-0.70 mm (0.008-0.028 in.)

Service Limit: 0.80 mm (0.031 in.)

6. Install the top ring and the second ring as shown. The top ring (A) has a 1R mark and the second ring (B) has a 2R mark. The manufacturing marks (C) must be facing upward.

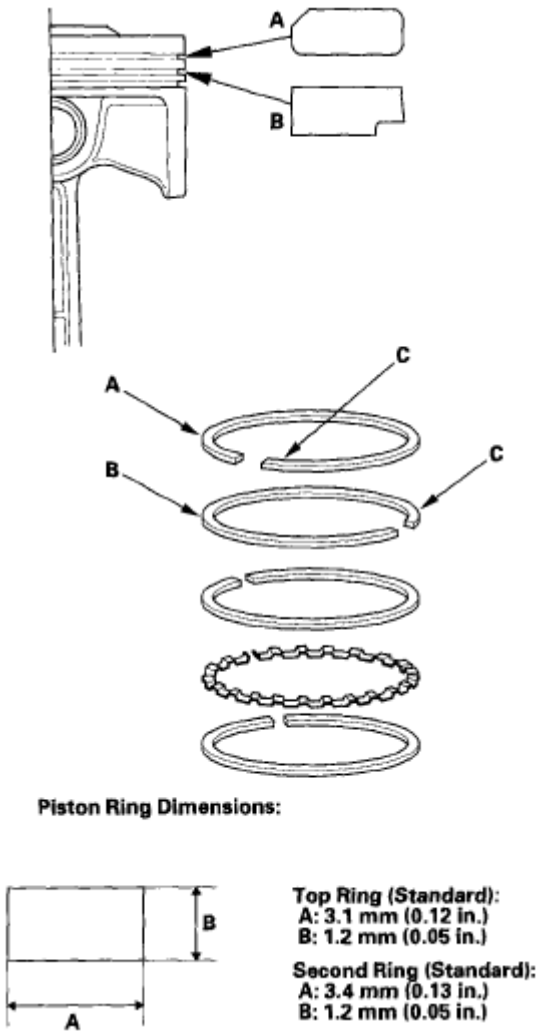

Fig. 120: Identifying Top Ring And Second Ring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Rotate the rings in their grooves to make sure they do not bind.
8. Position the ring end gaps as shown: About 90°

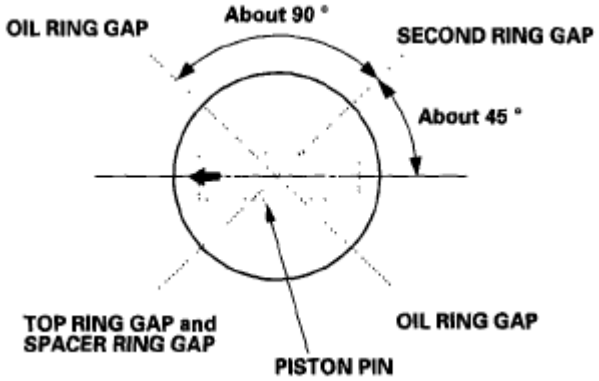

Fig. 121: Identifying Ring End Gaps Turning Angle
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. After installing a new set of rings, measure the ring-to-groove clearances.

   Top Ring Clearance

   Standard (New): 0.045-0.070 mm (0.0018-0.0028 in.)

   Service Limit: 0.13 mm (0.005 in.)

   Second Ring Clearance

   Standard (New): 0.040-0.065 mm (0.0016-0.0026 in.)

   Service Limit: 0.13 mm (0.005 in.)

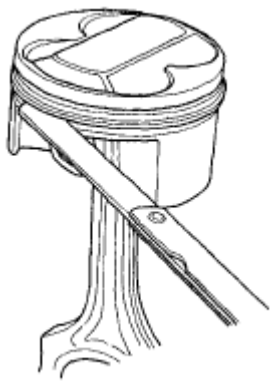

Fig. 122: Identifying Ring-To-Groove Clearances
Courtesy of AMERICAN HONDA MOTOR CO., INC.

PISTON INSTALLATION

If the Crankshaft is Already Installed

1. Set the crankshaft to bottom dead center (BDC) for each cylinder as its piston is installed.
2. Remove the connecting rod caps, then install the ring compressor. Check that the bearing is securely in place.
3. Apply new engine oil to the piston, inside of the ring compressor, and the cylinder bore, then attach the ring compressor to the piston/connecting rod assembly.
4. Position the mark (A) to face the cam chain side of the engine.

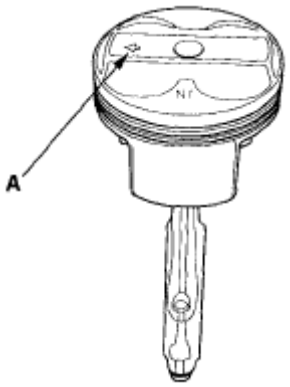

Fig. 123: Identifying Mark To Face Cam Chain Side Of Engine
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Position the piston in the cylinder, and tap it in using the wooden handle of a hammer (A). Push down on the ring compressor (B) to prevent the rings from expanding before entering the cylinder bore.

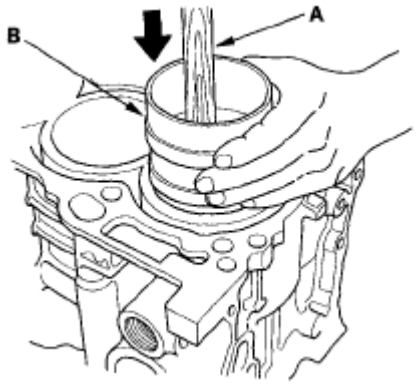

Fig. 124: Pushing Down On Ring Compressor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Stop after the ring compressor pops free, and check the connecting rod-to-crank journal alignment before pushing the piston into place.
7. Check the connecting rod bearing clearance with plastigage (see **CONNECTING ROD BEARING REPLACEMENT**).
8. Inspect the connecting rod bolts (see **CONNECTING ROD BOLT INSPECTION**).
9. Install the rod caps with bearings. Torque the bolts to 29 N.m (3.0 kgf.m, 22 lbf.ft).
10. Tighten the connecting rod bolts an additional 90 °.

NOTE: Remove the connecting rod bolt if you tightened it beyond the specified angle, and go back to step 8 of the procedure. Do not loosen it back to the specified angle.

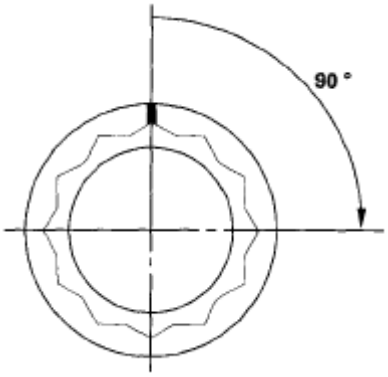

Fig. 125: Identifying Connecting Rod Bolt Tightening Angle
Courtesy of AMERICAN HONDA MOTOR CO., INC.

If the Crankshaft is Not Installed

1. Remove the connecting rod caps, then install the ring compressor, and check that the bearing is securely in place.
2. Apply new engine oil to the piston, inside of the ring compressor, and the cylinder bore, then attach the ring compressor to the piston/connecting rod assembly.
3. Position the mark (A) to face the cam chain side of the engine.

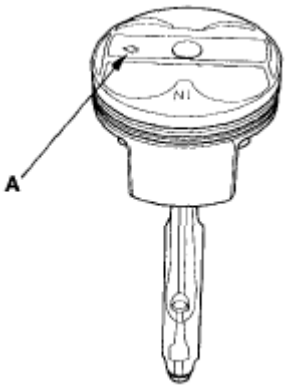

Fig. 126: Identifying Mark To Face Cam Chain Side Of Engine
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Position the piston in the cylinder, and tap it in using the wooden handle of a hammer (A). Push down on the ring compressor (B) to prevent the rings from expanding before entering the cylinder bore.

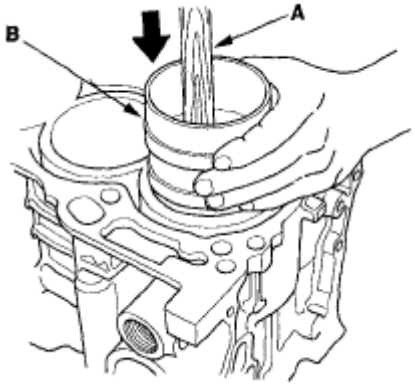

Fig. 127: Pushing Down On Ring Compressor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Position all pistons at top dead center (TDC).

CONNECTING ROD BOLT INSPECTION

1. Measure the diameter of each connecting rod bolt at point A and point B.

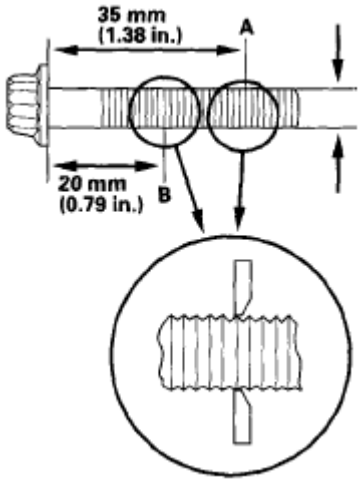

Fig. 128: Identifying Diameter Of Connecting Rod Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Calculate the difference in diameter between point A and point B.

   Point A-Point B = Difference in Diameter

   Difference in Diameter

   Specification: 0-0.1 mm (0-0.004 in.)

3. If the difference in diameter is out of specification, replace the connecting rod bolt.

CRANKSHAFT INSTALLATION

Special Tools Required

- Driver 07749-0010000
- Attachment, 24 x 26 mm 07746-0010700
- Oil seal driver attachment, 96 mm 07ZAD-PNAA100

1. Install the crankshaft end bushing when replacing the crankshaft.

   Using the special tools, drive in the crankshaft end bushing until the special tools bottom against the crankshaft.

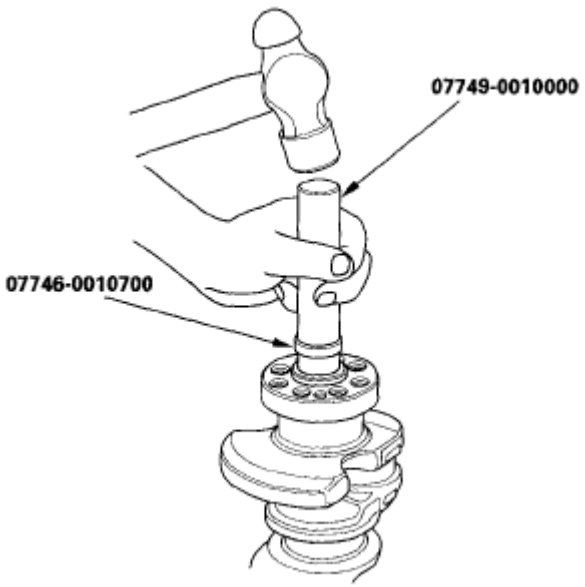

Fig. 129: Identifying Special Tool
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Check the connecting rod bearing clearance with plastigage (see **CONNECTING ROD BEARING REPLACEMENT**).
3. Check the main bearing clearance with plastigage (see **CRANKSHAFT MAIN BEARING REPLACEMENT**).
4. Install the bearing halves in the engine block and connecting rods.
5. Apply a coat of new engine oil to the main bearings and rod bearings.
6. Hold the crankshaft so that rod journal No. 2 and rod journal No. 3 are straight up, and lower the crankshaft into the engine block.
7. Apply new engine oil to the thrust washer surfaces. Install the thrust washers (A) in the No. 4 journal of the engine block.

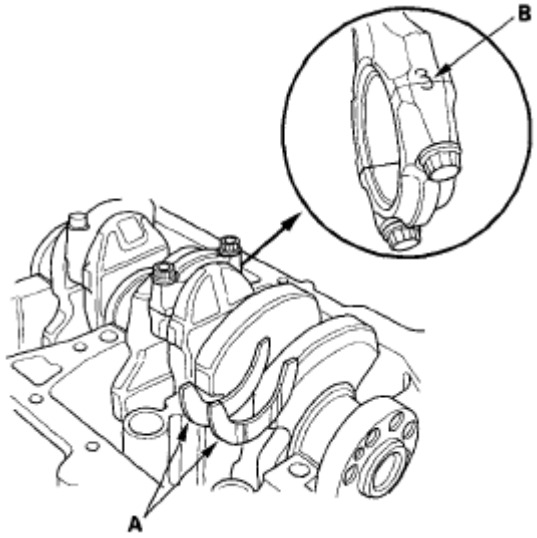

Fig. 130: Identifying Thrust Washers In Engine Block
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Inspect the connecting rod bolts (see **CONNECTING ROD BOLT INSPECTION**).
9. Apply engine oil to the threads of the connecting rod bolts.
10. Seat the rod journals into connecting rod No. 1 and connecting rod No. 4. Line up the mark (B) on the connecting rod and cap, then install the caps and bolts finger-tight.
11. Rotate the crankshaft clockwise, and seat the journals into connecting rod No. 2 and connecting rod No. 3. Line up the mark on the connecting rod and cap, then install the caps and bolts finger-tight.
12. Tighten the connecting rod bolts to 29 N.m (3.0 kgf.m, 22 lbf.ft).
13. Tighten the connecting rod bolts an additional 90 °.

NOTE: Remove the connecting rod bolt if you tightened it beyond the specified angle, and go back to step 8 of the procedure. Do not loosen it back to the specified angle.

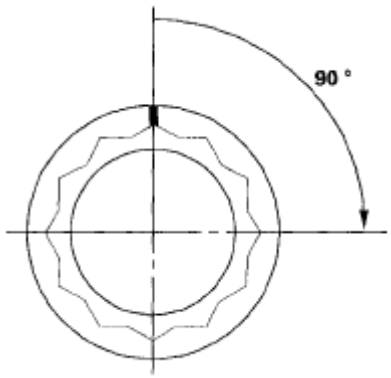

Fig. 131: Identifying Connecting Rod Bolt Tightening Angle
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Remove all of the old liquid gasket from the lower block mating surfaces, bolts, and bolt holes.
15. Clean, and dry the lower block mating surfaces.

16. Apply liquid gasket, P/N 08717-0004, 08718-0001, 08718-0002, 08718-0003, or 08718-0009, evenly to the engine block mating surface of the lower block.

NOTE: Do not install components if too much time has passed after applying the liquid gasket (for P/N 08718-0002, no more than 4 minutes, for all others, no more than 5 minutes). Instead, remove the old residue and reapply the liquid gasket.

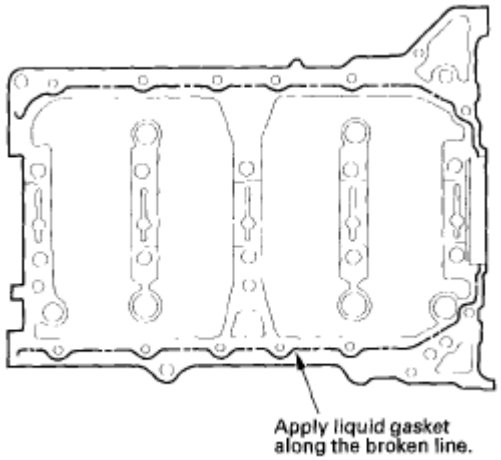

Fig. 132: Identifying Lower Block
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Put the lower block on the engine block.
18. Apply new engine oil to the threads of the bearing cap bolts.
19. Tighten the bearing cap bolts, in sequence, to 29 N.m (3.0 kgf.m, 22 lbf.ft).

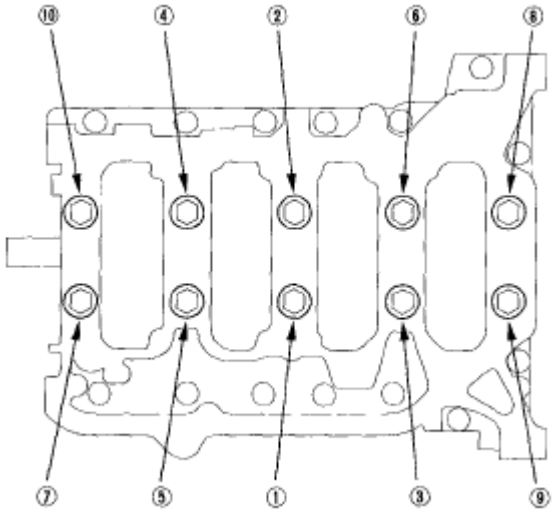

Fig. 133: Identifying Bearing Cap Bolts Tightening Sequence
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Tighten the bearing cap bolts an additional 56 °.

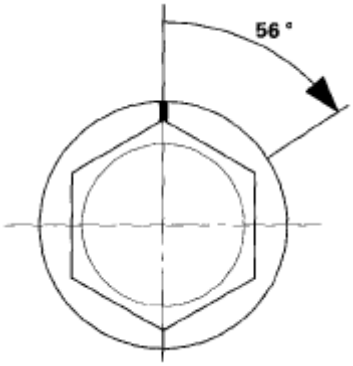

Fig. 134: Identifying Bearing Cap Bolts Tightening Angle
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Tighten the 8 mm bolts, in sequence, to 22 N.m (2.2 kgf.m, 16 lbf-ft).

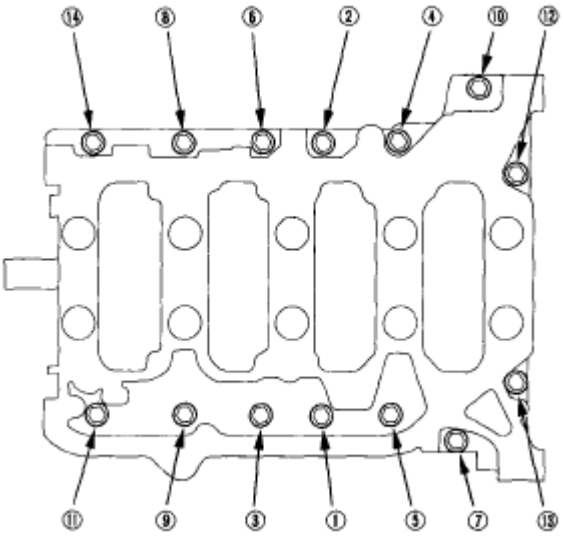

Fig. 135: Identifying Crank Shaft Bolt Tightening Sequence
Courtesy of AMERICAN HONDA MOTOR CO., INC.

22. Apply a light coat of new engine oil around the crankshaft oil seal.

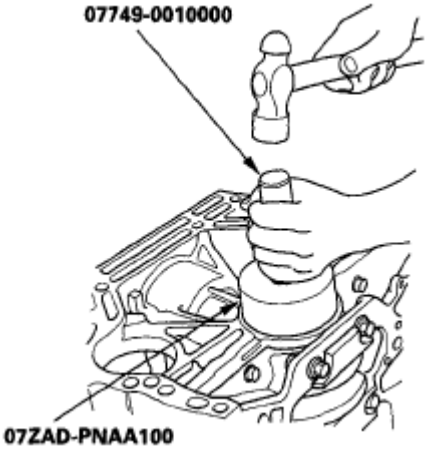

Fig. 136: Identifying Special Tool
Courtesy of AMERICAN HONDA MOTOR CO., INC.

23. Apply a light coat of new engine oil to the crankshaft and the lip of the crankshaft oil seal.

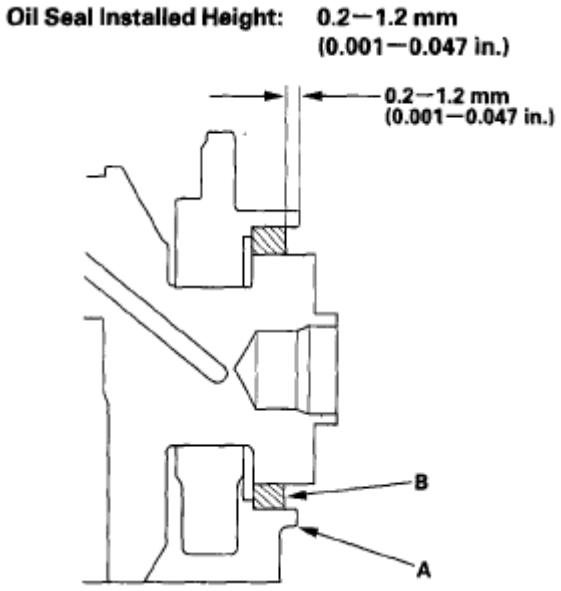

Fig. 137: Identifying Distance Between Engine Block And Oil Seal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

24. Use the driver handle and the oil seal driver attachment 96 to drive a new oil seal squarely into the engine block to the specified installed height.

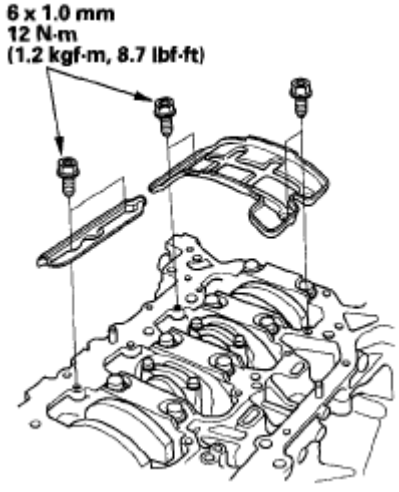

Fig. 138: Identifying Baffle Plates (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

25. Measure the distance between the eingine block (A) and the crankshaft oil seal (B).
26. Install the baffle plates.
27. Install the oil pump (see **OIL PUMP INSTALLATION**).
28. Install the oil pan (see **OIL PAN INSTALLATION**).

29. Install the cylinder head (see **CYLINDER HEAD INSTALLATION**).
30. Install the flywheel , clutch disc and pressure plate (see **PRESSURE PLATE AND CLUTCH DISC REMOVAL (6-SPEED MODEL)**).
31. Install the transmission (see **TRANSMISSION INSTALLATION**).
32. Install the engine assembly (see **ENGINE INSTALLATION**).

NOTE: Whenever any crankshaft or connecting rod bearing is replaced, it is necessary after reassembly to run the engine at idle speed until it reaches normal operating temperature, then continue to running it for about 15 minutes.

OIL PAN INSTALLATION

- Front subframe adapter VSB02C000016
- Engien support hanger, A and Reds AAR-T1256
- Engine hanger adapter VSB02C000015

These special tools are available through Honda Tool and Equipment Program, 888-424-6857

1. Remove all of the old liquid gasket from the oil pan mating surfaces, bolts, and bolt holes.
2. Clean, and dry the oil pan mating surfaces.
3. Apply liquid gasket, P/N 08717-0004,08718-0001, 08718-0002,08718-0003, or 08718-0009, evenly to the lower engine block mating surface and to the inside edge of the bolt holes.

NOTE: Do not install components if too much time has passed after applying the liquid gasket (for P/N 08718-0002, no more than 4 minutes, for all others, no more than 5 minutes). Instead, remove the old residue and reapply the liquid gasket.

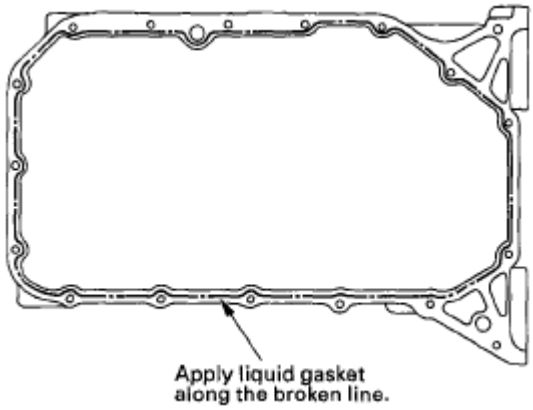

Fig. 139: Identifying Lower Engine Block Mating Surface
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the oil pan.
5. Tighten the bolts in two or three steps. In the final step, tighten all bolts, in sequence, to 12 N.m (1.2 kgf.m, 8.7 lbf.ft). Wipe off the excess liquid gasket on the each side of crankshaft pulley and

flywheel.

NOTE:

- **Wait at least 30 minutes to allow liquid gasket to cure before filling the engine with oil.**
- **Do not run the engine for at least 3 hours to allow liquid gasket to cure after installing the oil pan.**

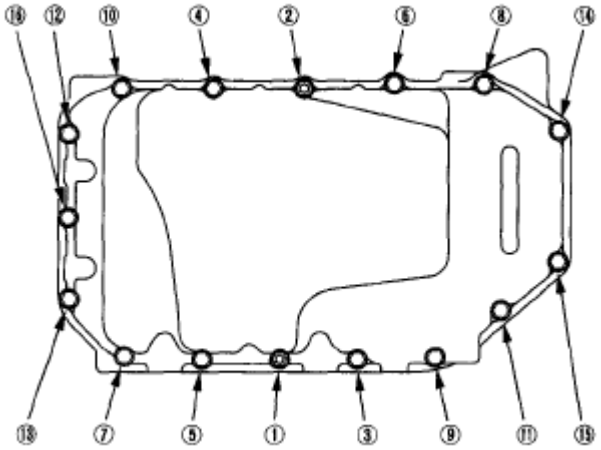

Fig. 140: Identifying Oil Pan Bolt Tightening Sequence
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Install the transmission mounting bolts (A) and clutch cover (B).

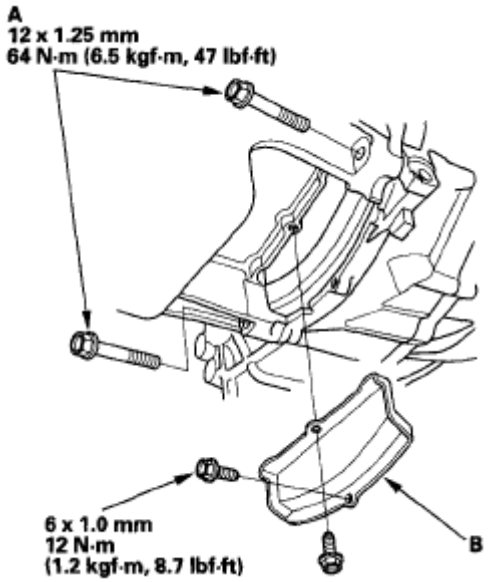

Fig. 141: Identifying Transmission Mounting Bolts And Clutch Cover (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the lower torque rod bracket.

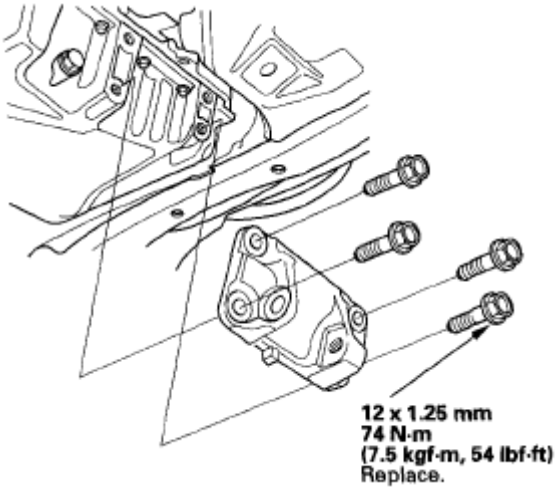

Fig. 142: Identifying Lower Torque Rod Bracket (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. If the engine still in the vehicle, do the following steps.
9. Attach the front subframe adapter (VSB02C000016) to the front subframe, and hang the belt of the front subframe adapter over the front of the subframe. Secure the belt with its stop, then tighten the wing nut (See step 11**ENGINE INSTALLATION**).
10. Line up the slots in the front subframe adapter arms with the bolt holes on the corner of the jack base, tnen securely attach them with four bolts, then lift the front subframe up to the body.
11. Loosely install the new front subframe mounting bolts (see step 13 **ENGINE INSTALLATION**).
12. Align all reference marks on the front subframe with the body, then tighten the bolts on the front subframe to the specified torque (see step 14 on **ENGINE INSTALLATION**).
13. Remove the jack and front subframe adapter.
14. Tighten the new front subframe mid-stiffener mounting bolts on both side (see step 16 on **ENGINE INSTALLATION**).
15. Lower the vehicle on the lift.
16. Loosen the upper torque rod mounting bolt (see step 5 on **ENGINE INSTALLATION**).
17. Raise the vehicle on the lift.
18. Install the lower torque rod, then tighten the new lower torque rod mounting bolts in the numbered sequence shown (see step 17 on **ENGINE INSTALLATION**).
19. Loosely tighten the new front mount mounting bolt (see step 18 on **ENGINE INSTALLATION**).
20. Lower the vehicle on the lift.
21. Remove the engine support hanger A and Reds (AAR-T1256), the 2006 Civic engine hanger (VSB02C000025) and the engine hanger adapter (VSB02C000015).
22. Tighten the upper torque rod mounting bolt (See step 21**ENGINE INSTALLATION**).
23. Raise the vehicle on the lift.
24. Tighten the front mount mounting bolt (see step 23 on **ENGINE INSTALLATION**).
25. Install the stiffener, then tighten the steering gearbox mounting bolt and stiffener mounting bolt. Install the harness clamp from the front subframe (see step 25 on **ENGINE INSTALLATION**).
26. Install the steering gearbox bracket. Install the stiffener, then tighten the steering gearbox mounting bolt and stiffener mounting bolt (see step 27 on **ENGINE INSTALLATION**).

27. Connect the lower arms to the knuckles (see step 5 on **LOWER ARM REMOVAL/INSTALLATION**).
28. Connect the stabilizer links (see **STABILIZER LINK REMOVAL/INSTALLATION**).
29. Install the front wheels.
30. Install the splash shield (see step 35 on **ENGINE INSTALLATION**).
31. Refill the engine with the recommended engine oil.

TRANSMISSION END CRANKSHAFT OIL SEAL INSTALLATION - IN CAR

Special Tools Required

- Driver 07749-0010000
- Oil seal driver attachment 96 07ZAD-PNAA100

1. Remove the transmission (see **TRANSMISSION REMOVAL**).
2. Remove the pressure plate , clutch disc and flywheel (see **PRESSURE PLATE AND CLUTCH DISC REMOVAL (5-SPEED MODEL)**).
3. Clean, and dry the crankshaft oil seal housing.
4. Apply a light coat of multipurpose grease to the crankshaft and to the lip of the seal.
5. Apply a light coat of new engine oil to the crankshaft and to the lip of the crankshaft oil seal.
6. Use the driver and the oil seal driver attachment 96 to drive a new oil seal squarely into the engine block to the specified installed height.

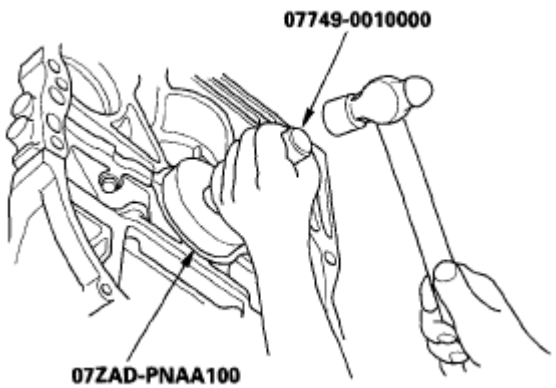

Fig. 143: Identifying Special Tool
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Measure the distance between the engine block (A) and oil seal (B).

   Oil Seal Installed Height: 0.2-1.2 mm (0.001-0.047 in.)

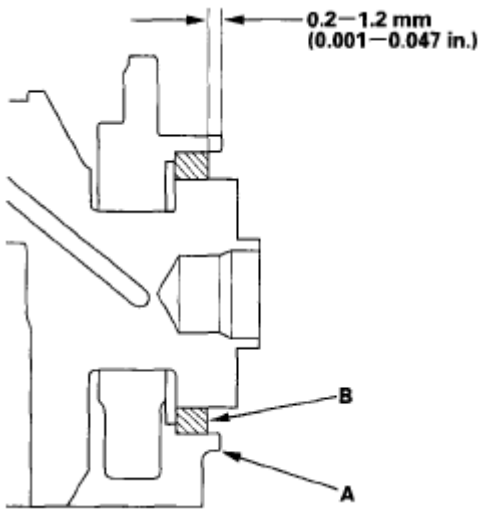

Fig. 144: Identifying Distance Between Engine Block And Oil Seal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Install the flywheel, clutch disc , and pressure plate (see **PRESSURE PLATE AND CLUTCH DISC REMOVAL (6-SPEED MODEL)**).
9. Install the transmission (see **TRANSMISSION INSTALLATION**).

SEALING BOLT AND JOINT PIPE INSTALLATION

NOTE:

- **When installing the sealing bolt, always use a new washer.**
- **When installing the joint pipe, always use a new O-ring.**

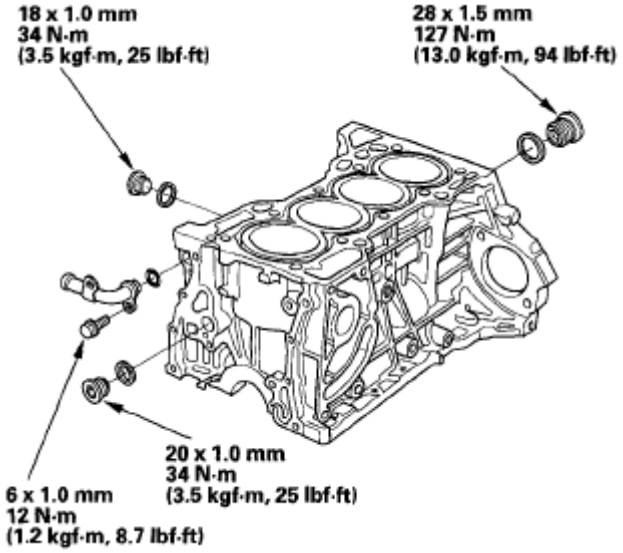

Fig. 145: Identifying Sealing Bolt And Joint Pipe (With Torque Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

DTC TROUBLESHOOTING

DTC P0122: TP SENSOR A CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check TP SENSOR A in the DATA LIST with the HDS.

   Is there about 0.3 V or less?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM.

4. Check for Temporary DTCs or DTCs with the HDS.

   Are DTC P0122 and P0222 indicated at the same time?

   YES - Go to step 10.

   NO - Go to step 5.

5. Turn the ignition switch OFF.
6. Disconnect the throttle body 6P connector.
7. Jump the SCS line with the HDS.
8. Disconnect ECM connector C (44P).
9. Check for continuity between throttle body 6P connector terminal No. 1 and body ground.

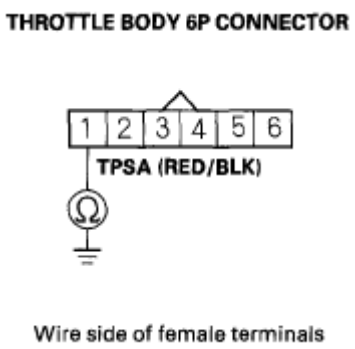

Fig. 2: Checking Continuity Between Throttle Body 6P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the throttle body and the ECM (C20), then go to step 18.

NO - Go to step 23.

10. Measure voltage between throttle body 6P connector terminal No. 2 and body ground.

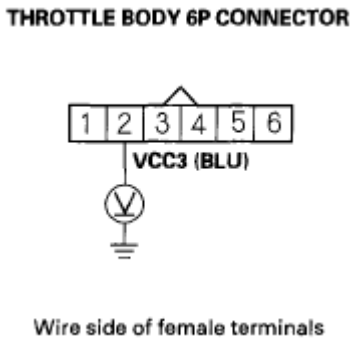

Fig. 3: Measuring Voltage Between Throttle Body 6P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 16.

NO - Go to step 11.

11. Turn the ignition switch OFF.
12. Jump the SCS line with the HDS.
13. Disconnect ECM connector C (44P).
14. Disconnect the throttle body 6P connector.
15. Check for continuity between ECM connector terminal C12 and throttle body 6P connector terminal No. 2.

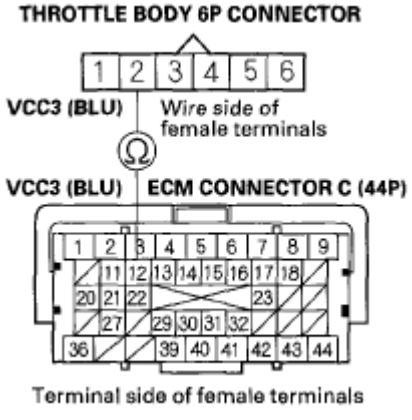

Fig. 4: Checking Continuity Between ECM Terminal C12 And Throttle Body 6P Terminal No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 23.

NO - Repair open in the wire between the throttle body and the ECM (C12), then go to step 18.

16. Turn the ignition switch OFF.
17. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
18. Reconnect all connectors.
19. Turn the ignition switch ON (II).
20. Reset the ECM with the HDS.
21. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
22. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0122 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

23. Reconnect all connectors.
24. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
25. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0122 indicated?

    YES - Check for poor connections or loose terminals at TP sensor A and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P0123: TP SENSOR A CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check TP SENSOR A in the DATA LIST with the HDS.

   Is there about 4.8 V or more?

   YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM.

4. Check for Temporary DTCs or DTCs with the HDS.

   Are DTC P0123 and P0223 indicated at the same time?

   YES - Go to step 13.

   NO - Go to step 5.

5. Turn the ignition switch OFF.
6. Disconnect the throttle body 6P connector.
7. Turn the ignition switch ON (II).
8. Measure voltage between throttle body 6P connector terminal No. 1 and body ground.

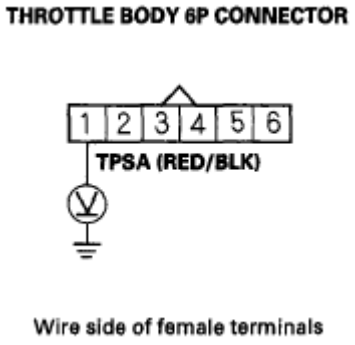

Fig. 5: Measuring Voltage Between Throttle Body 6P Connector Terminal No 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 18.

NO - Go to step 9.

9. Turn the ignition switch OFF.
10. Jump the SCS line with the HDS.
11. Disconnect ECM connector C (44P).
12. Check for continuity between ECM connector terminal C20 and throttle body 6P connector terminal No. 1.

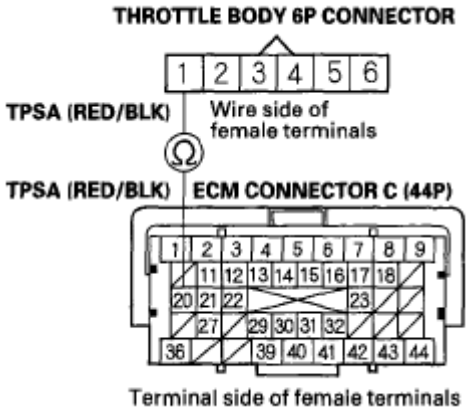

Fig. 6: Checking Continuity Between ECM Terminal C20 And Throttle Body 6P Connector Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the throttle body and the ECM (C20), then go to step 20.

13. Turn the ignition switch OFF.
14. Disconnect the throttle body 6P connector.
15. Jump the SCS line with the HDS.
16. Disconnect ECM connector C (44P).
17. Check for continuity between ECM connector terminal C39 and throttle body 6P connector terminal No. 4.

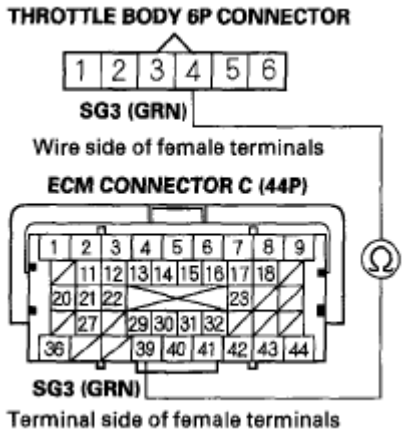

Fig. 7: Checking Continuity Between ECM Terminal C39 And Throttle Body 6P Terminal No. 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the throttle body and the ECM (C39), then go to step 20.

18. Turn the ignition switch OFF.
19. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
20. Reconnect all connectors.
21. Turn the ignition switch ON (II).
22. Reset the ECM with the HDS.
23. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
24. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0123 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

25. Reconnect all connectors.
26. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
27. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0123 indicated?

    YES - Check for poor connections or loose terminals at TP sensor A and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P0222: TP SENSOR B CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check TP SENSOR B in the DATA LIST with the HDS.

   Is there about 0.3 V or less?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals

at the throttle body and the ECM.

4. Check for Temporary DTCs or DTCs with the HDS.

   Are DTC P0122 and P0222 indicated at the same time?

   YES - Go to step 10.

   NO - Go to step 5.

5. Turn the ignition switch OFF.
6. Disconnect the throttle body 6P connector.
7. Jump the SCS line with the HDS.
8. Disconnect ECM connector C (44P).
9. Check for continuity between throttle body 6P connector terminal No. 3 and body ground.

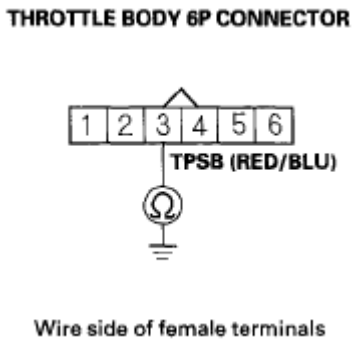

Fig. 8: Checking Continuity Between Throttle Body 6P Connector Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there continuity?

   YES - Repair short in the wire between the throttle body and the ECM (C21), then go to step 18.

   NO - Go to step 23.

10. Measure voltage between throttle body 6P connector terminal No. 2 and body ground.

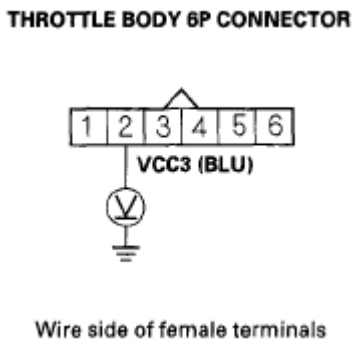

Fig. 9: Measuring Voltage Between Throttle Body 6P Connector Terminal No. 2 And Body

Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 16.

NO - Go to step 11.

11. Turn the ignition switch OFF.
12. Jump the SCS line with the HDS.
13. Disconnect ECM connector C (44P).
14. Disconnect the throttle body 6P connector.
15. Check for continuity between ECM connector terminal C12 and throttle body 6P connector terminal No. 2.

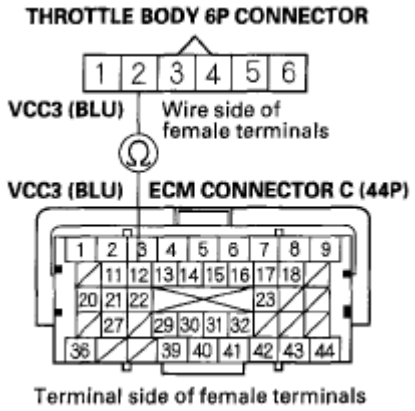

Fig. 10: Checking Continuity Between ECM Terminal C12 And Throttle Body 6P Terminal No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 23.

NO - Repair open in the wire between the throttle body and the ECM (C12), then go to step 18.

16. Turn the ignition switch OFF.
17. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
18. Reconnect all connectors.
19. Turn the ignition switch ON (II).
20. Reset the ECM with the HDS.
21. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
22. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0222 indicated?

YES - Check for poor connections or loose terminals at the throttle body and the ECM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

23. Reconnect all connectors.
24. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
25. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0222 indicated?

    YES - Check for poor connections or loose terminals at TP sensor A and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P0223-.TP SENSOR B CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check TP SENSOR B in the DATA LIST with the HDS.

   Is there about 4.8 V or more?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM.

4. Check for Temporary DTCs or DTCs with the HDS.

   Are DTC P0123 and P0223 indicated at the same time?

   YES - Go to step 13.

   NO - Go to step 5.

5. Turn the ignition switch OFF.
6. Disconnect the throttle body 6P connector.
7. Turn the ignition switch ON (II).

8. Measure voltage between throttle body 6P connector terminal No. 3 and body ground.

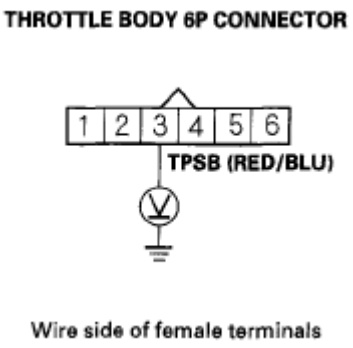

Fig. 11: Measuring Voltage Between Throttle Body 6P Connector Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 18.

NO - Go to step 9.

9. Turn the ignition switch OFF.
10. Jump the SCS line with the HDS.
11. Disconnect ECM connector C (44P).
12. Check for continuity between ECM connector terminal C21 and throttle body 6P connector terminal No. 3.

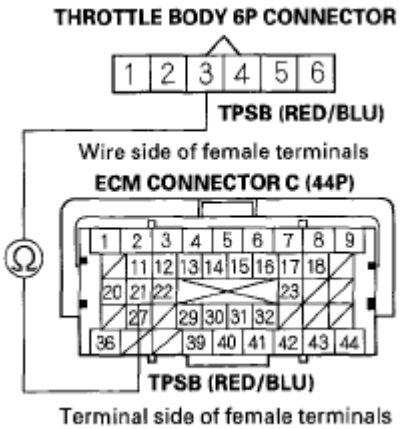

Fig. 12: Checking Continuity Between ECM Terminal C21 And Throttle Body 6P Terminal No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the throttle body and the ECM (C21), then go to step 20.

13. Turn the ignition switch OFF.
14. Disconnect the throttle body 6P connector.
15. Jump the SCS line with the HDS.
16. Disconnect ECM connector C (44P).
17. Check for continuity between ECM connector terminal C39 and throttle body 6P connector terminal No. 4.

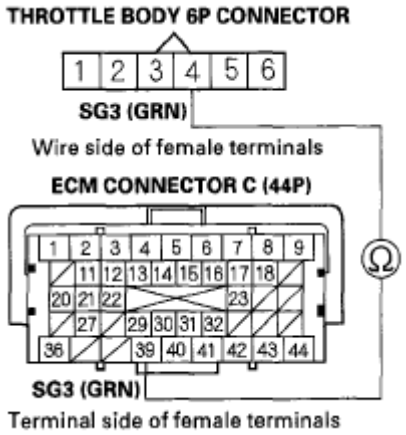

Fig. 13: Checking Continuity Between ECM Terminal C39 And Throttle Body 6P Connector Terminal No. 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the throttle body and the ECM (C39), then go to step 20.

18. Turn the ignition switch OFF.
19. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
20. Reconnect all connectors.
21. Turn the ignition switch ON (II).
22. Reset the ECM with the HDS.
23. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
24. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0223 indicated?

YES - Check for poor connections or loose terminals at the throttle body and the ECM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

25. Reconnect all connectors.
26. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
27. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0223 indicated?

    YES - Check for poor connections or loose terminals at TP sensor Band the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P1658: ELECTRONIC THROTTLE CONTROL SYSTEM (ETCS) CONTROL RELAY ON MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Do the ETCS TEST in the INSPECTION MENU with the HDS.

    Is the RELAY circuit OK?

    YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the ETCS control relay and the ECM.

    NO - Go to step 3.

3. Turn the ignition switch OFF.
4. Remove the ETCS control relay (F) from the under-hood fuse/relay box.

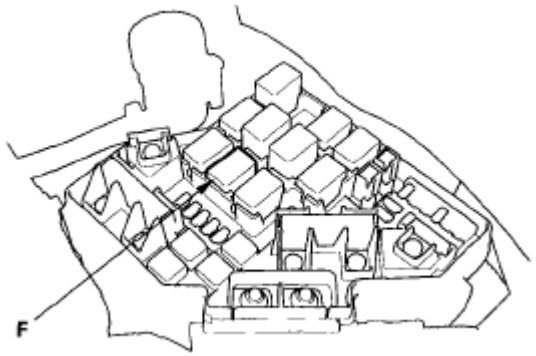

Fig. 14: Identifying ETCS Control Relay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Test the ETCS control relay (see **POWER RELAY TEST**).

   Is the ETCS control relay OK?

   YES - Go to step 6.

   NO - Replace the ETCS control relay, then go to step 13.

6. Jump the SCS line with the HDS.
7. Disconnect ECM connector A (44P).
8. Check for continuity between ECM connector terminal A20 and body ground.

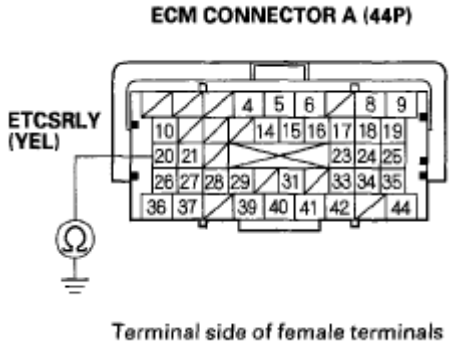

Fig. 15: Checking Continuity Between ECM Connector Terminal A20 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there continuity?

   YES - Repair short in the wire between the ECM (A20) and the ETCS control relay, then go to step 13.

   NO - Go to step 9.

9. Disconnect ECM connector C (44P).
10. Turn the ignition switch ON (II).
11. Measure voltage between ECM connector terminal C1 and body ground.

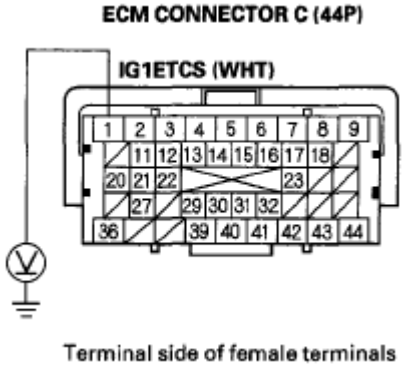

Fig. 16: Measuring Voltage Between ECM Connector Terminal C1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Repair short to power in the wire between the ECM (C1) and the ETCS control relay, then go to step 12.

NO - Go to step 18.

12. Turn the ignition switch OFF.
13. Reconnect all connectors.
14. Turn the ignition switch ON (II).
15. Reset the ECM with the HDS.
16. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
17. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P1658 indicated?

YES - Check for poor connections or loose terminals at the ETCS control relay and the ECM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

18. Turn the ignition switch OFF.
19. Reconnect all connectors.
20. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
21. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P1658 indicated?

YES - Check for poor connections or loose terminals at the ETCS control relay and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P1659: ELECTRONIC THROTTLE CONTROL SYSTEM (ETCS) CONTROL RELAY OFF MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P1659 indicated?

YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the ETCS control relay and the ECM.

4. Turn the ignition switch OFF.
5. Check the No. 21 DBW (THROTTLE ACTUATOR CONTROL) (15 A) fuse in the under-hood fuse/relay box.

   Is the fuse OK?

   YES - Go to step 6.

   NO - Go to step 17.

6. Remove the ETCS control relay (F) from the under-hood fuse/relay box.

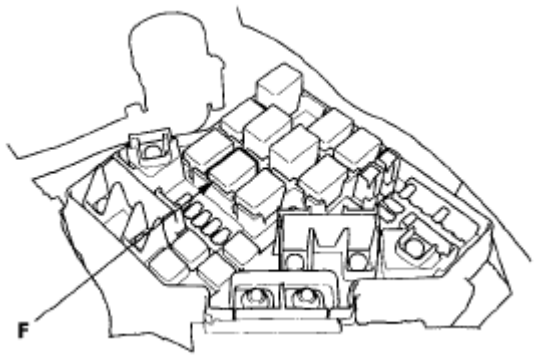

Fig. 17: Identifying ETCS Control Relay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Test the ETCS control relay (see **POWER RELAY TEST**).

   Is the ETCS control relay OK?

   YES - Go to step 8.

   NO - Replace the ETCS control relay, then go to step 23.

8. Turn the ignition switch ON (II).
9. Measure voltage between ETCS control relay 4P connector terminal No. 4 and body ground.

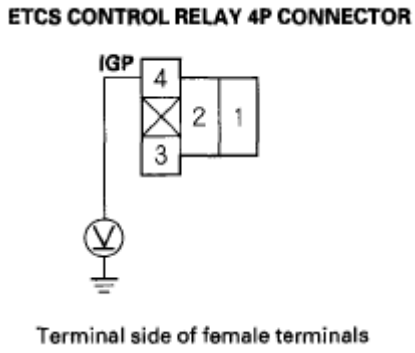

Fig. 18: Measuring Voltage Between ETCS Control Relay 4P Connector Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 10.

NO - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**), then go to step 22.

10. Measure voltage between ETCS control relay 4P connector terminal No. 1 and body ground.

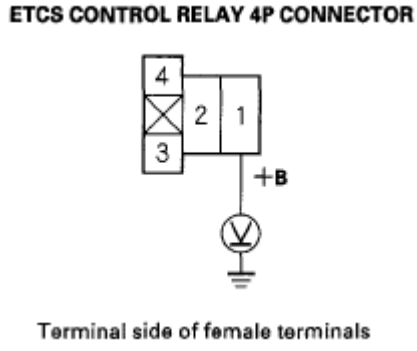

Fig. 19: Measuring Voltage Between ETCS Control Relay 4P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 11.

NO - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**), then go to step 22.

11. Turn the ignition switch OFF.
12. Jump the SCS line with the HDS.
13. Disconnect ECM connector C (44P).
14. Check for continuity between ETCS control relay 4P connector terminal No. 2 and ECM connector terminal C1.

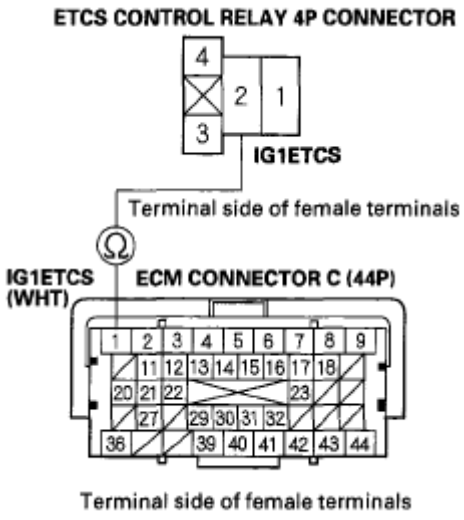

Fig. 20: Checking Continuity Between ETCS Control Relay 4P Terminal No 2 And ECM Terminal C1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 15.

NO - Repair open in the wire between the ECM (CD and the ETCS control relay, then go to step 23.

15. Disconnect ECM connector A (44P).
16. Check for continuity between ETCS control relay 4P connector terminal No. 3 and ECM connector terminal A20.

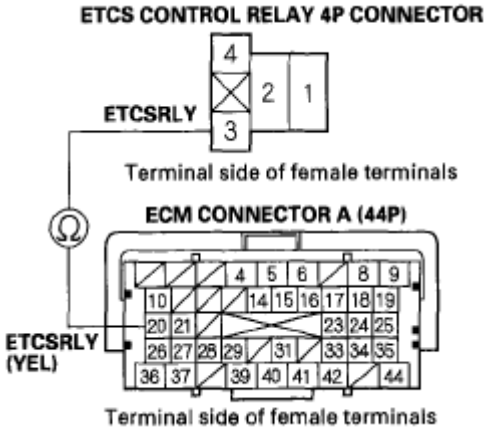

Fig. 21: Checking Continuity Between ETCS Control Relay 4P Terminal No. 3 And ECM Terminal A20
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 28.

NO - Repair open in the wire between the ECM (A20) and the ETCS control relay, then go to step 23.

17. Remove the ETCS control relay (F) from the understood fuse/relay box.

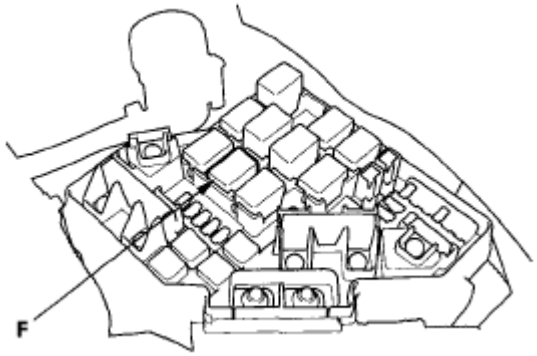

Fig. 22: Identifying ETCS Control Relay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

18. Jump the SCS line with the HDS.
19. Disconnect ECM connector C (44P).
20. Check for continuity between ECM connector terminal C1 and body ground.

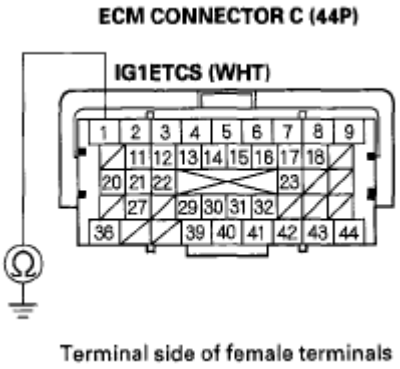

Fig. 23: Checking Continuity Between ECM Connector Terminal C1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM (C1) and the ETCS control relay, then go to step 23.

NO - Go to step 21.

21. Check for continuity between ETCS control relay 4P connector terminal No. 1 and body ground.

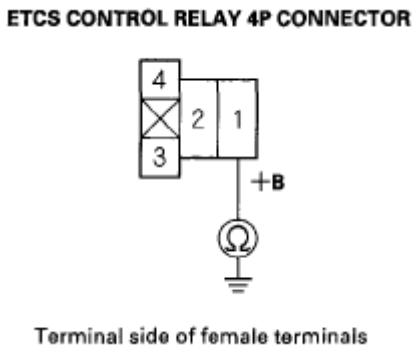

Fig. 24: Checking Continuity Between ETCS Control Relay 4P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**), then go to step 23.

NO - Go to step 28.

22. Turn the ignition switch OFF.
23. Reconnect all connectors.
24. Turn the ignition switch ON (II).
25. Reset the ECM with the HDS.
26. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
27. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1659 indicated?

    YES - Check for poor connections or loose terminals at the ETCS control relay and the ECM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

28. Reconnect all connectors.
29. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
30. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1659 indicated?

    YES - Check for poor connections or loose terminals at the ETCS control relay and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the

original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P1683: THROTTLE VALVE DEFAULT POSITION SPRING PERFORMANCE PROBLEM

CAUTION: Do not insert your fingers into the installed throttle body when you turn the ignition switch ON (II) or while the ignition switch is ON (II). If you do, you will seriously injure your fingers if the throttle valve is activated.

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
4. Turn the ignition switch OFF, and wait 10 seconds.
5. Turn the ignition switch ON (II).
6. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P1683 indicated?

   YES - Go to step 7.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM.

7. Turn the ignition switch OFF.
8. Disconnect the air intake duct from the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
9. Push the throttle valve closed as shown.

Fig. 25: Pushing Throttle Valve To Close Position
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Release the throttle valve.

    Does the throttle valve return?

    YES - Clean the throttle body (see **THROTTLE BODY CLEANING**), then go to step 12 and recheck. If DTC P1683 is indicated, go to step 11.

    NO - Go to step 11.

11. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
12. Turn the ignition switch ON (II).
13. Reset the ECM with the HDS.
14. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
15. Turn the ignition switch OFF, and wait 10 seconds.
16. Turn the ignition switch ON (II).
17. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1683 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P1684: THROTTLE VALVE RETURN SPRING PERFORMANCE PROBLEM

CAUTION: Do not insert your fingers into the installed throttle body when you turn the ignition switch ON (II) or while the ignition switch is ON (II). If you do, you will seriously injure your fingers if the throttle valve is activated.

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
4. Turn the ignition switch OFF, and wait 10 seconds.
5. Turn the ignition switch ON (II).
6. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P1684 indicated?

   YES - Go to step 7.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM.

7. Turn the ignition switch OFF.
8. Disconnect the air intake duct from the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
9. Push the throttle valve open as shown.

Fig. 26: Pushing Throttle Valve To Open Position
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Release the throttle valve.

    Does the throttle valve return?

    YES - Clean the throttle body (see **THROTTLE BODY CLEANING**), then go to step 12 and recheck. If DTC P1684 is indicated, go to step 11.

    NO - Go to step 11.

11. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
12. Turn the ignition switch ON (II).
13. Reset the ECM with the HDS.
14. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
15. Turn the ignition switch OFF, and wait 10 seconds.
16. Turn the ignition switch ON (II).
17. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1684 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P2101: ELECTRONIC THROTTLE CONTROL SYSTEM (ETCS) MALFUNCTION

CAUTION: Do not insert your fingers into the installed throttle body when you turn the ignition switch ON (II) or while the ignition switch is ON (II). If you do, you will seriously injure your fingers if the throttle valve is activated.

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Do the ETCS TEST in the INSPECTION MENU with the HDS.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2101 indicated?

   YES - Go to step 7.

   NO - Go to step 5.

5. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
   - ENGINE SPEED
   - VSS
   - APP SENSOR
6. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2101 indicated?

   YES - Go to step 7.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM, then clean the throttle body (see **THROTTLE BODY CLEANING**).

7. Turn the ignition switch OFF.
8. Disconnect the air intake duct from the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
9. Turn the ignition switch ON (II).
10. Clear the DTC with the HDS.
11. Do the ETCS TEST in the INSPECTION MENU with the HDS.
12. Visually check the throttle valve operation.

    Does the throttle valve operate smoothly?

    YES - Clean the throttle body (see **THROTTLE BODY CLEANING**), then go to step 22 and recheck. If DTC P2101 is indicated, go to step 19.

NO - Go to step 13.

13. Turn the ignition switch OFF.
14. Disconnect the throttle body 6P connector.
15. Jump the SCS line with the HDS.
16. Disconnect ECM connector C (44P).
17. Connect throttle body 6P connector terminals No. 5 and No. 6 with a jumper wire.

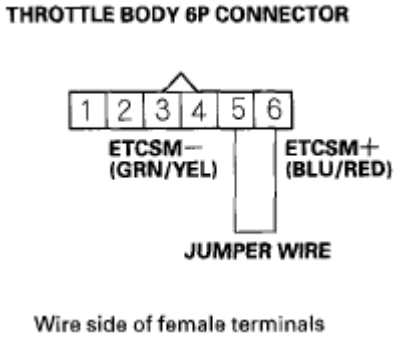

Fig. 27: Connecting Throttle Body 6P Connector Terminals No. 5 And 6 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

18. Check for continuity between ECM connector terminals C3 and C4.

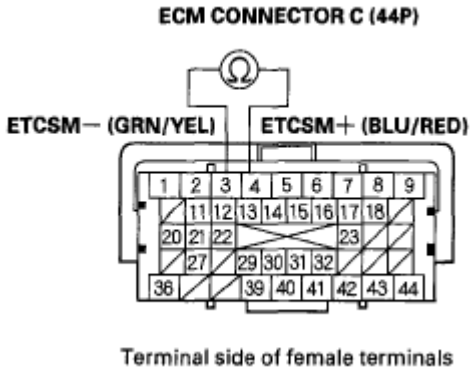

Fig. 28: Checking Continuity Between ECM Connector Terminals C3 And C4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 27.

NO - Repair open in the wires between the throttle body and the ECM (C3, C4), then go to step 21.

19. Turn the ignition switch OFF.
20. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
21. Reconnect all connectors.
22. Turn the ignition switch ON (II).
23. Reset the ECM with the HDS.

24. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
25. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VSS
    - APP SENSOR A
26. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2101 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM, then clean the throttle body (see **THROTTLE BODY CLEANING**), and go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

27. Reconnect all connectors.
28. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
29. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VSS
    - APP SENSOR A
30. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2101 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 29. If the ECM was substituted, go to step 1.

    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P2118: THROTTLE ACTUATOR CURRENT RANGE/PERFORMANCE PROBLEM

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Jump the SCS line with the HDS.
2. Disconnect ECM connector C (44P).
3. Measure resistance between ECM connector terminals C3 and C4.

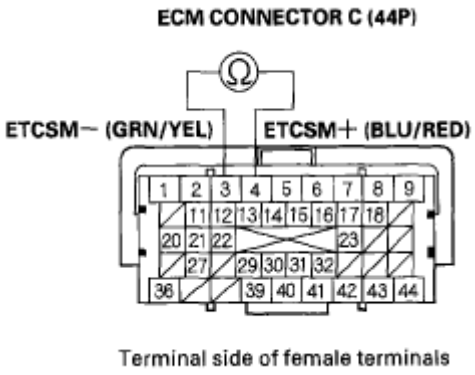

Fig. 29: Measuring Resistance Between ECM Connector Terminals C3 And C4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 1.0 ohms or less?

YES - Go to step 4.

NO - Go to step 15.

4. Disconnect the throttle body 6P connector.
5. At the throttle body side, measure resistance between throttle body 6P connector terminals No. 5 and No. 6 with the throttle fully closed.

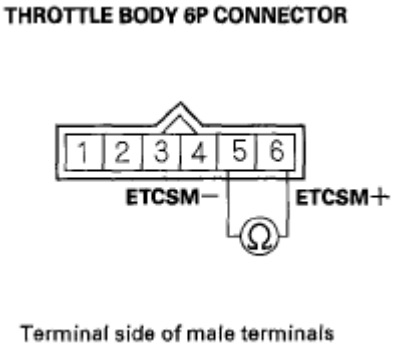

Fig. 30: Measuring Resistance Between Throttle Body 6P Connector Terminals No. 5 And 6
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 1.0 ohms, or less?

YES - Go to step 6.

NO - Repair short in the wires between the ECM C3 (ETCSM-line) and C4 (ETCSM+ line), then go to step 7.

6. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
7. Reconnect all connectors.
8. Turn the ignition switch ON (II).
9. Reset the ECM with the HDS.
10. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).

11. Turn the ignition switch OFF.
12. Turn the ignition switch ON (II).
13. Slowly press the accelerator pedal to the floor.
14. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2118 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

15. Reconnect all connectors.
16. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
17. Turn the ignition switch OFF.
18. Turn the ignition switch ON (II).
19. Slowly press the accelerator pedal to the floor.
20. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2118 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 17. If the ECM was substituted, go to step 1.

    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P2122: APP SENSOR A (THROTTLE POSITION SENSOR D) CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check APP SENSOR A in the DATA LIST with the HDS.

   Is there about 0.2 V or less?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at APP sensor A and the ECM.

3. Turn the ignition switch OFF.

4. Disconnect the APP sensor 6P connector.
5. Turn the ignition switch ON (II).
6. Measure voltage between APP sensor 6P connector terminals No. 2 and No. 3.

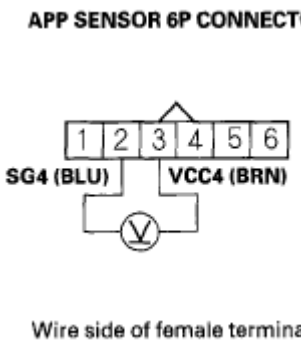

Fig. 31: Measuring Voltage Between APP Sensor 6P Connector Terminals No. 2 And 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 7.

NO - Go to step 17.

7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Disconnect ECM connector A (44P).
10. Check for continuity between APP sensor 6P connector terminal No. 1 and body ground.

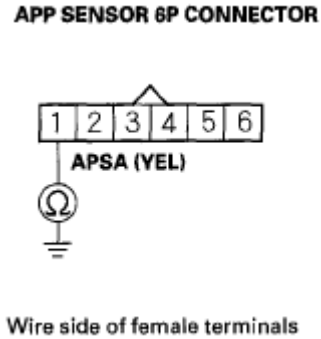

Fig. 32: Checking Continuity Between APP Sensor 6P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM (A17) and APP sensor A, then go to step 24.

NO - Go to step 11.

11. Connect APP sensor 6P connector terminal No. 1 to body ground with a jumper wire.

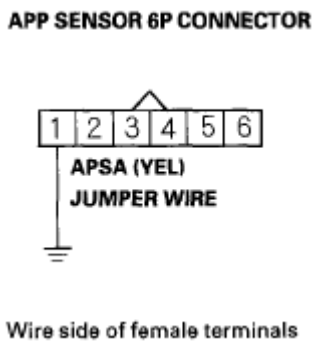

Fig. 33: Connecting APP Sensor 6P Connector Terminal No. 1 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Check for continuity between ECM connector terminal A17 and body ground.

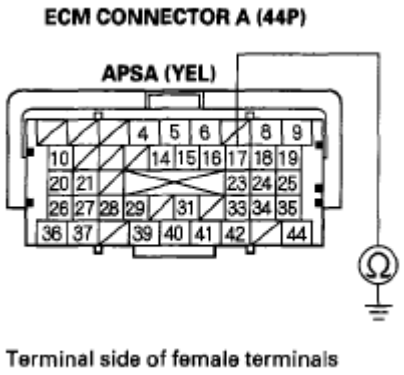

Fig. 34: Checking Continuity Between ECM Connector Terminal A17 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 13.

NO - Repair open in the wire between the ECM (A17) and APP sensor A, then go to step 24.

13. Reconnect ECM connector A (44P).
14. Connect APP sensor 6P connector terminals No. 1 and No. 3 with a jumper wire.

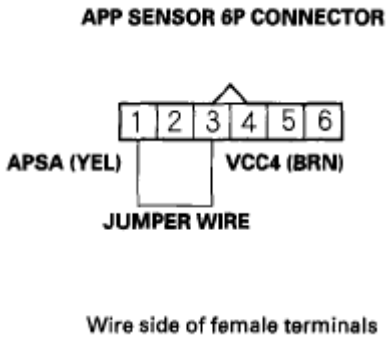

Fig. 35: Connecting APP Sensor 6P Connector Terminals No. 1 And 3 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Turn the ignition switch ON (II).
16. Check APP SENSOR A in the DATA LIST with the HDS.

    Is there about 0.2 V or less?

    YES - Go to step 29.

    NO - Go to step 22.

17. Turn the ignition switch OFF.
18. Jump the SCS line with the HDS.
19. Disconnect ECM connector A (44P).
20. Connect APP sensor 6P connector terminal No. 3 to body ground with a jumper wire.

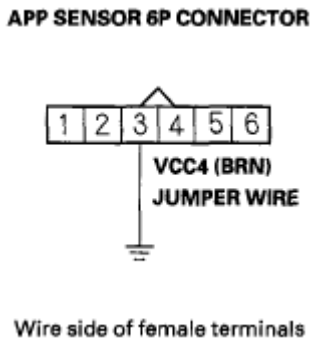

Fig. 36: Connecting APP Sensor 6P Connector Terminal No. 3 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Check for continuity between ECM connector terminal A25 and body ground.

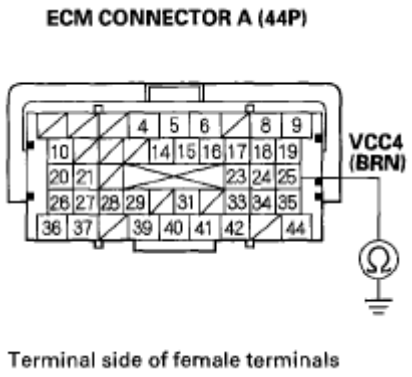

Fig. 37: Checking Continuity Between ECM Connector Terminal A25 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 30.

NO - Repair open in the wire between the ECM (A25) and APP sensor A, then go to step 24.

22. Turn the ignition switch OFF.
23. Replace the accelerator pedal module (see **ACCELERATOR PEDAL MODULE REMOVAL/INSTALLATION**).
24. Reconnect all connectors.
25. Turn the ignition switch ON (II).
26. Reset the ECM with the HDS.
27. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
28. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2122 indicated?

    YES - Check for poor connections or loose terminals at APP sensor A and the ECM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

29. Turn the ignition switch OFF.
30. Reconnect all connectors.
31. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
32. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2122 indicated?

    YES - Check for poor connections or loose terminals at APP sensor A and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P2123: APP SENSOR A (THROTTLE POSITION SENSOR D) CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check APP SENSOR A in the DATA LIST with the HDS.

   Is there about 4.9 V or more?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at APP sensor A and the ECM.

3. Turn the ignition switch OFF.
4. Disconnect the APP sensor 6P connector.
5. Turn the ignition switch ON (II).
6. Measure voltage between APP sensor 6P connector terminals No. 2 and No. 3.

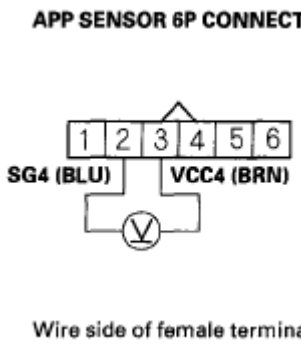

Fig. 38: Measuring Voltage Between APP Sensor 6P Connector Terminals No. 2 And 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 12.

NO - Go to step 7.

7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Disconnect ECM connector A (44P).
10. Connect APP sensor 6P connector terminal No. 2 to body ground with a jumper wire.

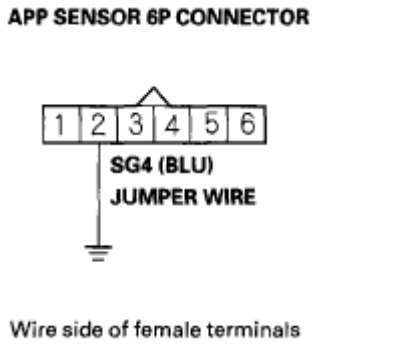

Fig. 39: Connecting APP Sensor 6P Connector Terminal No. 2 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Check for continuity between ECM connector terminal A35 and body ground.

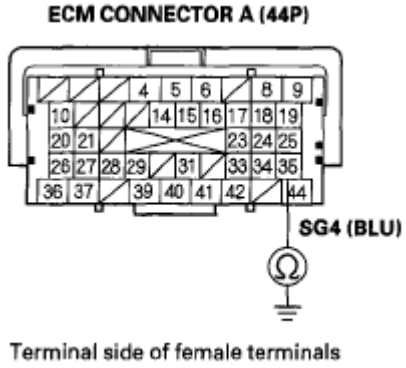

Fig. 40: Checking Continuity Between ECM Connector Terminal A35 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 19.

NO - Repair open in the wire between the ECM (A35) and APP sensor A, then go to step 14.

12. Turn the ignition switch OFF.
13. Replace the accelerator pedal module (see **ACCELERATOR PEDAL MODULE REMOVAL/INSTALLATION**).
14. Reconnect all connectors.
15. Turn the ignition switch ON (II).
16. Reset the ECM with the HDS.
17. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
18. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P2123 indicated?

YES - Check for poor connections or loose terminals at APP sensor A and the ECM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

19. Reconnect all connectors.
20. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
21. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2123 indicated?

    YES - Check for poor connections or loose terminals at APP sensor A and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P2127: APP SENSOR B (THROTTLE POSITION SENSOR E) CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check APP SENSOR B in the DATA LIST with the HDS.

   Is there about 0.2 V or less?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at APP sensor B and the ECM.

3. Turn the ignition switch OFF.
4. Disconnect the APP sensor 6P connector.
5. Turn the ignition switch ON (II).
6. Measure voltage between APP sensor 6P connector terminals No. 5 and No. 6.

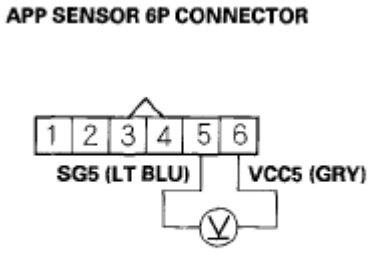

Fig. 41: Measuring Voltage Between APP Sensor 6P Connector Terminals No. 5 And 6
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 7.

NO - Go to step 17.

7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Disconnect ECM connector A (44P).
10. Check for continuity between APP sensor 6P connector terminal No. 4 and body ground.

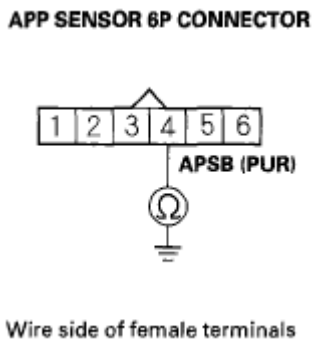

Fig. 42: Checking Continuity Between APP Sensor 6P Connector Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM (A18) and APP sensor B, then go to step 24.

NO - Go to step 11.

11. Connect APP sensor 6P connector terminal No. 4 to body ground with a jumper wire.

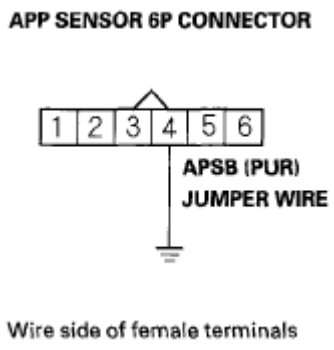

Fig. 43: Connecting APP Sensor 6P Connector Terminal No. 4 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Check for continuity between ECM connector terminal A18 and body ground.

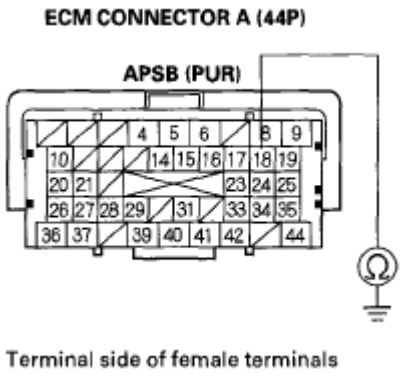

Fig. 44: Checking Continuity Between ECM Connector Terminal A18 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 13.

NO - Repair open in the wire between the ECM (A18) and APP sensor B, then go to step 24.

13. Reconnect ECM connector A (44P).
14. Connect APP sensor 6P connector terminals No. 4 and No. 6 with a jumper wire.

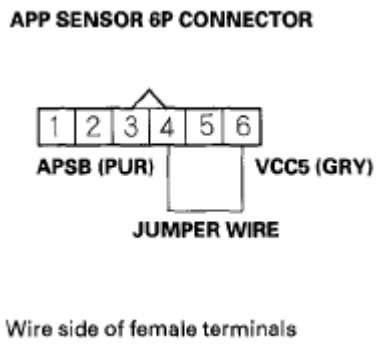

Fig. 45: Connecting APP Sensor 6P Connector Terminals No. 4 And 6 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Turn the ignition switch ON (II).
16. Check APP SENSOR B in the DATA LIST with the HDS.

Is there about 0.2 V or less?

YES - Go to step 29.

NO - Go to step 22.

17. Turn the ignition switch OFF.
18. Jump the SCS line with the HDS.

19. Disconnect ECM connector A (44P).
20. Connect APP sensor 6P connector terminal No. 6 to body ground with a jumper wire.

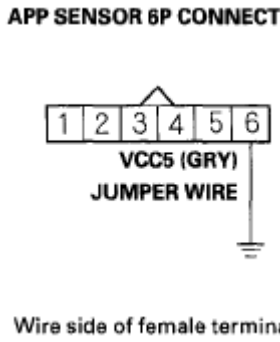

Fig. 46: Connecting APP Sensor 6P Connector Terminal No. 6 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Check for continuity between ECM connector terminal A24 and body ground.

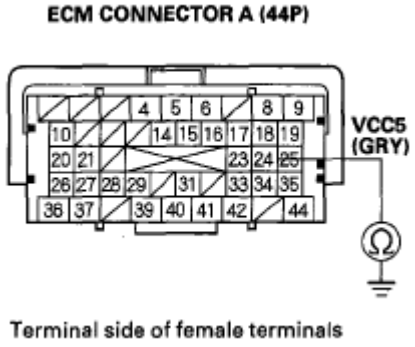

Fig. 47: Checking Continuity Between ECM Connector Terminal A24 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 30.

NO - Repair open in the wire between the ECM (A24) and APP sensor B, then go to step 24.

22. Turn the ignition switch OFF.
23. Replace the accelerator pedal module (see **ACCELERATOR PEDAL MODULE REMOVAL/INSTALLATION**).
24. Reconnect all connectors.
25. Turn the ignition switch ON (II).
26. Reset the ECM with the HDS.
27. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
28. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P2127 indicated?

YES - Check for poor connections or loose terminals at APP sensor B and the ECM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

29. Turn the ignition switch OFF.
30. Reconnect all connectors.
31. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
32. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P2127 indicated?

YES - Check for poor connections or loose terminals at APP sensor B and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P2128: APP SENSOR B (THROTTLE POSITION SENSOR E) CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check APP SENSOR B in the DATA LIST with the HDS.

Is there about 4.9 V or more?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at APP sensor Band the ECM.

3. Turn the ignition switch OFF.
4. Disconnect the APP sensor 6P connector.
5. Turn the ignition switch ON (II).
6. Measure voltage between APP sensor 6P connector terminals No. 5 and No. 6.

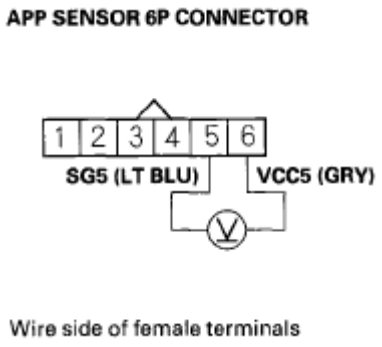

Fig. 48: Measuring Voltage Between APP Sensor 6P Connector Terminals No. 5 And 6
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 12.

NO - Go to step 7.

7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Disconnect ECM connector A (44P).
10. Connect APP sensor 6P connector terminal No. 5 to body ground with a jumper wire.

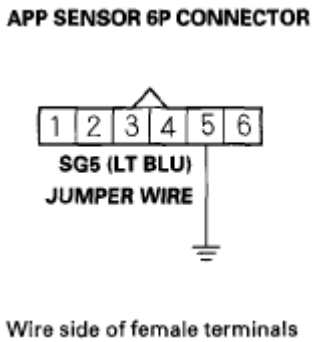

Fig. 49: Connecting APP Sensor 6P Connector Terminal No. 5 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Check for continuity between ECM connector terminal A34 and body ground.

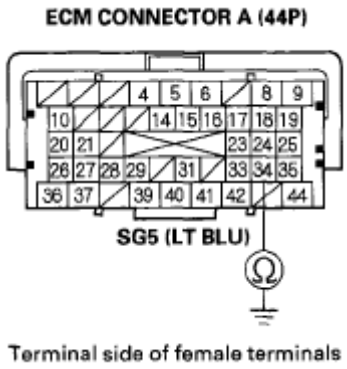

Fig. 50: Checking Continuity Between ECM Connector Terminal A34 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 19.

NO - Repair open in the wire between the ECM (A34) and APP sensor B, then go to step 14.

12. Turn the ignition switch OFF.
13. Replace the accelerator pedal module (see **ACCELERATOR PEDAL MODULE REMOVAL/INSTALLATION**).
14. Reconnect all connectors.
15. Turn the ignition switch ON (II).
16. Reset the ECM with the HDS.
17. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
18. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2128 indicated?

    YES - Check for poor connections or loose terminals at APP sensor B and the ECM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

19. Reconnect all connectors.
20. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
21. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2128 indicated?

    YES - Check for poor connections or loose terminals at APP sensor B and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the

original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P2135: TP SENSOR A/B INCORRECT VOLTAGE CORRELATION

CAUTION: Do not insert your fingers into the installed throttle body when you turn the ignition switch ON (II) or while the ignition switch is ON (II). If you do, you will seriously injure your fingers if the throttle valve is activated.

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Do the ETCS TEST in the INSPECTION MENU with the HDS.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2135 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM.

5. Turn the ignition switch OFF.
6. Disconnect the air intake duct from the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
7. Turn the ignition switch ON (II).
8. Visually check the throttle valve operation while you clear the DTC with the HDS.

   Does the valve temporarily move to its fully closed position?

   YES - Go to step 15.

   NO - Go to step 9.

9. Turn the ignition switch OFF.
10. Jump the SCS line with the HDS.
11. Disconnect ECM connector C (44P).
12. Check for continuity between ECM connector terminals C20 and C21.

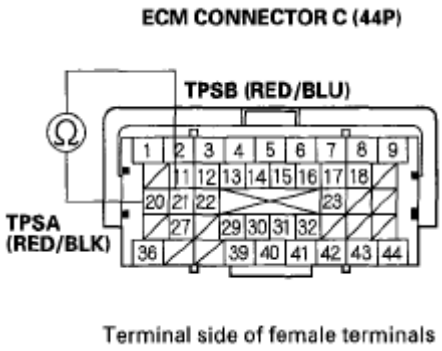

Fig. 51: Checking Continuity Between ECM Connector Terminals C20 And C21
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 13.

NO - Go to step 22.

13. Disconnect the throttle body 6P connector.
14. Check for continuity between ECM connector terminals C20 and C21.

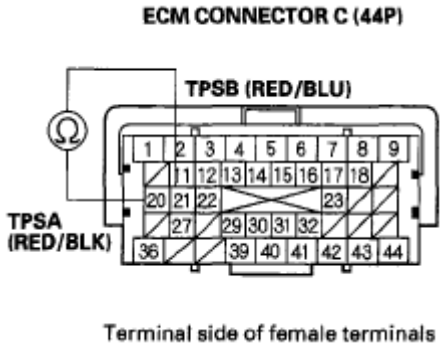

Fig. 52: Checking Continuity Between ECM Connector Terminals C20 And C21
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wires between the ECM C20 (TPSA line) and the C21 (TPSB line), then go to step 17.

NO - Go to step 15.

15. Turn the ignition switch OFF.
16. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
17. Reconnect all connectors.
18. Turn the ignition switch ON (II).
19. Reset the ECM with the HDS.
20. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).

21. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2135 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

22. Reconnect all connectors.
23. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
24. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2135 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P2138: APP SENSOR A/B (THROTTLE POSITION SENSOR D/E) INCORRECT VOLTAGE CORRELATION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with HDS.
3. Press the accelerator pedal to the floor.
4. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2138 indicated?

    YES - Go to step 5.

    NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the APP sensor and the ECM.

5. Check APP SENSOR A and APP SENSOR B in the DATA LIST with the HDS.

    Are they the same voltage?

    YES - Go to step 6.

NO - Go to step 12.

6. Turn the ignition switch OFF.
7. Jump the SCS line with the HDS.
8. Disconnect ECM connector A (44P).
9. Check for continuity between ECM connector terminals A17 and A18.

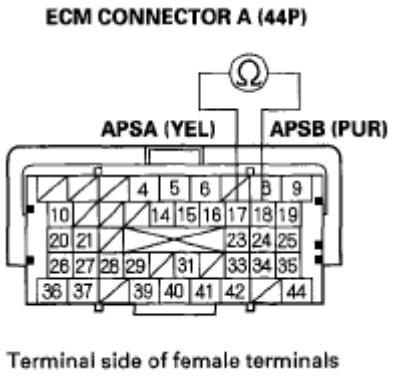

Fig. 53: Checking Continuity Between ECM Connector Terminals A17 And A18
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Go to step 22.

10. Disconnect the APP sensor 6P connector.
11. Check for continuity between ECM connector terminals A17 and A18.

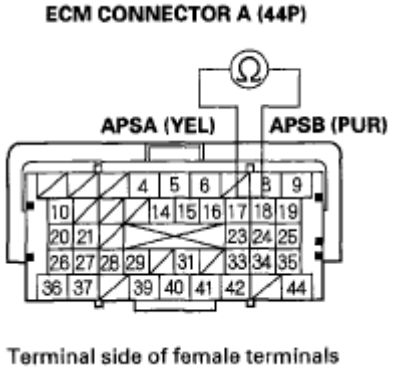

Fig. 54: Checking Continuity Between ECM Connector Terminals A17 And A18
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wires between ECM connector terminals A17 (APSA line) and A18 (APSB line), then go to step 14.

NO - Go to step 13.

12. Turn the ignition switch OFF.
13. Replace the accelerator pedal module (see **ACCELERATOR PEDAL MODULE REMOVAL/INSTALLATION**).
14. Reconnect all connectors.
15. Turn the ignition switch ON (II).
16. Reset the ECM with the HDS.
17. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
18. Turn the ignition switch OFF.
19. Turn the ignition switch ON (II).
20. Press the accelerator pedal to the floor.
21. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P2138 indicated?

YES - Check for poor connections or loose terminals at the APP sensor and the ECM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

22. Reconnect all connectors.
23. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
24. Turn the ignition switch OFF.
25. Turn the ignition switch ON (II).
26. Press the accelerator pedal to the floor.
27. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P2138 indicated?

YES - Check for poor connections or loose terminals at APP sensor A/B and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 24. If the ECM was substituted, go to step 1.

NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P2176: THROTTLE ACTUATOR CONTROL SYSTEM IDLE POSITION NOT LEARNED

CAUTION: Do not insert your fingers into the installed throttle body when you turn the ignition switch ON (II) or while the ignition switch is ON (II). If you do, you will seriously injure your fingers if the throttle valve is activated.

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P2135 is stored at the same time as DTC P2176, troubleshoot DTC P2135 first, then recheck for DTC P2176.**

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch OFF.
4. Turn the ignition switch ON (II), and wait 10 seconds.
5. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2176 indicated?

   YES - Go to step 6.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM, then clean the throttle body (see **THROTTLE BODY CLEANING**).

6. Turn the ignition switch OFF.
7. Disconnect the air intake duct from the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
8. Turn the ignition switch ON (II).
9. Clear the DTC with the HDS.
10. Visually check the throttle valve operation while performing the ETCS TEST in the INSPECTION MENU with the HDS.

    Does the throttle valve move to its fully closed position?

    YES - Go to step 11.

    NO - Go to step 12.

11. Check for sludge or carbon on the throttle valve.

    Is there sludge or carbon on the throttle valve?

    YES - Clean the throttle body (see **THROTTLE BODY CLEANING**), then go to step 21 and recheck.

    NO - Go to step 18.

12. Turn the ignition switch OFF.
13. Disconnect the throttle body 6P connector.
14. Jump the SCS line with the HDS.
15. Disconnect ECM connector C (44P).

16. Connect throttle body 6P connector terminals No. 5 and No. 6 with a jumper wire.

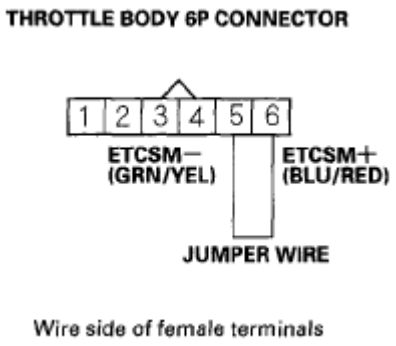

Fig. 55: Connecting Throttle Body 6P Connector Terminals No. 5 And 6 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Check for continuity between ECM connector terminals C3 and C4.

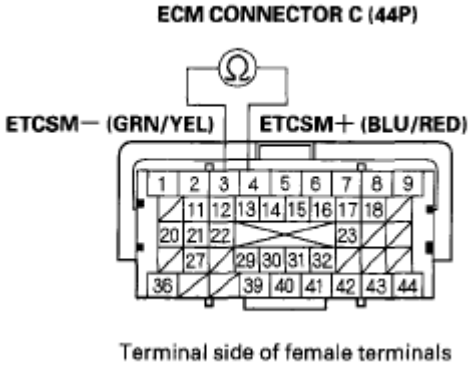

Fig. 56: Checking Continuity Between ECM Connector Terminals C3 And C4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 27.

NO - Repair open in the wires between the throttle body and the ECM (C3, C4), then go to step 20.

18. Turn the ignition switch OFF.
19. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
20. Reconnect all connectors.
21. Turn the ignition switch ON (II).
22. Reset the ECM with the HDS.
23. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
24. Turn the ignition switch OFF.
25. Turn the ignition switch ON (II), and wait 10 seconds.
26. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P2176 indicated?

YES - Check for poor connections or loose terminals at the throttle body and the ECM, then clean the throttle body (see **THROTTLE BODY CLEANING**), and go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

27. Reconnect all connectors.
28. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
29. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P2176 indicated?

YES - Check for poor connections or loose terminals at the throttle body and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

APP SENSOR SIGNAL INSPECTION

NOTE:

- **This procedure checks the APP sensor in its fully closed position. In any other position, the APP sensor stores DTCs which are covered in other troubleshooting procedures.**
- **Check for Temporary DTCs or DTCs with the HDS before doing this procedure. If any DTCs are indicated, troubleshoot them first, then do this procedure.**
- **Press the accelerator pedal several times, to check its operation. If it does not operate smoothly, check the pedal. If you find a problem, replace the accelerator pedal module (see ACCELERATOR PEDAL MODULE REMOVAL/INSTALLATION).**

1. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

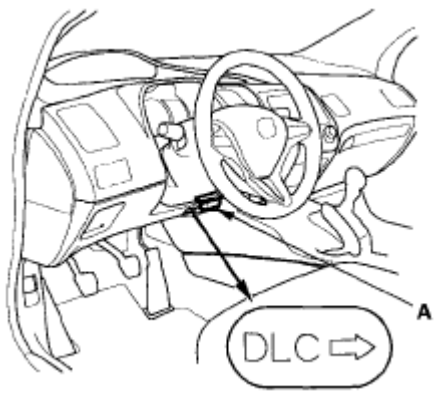

Fig. 57: Connecting HDS To DLC
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch ON (II).
3. Make sure the HDS communicates with the ECM. If it doesn't, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Make sure the accelerator pedal is not pressed, then check the APP SENSOR in the DATA LIST with the HDS.
   - If it is 0%, the APP sensor is OK.
   - If it is not 0%, update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 5.
5. Make sure the accelerator pedal is not pressed, then check the APP SENSOR in the DATA LIST with the HDS.
   - If it is 0%, the APP sensor is OK.
   - If it is not 0%, replace the accelerator pedal module (see **ACCELERATOR PEDAL MODULE REMOVAL/INSTALLATION**), then go to step 1.

ACCELERATOR PEDAL MODULE REMOVAL/INSTALLATION

REMOVAL

1. Disconnect the accelerator pedal module connector (A), then remove the nuts (B).

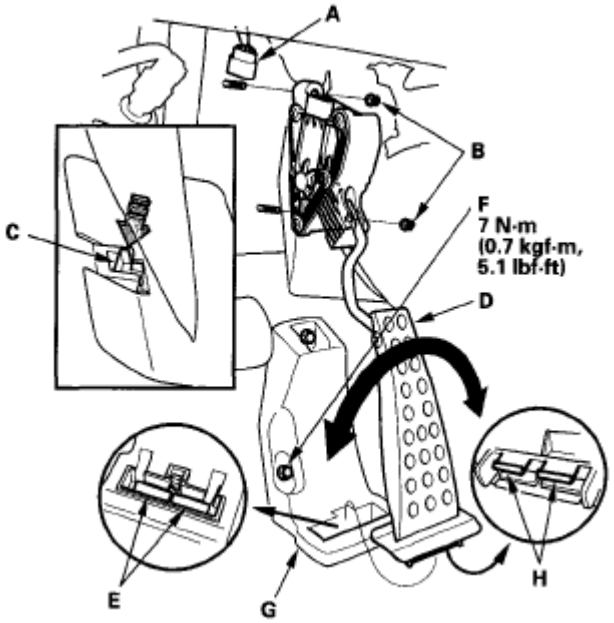

Fig. 58: Disconnecting Accelerator Pedal Module Connector (With Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Push the tab (C).
3. Pry the accelerator pedal module to right and left, and remove the accelerator pedal module (D).

NOTE:

- **The APP sensor is not available separately.**

  Do not disassemble the accelerator pedal module.

- **If the tab or tab receivers (E) are damaged, pull back the carpet, remove the nut (F), and replace the pedal stop (G).**
- **If the tabs (H) of the accelerator pedal module are damaged, replace the accelerator pedal module.**

INSTALLATION

1. Install the accelerator pedal module.

   NOTE: Make sure the tab (A) is secure.

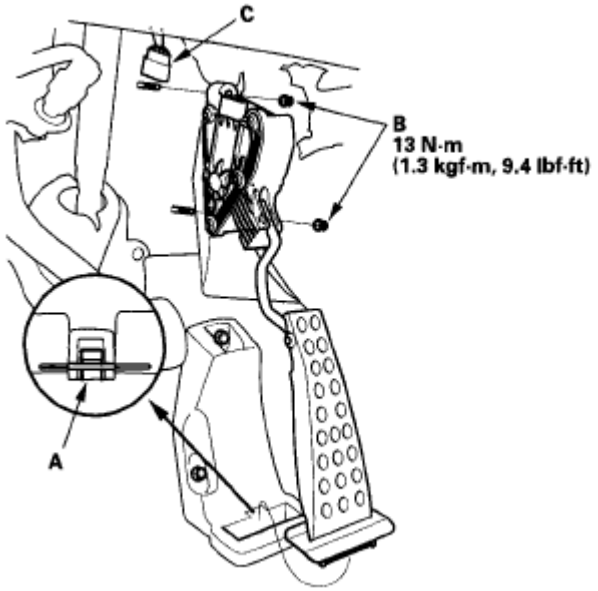

Fig. 59: Installing Accelerator Pedal Module
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the nuts (B), then connect the accelerator pedal module connector (C).

   NOTE: Make sure that the accelerator pedal module is secure.

DTC TROUBLESHOOTING

DTC P0122: TP SENSOR A CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check TP SENSOR A in the DATA LIST with the HDS.

   Is there about 0.3 V or less?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM/PCM.

4. Check for Temporary DTCs or DTCs with the HDS.

   Are DTC P0122 and P0222 indicated at the same time?

   YES - Go to step 10.

   NO - Go to step 5.

5. Turn the ignition switch OFF.
6. Disconnect the throttle body 6P connector.
7. Jump the SCS line with the HDS.
8. Disconnect ECM/PCM connector C (44P).
9. Check for continuity between throttle body 6P connector terminal No. 1 and body ground.

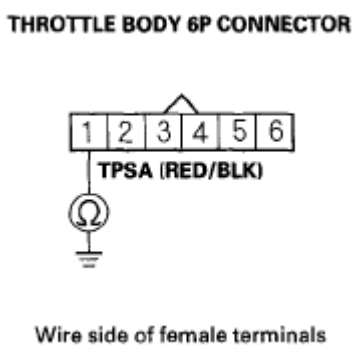

Fig. 2: Checking Continuity Between Throttle Body 6P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the throttle body and the ECM/PCM (C20), then go to step 18.

NO - Go to step 23.

10. Measure voltage between throttle body 6P connector terminal No. 2 and body ground.

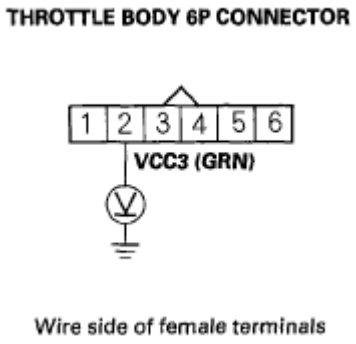

Fig. 3: Measuring Voltage Between Throttle Body 6P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 16.

NO - Go to step 23.

11. Turn the ignition switch OFF.
12. Jump the SCS line with the HDS.
13. Disconnect ECM/PCM connector C (44P).
14. Disconnect the throttle body 6P connector.
15. Check for continuity between ECM/PCM connector terminal C12 and throttle body 6P connector terminal No. 2.

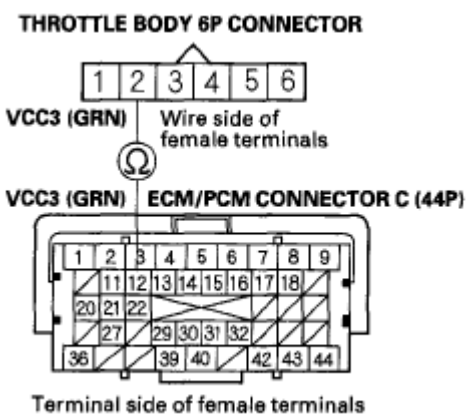

Fig. 4: Checking Continuity Between ECM/PCM Connector Terminals C12 And Throttle Body

6P Connector Terminal No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 23.

NO - Repair open in the wire between the throttle body and the ECM/PCM (C12), then go to step 18.

16. Turn the ignition switch OFF.
17. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
18. Reconnect all connectors.
19. Turn the ignition switch ON (II).
20. Reset the ECM/PCM with the HDS.
21. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
22. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0122 indicated?

YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

23. Reconnect all connectors.
24. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
25. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0122 indicated?

YES - Check for poor connections or loose terminals at TP sensor A and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P0123: TP SENSOR A CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.

3. Check TP SENSOR A in the DATA LIST with the HDS.

   Is there about 4.8 V or more?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM/PCM.

4. Check for Temporary DTCs or DTCs with the HDS.

   Are DTC P0123 and P0223 indicated at the same time?

   YES - Go to step 13.

   NO - Go to step 5.

5. Turn the ignition switch OFF.
6. Disconnect the throttle body 6P connector.
7. Turn the ignition switch ON (II).
8. Measure voltage between throttle body 6P connector terminal No. 1 and body ground.

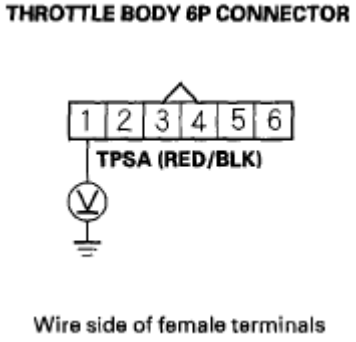

Fig. 5: Measuring Voltage Between Throttle Body 6P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there about 5 V?

   YES - Go to step 18.

   NO - Go to step 9.

9. Turn the ignition switch OFF.
10. Jump the SCS line with the HDS.
11. Disconnect ECM/PCM connector C (44P).
12. Check for continuity between ECM/PCM connector terminal C20 and throttle body 6P connector terminal No. 1.

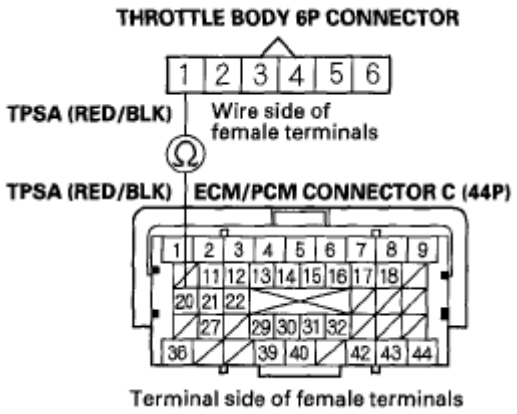

Fig. 6: Checking Continuity Between ECM/PCM Connector Terminal And Throttle Body 6P Connector Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the throttle body and the ECM/PCM (C20), then go to step 20.

13. Turn the ignition switch OFF.
14. Disconnect the throttle body 6P connector.
15. Jump the SCS line with the HDS.
16. Disconnect ECM/PCM connector C (44P).
17. Check for continuity between ECM/PCM connector terminal C39 and throttle body 6P connector terminal No. 4.

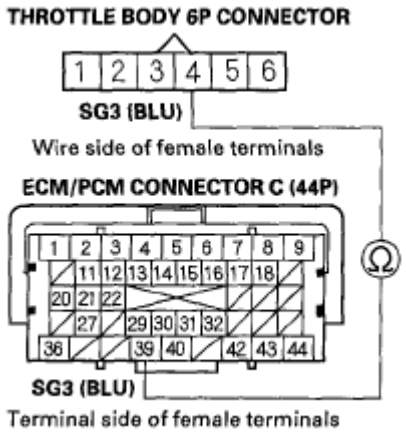

Fig. 7: Checking Continuity Between ECM/PCM Connector Terminal C39 And Throttle Body 6P Connector Terminal No. 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the throttle body and the ECM/PCM (C39), then go to step 20.

18. Turn the ignition switch OFF.
19. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
20. Reconnect all connectors.
21. Turn the ignition switch ON (II).
22. Reset the ECM/PCM with the HDS.
23. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
24. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0123 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

25. Reconnect all connectors.
26. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
27. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0123 indicated?

    YES - Check for poor connections or loose terminals at TP sensor A and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P0222: TP SENSOR B CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check TP SENSOR B in the DATA LIST with the HDS.

   Is there about 0.3 V or less?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals

at the throttle body and the ECM/PCM.

4. Check for Temporary DTCs or DTCs with the HDS.

   Are DTC P0122 and P0222 indicated at the same time?

   YES - Go to step 10.

   NO - Go to step 5.

5. Turn the ignition switch OFF.
6. Disconnect the throttle body 6P connector.
7. Jump the SCS line with the HDS.
8. Disconnect ECM/PCM connector C (44P).
9. Check for continuity between throttle body 6P connector terminal No. 3 and body ground.

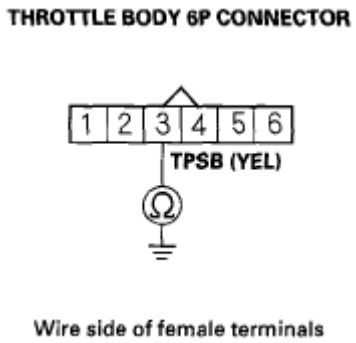

Fig. 8: Checking Continuity Between Throttle Body 6P Connector Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the throttle body and the ECM/PCM (C21), then go to step 18.

NO - Go to step 23.

10. Measure voltage between throttle body 6P connector terminal No. 2 and body ground.

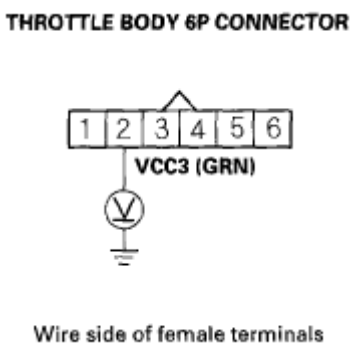

Fig. 9: Measuring Voltage Between Throttle Body 6P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 16.

NO - Go to step 11.

11. Turn the ignition switch OFF.
12. Jump the SCS line with the HDS.
13. Disconnect ECM/PCM connector C (44P).
14. Disconnect the throttle body 6P connector.
15. Check for continuity between ECM/PCM connector terminal C12 and throttle body 6P connector terminal No. 2.

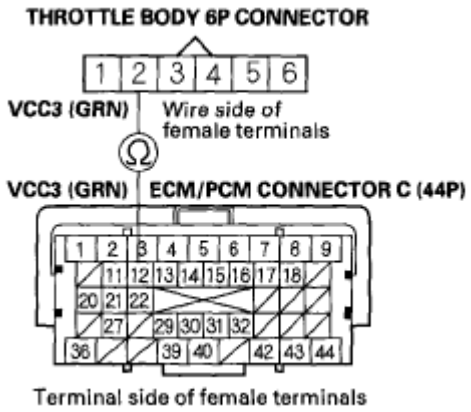

Fig. 10: Checking Continuity Between ECM/PCM Connector Terminal C12 And Throttle Body 6P Connector No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 23.

NO - Repair open in the wire between the throttle body and the ECM/PCM (C12), then go to step 18.

16. Turn the ignition switch OFF.
17. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
18. Reconnect all connectors.
19. Turn the ignition switch ON (II).
20. Reset the ECM/PCM with the HDS.
21. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
22. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0222 indicated?

YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

23. Reconnect all connectors.
24. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
25. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0222 indicated?

    YES - Check for poor connections or loose terminals at TP sensor A and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P0223: TP SENSOR B CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check TP SENSOR B in the DATA LIST with the HDS.

   Is there about 4.8 V or more?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM/PCM.

4. Check for Temporary DTCs or DTCs with the HDS.

   Are DTC P0123 and P0223 indicated at the same time?

   YES - Go to step 13.

   NO - Go to step 5.

5. Turn the ignition switch OFF.
6. Disconnect the throttle body 6P connector.
7. Turn the ignition switch ON (II).

8. Measure voltage between throttle body 6P connector terminal No. 3 and body ground.

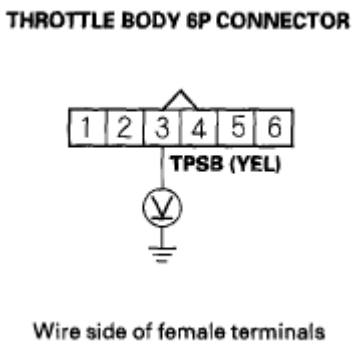

Fig. 11: Measuring Voltage Between Throttle Body 6P Connector Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 18.

NO - Go to step 9.

9. Turn the ignition switch OFF.
10. Jump the SCS line with the HDS.
11. Disconnect ECM/PCM connector C (44P).
12. Check for continuity between ECM/PCM connector terminal C21 and throttle body 6P connector terminal No. 3.

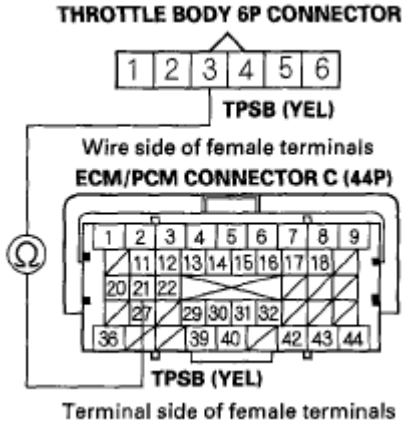

Fig. 12: Checking Continuity Between ECM/PCM Connector Terminal C21 And Throttle Body 6P Connector Terminal No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the throttle body and the ECM/PCM (C21), then go to step 20.

13. Turn the ignition switch OFF.
14. Disconnect the throttle body 6P connector.
15. Jump the SCS line with the HDS.
16. Disconnect ECM/PCM connector C (44P).
17. Check for continuity between ECM/PCM connector terminal C39 and throttle body 6P connector terminal No. 4.

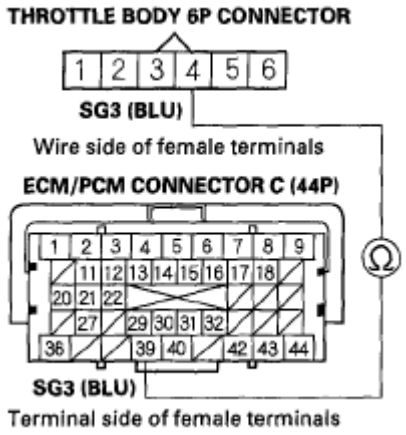

Fig. 13: Checking Continuity Between ECM/PCM Connector Terminal C39 And Throttle Body 6P Connector Terminal No. 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the throttle body and the ECM/PCM (C39), then go to step 20.

18. Turn the ignition switch OFF.
19. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
20. Reconnect all connectors.
21. Turn the ignition switch ON (II).
22. Reset the ECM/PCM with the HDS.
23. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
24. Check for Temporary DTCs or DTCs with the HDS.

Is DIG P0223 indicated?

YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

25. Reconnect all connectors.
26. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
27. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0223 indicated?

    YES - Check for poor connections or loose terminals at TP sensor B and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P1658: ELECTRONIC THROTTLE CONTROL SYSTEM (ETCS) CONTROL RELAY ON MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Do the ETCS TEST in the INSPECTION MENU with the HDS.

    Is the RELAY circuit OK?

    YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the ETCS control relay and the ECM/PCM.

    NO - Go to step 3.

3. Turn the ignition switch OFF.
4. Remove the ETCS control relay (F) from the under-hood fuse/relay box.

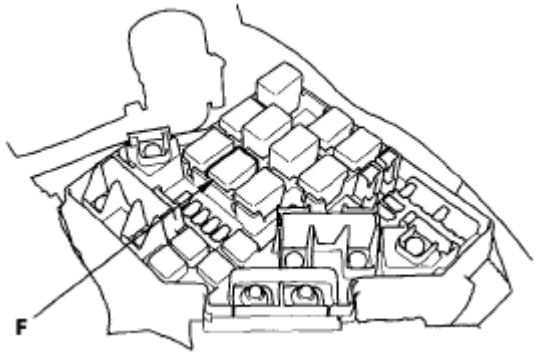

Fig. 14: Removing ETCS Control Relay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Test the ETCS control relay (see **POWER RELAY TEST**).

   Is the ETCS control relay OK?

   YES - Go to step 6.

   NO - Replace the ETCS control relay, then go to step 13.

6. Jump the SCS line with the HDS.
7. Disconnect ECM/PCM connector A (44P).
8. Check for continuity between ECM/PCM connector terminal A20 and body ground.

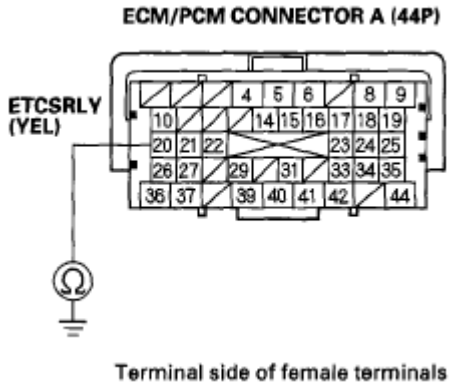

Fig. 15: Checking Continuity Between ECM/PCM Connector Terminal A20 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (A20) and the ETCS control relay, then go to step 13.

NO - Go to step 9.

9. Disconnect ECM/PCM connector C (44P).
10. Turn the ignition switch ON (II).
11. Measure voltage between ECM/PCM connector terminal C1 and body ground.

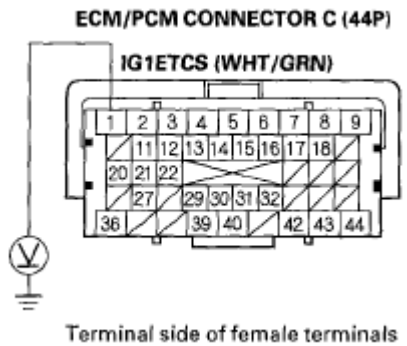

Fig. 16: Measuring Voltage Between ECM/PCM Connector Terminal C1 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Repair short to power in the wire between the ECM/PCM (CD and the ETCS control relay, then go to step 12.

NO - Go to step 18.

12. Turn the ignition switch OFF.
13. Reconnect all connectors.
14. Turn the ignition switch ON (II).
15. Reset the ECM/PCM with the HDS.
16. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
17. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P1658 indicated?

YES - Check for poor connections or loose terminals at the ETCS control relay and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

18. Turn the ignition switch OFF.
19. Reconnect all connectors.
20. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
21. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P1658 indicated?

YES - Check for poor connections or loose terminals at the ETCS control relay and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P1659: ELECTRONIC THROTTLE CONTROL SYSTEM (ETCS) CONTROL RELAY OFF MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).

2. Clear the DTC with the HDS.
3. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P1659 indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the ETCS control relay and the ECM/PCM.

4. Turn the ignition switch OFF.
5. Check the No. 21 DBW (THROTTLE ACTUATOR CONTROL) (15 A) fuse in the under-hood fuse/relay box.

   Is the fuse OK?

   YES - Go to step 6.

   NO - Go to step 17.

6. Remove the ETCS control relay (F) from the under-hood fuse/relay box.

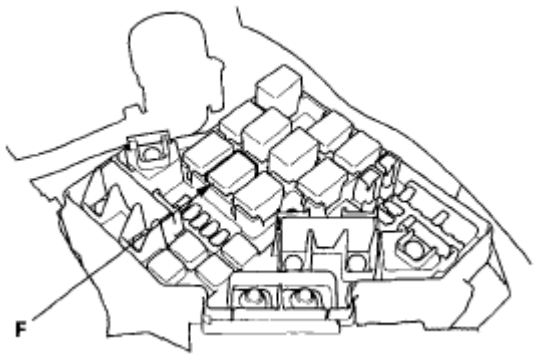

Fig. 17: Removing ETCS Control Relay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Test the ETCS control relay (see **POWER RELAY TEST**).

   Is the ETCS control relay OK?

   YES - Go to step 8.

   NO - Replace the ETCS control relay, then go to step 23.

8. Turn the ignition switch ON (II).
9. Measure voltage between ETCS control relay 4P connector terminal No. 4 and body ground.

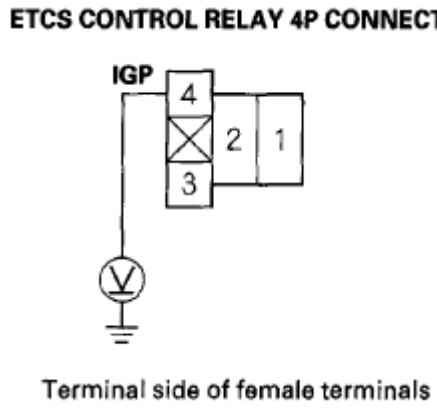

Fig. 18: Measuring Voltage Between ETCS Control Relay 4P Connector Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 10.

NO - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**), then go to step 23.

10. Measure voltage between ETCS control relay 4P connector terminal No. 1 and body ground.

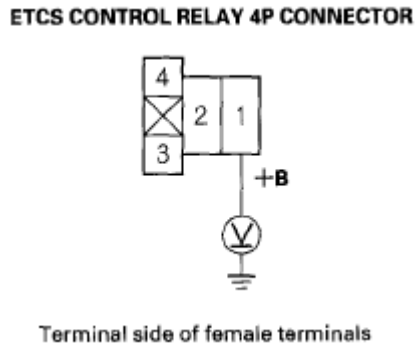

Fig. 19: Measuring Voltage Between ETCS Control Relay 4P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 11.

NO - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**), then go to step 22.

11. Turn the ignition switch OFF.
12. Jump the SCS line with the HDS.
13. Disconnect ECM/PCM connector C (44P).

14. Check for continuity between ETCS control relay 4P connector terminal No. 2 and ECM/PCM connector terminal C1.

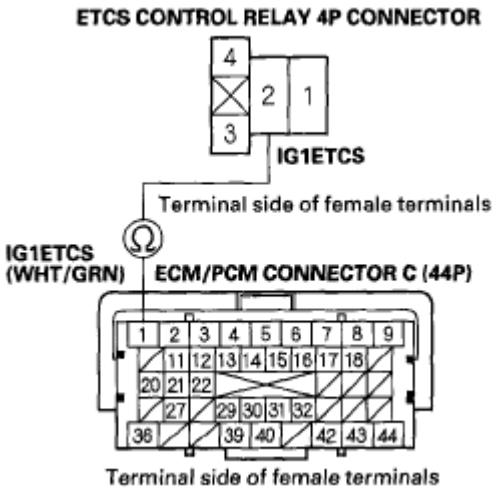

Fig. 20: Checking Continuity Between ETCS Control Relay 4P Connector Terminal No. 2 And ECM/PCM Connector Terminal C1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 15.

NO - Repair open in the wire between the ECM/PCM (CD and the ETCS control relay, then go to step 23.

15. Disconnect ECM/PCM connector A (44P).
16. Check for continuity between ETCS control relay 4P connector terminal No. 3 and ECM/PCM connector terminal A20.

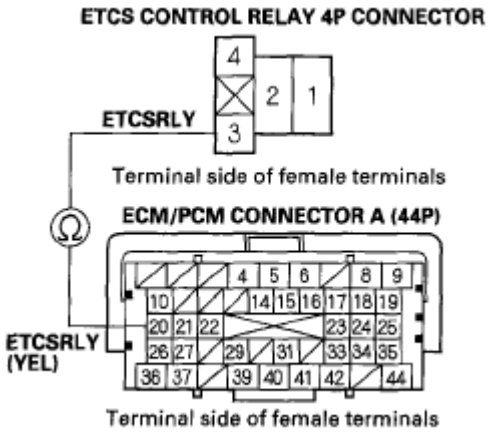

Fig. 21: Checking Continuity Between ETCS Control Relay 4P Connector Terminal No. 3 And ECM/PCM Connector Terminal A20
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 28.

NO - Repair open in the wire between the ECM/PCM (A20) and the ETCS control relay, then go to step 23.

17. Remove the ETCS control relay (F) from the under-hood fuse/relay box.

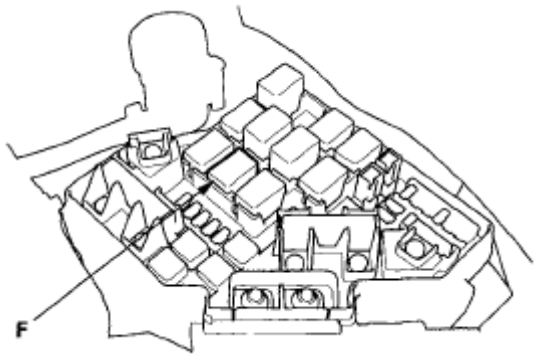

Fig. 22: Removing ETCS Control Relay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

18. Jump the SCS line with the HDS.
19. Disconnect ECM/PCM connector C (44P).
20. Check for continuity between ECM/PCM connector terminal C1 and body ground.

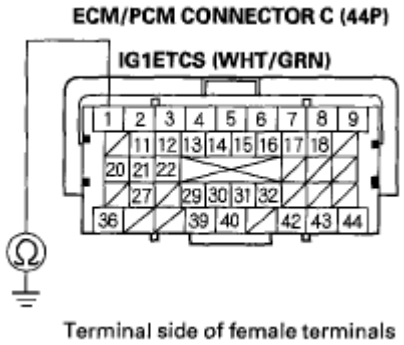

Fig. 23: Checking Continuity Between ECM/PCM Connector Terminal C1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (CD and the ETCS control relay, then go to step 23.

NO - Go to step 21.

21. Check for continuity between ETCS control relay 4P connector terminal No. 1 and body ground.

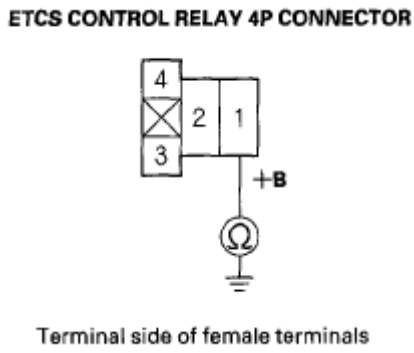

Fig. 24: Checking Continuity Between ETCS Control Relay 4P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**), then go to step 23.

NO - Go to step 28.

22. Turn the ignition switch OFF.
23. Reconnect all connectors.
24. Turn the ignition switch ON (II).
25. Reset the ECM/PCM with the HDS.
26. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
27. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1659 indicated?

    YES - Check for poor connections or loose terminals at the ETCS control relay and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

28. Reconnect all connectors.
29. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
30. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1659 indicated?

    YES - Check for poor connections or loose terminals at the ETCS control relay and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted,

replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P1683: THROTTLE VALVE DEFAULT POSITION SPRING PERFORMANCE PROBLEM

CAUTION: Do not insert your fingers into the installed throttle body when you turn the ignition switch ON (II) or while the ignition switch is ON (II). If you do, you will seriously injure your fingers if the throttle valve is activated.

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
4. Turn the ignition switch OFF, and wait 10 seconds.
5. Turn the ignition switch ON (II).
6. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P1683 indicated?

   YES - Go to step 7.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM/PCM.

7. Turn the ignition switch OFF.
8. Disconnect the intake air duct from the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
9. Push the throttle valve closed as shown.

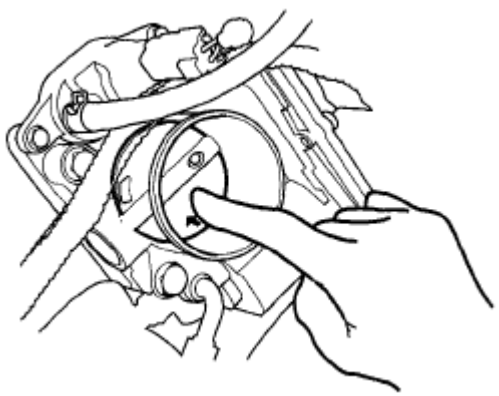

Fig. 25: Pushing Throttle Valve Closed
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Release the throttle valve.

    Does the throttle valve return?

    YES - Clean the throttle body (see **THROTTLE BODY CLEANING**), then go to step 12 and recheck. If DTC P1683 is indicated, go to step 11.

    NO - Go to step 11.

11. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
12. Turn the ignition switch ON (II).
13. Reset the ECM/PCM with the HDS.
14. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
15. Turn the ignition switch OFF, and wait 10 seconds.
16. Turn the ignition switch ON (II).
17. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1683 indicated?

    YES - If the throttle body was cleaned, check for poor connections or loose terminals at the throttle body and the ECM/PCM, then replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**), and recheck.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P1684: THROTTLE VALVE RETURN SPRING PERFORMANCE PROBLEM

CAUTION: Do not insert your fingers into the installed throttle body when you turn the ignition switch ON (II) or while the ignition switch is ON (II). If you do, you will seriously injure your fingers if the throttle valve is activated.

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
4. Turn the ignition switch OFF, and wait 10 seconds.
5. Turn the ignition switch ON (II).
6. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P1684 indicated?

YES - Go to step 7.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM/PCM.

7. Turn the ignition switch OFF.
8. Disconnect the intake air duct from the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
9. Push the throttle valve open as shown.

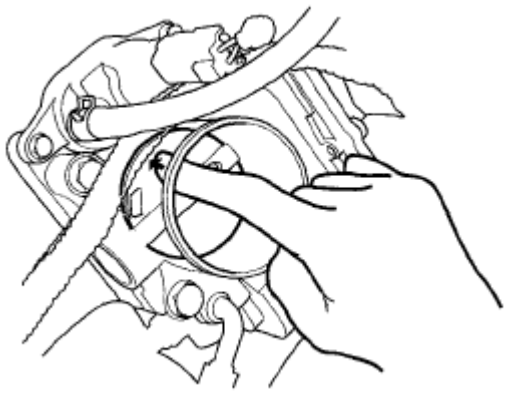

Fig. 26: Pushing Throttle Valve Open
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Release the throttle valve.

Does the throttle valve return?

YES - Clean the throttle body (see **THROTTLE BODY CLEANING**), then go to step 12 and recheck. If DTC P1684 is indicated, go to step 11.

NO - Go to step 11.

11. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
12. Turn the ignition switch ON (II).
13. Reset the ECM/PCM with the HDS.
14. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
15. Turn the ignition switch OFF, and wait 10 seconds.
16. Turn the ignition switch ON (II).
17. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P1684 indicated?

YES - If the throttle body was cleaned, check for poor connections or loose terminals at the throttle body and the ECM/PCM, then replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**), and recheck.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the

indicated DTCs troubleshooting.

DTC P2101: ELECTRONIC THROTTLE CONTROL SYSTEM (ETCS) MALFUNCTION

CAUTION: Do not insert your fingers into the installed throttle body when you turn the ignition switch ON (II) or while the ignition switch is ON (II). If you do, you will seriously injure your fingers if the throttle valve is activated.

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Do the ETCS TEST in the INSPECTION MENU with the HDS.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2101 indicated?

   YES - Go to step 7.

   NO - Go to step 5.

5. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
   - ENGINE SPEED
   - VSS
   - APP SENSOR
6. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2101 indicated?

   YES - Go to step 7.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM/PCM, then clean the throttle body (see **THROTTLE BODY CLEANING**).

7. Turn the ignition switch OFF.
8. Disconnect the intake air duct from the throttle body (see **THROTTLE BODY CLEANING**).
9. Turn the ignition switch ON (II).
10. Clear the DTC with the HDS.
11. Do the ETCS TEST in the INSPECTION MENU with the HDS.
12. Visually check the throttle valve operation.

    Does the throttle valve operate smoothly?

YES - Clean the throttle body (see **THROTTLE BODY CLEANING**), then go to step 22 and recheck. If DTC P2101 is indicated, go to step 19.

NO - Go to step 13.

13. Turn the ignition switch OFF.
14. Disconnect the throttle body 6P connector.
15. Jump the SCS line with the HDS.
16. Disconnect ECM/PCM connector C (44P).
17. Connect throttle body 6P connector terminals No. 5 and No. 6 with a jumper wire.

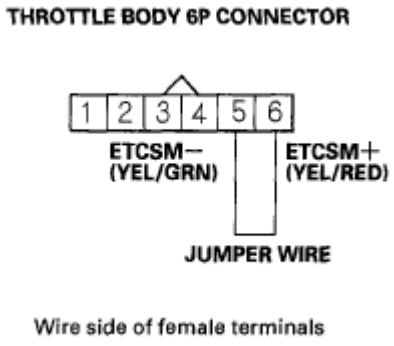

Fig. 27: Connecting Throttle Body 6P Connector Terminals No. 5 And 6 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

18. Check for continuity between ECM/PCM connector terminals C3 and C4.

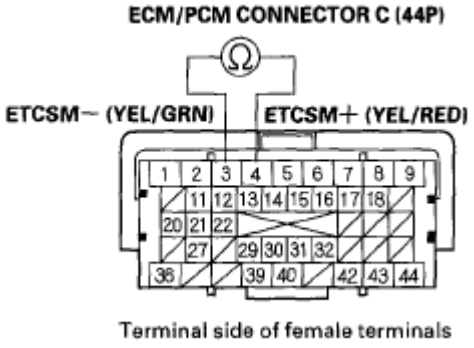

Fig. 28: Checking Continuity Between ECM/PCM Connector Terminals C3 And C4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 27.

NO - Repair open in the wires between the throttle body and the ECM/PCM (C3, C4), then go to step 21.

19. Turn the ignition switch OFF.
20. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).

21. Reconnect all connectors.
22. Turn the ignition switch ON (II).
23. Reset the ECM/PCM with the HDS.
24. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
25. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VSS
    - APP SENSOR A
26. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2101 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM, then clean the throttle body (see **THROTTLE BODY CLEANING**), and go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

27. Reconnect all connectors.
28. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
29. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VSS
    - APP SENSOR A
30. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2101 indicated ?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 28. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P2118: THROTTLE ACTUATOR CURRENT RANGE/PERFORMANCE PROBLEM

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Jump the SCS line with the HDS.
2. Disconnect ECM/PCM connector C (44P).
3. Measure resistance between ECM/PCM connector terminals C3 and C4.

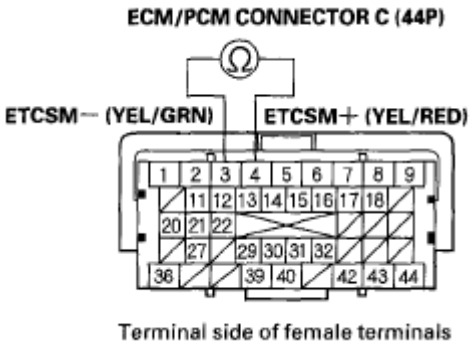

Fig. 29: Measuring Resistance Between ECM/PCM Connector Terminals C3 And C4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 1.0 ohms or less?

YES - Go to step 4.

NO - Go to step 15.

4. Disconnect the throttle body 6P connector.
5. At the throttle body side, measure resistance between throttle body 6P connector terminals No. 5 and No. 6 with the throttle fully closed.

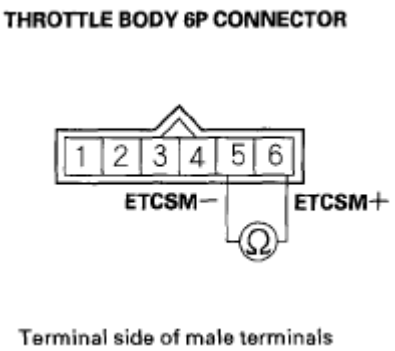

Fig. 30: Measuring Resistance Between Body 6P Connector Terminals No. 5 And 6 With Throttle Fully Closed
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 1.0 ohms or less?

YES - Go to step 6.

NO - Repair short in the wires between ECM/PCM connector terminals C3 (ETCSM-line) and C4 (ETCSM+ line), then go to step 7.

6. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
7. Reconnect all connectors.
8. Turn the ignition switch ON (II).
9. Reset the ECM/PCM with the HDS.

10. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
11. Turn the ignition switch OFF.
12. Turn the ignition switch ON (II).
13. Slowly press the accelerator pedal to the floor.
14. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2118 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

15. Reconnect all connectors.
16. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
17. Turn the ignition switch OFF.
18. Turn the ignition switch ON (II).
19. Slowly press the accelerator pedal to the floor.
20. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2118 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 17. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P2122: APP SENSOR A (THROTTLE POSITION SENSOR D) CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check APP SENSOR A in the DATA LIST with the HDS.

   Is there about 0.2 V or less?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at APP sensor A and the ECM/PCM.

3. Turn the ignition switch OFF.
4. Disconnect the APP sensor 6P connector.
5. Turn the ignition switch ON (II).
6. Measure voltage between APP sensor 6P connector terminals No. 2 and No. 3.

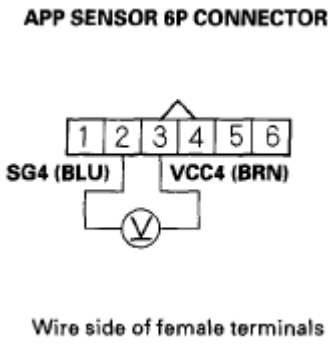

Fig. 31: Measuring Voltage Between APP Sensor 6P Connector Terminals No. 2 And 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 7.

NO - Go to step 17.

7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Disconnect ECM/PCM connector A (44P).
10. Check for continuity between APP sensor 6P connector terminal No. 1 and body ground.

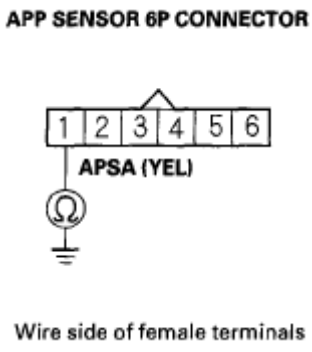

Fig. 32: Checking Continuity Between APP Sensor 6P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (A17) and APP sensor A, then go to step 24.

NO - Go to step 11.

11. Connect APP sensor 6P connector terminal No. 1 to body ground with a jumper wire.

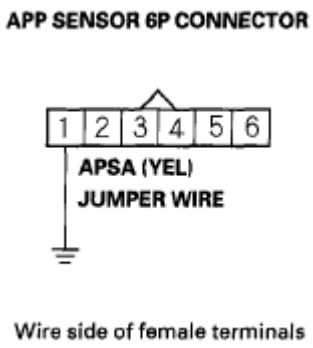

Fig. 33: Connecting APP Sensor 6P Connector Terminal No. 1 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Check for continuity between ECM/PCM connector terminal A17 and body ground.

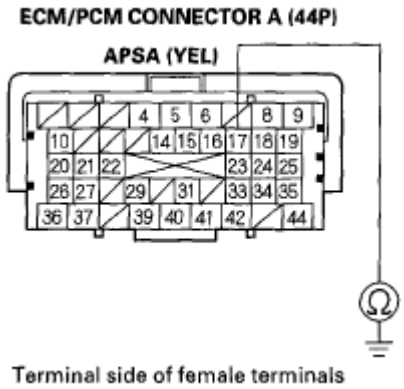

Fig. 34: Checking Continuity Between ECM/PCM Connector Terminal A17 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 13.

NO - Repair open in the wire between the ECM/PCM (A17) and APP sensor A, then go to step 24.

13. Reconnect ECM/PCM connector A (44P).
14. Connect APP sensor 6P connector terminals No. 1 and No. 3 with a jumper wire.

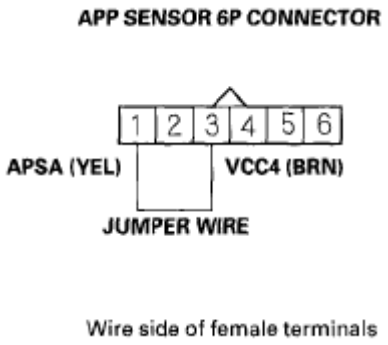

Fig. 35: Connecting APP Sensor 6P Connector Terminals No. 1 And No. 3 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Turn the ignition switch ON (II).
16. Check APP SENSOR A in the DATA LIST with the HDS.

    Is there about 0.2 V or less?

    YES - Go to step 29.

    NO - Go to step 22.

17. Turn the ignition switch OFF.
18. Jump the SCS line with the HDS.
19. Disconnect ECM/PCM connector A (44P).
20. Connect APP sensor 6P connector terminal No. 3 to body ground with a jumper wire.

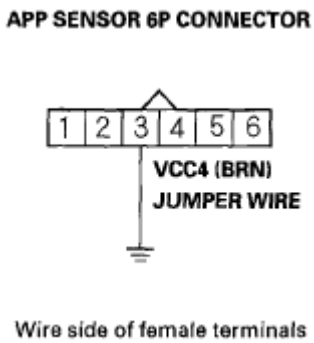

Fig. 36: Connecting APP Sensor 6P Connector Terminal No. 3 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Check for continuity between ECM/PCM connector terminal A25 and body ground.

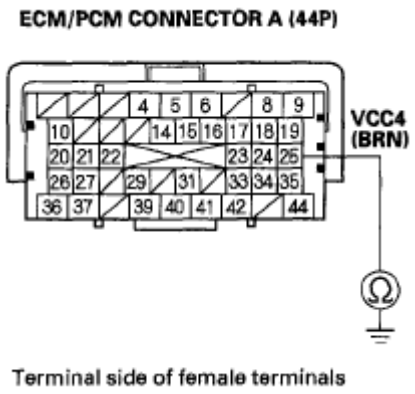

Fig. 37: Checking Continuity Between ECM/PCM Connector Terminal A25 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 30.

NO - Repair open in the wire between the ECM/PCM (A25) and APP sensor A, then go to step 24.

22. Turn the ignition switch OFF.
23. Replace the accelerator pedal module (see **ACCELERATOR PEDAL MODULE REMOVAL/INSTALLATION**).
24. Reconnect all connectors.
25. Turn the ignition switch ON (II).
26. Reset the ECM/PCM with the HDS.
27. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
28. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2122 indicated?

    YES - Check for poor connections or loose terminals at APP sensor A and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

29. Turn the ignition switch OFF.
30. Reconnect all connectors.
31. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
32. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2122 indicated?

    YES - Check for poor connections or loose terminals at APP sensor A and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P2123: APP SENSOR A (THROTTLE POSITION SENSOR D) CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check APP SENSOR A in the DATA LIST with the HDS.

   Is there about 4.9 V or more?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at APP sensor A and the ECM/PCM.

3. Turn the ignition switch OFF.
4. Disconnect the APP sensor 6P connector.
5. Turn the ignition switch ON (II).
6. Measure voltage between APP sensor 6P connector terminals No. 2 and No. 3.

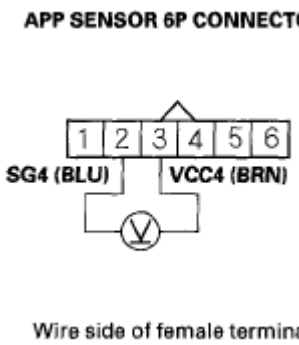

Fig. 38: Measuring Voltage Between APP Sensor 6P Connector Terminals No. 2 And 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 12.

NO - Go to step 7.

7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Disconnect ECM/PCM connector A (44P).
10. Connect APP sensor 6P connector terminal No. 2 to body ground with a jumper wire.

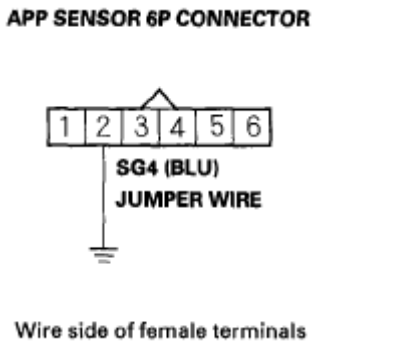

Fig. 39: Connecting APP Sensor 6P Connector Terminal No. 2 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Check for continuity between ECM/PCM connector terminal A35 and body ground.

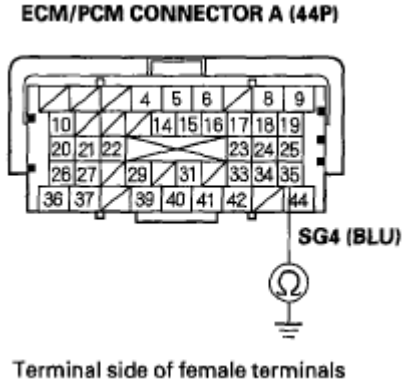

Fig. 40: Checking Continuity Between ECM/PCM Connector Terminal A35 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 19.

NO - Repair open in the wire between the ECM/PCM (A35) and APP sensor A, then go to step 14.

12. Turn the ignition switch OFF.
13. Replace the accelerator pedal module (see **ACCELERATOR PEDAL MODULE REMOVAL/INSTALLATION**).
14. Reconnect all connectors.
15. Turn the ignition switch ON (II).
16. Reset the ECM/PCM with the HDS.
17. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
18. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P2123 indicated?

YES - Check for poor connections or loose terminals at APP sensor A and the ECM/PCM, then go to

step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

19. Reconnect all connectors.
20. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
21. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2123 indicated?

    YES - Check for poor connections or loose terminals at APP sensor A and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P2127: APP SENSOR B (THROTTLE POSITION SENSOR E) CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check APP SENSOR B in the DATA LIST with the HDS.

   Is there about 0.2 V or less?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at APP sensor B and the ECM/PCM.

3. Turn the ignition switch OFF.
4. Disconnect the APP sensor 6P connector.
5. Turn the ignition switch ON (II).
6. Measure voltage between APP sensor 6P connector terminals No. 5 and No. 6.

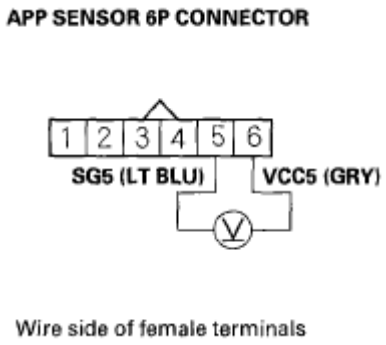

Fig. 41: Measuring Voltage Between APP Sensor 6P Connector Terminals No. 5 And 6
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 7.

NO - Go to step 17.

7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Disconnect ECM/PCM connector A (44P).
10. Check for continuity between APP sensor 6P connector terminal No. 4 and body ground.

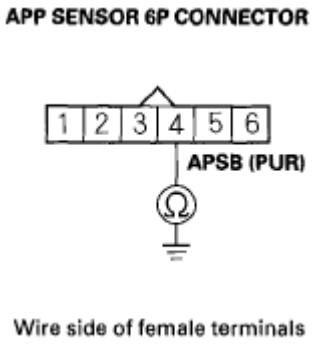

Fig. 42: Checking Continuity Between APP Sensor 6P Connector Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (A18) and APP sensor B, then go to step 24.

NO - Go to step 11.

11. Connect APP sensor 6P connector terminal No. 4 to body ground with a jumper wire.

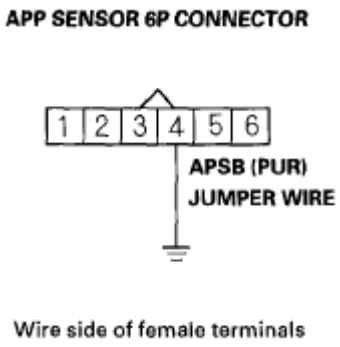

Fig. 43: Connecting APP Sensor 6P Connector Terminal No. 4 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Check for continuity between ECM/PCM connector terminal A18 and body ground.

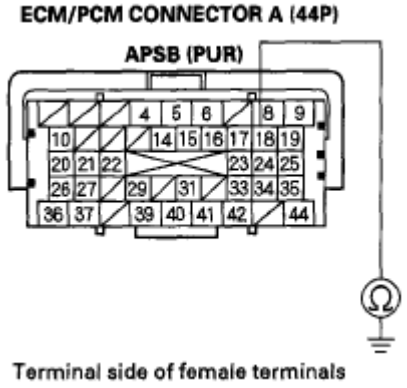

Fig. 44: Checking Continuity Between ECM/PCM Connector Terminal A18 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 13.

NO - Repair open in the wire between the ECM/PCM (A18) and APP sensor B, then go to step 24.

13. Reconnect ECM/PCM connector A (44P).
14. Connect APP sensor 6P connector terminals No. 4 and No. 6 with a jumper wire.

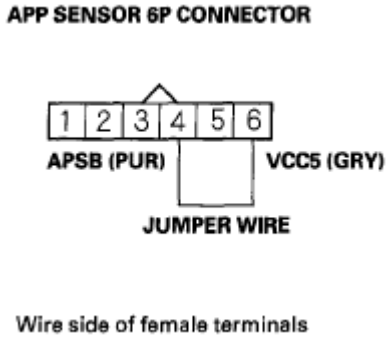

Fig. 45: Connecting APP Sensor 6P Connector Terminals No. 4 And 6 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Turn the ignition switch ON (II).
16. Check APP SENSOR B in the DATA LIST with the HDS.

    Is there about 0.2 V or less?

    YES - Go to step 29.

    NO - Go to step 22.

17. Turn the ignition switch OFF.
18. Jump the SCS line with the HDS.
19. Disconnect ECM/PCM connector A (44P).
20. Connect APP sensor 6P connector terminal No. 6 to body ground with a jumper wire.

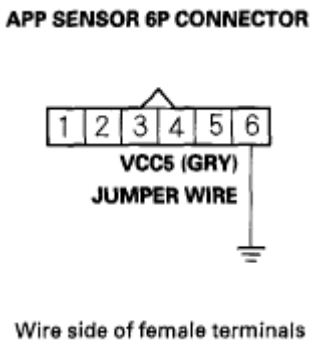

Fig. 46: Connecting APP Sensor 6P Connector Terminal No. 6 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Check for continuity between ECM/PCM connector terminal A24 and body ground.

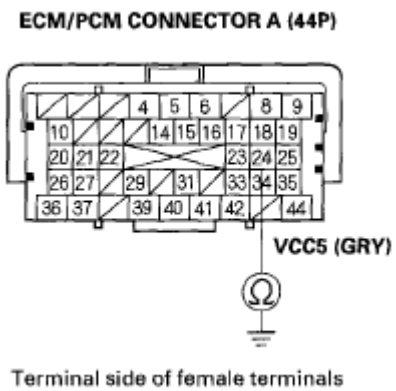

Fig. 47: Checking Continuity Between ECM/PCM Connector Terminal A24 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 30.

NO - Repair open in the wire between the ECM/PCM (A24) and APP sensor B, then go to step 24.

22. Turn the ignition switch OFF.
23. Replace the accelerator pedal module (see **ACCELERATOR PEDAL MODULE REMOVAL/INSTALLATION**).
24. Reconnect all connectors.
25. Turn the ignition switch ON (II).
26. Reset the ECM/PCM with the HDS.
27. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
28. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2127 indicated?

    YES - Check for poor connections or loose terminals at APP sensor B and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

29. Turn the ignition switch OFF.
30. Reconnect all connectors.
31. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
32. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2127 indicated?

    YES - Check for poor connections or loose terminals at APP sensor B and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P2128: APP SENSOR B (THROTTLE POSITION SENSOR E) CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check APP SENSOR B in the DATA LIST with the HDS.

   Is there about 4.9 V or more?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals APP sensor B and the ECM/PCM.

3. Turn the ignition switch OFF.
4. Disconnect the APP sensor 6P connector.
5. Turn the ignition switch ON (II).
6. Measure voltage between APP sensor 6P connector terminals No. 5 and No. 6.

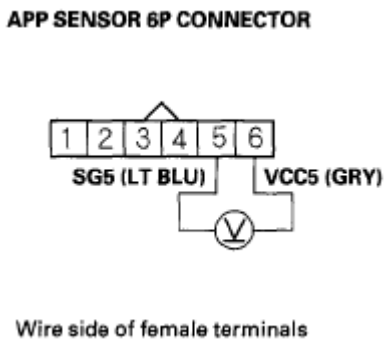

Fig. 48: Measuring Voltage Between APP Sensor 6P Connector Terminals No. 5 And 6
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 12.

NO - Go to step 7.

7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Disconnect ECM/PCM connector A (44P).
10. Connect APP sensor 6P connector terminal No. 5 to body ground with a jumper wire.

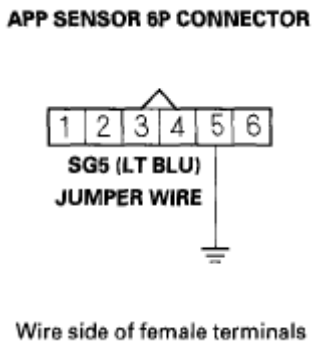

Fig. 49: Connecting APP Sensor 6P Connector Terminal No. 5 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Check for continuity between ECM/PCM connector terminal A34 and body ground.

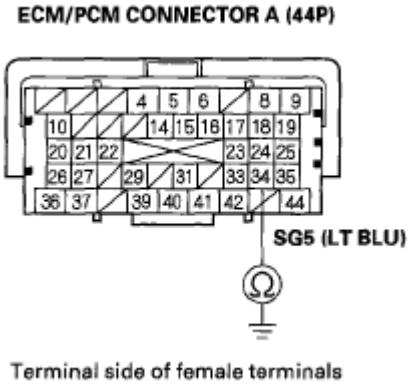

Fig. 50: Checking Continuity Between ECM/PCM Connector Terminal A34 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 19.

NO - Repair open in the wire between the ECM/PCM (A34) and APP sensor B, then go to step 14.

12. Turn the ignition switch OFF.
13. Replace the accelerator pedal module (see **ACCELERATOR PEDAL MODULE REMOVAL/INSTALLATION**).
14. Reconnect all connectors.
15. Turn the ignition switch ON (II).
16. Reset the ECM/PCM with the HDS.
17. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
18. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P2128 indicated?

YES - Check for poor connections or loose terminals at APP sensor B and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

19. Reconnect all connectors.
20. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
21. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P2128 indicated?

YES - Check for poor connections or loose terminals at APP sensor B and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE**

ECM/PCM), then recheck. If the ECM/PCM was substituted, go to step 1.

NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P2135: TP SENSOR A/B INCORRECT VOLTAGE CORRELATION

CAUTION: Do not insert your fingers into the installed throttle body when you turn the ignition switch ON (II) or while the ignition switch is ON (II). If you do, you will seriously injure your fingers if the throttle valve is activated.

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Do the ETCS TEST in the INSPECTION MENU with the HDS.
4. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P2135 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM/PCM.

5. Turn the ignition switch OFF.
6. Disconnect the intake air duct from the throttle body.
7. Turn the ignition switch ON (II).
8. Visually check the throttle valve operation while you clear the DTC with the HDS.

Does the valve temporarily move to its fully closed position?

YES - Go to step 15.

NO - Go to step 9.

9. Turn the ignition switch OFF.
10. Jump the SCS line with the HDS.
11. Disconnect ECM/PCM connector C (44P).
12. Check for continuity between ECM/PCM connector terminals C20 and C21.

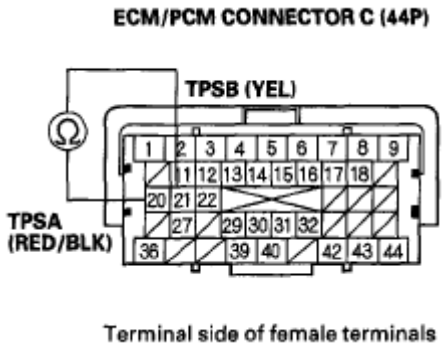

Fig. 51: Checking Continuity Between ECM/PCM Connector Terminals C20 And C21
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 13.

NO - Go to step 22.

13. Disconnect the throttle body 6P connector.
14. Check for continuity between ECM/PCM connector terminals C20 and C21.

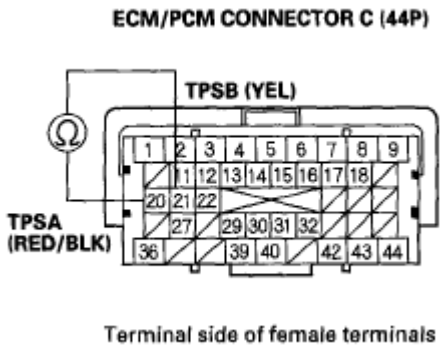

Fig. 52: Checking Continuity Between ECM/PCM Connector Terminals C20 And C21
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM C20 (TPSA line) and the C21 (TPSB line), then go to step 17.

NO - Go to step 15.

15. Turn the ignition switch OFF.
16. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
17. Reconnect all connectors.
18. Turn the ignition switch ON (II).
19. Reset the ECM/PCM with the HDS.
20. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).

21. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2135 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

22. Reconnect all connectors.
23. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
24. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2135 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P2138: APP SENSOR A/B (THROTTLE POSITION SENSOR D/E) INCORRECT VOLTAGE CORRELATION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with HDS.
3. Press the accelerator pedal to the floor.
4. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2138 indicated?

    YES - Go to step 5.

    NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at APP sensor A/B and the ECM/PCM.

5. Check APP SENSOR A and APP SENSOR B in the DATA LIST with the HDS.

    Are they the same voltage?

    YES - Go to step 6.

NO - Go to step 12.

6. Turn the ignition switch OFF.
7. Jump the SCS line with the HDS.
8. Disconnect ECM/PCM connector A (44P).
9. Check for continuity between ECM/PCM connector terminals A17 and A18.

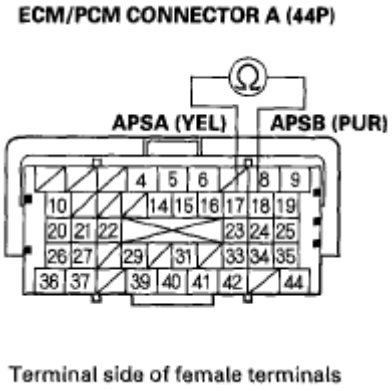

Fig. 53: Checking Continuity Between ECM/PCM Connector Terminals A17 And A18
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Go to step 22.

10. Disconnect the APP sensor 6P connector.
11. Check for continuity between ECM/PCM connector terminals A17 and A18.

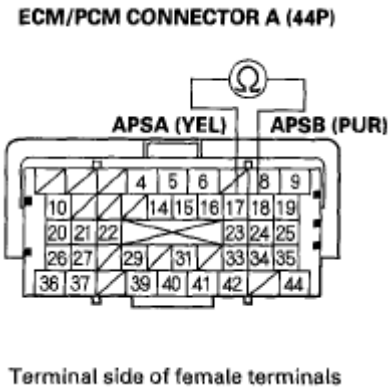

Fig. 54: Checking Continuity Between ECM/PCM Connector Terminals A17 And A18
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between ECM/PCM connector terminals A17 (APSA line) and A18 (APSB line), then go to step 14.

NO - Go to step 12.

12. Turn the ignition switch OFF.
13. Replace the accelerator pedal module (see **ACCELERATOR PEDAL MODULE REMOVAL/INSTALLATION**).
14. Reconnect all connectors.
15. Turn the ignition switch ON (II).
16. Reset the ECM/PCM with the HDS.
17. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
18. Turn the ignition switch OFF.
19. Turn the ignition switch ON (II).
20. Press the accelerator pedal to the floor.
21. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P2138 indicated?

YES - Check for poor connections or loose terminals at APP sensor A/B and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

22. Reconnect all connectors.
23. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
24. Turn the ignition switch OFF.
25. Turn the ignition switch ON (II).
26. Press the accelerator pedal to the floor.
27. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P2138 indicated?

YES - Check for poor connections or loose terminals at APP sensor A/B and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 24. If the ECM/PCM was substituted, go to step 1.

NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P2176: THROTTLE ACTUATOR CONTROL SYSTEM IDLE POSITION NOT LEARNED

CAUTION: Do not insert your fingers into the installed throttle body when you turn the ignition switch ON (II) or while the ignition switch is ON (II). If you do, you will seriously injure your fingers if the throttle valve is activated.

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P2135 is stored at the same time as DTC P2176, troubleshoot DTC P2135 first, then recheck for DTC P2176.**

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch OFF.
4. Turn the ignition switch ON (II), and wait 10 seconds.
5. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2176 indicated?

   YES - Go to step 6.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM/PCM, then clean the throttle body (see **THROTTLE BODY CLEANING**).

6. Turn the ignition switch OFF.
7. Disconnect the intake air duct from the throttle body.
8. Turn the ignition switch ON (II).
9. Clear the DTC with the HDS.
10. Visually check the throttle valve operation while performing the ETCS TEST in the INSPECTION MENU with the HDS.

    Does the throttle valve move to its fully closed position?

    YES - Go to step 11.

    NO - Go to step 12.

11. Check for sludge or carbon on the throttle valve.

    Is there sludge or carbon on the throttle valve?

    YES - Clean the throttle body (see **THROTTLE BODY CLEANING**), then go to step 21.

    NO - Go to step 18.

12. Turn the ignition switch OFF.
13. Disconnect the throttle body 6P connector.
14. Jump the SCS line with the HDS.
15. Disconnect ECM/PCM connector C (44P).
16. Connect throttle body 6P connector terminals No. 5 and No. 6 with a jumper wire.

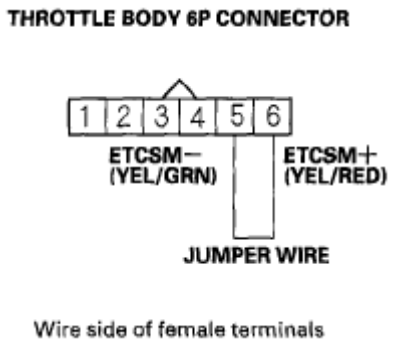

Fig. 55: Connecting Throttle Body 6P Connector Terminals No. 5 And 6 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Check for continuity between ECM/PCM connector terminals C3 and C4.

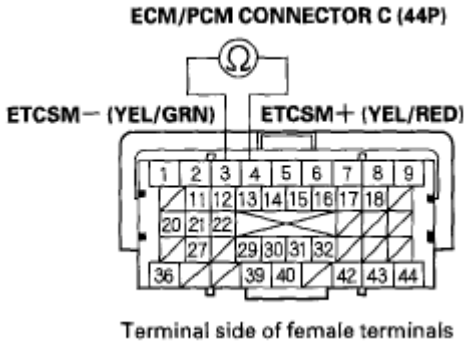

Fig. 56: Checking Continuity Between ECM/PCM Connector Terminals C3 And C4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 27.

NO - Repair open in the wires between the throttle body and the ECM/PCM (C3, C4), then go to step 20.

18. Turn the ignition switch OFF.
19. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
20. Reconnect all connectors.
21. Turn the ignition switch ON (II).
22. Reset the ECM/PCM with the HDS.
23. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
24. Turn the ignition switch OFF.
25. Turn the ignition switch ON (II), and wait 10 seconds.
26. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P2176 indicated?

YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM, then

clean the throttle body (see **THROTTLE BODY CLEANING**), and go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

27. Reconnect all connectors.
28. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
29. Turn the ignition switch to LOCK (0).
30. Turn the ignition switch to ON (11), and wait 10 seconds.
31. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P2176 indicated?

YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

APP SENSOR SIGNAL INSPECTION

NOTE:

- **This procedure checks the APP sensor in its fully closed position. In any other position, the APP sensor stores DTCs which are covered in other troubleshooting procedures.**
- **Check for Temporary DTCs or DTCs with the HDS before doing this procedure. If any DTCs are indicated, troubleshoot them first, then do this procedure.**
- **Press the accelerator pedal several times to check its operation. If it does not operate smoothly, check the pedal. If you find a problem, replace the accelerator pedal module (see ACCELERATOR PEDAL MODULE REMOVAL/INSTALLATION).**

1. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

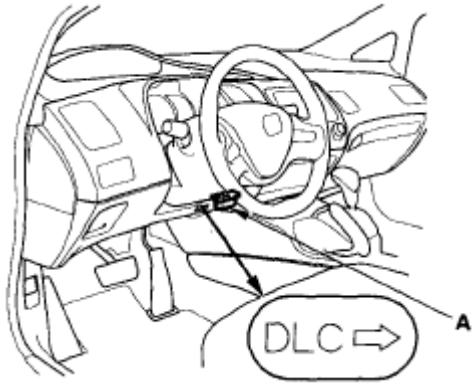

Fig. 57: Connecting HDS To DLC
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch ON (II).
3. Make sure the HDS communicates with the ECM/PCM. If it doesn't, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Make sure the accelerator pedal is not pressed, then check the APP SENSOR in the DATA LIST with the HDS.
   - If it is 0%, the APP sensor is OK.
   - If it is not 0%, update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 5.
5. Make sure the accelerator pedal is not pressed, then check the APP SENSOR in the DATA LIST with the HDS.
   - If it is 0%, the APP sensor is OK.
   - If it is not 0%, replace the accelerator pedal module (see **ACCELERATOR PEDAL MODULE REMOVAL/INSTALLATION**), then go to step 1.

ACCELERATOR PEDAL MODULE REMOVAL/INSTALLATION

'06-08 models

1. Disconnect the APP sensor 6P connector (A), then remove the nuts (B).

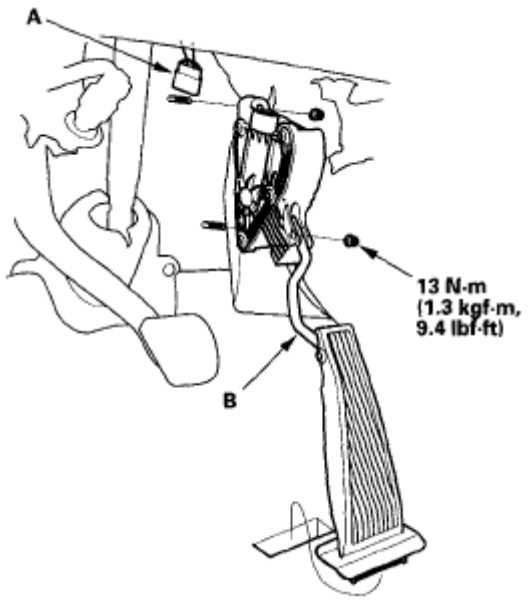

Fig. 58: Disconnecting Accelerator Pedal Module Connector (With Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the accelerator pedal module (B).

NOTE: The APP sensor is not available separately. Do not disassemble the accelerator pedal module.

3. Install the parts in the reverse order of removal.

'09 model

1. Disconnect the APP sensor 6P connector (A).

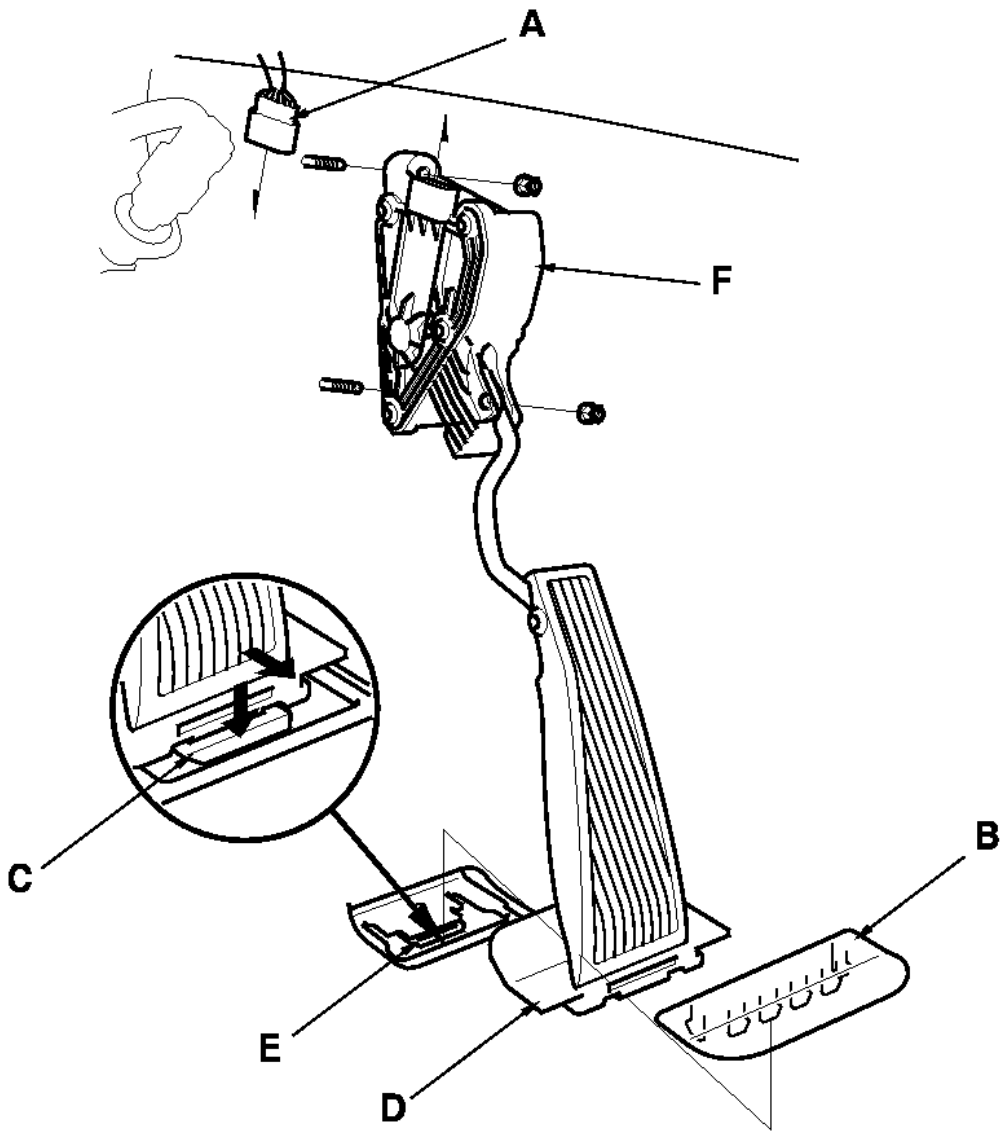

Fig. 59: Disconnecting Accelerator Pedal Module Connector
Courtesy of TOYOTA

2. Remove the clip (B).

NOTE: Do not reuse the clip once it is removed.

3. Push the tab (C), and remove the accelerator pedal pad (D) from the pedal stop (E).
4. Remove the accelerator pedal module (F).

NOTE: The APP sensor is not available separately. Do not disassemble the accelerator pedal module.

5. Set the accelerator pedal pad (A) to the pedal stop (B).

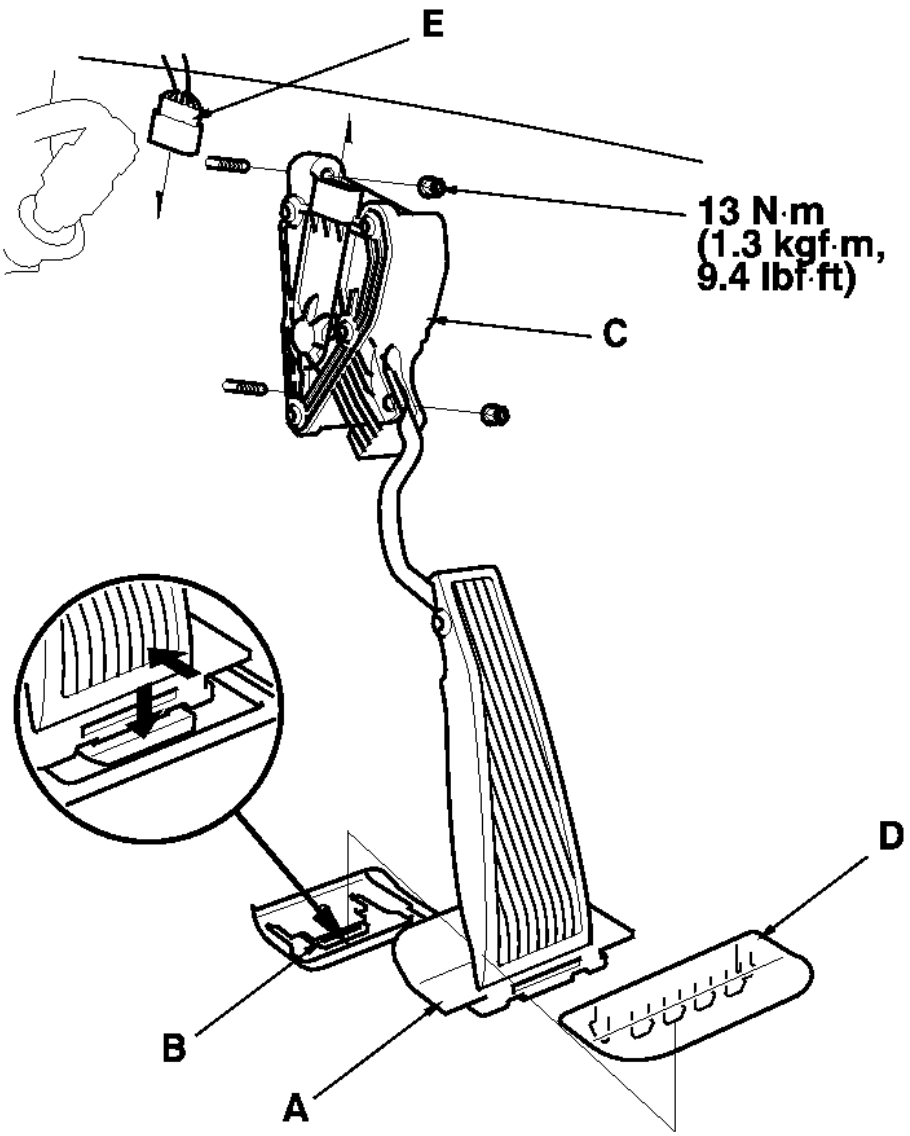

Fig. 60: Disconnecting Accelerator Pedal Module Connector
Courtesy of TOYOTA

6. Install the accelerator pedal module (C) with a new clip (D).
7. Reconnect the APP sensor 6P connector (E).

2006-08 ENGINE PERFORMANCE

Intake Air System (K20Z3) - Civic (All Except Si)

THROTTLE BODY TEST

CARBON ACCUMULATION CHECK

NOTE: If the malfunction indicator lamp (MIL) has been reported on, check for diagnostic trouble codes (DTCs).

1. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

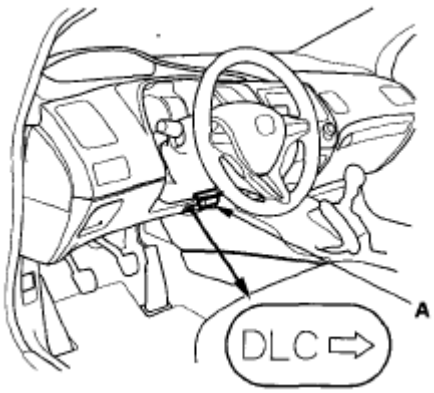

Fig. 1: Identifying Data Link Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch ON (II).
3. Make sure the HDS communicates with the ECM and other vehicle systems. If it doesn't, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
5. Check the REL TP SENSOR in the DATA LIST with the HDS. The reading should be below 2.46 deg. If it is not, clean the throttle body (see **THROTTLE BODY CLEANING**).

THROTTLE POSITION LEARNING CHECK

NOTE: If the malfunction indicator lamp (MIL) has been reported on, check for diagnostic trouble codes (DTCs).

1. Connect the HDS to the data link connector (DLC)

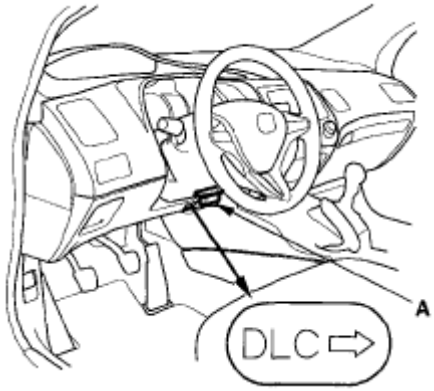

Fig. 2: Identifying Data Link Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch ON (II).
3. Make sure the HDS communicates with the ECM and other vehicle systems. If it doesn't, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Select the INSPECTION MENU with the HDS.
5. Do the TP POSITION CHECK in the ETCS TEST. If needed, clean the throttle body (see **THROTTLE BODY CLEANING**).

THROTTLE BODY CLEANING

CAUTION: Do not insert your fingers into the installed throttle body when you turn the ignition switch ON (II) or while the ignition switch is ON (II). If you do, you will seriously injure your fingers if the throttle valve is activated.

1. Check for damage to the air cleaner. If the air cleaner is damaged, replace it (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**).
2. Remove the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
3. Clean off the carbon from the throttle valve and inside the throttle body with a paper towel soaked in throttle plate and induction cleaner.

NOTE:

- **Remove the throttle body to clean it.**
- **Be careful not to pinch your fingers.**
- **To avoid removing the molybdenum coating, do not clean the bearing area of the throttle shaft (A).**
- **Do not spray throttle plate and induction cleaner directly on the throttle body.**
- **Use Honda genuine throttle plate and induction cleaner.**

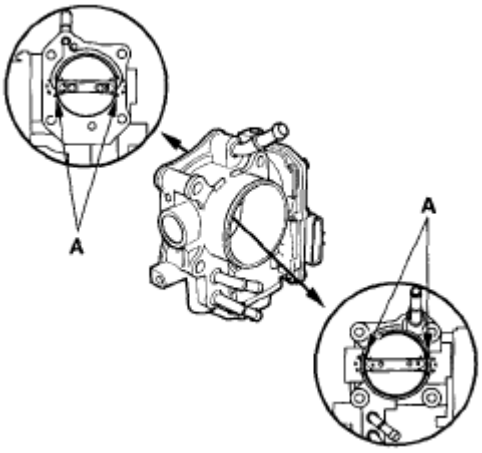

Fig. 3: Identifying Throttle Shaft Bearing Area
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
5. Reset the ECM with the HDS (see **HDS CLEAR COMMAND**).
6. Turn the ignition switch ON (II), and wait for 2 seconds.
7. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).

INTAKE AIR BYPASS CONTROL THERMAL VALVE TEST

Special Tools Required

Vacuum pump/gauge, 0-30 in.Hg, Snap-on YA4000A or equivalent, commercially available

1. Start the engine, and let it idle.

NOTE: Engine coolant temperature must be below 149°F (65°C).

2. Remove the intake manifold cover .
3. Remove the vacuum hose (A) from the air intake duct, and connect a vacuum pump/gauge, 0-30 in.Hg, to the hose.

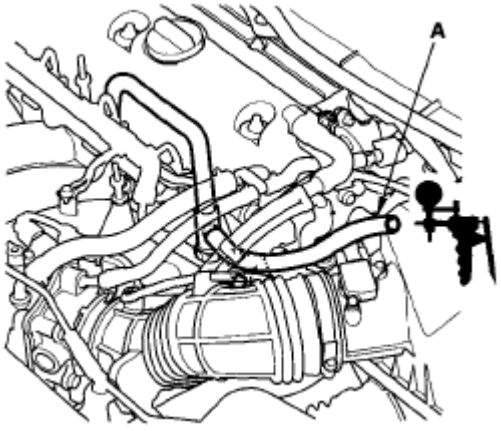

Fig. 4: Identifying Vacuum Hose
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Raise and lower the engine speed, and make sure the vacuum gauge reading changes as the engine speed changes.

   If the vacuum reading does not change, check for these problems:

   - Misrouted, leaking, broken, or clogged intake air bypass control system vacuum lines.
   - A cracked or damaged intake air bypass control thermal valve. Replace the valve if needed (see **INTAKE AIR BYPASS CONTROL THERMAL VALVE REPLACEMENT**).
5. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
6. Raise and lower the engine speed, and make sure the vacuum gauge reading does not change as the rpm changes.

   If the vacuum reading changes, check for these problems:

   - Misrouted, leaking, broken, or clogged intake air bypass control system vacuum lines.
   - A cracked or damaged intake air bypass control thermal valve. Replace the valve if needed (see **INTAKE AIR BYPASS CONTROL THERMAL VALVE REPLACEMENT**).

AIR CLEANER REMOVAL/INSTALLATION

1. Disconnect the MAF sensor/IAT sensor connector (A).

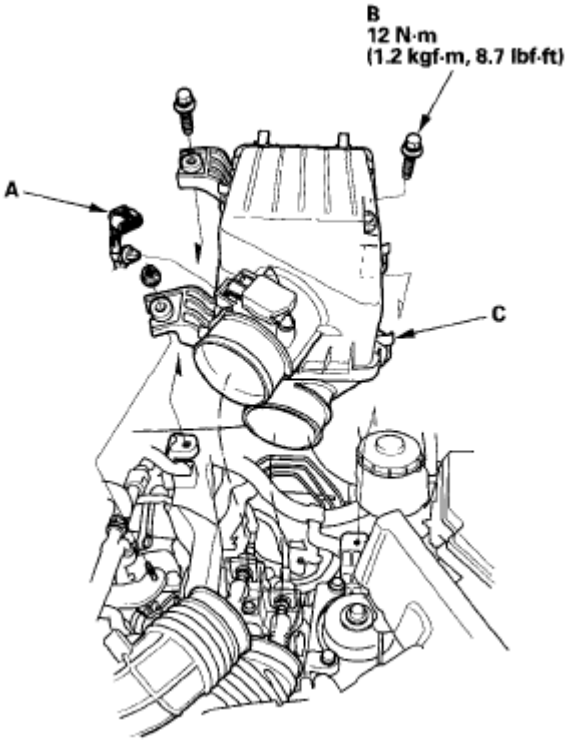

Fig. 5: Identifying MAF Sensor/IAT Sensor Connector And Air Cleaner
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the bolts (B), then remove the air cleaner (C).
3. Install the parts in the reverse order of removal.

AIR CLEANER ELEMENT INSPECTION/REPLACEMENT

1. Open the air cleaner housing cover (A).

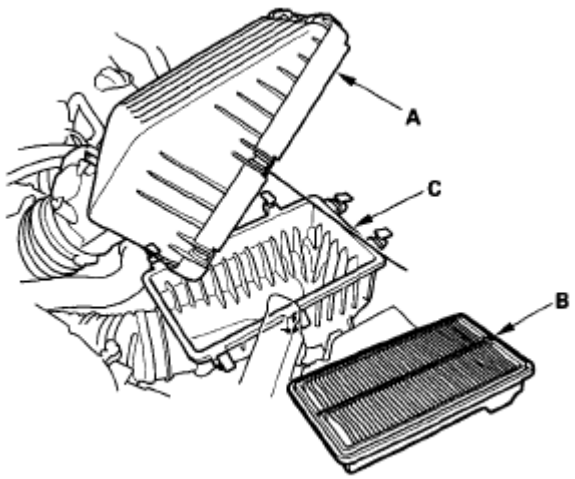

Fig. 6: Identifying Air Cleaner Housing Cover, Air Cleaner Element And Air Cleaner Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the air cleaner element (B) from the air cleaner housing (C).
3. Check the air cleaner element for damage or clogging. If there is damage or clogging, replace the air cleaner element.

NOTE: Do not use compressed air to clean the air cleaner element.

4. Install the parts in the reverse order of removal. Clean and remove any debris from inside the air cleaner housing.
5. If the maintenance minder required to replace the air cleaner element, reset the maintenance minder (see **MAINTENANCE MINDER**).
   - If you did not replace the air cleaner element, this procedure is complete.
   - If the maintenance minder required air cleaner element replacement, reset the maintenance minder. (see**MAINTENANCE MINDER**).
   - If you replaced the air cleaner element, reset the ECM with the HDS, and do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).

INTAKE AIR RESONATOR REMOVAL/INSTALLATION

1. Make sure you have the anti-theft code for the audio system and the navigation system (if equipped).
2. Remove the front bumper (see **FRONT BUMPER REMOVAL/INSTALLATION**).
3. Remove the bolt (A), and pipe (B).

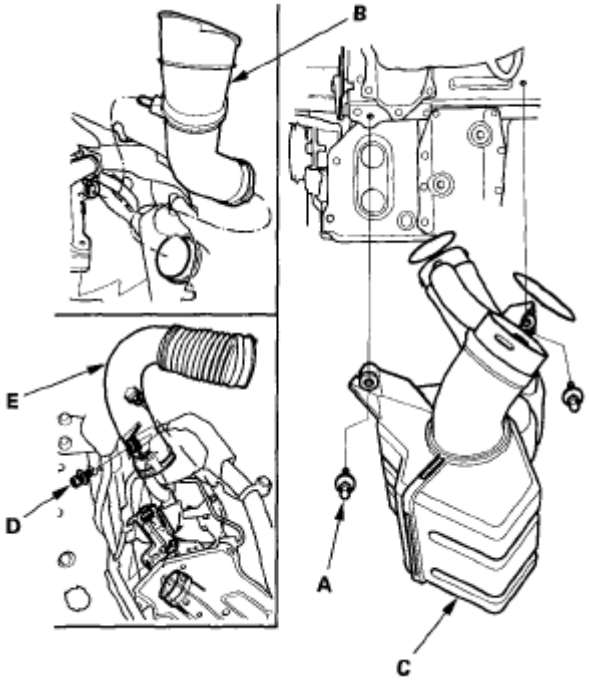

Fig. 7: Identifying Pipe, Duct And Resonator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the resonator (C).
5. Remove the battery.
6. Remove the bolt (D), and duct (E).
7. Install the parts in the reverse order of removal.
8. Reinstall the battery, and do these items:
   - Enter the anti-theft code for the audio system and the navigation system (if equipped).
   - Set the clock (if needed).

THROTTLE BODY REMOVAL/INSTALLATION

CAUTION: Do not insert your fingers into the installed throttle body when you turn the ignition switch ON (II) or while the ignition switch is ON (II). If you do, there will be serious injury to your fingers if the throttle valve is activated.

NOTE: If you are replacing or cleaning the throttle body, start at step 1. If you are removing the throttle body, start at step 5.

1. Connect the HDS to the DLC while the engine is stopped.
2. USA, Canada models: Select the INSPECTION MENU on the HDS.
3. USA, Canada models: Do the TP POSITION CHECK in the ETCS TEST.
4. Turn the ignition switch OFF.
5. Remove the air intake duct (A).

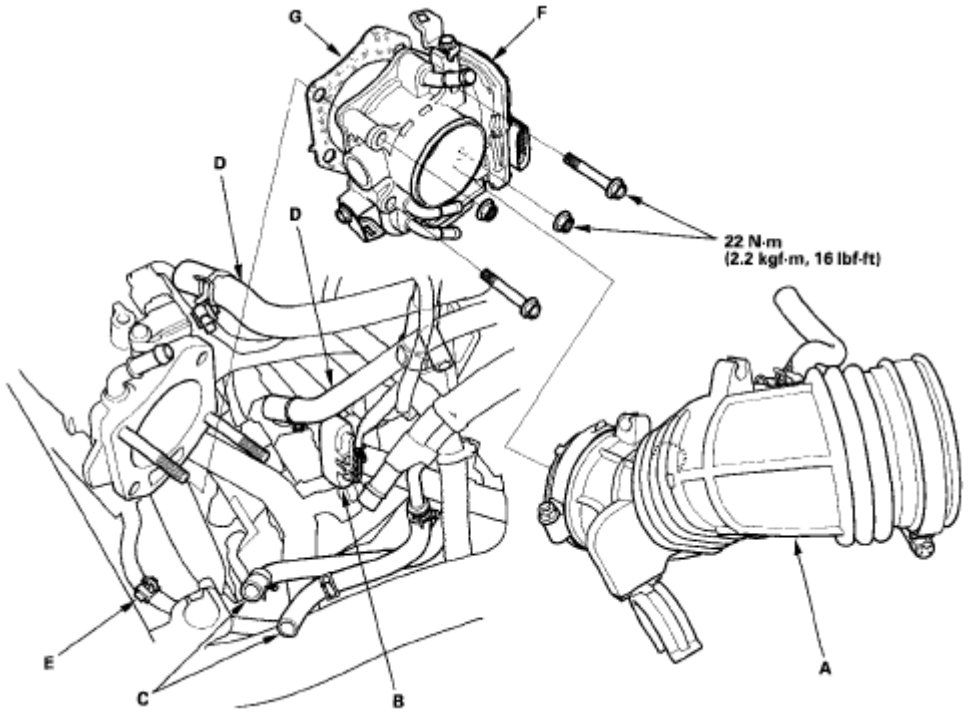

Fig. 8: Identifying Air Intake Duct, Throttle Body And Water Bypass/Vacuum Hoses (With Torque Specification)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Disconnect the throttle body connector (B).
7. Disconnect the water bypass hoses (C), and plug them.
8. Disconnect the vacuum hoses (D) and the clamp (E).
9. Remove the throttle body (F).
10. Install the parts in the reverse order of removal with a new gasket (G), then do this:
    - Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
    - Refill the radiator with engine coolant (see **COOLANT CHECK**).

THROTTLE BODY DISASSEMBLY/REASSEMBLY

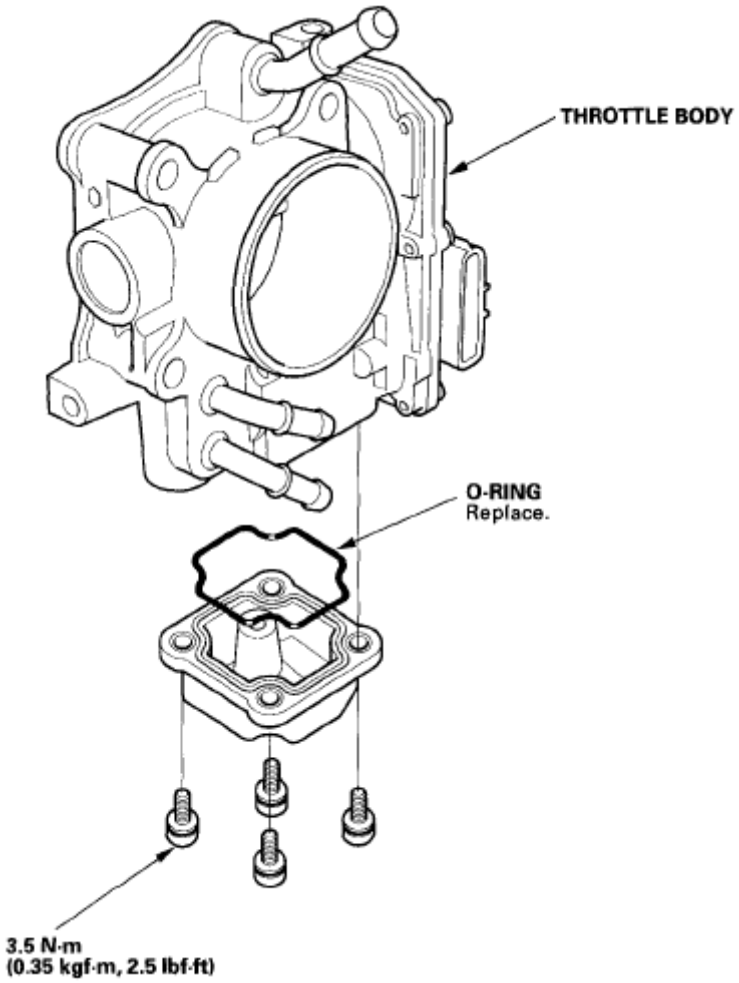

Fig. 9: Identifying Throttle Body And O-Ring (With Torque Specification)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

INTAKE AIR BYPASS CONTROL THERMAL VALVE REPLACEMENT

1. Remove the engine cover .
2. Remove the air intake duct (A).

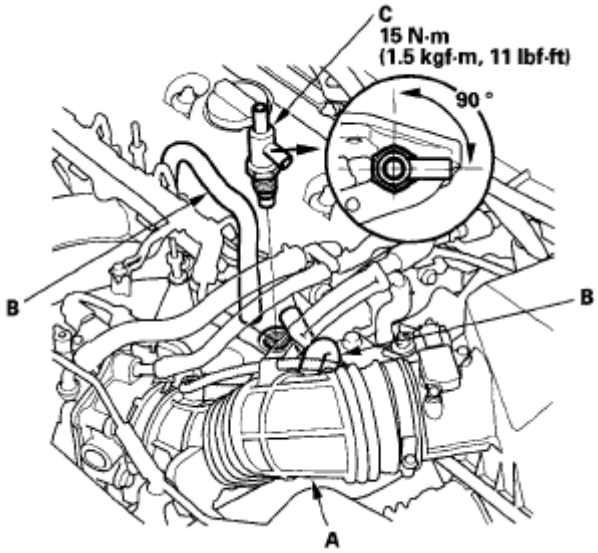

Fig. 10: Identifying Air Intake Duct And Intake Air Bypass Control Thermal Valve (With Torque Specification)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Disconnect the hoses (B).
4. Remove the intake air bypass control thermal valve (C).
5. Install the parts in the reverse order of removal.

