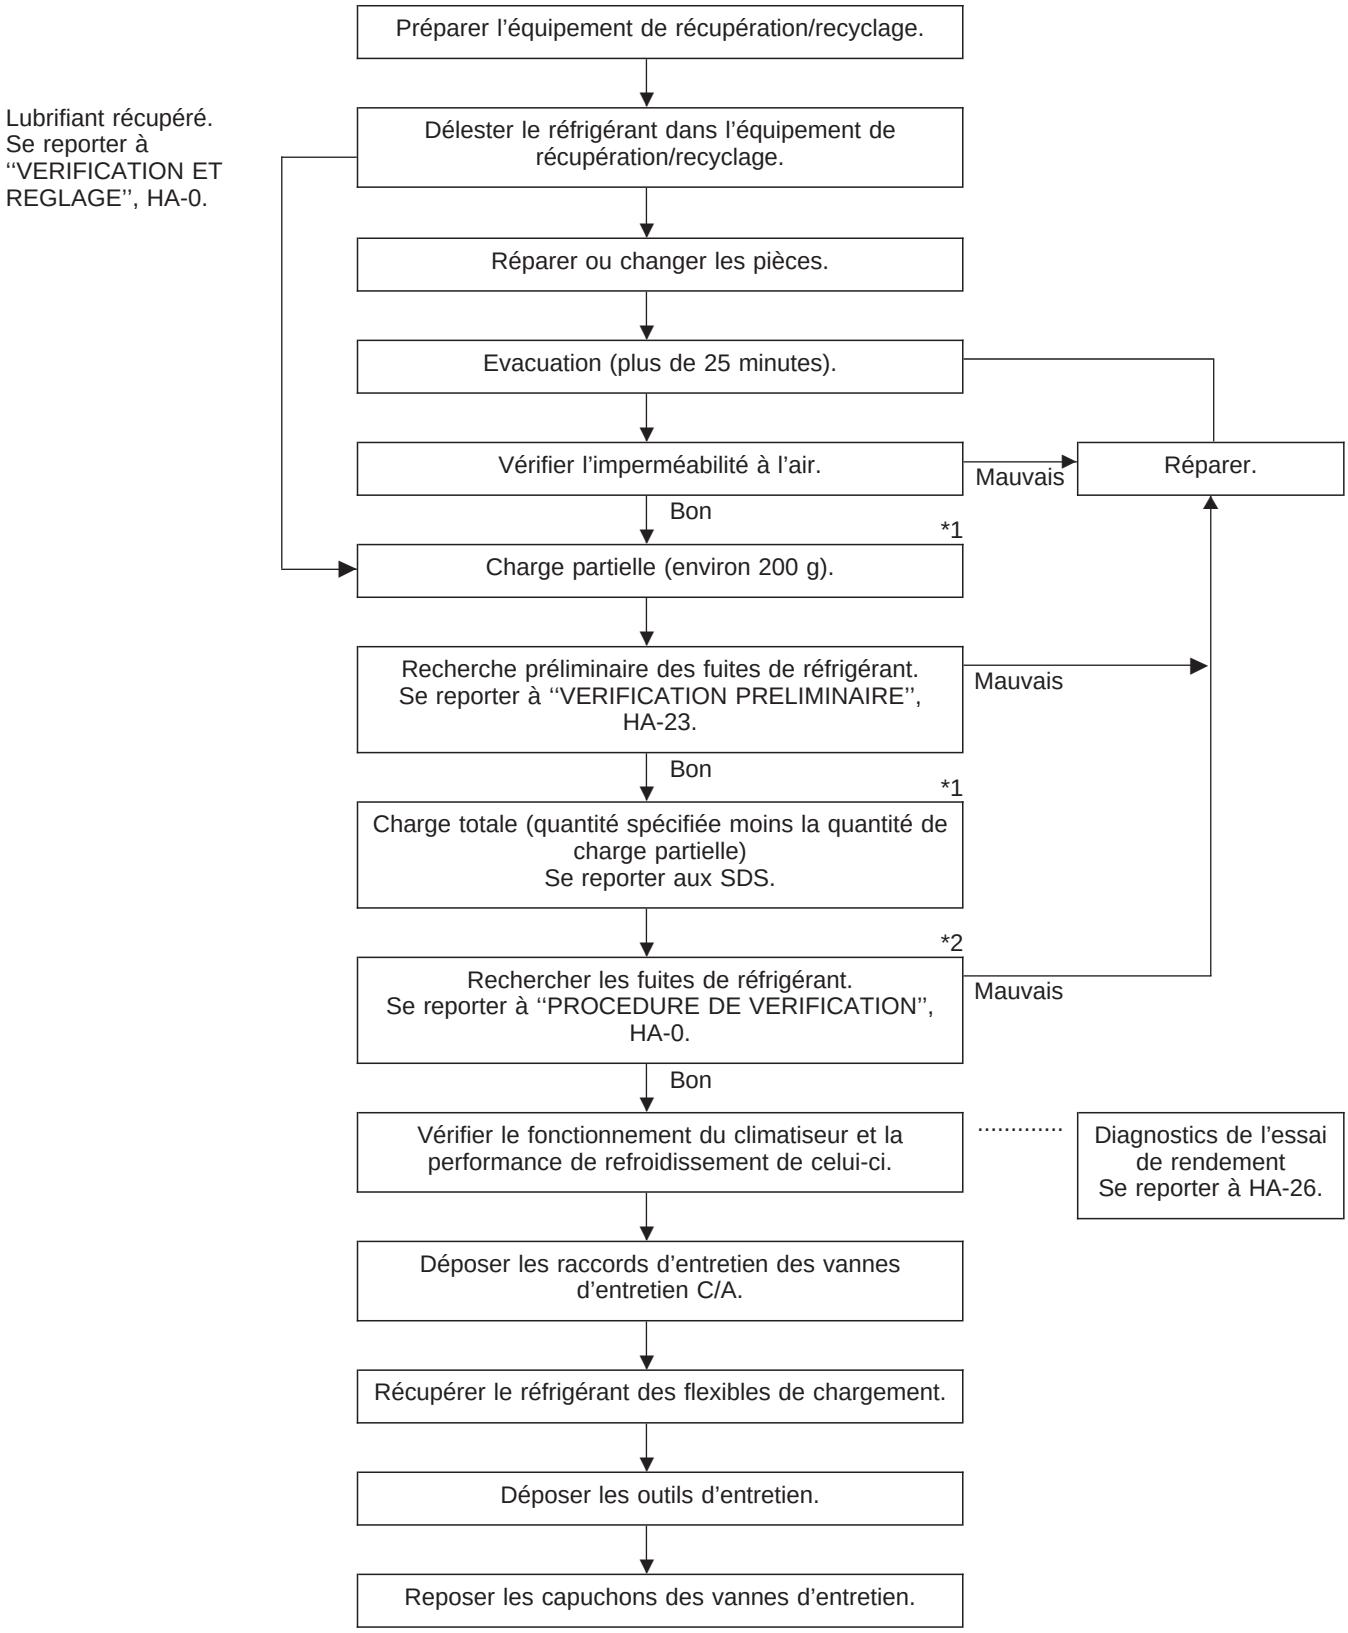
- Placer le curseur de commande de la température sur la position de CHAUD maxi.
  Régler le levier de volet de mélange d'air sur la position de chaud maxi. Tirer le câble externe dans le sens de la flèche, puis le serrer.
- **Après la repose du câble de commande de température, vérifier qu'il fonctionne correctement.**

CABLE DE COMMANDE DE VOLET D'ADMISSION



- Placer le curseur de recyclage sur la position .
  Régler le levier de recyclage sur le mode REC.
  Tirer le câble externe dans le sens de la flèche, puis le serrer.
- **Après la repose du câble de commande de volet d'admission, vérifier qu'il fonctionne correctement.**

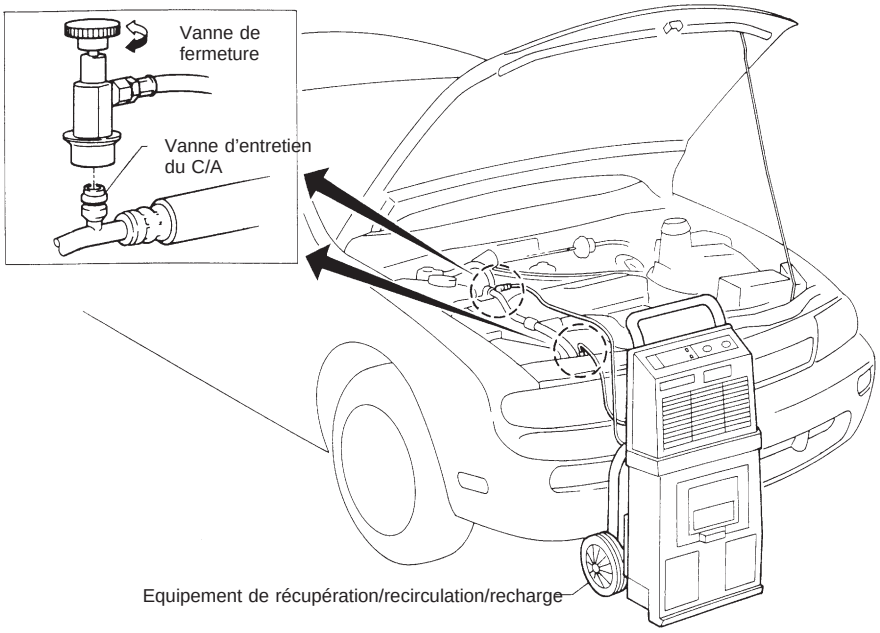
Procédure d'entretien du HFC-134a (R-134a)

Note : *1 Avant de remplir de réfrigérant, s'assurer que le moteur ne tourne pas.
*2 Avant de contrôler la présence éventuelle de fuites de réfrigérant, démarrer le moteur pour mettre en route le climatiseur, puis arrêter le moteur.
Les capuchons des vannes d'entretien doivent être reposés pour prévenir les fuites.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure d’entretien du HFC-134a (R-134a) (Suite)



INSTALLATION DES OUTILS ET DE L’EQUIPEMENT D’ENTRETIEN

DELESTAGE DU REFRIGERANT

AVERTISSEMENT :

Eviter d’inhaler du réfrigérant C/A, ou des vapeurs ou brouillard de lubrifiant. L’exposition peut irriter les yeux, le nez et la gorge. Evacuer le réfrigérant HFC-134a (R-134a) du système de climatisation à l’aide d’un équipement d’entretien agréé répondant aux normes de l’équipement de recyclage HFC-134a (R-134a), ou de l’équipement de récupération HFC-134a (R-134a). En cas de délestage accidentel, ventiler la zone de travail avant de reprendre l’opération d’entretien. Il est possible d’obtenir de plus amples informations sur la santé et la sécurité auprès des fabricants de réfrigérants et de lubrifiants.

Contrôle de la quantité de lubrifiant dans le compresseur

Le lubrifiant utilisé pour la lubrification du compresseur circule dans le système en même temps que le réfrigérant. Ajouter du lubrifiant au compresseur chaque fois que l'on remplace un composant quelconque ou qu'il se produit une fuite de gaz importante. Il est important de maintenir la quantité spécifiée.
Si la quantité de lubrifiant n'est pas maintenue à un niveau correct, les pannes suivantes risquent de se produire :

- Niveau de lubrifiant insuffisant : peut entraîner le grippage du compresseur.
- Quantité excessive de lubrifiant : refroidissement insuffisant (interférence avec l'échange thermique).

LUBRIFIANT

Nom : Huile du système de climatisation Nissan de type R
Numéro de pièce : KLH00-PAGR0

VERIFICATION ET REGLAGE

Faire l'appoint de lubrifiant en fonction du tableau ci-dessous.

DEMARRAGE

Est-ce que l'opération de retour de lubrifiant peut être effectuée ?
- Le climatiseur fonctionne correctement.
- Aucune fuite de lubrifiant importante n'est visible.

Oui → Effectuer l'opération de retour de lubrifiant en procédant comme suit :

1. Démarrer le moteur, et régler aux conditions suivantes :
   - **Condition d'essai**
     Régime du moteur : ralenti à 1 200 tr/mn
     Interrupteur C/A ou AUTO : MARCHE
     Vitesse de soufflerie : en position maxi.
     Commande de la temp. : optionnelle (régler de manière à ce que la température de l'air d'admission soit comprise entre 25 à 30°C)
2. **La rubrique suivante concerne les compresseurs V-5 et V-6. Brancher le manomètre du collecteur, et vérifier que la pression du côté haute pression est de 588 kPa (5,9 bar, 6 kg/cm^2) ou supérieure.**
   Si la pression est inférieure au niveau de référence, fixer un couvercle à l'avant du condenseur afin de faire monter la pression.
3. Effectuer l'opération de retour de lubrifiant pendant environ 10 minutes.
4. Arrêter le moteur.

ATTENTION :
Si l'on constate une fuite de lubrifiant excessive, ne pas effectuer l'opération de retour de lubrifiant.

Non

Le compresseur doit-il être remplacé ?

Non

Oui

Ⓐ (Passer à la page suivante).

Une pièce doit-elle être changée ? (Evaporateur, condenseur, réservoir de liquide ou en cas de fuite importante de lubrifiant manifeste).

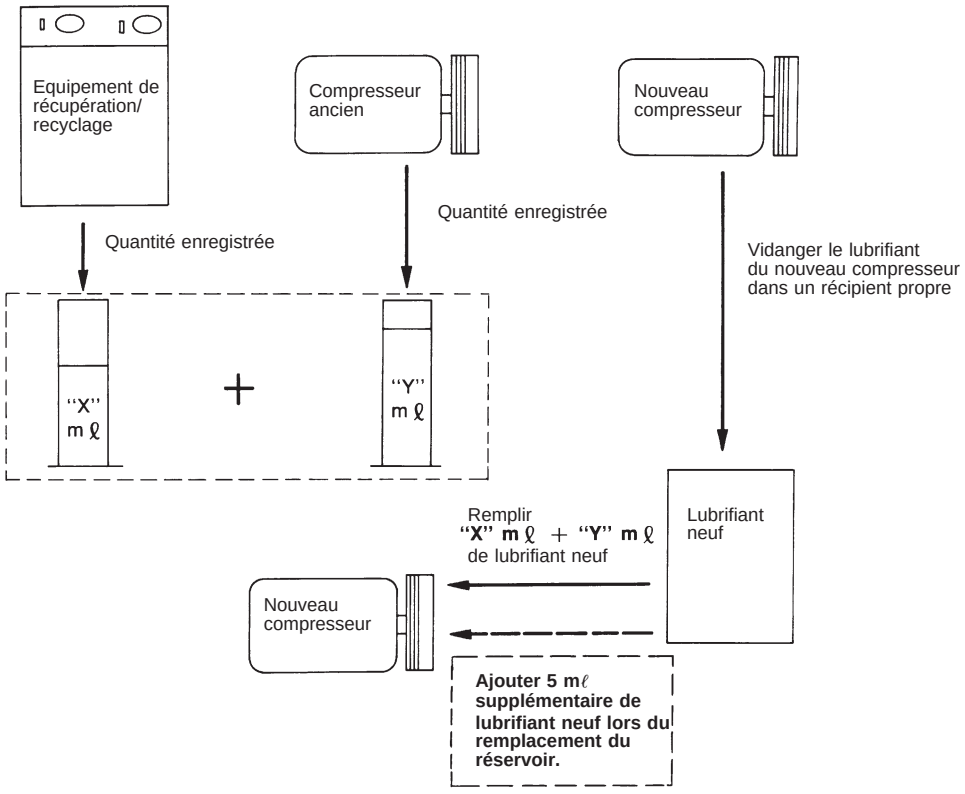
Oui → Après avoir remplacé une ou plusieurs pièces principales, rajouter la quantité de lubrifiant correcte dans le circuit.

Quantité de lubrifiant à ajouter

Pièce remplacée	Lubrifiant à ajouter au système Quantité de lubrifiant mℓ	Remarques
Evaporateur	75	–
Condenseur	75	–
Réservoir de liquide	5	En ajouter si le compresseur n'est pas remplacé. *1
En cas de fuite de réfrigérant	30	Fuite importante
	–	Fuite légère *2

*1 : Si l'on remplace le compresseur, l'appoint de lubrifiant est inclus dans le tableau de procédure.
*2 : Si la fuite de liquide réfrigérant est mineure, il n'est pas nécessaire d'ajouter de lubrifiant.

Non



Effectuer le test de performance du climatiseur.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Contrôle de la quantité de lubrifiant dans le compresseur (Suite)

Ⓐ

1. Délester le réfrigérant dans l'équipement de récupération/recyclage. Mesurer le lubrifiant délesté dans l'équipement de récupération/recyclage.
2. Déposer le bouchon de vidange du compresseur ''ancien'' (déposé) (seulement pour les compresseurs V-5, V-6 ou DKS-16H). Vidanger le lubrifiant dans un récipient gradué et enregistrer la quantité de lubrifiant vidangée.
3. Déposer le bouchon de vidange et vidanger le lubrifiant du ''nouveau'' compresseur dans un autre récipient propre.
4. Mesurer une quantité de lubrifiant neuf égale à la quantité vidangée de ''l'ancien'' compresseur. Ajouter ce lubrifiant au ''nouveau'' compresseur à travers l'orifice d'aspiration.
5. Mesurer une quantité de lubrifiant neuf égale à la quantité collectée pendant le délestage. Ajouter ce lubrifiant au ''nouveau'' compresseur à travers l'orifice d'aspiration.
6. Serrer le bouchon de vidange.
   Compresseur V-5 ou V-6 : 18 - 19 N·m (1,8 - 1,9 kg-m)
   Compresseur DKS-16H : 14 - 16 N·m (1,4 - 1,6 kg-m)
7. **Si le réservoir doit également être remplacé, ajouter 5 mℓ de lubrifiant supplémentaire à ce moment-là.**
   Ne pas ajouter ces 5 mℓ supplémentaires de lubrifiant si l'on ne remplace que le compresseur.

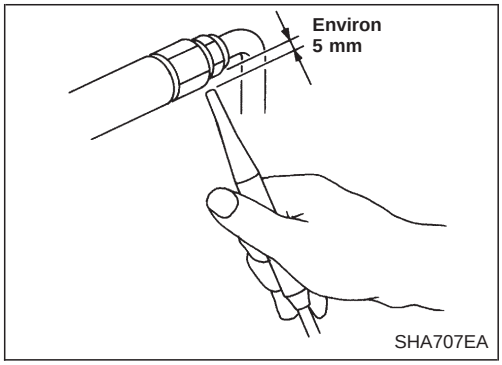
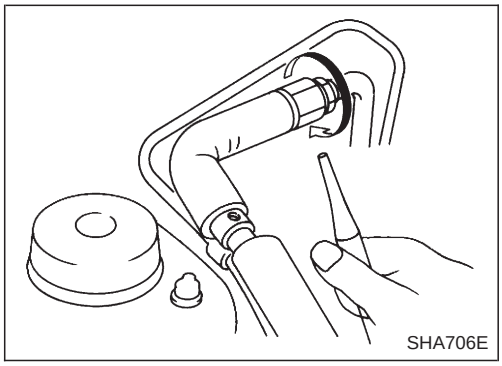
Vérification des fuites de réfrigérant



VERIFICATION PRELIMINAIRE

Effectuer une inspection visuelle de toutes les pièces de réfrigération, des raccords, des flexibles et des composants, pour voir s'ils ne présentent pas de fuites de lubrifiant de climatiseur, de dommage et de corrosion.

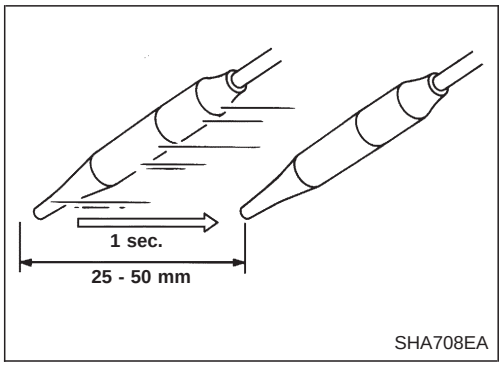
Détecteur de fuites de C/A
SHA705EB



PRECAUTIONS POUR LA MANIPULATION DU DETECTEUR DE FUITES

Pour la recherche des fuites de réfrigérant, utiliser un détecteur de fuites pour climatiseur ou un outil équivalent. S'assurer que l'instrument est calibré et qu'il est positionné selon les instructions de fonctionnement.
Le détecteur de fuites est un dispositif fragile. Pour l'utiliser correctement, lire les instructions de fonctionnement et effectuer tout entretien spécifié.
D'autres gaz dans la zone de travail ou substances sur les composants du climatiseur tels que antigel, lave-glace de pare-brise, dissolvants et produits de nettoyage peuvent fausser le déclenchement du détecteur de fuites. S'assurer que les surfaces à contrôler sont propres. Ne pas laisser la pointe du capteur du détecteur entrer en contact avec avec n'importe quelle substance. Ceci peut également entraîner une mauvaise interprétation et endommager le détecteur.

SHA707EA



1. Positionner la sonde à environ 5 mm du point à contrôler.

SHA706E

2. Lors du contrôle, déplacer la sonde tout autour de chaque raccord.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

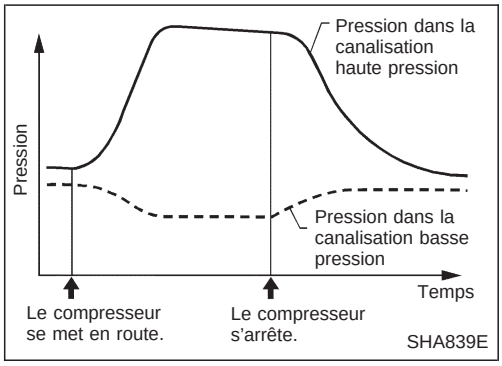
Vérification des fuites de réfrigérant (Suite)

3. Déplacer la sonde le long du composant à une vitesse d'environ 25 à 50 mm/sec.

PROCEDURE DE VERIFICATION

Pour éviter une lecture imprécise ou fausse, s'assurer qu'il n'y a aucune vapeur de réfrigérant ou fumée de cigarette à proximité du véhicule. Effectuer la recherche de fuites dans une zone calme (à l'abri des mouvements d'air/vent) de sorte que le réfrigérant qui fuit ne se disperse pas.

1. Arrêter le moteur.
2. Brancher un jeu de manomètre de collecteur de C/A adéquat sur les orifices d'entretien.
3. Vérifier si la pression du réfrigérant de climatiseur est au moins de 345 kPa (3,452 bar, 3,52 kg/cm^2) à une température supérieure à 16°C. Si elle se trouve en dessous des normes, purger le circuit et le recharger avec la quantité spécifiée de réfrigérant.
   REMARQUE : A des températures inférieures à 16°C, les fuites peuvent ne pas être détectées car le système n'atteint pas 345 kPa (3 452 bar, 3,52 kg/cm^2).
4. Effectuer la recherche de fuites de haut en bas, du point ⓐ au point ⓝ. Se reporter à HA-54.



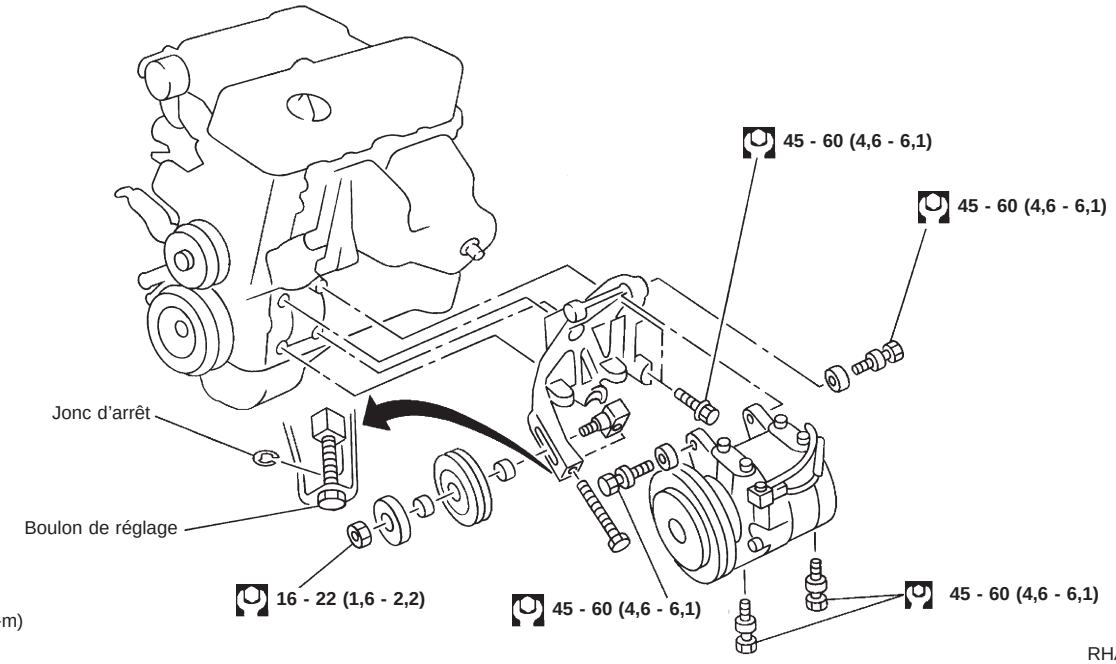
Effectuer avec précaution une recherche de fuites éventuelles dans les zones suivantes. Nettoyer le composant à contrôler et déplacer la sonde du détecteur de fuites tout autour du raccord/composant.

- **Compresseur**
  Vérifier les raccordements des flexibles de haute et basse pression, du limiteur de pression et du joint d'arbre.
- **Réservoir de liquide**
  Vérifier le manocontact, le raccordement du tube, les joints de soudure et les fixations des bougies de fusibles.
- **Soupapes d'entretien**
  Vérifier tout autour des soupapes d'entretien. S'assurer que les couvercles de soupapes d'entretien sont bien fixés sur les soupapes (pour éviter les fuites).
  REMARQUE : Après avoir déposé le jeu de manomètre de collecteur de C/A des vannes d'entretien, essuyer toute trace de résidus sur les soupapes afin d'éviter une lecture fausse due à une fuite dans le détecteur.
- **Unité de refroidissement (évaporateur)**
  Mettre le ventilateur de soufflerie en position rapide pendant au moins 15 secondes pour évacuer toute trace de réfrigérant de l'unité de refroidissement. Introduire la sonde du détecteur de fuites dans le flexible de vidange aussitôt après avoir coupé le contact (laisser la sonde à l'intérieur pendant au moins 10 secondes).

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Vérification des fuites de réfrigérant (Suite)

5. Si le détecteur détecte une fuite, vérifier au moins une fois en soufflant de l'air comprimé dans la zone de fuite suspectée avant de recommencer la vérification.
6. Ne pas arrêter lorsqu'une fuite est trouvée. Continuer de vérifier qu'il n'existe pas d'autres fuites dans tous les composants du système.
7. Démarrer le moteur.
8. Régler la commande de C/A du chauffage comme suit :
    a. Interrupteur de climatiseur sur MARCHE
    b. Mode facial
    c. Touche de recyclage sur MARCHE
    d. Température de froid maxi.
    e. Vitesse élevée du ventilateur
9. Faire tourner le moteur à un régime de 1 500 tr/mn pendant au moins 2 minutes.
10. Arrêter le moteur et effectuer une recherche de fuites éventuelles en répétant les étapes 4 à 6 décrites ci-dessus.



Les fuites de réfrigérant doivent être contrôlées immédiatement après l'arrêt du moteur. Commencer par détecter les fuites sur les canalisations haute pression. La pression dans la canalisation haute pression chutera progressivement après que la circulation du réfrigérant s'est arrêtée, et la pression dans la canalisation basse pression augmentera progressivement comme décrit sur la courbe. Il est plus facile de détecter les fuites lorsque la pression est élevée.

11. Délester le système C/A en utilisant un équipement de récupération de réfrigérant approuvé. Réparer les raccords ou composants qui comporteraient des fuites.
12. Purger et recharger le système C/A, puis procéder à un essai de fuite pour vérifier qu'il n'y a pas de fuites de réfrigérant.
13. Effectuer le test de performance du C/A pour s'assurer que le système fonctionne correctement.

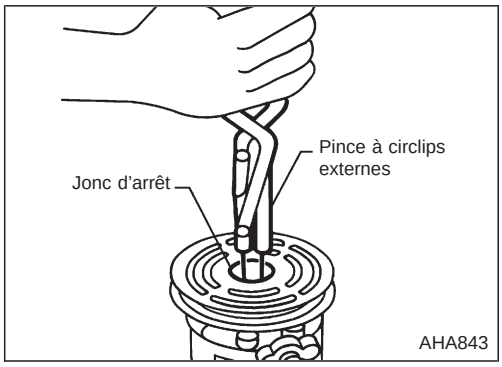
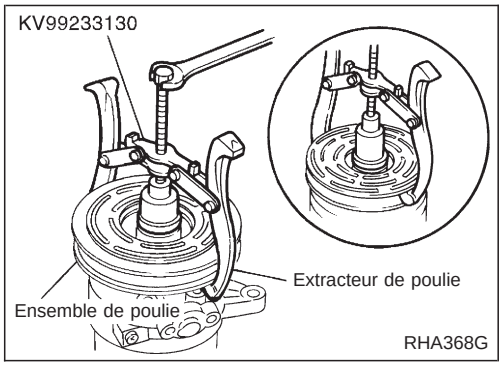
Compresseur – Modèle DKV-14C (marque ZEXEL)

Embrayage de compresseur – Modèle DKV-14C (marque ZEXEL)



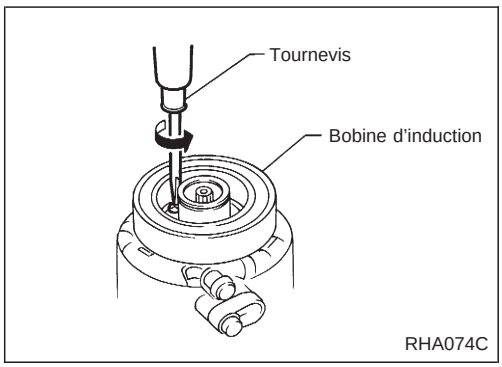
DEPOSE

- Lors de la dépose du boulon central, immobiliser le disque d'embrayage avec une clé pour disque d'embrayage.

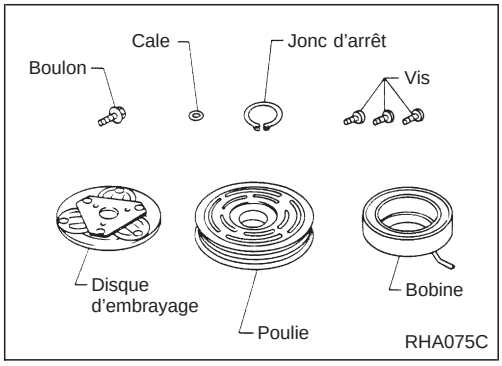


- Déposer le disque d'embrayage à l'aide de l'outil spécial KV99232340.
  Introduire les trois ergots de l'outil d'immobilisation dans le disque d'embrayage. Tourner l'outil dans le sens des aiguilles d'une montre afin de l'accrocher au plateau. Ensuite, serrer le boulon central pour déposer le disque d'embrayage.
  Lors du serrage du boulon central, introduire un tournevis à tige ronde entre deux des ergots (comme décrit sur l'illustration ci-à gauche) afin d'empêcher le disque d'embrayage de tourner. Après avoir déposé le disque d'embrayage, retirer les cales du semi-arbre ou du disque d'embrayage.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Embrayage de compresseur – Modèle DKV-14C (marque ZEXEL) (Suite)



- Retirer le jonc d'arrêt à l'aide d'une pince à circlips externes.

- Dépose de la poulie
  Utiliser n'importe quel extracteur de poulie en vente dans le commerce. Positionner son centre à l'extrémité du semi-arbre, puis déposer la poulie.
  Pour les poulies montées à la presse :
  Afin d'éviter de déformer la gorge de la poulie, placer les mâchoires de l'extracteur sous la gorge de la poulie (et non dans la gorge).
  Pour les poulies adaptées à la machine :
  Aligner la gorge de l'extracteur sur la gorge de la poulie, puis déposer la poulie.

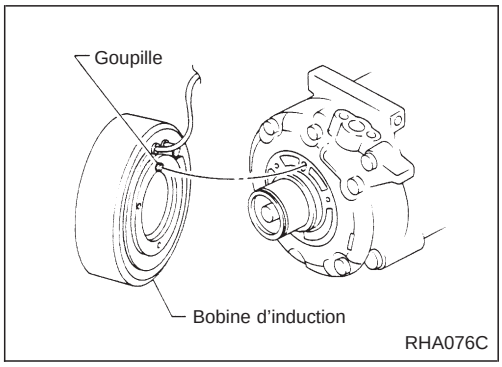
- Déposer la bride du faisceau de la bobine d'induction à l'aide d'un tournevis.
- Retirer les trois vis de fixation de la bobine d'induction et la déposer.

INSPECTION

Disque d'embrayage

Si la surface de friction montre des signes de dommages causés par un échauffement excessif, remplacer le disque d'embrayage et la poulie.

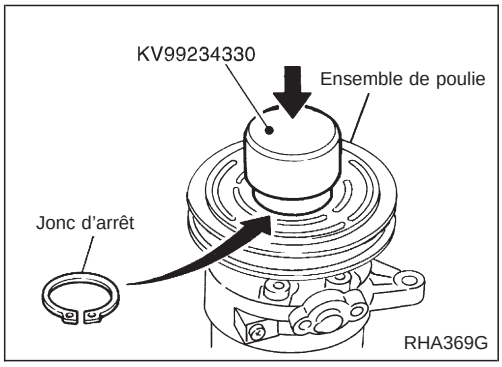
Poulie



Vérifier l'apparence de la poulie. Si la surface de contact de la poulie comporte des rayures excessives, la poulie et le disque d'embrayage doivent être remplacés. Les surfaces de contact de l'ensemble de poulie doivent être nettoyées avec un dissolvant approprié avant la repose.

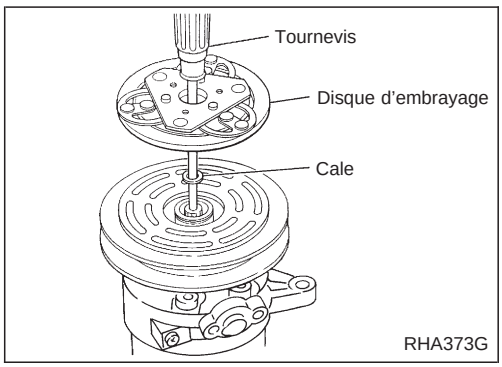
Bobine

Vérifier que la bobine ne présente pas de raccords desserrés ou d'isolation fissurée.

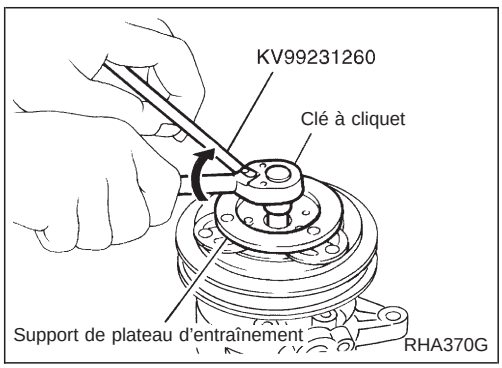


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Embrayage de compresseur – Modèle DKV-14C (marque ZEXEL) (Suite)

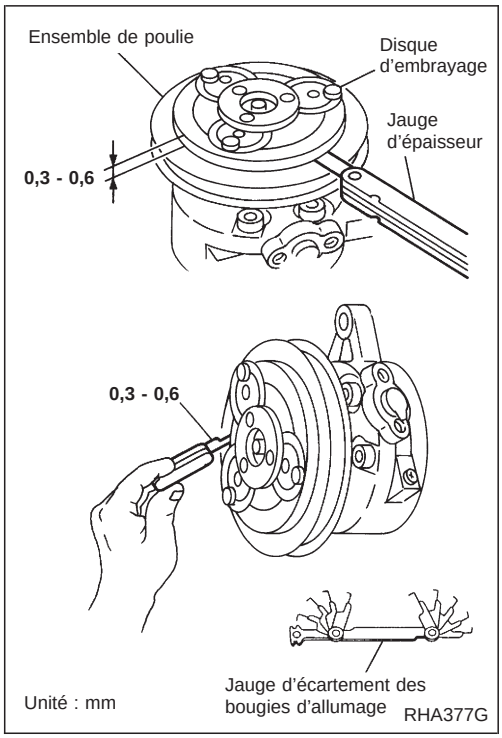


REPOSE



- Reposer la bobine d'induction.
- **Veiller à aligner la goupille de la bobine avec l'orifice de la culasse avant du compresseur.**
- Reposer la bride du faisceau de la bobine d'induction à l'aide d'un tournevis.

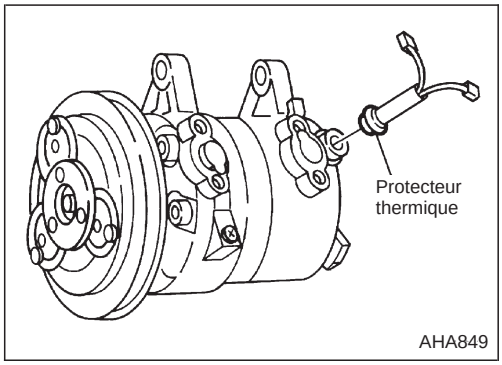
- Reposer l'ensemble de poulie à l'aide de l'outil de repose et d'une presse manuelle, puis reposer le jonc d'arrêt à l'aide d'une pince à circlips.



- Reposer le disque d'embrayage sur le semi-arbre avec la ou les cales d'origine. Appuyer sur le disque d'embrayage à la main.

- Tout en empêchant le plateau d'entraînement de tourner à l'aide de l'outil d'immobilisation, serrer le boulon à un couple de 12 à 15 N·m (1,2 à 1,5 kg-m).
- **Après avoir serré le boulon, contrôler que la poulie tourne librement.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

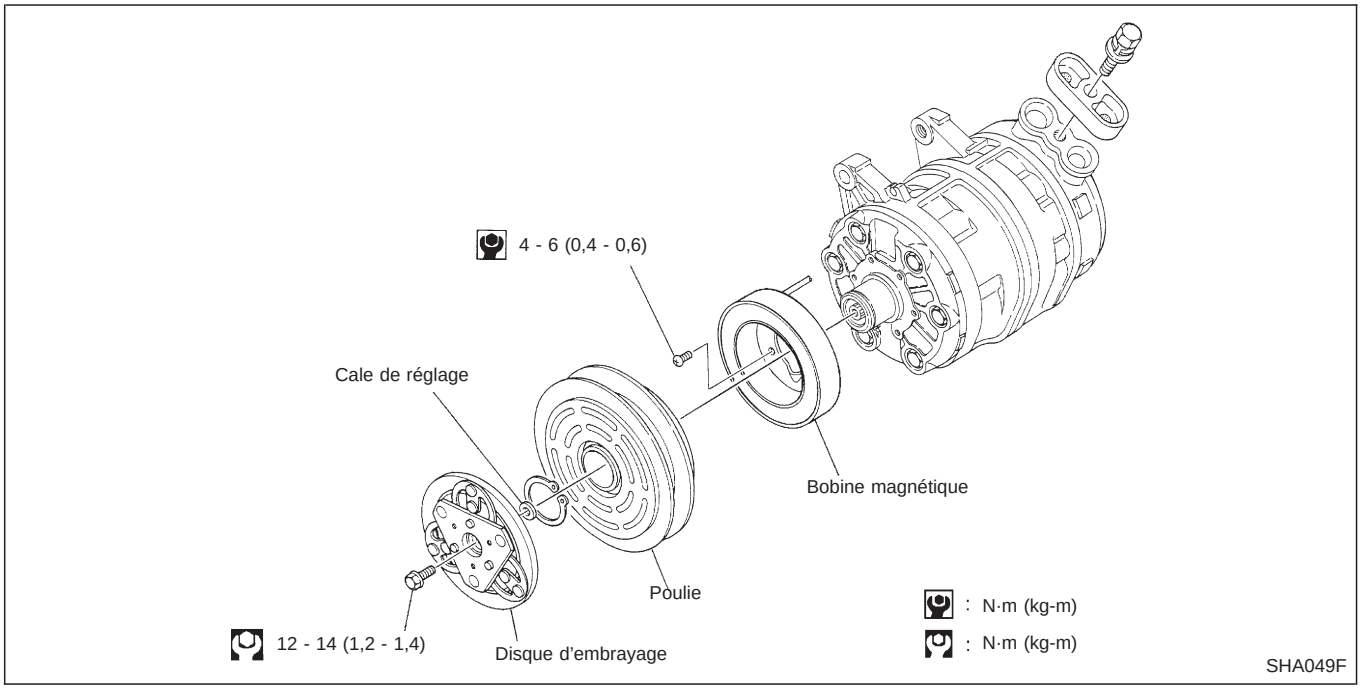


Embrayage de compresseur – Modèle DKV-14C (marque ZEXEL) (Suite)

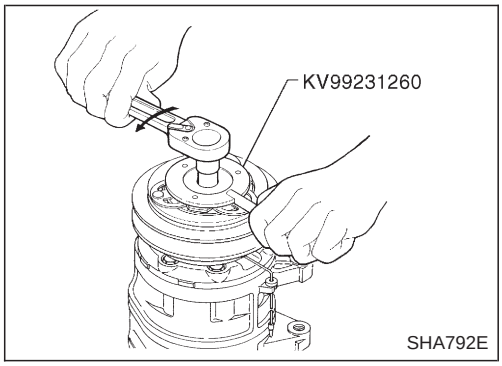
- Vérifier le jeu tout autour de la périphérie du disque d'embrayage.
  Jeu entre le disque et la poulie :
  0,3 - 0,6 mm
  Si le jeu spécifié n'est pas obtenu, remplacer l'entretoise de réglage et régler à nouveau.

RODAGE

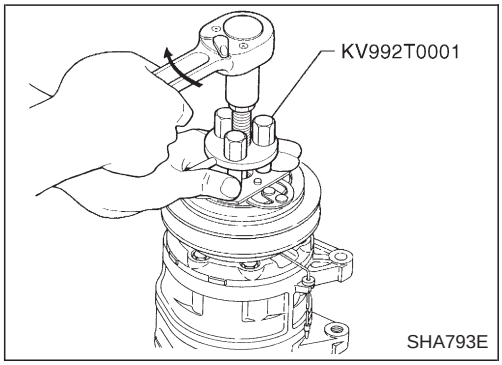
Toujours effectuer un rodage lorsque l'on remplace l'embrayage de compresseur. Pour ce faire, enfoncer et relâcher la pédale d'embrayage une trentaine de fois environ. Le rodage augmente le couple transmis.



Protecteur thermique – Modèle DKV-14C (marque ZEXEL)



INSPECTION

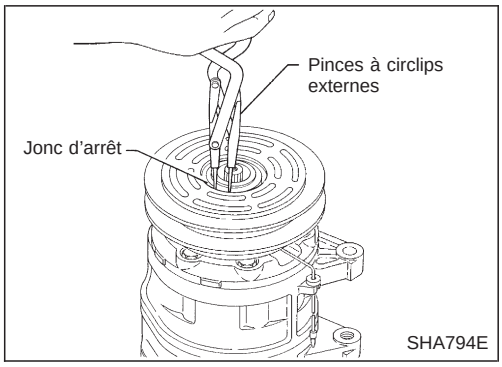


- Lors de l'entretien, empêcher la pénétration de substances étrangères dans le compresseur.
- Vérifier la continuité entre les deux bornes.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

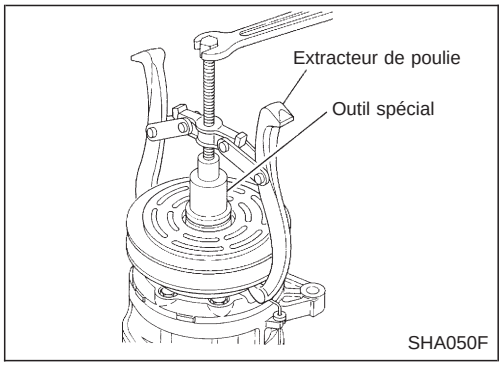
Compresseur – Modèle DKS-17CH (marque ZEXEL)

Embrayage de compresseur – Modèle DKS-17CH (marque ZEXEL)



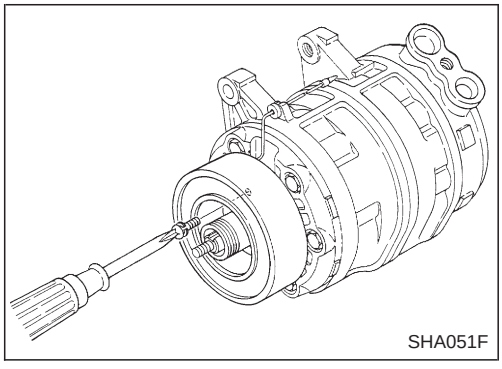
DEPOSE

- Lors de la dépose du boulon central, immobiliser le disque d'embrayage avec une clé pour disque d'embrayage.

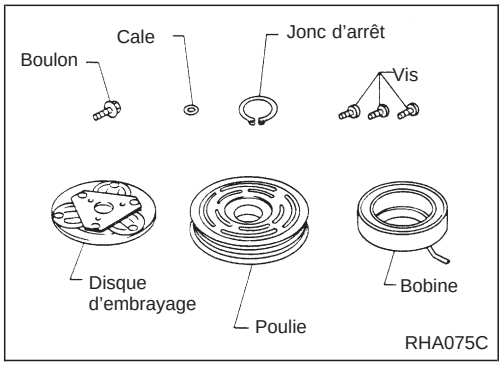


- Déposer le plateau d'entraînement à l'aide de l'outil spécial. Introduire les trois axes de l'outil d'immobilisation dans le plateau d'entraînement. Tourner l'outil dans le sens des aiguilles d'une montre afin de l'accrocher au plateau. Ensuite, serrer le boulon central pour déposer le plateau d'entraînement.
  Après avoir déposé le plateau d'entraînement, déposer les cales de l'arbre de transmission ou du plateau d'entraînement.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



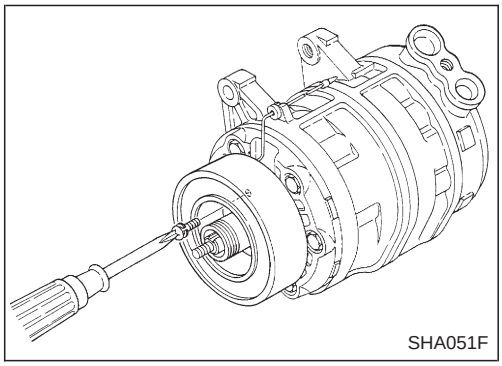
Embrayage de compresseur – Modèle DKS-17CH (marque ZEXEL) (Suite)



- Retirer le jonc d'arrêt à l'aide d'une pince à circlips externes.

- Dépose de la poulie
  Positionner son centre à l'extrémité de l'outil spécial, puis déposer la poulie.Utiliser n'importe quel extracteur de poulie ou outil spécial en vente dans le commerce. Positionner son centre à l'extrémité de l'outil spécial, puis déposer la poulie.
  Pour les poulies montées à la presse
  Afin d'éviter de déformer la rainure de la poulie, placer l'extracteur de poulie dans (et non sur) la rainure de la poulie.
  Pour les poulies attachées à la machine
  Aligner la rainure de l'extracteur sur la rainure de la poulie, puis déposer la poulie.

- Retirer les trois vis de fixation de la bobine d'induction et la déposer.



INSPECTION

Disque d'embrayage : Si la surface de friction montre des signes de dommages causés par un échauffement excessif, remplacer le disque d'embrayage et la poulie.
Poulie : vérifier l'apparence de l'ensemble de la poulie. Vérifier si la surface de contact de la poulie comporte des signes de rayures excessives causées par le patinage. Si c'est le cas, remplacer la poulie et le disque d'embrayage. Les surfaces de contact de l'ensemble de poulie doivent être nettoyées avec un dissolvant approprié avant la repose.

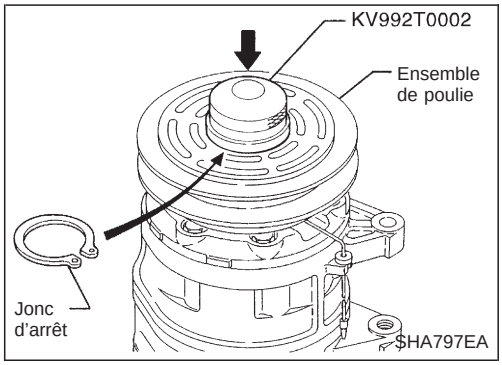
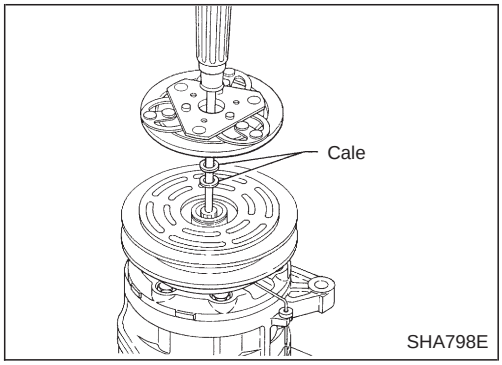
Embrayage de compresseur – Modèle DKS-17CH (marque ZEXEL) (Suite)



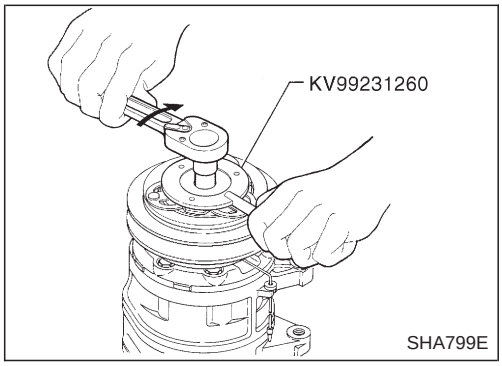
Bobine : vérifier que la bobine ne présente pas de raccords desserrés ou d'isolation fissurée.

SHA051F



REPOSE

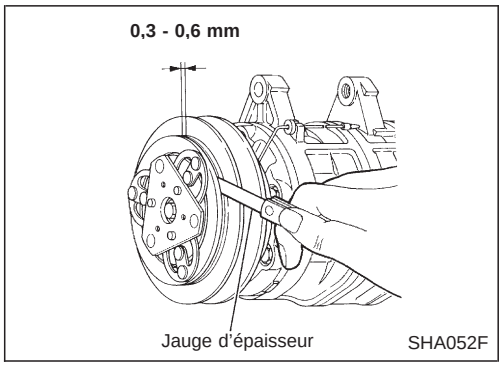
- Reposer la bobine d'induction.



Veiller à aligner la goupille de la bobine avec le trou avant du compresseur.

- Reposer l'ensemble de poulie à l'aide de l'outil de repose et d'une presse manuelle, puis reposer le jonc d'arrêt à l'aide d'une pince à circlips.

- Reposer le plateau d'entraînement sur le semi-arbre, avec la(les) cale(s) d'origine. Enfoncer le plateau d'entraînement à la main.



- En utilisant le support pour empêcher le plateau d'entraînement de tourner, serrer le boulon à un couple de 12 à 14 N.m (1,2 à 1,4 kg-m).

Après avoir serré le boulon, contrôler que la poulie tourne librement.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Embrayage de compresseur – Modèle DKS-17CH (marque ZEXEL) (Suite)

- Vérifier le jeu tout autour de la périphérie du disque d'embrayage.
  Jeu entre disque et poulie :
  0,3 - 0,6 mm
  Si le jeu spécifié n'est pas obtenu, remplacer la cale de réglage et régler à nouveau.

RODAGE

Toujours effectuer un rodage lorsque l'on remplace l'embrayage de compresseur. Pour ce faire, enfoncer et relâcher la pédale d'embrayage une trentaine de fois environ. Le rodage augmente le couple transmis.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure d’application du joint liquide

a. A l’aide d’un grattoir, retirer toutes les traces de l’ancien joint liquide des surfaces d’appui et des rainures. Eliminer également toutes les traces d’huile de ces surfaces.
b. Appliquer un cordon uniforme de joint liquide sur les surfaces d’appui (utiliser le joint liquide d’origine ou un équivalent).
   - Pour le carter d’huile, s’assurer que le diamètre du joint liquide est de 3,5 à 4,5 mm pour les moteurs à essence.
   - Pour les parties autres que le carter d’huile, s’assurer que le diamètre du joint liquide est de 2 à 3 mm pour les moteurs à essence, et de 2,5 à 3,5 mm pour les moteurs diesel.
c. Appliquer du joint liquide autour des surfaces intérieures des orifices de boulons (sauf indication contraire).
d. Procéder à l’assemblage dans les 5 minutes qui suivent l’application.
e. Attendre au moins 30 minutes avant de remplir le moteur d’huile et de réfrigérant.

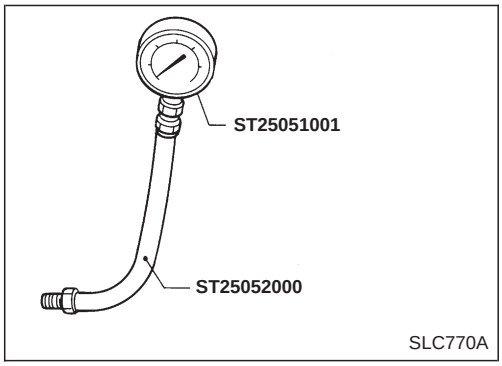
Circuit de lubrification



SLC150B

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

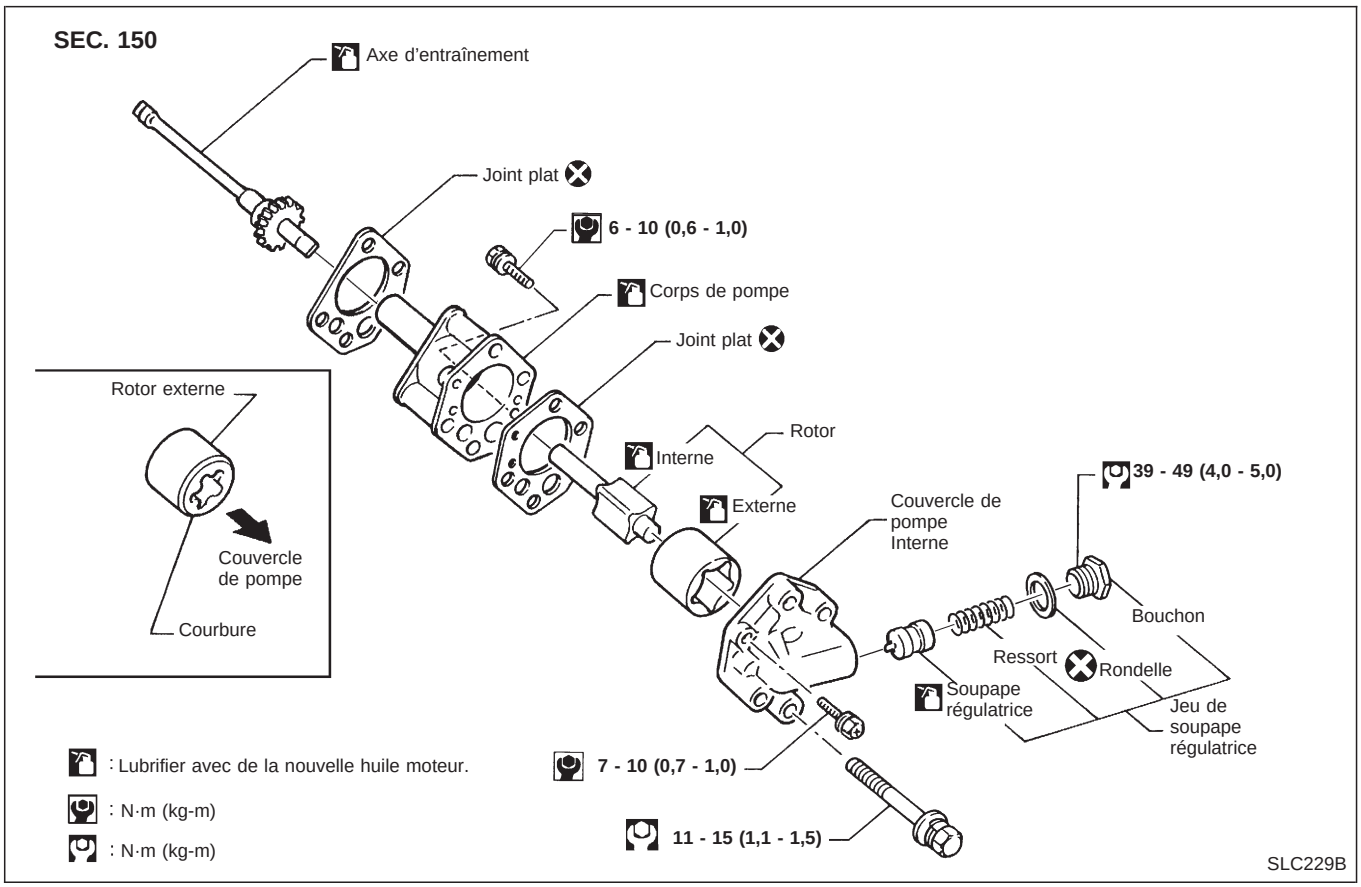
SLC183A

SLC770A

Vérification de la pression d'huile

AVERTISSEMENT :

- **Veiller à ne pas se brûler, car le moteur et l'huile risquent d'être très chauds.**
- **Placer le levier de vitesses en position neutre N.**

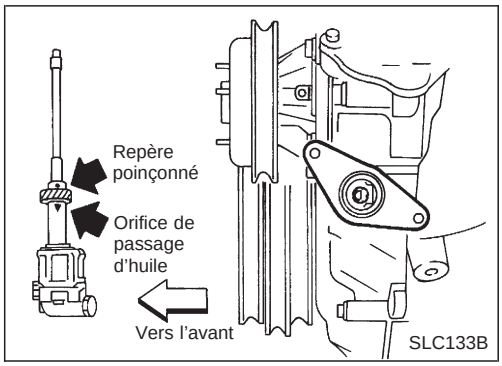


1. Vérifier le niveau d'huile.
2. Déposer le manocontact d'huile.
3. Brancher un manomètre.
4. Démarrer le moteur et le faire chauffer à la température de fonctionnement normale.
5. Vérifier la pression d'huile sans imposer de charge au moteur.

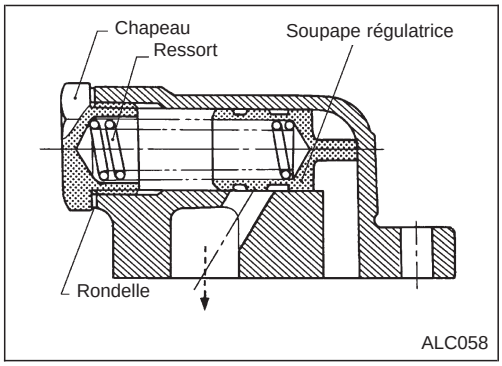
Régime du moteur tr/mn	Pression approximative de débit kPa (bar, kg/cm^2)
Régime de ralenti	Plus de 78 (0,78, 0,8)
3 000	412 - 481 (4,12 - 4,81, 4,2 - 4,9)

- **Si la différence est trop grande, vérifier les fuites éventuelles des passages d'huile et de la pompe à huile.**

6. Reposer le manocontact d'huile à l'aide de produit d'étanchéité.



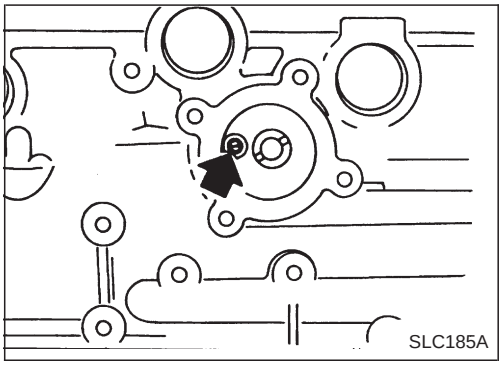
Pompe à huile



SLC229B

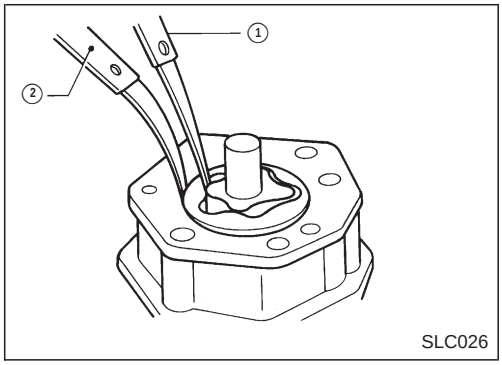
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Pompe à huile (Suite)



- **Toujours remplacer le joint d'huile et le joint plat par des pièces neuves.**
- **Lors de la dépose de la pompe à huile, tourner le vilebrequin de sorte que le piston n° 1 se trouve au PMH dans sa course de compression.**
- **Lors de l'installation de la pompe à huile, enduire les pignons d'huile moteur, et aligner le repère poinçonné du pivot d'entraînement avec l'orifice de passage d'huile de la pompe à huile.**

INSPECTION DE LA SOUPAPE REGULATRICE

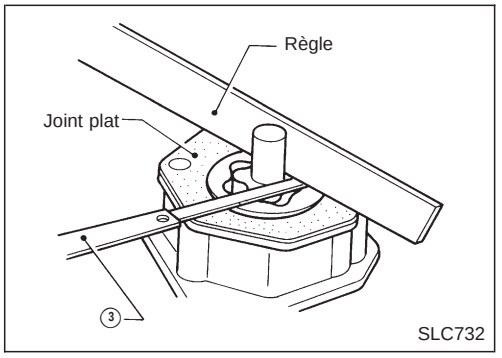


1. Vérifier visuellement si les pièces ne sont pas usées ou endommagées.
2. Vérifier la surface de glissement de la soupape régulatrice de pression d'huile et le ressort de soupape.
3. Enduire la soupape régulatrice d'huile moteur. Vérifier qu'elle chute en douceur dans l'orifice de soupape sous l'effet de son propre poids.

- **Remplacer le jeu de soupape régulatrice ou la pompe à huile, si endommagé.**

INSPECTION DE LA SOUPAPE DE DECHARGE DE PRESSION D'HUILE

Vérifier si la soupape de décharge de pression d'huile ne présente pas de mouvement, de fissures ou de cassures en poussant la bille. Si un remplacement est nécessaire, déposer la soupape en faisant levier à l'aide d'un outil adéquat.
Mettre la nouvelle soupape en place en lui donnant de petits coups.

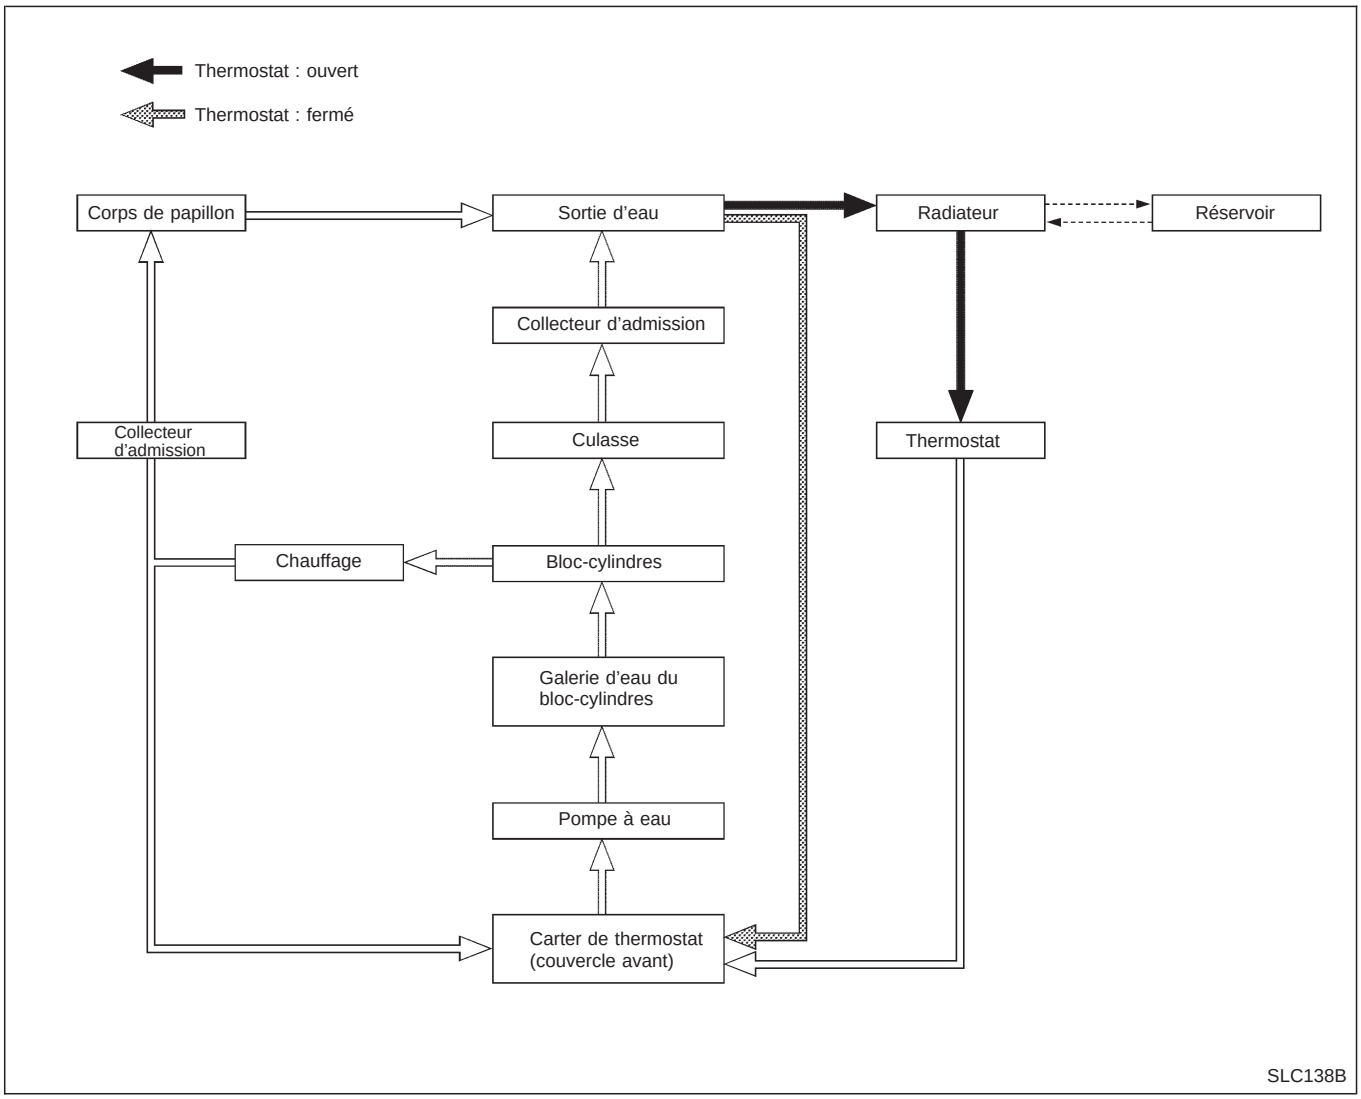


INSPECTION DE LA POMPE A HUILE

A l'aide d'un calibre d'épaisseur, vérifier les jeux suivants.

Jeu standard :

Unité : mm



Jeu à l'arête du rotor ①	Moins de 0,12
Jeu radial entre corps et rotor externe ②	0,15 - 0,21
Jeu latéral (avec joint plat) ③	0,04 - 0,08

- **Si le jeu à l'arête (①) dépasse la limite spécifiée, remplacer l'ensemble de rotor.**
- **Si les jeux entre le corps et le rotor (②, ③) dépassent la limite, remplacer l'ensemble de la pompe à huile.**

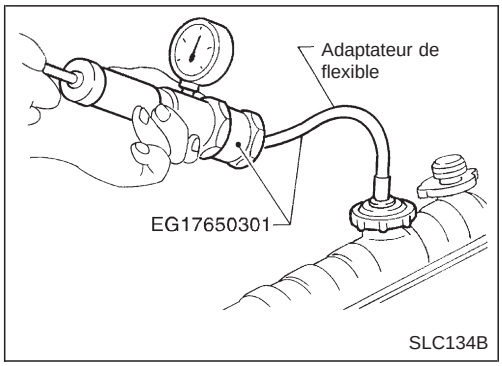
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Circuit de refroidissement

Vérification du circuit

AVERTISSEMENT :
Ne jamais déposer le bouchon de radiateur lorsque le moteur est chaud. Ceci peut entraîner des brûlures graves provoquées par le réfrigérant sous haute pression s'échappant du radiateur.
Enrouler un chiffon épais autour du bouchon. Le tourner lentement d'un quart de tour de façon à laisser la pression s'échapper. Déposer prudemment le bouchon en le tournant complètement.

VERIFICATION DES FLEXIBLES DU CIRCUIT DE REFROIDISSEMENT



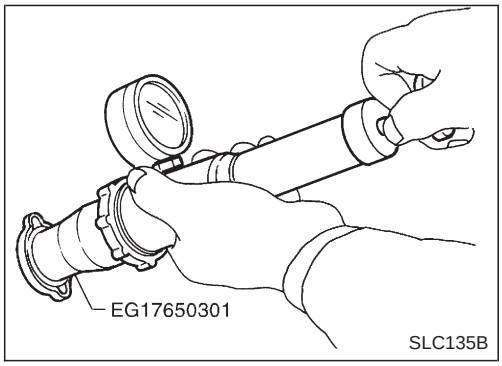
Vérifier si les flexibles présentent les défauts suivants :

- Fixation incorrecte
- Fuites
- Fissures
- Endommagements
- Eraflures
- Détériorations

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

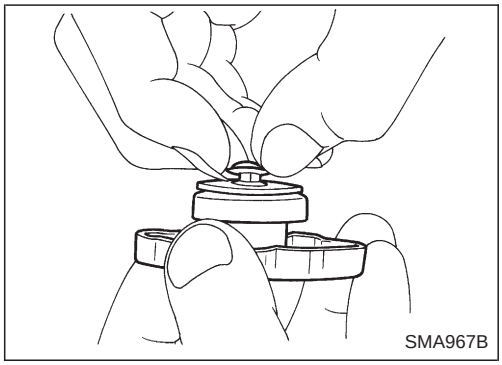
Vérification du circuit (Suite)

VERIFICATION DE L'ETANCHEITE DU CIRCUIT DE REFROIDISSEMENT



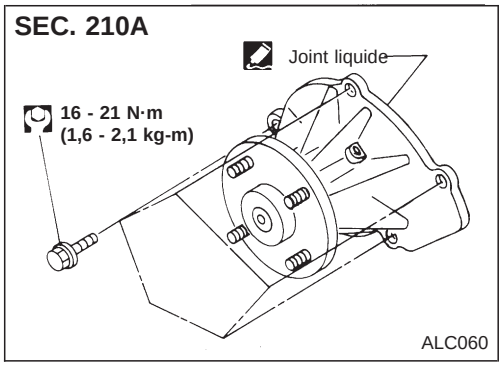
Vérifier s'il n'y a pas de fuites en exerçant une pression sur le circuit de refroidissement à l'aide d'un vérificateur.

Pression d'essai :
157 kPa (1,57 bar, 1,6 kg/cm^2)



ATTENTION :
Une pression supérieure à celle spécifiée peut abîmer le radiateur.

VERIFICATION DU BOUCHON DE RADIATEUR



Exercer une pression sur le bouchon de radiateur à l'aide d'un vérificateur afin de s'assurer que son fonctionnement est convenable.

Pression d'ouverture du bouchon de radiateur :
Standard
78 - 98 kPa (0,78 - 0,98 bar, 0,8 - 1,0 kg/cm^2)
Limite
59 - 98 kPa (0,59 - 0,98 bar, 0,6 - 1,0 kg/cm^2)

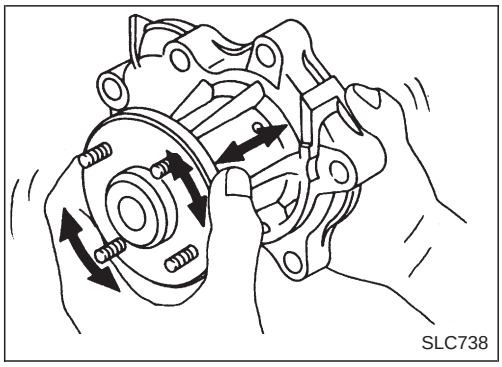
Tirer sur la soupape à dépression pour l'ouvrir.
Vérifier qu'elle se referme totalement une fois relâchée.

Pompe à eau

ATTENTION :

- **Lors de la dépose de la pompe à eau, veiller à ne pas renverser de liquide de refroidissement sur les courroies d'entraînement.**
- **La pompe à eau ne peut être démontée et doit être remplacée dans sa totalité.**
- **Après avoir reposé la pompe à eau, rebrancher le flexible et le fixer avec un collier, puis vérifier s'il n'y a pas de fuites à l'aide d'un vérificateur de bouchon de radiateur.**

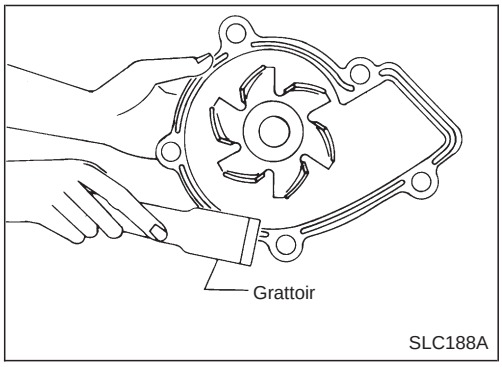
DEPOSE



1. Vidanger le liquide de refroidissement du radiateur et du bloc-cylindres.
   Se reporter à la section MA (''Remplacement du liquide de refroidissement moteur'' au chapitre ''ENTRETIEN DU MOTEUR'').
2. Déposer les courroies d'entraînement de la pompe de direction assistée, du générateur et du compresseur de climatiseur.
3. Déposer l'accouplement de ventilateur avec le ventilateur.
4. Déposer la pompe à eau.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

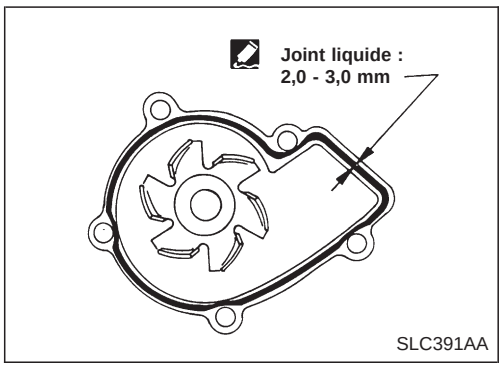
Pompe à eau (Suite)



INSPECTION

- Vérifier s'il n'y a pas de parties rouillées ou corrodées dans l'ensemble de corps.
- Vérifier si le fonctionnement n'est pas irrégulier par suite d'un jeu excessif.

SLC738

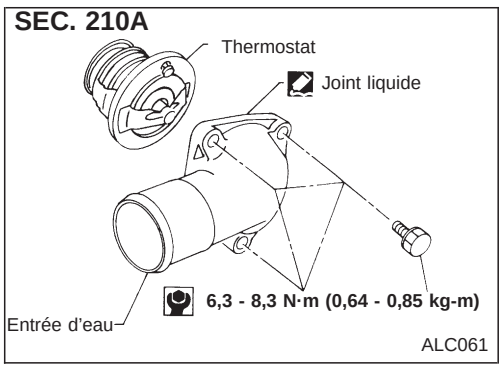


REPOSE

1. Retirer le joint liquide de la pompe à eau à l'aide d'un grattoir.
- **Eliminer également toute trace de joint liquide de la surface d'appui du bloc-cylindres.**

SLC188A

2. Appliquer un cordon uniforme de joint liquide sur les surfaces de contact de la pompe à eau.
- **Utiliser le joint liquide d'origine ou un produit équivalent.**



SLC391AA

Pour le remplissage du liquide de refroidissement dans le radiateur, se reporter à la section MA (''Remplacement du liquide de refroidissement moteur'', ''ENTRETIEN DU MOTEUR'').
Lors de la mise en place des courroies d'entraînement, se reporter à la section MA (''Vérification des courroies d'entraînement'').

Thermostat

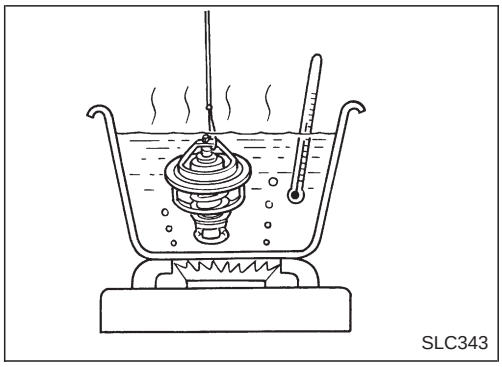
- **Veiller à ne pas renverser de liquide de refroidissement sur le compartiment moteur.**
  Placer un chiffon pour absorber le liquide de refroidissement.

ALC061

DEPOSE

1. Vidanger le liquide de refroidissement du moteur. Se reporter à la section MA (''Remplacement du liquide de refroidissement moteur'' au chapitre ''ENTRETIEN DU MOTEUR'').
2. Déposer le filtre à air et l'ensemble du conduit d'air.
3. Déposer le flexible d'eau du carter d'entrée d'eau.
4. Déposer le carter d'entrée d'eau, puis retirer le thermostat.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Thermostat (Suite)

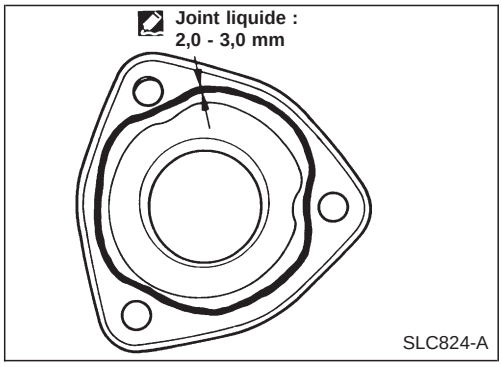
INSPECTION

1. Vérifier l'état du siège de soupape aux températures ambiantes ordinaires. Il doit avoir une bonne assise.
2. Vérifier la température d'ouverture de la soupape et le levage de cette dernière.

Température d'ouverture de la soupape	°C	76,5
Levage de la soupape	mm/°C	Plus de 8/90

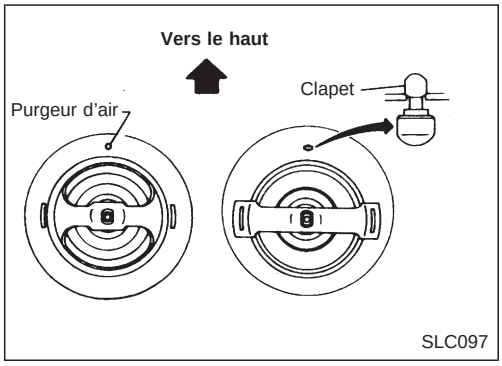
3. Vérifier ensuite si la soupape se ferme à 5°C en dessous de la température d'ouverture de soupape.

SLC343



REPOSE

1. A l'aide d'un grattoir, enlever toute trace de l'ancien joint liquide de l'entrée d'eau.



- **Eliminer les traces de joint liquide de la surface de contact du couvercle avant.**

2. Appliquer un cordon uniforme de joint liquide sur les surfaces de contact de l'entrée d'eau.

- **Utiliser le joint liquide d'origine ou un produit équivalent.**

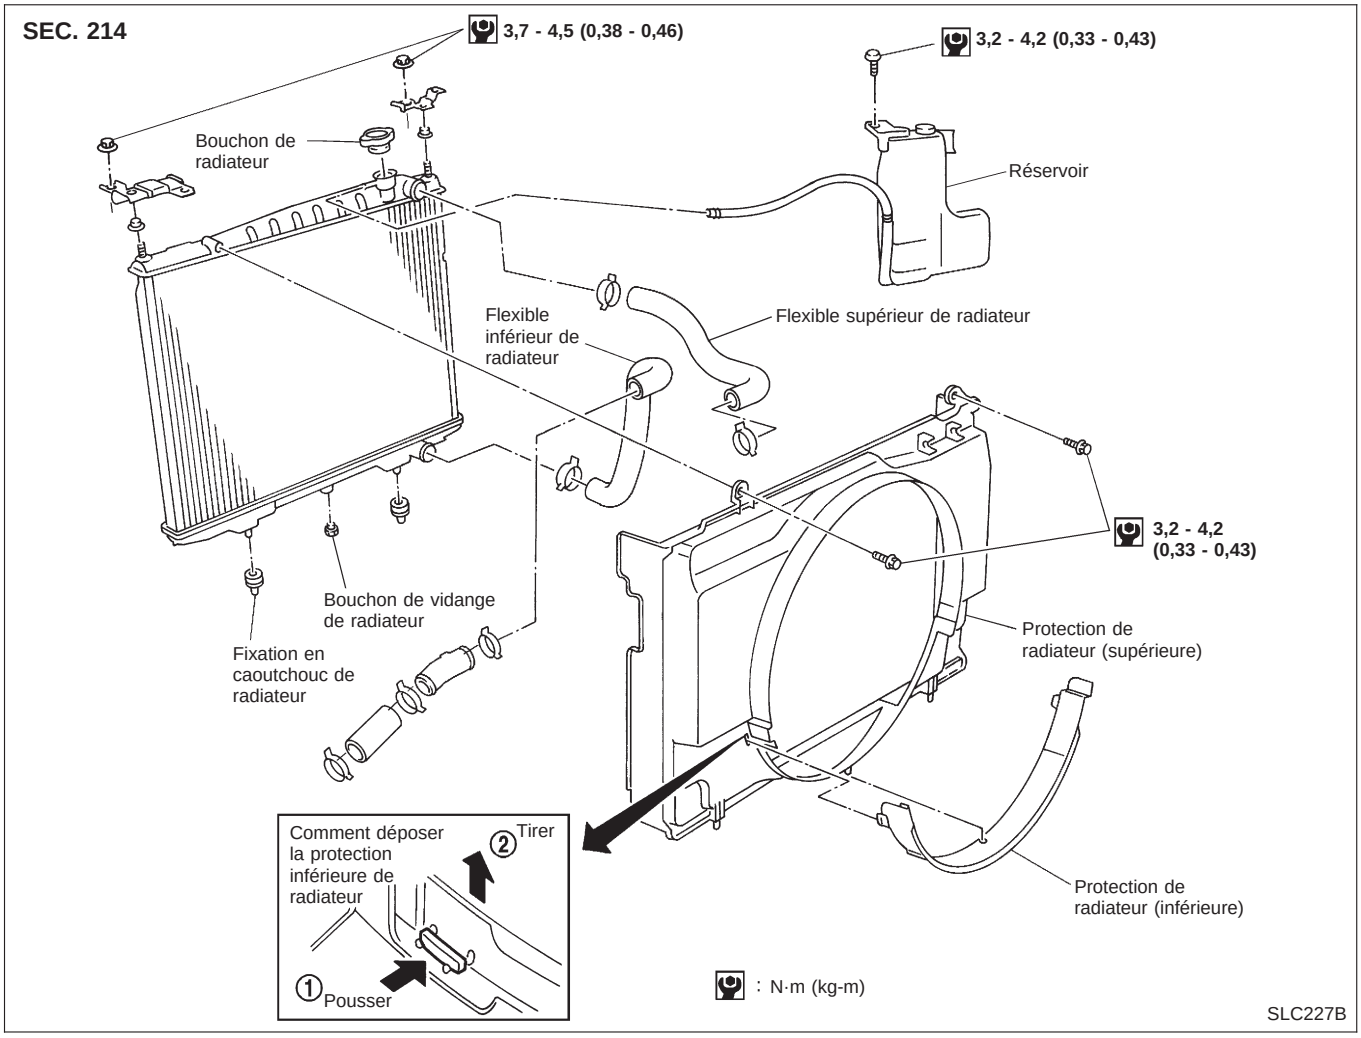
SLC824-A

SLC097

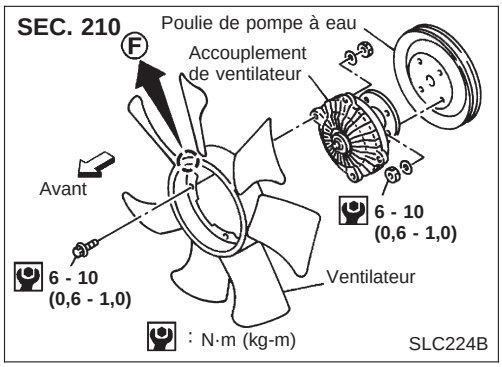
3. Monter le thermostat en plaçant le clapet ou le purgeur d'air vers le haut.
4. Reposer le carter d'entrée d'eau.
5. Reposer le flexible d'eau sur le carter d'entrée d'eau.
6. Reposer le filtre à air et l'ensemble de conduit d'air.
7. Faire le plein de liquide de refroidissement moteur. Se reporter à la section MA (''Remplacement du liquide de refroidissement moteur'' au chapitre ''ENTRETIEN DU MOTEUR'').

- **Après la repose, faire tourner le moteur pendant quelques minutes et vérifier qu'il n'y a pas de fuites.**

Radiateur



DEPOSE ET REPOSE



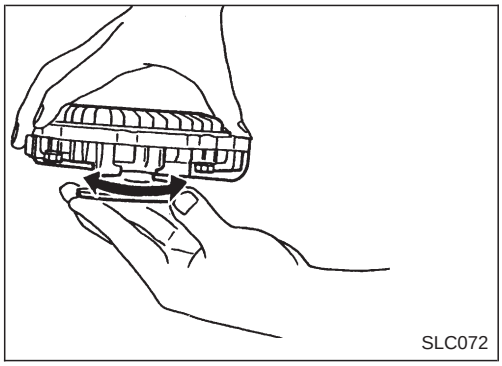
1. Vidanger le liquide de refroidissement du radiateur. Se reporter à la section MA (''Remplacement du liquide de refroidissement monteur'' au chapitre ''ENTRETIEN DU MOTEUR'').
2. Débrancher les flexibles inférieur et supérieur du radiateur.
3. Déposer le filtre à air et l'ensemble de conduit d'air.
4. Déposer la protection inférieure du radiateur.
5. Déposer le bouclier du radiateur.
6. Débrancher le flexible du réservoir de réfrigérant.
7. Déposer le radiateur.
8. Après le remplacement du radiateur, reposer toutes les pièces dans l'ordre inverse de la dépose.
9. Faire le plein de liquide de refroidissement. Se reporter à la section MA (''Remplacement du liquide de refroidissement moteur'' au chapitre ''ENTRETIEN DU MOTEUR'').

- **Après la repose, faire tourner le moteur pendant quelques minutes et vérifier qu'il n'y a pas de fuites.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

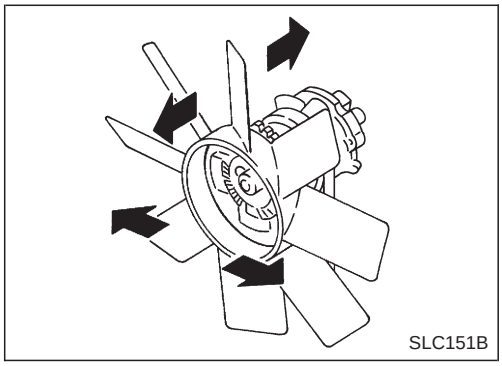
Radiateur (Suite)

Ventilateur de refroidissement (entraîné par vilebrequin)



DEPOSE ET REPOSE

- Ne pas relâcher la tension de la courroie d'entraînement lors de la dépose du ventilateur/de la poulie de pompe à eau.
- L'accouplement de ventilateur ne peut pas être démonté et devra être remplacé comme un ensemble. Si le repère avant Ⓕ existe, reposer le ventilateur de façon à ce que le côté indiqué par le repère Ⓕ soit disposé face à l'avant.
- Ne reposer la courroie d'entraînement qu'une fois que les boulons/écrous du flasque de la pompe à eau ont été correctement serrés sur le ventilateur et l'accouplement de ventilateur.
- Un alignement correct de ces composants est indispensable. Un alignement incorrect provoquera une oscillation de ces derniers et pourra éventuellement déclencher un détachement du ventilateur de la pompe à eau, créant ainsi des dégâts importants.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Ventilateur de refroidissement (entraîné par vilebrequin) (Suite)

INSPECTION

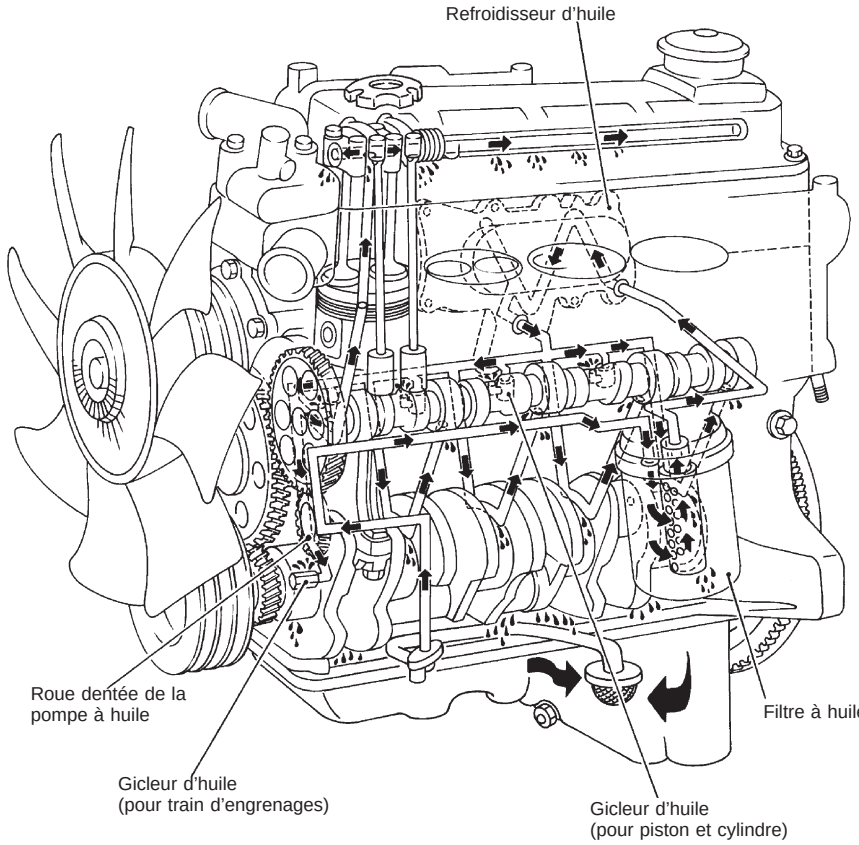
SLC072

Vérifier que l'accouplement de ventilateur fonctionne correctement, qu'il ne présente pas d'oscillations, de fuites d'huile ou que le bimétal n'est pas tordu.

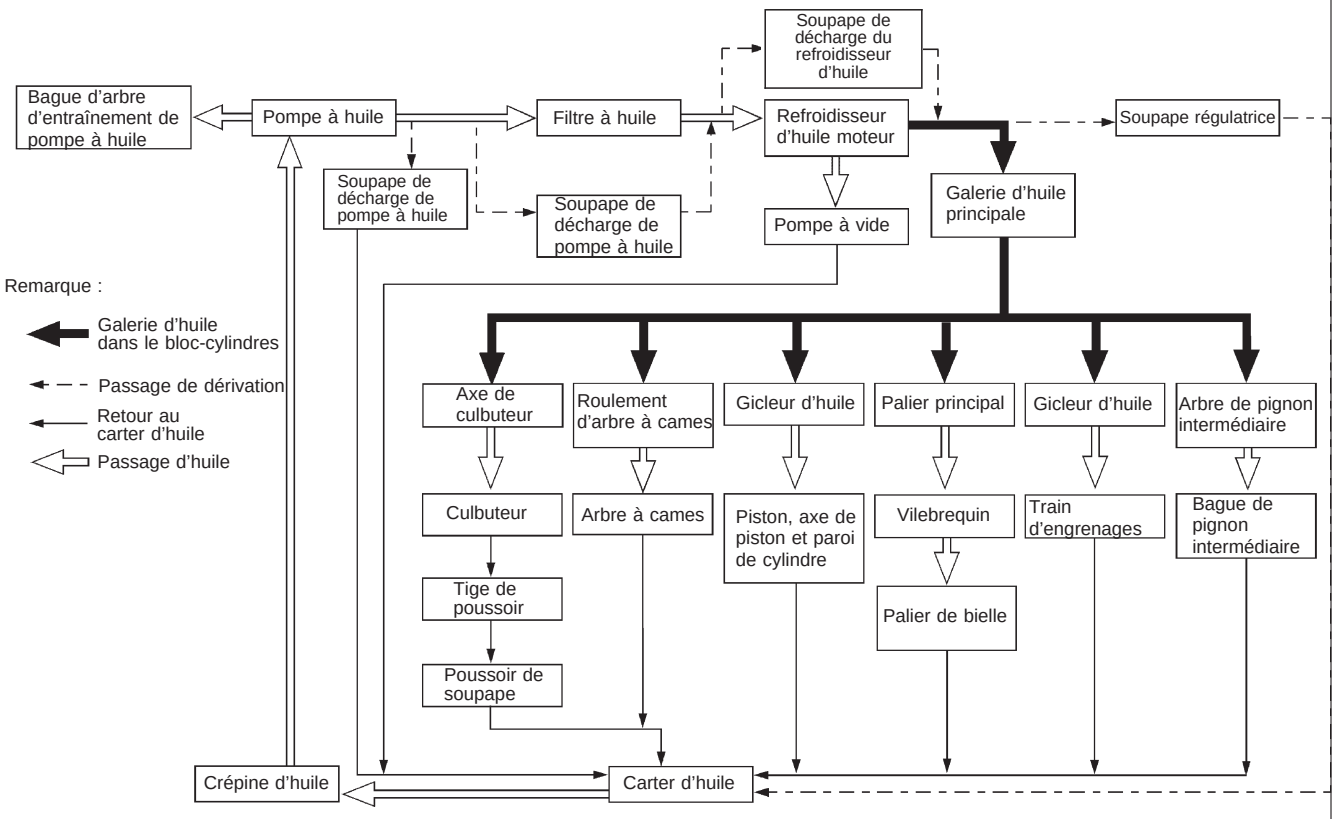
SLC151B

Après le montage, vérifier que le ventilateur n'oscille pas et ne claque pas lorsque le moteur tourne.

AVERTISSEMENT :



- **Lorsque le moteur tourne, veiller à garder ses mains et ses vêtements à distance des pièces qui tournent telles que les courroies d'entraînement et le ventilateur.**

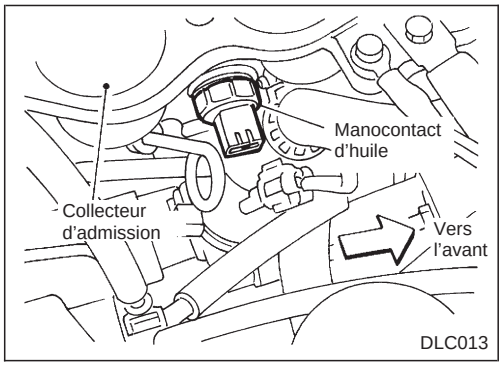


Remplissage du circuit de refroidissement

Pour de plus amples détails concernant le remplissage du liquide de refroidissement du moteur, se reporter à la section MA (''Remplacement du liquide de refroidissement moteur'', ''ENTRETIEN DU MOTEUR'').

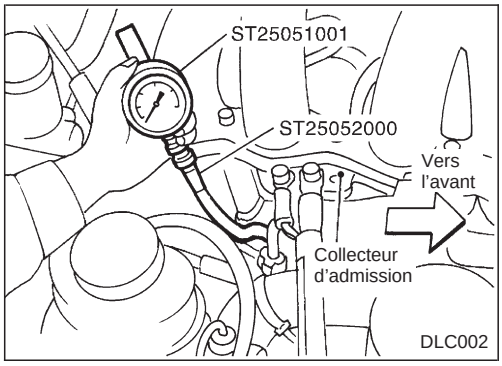
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Circuit de lubrification



DLC014

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



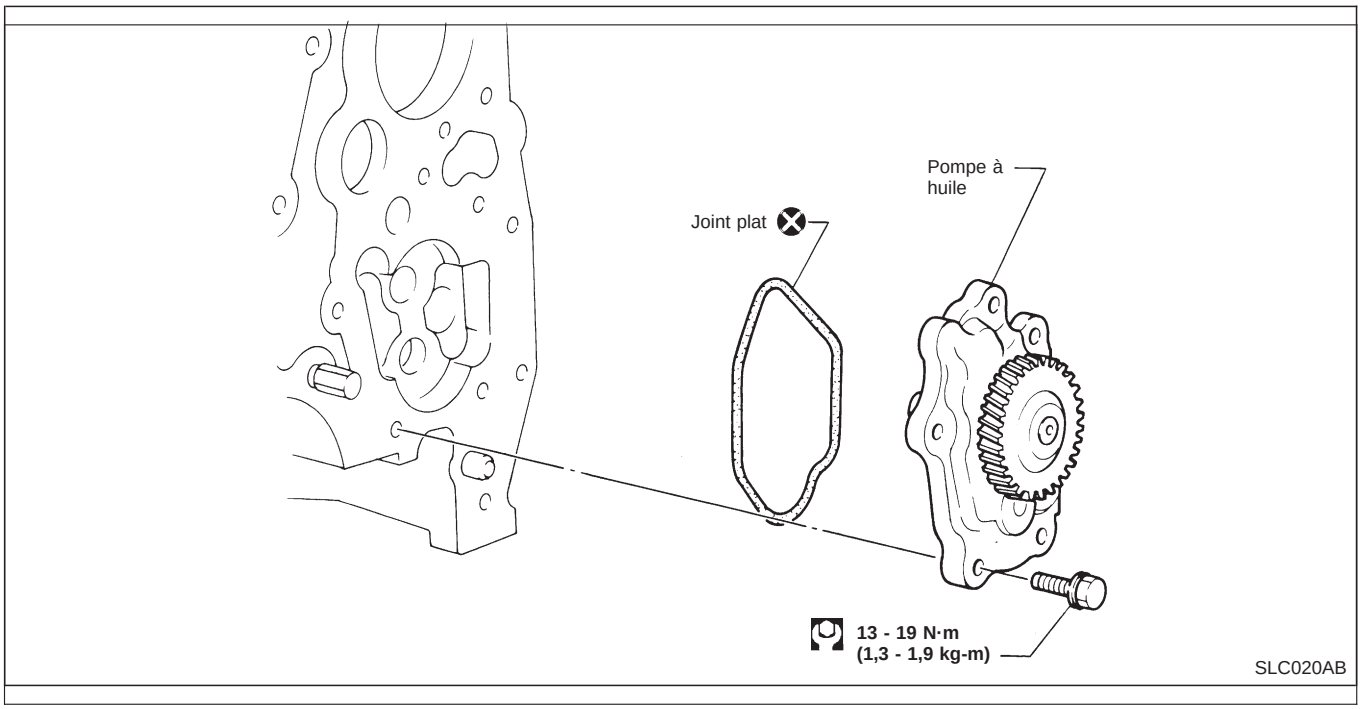
Vérification de la pression d'huile (entretien sur véhicule)

AVERTISSEMENT :

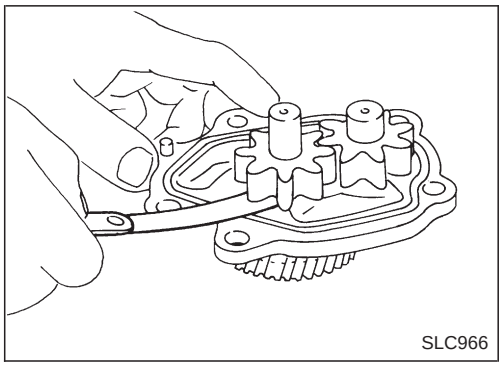
- **Veiller à ne pas se brûler, car le moteur et l'huile risquent d'être très chauds.**
- **La vérification de la pression d'huile doit être effectuée en position de point mort.**

1. Vérifier le niveau d'huile.
2. Débrancher le connecteur de faisceau du manocontact d'huile.
3. Déposer le manocontact d'huile.

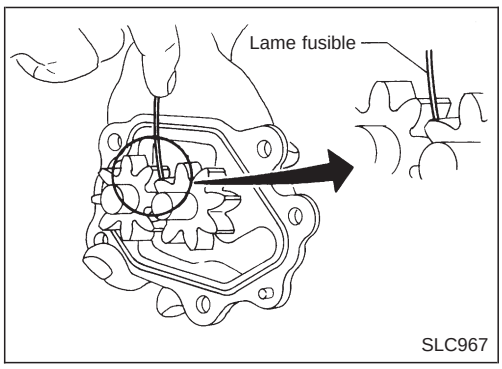
4. Monter un manomètre et un flexible.
5. Démarrer le moteur et le faire chauffer à la température de fonctionnement normale.
6. Vérifier la pression d'huile sans imposer de charge au moteur.



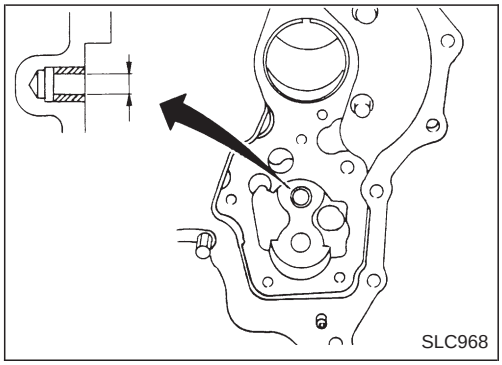
Régime du moteur tr/mn	Pression approximative de débit kPa (bar, kg/cm^2)
Régime de ralenti	Plus de 78 (0,78, 0,8)
3 000	294 - 392 (2,94 - 3,92, 3,0 - 4,0)



Si la différence est trop grande, vérifier les fuites éventuelles des passages d'huile et de la pompe à huile.



7. Reposer le manocontact d'huile à l'aide de produit d'étanchéité.
   Manocontact d'huile :
   : 10 - 13 N·m (1,0 - 1,3 kg-m)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Pompe à huile

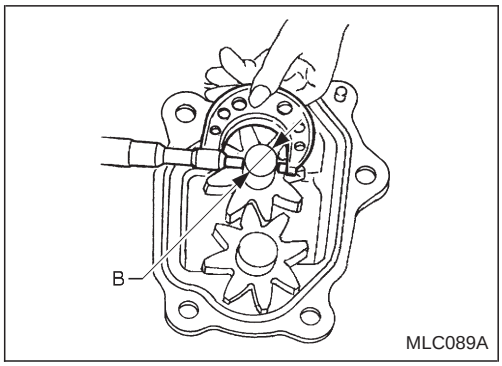
SLC966

SLC968

INSPECTION DE LA POMPE A HUILE

1. Inspecter le corps de pompe, les pignons et l'arbre d'entraînement pour voir s'ils sont usés ou endommagés.
2. En utilisant un calibre d'épaisseur et une lame fusible, vérifier les jeux suivants.

Jeu latéral de pignon :
Moins de 0,13 mm

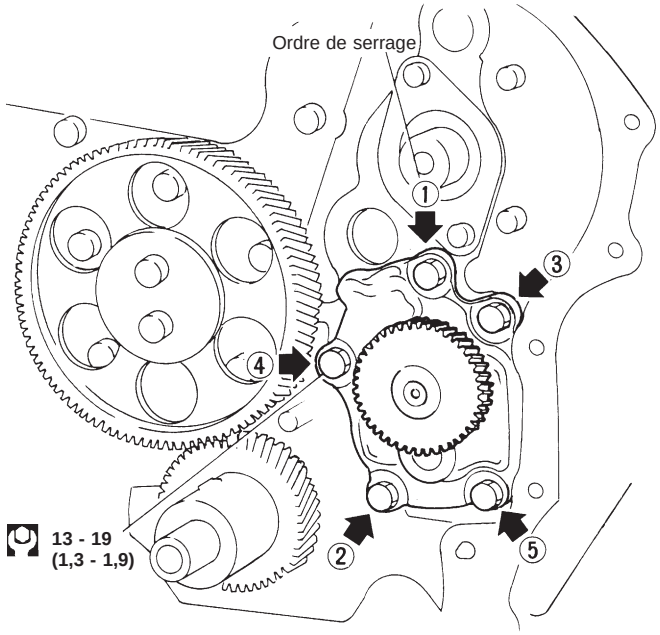


Battement de pignon :
Moins de 0,43 mm

3. Mesurer le diamètre intérieur ''A'' de la bague.

A : 13,012 - 13,106 mm

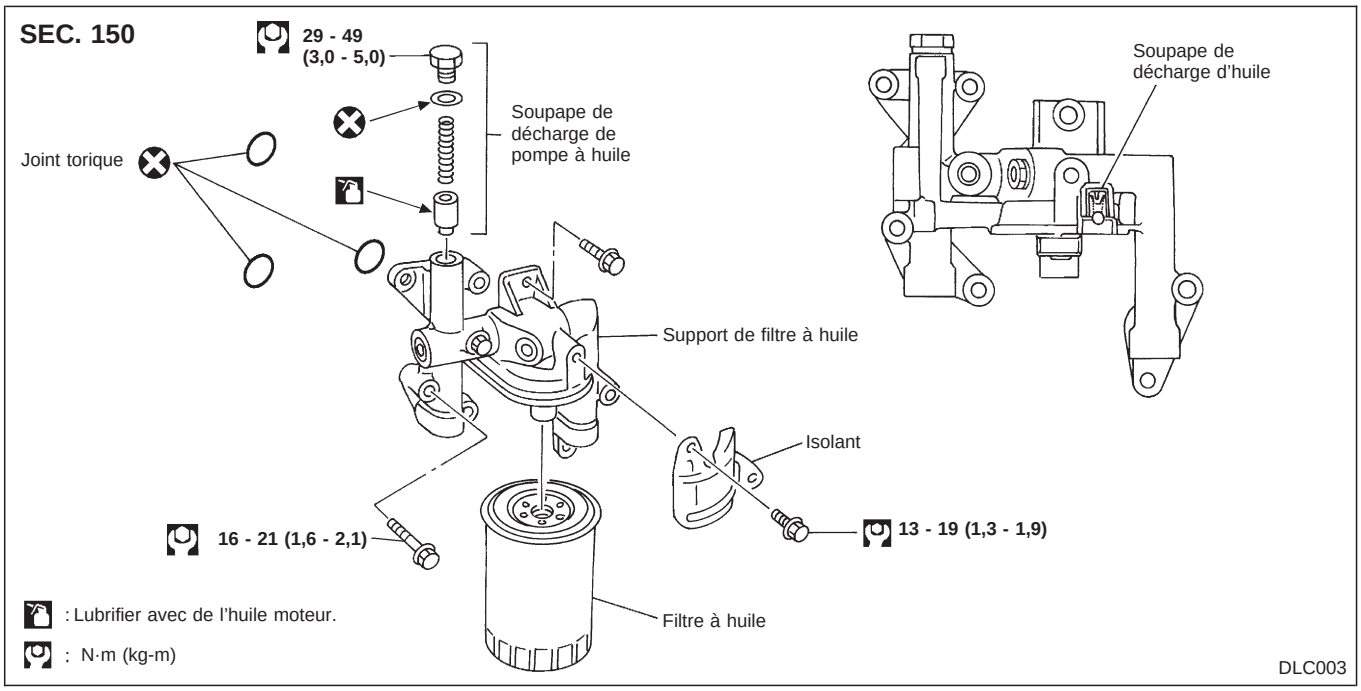
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Pompe à huile (Suite)

4. Mesurer le diamètre extérieur ‘‘B’’ de l’arbre de pignon d’entraînement.
   B : 12,974 - 12,992 mm
5. Calculer le jeu de la bague de la pompe à huile.
   Jeu de la bague de pompe à huile : A − B
   Moins de 0,15 mm

Si le jeu dépasse la limite, remplacer la bague ou la pompe à huile complète.



- **Lors de la repose de la pompe à huile, les boulons doivent être serrés en deux ou trois étapes dans l’ordre numérique.**
- **Après la repose, vérifier à la main que la pompe à huile tourne correctement.**

Pour l’installation du carter de distribution, se reporter à la section EM (aux chapitres ‘‘CARTER DU PIGNON DE DISTRIBUTION’’, ‘‘Remontage’’, ‘‘REVISION DU MOTEUR’’).

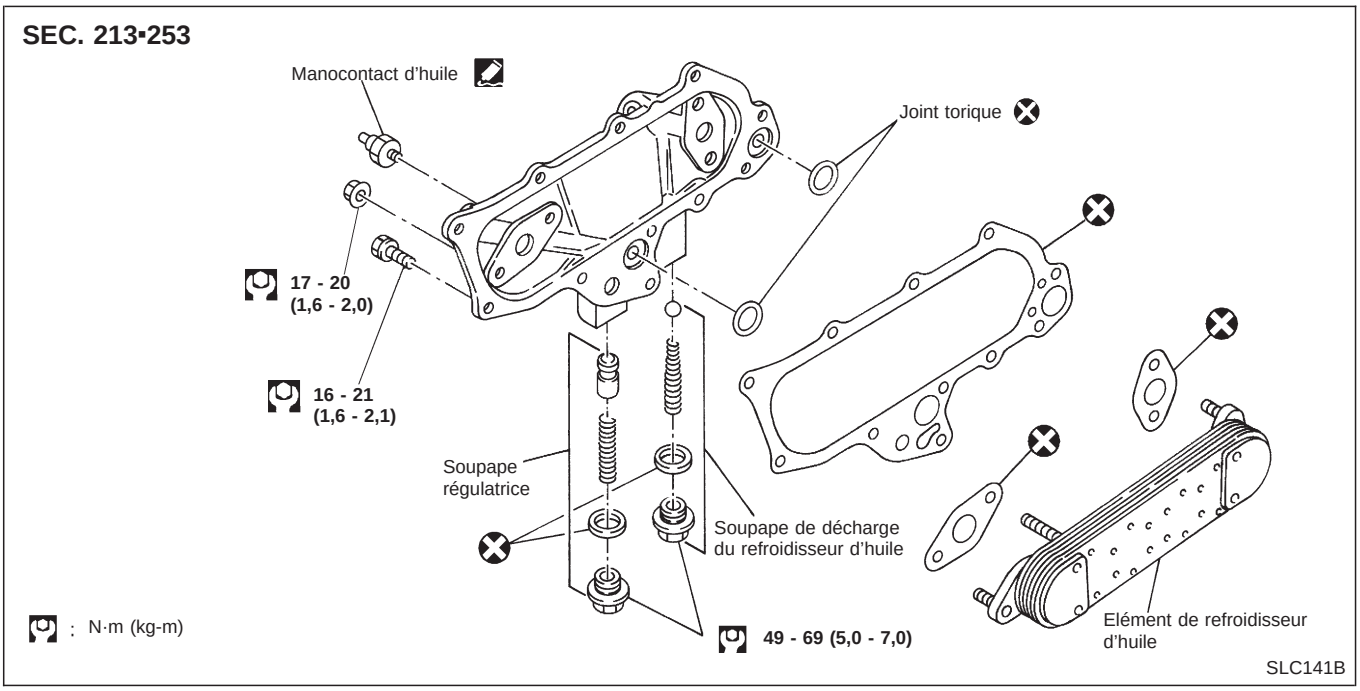
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Support de filtre à huile

INSPECTION DE LA SOUPAPE DE DECHARGE DE POMPE A HUILE

1. Vérifier visuellement si les pièces ne sont pas usées ou endommagées.
2. Enduire la soupape de décharge d'huile moteur et s'assurer qu'elle chute en douceur dans l'orifice de soupape sous l'effet de son propre poids.

En cas de dommage, remplacer le jeu de soupape de décharge de pompe à huile.



INSPECTION DE LA SOUPAPE DE DECHARGE DU FILTRE A HUILE

Vérifier que la soupape de décharge du filtre à huile se déplace en douceur et qu'elle n'est pas endommagée en poussant la bille.

Si la pièce est abîmée, remplacer l'ensemble du support de filtre à huile.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

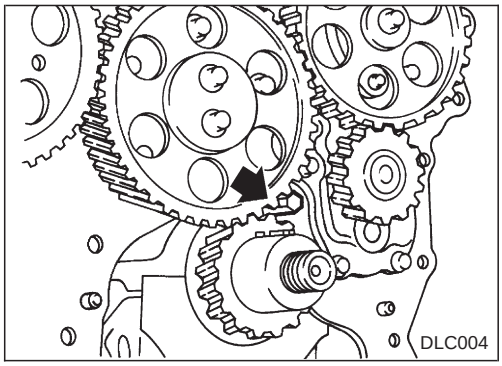
Refroidisseur d'huile

INSPECTION DE LA SOUPAPE DE DECHARGE DU REFROIDISSEUR D'HUILE

Vérifier si la soupape de décharge du refroidisseur ne présente pas de mouvements, de fissures et de cassures en poussant la bille.
En cas de dommage, remplacer le jeu de soupape de décharge du refroidisseur d'huile.

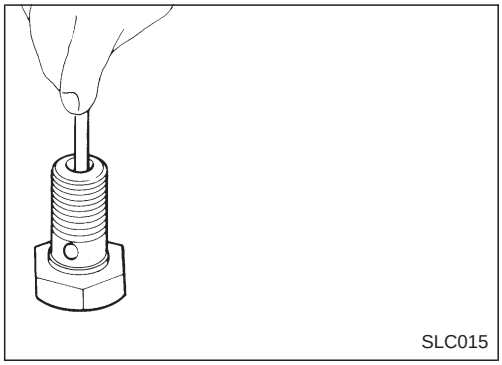
INSPECTION DE LA SOUPAPE REGULATRICE

1. Vérifier visuellement si les composants ne sont pas usés ou endommagés.
2. Enduire la soupape régulatrice d'huile moteur et s'assurer qu'elle chute en douceur dans l'orifice de soupape sous l'effet de son propre poids.



En cas de dommage, remplacer le jeu de soupape régulatrice.

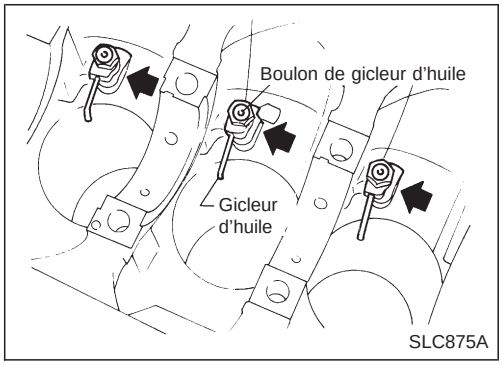
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Gicleur d'huile

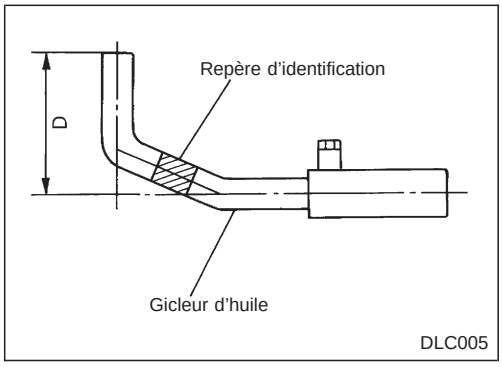
INSPECTION (pour train d'engrenages)

Vérifier que les orifices ne sont pas obstrués. Les nettoyer avec un fil si nécessaire.



Le gicleur d'huile doit être monté avec l'orifice de passage d'huile face au pignon de vilebrequin et au pignon intermédiaire.

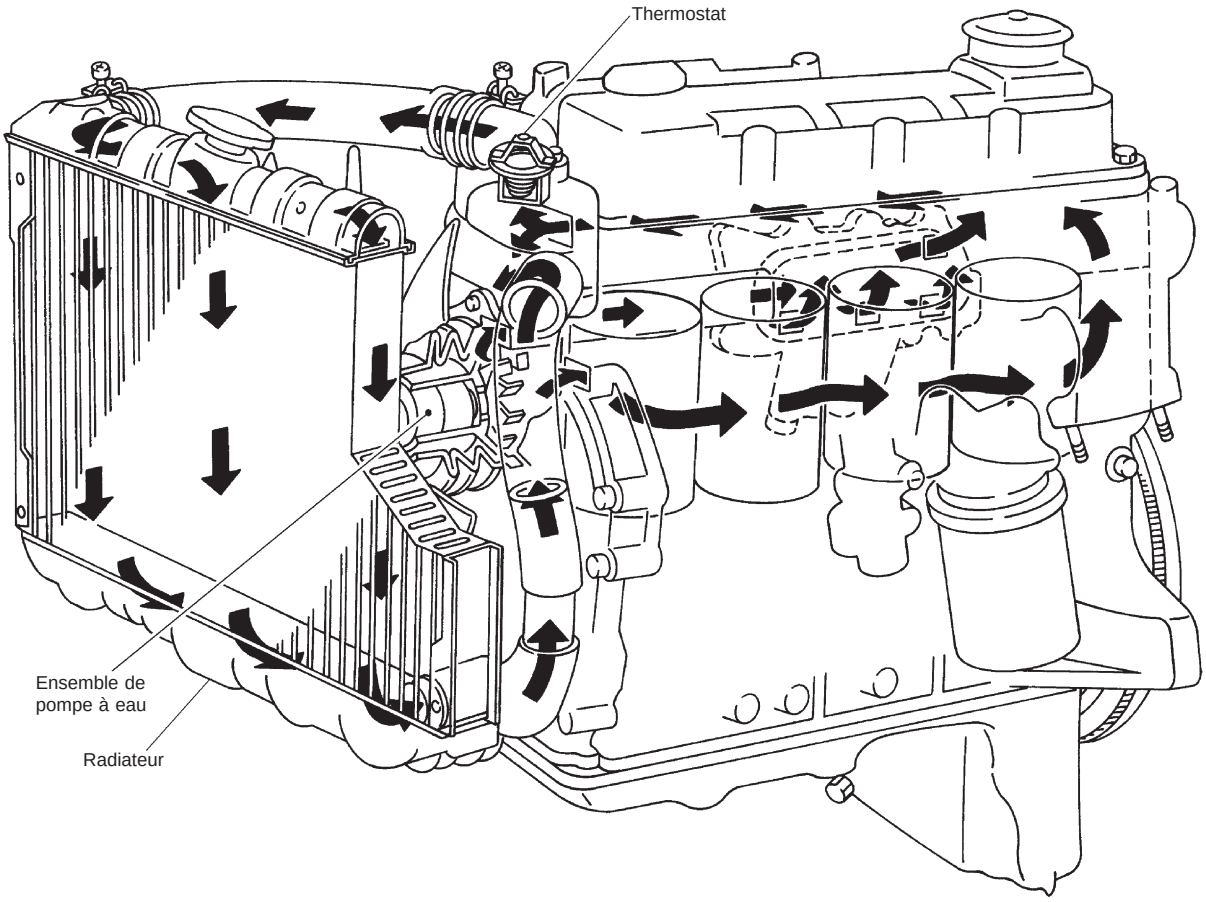
INSPECTION (pour piston)



1. Pousser la soupape de coupure du boulon de gicleur d'huile avec une tige en résine ou en cuivre propre afin de vérifier que la soupape de coupure bouge sans heurts et présente la force répulsive nécessaire.
2. S'assurer que le passage du gicleur d'huile n'est pas obturé. Nettoyer avec un fil si nécessaire.

Lors de la mise en place du gicleur d'huile, veiller à ce que son bossage soit aligné sur l'orifice du bloc-cylindres.

Boulon de gicleur d'huile :



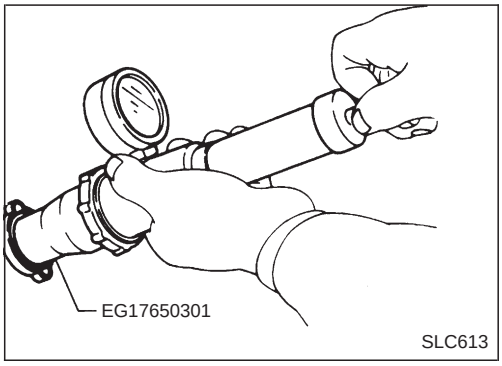
: 29 - 39 N·m (3,0 - 4,0 kg-m)

		TD25
Dimension "D" mm	Type I	–
	Type II	12
Couleur d'identification		–

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Circuit de refroidissement

DLC006

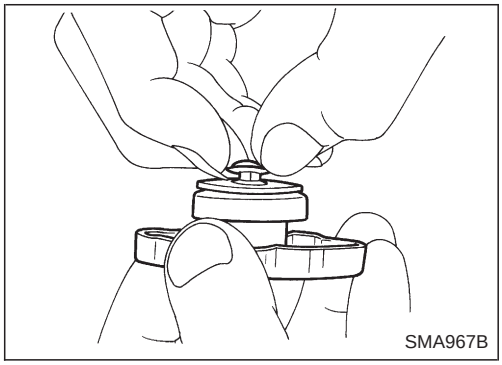


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

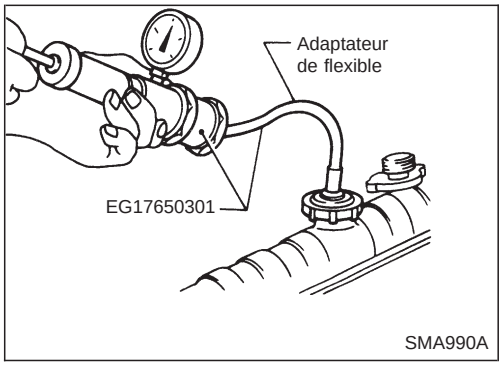
Vérification du circuit de refroidissement

AVERTISSEMENT :
Ne jamais déposer le bouchon de radiateur lorsque le moteur est chaud. Ceci peut entraîner des brûlures graves provoquées par le liquide sous haute pression s'échappant du radiateur.
Entourer le bouchon d'un chiffon épais et le desserrer avec précaution d'un quart de tour pour laisser la pression s'échapper. Puis retirer complètement le bouchon.

VERIFICATION DES FLEXIBLES



Vérifier que les flexibles ne présentent pas de mauvaise fixation, de fuites, de fissures, de dommages, de raccords desserrés, d'éraflures ni de détériorations.

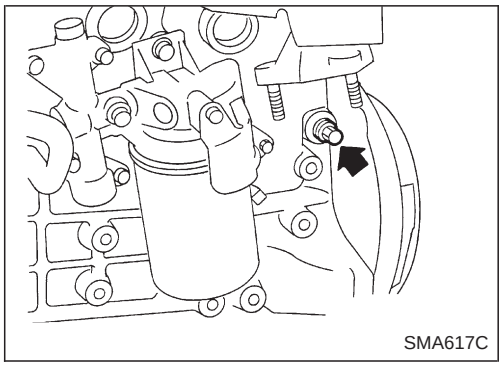


VERIFICATION DU BOUCHON DE RADIATEUR

Exercer une pression sur le bouchon de radiateur au moyen d'un vérificateur de bouchon afin de s'assurer que son fonctionnement est convenable.

Pression d'ouverture du bouchon de radiateur :
78 - 98 kPa (0,78 - 0,98 bar, 0,8 - 1,0 kg/cm^2)

Tirer sur la soupape à dépression pour l'ouvrir. Vérifier qu'elle se referme totalement une fois relâchée.



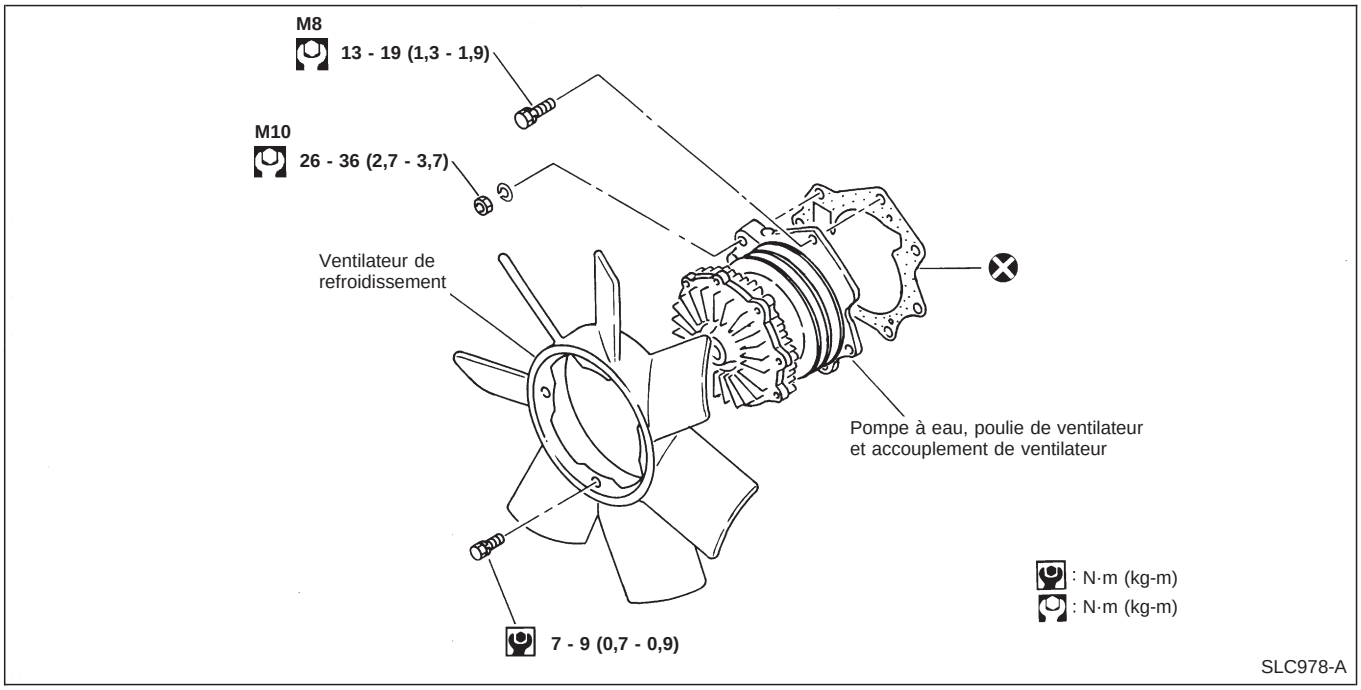
VERIFICATION DE L'ETANCHEITE DU CIRCUIT DE REFROIDISSEMENT

Exercer une pression sur le circuit de refroidissement au moyen d'un vérificateur pour s'assurer qu'il ne présente pas de fuites.

Pression d'essai :
157 kPa (1,57 bar, 1,6 kg/cm^2)

ATTENTION :
Une pression supérieure à celle spécifiée peut endommager le radiateur.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



SMA617C

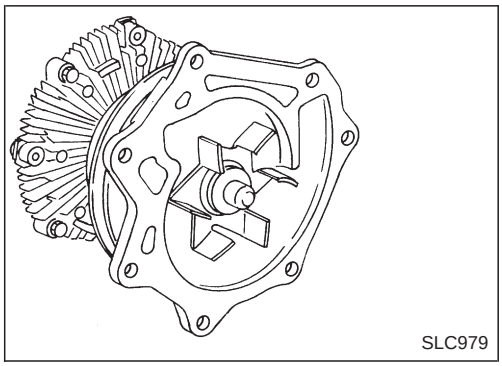
Pompe à eau et ventilateur de refroidissement (entraîné par arbre à cames)

DEPOSE ET REPOSE

Vidanger le liquide de refroidissement par les bouchons de vidange du bloc-cylindres et du radiateur.

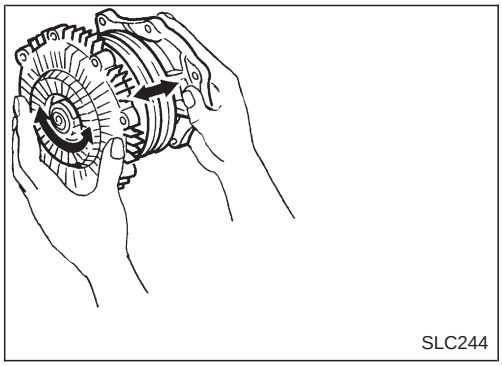
Bouchon de vidange du bloc-cylindres (utiliser du produit d'étanchéité adéquat) :
: 20 - 29 N·m (2,0 - 3,0 kg-m)

SLC978-A



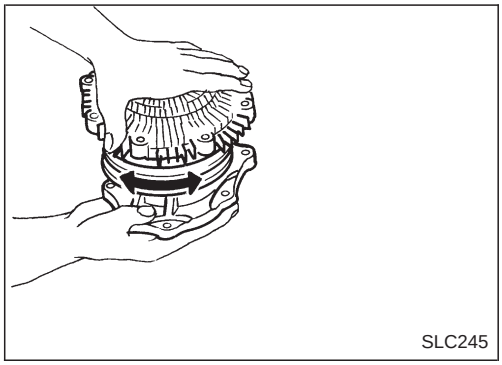
ATTENTION :
- **Lors de la dépose de l'ensemble de pompe à eau, veiller à ne pas renverser de liquide de refroidissement sur la courroie d'entraînement.**
- **La pompe à eau ne peut pas être démontée et doit être remplacée dans sa totalité.**
- **Toujours remplacer le joint plat par une pièce neuve.**
- **Après le montage, vérifier que le ventilateur n'oscille pas et ne bat pas lorsque le moteur tourne.**
- **Après avoir reposé la pompe à eau, rebrancher le flexible et le fixer avec un collier, puis vérifier s'il n'y a pas de fuites à l'aide d'un vérificateur de bouchon de radiateur.**

AVERTISSEMENT :
Lorsque le moteur tourne, veiller à garder ses mains et ses vêtements à distance des pièces qui tournent telles que les courroies d'entraînement et le ventilateur.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Pompe à eau et ventilateur de refroidissement (entraîné par arbre à cames) (Suite)



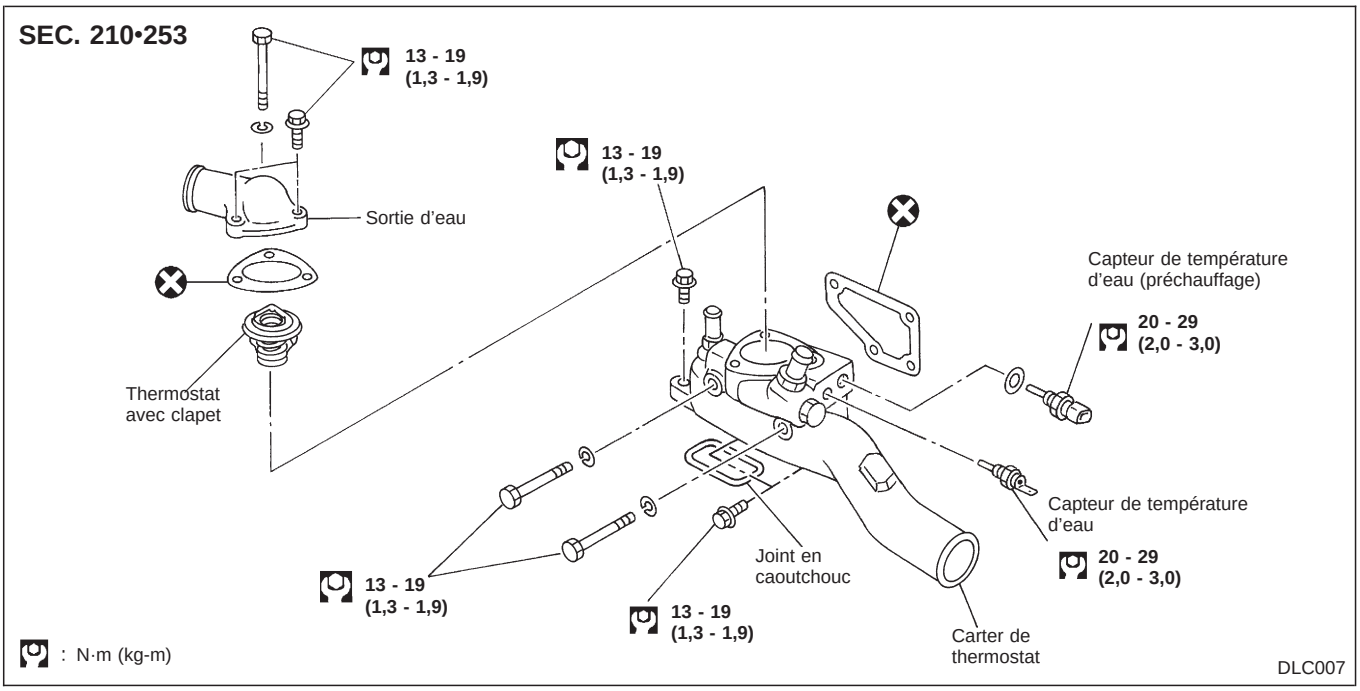
INSPECTION

SLC979

1. Vérifier s'il n'y a pas de parties fortement rouillées ou corrodées dans l'ensemble de corps et sur les ailettes.

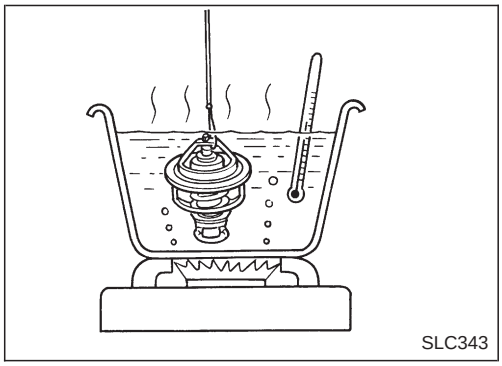
SLC244

2. Vérifier si le fonctionnement n'est pas irrégulier par suite d'un jeu excessif.



SLC245

3. Vérifier que l'accouplement de ventilateur fonctionne correctement, qu'il ne présente pas d'oscillations, de fuites d'huile ou que le bimétal n'est pas tordu.



La pompe à eau et l'accouplement de ventilateur ne peuvent pas être démontés et doivent être remplacés comme un ensemble.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

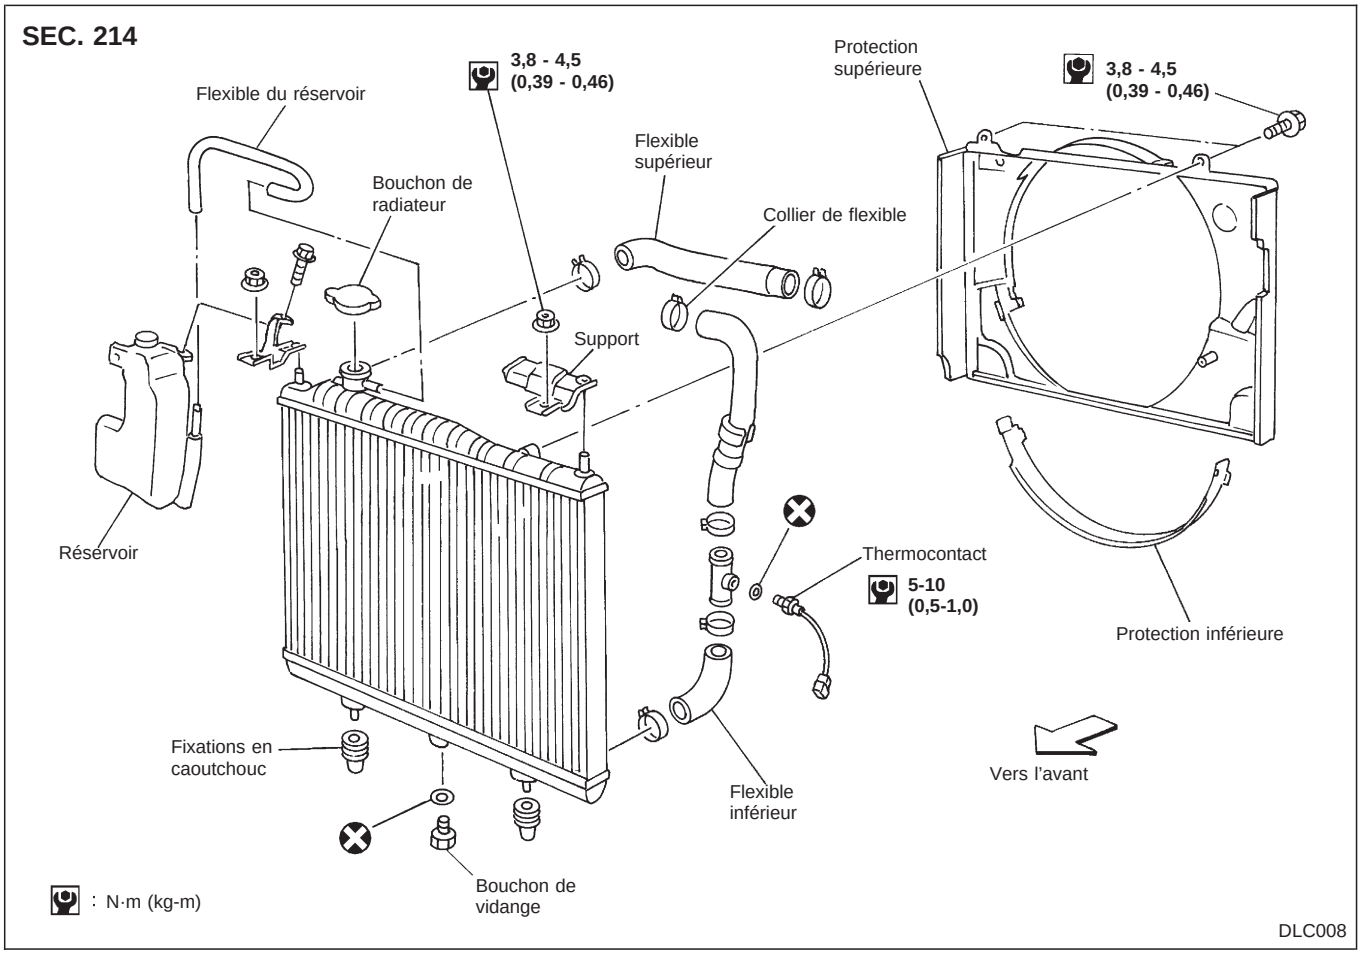
Thermostat

- **Après la repose, faire tourner le moteur pendant quelques minutes et vérifier qu'il n'y a pas de fuites.**
- **Veiller à ne pas renverser de liquide de refroidissement sur le compartiment moteur. Placer un chiffon pour absorber le liquide de refroidissement.**

INSPECTION

1. Vérifier l'assise de la soupape aux températures habituelles. Il doit avoir une bonne assise.
2. Vérifier la température d'ouverture de la soupape et le levage de cette dernière.

	Type pour pays tropicaux	Type standard
Température d'ouverture de la soupape °C	76,5	82
Levage de la soupape mm/°C	Plus de 8/90	Plus de 8/95



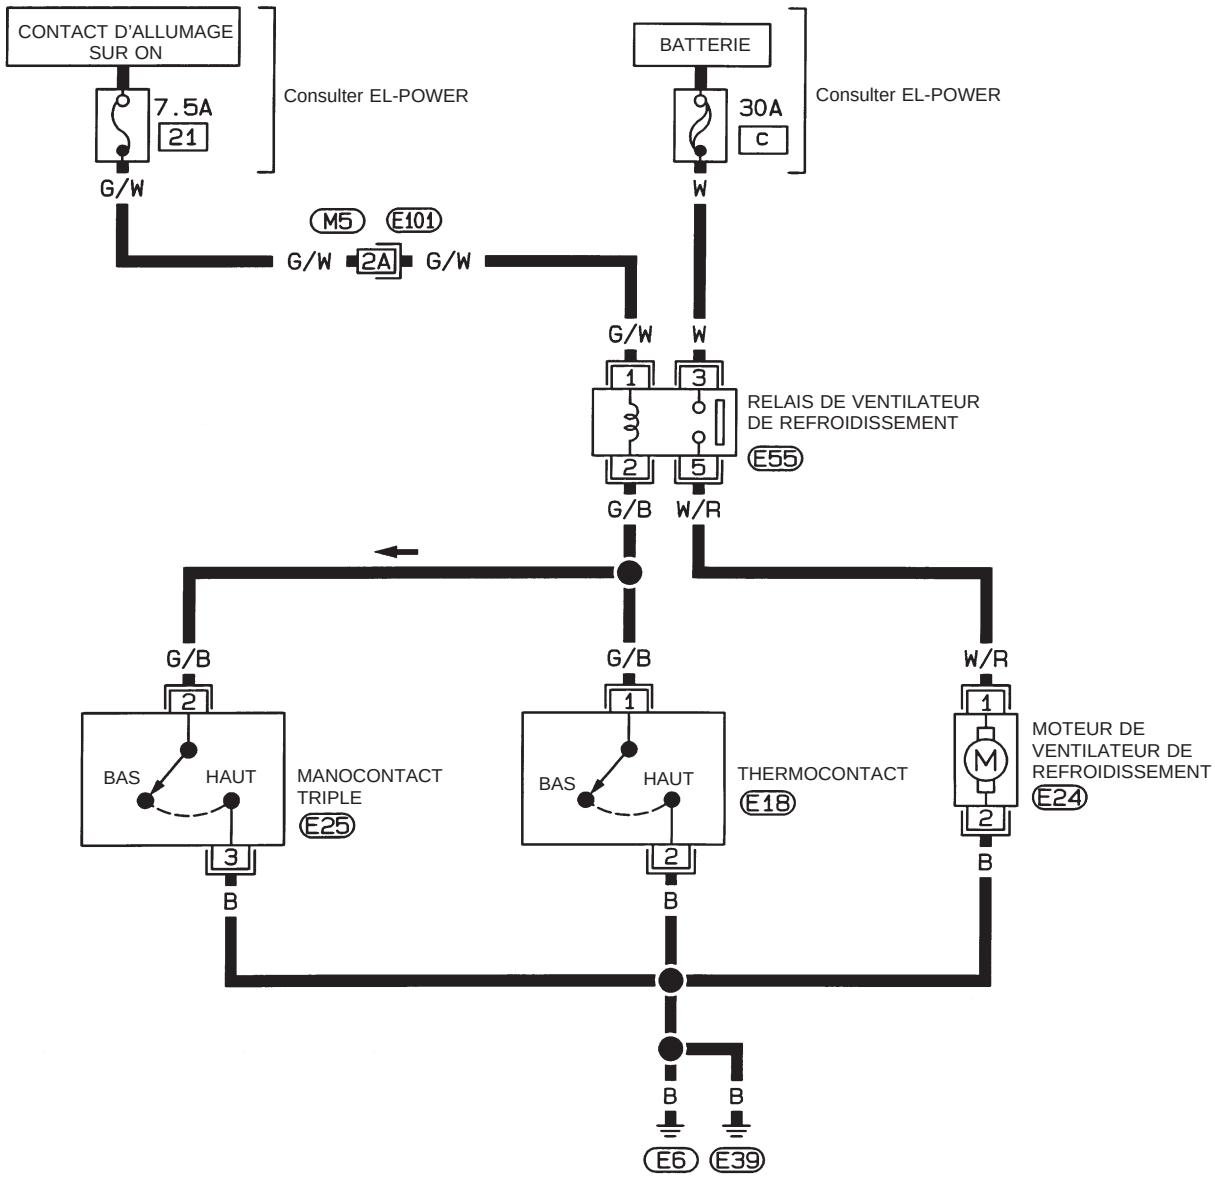
3. Vérifier ensuite si la soupape se ferme à 5°C en dessous de la température d'ouverture de la soupape.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Radiateur

DEPOSE ET REPOSE

1. Déposer le couvercle inférieur.
2. Vidanger le liquide de refroidissement par le bouchon de vidange.
3. Débrancher les flexibles inférieur et supérieur du radiateur.
4. Déposer la protection inférieure du radiateur.
5. Débrancher le flexible du réservoir.
6. Déposer le radiateur.
7. Après avoir réparé ou remplacé le radiateur, reposer toutes les pièces déposées dans l'ordre inverse de leur dépose.



Remplissage de liquide de refroidissement du moteur

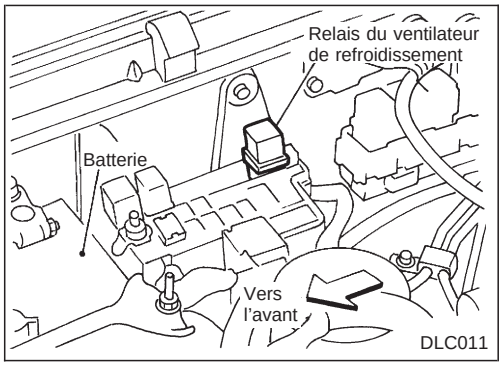
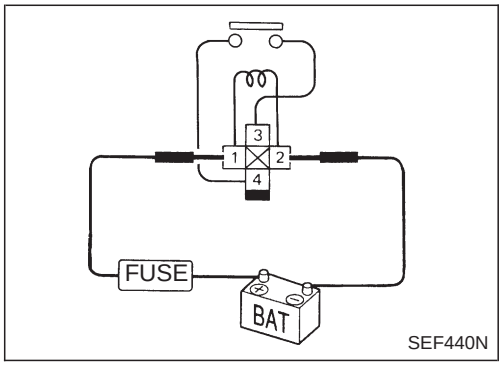
Ventilateur de refroidissement (entraîné par moteur)

Inspection des composants électriques

MOTEUR DE VENTILATEUR DE REFROIDISSEMENT



1. Débrancher le connecteur de faisceau du moteur de ventilateur de refroidissement.

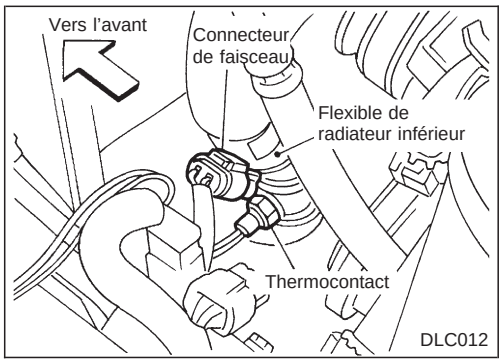


2. Fournir de la tension de batterie aux bornes du moteur de ventilateur de refroidissement et vérifier son bon fonctionnement.
   Le moteur de ventilateur de refroidissement doit fonctionner.
   Si le résultat n'est pas satisfaisant, remplacer le moteur de ventilateur de refroidissement.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

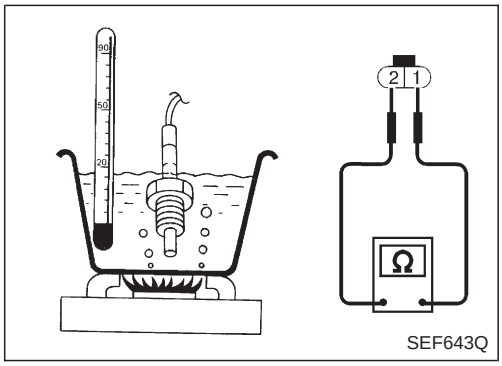
Inspection des composants électriques (Suite)

RELAIS DE VENTILATEUR DE REFROIDISSEMENT



Vérifier la continuité entre les bornes ③ et ④.

Conditions	Continuité
Courant continu de 12V entre les bornes ① et ②	Oui
Aucune alimentation électrique	Non



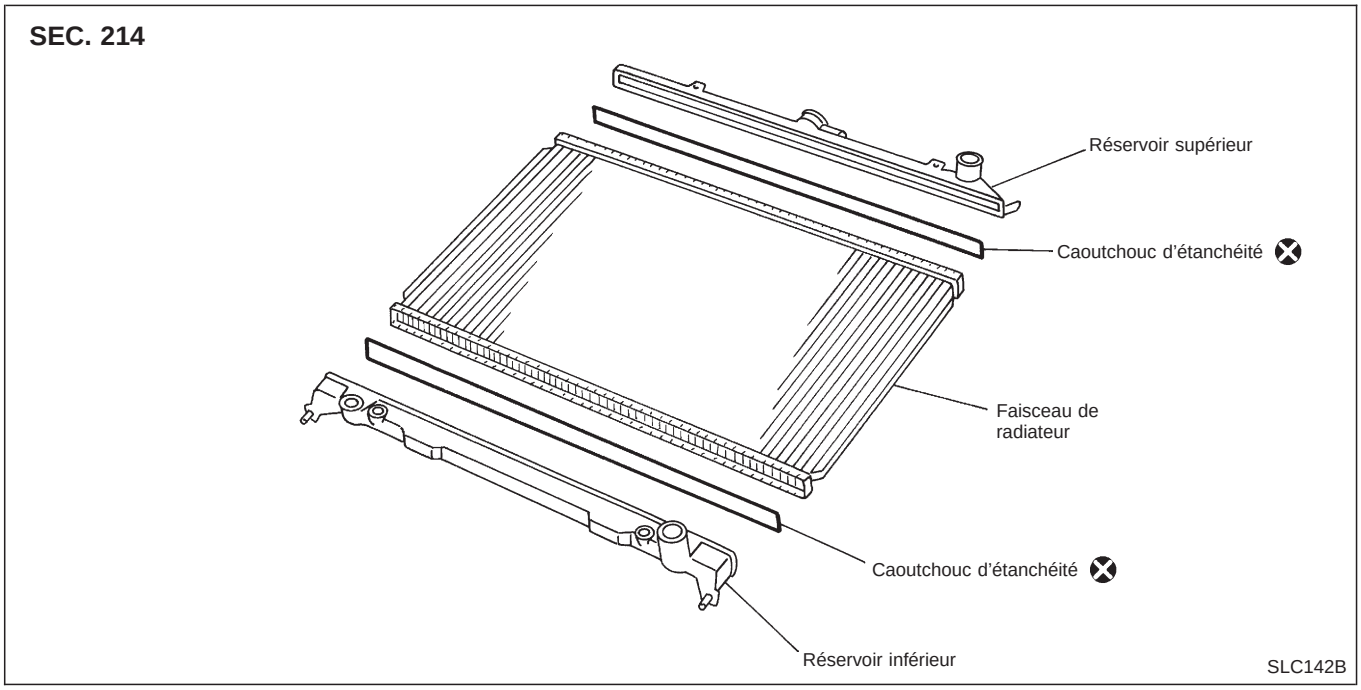
Si le résultat n'est pas satisfaisant, remplacer le relais.

THERMOCONTACT

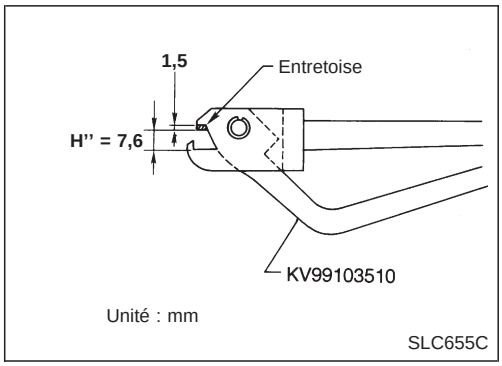
1. Débrancher le connecteur de faisceau du thermocontact.

2. Vérifier le fonctionnement comme indiqué sur la figure.

Température du réfrigérant °C	Fonctionnement	Continuité
Supérieure à 92 - 98	ARRET → MARCHE	MARCHE : existe.
Inférieure à 87 - 93	MARCHE → ARRET	ARRET : n'existe pas.



MANOCONTACT TRIPLE

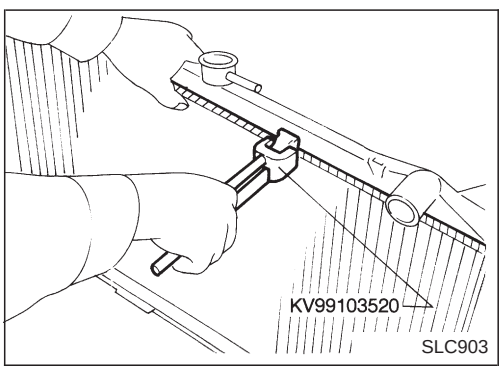


Pour l'inspection de ce contact, se reporter à la section HA (''MANOCONTACT TRIPLE'' au chapitre ''Inspection des composants électriques'').

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Radiateur (de type aluminium)

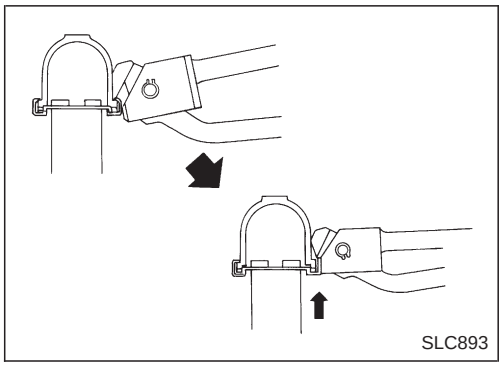
SEC. 214



PREPARATION

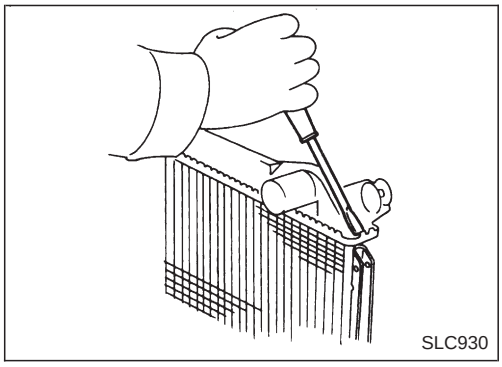
1. Fixer une entretoise au bout des pinces A à plaque de radiateur.
   Caractéristiques de l'entretoise : 1,5 mm épaisseur x 18 mm largeur x 8,5 mm longeur.
2. S'assurer que lorsque les pinces A à plaque de radiateur sont fermées, la cote H″ est d'environ 7,6 mm.
3. Si nécessaire, régler la dimension H″ à l'aide de l'entretoise.

- **Si les bords du faisceau de radiateur ne peuvent pas être rabattus comme indiqué, les pinces A de la plaque de radiateur doivent être adaptées. Se reporter au Bulletin Technique LC 91-001.**



DEMONTAGE

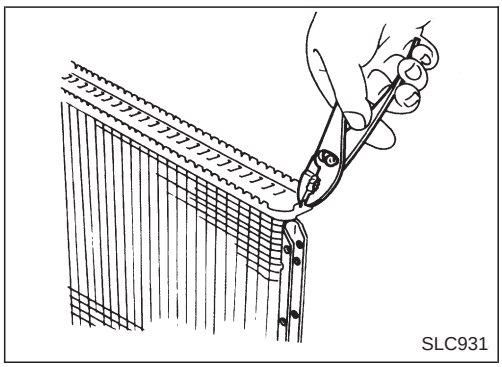
1. Déposer le réservoir à l'aide de l'outil.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Radiateur (de type aluminium) (Suite)

SLC893

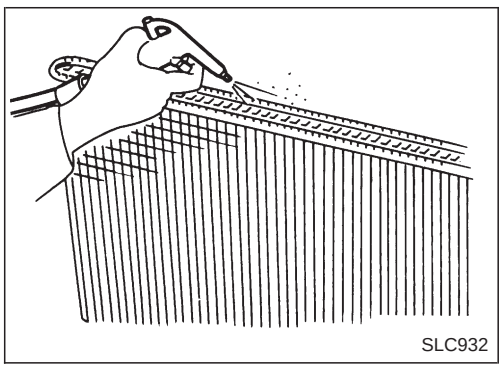


- Serrer le bord rabattu et le plier vers le haut de sorte que l'outil glisse et sorte.

Ne pas trop plier.

SLC930

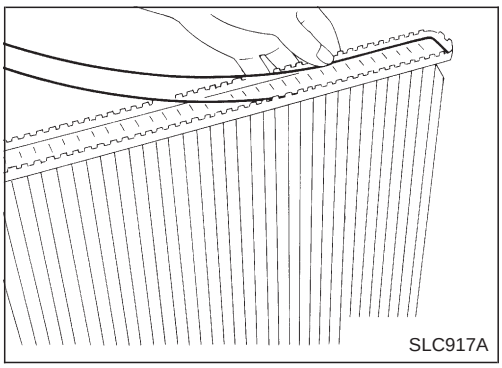
- Dans les zones où l'outil ne peut pas être utilisé, se servir d'un tournevis pour plier le bord vers le haut.



Prendre garde de ne pas endommager le réservoir.

SLC931

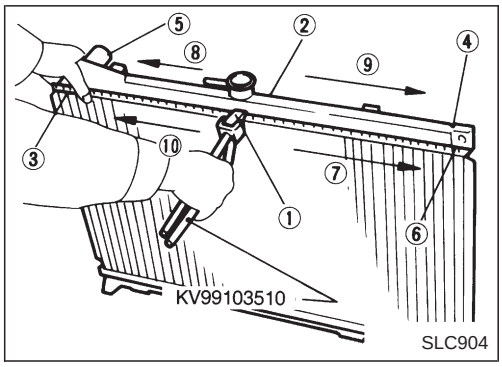
2. S'assurer que le rebord est dressé à la verticale.



REMONTAGE

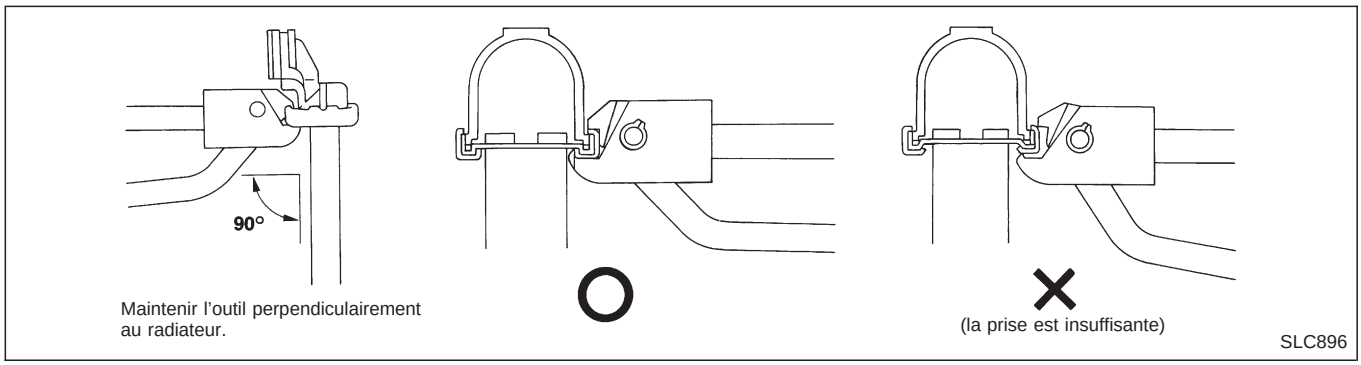
1. Nettoyer la partie de contact du réservoir.

SLC932

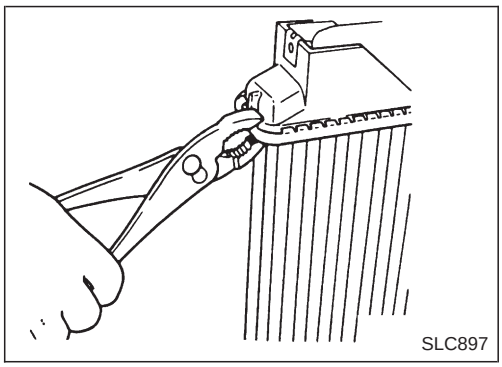


2. Installer un joint en caoutchouc.

L'enfoncer avec les doigts.
Prendre garde de ne pas tordre le joint en caoutchouc.

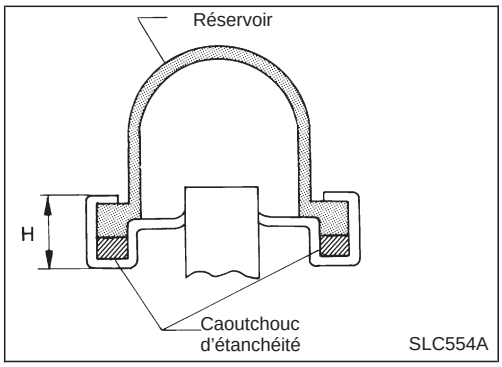


SLC917A

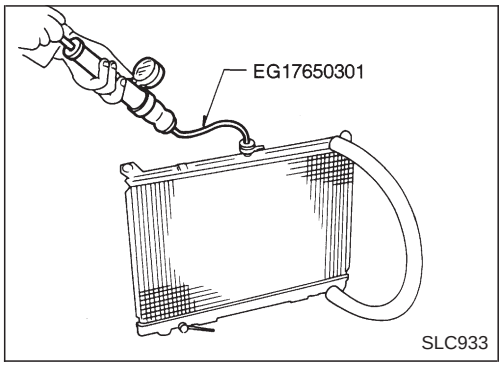


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Radiateur (de type aluminium) (Suite)



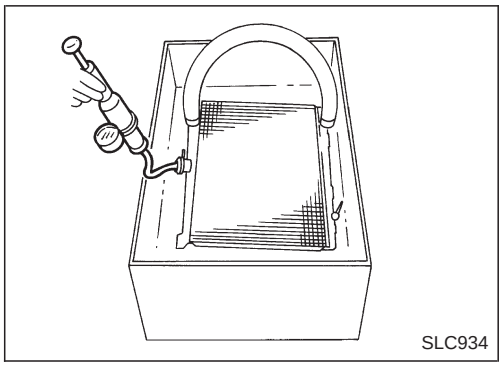
3. Mater le réservoir à l'aide de l'outil dans l'ordre indiqué.



- Utiliser des pinces aux endroits où l'outil n'est pas utilisable.

4. S'assurer que le bord est entièrement rabattu vers le bas.
   Hauteur standard "H" :
   8,0 - 8,4 mm
5. S'assurer qu'il n'y a pas de fuites.

Se reporter à "Inspection".



INSPECTION

1. Appliquer une pression avec l'outil.
   Valeur de pression spécifiée :
   157 kPa (1,57 bar, 1,6 kg/cm^2)

AVERTISSEMENT :
Pour éviter que le flexible ne se défasse pendant qu'il est sous pression, le fixer solidement avec un collier.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Radiateur (de type aluminium) (Suite)

2. Vérifier qu'il n'y a pas de fuites.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Analyse des causes de surchauffe

	Symptôme		Eléments à vérifier	
Pièces défectueuses du circuit de refroidissement	Transfert de chauffage de pauvre qualité	Défaut de la pompe à eau	Courroie d'entraînement usée ou desserrée	–
		Thermostat bloqué sur la position de fermeture	–	
		Ailettes endommagées	Obstruction par poussière ou papier	
			Dommage mécanique	
		Obturation du tuyau de refroidissement du radiateur	Excès de particules étrangères (rouille, saleté, sable, etc.)	
	Débit d'air réduit	Le ventilateur de refroidissement ne fonctionne pas	–	–
		L'accouplement de ventilateur ne fonctionne pas		
		Résistance élevée à la rotation de ventilateur		
		Ailettes de ventilateur endommagées		
	Protection de radiateur endommagée	–	–	–
	Richesse de mélange du liquide de refroidissement inadéquate	–	–	–
	Qualité insuffisante de liquide de refroidissement	–	–	–
	Liquide de refroidissement insuffisant	Fuites de liquide de refroidissement	Flexible de refroidissement	Collier détendu
				Flexible fissuré
			Pompe à eau	Mauvaise étanchéité
			Bouchon de radiateur	Desserré
				Mauvaise étanchéité
			Radiateur	Dommage, détérioration ou mauvaise fixation du joint torique
				Réservoir de radiateur fissuré
				Faisceau de radiateur fissuré
			Réservoir	Réservoir fissuré
		Trop-plein de réservoir	Fuites de gaz d'échappement dans le circuit de refroidissement	Détérioration de culasse
				Détérioration du joint de culasse

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Analyse des causes de surchauffe (Suite)

	Symptôme		Eléments à vérifier	
Sauf pièces défectueuses du circuit de refroidissement	–	Surcharge du moteur	Conduite forcée	Régime moteur élevé sans charge
				Conduite en première vitesse pendant une durée prolongée
				Conduite à vitesse très rapide
			Défaut du système de transmission	–
			Repose de roues et pneus de taille incorrecte	
			Grippage des freins	
			Calage de l'allumage inadéquat	
	Débit d'air bloqué ou restreint	Amortisseur bloqué	–	–
		Grille de radiateur bloquée	Installation du bouclier de radiateur du véhicule	
			Obstruction par boue ou papier	
		Radiateur bloqué	–	
		Condenseur bloqué	–	
		Repose d'un feu antibrouillard large

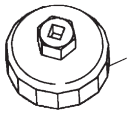
Système de retenue supplémentaire (SRS) ‘‘COUSSIN GONFLABLE’’ (modèles à 4 roues motrices)

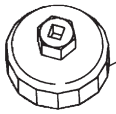
Utilisé avec une ceinture de sécurité, le coussin gonflable du système de retenue supplémentaire contribue à réduire les risques et la gravité des blessures subies par le conducteur en cas de collision frontale. Le système de retenue supplémentaire se compose d’un module de coussin gonflable (air bag) (situé dans le moyeu du volant), d’un boîtier de capteurs de diagnostic, d’un témoin avertisseur, d’un faisceau de câblage et d’un câble spiralé. Les informations nécessaires à l’entretien sans danger du système se trouvent à la **section RS** de ce manuel de réparation.

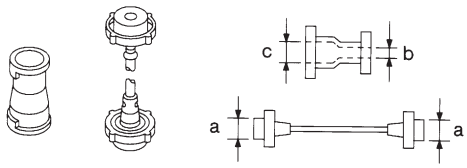
AVERTISSEMENT :

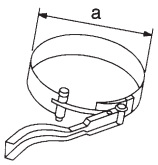
- **Pour ne pas affecter le fonctionnement du SRS, ce qui augmenterait les risques de blessures graves ou mortelles en cas de collision entraînant le déploiement du coussin gonflable (air bag), toutes les opérations d’entretien doivent être effectuées par un concessionnaire NISSAN agréé.**
- **Un entretien incorrect, y compris une mauvaise dépose ou repose du SRS, pourra entraîner des risques de blessures dues au déploiement accidentel du système.**
- **Ne pas utiliser d’équipement d’essai électrique sur les circuits connexes du SRS sauf sur indication de ce manuel de réparation. Les faisceaux de câblage électrique du SRS sont équipés d’une gaine d’isolation jaune soit juste devant les connecteurs de faisceau, soit sur le faisceau tout entier pour une identification plus rapide.**

Système de retenue supplementaire (SRS) ‘‘COUSSIN GONFLABLE’’ (modèles à 2 roues motrices)



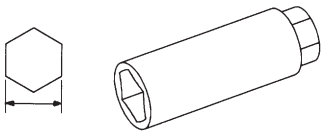






Utilisé avec une ceinture de sécurité, le coussin gonflable du système de retenue supplémentaire contribue à réduire les risques et la gravité des blessures subies par le conducteur en cas de collision frontale. Le système de retenue supplémentaire se compose d’un module de coussin gonflable (air bag) (situé dans le moyeu du volant), d’un boîtier de capteurs de diagnostic, d’un témoin avertisseur, d’un faisceau de câblage et d’un câble spiralé. Les informations nécessaires à l’entretien sans danger du système se trouvent à la **section RS** de ce manuel de réparation.

AVERTISSEMENT :



- **Pour ne pas affecter le fonctionnement du SRS, ce qui augmenterait les risques de blessures graves ou mortelles en cas de collision entraînant le déploiement du coussin gonflable (air bag), toutes les opérations d’entretien doivent être effectuées par un concessionnaire NISSAN agréé.**
- **Un entretien incorrect, y compris une mauvaise dépose ou repose du SRS, pourra entraîner des risques de blessures dues au déploiement accidentel du système.**

La liste ci-dessous est celle des points à vérifier avant de remettre un véhicule neuf à son acquéreur. Nous conseillons l'ajout des autres éléments nécessaires non mentionnés ici, en veillant bien aux conditions particulières à chaque pays.

Effectuer les interventions qui s'appliquent à chaque modèle. Prière de consulter le texte de cette section pour connaître les caractéristiques et valeurs de réglage.

SOUS LE CAPOT – moteur à l'arrêt

- ☐ Niveau du liquide de refroidissement dans le radiateur et fuites éventuelles aux branchements de conduites
- ☐ Niveau et densité de l'électrolyte de batterie et état des bornes de batterie
- ☐ Tension des courroies d'entraînement
- ☐ Présence éventuelle d'eau ou de poussière dans le filtre à carburant, et fuites éventuelles aux conduites d'alimentation et raccords
- ☐ Niveau d'huile moteur et fuites éventuelles
- ☐ Niveau du liquide de frein et d'embrayage dans le réservoir et fuites éventuelles des conduites hydrauliques
- ☐ Niveau du liquide dans les réservoirs de lave-glace de pare-brise, de lunette arrière et de lave-phare
- ☐ Niveau du liquide dans le réservoir de direction assistée et fuites éventuelles aux branchements de conduites

A L'INTERIEUR ET A L'EXTERIEUR

- ☐ Dépose du ressort avant/de l'entretoise d'amortisseur (le cas échéant)
- ☐ Fonctionnement de tous les instruments de bord, jauges, témoins et accessoires
- ☐ Fonctionnement du (des) avertisseur(s) sonore(s), des essuie-glaces et des lave-glaces
- ☐ Fonctionnement de l'antivol de direction
- ☐ Fuites de gaz éventuelles du climatiseur
- ☐ Fonctionnement des sièges avant, de la banquette arrière et des ceintures de sécurité
- ☐ Ajustage et alignement des moulures, garnitures et accouplements
- ☐ Fonctionnement et alignement de toutes les fenêtres
- ☐ Ajustage et alignement du capot-moteur, du couvercle du coffre à bagages et des panneaux de portières
- ☐ Fonctionnement des loquets, serrures et clés
- ☐ Adhérence et ajustage des bourrelets
- ☐ Orientation des faisceaux de phare
- ☐ Serrage des écrous de roue (y compris les écrous internes si applicable)
- ☐ Pression de gonflage des pneus (y compris les roues de secours)
- ☐ Contrôle du pincement des roues avant
- ☐ Repose du fusible de montre/de voltmètre/de plafonnier (le cas échéant)

SOUS LA CARROSSERIE

- ☐ Niveau d'huile de la boîte de vitesses/boîte/pont manuelle, de la boîte de transfert et du différentiel
- ☐ Fuites des canalisations de frein et d'alimentation et des réservoirs d'huile/liquide
- ☐ Serrage des boulons et écrous de la timonerie de direction, de la boîte de vitesses, de la suspension, des arbres de transmission et des semi-arbres

ESSAI SUR ROUTE

- ☐ Fonctionnement de l'embrayage
- ☐ Fonctionnement du frein de stationnement
- ☐ Fonctionnement des freins de conduite
- ☐ Commande et retour en ligne droite de la direction
- ☐ Rendement du moteur
- ☐ Grincements et cliquetis

FONCTIONNEMENT DU MOTEUR A CHAUD

- ☐ Réglage du mélange et du régime de ralenti (ainsi que du calage de l'allumage*1)
- ☐ Fonctionnement du bouton de commande de ralenti et d'arrêt du moteur (seulement pour moteur diesel)

VERIFICATION FINALE

- ☐ Mise en place des accessoires nécessaires (rétroviseur extérieur, enjoliveurs de roues, ceintures de sécurité, tapis de sol ou pare-boue)
- ☐ Inspection de l'état des parties métalliques et de la peinture à l'intérieur et à l'extérieur
- ☐ Contrôle de la présence de la roue de secours, du cric, des outils (cales de roue comprises) et de la documentation
- ☐ Lavage, nettoyage de l'intérieur et l'extérieur

*1 : Non requis sur les modèles dotés d'un système d'allumage direct

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

L'entretien général concerne les éléments du véhicule qui doivent faire l'objet de contrôles réguliers en fonctionnement normal. Ces éléments sont indispensables pour assurer le bon fonctionnement continu du véhicule. Les possesseurs d'un véhicule peuvent effectuer eux-mêmes ces contrôles et vérifications ou en charger leur concessionnaire NISSAN.

Elément	Pages de référence
EXTERIEUR DU VEHICULE Sauf indication contraire, les éléments indiqués ci-dessous doivent faire l'objet d'un contrôle périodique.	
Pneus Vérifier régulièrement, lors des arrêts dans une station-service, la pression des pneus au moyen d'un manomètre, sans oublier la roue de secours, et la régler si elle ne correspond pas à la pression spécifiée. Vérifier attentivement toute trace de dommages, de coupures ou d'usure excessive.	–
Balais d'essuie-glaces de pare-brise Vérifier qu'ils ne sont pas abîmés ou usagés lorsqu'ils n'essuient pas correctement le pare-brise.	–
Portes et capot Vérifier le bon fonctionnement des portes, du capot, du couvercle de coffre et du hayon. S'assurer également que toutes les serrures fonctionnent correctement. Lubrifier les charnières, loquets, galets et articulations si nécessaire. S'assurer que le loquet secondaire maintient le capot fermé lorsque le loquet principal est desserré. Lors de la conduite sur des chaussées recouvertes de sel ou autres matériaux corrosifs, effectuer de fréquents contrôles de graissage.	MA-43
Permutation des pneus La permutation des pneus doit être effectuée tous les 10 000 km pour les modèles à 2 roues motrices et tous les 5 000 km pour les modèles à 4 roues motrices.	MA-38
INTERIEUR DU VEHICULE Vérifier régulièrement les éléments ci-dessous, notamment lors d'une révision, d'un nettoyage, etc.	
Feux Vérifier le bon fonctionnement des phares, des feux stop, des feux arrière, des clignotants et des autres feux, et contrôler la sécurité de leur installation. Contrôler également la portée des feux de route.	–
Témoins et carillons Vérifier le bon fonctionnement de tous les témoins et carillons.	–
Volant Effectuer un contrôle en cas de changements dans la direction, tels qu'un jeu excessif, une direction trop dure ou des bruits étranges. **Jeu libre : moins de 35 mm**	–
Ceintures de sécurité Vérifier le bon fonctionnement et le montage correct des pièces du système de ceintures de sécurité (par exemple, les boucles, le dispositif d'ancrage, le dispositif de réglage et les enrouleurs). Vérifier si la ceinture n'est pas endommagée, usée, effilochée ou n'a pas de traces de coupure.	MA-44
SOUS LE CAPOT ET SOUS LE VEHICULE Les éléments ci-dessous doivent faire l'objet d'un contrôle régulier, par exemple à chaque plein ou à chaque vérification de l'huile moteur.	
Liquide de lave-glace de pare-brise Vérifier qu'il reste une quantité suffisante dans le réservoir.	–
Niveau du liquide de refroidissement du moteur Vérifier le niveau du liquide de refroidissement quand le moteur est froid.	MA-16, 26
Niveau d'huile moteur Vérifier le niveau de l'huile après avoir garé le véhicule sur un terrain plat et avoir arrêté le moteur.	MA-19, 25
Niveau de liquide de frein et d'embrayage S'assurer que les niveaux des liquides de frein et d'embrayage se trouvent bien entre les repères ''MAX'' et ''MIN'' sur le réservoir.	MA-35, 38
Batterie Vérifier le niveau du liquide de chaque élément. Il doit être compris entre les repères ''MAX'' et ''MIN''.	–

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Les tableaux suivants présentent le programme normal d'entretien. En fonction des conditions climatiques et atmosphériques, des types de revêtements de chaussée, des habitudes individuelles de conduite et de l'utilisation faite du véhicule, des opérations d'entretien supplémentaires ou plus fréquentes peuvent être requises, comme indiqué dans ''Entretien dans des conditions de conduite sévères''.

L'entretien périodique dépassant la dernière fréquence d'entretien indiquée dans les tableaux est du même ordre que l'entretien spécifié pour cette dernière.

Entretien courant pour les modèles avec moteur à essence

Entretien du moteur pour les véhicules dont le kilométrage est inférieur à 30 000km/an

Abréviations : R= Remplacer, I = Vérifier et corriger ou remplacer si nécessaire.

Entretien dans des conditions de conduite sévères

Les intervalles d'entretien indiqués aux pages précédentes sont donnés pour des conditions d'utilisation normales. Si le véhicule est principalement utilisé dans les conditions de conduite sévères suivantes, il est nécessaire d'augmenter la fréquence d'entretien comme indiquée dans le tableau.

Conditions de conduite sévères

A – Conduite dans un environnement poussiéreux
B – Conduite répétée sur de courtes distances
C – Tirage d'une remorque ou d'une caravane
D – Ralenti excessif
E – Conduite dans des conditions climatiques extrêmement difficiles ou dans des endroits où les températures ambiantes sont soit extrêmement basses, soit extrêmement élevées
F – Conduite dans des régions très humides ou montagneuses
G – Conduite sur des chaussées recouvertes de sel ou d'autres matériaux corrosifs
H – Conduite sur des routes inégales et/ou boueuses ou dans le désert
I – Conduite avec usage fréquent des freins ou dans des régions montagneuses
J – Conduite fréquente sur des surfaces inondées

Pour modèles avec moteur à essence

Opérations d'entretien : Vérifier = Vérifier et corriger ou remplacer si nécessaire

Entretien en cas de conduite tout-terrain (4x4 uniquement)

En cas de conduite sur des chaussées recouvertes de sable, de boue ou d'eau aussi profondes que le moyeu de roue, des entretiens plus fréquents peuvent être requis pour les pièces suivantes :

- ▲ Plaquettes et disques de freins
- ▲ Garniture et tambours de freins
- ▲ Canalisations et flexibles de freins
- ▲ Graisse pour roulement de roue et graisse pour moyeu de roue libre
- ▲ Graisse pour moyeu de roue libre
- ▲ Huile de boîte de différentiel, de boîte de vitesses et de boîte de transfert
- ▲ Timonerie de la direction
- ▲ Arbres de transmission et semi-arbres avant
- ▲ Filtre à air
- ▲ Carter d'embrayage (voir si l'eau pénètre. Se reporter à MA-36).

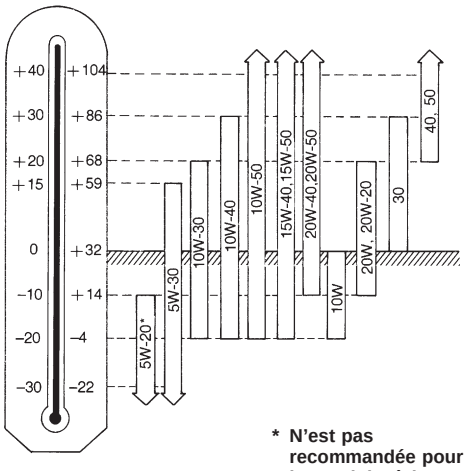
Indice de viscosité SAE

Température ambiante extérieure attendue avant prochaine vidange

HUILE POUR MOTEUR A ESSENCE



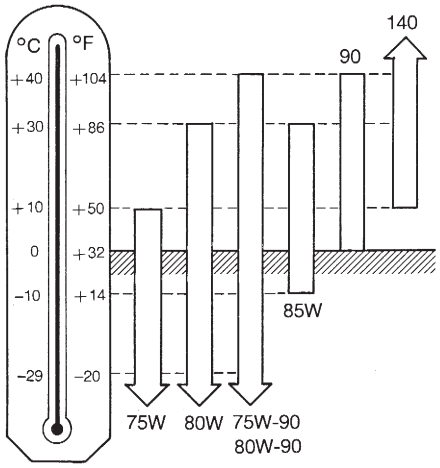
* N'est pas recommandée pour la conduite à haut régime soutenu

TI0005

- **Pour les régions tempérées et froides : l'huile 10W-30 convient, avec une température ambiante supérieure à −20°C.**
- **Pour les régions chaudes : les huiles 20W-20, 20W-40 et 20W-50 conviennent.**

Température ambiante extérieure attendue avant prochaine vidange

HUILE POUR MOTEUR DIESEL



* N'est pas recommandée pour la conduite à haut régime soutenu

TI0006

- **Pour les régions froides : l'huile 10W-30 est préférable.**
- **Pour les régions tempérées et chaudes : les huiles 20W-40 et 20W-50 conviennent.**

Température ambiante extérieure attendue avant prochaine vidange

HUILE A ENGRENAGES

TI0003

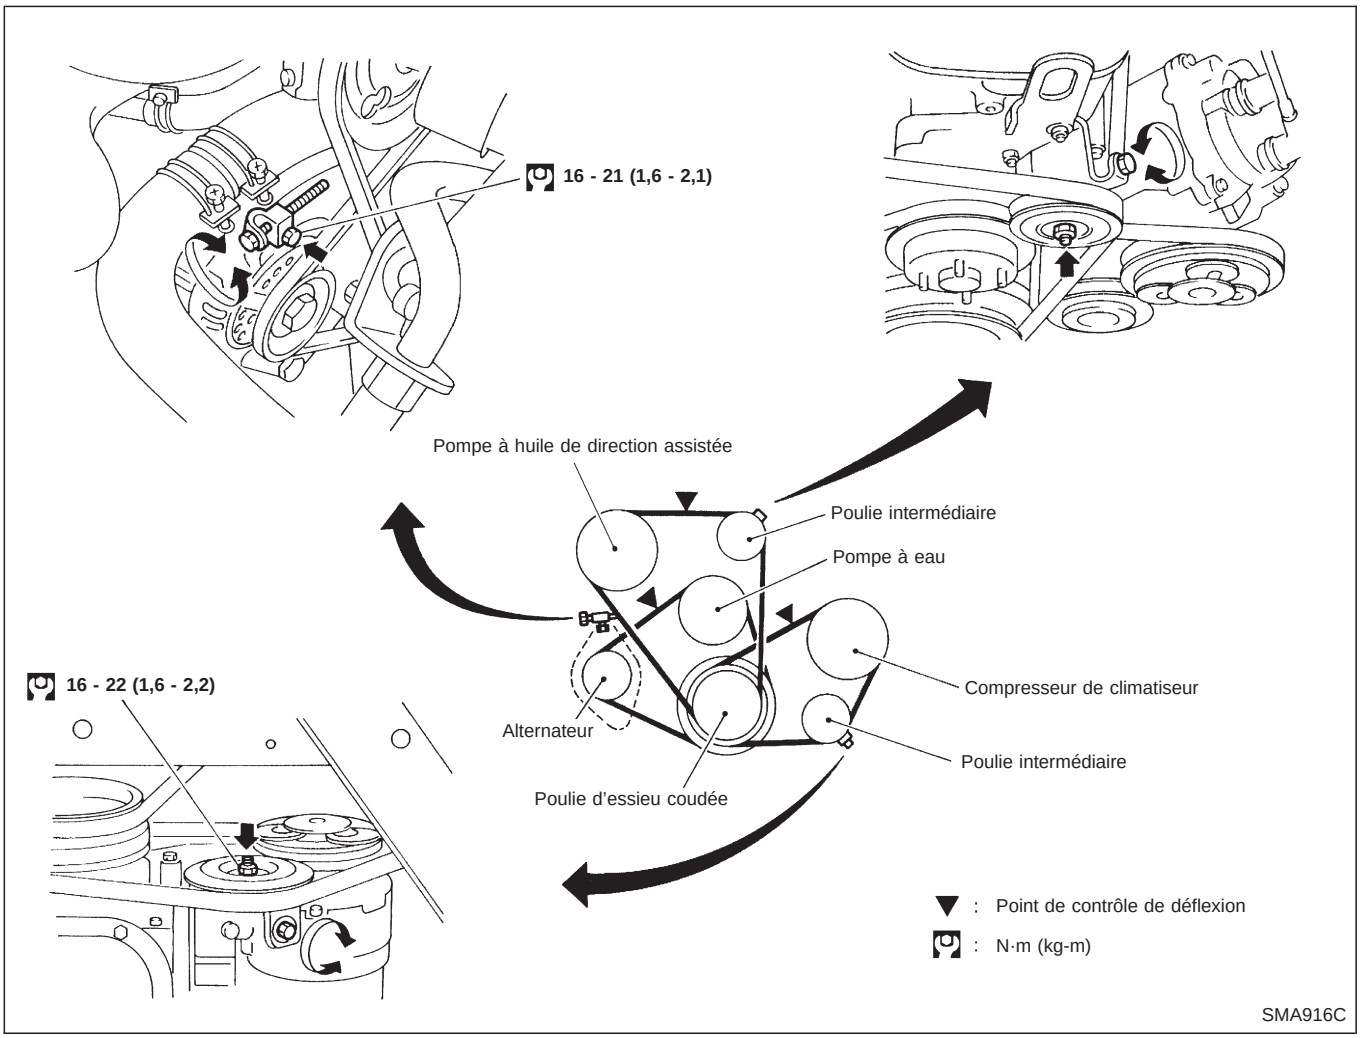
- **Pour les régions tempérées et froides : l'huile 75W-90 pour la boîte de transfert et l'huile 80W-90 pour le différentiel conviennent.**
- **Pour les régions chaudes : l'huile 90 convient à une température ambiante inférieure à 40°C.**
- **Pour tout type de régions : l'huile 75W-90 pour la boîte de vitesses est préférable.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Richesse de mélange du liquide de refroidissement antigel

Le circuit de refroidissement du moteur est rempli en atelier avec une solution de liquide de refroidissement antigel de haute qualité et d'une durée d'un an. La solution antigel contient des agents inhibiteurs contre la corrosion et la rouille. Il est donc inutile de rajouter des additifs au circuit de refroidissement.

ATTENTION :



Lors de l'ajout ou du remplacement du liquide de refroidissement, veiller à n'utiliser que de l'antigel contenant de l'éthylène glycol avec la richesse de mélange adéquate. Voir les exemples suivants :

Température extérieure jusqu'à	Antigel	Eau douce
°C		
−15	30%	70%
−35	50%	50%

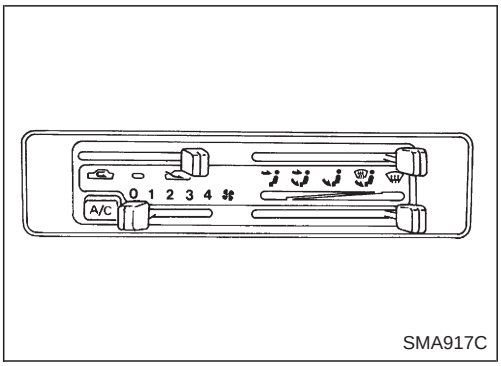
L'utilisation d'autres types de solutions de liquide de refroidissement peut endommager le circuit de refroidissement.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Vérification des courroies d'entraînement

1. Rechercher des traces de fissures, d'effilochages, d'usure ou d'huile. En cas de besoin, remplacer la courroie par une neuve.
2. Vérifier les déflexions des courroies d'entraînement en appuyant à mi-chemin entre les poulies.

Régler si les déflexions des courroies sont excessives.



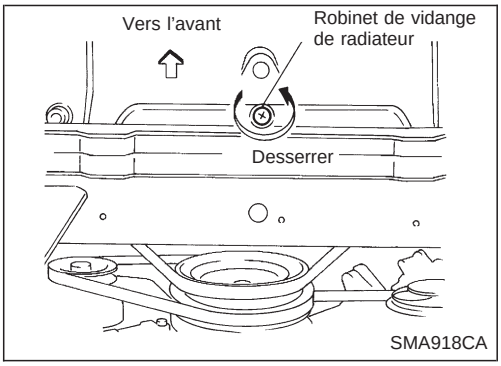
Déflexion des courroies :

Unité : mm

	Déflexion d'une courroie usagée		Déflexion d'une courroie neuve
	Limite	Déflexion après réglage	
Alternateur	17	10 - 12	8 - 10
Compresseur de climatiseur	16	10 - 12	8 - 10
Pompe à huile de direction assistée	15	9 - 11	7 - 9
Force de poussée	98 N (10 kg)		

Contrôler les déflexions des courroies d'entraînement lorsque le moteur est froid.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

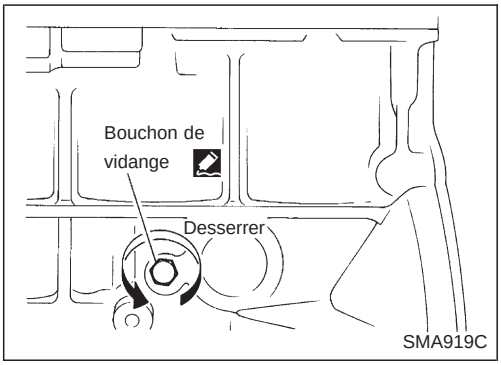


SMA917C

Remplacement du liquide de refroidissement du moteur

AVERTISSEMENT :
Pour éviter de se brûler, ne jamais changer le liquide de refroidissement lorsque le moteur est chaud.

– VIDANGE DU LIQUIDE DE REFROIDISSEMENT –

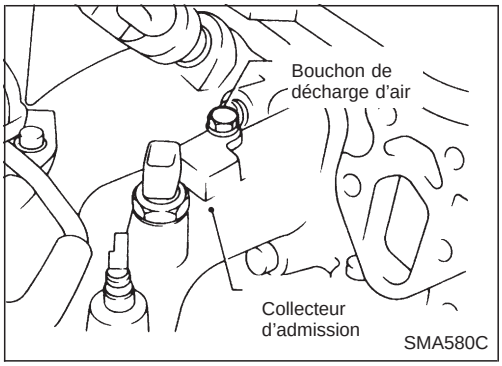


1. Déplacer le curseur de réglage de la température complètement jusqu'à la position ''CHAUD''.

SMA918CA

2. Ouvrir le robinet de vidange se trouvant en bas du radiateur et enlever le bouchon du radiateur.
3. Déposer le réservoir, vidanger le liquide de refroidissement, puis nettoyer le réservoir. Le reposer temporairement.

Veiller à ce que le liquide de refroidissement ne coule pas sur les courroies d'entraînement.



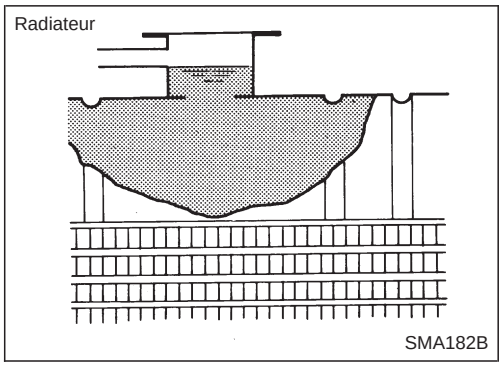
SMA919C

4. Retirer le bouchon de vidange du bloc-cylindres.

– RINÇAGE DU CIRCUIT DE REFROIDISSEMENT –

5. Reposer et fermer le robinet de vidange et bien serrer le bouchon de vidange.
6. Ouvrir le bouchon de décharge d'air.
7. Remplir le radiateur d'eau et fermer le bouchon de décharge d'air et le bouchon du radiateur.
8. Faire tourner le moteur et le laisser chauffer suffisamment.
9. Lancer le moteur deux ou trois fois à vide.
10. Arrêter le moteur et attendre qu'il refroidisse.
11. Répéter les opérations des étapes 2 à 10 jusqu'à ce que de l'eau propre commence à s'écouler du radiateur.
12. Vidanger l'eau.

– REMPLISSAGE DE LIQUIDE DE REFROIDISSEMENT –

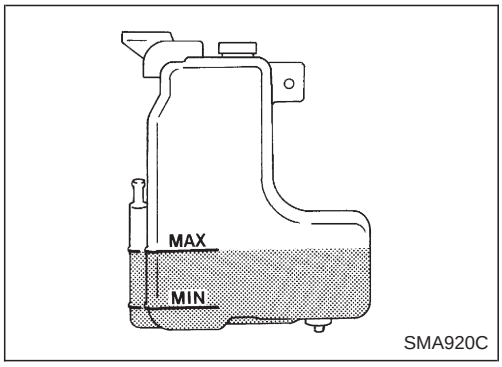


SMA580C

- **Appliquer du produit d'étanchéité sur le filetage du bouchon de vidange.**
  : 34 - 44 N·m
  (3,5 - 4,5 kg-m)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Remplacement du liquide de refroidissement du moteur (Suite)



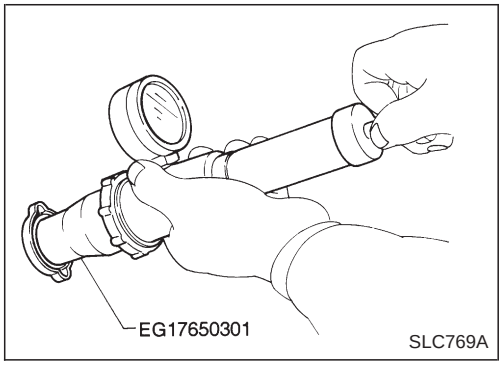
13. Ouvrir le bouchon du radiateur et le bouchon de décharge d'air.
14. Remplir le radiateur de liquide de refroidissement jusqu'au niveau spécifié.
    Se conformer aux instructions prévues sur le récipient d'antigel pour déterminer le rapport de mélange eau/antigel.

Pour la richesse de mélange du liquide de refroidissement, se reporter à MA-14.

Unité : ℓ

	Contenance en liquide de refroidissement :	
	2 roues motrices	4 roues motrices
Sans réservoir	6,1	
Réservoir	0,6	

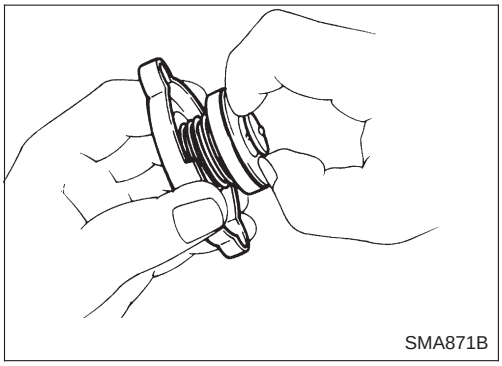
Verser lentement le liquide de refroidissement dans le goulot de remplissage afin que l'air puisse s'échapper.



15. Fermer le bouchon de décharge d'air.
16. Déposer le réservoir, vidanger le liquide de refroidissement, puis nettoyer le réservoir.
17. Reposer le réservoir et le remplir de réfrigérant jusqu'au niveau ''MAX'', puis reposer le bouchon du radiateur.
18. Faire tourner le moteur et le laisser chauffer suffisamment.
19. Lancer le moteur deux ou trois fois à vide.
20. Arrêter le moteur et le laisser refroidir, puis ajouter la quantité de liquide de refroidissement nécessaire.

Vérification du circuit de refroidissement

CONTROLE DES FLEXIBLES

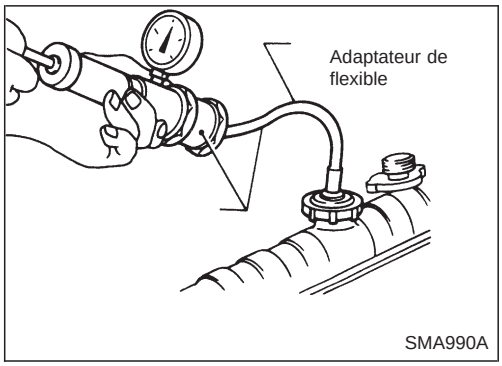


Vérifier l'état général des flexibles et voir s'il n'y a pas de fuites, de fissures, d'effilochages ni de raccords desserrés.

VERIFICATION DU BOUCHON DE RADIATEUR

Exercer une pression sur le bouchon du radiateur à l'aide d'un vérificateur de bouchon afin de vérifier si son fonctionnement est convenable.

Pression de décharge du bouchon de radiateur :
Standard
78 - 98 kPa (0,78 - 0,98 bar, 0,8 - 1,0 kg/cm^2)
Limite
59 - 98 kPa (0,59 - 0,98 bar, 0,6 - 1,0 kg/cm^2)

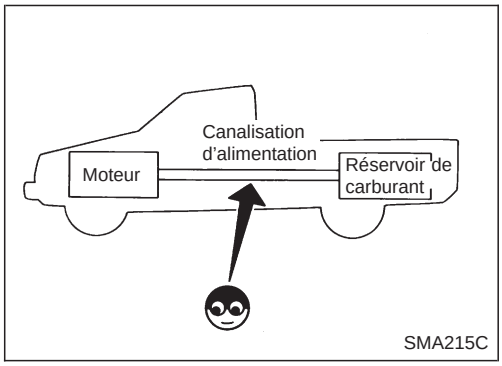


Tirer sur la soupape à dépression pour l'ouvrir. Vérifier si elle se ferme totalement une fois relâchée.

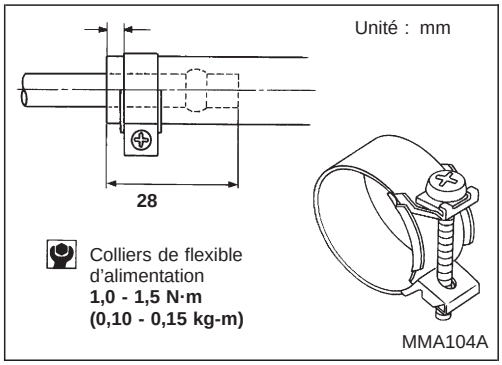
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Vérification du circuit de refroidissement (Suite)

VERIFICATION DE FUITES DE LIQUIDE DE REFROIDISSEMENT



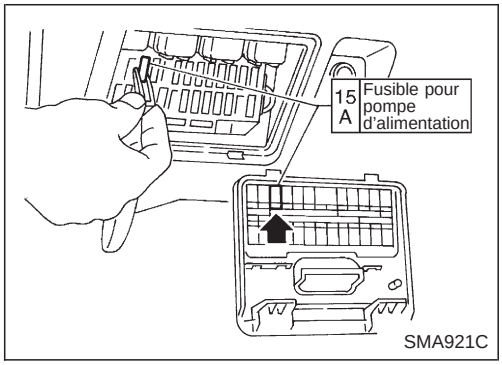
Vérifier s'il n'y a pas de fuites en exerçant une pression sur le circuit de refroidissement à l'aide du vérificateur de bouchon.



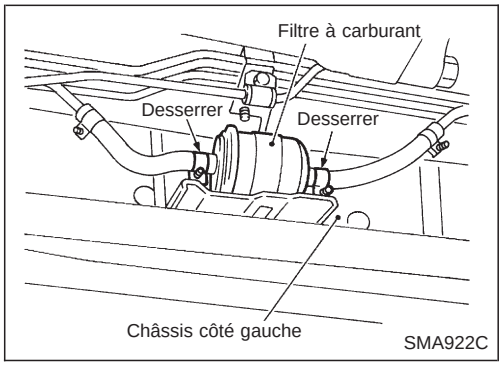
Pression d'essai :
157 kPa (1,57 bar, 1,6 kg/cm^2)

ATTENTION :
Une pression supérieure à la pression spécifiée peut abîmer le radiateur.

Vérification des canalisations d'alimentation



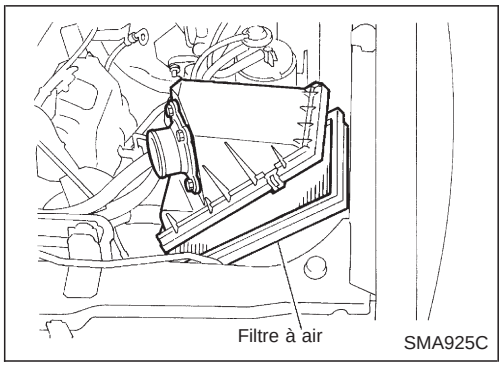
Vérifier les canalisations d'alimentation et le réservoir qui doivent être bien fixés, n'avoir ni fuites, ni fissures, ni dommages, ni raccords desserrés, ni usure, ni détériorations.
Si nécessaire, réparer ou remplacer les pièces défectueuses.



ATTENTION :
Serrer le collier du flexible en caoutchouc haute pression de manière à ce que son extrémité se trouve à 3 mm du bout du flexible.
Les couples de serrage spécifiés sont les mêmes que pour tous les colliers de flexible en caoutchouc.
S'assurer que la vis n'entre pas en contact avec des pièces voisines.

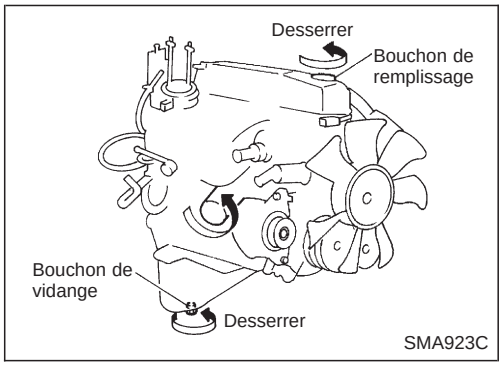
Remplacement du filtre à carburant

AVERTISSEMENT :
Avant de déposer le filtre à carburant, décharger la pression de la canalisation d'alimentation.



1. Déposer le fusible de la pompe d'alimentation.
2. Démarrer le moteur.
3. Après calage du moteur, faire démarrer le moteur deux ou trois fois pour s'assurer que la pression est relâchée.
4. Mettre le contact d'allumage sur ''OFF'' et reposer le fusible de pompe d'alimentation.

5. Desserrer les colliers du flexible d'alimentation.
6. Remplacer le filtre à carburant.

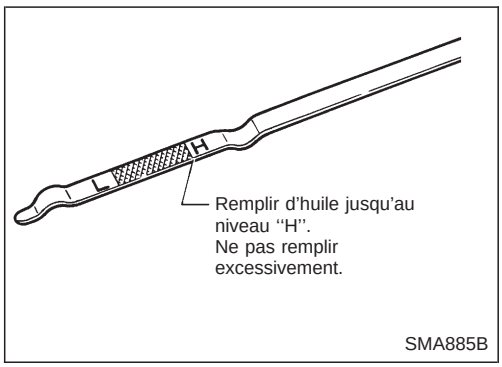


- **Prendre garde de ne pas renverser de carburant dans le compartiment moteur. Placer un chiffon pour absorber le trop-plein de carburant.**
- **Utiliser un filtre à carburant du type haute pression. Ne pas utiliser un filtre à carburant en résine synthétique.**
- **Lors du serrage des colliers du flexible d'alimentation, se reporter au titre ''Vérification des canalisations d'alimentation'', ci-dessus.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Remplacement du filtre à air (type à papier visqueux)

Les filtres à papier visqueux ne nécessitent pas de nettoyage entre deux changements.



Remplacement de l'huile moteur

AVERTISSEMENT :

- **Prendre garde de ne pas se brûler car l'huile moteur est très chaude.**
- **Les contacts prolongés et répétés avec les huiles moteur usagées peuvent provoquer des cancers de la peau ; éviter tout contact direct avec les huiles moteur usagées. En cas de contact avec la peau, laver soigneusement avec du savon ou un produit de nettoyage pour les mains aussi rapidement que possible.**

1. Chauffer le moteur, et vérifier si les composants du moteur ne présentent pas de fuites d'huile.
2. Déposer le bouchon de vidange et le bouchon de remplissage d'huile.
3. Vidanger l'huile et faire le plein d'huile moteur neuve.

Catégorie d'huile : API, SG ou SH
Viscosité : se reporter à ''LIQUIDES ET LUBRIFIANTS CONSEILLES'', MA-12.
Contenance en huile de remplissage (environ) :

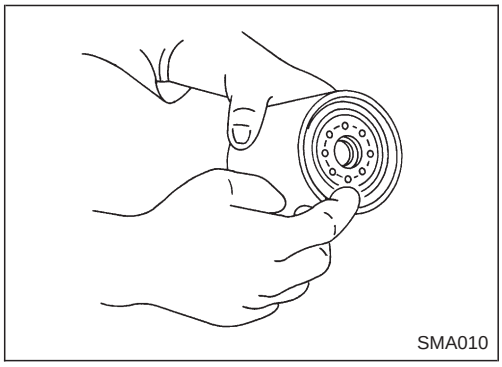
Unité : ℓ

	2 roues motrices	4 roues motrices
Avec remplacement du filtre à huile	3,9	4,1
Sans remplacement du filtre à huile	3,5	3,7

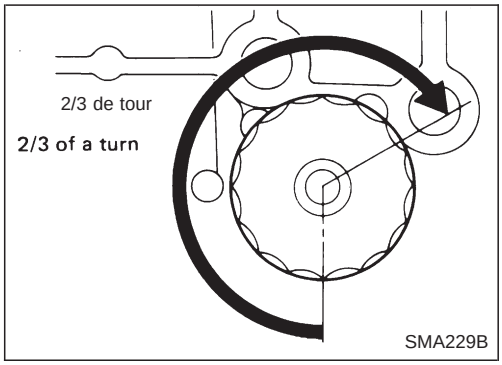
ATTENTION :

- **Veiller à nettoyer le bouchon de vidange et le reposer avec une rondelle neuve.**
  Bouchon de vidange :
  : 29 - 39 N·m (3,0 - 4,0 kg-m)
- **Utiliser de l'huile moteur recommandée.**
- **La capacité de remplissage varie selon la température de l'huile et le temps de vidange ; utiliser ces valeurs en tant que références et veiller à contrôler le niveau de la jauge lors du changement de l'huile.**

4. Contrôler le niveau d'huile.
5. Démarrer le moteur et vérifier s'il n'y a pas de fuites d'huile autour du bouchon de vidange et du filtre à huile.
6. Faire tourner le moteur pendant quelques minutes, puis couper le contact. Attendre quelques minutes et vérifier le niveau de l'huile.



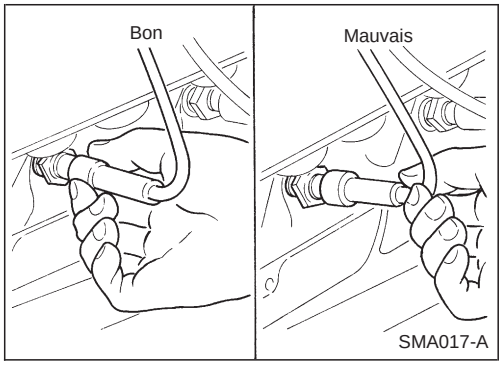
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Remplacement du filtre à huile

1. Déposer le filtre à huile avec l'outil adéquat.

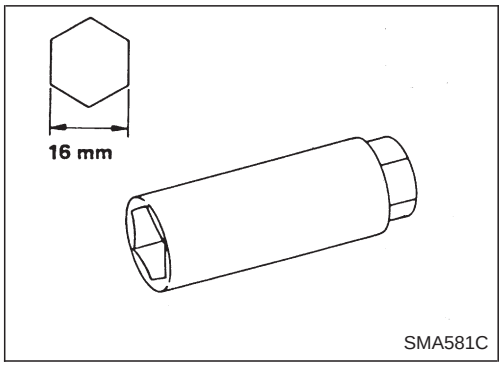
AVERTISSEMENT :
Prendre garde à ne pas se brûler car le moteur et l'huile moteur sont très chauds.



2. Avant d'adapter un filtre à huile neuf, nettoyer la surface de contact du filtre sur le bloc-cylindres, et enduire le joint en caoutchouc du filtre à huile d'un peu d'huile moteur.

3. Visser le filtre à huile jusqu'à ce qu'une légère résistance soit ressentie, puis le serrer de plus de 2/3 de tour supplémentaire.
4. Ajouter de l'huile moteur.

Se reporter à ''Remplacement de l'huile moteur'', MA-19.



Vérification et remplacement des bougies d'allumage

1. Débrancher les câbles d'allumage des bougies d'allumage à hauteur du soufflet.
   Ne pas tirer sur le câble.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

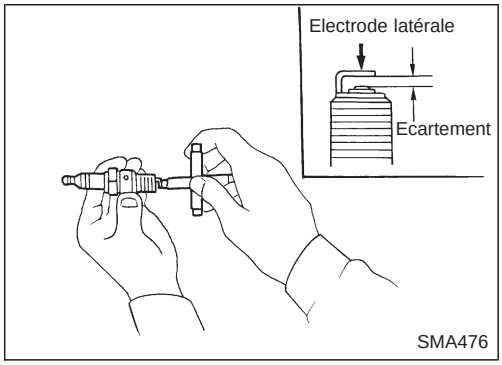
Vérification et remplacement des bougies d'allumage (Suite)

SMA581C

2. Déposer les bougies d'allumage à l'aide d'une clé à bougie.
3. Nettoyer les bougies à l'aide d'un appareil de sablage sous pression.
4. Vérifier si les isolants ne sont ni fissurés ni ébréchés, observer l'état général des joints et contrôler le degré d'usure des électrodes ainsi que leur état de brûlure éventuel. En cas d'usure excessive, procéder au remplacement des bougies d'allumage.

Bougie d'allumage :

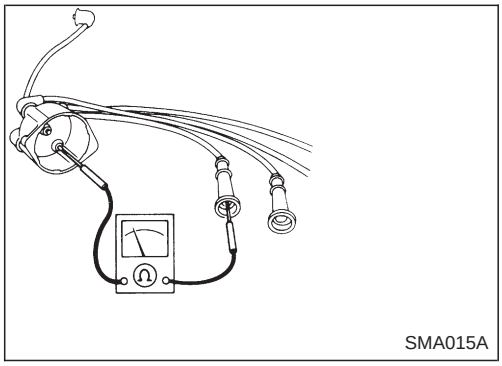
Fabricant	NGK
Type standard	ZFR5E-11
Type chaud	ZFR4E-11
Type froid	ZFR6E-11



Utiliser des bougies d'allumage de type standard pour des conditions normales.

Les bougies d'allumage de type chaud sont adéquates en cas d'encrassement avec des bougies standard dans les conditions suivantes :

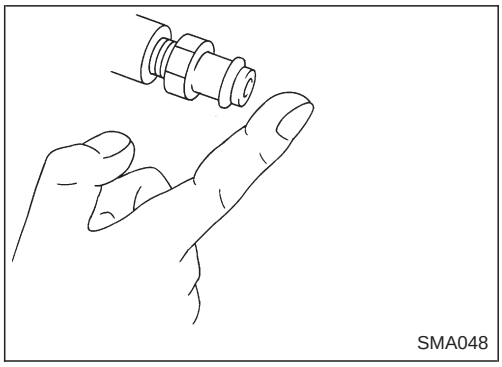
- démarrages fréquents du moteur
- températures ambiantes basses



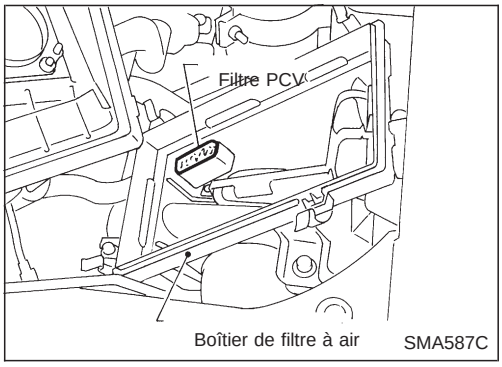
Les bougies d'allumage de type froid sont adéquates en cas de cognement des bougies de type standard dans les conditions suivantes :

- longs trajets sur autoroutes
- régime du moteur fréquemment élevé

SMA476

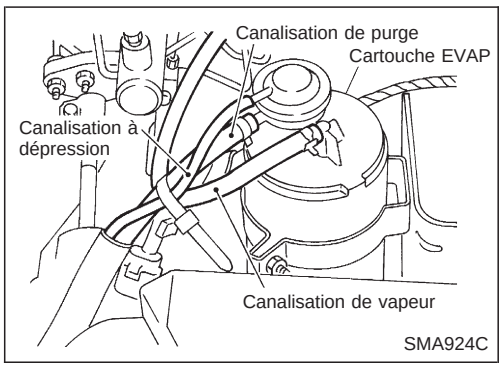


5. Vérifier l'écartement des électrodes des bougies d'allumage.
   Ecartement : 1,0 à 1,1 mm
6. Reposer les bougies. Rebrancher les câbles d'allumage en veillant à faire correspondre leurs numéros respectifs.
   Bougie d'allumage :
   : 20 - 29 N·m
   (2,0 - 3,0 kg-m)



SMA015A

Vérification des câbles d'allumage



1. Vérifier l'état des câbles à haute tension, voir s'ils ne sont pas fissurés, endommagés, et contrôler si les bornes ne sont pas brûlées et si le raccordement des cosses est correct.
2. Mesurer la résistance des câbles haute tension, en les secouant et en contrôlant les coupures intermittentes.
   Résistance : inférieure à 12,2 kΩ/m

SMA048

SMA587C

SMA924C

Vérification du système de ventilation positive du carter (PCV)

VERIFICATION DE LA VANNE PCV

Lorsque le moteur tourne au ralenti, déposer le flexible de ventilation de la vanne PCV ; si la vanne fonctionne correctement, un sifflement sera audible lorsque l'air passe à travers de celle-ci, et une forte dépression se fera ressentir immédiatement lorsque l'on place un doigt sur l'entrée de la vanne.

VERIFICATION DES FLEXIBLES DE VENTILATION

1. Rechercher la présence de fuites au niveau des flexibles et des raccords.
2. Débrancher tous les flexibles et les nettoyer à l'air comprimé. Remplacer tous les flexibles qui ne peuvent pas être débouchés à l'air comprimé.

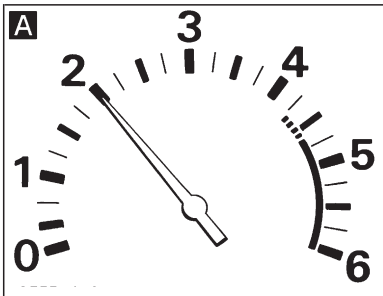
Remplacement du filtre de ventilation positive du carter (PCV)

Déposer le couvercle du filtre à air, puis retirer le filtre PCV situé à l'intérieur de ce dernier. Reposer un filtre PCV neuf.

Vérification des flexibles et des raccords à dépression

Vérifier la fixation des flexibles à dépression, voir s'il n'y a pas de fuites, de fissures, de dommages, de raccords desserrés, d'éraflures ni de détériorations.

Se reporter à Schéma des flexibles à dépression sous SYSTEME ENTIER DE COMMANDE DU MOTEUR ET DE CONTROLE ANTIPOLLUTION à la section EC.



Vérification des canalisations de vapeur

1. Vérifier visuellement la fixation des canalisations de vapeur et voir s'il n'y a pas de fissures, de dommages, de raccords desserrés, d'effilochages et de détériorations.
2. Vérifier si la soupape de décharge à dépression se trouvant sur le bouchon de remplissage du réservoir de carburant n'est pas bouchée, collée, etc.

Se reporter au chapitre ''SYSTEME DE CONTROLE DES EMISSIONS EVAPORATIVES'' à la section EC.

SEF292H

Vérification de la sonde à oxygène chauffée

Procédure de vérification

DEBUT DE L'INSPECTION

↓

Démarrer le moteur et le faire chauffer jusqu'à ce que l'indicateur de température du moteur atteigne le milieu du cadran.

↓

A

Faire tourner le moteur à environ 2 000 tr/mn pendant environ 2 minutes à vide.

↓

B

*S'assurer que la lampe d'inspection (DEL verte) de l'ECM s'allume et s'éteint plus de 5 fois pendant 10 secondes à 2 000 tr/mn à vide.

Bon → FIN DE L'INSPECTION

Mauvais → Les contrôles et réglages doivent être effectués d'après les instructions du paragraphe intitulé REGLAGE DU REGIME DE RALENTI / CALAGE D'ALLUMAGE / RICHESSE DE MELANGE DE RALENTI à la section EC.

→ retour à "Démarrer le moteur et le faire chauffer jusqu'à ce que l'indicateur de température du moteur atteigne le milieu du cadran."

FIN DE L'INSPECTION

* ● S'assurer que le mode de diagnostic est en mode I ou II.
● S'assurer que le sélecteur de mode de diagnostic est tourné complètement dans le sens inverse des aiguilles d'une montre.
Se reporter à Autodiagnostic dans la section EC.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Vérification des couples de serrage du collecteur

La vérification doit être effectuée lorsque le moteur est froid (environ 20°C).

Boulons et écrous de collecteurs :

Admission

: 13 - 19 N·m (1,3 - 1,9 kg-m)

Echappement

: 25 - 29 N·m (2,5 - 3,0 kg-m)

Ecrous de tuyau d'échappement :

: 41,2 - 48,0 N·m (4,2 - 4,9 kg-m)

Réglage du jeu des soupapes d'admission et d'échappement

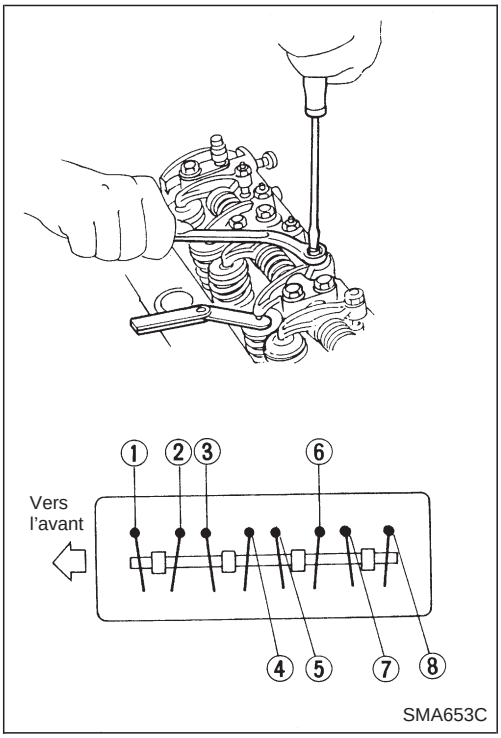
Le réglage doit être effectué alors que le moteur est chaud mais qu'il ne tourne pas.

1. Placer le cylindre n° 1 au point mort haut sur sa course de compression et régler le jeu des soupapes ①, ②, ③ et ⑥.
2. Placer le cylindre n° 4 au point mort haut sur sa course de compression et régler le jeu des soupapes ④, ⑤, ⑦ et ⑧.

Jeu des soupapes :

Admission ①, ③, ⑤ et ⑦

0,30 - 0,40 mm



Echappement ②, ④, ⑥ et ⑧

0,30 - 0,40 mm

Contre-écrous des vis de réglage :

: 15 - 20 N·m (1,5 - 2,0 kg-m)

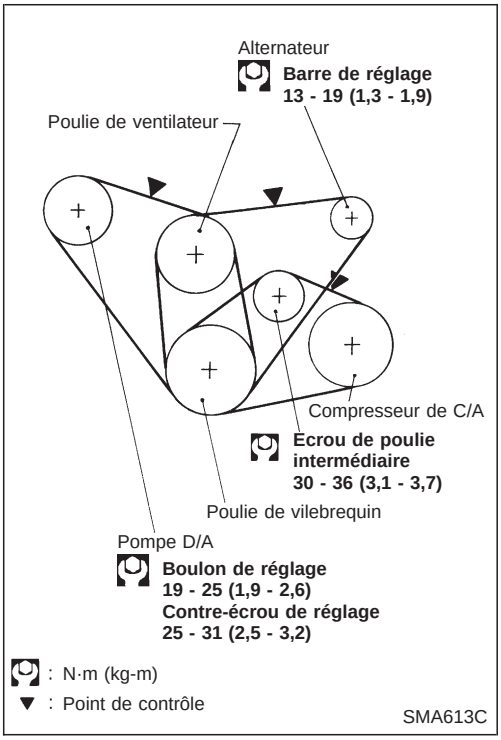
- Serrer les contre-écrous en fixant les vis de réglage au moyen d'un petit tournevis.

SMA653C

Vérification des courroies d'entraînement

1. Rechercher des traces de fissures, d'effilochages, d'usure et d'huile. Remplacer si nécessaire.

Les courroies ne doivent pas toucher le fond de la rainure de la poulie.



2. Vérifier la déflexion de la courroie d'entraînement en appuyant à mi-chemin entre les poulies.

Régler si les déflexions des courroies sont excessives.

Unité : mm

	Déflexion d'une courroie usagée		Déflexion d'une courroie neuve
	Limite	Déflexion après le réglage	
Alternateur	20	11 - 13	9 - 11
Compresseur de climatiseur	12	6 - 7,5	5 - 6,5
Pompe à huile de direction assistée	15	8 - 9,5	7 - 8,5
Force de poussée	98 N (10 kg)		

Vérifier les déflexions des courroies d'entraînement lorsque le moteur est froid.

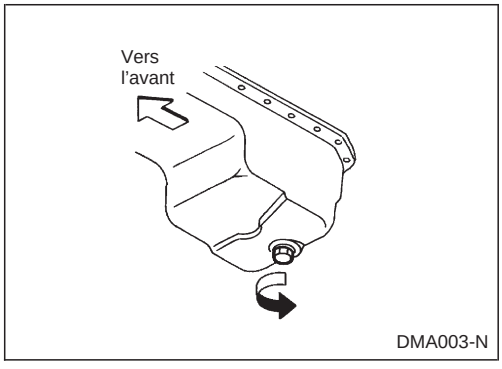
DMA002

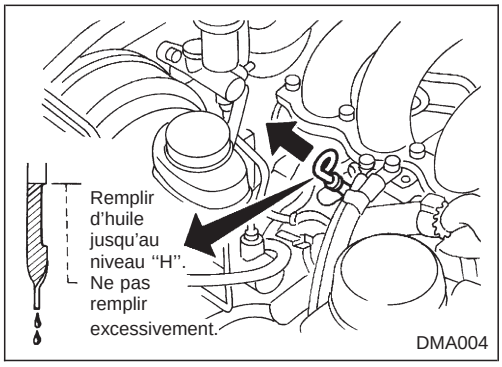


Remplacement de l’huile moteur

AVERTISSEMENT :

- **Prendre garde de ne pas se brûler car l’huile moteur est très chaude.**
- **Les contacts prolongés et répétés avec les huiles moteur usagées peuvent provoquer des cancers de la peau ; éviter tout contact direct avec les huiles moteur usagées. En cas de contact avec la peau, laver soigneusement avec du savon ou un produit de nettoyage pour les mains aussi rapidement que possible.**

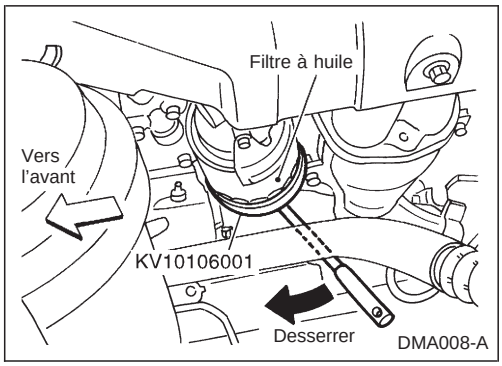
1. Réchauffer le moteur, et vérifier si les composants du moteur ne présentent pas de fuites d’huile.
2. Déposer le bouchon de remplissage d’huile et le bouchon de vidange.
3. Vidanger l’huile et faire le plein d’huile moteur neuve.



Catégorie d’huile : API CC ou CD sauf pour l’Europe
API, CD pour l’Europe
Viscosité :
Voir ‘‘LIQUIDES ET LUBRIFIANTS CONSEILLES’’, MA-12.
Contenance en huile de remplissage (environ) :
Sans remplacement du filtre à huile
TD25 6,5 ℓ
Avec remplacement du filtre à huile
TD25 7,2 ℓ

DMA003-N

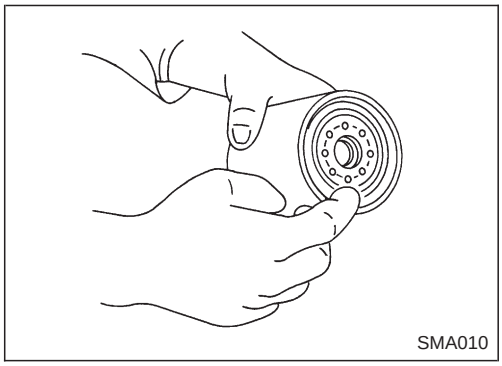
ATTENTION :



- **Veiller à nettoyer et à reposer le bouchon de vidange du carter d’huile avec la rondelle.**
  Bouchon de vidange :
  : 54 - 59 N·m (5,5 - 6,0 kg-m)
- **La capacité de remplissage varie selon la température de l’huile et le temps de vidange, utiliser ces valeurs en tant que références et veiller à contrôler le niveau de la jauge lors du changement de l’huile.**

DMA004

4. Contrôler le niveau d’huile.
5. Démarrer le moteur. Vérifier s’il n’y a pas de fuites d’huile autour du bouchon de vidange et du filtre à huile.
6. Faire tourner le moteur pendant quelques minutes, puis couper le contact. Attendre quelques minutes et vérifier le niveau de l’huile.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

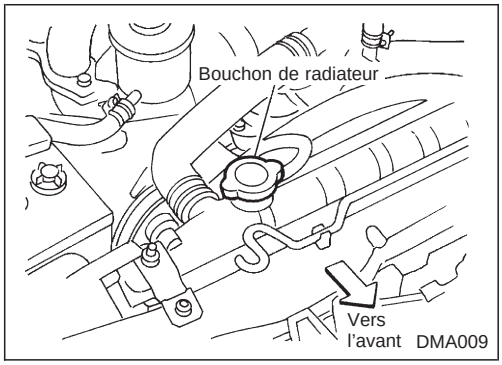
Remplacement du filtre à huile moteur

1. Déposer le filtre à huile avec l'outil spécial.

AVERTISSEMENT :
Prendre garde à ne pas se brûler car le moteur et l'huile moteur sont très chauds.

2. Nettoyer la surface de montage du filtre à huile sur le bloc-cylindres. Enduire le joint d'huile en caoutchouc du nouveau filtre à huile avec de l'huile moteur.
3. Visser le filtre à huile jusqu'à ce qu'une légère résistance soit ressentie, puis le serrer de plus de 2/3 de tour supplémentaire.
4. Ajouter de l'huile moteur.

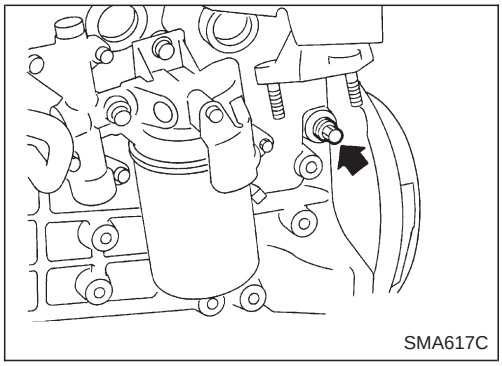
Se reporter à ''Remplacement de l'huile moteur''.



- **Nettoyer l'excédent d'huile moteur.**

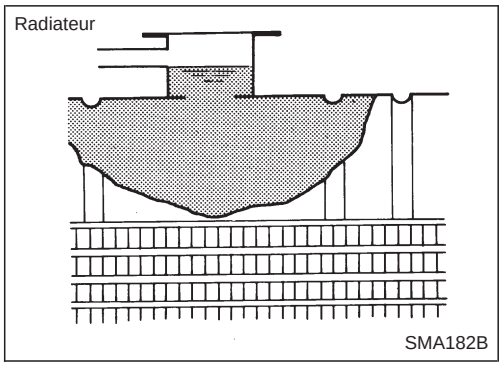
Remplacement du liquide de refroidissement du moteur

AVERTISSEMENT :
Pour éviter de se brûler, ne jamais changer le liquide de refroidissement lorsque le moteur est chaud.

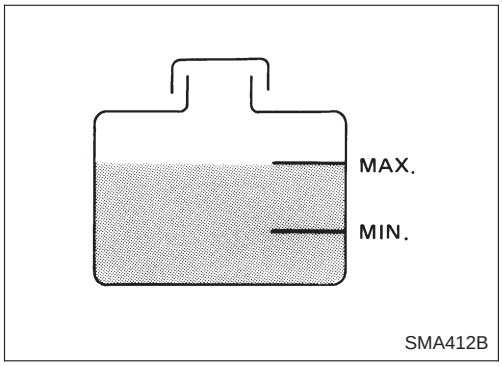


– VIDANGE DU LIQUIDE DE REFROIDISSEMENT –

1. Déplacer le curseur de réglage de la température complètement jusqu'à la position ''CHAUD''.
2. Ouvrir le bouchon de vidange situé en bas du radiateur.



3. Déposer le bouchon de remplissage du radiateur.
   Déposer le réservoir, vidanger le liquide de refroidissement, puis nettoyer le réservoir.
   Le reposer temporairement.



- **Veiller à ce que le liquide de refroidissement ne coule pas sur les courroies d'entraînement.**

4. Déposer le bouchon de vidange du bloc-cylindres situé à l'arrière gauche du bloc-cylindres.
5. Vidanger le liquide de refroidissement et installer les bouchons de vidange du bloc-cylindres et du radiateur.
6. Remplir le radiateur d'eau et réchauffer le moteur.
7. Arrêter le moteur et attendre qu'il refroidisse.
8. Répéter les étapes 2 à 7 à deux ou trois reprises.
9. Vidanger l'eau.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Remplacement du liquide de refroidissement du moteur (Suite)

– REMPLISSAGE DE LIQUIDE DE REFROIDISSEMENT –

10. Reposer le réservoir, le bouchon de vidange du radiateur, et les bouchons de vidange du bloc-cylindres.

- **Appliquer du produit d'étanchéité sur le filetage du bouchon de vidange du bloc-cylindres.**

Bouchon de vidange du bloc-cylindres :
: 54 - 64 N·m (5,5 - 6,5 kg-m)

11. Remplir le radiateur et le réservoir de réfrigérant jusqu'au niveau MAX. et reposer le bouchon de radiateur.

Pour la richesse de mélange du liquide de refroidissement antigel, consulter MA-14.

Contenance en liquide de refroidissement (avec réservoir) :
TD25 9,5 ℓ
Contenance du réservoir (pour niveau MAX) :
0,6 ℓ

Verser lentement le liquide de refroidissement dans le goulot de remplissage afin que l'air puisse s'échapper.

12. Réchauffer le moteur jusqu'à la température de fonctionnement normale.
13. Emballer le moteur à 2 000 tr/mn pendant 10 secondes puis retourner à la vitesse de ralenti.

- Répéter les opérations 2 ou 3 fois.

Surveiller la jauge de température du liquide de refroidissement pour éviter que le moteur ne surchauffe.

14. Arrêter le moteur et le laisser refroidir.

- Refroidir à l'aide d'un ventilateur pour réduire le temps de refroidissement.

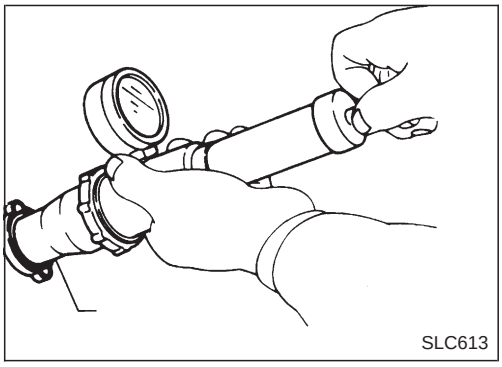
15. Déposer le bouchon de remplissage du radiateur et vérifier le niveau du liquide de refroidissement.

- Si nécessaire, remplir le radiateur jusqu'au goulot de remplissage avec du liquide de refroidissement.

16. Remplir le réservoir de liquide de refroidissement jusqu'au niveau ''MAX'.
17. Répéter les étapes 12 à 16 deux fois ou plus.
18. Réchauffer le moteur, et vérifier le bruit d'écoulement du liquide de refroidissement tout en emballant le moteur du ralenti à 2 000 tours, et en réglant la commande de température sur différentes positions entre ''FROID'' et ''CHAUD''.

- Le robinet d'eau du chauffage doit émettre des bruits.

19. Si un bruit se fait entendre, purger l'air du circuit de refroidissement en répétant les étapes 12 à 16 jusqu'à ce que le niveau du liquide de refroidissement ne baisse plus.

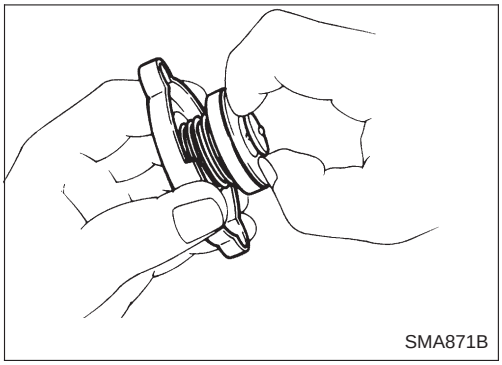


- **Nettoyer l'excédent de réfrigérant du moteur.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

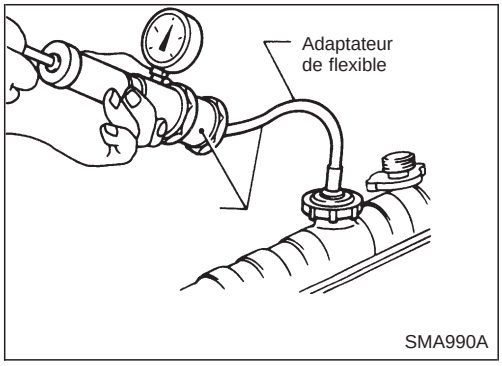
Vérification du circuit de refroidissement

VERIFICATION DES FLEXIBLES ET DES COLLIERS



Vérifier l'état général des flexibles et des colliers et voir s'il n'y a pas de fuites, de fissures, d'effilochages ni de raccords desserrés.

SLC613



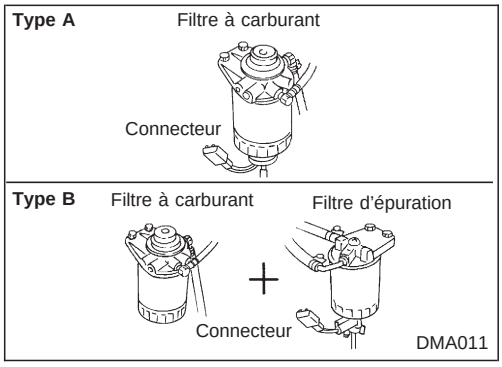
VERIFICATION DU BOUCHON DE RADIATEUR

Exercer une pression sur le bouchon du radiateur à l'aide du vérificateur de bouchon afin de vérifier si son fonctionnement est convenable.

Pression d'ouverture du bouchon de radiateur :
78 - 98 kPa
(0,78 - 0,98 bar, 0,8 - 1,0 kg/cm^2)

SMA871B

Tirer sur la soupape à dépression pour l'ouvrir. Vérifier qu'elle se referme totalement une fois relâchée.



SMA990A

VERIFICATION DE FUITES DE LIQUIDE DE REFROIDISSEMENT

Vérifier s'il n'y a pas de fuites en exerçant une pression sur le circuit de refroidissement à l'aide du vérificateur de bouchon.

Pression d'essai :
157 kPa (1,57 bar, 1,6 kg/cm^2)

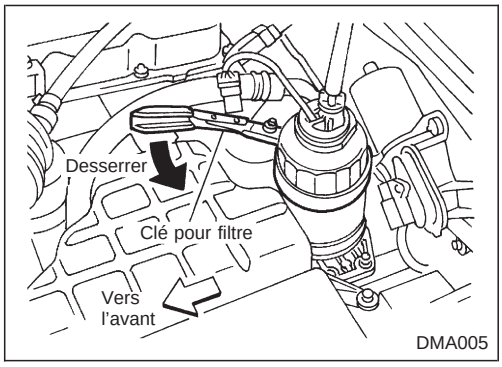
ATTENTION :
Une pression supérieure à la pression spécifiée peut abîmer le radiateur.

DMA011

Vérification et remplacement du filtre à carburant et vidange de l'eau

Prendre garde de ne pas renverser de carburant dans le compartiment moteur. Placer un chiffon pour absorber le trop-plein de carburant.

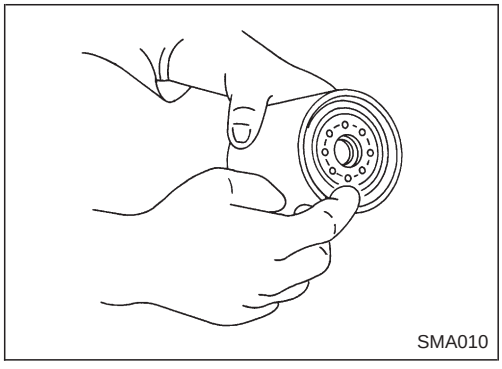
VERIFICATION DU FILTRE A CARBURANT



Contrôler le filtre à carburant et vérifier s'il n'y a pas de fuites de carburant, de dommages et d'autres anomalies.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Vérification et remplacement du filtre à carburant et vidange de l'eau (Suite)

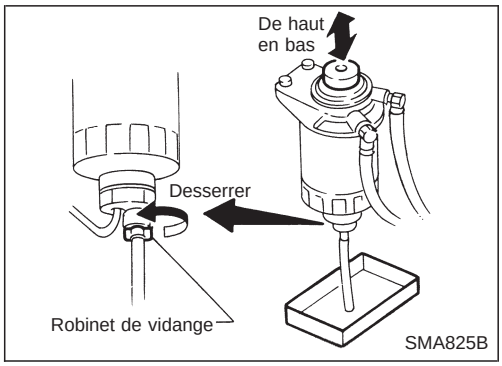


REMPLACEMENT DU FILTRE A CARBURANT

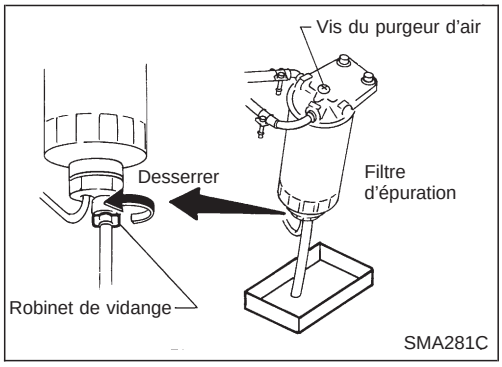
1. Débrancher le connecteur de faisceau et vidanger le carburant.

2. Déposer les deux boulons fixant le support du filtre à carburant, puis déposer le support avec le filtre à carburant. Ne pas déposer le flexible à carburant.
3. Reposer le filtre à carburant à l'envers en utilisant les orifices des boulons fixant le support du filtre à carburant.
4. Déposer le filtre à carburant à l'aide d'une clé pour filtre à bandes.
   Type A
   Déposer le filtre à carburant et son capteur.
   Type B
   Desserrer le filtre à carburant autant que possible sans renverser de carburant, replacer le filtre à carburant dans sa position d'origine, puis le déposer.

ATTENTION :
Déposer le filtre à carburant sans renverser de carburant. Si du liquide a été renversé, nettoyer immédiatement. Faire encore plus attention à ne pas renverser de carburant sur l'isolant de montage du moteur.



5. Bien nettoyer la surface de montage du filtre à carburant entrant en contact avec le support du filtre à carburant, et mettre un peu de carburant sur le joint en caoutchouc du filtre à carburant.
6. Visser le filtre à carburant jusqu'à ce qu'une légère résistance soit ressentie, puis le serrer de 2/3 de tour supplémentaire.
7. Reposer le capteur du filtre à carburant sur le filtre à carburant neuf. (Type A)
8. Purger l'air de la canalisation d'alimentation.



Se reporter à Système de purge de carburant dans la section EC.

9. Démarrer le moteur et rechercher la présence de fuites.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Vérification et remplacement du filtre à carburant et vidange de l'eau (Suite)

VIDANGE DE L'EAU

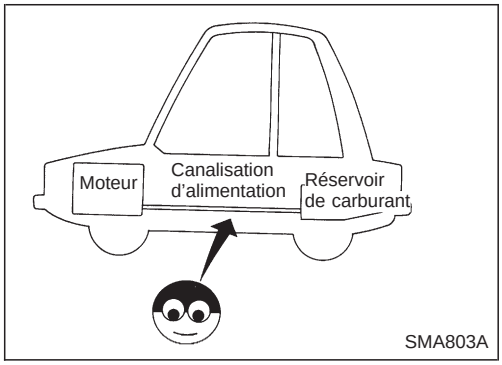
1. Vidanger l'eau comme suit.

Type A

Desserrer le robinet de vidange et vidanger l'eau.

En desserrant le robinet de vidange de 4 à 5 tours, l'eau commence à se vidanger. Ne pas déposer le robinet de vidange en le desserrant excessivement.

Si l'eau n'est pas vidangée correctement, déplacer la pompe d'amorçage de haut en bas.



Type B

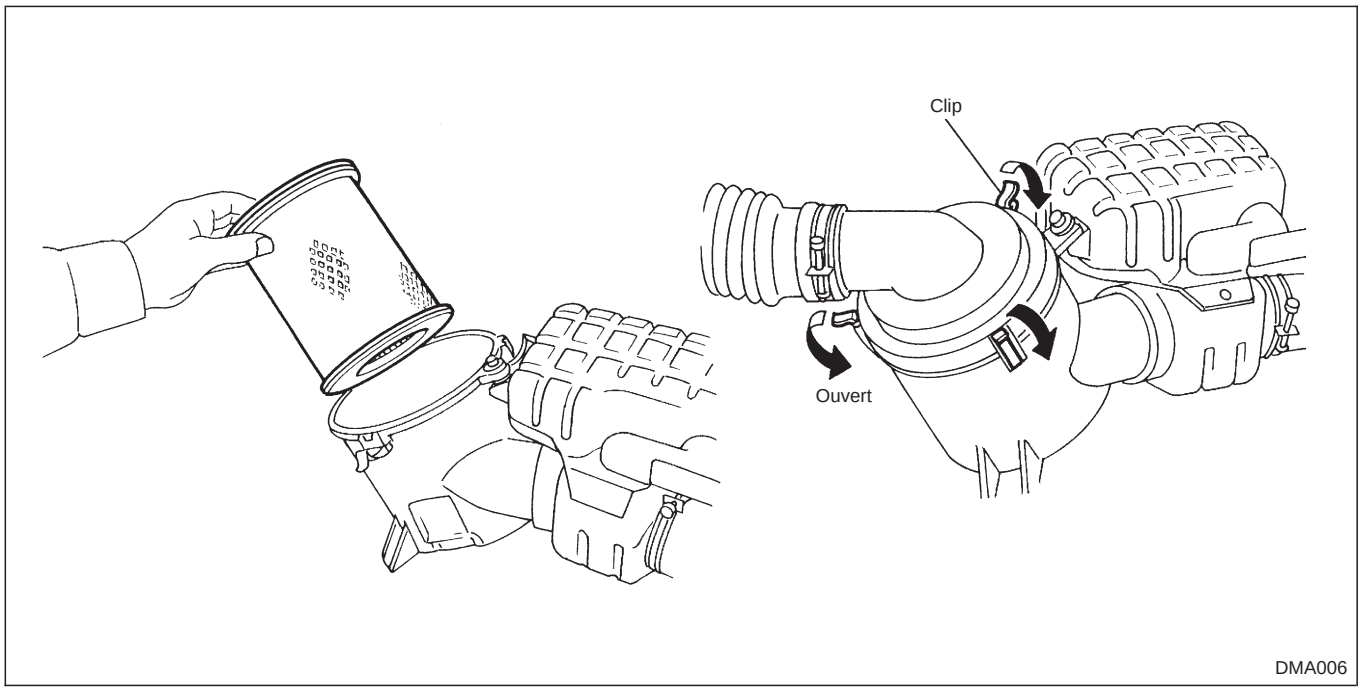
Desserrer la vis du purgeur d'air du couvercle de filtre d'épuration, puis desserrer le robinet de vidange et vidanger l'eau.

En desserrant le robinet de vidange de 4 à 5 tours, l'eau commence à se vidanger. Ne pas déposer le robinet de vidange en le desserrant excessivement.

2. Purger l'air.

Se reporter à Système de purge de carburant dans la section EC.

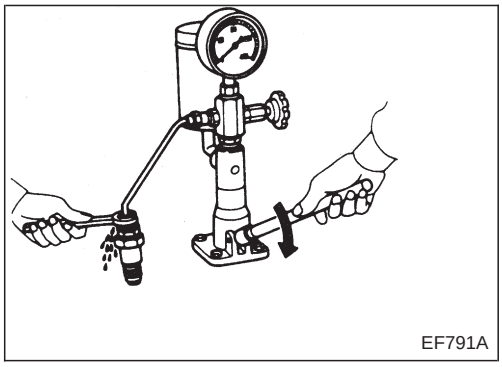
Vérification des canalisations d'alimentation



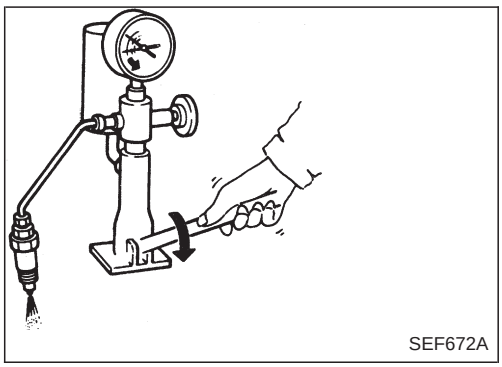
Vérifier les canalisations d'alimentation et le réservoir qui doivent être bien fixés, et s'assurer qu'elles n'ont ni fuites, ni fissures, ni dommages, ni raccords desserrés, ni usure, ni détériorations.

ATTENTION :

Conserver les pièces propres en utilisant de l'air comprimé lors du remontage.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Nettoyage et remplacement du filtre à air

TYPE A PAPIER VISQUEUX

Le filtre à air à papier visqueux ne nécessite pas de nettoyage entre deux changements.

Vérificationde l'injecteur

AVERTISSEMENT :

Lors de l'utilisation de l'appareil d'essai pour injecteurs, faire attention à ce que le carburant diesel qui s'écoule de l'injecteur n'entre pas en contact avec les mains ou tout autre partie du corps et veiller à porter des lunettes de protection.

1. Monter l'injecteur sur un appareil d'essai et purger l'air par l'écrou évasé.
2. Vérifier la pression d'injection initiale en pompant la poignée de l'appareil d'essai (un battement par seconde).

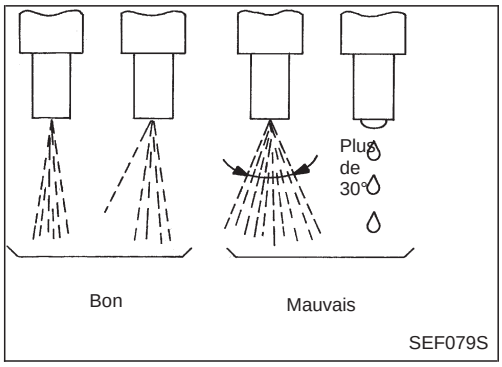
Pression initiale de l'injection :

Injecteur usagé

9 807 - 10 297 kPa

(98,1 - 103,0 bar, 100 - 105 kg/cm^2)

Injecteur neuf



10 297 - 11 278 kPa

(103,0 - 112,8 bar, 105 - 115 kg/cm^2)

- **Toujours contrôler la pression d'injection initiale avant d'installer un nouvel injecteur.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Vérificationde l’injecteur (Suite)

3. Contrôler la forme du jet en pompant la poignée de l’appareil d’essai à fond une fois par seconde.

a. Si l’angle du jet principal est compris dans les 30 degrés comme indiqué, cela signifie que l’injecteur est en bon état.

b. Le fonctionnement reste correct même si un mince filet du jet dévie du filet principal (modèle B).

4. Si la pression d’injection initiale n’est pas normale ou si l’injecteur est défectueux, régler ou nettoyer l’injecteur.
5. Tester à nouveau. Si le défaut n’est pas réglé, remplacer l’injecteur.

Se reporter à la section EC pour le réglage de la pression d’injection, le nettoyage et le remplacement.

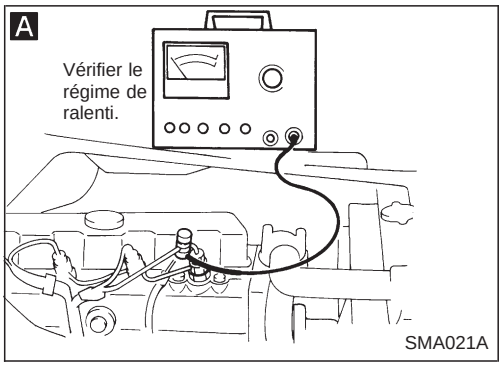
6. Monter tous les injecteurs à l’aide de l’outil spécial et brancher correctement les tubes de trop-plein de carburant et de refoulement.
7. Purger l’air du circuit d’alimentation et rechercher des fuites de carburant lorsque le moteur tourne.

De l’injecteur à la culasse :
: 54 - 64 N·m (5,5 - 6,5 kg-m)
Ecrou du tube de trop-plein :
: 29 - 39 N·m (3,0 - 4,0 kg-m)
Tuyau d’injection :
: 20 - 25 N·m (2,0 - 2,5 kg-m)

Vérification du régime de ralenti

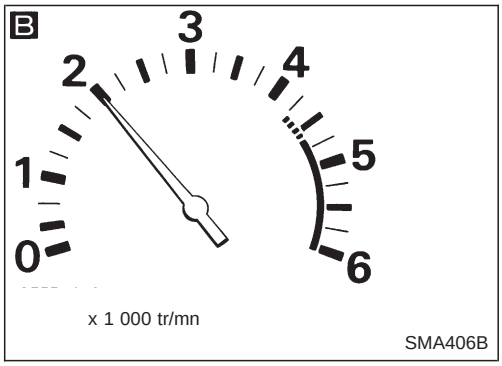
Préparation

1. S’assurer que le calage d’injection est correct.
2. Veiller à ce que les injecteurs soient en bon état.
3. S’assurer que les pièces suivantes sont en bon état.



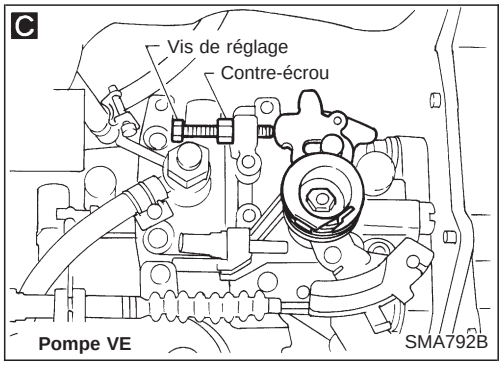
- Obturation du filtre à air
- Circuit de préchauffage
- Niveau d’huile moteur et de réfrigérant
- Jeu des soupapes
- Système d’admission d’air (bouchon de remplissage d’huile, jauge de niveau d’huile, etc.)

4. Placer le levier de vitesses sur la position ‘‘point mort’’. Serrer le frein de stationnement et bloquer les roues avant et arrière avec des cales.
5. Eteindre le climatiseur, les lumières et accessoires.
6. S’assurer que le bouton de commande du ralenti est relâché à fond et que la vis de réglage du ralenti entre en contact avec le levier de commande de l’accélérateur.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Vérification du régime de ralenti (Suite)



A

B

C

A

- Réchauffer le moteur jusqu'à ce que l'indicateur de température moteur atteigne le milieu du cadran.
- Attacher le pick-up du compte-tours au tuyau n° 1 d'injection.

Pour faire une lecture précise du régime moteur, déposer les colliers qui fixent le tuyau n° 1 d'injection.

↓

Démarrer le moteur.

↓

B

Faire tourner le moteur à environ 2 000 tr/mn pendant environ deux minutes à vide.

↓

Faire tourner le moteur pendant une minute au régime de ralenti.

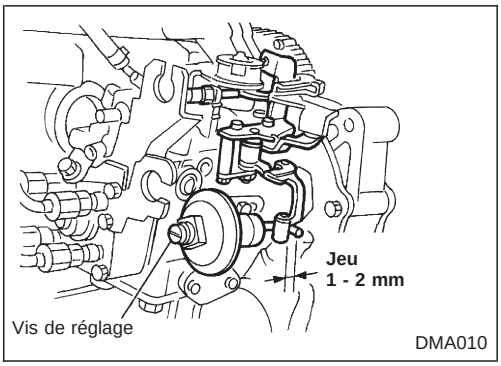
↓

Contrôler le régime de ralenti.

Régime de ralenti :
TD25 700±50 tr/mn

Mauvais → C Régler le régime de ralenti en tournant la vis de réglage. → B

Bon ↓



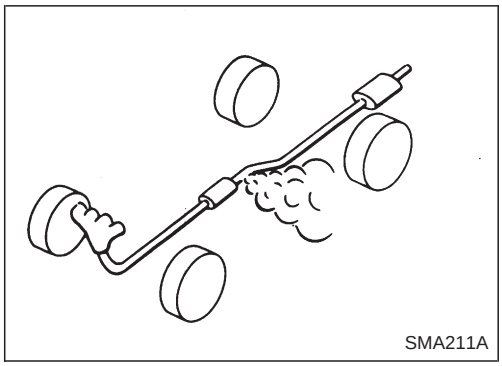
FIN

- **Emballer le moteur deux ou trois fois, puis le laisser retourner au régime de ralenti. Si le régime de ralenti n'est pas compris dans les limites spécifiées, vérifier si la timonerie d'accélération n'est pas coincée, et la corriger si nécessaire.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Vérification du régime de ralenti (Suite)

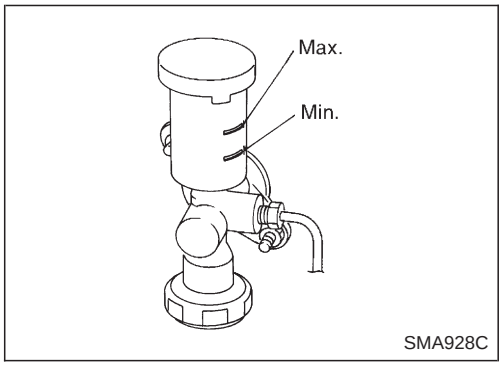
MODELE EQUIPE D'UN CLIMATISEUR



1. S'assurer que le jeu entre l'axe du levier de commande d'actionneur de ralenti et le levier de commande de la pompe à injection se trouve dans les limites spécifiées.
   Jeu : 1 - 2 mm
2. Régler le régime de ralenti à la valeur spécifiée sans déclencher le climatiseur.
3. Puis vérifier le régime de ralenti avec le climatiseur en marche, et contrôler que le réglage est bon.

Unité : tr/mn

Moteur	TD25
Régime de ralenti (climatiseur en marche)	850±50

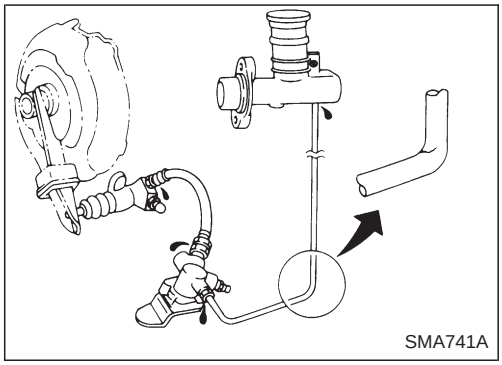


Si tel n'est pas le cas, le régler en tournant la vis de réglage de la course d'actionneur FICD.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

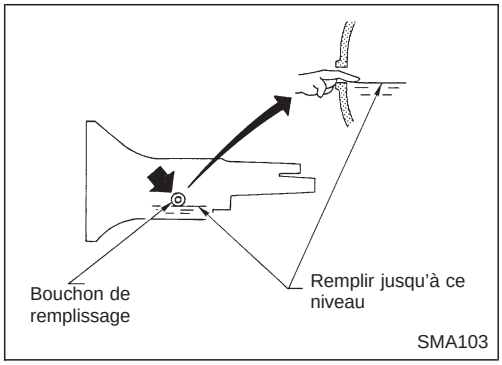
SMA211A

Vérification du système d'échappement



Vérifier l'état général, l'accouplement et le branchement des tuyaux d'échappement, du silencieux et de leurs accouplements et voir s'il n'y a ni fuites, ni fissures, ni rayures profondes.

SMA928C



Vérification du niveau de liquide d'embrayage et de l'étanchéité

Si le niveau du liquide est extrêmement bas, vérifier si le circuit d'embrayage ne fuit pas.

SMA741A

Vérification du circuit d'embrayage

Vérifier les canalisations de liquide, le cylindre récepteur et leurs fixations, et voir notamment s'il n'y a pas de fissures, de dommages, de raccords desserrés, de déformations ou d'autres détériorations.

SMA103

Vérification de l'huile de la boîte de vitesses manuelle

Vérifier s'il n'y a pas de fuites d'huile et contrôler le niveau d'huile.

Ne jamais mettre le moteur en marche pendant que l'on vérifie le niveau d'huile.

Bouchon de remplissage :

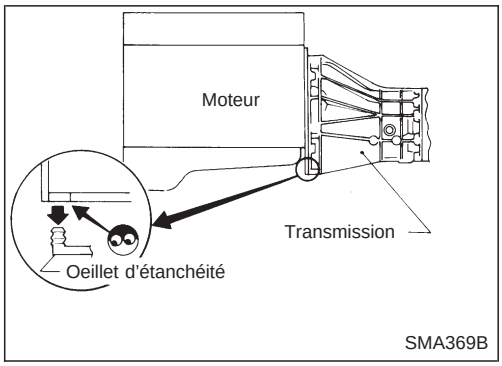
: 25 - 34 N·m (2,5 - 3,5 kg-m)

Remplacement de l'huile de la boîte de vitesses manuelle

1. Vidanger l'huile par le bouchon de vidange et faire le plein d'huile pour pignon neuve.
2. Contrôler le niveau d'huile.

Catégorie d'huile et viscosité :

API GL-4. Se reporter à ''LIQUIDES ET LUBRIFIANTS CONSEILLES'', MA-12.



Contenance en huile :

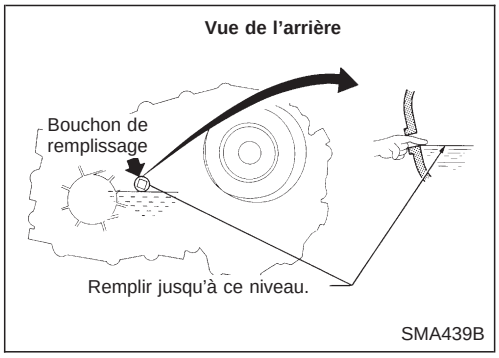
FS5W71C

2 roues motrices 2,0ℓ

4 roues motrices 4,9ℓ

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

FS5R30A



4 roues motrices 5,1ℓ

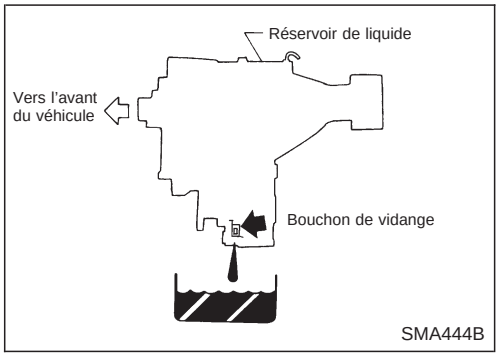
Bouchon de vidange :

: 25 - 34 N·m (2,5 - 3,5 kg-m)

Vérification de l'entrée d'eau – Pour modèles à 4 roues motrices

Après avoir roulé dans de l'eau profonde ou dans de la boue, vérifier si de l'eau n'a pas pénétré dans le carter d'embrayage en retirant l'œillet d'étanchéité.

Vérification de l'huile de la boîte de transfert



Vérifier s'il n'y a pas de fuites d'huile et contrôler le niveau d'huile.

Du liquide ATF est employé pour la boîte de transfert dans l'atelier.

Ne jamais mettre le moteur en marche pendant que l'on vérifie le niveau d'huile.

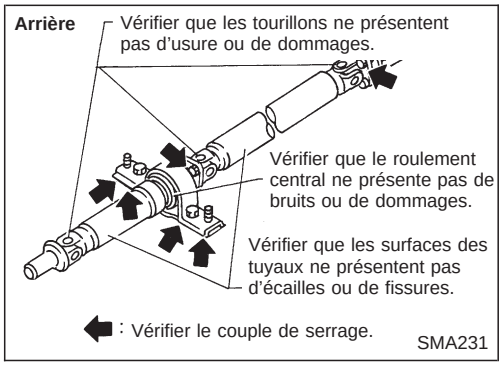
Bouchon de remplissage :

: 25 - 34 N·m (2,5 - 3,5 kg-m)

Remplacement de l'huile de la boîte de transfert

Lors du changement complet de l'huile de boîte de transfert, utiliser l'huile suivante.

Catégorie d'huile :



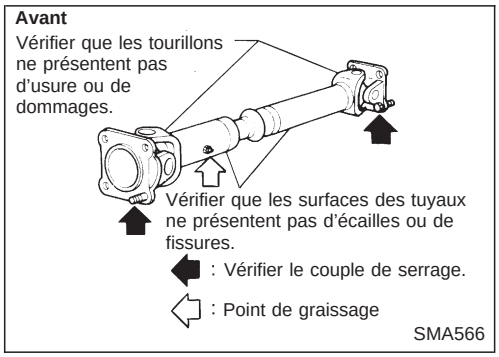
Matic "D" Nissan ou huile de boîte de vitesses automatique équivalente ou API GL-4. Se reporter à "LIQUIDES ET LUBRIFIANTS CONSEILLES", MA-12.

Contenance en huile :

2,2ℓ

Bouchon de vidange :

: 25 - 34 N·m (2,5 - 3,5 kg-m)

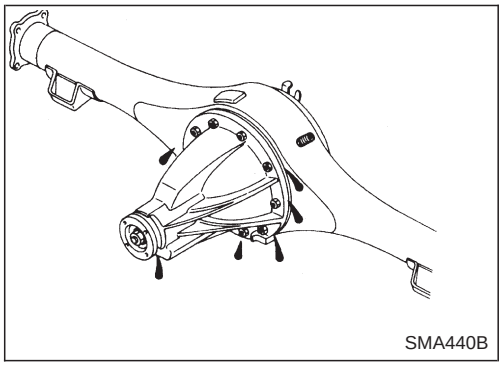


Vérification de l'arbre de transmission

Vérifier si l'arbre de transmission est endommagé, desserré et contrôler la présence de fuites de graisse éventuelles.

Couple de serrage : se reporter à la section PD.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Graissage de l'arbre de transmission

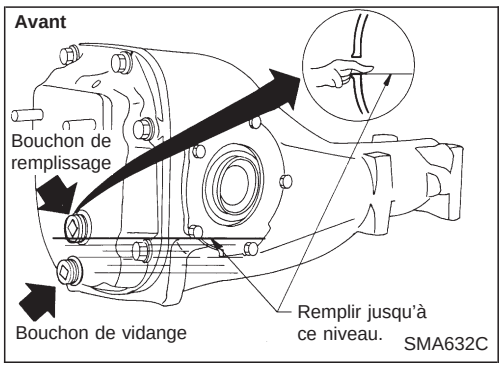
Enduire de graisse recommandée les graisseurs de l'arbre de transmission.

Type de graisse :

Se reporter à ''LIQUIDES ET LUBRIFIANTS CONSEILLES'', MA-12.

Vérification de l'huile du différentiel

Vérifier s'il n'y a pas de fuites d'huile et contrôler le niveau d'huile.



Bouchon de remplissage :

Avant

: 59 - 98 N·m (6 - 10 kg-m)

Arrière

: 59 - 98 N·m (6 - 10 kg-m)

Remplacement de l'huile du différentiel

1. Vidanger l'huile par le bouchon de vidange et faire le plein d'huile pour pignon neuve.
2. Contrôler le niveau d'huile.

Catégorie d'huile et viscosité :

Se reporter à ''LIQUIDES ET LUBRIFIANTS CONSEILLES'', MA-12.

Contenance en huile :

Avant

1,3ℓ

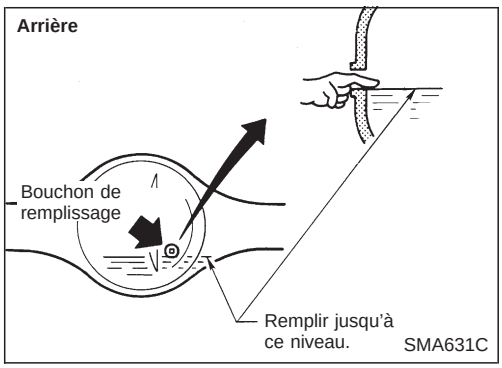
Arrière

C200

1,3ℓ

H233B

2,8ℓ



Bouchon de vidange :

Avant

: 59 - 98 N·m (6 - 10 kg-m)

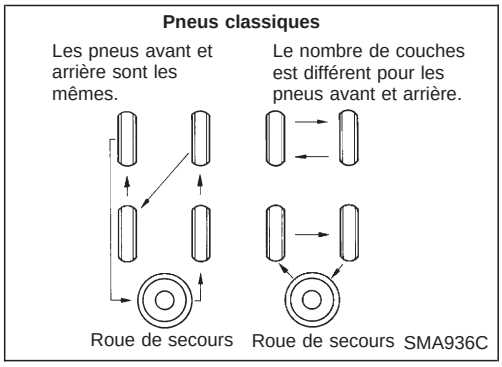
Arrière

: 59 - 98 N·m (6 - 10 kg-m)

Pignon de différentiel à glissement limité

- N'utiliser que l'huile pour pignon de différentiel à glissement limité approuvée.
- Identification du différentiel à glissement limité.

(1) Soulever du sol les deux roues arrière.
(2) Tourner une roue arrière à la main.
(3) Si les deux roues arrière tournent simultanément dans le même sens, cela signifie que le véhicule est équipé d'un différentiel à glissement limité.



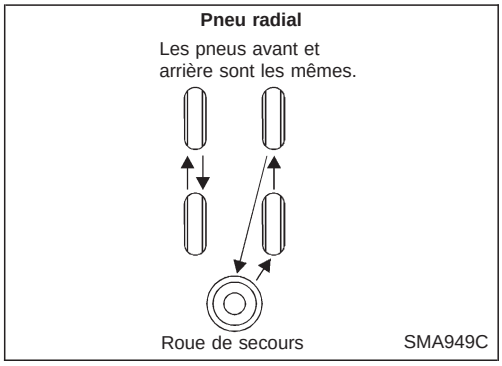
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

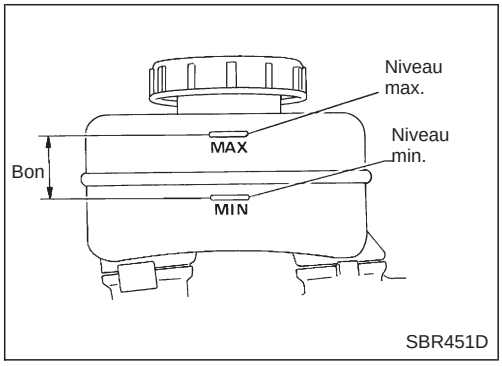
Equilibrage des roues

Régler l'équilibrage des roues au moyen d'une équilibreuse de roues.

Equilibrage des roues (déséquilibre maximum admissible) :

Se reporter aux SDS, MA-46.

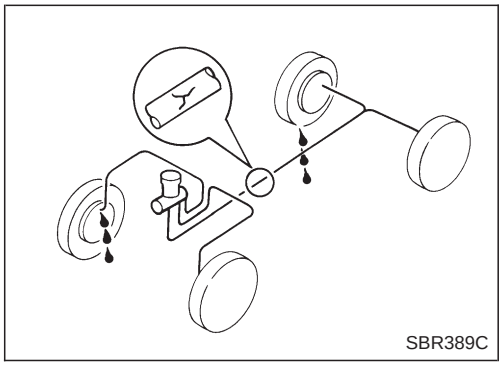




Permutation des pneus

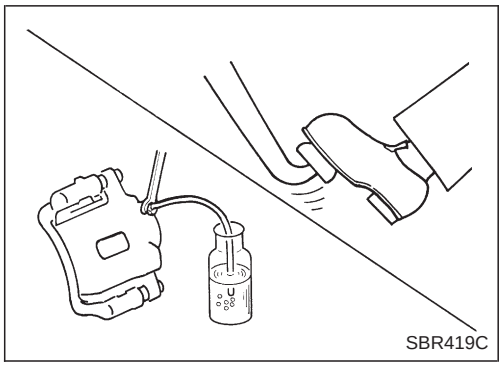
- **Après avoir tourné les roues, régler la pression des pneus.**
- **Resserrer les écrous des roues après que la roue en aluminium a effectué les premiers 1 000 km ou si un pneu crève.**

Ecrous de roue :



: 118 - 147 N·m (12 - 15 kg-m)

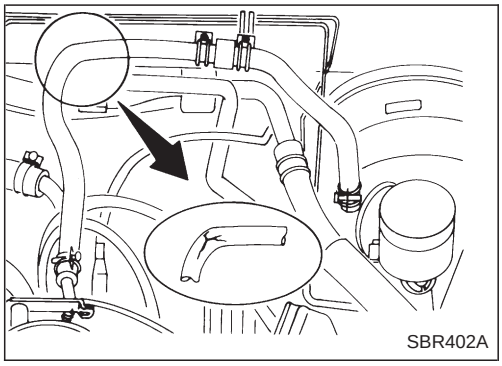
Vérification du niveau de liquide de frein et de l'étanchéité



Si le niveau du liquide de frein est très bas, vérifier l'étanchéité du circuit de freinage.