NOTE:

- **Position the valve angle as shown.**
- **Make sure the center of the clamp (D) and its lever end (E) are within the ranges shown.**

2006-08 ENGINE PERFORMANCE

Intake Air System (R18A1) - Civic (Except Hybrid)

COMPONENT LOCATION INDEX

NOTE: **Refer to the INTAKE AIR SYSTEM (GX) (SUPPLEMENT) article for additional information for the GX model.**

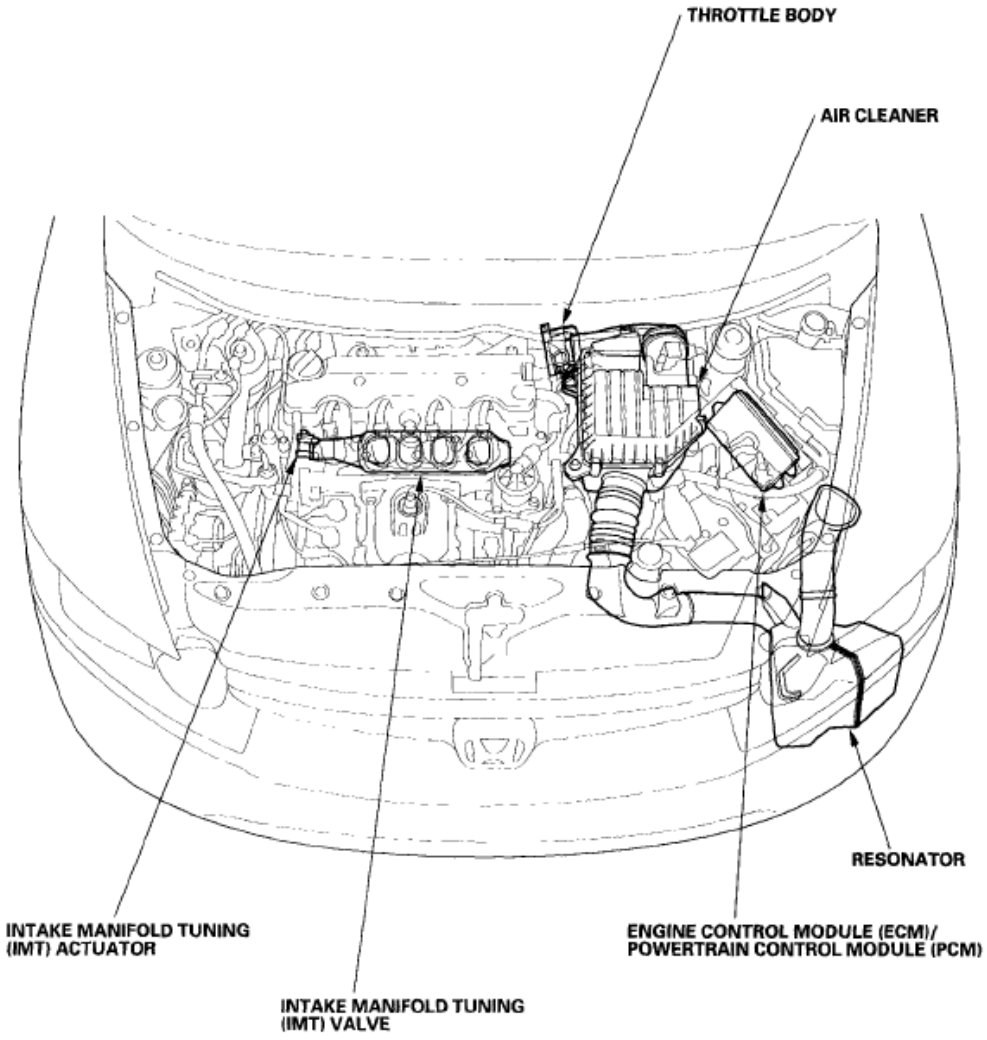

Fig. 1: Locating Intake Air System Components
Courtesy of AMERICAN HONDA MOTOR CO., INC.

DTC TROUBLESHOOTING

DTC P1077: IMT VALVE STUCK IN HIGH RPM POSITION

NOTE: **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Do the IMT TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the IMT actuator and the ECM/PCM.

   NO - Go to step 4.

4. Turn the ignition switch OFF.
5. Disconnect the IMT actuator 5P connector.
6. Turn the ignition switch ON (II).
7. Measure voltage between IMT actuator 5P connector terminal No. 1 and body ground.

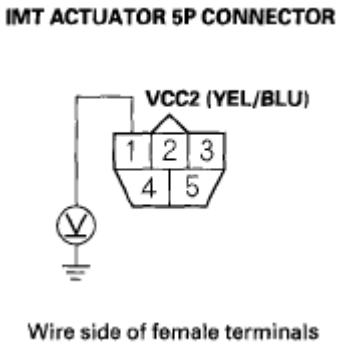

Fig. 2: Measuring Voltage Between IMT Actuator 5P Connector Terminal No 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there about 5 V?

   YES - Go to step 12.

   NO - Go to step 8.

8. Turn the ignition switch OFF.
9. Jump the SCS line with the HDS.
10. Disconnect ECM/PCM connector B (44P).
11. Check for continuity between IMT actuator 5P connector terminal No. 1 and ECM/PCM connector terminal B18.

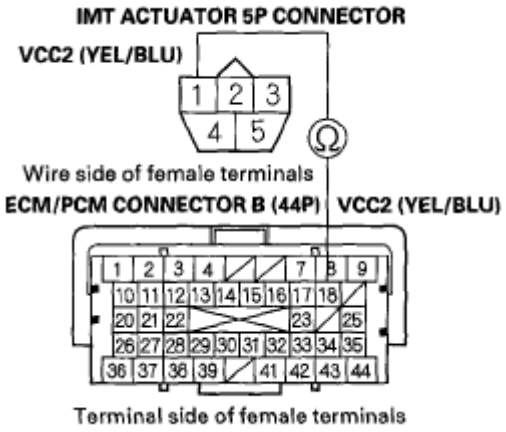

Fig. 3: Checking Continuity Between IMT Actuator 5P Connector Terminal No. 1 And ECM/PCM Terminal B18
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 36.

NO - Repair open in the wire between the ECM/PCM (B18) and the IMT actuator, then go to step 30.

12. Measure voltage between IMT actuator 5P connector terminal No. 3 and body ground.

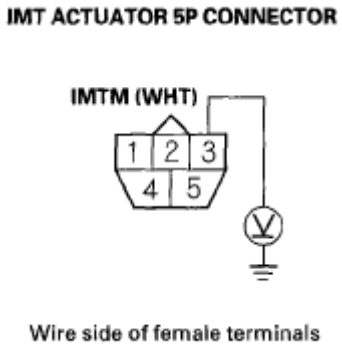

Fig. 4: Measuring Voltage Between IMT Actuator 5P Connector Terminal No 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 17.

NO - Go to step 13.

13. Turn the ignition switch OFF.
14. Jump the SCS line with the HDS.
15. Disconnect ECM/PCM connector B (44P).
16. Check for continuity between IMT actuator 5P connector terminal No. 3 and ECM/PCM connector

terminal B39.

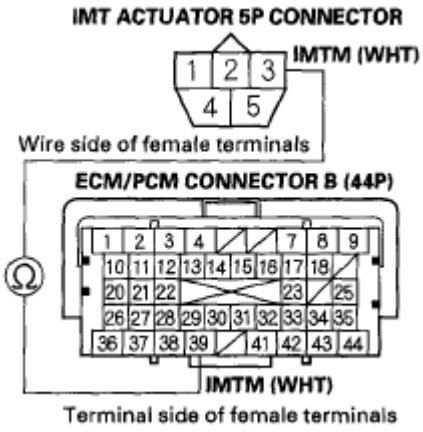

Fig. 5: Checking Continuity Between IMT Actuator 5P Connector Terminal No. 3 And ECM/PCM Terminal B39
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 36.

NO - Repair open in the wire between the ECM/PCM (B39) and the IMT actuator, then go to step 30.

17. Turn the ignition switch OFF.
18. Jump the SCS line with the HDS.
19. Disconnect ECM/PCM connector B (44P).
20. Check for continuity between IMT actuator 5P connector terminal No. 2 and ECM/PCM connector terminal B33.

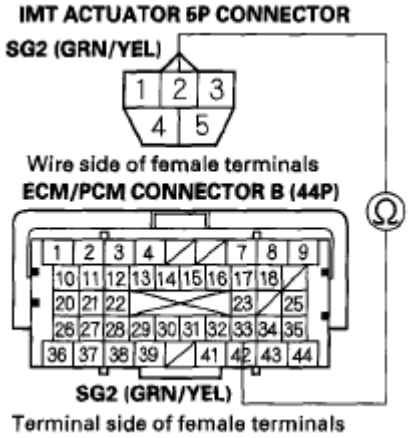

Fig. 6: Checking Continuity Between IMT Actuator 5P Connector Terminal No. 2 And ECM/PCM Terminal B33
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 21.

NO - Repair open in the wire between the ECM/PCM (B33) and the IMT actuator, then go to step 30.

21. Check for continuity between ECM/PCM connector terminal B37 and body ground.

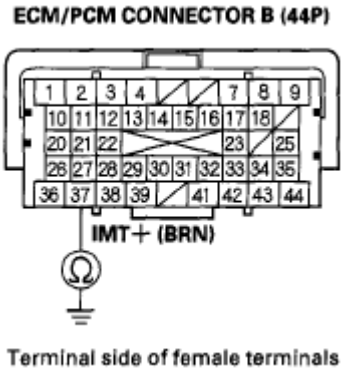

Fig. 7: Checking Continuity Between ECM/PCM Connector Terminal B37 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (B37) and the IMT actuator, then go to step 30.

NO - Go to step 22.

22. Check for continuity between ECM/PCM connector terminal B38 and body ground.

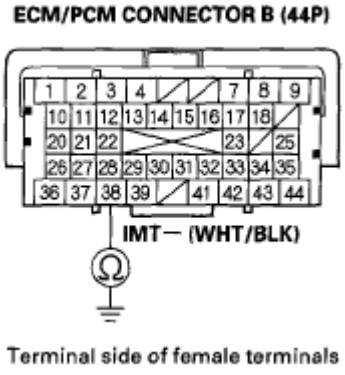

Fig. 8: Checking Continuity Between ECM/PCM Connector Terminal B38 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (B38) and the IMT actuator, then go to step 30.

NO - Go to step 23.

23. Check for continuity between IMT actuator 5P connector terminal No. 4 and ECM/PCM connector terminal B37.

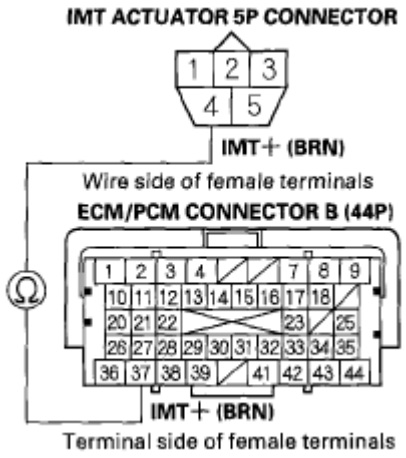

Fig. 9: Checking Continuity Between IMT Actuator 5P Connector Terminal No 4 And ECM/PCM Terminal B37
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 24.

NO - Repair open in the wire between the ECM/PCM (B37) and the IMT actuator, then go to step 30.

24. Check for continuity between IMT actuator 5P connector terminal No. 5 and ECM/PCM connector terminal B38.

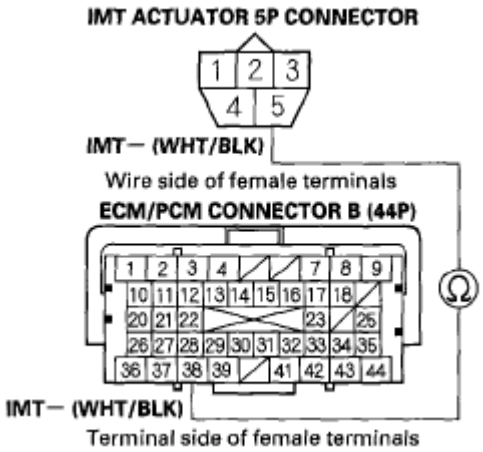

Fig. 10: Checking Continuity Between IMT Actuator 5P Connector Terminal No. 5 And ECM/PCM Terminal B38
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the ECM/PCM (B38) and the IMT actuator, then go to step 30.

25. Remove the IMT actuator (see **IMT ACTUATOR REMOVAL/INSTALLATION**).
26. Move the IMT valve by hand.

    Does it move smoothly?

    YES - Go to step 27.

    NO - Replace the IMT valve (see **IMT VALVE REPLACEMENT**), then go to step 30.

27. Substitute a known-good IMT actuator (see **IMT ACTUATOR REMOVAL/INSTALLATION**).
28. Turn the ignition switch ON (II).
29. Do the IMT TEST in the INSPECTION MENU with the HDS.

    Is the result OK?

    YES - Replace the original IMT actuator (see **IMT ACTUATOR REMOVAL/INSTALLATION**), then go to step 30.

    NO - Go to step 36.

30. Reconnect all connectors.
31. Turn the ignition switch ON (II).
32. Reset the ECM/PCM with the HDS.
33. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
34. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1077 indicated?

    YES - Check for poor connections or loose terminals at the IMT actuator and the ECM/PCM, then go to step 1.

    NO - Go to step 35.

35. Monitor the OBD STATUS for DTC P1077 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 34, go to the indicated DTCs troubleshooting.

    NO -If the screen indicates FAILED, check for poor connections or loose terminals at the IMT actuator and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

36. Reconnect all connectors.
37. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or

substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).

38. Start the engine, and let it idle.
39. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1077 indicated?

    YES - Check for poor connections or loose terminals at the IMT actuator and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 38. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 40.

40. Monitor the OBD STATUS for DTC P1077 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 39, go to the indicated DTCs troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the IMT actuator and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 38. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P1078: IMT VALVE STUCK IN LOW RPM POSITION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Do the IMT TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the IMT actuator and the ECM/PCM.

   NO - Go to step 4.

4. Turn the ignition switch OFF.
5. Disconnect the IMT actuator 5P connector.
6. Turn the ignition switch ON (II).
7. Check the IMT VALVE SW in the DATA LIST with the HDS.

   Is CLOSE indicated?

YES - Go to step 12.

NO - Go to step 8.

8. Turn the ignition switch OFF.
9. Jump the SCS line with the HDS.
10. Disconnect ECM/PCM connector B (44P).
11. Check for continuity between ECM/PCM connector terminal B39 and body ground.

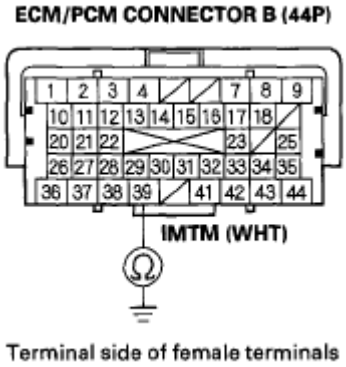

Fig. 11: Checking Continuity Between ECM/PCM Connector Terminal B39 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (B39) and the IMT actuator, then go to step 21.

NO - Go to step 28.

12. Check for continuity between ECM/PCM connector terminal B37 and body ground.

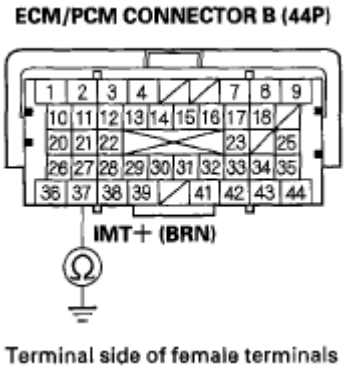

Fig. 12: Checking Continuity Between ECM/PCM Connector Terminal B37 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (B37) and the IMT actuator, then go to step 21.

NO - Go to step 13.

13. Check for continuity between ECM/PCM connector terminal B38 and body ground.

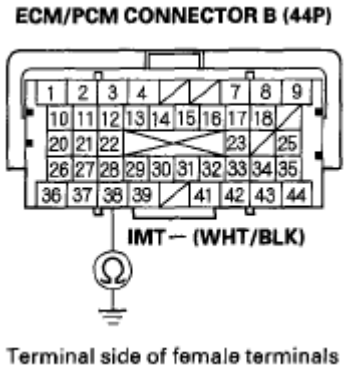

Fig. 13: Checking Continuity Between ECM/PCM Connector Terminal B38 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (B38) and the IMT actuator, then go to step 21.

NO - Go to step 14.

14. Check for continuity between IMT actuator 5P connector terminal No. 4 and ECM/PCM connector terminal B37.

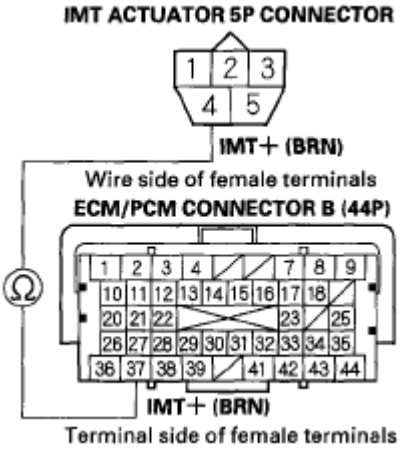

Fig. 14: Checking Continuity Between IMT Actuator 5P Connector Terminal No. 4 And ECM/PCM Terminal B37
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 15.

NO - Repair open in the wire between the ECM/PCM (B37) and the IMT actuator, then go to step 21.

15. Check for continuity between IMT actuator 5P connector terminal No. 5 and ECM/PCM connector terminal B38.

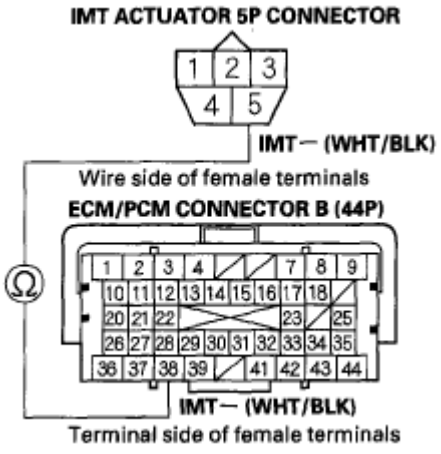

Fig. 15: Checking Continuity Between IMT Actuator 5P Connector Terminal No 5 And ECM/PCM Terminal B38
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 16.

NO - Repair open in the wire between the ECM/PCM (B38) and the IMT actuator, then go to step 21.

16. Remove the IMT actuator (see **IMT ACTUATOR REMOVAL/INSTALLATION**).
17. Move the IMT valve by hand.

Does it move smoothly?

YES - Go to step 18.

NO - Replace the IMT valve (see **IMT VALVE REPLACEMENT**), then go to step 21.

18. Substitute a known-good IMT actuator (see **IMT ACTUATOR REMOVAL/INSTALLATION**).
19. Turn the ignition switch ON (II).
20. Do the IMT TEST in the INSPECTION MENU with the HDS.

Is the result OK?

YES - Replace the original IMT actuator (see **IMT ACTUATOR REMOVAL/INSTALLATION**), then go to step 21.

NO - Go to step 29.

21. Reconnect all connectors.
22. Turn the ignition switch ON (II).
23. Reset the ECM/PCM with the HDS.

24. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
25. Do the IMT TEST in the INSPECTION MENU with the HDS.
26. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1078 indicated?

    YES - Check for poor connections or loose terminals at the IMT actuator and the ECM/PCM, then go to step 1.

    NO - Go to step 27.

27. Monitor the OBD STATUS for DTC P1078 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 26, go to the indicated DTCs troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the IMT actuator and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 25.

28. Reconnect all connectors.
29. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
30. Do the IMT TEST in the INSPECTION MENU with the HDS.
31. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1078 indicated?

    YES - Check for poor connections or loose terminals at the IMT actuator and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 30. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 32.

32. Monitor the OBD STATUS for DTC P0128 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 31, go to the indicated DTCs troubleshooting.

    NO -If the screen indicates FAILED, check for poor connections or loose terminals at the IMT actuator and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 30. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, go to step 30.

THROTTLE BODY TEST

CARBON ACCUMULATION CHECK

NOTE: If the malfunction indicator lamp (MIL) has been reported on, check for diagnostic trouble codes (DTCs).

1. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

Fig. 16: Connecting HDS To DLC
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch ON (II).
3. Make sure the HDS communicates with the ECM/PCM and other vehicle systems. If it doesn't, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
5. Check the REL TP SENSOR in the DATA LIST with the HDS. The reading should be below 3 deg. If it is not, clean the throttle body (see **THROTTLE BODY CLEANING**).

THROTTLE POSITION LEARNING CHECK

NOTE: If the malfunction indicator lamp (MIL) has been reported on, check for diagnostic trouble codes (DTCs).

1. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

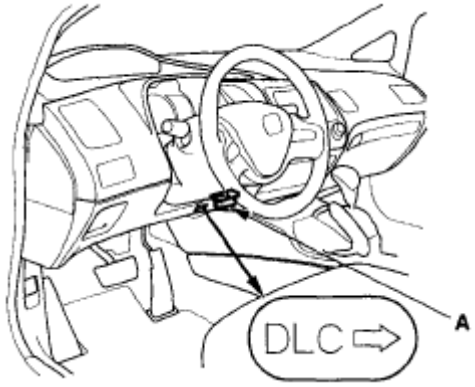

Fig. 17: Connecting HDS To DLC
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch ON (II).
3. Make sure the HDS communicates with the ECM/PCM and other vehicle systems. If it doesn't, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Select the INSPECTION MENU with the HDS.
5. Do the TP POSITION CHECK in the ETCS TEST. If needed, clean the throttle body (see **THROTTLE BODY CLEANING**).

THROTTLE BODY CLEANING

CAUTION: Do not insert your fingers into the installed throttle body when you turn the ignition switch ON (II) or while the ignition switch is ON (II). If you do, you will seriously injure your fingers if the throttle valve is activated.

1. Check for damage to the air cleaner. If the air cleaner is damaged, replace it (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**).
2. Remove the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
3. Clean off the carbon from the throttle valve and inside the throttle body with a paper towel soaked in throttle plate and induction cleaner.

NOTE:

- **Remove the throttle body to clean it.**
- **Be careful not to pinch your fingers.**
- **To avoid removing the molybdenum coating, do not clean the bearing area of the throttle shaft (A).**
- **Do not spray throttle plate and induction cleaner directly on the throttle body.**
- **Use Honda genuine throttle plate and induction cleaner.**

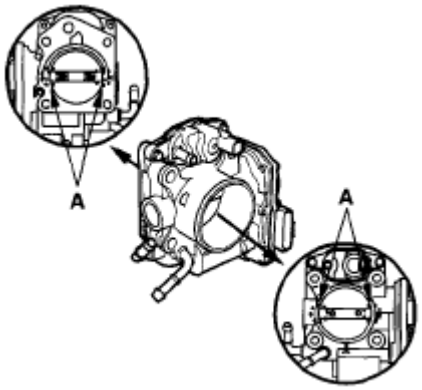

Fig. 18: Cleaning Off Carbon From Throttle Valve And Inside Throttle Body
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
5. Reset the ECM/PCM with the HDS (see **ECM/PCM RESET**).
6. Turn the ignition switch ON (II), and wait for 2 seconds.
7. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).

AIR CLEANER REMOVAL/INSTALLATION

1. Disconnect the MAF sensor/IAT sensor connector (A).

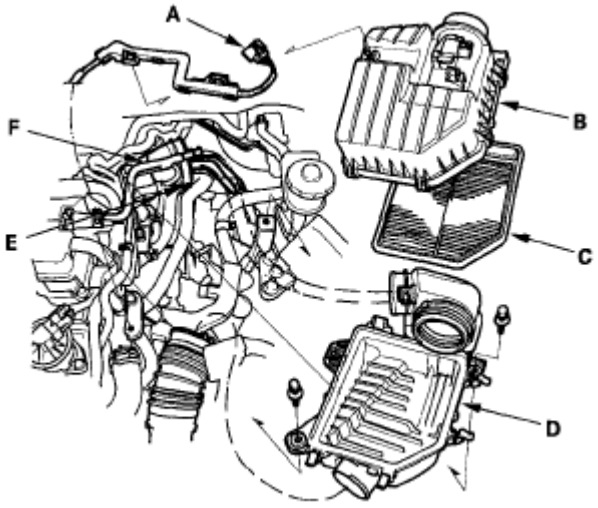

Fig. 19: Disconnecting MAF Sensor/IAT Sensor Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the air cleaner housing cover (B).
3. Remove the air cleaner element (C) from the air cleaner housing (D).
4. Loosen the bolt (E), and the pipe (F).
5. Remove the air cleaner housing.
6. Install the parts in the reverse order of removal.

AIR CLEANER ELEMENT INSPECTION/REPLACEMENT

1. Open the air cleaner housing cover (A).

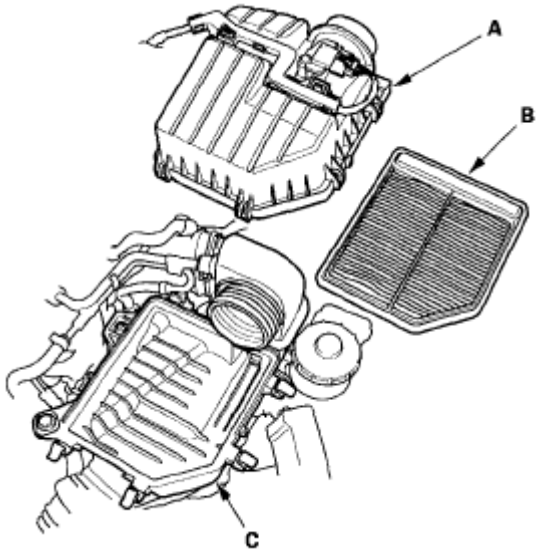

Fig. 20: Opening Air Cleaner Housing Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the air cleaner element (B) from the air cleaner housing (C).
3. Check the air cleaner element for damage or clogging. If there is damage or clogging, replace the air cleaner element.

NOTE: Do not use compressed air to clean the air cleaner element.

4. Install the parts in the reverse order of removal.
5. Install the parts in the reverse order of removal.
   - If you did not replace the air cleaner element, this procedure is complete.
   - If the maintenance minder required air cleaner element replacement, reset the maintenance minder.
   - If the idle speed fluctuates, do the idle speed inspection.

RESONATOR REMOVAL/INSTALLATION

1. Remove the front bumper (see **FRONT BUMPER REMOVAL/INSTALLATION**).
2. Remove the bolts (A), and the intake air ducts (B).

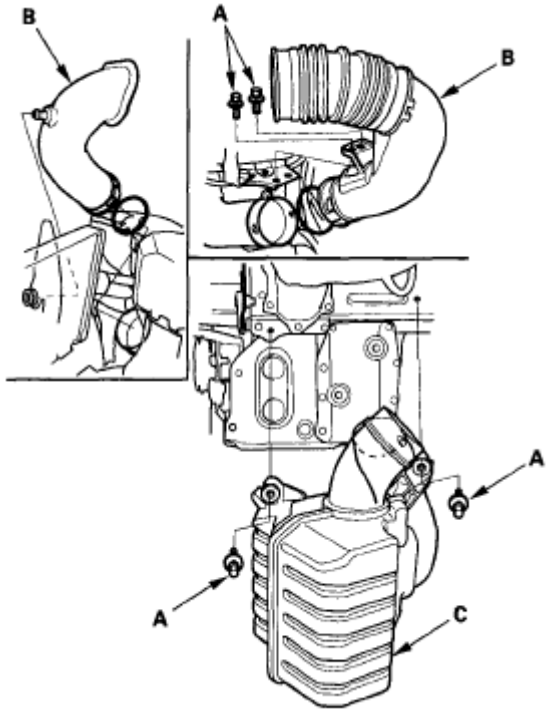

Fig. 21: Removing Intake Air Ducts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the resonator (C).
4. Install the parts in the reverse order of removal.

IMT ACTUATOR REMOVAL/INSTALLATION

1. Remove the intake manifold (see **REMOVAL**).
2. Remove the bolts (A) and the IMT actuator (B).

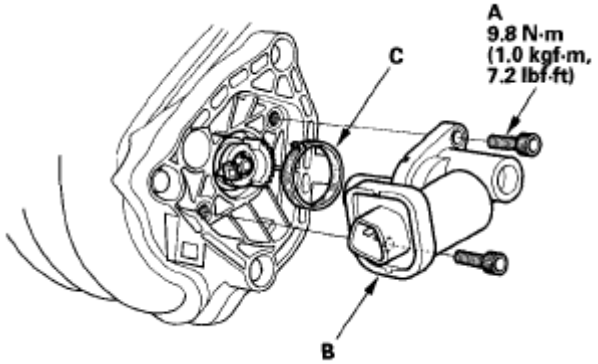

Fig. 22: Removing IMT Actuator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the parts in the reverse order of removal with a new O-ring (C).

IMT VALVE REPLACEMENT

1. Remove the IMT actuator (see **IMT ACTUATOR REMOVAL/INSTALLATION**).
2. Remove the IMT cover (A).

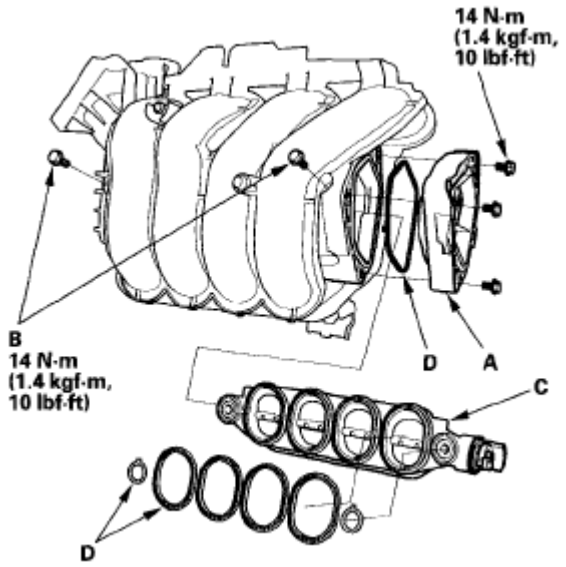

Fig. 23: Removing IMT Cover (With Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the bolts (B) and the IMT valve (C).
4. Install the parts in the reverse order of removal with new O-rings (D).

THROTTLE BODY REMOVAL/INSTALLATION

CAUTION: Do not insert your fingers into the installed throttle body when you turn the ignition switch ON (II) or while the ignition switch is ON (II). If you do, you will seriously injure your fingers if the throttle valve is activated.

NOTE: If you are replacing or cleaning the throttle body, start at step 1. If you are removing the throttle body, start at step 4.

1. Connect the HDS to the DLC while the engine is stopped.
2. USA, Canada models: Select the INSPECTION MENU on the HDS.
3. USA, Canada models: Do the TP POSITION CHECK in the ETCS TEST.
4. Remove the cowl cover and under-cowl panel (see **FRONT GRILLE COVER REPLACEMENT**).
5. Remove the air cleaner (see **THROTTLE BODY CLEANING**).
6. Disconnect the throttle body connector (A) and the EVAP purge control solenoid valve connector (B).

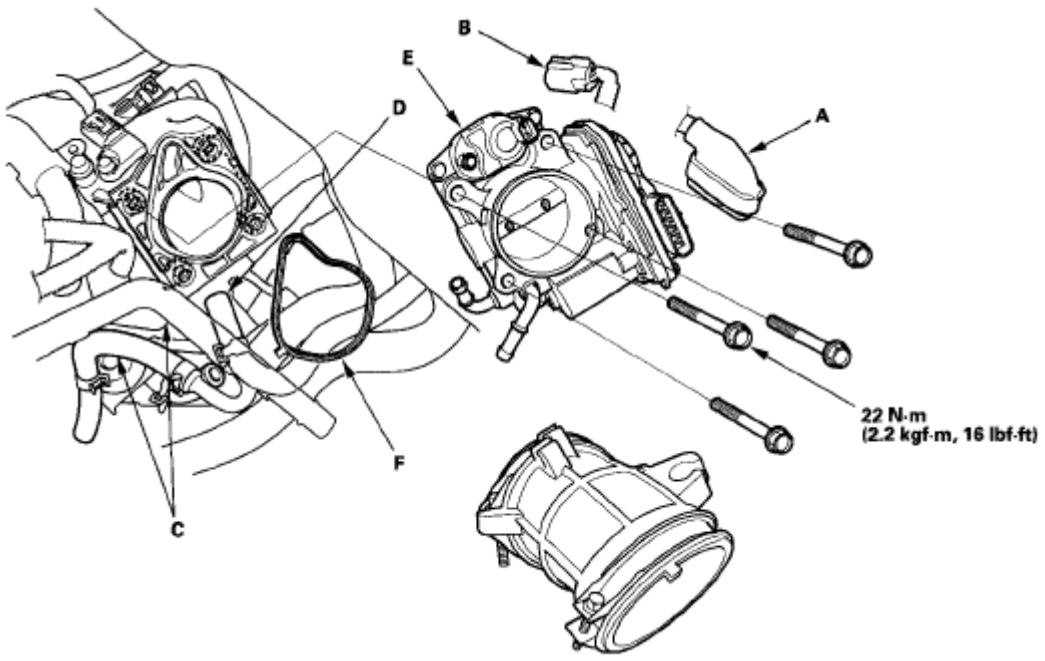

Fig. 24: Disconnecting Throttle Body Connector And EVAP Purge Control Solenoid Valve Connector (With Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Disconnect the throttle body connector (B) and the EVAP purge control solenoid valve connector (C).
8. Disconnect and plug the water bypass hoses (C).
9. Disconnect the vacuum hose (D).
10. Remove the throttle body (E).
11. Install the parts in the reverse order of removal with a new gasket (F).

NOTE:

- **Do the ECM/PCM idle learn procedure (see ECM/PCM IDLE LEARN PROCEDURE) after replacing throttle body.**
- **Refill the radiator with engine coolant (see COOLANT REPLACEMENT).**

THROTTLE BODY DISASSEMBLY/REASSEMBLY

Advanced Diagnostics - Civic

DTC P0010 (56): ADVANCED DIAGNOSTICS (K20Z3)

DTC P0010: VARIABLE VALVE TIMING CONTROL (VTC) OIL CONTROL SOLENOID VALVE MALFUNCTION (K20Z3)

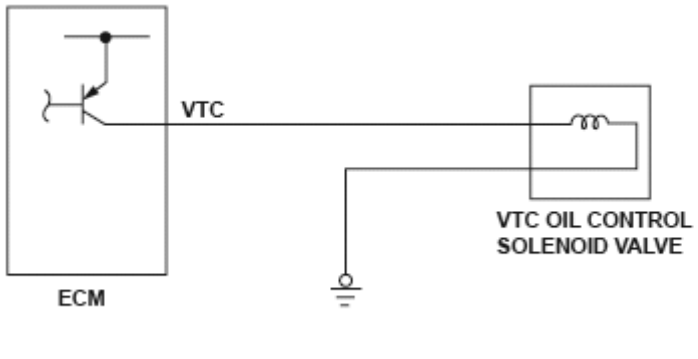

Fig. 1: Variable Valve Timing Control (VTC) Oil Control Solenoid Valve - Circuit Diagram

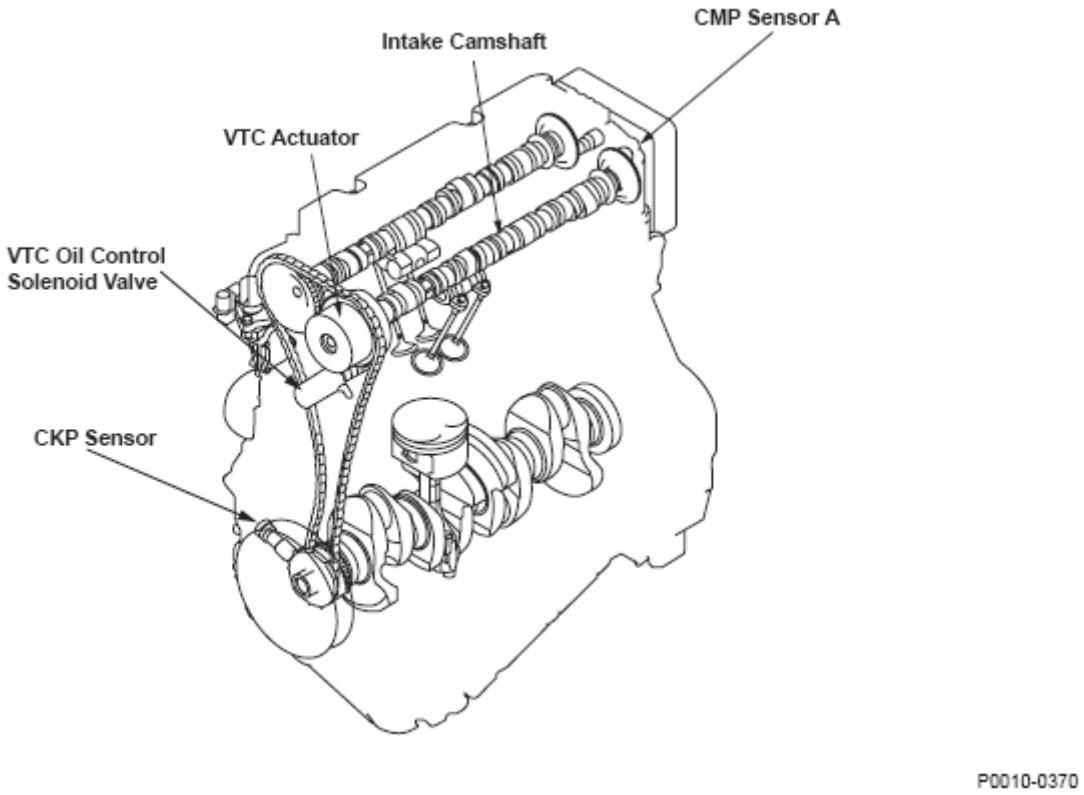

Fig. 2: Identifying Oil Control Solenoid Valve And CKP Sensor

General Description (K20Z3)

The variable valve timing control (VTC) consists of the VTC actuator, the VTC oil control solenoid valve, sensors, and the engine control module (ECM). The ECM controls the VTC oil control solenoid valve by

duty cycle and supplies hydraulic pressure to the advance chamber or the retard chamber in the actuator so the valve timing is optimized depending on the driving conditions (engine load, engine speed, and vehicle speed). If the current when compared to the output duty cycle is out of a set value, the ECM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions (K20Z3)

ENABLE CONDITIONS REFERENCE CHART

Condition	
State of the engine	Running

Malfunction Threshold (K20Z3)

One of these conditions must be met.

- Output duty is 40 % or more and the VTC current is 200 mA or less for at least 5 seconds.
- Output duty is 5 % or less and the VTC current is 800 mA or more for at least 5 seconds.

Driving Pattern (K20Z3)

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on.
2. Drive the vehicle at a steady speed between 25 - 75 mph (40 - 120 km/h) for at least 5 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (K20Z3)

Conditions for illuminating the MIL (K20Z3)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM memory.

Conditions for clearing the MIL (K20Z3)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0011 (56): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P0011: VARIABLE VALVE TIMING CONTROL (VTC) SYSTEM MALFUNCTION (K20Z3)

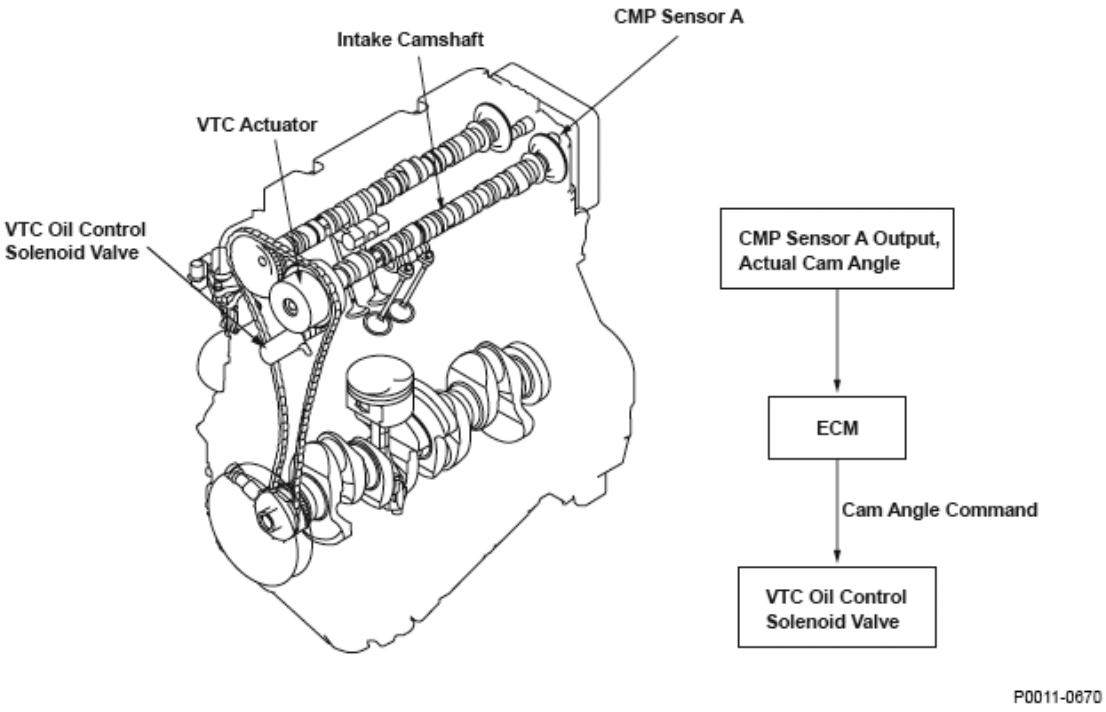

Fig. 3: Identifying Oil Control Solenoid Valve And CKP Sensor

General Description (K20Z3 Engine)

The variable valve timing control (VTC) system controls the timing of the intake camshaft. It uses hydraulic pressure to operate the VTC actuator so the valve timing is optimized depending on driving conditions. The engine control module (ECM) monitors the phase control command and the actual timing of the camshaft by using camshaft position (CMP) sensor A. If the phase difference between them is excessive for a certain time period, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	15 seconds or more
DTC Type	Two drive cycles, MIL ON
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions (K20Z3 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Elapsed time after starting the engine	10 seconds	-
23°F (-5°C)(1)	158°F (70°C)	

Engine coolant temperature	-13°F (-25°C)(1)	185°F (85°C)	-
Engine speed	203°F (95°C)(2)	800 rpm	-
	227°F (107°C)(2)	1,600 rpm	
Elapsed TDC revolutions	25°F (-4°C)(1)	Per 0 revolutions	-
	-13°F (-25°C)(1)	Per 23,500 revolutions	
Battery voltage		10.5 V	-
No active DTCs		P0107, P0108, P0112, P0113, P0117, P0118, P0122, P0123, P0222, P0223, P0335, P0339, P1128, P1129, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176, P2227, P2228, P2229, P2646, P2647, P2648, P2649	
(1) Depending on initial engine coolant temperature. (2) Depending on engine coolant temperature.			

Malfunction Threshold (K20Z3 Engine)

The timing difference between the timing control command and the actual timing of the camshaft is 20.0 ° or more for at least 15 seconds.

Confirmation Procedure with the HDS (K20Z3 Engine)

Do the VTC TEST in the INSPECTION MENU of the HDS.

Driving Pattern (K20Z3 Engine)

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on.
2. Drive the vehicle at a steady speed between 25 - 75 mph (40 - 120 km/h) for at least 15 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (K20Z3 Engine)

Conditions for illuminating the MIL (K20Z3 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the ECM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (K20Z3 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0101 (50): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P0101: MASS AIRFLOW (MAF) SENSOR CIRCUIT RANGE/PERFORMANCE PROBLEM (K20Z3)

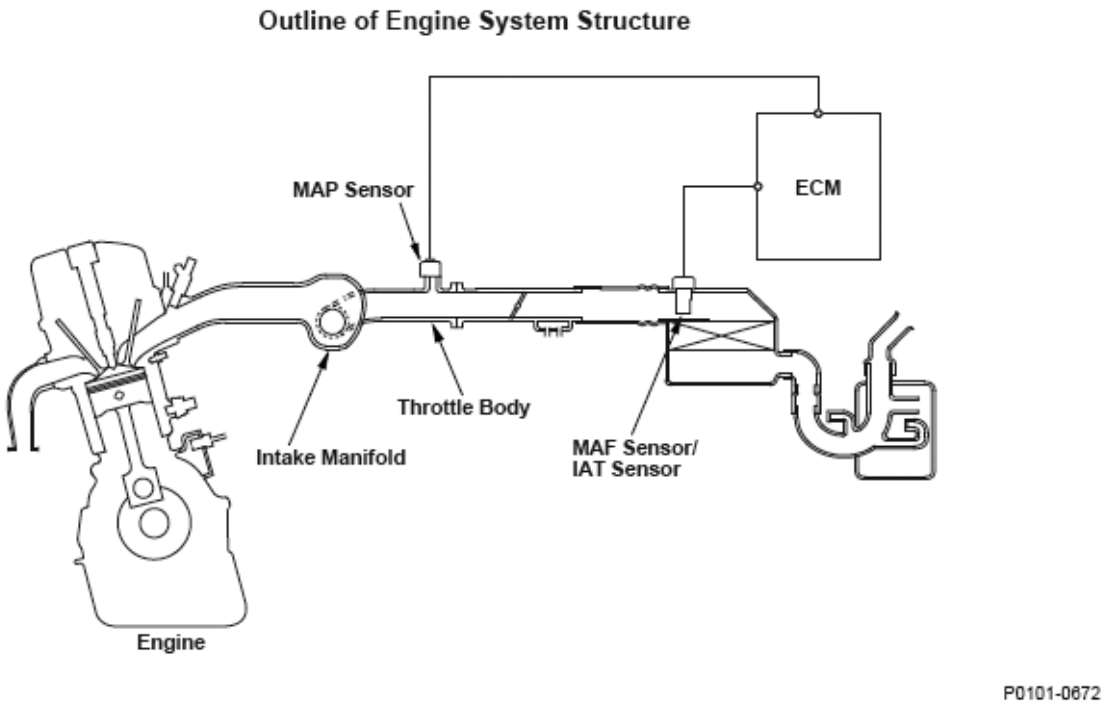

Fig. 4: Mass Airflow (MAF) Sensor - System Diagram

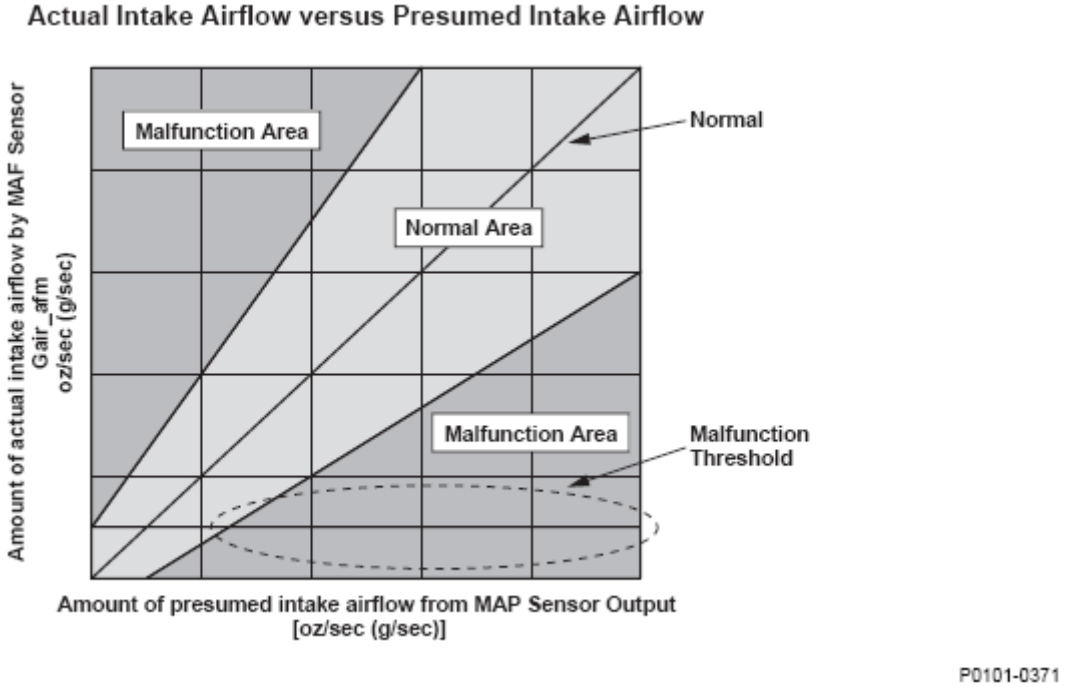

Fig. 5: Actual Intake Airflow Versus Presumed Intake Airflow Graph

General Description (K20Z3 Engine)

The mass airflow (MAF) sensor directly measures the amount of intake airflow into the engine, and the engine control module (ECM) controls the fuel injection based on the measured value. The manifold absolute pressure (MAP) sensor measures the intake manifold pressure and the ECM calculates the amount of intake airflow from the MAP sensor output and the engine revolutions.

The ECM compares the MAF sensor output (amount of intake airflow) and the amount of intake airflow calculated from MAP sensor output. If their difference is too large (in the malfunction area), the ECM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	None
Duration	5 seconds or more
DTC Type	Two drive cycles, MIL ON
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions (K20Z3 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Elapsed time after starting the engine	3 seconds	-
Engine coolant temperature	156°F (69°C)	-
Engine speed	650 rpm	7,700 rpm
No active DTCs	P0102, P0103, P0107, P0108, P0112, P0113, P0117, P0118, P0171, P0172, P0300, P0301, P0302, P0303, P0304, P0335, P0339, P0351, P0352, P0353, P0354, P0443, P0496, P0497, P0506, P0507, P1128, P1129, P2646, P2647, P2648, P2649	

Malfunction Threshold (K20Z3 Engine)

The difference between the amount of intake air measured by the MAF sensor and the amount of intake air calculated from the MAP sensor output is out of the normal area for at least 5 seconds.

Driving Pattern (K20Z3 Engine)

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on.
2. Let the engine idle for at least 5 seconds.

Diagnosis Details (K20Z3 Engine)

Conditions for illuminating the MIL (K20Z3 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the ECM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (K20Z3 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0101 (50): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0101: MASS AIRFLOW (MAF) SENSOR CIRCUIT RANGE/PERFORMANCE PROBLEM (R18A1)

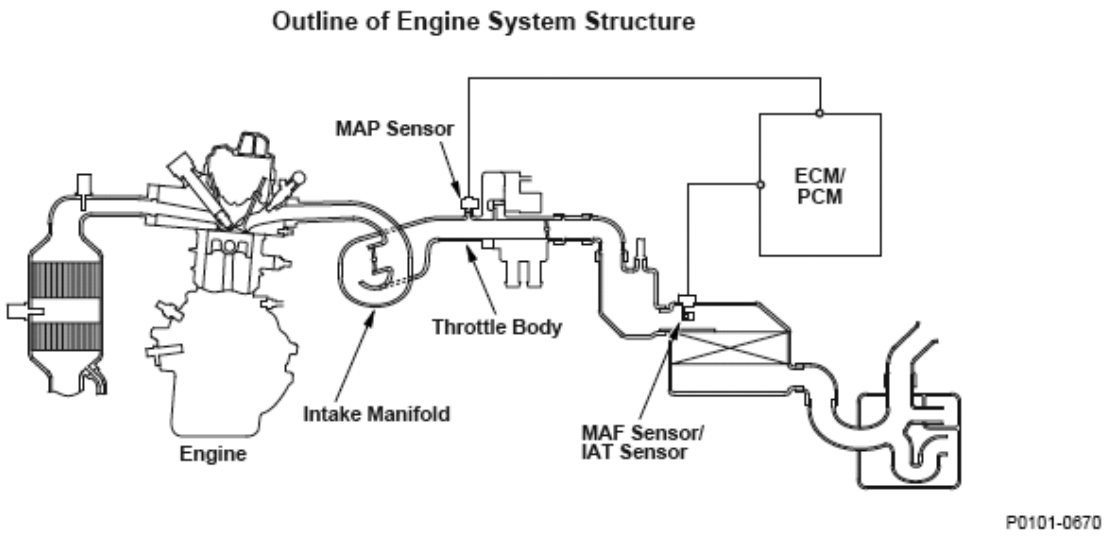

Fig. 6: Mass Airflow (MAF) Sensor - System Diagram

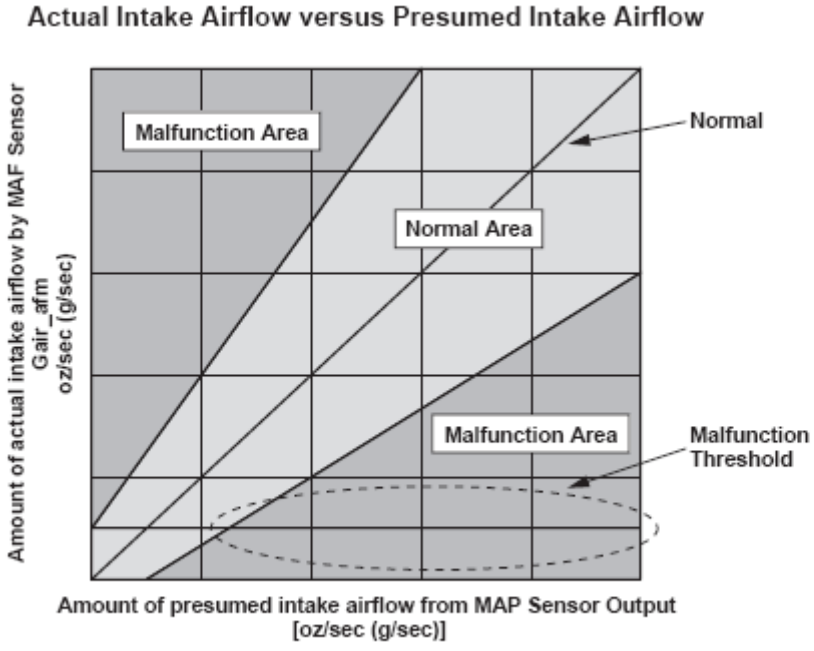

Fig. 7: Actual Intake Airflow Versus Presumed Intake Airflow Graph

General Description (R18A1 Engine)

The mass airflow (MAF) sensor directly measures the amount of intake airflow into the engine, and the engine control module (ECM)/powertrain control module (PCM) controls the fuel injection based on the measured value. The manifold absolute pressure (MAP) sensor measures the intake manifold pressure and the ECM/PCM calculates the amount of intake airflow from the MAP sensor output and the engine revolutions.

The ECM/PCM compares the MAF sensor output (amount of intake airflow) and the amount of intake airflow calculated from MAP sensor output. If their difference is too large (in the malfunction area), the ECM/PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

Malfunction Threshold (R18A1 Engine)

The difference between the amount of intake air measured by the MAF sensor and the amount of intake air calculated from the MAP sensor output is out of the normal area for at least 5 seconds.

Driving Pattern (R18A1 Engine)

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Let the engine idle for at least 5 seconds.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the ECM/PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0101 (50): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P0101: MASS AIR FLOW (MAF) SENSOR RANGE/PERFORMANCE PROBLEM (R18A4 ENGINE)

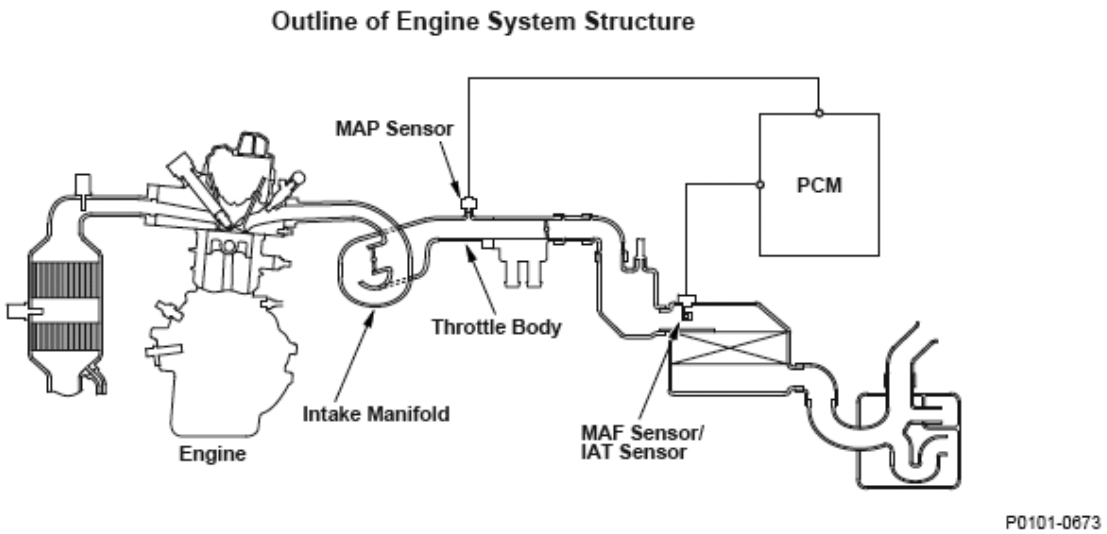

Fig. 8: Mass Air Flow (MAF) Sensor - System Diagram

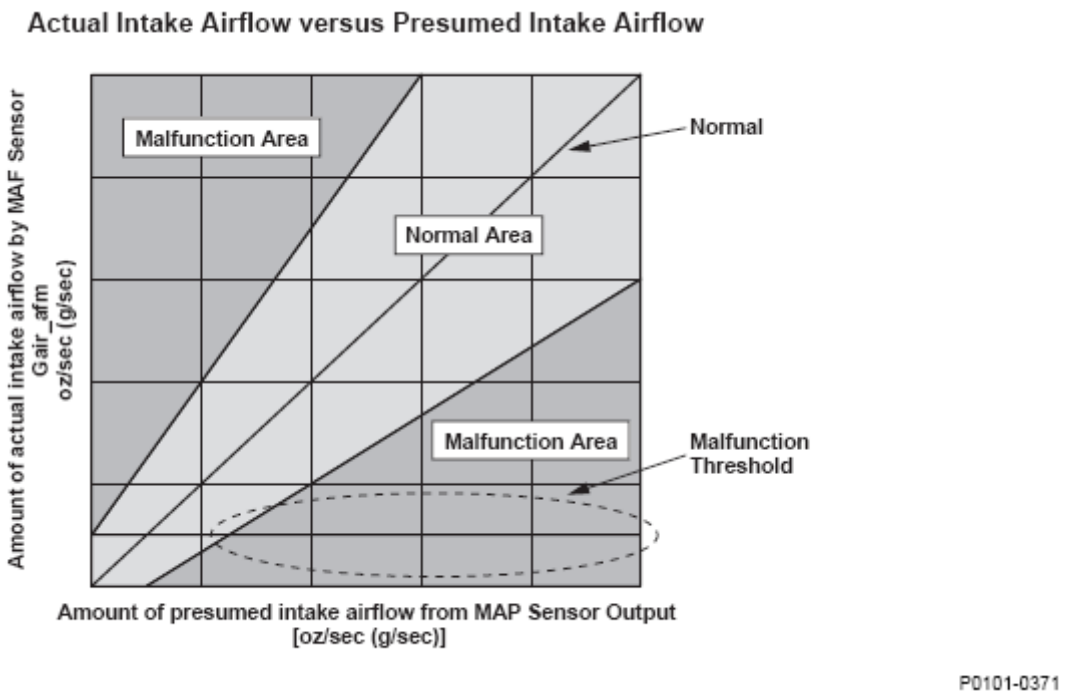

Fig. 9: Actual Intake Airflow Versus Presumed Intake Airflow Graph

General Description (R18A4 Engine)

The mass airflow (MAF) sensor directly measures the amount of intake airflow into the engine, and the powertrain control module (PCM) controls the fuel injection based on the measured value. The manifold absolute pressure (MAP) sensor measures the intake manifold pressure and the PCM calculates the amount of intake airflow from the MAP sensor output and the engine revolutions.

The PCM compares the MAF sensor output (amount of intake airflow) and the amount of intake airflow calculated from MAP sensor output. If their difference is too large (in the malfunction area), the PCM detects a malfunction and a DTC is stored.

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0102 (50): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P0102: MASS AIR FLOW (MAF) SENSOR CIRCUIT LOW VOLTAGE (K20Z3 ENGINE)

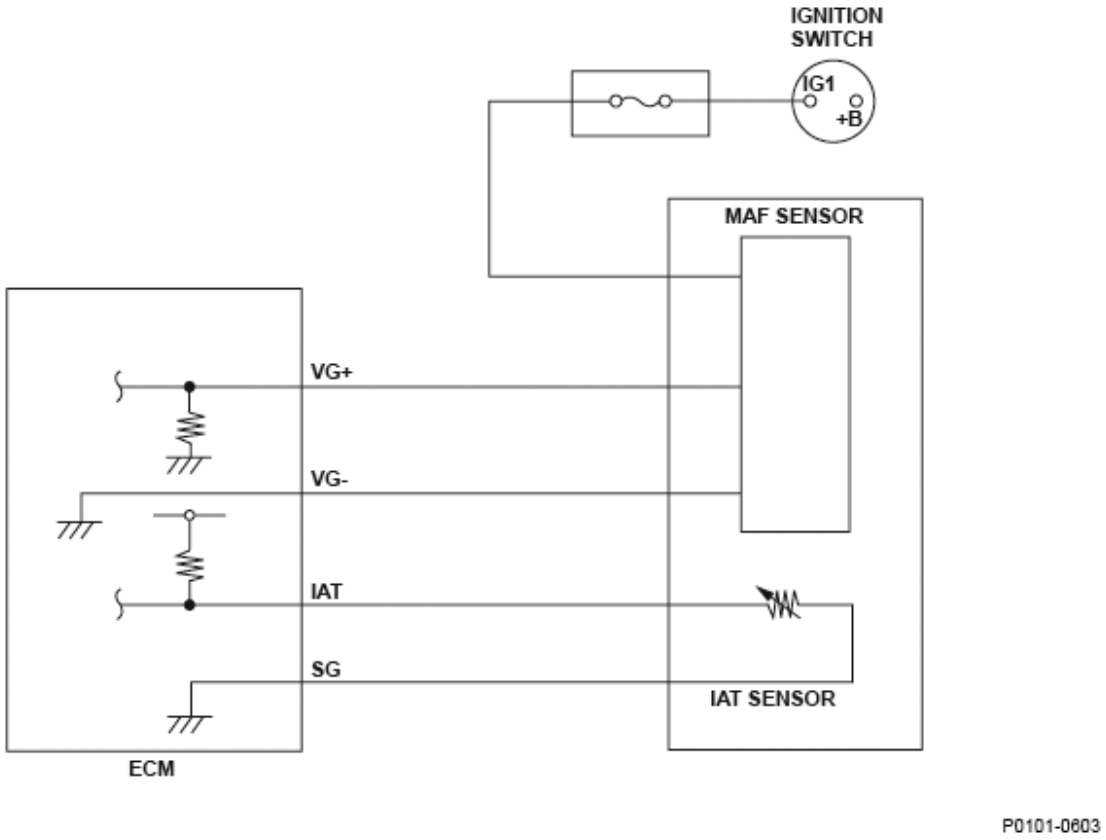

Fig. 10: Mass Air Flow (MAF) Sensor - Circuit Diagram

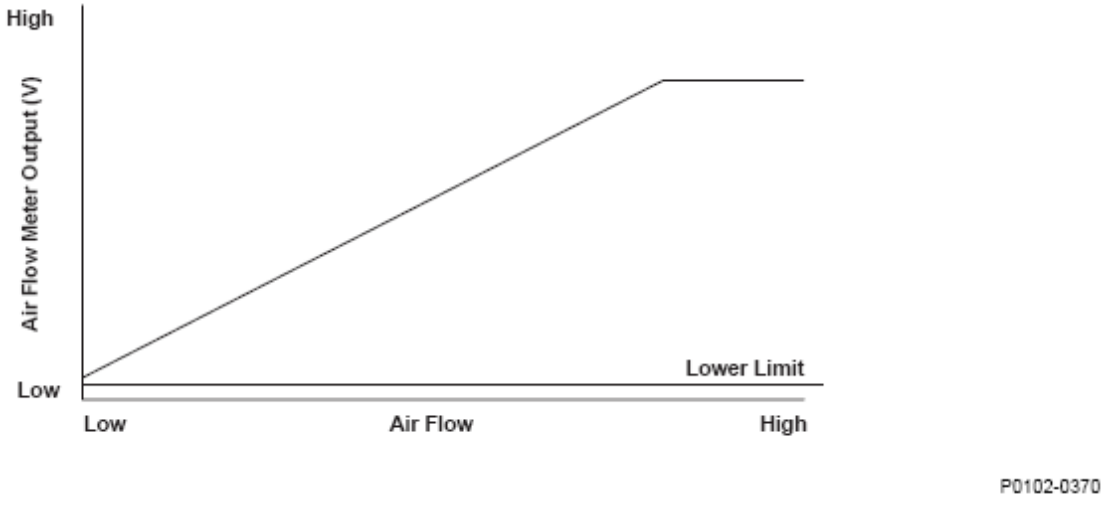

Fig. 11: Mass Air Flow Meter Output Voltage Graph

General Description (K20Z3 Engine)

The mass air flow (MAF) sensor is attached to the intake air passage, and it measures the amount of intake air flow. The MAF sensor is a hot wire air flow meter. The air flow cools the electrically heated wire that is mounted in the air passage. The engine control module (ECM) determines the amount of intake air flow by detecting the current that is required to keep the hot wire at a constant temperature. The lower limit of the MAF sensor output is specified. If the output is below that limit, the ECM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0103 (50): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P0103: MASS AIR FLOW (MAF) SENSOR CIRCUIT HIGH VOLTAGE (R18A4 ENGINE)

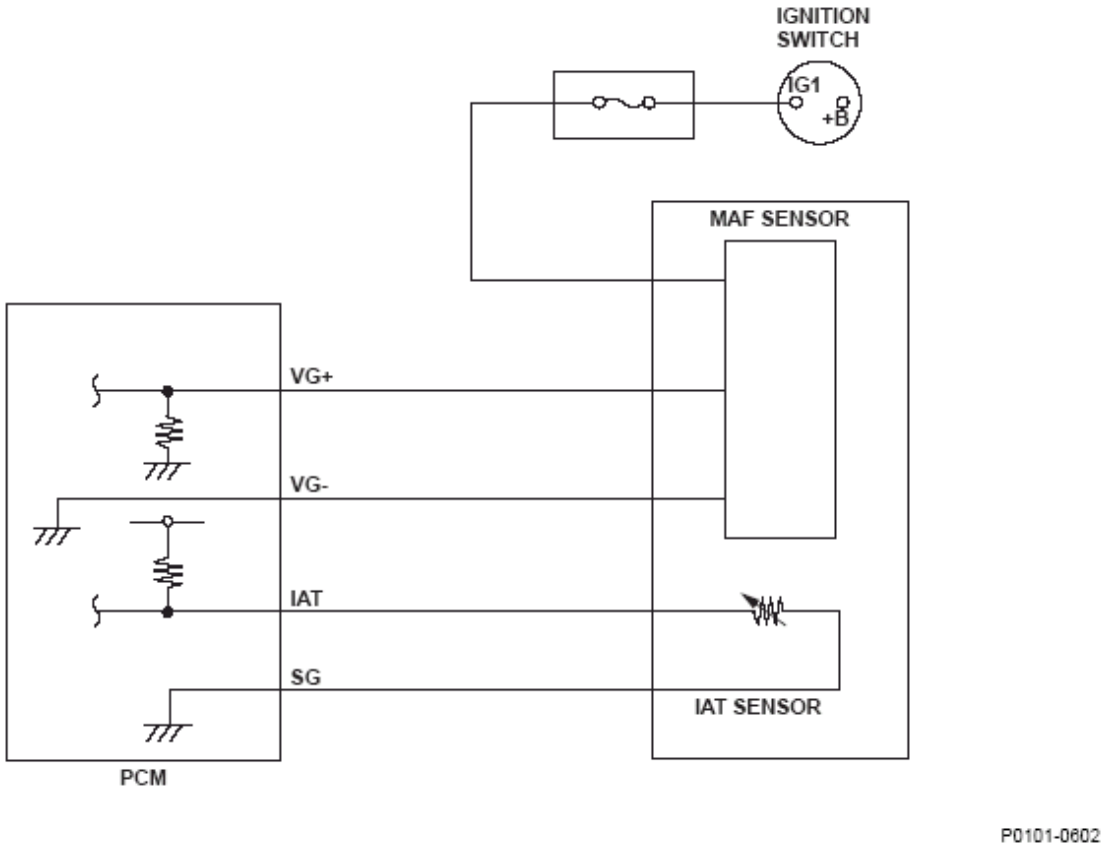

Fig. 20: Mass Air Flow Sensor - Circuit Diagram

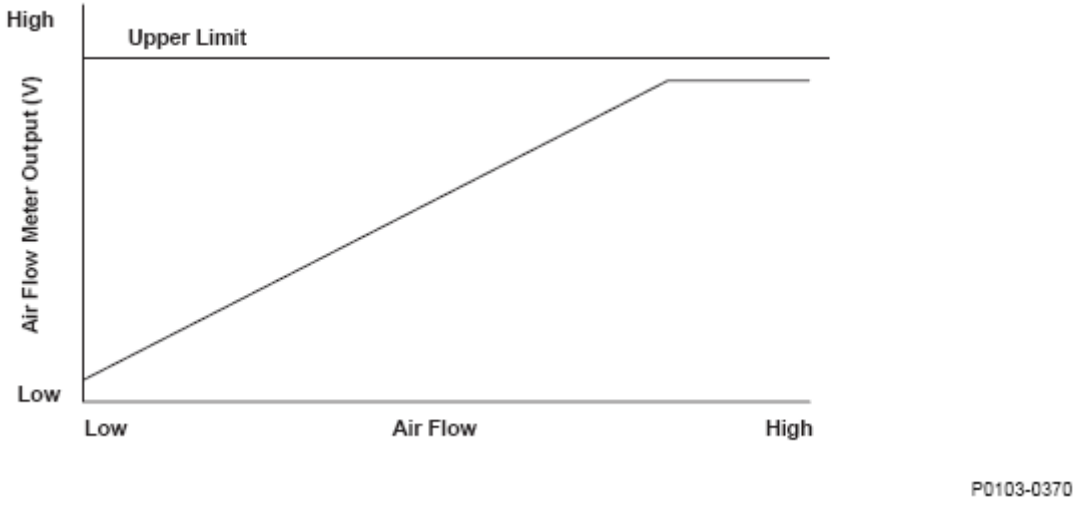

Fig. 21: Mass Air Flow Meter Output Voltage Graph

General Description (R18A4 Engine)

The mass airflow (MAF) sensor is attached to the intake air passage, and it measures the amount of intake airflow. The MAF sensor is a hot wire airflow meter. The airflow cools the electrically heated wire that is mounted in the air passage. The powertrain control module (PCM) determines the amount of intake airflow by detecting the current that is required to keep the hot wire at a constant temperature. The upper limit of the MAF sensor output is specified. If the output is above that limit, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A4 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	N/A

Enable Conditions (R18A4 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	
Ignition switch	ON
No active DTCs	P0102

Malfunction Threshold (R18A4 Engine)

The MAF sensor output voltage is 4.89 V or more for at least 2 seconds.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0107 (12): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0107: MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR CIRCUIT LOW VOLTAGE INPUT (R18A1 ENGINE)

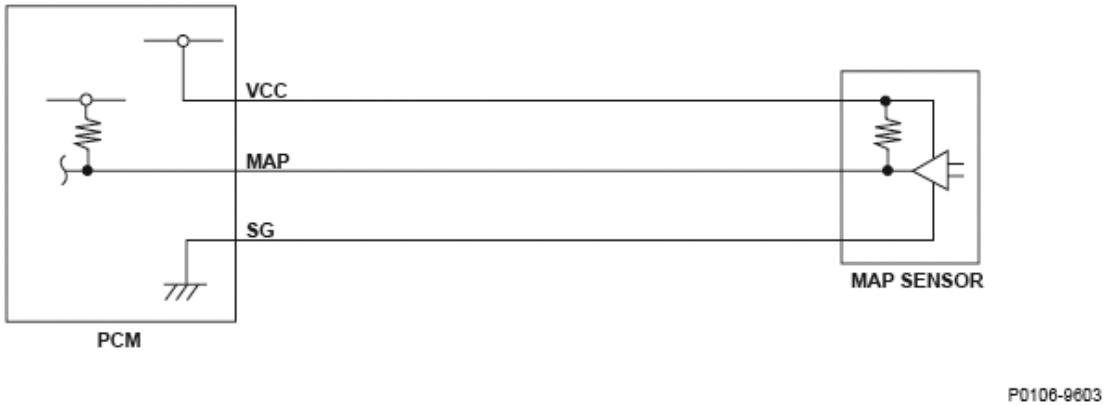

Fig. 22: Manifold Absolute Pressure (MAP) Sensor Circuit Diagram

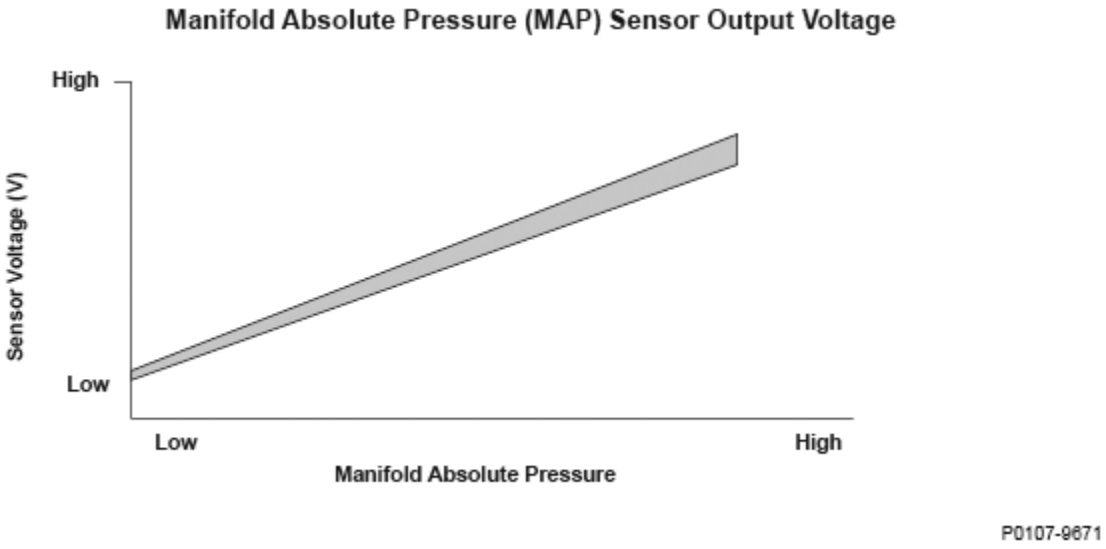

Fig. 23: Manifold Absolute Pressure (MAP) Sensor Output Voltage - Graph

General Description (R18A1 Engine)

The manifold absolute pressure (MAP) sensor senses manifold absolute pressure (vacuum) and converts it into electrical signals. The MAP sensor outputs low signal voltage at high-vacuum (throttle valve closed) and high signal voltage at low-vacuum (throttle valve wide open).

If a signal voltage from the MAP sensor is a set value or less, the powertrain control module (PCM) detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	One drive cycle, MIL OFF, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions (R18A1 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	
Ignition switch	ON
No active DTCs	P0108

Malfunction Threshold (R18A1 Engine)

The MAP sensor output voltage is 0.23 V or less for at least 2 seconds.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the indicator (R18A1 Engine)

When a malfunction is detected, the D indicator blinks, and the DTC and the freeze frame data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC (R18A1 Engine)

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0107 (12): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P0107: MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR CIRCUIT LOW VOLTAGE INPUT (R18A4 ENGINE)

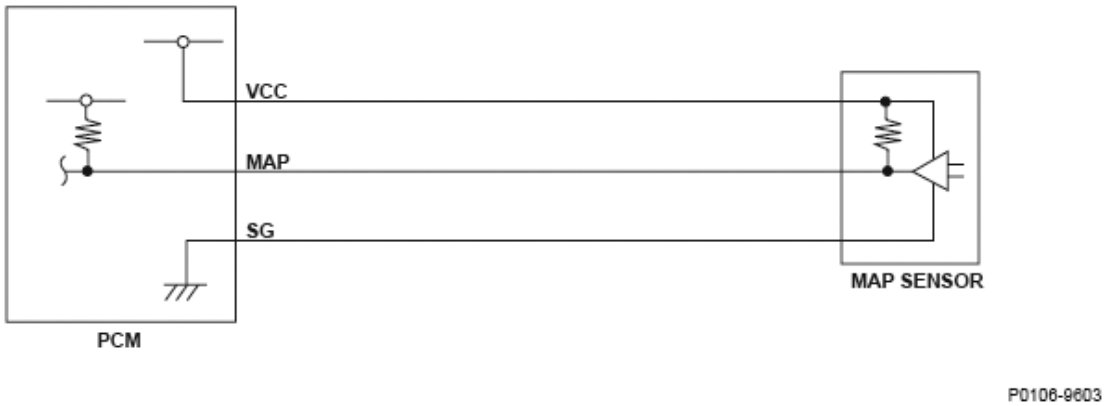

Fig. 24: Manifold Absolute Pressure (MAP) Sensor Circuit Diagram

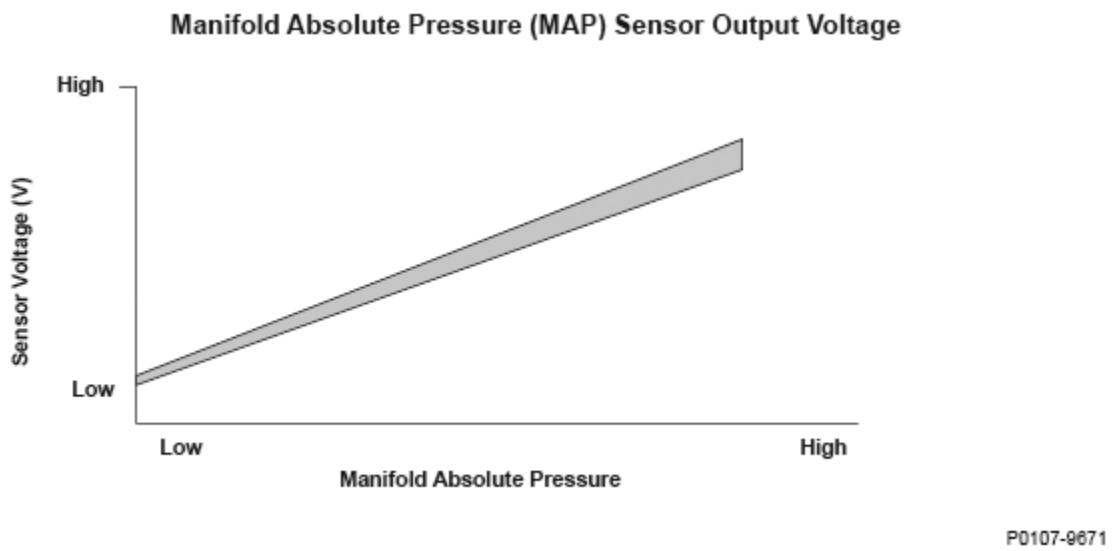

Fig. 25: Manifold Absolute Pressure (MAP) Sensor Output Voltage - Graph

General Description (R18A4 Engine)

The manifold absolute pressure (MAP) sensor senses manifold absolute pressure (vacuum) and converts it into electrical signals. The MAP sensor outputs low signal voltage at high-vacuum (throttle valve closed) and high signal voltage at low-vacuum (throttle valve wide open).

If a signal voltage from the MAP sensor is a set value or less, the powertrain control module (PCM) detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A4 Engine)

Diagnosis Details (K20Z3 Engine)

Conditions for illuminating the MIL (K20Z3 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM memory.

Conditions for clearing the MIL (K20Z3 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0111 (10): ADVANCED DIAGNOSTICS (M/T)

DTC P0111: INTAKE AIR TEMPERATURE (IAT) SENSOR CIRCUIT RANGE/PERFORMANCE PROBLEM (M/T)

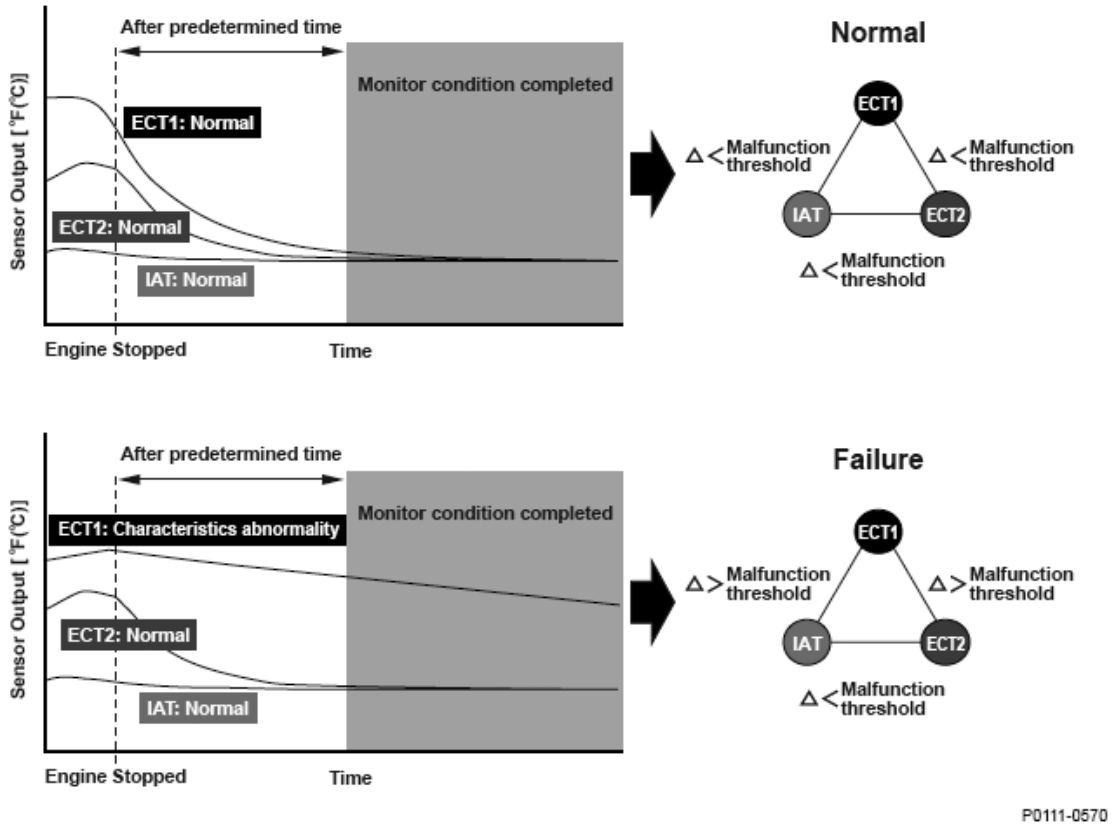

Fig. 42: Intake Air Temperature (IAT) Sensor Circuit Range/Performance Problem - Graph

General Description (M/T)

Two engine coolant temperature sensors and one intake air temperature sensor are used by the engine control module (ECM)/powertrain control module (PCM).

When the engine is stopped and enough time has passed, the temperature of the engine will equal the ambient temperature. When an inappropriate temperature is detected after comparing the temperature readings of each sensor, a malfunction in the corresponding sensor is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (M/T)

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	None
Duration	10 seconds or more
DTC Type	Two drive cycles, MIL ON
OBD Status	N/A

Enable Conditions (M/T)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Engine off time	6 hours	-
No active DTCs	P0112, P0113, P0116, P0117, P0118, P0125, P1116, P2183, P2184, P2185, P2610	

Malfunction Threshold (M/T)

A malfunction is detected if these three conditions are present after the engine and the ignition switch have been off for at least 6 hours:

- When the temperature difference between the IAT and ECT1 is 81°F (45°C)*1 , 59°F (33°C)*2 or more.
- When the temperature difference between the IAT and ECT2 is 45°F (25°C)*1 , 36°F (20°C)*2 or more.
- When the temperature difference between the ECT2 and ECT1 is 90°F (50°C)*1 , 66°F (37°C)*2 or more.

*1: R18A1 engine

*2: K20Z3 engine

Driving Pattern (M/T)

1. Turn the ignition off, and wait at least 6 hours.
2. Start the engine, and let it idle for at least 10 seconds.

Diagnosis Details (M/T)

Conditions for illuminating the MIL (M/T)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the ECM/PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (M/T)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs. The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0111 (10): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0111: INTAKE AIR TEMPERATURE (IAT) SENSOR CIRCUIT RANGE/PERFORMANCE PROBLEM (R18A1 ENGINE)

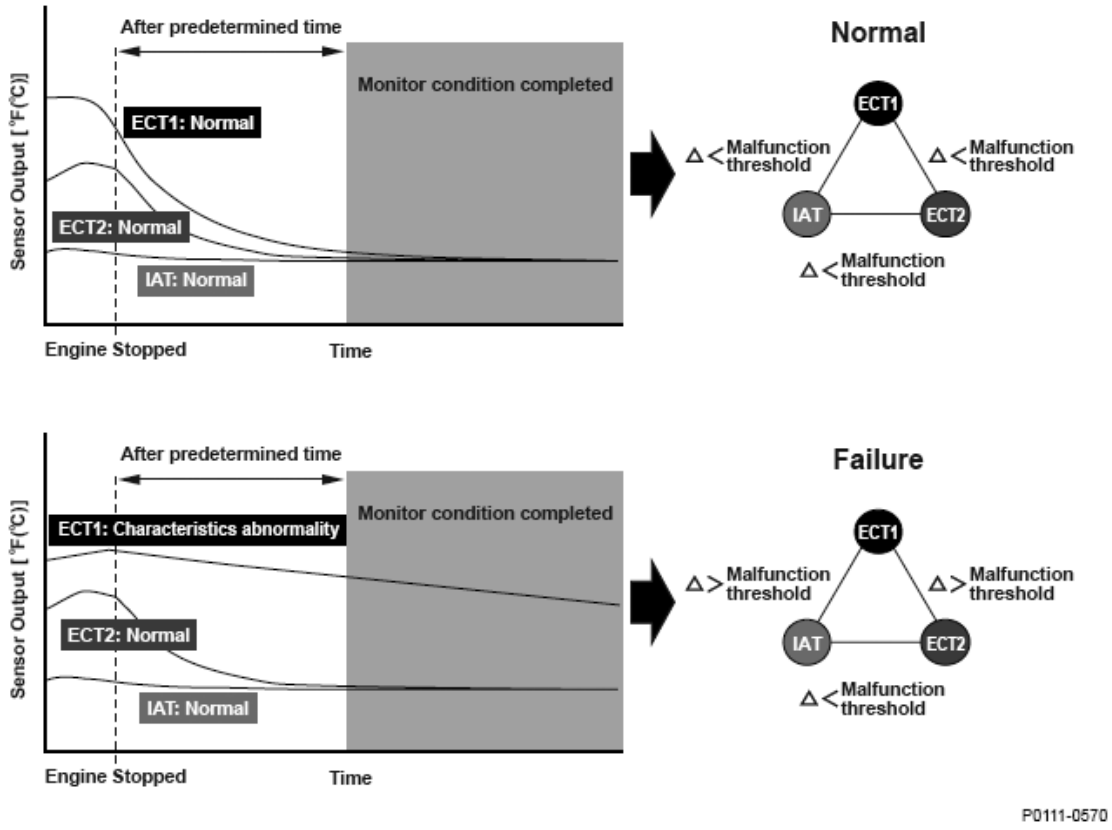

Fig. 43: Intake Air Temperature (IAT) Sensor Circuit Range/Performance Problem - Graph

General Description (R18A1 Engine)

Two engine coolant temperature sensors and one intake air temperature sensor are used by the engine control module (ECM)/powertrain control module (PCM).

When the engine is stopped and enough time has passed, the temperature of the engine will equal the ambient temperature. When an inappropriate temperature is detected after comparing the temperature readings of each sensor, a malfunction in the corresponding sensor is detected and a DTC is stored.

Malfunction Threshold (R18A4 Engine)

A malfunction is detected if these three conditions are present after the engine and the ignition switch have been off for at least 6 hours:

- When the temperature difference between the IAT and ECT1 is 81°F (45°C) or more.
- When the temperature difference between the IAT and ECT2 is 45°F (25°C) or more.
- When the temperature difference between the ECT2 and ECT1 is 90°F (50°C) or more.

Driving Pattern (R18A4 Engine)

1. Turn the ignition off, and wait at least 6 hours.
2. Start the engine, and let it idle for at least 10 seconds.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0112 (10): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P0112: INTAKE AIR TEMPERATURE (IAT) SENSOR CIRCUIT LOW VOLTAGE (K20Z3 ENGINE)

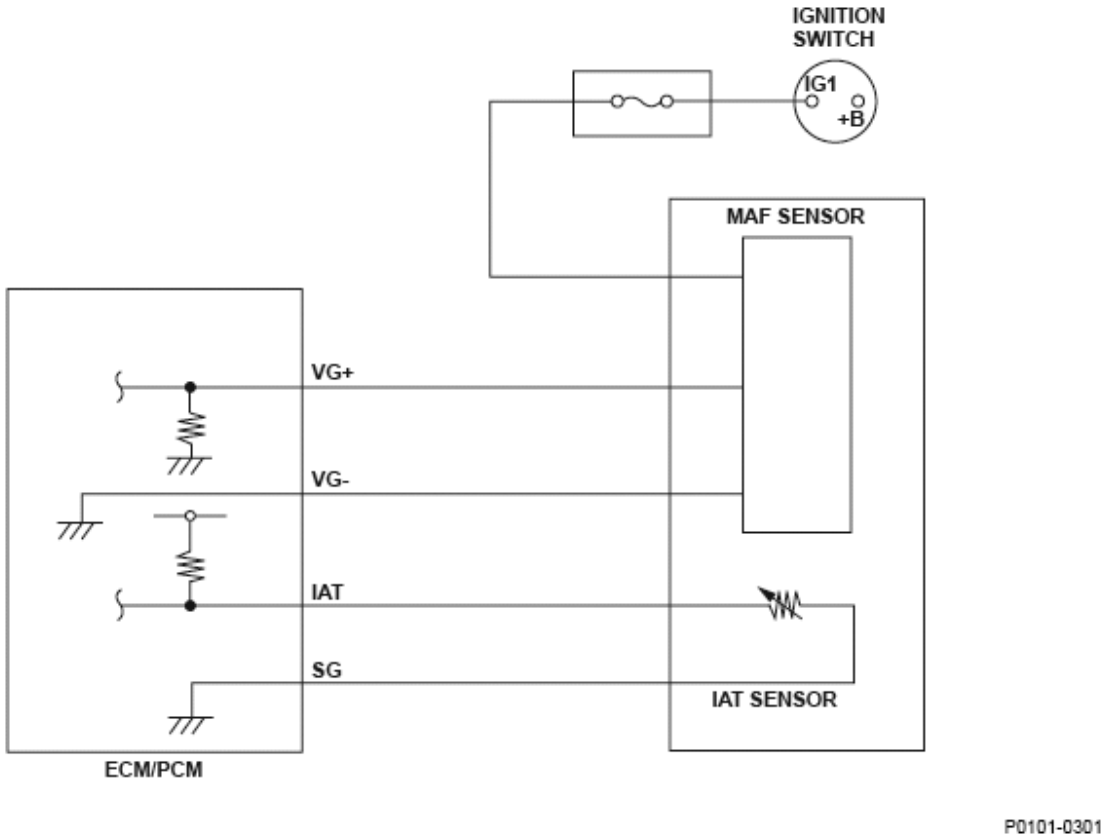

Fig. 45: Mass Air Flow (MAF) Sensor - Circuit Diagram

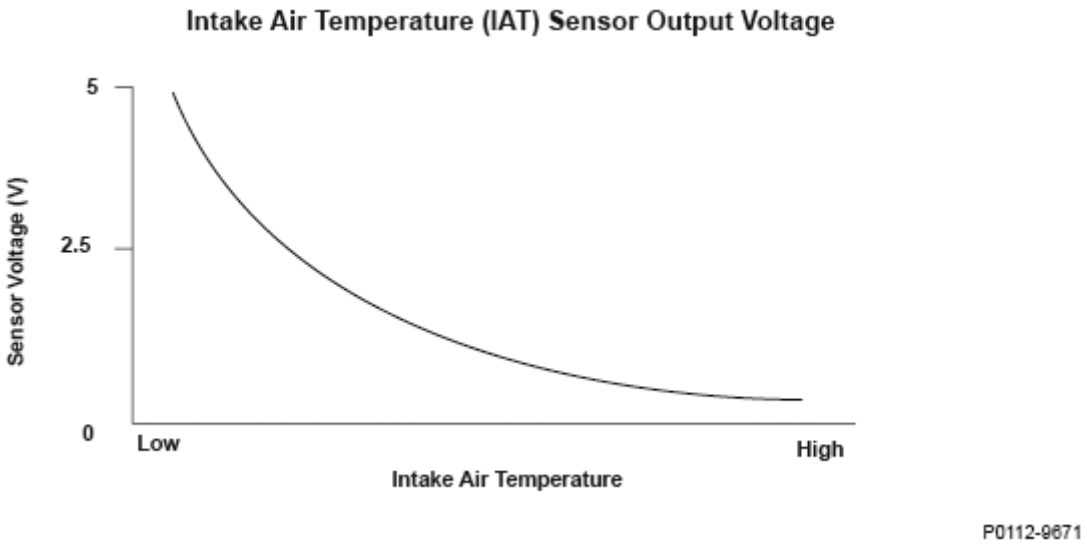

Fig. 46: Intake Air Temperature (IAT) Sensor Output Voltage - Graph

General Description (K20Z3 Engine)

The intake air temperature (IAT) sensor is a thermistor that detects intake air temperature, and it is used for A/F feedback control to compensate for the atmospheric density fluctuations that accompany changes in intake air temperature.

The IAT sensor resistance varies depending on temperature. The output voltage and the sensor resistance

increase as the intake air temperature decreases. Conversely, the output voltage and the sensor resistance decrease as the intake air temperature increases. If the IAT sensor output voltage is excessively low, the engine control module (ECM)/powertrain control module (PCM) detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM/PCM memory.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0112 (10): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P0112: INTAKE AIR TEMPERATURE (IAT) SENSOR CIRCUIT LOW VOLTAGE (R18A4 ENGINE)

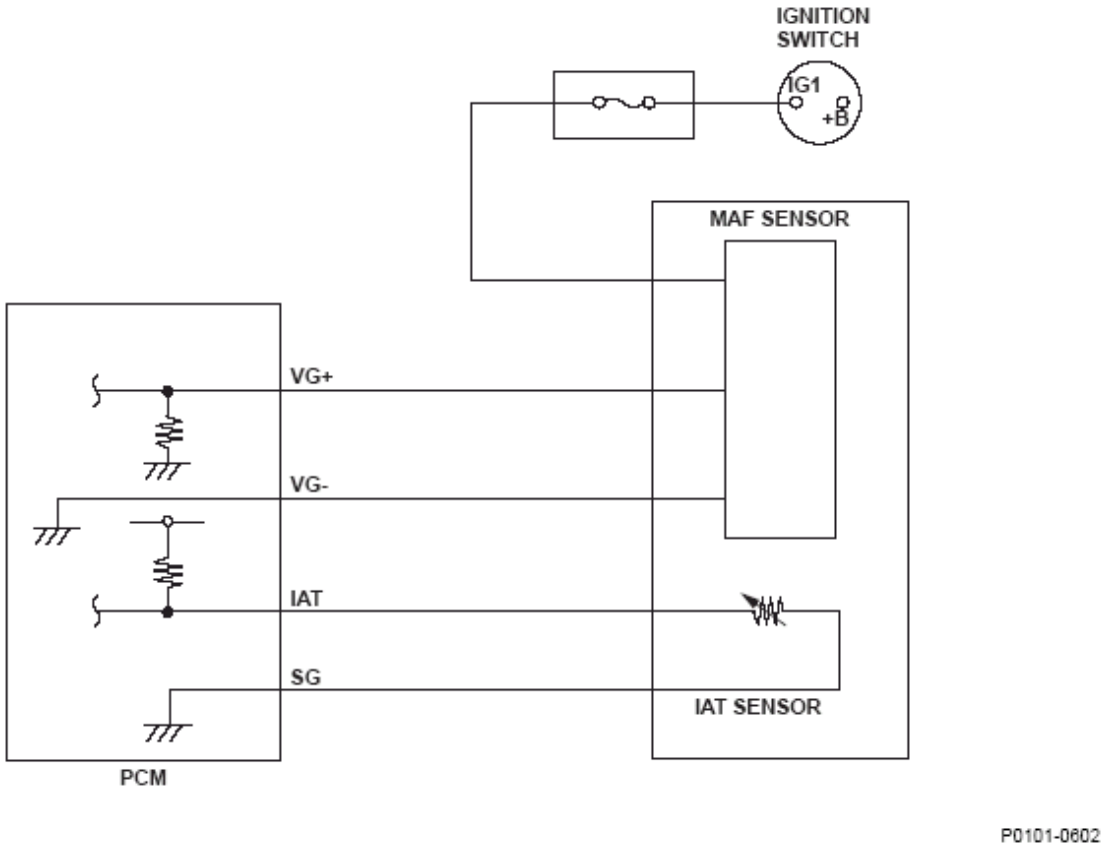

Fig. 49: Mass Air Flow Sensor - Circuit Diagram

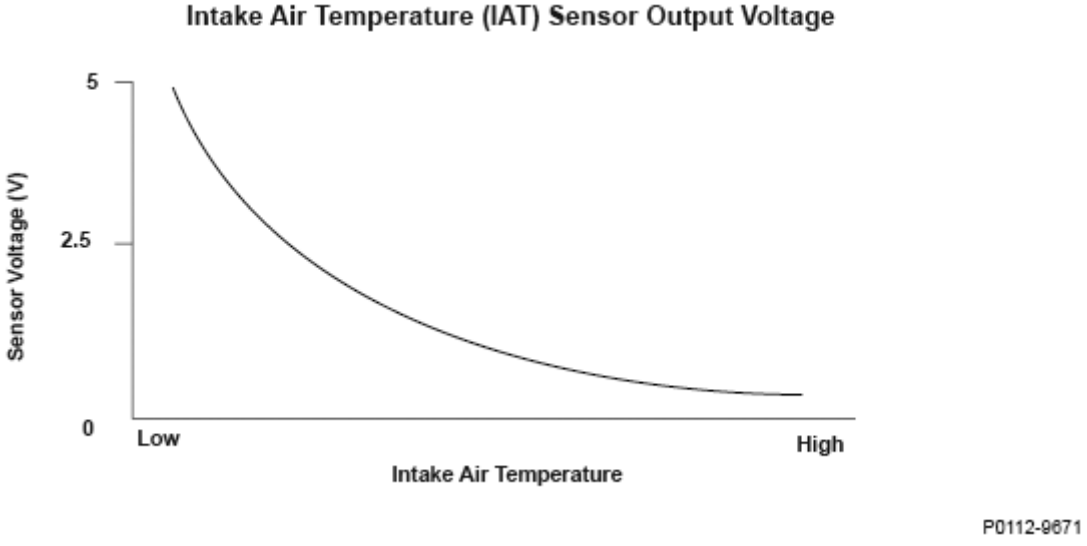

Fig. 50: Intake Air Temperature (IAT) Sensor Output Voltage - Graph

General Description (R18A4 Engine)

The intake air temperature (IAT) sensor is a thermistor that detects intake air temperature, and it is used for A/F feedback control to compensate for the atmospheric density fluctuations that accompany changes in intake air temperature.

The IAT sensor resistance varies depending on temperature. The output voltage and the sensor resistance increase as the intake air temperature decreases. Conversely, the output voltage and the sensor resistance decrease as the intake air temperature increases. If the IAT sensor output voltage is excessively low, the powertrain control module (PCM) detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A4 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	N/A

Enable Conditions (R18A4 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	
Ignition switch	ON
No active DTCs	P0113

Malfunction Threshold (R18A4 Engine)

The IAT sensor output voltage is 0.08 V or less for at least 2 seconds.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0113 (10): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P0113: INTAKE AIR TEMPERATURE (IAT) SENSOR CIRCUIT HIGH VOLTAGE (K20Z3 ENGINE)

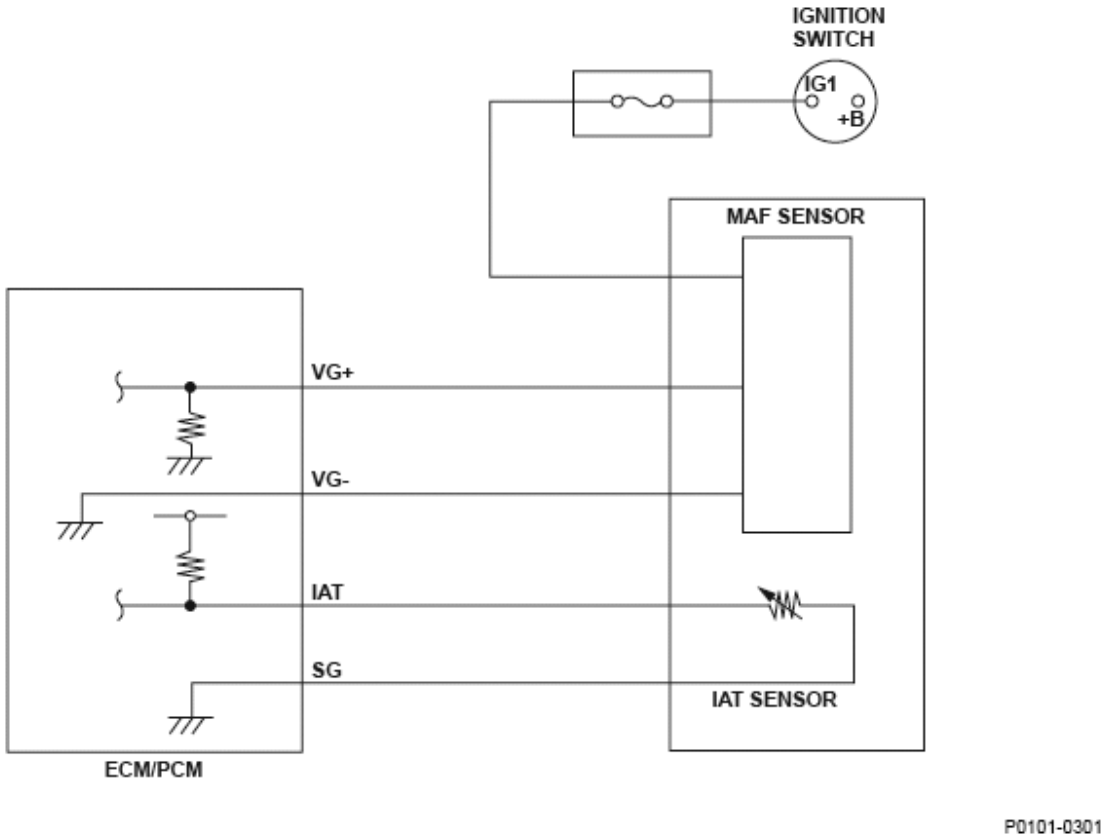

Fig. 51: Mass Air Flow (MAF) Sensor - Circuit Diagram

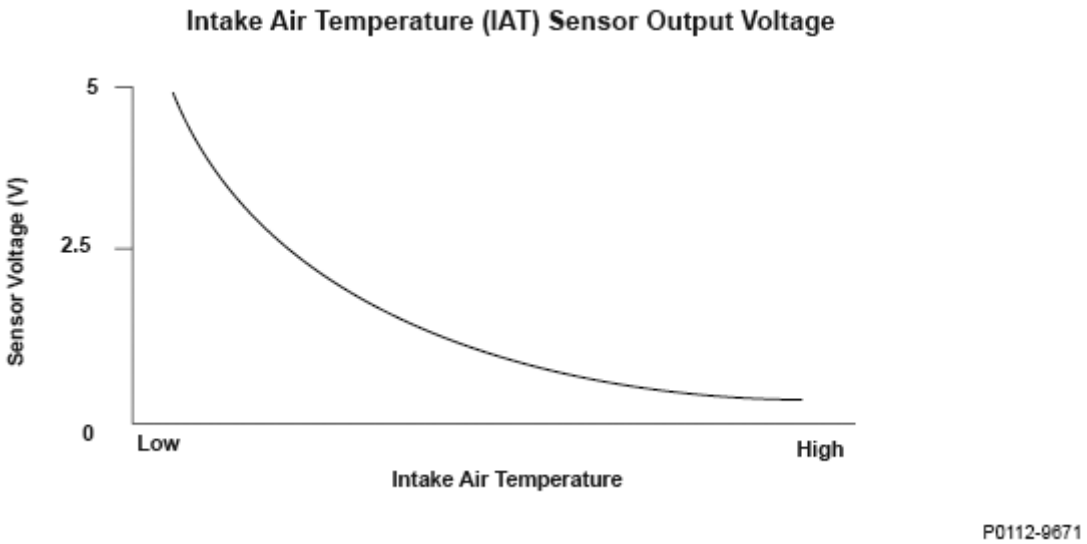

Fig. 52: Intake Air Temperature (IAT) Sensor Output Voltage - Graph

General Description (K20Z3 Engine)

The intake air temperature (IAT) sensor is a thermistor that detects intake air temperature, and it is used for A/F feedback control to compensate for the atmospheric density fluctuations that accompany changes in intake air temperature.

The IAT sensor resistance varies depending on temperature. The output voltage and the sensor resistance

increase as the intake air temperature decreases. Conversely, the output voltage and the sensor resistance decrease as the intake air temperature increases. If the IAT sensor output voltage is excessively high, the engine control module (ECM)/powertrain control module (PCM) detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

DTC P0116 (86): ADVANCED DIAGNOSTICS (M/T)

DTC P0116: ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1 CIRCUIT RANGE/PERFORMANCE PROBLEM (M/T)

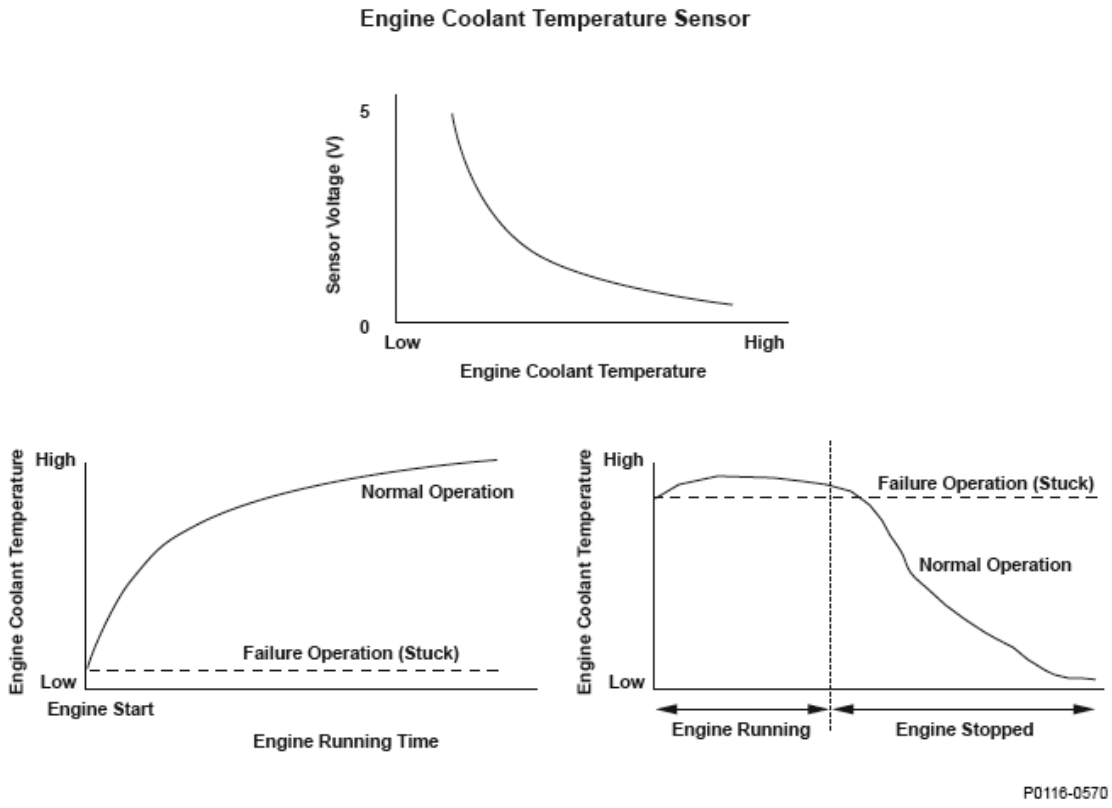

Fig. 57: Engine Coolant Temperature (ECT) Sensor 1 Circuit Range / Performance Problem - Graph

General Description (M/T)

The engine control module (ECM)/powertrain control module (PCM) supplies voltage to the engine coolant temperature (ECT) signal circuit (about 5 V) through a pull-up resistor. As the engine coolant cools, ECT sensor 1 resistance increases, and the ECM/PCM detects a high signal voltage. As the engine coolant warms, ECT sensor 1 resistance decreases, and the ECM/PCM detects a low signal voltage.

If the ECT sensor 1 output voltage after driving a set time after starting the engine does not reach a set temperature, or when the difference between the ECT sensor 1 output voltage when driving and the output voltage of the ECT sensor 1 after the engine is stopped a set time does not change a certain amount, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (M/T)

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	None
Duration	10 minutes or more
DTC Type	Two drive cycles, MIL ON
OBD Status	N/A

Enable Conditions (M/T)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum

Elapsed time after starting the engine	10 seconds	-
Fuel feedback	Other than during fuel cut-off operation	
No active DTCs	P0101, P0102, P0103, P0107, P0108, P0117, P0118, P0134, P0135, P0171, P0172, P0300, P0301, P0302, P0303, P0304, P0335, P0339, P0351, P0352, P0353, P0354, P0401(1), P0404(1), P0443, P0496, P0497, P0506, P0507, P0522, P0523, P1077(1), P1078(1), P1128, P1129, P1157, P1172, P2195, P2227, P2228, P2229, P2238, P2252, P2413(1), P2610, P2646, P2647, P2648, P2649	
Others	With a completely cooled engine (one that has been off for at least 6 hours): Judgment is made after the engine has been run for at least 10 minutes, turned off for at least 10 seconds, then started and run again for at least 10 seconds.	
	With a partially cooled engine (one that has been off for less than 6 hours): Judgment is made after the engine has been run for at least 10 minutes, turned off for at least 150(2), 210(1) minutes, then started and run again for at least 10 seconds.	
(1) R18A1 engine (2) K20Z3 engine		

Malfunction Threshold (M/T)

Malfunction determination 1:

With a completely cooled engine (one that has been off for at least 6 hours):

When the change in coolant temperature after 10 minutes or more of running time is 50°F (10°C) or less, a malfunction is detected.

Malfunction determination 2:

With a partially cooled engine (one that has been off for less than 6 hours):

When the difference between the coolant temperature after 10 minutes or more of running time minus the coolant temperature after the engine has been off for 150*2 , 210*1 minutes and then run for 10 seconds is 50°F (10°C) or less, a malfunction is detected.

Driving Pattern (M/T)

- With a completely cooled engine (one that has been off for at least 6 hours).

1. Start the engine, and let it idle for at least 10 minutes.
2. Turn off the ignition for 10 seconds, then restart the engine and let it idle for at least 10 seconds.

- With a partially cooled engine (one that has been off for less than 6 hours).

1. Start the engine, and let it idle for at least 10 minutes.
2. Turn off the ignition for 150*2, 210*1 minutes, then restart the engine and let it idle for at least 10 seconds.

Diagnosis Details (M/T)

Conditions for illuminating the MIL (M/T)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the ECM/PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (M/T)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

The engine coolant temperature (ECT) sensor 1 is used for air/fuel ratio feedback control, ignition timing control, idle speed control, and other functions. The ECT sensor 1 resistance varies depending on the engine coolant temperature. As the engine coolant cools, the ECT sensor 1 resistance increases, and the engine control module (ECM)/powertrain control module (PCM) detects a high signal voltage. As the engine coolant warms, the ECT sensor 1 resistance decreases, and the ECM/PCM detects a low signal voltage. If the ECT sensor 1 output voltage is more than a set value when the engine coolant temperature is low, the ECM/PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	N/A

Enable Conditions (R18A1 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	
Ignition switch	ON
No active DTCs	P0117

Malfunction Threshold (R18A1 Engine)

The output voltage from the ECT sensor 1 is 4.92 V or more for at least 2 seconds.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM/PCM memory.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0118 (6): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P0118: ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1 CIRCUIT HIGH VOLTAGE (R18A4 ENGINE)

Fig. 70: Engine Coolant Temperature (ECT) Sensor Circuit Diagram

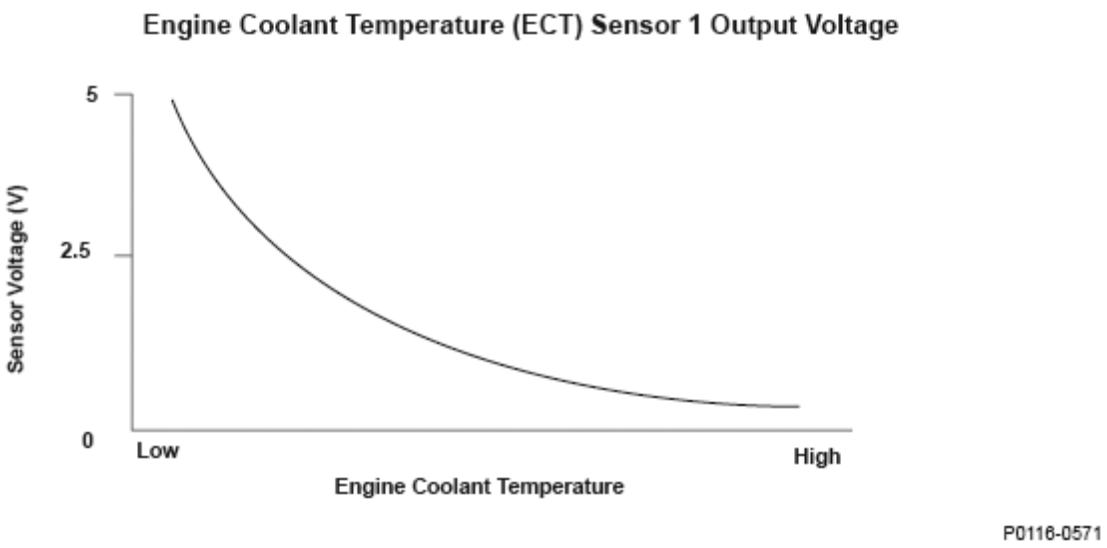

Fig. 71: Engine Coolant Temperature (ECT) Sensor 1 Output Voltage - Graph

General Description (R18A4 Engine)

The engine coolant temperature (ECT) sensor 1 is used for air/fuel ratio feedback control, ignition timing control, idle speed control, and other functions. The ECT sensor 1 resistance varies depending on the engine coolant temperature. As the engine coolant cools, the ECT sensor 1 resistance increases, and the powertrain control module (PCM) detects a high signal voltage. As the engine coolant warms, the ECT sensor 1 resistance decreases, and the PCM detects a low signal voltage. If the ECT sensor 1 output voltage is a set value or more when the engine coolant temperature is low, the PCM detects a malfunction and a DTC is stored.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0122 (7): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P0122: THROTTLE POSITION (TP) SENSOR A CIRCUIT LOW VOLTAGE (K20Z3 ENGINE)

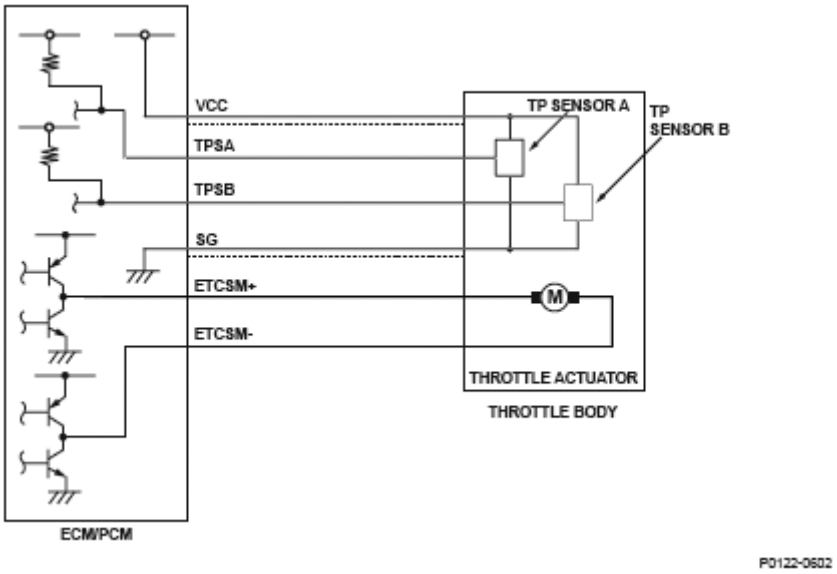

Fig. 72: Throttle Position (TP) Sensor - Circuit Diagram

General Description (K20Z3 Engine)

The electronic throttle control system (ETCS) controls the throttle valve opening. The system is composed of the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the accelerator pedal position (APP) sensor, and the engine control module (ECM)/powertrain control module (PCM).

Throttle position (TP) sensor A is a semiconductor type, and it is attached to the throttle body and shaft to determine throttle valve position.

The throttle valve position signal from TP sensor A is transmitted to the ECM/PCM for target position feedback control.

If the signal from TP sensor A is less than a fixed value for a set time, the ECM/PCM detects a TP sensor A malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	0.2 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	N/A

Enable Conditions (K20Z3 Engine)

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0125 (86): ADVANCED DIAGNOSTICS (M/T)

DTC P0125: ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1 MALFUNCTION/SLOW RESPONSE (M/T)

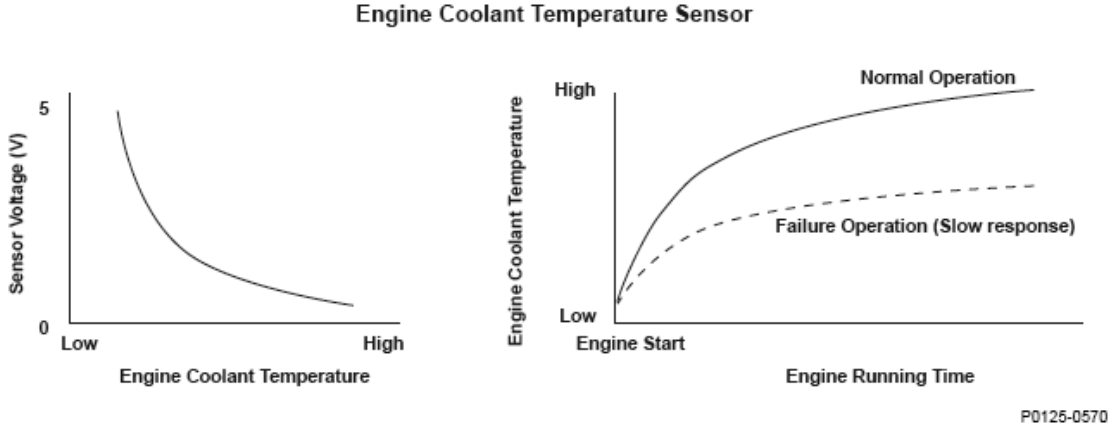

Fig. 78: Engine Coolant Temperature (ECT) Sensor 1 Malfunction/Slow Response - Graph

General Description (M/T)

The engine control module (ECM)/powertrain control module (PCM) supplies voltage to the engine coolant temperature (ECT) signal circuit (about 5 V) through a pull-up resistor. As the engine coolant cools, the ECT sensor 1 resistance increases, and the ECM/PCM detects a high signal voltage. As the engine coolant warms, the ECT sensor 1 resistance decreases, and the ECM/PCM detects a low signal voltage.

If the ECT sensor 1 output voltage does not reach a specified temperature at which closed-loop control for stoichiometric air/fuel ratio starts within a set time, depending on the initial coolant temperature after starting the engine, the ECM/PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (M/T)

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	None
Duration	20 minutes or less
DTC Type	Two drive cycles, MIL ON
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions (M/T)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Initial engine coolant temperature	-	0°F (-18°C)(2)
		10°F (-12°C)(1)
Fuel feedback	Other than during fuel cut-off operation	
No active DTCs	P0101, P0102, P0103, P0107, P0108, P0111, P0112, P0113, P0117, P0118, P0134, P0135, P0171, P0172, P0300, P0301, P0302, P0303, P0304, P0335, P0339, P0351, P0352, P0353, P0354, P0401(1), P0404(1), P0443, P0496, P0506, P0507, P0522, P0523, P1077(1), P1078(1), P1109, P1128, P1129, P1157, P1172, P2195, P2227, P2228, P2229, P2238, P2252, P2413(1), P2646, P2647, P2648, P2649	
(1) R18A1 engine (2) K20Z3 engine		

Malfunction Threshold (M/T)

The engine running time before the engine coolant temperature reaches 98 °F (36 °C), based on the initial engine coolant temperatures, is as follows.

MALFUNCTION THRESHOLD

Initial engine coolant temperature	-54°F (-48°C)*2	-35°F (-37°C)*2	0°F (-18°C)*2
	-43°F (-42°C)*1	-24°F (-31°C)*1	10°F (-12°C)*1
Engine running time	300 seconds or more		60 seconds or more

Driving Pattern (M/T)

1. Start the engine at an engine coolant temperature as specified under Enable Conditions.
2. Let the engine idle for at least 20 minutes.

Diagnosis Details (M/T)

Conditions for illuminating the MIL (M/T)

When a malfunction is detected during the first drive cycle with the ECT and IAT at engine start-up within the specified temperature range, a Temporary DTC is stored in the ECM/PCM memory. If the malfunction recurs during the next (second) drive cycle with the ECT and IAT at engine start-up within the specified temperature range, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (M/T)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0125 (86): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0125: ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1 MALFUNCTION/SLOW RESPONSE (R18A1 ENGINE)

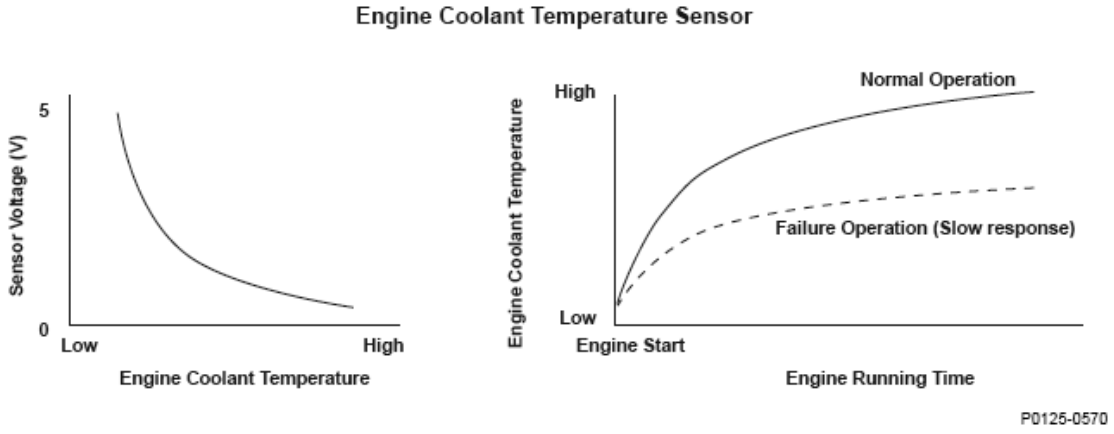

Fig. 79: Engine Coolant Temperature (ECT) Sensor 1 Malfunction/Slow Response - Graph

General Description (R18A1 Engine)

The engine control module (ECM)/powertrain control module (PCM) supplies voltage to the engine coolant temperature (ECT) signal circuit (about 5 V) through a pull-up resistor. As the engine coolant cools, the ECT sensor 1 resistance increases, and the ECM/PCM detects a high signal voltage. As the engine coolant warms, the ECT sensor 1 resistance decreases, and the ECM/PCM detects a low signal voltage.

If the ECT sensor 1 output voltage does not reach a specified temperature at which closed-loop control for stoichiometric air/fuel ratio starts within a set time, depending on the initial coolant temperature after starting the engine, the ECM/PCM detects a malfunction and a DTC is stored.

The engine running time before the engine coolant temperature reaches -34°F (-36°C), based on the initial engine coolant temperatures, is as follows.

MALFUNCTION THRESHOLD

Initial engine coolant temperature	-44°F (-42°C)	-25°F (-31°C)	10°F (-12°C)
Engine running time	300 seconds or more		60 seconds or more

Driving Pattern (R18A4 Engine)

1. Start the engine at an engine coolant temperature as specified under Enable Conditions.
2. Let the engine idle for at least 20 minutes.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected during the first drive cycle with the ECT and IAT at engine start-up within the specified temperature range, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle with the ECT and IAT at engine start-up within the specified temperature range, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0128 (87): ADVANCED DIAGNOSTICS (M/T)

DTC P0128: COOLING SYSTEM MALFUNCTION (M/T)

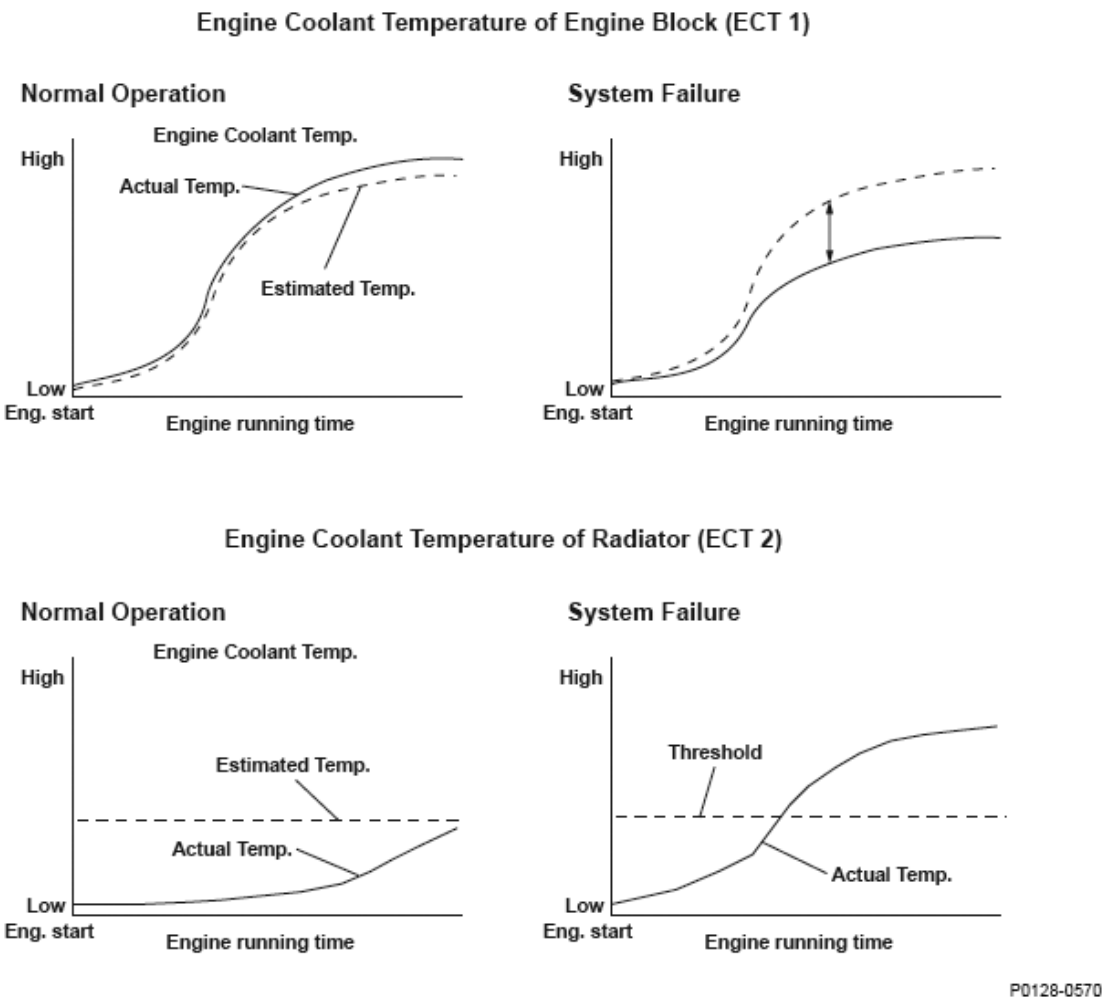

Fig. 81: Cooling System Malfunction - Graph

General Description (M/T)

The thermostat is closed when the engine coolant temperature is low, and it stops the circulation of engine coolant to speed engine warm up. When the engine coolant temperature increases, the thermostat opens and circulates engine coolant to control its temperature. When the engine coolant temperature decreases, the opening area of the thermostat is reduced to regulate the engine coolant temperature. If the thermostat sticks open, engine warm up is delayed, and exhaust emissions are adversely affected. The engine control module (ECM)/powertrain control module (PCM) measures the rise in the coolant temperature after the engine starts at the engine block and at the radiator, and it estimates the characteristics of the engine coolant temperature by calculations based on those two temperatures and the driving conditions. When ECT 2 immediately increases from the starting value, it is defined as the thermostat stuck open. When ECT 2 does not increase to the specified value, it is defined as a thermostat malfunction.

(1) Intake air temperature decrease judgement when there is no driving record of 25 mph (40 km/h) in this drive cycle.

(2) Intake air temperature decrease judgement when there is a driving record of 25 mph (40 km/h) in this drive cycle.

(3) R18A1 engine

Malfunction Threshold (M/T)

Malfunction determination 1:

If the difference between the current measured coolant temperature at the radiator (ECT 2) and the initial coolant temperature at the radiator (ECT 2) is at least 41°F (5°C)*2 , 46°F (8°C)*3 when the calculated coolant temperature at the engine (ECT 1) reaches 164°F (74°C), a malfunction is detected (thermostat stuck open); or if the coolant temperature at the radiator (ECT 2) only reaches 72°F (22°C), a malfunction is detected (thermostat malfunction).

Malfunction determination 2:

When the calculated engine coolant temperature (ECT 1) reaches 158°F (70°C) before the measured engine coolant temperature (ECT 1) reaches 158°F (70°C), a malfunction is detected.

*2: A/T model

*3: M/T model

Driving Pattern (M/T)

1. Start the engine under the conditions specified under Enable Conditions.
2. Drive the vehicle at a speed between 15 - 75 mph (24 - 120 km/h) for at least 10 minutes.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (M/T)

Conditions for illuminating the MIL (M/T)

When a malfunction is detected during the first drive cycle with the ECT and IAT at engine start-up within the specified temperature range, a Temporary DTC is stored in the ECM/PCM memory. If the malfunction recurs during the next (second) drive cycle with the ECT and IAT at engine start-up within the specified temperature range, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (M/T)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0128 (87): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0128: COOLING SYSTEM MALFUNCTION (R18A1 ENGINE)

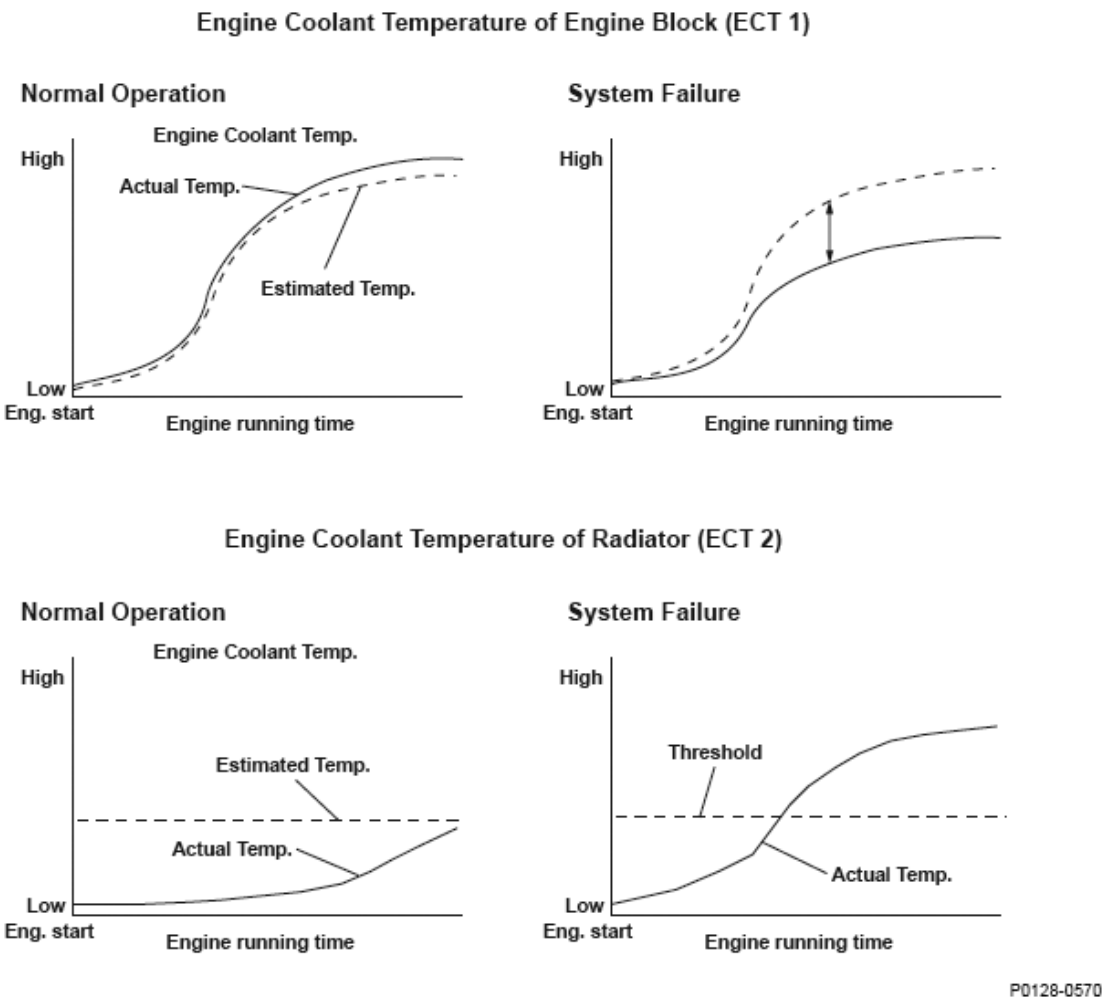

Fig. 82: Cooling System Malfunction - Graph

General Description (R18A1 Engine)

The thermostat is closed when the engine coolant temperature is low, and it stops the circulation of engine coolant to speed engine warm up. When the engine coolant temperature increases, the thermostat opens and circulates engine coolant to control its temperature. When the engine coolant temperature decreases, the opening area of the thermostat is reduced to regulate the engine coolant temperature. If the thermostat sticks open, engine warm up is delayed, and exhaust emissions are adversely affected. The engine control module (ECM)/powertrain control module (PCM) measures the rise in the coolant temperature after the engine starts at the engine block and at the radiator, and it estimates the characteristics of the engine coolant temperature by calculations based on those two temperatures and the driving conditions. When ECT 2 immediately increases from the starting value, it is defined as the thermostat stuck open. When ECT 2 does not increase to the specified value, it is defined as a thermostat malfunction.

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0133 (61): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P0133: AIR/FUEL RATIO (A/F) SENSOR (SENSOR 1) MALFUNCTION/SLOW RESPONSE (K20Z3)

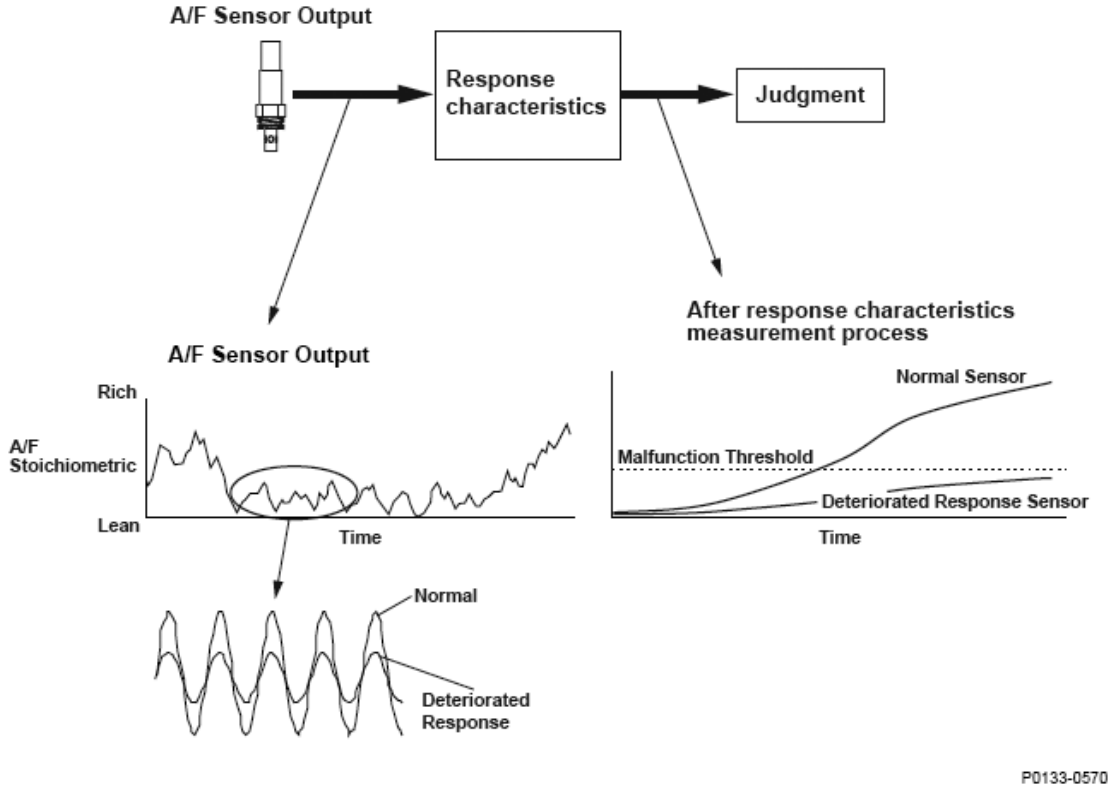

Fig. 84: Air/Fuel Ratio (A/F) Sensor (Sensor 1) Slow Response - Graph

General Description (K20Z3 Engine)

The air/fuel ratio (A/F) sensor has a linear signal output in relation to the oxygen concentration. The engine control module (ECM) computes the air/fuel ratio from the A/F sensor output voltage and uses fuel feedback control to improve exhaust emissions. The ECM measures the response characteristics against the A/F sensor output, and if the average inversion cycle time is less than the specified value, it detects a deteriorated response and stores a DTC.

- If the EVAP monitor runs instead of the HO2S monitor, turn the engine off, then restart it, and the HO2S monitor will restart.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0134 (41): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P0134: AIR/FUEL RATIO (A/F) SENSOR (SENSOR 1) HEATER SYSTEM MALFUNCTION (K20Z3 ENGINE)

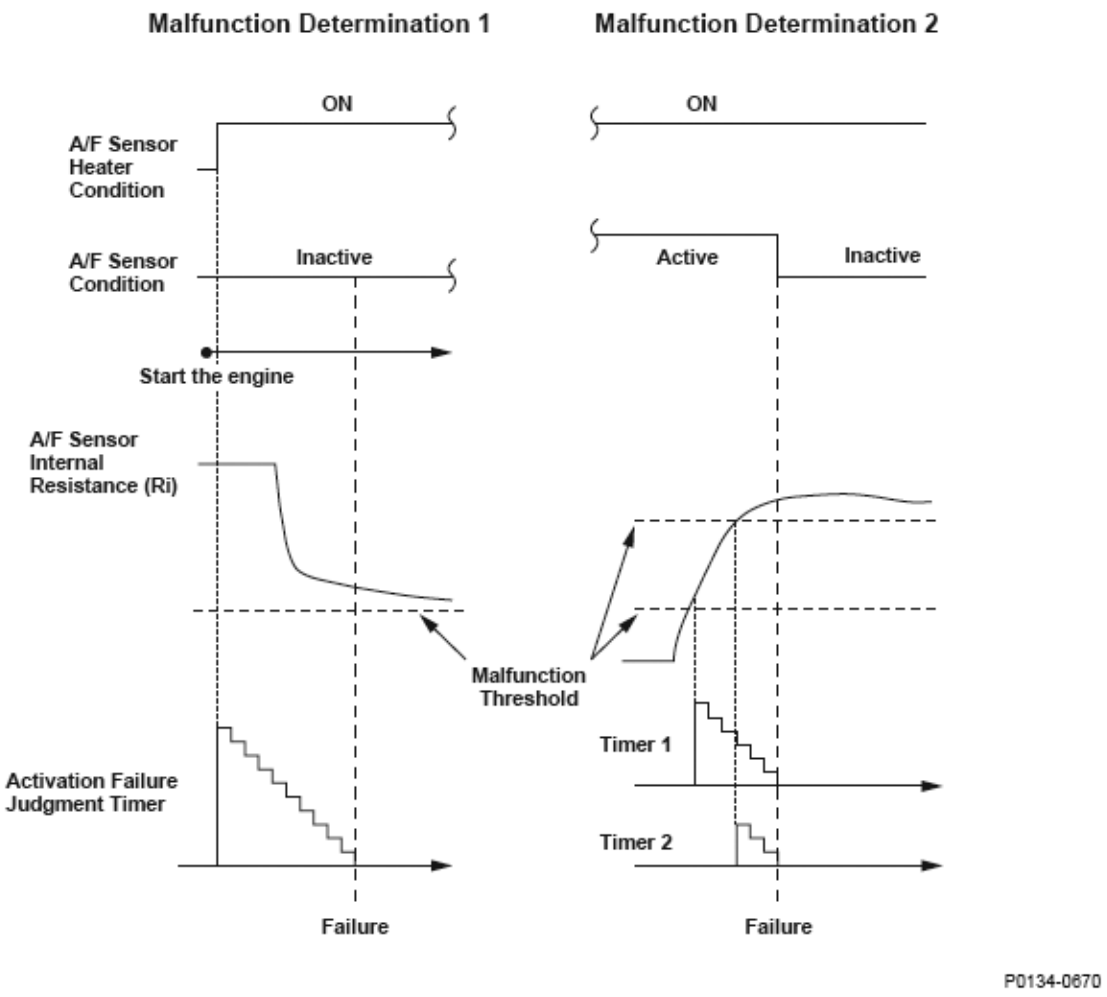

Fig. 90: Air/Fuel Ratio (A/F) Sensor (Sensor 1) Heater System Malfunction

General Description (K20Z3 Engine)

The air/fuel ratio (A/F) sensor is activated by warming the element with a heater to maintain it at a steady high temperature for accurate air/fuel (A/F) ratio calculation. The A/F sensor does not become active when the element is not properly heated due to a heater malfunction, and the exhaust emissions deteriorate. The engine control module (ECM)/powertrain control module (PCM) monitors the A/F sensor condition by monitoring the A/F sensor internal resistance.

1. When the A/F sensor does not activate in a set time after the A/F sensor heater is turned on (with high A/F sensor internal resistance), a malfunction of the A/F sensor heater is detected, and a DTC is stored.
2. The A/F sensor heater cycles ON and OFF within a set time. The heater's state is detected by monitoring the internal resistance of the A/F sensor. If the resistance remains high when the heater is ON, a malfunction in the A/F sensor heater is detected, and a DTC is stored.

Because the degree of effect on engine control differs according to the A/F sensor internal resistance, there are two malfunction detection threshold levels. When either one is reached, a malfunction is detected.

Condition	Minimum	Maximum
Battery voltage	10.5 V	-
Fuel feedback	Other than during fuel cut-off operation	
No active DTCs	P0135, P1157, P1172, P2195, P2238, P2252	

Malfunction Threshold (K20Z3 Engine)

Malfunction determination 1

The A/F sensor internal resistance value is 70 ohms or more for at least 40 seconds right after the engine starts.

Malfunction determination 2

- The A/F sensor internal resistance value is 70 ohms or more for at least 15 seconds.
- The A/F sensor internal resistance value is 90 ohms or more for at least 1 second.

Driving Pattern (K20Z3 Engine)

Start the engine, then let it idle for at least 2 minutes.

Diagnosis Details (K20Z3 Engine)

Conditions for illuminating the MIL (K20Z3 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the ECM/PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (K20Z3 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0134 (41): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0134: AIR/FUEL RATIO (A/F) SENSOR (SENSOR 1) HEATER SYSTEM MALFUNCTION (R18A1 ENGINE)

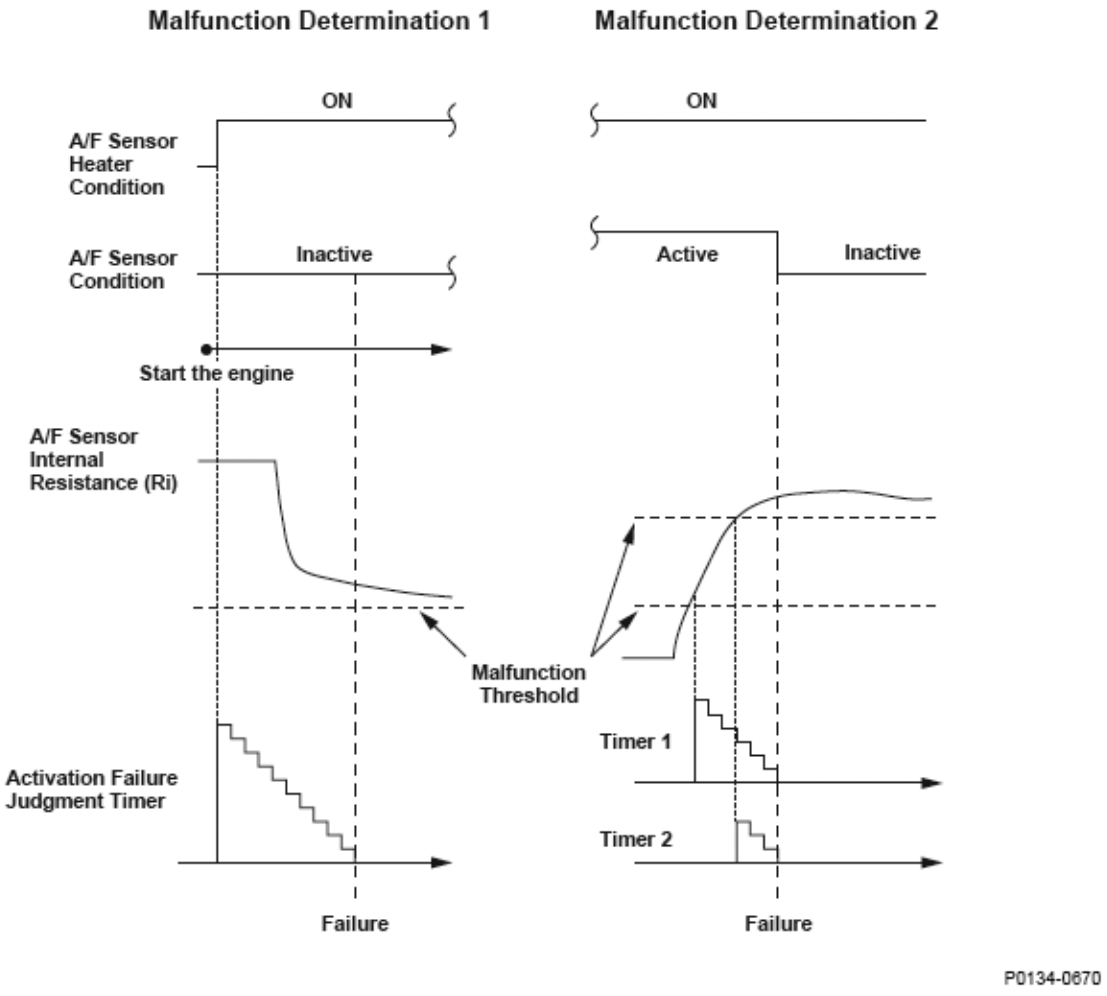

Fig. 91: Air/Fuel Ratio (A/F) Sensor (Sensor 1) Heater System Malfunction

General Description (R18A1 Engine)

The air/fuel ratio (A/F) sensor is activated by warming the element with a heater to maintain it at a steady high temperature for accurate air/fuel (A/F) ratio calculation. The A/F sensor does not become active when the element is not properly heated due to a heater malfunction, and the exhaust emissions deteriorate. The engine control module (ECM)/powertrain control module (PCM) monitors the A/F sensor condition by monitoring the A/F sensor internal resistance.

1. When the A/F sensor does not activate in a set time after the A/F sensor heater is turned on (with high A/F sensor internal resistance), a malfunction of the A/F sensor heater is detected, and a DTC is stored.
2. The A/F sensor heater cycles ON and OFF within a set time. The heater's state is detected by monitoring the internal resistance of the A/F sensor. If the resistance remains high when the heater is ON, a malfunction in the A/F sensor heater is detected, and a DTC is stored.

   Because the degree of effect on engine control differs according to the A/F sensor internal resistance, there are two malfunction detection threshold levels. When either one is reached, a malfunction is

detected.

Malfunction determination 1

The A/F sensor internal resistance value is 70 ohms or more for at least 40 seconds right after the engine starts.

Malfunction determination 2

- The A/F sensor internal resistance value is 70 ohms or more for at least 15 seconds.
- The A/F sensor internal resistance value is 90 ohms or more for at least 1 second.

Driving Pattern (R18A1 Engine)

Start the engine, then let it idle for at least 2 minutes.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the ECM/PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool

Clear command or by disconnecting the battery.

DTC P0134 (41): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P0134: AIR/FUEL RATIO (A/F) SENSOR (SENSOR 1) HEATER SYSTEM MALFUNCTION (R18A4 ENGINE)

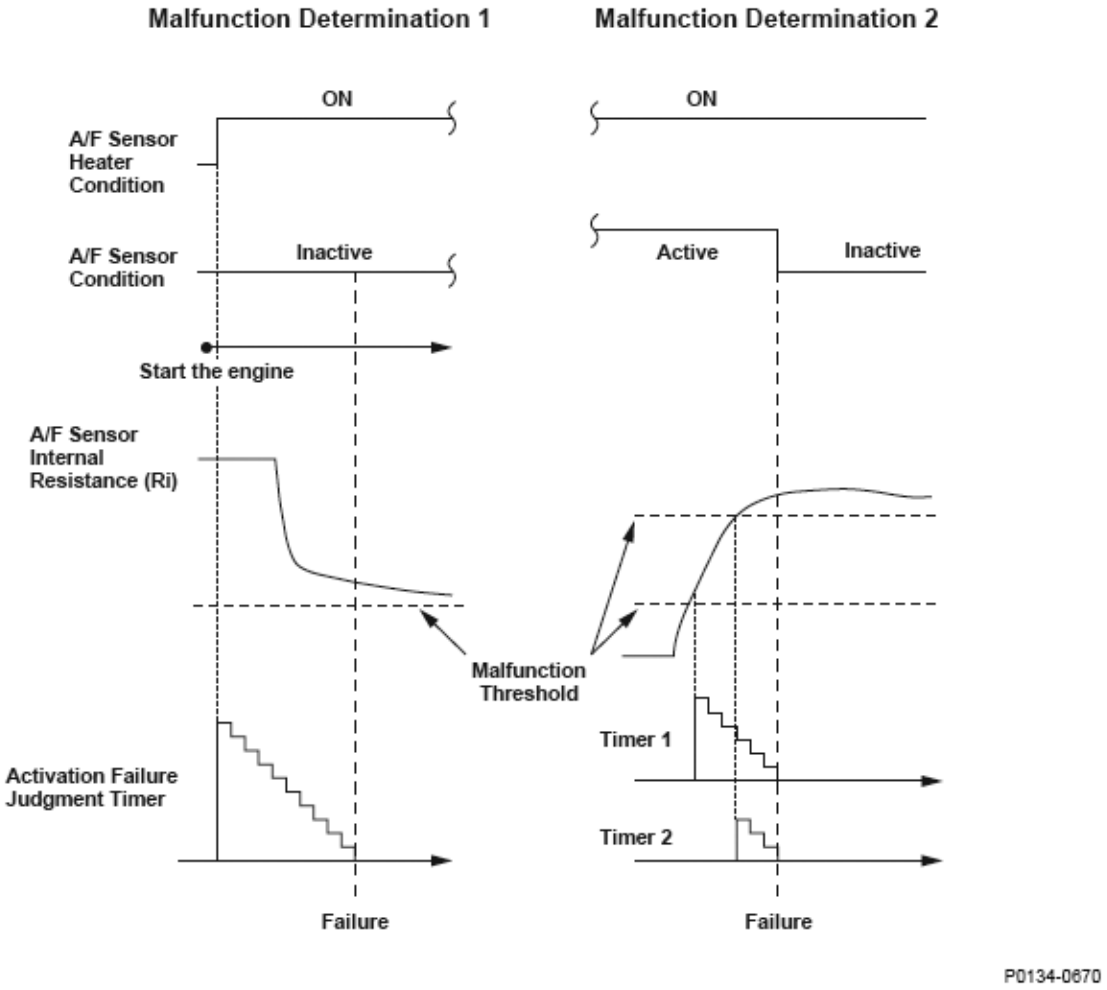

Fig. 92: Air/Fuel Ratio (A/F) Sensor (Sensor 1) Heater System Malfunction

General Description (R18A4 Engine)

The air/fuel ratio (A/F) sensor is activated by warming the element with a heater to maintain it at a steady high temperature for accurate air/fuel (A/F) ratio calculation. The A/F sensor does not become active when the element is not properly heated due to a heater malfunction, and the exhaust emissions deteriorate. The powertrain control module (PCM) monitors the A/F sensor condition by monitoring the A/F sensor internal resistance.

1. When the A/F sensor does not activate in a set time after the A/F sensor heater is turned on (with high A/F sensor internal resistance), a malfunction of the A/F sensor heater is detected, and a DTC is stored.
2. The A/F sensor heater cycles ON and OFF within a set time. The heater's state is detected by monitoring the internal resistance of the A/F sensor. If the resistance remains high when the heater is

ON, a malfunction in the A/F sensor heater is detected, and a DTC is stored.

Because the degree of effect on engine control differs according to the A/F sensor internal resistance, there are two malfunction detection threshold levels. When either one is reached, a malfunction is detected.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A4 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None

Fuel feedback	Other than during fuel cut-off operation	
No active DTCs	P0135, P1157, P1172, P2195, P2238, P2252	

Malfunction Threshold (R18A4 Engine)

Malfunction determination 1

The A/F sensor internal resistance value is 70 ohms or more for at least 40 seconds right after the engine starts.

Malfunction determination 2

- The A/F sensor internal resistance value is 70 ohms or more for at least 15 seconds.
- The A/F sensor internal resistance value is 90 ohms or more for at least 1 second.

Driving Pattern (R18A4 Engine)

Start the engine, then let it idle for at least 1 minute.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0135 (41): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P0135: AIR/FUEL RATIO (A/F) SENSOR (SENSOR 1) HEATER CIRCUIT MALFUNCTION (K20Z3 ENGINE)

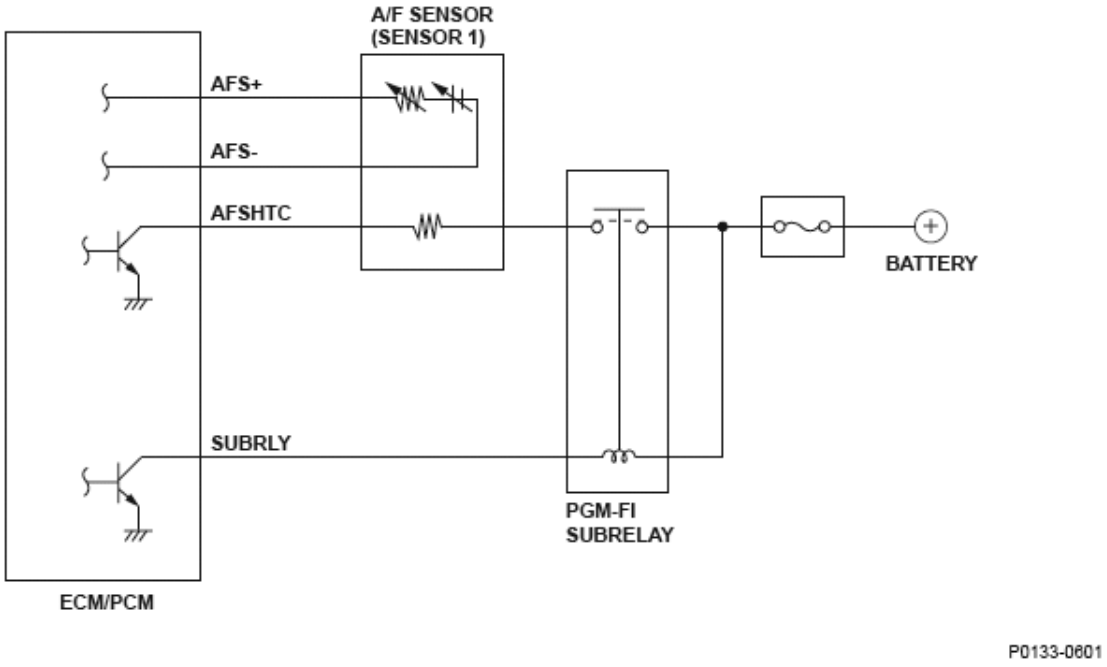

Fig. 93: Air/Fuel Ratio (A/F) Sensor - Circuit Diagram

General Description (K20Z3 Engine)

A heater for the sensor element is embedded in the air/fuel ratio (A/F) sensor (sensor 1), and it is controlled by the engine control module (ECM)/powertrain control module (PCM). It is activated and heats the sensor to stabilize and speed up the detection of oxygen content when the exhaust gas temperature is cold.

If the A/F sensor (sensor 1) heater current is not a set value, or the heater is overheated, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

MONITOR DESCRIPTION CHART

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0137 (63): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P0137: SECONDARY HEATED OXYGEN SENSOR (SECONDARY HO2S (SENSOR 2)) CIRCUIT LOW VOLTAGE (K20Z3)

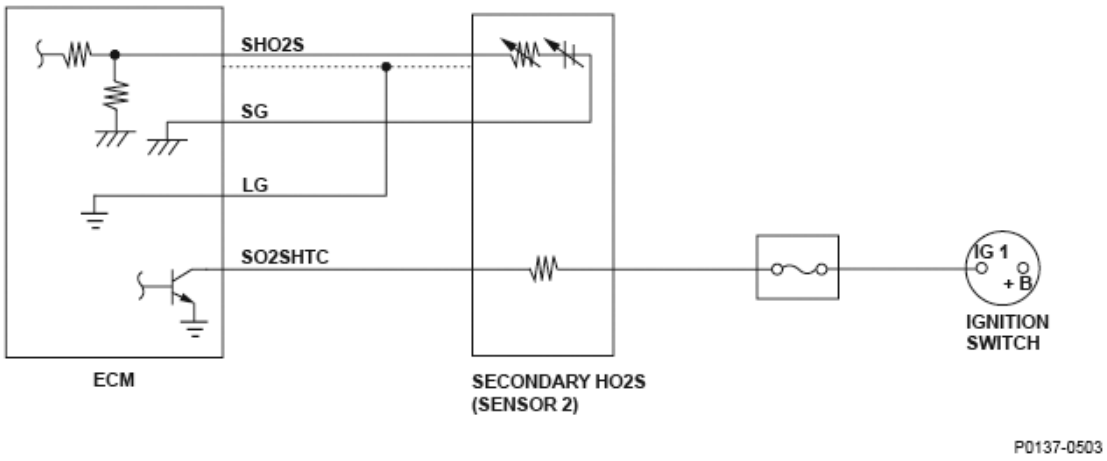

Fig. 96: Secondary Heated Oxygen Sensor (Secondary HO2S (Sensor 2)) Low Voltage - Circuit Diagram

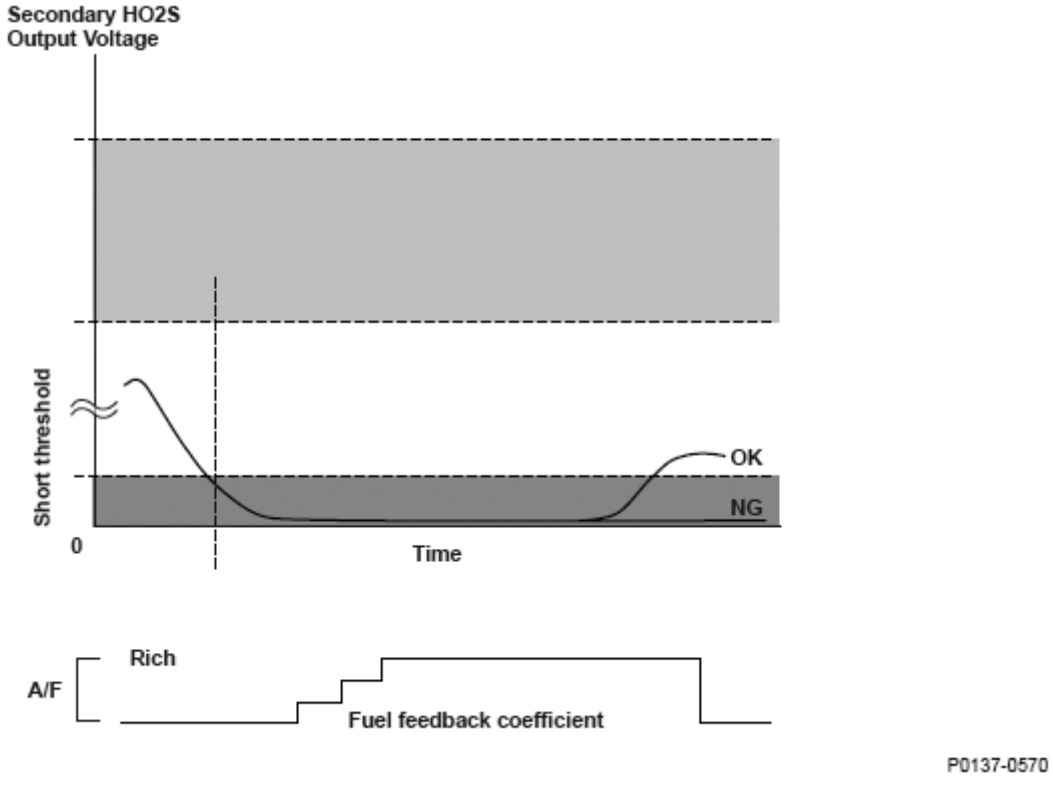

Fig. 97: Secondary Heated Oxygen Sensor Output Voltage - Graph

General Description (K20Z3 Engine)

The secondary heated oxygen sensor (HO2S) (sensor 2) detects the oxygen content in the exhaust gas downstream of the three way catalytic converter (TWC) during stoichiometric air/fuel ratio feedback control based on the primary heated oxygen sensor (HO2S) (sensor 1) output voltage. The secondary HO2S controls the air/fuel ratio from the primary HO2S output voltage so that the TWC efficiency is optimized.

After current is applied to the secondary HO2S heater, if the secondary HO2S output continues low (lean) during feedback control, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

OBD Status	PASSED/FAILED/EXECUTING/OUT OF (TEST) CONDITION

Enable Conditions (R18A1 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Elapsed time that secondary HO2S activity is not monitored after starting the engine	15 seconds	-
Engine coolant temperature	156°F (69°C)	-
Intake air temperature	-13°F (-25°C)	-
Fuel trim	0.73	1.47
Fuel feedback	Closed loop	
No active DTCs	P0101, P0102, P0103, P0107, P0108, P0112, P0113, P0117, P0118, P0133, P0134, P0135, P0141, P0171, P0172, P0300, P0301, P0302, P0303, P0304, P0351, P0352, P0353, P0354, P0400, P0401, P0404, P0443, P0496, P0497, P1077, P1078, P1128, P1129, P1157, P1172, P2195, P2238, P2252, P2413, P2646, P2647, P2648, P2649, P2A00	
Other	Other than at idle	

Malfunction Threshold (R18A1 Engine)

The secondary HO2S output voltage is 1.270 V or more for at least 5 seconds.

Driving Pattern (R18A1 Engine)

1. Start the engine. Let it idle until the radiator fan comes on.
2. Then, drive immediately at a steady engine speed between 1,500 - 3,000 rpm for at least 1 minute.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM/PCM memory.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0138 (63): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P0138: SECONDARY HEATED OXYGEN SENSOR (SECONDARY HO2S (SENSOR 2)) CIRCUIT HIGH VOLTAGE (R18A4 ENGINE)

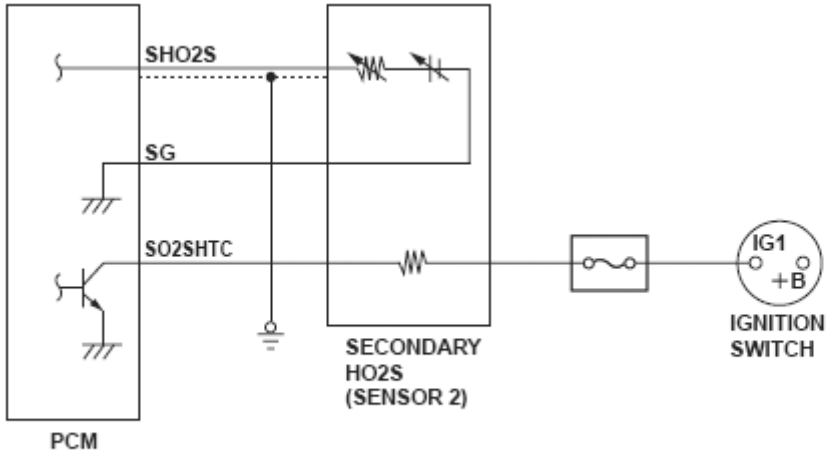

Fig. 106: Secondary Heated Oxygen Sensor (Secondary HO2S (Sensor 2)) Circuit Diagram

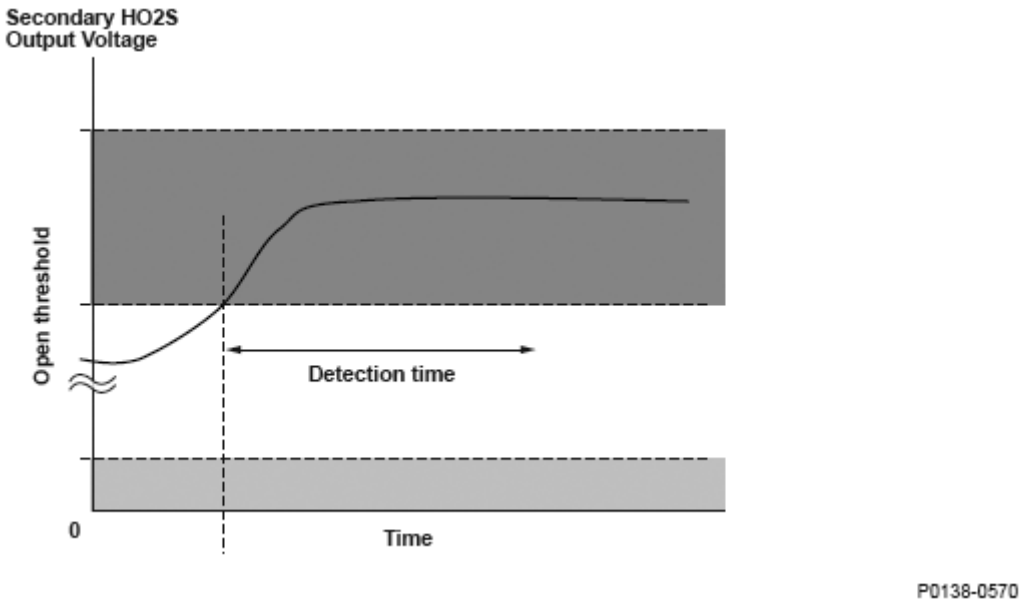

Fig. 107: Secondary Heated Oxygen Sensor Output Voltage - Graph

General Description (R18A4 Engine)

The secondary heated oxygen sensor (HO2S) (sensor 2) detects the oxygen content in the exhaust gas downstream of the three way catalytic converter (TWC) during stoichiometric air/fuel ratio feedback control based on the air/fuel ratio (A/F) sensor (sensor 1) output voltage. The secondary HO2S controls the air/fuel ratio from the A/F sensor output voltage to optimize TWC efficiency.

After current is applied to the secondary HO2S heater, if the secondary HO2S output continues high (rich) exceeding the upper limit used during feedback control, a malfunction is detected and a DTC is stored.

Malfunction Threshold (K20Z3 Engine)

1. When the secondary HO2S output drops to the response deterioration judgment threshold value and the response characteristics measurement is finished.

   MALFUNCTION THRESHOLD

MIN	0.53 second
MAX	1 second

2. The voltage does not drop to the response deterioration judgment threshold value after a

predetermined time (1 second) has elapsed.

Driving Pattern (K20Z3 Engine)

1. Start the engine. Let it idle until the radiator fan comes on.
2. Then, drive immediately at a steady speed of 35 mph (57 km/h) or more for at least 12.3 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (K20Z3 Engine)

Conditions for illuminating the MIL (K20Z3 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the ECM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (K20Z3 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0139 (63): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0139: SECONDARY HEATED OXYGEN SENSOR (SECONDARY HO2S (SENSOR 2)) SLOW RESPONSE (R18A1)

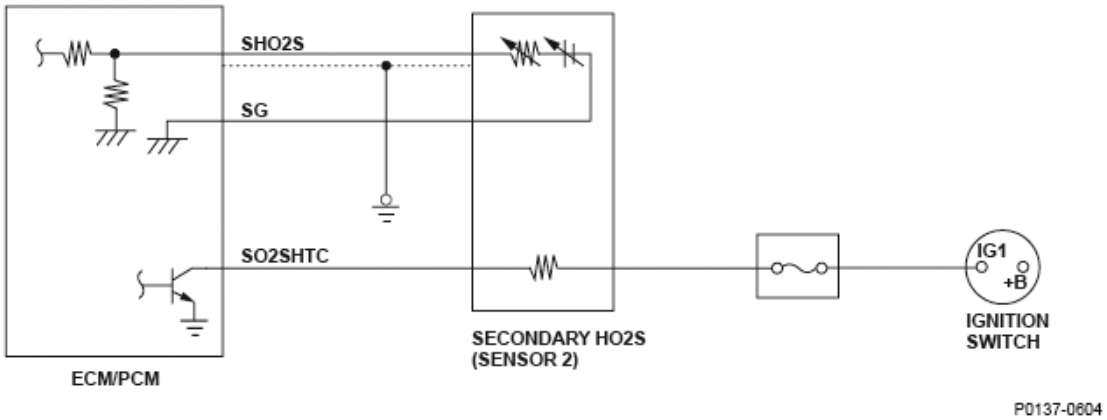

Fig. 110: Secondary Heated Oxygen Sensor - Circuit Diagram

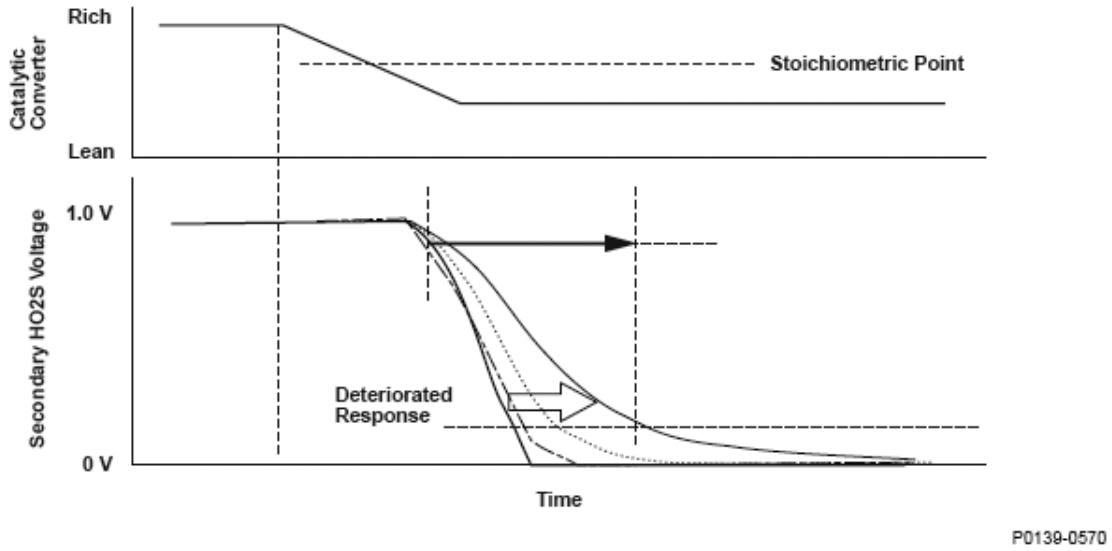

Fig. 111: Secondary Heated Oxygen Sensor Output Voltage - Graph

General Description (R18A1 Engine)

The secondary heated oxygen sensor (HO2S) (sensor 2) detects the oxygen content in the exhaust gas downstream of the three way catalytic converter (TWC) during stoichiometric air/fuel ratio feedback control. The secondary HO2S controls the air/fuel ratio with the A/F sensor output voltage to optimize TWC efficiency.

If the response time of the secondary HO2S becomes longer than the specified time after current to the secondary HO2S heater is applied, a malfunction is detected and a DTC is stored.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0141 (65): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P0141: SECONDARY HEATED OXYGEN SENSOR (SECONDARY HO2S (SENSOR 2)) HEATER CIRCUIT MALFUNCTION (K20Z3 ENGINE)

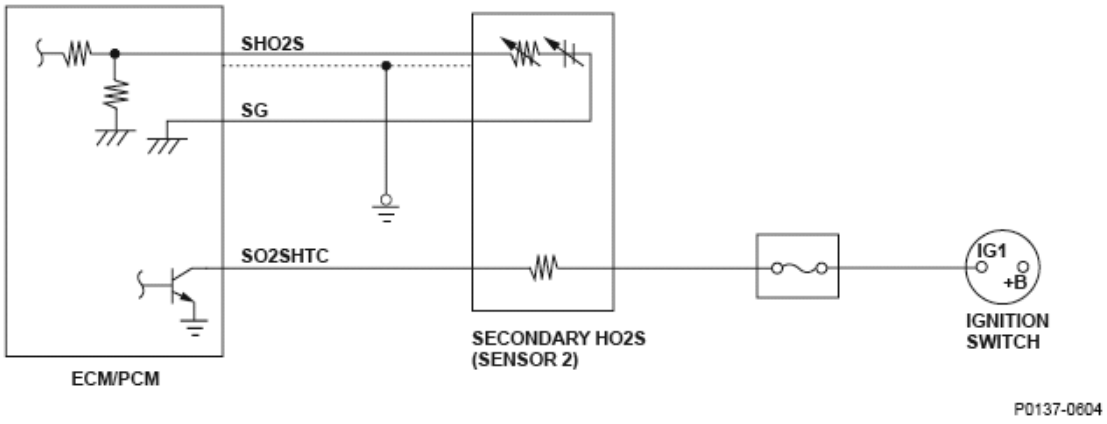

Fig. 114: Secondary Heated Oxygen Sensor - Circuit Diagram

General Description (K20Z3 Engine)

A heater for the zirconia element is embedded in the secondary heated oxygen sensor (secondary HO2S), and it is controlled by the engine control module (ECM)/powertrain control module (PCM). When activated, it heats the sensor to stabilize and speed up the detection of oxygen content when the exhaust gas temperature is cold.

If the secondary HO2S heater draws no more, or no less than a specified amperage, the ECM/PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions (K20Z3 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage (IGP terminal of ECM/PCM)	11.0 V	16.0 V
Engine coolant temperature	41°F (5°C)	-
State of the engine	Running	
No active DTCs	P0117, P0118	

Malfunction Threshold (K20Z3 Engine)

The current is 0.38 A or less, or 3.33 A or more, for at least 5 seconds when the heater is on.

Driving Pattern (K20Z3 Engine)

1. Start the engine. Let it idle until the radiator fan comes on.
2. Drive the vehicle at a steady speed of 35 mph (57 km/h) or more for at least 5 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (K20Z3 Engine)

Conditions for illuminating the MIL (K20Z3 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM/PCM memory.

Conditions for clearing the MIL (K20Z3 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0141 (65): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0141: SECONDARY HEATED OXYGEN SENSOR (SECONDARY HO2S (SENSOR 2)) HEATER CIRCUIT MALFUNCTION (R18A1 ENGINE)

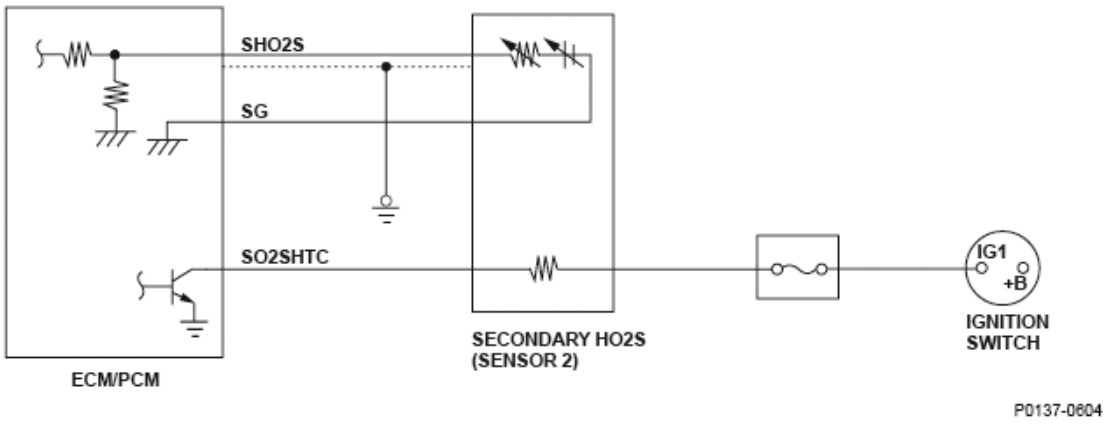

Fig. 115: Secondary Heated Oxygen Sensor - Circuit Diagram

General Description (R18A1 Engine)

A heater for the zirconia element is embedded in the secondary heated oxygen sensor (secondary HO2S), and it is controlled by the engine control module (ECM)/powertrain control module (PCM). When activated, it heats the sensor to stabilize and speed up the detection of oxygen content when the exhaust gas temperature is cold.

If the secondary HO2S heater draws no more, or no less than a specified amperage, the ECM/PCM detects a malfunction and a DTC is stored.

Malfunction Threshold (R18A4 Engine)

The current is 0.38 A or less, or 3.33 A or more, for at least 5 seconds when the heater is on.

Driving Pattern (R18A4 Engine)

1. Start the engine. Let it idle until the radiator fan comes on.
2. Drive the vehicle at a steady speed of 35 mph (57 km/h) or more for at least 5 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0171 (45): ADVANCED DIAGNOSTICS (M/T)

DTC P0171: FUEL SYSTEM TOO LEAN (M/T)

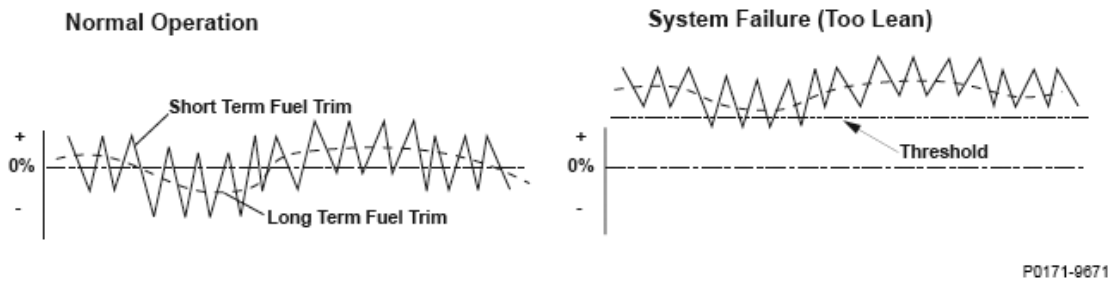

Fig. 117: Fuel System - Graph

General Description (M/T)

The engine control module (ECM)/powertrain control module (PCM) detects the oxygen content in the exhaust gas from the air/fuel ratio (A/F) sensor (sensor 1) signal voltage, and it uses fuel feedback control to maintain the optimal air/fuel ratio. The air/fuel ratio coefficient for correcting the amount of injected fuel is the short term fuel trim. The ECM/PCM varies short term fuel trim continuously to keep the air/fuel ratio close to the stoichiometric ratio for all driving conditions.

Long term fuel trim is computed from short term fuel trim and is used to regulate long term deviation from the stoichiometric air/fuel ratio, which occurs when fuel metering components deteriorate with age or system failures occur. In addition, long term fuel trim is stored in the ECM/PCM memory and is used to determine when fuel metering components malfunction.

When long term fuel trim is higher than normal, which is about 1.0 (0 %), the amount of injected fuel must be increased, and when lower than normal, it must be decreased. If long term fuel trim is higher than normal (too lean), a malfunction in the fuel metering components is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (M/T)

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle(1)
Sequence	None
Duration	Every 7 seconds
DTC Type	Two drive cycles, MIL ON
OBD Status	N/A
(1) The malfunction judgment is cleared when it is judged as normal under the same driving conditions in which the malfunction is detected.	

Enable Conditions (M/T)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Engine coolant temperature	156°F (69°C)	-
Intake air temperature	19°F (-7°C)	-
Engine speed	470 rpm(1)	4,000 rpm
	650 rpm(2)	
MAP value	20 kPa (6.0 in.Hg, 150 mmHg)(2)	-

	22 kPa (6.3 in.Hg, 160 mmHg)(1)
Fuel feedback	Closed loop
Monitoring priority	P0420, P0456, P0457, P0497
No active DTCs	P0107, P0108, P0112, P0113, P0117, P0118, P0134, P0135, P0137, P0138, P0300, P0301, P0302, P0303, P0304, P0335, P0339, P0351, P0352, P0353, P0354, P0401(1), P0404(1), P0443, P0496, P0497, P1077(1), P1078(1), P1128, P1129, P1157, P1172, P2195, P2227, P2228, P2229, P2238, P2252, P2270, P2271, P2413(1), P2646, P2647, P2648, P2649
(1) R18A1 engine (2) K20Z3 engine	

Malfunction Threshold (M/T)

Long term fuel trim is higher than 1.25 (+25 %).

Driving Pattern (M/T)

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Then, drive at a steady speed between 15 - 75 mph (24 - 120 km/h) for at least 15 minutes, and watch the long term fuel trim. If the long term fuel trim stays at about 1.0, the vehicle is OK or it is a very minor problem. If a significant fault is still present, the long term fuel trim will move up or down while driving.

- When freeze frame data is stored, drive the vehicle under those conditions instead of Driving Pattern 2.
- If the EVAP monitor runs instead of the HO2S monitor, turn the engine off, then restart it, and the HO2S monitor will restart.
- After clearing the DTC by disconnecting the battery or using the scan tool, extend Driving Pattern 2 to 40 minutes or longer to allow time for long term fuel trim to recover.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (M/T)

Conditions for illuminating the MIL (M/T)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the ECM/PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (M/T)

The MIL will be cleared if the malfunction does not recur during three consecutive drive cycles in which the engine conditions are similar to the first time the malfunction was detected.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool

Clear command or by disconnecting the battery.