Vérification du circuit de freinage

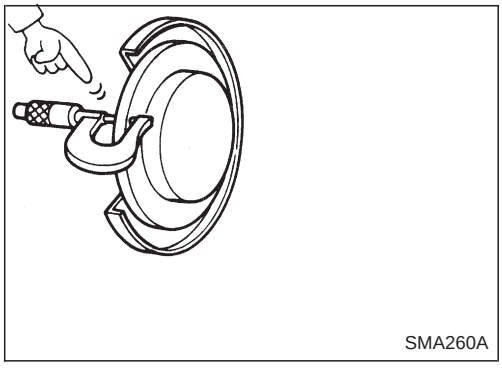
Vérifier si les canalisations de frein et les câbles de frein de stationnement sont correctement montés, et s'il n'y a pas de fuites, d'usure, d'abrasion, de détérioration, etc.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SBR419C

Remplacement du liquide de frein



1. Vidanger le liquide de frein à hauteur de chaque vanne de purge d'air.
2. Verser du liquide de frein neuf jusqu'à ce qu'il sorte par les purgeurs d'air. Pour le plein de liquide de frein, procéder comme lors de la purge du circuit hydraulique. Se reporter à la section BR.

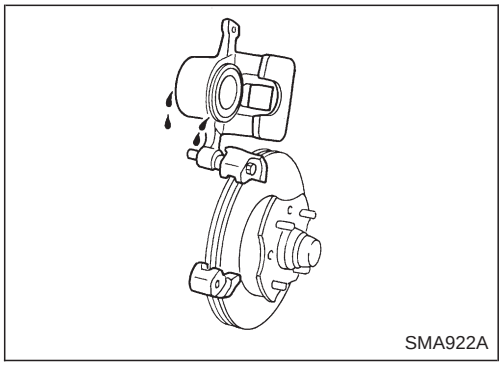
- **Remplir avec du liquide de frein recommandé (DOT 3 ou DOT 4). Se reporter à ''LIQUIDES ET LUBRIFIANTS CONSEILLES'', MA-12.**
- **Ne pas réutiliser le liquide de frein vidangé.**
- **Faire attention à ne pas renverser du liquide de frein sur la peinture.**

SBR402A

Vérification de l'assistance de frein, des flexibles à dépression, des raccords et du clapet sens unique

Vérifier si les conduites à dépression, les raccords et le clapet sens unique sont correctement fixés, et s'il n'y a pas de fuites, d'usure ou de détérioration.

SMA260A

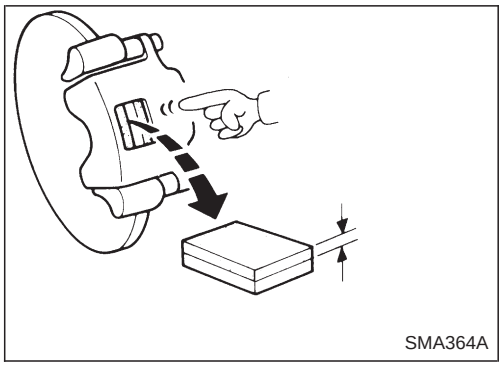


Vérification des freins à disque

ROTOR

Vérifier l'état général et l'épaisseur.

Epaisseur minimum :

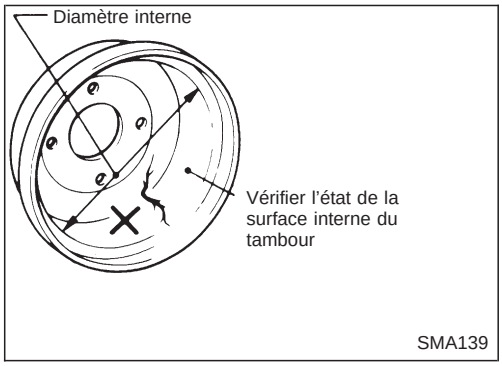


CL28VA	**20 mm**
CL28VD	**24 mm**

SMA922A

ETRIER

Vérifier s'il n'y a pas de fuites.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SMA364A

PLAQUETTE

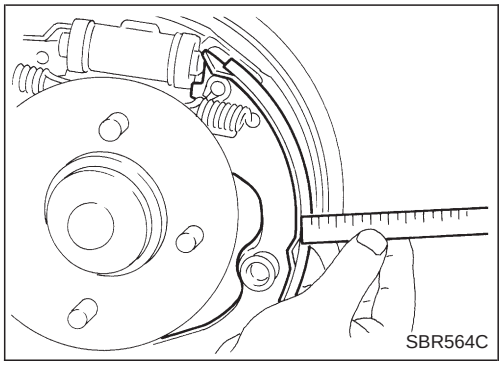
Vérifier l'usure ou tout dommage.

Epaisseur minimum : 2 mm

SMA139

Vérification des freins à tambour

CYLINDRE DE ROUE



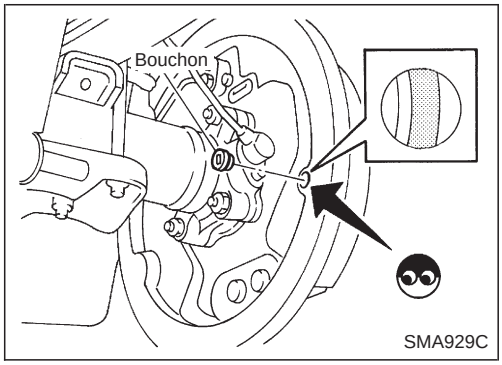
Vérifier s'il n'y a pas de fuites.

TAMBOUR

Vérifier l'état général et la surface intérieure.

Limite de réparation du tambour (diamètre interne maximum) :

LT26B	**261,5 mm**
LT30A	**296,5 mm**



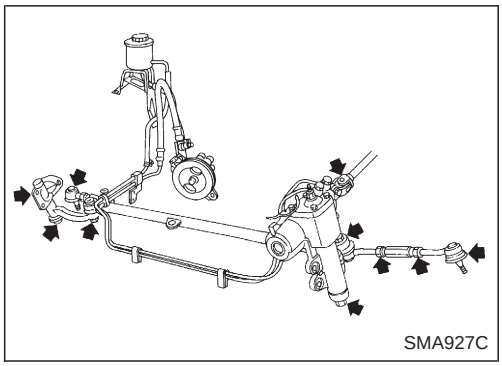
SBR564C

GARNITURES

Vérifier l'usure ou tout dommage.

Limite de rectification des garnitures (épaisseur minimum) :

1,5 mm



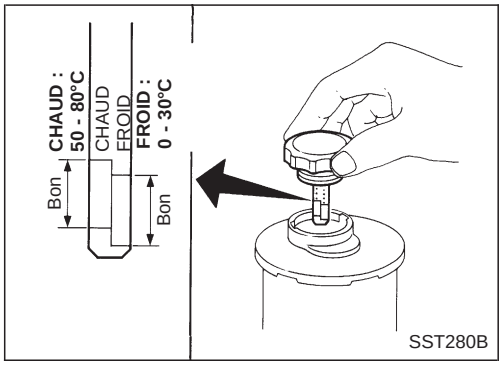
SMA929C

VERIFICATION PONCTUELLE DE L'USURE DES GARNITURES

Déposer le bouchon de l'orifice d'inspection et vérifier l'usure des garnitures.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SMA927C



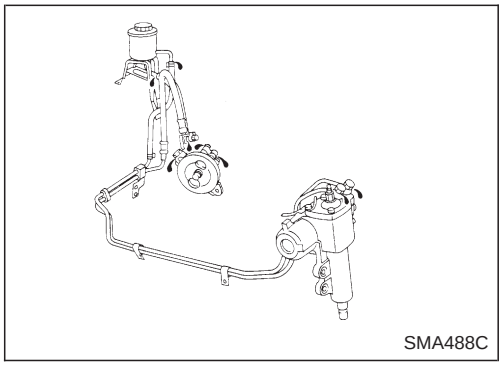
Vérification du boîtier et de la timonerie de direction

BOITIER DE DIRECTION

- Vérifier si le boîtier de direction et les soufflets ne présentent pas d'éléments desserrés, endommagés, ou des fuites de graisse.
- Vérifier si le raccordement avec la colonne de direction n'est pas desserré.

TIMONERIE DE DIRECTION

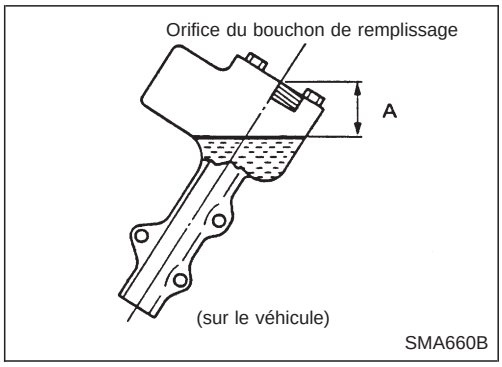
- Vérifier la rotule, le cache-poussière et les autres composants, en recherchant des pièces desserrées, de l'usure, des dommages ou des fuites de graisse.



SST280B

Vérification du liquide et des canalisations de direction assistée

- Vérifier le niveau d'huile, le moteur étant à l'arrêt.
- Vérifier le niveau de l'huile avec la jauge sur le bouchon du réservoir. Utiliser le repère ''CHAUD'' lorsque la température de l'huile est comprise entre 50 et 80°C. Utiliser le repère ''FROID'' lorsque la température de l'huile est comprise entre 0 et 30°C.



ATTENTION :

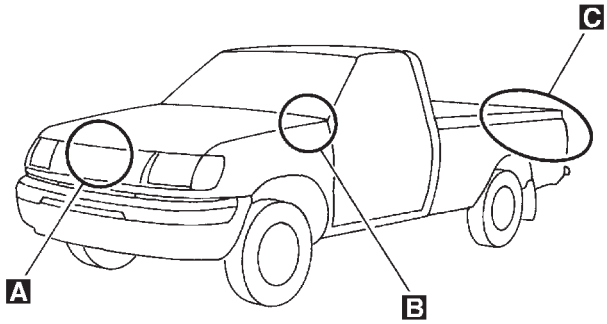
- **Ne pas remplir excessivement.**
- **Le liquide préconisé est celui pour boîte automatique ''DEXRON™ IIE'', ''DEXRON™ III'' ou type équivalent.**

SMA488C

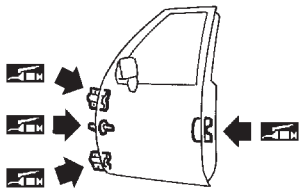
- Vérifier si les canalisations sont correctement fixées et voir s'il n'y a pas de fuites, de fissures, de dommages, d'effilochages ou de détériorations.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Vérification du niveau d’huile du boîtier de direction et de l’étanchéité

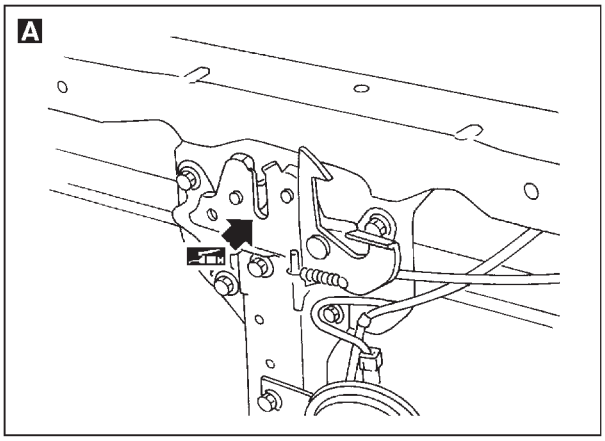


- Vérifier s’il n’y a pas de fuites d’huile et contrôler le niveau d’huile du boîtier de direction.
- Contrôler le niveau d’huile.

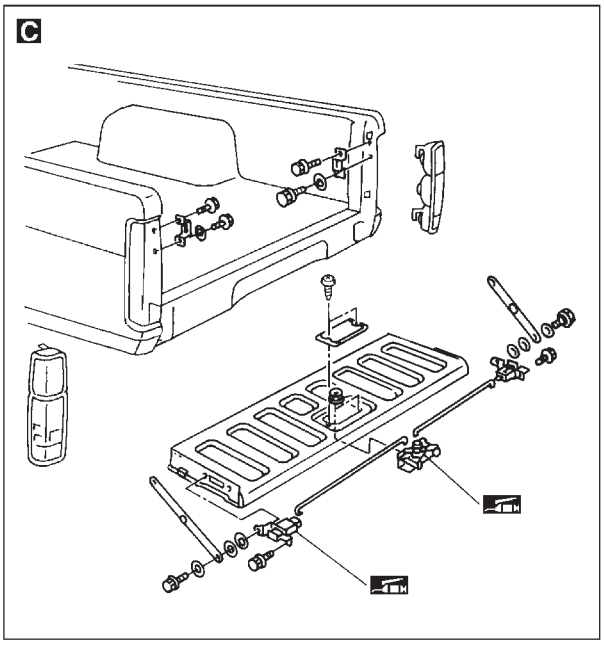


Niveau d’huile :
Distance “A”
20 mm ou moins

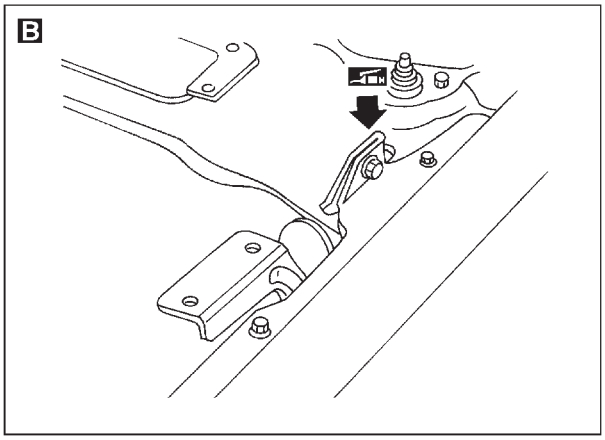
Veiller à ce que l’huile à engrenages ne déborde pas lors du remplissage.



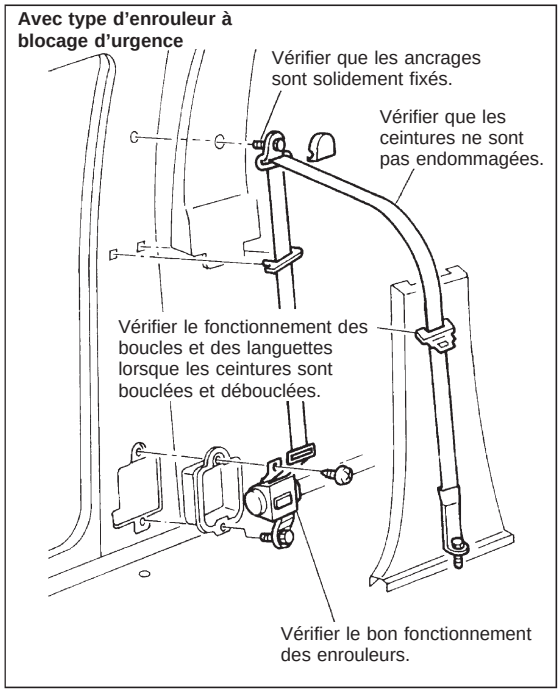
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

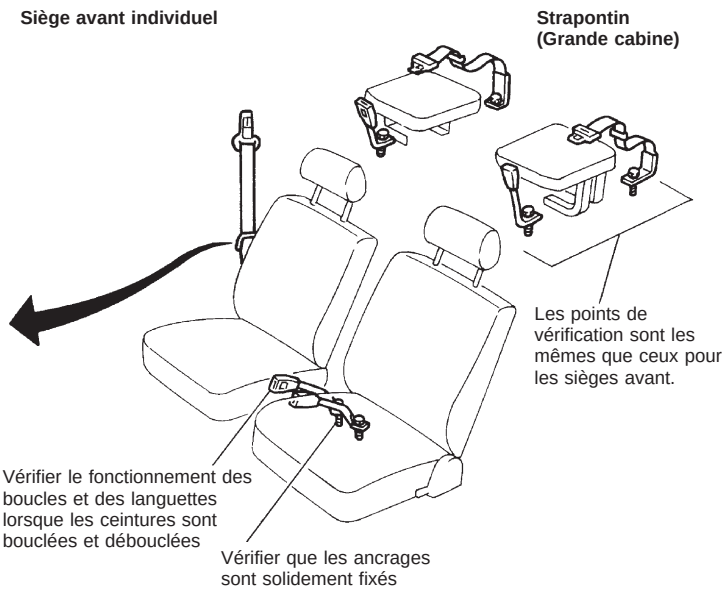


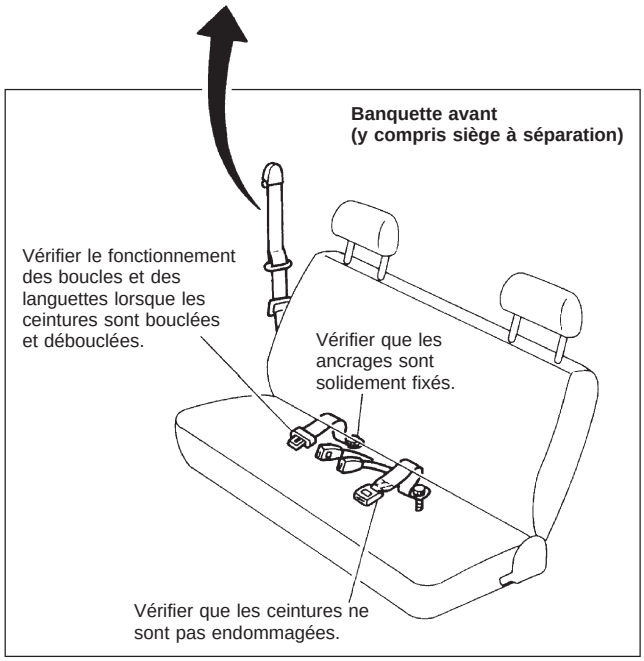
Graissage du système de fermeture du capot, des serrures et des charnières



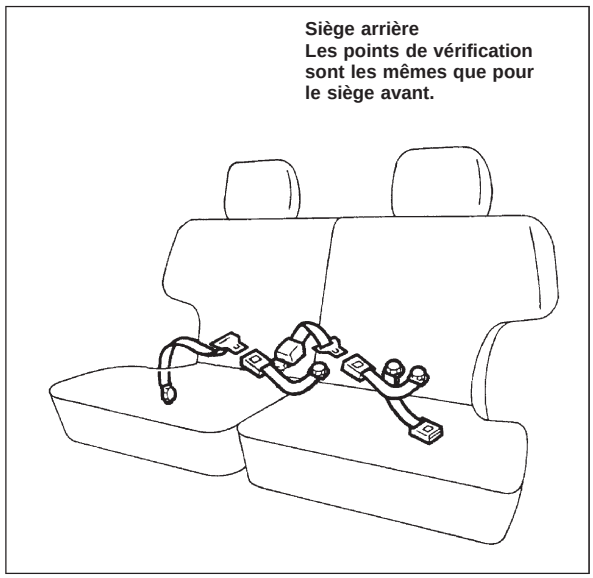
: Points de graissage







SMA944C



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Vérification des ceintures de sécurité, des boucles, des enrouleurs, des ancrages et des tendeurs

ATTENTION :

1. **Si le véhicule a subi une collision ou s'est retourné, remplacer tous les ensembles de ceinture de sécurité, quelle que soit la nature de l'accident.**
2. **Si l'état d'une pièce de la ceinture de sécurité est douteux, ne pas réparer mais remplacer la ceinture dans son ensemble.**
3. **Remplacer la ceinture de sécurité si sa trame est coupée, effilochée ou endommagée d'une manière quelconque.**
4. **Ne pas renverser de boissons, d'huile, etc. sur les boucles de ceintures ventrales. Ne jamais huiler les languettes et les boucles.**
5. **Utiliser des ceintures de sécurité d'origine NISSAN.**

Boulon d'ancrage :

: 43 - 55 N·m (4,4 - 5,6 kg-m)

SMA016D

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Contrôle de la corrosion de la carrosserie

Vérifier visuellement si la tôle de carrosserie n'est pas corrodée, si la peinture n'est pas endommagée (rayures, écaillage, frottement etc.) ou si les matières anti-corrosion ne sont pas endommagées. Vérifier en particulier les endroits suivants.

Partie ''ourlée''

Extrémité avant du capot, bas de porte, extrémité arrière du capot du coffre, etc.

Raccord de panneau

Bas de marche d'aile arrière et de montant central, logement de roue arrière d'aile arrière, pourtour d'amortisseur dans le compartiment moteur, etc.

Bord de panneau

Ouverture du couvercle de coffre, ouverture du toit ouvrant, bride de passage de roue, bride du couvercle du bouchon de remplissage de carburant, pourtour des orifices dans les panneaux, etc.

Contact des pièces

Moulure de ceinture, moulure de pare-brise, pare-chocs, etc.

Protecteurs

Dommages ou état du garde-boue, du protecteur d'aile, du protecteur contre l'écaillement, etc.

Matières anti-corrosion

Dommages ou séparation des matières anti-corrosion sous la carrosserie.

Orifices de vidange

Condition des orifices de vidange à la porte et au bas de marche.
Lors de l'entretien des zones corrodées, se reporter au manuel d'entretien contre la corrosion.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Remplacement du joint d'huile arrière — Modèles à 2 roues motrices

DEPOSE

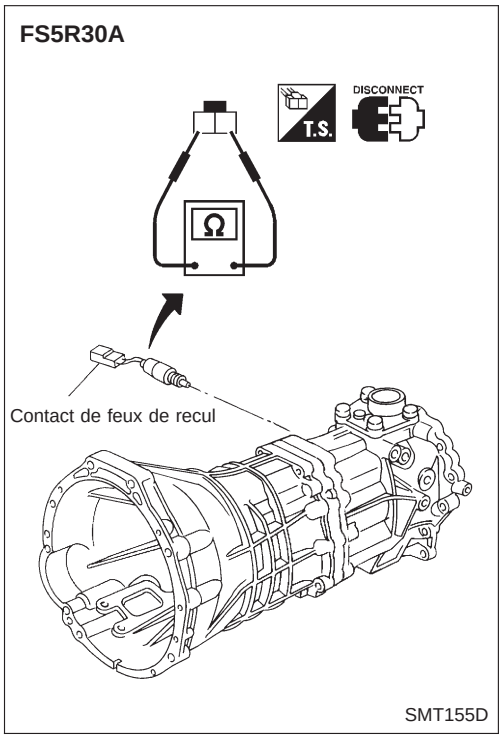
1. Déposer l'arbre de transmission. Consulter la section PD (''Dépose et repose'', ''ARBRE DE TRANSMISSION'').
2. Déposer le joint d'huile arrière à l'aide de l'outil spécial.

- **Toujours remplacer le joint avec une pièce neuve après la dépose.**

REPOSE

1. Installer le nouveau joint d'huile jusqu'à ce qu'il s'arrête.

- **Appliquer de la graisse à usages multiples sur la lèvre d'étanchéité du joint d'huile avant la repose.**



2. Remonter toutes les pièces déposées.

Contrôle des contacts de position

- Vérifier la continuité.

Contact	Rapport	Continuité
Contact de feux de recul	Marche arrière	Oui
	Sauf marche arrière	Non
Contact de point mort (moteur KA24E uniquement)	Point mort	Oui
	Sauf point mort	Non

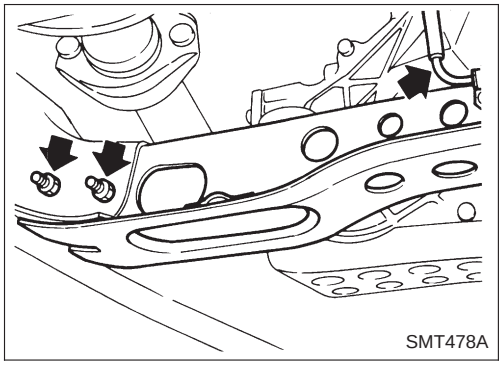
Dépose

MODELE A DEUX ROUES MOTRICES

1. Déposer la borne négative de la batterie et le moteur de démarreur. Consulter la section EL (‘‘Dépose et repose’’, ‘‘CIRCUIT DE DEMARRAGE’’).
2. Déposer le bouton de passage de boîte de vitesses, le soufflet pare-poussière, le couvercle d’orifice et le levier de passage de boîte de vitesses.
3. Déposer l’arbre de transmission. Consulter la section PD (‘‘Dépose et repose’’, ‘‘ARBRE DE TRANSMISSION’’).
4. Déposer le tuyau d’échappement.
5. Déposer le contact de feux de recul et les connecteurs de faisceau du contact de point mort.
6. Déposer le cylindre récepteur d’embrayage de la boîte de vitesses. Consulter la section CL (‘‘Cylindre récepteur’’, ‘‘COMMANDE D’EMBRAYAGE HYDRAULIQUE’’).

- **Introduire un bouchon dans le joint d’huile arrière après la dépose de l’arbre de transmission.**
- **Lors de la dépose de l’arbre de transmission, faire attention à ne pas endommager les cannelures, la chape à manchon et le joint d’huile arrière.**

SMT099A



7. Soutenir le moteur en plaçant un cric sous le carter d’huile et sous la boîte de vitesse, puis la traverse centrale.

- **Ne pas placer le cric sous le bouchon de vidange du carter d’huile.**

8. Séparer la boîte de vitesses du moteur.

AVERTISSEMENT :
Soutenir la boîte de vitesses manuelle pendant la dépose.

9. Boîte de vitesses inférieure.

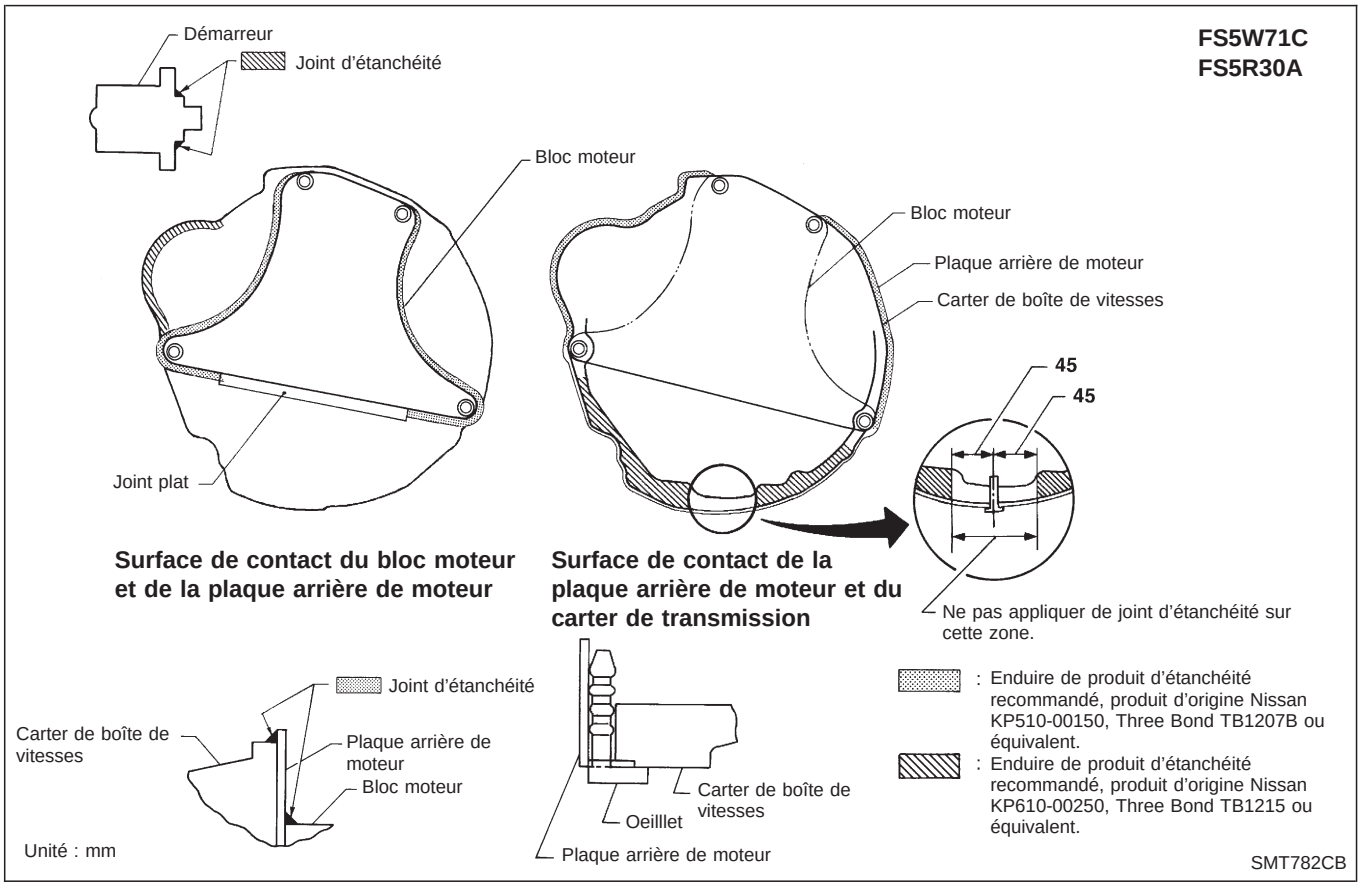
SMT478A

MODELE A QUATRE ROUES MOTRICES

1. Déposer la borne négative de la batterie et le moteur de démarreur. Consulter la section EL (‘‘Dépose et repose’’, ‘‘CIRCUIT DE DEMARRAGE’’).
2. Déposer le bouton de commande de transfert, le soufflet pare-poussière, le couvercle d’orifice, le levier de passage de boîte de vitesses et le levier de commande de transfert.
3. Déposer les arbres de transmission avant et arrière. Consulter la section PD (‘‘Dépose et repose’’, ‘‘ARBRE DE TRANSMISSION’’).
4. Déposer le tuyau d’échappement.
5. Déposer les ressorts de barre de torsion. Consulter la section FA (‘‘Barre de torsion’’, ‘‘SUSPENSION AVANT’’). Puis déposer la seconde barre transversale.
6. Déposer le cylindre récepteur d’embrayage de la boîte de vitesses. Consulter la section CL (‘‘Cylindre récepteur’’, ‘‘COMMANDE D’EMBRAYAGE HYDRAULIQUE’’).
7. Déposer le contact de feux de recul et le connecteur de faisceau du contact de point mort.

- **Introduire un bouchon dans les joints d’huile avant et arrière du transfert après avoir déposé les arbres de transmission.**
- **Veiller à ne pas endommager les cannelures, les chapes**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

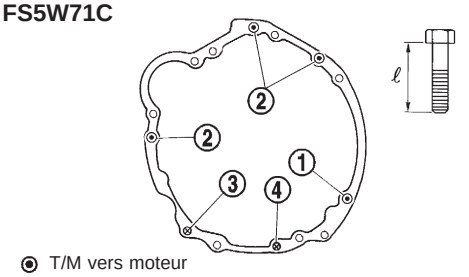


Dépose (Suite)

à manchon, et les joints d'huile avant et arrière du transfert lors de la dépose de l'arbre de transmission.

8. Déposer le gousset du moteur (modèle FS5R30A uniquement).
9. Soutenir le transfert et déposer la traverse centrale.
10. Soutenir la boîte de vitesses et déposer la traverse arrière du moteur.
11. Séparer la boîte de vitesses et le transfert du moteur.
12. Abaisser la boîte de vitesses et le transfert.

Repose



- Appliquer du produit d'étanchéité sur les zones indiquées ci-dessous : — Modèles à 4 roues motrices

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

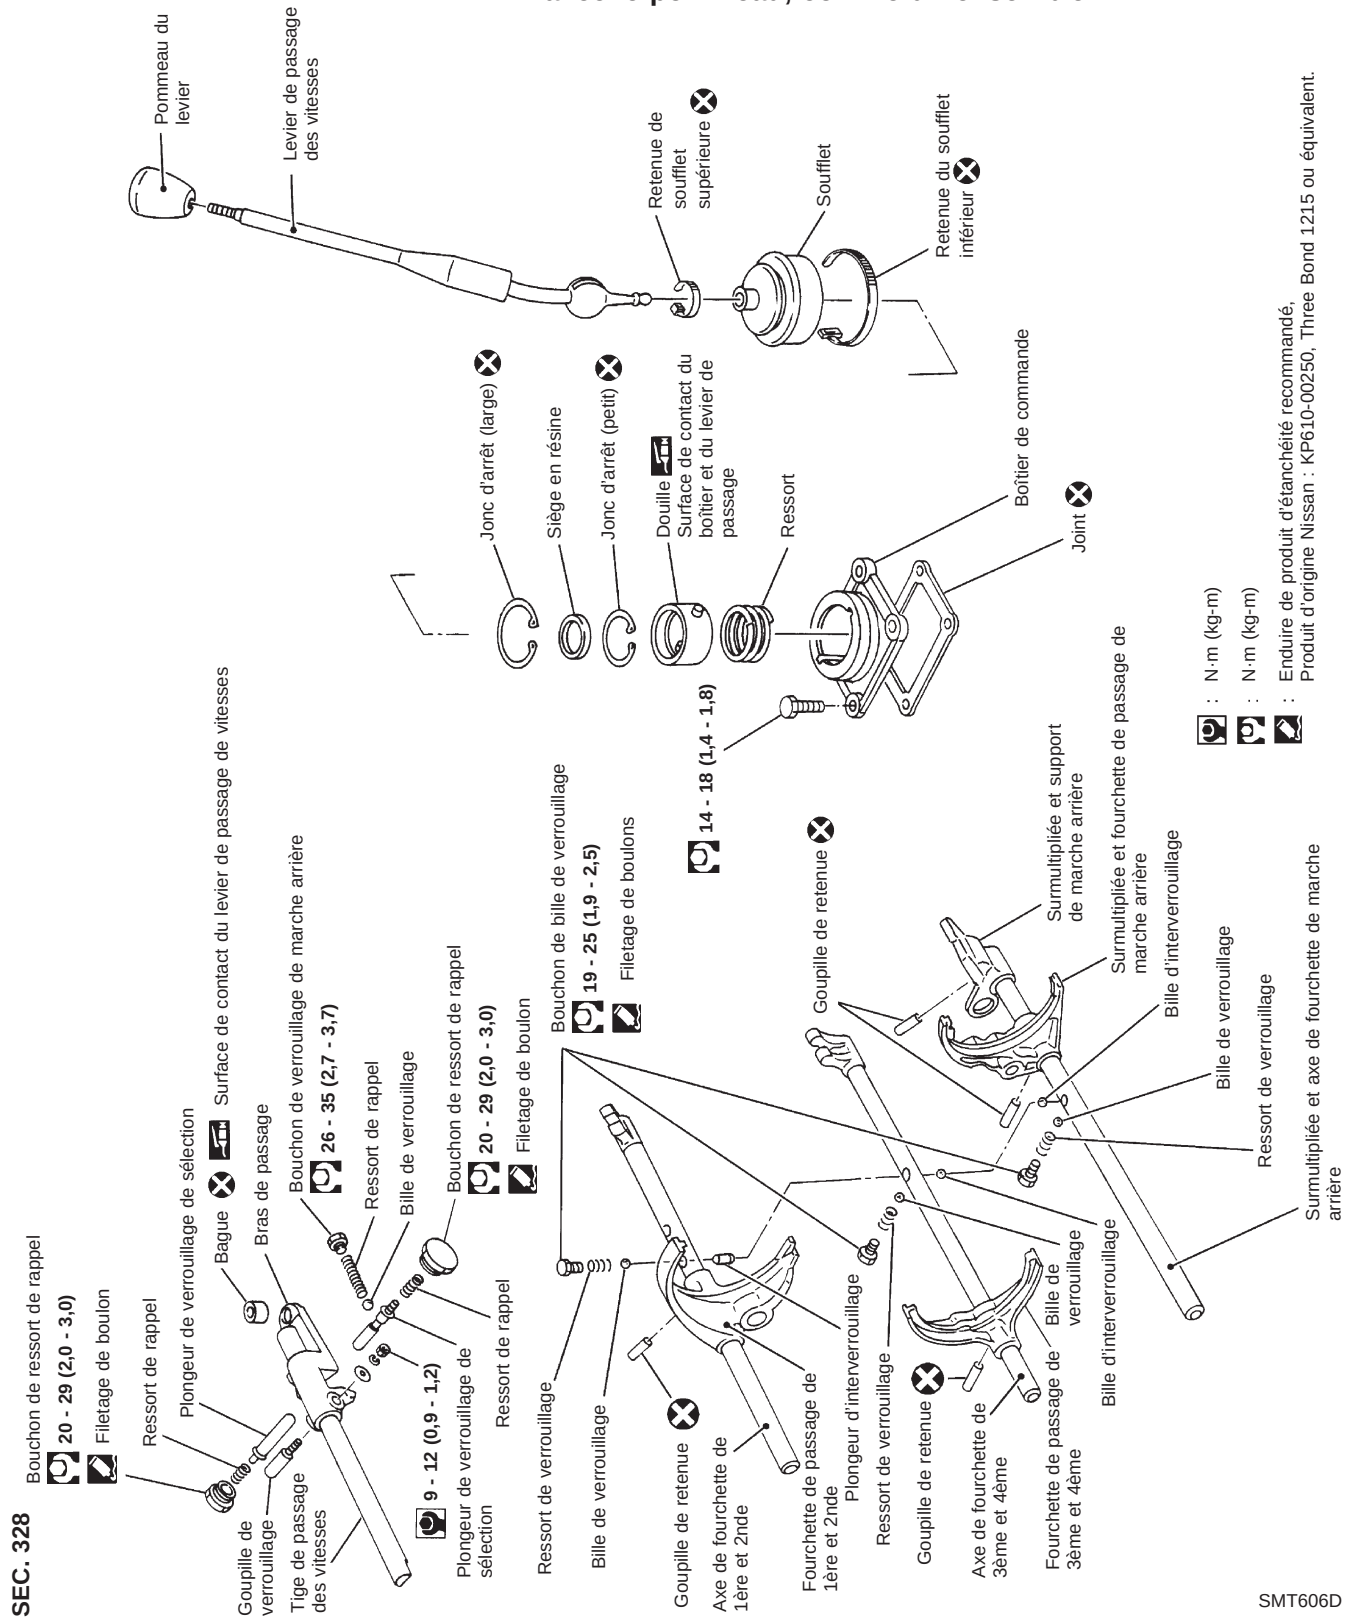
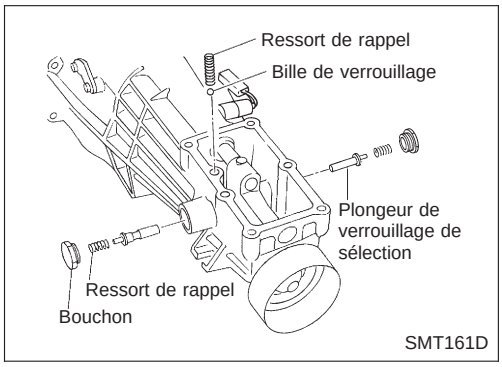
Composants de la commande de passage des vitesses — Modèles à 2 roues motrices

ATTENTION :
Pour éviter tout dommage lors du remplacement du pommeau du levier, déposer le levier de passage avec le pommeau, comme un ensemble.



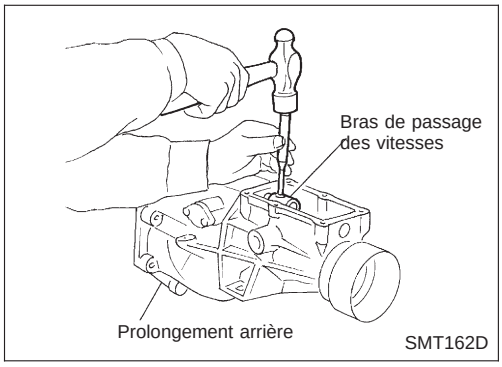
SEC. 328



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

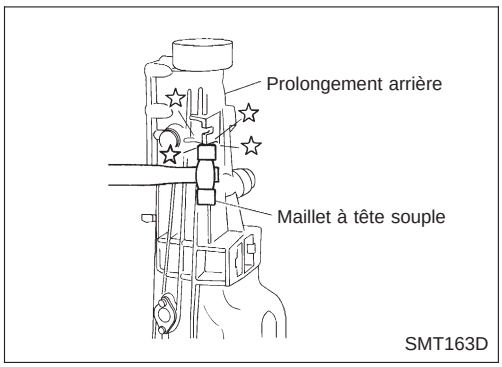
Composants de la commande de passage des vitesses — Modèles à 4 roues motrices

ATTENTION :
Pour éviter tout dommage lors du remplacement du pommeau de livier de passage, déposer le levier de passage avec le pommeau, comme un ensemble.



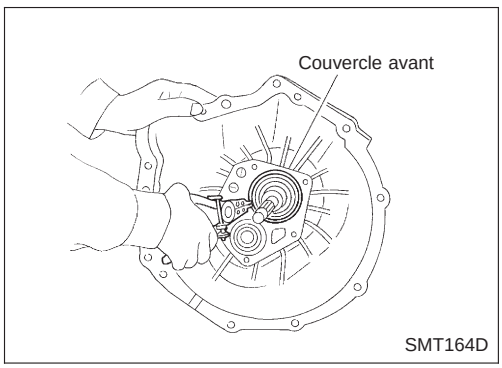
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Composants du carter

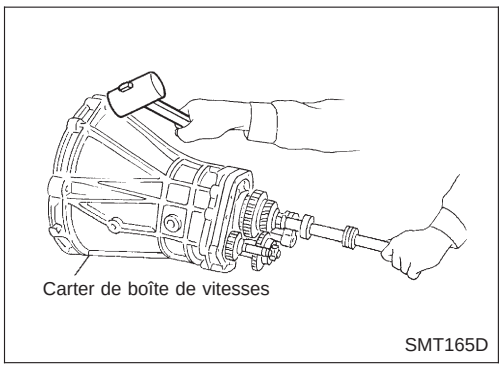


1. Déposer le prolongement arrière.

a. Déposer le boîtier de commande de vitesses, la bille de verrouillage, le ressort de rappel, le bouchon, et choisir le plongeur de verrouillage et les ressorts de rappel.

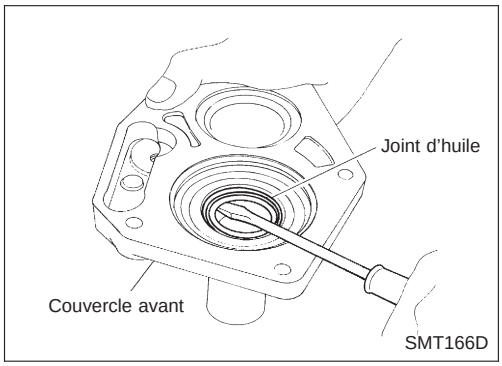


b. Chasser la goupille de retenue du bras de passage des vitesses.



c. Déposer le bras de passage de l'axe de passage.

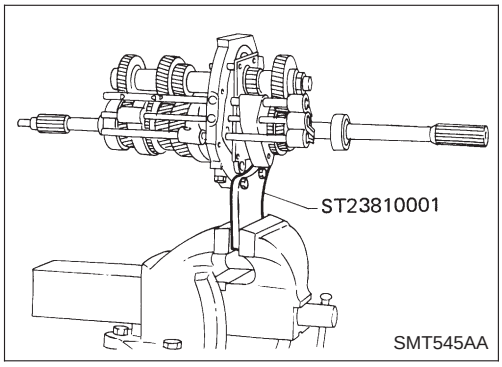
d. Déposer le prolongement arrière en le tapant légèrement.



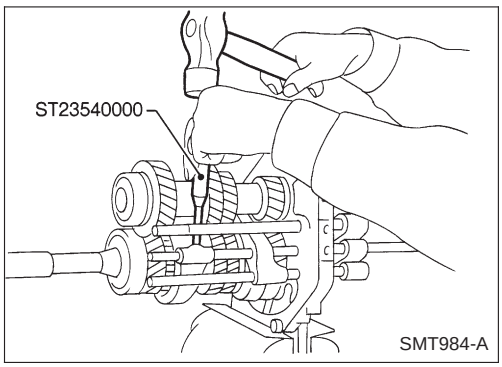
2. Déposer le couvercle avant, le joint plat, la cale de roulement avant d'arbre de renvoi, et le jonc d'arrêt du roulement à billes de pignon d'entraînement principal.

3. Déposer le carter de transmission en le frappant légèrement. Puis séparer le carter de boîte de vitesses de la plaque adaptatrice avant.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

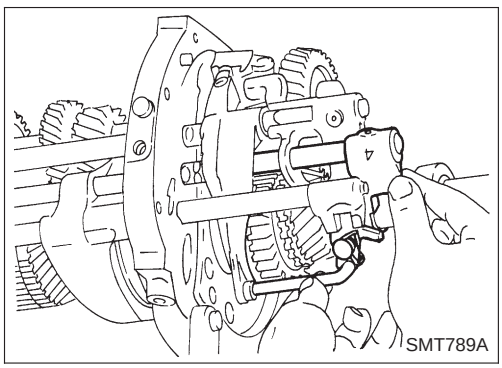


Composants du carter (Suite)



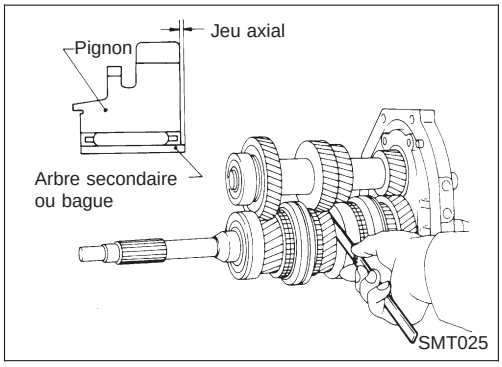
4. Déposer le joint d'huile de couvercle avant.

- **Veiller à ne pas endommager la surface de contact du couvercle avant.**



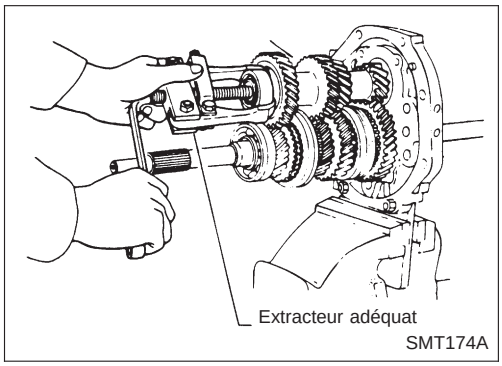
Composants de la commande de passage des vitesses

1. Monter l'outil spécial sur la plaque adaptatrice.
2. Déposer la tige de passage des vitesses de la plaque adaptatrice.
3. Déposer les bouchons de bille de verrouillage, les ressorts de verrouillage et les billes de verrouillage.

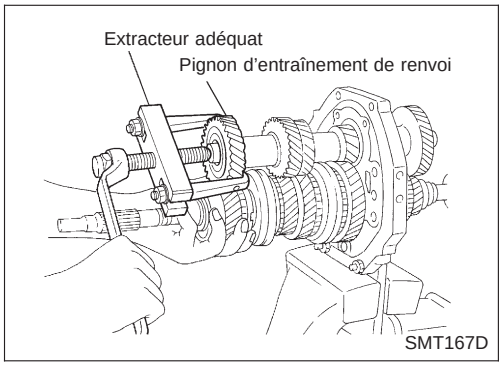


4. Chasser les goupilles de retenue. Sortir ensuite les axes de fourchette et déposer les billes d'interverrouillage.

5. Sortir les axes de fourchette de 3ème-4ème ainsi que de surmultipliée et de marche arrière.



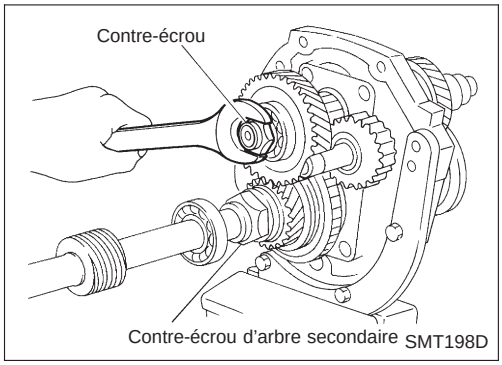
Composants de la boîte



1. Mesurer le jeu axial de chaque pignon avant de déposer les pignons et les arbres.
   Jeu axial des pignons :
   Consulter les SDS, MT-59.
   Si le jeu axial n'est pas dans les limites spécifiées, démonter et vérifier la surface de contact du pignon avec le moyeu, la rondelle, la bague, le roulement à aiguilles et l'arbre.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

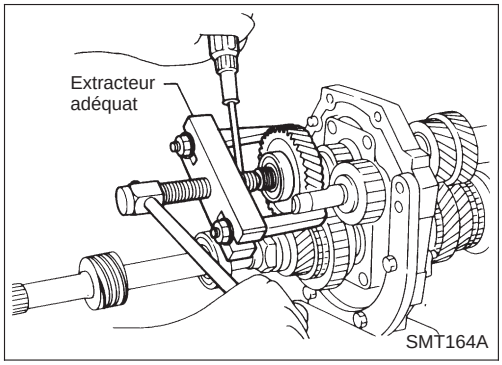
Composants de la boîte (Suite)



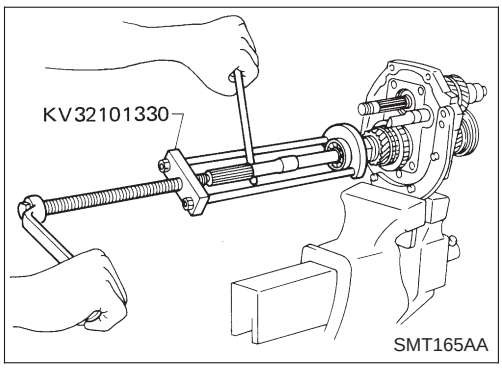
2. Engrener les pignons de 2nde et de marche arrière, puis retirer le roulement avant de pignon de renvoi à l'aide d'un extracteur adéquat.
3. Déposer le jonc d'arrêt, puis déposer le support de pignon auxiliaire, le ressort de pignon auxiliaire et le pignon auxiliaire.

4. Sortir le pignon d'entraînement de renvoi avec l'ensemble de pignon d'entraînement principal à l'aide d'un extracteur adéquat.

- **Lors de l'extraction du pignon d'entraînement principal, veiller à ne pas laisser tomber le roulement pilote et l'anneau de synchro.**



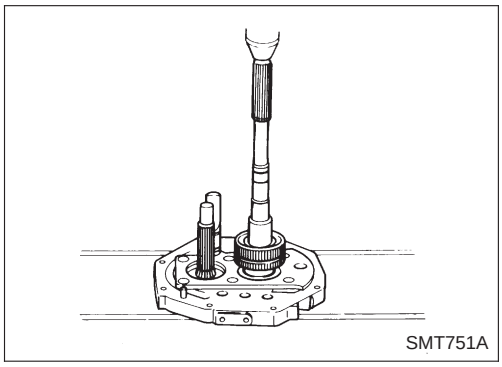
5. Déposer le jonc d'arrêt et extraire le synchroniseur de 3ème et 4ème ainsi que le pignon de 3ème.



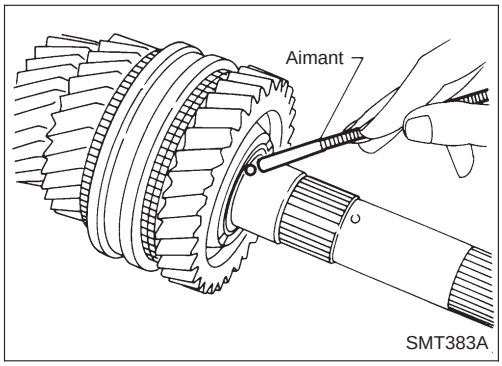
6. Déposer les composants arrière de l'arbre secondaire et du pignon de renvoi de la manière suivante.

a. Débloquer le contre-écrou d'arbre de renvoi et le contre-écrou d'arbre secondaire, puis desserrer les écrous.

- **Contre-écrou d'arbre secondaire : filetage à gauche**



b. Extraire le pignon de renvoi de surmultipliée avec le roulement d'extrémité arrière du pignon de renvoi à l'aide d'un extracteur approprié.
c. Extraire le pignon de renvoi de marche arrière et son entretoise.
d. Déposer les joncs d'arrêt de l'arbre de renvoi de marche arrière et extraire les rondelles de butée du pignon intermédiaire de marche arrière, le pignon intermédiaire de marche arrière et le roulement de pignon intermédiaire de marche arrière.
e. Déposer le pignon d'entraînement de compteur de vitesse et la bille d'acier (modèle à 2 roues motrices uniquement).
f. Déposer le jonc d'arrêt et extraire le roulement d'arbre secondaire de surmultipliée, puis déposer le jonc d'arrêt.
g. Déposer le contre-écrou d'arbre secondaire.
h. Déposer le rouleau d'acier et la rondelle de butée.
i. Déposer le roulement à rouleaux et la rondelle.
j. Déposer le pignon principal de surmultipliée, le roulement à aiguilles et l'anneau de synchro. de surmultipliée.
k. Déposer le manchon d'accouplement de surmultipliée (4 roues motrices) et les cales de passage des vitesses.
l. Déposer le pignon primaire de marche arrière (2 roues motrices) et les cales de passage des vitesses.

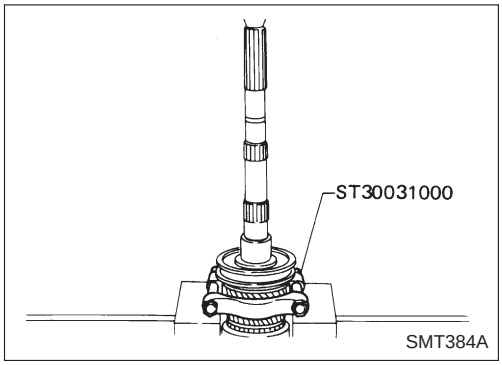


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Composants de la boîte (Suite)

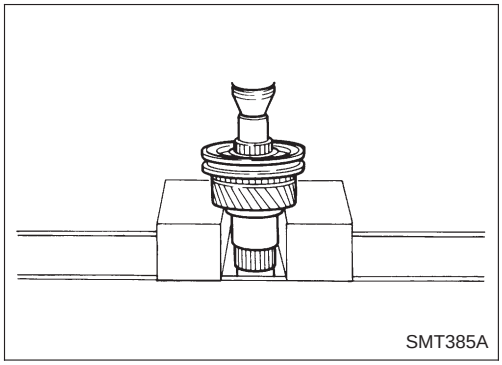
SMT751A

m. Chasser alternativement l'arbre secondaire et le pignon de renvoi.



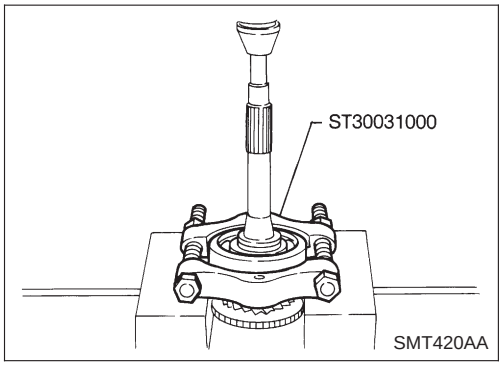
- **Enfoncer alternativement et avec soin l'arbre secondaire et le pignon de renvoi. Veiller à ce que les pignons de l'arbre secondaire et du pignon de renvoi situés sous la plaque adaptatrice ne se cognent pas.**

SMT383A



7. Déposer les composants avant de l'arbre secondaire.
a. Déposer la rondelle de butée de l'arbre secondaire et la bille d'acier.
b. Déposer le pignon principal de 1ère ainsi que le roulement à aiguilles de pignon de 1ère.

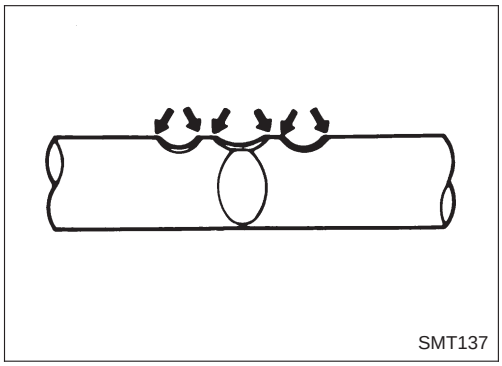
- **Faire attention de ne pas égarer la bille d'acier.**



SMT384A

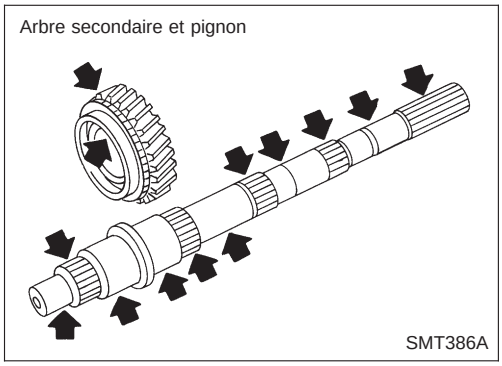
c. Chasser le pignon principal de 2nde avec la bague de pignon de 1ère et l'ensemble de synchro. de 1ère et 2nde.
d. Déposer le jonc d'arrêt avant de l'arbre secondaire.

SMT385A



e. Chasser le pignon principal de 3ème avec l'ensemble de synchro. de 3ème et 4ème et le roulement à aiguilles de pignon de 3ème.

SMT420AA



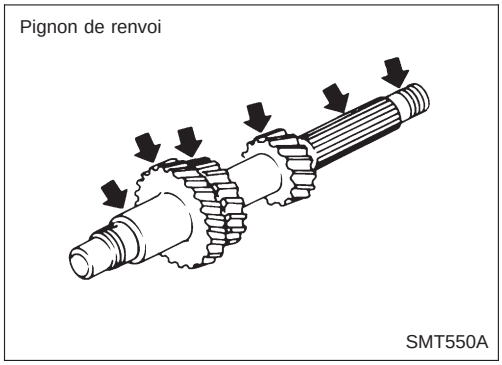
8. Déposer le roulement du pignon d'entraînement principal.
a. Déposer le jonc d'arrêt du pignon d'entraînement principal ainsi que l'entretoise.
b. Chasser le roulement du pignon d'entraînement principal.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

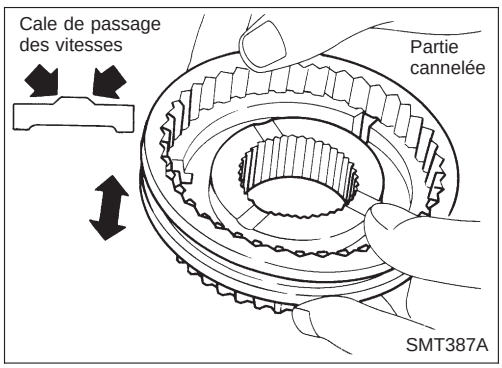
SMT137

Composants de la commande de passage des vitesses

- Contrôler la surface de contact et la surface de glissement pour voir si elles ne sont pas usées ou rayées et si elles ne présentent pas des aspérités ou autres défauts.



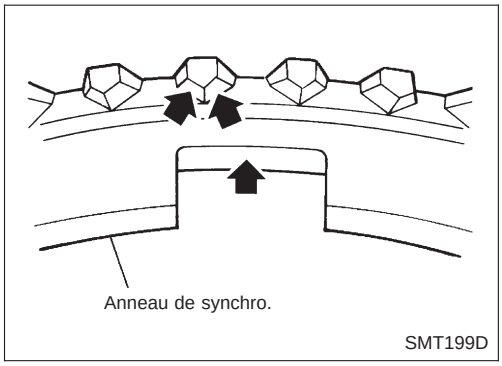
SMT386A



Composants de la boîte

PIGNON ET ARBRE

- Contrôler les arbres pour voir s'ils ne sont pas fêlés, usés ou pliés.
- Contrôler que les pignons ne sont pas excessivement usés, ébréchés ou fêlés.

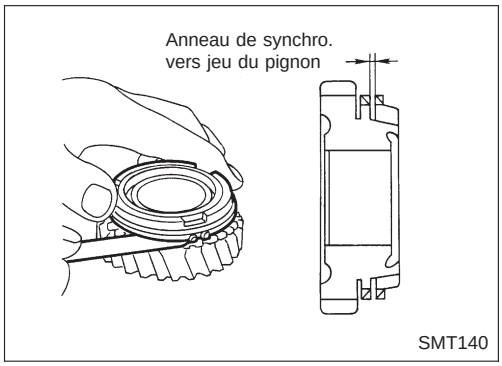


SMT550A

SMT387A

ENSEMBLES DE SYNCHRONISEUR

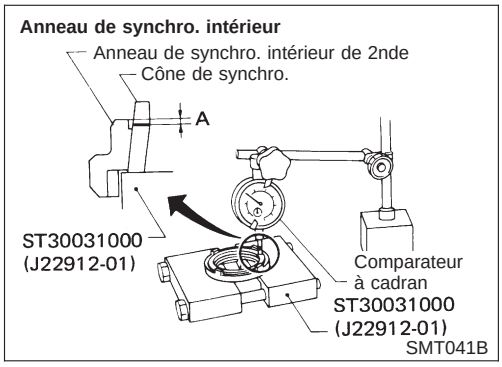
- Vérifier la partie cannelée des manchons d'accouplement, des moyeux et des pignons pour voir si elle n'est pas usée ou fêlée.
- Contrôler les cales de passage des vitesses pour voir si elles ne sont pas usées ou déformées.
- Vérifier pour s'assurer que le ressort d'expansion ne présente pas de déformation.



SMT199D

- Contrôler que les anneaux de synchro. ne sont pas fêlés ou déformés.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

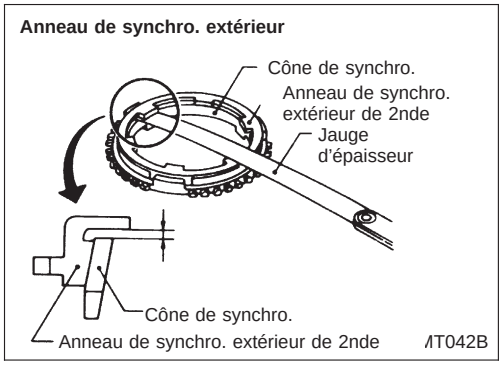


Composants de la boîte (Suite)

- Mesurer l'usure de anneau de synchro.

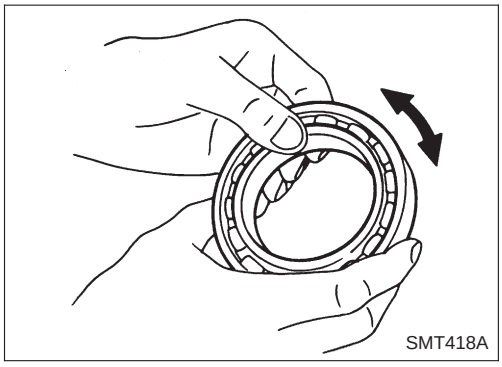
a. Mesurer le jeu entre l'anneau de synchro. et le pignon.
Jeu entre les anneaux de synchro. et les pignons :
Consulter les SDS, MT-59.

- Si le jeu est inférieur à la limite d'usure, remplacer l'anneau de synchro.



- Mesurer l'usure des anneaux de synchro. de 2nde et 3ème — Moteur TD25 seulement.

a. Positionner les anneaux de synchro. sur le cône de synchro.

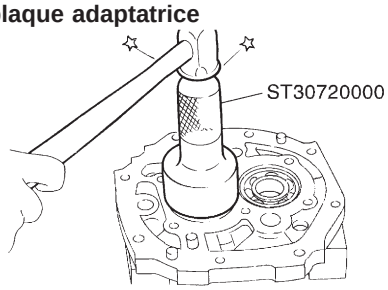


b. Mesurer les dimensions ''A'' et ''B'' tout en poussant à fond les anneaux de synchro. contre le cône de synchro.
Standard :
Interne ''A'' : 0,7 - 0,9 mm
Externe ''B'' : 0,6 - 1,1 mm
Limite d'usure :
0,2 mm

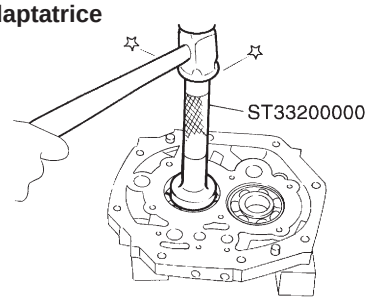
- **Si la dimension ''A'' ou ''B'' est inférieure à la limite d'usure, remplacer l'anneau extérieur de synchro., l'anneau intérieur de synchro. et le cône de synchro. comme un ensemble.**

ROULEMENTS

- S'assurer que tous les roulements tournent librement, qu'ils n'émettent pas de bruits et qu'ils ne sont ni fêlés, ni piqués, ni usés.

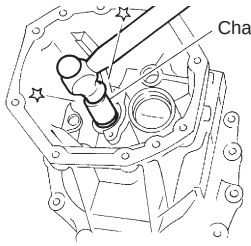


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



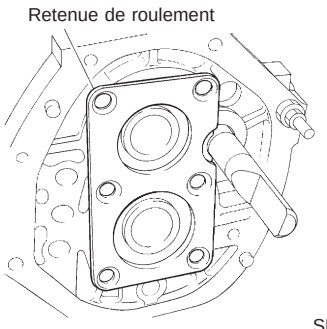
Composants de la boîte

1. Reposer les roulements dans les composants du carter.



Roulement avant d'arbre secondaire dans la plaque adaptatrice

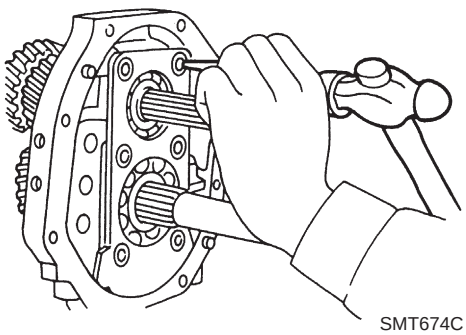
Roulement arrière de renvoi dans la plaque adaptatrice



Roulement d'extrémité arrière de pignon de renvoi dans le carter de pignon de surmultipliée (modèles à 4 roues motrices)

Doit être au ras de la surface avant du carter de pignon de surmultipliée.

SMT168D

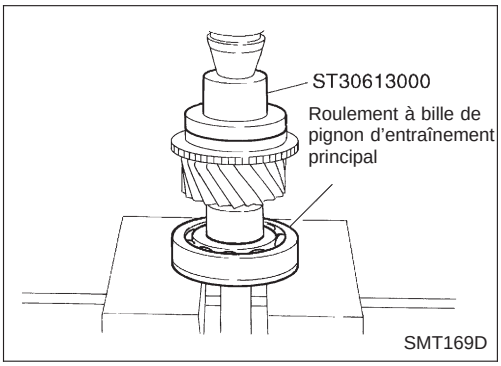


SMT175D

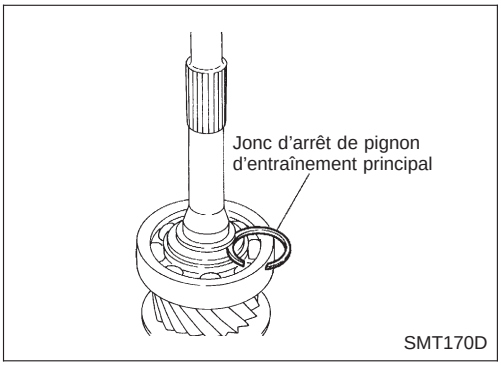
2. Assembler les pièces de la plaque adaptatrice.

● Reposer la retenue de roulement.

a. Insérer l'arbre intermédiaire de marche arrière, puis reposer la retenue de roulement.



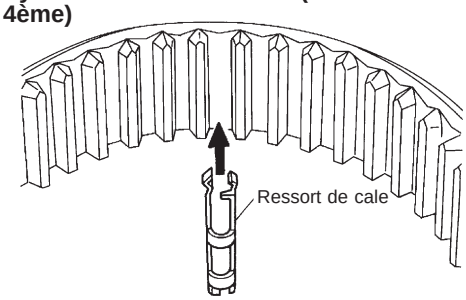
SMT674C



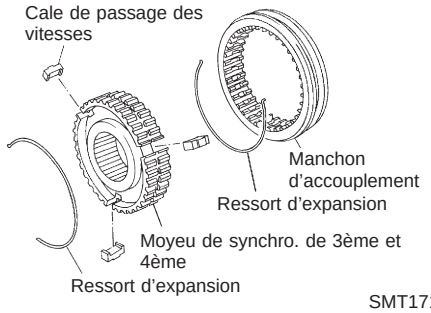
b. Serrer chaque vis, puis les marquer en deux points différents.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Composants de la boîte (Suite)

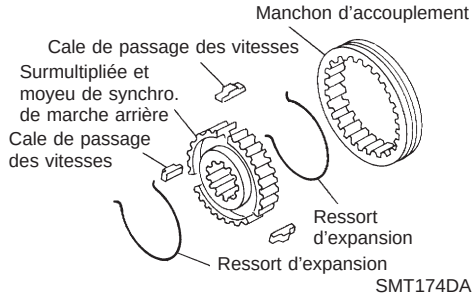


3. Reposer le roulement à billes du pignon d'entraînement principal.
a. Enfoncer à la presse le roulement à billes du pignon d'entraînement principal.



b. Sélectionner le jonc d'arrêt du roulement de pignon d'entraînement principal adéquat pour minimiser le jeu dans la rainure.
Tolérance de jeu dans la rainure :
0 - 0,13 mm
Jonc d'arrêt du roulement de pignon d'entraînement principal :
Consulter les SDS, MT-59.
c. Reposer le jonc d'arrêt choisi sur le pignon d'entraînement principal.

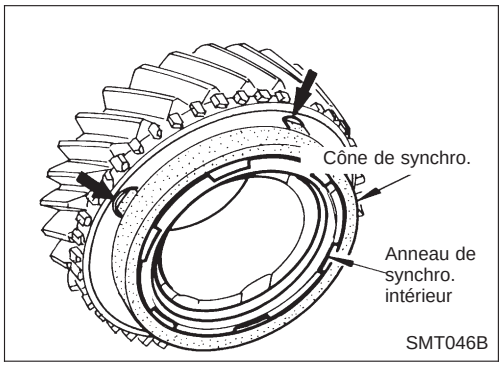
Synchro. de 1ère et 2nde (ou 3ème et 4ème)



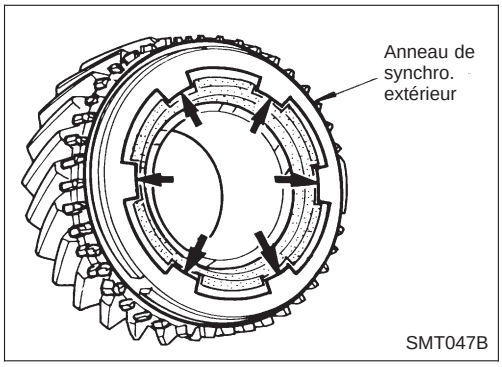
4. Assembler les synchroniseurs.
- Synchroniseur de 1ère et 2nde
- (Synchroniseur de 3ème et 4ème pour moteur TD25)

Synchroniseur de 3ème et 4ème

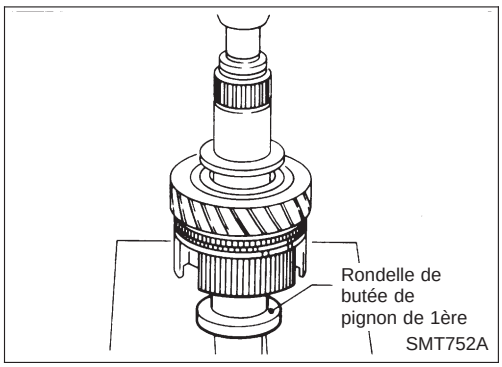
- Synchroniseur de 3ème et 4ème



Synchroniseur de surmultipliée et de marche arrière



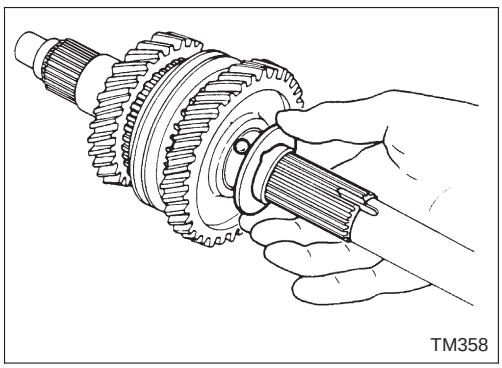
- Synchroniseur de surmultipliée et marche arrière



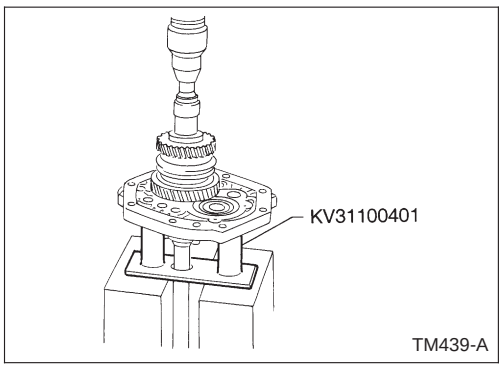
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Composants de la boîte (Suite)

- Synchro. de type anneau de synchro. double de 1ère et 2nde (moteur TD25 seulement)



5. Assembler les composants avant sur l'arbre secondaire.

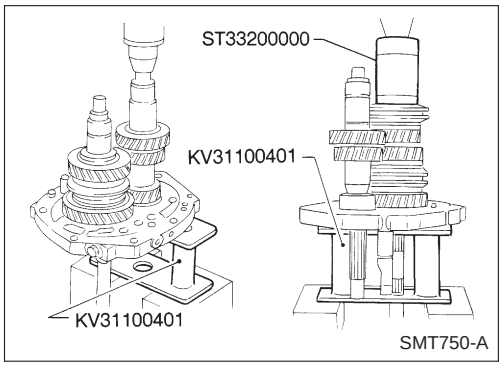


a. Reposer le pignon principal de 2nde, le roulement à aiguilles et le synchroniseur de 1ère et 2nde puis adapter à la presse la bague de pignon de 1ère sur l'arbre secondaire.

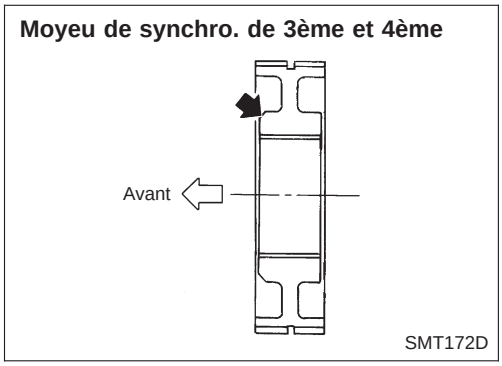
b. Reposer le pignon principal de 1ère.

c. Reposer la bille d'acier ainsi que la rondelle de pignon de 1ère.

- **Avant la repose, enduire la bille d'acier et les deux côtés de la rondelle de butée de graisse à usages multiples.**

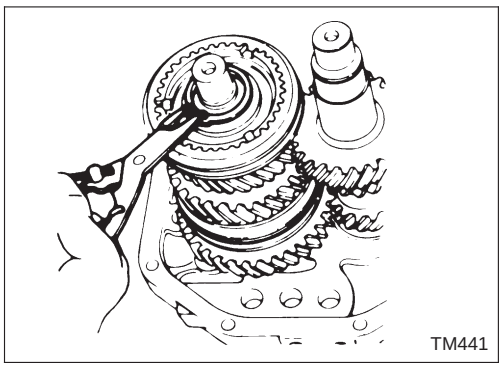


6. Reposer l'arbre secondaire et le pignon de renvoi sur la plaque adaptatrice et le pignon d'entraînement principal sur l'arbre secondaire comme suit :

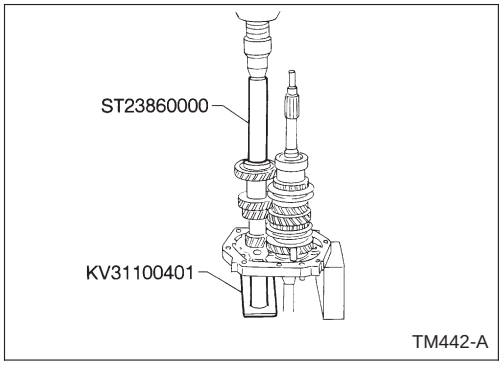


a. Monter à la presse l'ensemble d'arbre secondaire sur la plaque adaptatrice à l'aide de l'outil spécial.

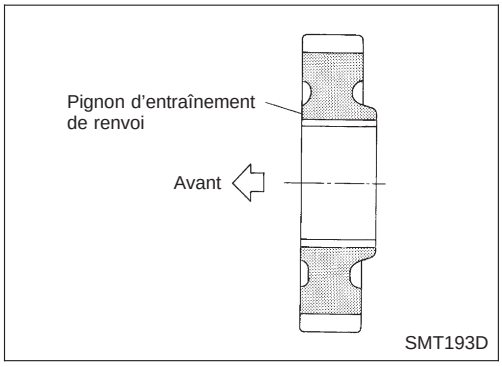
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Composants de la boîte (Suite)

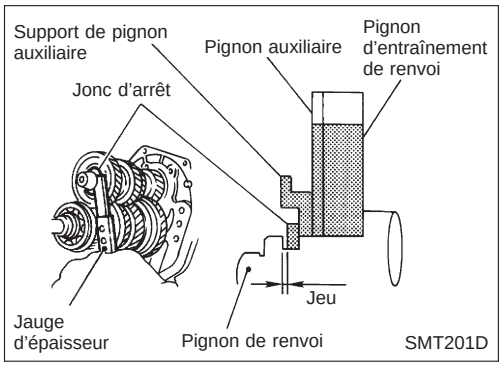


b. Enfoncer à la presse le pignon de renvoi dans la plaque adaptatrice à l'aide de l'outil spécial.
c. Monter le pignon principal de 3ème et le roulement à aiguilles, puis adapter à la presse l'ensemble synchroniseur de 3ème et 4ème sur l'arbre secondaire.



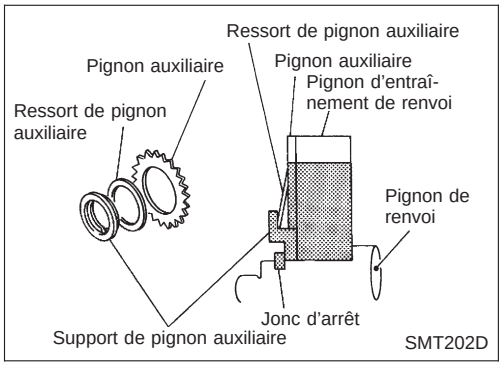
- **Faire attention au sens de montage du moyeu de synchro. de 3ème et de 4ème.**

7. Reposer la rondelle de butée sur l'arbre secondaire et la bloquer à l'aide d'un jonc d'arrêt avant d'arbre secondaire.
- **Sélectionner le jonc d'arrêt adéquat pour minimiser le jeu de la rainure de l'arbre secondaire.**
  Tolérance de jeu dans la rainure :
  0 - 0,18 mm
  Jonc d'arrêt avant d'arbre secondaire :
  Consulter les SDS, MT-59.
8. Appliquer de l'huile à engrenages sur le roulement pilote d'arbre secondaire et le reposer sur l'arbre secondaire.



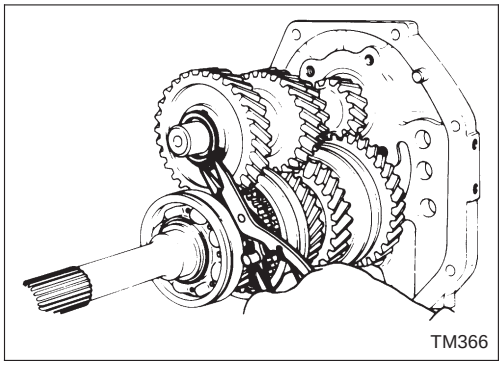
9. Monter à la presse le pignon d'entraînement de renvoi sur le pignon d'arbre primaire à l'aide de l'outil spécial.

- **Faire attention au sens de montage du pignon d'entraînement de renvoi.**

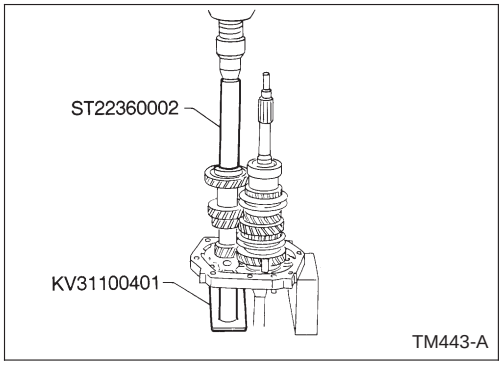


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

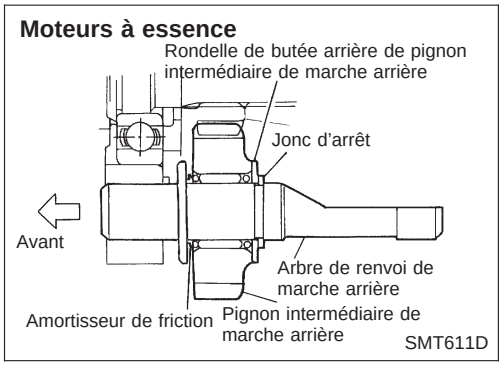
Composants de la boîte (Suite)



10. Reposer les composants du pignon auxiliaire.
a. Reposer le pignon auxiliaire et le support de pignon auxiliaire sur le pignon de commande de renvoi puis choisir un jonc d'arrêt adéquat qui réduira le jeu de la rainure du pignon de renvoi.

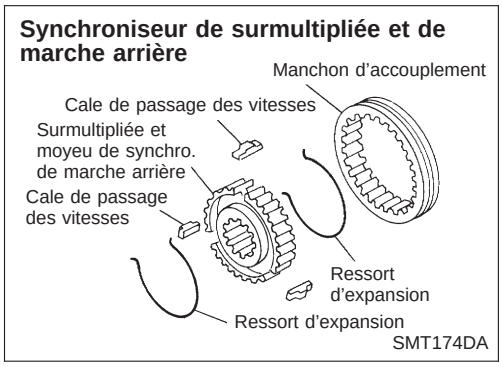


- **Ne pas encore monter le ressort de pignon auxiliaire.**
  Tolérance de jeu dans la rainure :
  0 - 0,18 mm
  Jonc d'arrêt du pignon d'entraînement de renvoi :
  Consulter les SDS, MT-59.

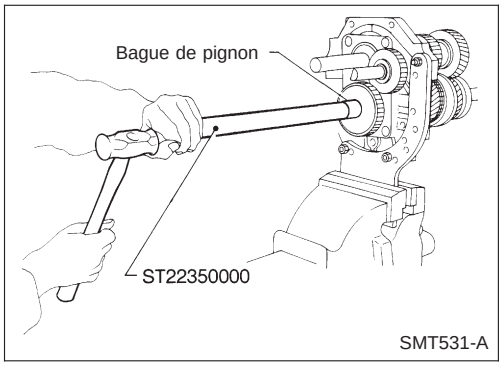


b. Déposer le jonc d'arrêt, le support de pignon auxiliaire et le pignon auxiliaire du pignon de renvoi.
c. Reposer le pignon auxiliaire, son ressort et son support.

11. Reposer le jonc d'arrêt de pignon d'entraînement de renvoi préalablement sélectionné.



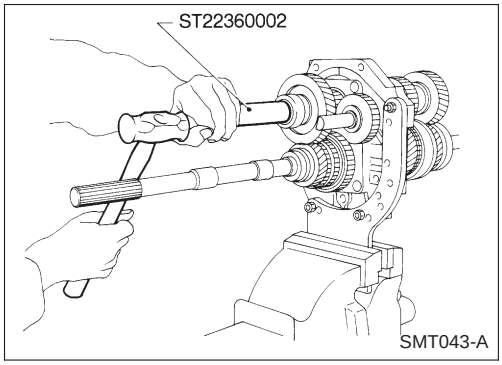
12. Enfoncer le roulement avant de pignon de renvoi dans le pignon de renvoi.



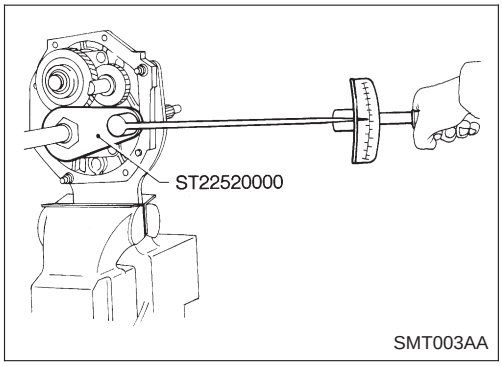
13. Assembler les pièces à l'arrière de la plaque adaptatrice comme suit :
a. Poser le pignon intermédiaire de marche arrière sur l'arbre de renvoi de marche arrière avec les rondelles de butée de pignon intermédiaire de marche arrière, les joncs d'arrêt et le roulement à aiguilles.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Composants de la boîte (Suite)

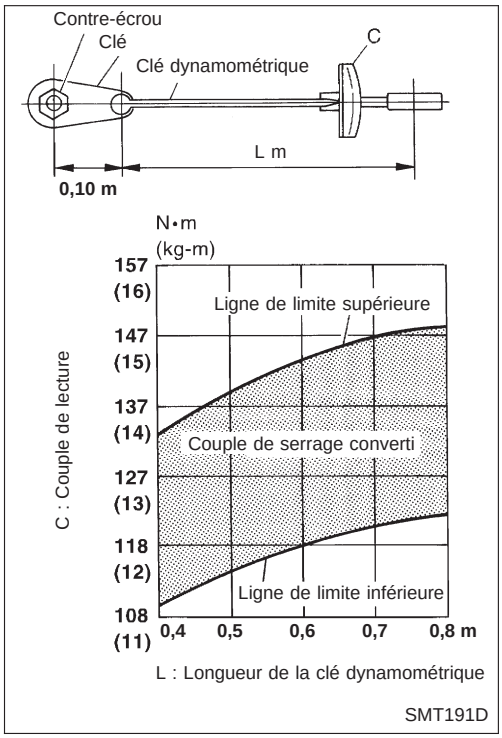


b. Reposer la retenue de passage de vitesses et le synchroniseur de surmultipliée et de marche arrière sur l'arbre secondaire.
- **Faire attention au sens de montage du moyeu.**



c. Reposer la bague de pignon de surmultipliée à l'aide d'un outil spécial.
d. Reposer le pignon principal de surmultipliée, le roulement à aiguilles.
e. Reposer l'entretoise du pignon de renvoi de marche arrière, le pignon de renvoi de marche arrière et le pignon de renvoi de surmultipliée.
- **Le pignon principal de surmultipliée et le pignon de renvoi de surmultipliée doivent être appariés.**

f. Reposer la rondelle, le roulement à galets, le rouleau d'acier, la rondelle de butée, la bille d'acier et le pignon d'entraînement du compteur de vitesses (2 roues motrices).
g. Serrer provisoirement le contre-écrou d'arbre secondaire.
- **Toujours utiliser un contre-écrou neuf.**



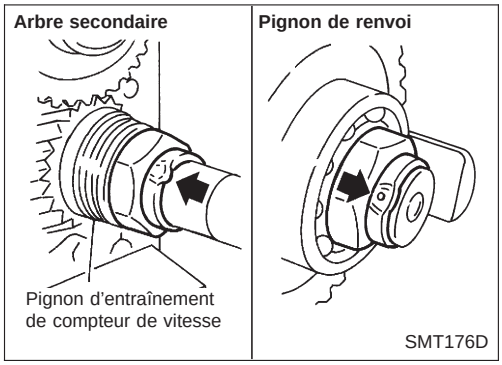
h. Remonter le roulement d'extrémité arrière du pignon de renvoi avec l'outil spécial.

14. Engrener les pignons de 2nde et de marche arrière, puis serrer le contre-écrou d'arbre secondaire à l'aide de l'outil spécial.
- **Il y a un décalage entre la valeur indiquée par la clé dynamométrique et la valeur réelle du couple de serrage. Calculer la valeur du couple convertie en tenant compte de la longueur de la clé dynamométrique.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Composants de la boîte (Suite)

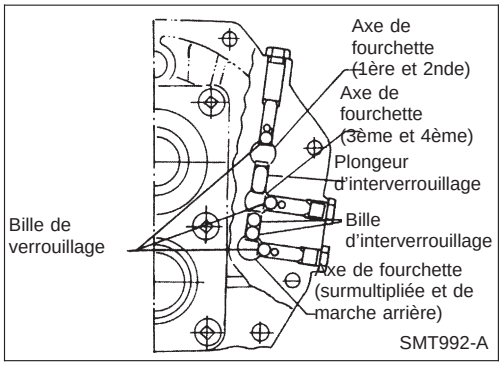
- Consulter la figure de gauche pour déterminer la valeur du couple de serrage convertie.



Référence : formule pour convertir la mesure du couple de serrage donnée par la clé dynamométrique en mesure réelle :

$$T = \frac{0{,}1\ m + L}{L} \times C$$

Si le couple de serrage spécifié est T kg-m, la valeur C indiquée par la clé dynamométrique sera déterminée par la formule suivante.

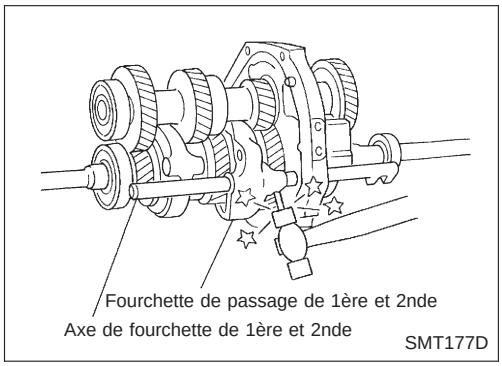


$$C = \frac{T \times L}{0{,}1\ m + L}$$

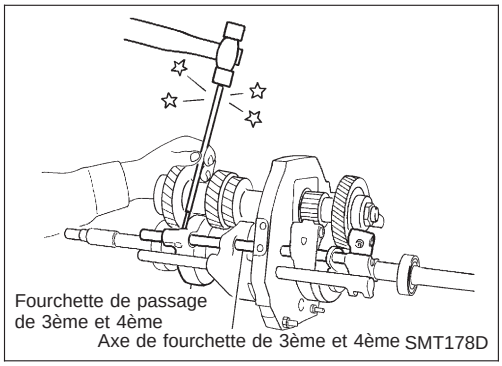
15. Serrer le contre-écrou de pignon de renvoi.
- **Toujours utiliser un contre-écrou neuf.**

16. Mater le contre-écrou d'arbre secondaire et le contre-écrou d'arbre de renvoi à l'aide d'un poinçon.
17. Mesurer le jeu axial des pignons.
    Jeu axial des pignons :
    Consulter les SDS, MT-59.

18. Installer le jonc d'arrêt et le roulement d'arbre secondaire de surmultipliée, puis le jonc d'arrêt (modèles à 2 roues motrices).
    Jeu toléré :
    0 - 0,14
    Jonc d'arrêt de roulement d'arbre secondaire de surmultipliée (modèles à 2 roues motrices) :
    Consulter les SDS, MT-59.

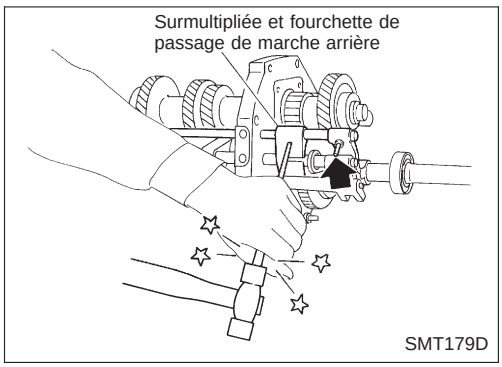


Composants de la commande de passage des vitesses



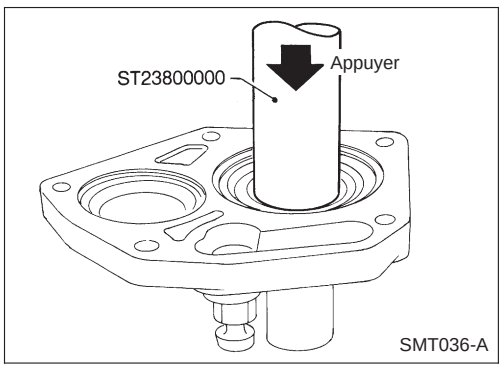
1. Remonter les axes de fourchette, le plongeur d'interverrouillage, les billes d'interverrouillage et les billes de verrouillage.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

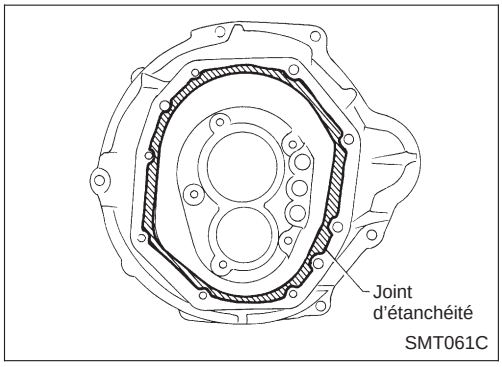


Composants de la commande de passage des vitesses (Suite)

2. Monter les fourchettes de passage de 1ère et 2nde, puis enfoncer la goupille de retenue.



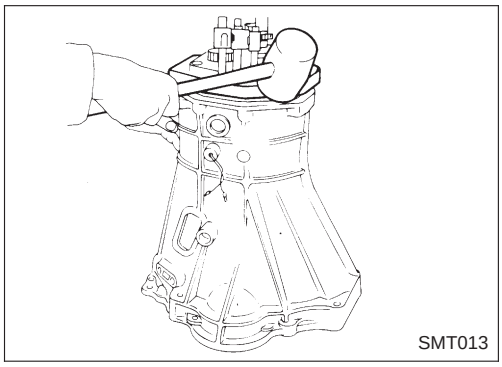
3. Monter les fourchettes de passage de 3ème et 4ème, puis enfoncer la goupille de retenue.



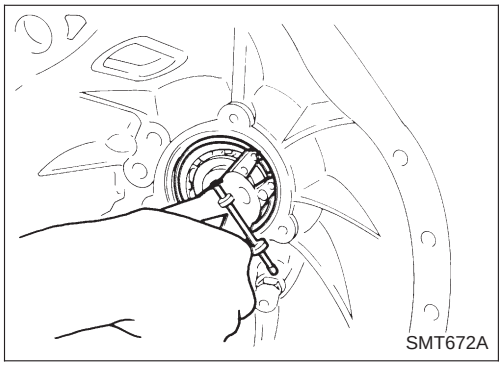
4. Monter la fourchette de passage de surmultipliée et de marche arrière, puis enfoncer la goupille de retenue.

Composants du carter

1. Reposer le joint d'huile de couvercle avant à l'aide de l'outil spécial.

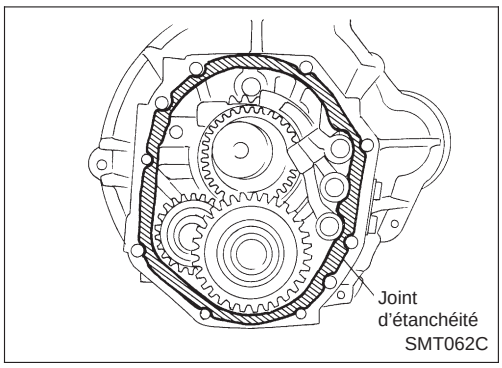


- **Enduire la lèvre du joint de graisse à usages multiples.**



2. Enduire de produit d'étanchéité la surface de contact du carter de boîte de vitesses.

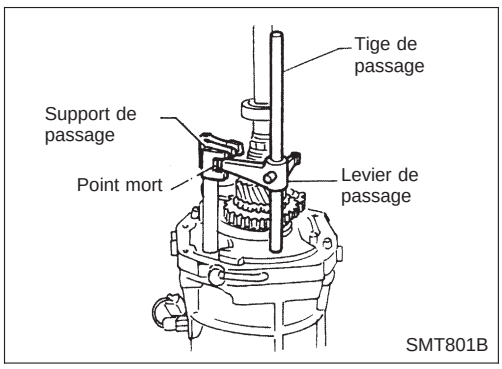
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Composants du carter (Suite)

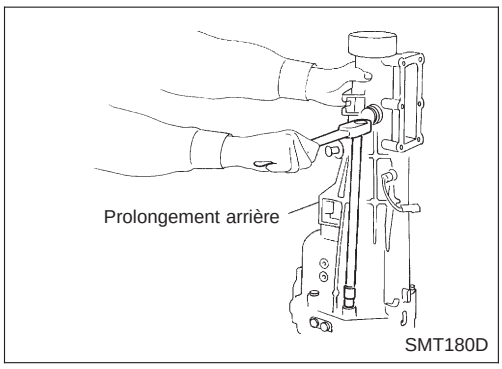
SMT013

3. Reposer l'ensemble de pignons avec la plaque adaptatrice sur le carter de transmission en donnant de légers coups de maillet à tête élastique.



SMT672A

4. Reposer le jonc d'arrêt du roulement à billes du pignon d'entraînement principal.

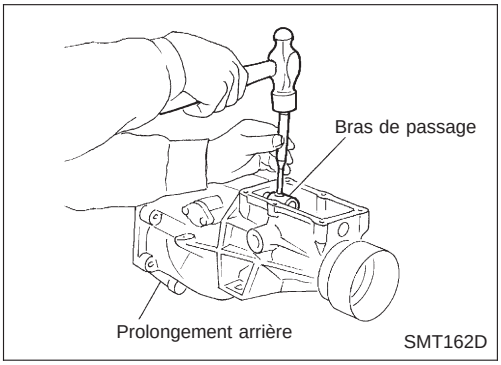


SMT062C

5. Enduire de produit d'étanchéité la surface d'assemblage de la plaque adaptatrice.

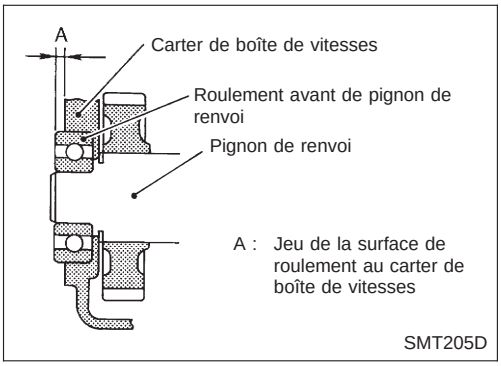
SMT801B

6. Amener les fourchettes de passage à la position point mort.
7. Reposer le levier de passage et la tige sur la plaque adaptatrice, et aligner le levier de passage sur les supports de passage.



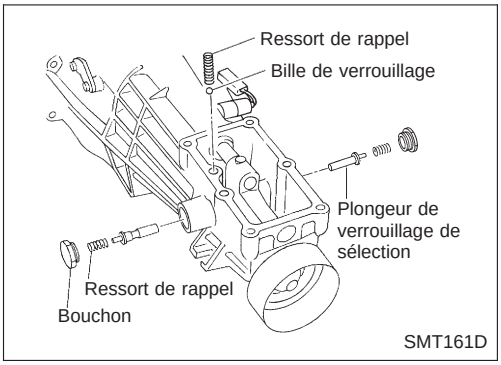
SMT180D

8. Reposer le prolongement arrière.



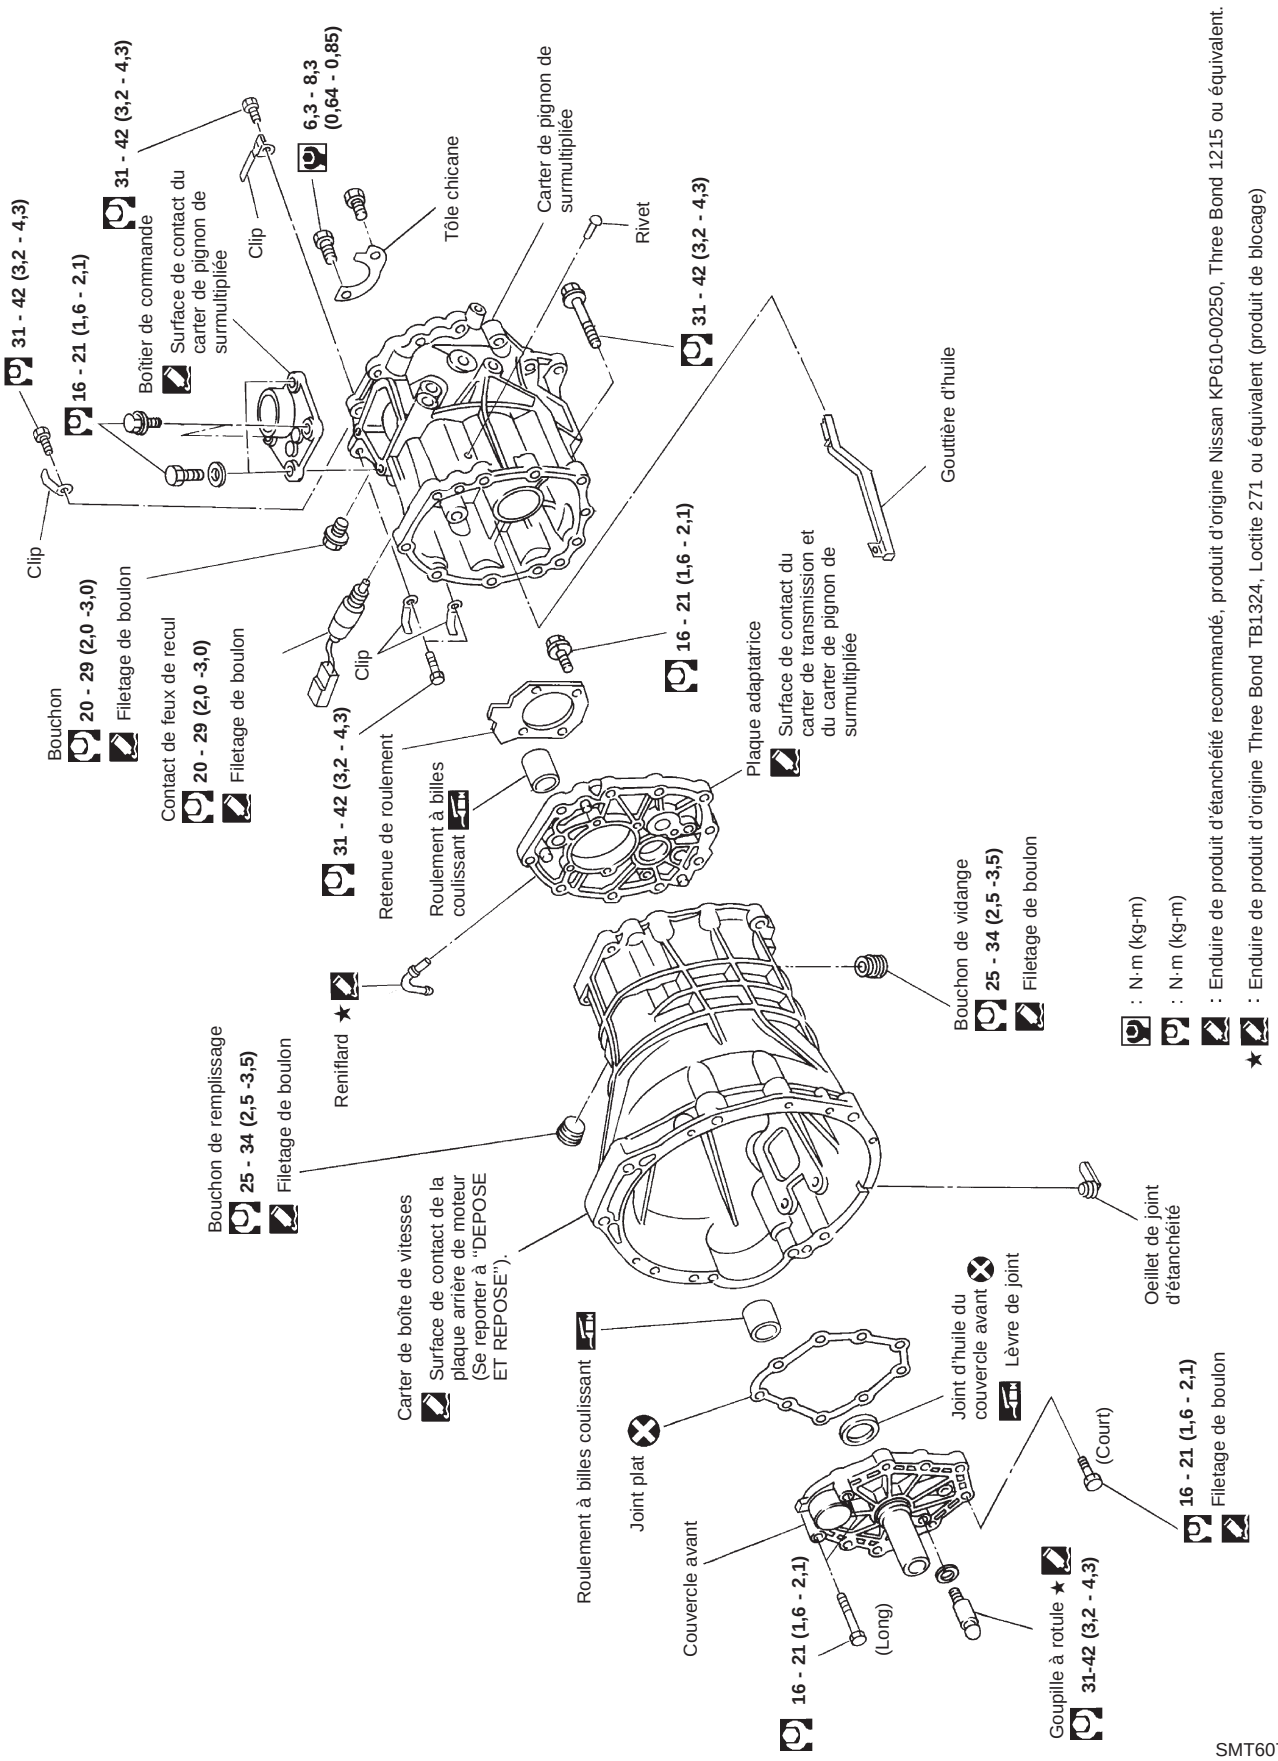
- **Serrer les boulons de montage diagonalement avec la même force.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Composants du carter (Suite)

9. Installer la goupille de verrouillage du bras de passage.



10. Sélectionner une cale de roulement avant de pignon de renvoi.
    Jeu admissible (A) entre la surface de roulement et le carter de boîte :
    0 - 0,16 mm
    Cale de roulement avant du pignon de renvoi :
    Consulter les SDS, MT-59.
11. Reposer le joint plat et le couvercle avant.

12. Reposer les bouchons de ressort de rappel, la bille de verrouillage, les ressorts de rappel et choisir les plongeurs de verrouillage.
13. Reposer le boîtier de commande de vitesses et le joint plat.

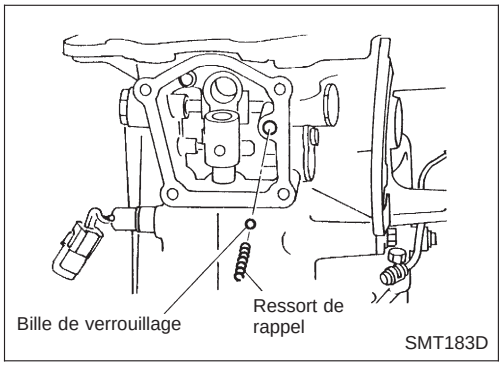
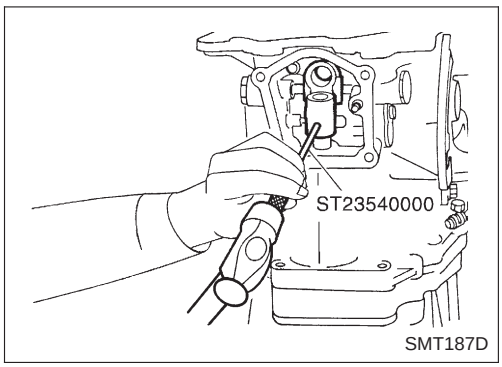
Composants de la commande de passage des vitesses

ATTENTION :
Pour éviter tout dommage lors du remplacement du pommeau de levier de passage, déposer le levier de passage avec le pommeau, comme un ensemble.



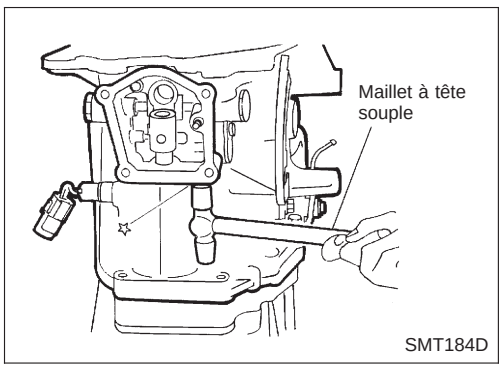
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Composants du carter

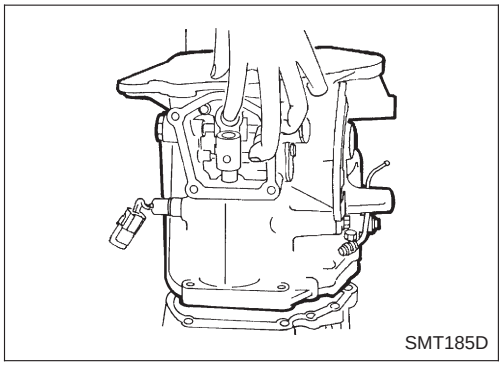


1. Déposer le bouchon de bille de verrouillage, le ressort de verrouillage, ainsi que la bille de verrouillage. Déposer ensuite la butée d'interverrouillage.

- **La bille de verrouillage risque de tomber dans le carter de boîte si l'ensemble d'interverrouillage est déposé en une fois.**
- **Veiller à ne pas perdre la bille de verrouillage.**

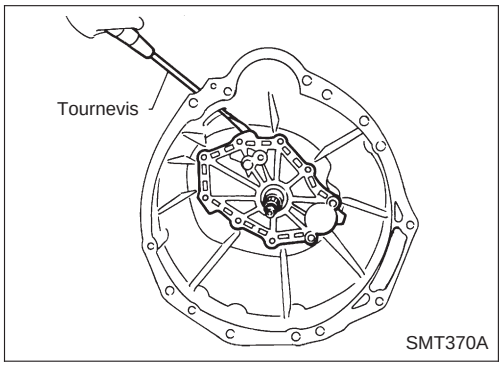


2. Déposer le boîtier de commande, le ressort de rappel et la bille de verrouillage.

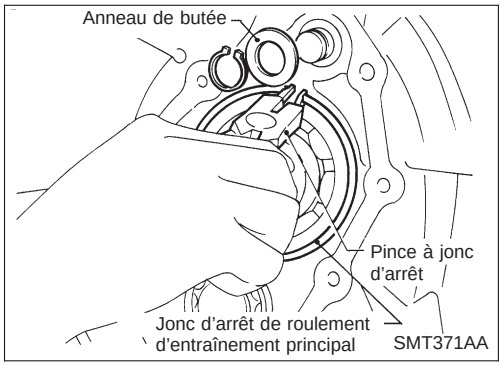


- **Veiller à ne pas perdre la bille de verrouillage.**

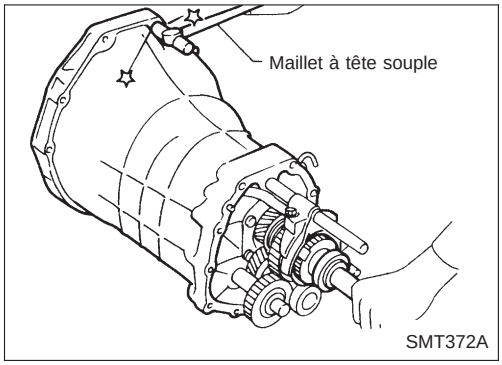
3. Chasser la goupille de retenue du bras de passage.



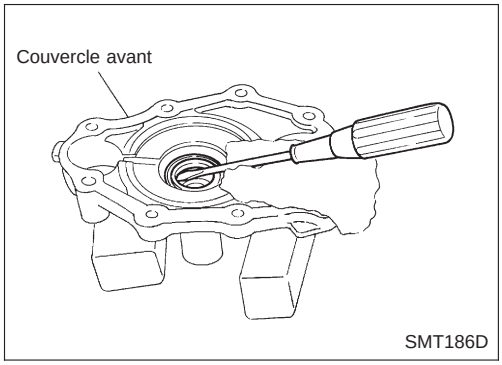
4. Déposer le carter de pignon de surmultipliée et le bras de passage des vitesses en les frappant légèrement.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

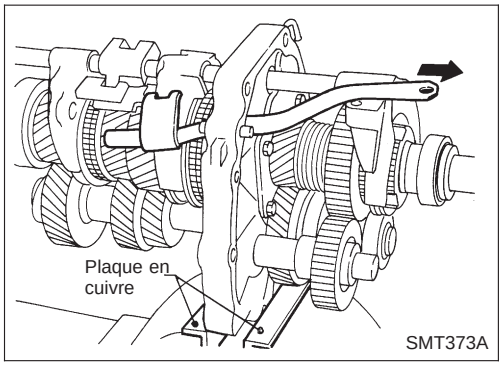


Composants du carter (Suite)



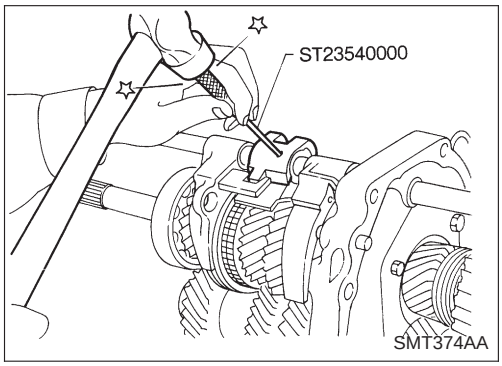
5. Déposer le couvercle avant ainsi que le joint plat.

6. Déposer l'anneau de butée ainsi que le jonc d'arrêt de roulement d'entraînement principal.

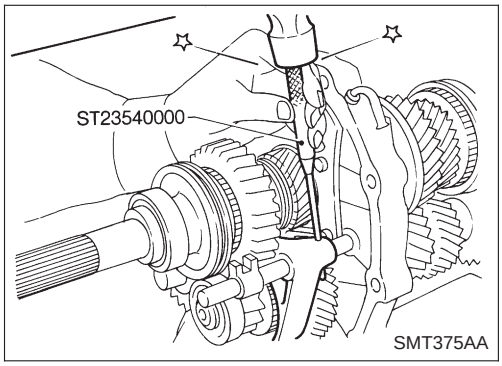


7. Déposer le carter de transmission en le frappant légèrement.

8. Déposer le joint d'huile de couvercle avant.



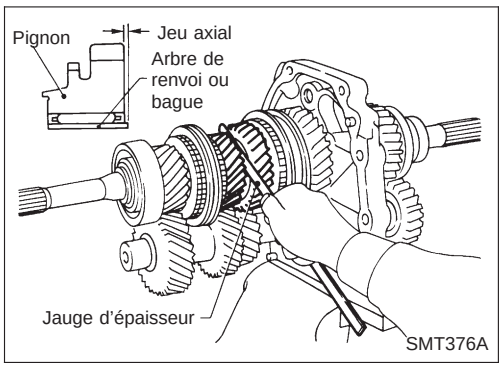
Composants de la commande de passage des vitesses



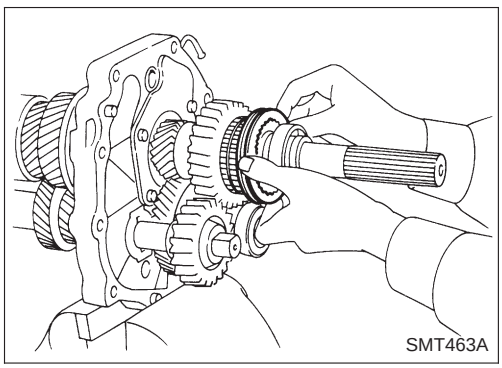
1. Monter la plaque adaptatrice dans un étau.
2. Déposer l'axe de fourchette de surmultipliée et de marche arrière.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Composants de la commande de passage des vitesses (Suite)

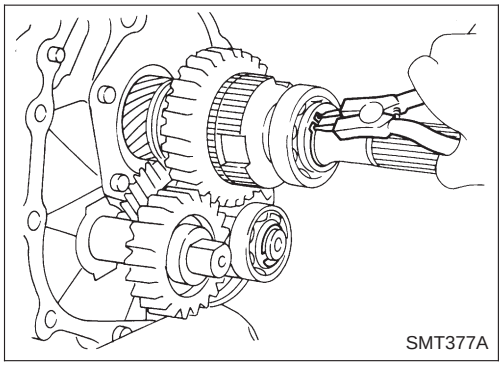


3. Chasser la goupille de retenue du levier de passage.
4. Déposer le levier de passage ainsi que l'interverrouillage de passage tout en extrayant la tige de passage. Puis déposer la fourchette de passage de 1ère et 2nde, de 3ème et 4ème et de marche arrière.



5. Chasser la goupille de retenue de la fourchette de passage de surmultipliée.
6. Extraire l'axe de fourchette de surmultipliée puis déposer la fourchette de passage de surmultipliée.

Composants de la boîte

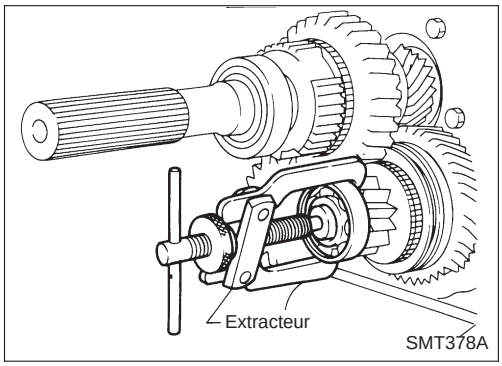


1. Mesurer le jeu axial de chaque pignon avant de déposer les pignons et les arbres.
   Jeu axial des pignons :
   Consulter les SDS, MT-61.

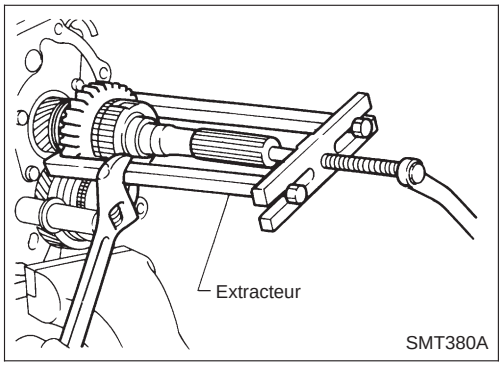
- Si le jeu axial n'est pas dans les limites spécifiées, démonter et vérifier la surface de contact du pignon avec le moyeu, la rondelle, la bague, le roulement à aiguilles et l'arbre.

2. Déposer les composants arrière de l'arbre secondaire et du pignon de renvoi.

a. Déposer le manchon d'accouplement de marche arrière.

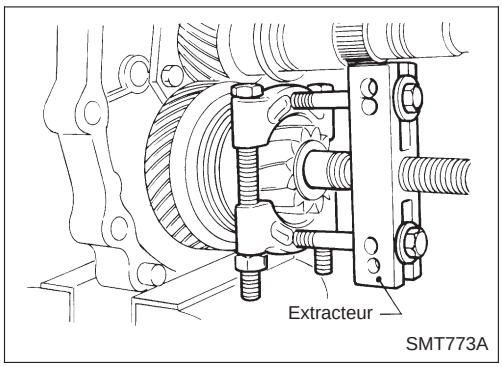


b. Déposer le jonc d'arrêt arrière de l'arbre secondaire et le jonc d'arrêt arrière du pignon de renvoi.

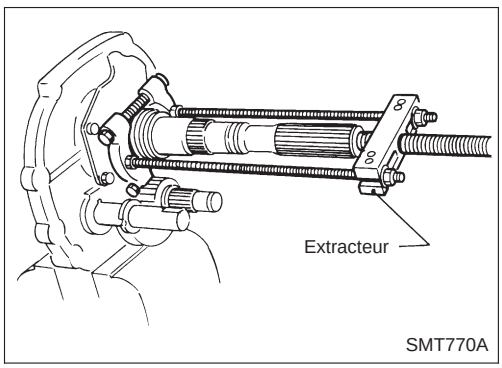


c. Déposer le porteur de demi-jonc et les demi-joncs de l'arbre secondaire. Chasser les demi-joncs à l'aide d'un poinçon et d'un marteau.

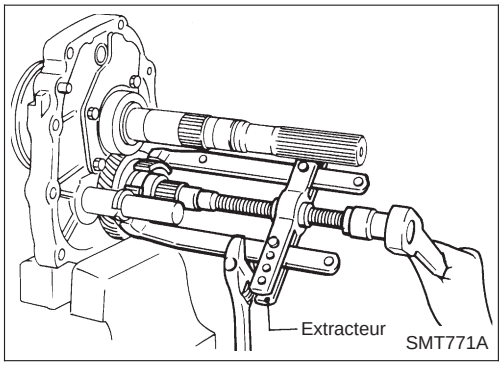
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Composants de la boîte (Suite)



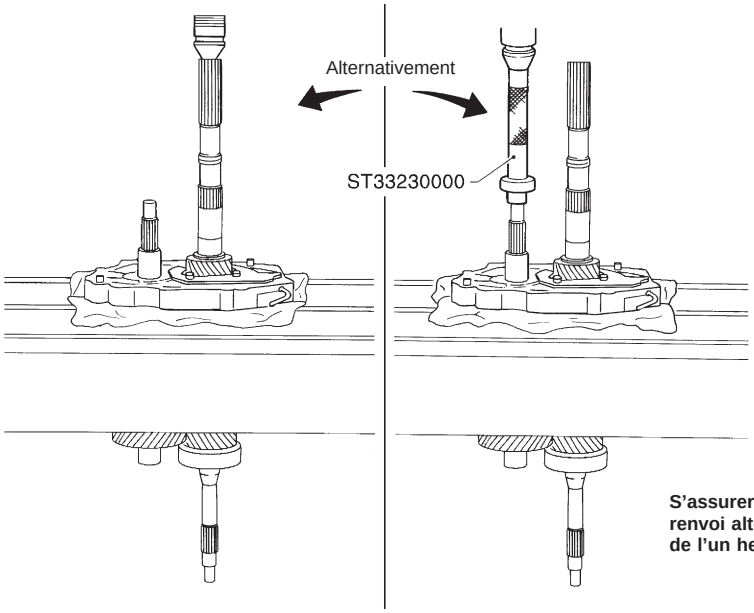
d. Extraire le roulement d'extrémité arrière du pignon de renvoi.
e. Déposer le pignon intermédiaire de marche arrière ainsi que les rondelles de butée de pignon intermédiaire de marche arrière.



f. Extraire le pignon principal de marche arrière avec l'entretoise d'arbre secondaire et le moyeu de synchro. de marche arrière. Puis déposer les roulements à aiguilles de pignon de marche arrière.

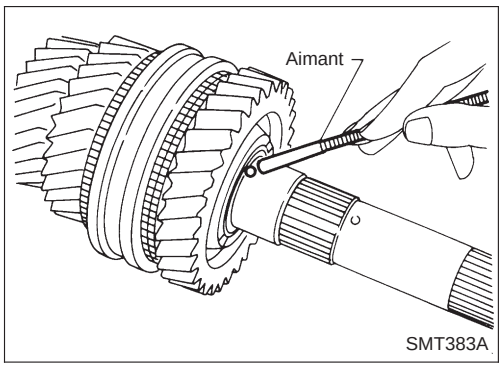
g. Extraire le pignon de renvoi de marche arrière.
h. Déposer le manchon d'accouplement de surmultipliée avec l'anneau de synchro. de surmultipliée, l'anneau de synchro. de marche arrière et les ressorts de cale.

i. Extraire la bague de pignon de marche arrière.



j. Extraire le pignon de renvoi de surmultipliée avec le cône de marche arrière.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

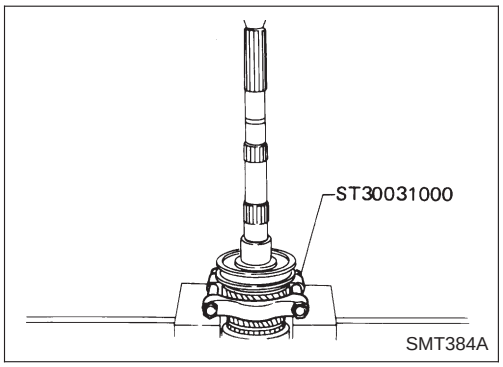


Composants de la boîte (Suite)

3. Chasser alternativement l'arbre secondaire et le pignon de renvoi.

S'assurer de bien chasser l'arbre secondaire et le pignon de renvoi alternativement afin de ne pas laisser la surface avant de l'un heurter la surface arrière de l'autre.

SMT772AB

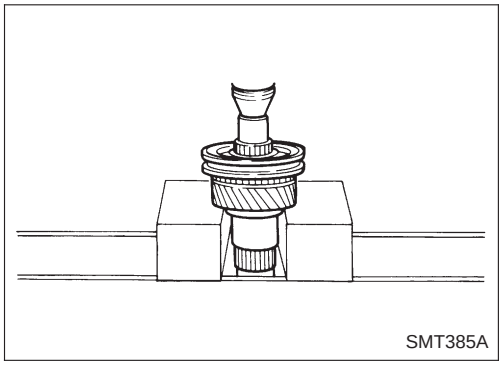


SMT383A

4. Déposer les composants avant de l'arbre secondaire.

a. Déposer la rondelle de pignon de 1ère ainsi que la bille d'acier.

b. Déposer le pignon principal de 1ère ainsi que le roulement à aiguilles de pignon de 1ère.

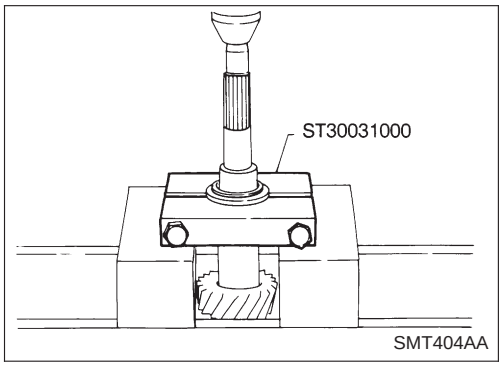


- **Faire attention de ne pas égarer la bille d'acier.**

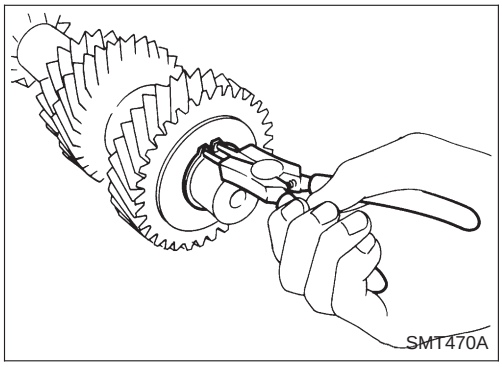
SMT384A

c. Chasser le pignon principal de 2nde avec la bague de pignon de 1ère et l'ensemble de synchro. de 1ère et 2nde.

d. Déposer le jonc d'arrêt avant de l'arbre secondaire.

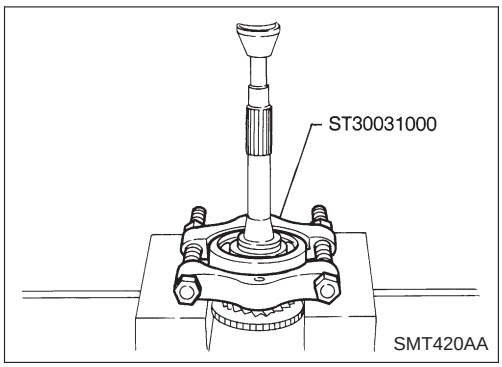


SMT385A



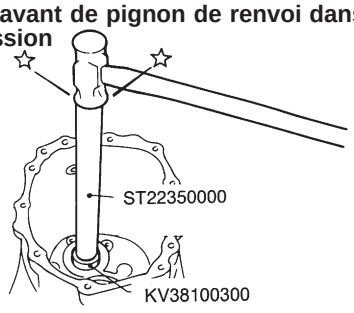
e. Chasser le pignon principal de 3ème avec l'ensemble de synchro. de 3ème et 4ème et le roulement à aiguilles de pignon de 3ème.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

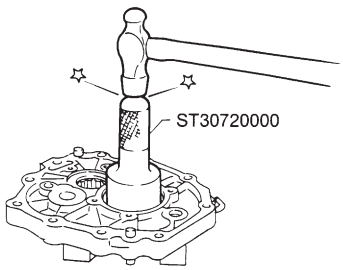


Composants de la boîte (Suite)

5. Déposer les composants avant du pignon de renvoi.
a. Déposer le roulement de butée arrière du pignon de renvoi.

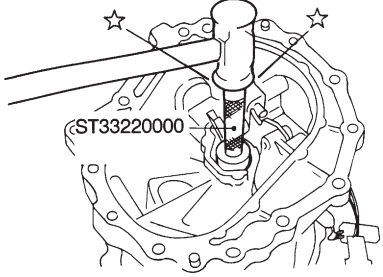


b. Déposer les composants du pignon auxiliaire.

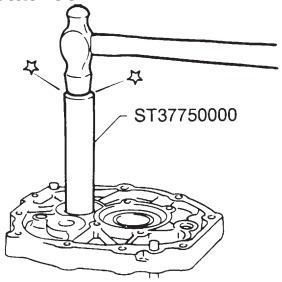


6. Déposer le roulement du pignon d'entraînement principal.
a. Déposer le jonc d'arrêt du pignon d'entraînement principal ainsi que l'entretoise.
b. Chasser le roulement du pignon d'entraînement principal.

7. Déposer les roulements des composants du carter de boîte.

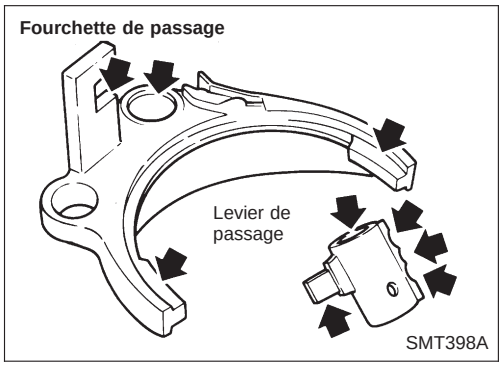


Roulement avant de pignon de renvoi dans le carter de transmission

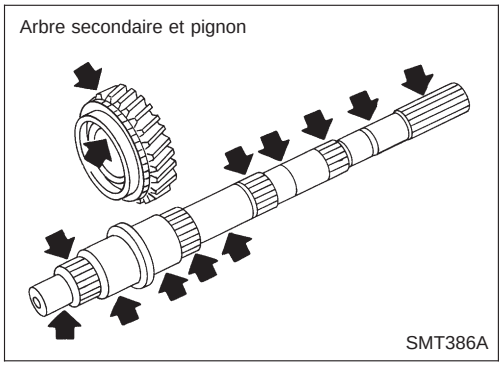


Roulement avant d'arbre secondaire dans la plaque adaptatrice

Roulement d'extrémité arrière de pignon de renvoi dans le carter de pignon de surmultipliée



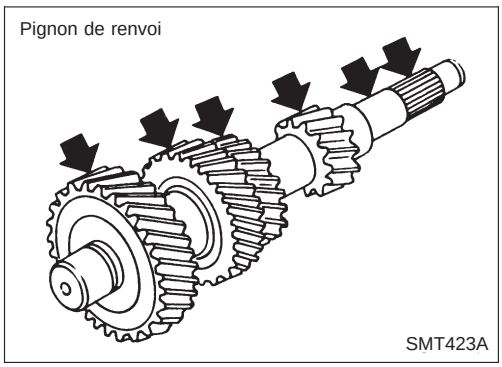
Roulement arrière de pignon de renvoi dans la plaque adaptatrice



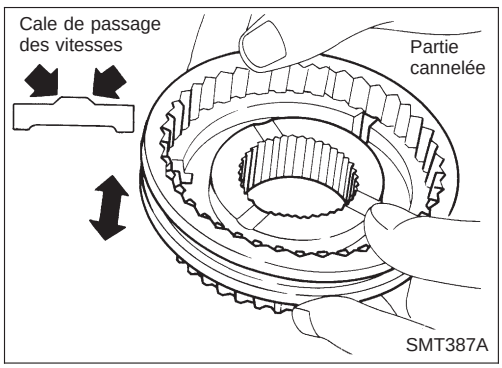
SMT063CB

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Composants de la commande de passage des vitesses

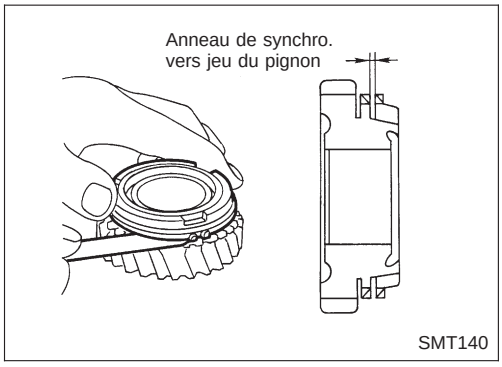


- Contrôler la surface de contact et la surface de glissement pour voir si elles ne sont pas usées ou rayées et si elles ne présentent pas des aspérités ou autres défauts.



Composants de la boîte

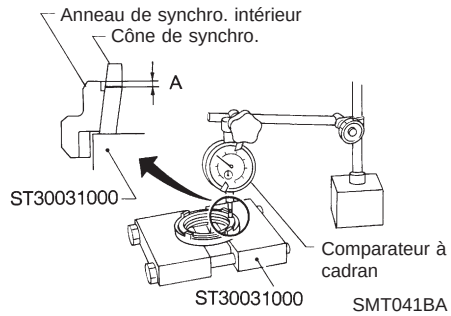
PIGNONS ET ARBRES



- Contrôler les arbres pour voir s'ils ne sont pas fêlés, usés ou pliés.
- S'assurer que les pignons ne sont pas excessivement usés, ébréchés ou fêlés.

ENSEMBLES DE SYNCHRONISEUR

- Vérifier la partie cannelée des manchons d'accouplement, des moyeux et des pignons pour voir si elle n'est pas usée ou fêlée.
- S'assurer que les anneaux de synchro. ne sont pas fêlés ou déformés.
- Contrôler les cales de passage des vitesses pour voir si elles ne sont pas usées ou déformées.
- Contrôler les ressorts de cales pour voir s'ils ne sont pas déformés.



Jeu entre les anneaux de synchro. et les pignons :
Consulter les SDS, MT-61.

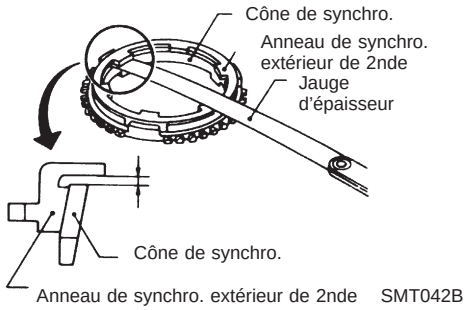
- **Remplacer l'anneau de synchro. si le jeu est inférieur à la limite d'usure.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

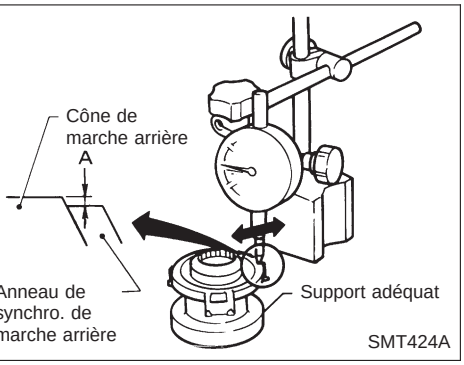
Composants de la boîte (Suite)

Anneau de synchro. intérieur

- Mesurer l'usure des anneaux de synchro. des pignons de 2nde et de 3ème.



a. Positionner les anneaux de synchro. sur le cône de synchro.
b. Mesurer les dimensions ''A'' et ''B'' tout en poussant à fond les anneaux de synchro. contre le cône de synchro.

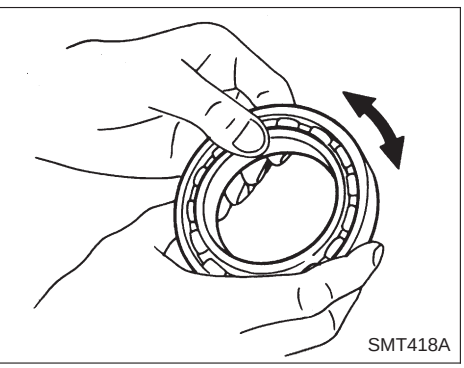


Dimensions ''A'' et ''B'' :

Consulter les SDS, MT-61.

- **Si la dimension ''A'' ou ''B'' est inférieure à la limite d'usure, remplacer l'anneau extérieur de synchro., l'anneau intérieur de synchro. et le cône de synchro. comme un ensemble.**

Anneau de synchro. extérieur



- Mesurer l'usure de l'anneau de synchro. de marche arrière.

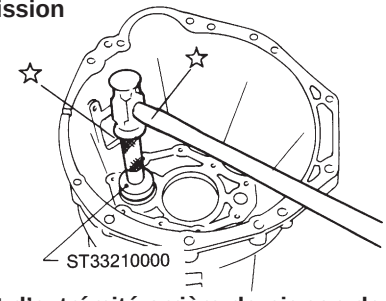
a. Mettre l'anneau de synchro. à sa place sur le cône de marche arrière.
b. Enfoncer l'anneau de synchro. contre le cône de marche arrière en le poussant autant que possible et mesurer la dimension ''A'' à l'aide d'un comparateur à cadran.

Dimension ''A'' :

Consulter les SDS, MT-61.

c. Remplacer l'anneau de synchro. si la dimension ''A'' est supérieure à la limite d'usure.

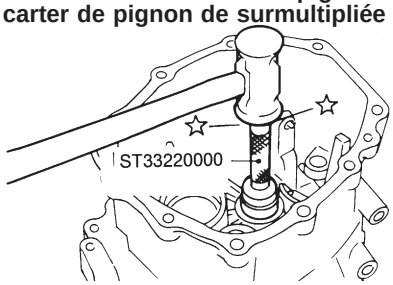
ROULEMENTS



- S'assurer que les roulements tournent librement, qu'ils n'émettent pas de bruits et qu'ils ne sont ni fêlés, piqués ou usés.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

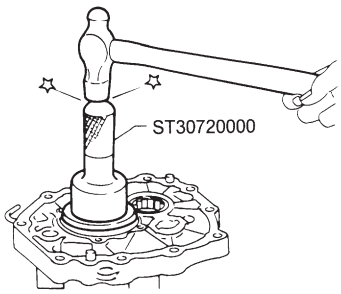
Composants de la boîte



1. Reposer les roulements dans les composants du carter.

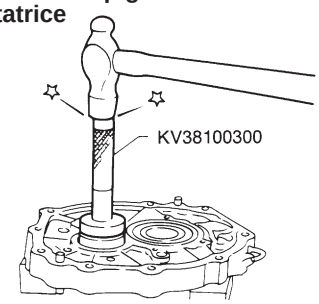
Roulement avant de pignon de renvoi dans le carter de transmission

SMT389A



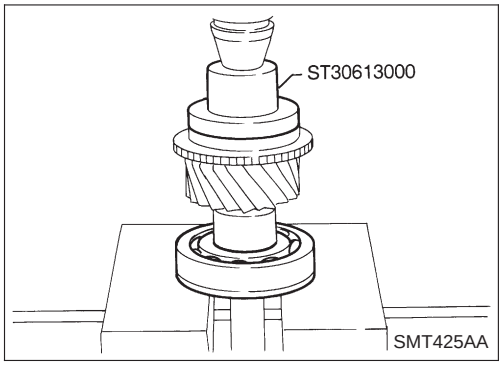
Roulement d'extrémité arrière de pignon de renvoi dans le carter de pignon de surmultipliée

Doit être au ras de la surface avant du carter de pignon de surmultipliée.



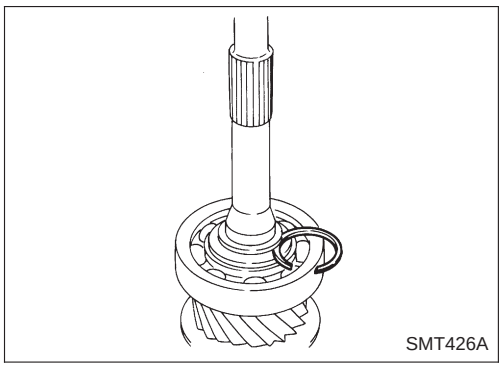
SMT391A

Roulement avant d'arbre secondaire dans la plaque adaptatrice



SMT397A

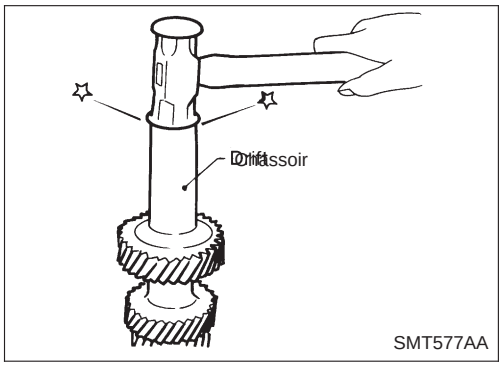
Roulement arrière de pignon de renvoi dans la plaque adaptatrice



SMT484CD

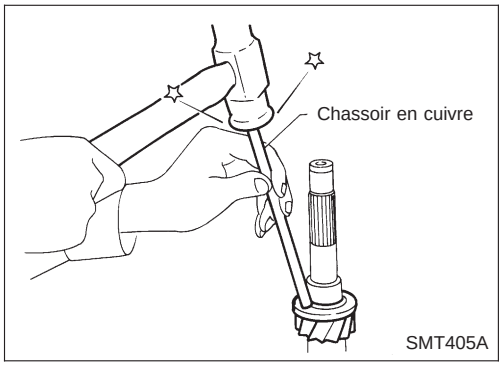
SMT425AA

2. Reposer le roulement du pignon d'entraînement.
a. Enfoncer à la presse le roulement de pignon d'entraînement principal.
b. Reposer l'entretoise du pignon d'entraînement principal.



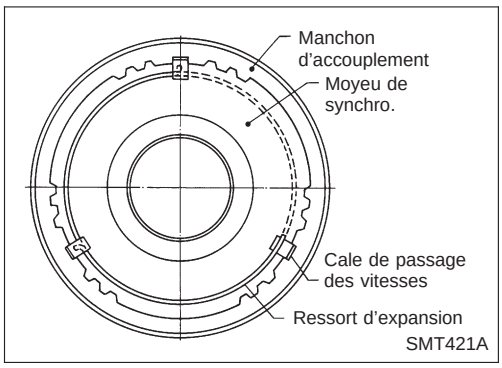
SMT426A

c. Choisir un jonc d'arrêt approprié de pignon d'entraînement principal pour minimiser le jeu de la rainure.
   Tolérance de jeu dans la rainure :
   0 - 0,1 mm
   Jonc d'arrêt de pignon d'entraînement principal :
   Consulter les SDS, MT-61.
d. Reposer le jonc d'arrêt choisi sur le pignon d'entraînement principal.

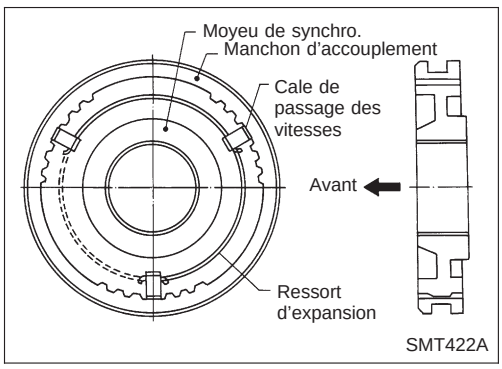


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

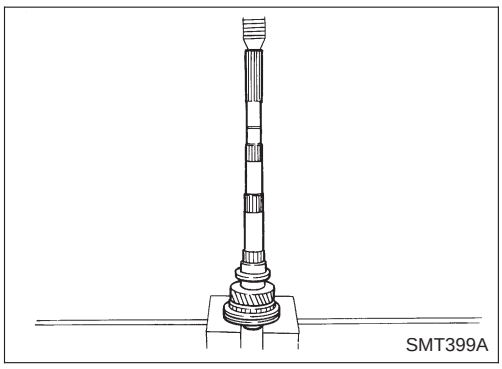
Composants de la boîte (Suite)



3. Reposer les composants sur le pignon de renvoi.
a. Reposer les composants du pignon auxiliaire.



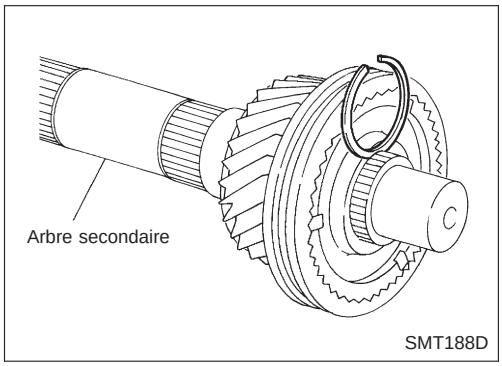
- **Lors de la repose du jonc d'arrêt de pignon auxiliaire, le frapper doucement pour le placer sur le pignon de renvoi.**



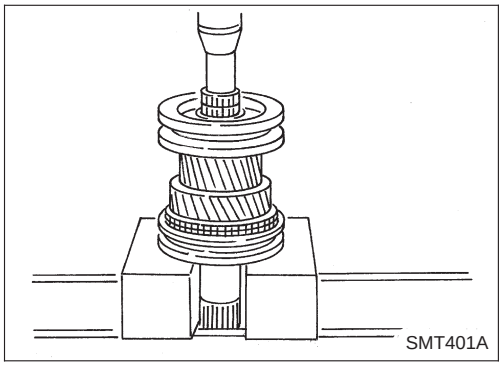
b. Reposer le roulement de butée arrière de pignon de renvoi.

4. Reposer les composants avant de l'arbre secondaire.
a. Monter l'ensemble de synchro. de 1ère et 2nde.

b. Monter l'ensemble de synchro. de 3ème et 4ème.

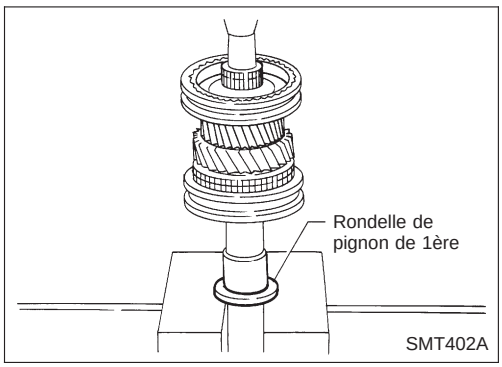


c. Enfoncer à la presse l'ensemble de synchro. de 3ème et 4ème avec le pignon principal de 3ème et le roulement à aiguilles de pignon de 3ème.

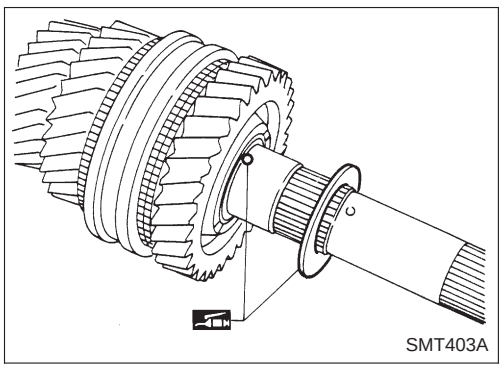


- **Faire attention au sens de montage de l'ensemble de synchro.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



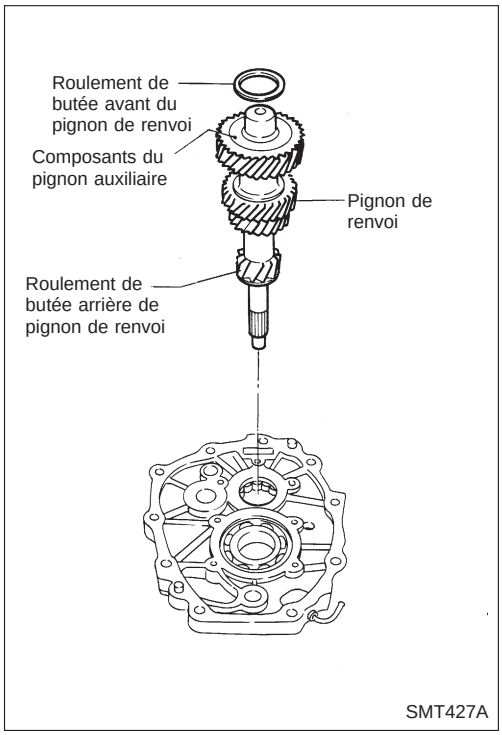
Composants de la boîte (Suite)



d. Choisir un jonc d'arrêt approprié pour minimiser le jeu de la rainure.
   Tolérance de jeu dans la rainure :
   0 - 0,1 mm
   Jonc d'arrêt avant d'arbre secondaire :
   Consulter les SDS, MT-61.
e. Reposer le jonc d'arrêt choisi sur l'arbre secondaire.

f. Enfoncer à la presse l'ensemble de synchro. de 1ère et 2nde avec le pignon principal de 2nde et le roulement à aiguilles de pignon de 2nde.

g. Enfoncer à la presse la bague de pignon de 1ère à l'aide de la rondelle de pignon de 1ère.
h. Reposer le pignon principal de 1ère ainsi que son roulement à aiguilles.

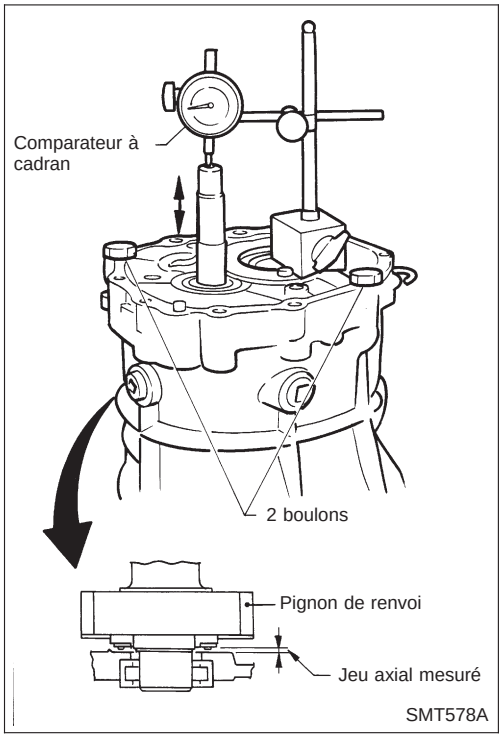


i. Reposer la bille d'acier ainsi que la rondelle de pignon de 1ère.

- **Enduire la bille d'acier et la rondelle de pignon de 1ère de graisse à usages multiples avant la repose.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Composants de la boîte (Suite)



5. Lors du remplacement du carter de boîte de vitesses, du pignon de renvoi, du roulement de butée avant ou arrière du pignon de renvoi ou des composants du pignon auxiliaire, choisir une cale de roulement avant de pignon de renvoi appropriée.

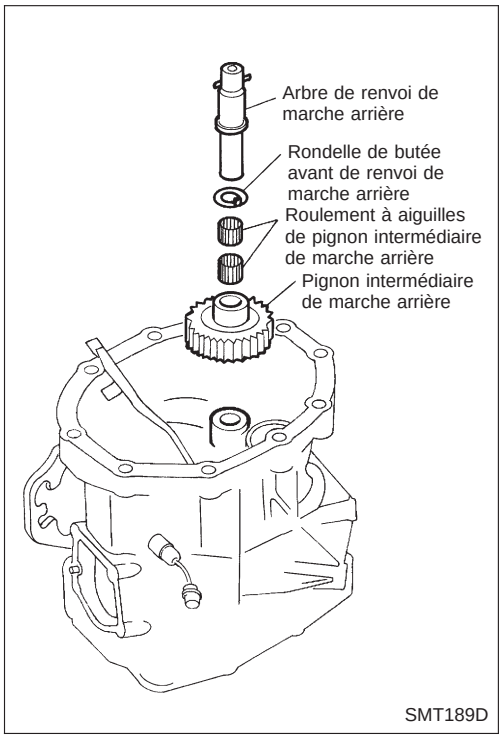
a. Reposer le pignon de renvoi avec les composants du pignon auxiliaire et les roulements de butée avant et arrière de pignon de renvoi sur la plaque adaptatrice.

- **Ne pas déjà monter la cale de roulement avant le pignon de renvoi.**

b. Disposer la plaque adaptatrice ainsi que l'ensemble de pignon de renvoi dans le carter de transmission (tourné à l'envers).

c. Serrer la plaque adaptatrice sur le carter de transmission à l'aide de deux boulons.

d. Monter un comparateur à cadran sur l'extrémité arrière du pignon de renvoi.



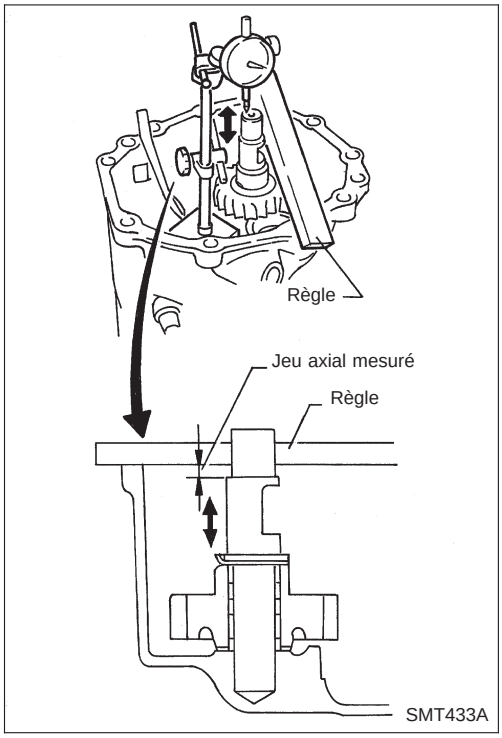
e. Faire jouer le pignon de renvoi verticalement et relever l'indication du comparateur à cadran.

f. Choisir la cale appropriée à l'aide des indications du tableau ci-dessous.

Jeu axial du pignon de renvoi admissible :
0,10 - 0,26 mm
Tableau de sélection d'une cale de roulement avant de pignon de renvoi appropriée :
Consulter les SDS, MT-62.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Composants de la boîte (Suite)



6. Choisir une rondelle de butée arrière appropriée de pignon intermédiaire de marche arrière lorsqu'on remplace le carter de pignon de surmultipliée, le pignon d'arbre de renvoi de marche arrière ou la rondelle de butée avant de renvoi de marche arrière.

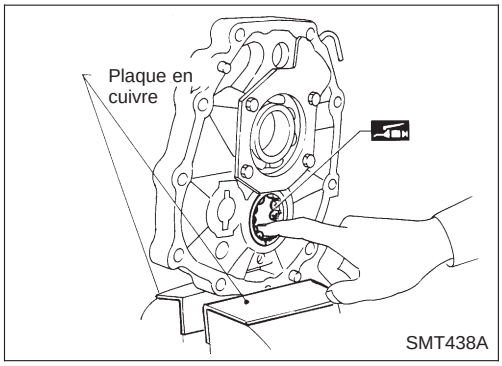
a. Installer le pignon auxiliaire, le ressort de pignon auxiliaire, le support de pignon auxiliaire, le jonc d'arrêt et la bille sur le pignon intermédiaire de marche arrière.

Se reporter aux composants de la boîte, MT-36.

b. Reposer le pignon intermédiaire de marche arrière, les roulements à aiguilles de pignon intermédiaire de marche arrière, l'arbre de renvoi de marche arrière dans le carter de pignon de surmultipliée.

- **Ne pas déjà monter la rondelle de butée arrière de pignon intermédiaire de marche arrière.**

c. Placer un comparateur à cadran sur l'extrémité avant de l'arbre de renvoi de marche arrière.



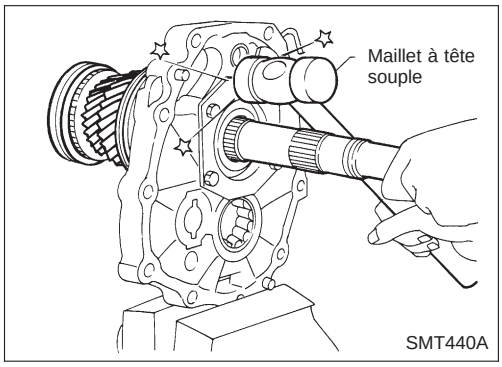
d. Placer une règle sur la surface avant du carter de pignon de surmultipliée. Cette règle fait fonction de butée de l'arbre de renvoi de marche arrière.

e. Faire jouer l'arbre de renvoi de marche arrière verticalement et mesurer le jeu axial du pignon intermédiaire de marche arrière.

Jeu axial de pignon intermédiaire de marche arrière :
0,30 - 0,53 mm

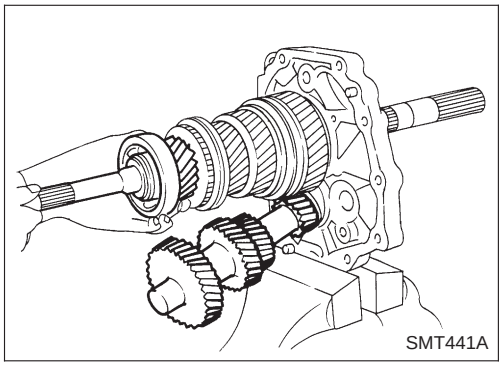
f. Si le jeu n'est pas dans les limites spécifiées, remplacer la rondelle de butée arrière de pignon intermédiaire de marche arrière par l'une des pièces A ou B et vérifier de nouveau.

Rondelle de butée arrière de pignon intermédiaire de marche arrière :
Consulter les SDS, MT-62.



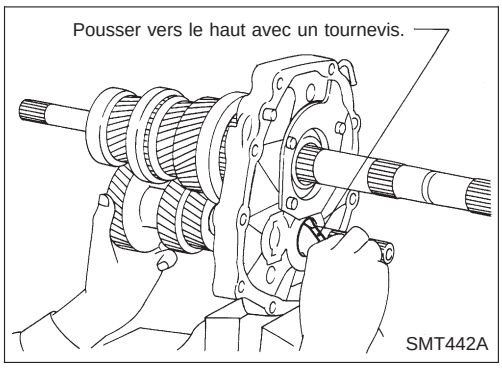
7. Reposer l'arbre secondaire ainsi que le pignon de renvoi sur la plaque adaptatrice et le pignon principal d'entraînement sur l'arbre secondaire.

a. Monter la plaque adaptatrice dans un étau et enduire le roulement arrière de pignon de renvoi de graisse à usages multiples.

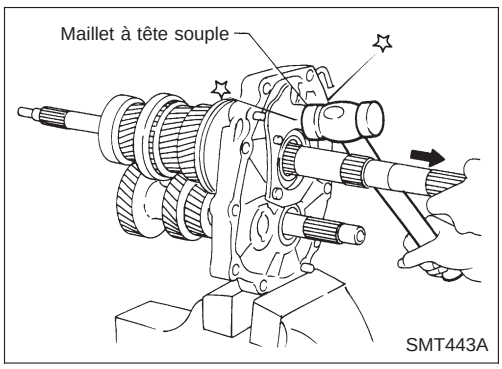


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

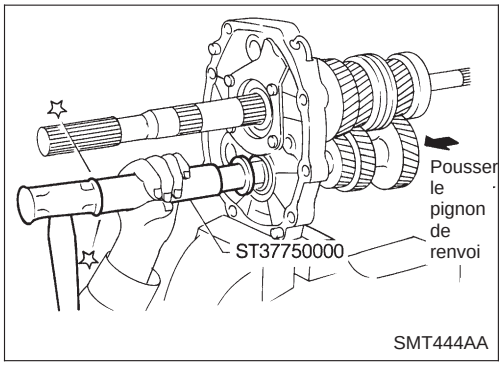
Composants de la boîte (Suite)



b. Enfoncer légèrement l'arbre secondaire sur son roulement avant.



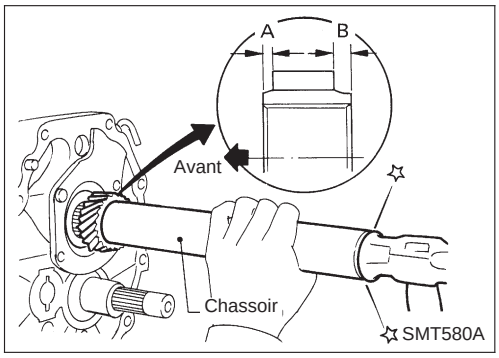
- **Ne pas enfoncer complètement l'arbre secondaire afin de permettre la repose du pignon de renvoi.**



c. Reposer le pignon de renvoi sur son roulement arrière et reposer l'arbre principal d'entraînement, le roulement pilote et l'entretoise sur l'arbre secondaire.

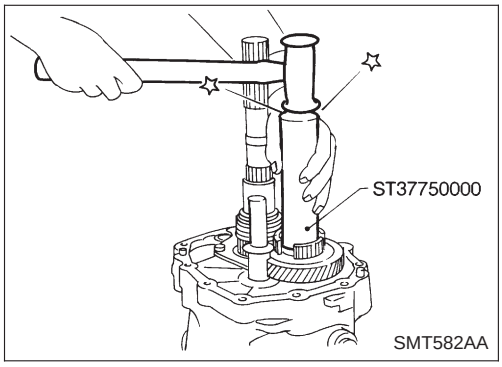
- **Lors de l'introduction du pignon de renvoi dans son roulement arrière, relever légèrement le galet supérieur du roulement arrière de pignon de renvoi à l'aide d'un tournevis.**

d. Monter complètement l'arbre secondaire ainsi que le pignon de renvoi en frappant l'arrière de la plaque adaptatrice et en tirant sur l'arbre secondaire.



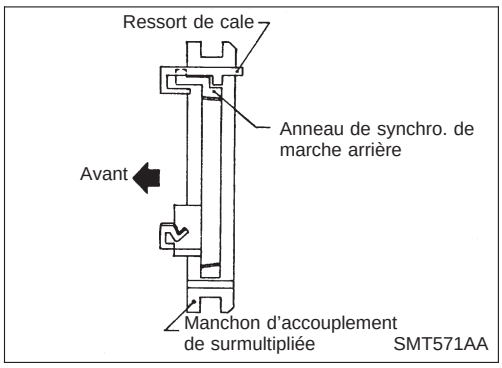
8. Reposer les composants arrière sur l'arbre secondaire et le pignon de renvoi.

a. Reposer la bague de pignon de surmultipliée tout en appuyant sur l'avant du pignon de renvoi.

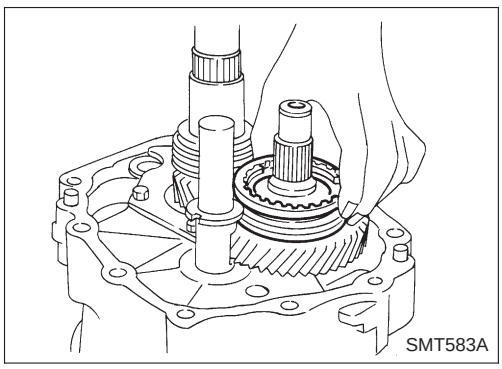


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

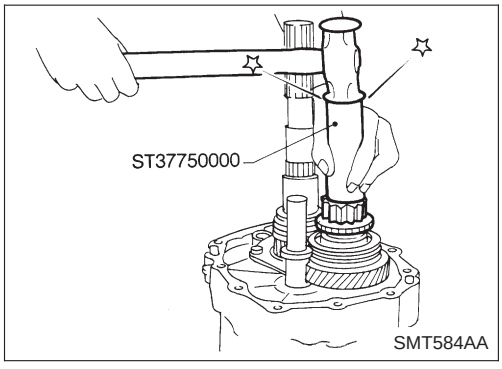
Composants de la boîte (Suite)



b. Reposer le pignon principal de surmultipliée.
- **Prêter attention au sens du pignon principal de surmultipliée (B est plus large que A, comme indiqué sur la figure ci-contre).**

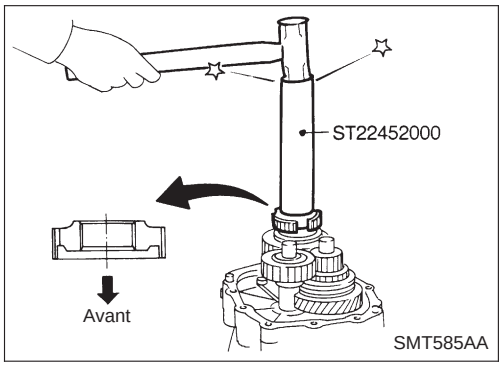


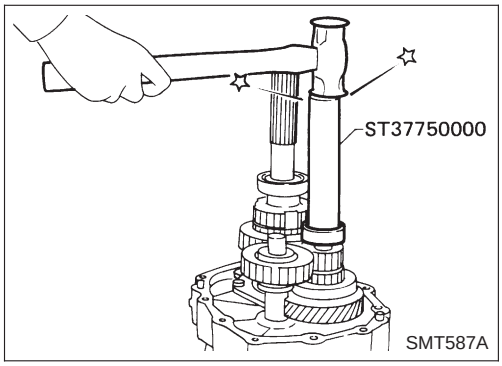
c. Reposer la plaque adaptatrice avec l'ensemble de pignon sur le carter de transmission.
d. Reposer le roulement à aiguilles du pignon de surmultipliée puis reposer le pignon de renvoi de surmultipliée ainsi que l'arbre de renvoi de marche arrière.



e. Reposer le cône de marche arrière.

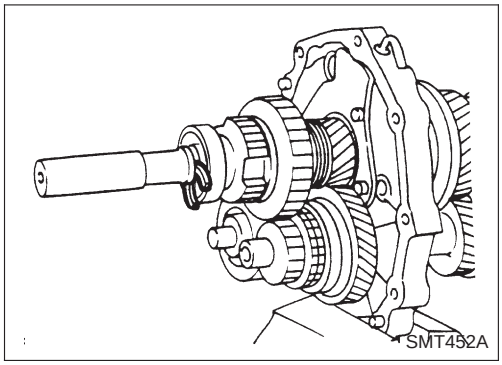
f. Reposer les ressorts de cale de synchro. ainsi que l'anneau de synchro. de marche arrière sur le manchon d'accouplement de surmultipliée. Puis reposer ces pièces et l'anneau de synchro. de surmultipliée sur le pignon de renvoi de surmultipliée.
- **Prêter attention au sens du manchon d'accouplement de surmultipliée.**



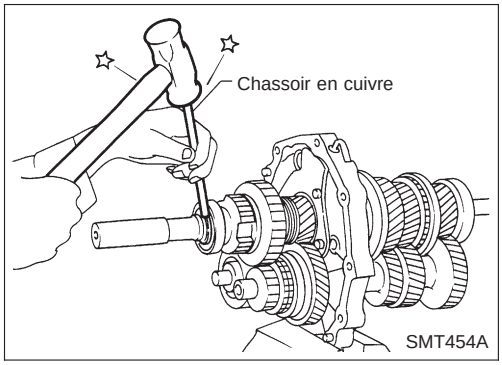


g. Reposer le pignon de renvoi de marche arrière.
h. Reposer le roulement à aiguilles de pignon de marche arrière puis reposer le pignon principal de marche arrière, le pignon intermédiaire de marche arrière ainsi que les rondelles de butée de pignon intermédiaire de marche arrière.

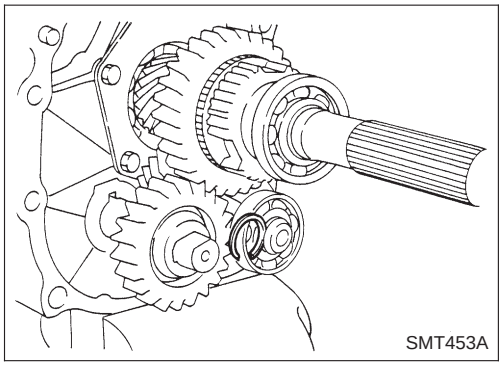
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Composants de la boîte (Suite)

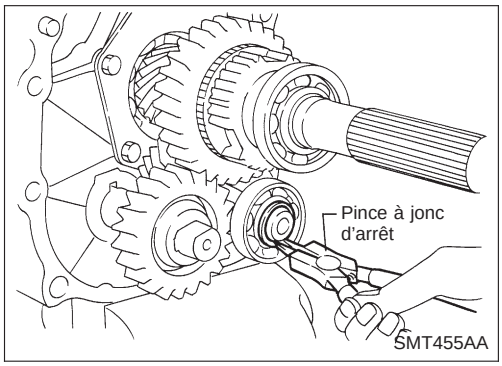


i. Reposer le moyeu de marche arrière.
- **Prêter attention au sens du moyeu.**

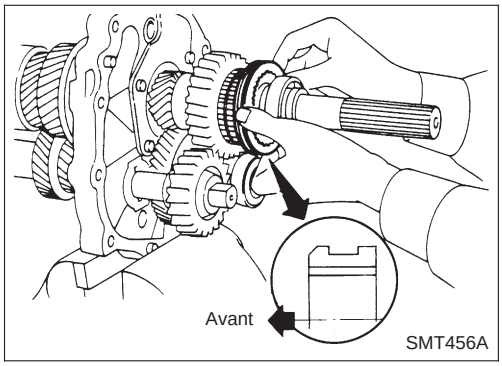


j. Reposer le roulement d'extrémité arrière de pignon de renvoi.
k. Séparer la plaque d'adaptateur du carter de transmission et monter à nouveau la plaque d'adaptateur sur l'étau.

l. Choisir un demi-jonc approprié d'arbre secondaire pour minimiser le jeu de la rainure.
Tolérance de jeu dans la rainure :
0 - 0,1 mm
Demi-jonc d'arbre secondaire :
Consulter les SDS, MT-62.

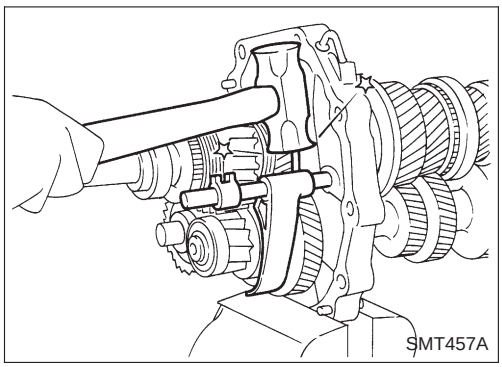


m. Reposer le demi-jonc choisi, le porte demi-jonc ainsi que le jonc d'arrêt arrière d'arbre secondaire.

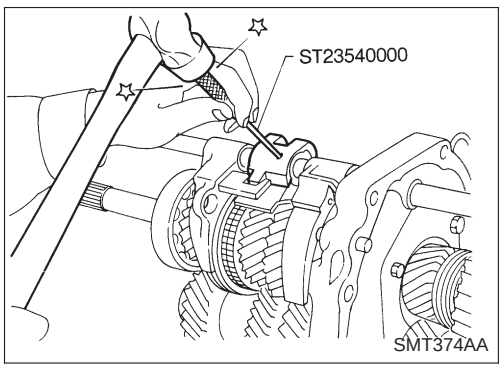


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Composants de la boîte (Suite)



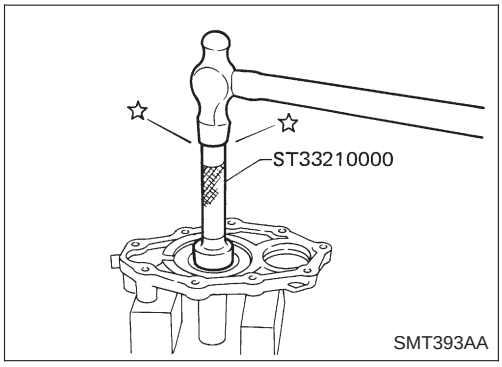
n. Reposer l'entretoise et choisir un jonc d'arrêt arrière approprié de pignon de renvoi pour minimiser le jeu de la rainure.
Tolérance de jeu dans la rainure :
0 - 0,1 mm
Jonc d'arrêt arrière de pignon de renvoi :
Consulter les SDS, MT-62.
o. Reposer le jonc d'arrêt arrière choisi de pignon de renvoi.



p. Reposer le manchon d'accouplement de marche arrière.
- **Prêter attention au sens du montage.**

q. Mesurer pour finir chaque jeu axial des pignons. Consulter les SDS, MT-61.

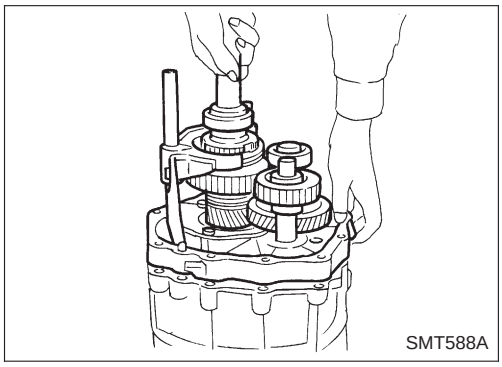
Composants de la commande de passage des vitesses



1. Reposer l'axe de fourchette de surmultipliée ainsi que la fourchette de passage de surmultipliée. Puis installer la goupille de retenue dans la fourchette de passage de surmultipliée.
2. Installer la fourchette de passage de 1ère et de 2nde, de 3ème et de 4ème et de marche arrière sur le manchon d'accouplement.

3. Remonter la tige de passage dans l'orifice des fourchettes, du levier de passage et de l'interverrouillage puis reposer la goupille de retenue dans le levier de passage.
- **S'assurer que la tige de passage est parfaitement mobile.**

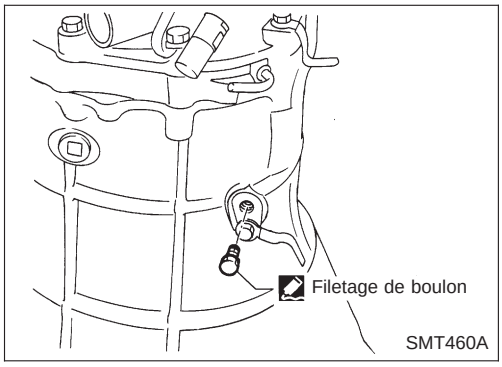
Composants du carter



1. Reposer le joint d'huile de couvercle avant.
- **Enduire la lèvre du joint de graisse à usages multiples.**

2. Reposer la cale choisie de roulement avant de pignon de renvoi dans le carter de boîte.
- **Enduire de graisse à usages multiples.**

3. Enduire de produit d'étanchéité la surface de contact du carter de boîte de vitesses.

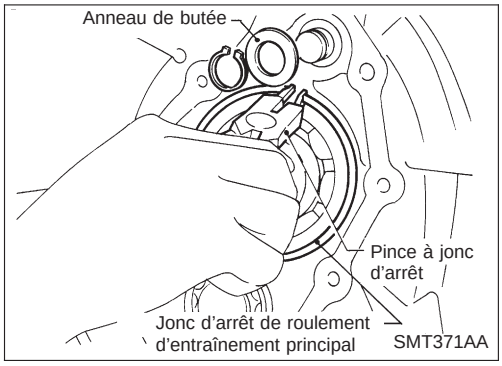


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Composants du carter (Suite)

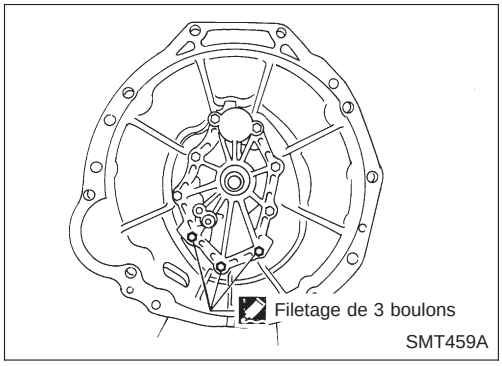
SMT588A

4. Reposer l'ensemble de pignon dan le carter de boîte.
5. Reposer le ressort de verrouillage ainsi que la bille de verrouillage dans la butée d'interverrouillage.



- **Enduire la bille de verrouillage de graisse à usages multiples.**

SMT460A

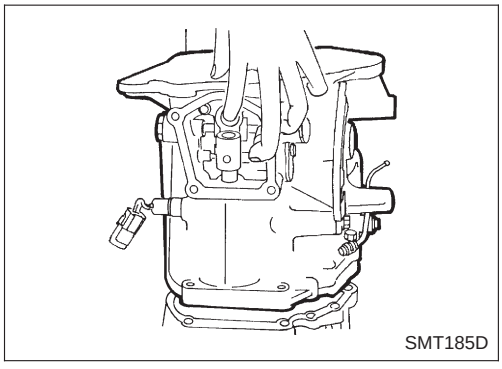


6. Reposer l'ensemble de butée d'interverrouillage puis serrer le bouchon de bille de contrôle.

- **Enduire de produit d'étanchéité la partie filetée du bouchon de bille de verrouillage.**

SMT371AA

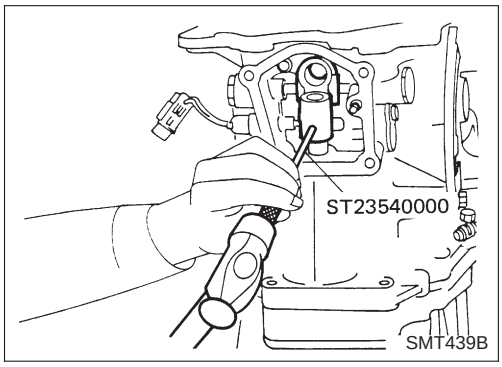
7. Reposer l'anneau de butée ainsi que le jonc d'arrêt de roulement d'entraînement principal.



SMT459A

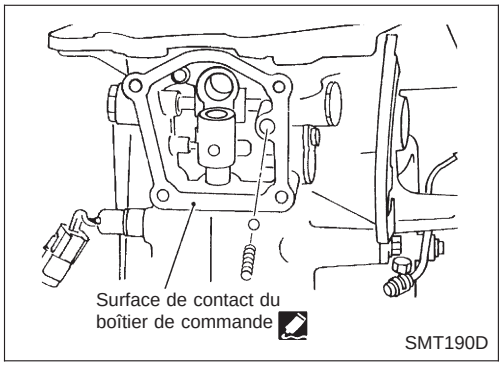
8. Reposer le couvercle avant et le joint plat.

- **Enduire de produit d'étanchéité le filetage des 3 boulons indiqués ci-contre.**



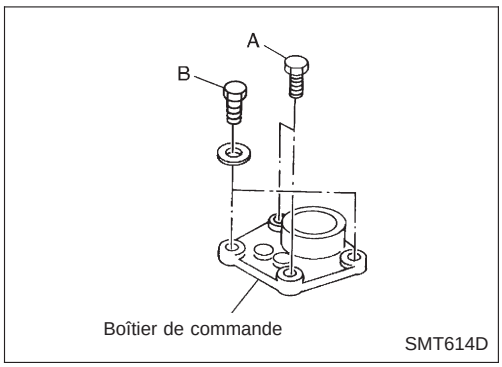
9. Enduire de produit d'étanchéité la surface d'assemblage de la plaque adaptatrice.

SMT185D



10. Installer le carter de pignon de surmultipliée avec le bras de passage des vitesses.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Composants du carter (Suite)

11. Reposer la goupille de retenue dans le bras de passage.

12. Reposer le ressort de rappel ainsi que la bille de verrouillage puis reposer le boîtier de commande.
- **Enduire la surface d'appui du carter de pignon de sur-multipliée de produit d'étanchéité.**

13. Serrer les boulons du logement de commande.
Dimension de la tête de boulon :
Boulons A 12 mm
Boulons B 13 mm
Couple de serrage :
Se reporter aux composants de la commande de passage des vitesses, MT-38.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

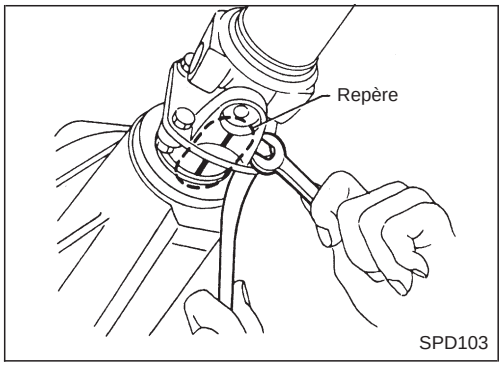
SPD728

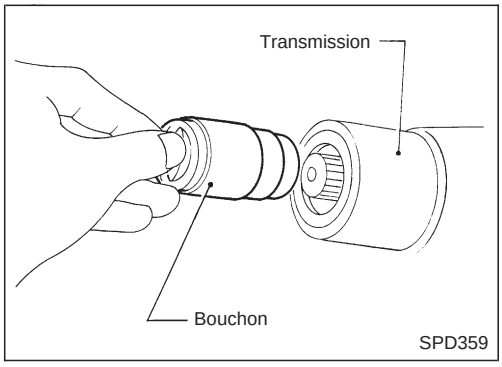
SPD102

Entretien sur véhicule



VIBRATIONS DE L'ARBRE DE TRANSMISSION

Si l'on constate des vibrations à grande vitesse, contrôler tout d'abord le voile de l'arbre de transmission.

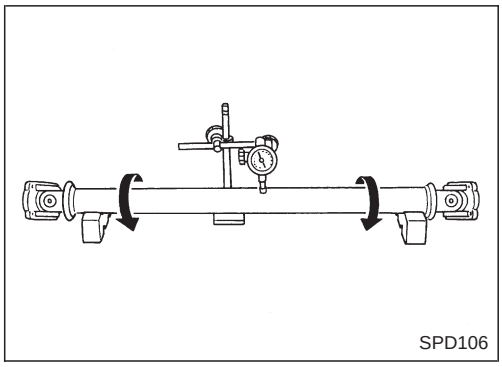


1. Soulever l'extrémité arrière du véhicule jusqu'à ce que les roues décollent du sol.
2. Mesurer le voile de l'arbre de transmission en plusieurs endroits le long de l'arbre en faisant tourner à la main le flasque d'accouplement du pont.
3. Si le voile dépasse les valeurs spécifiées, désaccoupler l'arbre de transmission à hauteur du flasque d'accouplement du pont. Faire tourner le flasque d'accouplement de 180 degrés, puis réaccoupler l'arbre de transmission.
   Limite de voile : 0,6 mm
4. Contrôler à nouveau le voile. Si le voile dépasse encore la limite, remplacer l'ensemble de l'arbre de transmission.
5. Effectuer un essai sur route.

CONTROLE DE L'ASPECT

- Vérifier si la surface des tubes de l'arbre de transmission ne présente pas de bosses ou de fissures, et les remplacer si nécessaire.
- Vérifier si le roulement central est bruyant ou endommagé et le remplacer si nécessaire.

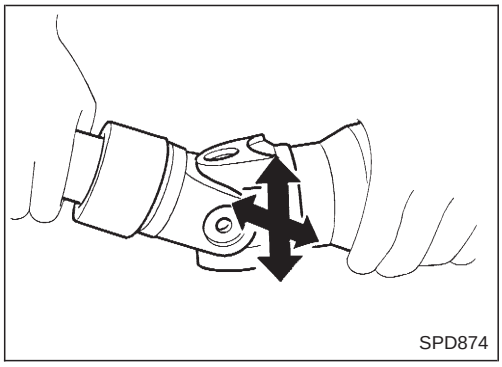
SPD103



SPD359

Dépose et repose

1. Tracer des marques de repère sur les flasques, puis séparer l'arbre de transmission du pont.



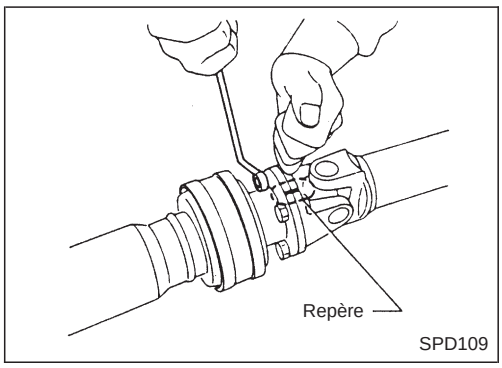
2. Déposer l'arbre de transmission.
- **Insérer le bouchon dans le joint d'huile arrière après avoir déposé l'arbre de transmission arrière.**

Simpo PDF Merge and Split Unregistered Version - http://www.simopdf.com

SPD106

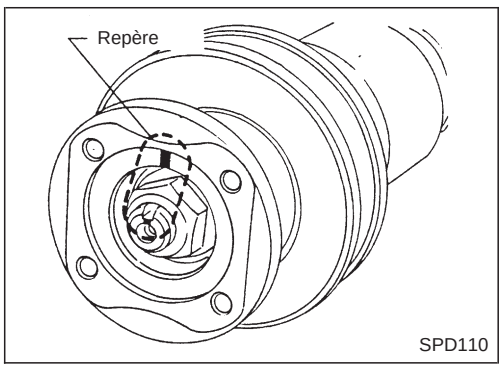
Inspection

- Vérifier le voile de l'arbre de transmission. Si le voile dépasse la limite, remplacer l'ensemble de l'arbre de transmission.
  Limite de voile : 0,6 mm



SPD874

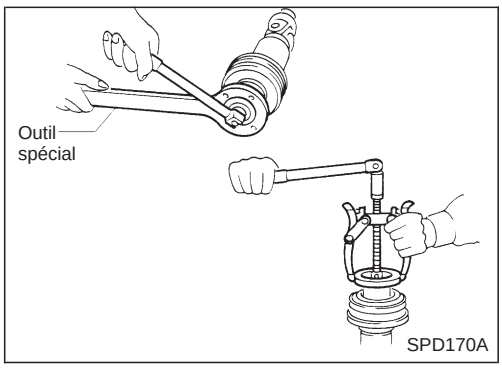
- Vérifier le jeu axial du croisillon.
  Si la limite est dépassée, remplacer l'ensemble de l'arbre de transmission.
  Jeu axial de croisillon :
  0,02 mm ou moins



Démontage

ROULEMENT CENTRAL

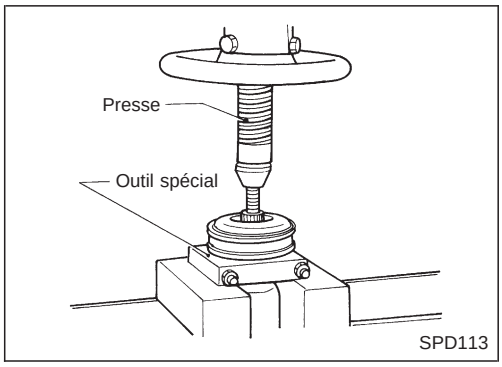
1. Tracer des marques de repère sur les flasques, puis séparer le second tube du premier tube.



SPD109

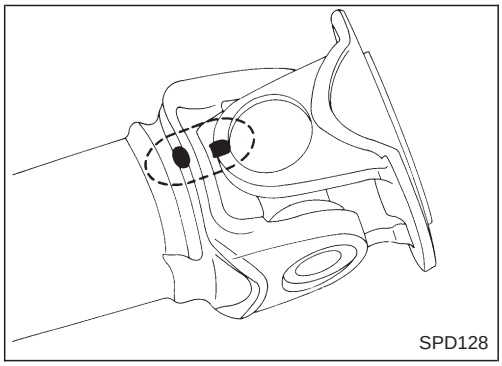
SPD110

2. Tracer des marques de repère sur le flasque et l'arbre.



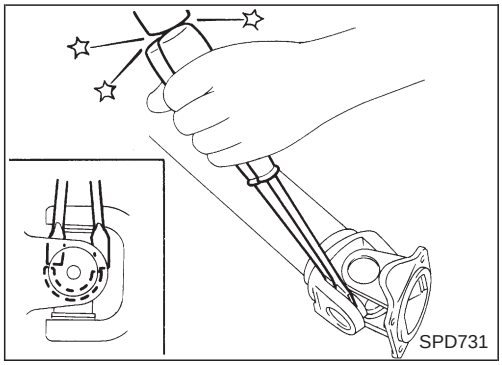
SPD170A

3. Déposer l'écrou d'arrêt avec l'outil spécial.
   Numéros d'outils :
   R180A, C200
   ST38060002
   H233B
   KV38104700
4. Déposer le flasque d'accouplement à l'aide d'un extracteur.

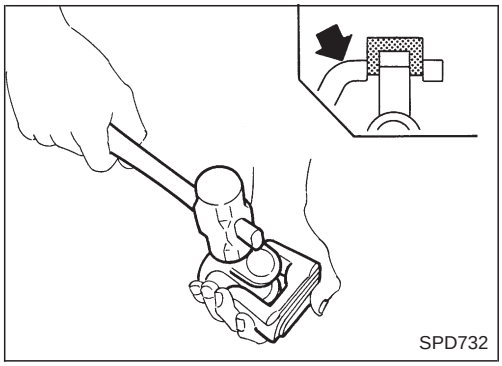


Simpo PDF Merge and Split Unregistered Version - http://www.simopdf.com

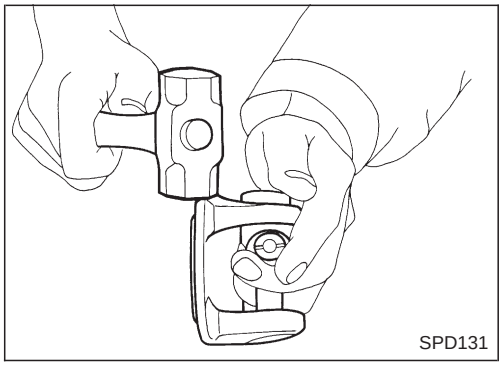
Démontage (Suite)



5. Déposer le roulement central à l'aide d'un outil spécial et d'une presse.
   Numéro de l'outil : ST30031000

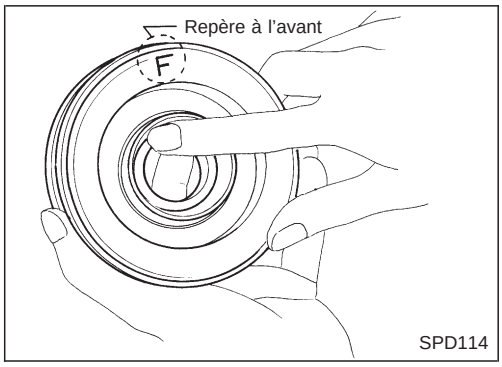


CROISILLON



1. Tracer des marques de repère sur l'arbre de transmission et sur le flasque ou la chape.

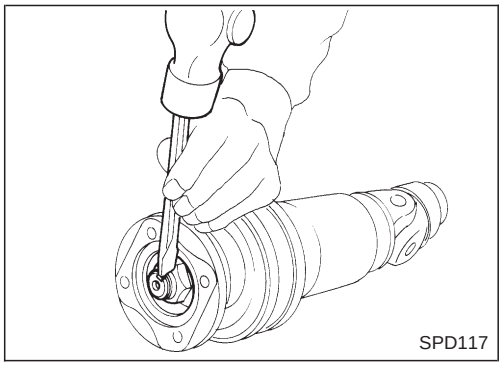
2. Déposer le jonc d'arrêt.



3. Déposer le roulement de croisillon repoussé en frappant légèrement sur la chape avec un marteau, en prenant garde de ne pas endommager le croisillon et l'orifice de chape.

4. Déposer le roulement opposé de la même manière.

Tracer des repères sur les pièces démontées de façon à pouvoir les replacer dans leur position d'origine.

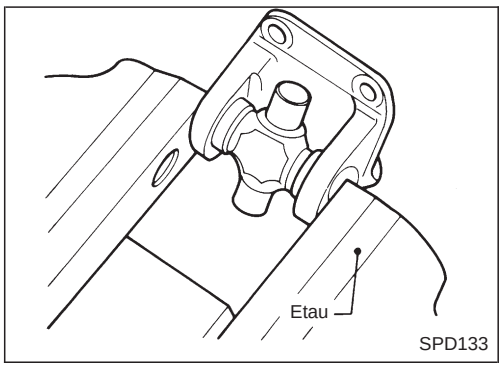


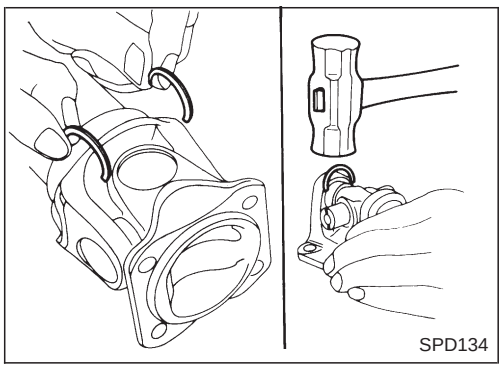
Simpo PDF Merge and Split Unregistered Version - http://www.simopdf.com

Remontage

ROULEMENT CENTRAL

- Lors de la repose du roulement central, disposer la marque "F" située au centre du roulement vers l'avant du véhicule.
- **Enduire d'une couche de graisse au lithium (à usages multiples contenant du bisulfure de molybdène) l'extrémité du roulement central et les deux côtés de la rondelle.**

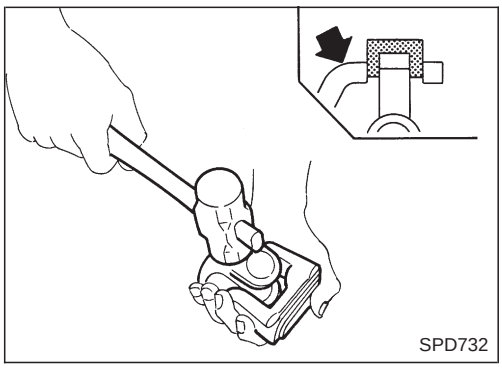




- Estamper l'écrou. Toujours utiliser un écrou neuf.
- Aligner les marques de repère lorsqu'on remonte les tubes.

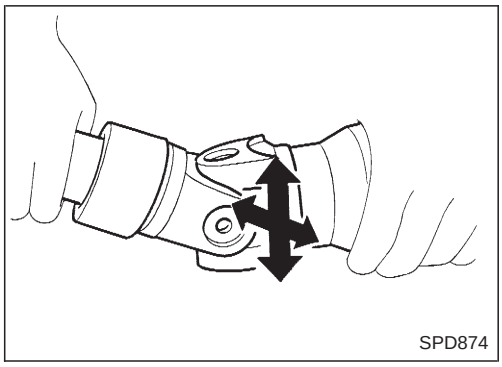
CROISILLON

1. Remonter le roulement de croisillon. Enduire la surface interne du roulement de graisse à usages multiples recommandée.



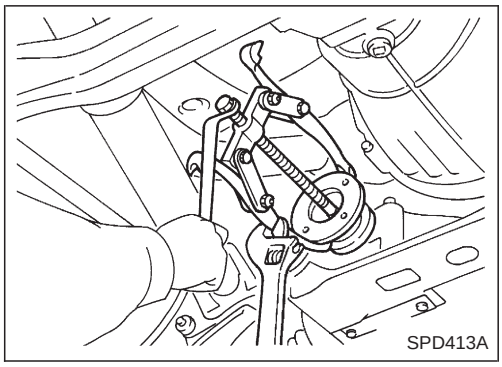
Lors du remontage, veiller à ne pas laisser tomber le roulement à aiguilles.

2. Sélectionner un jonc d'arrêt qui permettra d'obtenir le jeu axial de croisillon spécifié, et le monter.
   Consulter les SDS, PD-80.



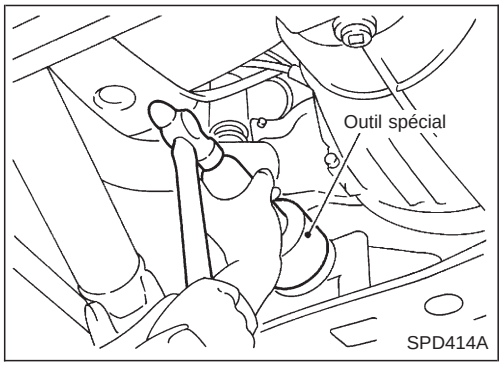
Choisir pour les deux côtés des joncs d'arrêt dont la différence d'épaisseur ne dépasse pas 0,06 mm.

3. Régler le jeu entre le roulement et le jonc d'arrêt à une valeur nulle (zéro) en frappant sur la chape.



Simpo PDF Merge and Split Unregistered Version - http://www.simopdf.com

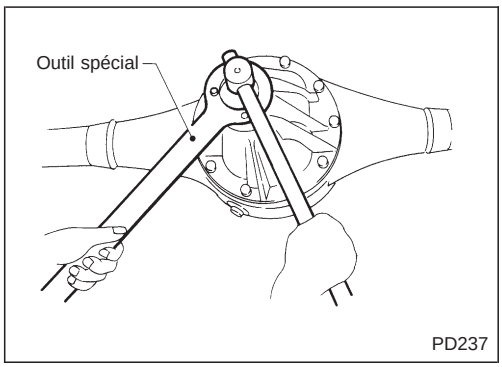
Remontage (Suite)



4. S'assurer que le croisillon se déplace librement et vérifier le jeu axial.
   Jeu axial : 0,02 mm ou moins

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SPD413A

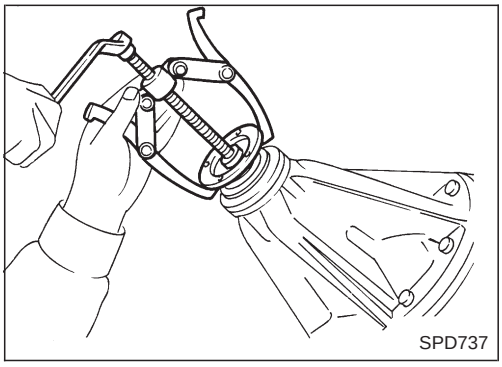


Remplacement du joint d'huile avant (pont avant : modèle R180A)

1. Déposer l'arbre de transmission avant.
2. Desserrer l'écrou de pignon d'attaque.
3. Déposer le flasque d'accouplement à l'aide d'un extracteur.
4. Déposer le joint d'huile avant.

SPD414A

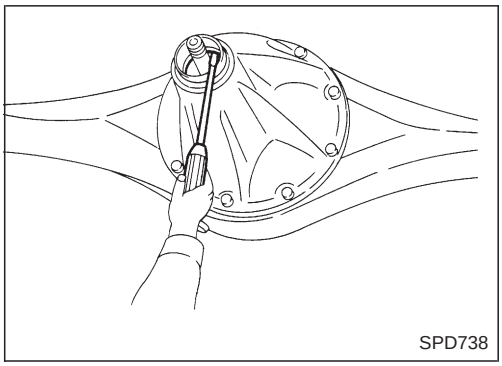
5. Remplir de graisse à usages multiples le creux entre les lèvres du joint d'huile. Enfoncer le joint d'huile avant dans le carter de pont.
   Numéro de l'outil : KV38100500
6. Reposer le flasque d'accouplement et l'écrou de pignon d'attaque.
7. Reposer l'arbre de transmission.



PD237

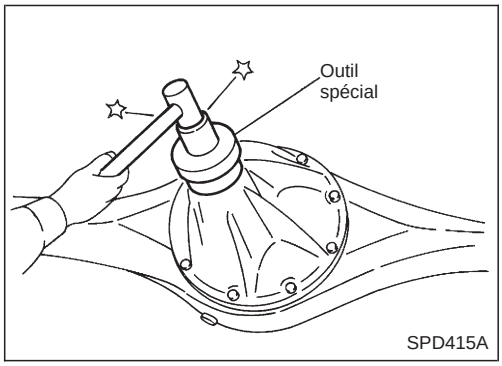
Remplacement du joint d'huile avant (pont arrière : modèle H233B)

ATTENTION :
Dans le cas des modèles de pont dotés d'une entretoise escamotable (C200), la précharge du roulement doit être réglée après chaque dépose du flasque d'accouplement. Par conséquent, une révision complète du pont est nécessaire.



1. Déposer l'arbre de transmission.
2. Desserrer l'écrou de pignon d'attaque.
   Numéro de l'outil : KV38104700

SPD737

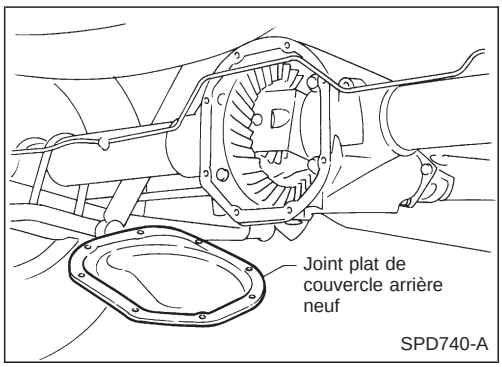


3. Déposer le flasque d'accouplement.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Remplacement du joint d'huile avant (pont arrière : modèle H233B) (Suite)

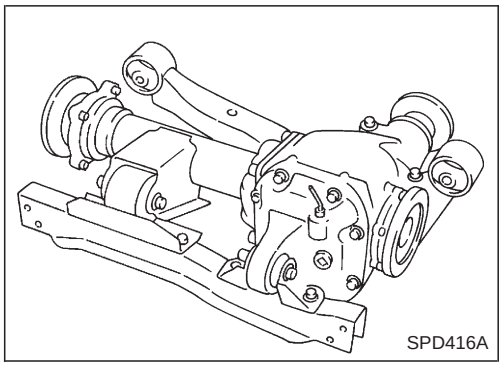
SPD738



4. Déposer le joint d'huile avant.

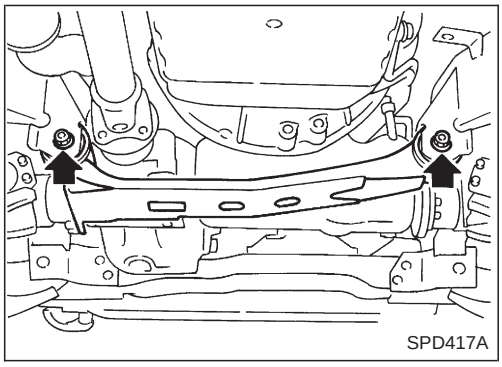
SPD415A

5. Remplir de graisse à usages multiples le creux entre les lèvres du joint d'huile. Enfoncer le joint d'huile avant dans le carter de pont.
   Numéros d'outils : ST15310000
   KV40104710
6. Reposer le flasque d'accouplement et l'écrou de pignon d'attaque.
7. Reposer l'arbre de transmission arrière.



Remplacement du joint plat du couvercle arrière (pont arrière : modèle C200)

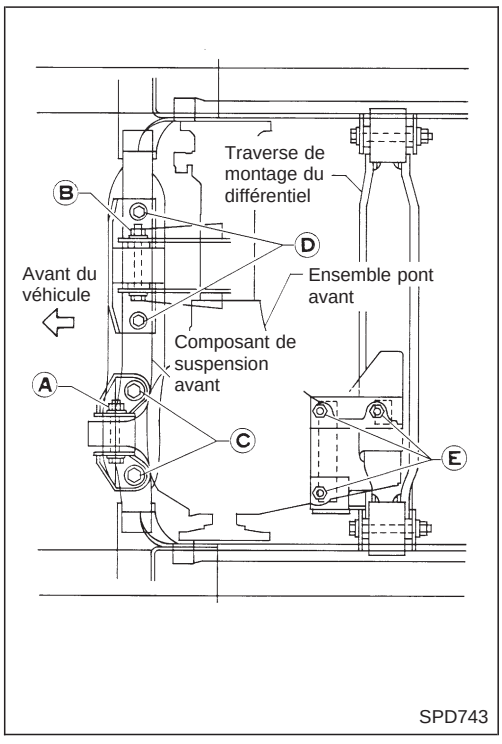
SPD740-A



1. Vidanger l'huile pour engrenages.
2. Déposer le couvercle arrière et le joint plat du couvercle arrière.
3. Reposer un joint plat de couvercle arrière neuf ainsi que le couvercle arrière.
4. Remplir le pont d'huile pour engrenages recommandée.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SPD416A



Dépose

1. Déposer l'arbre de transmission avant.
2. Déposer le semi-arbre. Consulter la section FA ["Semi-arbre", "ESSIEU AVANT — 4 roues motrices —"].
3. Déposer les boulons de montage du moteur et soulever le moteur.
4. Déposer le pont avant avec la traverse de montage du différentiel.

SPD417A

Repose

1. Reposer l'ensemble pont avant avec la traverse de montage du différentiel.

SPD743

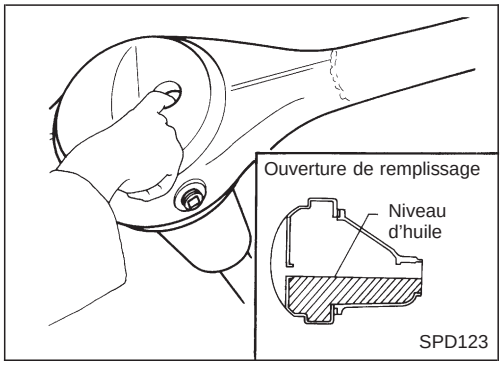
2. Serrer les écrous et boulons de fixation du pont avant en suivant la procédure suivante pour éviter toute vibration de la transmission.

a. Serrer provisoirement l'écrou Ⓐ.
b. Serrer provisoirement l'écrou Ⓑ.
c. Serrer le boulon Ⓒ à un couple de 68 à 87 N·m (6,9 à 8,9 kg-m).
d. Serrer le boulon Ⓓ à un couple de 68 à 87 N·m (6,9 à 8,9 kg-m).
e. Serrer l'écrou Ⓐ à un couple de 68 à 87 N·m (6,9 à 8,9 kg-m).
f. Serrer l'écrou Ⓑ à un couple de 68 à 87 N·m (6,9 à 8,9 kg-m).
g. Serrer l'écrou Ⓔ à un couple de 68 à 87 N·m (6,9 à 8,9 kg-m).

3. Reposer le semi-arbre. Consulter la section FA ["Semi-arbre", "ESSIEU AVANT — 4 roues motrices —"].
4. Reposer l'arbre de transmission avant.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

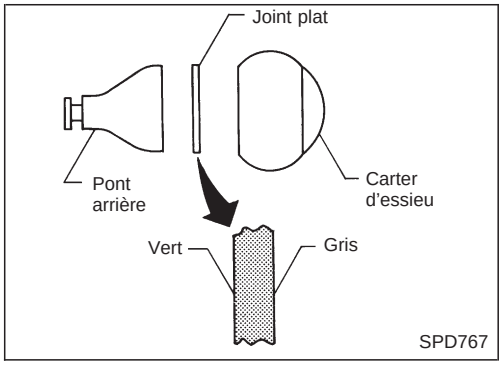
Dépose



- Déposer l'arbre de transmission.

Boucher l'extrémité avant du transfert.

- Déposer l'arbre d'essieu.
  Consulter la section RA (''ESSIEU ARRIERE'').

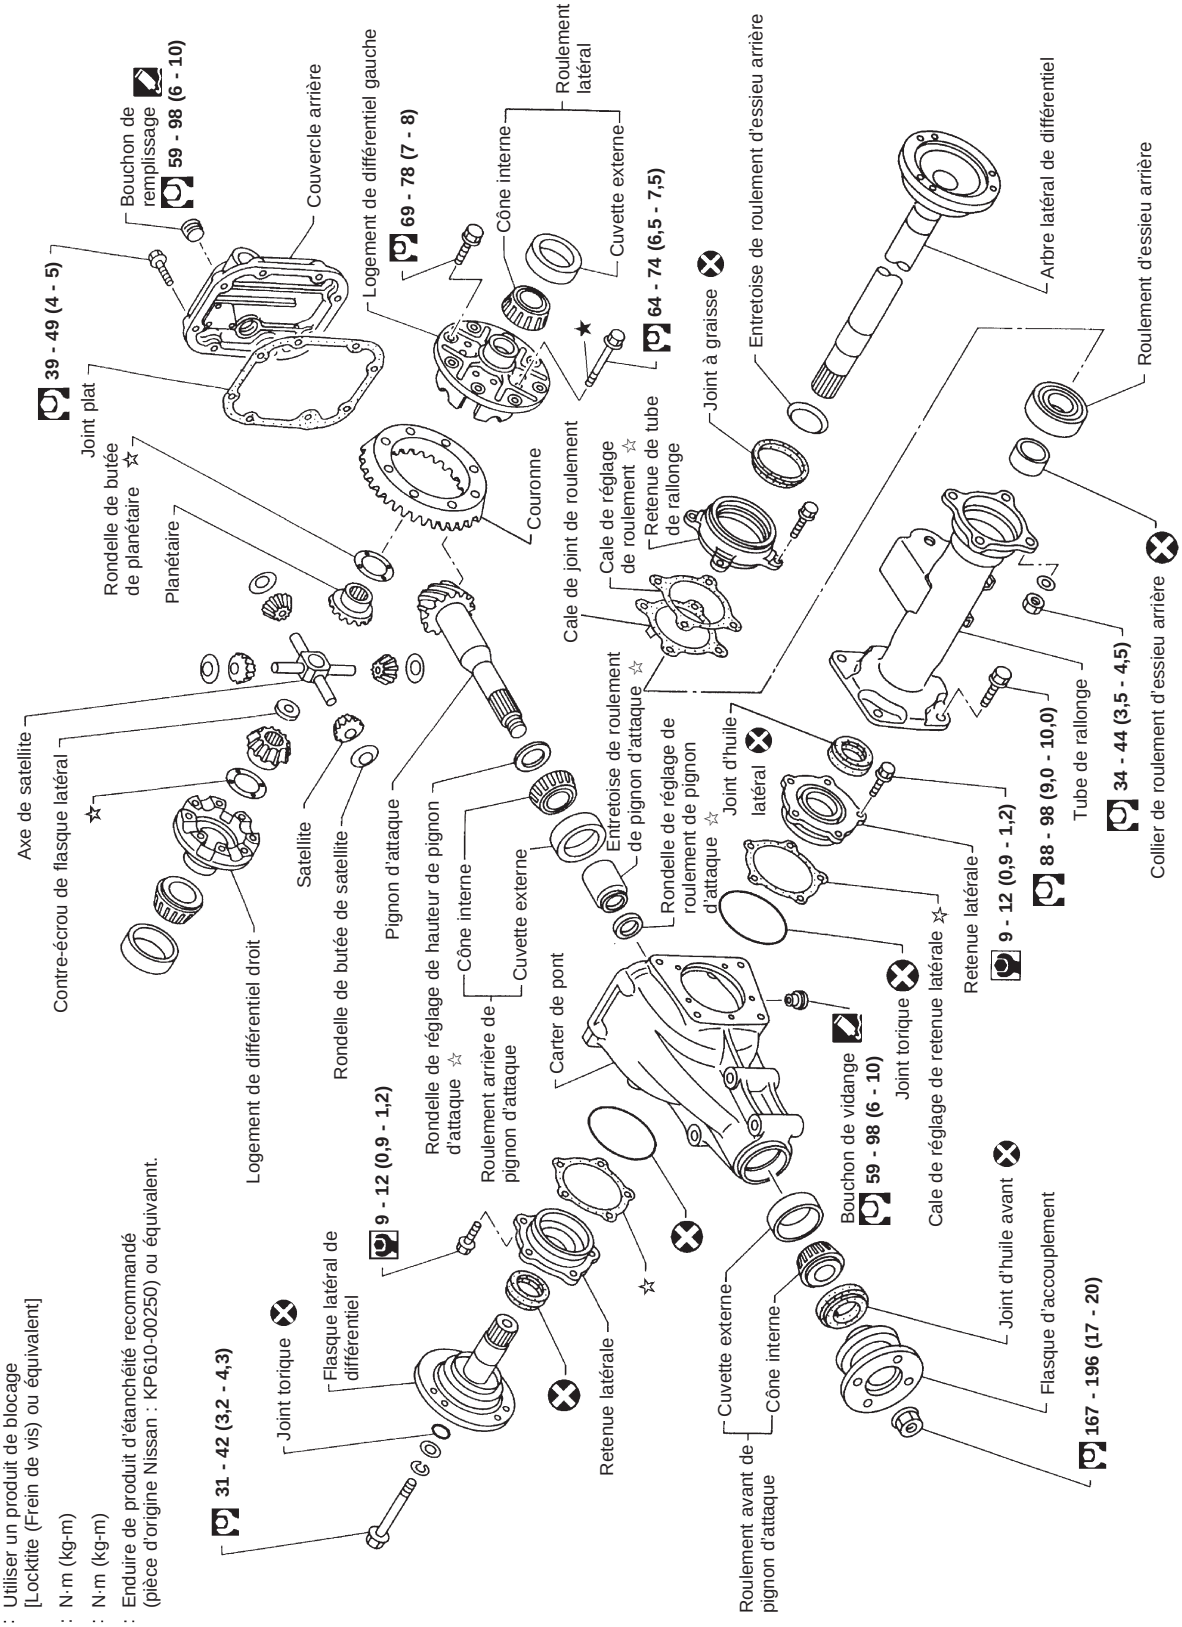


ATTENTION :

- **Veiller à ne pas endommager les cannelures, la chape à manchon coulissant et le joint d'huile avant lors de la dépose de l'arbre de transmission.**
- **Avant de déposer le pont ou l'essieu arrière, débrancher le connecteur de faisceau du capteur ABS de l'ensemble et éloigner de la zone de pont/d'essieu arrière. Le non respect de cette instruction risque de provoquer l'endommagement des câbles de capteur et l'inefficacité du capteur.**

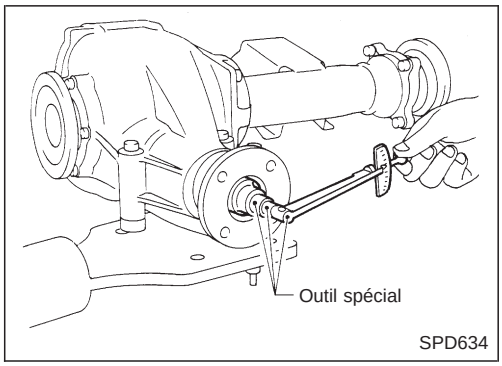
Repose

- Remplir le pont d'huile pour engrenages recommandée.



- Prêter attention au sens du joint (H233B uniquement).

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

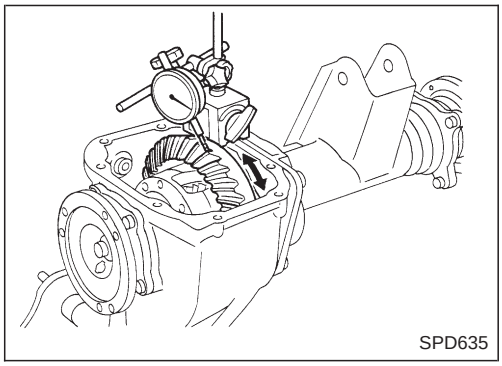


SEC. 381

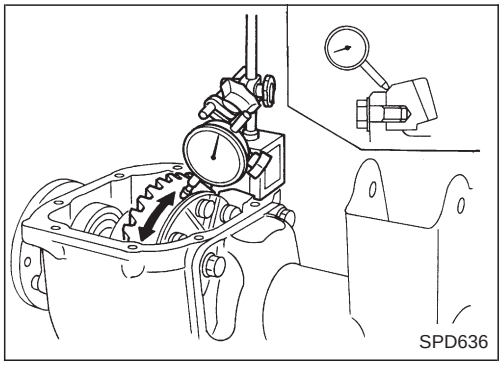
☆ : Réglage nécessaire
★ : Utiliser un produit de blocage [Locktite (Frein de vis) ou équivalent]
: N·m (kg-m)
: N·m (kg-m)
: Enduire de produit d'étanchéité recommandé (pièce d'origine Nissan : KP610-00250) ou équivalent.

SPD429A

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



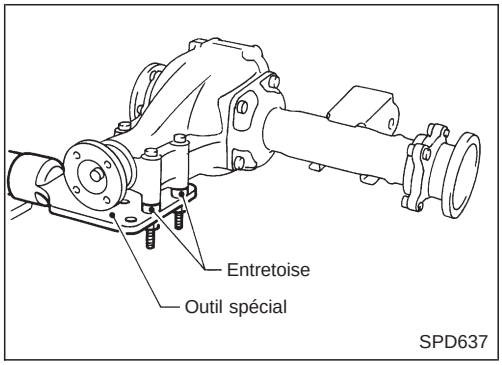
Inspection préalable



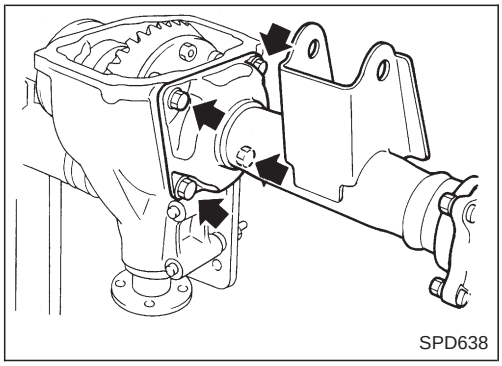
Avant de démonter le pont, effectuer l'inspection suivante.

- Précharge totale

a. Tourner le pignon d'attaque de plusieurs tours dans les deux sens pour asseoir les rouleaux de roulement.
b. Contrôler la précharge totale à l'aide de l'outil spécial.
   Numéro de l'outil : ST3127S000
   Précharge totale:
   1,2 - 2,3 N·m
   (12 - 23 kg-cm)



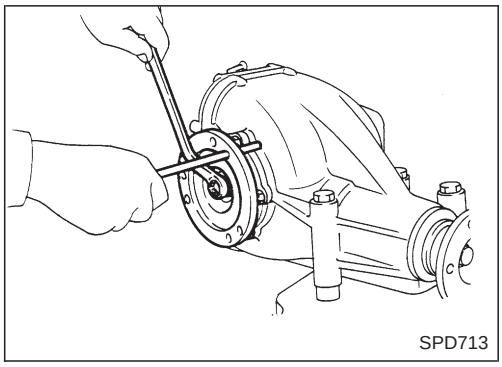
- Battement entre la couronne et le pignon d'attaque
  Vérifier le battement de la couronne à l'aide d'un comparateur à cadran, à plusieurs endroits.
  Battement entre la couronne et le pignon d'attaque :
  0,13 - 0,18 mm



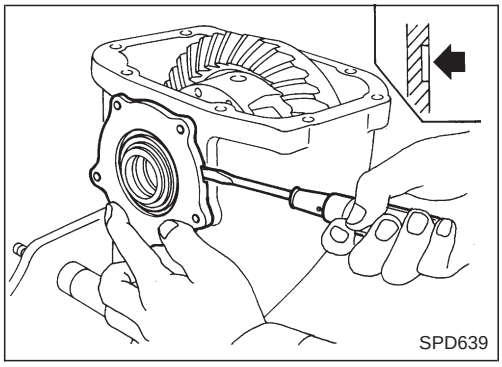
- Voile de la couronne
  Contrôler le voile de la couronne à l'aide d'un comparateur à cadran.
  Limite de voile :
  0,05 mm
- Contact entre les dents
  Contrôler le contact entre les dents. Consulter le titre ''REGLAGE'', PD-28.

Carter de pont

1. Monter l'ensemble de pont sur l'outil spécial en utilisant trois entretoises (20 mm).
   Numéro de l'outil : KV38100800

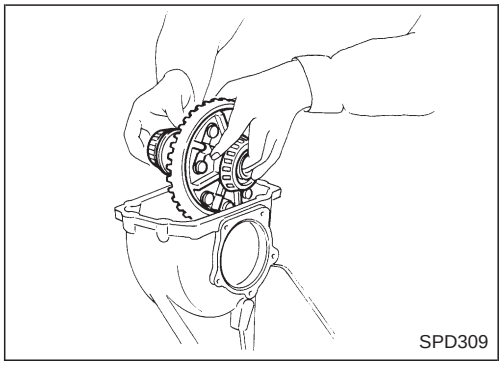


2. Déposer le tube de rallonge et l'ensemble d'arbre latéral de différentiel.



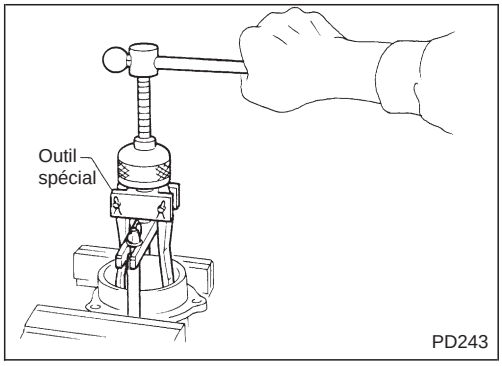
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Carter de pont (Suite)



SPD713

3. Déposer le flasque latéral de différentiel.



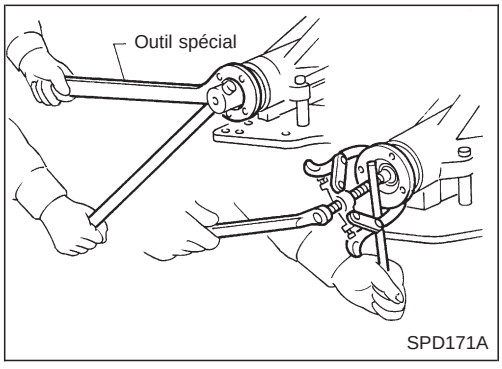
SPD639

4. Tracer des marques de repère sur les pièces de retenue latérales. Déposer les pièces de retenue latérales.

Veiller à ne pas confondre les pièces de retenue et les cales d'épaisseur gauche et droite.

SPD309

5. Extraire le logement de différentiel du carter de pont.

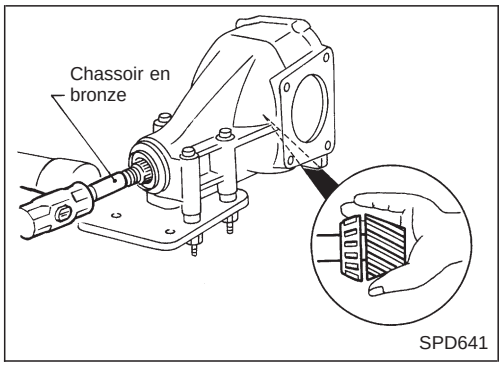


PD243

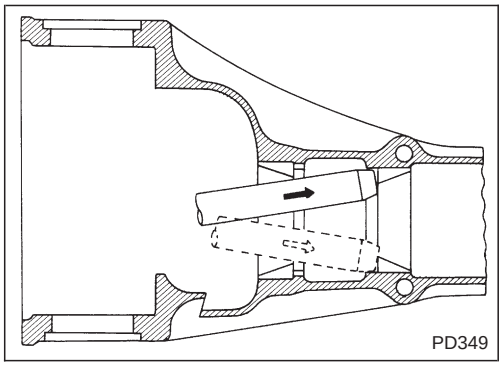
6. Déposer les cuvettes externes latérales.
   Numéro de l'outil : ST33290001

Conserver les cuvettes externes de roulements latéraux avec leurs cônes internes respectifs – ne jamais les intervertir.

7. Déposer le joint d'huile latéral.

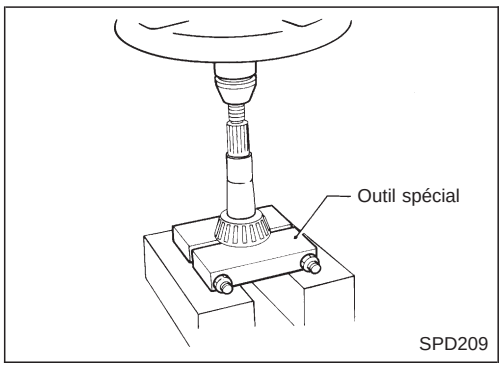


SPD171A



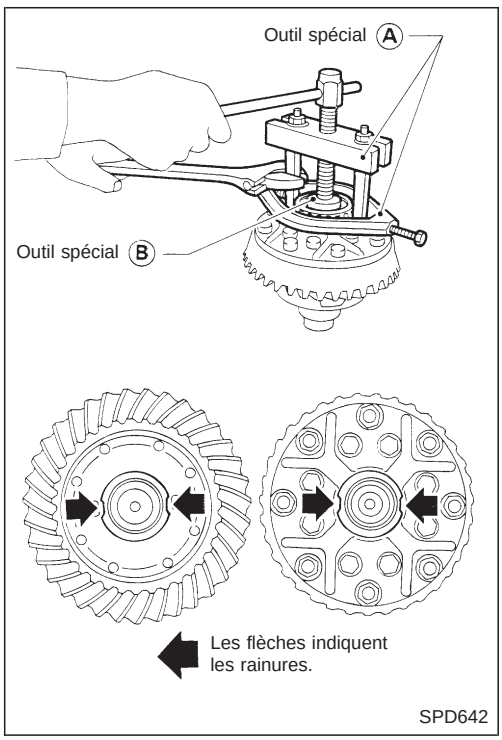
8. Desserrer l'écrou de pignon d'attaque.
   Numéro de l'outil : ST38060002
9. Déposer le flasque d'accouplement avec un extracteur.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Carter de pont (Suite)

10. Sortir le pignon d'attaque avec le cône interne de roulement arrière de pignon d'attaque, l'entretoise de roulement de pignon d'attaque et la rondelle de réglage de roulement de pignon d'attaque.
11. Déposer le joint d'huile avant et le cône interne du roulement avant de pignon.

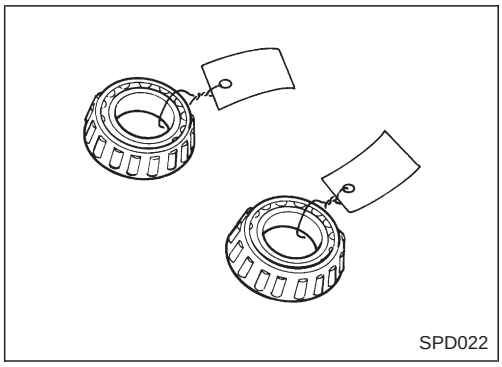


12. Déposer les cuvettes externes des roulements avant et arrière du pignon avec un chassoir en bronze.

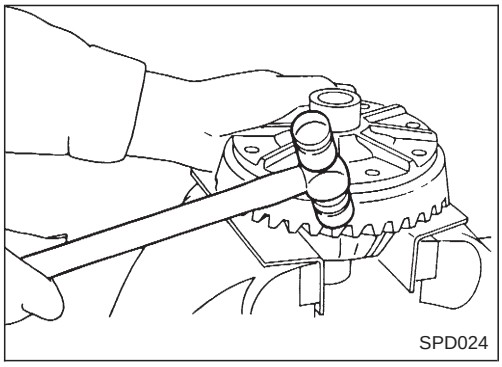
13. Déposer le cône interne de roulement arrière du pignon et la rondelle de réglage du pignon d'attaque.
    Numéro de l'outil : ST30031000

Logement de différentiel

1. Déposer les cônes internes de roulements latéraux.



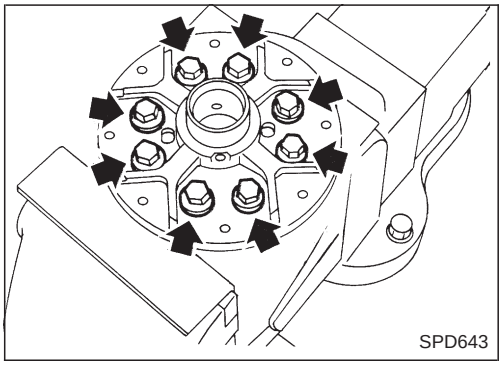
Pour éviter d'endommager les roulements, introduire les griffes de l'extracteur dans les rainures.



Numéros d'outils :
- Ⓐ **ST33051001**
- Ⓑ **ST33061000**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Logement de différentiel (Suite)

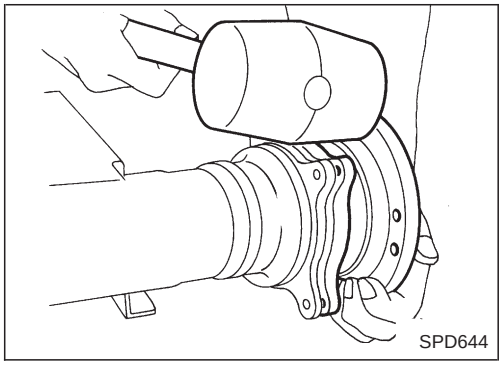


Veiller à ne pas confondre les pièces gauche et droite.

SPD022

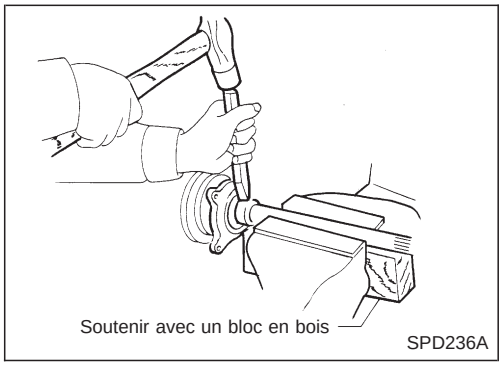
SPD024

2. Desserrer en diagonale les boulons de la couronne.
3. Frapper la couronne avec un marteau à tête élastique pour la détacher du différentiel.



Frapper de manière régulière sur toute la périphérie, afin d'éviter que la couronne ne se voile.

SPD643



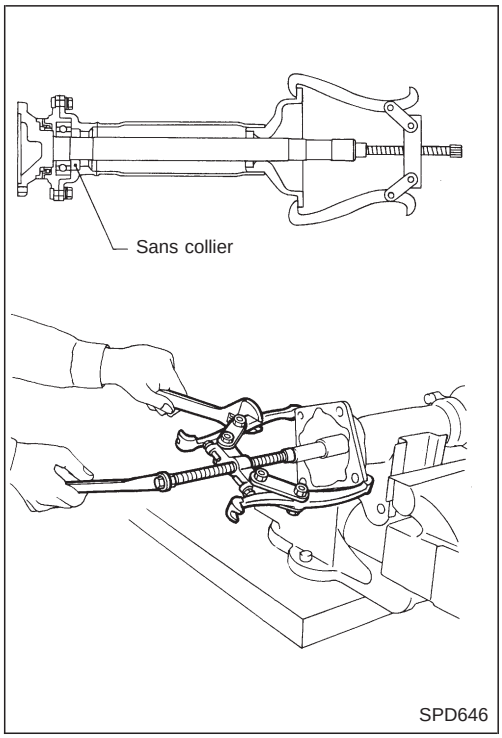
4. Séparer les logements de différentiel gauche et droit.

Tracer des marques de repère sur les côtés gauche et droit du logement de différentiel avant de les séparer.

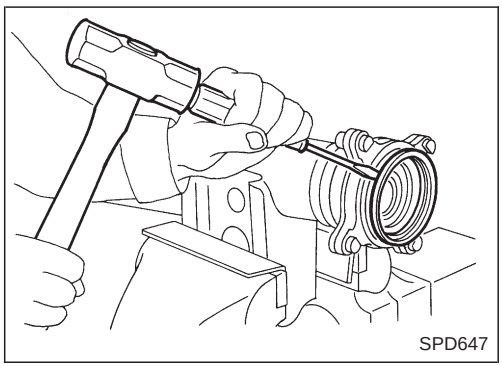
Tube de rallonge et arbre latéral de différentiel

SPD644

1. Déposer l'ensemble d'arbre latéral de différentiel du tube de rallonge.



SPD236A

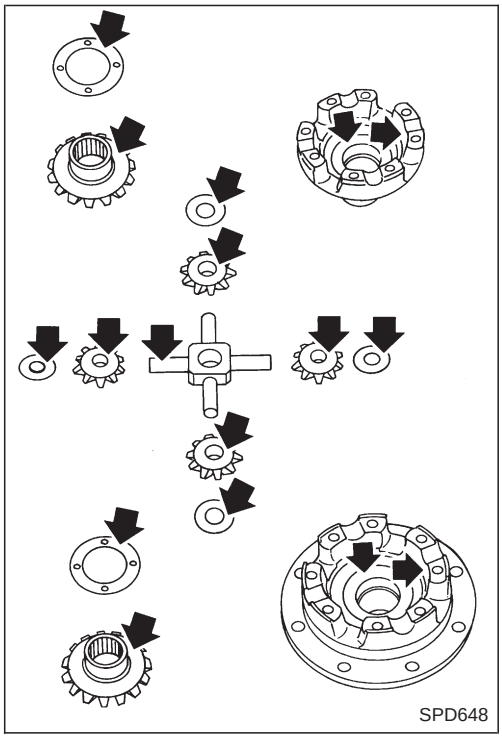


2. Couper le collier du roulement d'essieu arrière avec un ciseau à froid. Veiller à ne pas endommager l'arbre latéral de différentiel.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

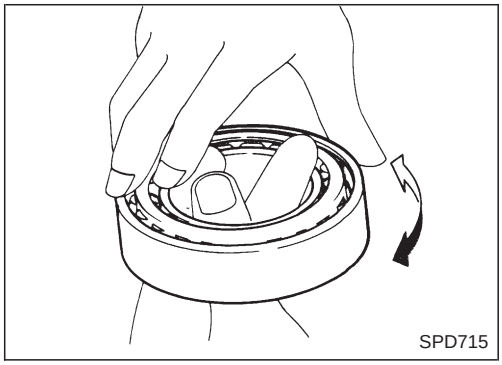
Tube de rallonge et arbre latéral de différentiel (Suite)

3. Remonter l'arbre latéral de différentiel dans le tube de rallonge et le fixer avec des boulons. Déposer le roulement d'essieu arrière en chassant l'arbre latéral de différentiel du roulement d'essieu arrière avec un extracteur.



4. Déposer le joint à graisse.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Couronne et pignon d'attaque

Contrôler les dents de la couronne pour voir si elles ne sont pas ébréchées, fêlées ou rayées.
Si l'on découvre une détérioration quelconque, remplacer la couronne et le pignon d'attaque comme un ensemble (jeu de pignons hypoïdes).

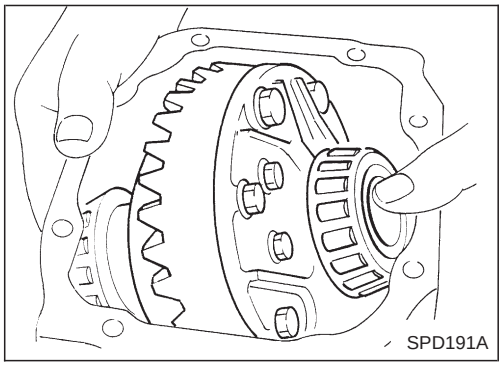
SPD648

Ensemble de logement de différentiel

Contrôler les surfaces d'appui du logement de différentiel, des planétaires, des satellites, de l'axe de satellite et des rondelles de butée.

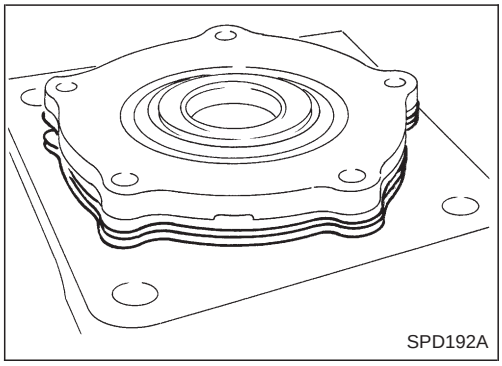
SPD715

Roulements



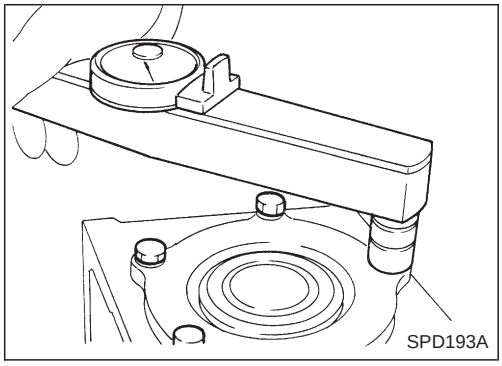
1. Nettoyer soigneusement les roulements.
2. Vérifier si les roulements ne sont pas usés, rayés, piqués ou ébréchés.
   Vérifier si les roulements à rouleaux coniques tournent librement. S'ils sont endommagés, remplacer comme un ensemble la cuvette externe et le cône interne.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



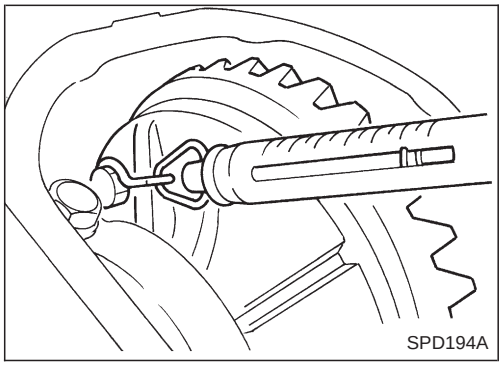
Pour que le pont fonctionne de façon silencieuse et fiable, les cinq réglages ci-dessous doivent être exécutés correctement :
1. Précharge de roulement latéral.
2. Hauteur du pignon d'attaque.
3. Précharge de roulement du pignon.
4. Battement entre la couronne et le pignon. Consulter ''REMONTAGE'', PD-33.
5. Jeu d'entre-dents de la couronne et du pignon.

Précharge de roulement latéral



Une sélection de cales de réglage de retenue latérale de support de différentiel est utile pour mener à bien cette procédure.

SPD191A



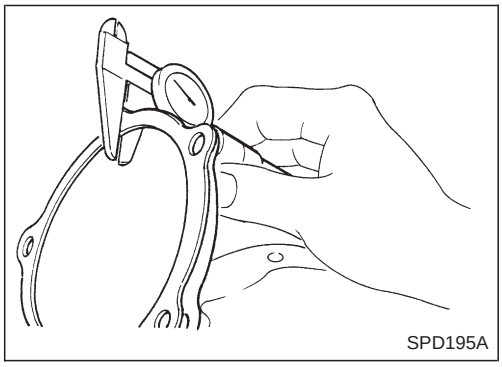
1. S'assurer que toutes les pièces sont propres. S'assurer également que les roulements ont bien été lubrifiés avec de l'huile fluide ou de l'huile pour boîte automatique de type ''DEXRON™''.
2. Reposer le boîtier de différentiel et l'ensemble des roulements latéraux dans le carter de pont.

SPD192A

3. Placer toutes les cales de reglage originales de retenue latérale sur la retenue de roulement latérale disposée à l'extrémité de la couronne du carter de pont.

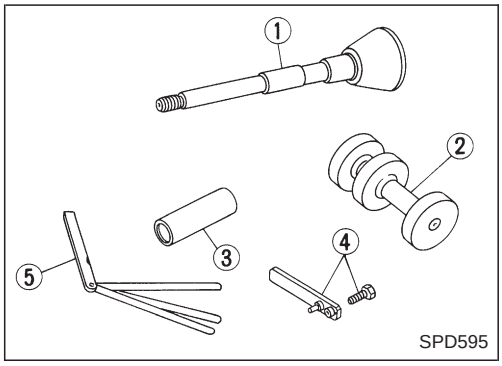
SPD193A

4. Installer les deux pièces de retenue de roulement sur le carter de pont et serrer les boulons de retenue.
   Couple de serrage du boulon :
   : 9 - 12 N·m (0,9 - 1,2 kg-m)



SPD194A

5. Tourner le support de différentiel plusieurs fois pour asseoir les roulements.
6. Mesurer le couple de rotation du support de différentiel avec un dynamomètre au niveau du boulon de serrage de la couronne.
   Spécification du couple de rotation :
   34,3 - 39,2 N (3,5 - 4,0 kg) de force de traction au boulon de couronne



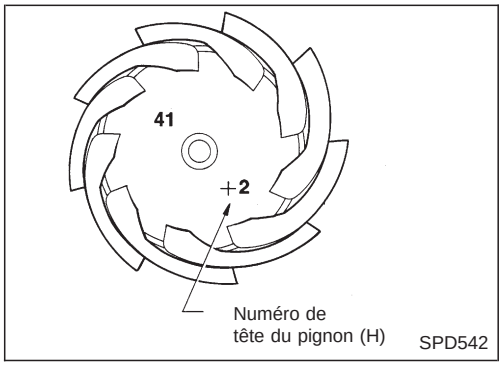
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Précharge de roulement latéral (Suite)

7. Si le couple de rotation mesuré est incorrect, établir la précharge de roulement correcte en ajoutant ou retirant de l'épaisseur de cale de l'épaisseur totale.
- Augmenter l'épaisseur de la cale pour diminuer le couple de rotation du support de différentiel.
- Diminuer l'épaisseur de la cale pour augmenter le couple de rotation du support de différentiel.

SPD195A

8. Noter l'épaisseur totale correcte des cales de réglage de retenue latérales, et déposer le support de différentiel et les roulements du carter de pont. Conserver les cales pour un usage ultérieur.

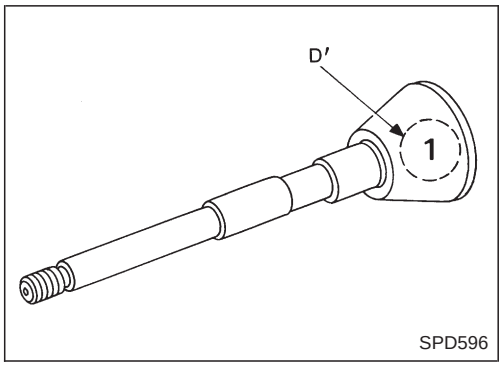


SPD595

Hauteur de pignon d'attaque

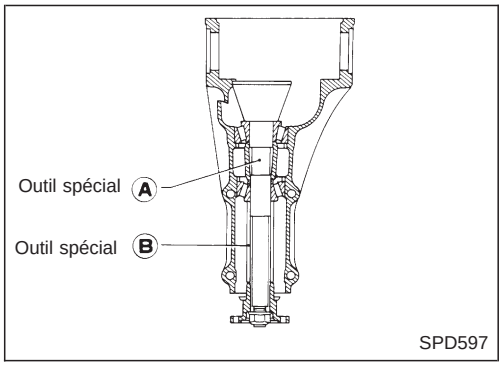
1. Préparer d'abord les outils permettant le réglage de la hauteur de pignon.
   ① Faux-arbre (KV38100110)
   ② Jauge de hauteur (KV38100120)
   ③ Collier (KV38100130)
   ④ Arrêt (KV38100140)
   ⑤ Jauge d'épaisseur
2. Pour faciliter le travail, préparer un tableau, comme celui ci-dessous, pour organiser les calculs.

LETTRES	CENTIEMES DE MILLIMETRE
H : Numéro de tête du pignon	
D′ : Chiffre indiqué sur le faux-arbre	
N : Mesure du jeu	

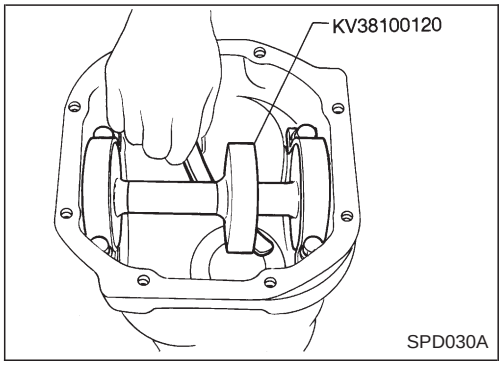


SPD542

3. Reporter les chiffres suivants dans le tableau.
   H : Numéro de tête du pignon



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Hauteur de pignon d'attaque (Suite)

D′: Chiffre indiqué sur le faux-arbre.

4. Placer l'outil spécial (faux-arbre) de la façon indiquée ci-contre et serrer avec précaution l'écrou de pignon d'attaque à une précharge de 1,0 à 1,4 N·m (10 à 14 kg-cm).
   Numéros d'outils :
   - Ⓐ **Faux-arbre (KV38100110)**
   - Ⓑ **Collier (KV38100130)**

5. Monter l'outil spécial (jauge de hauteur) dans le carter de pont et mesurer le jeu entre la jauge de hauteur et la face du faux-arbre.
6. Substituer ces valeurs dans l'équation pour calculer l'épaisseur de la rondelle.

Si les valeurs représentant H et D′ ne sont pas données, les considérer comme nulles et procéder aux calculs.

T (épaisseur de la rondelle) = N − [(H − D′) x 0,01] + 3,00

Exemple :

N = 0,23
H = 2
D′ = 1

T = N − [(H − D′) x 0,01] + 3,00
= 0,23 − [(2 − 1) x 0,01] + 3,00

(1) H 2
−D′ ..... −1
+1

(2) +1
x 0,01
+0,01

(3) N 0,23
− (+0,01)
0,22

(4) 0,22
+3,00
3,22

∴T = 3,22

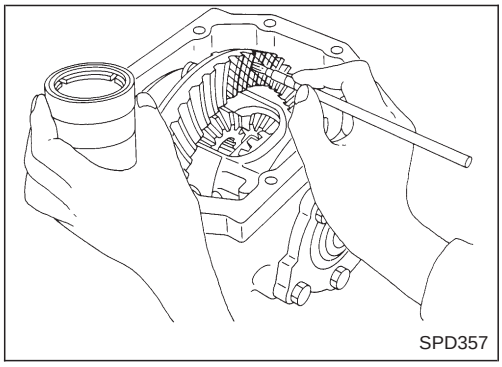
7. Sélectionner la rondelle de réglage en hauteur du pignon appropriée.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Hauteur de pignon d’attaque (Suite)

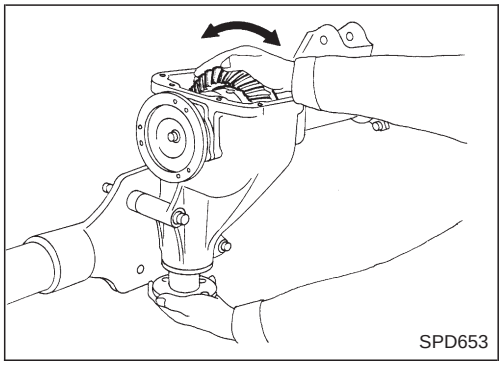
Rondelle de réglage en hauteur du pignon d’attaque :
Consulter les SDS, PD-82.

Si l’on ne peut trouver une rondelle de l’épaisseur désirée, utiliser une rondelle dont l’épaisseur est la plus proche de la valeur calculée.



Exemple :

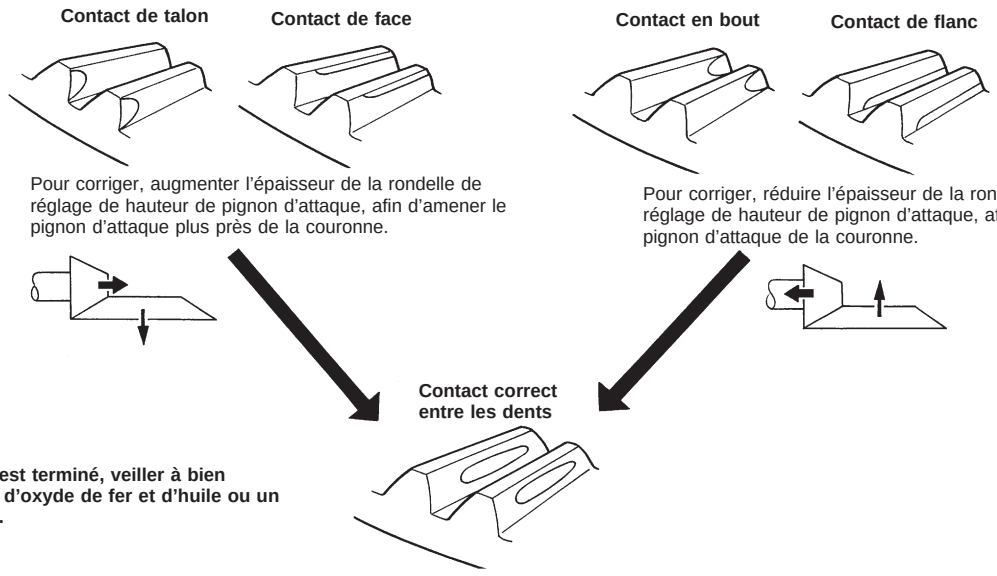
Valeur calculée . . . T = 3,22 mm
Rondelle à utiliser . . . T = 3,21 mm



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Contact entre les dents

Il est nécessaire de vérifier le jeu d'entre-dents, afin de s'assurer que la relation entre la couronne et le pignon d'attaque est correcte.
Des jeux de pignons hypoïdes en position incorrecte pourront être bruyants ou voir leur durée de vie abrégée. On peut assurer un niveau de bruit minimum et une longévité maximum grâce à la vérification du contact entre les dents.

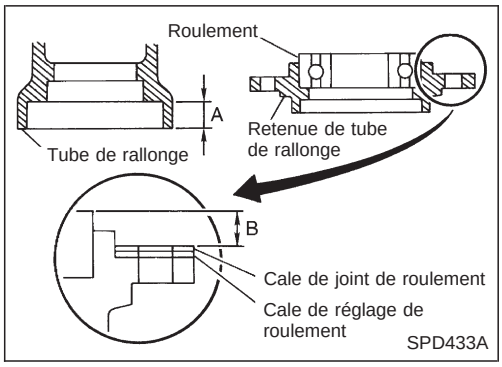


SPD357

1. Nettoyer soigneusement les dents de la couronne et du pignon d'attaque.
2. Appliquer une très légère quantité d'oxyde de fer en poudre et d'huile ou un mélange équivalent sur 3 ou 4 dents du côté entraînement de la couronne.

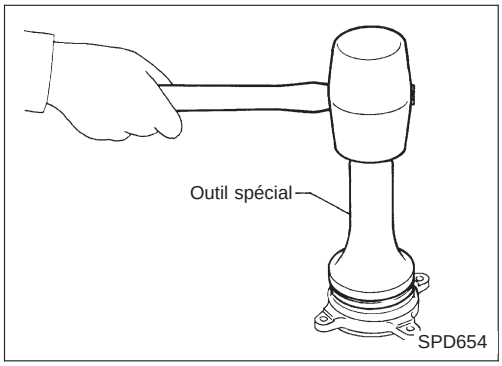
SPD653

3. Maintenir le flasque d'accouplement à l'arrêt et faire tourner la couronne dans les deux sens.



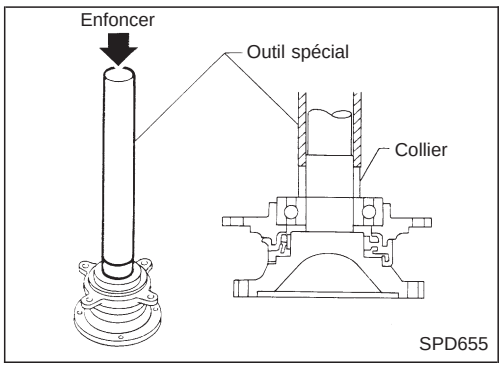
En principe, le contact entre les dents sera correct si l'on a correctement calculé l'épaisseur des cales et si le battement est correct. Néanmoins, il peut arriver qu'il soit nécessaire de suivre une méthode empirique afin d'obtenir un contact correct entre les dents. La surface de contact entre les dents sera la meilleure indication de la justesse du réglage du différentiel.

Lorsque le réglage est terminé, veiller à bien essuyer toute trace d'oxyde de fer et d'huile ou un mélange équivalent.

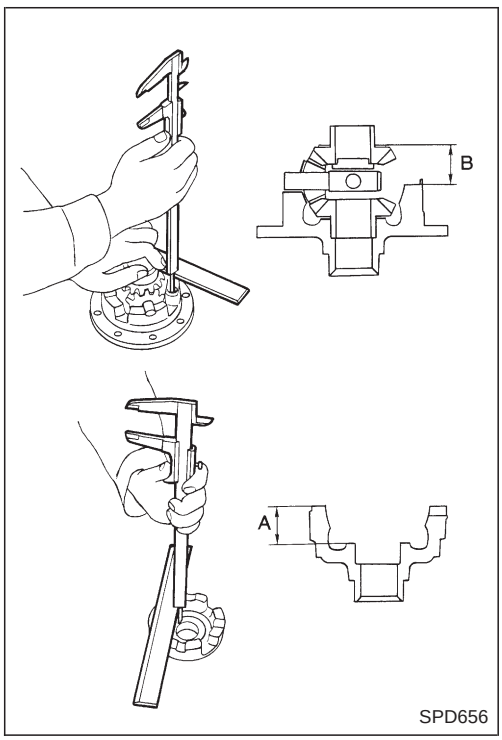


SPD007

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



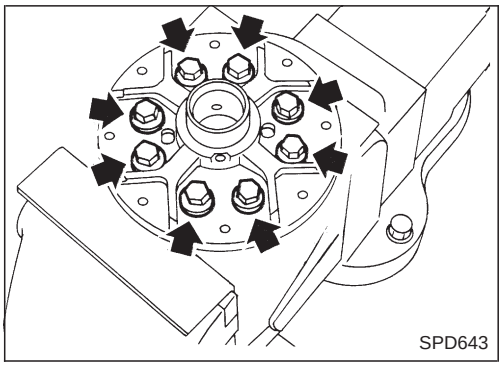
Tube de rallonge et arbre latéral de différentiel



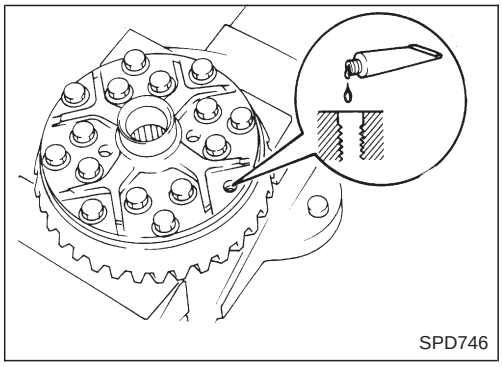
1. Mesurer le jeu axial du roulement d'essieu arrière.
   Jeu axial du roulement d'essieu arrière (A − B) :
   0,1 mm ou moins
   Le jeu axial peut être réglé au moyen d'une cale de réglage de roulement.
   Cales de réglage de roulement disponibles :
   Consulter les SDS, PD-82.

2. Reposer le joint à graisse.

3. Reposer la pièce de retenue du tube de rallonge, le roulement d'essieu arrière et le collier de roulement d'axe d'essieu arrière sur l'arbre latéral de différentiel.
4. Reposer l'ensemble d'arbre latéral de différentiel dans le tube de rallonge.



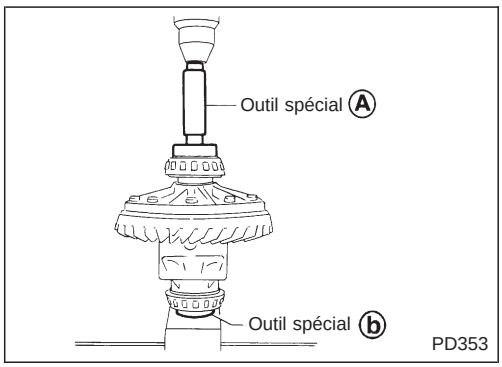
Logement de différentiel



1. Mesurer le jeu entre la rondelle de butée de planétaire et le logement de différentiel.
   Jeu entre rondelle de butée de planétaire et logement de différentiel (A − B) :
   Moins de 0,15 mm
   Le jeu peut être réglé au moyen d'une rondelle de butée de planétaire.
   Rondelles de butée de planétaires disponibles :
   Consulter les SDS, PD-82.
2. Enduire d'huile pour engrenages les surfaces des dents des planétaires et les surfaces de butée, et vérifier si l'ensemble tourne correctement.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Logement de différentiel (Suite)

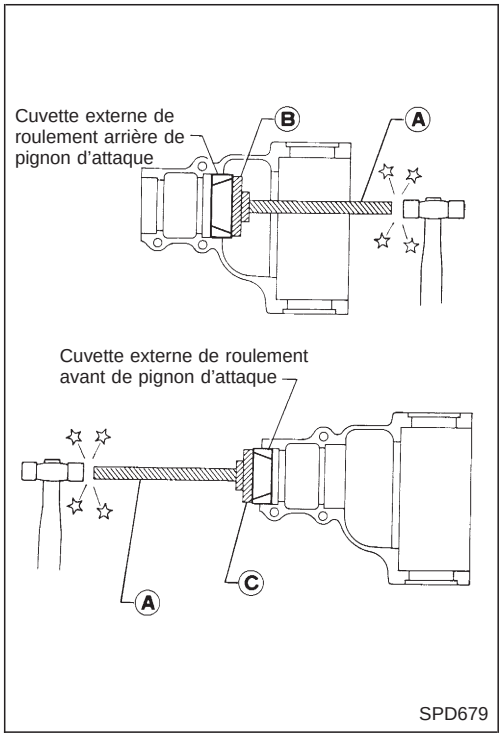


SPD643

3. Reposer les logements de différentiel gauche et droit.

SPD746

4. Poser le logement de différentiel sur la couronne.
5. Appliquer du produit de blocage [Locktite (blocage de goujon) ou un équivalent] sur les boulons de la couronne, et visser les boulons.



Serrer les boulons en diagonale, en tapotant doucement les têtes de boulons avec un marteau.

PD353

6. Enfoncer à la presse les cônes internes du roulement latéral dans le logement de différentiel à l'aide des outils spéciaux.

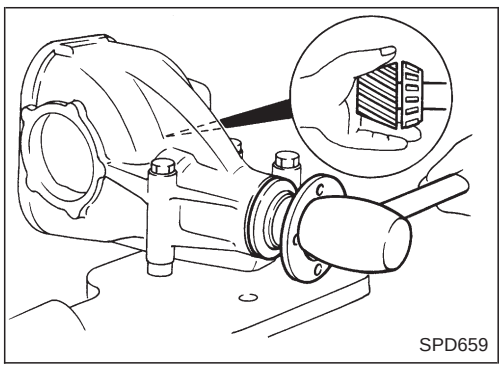
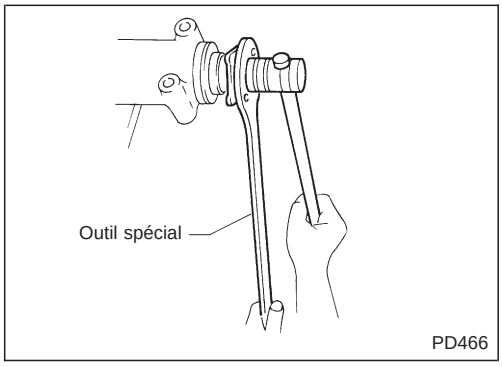
Carter de pont (Suite)



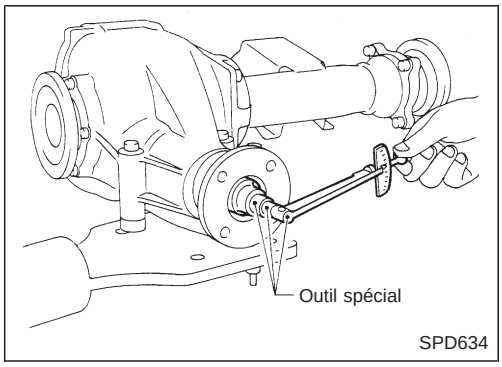
2. Sélectionner une rondelle de réglage de roulement de pignon d'attaque et une rondelle de réglage de hauteur du pignon d'attaque. Consulter le titre ''REGLAGE'', PD-25.
3. Reposer la rondelle de réglage de hauteur de pignon d'attaque sur le pignon d'attaque, et monter à la presse le cône interne de roulement arrière dans ce dernier, à l'aide d'une presse et de l'outil spécial.
   Numéro de l'outil : ST30901000



4. Placer le cône interne de roulement avant de pignon d'attaque dans le carter de pont.
5. Remplir le creux entre les lèvres du joint d'huile de graisse à usages multiples. Monter le joint d'huile avant.
   Numéro de l'outil : ST30720000

6. Placer l'entretoise de roulement du pignon d'attaque, la rondelle de réglage de roulement du pignon et le pignon d'attaque dans le carter de pont.

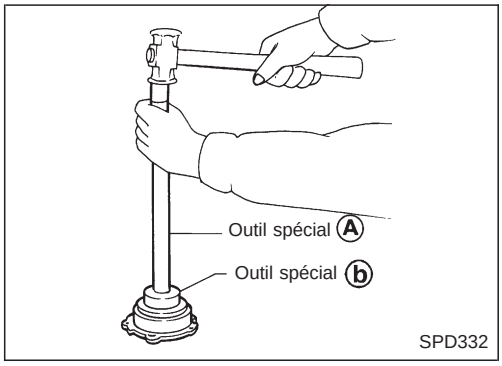
7. Introduire le flasque d'accouplement dans le pignon d'attaque en le tapant légèrement avec un maillet à tête souple.



8. Serrer l'écrou de pignon d'attaque au couple spécifié.

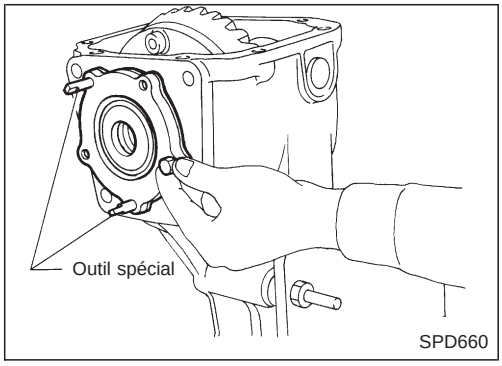
Eliminer toutes traces d'huile ou de graisse du filetage du pignon d'attaque et de l'écrou de pignon.

Numéro de l'outil : ST38060002

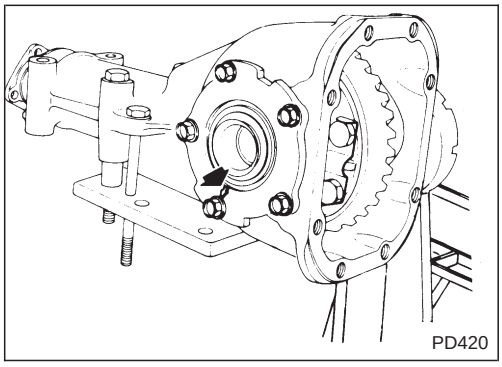


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Carter de pont (Suite)

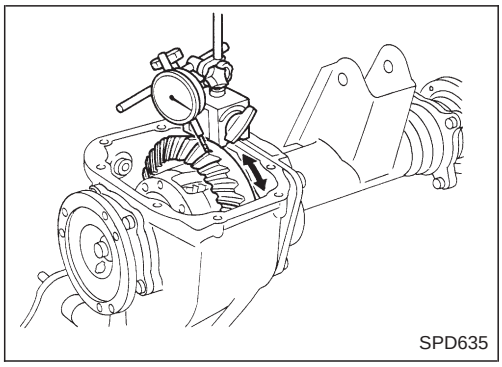


9. Tourner le pignon d'attaque de plusieurs tours dans les deux sens et mesurer la précharge de roulement du pignon.
   Numéro de l'outil : ST3127S000
   Précharge de roulement du pignon (avec le joint d'huile avant) :
   1,1 - 1,7 N·m (11 - 17 kg-cm)
   Précharge de roulement du pignon (sans le joint d'huile avant) :
   1,0 - 1,6 N·m (10 - 16 kg-cm)



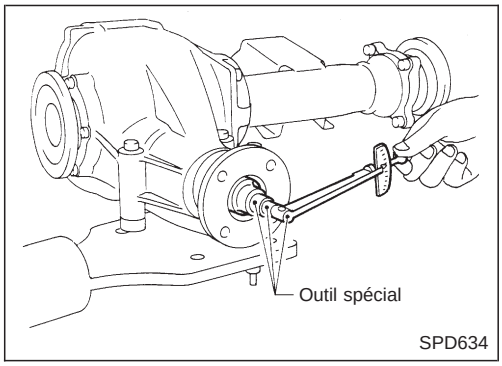
Si la précharge de roulement du pignon est hors spécifications, remplacer la rondelle de réglage de roulement de pignon et l'entretoise par des pièces d'épaisseur différentes.

10. Sélectionner une cale de réglage de pièce de retenue latérale. Consulter le titre ''REGLAGE'', PD-24.
11. Monter la cuvette externe de roulement latéral dans la pièce de retenue latérale.
    Numéros d'outils :
    Ⓐ ST30611000
    Ⓑ ST30621000



12. Monter le joint d'huile latéral sur la pièce de retenue latérale.
    Numéro de l'outil : ST33270000
13. Monter l'ensemble du logement de différentiel.
14. Placer les cales de réglage de retenue latérale (consulter ''REGLAGE'', PD-24), et le joint torique sur la pièce de retenue latérale, puis monter le tout dans le carter de pont.
    Numéro de l'outil : ST33720000

- Aligner les flèches poinçonnées sur la retenue latérale et le carter de pont.



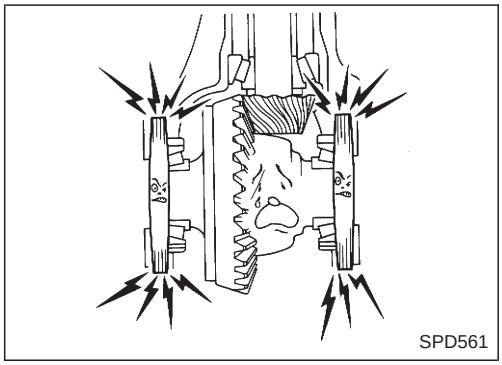
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Carter de pont (Suite)

SPD635

15. Mesurer le battement entre la couronne et le pignon d'attaque avec un comparateur à cadran.
    Battement entre la couronne et le pignon d'attaque :
    0,13 - 0,18 mm
- Si le battement est trop petit, diminuer l'épaisseur de la cale droite et augmenter l'épaisseur de la cale gauche d'une quantité égale.
  Si le battement est trop grand, inverser la procédure ci-dessus.

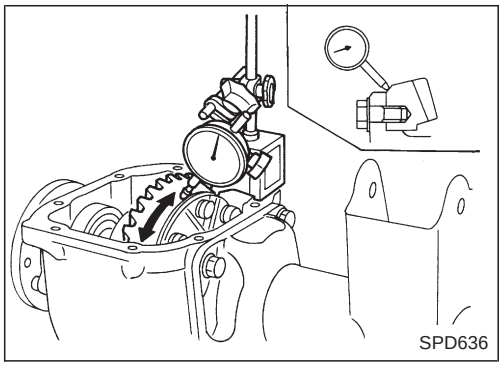
Ne jamais changer la quantité totale de cales d'épaisseur, car ceci changera la précharge des roulements.



SPD634

16. Contrôler la précharge totale à l'aide de l'outil spécial.

Lors du contrôle de la précharge, faire tourner le pignon d'attaque plusieurs fois dans les deux sens pour asseoir les rouleaux de roulement.



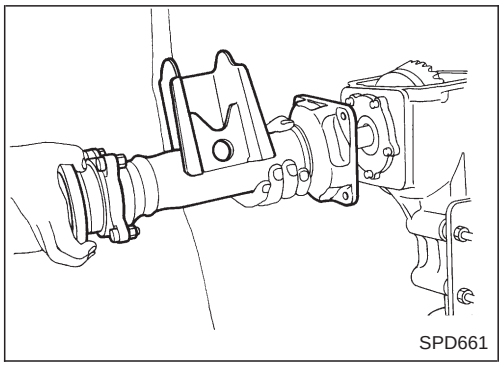
Numéro de l'outil : ST3127S000
Précharge totale :
1,2 - 2,3 N·m
(12 - 23 kg-cm)

SPD561

- Si la précharge est trop grande, ajouter la même épaisseur de cale de chaque côté.
- Si la précharge est trop petite, retirer la même épaisseur de cale de chaque côté.