DTC P0171 (45): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0171: FUEL SYSTEM TOO LEAN (R18A1 ENGINE)

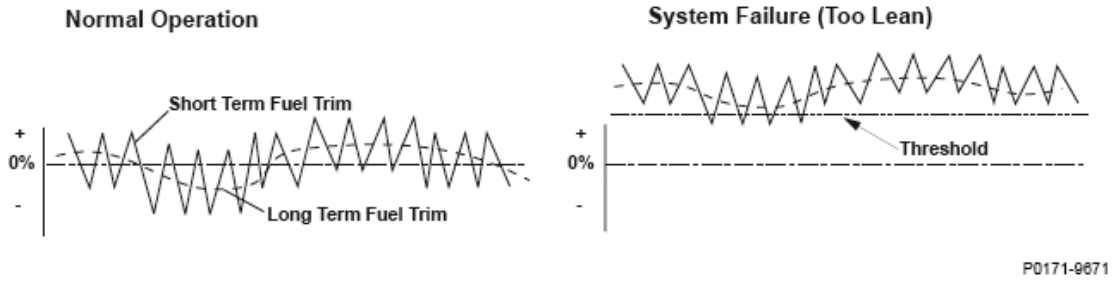

Fig. 118: Fuel System - Graph

General Description (R18A1 Engine)

The engine control module (ECM)/powertrain control module (PCM) detects the oxygen content in the exhaust gas from the air/fuel ratio (A/F) sensor (sensor 1) signal voltage, and it uses fuel feedback control to maintain the optimal air/fuel ratio. The air/fuel ratio coefficient for correcting the amount of injected fuel is the short term fuel trim. The ECM/PCM varies short term fuel trim continuously to keep the air/fuel ratio close to the stoichiometric ratio for all driving conditions.

Long term fuel trim is computed from short term fuel trim and is used to regulate long term deviation from the stoichiometric air/fuel ratio, which occurs when fuel metering components deteriorate with age or system failures occur. In addition, long term fuel trim is stored in the ECM/PCM memory and is used to determine when fuel metering components malfunction.

When long term fuel trim is higher than normal, which is about 1.0 (0 %), the amount of injected fuel must be increased, and when lower than normal, it must be decreased. If long term fuel trim is higher than normal (too lean), a malfunction in the fuel metering components is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle(1)
Sequence	None
Duration	Every 7 seconds
DTC Type	Two drive cycles, MIL ON
OBD Status	N/A
(1) The malfunction judgment is cleared when it is judged as normal under the same driving conditions in which the malfunction is detected.	

Enable Conditions (R18A1 Engine)

(1) R18A1 engine (2) K20Z3 engine		

Malfunction Threshold (R18A1 Engine)

Long term fuel trim is higher than 1.25 (+25 %).

Driving Pattern (R18A1 Engine)

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Then, drive at a steady speed between 15 - 75 mph (24 - 120 km/h) for at least 15 minutes, and watch the long term fuel trim. If the long term fuel trim stays at about 1.0, the vehicle is OK or it is a very minor problem. If a significant fault is still present, the long term fuel trim will move up or down while driving.

- When freeze frame data is stored, drive the vehicle under those conditions instead of Driving Pattern 2.
- If the EVAP monitor runs instead of the HO2S monitor, turn the engine off, then restart it, and the HO2S monitor will restart.
- After clearing the DTC by disconnecting the battery or using the scan tool, extend Driving Pattern 2 to 40 minutes or longer to allow time for long term fuel trim to recover.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive drive cycles in which the

engine conditions are similar to the first time the malfunction was detected.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0181 (96): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P0181: FUEL TEMPERATURE SENSOR CIRCUIT RANGE/PERFORMANCE PROBLEM (R18A4 ENGINE)

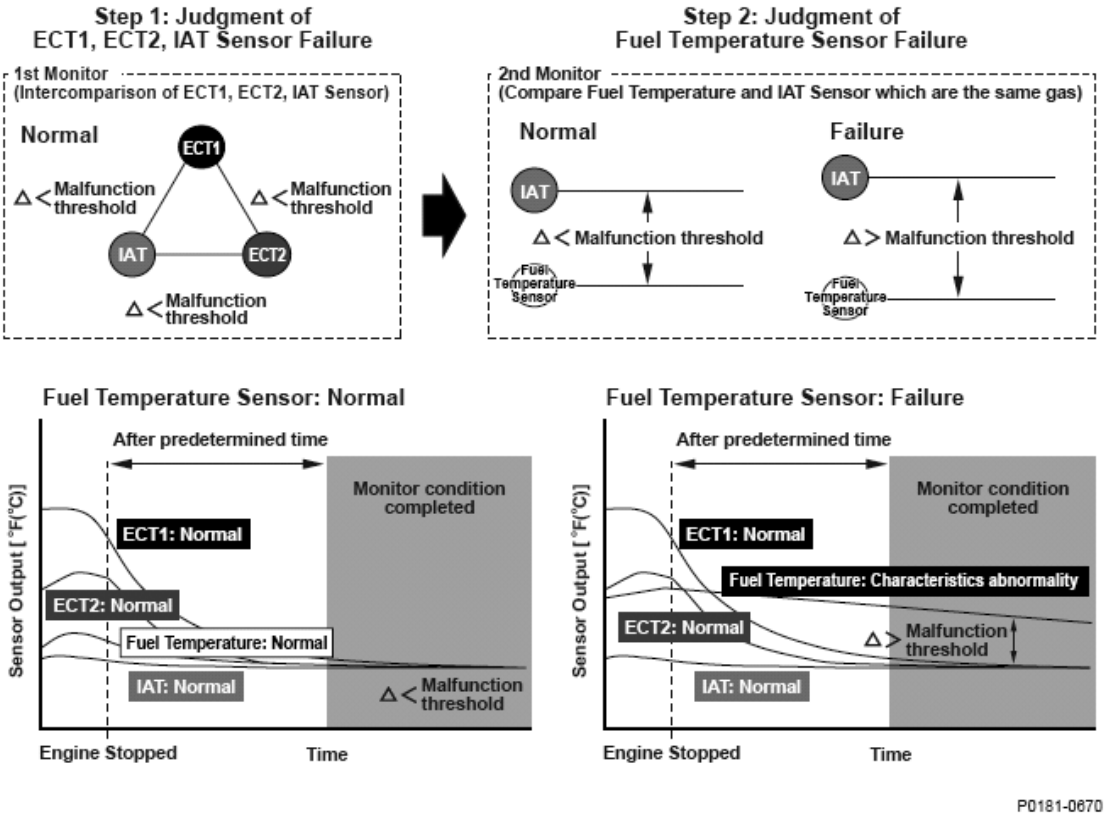

Fig. 123: Fuel Temperature Sensor Performance Graph

General Description (R18A4 Engine)

The powertrain control module (PCM) measures the fuel temperature immediately before the injection of the CNG and corrects the air density of the CNG.

When the engine stops and enough time has passed, each part of the vehicle becomes the same temperature as the ambient air.

At step 1, the two coolant temperature sensors are compared to judge if the intake temperature sensor reading is normal.

When the intake temperature sensor is judged as normal, the intake temperature sensor and CNG fuel temperature sensor are compared at step 2, and if an improper temperature is detected, a CNG fuel temperature sensor problem is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A4 Engine)

Malfunction Threshold (R18A4 Engine)

When the temperature difference between the fuel temperature sensor and IAT is 45 °F (25 °C) or more.

Driving Pattern (R18A4 Engine)

1. Turn the ignition off, and wait at least 6 hours.
2. Start the engine, and let it idle for at least 10 seconds.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0182 (96): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P0182: FUEL TEMPERATURE SENSOR CIRCUIT LOW VOLTAGE (R18A4 ENGINE)

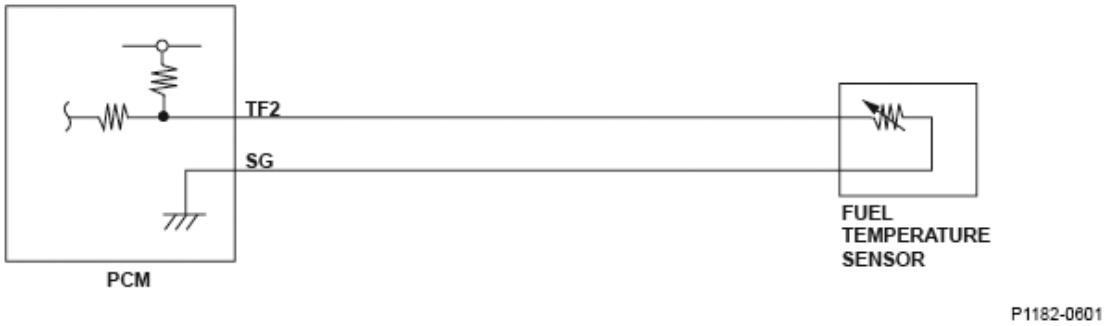

Fig. 124: Fuel Temperature Sensor - Circuit Diagram

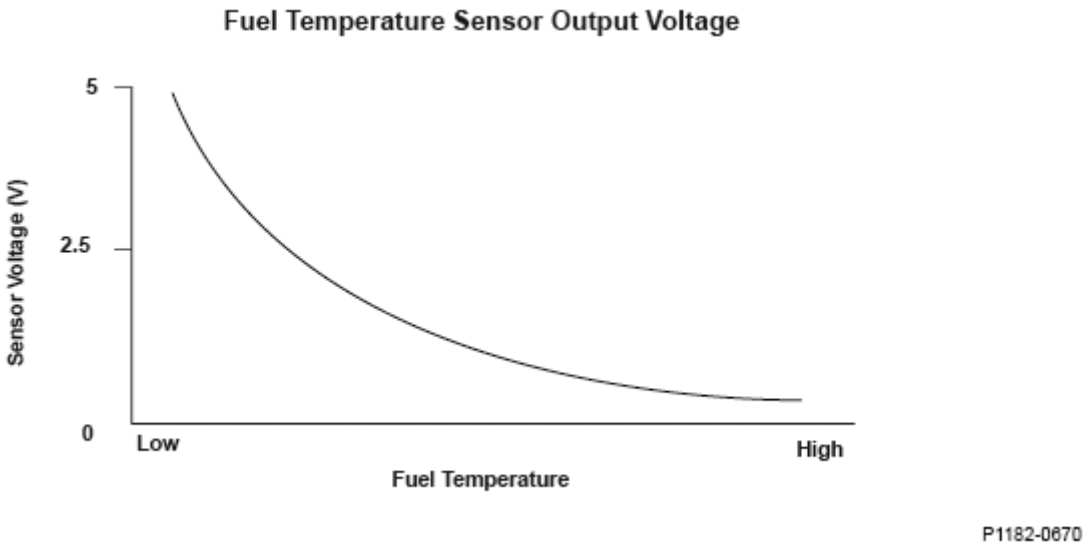

Fig. 125: Fuel Temperature Sensor Output Voltage Graph

General Description (R18A4 Engine)

The fuel temperature sensor is located on the fuel rail and detects the temperature of the fuel. This signal is used to adjust the fuel injector duration according to the fuel temperature.

The sensor's resistance varies with the fuel temperature sensed by the thermistor. As the fuel temperature falls, the sensor resistance increases, resulting in an increase of sensor output voltage. As the fuel temperature rises, the sensor resistance decreases, resulting in a decrease of sensor output voltage.

If the fuel temperature sensor output voltage is excessively low, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0183 (96): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P0183: FUEL TEMPERATURE SENSOR CIRCUIT HIGH VOLTAGE (R18A4 ENGINE)

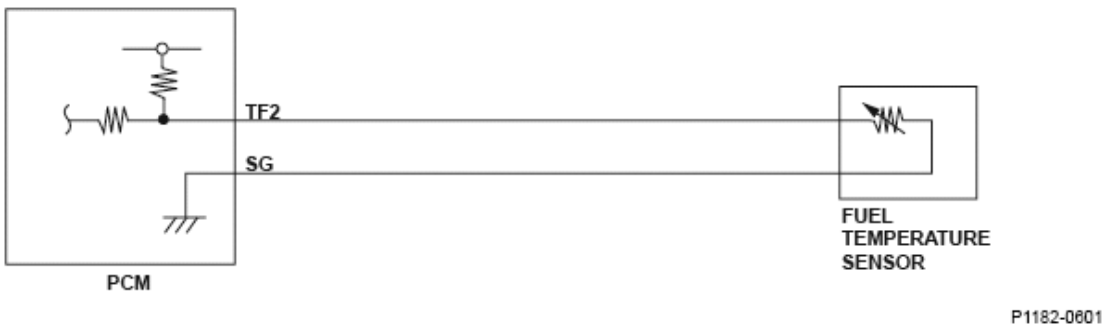

Fig. 126: Fuel Temperature Sensor - Circuit Diagram

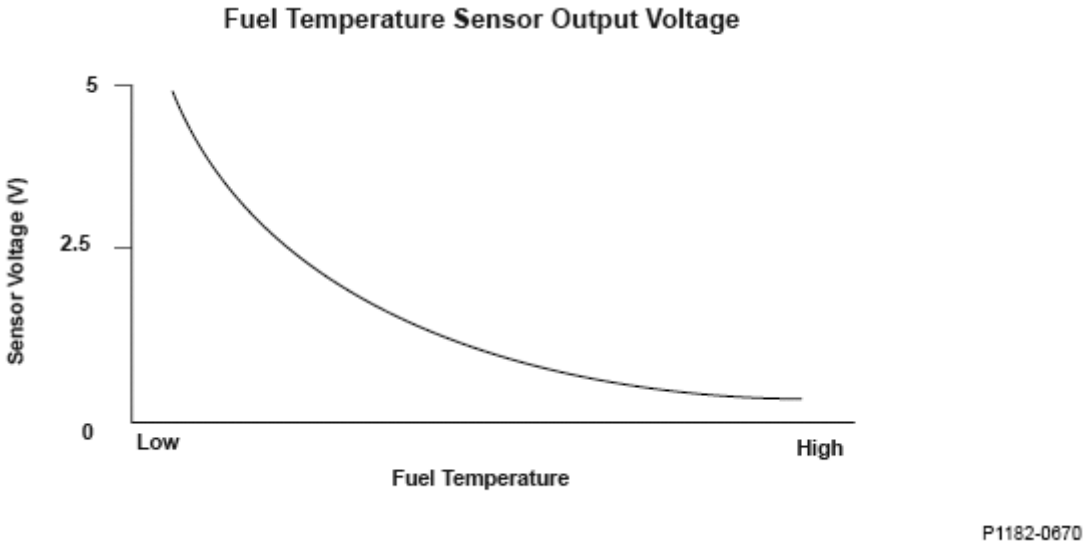

Fig. 127: Fuel Temperature Sensor Output Voltage Graph

General Description (R18A4 Engine)

The fuel temperature sensor is located on the fuel rail and detects the temperature of the fuel. This signal is used to adjust the fuel injector duration according to the fuel temperature.

The sensor's resistance varies with the fuel temperature sensed by the thermistor. As the fuel temperature falls, the sensor resistance increases, resulting in an increase of sensor output voltage. As the fuel temperature rises, the sensor resistance decreases, resulting in a decrease of sensor output voltage.

If the fuel temperature sensor output voltage is excessively high, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A4 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	N/A

Enable Conditions (R18A4 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Intake air temperature	-22°F (-30°C)	-
Ignition switch	ON	
No active DTCs	P0112, P0113, P0182	

Malfunction Threshold (R18A4 Engine)

The fuel temperature sensor output voltage is 4.92 V or more for at least 2 seconds.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0191 (96): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P0191: FUEL RAIL PRESSURE SENSOR CIRCUIT RANGE/PERFORMANCE PROBLEM (R18A4 ENGINE)

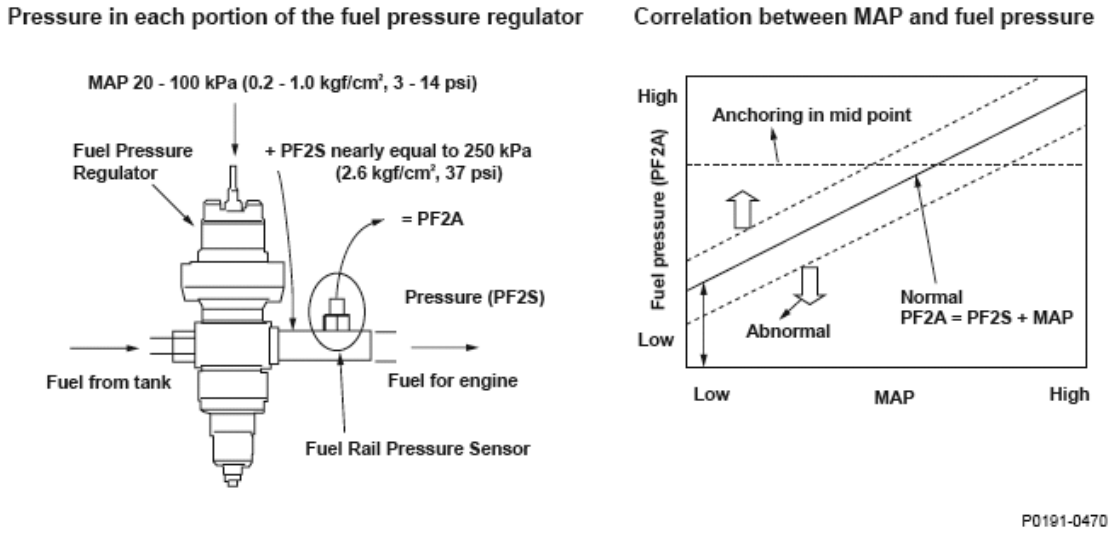

Fig. 128: Fuel Rail Pressure Sensor Performance Description

General Description (R18A4 Engine)

The compressed natural gas (CNG) is supplied from the fuel tank, and it is regulated to about 250 kPa (depending on the MAP sensor value) by the fuel pressure regulator before it reaches the engine. The powertrain control module (PCM) monitors the fuel pressure value detected by the fuel pressure sensor (PF2A) to maintain the correlation with the MAP sensor value. The PCM uses Modes 1 and 2 based on the correlation between the MAP and PF2A shown in the graph to detect abnormal sensor output characteristics.

Mode 1: If the variance of PF2A is within a set range when the MAP varies beyond a certain value, no malfunction is detected, and Mode 2 is started. If the variance of PF2A is out of a set range, a malfunction is detected and a DTC is stored.

Mode 2: If the calculated PF2S is out of a set range, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A4 Engine)

MONITOR DESCRIPTION - MODE 1

Execution	Once per driving cycle
Sequence	None
Duration	1 second or more
DTC Type	Two drive cycles, MIL ON
OBD Status	PASSED/FAILED/EXECUTING/OUT OF (TEST) CONDITION

MONITOR DESCRIPTION - MODE 2

Execution	Once per driving cycle
Sequence	None
Duration	3 seconds or more
DTC Type	Two drive cycles, MIL ON
OBD Status	PASSED/FAILED/EXECUTING/OUT OF (TEST) CONDITION

Enable Conditions (R18A4 Engine)

ENABLE CONDITIONS - MODE 1

Condition	Minimum	Maximum
Elapsed time after starting the engine	5 seconds	-
No active DTCs	P0107, P0108, P0116, P0117, P0118, P0125, P0192, P0193, P1128, P1129	

ENABLE CONDITIONS - MODE 2

Condition	Minimum	Maximum
Elapsed time after starting the engine	5 seconds	-
Engine coolant temperature	156°F (69°C)	-
No active DTCs	P0107, P0108, P0116, P0117, P0118, P0125, P0192, P0193, P1128, P1129	

Malfunction Threshold (R18A4 Engine)

Mode 1: The difference between PF2A values when the MAP is maximum and when the MAP is minimum is 4 bits or less.

Mode 2: PF2A is not between 204 - 326 kPa (2.1 - 3.3 kgf/cm^2 , 30 - 47 psi) for at least 3 seconds. (PF2S = PF2A - MAP)

Driving Pattern (R18A4 Engine)

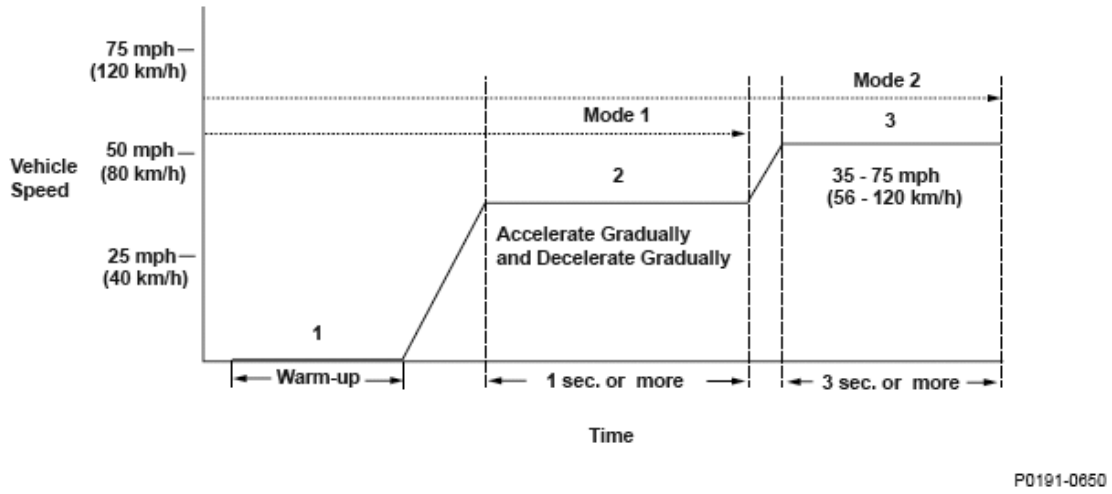

Fig. 129: Identifying Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Drive the vehicle, and gradually accelerate and decelerate for at least 1 second. (Mode 1)
3. Then, drive at a speed between 35 - 75 mph (56 - 120 km/h) for at least 3 seconds. (Mode 2)

- If you have difficulty duplicating the DTC, retest after turning off electrical components such as the audio system and A/C, and try a different gear position.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0192 (95): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P0192: FUEL RAIL PRESSURE SENSOR CIRCUIT LOW VOLTAGE (R18A4 ENGINE)

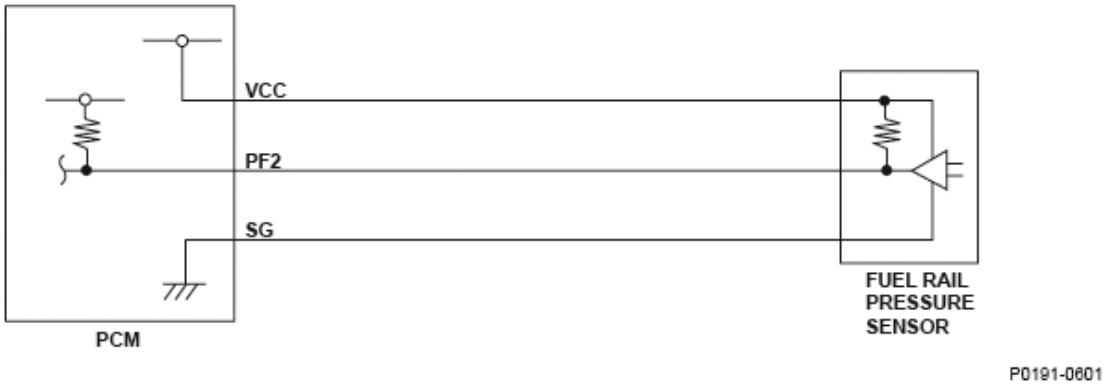

Fig. 130: Fuel Rail Pressure Sensor - Circuit Diagram

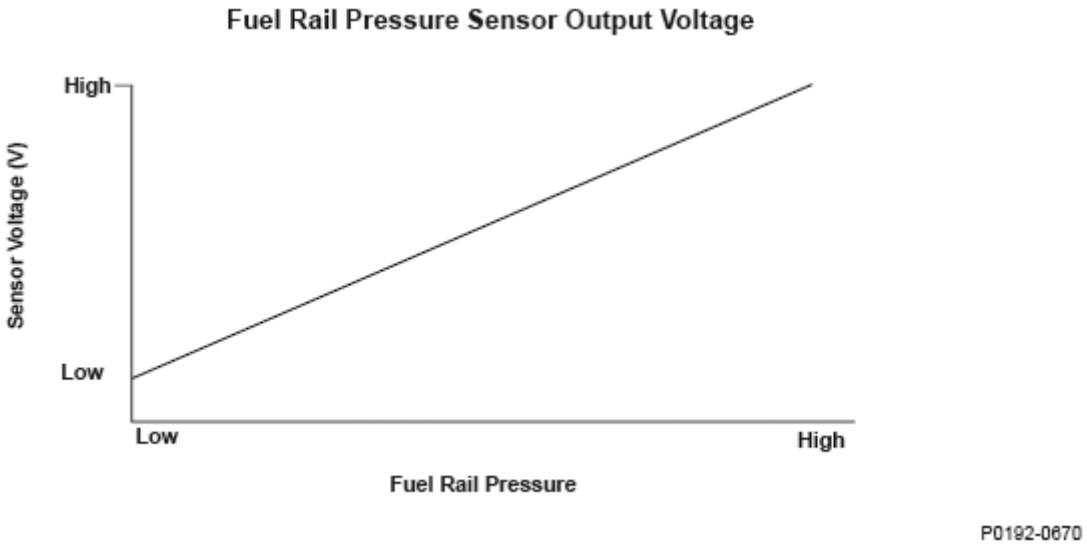

Fig. 131: Fuel Rail Pressure Sensor Output Voltage Graph

General Description (R18A4 Engine)

The fuel rail pressure sensor senses fuel rail absolute pressure and converts it into electrical signals. The fuel rail pressure sensor outputs low signal voltage at low-fuel rail pressure and high signal voltage at high-fuel rail pressure.

If the fuel rail pressure sensor output voltage is a set value or less, the powertrain control module (PCM) detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A4 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	N/A

Enable Conditions (R18A4 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	
Ignition switch	ON
No active DTCs	P0193

Malfunction Threshold (R18A4 Engine)

The fuel rail pressure sensor output voltage is 0.23 V or less for at least 2 seconds.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0193 (95): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P0193: FUEL RAIL PRESSURE SENSOR CIRCUIT HIGH VOLTAGE (R18A4 ENGINE)

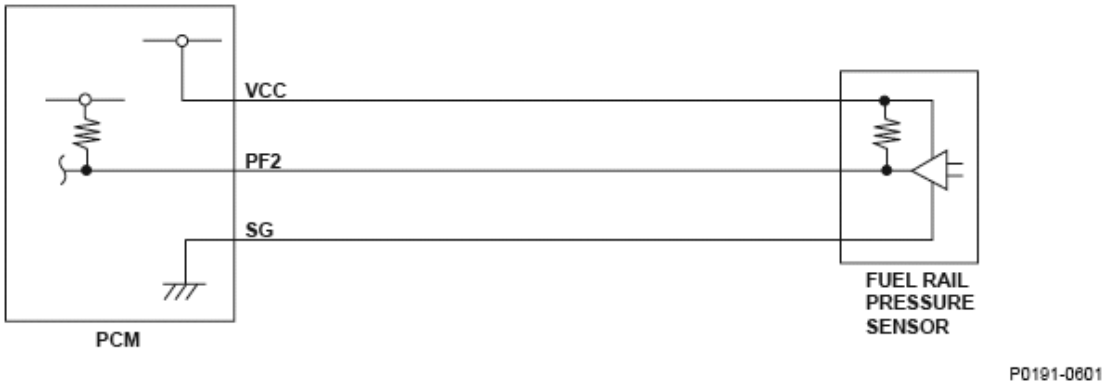

Fig. 132: Fuel Rail Pressure Sensor - Circuit Diagram

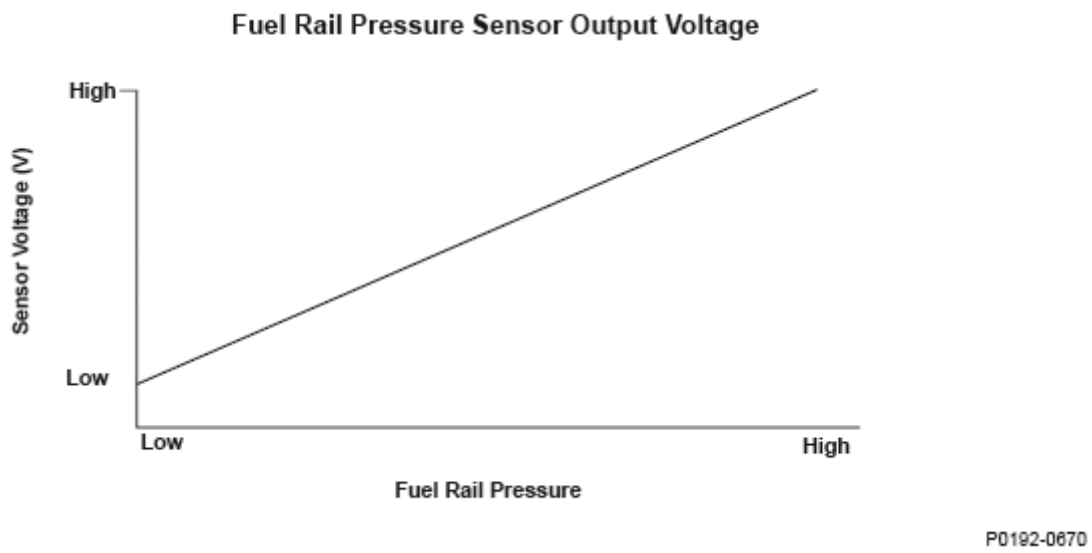

Fig. 133: Fuel Rail Pressure Sensor Output Voltage Graph

General Description (R18A4 Engine)

The fuel rail pressure sensor senses fuel rail absolute pressure and converts it into electrical signals. The fuel rail pressure sensor outputs low signal voltage at low-fuel rail pressure and high signal voltage at high-fuel rail pressure.

If the fuel rail pressure sensor output voltage is a set value or more, the powertrain control module (PCM) detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A4 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	N/A

Enable Conditions (R18A4 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	
Ignition switch	ON
No active DTCs	P0192

Malfunction Threshold (R18A4 Engine)

The fuel rail pressure sensor output voltage is 4.77 V or more for at least 2 seconds.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0222 (7): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P0222: THROTTLE POSITION (TP) SENSOR B CIRCUIT LOW VOLTAGE (K20Z3 ENGINE)

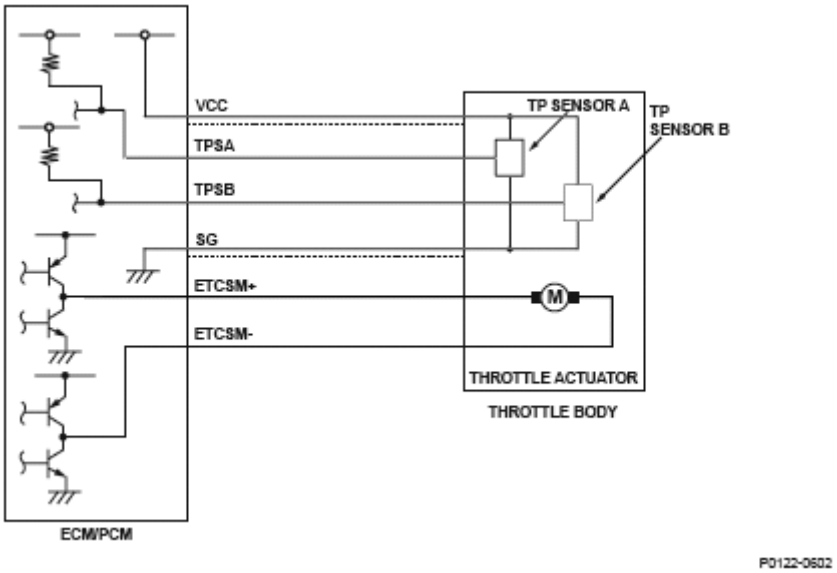

Fig. 134: Throttle Position (TP) Sensor - Circuit Diagram

General Description (K20Z3 Engine)

The electronic throttle control system (ETCS) controls the throttle valve opening. The system is composed of the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the accelerator pedal position (APP) sensor, and the engine control module (ECM)/powertrain control module (PCM).

Throttle position (TP) sensor B is a semiconductor type, and it is attached to the throttle body and shaft to determine throttle valve position.

The throttle valve position signal from TP sensor B is transmitted to the ECM/PCM for target position feedback control. If the signal from TP sensor B is less than a fixed value for a set time, the ECM/PCM detects a TP sensor B malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	0.2 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	N/A

Enable Conditions (K20Z3 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	
Ignition switch	ON
No active DTCs	P0223, P2101, P2118, P2135, P2176

Malfunction Threshold (K20Z3 Engine)

The TP sensor B output voltage is 0.3 V or less for at least 0.2 seconds.

Diagnosis Details (K20Z3 Engine)

Conditions for illuminating the MIL (K20Z3 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM/PCM memory.

Conditions for clearing the MIL (K20Z3 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0222 (7): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0222: THROTTLE POSITION (TP) SENSOR B CIRCUIT LOW VOLTAGE (R18A1 ENGINE)

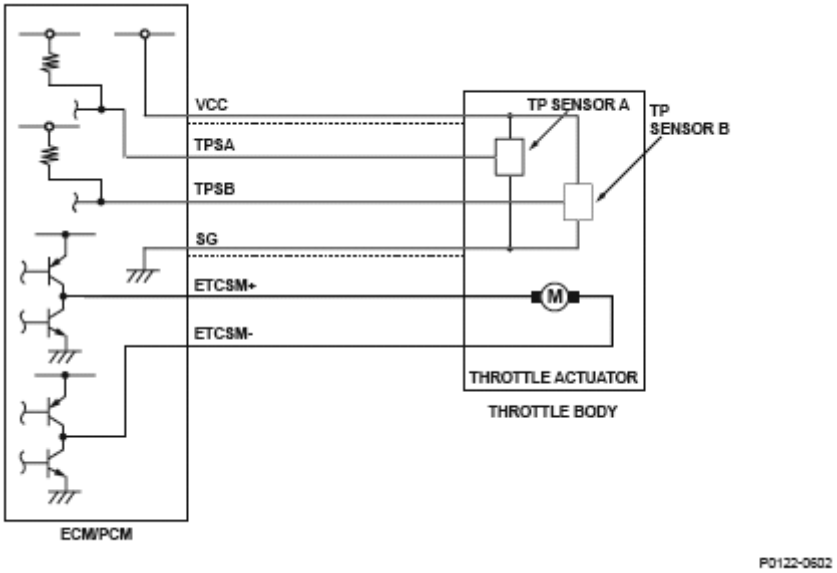

Fig. 135: Throttle Position (TP) Sensor - Circuit Diagram

General Description (R18A1 Engine)

The electronic throttle control system (ETCS) controls the throttle valve opening. The system is composed of the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the accelerator pedal position (APP) sensor, and the engine control module (ECM)/powertrain control module (PCM).

Throttle position (TP) sensor B is a semiconductor type, and it is attached to the throttle body and shaft to determine throttle valve position.

The throttle valve position signal from TP sensor B is transmitted to the ECM/PCM for target position feedback control.

If the signal from TP sensor B is less than a fixed value for a set time, the ECM/PCM detects a TP sensor B malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

OBD Status	N/A

Enable Conditions (R18A1 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	
Ignition switch	ON
No active DTCs	P0223, P2101, P2118, P2135, P2176

Malfunction Threshold (R18A1 Engine)

The TP sensor B output voltage is 0.3 V or less for at least 0.2 seconds.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM/PCM memory.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0222 (7): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P0222: THROTTLE POSITION (TP) SENSOR B CIRCUIT LOW VOLTAGE (R18A4 ENGINE)

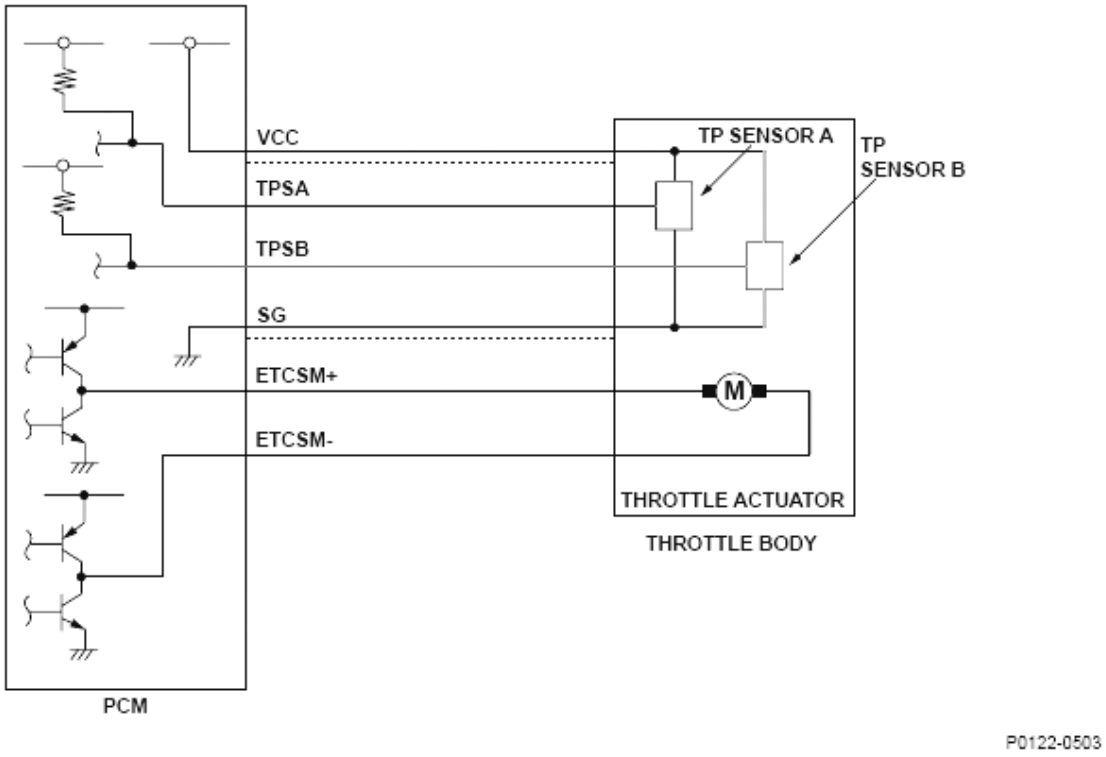

Fig. 136: Throttle Position (TP) Sensor A Circuit Low Voltage - Circuit Diagram

General Description (R18A4 Engine)

The electronic throttle control system (ETCS) controls the throttle valve opening. The system is composed

of the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the accelerator pedal position (APP) sensor, and the powertrain control module (PCM).

Throttle position (TP) sensor B is a semiconductor type, and it is attached to the throttle body and shaft to determine throttle valve position.

The throttle valve position signal from TP sensor B is transmitted to the PCM for target position feedback control.

If the signal from TP sensor B is less than a fixed value for a set time, the PCM detects a TP sensor B malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A4 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	
Ignition switch	ON
No active DTCs	P0222, P2101, P2118, P2135, P2176

Malfunction Threshold (R18A4 Engine)

The TP sensor B output voltage is 4.8 V or more for at least 0.2 seconds.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0300 (75): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P0300: RANDOM MISFIRE DETECTED (K20Z3)

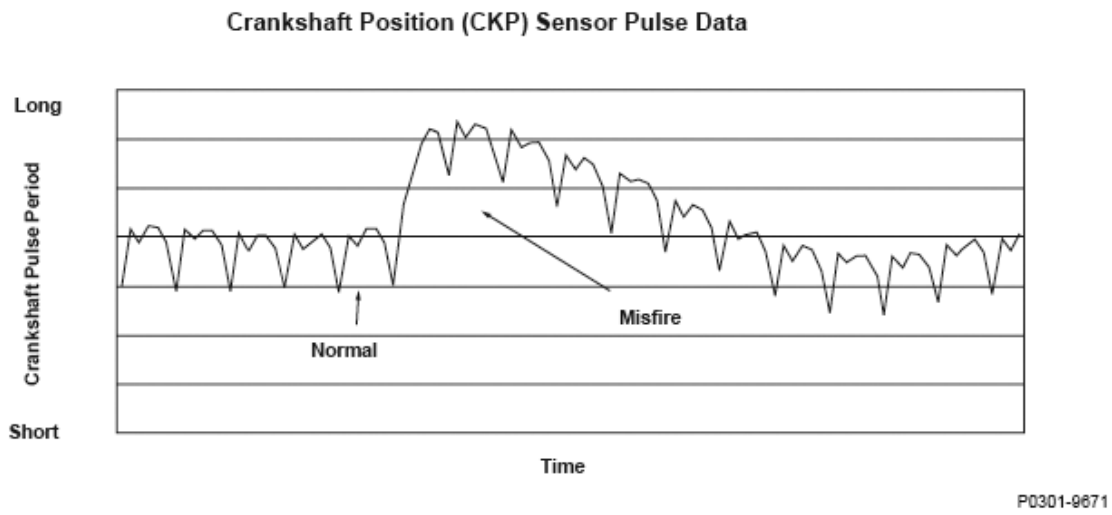

Fig. 141: Crankshaft Position Sensor Pulse Data - Graph

General Description (K20Z3 Engine)

The crankshaft vibrates slightly when each cylinder fires. If a misfire occurs, the crankshaft rotation speed changes rapidly. The engine control module (ECM) monitors the crankshaft rotation speed based on the output pulses from the crankshaft position (CKP) sensor. By monitoring changes in the crankshaft rotation speed, the ECM counts the number of misfires and determines which cylinder is misfiring. If more than one DTC from P0301 through P0304 has been stored while misfires in multiple cylinders are detected, a malfunction is detected and a DTC is stored.

There are two types of misfire detection.

Type 1 (1 drive cycle): When the number of misfires per 200 engine revolutions reaches the level that damages the three way catalyst (TWC), a DTC is stored and the MIL blinks. When the misfire ceases, the MIL remains on steady instead of blinking.

Type 2 (2 drive cycles): When the number of misfires per 1,000 engine revolutions reaches the level that affects FTP mode exhaust emissions, a DTC is stored and the MIL comes on.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

MONITOR DESCRIPTION CHART

Execution		Continuous
Sequence		None
Duration	Type 1	Every 200 rpm
	Type 2	Every 1,000 rpm
DTC Type		Two drive cycles, MIL ON
OBD Status		PASSED/FAILED/EXECUTING/OUT OF (TEST) CONDITION

Enable Conditions (K20Z3 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition		Minimum	Maximum
Engine coolant temperature		14°F (-10°C)(1)	-
		68°F (20°C)(2)	
Engine speed		500 rpm	8,000 rpm
MAP value(3)	750 rpm	22 kPa (6.4 in.Hg, 162 mmHg)	-
	2,000 rpm	22 kPa (6.3 in.Hg, 158 mmHg)	-
Fuel feedback		Other than during fuel cut-off operation	
No active DTCs		P0107, P0108, P0117, P0118, P0122, P0123, P0222, P0223, P0335, P0339, P1128, P1129, P2227, P2228, P2229	
Other		Test-drive on a flat road to avoid misdetection	

(1) When starting the engine at an engine coolant temperature of more than 14°F (-10°C).

(2) When starting the engine at an engine coolant temperature of 14°F (-10°C) or less.

(3) Varies with driving conditions.

Malfunction Threshold (K20Z3 Engine)

The number of misfires versus engine revolutions is equal to or greater than the values in the table.

MALFUNCTION THRESHOLD

Misfire Type	The number of engine revolutions	The number of misfires
Misfire Type 1 (Severe)	Per 200 revolutions	19 - 89 times(1)
Misfire Type 2 (Light)	Per 1,000 revolutions	49 times

(1) Depending on engine speed and load.

Driving Pattern (K20Z3 Engine)

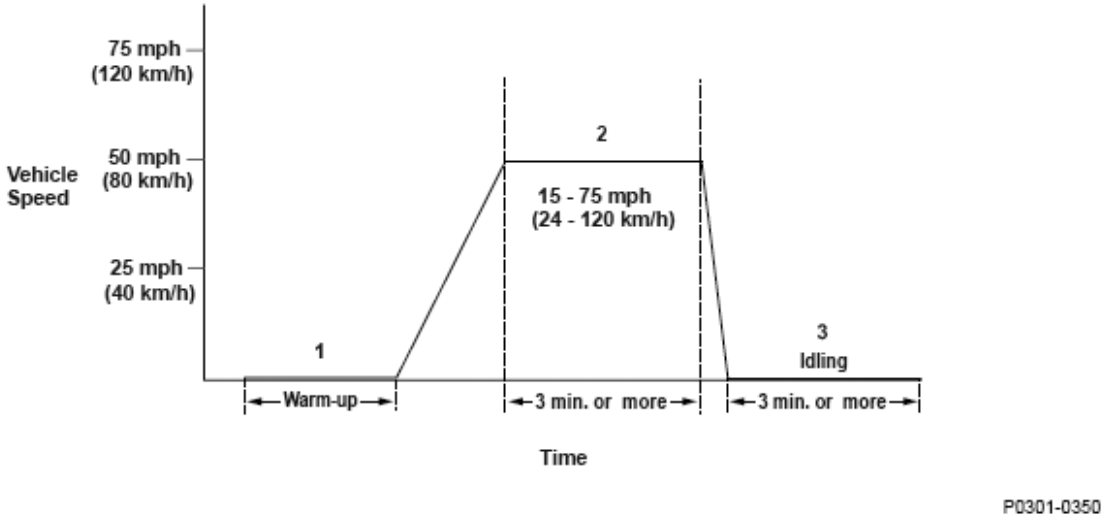

Fig. 142: Identifying Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on.
2. Drive the vehicle at a speed between 15 - 75 mph (24 - 120 km/h) for at least 3 minutes.
3. Stop the vehicle, and let the engine idle for at least 3 minutes.

- When freeze frame data is stored, drive the vehicle under those conditions instead of Driving Patterns 2 or 3.
- When you have difficulty duplicating the DTC because of road conditions and traffic situations, repeat the driving pattern several times.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (K20Z3 Engine)

Conditions for illuminating the MIL (K20Z3 Engine)

Misfire Type 1: Under high rpm or high load conditions: The MIL blinks once per second if a type 1 misfire (catalyst damaging) occurs, and a Temporary DTC is stored. If the type 1 misfire ceases, the MIL goes off. If a type 1 misfire occurs during the next (second) drive cycle, the MIL blinks at the first misfire occurrence, and the DTC and the freeze frame data are stored. The MIL remains on steady if the type 1 misfire ceases.

Under normal driving conditions: The MIL blinks once per second if a type 1 misfire occurs a third time, and a Temporary DTC is stored. If a type 1 misfire occurs during the next (second) drive cycle, the MIL blinks during the third type 1 misfire occurrence, and the DTC and the freeze frame data are stored. If the type 1 misfire ceases, the MIL remains on steady.

Misfire Type 2: When a type 2 misfire (emission-related but not severe enough to immediately damage the TWC) occurs within the first 1,000 engine revolutions after engine start-up, a Temporary DTC is stored.

If a type 2 misfire occurs after the first 1,000 engine revolutions after engine start-up, a Temporary DTC is stored during the fourth type 2 misfire occurrence.

If a type 2 misfire occurs during the next (second) drive cycle, the MIL comes on, and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (K20Z3 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive drive cycles in which the engine conditions are similar to the first time the malfunction was detected.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0300 (75): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0300: RANDOM MISFIRE DETECTED (R18A1)

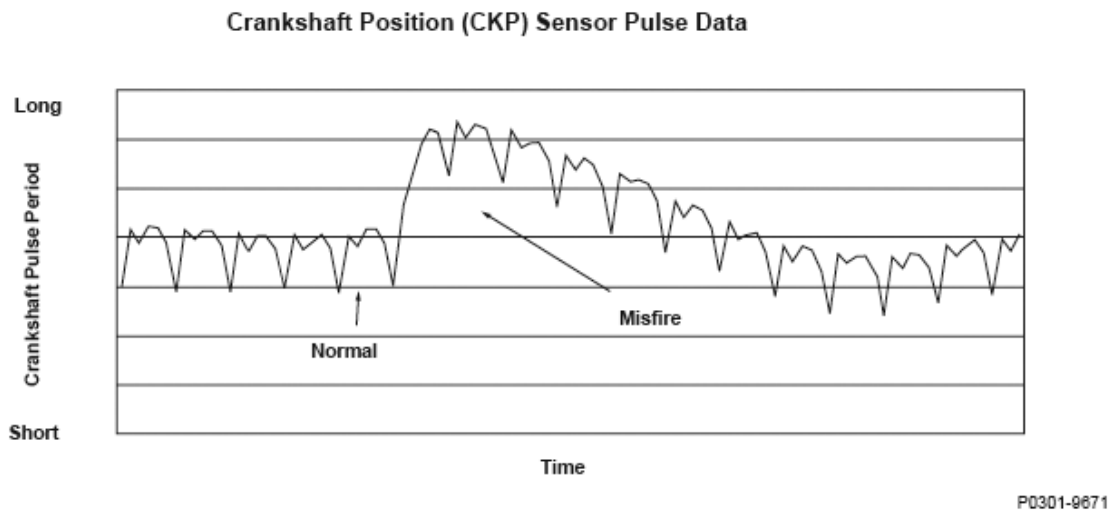

Fig. 143: Crankshaft Position Sensor Pulse Data - Graph

General Description (R18A1 Engine)

The crankshaft vibrates slightly when each cylinder fires. If a misfire occurs, the crankshaft rotation speed changes rapidly. The engine control module (ECM)/powertrain control module (PCM) monitors the crankshaft rotation speed based on the output pulses from the crankshaft position (CKP) sensor. By monitoring changes in the crankshaft rotation speed, the ECM/ PCM counts the number of misfires and determines which cylinder is misfiring. If more than one DTC from P0301 through P0304 has been stored while misfires in multiple cylinders are detected, a malfunction is detected and a DTC is stored. There are two types of misfire detection.

Type 1 (1 drive cycle): When the number of misfires per 200 engine revolutions reaches the level that damages the three way catalyst (TWC), a DTC is stored and the MIL blinks. When the misfire ceases, the MIL remains on steady instead of blinking.

Type 2 (2 drive cycles): When the number of misfires per 1,000 engine revolutions reaches the level that affects FTP mode exhaust emissions, a DTC is stored and the MIL comes on.

(1) When starting the engine at an engine coolant temperature of more than 14°F (-10°C).

(2) When starting the engine at an engine coolant temperature of 14°F (-10°C) or less.

(3) Varies with driving conditions.

Malfunction Threshold (R18A1 Engine)

The number of misfires versus engine revolutions is equal to or greater than the values in the table.

MALFUNCTION THRESHOLD

Misfire Type	The number of engine revolutions	The number of misfires
Misfire Type 1 (Severe)	Per 200 revolutions	18 - 90 times(1)
Misfire Type 2 (Light)	Per 1,000 revolutions	24(2), 28(3) times

(1) Depending on engine speed and load.

(2) A/T model

(3) M/T model

Driving Pattern (R18A1 Engine)

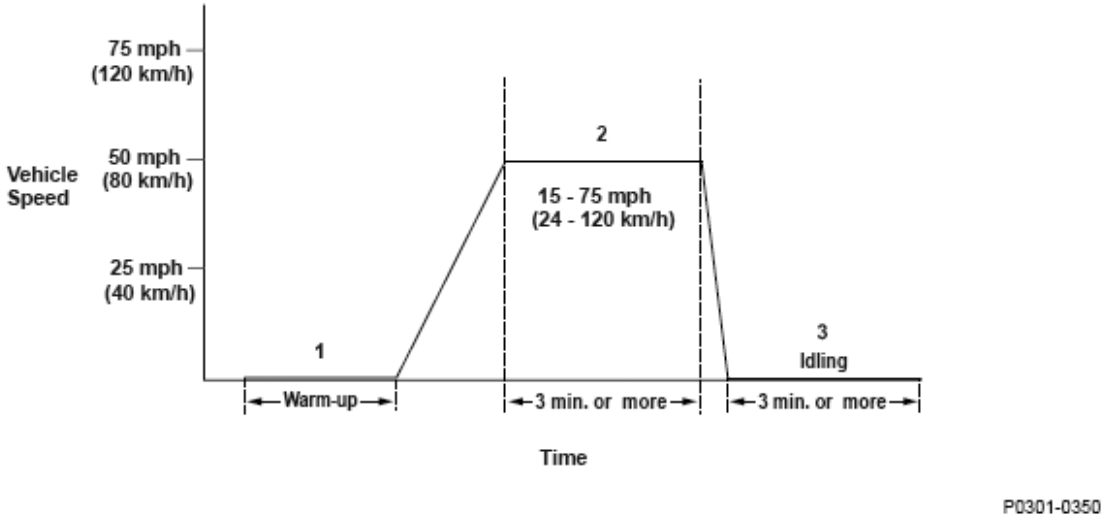

Fig. 144: Identifying Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Drive the vehicle at a speed between 15 - 75 mph (24 - 120 km/h) for at least 3 minutes.
3. Stop the vehicle, and let the engine idle for at least 3 minutes.

- When freeze frame data is stored, drive the vehicle under those conditions instead of Driving Patterns 2 or 3.
- When you have difficulty duplicating the DTC because of road conditions and traffic situations, repeat the driving pattern several times.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

Misfire Type 1:

- If a type 1 misfire (catalyst damaging) occurs once, the MIL blinks once per second, a Temporary DTC is stored, and the high rpm fuel injection stop system activates. The fuel injection stops, at high rpm only, on the bank of cylinders with the cylinder that has the highest misfire counts. the MIL continues to blink and the fuel injection stays off at high rpm, until the drive is completed.
- If a type 1 misfire occurs during a second drive cycle, the MIL and fuel injection behave the same and a DTC is stored.
- After a type 1 misfire has been detected during two drive cycles, the MIL comes on and stays on solid beginning with the third drive cycle, unless the Temporary DTC has been cleared by the ECM/PCM*. Even if the MIL is on, it will start blinking if a type 1 misfire occurs.

Misfire Type 2:

If a type 2 misfire (emission-related but not severe enough to immediately damage the catalyst) occurs, a Temporary DTC is stored, but the MIL does come on or blink. If a type 2 misfire occurs during a second drive cycle, the MIL comes on and stays on unless the Temporary DTC has been cleared by the

ECM/PCM*.

* The temporary DTC is erased under these conditions:

- The vehicle is operated under the same driving conditions as the first misfire detection, and no misfire is detected.
- 80 drive cycles are completed with no misfire detected.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive drive cycles in which the engine conditions are similar to the first time the malfunction was detected.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0300 (75): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P0300: RANDOM MISFIRE DETECTED (R18A4 ENGINE)

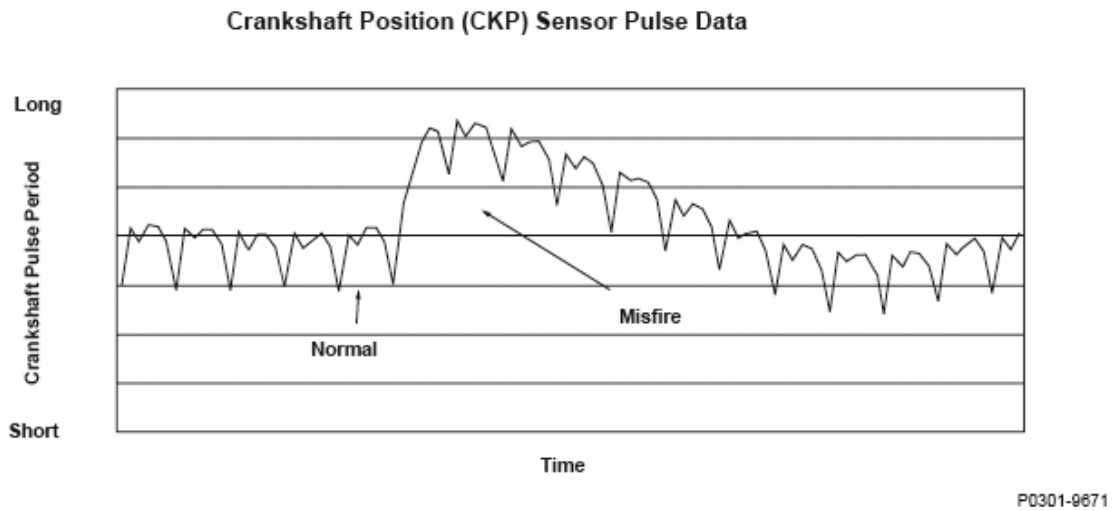

Fig. 145: Crankshaft Position Sensor Pulse Data - Graph

General Description (R18A4 Engine)

The crankshaft vibrates slightly when each cylinder fires. If a misfire occurs, the crankshaft rotation speed changes rapidly. The powertrain control module (PCM) monitors the crankshaft rotation speed based on the output pulses from the crankshaft position (CKP) sensor. By monitoring changes in the crankshaft rotation speed, the PCM counts the number of misfires and determines which cylinder is misfiring. If more than one DTC from P0301 through P0304 has been stored while misfires in multiple cylinders are detected, a malfunction is detected and a DTC is stored.

There are two types of misfire detection.

Type 1 (1 drive cycle): When the number of misfires per 200 engine revolutions reaches the level that damages the three way catalyst (TWC), a DTC is stored and the MIL blinks. When the misfire ceases, the

MIL remains on steady instead of blinking.

Type 2 (2 drive cycles): When the number of misfires per 1,000 engine revolutions reaches the level that affects FTP mode exhaust emissions, a DTC is stored and the MIL comes on.

Malfunction Threshold (R18A4 Engine)

The number of misfires versus engine revolutions is equal to or greater than the values in the table.

MALFUNCTION THRESHOLD

Misfire Type	The number of engine revolutions	The number of misfires
Misfire Type 1 (Severe)	Per 200 revolutions	33 - 82 times(1)
Misfire Type 2 (Light)	Per 1,000 revolutions	65 times

(1) Depending on engine speed and load.

Driving Pattern (R18A4 Engine)

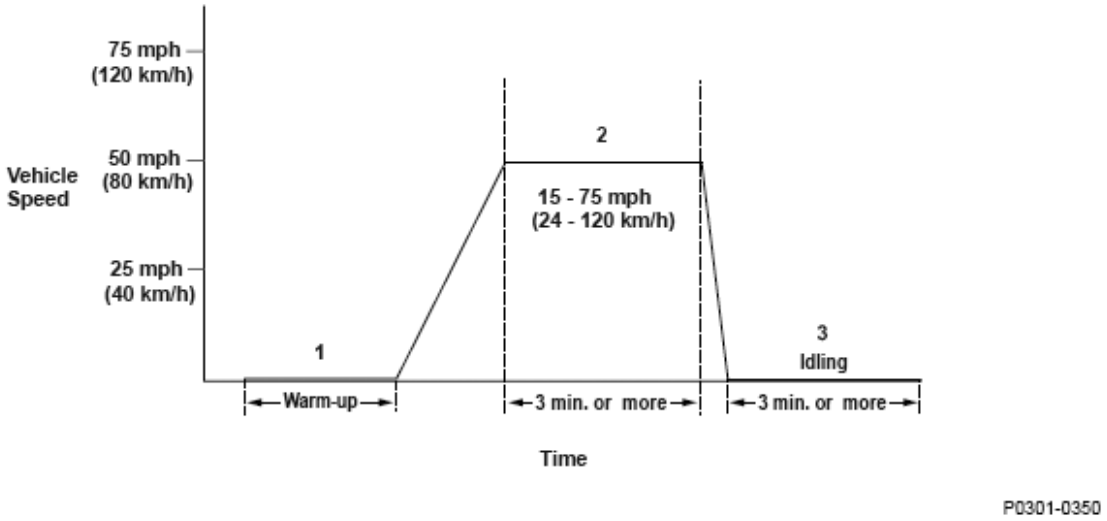

Fig. 146: Identifying Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Drive the vehicle at a speed between 15 - 75 mph (24 - 120 km/h) for at least 3 minutes.
3. Stop the vehicle, and let the engine idle for at least 3 minutes.

- When freeze frame data is stored, drive the vehicle under those conditions instead of Driving Patterns 2 or 3.
- When you have difficulty duplicating the DTC because of road conditions and traffic situations, repeat the driving pattern several times.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

Misfire Type 1: Under high rpm or high load conditions: The MIL blinks once per second if a type 1 misfire (catalyst damaging) occurs, and a Temporary DTC is stored. If the type 1 misfire ceases, the MIL goes off. If a type 1 misfire occurs during the next (second) drive cycle, the MIL blinks at the first misfire occurrence, and the DTC and the freeze frame data are stored. The MIL remains on steady if the type 1 misfire ceases.

Under normal driving conditions: The MIL blinks once per second if a type 1 misfire occurs a third time, and a Temporary DTC is stored. If a type 1 misfire occurs during the next (second) drive cycle, the MIL blinks during the third type 1 misfire occurrence, and the DTC and the freeze frame data are stored. If the type 1 misfire ceases, the MIL remains on steady.

Misfire Type 2: When a type 2 misfire (emission-related but not severe enough to immediately damage the TWC) occurs within the first 1,000 engine revolutions after engine start-up, a Temporary DTC is stored.

If a type 2 misfire occurs after the first 1,000 engine revolutions after engine start-up, a Temporary DTC is stored during the fourth type 2 misfire occurrence.

If a type 2 misfire occurs during the next (second) drive cycle, the MIL comes on, and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive drive cycles in which the engine conditions are similar to the first time the malfunction was detected.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Drive the vehicle at a speed between 15 - 75 mph (24 - 120 km/h) for at least 3 minutes.
3. Stop the vehicle, and let the engine idle for at least 3 minutes.

- When freeze frame data is stored, drive the vehicle under those conditions instead of Driving Patterns 2 or 3.
- When you have difficulty duplicating the DTC because of road conditions and traffic situations, repeat the driving pattern several times.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

Misfire Type 1:

- If a type 1 misfire (catalyst damaging) occurs once, the MIL blinks once per second, a Temporary DTC is stored, and the high rpm fuel injection stop system activates. The fuel injection stops, at high rpm only, on the bank of cylinders with the cylinder that has the highest misfire counts. the MIL continues to blink and the fuel injection stays off at high rpm, until the drive is completed.
- If a type 1 misfire occurs during a second drive cycle, the MIL and fuel injection behave the same and a DTC is stored.
- After a type 1 misfire has been detected during two drive cycles, the MIL comes on and stays on solid beginning with the third drive cycle, unless the Temporary DTC has been cleared by the ECM/PCM*. Even if the MIL is on, it will start blinking if a type 1 misfire occurs.

Misfire Type 2:

If a type 2 misfire (emission-related but not severe enough to immediately damage the catalyst) occurs, a

Temporary DTC is stored, but the MIL does come on or blink. If a type 2 misfire occurs during a second drive cycle, the MIL comes on and stays on unless the Temporary DTC has been cleared by the ECM/PCM*.

* The temporary DTC is erased under these conditions:

- The vehicle is operated under the same driving conditions as the first misfire detection, and no misfire is detected.
- 80 drive cycles are completed with no misfire detected.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive drive cycles in which the engine conditions are similar to the first time the malfunction was detected.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

3. Stop the vehicle, and let the engine idle for at least 3 minutes.

- When freeze frame data is stored, drive the vehicle under those conditions instead of Driving Patterns 2 or 3.
- When you have difficulty duplicating the DTC because of road conditions and traffic situations, repeat the driving pattern several times.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

Misfire Type 1: Under high rpm or high load conditions: The MIL blinks once per second if a type 1 misfire (catalyst damaging) occurs, and a Temporary DTC is stored. If the type 1 misfire ceases, the MIL goes off. If a type 1 misfire occurs during the next (second) drive cycle, the MIL blinks at the first misfire occurrence, and the DTC and the freeze frame data are stored. The MIL remains on steady if the type 1 misfire ceases.

Under normal driving conditions: The MIL blinks once per second if a type 1 misfire occurs a third time, and a Temporary DTC is stored. If a type 1 misfire occurs during the next (second) drive cycle, the MIL blinks during the third type 1 misfire occurrence, and the DTC and the freeze frame data are stored. If the type 1 misfire ceases, the MIL remains on steady.

Misfire Type 2: When a type 2 misfire (emission-related but not severe enough to immediately damage the TWC) occurs within the first 1,000 engine revolutions after engine start-up, a Temporary DTC is stored.

If a type 2 misfire occurs after the first 1,000 engine revolutions after engine start-up, a Temporary DTC is stored during the fourth type 2 misfire occurrence.

If a type 2 misfire occurs during the next (second) drive cycle, the MIL comes on, and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive drive cycles in which the engine conditions are similar to the first time the malfunction was detected.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0325 (23): ADVANCED DIAGNOSTICS (M/T)

DTC P0325: KNOCK SENSOR CIRCUIT MALFUNCTION (M/T)

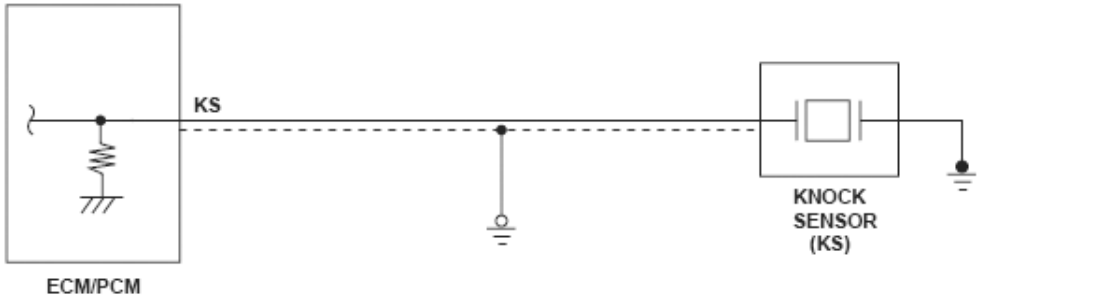

Fig. 153: Knock Sensor Circuit Malfunction Diagram

General Description (M/T)

The knock sensor is mounted on the engine block and detects engine knocking. The vibrations caused by the knocking are converted into electrical signals through the piezo ceramic element. The engine control module (ECM)/powertrain control module (PCM) controls the ignition timing based on the electrical signals. If the signals from the knock sensor do not vary for a set time, the ECM/PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (M/T)

(1) K20Z3 engine		

Malfunction Threshold (M/T)

No signals from the knock sensor are detected for at least 5 seconds.

Driving Pattern (M/T)

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Hold the engine speed at 3,000 - 4,000 rpm for at least 10 seconds.

Diagnosis Details (M/T)

Conditions for illuminating the MIL (M/T)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM/PCM memory.

Conditions for clearing the MIL (M/T)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0325 (23): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P0325: KNOCK SENSOR CIRCUIT MALFUNCTION (K20Z3 ENGINE)

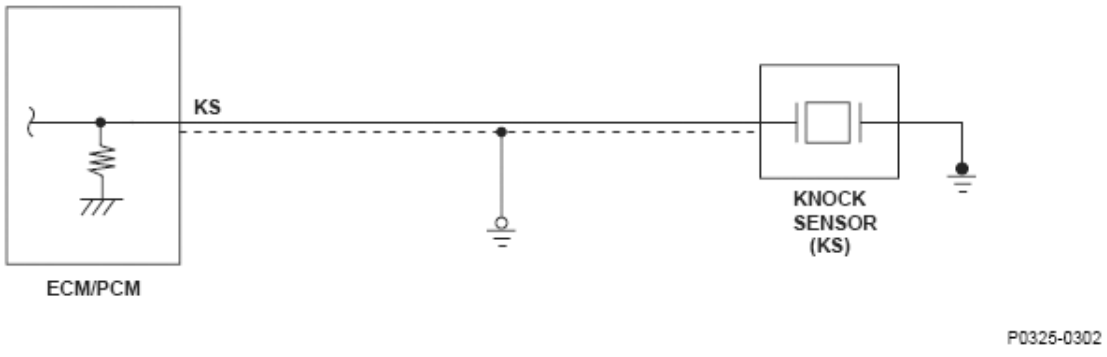

Fig. 154: Knock Sensor Circuit Malfunction Diagram

General Description (K20Z3 Engine)

The knock sensor is mounted on the engine block and detects engine knocking. The vibrations caused by the knocking are converted into electrical signals through the piezo ceramic element. The engine control module (ECM)/powertrain control module (PCM) controls the ignition timing based on the electrical signals. If the signals from the knock sensor do not vary for a set time, the ECM/PCM detects a malfunction and stores a DTC.

(1) K20Z3 engine		

Malfunction Threshold (K20Z3 Engine)

No signals from the knock sensor are detected for at least 5 seconds.

Driving Pattern (K20Z3 Engine)

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Hold the engine speed at 3,000 - 4,000 rpm for at least 10 seconds.

Diagnosis Details (K20Z3 Engine)

Conditions for illuminating the MIL (K20Z3 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM/PCM memory.

Conditions for clearing the MIL (K20Z3 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0335 (4) (PGM-FI SYSTEM): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P0335: CRANKSHAFT POSITION (CKP) SENSOR NO SIGNAL (K20Z3 ENGINE)

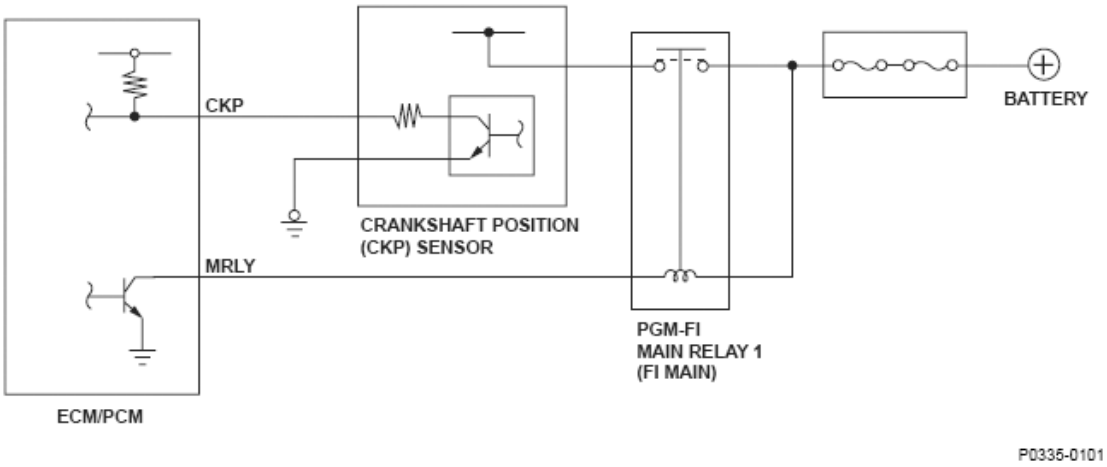

Fig. 155: Crankshaft Position Sensor Signal - Circuit Diagram

General Description (K20Z3 Engine)

The crankshaft position (CKP) sensor consists of a rotor and a semiconductor that detects rotor position. When the engine starts, the rotor turns and the magnetic flux in the semiconductor device changes. The changes of magnetic flux are converted into pulsing signals to the engine control module (ECM)/powertrain control module (PCM). The CKP sensor detects injection/ignition timing for each cylinder and engine speed.

If no pulsing signals from the CKP sensor are detected, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	2 seconds or more (when the engine speed is 750 rpm)

Conditions for illuminating the MIL (K20Z3 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM/PCM memory.

Conditions for clearing the MIL (K20Z3 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0335 (4) (PGM-FI SYSTEM): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P0335: CRANKSHAFT POSITION (CKP) SENSOR NO SIGNAL (R18A4 ENGINE)

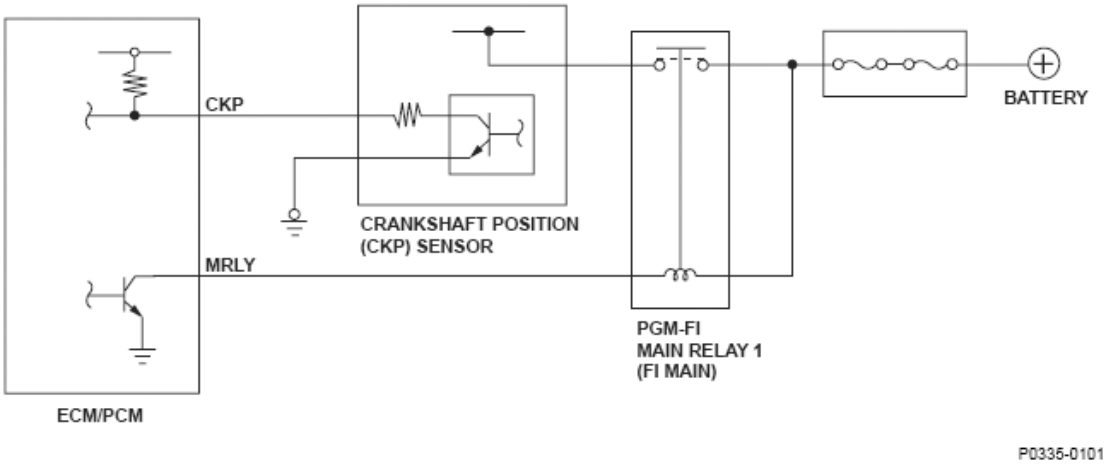

Fig. 156: Crankshaft Position Sensor Signal - Circuit Diagram

General Description (R18A4 Engine)

The crankshaft position (CKP) sensor consists of a rotor and a semiconductor that detects rotor position. When the engine starts, the rotor turns and the magnetic flux in the semiconductor device changes. The changes of magnetic flux are converted into pulsing signals to the engine control module (ECM)/powertrain control module (PCM). The CKP sensor detects injection/ignition timing for each cylinder and engine speed.

If no pulsing signals from the CKP sensor are detected, a malfunction is detected and a DTC is stored.

No signals from CMP sensor A are detected at least 25 times in succession.

Diagnosis Details (K20Z3 Engine)

Conditions for illuminating the MIL (K20Z3 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM memory.

Conditions for clearing the MIL (K20Z3 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0341 (57): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P0341: CAMSHAFT POSITION (CMP) SENSOR A AND CRANKSHAFT POSITION (CKP) SENSOR INCORRECT PHASE DETECTED (K20Z3)

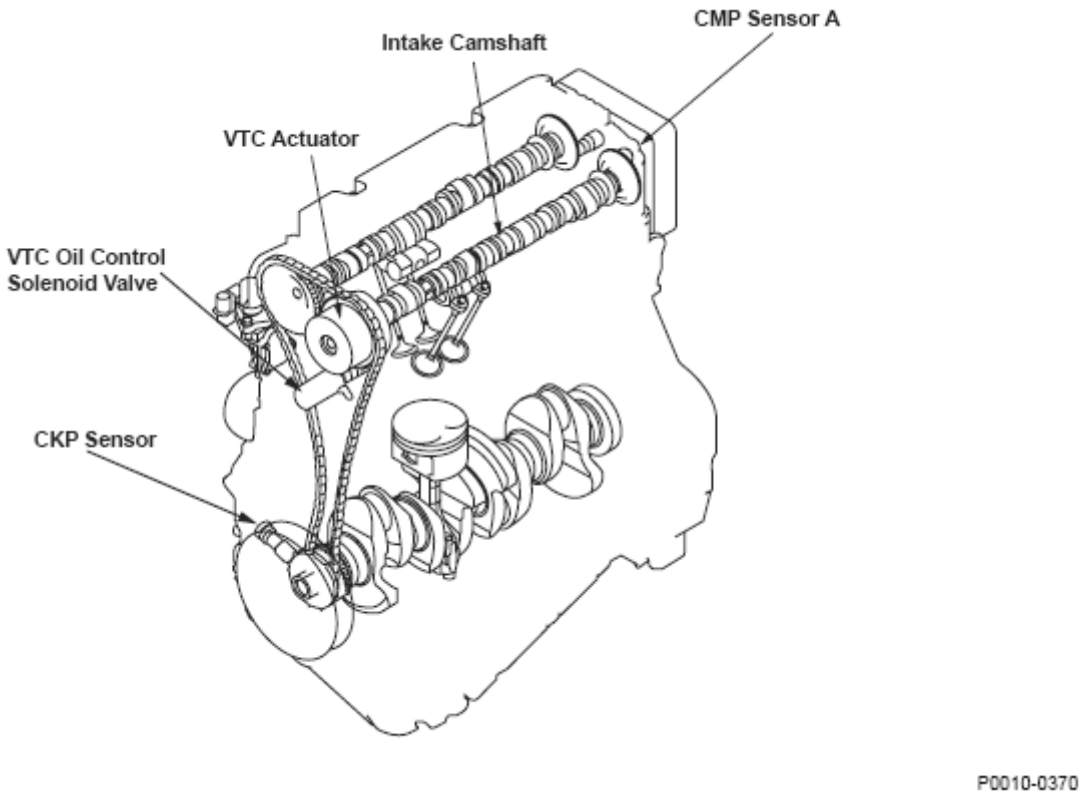

Fig. 166: Identifying Oil Control Solenoid Valve And CKP Sensor

General Description (K20Z3 Engine)

Camshaft position (CMP) sensor A detects the intake camshaft timing and sends pulsing signals to the engine control module (ECM). The ECM determines the advance or the retard of the camshaft timing according to the signals from the crankshaft position (CKP) sensor and CMP sensor A. If the pulse deviates from a set range over a specified time period while the variable valve timing control (VTC) is not activated, or the timing of the camshaft deviates from a set range over a specified time period while the engine is running with the VTC activated, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions (K20Z3 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Engine speed	400 rpm	-
No active DTCs	P0010, P0335, P0339, P0340, P0344, P1009	

Malfunction Threshold (K20Z3 Engine)

VTC OFF

- The gap between the position of the CMP sensor A pulse and the median of the CMP sensor A assembly is 10 ° or more for at least 5 seconds.

Engine running, VTC active

- The timing of the camshaft is out of the specified range (other than when BTDC is between 10 - 100°) for at least 5 seconds.

Driving Pattern (K20Z3 Engine)

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on.
2. Drive the vehicle at a steady speed between 19 - 38 mph (30 - 60 km/h) for at least 10 minutes.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (K20Z3 Engine)

Conditions for illuminating the MIL (K20Z3 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM memory.

Conditions for clearing the MIL (K20Z3 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0344 (57): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P0344: CAMSHAFT POSITION (CMP) SENSOR A CIRCUIT INTERMITTENT INTERRUPTION (K20Z3)

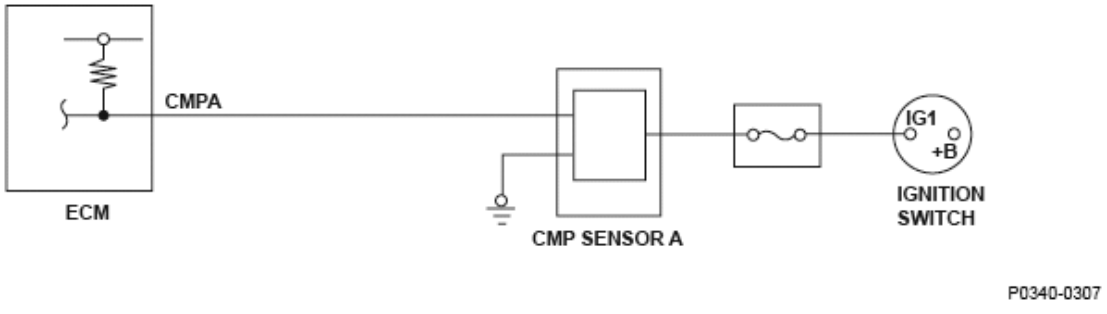

Fig. 167: Camshaft Position (CMP) Sensor - Circuit Diagram

General Description (K20Z3 Engine)

Camshaft position (CMP) sensor A detects the intake camshaft timing and sends pulsing signals to the engine control module (ECM). The ECM determines the advance or the retard of the camshaft timing according to the signals from the crankshaft position (CKP) sensor and CMP sensor A. If the number of pulsing signals from CMP sensor A during intervals between the CKP standard pulses is more or less than the proper number, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

Malfunction Threshold (K20Z3 Engine)

More or less than two CMP sensor A pulses are detected during intervals between the CKP standard pulses. This condition occurs at least 30 times.

Diagnosis Details (K20Z3 Engine)

Conditions for illuminating the MIL (K20Z3 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM memory.

Conditions for clearing the MIL (K20Z3 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0351 (71), P0352 (72), P0353 (73), P0354 (74): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0351: NO. 1 CYLINDER IGNITION COIL CIRCUIT MALFUNCTION (R18A1); DTC P0352: NO. 2 CYLINDER IGNITION COIL CIRCUIT MALFUNCTION (R18A1); DTC P0353: NO. 3

CYLINDER IGNITION COIL CIRCUIT MALFUNCTION (R18A1); DTC P0354: NO. 4 CYLINDER IGNITION COIL CIRCUIT MALFUNCTION (R18A1)

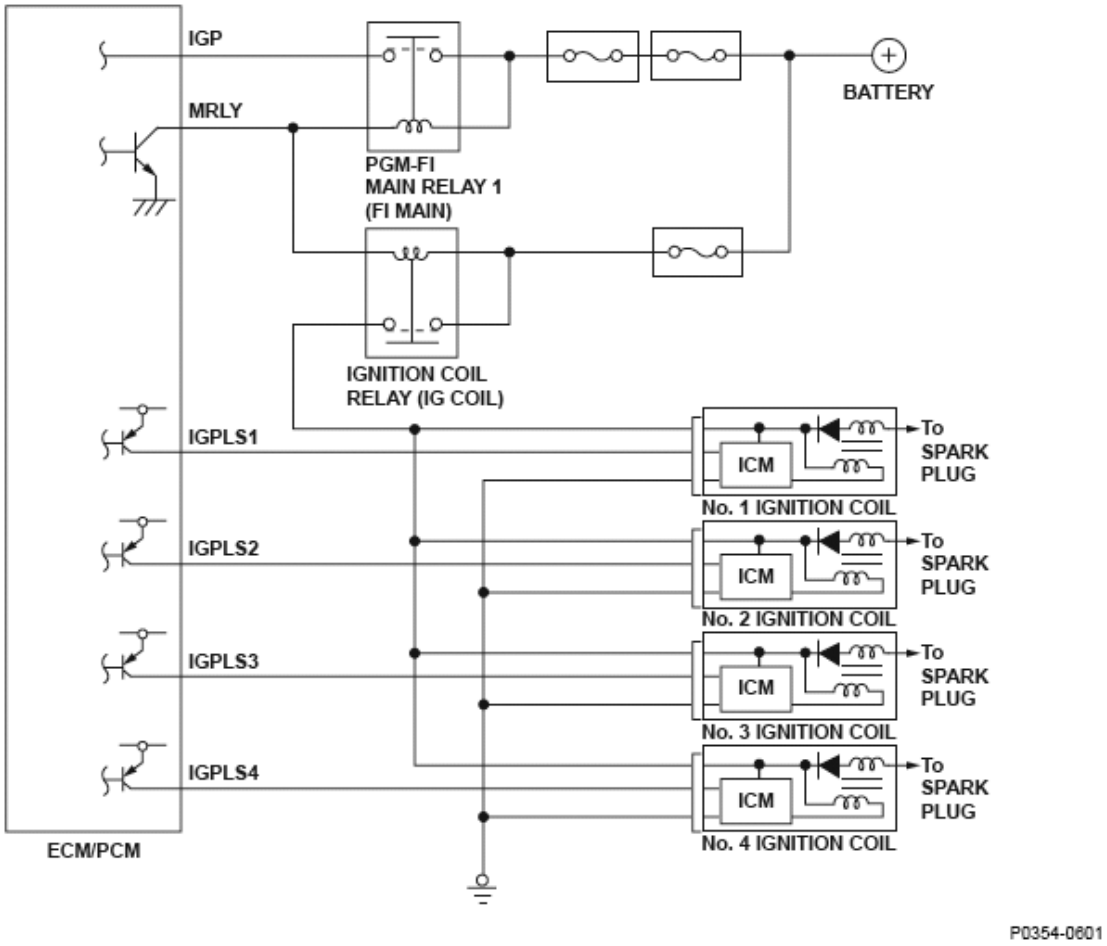

Fig. 168: Cylinder Ignition Coil - Circuit Diagram

General Description (R18A1 Engine)

The igniter ignites at the optimum time based on the control of the engine control module (ECM)/powertrain control module (PCM). The ECM/PCM detects a malfunction when the engine is running.

When the ignition is turned on and the return signal does not change for a specified time or more, the ECM/PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0365 (8) (PGM-FI SYSTEM): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0365: CAMSHAFT POSITION (CMP) SENSOR NO SIGNAL (R18A1)

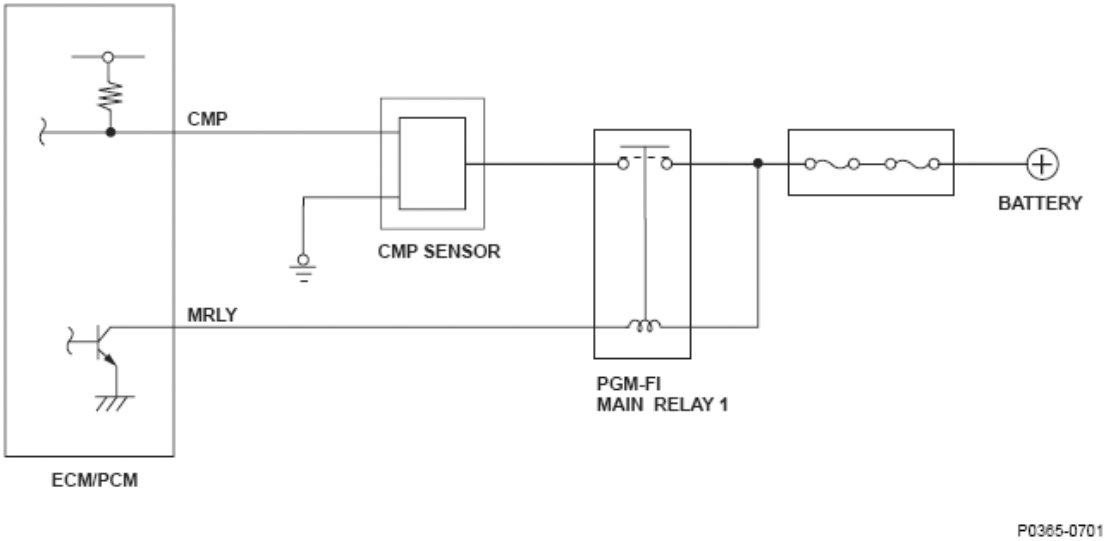

Fig. 170: Camshaft Position (CMP) Sensor Circuit Diagram

General Description (R18A1 Engine)

The camshaft position (CMP) sensor consists of a rotor and a semiconductor that detects rotor position. When the rotor turns after starting the engine, the changes of magnetic flux in the semiconductor are converted into pulsing signals to the engine control module (ECM)/powertrain control module (PCM). The

CMP sensor detects the top dead center position of each cylinder for fuel injection timing.

If no CMP sensor pulsing signals are detected, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

State of the engine	Running
No active DTCs	P0335, P0339, P0369

Malfunction Threshold (R18A1 Engine)

No CMP sensor pulsing signals are detected at least 50 times.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM/PCM memory.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0365 (8) (PGM-FI SYSTEM): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P0365: CAMSHAFT POSITION (CMP) SENSOR NO SIGNAL (R18A4 ENGINE)

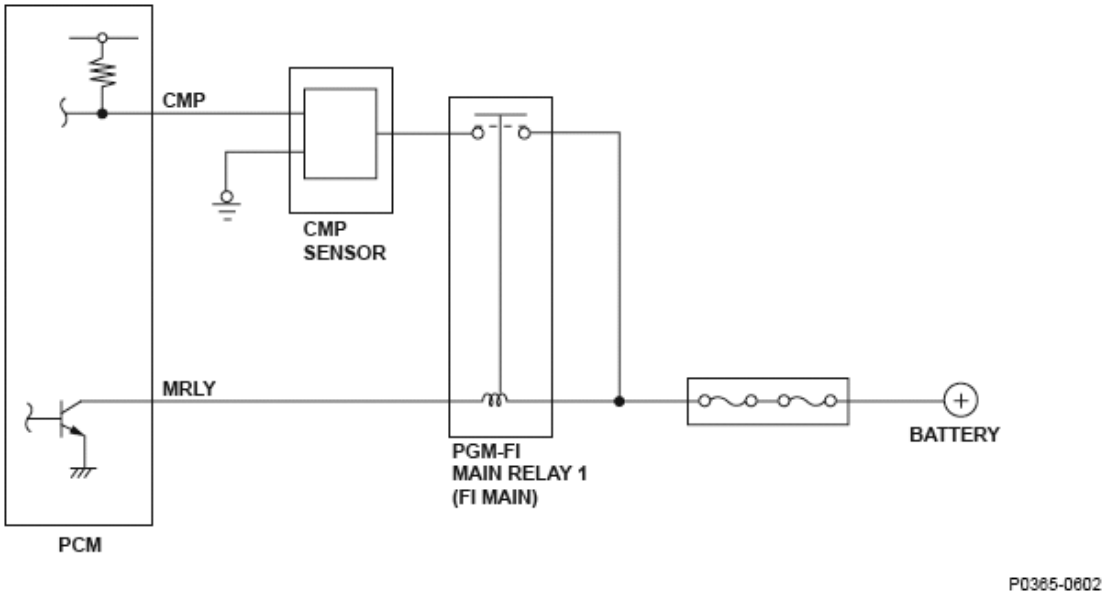

Fig. 171: Camshaft Position (CMP) Sensor - Circuit Diagram

General Description (R18A4 Engine)

The camshaft position (CMP) sensor consists of a rotor and a semiconductor that detects rotor position. When the rotor turns after starting the engine, the changes of magnetic flux in the semiconductor are converted into pulsing signals to the powertrain control module (PCM). The CMP sensor detects the top dead center of each cylinder for fuel injection timing. If no CMP sensor pulsing signals are detected, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A4 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0365 (8): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P0365: CAMSHAFT POSITION (CMP) SENSOR B NO SIGNAL (K20Z3)

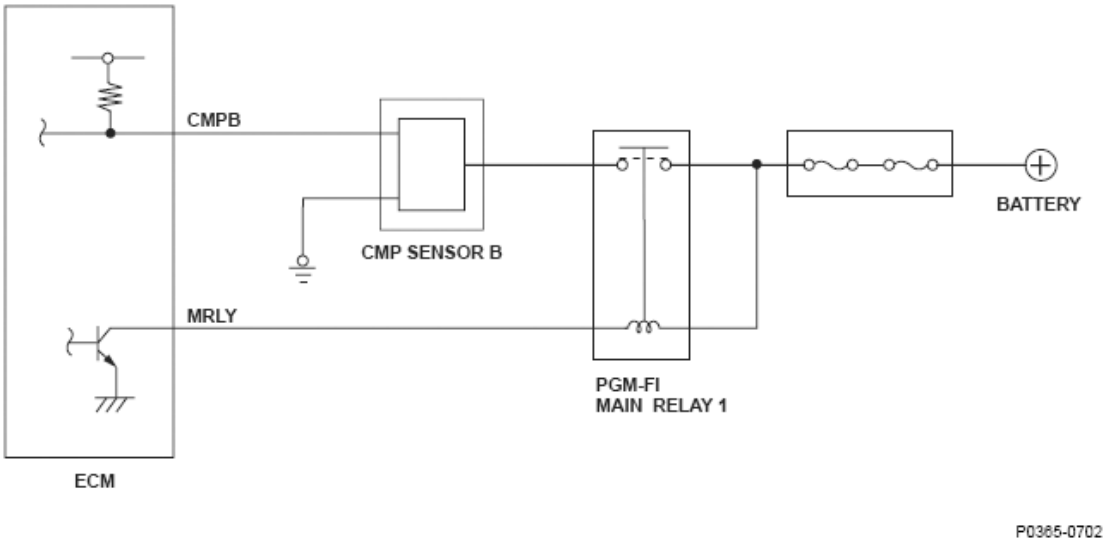

Fig. 172: Camshaft Position (CMP) Sensor B Circuit Diagram

General Description (K20Z3 Engine)

Camshaft position (CMP) sensor B consists of a rotor and a semiconductor that detects rotor position. When the rotor turns after starting the engine, the changes of magnetic flux in the semiconductor are converted into pulsing signals to the engine control module (ECM). CMP sensor B detects the top dead center of each cylinder for fuel injection timing.

If no CMP sensor B pulsing signals are detected, a malfunction is detected and a DTC is stored.

Conditions for illuminating the indicator (R18A4 Engine)

When a malfunction is detected, the D indicator blinks, and the DTC and the freeze frame data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC (R18A4 Engine)

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0400 (80): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0400: EXHAUST GAS RECIRCULATION (EGR) SYSTEM LEAK DETECTED (R18A1)

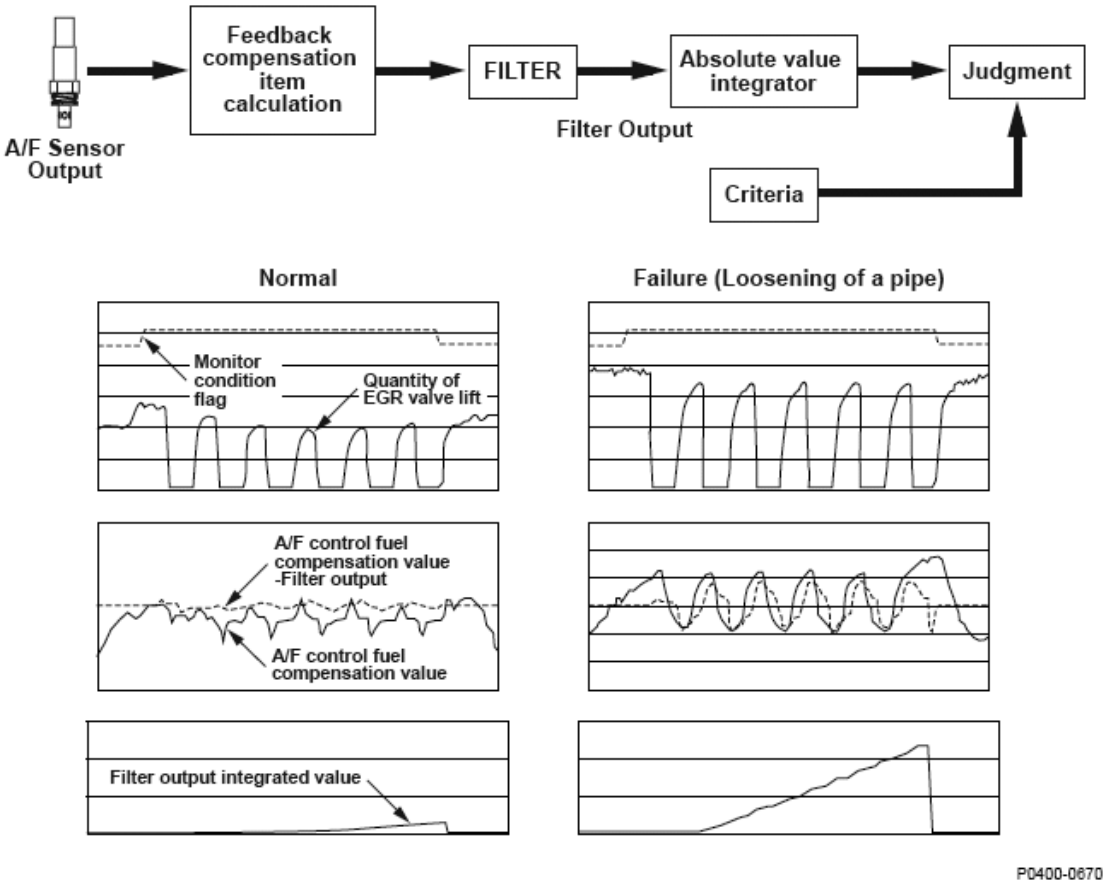

Fig. 180: Exhaust Gas Recirculation (EGR) System Signal Output

General Description (R18A1 Engine)

The exhaust gas recirculation (EGR) deterioration failure conditions include a sticking lift sensor, restricted passages, and leakage from the external piping.

At any specific EGR lift value there is a corresponding A/F compensation value. If the A/F compensation value is greater than the corresponding EGR lift value, the engine control module (ECM)/powertrain control module (PCM) detects this as a malfunction (the likely cause is leakage from the external piping), and DTC P0400 is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	None
Duration	8.5 seconds or more

No active DTCs		P0101, P0102, P0103, P0107, P0108, P0111, P0112, P0113, P0116, P0117, P0118, P0122, P0123, P0133, P0134, P0135, P0171, P0222, P0223, P0300, P0301, P0302, P0303, P0304, P0335, P0339, P0351, P0352, P0353, P0354, P0401, P0404, P0406, P0443, P0496, P0497, P0506, P0507, P1077, P1078, P1116, P1128, P1129, P1157, P1172, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176, P2195, P2227, P2228, P2229, P2238, P2252, P2413, P2646, P2647, P2648, P2649, P2A00	
Other		Without excessive load change	

Malfunction Threshold (R18A1 Engine)

The A/F sensor response parameter according to the opening and closing of the EGR is 31,457 (LT80A) or more.

Driving Pattern (R18A1 Engine)

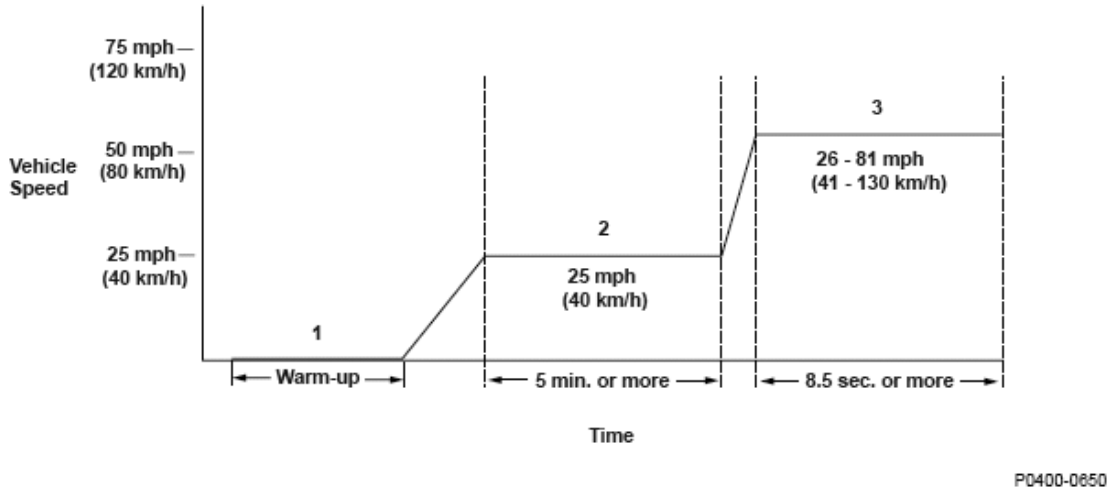

Fig. 181: Identifying Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Drive the vehicle at a steady speed of 25 mph (40 km/h) or less, for at least 5 minutes.
3. Then, drive immediately at a steady speed between 26 - 81 mph (41 - 130 km/h) for at least 8.5 seconds.

- If the EVAP monitor runs instead of the HO2S monitor, turn the engine off, then restart it, and the HO2S monitor will restart.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the ECM/PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0401 (80): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0401: EXHAUST GAS RECIRCULATION (EGR) INSUFFICIENT FLOW (R18A1)

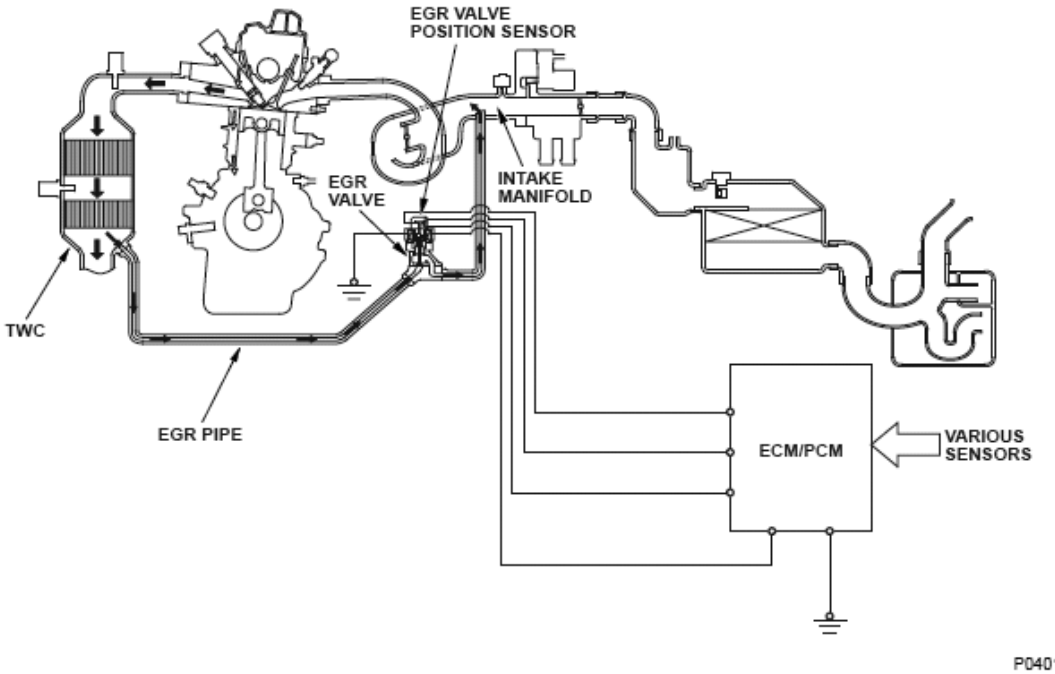

Fig. 182: Exhaust Gas Recirculation (EGR) Air Flow Diagram

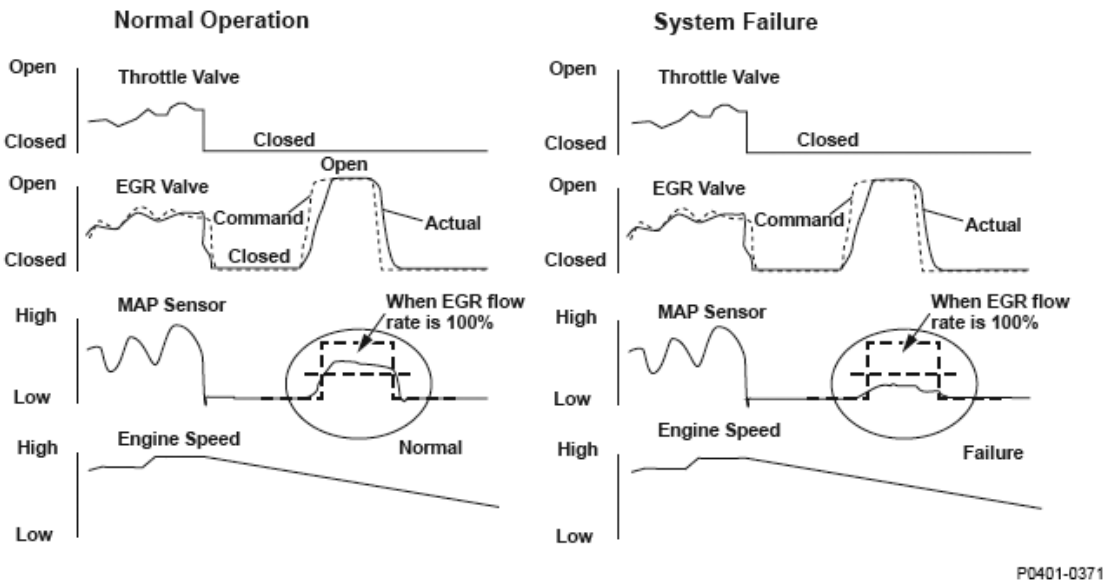

Fig. 183: Exhaust Gas Recirculation Valve Operation Graph

General Description (R18A1 Engine)

The exhaust gas recirculation (EGR) valve, which is controlled by the engine control module (ECM)/powertrain control module (PCM), is opened and the exhaust gas flows from the exhaust manifold through the EGR valve and the intake manifold and the EGR passage. the exhaust gas is circulated into the air/fuel mixture and the mixture is drawn into the combustion chamber to lower combustion temperatures, thus reducing oxides of nifrogen (NOx) emissions.

The EGR flow is inspected as follows. The EGR valve is closed during deceleration with the throttle valve fully closed. Then the ECM/PCM fully opens the EGR valve. After a set time, the ECM/PCM computes the ratio of the present EGR flow to the normal EGR flow by monitoring the fluctuation of the intake manifold pressure between when the EGR valve is fully opened and when it is fully closed. If the EGR flow rate is lower than normal, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

Enable Conditions (R18A1 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Engine coolant temperature	156°F (69°C)	-
Engine speed	1,200 rpm	3,600 rpm

MAP value	10 kPa (2.8 in.Hg, 70 mmHg)	-
Vehicle speed	26 mph (41 km/h)	-
Battery voltage	10.5 V	-
Throttle position	Fully closed	
Fuel feedback	During deceleration	
No active DTCs	P0101, P0102, P0103, P0107, P0108, P0112, P0113, P0117, P0118, P0122, P0123, P0134, P0135, P0222, P0223, P0335, P0339, P0404, P0406, P0443, P0496, P0497, P0506, P0507, P1077, P1078, P1128, P1129, P1157, P1172, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176, P2195, P2227, P2228, P2229, P2238, P2252, P2413, P2646, P2647, P2648, P2649	

Malfunction Threshold (R18A1 Engine)

The ratio of the current EGR flow to the normal EGR flow is 20 % or less.

The difference between the MAP value before and after the Enable Conditions are met is no more than the values in the table. The change in pressure should occur for at least 3.5 seconds.

MALFUNCTION THRESHOLD

Engine speed	Barometric pressure	
	62 kPa (18.2 in.Hg, 460 mmHg)	102 kPa (30.0 in.Hg, 760 mmHg)
1,200 rpm	15 kPa (4.6 in.Hg, 118 mmHg)	25 kPa (7.4 in.Hg, 189 mmHg)
2,400 rpm	7 kPa (2.2 in.Hg, 56 mmHg)	12 kPa (3.5 in.Hg, 91 mmHg)

Confirmation Procedure with the HDS (R18A1 Engine)

Do the EGR TEST in the INSPECTION MENU with the HDS.

Driving Pattern (R18A1 Engine)

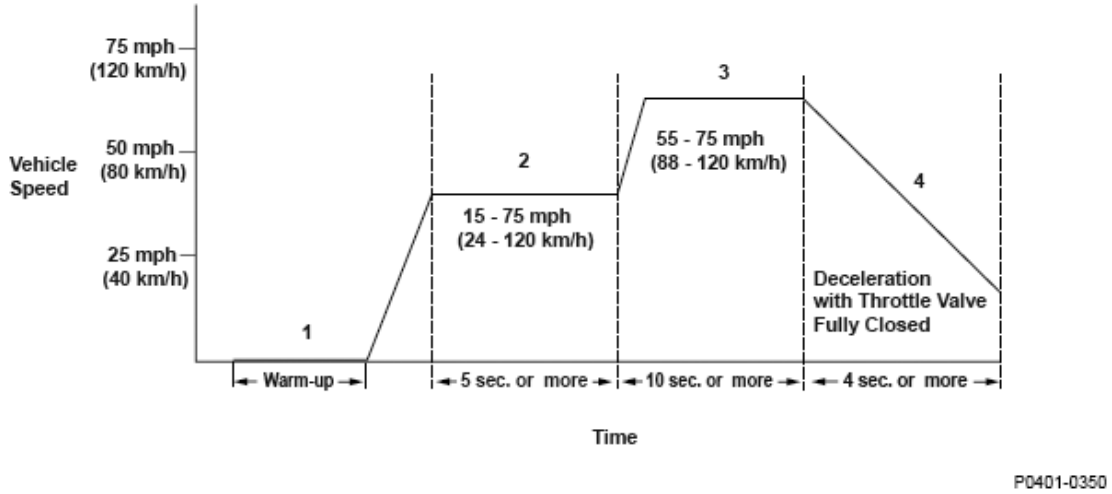

Fig. 184: Vehicle Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the

radiator fan comes on.
2. Drive the vehicle at a speed between 15 - 75 mph (24 - 120 km/h) for at least 5 seconds.
3. Then, drive at a steady speed between 55 - 75 mph (88 - 120 km/h) for at least 10 seconds.
4. Decelerate with the throttle valve fully closed for at least 4 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the ECM/PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0404 (12): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0404: EXHAUST GAS RECIRCULATION (EGR) VALVE CIRCUIT RANGE/PERFORMANCE PROBLEM (R18A1)

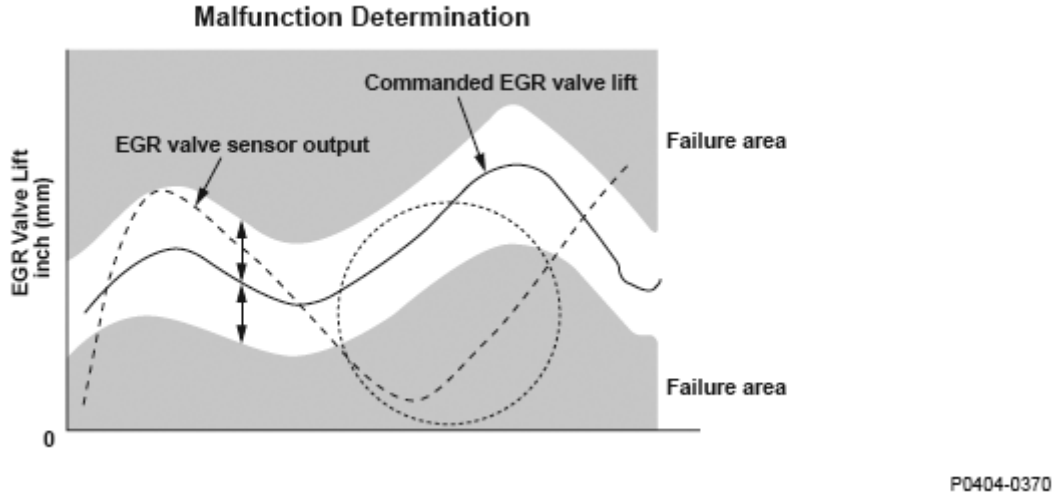

Fig. 185: Exhaust Gas Recirculation Valve Lift Graph

General Description (R18A1 Engine)

The exhaust gas recirculation (EGR) valve, which is controlled by the engine control module (ECM)/powertrain control module (PCM), is opened and the exhaust gas flows from the exhaust manifold through the EGR valve and the intake manifold and the EGR passage. The exhaust gas is circulated into the

air/fuel mixture and the mixture is drawn into the combustion chamber to lower combustion temperatures, thus reducing oxides of nitrogen (NOx) emissions.

A sensor (lift sensor) is built into the EGR valve and detects the amount of valve lift. The command value for the target valve lift is stored in the ECM/PCM so that exhaust gas recirculation can be optimized according to driving conditions.

Comparing this command value with the lift sensor output signal value, the ECM/PCM controls the EGR valve to make the amount of actual valve lift equal to the command value.

If the lift sensor output (actual valve lift) is greater than the commanded valve lift, an abnormality in the EGR valve or the lift sensor output is determined.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	None
Duration	5 seconds or more
DTC Type	Two drive cycles, MIL ON
OBD Status	PASSED/FAILED/EXECUTING/OUT OF (TEST) CONDITION

Enable Conditions (R18A1 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Engine speed	-	5,500 rpm
Battery voltage	10.5 V	-
Commanded EGR valve lift	0.010 in. (0.25 mm)	-
No active DTCs	P0101, P0101, P0102, P0103, P0107, P0108, P0112, P0113, P0117, P0118, P0134, P0135, P0300, P0301, P0302, P0303, P0304, P0335, P0339, P0351, P0352, P0353, P0354, P0400, P0401, P0406, P1128, P1129, P1157, P1172, P2195, P2238, P2252	

Malfunction Threshold (R18A1 Engine)

The difference between the command value of the amount of EGR valve lift in the ECM/PCM and the actual amount of valve lift is 0.041 in. (1.020 mm) or more for at least 5 seconds.

Confirmation Procedure with the HDS (R18A1 Engine)

Do the EGR TEST in the INSPECTION MENU with the HDS.

Driving Pattern (R18A1 Engine)

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Drive the vehicle at a speed between 15 - 75 mph (24 - 120 km/h) for at least 5 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the ECM/PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0406 (12): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0406: EXHAUST GAS RECIRCULATION (EGR) VALVE POSITION SENSOR CIRCUIT HIGH VOLTAGE (R18A1)

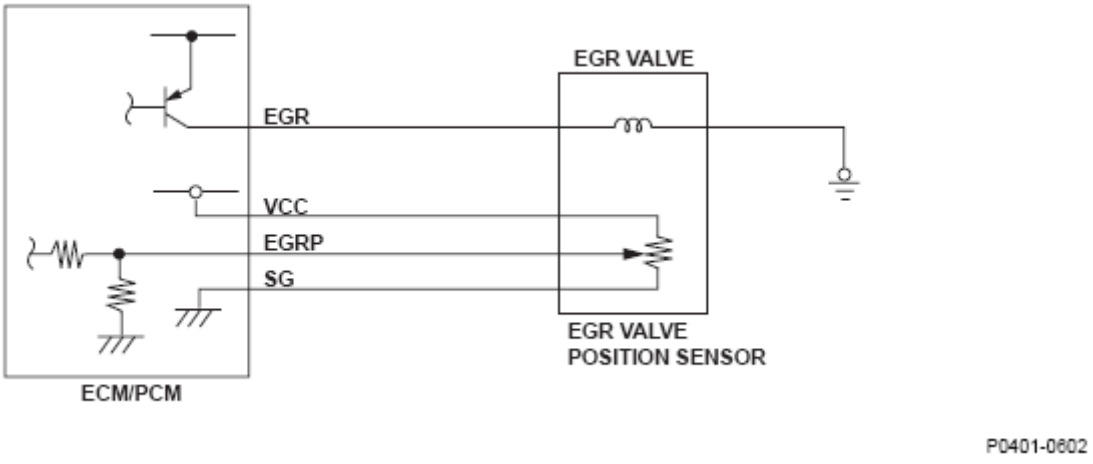

Fig. 186: Exhaust Gas Recirculation (EGR) Valve Position Sensor Circuit Diagram - High Voltage

General Description (R18A1 Engine)

The exhaust gas recirculation (EGR) system reduces oxides of nitrogen (NOx). NOx is generated by high combustion temperatures. The EGR system lowers peak combustion temperature by recirculating inert exhaust gas into the air/fuel mixture, thus reducing NOx emissions. To determine the optimal amount of recirculating exhaust gas, depending on driving conditions, a command value (the amount of valve lift) is stored in the engine control module (ECM)/powertrain control module (PCM). The EGR valve position sensor indicates the amount of valve lift, and the ECM/PCM controls the EGR valve so that the amount of actual valve lift equals the command value by comparing the command value and the actual amount of valve lift.

If EGR valve position sensor output voltage is not within a specified value, a malfunction is detected and a

DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	N/A

Enable Conditions (R18A1 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	
State of the engine	Running

Malfunction Threshold (R18A1 Engine)

The EGR valve position sensor output voltage is 4.88 V or more for at least 2 seconds.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM/PCM memory.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0420 (67): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P0420: CATALYST SYSTEM EFFICIENCY BELOW THRESHOLD (K20Z3)

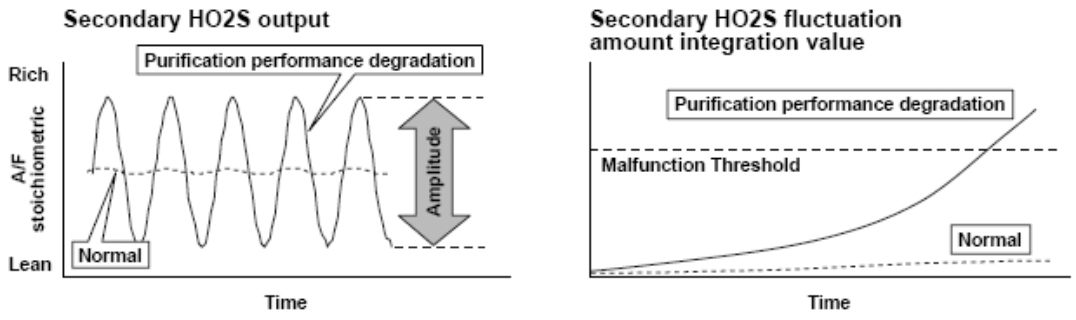

Fig. 187: Catalyst System Mixture Ratio

General Description (K20Z3 Engine)

The three way catalystic converter (TWC) converts hydrocarbons (HC), carbon monoxide (CO), and oxides of nitrogen (NOx) in the exhaust gas to water vapor, carbon dioxide (CO2), and dinitrogen (N2).

The engine control module (ECM) fluctuates the air/fuel ratio (A/F) temporarily to detect the purification performance of TWC and measures the degree of fluctuation in the secondary HO2S output. If the accumulation value for a set time is too much, deterioration of purification performance of catalysis is detected.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	None
Duration	9.5 seconds or more

Others	Has record of deceleration at least once
	Cruise load or more

Malfunction Threshold (K20Z3 Engine)

The secondary HO2S fluctuation integration value is 3,300 mV or more for at least 9.5 seconds.

Driving Pattern (K20Z3 Engine)

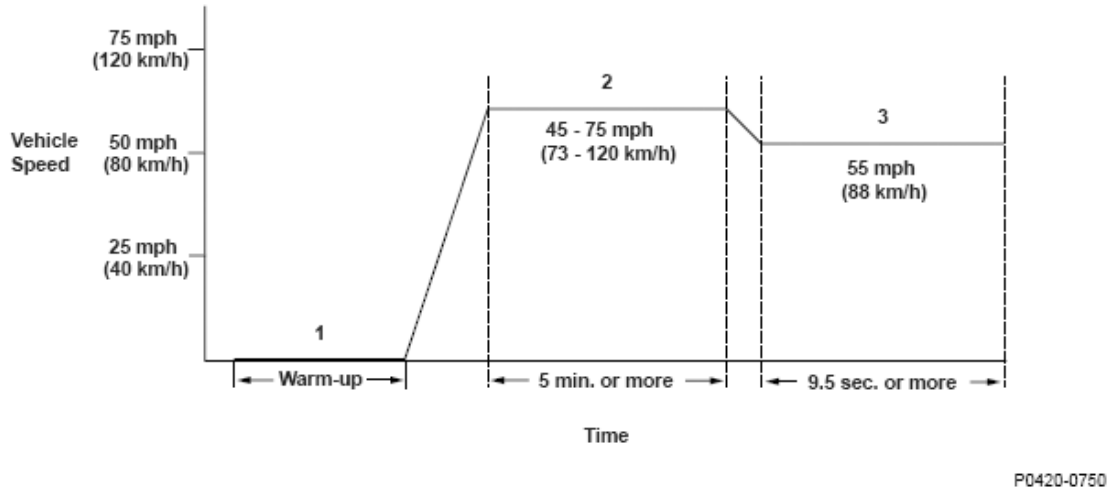

Fig. 188: Identifying Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on.
2. Drive the vehicle at a speed between 45 - 75 mph (73 - 120 km/h) for at least 5 minutes, to warm up the TWC.
3. Set a vehicle speed of 55 mph (88 km/h) on the cruise control, and drive for at least 9.5 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (K20Z3 Engine)

Conditions for illuminating the MIL (K20Z3 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the ECM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (K20Z3 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the

diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0420 (67): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0420: CATALYST SYSTEM EFFICIENCY BELOW THRESHOLD (R18A1)

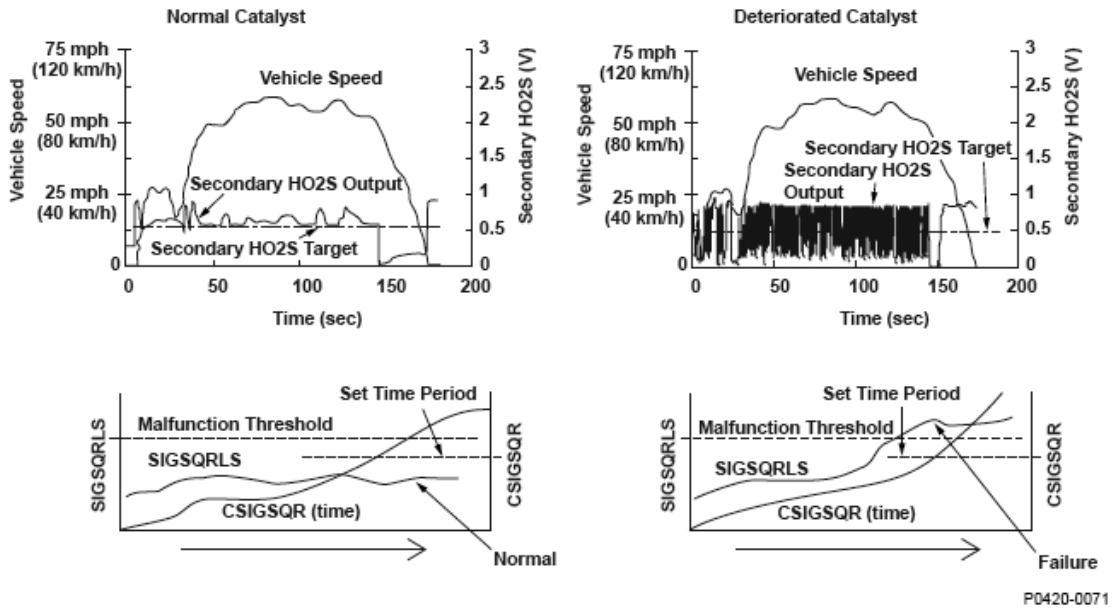

Fig. 189: Catalyst System Efficiency Voltage And Time - Graph

General Description (R18A1 Engine)

The three way catalytic converter (TWC) converts hydrocarbons (HC), carbon monoxide (CO), and oxides of nitrogen (NOx) in the exhaust gas to water vapor, carbon dioxide (CO2), and dinitrogen (N2).

The TWC efficiency does not depend entirely on engine conditions or the deterioration level of the TWC. It can be optimized by stabilizing the secondary HO2S output.

If the TWC deteriorates, the air/fuel ratio downstream of the TWC (the secondary HO2S output) often differs from the target secondary HO2S output, and the status is represented by the parameter (SIGSQRLS).

Therefore, if the SIGSQRLS exceeds a specified value for a set time, a malfunction is detected and a DTC is stored.

DTC P0443 (92): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P0443: EVAPORATIVE EMISSION (EVAP) CANISTER PURGE VALVE CIRCUIT MALFUNCTION (K20Z3 ENGINE)

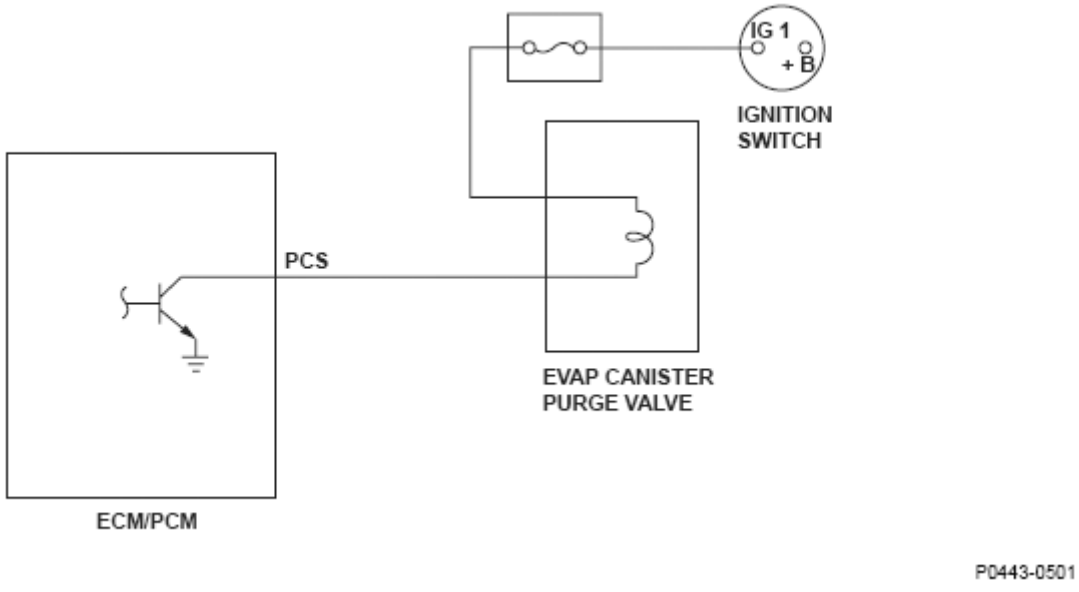

Fig. 193: Evaporative Emission Control System Canister Purge Valve Circuit Malfunction Diagram

General Description (K20Z3 Engine)

The evaporative emission (EVAP) canister purge valve is attached to the vacuum port between the EVAP canister and the intake manifold. The engine control module (ECM)/powertrain control module (PCM) does not turn on the EVAP canister purge valve when the engine coolant temperature is 140 °F (60 °C) or less. The ECM/PCM adjusts the amount of fuel vapor sent to the engine by controlling the EVAP canister purge valve duty cycle.

When the return signal does not change according to the EVAP canister purge valve output for a set time, the ECM/PCM detects a malfunction, and a DTC is stored.

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM/PCM memory.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0451 (91): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P0451: FUEL TANK PRESSURE (FTP) SENSOR RANGE/PERFORMANCE PROBLEM (K20Z3)

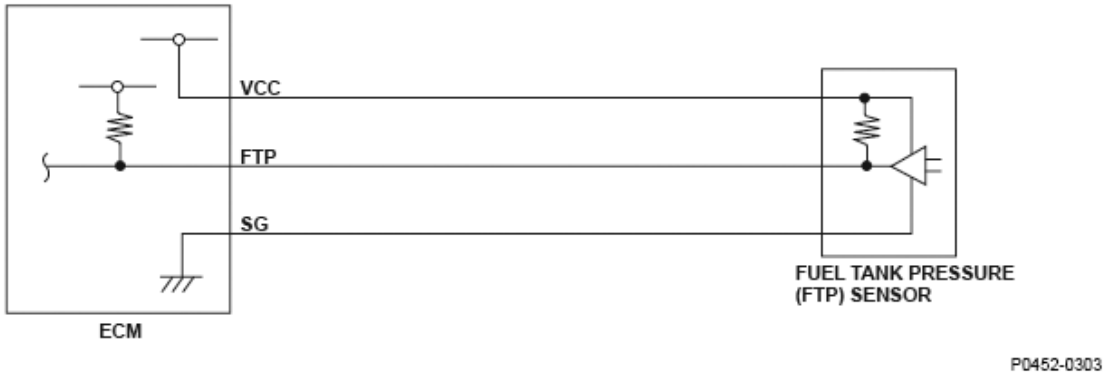

Fig. 195: Fuel Tank Pressure (FTP) Sensor Range/Performance Problem - Circuit Diagram

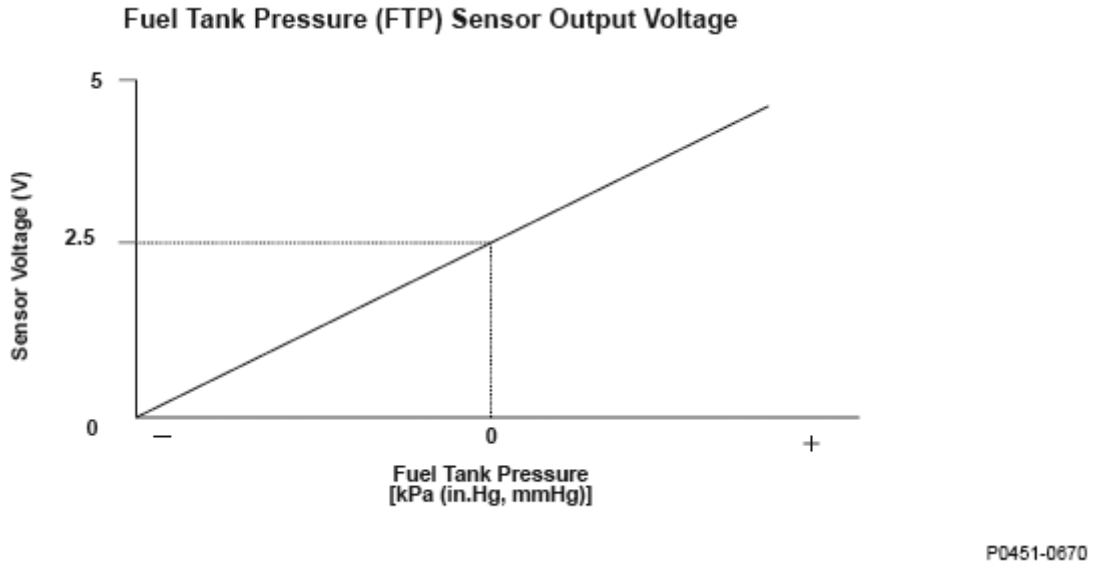

Fig. 196: Fuel Tank Pressure (FTP) Sensor Voltage - Graph

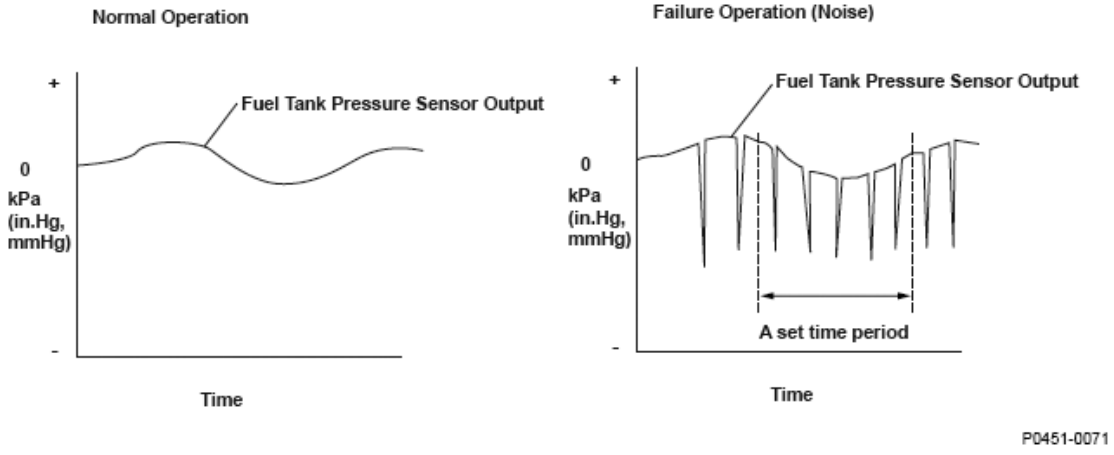

Fig. 197: Fuel Tank Pressure - Graph

General Description (K20Z3 Engine)

The fuel tank pressure (FTP) sensor is installed on the evaporative emission (EVAP) canister. The FTP sensor is used to detect leaks in the EVAP system. The engine control module (ECM) monitors the FTP sensor output voltage. The FTP sensor output voltage rises as the fuel tank pressure increases. Conversely, the FTP sensor output voltage drops as the fuel tank pressure decreases. Rapid changes in the FTP sensor output voltage due to electrical noise or an intermittent open during the EVAP leak detection may cause incorrect leak detection, so abnormal output is monitored.

If the FTP sensor output voltage changes a specified number of times within a set time, the ECM detects a malfunction and stores a DTC.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by

disconnecting the battery.

DTC P0455 (90): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P0455: EVAPORATIVE EMISSION (EVAP) SYSTEM LARGE LEAK DETECTED (K20Z3)

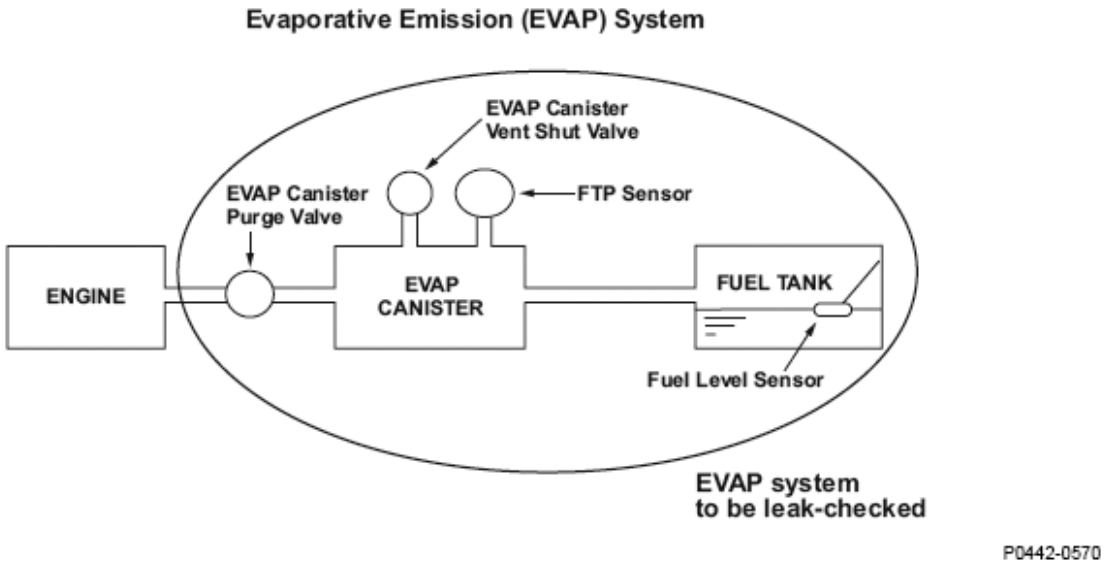

Fig. 207: Evaporative Emission (EVAP) System Large Leak Detected - Diagram

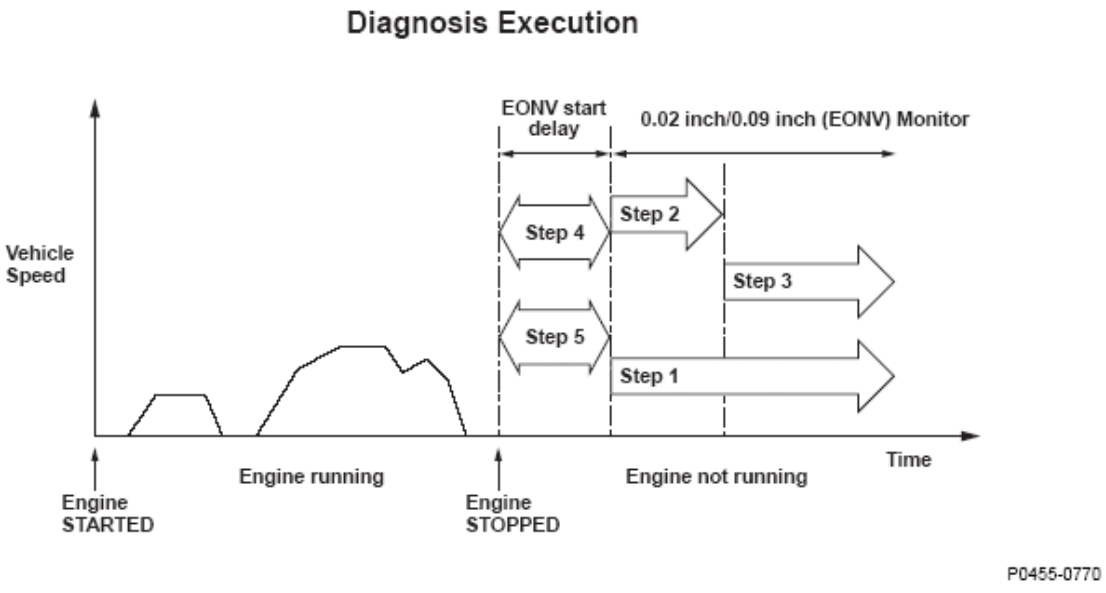

Fig. 208: Evaporative Emission (EVAP) System Diagnosis Execution

General Description (K20Z3 Engine)

The evaporative emission (EVAP) leak detection system uses an engine off natural vacuum (EONV) method. The EONV method detects leakage from the change in fuel tank pressure via the fuel tank pressure (FTP) sensor with the engine off.

Here is an overview of the malfunction detection for the EONV method:

Step 1: Judgement of detection of 0.09 inch leak as normal operation

Step 2: Judgement of detection of 0.02 inch leak as normal operation

Step 3: Detection of 0.02 inch leak

Step 4: Detection of atmospheric pressure failure

Step 5: Flickering of the FTP sensor

< Step 1, 2 and 3 proceed simultaneously. Step 4 and 5 proceed simultaneously. >

Step 1:

After the engine has stopped, the engine control module (ECM) monitors the variation of the FTP sensor output to detect "no 0.09 inch leak" depending on the variation of the pressure inside the fuel tank.

- If the variation of the pressure is less than a specified value and continues for a specified duration, it is identified as a "0.09 inch leak" and the diagnosis completes.
- If the variation of the pressure is more than a specified value before a specified duration has passed, it is defined as "no 0.09 inch leak", the judgement of detection of a 0.09 inch leak is completed, and it goes to 0.02 inch leak monitor.

Step 2:

After the engine has stopped, the ECM monitors the variation of the FTP sensor output to detect "no 0.02 inch leak" depending on the variation corresponding to the increasing pressure inside the fuel tank.

- If "no 0.02 inch leak" is detected, it is identified as normal; the diagnosis is complete.
- If the pressure inside the fuel tank does not increase a specified value or more within a specified duration, it goes to step 3.

Step 3:

The ECM continues to monitor the FTP sensor output to detect "no 0.02 inch leak" depending on the variation corresponding to the decreasing pressure inside the fuel tank. until the detection completes.

- If a "0.02 inch leak" is detected, it is identified as a malfunction; the diagnosis is complete.
- If "no leakage" is detected, it is identified as normal; the diagnosis is complete.
- If the pressure is not atmospheric pressure or less when the detection is completed, that data is stored and the diagnosis is complete.

Step 4:

After the engine has stopped, the ECM monitors the variation of the FTP sensor output to detect atmospheric pressure, after keeping the canister vent opened for a specified duration to stabilize the pressure inside the fuel tank.

- If the pressure inside the fuel tank after a specified duration has not reached a specified value from the

sensor zero point, a canister vent blockage is detected.

Step 5:

After the engine has stopped, the ECM monitors the variation of the FTP sensor output to detect FTP sensor electrical noise failure, after keeping the canister vent opened for a specified time to stabilize the pressure inside the fuel tank.

- If the deviation of pressure inside the fuel tank and an average value after a specified duration has exceeded a specified value for more than a specified duration, an FTP sensor electrical noise failure is detected.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	None
Duration	36 minutes, 37 seconds or less
DTC Type	Two drive cycles, MIL ON
OBD Status	N/A

Enable Conditions (K20Z3 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Elapsed time before starting the engine	6 hours	-
Initial condition A(1)	-	18°F (10°C)
Initial condition B(2)	-	18°F (10°C)
Initial engine coolant temperature	40°F (5°C)	95°F (35°C)
Initial intake air temperature	40°F (5°C)	95°F (35°C)
Barometric pressure	76 kPa (22.5 in.Hg, 569 mmHg)	-
Battery voltage	10.5 V	-
No active DTCs	P0111, P0112, P0113, P0116, P0117, P0118, P0125, P0443, P0451, P0452, P0453, P0496, P0497, P0498, P0499, P0685, P1116, P1454, P145C, P2227, P2228, P2229, P2422, P2610	
Others	Other than when there is excessive vapor generation (fuel level is not full)	
	Avoid abrupt acceleration, deceleration, and turns	
	Test-drive on a flat road to avoid misdetection	
	No refueling is required	

(1) The initial intake air temperature minus the current intake air temperature

(2) The initial engine coolant temperature minus the initial intake air temperature

Malfunction Threshold (K20Z3 Engine)

The variation of pressure inside the fuel tank is 0.03 kPa (0.009 in.Hg, 0.24 mmHg) or more.

Confirmation Procedure with the HDS (K20Z3 Engine)

Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

Driving Pattern (K20Z3 Engine)

1. After the vehicle has been left for an appropriate amount of time as specified, with the engine coolant temperature and intake air temperature within the specified range, start the engine.
2. Warm up the engine at idle until the radiator fan comes on.
3. Drive the vehicle immediately at a speed between 45 - 75 mph (72 - 120 km/h) for at least 20 minutes.
4. After stopping the engine, turn the ignition switch off, and leave the vehicle for 37 minutes or more (EONV executes).
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (K20Z3 Engine)

Conditions for illuminating the MIL (K20Z3 Engine)

When a malfunction is detected during the first drive cycle with the ECT and IAT at engine start-up within the specified temperature range, a Temporary DTC is stored in the ECM memory. If the malfunction recurs during the next (second) drive cycle with the ECT and IAT at engine start-up within the specified temperature range, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (K20Z3 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0455 (90): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0455: EVAPORATIVE EMISSION (EVAP) SYSTEM LARGE LEAK DETECTED (R18A1)

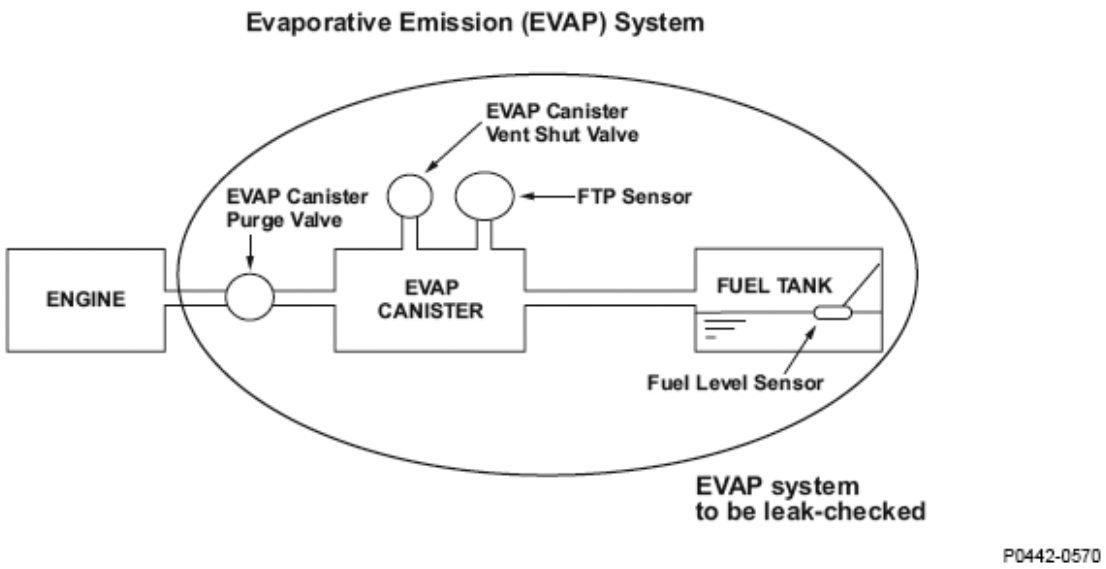

Fig. 209: Evaporative Emission (EVAP) System Large Leak Detected - Diagram

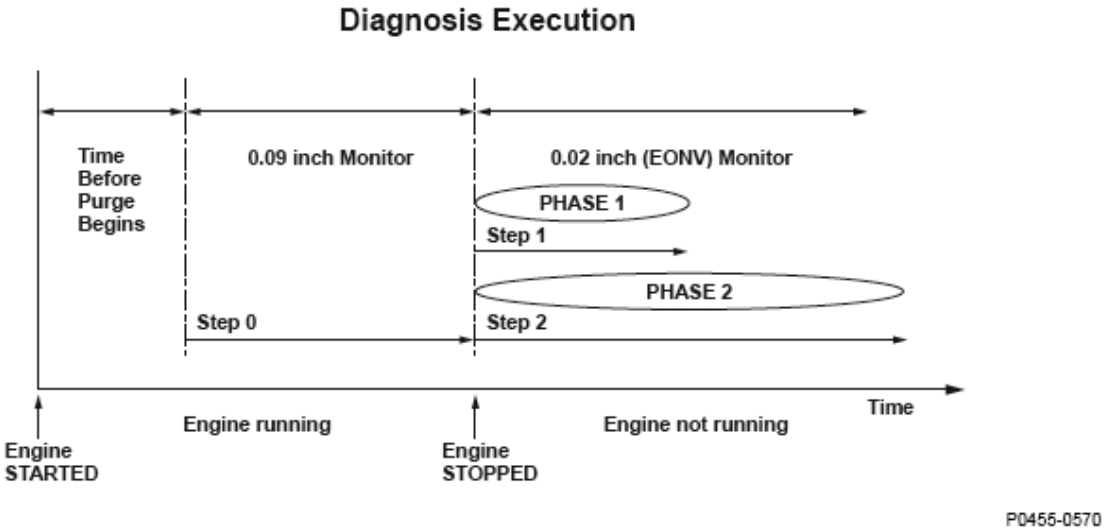

Fig. 210: Evaporative Emission (EVAP) System - Diagnosis Execution

General Description (R18A1 Engine)

The evaporative emission (EVAP) leak detection system uses a vacuum-retention (decompression) method and an engine off natural vacuum (EONV) method. This method detects leakage by monitoring the vacuum-retention ability of the EVAP system (from EVAP canister purge valve to fuel tank). The EONV method detects leakage from the change in fuel tank pressure via the fuel tank pressure (FTP) sensor with the engine off.

Here is an overview of the malfunction detection for the EONV method:

Step 0: Judgement of detection of 0.09 inch leak as normal operation < decompressing monitor >

Step 1: Judgement of detection of 0.02 inch leak as normal operation < phase 1 >

Step 2: Detection of 0.02 inch leak < phase 2 >

Step 0:

Once required conditions for the monitor are met, the engine control module (ECM)/powertrain control module (PCM) applies vacuum to the EVAP system line from the purge control solenoid (PCS) valve through the fuel tank, and monitors the variation of the FTP sensor output to detect a "0.09 inch leak".

- If a "0.09 inch leak" is detected, it is identified as a malfunction; the diagnosis is complete.
- If "no 0.09 inch leak" is detected, the ECM/PCM goes to step 1, judgement of detection of a 0.02 inch leak as normal operation < phase 1 >.
- If sufficient vacuum cannot be drawn on the EVAP system line, it is identified as either "**EVAP SYSTEM LOW PURGE FLOW (P0497)**" or "**EVAP SYSTEM LEAK DETECTED FUEL FILL CAP LOOSE/OFF (P0457)**" .

Step 1:

After the engine has stopped, the ECM/PCM monitors the variation of the FTP sensor output to detect "no 0.02 inch leak" depending on the variation corresponding to the increasing pressure inside the fuel tank.

- If "no 0.02 inch leak" is detected, it is identified as normal; the diagnosis is complete.
- If "no 0.02 inch leak" is not detected, the ECM/PCM goes to step 2, detection of a 0.02 inch leak < phase 2 >.

Step 2:

The ECM/PCM continues to monitor the FTP sensor output to detect "no 0.02 inch leak" depending on the variation corresponding to the decreasing pressure inside the fuel tank.

- If a "0.02 inch leak" is detected, it is identified as a malfunction; the diagnosis is complete.
- If "no leakage" is detected, it is identified as normal; the diagnosis is complete.

DTC P0456 (90): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P0456: EVAPORATIVE EMISSION (EVAP) SYSTEM VERY SMALL LEAK DETECTED (K20Z3)

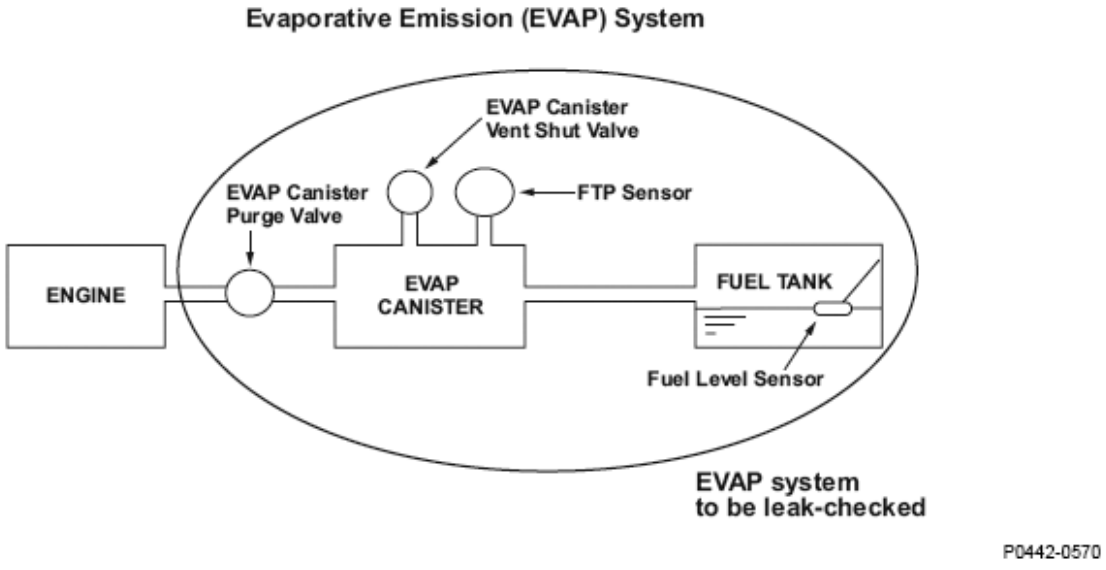

Fig. 211: Evaporative Emission (EVAP) System Large Leak Detected - Diagram

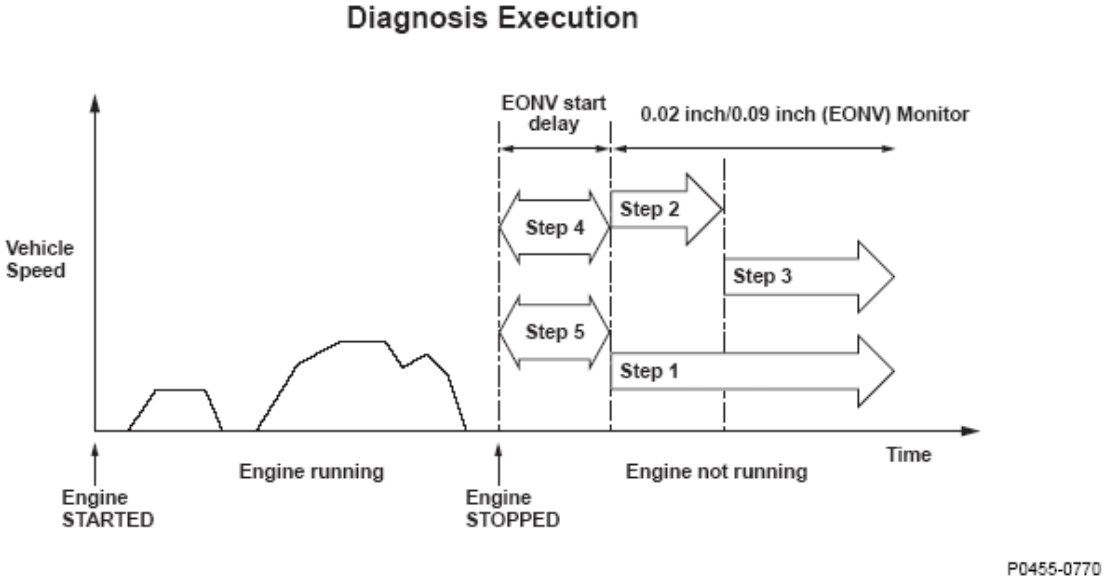

Fig. 212: Evaporative Emission (EVAP) System Diagnosis Execution

General Description (K20Z3 Engine)

The evaporative emission (EVAP) leak detection system uses an engine off natural vacuum (EONV) method. The EONV method detects leakage from the change in fuel tank pressure via the fuel tank pressure (FTP) sensor with the engine off.

Here is an overview of the malfunction detection for the EONV method:

Step 1: Judgement of detection of 0.09 inch leak as normal operation

Step 2: Judgement of detection of 0.02 inch leak as normal operation

Step 3: Detection of 0.02 inch leak

Step 4: Detection of atmospheric pressure failure

Step 5: Flickering of the FTP sensor

< Step 1, 2 and 3 proceed simultaneously. Step 4 and 5 proceed simultaneously. >

Step 1:

After the engine has stopped, the engine control module (ECM) monitors the variation of the FTP sensor output to detect "no 0.09 inch leak" depending on the variation of the pressure inside the fuel tank.

- If the variation of the pressure is less than a specified value and continues for a specified duration, it is identified as a "0.09 inch leak" and the diagnosis completes.
- If the variation of the pressure is more than a specified value before a specified duration has passed, it is defined as "no 0.09 inch leak", the judgement of detection of a 0.09 inch leak is completed, and it goes to 0.02 inch leak monitor.

Step 2:

After the engine has stopped, the ECM monitors the variation of the FTP sensor output to detect "no 0.02 inch leak" depending on the variation corresponding to the increasing pressure inside the fuel tank.

- If "no 0.02 inch leak" is detected, it is identified as normal; the diagnosis is complete.
- If the pressure inside the fuel tank does not increase a specified value or more within a specified duration, it goes to step 3.

Step 3:

The ECM continues to monitor the FTP sensor output to detect "no 0.02 inch leak" depending on the variation corresponding to the decreasing pressure inside the fuel tank. until the detection completes.

- If a "0.02 inch leak" is detected, it is identified as a malfunction; the diagnosis is complete.
- If "no leakage" is detected, it is identified as normal; the diagnosis is complete.
- If the pressure is not atmospheric pressure or less when the detection is completed, that data is stored and the diagnosis is complete.

Step 4:

After the engine has stopped, the ECM monitors the variation of the FTP sensor output to detect atmospheric pressure, after keeping the canister vent opened for a specified duration to stabilize the pressure inside the fuel tank.

- If the pressure inside the fuel tank after a specified duration has not reached a specified value from the sensor zero point, a canister vent blockage is detected.

Step 5:

After the engine has stopped, the ECM monitors the variation of the FTP sensor output to detect FTP sensor electrical noise failure, after keeping the canister vent opened for a specified time to stabilize the pressure inside the fuel tank.

- If the deviation of pressure inside the fuel tank and an average value after a specified duration has exceeded a specified value for more than a specified duration, an FTP sensor electrical noise failure is detected.

DTC P0456 (90): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0456: EVAPORATIVE EMISSION (EVAP) SYSTEM VERY SMALL LEAK DETECTED (R18A1)

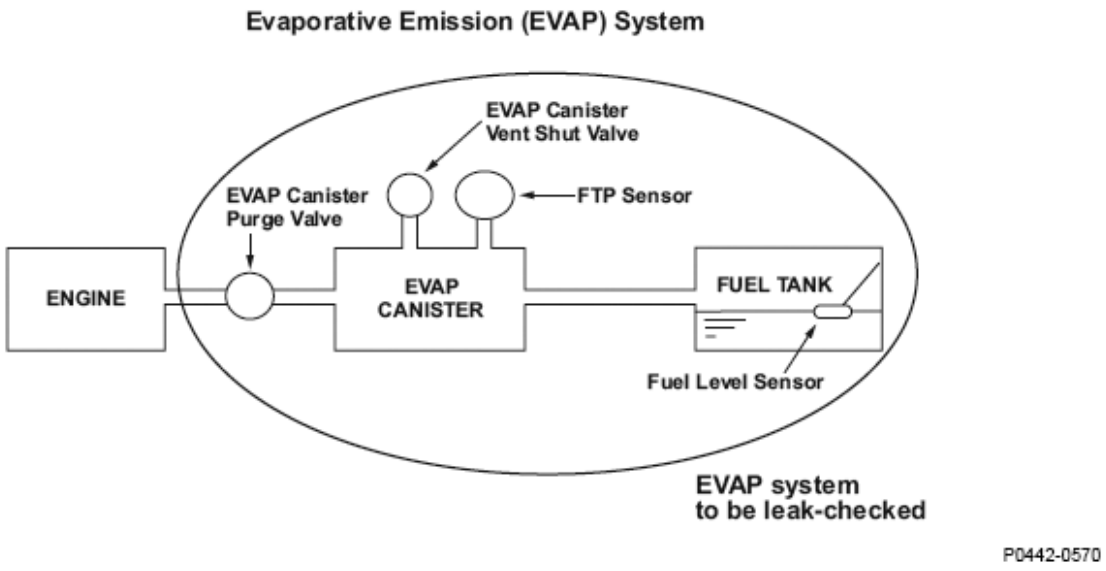

Fig. 213: Evaporative Emission (EVAP) System Large Leak Detected - Diagram

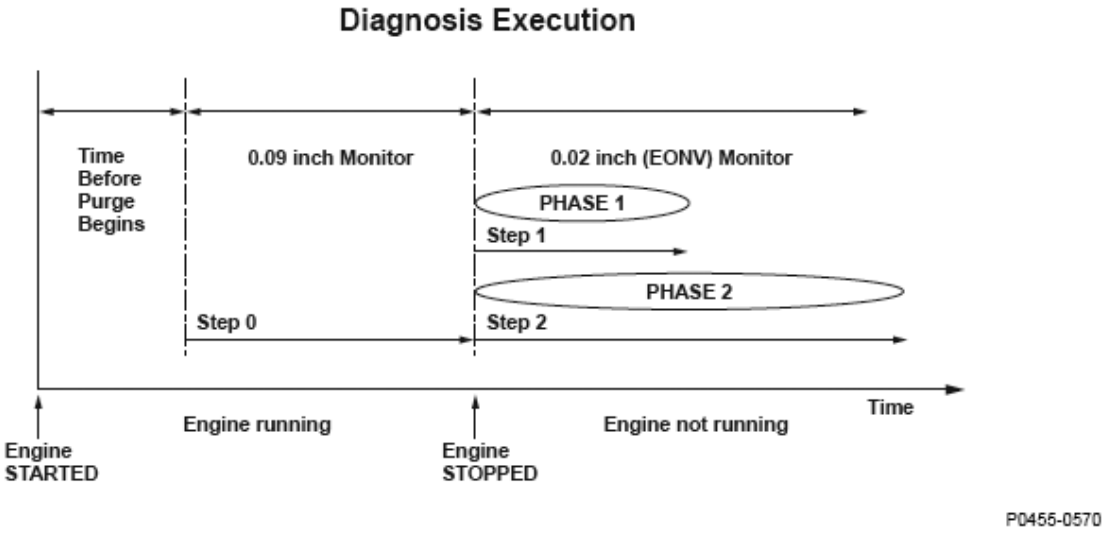

Fig. 214: Evaporative Emission (EVAP) System - Diagnosis Execution

General Description (R18A1 Engine)

The evaporative emission (EVAP) leak detection system uses a vacuum-retention (decompression) method and an engine off natural vacuum (EONV) method. This method detects leakage by monitoring the vacuum-retention ability of the EVAP system (from EVAP canister purge valve to fuel tank). The EONV method detects leakage from the change in fuel tank pressure via the fuel tank pressure (FTP) sensor with the engine off.

Here is an overview of the malfunction detection for the EONV method:

Step 0: Judgement of detection of 0.09 inch leak as normal operation < decompressing monitor >

Step 1: Judgement of detection of 0.02 inch leak as normal operation < phase 1 >

Step 2: Detection of 0.02 inch leak < phase 2 >

Step 0:

Once required conditions for the monitor are met, the engine control module (ECM)/powertrain control module (PCM) applies vacuum to the EVAP system line from the purge control solenoid (PCS) valve through the fuel tank, and monitors the variation of the FTP sensor output to detect a "0.09 inch leak".

- If a "0.09 inch leak" is detected, it is identified as a malfunction; the diagnosis is complete.
- If "no 0.09 inch leak" is detected, the ECM/PCM goes to step 1, judgement of detection of a 0.02 inch leak as normal operation < phase 1 >.
- If sufficient vacuum cannot be drawn on the EVAP system line, it is identified as either "**EVAP SYSTEM LOW PURGE FLOW (P0497)**" or "**EVAP SYSTEM LEAK DETECTED FUEL FILL CAP LOOSE/OFF (P0457)**" .

Step 1:

After the engine has stopped, the ECM/PCM monitors the variation of the FTP sensor output to detect "no 0.02 inch leak" depending on the variation corresponding to the increasing pressure inside the fuel tank.

- If "no 0.02 inch leak" is detected, it is identified as normal; the diagnosis is complete.
- If "no 0.02 inch leak" is not detected, the ECM/PCM goes to step 2, detection of a 0.02 inch leak < phase 2 >.

Step 2:

The ECM/PCM continues to monitor the FTP sensor output to detect "no 0.02 inch leak" depending on the variation corresponding to the decreasing pressure inside the fuel tank.

- If a "0.02 inch leak" is detected, it is identified as a malfunction; the diagnosis is complete.
- If "no leakage" is detected, it is identified as normal; the diagnosis is complete.

4. After stopping the engine, turn the ignition switch off, and leave the vehicle for 32 minutes or more (EONV executes).
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected during the first drive cycle with the ECT and IAT at engine start-up within the specified temperature range, a Temporary DTC is stored in the ECM/PCM memory. If the malfunction recurs during the next (second) drive cycle with the ECT and IAT at engine start-up within the specified temperature range, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0457 (90): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P0457: EVAPORATIVE EMISSION (EVAP) SYSTEM LEAK DETECTED/FUEL FILL CAP LOOSE OR MISSING (K20Z3)

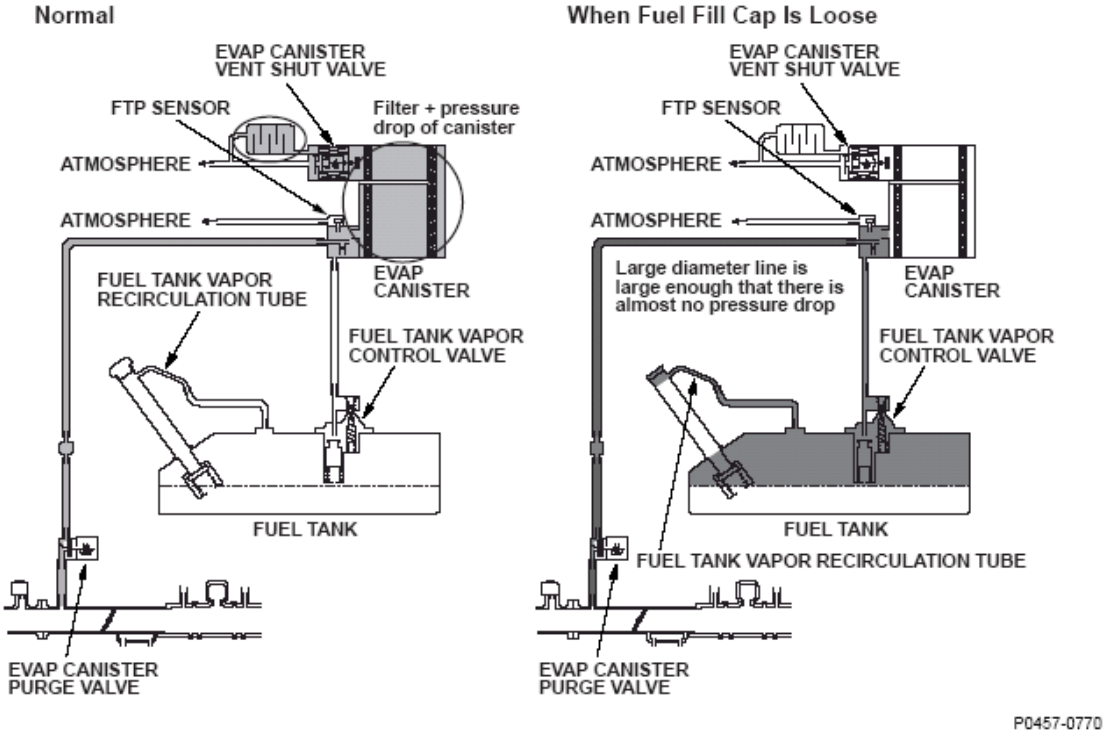

Fig. 215: Evaporative Emission (EVAP) System Diagram (Fuel Fill Cap Loose)

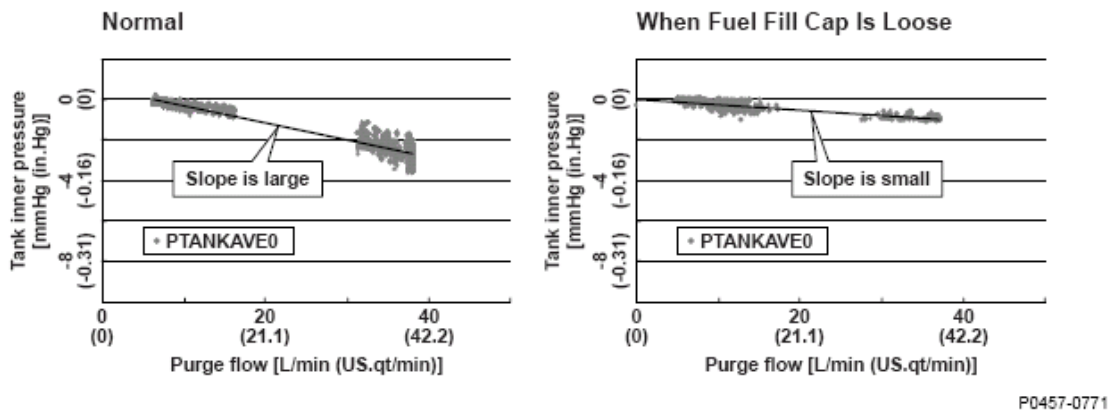

Fig. 216: Fuel Tank Inner Pressure Graph

General Description (K20Z3 Engine)

When the fuel fill cap is installed properly, the purge flow occurs due to the airflow resistance of the canister, and tank pressure will be reduced.

When the fuel fill cap is loosened, the fuel tank pressure will not decrease even when the airflow resistance decreases and the purge flow occurs, because air is being exhausted from the tank to the atmosphere.

By examining the fuel tank pressure with less purge flow area and the fuel tank pressure with more purge flow area, and using the above characteristics, a loose fuel fill cap is detected.

The engine control module (ECM) calculates the relationship of the purge flow and fuel tank pressure (FTP) sensor, and when the slope of the decreasing fuel tank pressure to the purge flow increase is small, a loose fuel fill cap is detected.

< Above failure detection is normally operated during purge >

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	P0455 or P0456 are judged as NG
Duration	12 seconds or more
DTC Type	One drive cycle, MIL OFF
OBD Status	N/A

Enable Conditions (K20Z3 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Engine coolant temperature before EVAP purge control starts	140°F (60°C)	-

	No refueling is required	

Malfunction Threshold (K20Z3 Engine)

The output from the fuel cap monitor is 0.018 or more for at least 12 seconds (when there is no NG judgment history in this drive cycle).

Confirmation Procedure with the HDS (K20Z3 Engine)

Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

Driving Pattern (K20Z3 Engine)

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on.
2. Let the engine idle for at least 12 seconds.
3. Drive the vehicle immediately at a speed between 45 - 75 mph (72 - 120 km/h) for at least 12 minutes.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (K20Z3 Engine)

Conditions for illuminating the fuel fill cap caution (K20Z3 Engine)

1. When a loose fuel fill cap is judged by this detection, the fuel fill cap caution is displayed. At this time, a DTC is not stored.
2. When the first drive cycle leak judgement (temporary DTC stored) is detected at a 0.02 inch leak or a 0.09 inch leak, the fuel fill cap caution is displayed when the ignition is turned on the next time.

Conditions for clearing the fuel fill cap caution (K20Z3 Engine)

1. When the fuel fill cap caution is displayed by the first drive cycle leak judgement (temporary DTC stored) at a 0.02 inch leak or a 0.09 inch leak, the fuel fill cap caution goes out when the next failure

occurs (second drive cycle) and P0457 is stored. (MIL illuminates)

2. When no leak is judged by a 0.02 inch leak or a 0.09 inch leak after the fuel fill cap caution is displayed, the fuel fill cap caution goes out when the ignition is turned on the next time. (P0457 is not stored at this time)
3. When driven three times without this failure detected and a 0.02 inch leak or a 0.09 inch leak detection is not done after the fuel fill cap caution is displayed, the fuel fill cap caution goes out. (P0457 is not stored at this time)
4. Use the Clear command of scan tool to erase the caution. The caution is erased when the MIL is illuminated.

DTC P0457 (90): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0457: EVAPORATIVE EMISSION (EVAP) SYSTEM LEAK DETECTED/FUEL FILL CAP LOOSE OR MISSING (R18A1)

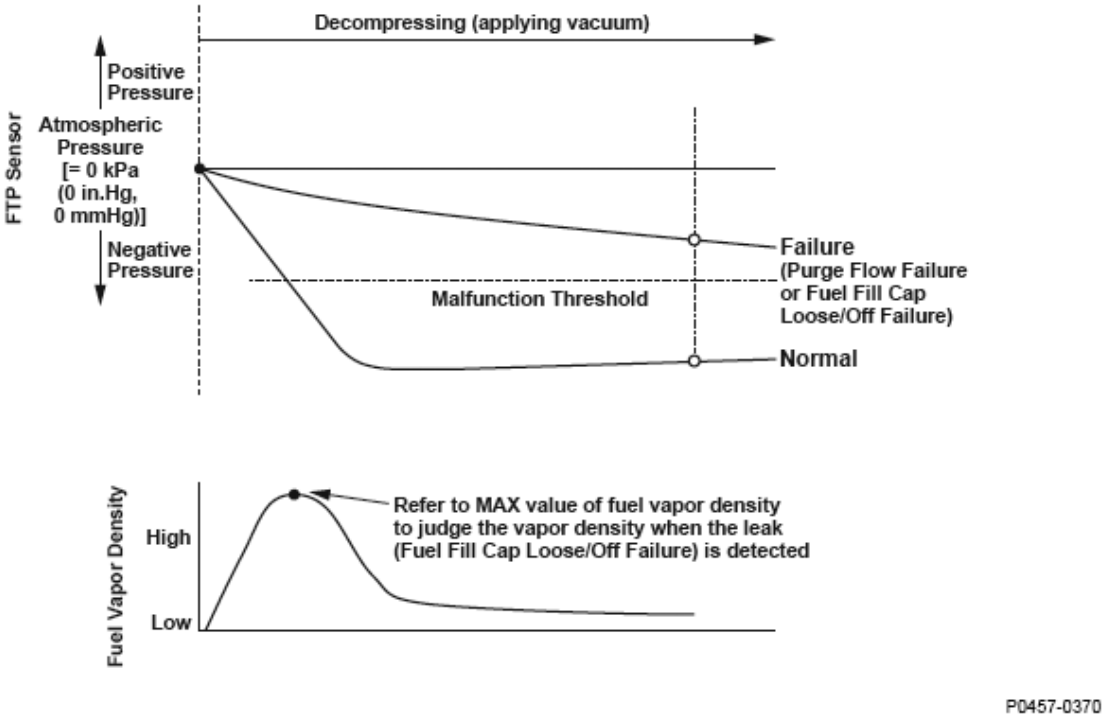

Fig. 217: Evaporative Emission (EVAP) System Leak Detected/Fuel Fill Cap Loose Or Missing - Graph

General Description (R18A1 Engine)

There are two conditions when the evaporative emission (EVAP) system will not hold vacuum sufficiently, and the pressure in the fuel tank doesn't become negative.

1. EVAP system low purge flow.
2. EVAP system leakage or the fuel fill cap is loose/off.

Here is a description of condition 2:

The engine control module (ECM)/powertrain control module (PCM) monitors the fuel tank pressure (FTP)

sensor output. If the FTP sensor output does not indicate the specified vacuum when applying vacuum when the fuel vapor density is high, the ECM/PCM detects a large leak (fuel fill cap loose/off) and a DTC is stored. [The malfunction detection is done during EVAP system leak detection (P0455, P0456).]

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	None
Duration	45 seconds or less
DTC Type	Two drive cycles, MIL ON
OBD Status	N/A

Enable Conditions (R18A1 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Initial engine coolant temperature	40°F (5°C)	-
Initial intake air temperature	40°F (5°C)	-
Engine coolant temperature	156°F (69°C)	212°F (100°C)
Engine coolant temperature before EVAP purge control starts	140°F (60°C)	-
Vehicle speed	7 mph (10 km/h)	-
Battery voltage	10.5 V	-
Fuel trim	0.73	1.47
Fuel feedback	Closed loop at stoichiometric	
No active DTCs	P0101, P0102, P0103, P0107, P0108, P0117, P0118, P0134, P0135, P0300, P0301, P0302, P0303, P0304, P0335, P0339, P0351, P0352, P0353, P0354, P0443, P0451, P0452, P0453, P0496, P0497, P0498, P0499, P1128, P1129, P1157, P1172, P1454, P2195, P2227, P2228, P2229, P2238, P2252, P2422, P2647, U0155	
Others	Other than when there is excessive vapor generation (fuel level is not full)	
	Avoid abrupt acceleration, deceleration, and turns	
	Test-drive on a flat road to avoid misdetection	
	No refueling is required	

Malfunction Threshold (R18A1 Engine)

- The output from the fuel tank pressure sensor is -0.2 kPa (-0.07 in.Hg, -2 mmHg) or more for at least 45 seconds.
- Fuel vapor density during compression is at least 0.1 g (0.004 oz) for up to 45 seconds.

Confirmation Procedure with the HDS (R18A1 Engine)

Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

Driving Pattern (R18A1 Engine)

1. After the vehicle has been left for an appropriate amount of time as specified, with the engine coolant temperature and intake air temperature within the specified range, start the engine.
2. Warm up the engine at idle until the radiator fan comes on.
3. Drive the vehicle immediately at a speed between 45 - 75 mph (72 - 120 km/h) for at least 20 minutes.
4. After stopping the engine, turn the ignition switch off, and leave the vehicle for 32 minutes or more (EONV executes).
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the fuel fill cap caution (R18A1 Engine)

When a malfunction is detected during the first drive cycle with the ECT at engine start-up within the specified temperature range, a Temporary DTC is stored in the ECM/PCM memory and the caution is indicated. If the malfunction recurs during the next (third) drive cycle with the ECT at engine start-up within the specified temperature range, the MIL comes on and the DTC and the freeze frame data are stored. The caution is cleared when the MIL comes on.

Conditions for clearing the fuel fill cap caution (R18A1 Engine)

The caution will be cleared if the malfunction does not recur during the EVAP system leakage diagnostic or if driving is performed without this malfunction detection three times. The caution can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0461 (121): ADVANCED DIAGNOSTICS (M/T)

DTC P0461: FUEL LEVEL SENSOR (FUEL GAUGE SENDING UNIT) CIRCUIT RANGE / PERFORMANCE PROBLEM (M/T)

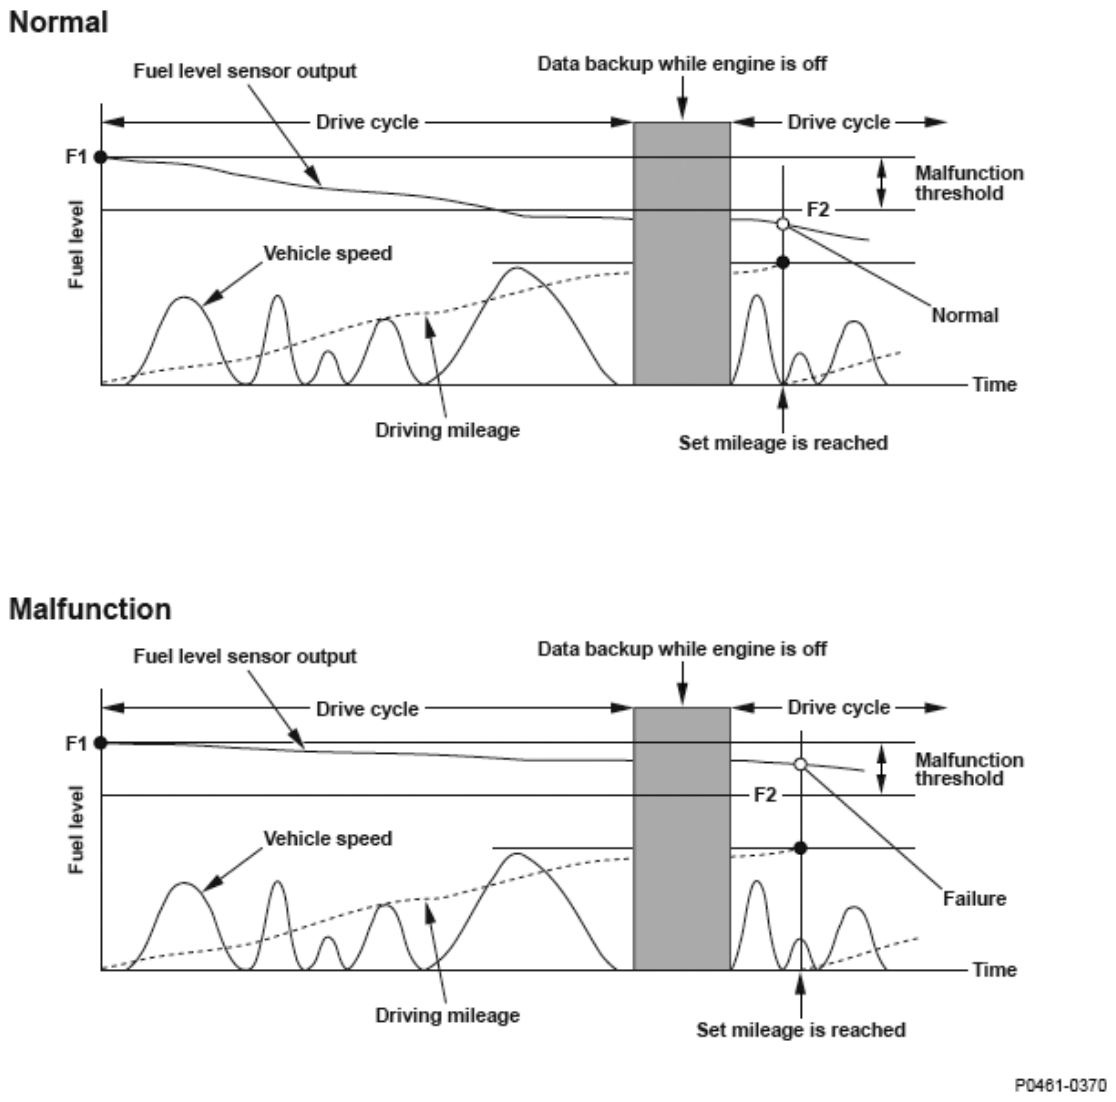

Fig. 218: Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit Range / Performance Problem - Graph

General Description (M/T)

The fuel level sensor is incorporated with the fuel pump and installed in the fuel tank. Using a built-in potentiometer and float, it converts the movement of the float into electrical signals that correspond to the fuel level, and it indicates the amount of fuel in the fuel tank. If the engine control module (ECM)/powertrain control module (PCM) receives no change in the fuel level sensor output after driving for a specified number of miles, it detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (M/T)

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	None
Duration	-
DTC Type	One drive cycle, MIL OFF
OBD Status	N/A

Enable Conditions (M/T)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Mileage	125 miles (200 km)	-
No active DTCs	P0462, P0463, U0155	
Others	Avoid driving and stopping on a steep road	

Malfunction Threshold (M/T)

The change in the fuel level sensor output is 3.5 % or less.

Driving Pattern (M/T)

Drive for the specified mileage under Enable Conditions without refueling. (turning the ignition switch off is acceptable.)

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (M/T)

Conditions for illuminating the indicator (M/T)

When a malfunction is detected, the DTC and the freeze frame data are stored in the ECM/PCM memory. The MIL does not come on.

Conditions for clearing the DTC (M/T)

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0461 (121): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0461: FUEL LEVEL SENSOR (FUEL GAUGE SENDING UNIT) CIRCUIT RANGE / PERFORMANCE PROBLEM (R18A1 ENGINE)

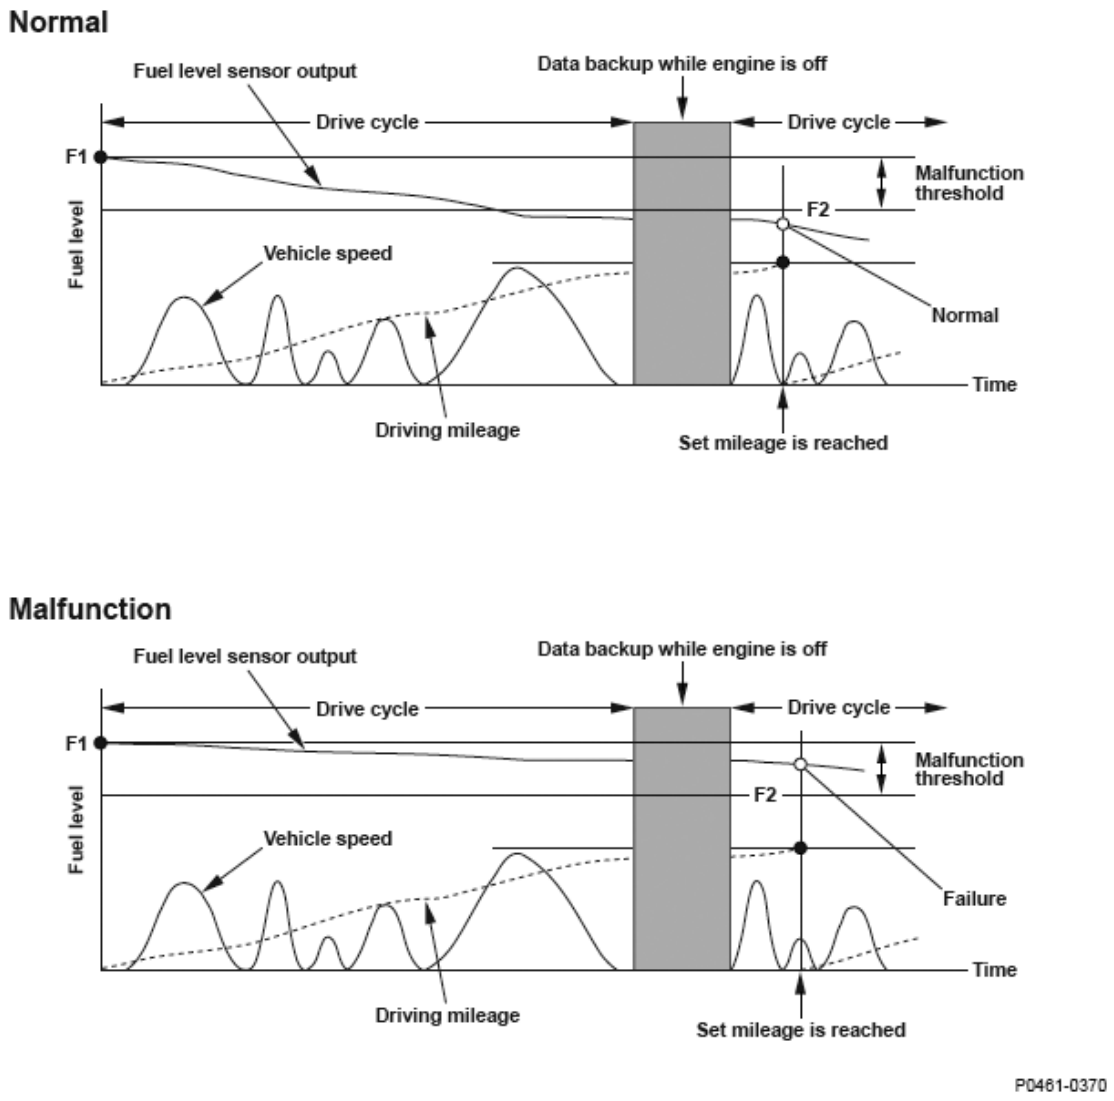

Fig. 219: Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit Range/Performance Problem - Graph

General Description (R18A1 Engine)

The fuel level sensor is incorporated with the fuel pump and installed in the fuel tank. Using a built-in potentiometer and float, it converts the movement of the float into electrical signals that correspond to the fuel level, and it indicates the amount of fuel in the fuel tank. If the engine control module (ECM)/powertrain control module (PCM) receives no change in the fuel level sensor output after driving for a specified number of miles, it detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	None
Duration	-
DTC Type	One drive cycle, MIL OFF
OBD Status	N/A

Enable Conditions (R18A1 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Mileage	125 miles (200 km)	-
No active DTCs	P0462, P0463, U0155	
Others	Avoid driving and stopping on a steep road	

Malfunction Threshold (R18A1 Engine)

The change in the fuel level sensor output is 3.5 % or less.

Driving Pattern (R18A1 Engine)

Drive for the specified mileage under Enable Conditions without refueling. (turning the ignition switch off is acceptable.)

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the indicator (R18A1 Engine)

When a malfunction is detected, the DTC and the freeze frame data are stored in the ECM/PCM memory. The MIL does not come on.