Ne jamais rajouter ou enlever un nombre différent de cales d'épaisseur de chaque côté, car ceci changera le battement entre la couronne et le pignon d'attaque.

17. Vérifier à nouveau le battement entre la couronne et le pignon d'attaque car celui-ci peut changer avec l'augmentation ou la diminution de l'épaisseur des cales.



SPD636

18. Contrôler le voile de la couronne à l'aide d'un comparateur à cadran.
    Limite de voile :
    0,05 mm
- Si le battement varie de manière excessive en plusieurs endroits, les variations proviennent parfois de la présence de corps étrangers entre la couronne et le logement de différentiel.
- Si le battement varie fortement alors que le voile de la couronne se trouve dans les limites spécifiées, il faut remplacer le jeu de pignons hypoïdes ou le logement de différentiel.

19. Contrôler le contact entre les dents. Consulter le titre ''REGLAGE'', PD-28.
20. Remonter le couvercle arrière et le joint plat.

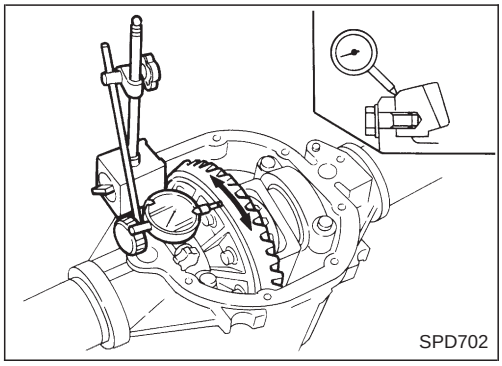
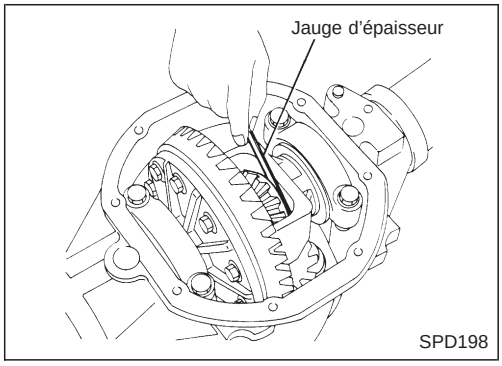
Inspection préalable

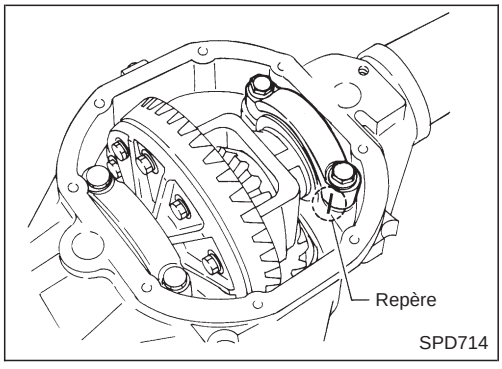


Avant de démonter le pont, il faut effectuer l'inspection ci-dessous.

- Précharge totale



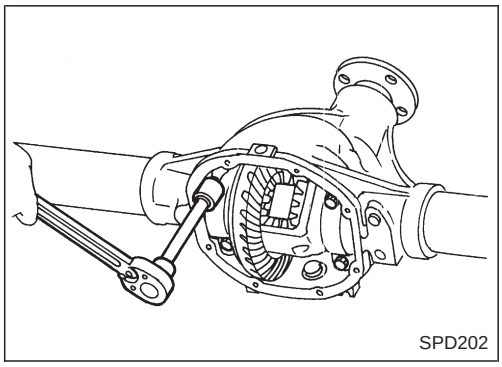
a. Tourner le pignon d'attaque de plusieurs tours dans les deux sens pour asseoir les rouleaux de roulement.
b. Contrôler la précharge totale à l'aide de l'outil spécial.
   Numéro de l'outil : ST3127S000
   Précharge totale :
   1,2 - 2,3 N·m
   (12 - 23 kg-cm)



- Battement entre la couronne et le pignon d'attaque.
  Vérifier le battement de la couronne à l'aide d'un comparateur à cadran, à plusieurs endroits.
  Battement entre la couronne et le pignon d'attaque :
  0,13 - 0,18 mm

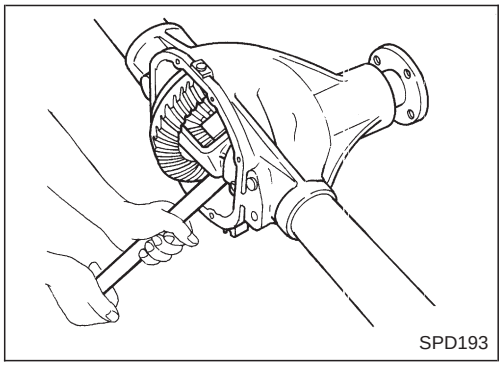
- Voile de la couronne
  Contrôler le voile de la couronne à l'aide d'un comparateur à cadran.
  Limite de voile : 0,05 mm

- Contact entre les dents
  Contrôler le contact entre les dents. Consulter le titre ''REGLAGE'', PD-52.
- Battement entre les planétaires et les satellites
  Mesurer le jeu entre la rondelle de butée de planétaire et le logement de différentiel à l'aide d'un calibre d'épaisseur.
  Jeu entre rondelle de butée de planétaire et logement de différentiel :
  Moins de 0,15 mm



Boîtier de différentiel

1. Déposer le couvercle arrière et le joint plat du couvercle arrière.
2. Tracer des marques de repère sur un côté du chapeau de roulement latéral avec de la peinture ou un poinçon pour s'assurer qu'il est remis en position adéquate lors du remontage.



Les chapeaux de roulement sont alésés en ligne durant l'usinage et doivent être reposés dans leur position d'origine.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

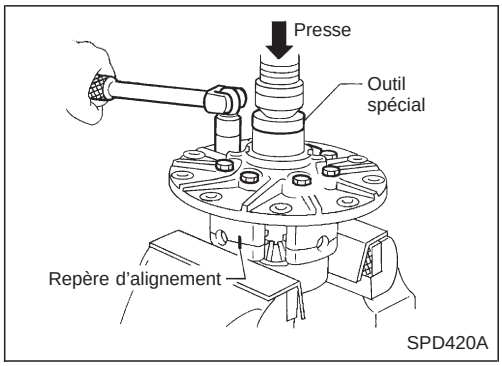
Nombre de disques et plateaux (un côté)

Modèle	C200
Disque de friction	6
Plateau de friction	6
Plaque à ressort	1

ATTENTION :
Ne pas faire tourner le moteur lorqu'une seule roue (arrière) est décollée du sol.

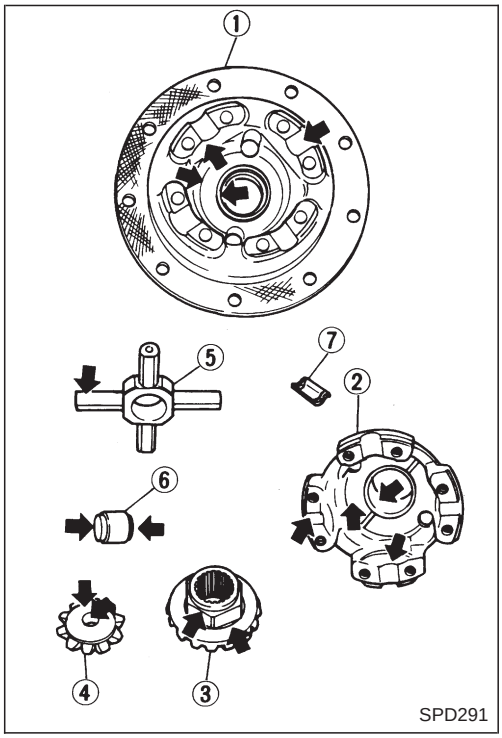


Préparation pour démontage

VERIFICATION DU COUPLE DE DIFFERENTIEL

Mesurer le couple de différentiel avec les outils spéciaux.
S'il n'est pas dans les limites spécifiées, inspecter les composants du différentiel à glissement limité.

Couple de différentiel :
88 - 108 N·m
(9,0 - 11,0 kg-m)
Numéros d'outils :
(A) KV38105110
(B) KV38105120

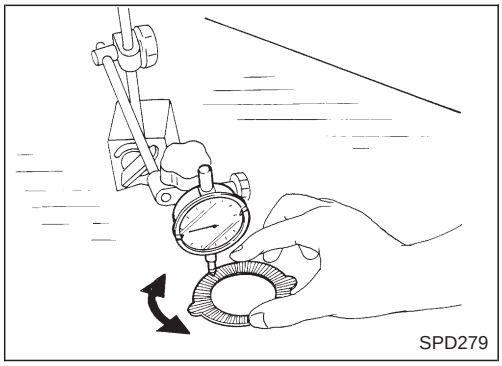


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Démontage

1. Déposer les boulons du coupleur à la presse.
   Numéro de l'outil : ST33081000
2. Séparer les logements de différentiel A et B.
   Sortir les composants internes (disques et plateaux, etc.).

Tracer des repères sur les logements de différentiel de manière à pouvoir les réinstaller dans leur position d'origine.

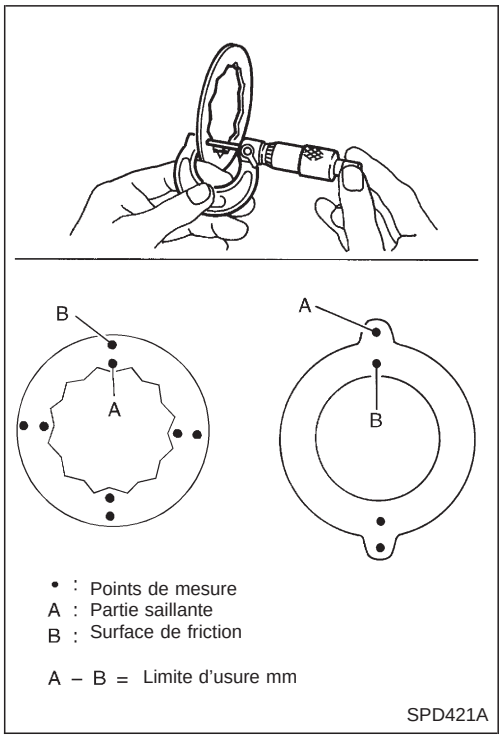


Inspection

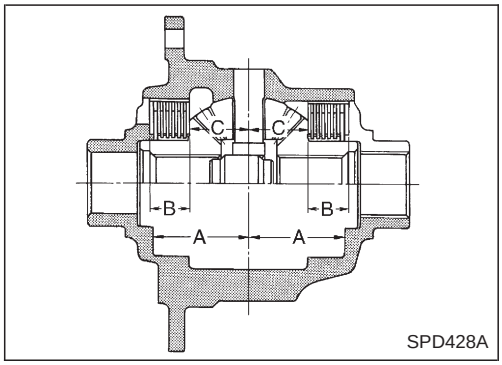
SURFACES DE CONTACT

1. Nettoyer les pièces démontées dans un bain de solvant approprié et les sécher à l'air comprimé.
2. Si les surfaces suivantes présentent des traces de bavures ou de rayures, les poncer avec une pierre à fusil.
   ① Logement de différentiel B
   ② Logement de différentiel A
   ③ Planétaire
   ④ Satellite
   ⑤ Axe de satellite
   ⑥ Butoir
   ⑦ Guide de plateau de friction

DISQUE ET PLATEAU



1. Nettoyer les disques et les plateaux dans un bain de solvant approprié et les sécher à l'air comprimé.
2. Vérifier si les disques et les plateaux ne sont pas usés, ébréchés et qu'ils ne présentent pas de bavures.



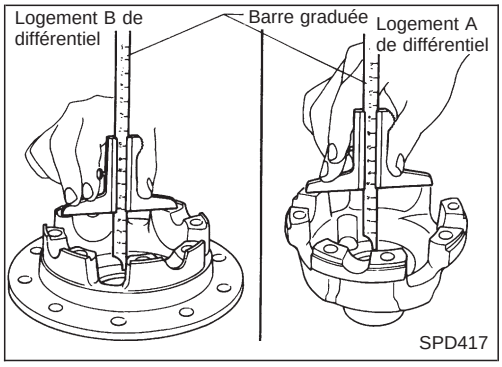
3. Vérifier si les disques ou plateaux de friction ne sont pas voilés.
   Voile maximum toléré :
   0,08 mm
   Si la limite est dépassée, remplacer par un nouveau disque ou plateau pour éviter que l'embrayage ne patine ou ne colle.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (Suite)

4. Mesurer les surfaces de friction et les parties saillantes des disques de friction, des plateaux de friction et de la plaque à ressort. Si l'une des pièces est usée au-delà de la limite spécifiée, la remplacer avec une pièce neuve ayant la même épaisseur que la partie protubérante.
   Limite d'usure :
   0,1 mm ou moins

Réglage

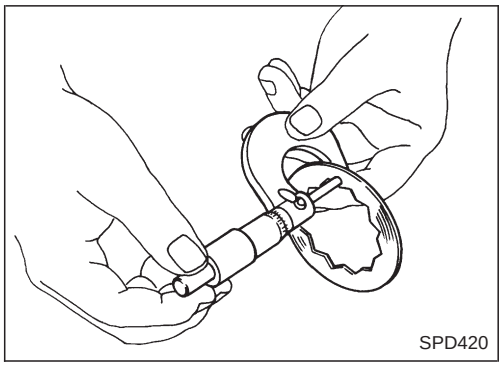


JEU AXIAL ENTRE DISQUE DE FRICTION ET PLATEAU DE FRICTION

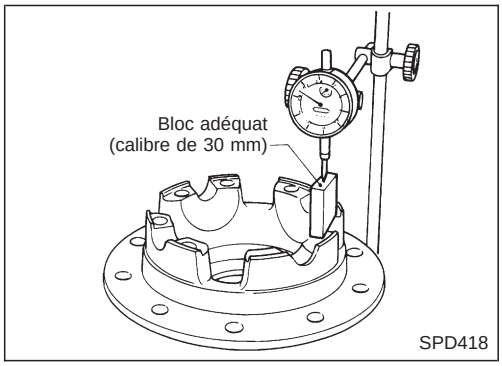
Le jeu axial des disques et plateaux de friction peut être calculé à l'aide de l'équation suivante et doit être réglé dans la plage suivante.
Le réglage peut se faire en choisissant un disque de friction ayant deux épaisseurs différentes.

Jeu axial E :
0,05 - 0,15 mm

E = A − (B + C)



A : Longueur de la surface de contact du logement de différentiel par rapport au fond intérieur du logement de différentiel.
B : Epaisseur totale des disques de friction, des plateaux de friction et de la plaque à ressort d'un côté du logement de différentiel.
C : Longueur de la surface de contact du logement de différentiel par rapport au côté arrière du planétaire de différentiel

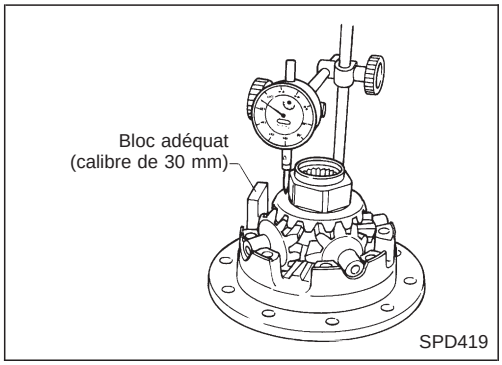


1. Valeurs de mesure de ''A''.
   Longueur standard A :
   49,50 - 49,55 mm

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Réglage (Suite)

SPD420



2. Mesurer l'épaisseur de chaque disque et plateau.
   Epaisseur totale "B" :
   19,24 - 20,36 mm
   Nombre de disques et plateaux (un côté) :
   Disques de friction 6
   Plateaux de friction 6
   Plaque à ressort 1

SPD418

3. Mesurer les valeurs de "C".
a. Monter un comparateur à cadran sur la plaque de base.
b. Placer le logement de différentiel B sur la plaque de base, et reposer le calibre sur le logement B.

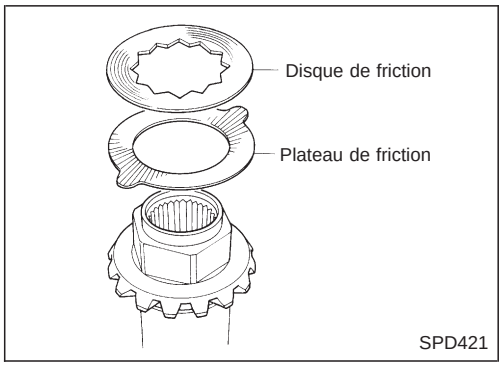
Etalonner ensuite le comparateur en plaçant son pointeau sur le calibre.

SPD419

c. Reposer les satellites, les planétaires et l'axe de satellite dans le logement de différentiel B.
d. Placer le pointeau du comparateur à cadran sur le planétaire, et lire la mesure.

Exemple :

E = A − D
= A − (B + C)
= 0,05 à 0,15 mm
A = 49,52 mm
B = 19,45 mm
C = 29,7 mm
D = B + C



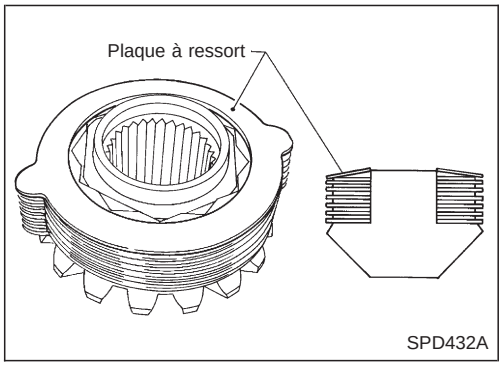
B . . .	19,45
+ C . . .	29,7
	49,15

E = A − D

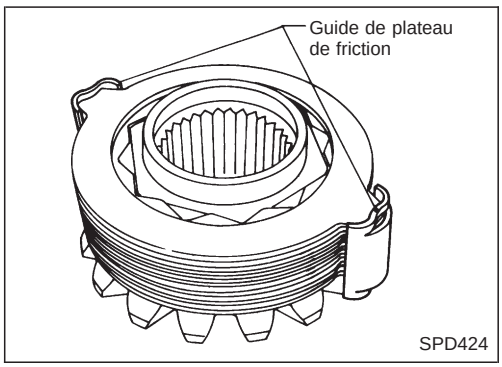
A . . .	49,52
−D . . .	49,15
	0,37

D'après l'équation ci-dessus, le jeu axial de 0,37 mm dépasse la limite spécifiée entre 0,05 et 0,15 mm.
Sélectionner des disques et plateaux appropriés pour assurer un réglage correct.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



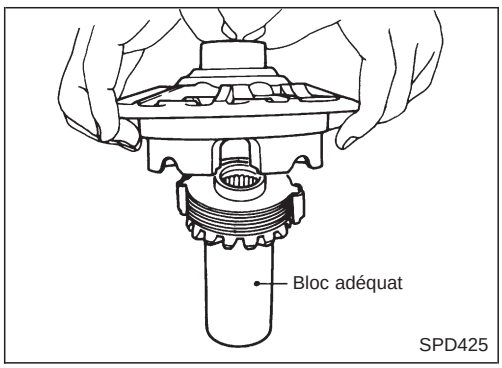
Remontage



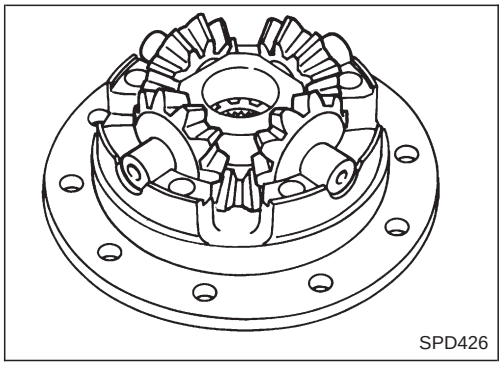
Avant d'assembler les disques et les plateaux, les lubrifier dans un bain d'huile pour différentiel à glissement limité.

1. Faire alterner les plateaux et les disques de friction en observant les numéros spécifiés à l'arrière du planétaire.

Toujours positionner le plateau de friction en premier lieu sur l'arrière du planétaire.



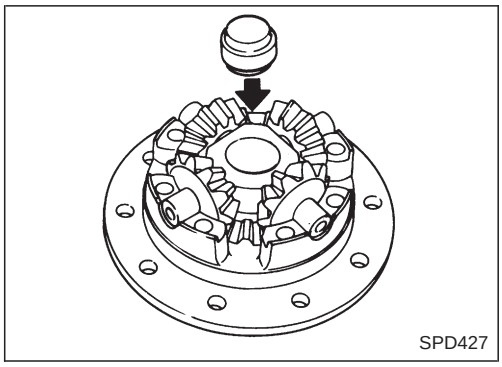
2. Reposer la plaque à ressort.



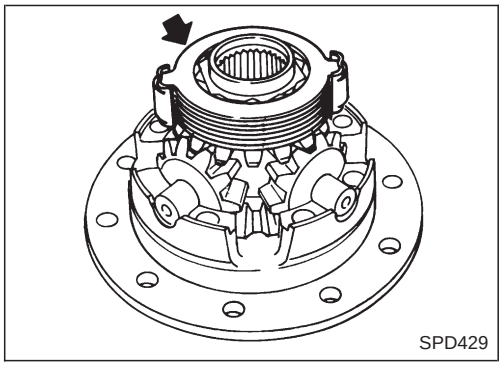
3. Reposer les guides de plateaux de friction.

Aligner correctement les protubérances des plateaux de friction et enduire de graisse les surfaces internes des guides de plateaux de friction afin de les empêcher de tomber.

4. Monter le logement de différentiel B sur l'ensemble constitué par les planétaires, les disques, les plateaux et le guide de plateau de friction.



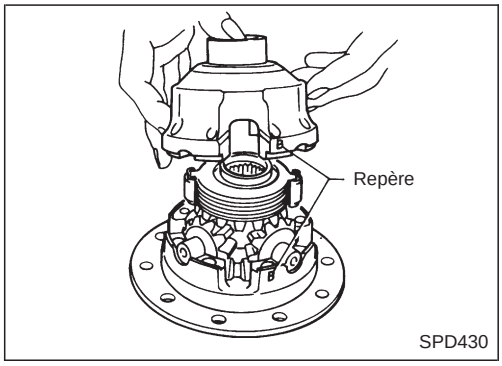
- **Reposer le support de différential B en soutenant les guides de plateaux de friction avec le majeur par l'orifice d'huile du logement de différentiel.**
- **Veiller à ne pas détacher la plaque à ressort de la partie héxagonale du planétaire.**



5. Monter les satellites et l'axe de satellite dans le logement de différentiel B.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Remontage (Suite)

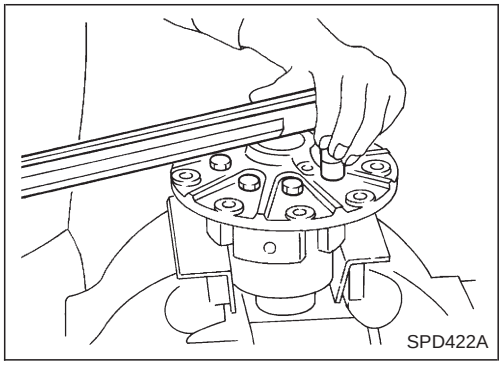


SPD427

6. Reposer le butoir.

SPD429

7. Reposer le planétaire sur les satellites.
8. Reposer chaque disque et plateau.



Suivre la même procédure que celle décrite aux étapes 1 à 3.

SPD430

9. Reposer le logement de différentiel A.

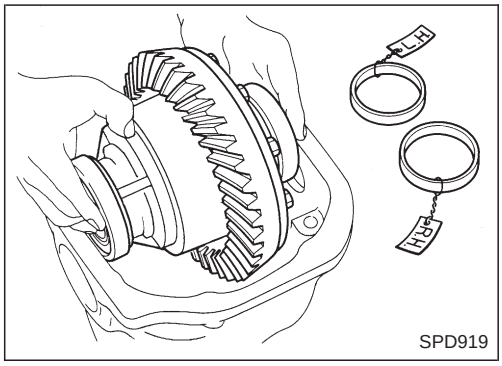
Positionner les logements de différentiel A et B en alignant les repères sur les logements.

SPD422A

10. Serrer les boulons du logement de différentiel.
11. Placer la couronne sur le logement de différentiel et reposer des boulons neufs.

Serrer les boulons en diagonale, en tapotant doucement les têtes de boulons avec un marteau.

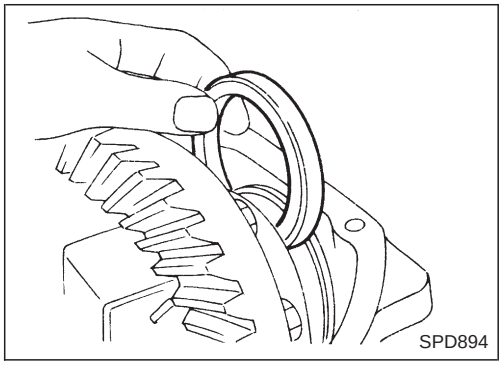
12. Reposer le cône interne de roulement latéral.
13. Vérifier le couple de différentiel.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

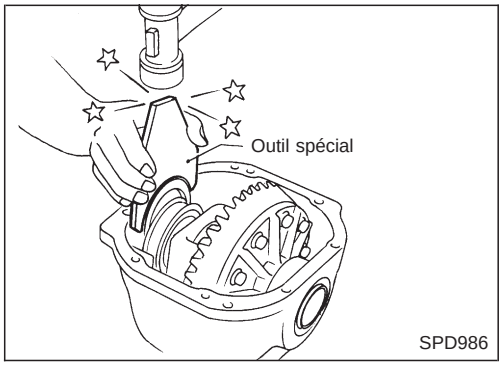
Pour que le pont puisse fonctionner de façon silencieuse et fiable, les cinq réglages suivants doivent être exécutés correctement.

1. Précharge du roulement latéral.
2. Hauteur du pignon d'attaque.
3. Précharge de roulement du pignon. Consulter le titre ''REMONTAGE'', PD-56.
4. Battement entre la couronne et le pignon. Consulter le titre ''REMONTAGE'', PD-57.
5. Jeu d'entre-dents de la couronne et du pignon.



Précharge de roulement latéral

Une sélection de cales de précharge de roulement latéral de support de différentiel est utile pour mener à bien cette procédure.



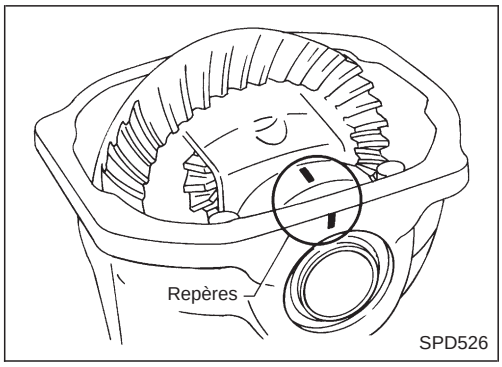
SPD919

1. S'assurer que toutes les pièces sont propres. S'assurer également que les roulements ont bien été lubrifiés avec de l'huile fluide ou de l'huile pour boîte automatique de type ''DEXRON™''.
2. Mettre en place le boîtier de différentiel, contenant les roulements latéraux et les cuvette de roulement, dans le carter de pont.

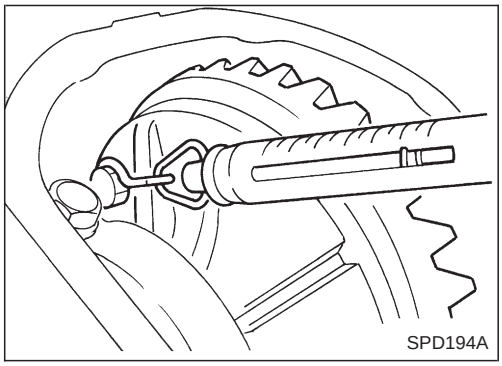
SPD894

3. Mettre l'entretoise de roulement latéral en place.

ATTENTION :
L'entretoise de roulement latéral est placée sur la droite ou sur la gauche en fonction du rapport de la vitesse du pont. Veiller à la replacer du bon côté.

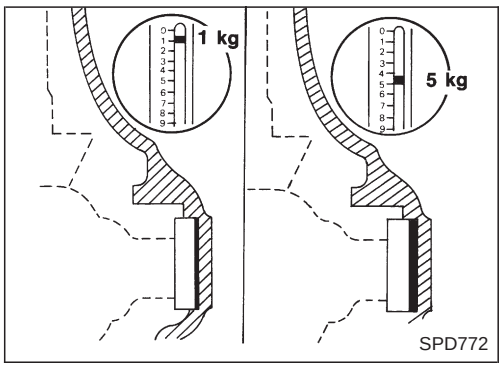


SPD986



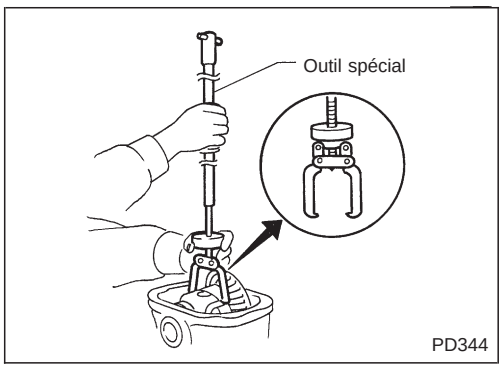
4. Utiliser l'outil spécial pour placer les cales d'origine de précharge de roulement latéral du support de différentiel sur l'extrémité du support, du côté opposé à la couronne.
   Numéro de l'outil : KV38100600

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

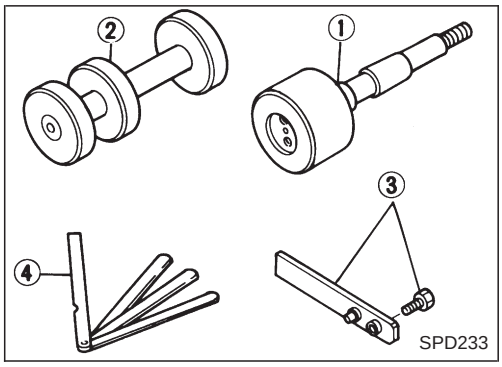


Précharge de roulement latéral (Suite)

5. Placer les chapeaux des roulements latéraux en position correcte et serrer au couple prescrit les boulons de serrage des chapeaux de roulements.
   Spécification :
   88 - 98 N·m
   (9,0 - 10,0 kg-m)
6. Tourner le support de différentiel plusieurs fois pour asseoir les roulements.



7. Mesurer le couple de rotation du support de différentiel avec un dynamomètre au niveau du boulon de serrage de la couronne.
   Spécification :
   34,3 - 39,2 N (3,5 - 4,0 kg) de force de traction au boulon de couronne

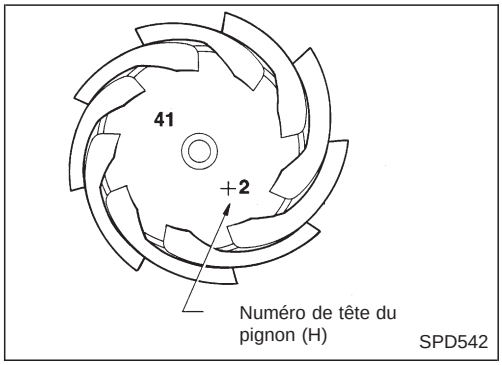


8. Si le couple de rotation n'est pas compris dans les spécifications, le corriger de la manière suivante :
- Si le couple de rotation est inférieur à la valeur spécifiée, installer des rondelles plus épaisses.
- Si le couple de rotation est supérieur à la valeur spécifiée, installer des rondelles plus fines.
- Consulter la section relative aux SDS pour les dimensions de rondelles et les numéros de pièces.

9. Noter la quantité totale d'épaisseur de cale nécessaire pour obtenir une précharge de roulement latéral de support de différentiel correcte.

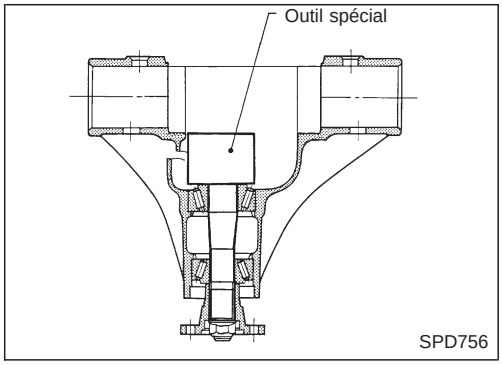
10. Déposer le support de différentiel du carter de pont. Conserver les rondelles de précharge sélectionnées pour un usage ultérieur lors du remontage de l'unité de pont.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Hauteur de pignon d'attaque

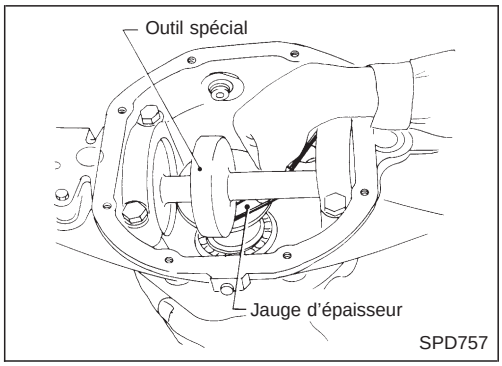
1. Préparer les outils spéciaux permettant le réglage de la hauteur du pignon d'attaque.



① Faux-arbre (KV38103910)
② Jauge de hauteur (KV38100120)
③ Arrêt (KV38100140)
④ Jauge d'épaisseur

2. Pour faciliter le travail, préparer un tableau, comme celui ci-dessous, pour organiser les calculs.

LETTRES	CENTIEMES DE MILLIMETRE
H : Numéro de tête du pignon	
N : Mesure du jeu	



3. Reporter les chiffres suivants dans le tableau.
H : Numéro de tête du pignon

4. Placer l'outil spécial (faux-arbre) de la façon indiquée ci-contre et serrer avec précaution l'écrou de pignon d'attaque à une précharge de 1,0 à 1,3 N·m (10 à 13 kg-cm).
Numéro de l'outil : KV38103910

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Hauteur de pignon d'attaque (Suite)

5. Monter l'outil (jauge de hauteur) dans le carter de pont et mesurer le jeu ''N'' entre la jauge de hauteur et la face du faux-arbre.
   Numéro de l'outil : KV38100120
6. Substituer ces valeurs dans l'équation pour calculer l'épaisseur de la rondelle.

Si la valeur représentant H n'est pas donnée, la considérer comme nulle et procéder au calcul.

T (épaisseur de la rondelle) = N − (H x 0,01) + 3,00

Exemple :

N = 0,23
H = 1

T = N − (H x 0,01) + 3,00 = 0,23 − (1 x 0,01) + 3,00

(1) H 1
x 0,01

+0,01

(2) N 0,23
− (+0,01)

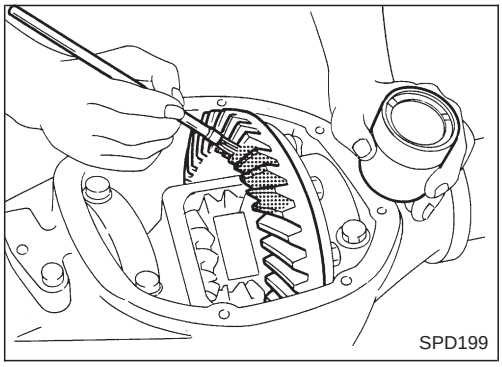
0,22

(3) 0,22
+3,00

3,22

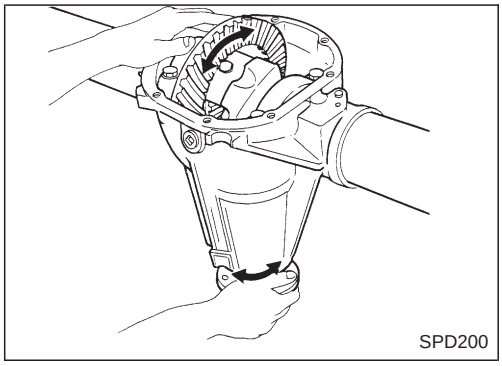
∴T = 3,22

7. Sélectionner la rondelle adéquate (consulter les SDS).



Si l'on ne peut trouver une rondelle de l'épaisseur désirée, utiliser une rondelle dont l'épaisseur est la plus proche de la valeur calculée.

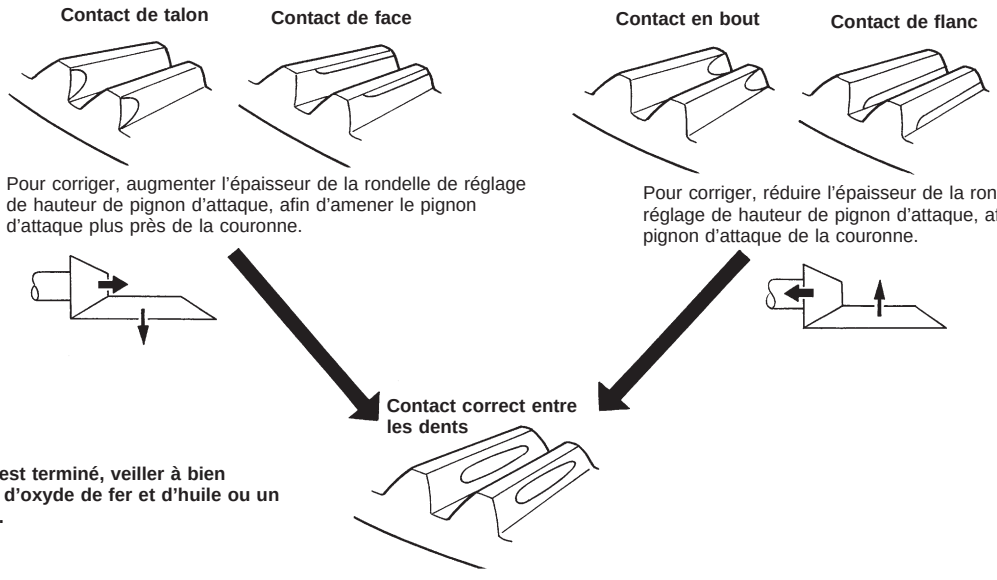
Exemple :
Valeur calculée . . . T = 3,22 mm
Rondelle à utiliser . . . T = 3,21 mm



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Contact entre les dents

Il est nécessaire de vérifier le jeu d'entre-dents, afin de s'assurer que la relation entre la couronne et le pignon d'attaque est correcte.
Des jeux de pignons hypoïdes en position incorrecte pourront être bruyants ou voir leur durée de vie abrégée. On peut assurer un niveau de bruit minimum et une longévité maximum grâce à la vérification du contact entre les dents.

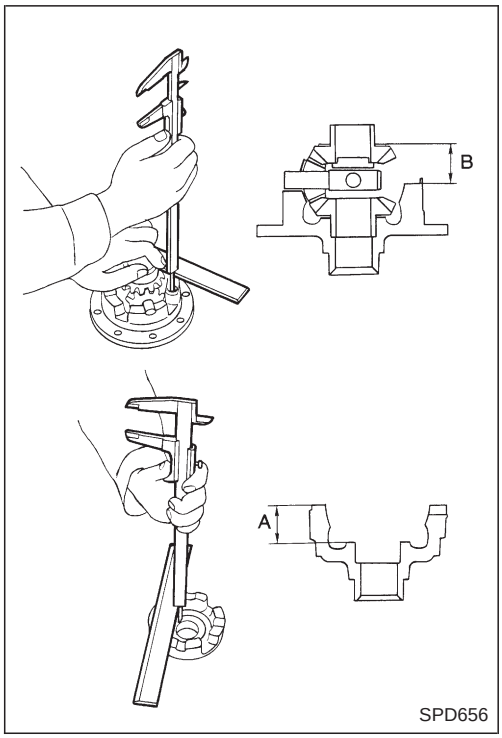


SPD199

1. Nettoyer soigneusement les dents de la couronne et du pignon d'attaque.
2. Appliquer une très légère quantité d'oxyde de fer en poudre et d'huile ou un mélange équivalent sur 3 ou 4 dents du côté entraînement de la couronne.

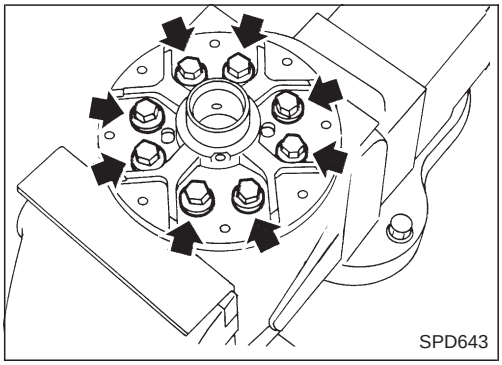
SPD200

3. Maintenir le flasque d'accouplement à l'arrêt et faire tourner la couronne dans les deux sens.



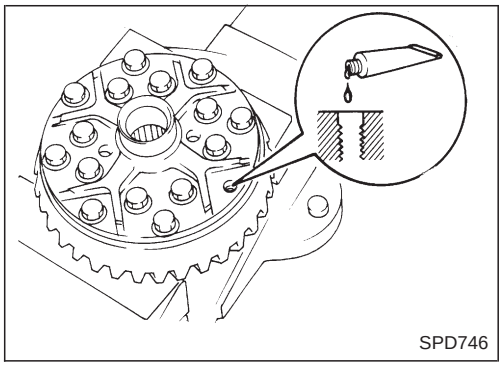
En principe, le contact entre les dents sera correct si l'on a correctement calculé l'épaisseur des cales et si le battement est correct. Néanmoins, il peut arriver qu'il soit nécessaire de suivre une méthode empirique afin d'obtenir un contact correct entre les dents. La surface de contact entre les dents sera la meilleure indication de la justesse du réglage du différentiel.

Lorsque le réglage est terminé, veiller à bien essuyer toute trace d'oxyde de fer et d'huile ou un mélange équivalent.



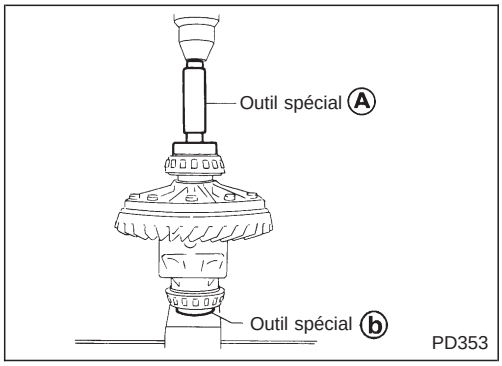
SPD007

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

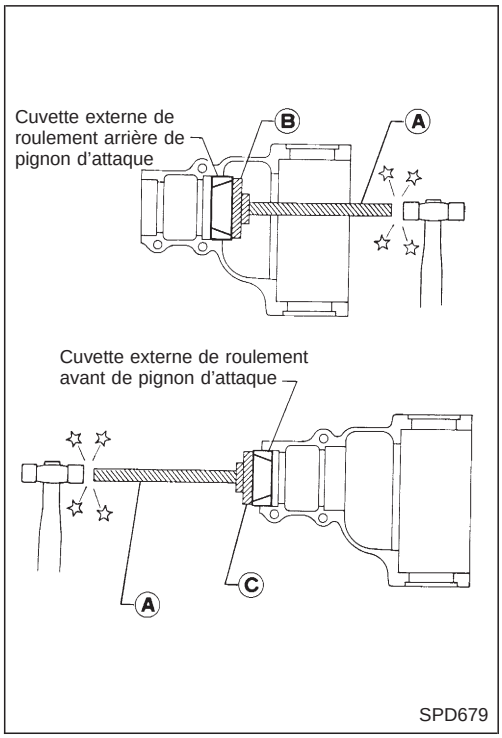


Logement de différentiel

1. Mesurer le jeu entre la rondelle de butée de planétaire et le logement de différentiel.
   Jeu entre rondelle de butée de planétaire et logement de différentiel (A − B) :
   Moins de 0,15 mm
   Le jeu peut être réglé au moyen d'une rondelle de butée de planétaire. Consulter les SDS, PD-83.
2. Enduire d'huile pour engrenages les surfaces des dents des planétaires et les surfaces de butée, et vérifier si l'ensemble tourne correctement.

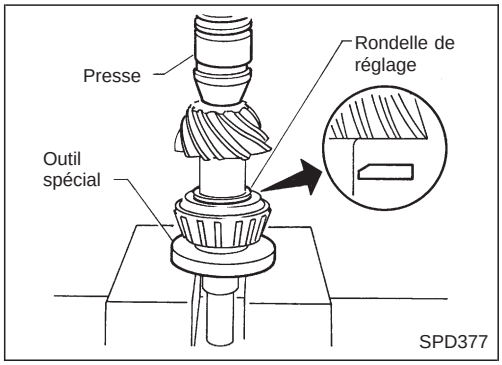


3. Reposer les logements de différentiel gauche et droit.



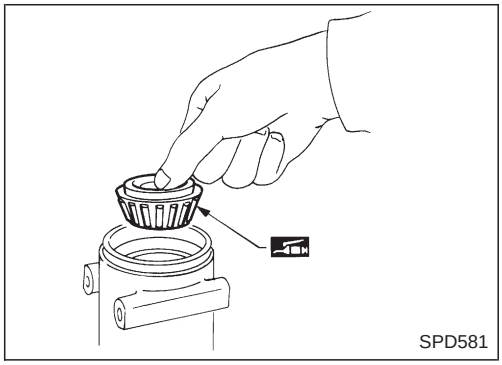
4. Poser le logement de différentiel sur la couronne.
5. Appliquer du produit de blocage [Locktite (blocage de goujon) ou un équivalent] sur les boulons de la couronne, et visser les boulons.

Serrer les boulons en diagonale, en tapotant doucement les têtes de boulons avec un marteau.

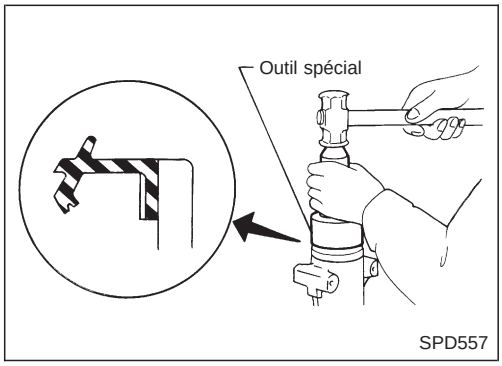


6. Enfoncer à la presse les cônes internes du roulement latéral dans le logement de différentiel à l'aide des outils spéciaux.
   Numéros d'outils :
   Ⓐ **ST33230000**
   Ⓑ **ST33081000**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

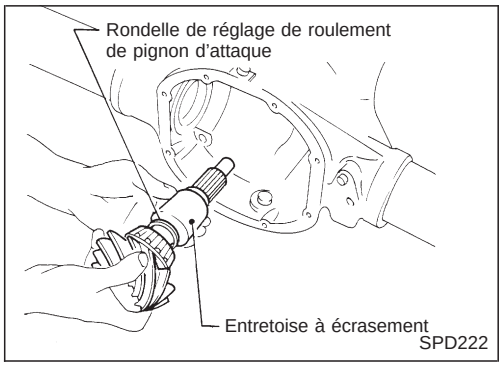


Boîtier de différentiel

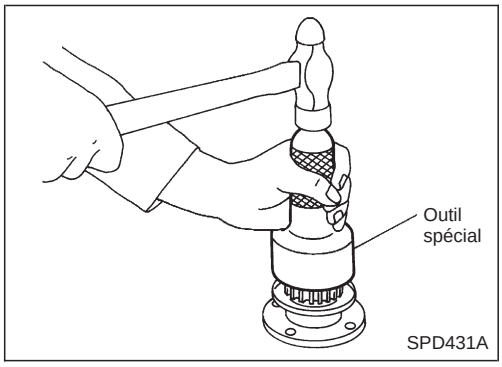


1. Enfoncer à la presse les cuvettes externes de roulement avant et arrière à l'aide des outils spéciaux.
   Numéros d'outils :
   - Ⓐ **ST30611000**
   - Ⓑ **ST30621000**
   - Ⓒ **ST30613000**

2. Sélectionner une rondelle de réglage de hauteur de pignon. Consulter le titre ''REGLAGE'', PD-50.
3. Monter la rondelle de réglage de hauteur de pignon sur le pignon d'attaque, puis monter à la presse le cône interne du roulement arrière dans ce dernier, à l'aide d'une presse et de l'outil spécial.
   Numéro de l'outil : ST30901000

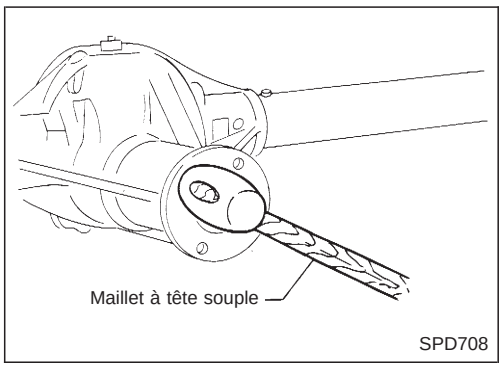


4. Placer le cône interne de roulement avant du pignon dans le carter de pont.

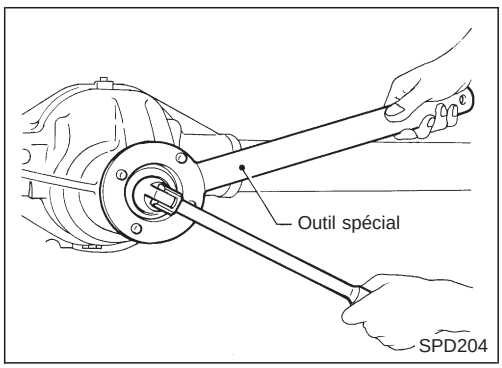


5. Remplir le creux entre les lèvres du joint d'huile de graisse à usages multiples. Monter le joint d'huile avant.
   Numéro de l'outil : KV38100500

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

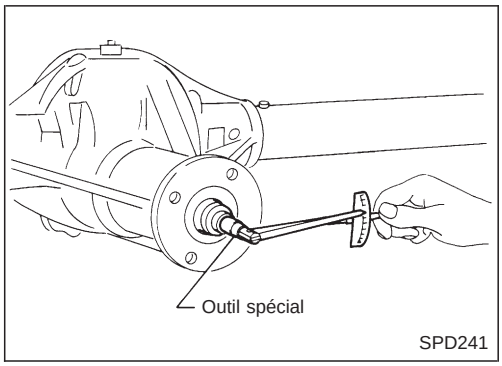


Boîtier de différentiel (Suite)



6. Mettre en place l'entretoise de roulement du pignon d'attaque, la rondelle de réglage de roulement du pignon d'attaque et le pignon d'attaque dans le carter de pont.

7. Introduire le rotor du capteur dans le flasque d'accouplement avec l'outil spécial.
   Numéro de l'outil : ST30720000
8. Monter le boîtier de capteur d'ABS sur le carter de pont.

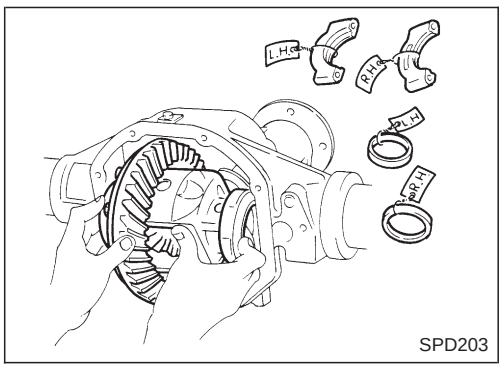


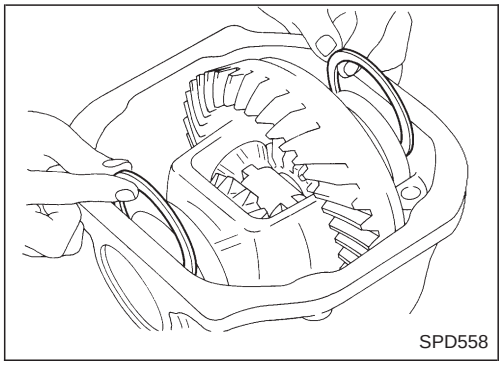
9. Installer le flasque d'accouplement dans le pignon d'attaque en le tapant légèrement avec un maillet à tête souple.

10. Serrer l'écrou de pignon à 127 N·m (13 kg-m).
Eliminer toutes traces d'huile ou de graisse du filetage du pignon d'attaque et de l'écrou de pignon.
Numéro de l'outil : ST38060002

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

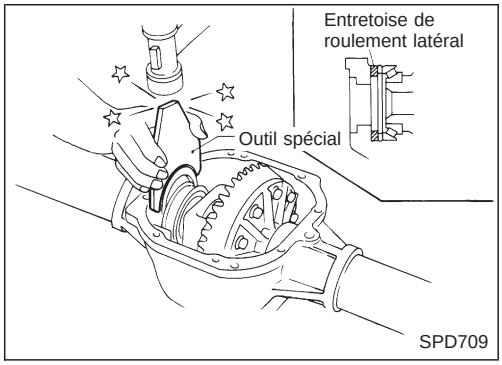
Boîtier de différentiel (Suite)





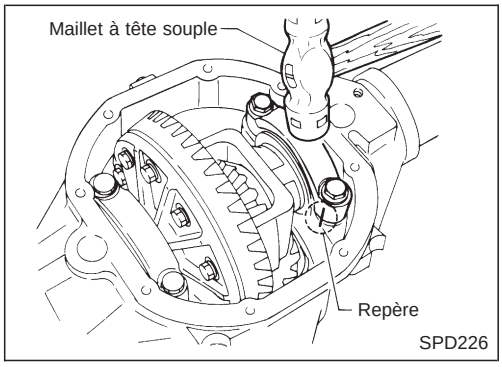
11. Serrer l'écrou de pignon progressivement par petits degrés jusqu'à ce que la précharge spécifiée soit obtenue. Lors du contrôle de la précharge, tourner le pignon d'attaque plusieurs fois dans les deux sens pour asseoir les rouleaux de roulement.
    Numéro de l'outil : ST3127S000
    Précharge de roulement du pignon (avec le joint d'huile avant) :
    1,1 - 1,7 N·m (11 - 17 kg-cm)
    Précharge de roulement du pignon (sans le joint d'huile avant) :
    1,0 - 1,6 N·m (10 - 16 kg-cm)

Il faudra répéter cette procédure si :

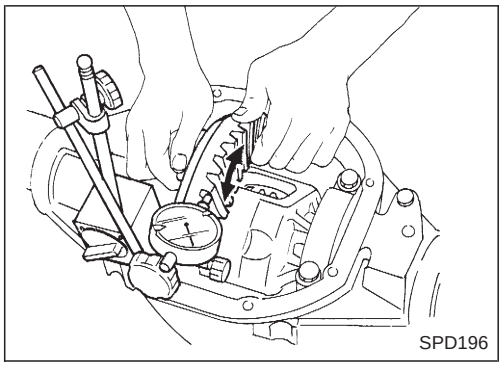


- **La précharge maximum est obtenue avant que le couple de serrage minimum d'écrou de pignon ne soit atteint.**
- **La précharge minimum n'est pas obtenue tant que le couple de serrage maximum d'écrou de pignon n'est pas atteint.**

12. Sélectionner une rondelle de réglage de roulement latéral. Consulter le titre Réglage.
13. Reposer l'ensemble de logement de différentiel avec les cuvettes externes de roulement latéral dans le carter de pont.

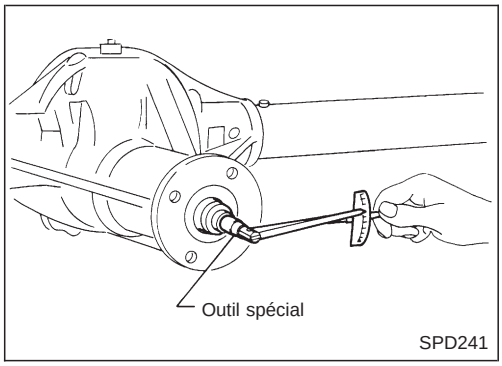


14. Mettre les rondelles de réglage des roulements latéraux gauche et droit en place entre les roulements latéraux et le carter de pont.



15. Enfoncer l'entretoise de roulement latéral à l'aide de l'outil spécial.
    Numéro de l'outil : KV38100600

16. Aligner les marques de repères des chapeaux de roulements avec celles du carter de pont et monter les chapeaux sur le carter de pont.



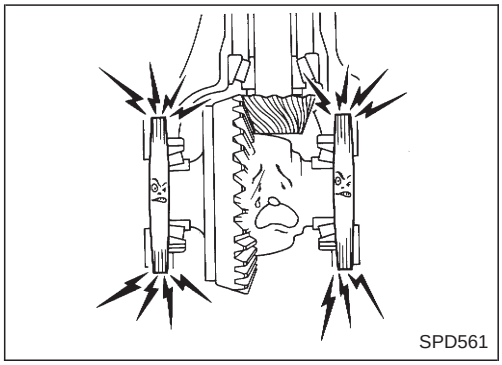
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Boîtier de différentiel (Suite)

SPD196

17. Mesurer le battement entre la couronne et le pignon d'attaque avec un comparateur à cadran.
    Battement entre la couronne et le pignon d'attaque :
    0,13 - 0,18 mm
- Si le battement est trop petit, diminuer l'épaisseur de la cale d'épaisseur droite et augmenter l'épaisseur de la cale gauche d'une quantité égale.
  Si le battement est trop grand, inverser la procédure ci-dessus.

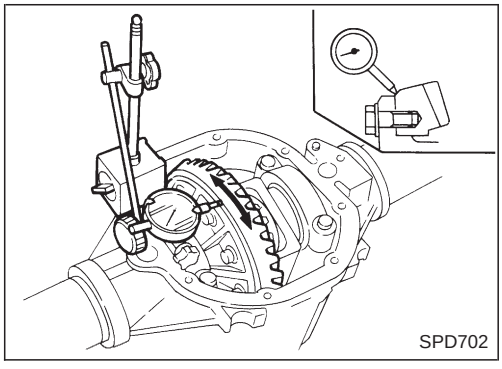
Ne jamais changer la quantité totale de cales d'épaisseur, car ceci changera la précharge des roulements.



SPD241

18. Contrôler la précharge totale à l'aide de l'outil spécial.

Lors du contrôle de la précharge, tourner le pignon d'attaque plusieurs fois dans les deux sens pour asseoir correctement les rouleaux de roulement.

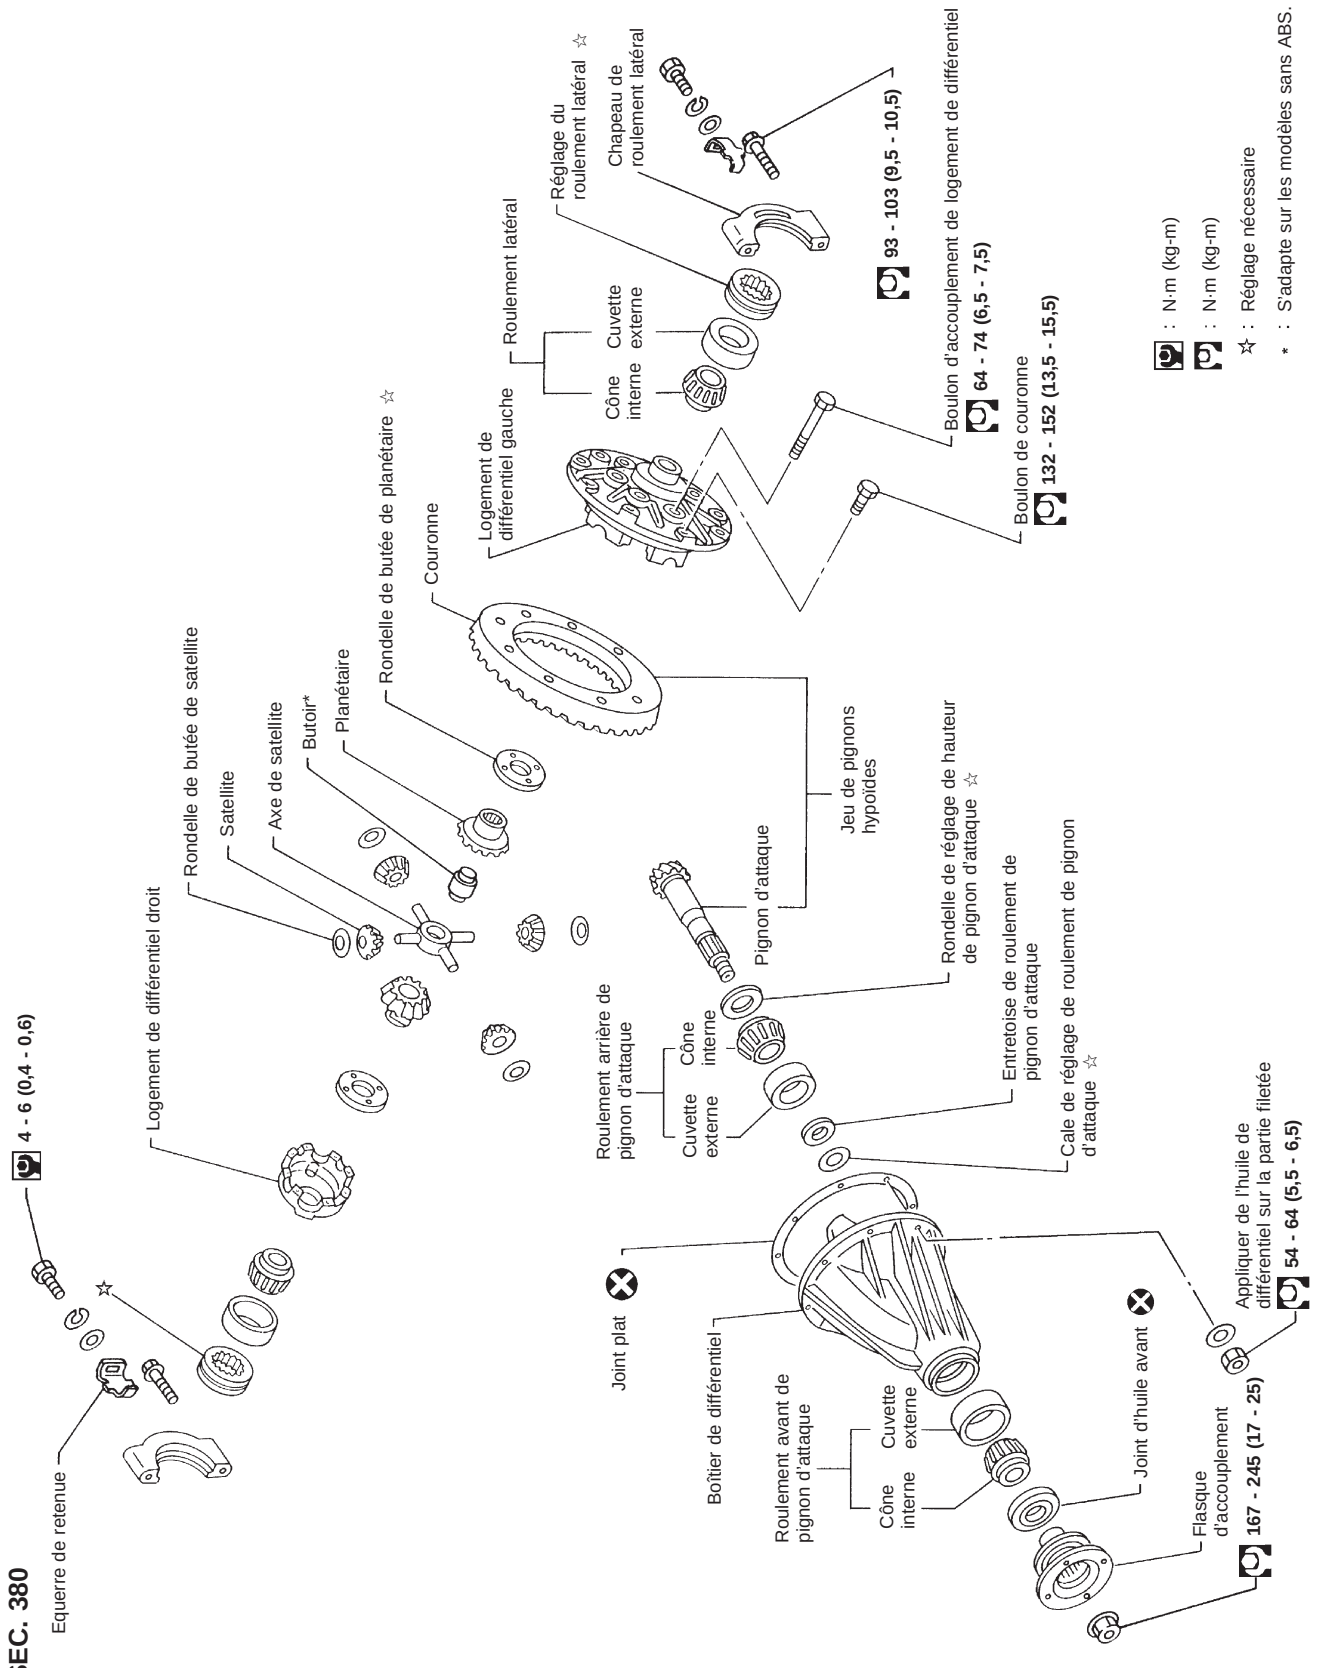


Précharge totale:
1,2 - 2,3 N·m (12 - 23 kg-cm)
Numéro de l'outil : ST3127S000

SPD561

- Si la précharge est trop grande, retirer la même épaisseur de cale de chaque côté.
- Si la précharge est trop faible, ajouter la même quantité de cale des deux côtés.

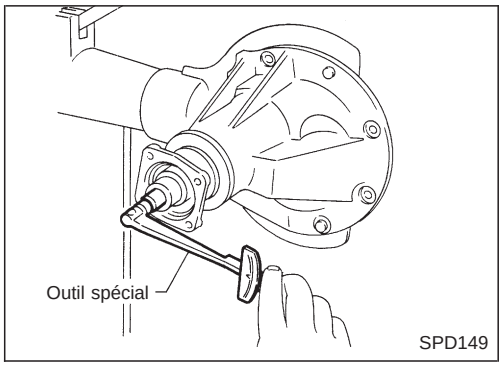
Ne jamais rajouter ou enlever un nombre différent de cales d'épaisseur de chaque côté, car ceci changera le battement entre la couronne et le pignon d'attaque.



19. Vérifier à nouveau le battement entre la couronne et le pignon d'attaque car celui-ci peut changer avec l'augmentation ou la diminution de l'épaisseur des cales.

SPD702

20. Contrôler le voile de la couronne à l'aide d'un comparateur à cadran.
    Limite de voile :
    0,05 mm
- Si le battement varie de manière excessive en plusieurs endroits, les variations proviennent parfois de la présence de corps étrangers entre la couronne et le logement de différentiel.
- Si le battement varie fortement alors que le voile de la couronne se trouve dans les limites spécifiées, il faut remplacer le jeu de pignons hypoïdes ou le logement de différentiel.



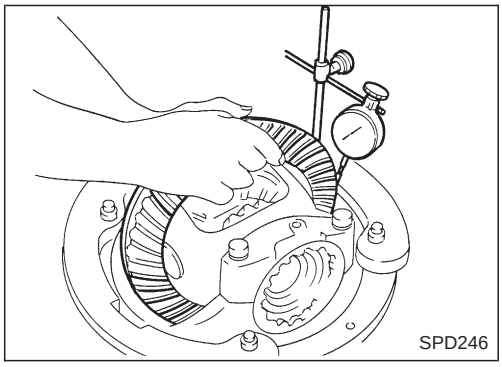
21. Contrôler le contact entre les dents. Consulter le titre ''REGLAGE'', PD-52.
22. Remonter le couvercle arrière et le joint plat.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SPD427A

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection préalable

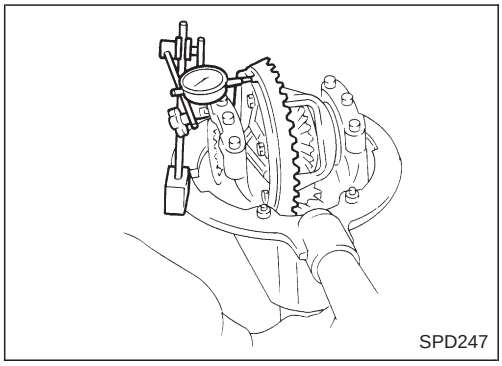


Avant de démonter le pont, effectuer l'inspection suivante.

- Précharge totale

a. Tourner le pignon d'attaque de plusieurs tours dans les deux sens pour asseoir correctement les rouleaux de roulement.

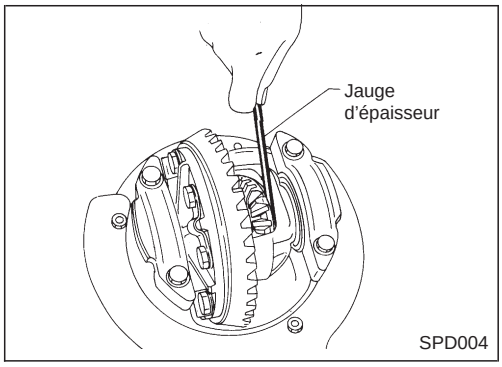
b. Contrôler la précharge totale à l'aide de l'outil spécial.



Précharge totale (avec joint d'huile avant) :
Roulement du pignon d'attaque
Neuf : 1,5 - 1,7 N·m (15 - 17 kg-cm)
Usagé : 1,7 - 2,5 N·m (17 - 25 kg-cm)
Numéro de l'outil : ST3127S000

- Battement entre la couronne et le pignon d'attaque

Vérifier le battement de la couronne à l'aide d'un comparateur à cadran, à plusieurs endroits.

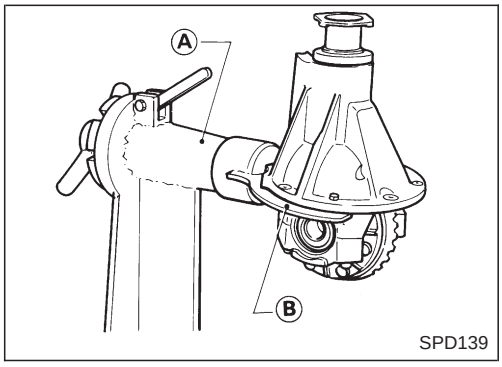


Battement entre la couronne et le pignon d'attaque :
0,13 - 0,18 mm

- Voile de la couronne

Contrôler le voile de la couronne à l'aide d'un comparateur à cadran.

Limite de voile :
0,08 mm



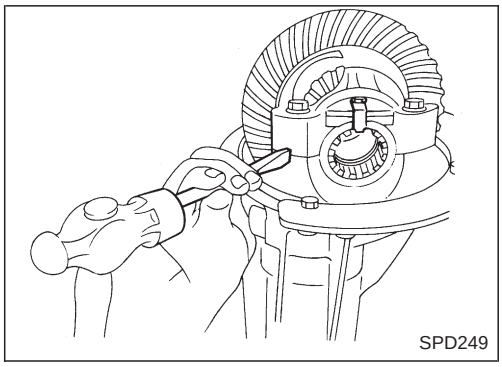
- Contact entre les dents

Vérifier le contact entre les dents, consulter ''REGLAGE'', PD-73.

- Battement entre les planétaires et les satellites

Mesurer le jeu entre la rondelle de butée de planétaire et le logement de différentiel à l'aide d'une jauge d'épaisseur.

Jeu entre rondelle de butée de planétaire et logement de différentiel :
0,1 - 0,2 mm



Boîtier de différentiel

1. Monter l'ensemble de pont sur l'outil spécial.

Numéros d'outils :
Ⓐ ST0501S000
Ⓑ ST06340000

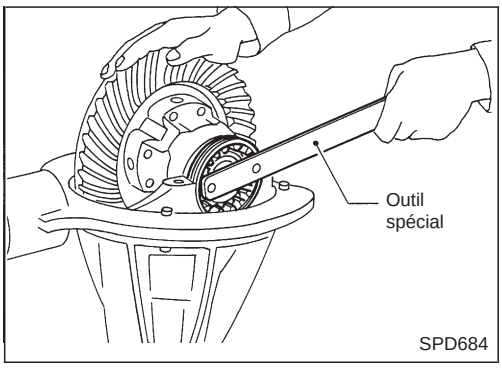
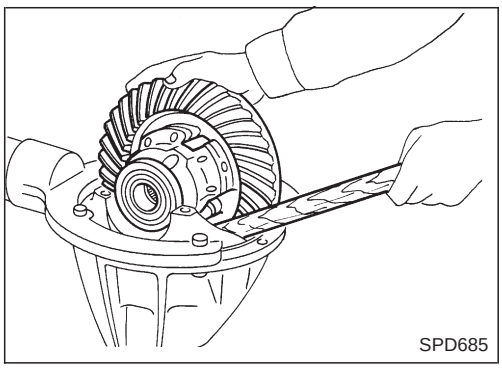
Boîtier de différentiel (Suite)

SPD249



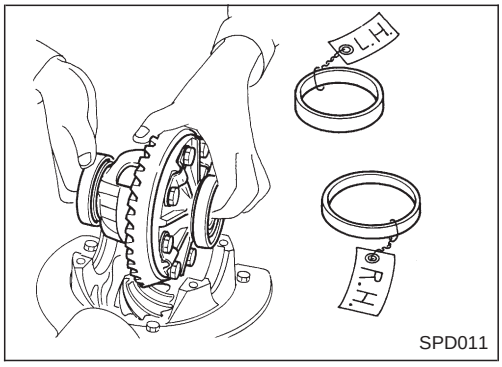
2. Tracer des marques de repères sur un côté du chapeau de roulement latéral avec de la peinture ou un poinçon pour s'assurer qu'il est remis en position adéquate lors du remontage.

Les chapeaux de roulement sont alésés en ligne durant l'usinage et doivent être reposés dans leur position d'origine.



SPD250

3. Déposer les équerres de retenue et les chapeaux de roulements latéraux.

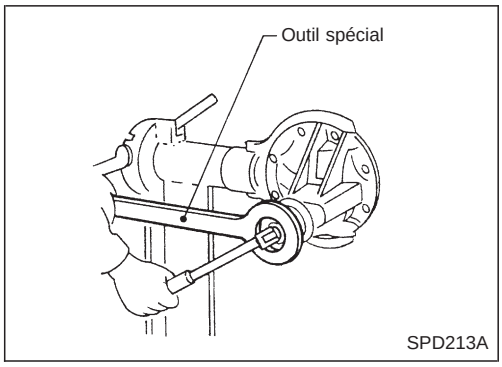


SPD684

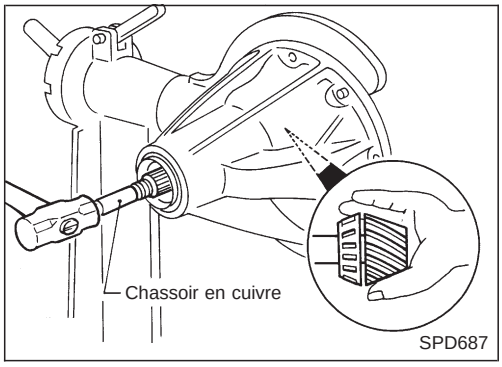
4. Déposer le régleur de roulement latéral avec l'outil spécial.
   Numéro de l'outil : ST32580000

SPD685

5. Déposer l'ensemble du logement de différentiel avec un pied de biche.

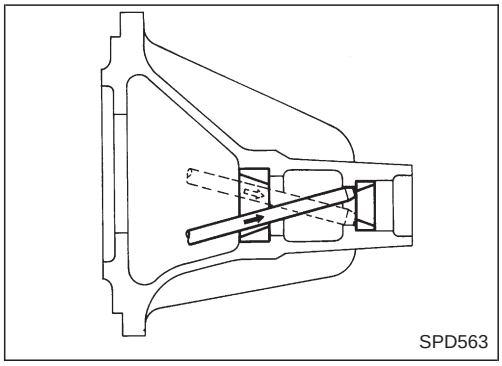


SPD011

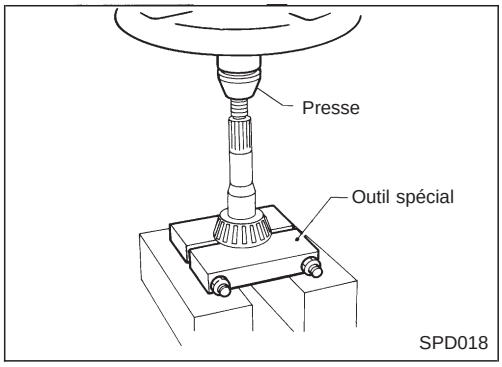


Conserver les cuvettes externes du roulement latéral avec leurs cônes internes respectifs – ne jamais les intervertir.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

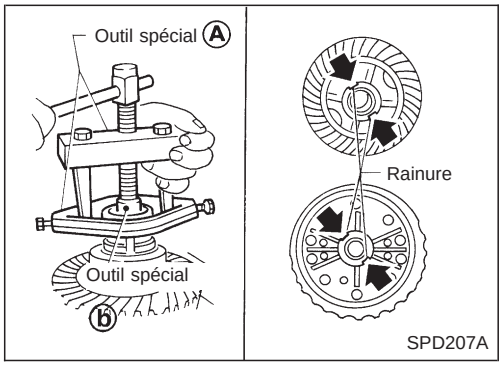


Boîtier de différentiel (Suite)



6. Déposer l'écrou de pignon d'attaque avec l'outil spécial.
   Numéro de l'outil : KV38104700
7. Déposer le flasque d'accouplement avec un extracteur.
8. Déposer le capteur d'ABS.

9. Sortir le pignon d'attaque avec le cône interne de roulement arrière de pignon, l'entretoise de roulement de pignon d'attaque et la cale de réglage de roulement du pignon.

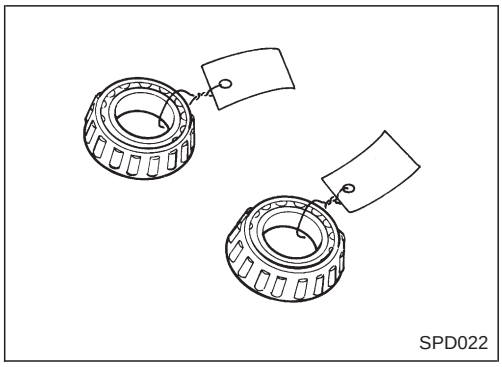


10. Déposer le joint d'huile avant et le cône interne de roulement avant du pignon.
11. Déposer les cuvettes externes de roulement du pignon avec un chassoir en bronze.

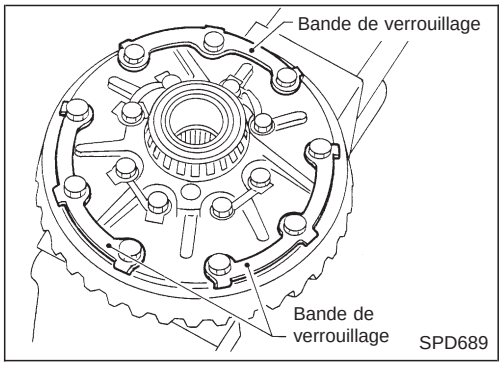
12. Déposer le cône interne du roulement arrière du pignon et la rondelle de réglage du pignon d'attaque.
    Numéro de l'outil : ST30031000

Logement de différentiel

1. Déposer les cônes internes de roulements latéraux.



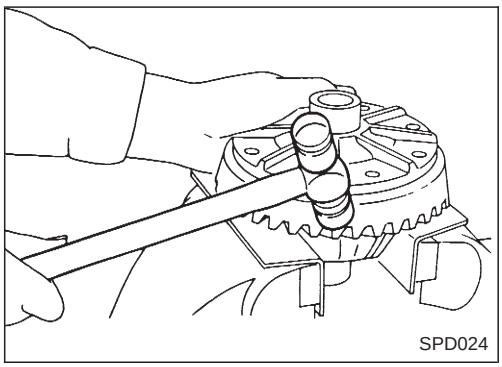
Pour éviter d'endommager les roulements, introduire les griffes de l'extracteur dans les rainures.



Numéros d'outils :
- Ⓐ **ST33051001**
- Ⓑ **ST33061000**

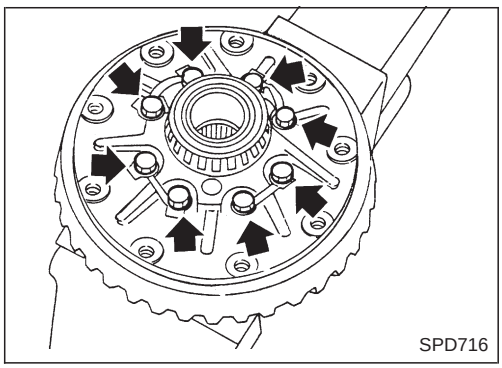
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Logement de différentiel (Suite)



Veiller à ne pas confondre les pièces gauche et droite.

SPD022



SPD689

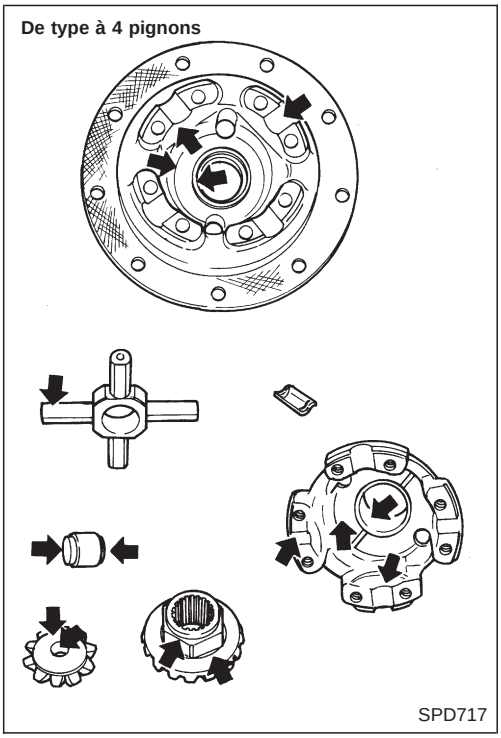
2. Déployer les nouvelles bandes de verrouillage et desserrer en diagonale les boulons de la couronne.

SPD024

3. Frapper la couronne avec un maillet à tête souple pour la détacher du différentiel.

Frapper de manière régulière sur toute la périphérie, afin d'éviter que la couronne ne se voile.

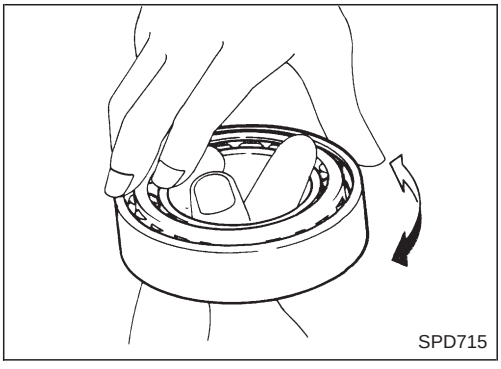
SPD716



4. Séparer les logements de différentiel gauche et droit.

Tracer des marques de repères sur les côtés gauche et droit du logement de différentiel avant de les séparer.

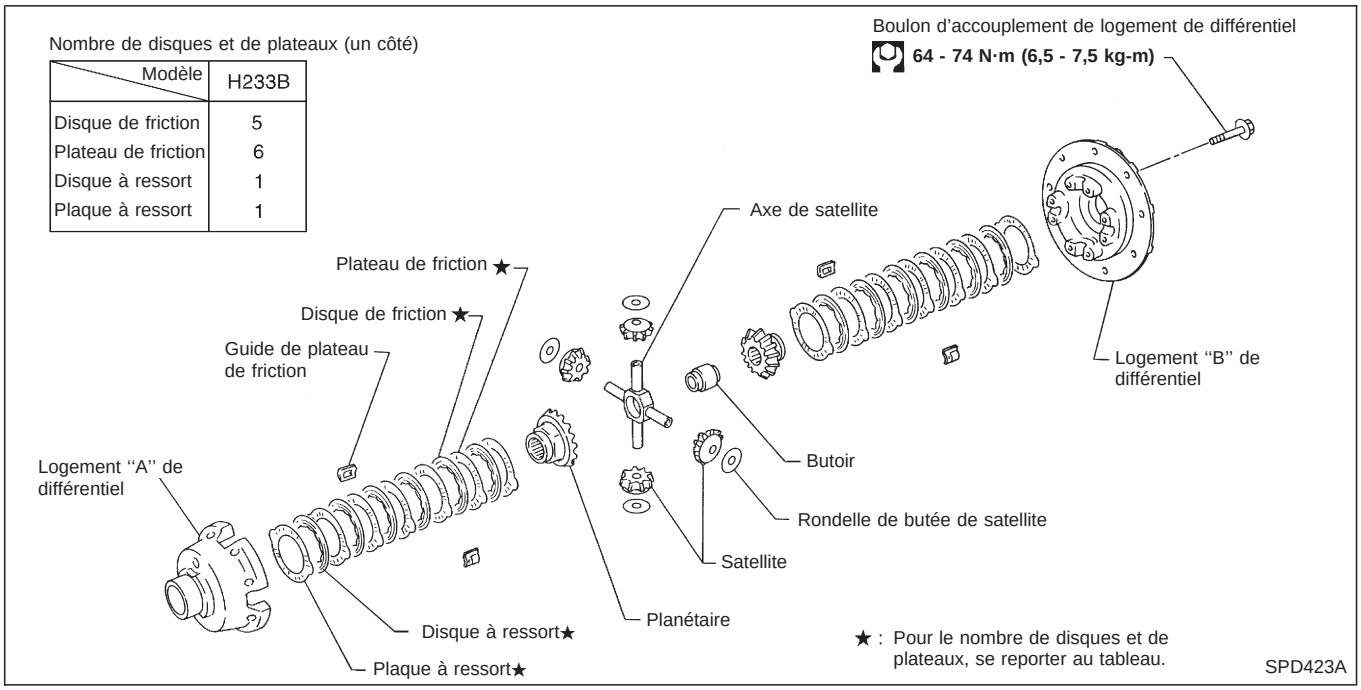
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



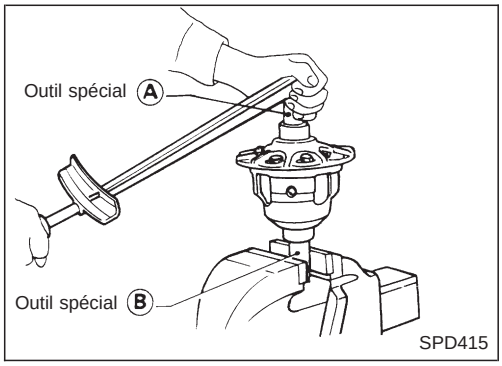
Couronne et pignon d'attaque

Contrôler les dents de la couronne pour voir si elles ne sont pas ébréchées, fêlées ou rayées.
Si l'on découvre une détérioration quelconque, remplacer la couronne et le pignon d'attaque comme un ensemble (jeu de pignons hypoïdes).

Ensemble de logement de différentiel



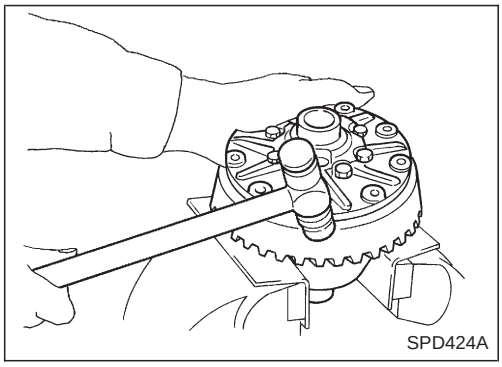
Contrôler les surfaces d'appui du logement de différentiel, des planétaires, des satellites, de l'axe de satellite et des rondelles de butée.



Roulements

1. Nettoyer soigneusement les roulements.
2. Vérifier si les roulements ne sont pas usés, rayés, piqués ou ébréchés.
   Vérifier si les roulements à rouleaux coniques tournent librement. S'ils sont endommagés, remplacer comme un ensemble la cuvette externe et le cône interne.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



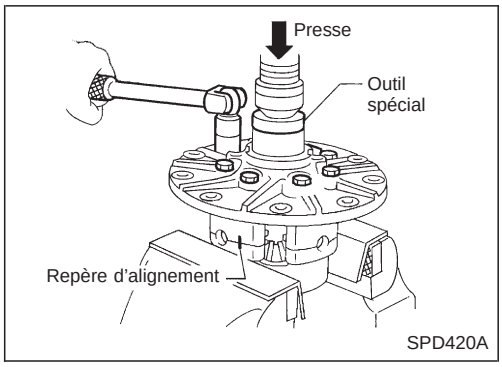
ATTENTION :
Ne pas faire tourner le moteur lorqu'une seule roue (arrière) est décollée du sol.

Préparation pour démontage

VERIFICATION DU COUPLE DE DIFFERENTIEL

Mesurer le couple de différentiel avec les outils spéciaux.
S'il n'est pas dans les limites spécifiées, inspecter les composants du différentiel à glissement limité.

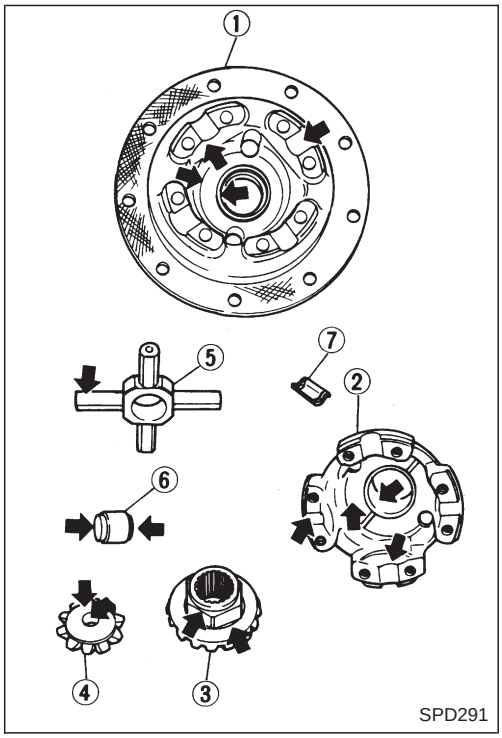
Couple de différentiel :
201 - 240 N·m
(20,5 - 24,5 kg-m)
Numéros d'outils :
Ⓐ KV38105210
Ⓑ KV38105220



Démontage

1. Déposer le cône interne du roulement latéral avec l'outil spécial.
2. Desserrer en diagonale les boulons de la couronne.
3. Frapper la couronne avec un maillet à tête souple pour l'extraire du logement de différentiel.

Frapper de manière régulière sur toute la périphérie, afin d'éviter que la couronne ne se voile.

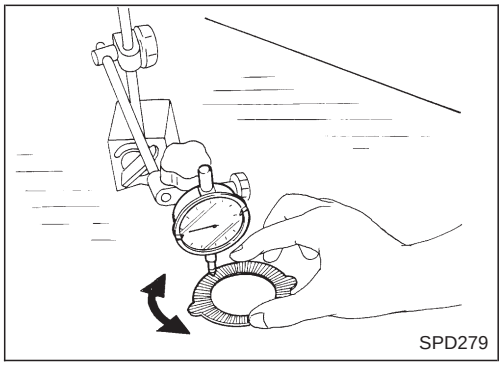


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Démontage (Suite)

4. Déposer les boulons du coupleur des logements de différentiel A et B avec une presse.
   Numéro de l'outil : ST33081000
5. Séparer les logements de différentiel A et B.
   Sortir les composants internes (disques et plateaux, etc.).

Tracer des repères sur les logements de différentiel de manière à pouvoir les réinstaller dans leur position d'origine.

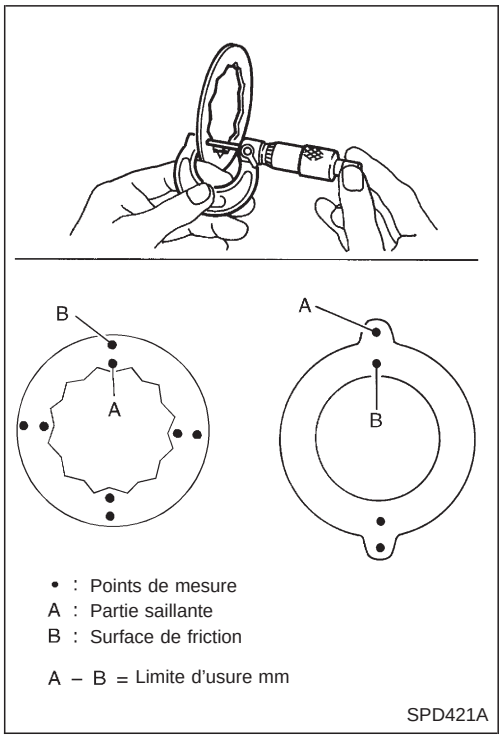


Inspection

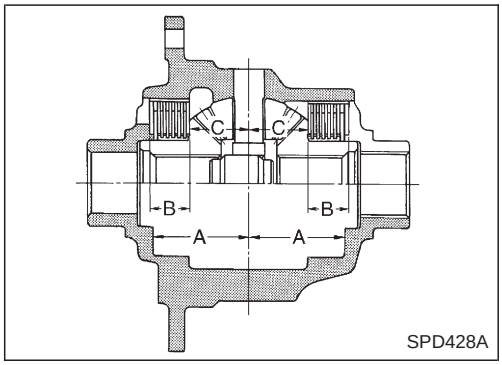
SURFACES DE CONTACT

1. Nettoyer les pièces démontées dans un bain de solvant approprié et les sécher à l'air comprimé.
2. Si les surfaces suivantes présentent des traces de bavures ou de rayures, les poncer avec une pierre à fusil.
   ① Carter de différentiel B
   ② Carter de différentiel A
   ③ Planétaire
   ④ Satellite
   ⑤ Axe de satellite
   ⑥ Butoir
   ⑦ Guide de plateau de friction

DISQUE ET PLATEAU



1. Nettoyer les disques et les plateaux dans un bain de solvant approprié et les sécher à l'air comprimé.
2. Vérifier si les disques et les plateaux ne sont pas usés, ébréchés et qu'ils ne présentent pas de bavures.

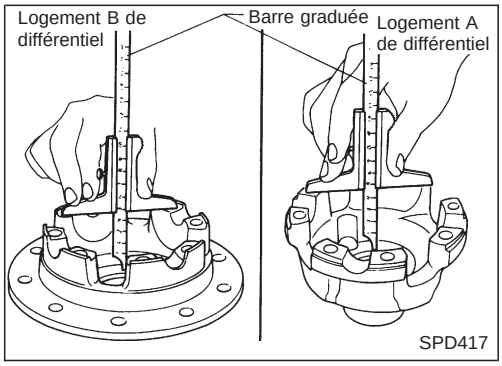


3. Vérifier si les disques ou plateaux de friction ne sont pas voilés.
   Voile maximum toléré :
   0,08 mm
   Si la limite est dépassée, remplacer par un nouveau disque ou plateau pour éviter que l'embrayage ne patine ou ne colle.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (Suite)

4. Mesurer les surfaces de friction et les parties saillantes des disques de friction, des plateaux de friction, du disque et de la plaque à ressort.
   Si l'une des pièces est usée au-delà de la limite spécifiée, la remplacer avec une pièce neuve ayant la même épaisseur que la partie protubérante.
   Limite d'usure :
   0,1 mm ou moins

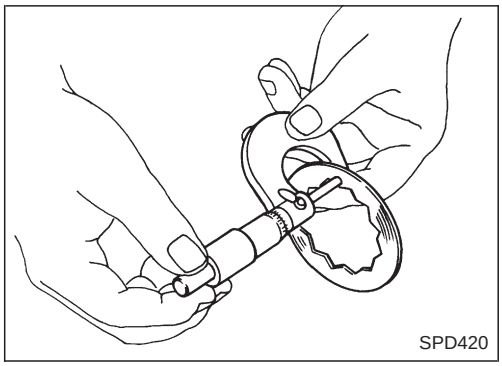


Réglage

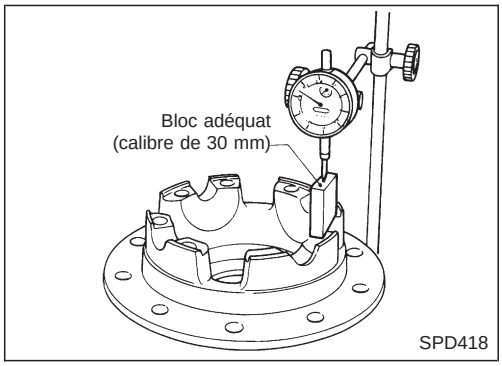
JEU AXIAL ENTRE DISQUE DE FRICTION ET PLATEAU DE FRICTION

Le jeu axial des disques et plateaux de friction peut être calculé à l'aide de l'équation suivante et doit être réglé dans la plage suivante.
Le réglage peut se faire en choisissant un disque de friction ayant deux épaisseurs différentes.

Jeu axial E :
0,05 - 0,15 mm
E = A − (B + C)



A: Longueur de la surface de contact du logement de différentiel par rapport au fond intérieur du logement de différentiel.
B: Epaisseur totale des disques de friction, des plateaux de friction, du disque à ressort et de la plaque à ressort d'un côté du logement de différentiel.
C: Longueur de la surface de contact du logement de différentiel par rapport au côté arrière du planétaire de différentiel.

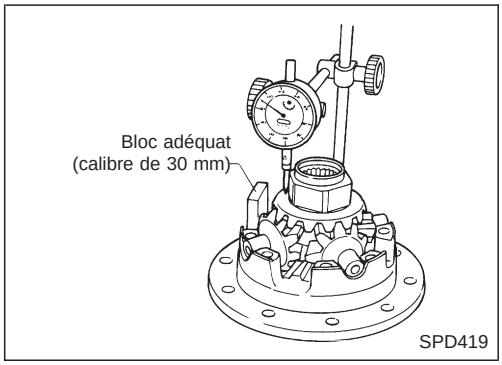


1. Valeurs de mesure de ''A''.
   Longueur standard A :
   49,50 - 49,55 mm

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Réglage (Suite)

SPD420



2. Mesurer l'épaisseur de chaque disque et plateau.
   Epaisseur totale "B" :
   19,24 - 20,26 mm
   Nombre de disques et plateaux (un côté) :
   Disques de friction 5
   Plateaux de friction 6
   Disque à ressort 1
   Plaque à ressort 1

SPD418

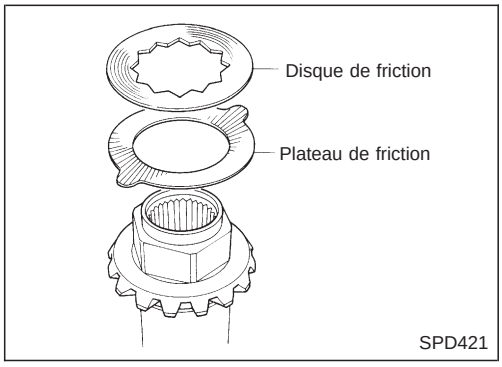
3. Mesurer les valeurs de "C".
a. Monter un comparateur à cadran sur la plaque de base.
b. Placer le logement de différentiel B sur la plaque de base, et reposer le calibre sur le logement B.

Etalonner ensuite le comparateur en plaçant son pointeau sur le calibre.

SPD419

c. Reposer les satellites, les planétaires et l'axe de satellite dans le logement de différentiel B.
d. Placer le pointeau du comparateur à cadran sur le planétaire, et lire la mesure.

Exemple :



E = A − D = A − (B + C) = 0,05 à 0,15 mm
A = 49,52 mm
B = 19,45 mm
C = 29,7 mm
D = B + C

B . . . 19,45	
+C . . . 29,7	
49,15	

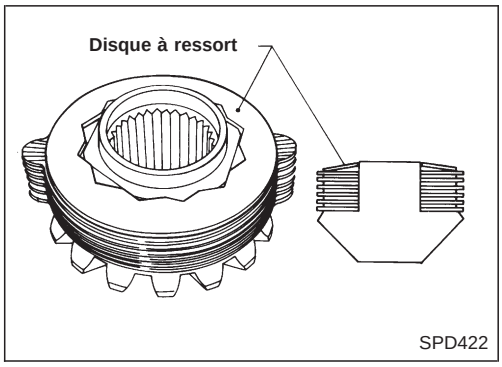
E = A − D

A . . . 49,52	
−D . . . 49,15	
0,37	

D'après l'équation ci-dessus, le jeu axial de 0,37 mm dépasse la limite spécifiée entre 0,05 et 0,15 mm.
Sélectionner des disques et plateaux appropriés pour assurer un réglage correct.

SPD421

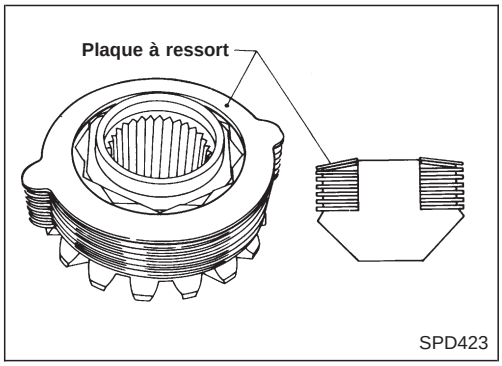
Remontage



Avant d'assembler les disques et les plateaux, les lubrifier dans un bain d'huile pour différentiel à glissement limité.

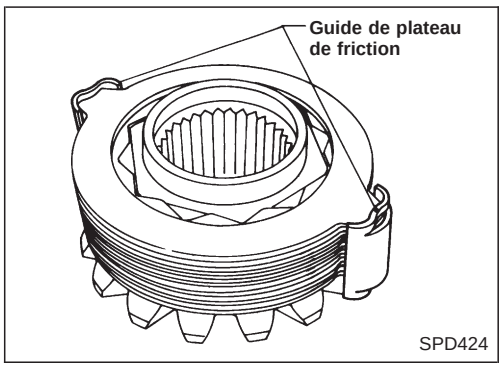
1. Faire alterner les plateaux et les disques de friction en observant les numéros spécifiés à l'arrière du planétaire.

Toujours positionner le plateau de friction en premier lieu sur l'arrière du planétaire.



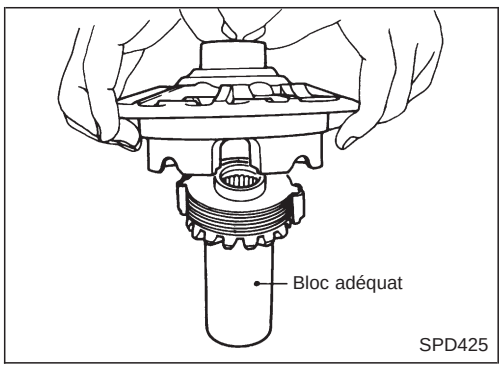
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Remontage (Suite)

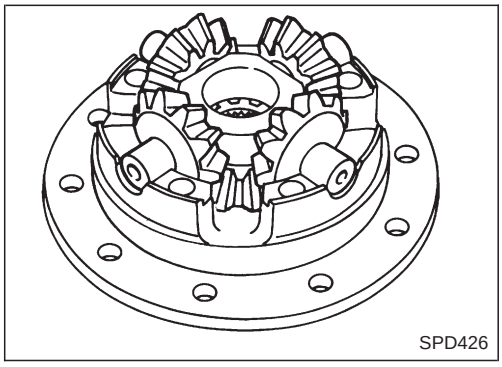


2. Reposer le disque à ressort.

Aligner les 12 trous angulaires dans le disque à ressort sur la surface hexagonale du planétaire.



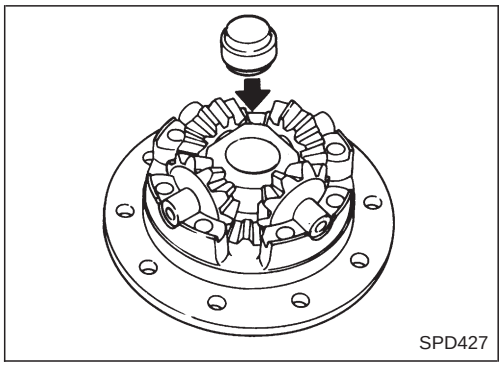
3. Reposer la plaque à ressort.



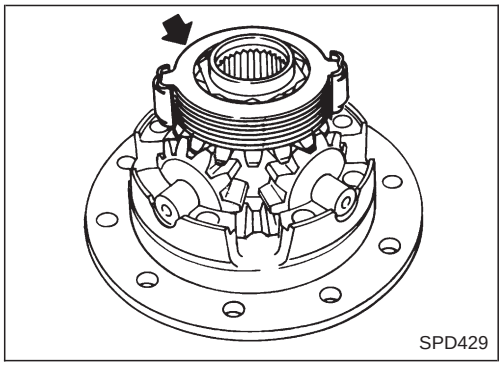
4. Reposer les guides de plateaux de friction.

Aligner correctement les protubérances des plateaux de friction et enduire de graisse les surfaces internes des guides de plateaux de friction afin de les empêcher de tomber.

5. Monter le logement de différentiel B sur l'ensemble constitué par les planétaires, les disques, les plateaux et le guide de plateau de friction.



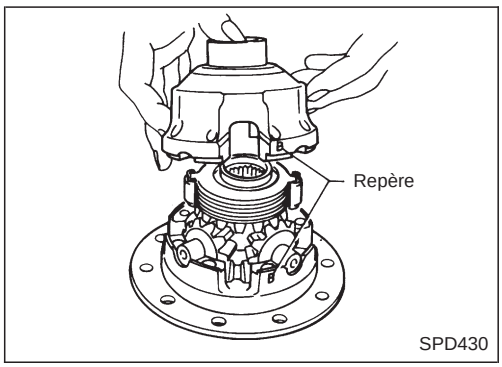
- **Reposer le support de différential B en soutenant les guides de plateaux de friction avec le majeur par l'orifice d'huile du logement de différentiel.**
- **Veiller à ne pas détacher le disque à ressort de la partie hexagonale du planétaire.**



6. Monter les satellites et l'axe de satellite dans le logement de différentiel B.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Remontage (Suite)

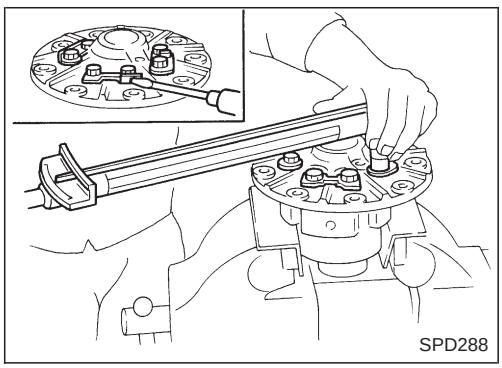


SPD427

7. Reposer le bloc de butoir.

SPD429

8. Reposer le planétaire sur les satellites.
9. Reposer chaque disque et plateau.



Suivre la même procédure que celle décrite aux étapes 1 à 4.

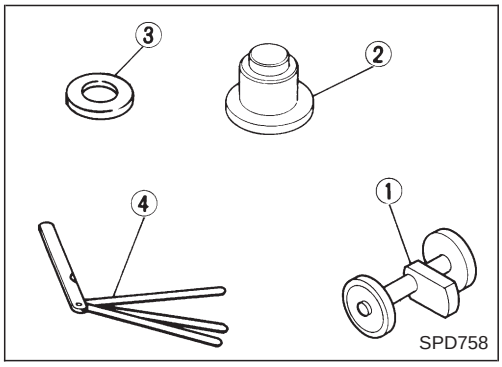
SPD430

10. Reposer le logement de différentiel A.

Positionner les logements de différentiel A et B en alignant les repères sur les logements.

SPD288

11. Serrer les boulons du logement de différentiel.
12. Placer la couronne sur le logement de différentiel et reposer des bandes de verrouillage et des boulons neufs.



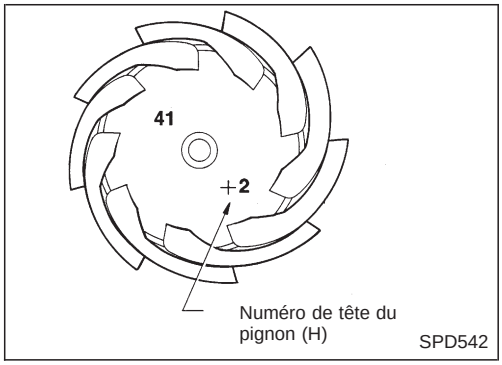
Serrer les boulons en diagonale, en tapotant doucement les têtes de boulons avec un marteau.
Puis plier les bandes de verrouillage pour bloquer les boulons en place.

13. Reposer le cône interne de roulement latéral.
14. Vérifier le couple de différentiel.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

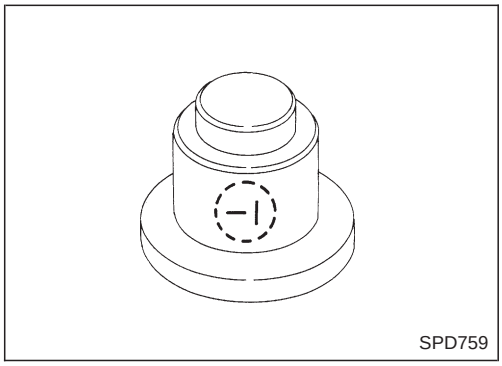
Pour que le pont puisse fonctionner de façon silencieuse et fiable, les cinq réglages suivants doivent être exécutés correctement.

1. Précharge du roulement latéral.
2. Hauteur du pignon d'attaque.
3. Précharge de roulement du pignon. Consulter le titre ''REMONTAGE'', PD-76.
4. Battement entre la couronne et le pignon. Consulter le titre ''REMONTAGE'', PD-77.
5. Jeu d'entre-dents de la couronne et du pignon.



SPD758

Hauteur de pignon d'attaque



1. Préparer d'abord les outils permettant le réglage de hauteur de pignon.
   ① Jauge de hauteur (ST31251000)
   ② Faux-arbre (ST31181001)
   ③ Entretoise (épaisseur : 2,00 mm) (KV38108700)
   ④ Jauge d'épaisseur
2. Pour faciliter le travail, préparer un tableau, comme celui ci-dessous, pour organiser les calculs.

LETTRES	CENTIEMES DE MILLIMETRE
H : Numéro de tête du pignon	
D′ : Chiffre indiqué sur le faux-arbre	
S : Chiffre indiqué sur la jauge de hauteur	
N : Mesure du jeu	

SPD542

3. Reporter les chiffres suivants dans le tableau.
   H : Numéro de tête du pignon

SPD271

4. Mettre en place la cuvette interne de roulement arrière de pignon et les outils spéciaux dans le carter de pont.

SPD365A

5. Monter l'outil (jauge de hauteur) sur le carter de pont et mesurer le jeu entre la pointe de la jauge de hauteur et la face du faux-arbre.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Hauteur de pignon d'attaque (Suite)

6. Substituer ces valeurs dans l'équation pour calculer l'épaisseur de la rondelle.

Si les valeurs représentant H, D′ et S ne sont pas données, les considérer comme nulles et procéder au calcul.

T (épaisseur de la rondelle) = N − [(H − D′ − S) x 0,01] + 2,75

Exemple :

N = 0,30
H = 2
D′ = −1
S = 0

T = N − [(H − D′ − S) x 0,01] + 2,75
= 0,30 − [{2 − (−1) − 0} x 0,01] + 2,75

(1)
H 2
−D′ ..... −(−1)
3
−S ..... −0
3

(2)
3
x 0,01
0,03

(3)
N 0,30
−0,03
0,27

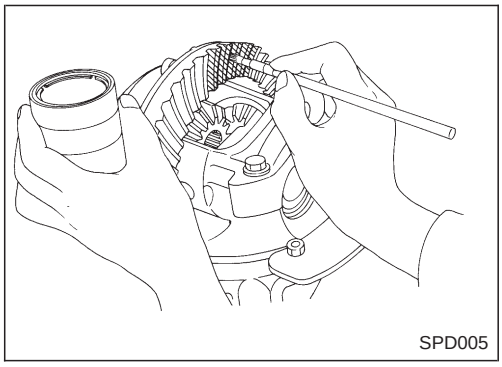
(4)
0,27
+2,75
3,02

∴T = 3,02

7. Sélectionner la rondelle de réglage en hauteur du pignon appropriée.

Rondelle de réglage en hauteur du pignon d'attaque : Consulter les SDS, PD-84.

Si l'on ne peut trouver une rondelle de l'épaisseur désirée, utiliser une rondelle dont l'épaisseur est la plus proche de la valeur calculée.



Exemple :

Valeur calculée . . . T = 3,02 mm
Rondelle à utiliser . . . T = 3,03 mm

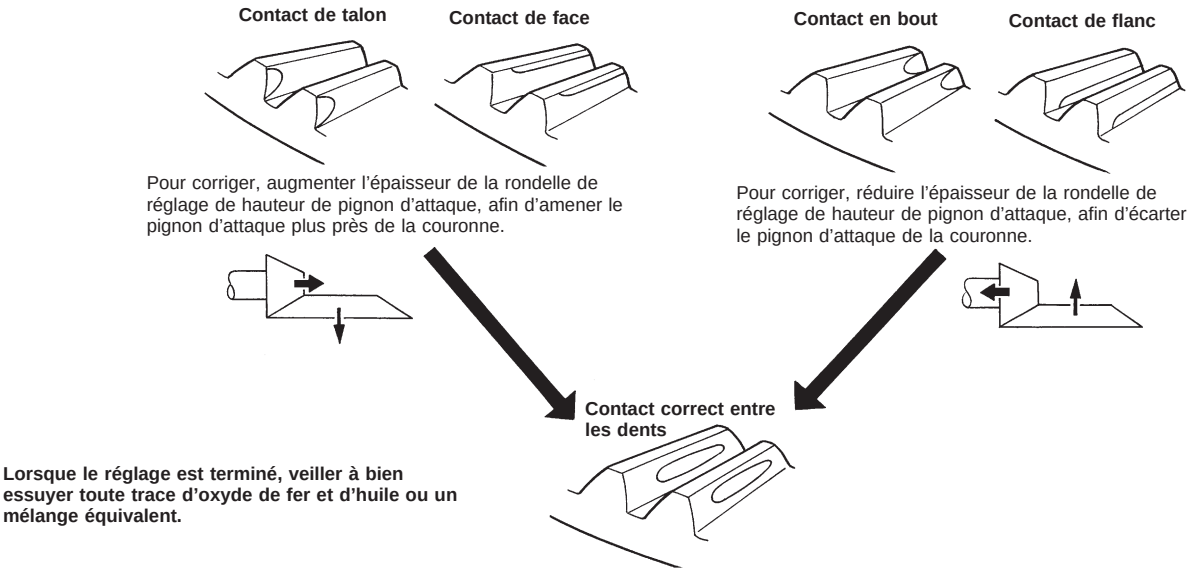
Contact entre les dents

Il est nécessaire de vérifier le jeu d'entre-dents, afin de s'assurer que la relation entre la couronne et le pignon d'attaque est correcte.
Des jeux de pignons hypoïdes en position incorrecte pourront être bruyants ou voir leur durée de vie abrégée. On peut assurer un niveau de bruit minimum et une longévité maximum grâce à la vérification du contact entre les dents.

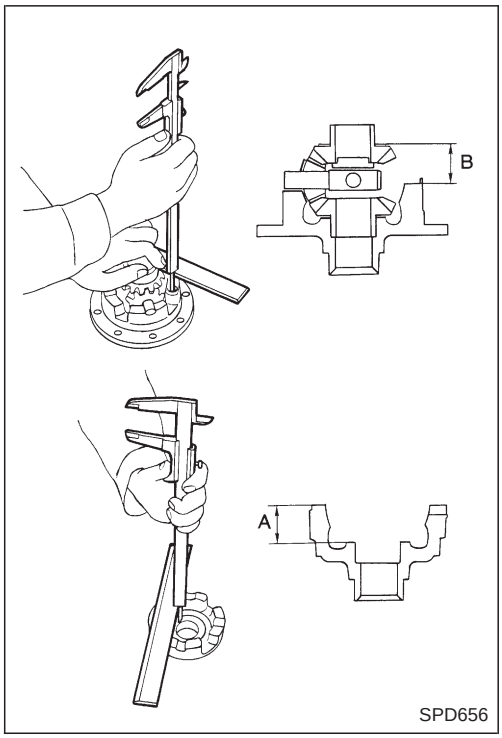


SPD005

1. Nettoyer soigneusement les dents de la couronne et du pignon d'attaque.
2. Appliquer une très légère quantité d'oxyde de fer en poudre et d'huile ou un mélange équivalent sur 3 ou 4 dents du côté entraînement de la couronne.

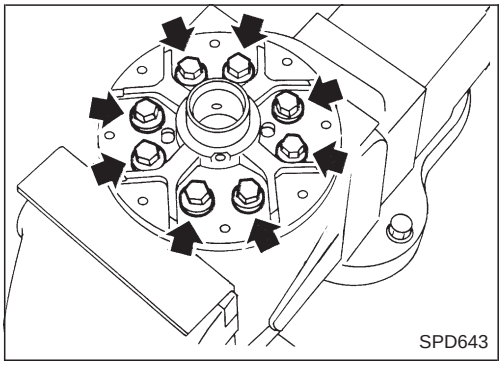
SPD695

3. Maintenir le flasque d'accouplement à l'arrêt et faire tourner la couronne dans les deux sens.



en principe, le contact entre les dents sera correct si l'on a correctement calculé l'épaisseur des cales et si le battement est correct. Néanmoins, il peut arriver qu'il soit nécessaire de suivre une méthode empirique afin d'obtenir un contact correct entre les dents. La surface de contact entre les dents sera la meilleure indication de la justesse du réglage du différentiel.

Lorsque le réglage est terminé, veiller à bien essuyer toute trace d'oxyde de fer et d'huile ou un mélange équivalent.



SPD007

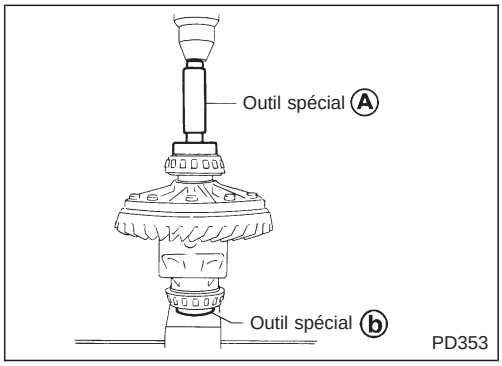
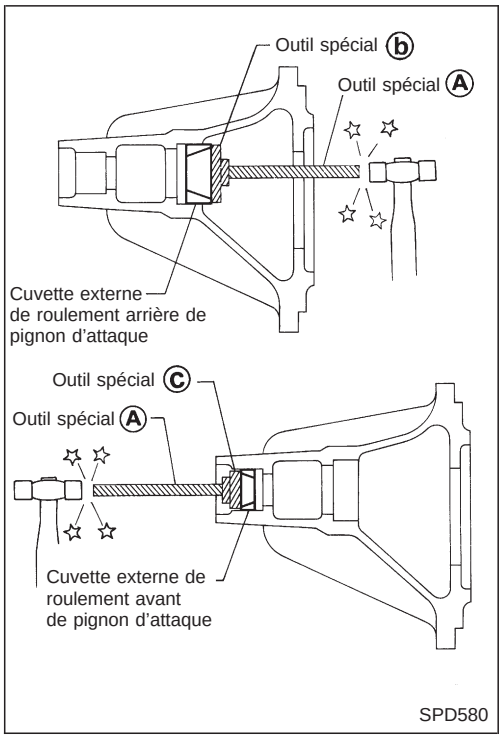
Logement de différentiel

1. Mesurer le jeu entre la rondelle de butée de planétaire et le logement de différentiel.
   Jeu entre rondelle de butée de planétaire et logement de différentiel (A − B) :
   Moins de 0,15 mm
   Le jeu peut être réglé au moyen d'une rondelle de butée de planétaire. Consulter les SDS, PD-84.
2. Enduire d'huile pour engrenages les surfaces des dents des pignons et les surfaces de butée, et vérifier si l'ensemble tourne correctement.

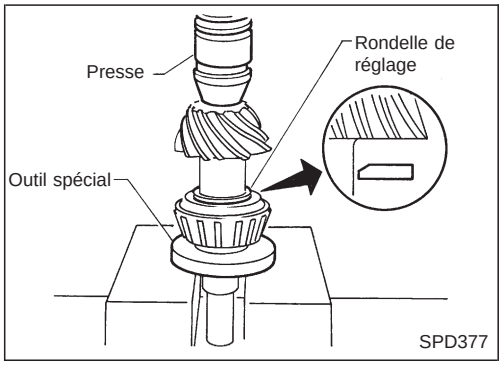


3. Reposer les logements de différentiel gauche et droit.
4. Reposer le logement de différentiel sur la couronne.



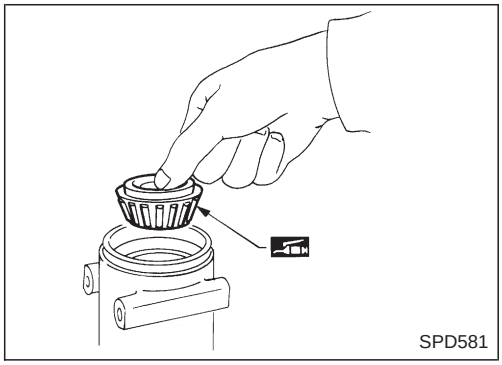
5. Poser le logement de différentiel sur la couronne.
6. Appliquer du produit de blocage [Locktite (blocage de goujon) ou un équivalent] sur les boulons de la couronne, et visser les boulons.

Serrer les boulons en diagonale, en tapotant doucement les têtes de boulons avec un marteau.

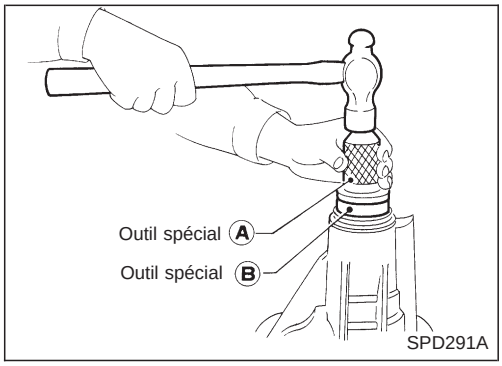


7. Enfoncer à la presse les cônes internes du roulement latéral dans le logement de différentiel à l'aide des outils spéciaux.
   Numéros d'outils :
   Ⓐ **ST33190000**
   Ⓑ **ST33081000**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

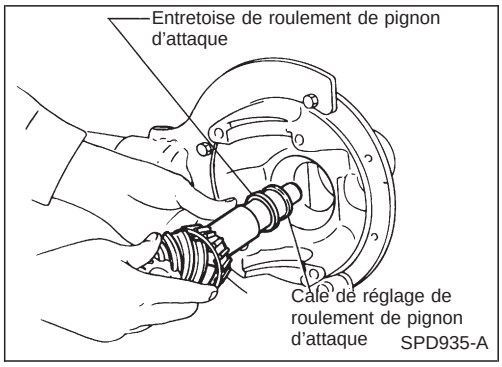


Boîtier de différentiel

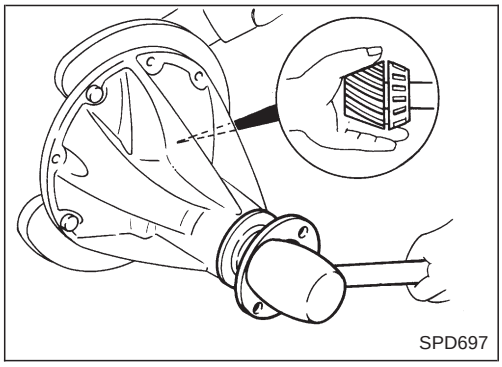


1. Enfoncer à la presse les cuvettes externes de roulement avant et arrière à l'aide des outils spéciaux.
   Numéros d'outils :
   - (A) **ST30611000**
   - (B) **ST30621000**
   - (C) **ST30613000**

2. Sélectionner une rondelle de réglage de hauteur du pignon d'attaque. Consulter le titre ''REGLAGE'', PD-70.
3. Reposer la rondelle de réglage du pignon d'attaque sur le pignon d'attaque, et monter à la presse le cône interne de roulement arrière dans ce dernier, à l'aide d'une presse et de l'outil spécial.
   Numéro de l'outil : ST30901000

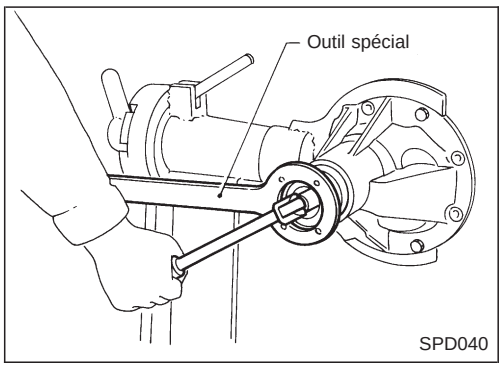


4. Placer le cône interne de roulement avant du pignon d'attaque dans le carter de pont.



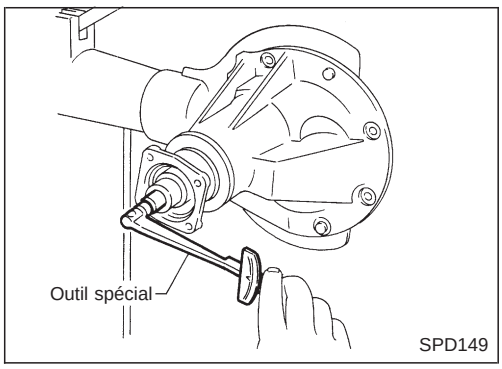
5. Remplir le creux entre les lèvres du joint d'huile de graisse à usages multiples. Monter le joint d'huile avant.
   Numéros d'outils :
   - (A) **ST15310000**
   - (B) **KV40104710**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Boîtier de différentiel (Suite)

6. Placer l'entretoise de roulement du pignon d'attaque, la cale de réglage de roulement du pignon et le pignon d'attaque dans le carter de pont.



7. Introduire le flasque d'accouplement dans le pignon d'attaque en le tapant légèrement avec un maillet à tête souple.

8. Serrer l'écrou de pignon au couple spécifié.

Eliminer toutes traces d'huile ou de graisse du filetage du pignon d'attaque et de l'écrou de pignon.

Numéro de l'outil : KV38104700

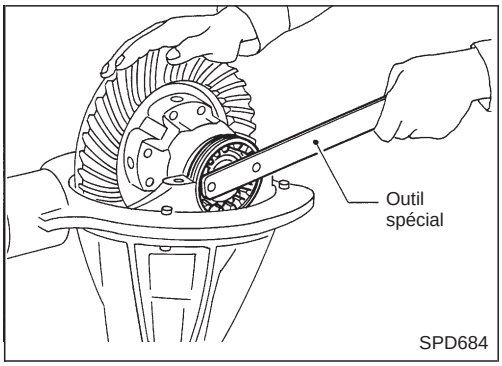
9. Tourner le pignon d'attaque de plusieurs tours dans les deux sens, et mesurer la précharge de roulement du pignon.

Numéro de l'outil : ST3127S000

Précharge de roulement du pignon (avec le joint d'huile avant) :

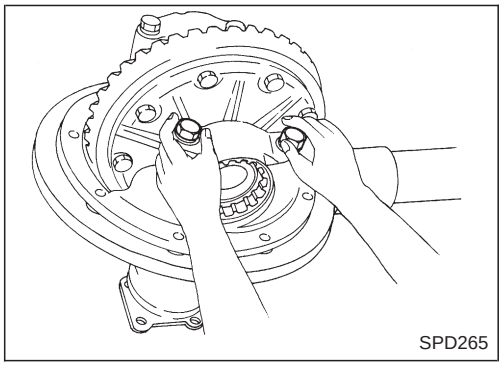
1,4 - 1,7 N·m (14 - 17 kg-cm)

Précharge de roulement du pignon (sans le joint d'huile avant) :



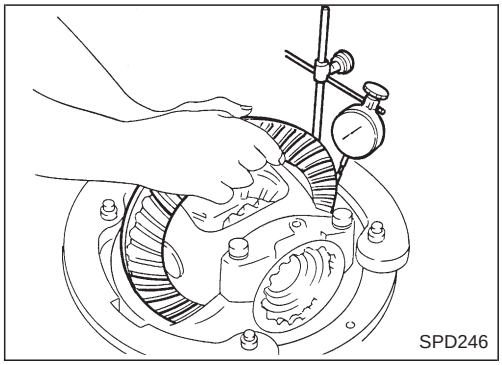
1,2 - 1,5 N·m (12 - 15 kg-cm)

Si la précharge est hors spécification, régler l'épaisseur combinée de l'entretoise et de la cale en remplaçant la cale et l'entretoise par des pièces plus fines.

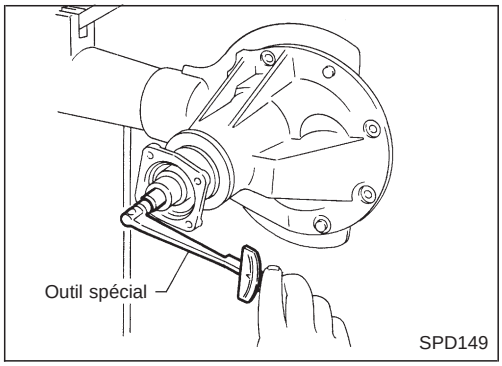


- Commencer par l'épaisseur combinée d'entretoise et de cale la plus épaisse.
- Associer chaque épaisseur d'entretoise et de cale une par une jusqu'à obtenir la valeur spécifiée.

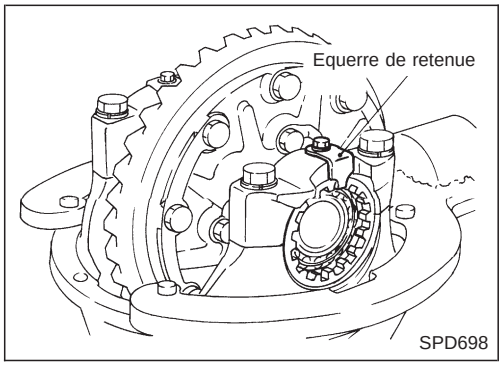
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Boîtier de différentiel (Suite)

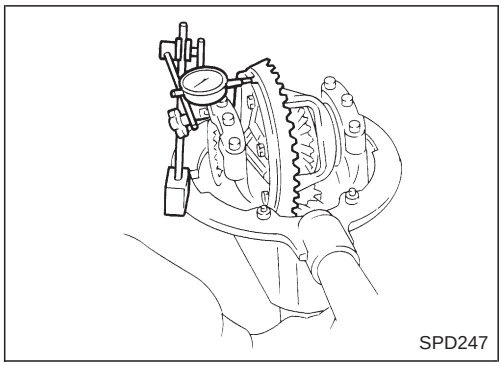


10. Reposer l'ensemble de logement de différentiel avec les cuvettes externes de roulement latéral dans le carter de pont.
11. Positionner les régleurs de roulements latéraux sur le carter de pont en engrenant correctement les filetages; visser les régleurs légèrement à ce stade de l'assemblage.
    Numéro de l'outil : ST32580000



12. Aligner les marques de repères des chapeaux de roulement avec celles du carter de pont et monter les chapeaux sur le carter de pont.
- Ne pas encore serrer pour permettre le serrage futur des régleurs de roulements latéraux.

13. Serrer les régleurs de roulement latéraux gauche et droit alternativement et mesurer en même temps le battement de la couronne et la précharge totale. Ajuster les régleurs de roulements latéraux droit et gauche en les serrant alternativement de façon à obtenir le battement de couronne approprié et la précharge totale.
    Battement entre la couronne et le pignon d'attaque :
    0,13 - 0,18 mm



- **Lors du contrôle de la précharge, tourner le pignon d'attaque plusieurs fois dans les deux sens pour asseoir les rouleaux de roulement.**
  Numéro de l'outil : ST3127S000
  Précharge totale (avec joint d'huile avant) :
  Roulement du pignon d'attaque
  Neuf : 1,5 - 1,7 N·m (15 - 17 kg-cm)
  Usagé : 1,7 - 2,5 N·m (17 - 25 kg-cm)

14. Serrer les boulons des chapeaux de roulements latéraux.
15. Reposer les équerres de retenue afin d'éviter que les roulements tournent.

Boîtier de différentiel (Suite)

SPD247

16. Contrôler le voile de la couronne à l'aide d'un comparateur à cadran.
    Limite de voile : 0,08 mm
- Si le battement varie de manière excessive en plusieurs endroits, les variations proviennent parfois de la présence de corps étrangers entre la couronne et le logement de différentiel.
- Si le battement varie fortement alors que le voile de la couronne se trouve dans les limites spécifiées, il faut remplacer le jeu de pignons hypoïdes ou le logement de différentiel.

17. Contrôler le contact entre les dents. Consulter le titre ''REGLAGE'', PD-73.

SEC. 380•430•431

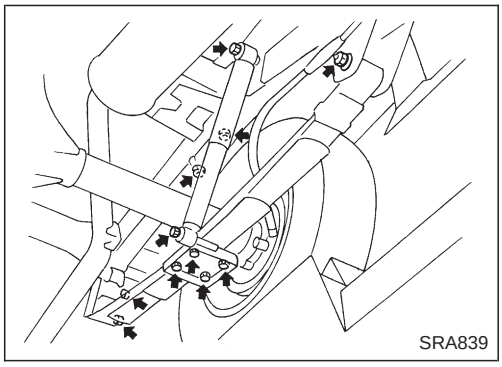
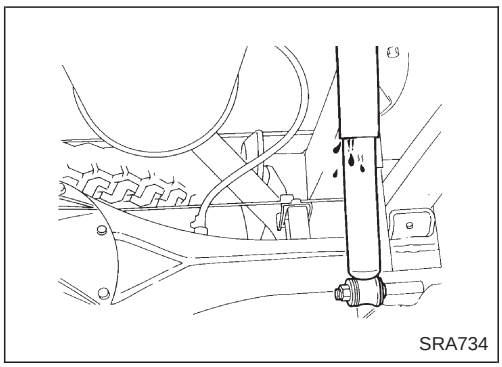
SRA796A



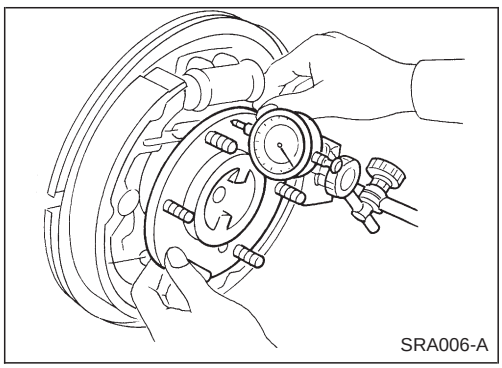
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SMA525A



Pièces de la suspension et de l'essieu arrière

Vérifier que les pièces de la suspension et de l'essieu arrière ne présentent pas de jeu excessif, d'usure ou de dommages.



- Secouer chaque roue arrière pour détecter tout jeu excessif.

SRA839

- Resserrer tous les écrous et boulons au couple spécifié.
  : se reporter à SUSPENSION ARRIERE, RA-12.

SRA734

- Vérifier que les amortisseurs ne présentent pas de fuites d'huile ou d'autres traces de détérioration.
- Vérifier que la bague de l'amortisseur ne présente pas d'usure excessive ou autres dommages.

SRA006-A

Roulement de roue arrière

- S'assurer que les roulements de roues tournent en douceur.
- Vérifier le jeu axial.

  Jeu axial :

  Se reporter aux SDS, RA-16.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

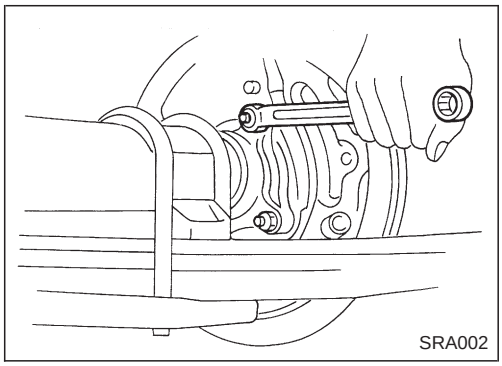
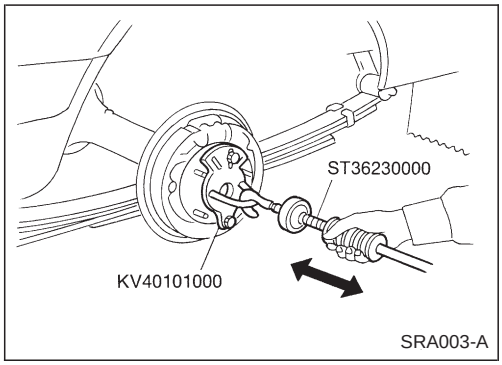
Modèles à 4 roues motrices avec ABS



SRA798AA



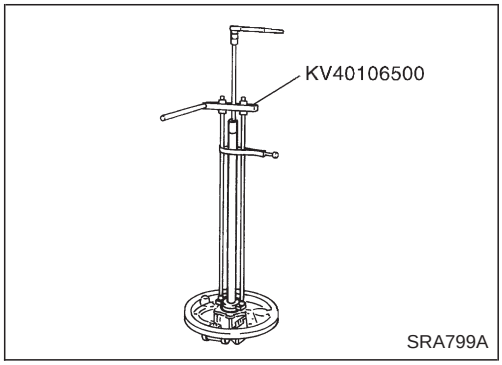
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Dépose

- **Avant de déposer l'essieu arrière, déconnecter le capteur de roue ABS de l'ensemble. Puis le déposer de l'essieu. Dans le cas contraire, les câbles de capteur pourraient s'endommager ce que rendrait le capteur inopérant.**
- **Le roulement de roue ne nécessite aucun entretien.**
- Si le roulement de roue émet un grincement pendant l'opération, remplacer le roulement de roue.
- Une fois que le roulement de roue est déposé, il faut le remplacer par un neuf. L'ancien ensemble ne peut être réutilisé.

SRA002

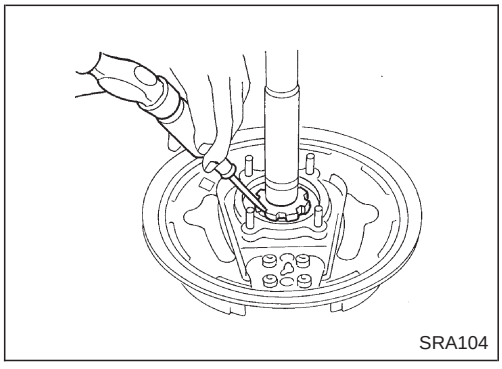
1. Débrancher le câble de frein de stationnement et le tuyau de frein.
2. Déposer les écrous fixant la cage de roulement de roue avec le plateau de frein.



SRA003-A

3. Extraire l'arbre d'essieu à l'aide d'un outil spécial.

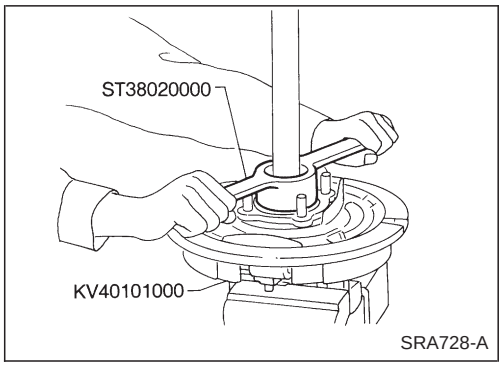
Lors de l'extraction de l'arbre d'essieu, veiller à ne pas endommager le joint d'huile.



4. Déposer la cale et le joint du carter.
   — Modèles à 2 et 4 roues motrices sans ABS —
5. Déposer le joint torique. — Modèles 4 X 4 avec ABS —
6. Déposer le joint d'huile.

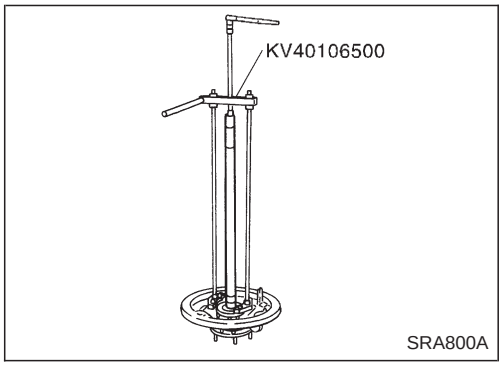
Ne pas réutiliser le joint d'huile une fois déposé.
Toujours reposer un joint neuf.

SRA799A



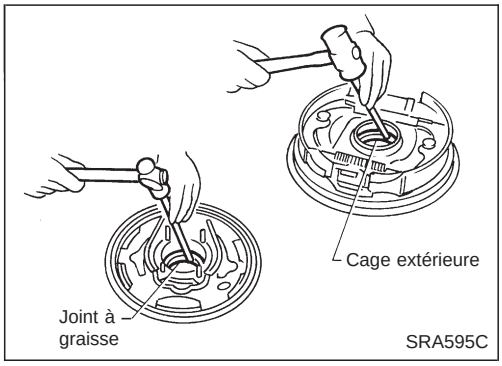
7. Déposer le rotor de capteur ABS. — Modèles 4 X 4 avec ABS —

SRA104

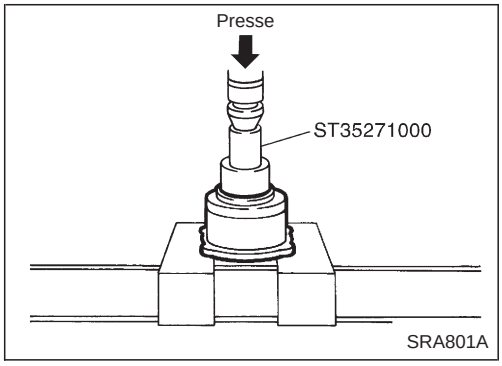


8. Redresser la rondelle de verrouillage à l'aide d'un tournevis.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Dépose (Suite)



9. Déposer le contre-écrou de roulement de roue à l'aide de l'outil spécial.

10. Déposer le roulement de roue avec la cage de roulement et le plateau de frein de l'arbre d'essieu.

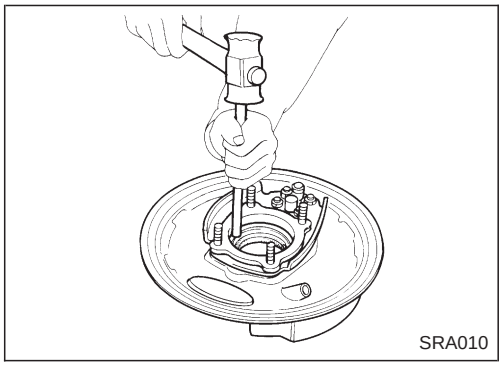
11. Déposer le joint à graisse dans la cage de roulement à l'aide d'une barre adéquate.
12. Déposer la cage extérieure du roulement de roue à l'aide d'un chassoir en laiton.
    — Modèles à 2 et 4 roues motrices sans ABS —

13. Déposer le roulement de roue.
    — Modèles 4 X 4 avec ABS —

Inspection

ARBRE D'ESSIEU

- Vérifier que le semi-arbre n'est pas tordu, fendu, abîmé, usé ou déformé. Remplacer si nécessaire.

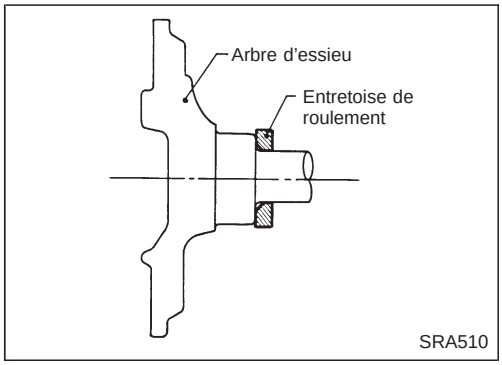


ROULEMENT DE ROUE

- S'assurer que le roulement de roue tourne librement et sans bruit, qu'il n'est pas fissuré, piqué ou usé.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

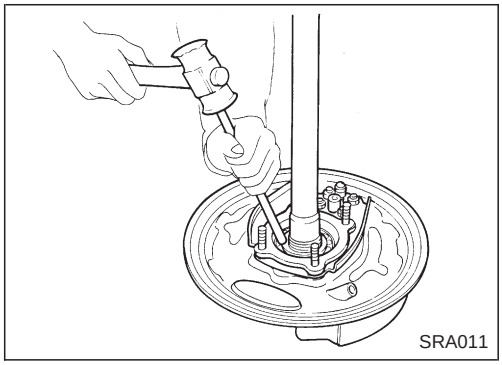
CARTER D'ESSIEU



- Vérifier que le carter d'essieu n'est pas tordu, déformé ou fissuré. Le remplacer si nécessaire.

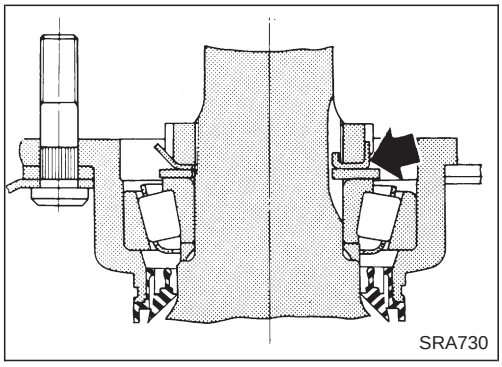
SRA010

Repose — Modèles à 2 et 4 roues motrices sans ABS —



1. Reposer la cage extérieure de roulement de roue à l'aide d'un chassoir en laiton.
2. Reposer un joint à graisse neuf dans la cage de roulement.

Après la repose d'un joint d'huile neuf, enduire la lèvre d'étanchéité de graisse à usages multiples.



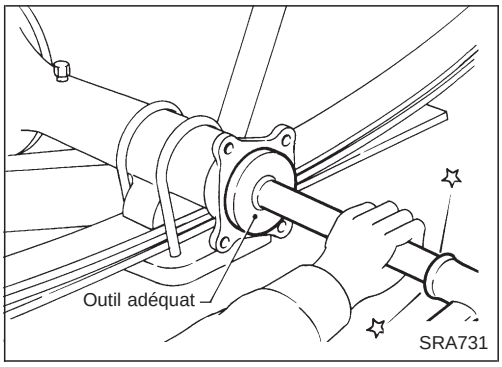
SRA510

3. Reposer l'entretoise de roulement avec le côté chanfreiné orienté vers le flasque de l'arbre d'essieu.

SRA011

4. Reposer la cage intérieure de roulement de roue à l'aide d'un chassoir en laiton.
5. Enduire chaque cône de roulement de graisse à usages multiples.

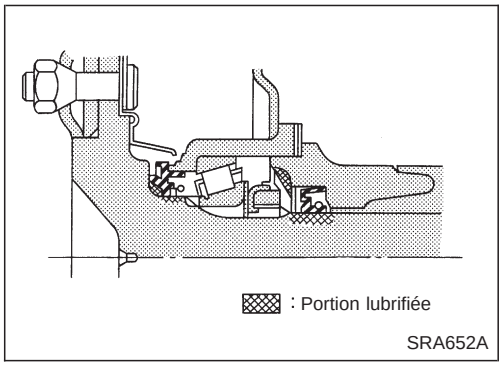
Quantité adéquate de graisse :
8 - 12 g



SRA730

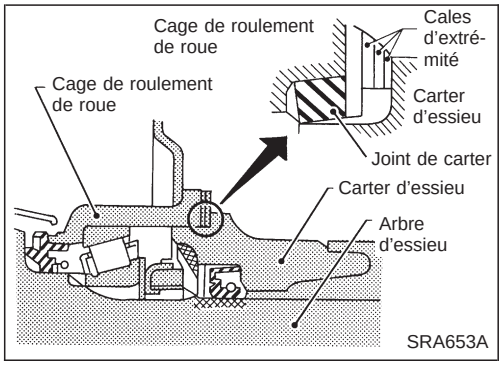
6. Reposer une rondelle plate et une rondelle de verrouillage de roulement de roue neuve.
7. Serrer le contre-écrou de roulement de roue.

Adapter correctement la lèvre de la rondelle de verrouillage du roulement de roue dans la rainure du contre-écrou de roulement de roue en serrant le contre-écrou. Veiller à tordre la rondelle vers le haut.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

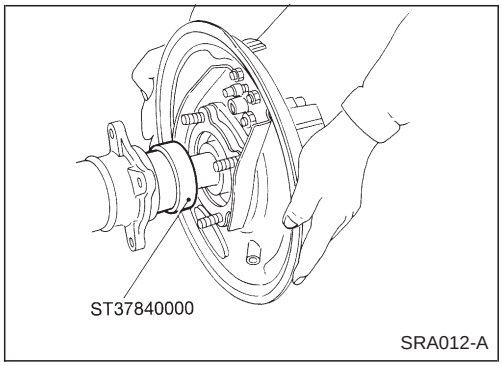
Repose — Modèles à 2 et 4 roues motrices sans ABS — (Suite)



8. Reposer un joint à graisse neuf à l'aide d'un outil adéquat.

Après repose d'un joint d'huile neuf, enduire la lèvre d'étanchéité de graisse à usages multiples.

9. Appliquer de la graisse à usages multiples sur l'encoche à l'extrémité du carter d'essieu.
10. Appliquer de l'huile pour pignons sur la cannelure de l'arbre d'essieu. Enduire la surface d'étanchéité de l'arbre d'essieu de graisse à usages multiples (comme indiqué ci-à gauche).



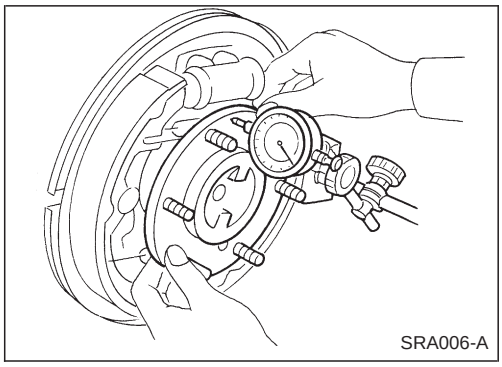
11. Régler le jeu axial.

a. Sélectionner les cales d'extrémité.

Epaisseur standard : 1,5 mm
Cale d'extrémité du carter arrière : se reporter aux SDS, RA-16.

Ne pas introduire les cales d'extrémité entre le joint de carter et la cage de roulement.

b. Introduire l'arbre d'essieu en le guidant avec l'outil spécial.

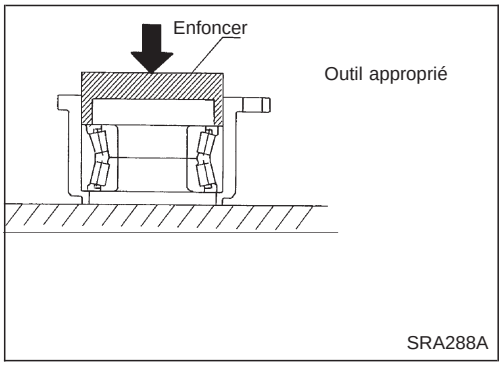


Lors de l'insertion de l'arbre d'essieu, veiller à ne pas endommager le joint d'huile.

c. Mesurer le jeu de l'arbre d'essieu.

Jeu axial :
Entretien d'un côté de l'essieu
0,02 - 0,15 mm
Entretien des deux côtés de l'essieu
Sur le premier essieu (droit ou gauche)
0,30 - 0,90 mm
Sur le deuxième essieu
0,02 - 0,15 mm

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

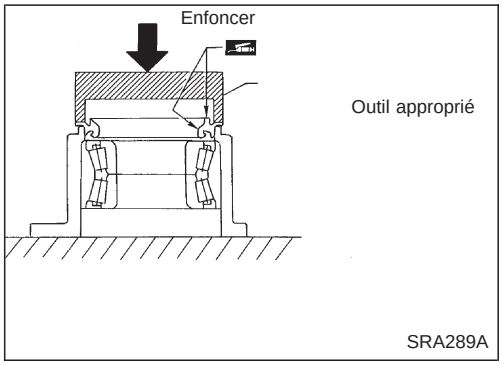


Repose — Modèles à 2 et 4 roues motrices sans ABS — (Suite)

SRA006-A

d. Si le jeu axial n'est pas dans les limites spécifiées, resélectionner les cales d'extrémité du carter d'essieu.

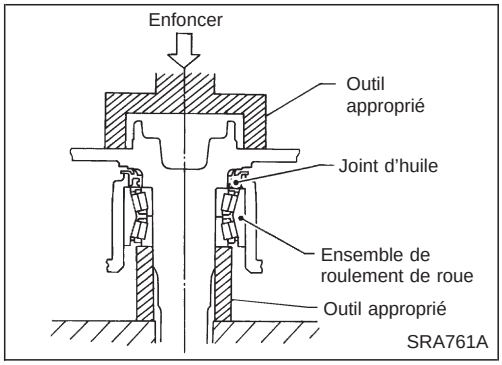
Si les cales gauche et droite présentent une différence d'épaisseur de plus de 1 mm, ajuster leur épaisseur en ajoutant ou ôtant des cales par le côté jusqu'à ce que la différence soit inférieure à 1 mm.



Repose – Modèles 4 x 4 avec ABS –

SRA288A

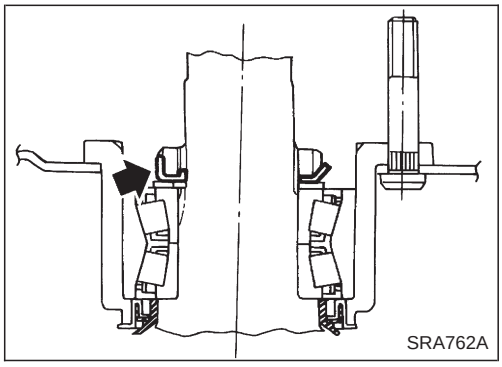
1. Enfoncer l'ensemble de roulement de roue neuf jusqu'à ce qu'il s'emboîte au fond de la cage de roulement.
   Charge maximum P :
   78 kN (8 tonnes)



Toujours enfoncer la cuvette externe de roulement de roue lors de la repose.

SRA289A

2. Enfoncer le joint à graisse neuf jusqu'à ce qu'il touche le fond de la cage de roulement.

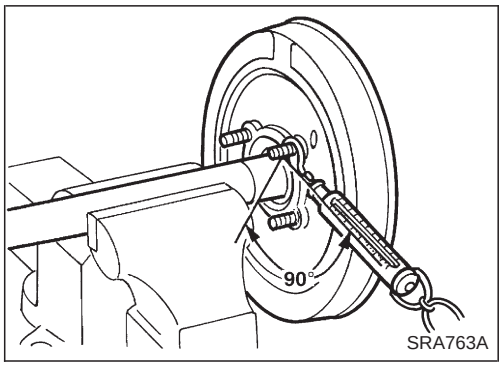


Après la repose d'un joint d'huile neuf, enduire sa lèvre d'étanchéité de graisse à usages multiples.

SRA761A

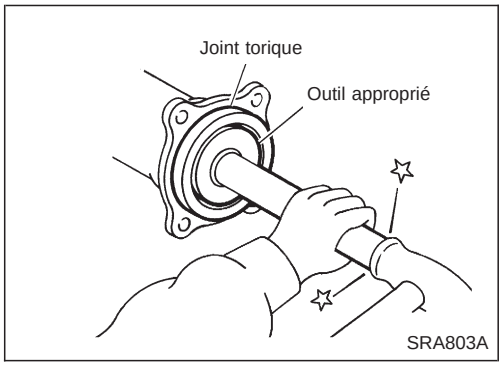
3. Enfoncer l'arbre d'essieu dans la cuvette interne de roulement de roue.
   Charge maximum P :
   47,1 kN (4,8 tonnes)

Veiller à ne pas endommager ou déformer le joint d'huile.



SRA762A

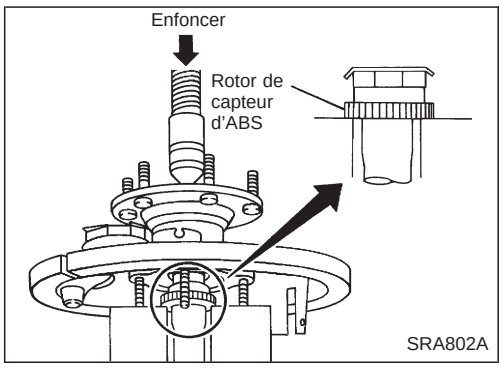
4. Reposer une rondelle plate et une rondelle de verrouillage de roulement de roue neuve.
5. Serrer le contre-écrou de roulement de roue au couple spécifié.
   : 245 - 294 (25 - 30 kg-m)



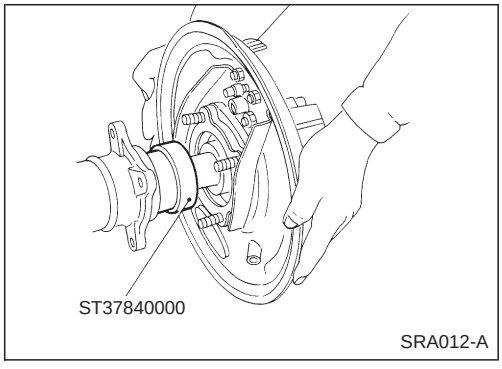
Adapter correctement la lèvre de la rondelle de verrouillage du roulement de roue dans la rainure du contre-écrou de roulement de roue en serrant le contre-écrou. Veiller à tordre la rondelle vers le haut.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Repose – Modèles 4 x 4 avec ABS – (Suite)



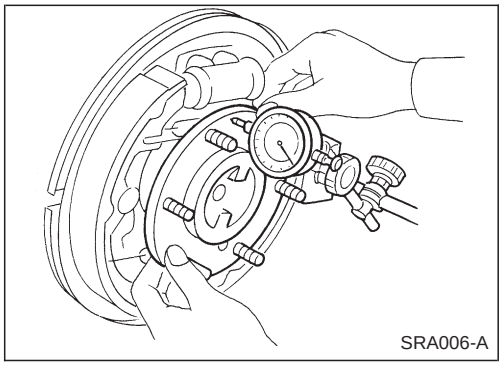
6. Contrôler la précharge du roulement de roues.
a. Tourner la cuvette de roulement (en prenant soin de l'arbre d'essieu) deux ou trois fois. Il doit tourner librement.
b. Fixer le dynamomètre au boulon de la cuvette externe (comme indiqué ci-à gauche), et le tirer à un régime de 10 tr/mn pour mesurer la précharge.
Indication du dynamomètre :
6,9 - 48,1 N (0,7 - 4,9 kg)



7. Reposer un joint d'huile neuf sur le carter de l'essieu arrière à l'aide d'un outil adéquat.

Après la repose d'un joint d'huile neuf, enduire la lèvre d'étanchéité de graisse à usages multiples.

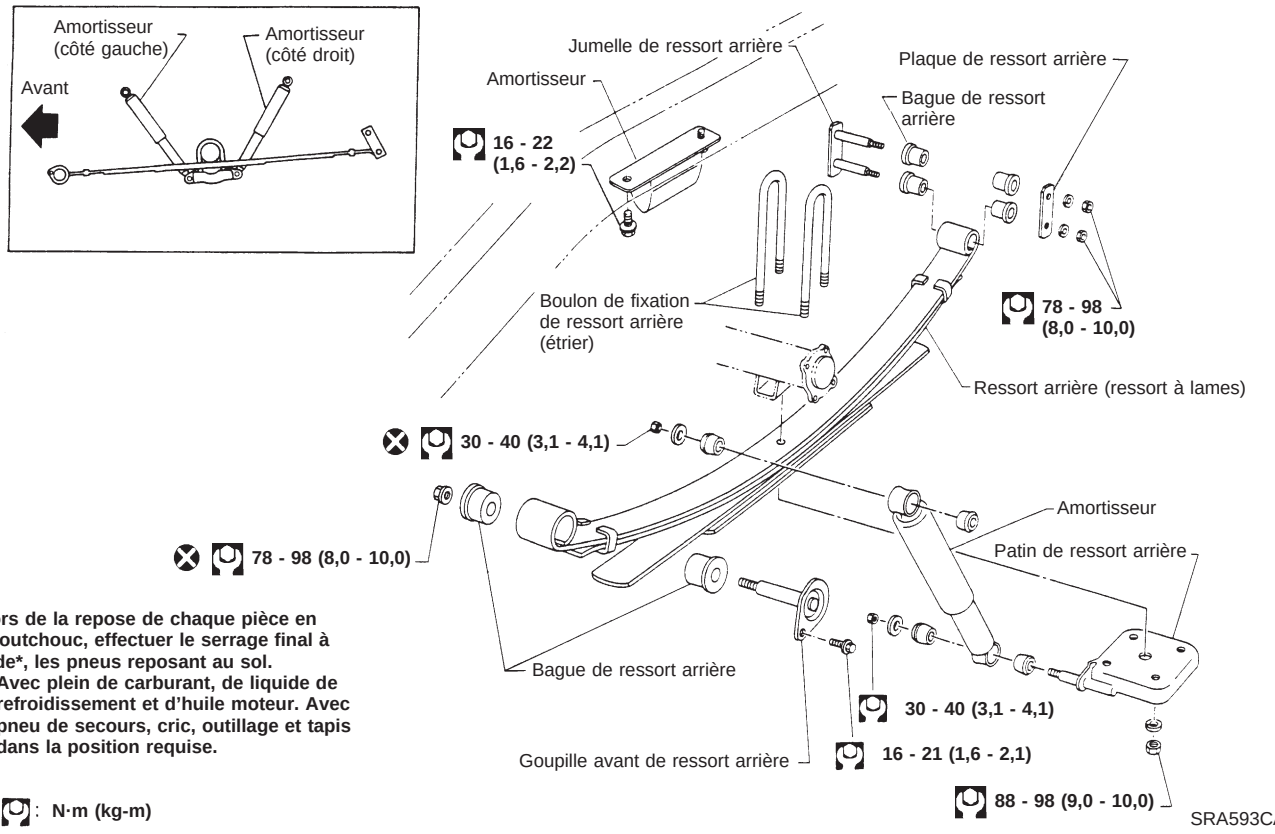
8. Reposer le joint torique neuf sur le carter d'essieu arrière.



9. Enfoncer le rotor de capteur d'ABS dans l'arbre d'essieu jusqu'à ce qu'il entre en contact avec le contre-écrou de roulement de roue.

10. Positionner les arbres d'essieu dans le carter d'essieu arrière en les guidant avec l'outil spécial.

Veiller à ne pas endommager le joint d'huile.



11. Vérifier le jeu axial.
a. S'assurer que les roulements de roues tournent en douceur.
b. Vérifier le jeu axial.
Jeu axial :
0 mm

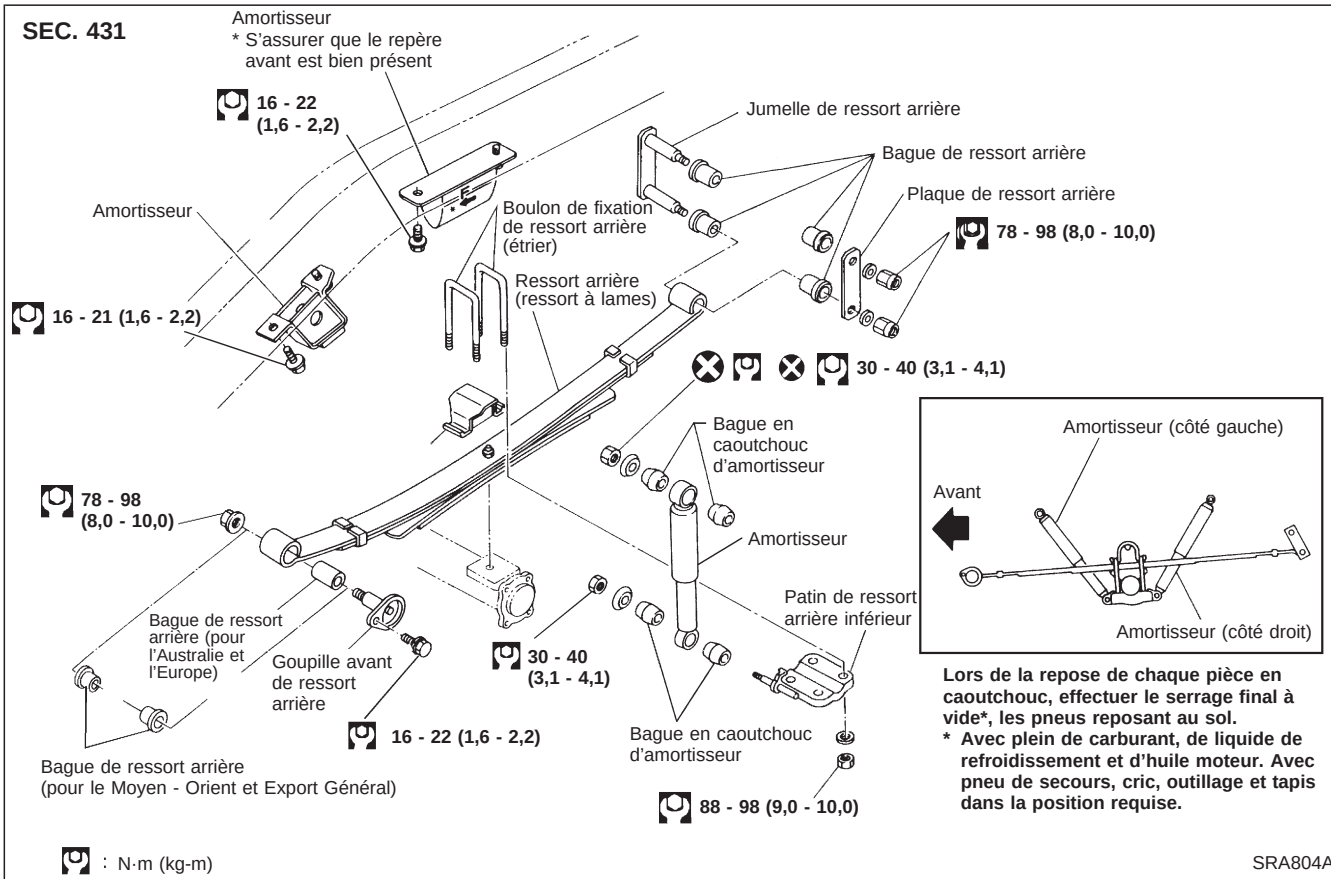
2 ROUES MOTRICES (2 X 2)

SEC. 431



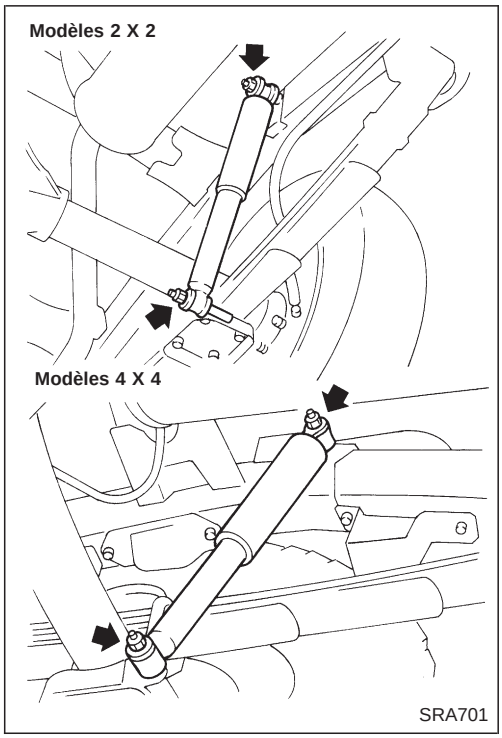
Lors de la repose de chaque pièce en caoutchouc, effectuer le serrage final à vide*, les pneus reposant au sol.
*** Avec plein de carburant, de liquide de refroidissement et d'huile moteur. Avec pneu de secours, cric, outillage et tapis dans la position requise.**

: N·m (kg-m)

SRA593CA

4 ROUES MOTRICES (4 X 4)

SEC. 431

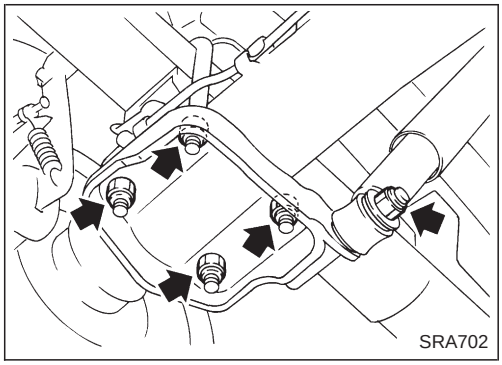


Lors de la repose de chaque pièce en caoutchouc, effectuer le serrage final à vide*, les pneus reposant au sol.
*** Avec plein de carburant, de liquide de refroidissement et d'huile moteur. Avec pneu de secours, cric, outillage et tapis dans la position requise.**

: N·m (kg-m)

SRA804AA

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

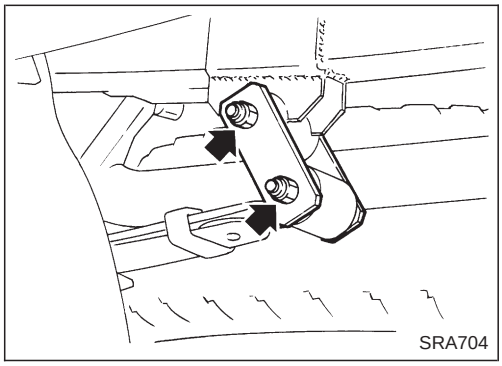


Amortisseur

DEPOSE ET REPOSE

- Déposer l'amortisseur en désaccouplant les extrémités supérieure et inférieure.

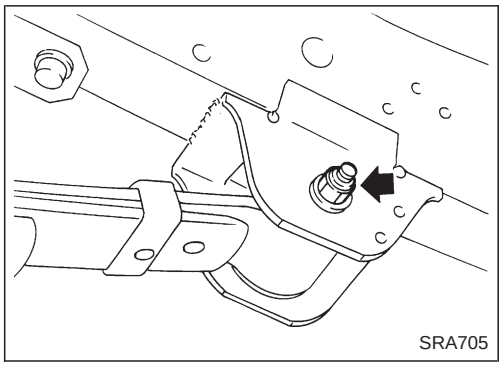
INSPECTION



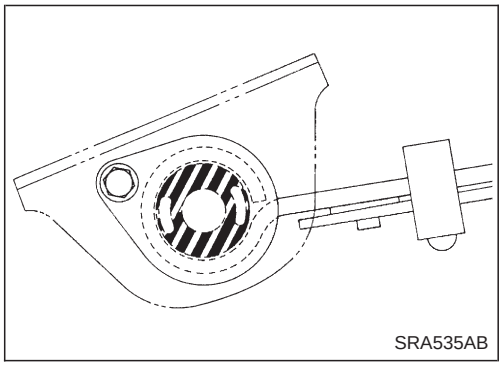
- Si des fuites d'huile, des fissures ou des déformations surviennent, remplacer l'amortisseur.
- Si les bagues en caoutchouc sont fissurées ou déformées, les remplacer.

Ressort à lames

DEPOSE ET REPOSE



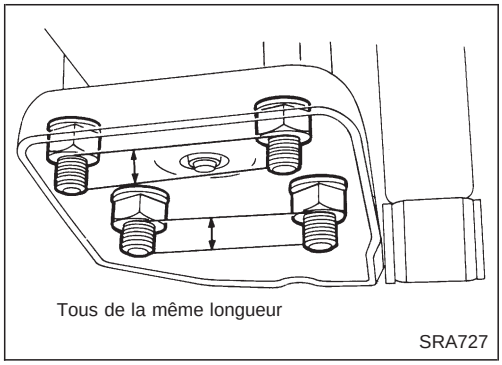
1. Débrancher l'extrémité inférieure de l'amortisseur, et déposer les étriers.



2. Désaccoupler la jumelle de ressort.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Ressort à lames (Suite)



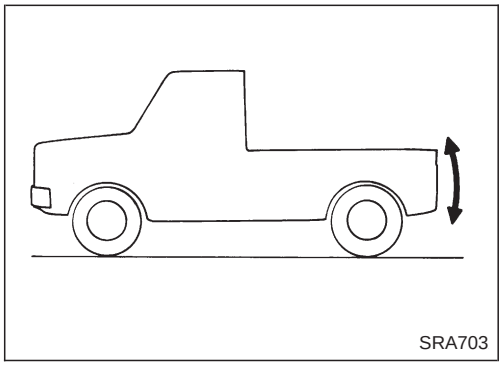
SRA705

3. Extraire la goupille.

SRA535AB

INSPECTION

- Vérifier que le ressort à lames n'est pas fissuré. Remplacer si nécessaire.
- Vérifier que le support avant et sa goupille, la jumelle, les étriers et le patin de ressort ne sont pas usés, fendus ou tordus et que les filets ne sont pas abîmés. Les remplacer si nécessaire.
- Vérifier que toutes les bagues ne présentent pas de déformations ou de fissures. Remplacer si nécessaire.
  [Modèles 4 X 4 pour l'Australie et l'Europe : bague avant de ressort arrière]
  S'assurer que la bague avant est correctement installée.

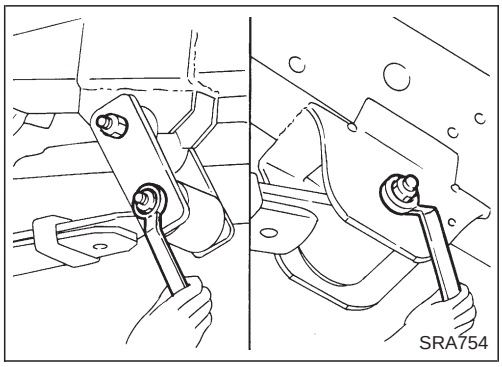


Tous de la même longueur
SRA727

REPOSE

1. Enduire de savon les bagues en caoutchouc.
2. Reposer la jumelle du ressort et la goupille avant, puis serrer les écrous à la main.
3. Reposer le patin et les écrous de ressort sous le ressort à lames ou le carter d'essieu.
4. Serrer en diagonale les écrous de fixation de l'étrier.

Serrer les étriers de sorte que tous les étriers sous le patin aient la même longueur.



5. Reposer l'amortisseur et serrer les écrous à la main.

SRA703

6. Déposer les chandelles et basculer le véhicule afin de stabiliser la suspension (à vide).

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Ressort à lames (Suite)

7. Serrer les écrous de jumelle de ressort, les écrous de goupille avant et les écrous de l'amortisseur.

Lors de la repose des pièces en caoutchouc, effectuer le serrage final à vide*, les pneus reposant au sol.

* Avec plein de carburant, de liquide de refroidissement et d'huile moteur. Avec pneu de secours, cric, outillage à main et tapis dans la position spécifiée.

Lors de la lecture des schémas de câblage :
- **Lire la section GI, ‘‘COMMENT LIRE LES SCHEMAS DE CABLAGE’’.**
- **Voir la section EL, ‘‘DISTRIBUTION DE L’ALIMENTATION ELECTRIQUE’’ pour connaître les circuits de distribution de l’alimentation électrique.**

Se reporter à la section GI aux chapitres ‘‘COMMENT LIRE LES ORGANIGRAMMES DANS LES DIAGNOSTICS DES DEFAUTS’’ et ‘‘COMMENT ACCOMPLIR UN DIAGNOSTIC EFFICACE EN CAS D’INCIDENT ELECTRIQUE’’ pour effectuer les diagnostics des défauts.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Système de retenue supplémentaire (SRS) ‘‘COUSSIN GONFLABLE’’ (modèles à 4 roues motrices)

Utilisé avec une ceinture de sécurité, le coussin gonflable du système de retenue supplémentaire contribue à réduire les risques et la gravité des blessures subies par le conducteur en cas de collision frontale. Le système de retenue supplémentaire se compose de module de coussin gonflable (air bag) (situé dans le moyeu du volant) d’un boîtier de capteurs de diagnostic, d’un témoin lumineux, d’un faisceau de câblage et d’un câble spiralé.

AVERTISSEMENT :

- **Pour ne pas affecter le fonctionnement du SRS, ce qui augmenterait les risques de blessures graves ou mortelles en cas de collision entraînant le déploiement du coussin gonflable, toutes les opérations d’entretien doivent être effectuées par un concessionnaire NISSAN agréé.**
- **Un entretien incorrect, y compris une mauvaise dépose ou repose du SRS, pourra entraîner des risques de blessures dues au déploiement accidentel du système.**
- **Ne pas utiliser d’équipement d’essai électrique sur les circuits connexes au SRS, sauf instructions données dans ce Manuel de Réparation. Les faisceaux de câblage du SRS sont recouverts d’une gaine d’isolation de couleur jaune soit juste devant les connecteurs de faisceau soit sur le faisceau en entier pour faciliter leur identification.**

Système de retenue supplémentaire (SRS) ‘‘COUSSIN GONFLABLE’’ (modèles à 2 roues motrices)

Utilisé avec une ceinture de sécurité, le coussin gonflable du système de retenue supplémentaire contribue à réduire les risques et la gravité des blessures subies par le conducteur en cas de collision frontale. Le système de retenue supplémentaire se compose de module de coussin gonflable (air bag) (situé dans le moyeu du volant) d’un boîtier de capteurs de diagnostic, d’un témoin lumineux, d’un faisceau de câblage et d’un câble spiralé.

AVERTISSEMENT :

- **Pour ne pas affecter le fonctionnement du SRS, ce qui augmenterait les risques de blessures graves ou mortelles en cas de collision entraînant le déploiement du coussin gonflable, toutes les opérations d’entretien doivent être effectuées par un concessionnaire NISSAN agréé.**
- **Un entretien incorrect, y compris une mauvaise dépose ou repose du SRS, pourra entraîner des risques de blessures dues au déploiement accidentel du système.**

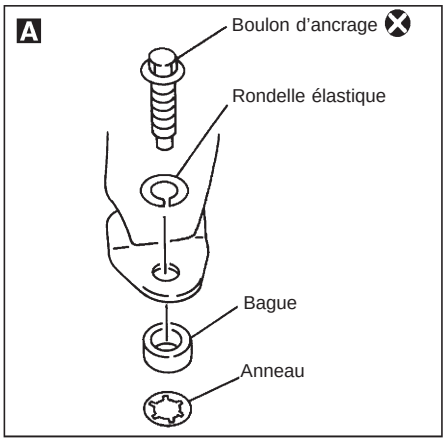
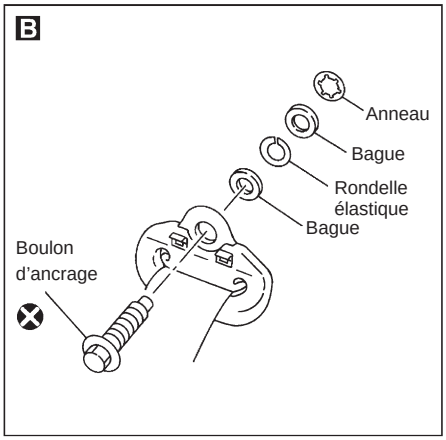
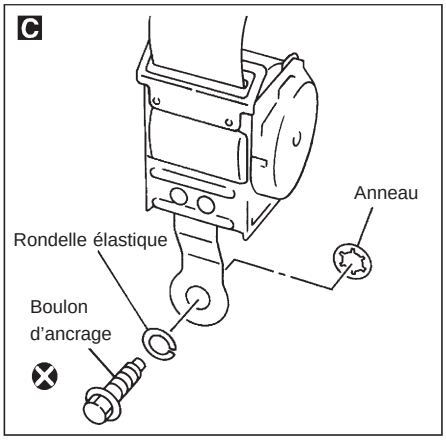
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



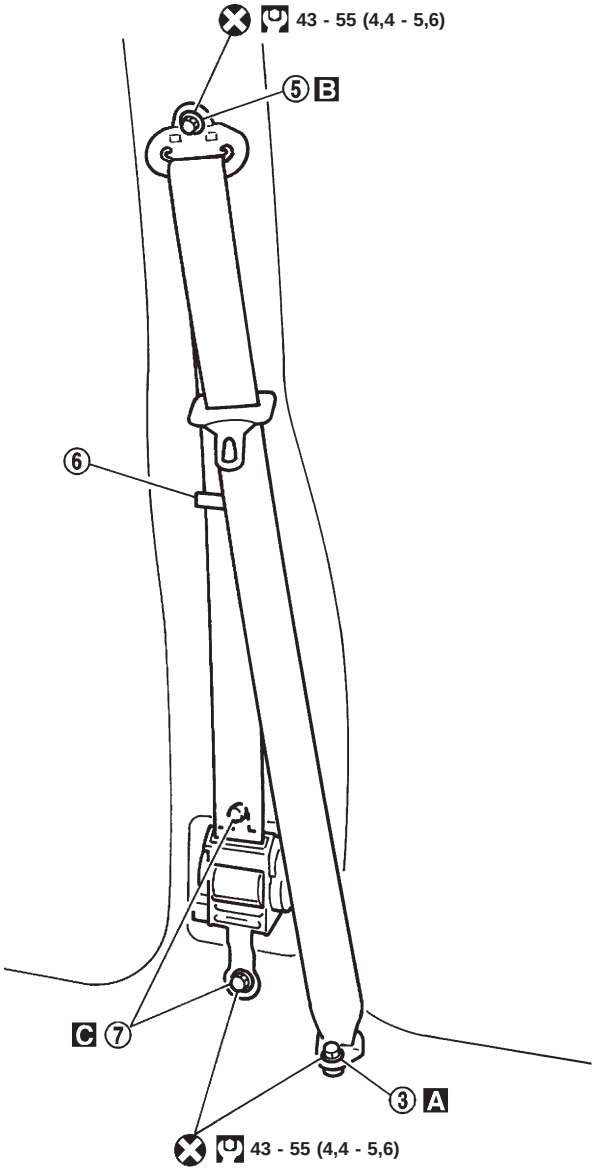
ATTENTION :



- **Ne pas démonter la boucle ou l'ensemble de la ceinture de sécurité.**
- **Remplacer les boulons d'ancrage s'ils sont déformés ou usés.**
- **Ne pas huiler la languette et la boucle.**
- **Ne pas réparer les composants de l'ensemble de ceinture de sécurité dont l'état est suspect. Remplacer l'ensemble complet de ceinture de sécurité.**
- **Si les sangles sont coupées, usées ou endommagées, remplacer l'ensemble de ceinture de sécurité.**
- **Lors du remplacement de l'ensemble de ceinture de sécurité, utiliser un ensemble de ceinture de sécurité d'origine.**
- **Après chaque collision, inspecter toutes les ceintures de sécurité ainsi que les enrouleurs et toutes les autres pièces connexes.**



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Ceinture de sécurité avant

① Déposer le siège avant. Se reporter au chapitre ‘‘SIEGES’’ dans la section BT pour plus de détails.
② Déposer la protection du boulon d’ancrage.
③ Déposer le boulon d’ancrage au plancher.
④ Déposer la garniture de montant central. Se reporter au chapitre ‘‘GARNITURE INTERIEURE’’ dans la section BT pour plus de détails.
⑤ Déposer le boulon d’ancrage de baudrier.
⑥ Déposer le second guide de ceinture.
⑦ Déposer les boulons de fixation de l’enrouleur de ceinture de sécurité, puis déposer la ceinture de sécurité et son enrouleur.

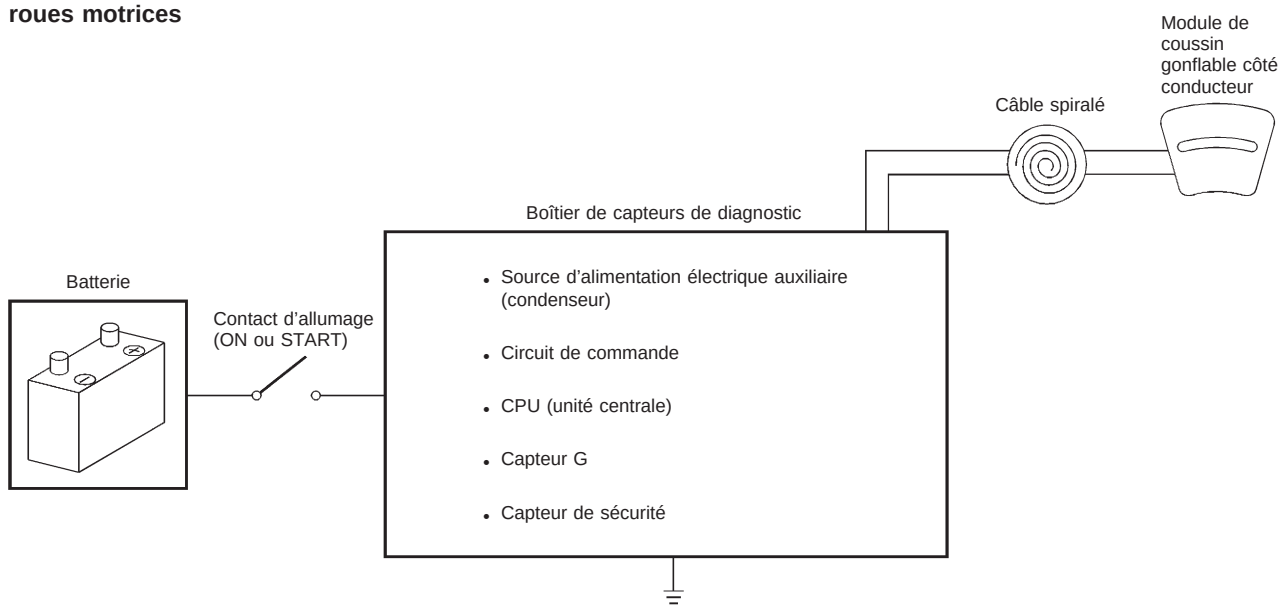
Précautions pour l'entretien du SRS ''COUSSIN GONFLABLE''

- Ne pas utiliser de multimètre pour vérifier les circuits du SRS, sauf si indiqué dans ce Manuel de Réparation.
- Couper le contact d'allumage (''OFF''), débrancher les deux câbles de la batterie et attendre au moins 3 minutes avant de procéder à toute réparation du SRS.
  Le coussin gonflable peut encore se déployer pendant un délai de 3 minutes environ après que les câbles ont été débranchés. Attendre par conséquent au moins 3 minutes avant de travailler sur les connecteurs ou les câbles du SRS.
- Pour les modèles à 2 roues motrices, ne pas séparer le boîtier de capteurs de diagnostic du volant de direction.
- Pour les modèles à 4 roues motrices, le boîtier de capteurs de diagnostic doit toujours être reposé en prenant soin d'orienter les flèches ''⇧'' vers l'avant du véhicule pour assurer un bon fonctionnement. Vérifier également que le boîtier de capteurs de diagnostic ne présente pas de fissures, déformations ou traces de rouille avant de le reposer. Le remplacer le cas échéant.
- Le câble spiralé doit être aligné avec le point mort car le nombre de tours qu'il peut faire est limité. Ne pas tenter de tourner le volant de direction ou la colonne de direction après la dépose du pignon de direction.
- Manipuler le module de coussin gonflable avec précaution. Toujours le poser avec la garniture dirigée vers le haut.
- Exécuter l'autodiagnostic pour contrôler que l'ensemble du SRS fonctionne normalement après avoir remplacé l'un des composants.

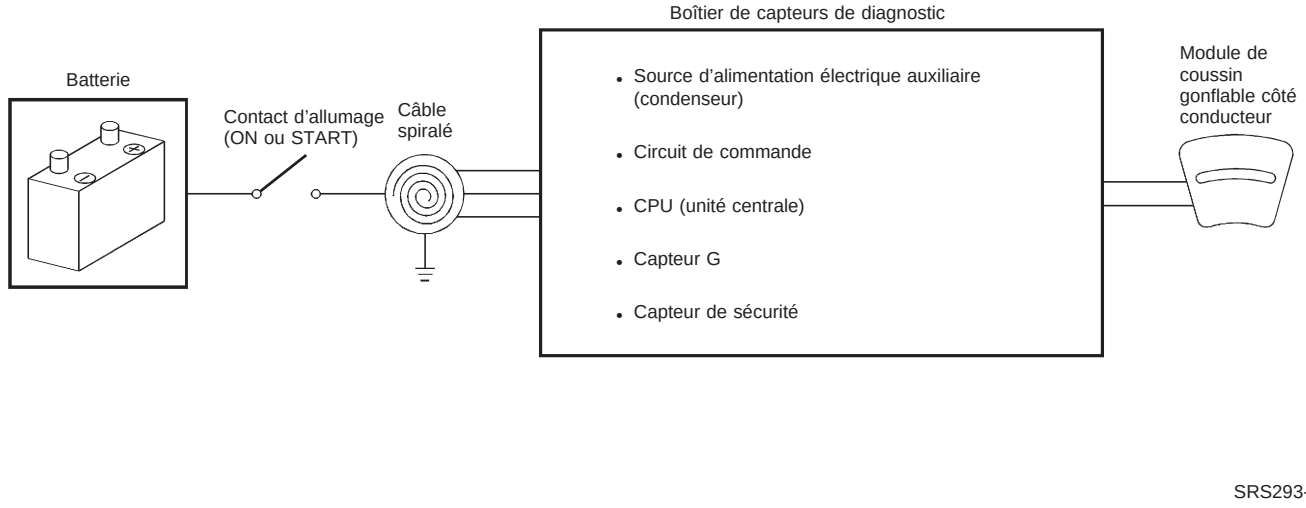
Outillage spécial

Numéro de l'outil Nom de l'outil	Description	
KV99106400 Outil de déploiement	 NT357	Mise au rebut du module de coussin gonflable
KV99105300 Support de module de coussin gonflable.	 NT354	Plaque d'ancrage du module de coussin gonflable
HT61961000 et HT62152000 combinés *1 Tournevis spécial pour vis torx	 NT361	A utiliser pour les boulons spéciaux. [TOURNEVIS A EMPREINTE ANTI-EFFRACTION (Taille T50)]. **a : 3,5 dia.** **b : 8,5 - 8,6 dia.** **c : environ 10 mm^2.** Unité : mm



*1 : Outil spécial ou équivalent en vente dans le commerce

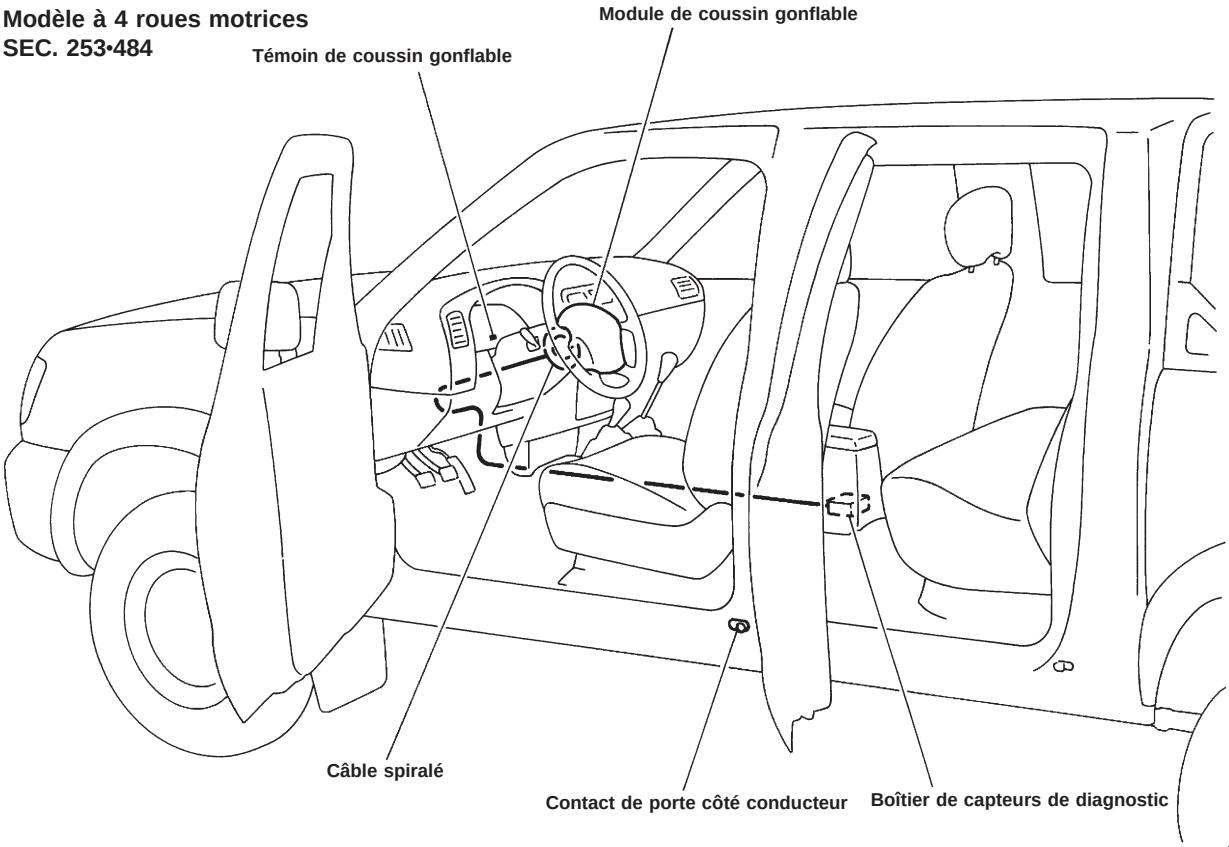
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Description

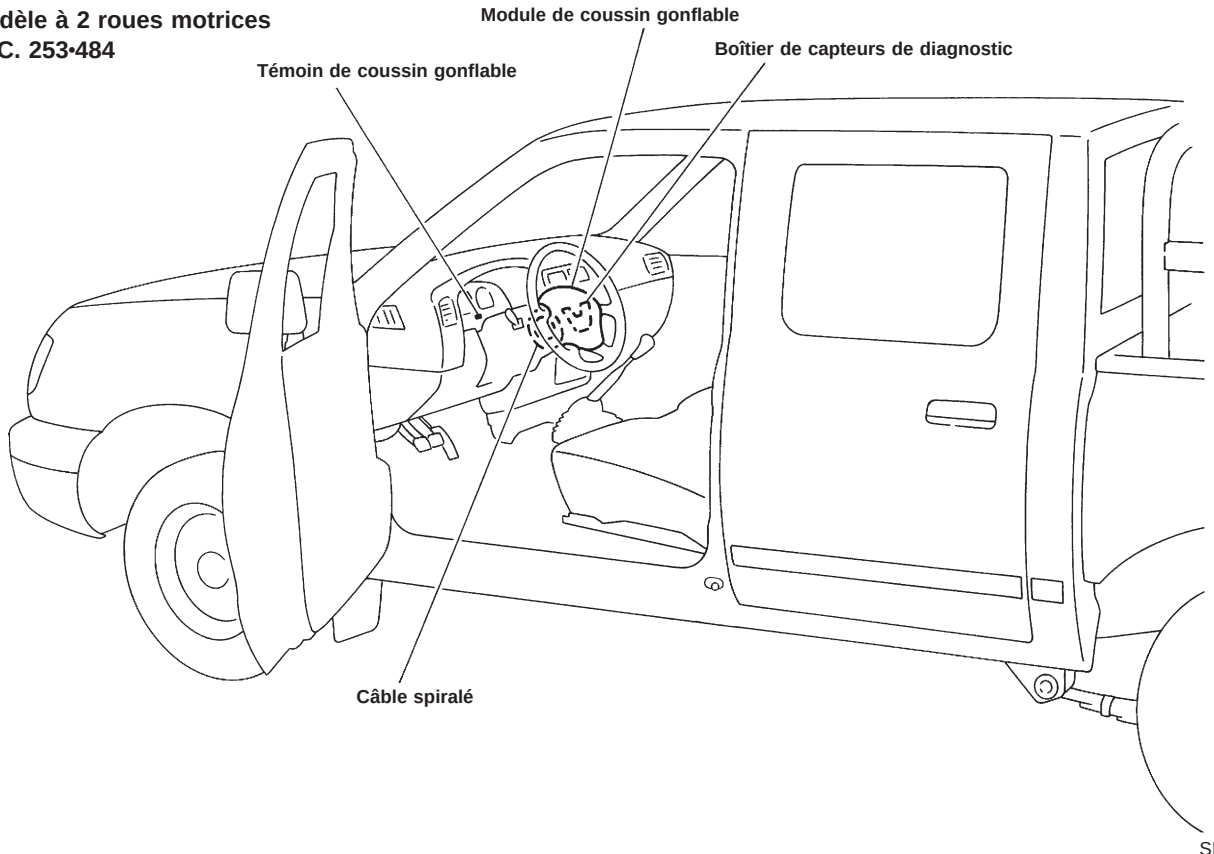
Le coussin gonflable se déploie lorsque le boîtier de capteurs de diagnostic est activé alors que le contact est sur la position ‘‘ON’’ ou ‘‘START’’.

Modèles à 4 roues motrices



Modèles à 2 roues motrices

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Disposition des composants du SRS

SEC. 253•484

SRS395

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Points d'entretien

ATTENTION :
Ne pas utiliser de multimètre pour tester le circuit du SRS.

1. Vérifier le fonctionnement du témoin ''AIR BAG''.
   Le témoin ''AIR BAG'' s'allume lorsque l'on tourne la clé du contact d'allumage sur ''ON''. Le témoin ''AIR BAG'' s'éteindra après environ 7 secondes si aucun défaut n'est détecté. Si l'une des conditions suivantes affectant le témoin de coussin gonflable se produit, vérifier immédiatement le système de coussin gonflable. Se reporter à RS-29 (4 x 4), RS-20 (2 x 2) pour plus de détails.

- Le témoin ne s'allume pas lorsque le contact d'allumage est sur ''ON''.
- Le témoin ne s'éteint pas dans les 7 secondes après que le contact d'allumage a été mis sur ''ON''.
- Le témoin clignote pendant environ 7 secondes après que le contact d'allumage a été mis sur ''ON''.

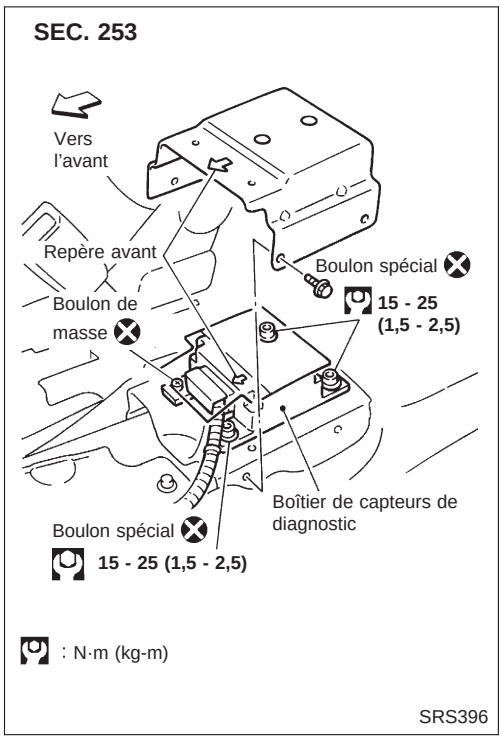
2. Inspecter visuellement les composants du SRS.

(1) Boîtier de capteurs de diagnostic
- Vérifier si le boîtier de capteurs de diagnostic et le support ne sont pas bosselés, fissurés ou déformés.
- Vérifier si les connecteurs ne sont pas endommagés et les bornes déformées.

(2) Module de coussin gonflable et volant de direction
- Déposer le module de coussin gonflable du volant de direction. Vérifier si le cache du faisceau et les connecteurs ne sont pas endommagés, les bornes déformées et le faisceau coincé.
- Reposer le module de coussin gonflable côté conducteur sur le volant de direction et vérifier s'il est correctement monté et aligné sur le volant de direction.
- Vérifier si le volant de direction ne présente pas un jeu excessif.

(3) Câble spiralé
- Vérifier si le câble spiralé n'est pas bosselé, fissuré ou déformé.
- Vérifier si les connecteurs et la bande de protection ne sont pas endommagés.
- Vérifier si le volant de direction est exempt de tout bruit, point de force et qu'il tourne librement.

(4) Faisceau principal et faisceau de coussin gonflable
- Vérifier si les connecteurs ne sont pas desserrés ou endommagés et que les bornes ne sont pas déformées.
- Vérifier si les faisceaux ne coincent pas et qu'ils ne sont pas usés par le frottement ou coupés.



ATTENTION :
Remplacer les boulons usagés, le boulon de masse par des boulons neufs.

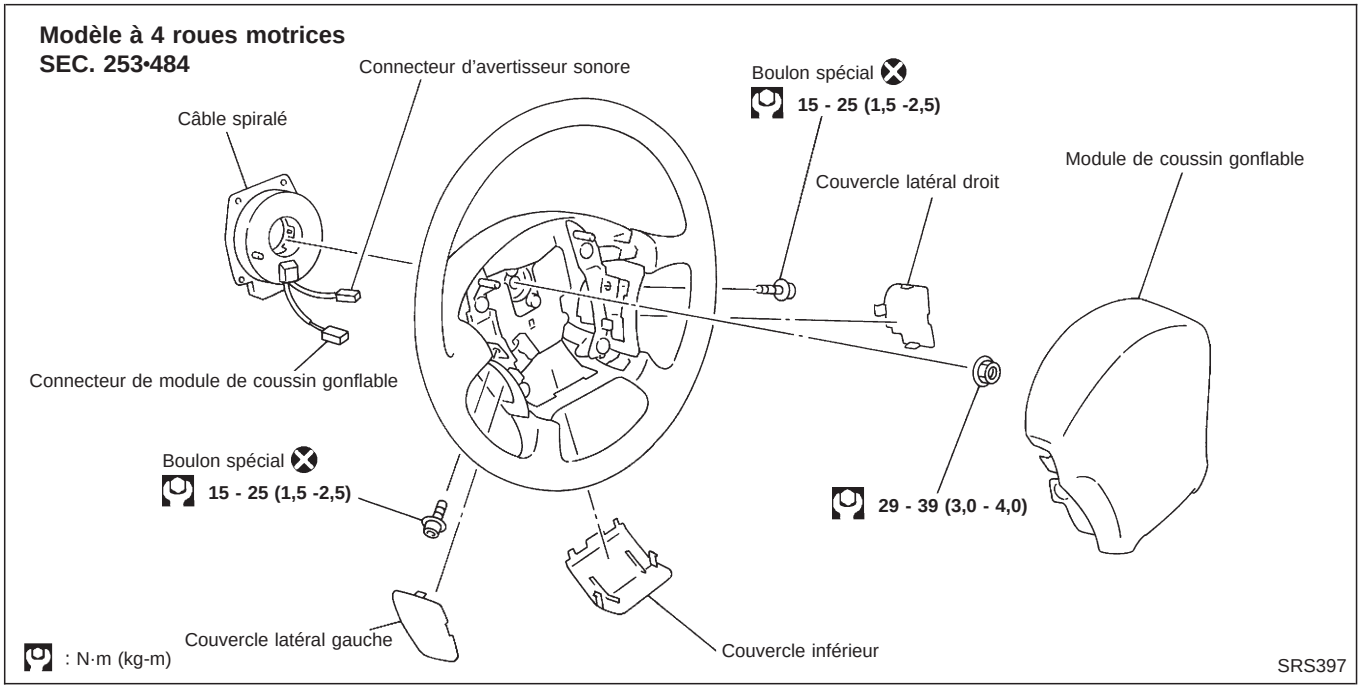
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Dépose et repose – Boîtier de capteurs de diagnostic (modèles à 4 roues motrices)

ATTENTION :

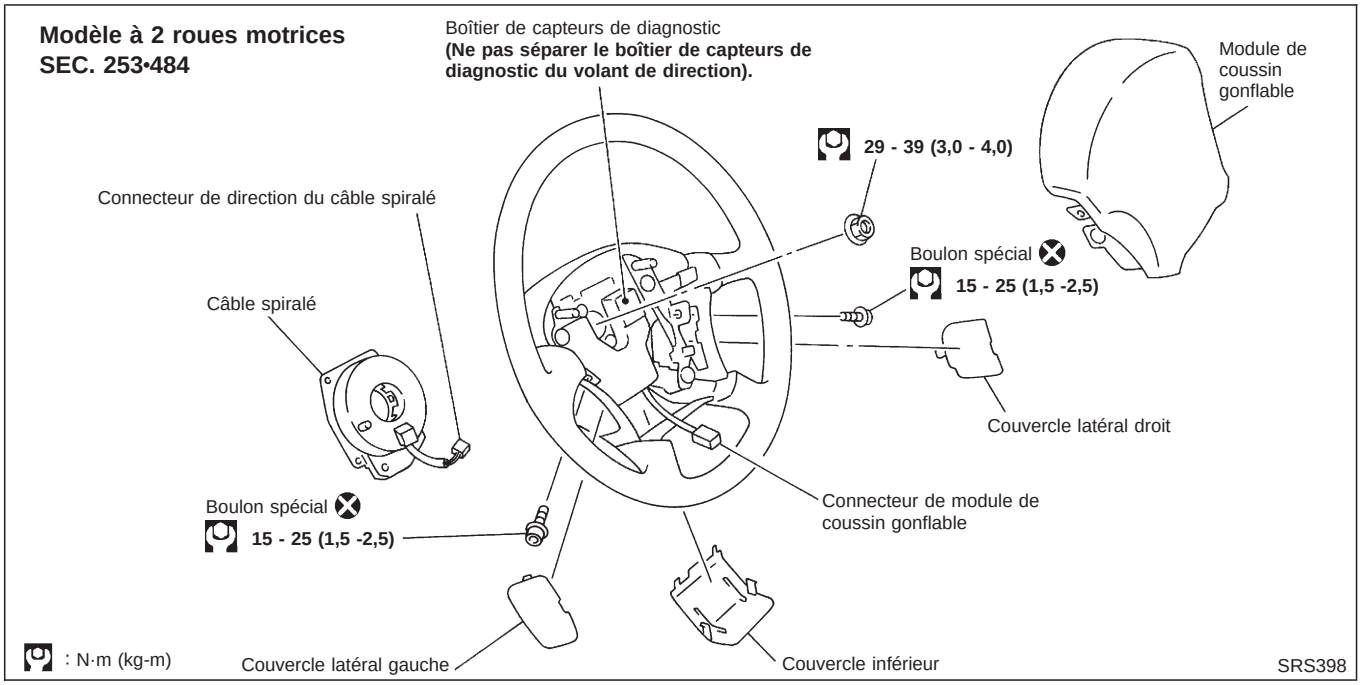
- **Avant de procéder à l'entretien du SRS, couper le contact d'allumage, déconnecter les deux câbles de la batterie et attendre au moins 3 minutes.**
- **Les boulons spéciaux sont revêtus d'une couche d'agent de freinage tandis que le boulon supplémentaire correspond à la masse. Ne pas réutiliser les boulons une fois déposés ; les remplacer par des neufs.**
- **Vérifier si le boîtier de capteurs de diagnostic est reposé correctement.**
- **Vérifier si le boîtier de capteurs de diagnostic n'est pas déformé, bosselé, fissuré ou rouillé. S'il est visiblement endommagé, le remplacer par un neuf.**
- **Vérifier si les supports du boîtier de capteurs de diagnostic ne sont pas déformés ou rouillés.**
- **Remplacer le boîtier de capteurs de diagnostic en cas de chute ou d'impact.**
- **Après avoir remplacé le boîtier de capteurs de diagnostic, effectuer l'autodiagnostic du SRS. Se reporter à ''Autodiagnostic'' pour plus de détails (RS-29).**

DEPOSE DU BOITIER DE CAPTEURS DE DIAGNOSTIC



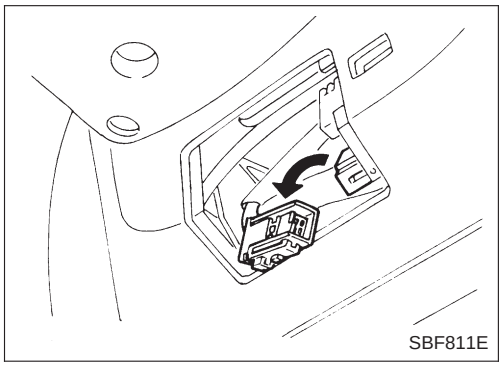
1. Débrancher le connecteur du module de coussin gonflable.
2. Déposer la console. Se reporter à ''TABLEAU DE BORD'' dans la section BT (modèles à cabine double à 4 roues motrices)
3. Déposer le support de la console.
4. Débrancher le connecteur du boîtier de capteurs de diagnostic.
5. Déposer le boulon et les boulons spéciaux du boîtier de capteurs de diagnostic à l'aide du TOURNEVIS A EMPREINTE ANTIEFFRACTION (Taille T50).
   Puis déposer le boîtier de capteurs de diagnostic.

NOTE :



- **Pour la repose, procéder dans l'ordre inverse de la dépose.**

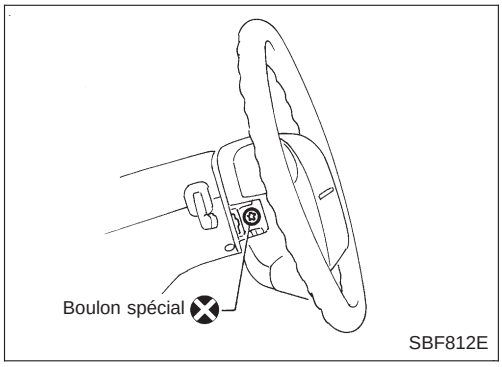
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Dépose et repose – module de coussin gonflable et câble spiralé (modèles à 4 roues motrices)

Dépose et repose – module de coussin gonflable et câble spiralé (modèles à 2 roues motrices)

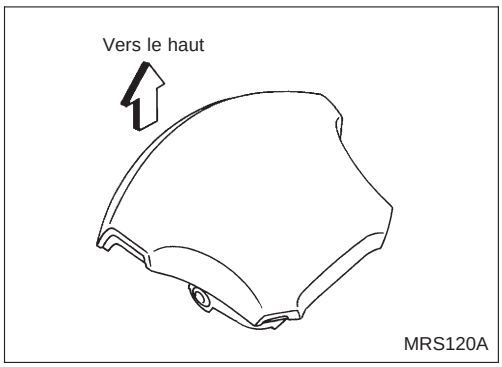
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



SBF811E

Dépose – module de coussin gonflable et câble spiralé

ATTENTION :



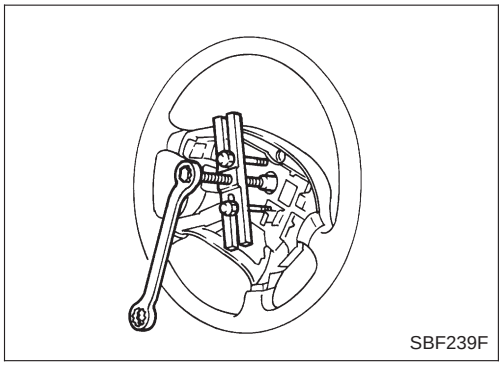
- **Avant de procéder à l'entretien du SRS, couper le contact d'allumage, déconnecter les deux câbles de la batterie et attendre au moins 3 minutes.**
- **Toujours se positionner sur le côté du module de coussin gonflable.**

1. Déposer le couvercle inférieur du volant de direction et débrancher le connecteur du module de coussin gonflable.

SBF812E

2. Déposer les couvercles latéraux. A l'aide d'un TOURNEVIS A EMPREINTE ANTIEFFRACTION (taille 50), déposer les boulons spéciaux gauche et droit. Le module de coussin gonflable peut alors être déposé.

MRS120A



ATTENTION :

- **Toujours poser le module de coussin gonflable avec la garniture dirigée vers le haut.**
- **Ne pas tenter de démonter le module de coussin gonflable.**
- **Les boulons spéciaux sont revêtus d'une couche d'agent de freinage. Ne pas réutiliser les boulons une fois déposés ; les remplacer par des neufs.**

SBF814E

- **Remplacer le module de coussin gonflable s'il est tombé ou s'il a subi un impact.**
- **Ne pas exposer le module de coussin gonflable à des températures supérieures à 90°C.**
- **Ne pas laisser de l'huile, de la graisse ou de l'eau venir en contact avec le module de coussin gonflable.**

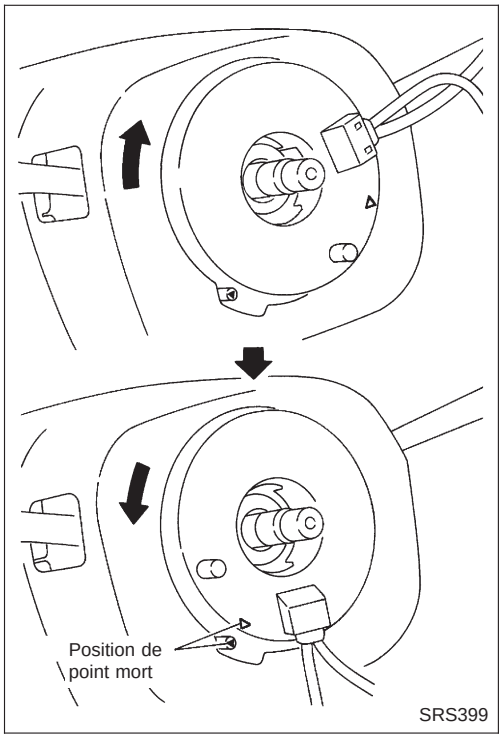
SBF239F

3. Régler le volant de direction en position neutre.
4. Débrancher le connecteur de l'avertisseur sonore (système de coussin gonflable double)/le connecteur de direction du câble spiralé (système de coussin gonflable simple) et déposer les écrous.
5. A l'aide d'un extracteur de volant de direction, déposer le volant de direction. Veiller à ne pas trop serrer le boulon de l'extracteur sur le volant de direction.

ATTENTION :

- **Ne pas taper ou heurter le volant de direction.**

6. Déposer le couvercle de la colonne de direction.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Dépose – module de coussin gonflable et câble spiralé (Suite)

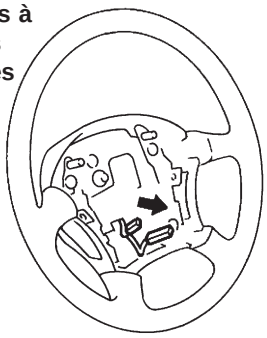
7.Débrancher les connecteurs et retirer les quatre vis. Le câble spiralé peut alors être déposé.

ATTENTION :

- **Ne pas essayer de démonter le câble spiralé.**
- **Ne pas lubrifier le câble spiralé.**
- **Pour les modèles à 2 roues motrices, ne pas séparer le boîtier de capteurs de diagnostic du volant de direction.**

SRS399

Repose – Module de coussin gonflable et câble spiralé



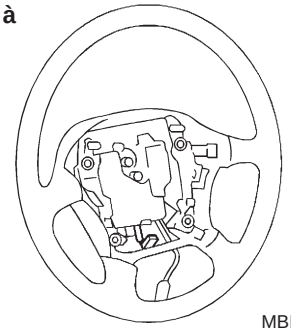
1. Placer les roues avant en ligne droite.
2. Brancher le connecteur de câble spiralé et le serrer le câble avec des vis. Reposer le cache de colonne de direction.

ATTENTION :

- **Un câble spiralé incorrectement monté peut se rompre lorsqu'on tourne le volant de direction.**
- **La timonerie de direction étant déconnectée, le câble risque de se rompre si l'on tourne le volant de direction au delà d'un nombre limité de tours. Le câble spiralé peut effectuer jusqu'à 2,5 tours de la gauche en partant de la position de butée droite.**

3. S'assurer que le câble spiralé est sur la position neutre. Pour obtenir la position neutre, le tourner d'environ 2,5 tours vers la gauche à partir de la position de butée droite. Aligner les deux repères(▽ ▲).

Modèles à 4 roues motrices



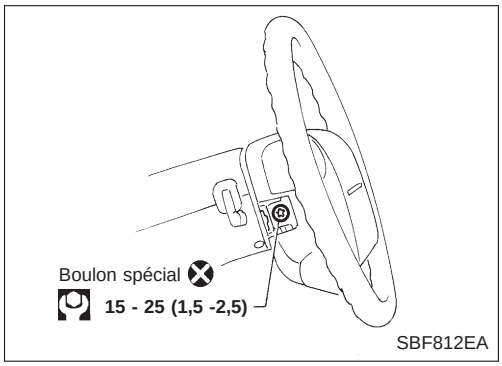
SRS166-B

MODELES A 4 ROUES MOTRICES

4. Reposer les douilles de guidage du câble spiralé du volant de direction, puis tirer le câble spiralé à travers celles-ci.
5. Brancher le connecteur d'avertisseur sonore et engager le câble spiralé dans les cliquets du volant de direction.
6. Serrer l'écrou.

: 29 - 39 N·m (3,0 - 4,0 kg-m)

Modèles à 2 roues motrices



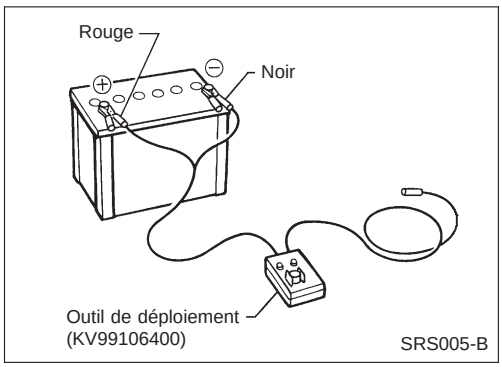
MBF648BB

MODELES A 2 ROUES MOTRICES

4. Reposer les douilles de guidage du câble spiralé du volant de direction, puis tirer le câble spiralé à travers celles-ci.
5. Brancher le connecteur de direction du câble spiralé au boîtier de capteurs de diagnostic dans le volant de direction.
6. Serrer l'écrou.

: 29 - 39 N·m (3,0 - 4,0 kg-m)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Repose – Module de coussin gonflable et câble spiralé (Suite)

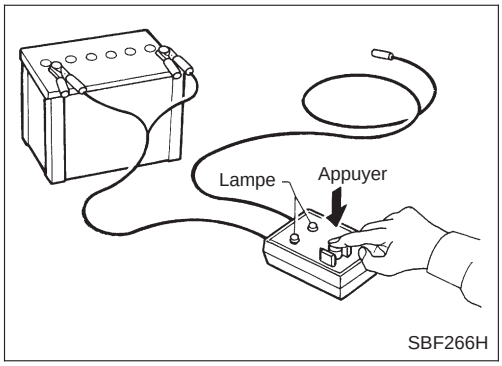
7. Mettre le module de coussin gonflable en position et le fixer avec des boulons spéciaux neufs.
8. Brancher le connecteur du module de coussin gonflable.
9. Reposer tous les couvercles.
10. Exécuter l'autodiagnostic afin de s'assurer du fonctionnement normal du SRS (utiliser CONSULT ou contrôler le témoin).
    Avant d'effectuer l'autodiagnostic, brancher les deux câbles de batterie.
11. Braquer le volant de direction à fond vers la gauche, puis vers la droite pour s'assurer que le câble spiralé est en position neutre.
    Si le témoin de coussin gonflable clignote ou reste allumé (en mode Utilisateur), cela signifie que le câble spiralé peut se rompre en raison de sa position incorrecte. Effectuer l'autodiagnostic de nouveau (en utilisant le CONSULT ou le témoin). Si un défaut est trouvé, remplacer le câble spiralé par un neuf.

Mise au rebut du module de coussin gonflable

- Avant de mettre au rebut les modules de coussin gonflable ou les véhicules équipés d'un tel système, déployer le système. Si ce système a déjà été déployé lors d'un accident, le mettre au rebut en se reportant au chapitre ''MISE AU REBUT DU MODULE DE COUSSIN GONFLABLE (RS-17).
- Lors du déploiement du module de coussin gonflable, toujours utiliser l'outil spécial ; outil de déploiement KV99106400.
- Se tenir à une distance minimum de 5 m lors du déploiement du module de coussin gonflable.
- Lors du déploiement du module de coussin gonflable, une détonation bruyante et un dégagement de fumée s'ensuivent. La fumée n'est pas nocive, mais on veillera toutefois à ne pas l'inhaler en raison de ses propriétés irritantes pouvant être à l'origine d'un étouffement.
- Ne jamais déployer plus d'un module de coussin gonflable à la fois.
- En raison de la température élevée des composants du module de coussin gonflable, ne pas toucher le module pendant au moins 30 minutes après le déploiement.
- Veiller à porter des gants lors de la manipulation d'un module de coussin gonflable déployé.
- Ne jamais asperger d'eau sur un module de coussin gonflable déployé.
- Se nettoyer les mains correctement une fois le travail fini.
- Garer le véhicule à l'extérieur dans un espace libre d'au moins 6 mètres de rayon avant de déployer le module de coussin gonflable monté sur le véhicule.
- Utiliser un voltmètre pour s'assurer que la batterie du véhicule est chargée à fond.
- Ne pas mettre au rebut le module de coussin gonflable non déployé.

VERIFICATION DE L'OUTIL DE DEPLOIEMENT
Branchement sur la batterie

ATTENTION :
La batterie doit débiter au moins 9,6 V.
Sortir la batterie du véhicule et la placer sur une cale en bois dur à environ 5 m du véhicule.



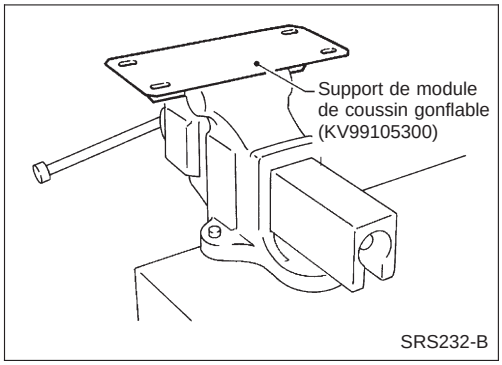
- Attendre 10 à 12 minutes après que la batterie du véhicule est débranchée, avant de continuer.
- Brancher le clip rouge de l'outil de déploiement à la borne positive de batterie et le clip noir à la borne négative.

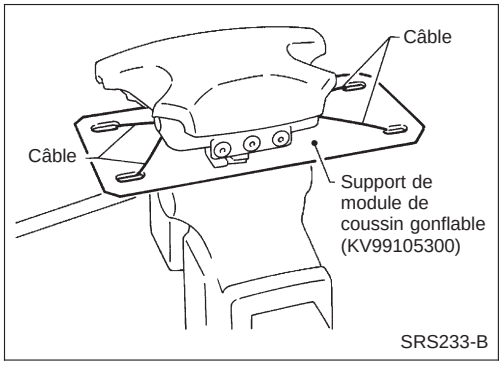
Veiller à respecter les polarités. Le témoin à la droite de l'outil, sur lequel est indiqué ''outil de déploiement sous tension'', doit s'allumer en vert. Si le témoin de droite s'allume en rouge, inverser les polarités à la batterie.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Mise au rebut du module de coussin gonflable (Suite)

Vérification de l'outil de déploiement





Appuyer sur l'interrupteur de l'outil de déploiement pour l'amener en position ''MARCHE''. Le témoin à la gauche de l'outil, sur lequel est indiqué ''tension du connecteur de coussin gonflable'' doit s'allumer. S'il ne s'allume pas, remplacer l'outil.

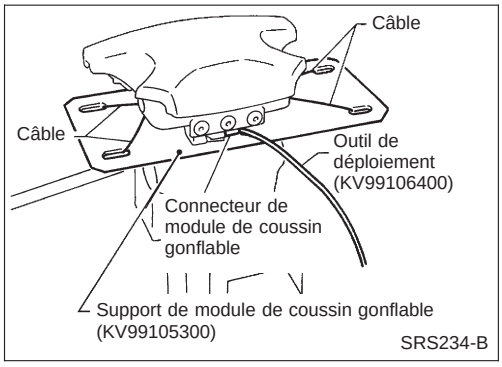


Tableau de fonctionnement des témoins de l'outil de déploiement de coussin gonflable (batterie branchée)

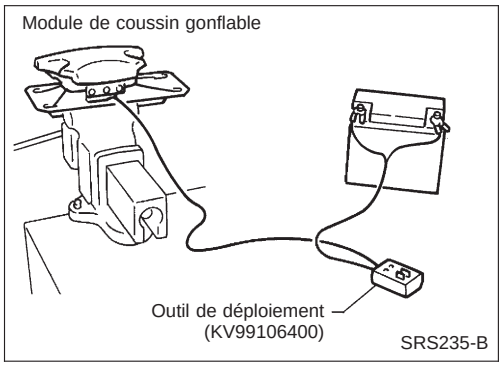
Position de l'interrupteur	Témoin gauche, vert* ''TENSION CONNECTEUR COUSSIN GONFLABLE''.	Témoin de droite, vert* ''OUTIL DE DEPLOIEMENT SOUS TENSION''
ARRET	ARRET	MARCHE
MARCHE	MARCHE	MARCHE

* : Si ce témoin s'allume en rouge, l'outil est mal connecté à la batterie. Inverser le sens des polarités et s'assurer que le témoin s'allume en vert.

PROCEDURES DE DEPLOIEMENT DU MODULE DE COUSSIN GONFLABLE (EXTERIEUR DU VEHICULE)

Il est déconseillé de déployer le module de coussin gonflable à bord du véhicule, sauf si ce dernier doit être mis au rebut. Ceci est susceptible d'endommager l'intérieur du véhicule.
Immobiliser le module de coussin gonflable dans un étau fixé sur une base solide pendant le déploiement.

Déploiement du module de coussin gonflable côté conducteur (extérieur du véhicule)

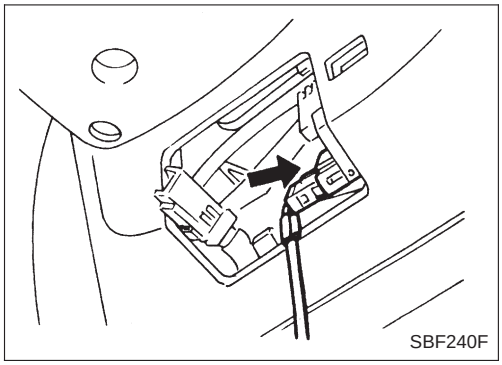


1. Attacher le module de coussin gonflable sur son support à l'aide d'un câble.

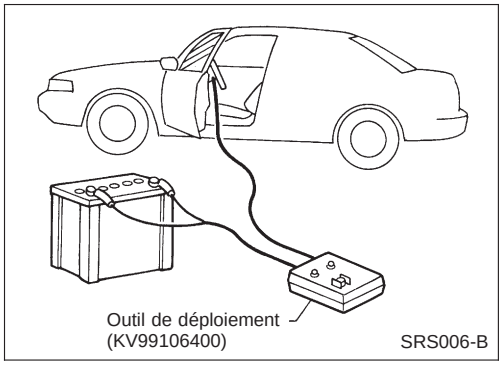
ATTENTION :
Utiliser un câble d'au moins 1 mm de diamètre.

2. Fixer solidement dans un étau le support de module de coussin gonflable [outil spécial : KV99105300] assorti du module.

3. Brancher l'outil de déploiement (outil spécial : KV99106400) au connecteur du module de coussin gonflable.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Mise au rebut du module de coussin gonflable (Suite)

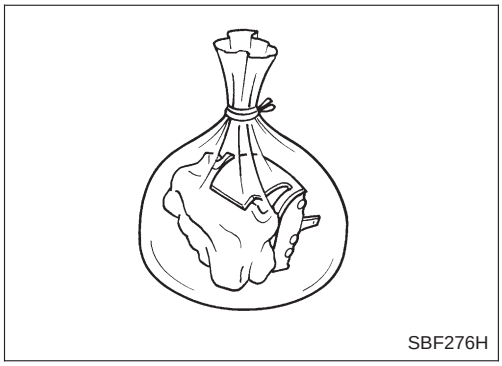
4. Brancher le clip rouge de l'outil de déploiement à la borne positive de batterie et le clip noir à la borne négative.
5. Le témoin à la droite de l'outil, sur lequel est indiqué ''outil de déploiement sous tension'', doit s'allumer en vert et non en rouge.
6. Appuyer sur l'interrupteur de l'outil de déploiement. Le témoin à la gauche de l'outil, sur lequel est indiqué ''tension du connecteur de coussin gonflable'' doit s'allumer et le module de coussin gonflable se déployer.

ATTENTION :
Se tenir à une distance minimum de 5 m lors du déploiement du module de coussin gonflable.

DEPLOIEMENT DU MODULE DE COUSSIN GONFLABLE INSTALLE SUR LE VEHICULE

Lors de la mise au rebut du véhicule, déployer le module de coussin gonflable alors qu'il est toujours installé dans le véhicule.

ATTENTION :
Lors du déploiement du module de coussin gonflable, s'assurer que le véhicule est vide.



1. Débrancher les deux câbles de la batterie et attendre 3 minutes.
2. Débrancher le connecteur du module de coussin gonflable.
3. Brancher l'outil de déploiement (outil spécial : KV99106400) au module de coussin gonflable.
4. Brancher le clip rouge de l'outil de déploiement à la borne positive de batterie et le clip noir à la borne négative.
5. Le témoin à la droite de l'outil, sur lequel est indiqué ''outil de déploiement sous tension'', doit s'allumer en vert et non en rouge.
6. Appuyer sur l'interrupteur de l'outil de déploiement. Le témoin à la gauche de l'outil, sur lequel est indiqué ''tension du connecteur de coussin gonflable'' doit s'allumer et le module de coussin gonflable se déployer.

ATTENTION :

- **Garer le véhicule à l'extérieur dans un espace libre d'au moins 6 mètres de rayon avant de déployer le module de coussin gonflable monté sur le véhicule.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Mise au rebut du module de coussin gonflable (Suite)

SBF276H

MISE AU REBUT DU MODULE DE COUSSIN GONFLABLE

Le module de coussin gonflable est très chaud. Avant de mettre le module de coussin gonflable au rebut, attendre au moins 30 minutes. L'enfermer dans un sac en plastique hermétique avant de le mettre au rebut.

ATTENTION :

- **Ne jamais asperger d'eau un module de coussin gonflable déployé.**
- **Veiller à porter des gants lors de la manipulation d'un module de coussin gonflable déployé.**
- **Le déploiement du coussin gonflable ne dégage pas de gaz nocifs. Toutefois veiller à ne pas inhaler le gaz en raison de ses propriétés irritantes pouvant être à l'origine d'un étouffement.**
- **Ne pas tenter de démonter le module de coussin gonflable.**
- **Le module de coussin gonflable ne peut être réutilisé.**
- **Se nettoyer les mains correctement une fois le travail fini.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Comment effectuer des diagnostics de défauts permettant une réparation rapide et précise

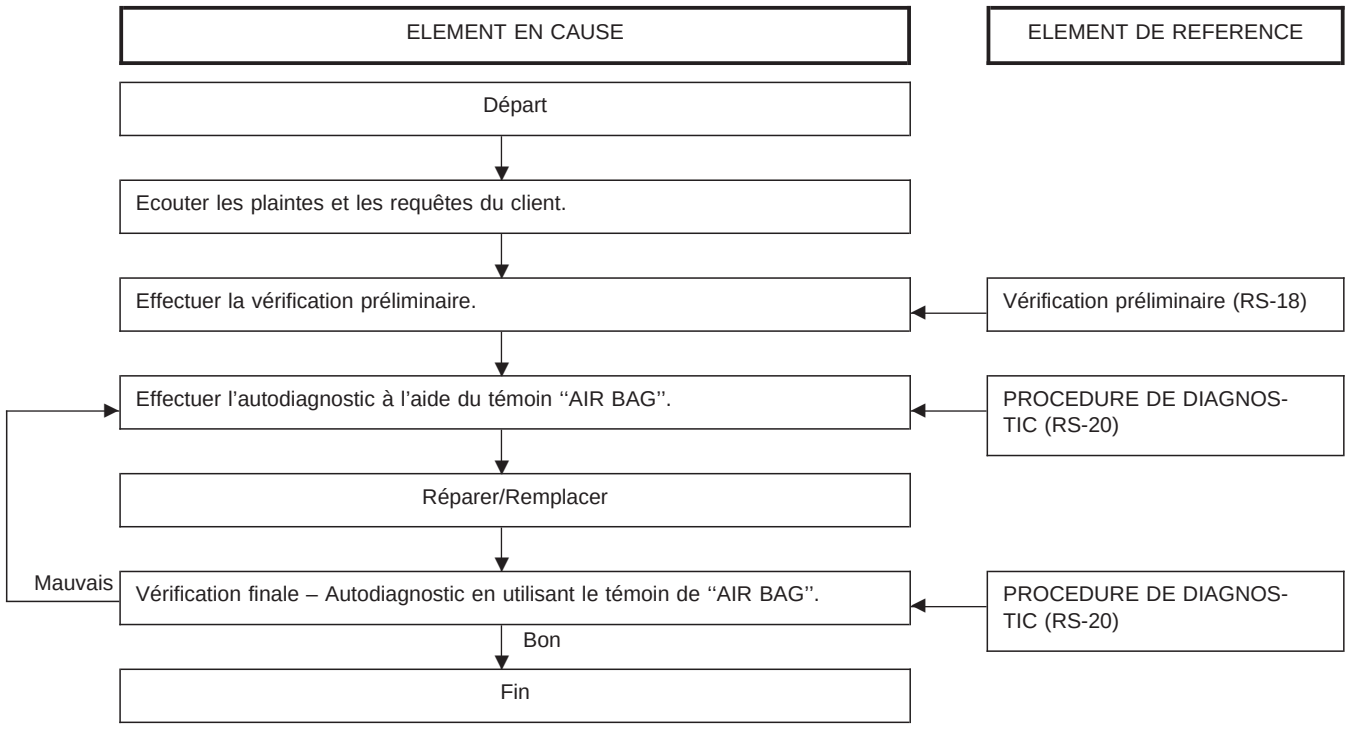
Une bonne compréhension des conditions de mauvais fonctionnement peut permettre de localiser la panne plus rapidement et avec plus de précision.
En règle générale, chaque client réagit différemment face à un problème. Il est indispensable de bien comprendre les symptômes ou les conditions de la plainte d'un client.

INFORMATIONS FOURNIES PAR LE CLIENT

QUOI	Modèle de véhicule
QUAND	Date, fréquences
OU	Etat de la route
COMMENT	Conditions de fonctionnement, symptômes

VERIFICATION PRELIMINAIRE

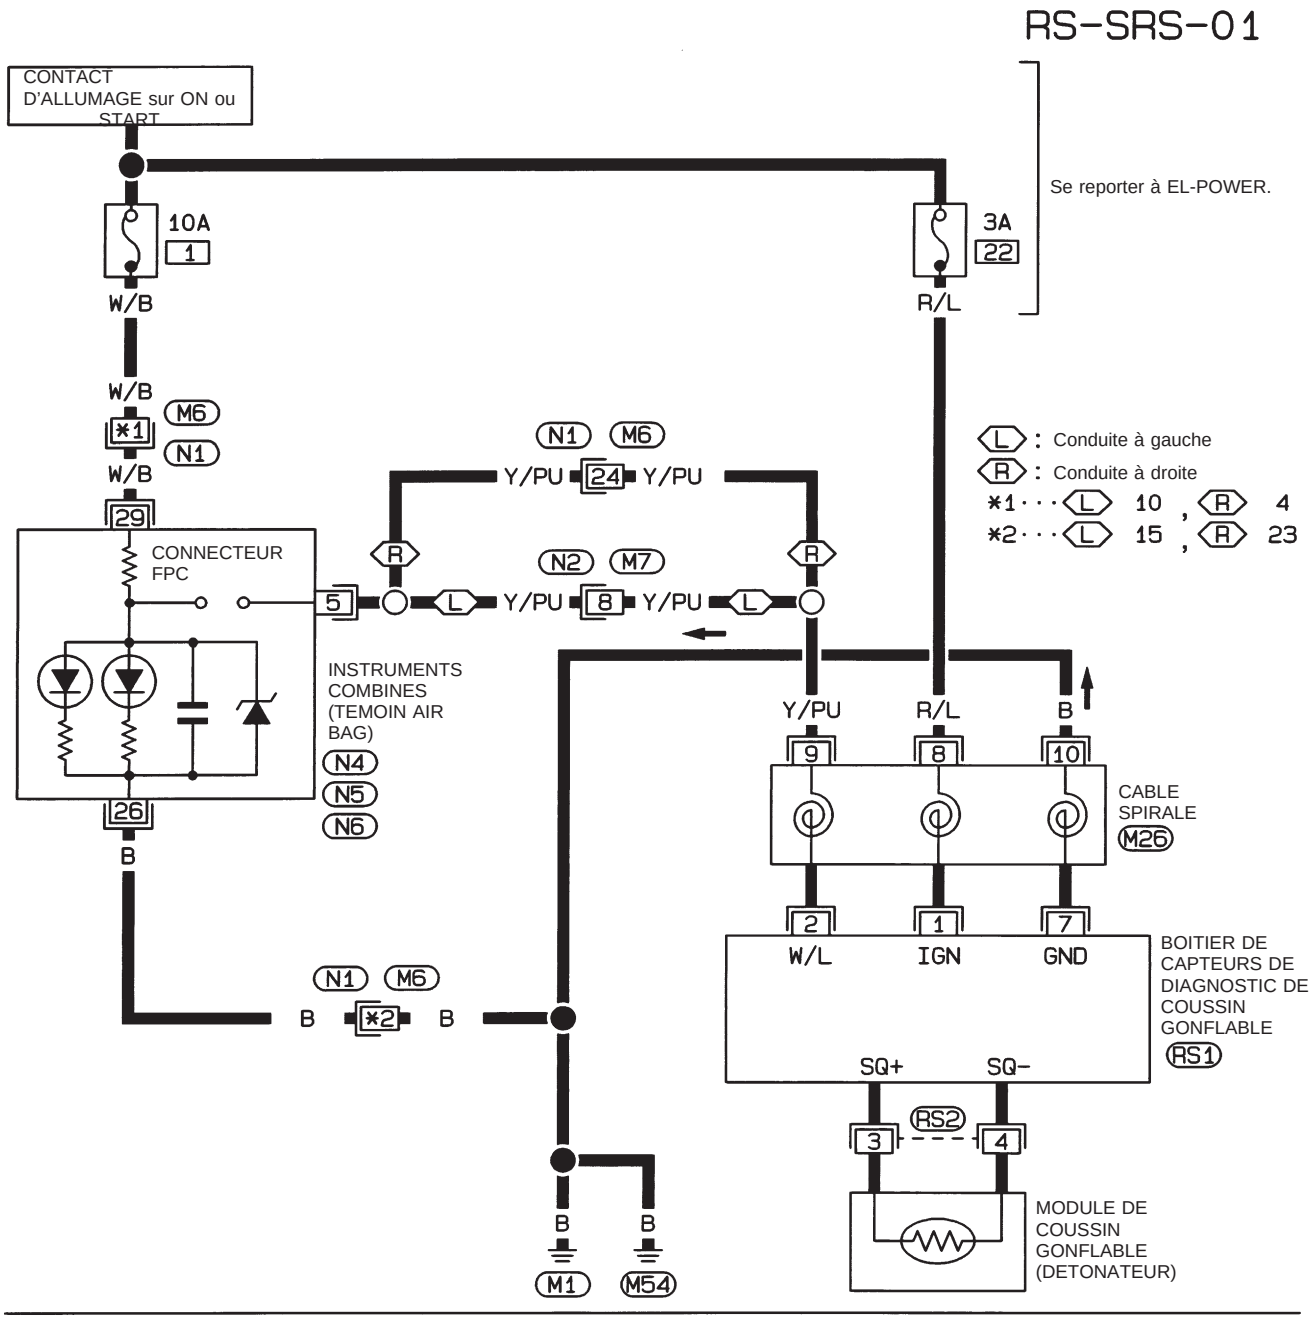
Vérifier si les pièces suivantes sont en bon état.
- Batterie [se reporter à la section MA (''ENTRETIEN GENERAL'')].
- Fusible [Se reporter à la section EL (''Fusible'', ''DISPOSITION DE L'ALIMENTATION ELECTRIQUE'')].
- Connexions entre les composants du système et le faisceau.



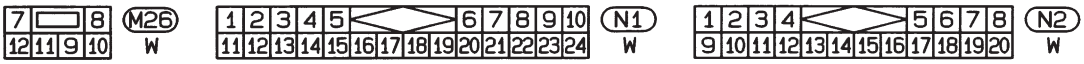
FONCTION DE DIAGNOSTIC

Les résultats de l'autodiagnostic du SRS peuvent être lus à l'aide du témoin ''AIR BAG''.

Note : CONSULT ne peut pas être utilisé pour les diagnostics des défauts.



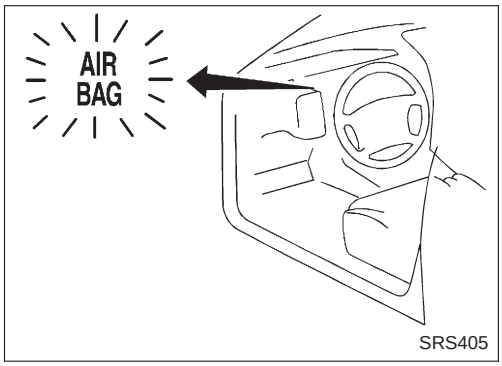
ATTENTION :
- **Ne pas utiliser de multimètre pour vérifier les connecteurs du faisceau du SRS, sauf instructions expresses données dans ce Manuel de Réparation.**
- **Ne pas essayer de réparer, épisser ou modifier le faisceau de câblage du SRS. Si le faisceau est endommagé, le remplacer par un neuf.**
- **Maintenir le circuit de masse dans un état de propreté satisfaisant.**



PROCEDURE DE TRAVAIL

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Schéma de câblage – SRS –



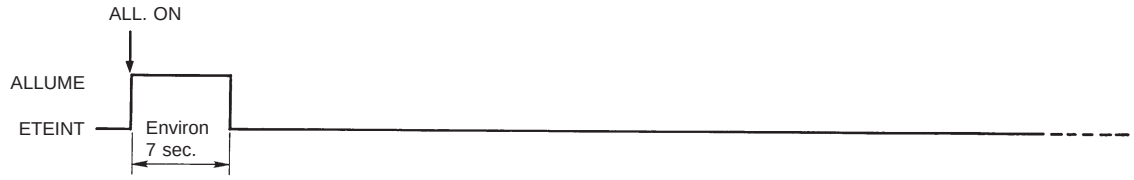
* : Ce connecteur n'est pas indiqué dans "DISPOSITION DES FAISCEAUX" dans la section EL.

HRS034

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Autodiagnostic

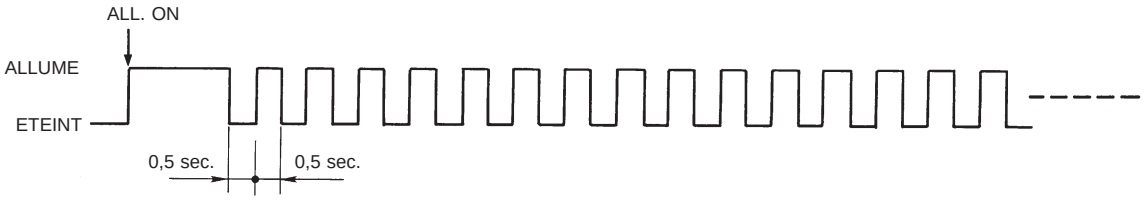
PROCEDURE DE DIAGNOSTIC
(sans CONSULT)



Vérifier le fonctionnement du SRS à l'aide du témoin ''AIR BAG'' – Mode Utilisateur

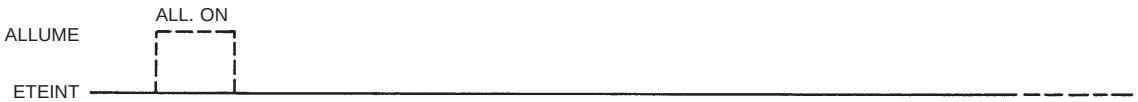
1. Le témoin ''AIR BAG'' est actionné lorsque l'on tourne le contact d'allumage de la position ''OFF'' sur ''ON''.
2. Comparer le fonctionnement du témoin ''AIR BAG'' au tableau ci-dessous.

Note : CONSULT ne peut pas être utilisé pour les diagnostics des défauts.



Fonctionnement du témoin ''AIR BAG'' – Mode utilisateur –

1. Normal



2. Anormal– Si le témoin fonctionne comme suit, vérifier immédiatement le SRS.

- Clignotement

- Le témoin ne s'allume pas du tout.

- Constamment allumé

MRS106

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Autodiagnostic (Suite)

PROCEDURES DE REPARATION

ATTENTION :
Avant toute intervention sur un coussin gonflable, couper le contact, débrancher les deux câbles de la batterie et attendre au moins 3 minutes.

Fonctionnement du témoin	Explication	Ordre de réparation
Le témoin clignote.*	Le circuit du module de coussin gonflable est ouvert ou court-circuité.	1. Inspecter visuellement le faisceau de câblage et les connecteurs. 2. Remplacer le module de coussin gonflable. 3. Remplacer l'ensemble de volant de direction (y compris le boîtier de capteurs de diagnostic).
	Boîtier de capteurs de diagnostic défectueux	
Le témoin ne s'allume pas du tout.	Le fusible des instruments combinés est grillé.	1. Vérifier le fusible des instruments combinés. 2. Inspecter visuellement les faisceaux de câblage et les connecteurs. 3. Vérifier la D.E.L. du témoin. 4. Remplacer le câble spiralé. 5. Remplacer l'ensemble de volant de direction (y compris le boîtier de capteurs de diagnostic). 6. Remplacer les instruments combinés.
	Le circuit de l'alimentation électrique du témoin est ouvert	
	Il y a court-circuit entre le témoin et le boîtier de capteurs de diagnostic.	
	D.E.L. défectueuse	
	Instruments combinés défectueux	
	Boîtier de capteurs de diagnostic défectueux	
Le témoin est constamment allumé.	Le fusible du SRS coussin gonflable est grillé.	1. Vérifier le fusible du coussin gonflable. 2. Inspecter visuellement le faisceau de câblage et les connecteurs des instruments combinés, du boîtier de capteurs de diagnostic et du câble spiralé. 3. Remplacer le câble spiralé. 4. Remplacer l'ensemble de volant de direction (y compris le boîtier de capteurs de diagnostic).
	Circuit ouvert entre le témoin et le boîtier de capteurs de diagnostic.	
	Boîtier de capteurs de diagnostic défectueux	

*** : Une fois le coussin gonflable déployé, le témoin peut clignoter en raison d'un circuit ouvert dans le module de coussin gonflable.**

Suivre les procédures dans l'ordre numérique lors de la réparation des pièces défectueuses. Vérifier si le défaut est éliminé à l'aide du témoin de coussin gonflable, après chaque réparation. Si le défaut subsiste, passer à l'étape suivante. Aucune réparation supplémentaire n'est requise si le défaut a disparu.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Pour réparer le SRS ‘‘COUSSIN GONFLABLE’’, effectuer les étapes suivantes :

Lorsque le SRS est activé lors d’une collision :

① Déposer le module de coussin gonflable.
② Déposer l’ensemble de volant de direction.
③ Vérifier le câble spiralé à l’aide du tableau ci-dessous :
- Si le câble spiralé est visiblement endommagé (bosses, fissures ou déformation), le remplacer par un câble neuf.

④ Installer un ensemble de volant de direction neuf.
⑤ Reposer un nouveau module de coussin gonflable.
⑥ Effectuer un autodiagnostic à l’aide du témoin ‘‘AIR BAG’’ pour vérifier que l’ensemble du SRS fonctionne correctement.
Se reporter à RS-20 pour plus de détails.

Lorsque le SRS n’est pas activé lors d’une collision :

① Contrôler les composants du SRS à l’aide du tableau ci-dessous :
- Si les composants du SRS sont visiblement bosselés, fissurés ou déformés, les remplacer par des composants neufs.

② Effectuer un autodiagnostic à l’aide du témoin ‘‘AIR BAG’’ pour vérifier que l’ensemble du SRS fonctionne correctement. Se reporter à RS-20 pour plus de détails.

Inspection du SRS

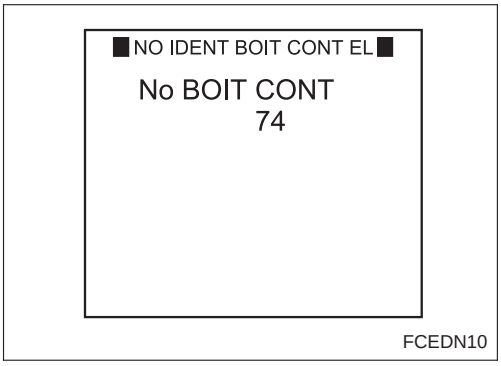
Pièce	Le SRS est activé.	Le SRS n’est PAS activé.
Module de coussin gonflable	REMPLACER Reposer avec les boulons neufs.	1. Déposer le module de coussin gonflable. Vérifier si le cache du faisceau et les connecteurs ne sont pas endommagés, les bornes déformées et le faisceau coincé. 2. Reposer le module de coussin gonflable dans le volant de direction pour en contrôler l’adaptabilité ou l’alignement avec le volant de direction. 3. Aucun dommage trouvé, reposer l’ensemble en utilisant des boulons neufs. 4. En cas de dommage – REMPLACER. Le coussin gonflable doit être déployé avant d’être mis au rebut.
Ensemble de volant de direction (y compris le boîtier de capteurs de diagnostic)	REMPLACER	1. Vérifier visuellement si le volant de direction n’est pas déformé. 2. Vérifier si le faisceau et les connecteurs ne sont pas endommagés et que les bornes ne sont pas déformées. 3. Vérifier si le boîtier de capteurs de diagnostic n’est pas bosselé, fissuré ou déformé. **Ne pas déposer le boîtier de capteurs de diagnostic du volant de direction.** 4. Monter le module de coussin gonflable pour en contrôler l’adaptabilité ou l’alignement avec le volant de direction. 5. Si l’on ne peut trouver aucun dommage, remonter l’ensemble de volant de direction. 6. En cas de dommage – REMPLACER.
Câble spiralé	1. Vérifier si le câble spiralé n’est pas bosselé, fissuré ou déformé. 2. Vérifier si les connecteurs et la bande de protection ne sont pas endommagés. 3. Vérifier si le volant de direction est exempt de tout bruit, point de force et qu’il tourne librement. 4. Si l’on ne constate aucun dommage, le reposer. 5. En cas de dommage – REMPLACER.	
Faisceau et connecteurs	1. Vérifier si les connecteurs sont bien branchés, s’ils ne sont pas endommagés et si les bornes ne sont pas déformées. 2. Vérifier si le faisceau ne coince pas et qu’il n’est pas effiloché, coupé ou déformé. 3. Reposer le faisceau et les connecteurs s’il n’y a pas de dommage. 4. En cas de dommage – REMPLACER la partie du faisceau endommagée. Ne pas essayer de réparer, épisser ou modifier le faisceau du SRS.	

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Introduction des diagnostics de défauts

ATTENTION :

- **Ne pas utiliser de multimètre pour vérifier les connecteurs du faisceau du SRS, sauf instructions expresses données dans ce Manuel de Réparation. Les faisceaux de câblage du SRS sont facilement identifiables grâce à une gaine de faisceau ou à une bande isolante jaune placée juste avant les connecteurs de faisceau.**
- **Ne pas essayer de réparer, épisser ou modifier le faisceau de câblage du SRS. Si le faisceau est endommagé, le remplacer par un neuf.**
- **Maintenir le circuit de masse dans un état de propreté satisfaisant.**



FONCTION DE DIAGNOSTIC

Les résultats de l'autodiagnostic du SRS peuvent être lus à l'aide du témoin ''AIR BAG'' et/ou de CONSULT. La lecture de ces résultats peut avoir lieu grâce aux deux modes suivants – ''Mode utilisateur'' et ''Mode de diagnostic''.
Le mode Utilisateur est exclusivement conçu pour le client (conducteur). Ce mode avertit le conducteur de la présence d'un défaut dans le système en actionnant le témoin ''AIR BAG''.
Le mode de Diagnostic permet au technicien de localiser et d'inspecter la pièce défectueuse.
Les applications des modes témoin ''AIR BAG'' et CONSULT sont comme suit :

	Mode utilisateur	Mode de diagnostic	Type d'affichage
Témoin ''AIR BAG''	X	X	Fonctionnement MAR/ARR.
CONSULT	–	X	Contrôle

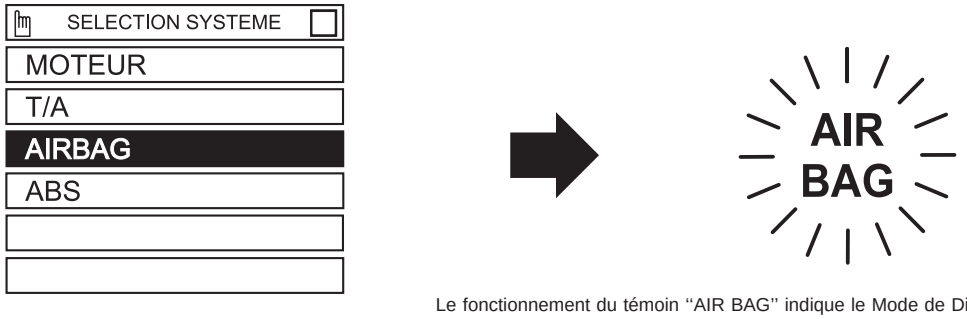
MODE DE DIAGNOSTIC POUR CONSULT

- ''AUTO-DIAG [COURANT]''
  Un résultat d'autodiagnostic courant (également indiqué par le clignotement du témoin en mode de Diagnostic) s'affiche en temps réel sur l'écran de CONSULT. Cela signifie qu'une pièce défectueuse doit être réparée.
- ''AUTO-DIAG'' [PASS]''
  Les résultats de diagnostic enregistrés auparavant dans la mémoire (également indiqués par le nombre de clignotements du témoin en mode de Diagnostic) s'affichent sur l'écran CONSULT. Les résultats enregistrés sont gardé en mémoire tant que celle-ci n'a pas été effacée.
- ''ENREG DIAG DEFAUT''
  Avec ''ENREG DIAG DEFAUT'', les résultats de diagnostic précedemment effacés peuvent être rappelés et affichés à nouveau sur l'écran CONSULT.

- No IDENT BOIT CONT EL
  Pour chaque modèle, le boîtier de capteurs de diagnostic est assorti d'un numéro de classification propre et individuel. Ce numéro s'affichera sur l'écran CONSULT, comme illustré sur la figure de gauche. Lors du remplacement du boîtier de capteurs de diagnostic, se reporter au numéro de pièce pour une bonne compatibilité. Après la repose, il est possible de vérifier si le boîtier de remplacement est approprié en confirmant ce numéro de classification sur l'écran CONSULT.

Pour les modèles D22 NISSAN à 4 roues motrices, le numéro de classification du boîtier de capteurs de diagnostic est 74.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

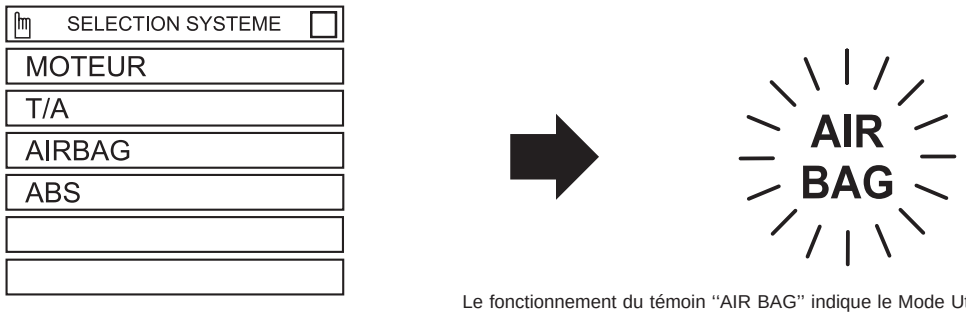


Introduction des diagnostics de défauts (Suite)

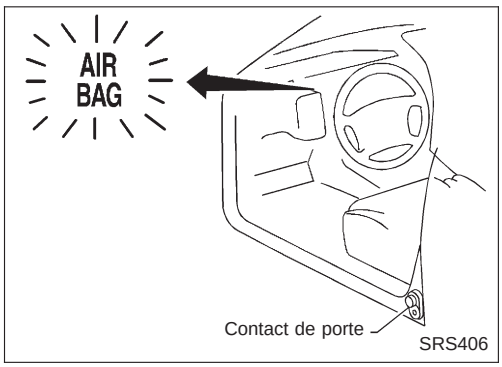
COMMENT CHANGER LE MODE D'AUTODIAGNOSTIC

Avec CONSULT

Du mode Utilisateur au mode de Diagnostic.



Le système passe automatiquement du mode Utilisateur en mode de Diagnostic lorsque l'on sélectionne l'option AIRBAG sur l'écran ''SELECTION SYSTEME''.



Le fonctionnement du témoin ''AIR BAG'' indique le Mode de Diagnostic. FCXSS03

Du mode de Diagnostic au mode Utilisateur.

Pour revenir sur le mode Utilisateur à partir du mode de Diagnostic, appuyer sur la touche ''BACK'' (RETOUR) de CONSULT, jusqu'à ce que ''SELECTION SYSTEME'' s'affiche. Le mode de Diagnostic est automatiquement remplacé par le mode Utilisateur.

Le fonctionnement du témoin ''AIR BAG'' indique le Mode Utilisateur. FCXSS04

Sans CONSULT

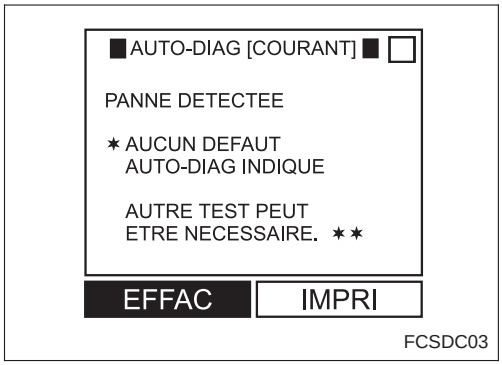
Du mode Utilisateur au mode de Diagnostic.

Le mode de Diagnostic est activé uniquement lorsqu'un défaut est détecté, en appuyant au moins 5 fois dans un délai de 7 secondes sur le contact de la porte du conducteur après avoir mis le contact d'allumage. Le SRS ne passera pas en mode de Diagnostic si aucun défaut n'est détecté.

Du mode de Diagnostic au mode Utilisateur.

Lorsqu' un défaut est détecté pour revenir sur le mode Utilisateur à partir du mode de Diagnostic, couper le contact d'allumage, l'allumer de nouveau et appuyer sur le contact de porte côté conducteur au moins 5 fois en 7 secondes.

Une fois le défaut réparé, couper le contact d'allumage pendant au moins une seconde avant de le rétablir. Le mode de Diagnostic retourne au mode Utilisateur.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Introduction des diagnostics de défauts (Suite)

COMMENT EFFACER LES RESULTATS DE L'AUTODIAGNOSTIC

Avec CONSULT

- ''AUTO-DIAG [COURANT]''
  Le résultat d'autodiagnostic courant s'affiche en temps réel sur l'écran de CONSULT. Une fois le défaut complètement éliminé, aucun défaut de fonctionnement n'est plus détecté sur l'écran ''AUTO-DIAG [COURANT]''.

- ''AUTO-DIAG'' [PASSE]''

Revenir sur l'écran CONSULT ''AUTO-DIAG [COURANT]'' en appuyant sur la touche ''BACK'' (RETOUR) de CONSULT et en sélectionnant ''AUTO-DIAG [COURANT]'' dans ''SELECTION MODE DIAG''. Appuyer sur ''EFFAC'' en mode ''AUTO-DIAG [COURANT]''.

NOTE :
Si le défaut mémorisé en mode ''AUTO-DIAG [PASSE]'' n'est pas effacé, le mode Utilisateur indiquera un défaut de système par le biais du témoin, même si le défaut a été complètement éliminé.

- ''ENREG DIAG DEFAUT''
  La mémoire du mode ''ENREGIS DIAG DEFAUT'' ne peut pas être effacée.

Sans CONSULT

Une fois le défaut réparé, couper le contact d'allumage pendant au moins une seconde avant de le rétablir. Le mode de Diagnostic retourne au mode Utilisateur. Le code de défaut sera alors effacé.

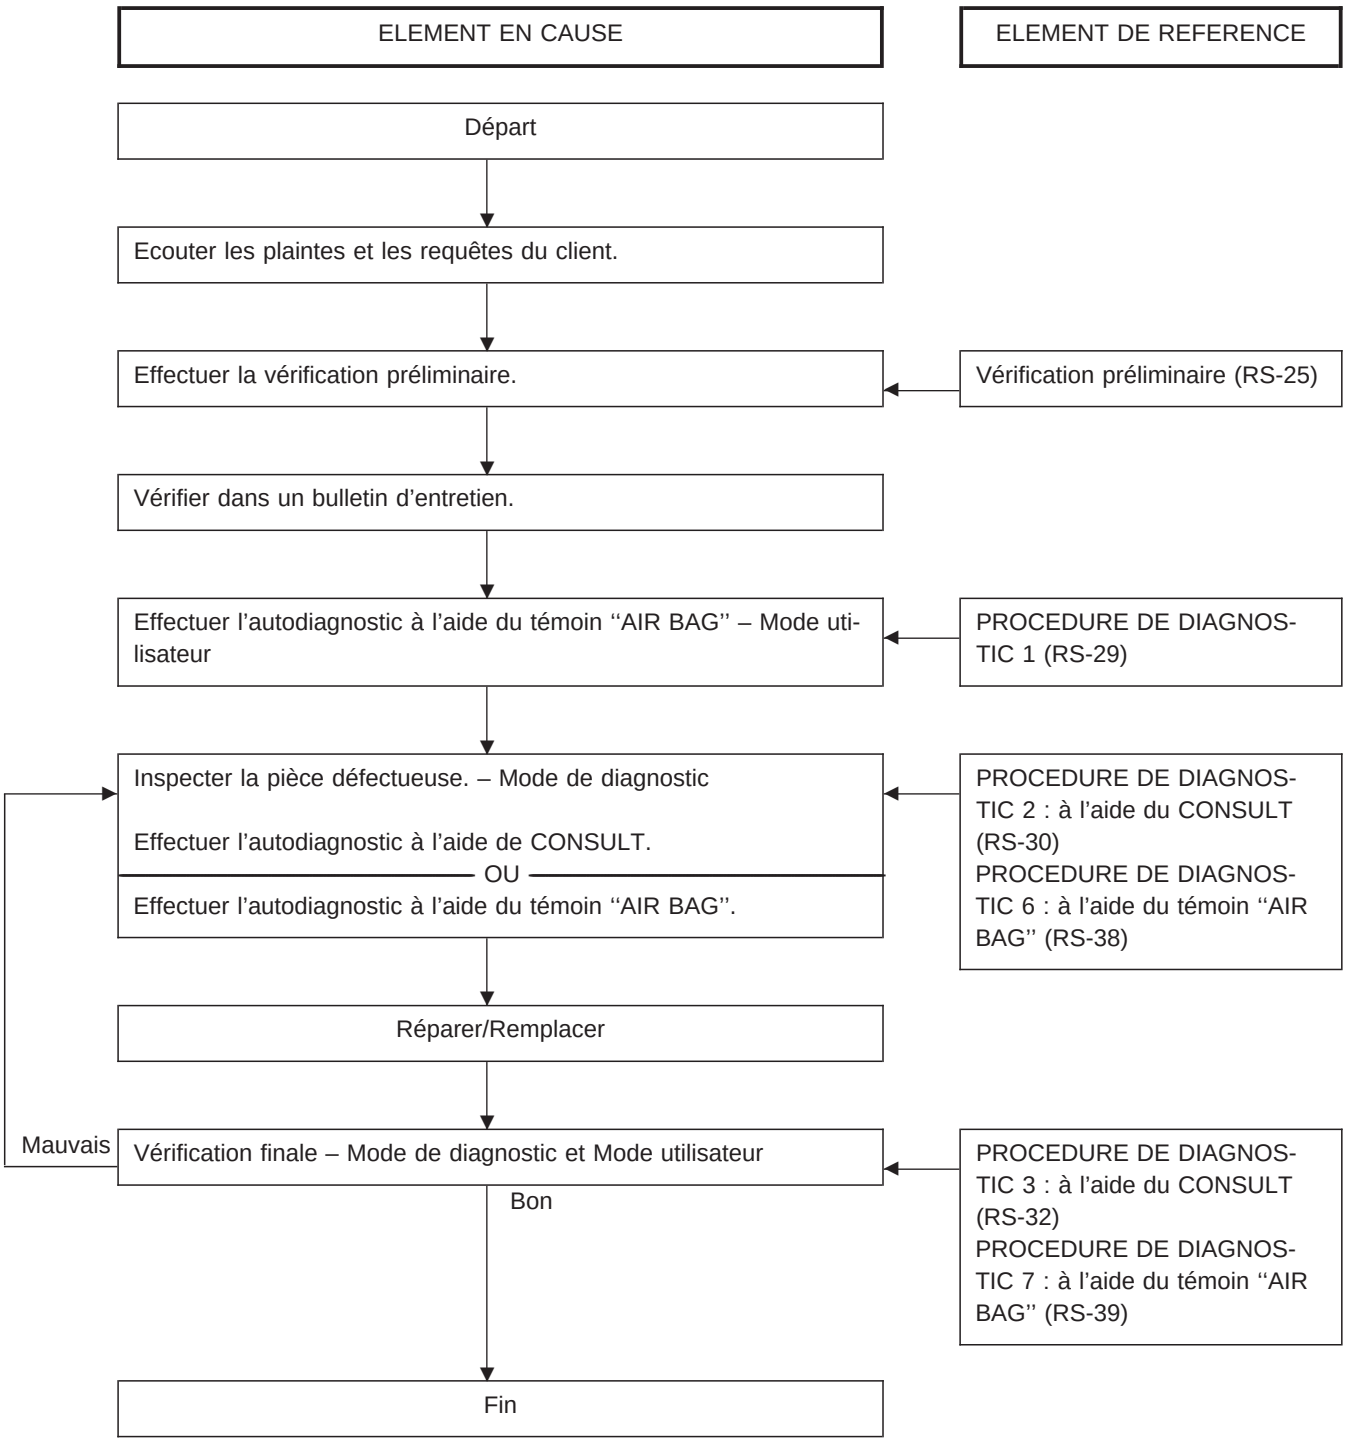
Comment effectuer des diagnostics de défauts permettant une réparation rapide et précise

Une bonne compréhension des conditions de mauvais fonctionnement peut permettre de localiser la panne plus rapidement et avec plus de précision.
En règle générale, chaque client réagit différemment face à un problème. Il est indispensable de bien comprendre les symptômes ou les conditions de la plainte d'un client.

INFORMATIONS FOURNIES PAR LE CLIENT

QUOI	Modèle de véhicule
QUAND	Date, fréquences
OU	Etat de la route
COMMENT	Conditions de fonctionnement, symptômes

VERIFICATION PRELIMINAIRE



Vérifier si les pièces suivantes sont en bon état.

- Batterie [Se reporter à la section EL (''BATTERIE'').]
- Fusible [Se reporter à la section EL (''Fusible'', ''DISPOSITION DE L'ALIMENTATION ELECTRIQUE'')].
- Connexions entre les composants du système et le faisceaux.