Conditions for clearing the DTC (R18A1 Engine)

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0462 (121): ADVANCED DIAGNOSTICS (M/T)

DTC P0462: FUEL LEVEL SENSOR (FUEL GAUGE SENDING UNIT) CIRCUIT LOW VOLTAGE (M/T)

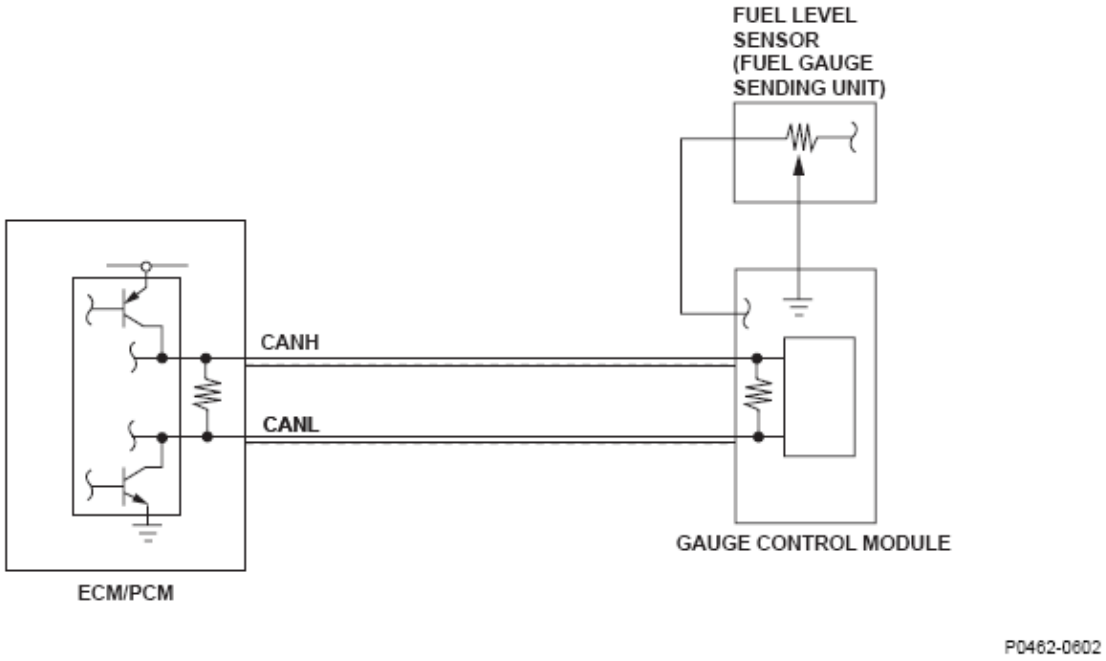

Fig. 220: Fuel Level Sensor Circuit Diagram

General Description (M/T)

The fuel level sensor (fuel gauge sending unit) is incorporated into the fuel pump and installed in the fuel tank. Using a built-in potentiometer and float, it converts the movement of the float to electrical signals as an output that corresponds to fuel level variations in the fuel tank. The fuel level, which is indicated by the gauge control module, is sent to the engine control module (ECM)/powertrain control module (PCM) via the controller area network (CAN). If the ECM/PCM detects a signal from the fuel level sensor (fuel gauge sending unit) below a predetermined value for a set time or more, it detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (M/T)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	One drive cycle, MIL OFF
OBD Status	N/A

Enable Conditions (M/T)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	10.0 V	-
Ignition switch	ON	
No active DTCs	P0463, U0028(1), U0155	
(1) K20Z3 engine		

Malfunction Threshold (M/T)

The fuel level sensor (fuel gauge sending unit) output voltage is 0.09 V or less for at least 5 seconds.

Diagnosis Details (M/T)

Conditions for illuminating the indicator (M/T)

When a malfunction is detected, the DTC and the freeze frame data are stored in the ECM/PCM memory. The MIL does not come on.

Conditions for clearing the DTC (M/T)

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0462 (121): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0462: FUEL LEVEL SENSOR (FUEL GAUGE SENDING UNIT) CIRCUIT LOW VOLTAGE (R18A1 ENGINE)

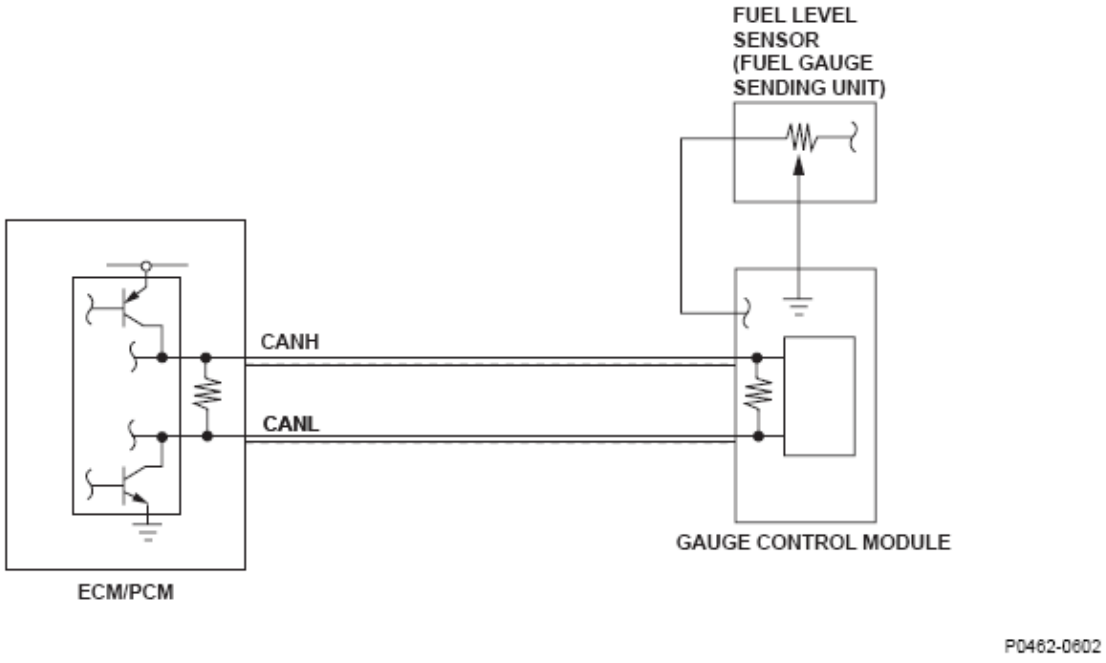

Fig. 221: Fuel Level Sensor Circuit Diagram

General Description (R18A1 Engine)

The fuel level sensor (fuel gauge sending unit) is incorporated into the fuel pump and installed in the fuel tank. Using a built-in potentiometer and float, it converts the movement of the float to electrical signals as an output that corresponds to fuel level variations in the fuel tank. The fuel level, which is indicated by the gauge control module, is sent to the engine control module (ECM)/powertrain control module (PCM) via the controller area network (CAN). If the ECM/PCM detects a signal from the fuel level sensor (fuel gauge sending unit) below a predetermined value for a set time or more, it detects a malfunction and stores a DTC.

Malfunction Threshold (R18A1 Engine)

The fuel level sensor (fuel gauge sending unit) output voltage is 4.84 V or more for at least 5 seconds.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the indicator (R18A1 Engine)

When a malfunction is detected, the DTC and the freeze frame data are stored in the ECM/PCM memory. The MIL does not come on.

Conditions for clearing the DTC (R18A1 Engine)

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0496 (92): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P0496: EVAPORATIVE EMISSION (EVAP) SYSTEM HIGH PURGE FLOW DETECTED (K20Z3)

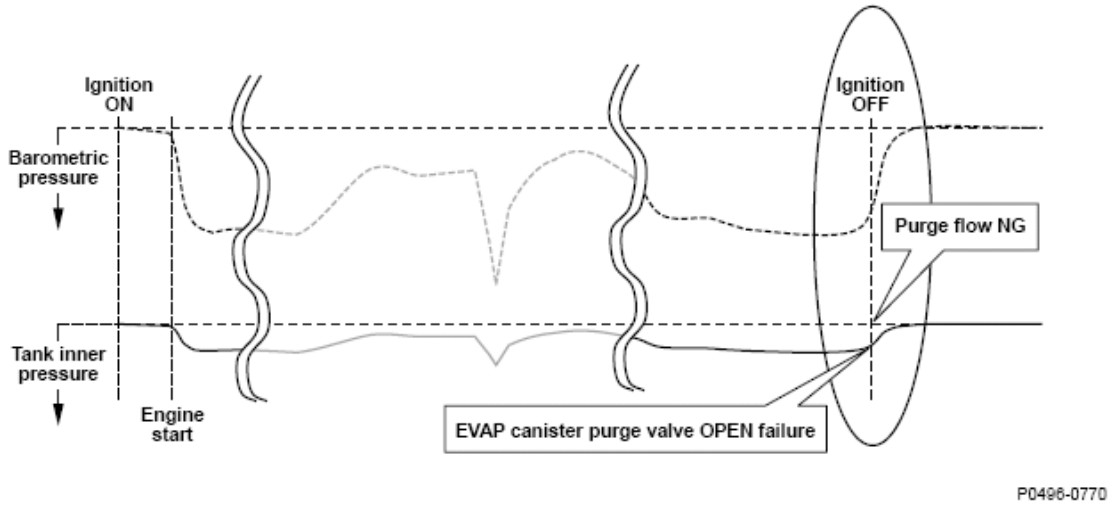

Fig. 224: Evaporative Emission (EVAP) System High Purge Flow Graph

General Description (K20Z3 Engine)

The fuel (vapor) vaporized in the fuel tank is stored in the canister temporarily and introduced in the engine through the evaporative emission (EVAP) canister purge valve. The engine control module (ECM) controls the amount of vapor introduced in the engine by repeatedly switching the power of the EVAP canister purge valve at a constant frequency according to the condition of the engine.

< STEP 1 >

The EVAP canister purge valve opens normally (EVAP canister purge valve OPEN OK) and detects that the purge flow is normal when the pulse of the EVAP canister purge valve drive cycle is transmitted to fuel tank pressure (FTP) sensor by the purge flow (pulse method).

OK determination: Pulse exists (P145C OK)

- P0497 Purge flow OK
- P0496 EVAP canister purge valve stuck Open OK

NG determination: No pulse (P145C NG)

- Either purge flow P0497 abnormality or P0496 EVAP canister purge valve OPEN failure.
- In this case, classify the failure part according to < STEP 2 >.

< STEP 2 >

If there is no pulse, it is determined as either no purge flow or the EVAP canister purge valve is stuck OPEN:

When the FTP sensor fluctuates from negative pressure to atmospheric pressure after the ignition is turned off: P0496 EVAP canister purge valve stuck OPEN

When there is no fluctuation of the FTP sensor: P0497 purge flow NG

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	P145C is judged as OK
Duration	-
DTC Type	Two drive cycles, MIL ON
OBD Status	N/A

Enable Conditions (K20Z3 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Low load duration time	10 seconds	-
Wait for stability after the ignition is turned off	10 seconds	-
Engine coolant temperature before EVAP purge control starts	140°F (60°C)	-
No active DTCs	P0101, P0102, P0103, P0107, P0108, P0117, P0118, P0134, P0135, P0300, P0301, P0302, P0303, P0304, P0335, P0339, P0443, P0451, P0452, P0453, P0498, P0499, P0685, P1128, P1129, P1157, P1172, P1454, P2195, P2227, P2228, P2229, P2238, P2252, P2422	

Malfunction Threshold (K20Z3 Engine)

The output from the EVAP canister purge valve is 0.2 kPa (0.07 in.Hg, 2 mmHg) or more for at least 10 seconds.

Confirmation Procedure with the HDS (K20Z3 Engine)

Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

Driving Pattern (K20Z3 Engine)

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on.
2. Let the engine idle for at least 77 seconds.
3. Turn off the ignition for at least 10 seconds.

Diagnosis Details (K20Z3 Engine)

Conditions for illuminating the MIL (K20Z3 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the ECM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (K20Z3 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0496 (92): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0496: EVAPORATIVE EMISSION (EVAP) SYSTEM HIGH PURGE FLOW DETECTED (R18A1)

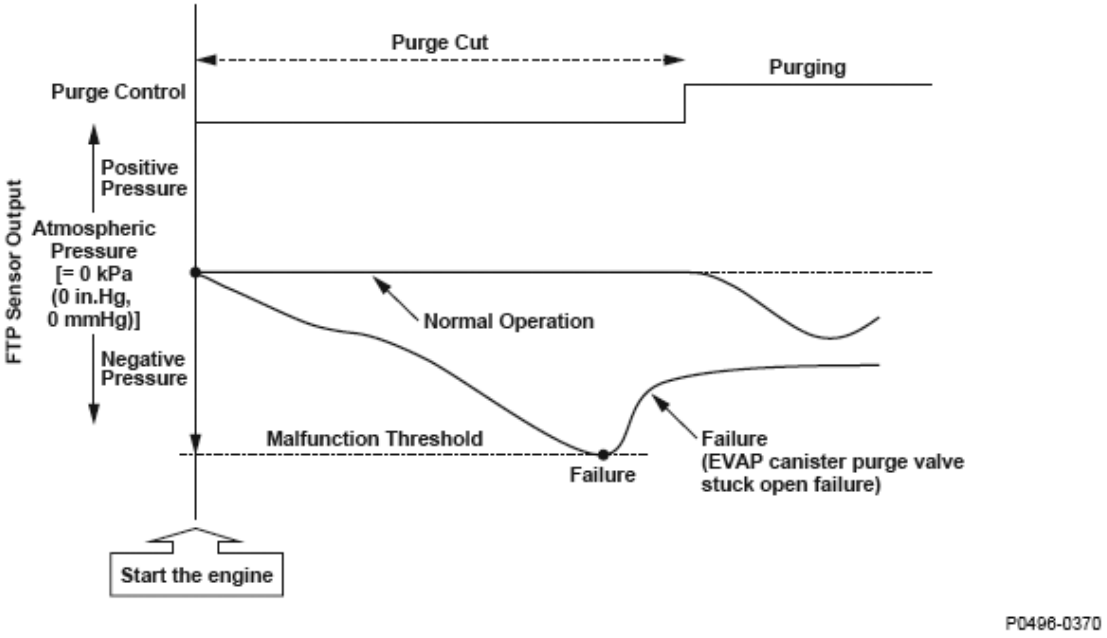

Fig. 225: Evaporative Emission (EVAP) System High Purge Flow - Graph

General Description (R18A1 Engine)

The engine control module (ECM)/powertrain control module (PCM) adjusts the amount of fuel vapor sent to the engine by controlling the evaporative emission (EVAP) canister purge valve. If the EVAP canister purge valve is stuck open, engine vacuum flows into the purge line before purge control starts when starting the engine. The ECM/PCM monitors the fuel tank pressure (FTP) sensor output when purge control starts. If the FTP sensor output indicates negative pressure, the ECM/PCM detects a malfunction in the EVAP canister purge valve, and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	None
Duration	10 seconds or more
DTC Type	Two drive cycles, MIL ON
OBD Status	N/A

(1) Initial engine coolant temperature minus initial intake air temperature

(2) Initial intake air temperature minus current intake air temperature

Malfunction Threshold (R18A1 Engine)

The output from the fuel tank pressure sensor is -2 kPa (-0.6 in.Hg, -15 mmHg) or less for at least 10 seconds.

Confirmation Procedure with the HDS (R18A1 Engine)

Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

Driving Pattern (R18A1 Engine)

Start the engine at an engine coolant temperature and intake air temperature as specified under Enable Conditions, and let it idle until the radiator fan comes on.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected during the first drive cycle with the ECT and IAT at engine start-up within the specified temperature range, a Temporary DTC is stored in the ECM/PCM memory. If the malfunction recurs during the next (second) drive cycle with the ECT and IAT at engine start-up within the specified temperature range, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the

diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0497 (90): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P0497: EVAPORATIVE EMISSION (EVAP) SYSTEM LOW PURGE FLOW DETECTED (K20Z3)

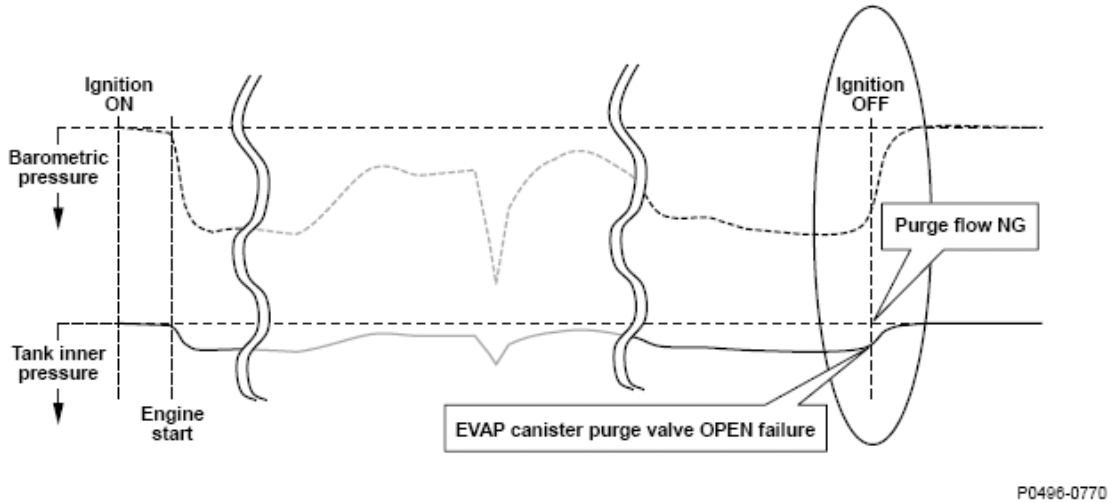

Fig. 226: Evaporative Emission (EVAP) System High Purge Flow Graph

General Description (K20Z3 Engine)

The fuel (vapor) vaporized in the fuel tank is stored in the canister temporarily and introduced in the engine through the evaporative emission (EVAP) canister purge valve. The engine control module (ECM) controls the amount of vapor introduced in the engine by repeatedly switching the power of the EVAP canister purge valve at a constant frequency according to the condition of the engine.

< STEP 1 >

The EVAP canister purge valve opens normally (EVAP canister purge valve OPEN OK) and detects that the purge flow is normal when the pulse of the EVAP canister purge valve drive cycle is transmitted to fuel tank pressure (FTP) sensor by the purge flow (pulse method).

OK determination: Pulse exists (P145C OK)

- P0497 Purge flow OK
- P0496 EVAP canister purge valve stuck Open OK

NG determination: No pulse (P145C NG)

- Either purge flow P0497 abnormality or P0496 EVAP canister purge valve OPEN failure.
- In this case, classify the failure part according to < STEP 2 >.

< STEP 2 >

If there is no pulse, it is determined as either no purge flow or the EVAP canister purge valve is stuck OPEN:

When the FTP sensor fluctuates from negative pressure to atmospheric pressure after the ignition is turned off: P0496 EVAP canister purge valve stuck OPEN

When there is no fluctuation of the FTP sensor: P0497 purge flow NG

Diagnosis Details (K20Z3 Engine)

Conditions for illuminating the MIL (K20Z3 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the ECM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (K20Z3 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0497 (90): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0497: EVAPORATIVE EMISSION (EVAP) SYSTEM LOW PURGE FLOW DETECTED (R18A1)

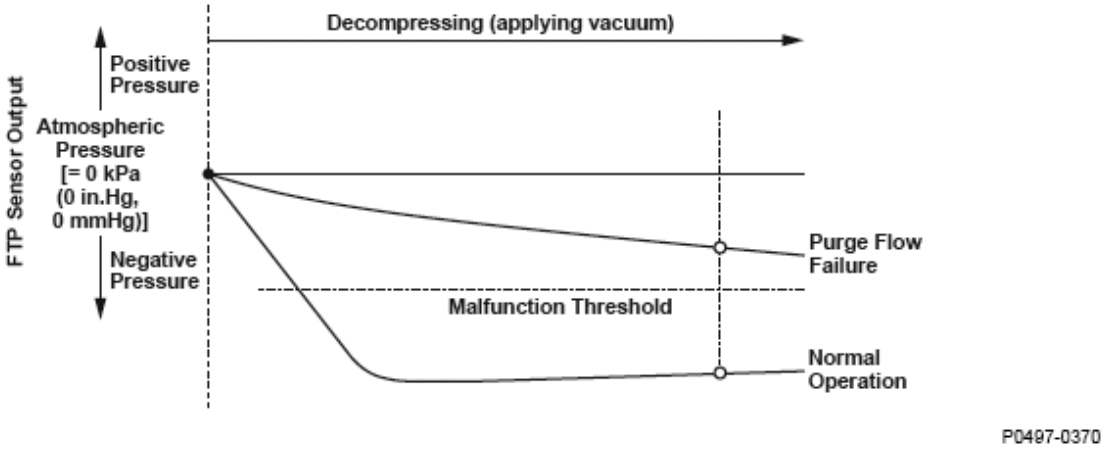

Fig. 227: Evaporative Emission (EVAP) System Low Purge Flow - Graph

General Description (R18A1 Engine)

There are two conditions when the evaporative emission (EVAP) system will not hold vacuum, and the pressure in the fuel tank doesn't become negative.

1. EVAP system low purge flow.
2. EVAP system leakage or the fuel fill cap is loose/off.

Here is a description of condition 1:

The malfunction detection is done during EVAP system leak detection (P0455, P0456).

The engine control module (ECM)/powertrain control module (PCM) monitors the fuel tank pressure (FTP) sensor output. If the FTP sensor output does not indicate the prescribed negative pressure when purging, the

ECM/PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	None
Duration	45 seconds or less
DTC Type	Two drive cycles, MIL ON
OBD Status	N/A

Enable Conditions (R18A1 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Initial engine coolant temperature	40°F (5°C)	-
Initial intake air temperature	40°F (5°C)	-
Engine coolant temperature	156°F (69°C)	212°F (100°C)
Engine coolant temperature before EVAP purge control starts	140°F (60°C)	-
Vehicle speed	7 mph (10 km/h)	-
Battery voltage	10.5 V	-
Fuel trim	0.73	1.47
Fuel feedback	Closed loop at stoichiometric	
No active DTCs	P0101, P0102, P0103, P0107, P0108, P0117, P0118, P0134, P0135, P0300, P0301, P0302, P0303, P0304, P0335, P0339, P0351, P0352, P0353, P0354, P0443, P0451, P0452, P0453, P0496, P0498, P0499, P0685, P1128, P1129, P1157, P1172, P1454, P2195, P2227, P2228, P2229, P2238, P2252, P2422	
Others	Other than when there is excessive vapor generation (fuel level is not full)	
	Avoid abrupt acceleration, deceleration, and turns	
	Test-drive on a flat road to avoid misdetection	
	No refueling is required	

Malfunction Threshold (R18A1 Engine)

The output from the fuel tank pressure sensor is at least -0.2 kPa (-0.07 in.Hg, -2 mmHg) for up to 45 seconds.

Confirmation Procedure with the HDS (R18A1 Engine)

Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

Driving Pattern (R18A1 Engine)

1. After the vehicle has been left for an appropriate amount of time as specified, with the engine coolant temperature and intake air temperature within the specified range, start the engine.

2. Warm up the engine at idle until the radiator fan comes on.
3. Drive the vehicle immediately at a speed between 45 - 75 mph (72 - 120 km/h) for at least 20 minutes.
4. After stopping the engine, turn the ignition switch off, and leave the vehicle for 32 minutes or more (EONV executes).
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected during the first drive cycle with the ECT and IAT at engine start-up within the specified temperature range, a Temporary DTC is stored in the ECM/PCM memory. If the malfunction recurs during the next (second) drive cycle with the ECT and IAT at engine start-up within the specified temperature range, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0498 (117): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P0498: EVAPORATIVE EMISSION (EVAP) CANISTER VENT SHUT VALVE CIRCUIT LOW VOLTAGE (K20Z3 ENGINE)

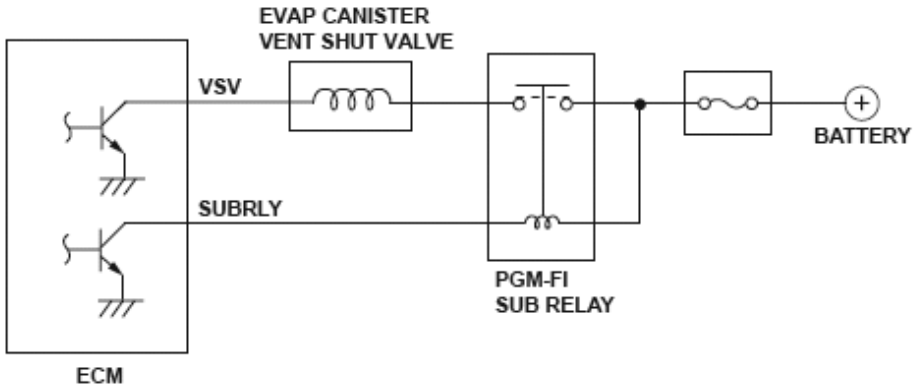

Fig. 228: Evaporative Emission (EVAP) Canister Vent Shut Valve - Circuit Diagram

General Description (K20Z3 Engine)

The evaporative emission (EVAP) canister vent shut valve is attached to the EVAP canister to control the venting of the EVAP canister to atmosphere.

The EVAP canister vent shut valve is open (open to atmosphere) when the VSV signal is OFF.

If the return signal is "OFF" when the engine control module (ECM) outputs the "ON" signal to the EVAP canister vent shut valve, the ECM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	N/A

Enable Conditions (K20Z3 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	10.0 V	-
State of the engine	Running	
No active DTCs	P0499	

Malfunction Threshold (K20Z3 Engine)

The return signal is "OFF" for at least 5 seconds when the ECM outputs the "ON" signal to the EVAP canister vent shut valve.

Confirmation Procedure with the HDS (K20Z3 Engine)

Do the EVAP CVS ON in the INSPECTION MENU with the HDS.

Diagnosis Details (K20Z3 Engine)

Conditions for illuminating the MIL (K20Z3 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM memory.

Conditions for clearing the MIL (K20Z3 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0498 (117): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0498: EVAPORATIVE EMISSION (EVAP) CANISTER VENT SHUT VALVE CIRCUIT LOW VOLTAGE (R18A1 ENGINE)

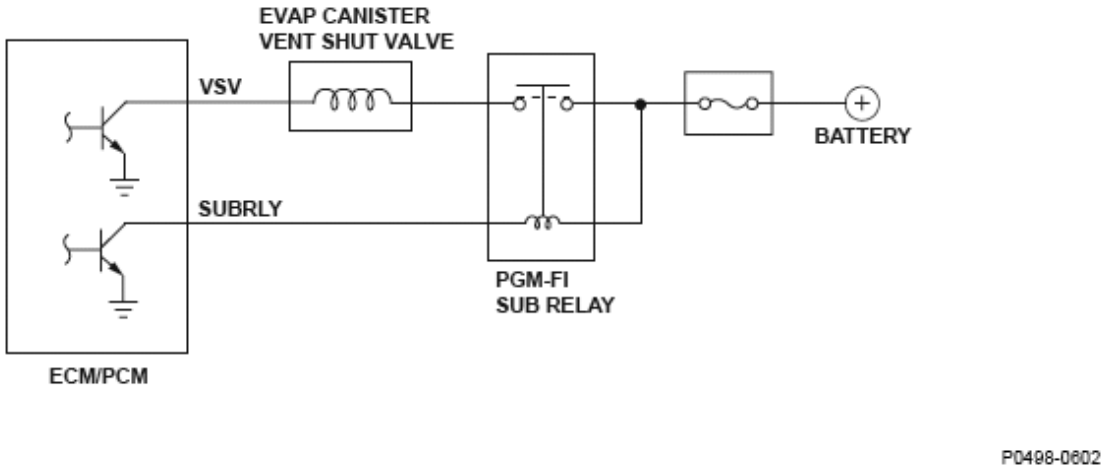

Fig. 229: Evaporative Emission (EVAP) Canister Vent Shut Valve - Circuit Diagram

General Description (R18A1 Engine)

The evaporative emission (EVAP) canister vent shut valve is attached to the EVAP canister to control the venting of the EVAP canister to atmosphere.

The EVAP canister vent shut valve is open (open to atmosphere) when the VSV signal is OFF.

If the return signal is "OFF" when the engine control module (ECM)/powertrain control module (PCM) outputs the "ON" signal to the EVAP canister vent shut valve, the ECM/PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	N/A

Enable Conditions (R18A1 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	10.0 V	-
State of the engine	Running	
No active DTCs	P0499	

Malfunction Threshold (R18A1 Engine)

The return signal is "OFF" for at least 5 seconds when the ECM/PCM outputs the "ON" signal to the EVAP canister vent shut valve.

Confirmation Procedure with the HDS (R18A1 Engine)

Do the EVAP CVS ON in the INSPECTION MENU with the HDS.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM/PCM memory.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0499 (117): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P0499: EVAPORATIVE EMISSION (EVAP) CANISTER VENT SHUT VALVE CIRCUIT HIGH VOLTAGE (K20Z3 ENGINE)

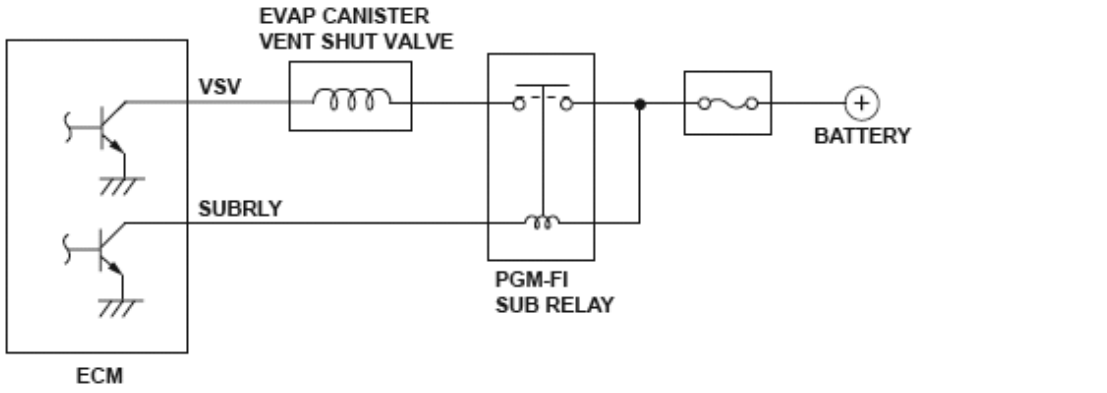

Fig. 230: Evaporative Emission (EVAP) Canister Vent Shut Valve - Circuit Diagram

General Description (K20Z3 Engine)

The evaporative emission (EVAP) canister vent shut valve is attached to the EVAP canister to control the venting of the EVAP canister to atmosphere.

The EVAP canister vent shut valve is open (open to atmosphere) when the VSV signal is OFF.

If the return signal is "ON" when the engine control module (ECM) outputs the "OFF" signal to the EVAP canister vent shut valve, the ECM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	N/A

Enable Conditions (K20Z3 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	10.0 V	-
State of the engine	Running	
No active DTCs	P0498	

Malfunction Threshold (K20Z3 Engine)

The return signal is "ON" for at least 5 seconds when the ECM outputs the "OFF" signal to the EVAP canister vent shut valve.

Confirmation Procedure with the HDS (K20Z3 Engine)

Do the EVAP CVS ON in the INSPECTION MENU with the HDS.

Diagnosis Details (K20Z3 Engine)

Conditions for illuminating the MIL (K20Z3 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM memory.

Conditions for clearing the MIL (K20Z3 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0499 (117): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0499: EVAPORATIVE EMISSION (EVAP) CANISTER VENT SHUT VALVE CIRCUIT HIGH VOLTAGE (R18A1 ENGINE)

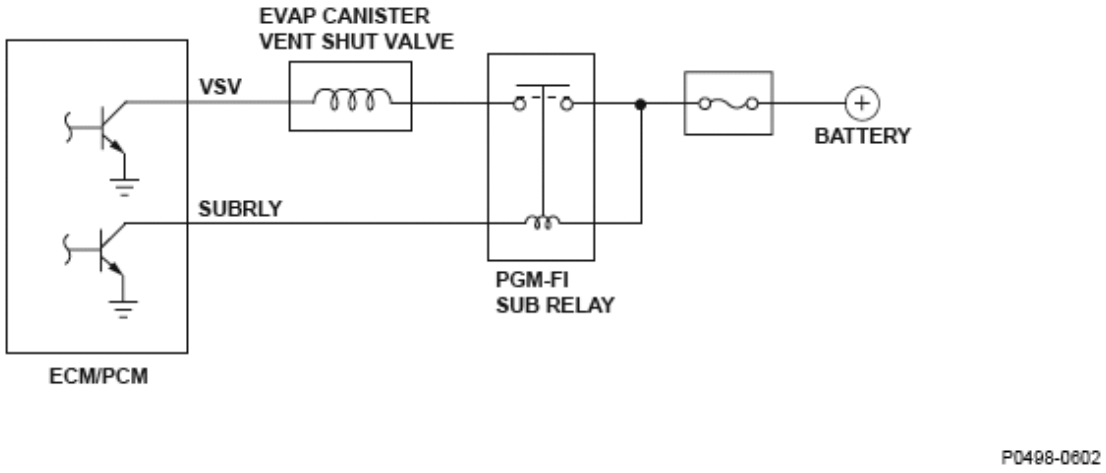

Fig. 231: Evaporative Emission (EVAP) Canister Vent Shut Valve - Circuit Diagram

General Description (R18A1 Engine)

The evaporative emission (EVAP) canister vent shut valve is attached to the EVAP canister to control the venting of the EVAP canister to atmosphere.

The EVAP canister vent shut valve is open (open to atmosphere) when the VSV signal is OFF.

If the return signal is "ON" when the engine control module (ECM)/powertrain control module (PCM) outputs the "OFF" signal to the EVAP canister vent shut valve, the ECM/PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	N/A

Enable Conditions (R18A1 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	10.0 V	-
State of the engine	Running	
No active DTCs	P0498	

Malfunction Threshold (R18A1 Engine)

The return signal is "ON" for at least 5 seconds when the ECM/PCM outputs the "OFF" signal to the EVAP canister vent shut valve.

Confirmation Procedure with the HDS (R18A1 Engine)

Do the EVAP CVS ON in the INSPECTION MENU with the HDS.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM/PCM memory.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0506 (14): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P0506: IDLE CONTROL SYSTEM RPM LOWER THAN EXPECTED (K20Z3)

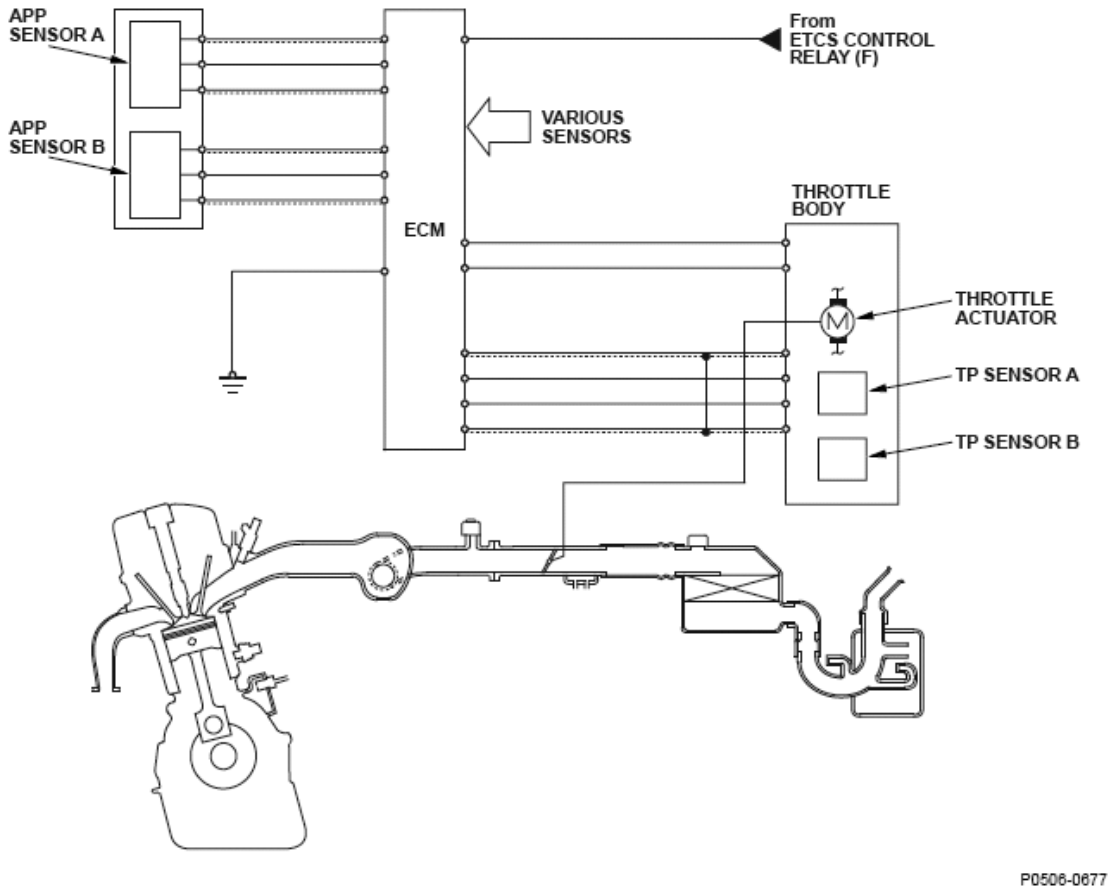

Fig. 232: Idle Control System - Communication Diagram

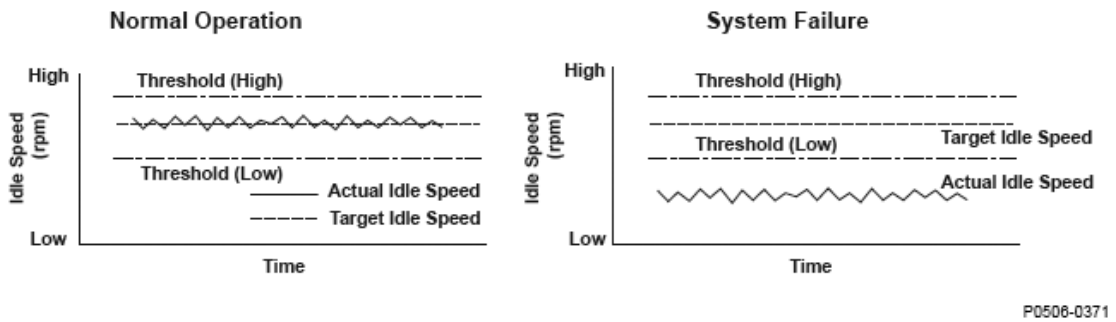

Fig. 233: Idle Control System RPM - Graph

General Description (K20Z3 Engine)

A target idle speed that meets the engine operating conditions (coolant temperature, A/C ON or OFF, etc.) is stored in the engine control module (ECM). The ECM monitors and controls the idle speed so that the actual idle speed is equal to the target idle speed. If the actual idle speed varies beyond a specified value from the target speed over a certain period of time, the ECM detects a malfunction in the idle speed control system and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	None
Duration	20 seconds or more
DTC Type	Two drive cycles, MIL ON
OBD Status	PASSED/FAILED/EXECUTING/OUT OF (TEST) CONDITION

Enable Conditions (K20Z3 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Engine coolant temperature	156°F (69°C)	-
Intake air temperature	19°F (-7°C)	-
Battery voltage	10.5 V	-
Fuel trim	0.69	1.47
Fuel feedback	Closed loop	
Throttle position	Fully closed	
No active DTCs	P0107, P0108, P0112, P0113, P0117, P0118, P0122, P0123, P0171, P0172, P0222, P0223, P0300, P0301, P0302, P0303, P0304, P0443, P0496, P0497, P1128, P1129, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176, P2646, P2647, P2648, P2649	
Other	The engine is under no load	

Malfunction Threshold (K20Z3 Engine)

The actual idle speed is at least 100 rpm less than the target idle speed for at least 20 seconds.

Driving Pattern (K20Z3 Engine)

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on.
2. Let the engine idle for at least 20 seconds.

Diagnosis Details (K20Z3 Engine)

Conditions for illuminating the MIL (K20Z3 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the ECM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (K20Z3 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0506 (14): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0506: IDLE CONTROL SYSTEM RPM LOWER THAN EXPECTED (R18A1)

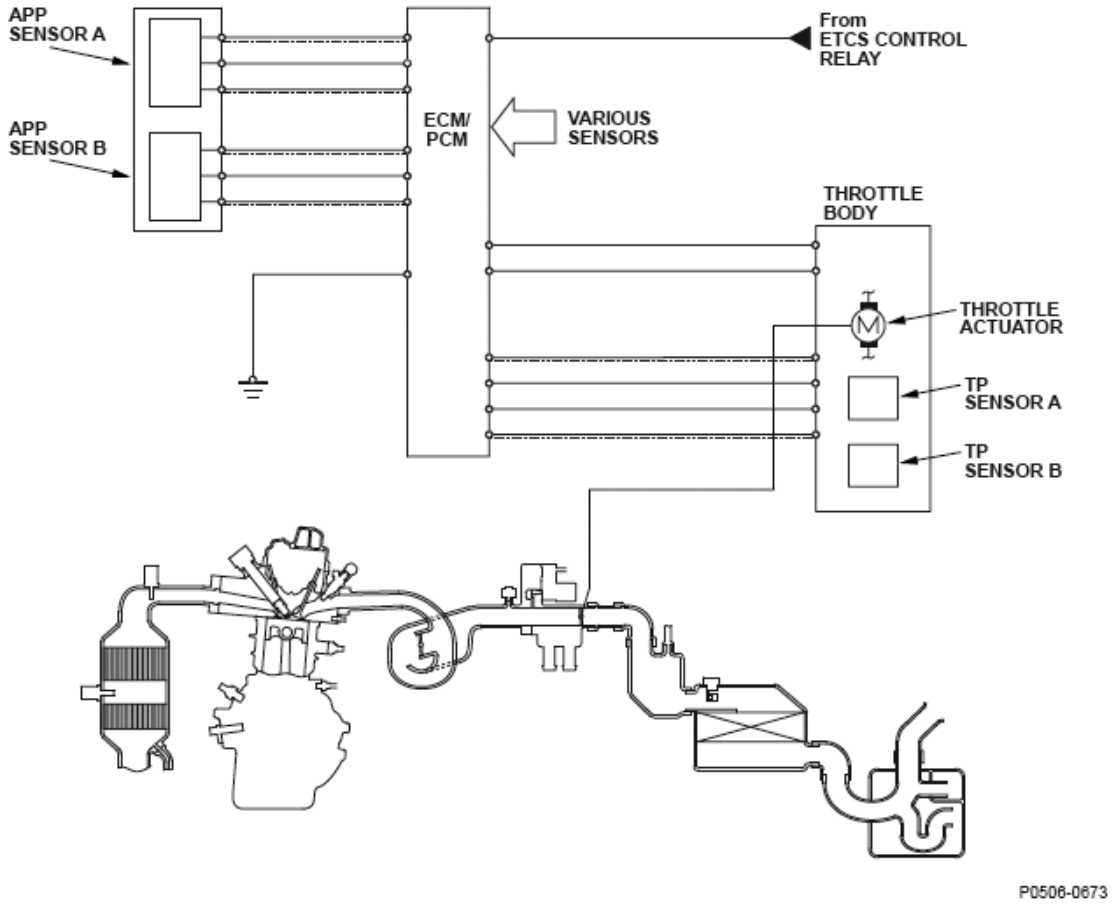

Fig. 234: Idle Control System - Communication Diagram

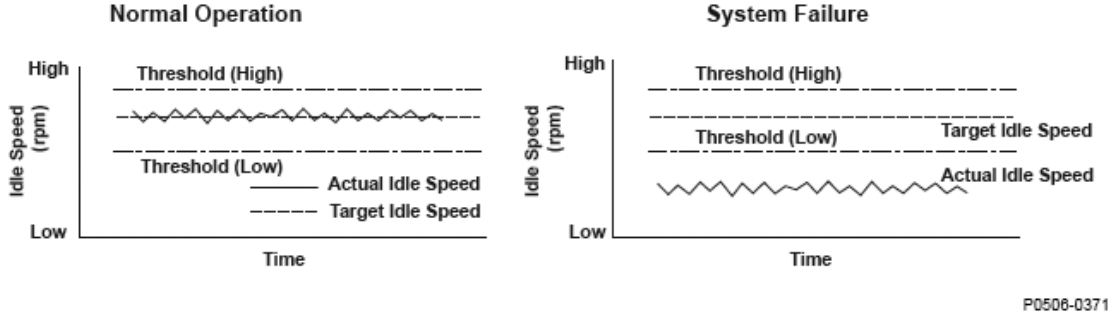

Fig. 235: Idle Control System RPM - Graph

General Description (R18A1 Engine)

A target idle speed that meets the engine operating conditions (coolant temperature, A/C ON or OFF, etc.) is stored in the engine control module (ECM)/powertrain control module (PCM). The ECM/PCM monitors and controls the idle speed so that the actual idle speed is equal to the target idle speed. If the actual idle speed varies beyond a specified value from the target speed over a certain period of time, the ECM/PCM detects a malfunction in the idle speed control system and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

No active DTCs	P0108, P0112, P0113, P0117, P0118, P0122, P0123, P0171, P0172, P0181, P0182, P0183, P0191, P0192, P0193, P0222, P0223, P0300, P0301, P0302, P0303, P0304, P0351, P0352, P0353, P0354, P1109, P1128, P1129, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176, P2227, P2228, P2229, P2646, P2647, P2648, P2649	
Other	The engine is under no load	

Malfunction Threshold (R18A4 Engine)

The actual idle speed is at least 200 rpm greater than the target idle speed for at least 24 seconds.

Driving Pattern (R18A4 Engine)

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Let the engine idle for at least 24 seconds.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P050A (167): ADVANCED DIAGNOSTICS (M/T)

DTC P050A: COLD START IDLE AIR CONTROL SYSTEM PERFORMANCE PROBLEM (M/T)

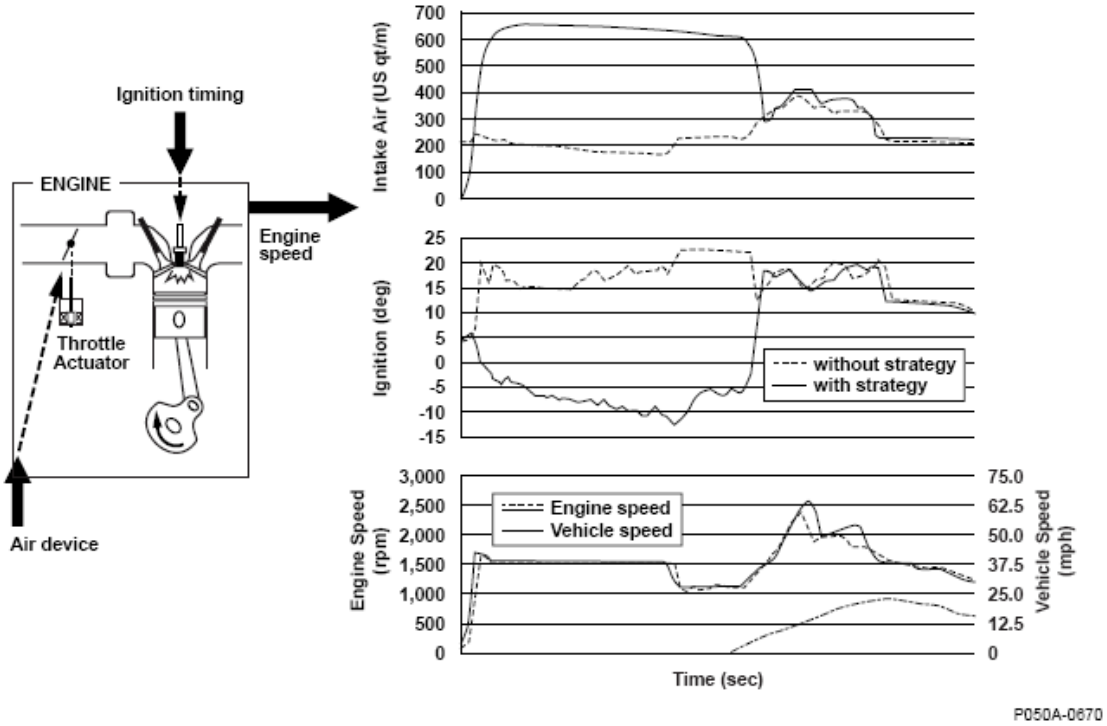

Fig. 244: Cold Start Idle Air Control System Performance Chart - SULEV Model (1 Of 2)

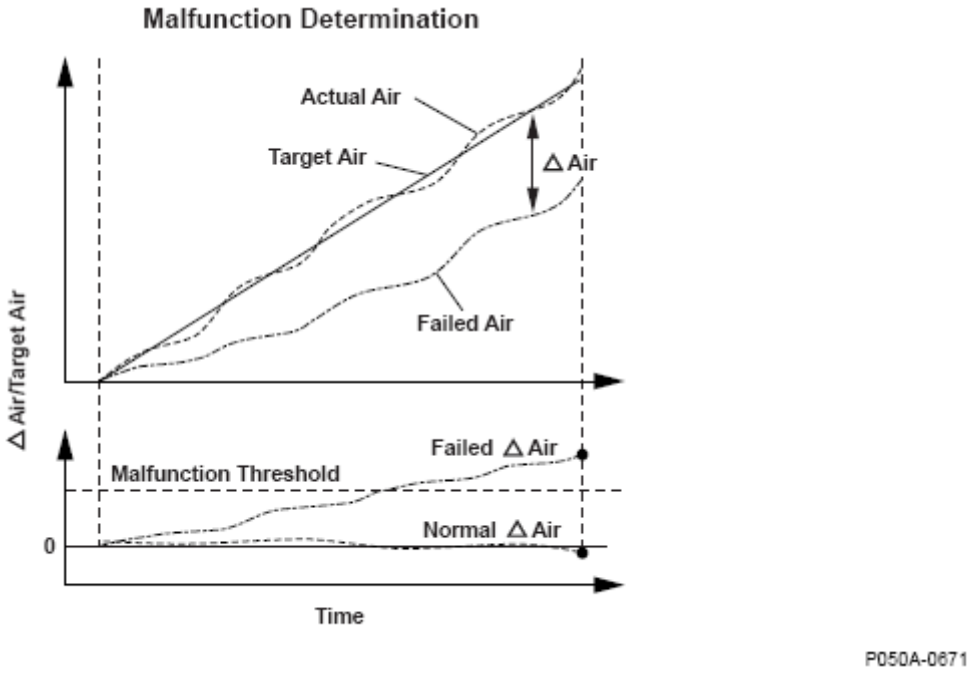

Fig. 245: Cold Start Idle Air Control System Performance Chart - SULEV Model (2 Of 2)

General Description (M/T)

The quick warm-up system supplies additional air and retards the ignition timing when the engine is cold to activate the catalytic converter as quickly as possible.

When the actual amount of air is less than the target amount, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (M/T)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0522 (22): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0522: ENGINE OIL PRESSURE (EOP) SENSOR CIRCUIT LOW VOLTAGE (R18A1)

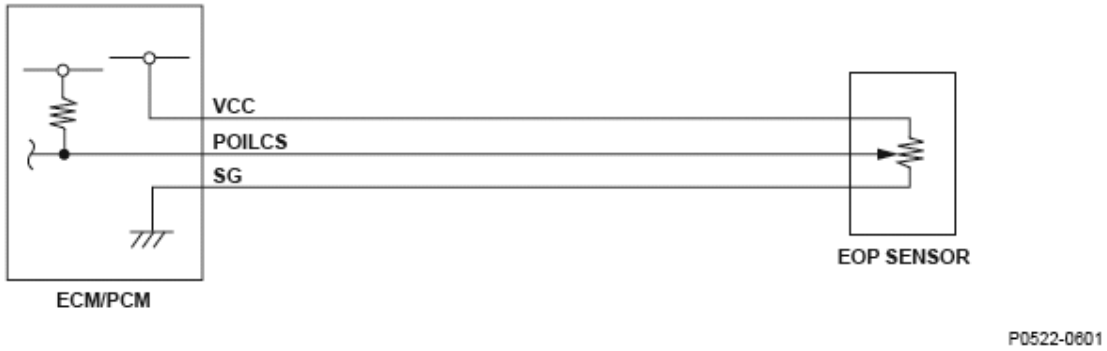

Fig. 252: Engine Oil Pressure (EOP) Sensor - Circuit Diagram

General Description (R18A1 Engine)

The engine oil pressure (EOP) sensor detects the engine oil pressure in the VTEC system.

When the voltage from the EOP sensor is a set value or less for a specified time, the engine control module (ECM)/powertrain control module (PCM) detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0532 (191): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P0532: A/C PRESSURE SENSOR CIRCUIT LOW VOLTAGE (K20Z3 ENGINE)

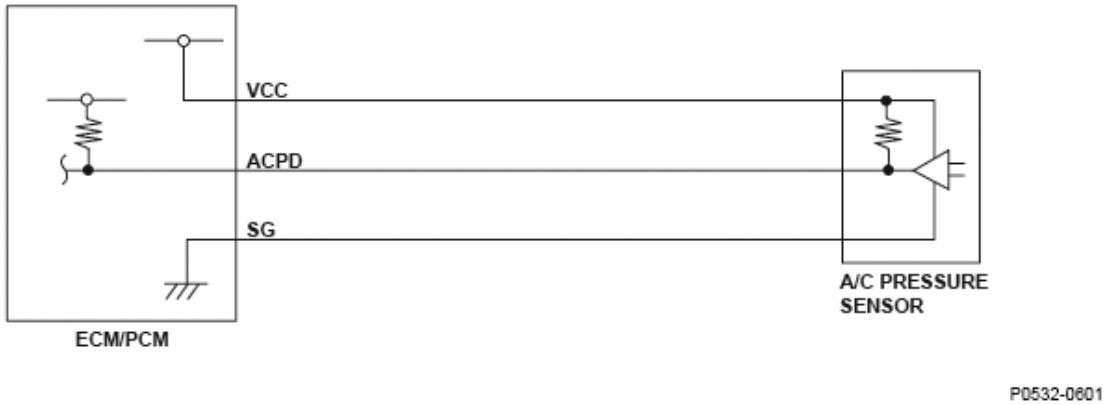

Fig. 256: A/C Pressure Sensor - Circuit Diagram

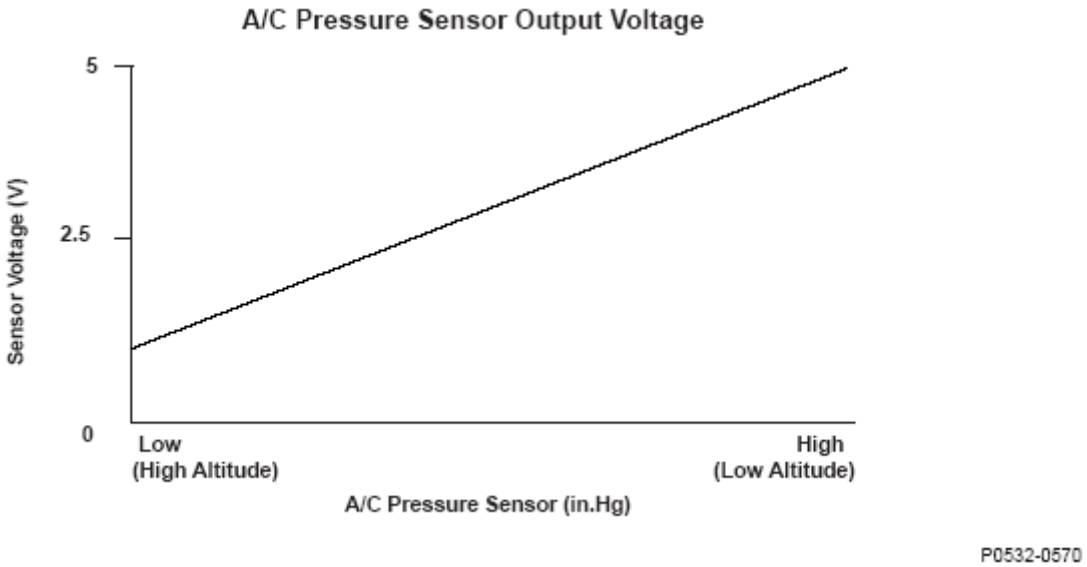

Fig. 257: A/C Pressure Sensor Voltage Graph

General Description (K20Z3 Engine)

The A/C pressure sensor measures the pressure change of the air conditioning refrigerant gas. The signal from the A/C pressure sensor is low at low voltage (when the air conditioning load is low) and high at high voltage (when the air conditioning load is high). The engine contol module (ECM)/powertrain control module (PCM) compares the preset voltage to the A/C pressure sensor output voltage.

When the A/C pressure sensor output voltage is lower than the preset voltage for a set time or more, a

malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

The A/C pressure sensor output voltage is 4.76 V or more for at least 10 seconds.

Diagnosis Details (K20Z3 Engine)

Conditions for illuminating the indicator (K20Z3 Engine)

When a malfunction is detected, the DTC and the freeze frame data are stored in the ECM/PCM memory. The MIL does not come on.

Conditions for clearing the DTC (K20Z3 Engine)

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0533 (191): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0533: A/C PRESSURE SENSOR CIRCUIT HIGH VOLTAGE (R18A1 ENGINE)

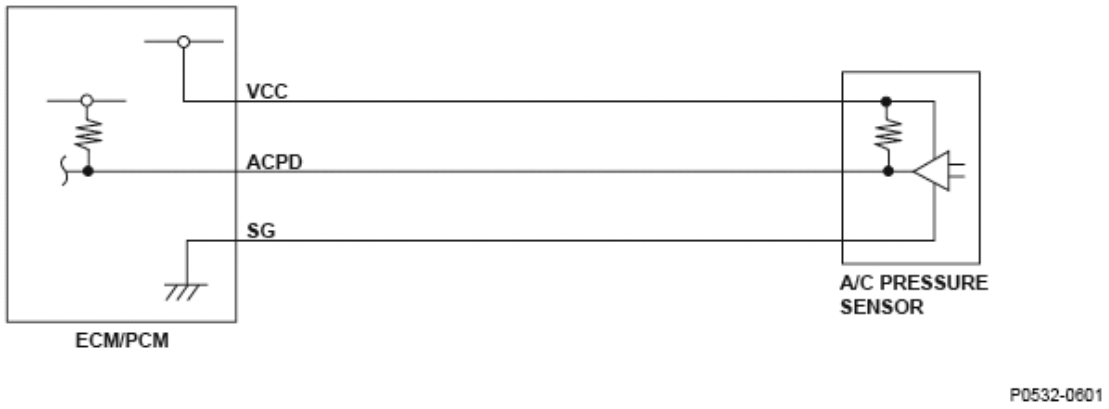

Fig. 264: A/C Pressure Sensor - Circuit Diagram

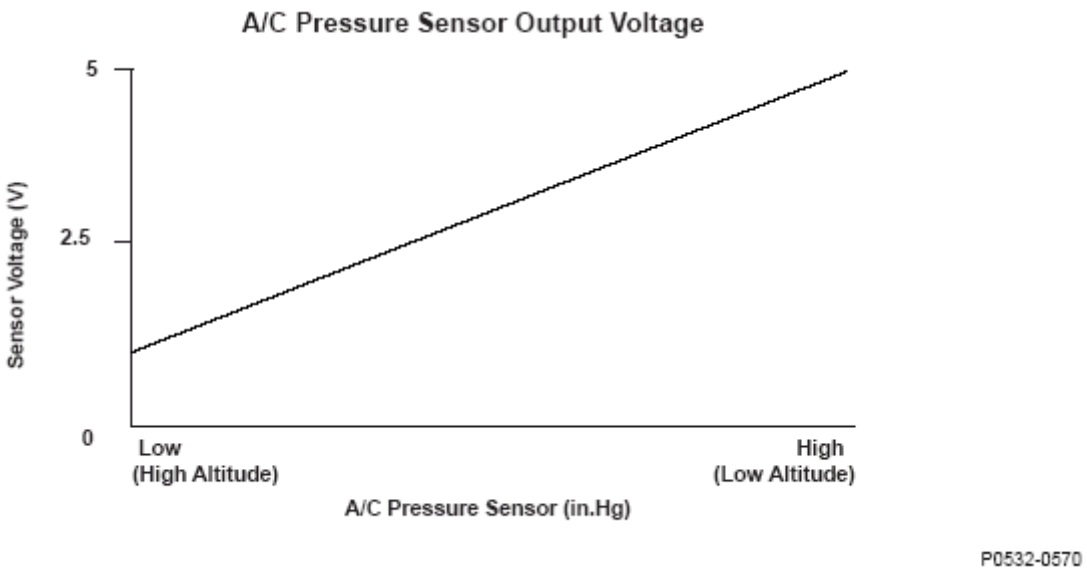

Fig. 265: A/C Pressure Sensor Voltage Graph

General Description (R18A1 Engine)

The A/C pressure sensor measures the pressure change of the air conditioning refrigerant gas. The signal from the A/C pressure sensor is low at low voltage (when the air conditioning load is low) and high at high voltage (when the air conditioning load is high). The engine control module (ECM)/powertrain control module (PCM) compares the preset voltage to the A/C pressure sensor output voltage.

When the A/C pressure sensor output voltage is higher than the preset voltage for a set time or more, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

DTC P0562 (34): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P0562: CHARGING SYSTEM LOW VOLTAGE (K20Z3)

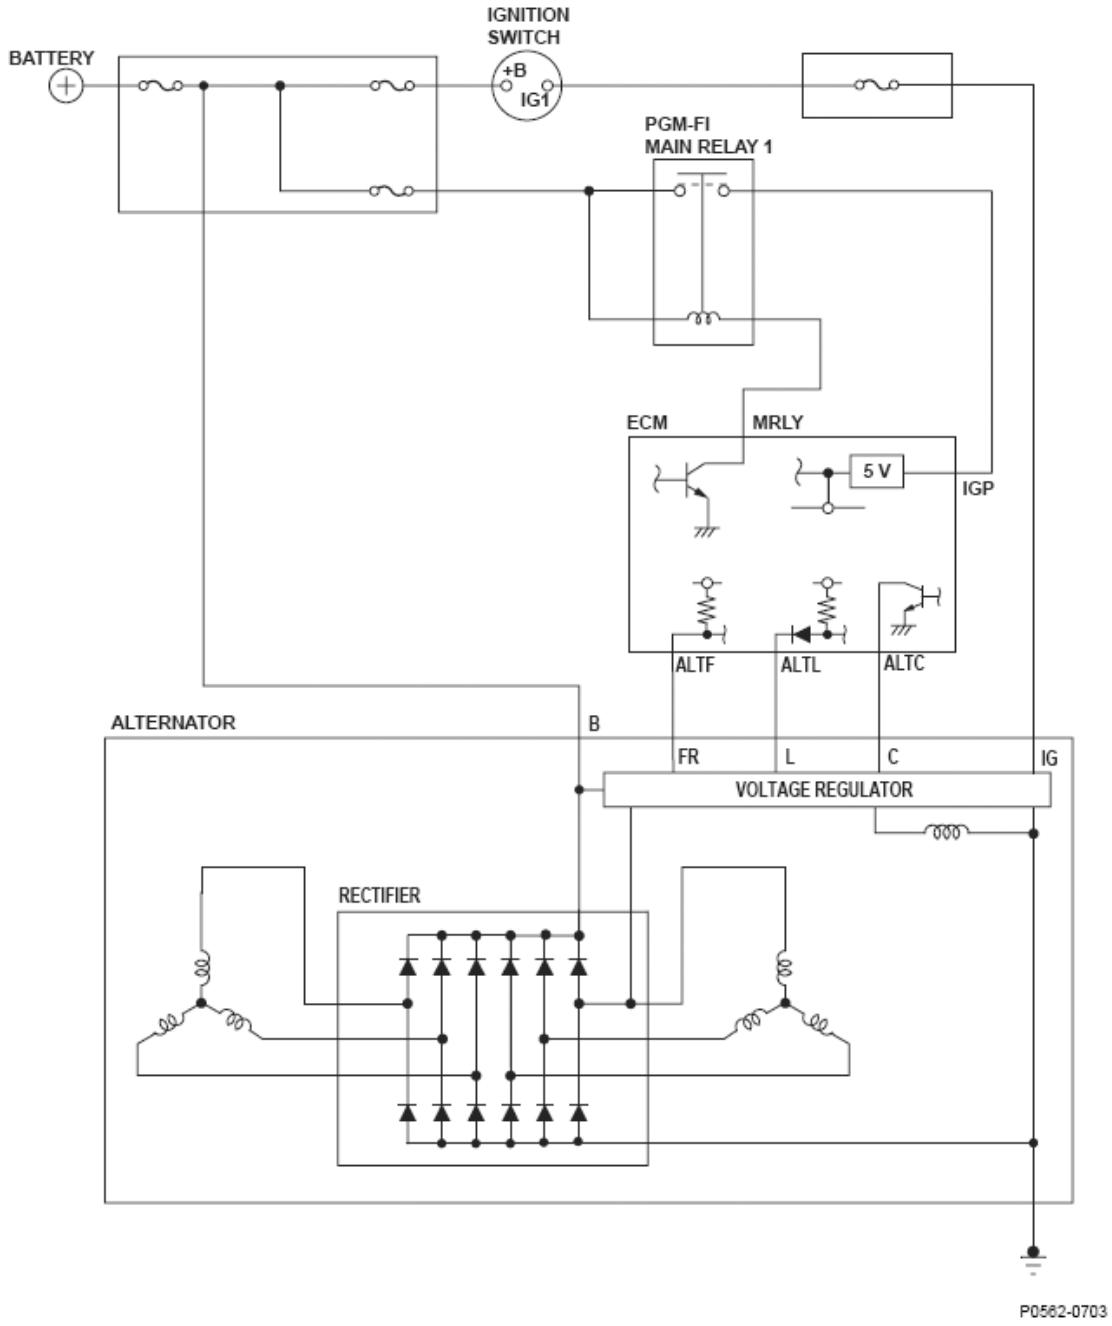

Fig. 268: Charging System Circuit Diagram

General Description (K20Z3 Engine)

The alternator is driven by the engine, and it generates electricity to supply the necessary power to the electrical system and to charge the battery. The alternator voltage target values of 14.5 V and 12.5 V are achieved by switching the alternator control mode (controlled by the engine control module (ECM)). The alternator output signal is sent to the ECM, and it varies according to the battery's state of charge, the electrical load, and engine speed.

When the IGP (power source) terminal voltage is a set value or less for a set time, the ECM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

DTC P0602 (196): ADVANCED DIAGNOSTICS (M/T)

DTC P0602: ENGINE CONTROL MODULE (ECM)/POWERTRAIN CONTROL MODULE (PCM) PROGRAMMING ERROR (M/T)

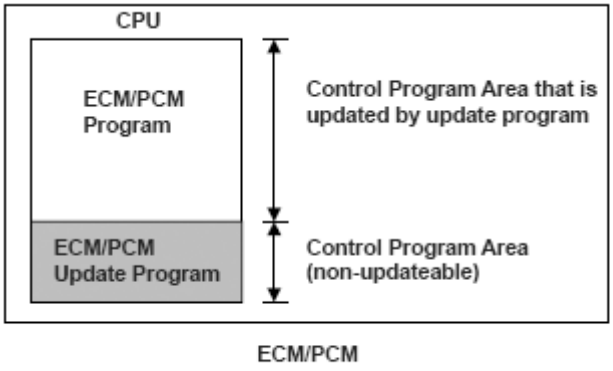

Fig. 274: ECM/PCM Programming Error

General Description (M/T)

The engine control module (ECM)/powertrain control module (PCM) is equipped with an update program to update its control program. The programs in the CPU of the ECM/PCM are classified as an ECM/PCM program (update-capable program) and a program for the update function (non-updateable program). The program update only updates the ECM/PCM program.

When the ECM/PCM power is turned off during an update, the power for the update function is lost, and the update process stops. When the program update is stopped before it is completed, the ECM/PCM stores a DTC that indicates the update is not finished.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (M/T)

The DTC will be cleared when the PCM program update is complete.

DTC P0603 (0): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0603: POWERTRAIN CONTROL MODULE (PCM) KEEP ALIVE MEMORY (KAM) ERROR (R18A1 ENGINE)

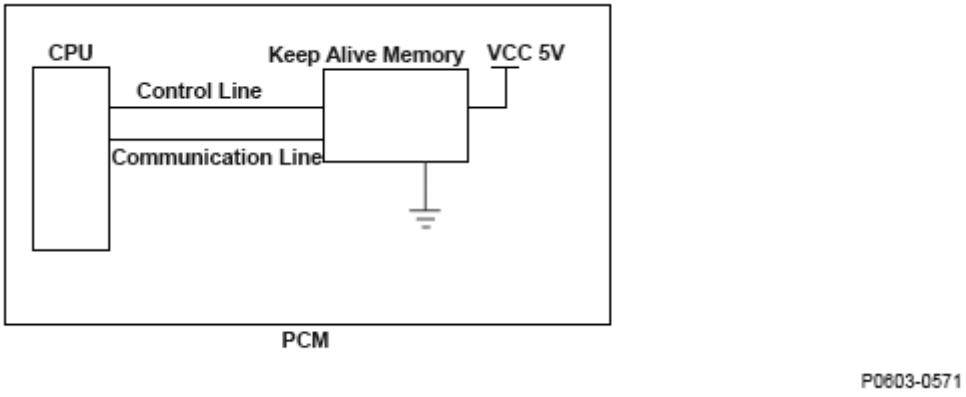

Fig. 277: Powertrain Control Module (PCM) Internal Control Module KAM Error Chart

General Description (R18A1 Engine)

The powertrain control module (PCM) is equipped with a keep-alive memory. The data (control learn data, etc.) for powertrain control and information (vehicle identification number (VIN), etc.) related to vehicle control is stored in the keep alive memory, so that it can be maintained even when power is not supplied to the PCM such as when the battery is disconnected. When power is restored to the PCM, the CPU retrieves the stored information from the keep-alive memory, but when the data retrieval process is not finished normally, a malfunction is detected and a DTC is stored.

The CPU writes data to the keep-alive memory from the CPU: Control related data is written when the ignition is turned on, and vehicle information when commanded from the HDS.

If the data writing process is not completed normally, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

Malfunction Threshold (K20Z3 Engine)

Either condition mentioned below must be met for at least 5 seconds.

- No signal from the DKS CPU is detected.
- Signal from the DKS CPU is detected to be abnormal.

Driving Pattern (K20Z3 Engine)

Start the engine, let it idle for at least 30 seconds or raise the engine speed to at least 1,000 rpm.

Diagnosis Details (K20Z3 Engine)

Conditions for illuminating the MIL (K20Z3 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM/PCM memory.

Conditions for clearing the MIL (K20Z3 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0606 (0): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0606: ECM/PCM PROCESSOR MALFUNCTION (R18A1 ENGINE)

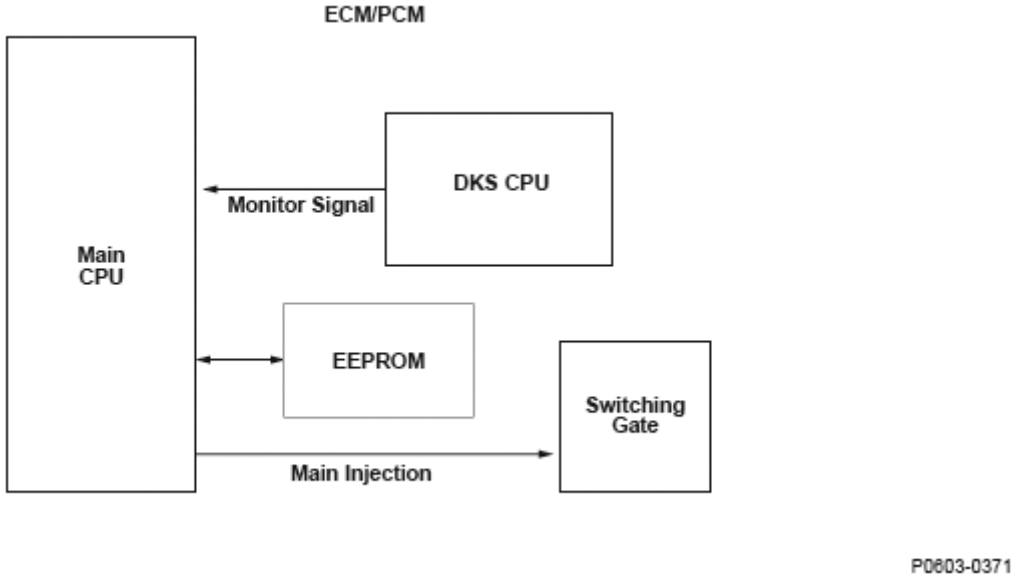

Fig. 283: ECM/PCM Processor - Communication Diagram

General Description (R18A1 Engine)

If something is wrong in the engine control module (ECM)/powertrain control module (PCM), and the monitor signal from the digital knock system (DKS) CPU is not received for a set period of time, or a signal

communication error remains for a set period time, the ECM/PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	N/A

Enable Conditions (R18A1 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	10 V	-
State of the engine	Running	
Other	After 30 seconds have elapsed since start-up, or after the engine speed exceeds 1,000 rpm once	
No active DTCs	P0335, P0339, P0365, P0369	

Malfunction Threshold (R18A1 Engine)

Either condition mentioned below must be met for at least 5 seconds.

- No signal from the DKS CPU is detected.
- Signal from the DKS CPU is detected to be abnormal.

Driving Pattern (R18A1 Engine)

Start the engine, let it idle for at least 30 seconds or raise the engine speed to at least 1,000 rpm.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM/PCM memory.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0606 (0): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P0606: POWERTRAIN CONTROL MODULE (PCM) PROCESSOR MALFUNCTION (R18A4 ENGINE)

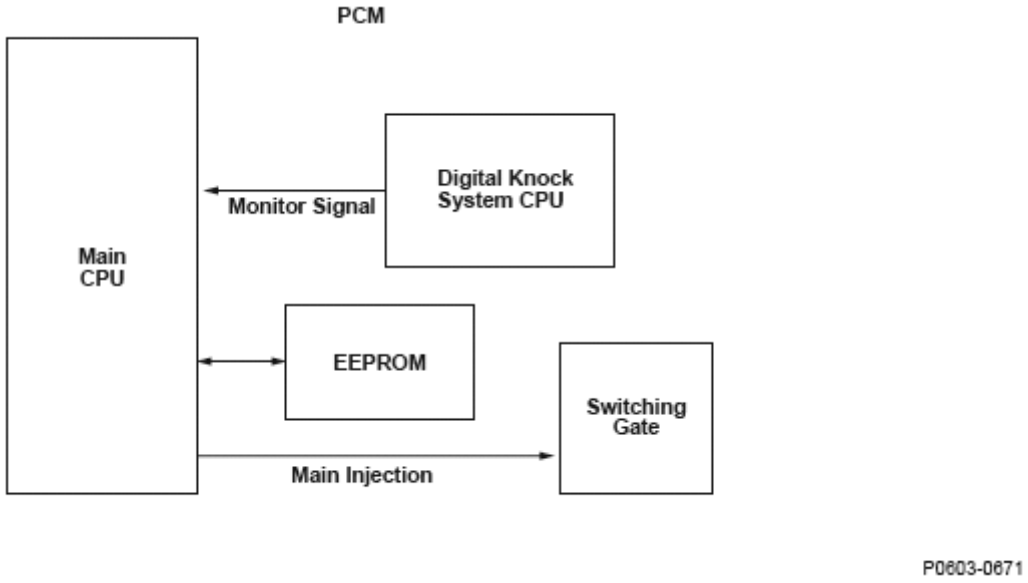

Fig. 284: Powertrain Control Module (PCM) Processor - Communication Diagram

General Description (R18A4 Engine)

If something is wrong in the powertrain control module (PCM), and the monitor signal from the digital knock system CPU is not received for a set time, or a signal communication error remains for a set time, the PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A4 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	N/A

Enable Conditions (R18A4 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	10.0 V	-
State of the engine	Running	
No active DTCs	P0335, P0339, P0365, P0369	

Malfunction Threshold (R18A4 Engine)

One of these conditions must be met for at least 5 seconds.

- No signal from the digital knock system CPU is detected.
- Signal from the digital knock system CPU is detected to be abnormal.

Driving Pattern (R18A4 Engine)

Start the engine, let it idle for at least 30 seconds or hold the engine speed to at least 1,000 rpm.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P060A (131): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P060A: POWERTRAIN CONTROL MODULE (PCM) INTERNAL CONTROL MODULE MALFUNCTION (R18A1)

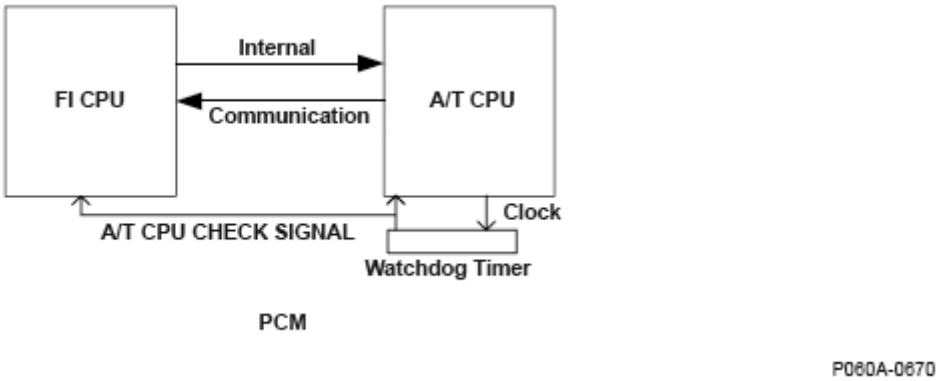

Fig. 285: Powertrain Control Module (PCM) - Communication Diagram

General Description (R18A1 Engine)

When a malfunction occurs in the internal communication between the FI CPU and the A/T CPU in the powertrain control module (PCM) and the internal communication is interrupted for a set time or more, or when the watchdog timer that monitors the A/T CPU detects an abnormality in the A/T CPU and notifies the FI CPU via the A/T CPU check signal line, the PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	1 second or more(1), 0.2 second or more(2)
DTC Type	One drive cycle, MIL ON
OBD Status	N/A
(1) Symptom 1 (2) Symptom 2	

Enable Conditions (R18A1 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	10.0 V	-
Ignition switch	ON	

Malfunction Threshold (R18A1 Engine)

One of these symptom occurs.

- Symptom 1

  The internal communication between the FI CPU and A/T CPU is abnormal or the internal communication is interrupted for at least 1 second.

- Symptom 2

  The watchdog timer that monitors the A/T CPU detects an abnormality, and the FI CPU receives the A/T CPU check signal for at least 0.2 second.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P060A (131): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P060A: POWERTRAIN CONTROL MODULE (PCM) (A/T SYSTEM) INTERNAL CONTROL

MODULE MALFUNCTION (R18A4 ENGINE)

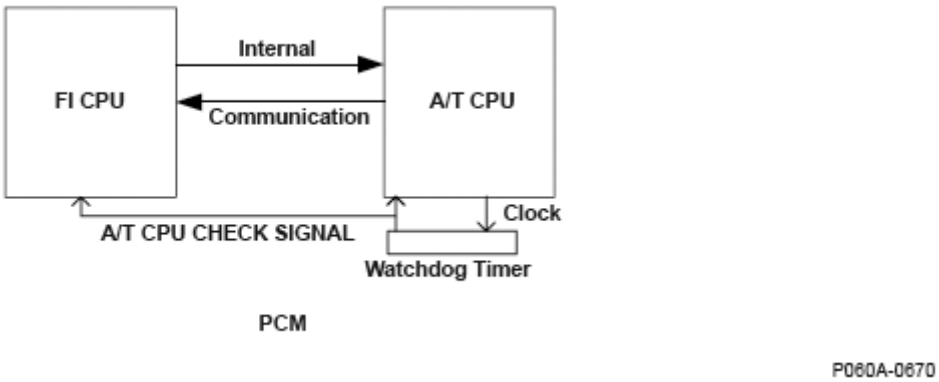

Fig. 286: Powertrain Control Module (PCM) - Communication Diagram

General Description (R18A4 Engine)

When a malfunction occurs in the internal communication between the FI CPU and the A/T CPU in the powertrain control module (PCM) and the internal communication is interrupted for a set time or more, or when the watchdog timer that monitors the A/T CPU detects an abnormality in the A/T CPU and notifies the FI CPU via the A/T CPU check signal line, the PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A4 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	10.0 V	-
Ignition switch	ON	

Malfunction Threshold (R18A4 Engine)

One of these symptom occurs.

- Symptom 1

  The internal communication between the FI CPU and A/T CPU is abnormal or the internal

communication is interrupted for at least 1 second.

- Symptom 2

  The watchdog timer that monitors the A/T CPU detects an abnormality, and the FI CPU receives the A/T CPU check signal for at least 0.2 seconds.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0630 (139): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P0630: VIN NOT PROGRAMMED OR MISMATCH (K20Z3 ENGINE)

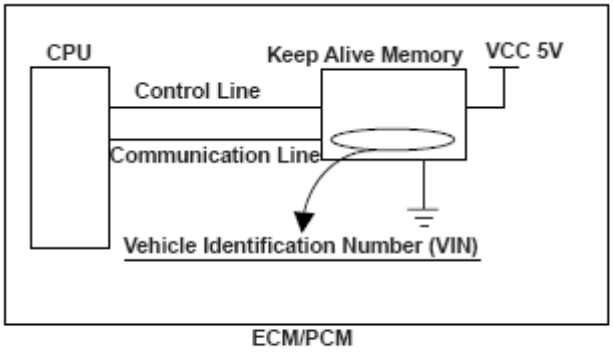

Fig. 287: ECM/PCM Diagram

General Description (K20Z3 Engine)

The Engine control module (ECM)/powertrain control module (PCM) stores a vehicle identification number (VIN) in the keep-alive memory and outputs the VIN according to the command from the scan tool.

The VIN for each vehicle is registered to the ECM/PCM using the scan tool. The registered VIN is read by the CPU from the keep-alive memory after the ignition is turned on or after the Clear command is executed.

If the VIN is not registered in the keep-alive memory when the ignition is turned on or when the Clear command is executed, it is detected as a VIN unregistered condition and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM/PCM memory.

Conditions for clearing the MIL (R18A1 Engine)

When the VIN registration is completed, MIL is cleared.

DTC P0630 (139): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P0630: VIN NOT PROGRAMMED OR MISMATCH (R18A4 ENGINE)

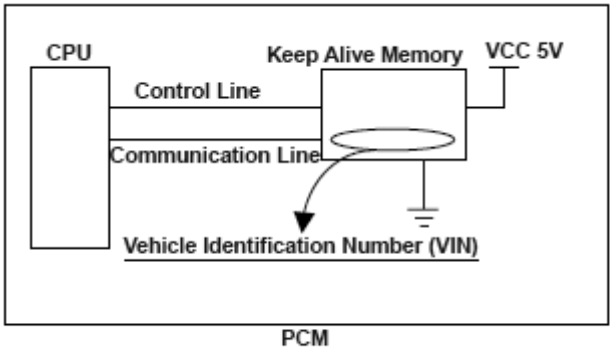

Fig. 289: Identifying PCM Diagram

General Description (R18A4 Engine)

The powertrain control module (PCM) stores a vehicle identification number (VIN) in the keep-alive memory and outputs the VIN according to the command from the HDS.

The VIN for each vehicle is registered to the PCM using the HDS. The registered VIN is read by the CPU from the keep-alive memory after the ignition is turned on or after the Clear command is executed.

If the VIN is not registered in the keep-alive memory when the ignition is turned on or when the Clear command is executed, it is detected as a VIN unregistered condition and a DTC is stored.

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the

PCM memory.

Conditions for clearing the MIL (R18A4 Engine)

When the VIN registration is completed, the MIL is cleared.

DTC P0685 (135): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P0685: ENGINE CONTROL MODULE (ECM)/POWERTRAIN CONTROL MODULE (PCM) POWER CONTROL CIRCUIT/INTERNAL CIRCUIT MALFUNCTION (K20Z3 ENGINE)

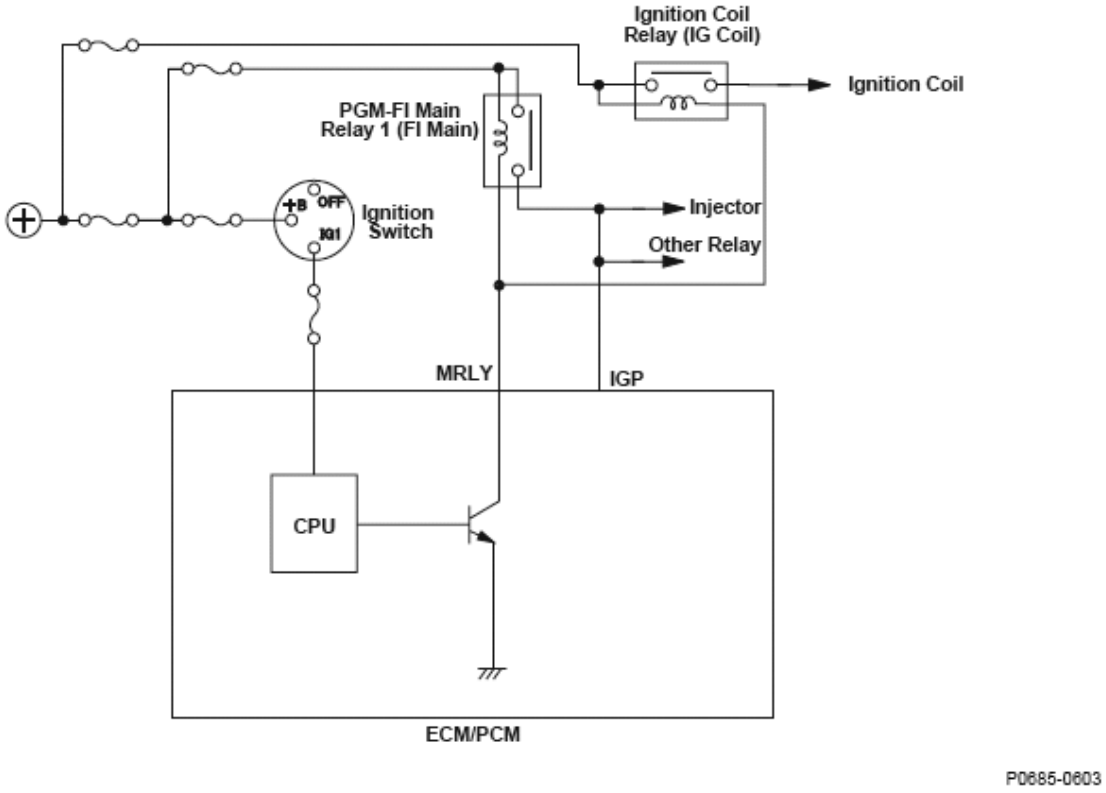

Fig. 290: Engine Control Module (ECM)/Powertrain Control Module (PCM) Power Control - Circuit Diagram

General Description (K20Z3 Engine)

After the ignition switch is turned off, the engine control module (ECM)/powertrain control module (PCM) does not shut down immediately. After finishing a predetermined process according to the request of each device and system, the power supply is automatically disconnected (self shut-down function). The ECM/PCM power is disconnected by controlling PGM-FI main relay 1 (FI MAIN).

During a normal ECM/PCM shut down, the shut down process is executed by the CPU, PGM-FI main relay 1 (FI MAIN) is turned off, and the voltage to the ECM/PCM is turned off to shut down the ECM/PCM. When the voltage to the ECM/PCM is turned off and the ECM/PCM shuts down without the normal shut down procedure, a malfunction in the PGM-FI main relay 1 (FI MAIN) control circuit is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

Malfunction Threshold (K20Z3 Engine)

The ECM/PCM is shut down without the normal shut down procedure.

Diagnosis Details (K20Z3 Engine)

Conditions for illuminating the MIL (K20Z3 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the ECM/PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (K20Z3 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive drive cycles in which the engine conditions are similar to the first time the malfunction was detected.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0685 (135): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0685: ENGINE CONTROL MODULE (ECM)/POWERTRAIN CONTROL MODULE (PCM) POWER CONTROL CIRCUIT/INTERNAL CIRCUIT MALFUNCTION (R18A1 ENGINE)

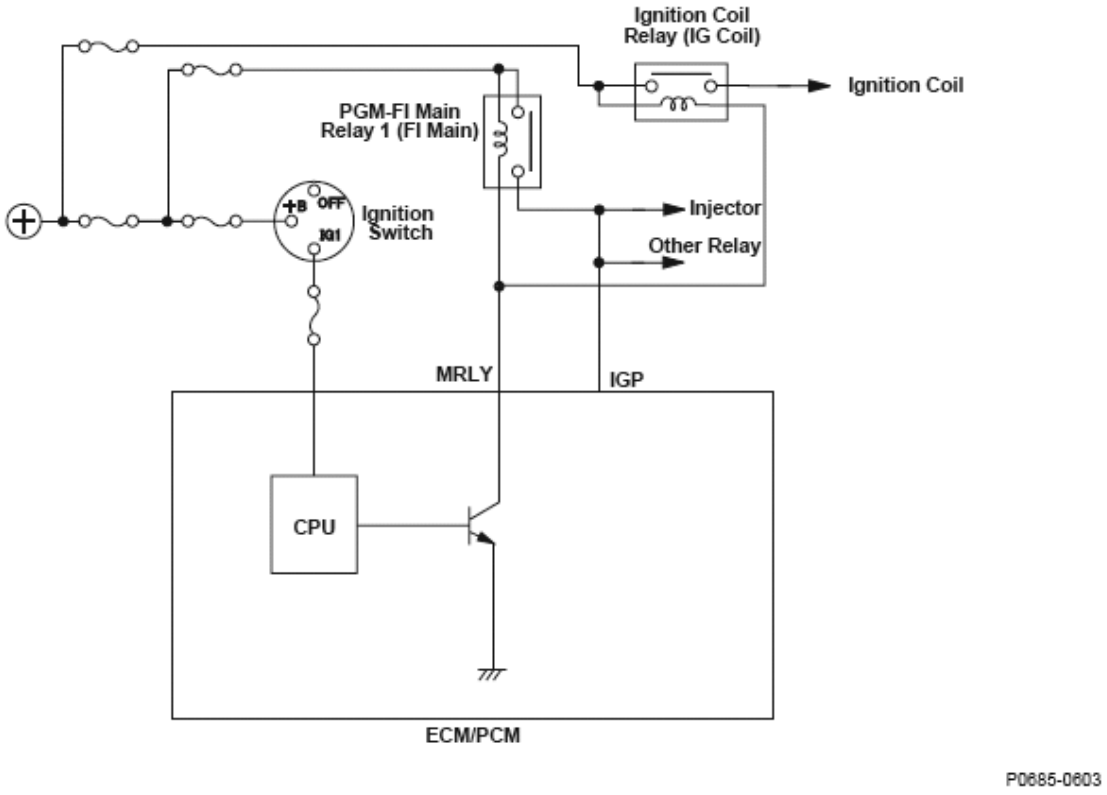

Fig. 291: Engine Control Module (ECM)/Powertrain Control Module (PCM) Power Control - Circuit Diagram

General Description (R18A1 Engine)

After the ignition switch is turned off, the engine control module (ECM)/powertrain control module (PCM) does not shut down immediately. After finishing a predetermined process according to the request of each device and system, the power supply is automatically disconnected (self shut-down function). The ECM/PCM power is disconnected by controlling PGM-FI main relay 1 (FI MAIN).

During a normal ECM/PCM shut down, the shut down process is executed by the CPU, PGM-FI main relay 1 (FI MAIN) is turned off, and the voltage to the ECM/PCM is turned off to shut down the ECM/PCM. When the voltage to the ECM/PCM is turned off and the ECM/PCM shuts down without the normal shut down procedure, a malfunction in the PGM-FI main relay 1 (FI MAIN) control circuit is detected and a DTC is stored.

DTC P0705 (5): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0705: SHORT IN TRANSMISSION RANGE SWITCH CIRCUIT (MULTIPLE SHIFT-POSITION INPUT)

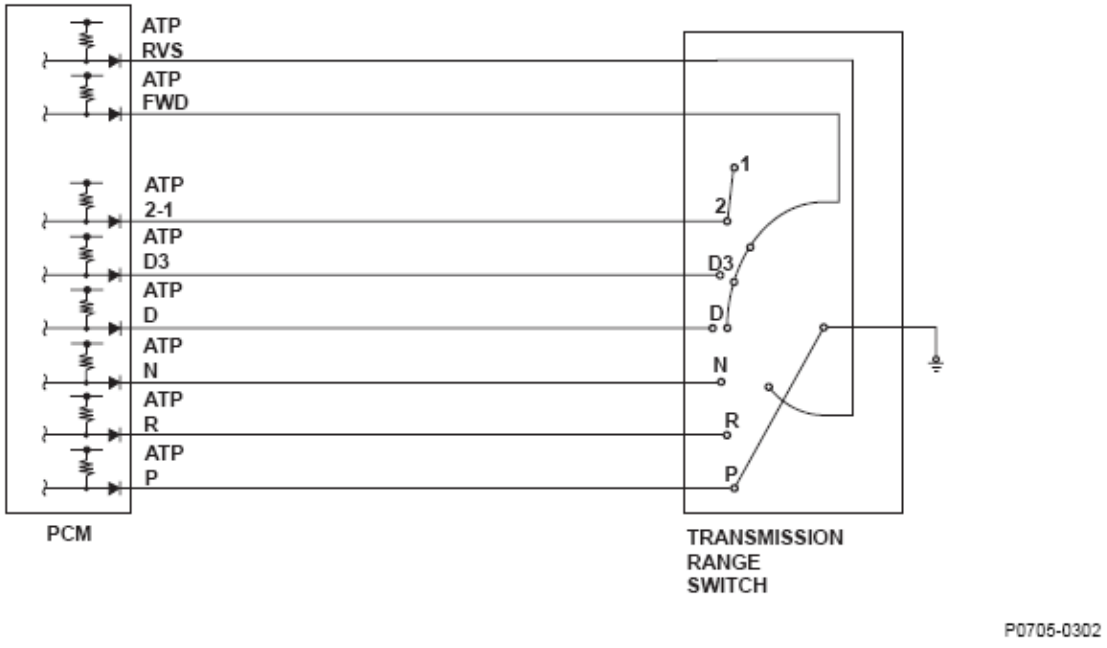

Fig. 293: Transmission Range Switch Circuit Diagram

TRANSMISSION RANGE SWITCH CONTACT POINT INPUT MATRIX

Shift lever position	Input per switch							

	P	R	RVS	N	D	D3	2 / 1	FWD
P	o	X	X	X	X	X	X	X
R	X	o	o	X	X	X	X	X
N	X	X	X	o	X	X	X	X
D	X	X	X	X	o	X	X	o
D3	X	X	X	X	X	o	X	o
2	X	X	X	X	X	X	o	o
1	X	X	X	X	X	X	o	X
o: Closed X: Open								

General Description (R18A1 Engine)

The transmission range switch is attached to the control shaft. Operation of the shift lever makes the control shaft rotate via the shift cable. The A/T gear position indicator indicates which position is selected according to the signal Low/High combinations which vary based on shift lever position. The control shaft changes the position of the transmission range switch, activates the manual valve, and switches hydraulic pressure to shift the transmission through forward/neutral/reverse. The transmission range switch signal is used to determine the shift schedule. The voltage is 12 V (High) at the powertrain control module (PCM) input terminal when each transmission range switch position is open, and it is 0 V (Low) when each switch is closed. If the PCM detects multiple switch inputs instead of the correct switch input for the selected range at that time, it detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

The voltage is 12 V (High) at the powertrain control module (PCM) input terminal when each transmission range switch position is open, and it is 0 V (Low) when each switch is closed. If the FWD switch stays open while the vehicle repeatedly accelerates to a specified vehicle speed and then stops despite being in the D position, the PCM detects a malfunction in the transmission range switch (open) and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A4 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	Depending on the driving pattern
DTC Type	Two drive cycles, MIL ON, D indicator OFF
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions (R18A4 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	11.0 V	-
No active DTCs	P0705, P0721, P0722	

Malfunction Threshold (R18A4 Engine)

No FWD position signal is detected when the vehicle speed changes from 6 mph (10 km/h) --> 25 mph (40 km/h) --> 6 mph (10 km/h) in the D or D3 position.

Driving Pattern (R18A4 Engine)

1. Start the engine, and accelerate to 25 mph (40 km/h) or more in the D position, then slow down to 6 mph (10 km/h).
2. Stop the vehicle, turn the ignition switch OFF, and repeat step 1.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0711 (28): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0711: PROBLEM IN ATF TEMPERATURE SENSOR CIRCUIT (R18A1 ENGINE)

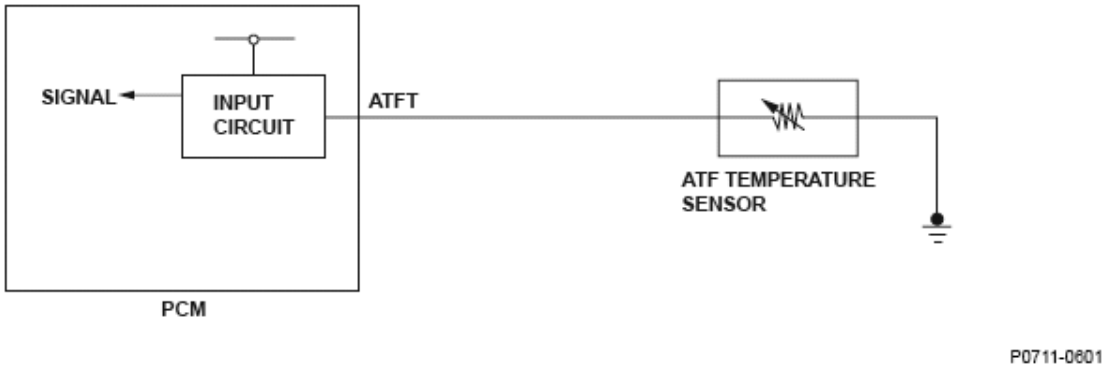

Fig. 297: ATF Temperature Sensor - Circuit Diagram

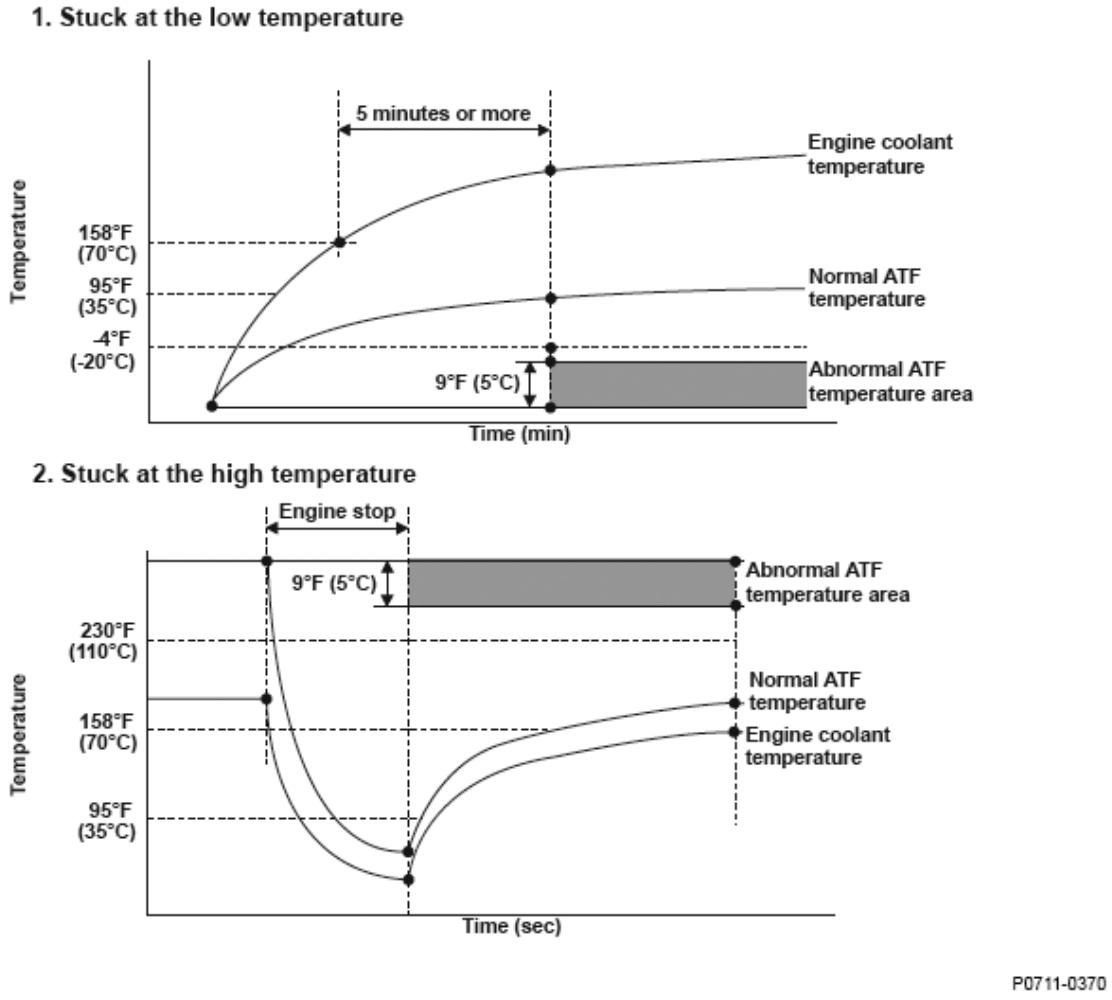

Fig. 298: ATF Temperature Graph

General Description (R18A1 Engine)

The ATF temperature sensor is a thermistor type sensor whose resistance changes according to the change in ATF temperature. The powertrain control module (PCM) sends a 5 V reference voltage to the grounded sensor through a pull-up resistor. When the ATF temperature is low, the sensor resistance increases and the PCM detects a high signal voltage. As the ATF temperature rises, the sensor resistance decreases and the PCM detects a low signal voltage.

If the ATF temperature sensor signal does not change, the PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	None
Duration	5 minutes or more(1)
	20 seconds or more(2)
DTC Type	One drive cycle, MIL OFF, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

(1) Stuck at low temperature is detected

(2) Stuck at hgh temperature is detected

Enable Conditions (R18A1 Engine)

1. Stuck at Low temperature

ENABLE CONDITIONS - LOW TEMPERATURE

Condition	Minimum	Maximum
Battery voltage	11.0 V	-
ATF temperature	-	-4°F (-20°C)
Initial engine coolant temperature	-	95°F (35°C)
Engine coolant temperature	158°F (70°C)	-
Throttle position	4.0 °	-
Vehicle speed	19 mph (30 km/h)	-
No active DTCs	P0116, P0117, P0118, P0712, P0713, P0721, P0722	
Other	After the engine coolant temperature reaches the fixed value, both the vehicle speed and the throttle position meet the conditions for at least 5 minutes	

2. Stuck at High temperature

ENABLE CONDITIONS - HIGH TEMPERATURE

Condition	Minimum	Maximum
Battery voltage	11.0 V	-
ATF temperature	230°F (110°C)	-
Previous engine coolant temperature when the ignition switch was turned OFF	158°F (70°C)	-
Present engine coolant temperature when the ignition switch is turned ON	-	95°F (35°C)
Engine coolant temperature	158°F (70°C)	-
No active DTCs	P0116, P0117, P0118, P0712, P0713, P0721, P0722	

Malfunction Threshold (R18A1 Engine)

1. Stuck at low temperature

   The ATF temperature rise is 9°F (5°C) or less after the ignition switch is turned ON, and the current ATF temperature is -4°F (-20°C) or less for at least 5 minutes.

2. Stuck at high temperature

   The ATF temperature drop is -9°F (-5°C) or less after the ignition switch is turned OFF, and the current ATF temperature is 230°F (110°C) or more for at least 20 seconds.

Driving Pattern (R18A1 Engine)

1. Stuck at Low temperature

   Start the engine with engine coolant temperature at 95°F (35°C) or less, and warm up the engine until the engine coolant temperature reaches 158°F (70°C) or more. Then drive the vehicle at a speed of 19 mph (30 km/h) or more with the throttle position at 4.0° or more for at least 5 minutes.

2. Stuck at High temperature

   Turn off the engine with the engine coolant temperature at 158°F (70°C) or more. Restart the engine after the engine coolant temperature drops to 95°F (35°C) or less, and warm up the engine until the engine coolant temperature reaches 158°F (70°C), and wait for at least 20 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the indicator (R18A1 Engine)

When a malfunction is detected, the D indicator blinks, and the DTC and the freeze frame data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC (R18A1 Engine)

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0711 (28): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P0711: PROBLEM IN ATF TEMPERATURE SENSOR CIRCUIT (R18A4 ENGINE)

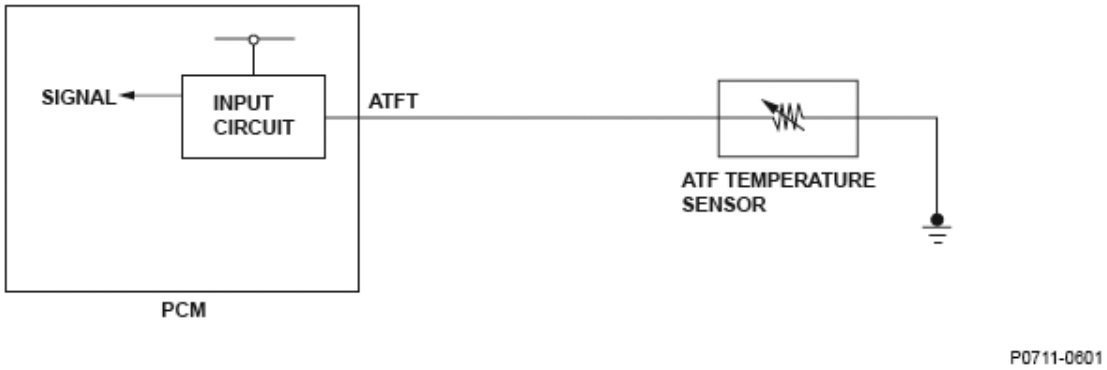

Fig. 299: ATF Temperature Sensor - Circuit Diagram

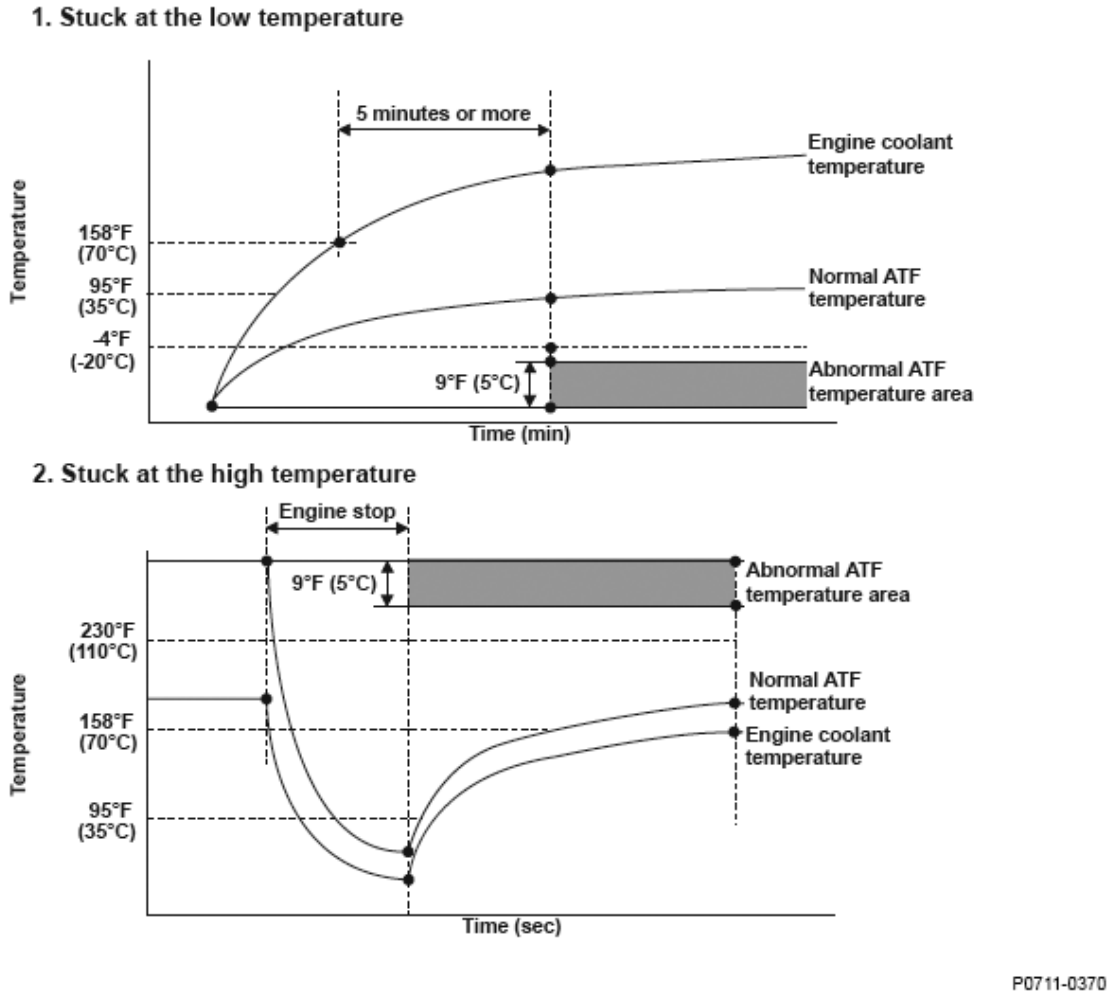

Fig. 300: ATF Temperature Graph

General Description (R18A4 Engine)

The ATF temperature sensor is a thermistor type sensor whose resistance changes according to the change in ATF temperature. The powertrain control module (PCM) sends a 5 V reference voltage to the grounded sensor through a pull-up resistor. When the ATF temperature is low, the sensor resistance increases and the PCM detects a high signal voltage. As the ATF temperature rises, the sensor resistance decreases and the PCM detects a low signal voltage.

If the ATF temperature sensor signal does not change, the PCM detects a malfunction and a DTC is stored.

No active DTCs	P0116, P0117, P0118, P0712, P0713, P0721, P0722	

Malfunction Threshold (R18A4 Engine)

1. Stuck at low temperature

   The ATF temperature rise is 9°F (5°C) or less after the ignition switch is turned ON, and the current ATF temperature is -4°F (-20°C) or less for at least 5 minutes.

2. Stuck at high temperature

   The ATF temperature drop is -9°F (-5°C) or less after the ignition switch is turned OFF, and the current ATF temperature is 230°F (110°C) or more for at least 20 seconds.

Driving Pattern (R18A4 Engine)

1. Stuck at Low temperature

   Start the engine with engine coolant temperature at 95°F (35°C) or less, and warm up the engine until the engine coolant temperature reaches 158°F (70°C) or more. Then drive the vehicle at a speed of 19 mph (30 km/h) or more with the throttle position at 4.0° or more for at least 5 minutes.

2. Stuck at High temperature

   Turn off the engine with the engine coolant temperature at 158°F (70°C) or more. Restart the engine after the engine coolant temperature drops to 95°F (35°C) or less, and warm up the engine until the engine coolant temperature reaches 158°F (70°C), and wait for at least 20 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the indicator (R18A4 Engine)

When a malfunction is detected, the D indicator blinks, and the DTC and the freeze frame data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC (R18A4 Engine)

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0712 (28): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0712: SHORT IN ATF TEMPERATURE SENSOR CIRCUIT (R18A1 ENGINE)

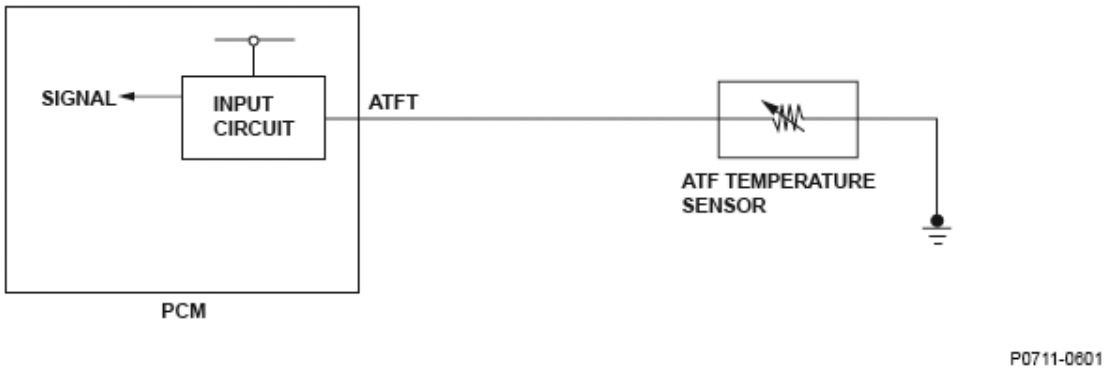

Fig. 301: ATF Temperature Sensor - Circuit Diagram

General Description (R18A1 Engine)

The ATF temperature sensor is a thermistor type sensor whose resistance changes according to the change in ATF temperature. The powertrain control module (PCM) sends a 5 V reference voltage to the grounded sensor through a pull-up resistor. When the ATF temperature is low, the sensor resistance increases and the PCM detects a high signal voltage. As the ATF temperature rises, the sensor resistance decreases and the

PCM detects a low signal voltage.

When the ATF temperature sensor signal voltage to the PCM is under the specification, indicating that the temperature is above the specification (a short to ground), a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	10 seconds or more
DTC Type	One drive cycle, MIL OFF, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions (R18A1 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	11.0 V	-
No active DTCs	P0711, P0713	

Malfunction Threshold (R18A1 Engine)

The ATF temperature sensor output voltage is less than 0.07 V for at least 10 seconds.

Driving Pattern (R18A1 Engine)

Start the engine, shift to the P position, and wait for at least 10 seconds.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the indicator (R18A1 Engine)

When a malfunction is detected, the D indicator blinks, and the DTC and the freeze frame data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC (R18A1 Engine)

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0712 (28): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P0712: SHORT IN ATF TEMPERATURE SENSOR CIRCUIT (R18A4 ENGINE)

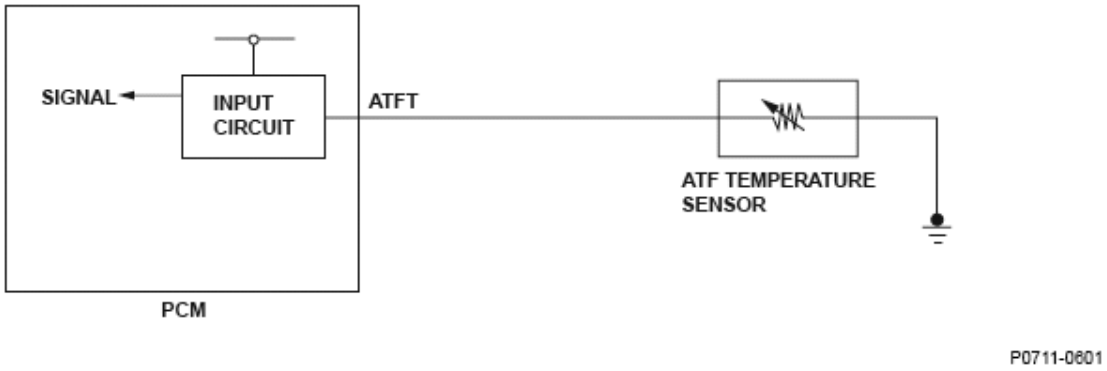

Fig. 302: ATF Temperature Sensor - Circuit Diagram

General Description (R18A4 Engine)

The ATF temperature sensor is a thermistor type sensor whose resistance changes according to the change in ATF temperature. The powertrain control module (PCM) sends a 5 V reference voltage to the grounded sensor through a pull-up resistor. When the ATF temperature is low, the sensor resistance increases and the PCM detects a high signal voltage. As the ATF temperature rises, the sensor resistance decreases and the PCM detects a low signal voltage.

When the ATF temperature sensor signal voltage to the PCM is under the specification, indicating that the temperature is above the specification (a short to ground), a malfunction is detected and a DTC is stored.

Malfunction Threshold (R18A4 Engine)

The ATF temperature sensor output voltage is 4.93 V or more for at least 10 seconds.

Driving Pattern (R18A4 Engine)

Start the engine, shift to the P position, and wait for at least 10 seconds.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the indicator (R18A4 Engine)

When a malfunction is detected, the D indicator blinks, and the DTC and the freeze frame data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC (R18A4 Engine)

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0716 (15): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0716: PROBLEM IN INPUT SHAFT (MAINSHAFT) SPEED SENSOR CIRCUIT (R18A1 ENGINE)

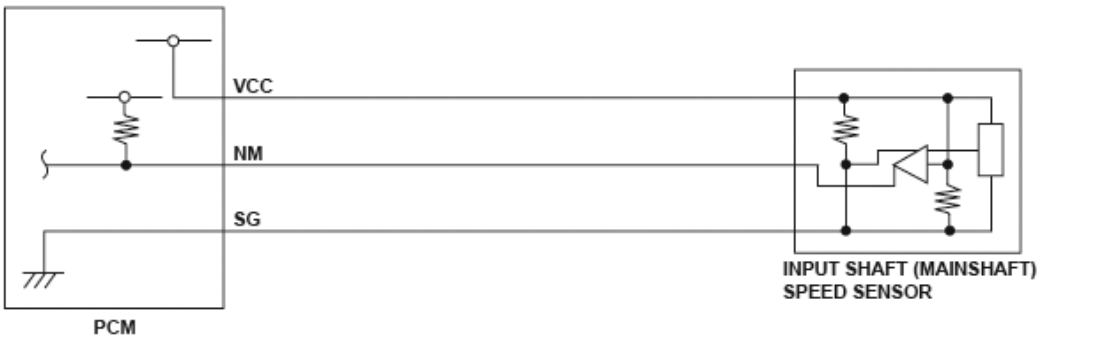

Fig. 305: Problem In Input Shaft (Mainshaft) Speed Sensor Circuit Diagram

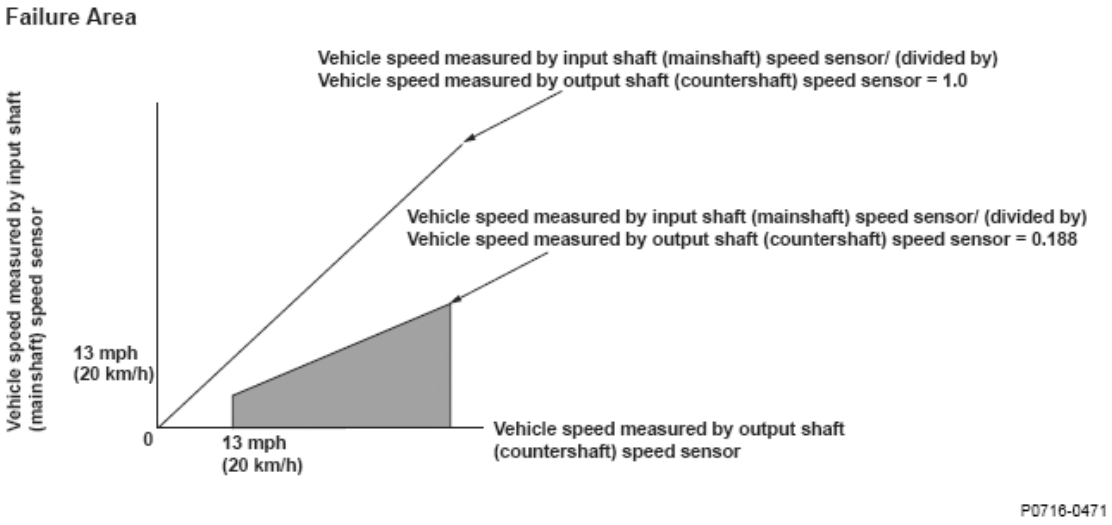

Fig. 306: Speed Sensor Graph

General Description (R18A1 Engine)

The input shaft (mainshaft) speed sensor is attached to the outside of the transmission housing. The input shaft (mainshaft) speed sensor generates a pulsing signal according to the speed of the input shaft (mainshaft) idler gear on the input shaft (mainshaft). Using that signal, the powertrain control module (PCM) determines the speed of the input shaft (mainshaft). If no pulses occur with the input shaft (mainshaft) rotating, the PCM detects a malfunction that may be caused by an open, a temporary open, or a short to ground. Based on the velocity ratio measured by the output shaft (countershaft) speed sensor and the input shaft (mainshaft) speed sensor, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	10 seconds or more
DTC Type	One drive cycle, MIL ON, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions (R18A1 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	11.0 V	-
Engine speed	500 rpm	-
Vehicle speed	13 mph (20 km/h)	-
Shift lever position	D, D3, 2, or 1	
No active DTCs	P0705, P0706, P0717, P0721, P0722, P0962, P0963, P0966, P0967, P0970, P0971, P0973, P0974, P0976, P0977, P0979, P0980, P0982, P0983	
Others	Not during shifting	
	Not when the shift lever is being shifted	
	No electrical noise in the countershaft speed sensor output circuit	

Malfunction Threshold (R18A1 Engine)

The vehicle speed measured by the input shaft (mainshaft) speed sensor/(divided by) the vehicle speed measured by the output shaft (countershaft) speed sensor < 0.188 for at least 10 seconds.

Driving Pattern (R18A1 Engine)

Start the engine, and drive the vehicle at a speed of 13 mph (20 km/h) or more for at least 10 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

When the vehicle speed measured by the output shaft (countershaft) speed sensor is 13 mph (20 km/h) or more, the vehicle speed measured by the input shaft (mainshaft) speed sensor is 1 mph (2 km/h) or less for at least 10 seconds.

Driving Pattern (R18A4 Engine)

Start the engine, and drive the vehicle at a speed of 13 mph (20 km/h) or more for at least 10 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0718 (15): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0718: INPUT SHAFT (MAINSHAFT) SPEED SENSOR INTERMITTENT FAILURE (R18A1 ENGINE)

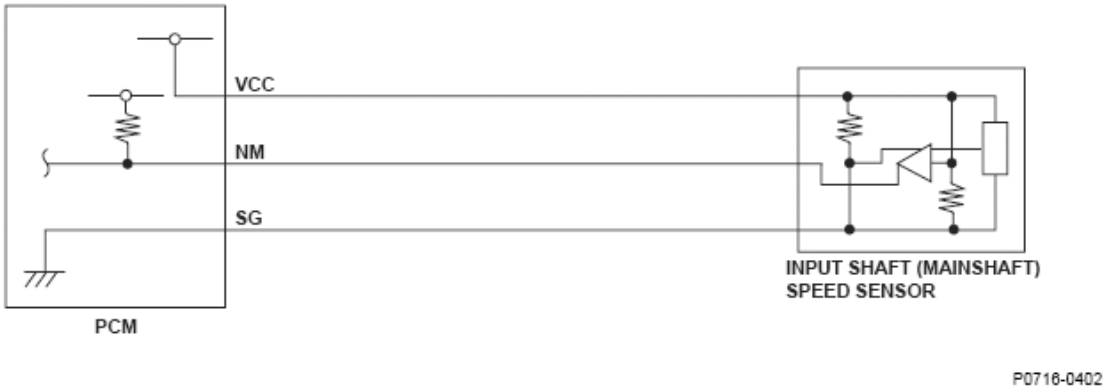

Fig. 313: Input Shaft (Mainshaft) Speed Sensor - Circuit Diagram

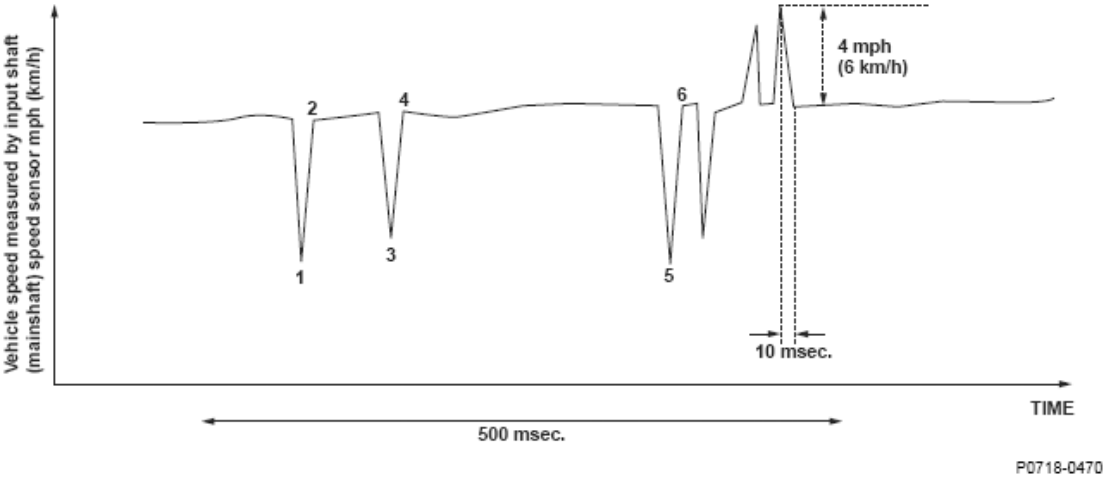

Fig. 314: Input Shaft Speed Sensor Graph

General Description (R18A1 Engine)

The input shaft (mainshaft) speed sensor is attached to the outside of the transmission housing. The input shaft (mainshaft) speed sensor generates a pulsing signal according to the speed of the input shaft (mainshaft) idler gear on the input shaft (mainshaft). Using that signal, the powertrain control module (PCM) determines the speed of the input shaft (mainshaft). If no pulses occur with the input shaft (mainshaft) rotating, the PCM detects a malfunction that may be caused by an open, a temporary open, or a short to ground. Based on the fluctuation of the vehicle speed measured by the input shaft (mainshaft) speed sensor, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	500 msec
DTC Type	Two drive cycles, MIL ON, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions (R18A1 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	11.0 V	-
Vehicle speed	13 mph (20 km/h)	-
No active DTCs	P0716, P0717, P0721, P0722	
Others	Not during shifting	
	Not when an output shaft (countershaft) speed sensor intermittent failure is detected	

Malfunction Threshold (R18A1 Engine)

The fluctuation of the vehicle speed measured by the input shaft (mainshaft) speed sensor in 10 milliseconds is 4 mph (6km/h) or more, and it fluctuates at least six times within 500 milliseconds.

Driving Pattern (R18A1 Engine)

Start the engine, and drive the vehicle at a speed of 13 mph (20 km/h) or more so it shifts from 1st to 5th in the D position.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0718 (15): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P0718: INPUT SHAFT (MAINSHAFT) SPEED SENSOR INTERMITTENT FAILURE (R18A4 ENGINE)

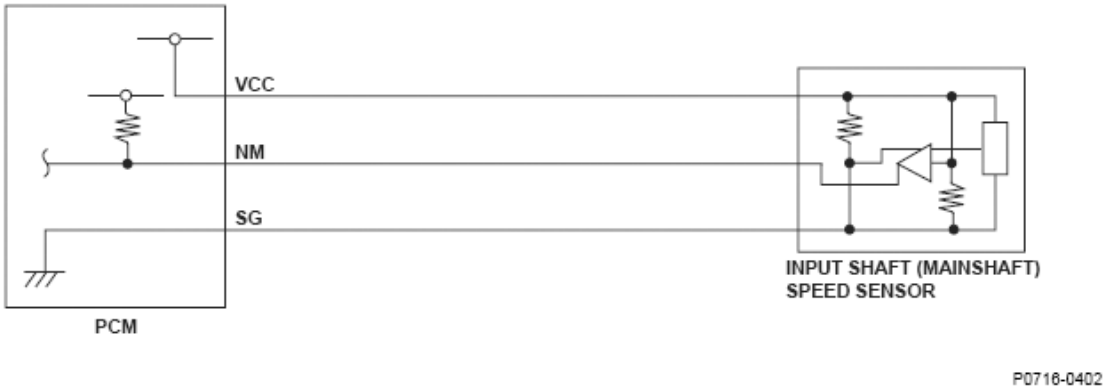

Fig. 315: Input Shaft (Mainshaft) Speed Sensor - Circuit Diagram

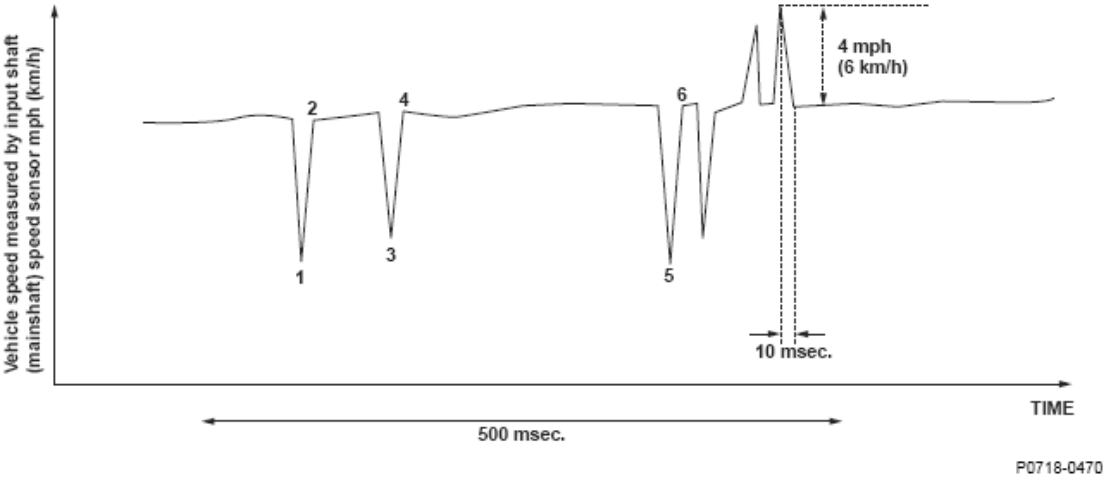

Fig. 316: Input Shaft Speed Sensor Graph

General Description (R18A4 Engine)

The input shaft (mainshaft) speed sensor is attached to the outside of the transmission housing. The input shaft (mainshaft) speed sensor generates a pulsing signal according to the speed of the input shaft (mainshaft) idler gear on the input shaft (mainshaft). Using that signal, the powertrain control module (PCM) determines the speed of the input shaft (mainshaft). If no pulses occur with the input shaft (mainshaft) rotating, the PCM detects a malfunction that may be caused by an open, a temporary open, or a short to ground. Based on the fluctuation of the vehicle speed measured by the input shaft (mainshaft) speed sensor, a malfunction is detected and a DTC is stored.

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0720 (122): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P0720: OUTPUT SHAFT (COUNTERSHAFT) SPEED SENSOR CIRCUIT MALFUNCTION (K20Z3 ENGINE)

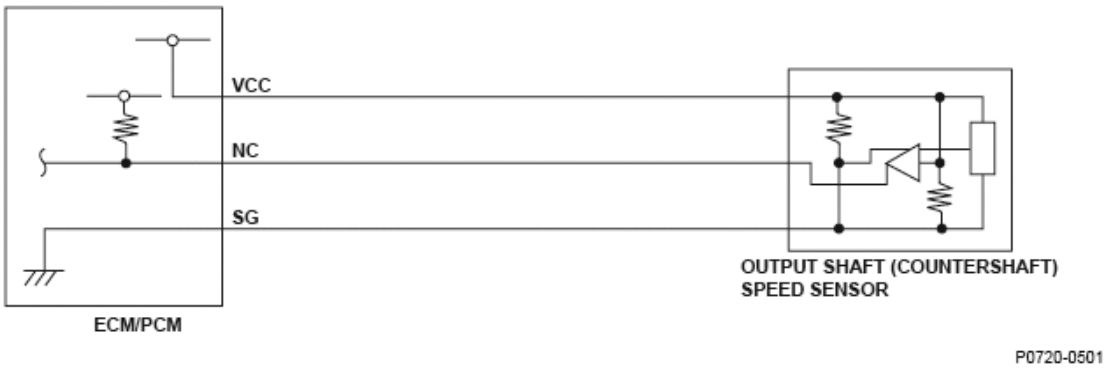

Fig. 317: Output Shaft (Countershaft) Speed Sensor - Circuit Diagram

General Description (K20Z3 Engine)

The output shaft (countershaft) speed sensor is attached to the transmission housing to sense output shaft (countershaft) revolutions. The engine control module (ECM)/powertrain control module (PCM) determines the vehicle speed according to the signal from the output shaft (countershaft) speed sensor to the control units. If no signal from the output shaft (countershaft) speed sensor is received for a set time, the ECM/PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous

	Not when an input shaft (mainshaft) speed sensor intermittent failure is detected	

Malfunction Threshold (R18A4 Engine)

The fluctuation of the vehicle speed measured by the output shaft (countershaft) speed sensor in 10 milliseconds is 4 mph (6km/h) or more, and it fluctuates at least six times within 500 milliseconds.

Driving Pattern (R18A4 Engine)

Start the engine, and drive the vehicle at a speed of 13 mph (20 km/h) or more so it shifts from 1st to 5th in the D position.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0731 (64): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0731: PROBLEM IN 1ST CLUTCH AND 1ST CLUTCH HYDRAULIC CIRCUIT (1ST GEAR INCORRECT RATIO)

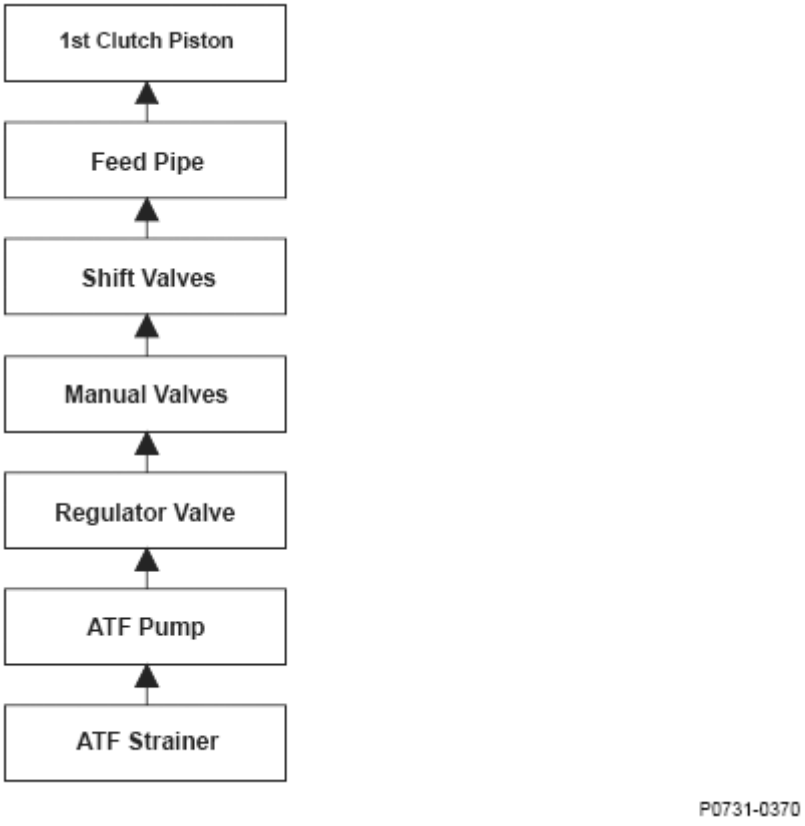

Fig. 332: 1st Clutch Hydraulic Circuit Chart

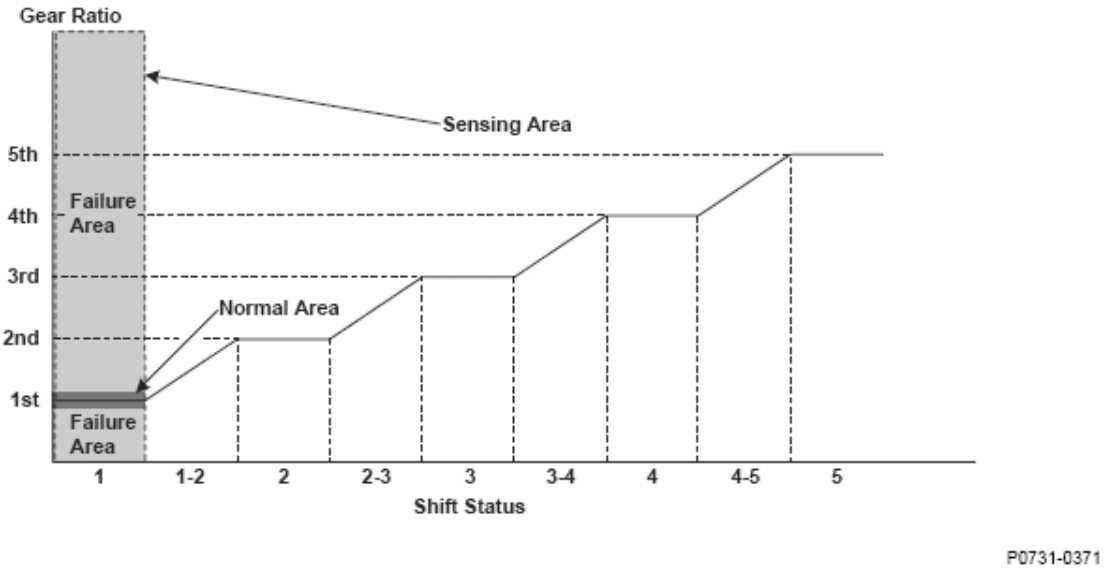

Fig. 333: Gear Ratio Graph

General Description (R18A1 Engine)

To engage 1st gear, line pressure is supplied to the 1st clutch piston, engaging the 1st clutch, and the secondary shaft and the secondary shaft 1st gear are connected and revolve together. Hydraulic pressure is supplied to the 1st clutch through the ATF strainer --> the ATF pump --> the regulator valve --> the manual valve --> the shift valves --> the feed pipe --> 1st clutch piston. (A shift valve failure in the supply route

above is detected by the malfunction detection of each shift solenoid valve.) The powertrain control module (PCM) computes the ratio of the input shaft (mainshaft) speed to the output shaft (countershaft) speed. When the ratio is not the 1st gear ratio, it is detected as a malfunction of the hydraulic circuit or the 1st clutch, and a DTC is stored.

Malfunction Threshold (R18A1 Engine)

The actual gear ratio must match one of these conditions for at least 12 seconds with the 1st gear command.

- Actual gear ratio is greater than the 1st gear ratio by a factor of 1.2.
- Actual gear ratio is less than the 1st gear ratio by a factor of 0.75.

Driving Pattern (R18A1 Engine)

Start the engine, shift to the D position, and drive the vehicle at a speed of 8 mph (12 km/h) or more for at least 12 seconds in 1st gear.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the DTC and the freeze frame data are stored. The MIL does not come on.

Conditions for clearing the MIL (R18A1 Engine)

The DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0731 (64): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P0731: PROBLEM IN 1ST CLUTCH AND 1ST CLUTCH HYDRAULIC CIRCUIT (1ST GEAR INCORRECT RATIO)

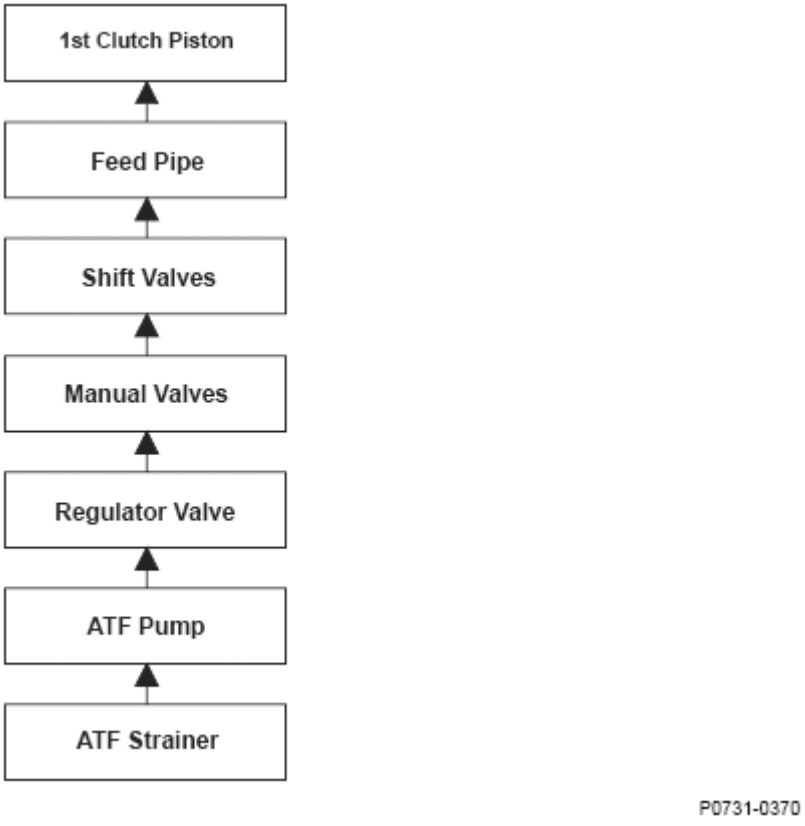

Fig. 334: 1st Clutch Hydraulic Circuit Chart

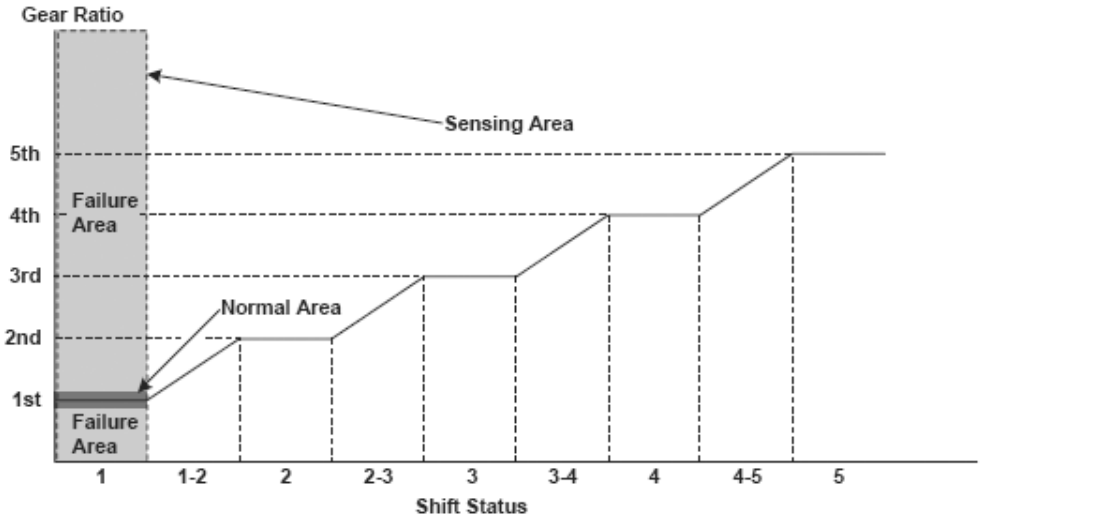

Fig. 335: Gear Ratio Graph

General Description (R18A4 Engine)

To engage 1st gear, line pressure is supplied to the 1st clutch piston, engaging the 1st clutch, and the secondary shaft and the secondary shaft 1st gear are connected and revolve together. Hydraulic pressure is supplied to the 1st clutch through the ATF strainer --> the ATF pump --> the regulator valve --> the manual valve --> the shift valves --> the feed pipe --> 1st clutch piston. (A shift valve failure in the supply route above is detected by the malfunction detection of each shift solenoid valve.) The powertrain control module (PCM) computes the ratio of the input shaft (mainshaft) speed to the output shaft (countershaft) speed. When the ratio is not the 1st gear ratio, it is detected as a malfunction of the hydraulic circuit or the 1st clutch, and a DTC is stored.

DTC P0732 (64): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0732: PROBLEM IN 2ND CLUTCH AND 2ND CLUTCH HYDRAULIC CIRCUIT (2ND GEAR INCORRECT RATIO)

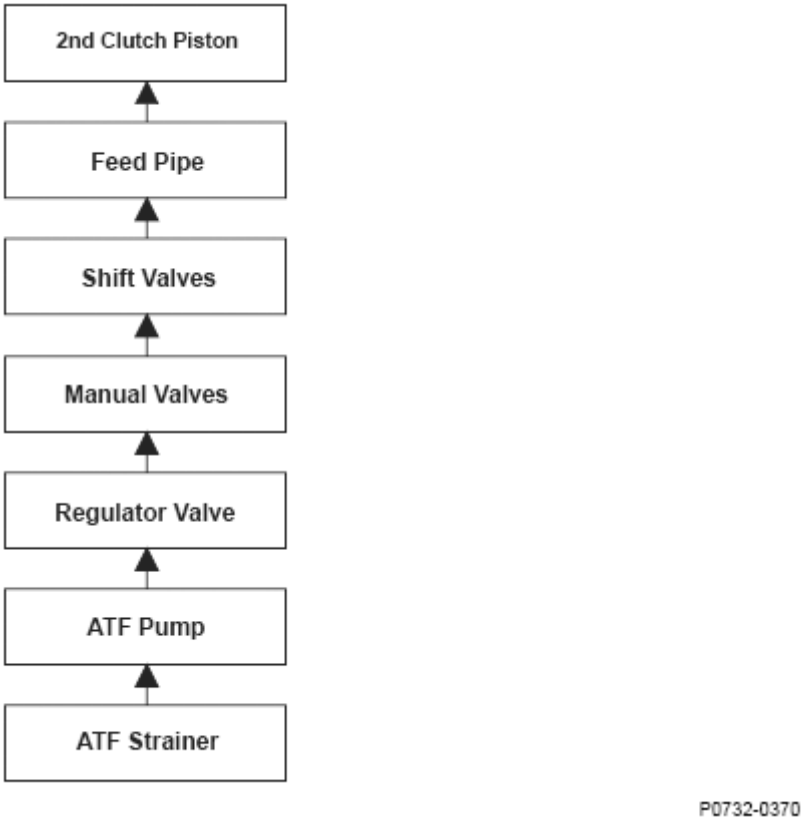

Fig. 336: 2nd Clutch Hydraulic Circuit Chart

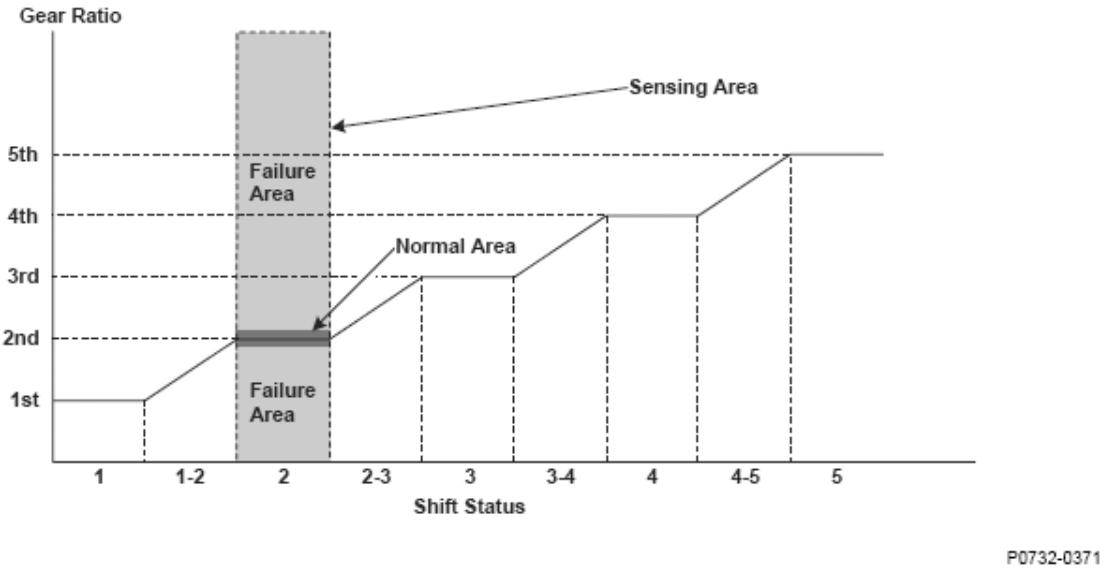

Fig. 337: Gear Ratio Graph

General Description (R18A1 Engine)

To engage 2nd gear, line pressure is supplied to the 2nd clutch piston, engaging the 2nd clutch, and the secondary shaft and the secondary shaft 2nd gear are connected and revolve together. Hydraulic pressure is supplied to the 2nd clutch through the ATF strainer --> the ATF pump --> the regulator valve --> the manual valve --> the shift valves --> the feed pipe --> 2nd clutch piston. (A shift valve failure in the supply route

above is detected by the malfunction detection of each shift solenoid valve.) The powertrain control module (PCM) computes the ratio of the input shaft (mainshaft) speed to the output shaft (countershaft) speed. When the ratio is not the 2nd gear ratio, it is detected as a malfunction of the hydraulic circuit or the 2nd clutch, and a DTC is stored.

DTC P0735 (64): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0735: PROBLEM IN 5TH CLUTCH AND 5TH CLUTCH HYDRAULIC CIRCUIT (5TH GEAR INCORRECT RATIO)

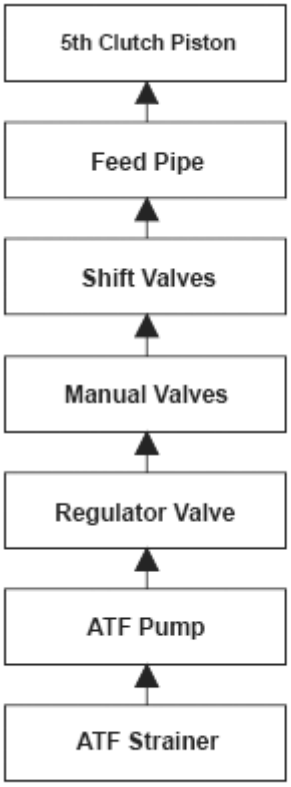

Fig. 348: 5th Clutch Hydraulic Circuit Chart

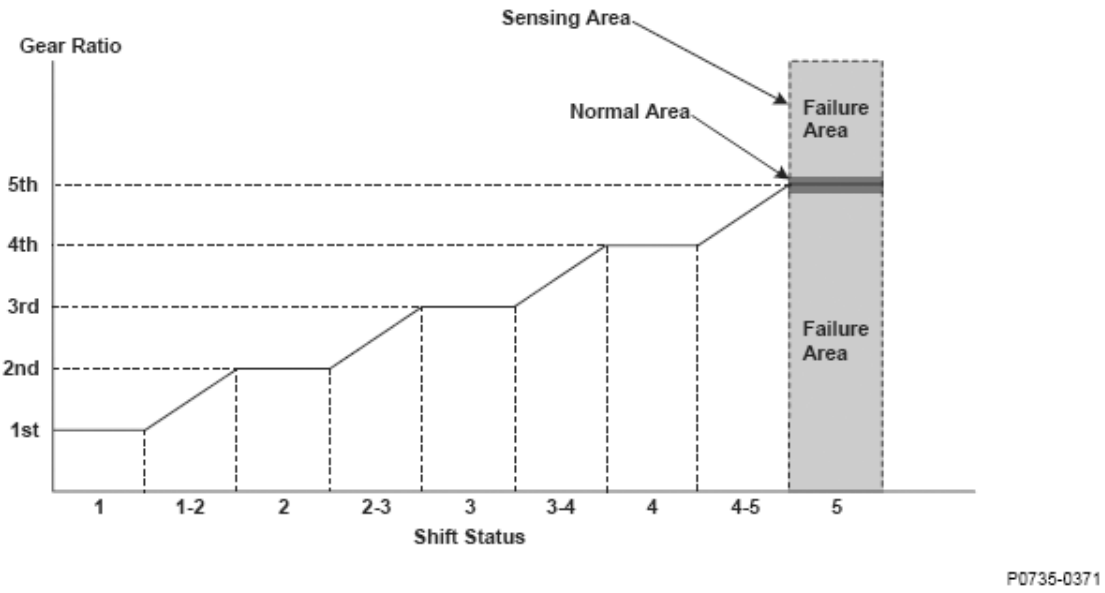

Fig. 349: Gear Ratio Graph

General Description (R18A1 Engine)

To engage 5th gear, line pressure is supplied to the 5th clutch piston, engaging the 5th clutch, and the input shaft (mainshaft) and the input shaft (mainshaft) 5th gear are connected and revolve together. Hydraulic pressure is supplied to the 5th clutch through the ATF strainer --> the ATF pump --> the regulator valve --> the manual valve --> the shift valves --> the feed pipe --> 5th clutch piston. (A shift valve failure in the

supply route above is detected by the malfunction detection of each shift solenoid valve.) The powertrain control module (PCM) computes the ratio of the input shaft (mainshaft) speed to the output shaft (countershaft) speed. When the ratio is not the 5th gear ratio, it is detected as a malfunction of the hydraulic circuit or the 5th clutch, and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	12 seconds or more
DTC Type	Two drive cycles, MIL OFF, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions (R18A1 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	11.0 V	-
Engine speed	1,000 rpm	-
Vehicle speed	8 mph (12 km/h)	-
Shift lever position	D	
No active DTCs	P0116, P0117, P0118, P0112, P0123, P0222, P0223, P0705, P0706, P0716, P0717, P0718, P0721, P0722, P0723, P0731, P0732, P0733, P0734, P0746, P0747, P0751, P0752, P0756, P0757, P0761, P0762, P0766, P0767, P0776, P0777, P0796, P0797, P0962, P0963, P0966, P0967, P0970, P0971, P0973, P0974, P0976, P0977, P0979, P0980, P0982, P0983, P1746, P1747, P1780	

Malfunction Threshold (R18A1 Engine)

The actual gear ratio must match one of these conditions for at least 12 seconds with the 5th gear command.

- Actual gear ratio is greater than the 5th gear ratio by a factor of 1.2.
- Actual gear ratio is less than the 5th gear ratio by a factor of 0.75.

Driving Pattern (R18A1 Engine)

Start the engine, shift to the D position, and drive the vehicle at a speed of 8 mph (12 km/h) or more for at least 12 seconds in 5th gear.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the DTC and the freeze frame data are stored. The MIL does not come on.

Conditions for clearing the MIL (R18A1 Engine)

The DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0735 (64): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P0735: PROBLEM IN 5TH CLUTCH AND 5TH CLUTCH HYDRAULIC CIRCUIT (5TH GEAR INCORRECT RATIO)

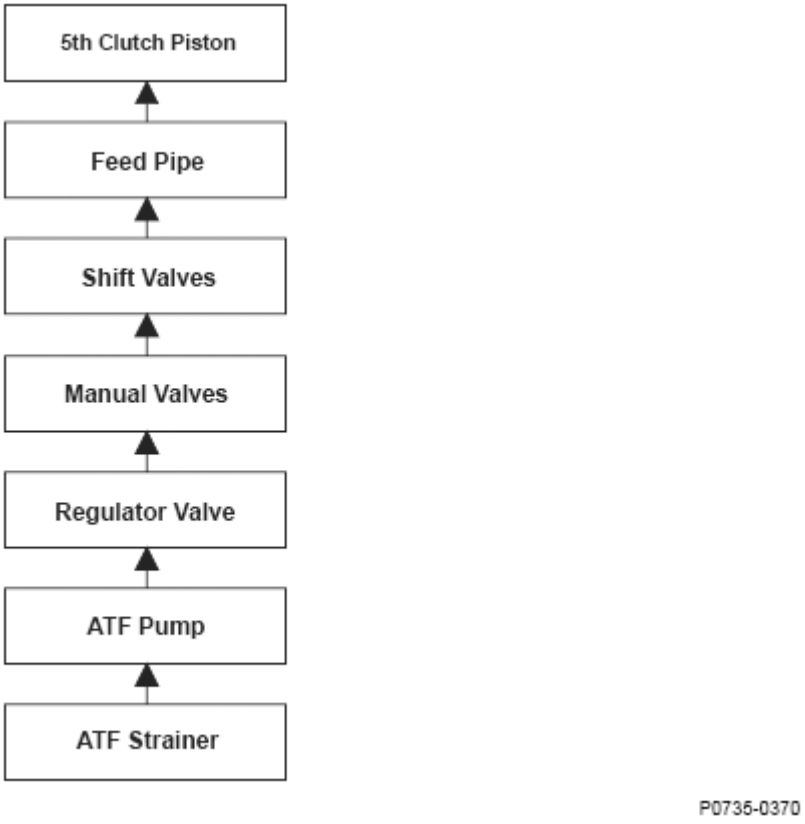

Fig. 350: 5th Clutch Hydraulic Circuit Chart

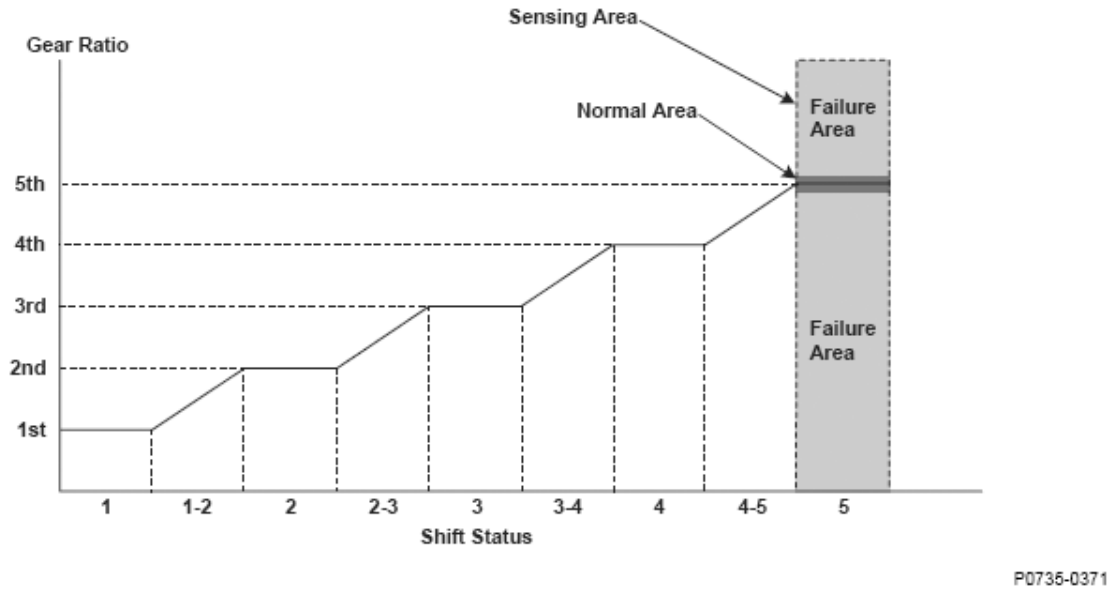

Fig. 351: Gear Ratio Graph

General Description (R18A4 Engine)

To engage 5th gear, line pressure is supplied to the 5th clutch piston, engaging the 5th clutch, and the input shaft (mainshaft) and the input shaft (mainshaft) 5th gear are connected and revolve together. Hydraulic pressure is supplied to the 5th clutch through the ATF strainer --> the ATF pump --> the regulator valve --> the manual valve --> the shift valves --> the feed pipe --> 5th clutch piston. (A shift valve failure in the supply route above is detected by the malfunction detection of each shift solenoid valve.) The powertrain control module (PCM) computes the ratio of the input shaft (mainshaft) speed to the output shaft (countershaft) speed. When the ratio is not the 5th gear ratio, it is detected as a malfunction of the hydraulic circuit or the 5th clutch, and a DTC is stored.

- Actual gear ratio is greater than the 5th gear ratio by a factor of 1.2.
- Actual gear ratio is less than the 5th gear ratio by a factor of 0.75.

Driving Pattern (R18A4 Engine)

Start the engine, shift to the D position, and drive the vehicle at a speed of 8 mph (12 km/h) or more for at least 12 seconds in 5th gear.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the DTC and the freeze frame data are stored. The MIL does not come on.

Conditions for clearing the MIL (R18A4 Engine)

The DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0741 (40): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0741: TORQUE CONVERTER CLUTCH HYDRAULIC CIRCUIT STUCK OFF (R18A1 ENGINE)

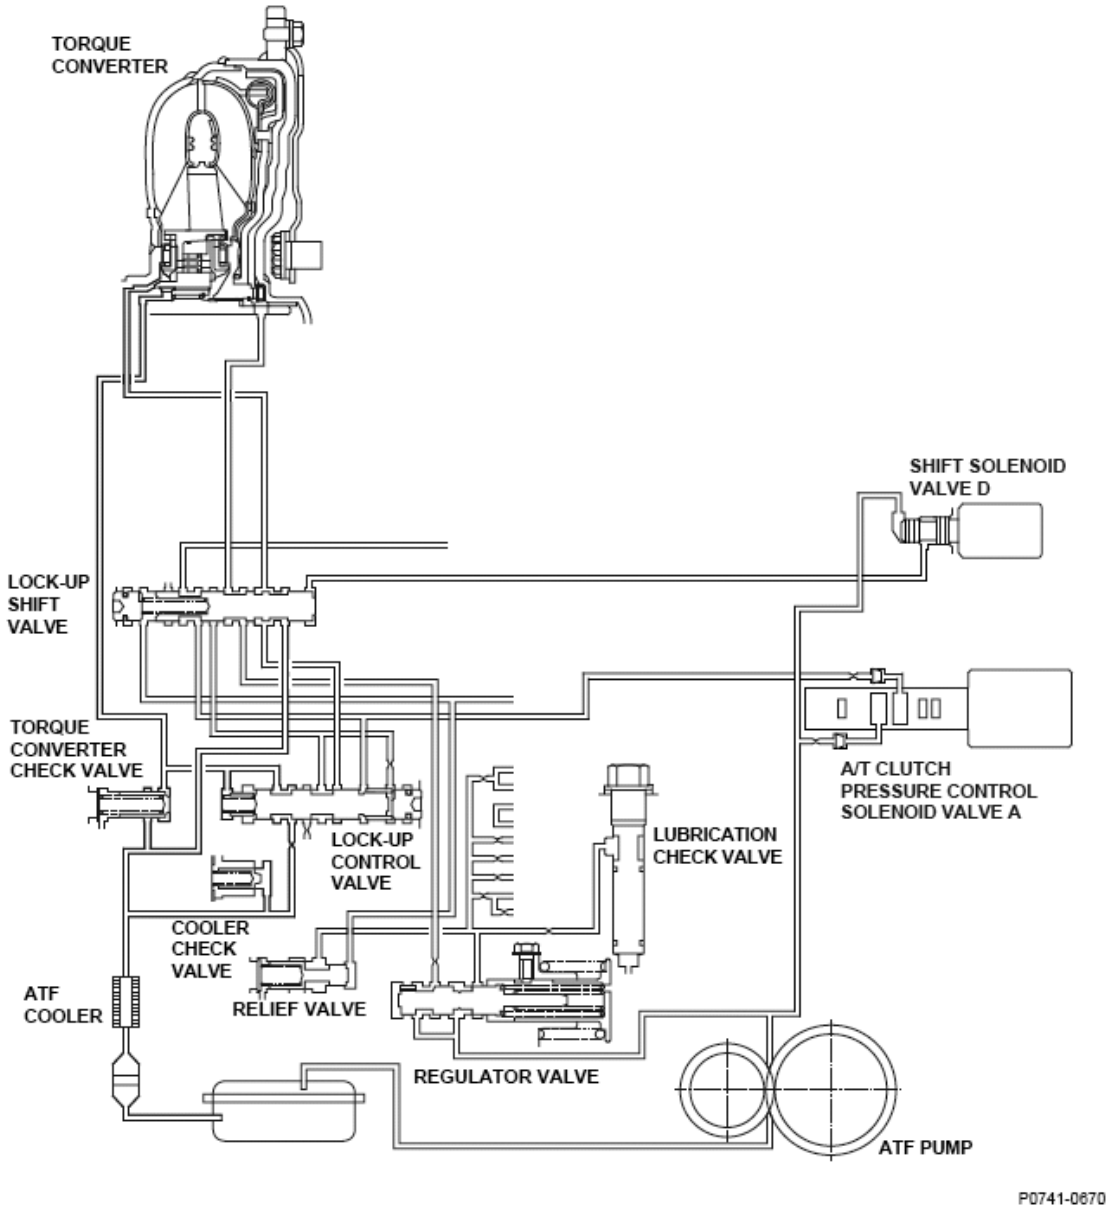

Fig. 352: Torque Converter Clutch Hydraulic - System Diagram

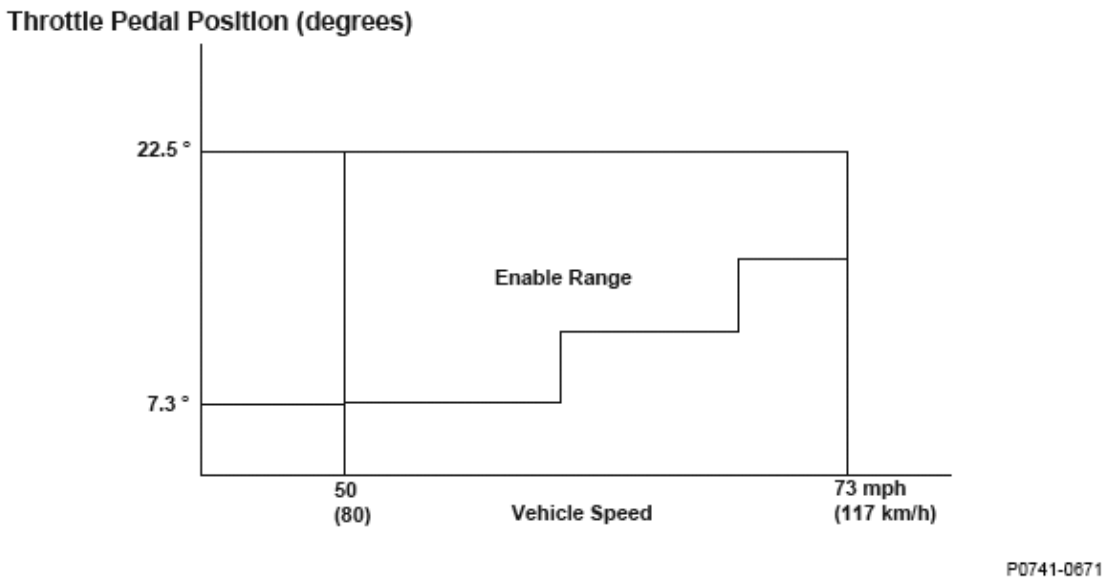

Fig. 353: Throttle Pedal Position Angle

General Description (R18A1 Engine)

The power transfer capacity of the torque converter clutch is controlled by the balance of automatic transmission fluid (ATF) supplied to and discharged from the torque converter. When hydraulic pressure is applied internally, the torque converter clutch turns ON, and when hydraulic pressure is applied from the back pressure side, the lock-up clutch turns OFF. As the hydraulic pressure from the internal pressure side increases, the power transfer capacity of the torque converter clutch increases. The direction of hydraulic pressure supply is switched by shift solenoid valve D and the lock-up shift valve. ATF is supplied from the internal pressure side to shift solenoid valve D when the signal from the powertrain control module (PCM) is ON (12 V), and ATF is supplied from the back pressure side when it is OFF (0 V). The balance of internal pressure and back pressure is controlled by A/T clutch pressure control solenoid valve A and the lock-up control valve. A/T clutch pressure control solenoid valve A maximizes the power transfer capacity of the torque converter clutch when the signal from the PCM is ON (1 A), and it minimizes the power transfer capacity of the torque converter clutch when the signal from the PCM is OFF (0 A). If the ratio of engine speed and mainshaft speed is not about 1:1 while the PCM is issuing the command to turn shift solenoid valve D and A/T clutch pressure control solenoid valve A ON, the PCM detects a faulty lock-up control system and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	None
Duration	20 seconds
DTC Type	Two drive cycles, MIL ON, D indicator OFF
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions (R18A1 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum

Battery voltage	11.0 V	-
Engine coolant temperature	158°F (70°C)	212°F (100°C)
ATF temperature	-	284°F (140°C)
Shift status	5th	
Torque converter clutch	During controlling operation	
No active DTCs	P0116, P0117, P0118, P0122, P0123, P0222, P0223, P0705, P0706, P0716, P0717, P0718, P0721, P0722, P0723, P0746, P0747, P0751, P0752, P0756, P0757, P0761, P0762, P0766, P0767, P0776, P0777, P0796, P0797, P0962, P0963, P0966, P0967, P0970, P0971, P0973, P0974, P0976, P0977, P0979, P0980, P0982, P0983, P1780	
Other	When both the vehicle speed and the throttle position are in Enable Range	

Malfunction Threshold (R18A1 Engine)

The ratio of the engine revolution to the transmission input pulse does not reach about 100 % for at least 20 seconds.

Driving Pattern (R18A1 Engine)

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Drive the vehicle at a constant speed of 60 mph (96 km/h) for at least 20 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

CPC: Clutch Pressure Control pressure

Fig. 355: Shift Solenoid Valve Driving Signal Combination Chart

General Description (R18A1 Engine)

Hydraulic pressure to each clutch is controlled by the shift valve. The shift valve activates according to the ON/OFF status of shift solenoid valves A, B, C, and D. Hydraulic pressure supply in D position is shown above. The line pressure or the clutch pressure control pressure (CPC A, CPC B, or CPC C) is supplied to each clutch by the shift valve activated. The powertrain control module (PCM) computes the actual ratio of input shaft (mainshaft) and output shaft (countershaft) revolutions. If a difference between the actual ratio and the commanded gear occurs when shifting to each gear position, a malfunction in A/T clutch pressure control solenoid valve A or the hydraulic system is detected and a DTC is stored.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

CPC: Clutch Pressure Control pressure

Fig. 363: Shift Solenoid Valve Driving Signal Combination Chart

General Description (R18A1 Engine)

Shift solenoid valve A is installed in the transmission housing. It is controlled by the ON/OFF signal from the powertrain control module (PCM), to apply line pressure to shift valve A. The signal from the PCM is output to apply clutch pressure control pressure to the proper gear change clutch according to the gear change schedule. When the signal to shift solenoid valve A from the PCM is ON, and line pressure is applied to shift valve A, it operates against the shift valve A spring. When the signal to shift solenoid valve A from the PCM is OFF, and line pressure is discharged, shift valve A is inactive. The PCM monitors the input shaft (mainshaft) speed and the output shaft (countershaft) speed at the gear change determined by the shift schedule. When an improper gear ratio is output compared to the predetermined gear change mode, a shift solenoid valve A OFF failure is detected and a DTC is stored.

Malfunction Threshold (R18A4 Engine)

One of these symptoms occurs.

MALFUNCTION THRESHOLD - SYMPTOM 1

Symptom	Gear position commanded by the PCM	Actual gear position
1-A	Driving in 1st gear	Driving in 3rd gear

MALFUNCTION THRESHOLD - SYMPTOM 2

Symptom	Gear position commanded by the PCM	Actual gear position
2-A	4th --> 5th gear upshift	Turn on the 3rd clutch transmission fluid pressure switch

SYMPTOM 3 (SYMPTOM 3-B OCCURS AFTER SYMPTOM 3-A OCCURS)

Symptom	Gear position commanded by the PCM	Actual gear position
3-A	Driving in 5th gear	Neutral
3-B	Driving in 1st gear	Driving in 3rd gear

Driving Pattern (R18A4 Engine)

Start the engine, and accelerate the vehicle until the transmission shifts into 5th gear in the D position.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

CPC: Clutch Pressure Control pressure

Fig. 375: Shift Solenoid Valve Driving Signal Combination Chart

General Description (R18A1 Engine)

Shift solenoid valve B is installed in the transmission housing. It is controlled by the ON/OFF signal from the powertrain control module (PCM), to apply line pressure to shift valve B. The signal from the PCM is output to apply clutch pressure control pressure to the proper gear change clutch according to the gear change schedule. When the signal to shift solenoid valve B from the PCM is ON, and line pressure is applied to shift valve B, it operates against the shift valve B spring. When the signal to shift solenoid valve B from the PCM is OFF, and line pressure is discharged, shift valve B is inactive. The PCM monitors the input shaft (mainshaft) speed and the output shaft (countershaft) speed at the gear change determined by the shift schedule. When an improper gear ratio is output compared to the predetermined gear change mode, a shift solenoid valve B ON failure is detected and a DTC is stored.

(3) Symptom 2-A

(4) Symptom 2-B

(5) Symptom 3-A

Malfunction Threshold (R18A4 Engine)

One of these symptoms occurs.

SYMPTOM 1 (SYMPTOM 1-B OCCURS AFTER SYMPTOM 1-A OCCURS)

Symptom	Gear position commanded by the PCM	Actual gear position
1-A	Driving in 1st gear	Neutral
1-B	Driving in 2nd gear	Driving in 4th gear

SYMPTOM 2 (SYMPTOM 2-B OCCURS AFTER SYMPTOM 2-A OCCURS)

Symptom	Gear position commanded by the PCM	Actual gear position
2-A	Driving in 1st gear	Driving in 5th gear
2-B	Driving in 2nd gear	Driving in 4th gear

SYMPTOM 3

Symptom	Gear position commanded by the PCM	Actual gear position
3-A	Driving in 2nd gear	Driving in 4th gear

Driving Pattern (R18A4 Engine)

Start the engine, and accelerate the vehicle until the transmission shifts into 5th gear in the D position.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

CPC: Clutch Pressure Control pressure

Fig. 387: Shift Solenoid Valve Driving Signal Combination Chart

General Description (R18A1 Engine)

Shift solenoid valve D is installed in the transmission housing. It is controlled by the ON/OFF signal from the powertrain control module (PCM), to apply line pressure to shift valve D. The signal from the PCM is output to apply clutch pressure control pressure to the proper gear change clutch according to the gear change schedule. When the signal to shift solenoid valve D from the PCM is ON, and line pressure is applied to shift valve D, it operates against the shift valve D spring. When the signal to shift solenoid valve D from the PCM is OFF, and line pressure is discharged, shift valve D is inactive. The PCM monitors the input shaft (mainshaft) speed and the output shaft (countershaft) speed at the gear change determined by the shift schedule. When an improper gear ratio is output compared to the predetermined gear change mode, a shift solenoid valve D OFF failure is detected and a DTC is stored.

CPC: Clutch Pressure Control pressure

Fig. 395: Shift Solenoid Valve Driving Signal Combination Chart

General Description (R18A1 Engine)

Hydraulic pressure to each clutch is controlled by the shift valve. The shift valve activates according to the ON/OFF status of shift solenoid valves A, B, C, and D. Hydraulic pressure supply in D position is shown above. The line pressure or the clutch pressure control pressure (CPC A, CPC B, or CPC C) is supplied to each clutch by the shift valve activated. The powertrain control module (PCM) computes the actual ratio of mainshaft and countershaft revolutions. If a difference between the actual ratio and the commanded gear occurs when shifting to each gear position, a malfunction in A/T clutch pressure control solenoid valve B or the hydraulic system is detected and a DTC is stored.

Malfunction Threshold (R18A4 Engine)

The engine speed flares for at least 2.5 seconds when upshifting from 1st - 2nd.

Driving Pattern (R18A4 Engine)

Start the engine, and accelerate the vehicle until the transmission shifts into 5th gear in the D position.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and

the freeze frame data are stored.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

CPC: Clutch Pressure Control pressure

Fig. 399: Shift Solenoid Valve Driving Signal Combination Chart

General Description (R18A1 Engine)

Hydraulic pressure to each clutch is controlled by the shift valve. The shift valve activates according to the ON/OFF status of shift solenoid valves A, B, C, and D. Hydraulic pressure supply in D position is shown above. The line pressure or the clutch pressure control pressure (CPC A, CPC B, or CPC C) is supplied to each clutch by the shift valve activated. The powertrain control module (PCM) computes the actual ratio of mainshaft and countershaft revolutions. If a difference between the actual ratio and the commanded gear occurs when shifting to each gear position, a malfunction in A/T clutch pressure control solenoid valve B or the hydraulic system is detected and a DTC is stored.

2	X	X	X	X	X	X	o	o

1	X	X	X	X	X	X	o	X
o: Closed X: Open								

General Description (R18A1 Engine)

The transmission range switch is attached to the control shaft. Operating the shift lever makes the control shaft rotate via the shift cable. The A/T gear position indicator indicates which position is selected according to the Low/High signal combinations which vary based on shift lever position. The control shaft changes the position of the transmission range switch, activates the manual valve, and switches hydraulic pressure to shift the transmission through forward/neutral/reverse. The transmission range switch signal is used to determine the shift schedule. The voltage is 12 V (High) at the powertrain control module (PCM) input terminal when each transmission range switch position is open, and it is 0 V (Low) when each switch is closed. If the R switch is OPEN with the shift lever in the R position, the PCM detects a switch OPEN failure and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	Depending on the driving pattern
DTC Type	Two drive cycles, MIL ON, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions (R18A1 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	11.0 V	-
Engine speed	1,000 rpm	-
Shift lever position	R	
No active DTCs	P0705, P0716, P0717, P0721, P0722, P1717	

Malfunction Threshold (R18A1 Engine)

No R signal is detected with the shift lever in the R position.

Driving Pattern (R18A1 Engine)

1. Start the engine.
2. Drive the vehicle at a speed of 3 mph (5 km/h) or less in the R position for at least 2 seconds.
3. Drive the vehicle at a speed of 3 mph (5 km/h) or more in the R position for at least 2 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0842 (25): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0842: SHORT IN 2ND CLUTCH TRANSMISSION FLUID PRESSURE SWITCH CIRCUIT, OR 2ND CLUTCH TRANSMISSION FLUID PRESSURE SWITCH STUCK ON (R18A1 ENGINE)

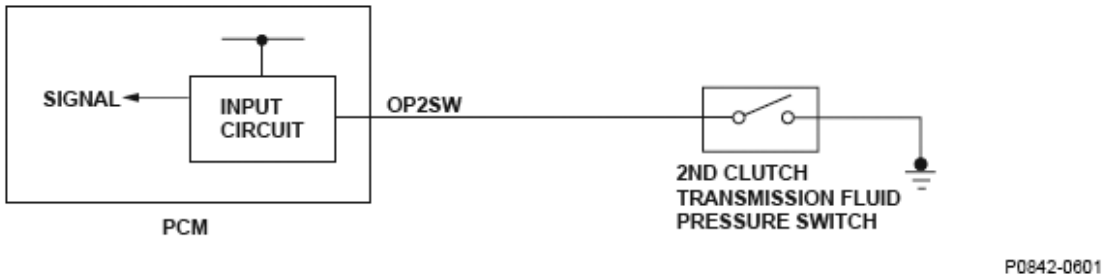

Fig. 412: 2nd Clutch Transmission Fluid Pressure Switch Circuit Diagram

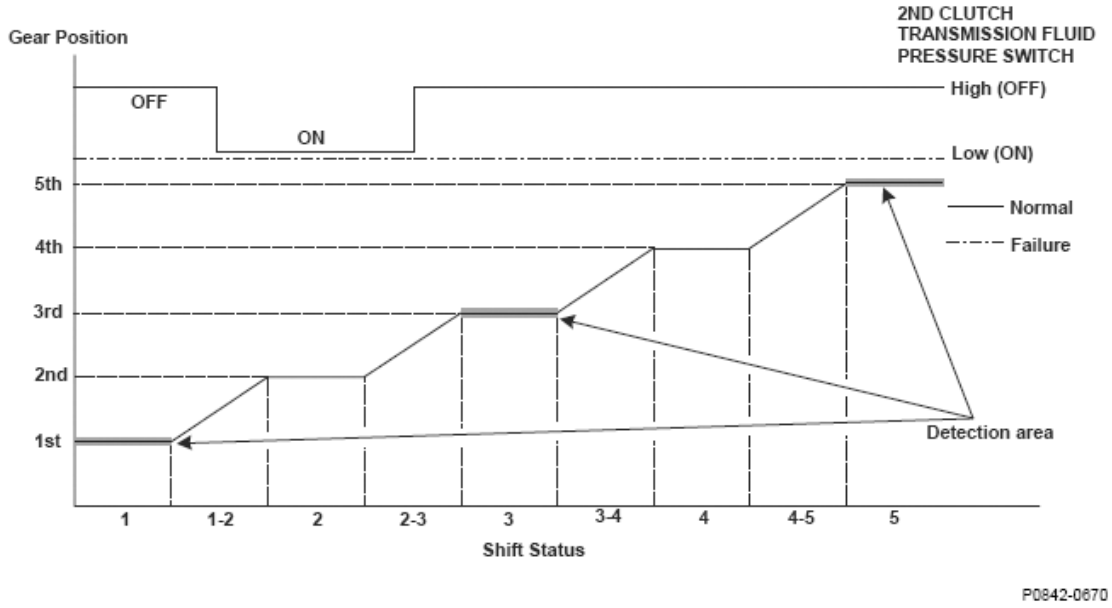

Fig. 413: Gear Position Graph

General Description (R18A1 Engine)

The 2nd clutch transmission fluid pressure switch is installed in the hydraulic pressure circuit to the 2nd clutch. When hydraulic pressure is supplied to the 2nd clutch, the switch is turned ON. When hydraulic pressure is not supplied to the 2nd clutch, the switch is turned OFF. The signal from the 2nd clutch transmission fluid pressure switch is input to the powertrain control module (PCM). The PCM detects the hydraulic pressure supply conditions at the gear change to 2nd gear (1st --> 2nd, 3rd --> 2nd) to reduce the shock that occurs at the gear change.

If the 2nd clutch transmission fluid pressure switch is ON while driving the vehicle with the speed ratio of the output shaft (countershaft) to the input shaft (mainshaft) other than the 2nd ratio, the PCM detects a 2nd clutch transmission fluid pressure switch failure and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

DTC P0848: OPEN IN 3RD CLUTCH TRANSMISSION FLUID PRESSURE SWITCH CIRCUIT, OR 3RD CLUTCH TRANSMISSION FLUID PRESSURE SWITCH STUCK OFF (R18A4 ENGINE)

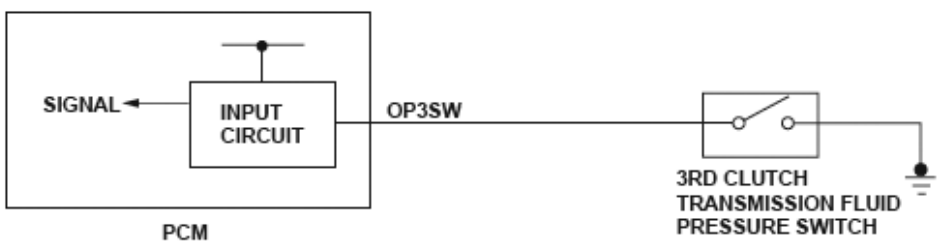

Fig. 426: 3rd Clutch Transmission Fluid Pressure Switch - Circuit Diagram

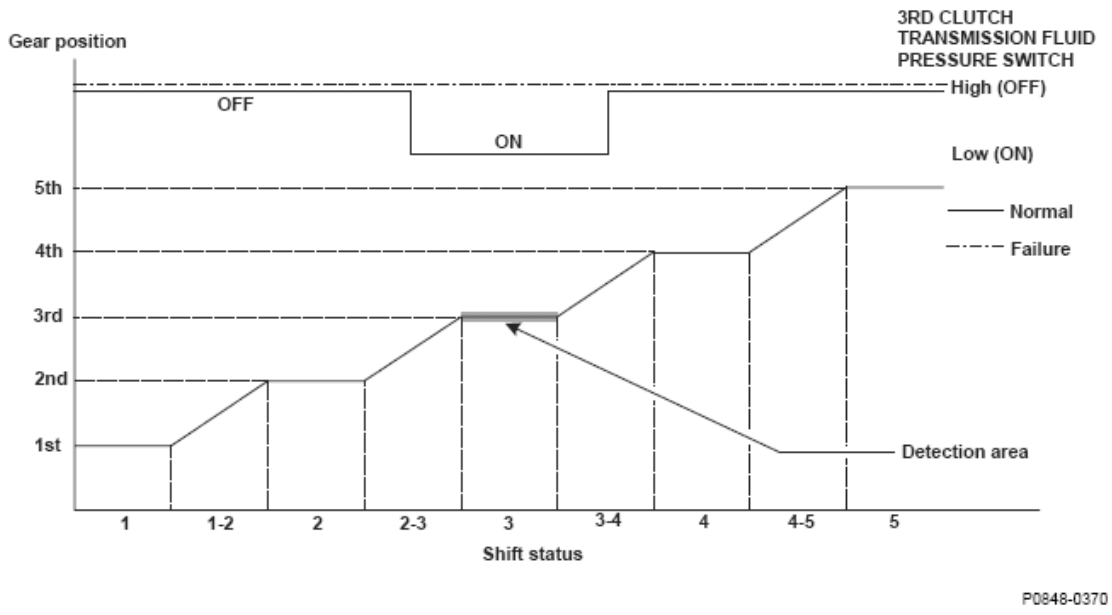

Fig. 427: Gear Position Graph

General Description (R18A4 Engine)

The 3rd clutch transmission fluid pressure switch is installed in the hydraulic pressure circuit to the 3rd clutch. When hydraulic pressure is supplied to the 3rd clutch, the switch is turned ON. When hydraulic pressure is not supplied to the 3rd clutch, the switch is turned OFF. The signal from the 3rd clutch transmission fluid pressure switch is input to the powertrain control module (PCM). The PCM detects the hydraulic pressure supply conditions at the gear change to 3rd gear (2nd --> 3rd, 4th --> 3rd) to reduce the shock that occurs at the gear change. If the 3rd clutch transmission fluid pressure switch is OFF while the rotation speed ratio of the input/output pulses is that of 3rd gear, the PCM detects a malfunction in the 3rd clutch transmission fluid pressure switch and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A4 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	One drive cycle, MIL ON, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions (R18A4 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	11.0 V	-
No active	P0116, P0117, P0118, P0716, P0717, P0721, P0722, P0746, P0747, P0751, P0752, P0756, P0757, P0761, P0762, P0766, P0767, P0776, P0777, P0796, P0797, P0847,	

DTCs	P0962, P0963, P0966, P0967, P0970, P0971, P0973, P0974, P0976, P0977, P0979, P0980, P0982, P0983, P1746, P1747, P1780

Malfunction Threshold (R18A4 Engine)

The input signal from the 3rd clutch transmission fluid pressure switch to the PCM is high when driving in 3rd gear.