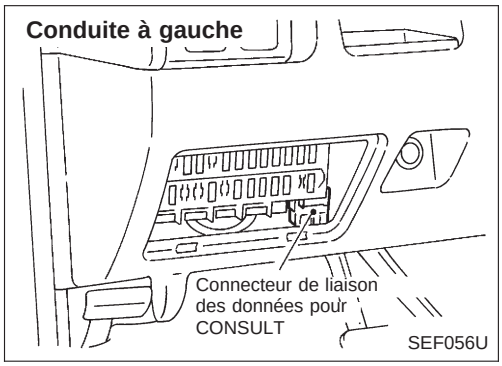
Vérification du fonctionnement du SRS

PROCEDURE DE DIAGNOSTIC 1



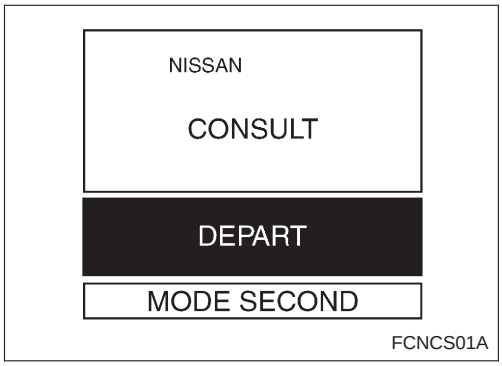
Vérifier le fonctionnement du SRS à l'aide du témoin ''AIR BAG'' – Mode Utilisateur

1. le témoin ''AIR BAG'' s'allume lorsque l'on tourne le contact d'allumage de la position ''OFF'' sur ''ON''.
2. Comparer le fonctionnement du témoin ''AIR BAG'' au tableau ci-dessous.

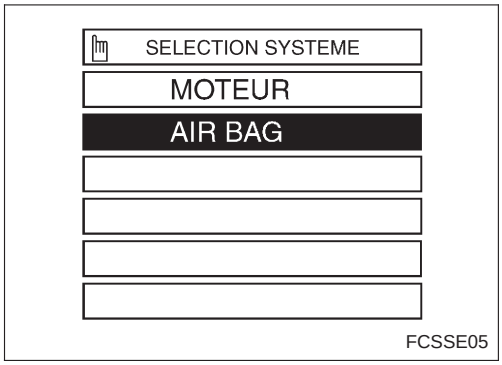
Fonctionnement du témoin ''AIR BAG'' – Mode utilisateur –	Conditions du SRS	Elément de référence
 MRS095A	Aucun défaut n'est détecté. Aucune démarche supplémentaire n'est nécessaire.	—
 MRS096A	Le système présente un défaut et doit être réparé comme indiqué.	Aller à la PROCEDURE DE DIAGNOSTIC 2 ou 6 (RS-30 ou 38)
 MRS097A	Le coussin gonflable est déployé.	Aller à DIAGNOSTIC DE COLLISION (RS-44).
	Le fusible de coussin gonflable, le boîtier de capteurs de diagnostic ou le faisceau est défectueux et doit être réparé.	Aller à la PROCEDURE DE DIAGNOSTIC 9 (RS-42).
 MRS098A	Un des défauts suivants s'est manifesté et doit être réparé. ● Le fusible des instruments combinés est grillé. ● Le circuit du témoin ''AIR BAG'' est en court-circuit. ● Le boîtier de capteurs de diagnostic est défectueux.	Aller à la PROCEDURE DE DIAGNOSTIC 10 (RS-43).

NOTE :
Si le fonctionnement du témoin ''AIR BAG'' diffère du fonctionnement spécifié plus haut, se reporter à Fonctionnement du témoin ''AIR BAG'' – Mode de diagnostic –, PROCEDURE DE DIAGNOSTIC 6 (étape 4), RS-38.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

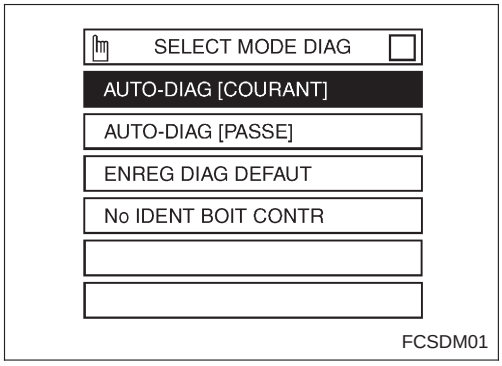


Diagnostic des défauts avec CONSULT

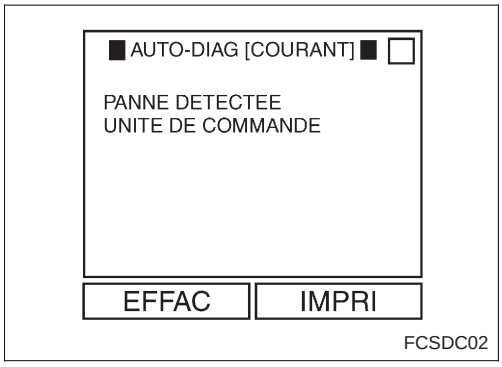


PROCEDURE DE DIAGNOSTIC 2

Inspection des pièces défectueuses du SRS à l'aide de CONSULT – Mode de diagnostic

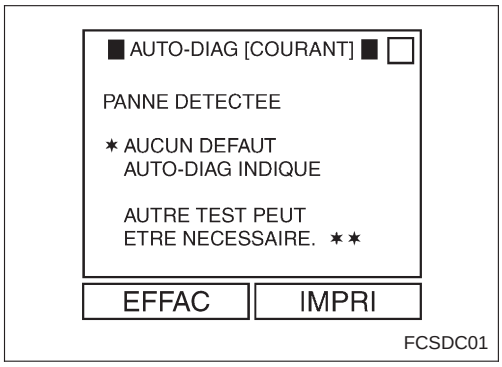


1. Tourner le contact d'allumage sur ''OFF''.
2. Brancher ''CONSULT'' au connecteur de liaison des données.



3. Mettre le contact d'allumage sur 'ON''.
4. Appuyer sur ''DEPART''.

5. Appuyer sur ''AIR BAG''.



6. Appuyer sur ''AUTO-DIAG [COURANT]''.

7. Les codes de diagnostic sont affichés dans ''AUTO-DIAG [COURANT]''.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostic des défauts avec CONSULT (Suite)

Si aucun défaut n'est détecté dans ''AUTO-DIAG [COURANT]'', même lorsqu'un défaut est détecté en PROCEDURE DE DIAGNOSTIC 1, vérifier la tension de la batterie. Si la tension de la batterie est inférieure à 9 V, recharger la batterie. Puis aller à la PROCEDURE DE DIAGNOSTIC 3, page RS-32. Si la tension de la batterie est normale, aller à la PROCEDURE DE DIAGNOSTIC 4, page RS-34 afin d'effectuer le diagnostic des cas suivants :

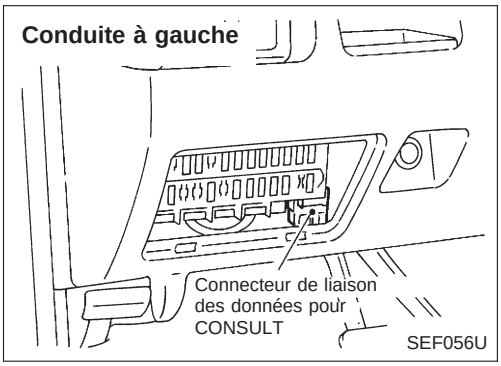
- Les résultats de diagnostic (précédemment mémorisés) n'ont pas été effacés, même après que le système a été réparé.
- Défaut de fonctionnement intermittent du SRS.

8. Appuyer sur ''IMPRI''.
9. Comparer les codes de diagnostic au TABLEAU DES CODES DE DIAGNOSTIC CONSULT, page RS-31.
10. Pour revenir sur le mode Utilisateur à partir du mode de Diagnostic, appuyer sur la touche ''BACK'' (RETOUR) de CONSULT, jusqu'à ce que ''SELECTION SYSTEME'' s'affiche.
11. Couper le contact, puis débrancher le CONSULT ainsi que les deux câbles de la batterie.
12. Réparer le système comme décrit dans ''Ordre de réparation'' dans le TABLEAU DE CODE DE DIAGNOSTIC DU CONSULT, qui correspond au code du problème. Se reporter à RS-10 pour la procédure de remplacement des composants.
13. Après avoir réparé le système, aller à la PROCEDURE DE DIAGNOSTIC 3 pour effectuer un contrôle final, page RS-32.

TABLEAU DES CODES DE DIAGNOSTIC CONSULT (''AUTO-DIAG [COURANT]'')

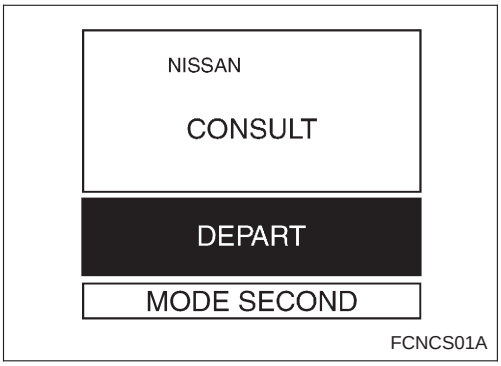
Elément de diagnostic	Explication/causes possibles		Ordre de réparation **Vérifier le système SRS à chaque remplacement de pièce.**
AUCUN DEFAUT AUTO-DIAG INDIQUE.	Lorsque le défaut de fonctionnement est indiqué par le témoin ''AIR BAG'' en mode Utilisateur.	● Le défaut d'autodiagnostic (''AUTO-DIAG [PASSE]'') (précédemment mémorisé) n'a pas été effacé après que le système a été réparé. ● Un problème intermittent a été détecté dans le passé.	● Aller à la PROCEDURE DE DIAGNOSTIC 4 (RS-34).
	● Aucun défaut n'est détecté.		● Aller à PROCEDURE DE DIAGNOSTIC 3 (RS-32)
MODULE AIR BAG [OUVERT]	● Le circuit du module de coussin gonflable côté conducteur est ouvert (y compris le câble spiralé).)		1. Inspecter visuellement la connexion du faisceau de câblage. 2. Remplacer le faisceau s'il est visiblement endommagé. 3. Remplacer le module de coussin gonflable côté conducteur. (il doit être déployé avant la mise au rebut). 4. Remplacer le câble spiralé. 5. Remplacer le boîtier de capteurs de diagnostic.
MODULE AIR BAG [COURT TENS BATT]	● Le circuit du module de coussin gonflable côté conducteur est court-circuité à l'un des circuits d'alimentation électrique (y compris le câble spiralé).		
MODULE AIR BAG [COURT-CIRC MASSE]	● Le circuit du module de coussin gonflable du conducteur est court-circuité à la masse (y compris le câble spiralé).		
MODULE AIR BAG [COURT-CIRC]	● Les circuits du module de coussin gonflable côté conducteur sont court-circuités les uns avec autres.		
UNITE DE COMMANDE	● Le boîtier de capteurs de diagnostic est hors service.		1. Vérifier visuellement les connexions de faisceau de câblage. 2. Remplacer le boîtier de capteurs de diagnostic.

*** Suivre les procédures dans l'ordre numérique lors de la réparation des pièces défectueuses. Vérifier si le défaut de fonctionnement est éliminé à l'aide du témoin de coussin gonflable ou de CONSULT après chaque réparation. Si le défaut subsiste, passer à l'étape suivante. Aucune réparation supplémentaire n'est requise si le défaut a disparu.**



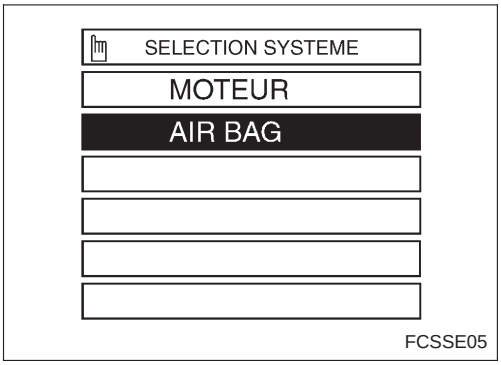
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostic des défauts avec CONSULT (Suite)

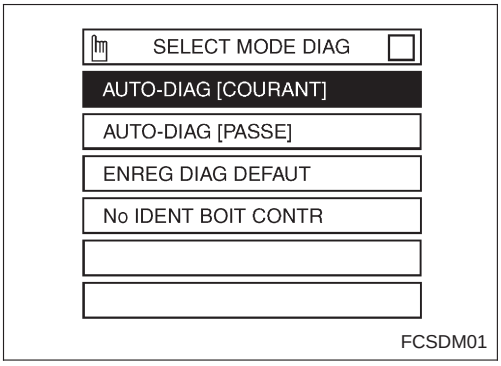


PROCEDURE DE DIAGNOSTIC 3

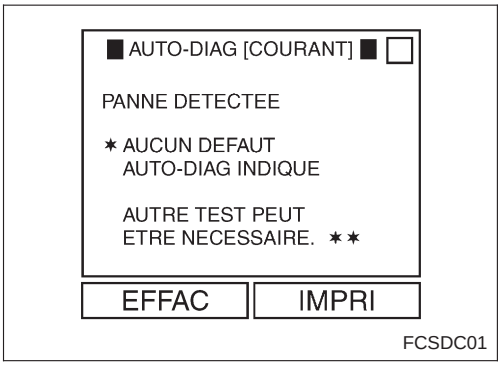
Vérification finale après réparation du SRS à l'aide de CONSULT – mode de Diagnostic



1. Après avoir réparé le SRS, brancher les deux câbles de la batterie.
2. Brancher CONSULT au connecteur de liaison des données.
3. Mettre le contact d'allumage de la position ''OFF'' sur ''ON''.

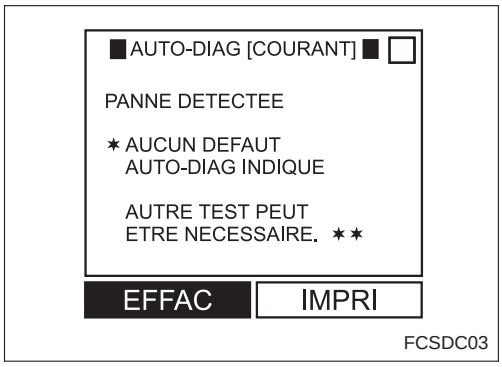


4. Appuyer sur ''DEPART''.



5. Appuyer sur ''AIR BAG''.

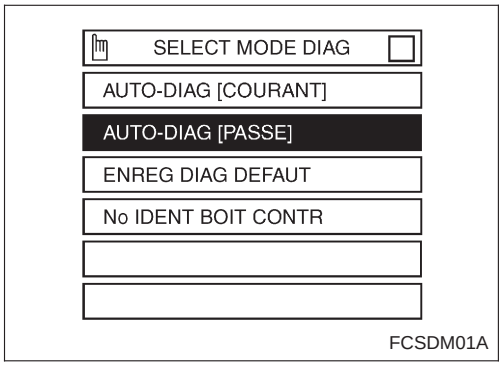
6. Appuyer sur ''AUTO-DIAG [COURANT]''.



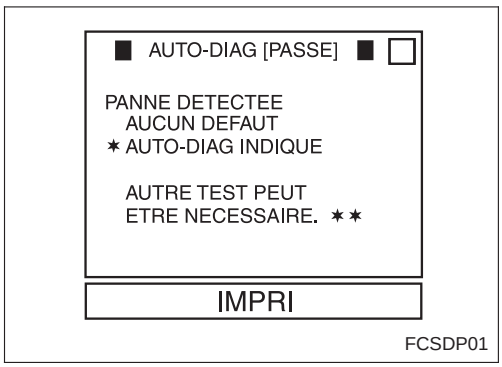
7. Si aucun défaut n'est détecté dans ''AUTO-DIAG [COURANT]'', cela signifie que la réparation du SRS est achevée.
   Si un code de défaut est affiché dans ''AUTO-DIAG [COURANT]'', le composant défectueux n'a pas été complètement réparé ou un autre composant défectueux a été détecté. Aller à la PROCEDURE DE DIAGNOSTIC 2, page RS-30 et réparer complètement le composant défectueux.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostic des défauts avec CONSULT (Suite)



8. Appuyer sur ‘‘EFFAC’’.

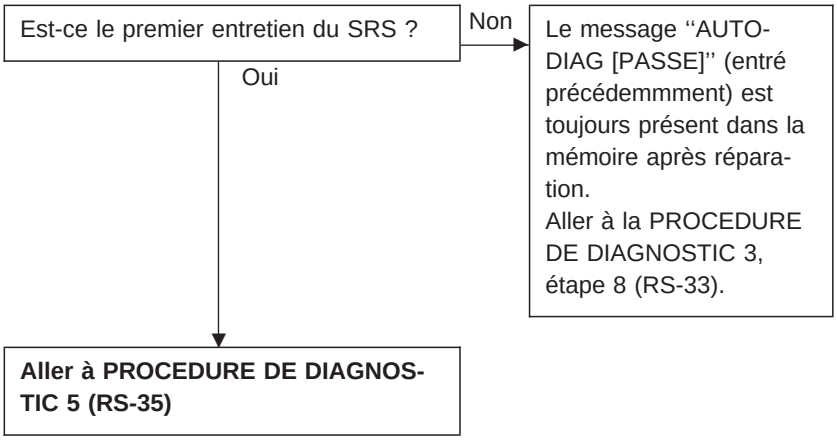


NOTE :

Appuyer sur ‘‘EFFAC’’ pour effacer le défaut de la mémoire (‘‘AUTO-DIAG [PASSE]’’).

Si le défaut mémorisé en mode ‘‘AUTO-DIAG [PASSE]’’ n’est pas effacé, le mode Utilisateur indiquera un défaut de système par le biais du témoin, même si le défaut a été complètement éliminé.

9. Appuyer sur la touche ‘‘BACK’’ (RETOUR) de CONSULT pour sélectionner ‘‘AUTO-DIAG [PASSE]’’ sur l’écran ‘‘SELECT MODE DIAG’’. Appuyer sur ‘‘AUTO-DIAG [PASSE]’’.



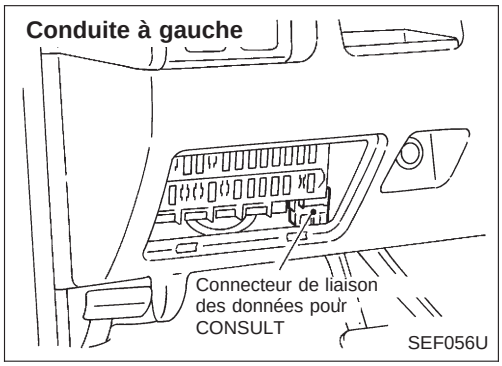
10. Vérifier qu’aucun défaut d’autodiagnostic n’est détecté dans ‘‘AUTO-DIAG [PASSE]’’.
11. Appuyer sur la touche ‘‘BACK’’ (RETOUR) de CONSULT jusqu’à affichage de SELECTION SYSTEME afin de passer du mode de Diagnostic en mode Utilisateur, puis débrancher CONSULT.
12. Tourner le contact d’allumage sur ‘‘OFF’’.
13. Aller à la PROCEDURE DE DIAGNOSTIC 1, page RS-29, pour vérifier le fonctionnement du SRS à l’aide du témoin ‘‘AIR BAG’’ en mode Utilisateur.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostic des défauts avec CONSULT (Suite)

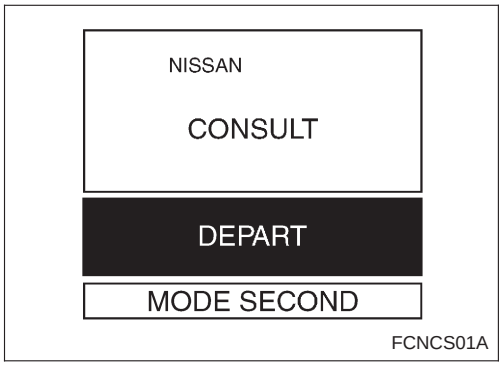
PROCEDURE DE DIAGNOSTIC 4 (suite de la PROCEDURE DE DIAGNOSTIC 2)

Inspection d'un défaut enregistré du SRS



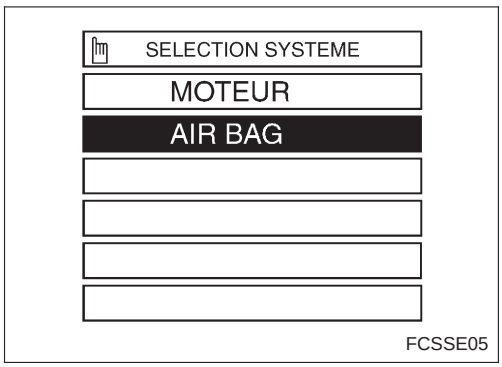
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostic des défauts avec CONSULT (Suite)

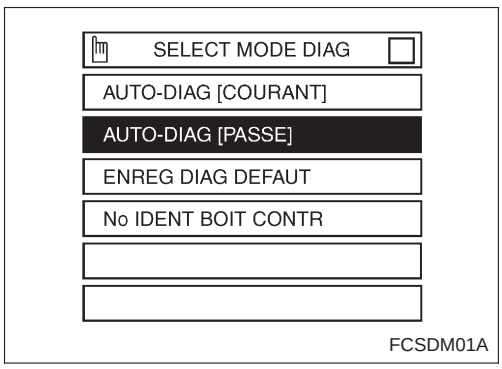


PROCEDURE DE DIAGNOSTIC 5

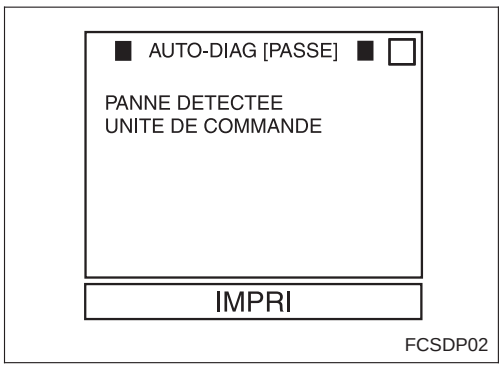
Inspection d'un problème intermittent du SRS à l'aide de CONSULT – Mode de diagnostic



1. Tourner le contact d'allumage sur ''OFF''.
2. Brancher ''CONSULT'' au connecteur de liaison des données.

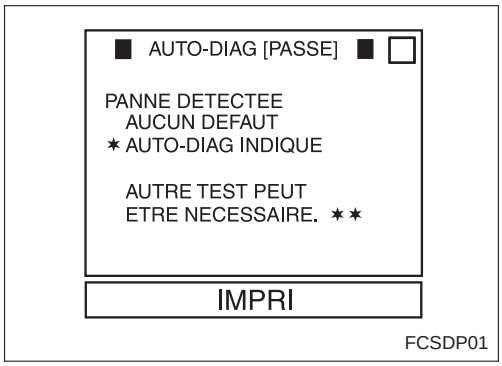


3. Mettre le contact d'allumage sur 'ON''.
4. Appuyer sur ''DEPART''.



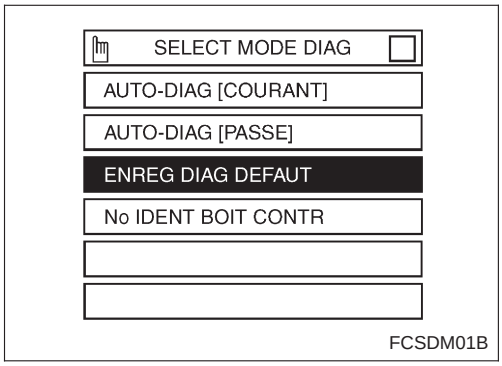
5. Appuyer sur ''AIR BAG''.

6. Appuyer sur ''AUTO-DIAG [PASSE]''.



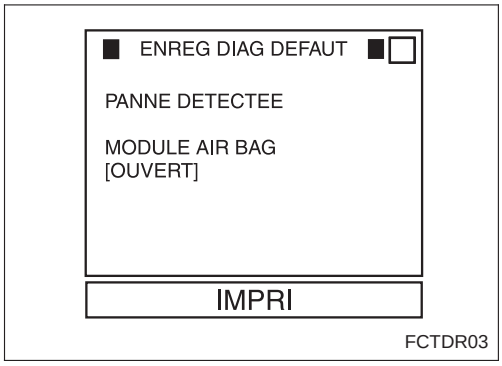
7. Si les codes de diagnostic s'affichent dans ''AUTO-DIAG [PASSE]'', passer à l'étape 10.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Diagnostic des défauts avec CONSULT (Suite)

Si aucun défaut d'autodiagnostic n'est détecté dans ''AUTO-DIAG [PASSE]'', appuyer sur ''RETOUR'' et revenir à ''SELECT MODE DIAG''.



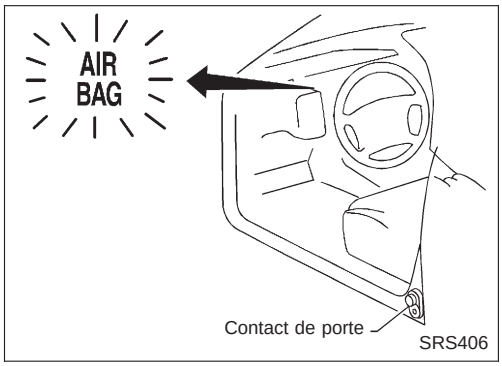
8. Appuyer sur ''ENREG DIAG DEFAUT''.

NOTE :
Avec ''ENREG DIAG DEFAUT'', les résultats de diagnostic précedemment effacés peuvent être rappelés et affichés à nouveau.

9. Le code de diagnostic est affiché dans ''ENREG DIAG DEFAUT''.

10. Appuyer sur ''IMPRI''.
11. Comparer les codes de diagnostic au TABLEAU DES CODES DE DIAGNOSTIC DES PROBLEMES INTERMITTENTS, à la page RS-37.
12. Appuyer sur la touche ''RETOUR'' du CONSULT jusqu'à ce que l'écran ''SELECTION SYSTEM'' apparaisse, puis éteindre le CONSULT.
13. Couper le contact, puis débrancher le CONSULT ainsi que les deux câbles de la batterie.
14. Réparer le système comme décrit dans ''Ordre de réparation'' dans le TABLEAU DES CODES DE DIAGNOSTIC POUR PROBLEMES INTERMITTENTS, qui correspond au code du problème. Se reporter à RS-10 pour la procédure de remplacement des composants.
15. Aller à la PROCEDURE DE DIAGNOSTIC 3, page RS-32, pour effectuer un contrôle final.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Diagnostic des défauts avec CONSULT (Suite)

TABLEAU DES CODES DE DIAGNOSTIC DES PROBLEMES INTERMITTENTS (''AUTO-DIAG [PASSE]'' ou ''ENREGIST DIAG DEFAUT'')

Elément de diagnostic	Explication	Ordre de réparation
AUCUN DEFAUT AUTO-DIAG INDIQUE.	● Aucun défaut n'est détecté.	● Aller à la PROCEDURE DE DIAGNOSTIC 3 (RS-32) après avoir rechargé la batterie.
MODULE AIR BAG [OUVERT]	● Le circuit du module de coussin gonflable côté conducteur est ouvert (y compris le câble spiralé).	● Inspecter visuellement la connexion du faisceau de câblage. ● Remplacer le faisceau s'il est visiblement endommagé. ● Remplacer le module de coussin gonflable côté conducteur. (il doit être déployé avant la mise au rebut). ● Remplacer le câble spiralé. ● Remplacer le boîtier de capteurs de diagnostic.
MODULE AIR BAG [COURT TENS BATT]	● Le circuit du module de coussin gonflable côté conducteur est court-circuité à l'un des circuits d'alimentation électrique (y compris le câble spiralé).	
MODULE AIR BAG [COURT-CIRC MASSE]	● Le circuit du module de coussin gonflable du conducteur est court-circuité à la masse (y compris le câble spiralé).	
MODULE AIR BAG [COURT-CIRC]	● Les circuits du module de coussin gonflable côté conducteur sont court-circuités les uns avec autres.	
UNITE DE COMMANDE	● Le boîtier de capteurs de diagnostic est hors service.	● Inspecter visuellement la connexion du faisceau de câblage. ● Remplacer le boîtier de capteurs de diagnostic.

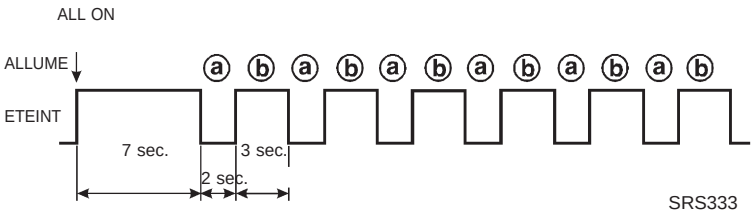
* Il est difficile de situer les emplacements où les problèmes intermittents se manifestent. Pour cette raison, il convient d'effectuer les procédures décrites dans l'ordre de réparation, avant de procéder au contrôle final du système.

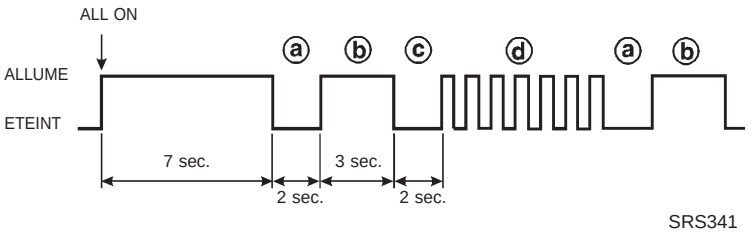
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostic de défaut sans CONSULT

PROCEDURE DE DIAGNOSTIC 6

Inspection des pièces défectueuses du SRS à l'aide du témoin ''AIR BAG'' – Mode de diagnostic





NOTE :

Le SRS ne passera pas en mode de Diagnostic si aucun défaut n'est détecté en mode Utilisateur.

1. Ouvrir la portière du conducteur.
2. Mettre le contact d'allumage de la position ''OFF'' sur ''ON''.
3. Appuyer sur le contact de porte côté conducteur au moins 5 fois en 7 secondes après avoir mis le contact d'allumage sur ''ON''.
   Le SRS est maintenant en mode de Diagnostic.
4. Le témoin ''AIR BAG'' fonctionne en mode de Diagnostic comme suit :

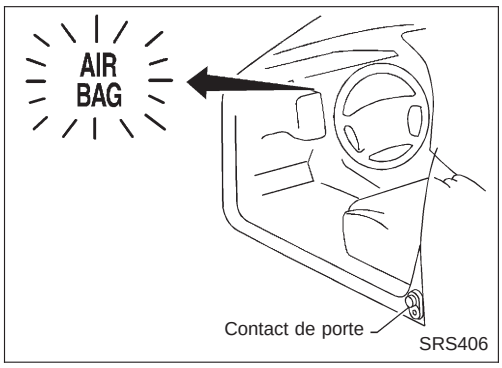
NOTE :

Si le SRS ne passe pas en mode de Diagnostic, alors qu'un défaut de fonctionnement est détecté en mode Utilisateur, aller à la PROCEDURE DE DIAGNOSTIC 11, page RS-43.

N°	Séquence de clignotement du témoin ''AIR BAG'' – Mode de Diagnostic –	Conditions du SRS
1	ⓐ à ⓑ sont répétés 	● Les résultats de diagnostic (précédemment mémorisés) n'ont pas été effacés, même après que le système a été réparé. ● Un problème intermittent a été détecté dans le passé. Aller à PROCEDURE DE DIAGNOSTIC 8 (RS-42)
2	ⓐ à ⓓ sont répétés. ⓑ – Témoin de coussin gonflable côté conducteur et passager (pour l'identification d'un défaut de coussin gonflable pour conducteur et/ou passager) ⓓ – Indique le composant défectueux. Le nombre de clignotements varie selon le composant défectueux (0,5 sec. ALLUME et 0,5 sec. ETEINT. L'état ETEINT représente un clignotement). 	Le système présente un défaut et doit être réparé.

5. Le composant défectueux est indiqué par le nombre de clignotements (ⓓ ou ⓕ). Comparer le nombre de clignotements au TABLEAU DE CODES DE CLIGNOTEMENT DU TEMOIN ''AIR BAG'', page RS-39, et localiser le composant défectueux.
6. Couper le contact et débrancher les deux câbles de masse de la batterie.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



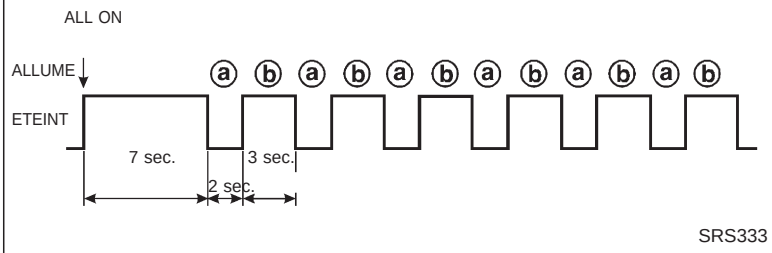
Diagnostic de défaut sans CONSULT (Suite)

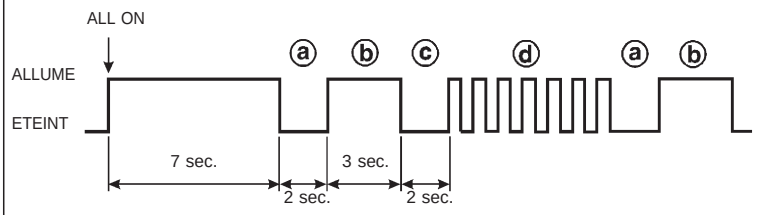
7. Réparer le système selon l'''Ordre de réparation'' du TABLEAU DE CODES DE CLIGNOTEMENT DU TEMOIN ''AIR BAG'' correspondant au code de clignotement. Se reporter à RS-10 pour la procédure de remplacement des composants.
8. Après avoir réparé le système, aller à la PROCEDURE DE DIAGNOSTIC 7, page RS-39.

TABLEAU DE CODES DE CLIGNOTEMENT DU TEMOIN ''AIR BAG'' (MODE DE DIAGNOSTIC)

Témoin	Code de clignotement ⓓ (nombre de clignotements)	Explication	Ordre de réparation Vérifier le système SRS à chaque remplacement de pièce.
Témoin ''AIR BAG''	0	● Le défaut d'autodiagnostic n'a pas été effacé après que le système a été réparé. ● Un problème intermittent a été détecté dans le passé.	Aller à PROCEDURE DE DIAGNOSTIC 8 (RS-42).
	2	Le circuit du module de coussin gonflable côté conducteur est hors service.	1. Vérifier visuellement les connexions de faisceau de câblage. 2. Remplacer le câble spiralé. 3. Remplacer le module de coussin gonflable côté conducteur (avant de le mettre au rebut, il est nécessaire de le déployer). 4. Remplacer le boîtier de capteurs de diagnostic. 5. Remplacer le faisceau de coussin gonflable.
	7	Le boîtier de capteurs de diagnostic ne fonctionne pas.	1. Vérifier visuellement les connexions de faisceau de câblage. 2. Remplacer le boîtier de capteurs de diagnostic.

*** Suivre les procédures dans l'ordre numérique lors de la réparation des pièces défectueuses. Vérifier si le défaut est éliminé à l'aide du témoin de coussin gonflable (en mode Utilisateur) ou du CONSULT après chaque réparation. Si le défaut subsiste, passer à l'étape suivante. Aucune réparation supplémentaire n'est requise si le défaut a disparu.**





PROCEDURE DE DIAGNOSTIC 7

Vérification finale après réparation du SRS à l'aide du témoin ''AIR BAG'' – Mode de Diagnostic et mode Utilisateur

1. Après avoir réparé le SRS, brancher les deux câbles de la batterie.
2. Ouvrir la portière du conducteur.
3. Mettre le contact d'allumage de la position ''OFF'' sur ''ON''.
4. Le témoin ''AIR BAG'' fonctionne en mode de Diagnostic comme suit :

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostic de défaut sans CONSULT (Suite)

N°	Séquence de clignotement du témoin ''AIR BAG'' – Mode de Diagnostic –		Conditions du SRS
1	 SRS333	ⓐ à ⓑ sont répétés.	Aucun défaut n'est détecté ou la réparation est achevée. Aucune démarche supplémentaire n'est nécessaire.
2	 SRS341	ⓐ à ⓓ sont répétés. ⓑ – Témoin de coussin gonflable côté conducteur et passager (pour l'identification d'un défaut de coussin gonflable pour conducteur et/ou passager) ⓓ – Indique le composant défectueux. Le nombre de clignotements varie selon le composant défectueux (0,5 sec. ALLUME et 0,5 sec. ETEINT. L'état ETEINT représente un clignotement).	Le système présente un défaut et doit être réparé.

NOTE :
Si le boîtier de capteurs de diagnostic est remplacé par un boîtier neuf, le témoin ''AIR BAG'' fonctionnera en mode Utilisateur. La vérification du fonctionnement du témoin ''AIR BAG'' en mode de Diagnostic n'est pas nécessaire. Passer à l'étape 6.

5. Si le témoin ''AIR BAG'' fonctionne conformément à la séquence n° 1 du tableau précédent, couper le contact d'allumage pour passer du mode de Diagnostic en mode Utilisateur et pour effacer le défaut de la mémoire. Puis passer à l'étape 6.

   Si le témoin ''AIR BAG'' fonctionne conformément à la séquence n° 2 ou n° 3 du tableau précédent, le composant défectueux n'est pas complètement réparé ou un autre composant défectueux a été détecté. Aller à la PROCEDURE DE DIAGNOSTIC 6, page RS-38, et réparer complètement le composant défectueux.
6. Tourner le contact d'allumage sur ''ON''. Le témoin ''AIR BAG'' fonctionne en mode Utilisateur. Comparer le fonctionnement du témoin ''AIR BAG'' au tableau ci-dessous.

NOTE :
S'il est nécessaire de passer du mode de Diagnostic au mode Utilisateur quand un défaut est détecté, tourner le contact d'allumage de ''OFF'' sur ''ON''. Puis appuyer sur le contact de porte côté conducteur au moins 5 fois en 7 secondes après avoir mis le contact d'allumage sur ''ON''.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostic de défaut sans CONSULT (Suite)

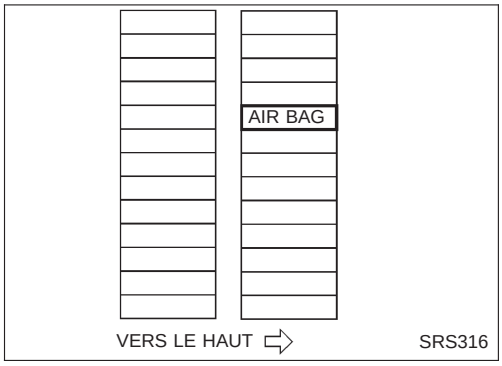
Le SRS est maintenant en mode Utilisateur.

Fonctionnement du témoin ‘‘AIR BAG’’ – Mode utilisateur –	Conditions du SRS	Elément de référence
 MRS095A	Aucun défaut n’est détecté. Aucune démarche supplémentaire n’est nécessaire.	–
 MRS096A	Le système présente un défaut et doit être réparé comme indiqué.	Aller à la PROCEDURE DE DIAGNOSTIC 2 ou 6 (RS-30 ou 38)
 MRS097A	Le coussin gonflable est déployé.	Aller à DIAGNOSTIC DE COLLISION (RS-44)
	Le fusible de coussin gonflable, le boîtier de capteurs de diagnostic ou le faisceau est défectueux et doit être réparé.	Aller à la PROCEDURE DE DIAGNOSTIC 9 (RS-42).
 MRS098A	Un des défauts suivants s’est manifesté et doit être réparé. ● Le fusible des instruments combinés est grillé. ● Le circuit du témoin ‘‘AIR BAG’’ est ouvert ou en court-circuit. ● Le boîtier de capteurs de diagnostic est défectueux.	Aller à la PROCEDURE DE DIAGNOSTIC 10 (RS-43).

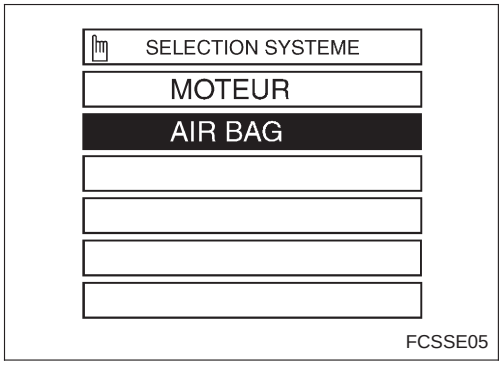
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostic de défaut sans CONSULT (Suite)

PROCEDURE DE DIAGNOSTIC 8 (suite de la PROCEDURE DE DIAGNOSTIC 6)



Inspection d'un défaut enregistré du SRS



Est-ce le premier entretien du SRS ?

Non → Les résultats de diagnostic (précédemment mémorisés) n'ont pas été effacés, même après que le système a été réparé.
Aller à PROCEDURE DE DIAGNOSTIC 7, étape 5 (RS-40)

Oui

Aller à PROCEDURE DE DIAGNOSTIC 5 (RS-35) (l'inspection ne peut être poursuivie sans CONSULT).

Diagnostics de défaut : le témoin ''AIR BAG'' ne s'éteint pas

PROCEDURE DE DIAGNOSTIC 9

Le coussin gonflable est-il déployé ?

Oui → Consulter le DIAGNOSTIC DE COLLISION (RS-44)

Non

Le fusible du coussin gonflable (''Air Bag'') du SRS fonctionne-t-il correctement ?

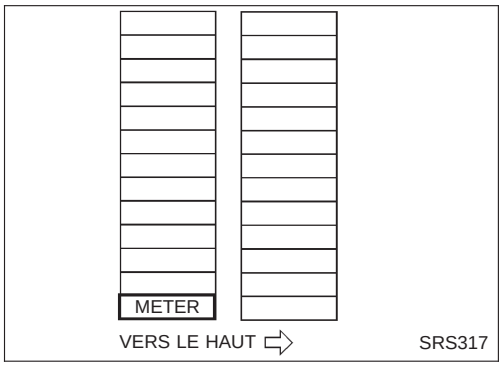
Non → Remplacer le fusible.

Oui

Brancher CONSULT et appuyer sur ''DEPART''.
●Est-ce que ''AIR BAG'' s'affiche sur l'écran CONSULT ?

Non → Inspecter visuellement les connexions du faisceau de câblage du boîtier de capteurs de diagnostic. Si les raccords de faisceaux sont bons, remplacer le boîtier de capteurs de diagnostic.

Oui

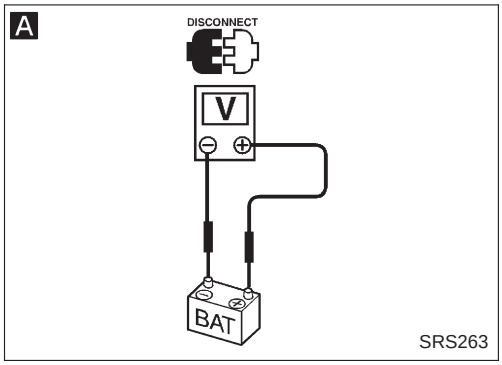


Est-ce que la connexion de faisceau entre le témoin et le boîtier de capteurs de diagnostic est bonne ?

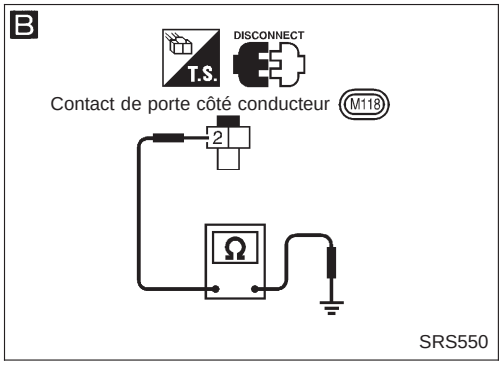
Non → Brancher le connecteur du témoin et du boîtier de capteurs de diagnostic correctement. Si le témoin ne s'éteint toujours pas, remplacer le faisceau.

Oui

Remplacer le boîtier de capteurs de diagnostic.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Diagnostics de défaut : le témoin ‘‘AIR BAG’’ ne s’allume pas

PROCEDURE DE DIAGNOSTIC 10

Le fusible du témoin fonctionne-t-il correctement ?	Non	Remplacer le fusible.
Oui		
Est-ce que la D.E.L. du témoin fonctionne correctement ?	Non	Remplacer la D.E.L. du témoin.
Oui		
1. Débrancher le connecteur du boîtier de capteurs de diagnostic. 2. Mettre le contact d’allumage sur ON. ● Le témoin s’allume-t-il ?	Non	Vérifier le circuit de mise à la masse du témoin ‘‘AIR BAG’’.
Oui		
Remplacer le boîtier de capteurs de diagnostic.		

Diagnostics de défaut : le SRS ne passe pas en mode de Diagnostic en utilisant le contact de porte

PROCEDURE DE DIAGNOSTIC 11

A

Débrancher les deux câbles de la batterie et contrôler la tension de cette dernière à l’aide du multimètre. ● Est-ce que la tension de la batterie est de plus de 9V ?	Non	Charger la batterie.
Oui		

B

Vérifier la continuité du faisceau entre la borne ② du connecteur du contact de porte côté conducteur et la masse de carrosserie. ● Y a-t-il continuité ?	Non	Remplacer le contact de porte côté conducteur. Si le SRS ne passe toujours pas en mode de Diagnostic, remplacer ou réparer le faisceau.
Oui		
Remplacer le boîtier de capteurs de diagnostic.		
Aller à PROCEDURE DE DIAGNOSTIC 1 (RS-29)		

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

COLLISION FRONTALE

Procéder de la façon suivante pour réparer le SRS en cas de collision frontale.

Lorsque le SRS est activé lors d'une collision :

① Remplacer le boîtier de capteurs de diagnostic.
② Déposer le module de coussin gonflable.
③ Contrôler les composants du SRS à l'aide du tableau ci-dessous :
- Remplacer les composants du SRS qui montrent des signes visibles de dommages (bosses, fissures, déformation).

④ Reposer un nouveau module de coussin gonflable.
⑤ Effectuer un autodiagnostic à l'aide de CONSULT et du témoin ''AIR BAG''. Se reporter à ''Autodiagnostic'' pour plus de détails (RS-29). S'assurer que l'ensemble du SRS fonctionne correctement.

Lorsque le SRS n'est pas activé lors d'une collision :

① Contrôler les composants du SRS à l'aide du tableau ci-dessous :
- Remplacer les composants du SRS qui montrent des signes visibles de dommages (bosses, fissures, déformation).

② Effectuer un autodiagnostic à l'aide de CONSULT et du témoin ''AIR BAG''. Se reporter à ''Autodiagnostic'' pour plus de détails (RS-29). S'assurer que l'ensemble du SRS fonctionne correctement.

Inspection du SRS

Pièce	Le SRS est activé.	Le SRS n'est PAS activé.
Module de coussin gonflable	REMPLACER Reposer le module de coussin gonflable en utilisant des boulons neufs.	1. Déposer le module de coussin gonflable. Vérifier si le cache du faisceau et les connecteurs ne sont pas endommagés, les bornes déformées et le faisceau coincé. 2. Reposer le module de coussin gonflable côté conducteur sur le volant de direction et vérifier s'il est correctement monté et aligné sur le volant de direction. 3. Si aucun dommage n'a été trouvé, reposer l'ensemble en utilisant des boulons neufs. 4. En cas de dommage – REMPLACER. Le coussin gonflable doit être déployé avant d'être mis au rebut.
Boîtier de capteurs de diagnostic	REMPLACER Reposer le boîtier de capteurs de diagnostic en utilisant des boulons neufs.	1. Vérifier si le boîtier et son support ne sont pas bosselés, fissurés ou déformés. 2. Vérifier si les connecteurs ne sont pas endommagés et les bornes déformées. 3. Si aucun dommage n'a été trouvé, reposer l'ensemble avec des boulons neufs. 4. En cas de dommage – REMPLACER. Reposer le boîtier de capteurs de diagnostic en utilisant des boulons neufs.
Volant de direction	1. Vérifier visuellement que le volant de direction n'est pas endommagé. 2. Vérifier si le faisceau (intégré au volant de direction) et les connecteurs ne sont pas endommagés et les bornes déformées. 3. Monter le module de coussin gonflable pour en contrôler l'adaptabilité ou l'alignement avec le volant de direction. 4. Vérifier si le volant de direction ne présente pas un jeu excessif. 5. Reposer l'ensemble s'il n'y a pas de dommage. 6. En cas de dommage – REMPLACER.	
Câble spiralé	1. Contrôler visuellement que le câble spiralé et la commande combinée ne sont pas endommagés. 2. Vérifier si les connecteurs, les câbles de plomb et la bande de protection sont en bon état. 3. Vérifier si le volant de direction est exempt de tout bruit, point de force et qu'il tourne librement. 4. Si l'on ne constate aucun dommage, le reposer. 5. En cas de dommage – REMPLACER.	
Faisceau et connecteurs	1. Vérifier si les connecteurs sont bien branchés, s'ils ne sont pas endommagés et si les bornes ne sont pas déformées. 2. Vérifier si le faisceau ne coince pas et qu'il n'est pas effiloché, coupé ou déformé. 3. Si l'on ne constate aucun dommage, reposer le faisceau et les connecteurs. 4. En cas de dommage – REMPLACER la partie du faisceau endommagée. Ne pas essayer de réparer, épisser ou modifier le faisceau du SRS.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Système de retenue supplémentaire (SRS) "COUSSIN GONFLABLE" (modèles à 4 roues motrices)

Utilisé avec une ceinture de sécurité, le coussin gonflable du système de retenue supplémentaire contribue à réduire les risques et la gravité des blessures subies par le conducteur en cas de collision frontale. Le système de retenue supplémentaire se compose d'un module de coussin gonflable (air bag) (situé dans le moyeu du volant), d'un boîtier de capteurs de diagnostic, d'un témoin avertisseur, d'un faisceau de câblage et d'un câble spiralé. Les informations nécessaires à l'entretien sans danger du système se trouvent à la **section RS** de ce manuel de réparation.

AVERTISSEMENT :

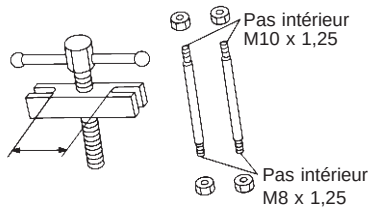
- **Pour ne pas affecter le fonctionnement du SRS, ce qui augmenterait les risques de blessures graves ou mortelles en cas de collision entraînant le déploiement du coussin gonflable (air bag), toutes les opérations d'entretien doivent être effectuées par un concessionnaire NISSAN agréé.**
- **Un entretien incorrect, y compris une mauvaise dépose ou repose du SRS, pourra entraîner des risques de blessures dues au déploiement accidentel du système.**
- **Ne pas utiliser d'équipement d'essai électrique sur les circuits connexes du SRS sauf sur indication de ce manuel de réparation. Les faisceaux de câblage électrique du SRS sont équipés d'une gaine d'isolation jaune soit juste devant les connecteurs de faisceau, soit sur le faisceau tout entier pour une identification plus rapide.**

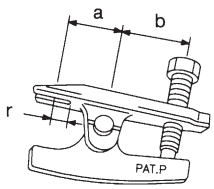
Système de retenue supplementaire (SRS) "COUSSIN GONFLABLE" (modèles à 2 roues motrices)

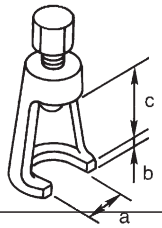
Utilisé avec une ceinture de sécurité, le coussin gonflable du système de retenue supplémentaire contribue à réduire les risques et la gravité des blessures subies par le conducteur en cas de collision frontale. Le système de retenue supplémentaire se compose d'un module de coussin gonflable (air bag) (situé dans le moyeu du volant), d'un boîtier de capteurs de diagnostic, d'un témoin avertisseur, d'un faisceau de câblage et d'un câble spiralé. Les informations nécessaires à l'entretien sans danger du système se trouvent à la **section RS** de ce manuel de réparation.

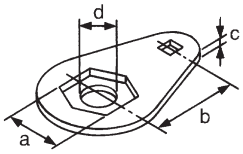
AVERTISSEMENT :

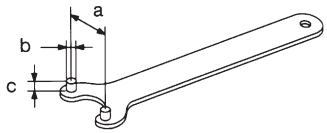
- **Pour ne pas affecter le fonctionnement du SRS, ce qui augmenterait les risques de blessures graves ou mortelles en cas de collision entraînant le déploiement du coussin gonflable (air bag), toutes les opérations d'entretien doivent être effectuées par un concessionnaire NISSAN agréé.**
- **Un entretien incorrect, y compris une mauvaise dépose ou repose du SRS, pourra entraîner des risques de blessures dues au déploiement accidentel du système.**
- **Ne pas utiliser d'équipement d'essai électrique sur les circuits connexes du SRS.**

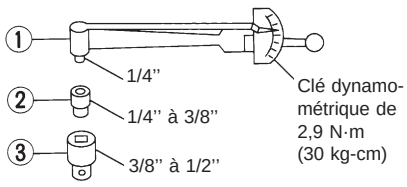








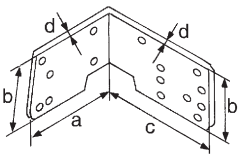


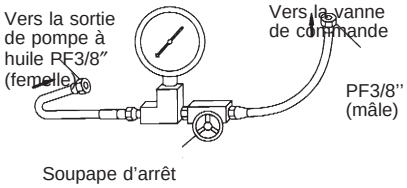


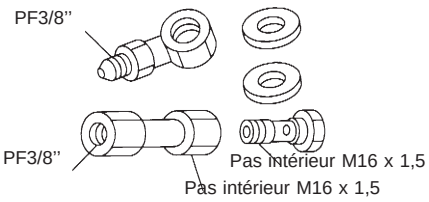
Précautions pour le système de direction

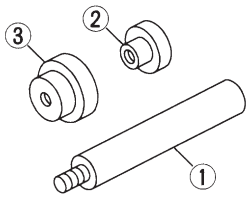
- **Avant le démontage, nettoyer soigneusement l'extérieur du boîtier.**
- **Le démontage doit être fait dans un environnement propre. Il est particulièrement important d'empêcher la contamination des parties internes du système par la saleté ou tout autre corps étranger.**
- **Pour assurer un remontage simple et correct, disposer les pièces démontées, en ordre, sur un établi.**
- **Utiliser des chiffons en nylon ou des serviettes en papier pour essuyer les pièces ; les chiffons habituels d'atelier risquent de laisser des peluches qui peuvent entraîner des défaillances dans le fonctionnement.**
- **Avant l'inspection ou le remontage, nettoyer soigneusement toutes les pièces à l'aide d'un solvant ininflammable à usages multiples.**
- **Avant le remontage, enduire les pièces du circuit hydraulique de liquide pour boîte de vitesses automatique* recommandé. On peut enduire les joints toriques et les joints d'huile de graisse minérale (vaseline). Ne jamais utiliser d'autre graisse.**
- **Remplacer tous les joints, les joints d'huile et les joints toriques. Eviter d'endommager les joints toriques, les joints d'huile et les joints lors du montage. Exécuter tous les essais de fonctionnement indiqués.**

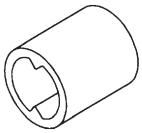
  *** : Liquide pour boîte de vitesses automatique de type DEXRON™ II E, DEXRON™ III, ou un produit équivalent.**











Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

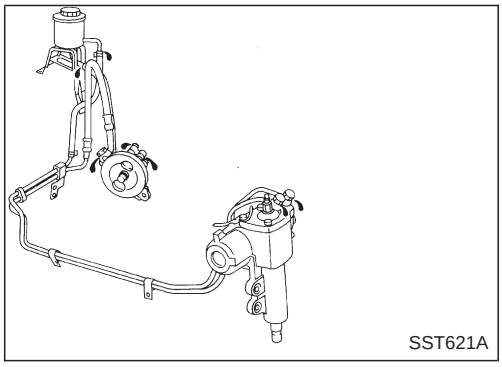
Système de direction

Contrôle et réglage des courroies d'entraînement (pour direction assistée)

Consulter la section MA (''Contrôle des courroies d'entraînement'', ''ENTRETIEN DU MOTEUR'').

Contrôle du niveau de liquide (pour direction assistée)



Vérifier le niveau de liquide avec le moteur arrêté.
Vérifier le niveau de liquide sur la jauge du bouchon de réservoir.
Le niveau de liquide doit être contrôlé au repère ''HOT'' (chaud) lorsque la température du liquide est comprise entre 50 et 80°C.
Le niveau de liquide doit être contrôlé au repère ''COLD'' (froid) lorsque la température du liquide est comprise entre 0 et 30°C.
ATTENTION :

- **Ne pas remplir excessivement.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Contrôle du niveau de liquide (pour direction assistée) (Suite)

- **Le fluide recommandé est le liquide pour boîte de vitesses automatique de type ''DEXRON™ II E, DEXRON™ III'', ou un liquide équivalent.**

SST621A

Contrôle des fuites de liquide (pour direction assistée)

Vérifier si les canalisations sont correctement raccordées et rechercher la présence de fuites, fissures, dommages, usure par frottement ou autres détériorations.

1. Faire tourner le moteur au ralenti et à 1 000 tr/mn.
- **S'assurer que la température du liquide contenu dans le réservoir atteint environ 60 à 80°.**
2. Faire tourner à plusieurs reprises le volant de gauche à droite.
3. Maintenir le volant dans chaque position de butée pendant 5 secondes et vérifier soigneusement s'il n'y a pas de fuites.

ATTENTION :
Ne pas maintenir le volant de direction à la butée pendant plus de 15 secondes.

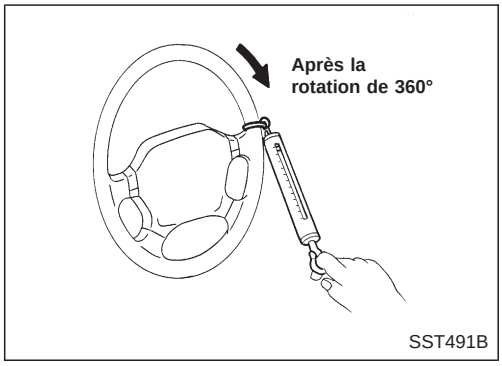
4. Si l'on remarque une fuite au niveau des canalisations, desserrer l'écrou évasé puis le resserrer.

Ne pas serrer le raccord excessivement, car ceci risque d'endommager le joint torique, la rondelle et le raccord.

5. Si l'on remarque une fuite au niveau de la pompe de direction assistée, inspecter la pompe. Consulter la page ST-35.
6. Si l'on remarque une fuite au niveau du mécanisme de direction assistée, vérifier le mécanisme. Consulter la page ST-20 (PB48S), ou ST-28 (PB59K).

Purge du système hydraulique (pour direction assistée)

1. Décoller les roues avant du sol en levant l'avant du véhicule.
2. Faire l'appoint de liquide dans le réservoir jusqu'au niveau spécifié. Puis tourner le volant de façon rapide dans les deux sens en touchant légèrement les butées.
   Recommencer cette opération jusqu'à ce que le niveau de liquide ne diminue plus.
3. Démarrer le moteur.
   Recommencer l'étape 2 ci-dessus.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Purge du système hydraulique (pour direction assistée) (Suite)

- Une purge d'air incomplète causera les défaillances suivantes :

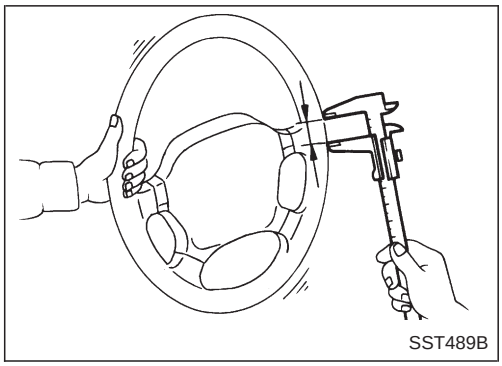
a. Apparition de bulles d'air dans le réservoir
b. Bruit de cliquetis provenant de la pompe de direction assistée
c. Bourdonnement excessif de la pompe de direction assistée
Dans ce cas, recommencer la purge de l'air.

La soupape ou la pompe de direction assistée peuvent émettre un bruit d'écoulement de liquide. Ceci est normal lorsque le véhicule est stationnaire ou lorsque l'on tourne lentement le volant de direction, et n'affecte en rien les performances ou la durée de vie du système.

Contrôle de la force de rotation du volant (pour direction assistée)

1. Garer le véhicule sur une surface plane et sèche, et serrer le frein de stationnement.
2. Démarrer le moteur et le laisser tourner au ralenti ou à 1 000 tr/mn.
3. Amener le liquide de direction assistée à sa température de fonctionnement normale (s'assurer que la température du liquide atteint environ 60 à 80°C).

La pression de gonflage des pneus doit être normale.

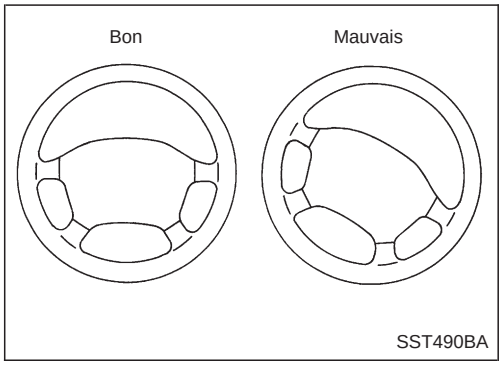


4. Contrôler la force de rotation du volant après avoir tourné le volant de 360° à partir de la position neutre.

Force de rotation du volant :
Type PB48S
24,5 - 29,4 N (2,5 - 3,0 kg)
Type PB59K
39 N (4 kg) ou moins

5. Si la force de rotation du volant est hors spécification, vérifier les points suivants :

a. Le système hydraulique. Consulter le titre ''Contrôle du système hydraulique'', ST-8.
b. La colonne de direction. Se reporter à la page ST-10.
c. La suspension et l'essieu avant. Consulter la section FA (''Pièces de l'essieu et de la suspension avant'', ''ENTRETIEN SUR LE VEHICULE'').
d. Le couple de rotation du boîtier de direction. Consulter le titre ''MESURE DU COUPLE DE ROTATION'', ST-22 (PB48S), ou ST-30 (PB59K).



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

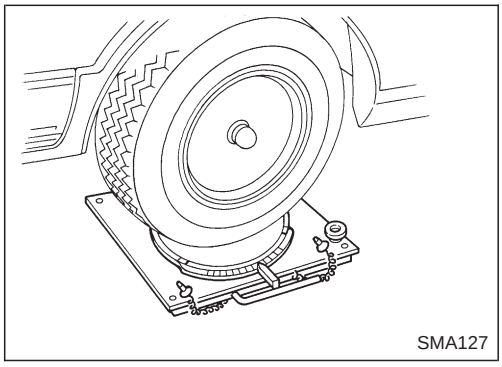
SST489B

Contrôle du jeu du volant de direction

- Placer les roues en position de marche en ligne droite et vérifier le jeu du volant.
  Jeu à hauteur du volant :
  35 mm ou moins
- Si le jeu est hors spécification, vérifier si les composants suivants ne sont pas desserrés ou usés.

a. La colonne de direction. Consulter la page ST-10.
b. La suspension et l'essieu avant. Consulter la section FA (''Pièces de l'essieu et de la suspension avant'', ''ENTRETIEN SUR LE VEHICULE'').
c. Le boîtier de direction [consulter les pages ST-13(direction manuelle), 21 (direction assistée PB48S), ou ST-28 (direction assistée PB59K)].

SST490BA

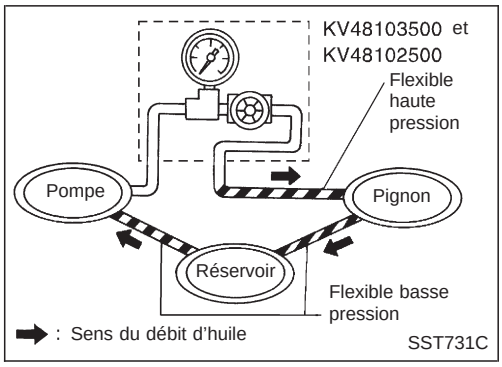


Contrôle de la position neutre du volant

- S'assurer que l'alignement des roues est correct.
  Alignement des roues :
  Consulter la section FA (''Inspection et réglage'', ''CARACTERISTIQUES ET VALEURS DE REGLAGE'').
- Avant de retirer le volant, vérifier que le boîtier de direction est correctement centré.

Contrôle

1. S'assurer que le volant se trouve dans la position neutre lorsqu'on roule en ligne droite.
2. S'il n'est pas dans la position neutre, déposer le volant et le remonter correctement.
3. Si la position neutre n'est toujours pas correcte :



a. Desserrer les contre-écrous de barre d'accouplement.
b. Déplacer les barres d'accouplement, dans la direction opposée, d'une même distance des côtés gauche et droit. Ceci compensera l'erreur du point neutre.

SMA127

Contrôle de l'angle de rotation des roues avant

1. Faire tourner le volant à bout de course vers la droite, puis vers la gauche ; mesurer l'angle de braquage.
   Angle de braquage total :
   Consulter la section FA (''Inspection et réglage'', ''CARACTERISTIQUES ET VALEURS DE REGLAGE'').
2. Si l'angle est hors spécification, vérifier le réglage du boulon de butée. Consulter la section FA (''ANGLE DE BRAQUAGE DES ROUES AVANT'', ''Alignement des roues avant'').

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Contrôle du système hydraulique (pour direction assistée)

Vérifier la tension de la courroie d'entraînement, la poulie motrice ainsi que la pression de gonflage des pneus, avant de commencer.

1. Disposer l'outil spécial. Ouvrir la soupape d'arrêt. Purger l'air hors du circuit. Consulter le titre ''Purge du système hydraulique'', ST-5.
2. Faire tourner le moteur au ralenti ou à 1 000 tr/mn.

- **S'assurer que la température du liquide dans le réservoir atteint environ 60 à 80°.**

AVERTISSEMENT :

Réchauffer le moteur une fois la soupape d'arrêt entièrement ouverte. Si le moteur est démarré avec la soupape d'arrêt fermée, la pression de liquide dans la pompe de direction assistée augmentera à son maximum. Ceci fera augmenter la température du liquide de façon anormale.

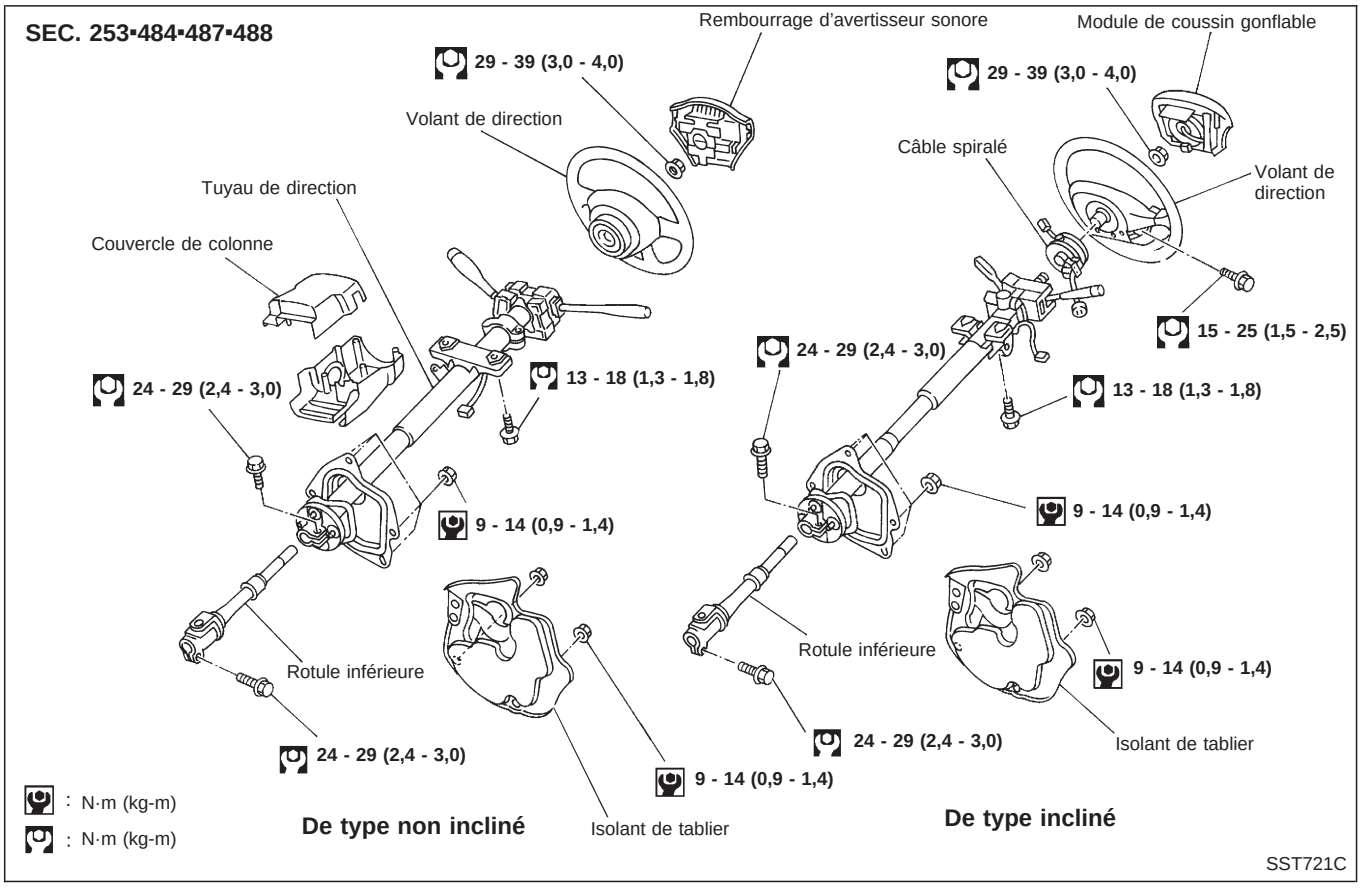
3. Vérifier la pression alors que le volant est tourné à bout de course vers la gauche ou vers la droite, avec le moteur à un ralenti de 1 000 tr/mn.

ATTENTION :

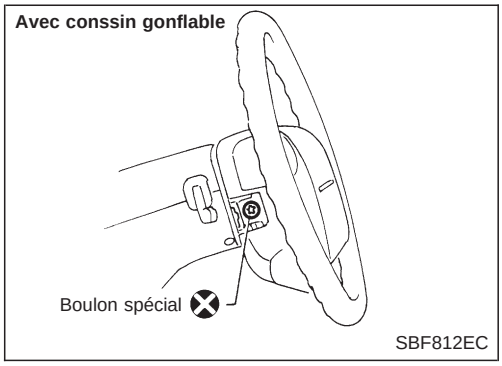
Ne pas maintenir le volant à la butée pendant plus de 15 secondes à la fois.

Pression maximum de la pompe à huile :
7 649 - 8 238 kPa (76,5 - 82,4 bar, 78 - 84 kg/cm^2)
au ralenti

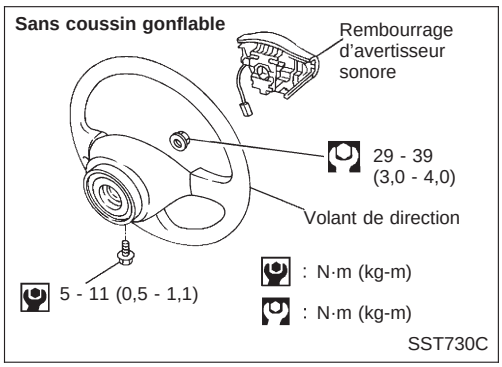
4. Si la pression de direction assistée est en dessous de la pression standard, fermer lentement la soupape d'arrêt et vérifier la pression.



ATTENTION :



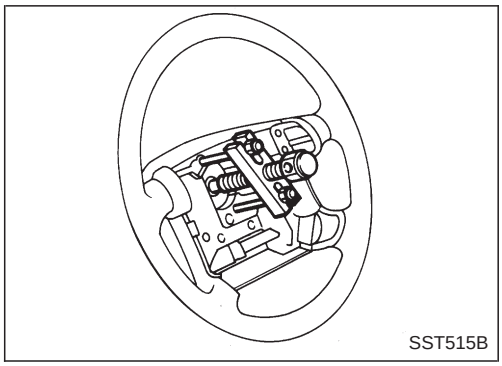
Ne pas laisser la soupape d'arrêt fermée pendant plus de 15 secondes.



- Lorsque la pression atteint son maximum, le boîtier est endommagé. Contrôler le mécanisme de direction assistée. Consulter la page ST-21 (PB48S), ou ST28 (PB59K).
- Si la pression reste en dessous de la pression standard, la pompe est endommagée. Contrôler la pompe de direction assistée. Consulter la page ST-35.

5. Si la pression de direction assistée est supérieure à la pression standard, la soupape de commande de débit de la pompe de direction assistée est endommagée. Contrôler la pompe de direction assistée. Consulter la page ST-35.
6. Après la vérification du système hydraulique, déposer l'outil spécial et faire l'appoint de liquide selon les besoins. Puis purger complètement l'air du système. Consulter la page ST-5.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Volant

DEPOSE ET REPOSE

1. Déposer le module de coussin gonflable et le câble spiralé. Consulter la secion RS [''Module de coussin gonflable et câble spiralé'', ''SYSTEME DE RETENUE SUPPLEMENTAIRE (SRS)] (avec coussin gonflable).
   Déposer le rembourrage d'avertisseur sonore (sans coussin gonflable).
2. Débrancher le connecteur de l'avertisseur sonore et déposer l'écrou du volant.

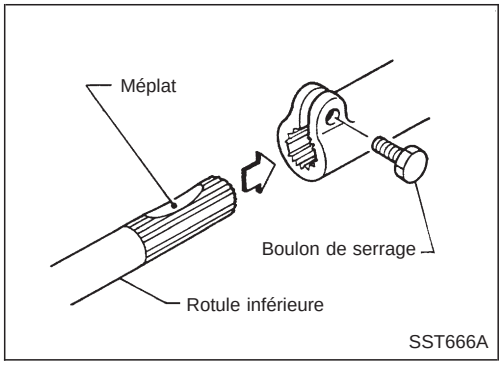
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Volant (Suite)

SST515B

3. Déposer le volant avec l'outil spécial.

- Pour la repose, consulter la section RS [''Module de coussin gonflable et câble spiralé'', ''SYSTEME DE RETENUE SUPPLEMENTAIRE (SRS)''].



Colonne de direction

DEPOSE

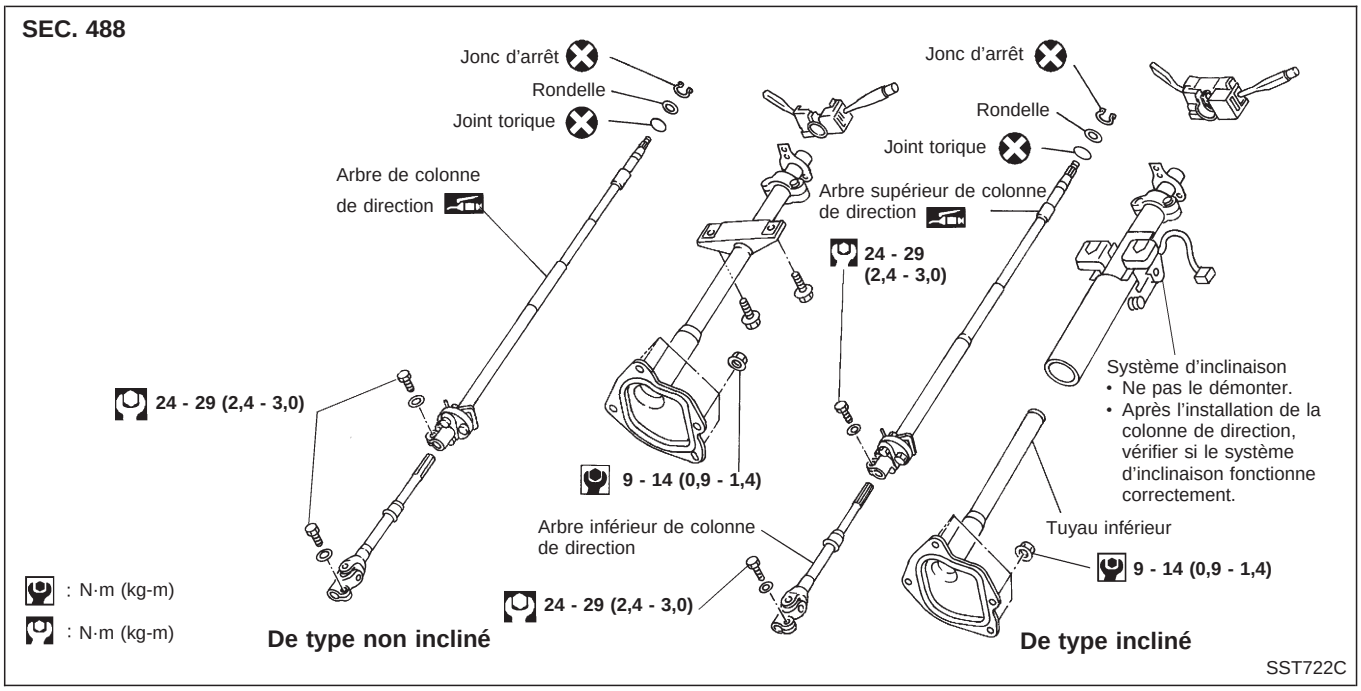
ATTENTION :

- **La rotation du câble spiralé (élément de coussin gonflable du SRS) est limitée. Si le boîtier de direction doit être déposé, mettre les roues avant en position de marche en ligne droite.**
  Ne pas tourner la colonne de direction lorsque le boîtier est déposé.
- **Déposer le volant avant la rotule inférieure de direction de façon à ne pas endommager le câble spiralé du SRS. Consulter la page ST-9.**

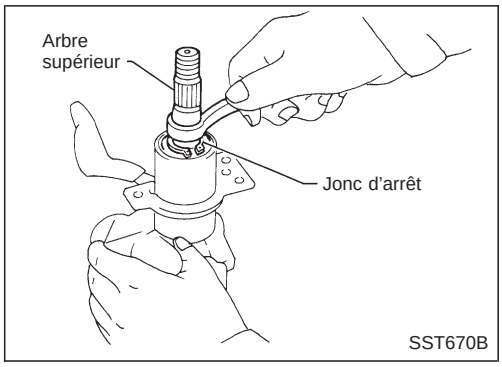
1. Déposer le volant, consulter la page ST-9.
2. Déposer le capot de colonne de direction.
3. Déposer le panneau inférieur du tableau de bord.
4. Débrancher les connecteurs électriques de la commande combinée et le connecteur de faisceau du coussin gonflable.
5. Déposer l'isolant de tablier.
6. Déposer le boulon de la rotule inférieure.
7. Retirer les deux boulons de la colonne de direction et déposer la colonne.

SST666A

REPOSE

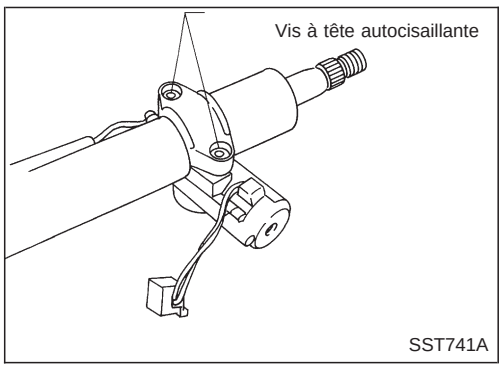


- Lors de la repose de la colonne de direction, serrer à la main tous les boulons de fixation du support inférieur et de la bride ; les serrer ensuite au couple spécifié. S'assurer que la colonne de direction n'est pas soumise à une tension excessive.
- Lors du raccordement de la rotule inférieure de direction, veiller à orienter le boulon de serrage vers le méplat.
- Aligner correctement le câble spiralé lors de la repose du volant. Consulter la section RS [''Module de coussin gonflable et câble spiralé'', ''SYSTEME DE RETENUE SUPPLEMENTAIRE (SRS)''].



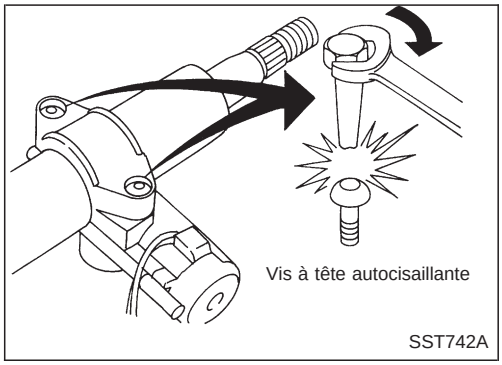
ATTENTION :

Après la repose, manoeuvrer le volant afin de s'assurer qu'il tourne librement et que le nombre de tours depuis la position de marche en ligne droite vers les butées gauche et droite est identique. S'assurer que le volant se trouve en position neutre en position de marche en ligne droite.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

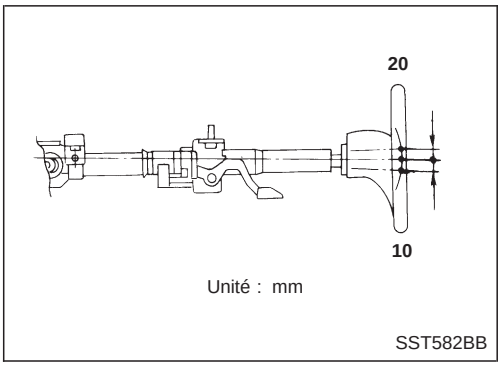
Démontage et remontage



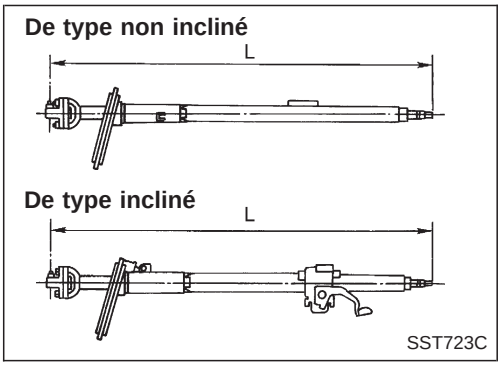
- Lors du montage et du démontage, déverrouiller l'antivol de direction à l'aide de sa clé.
- Déposer la commande combinée.
- Veiller à ce que la partie circulaire du jonc d'arrêt soit bien tournée vers le roulement lors de sa mise en place.
- Monter le jonc d'arrêt sur l'arbre supérieur à l'aide d'un outil approprié.

- Verrouillage de direction

a. Briser les vis à tête autocisaillante à l'aide d'une perceuse ou d'un outil approprié quelconque.



b. Reposer des vis à tête autocisaillante, puis les serrer jusqu'à rupture de la tête.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Démontage et remontage (Suite)

Système d'inclinaison

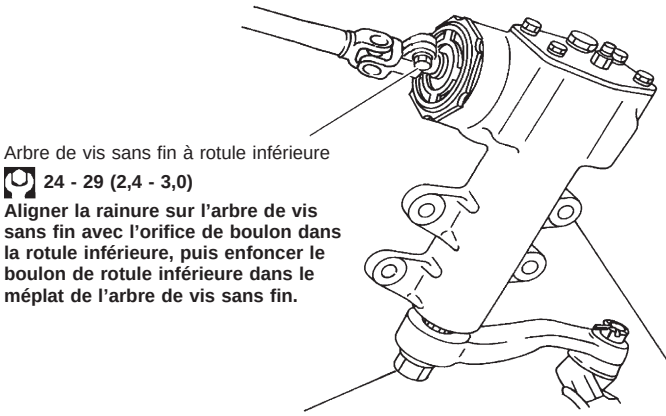
Après avoir remonté la colonne de direction, vérifier le fonctionnement du mécanisme d'inclinaison.

Inspection

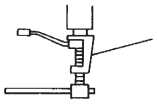
- Si le volant ne tourne pas en douceur, vérifier la colonne de direction comme indiqué ci-après et remplacer les pièces endommagées.

a. Vérifier si les roulements de colonne ne sont pas endommagés ou usés de manière inégale. Lubrifier avec de la graisse à usages multiples recommandée ou remplacer la colonne de direction comme un ensemble, si nécessaire.

b. Vérifier si la jupe de colonne de direction n'est ni déformée ni brisée. La remplacer si nécessaire.



- Lorsque le véhicule a subi une légère collision, vérifier la dimension "L". Si la valeur trouvée n'est pas dans les limites spécifiées, remplacer la colonne de direction comme un ensemble.

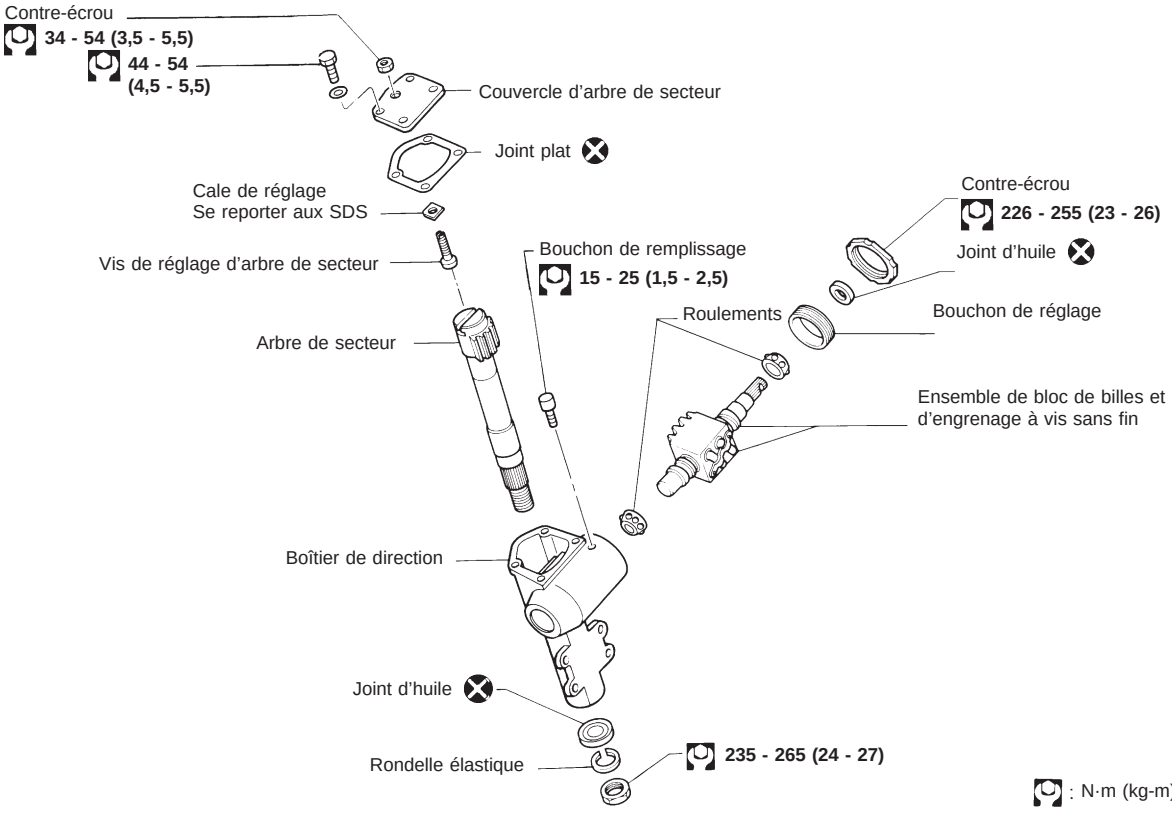


Longueur de la colonne de direction "L" :
Moteur KA24 avec conduite à droite
822,1 - 823,7 mm
Sauf moteur KA24 avec conduite à droite
866,1 - 867,7 mm

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Dépose et repose

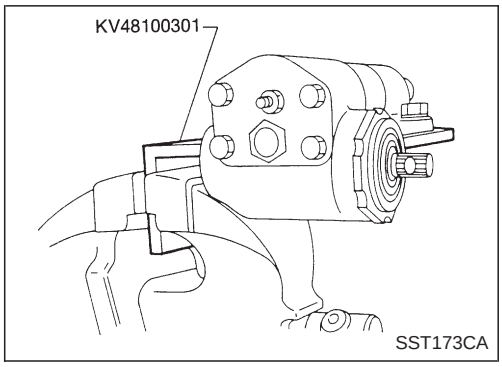
SEC. 480



• Installer la bielle pendante.
Aligner les quatre rainures des cannelures de l'arbre de pignon sur les quatre saillies des cannelures de l'arbre de secteur, puis installer et serrer la rondelle de verrouillage et l'écrou.

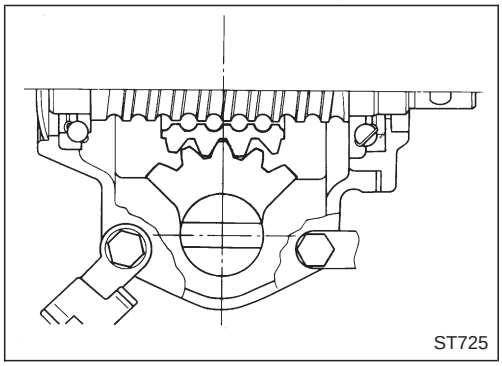
: N·m (kg-m)

SST724C



SEC. 480

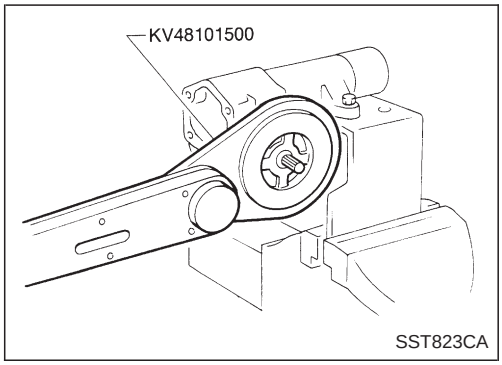
: N·m (kg-m)



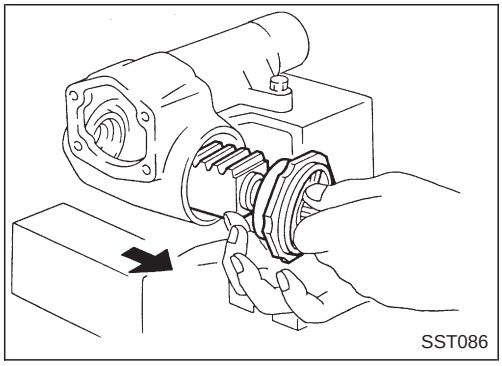
SST312CA

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Démontage



1. Placer le boîtier de direction dans un étau à l'aide de l'outil spécial.

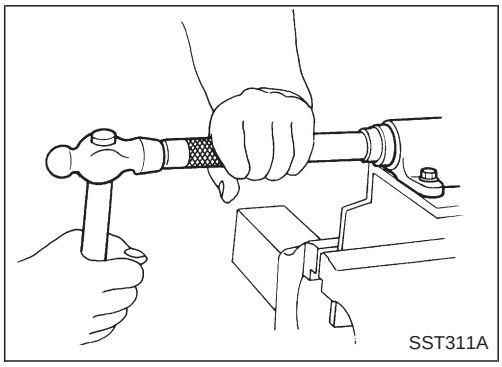


2. Mettre l'engrenage à vis sans fin en position de marche en ligne droite.
3. Déposer l'arbre de secteur avec son couvercle.

ATTENTION :

- **Lorsque l'on retire l'arbre de secteur, il faut veiller à ne pas endommager le joint d'huile ou les pièces associées.**
- **Ne pas déposer les roulements à aiguilles d'arbre de secteur du boîtier de direction. Remplacer le boîtier de direction comme un ensemble, si nécessaire.**

4. Desserrer le contre-écrou du bouchon de réglage avec l'outil spécial.



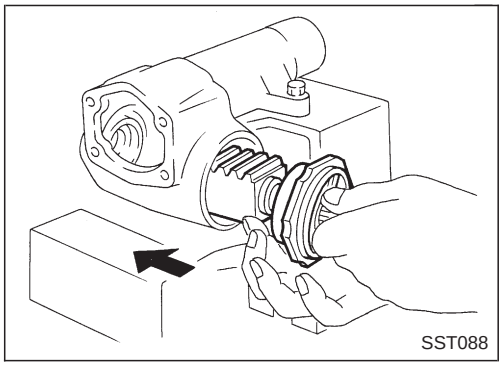
5. Déposer l'engrenage à vis sans fin avec le roulement à vis.

ATTENTION :

- **Veiller à ne pas faire tourner le bloc de billes entièrement d'un côté ou de l'autre de l'engrenage à vis sans fin.**
  Les extrémités des guides de billes seront endommagées si l'écrou tourne jusqu'à ce qu'il soit arrêté par l'extrémité de l'engrenage à vis sans fin.
- **Ne pas séparer le bloc de billes de l'ensemble d'engrenage à vis sans fin.**
  Si nécessaire, remplacer le tout comme un ensemble.
- **Ne pas déposer les roulements à aiguilles d'arbre de secteur du boîtier de direction.**
  Si nécessaire, remplacer le boîtier de direction complet comme un ensemble.

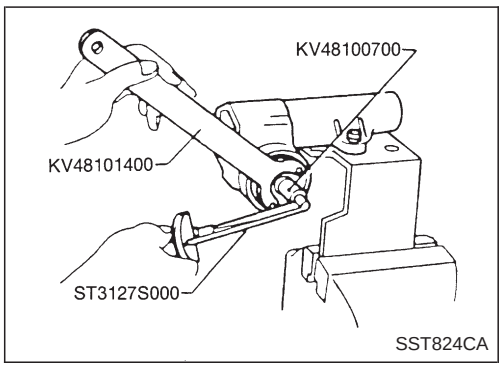
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SST311A



Remontage et réglage

Enduire de graisse à usages multiples la surface d'étanchéité des joints d'huile neufs de l'arbre de secteur et de l'engrenage à vis sans fin.



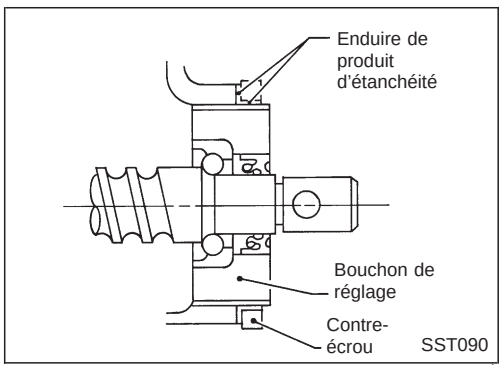
PRECHARGE DE ROULEMENT D'ENGRENAGE A VIS SANS FIN

1. Mettre le joint d'huile en place.

Avant de reposer le joint d'huile, enduire sa surface de contact avec de l'huile pour engrenages.

SST088

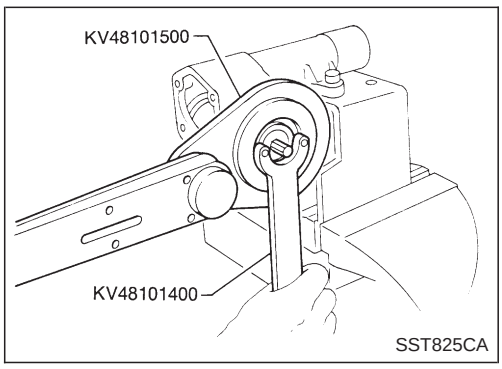
2. Mettre en place l'ensemble d'engrenage à vis sans fin, avec son roulement, dans le boîtier de direction.



SST824CA

3. Régler la précharge de roulement d'engrenage à vis sans fin à l'aide des outils spéciaux.

ATTENTION :

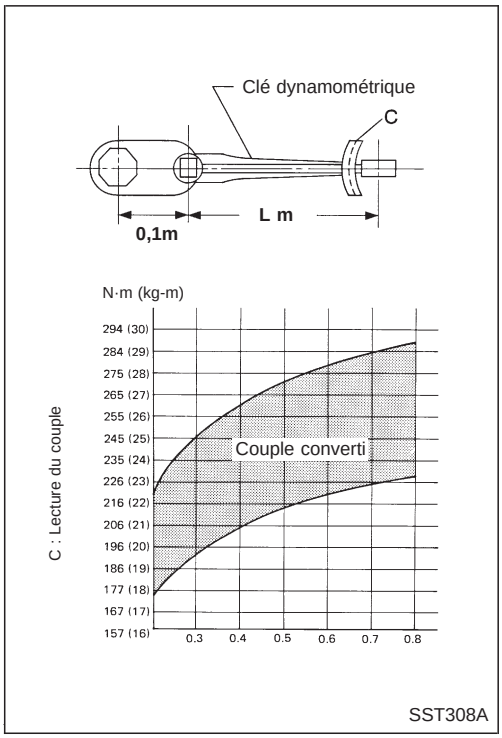


- **Toujours régler la précharge de roulement d'engrenage à vis sans fin en tournant le bouchon de réglage dans le sens des aiguilles d'une montre.**
- **Avant de mesurer la précharge, faire tourner l'engrenage à vis sans fin de plusieurs tours dans les deux sens pour asseoir le roulement d'engrenage à vis sans fin.**

Précharge de roulement d'engrenage à vis sans fin :
0,69 - 0,88 N·m (7,0 - 9,0 kg-cm)

SST090

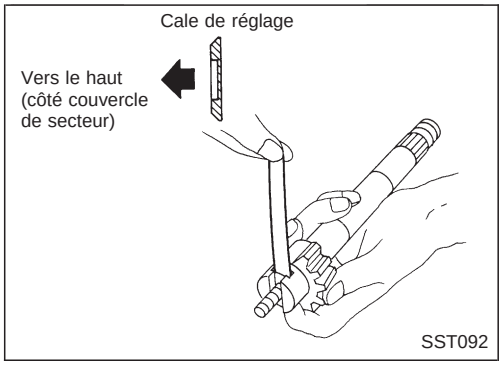
4. Enduire la surface interne du contre-écrou avec un produit d'étanchéité adéquat.



SST825CA

5. Serrer le contre-écrou à l'aide des outils spéciaux.

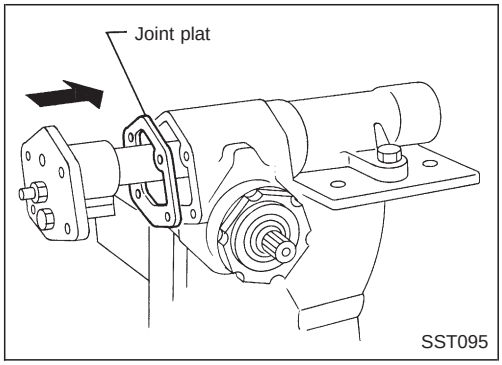
Contre-écrou :
: 226 - 255 N·m (23 - 26 kg-m)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Remontage et réglage (Suite)

- Lors du serrage du contre-écrou, utiliser le graphique ci-contre pour déterminer la lecture correcte du couple (longueur de la clé dynamométrique par rapport au réglage ou à la lecture du couple).



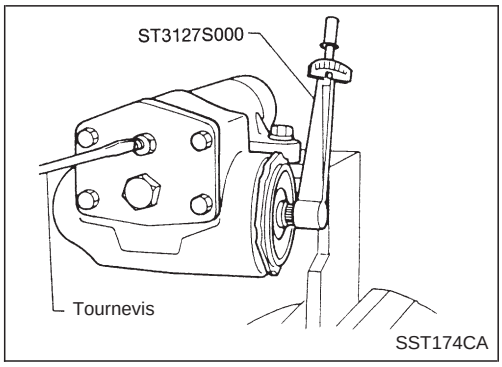
6. Après avoir serré le contre-écrou, s'assurer que la précharge de roulement d'engrenage à vis sans fin est conforme à la valeur spécifiée.

JEU AXIAL DE L'ARBRE DE SECTEUR

Sélectionner et installer une cale de réglage adéquate pour obtenir un jeu axial approprié entre l'arbre de secteur et la vis de réglage.

Jeu axial d'arbre de secteur :
0,1 mm ou moins
Cales d'épaisseur de vis de réglage d'arbre de secteur :
Consulter les SDS, ST-43.

PRECHARGE DU BOITIER DE DIRECTION ET BATTEMENT



1. Mettre la vis sans fin dans la position de marche en ligne droite.

Introduire avec précaution l'arbre de secteur dans le boîtier de direction, en veillant à ne pas rayer le joint d'huile.

2. Tourner la vis de réglage jusqu'à ce que l'arbre de secteur soit juste en contact avec le bloc de billes. Serrer provisoirement le contre-écrou.
3. Lubrifier la partie en contact avec l'arbre de secteur et le bloc de billes à l'aide d'huile pour engrenages ou de graisse pour roulements.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Remontage et réglage (Suite)

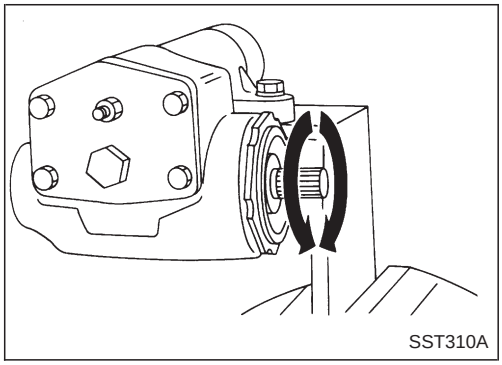
4. Régler le couple de rotation du boîtier de direction dans une position de marche en ligne droite avec l'outil spécial, puis verrouiller avec le contre-écrou.

ATTENTION :

- **Toujours régler la précharge du boîtier de direction en tournant la vis de réglage dans le sens des aiguilles d'une montre.**
- **Faire tourner l'engrenage à vis sans fin de quelques tours dans les deux sens pour asseoir le boîtier de direction.**

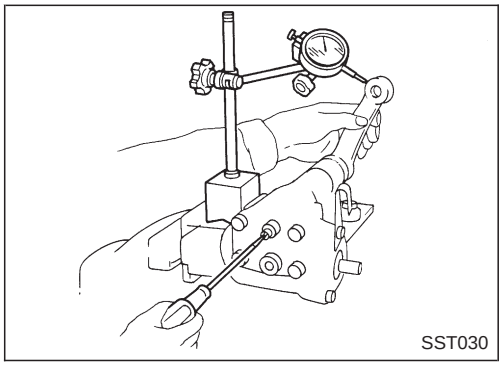
a. Mesurer le couple de rotation à 360° de la position de marche en ligne droite, à l'aide des outils spéciaux.

Couple de rotation à 360° :
0,69 - 0,88 N·m (7,0 - 9,0 kg-cm)



b. Mesurer le couple de rotation en position de marche en ligne droite.

La position de marche en ligne droite est la position dans laquelle l'arbre d'entrée est ramené de 2,14 tours (deux tours complets et 50°) depuis la butée.



Couple de rotation en position de marche en ligne droite :
0,20 - 0,39 N·m (2,0 - 4,0 kg-cm) supérieur au couple de rotation à 360°

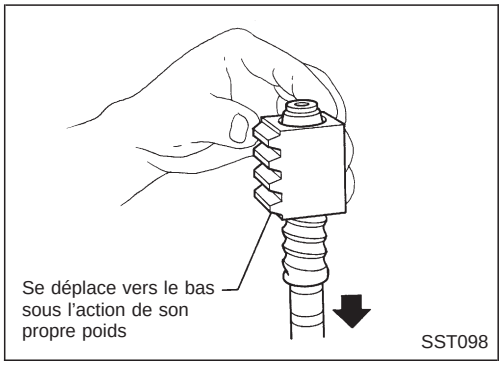
Couple de rotation maximum :
1,08 N·m (11,0 kg-cm)

Si le couple de rotation est hors spécifications, le régler en agissant sur la vis de réglage de l'arbre de secteur.

5. Tourner la vis sans fin à plusieurs reprises à la main afin d'asseoir correctement le roulement.
6. Vérifier la précharge du boîtier de direction. La réajuster si nécessaire.

7. Mesurer la précharge totale.
8. Vérifier le battement.
   Mesurer le battement au niveau de l'extrémité supérieure de la bielle pendante dans la position de marche en ligne droite.

Battement (en position de marche en ligne droite) :
0,1 mm ou moins



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection

Nettoyer toutes les pièces démontées dans un bain de solvant, et vérifier leur état.

ARBRE DE SECTEUR

1. Contrôler la surface des dents pour voir si elle n'est pas piquée, rayée, ébréchée ou autrement endommagée, et remplacer si nécessaire.
2. Contrôler si l'arbre de secteur n'est pas déformé à hauteur du moletage et le remplacer si nécessaire. Vérifier également si le boîtier de direction n'est pas déformé.

ENSEMBLE DE VIS SANS FIN

1. Contrôler la surface des dents du bloc de billes. Remplacer si l'on découvre des piqûres, de l'usure ou tout autre dommage.
2. Le bloc de billes doit tourner librement sur la vis sans fin. S'il est trop serré, l'ensemble doit être remplacé. Contrôler la rotation du bloc de billes en procédant comme suit :

ATTENTION :
Veiller à ne pas laisser le bloc de billes tourner entièrement d'un côté ou de l'autre de l'engrenage à vis sans fin.

a. Déplacer le bloc de billes d'une extrémité à l'autre de l'engrenage à vis sans fin. Ramener progressivement l'arbre de vis sans fin et le bloc de billes vers l'extrémité jusqu'à ce que le bloc se déplace vers le bas sur l'engrenage à vis sans fin, sous l'action de son propre poids.
b. Si le bloc ne se déplace pas librement sur toute la course, remplacer l'ensemble.

Veiller à ne pas endommager le tube de guidage du bloc de billes lorsqu'on effectue ce contrôle.

ROULEMENT

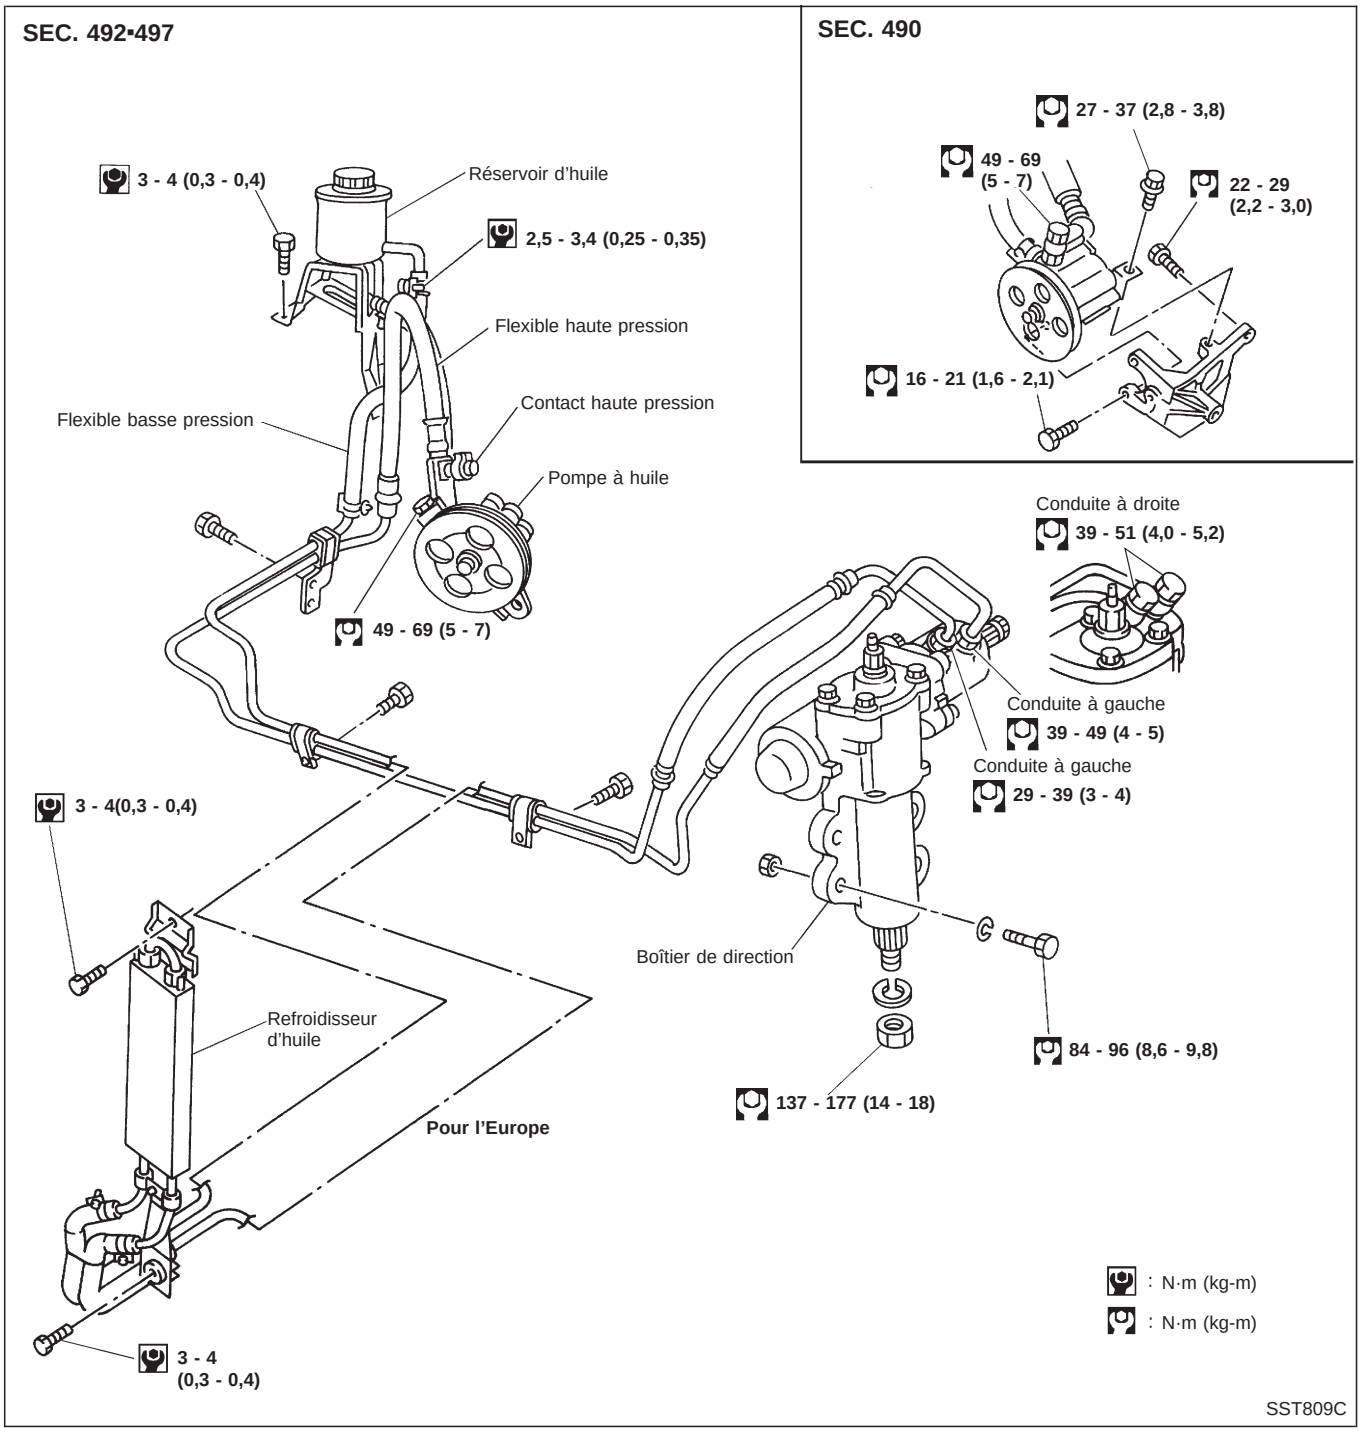
1. Inspecter le roulement de l'engrenage à vis sans fin pour voir s'il n'est pas usé, piqué ou endommagé. Le remplacer si nécessaire.

Lors du remplacement du roulement d'engrenage à vis sans fin, remplacer le roulement et la cuvette externe comme un ensemble.

2. Si le roulement à aiguilles de l'arbre de secteur est usé ou endommagé, remplacer le boîtier de direction comme un ensemble.

JOINTS D'HUILE

- Jeter tous les joints d'huile qui ont été déposés.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

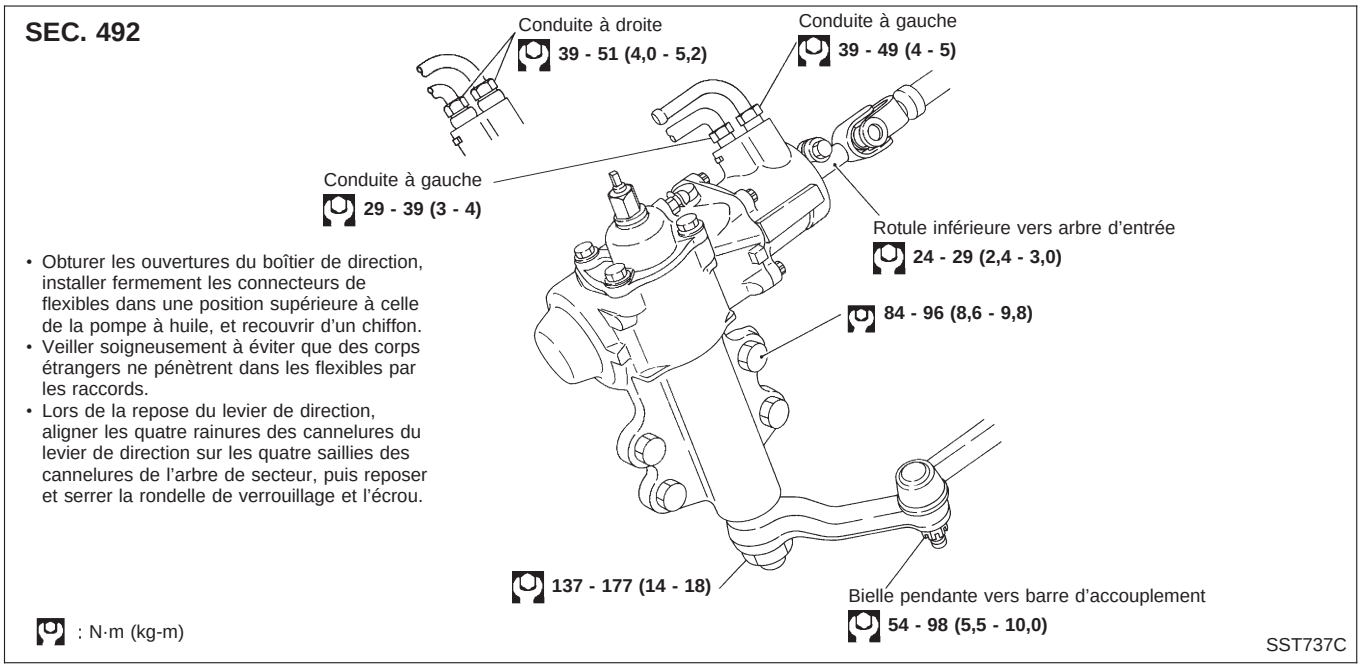
Inspection (Suite)

- Remplacer le joint d'huile si sa surface d'étanchéité est déformée ou fissurée.
- Mettre au rebut le joint d'huile si le ressort est fatigué ou disloqué.

Simpo PDF Merge and Split Unregistered Version (http://www.simpopdf.com

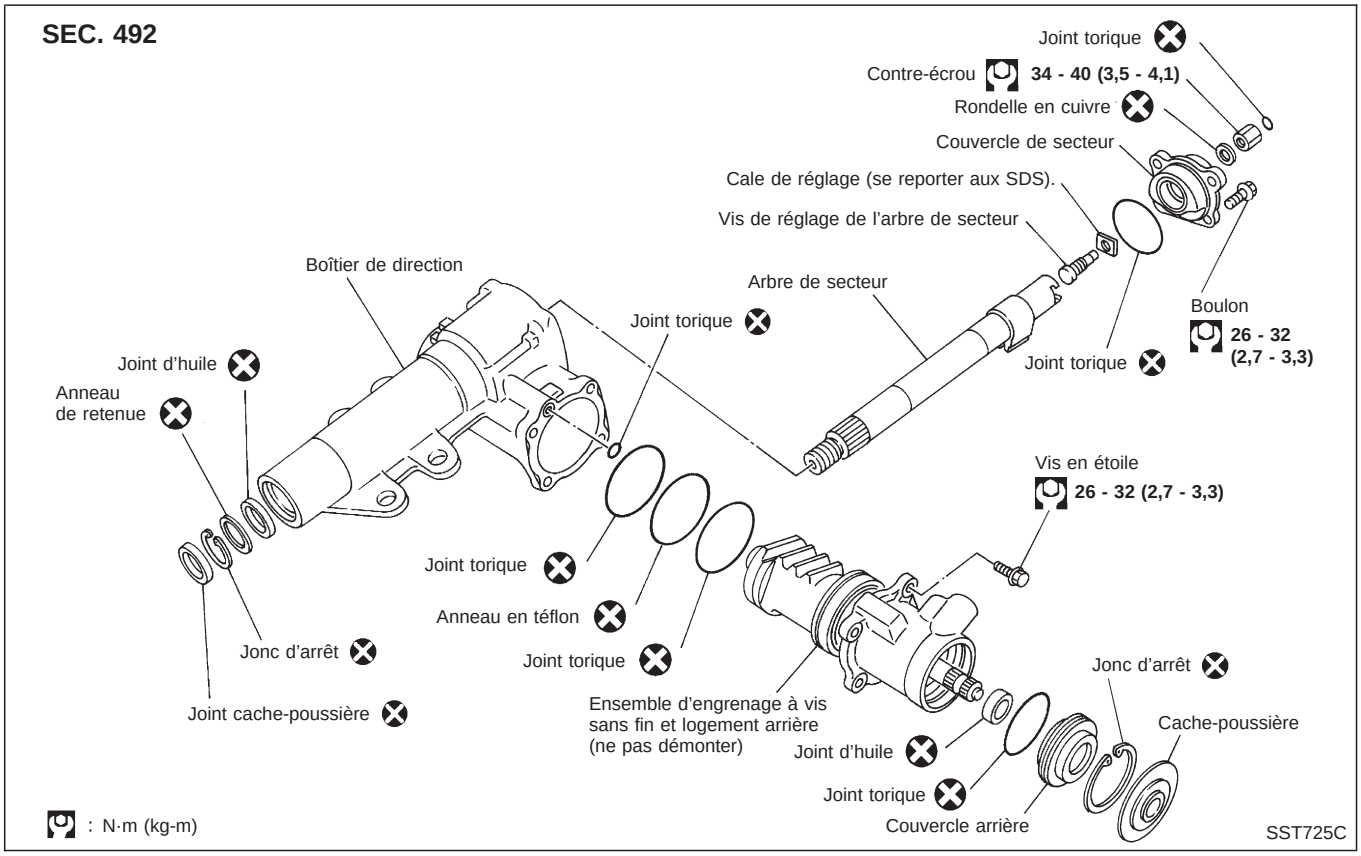
Description

ATTENTION :



- **Seules certaines pièces sont démontables. Ne démonter que les pièces spécifiées.**
- **L'endroit où le démontage est effectué doit être le plus propre possible.**
- **Se laver les mains avant d'entreprendre le démontage.**
- **Ne pas utiliser de chiffons d'atelier ; utiliser du tissu en nylon ou des serviettes en papier.**
- **Suivre les procédures et respecter les avertissements du Manuel de Réparation.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



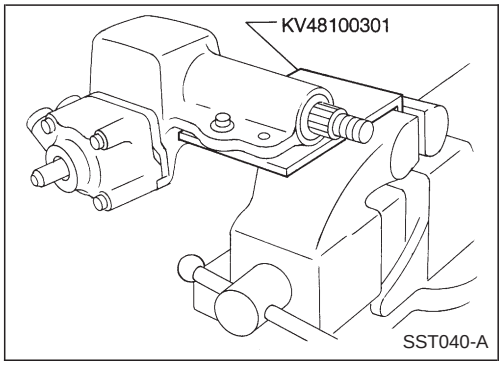
Dépose et repose

Avant la dépose, nettoyer à la vapeur les parties extérieures du boîtier de direction et de la pompe à huile. Puis sécher à l'air comprimé.

BOITIER DE DIRECTION

Composants du mécanisme de direction assistée

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

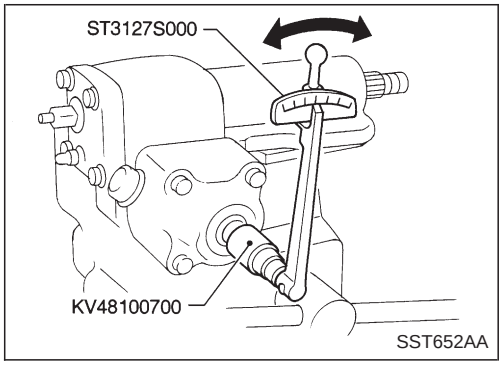


Inspection et réglage de pré-démontage

Avant de démonter les composants du mécanisme de direction assistée, s'assurer qu'il n'y a pas de fuites d'huile sur le pourtour de la surface d'étanchéité, et contrôler le couple de rotation de la direction de la manière suivante :

Contrôler la surface d'étanchéité.

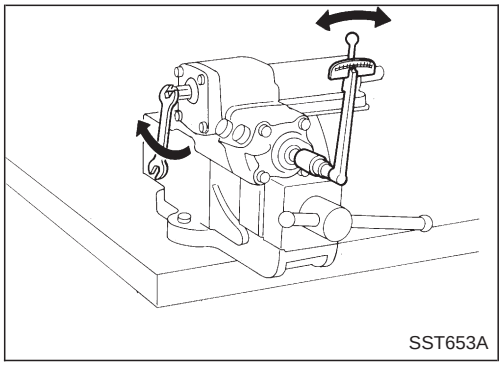
- Joint torique d'écrou de vis de réglage
- Joint torique de couvercle d'arbre de secteur
- Joint d'huile d'arbre de secteur
- Joint d'huile et joint torique de couvercle arrière
- Joint torique de logement arrière
- Joint torique de boîtier de direction



Jeter les joints d'huile et les joints toriques qui ont été déposés. Remplacer les joints d'huile et les joints toriques si leur surface d'étanchéité est déformée ou fissurée.

MESURE DU COUPLE DE ROTATION

1. Mesurer le couple de rotation à 360°.



a. Installer le boîtier de direction sur l'outil spécial.

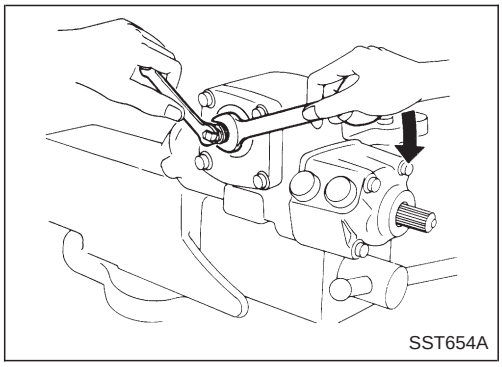
b. Tourner l'arbre d'entrée à bout de course vers la gauche et la droite à plusieurs reprises.

c. Mesurer le couple de rotation à 360° de la position de marche en ligne droite à l'aide des outils spéciaux.

Couple de rotation à 360° :
0,7 - 1,2 N·m (7 - 12 kg-cm)

d. Mesurer le couple de rotation en position de marche en ligne droite.

La position de marche en ligne droite est la position dans laquelle l'arbre d'entrée est ramené de 2,14 tours (deux tours complets et 50°) depuis la butée.

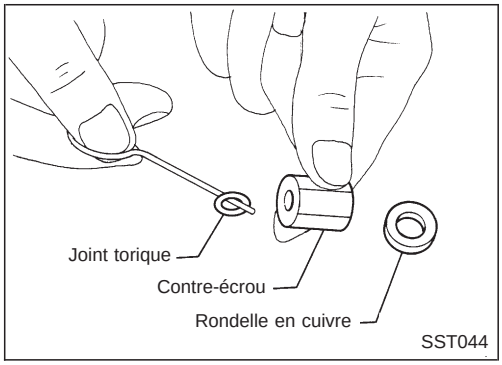


Couple de rotation en position de marche en ligne droite :
0,1 - 0,4 N·m (1 - 4 kg-cm) supérieur au couple de rotation à 360°

Couple de rotation maximum :
1,1 - 1,6 N·m (11 - 16 kg-cm)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection et réglage de pré-démontage (Suite)



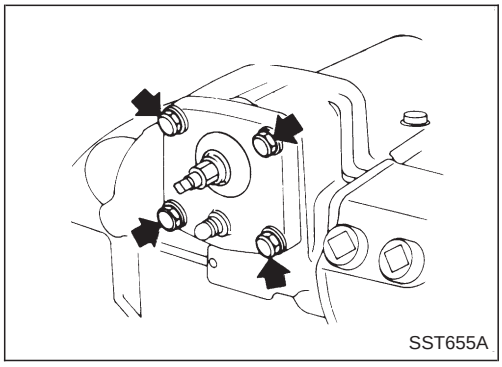
Si le couple de rotation est hors spécifications, le régler en agissant sur la vis de réglage de l'arbre de secteur.

SST654A

2. Serrer le contre-écrou de vis de réglage à l'aide des outils spéciaux.

Démontage

Mesurer le couple de rotation avant de procéder au démontage.
S'il est hors spécifications, remplacer l'ensemble de boîtier de direction.
ATTENTION :
Les pièces d'étanchéité à l'huile, la rondelle de cuivre et le jonc d'arrêt ne doivent pas être réutilisés une fois qu'ils ont été déposés.

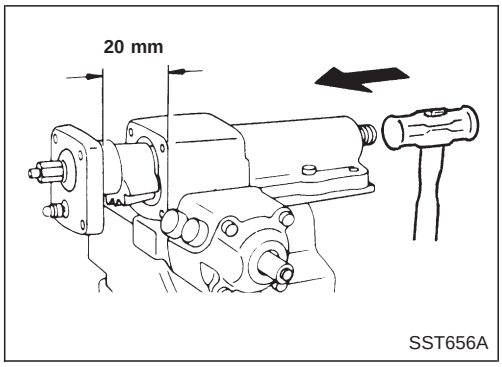


SST044

JONC D'ARRET DE CONTRE-ECROU DE VIS DE REGLAGE

Déposer le contre-écrou de vis de réglage, et remplacer le joint torique.

JOINT D'HUILE D'ARBRE DE SECTEUR

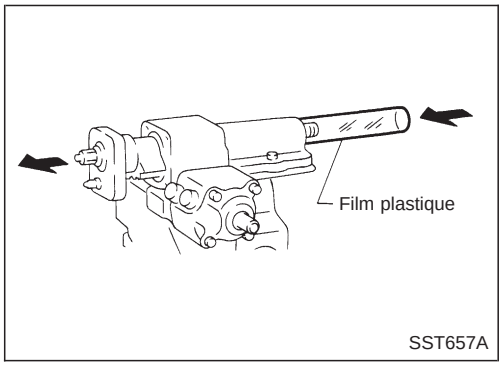


1. Placer l'arbre d'entrée en position de marche en ligne droite.
La position de marche en ligne droite est la position dans laquelle l'arbre d'entrée est ramené de 2,14 tours (deux tours complets et 50°) depuis la butée.

SST655A

2. Déconnecter le boulon du couvercle d'arbre de secteur.
Ne pas tourner le contre-écrou sauf en cas de nécessité; sans quoi il endommagerait le joint torique, ce qui provoquerait une fuite d'huile.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

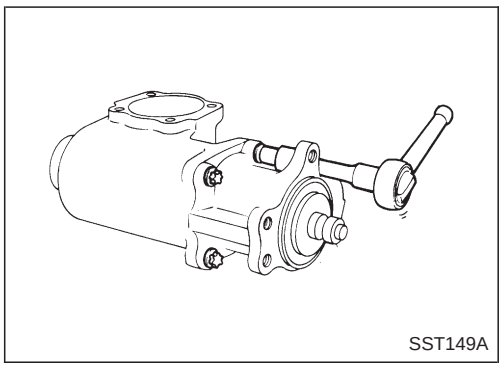


Démontage (Suite)

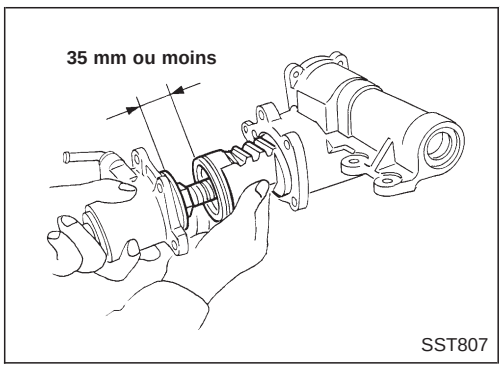
SST656A

3. Extraire l'arbre de secteur.

Faire sortir l'extrémité de l'arbre de secteur d'environ 20 mm.



SST657A



4. Connecter un rouleau de film plastique à l'arbre de secteur.
   Film plastique :
   Epaisseur 0,1 mm
   Longueur x largeur 200 x 200 mm
5. Sortir l'arbre de secteur à la main.

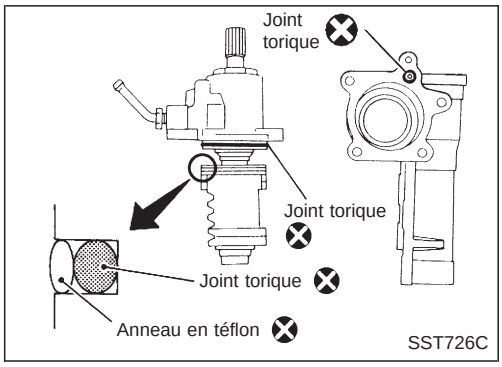
Entourer d'un film plastique les roulements à aiguilles situés à deux endroits à l'intérieur du boîtier de direction, et extraire l'arbre de secteur au même moment de façon à ce que les roulements ne chutent pas dans le boîtier.

JOINT TORIQUE DE LOGEMENT ARRIERE

1. Retirer la vis en étoile.

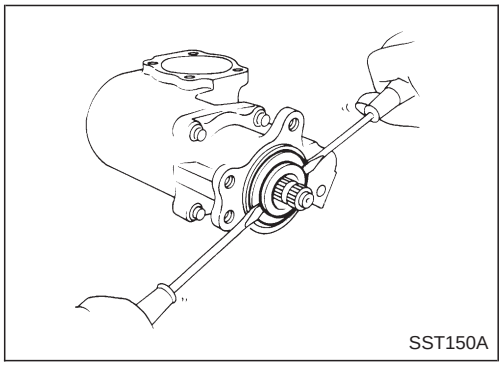
SST149A

SST807



2. Déposer le logement arrière avec l'ensemble d'engrenage à vis sans fin.

ATTENTION :

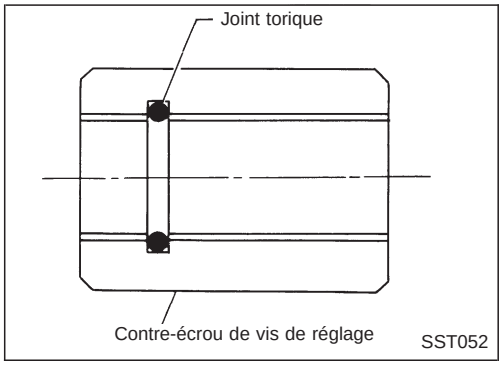


- **Lorsque l'engrenage à vis sans fin est déposé, il est possible que le piston tourne et se détache sous l'effet de son propre poids. Maintenir le piston pour l'empêcher de tourner.**
- **Si le jeu entre le piston et le logement arrière excède 35 mm, la recirculation de billes sortira de la rainure d'engrenage à vis sans fin ; il ne faut donc pas reposer le piston mais remplacer l'ensemble complet.**
- **Lors de la dépose, veiller à ne pas endommager l'anneau en téflon situé à l'extrémité du piston.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Démontage (Suite)

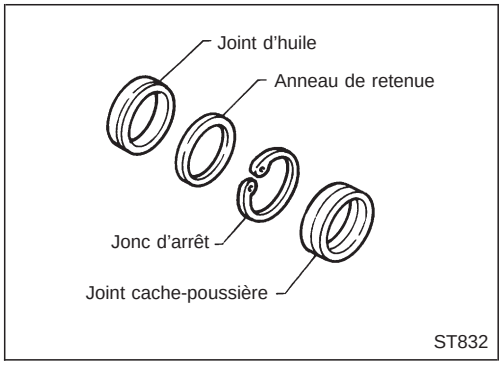
3. Déposer les joints toriques et l'anneau en téflon.



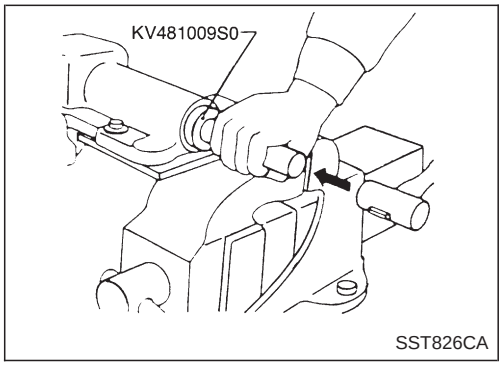
JOINT TORIQUE DE COUVERCLE ARRIERE ET JOINT D'HUILE

1. Déposer le jonc d'arrêt, puis le couvercle arrière.
2. Déposer le joint torique et le joint d'huile.

Remontage



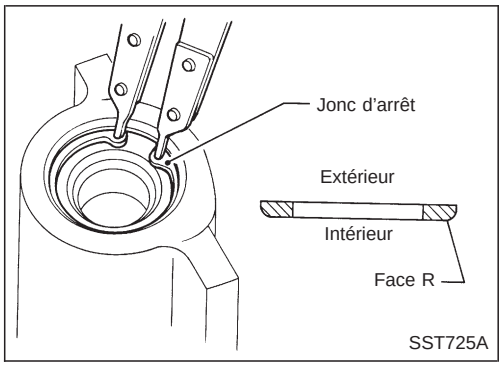
JOINT TORIQUE DE CONTRE-ECROU DE VIS DE REGLAGE



Introduire un joint torique neuf dans le contre-écrou de la vis de réglage.