Driving Pattern (R18A4 Engine)

Start the engine, and drive the vehicle in the D position and 3rd gear for at least 2 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0962 (16): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0962: PROBLEM IN A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A CIRCUIT (R18A1 ENGINE)

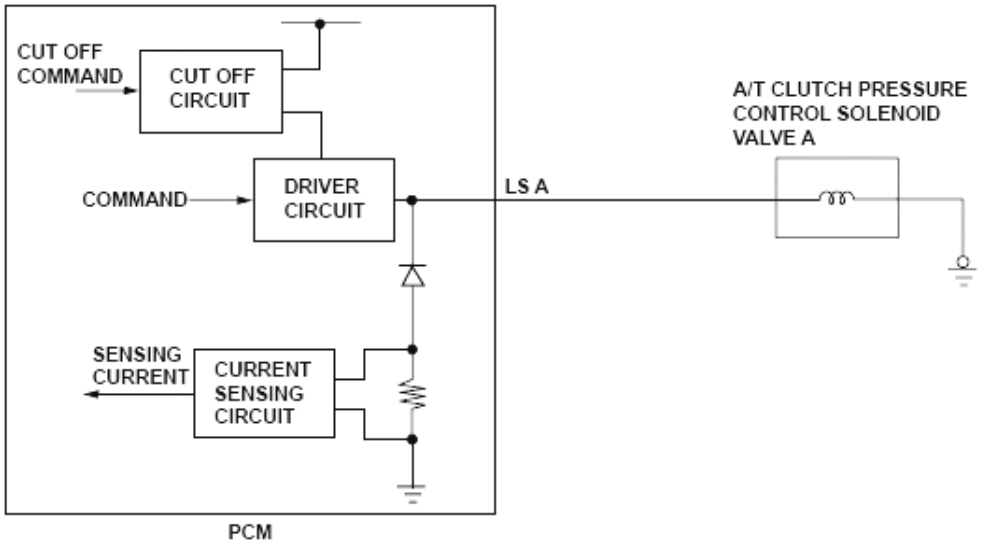

Fig. 428: A/T Clutch Pressure Control Solenoid - Circuit Diagram

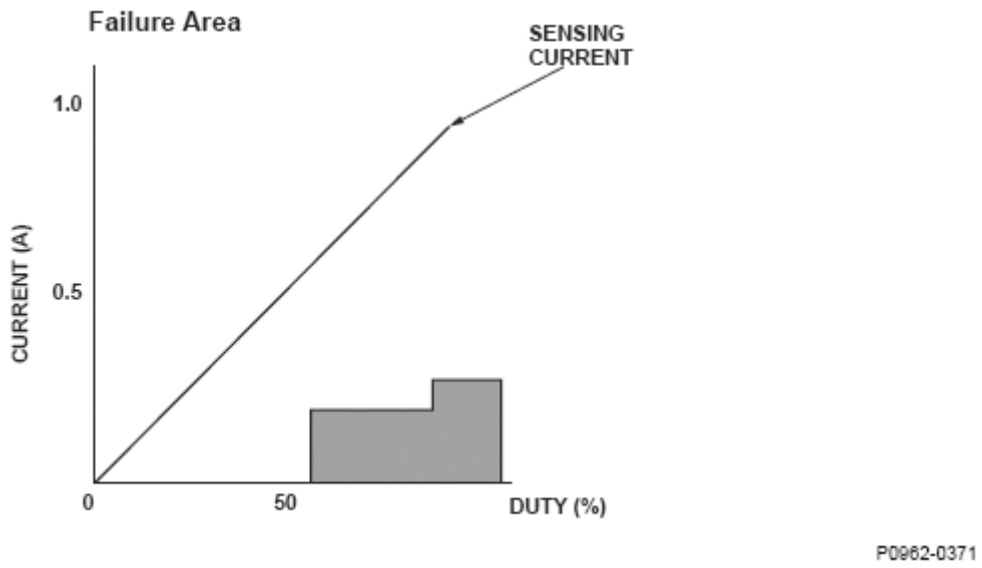

Fig. 429: A/T Clutch Pressure Control Solenoid Valve Failure Area Graph

General Description (R18A1 Engine)

A/T clutch pressure control solenoid valve A is used for clutch pressure control and lock-up control. A spool in A/T clutch pressure control solenoid valve A pushes a valve according to the duty cycle that is controlled by the powertrain control module (PCM) to pressurize fluid so the hydraulic pressure is proportional to the current. The PCM measures the current flowing through A/T clutch pressure control solenoid valve A and uses feedback control to compensate for the difference between the actual current and the commanded one. If the measured current for the PCM output duty cycle is not within a specified range (open or short), a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL ON, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions (R18A1 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	11.0 V	-
No active DTCs	P0963, P0970, P0971, P0973, P0974	

Malfunction Threshold (R18A1 Engine)

The measured current for the PCM's command value is as specified here for at least 1 second.

MALFUNCTION THRESHOLD

Duty (%)	Current (A)	Failure mode
56.5 - 89	Less than 0.19	Low Input
More than 89	Less than 0.27	Low Input

Driving Pattern (R18A1 Engine)

Start the engine, and wait for at least 1 second.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0962 (16): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

Enable Conditions (R18A4 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	11.0 V	-
No active DTCs	P0962, P0963, P0970, P0973, P0974	

Malfunction Threshold (R18A4 Engine)

The measured current for the PCM's command value is as specified here for at least 1 second.

MALFUNCTION THRESHOLD

Duty (%)	Current (A)	Failure mode
Less than 13.7	More than 0.6	High Input
13.7 - 20	More than 0.9	High Input

Driving Pattern (R18A4 Engine)

Start the engine, and wait for at least 1 second.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0973 (7): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0973: SHORT IN SHIFT SOLENOID VALVE A CIRCUIT (R18A1 ENGINE)

5th	OFF	ON	OFF	ON/OFF

Fig. 453: Shift Solenoid Valve Driving Signal Combination Chart

General Description (R18A1 Engine)

When shift solenoid valves A, B, C, and D are turned ON, the hydraulic pressure circuit opens. The hydraulic pressure circuit supplies/discharges hydraulic pressure to/from each clutch according to the combination of the ON/OFF status of those valves and the shift valves. The powertrain control module (PCM) commands the driver circuit to turn on the shift solenoid valve. The circuit diagnoses malfunctions such as a circuit short or open, and sends back a return signal during the PCM's command. When the return signal does not match the PCM command, a malfunction is detected by the PCM. The malfunction is detected when the return signal does not match the PCM command to turn ON the shift solenoid valve, and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	1 second or more

General Description (R18A4 Engine)

When shift solenoid valves A, B, C, and D are turned ON, the hydraulic pressure circuit opens. The hydraulic pressure circuit supplies/discharges hydraulic pressure to/from each clutch according to the combination of the ON/OFF status of those valves and the shift valves. The powertrain control module (PCM) commands the driver circuit to turn on the shift solenoid valve. The circuit diagnoses malfunctions such as a circuit short or open, and sends back a return signal during the PCM's command. When the return signal does not match the PCM command, a malfunction is detected by the PCM. The malfunction is detected when the return signal does not match the PCM command to turn ON the shift solenoid valve, and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A4 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL ON, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions (R18A4 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	11.0 V	-
No active DTCs	P0966, P0967, P0976, P0977, P0980	

Malfunction Threshold (R18A4 Engine)

The return signal does not match the command to turn ON shift solenoid valve C for at least 1 second.

Driving Pattern (R18A4 Engine)

Start the engine, and drive the vehicle in 1st gear in the D position for at least 1 second.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0980 (22): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P0980: OPEN IN SHIFT SOLENOID VALVE C CIRCUIT (R18A1 ENGINE)

Fig. 473: Shift Solenoid Valve Driving Signal Combination Chart

General Description (R18A1 Engine)

When shift solenoid valves A, B, C, and D are turned ON, the hydraulic pressure circuit opens. The hydraulic pressure circuit supplies/discharges hydraulic pressure to/from each clutch according to the combination of the ON/OFF status of those valves and the shift valves. The powertrain control module (PCM) commands the driver circuit to turn on the shift solenoid valve. The circuit diagnoses malfunctions such as a circuit short or open, and sends back a return signal during the PCM's command. When the return signal does not match the PCM command, a malfunction is detected by the PCM. The malfunction is detected when the return signal does not match the PCM command to turn OFF the shift solenoid valve, and a DTC is stored.

Start the engine, shift to the P position, and wait for at least 1 second.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1009 (56): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P1009: VARIABLE VALVE TIMING CONTROL (VTC) ADVANCE MALFUNCTION (K20Z3)

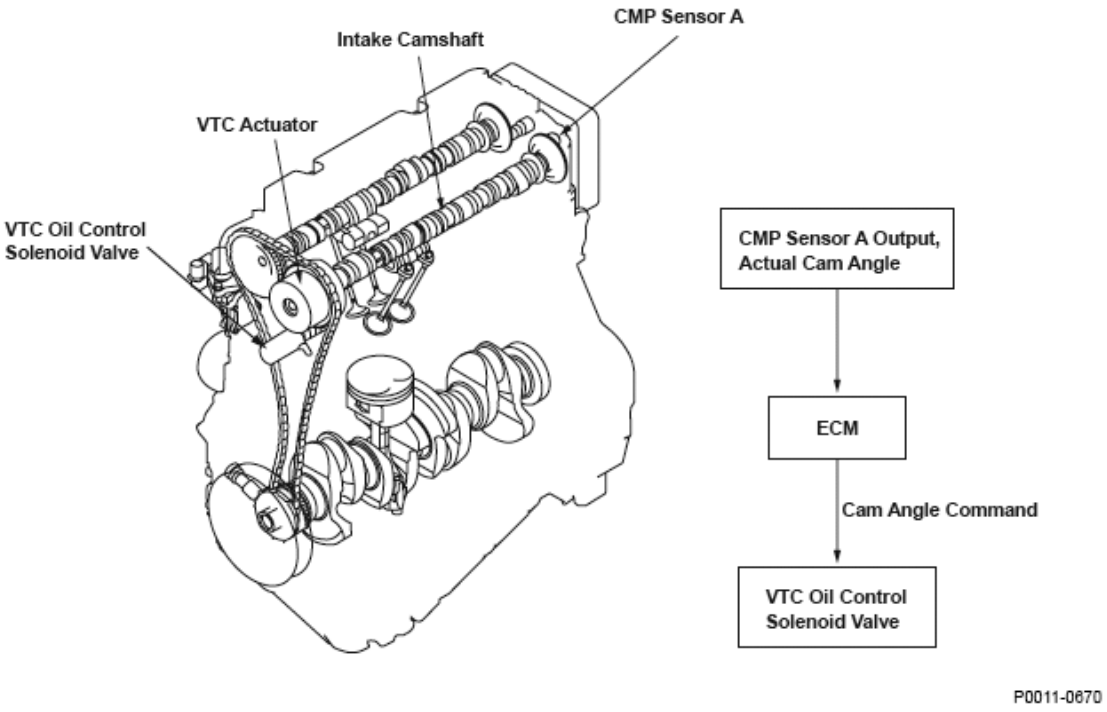

Fig. 484: Identifying Oil Control Solenoid Valve And CKP Sensor

General Description (K20Z3 Engine)

The variable valve timing control (VTC) system controls the phase of the intake camshaft. It uses oil pressure to operate the VTC actuator so the valve timing is optimized depending on driving conditions. The engine control module (ECM) monitors the phase control command and the actual timing of the camshaft by using camshaft position (CMP) sensor A. If an over-advanced camshaft phase (compared to the directed value) continues or when the camshaft phase is otherwise abnormal, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	0.5 second or more, up to 3 seconds
DTC Type	One drive cycle, MIL ON
OBD Status	N/A

Enable Conditions (K20Z3 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Elapsed time after starting the		

engine	0.5 second	-
No active DTCs	P0335, P0339, P0340, P0341, P0344	
Other	After restarting the engine with the intake camshaft angle 10 ° for 0.5 second or more	

Malfunction Threshold (K20Z3 Engine)

When the camshaft phase value is not 48.8 ° or less within the monitored area (camshaft phase control directed value plus failure judgment value) after 3 seconds have passed, or when the camshaft phase value is 20.0 ° or less and continues for 3 seconds or more, even when the VTC does not actuate.

Driving Pattern (K20Z3 Engine)

Start the engine. Let it idle.

Diagnosis Details (K20Z3 Engine)

Conditions for illuminating the MIL (K20Z3 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM memory.

Conditions for clearing the MIL (K20Z3 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1077 (106): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P1077: INTAKE MANIFOLD TUNING (IMT) VALVE STUCK IN HIGH RPM POSITION (R18A1)

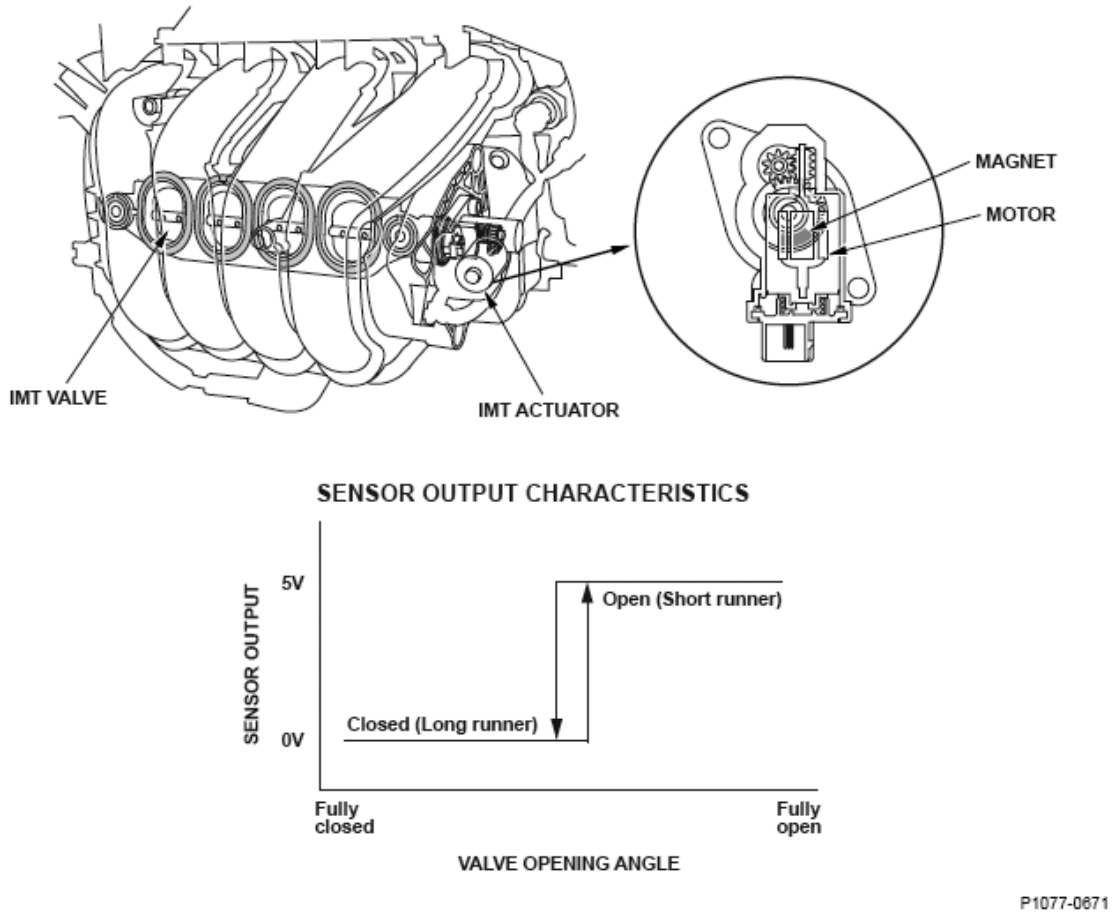

Fig. 485: Identifying IMT Valve And IMT Actuator Location

General Description (R18A1 Engine)

The intake manifold tuning (IMT) system controls engine output by selecting either long or short intake runner lengths. The system consists of the IMT valve, the IMT actuator, and the engine control module (ECM)/powertrain control module (PCM). The IMT actuator is attached to the intake manifold and it includes the motor and the Hall-effect-IC position sensing unit. The ECM/PCM actuates the motor, which operates the IMT valve. When the IMT valve is closed, the long runner is selected, increasing torque at low engine speed. When the IMT valve is open, the short runner is selected, increasing torque at high engine speed. A Hall-effect-IC position sensing unit is integrated with the motor to provide precise open/close feedback to the ECM/PCM. The IMT actuator sends a long runner return signal to the ECM/PCM when the IMT valve is closed, and it sends a short runner return signal when the IMT valve is open.

If the ECM/PCM receives no closed return signal when it sends a close command, or if it receives no open return signal when sending an open command to the IMT actuator, for a specified time, it detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	None
Duration	6 seconds or more

DTC Type	Two drive cycles, MIL ON
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions (R18A1 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Intake air temperature	32°F (0°C)	-
Engine speed	-	5,000 rpm
Battery voltage	10.5 V	-
No active DTCs	P0107, P0108, P0112, P0113, P0117, P0118, P0563, P1128, P1129, P2227, P2228, P2229	

Malfunction Threshold (R18A1 Engine)

When the ECM/PCM sends a close (long runner) command, no long runner return signal is received for at least 6 seconds.

Confirmation Procedure with the HDS (R18A1 Engine)

Do the IMT TEST in the INSPECTION MENU with the HDS.

Driving Pattern (R18A1 Engine)

1. Start the engine. Let it idle until the radiator fan comes on.
2. Let the engine idle for at least 6 seconds.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the ECM/PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1077 (106): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P1077: INTAKE MANIFOLD TUNING (IMT) VALVE STUCK IN HIGH RPM POSITION (R18A4 ENGINE)

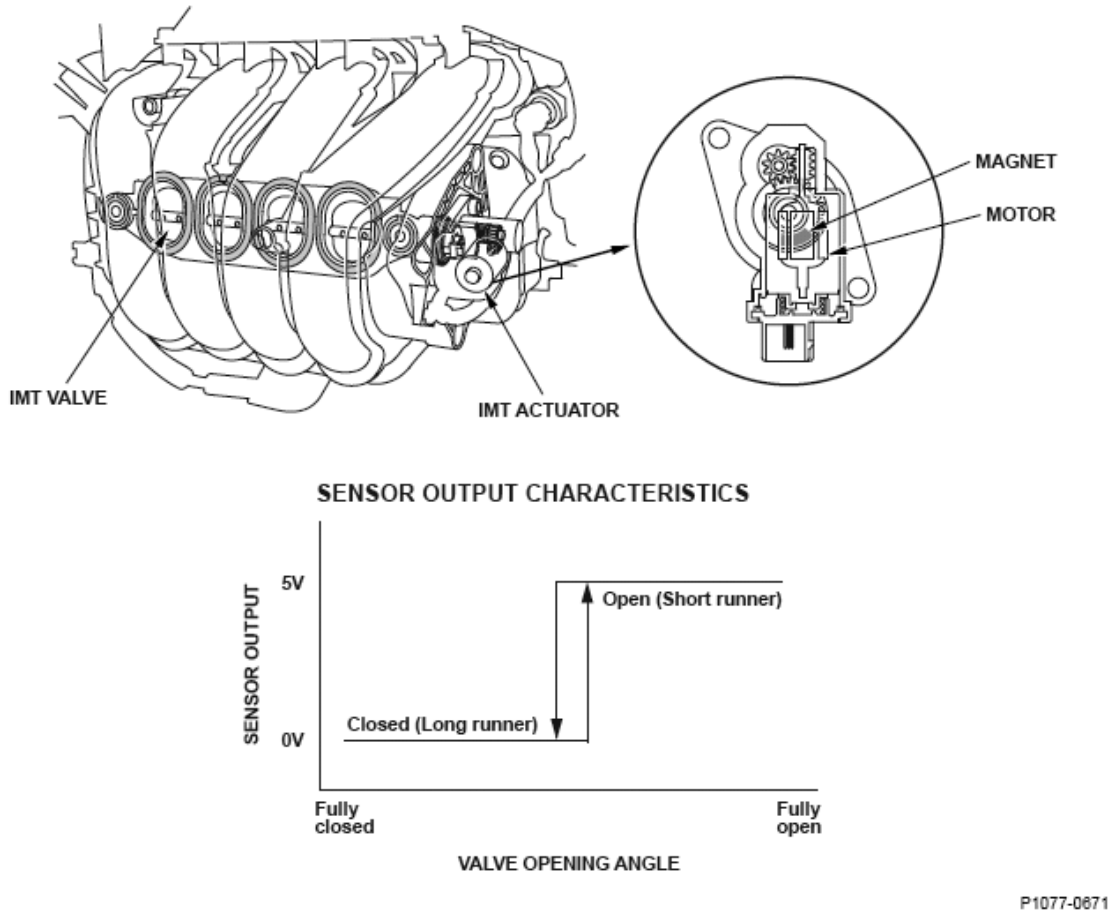

Fig. 486: Identifying IMT Valve And IMT Actuator Location

General Description (R18A4 Engine)

The intake manifold tuning (IMT) system controls engine output by selecting either long or short intake runner lengths. The system consists of the IMT valve, the IMT actuator, and the powertrain control module (PCM). The IMT actuator is attached to the intake manifold and it includes the motor and the Hall-effect-IC position sensing unit. The PCM actuates the motor, which operates the IMT valve. When the IMT valve is closed, the long runner is selected, increasing torque at low engine speed. When the IMT valve is open, the short runner is selected, increasing torque at high engine speed. A Hall-effect-IC position sensing unit is integrated with the motor to provide precise open/close feedback to the PCM. The IMT actuator sends a long runner return signal to the PCM when the IMT valve is closed, and it sends a short runner return signal when the IMT valve is open.

If the PCM receives no closed return signal when it sends a close command, or if it receives no open return signal when sending an open command to the IMT actuator, for a specified time, it detects a malfunction and stores a DTC.

Malfunction Threshold (R18A4 Engine)

When the PCM sends a close (long runner) command, no long runner return signal is received for at least 6 seconds.

Confirmation Procedure with the HDS (R18A4 Engine)

Do the IMT TEST in the INSPECTION MENU with the HDS.

Driving Pattern (R18A4 Engine)

1. Start the engine. Let it idle until the radiator fan comes on.
2. Let the engine idle for at least 6 seconds.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1078 (106): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P1078: INTAKE MANIFOLD TUNING (IMT) VALVE STUCK IN LOW RPM POSITION (R18A1)

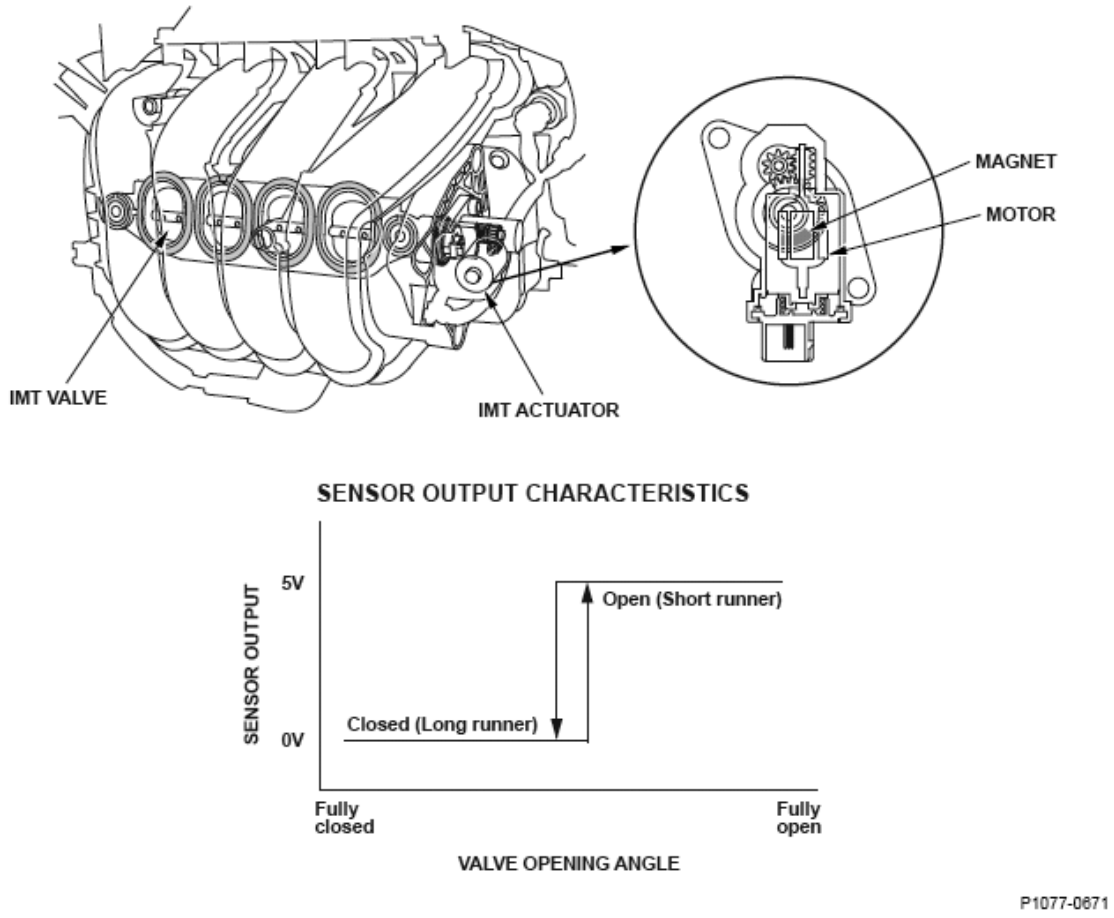

Fig. 487: Identifying IMT Valve And IMT Actuator Location

General Description (R18A1 Engine)

The intake manifold tuning (IMT) system controls engine output by selecting either long or short intake runner lengths. The system consists of the IMT valve, the IMT actuator, and the engine control module (ECM)/powertrain control module (PCM). The IMT actuator is attached to the intake manifold and it includes the motor and the Hall-effect-IC position sensing unit. The ECM/PCM actuates the motor, which operates the IMT valve. When the IMT valve is closed, the long runner is selected, increasing torque at low engine speed. When the IMT valve is open, the short runner is selected, increasing torque at high engine speed. A Hall-effect-IC position sensing unit is integrated with the motor to provide precise open/close feedback to the ECM/PCM. The IMT actuator sends a long runner return signal to the ECM/PCM when the IMT valve is closed, and it sends a short runner return signal when the IMT valve is open.

If the ECM/PCM receives no closed return signal when it sends a close command, or if it receives no open return signal when sending an open command to the IMT actuator, for a specified time, it detects a malfunction and stores a DTC.

Malfunction Threshold (R18A1 Engine)

When the ECM/PCM sends an open (short runner) command, no short runner return signal is received for at least 3 seconds.

Confirmation Procedure with the HDS (R18A1 Engine)

Do the IMT TEST in the INSPECTION MENU with the HDS.

Driving Pattern (R18A1 Engine)

1. Start the engine. Let it idle until the radiator fan comes on.
2. Hold the engine speed to 5,200 rpm or more for at least 3 seconds.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the ECM/PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1078 (106): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P1078: INTAKE MANIFOLD TUNING (IMT) VALVE STUCK IN LOW RPM POSITION (R18A4 ENGINE)

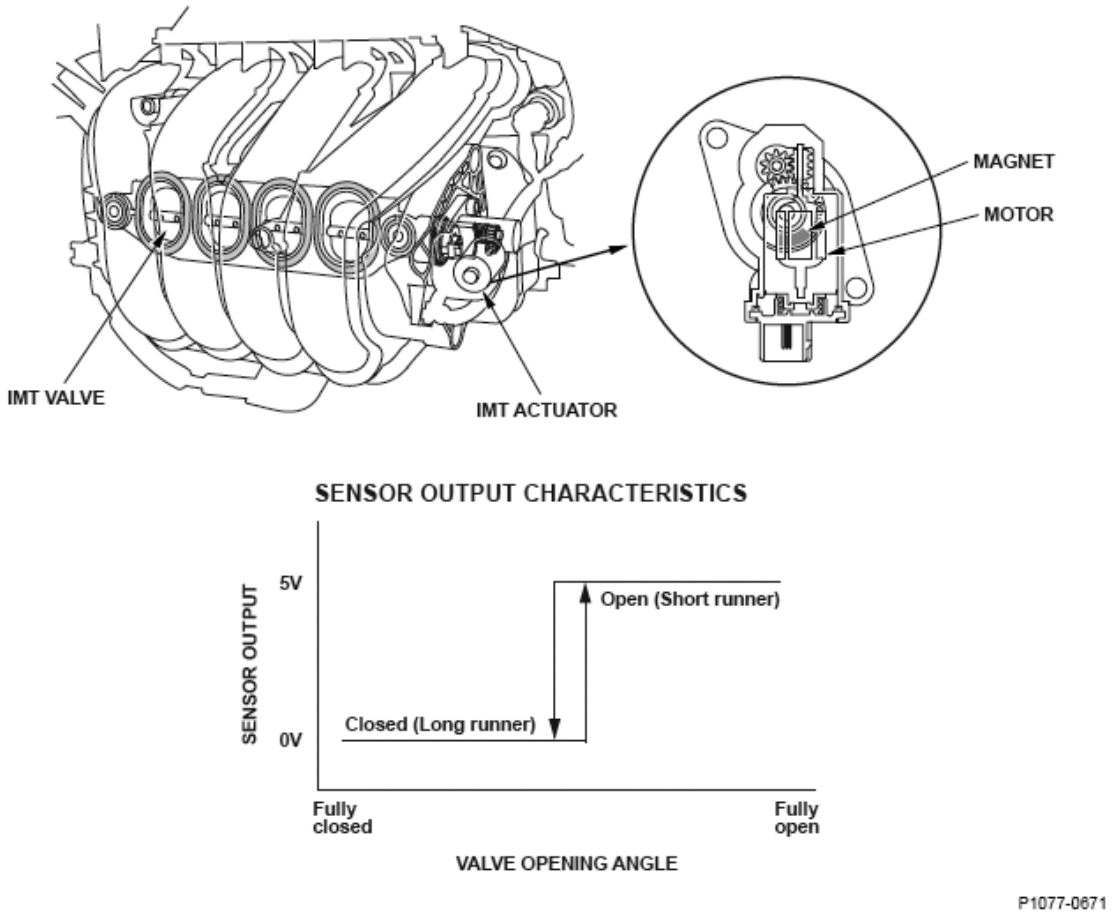

Fig. 488: Identifying IMT Valve And IMT Actuator Location

General Description (R18A4 Engine)

The intake manifold tuning (IMT) system controls engine output by selecting either long or short intake runner lengths. The system consists of the IMT valve, the IMT actuator, and the powertrain control module (PCM). The IMT actuator is attached to the intake manifold and it includes the motor and the Hall-effect-IC position sensing unit. The PCM actuates the motor, which operates the IMT valve. When the IMT valve is closed, the long runner is selected, increasing torque at low engine speed. When the IMT valve is open, the short runner is selected, increasing torque at high engine speed. A Hall-effect-IC position sensing unit is integrated with the motor to provide precise open/close feedback to the PCM. The IMT actuator sends a long runner return signal to the PCM when the IMT valve is closed, and it sends a short runner return signal when the IMT valve is open.

If the PCM receives no closed return signal when it sends a close command, or if it receives no open return signal when sending an open command to the IMT actuator, for a specified time, it detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A4 Engine)

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	None
Duration	3 seconds or more

DTC Type	Two drive cycles, MIL ON
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions (R18A4 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Intake air temperature	32°F (0°C)	-
Engine speed	5,200 rpm	-
Battery voltage	10.5 V	-
No active DTCs	P0107, P0108, P0112, P0113, P0117, P0118, P0563, P1109, P1128, P1129, P2227, P2228, P2229	

Malfunction Threshold (R18A4 Engine)

When the PCM sends an open (short runner) command, no short runner return signal is received for at least 3 seconds.

Confirmation Procedure with the HDS (R18A4 Engine)

Do the IMT TEST in the INSPECTION MENU with the HDS.

Driving Pattern (R18A4 Engine)

1. Start the engine. Let it idle until the radiator fan comes on.
2. Hold the engine speed to 5,200 rpm or more for at least 3 seconds.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1109 (13): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P1109: BAROMETRIC PRESSURE (BARO) SENSOR CIRCUIT OUT OF RANGE-HIGH (K20Z3 ENGINE)

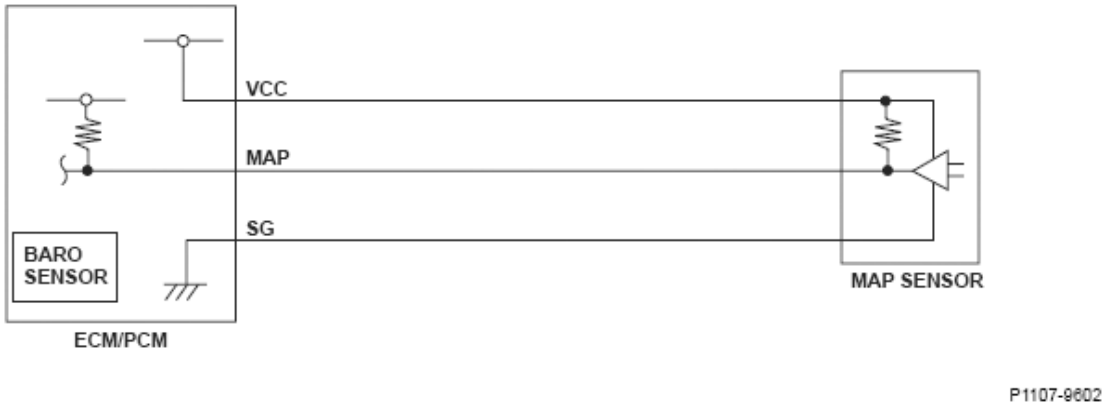

Fig. 489: Barometric Pressure (BARO) Sensor - Circuit Diagram

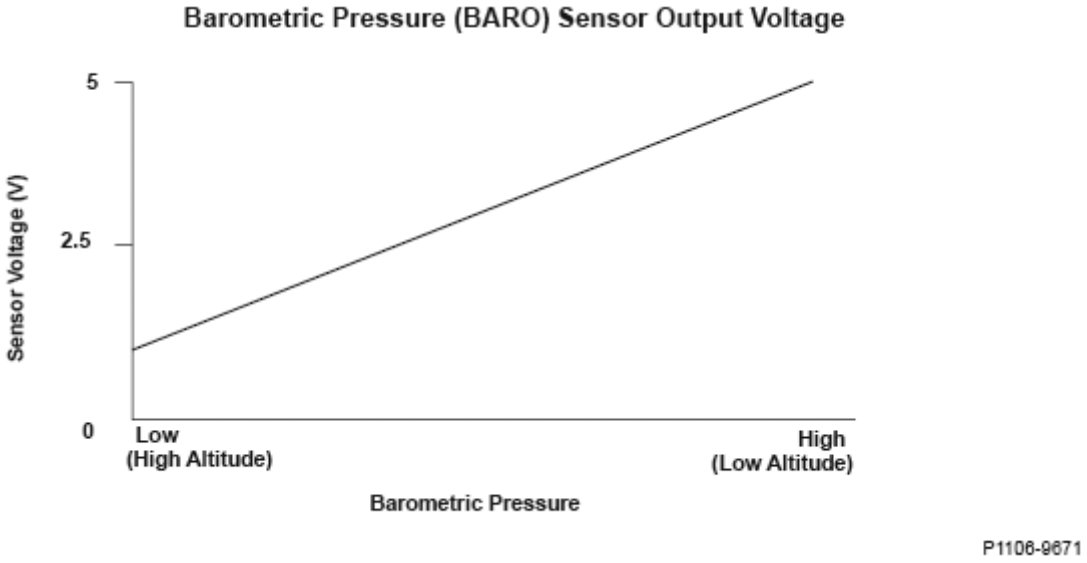

Fig. 490: Barometric Pressure (BARO) Sensor Voltage - Graph

General Description (K20Z3 Engine)

The barometric pressure (BARO) sensor is built into the engine control module (ECM)/powertrain control module (PCM), and it monitors atmospheric pressure. The ECM/PCM estimates appropriate intake airflow from the manifold absolute pressure (MAP) sensor output voltage and BARO sensor output voltage. When BARO sensor output voltage is within the specified range, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

The BARO sensor output voltage is between 3.59 V to 4.49 V for at least 2 seconds.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1116 (86): ADVANCED DIAGNOSTICS (M/T)

DTC P1116: ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1 CIRCUIT RANGE / PERFORMANCE PROBLEM (M/T)

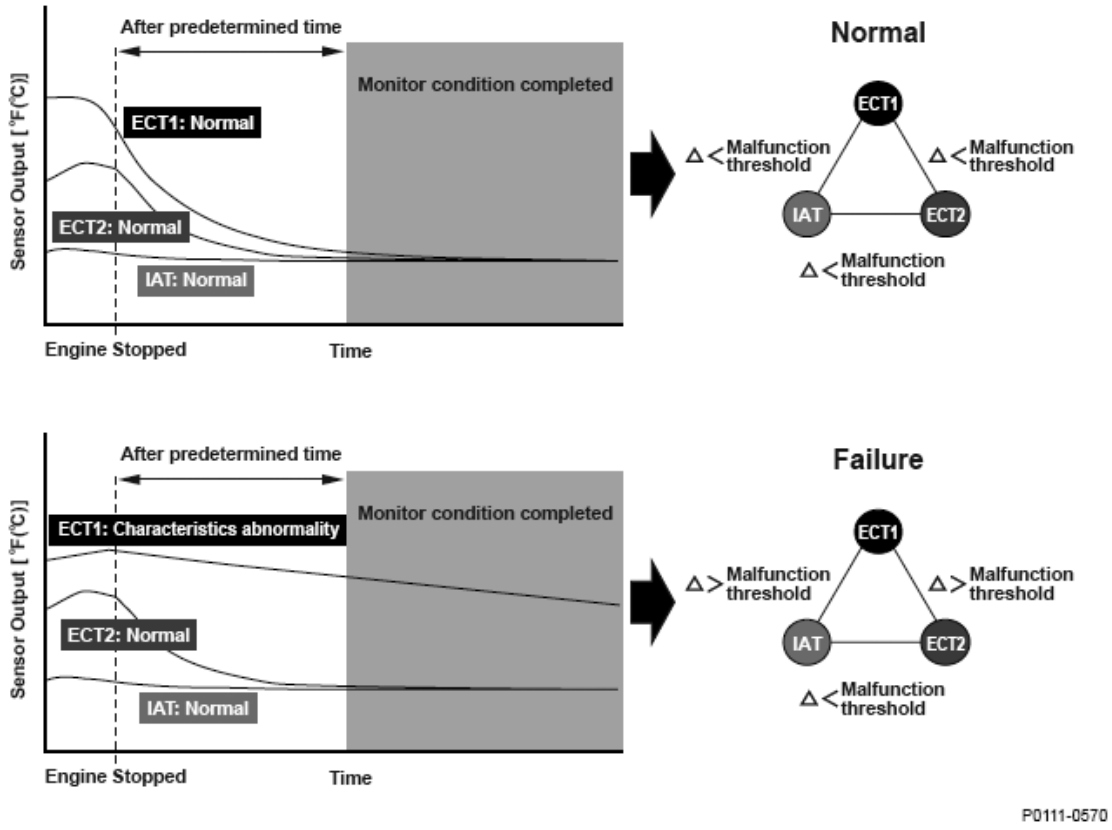

Fig. 495: Intake Air Temperature (IAT) Sensor Circuit Range/Performance Problem - Graph

General Description (M/T)

Two engine coolant temperature sensors and one intake air temperature sensor are used by the engine control module (ECM)/powertrain control module (PCM).

When the engine is stopped and enough time has passed, the temperature of the engine will equal the ambient temperature. When an inappropriate temperature is detected after comparing the temperature readings of each sensor, a malfunction in the corresponding sensor is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (M/T)

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	None
Duration	10 seconds or more
DTC Type	Two drive cycles, MIL ON
OBD Status	N/A

Enable Conditions (M/T)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Engine off time	6 hours	-
No active DTCs	P0111, P0112, P0113, P0116, P0117, P0118, P0125, P2183, P2184, P2185, P2610	

Malfunction Threshold (M/T)

A malfunction is detected if these three conditions are present after the engine and the ignition switch have been off for at least 6 hours:

- When the temperature difference between the IAT and ECT1 is 81°F (45°C)*1, 59°F (33°C)*2 or more.
- When the temperature difference between the IAT and ECT2 is 45°F (25°C)*1, 36°F (20°C)*2 or more.
- When the temperature difference between the ECT2 and ECT1 is 90°F (50°C)*1, 66°F (37°C)*2 or more.

*1: R18A1 engine

*2: K20Z3 engine

Driving Pattern (M/T)

1. Turn the ignition off, and wait at least 6 hours.
2. Start the engine, and let it idle for at least 10 seconds.

Diagnosis Details (M/T)

Conditions for illuminating the MIL (M/T)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the ECM/PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Malfunction Threshold (R18A4 Engine)

A malfunction is detected if these three conditions are present after the engine and the ignition switch have been off for at least 6 hours before restarting the engine.

- When the temperature difference between the IAT and ECT1 is 81°F (45°C) or more.
- When the temperature difference between the IAT and ECT2 is 45°F (25°C) or more.
- When the temperature difference between the ECT2 and ECT1 is 90°F (50°C) or more.

Driving Pattern (R18A4 Engine)

1. Turn the ignition off, and wait at least 6 hours.
2. Start the engine, and let it idle for at least 10 seconds.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1128 (5): ADVANCED DIAGNOSTICS (M/T)

DTC P1128: MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR SIGNAL LOWER THAN EXPECTED (M/T)

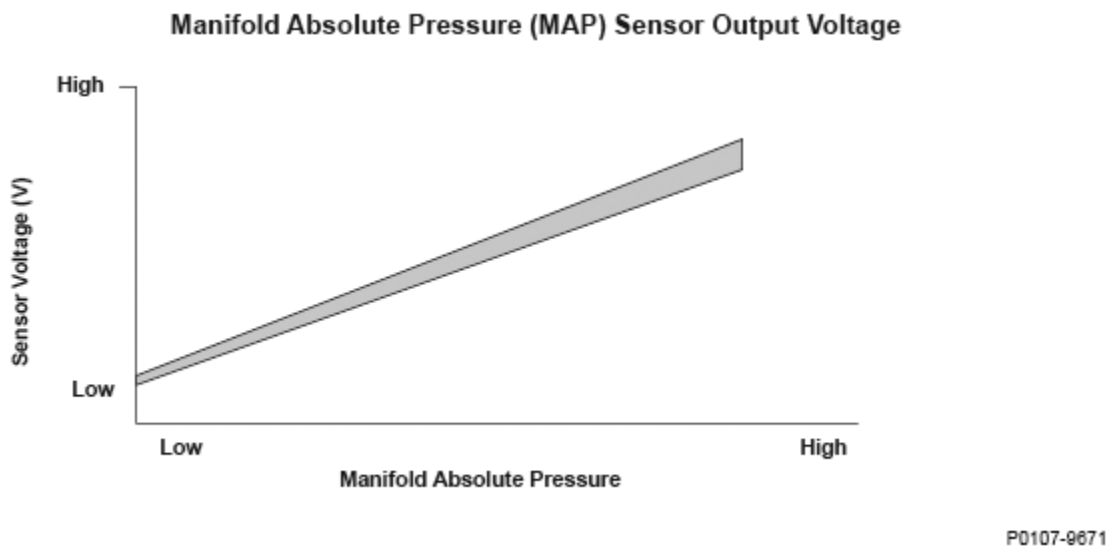

Fig. 498: Manifold Absolute Pressure (MAP) Sensor Output Voltage - Graph

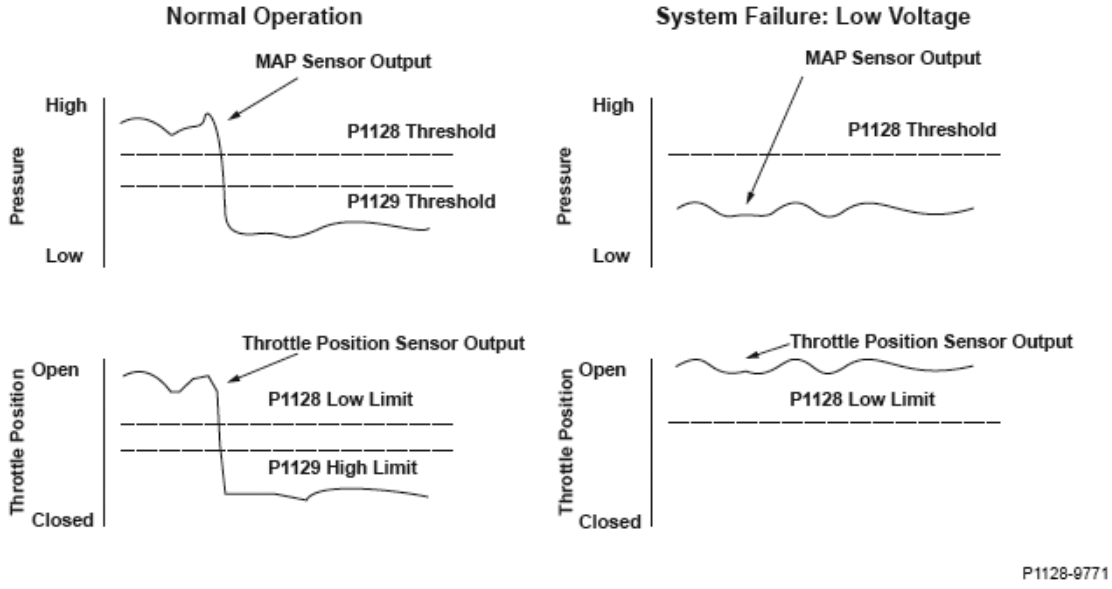

Fig. 499: Manifold Absolute Pressure (MAP) Sensor Signal Lower Than Expected - Graph

General Description (M/T)

The manifold absolute pressure (MAP) sensor senses manifold absolute pressure (vacuum) and converts it into electrical signals. The MAP sensor outputs low signal voltage at high-vacuum (idling) and high signal voltage at low-vacuum (throttle valve wide open).

The engine control module (ECM)/powertrain control module (PCM) compares a predetermined MAP value at a given throttle position and manifold absolute pressure to the output voltage value of the MAP sensor.

If the MAP sensor outputs lower voltage than expected, the ECM/PCM detects a malfunction and stores a DTC.

DTC P1129: MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR SIGNAL HIGHER THAN EXPECTED (M/T)

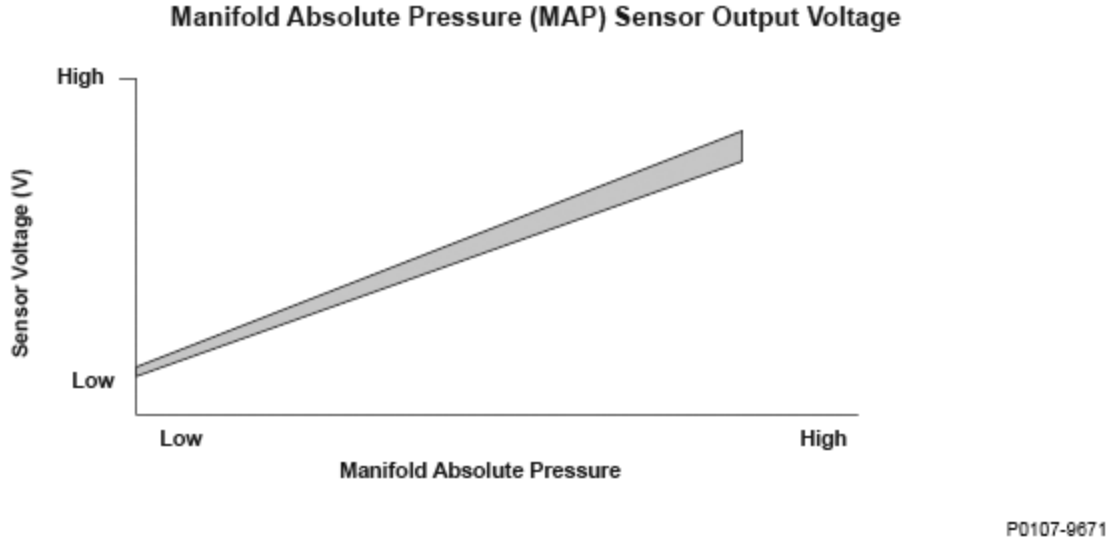

Fig. 504: Manifold Absolute Pressure (MAP) Sensor Output Voltage - Graph

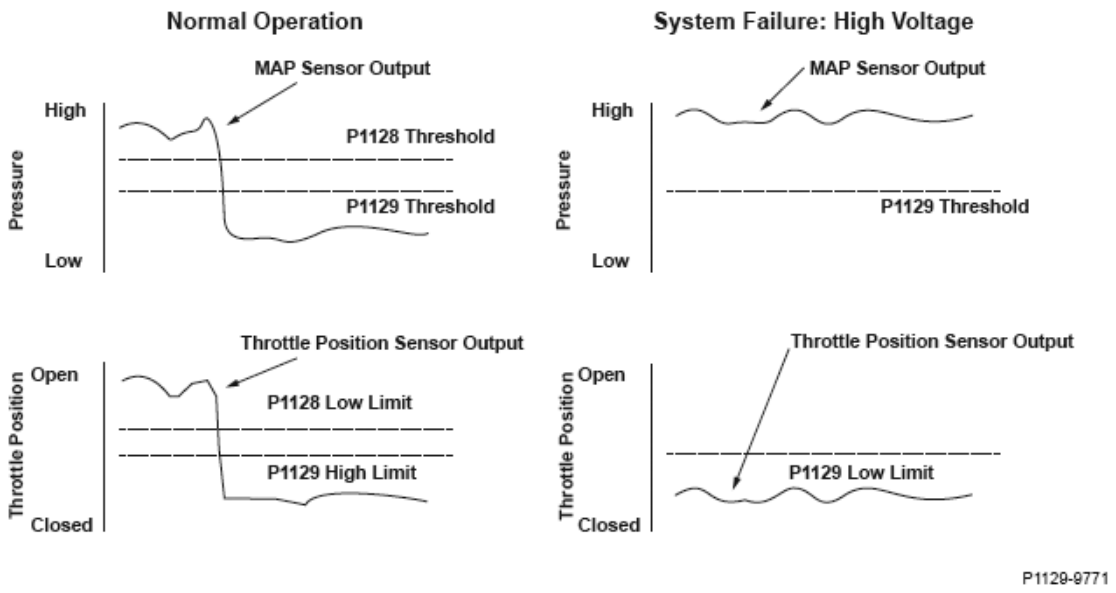

Fig. 505: Manifold Absolute Pressure (MAP) Sensor Signal Higher Than Expected - Graph

General Description (M/T)

The manifold absolute pressure (MAP) sensor senses manifold absolute pressure (vacuum) and converts it into electrical signals. The MAP sensor outputs low signal voltage at high-vacuum (throttle valve closed) and high signal voltage at low-vacuum (throttle valve wide open).

The engine control module (ECM)/powertrain control module (PCM) compares a predetermined MAP value at a given throttle position and manifold absolute pressure to the output voltage value of the MAP sensor.

If the MAP sensor outputs high voltage during fuel cut-off operation for deceleration with the throttle valve fully closed, which should make the manifold absolute pressure lower, the ECM/PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (M/T)

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	None
Duration	2 seconds or more
DTC Type	Two drive cycles, MIL ON
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions (M/T)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Elapsed time after the VTEC system changes(1)	3 seconds	-
Engine coolant temperature	156°F (69°C)	-
Engine speed	1,200 rpm(1)	5,400 rpm(1)

	1,300 rpm(2)	7,700 rpm(2)
Vehicle speed	15 mph (24 km/h)	-
Fuel feedback	During deceleration	
Throttle position	Fully closed	
No active DTCs	P0107, P0108, P0112, P0113, P0117, P0118, P0122, P0123, P0171, P0172, P0222, P0223, P0300, P0301, P0302, P0303, P0304, P0351,(1) P0352(1), P0353(1), P0354(1), P0401(1), P0404(1), P0443, P0496, P0497, P0506, P0507, P1077(1), P1078(1), P1128, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176, P2413(1), P2646, P2647, P2648, P2649	
(1) R18A1 engine (2) K20Z3 engine		

Malfunction Threshold (M/T)

The MAP sensor output is 37 kPa (10.9 in.Hg, 277 mmHg) or more for at least 2 seconds.

Driving Pattern (M/T)

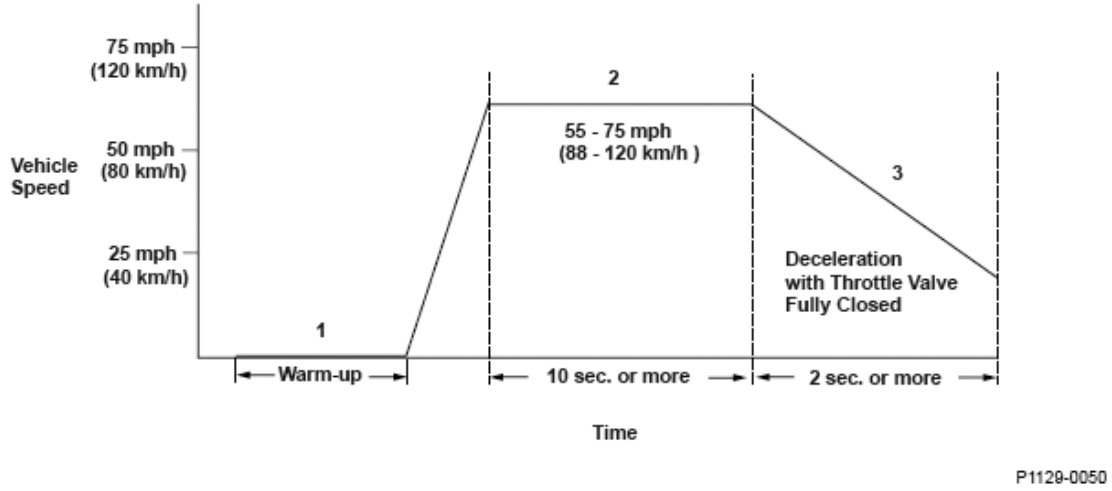

Fig. 506: Identifying Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Drive the vehicle at a steady speed between 55 - 75 mph (88 - 120 km/h) for at least 10 seconds.
3. Then, decelerate with the throttle valve fully closed for at least 2 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (M/T)

Conditions for illuminating the MIL (M/T)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the ECM/PCM

memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (M/T)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1129 (5): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P1129: MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR SIGNAL HIGHER THAN EXPECTED (R18A1 ENGINE)

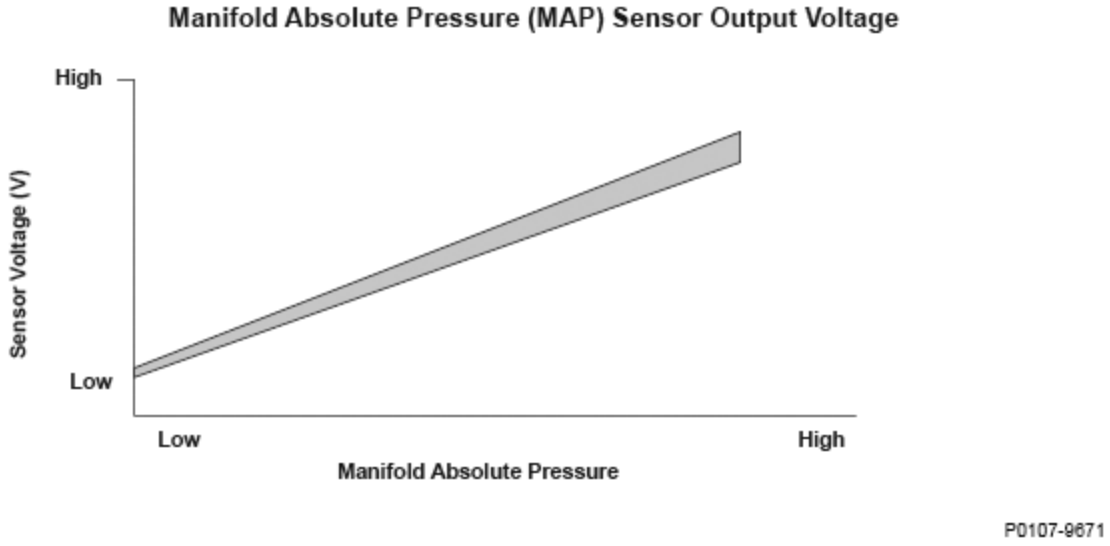

Fig. 507: Manifold Absolute Pressure (MAP) Sensor Output Voltage - Graph

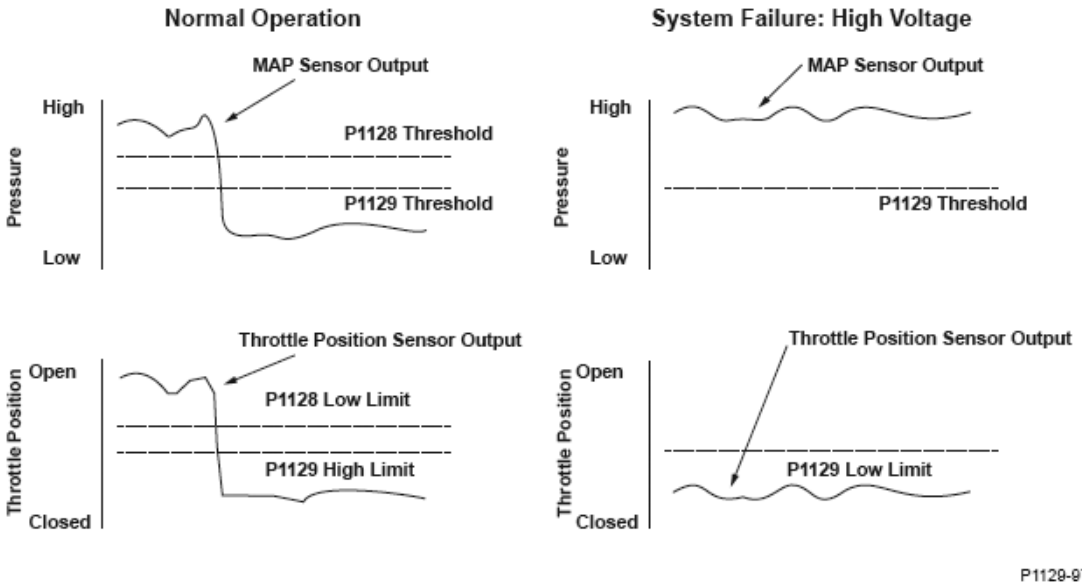

Fig. 508: Manifold Absolute Pressure (MAP) Sensor Signal Higher Than Expected - Graph

General Description (R18A1 Engine)

The manifold absolute pressure (MAP) sensor senses manifold absolute pressure (vacuum) and converts it into electrical signals. The MAP sensor outputs low signal voltage at high-vacuum (throttle valve closed) and high signal voltage at low-vacuum (throttle valve wide open).

The engine control module (ECM)/powertrain control module (PCM) compares a predetermined MAP value at a given throttle position and manifold absolute pressure to the output voltage value of the MAP sensor.

If the MAP sensor outputs high voltage during fuel cut-off operation for deceleration with the throttle valve fully closed, which should make the manifold absolute pressure lower, the ECM/PCM detects a malfunction and stores a DTC.

DTC P1157 (48): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P1157: AIR/FUEL RATIO (A/F) SENSOR (SENSOR 1) AFS CIRCUIT MALFUNCTION (K20Z3 ENGINE)

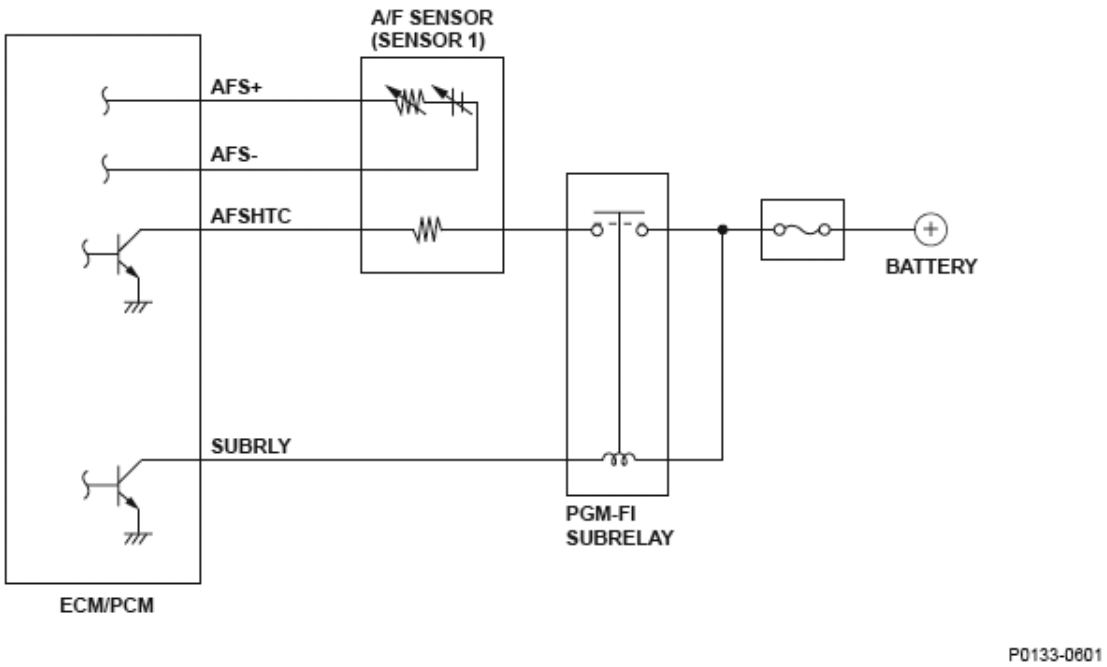

Fig. 513: Air/Fuel Ratio (A/F) Sensor - Circuit Diagram

General Description (K20Z3 Engine)

The air/fuel ratio (A/F) sensor (sensor 1) is installed in the exhaust system and detects oxygen content in the

exhaust gas. The A/F sensor outputs voltage to the engine control module (ECM)/powertrain control module (PCM). A heater for the sensor element is embedded in the A/F sensor (sensor 1). When activated, it heats the sensor to stabilize and speed up the detection of oxygen content by controlling current flow through the heater. The current diminishes as the voltage applied to the element reaches a certain range because the amount of oxygen that passes through the diffusion layer is limited. The current is proportional to the oxygen content in the exhaust gas, so the air/fuel ratio is detected by the measurement of the current. The ECM/PCM compares the set target air/fuel ratio to the detected air/fuel ratio and adjusts the fuel injection duration.

If the A/F sensor (sensor 1) voltage is low, the air/fuel ratio is lean, and the ECM/PCM uses A/F feedback control to issue a Rich command. If the A/F sensor (sensor 1) voltage is high, the air/fuel ratio is rich, and the ECM/PCM uses A/F feedback control to issue a Lean command.

If the element is not activated for a set time when power is drawn by the A/F sensor (sensor 1) heater, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1172 (61): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P1172: AIR/FUEL RATIO (A/F) SENSOR (SENSOR 1) CIRCUIT OUT OF RANGE HIGH (K20Z3)

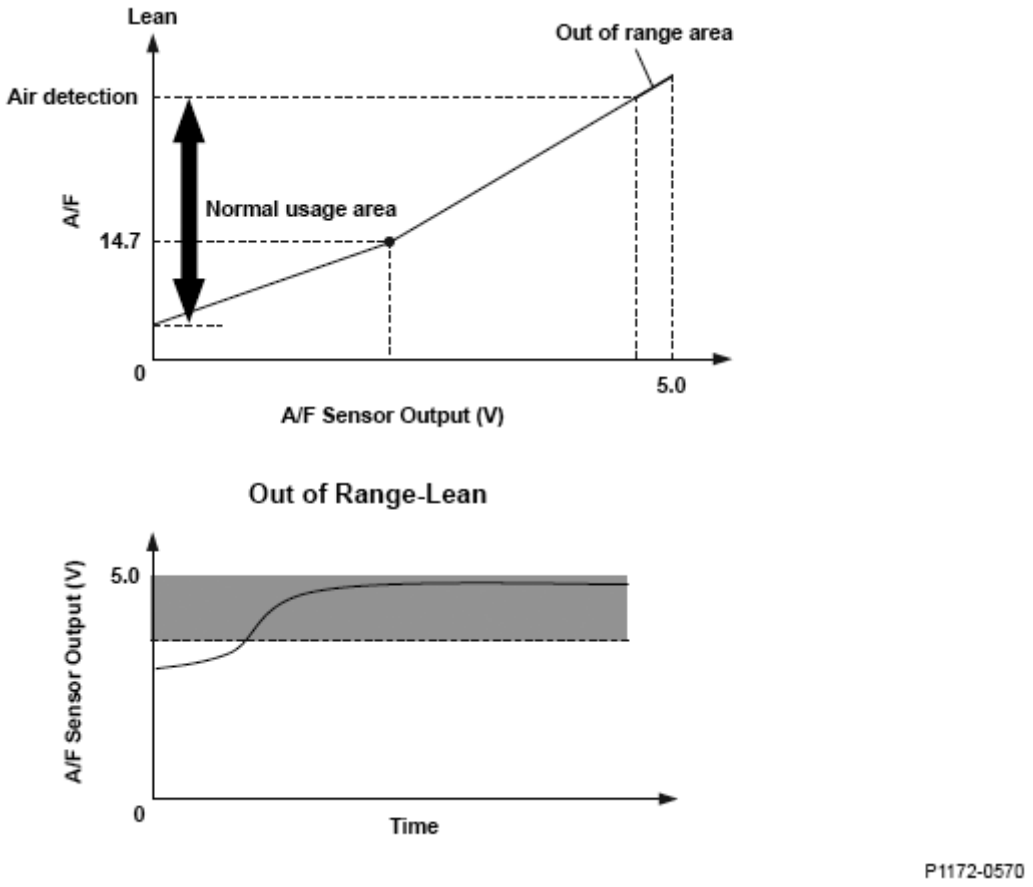

Fig. 516: Air/Fuel Ratio (A/F) Sensor Voltage - Graph

General Description (K20Z3 Engine)

If a malfunction causes the air/fuel sensor value sent to the engine control module (ECM) to deviate from the normal control area, the air/fuel (A/F) sensor may still become active after the engine starts, but the air/fuel feedback does not start normally and the emissions deteriorate. When the A/F sensor output is out of the normal area, and this condition continues after the A/F sensor is active, the ECM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

DTC P1187 (98): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P1187: FUEL TANK TEMPERATURE (FTT) SENSOR CIRCUIT LOW VOLTAGE (R18A4 ENGINE)

Fig. 519: Fuel Tank Temperature (FTT) Sensor - Circuit Diagram

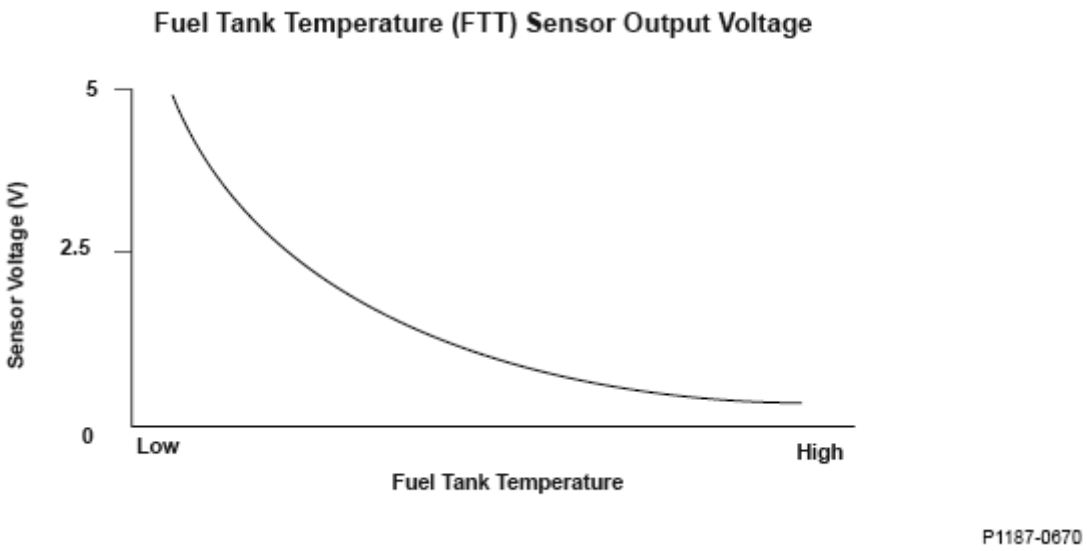

Fig. 520: Fuel Tank Temperature (FTT) Sensor Output Voltage Graph

General Description (R18A4 Engine)

The fuel tank temperature (FTT) sensor is located on the fuel joint block and detects the temperature of the fuel. This signal is used to calculate injector duration.

The sensor's resistance varies depending on the fuel temperature sensed by its thermistor. As the fuel temperature falls, the sensor resistance increases, resulting in an increase of sensor output voltage. As the fuel temperature rises, the sensor resistance decreases, resulting in a decrease of sensor output voltage.

If the fuel tank temperature (FTT) sensor output voltage is excessively low, the powertrain control module (PCM) detects a malfunction and stores a DTC.

No active DTCs	P1188

Malfunction Threshold (R18A4 Engine)

The fuel tank temperature (FTT) sensor output voltage is 0.08 V or less for at least 2 seconds.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the indicator (R18A4 Engine)

When a malfunction is detected, the DTC and the freeze frame data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC (R18A4 Engine)

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1188 (98): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P1188: FUEL TANK TEMPERATURE (FTT) SENSOR CIRCUIT HIGH VOLTAGE (R18A4 ENGINE)

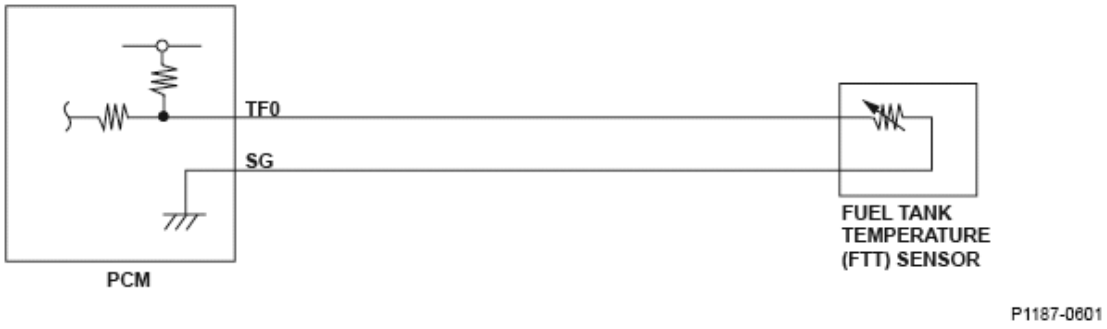

Fig. 521: Fuel Tank Temperature (FTT) Sensor - Circuit Diagram

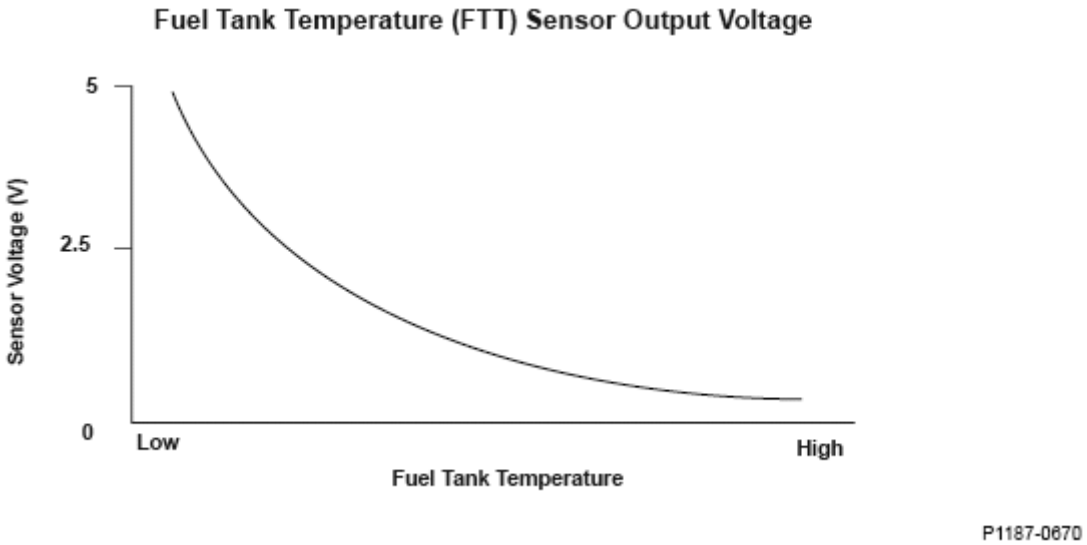

Fig. 522: Fuel Tank Temperature (FTT) Sensor Output Voltage Graph

General Description (R18A4 Engine)

The fuel tank temperature (FTT) sensor is located on the fuel joint block and detects the temperature of the fuel. This signal is used to calculate injector duration.

The sensor's resistance varies depending on the fuel temperature sensed by its thermistor. As the fuel temperature falls, the sensor resistance increases, resulting in an increase of sensor output voltage. As the fuel temperature rises, the sensor resistance decreases, resulting in a decrease of sensor output voltage.

If the fuel tank temperature (FTT) sensor output voltage is excessively high, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A4 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	One drive cycle, MIL OFF
OBD Status	N/A

Enable Conditions (R18A4 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	
Ignition switch	ON
No active DTCs	P1187

Malfunction Threshold (R18A4 Engine)

The fuel tank temperature (FTT) sensor output voltage is 4.92 V or more for at least 2 seconds.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the indicator (R18A4 Engine)

When a malfunction is detected, the DTC and the freeze frame data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC (R18A4 Engine)

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1192 (97): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P1192: FUEL TANK PRESSURE (FTP) SENSOR CIRCUIT LOW VOLTAGE (R18A4 ENGINE)

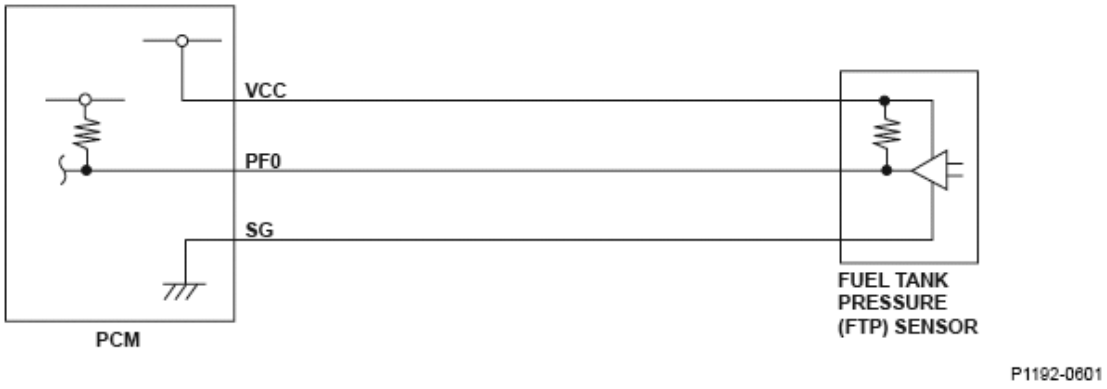

Fig. 523: Fuel Tank Pressure (FTP) Sensor - Circuit Diagram

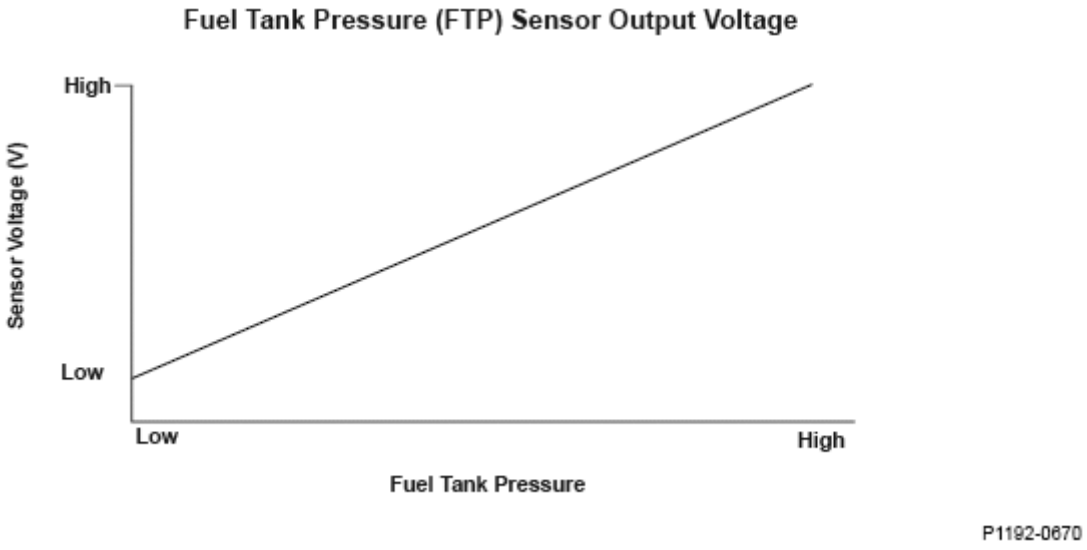

Fig. 524: Fuel Tank Pressure (FTP) Sensor Output Voltage Graph

General Description (R18A4 Engine)

The fuel tank pressure (FTP) sensor senses fuel tank absolute pressure and converts it into electrical signals. The fuel tank pressure (FTP) sensor outputs low signal voltage at low-fuel pressure and high signal voltage at high-fuel pressure.

If the fuel tank pressure (FTP) sensor output voltage is a set value or less, the powertrain control module (PCM) detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A4 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	One drive cycle, MIL OFF
OBD Status	N/A

ENABLE CONDITIONS REFERENCE CHART

Condition	
Ignition switch	ON
No active DTCs	P1193

Malfunction Threshold (R18A4 Engine)

The fuel tank pressure (FTP) sensor output voltage is 0.23 V or less for at least 2 seconds.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the indicator (R18A4 Engine)

When a malfunction is detected, the DTC and the freeze frame data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC (R18A4 Engine)

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1193 (97): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P1193: FUEL TANK PRESSURE (FTP) SENSOR CIRCUIT HIGH VOLTAGE (R18A4 ENGINE)

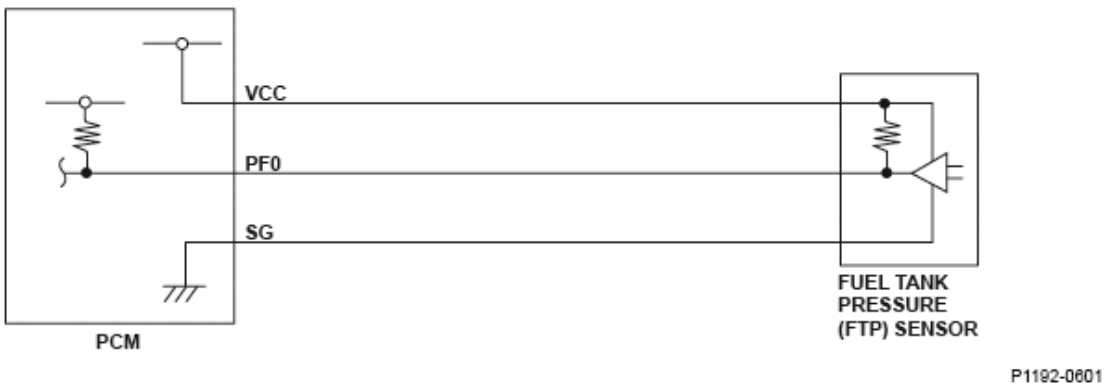

Fig. 525: Fuel Tank Pressure (FTP) Sensor - Circuit Diagram

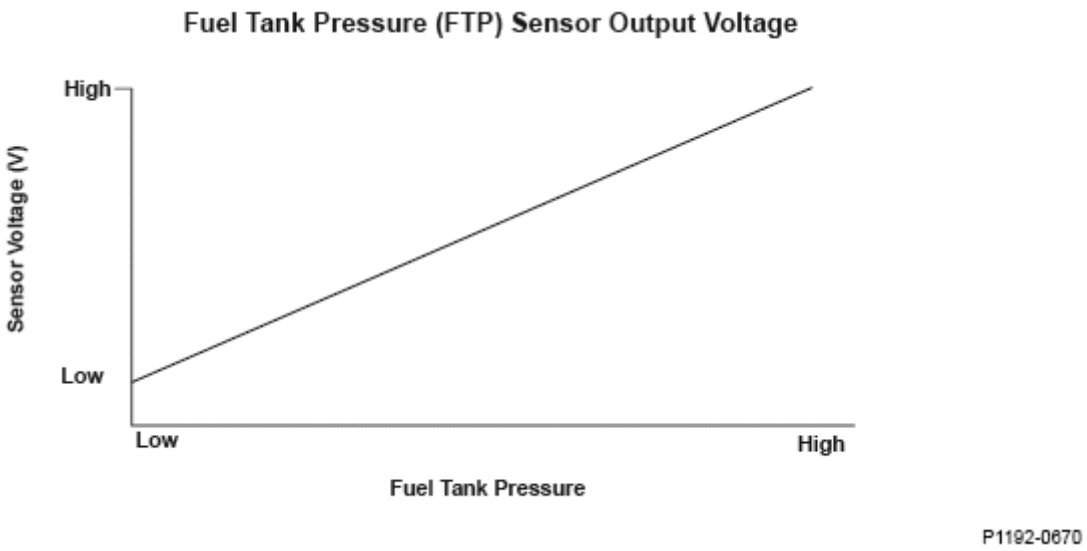

Fig. 526: Fuel Tank Pressure (FTP) Sensor Output Voltage Graph

General Description (R18A4 Engine)

The fuel tank pressure (FTP) sensor senses fuel tank absolute pressure and converts it into electrical signals. The fuel tank pressure (FTP) sensor outputs low signal voltage at low-fuel pressure and high signal voltage at high-fuel pressure.

If the fuel tank pressure (FTP) sensor output voltage is a set value or more, the powertrain control module (PCM) detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A4 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	One drive cycle, MIL OFF
OBD Status	N/A

Enable Conditions (R18A4 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	
Ignition switch	ON
No active DTCs	P1192

Malfunction Threshold (R18A4 Engine)

The fuel tank pressure (FTP) sensor output voltage is 4.61 V or more for at least 2 seconds.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the indicator (R18A4 Engine)

When a malfunction is detected, the DTC and the freeze frame data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC (R18A4 Engine)

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1297 (20): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P1297: ELECTRICAL LOAD DETECTOR (ELD) CIRCUIT LOW VOLTAGE (K20Z3 ENGINE)

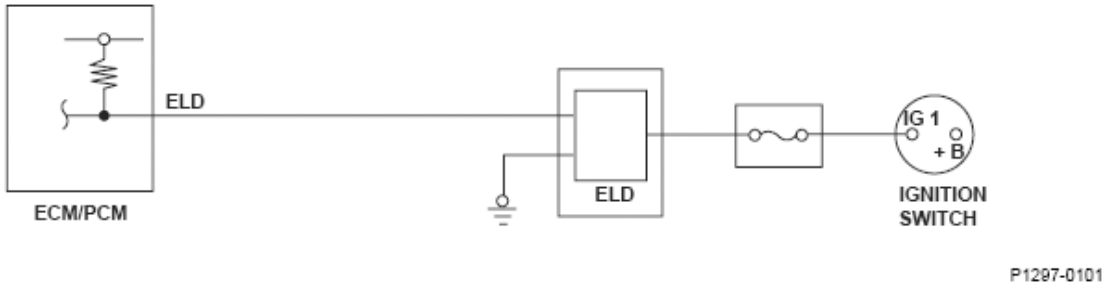

Fig. 527: Electrical Load Detector (ELD) Low Voltage - Circuit Diagram

General Description (K20Z3 Engine)

The electrical load detector (ELD) is built into the under-hood fuse/relay box. It monitors the current fed to the ignition switch and sends a signal to the engine control module (ECM)/powertrain control module (PCM). If the ELD output voltage is extremely low, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

Conditions for illuminating the indicator (R18A4 Engine)

When a malfunction is detected, the DTC and the freeze frame data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC (R18A4 Engine)

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1454 (91): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P1454: FUEL TANK PRESSURE (FTP) SENSOR RANGE/PERFORMANCE PROBLEM (K20Z3)

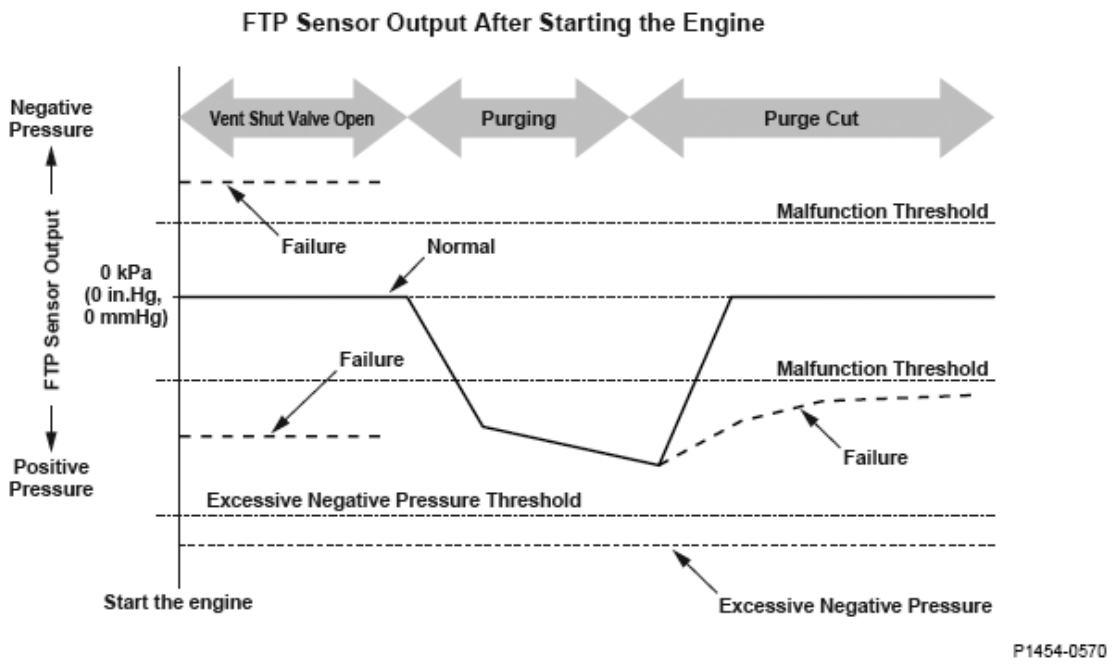

Fig. 533: Fuel Tank Pressure (FTP) - Graph

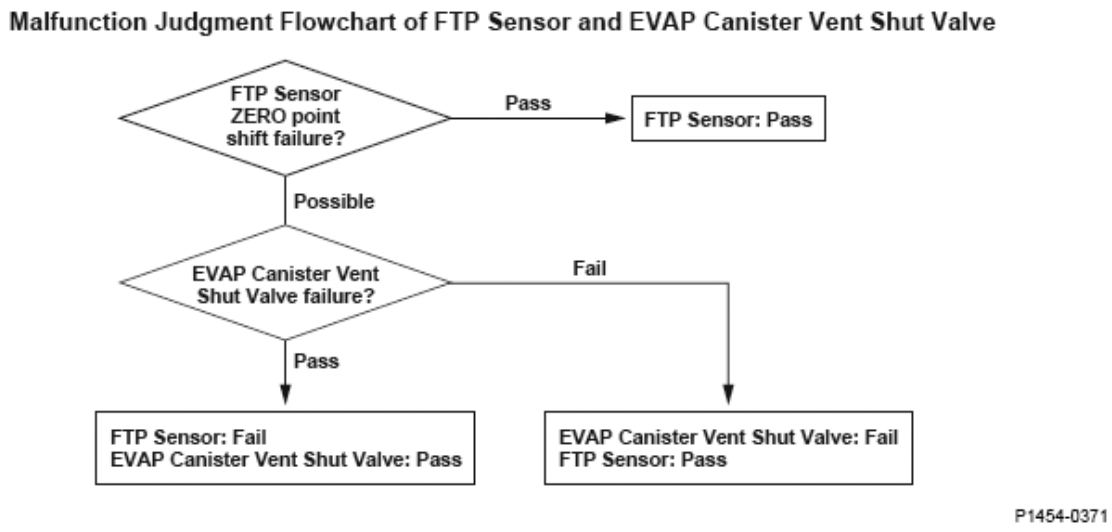

Fig. 534: Flow Chart

General Description (K20Z3 Engine)

The fuel tank pressure is about 0 kPa (0 in.Hg, 0 mmHg) when starting a cold engine. When the fuel tank pressure (FTP) sensor output value is out of a specified range and the engine control module (ECM) judges that there's no other cause [no evaporative emission (EVAP) canister vent shut valve failure, etc.] of the FTP sensor zero point shift, the ECM detects an FTP sensor malfunction.

However, if the FTP sensor output when starting the engine is a prescribed negative value or less (excessive negative pressure is detected), the malfunction judgment should be done as follows because it is difficult to distinguish the FTP sensor zero point shift (P1454) from the EVAP canister vent shut valve failure (P2422).

1. If either Temporary DTC P1454 or P2422 is not stored, the ECM stores both DTCs.

2. If both P1454 and P2422 Temporary DTCs are stored and an excessive negative pressure is detected, both P1454 and P2422 DTCs are stored.
3. If either Temporary DTC P1454 or P2422 is stored and an excessive negative pressure is detected, the ECM stores the DTC of the temporary DTC that was stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	P0452, P0453 are judged as OK
Duration	8 seconds or more
DTC Type	Two drive cycles, MIL ON
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions (K20Z3 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Elapsed time after starting the engine	10 seconds	-
No active DTCs	P0101, P0102, P0103, P0107, P0108, P0117, P0118, P0134, P0135, P0300, P0301, P0302, P0303, P0304, P0335, P0339, P0443, P0451, P0452, P0453, P0496, P0497, P0498, P0499, P1128, P1129, P1157, P1172, P2195, P2227, P2228, P2229, P2238, P2252, P2422	
Others	The EVAP canister vent shut valve has not been closing	
	Stopping the purge control	

Malfunction Threshold (K20Z3 Engine)

- The FTP sensor output fluctuates by 0.7 kPa (0.2 in.Hg, 5 mmHg) or more, or -0.7 kPa (-0.2 in.Hg, -5 mmHg) or less, for at least 8 seconds.
- The FTP sensor output value is -1.3 kPa (-0.3 in.Hg, -10 mmHg) or less for at least 8 seconds.

Confirmation Procedure with the HDS (K20Z3 Engine)

Do the EVAP CVS ON in the INSPECTION MENU with the HDS.

Driving Pattern (K20Z3 Engine)

Start the engine, and let it idle until the radiator fan comes on.

Diagnosis Details (K20Z3 Engine)

Conditions for illuminating the MIL (K20Z3 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the ECM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (K20Z3 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1454 (91): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P1454: FUEL TANK PRESSURE (FTP) SENSOR RANGE/PERFORMANCE PROBLEM (R18A1)

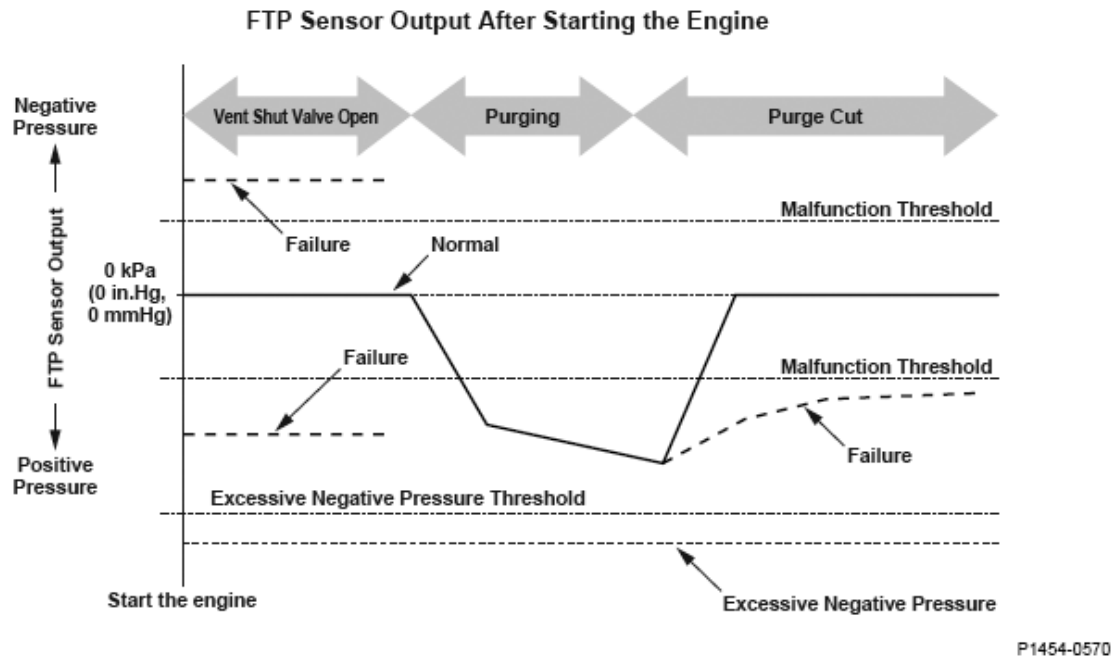

Fig. 535: Fuel Tank Pressure (FTP) - Graph

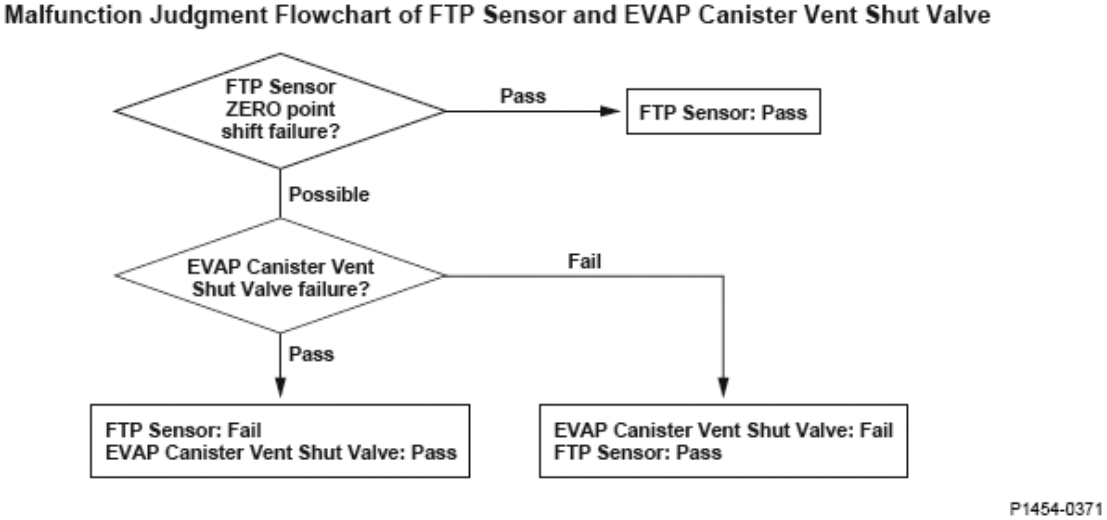

Fig. 536: FTP Sensor And EVAP Canister Vent Shut Valve Chart

General Description (R18A1 Engine)

The fuel tank pressure is about 0 kPa (0 in.Hg, 0 mmHg) when starting a cold engine. When the fuel tank pressure (FTP) sensor output value is out of a specified range and the engine control module (ECM)/powertrain control module (PCM) judges that there's no other cause [no evaporative emission (EVAP) canister vent shut valve failure, etc.] of the FTP sensor zero point shift, the ECM/PCM detects an FTP sensor malfunction.

However, if the FTP sensor output when starting the engine is a prescribed negative value or less (excessive negative pressure is detected), the malfunction judgment should be done as follows because it is difficult to distinguish the FTP sensor zero point shift (P1454) from the EVAP canister vent shut valve failure (P2422).

1. If either Temporary DTC P1454 or P2422 is not stored, the ECM/PCM stores both DTCs.
2. If both P1454 and P2422 Temporary DTCs are stored and an excessive negative pressure is detected, both P1454 and P2422 DTCs are stored.
3. If either Temporary DTC P1454 or P2422 is stored and an excessive negative pressure is detected, the ECM/PCM stores the DTC of the temporary DTC that was stored.

Malfunction Threshold (R18A1 Engine)

- The FTP sensor output fluctuates by 0.7 kPa (0.2 in.Hg, 5 mmHg) or more, or -0.7 kPa (-0.2 in.Hg, -5 mmHg) or less, for at least 3 seconds.
- The FTP sensor output value is -1.3 kPa (-0.3 in.Hg, -10 mmHg) or less for at least 3 seconds.

Confirmation Procedure with the HDS (R18A1 Engine)

Do the EVAP CVS ON in the INSPECTION MENU with the HDS.

Driving Pattern (R18A1 Engine)

Start the engine, and let it idle until the radiator fan comes on.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the ECM/PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P145C (90): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P145C: EVAPORATIVE EMISSION (EVAP) SYSTEM PURGE FLOW MALFUNCTION (K20Z3)

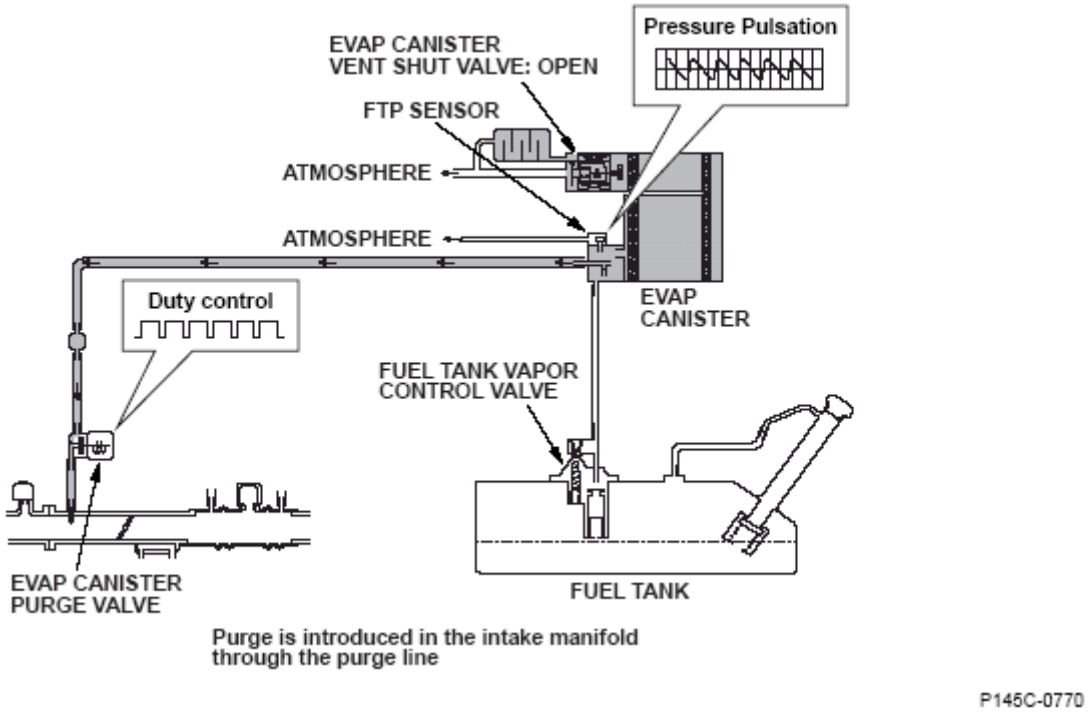

Fig. 537: Evaporative Emission System Purge Flow Diagram (Vacuum Line)

General Description (K20Z3 Engine)

The fuel (vapor) vaporized in the fuel tank is stored in the canister temporarily and introduced in the engine through the evaporative emission (EVAP) canister purge valve. The engine control module (ECM) controls the amount of vapor introduced in the engine by repeatedly switching the power of the EVAP canister purge valve at a constant frequency according to the condition of the engine.

< STEP 1 >

The EVAP canister purge valve opens normally (EVAP canister purge valve OPEN OK) and detects that the purge flow is normal when the pulse of the EVAP canister purge valve drive cycle is transmitted to fuel tank pressure (FTP) sensor by the purge flow (pulse method).

OK determination: Pulse exists (P145C OK)

- P0497 Purge flow OK
- P0496 EVAP canister purge valve stuck Open OK

NG determination: No pulse (P145C NG)

- Either purge flow P0497 abnormality or P0496 EVAP canister purge valve OPEN failure.
- In this case, classify the failure part according to < STEP 2 >.

< STEP 2 >

If there is no pulse, it is determined as either no purge flow or the EVAP canister purge valve is stuck OPEN:

When the FTP sensor fluctuates from negative pressure to atmospheric pressure after the ignition is turned off: P0496 EVAP canister purge valve stuck OPEN

When there is no fluctuation of the FTP sensor: P0497 purge flow NG

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

No active DTCs	P0101, P0102, P0103, P0107, P0108, P0117, P0118, P0134, P0135, P0300, P0301, P0302, P0303, P0304, P0335, P0339, P0443, P0451, P0452, P0453, P0496, P0498, P0499, P0685, P1128, P1129, P1157, P1172, P1454, P2195, P2227, P2228, P2229, P2238, P2252, P2422	

Malfunction Threshold (K20Z3 Engine)

The pulse method from the fuel tank pressure sensor is 0.30 % or less for at least 31 seconds.

Confirmation Procedure with the HDS (K20Z3 Engine)

Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

Driving Pattern (K20Z3 Engine)

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on.
2. Let the engine idle for at least 77 seconds.
3. Turn off the ignition for at least 10 seconds.

Diagnosis Details (K20Z3 Engine)

Conditions for illuminating the MIL (K20Z3 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the ECM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (K20Z3 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1549 (34): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P1549: CHARGING SYSTEM HIGH VOLTAGE (K20Z3)

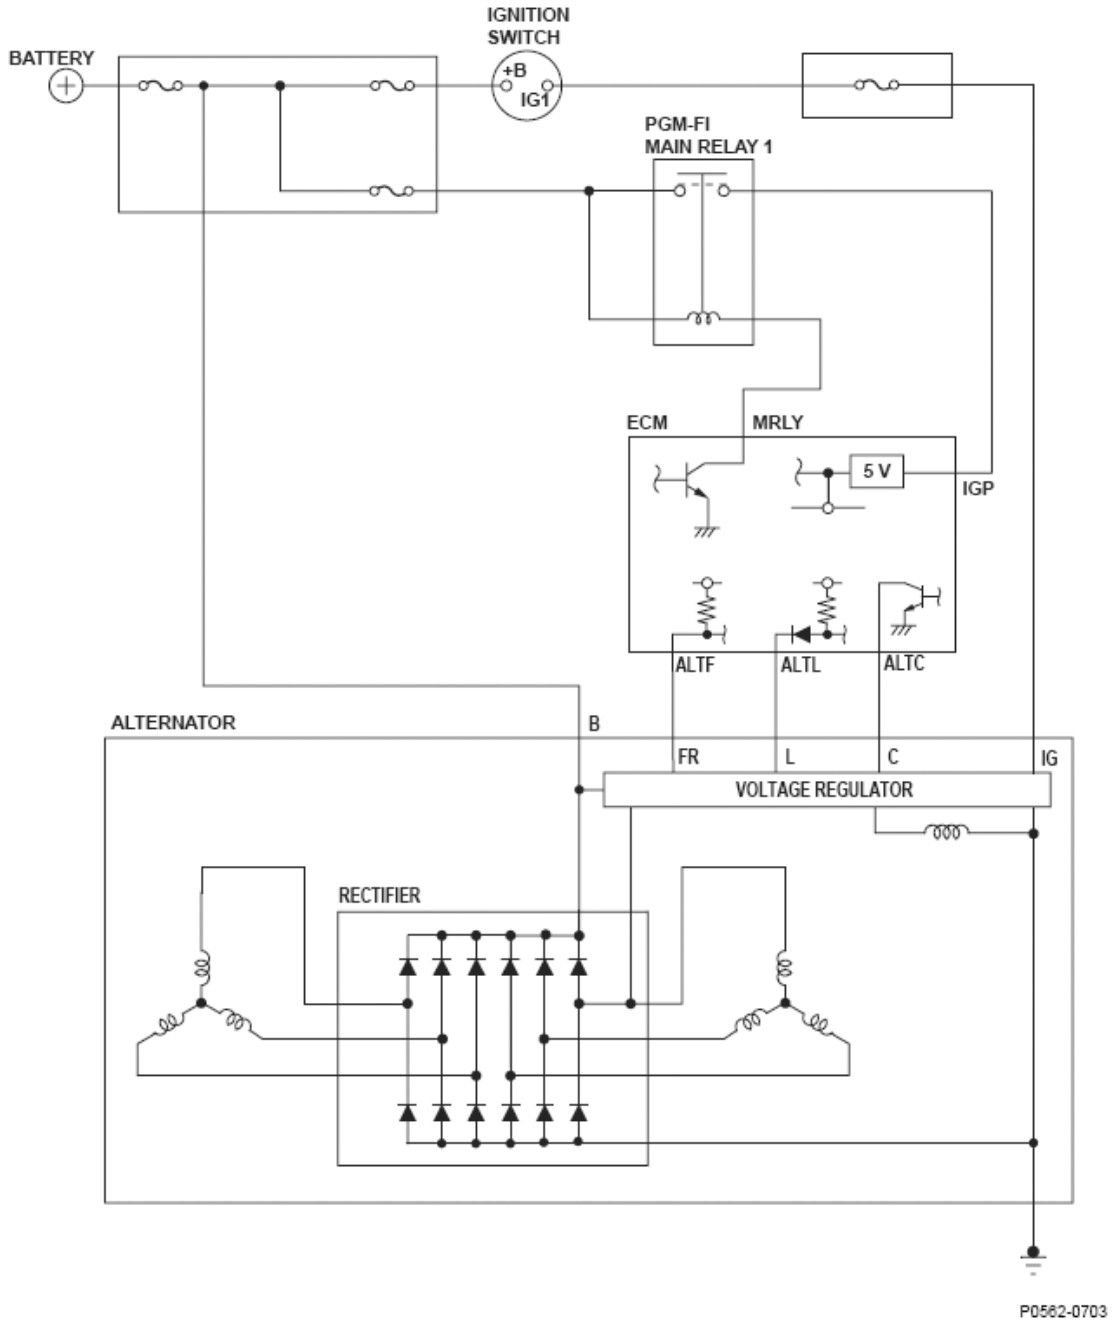

Fig. 538: Charging System Circuit Diagram

General Description (K20Z3 Engine)

The alternator is driven by the engine, and it generates electricity to supply the necessary power to the electrical system and to charge the battery. The alternator voltage target values of 14.5 V and 12.5 V are achieved by switching the alternator control mode (controlled by the engine control module (ECM)). The alternator output signal is sent to the ECM, and it varies according to the battery's state of charge, the electrical load, and the engine speed.

When the IGP terminal voltage of the ECM is a set value or more for a set time, a malfunction is detected and a DTC is stored.

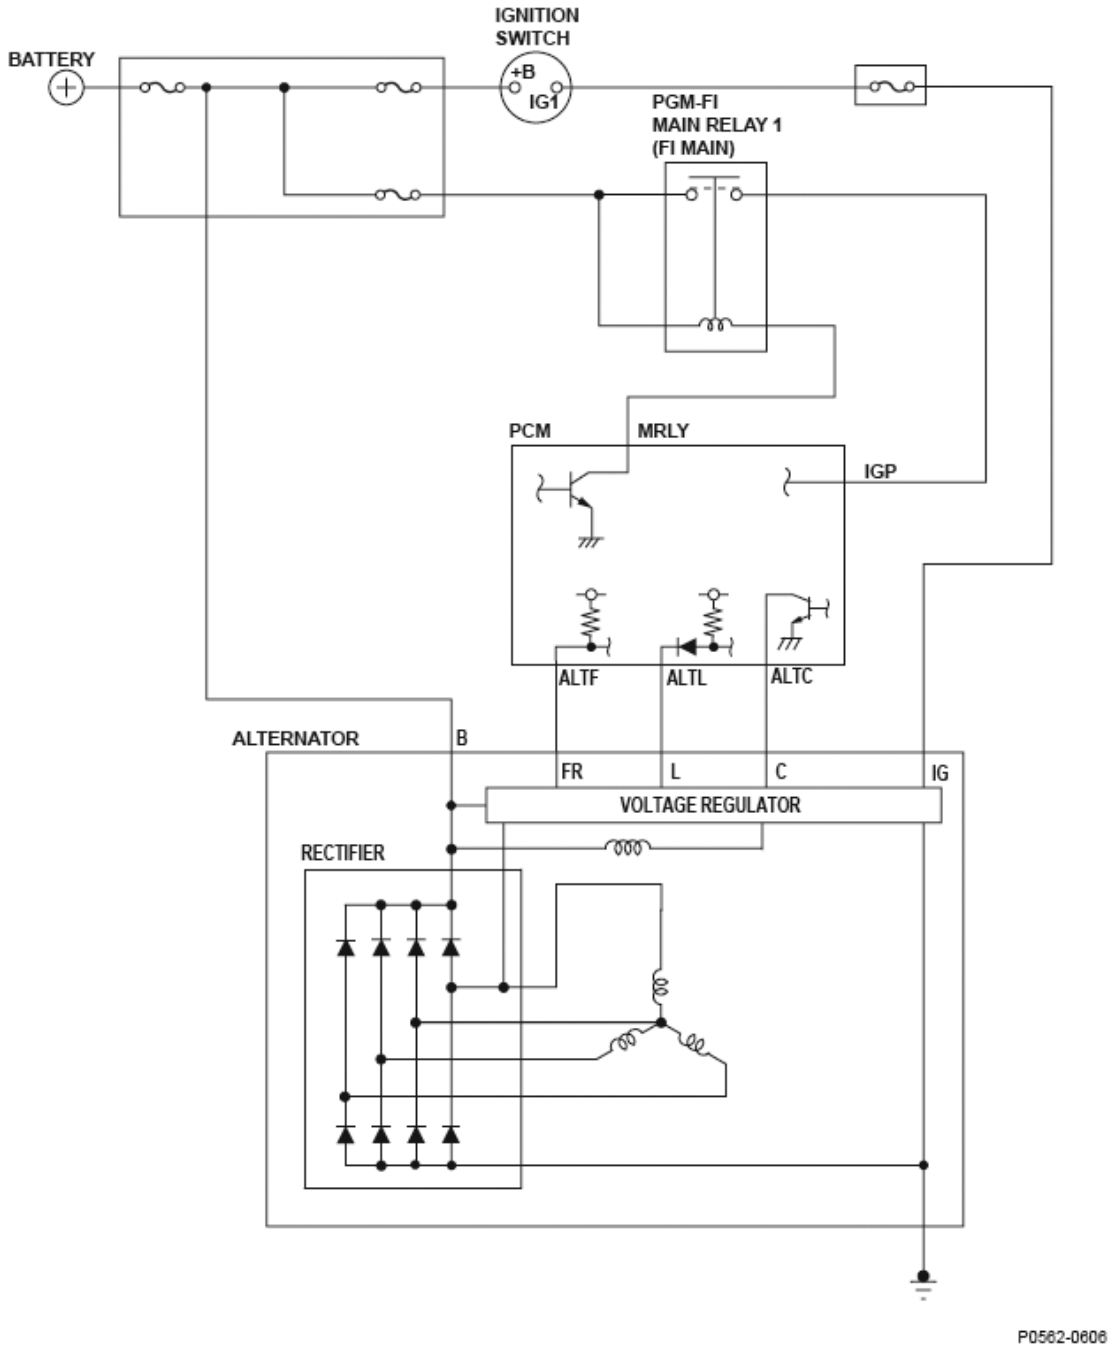

Fig. 540: Charging System - Circuit Diagram

General Description (R18A4 Engine)

The alternator is driven by the engine and generates electricity to supply the necessary power to the electrical system and to charge the battery. The alternator voltage target values of 14.5 V and 12.5 V are achieved by switching the alternator control mode (controlled by the powertrain control module (PCM)). The alternator output signal is sent to the PCM, and it varies according to the battery's state of charge, the electrical load, and engine speed.

When the IGP (power source) terminal voltage is a set value or less for a set time, the PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A4 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	60 seconds or more
DTC Type	One drive cycle, MIL OFF
OBD Status	N/A

Enable Conditions (R18A4 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Engine speed	500 rpm	-

Malfunction Threshold (R18A4 Engine)

The IGP terminal voltage is 16.0 V or more for at least 60 seconds.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the indicator (R18A4 Engine)

When a malfunction is detected, the DTC and the freeze frame data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC (R18A4 Engine)

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1658 (40): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P1658: ELECTRONIC THROTTLE CONTROL SYSTEM (ETCS) CONTROL RELAY ON MALFUNCTION (K20Z3 ENGINE)

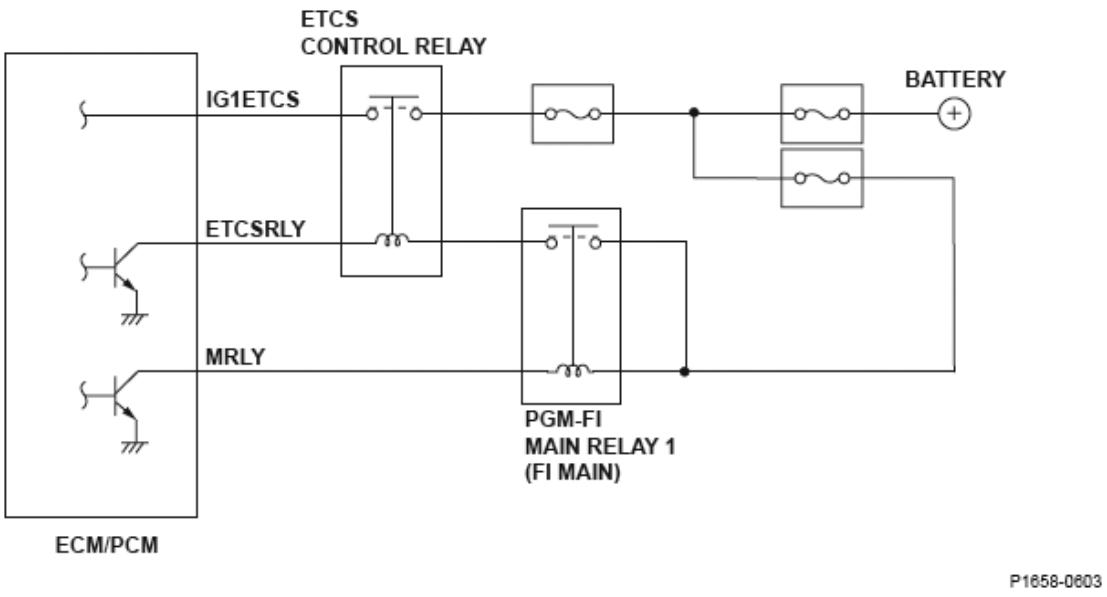

Fig. 541: Electronic Throttle Control System (ETCS) Control Relay - Circuit Diagram

General Description (K20Z3 Engine)

The engine control module (ECM)/powertrain control module (PCM) controls the throttle valve opening. The system is composed of the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the accelerator pedal position (APP) sensor, the electronic throttle control system (ETCS) control relay, and the ECM/PCM.

The APP sensor is operated via the throttle cable to determine the accelerator opening value when the driver presses the accelerator pedal. The accelerator pedal opening value is converted to a signal in the APP sensor and transmitted to the ECM/PCM to compute the target position.

The ECM/PCM determines the throttle valve target position according to the signal received and operates the throttle actuator to move the throttle valve to the target position. The actual throttle valve position is determined by TP sensor A, installed in the throttle body.

When the voltage is applied from the ETCS control relay to the IG1ETCS terminal for a set time after the ETCS control relay is turned off, the ECM/PCM detects a malfunction in the ETCS control relay power switch and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	None
Duration	2 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	N/A

Enable Conditions (K20Z3 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	8.0 V	-
Ignition switch	OFF	
No active DTCs	P1659, P2101, P2118, P2135, P2176	

Malfunction Threshold (K20Z3 Engine)

The communication signal is input from the ECM/PCM for at least 2 seconds after the ETCS control relay is turned off.

Diagnosis Details (K20Z3 Engine)

Conditions for illuminating the MIL (K20Z3 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM/PCM memory.

Conditions for clearing the MIL (K20Z3 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1658 (40): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P1658: ELECTRONIC THROTTLE CONTROL SYSTEM (ETCS) CONTROL RELAY ON MALFUNCTION (R18A1 ENGINE)

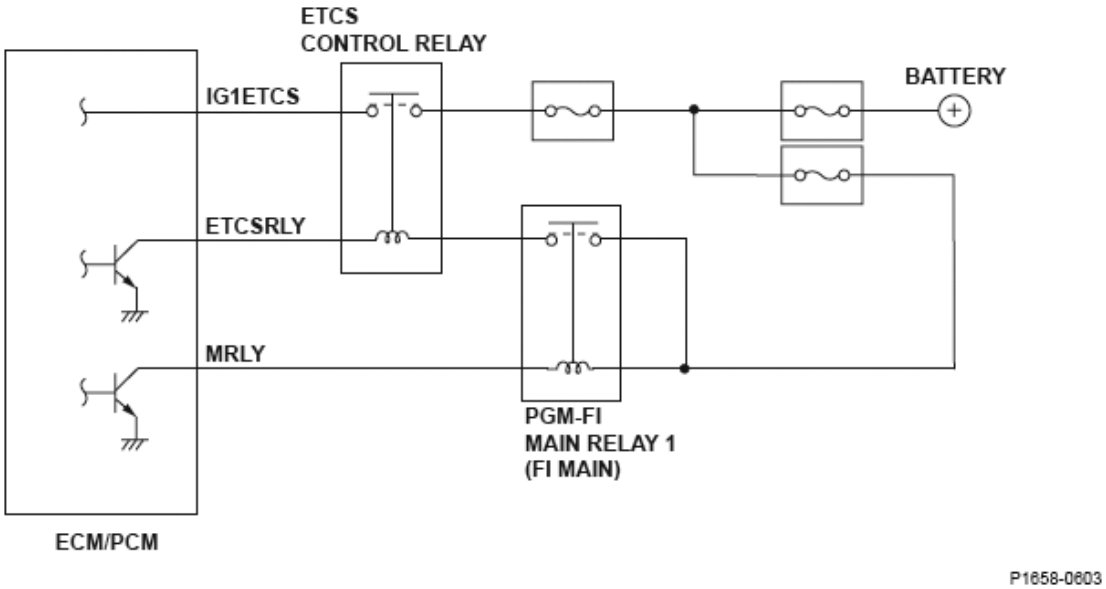

Fig. 542: Electronic Throttle Control System (ETCS) Control Relay - Circuit Diagram

General Description (R18A1 Engine)

The engine control module (ECM)/powertrain control module (PCM) controls the throttle valve opening. The system is composed of the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the accelerator pedal position (APP) sensor, the electronic throttle control system (ETCS) control relay, and the ECM/PCM.

The APP sensor is operated via the throttle cable to determine the accelerator opening value when the driver presses the accelerator pedal. The accelerator pedal opening value is converted to a signal in the APP sensor and transmitted to the ECM/PCM to compute the target position.

The ECM/PCM determines the throttle valve target position according to the signal received and operates the throttle actuator to move the throttle valve to the target position. The actual throttle valve position is determined by TP sensor A, installed in the throttle body.

When the voltage is applied from the ETCS control relay to the IG1ETCS terminal for a set time after the ETCS control relay is turned off, the ECM/PCM detects a malfunction in the ETCS control relay power switch and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	None
Duration	2 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	N/A

Enable Conditions (R18A1 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	8.0 V	-
Ignition switch	OFF	
No active DTCs	P1659, P2101, P2118, P2135, P2176	

Malfunction Threshold (R18A1 Engine)

The communication signal is input from the ECM/PCM for at least 2 seconds after the ETCS control relay is turned off.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM/PCM memory.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1658 (40): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P1658: ELECTRONIC THROTTLE CONTROL SYSTEM (ETCS) CONTROL RELAY ON MALFUNCTION (R18A4 ENGINE)

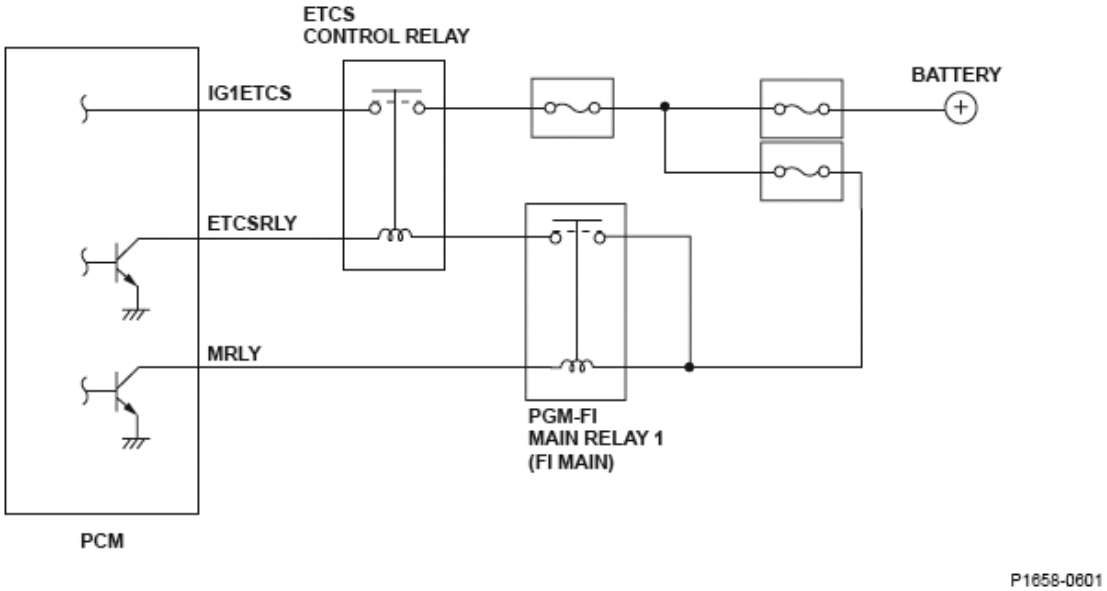

Fig. 543: Electronic Throttle Control System Control Relay - Circuit Diagram

General Description (R18A4 Engine)

The powertrain control module (PCM) controls the throttle valve opening. The system is composed of the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the accelerator pedal position (APP) sensor, the electronic throttle control system (ETCS) control relay, and the PCM.

The APP sensor is operated via the throttle cable to determine the accelerator opening value when the driver presses the accelerator pedal. The accelerator pedal opening value is converted to a signal in the APP sensor and transmitted to the PCM to compute the target position.

The PCM determines the throttle valve target position according to the signal received and operates the throttle actuator to move the throttle valve to the target position. The actual throttle valve position is determined by TP sensor A installed in the throttle body.

When the voltage is applied from the ETCS control relay to the IG1ETCS terminal for a set time after the ETCS control relay is turned off, the PCM detects a malfunction in the ETCS control relay power switch and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A4 Engine)

OBD Status	N/A

Enable Conditions (R18A4 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	8.0 V	-
Ignition switch	OFF	
No active DTCs	P1659, P2101, P2118, P2135, P2176	

Malfunction Threshold (R18A4 Engine)

The communication signal is input from the PCM for at least 2 seconds after the ETCS control relay is turned off.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1659 (40): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P1659: ELECTRONIC THROTTLE CONTROL SYSTEM (ETCS) CONTROL RELAY OFF MALFUNCTION (K20Z3 ENGINE)

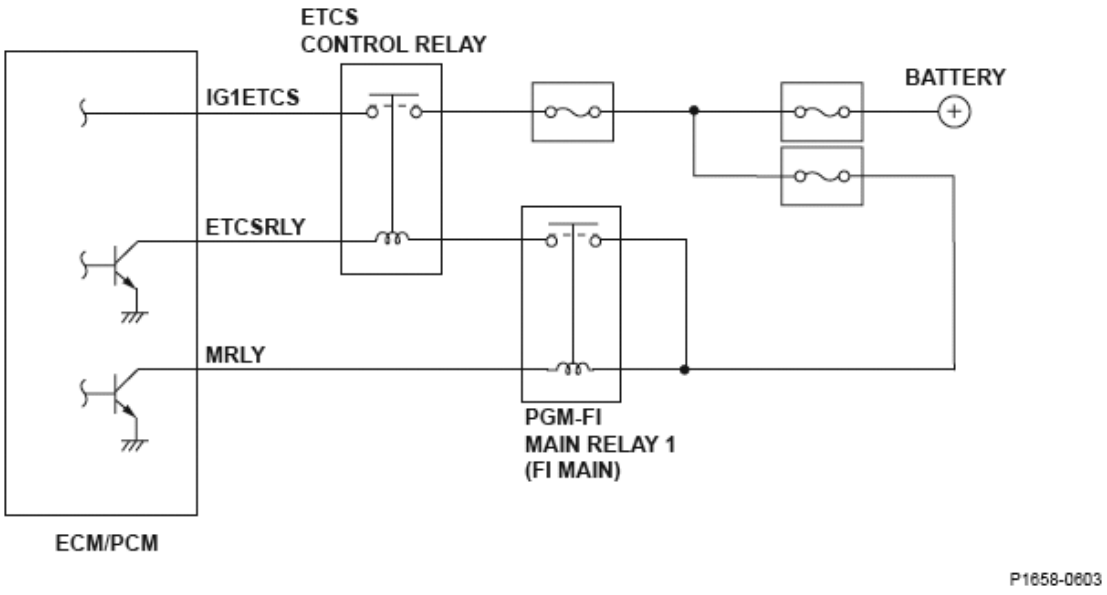

Fig. 544: Electronic Throttle Control System (ETCS) Control Relay - Circuit Diagram

General Description (K20Z3 Engine)

The engine control module (ECM)/powertrain control module (PCM) controls the throttle valve opening. The system is composed of the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the accelerator pedal position (APP) sensor, the electronic throttle control system (ETCS) control relay, and the ECM/PCM.

The APP sensor is operated via the throttle cable to determine the accelerator opening value when the driver presses the accelerator pedal. The accelerator pedal opening value is converted to a signal in the APP sensor and transmitted to the ECM/PCM to compute the target position.

The ECM/PCM determines the throttle valve target position according to the signal received and operates the throttle actuator to move the throttle valve to the target position. The actual throttle valve position is determined by TP sensor A, installed in the throttle body.

When the voltage from the ETCS control relay is not input for a set time after the ETCS control relay is turned on when the ignition is turned on, or when voltage is not applied for a set time when the throttle actuator is operating, a malfunction in the ETCS control relay power switch is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	None
Duration	0.2 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	N/A

Enable Conditions (K20Z3 Engine)

The voltage is not applied from the ETCS control relay for at least 0.2 seconds.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1683 (40): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P1683: THROTTLE VALVE DEFAULT POSITION SPRING PERFORMANCE PROBLEM (K20Z3 ENGINE)

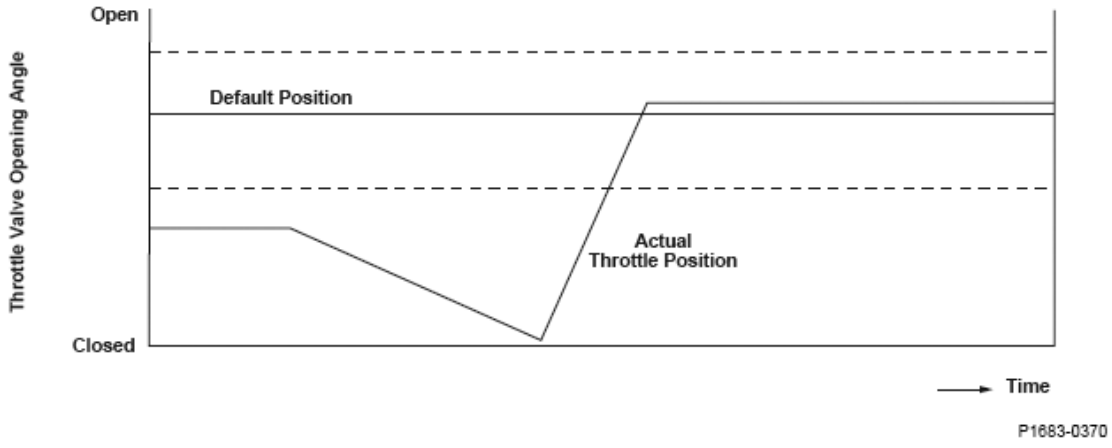

Fig. 547: Throttle Valve Default Position - Graph

General Description (K20Z3 Engine)

The electronic throttle control system (ETCS) controls the throttle valve opening. The system is composed of the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the throttle actuator control module, the throttle actuator control module relay, the accelerator pedal position (APP) sensor, and the engine control module (ECM)/powertrain control module (PCM).

The throttle valve default position spring is attached to the throttle valve gear. It opens the throttle valve to improve starting performance in cold conditions, or to retain minimum running performance in case of an electronic throttle control system failure.

If the throttle valve does not return to the default position when the throttle actuator control module moves the throttle actuator to the default position from the fully closed position, a malfunction is detected and the malfunction data is transmitted to the ECM/PCM. When the ECM/PCM receives the malfunction data from the throttle actuator control module, the ECM/PCM detects a malfunction in the throttle valve default position spring, and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	None
Duration	2.5 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	N/A

Enable Conditions (K20Z3 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	6.0 V	-
Engine coolant temperature	158°F (70°C)	-
Ignition switch	OFF	
No active DTCs	P0117, P0118, P2101, P2118, P2135, P2176	

Malfunction Threshold (K20Z3 Engine)

The throttle valve is at a position greater than +5° from the fully closed position, or at a position lower than +3 ° from the fully closed position, for at least 2.5 seconds.

Driving Pattern (K20Z3 Engine)

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Turn the ignition switch OFF.
3. Turn the ignition switch ON.

Diagnosis Details (K20Z3 Engine)

Conditions for illuminating the MIL (K20Z3 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM/PCM memory.

Conditions for clearing the MIL (K20Z3 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1683 (40): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P1683: THROTTLE VALVE DEFAULT POSITION SPRING PERFORMANCE PROBLEM (R18A1 ENGINE)

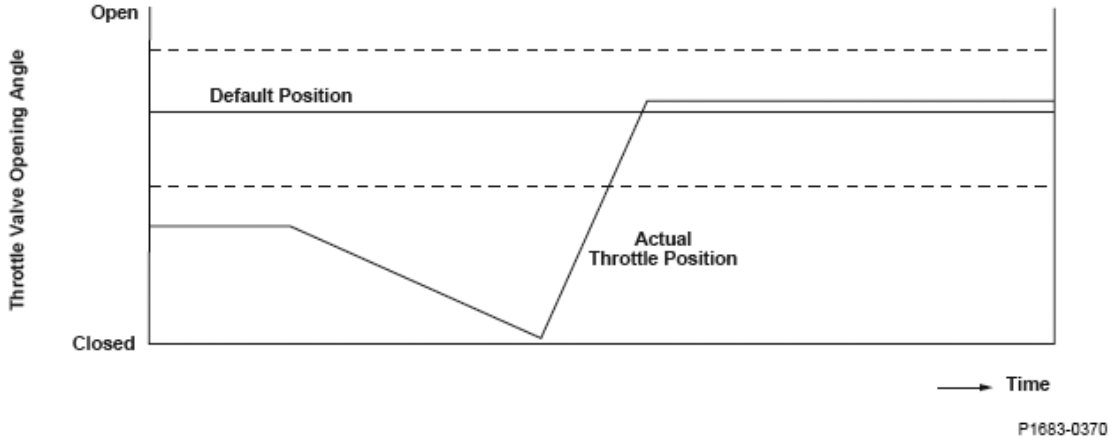

Fig. 548: Throttle Valve Default Position - Graph

General Description (R18A1 Engine)

The electronic throttle control system (ETCS) controls the throttle valve opening. The system is composed of the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the throttle actuator control module, the throttle actuator control module relay, the accelerator pedal position (APP) sensor, and the engine control module (ECM)/powertrain control module (PCM).

The throttle valve default position spring is attached to the throttle valve gear. It opens the throttle valve to improve starting performance in cold conditions, or to retain minimum running performance in case of an electronic throttle control system failure.

If the throttle valve does not return to the default position when the throttle actuator control module moves the throttle actuator to the default position from the fully closed position, a malfunction is detected and the malfunction data is transmitted to the ECM/PCM. When the ECM/PCM receives the malfunction data from the throttle actuator control module, the ECM/PCM detects a malfunction in the throttle valve default position spring, and a DTC is stored.

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1684 (40): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P1684: THROTTLE VALVE RETURN SPRING PERFORMANCE PROBLEM (K20Z3 ENGINE)

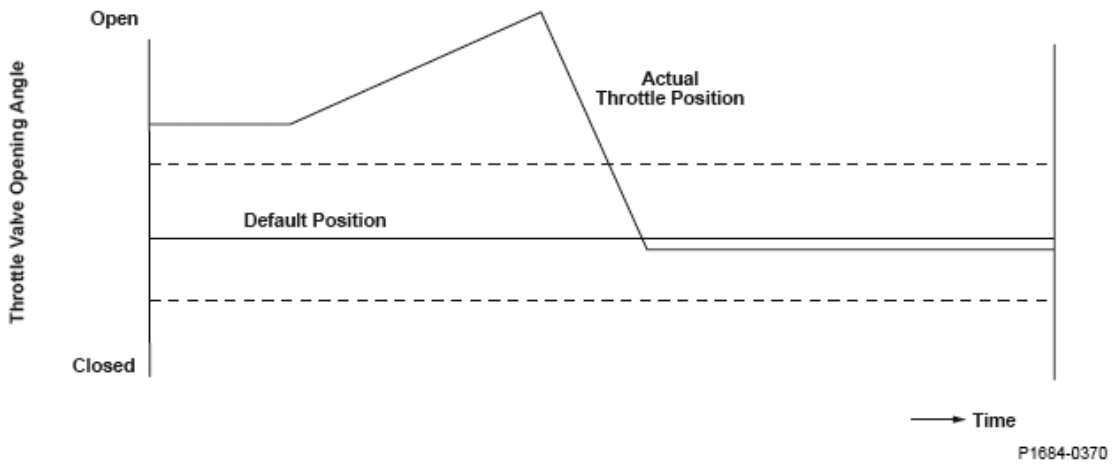

Fig. 550: Throttle Valve Default Position - Graph

General Description (K20Z3 Engine)

The electronic throttle control system (ETCS) controls the throttle valve opening. The system is composed

of the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the throttle actuator control module, the throttle actuator control module relay, the accelerator pedal position (APP) sensor, and the engine control module (ECM)/powertrain control module (PCM).

The throttle valve return spring is attached to the throttle valve gear to return the throttle valve to the default position.

If the throttle valve does not return to the default position when the throttle actuator control module moves the throttle actuator to the default position from the middle position, a malfunction is detected and the malfunction data is transmitted to the ECM/PCM. When the ECM/PCM receives the malfunction data from the throttle actuator control module, the ECM/PCM detects a malfunction in the throttle valve return spring and a DTC is stored.

2. Turn the ignition switch OFF.
3. Turn the ignition switch ON.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P16BB (116): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P16BB: ALTERNATOR B TERMINAL CIRCUIT LOW VOLTAGE (K20Z3)

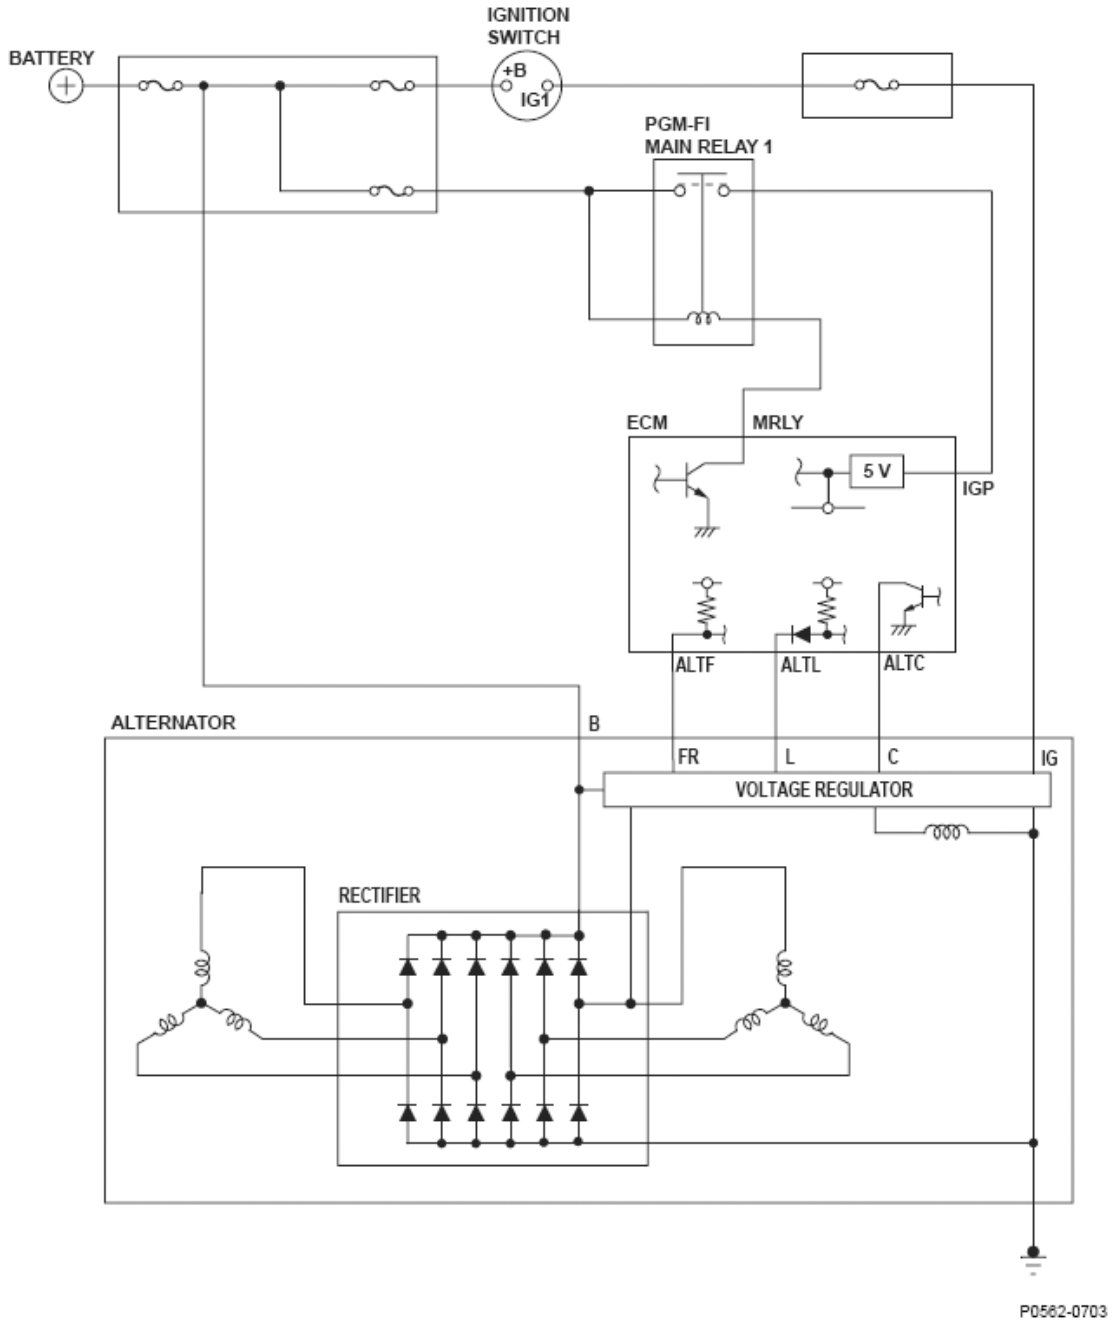

Fig. 553: Charging System Circuit Diagram

General Description (K20Z3 Engine)

The alternator is driven by the engine, and it generates electricity to supply the necessary power to the electrical system and to charge the battery. The alternator voltage target values of 14.5 V and 12.5 V are achieved by switching the alternator control mode (controlled by the engine control module (ECM)). The alternator output signal is sent to the ECM, and it varies according to the battery's state of charge, the electrical load, and the engine speed.

When the engine speed is a specified value and the IGP terminal voltage is below a set value when the alternator is in the 14.5 V mode, and the alternator power generation amount is within the set range, and this condition continues more than set time, the ECM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	60 seconds or more
DTC Type	One drive cycle, MIL OFF
OBD Status	N/A

Enable Conditions (K20Z3 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Engine speed	500 rpm	3,000 rpm
Alternator control mode	14.5 V mode	

Malfunction Threshold (K20Z3 Engine)

The IGP terminal voltage is 12.0 V or less, and the alternator power generation amount is within 1.0 % to 60.0 %, for at least 60 seconds.

Driving Pattern (K20Z3 Engine)

1. Start the engine.
2. Maintain an engine speed of 500 rpm to 3,000 rpm.
3. Turn on the headlights (high beam) and rear window defogger.

Diagnosis Details (K20Z3 Engine)

Conditions for illuminating the indicator (K20Z3 Engine)

When a malfunction is detected, the DTC and the freeze frame data are stored in the ECM memory. The MIL does not come on.

Conditions for clearing the DTC (K20Z3 Engine)

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P16BB (116): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P16BB: ALTERNATOR B TERMINAL CIRCUIT LOW VOLTAGE (R18A1)

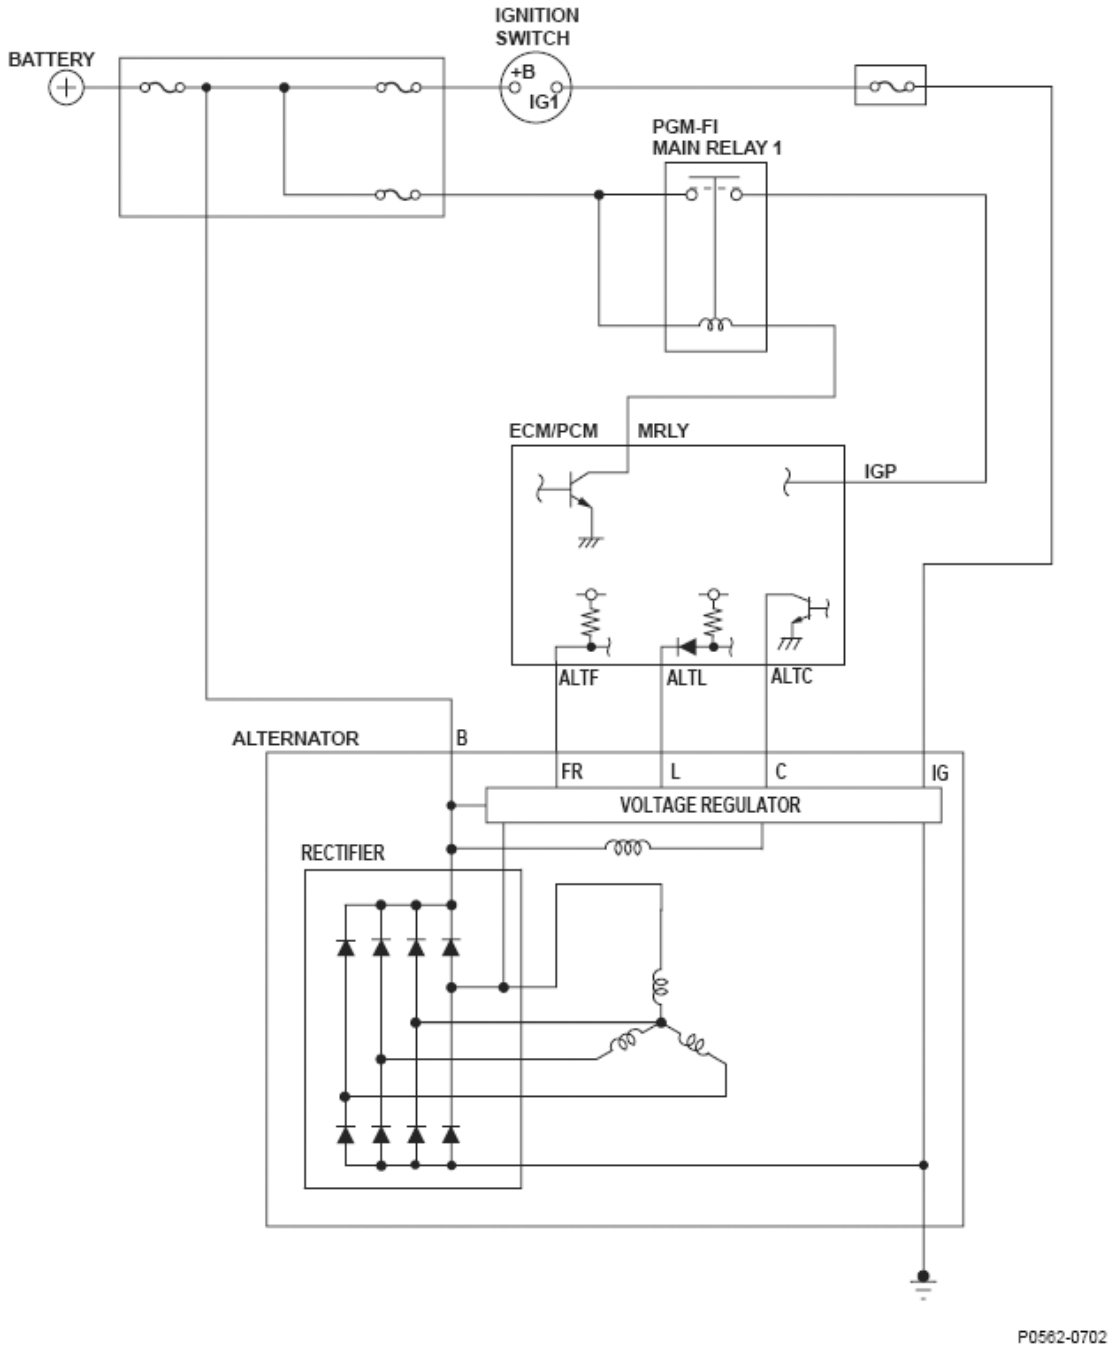

Fig. 554: Charging System Circuit Diagram

General Description (R18A1 Engine)

The alternator is driven by the engine, and it generates electricity to supply the necessary power to the electrical system and to charge the battery. The alternator voltage target values of 14.5 V and 12.5 V are achieved by switching the alternator control mode (controlled by the engine control module (ECM)/powertrain control module (PCM)). The alternator output signal is sent to the ECM/PCM, and it varies according to the battery's state of charge, the electrical load, and the engine speed.

When the engine speed is a specified value and the IGP terminal voltage is below a set value when the alternator is in the 14.5 V mode, and the alternator power generation amount is within the set range, and this condition continues more than a set time, the ECM/PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P16C0 (99): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P16C0: PCM A/T CONTROL SYSTEM INCOMPLETE UPDATE (R18A1 ENGINE)

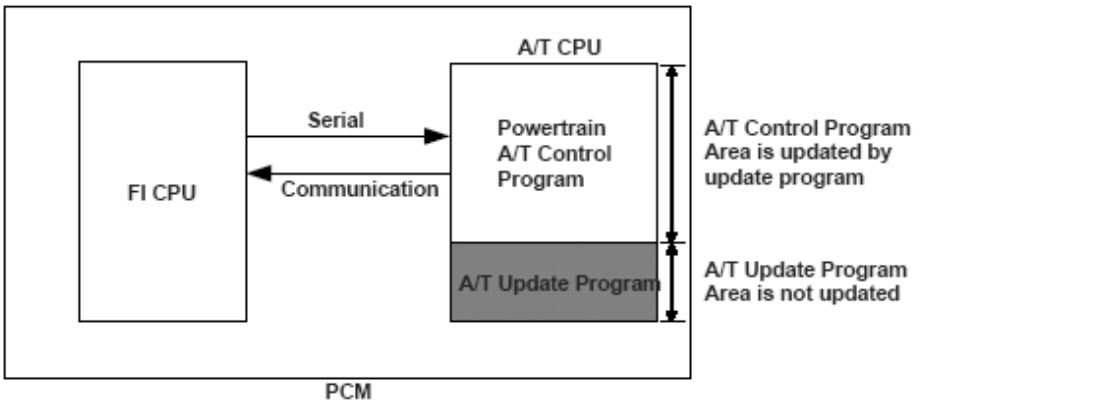

Fig. 559: Communication Diagram Between FI CPU And A/T CPU

General Description (R18A1 Engine)

The control program in the powertrain control module (PCM) has a rewriting function that can be done in the field. The program in the CPU is classified into a powertrain control program (re-writable program) and a program for the rewrite function (non-re-writable program), and the program rewrite function only rewrites the powertrain control program.

When the program rewriting process is not finished normally due to an irregular process, such as turning off the PCM power during the A/T CPU re-writing process, and the ignition switch is turned on again, the A/T CPU starts according to the rewriting function program, and this DTC is sent to the FI CPU via serial communication and stored in the PCM.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1717 (62): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P1717: OPEN IN TRANSMISSION RANGE SWITCH ATP RVS SWITCH CIRCUIT (R18A1 ENGINE)

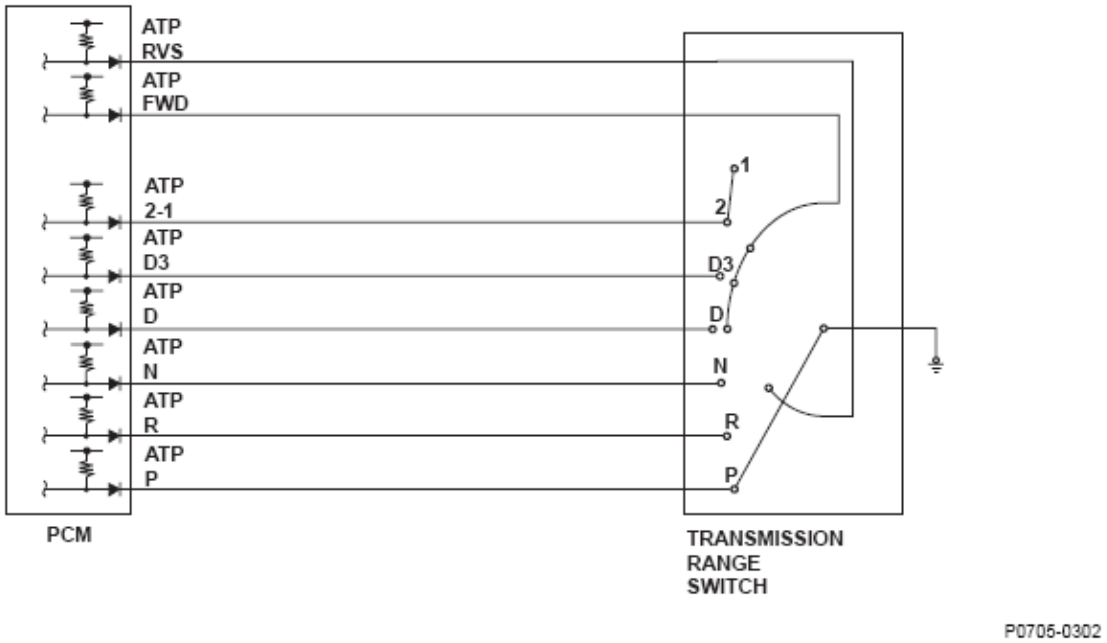

Fig. 561: Transmission Range Switch Circuit Diagram

TRANSMISSION RANGE SWITCH CONTACT POINT INPUT MATRIX

Shift lever position	Input per switch							
	P	R	RVS	N	D	D3	2 / 1	FWD
P	o	X	X	X	X	X	X	X
R	X	o	o	X	X	X	X	X
N	X	X	X	o	X	X	X	X
D	X	X	X	X	o	X	X	o
D3	X	X	X	X	X	o	X	o
2	X	X	X	X	X	X	o	o
1	X	X	X	X	X	X	o	X
o: Closed X: Open								

General Description (R18A1 Engine)

The transmission range switch is attached to the control shaft. Operating the shift lever makes the control shaft rotate via the shift cable. The A/T gear position indicator indicates which position is selected according to the Low/High signal combinations which vary based on shift lever position. The control shaft changes the position of the transmission range switch, activates the manual valve, and switches hydraulic pressure to shift the transmission through forward/neutral/reverse. The transmission range switch signal is used to determine the shift schedule. The voltage is 12 V (High) at the powertrain control module (PCM) input terminal when each transmission range switch position is open, and it is 0 V (Low) when each switch is closed. If the RVS switch is OPEN with the shift lever in R position, the PCM detects a RVS switch OPEN failure and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous

Sequence	None
Duration	Depending on the driving pattern

1st Clutch		LINE	CPC C	CPC C	
5th Clutch					CPC C

CPC: Clutch Pressure Control pressure

Fig. 564: Hydraulic Pressure Supply To Clutch By Shift Solenoid Valve Output Position Table

General Description (R18A1 Engine)

The cut A valve and the cut B valve is installed in the hydraulic control circuit in the transmission. The cut A valve and the cut B valve supplies line pressure and clutch pressure control pressure to the 1st clutch or the 5th clutch according to the combination of the solenoid signal.

When the signal to the shift solenoid valve A from the powertrain control module (PCM) is ON, and line pressure is applied to shift valve A, it operates against the shift valve A spring. When the signal to shift solenoid valve A from the PCM is OFF, and line pressure is discharged, shift valve A is inactive.

When the cut A valve is once active, it is self-locked by the line pressure which is supplied only in case of the D position. The cut A valve is switch to inactive side due to pressure supplied to the 1st clutch.

When the pressure is supplied to the 1st clutch, the cut B valve operates against the spring. When the pressure is not supplied to the 1st clutch, the cut B valve is inactive.

When the cut B valve is once active, it is self-locked by the line pressure which is supplied only in case of the D position. The cut B valve is switched to inactive side when the signal to the shift solenoid C from the PCM is ON. The signal from the PCM is output to apply clutch pressure control pressure to the proper gear change clutch according to the gear change schedule. The PCM monitors the input shaft (mainshaft) speed and the output shaft (countershaft) speed at the gear change which is decided according to the shift schedule.

When an improper gear ratio is output compared to the predetermined gear change mode, the cut A valve OFF failure or the cut B valve ON failure is detected and a DTC is stored.

5th Clutch					CPC C

CPC: Clutch Pressure Control pressure

Fig. 566: Hydraulic Pressure Supply To Clutch By Shift Solenoid Valve Output Position Table

General Description (R18A4 Engine)

The cut A valve and the cut B valve is installed in the hydraulic control circuit in the transmission. The cut A valve and the cut B valve supplies line pressure and clutch pressure control pressure to the 1st clutch or the 5th clutch according to the combination of the solenoid signal.

When the signal to the shift solenoid valve A from the powertrain control module (PCM) is ON, and line pressure is applied to shift valve A, it operates against the shift valve A spring. When the signal to shift solenoid valve A from the PCM is OFF, and line pressure is discharged, shift valve A is inactive.

When the cut A valve is once active, it is self-locked by the line pressure which is supplied only in case of the D position. The cut A valve is switch to inactive side due to pressure supplied to the 1st clutch.

When the pressure is supplied to the 1st clutch, the cut B valve operates against the spring. When the pressure is not supplied to the 1st clutch, the cut B valve is inactive.

When the cut B valve is once active, it is self-locked by the line pressure which is supplied only in case of the D position. The cut B valve is switched to inactive side when the signal to the shift solenoid C from the PCM is ON. The signal from the PCM is output to apply clutch pressure control pressure to the proper gear change clutch according to the gear change schedule. The PCM monitors the input shaft (mainshaft) speed and the output shaft (countershaft) speed at the gear change which is decided according to the shift schedule.

When an improper gear ratio is output compared to the predetermined gear change mode, the cut A valve OFF failure or the cut B valve ON failure is detected and a DTC is stored.

DTC P2101 (40): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P2101: ELECTRONIC THROTTLE CONTROL SYSTEM (ETCS) MALFUNCTION (K20Z3 ENGINE)

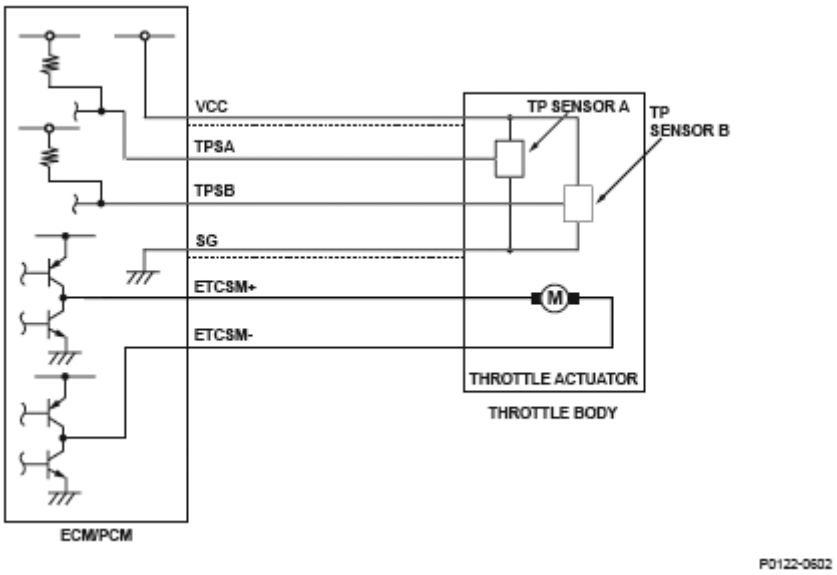

Fig. 571: Throttle Position (TP) Sensor - Circuit Diagram

General Description (K20Z3 Engine)

The electronic throttle control system (ETCS) controls the throttle valve opening. The system is composed of the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the accelerator pedal position (APP) sensor, and the engine control module (ECM)/powertrain control module (PCM).

The APP sensor is operated via the throttle cable to determine the accelerator opening value when the driver presses the accelerator pedal. The accelerator pedal opening value is converted to a signal in the APP sensor and transmitted to the ECM/PCM to compute the target position.

The ECM/PCM determines the throttle valve target position according to the signal received and operates the throttle actuator to move the throttle valve to the target position. The actual throttle valve position is determined by TP sensor A installed in the throttle body.

The ECM/PCM compares the throttle valve target opening angle and the actual throttle valve opening angle from TP sensor A, and when the difference exceeds the specification, the ECM/PCM detects the malfunction of the throttle actuator system and a DTC is stored.

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM/PCM memory.

Conditions for clearing the MIL (K20Z3 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2118 (40): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P2118: THROTTLE ACTUATOR CURRENT RANGE/PERFORMANCE PROBLEM (R18A1 ENGINE)

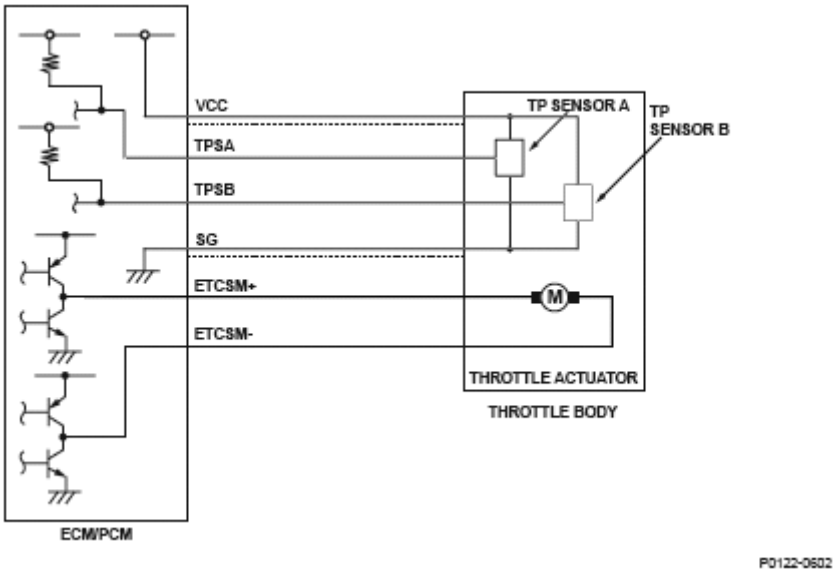

Fig. 575: Throttle Position (TP) Sensor - Circuit Diagram

General Description (R18A1 Engine)

The electronic throttle control system (ETCS) controls the throttle valve opening. The system is composed of the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the accelerator pedal position (APP) sensor, and the engine control module (ECM)/powertrain control module (PCM).

The APP sensor is operated via the throttle cable to determine the accelerator opening value when the driver presses the accelerator pedal. The accelerator pedal opening value is converted to a signal in the APP sensor and transmitted to the ECM/PCM to compute the target position.

The ECM/PCM determines the throttle valve target position according to the signal received and operates the throttle actuator to move the throttle valve to the target position. The actual throttle valve position is determined by TP sensor A installed in the throttle body.

When the output voltage to the throttle actuator exceeds the specification for a set time, the ECM/PCM detects a malfunction of the throttle actuator system and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	0.2 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	N/A

Enable Conditions (R18A1 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	6.0 V	-
Ignition switch	ON	
No active DTCs	P2101, P2135, P2176	

Malfunction Threshold (R18A1 Engine)

The current flow to the throttle actuator is 11 A or more for at least 0.2 seconds.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM/PCM memory.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2118 (40): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P2118: THROTTLE ACTUATOR CURRENT RANGE/PERFORMANCE PROBLEM (R18A4 ENGINE)

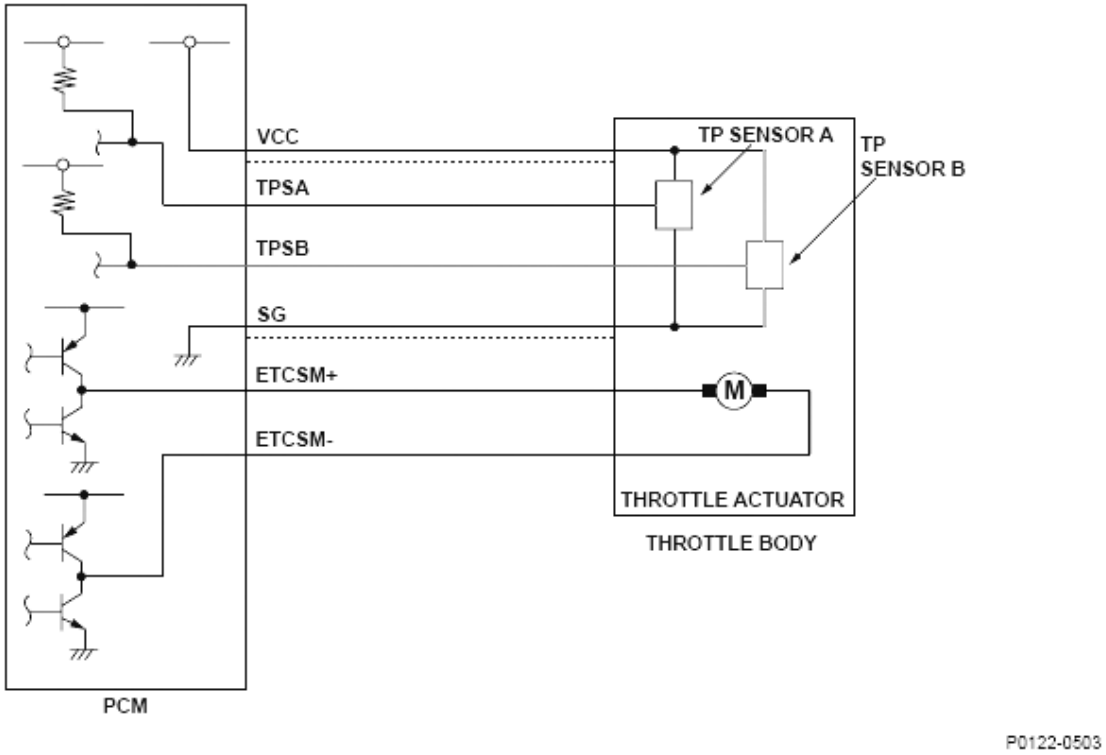

Fig. 576: Throttle Position (TP) Sensor A Circuit Low Voltage - Circuit Diagram

General Description (R18A4 Engine)

The electronic throttle control system (ETCS) controls the throttle valve opening. The system is composed of the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the accelerator pedal position (APP) sensor, and the powertrain control module (PCM).

The APP sensor is operated via the throttle cable to determine the accelerator opening value when the driver presses the accelerator pedal. The accelerator pedal opening value is converted to a signal in the APP sensor and transmitted to the PCM to compute the target position.

The PCM determines the throttle valve target position according to the signal received and operates the throttle actuator to move the throttle valve to the target position. The actual throttle valve position is determined by TP sensor A installed in the throttle body.

When the output voltage to the throttle actuator exceeds the specification for a set time, the PCM detects a malfunction of the throttle actuator system and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A4 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	0.2 seconds or more

DTC Type	One drive cycle, MIL ON
OBD Status	N/A

Enable Conditions (R18A4 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	6.0 V	-
Ignition switch	ON	
No active DTCs	P2101, P2135, P2176	

Malfunction Threshold (R18A4 Engine)

The current flow to the throttle actuator is 11 A or more for at least 0.2 seconds.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2122 (20): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P2122: ACCELERATOR PEDAL POSITION (APP) SENSOR A (THROTTLE POSITION SENSOR D) CIRCUIT LOW VOLTAGE INPUT (R18A1 ENGINE)

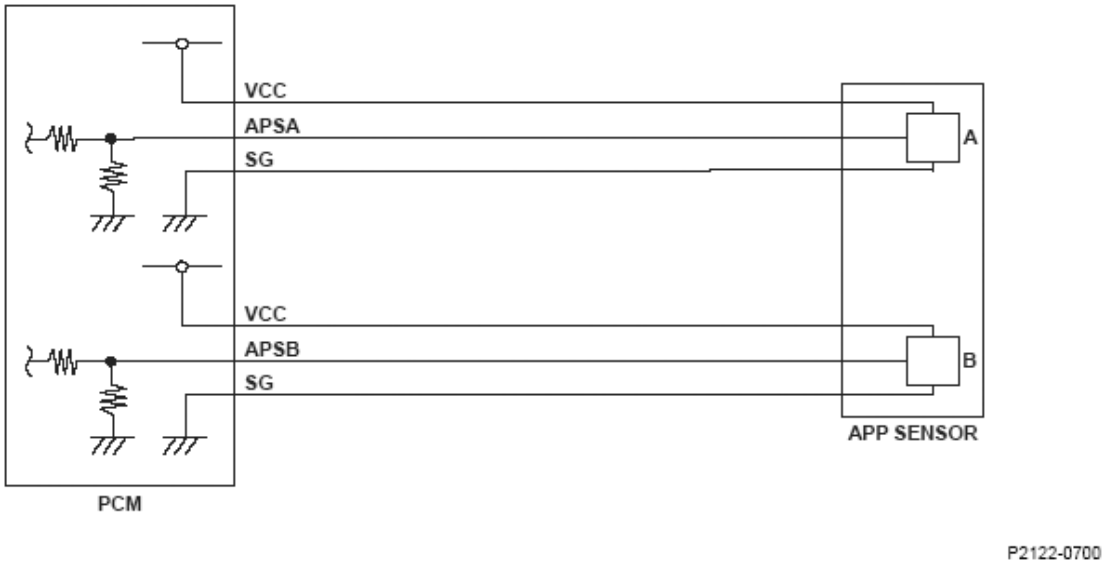

Fig. 577: Accelerator Pedal Position Sensor A - Circuit Diagram

General Description (R18A1 Engine)

Accelerator pedal position (APP) sensor A is a part of the electronic throttle control system (ETCS), and it is used to convert the position of the accelerator pedal into electrical signals. Based on these signals, the powertrain control module (PCM) controls the throttle actuator so that the throttle position agrees with the accelerator pedal position. If the signal voltage from APP sensor A is a set value or less, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	0.2 second or more
DTC Type	One drive cycle, MIL ON, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions (R18A1 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	
Ignition switch	ON
No active DTCs	P2123

Malfunction Threshold (R18A1 Engine)

The APP sensor A output voltage is 0.2 V or less for at least 0.2 second.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2122 (20): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P2122: ACCELERATOR PEDAL POSITION (APP) SENSOR A (THROTTLE POSITION SENSOR D) CIRCUIT LOW VOLTAGE INPUT (R18A4 ENGINE)

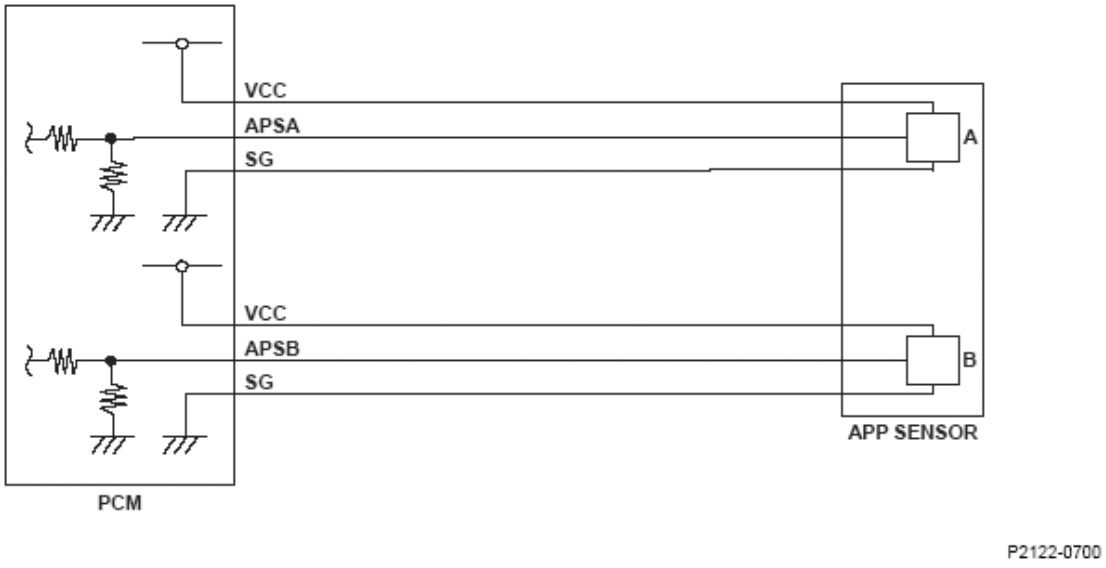

Fig. 578: Accelerator Pedal Position Sensor - Circuit Diagram

General Description (R18A4 Engine)

Accelerator pedal position (APP) sensor A is a part of the electronic throttle control system (ETCS), and it is used to convert the position of the accelerator pedal into electrical signals. Based on these signals, the powertrain control module (PCM) controls the throttle actuator so that the throttle position agrees with the accelerator pedal position. If the signal voltage from APP sensor A is a set value or less, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A4 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	0.2 second or more
DTC Type	One drive cycle, MIL ON, D indicator blinks

OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions (R18A4 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	
Ignition switch	ON
No active DTCs	P2123

Malfunction Threshold (R18A4 Engine)

The APP sensor A output voltage is 0.2 V or less for at least 0.2 second.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2122 (37) (PGM-FI SYSTEM): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P2122: ACCELERATOR PEDAL POSITION (APP) SENSOR A (THROTTLE POSITION (TP) SENSOR D) CIRCUIT LOW VOLTAGE (K20Z3 ENGINE)

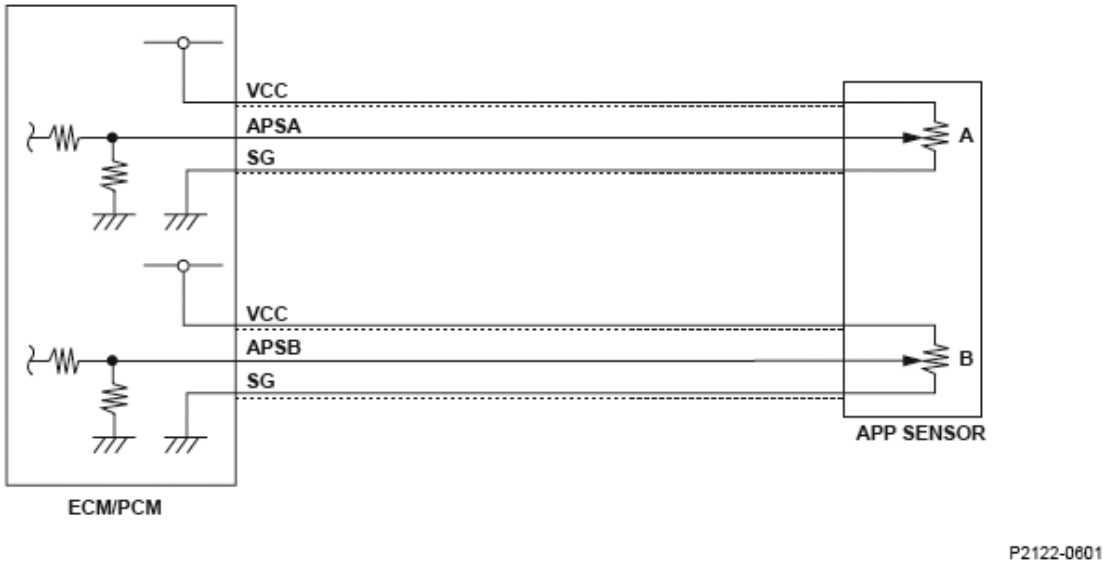

Fig. 579: Accelerator Pedal Position (APP) Sensor - Circuit Diagram

General Description (K20Z3 Engine)

Accelerator pedal position (APP) sensor A is a part of the electronic throttle control system (ETCS), and it is used to convert the position of the accelerator pedal into electrical signals. Based on these signals, the engine control module (ECM)/power-train control module (PCM) controls the throttle actuator so that the throttle position agrees with the accelerator pedal position. If the signal voltage from APP sensor A is a set value or less, the ECM/PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM/PCM memory.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2128 (37): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P2128: ACCELERATOR PEDAL POSITION (APP) SENSOR B (THROTTLE POSITION (TP) SENSOR E) CIRCUIT HIGH VOLTAGE (R18A4 ENGINE)

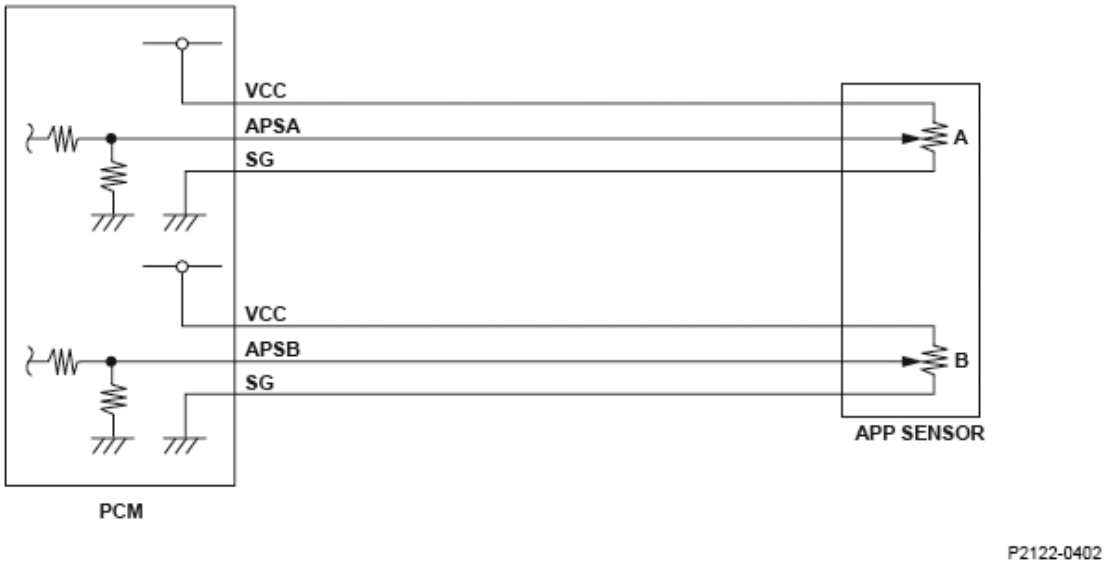

Fig. 592: Accelerator Pedal Position (APP) Sensor - Circuit Diagram

General Description (R18A4 Engine)

Accelerator pedal position (APP) sensor B is a part of the electronic throttle control system (ETCS), and it is used to convert the position of the accelerator pedal into electrical signals. Based on these signals, the powertrain control module (PCM) controls the throttle actuator so that the throttle position agrees with the accelerator pedal position. If the signal voltage from APP sensor B is a set value or more, the PCM detects a malfunction and stores a DTC.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2135 (7): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P2135: THROTTLE POSITION (TP) SENSOR A/B VOLTAGE INCORRECT CORRELATION (K20Z3 ENGINE)

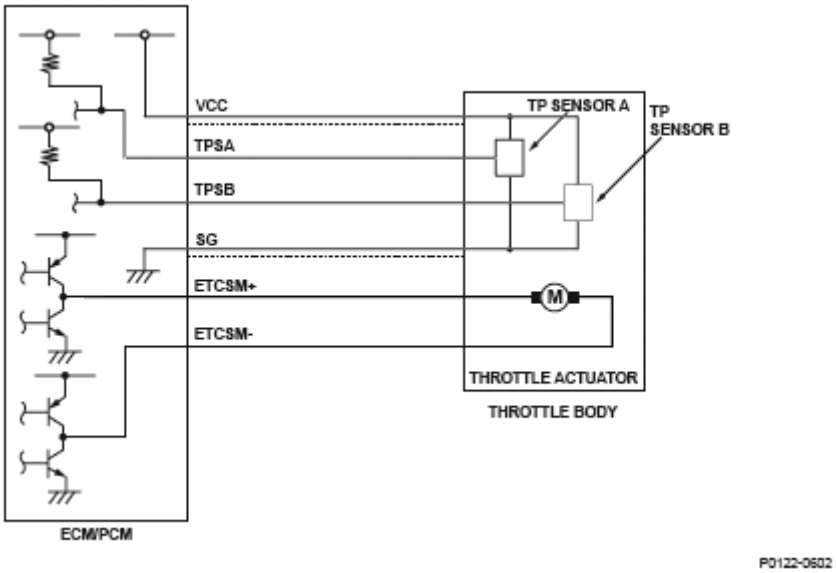

Fig. 593: Throttle Position (TP) Sensor - Circuit Diagram

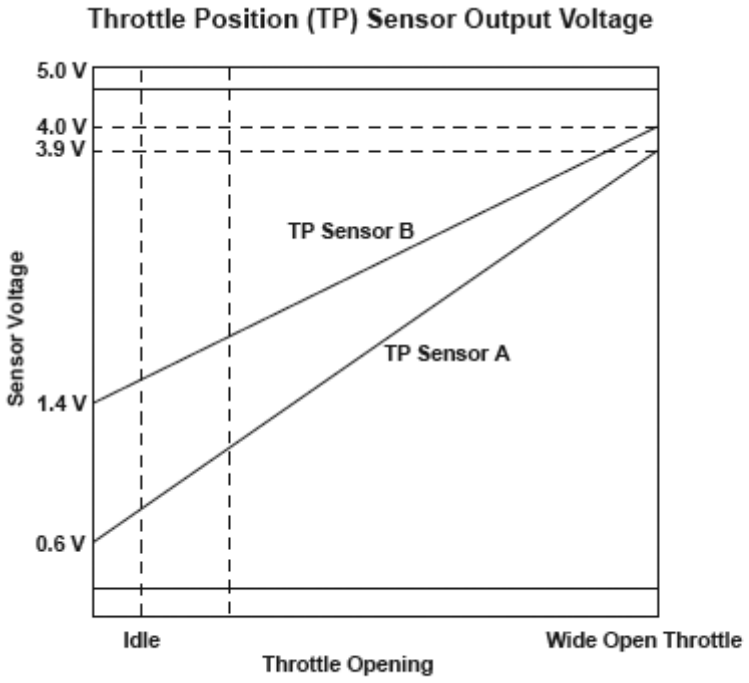

Fig. 594: Throttle Position (TP) Sensor Voltage - Graph

General Description (K20Z3 Engine)

The electronic throttle control system (ETCS) controls the throttle valve opening. The system is composed of the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the accelerator pedal position (APP) sensor, and the engine control module (ECM)/powertrain control module (PCM).

The APP sensor is operated via the throttle cable to determine the accelerator opening value when the driver presses the accelerator pedal. The accelerator pedal opening value is converted to a signal in the APP sensor and transmitted to the ECM/PCM to compute the target position.

The ECM/PCM determines the throttle valve target position according to the signal received and operates the throttle actuator to move the throttle valve to the target position. The actual throttle valve position is determined by TP sensor A installed in the throttle body.

The ECM/PCM compares the voltages and the throttle valve positions of TP sensor A and TP sensor B. If the difference of the voltages or the throttle valve positions is a certain value or less for a set time, the ECM/PCM detects a malfunction in the relationship between TP sensor A and TP sensor B, and stores a DTC.

DTC P2138 (37): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P2138: ACCELERATOR PEDAL POSITION (APP) SENSOR A/B (THROTTLE POSITION (TP) SENSOR D/E) INCORRECT VOLTAGE CORRELATION (K20Z3 ENGINE)

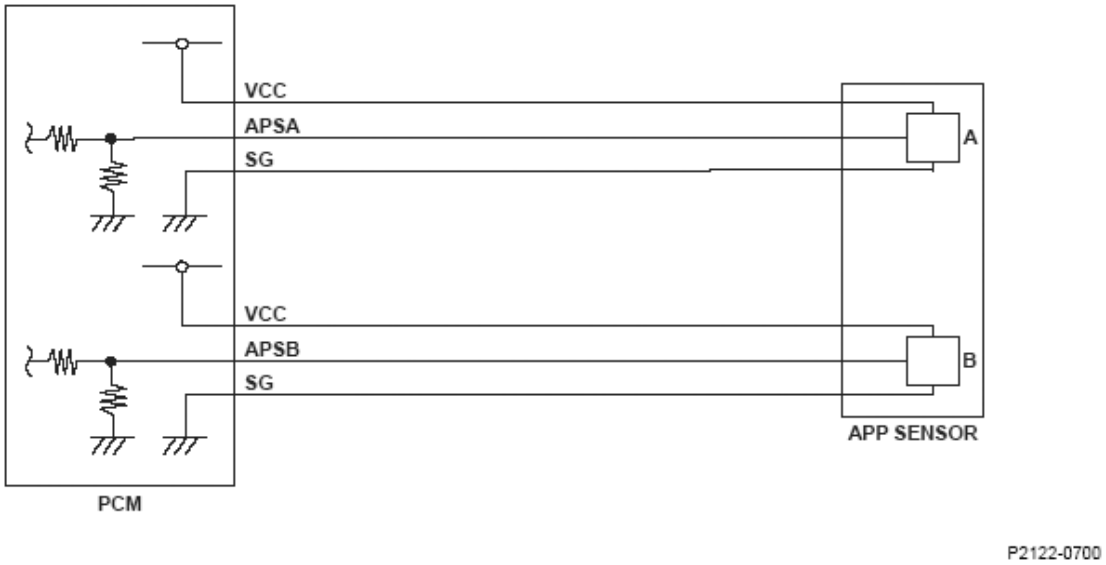

Fig. 599: Accelerator Pedal Position Sensor - Circuit Diagram

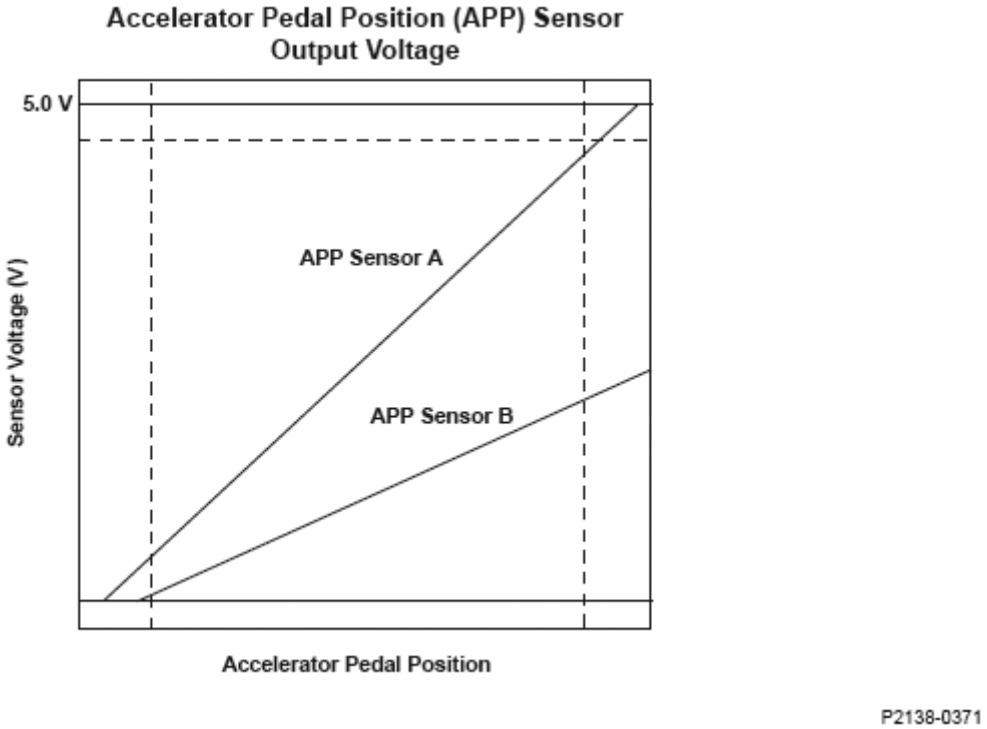

Fig. 600: Accelerator Pedal Position (APP) Sensor Voltage - Graph

General Description (K20Z3 Engine)

Accelerator pedal position (APP) sensor A and accelerator pedal position (APP) sensor B are potentiometers, and they are installed in the engine compartment.

APP sensors A and B are operated via the throttle linkage to determine the accelerator opening value when the driver presses the accelerator pedal. The accelerator pedal opening value is converted to a signal in APP sensors A and B and transmitted to the engine control module (ECM)/powertrain control module (PCM) to compute the target position. The target position signal is then transmitted to the throttle actuator control

module.

APP sensor A is for the primary control, and APP sensor B is a back-up of APP sensor A in case it malfunctions. Both sensors compare their output voltage to each other for malfunction detection.

When the voltage difference of APP sensor B is out of a fixed range for a set time, the ECM/PCM detects a malfunction, and a DTC is stored.

DTC P2176 (40): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P2176: THROTTLE ACTUATOR CONTROL SYSTEM IDLE POSITION NOT LEARNED (K20Z3 ENGINE)

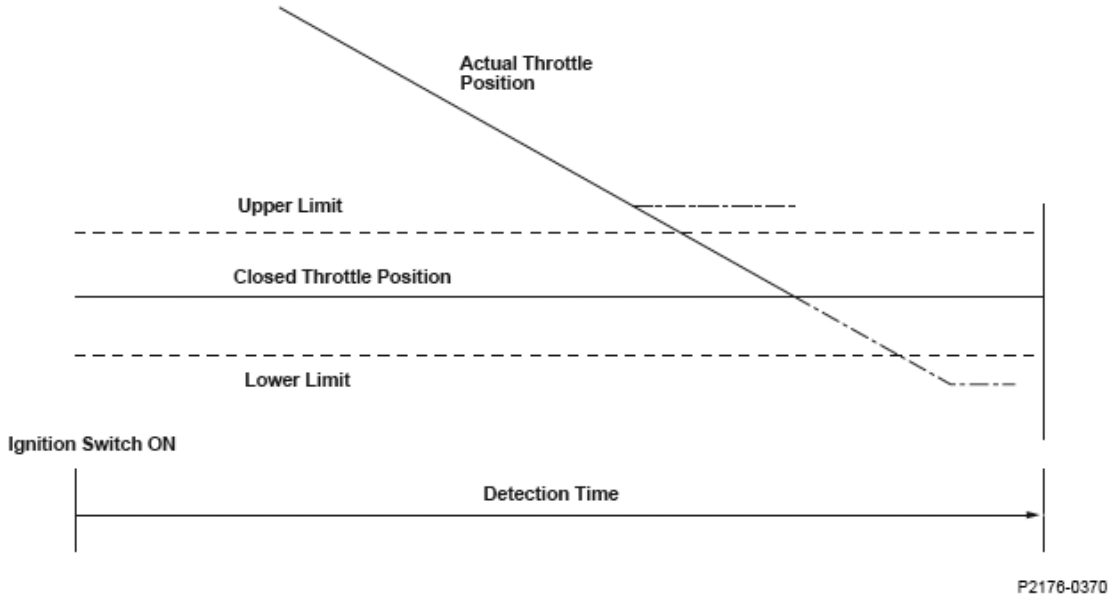

Fig. 605: Identifying Throttle Actuator Control System Idle Position

General Description (K20Z3 Engine)

The electronic throttle control system (ETCS) controls the throttle valve opening. The system is composed of the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the throttle actuator control module, the throttle actuator control module relay, the accelerator pedal position (APP) sensor, and the engine control module (ECM)/powertrain control module (PCM).

The APP sensor is operated via the throttle cable to determine the accelerator opening value when the driver presses the accelerator pedal. The accelerator pedal opening value is converted to a signal in the APP sensor and transmitted to the ECM/PCM to compute the target position. The target position signal is then transmitted to the throttle actuator control module.

The throttle actuator control module determines the throttle valve target position according to the signal received and operates the throttle actuator to move the throttle valve to the target position. The actual throttle valve position is determined by TP sensor A installed in the throttle body.

The throttle actuator control module transmits a signal to the throttle actuator and moves the throttle valve to the fully closed position to register the throttle valve fully closed position after the ignition switch is turned ON.

The throttle actuator control module detects the malfunction of the throttle actuator control system, and it transmits a malfunction signal to the ECM/PCM when the registration of the throttle valve fully closed position is not completed within a predetermined time or the registered value is out of predetermined range

after the ignition switch is turned ON. When the ECM/PCM receives the malfunction data from the throttle actuator control module, the ECM/PCM detects a malfunction in the throttle actuator control system and stores a DTC.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2183 (192): ADVANCED DIAGNOSTICS (M/T)

DTC P2183: ENGINE COOLANT TEMPERATURE (ECT) SENSOR 2 CIRCUIT RANGE/PERFORMANCE PROBLEM (M/T)

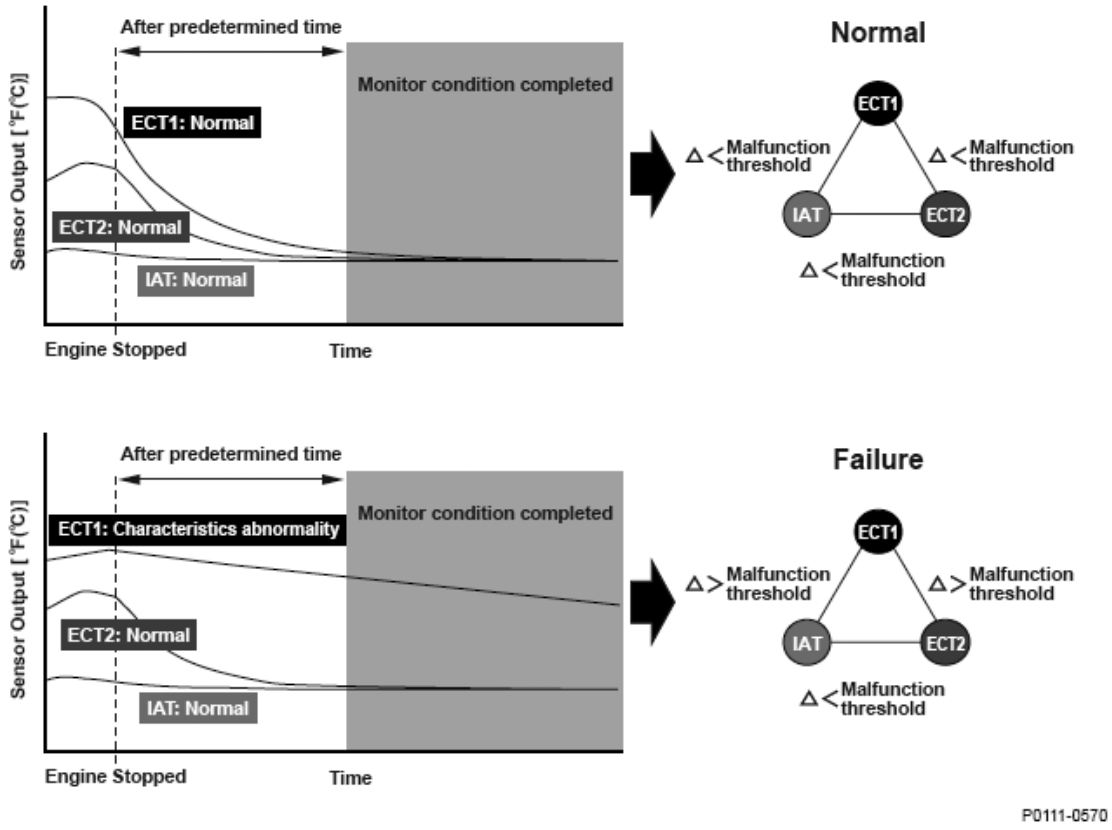

Fig. 608: Intake Air Temperature (IAT) Sensor Circuit Range/Performance Problem - Graph

General Description (M/T)

Two engine coolant temperature sensors and one intake air temperature sensor are used by the engine control module (ECM)/powertrain control module (PCM).

When the engine is stopped and enough time has passed, the temperature of the engine will equal the ambient temperature.

When an inappropriate temperature is detected after comparing the temperature readings of each sensor, a malfunction in the corresponding sensor is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (M/T)

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	None
Duration	10 seconds or more
DTC Type	Two drive cycles, MIL ON
OBD Status	N/A

Enable Conditions (M/T)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum

Engine off time	6 hours	-
No active DTCs	P0111, P0112, P0113, P0116, P0117, P0118, P0125, P1116, P2184, P2185, P2610	

Malfunction Threshold (M/T)

A malfunction is detected if these three conditions are present after the engine and the ignition switch have been off for at least 6 hours:

- When the temperature difference between the IAT and ECT1 is 81°F (45°C)*1 , 59°F (33°C)*2 or more.
- When the temperature difference between the IAT and ECT2 is 45°F (25°C)*1 , 36°F (20°C)*2 or more.
- When the temperature difference between the ECT2 and ECT1 is 90°F (50°C)*1 , 66°F (37°C)*2 or more.

*1: R18A1 engine

*2: K20Z3 engine

Driving Pattern (M/T)

1. Turn the ignition off, and wait at least 6 hours.
2. Start the engine, and let it idle for at least 10 seconds.

Diagnosis Details (M/T)

Conditions for illuminating the MIL (M/T)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the ECM/PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (M/T)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2183 (192): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P2183: ENGINE COOLANT TEMPERATURE (ECT) SENSOR 2 CIRCUIT RANGE/PERFORMANCE PROBLEM (R18A1 ENGINE)

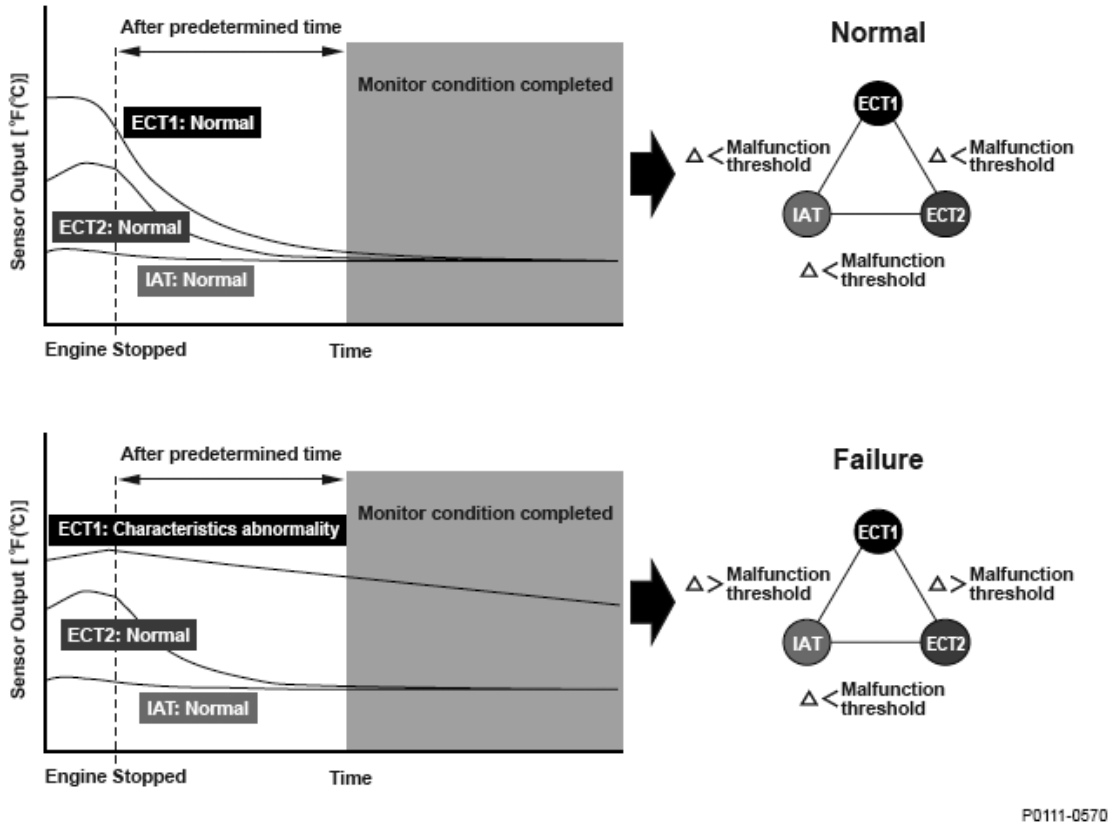

Fig. 609: Intake Air Temperature (IAT) Sensor Circuit Range/Performance Problem - Graph

General Description (R18A1 Engine)

Two engine coolant temperature sensors and one intake air temperature sensor are used by the engine control module (ECM)/powertrain control module (PCM).

When the engine is stopped and enough time has passed, the temperature of the engine will equal the ambient temperature.

When an inappropriate temperature is detected after comparing the temperature readings of each sensor, a malfunction in the corresponding sensor is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	None
Duration	10 seconds or more
DTC Type	Two drive cycles, MIL ON
OBD Status	N/A

Enable Conditions (R18A1 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum

Engine off time	6 hours	-
No active DTCs	P0111, P0112, P0113, P0116, P0117, P0118, P0125, P1116, P2184, P2185, P2610	

Malfunction Threshold (R18A1 Engine)

A malfunction is detected if these three conditions are present after the engine and the ignition switch have been off for at least 6 hours:

- When the temperature difference between the IAT and ECT1 is 81°F (45°C)[*1] , 59°F (33°C)6[*2] or more.
- When the temperature difference between the IAT and ECT2 is 45°F (25°C)[*1] , 36°F (20°C)[*2] or more.
- When the temperature difference between the ECT2 and ECT1 is 90°F (50°C)[*1] , 66°F (37°C)[*2] or more.

*1: R18A1 engine

*2: K20Z3 engine

Driving Pattern (R18A1 Engine)

1. Turn the ignition off, and wait at least 6 hours.
2. Start the engine, and let it idle for at least 10 seconds.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the ECM/PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2183 (192): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P2183: ENGINE COOLANT TEMPERATURE (ECT) SENSOR 2 RANGE/PERFORMANCE PROBLEM (R18A4 ENGINE)

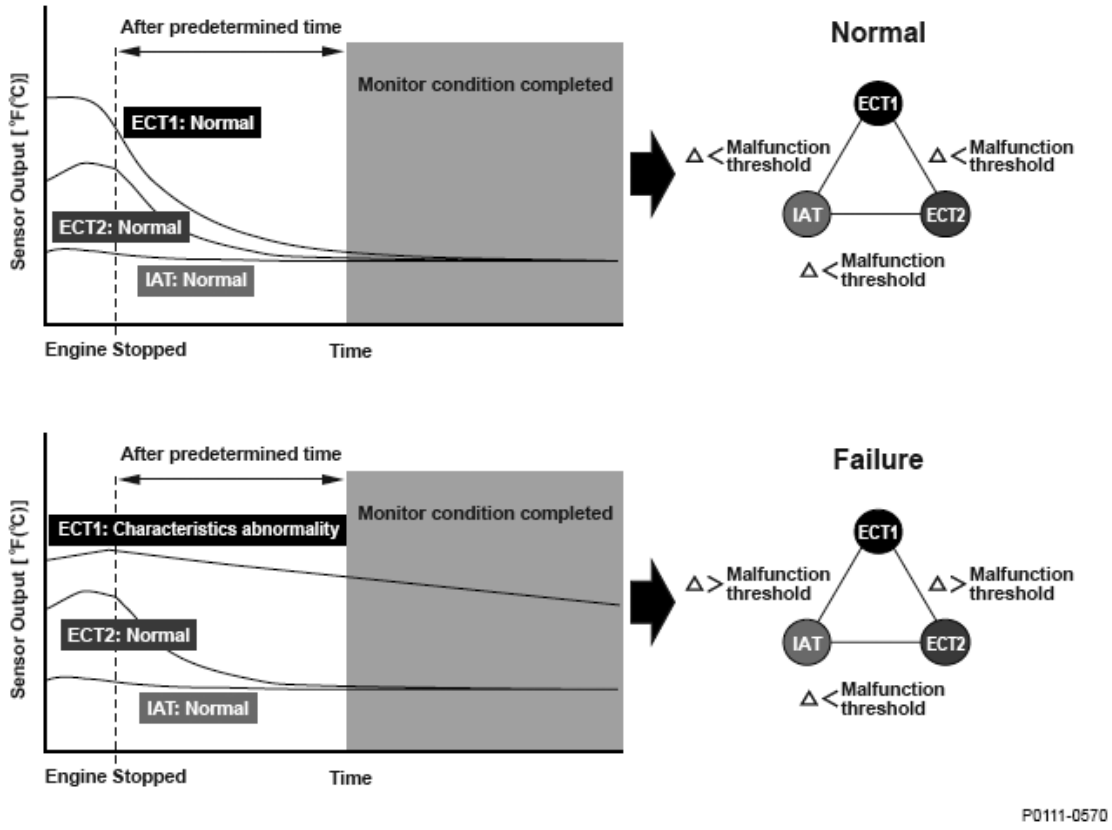

Fig. 610: Intake Air Temperature (IAT) Sensor Circuit Range/Performance Problem - Graph

General Description (R18A4 Engine)

Two engine coolant temperature sensors and one intake air temperature sensor are used by the powertrain control module (PCM).

When the engine is stopped and enough time has passed, the temperature of the engine will equal the ambient temperature.

When an inappropriate temperature is detected after comparing the temperature readings of each sensor, a malfunction in the corresponding sensor is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A4 Engine)

Execution	Once per driving cycle
Sequence	None
Duration	10 seconds or more
DTC Type	Two drive cycles, MIL ON
OBD Status	N/A

Enable Conditions (R18A4 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum

Engine off time	6 hours	-
No active DTCs	P0112, P0113, P0116, P0117, P0118, P0125, P1116, P2183, P2184, P2185, P2610	

Malfunction Threshold (R18A4 Engine)

A malfunction is detected if these three conditions are present after the engine and the ignition switch have been off for at least 6 hours before restarting the engine.

- When the temperature difference between the IAT and ECT1 is 81°F (45°C) or more.
- . When the temperature difference between the IAT and ECT2 is 45°F (25°C) or more.
- . When the temperature difference between the ECT2 and ECT1 is 90°F (50°C) or more.

Driving Pattern (R18A4 Engine)

1. Turn the ignition off, and wait at least 6 hours.
2. Start the engine, and let it idle for at least 10 seconds.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2184 (192): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P2184: ENGINE COOLANT TEMPERATURE (ECT) SENSOR 2 CIRCUIT LOW VOLTAGE (K20Z3 ENGINE)

Fig. 611: Engine Coolant Temperature (ECT) Sensor 2 Circuit Diagram

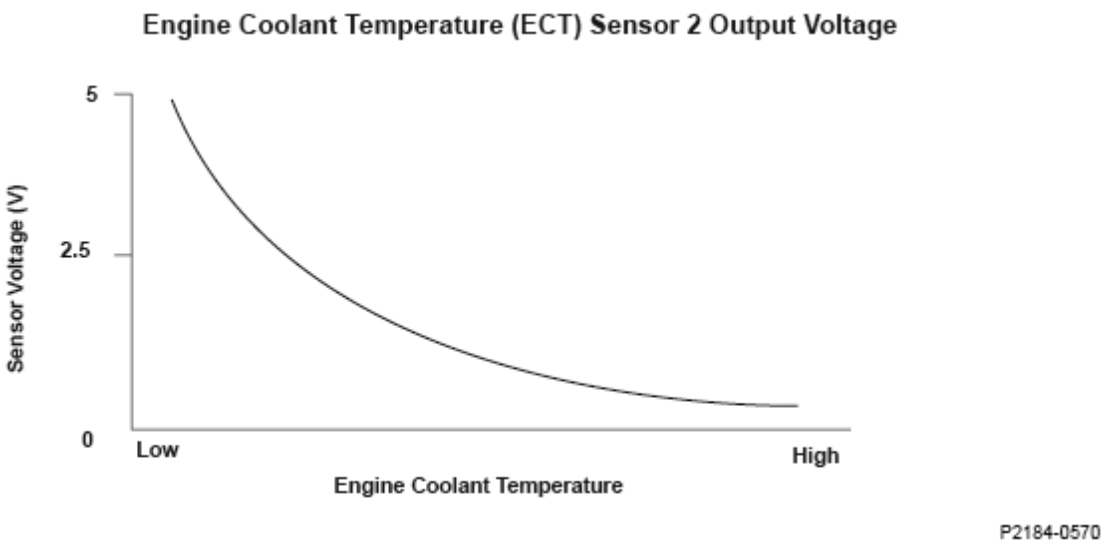

Fig. 612: Engine Coolant Temperature Sensor Voltage - Graph

General Description (K20Z3 Engine)

The engine coolant temperature (ECT) sensor 2 is a thermistor attached to the radiator. The ECM/PCM applies voltage (about 5 V) to the ECT2 signal circuit through a pull up resistor. As the engine coolant temperature cools, ECT sensor 2 resistance increases, and the ECM/PCM detects a high signal voltage. As the engine coolant warms, the sensor resistance decreases, and the ECM/PCM detects a low ECT2 signal voltage.

If the ECT sensor 2 output voltage is less than a set value when the engine coolant temperature is high, the ECM/PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2195 (48): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P2195: AIR/FUEL RATIO (A/F) SENSOR (SENSOR 1) SIGNAL STUCK LEAN (K20Z3)

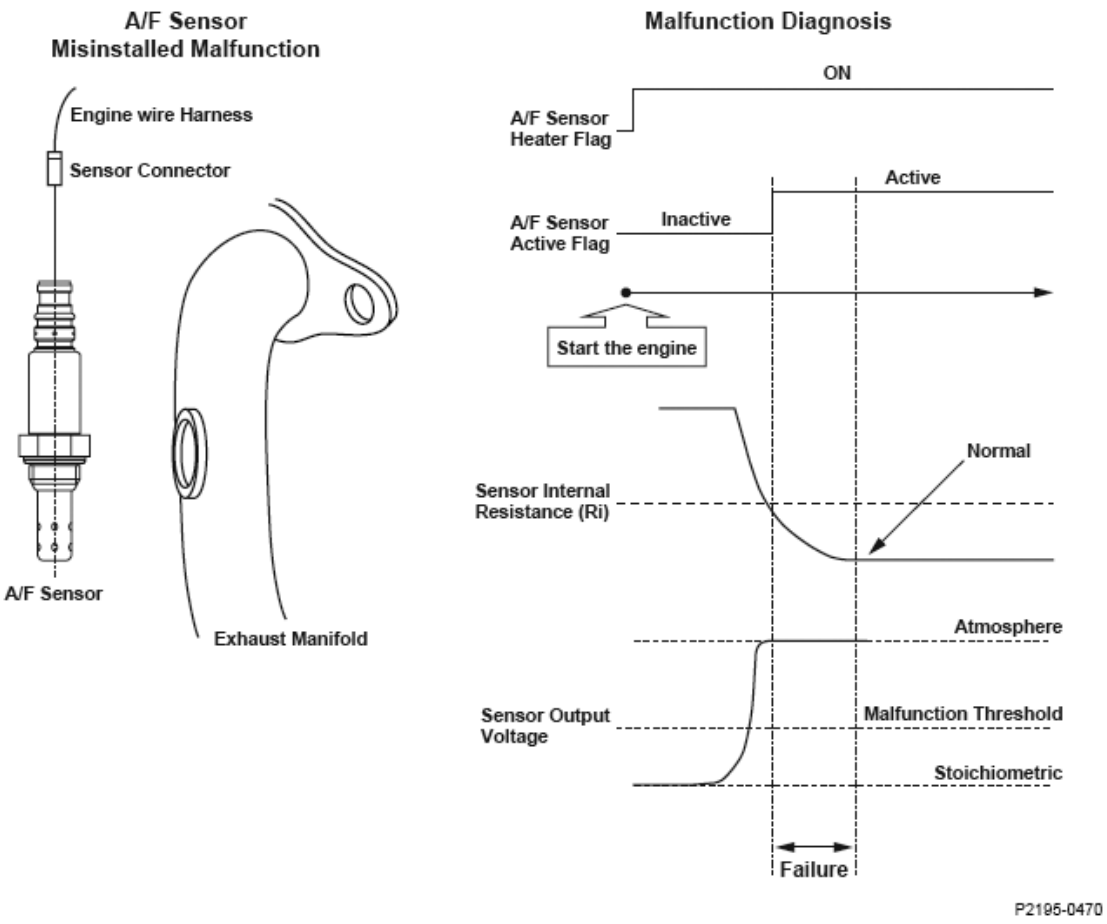

Fig. 623: Air/Fuel Ratio (A/F) Sensor (Sensor 1) Signal Stuck Lean Malfunction

General Description (K20Z3 Engine)

When the air/fuel ratio (A/F) sensor (sensor 1) is properly connected to the engine wire harness, but not installed in the exhaust pipe, the A/F feedback is not done properly even if the A/F sensor is active after starting the engine. Thus, the exhaust emissions increase.

When the A/F sensor output stays out of the normal range after the A/F sensor becomes active, the engine control module (ECM) detects that the A/F sensor is not properly installed and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

DTC P2227 (13): ADVANCED DIAGNOSTICS (M/T)

DTC P2227: BAROMETRIC PRESSURE (BARO) SENSOR CIRCUIT RANGE/PERFORMANCE PROBLEM (M/T)

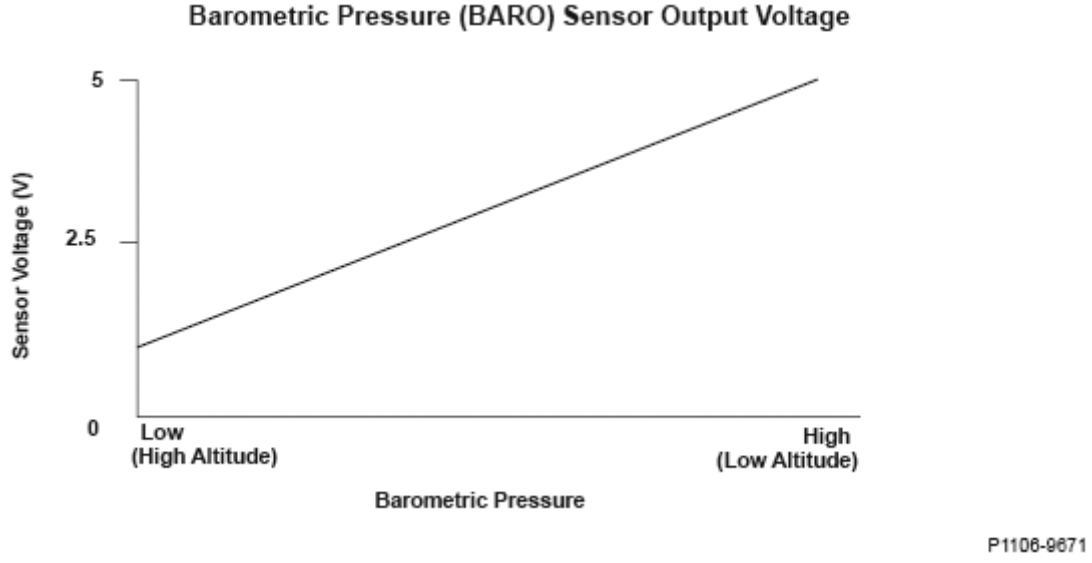

Fig. 626: Barometric Pressure (BARO) Sensor Voltage - Graph

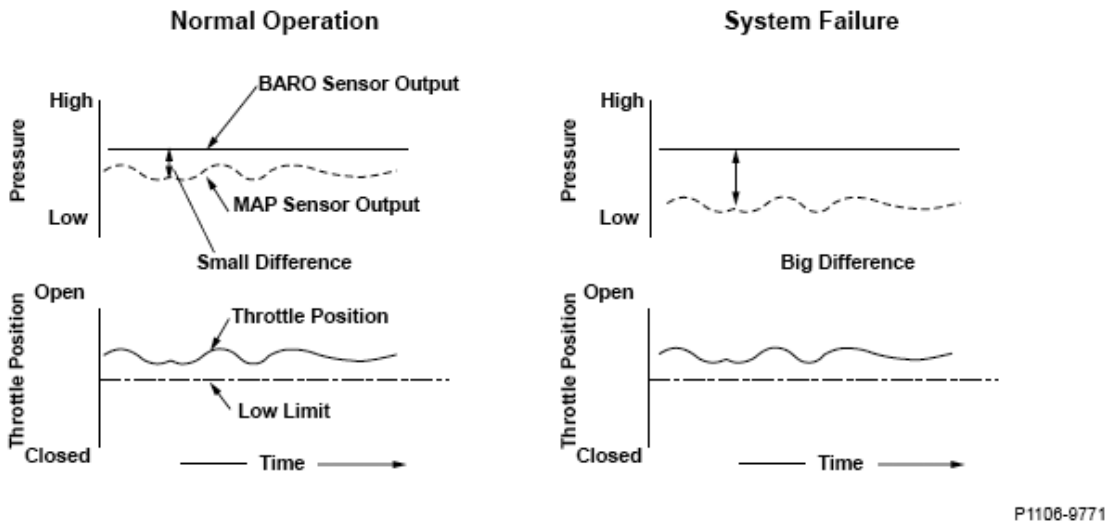

Fig. 627: Barometric Pressure (BARO) Sensor Throttle Position - Graph

General Description (M/T)

The barometric pressure (BARO) sensor is built into the engine control module (ECM)/powertrain control module (PCM) and monitors atmospheric pressure. When the throttle valve is wide open, the manifold absolute pressure (MAP) sensor output is nearly equal to the BARO sensor output. Making use of this characteristic, a malfunction can be detected in the BARO sensor output.

If the throttle position is beyond a value stored in the ECM/PCM that is used to detect "wide-open throttle," and if the difference between the MAP sensor output and the BARO sensor output is equal to or greater than a set value, a malfunction in the BARO sensor output is detected and a DTC is stored.

(1) R18A1 engine rocker arm oil control solenoid: ON (2) R18A1 engine rocker arm oil control solenoid: OFF			

Malfunction Threshold (M/T)

The difference between the BARO sensor output and the MAP sensor output is 28 kPa (8.1 in.Hg, 204 mmHg)*1 , 38 kPa (11.2 in.Hg, 284 mmHg)*1 or more for at least 2.5*2 , 3*1 seconds.

Driving Pattern (M/T)

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Drive the vehicle with the throttle position as specified under Enable Conditions for at least 2.5*2 , 3*1 seconds.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (M/T)

Conditions for illuminating the MIL (M/T)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the ECM/PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (M/T)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2227 (13): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P2227: BAROMETRIC PRESSURE (BARO) SENSOR CIRCUIT RANGE/PERFORMANCE PROBLEM (R18A1 ENGINE)

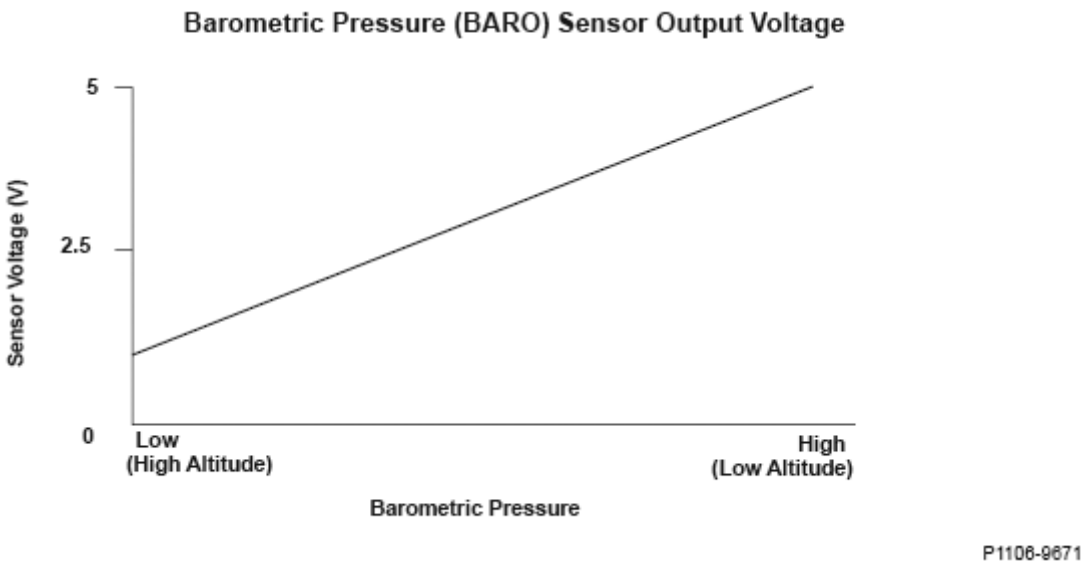

Fig. 628: Barometric Pressure (BARO) Sensor Voltage - Graph

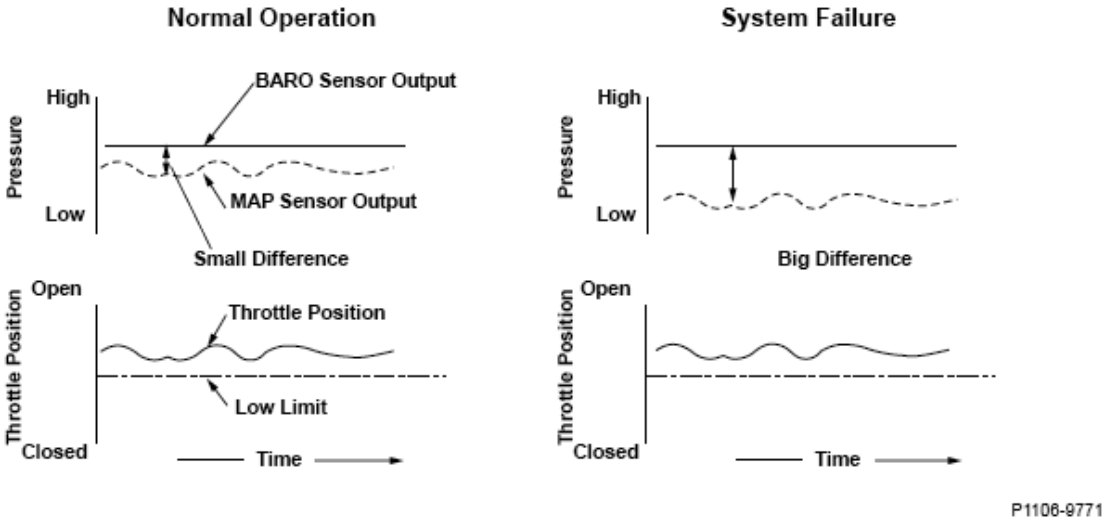

Fig. 629: Barometric Pressure (BARO) Sensor Throttle Position - Graph

General Description (R18A1 Engine)

The barometric pressure (BARO) sensor is built into the engine control module (ECM)/powertrain control module (PCM) and monitors atmospheric pressure. When the throttle valve is wide open, the manifold absolute pressure (MAP) sensor output is nearly equal to the BARO sensor output. Making use of this characteristic, a malfunction can be detected in the BARO sensor output.

If the throttle position is beyond a value stored in the ECM/PCM that is used to detect "wide-open throttle," and if the difference between the MAP sensor output and the BARO sensor output is equal to or greater than a set value, a malfunction in the BARO sensor output is detected and a DTC is stored.

(1) R18A1 engine rocker arm oil control solenoid: ON (2) R18A1 engine rocker arm oil control solenoid: OFF			

Malfunction Threshold (R18A1 Engine)

The difference between the BARO sensor output and the MAP sensor output is 28 kPa (8.1 in.Hg, 204 mmHg)*1 , 38 kPa (11.2 in.Hg, 284 mmHg)*1 or more for at least 2.5*2 , 3*1 seconds.

Driving Pattern (R18A1 Engine)

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Drive the vehicle with the throttle position as specified under Enable Conditions for at least 2.5*2 , 3*1 seconds.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the ECM/PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2227 (13): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P2227: BAROMETRIC PRESSURE (BARO) SENSOR RANGE/PERFORMANCE PROBLEM (R18A4 ENGINE)

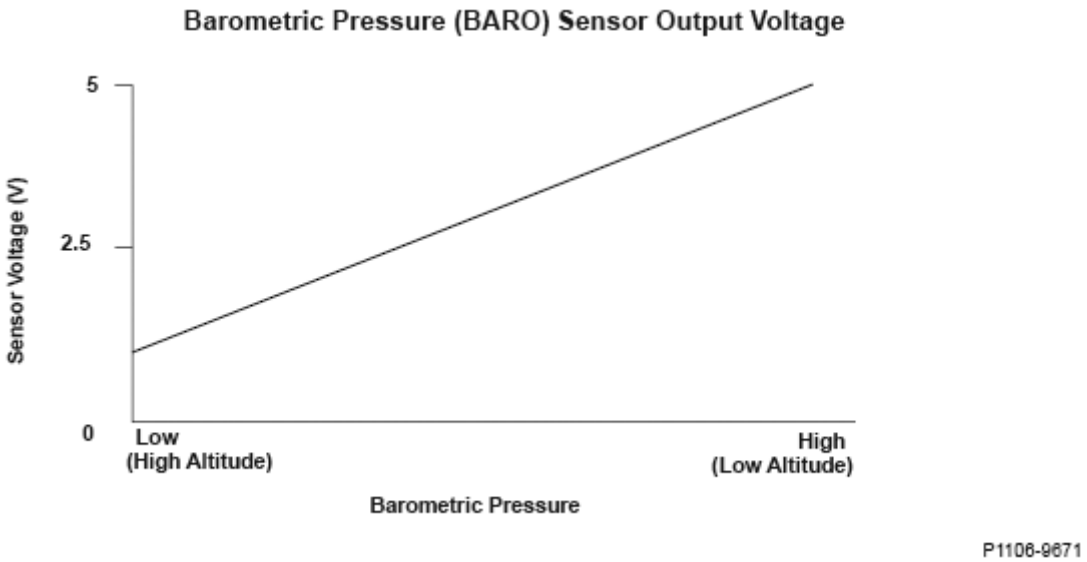

Fig. 630: Barometric Pressure (BARO) Sensor Voltage - Graph

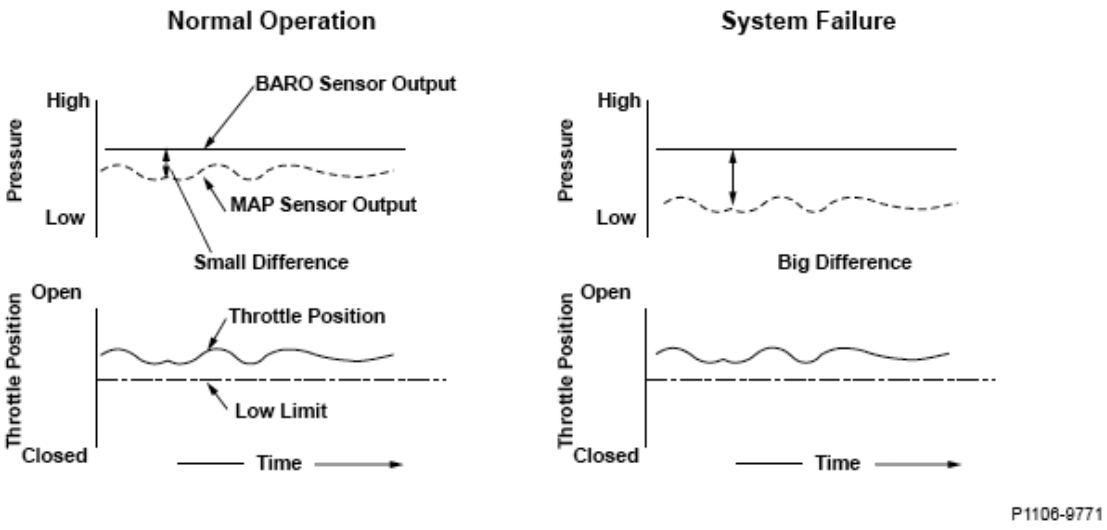

Fig. 631: Barometric Pressure (BARO) Sensor Throttle Position - Graph

General Description (R18A4 Engine)

The barometric pressure (BARO) sensor is built into the powertrain control module (PCM) and monitors atmospheric pressure. When the throttle valve is wide open, the manifold absolute pressure (MAP) sensor output is nearly equal to the BARO sensor output. Making use of this characteristic, a malfunction can be detected in the BARO sensor output.

If the throttle position is beyond a value stored in the PCM that is used to detect "wide-open throttle," and if the difference between the MAP sensor output and the BARO sensor output is equal to or greater than a set value, a malfunction in the BARO sensor output is detected and a DTC is stored.

Driving Pattern (R18A4 Engine)

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Drive the vehicle with the throttle position as specified under Enable Conditions for at least 2 seconds.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2228 (13): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P2228: BAROMETRIC PRESSURE (BARO) SENSOR CIRCUIT LOW VOLTAGE (K20Z3 ENGINE)

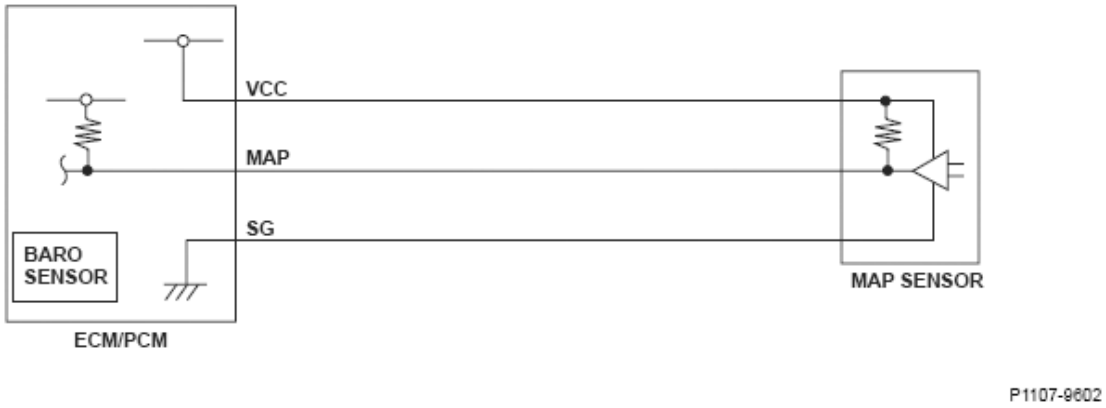

Fig. 632: Barometric Pressure (BARO) Sensor - Circuit Diagram

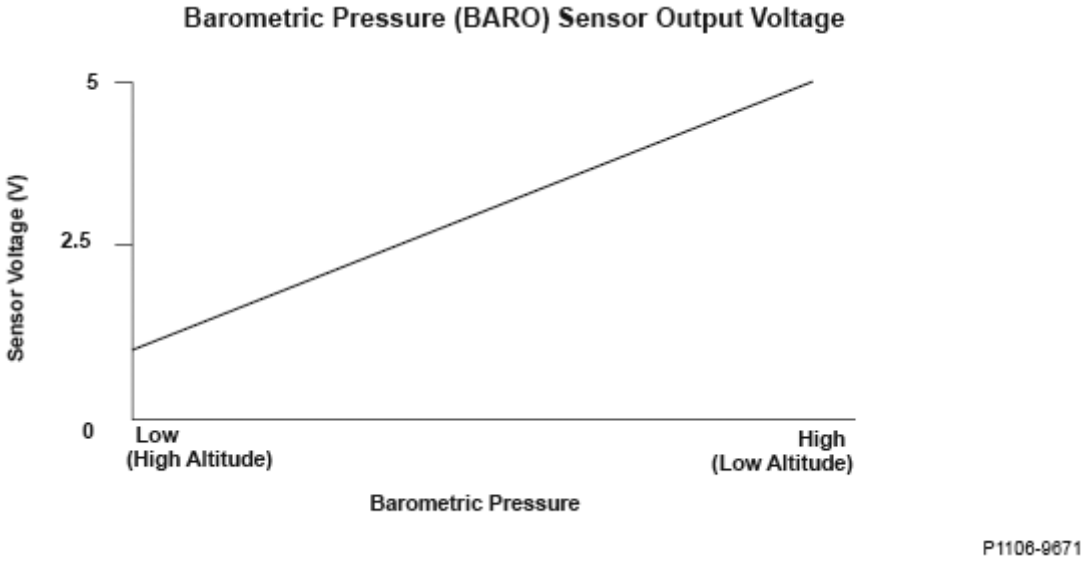

Fig. 633: Barometric Pressure (BARO) Sensor Voltage - Graph

General Description (K20Z3 Engine)

The barometric pressure (BARO) sensor is built into the engine control module (ECM)/powertrain control module (PCM), and it monitors atmospheric pressure. The ECM/PCM estimates appropriate intake airflow from the manifold absolute pressure (MAP) sensor output voltage and BARO sensor output voltage. If the BARO sensor output voltage is a specified value or less, the ECM/PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

DTC P2238 (48): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P2238: AIR/FUEL RATIO (A/F) SENSOR (SENSOR 1) AFS+ CIRCUIT LOW VOLTAGE (K20Z3 ENGINE)

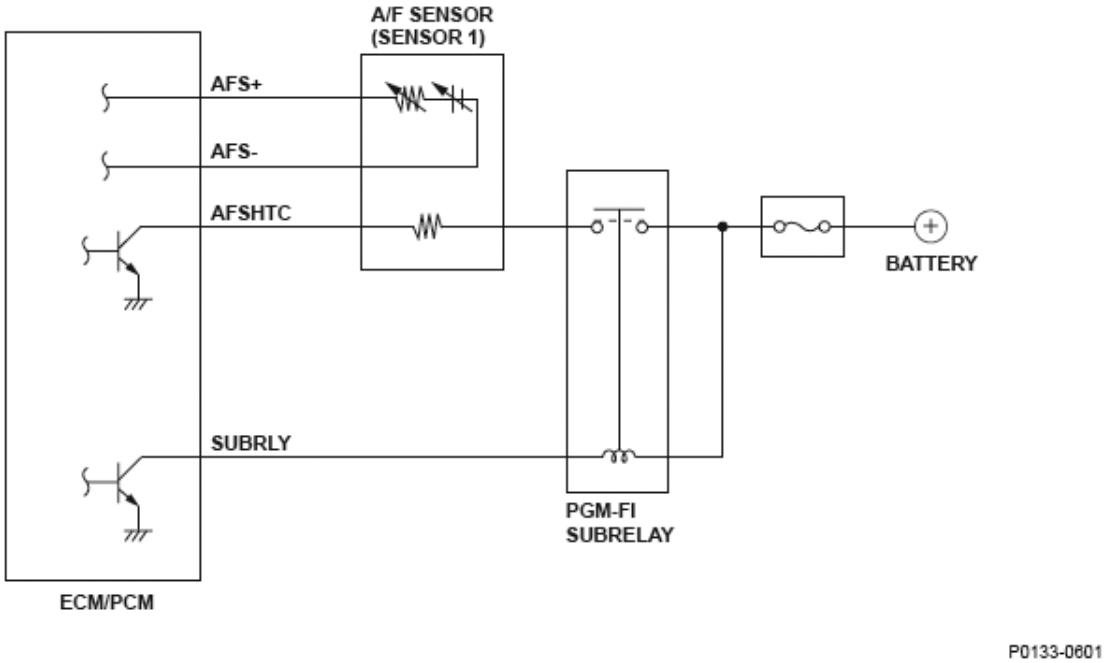

Fig. 644: Air/Fuel Ratio (A/F) Sensor - Circuit Diagram

General Description (K20Z3 Engine)

The air/fuel ratio (A/F) sensor (sensor 1) is installed in the exhaust system and detects oxygen content in the exhaust gas. The A/F sensor transmits a signal to the engine control module (ECM)/powertrain control module (PCM). A heater for the sensor element is embedded in the A/F sensor (sensor 1). It heats the sensor to stabilize and speed up the detection of oxygen content. The increase in current through the heater levels off as the voltage applied to the electrode reaches a certain range because the amount of oxygen that goes through the diffusion layer is limited. The current is proportional to oxygen content in the exhaust gas, so the air/fuel ratio is detected by the measurement of the current. The ECM/PCM compares a set target air/fuel ratio with the detected air/fuel ratio and controls the fuel injection duration.

If the A/F sensor (sensor 1) voltage is low, the air/fuel ratio is lean, and the ECM/PCM uses A/F feedback control to issue a Rich command. If the A/F sensor (sensor 1) voltage is high, the air/fuel ratio is rich, and the ECM/PCM uses A/F feedback control to issue a Lean command.

If the element is not activated or the ECM/PCM terminal voltage is a set value or less for a set time when power is applied to the A/F sensor (sensor 1) heater, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

State of the engine	Running	
No active DTCs	P0117, P0118, P0134, P0135, P1157, P2195, P2238	

Malfunction Threshold (R18A1 Engine)

The AFS-terminal voltage is 0.4 V or less for at least 4 seconds.

Driving Pattern (R18A1 Engine)

Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle for 2 minutes.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM/PCM memory.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2252 (48): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P2252: AIR/FUEL RATIO (A/F) SENSOR (SENSOR 1) AFS-LINE LOW VOLTAGE (R18A4 ENGINE)

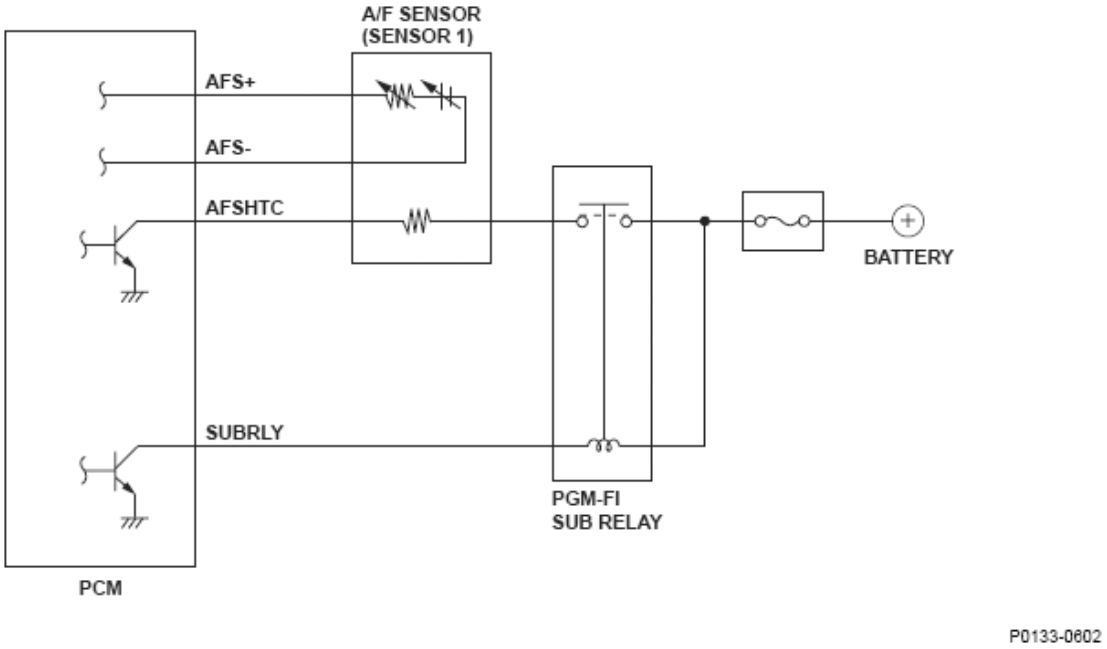

Fig. 649: Circuit Diagram - DTC P0135 - Air/Fuel Ratio (A/F) Sensor (Sensor 1)

General Description (R18A4 Engine)

The air/fuel ratio (A/F) sensor (sensor 1) is installed in the exhaust system and detects oxygen content in the exhaust gas. The A/F sensor transmits output voltage to the powertrain control module (PCM). A heater for the sensor element is embedded in the A/F sensor (sensor 1). It heats the sensor to stabilize and speed the detection of oxygen content. The increase in the current through the heater levels off as the voltage applied to the electrode reaches a certain range because the amount of oxygen that goes through the diffusion layer is limited. The current is proportional to oxygen content in the exhaust gas, so the air/fuel ratio is detected by the measurement of the current. The PCM compares a set target air/fuel ratio with the detected air/fuel ratio and controls the fuel injection duration.

If the A/F sensor (sensor 1) voltage is low, the air/fuel ratio is lean, and the PCM uses A/F feedback control to issue a Rich command. If the A/F sensor (sensor 1) voltage is high, the air/fuel ratio is rich, and the PCM uses A/F feedback control to issue a Lean command.

If the element is not activated or the PCM terminal voltage is a set value or less for a set time when power is drawn to the A/F sensor (sensor 1) heater, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A4 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	4 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions (R18A4 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	10.5 V	-
State of the engine	Running	
No active DTCs	P0117, P0118, P0134, P0135, P1157, P2195, P2238	

Malfunction Threshold (R18A4 Engine)

The AFS-terminal voltage is 0.4 V or less for at least 4 seconds.

Driving Pattern (R18A4 Engine)

Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle for 2 minutes.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2270 (63): ADVANCED DIAGNOSTICS (M/T)

DTC P2270: SECONDARY HEATED OXYGEN SENSOR (SECONDARY HO2S (SENSOR 2)) CIRCUIT SIGNAL STUCK LEAN (M/T)

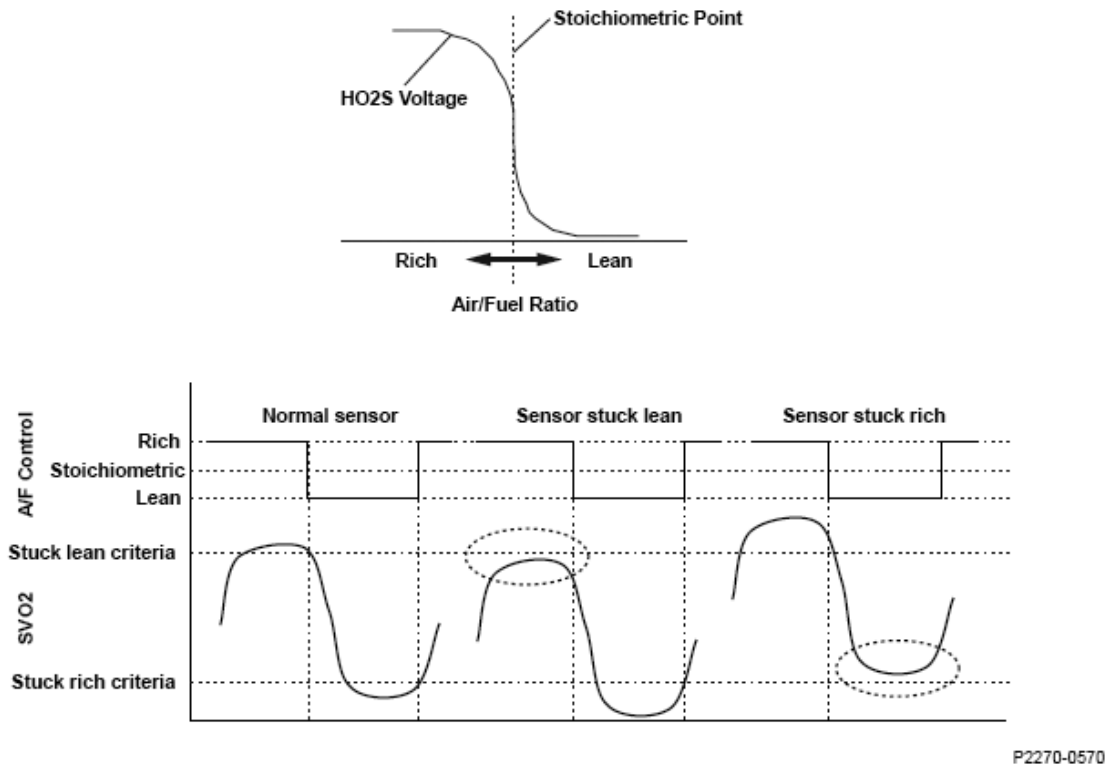

Fig. 650: Air Fuel Ratio - Graph

General Description (M/T)

The secondary HO2S detects the oxygen concentration in the exhaust gas downstream of the three-way catalyst (TWC). The sensor output voltage characteristics are similar to the air/fuel ratio (A/F) sensor. The oxygen concentration is detected after the TWC during fuel feedback control using the A/F sensor, and it optimizes the fuel feedback control to maximize the effect of the TWC. If, after current is applied to the secondary HO2S heater, the secondary HO2S does not fluctuate and the output is stuck within the specified area, a malfunction is detected and a DTC is stored.

No active DTCs	P0101, P0102, P0103, P0107, P0108, P0111, P0112, P0113, P0117, P0118, P0133, P0134, P0135, P0137, P0138, P0141, P0171, P0172, P0181, P0182, P0183, P0191, P0192, P0193, P0300, P0301, P0302, P0303, P0304, P0335, P0339, P0351, P0352, P0353, P0354, P1077, P1078, P1128, P1129, P1157, P1172, P2195, P2238, P2252, P2270, P2646, P2647, P2648, P2649, P2A00	
Other	Not during valve pausing	

Malfunction Threshold (R18A4 Engine)

The secondary HO2S output voltage is 0.293 V or more.

Driving Pattern (R18A4 Engine)

1. Start the engine. Let it idle until the radiator fan comes on.
2. Drive the vehicle at a steady speed of 35 mph (57 km/h) or more, for at least 25.4 seconds.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2413 (12): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P2413: EXHAUST GAS RECIRCULATION (EGR) SYSTEM MALFUNCTION (R18A1)

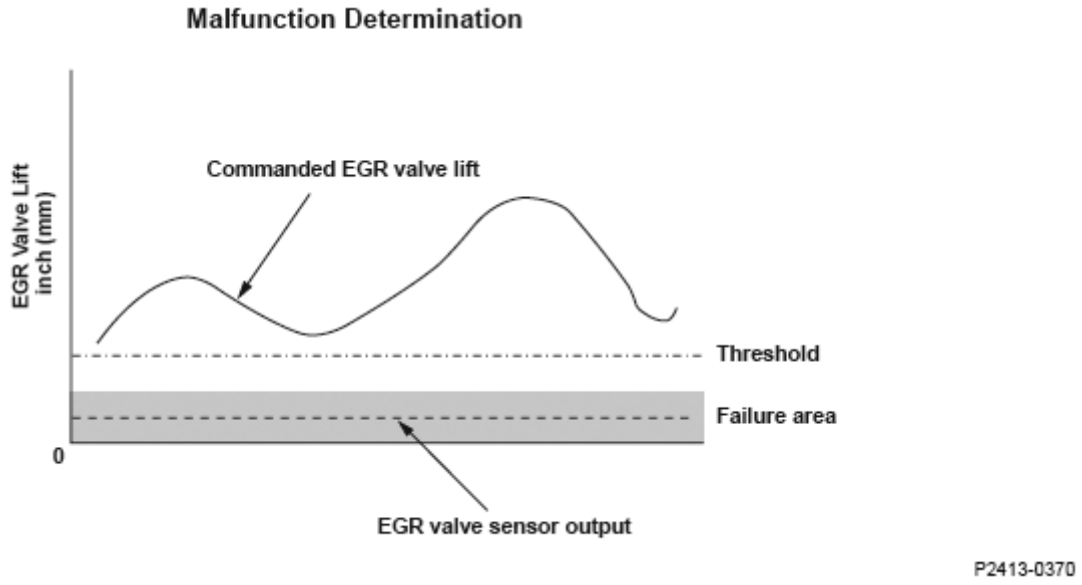

Fig. 656: EGR Valve Sensor Output And Valve Lifting Position Graph

General Description (R18A1 Engine)

The exhaust gas recirculation (EGR) valve, which is controlled by the engine control module (ECM)/powertrain control module (PCM), is opened and the exhaust gas flows from the exhaust manifold through the EGR valve and the intake manifold and the EGR passage. The exhaust gas is circulated into the air/fuel mixture and the mixture is drawn into the combustion chamber to lower the combustion temperatures, thus reducing oxides of nitrogen (NOx) emissions.

A sensor (lift sensor) is built into the EGR valve and detects the amount of valve lift. The command value for the target valve lift is stored in the ECM/PCM so that exhaust gas recirculation can be optimized according to driving conditions.

Comparing this command value with the lift sensor output signal value, the ECM/PCM controls the EGR valve to make the amount of actual valve lift equal to the command value.

If the valve sensor output is insufficient for the commanded valve lift, a malfunction is detected.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	None
Duration	5 seconds or more
DTC Type	Two drive cycles, MIL ON
OBD Status	PASSED/FAILED/EXECUTING/OUT OF (TEST) CONDITION

Enable Conditions (R18A1 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Engine speed	-	5,500 rpm

Battery voltage	10.5 V	-
Commanded EGR valve lift	0.040 in. (1.00 mm)	-
No active DTCs	P0101, P0101, P0102, P0103, P0107, P0108, P0112, P0113, P0117, P0118, P0134, P0135, P0300, P0301, P0302, P0303, P0304, P0335, P0339, P0351, P0352, P0353, P0354, P0400, P0401, P0406, P1128, P1129, P1157, P1172, P2195, P2238, P2252	

Malfunction Threshold (R18A1 Engine)

If the actual valve lift is 0.006 in. (0.15 mm) or less for at least 5 seconds, the valve is considered stuck closed.

Confirmation Procedure with the HDS (R18A1 Engine)

Do the EGR TEST in the INSPECTION MENU with the HDS.

Driving Pattern (R18A1 Engine)

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Drive the vehicle at a speed between 15 - 75 mph (24 - 120 km/h) for at least 5 seconds.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the ECM/PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2422 (117): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P2422: EVAPORATIVE EMISSION (EVAP) CANISTER VENT SHUT VALVE STUCK CLOSED MALFUNCTION (K20Z3)

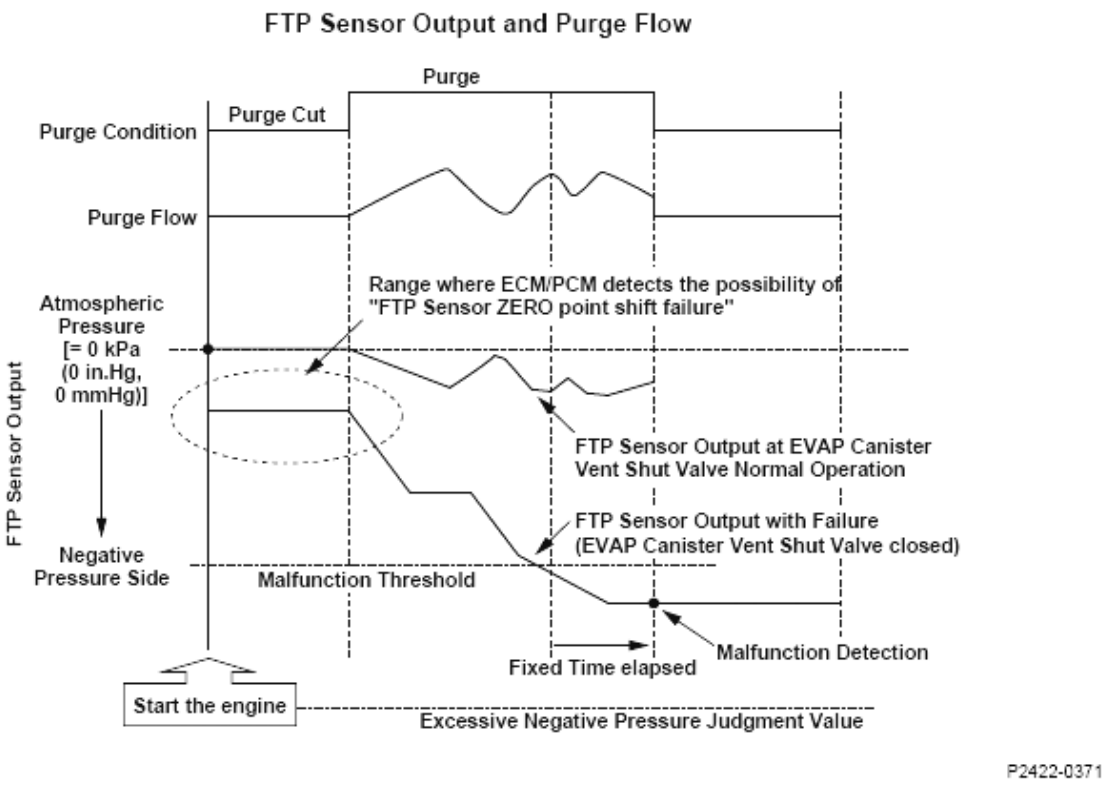

Fig. 657: FTP Sensor Output And Purge Flow Graph

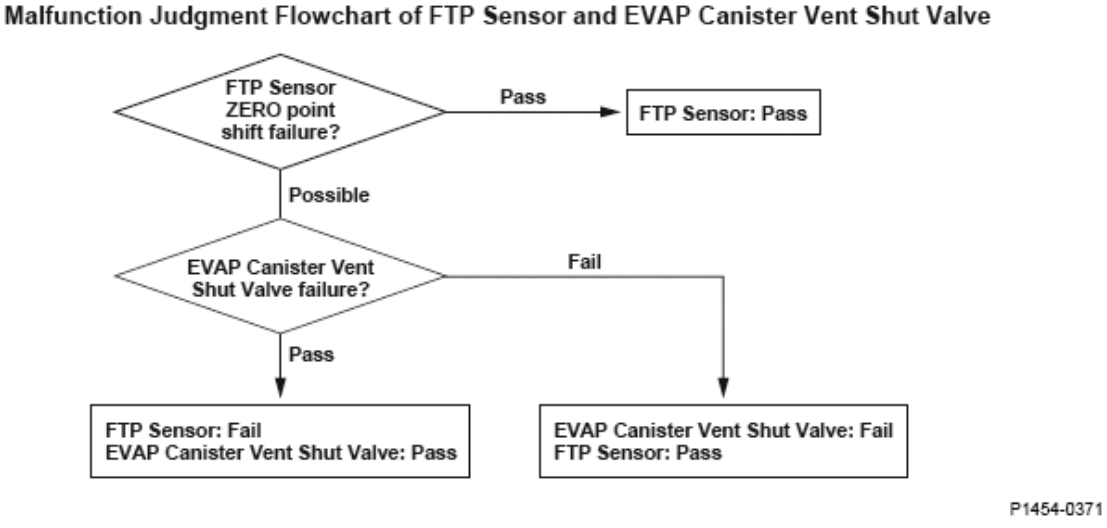

Fig. 658: Flow Chart

General Description (K20Z3 Engine)

The fuel tank pressure (FTP) sensor output indicates about atmospheric pressure 0 kPa (0 in.Hg, 0 mmHg) before purge starts since the evaporative emission (EVAP) canister vent shut valve is normally open (open to the atmosphere). The sensor indicates a negative pressure value (vacuum) during purging.

When the FTP sensor indicates vacuum after starting the engine, there is the possibility of an FTP sensor zero point shift failure or an EVAP canister vent shut valve stuck closed failure. So the engine control module (ECM) monitors the FTP sensor output after purge starts. The ECM detects a malfunction of the

EVAP canister vent shut valve if the output indicates excessive vacuum.

However, if the fuel tank internal pressure is below the specified value (excessive vacuum is detected) when starting the engine, the malfunction detection should be done as follows because it is difficult to distinguish the FTP sensor range problem (P1454) from the EVAP canister vent shut valve stuck closed (P2422).

1. If neither Temporary DTC (P1454 nor P2422) is stored, both DTCs are stored.
2. If both Temporary DTCs (P1454 and P2422) are stored and excessive vacuum is detected, both DTCs are stored.
3. If either Temporary DTC (P1454 or P2422) is stored and excessive vacuum is detected, the ECM stores the DTC of the Temporary DTC that was stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	P0452, P0453 are judged as OK
Duration	1.04(1), 8(2) seconds or more
DTC Type	Two drive cycles, MIL ON
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)
(1) Elapsed time after the FTP sensor output exceeds the malfunction threshold. (2) Excessive negative pressure is detected.

Others	The EVAP canister vent shut valve has not been closing	
	Stopping the purge control	
(1) Condition to start the purge control.		

Malfunction Threshold (K20Z3 Engine)

The output from the fuel tank pressure sensor is -4 kPa (-1.0 in.Hg, -25 mmHg)*, -2 kPa (-0.4 in.Hg, -10 mmHg)** or less for at least 1.04*, 8** seconds.

*: Elapsed time after the FTP sensor output exceeds the malfunction threshold.

**: Excessive negative pressure is detected.

Confirmation Procedure with the HDS (K20Z3 Engine)

Do the EVAP CVS ON in the INSPECTION MENU with the HDS.

Driving Pattern (K20Z3 Engine)

Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.

Diagnosis Details (K20Z3 Engine)

Conditions for illuminating the MIL (K20Z3 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the ECM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (K20Z3 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2422 (117): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P2422: EVAPORATIVE EMISSION (EVAP) CANISTER VENT SHUT VALVE STUCK CLOSED MALFUNCTION (R18A1)

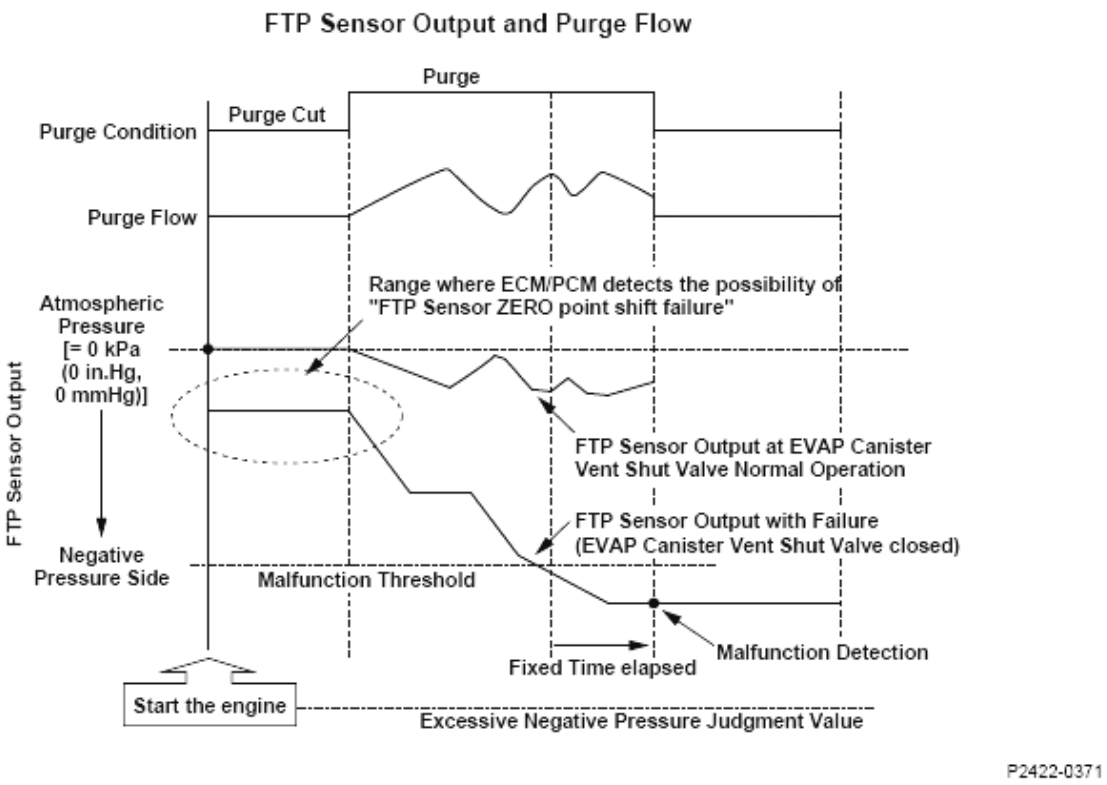

Fig. 659: FTP Sensor Output And Purge Flow Graph

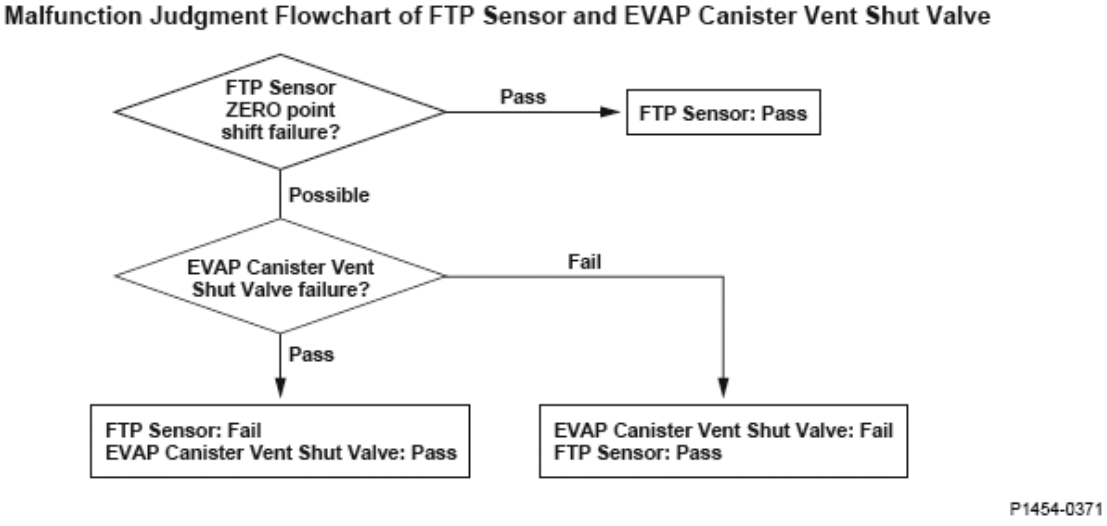

Fig. 660: Flow Chart

General Description (R18A1 Engine)

The fuel tank pressure (FTP) sensor output indicates about atmospheric pressure 0 kPa (0 in.Hg, 0 mmHg) before purge starts since the evaporative emission (EVAP) canister vent shut valve is normally open (open to the atmosphere). The sensor indicates a negative pressure value (vacuum) during purging.

When the FTP sensor indicates vacuum after starting the engine, there is the possibility of an FTP sensor zero point shift failure or an EVAP canister vent shut valve stuck closed failure. So the engine control module (ECM)/powertrain control module (PCM) monitors the FTP sensor output after purge starts. The

ECM/PCM detects a malfunction of the EVAP canister vent shut valve if the output indicates excessive vacuum.

However, if the fuel tank internal pressure is below the specified value (excessive vacuum is detected) when starting the engine, the malfunction detection should be done as follows because it is difficult to distinguish the FTP sensor range problem (P1454) from the EVAP canister vent shut valve stuck closed (P2422).

1. If neither Temporary DTC (P1454 nor P2422) is stored, both DTCs are stored.
2. If both Temporary DTCs (P1454 and P2422) are stored and excessive vacuum is detected, both DTCs are stored.
3. If either Temporary DTC (P1454 or P2422) is stored and excessive vacuum is detected, the ECM/PCM stores the DTC of the Temporary DTC that was stored.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2610 (132): ADVANCED DIAGNOSTICS (M/T)

DTC P2610: ENGINE CONTROL MODULE (ECM)/POWERTRAIN CONTROL MODULE (PCM) IGNITION OFF INTERNAL TIMER MALFUNCTION (M/T)

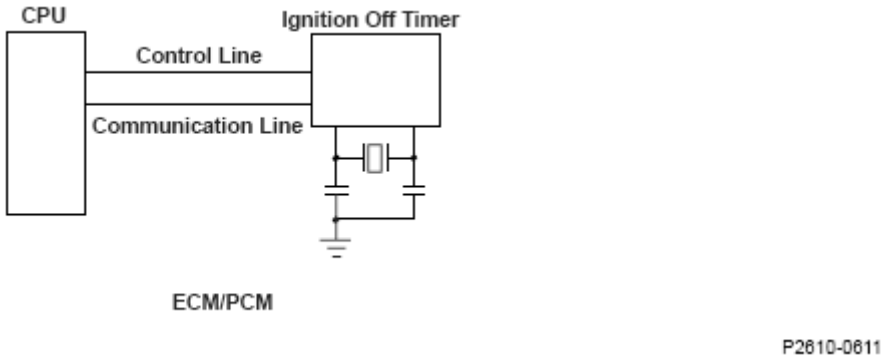

Fig. 661: Engine Control Module Ignition Off Internal Timer - Communication Diagram

General Description (M/T)

The engine control module (ECM)/powertrain control module (PCM) has a built-in ignition off timer that

measures the duration of time from ignition off to the next ignition on. The measured duration is used for evaporative emission (EVAP) leak detection and temperature assumption of the catalytic converter.

The CPU in the ECM/PCM accesses the ignition off timer when reading the measured duration. When the access process fails, a malfunction is detected and a DTC is stored. When an abnormality is found in the read data, a malfunction is detected and a DTC is stored.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2646 (22): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P2646: ROCKER ARM OIL PRESSURE SWITCH CIRCUIT LOW VOLTAGE (K20Z3)

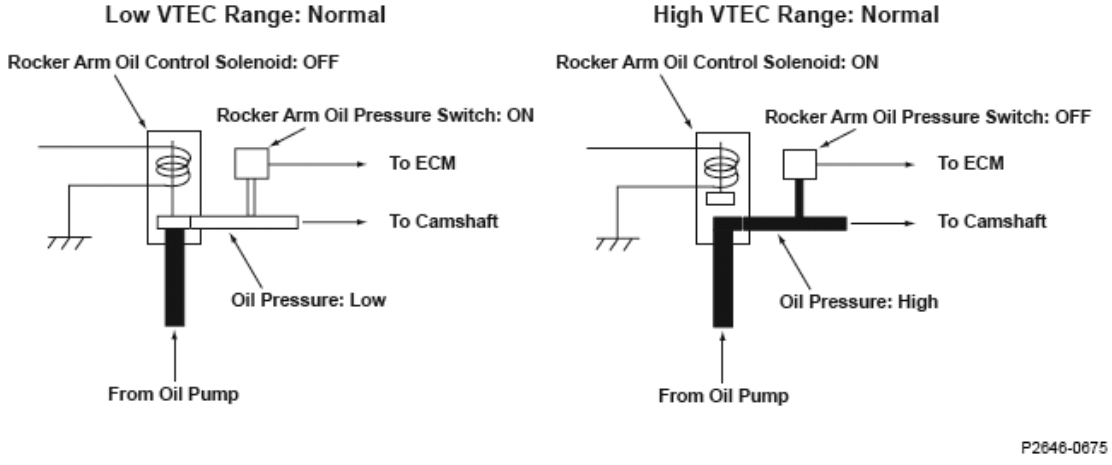

Fig. 664: Rocker Arm Oil Pressure Switch - Circuit Diagram

ROCKER ARM OIL PRESSURE SWITCH

Logic Decision	Rocker Arm Oil Pressure Switch	
	'ON'	'OFF'
Rocker Arm Oil Control Solenoid Command 'ON'	Failure	Normal
Rocker Arm Oil Control Solenoid Command 'OFF'	Normal	Failure

General Description (K20Z3 Engine)

The VTEC system activates the rocker arm oil control solenoid by command from the engine control module (ECM), and it charges/discharges the hydraulic circuit of the VTEC mechanism that switches valve timing between Low and High. The ECM monitors oil pressure in the hydraulic circuit of the VTEC mechanism using the rocker arm oil pressure switch down-stream of the rocker arm oil control solenoid. If there is a difference between the oil pressure condition in the hydraulic circuit that is determined by the ECM command and the oil pressure condition that is determined by the status of the rocker arm oil pressure switch, the system is considered faulty, and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2647 (22): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P2647: ROCKER ARM OIL PRESSURE SWITCH CIRCUIT HIGH VOLTAGE (K20Z3)

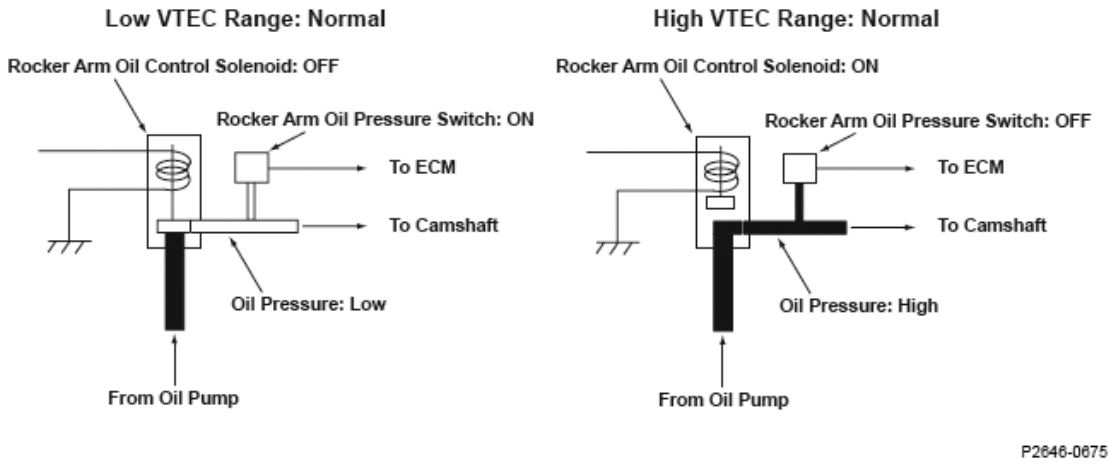

Fig. 667: Rocker Arm Oil Pressure Switch - Circuit Diagram

ROCKER ARM OIL PRESSURE SWITCH

Logic Decision	Rocker Arm Oil Pressure Switch	
	'ON'	'OFF'
Rocker Arm Oil Control Solenoid Command 'ON'	Failure	Normal
Rocker Arm Oil Control Solenoid Command 'OFF'	Normal	Failure

General Description (K20Z3 Engine)

The VTEC system activates the rocker arm oil control solenoid by command from the engine control module (ECM), and it charges/discharges the hydraulic circuit of the VTEC mechanism that switches valve timing between Low and High. The ECM monitors oil pressure in the hydraulic circuit of the VTEC mechanism using the rocker arm oil pressure switch down-stream of the rocker arm oil control solenoid. If there is a difference between the oil pressure condition in the hydraulic circuit that is determined by the ECM command and the oil pressure condition that is determined by the status of the rocker arm oil pressure switch, the system is considered faulty, and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	None
Duration	7 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions (K20Z3 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	10.5 V	-
No active DTCs	P2648, P2649	
Other	At idle	

Malfunction Threshold (K20Z3 Engine)

Low lift cam operation

When the rocker arm oil control solenoid is OFF, the rocker arm oil pressure switch remains OFF.

Confirmation Procedure with the HDS (K20Z3 Engine)

Do the VTEC TEST in the INSPECTION MENU with the HDS.

Driving Pattern (K20Z3 Engine)

Start the engine, and let it idle for at least 7 seconds.

Diagnosis Details (K20Z3 Engine)

Conditions for illuminating the MIL (K20Z3 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM memory.

Conditions for clearing the MIL (K20Z3 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2647 (22): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P2647: VTEC SYSTEM STUCK ON (R18A1)

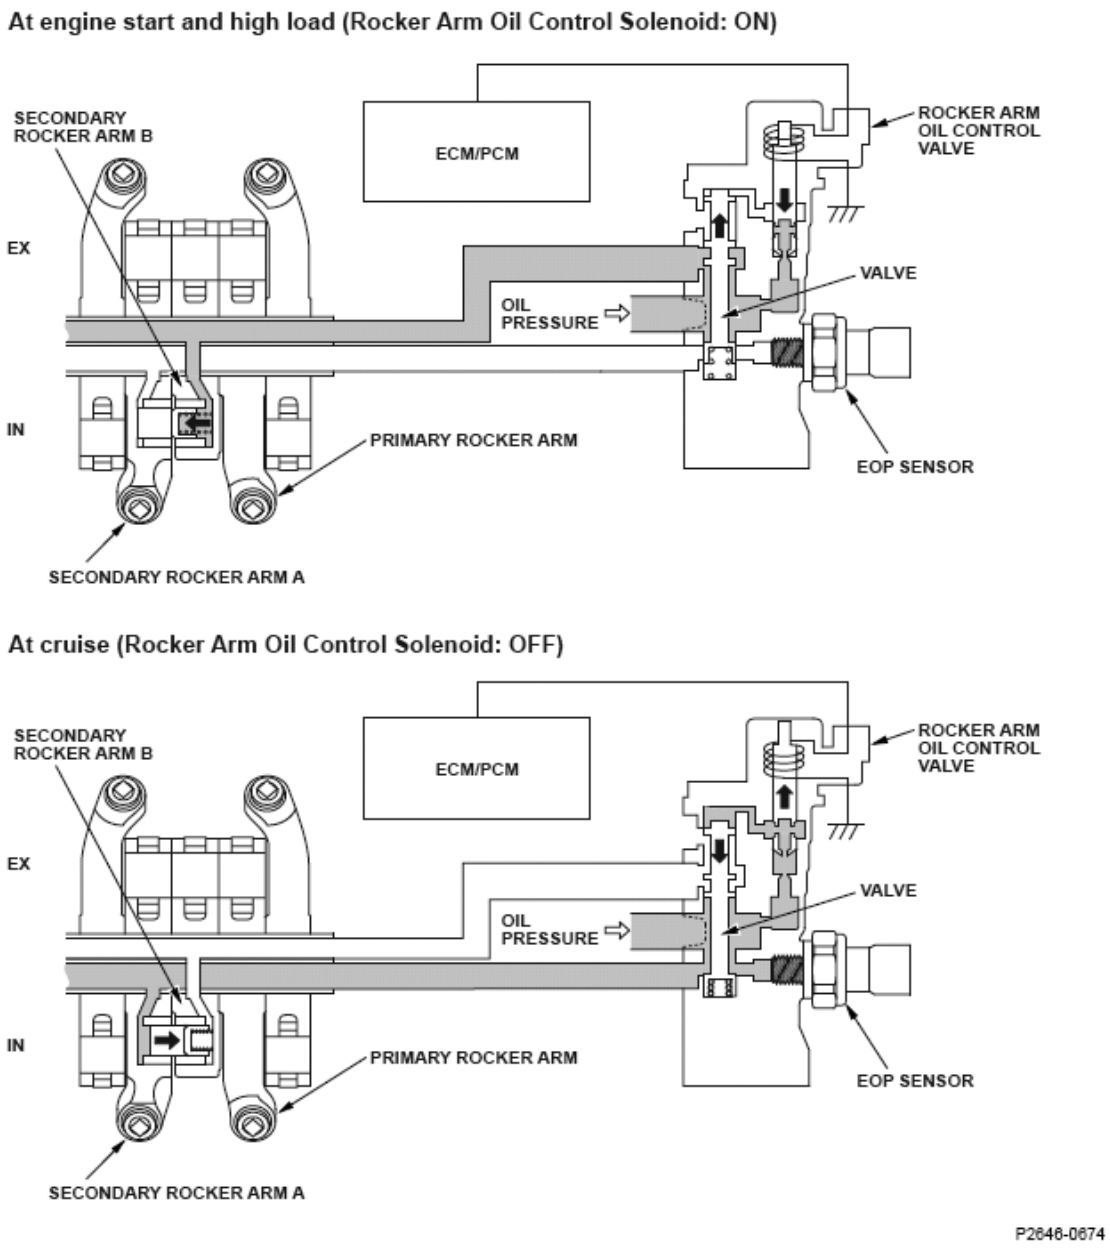

Fig. 668: Rocker Arm Oil Pressure Flow Diagram

EOP SENSOR REFERENCE

	EOP sensor	
	'High'	'Low'
Rocker Arm Oil Control Solenoid: ON	Failure	Normal
Rocker Arm Oil Control Solenoid: OFF	Normal	Failure

General Description (R18A1 Engine)

The VTEC system activates the rocker arm oil control solenoid by command from the engine control module (ECM)/powertrain control module (PCM), and it charges/discharges the hydraulic circuit of the VTEC mechanism that switches valve timing between Low and High. The ECM/PCM monitors oil pressure in the hydraulic circuit of the VTEC mechanism using the rocker arm oil pressure switch downstream of the rocker arm oil control solenoid. If there is a difference between the oil pressure condition in the hydraulic

circuit that is determined by the ECM/PCM command and the oil pressure condition that is determined by the status of the rocker arm oil pressure switch, the system is considered faulty, and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	One per driving cycle
Sequence	None
Duration	2.5 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions (R18A1 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	10.5 V	-
No active	DTCs P0522, P0523, P2648, P2649	

Malfunction Threshold (R18A1 Engine)

When the rocker arm oil control solenoid is OFF, the EOP sensor output remains low (49 kPa (14.4 in.Hg, 367 mmHg) or less).

Confirmation Procedure with the HDS (R18A1 Engine)

Do the VTEC TEST in the INSPECTION MENU with the HDS.

Driving Pattern (R18A1 Engine)

Start the engine, and let it idle for at least 2.5 seconds.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM/PCM memory.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2647 (22): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P2647: VTEC SYSTEM STUCK ON (R18A4 ENGINE)

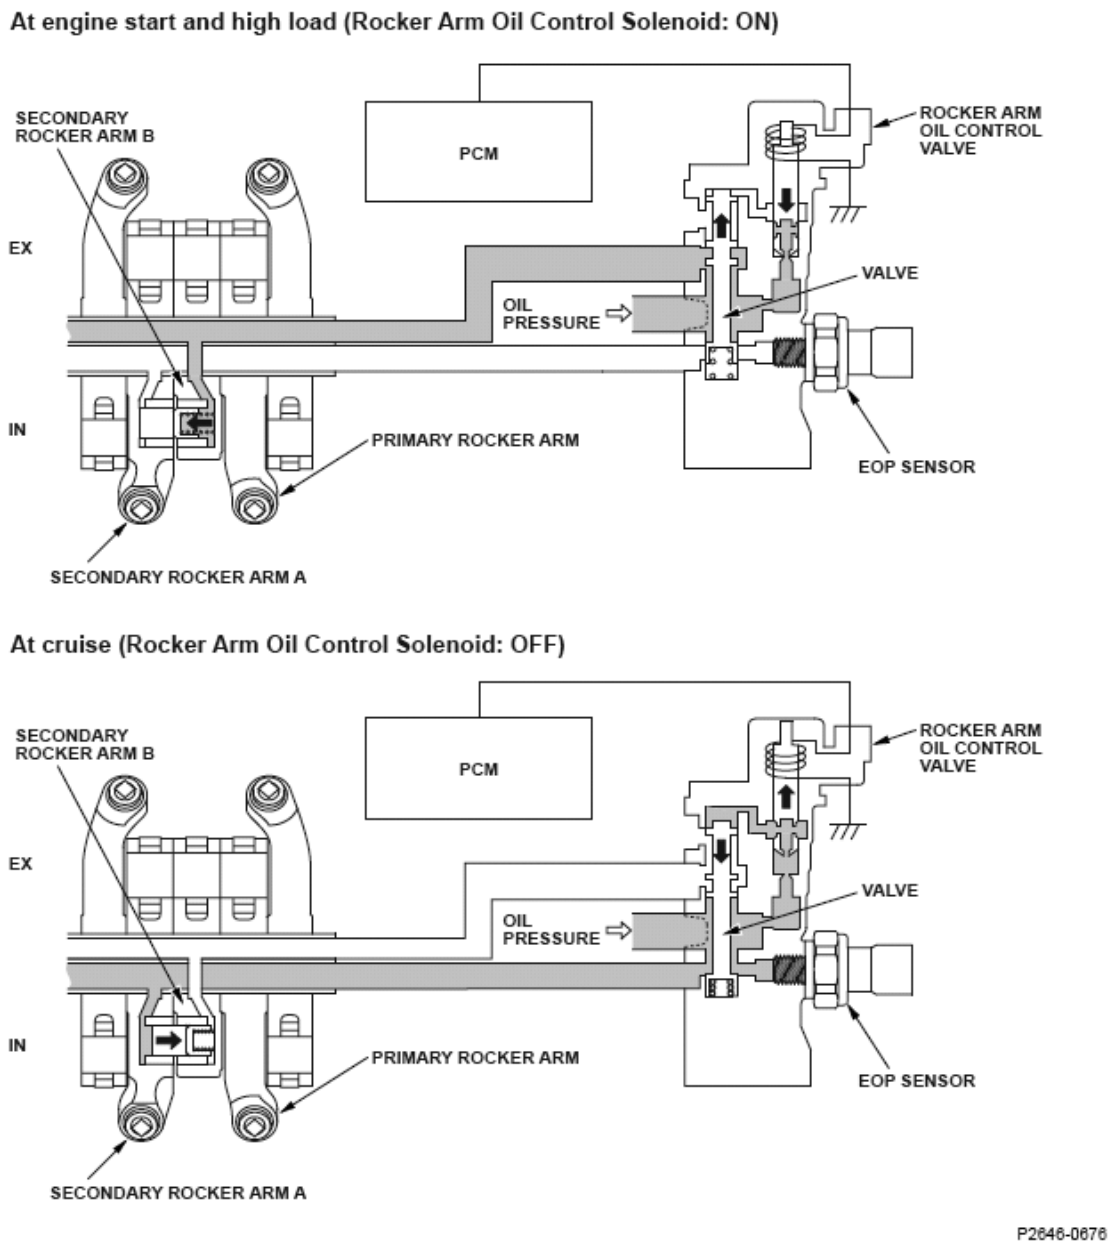

Fig. 669: VTEC System Diagram

EOP SENSOR REFERENCE

	EOP sensor	
	'High'	'Low'
Rocker Arm Oil Control Solenoid: ON	Failure	Normal
Rocker Arm Oil Control Solenoid: OFF	Normal	Failure

General Description (R18A4 Engine)

The VTEC system activates the rocker arm oil control solenoid by command from the powertrain control module (PCM), and it charges/discharges the hydraulic circuit of the VTEC mechanism that switches valve timing between Low and High. The PCM monitors oil pressure in the hydraulic circuit of the VTEC mechanism using the rocker arm oil pressure switch down-stream of the rocker arm oil control solenoid. If there is a difference between the oil pressure condition in the hydraulic circuit that is determined by the

PCM command and the oil pressure condition that is determined by the status of the rocker arm oil pressure switch, the system is considered faulty, and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A4 Engine)

MONITOR DESCRIPTION CHART

Execution	One per driving cycle
Sequence	None
Duration	2.5 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions (R18A4 Engine)

Condition	Minimum	Maximum
Battery voltage	10.5 V	-
No active DTCs	P0522, P0523, P1109, P2227, P2228, P2229, P2648, P2649	

Malfunction Threshold (R18A4 Engine)

When the rocker arm oil control solenoid is OFF, the EOP sensor output remains low (49 kPa (14.4 in.Hg, 367 mmHg) or less).

Confirmation Procedure with the HDS (R18A4 Engine)

Do the VTEC TEST in the INSPECTION MENU with the HDS.

Driving Pattern (R18A4 Engine)

Start the engine, and let it idle for at least 2.5 seconds.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2648 (21): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC P2648: ROCKER ARM OIL CONTROL SOLENOID CIRCUIT LOW VOLTAGE (K20Z3)

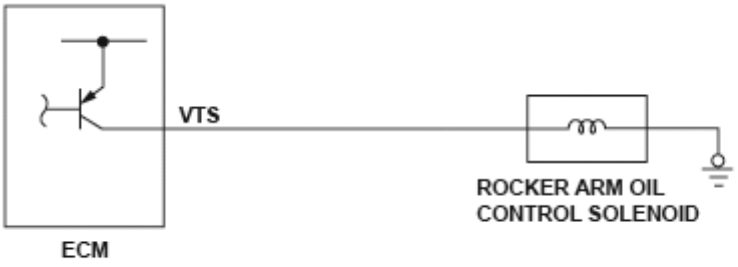

Fig. 670: Rocker Arm Oil Control Solenoid - Circuit Diagram

General Description (K20Z3 Engine)

The VTEC system activates the rocker arm oil control solenoid by command from the engine control module (ECM), and it charges/discharges the hydraulic circuit of the VTEC mechanism that switches valve timing between low and high. If the return signal is OFF (low) when the ECM outputs the ON (high) signal to the rocker arm oil control solenoid, the ECM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	1.1 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions (K20Z3 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	10.0 V	-
No active DTCs	P2649	

Malfunction Threshold (K20Z3 Engine)

The return signal is OFF (low) for at least 1.1 seconds when the ECM outputs the ON (high) signal to the rocker arm oil control solenoid.

Driving Pattern (K20Z3 Engine)

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on.
2. Drive the vehicle in a lower gear at 4,000 rpm or more with a manifold absolute pressure (MAP) value of 12 kPa (3.5 in.Hg, 90 mmHg) or more for at least 7 seconds.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (K20Z3 Engine)

Conditions for illuminating the MIL (K20Z3 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM memory.

Conditions for clearing the MIL (K20Z3 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2648 (21): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC P2648: ROCKER ARM OIL CONTROL SOLENOID CIRCUIT LOW VOLTAGE (R18A1)

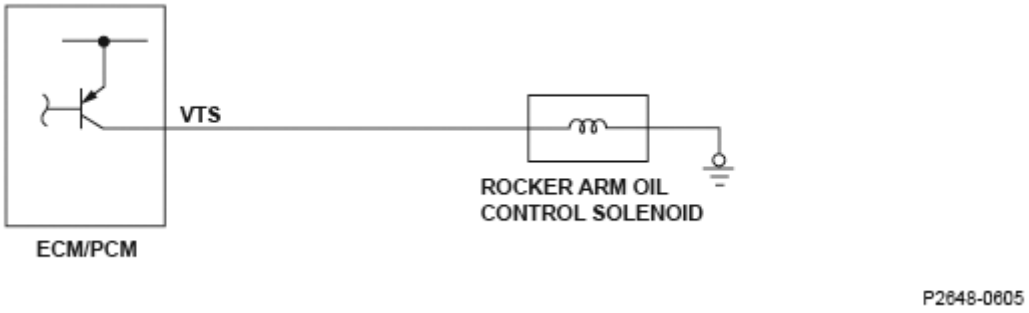

Fig. 671: Rocker Arm Oil Control Solenoid - Circuit Diagram

General Description (R18A1 Engine)

The VTEC system activates the rocker arm oil control solenoid by command from the engine control module (ECM)/powertrain control module (PCM), and it charges/discharges the hydraulic circuit of the VTEC mechanism that switches valve timing between low and high. If the return signal is OFF (low) when the ECM/PCM outputs the ON (high) signal to the rocker arm oil control solenoid, the ECM/PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	1.1 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions (R18A1 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum

Battery voltage	10.0 V	-
No active DTCs	P2649	

Malfunction Threshold (R18A1 Engine)

The return signal is OFF (low) for at least 1.1 seconds when the ECM/PCM outputs the ON (high) signal to the rocker arm oil control solenoid.

Driving Pattern (R18A1 Engine)

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Drive immediately at a steady engine speed between 1,100 rpm and 3,300 rpm for at least 15.5 seconds.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM/PCM memory.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2648 (21): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC P2648: ROCKER ARM OIL CONTROL VALVE CIRCUIT LOW VOLTAGE (R18A4 ENGINE)

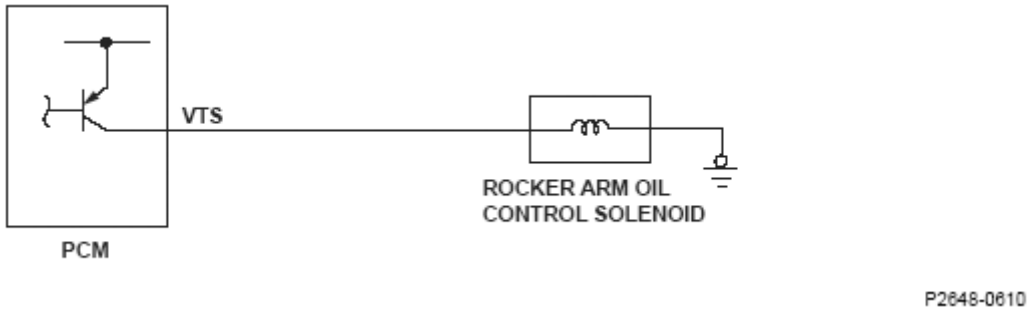

Fig. 672: Rocker Arm Oil Control Solenoid - Circuit Diagram

General Description (R18A4 Engine)

The VTEC system activates the rocker arm oil control solenoid by command from the powertrain control module (PCM), and it charges/discharges the hydraulic circuit of the VTEC mechanism that switches valve timing between low and high. If the return signal is OFF (low) when the PCM outputs the ON (high) signal to the rocker arm oil control solenoid, the PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A4 Engine)

Malfunction Threshold (R18A4 Engine)

The return signal is ON (high) for at least 1.1 seconds when the PCM outputs the OFF (low) signal to the rocker arm oil control solenoid.

Driving Pattern (R18A4 Engine)

Start the engine, and let it idle for at least 2.5 seconds.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2A00 (61): ADVANCED DIAGNOSTICS (M/T)

DTC P2A00: AIR/FUEL RATIO (A/F) SENSOR (SENSOR 1) CIRCUIT RANGE/PERFORMANCE PROBLEM (M/T)

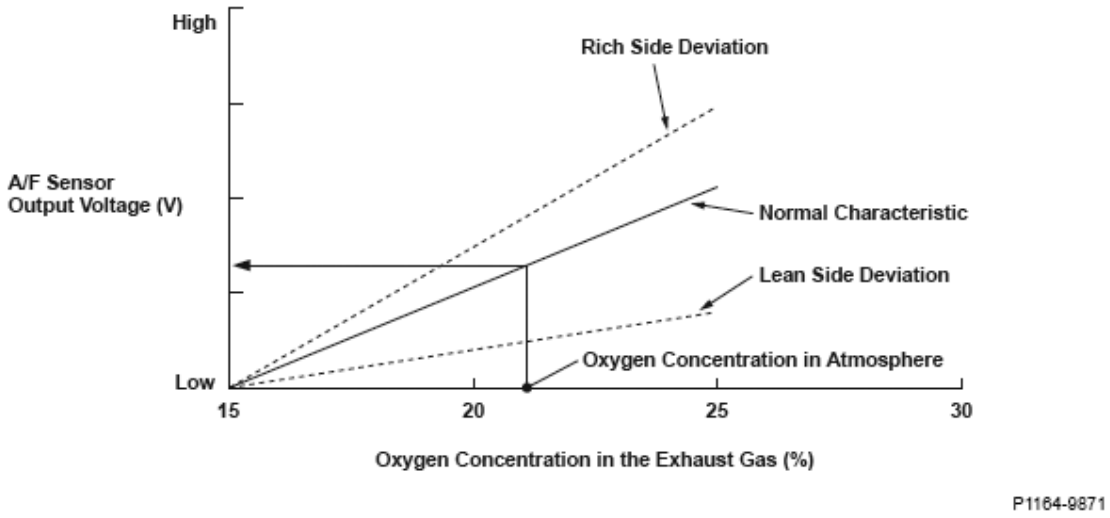

Fig. 676: A/F Sensor Voltage - Graph

General Description (M/T)

The air/fuel ratio (A/F) sensor has a linear signal output in relation to the oxygen concentration. The engine control module (ECM)/powertrain control module (PCM) computes the air/fuel ratio from A/F sensor output voltage and uses the fuel feedback control to improve exhaust emissions. The ECM/PCM monitors A/F sensor output voltage during deceleration with the throttle fully closed, and if the output voltage deviates greatly from normal oxygen concentration levels, it detects a malfunction and stores a DTC.

* Output to the scan tool exhibits a relationship between the A/F sensor output and oxygen concentration, which is opposite to the characteristic shown in the graph. That is, a deviation toward the rich side increases the output voltage and one toward the lean side decreases the output voltage as the stoichiometric ratio is 0.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (M/T)

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	None
Duration	3.5 seconds or more
DTC Type	Two drive cycles, MIL ON
OBD Status	PASSED/FAILED/EXECUTING/OUT OF (TEST) CONDITION

Enable Conditions (M/T)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Elapsed time after starting the engine	60 seconds	-
Engine coolant temperature	156°F (69°C)	-
Intake air temperature	-13°F (-25°C)	-
Engine speed	-	3,600 rpm(1)
		4,000 rpm(2)

Vehicle speed	30 mph (48 km/h)	-
Fuel feedback	During deceleration

(1) R18A1 engine (2) K20Z3 engine		

Malfunction Threshold (M/T)

The A/F sensor output voltage is 2.80*1 , 3.00*2 V or less, or 4.80 V or more.

Driving Pattern (M/T)

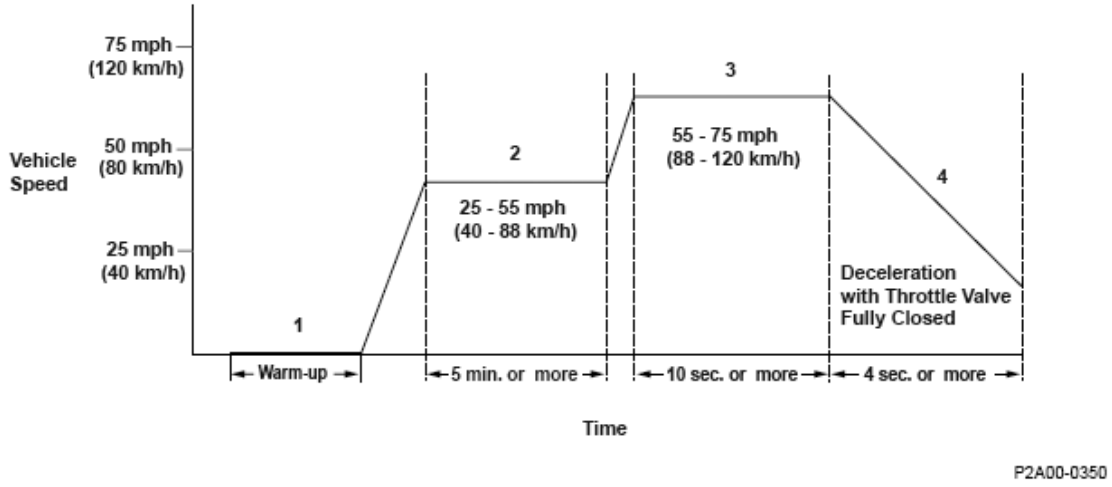

Fig. 677: Identifying Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Drive the vehicle at a speed between 25 - 55 mph (40 - 88 km/h) for at least 5 minutes.
3. Then, drive immediately at a steady speed between 55 - 75 mph (88 - 120 km/h) for at least 10 seconds.
4. Decelerate with the throttle valve fully closed for at least 4 seconds.
   - If the EVAP monitor runs instead of the HO2S monitor, turn the engine off, then restart it, and the HO2S monitor will restart.
   - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (M/T)

Conditions for illuminating the MIL (M/T)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the ECM/PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (M/T)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

Driving Pattern (R18A4 Engine)

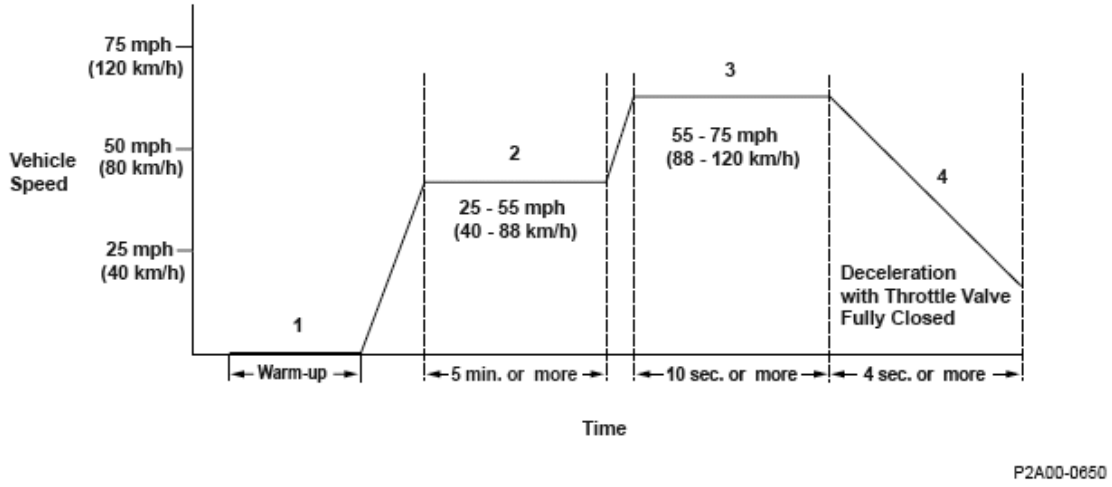

Fig. 681: Identifying Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Drive the vehicle at a speed between 25 - 55 mph (40 - 88 km/h) for at least 5 minutes.
3. Then, drive immediately at a steady speed between 55 - 75 mph (88 - 120 km/h) for at least 10 seconds.
4. Decelerate with the throttle valve fully closed for at least 4 seconds.
    - If the EVAP monitor runs instead of the HO2S monitor, turn the engine off, then restart it, and the HO2S monitor will restart.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the

diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC U0028 (107): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC U0028: F-CAN COMMUNICATION CIRCUIT ERROR (F-CAN BUS OFF)

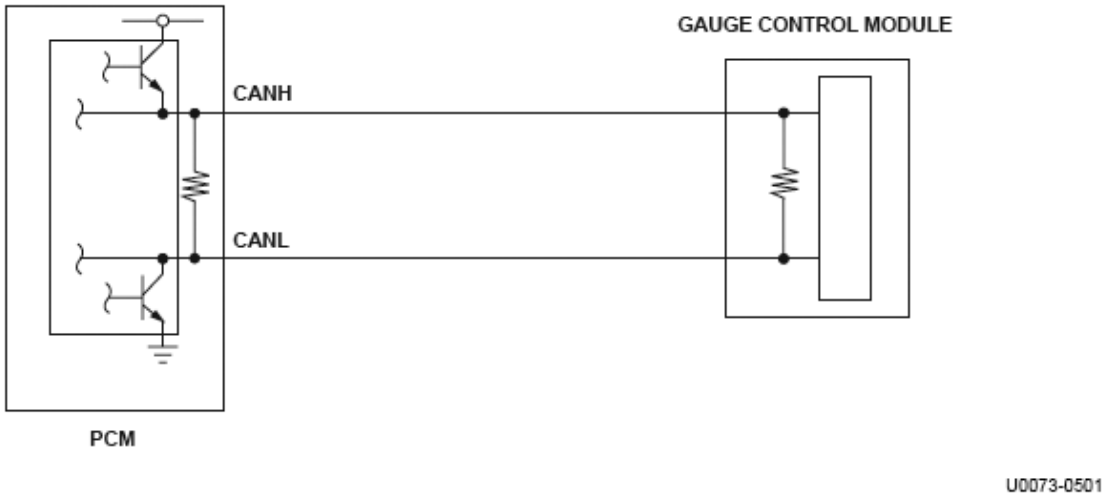

Fig. 682: F-CAN Malfunction Diagram

General Description (R18A1 Engine)

The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (CANH and CANL).

When the powertrain control module (PCM) does not receive the signals via the CAN lines for a set time or more, the PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL OFF, D indicator blinks
OBD Status	N/A

Enable Conditions (R18A1 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	10.0 V	-
No active DTCs	U0121, U0155	

Malfunction Threshold (R18A1 Engine)

The PCM does not receive any signals for at least 1 second.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the indicator (R18A1 Engine)

When a malfunction is detected, the D indicator blinks, and the DTC and the freeze frame data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC (R18A1 Engine)

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC U0028 (107): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC U0028: F-CAN COMMUNICATION CIRCUIT ERROR (F-CAN BUS OFF)

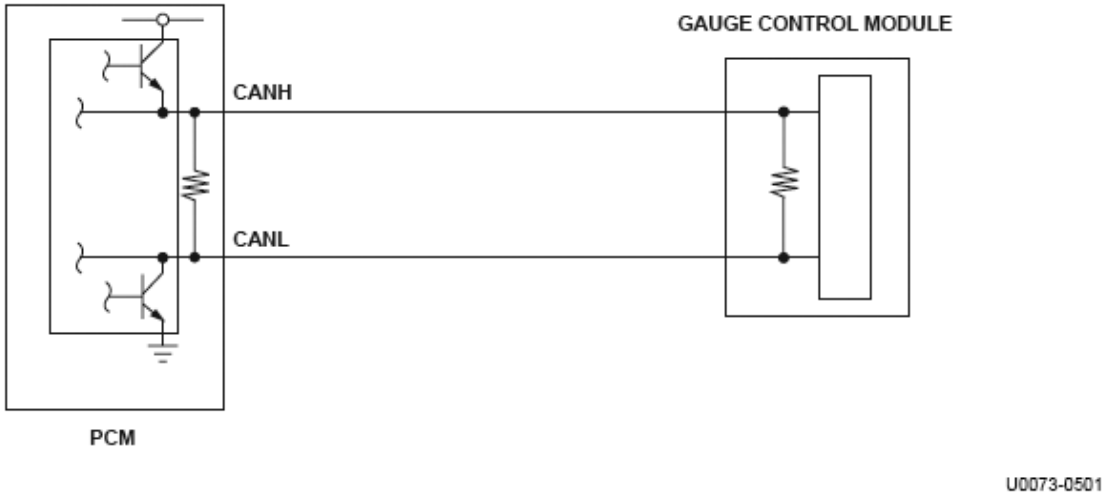

Fig. 683: F-CAN Malfunction Diagram

General Description (R18A4 Engine)

The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (CANH and CANL).

When the powertrain control module (PCM) does not receive the signals via the CAN lines for a set time or more, the PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A4 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	1 second or more

DTC Type	One drive cycle, MIL OFF, D indicator blinks
OBD Status	N/A

Enable Conditions (R18A4 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	10.0 V	-
No active DTCs	U0121, U0155	

Malfunction Threshold (R18A4 Engine)

The PCM does not receive any signals for at least 1 second.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the indicator (R18A4 Engine)

When a malfunction is detected, the D indicator blinks, and the DTC and the freeze frame data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC (R18A4 Engine)

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC U0028 (126): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC U0028: F-CAN MALFUNCTION (BUS-OFF) (K20Z3)

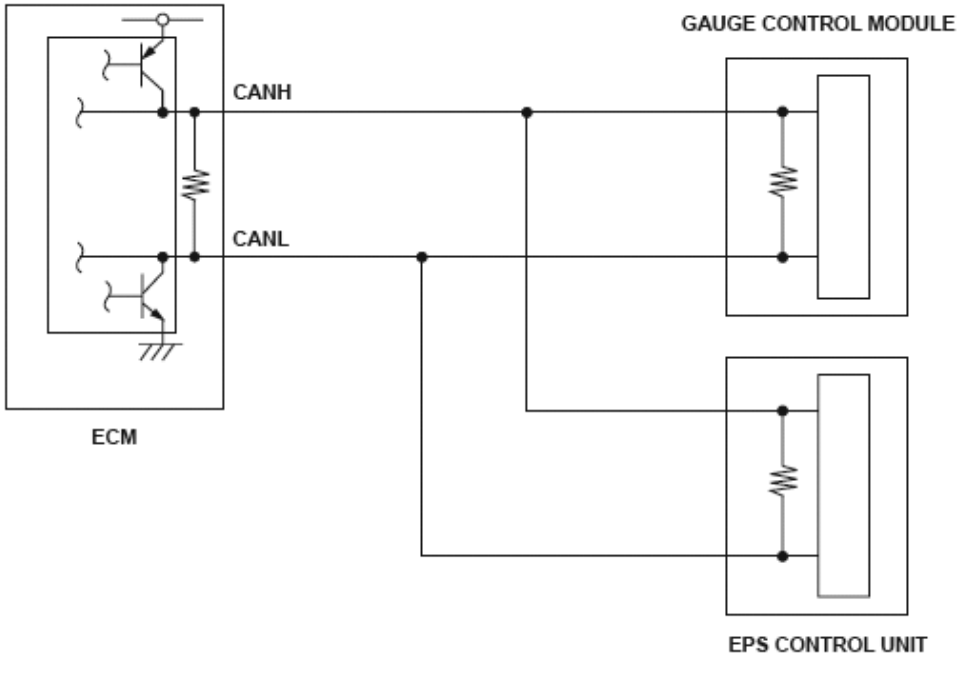

Fig. 684: F-CAN Malfunction Diagram

General Description (K20Z3 Engine)

The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (CANH and CANL).

When the engine control module (ECM) does not receive the signals via the CAN lines for more than a set time, the ECM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL ON
OBD Status	N/A

Enable Conditions (K20Z3 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	10.0 V	-

Malfunction Threshold (K20Z3 Engine)

The ECM does not receive any signals for at least 1 second.

Diagnosis Details (K20Z3 Engine)

Conditions for illuminating the MIL (K20Z3 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM memory.

Conditions for clearing the MIL (K20Z3 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC U0121 (107): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC U0121: LOST COMMUNICATION WITH ABS MODULATOR-CONTROL UNIT (R18A1 ENGINE)

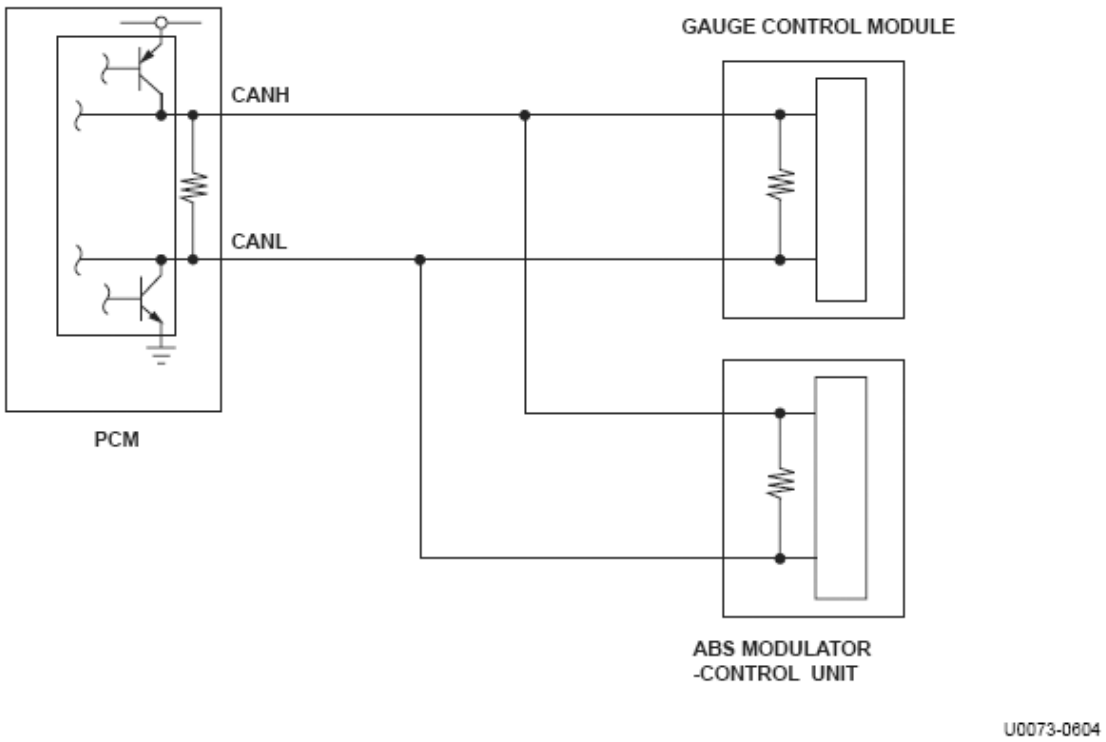

Fig. 685: ABS Modulator Control Unit Circuit Diagram

General Description (R18A1 Engine)

The controller area network (CAN) transmits/receives multiple signals to/from the multiple control modules simultaneously by using two signal lines (CANH and CANL).

When the powertrain control module (PCM) does not receive the signals from the ABS modulator-control unit via the CAN lines for more than a set time, the PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL OFF, D indicator blinks
OBD Status	N/A

Enable Conditions (R18A1 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	9.0 V	-
No active DTCs	U0028, U0155	

Malfunction Threshold (R18A1 Engine)

No signals from the ABS modulator-control unit via the CAN lines are received for at least 1 second.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the indicator (R18A1 Engine)

When a malfunction is detected, the D indicator blinks, and the DTC and the freeze frame data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC (R18A1 Engine)

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC U0121 (107): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC U0121: LOST COMMUNICATION WITH ABS MODULATOR-CONTROL UNIT (R18A4 ENGINE)

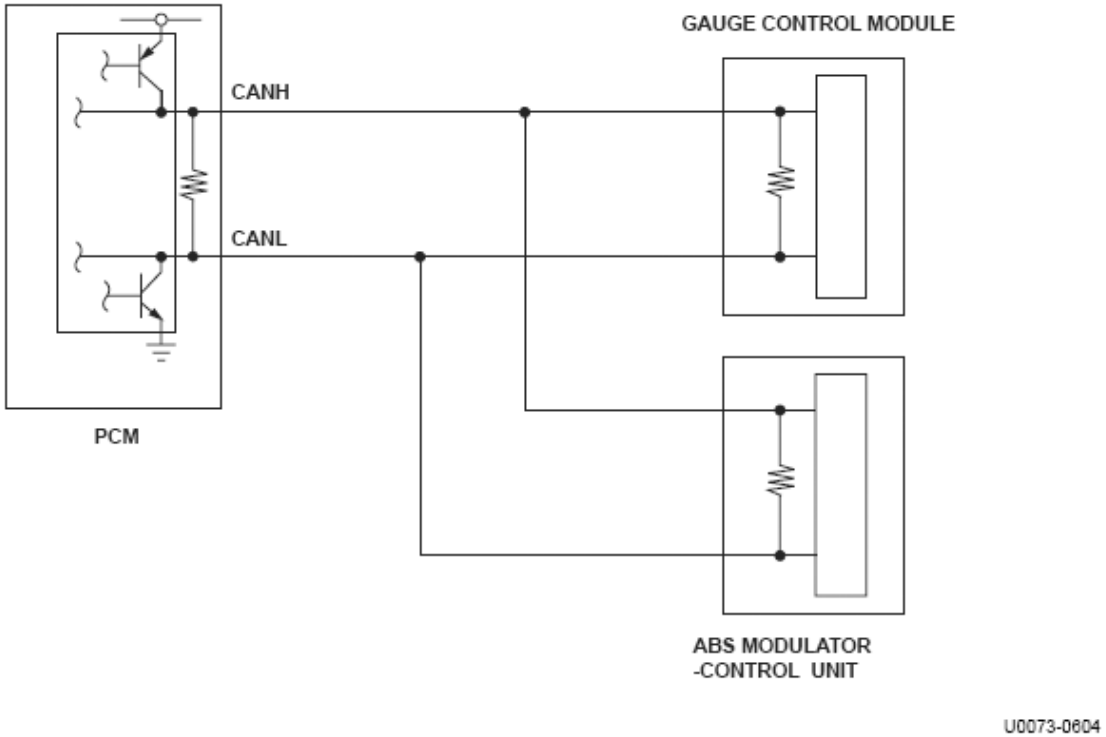

Fig. 686: ABS Modulator Control Unit Circuit Diagram

General Description (R18A4 Engine)

The controller area network (CAN) transmits/receives multiple signals to/from the multiple control modules simultaneously by using two signal lines (CANH and CANL).

When the powertrain control module (PCM) does not receive the signals from the ABS modulator-control unit via the CAN lines for more than a set time, the PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A4 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL OFF, D indicator blinks
OBD Status	N/A

Enable Conditions (R18A4 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	9.0 V	-
No active DTCs	U0028, U0155	

Malfunction Threshold (R18A4 Engine)

No signals from the ABS modulator-control unit via the CAN lines are received for at least 1 second.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the indicator (R18A4 Engine)

When a malfunction is detected, the D indicator blinks, and the DTC and the freeze frame data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC (R18A4 Engine)

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC U0122 (126): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC U0122: F-CAN MALFUNCTION (ENGINE CONTROL MODULE (ECM)-VSA MODULATOR-CONTROL UNIT) (K20Z3)

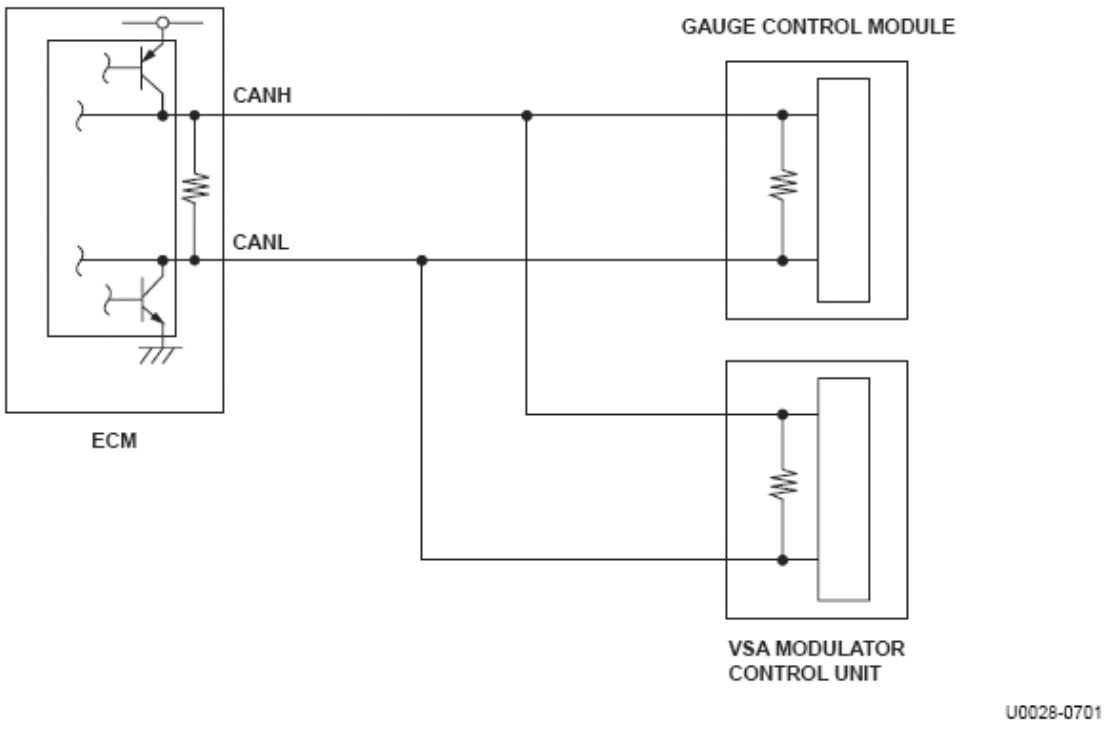

Fig. 687: Engine Control Module (ECM)-VSA Modulator-Control Unit Circuit Diagram

General Description (K20Z3 Engine)

The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (CANH and CANL).

When the engine control module (ECM) does not receive the signals via the CAN lines for more than a set time, the ECM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL OFF
OBD Status	N/A

Enable Conditions (K20Z3 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	10.0 V	-

Malfunction Threshold (K20Z3 Engine)

No signals from the VSA modulator-control unit via the CAN lines are received for at least 1 second.

Diagnosis Details (K20Z3 Engine)

Conditions for illuminating the indicator (K20Z3 Engine)

When a malfunction is detected, the DTC and the freeze frame data are stored in the ECM memory. The MIL does not come on.

Conditions for clearing the DTC (K20Z3 Engine)

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC U0131 (126): ADVANCED DIAGNOSTICS (K20Z3 ENGINE)

DTC U0131: F-CAN MALFUNCTION (ENGINE CONTROL MODULE (ECM)-EPS CONTROL UNIT) (K20Z3)

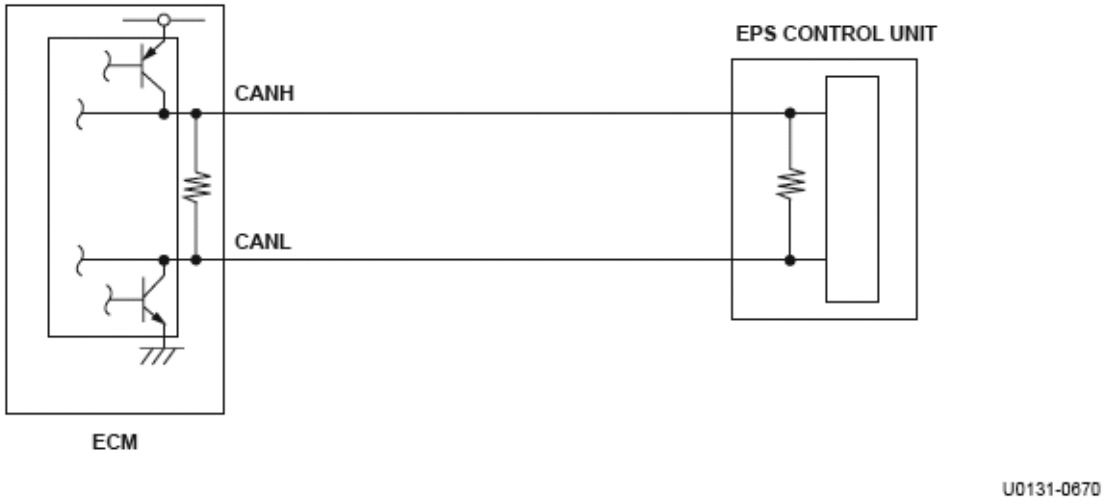

Fig. 688: EPS Control Unit-Engine Control Module - Circuit Diagram

General Description (K20Z3 Engine)

The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously using two signal lines (CANH and CANL).

When the engine control module (ECM) does not receive signals from the electrical power steering (EPS) control unit via the CAN lines for a set time or more, the ECM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (K20Z3 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL OFF
OBD Status	N/A

Enable Conditions (K20Z3 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	10.0 V	-
No active DTCs	U0028	

Malfunction Threshold (K20Z3 Engine)

The ECM does not receive any signals from the EPS control unit for at least 1 second.

Diagnosis Details (K20Z3 Engine)

Conditions for illuminating the indicator (K20Z3 Engine)

When a malfunction is detected, the DTC and the freeze frame data are stored in the ECM memory. The MIL does not come on.

Conditions for clearing the DTC (K20Z3 Engine)

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC U0155 (107): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC U0155: LOST COMMUNICATION WITH GAUGE CONTROL MODULE (R18A1 ENGINE)

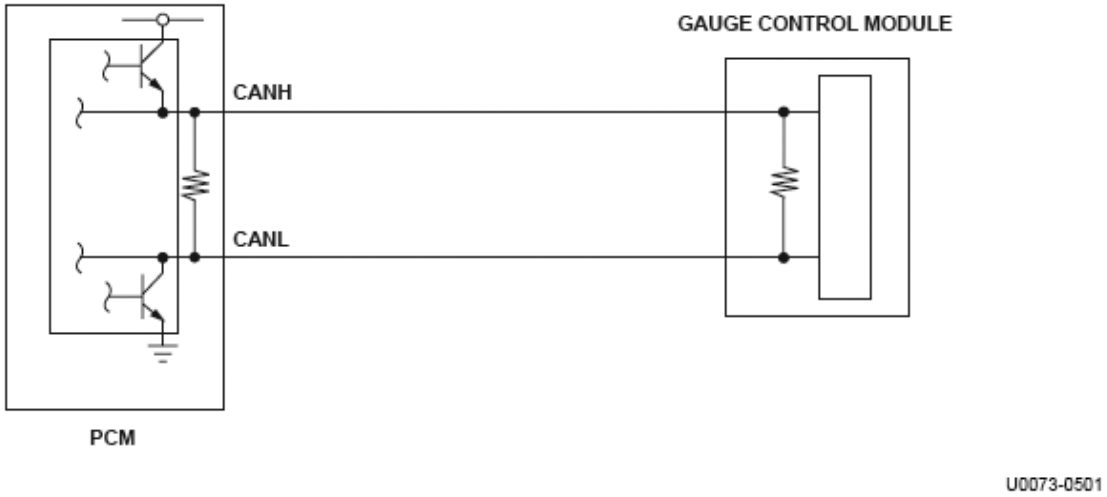

Fig. 689: F-CAN Malfunction Diagram

General Description (R18A1 Engine)

The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (CANH and CANL).

When the powertrain control module (PCM) does not receive the signals from the gauge control module via the CAN lines for a set time or more, the PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL OFF, D indicator blinks
OBD Status	N/A

Enable Conditions (R18A1 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	10.0 V	-
No active DTCs	U0028, U0121	

Malfunction Threshold (R18A1 Engine)

No signals from the gauge control module via the CAN lines are received for at least 1 second.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the indicator (R18A1 Engine)

When a malfunction is detected, the D indicator blinks, and the DTC and the freeze frame data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC (R18A1 Engine)

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC U0155 (107): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC U0155: LOST COMMUNICATION WITH GAUGE CONTROL MODULE (R18A4 ENGINE)

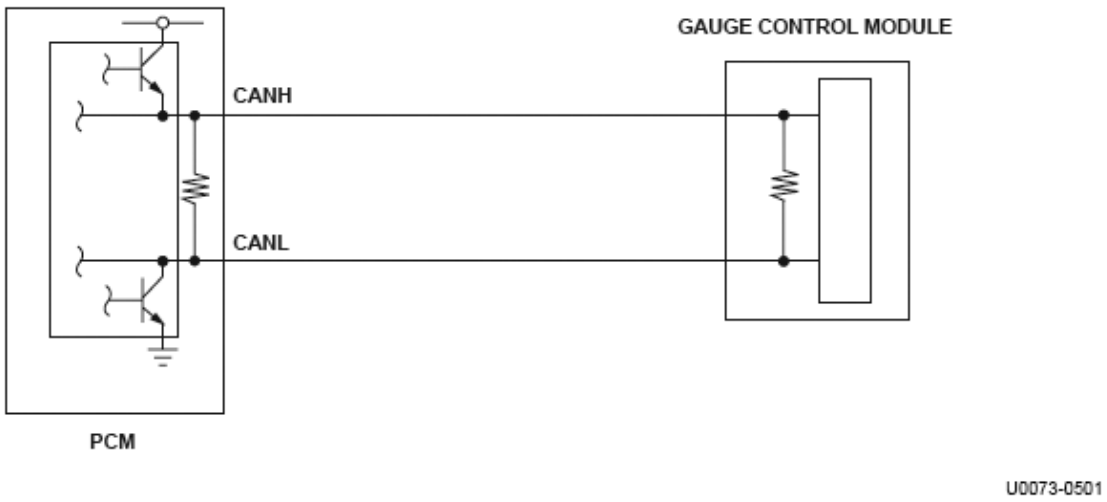

Fig. 690: F-CAN Malfunction Diagram

General Description (R18A4 Engine)

The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (CANH and CANL).

When the powertrain control module (PCM) does not receive the signals from the gauge control module via the CAN lines for a set time or more, the PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A4 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL OFF, D indicator blinks
OBD Status	N/A

Enable Conditions (R18A4 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	10.0 V	-
No active DTCs	U0028, U0121	

Malfunction Threshold (R18A4 Engine)

No signals from the gauge control module via the CAN lines are received for at least 1 second.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the indicator (R18A4 Engine)

When a malfunction is detected, the D indicator blinks, and the DTC and the freeze frame data are stored in

the PCM memory. The MIL does not come on.

Conditions for clearing the DTC (R18A4 Engine)

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC U0155 (126) (PGM-FI SYSTEM): ADVANCED DIAGNOSTICS (M/T)

DTC U0155: F-CAN MALFUNCTION (ENGINE CONTROL MODULE (ECM)/POWERTRAIN CONTROL MODULE (PCM)-GAUGE CONTROL MODULE)

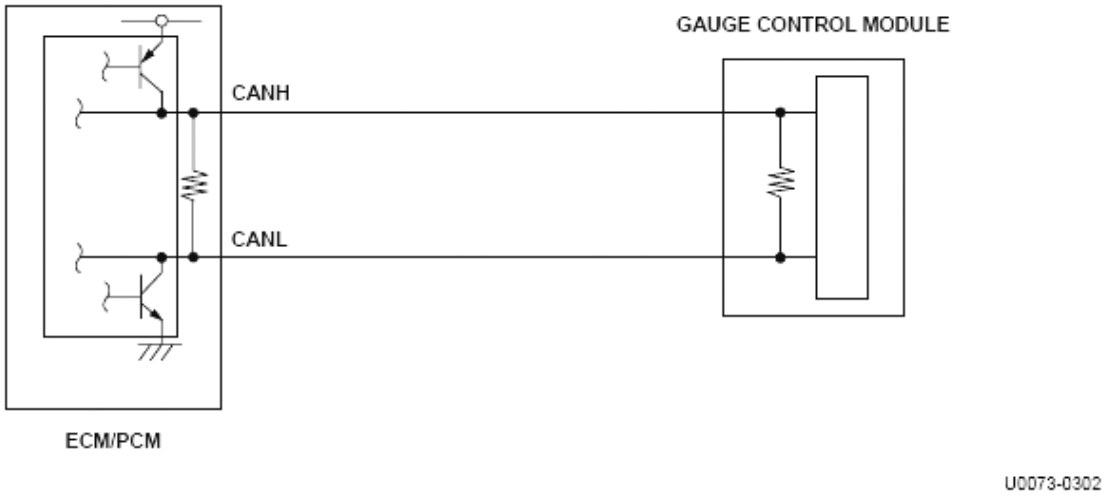

Fig. 691: Gauge Control Module Circuit Diagram

General Description (M/T)

The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (CANH and CANL).

When the engine control module (ECM)/powertrain control module (PCM) does not receive the signals from the gauge control module via the CAN lines for more than a set time, the ECM/PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (M/T)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL ON
OBD Status	N/A

Enable Conditions (M/T)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	10.0 V	-
No active DTCs	U0028(1)	
(1) K20Z3 engine		

Malfunction Threshold (M/T)

No signals from the gauge control module via the CAN lines are received for at least 1 second.

Diagnosis Details (M/T)

Conditions for illuminating the MIL (M/T)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the ECM/PCM memory.

Conditions for clearing the MIL (M/T)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC U0155 (126) (PGM-FI SYSTEM): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC U0155: F-CAN MALFUNCTION (ENGINE CONTROL MODULE (ECM)/POWERTRAIN CONTROL MODULE (PCM)-GAUGE CONTROL MODULE)

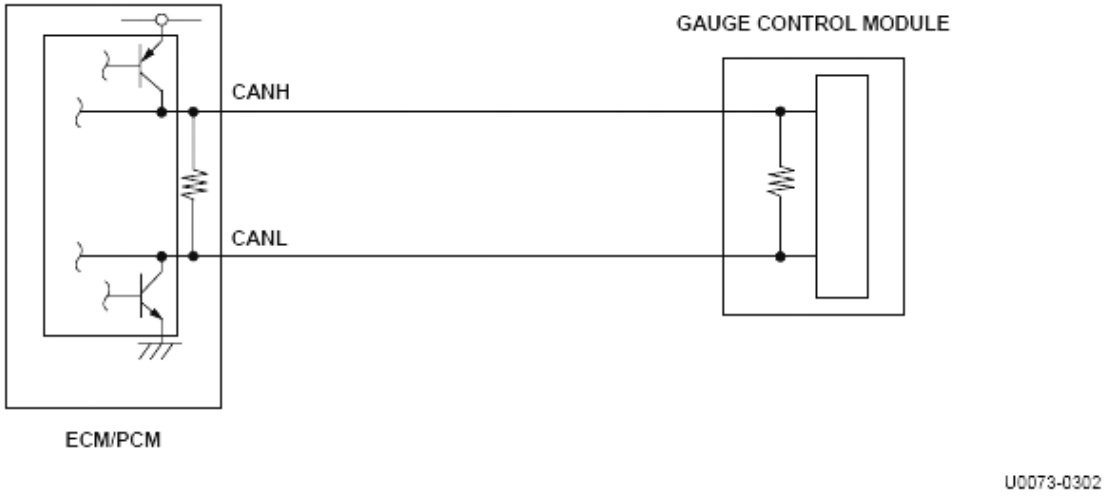

Fig. 692: Gauge Control Module Circuit Diagram

General Description (R18A1 Engine)

The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (CANH and CANL).

When the engine control module (ECM)/powertrain control module (PCM) does not receive the signals from the gauge control module via the CAN lines for more than a set time, the ECM/PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL ON
OBD Status	N/A

Enable Conditions (R18A4 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	Minimum	Maximum
Battery voltage	10.0 V	-

Malfunction Threshold (R18A4 Engine)

No signals from the gauge control module via the CAN lines are received for at least 1 second.

Diagnosis Details (R18A4 Engine)

Conditions for illuminating the MIL (R18A4 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (R18A4 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC U0300 (131): ADVANCED DIAGNOSTICS (R18A1 ENGINE)

DTC U0300: PGM-FI SYSTEM AND A/T SYSTEM PROGRAM VERSION MISMATCH (R18A1)

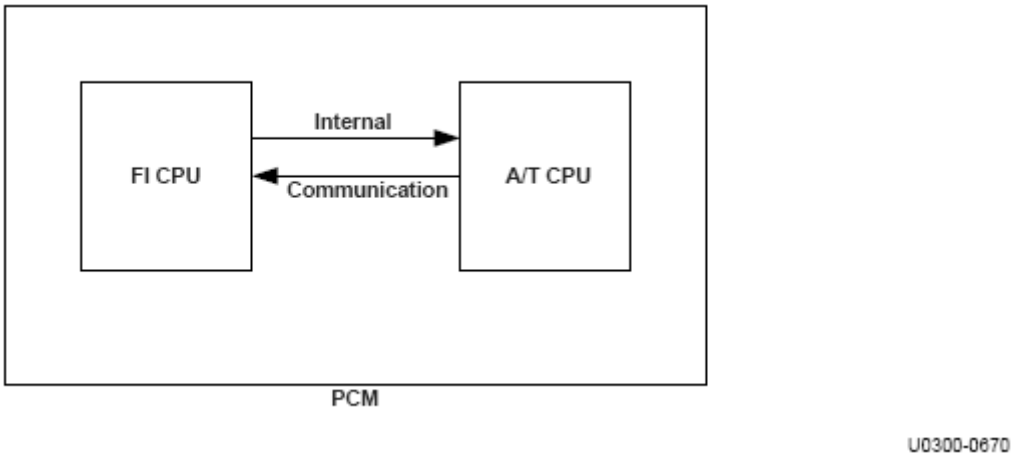

Fig. 694: Communication Diagram Between FI CPU And A/T CPU

General Description (R18A1 Engine)

An internal version check of the communication data set is done during communication between the FI CPU and the A/T CPU.

When the FI CPU or the A/T CPU is rewritten at the powertrain control module (PCM), and the internal communication data version is that rewritten does not match, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A1 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	0.5 second or more
DTC Type	One drive cycle, MIL ON
OBD Status	N/A

Enable Conditions (R18A1 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	
Ignition switch	ON

Malfunction Threshold (R18A1 Engine)

The FI CPU or the A/T CPU is rewritten at the PCM, but the internal communication data version that is rewritten does not match.

Diagnosis Details (R18A1 Engine)

Conditions for illuminating the MIL (R18A1 Engine)

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (R18A1 Engine)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC U0300 (131): ADVANCED DIAGNOSTICS (R18A4 ENGINE)

DTC U0300: PGM-FI SYSTEM AND A/T SYSTEM PROGRAM VERSION MISMATCH (R18A4 ENGINE)

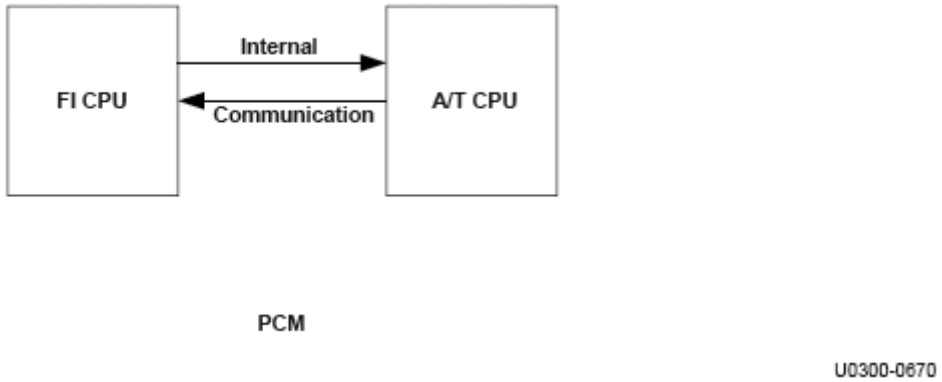

Fig. 695: PGM-FI System And A/T System - Communication Diagram

General Description (R18A4 Engine)

An internal version check of the communication data set is done during communication between the FI CPU and the A/T CPU.

When the FI CPU or the A/T CPU is rewritten at the powertrain control module (PCM), and the internal communication data version is that rewritten does not match, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (R18A4 Engine)

MONITOR DESCRIPTION CHART

Execution	Continuous

Sequence	None
Duration	0.5 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	N/A

Enable Conditions (R18A4 Engine)

ENABLE CONDITIONS REFERENCE CHART

Condition	
Ignition switch	ON

Malfunction Threshold (R18A4 Engine)

The FI CPU or the A/T CPU is rewritten at the PCM, but the internal communication data version that is rewritten does not match.

Courtesy of AMERICAN HONDA MOTOR CO., INC.

DTC TROUBLESHOOTING

DTC P0400: EGR SYSTEM LEAK DETECTED

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Check for a loose or damaged EGR pipe.

   Is the EGR pipe OK?

   YES - Go to step 2.

   NO - Reconnect or replace the EGR pipe, then go to step 7.

2. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the

radiator fan comes on, then let it idle.

3. Test-drive under these conditions:
   - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
   - A/T in D position (M/T in 4th gear)
   - Vehicle speed at 25 mph (40 km/h) for 5 minutes or more
   - Maintain the vehicle speed at 32 mph (50 km/h) for 5 minutes or more with cruise control set
4. Monitor the OBD STATUS for DTC P0400 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 5.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EGR valve and the ECM/PCM. If the screen indicates NOT COMPLETED, go to step 3 and recheck.

5. Turn the ignition switch OFF.
6. Replace the EGR valve (see **EGR VALVE REPLACEMENT**).
7. Turn the ignition switch ON (II).
8. Reset the ECM/PCM with the HDS.
9. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
10. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
    - A/T in D position (M/T in 4th gear)
    - Vehicle speed at 25 mph (40 km/h) for 5 minutes or more
    - Maintain the vehicle speed at 32 mph (50 km/h) for 5 minutes or more with cruise control set
11. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0400 indicated?

    YES - Check for poor connections or loose terminals at the EGR valve and the ECM/PCM, then go to step 1.

    NO - Go to step 12.

12. Monitor the OBD STATUS for DTC P0400 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 11, go to the indicated DTCs troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the EGR valve and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 10.

DTC P0401: EGR INSUFFICIENT FLOW

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
4. Do the EGR TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES - Go to step 5.

   NO - Go to step 7.

5. Test-drive under these conditions:
   - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
   - A/T in D position (M/T in 4th gear)
   - Drive at a steady speed between 55-75 mph (88-120 km/h) for at least 10 seconds
   - During the drive, decelerate (with the throttle fully closed) for 5 seconds
6. Monitor the OBD STATUS for DTC P0401 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Clean the intake manifold EGR port and EGR pipe (see **EGR VALVE REPLACEMENT**) with throttle plate and induction cleaner. Also, clean the passage inside the EGR valve with throttle plate and induction cleaner, then go to step 9.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EGR valve and the ECM/PCM. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 5 and recheck.

7. Turn the ignition switch OFF.
8. Replace the EGR valve (see **EGR VALVE REPLACEMENT**).
9. Turn the ignition switch ON (II).
10. Reset the ECM/PCM with the HDS.
11. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
12. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
    - A/T in D position (M/T in 4th gear)
    - Drive at a steady speed between 55-75 mph (88-120 km/h) for at least 10 seconds
    - During the drive, decelerate (with the throttle fully closed) for 5 seconds
13. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0401 indicated?

YES - Check for poor connections or loose terminals at the EGR valve and the ECM/PCM. If the connections are OK, go to step 15.

NO - Go to step 14.

14. Monitor the OBD STATUS for DTC P0401 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 13, go to the indicated DTCs troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the EGR valve and the ECM/PCM, then go to step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 12.

15. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
16. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
    - A/T in D position (M/T in 4th gear)
    - Drive at a steady speed between 55-75 mph (88-120 km/h) for at least 10 seconds
    - During the drive, decelerate (with the throttle fully closed) for 5 seconds
17. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0401 indicated?

    YES - Check for poor connections or loose terminals at the EGR valve and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 16. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 18.

18. Monitor the OBD STATUS for DTC P0401 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 17, go to the indicated DTCs troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the EGR valve and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 16. If the ECM/PCM was substituted, go to step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 16.

DTC P0404: EGR VALVE CIRCUIT RANGE/PERFORMANCE PROBLEM

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
4. Do the EGR TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES - Intermittent failure, the system is OK at this time. Clean any carbon build-up on the EGR valve with throttle plate and induction cleaner.

   NO - Go to step 5.

5. Turn the ignition switch OFF.
6. Disconnect the EGR valve 6P connector.
7. At the EGR valve side, measure resistance between EGR valve 6P connector terminals No. 1 and No. 2.

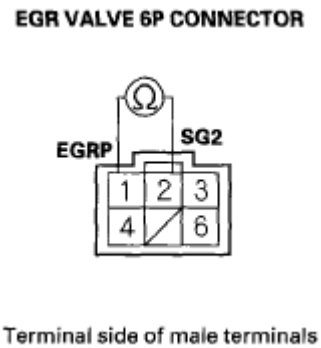

Fig. 2: Measuring Resistance Between EGR Valve 6P Connector Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 100 kohms or more?

YES - Go to step 25.

NO - Go to step 8.

8. At the EGR valve side, measure resistance between EGR valve 6P connector terminals No. 1 and No. 3.

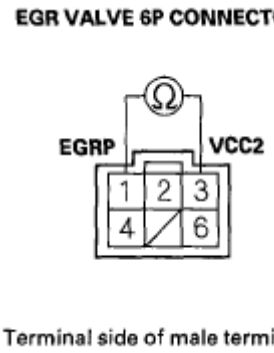

Fig. 3: Measuring Resistance Between EGR Valve 6P Connector Terminals No. 1 And No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 100 k ohms or more?

YES - Go to step 25.

NO - Go to step 9.

9. Check for continuity between EGR valve 6P connector terminal No. 6 and body ground.

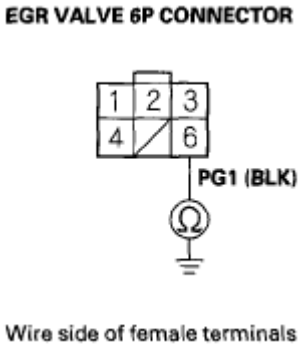

Fig. 4: Checking Continuity Between EGR Valve 6P Connector Terminal No. 1 And No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Repair open in the wire between the EGR valve and G101; A/T model (see **CONNECTOR TO HARNESS INDEX**), M/T model (see **CONNECTOR TO HARNESS INDEX**), then go to step 26.

10. Jump the SCS line with the HDS.
11. Disconnect ECM/PCM connector B (44P).
12. Check for continuity between ECM/PCM connector terminal B2 and body ground.

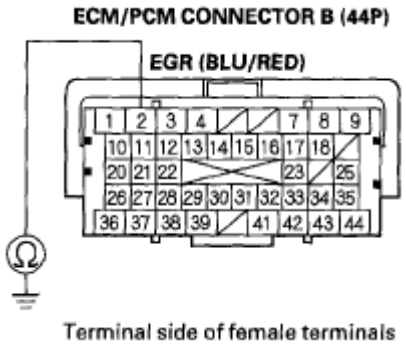

Fig. 5: Checking Continuity Between ECM/PCM Connector Terminal B2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (B2) and the EGR valve, then go to step 26.

NO - Go to step 13.

13. Check for continuity between ECM/PCM connector terminal B2 and EGR valve 6P connector terminal No. 4.

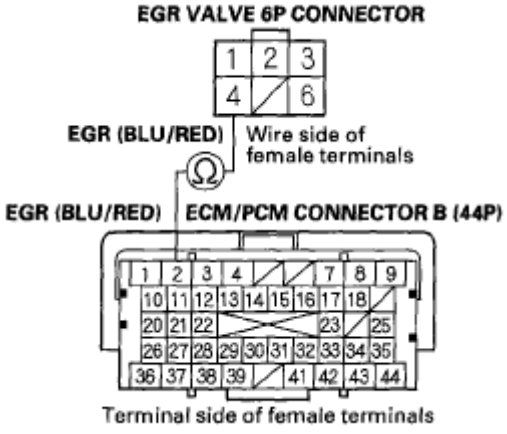

Fig. 6: Checking Continuity Between ECM/PCM Connector Terminal B2 And EGR Valve 6P Connector Terminal No. 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 14.

NO - Repair open in the wire between the ECM/PCM (B2) and the EGR valve, then go to step 26.

14. Remove the EGR valve (see **EGR VALVE REPLACEMENT**).
15. Clean the intake manifold EGR port and the EGR pipe (see **EGR VALVE REPLACEMENT**) with throttle plate and induction cleaner. Also, clean the passage inside the EGR valve with throttle plate and induction cleaner.
16. Install the EGR valve (see **EGR VALVE REPLACEMENT**).

17. Reconnect the EGR valve 6P connector.
18. Reconnect ECM/PCM connector B (44P).
19. Turn the ignition switch ON (II).
20. Reset the ECM/PCM with the HDS.
21. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
22. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
23. Do the EGR TEST in the INSPECTION MENU with the HDS.

    Is the result OK?

    YES - Go to step 32.

    NO - Go to step 24.

24. Turn the ignition switch OFF.
25. Replace the EGR valve (see **EGR VALVE REPLACEMENT**).
26. Reconnect all connectors.
27. Turn the ignition switch ON (II).
28. Reset the ECM/PCM with the HDS.
29. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
30. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
31. Do the EGR TEST in the INSPECTION MENU with the HDS.
32. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0404 indicated?

    YES - Check for poor connections or loose terminals at the EGR valve and the ECM/PCM, then go to step 1. If the connections and terminals are OK, go to step 34.

    NO - Go to step 33.

33. Monitor the OBD STATUS for DTC P0404 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 32, go to the indicated DTCs troubleshooting.

    NO - If the screen indicates FAILED, go to step 1 and recheck. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 30.

34. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
35. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the

radiator fan comes on, then let it idle.

36. Do the EGR TEST in the INSPECTION MENU with the HDS.
37. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0404 indicated?

    YES - Check for poor connections or loose terminals at the EGR valve and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 35. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 38.

38. Monitor the OBD STATUS for DTC P0404 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 37, go to the indicated DTCs troubleshooting.

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the EGR valve and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 35. If the ECM/PCM was substituted, go to step 1. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 35.

DTC P0406: EGR VALVE POSITION SENSOR CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check EGR VLS in the DATA LIST with the HDS. Is 4.88 V or more indicated?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EGR valve and the ECM/PCM.

3. Turn the ignition switch OFF.
4. Disconnect the EGR valve 6P connector.
5. Turn the ignition switch ON (II).
6. Measure voltage between EGR valve 6P connector terminals No. 2 and No. 3.

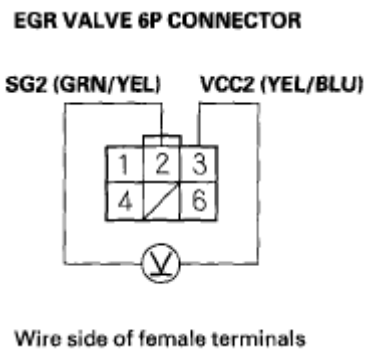

Fig. 7: Measuring Voltage Between EGR Valve 6P Connector Terminals No. 2 And No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 11.

NO - Go to step 7

7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Disconnect ECM/PCM connector B (44P).
10. Check for continuity between EGR valve 6P connector terminal No. 2 and ECM/PCM connector terminal B33.

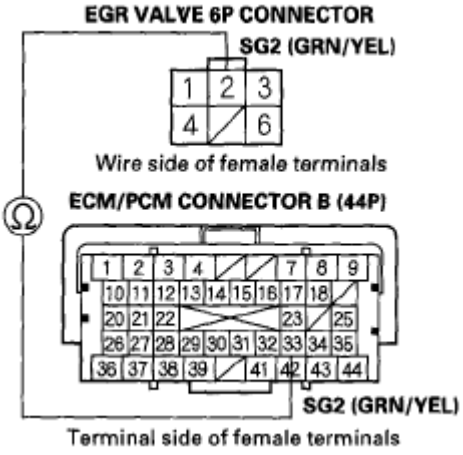

Fig. 8: Checking Continuity Between EGR Valve 6P Connector Terminal No. 2 And ECM/PCM Connector Terminal B33
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 18.

NO - Repair open in the wire between the ECM/PCM (B33) and the EGR valve, then go to step 13.

11. Turn the ignition switch OFF.

12. Replace the EGR valve (see **EGR VALVE REPLACEMENT**).
13. Reconnect all connectors.
14. Turn the ignition switch ON (II).
15. Reset the ECM/PCM with the HDS.
16. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
17. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0406 indicated?

    YES - Check for poor connections or loose terminals at the EGR valve and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

18. Reconnect all connectors.
19. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
20. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0406 indicated?

    YES - Check for poor connections or loose terminals at the EGR valve and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P2413: EGR SYSTEM MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
4. Do the EGR TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EGR valve and the ECM/PCM.

NO - Go to step 5.

5. Turn the ignition switch OFF.
6. Turn the ignition switch ON (II).
7. Check the EGR VLS in the DATA LIST with the HDS.

Is about 0 V indicated?

YES - Go to step 8.

NO - Go to step 21.

8. Turn the ignition switch OFF.
9. Disconnect the EGR valve 6P connector.
10. Turn the ignition switch ON (II).
11. Measure voltage between EGR valve 6P connector terminal No. 3 and body ground.

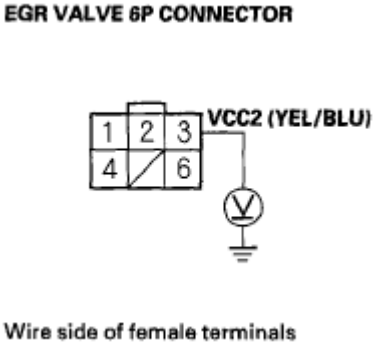

Fig. 9: Measuring Voltage Between EGR Valve 6P Connector Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 16.

NO - Go to step 12.

12. Turn the ignition switch OFF.
13. Jump the SCS line with the HDS.
14. Disconnect ECM/PCM connector B (44P).
15. Check for continuity between ECM/PCM connector terminal B18 and EGR valve 6P connector terminal No. 3.

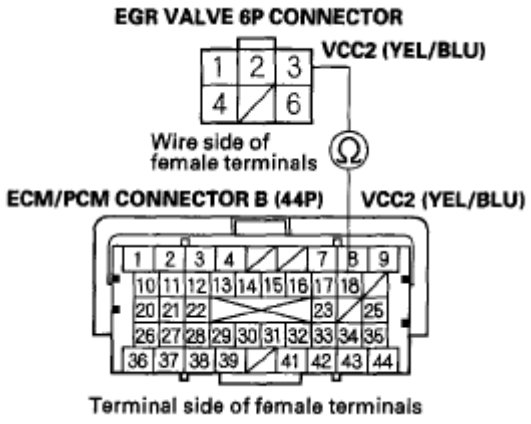

Fig. 10: Checking Continuity Between ECM/PCM Connector Terminal B18 And EGR Valve 6P Connector Terminal No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 51.

NO - Repair open in the wire between the EGR valve and the ECM/PCM (B18), then go to step 44.

16. Turn the ignition switch OFF.
17. Jump the SCS line with the HDS.
18. Disconnect ECM/PCM connector B (44P).
19. Check for continuity between ECM/PCM connector terminal B29 and body ground.

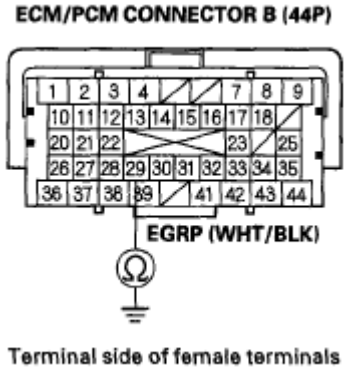

Fig. 11: Checking Continuity Between ECM/PCM Connector Terminal B29 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (B29) and the EGR valve, then go to step 44.

NO - Go to step 20.

20. Check for continuity between ECM/PCM connector terminal B29 and EGR valve 6P connector terminal No. 1.

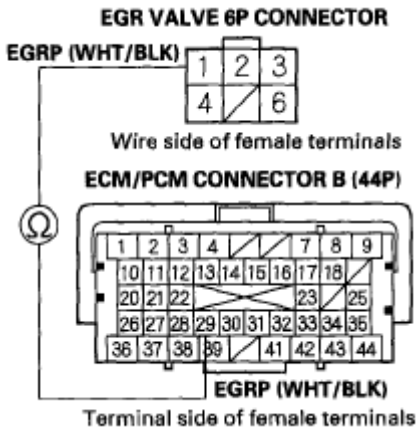

Fig. 12: Checking Continuity Between ECM/PCM Connector Terminal B29 And EGR Valve 6P Connector Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 21.

NO - Repair open in the wire between the ECM/PCM (B29) and the EGR valve, then go to step 44.

21. Turn the ignition switch OFF.
22. If not already done, disconnect the EGR valve 6P connector.
23. At the EGR valve side, measure resistance between EGR valve 6P connector terminals No. 1 and No. 2.

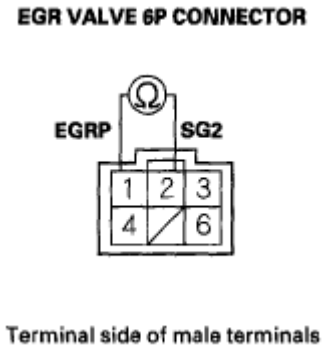

Fig. 13: Measuring Resistance Between EGR Valve 6P Connector Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 100 kohms or more?

YES - Go to step 43.

NO - Go to step 24.

24. At the EGR valve side, measure resistance between EGR valve 6P connector terminals No. 1 and No. 3.

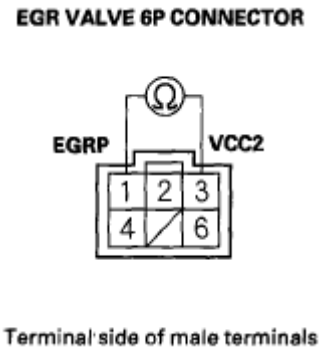

Fig. 14: Measuring Resistance Between EGR Valve 6P Connector Terminals No. 1 And No. 3.
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 100 kohms or more?

YES - Go to step 43.

NO - Go to step 25.

25. If not already done, jump the SCS line with the HDS.
26. If not already done, disconnect ECM/PCM connector B (44P).
27. Check for continuity between ECM/PCM connector terminal B2 and body ground.

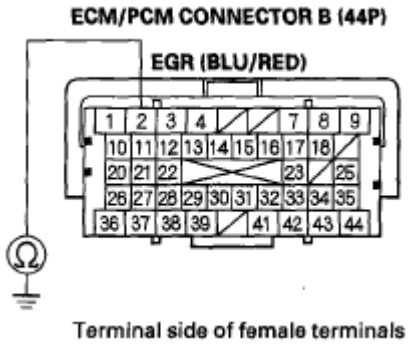

Fig. 15: Checking For Continuity Between ECM/PCM Connector Terminal B2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (B2) and the EGR valve, then go to step 44.

NO - Go to step 28.

28. Check for continuity between ECM/PCM connector terminal B2 and EGR valve 6P connector terminal No. 4.

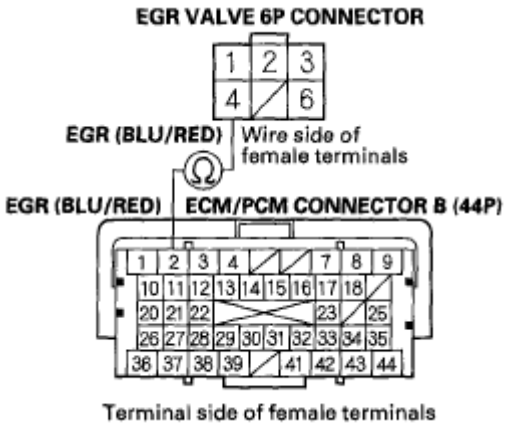

Fig. 16: Checking Continuity Between ECM/PCM Connector Terminal B2 And EGR Valve 6P Connector Terminal 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 29.

NO - Repair open in the wire between the ECM/PCM (B2) and the EGR valve, then go to step 44.

29. Check for continuity between EGR valve 6P connector terminal No. 6 and body ground.

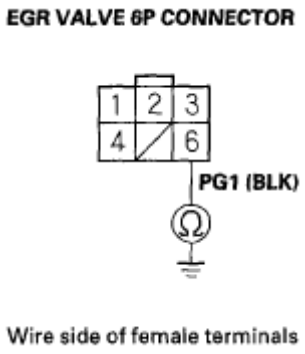

Fig. 17: Checking Continuity Between EGR Valve 6P Connector Terminal No. 6 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 30.

NO - Repair open in the wire between the EGR valve and G101; A/T model (see **CONNECTOR TO HARNESS INDEX**), M/T model (see **CONNECTOR TO HARNESS INDEX**), then go to step 44.

30. Reconnect ECM/PCM connector B (44P).
31. Connect the battery positive terminal to EGR valve 6P connector terminal No. 4 with a jumper wire.

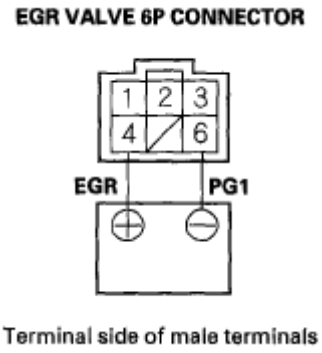

Fig. 18: Connecting Battery Positive Terminal To EGR Valve 6P Connector Terminal No. 4 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

32. Start the engine, and let it idle. Then connect the battery negative terminal to EGR valve 6P connector terminal No. 6 with a jumper wire.

    Does the engine stall or run roughly?

    YES - Go to step 51.

    NO - Go to step 33.

33. Turn the ignition switch OFF.
34. Remove the EGR valve (see **EGR VALVE REPLACEMENT**).
35. Clean the intake manifold EGR port and the EGR pipe (see **EGR VALVE REPLACEMENT**) with throttle plate and induction cleaner. Also, clean the passage inside the EGR valve with throttle plate and induction cleaner.
36. Install the EGR valve (see **EGR VALVE REPLACEMENT**).
37. Reconnect all connectors.
38. Turn the ignition switch ON (II).
39. Reset the ECM/PCM with the HDS.
40. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
41. Do the EGR TEST in the INSPECTION MENU with the HDS.

    Is the result OK?

    YES - Go to step 49.

    NO - Go to step 42.

42. Turn the ignition switch OFF.
43. Replace the EGR valve (see **EGR VALVE REPLACEMENT**).
44. Reconnect all connectors.
45. Turn the ignition switch ON (II).
46. Reset the ECM/PCM with the HDS.
47. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).

48. Do the EGR TEST in the INSPECTION MENU with the HDS.
49. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2413 indicated?

    YES - Check for poor connections or loose terminals at the EGR valve and the ECM/PCM, then go to step 1.

    NO - Go to step 50.

50. Monitor the OBD STATUS for DTC P2413 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 49, go to the indicated DTCs troubleshooting.

    NO - If the screen indicates FAILED, go to step 1 and recheck. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 47.

51. Turn the ignition switch OFF.
52. Reconnect all connectors.
53. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
54. Do the EGR TEST in the INSPECTION MENU with the HDS.
55. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2413 indicated?

    YES - Check for poor connections or loose terminals at the EGR valve and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 54. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 56.

56. Monitor the OBD STATUS for DTC P2413 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 55, go to the indicated DTCs troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the EGR valve and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 54. If the ECM/PCM was substituted, go to step 1. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 54.

EGR VALVE REPLACEMENT

1. Remove the injector cover (see step 8 in **ENGINE REMOVAL**).
2. Disconnect the EGR valve 6P connector (A).

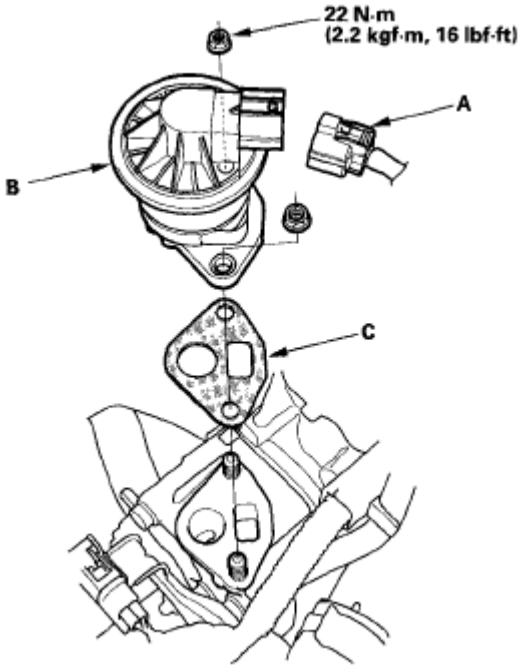

Fig. 19: Disconnecting EGR Valve 6P Connector (With Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the EGR valve (B).
4. Install the parts in the reverse order of removal with a new gasket (C).
5. Install the injector cover (see step 48 in **ENGINE INSTALLATION**).

EGR PIPE REPLACEMENT

REMOVAL

1. Remove the bolts (A) and nuts (B).

Fig. 20: Removing EGR Pipe Bolts And Nuts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the EGR pipe (C).

INSTALLATION

1. Install the EGR pipe on the water passage side, and tighten the nuts (A) by hand with a new gasket (B).

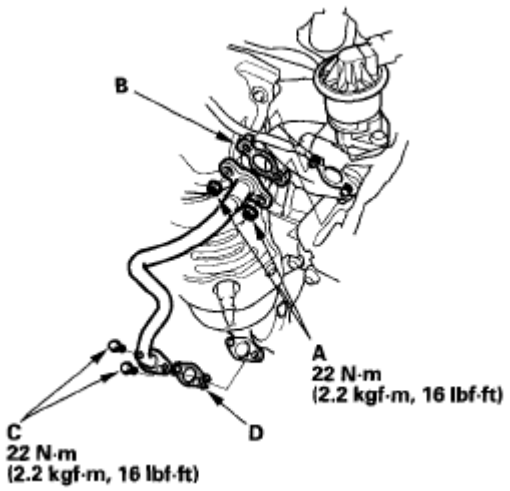

Fig. 21: Installing EGR Pipe On Water Passage Side (With Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the EGR pipe on the TWC side, and tighten the bolts (C) with a new gasket (D).
3. Tighten the nuts on the water passage side.

DTC TROUBLESHOOTING

DTC P0122: TP SENSOR A CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check TP SENSOR A in the DATA LIST with the HDS.

   Is there about 0.3 V or less?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM.

4. Check for Temporary DTCs or DTCs with the HDS.

   Are DTC P0122 and P0222 indicated at the same time?

   YES - Go to step 10.

NO - Go to step 5.

5. Turn the ignition switch OFF.
6. Disconnect the throttle body 6P connector.
7. Jump the SCS line with the HDS.
8. Disconnect ECM connector C (44P).
9. Check for continuity between throttle body 6P connector terminal No. 1 and body ground.

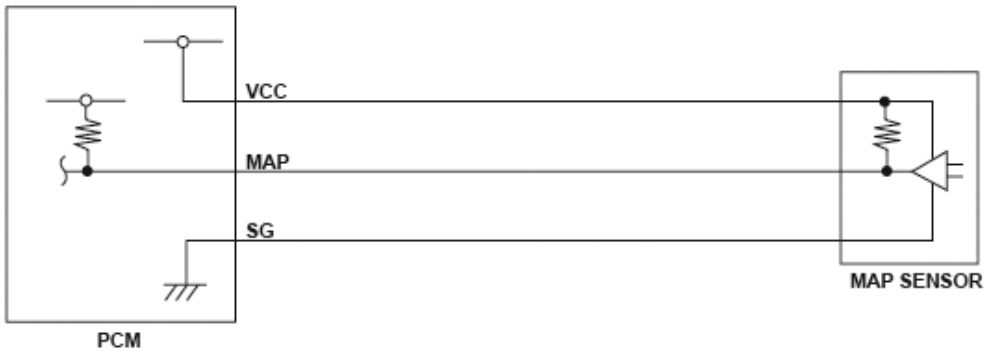

Fig. 2: Checking Continuity Between Throttle Body 6P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the throttle body and the ECM (C20), then go to step 18.

NO - Go to step 23.

10. Measure voltage between throttle body 6P connector terminal No. 2 and body ground.

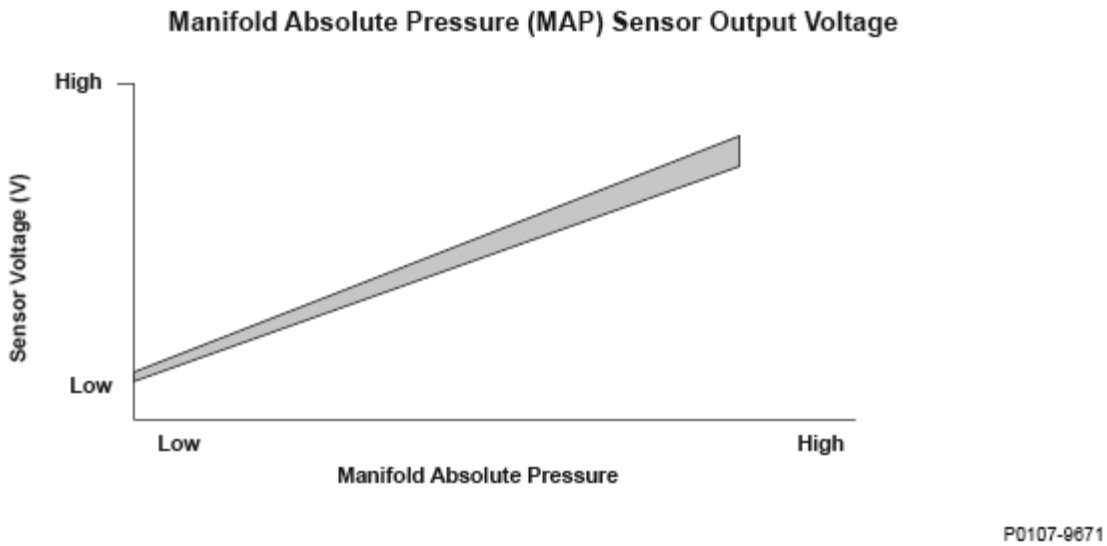

Fig. 3: Measuring Voltage Between Throttle Body 6P Connector Terminal No. 2 And Body

Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 16.

NO - Go to step 11.

11. Turn the ignition switch OFF.
12. Jump the SCS line with the HDS.
13. Disconnect ECM connector C (44P).
14. Disconnect the throttle body 6P connector.
15. Check for continuity between ECM connector terminal C12 and throttle body 6P connector terminal No. 2.

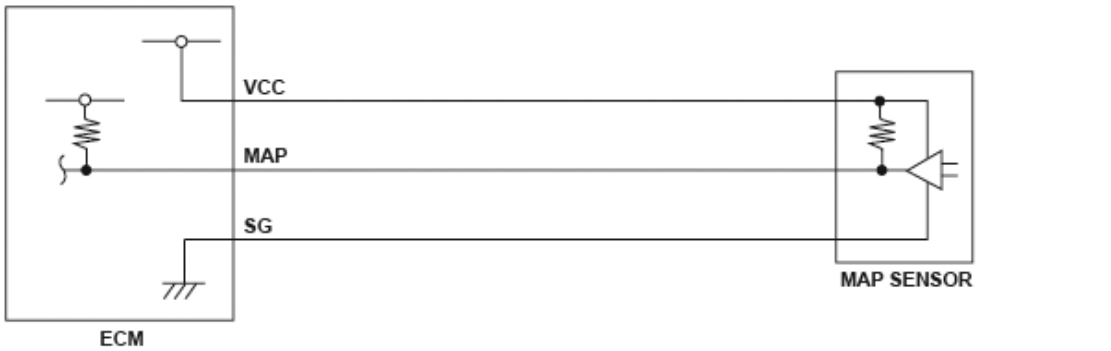

Fig. 4: Checking Continuity Between ECM Terminal C12 And Throttle Body 6P Terminal No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 23.

NO - Repair open in the wire between the throttle body and the ECM (C12), then go to step 18.

16. Turn the ignition switch OFF.
17. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
18. Reconnect all connectors.
19. Turn the ignition switch ON (II).
20. Reset the ECM with the HDS.
21. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
22. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0122 indicated?

YES - Check for poor connections or loose terminals at the throttle body and the ECM, then go to step

1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

23. Reconnect all connectors.
24. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
25. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0122 indicated?

    YES - Check for poor connections or loose terminals at TP sensor A and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P0123: TP SENSOR A CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check TP SENSOR A in the DATA LIST with the HDS.

   Is there about 4.8 V or more?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM.

4. Check for Temporary DTCs or DTCs with the HDS.

   Are DTC P0123 and P0223 indicated at the same time?

   YES - Go to step 13.

   NO - Go to step 5.

5. Turn the ignition switch OFF.
6. Disconnect the throttle body 6P connector.
7. Turn the ignition switch ON (II).

8. Measure voltage between throttle body 6P connector terminal No. 1 and body ground.

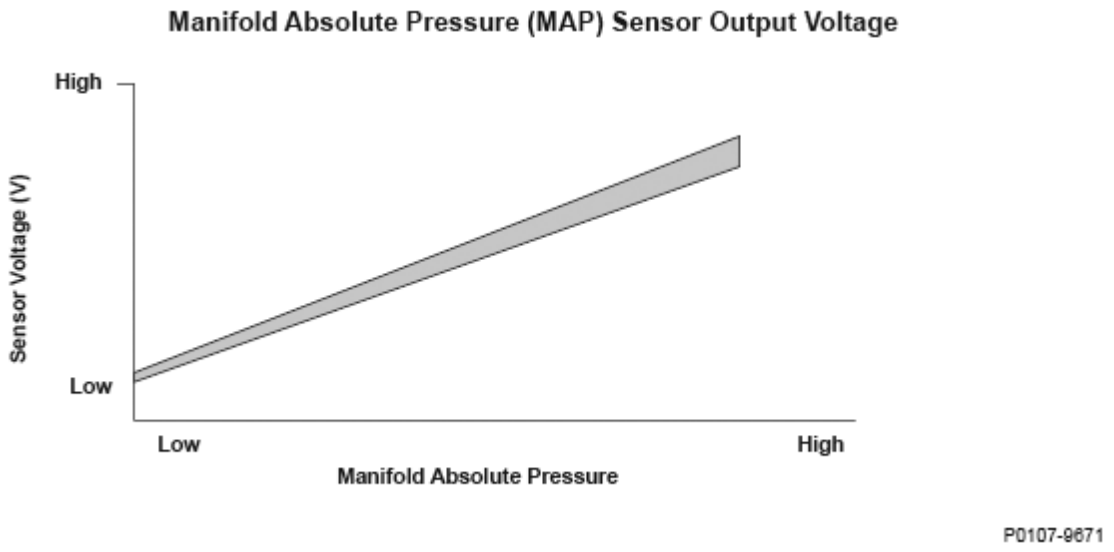

Fig. 5: Measuring Voltage Between Throttle Body 6P Connector Terminal No 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 18.

NO - Go to step 9.

9. Turn the ignition switch OFF.
10. Jump the SCS line with the HDS.
11. Disconnect ECM connector C (44P).
12. Check for continuity between ECM connector terminal C20 and throttle body 6P connector terminal No. 1.

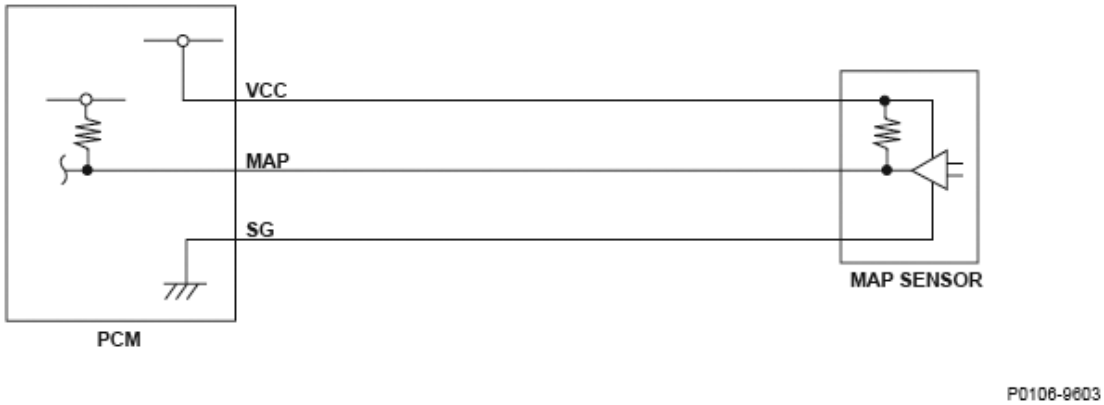

Fig. 6: Checking Continuity Between ECM Terminal C20 And Throttle Body 6P Connector Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the throttle body and the ECM (C20), then go to step 20.

13. Turn the ignition switch OFF.
14. Disconnect the throttle body 6P connector.
15. Jump the SCS line with the HDS.
16. Disconnect ECM connector C (44P).
17. Check for continuity between ECM connector terminal C39 and throttle body 6P connector terminal No. 4.

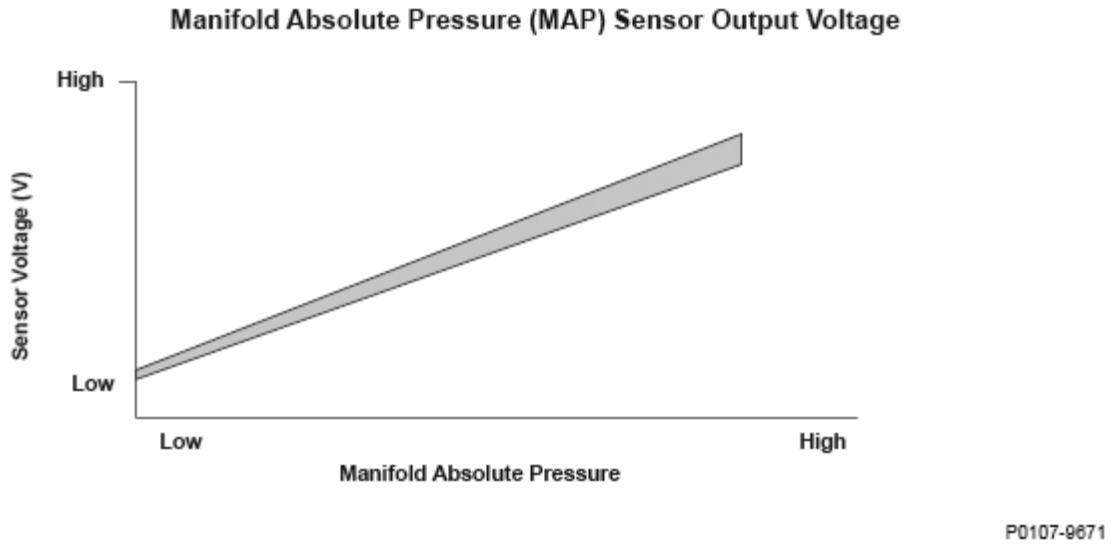

Fig. 7: Checking Continuity Between ECM Terminal C39 And Throttle Body 6P Terminal No. 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the throttle body and the ECM (C39), then go to step 20.

18. Turn the ignition switch OFF.
19. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
20. Reconnect all connectors.
21. Turn the ignition switch ON (II).
22. Reset the ECM with the HDS.
23. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
24. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0123 indicated?

YES - Check for poor connections or loose terminals at the throttle body and the ECM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

25. Reconnect all connectors.
26. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
27. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0123 indicated?

    YES - Check for poor connections or loose terminals at TP sensor A and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P0222: TP SENSOR B CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check TP SENSOR B in the DATA LIST with the HDS.

   Is there about 0.3 V or less?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM.

4. Check for Temporary DTCs or DTCs with the HDS.

   Are DTC P0122 and P0222 indicated at the same time?

   YES - Go to step 10.

   NO - Go to step 5.

5. Turn the ignition switch OFF.
6. Disconnect the throttle body 6P connector.
7. Jump the SCS line with the HDS.

8. Disconnect ECM connector C (44P).
9. Check for continuity between throttle body 6P connector terminal No. 3 and body ground.

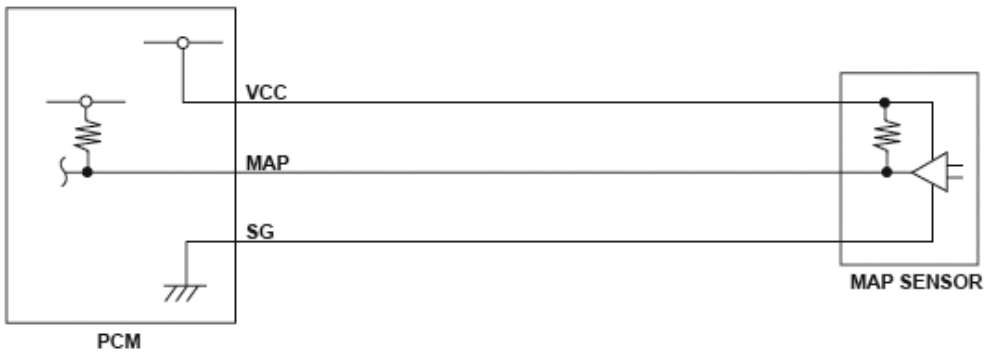

Fig. 8: Checking Continuity Between Throttle Body 6P Connector Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the throttle body and the ECM (C21), then go to step 18.

NO - Go to step 23.

10. Measure voltage between throttle body 6P connector terminal No. 2 and body ground.

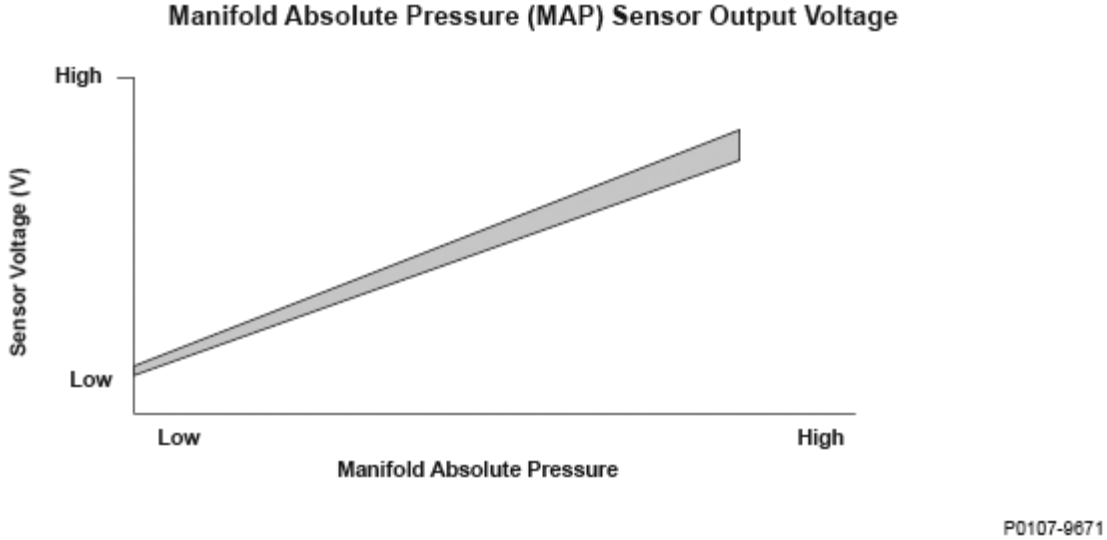

Fig. 9: Measuring Voltage Between Throttle Body 6P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 16.

NO - Go to step 11.

11. Turn the ignition switch OFF.
12. Jump the SCS line with the HDS.
13. Disconnect ECM connector C (44P).
14. Disconnect the throttle body 6P connector.
15. Check for continuity between ECM connector terminal C12 and throttle body 6P connector terminal No. 2.

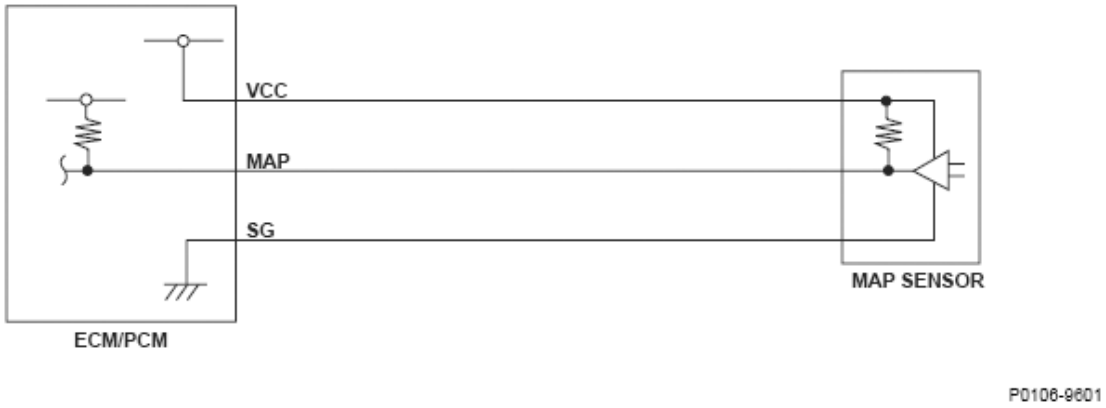

Fig. 10: Checking Continuity Between ECM Terminal C12 And Throttle Body 6P Terminal No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 23.

NO - Repair open in the wire between the throttle body and the ECM (C12), then go to step 18.

16. Turn the ignition switch OFF.
17. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
18. Reconnect all connectors.
19. Turn the ignition switch ON (II).
20. Reset the ECM with the HDS.
21. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
22. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0222 indicated?

YES - Check for poor connections or loose terminals at the throttle body and the ECM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

23. Reconnect all connectors.

24. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
25. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0222 indicated?

    YES - Check for poor connections or loose terminals at TP sensor A and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P0223-.TP SENSOR B CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check TP SENSOR B in the DATA LIST with the HDS.

   Is there about 4.8 V or more?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM.

4. Check for Temporary DTCs or DTCs with the HDS.

   Are DTC P0123 and P0223 indicated at the same time?

   YES - Go to step 13.

   NO - Go to step 5.

5. Turn the ignition switch OFF.
6. Disconnect the throttle body 6P connector.
7. Turn the ignition switch ON (II).
8. Measure voltage between throttle body 6P connector terminal No. 3 and body ground.

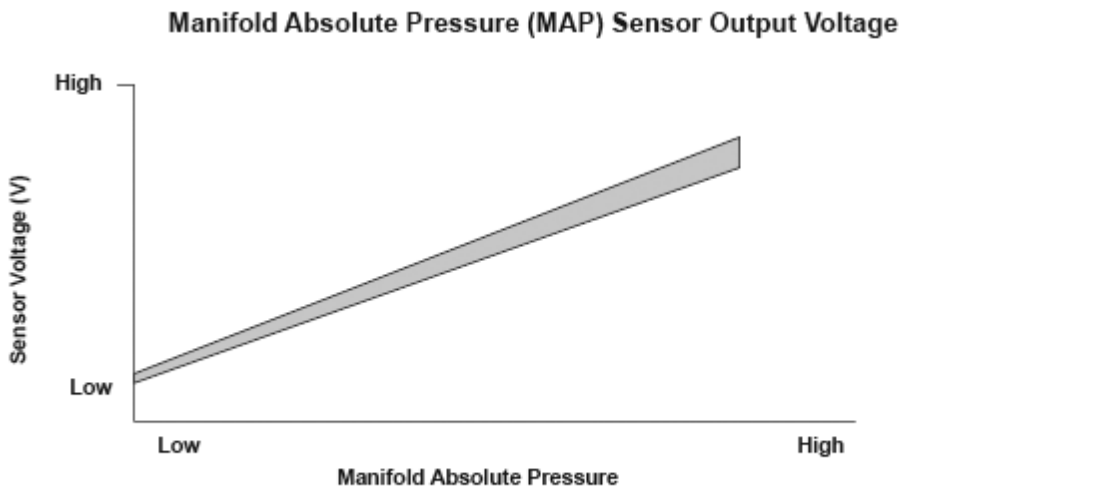

Fig. 11: Measuring Voltage Between Throttle Body 6P Connector Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 18.

NO - Go to step 9.

9. Turn the ignition switch OFF.
10. Jump the SCS line with the HDS.
11. Disconnect ECM connector C (44P).
12. Check for continuity between ECM connector terminal C21 and throttle body 6P connector terminal No. 3.

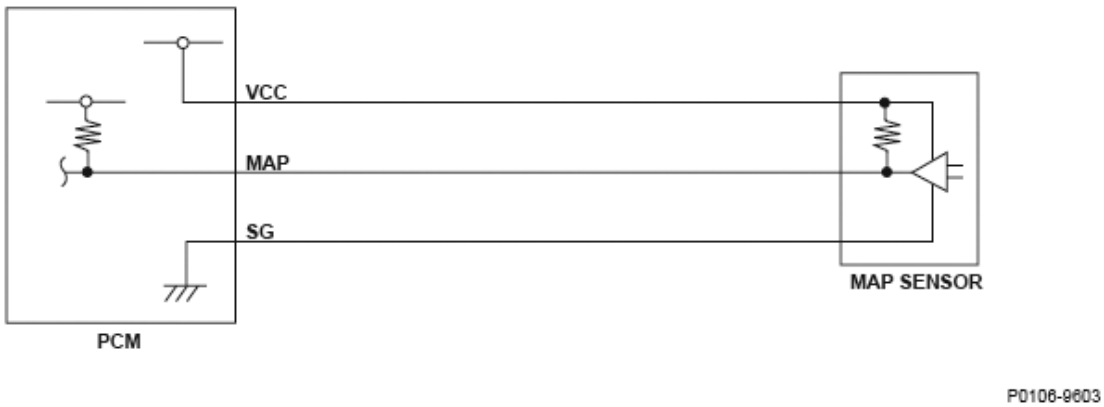

Fig. 12: Checking Continuity Between ECM Terminal C21 And Throttle Body 6P Terminal No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the throttle body and the ECM (C21), then go to step 20.

13. Turn the ignition switch OFF.
14. Disconnect the throttle body 6P connector.
15. Jump the SCS line with the HDS.
16. Disconnect ECM connector C (44P).
17. Check for continuity between ECM connector terminal C39 and throttle body 6P connector terminal No. 4.

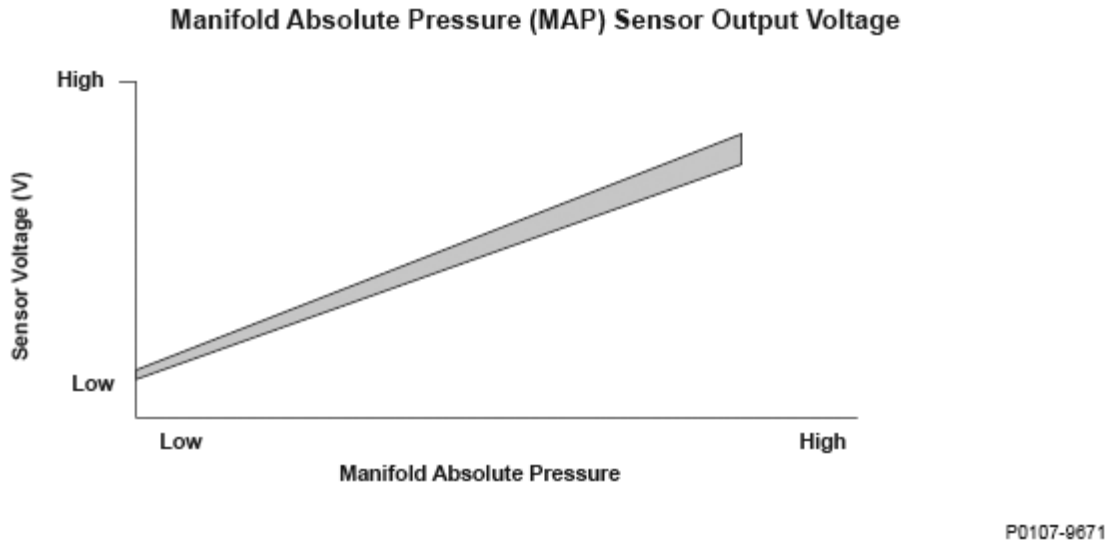

Fig. 13: Checking Continuity Between ECM Terminal C39 And Throttle Body 6P Connector Terminal No. 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the throttle body and the ECM (C39), then go to step 20.

18. Turn the ignition switch OFF.
19. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
20. Reconnect all connectors.
21. Turn the ignition switch ON (II).
22. Reset the ECM with the HDS.
23. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
24. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0223 indicated?

YES - Check for poor connections or loose terminals at the throttle body and the ECM, then go to step

1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

25. Reconnect all connectors.
26. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
27. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0223 indicated?

YES - Check for poor connections or loose terminals at TP sensor Band the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P1658: ELECTRONIC THROTTLE CONTROL SYSTEM (ETCS) CONTROL RELAY ON MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Do the ETCS TEST in the INSPECTION MENU with the HDS.

Is the RELAY circuit OK?

YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the ETCS control relay and the ECM.

NO - Go to step 3.

3. Turn the ignition switch OFF.
4. Remove the ETCS control relay (F) from the under-hood fuse/relay box.

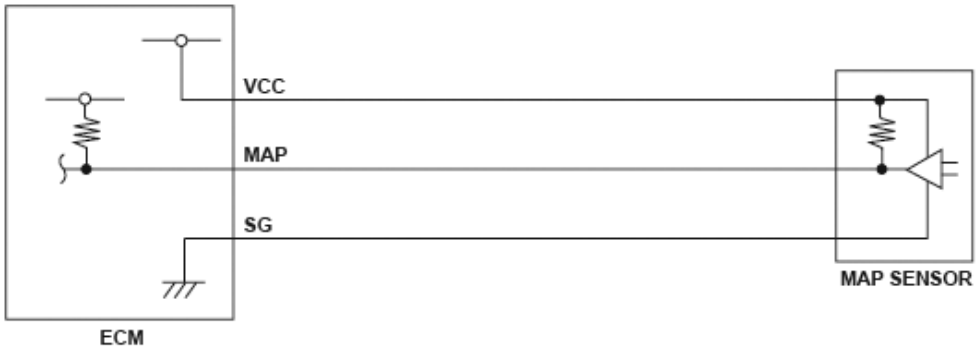

Fig. 14: Identifying ETCS Control Relay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Test the ETCS control relay (see **POWER RELAY TEST**).

   Is the ETCS control relay OK?

   YES - Go to step 6.

   NO - Replace the ETCS control relay, then go to step 13.

6. Jump the SCS line with the HDS.
7. Disconnect ECM connector A (44P).
8. Check for continuity between ECM connector terminal A20 and body ground.

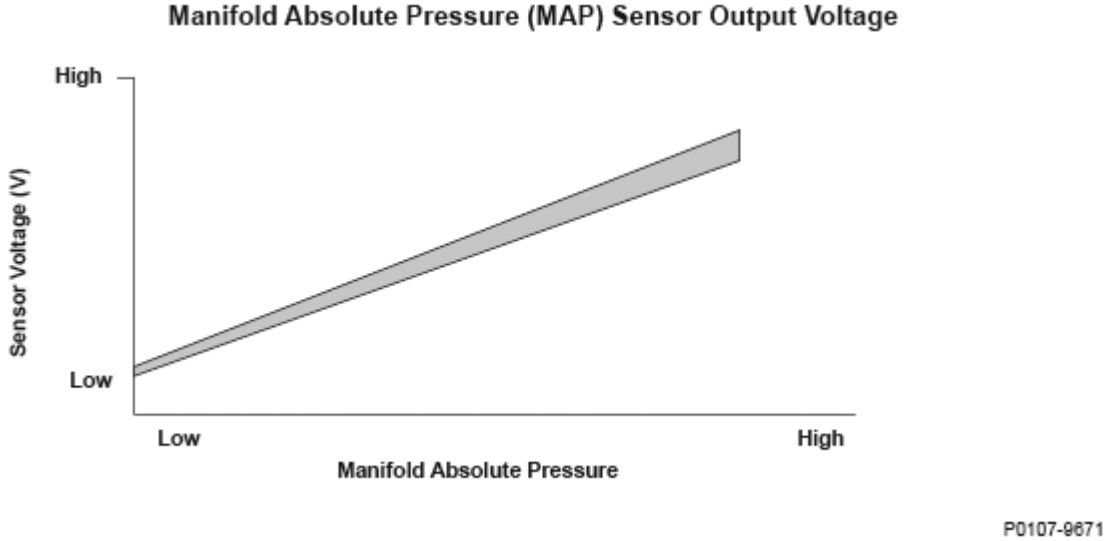

Fig. 15: Checking Continuity Between ECM Connector Terminal A20 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM (A20) and the ETCS control relay, then go to step 13.

NO - Go to step 9.

9. Disconnect ECM connector C (44P).
10. Turn the ignition switch ON (II).
11. Measure voltage between ECM connector terminal C1 and body ground.

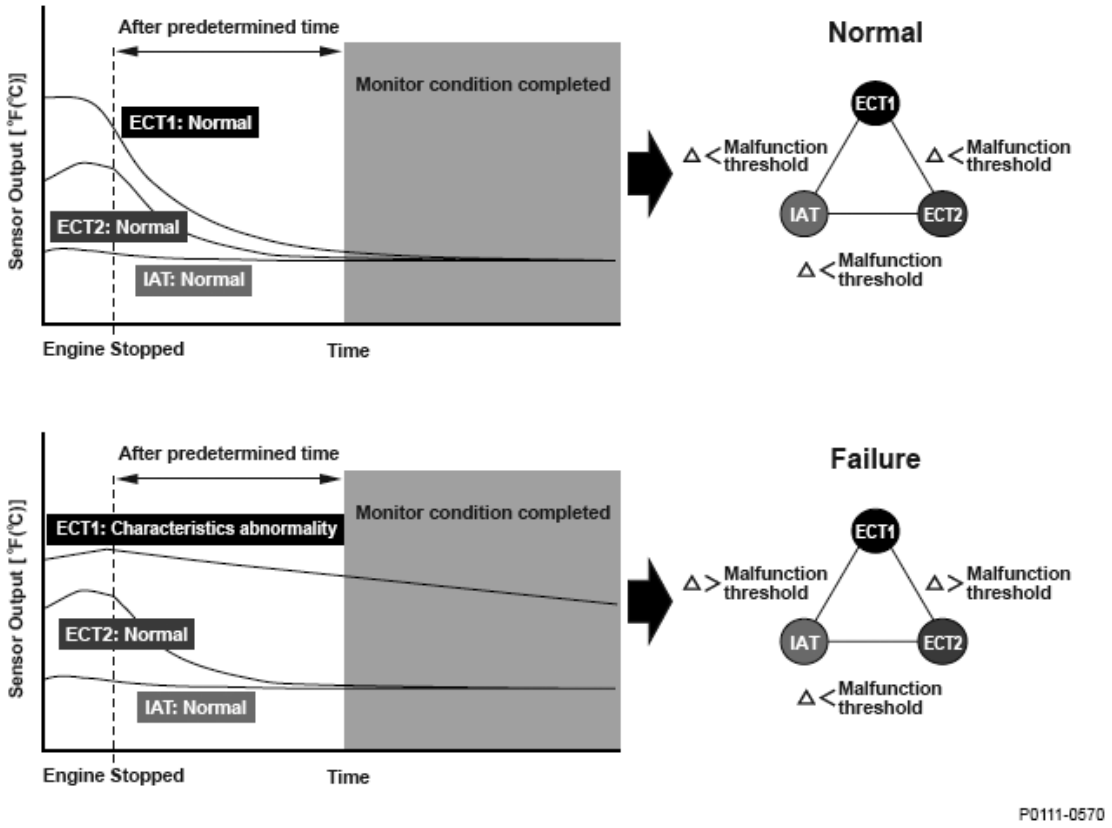

Fig. 16: Measuring Voltage Between ECM Connector Terminal C1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Repair short to power in the wire between the ECM (C1) and the ETCS control relay, then go to step 12.

NO - Go to step 18.

12. Turn the ignition switch OFF.
13. Reconnect all connectors.
14. Turn the ignition switch ON (II).
15. Reset the ECM with the HDS.
16. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
17. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P1658 indicated?

YES - Check for poor connections or loose terminals at the ETCS control relay and the ECM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

18. Turn the ignition switch OFF.
19. Reconnect all connectors.
20. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
21. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1658 indicated?

    YES - Check for poor connections or loose terminals at the ETCS control relay and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P1659: ELECTRONIC THROTTLE CONTROL SYSTEM (ETCS) CONTROL RELAY OFF MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P1659 indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the ETCS control relay and the ECM.

4. Turn the ignition switch OFF.
5. Check the No. 21 DBW (THROTTLE ACTUATOR CONTROL) (15 A) fuse in the under-hood fuse/relay box.

   Is the fuse OK?

   YES - Go to step 6.

   NO - Go to step 17.

6. Remove the ETCS control relay (F) from the under-hood fuse/relay box.

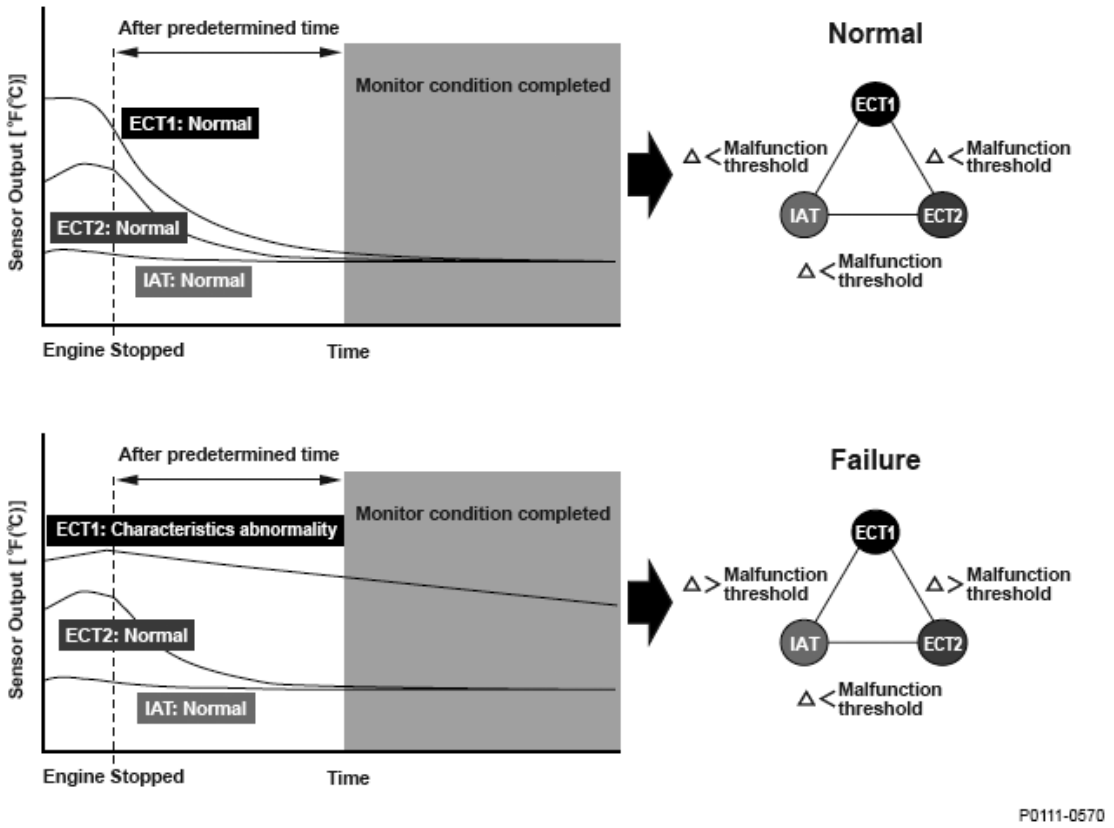

Fig. 17: Identifying ETCS Control Relay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Test the ETCS control relay (see **POWER RELAY TEST**).

   Is the ETCS control relay OK?

   YES - Go to step 8.

   NO - Replace the ETCS control relay, then go to step 23.

8. Turn the ignition switch ON (II).
9. Measure voltage between ETCS control relay 4P connector terminal No. 4 and body ground.

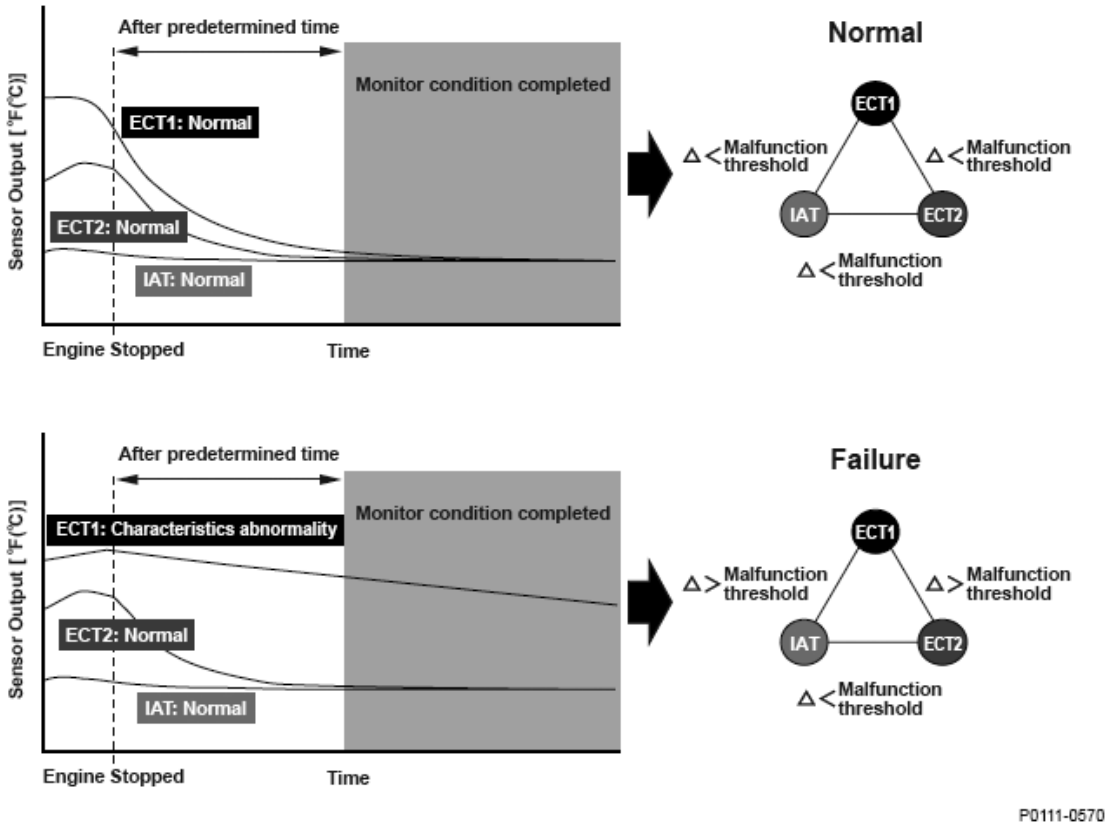

Fig. 18: Measuring Voltage Between ETCS Control Relay 4P Connector Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 10.

NO - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**), then go to step 22.

10. Measure voltage between ETCS control relay 4P connector terminal No. 1 and body ground.

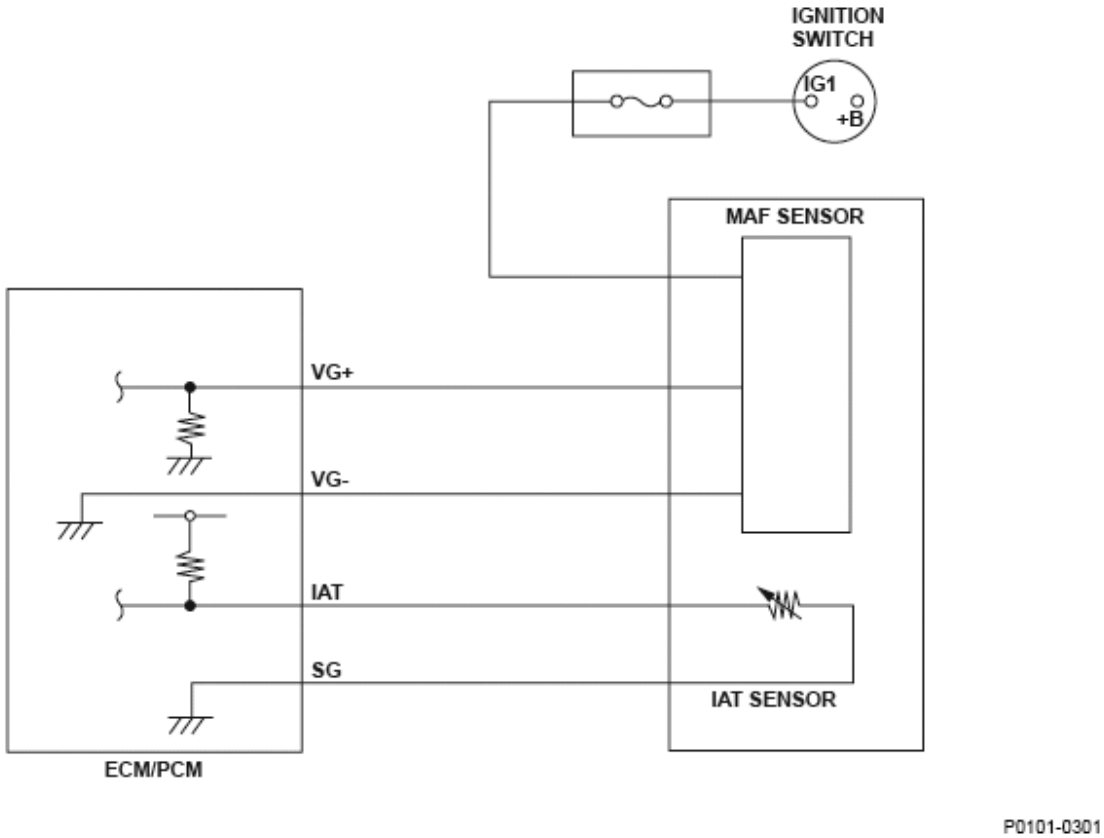

Fig. 19: Measuring Voltage Between ETCS Control Relay 4P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 11.

NO - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**), then go to step 22.

11. Turn the ignition switch OFF.
12. Jump the SCS line with the HDS.
13. Disconnect ECM connector C (44P).
14. Check for continuity between ETCS control relay 4P connector terminal No. 2 and ECM connector terminal C1.

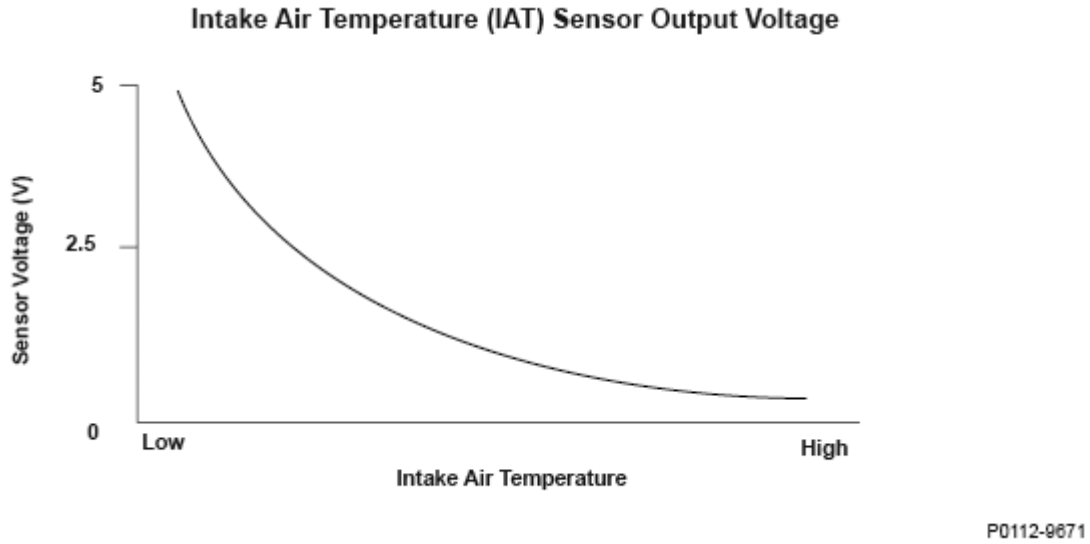

Fig. 20: Checking Continuity Between ETCS Control Relay 4P Terminal No 2 And ECM Terminal C1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 15.

NO - Repair open in the wire between the ECM (CD and the ETCS control relay, then go to step 23.

15. Disconnect ECM connector A (44P).
16. Check for continuity between ETCS control relay 4P connector terminal No. 3 and ECM connector terminal A20.

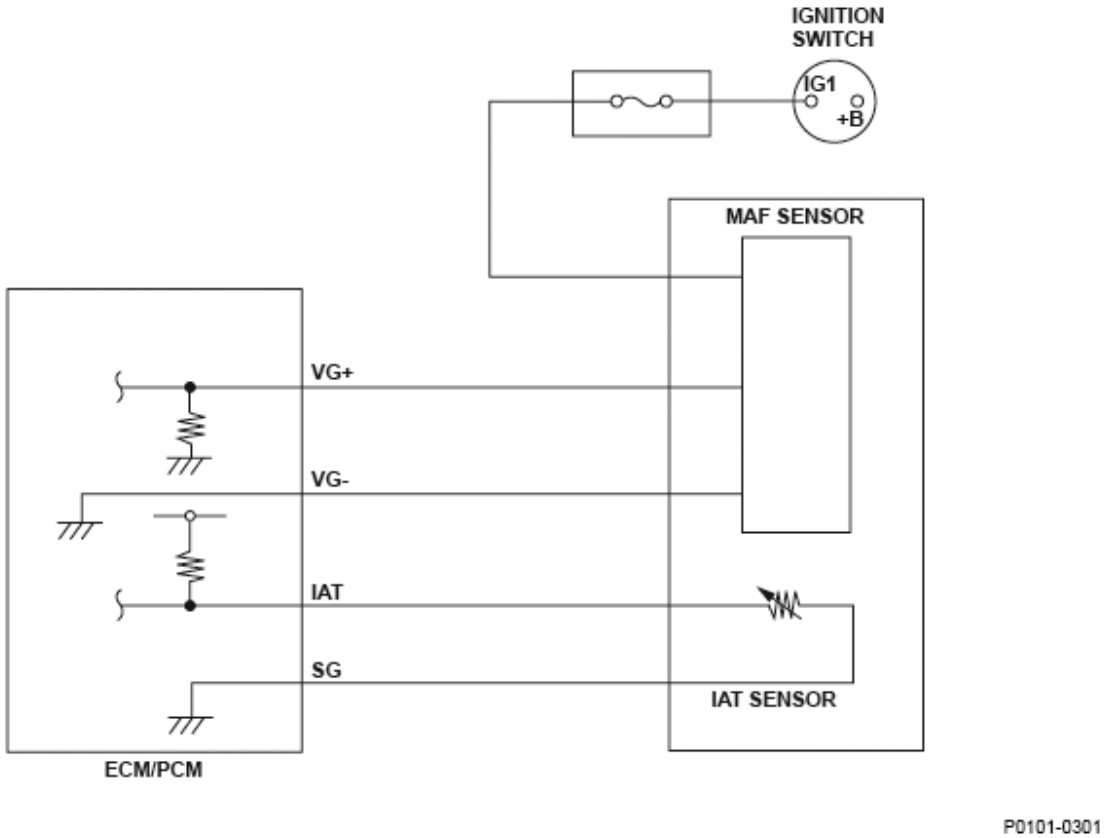

Fig. 21: Checking Continuity Between ETCS Control Relay 4P Terminal No. 3 And ECM Terminal A20
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 28.

NO - Repair open in the wire between the ECM (A20) and the ETCS control relay, then go to step 23.

17. Remove the ETCS control relay (F) from the understood fuse/relay box.

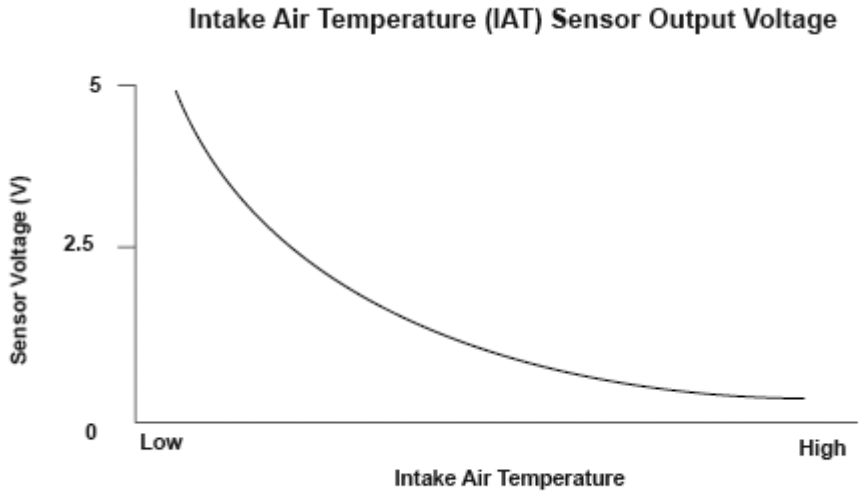

Fig. 22: Identifying ETCS Control Relay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

18. Jump the SCS line with the HDS.
19. Disconnect ECM connector C (44P).
20. Check for continuity between ECM connector terminal C1 and body ground.

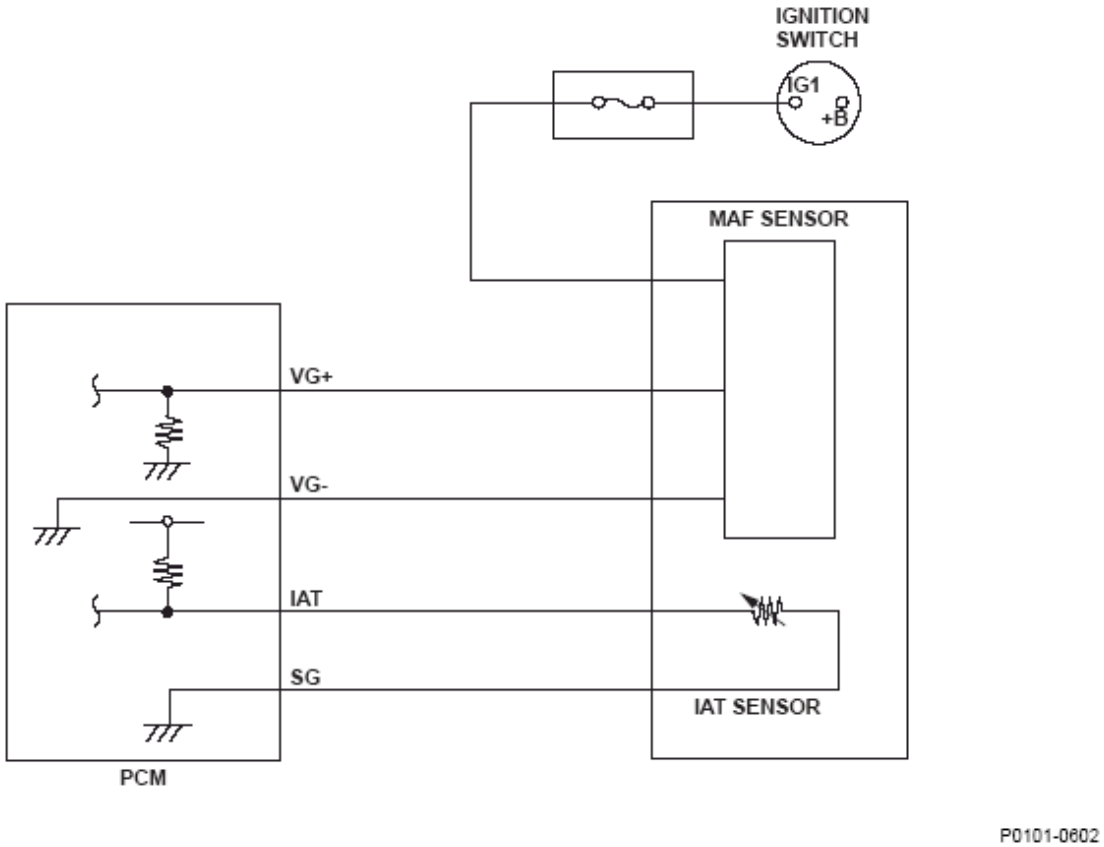

Fig. 23: Checking Continuity Between ECM Connector Terminal C1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM (C1) and the ETCS control relay, then go to step 23.

NO - Go to step 21.

21. Check for continuity between ETCS control relay 4P connector terminal No. 1 and body ground.

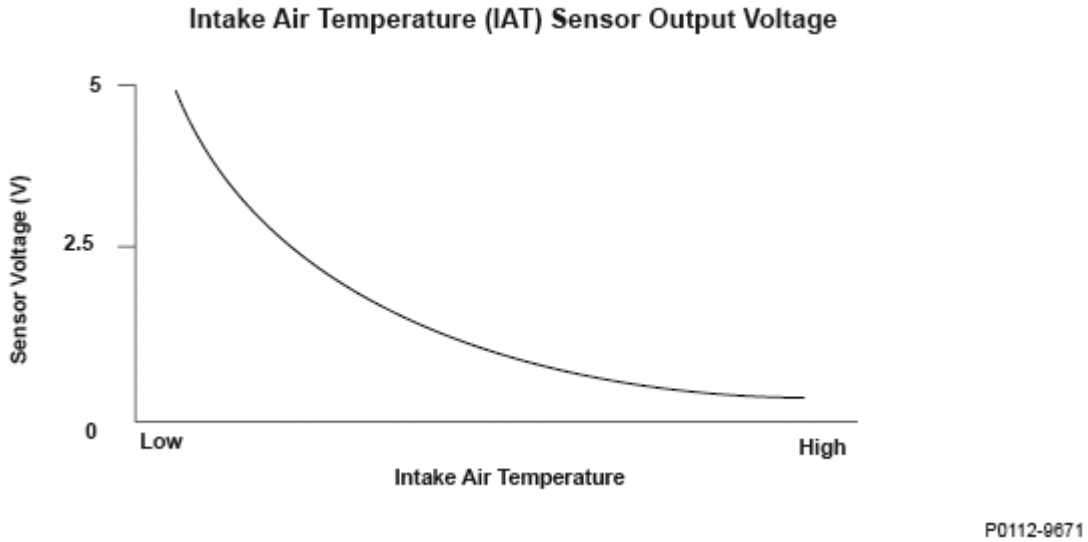

Fig. 24: Checking Continuity Between ETCS Control Relay 4P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**), then go to step 23.

NO - Go to step 28.

22. Turn the ignition switch OFF.
23. Reconnect all connectors.
24. Turn the ignition switch ON (II).
25. Reset the ECM with the HDS.
26. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
27. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P1659 indicated?

YES - Check for poor connections or loose terminals at the ETCS control relay and the ECM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

28. Reconnect all connectors.
29. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
30. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1659 indicated?

    YES - Check for poor connections or loose terminals at the ETCS control relay and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P1683: THROTTLE VALVE DEFAULT POSITION SPRING PERFORMANCE PROBLEM

CAUTION: Do not insert your fingers into the installed throttle body when you turn the ignition switch ON (II) or while the ignition switch is ON (II). If you do, you will seriously injure your fingers if the throttle valve is activated.

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
4. Turn the ignition switch OFF, and wait 10 seconds.
5. Turn the ignition switch ON (II).
6. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1683 indicated?

    YES - Go to step 7.

    NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM.

7. Turn the ignition switch OFF.
8. Disconnect the air intake duct from the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
9. Push the throttle valve closed as shown.

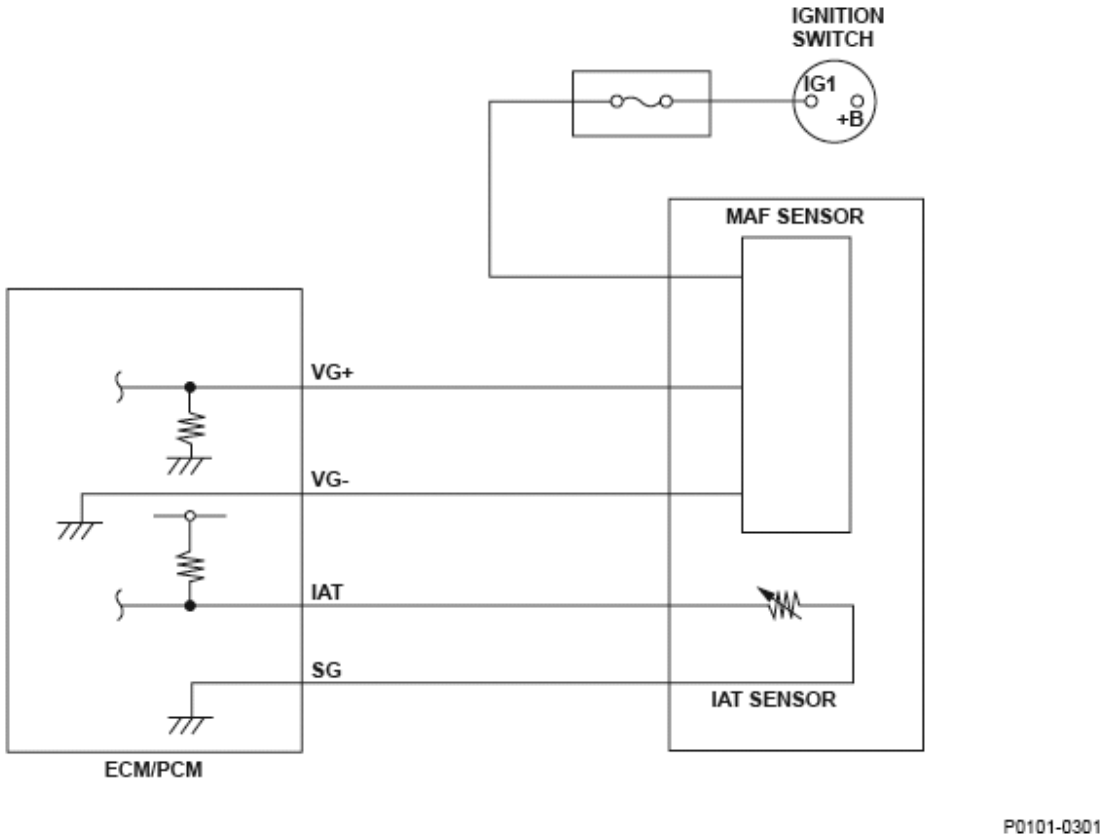

Fig. 25: Pushing Throttle Valve To Close Position
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Release the throttle valve.

    Does the throttle valve return?

    YES - Clean the throttle body (see **THROTTLE BODY CLEANING**), then go to step 12 and recheck. If DTC P1683 is indicated, go to step 11.

    NO - Go to step 11.

11. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
12. Turn the ignition switch ON (II).
13. Reset the ECM with the HDS.
14. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
15. Turn the ignition switch OFF, and wait 10 seconds.
16. Turn the ignition switch ON (II).
17. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1683 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P1684: THROTTLE VALVE RETURN SPRING PERFORMANCE PROBLEM

CAUTION: Do not insert your fingers into the installed throttle body when you turn the ignition switch ON (II) or while the ignition switch is ON (II). If you do, you will seriously injure your fingers if the throttle valve is activated.

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
4. Turn the ignition switch OFF, and wait 10 seconds.
5. Turn the ignition switch ON (II).
6. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P1684 indicated?

   YES - Go to step 7.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM.

7. Turn the ignition switch OFF.
8. Disconnect the air intake duct from the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
9. Push the throttle valve open as shown.

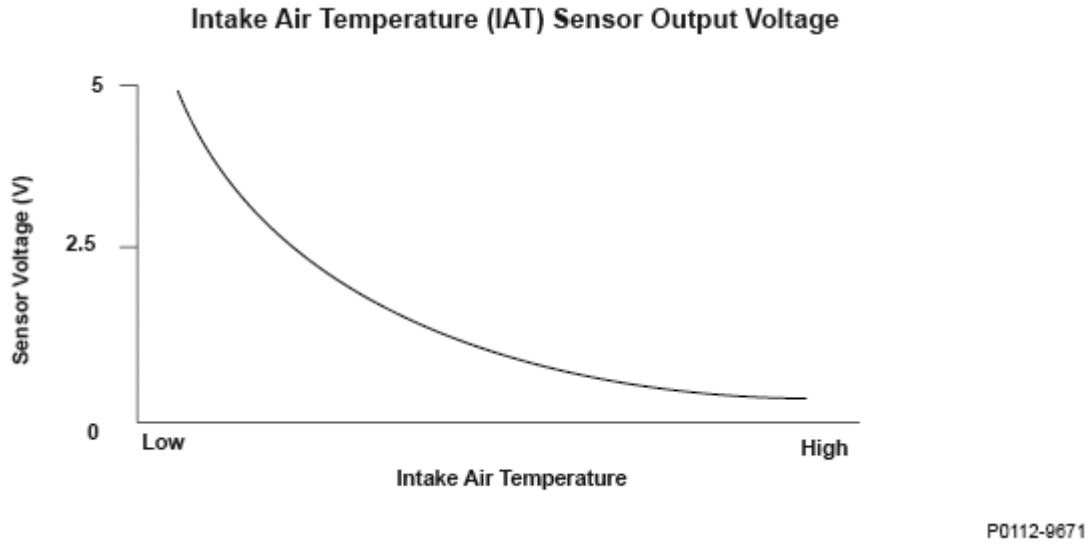

Fig. 26: Pushing Throttle Valve To Open Position
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Release the throttle valve.

    Does the throttle valve return?

    YES - Clean the throttle body (see **THROTTLE BODY CLEANING**), then go to step 12 and recheck. If DTC P1684 is indicated, go to step 11.

    NO - Go to step 11.

11. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
12. Turn the ignition switch ON (II).
13. Reset the ECM with the HDS.
14. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
15. Turn the ignition switch OFF, and wait 10 seconds.
16. Turn the ignition switch ON (II).
17. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1684 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P2101: ELECTRONIC THROTTLE CONTROL SYSTEM (ETCS) MALFUNCTION

CAUTION: Do not insert your fingers into the installed throttle body when you turn the ignition switch ON (II) or while the ignition switch is ON (II). If you do, you will seriously injure your fingers if the throttle valve is

activated.

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Do the ETCS TEST in the INSPECTION MENU with the HDS.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2101 indicated?

   YES - Go to step 7.

   NO - Go to step 5.

5. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
   - ENGINE SPEED
   - VSS
   - APP SENSOR
6. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2101 indicated?

   YES - Go to step 7.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM, then clean the throttle body (see **THROTTLE BODY CLEANING**).

7. Turn the ignition switch OFF.
8. Disconnect the air intake duct from the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
9. Turn the ignition switch ON (II).
10. Clear the DTC with the HDS.
11. Do the ETCS TEST in the INSPECTION MENU with the HDS.
12. Visually check the throttle valve operation.

    Does the throttle valve operate smoothly?

    YES - Clean the throttle body (see **THROTTLE BODY CLEANING**), then go to step 22 and recheck. If DTC P2101 is indicated, go to step 19.

    NO - Go to step 13.

13. Turn the ignition switch OFF.

14. Disconnect the throttle body 6P connector.
15. Jump the SCS line with the HDS.
16. Disconnect ECM connector C (44P).
17. Connect throttle body 6P connector terminals No. 5 and No. 6 with a jumper wire.

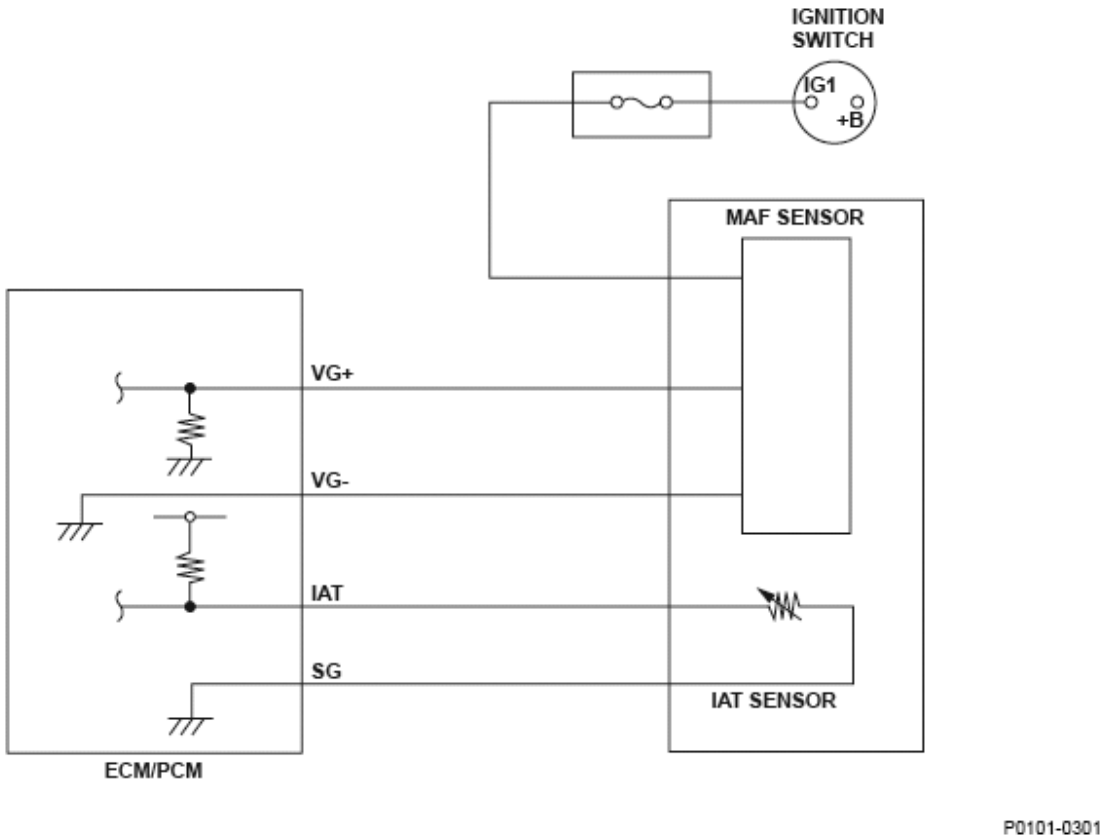

Fig. 27: Connecting Throttle Body 6P Connector Terminals No. 5 And 6 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

18. Check for continuity between ECM connector terminals C3 and C4.

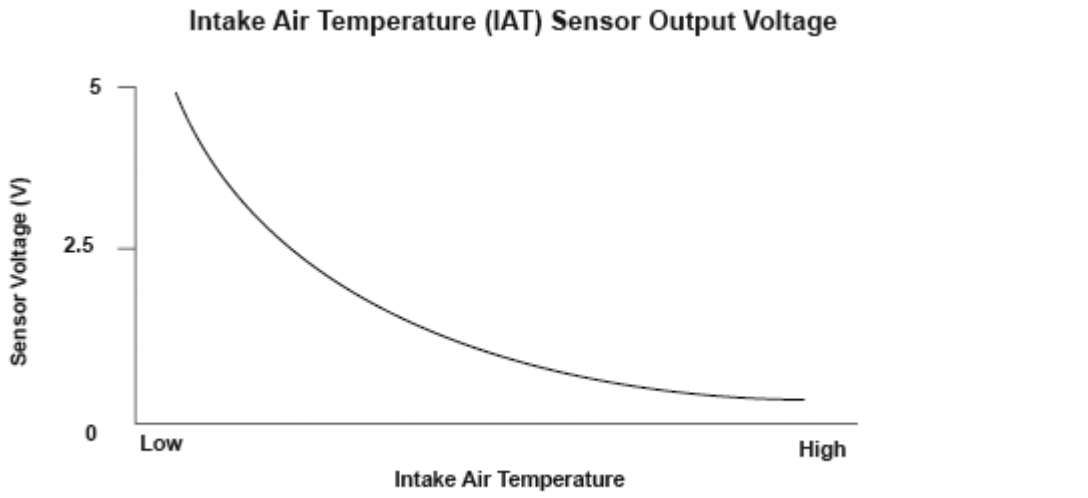

Fig. 28: Checking Continuity Between ECM Connector Terminals C3 And C4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 27.

NO - Repair open in the wires between the throttle body and the ECM (C3, C4), then go to step 21.

19. Turn the ignition switch OFF.
20. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
21. Reconnect all connectors.
22. Turn the ignition switch ON (II).
23. Reset the ECM with the HDS.
24. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
25. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VSS
    - APP SENSOR A
26. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2101 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM, then clean the throttle body (see **THROTTLE BODY CLEANING**), and go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

27. Reconnect all connectors.
28. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
29. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VSS
    - APP SENSOR A
30. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2101 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 29. If the ECM was substituted, go to step 1.

    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated,

go to the indicated DTCs troubleshooting.

DTC P2118: THROTTLE ACTUATOR CURRENT RANGE/PERFORMANCE PROBLEM

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Jump the SCS line with the HDS.
2. Disconnect ECM connector C (44P).
3. Measure resistance between ECM connector terminals C3 and C4.

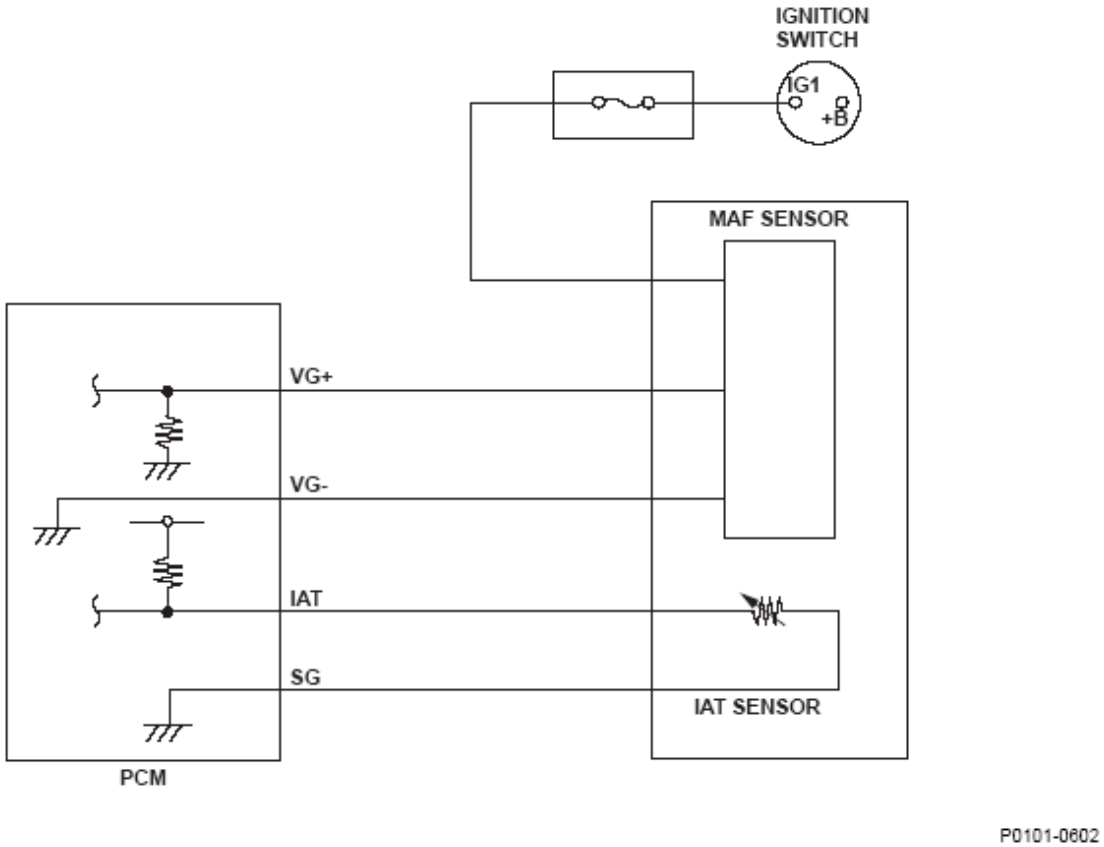

Fig. 29: Measuring Resistance Between ECM Connector Terminals C3 And C4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 1.0 ohms or less?

YES - Go to step 4.

NO - Go to step 15.

4. Disconnect the throttle body 6P connector.
5. At the throttle body side, measure resistance between throttle body 6P connector terminals No. 5 and No. 6 with the throttle fully closed.

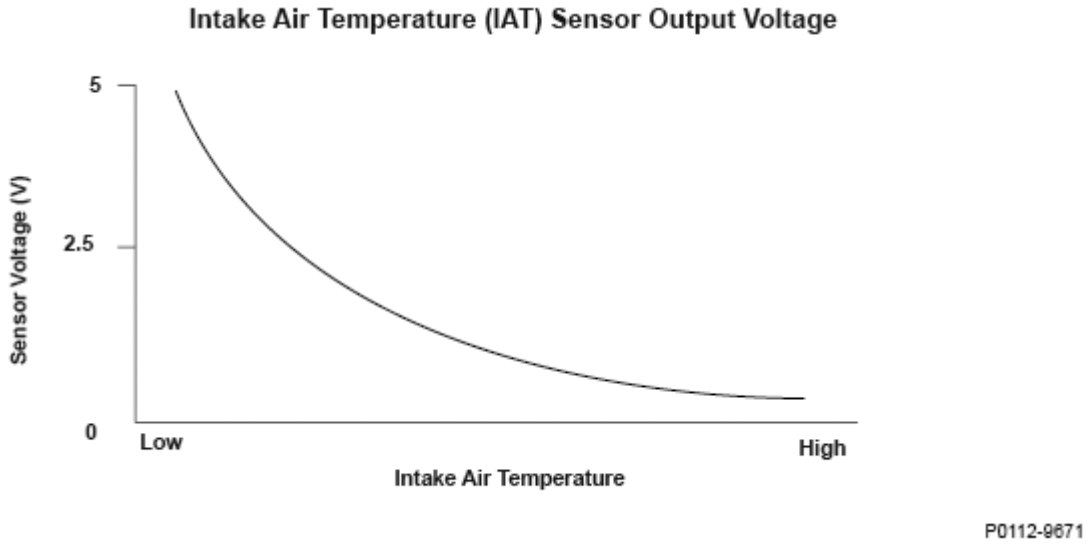

Fig. 30: Measuring Resistance Between Throttle Body 6P Connector Terminals No. 5 And 6
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 1.0 ohms, or less?

YES - Go to step 6.

NO - Repair short in the wires between the ECM C3 (ETCSM-line) and C4 (ETCSM+ line), then go to step 7.

6. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
7. Reconnect all connectors.
8. Turn the ignition switch ON (II).
9. Reset the ECM with the HDS.
10. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
11. Turn the ignition switch OFF.
12. Turn the ignition switch ON (II).
13. Slowly press the accelerator pedal to the floor.
14. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P2118 indicated?

YES - Check for poor connections or loose terminals at the throttle body and the ECM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

15. Reconnect all connectors.
16. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
17. Turn the ignition switch OFF.

18. Turn the ignition switch ON (II).
19. Slowly press the accelerator pedal to the floor.
20. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P2118 indicated?

YES - Check for poor connections or loose terminals at the throttle body and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 17. If the ECM was substituted, go to step 1.

NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P2122: APP SENSOR A (THROTTLE POSITION SENSOR D) CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check APP SENSOR A in the DATA LIST with the HDS.

Is there about 0.2 V or less?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at APP sensor A and the ECM.

3. Turn the ignition switch OFF.
4. Disconnect the APP sensor 6P connector.
5. Turn the ignition switch ON (II).
6. Measure voltage between APP sensor 6P connector terminals No. 2 and No. 3.

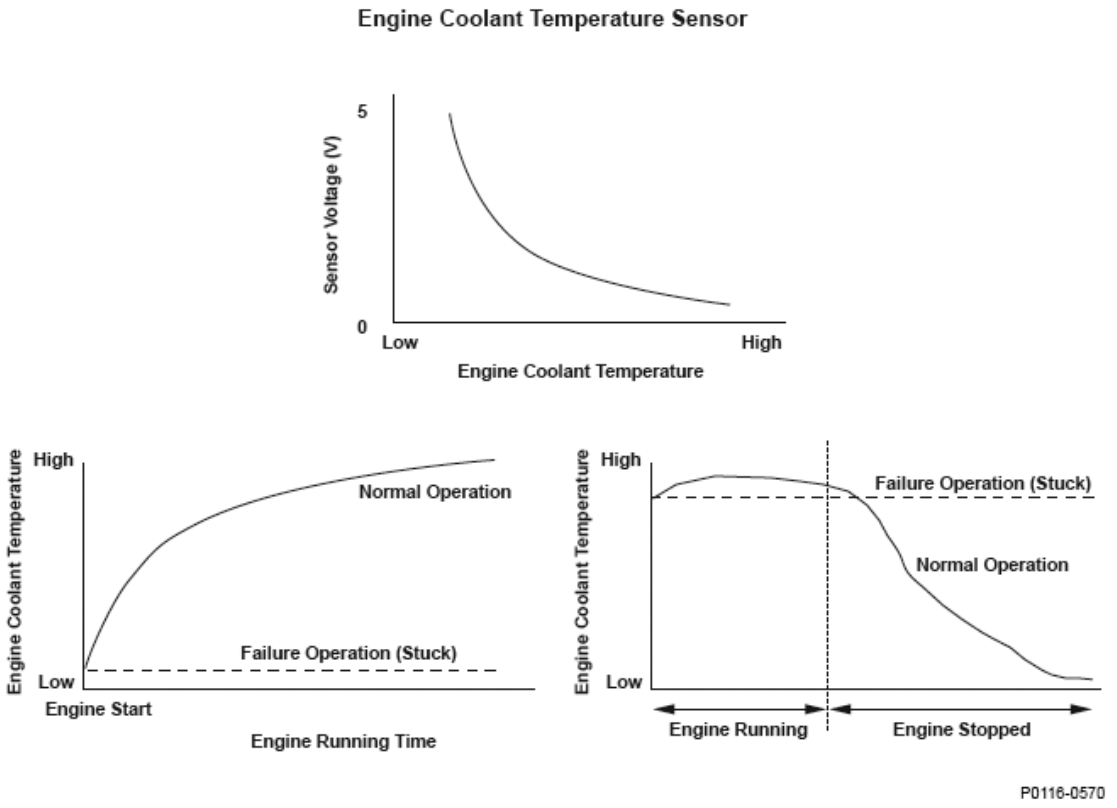

Fig. 31: Measuring Voltage Between APP Sensor 6P Connector Terminals No. 2 And 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 7.

NO - Go to step 17.

7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Disconnect ECM connector A (44P).
10. Check for continuity between APP sensor 6P connector terminal No. 1 and body ground.

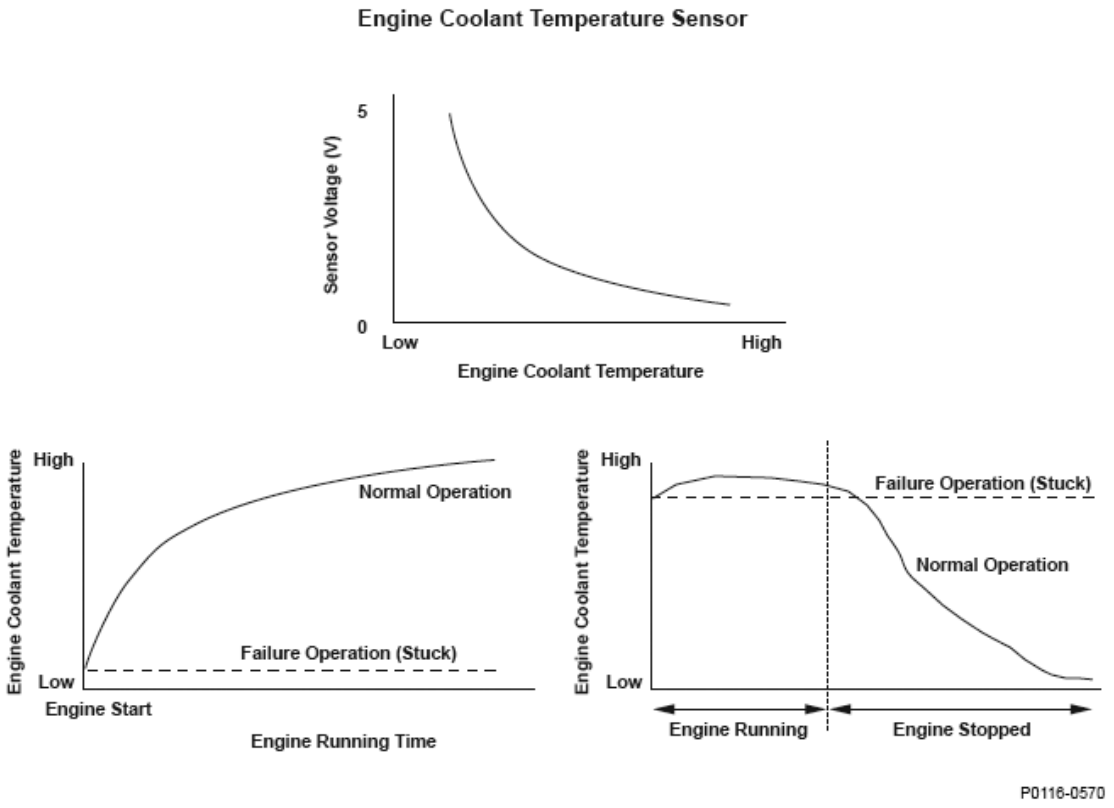

Fig. 32: Checking Continuity Between APP Sensor 6P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM (A17) and APP sensor A, then go to step 24.

NO - Go to step 11.

11. Connect APP sensor 6P connector terminal No. 1 to body ground with a jumper wire.

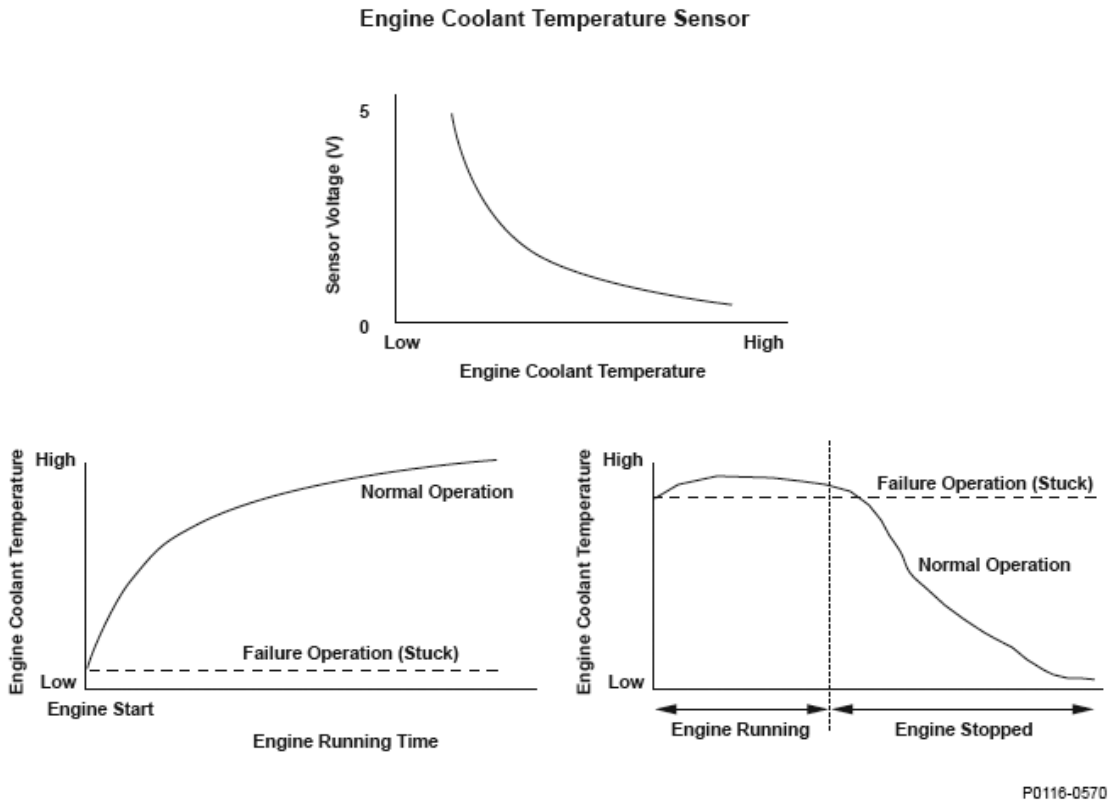

Fig. 33: Connecting APP Sensor 6P Connector Terminal No. 1 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Check for continuity between ECM connector terminal A17 and body ground.

Fig. 34: Checking Continuity Between ECM Connector Terminal A17 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 13.

NO - Repair open in the wire between the ECM (A17) and APP sensor A, then go to step 24.

13. Reconnect ECM connector A (44P).
14. Connect APP sensor 6P connector terminals No. 1 and No. 3 with a jumper wire.

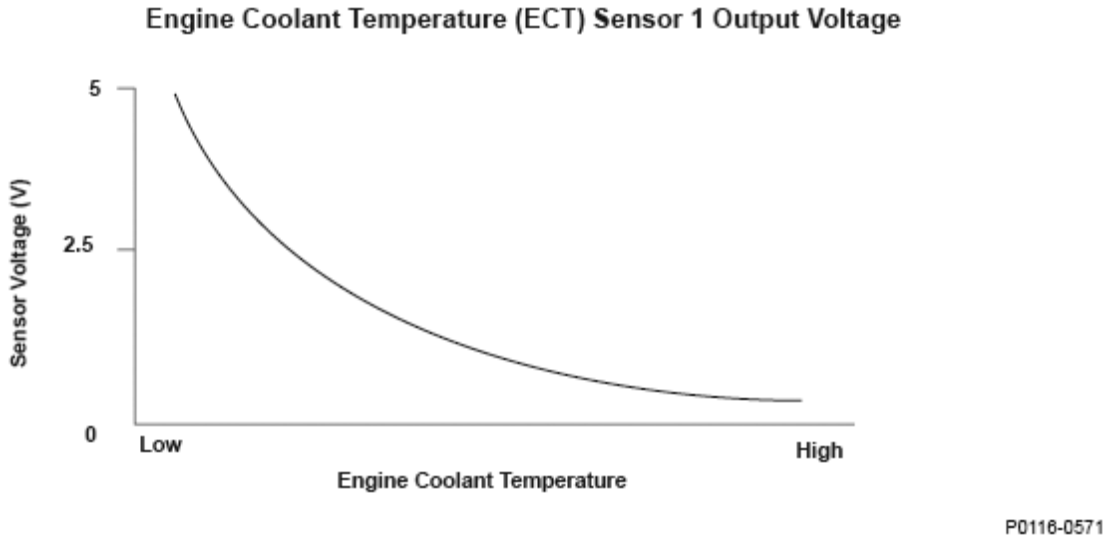

Fig. 35: Connecting APP Sensor 6P Connector Terminals No. 1 And 3 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Turn the ignition switch ON (II).
16. Check APP SENSOR A in the DATA LIST with the HDS.

    Is there about 0.2 V or less?

    YES - Go to step 29.

    NO - Go to step 22.

17. Turn the ignition switch OFF.
18. Jump the SCS line with the HDS.
19. Disconnect ECM connector A (44P).
20. Connect APP sensor 6P connector terminal No. 3 to body ground with a jumper wire.

Fig. 36: Connecting APP Sensor 6P Connector Terminal No. 3 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Check for continuity between ECM connector terminal A25 and body ground.

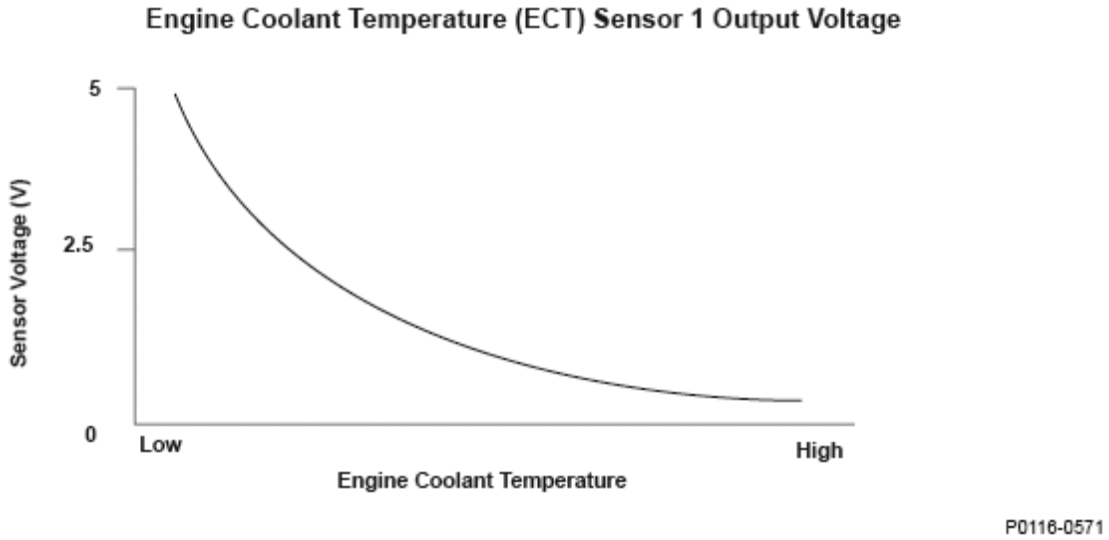

Fig. 37: Checking Continuity Between ECM Connector Terminal A25 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 30.

NO - Repair open in the wire between the ECM (A25) and APP sensor A, then go to step 24.

22. Turn the ignition switch OFF.
23. Replace the accelerator pedal module (see **ACCELERATOR PEDAL MODULE REMOVAL/INSTALLATION**).
24. Reconnect all connectors.
25. Turn the ignition switch ON (II).
26. Reset the ECM with the HDS.
27. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
28. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2122 indicated?

    YES - Check for poor connections or loose terminals at APP sensor A and the ECM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

29. Turn the ignition switch OFF.
30. Reconnect all connectors.
31. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
32. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2122 indicated?

YES - Check for poor connections or loose terminals at APP sensor A and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P2123: APP SENSOR A (THROTTLE POSITION SENSOR D) CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check APP SENSOR A in the DATA LIST with the HDS.

   Is there about 4.9 V or more?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at APP sensor A and the ECM.

3. Turn the ignition switch OFF.
4. Disconnect the APP sensor 6P connector.
5. Turn the ignition switch ON (II).
6. Measure voltage between APP sensor 6P connector terminals No. 2 and No. 3.

Fig. 38: Measuring Voltage Between APP Sensor 6P Connector Terminals No. 2 And 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 12.

NO - Go to step 7.

7. Turn the ignition switch OFF.

8. Jump the SCS line with the HDS.
9. Disconnect ECM connector A (44P).
10. Connect APP sensor 6P connector terminal No. 2 to body ground with a jumper wire.

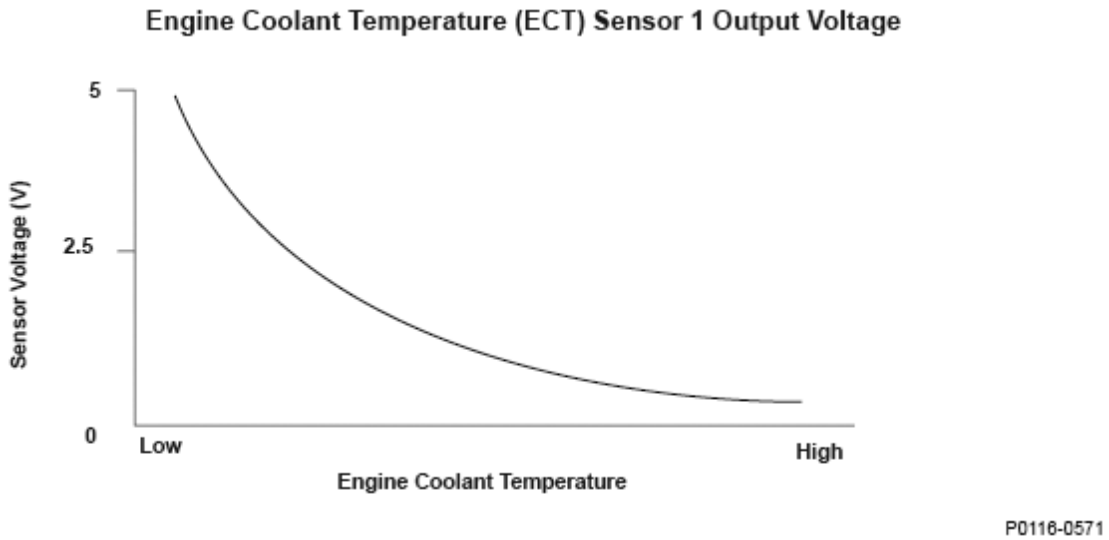

Fig. 39: Connecting APP Sensor 6P Connector Terminal No. 2 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Check for continuity between ECM connector terminal A35 and body ground.

Fig. 40: Checking Continuity Between ECM Connector Terminal A35 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 19.

NO - Repair open in the wire between the ECM (A35) and APP sensor A, then go to step 14.

12. Turn the ignition switch OFF.
13. Replace the accelerator pedal module (see **ACCELERATOR PEDAL MODULE REMOVAL/INSTALLATION**).
14. Reconnect all connectors.
15. Turn the ignition switch ON (II).

16. Reset the ECM with the HDS.
17. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
18. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2123 indicated?

    YES - Check for poor connections or loose terminals at APP sensor A and the ECM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

19. Reconnect all connectors.
20. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
21. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2123 indicated?

    YES - Check for poor connections or loose terminals at APP sensor A and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P2127: APP SENSOR B (THROTTLE POSITION SENSOR E) CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check APP SENSOR B in the DATA LIST with the HDS.

   Is there about 0.2 V or less?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at APP sensor B and the ECM.

3. Turn the ignition switch OFF.
4. Disconnect the APP sensor 6P connector.
5. Turn the ignition switch ON (II).
6. Measure voltage between APP sensor 6P connector terminals No. 5 and No. 6.

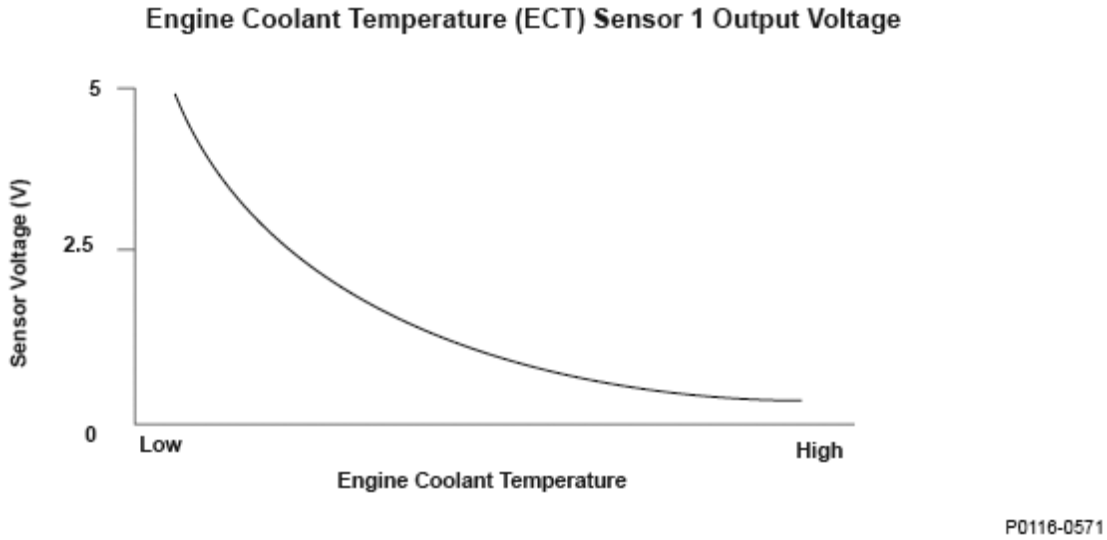

Fig. 41: Measuring Voltage Between APP Sensor 6P Connector Terminals No. 5 And 6
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 7.

NO - Go to step 17.

7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Disconnect ECM connector A (44P).
10. Check for continuity between APP sensor 6P connector terminal No. 4 and body ground.

Fig. 42: Checking Continuity Between APP Sensor 6P Connector Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM (A18) and APP sensor B, then go to step 24.

NO - Go to step 11.

11. Connect APP sensor 6P connector terminal No. 4 to body ground with a jumper wire.

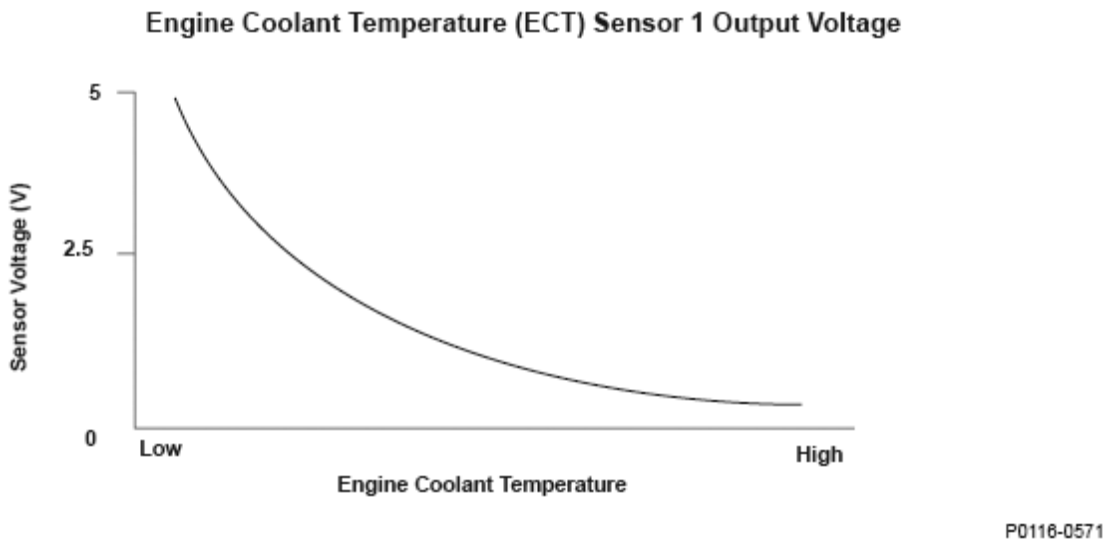

Fig. 43: Connecting APP Sensor 6P Connector Terminal No. 4 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Check for continuity between ECM connector terminal A18 and body ground.

Fig. 44: Checking Continuity Between ECM Connector Terminal A18 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 13.

NO - Repair open in the wire between the ECM (A18) and APP sensor B, then go to step 24.

13. Reconnect ECM connector A (44P).
14. Connect APP sensor 6P connector terminals No. 4 and No. 6 with a jumper wire.

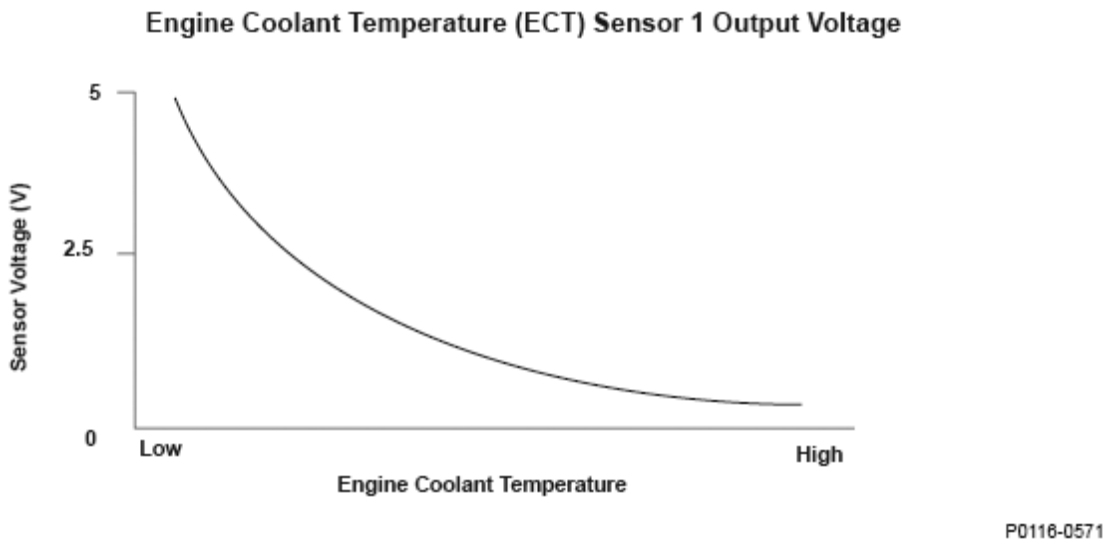

Fig. 45: Connecting APP Sensor 6P Connector Terminals No. 4 And 6 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Turn the ignition switch ON (II).
16. Check APP SENSOR B in the DATA LIST with the HDS.

    Is there about 0.2 V or less?

    YES - Go to step 29.

    NO - Go to step 22.

17. Turn the ignition switch OFF.
18. Jump the SCS line with the HDS.
19. Disconnect ECM connector A (44P).
20. Connect APP sensor 6P connector terminal No. 6 to body ground with a jumper wire.

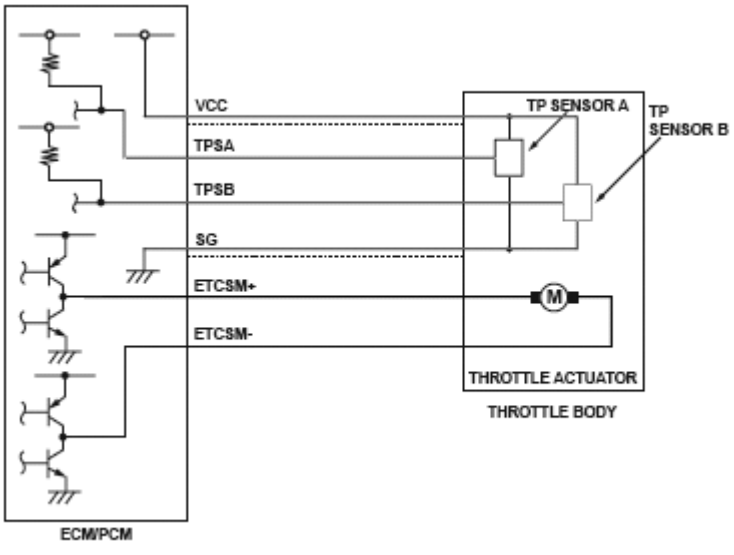

Fig. 46: Connecting APP Sensor 6P Connector Terminal No. 6 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Check for continuity between ECM connector terminal A24 and body ground.

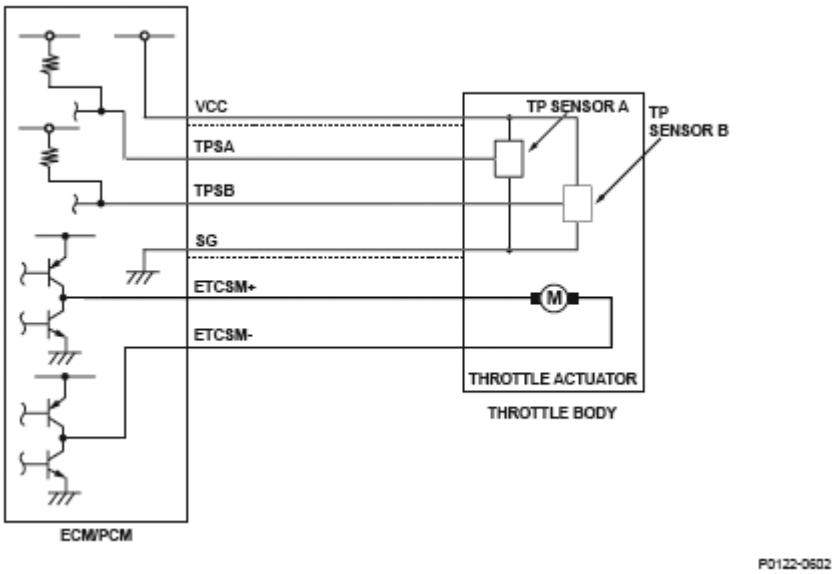

Fig. 47: Checking Continuity Between ECM Connector Terminal A24 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 30.

NO - Repair open in the wire between the ECM (A24) and APP sensor B, then go to step 24.

22. Turn the ignition switch OFF.
23. Replace the accelerator pedal module (see **ACCELERATOR PEDAL MODULE REMOVAL/INSTALLATION**).
24. Reconnect all connectors.
25. Turn the ignition switch ON (II).
26. Reset the ECM with the HDS.
27. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
28. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P2127 indicated?

YES - Check for poor connections or loose terminals at APP sensor B and the ECM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

29. Turn the ignition switch OFF.

30. Reconnect all connectors.
31. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
32. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2127 indicated?

    YES - Check for poor connections or loose terminals at APP sensor B and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P2128: APP SENSOR B (THROTTLE POSITION SENSOR E) CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check APP SENSOR B in the DATA LIST with the HDS.

   Is there about 4.9 V or more?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at APP sensor Band the ECM.

3. Turn the ignition switch OFF.
4. Disconnect the APP sensor 6P connector.
5. Turn the ignition switch ON (II).
6. Measure voltage between APP sensor 6P connector terminals No. 5 and No. 6.

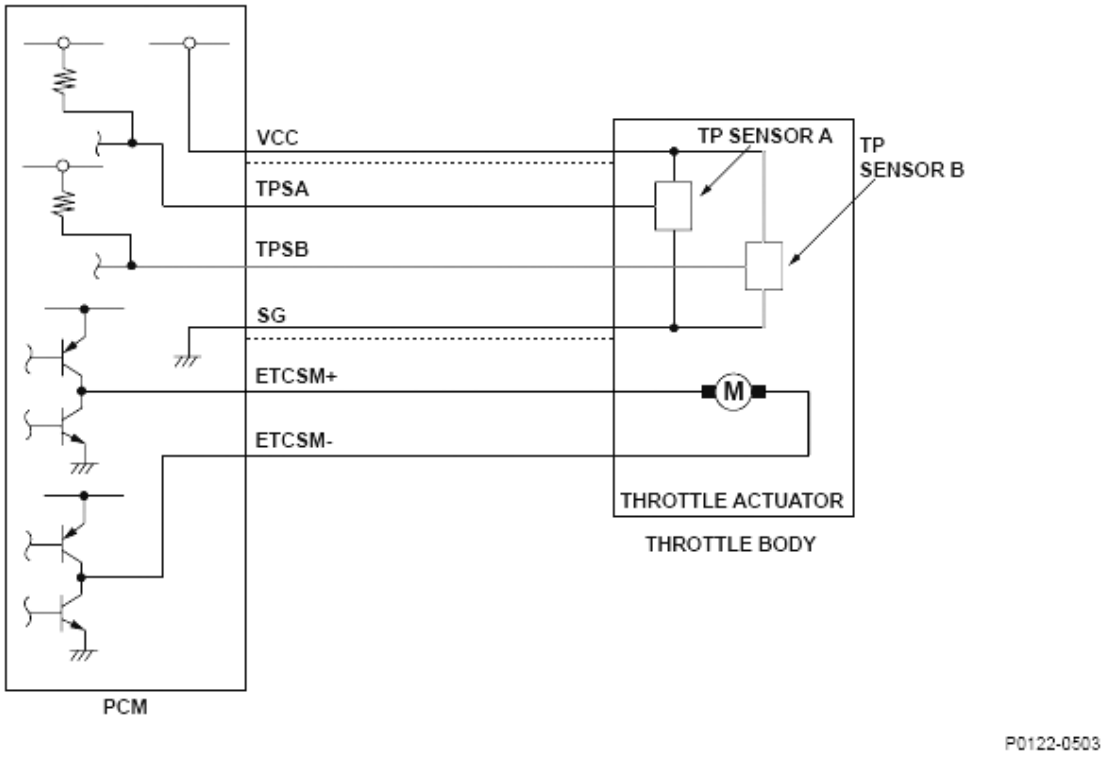

Fig. 48: Measuring Voltage Between APP Sensor 6P Connector Terminals No. 5 And 6
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 12.

NO - Go to step 7.

7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Disconnect ECM connector A (44P).
10. Connect APP sensor 6P connector terminal No. 5 to body ground with a jumper wire.

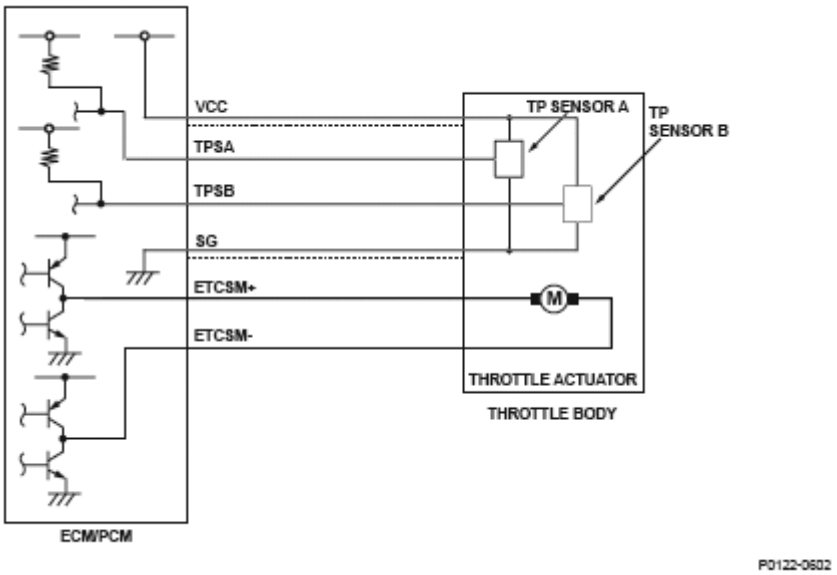

Fig. 49: Connecting APP Sensor 6P Connector Terminal No. 5 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Check for continuity between ECM connector terminal A34 and body ground.

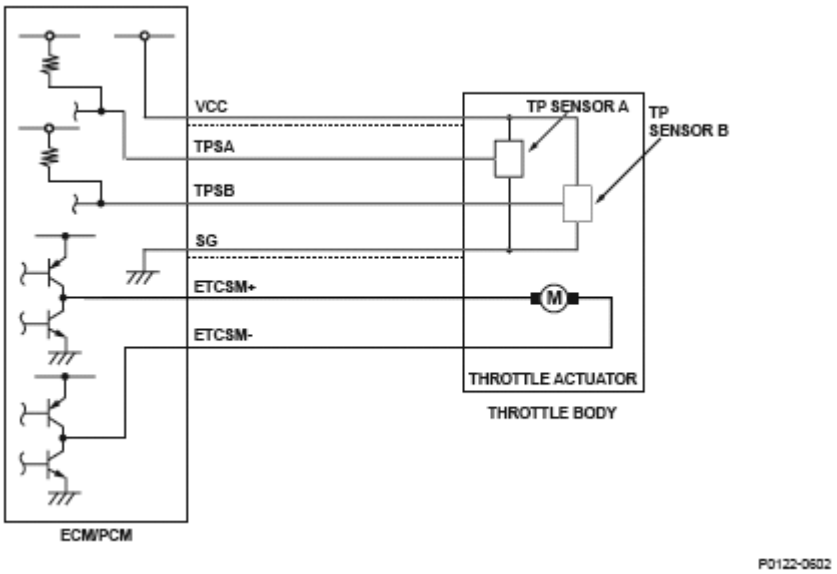

Fig. 50: Checking Continuity Between ECM Connector Terminal A34 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 19.

NO - Repair open in the wire between the ECM (A34) and APP sensor B, then go to step 14.

12. Turn the ignition switch OFF.
13. Replace the accelerator pedal module (see **ACCELERATOR PEDAL MODULE**

REMOVAL/INSTALLATION).

14. Reconnect all connectors.
15. Turn the ignition switch ON (II).
16. Reset the ECM with the HDS.
17. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
18. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2128 indicated?

    YES - Check for poor connections or loose terminals at APP sensor B and the ECM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

19. Reconnect all connectors.
20. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
21. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2128 indicated?

    YES - Check for poor connections or loose terminals at APP sensor B and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P2135: TP SENSOR A/B INCORRECT VOLTAGE CORRELATION

CAUTION: Do not insert your fingers into the installed throttle body when you turn the ignition switch ON (II) or while the ignition switch is ON (II). If you do, you will seriously injure your fingers if the throttle valve is activated.

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Do the ETCS TEST in the INSPECTION MENU with the HDS.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2135 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM.

5. Turn the ignition switch OFF.
6. Disconnect the air intake duct from the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
7. Turn the ignition switch ON (II).
8. Visually check the throttle valve operation while you clear the DTC with the HDS.

Does the valve temporarily move to its fully closed position?

YES - Go to step 15.

NO - Go to step 9.

9. Turn the ignition switch OFF.
10. Jump the SCS line with the HDS.
11. Disconnect ECM connector C (44P).
12. Check for continuity between ECM connector terminals C20 and C21.

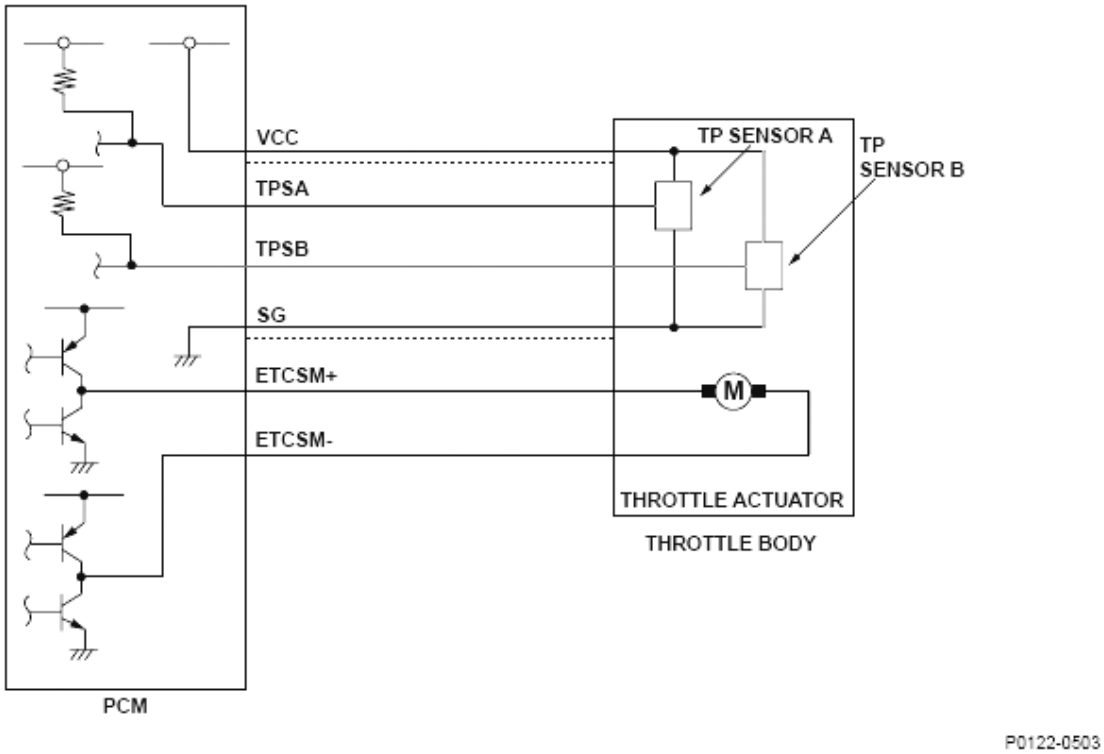

Fig. 51: Checking Continuity Between ECM Connector Terminals C20 And C21
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 13.

NO - Go to step 22.

13. Disconnect the throttle body 6P connector.
14. Check for continuity between ECM connector terminals C20 and C21.

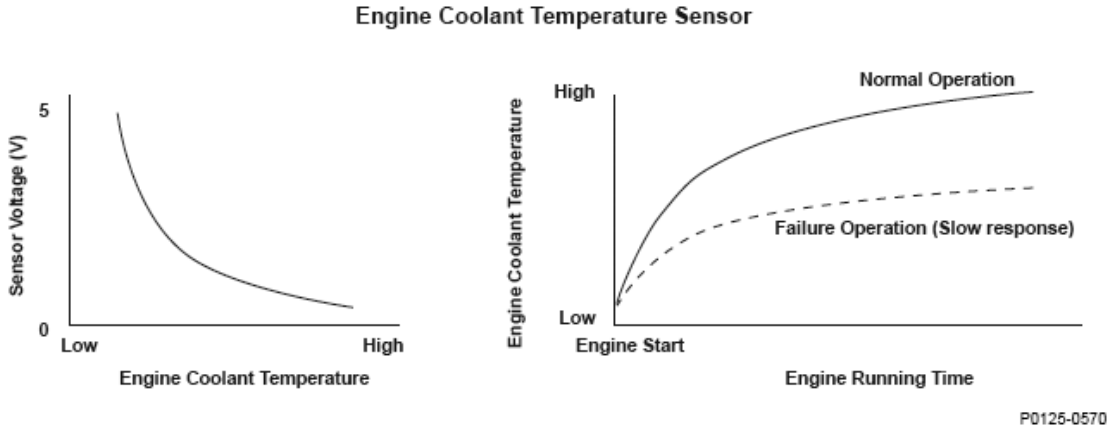

Fig. 52: Checking Continuity Between ECM Connector Terminals C20 And C21
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wires between the ECM C20 (TPSA line) and the C21 (TPSB line), then go to step 17.

NO - Go to step 15.

15. Turn the ignition switch OFF.
16. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
17. Reconnect all connectors.
18. Turn the ignition switch ON (II).
19. Reset the ECM with the HDS.
20. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
21. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P2135 indicated?

YES - Check for poor connections or loose terminals at the throttle body and the ECM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

22. Reconnect all connectors.
23. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).

24. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2135 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P2138: APP SENSOR A/B (THROTTLE POSITION SENSOR D/E) INCORRECT VOLTAGE CORRELATION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with HDS.
3. Press the accelerator pedal to the floor.
4. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2138 indicated?

    YES - Go to step 5.

    NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the APP sensor and the ECM.

5. Check APP SENSOR A and APP SENSOR B in the DATA LIST with the HDS.

    Are they the same voltage?

    YES - Go to step 6.

    NO - Go to step 12.

6. Turn the ignition switch OFF.
7. Jump the SCS line with the HDS.
8. Disconnect ECM connector A (44P).
9. Check for continuity between ECM connector terminals A17 and A18.

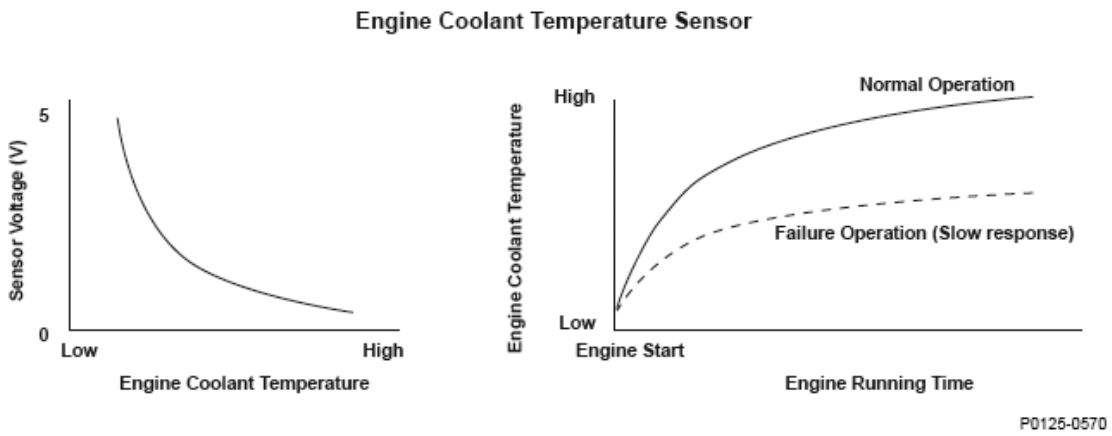

Fig. 53: Checking Continuity Between ECM Connector Terminals A17 And A18
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Go to step 22.

10. Disconnect the APP sensor 6P connector.
11. Check for continuity between ECM connector terminals A17 and A18.

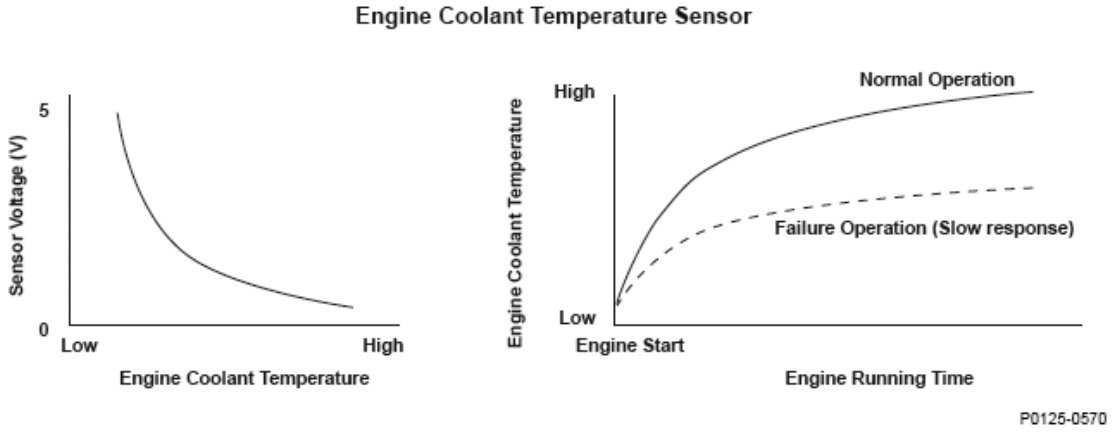

Fig. 54: Checking Continuity Between ECM Connector Terminals A17 And A18
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wires between ECM connector terminals A17 (APSA line) and A18 (APSB line), then go to step 14.

NO - Go to step 13.

12. Turn the ignition switch OFF.
13. Replace the accelerator pedal module (see **ACCELERATOR PEDAL MODULE REMOVAL/INSTALLATION**).

14. Reconnect all connectors.
15. Turn the ignition switch ON (II).
16. Reset the ECM with the HDS.
17. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
18. Turn the ignition switch OFF.
19. Turn the ignition switch ON (II).
20. Press the accelerator pedal to the floor.
21. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2138 indicated?

    YES - Check for poor connections or loose terminals at the APP sensor and the ECM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

22. Reconnect all connectors.
23. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
24. Turn the ignition switch OFF.
25. Turn the ignition switch ON (II).
26. Press the accelerator pedal to the floor.
27. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2138 indicated?

    YES - Check for poor connections or loose terminals at APP sensor A/B and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 24. If the ECM was substituted, go to step 1.

    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P2176: THROTTLE ACTUATOR CONTROL SYSTEM IDLE POSITION NOT LEARNED

CAUTION: Do not insert your fingers into the installed throttle body when you turn the ignition switch ON (II) or while the ignition switch is ON (II). If you do, you will seriously injure your fingers if the throttle valve is activated.

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P2135 is stored at the same time as DTC P2176, troubleshoot**

DTC P2135 first, then recheck for DTC P2176.

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch OFF.
4. Turn the ignition switch ON (II), and wait 10 seconds.
5. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2176 indicated?

   YES - Go to step 6.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM, then clean the throttle body (see **THROTTLE BODY CLEANING**).

6. Turn the ignition switch OFF.
7. Disconnect the air intake duct from the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
8. Turn the ignition switch ON (II).
9. Clear the DTC with the HDS.
10. Visually check the throttle valve operation while performing the ETCS TEST in the INSPECTION MENU with the HDS.

    Does the throttle valve move to its fully closed position?

    YES - Go to step 11.

    NO - Go to step 12.

11. Check for sludge or carbon on the throttle valve.

    Is there sludge or carbon on the throttle valve?

    YES - Clean the throttle body (see **THROTTLE BODY CLEANING**), then go to step 21 and recheck.

    NO - Go to step 18.

12. Turn the ignition switch OFF.
13. Disconnect the throttle body 6P connector.
14. Jump the SCS line with the HDS.
15. Disconnect ECM connector C (44P).
16. Connect throttle body 6P connector terminals No. 5 and No. 6 with a jumper wire.

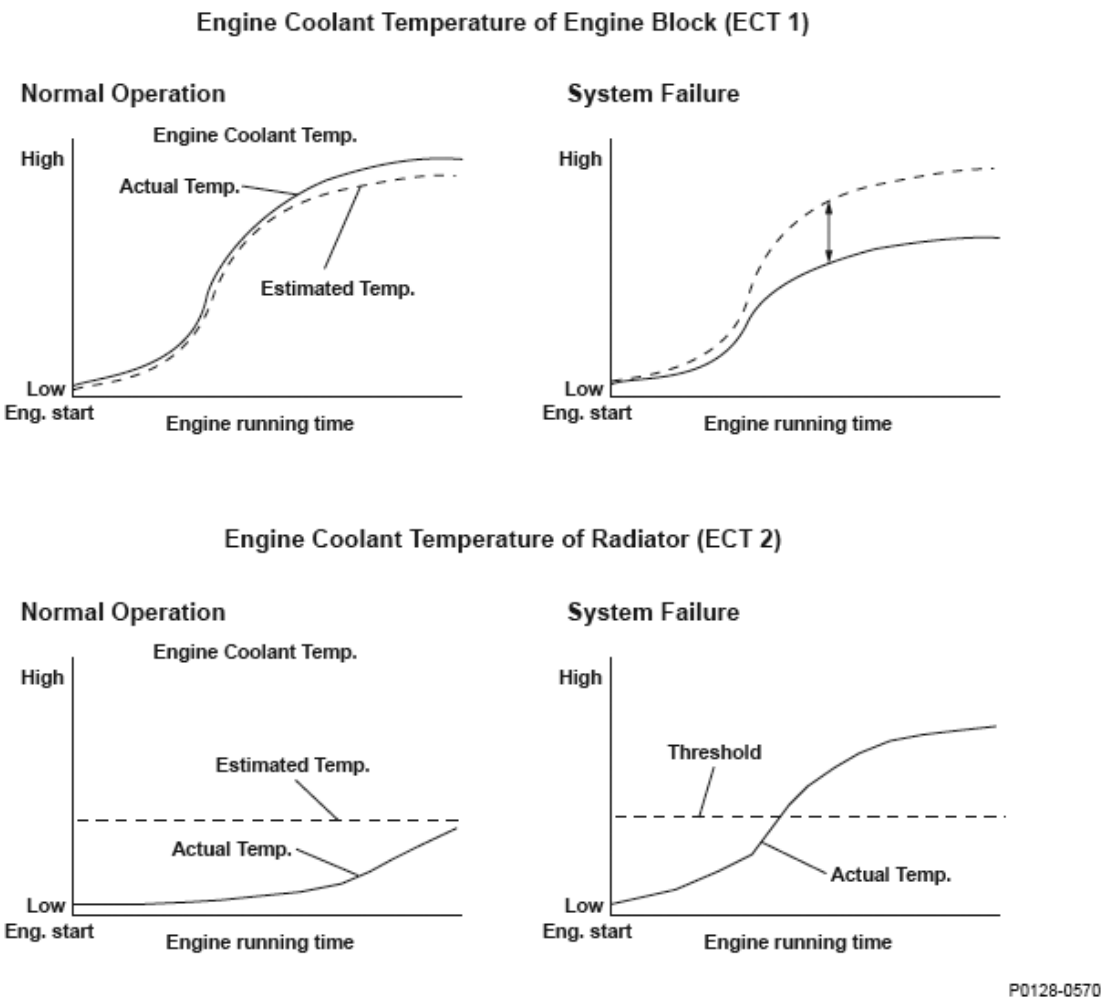

Fig. 55: Connecting Throttle Body 6P Connector Terminals No. 5 And 6 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Check for continuity between ECM connector terminals C3 and C4.

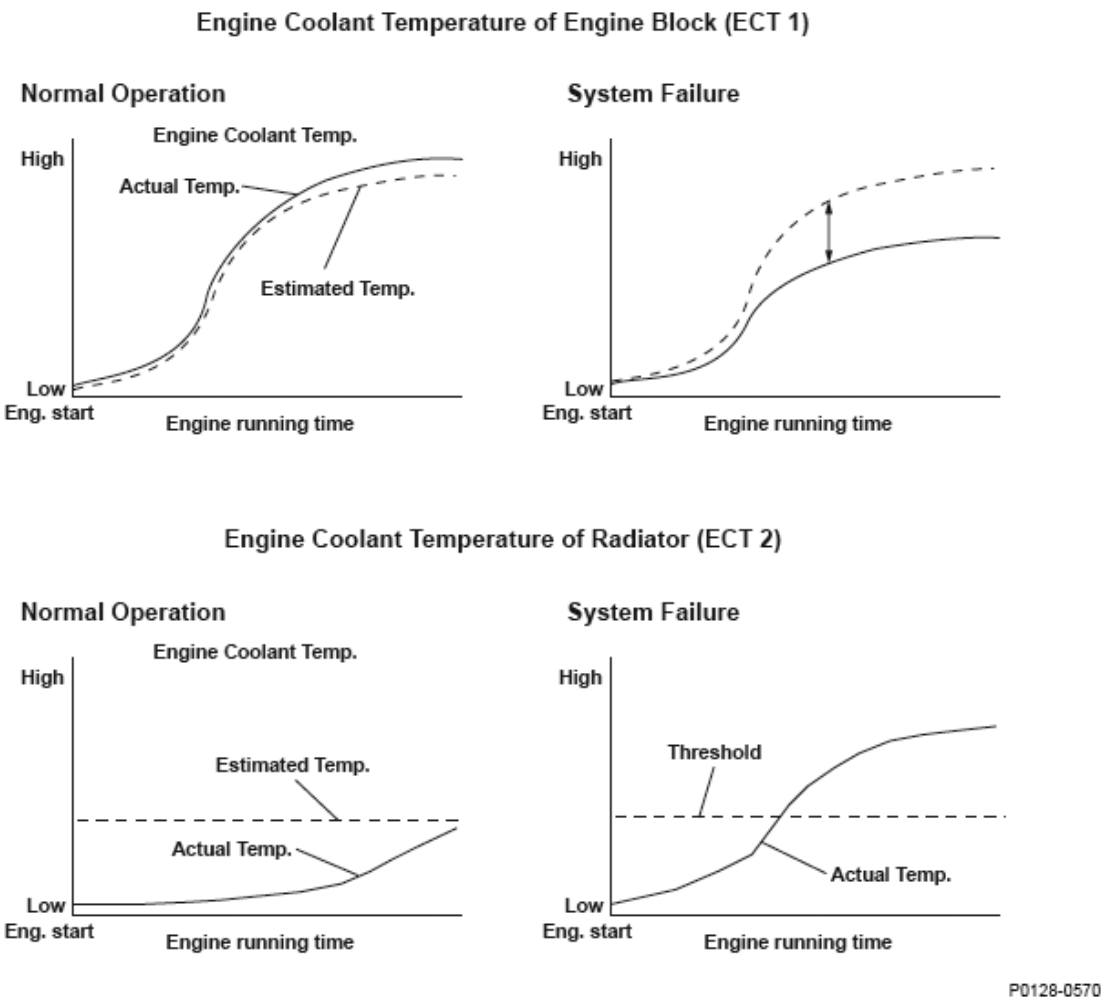

Fig. 56: Checking Continuity Between ECM Connector Terminals C3 And C4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 27.

NO - Repair open in the wires between the throttle body and the ECM (C3, C4), then go to step 20.

18. Turn the ignition switch OFF.
19. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
20. Reconnect all connectors.
21. Turn the ignition switch ON (II).
22. Reset the ECM with the HDS.
23. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
24. Turn the ignition switch OFF.
25. Turn the ignition switch ON (II), and wait 10 seconds.
26. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P2176 indicated?

YES - Check for poor connections or loose terminals at the throttle body and the ECM, then clean the throttle body (see **THROTTLE BODY CLEANING**), and go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

27. Reconnect all connectors.
28. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
29. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P2176 indicated?

YES - Check for poor connections or loose terminals at the throttle body and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then recheck. If the ECM was substituted, go to step 1.

NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

APP SENSOR SIGNAL INSPECTION

NOTE:

- **This procedure checks the APP sensor in its fully closed position. In any other position, the APP sensor stores DTCs which are covered in other troubleshooting procedures.**
- **Check for Temporary DTCs or DTCs with the HDS before doing this procedure. If any DTCs are indicated, troubleshoot them first, then do this procedure.**
- **Press the accelerator pedal several times, to check its operation. If it does not operate smoothly, check the pedal. If you find a problem, replace the accelerator pedal module (see ACCELERATOR PEDAL MODULE REMOVAL/INSTALLATION).**

1. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

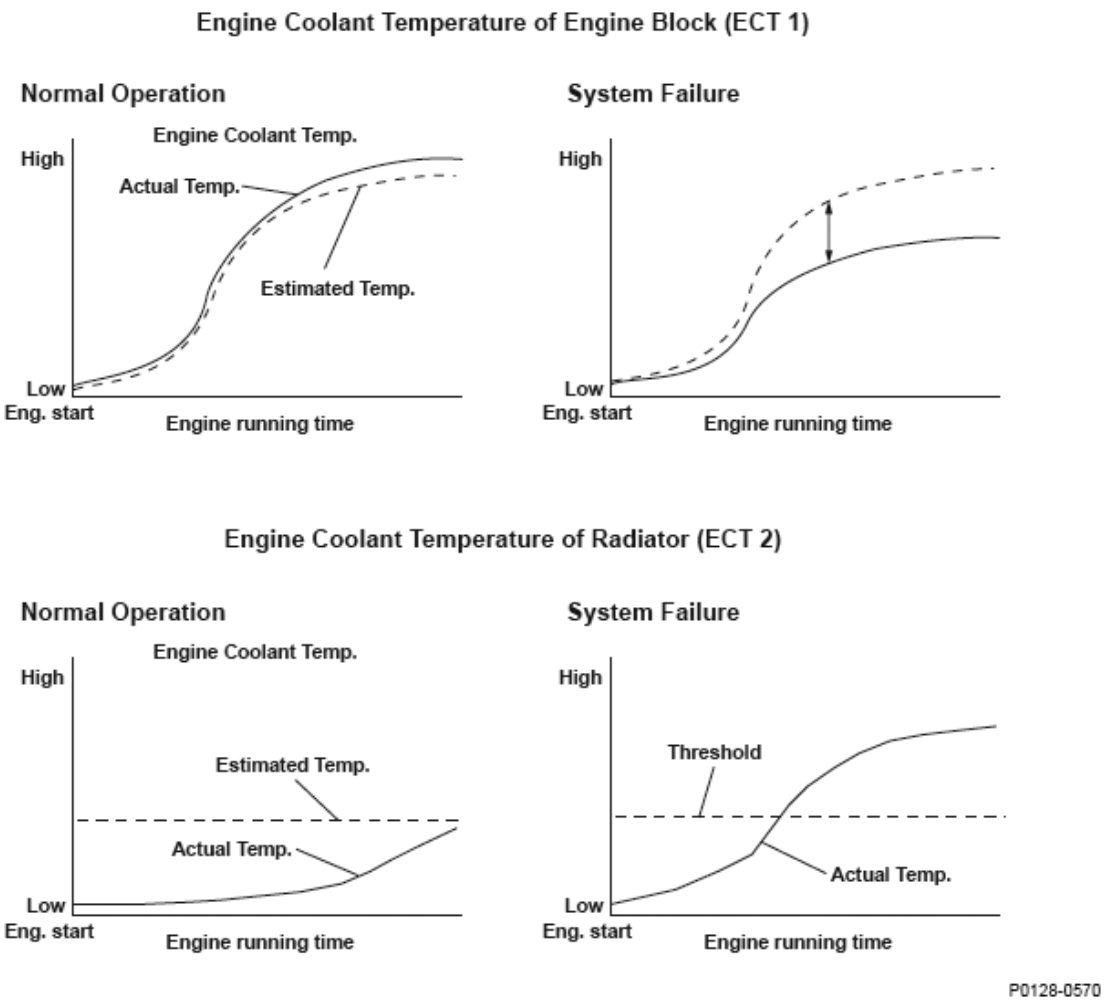

Fig. 57: Connecting HDS To DLC
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch ON (II).
3. Make sure the HDS communicates with the ECM. If it doesn't, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Make sure the accelerator pedal is not pressed, then check the APP SENSOR in the DATA LIST with the HDS.
   - If it is 0%, the APP sensor is OK.
   - If it is not 0%, update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 5.
5. Make sure the accelerator pedal is not pressed, then check the APP SENSOR in the DATA LIST with the HDS.
   - If it is 0%, the APP sensor is OK.
   - If it is not 0%, replace the accelerator pedal module (see **ACCELERATOR PEDAL MODULE REMOVAL/INSTALLATION**), then go to step 1.

ACCELERATOR PEDAL MODULE REMOVAL/INSTALLATION

REMOVAL

1. Disconnect the accelerator pedal module connector (A), then remove the nuts (B).

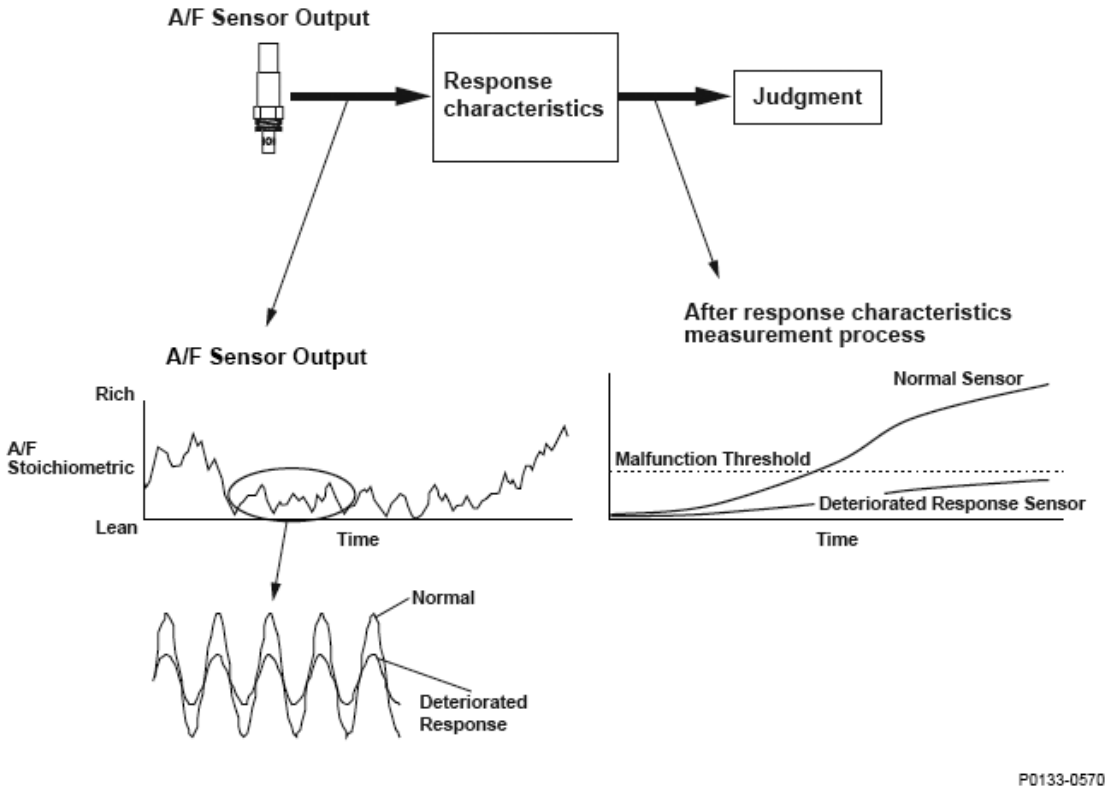

Fig. 58: Disconnecting Accelerator Pedal Module Connector (With Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Push the tab (C).
3. Pry the accelerator pedal module to right and left, and remove the accelerator pedal module (D).

NOTE:

- **The APP sensor is not available separately.**

  Do not disassemble the accelerator pedal module.

- **If the tab or tab receivers (E) are damaged, pull back the carpet, remove the nut (F), and replace the pedal stop (G).**
- **If the tabs (H) of the accelerator pedal module are damaged, replace the accelerator pedal module.**

INSTALLATION

1. Install the accelerator pedal module.

NOTE: Make sure the tab (A) is secure.

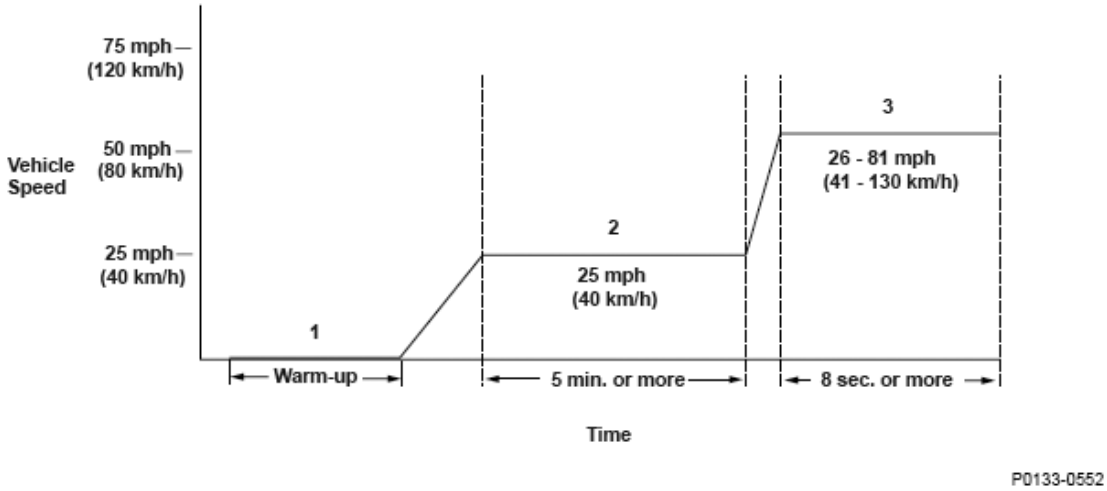

Fig. 59: Installing Accelerator Pedal Module
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the nuts (B), then connect the accelerator pedal module connector (C).

NOTE: Make sure that the accelerator pedal module is secure.

DTC TROUBLESHOOTING

DTC P0122: TP SENSOR A CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check TP SENSOR A in the DATA LIST with the HDS.

   Is there about 0.3 V or less?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM/PCM.

4. Check for Temporary DTCs or DTCs with the HDS.

   Are DTC P0122 and P0222 indicated at the same time?

   YES - Go to step 10.

   NO - Go to step 5.

5. Turn the ignition switch OFF.
6. Disconnect the throttle body 6P connector.
7. Jump the SCS line with the HDS.
8. Disconnect ECM/PCM connector C (44P).
9. Check for continuity between throttle body 6P connector terminal No. 1 and body ground.

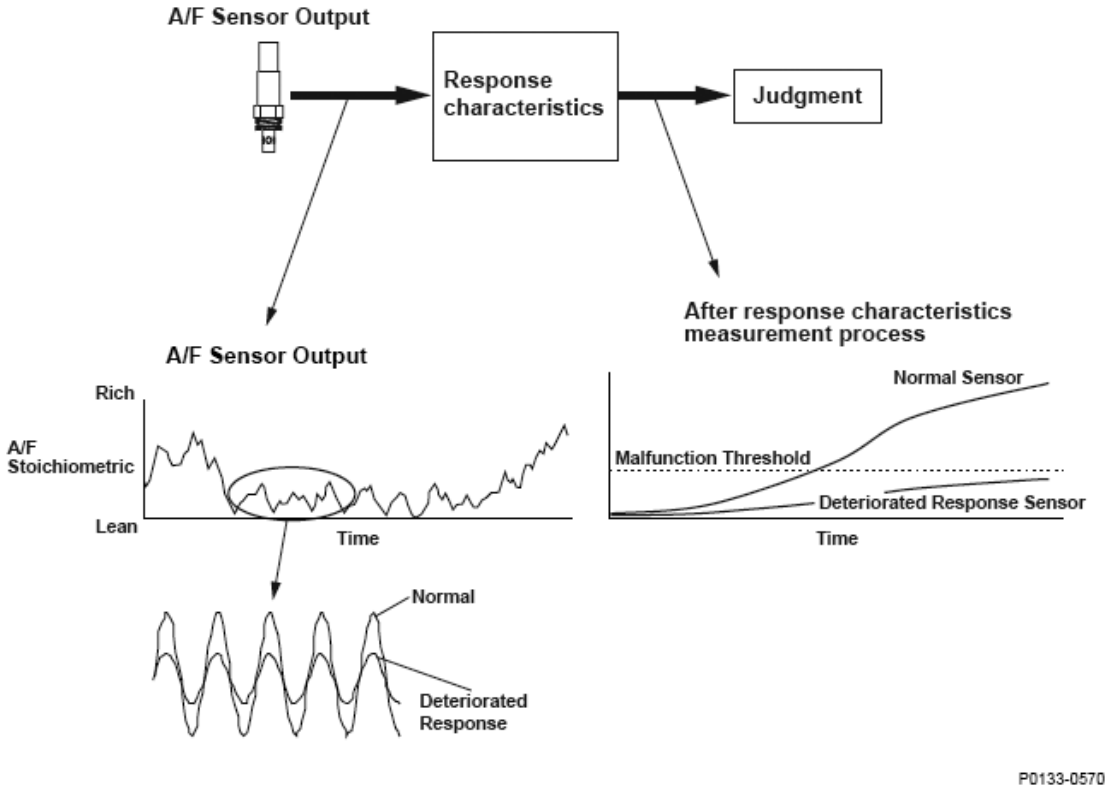

Fig. 2: Checking Continuity Between Throttle Body 6P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the throttle body and the ECM/PCM (C20), then go to step 18.

NO - Go to step 23.

10. Measure voltage between throttle body 6P connector terminal No. 2 and body ground.

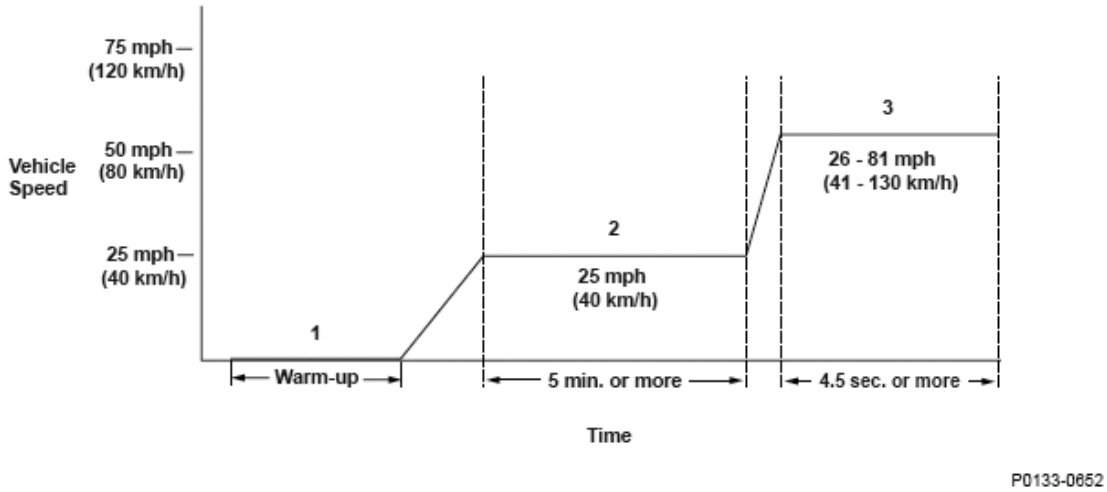

Fig. 3: Measuring Voltage Between Throttle Body 6P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 16.

NO - Go to step 23.

11. Turn the ignition switch OFF.
12. Jump the SCS line with the HDS.
13. Disconnect ECM/PCM connector C (44P).
14. Disconnect the throttle body 6P connector.
15. Check for continuity between ECM/PCM connector terminal C12 and throttle body 6P connector terminal No. 2.

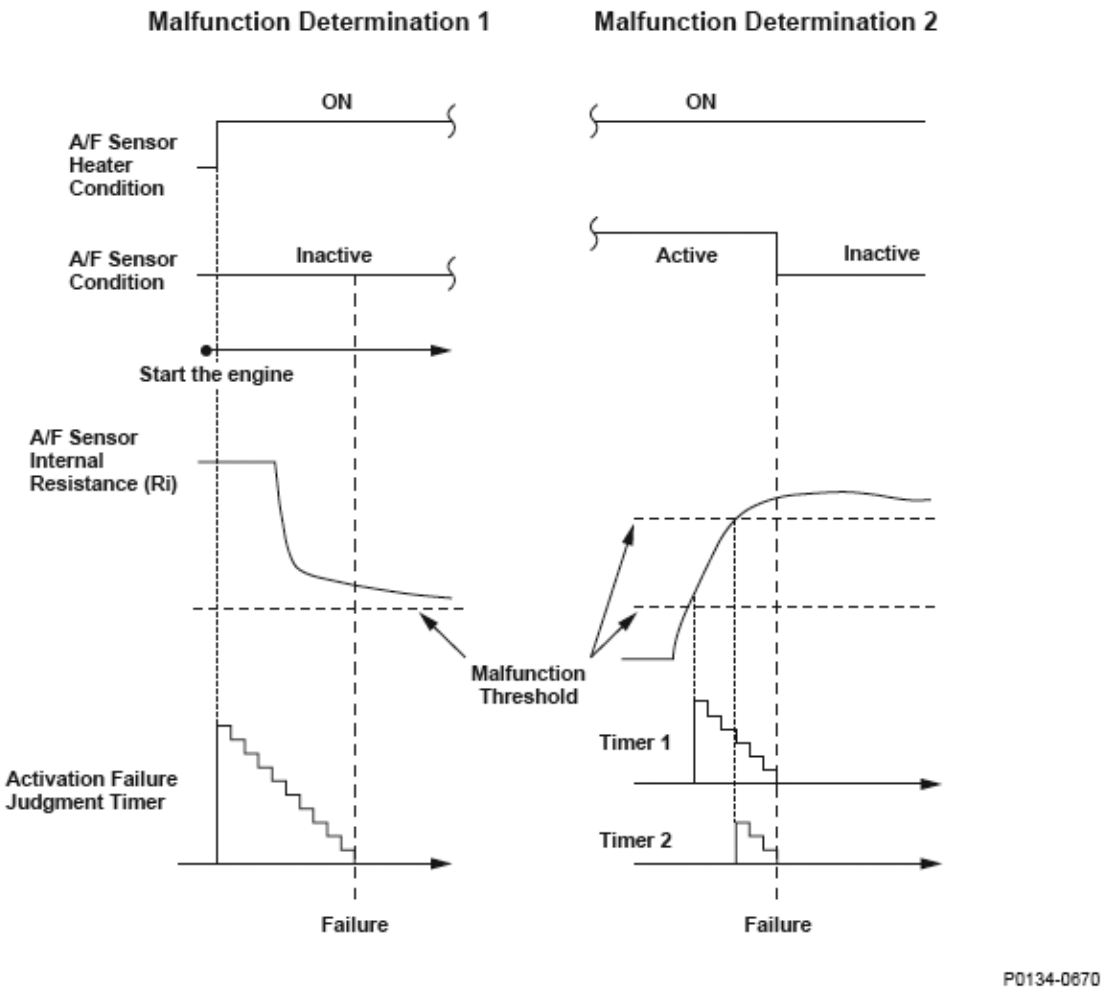

Fig. 4: Checking Continuity Between ECM/PCM Connector Terminals C12 And Throttle Body 6P Connector Terminal No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 23.

NO - Repair open in the wire between the throttle body and the ECM/PCM (C12), then go to step 18.

16. Turn the ignition switch OFF.
17. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
18. Reconnect all connectors.
19. Turn the ignition switch ON (II).
20. Reset the ECM/PCM with the HDS.
21. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
22. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0122 indicated?

YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM, then go

to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

23. Reconnect all connectors.
24. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
25. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0122 indicated?

    YES - Check for poor connections or loose terminals at TP sensor A and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P0123: TP SENSOR A CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check TP SENSOR A in the DATA LIST with the HDS.

   Is there about 4.8 V or more?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM/PCM.

4. Check for Temporary DTCs or DTCs with the HDS.

   Are DTC P0123 and P0223 indicated at the same time?

   YES - Go to step 13.

   NO - Go to step 5.

5. Turn the ignition switch OFF.
6. Disconnect the throttle body 6P connector.
7. Turn the ignition switch ON (II).

8. Measure voltage between throttle body 6P connector terminal No. 1 and body ground.

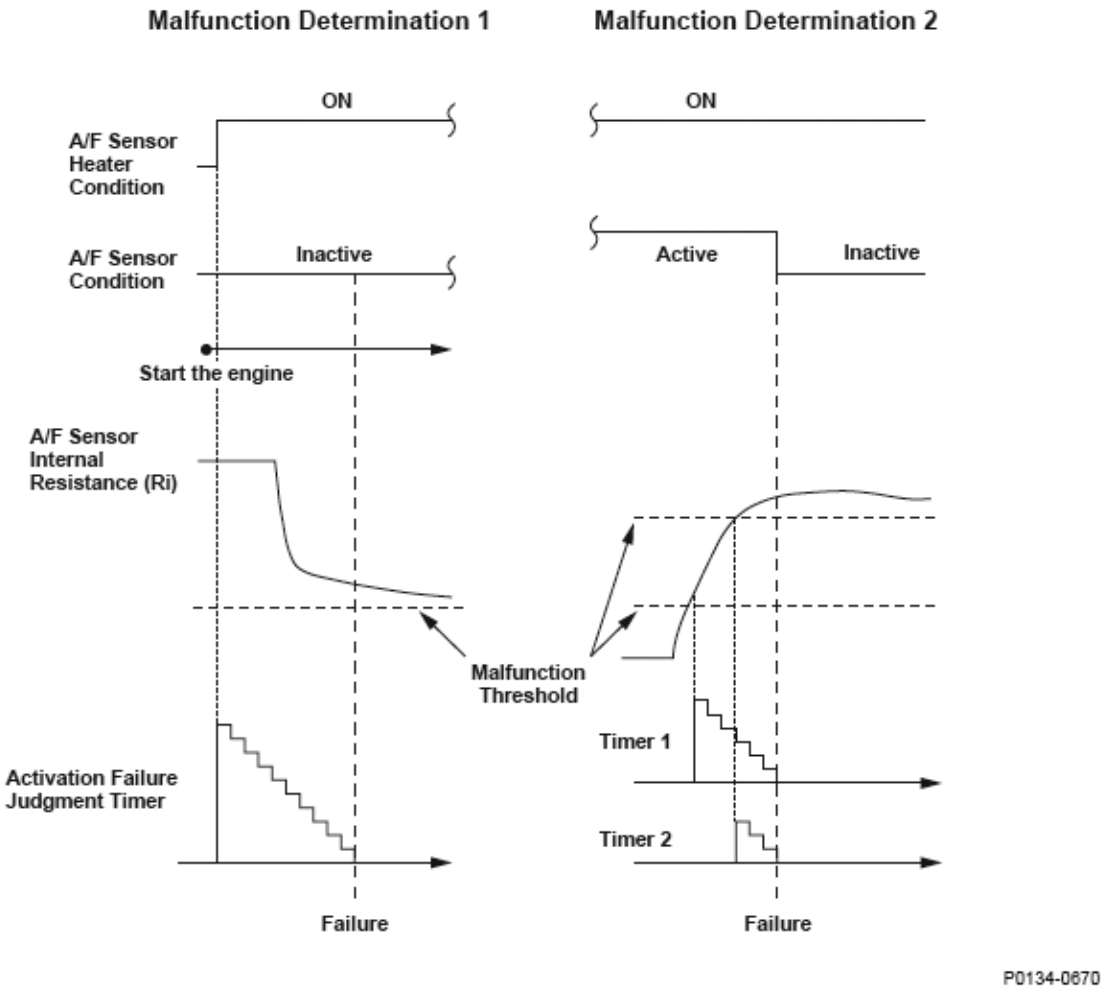

Fig. 5: Measuring Voltage Between Throttle Body 6P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 18.

NO - Go to step 9.

9. Turn the ignition switch OFF.
10. Jump the SCS line with the HDS.
11. Disconnect ECM/PCM connector C (44P).
12. Check for continuity between ECM/PCM connector terminal C20 and throttle body 6P connector terminal No. 1.

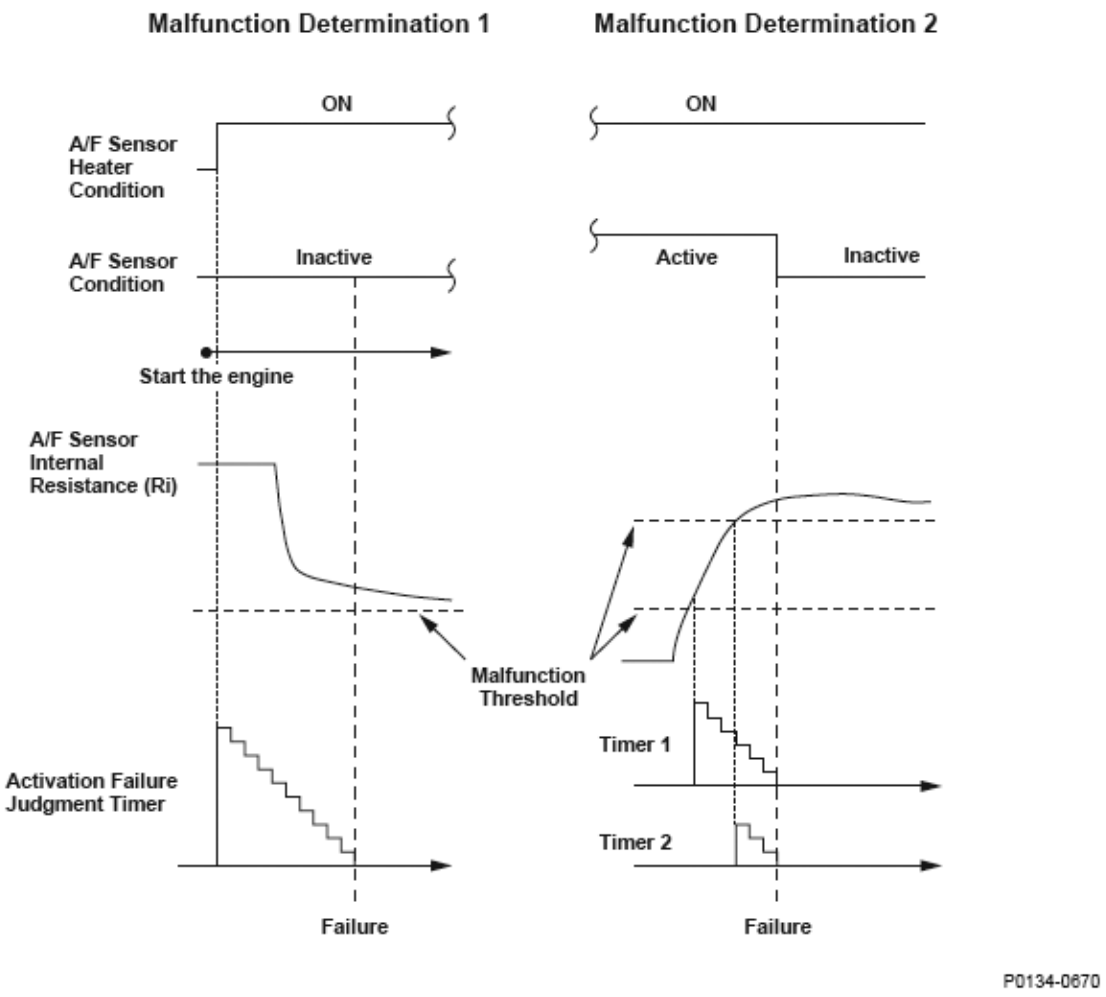

Fig. 6: Checking Continuity Between ECM/PCM Connector Terminal And Throttle Body 6P Connector Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the throttle body and the ECM/PCM (C20), then go to step 20.

13. Turn the ignition switch OFF.
14. Disconnect the throttle body 6P connector.
15. Jump the SCS line with the HDS.
16. Disconnect ECM/PCM connector C (44P).
17. Check for continuity between ECM/PCM connector terminal C39 and throttle body 6P connector terminal No. 4.

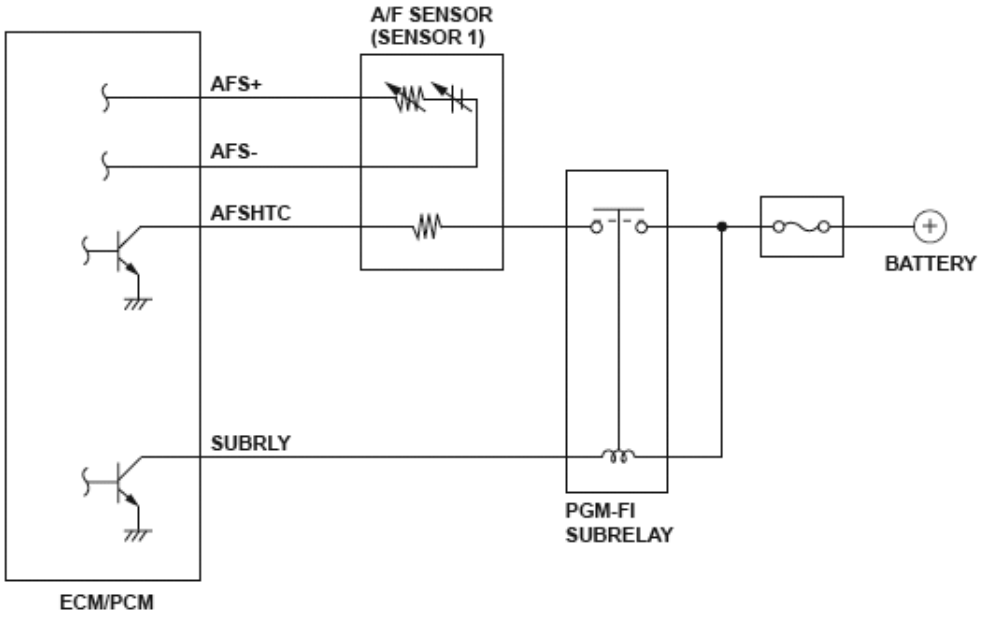

Fig. 7: Checking Continuity Between ECM/PCM Connector Terminal C39 And Throttle Body 6P Connector Terminal No. 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the throttle body and the ECM/PCM (C39), then go to step 20.

18. Turn the ignition switch OFF.
19. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
20. Reconnect all connectors.
21. Turn the ignition switch ON (II).
22. Reset the ECM/PCM with the HDS.
23. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
24. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0123 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

25. Reconnect all connectors.
26. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).

27. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0123 indicated?

    YES - Check for poor connections or loose terminals at TP sensor A and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P0222: TP SENSOR B CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check TP SENSOR B in the DATA LIST with the HDS.

   Is there about 0.3 V or less?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM/PCM.

4. Check for Temporary DTCs or DTCs with the HDS.

   Are DTC P0122 and P0222 indicated at the same time?

   YES - Go to step 10.

   NO - Go to step 5.

5. Turn the ignition switch OFF.
6. Disconnect the throttle body 6P connector.
7. Jump the SCS line with the HDS.
8. Disconnect ECM/PCM connector C (44P).
9. Check for continuity between throttle body 6P connector terminal No. 3 and body ground.

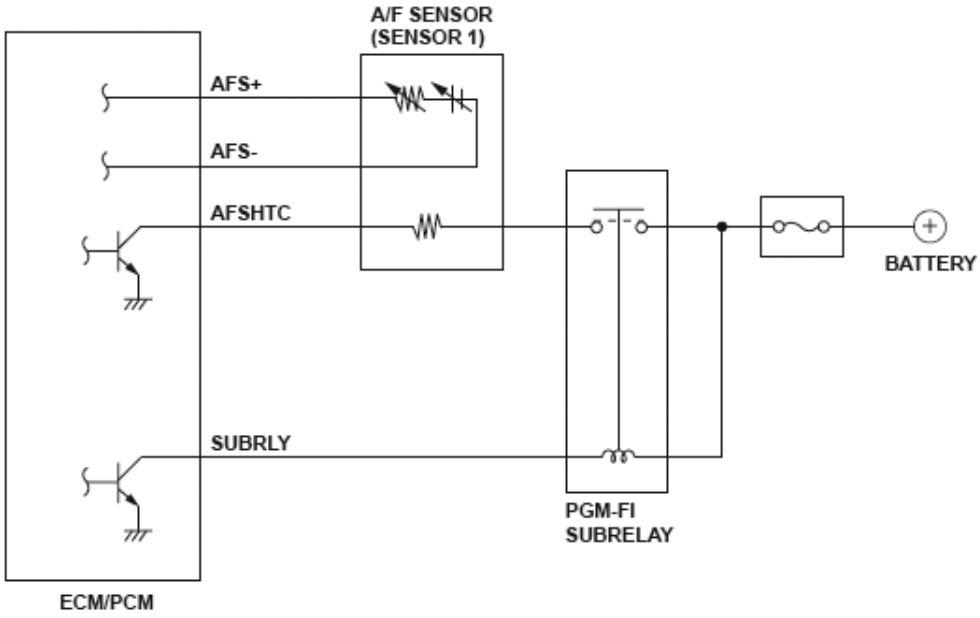

Fig. 8: Checking Continuity Between Throttle Body 6P Connector Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the throttle body and the ECM/PCM (C21), then go to step 18.

NO - Go to step 23.

10. Measure voltage between throttle body 6P connector terminal No. 2 and body ground.

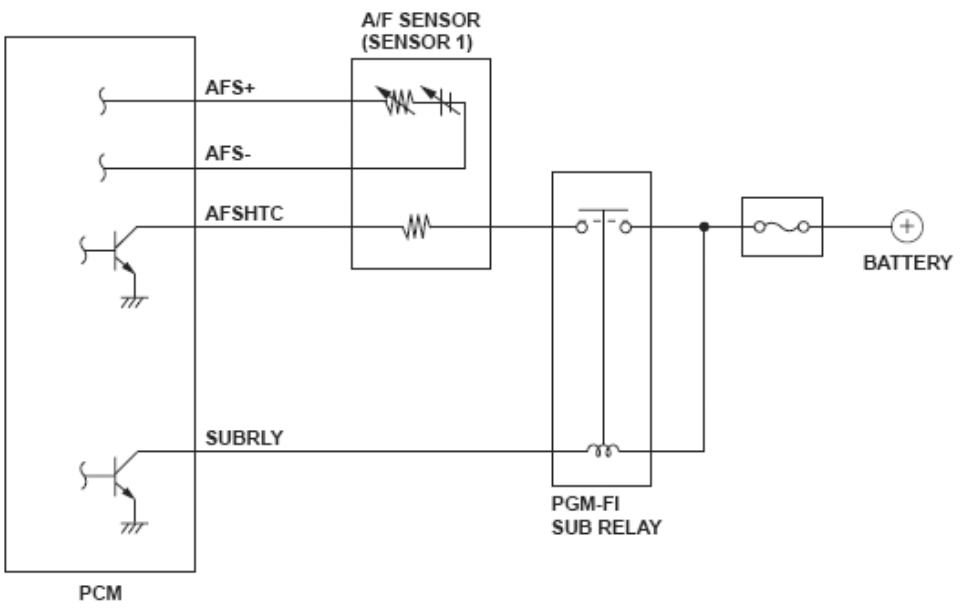

Fig. 9: Measuring Voltage Between Throttle Body 6P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 16.

NO - Go to step 11.

11. Turn the ignition switch OFF.
12. Jump the SCS line with the HDS.
13. Disconnect ECM/PCM connector C (44P).
14. Disconnect the throttle body 6P connector.
15. Check for continuity between ECM/PCM connector terminal C12 and throttle body 6P connector terminal No. 2.

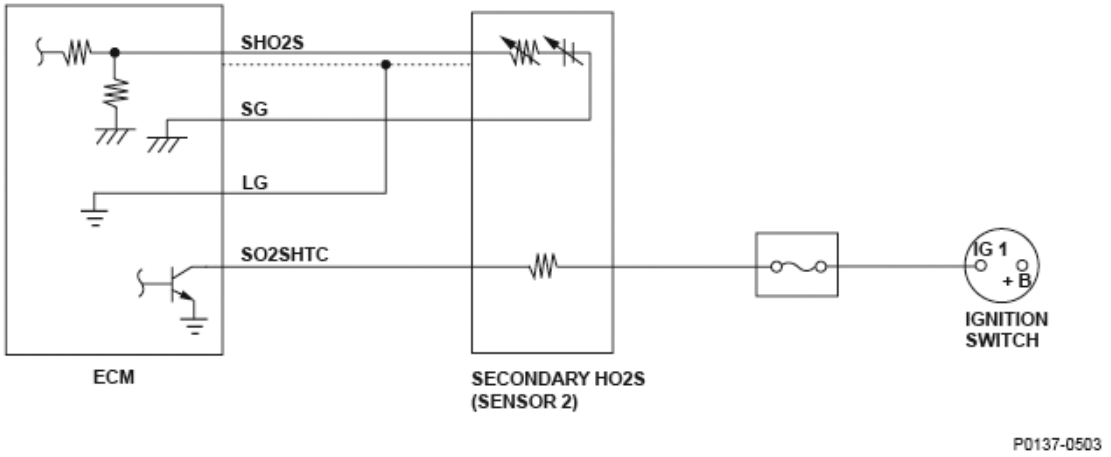

Fig. 10: Checking Continuity Between ECM/PCM Connector Terminal C12 And Throttle Body 6P Connector No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 23.

NO - Repair open in the wire between the throttle body and the ECM/PCM (C12), then go to step 18.

16. Turn the ignition switch OFF.
17. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
18. Reconnect all connectors.
19. Turn the ignition switch ON (II).
20. Reset the ECM/PCM with the HDS.
21. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
22. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0222 indicated?

YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

23. Reconnect all connectors.
24. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
25. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0222 indicated?

YES - Check for poor connections or loose terminals at TP sensor A and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P0223: TP SENSOR B CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check TP SENSOR B in the DATA LIST with the HDS.

Is there about 4.8 V or more?

YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM/PCM.

4. Check for Temporary DTCs or DTCs with the HDS.

Are DTC P0123 and P0223 indicated at the same time?

YES - Go to step 13.

NO - Go to step 5.

5. Turn the ignition switch OFF.

6. Disconnect the throttle body 6P connector.
7. Turn the ignition switch ON (II).
8. Measure voltage between throttle body 6P connector terminal No. 3 and body ground.

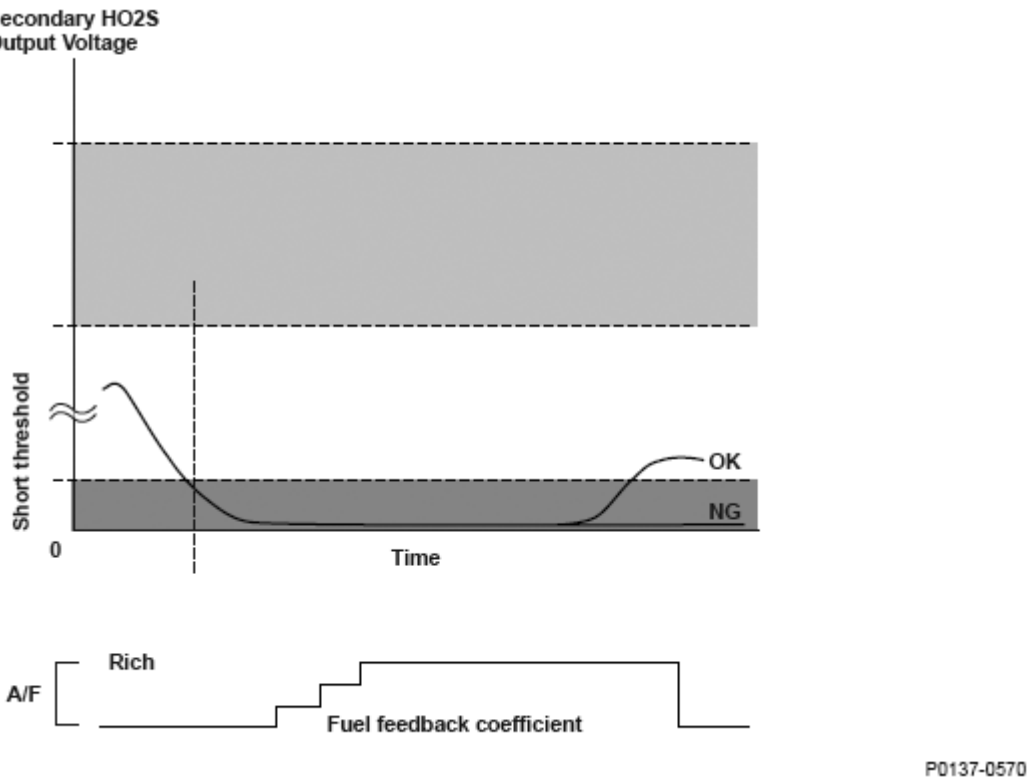

Fig. 11: Measuring Voltage Between Throttle Body 6P Connector Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 18.

NO - Go to step 9.

9. Turn the ignition switch OFF.
10. Jump the SCS line with the HDS.
11. Disconnect ECM/PCM connector C (44P).
12. Check for continuity between ECM/PCM connector terminal C21 and throttle body 6P connector terminal No. 3.

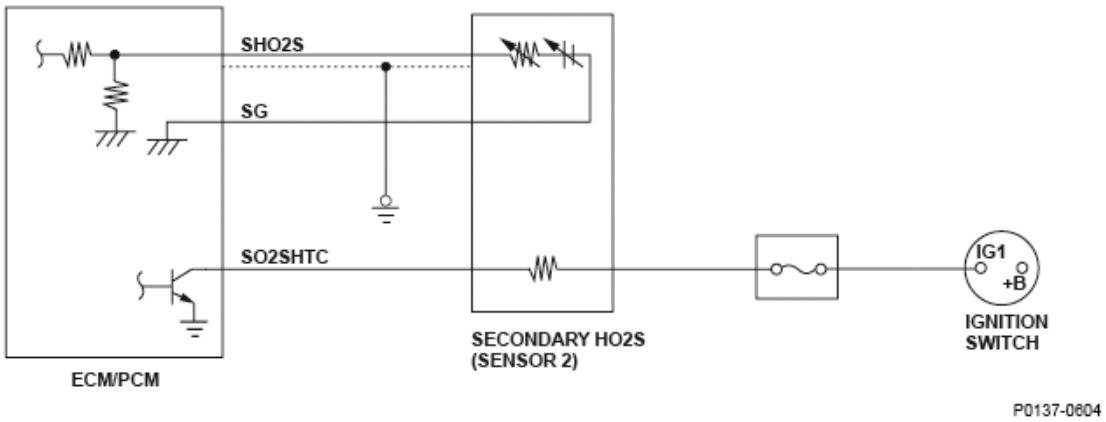

Fig. 12: Checking Continuity Between ECM/PCM Connector Terminal C21 And Throttle Body 6P Connector Terminal No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the throttle body and the ECM/PCM (C21), then go to step 20.

13. Turn the ignition switch OFF.
14. Disconnect the throttle body 6P connector.
15. Jump the SCS line with the HDS.
16. Disconnect ECM/PCM connector C (44P).
17. Check for continuity between ECM/PCM connector terminal C39 and throttle body 6P connector terminal No. 4.

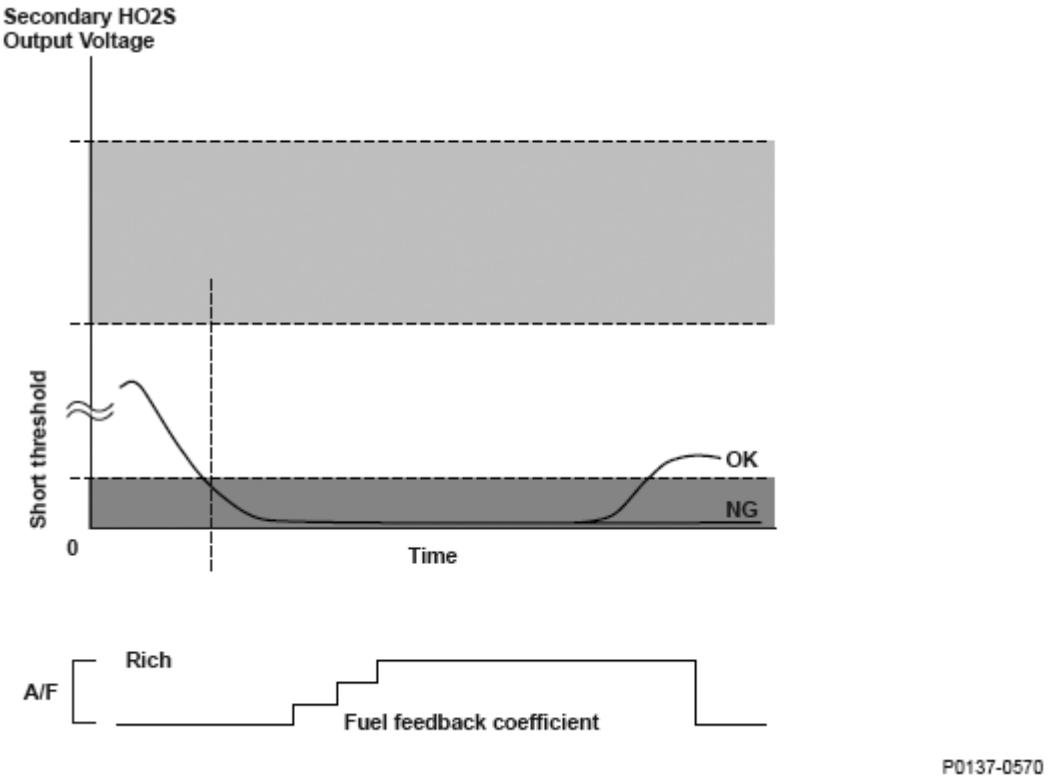

Fig. 13: Checking Continuity Between ECM/PCM Connector Terminal C39 And Throttle Body 6P Connector Terminal No. 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the throttle body and the ECM/PCM (C39), then go to step 20.

18. Turn the ignition switch OFF.
19. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
20. Reconnect all connectors.
21. Turn the ignition switch ON (II).
22. Reset the ECM/PCM with the HDS.
23. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
24. Check for Temporary DTCs or DTCs with the HDS.

    Is DIG P0223 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

25. Reconnect all connectors.

26. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
27. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0223 indicated?

    YES - Check for poor connections or loose terminals at TP sensor B and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P1658: ELECTRONIC THROTTLE CONTROL SYSTEM (ETCS) CONTROL RELAY ON MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Do the ETCS TEST in the INSPECTION MENU with the HDS.

    Is the RELAY circuit OK?

    YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the ETCS control relay and the ECM/PCM.

    NO - Go to step 3.

3. Turn the ignition switch OFF.
4. Remove the ETCS control relay (F) from the under-hood fuse/relay box.

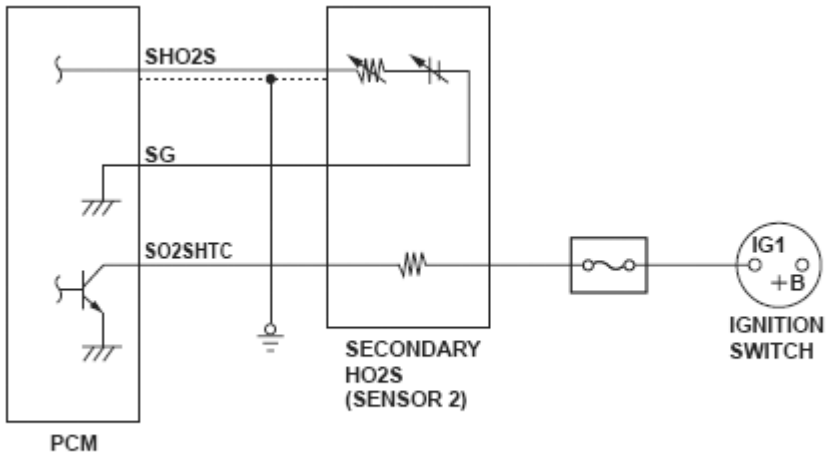

Fig. 14: Removing ETCS Control Relay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Test the ETCS control relay (see **POWER RELAY TEST**).

   Is the ETCS control relay OK?

   YES - Go to step 6.

   NO - Replace the ETCS control relay, then go to step 13.

6. Jump the SCS line with the HDS.
7. Disconnect ECM/PCM connector A (44P).
8. Check for continuity between ECM/PCM connector terminal A20 and body ground.

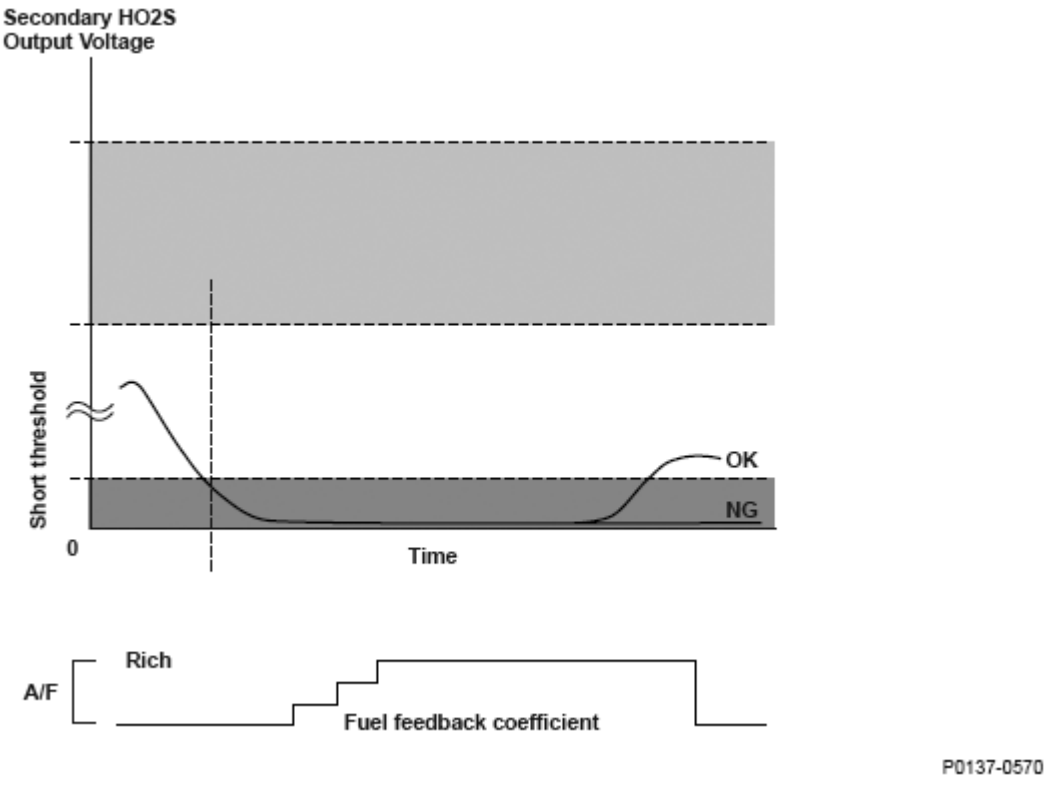

Fig. 15: Checking Continuity Between ECM/PCM Connector Terminal A20 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (A20) and the ETCS control relay, then go to step 13.

NO - Go to step 9.

9. Disconnect ECM/PCM connector C (44P).
10. Turn the ignition switch ON (II).

11. Measure voltage between ECM/PCM connector terminal C1 and body ground.

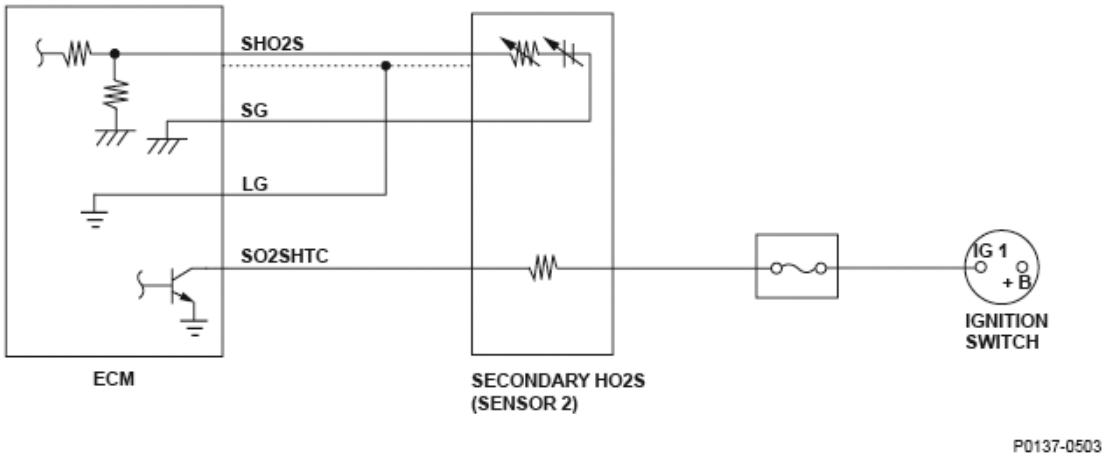

Fig. 16: Measuring Voltage Between ECM/PCM Connector Terminal C1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Repair short to power in the wire between the ECM/PCM (CD and the ETCS control relay, then go to step 12.

NO - Go to step 18.

12. Turn the ignition switch OFF.
13. Reconnect all connectors.
14. Turn the ignition switch ON (II).
15. Reset the ECM/PCM with the HDS.
16. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
17. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P1658 indicated?

YES - Check for poor connections or loose terminals at the ETCS control relay and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

18. Turn the ignition switch OFF.
19. Reconnect all connectors.
20. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
21. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P1658 indicated?

YES - Check for poor connections or loose terminals at the ETCS control relay and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P1659: ELECTRONIC THROTTLE CONTROL SYSTEM (ETCS) CONTROL RELAY OFF MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P1659 indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the ETCS control relay and the ECM/PCM.

4. Turn the ignition switch OFF.
5. Check the No. 21 DBW (THROTTLE ACTUATOR CONTROL) (15 A) fuse in the under-hood fuse/relay box.

   Is the fuse OK?

   YES - Go to step 6.

   NO - Go to step 17.

6. Remove the ETCS control relay (F) from the under-hood fuse/relay box.

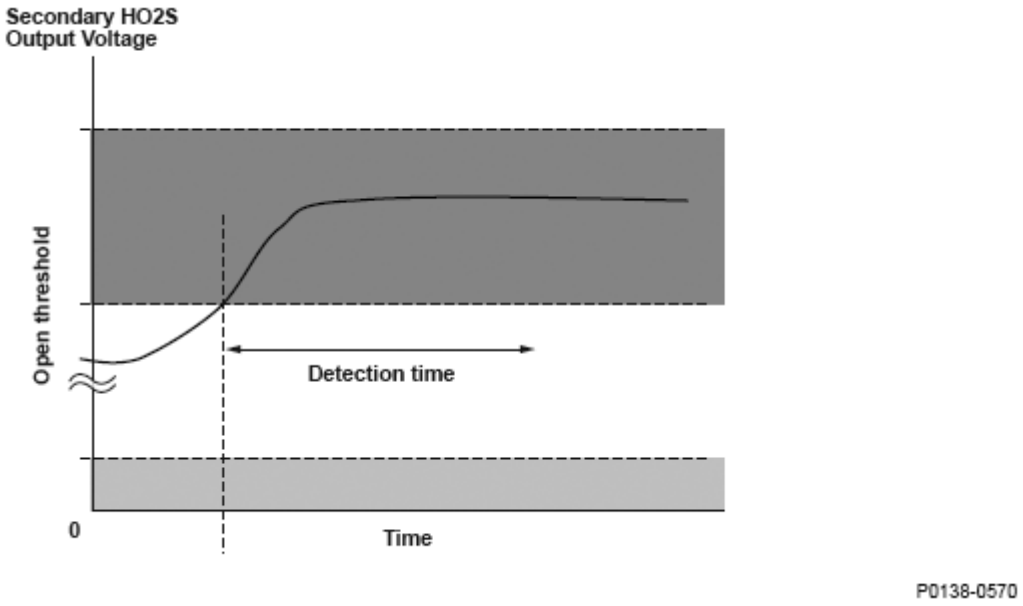

Fig. 17: Removing ETCS Control Relay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Test the ETCS control relay (see **POWER RELAY TEST**).

   Is the ETCS control relay OK?

   YES - Go to step 8.

   NO - Replace the ETCS control relay, then go to step 23.

8. Turn the ignition switch ON (II).
9. Measure voltage between ETCS control relay 4P connector terminal No. 4 and body ground.

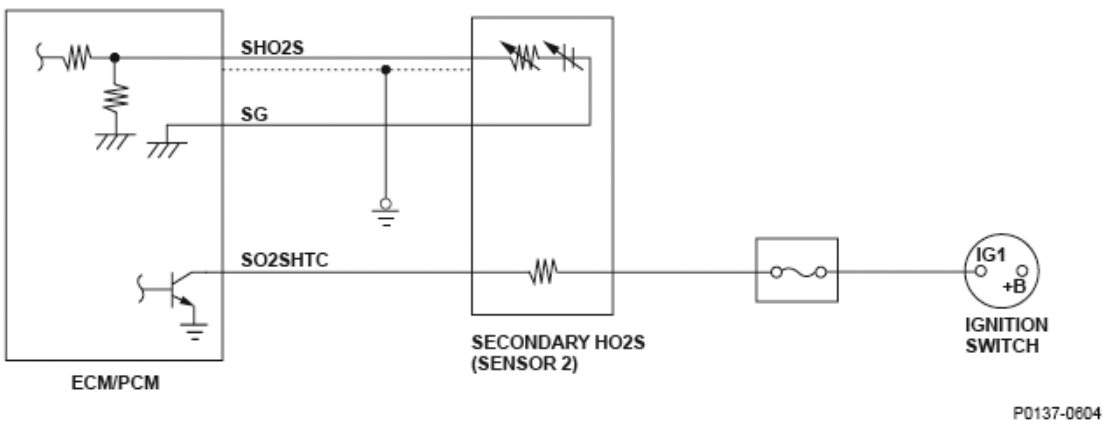

Fig. 18: Measuring Voltage Between ETCS Control Relay 4P Connector Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 10.

NO - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**), then go to step 23.

10. Measure voltage between ETCS control relay 4P connector terminal No. 1 and body ground.

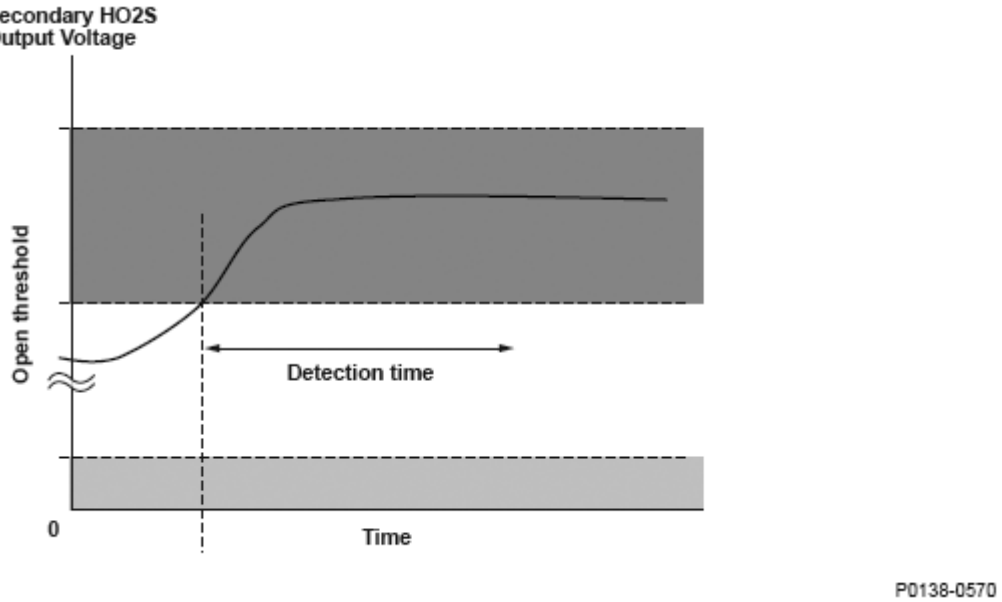

Fig. 19: Measuring Voltage Between ETCS Control Relay 4P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 11.

NO - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**), then go to step 22.

11. Turn the ignition switch OFF.
12. Jump the SCS line with the HDS.
13. Disconnect ECM/PCM connector C (44P).
14. Check for continuity between ETCS control relay 4P connector terminal No. 2 and ECM/PCM connector terminal C1.

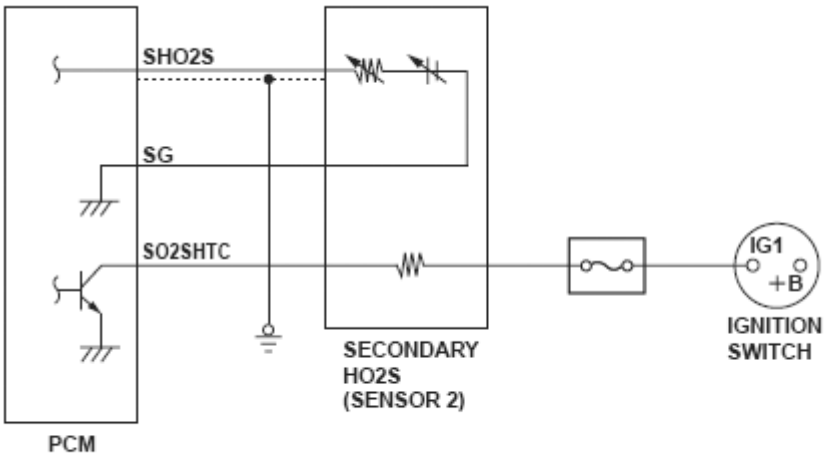

Fig. 20: Checking Continuity Between ETCS Control Relay 4P Connector Terminal No. 2 And ECM/PCM Connector Terminal C1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 15.

NO - Repair open in the wire between the ECM/PCM (CD and the ETCS control relay, then go to step 23.

15. Disconnect ECM/PCM connector A (44P).
16. Check for continuity between ETCS control relay 4P connector terminal No. 3 and ECM/PCM connector terminal A20.

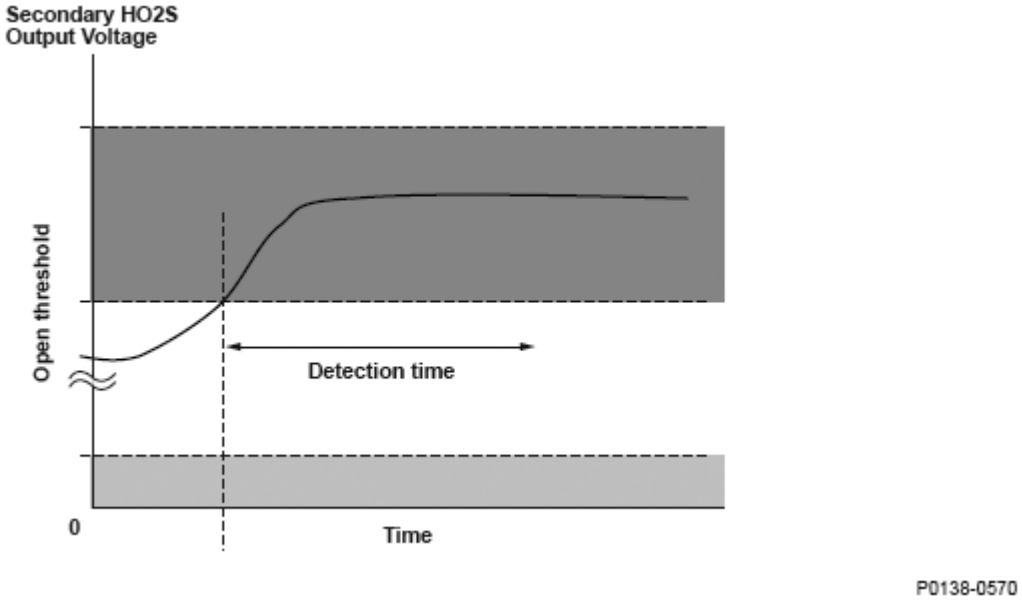

Fig. 21: Checking Continuity Between ETCS Control Relay 4P Connector Terminal No. 3 And ECM/PCM Connector Terminal A20
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 28.

NO - Repair open in the wire between the ECM/PCM (A20) and the ETCS control relay, then go to step 23.

17. Remove the ETCS control relay (F) from the under-hood fuse/relay box.

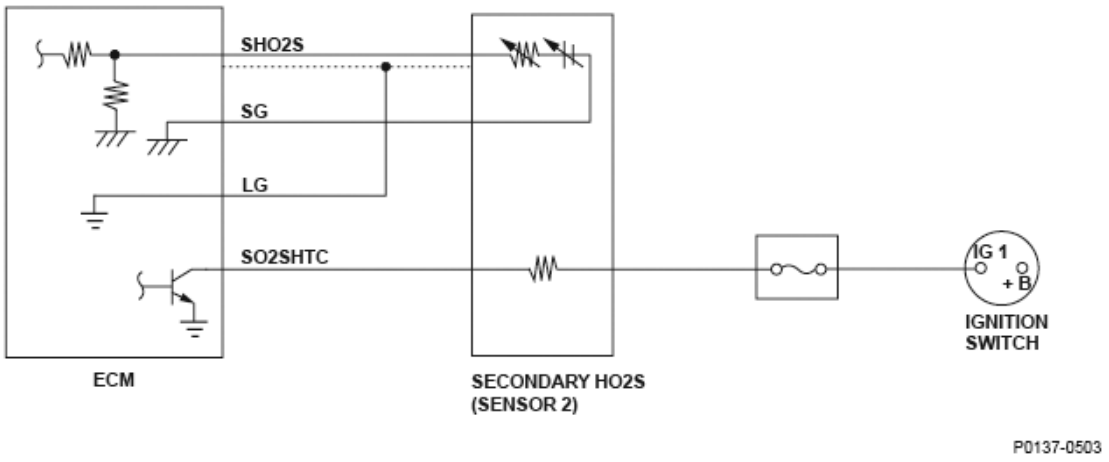

Fig. 22: Removing ETCS Control Relay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

18. Jump the SCS line with the HDS.
19. Disconnect ECM/PCM connector C (44P).
20. Check for continuity between ECM/PCM connector terminal C1 and body ground.

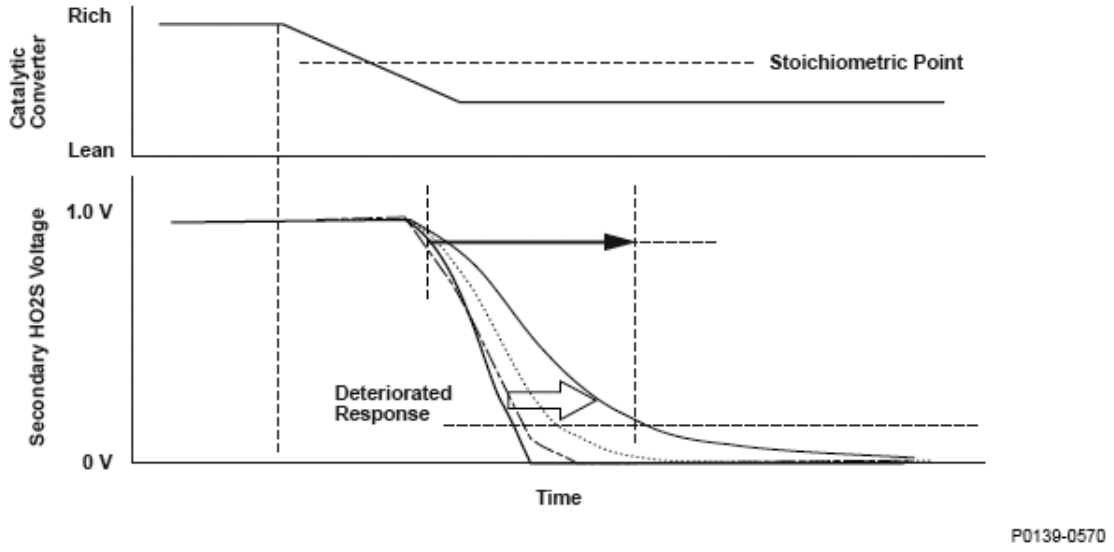

Fig. 23: Checking Continuity Between ECM/PCM Connector Terminal C1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (CD and the ETCS control relay, then go to step 23.

NO - Go to step 21.

21. Check for continuity between ETCS control relay 4P connector terminal No. 1 and body ground.

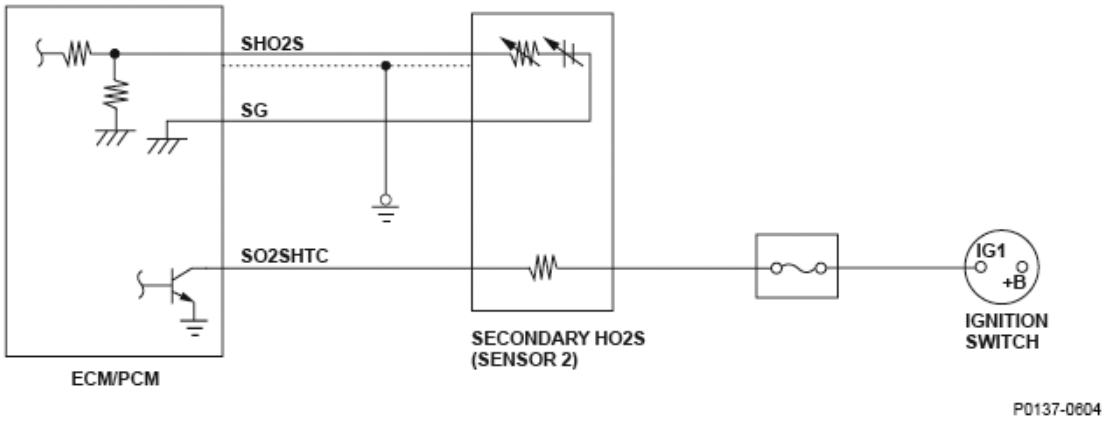

Fig. 24: Checking Continuity Between ETCS Control Relay 4P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**), then go to step 23.

NO - Go to step 28.

22. Turn the ignition switch OFF.
23. Reconnect all connectors.
24. Turn the ignition switch ON (II).
25. Reset the ECM/PCM with the HDS.
26. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
27. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P1659 indicated?

YES - Check for poor connections or loose terminals at the ETCS control relay and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

28. Reconnect all connectors.
29. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).

30. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1659 indicated?

    YES - Check for poor connections or loose terminals at the ETCS control relay and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P1683: THROTTLE VALVE DEFAULT POSITION SPRING PERFORMANCE PROBLEM

CAUTION: Do not insert your fingers into the installed throttle body when you turn the ignition switch ON (II) or while the ignition switch is ON (II). If you do, you will seriously injure your fingers if the throttle valve is activated.

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
4. Turn the ignition switch OFF, and wait 10 seconds.
5. Turn the ignition switch ON (II).
6. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P1683 indicated?

   YES - Go to step 7.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM/PCM.

7. Turn the ignition switch OFF.
8. Disconnect the intake air duct from the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
9. Push the throttle valve closed as shown.

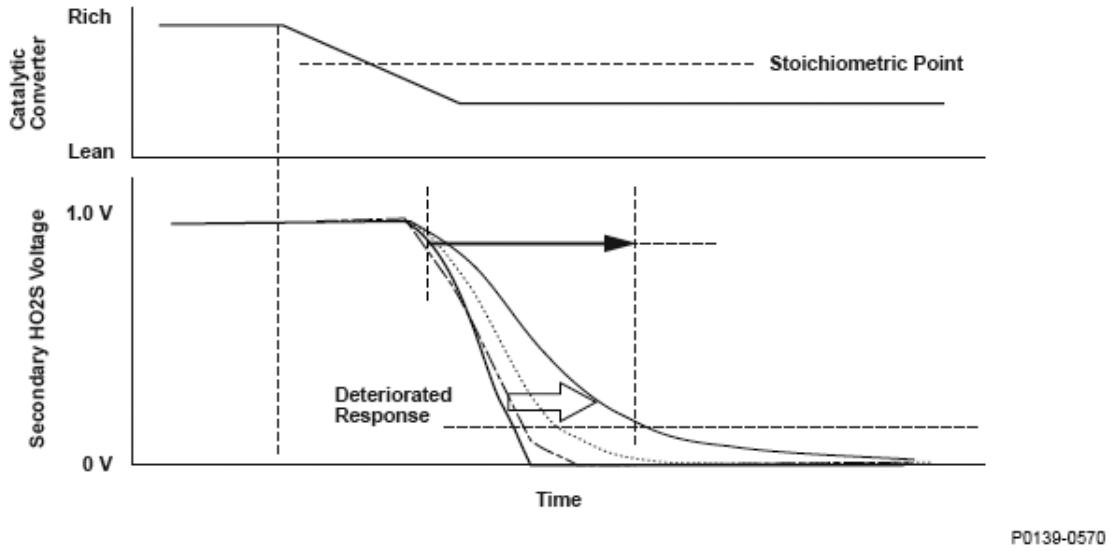

Fig. 25: Pushing Throttle Valve Closed
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Release the throttle valve.

    Does the throttle valve return?

    YES - Clean the throttle body (see **THROTTLE BODY CLEANING**), then go to step 12 and recheck. If DTC P1683 is indicated, go to step 11.

    NO - Go to step 11.

11. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
12. Turn the ignition switch ON (II).
13. Reset the ECM/PCM with the HDS.
14. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
15. Turn the ignition switch OFF, and wait 10 seconds.
16. Turn the ignition switch ON (II).
17. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1683 indicated?

    YES - If the throttle body was cleaned, check for poor connections or loose terminals at the throttle body and the ECM/PCM, then replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**), and recheck.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P1684: THROTTLE VALVE RETURN SPRING PERFORMANCE PROBLEM

CAUTION: Do not insert your fingers into the installed throttle body when you turn the ignition switch ON (II) or while the ignition switch is ON (II). If you

do, you will seriously injure your fingers if the throttle valve is activated.

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.
4. Turn the ignition switch OFF, and wait 10 seconds.
5. Turn the ignition switch ON (II).
6. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P1684 indicated?

   YES - Go to step 7.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM/PCM.

7. Turn the ignition switch OFF.
8. Disconnect the intake air duct from the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
9. Push the throttle valve open as shown.

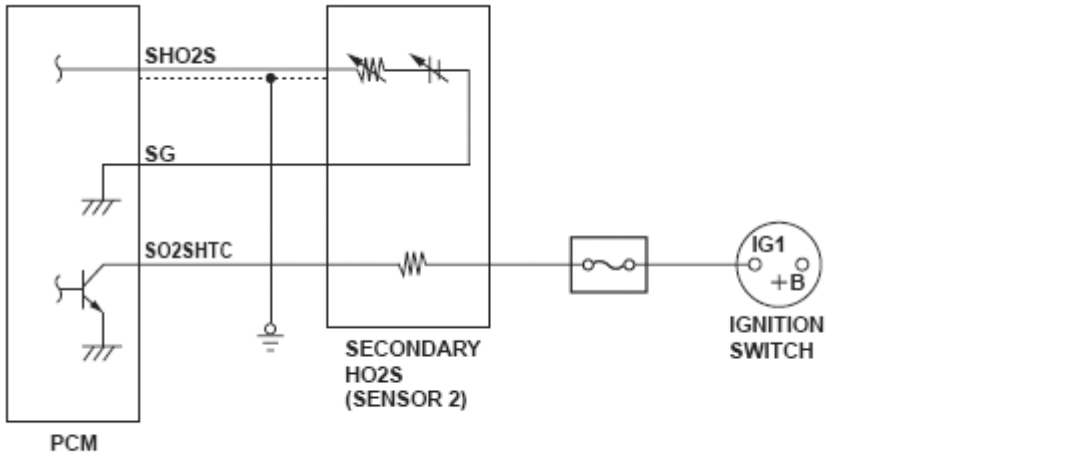

Fig. 26: Pushing Throttle Valve Open
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Release the throttle valve.

    Does the throttle valve return?

YES - Clean the throttle body (see **THROTTLE BODY CLEANING**), then go to step 12 and recheck. If DTC P1684 is indicated, go to step 11.

NO - Go to step 11.

11. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
12. Turn the ignition switch ON (II).
13. Reset the ECM/PCM with the HDS.
14. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
15. Turn the ignition switch OFF, and wait 10 seconds.
16. Turn the ignition switch ON (II).
17. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P1684 indicated?

YES - If the throttle body was cleaned, check for poor connections or loose terminals at the throttle body and the ECM/PCM, then replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**), and recheck.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P2101: ELECTRONIC THROTTLE CONTROL SYSTEM (ETCS) MALFUNCTION

CAUTION: Do not insert your fingers into the installed throttle body when you turn the ignition switch ON (II) or while the ignition switch is ON (II). If you do, you will seriously injure your fingers if the throttle valve is activated.

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Do the ETCS TEST in the INSPECTION MENU with the HDS.
4. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P2101 indicated?

YES - Go to step 7.

NO - Go to step 5.

5. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
   - ENGINE SPEED
   - VSS

- APP SENSOR

6. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2101 indicated?

   YES - Go to step 7.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM/PCM, then clean the throttle body (see **THROTTLE BODY CLEANING**).

7. Turn the ignition switch OFF.
8. Disconnect the intake air duct from the throttle body (see **THROTTLE BODY CLEANING**).
9. Turn the ignition switch ON (II).
10. Clear the DTC with the HDS.
11. Do the ETCS TEST in the INSPECTION MENU with the HDS.
12. Visually check the throttle valve operation.

    Does the throttle valve operate smoothly?

    YES - Clean the throttle body (see **THROTTLE BODY CLEANING**), then go to step 22 and recheck. If DTC P2101 is indicated, go to step 19.

    NO - Go to step 13.

13. Turn the ignition switch OFF.
14. Disconnect the throttle body 6P connector.
15. Jump the SCS line with the HDS.
16. Disconnect ECM/PCM connector C (44P).
17. Connect throttle body 6P connector terminals No. 5 and No. 6 with a jumper wire.

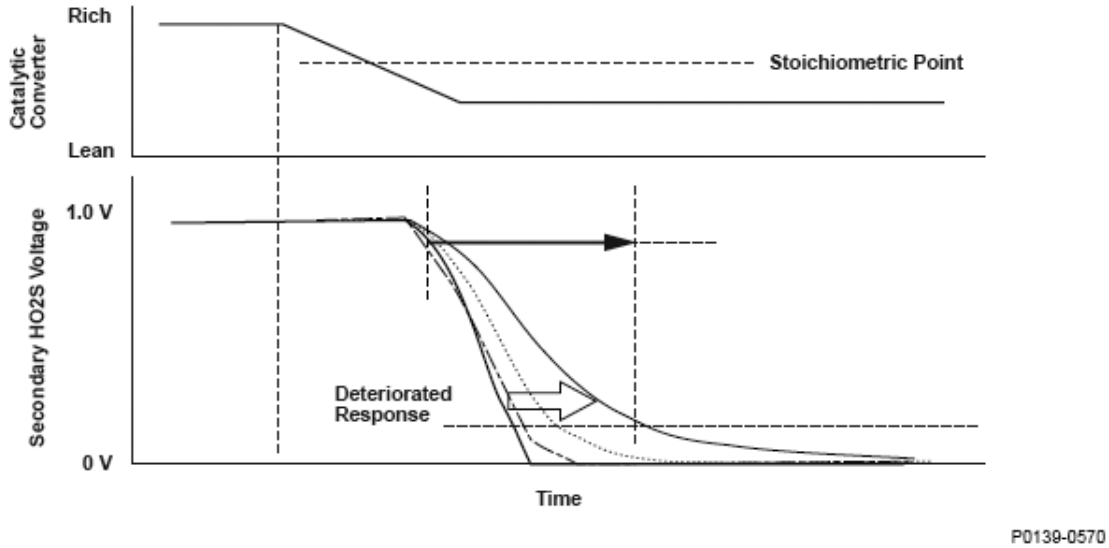

Fig. 27: Connecting Throttle Body 6P Connector Terminals No. 5 And 6 With Jumper Wire

Courtesy of AMERICAN HONDA MOTOR CO., INC.

18. Check for continuity between ECM/PCM connector terminals C3 and C4.

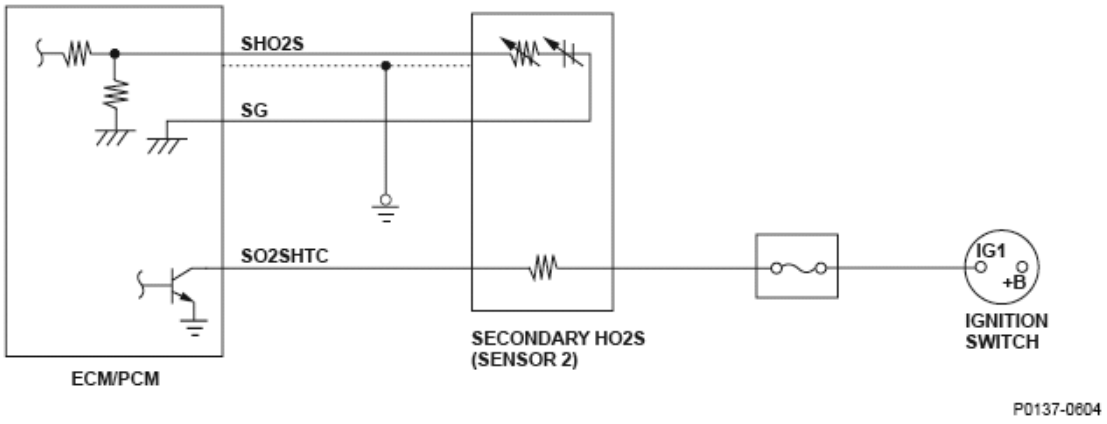

Fig. 28: Checking Continuity Between ECM/PCM Connector Terminals C3 And C4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 27.

NO - Repair open in the wires between the throttle body and the ECM/PCM (C3, C4), then go to step 21.

19. Turn the ignition switch OFF.
20. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
21. Reconnect all connectors.
22. Turn the ignition switch ON (II).
23. Reset the ECM/PCM with the HDS.
24. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
25. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VSS
    - APP SENSOR A
26. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P2101 indicated?

YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM, then clean the throttle body (see **THROTTLE BODY CLEANING**), and go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

27. Reconnect all connectors.

28. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
29. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VSS
    - APP SENSOR A
30. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2101 indicated ?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 28. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P2118: THROTTLE ACTUATOR CURRENT RANGE/PERFORMANCE PROBLEM

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Jump the SCS line with the HDS.
2. Disconnect ECM/PCM connector C (44P).
3. Measure resistance between ECM/PCM connector terminals C3 and C4.

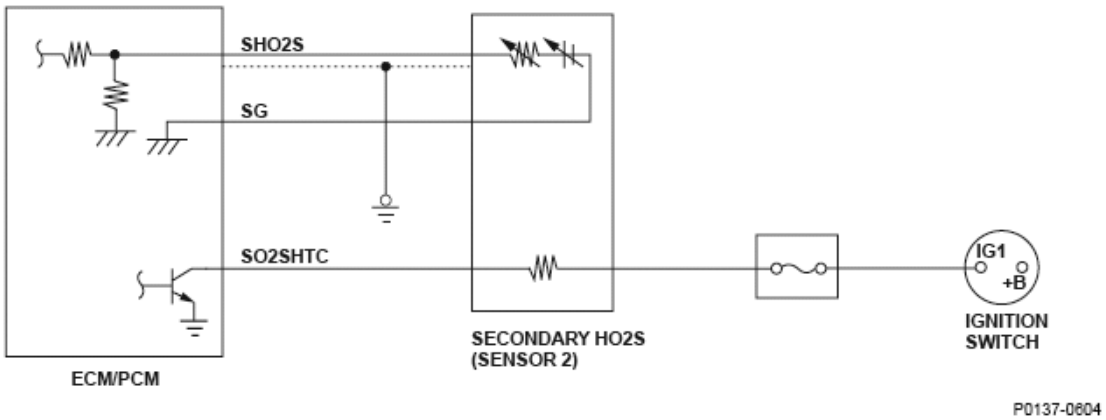

Fig. 29: Measuring Resistance Between ECM/PCM Connector Terminals C3 And C4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 1.0 ohms or less?

YES - Go to step 4.

NO - Go to step 15.

4. Disconnect the throttle body 6P connector.
5. At the throttle body side, measure resistance between throttle body 6P connector terminals No. 5 and No. 6 with the throttle fully closed.

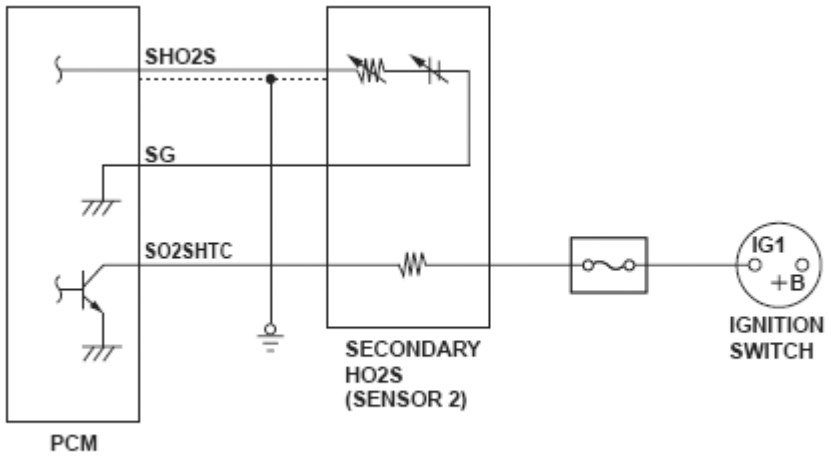

Fig. 30: Measuring Resistance Between Body 6P Connector Terminals No. 5 And 6 With Throttle Fully Closed
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 1.0 ohms or less?

YES - Go to step 6.

NO - Repair short in the wires between ECM/PCM connector terminals C3 (ETCSM-line) and C4 (ETCSM+ line), then go to step 7.

6. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
7. Reconnect all connectors.
8. Turn the ignition switch ON (II).
9. Reset the ECM/PCM with the HDS.
10. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
11. Turn the ignition switch OFF.
12. Turn the ignition switch ON (II).
13. Slowly press the accelerator pedal to the floor.
14. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P2118 indicated?

YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

15. Reconnect all connectors.
16. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
17. Turn the ignition switch OFF.
18. Turn the ignition switch ON (II).
19. Slowly press the accelerator pedal to the floor.
20. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2118 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 17. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P2122: APP SENSOR A (THROTTLE POSITION SENSOR D) CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check APP SENSOR A in the DATA LIST with the HDS.

   Is there about 0.2 V or less?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at APP sensor A and the ECM/PCM.

3. Turn the ignition switch OFF.
4. Disconnect the APP sensor 6P connector.
5. Turn the ignition switch ON (II).
6. Measure voltage between APP sensor 6P connector terminals No. 2 and No. 3.

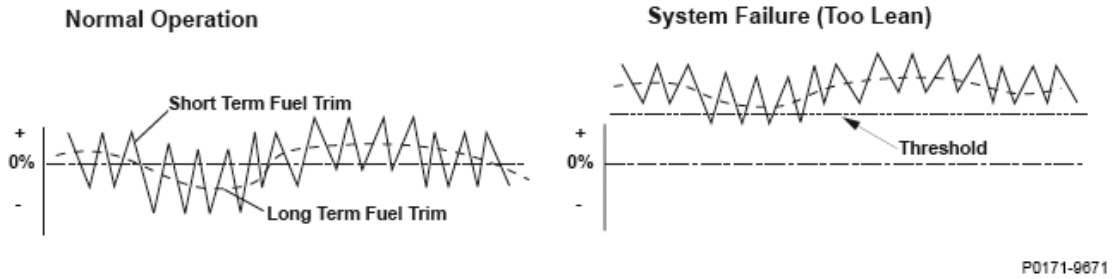

Fig. 31: Measuring Voltage Between APP Sensor 6P Connector Terminals No. 2 And 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 7.

NO - Go to step 17.

7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Disconnect ECM/PCM connector A (44P).
10. Check for continuity between APP sensor 6P connector terminal No. 1 and body ground.

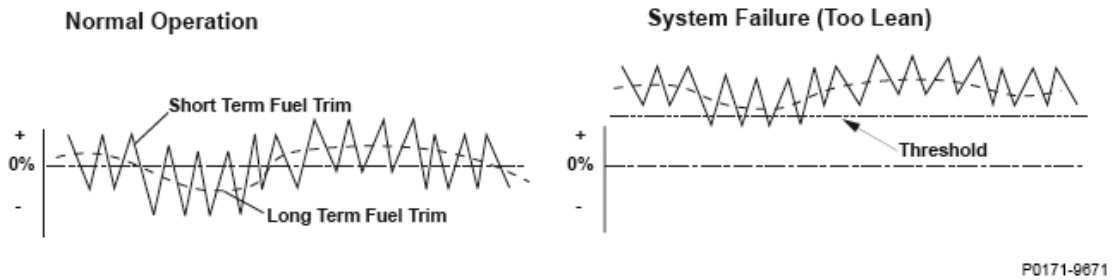

Fig. 32: Checking Continuity Between APP Sensor 6P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (A17) and APP sensor A, then go to step 24.

NO - Go to step 11.

11. Connect APP sensor 6P connector terminal No. 1 to body ground with a jumper wire.

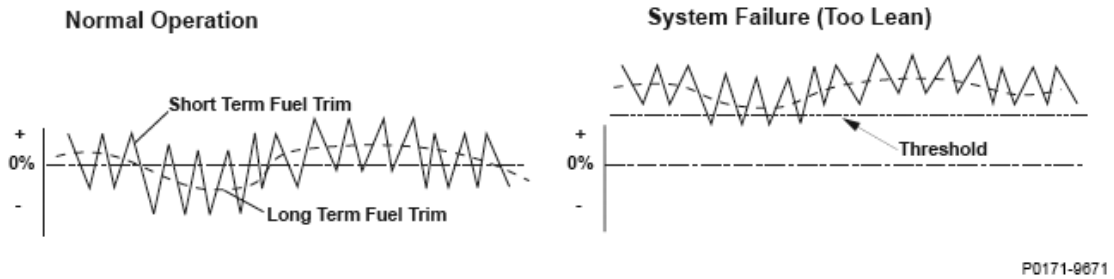

Fig. 33: Connecting APP Sensor 6P Connector Terminal No. 1 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Check for continuity between ECM/PCM connector terminal A17 and body ground.

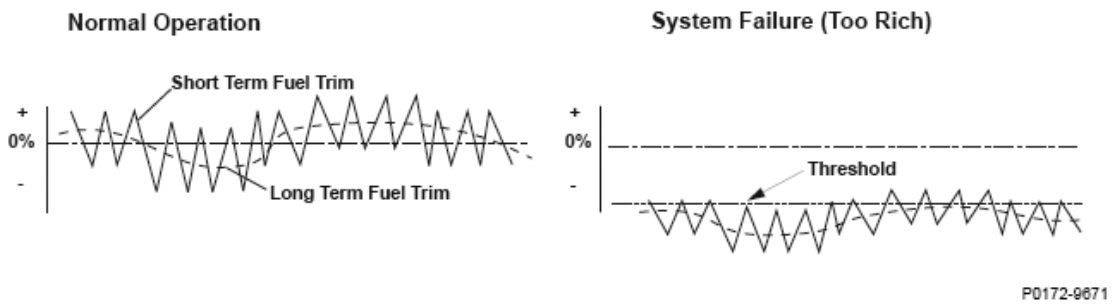

Fig. 34: Checking Continuity Between ECM/PCM Connector Terminal A17 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 13.

NO - Repair open in the wire between the ECM/PCM (A17) and APP sensor A, then go to step 24.

13. Reconnect ECM/PCM connector A (44P).
14. Connect APP sensor 6P connector terminals No. 1 and No. 3 with a jumper wire.

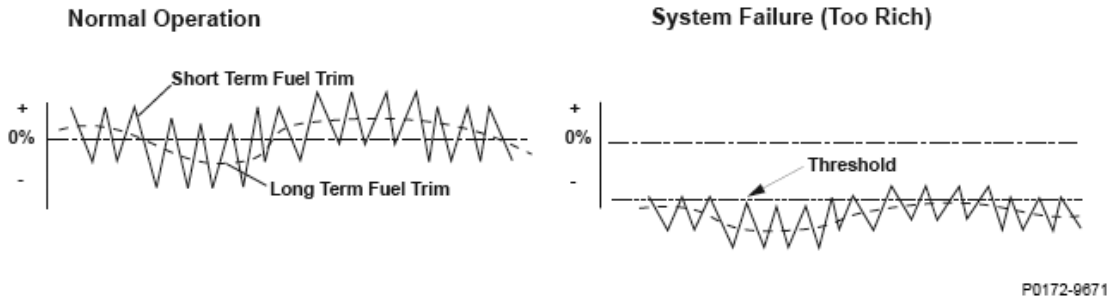

Fig. 35: Connecting APP Sensor 6P Connector Terminals No. 1 And No. 3 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Turn the ignition switch ON (II).
16. Check APP SENSOR A in the DATA LIST with the HDS.

Is there about 0.2 V or less?

YES - Go to step 29.

NO - Go to step 22.

17. Turn the ignition switch OFF.
18. Jump the SCS line with the HDS.
19. Disconnect ECM/PCM connector A (44P).
20. Connect APP sensor 6P connector terminal No. 3 to body ground with a jumper wire.

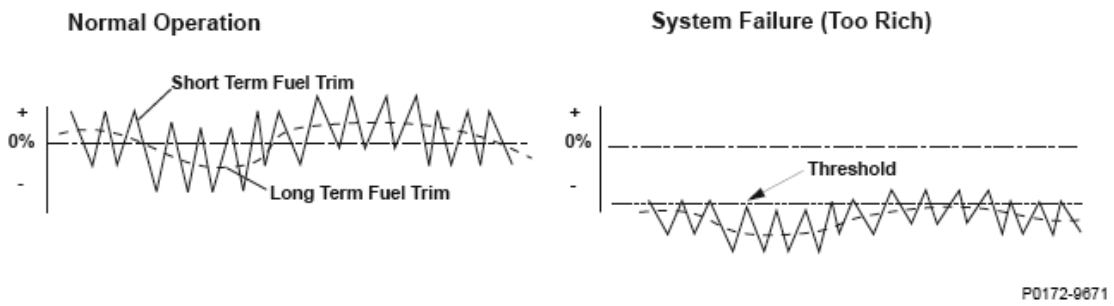

Fig. 36: Connecting APP Sensor 6P Connector Terminal No. 3 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Check for continuity between ECM/PCM connector terminal A25 and body ground.

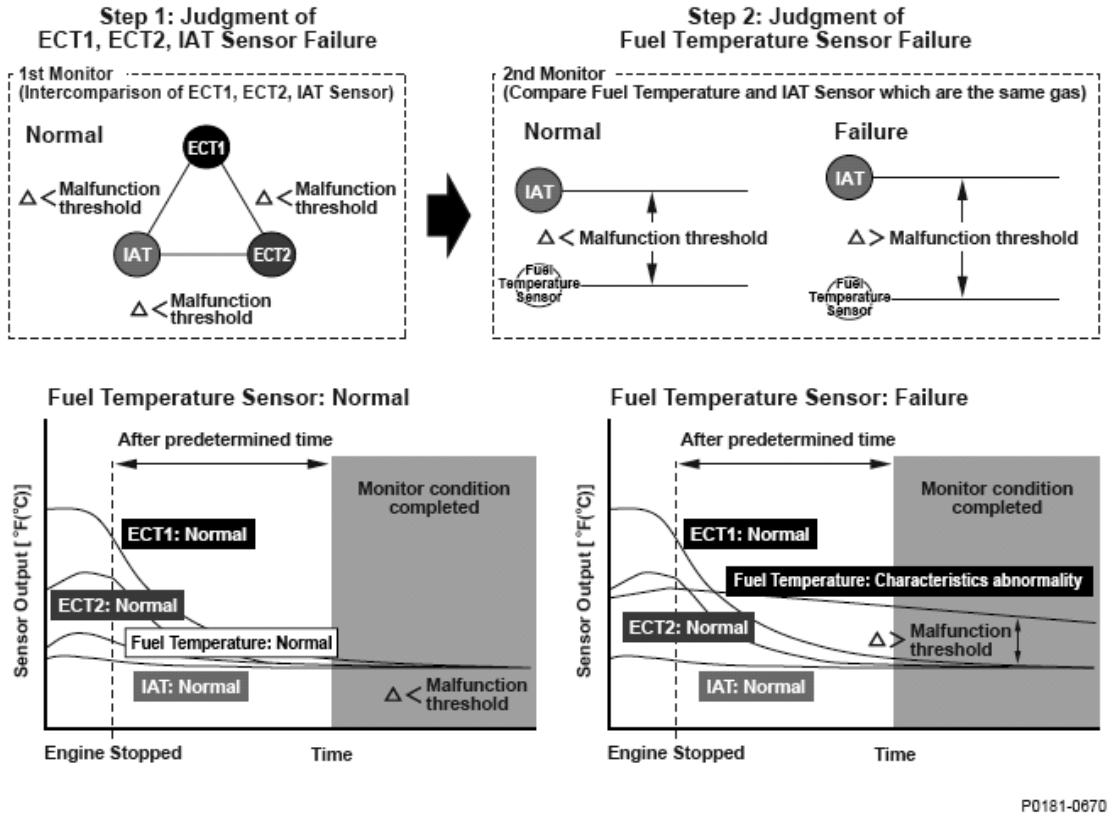

Fig. 37: Checking Continuity Between ECM/PCM Connector Terminal A25 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 30.

NO - Repair open in the wire between the ECM/PCM (A25) and APP sensor A, then go to step 24.

22. Turn the ignition switch OFF.
23. Replace the accelerator pedal module (see **ACCELERATOR PEDAL MODULE REMOVAL/INSTALLATION**).

24. Reconnect all connectors.
25. Turn the ignition switch ON (II).
26. Reset the ECM/PCM with the HDS.
27. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
28. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2122 indicated?

    YES - Check for poor connections or loose terminals at APP sensor A and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

29. Turn the ignition switch OFF.
30. Reconnect all connectors.
31. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
32. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2122 indicated?

    YES - Check for poor connections or loose terminals at APP sensor A and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P2123: APP SENSOR A (THROTTLE POSITION SENSOR D) CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check APP SENSOR A in the DATA LIST with the HDS.

    Is there about 4.9 V or more?

    YES - Go to step 3.

    NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at APP sensor A and the ECM/PCM.

3. Turn the ignition switch OFF.
4. Disconnect the APP sensor 6P connector.

5. Turn the ignition switch ON (II).
6. Measure voltage between APP sensor 6P connector terminals No. 2 and No. 3.

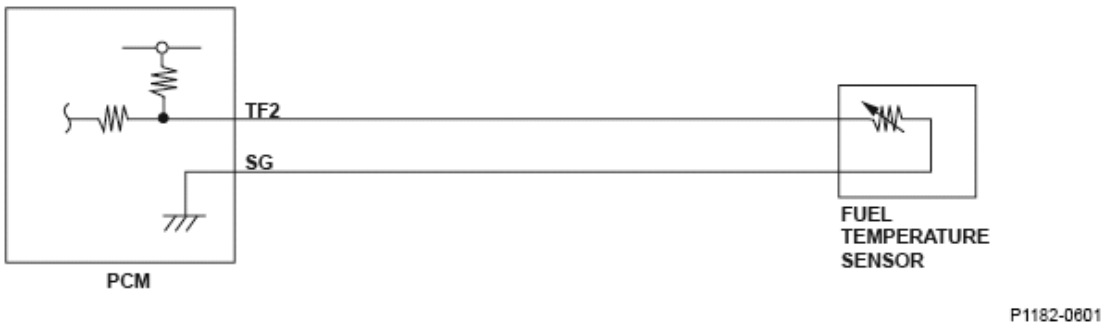

Fig. 38: Measuring Voltage Between APP Sensor 6P Connector Terminals No. 2 And 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 12.

NO - Go to step 7.

7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Disconnect ECM/PCM connector A (44P).
10. Connect APP sensor 6P connector terminal No. 2 to body ground with a jumper wire.

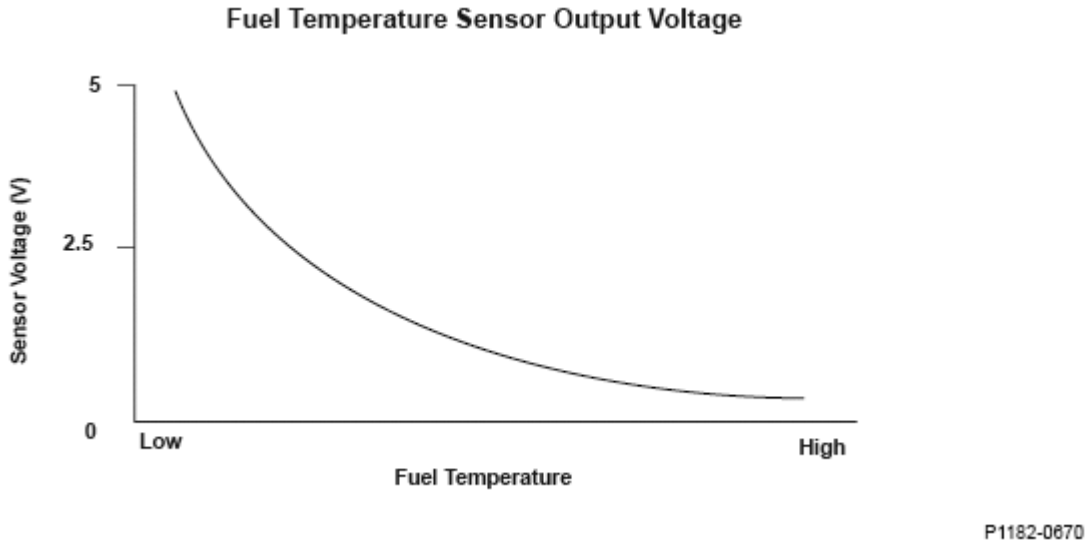

Fig. 39: Connecting APP Sensor 6P Connector Terminal No. 2 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Check for continuity between ECM/PCM connector terminal A35 and body ground.

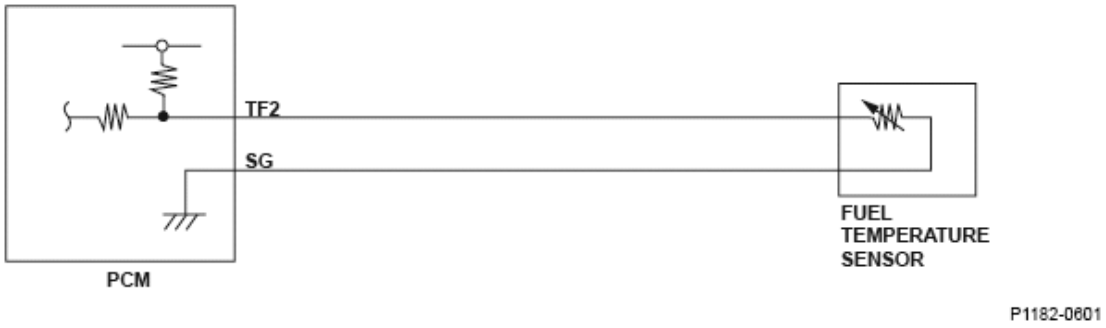

Fig. 40: Checking Continuity Between ECM/PCM Connector Terminal A35 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 19.

NO - Repair open in the wire between the ECM/PCM (A35) and APP sensor A, then go to step 14.

12. Turn the ignition switch OFF.
13. Replace the accelerator pedal module (see **ACCELERATOR PEDAL MODULE REMOVAL/INSTALLATION**).
14. Reconnect all connectors.
15. Turn the ignition switch ON (II).
16. Reset the ECM/PCM with the HDS.
17. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
18. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2123 indicated?

    YES - Check for poor connections or loose terminals at APP sensor A and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

19. Reconnect all connectors.
20. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
21. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2123 indicated?

    YES - Check for poor connections or loose terminals at APP sensor A and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs

or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P2127: APP SENSOR B (THROTTLE POSITION SENSOR E) CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check APP SENSOR B in the DATA LIST with the HDS.

   Is there about 0.2 V or less?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at APP sensor B and the ECM/PCM.

3. Turn the ignition switch OFF.
4. Disconnect the APP sensor 6P connector.
5. Turn the ignition switch ON (II).
6. Measure voltage between APP sensor 6P connector terminals No. 5 and No. 6.

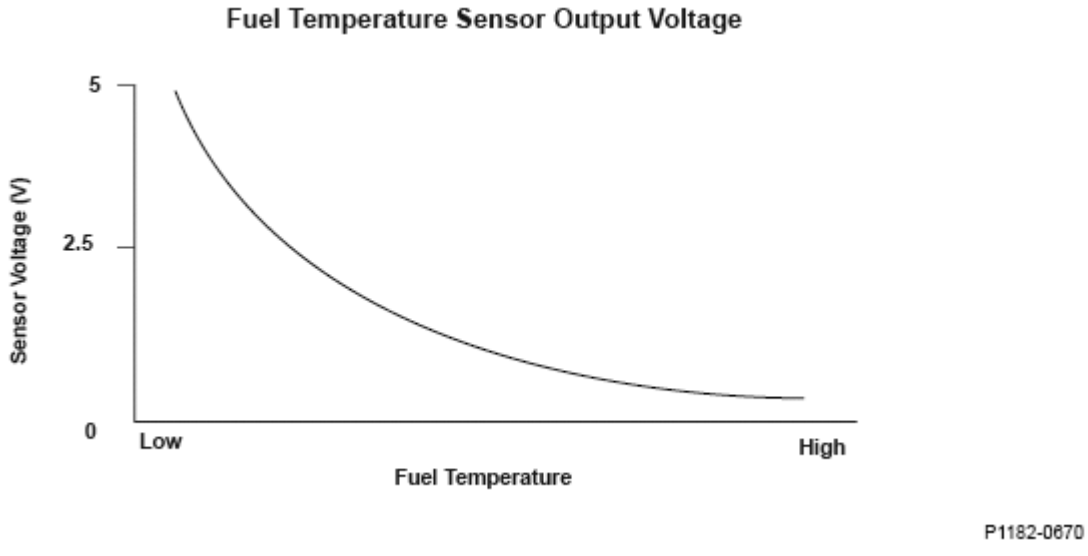

Fig. 41: Measuring Voltage Between APP Sensor 6P Connector Terminals No. 5 And 6
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 7.

NO - Go to step 17.

7. Turn the ignition switch OFF.

8. Jump the SCS line with the HDS.
9. Disconnect ECM/PCM connector A (44P).
10. Check for continuity between APP sensor 6P connector terminal No. 4 and body ground.

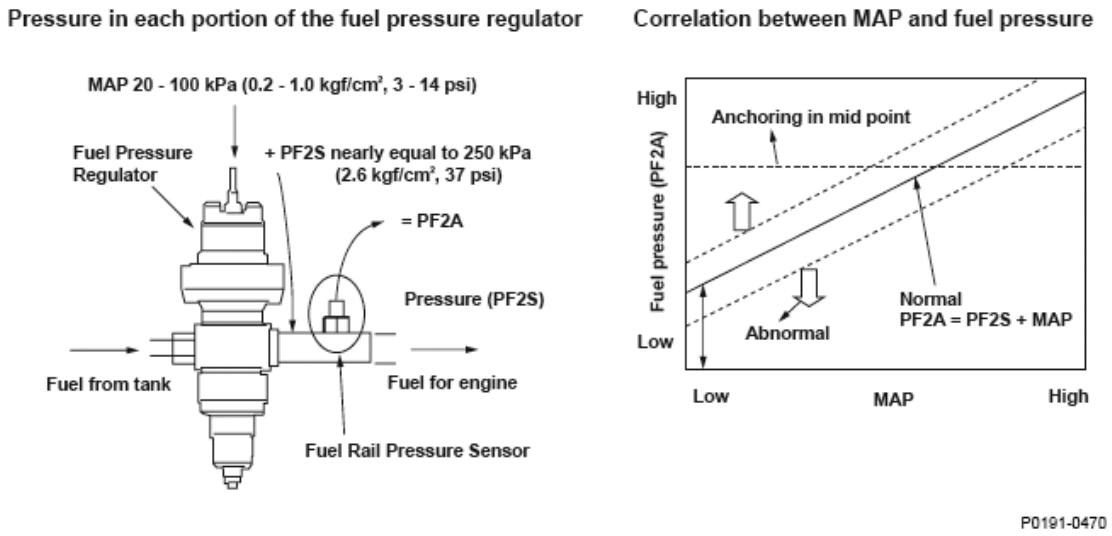

Fig. 42: Checking Continuity Between APP Sensor 6P Connector Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (A18) and APP sensor B, then go to step 24.

NO - Go to step 11.

11. Connect APP sensor 6P connector terminal No. 4 to body ground with a jumper wire.

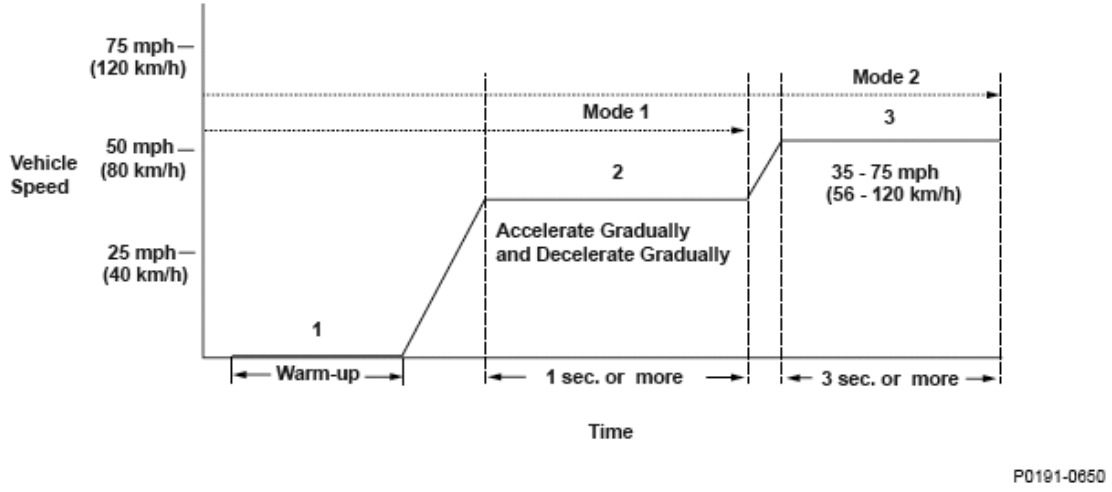

Fig. 43: Connecting APP Sensor 6P Connector Terminal No. 4 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Check for continuity between ECM/PCM connector terminal A18 and body ground.

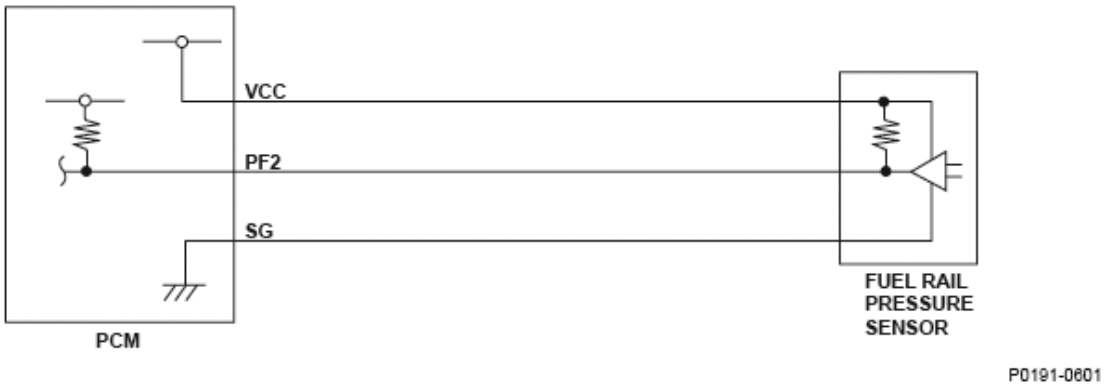

Fig. 44: Checking Continuity Between ECM/PCM Connector Terminal A18 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 13.

NO - Repair open in the wire between the ECM/PCM (A18) and APP sensor B, then go to step 24.

13. Reconnect ECM/PCM connector A (44P).
14. Connect APP sensor 6P connector terminals No. 4 and No. 6 with a jumper wire.

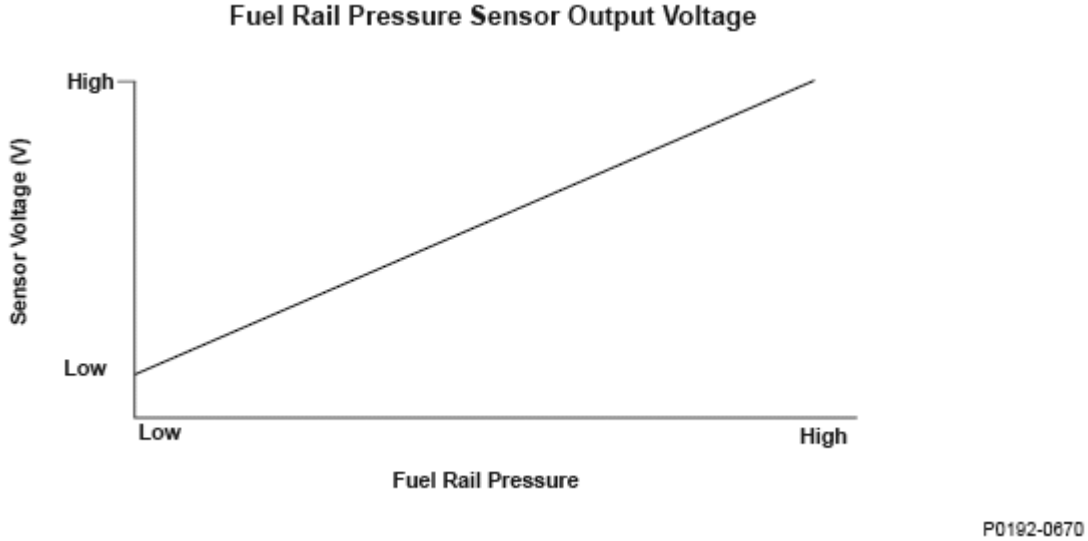

Fig. 45: Connecting APP Sensor 6P Connector Terminals No. 4 And 6 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Turn the ignition switch ON (II).
16. Check APP SENSOR B in the DATA LIST with the HDS.

Is there about 0.2 V or less?

YES - Go to step 29.

NO - Go to step 22.

17. Turn the ignition switch OFF.
18. Jump the SCS line with the HDS.
19. Disconnect ECM/PCM connector A (44P).
20. Connect APP sensor 6P connector terminal No. 6 to body ground with a jumper wire.

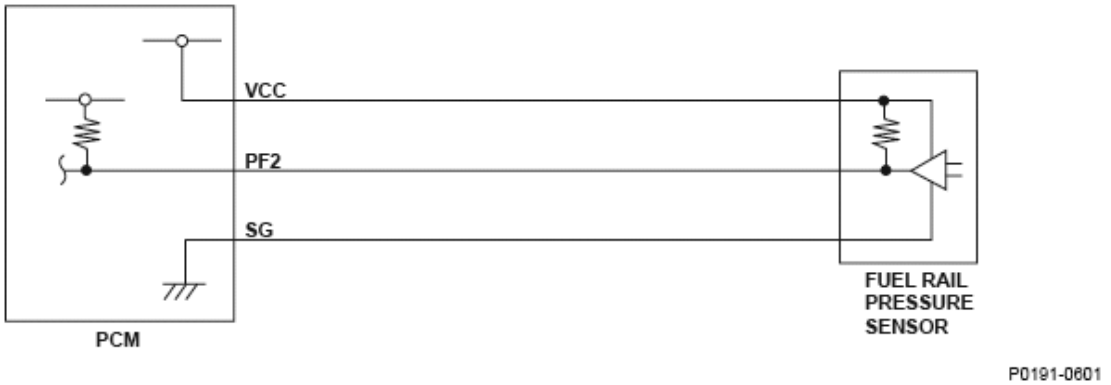

Fig. 46: Connecting APP Sensor 6P Connector Terminal No. 6 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Check for continuity between ECM/PCM connector terminal A24 and body ground.

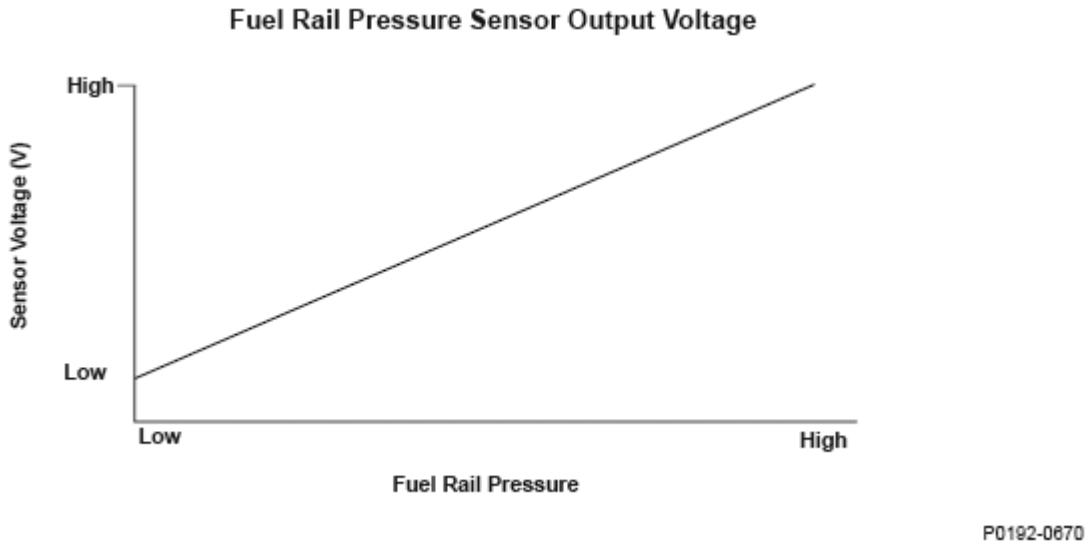

Fig. 47: Checking Continuity Between ECM/PCM Connector Terminal A24 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 30.

NO - Repair open in the wire between the ECM/PCM (A24) and APP sensor B, then go to step 24.

22. Turn the ignition switch OFF.
23. Replace the accelerator pedal module (see **ACCELERATOR PEDAL MODULE REMOVAL/INSTALLATION**).
24. Reconnect all connectors.
25. Turn the ignition switch ON (II).
26. Reset the ECM/PCM with the HDS.
27. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
28. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2127 indicated?

    YES - Check for poor connections or loose terminals at APP sensor B and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

29. Turn the ignition switch OFF.
30. Reconnect all connectors.
31. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
32. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2127 indicated?

    YES - Check for poor connections or loose terminals at APP sensor B and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P2128: APP SENSOR B (THROTTLE POSITION SENSOR E) CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Check APP SENSOR B in the DATA LIST with the HDS.

   Is there about 4.9 V or more?

   YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals APP sensor B and the ECM/PCM.

3. Turn the ignition switch OFF.
4. Disconnect the APP sensor 6P connector.
5. Turn the ignition switch ON (II).
6. Measure voltage between APP sensor 6P connector terminals No. 5 and No. 6.

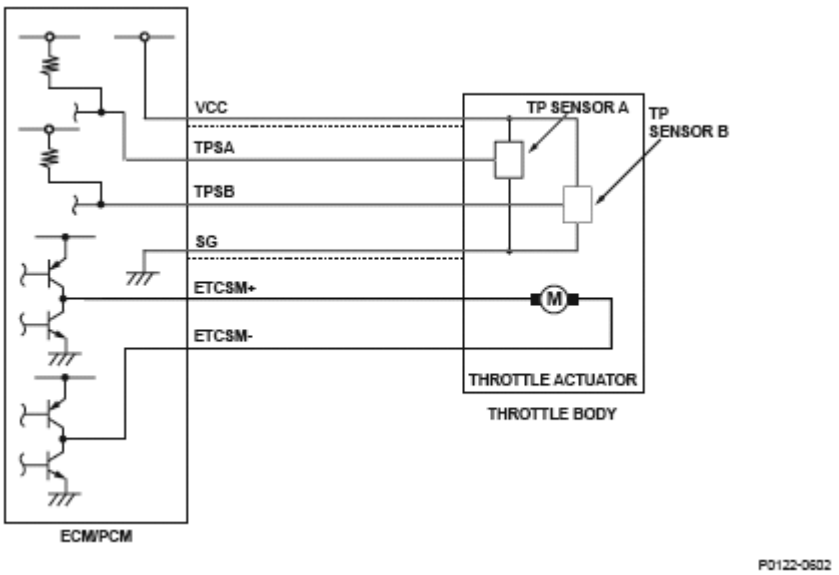

Fig. 48: Measuring Voltage Between APP Sensor 6P Connector Terminals No. 5 And 6
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 12.

NO - Go to step 7.

7. Turn the ignition switch OFF.
8. Jump the SCS line with the HDS.
9. Disconnect ECM/PCM connector A (44P).
10. Connect APP sensor 6P connector terminal No. 5 to body ground with a jumper wire.

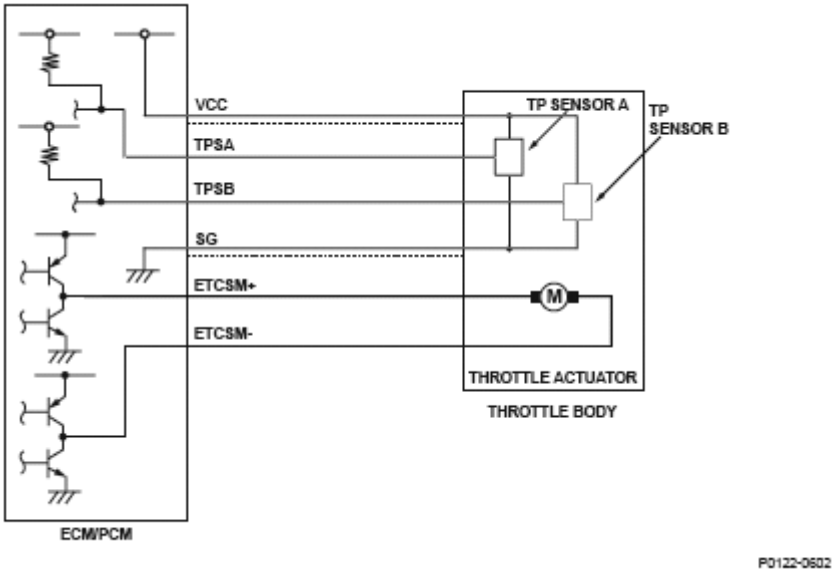

Fig. 49: Connecting APP Sensor 6P Connector Terminal No. 5 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Check for continuity between ECM/PCM connector terminal A34 and body ground.

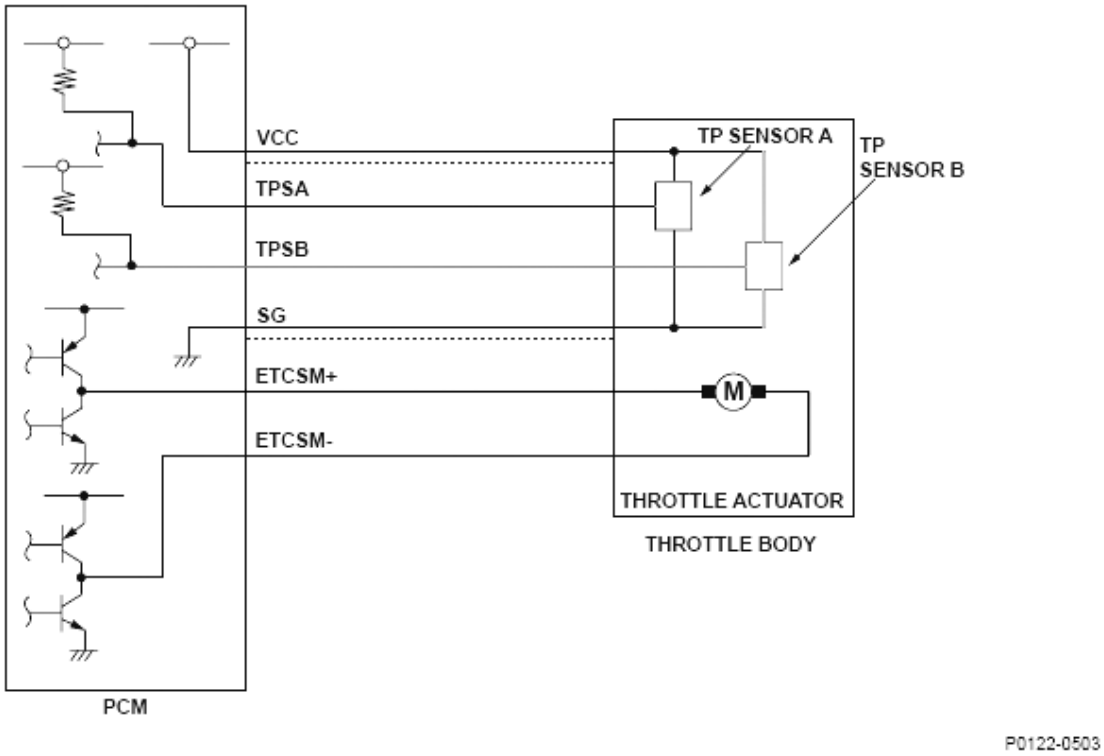

Fig. 50: Checking Continuity Between ECM/PCM Connector Terminal A34 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 19.

NO - Repair open in the wire between the ECM/PCM (A34) and APP sensor B, then go to step 14.

12. Turn the ignition switch OFF.
13. Replace the accelerator pedal module (see **ACCELERATOR PEDAL MODULE REMOVAL/INSTALLATION**).
14. Reconnect all connectors.
15. Turn the ignition switch ON (II).
16. Reset the ECM/PCM with the HDS.
17. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
18. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2128 indicated?

    YES - Check for poor connections or loose terminals at APP sensor B and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

19. Reconnect all connectors.
20. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
21. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2128 indicated?

    YES - Check for poor connections or loose terminals at APP sensor B and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P2135: TP SENSOR A/B INCORRECT VOLTAGE CORRELATION

CAUTION: Do not insert your fingers into the installed throttle body when you turn the ignition switch ON (II) or while the ignition switch is ON (II). If you do, you will seriously injure your fingers if the throttle valve is activated.

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.

3. Do the ETCS TEST in the INSPECTION MENU with the HDS.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2135 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM/PCM.

5. Turn the ignition switch OFF.
6. Disconnect the intake air duct from the throttle body.
7. Turn the ignition switch ON (II).
8. Visually check the throttle valve operation while you clear the DTC with the HDS.

   Does the valve temporarily move to its fully closed position?

   YES - Go to step 15.

   NO - Go to step 9.

9. Turn the ignition switch OFF.
10. Jump the SCS line with the HDS.
11. Disconnect ECM/PCM connector C (44P).
12. Check for continuity between ECM/PCM connector terminals C20 and C21.

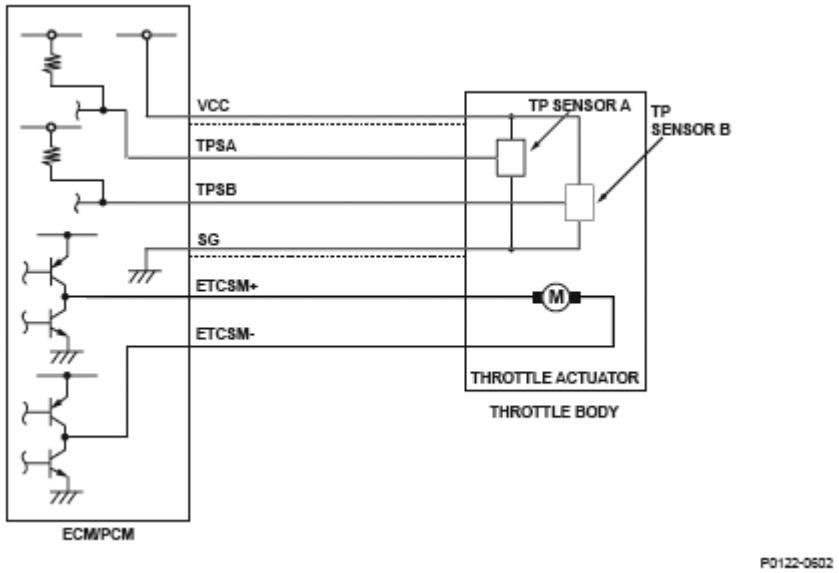

Fig. 51: Checking Continuity Between ECM/PCM Connector Terminals C20 And C21
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 13.

NO - Go to step 22.

13. Disconnect the throttle body 6P connector.
14. Check for continuity between ECM/PCM connector terminals C20 and C21.

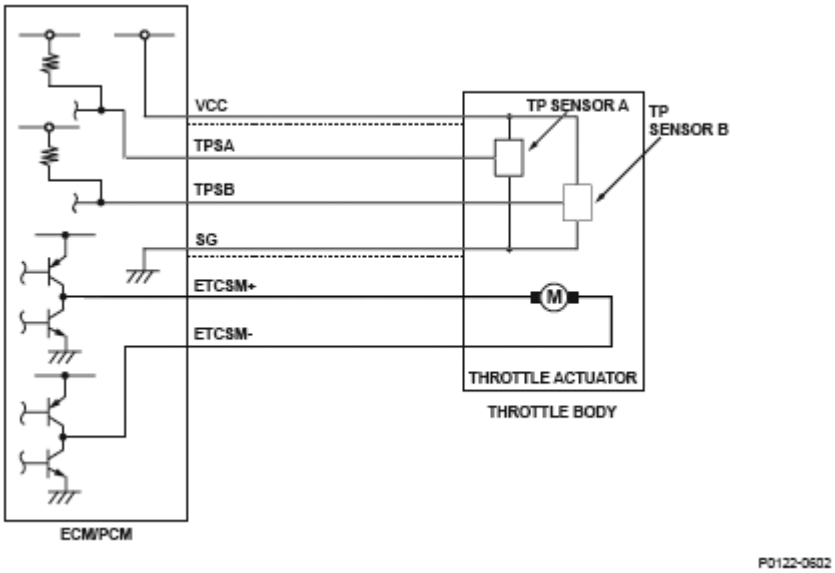

Fig. 52: Checking Continuity Between ECM/PCM Connector Terminals C20 And C21
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM C20 (TPSA line) and the C21 (TPSB line), then go to step 17.

NO - Go to step 15.

15. Turn the ignition switch OFF.
16. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
17. Reconnect all connectors.
18. Turn the ignition switch ON (II).
19. Reset the ECM/PCM with the HDS.
20. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
21. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P2135 indicated?

YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

22. Reconnect all connectors.

23. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
24. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2135 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P2138: APP SENSOR A/B (THROTTLE POSITION SENSOR D/E) INCORRECT VOLTAGE CORRELATION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with HDS.
3. Press the accelerator pedal to the floor.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2138 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at APP sensor A/B and the ECM/PCM.

5. Check APP SENSOR A and APP SENSOR B in the DATA LIST with the HDS.

   Are they the same voltage?

   YES - Go to step 6.

   NO - Go to step 12.

6. Turn the ignition switch OFF.
7. Jump the SCS line with the HDS.
8. Disconnect ECM/PCM connector A (44P).
9. Check for continuity between ECM/PCM connector terminals A17 and A18.

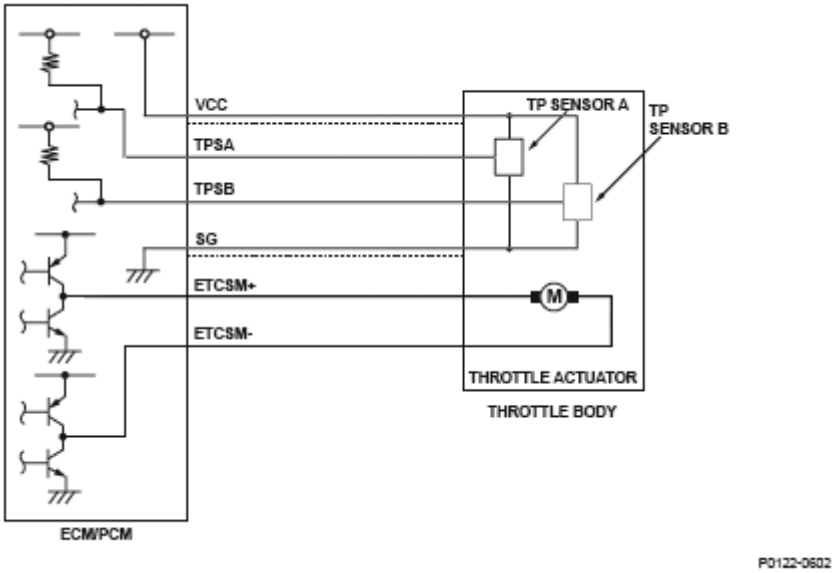

Fig. 53: Checking Continuity Between ECM/PCM Connector Terminals A17 And A18
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Go to step 22.

10. Disconnect the APP sensor 6P connector.
11. Check for continuity between ECM/PCM connector terminals A17 and A18.

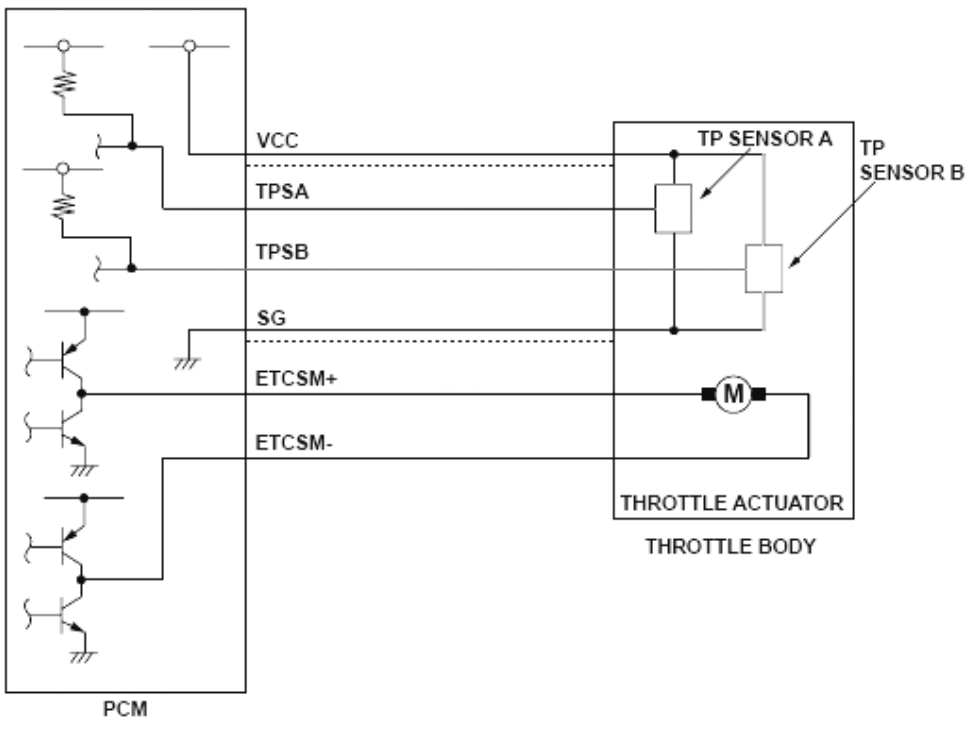

Fig. 54: Checking Continuity Between ECM/PCM Connector Terminals A17 And A18
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between ECM/PCM connector terminals A17 (APSA line) and A18 (APSB line), then go to step 14.

NO - Go to step 12.

12. Turn the ignition switch OFF.
13. Replace the accelerator pedal module (see **ACCELERATOR PEDAL MODULE REMOVAL/INSTALLATION**).
14. Reconnect all connectors.
15. Turn the ignition switch ON (II).
16. Reset the ECM/PCM with the HDS.
17. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
18. Turn the ignition switch OFF.
19. Turn the ignition switch ON (II).
20. Press the accelerator pedal to the floor.
21. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P2138 indicated?

YES - Check for poor connections or loose terminals at APP sensor A/B and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

22. Reconnect all connectors.
23. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
24. Turn the ignition switch OFF.
25. Turn the ignition switch ON (II).
26. Press the accelerator pedal to the floor.
27. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P2138 indicated?

YES - Check for poor connections or loose terminals at APP sensor A/B and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 24. If the ECM/PCM was substituted, go to step 1.

NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC P2176: THROTTLE ACTUATOR CONTROL SYSTEM IDLE POSITION NOT LEARNED

CAUTION: Do not insert your fingers into the installed throttle body when you turn the ignition switch ON (II) or while the ignition switch is ON (II). If you do, you will seriously injure your fingers if the throttle valve is activated.

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P2135 is stored at the same time as DTC P2176, troubleshoot DTC P2135 first, then recheck for DTC P2176.**

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch OFF.
4. Turn the ignition switch ON (II), and wait 10 seconds.
5. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P2176 indicated?

   YES - Go to step 6.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM/PCM, then clean the throttle body (see **THROTTLE BODY CLEANING**).

6. Turn the ignition switch OFF.
7. Disconnect the intake air duct from the throttle body.
8. Turn the ignition switch ON (II).
9. Clear the DTC with the HDS.
10. Visually check the throttle valve operation while performing the ETCS TEST in the INSPECTION MENU with the HDS.

    Does the throttle valve move to its fully closed position?

    YES - Go to step 11.

    NO - Go to step 12.

11. Check for sludge or carbon on the throttle valve.

    Is there sludge or carbon on the throttle valve?

    YES - Clean the throttle body (see **THROTTLE BODY CLEANING**), then go to step 21.

    NO - Go to step 18.

12. Turn the ignition switch OFF.
13. Disconnect the throttle body 6P connector.
14. Jump the SCS line with the HDS.
15. Disconnect ECM/PCM connector C (44P).
16. Connect throttle body 6P connector terminals No. 5 and No. 6 with a jumper wire.

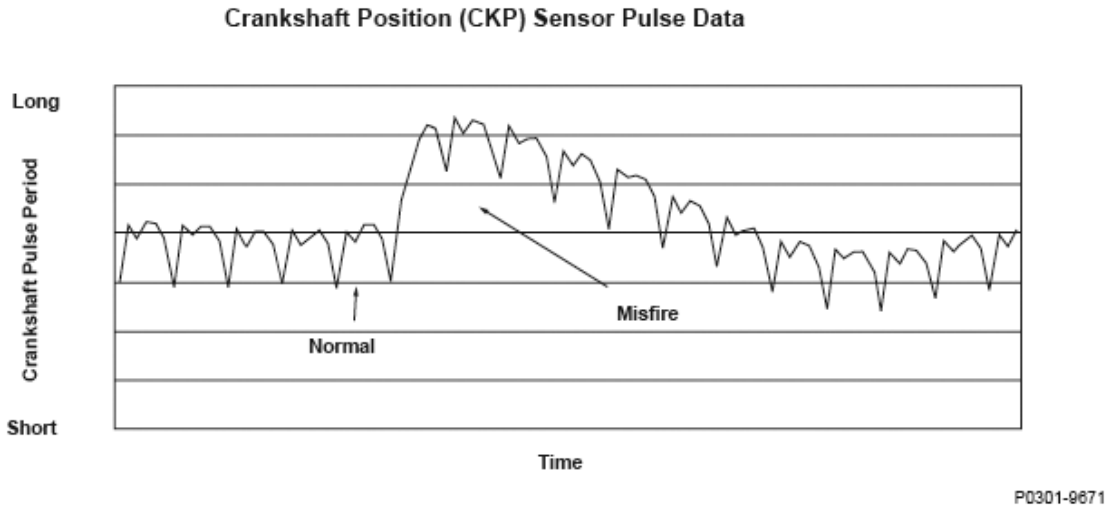

Fig. 55: Connecting Throttle Body 6P Connector Terminals No. 5 And 6 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Check for continuity between ECM/PCM connector terminals C3 and C4.

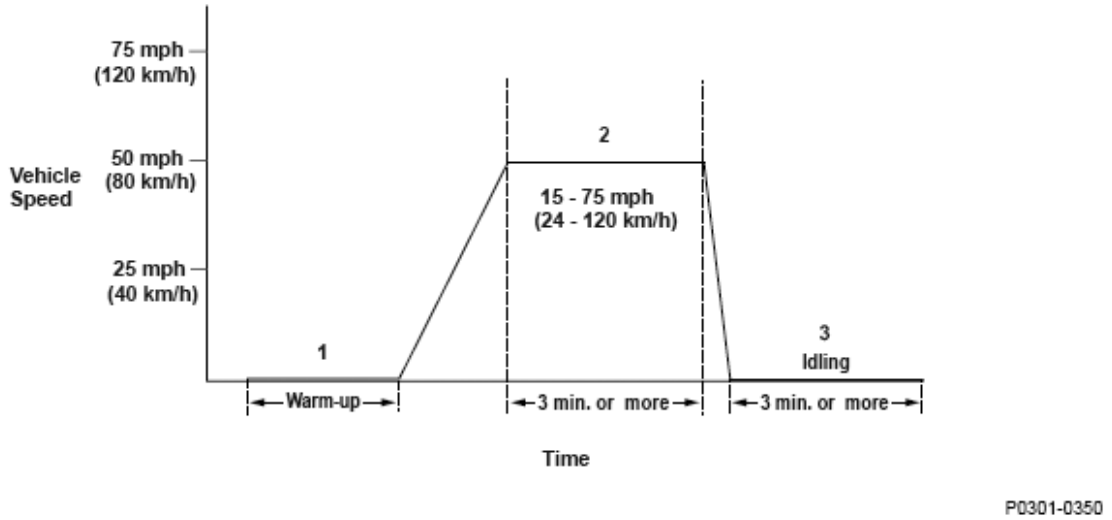

Fig. 56: Checking Continuity Between ECM/PCM Connector Terminals C3 And C4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 27.

NO - Repair open in the wires between the throttle body and the ECM/PCM (C3, C4), then go to step

20.

18. Turn the ignition switch OFF.
19. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
20. Reconnect all connectors.
21. Turn the ignition switch ON (II).
22. Reset the ECM/PCM with the HDS.
23. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
24. Turn the ignition switch OFF.
25. Turn the ignition switch ON (II), and wait 10 seconds.
26. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2176 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM, then clean the throttle body (see **THROTTLE BODY CLEANING**), and go to step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

27. Reconnect all connectors.
28. Update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
29. Turn the ignition switch to LOCK (0).
30. Turn the ignition switch to ON (11), and wait 10 seconds.
31. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2176 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Temporary DTCs or DTCs are indicated, go to the indicated DTCs troubleshooting.

APP SENSOR SIGNAL INSPECTION

NOTE:

- **This procedure checks the APP sensor in its fully closed position. In any other position, the APP sensor stores DTCs which are covered in other troubleshooting procedures.**
- **Check for Temporary DTCs or DTCs with the HDS before doing this procedure. If any DTCs are indicated, troubleshoot them first, then do this procedure.**
- **Press the accelerator pedal several times to check its operation. If it**

does not operate smoothly, check the pedal. If you find a problem, replace the accelerator pedal module (see ACCELERATOR PEDAL MODULE REMOVAL/INSTALLATION).

1. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

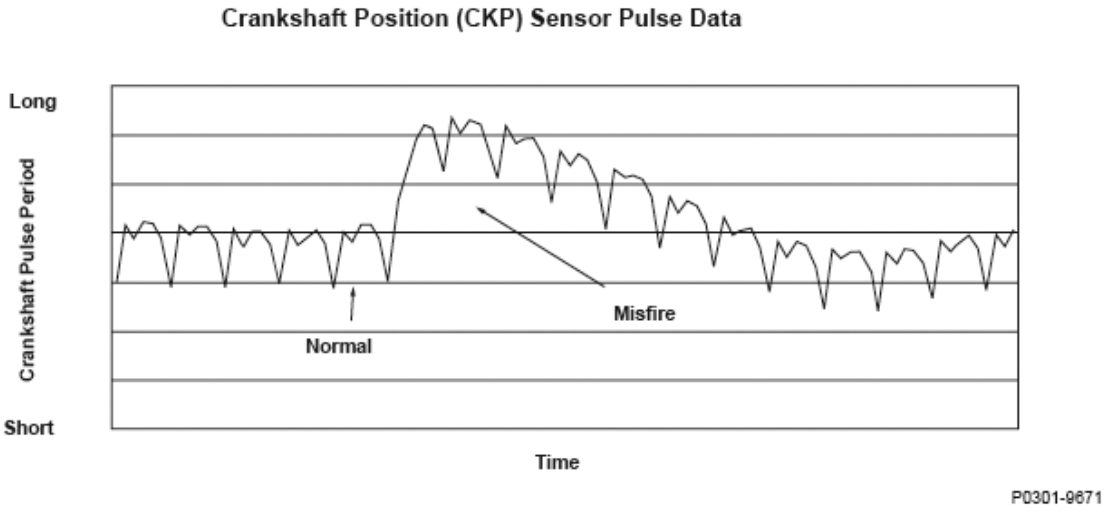

Fig. 57: Connecting HDS To DLC
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch ON (II).
3. Make sure the HDS communicates with the ECM/PCM. If it doesn't, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Make sure the accelerator pedal is not pressed, then check the APP SENSOR in the DATA LIST with the HDS.
   - If it is 0%, the APP sensor is OK.
   - If it is not 0%, update the ECM/PCM if it does not have the latest software (see **UPDATING ECM/PCM**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 5.
5. Make sure the accelerator pedal is not pressed, then check the APP SENSOR in the DATA LIST with the HDS.
   - If it is 0%, the APP sensor is OK.
   - If it is not 0%, replace the accelerator pedal module (see **ACCELERATOR PEDAL MODULE REMOVAL/INSTALLATION**), then go to step 1.

ACCELERATOR PEDAL MODULE REMOVAL/INSTALLATION

'06-08 models

1. Disconnect the APP sensor 6P connector (A), then remove the nuts (B).

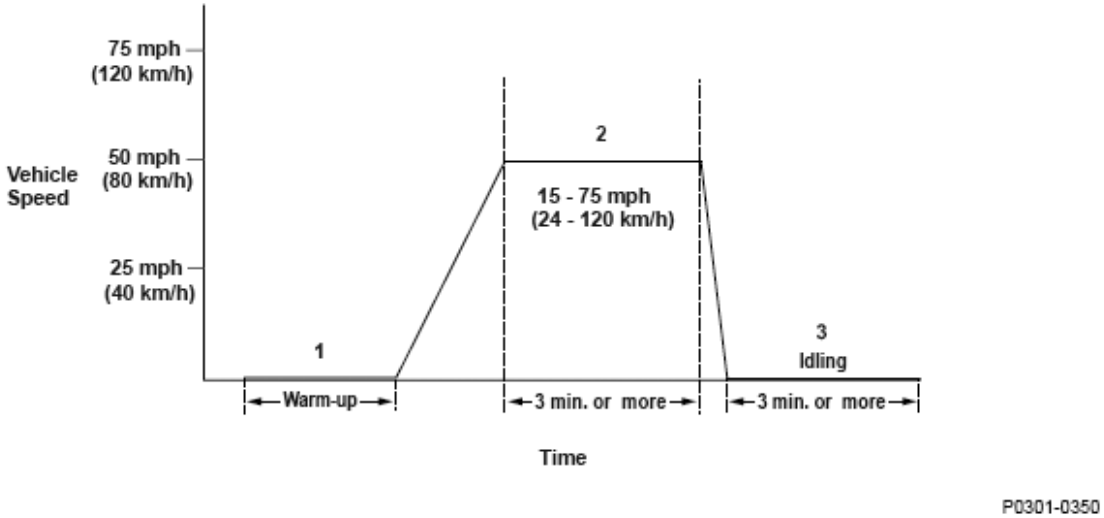

Fig. 58: Disconnecting Accelerator Pedal Module Connector (With Specifications)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the accelerator pedal module (B).

NOTE: The APP sensor is not available separately. Do not disassemble the accelerator pedal module.

3. Install the parts in the reverse order of removal.

'09 model

1. Disconnect the APP sensor 6P connector (A).

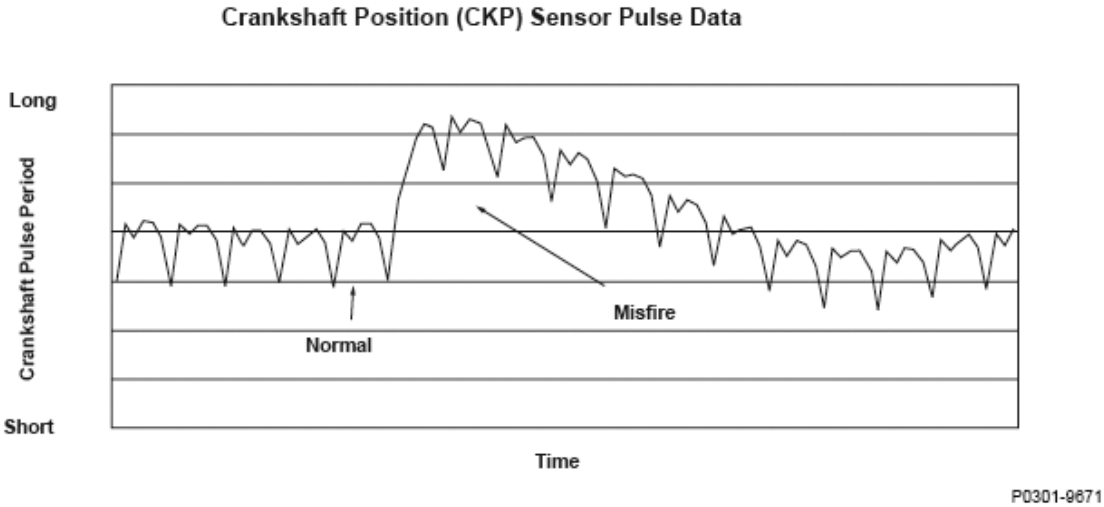

Fig. 59: Disconnecting Accelerator Pedal Module Connector
Courtesy of TOYOTA

2. Remove the clip (B).

NOTE: Do not reuse the clip once it is removed.

3. Push the tab (C), and remove the accelerator pedal pad (D) from the pedal stop (E).
4. Remove the accelerator pedal module (F).

NOTE: The APP sensor is not available separately. Do not disassemble the accelerator pedal module.

5. Set the accelerator pedal pad (A) to the pedal stop (B).

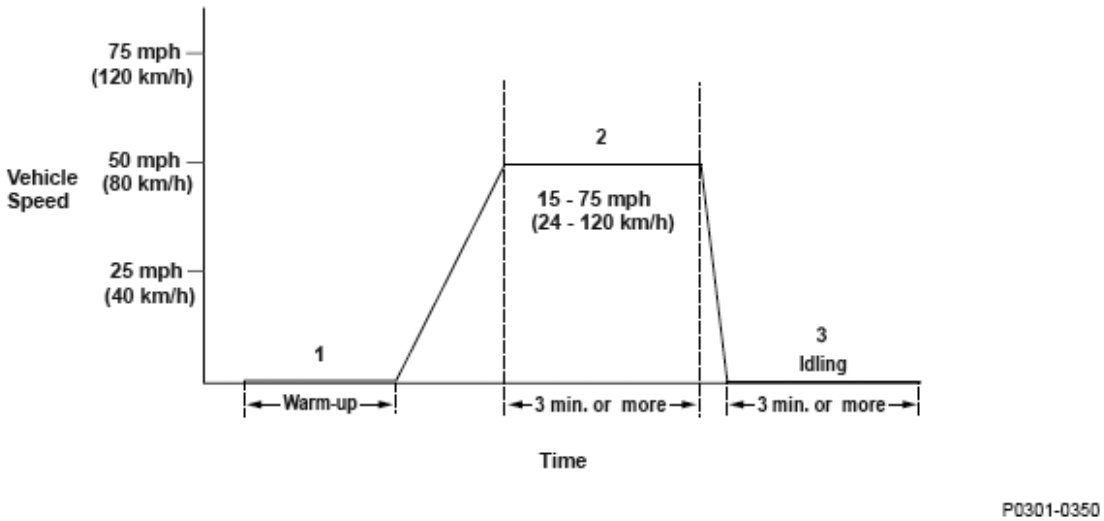

Fig. 60: Disconnecting Accelerator Pedal Module Connector
Courtesy of TOYOTA

6. Install the accelerator pedal module (C) with a new clip (D).
7. Reconnect the APP sensor 6P connector (E).

2006-08 ENGINE PERFORMANCE

EVAP System (K20Z3) - Civic (Except GX & Si)

COMPONENT LOCATION INDEX

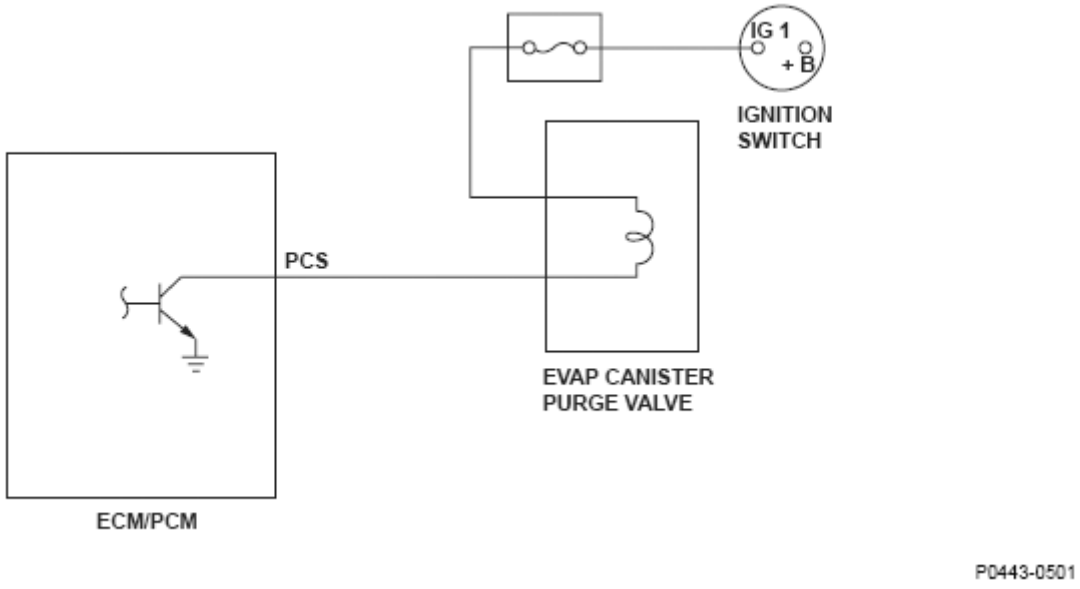

Fig. 1: Identifying EVAP System Component Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

DTC TROUBLESHOOTING

DTC P0443: EVAP CANISTER PURGE VALVE CIRCUIT MALFUNCTION

Special Tools Required

Vacuum pump/gauge, 0-30 in.Hg, Snap-on YA4000A or equivalent, commercially available

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on, then let it idle.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0443 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals

at the EVAP canister purge valve and the ECM.

5. Turn the ignition switch OFF, and allow the engine to cool below 140°F (60°C).
6. Disconnect the vacuum hose (A) from the purge valve (B) in the engine compartment, and connect a vacuum pump/gauge, 0-30 in.Hg, to the hose.

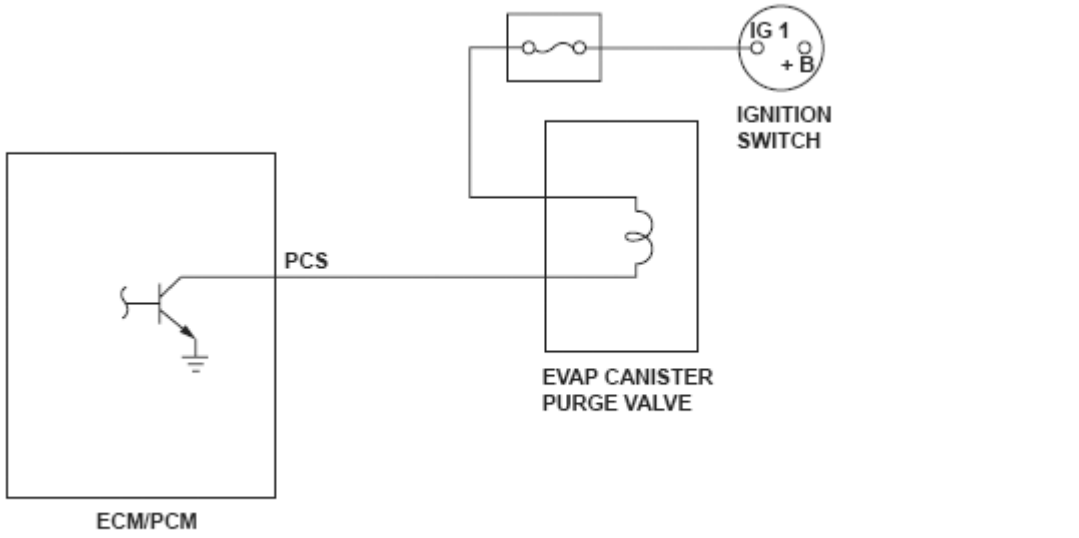

Fig. 2: Disconnecting Vacuum Hose From Purge Valve
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Start the engine, and let it idle.

   Is there vacuum?

   YES - Go to step 8.

   NO - Go to step 14.

8. Turn the ignition switch OFF.
9. Disconnect the EVAP canister purge valve 2P connector.
10. Check for continuity between EVAP canister purge valve 2P connector terminal No. 2 and body ground.

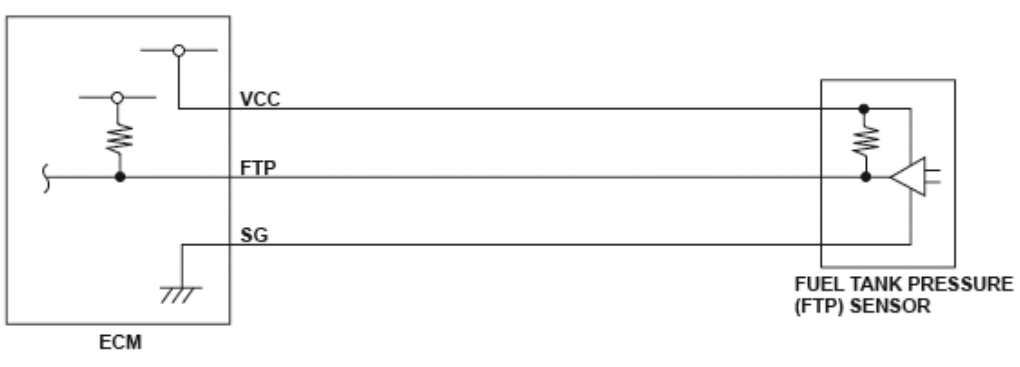

Fig. 3: Checking Continuity Between EVAP Canister Purge Valve 2P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 11.

NO - Go to step 23.

11. Jump the SCS line with the HDS.
12. Disconnect ECM connector B (44P).
13. Check for continuity between EVAP canister purge valve 2P connector terminal No. 2 and body ground.

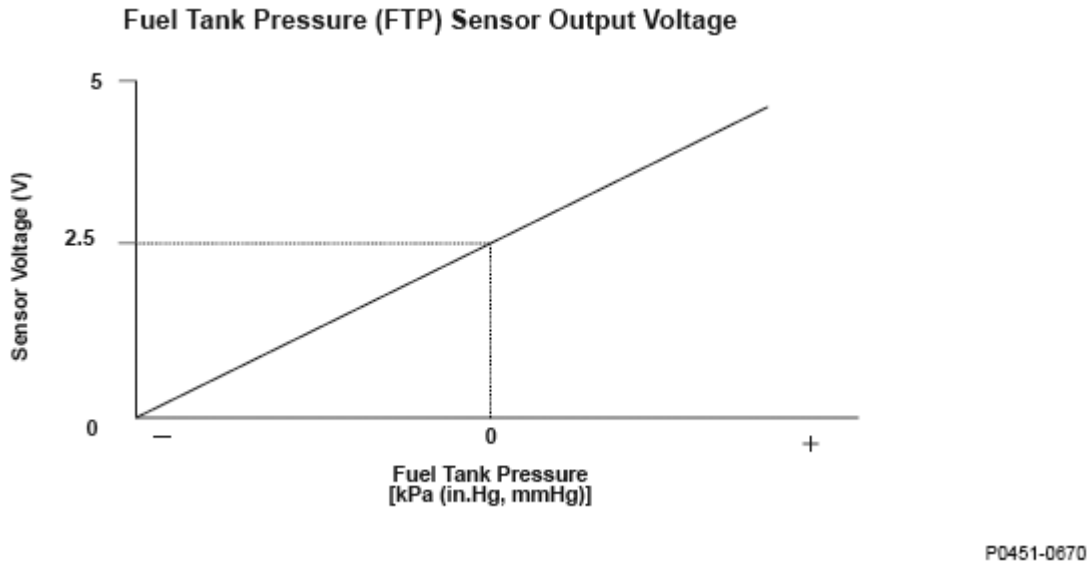

Fig. 4: Checking Continuity Between EVAP Canister Purge Valve 2P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the EVAP canister purge valve and the ECM (B3), then go to step 24.

NO - Go to step 30.

14. Turn the ignition switch OFF.
15. Disconnect the EVAP canister purge valve 2P connector.
16. Turn the ignition switch ON (II).
17. Measure voltage between EVAP canister purge valve 2P connector terminal No. 1 and body ground.

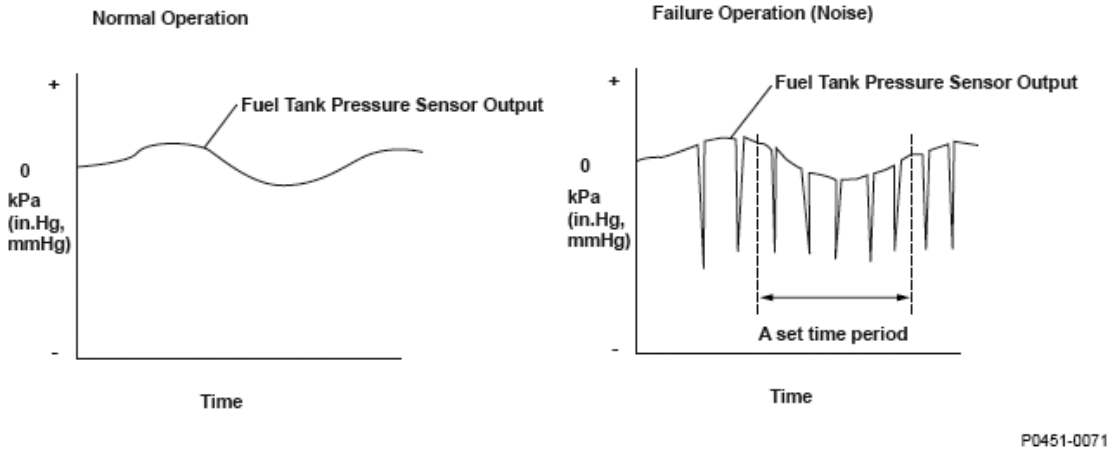

Fig. 5: Measuring Voltage Between EVAP Canister Purge Valve 2P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 18.

NO - Repair open in the wire between the EVAP canister purge valve and the No. 3 ALTERNATOR (10 A) fuse in the under-dash fuse/relay box, then go to step 24.

18. Turn the ignition switch OFF.
19. Jump the SCS line with the HDS.
20. Disconnect ECM connector B (44P).
21. Check for continuity between ECM connector terminal B3 and EVAP canister purge valve 2P connector terminal No. 2.

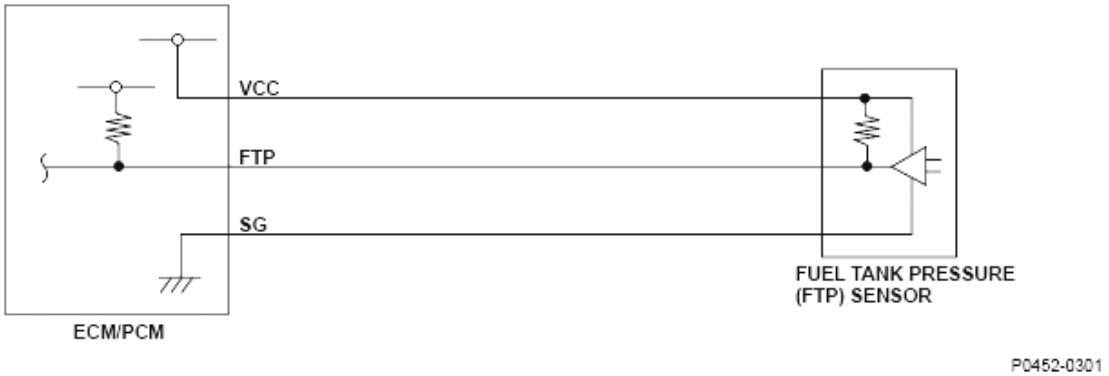

Fig. 6: Checking Continuity Between ECM Terminal B3 And EVAP Canister Purge Valve 2P Terminal No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 22.

NO - Repair open in the wire between the EVAP canister purge valve and the ECM (B3), then go to step 24.

22. At the valve side, measure resistance between EVAP canister purge valve 2P connector terminals No. 1 and No. 2.

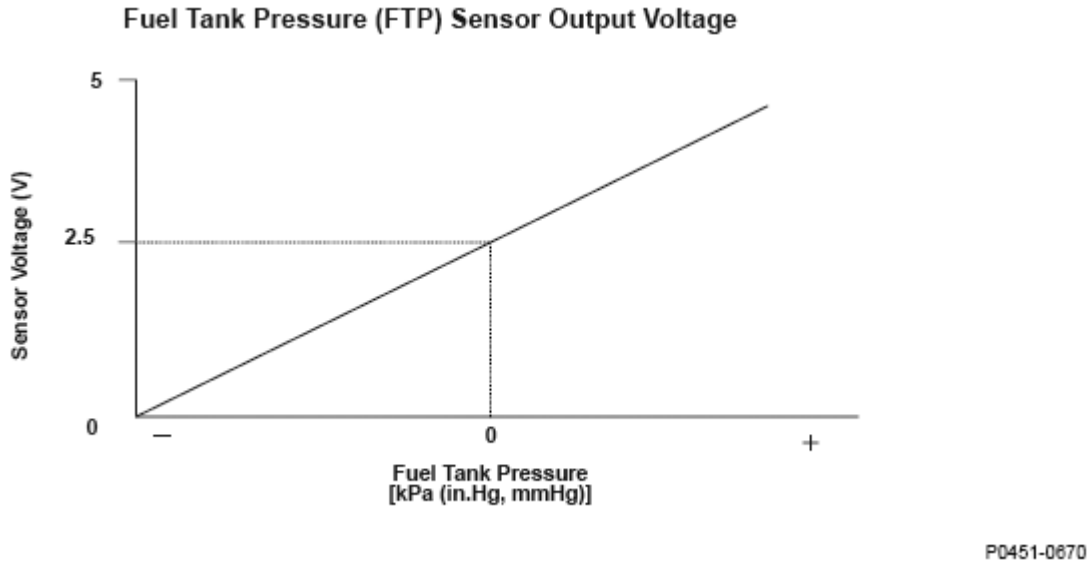

Fig. 7: Measuring Resistance Between EVAP Canister Purge Valve 2P Connector Terminals No. 1 And 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 25 ohms at room temperature?

YES - Go to step 30.

NO - Go to step 23.

23. Replace the EVAP canister purge valve (see **EVAP CANISTER VENT SHUT VALVE REPLACEMENT**).
24. Reconnect all connectors.
25. Turn the ignition switch ON (II).
26. Reset the ECM with the HDS.
27. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
28. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0443 indicated?

YES - Check for poor connections or loose terminals at the EVAP canister purge valve and the ECM, then go to step 1.

NO - Go to step 29.

29. Monitor the OBD STATUS for DTC P0443 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 28, go to the indicated DTC's troubleshooting.

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the EVAP canister purge valve and the ECM, then go to step 1. If the screen indicates EXECUTING or OUT OF CONDITION, keep idling until a result comes on.

30. Reconnect all connectors.
31. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
32. Start the engine, and let it idle.
33. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0443 indicated?

YES - Check for poor connections or loose terminals at the EVAP canister purge valve and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 32. If the ECM was substituted, go to step 1.

NO - Go to step 34.

34. Monitor the OBD STATUS for DTC P0443 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 33, go to the indicated DTC's troubleshooting.

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the EVAP canister purge valve and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 32. If the ECM was substituted, go to step 1. If the screen indicates EXECUTING or OUT OF CONDITION, keep idling until a result comes on.

DTC P0451: FTP SENSOR CIRCUIT RANGE/PERFORMANCE PROBLEM

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P2422 is stored at the same time as DTC P0451, troubleshoot DTC P2422 first, then recheck for DTC P0451.**

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle 1 minute.
4. Monitor the OBD STATUS for DTC P0451 in the DTCs MENU with the HDS.

Does the screen indicate FAILED?

YES - Go to step 5.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the FTP sensor and the ECM. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

5. Turn the ignition switch OFF.
6. Replace the FTP sensor (see **FTP SENSOR REPLACEMENT**).
7. Turn the ignition switch ON (II).
8. Reset the ECM with the HDS.
9. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
10. Start the engine, and let it idle 1 minute.
11. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0451 indicated?

YES - Check for poor connections or loose terminals at the FTP sensor and the ECM, then go to step 1.

NO - Go to step 12.

12. Monitor the OBD STATUS for DTC P0451 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 11, go to the indicated DTC's troubleshooting.

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the FTP sensor and the ECM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P0452: FTP SENSOR CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch OFF.
4. Remove the fuel fill cap.
5. Turn the ignition switch ON (II).
6. Check the FTP SENSOR in the DATA LIST with the HDS.

Is about - 7.3 kPa (-2.16 in.Hg, - 55 mmHg), or 0.3 V or less indicated?

YES - Go to step 10.

NO - Go to step 7.

7. Install the fuel fill cap.
8. Start the engine.
9. Monitor the OBD STATUS for DTC P0452 in the DTCs MENU with the HDS.

Does the screen indicate FAILED?

YES - Go to step 10.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the FTP sensor and the ECM. If the screen indicates NOT COMPLETED, go to step 4 and recheck.

10. Turn the ignition switch OFF.
11. Disconnect the FTP sensor 3P connector.
12. Turn the ignition switch ON (II).
13. Check the FTP SENSOR in the DATA LIST with the HDS.

Is about 7.3 kPa (2.15 in.Hg, 54.7 mmHg) or 4.90 V or more indicated?

YES - Go to step 24.

NO - Go to step 14.

14. Measure voltage between FTP sensor 3P connector terminal No. 1 and body ground.

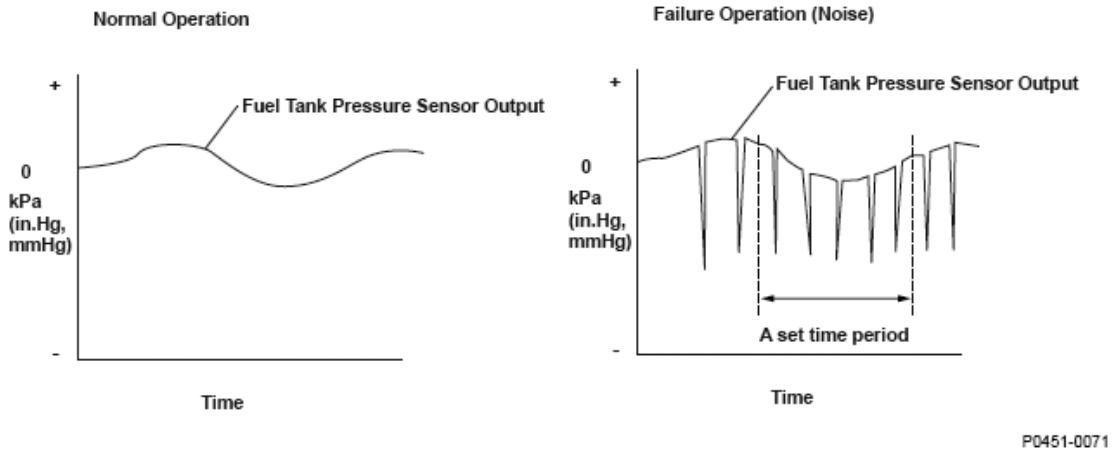

Fig. 8: Measuring Voltage Between FTP Sensor 3P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 20.

NO - Go to step 15.

15. Turn the ignition switch OFF.
16. Jump the SCS line with the HDS.
17. Disconnect ECM connector A (44P).
18. Connect FTP sensor 3P connector terminal No. 1 to body ground with a jumper wire.

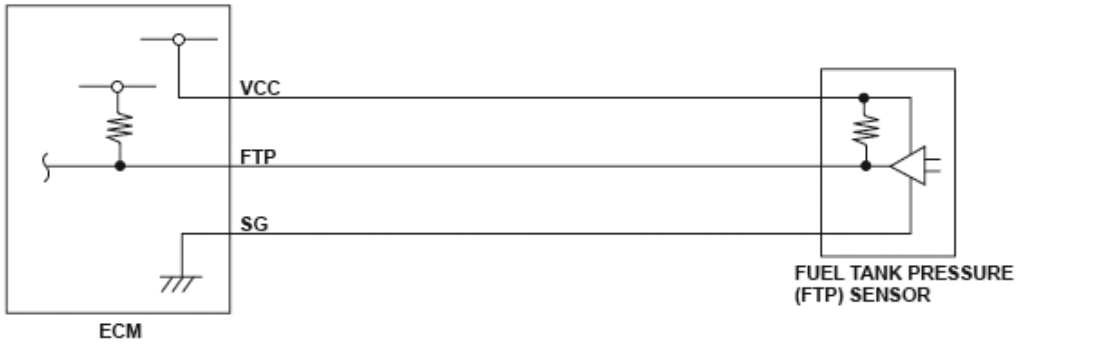

Fig. 9: Connecting FTP Sensor 3P Connector Terminal No. 1 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. Check for continuity between ECM connector terminal A19 and body ground.

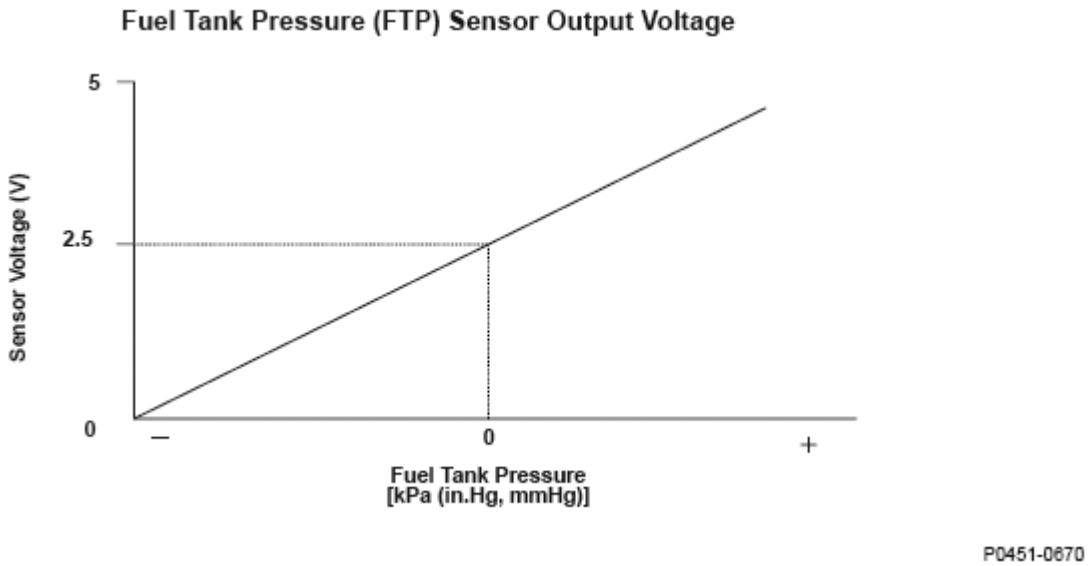

Fig. 10: Checking Continuity Between ECM Connector Terminal A19 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 32.

NO - Repair open in the wire between the ECM (A19) and the FTP sensor, then go to step 26.

20. Turn the ignition switch OFF.
21. Jump the SCS line with the HDS.
22. Disconnect ECM connector A (44P).
23. Check for continuity between FTP sensor 3P connector terminal No. 2 and body ground.

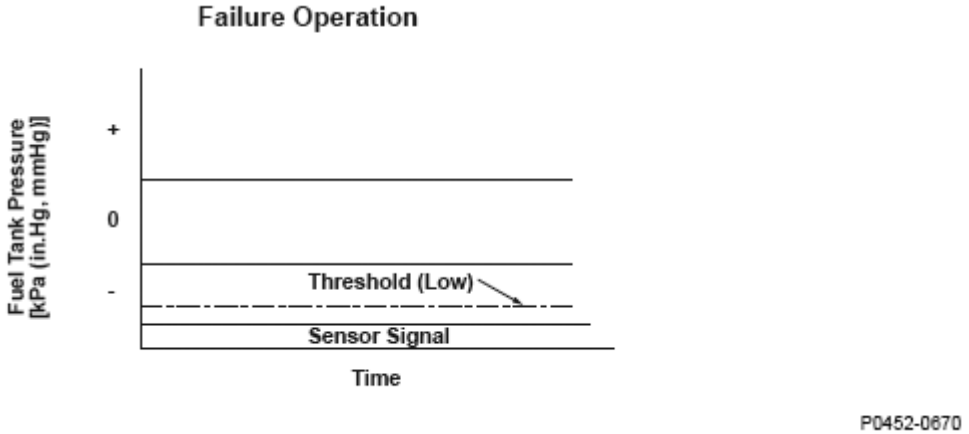

Fig. 11: Checking Continuity Between FTP Sensor 3P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM (A26) and the FTP sensor, then go to step 26.

NO - Go to step 32.

24. Turn the ignition switch OFF.
25. Replace the FTP sensor (see **FTP SENSOR REPLACEMENT**).
26. Reconnect all connectors.
27. Turn the ignition switch ON (II).
28. Reset the ECM with the HDS.
29. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
30. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0452 indicated?

YES - Check for poor connections or loose terminals at the FTP sensor and the ECM, then go to step 1.

NO - Go to step 31.

31. Monitor the OBD STATUS for DTC P0452 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 30, go to the indicated DTC's troubleshooting.

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the FTP sensor and the ECM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

32. Reconnect all connectors.
33. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
34. Start the engine and let it idle.
35. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0452 indicated?

    YES - Check for poor connections or loose terminals at the FTP sensor and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 34. If the ECM was substituted, go to step 1.

    NO - Go to step 36.

36. Monitor the OBD STATUS for DTC P0452 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 35, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the FTP sensor and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 34. If the ECM was substituted, go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P0453: FTP SENSOR CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch OFF.
4. Remove the fuel fill cap.
5. Turn the ignition switch ON (II).
6. Check the FTP SENSOR in the DATA LIST with the HDS.

   Is about 7.3 kPa (2.16 in.Hg, 55 mmHg), or 4.7 V or more indicated?

YES - Go to step 10.

NO - Go to step 7.

7. Install the fuel fill cap.
8. Start the engine.
9. Monitor the OBD STATUS for DTC P0453 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 10.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the FTP sensor and the ECM. If the screen indicates NOT COMPLETED, go to step 6 and recheck.

10. Turn the ignition switch OFF.
11. Disconnect the FTP sensor 3P connector.
12. Connect FTP sensor 3P connector terminals No. 2 and No. 3 with a jumper wire.

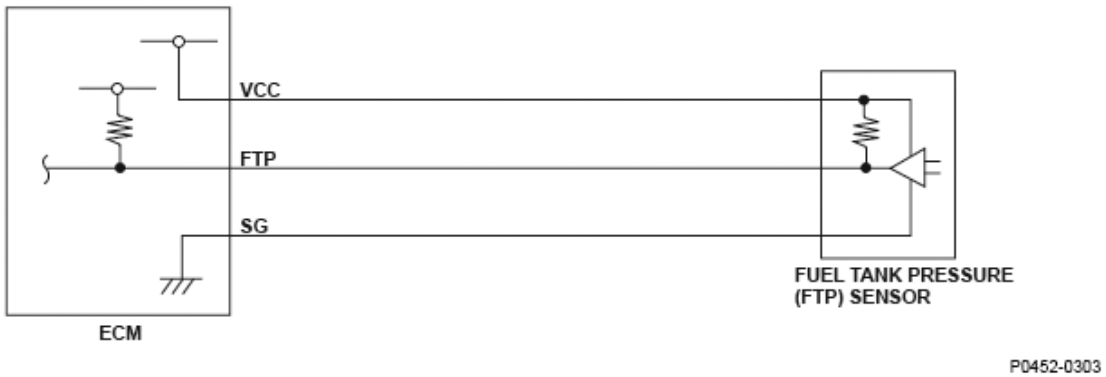

Fig. 12: Connecting FTP Sensor 3P Connector Terminals No. 2 And 3 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Turn the ignition switch ON (II).
14. Check the FTP SENSOR in the DATA LIST with the HDS.

    Is about 7.3 kPa (2.16 in.Hg, 55 mmHg), or 4.7 V or more indicated?

    YES - Go to step 15.

    NO - Go to step 26.

15. Measure voltage between FTP sensor 3P connector terminals No. 1 and No. 3.

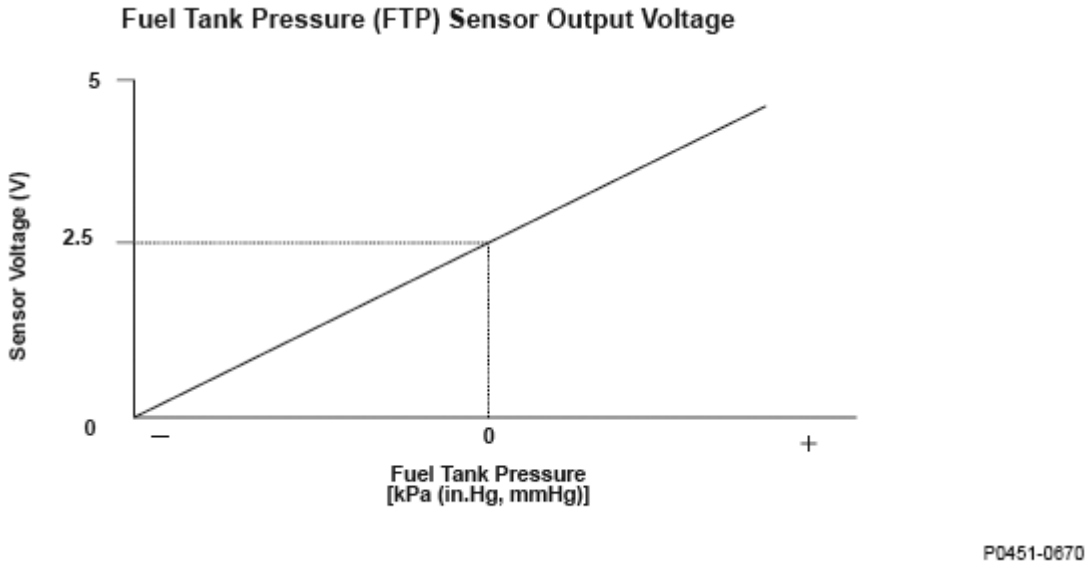

Fig. 13: Measuring Voltage Between FTP Sensor 3P Connector Terminals No. 1 And 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 21.

NO - Go to step 16.

16. Turn the ignition switch OFF.
17. Jump the SCS line with the HDS.
18. Disconnect ECM connector A (44P).
19. Connect FTP sensor 3P connector terminal No. 3 to body ground with a jumper wire.

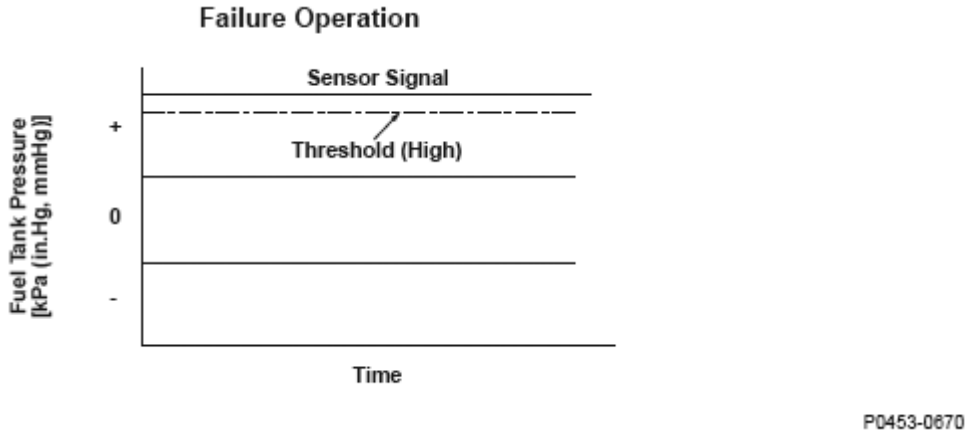

Fig. 14: Connecting FTP Sensor 3P Connector Terminal No. 3 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Check for continuity between ECM connector terminal A9 and body ground.

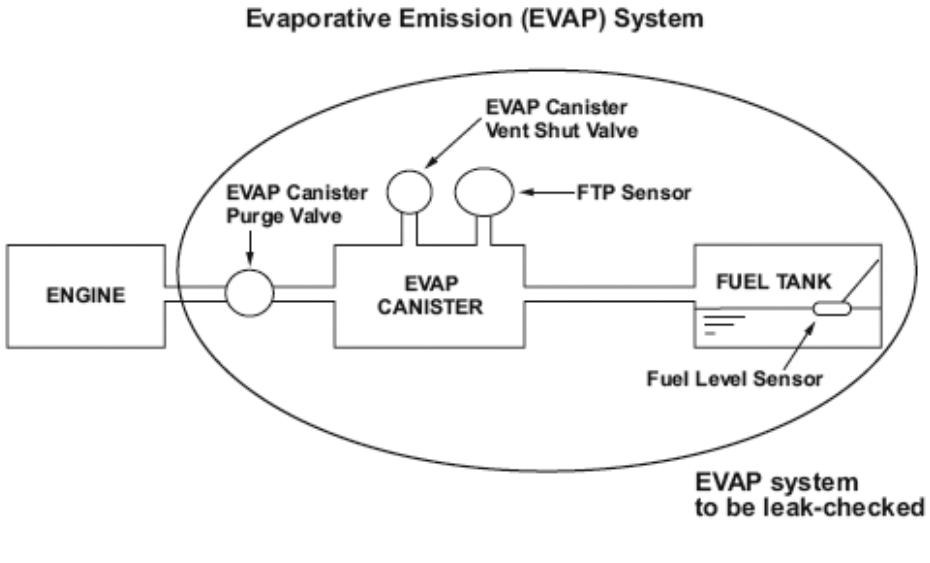

Fig. 15: Checking Continuity Between ECM Connector Terminal A9 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 34.

NO - Repair open in the wire between the ECM (A9) and the FTP sensor, then go to step 28.

21. Turn the ignition switch OFF.
22. Jump the SCS line with the HDS.
23. Disconnect ECM connector A (44P).
24. Connect FTP sensor 3P connector terminal No. 2 to body ground with a jumper wire.

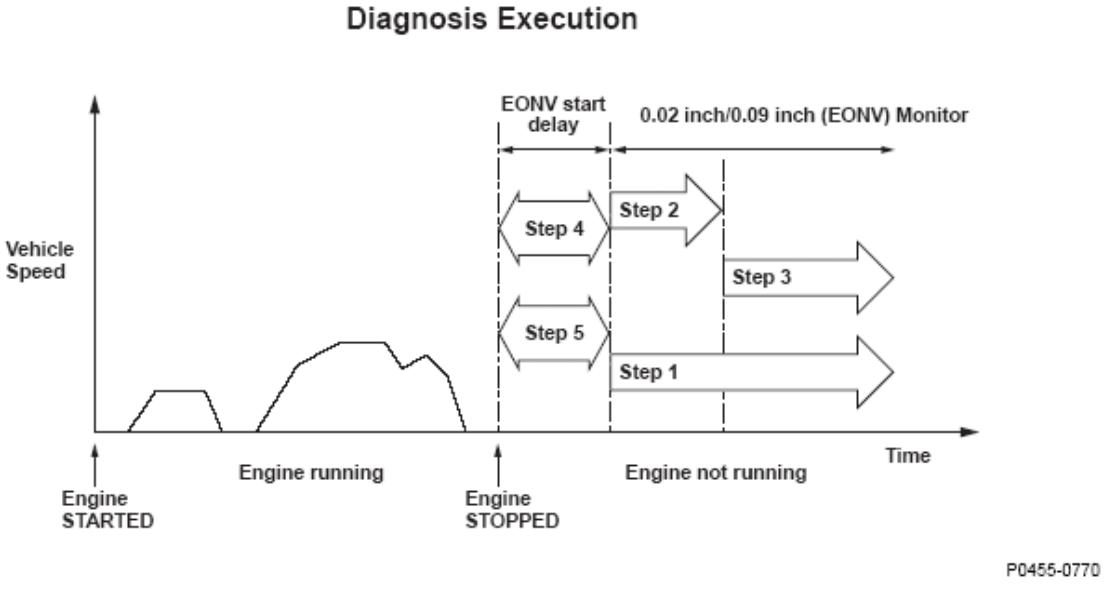

Fig. 16: Connecting FTP Sensor 3P Connector Terminal No. 2 To Body Ground With Jumper Wire

Courtesy of AMERICAN HONDA MOTOR CO., INC.

25. Check for continuity between ECM connector terminal A26 and body ground.

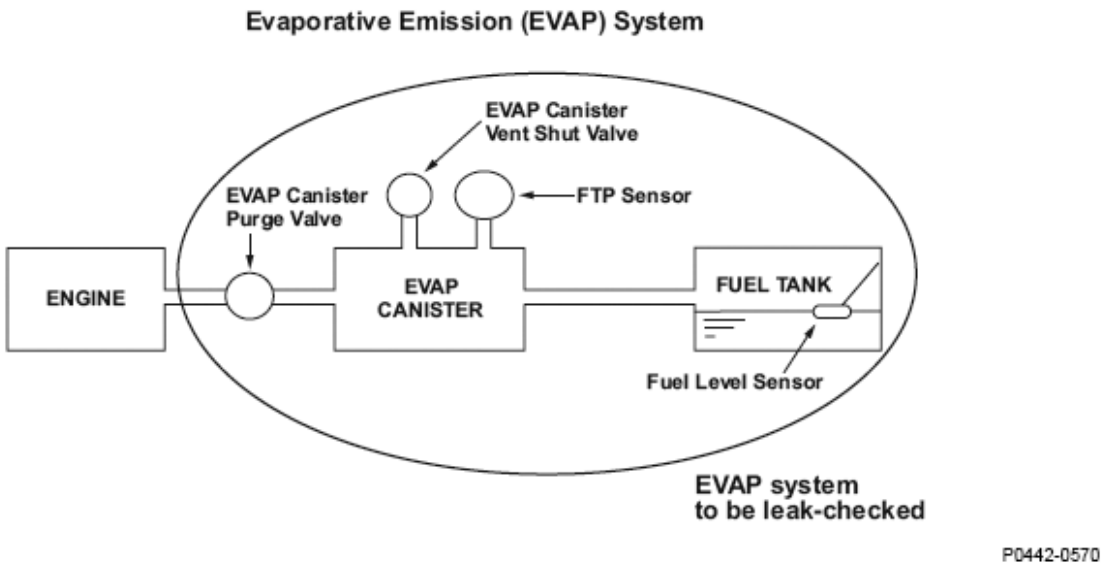

Fig. 17: Checking Continuity Between ECM Connector Terminal A26 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 34.

NO - Repair open in the wire between the ECM (A26) and the FTP sensor, then go to step 28.

26. Turn the ignition switch OFF.
27. Replace the FTP sensor (see **FTP SENSOR REPLACEMENT**).
28. Reconnect all connectors.
29. Turn the ignition switch ON (II).
30. Reset the ECM with the HDS.
31. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
32. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0453 indicated?

YES - Check for poor connections or loose terminals at the FTP sensor and the ECM, then go to step 1.

NO - Go to step 33.

33. Monitor the OBD STATUS for DTC P0453 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in step 32, go to the indicated DTC's troubleshooting.

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the FTP sensor and the ECM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

34. Reconnect all connectors.
35. Update the ECM if it does not have the latest software (see **UPDATING THE ECM**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM**).
36. Start the engine, and let it idle.
37. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0453 indicated?

    YES - Check for poor connections or loose terminals at the FTP sensor and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 36. If the ECM was substituted, go to step 1.

    NO - Go to step 38.

38. Monitor the OBD STATUS for DTC P0453 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM (see **ECM REPLACEMENT**). If any other Temporary DTCs or DTCs were indicated in step 37, go to the indicated DTC's troubleshooting.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the FTP sensor and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM**), then go to step 36. If the ECM was substituted, go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P0455: EVAP SYSTEM LARGE LEAK DETECTED; DTC P0456: EVAP SYSTEM VERY SMALL LEAK DETECTED

NOTE: **The fuel system is designed to allow specified maximum vacuum and pressure conditions. Do not deviate from the vacuum and pressure tests as indicated in these procedures. Excessive pressure/vacuum would damage the EVAP components or cause eventual fuel tank failure.**

Special Tools Required

Vacuum pump/gauge, 0-30 in.Hg, Snap-on YA4000A or equivalent, commercially available

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**

- **Fresh fuel has a higher volatility that will create greater pressure/vacuum. The optimum condition for testing is less than a full tank of fresh fuel. If possible, to assist in leak detection, add 1 gallon of fresh fuel to the tank (as long as it will not fill the tank), just before starting these procedures.**

1. Check the fuel fill cap (the cap must say "TIGHTEN TO CLICK"). It should turn 1/4 turn after it's tight, then it clicks.

   Is the correct fuel fill cap installed and properly tightened?

   YES - Go to step 2.

   NO - Replace or tighten the cap, then go to step 30.

2. Check the fuel fill cap seal (A) and the fuel fill pipe mating surface (B). Verify that the fuel fill cap tether cord (C) is not caught under the cap.

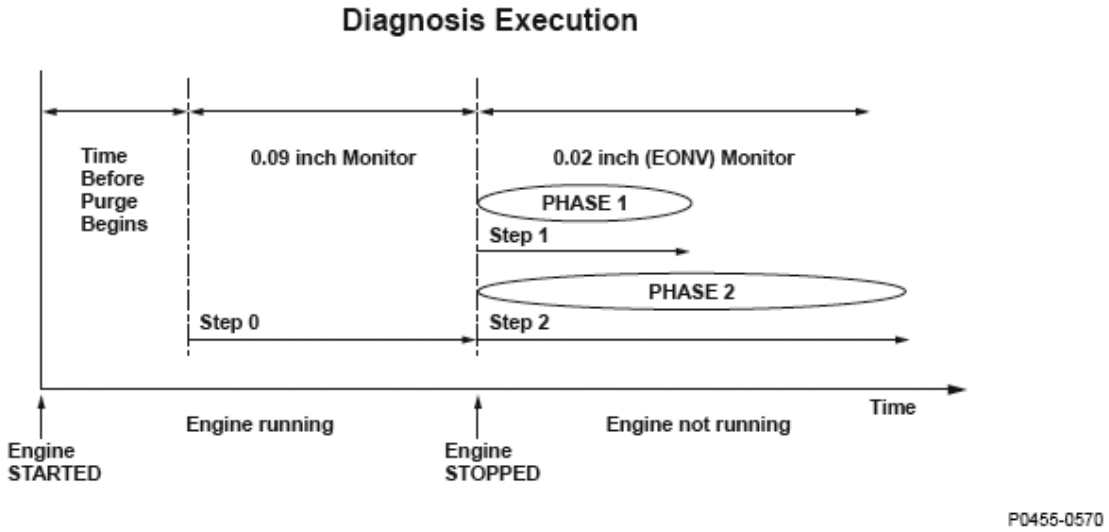

Fig. 18: Checking Fill Cap Seal And Fuel Fill Pipe Mating Surface
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the fuel fill cap seal missing or damaged, is the fuel fill pipe damaged, or is the tether cord caught under the cap?

YES - Replace the fuel fill cap or the fuel fill pipe, then go to step 30.

NO - Go to step 3.

3. Turn the ignition switch ON (II).
4. Clear the DTC with the HDS.
5. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the FTP sensor, the EVAP canister purge valve, or the EVAP canister vent shut valve and the ECM.

NO - Go to step 6.

6. Turn the ignition switch OFF.
7. Check for a poor connection or damage at the fuel tank vapor recirculation tube.

   Is the tube OK?

   YES - Go to step 8.

   NO -

   - Replace the fuel tank vapor recirculation tube, then go to step 30.
   - If necessary, replace the fuel tank (see **FUEL TANK REPLACEMENT**), then go to step 30.
8. Disconnect the fuel tank vapor recirculation tube (A) from the EVAP canister (B), and plug the EVAP canister port (C).

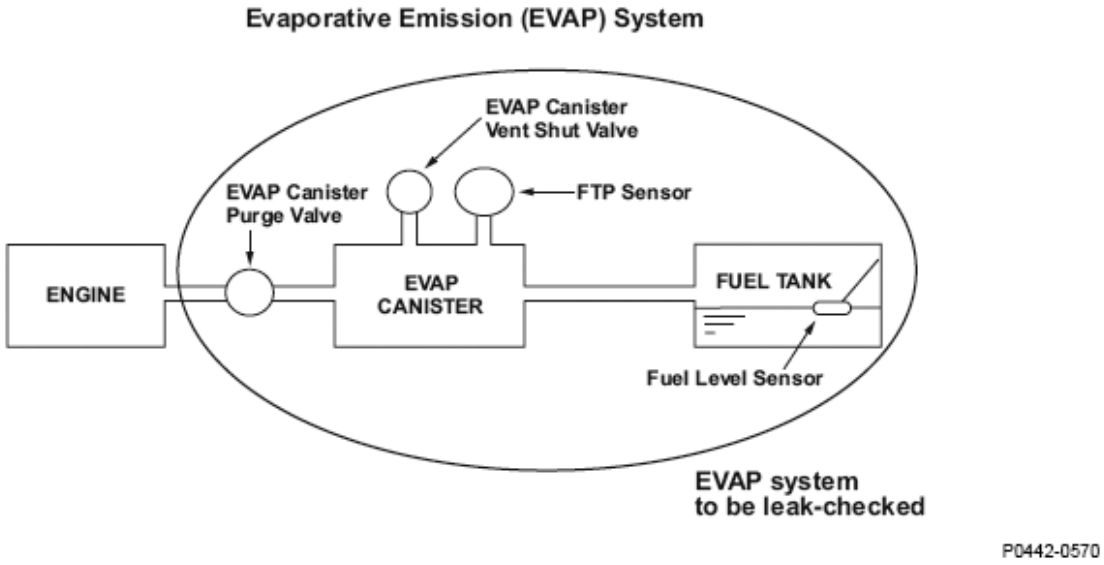

Fig. 19: Disconnecting Fuel Tank Vapor Recirculation Tube From EVAP Canister
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Disconnect the vacuum hose (purge line) (A) from the EVAP canister purge valve (B) in the engine compartment, and connect a vacuum pump/gauge, 0-30 in.Hg, to the vacuum hose as shown.

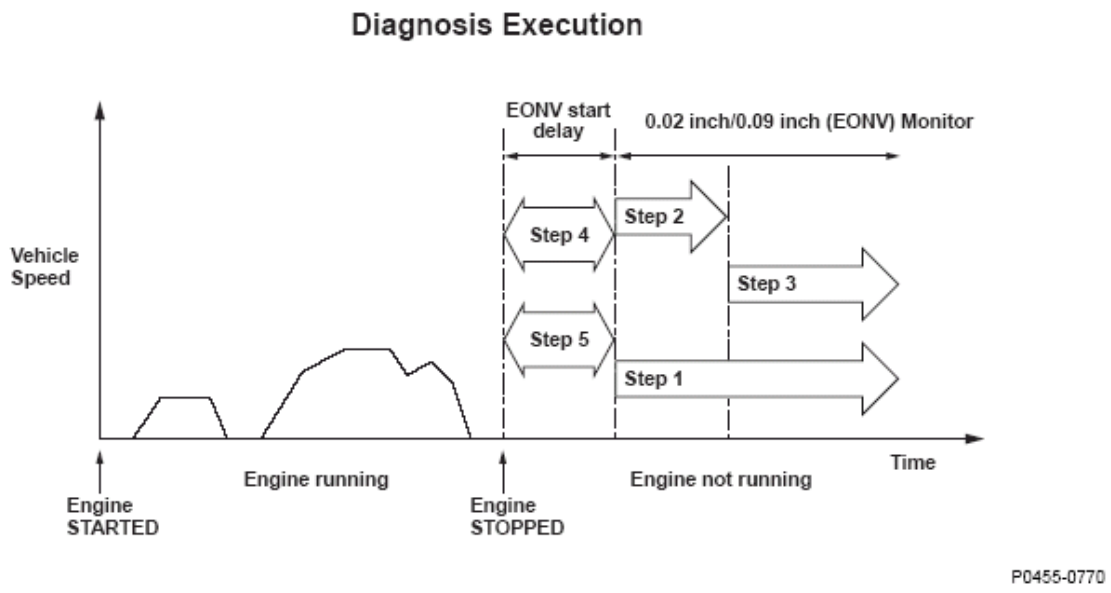

Fig. 20: Disconnecting Vacuum Hose (Purge Line)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Turn the ignition switch ON (II).
11. Select EVAP CVS ON in the INSPECTION MENU with the HDS.
12. Apply vacuum to the hose until the FTP reads 1.90 V (-0.59 in.Hg, -15.1 mmHg).

NOTE: Be careful not to exceed the pressure. If you exceed the pressure, the FTP sensor can be damaged.

13. Select EVAP PCS OFF in the INSPECTION MENU with the HDS.
14. Monitor the FTP SENSOR in the DATA LIST for 1 minute with the HDS.

Does the voltage increase more than 0.2 V (0.1 in.Hg, 0.5 mmHg)?

YES - Go to step 14.

NO - Go to step 22.

15. Turn the ignition switch to LOCK (0).
16. Disconnect the vacuum pump/gauge from the EVAP canister purge valve.
17. Reconnect the vacuum hose (engine side) (A) to the EVAP canister purge valve (B) and disconnect the vacuum hose (EVAP canister side) (C) from the EVAP canister purge valve, then connect a vacuum pump/gauge, 0-30 inHg, to the vacuum hose as shown.
18. Turn the ignition switch to ON (II).

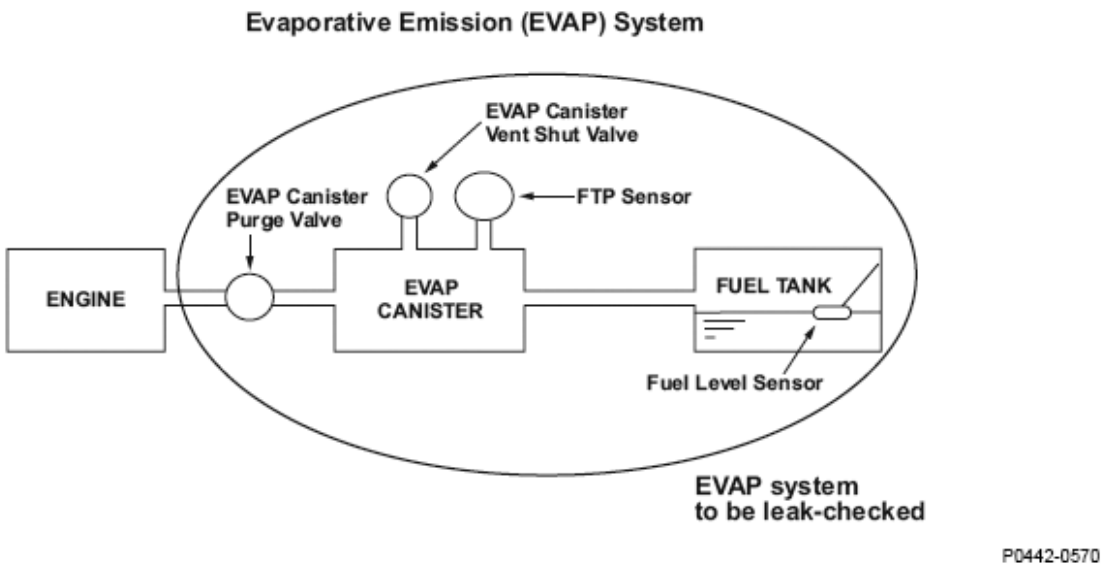

Fig. 21: Disconnecting Fresh Air Hose From EVAP Canister
Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. Apply vacuum to the hose until the FTP reads 1.90 V (-0.59 inHg, -15.1 mmHg).

NOTE: Be careful not to exceed the vacuum. If you do, the FTP sensor can be damaged.

20. Monitor the FTP SENSOR in the DATA LIST for 1 minute with the HDS.

Does the voltage increase more than 0.2 V (0.1 in.Hg, 2.5 mmHg)?

YES - Go to step 18.

NO - Replace the EVAP canister vent shut valve, then go to step 29.

21. Check for a loose or damaged EVAP canister purge line between the EVAP canister and the EVAP canister purge valve.

Are the line and the EVAP canister OK?

YES - Replace these parts, then go to step 29:

- FTP sensor O-ring
- EVAP canister vent shut valve case and O-ring
- EVAP canister

NO - Reconnect or repair the EVAP canister purge hose, then go to step 29.

22. Reconnect the fresh air hose (A) to the EVAP canister (B).
23. Reconnect the vacuum hose (engine side) (A) to the EVAP canister purge valve (B) and disconnect the vacuum hose (EVAP canister side) (C) from the EVAP canister purge valve, then connect a vacuum pump/gauge, 0-30 inHg, to the vacuum hose as shown.

24. Select EVAP CVS ON in the INSPECTION MENU with the HDS.
25. Apply vacuum to the EVAP system until the FTP reads 1.90 V (-0.59 inHg, -15.1 mmHg).

NOTE: Be careful not to exceed the vacuum. If you exceed the vacuum, the FTP sensor can be damaged.

26. Monitor the FTP SENSOR in the DATA LIST for 1 minute with the HDS.

Does the voltage increase more than 0.2 V (0.1 inHg, 2.5 mmHg)?

YES - Replace the EVAP canister vent shut valve, then go to step 29.

NO - Go to step 26.

27. Select EVAP CVS OFF in the INSPECTION MENU with the HDS.
28. Check these parts for looseness or damage:
    - Fuel fill pipe
    - Fuel vapor return pipe

Are the parts OK?

YES - Check the fuel tank unit base gasket (see **FUEL TANK REPLACEMENT**), and check the fuel tank, then go to step 21.

NO - Repair or replace the damaged parts, then go to step 21.

29. Reconnect all hoses and connectors.
30. Turn the ignition switch ON (II).
31. Reset the ECM with the HDS.
32. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
33. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

Is the result OK?

YES - Troubleshooting is complete.

NO - Check for poor connections or loose terminals at the FTP sensor, the EVAP canister purge valve, the EVAP canister vent shut valve, and the ECM, then go to step 1.

DTC P0457: EVAP SYSTEM LEAK DETECTED/FUEL FILL CAP LOOSE OR MISSING

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Check the fuel fill cap (the cap must say "TIGHTEN TO CLICK"). It should turn 1/4 turn after it's tight, then it clicks.

Is the correct fuel fill cap installed and properly tightened?

YES - Go to step 2.

NO - Replace or tighten the cap, then go to step 19.

2. Check the fuel fill cap seal (A) and the fuel fill pipe mating surface (B). Verify that the fuel fill cap tether cord (C) is not caught under the cap.

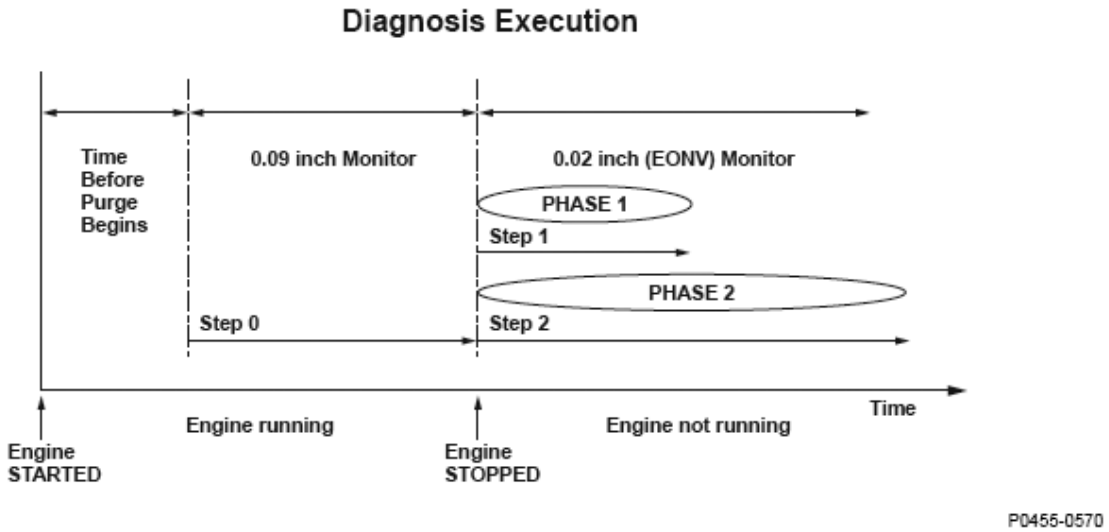

Fig. 22: Checking Fuel Fill Cap Seal And Fuel Fill Pipe Mating Surface
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the fuel fill cap seal missing or damaged, is the fuel fill pipe damaged, or is the tether cord caught under the cap?

YES - Replace the fuel fill cap or the fuel fill pipe, then go to step 19.

NO - Go to step 3.

3. Turn the ignition switch ON (II).
4. Clear the DTC with the HDS.
5. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

Is the result OK?

YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the FTP sensor, or the EVAP canister vent shut valve, and the ECM.

NO - Go to step 6.

6. Turn the ignition switch OFF.
7. Remove the EVAP canister vent shut valve from the EVAP canister (see **EVAP CANISTER VENT SHUT VALVE REPLACEMENT**).
8. Connect the 2P connector to the EVAP canister vent shut valve.

9. Turn the ignition switch ON (II).
10. Select EVAP CVS ON in the INSPECTION MENU with the HDS.
11. Check the EVAP canister vent shut valve (A) operation.

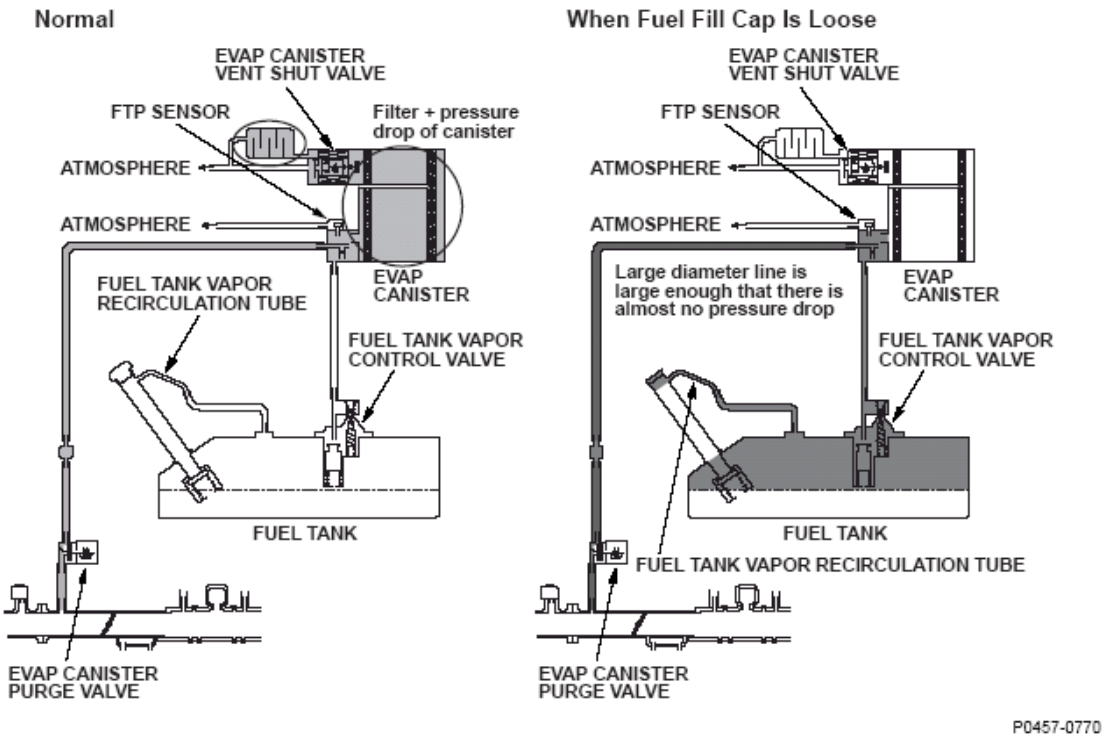

Fig. 23: Checking EVAP Canister Vent Shut Valve Operation
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Does the valve operate?

YES - Check the routing of the EVAP canister vent tube, then go to step 18.

NO - Go to step 12.

12. Turn the ignition switch OFF.
13. Replace the EVAP canister vent shut valve (see **EVAP CANISTER VENT SHUT VALVE REPLACEMENT**).
14. Turn the ignition switch ON (II).
15. Reset the ECM with the HDS.
16. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
17. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

Is the result OK?

YES - Troubleshooting is complete.

NO - Check for poor connections or loose terminals at the FTP sensor, the EVAP canister vent shut valve, and the ECM, then go to step 1.

18. Reinstall the EVAP canister vent shut valve.
19. Turn the ignition switch ON (II).
20. Reset the ECM with the HDS.
21. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
22. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

Is the result OK?

YES - Troubleshooting is complete.

NO - Check for poor connections or loose terminals at the FTP sensor, the EVAP canister vent shut valve, and the ECM, then go to step 1.

DTC P0496: EVAP SYSTEM HIGH PURGE FLOW DETECTED

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

Is the result OK?

YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the FTP sensor, the EVAP canister purge valve, the EVAP canister vent shut valve, and the ECM.

NO - Go to step 4.

4. Turn the ignition switch OFF.
5. Replace the EVAP canister purge valve (see **EVAP CANISTER VENT SHUT VALVE REPLACEMENT**).
6. Turn the ignition switch ON (II).
7. Reset the ECM with the HDS.
8. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
9. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

Is the result OK?

YES - Troubleshooting is complete.

NO - Check for poor connections or loose terminals at the FTP sensor, the EVAP canister purge valve, the EVAP canister vent shut valve, and the ECM, then go to step 1.

DTC P0497: EVAP SYSTEM LOW PURGE FLOW DETECTED ('06 MODEL)

Special Tools Required

- Vacuum/pressure gauge, 0-4 in.Hg, 07JAZ-001000B
- Vacuum pump/gauge, 0-30 in.Hg, Snap-on YA4000A or equivalent, commercially available

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Check the fuel fill cap installation (The cap must say "TIGHTEN TO CLICK". The cap should tighten 1/4 turn after it is tight.).

   Is the fuel fill cap installed and properly tightened?

   YES - Go to step 2.

   NO - Properly install the fuel fill cap, then go to step 23.

2. Turn the ignition switch ON (II).
3. Clear the DTC with the HDS.
4. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the FTP sensor, the EVAP canister purge valve, or the EVAP canister vent shut valve and the ECM.

   NO - Go to step 5.

5. Check for a loose or damaged EVAP canister purge line between the intake manifold and the EVAP canister purge valve.

   Is the line OK?

   YES - Go to step 6.

   NO - Reconnect or repair the EVAP canister purge line, then go to step 23.

6. Disconnect the vacuum hose (A) from the EVAP canister purge valve (B) in the engine compartment, and connect a T-fitting (C) from the vacuum gauge and the vacuum pump/gauge, 0-30 in.Hg, to the vacuum hose as shown.

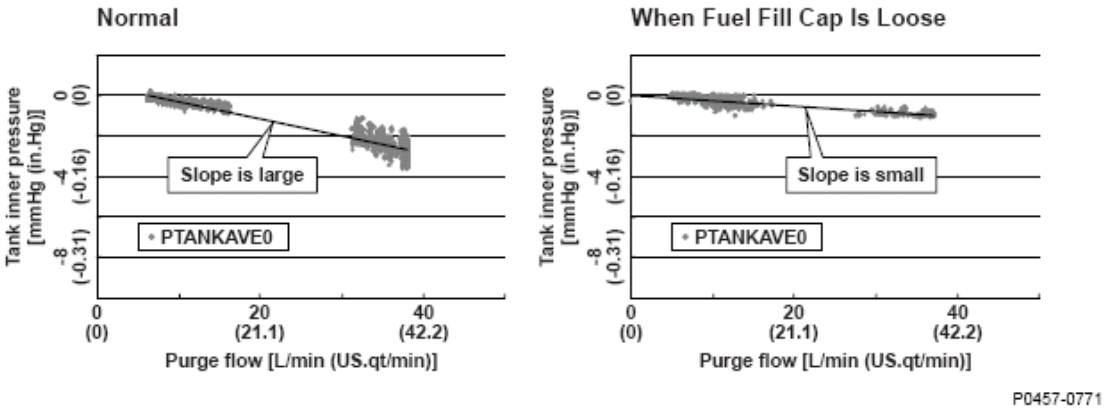

Fig. 24: Disconnecting Vacuum Hose From EVAP Canister Purge Valve In Engine Compartment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Select EVAP PCS ON in the INSPECTION MENU with the HDS.
8. Slowly apply about 0.6 in.Hg (15 mmHg) of vacuum to the hose.

   Does it hold vacuum?

   YES - Replace the EVAP canister purge valve, then go to step 22.

   NO - Go to step 9.

9. Reconnect the vacuum hose to the EVAP canister purge valve.
10. Disconnect the vacuum hose from the purge line (at the EVAP canister side), and connect a T-fitting (A) from the vacuum gauge and the vacuum pump/gauge, 0-30 in.Hg, to the hose as shown.

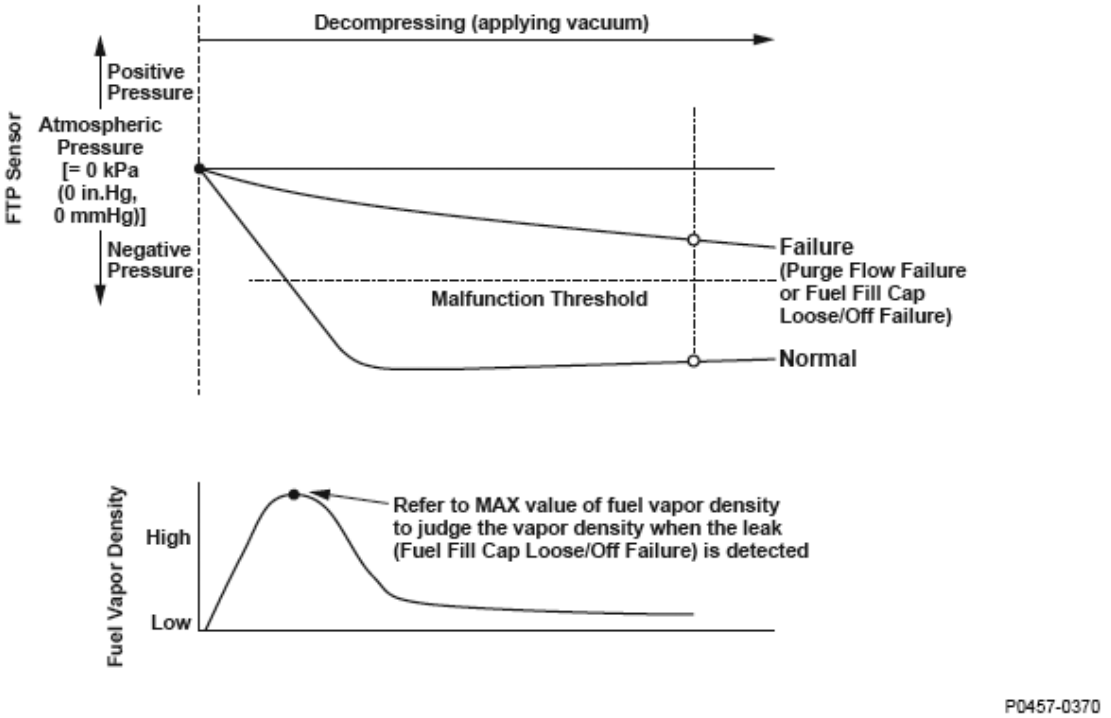

Fig. 25: Connecting T-Fitting From Vacuum Gauge And Vacuum Pump/Gauge To Hose
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Select EVAP PCS ON in the INSPECTION MENU with the HDS.
12. Slowly apply about 2 kPa (0.6 in.Hg, 15 mmHg) of vacuum to the hose.

Does it hold vacuum?

YES - Check for a restrictied EVAP canister purge line between the EVAP canister purge valve and the EVAP canister, then go to step 22.

NO - Go to step 13.

13. Remove the FTP sensor with its connector connected (see **FTP SENSOR REPLACEMENT**).
14. Connect a T-fitting (A) from the vacuum pump/gauge, 0-30 in.Hg, and the vacuum pump to the FTP sensor (B) as shown.

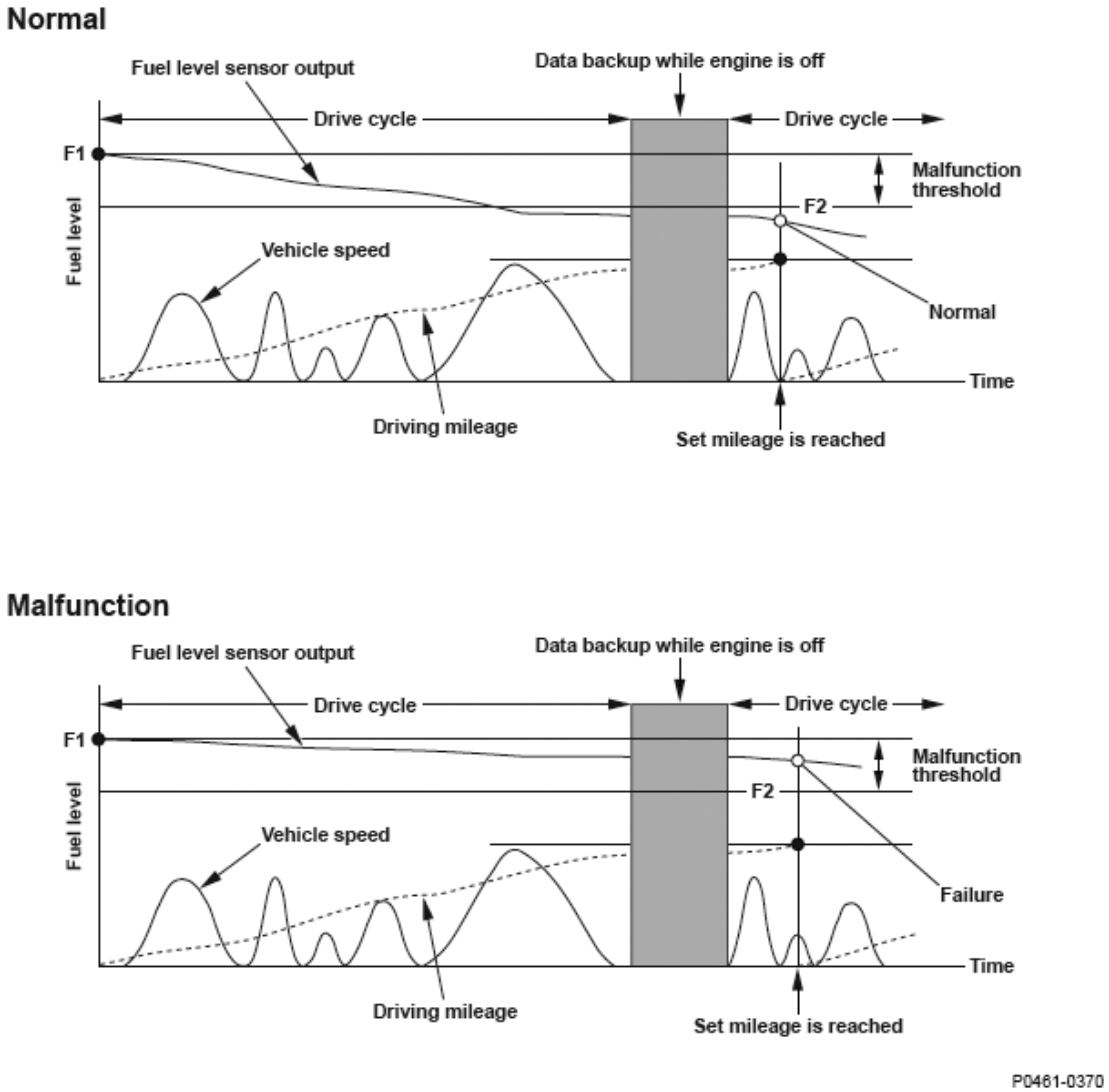

Fig. 26: Connecting T-Fitting From Vacuum Pump/Gauge And Vacuum Pump To FTP Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Check and record the FTP SENSOR reading in the DATA LIST with the HDS.
16. Slowly apply about 1.3 kPa (0.4 in.Hg, 10 mmHg) of vacuum to the hose.
17. Check the FTP SENSOR in the DATA LIST with the HDS.

    Is the difference more than 1.1 kPa (0.31 in.Hg, 8 mmHg) before and after applying vacuum?

    YES - Go to step 18.

    NO - Replace the FTP sensor (see **FTP SENSOR REPLACEMENT**), then go to step 22.

18. Reconnect the vacuum hoses to the EVAP canister purge line (EVAP canister side), and reinstall the FTP sensor.
19. Disconnect the vacuum hose (purge line) (A) from the EVAP canister purge valve (B), and connect a T-fitting (C) from the vacuum gauge and the vacuum pump/gauge, 0-30 in.Hg, to the hose as shown.

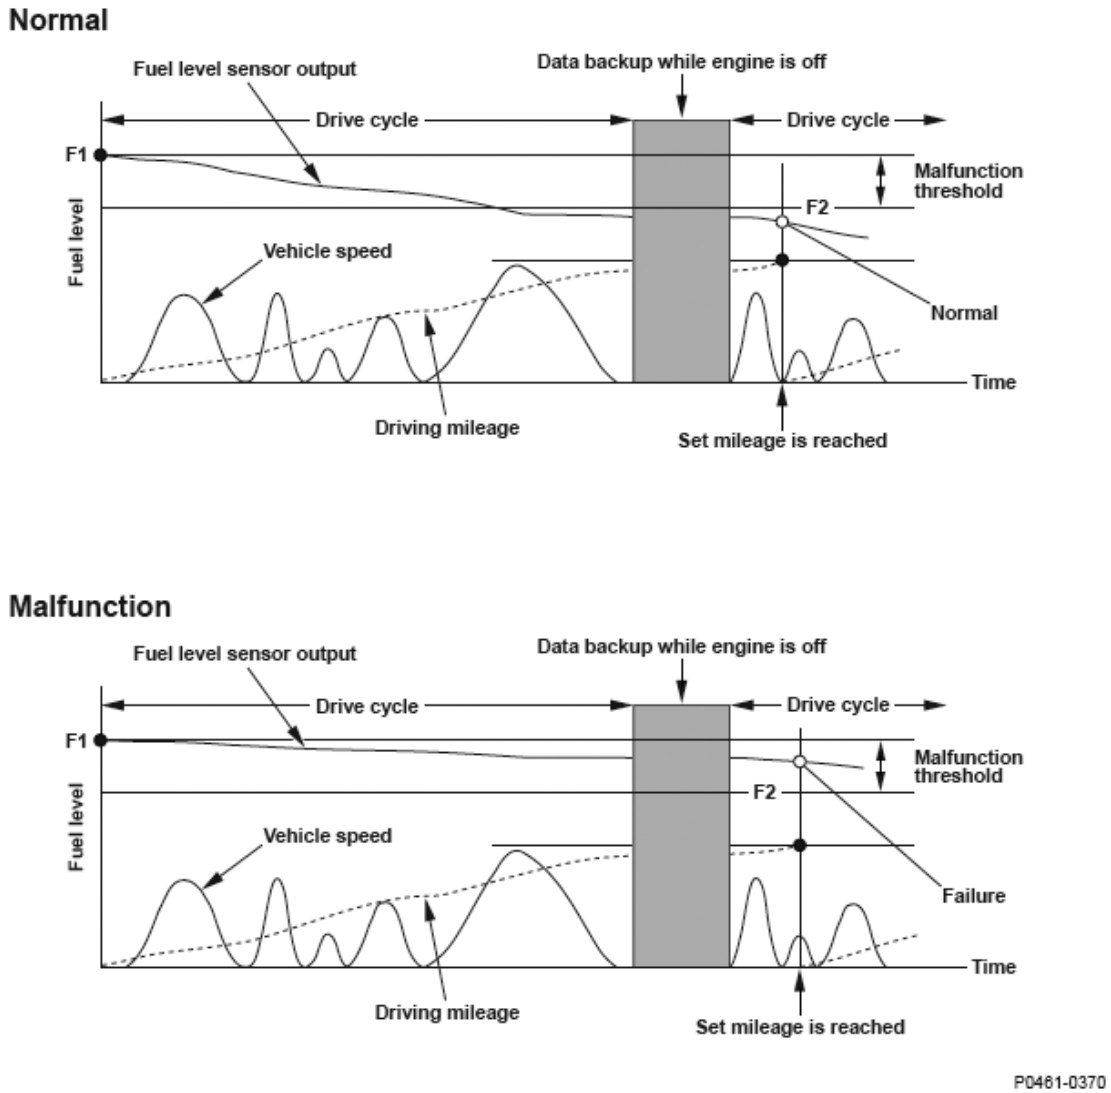

Fig. 27: Connecting T-Fitting From Vacuum Gauge And Vacuum Pump/Gauge To Hose
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Select EVAP CVS ON in the INSPECTION MENU with the HDS.
21. Slowly apply about 2 kPa (0.6 in.Hg, 15 mmHg) of vacuum to the hose.

    Does the hose hold vacuum?

    YES - Check for blockage at the EVAP canister port, then go to step 22.

    NO - Replace the EVAP canister vent shut valve (see **EVAP CANISTER VENT SHUT VALVE REPLACEMENT**), then go to step 22.

22. Reconnect all hoses.
23. Turn the ignition switch ON (II).
24. Reset the ECM with the HDS.
25. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
26. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

    Is the result OK?

    YES - Troubleshooting is complete.

    NO - Check for poor connections or loose terminals at the FTP sensor, the EVAP canister purge valve, the EVAP canister vent shut valve, and the ECM, then go to step 1.

DTC P0497: EVAP SYSTEM LOW PURGE FLOW DETECTED ('07 MODEL)

Special Tools Required

- Vacuum/pressure gauge, 0-4 in.Hg 07JAZ-001000B
- Vacuum pump/gauge, 0-30 in.Hg, Snap-on YA4000A or equivalent, commercially available

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

    Is the result OK?

    YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the FTP sensor and the ECM.

    NO - Go to step 4.

4. Turn the ignition switch OFF.
5. Check for poor connection, blockage, or damage at the EVAP canister purge line between the throttle

body and the EVAP canister.

Is the line OK?

YES - Go to step 5.

NO - Reconnect or repair the EVAP canister purge line, then go to step 25.

6. Disconnect the vacuum hose (A) from the EVAP canister purge valve (B).

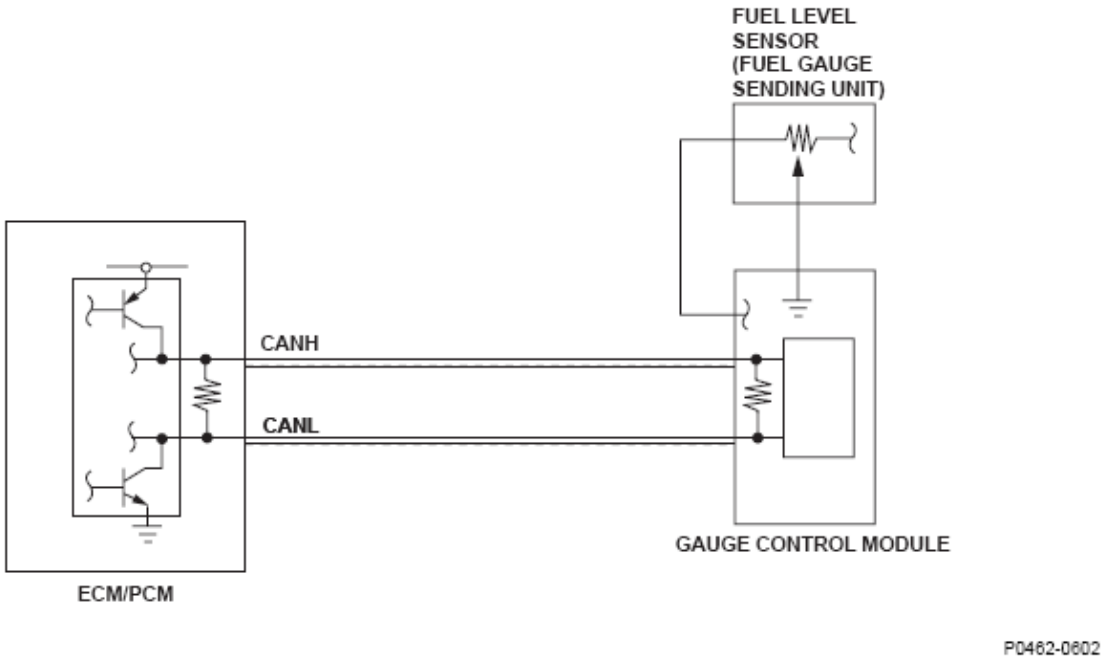

Fig. 28: Disconnecting Vacuum Hose From EVAP Canister Purge Valve
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Disconnect the vacuum hose from the purge line (at the EVAP canister side), and connect a T-fitting (A) from the vacuum gauge and the vacuum pump/gauge, 0-30 in.Hg, to the hose as shown.

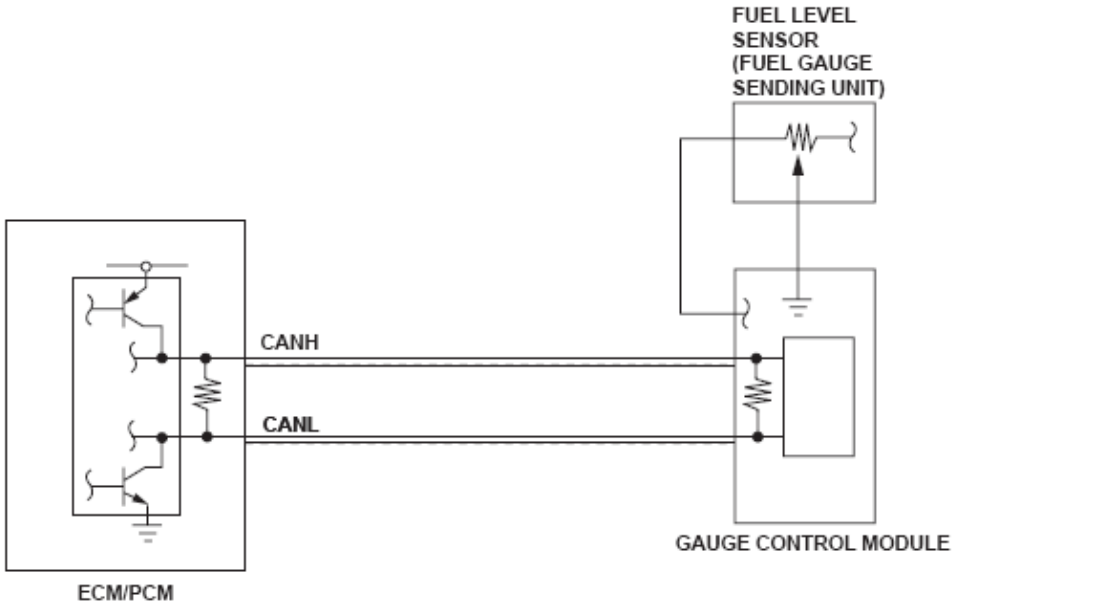

Fig. 29: Connecting T-Fitting From Vacuum Gauge And Vacuum Pump/Gauge To Hose
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Apply about 2 kPa (0.6 in.Hg, 15 mmHg) of vacuum to the hose.
9. Select EVAP PCS ON in the INSPECTION MENU with the HDS.

   Does the vacuum release momentary?

   YES - Go to step 15.

   NO - Go to step 10.

10. Select EVAP PCS OFF in the INSPECTION MENU with the HDS.
11. Disconnect the vacuum hose (A) from the EVAP canister purge valve (B). Connect a T-fitting (C) from the vacuum gauge and the vacuum pump/gauge, 0-30 in.Hg, and the EVAP canister purge valve as shown.

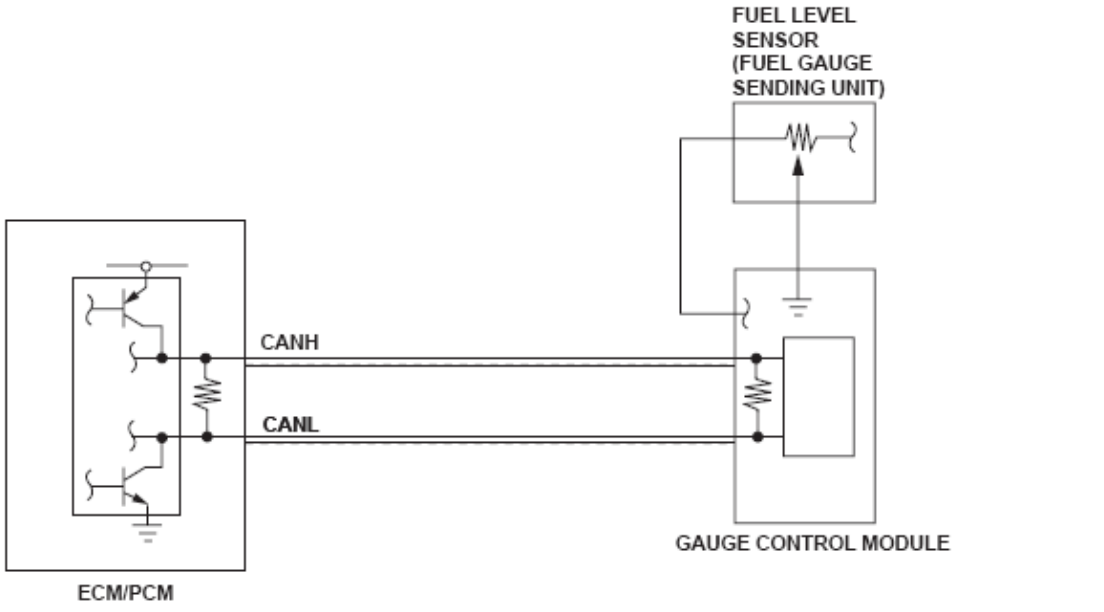

Fig. 30: Connecting T-Fitting From Vacuum Gauge And Vacuum Pump/Gauge And EVAP Canister Purge Valve
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Apply about 2 kPa (0.6 in.Hg, 15 mmHg) of vacuum to the hose.
13. Turn the ignition switch to ON (II).
14. Select EVAP PCS ON in the INSPECTION MENU with the HDS.

    Does the vacuum release momentary?

    YES - Check for blockage in the EVAP canister purge line between the EVAP canister purge valve and the EVAP canister, then go to step 25.

    NO - Replace the EVAP canister purge valve (see **EVAP CANISTER VENT SHUT VALVE REPLACEMENT**), then go to step 25.

15. Connect the vacuum pump/gauge, 0-30 in.Hg, to the vacuum hose (A) as shown.

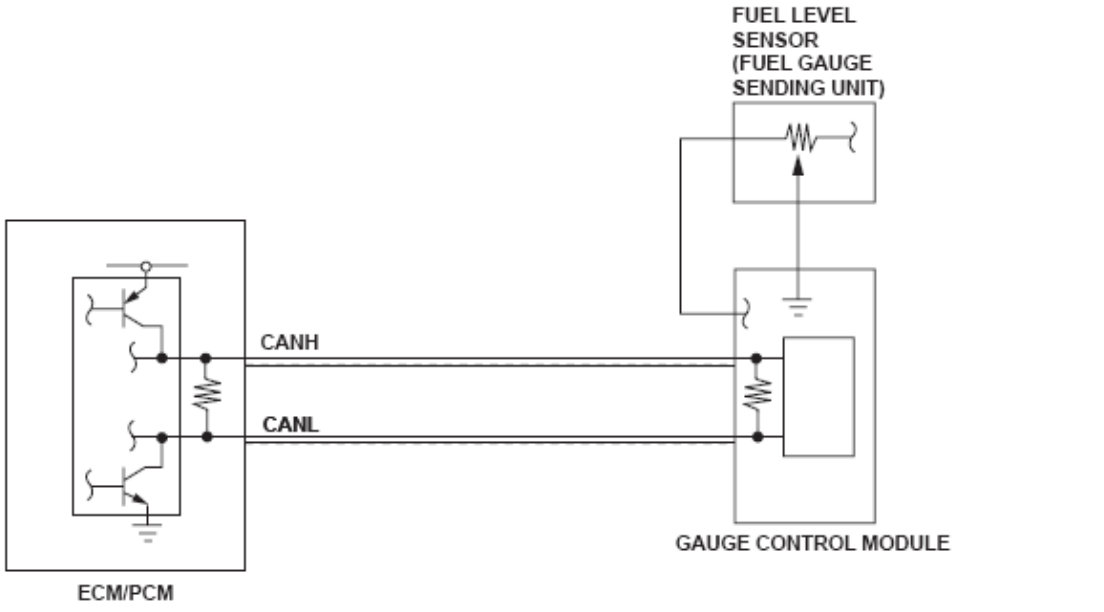

Fig. 31: Connecting Vacuum Pump/Gauge To Vacuum Hose Turn The Ignition Switch To On (Ii).
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Start the engine, and let it idle.

    Is there vacuum?

    YES - Go to step 16.

    NO - Check for blockage at the EVAP purge line between the throttle body and the EVAP canister purge valve, then go to step 25.

17. Turn the ignition switch OFF.
18. Remove the FTP sensor with its connector connected (see **FTP SENSOR REPLACEMENT**).
19. Connect a T-fitting (A) from the vacuum pump/gauge, 0-30 in.Hg, and the vacuum pump, to the FTP sensor (B) as shown.

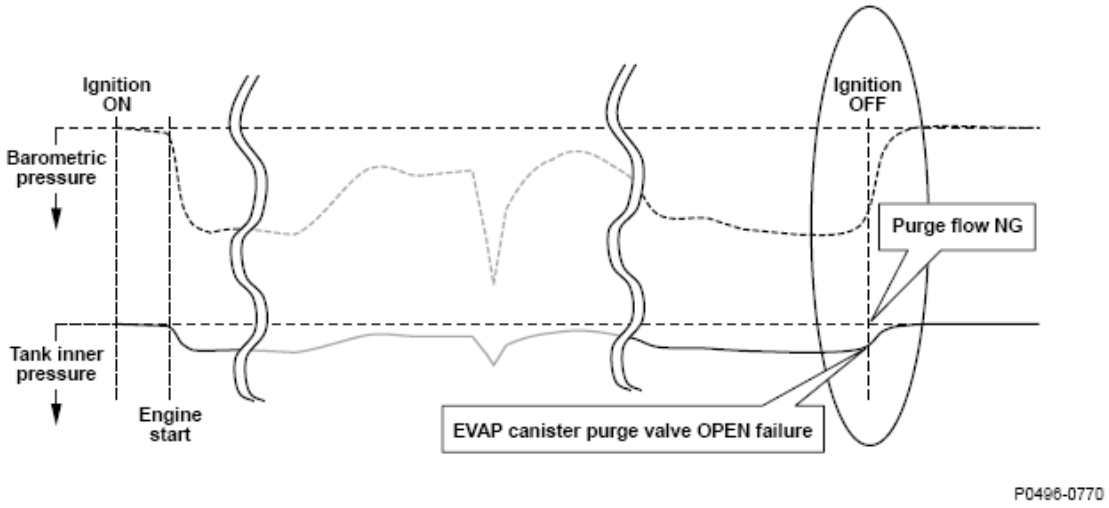

Fig. 32: Identifying T-Fitting And FTP Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Turn the ignition switch ON (II).
21. Check and record the FTP SENSOR reading in the DATA LIST with the HDS.
22. Slowly apply about 1.3 kPa (0.4 in.Hg, 10 mmHg) of vacuum to the hose.
23. Check the FTP SENSOR in the DATA LIST with the HDS.

Does the value change?

YES - Check for debris or blockage at the EVAP canister port, then go to step 25.

NO - Go to step 23.

24. Replace the FTP sensor (see **FTP SENSOR REPLACEMENT**).
25. Reconnect all hoses.
26. Turn the ignition switch ON (II).
27. Reset the ECM with the HDS.
28. Do the ECM idle learn procedure (see **ECM IDLE LEARN PROCEDURE**).
29. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

Is the result OK?

YES - Troubleshooting is complete.

NO - Check for poor connections or loose terminals at the FTP sensor and the ECM, then go to step 1.

DTC P0498: EVAP CANISTER VENT SHUT VALVE CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0498 indicated?

   YES - Go to step 6.

   NO - Go to step 4.

4. Select EVAP CVS ON in the INSPECTION MENU with the HDS.
5. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0498 indicated?

   YES - Go to step 6.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP canister vent shut valve and the ECM.

6. Turn the ignition switch OFF.
7. Disconnect the EVAP canister vent shut valve 2P connector.
8. Turn the ignition switch ON (II).
9. Measure voltage between EVAP canister vent shut valve 2P connector terminal No. 2 and body ground.

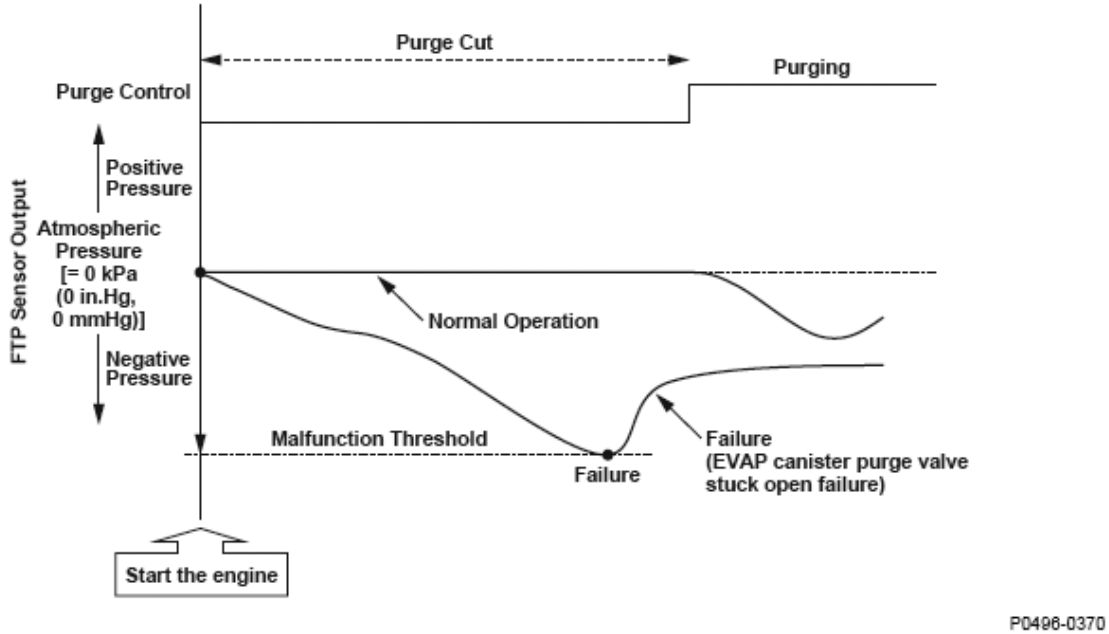

Fig. 33: Measuring Voltage Between EVAP Canister Vent Shut Valve 2P Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 10.

NO - Repair open in the wire between the EVAP canister vent shut valve and the PGM-FI subrelay, then go to step 18.

10. Turn the ignition switch OFF.
11. At the valve side, measure resistance between EVAP canister vent shut valve 2P connector terminals No. 1 and No. 2.

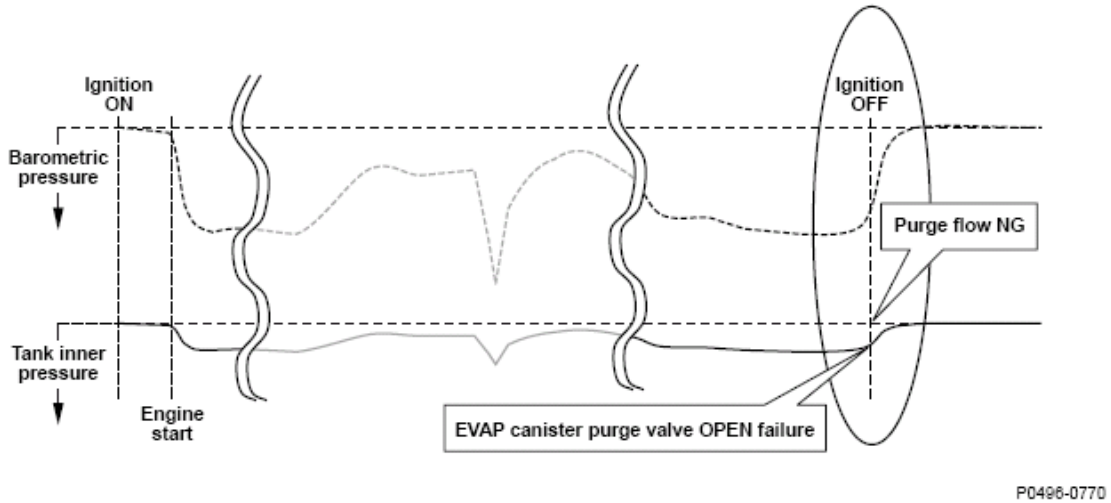

Fig. 34: Measuring Resistance Between EVAP Canister Vent Shut Valve 2P Connector Terminals No. 1 And 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 25-30 0, at room temperature?

YES - Go to step 12.

NO - Go to step 17.

12. Jump the SCS line with the HDS.
13. Disconnect ECM connector A (44P).
14. Check for continuity between ECM connector terminal A10 and body ground.

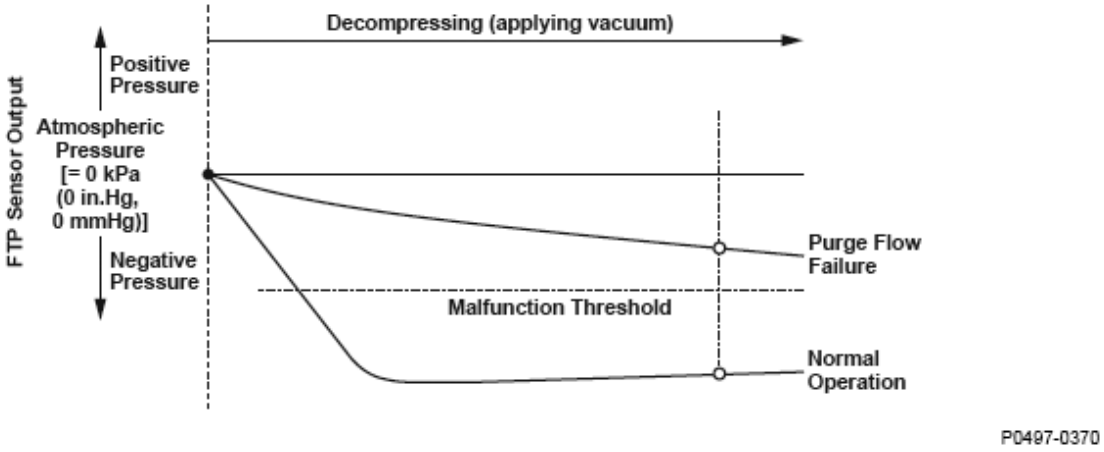

Fig. 35: Checking Continuity Between ECM Connector Terminal A10 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the EVAP canister vent shut valve and the ECM (A10), then go to step 18.

NO - Go to step 15.

15. Connect EVAP canister vent shut valve 2P connector terminal No. 1 to body ground with a jumper wire.