- **Appliquer une fine couche de vaseline sur le joint torique avant de le reposer.**
- **Introduire le joint torique pour s'assurer qu'il est adapté à la rainure.**

JOINT D'HUILE D'ARBRE DE SECTEUR

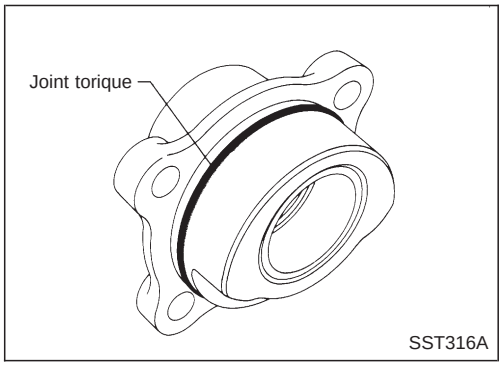


- **Lors de la repose, veiller à utiliser un joint d'huile neuf, un joint cache-poussière, un anneau de retenue et un jonc d'arrêt.**
- **Enduire le joint d'huile neuf et le joint cache-poussière d'une fine couche de vaseline avant de les monter.**

1. Monter un joint d'huile neuf à la presse, puis monter le joint de réserve avec l'outil spécial.

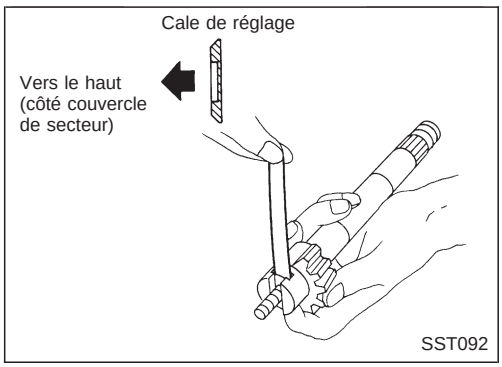
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Remontage (Suite)



2. Reposer un jonc d'arrêt neuf dans le boîtier de direction.

ATTENTION :

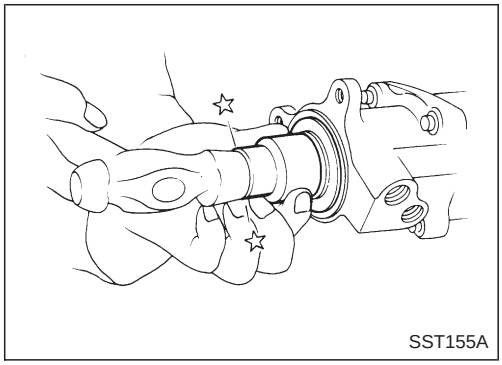


- **Tourner le jonc d'arrêt pour s'assurer qu'il passe dans la rainure.**
- **Toujours reposer le jonc d'arrêt en orientant la face R vers l'intérieur.**

3. Monter un joint cache-poussière à la presse.

4. Monter le joint torique dans le couvercle d'arbre de secteur.

- **Avant la repose, enduire le joint torique d'une fine couche de vaseline.**
- **S'assurer que le joint torique est correctement installé et n'est pas endommagé par l'arbre de secteur.**

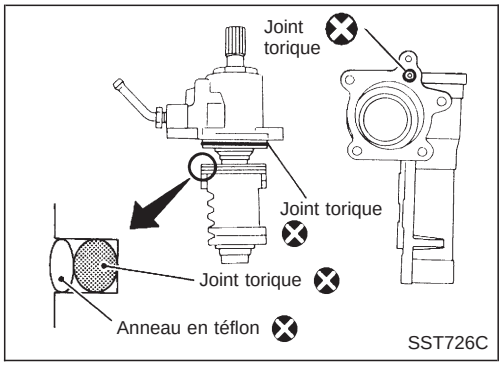


JEU AXIAL DE L'ARBRE DE SECTEUR

Choisir une cale d'épaisseur de réglage adéquate et régler le jeu axial entre l'arbre de secteur et la vis de réglage.

Jeu axial d'arbre de secteur :
0,01 - 0,03 mm

Cales d'épaisseur de vis de réglage d'arbre de secteur :
Consulter les SDS, ST-43.



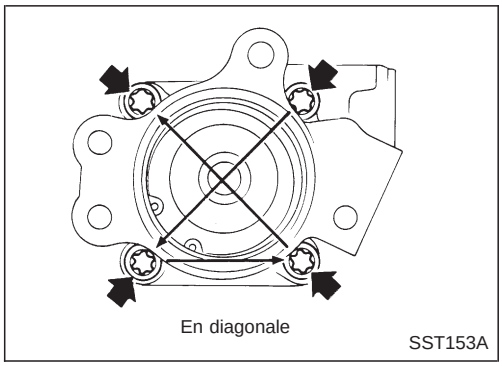
JOINT TORIQUE DE COUVERCLE ARRIERE ET JOINT D'HUILE

1. Reposer un joint torique et un joint d'huile neufs.
2. Reposer le couvercle arrière, puis reposer un jonc d'arrêt neuf.

ATTENTION :

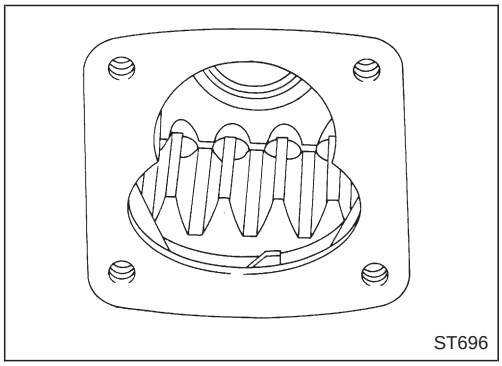
- **Tourner le jonc d'arrêt en s'assurant qu'il s'adapte bien dans la rainure.**
- **Toujours reposer le jonc d'arrêt en tournant la bordure arrondie vers le couvercle arrière.**

JOINT TORIQUE DE LOGEMENT ARRIERE



1. Reposer des joints toriques et un anneau en téflon neufs.

a. Avant la repose, enduire les joints d'une fine couche de vaseline.



b. S'assurer que les joints sont correctement installés et ne sont pas endommagés par l'engrenage à vis sans fin.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Remontage (Suite)

2. Introduite progressivement l'engrenage à vis sans fin et l'ensemble du logement arrière dans le boîtier de direction, en veillant à ne pas endommager le joint d'huile et les joints toriques.
3. Reposer des vis en étoile.

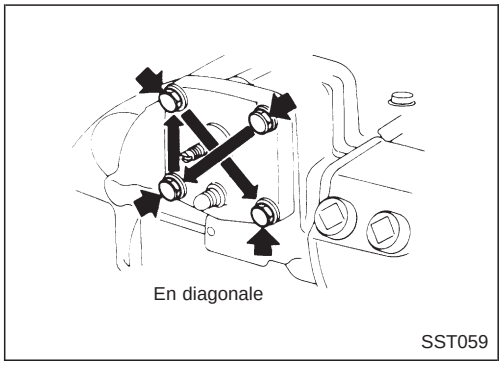
ARBRE DE SECTEUR

1. Placer la crémaillère de piston en position de marche en ligne droite.

Tourner la crémaillère de piston d'environ 10° à 15° vers soi avec le doigt. Ceci permet d'introduire facilement l'arbre de secteur.

2. Envelopper de ruban adhésif en vinyle la partie cannelée de l'arbre de secteur.

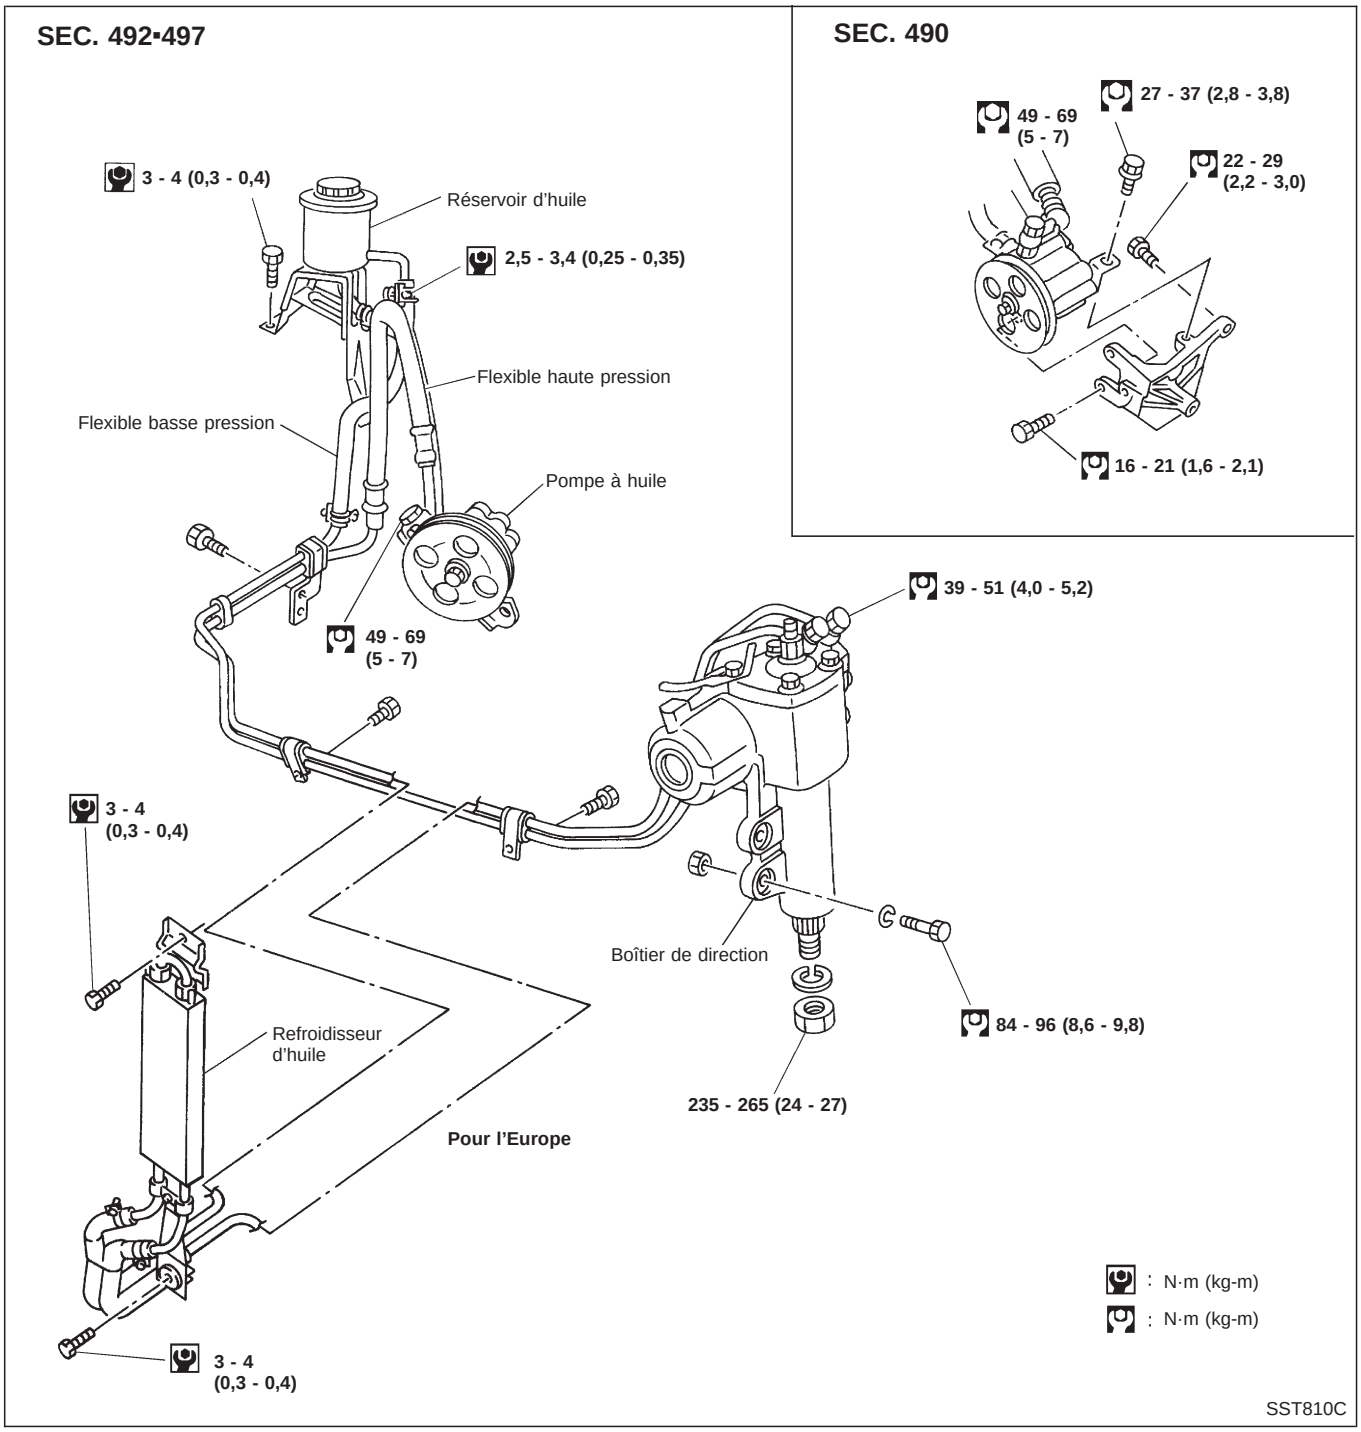
Le ruban adhésif en vinyle empêche les lèvres du joint d'huile d'être endommagées pendant l'insertion.



3. Introduire l'arbre de secteur progressivement dans le boîtier de direction, en veillant à ne pas endommager le joint d'huile.

Retirer le film plastique lors de l'insertion de l'arbre de secteur dans le boîtier de direction. Veiller à ce que les roulements ne tombent pas dans le boîtier.

4. Serrer les boulons du couvercle d'arbre de secteur.
5. Vérifier le couple de rotation et la précharge du boîtier de direction assistée.



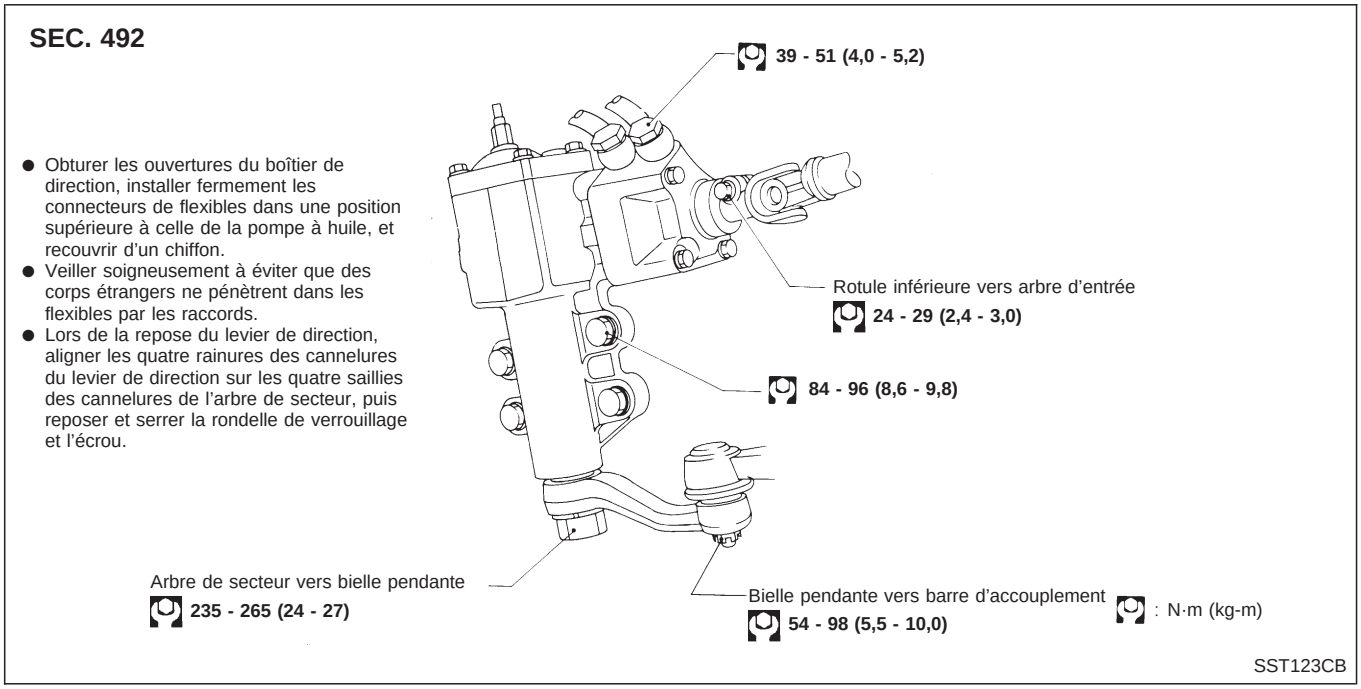
Consulter le titre ''MESURE DU COUPLE DE ROTATION'', ''Inspection et réglage de pré-démontage'', ST-22.

- **Si le couple de rotation est très différent de la valeur avant démontage, remplacer l'ensemble complet.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

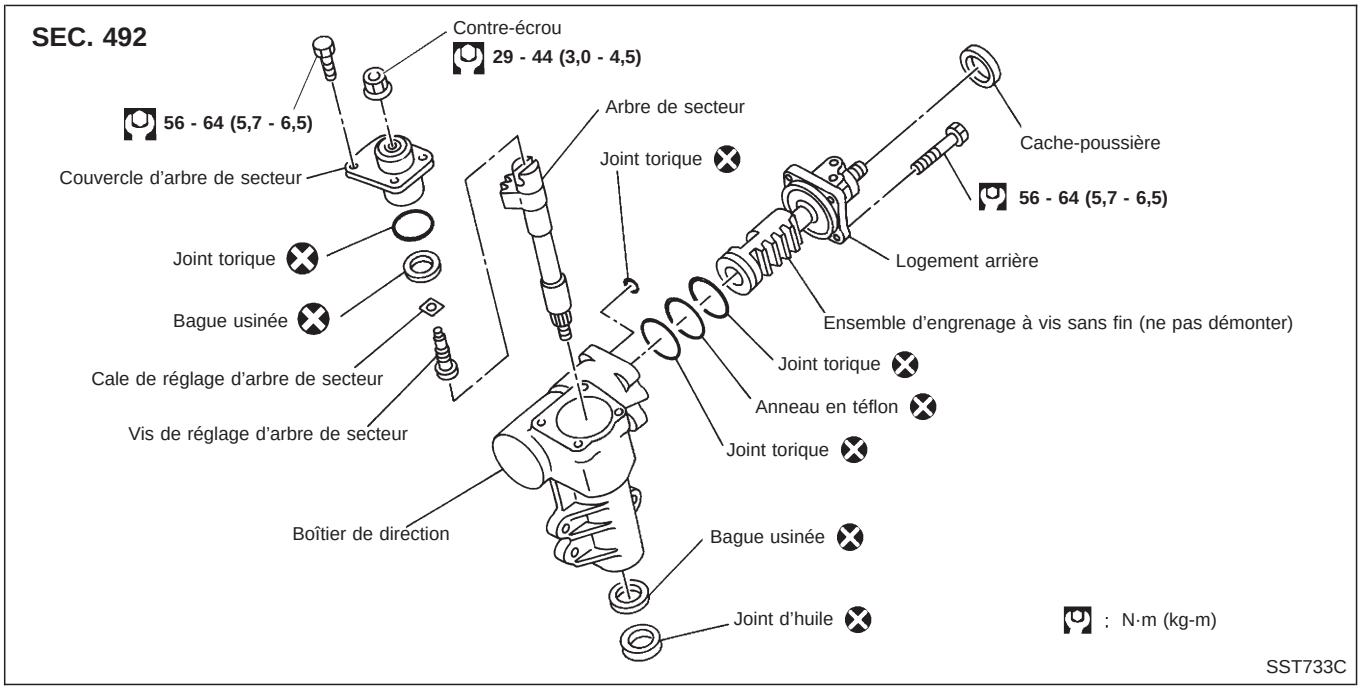
Description

ATTENTION :



- **Seules certaines pièces sont démontables. Ne démonter que les pièces spécifiées.**
- **L'endroit où le démontage est effectué doit être le plus propre possible.**
- **Se laver les mains avant d'entreprendre le démontage.**
- **Ne pas utiliser de chiffons d'atelier ; utiliser du tissu en nylon ou des serviettes en papier.**
- **Suivre les procédures et respecter les avertissements du Manuel de Réparation.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



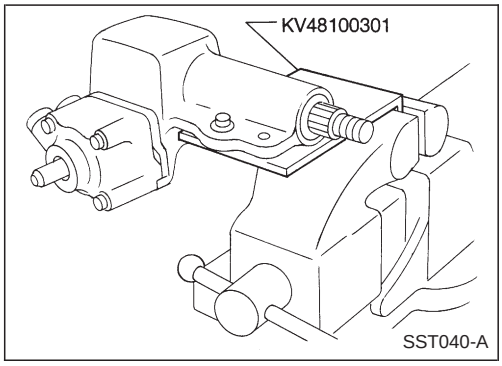
Dépose et repose

Avant la dépose, nettoyer à la vapeur les parties extérieures du boîtier de direction et de la pompe à huile. Puis sécher à l'air comprimé.

BOITIER DE DIRECTION

Composants du mécanisme de direction assistée

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

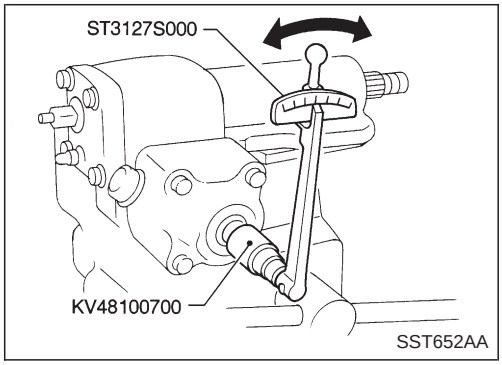


Inspection et réglage de pré-démontage

Avant de démonter les composants du mécanisme de direction assistée, s'assurer qu'il n'y a pas de fuites d'huile sur le pourtour de la surface d'étanchéité, et contrôler le couple de rotation de la direction de la manière suivante :

Contrôler la surface d'étanchéité.

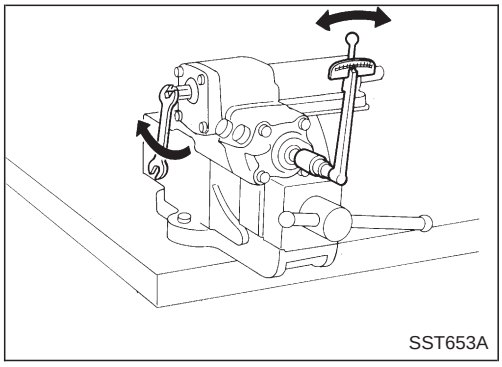
- Joint torique de couvercle d'arbre de secteur
- Bague usinée d'arbre de secteur
- Joint d'huile d'arbre de secteur
- Joint torique de logement arrière
- Joint torique du boîtier de direction



Jeter les joints d'huile et les joints toriques qui ont été déposés. Remplacer les joints d'huile et les joints toriques si la surface d'étanchéité est déformée ou fissurée.

MESURE DU COUPLE DE ROTATION

1. Mesurer le couple de rotation à 360°.



a. Monter le boîtier de direction sur l'outil spécial.

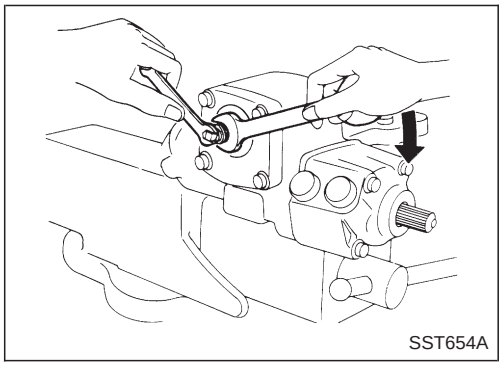
b. Tourner l'arbre d'entrée à bout de course vers la gauche et la droite à plusieurs reprises.

c. Mesurer le couple de rotation à 360° de la position de marche en ligne droite à l'aide des outils spéciaux.

Couple de rotation à 360° :
0,15 - 0,78 N·m (1,5 - 8,0 kg-cm)

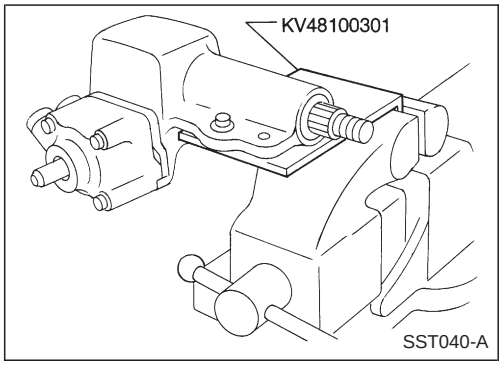
d. Mesurer le couple de rotation en position de marche en ligne droite.

La position de marche en ligne droite est la position dans laquelle l'arbre d'entrée est ramené de 2,14 tours (deux tours complets et 50°) depuis la butée.



Couple de rotation en position de marche en ligne droite :
0,2 - 0,5 N·m (2 - 5 kg-cm) supérieur au couple de rotation à 360°

Couple de rotation maximum :
0,44 - 1,18 N·m (4,5 - 12 kg-cm)



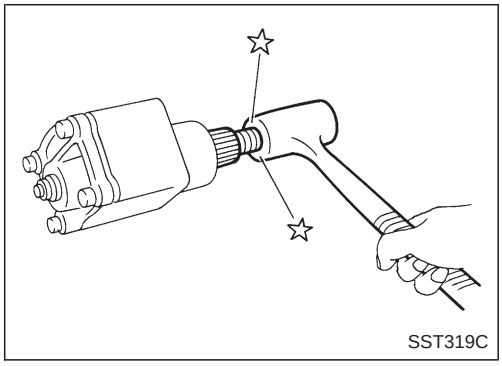
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection et réglage de pré-démontage (Suite)

Si le couple de rotation est hors spécifications, le régler en agissant sur la vis de réglage de l'arbre de secteur.

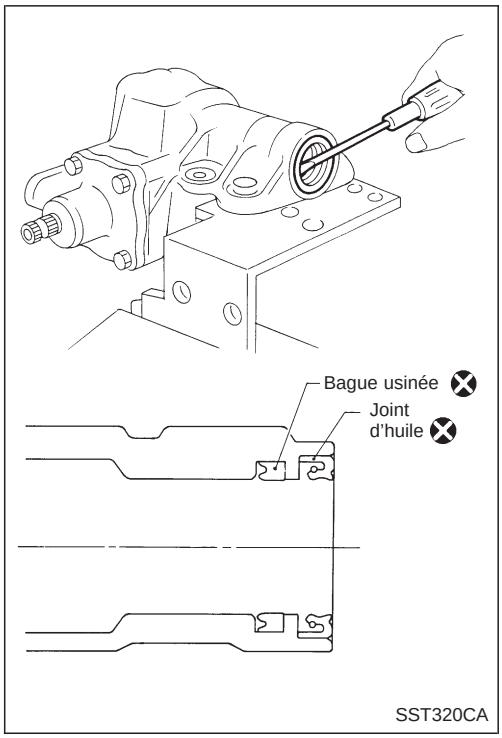
SST654A

2. Serrer le contre-écrou de vis de réglage à l'aide des outils spéciaux.



SST040-A

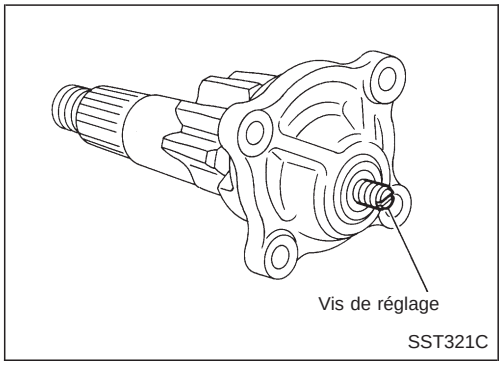
Démontage



Mesurer le couple de rotation avant de procéder au démontage.
S'il est hors spécifications, remplacer l'ensemble de boîtier de direction.
ATTENTION :
Les pièces d'étanchéité à l'huile et le jonc d'arrêt ne doivent pas être réutilisés une fois qu'ils ont été déposés.

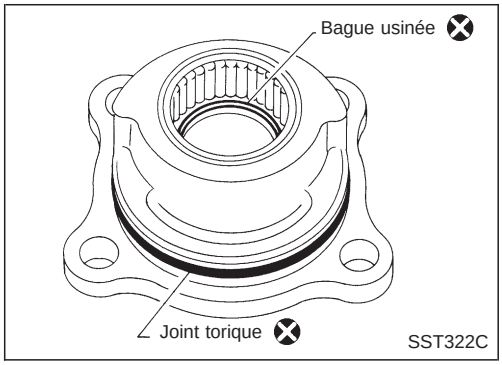
1. Placer le boîtier de direction dans l'étau à l'aide de l'outil spécial.
2. Mettre la vis sans fin dans la position de marche en ligne droite.
3. Desserrer (sans le retirer) le boulon du couvercle de l'arbre de secteur.
4. Taper sur l'extrémité de l'arbre de secteur avec un maillet à tête en caoutchouc.
5. Déposer l'arbre de secteur à la main.

SST319C



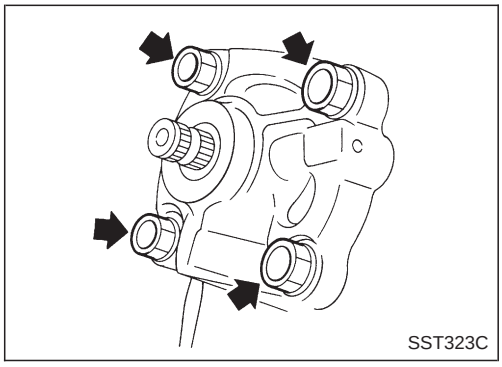
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Démontage (Suite)



6. Déposer le joint d'huile.
7. Déposer la bague usinée.

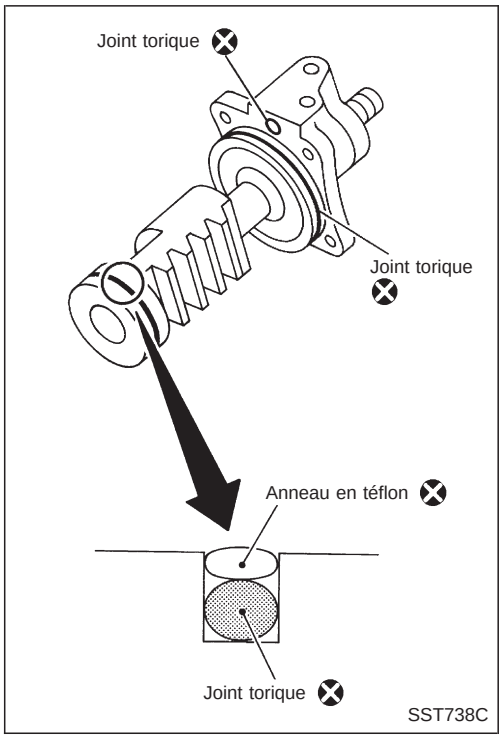
ATTENTION :
Veiller à ne pas rayer le boîtier de direction lors de la dépose du joint d'huile et de la bague usinée.



8. Déposer le contre-écrou, puis desserrer la vis de réglage avec un tournevis. Dissocier le coucercle et l'arbre de secteur.

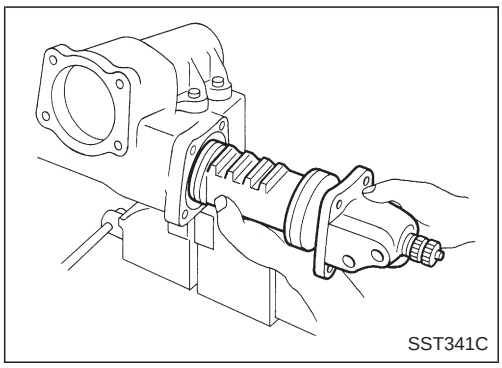
9. Déposer le joint torique.
10. Déposer la bague usinée.

ATTENTION :
- **Lors de la dépose de la bague usinée, veiller à ne pas griffer le couvercle de secteur, le roulement à aiguilles, etc.**
- **Le roulement à aiguilles est une pièce indémontable. Déposer l'ensemble du couvercle secteur s'il est endommagé.**



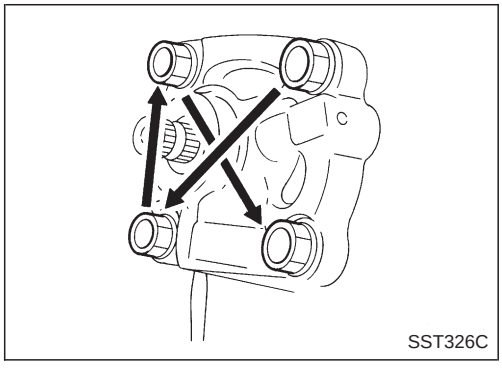
11. Déposer le cache-poussière.
12. Dépose les boulons de logement arrière.
13. Déposer le logement arrière avec l'ensemble d'engrenage à vis sans fin.

ATTENTION :
L'ensemble d'engrenage à vis sans fin est une pièce indémontable. Lors de sa dépose, veiller à ne pas désengager l'engrenage à vis sans fin de l'arbre et à ne pas le laisser chuter.



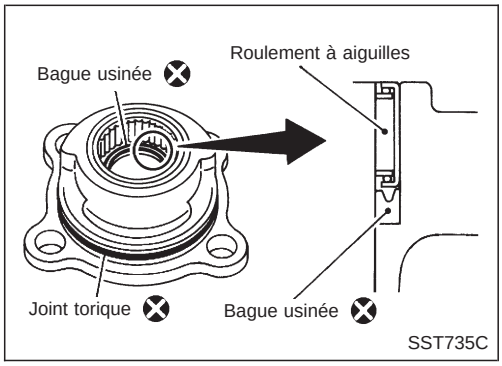
14. Déposer l'anneau en téflon et le joint torique de l'ensemble d'engrenage à vis sans fin.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



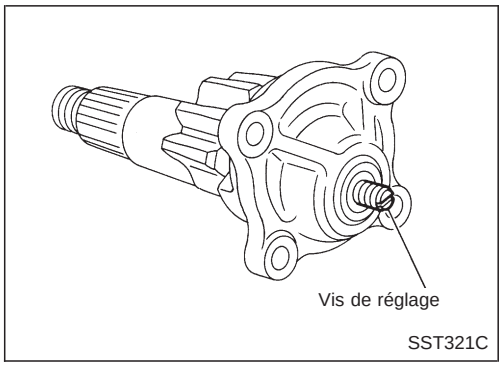
Remontage

1. Reposer un joint torique neuf sur l'ensemble d'engrenage à vis sans fin.
- **Enduire le joint torique neuf d'une fine couche de liquide ATF.**
2. Monter un anneau en téflon neuf sur l'ensemble d'engrenage à vis sans fin.
- **Veiller à ce que l'anneau en téflon ait une assise correcte.**
3. Adapter des joints toriques neufs sur le logement arrière.

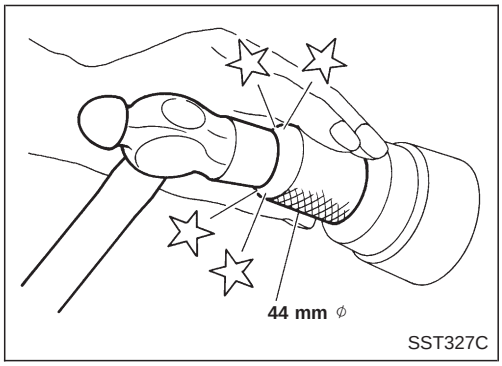


4. Reposer l'ensemble d'engrenage à vis sans fin en plaçant le logement arrière dans le boîtier de direction.

ATTENTION :
- **Enduire le boîtier de direction et le piston d'une fine couche de liquide ATF avant de les introduire.**
- **Veiller à ne pas endommager l'anneau en téflon situé à l'extrémité du piston lorsqu'on introduit l'ensemble d'engrenage à vis sans fin dans le boîtier de direction.**

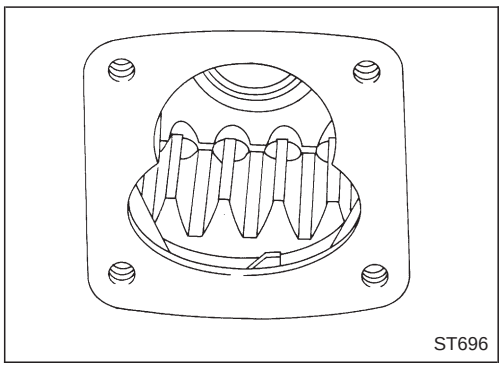


5. Serrer progressivement en diagonale les boulons du logement arrière.



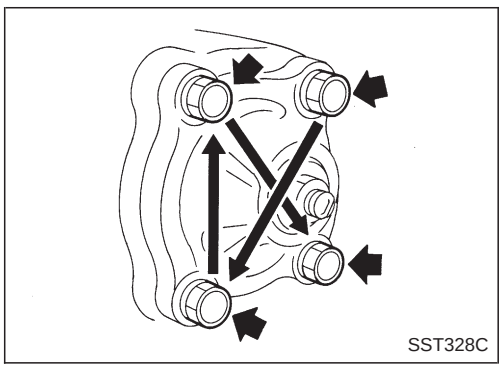
6. Monter un joint torique neuf dans le couvercle de l'arbre de secteur.
- **Avant la repose, enduire le joint torique d'une fine couche de liquide ATF.**
7. Reposer une bague usinée neuve dans le couvercle de l'arbre de secteur.
- **Avant la repose, enduire la bague usinée d'une fine couche de liquide ATF.**
- **Diriger le côté rainuré de la bague usinée vers le roulement à aiguilles.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Remontage (Suite)

8. Adapter l'arbre de secteur dans le couvercle d'arbre de secteur.
   Régler la vis de réglage à sa position de dépassement maximum.
- **Avant d'adapter l'arbre de secteur, enduire la vis de réglage et la cale de vis de réglage de graisse à usages multiples.**

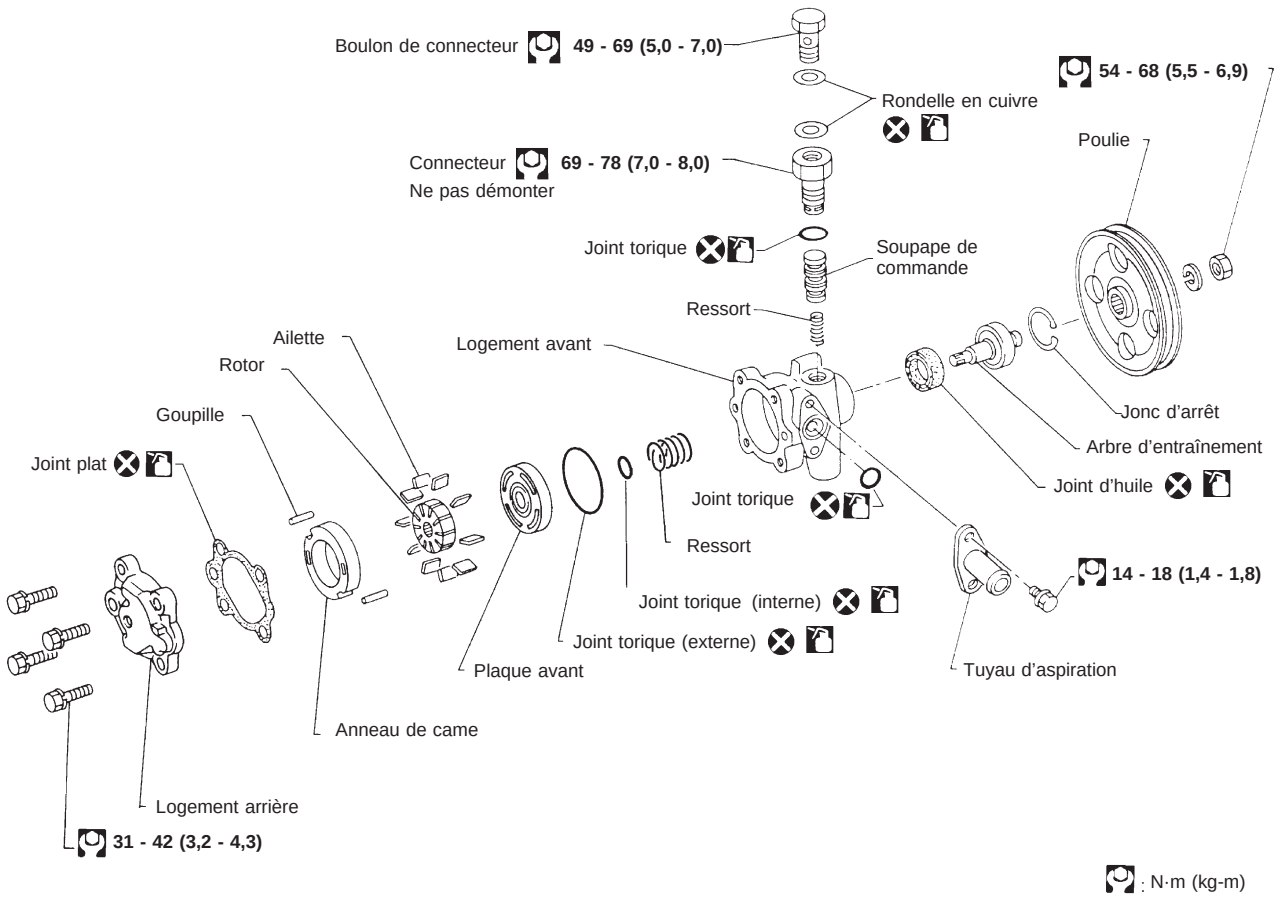


9. Reposer un joint d'huile neuf dans le boîtier de direction à l'aide d'un outil adéquat.
- **Enduire les lèvres du joint d'huile de graisse à usages multiples avant de le reposer.**

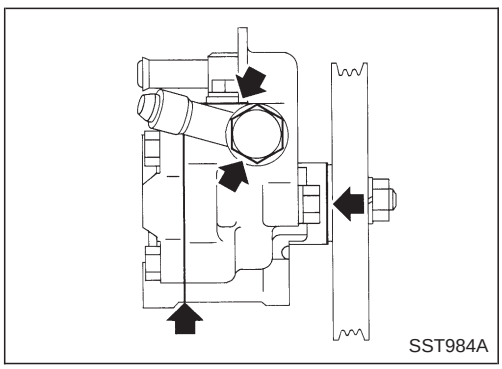
10. Placer la crémaillère de piston en position de marche en ligne droite.

Tourner la crémaillère de piston d'environ 10° à 15° vers soi avec le doigt.
Ceci permet d'introduire facilement l'arbre de secteur.

11. Introduire progressivement l'arbre de secteur dans le boîtier de direction.
12. Serrer les boulons du couvercle d'arbre de secteur.
13. Régler le couple de rotation de l'engrenage à vis sans fin en agissant sur la vis de réglage de l'arbre de secteur puis en la bloquant avec un contre-écrou.



Consulter le titre ''MESURE DU COUPLE DE ROTATION'', ''Inspection et réglage de pré-démontage'', ST-30.
- **Si la valeur du couple de rotation réglée et à régler est considérablement différente de la valeur avant la dépose, remplacer l'ensemble complet.**



14. Contrôler le jeu axial de l'arbre de secteur en position neutre.
    Jeu axial :
    Moins de 0,1 mm
    L'ajuster avec la vis de réglage s'il est hors spécifications.
15. Vérifer la précharge de l'engrenage à vis sans fin. Si la valeur ne se trouve pas dans les limites spécifiées, la régler à nouveau.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Démontage et remontage

SEC. 490

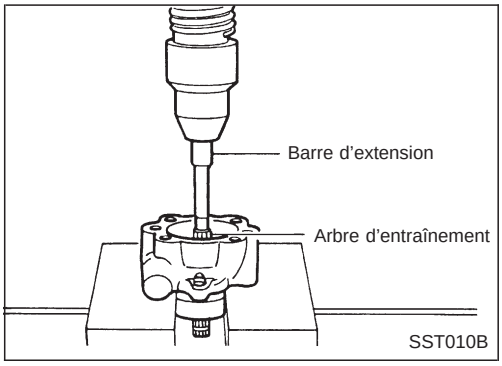
Inspection de pré-démontage

Démonter la pompe à huile de direction assistée uniquement lorsque les problèmes suivants sont détectés.

- Fuites d'huile aux points indiqués sur la figure.
- Poulie déformée ou endommagée.
- Performance pauvre.

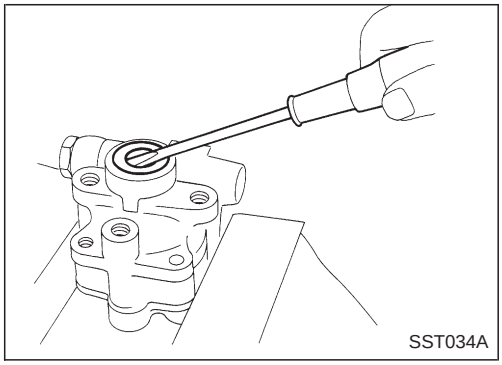
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection



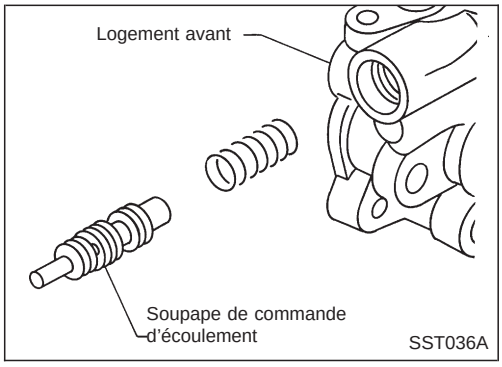
POULIE ET AXE DE POULIE

- Si la poulie est fissurée ou déformée, la remplacer.
- Si l'on découvre une fuite à hauteur de l'axe de poulie, remplacer le joint d'huile.



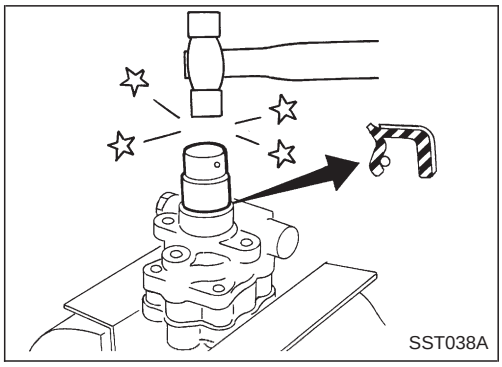
Démontage

ATTENTION :



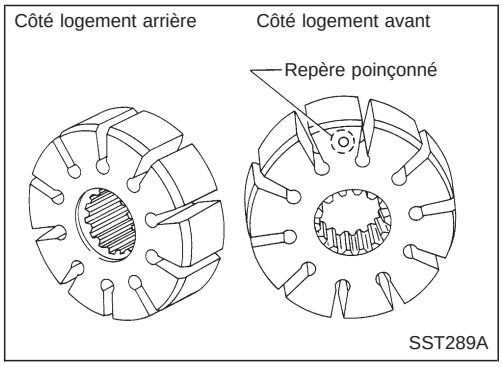
- **Seules certaines pièces sont démontables. Ne démonter que les pièces spécifiées.**
- **L'endroit où le démontage est effectué doit être le plus propre possible.**
- **Se laver les mains avant d'entreprendre le démontage.**
- **Ne pas utiliser de chiffons d'atelier ; utiliser du tissu en nylon ou des serviettes en papier.**
- **Ne pas laisser d'impuretés pénétrer dans les pièces ni les toucher lors du démontage et du remontage.**

- Déposer le jonc d'arrêt, puis extraire l'arbre d'entraînement.
- **Veiller à ne pas laisser tomber l'arbre d'entraînement.**



- Déposer le joint d'huile.
- **Veiller à ne pas endommager le logement avant.**

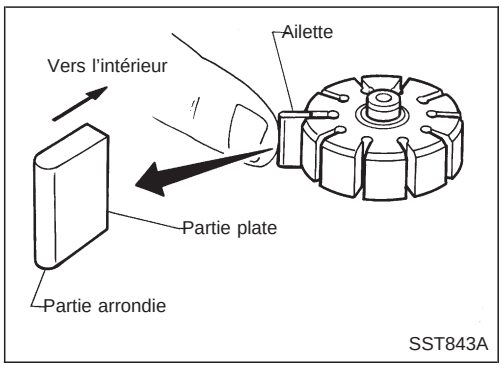
- Déposer le raccord.
- **Veiller à ne pas laisser tomber la soupape de commande.**



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

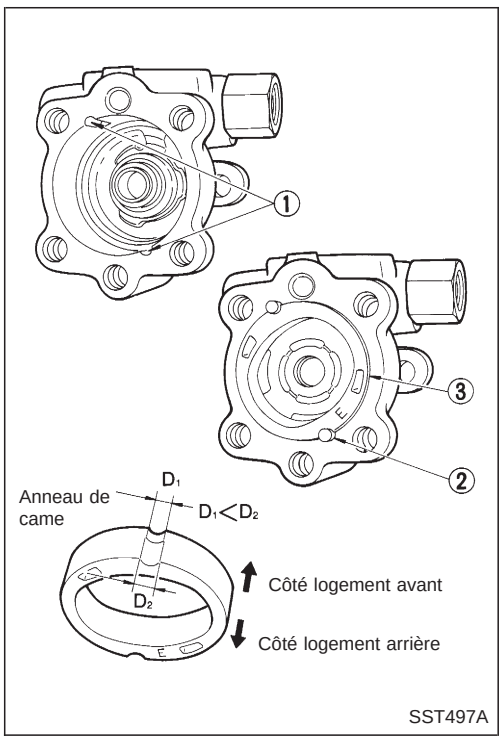
SST038A

Remontage



Monter la pompe à huile en respectant les instructions suivantes.

- Veiller à mettre les joints toriques et le joint d'huile en place convenablement.
- Toujours monter des joints toriques et des joint d'huile neufs.
- Faire attention au sens de pose du joint d'huile.
- L'anneau de came, le rotor et les ailettes doivent être remplacés en tant qu'ensemble si nécessaire.
- Lors du remontage, enduire chaque pièce de liquide ATF.

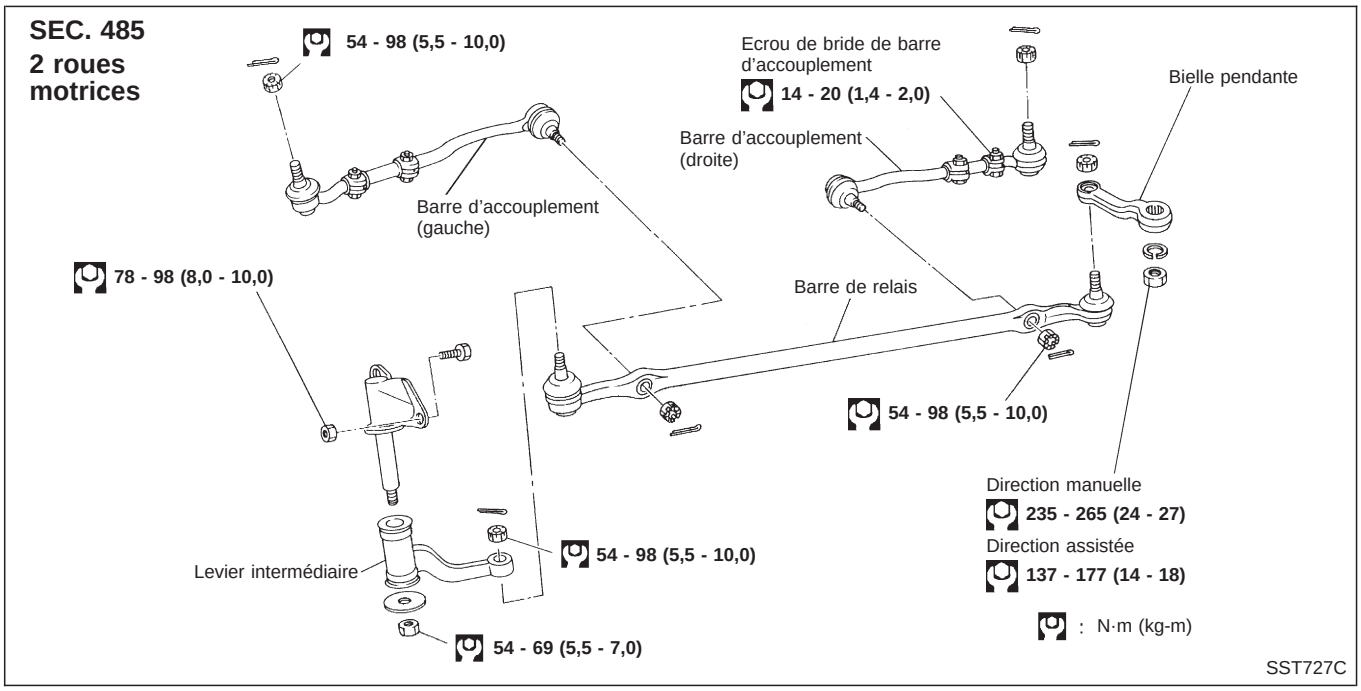


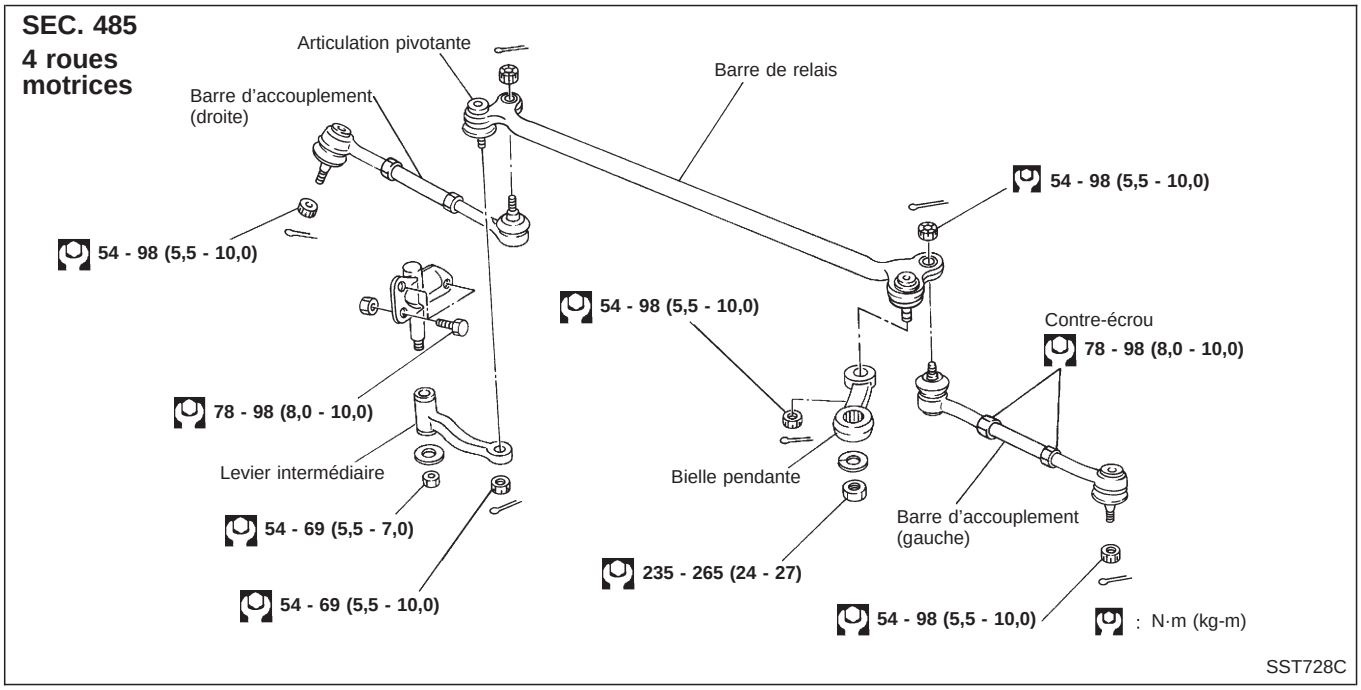
SST289A

- Faire attention au sens de montage du rotor.

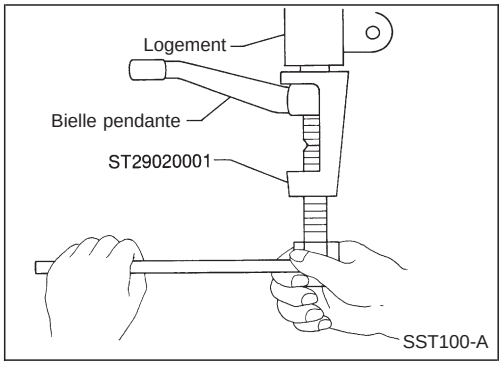
SST843A

- Lors de la repose des ailettes sur le rotor, les bords arrondis des ailettes doivent être face au côté anneau de came.





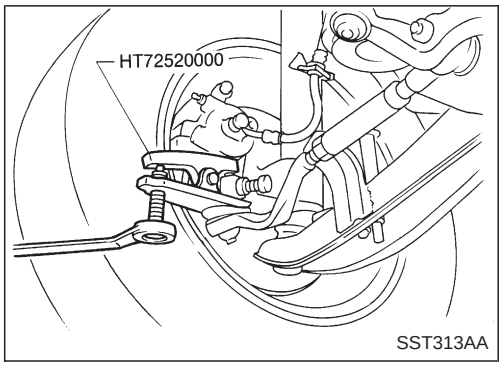
SST497A

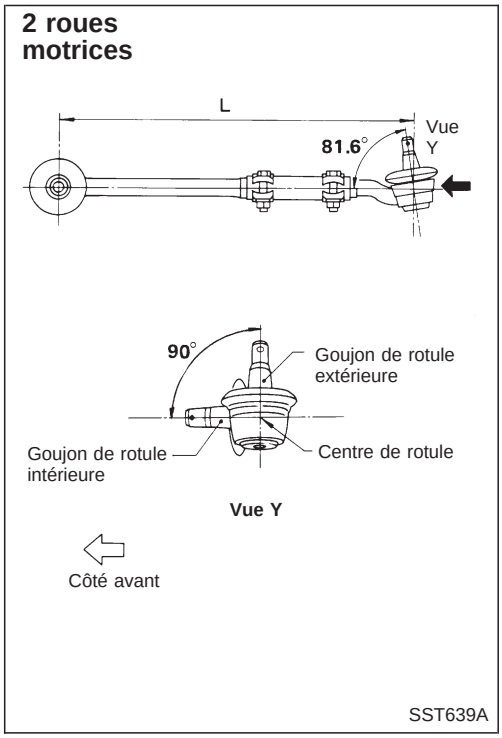


- Introduire la goupille ② dans la rainure ① du logement avant et de la plaque avant. Puis monter l'anneau de came ③ de la façon indiquée ci-contre.
  Anneau de came :
  D_1 est inférieur à D_2

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Dépose et repose





Déposer la bielle pendante avec l'outil spécial.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

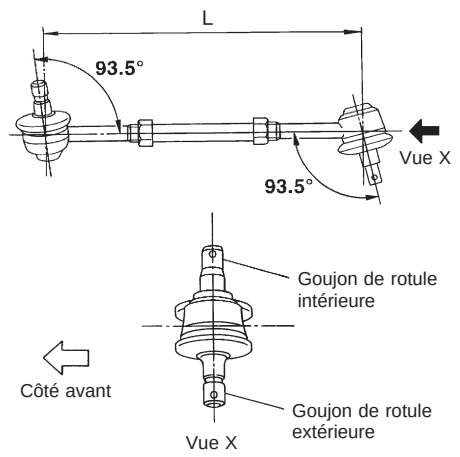
Dépose et repose (Suite)

Déposer la barre d'accouplement du bras de fusée avec l'outil spécial.

Démontage

ENSEMBLE DE LEVIER INTERMEDIAIRE

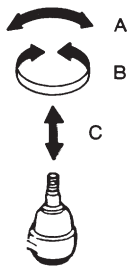
- Enduire les bagues d'une couche de graisse à usages multiples.
- Monter les bagues à la presse dans les carters de renvoi, puis introduire avec précaution l'axe de support de renvoi jusqu'à ce que la bague dépasse.



BARRE INTERMEDIAIRE DE DIRECTION ET BARRE D'ACCOUPLEMENT

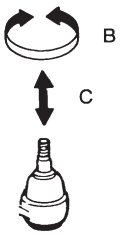
1. Lorsque les joints à rotule de la barre d'accouplement et la barre sont séparés, régler correctement la longueur de la barre d'accouplement.
   Il faut procéder au réglage à l'entraxe des goujons des rotules.
2. Serrer l'écrou de bride de barre d'accouplement de façon à ce que la rotule sur le goujon de rotule extérieure se place comme suit par rapport à celle sur le goujon de rotule intérieure.
   L : Standard
   343,9 mm . . . 2 roues motrices
   297,6 mm . . . 4 roues motrices

ATTENTION :
Veiller à ce que les barres d'accouplement soient vissées de plus de 35 mm dans leurs tubes.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

4 roues motrices



SST729C

Rotule

SST827C

Articulation pivotante

SFA817A

Inspection

ARTICULATIONS A ROTULES ET ARTICULATIONS PIVOTANTES

1. Vérifier s'il n'y a pas de jeu aux articulations. Si le goujon de la rotule ou de l'articulation pivotante est usé, si son jeu axial est excessif ou si sa manoeuvre est difficile, remplacer l'unité complète.
   Force d'oscillation (point de mesure : l'orifice de goupille fendue) ''A'' :
   Rotule
   15,7 - 147,1 N (1,6 - 15,0 kg)
   Couple de rotation ''B'' :
   Rotule
   0,5 - 4,9 N·m (5 - 50 kg-cm)
   Articulation pivotante
   1,0 - 5,9 N·m (10 - 60 kg-cm)
   Jeu axial ''C'' :
   Rotule et articulation pivotante
   0 mm
2. Vérifier l'état du cache-poussière. S'il est excessivement craquelé, remplacer l'unité complète.

ATTENTION :
Veiller à ne pas laisser les cônes des articulations entrer en contact avec de la graisse ou de l'huile.

ENSEMBLE DE LEVIER INTERMEDIAIRE

- Vérifier si la bague de caoutchouc de l'arbre intermédiaire n'est pas brisée, abîmée, ou qu'elle ne présente pas de jeu. La remplacer si nécessaire.
- Lubrifier l'ensemble d'arbre intermédiaire avec de la graisse à usages multiples, si nécessaire.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (Suite)

BARRE INTERMEDIAIRE DE DIRECTION ET BARRE D'ACCOUPLEMENT

Vérifier si les barres d'accouplement et les barres intermédiaires de direction ne sont pas brisées, tordues ou fissurées, et les remplacer par des pièces neuves si nécessaire.

EMPLACEMENT DES FIXATIONS

- Vérifier si les points de fixation (écrous et goupilles fendues) ne sont pas desserrés, n'ont pas de jeu et ne sont pas brisés.
- Lorsqu'on décèle un desserrement ou un jeu, contrôler que la partie conique des articulations, de l'axe de pignon ou du bras intermédiaire n'est pas usée.
- Pour le remontage de chaque articulation, utiliser des goupilles fendues neuves.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

DIRECTION ASSISTEE (modèle : PB59K)

Force de rotation du volant (à 360° de la position neutre et à la circonférence du volant) N (kg)	39 (4) ou moins
Pression de la pompe à huile kPa (bar, kg/cm^2)	7 649 - 8 238 (76,5 - 82,4, 78 - 84) au ralenti
Contenance en liquide mℓ	Environ 1 000 à 1 100
Température normale de fonctionnement °C	60 - 80
Couple de rotation du boîtier de direction N·m (kg-cm)	
à 360° de la position de marche en ligne droite	0,15 - 0,78 (1,5 - 8,0)
Position de marche en ligne droite (par rapport à une rotation du volant de 360°)	0,2 - 0,5 (2 - 5) plus élevée
Couple de rotation maximum	0,44 - 1,18 (4,5 - 12)
Battement à l'extrémité supérieure de la bielle pendante (position de marche en ligne droite) mm	0 - 0,1
Jeu axial (à l'extrémité de l'arbre de secteur en position neutre) mm	0,1 ou moins

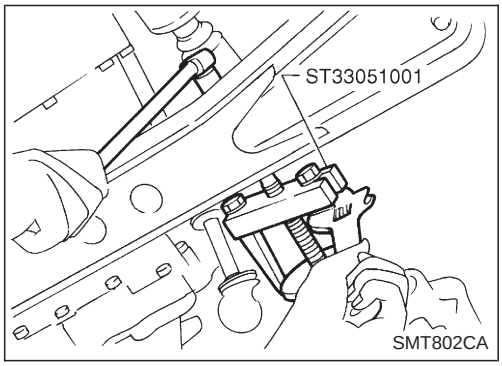
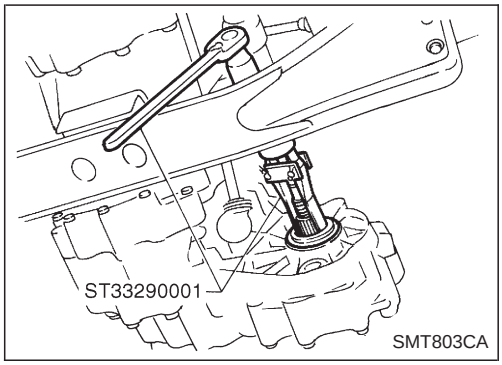
Vue en coupe

SMT598D

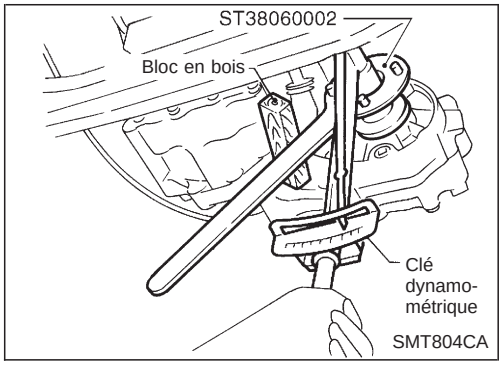


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

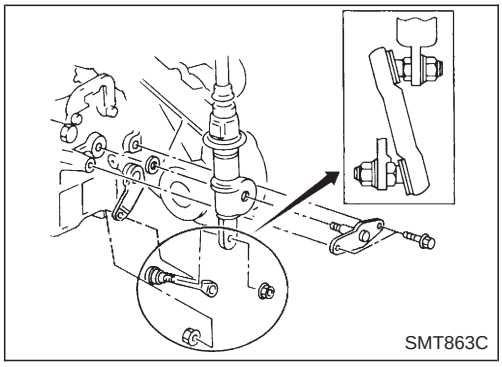


Remplacement du joint d'huile

JOINT D'HUILE DU CARTER CENTRAL



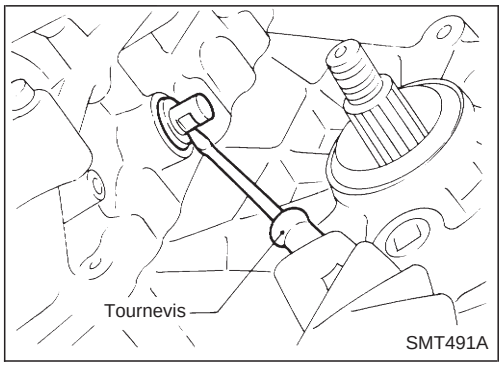
1. Déposer le tuyau d'échappement avant et l'isolant thermique. Se reporter à ''Dépose'', TF-6.
2. Déposer l'arbre de transmission avant. Se reporter à la section PD (''Dépose et repose'', ''ARBRE DE TRANSMISSION'').
3. Déposer l'écrou du flasque d'accouplement.



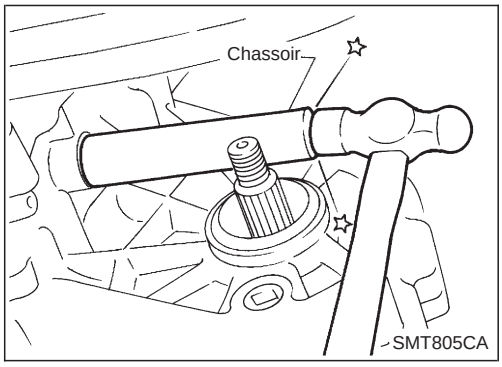
4. Déposer le flasque d'accouplement.

5. Déposer le joint d'huile du carter central.
6. Reposer le joint d'huile du carter central.
- **Avant la repose, appliquer de la graisse à usages multiples sur la lèvre du joint.**
7. Reposer le flasque d'accouplement.

8. Serrer l'écrou au couple spécifié.
9. Reposer l'arbre de transmission avant.



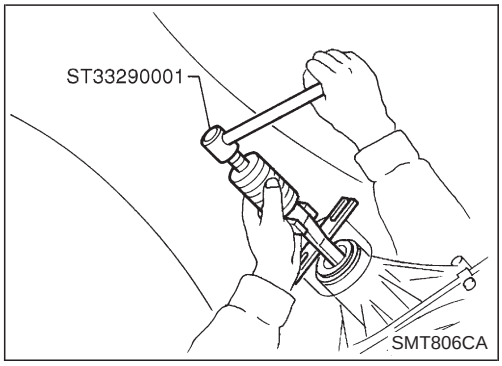
JOINT D'HUILE DE L'ARBRE DE PASSAGE DES VITESSES



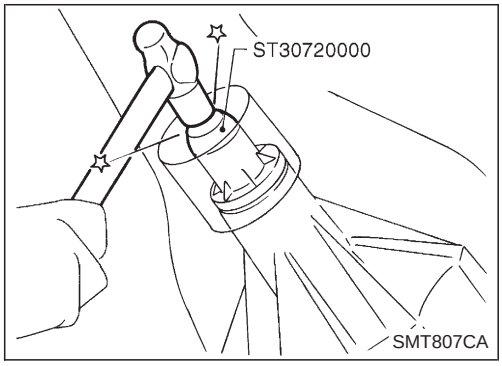
1. Déposer l'arbre de transmission avant. Se reporter à la section PD (''Dépose et repose'', ''ARBRE DE TRANSMISSION'').
2. Déposer le flasque d'accouplement. Se reporter au joint d'huile du carter central, ci-dessus.
3. Déposer le levier de commande de la boîte de transfert du levier de passage externe de la boîte de transfert. Puis déposer le levier de passage externe.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Remplacement du joint d'huile (Suite)

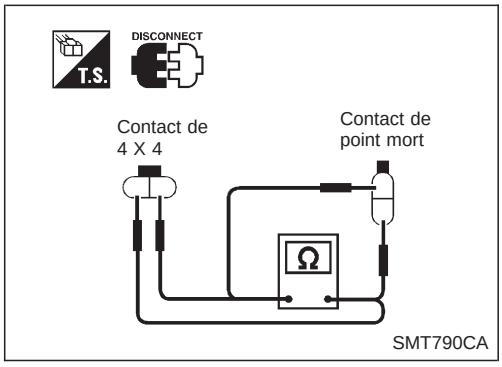


4. Déposer le joint d'huile de l'arbre de passage des vitesses.
● **Veiller à ne pas endommager l'arbre transversal.**

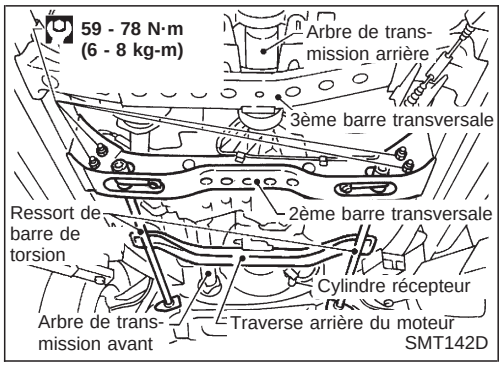


5. Reposer le joint d'huile de l'arbre de passage des vitesses.
● **Avant la repose, appliquer de la graisse à usages multiples sur la lèvre du joint.**
6. Reposer la timonerie de commande de la boîte de transfert.
7. Reposer le flasque d'accouplement. Se reporter au joint d'huile du carter central, TF-4.
8. Reposer l'arbre de transmission avant.

JOINT D'HUILE ARRIERE

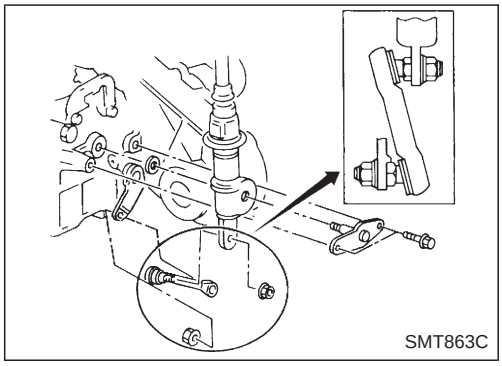


1. Déposer l'arbre de transmission arrière. Se reporter à la section PD (''Dépose et repose'', ''ARBRE DE TRANSMISSION'').
2. Déposer le joint d'huile arrière.



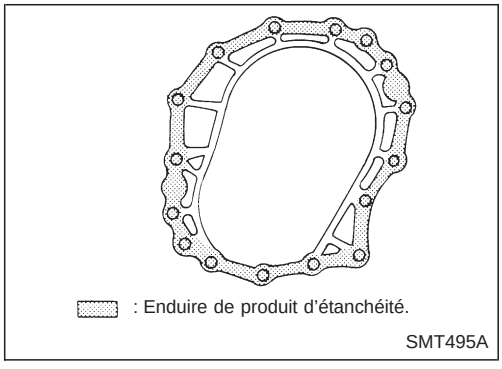
3. Reposer le joint d'huile arrière.
● **Avant la repose, appliquer de la graisse à usages multiples sur la lèvre du joint.**
4. Reposer l'arbre de transmission arrière.

Vérification du contact de position



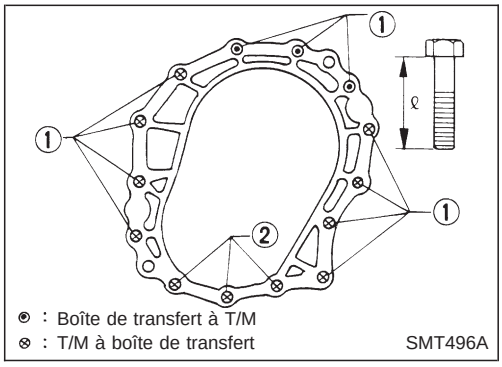
Contact	Position de pignon	Continuité
Contact de 4 X 4	4 X 4	Oui
	Sauf 4 X 4	Non
Contact de point mort	Point mort	Oui
	Sauf point mort	Non

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Dépose

1. Vidanger l'huile des boîtes de transfert et de vitesses.
2. Déposer l'arbre de transmission avant et arrière. Se reporter à la section PD (''Dépose et repose'', ''ARBRE DE TRANSMISSION'').
   Introduire le bouchon dans le joint d'huile arrière après avoir déposé l'arbre de transmission.
   - **Veiller à ne pas endommager la cannelure, la chape à manchon et le joint d'huile arrière lors de la dépose de l'arbre de transmission.**
3. Déposer le ressort de la barre de torsion. Se reporter à la section FA (''Ressort de barre de torsion'', ''SUSPENSION AVANT''). Puis déposer la deuxième barre transversale.
4. Débrancher les contacts de 4 X 4 et de point mort.

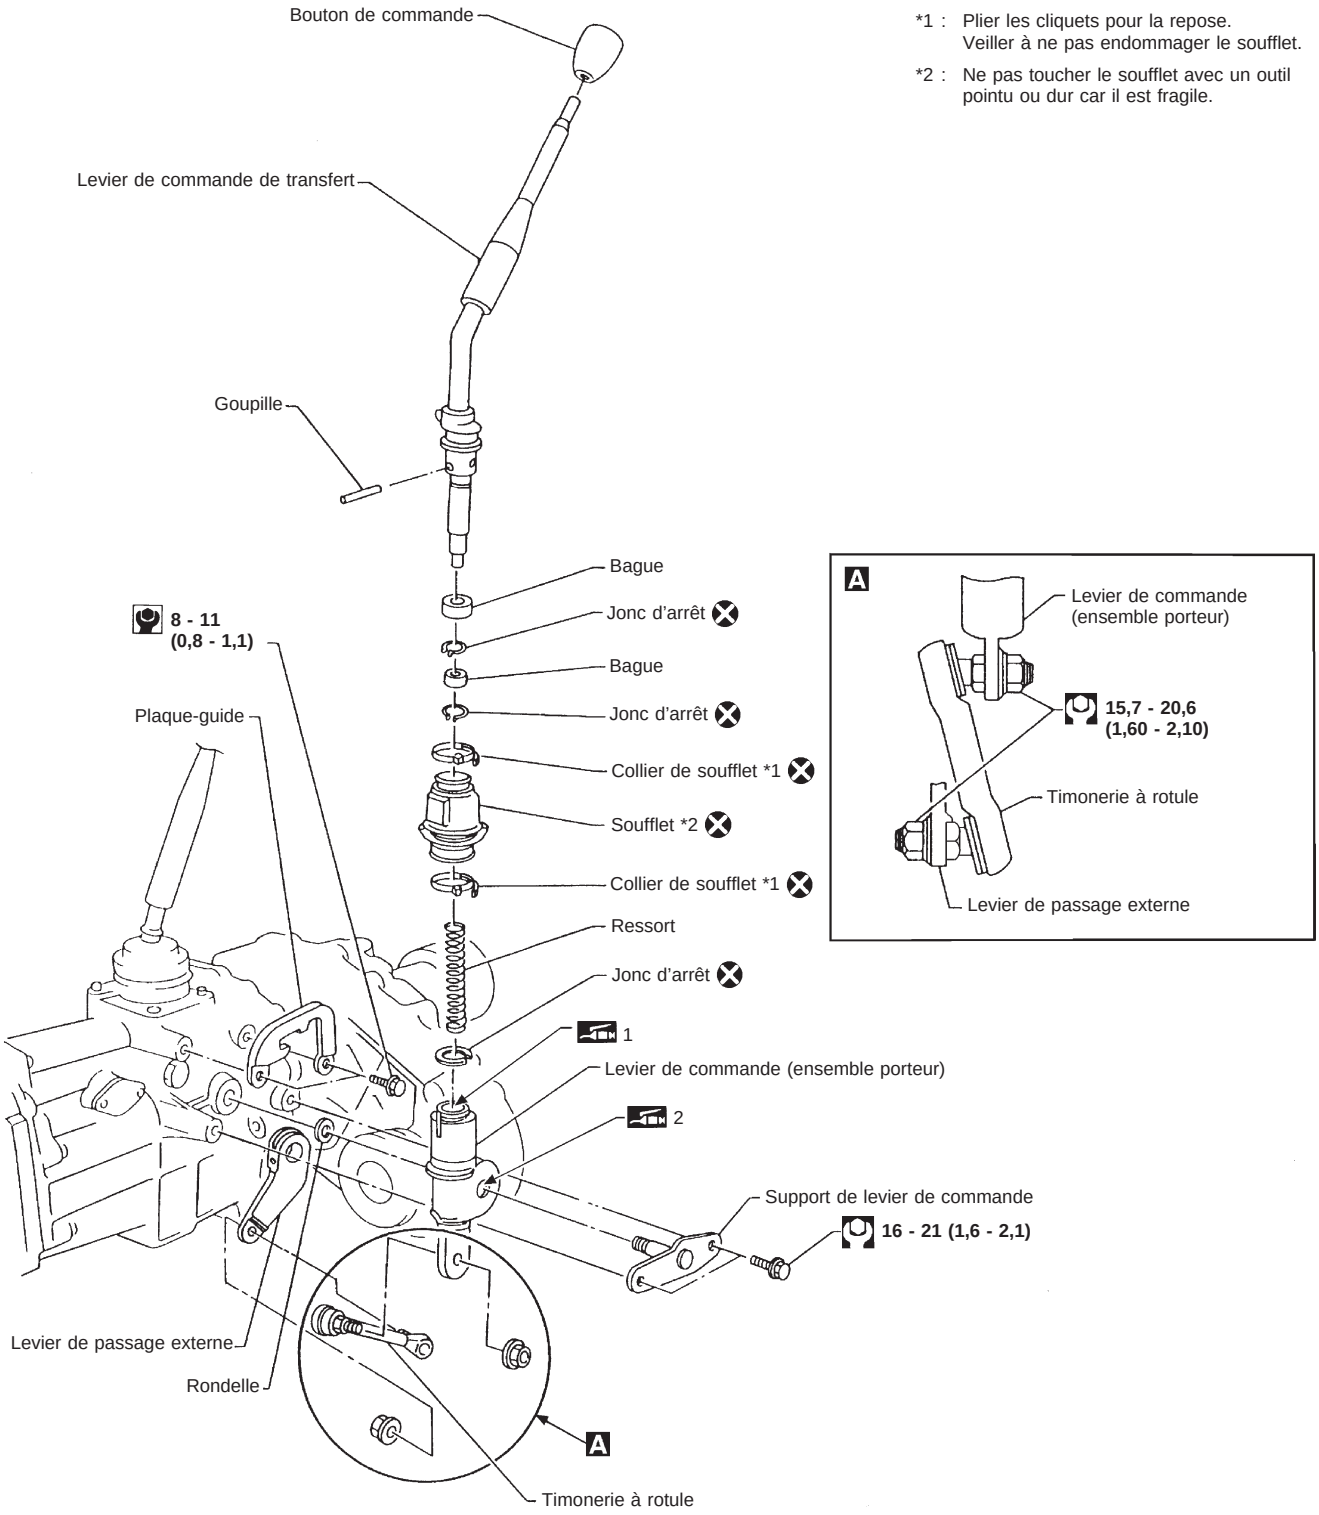


5. Déposer le levier de commande de la boîte de transfert du levier de passage externe de la boîte de transfert.
6. Séparer la boîte de transfert de la boîte de vitesses.

ATTENTION :
Soutenir la boîte de transfert lors de sa dépose.

Repose

- Enduire de produit d'étanchéité recommandé la surface d'appui de la boîte de vitesses.
  Produit d'étanchéité recommandé :
  Pièce Nissan d'origine KP610-00250, Three Bond 1215 ou équivalent

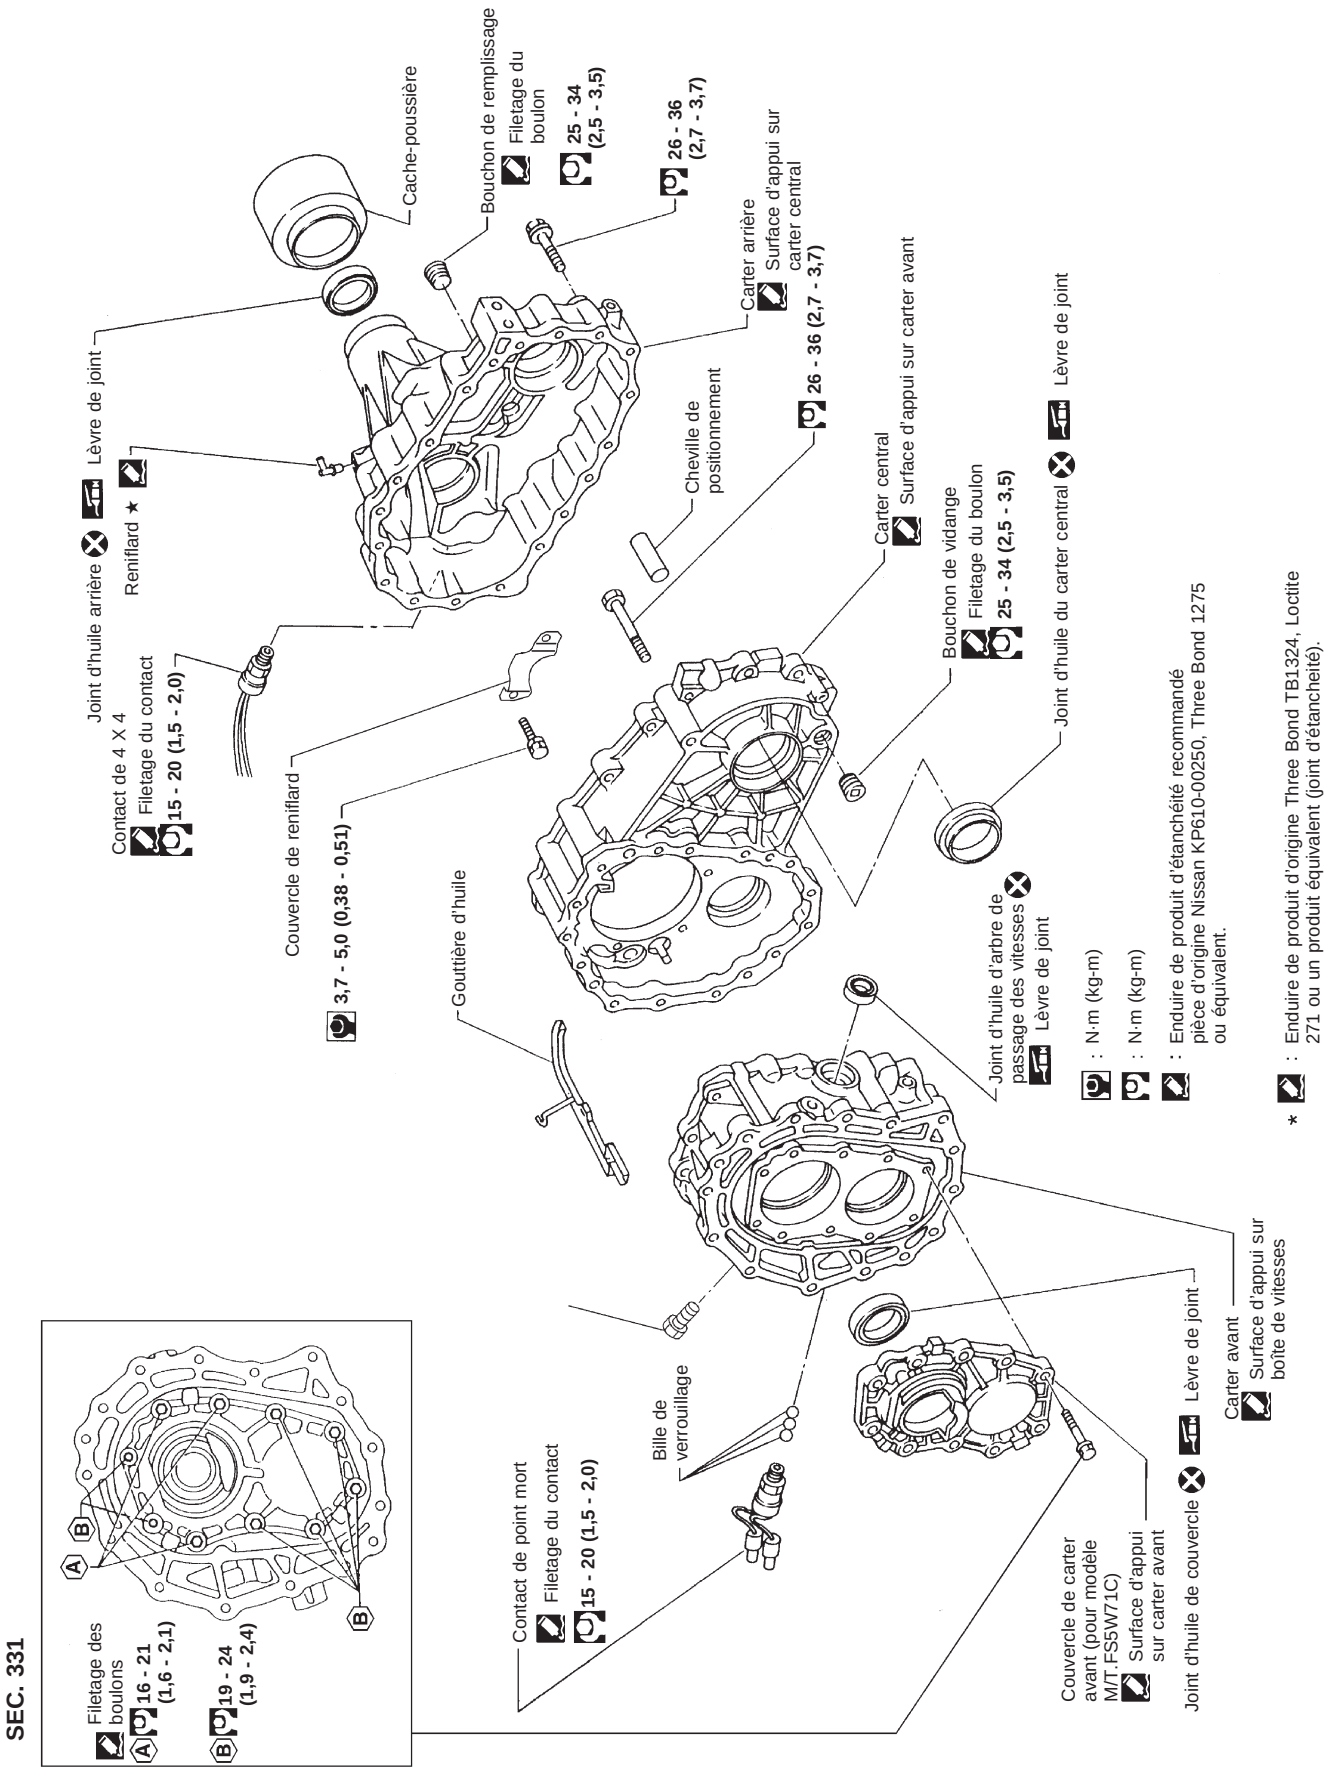


- Serrer les boulons de fixation de la boîte de transfert.

N° de boulon	Couple de serrage N·m (kg-m)	ℓ mm
①	31 à 41 (3,2 à 4,2)	45
②	31 à 41 (3,2 à 4,2)	60

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

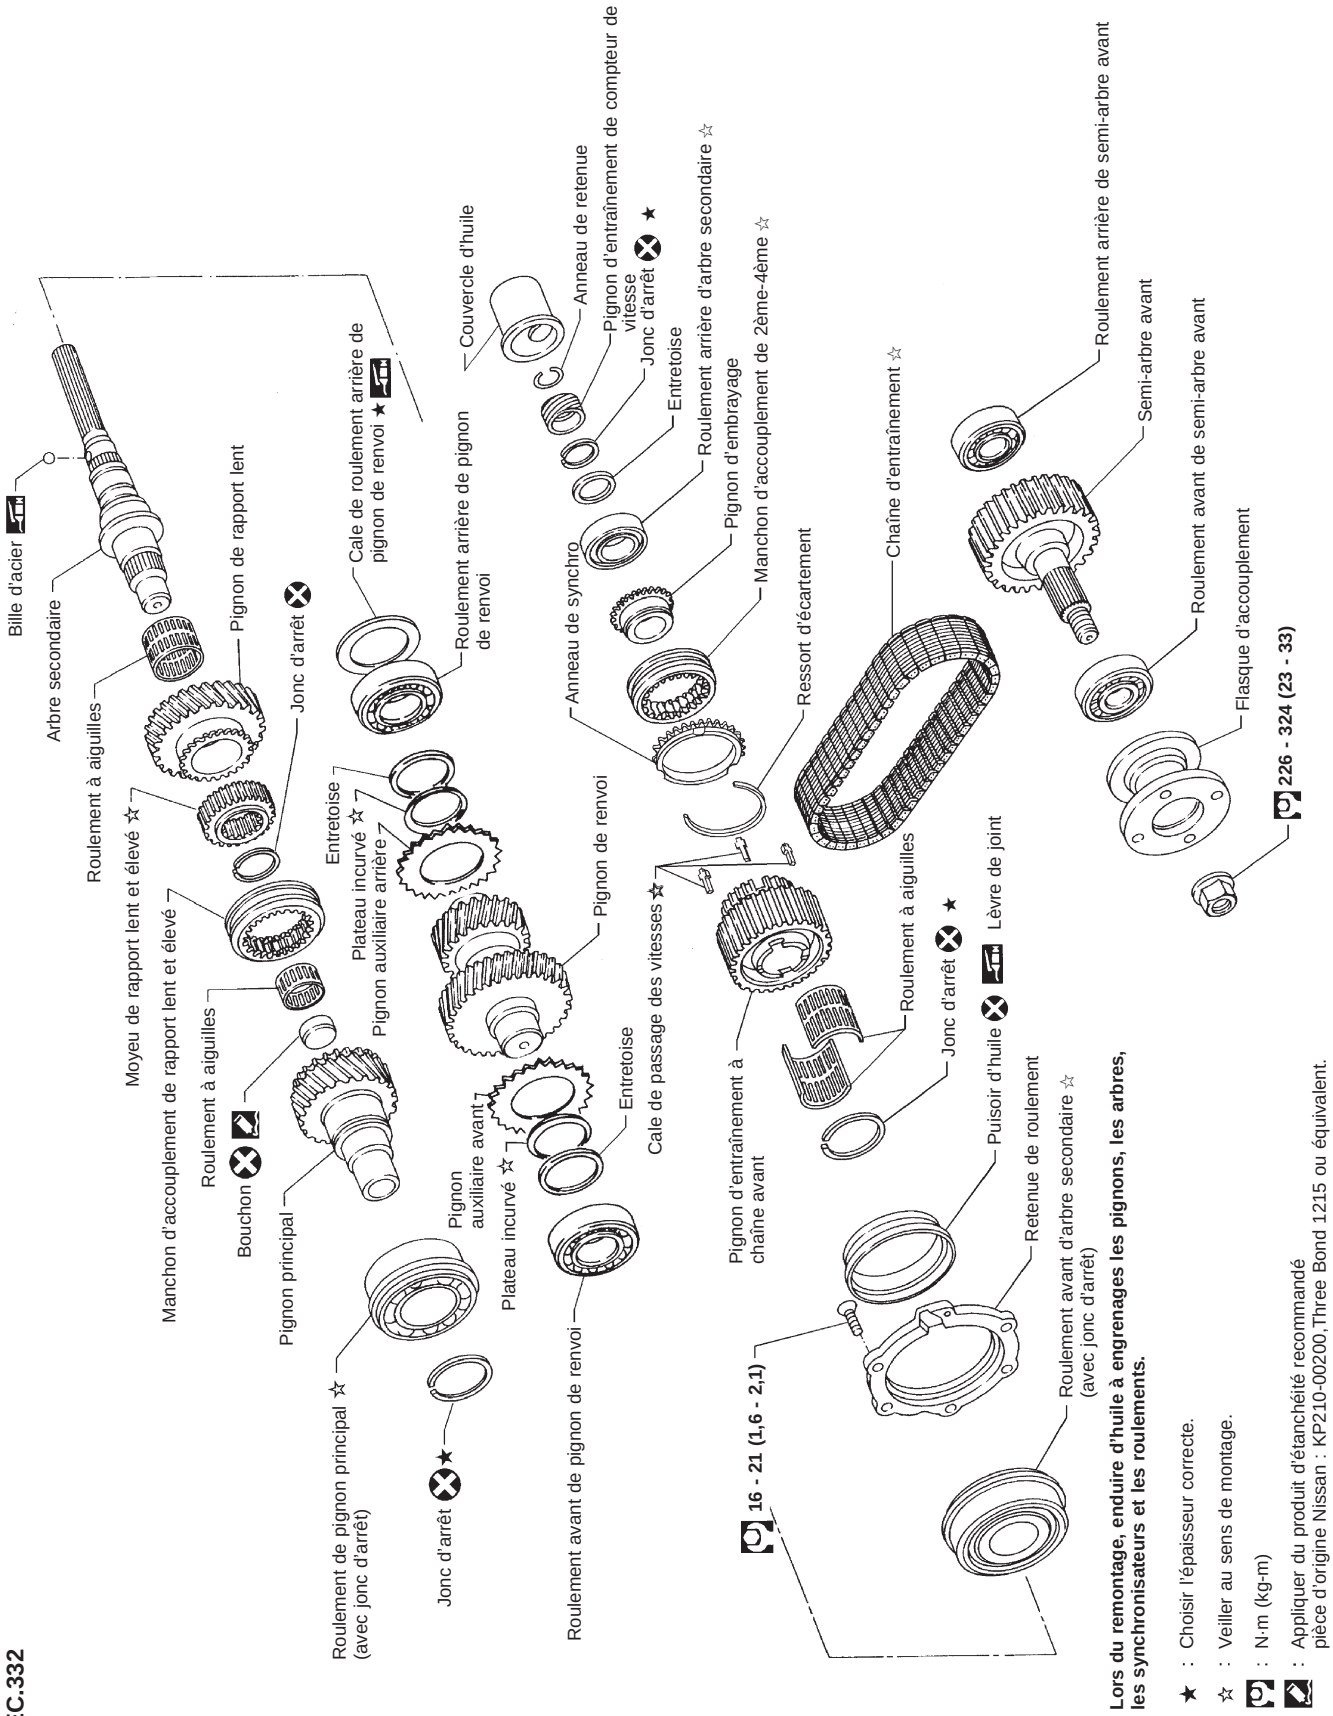
SEC. 333



: N·m (kg-m)
: N·m (kg-m)
1 : Remplir de graisse à usages multiples.
2 : Enduire de graisse à usages multiples.
*1 : Plier les cliquets pour la repose. Veiller à ne pas endommager le soufflet.
*2 : Ne pas toucher le soufflet avec un outil pointu ou dur car il est fragile.

SMT864CB

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

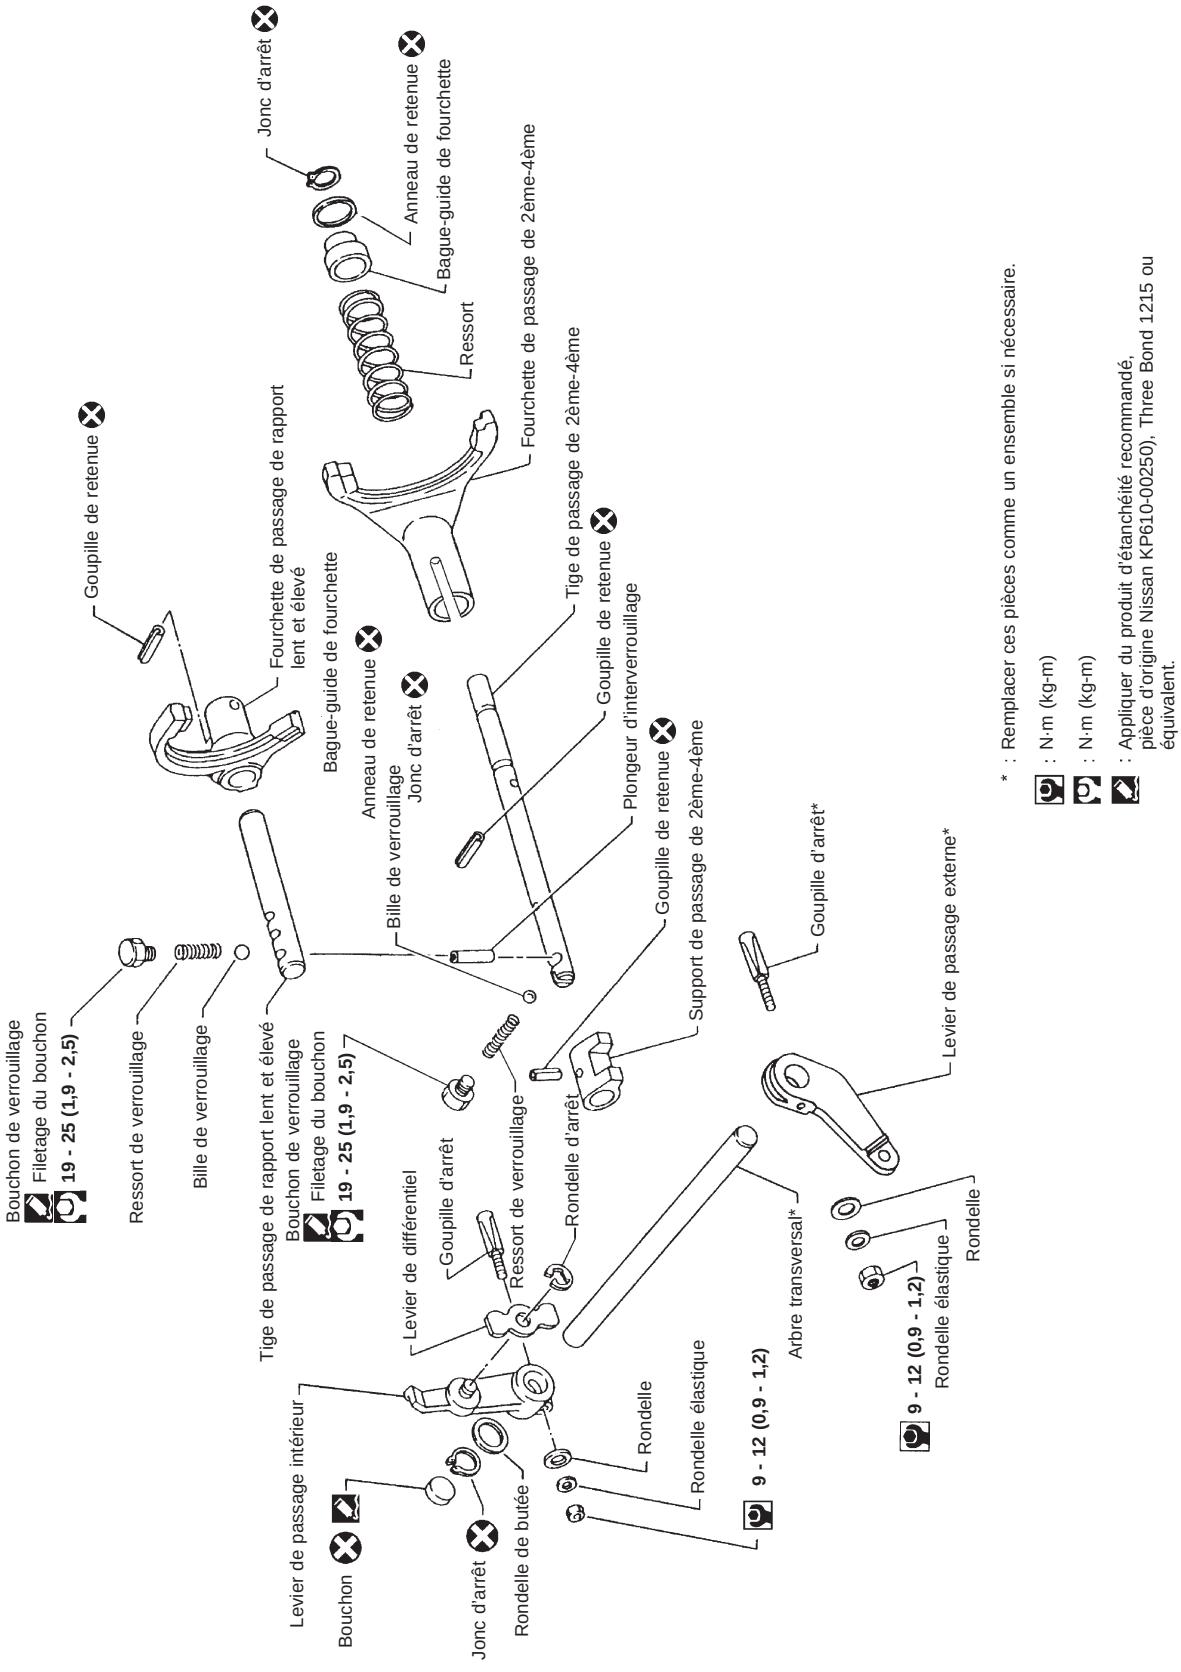


Composants du carter

SMT599D

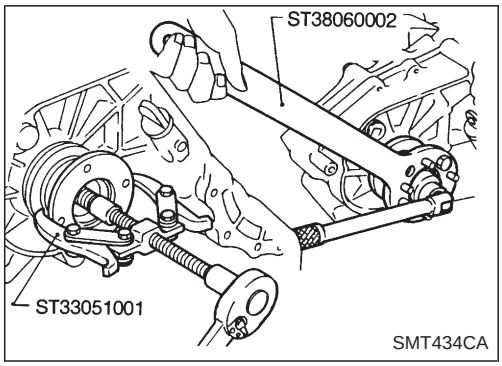
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Composants de la boîte



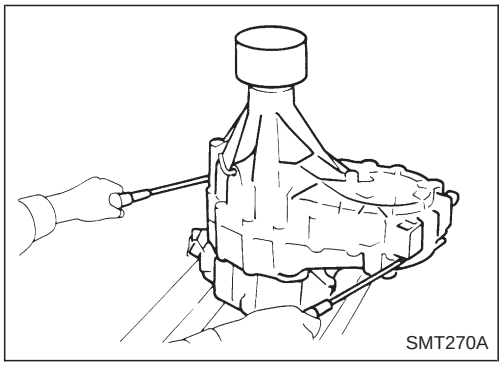
SEC.332

SMT141DA



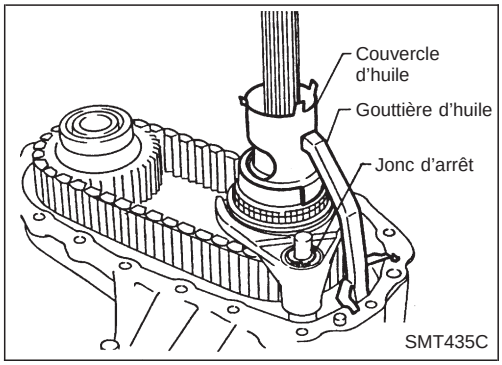
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Composants de la commande des vitesses

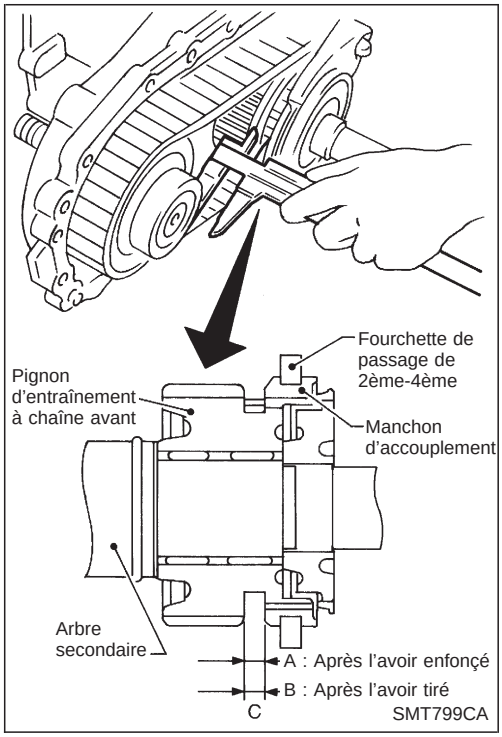


SMT600D

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



1. Déposer l'écrou du flasque d'accouplement.
2. Déposer le flasque d'accouplement.



3. Déposer le contact de 4 X 4.
4. Déposer le carter arrière.

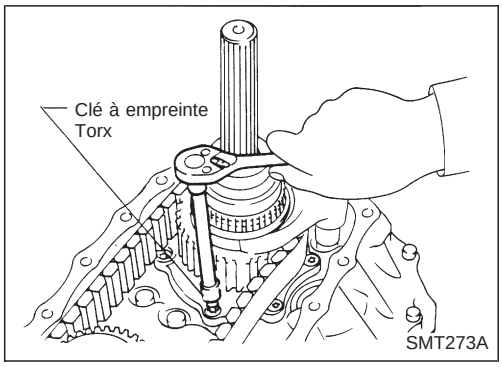
● **Veiller à ne pas endommager la surface d'appui.**

5. Déposer le couvercle et la gouttière d'huile.
6. Déposer le jonc d'arrêt et l'anneau de retenue de la tige de passage de 2ème-4ème.

7. A l'aide de calibres, mesurer la différence entre le pignon d'entraînement à chaîne avant et le manchon d'accouplement de 2ème-4ème comme indiqué dans la Méthode de mesure ci-dessous. Si hors spécifications, vérifier que le pignon d'entraînement à chaîne avant, le manchon d'accouplement de 2ème-4ème, le pignon d'embrayage, la fourchette de passage de 2ème-4ème et l'axe de fourchette de 2ème-4ème ne présentent pas de défauts. Remplacer la(les) pièce(s) défectueuse(s) si nécessaire.

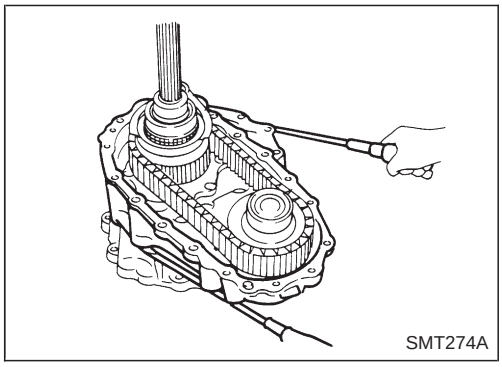
Méthode de mesure

a. Déplacer le manchon d'accouplement jusqu'à ce qu'il entre en contact avec le pignon à chaîne, puis mesurer la dimension A. Déplacer le manchon d'accouplement jusqu'à ce qu'il entre en contact avec le pignon d'embrayage, puis mesurer la dimension B. Calculer la différence de dimension C entre les deux mesures A et B.



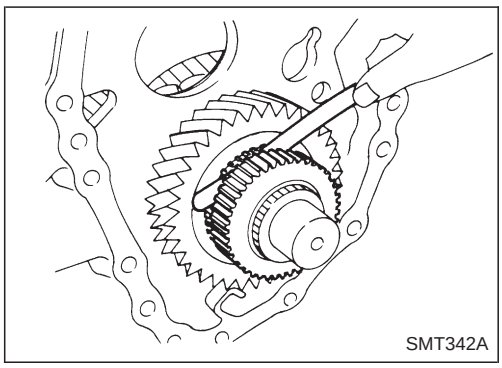
C = A − B

b. Pour déterminer la dimension A, mesurer à 3 ou 4 endroits différents en tournant le pignon à chaîne pour obtenir une valeur moyenne sur 3 à 4 mesures.

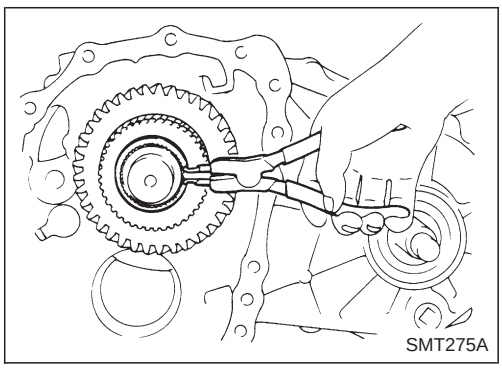


Spécification C :

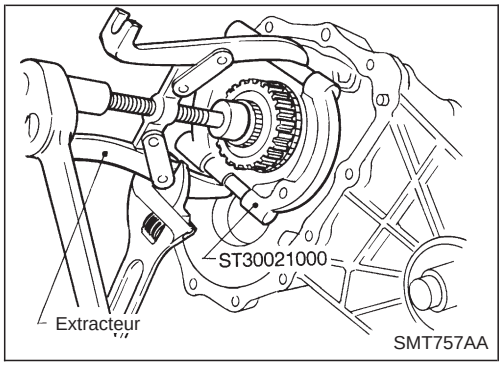
Se reporter à TF-31.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

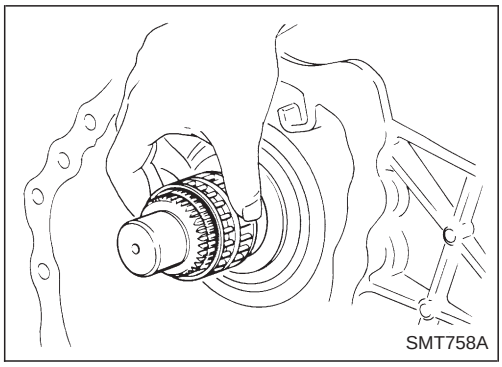


8. Déposer les boulons fixant la retenue de roulement.
- **Cette étape est indispensable pour pouvoir déposer l'arbre secondaire du carter central.**

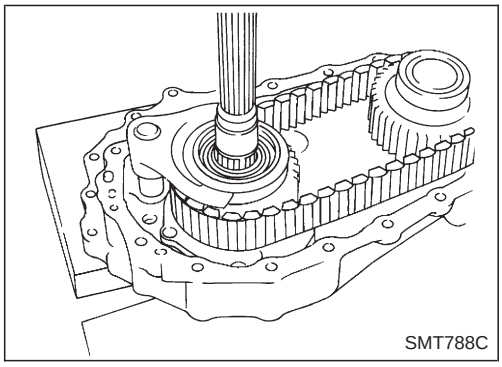


9. Déposer les boulons fixant le carter central au carter avant, puis séparer le carter central du carter avant.

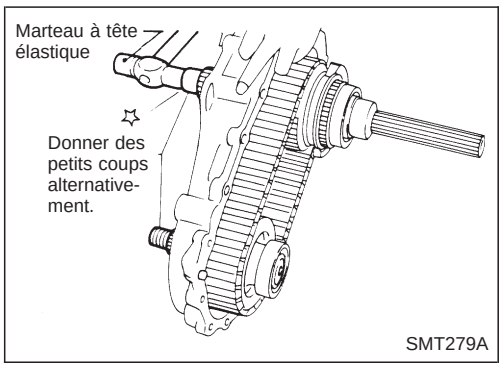
10. Mesurer le jeu axial du pignon de rapport lent.
Standard :
0,2 - 0,35 mm
- **Si le jeu axial dépasse la valeur maximum, vérifier si le pignon de rapport lent et le moyeu de rapport lent/élevé ne sont pas usés.**



11. Démonter le carter central.
a. Déposer le jonc d'arrêt de l'arbre secondaire.



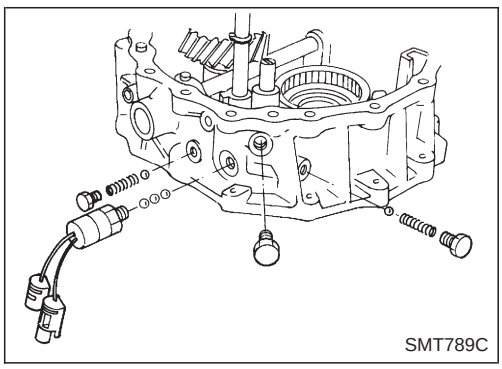
b. Extraire le pignon de rapport lent avec le moyeu de rapport lent/élevé.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

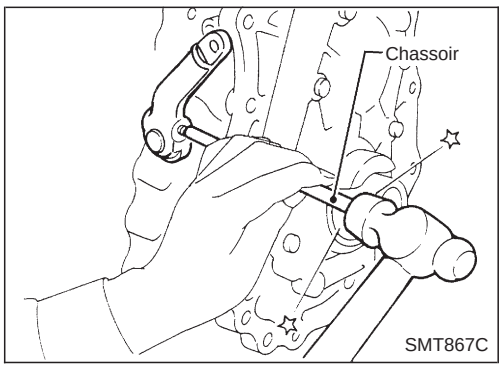
SMT758A

c. Déposer le roulement à aiguilles du pignon de rapport lent.



SMT788C

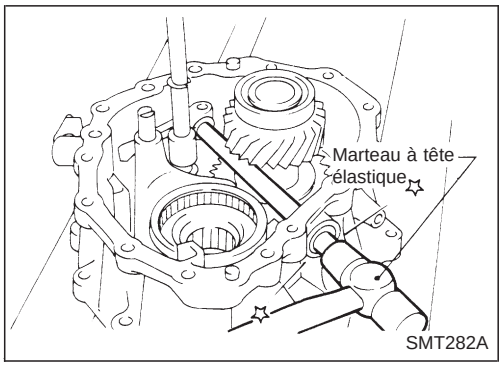
d. S'assurer que la chaîne d'entraînement est correctement orientée avant de la déposer (elle doit être reposée dans la même direction).



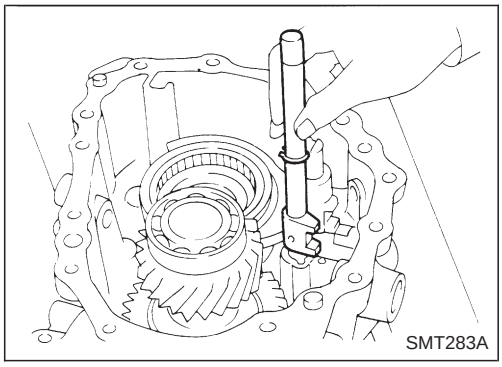
SMT279A

e. Déposer l'arbre secondaire, le pignon d'entraînement avant et la chaîne d'entraînement comme un ensemble en frappant alternativement sur l'extrémité avant de l'arbre secondaire et du semi-arbre avant.
- **Veiller à ne pas tordre la chaîne d'entraînement.**

SMT789C

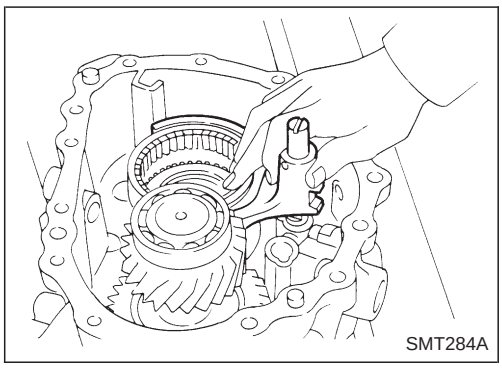


12. Démonter le carter avant.
a. Déposer le contact, les bouchons, les ressorts et les billes de verrouillage.

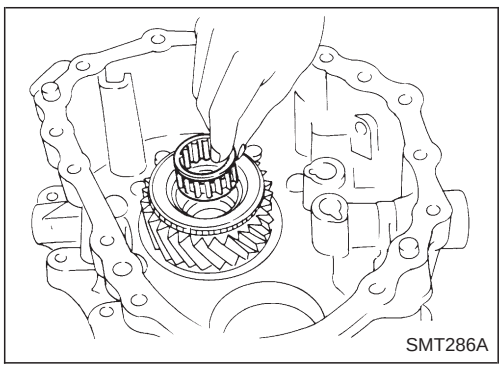


SMT867C

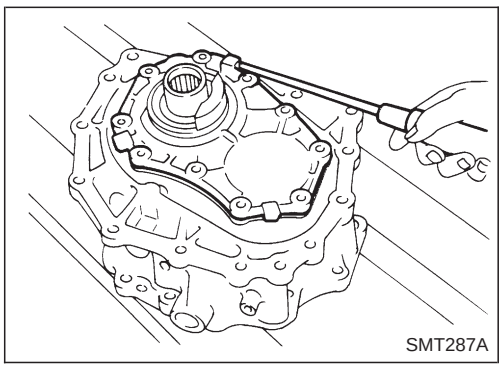
b. Déposer le levier de passage externe.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

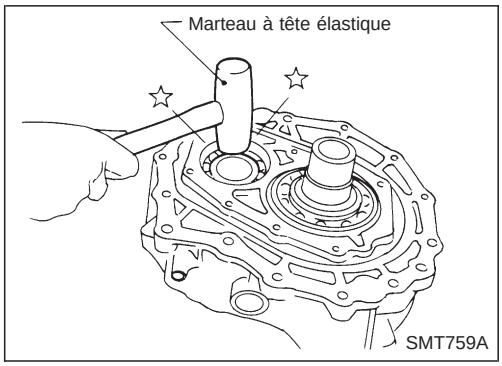


c. Déposer la goupille d'arrêt du levier de passage interne, et chasser l'arbre transversal avec le bouchon.

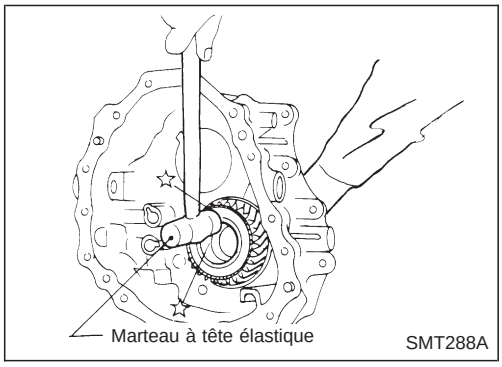


d. Déposer la tige de passage de 2ème-4ème.

e. Déposer la fourchette et la tige de passage de rapport lent/élevé avec le manchon d'accouplement.

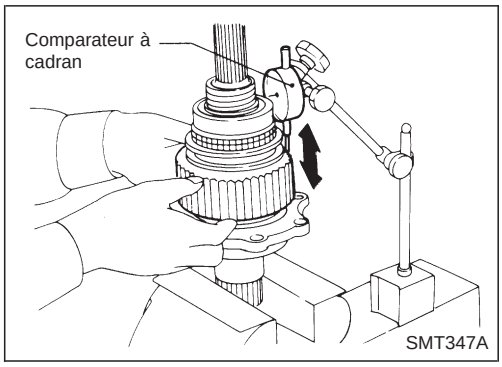


f. Déposer le roulement à aiguilles du pignon principal.



g. Déposer les boulons fixant le couvercle de carter avant, puis déposer le carter.

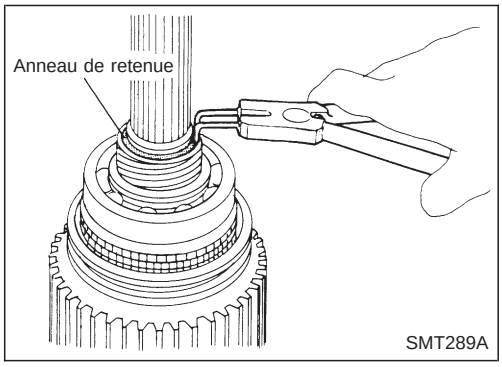
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



h. Déposer le pignon de renvoi en le frappant légèrement.

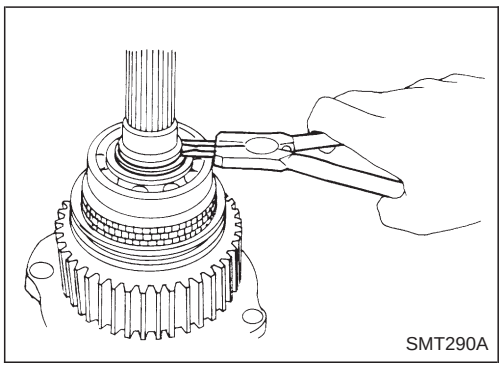
i. Déposer le pignon principal en le frappant légèrement.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



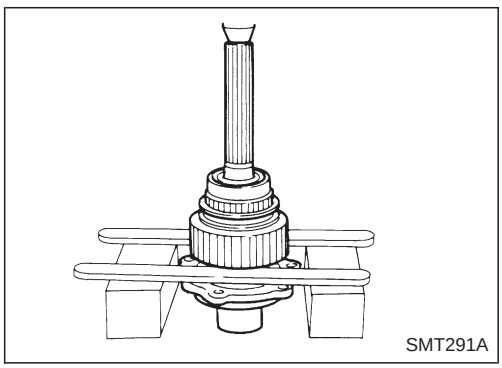
Arbre secondaire

DEMONTAGE

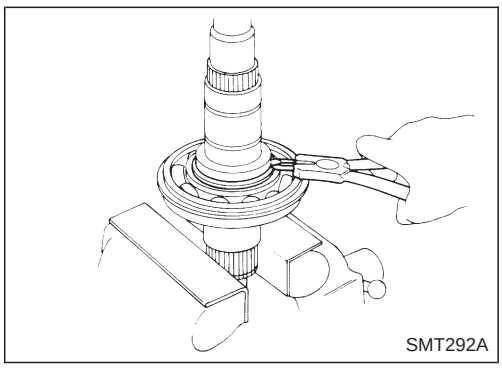


1. Vérifier le jeu axial du pignon d'entraînement à chaîne avant.
   Standard :
   0,2 - 0,35 mm

- **Si le jeu axial dépasse la valeur maximum, vérifier si le pignon d'entraînement à chaîne avant et le pignon d'embrayage ne sont pas usés.**

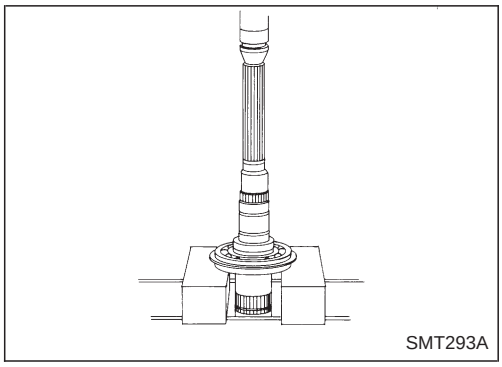


2. Déposer l'anneau de retenue, le pignon d'entraînement du compteur de vitesse et la bille d'acier.



- **Veiller à ne pas perdre la bille d'acier.**

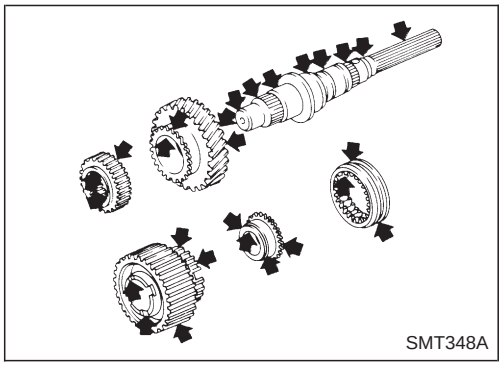
3. Déposer le jonc d'arrêt et l'entretoise.



4. Extraire le pignon d'entraînement à chaîne avant avec le roulement arrière d'arbre secondaire et le pignon d'embrayage.
5. Déposer le roulement à aiguilles.

6. Déposer la retenue de roulement, puis déposer le jonc d'arrêt et l'entretoise.

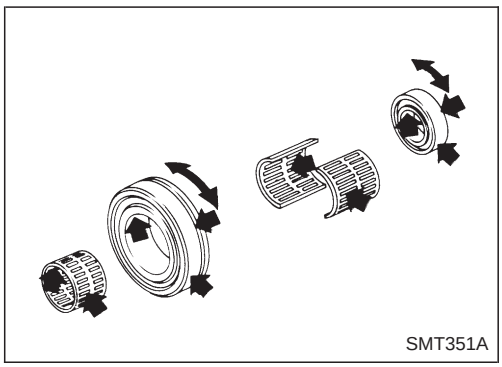
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Arbre secondaire (Suite)

SMT293A

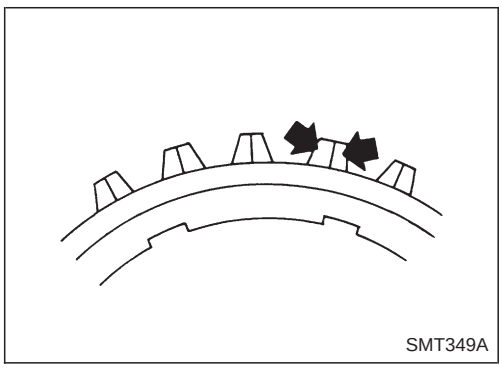
7. Extraire le roulement avant d'arbre secondaire de l'arbre secondaire.



INSPECTION

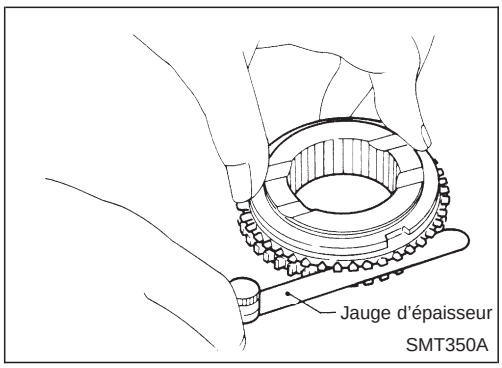
Pignon et arbre

SMT348A



- Vérifier si les pignons ne se sont pas excessivement usés, ébréchés ou fêlés.
- Vérifier que l'arbre ne présente pas de fissures, d'usure ou de voilage.
- Vérifier que le manchon d'accouplement ne présente pas d'usure ou de dommages.

Roulement



SMT351A

- S'assurer que les roulements tournent librement et qu'ils sont exempts de bruits, fissures, piqûres ou usure.

Anneau de synchro.

SMT349A

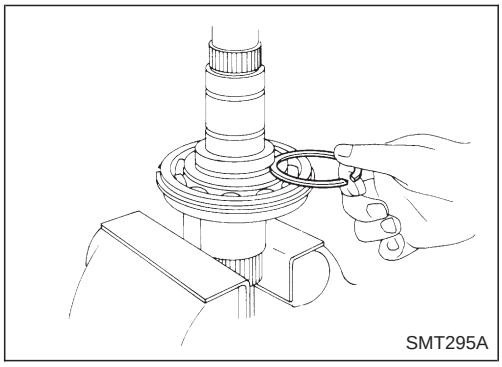
- Vérifier que l'anneau de synchro. ne présente pas de fissures ou de déformations.

SMT350A

- Mesurer le jeu entre l'anneau de synchro. et le pignon d'embrayage.

  Jeu entre l'anneau de synchro. et le pignon d'embrayage :

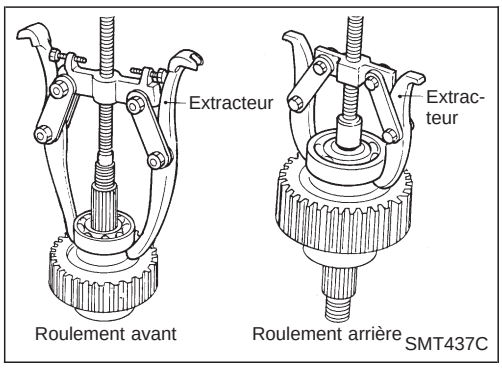
  Se reporter aux SDS, TF-31.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Arbre secondaire (Suite)

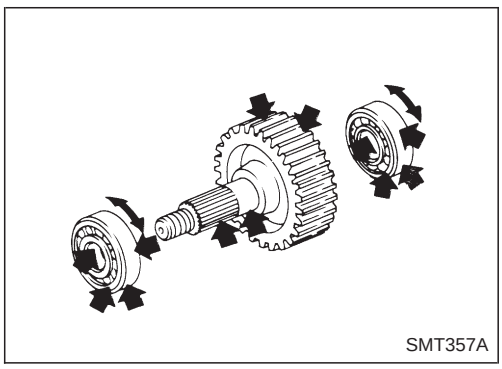
REMONTAGE



1. Monter à la presse le roulement avant de l'arbre secondaire dans l'arbre secondaire.
   - **Veiller au sens de la repose.**

2. Reposer l'entretoise.
3. Choisir un jonc d'arrêt d'épaisseur adéquate, puis le monter.
   Jeu admissible entre le jonc d'arrêt et la rainure :
   0 - 0,15 mm
   Jonc d'arrêt disponible pour roulement avant d'arbre secondaire :
   Se reporter aux SDS, TF-31.
4. En ce qui concerne les autres procédures, se reporter à "REMONTAGE", TF-24.

Semi-arbre avant

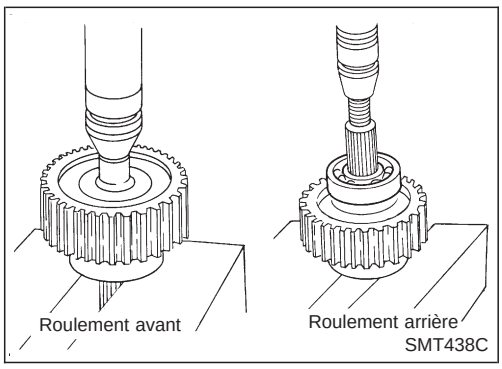


DEMONTAGE

- Roulements avant et arrière du semi-arbre avant

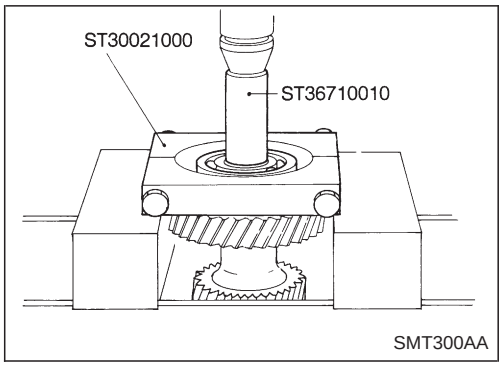
INSPECTION

Pignon à chaîne et arbre



- Vérifier que le pignon à chaîne n'est pas excessivement usé, ébréché ou fêlé.
- Vérifier si l'arbre n'est pas fissuré ou usé.

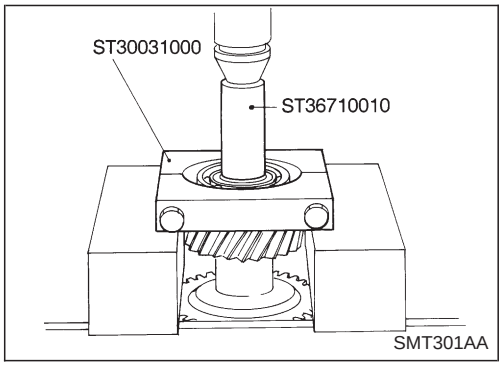
Roulement



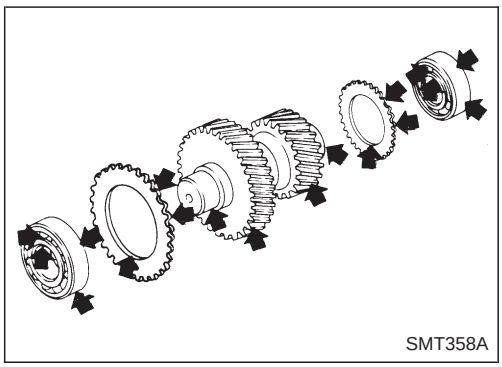
- S'assurer que les roulements tournent librement et qu'ils sont exempts de bruits, fissures, piqûres ou usure.

REMONTAGE

- Monter à la presse les roulements avant et arrière du semi-arbre avant.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

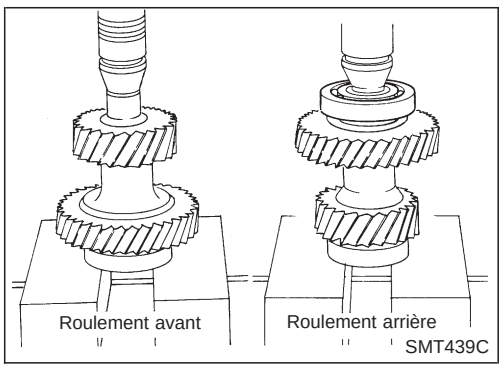


Pignon de renvoi

DEMONTAGE

1. Chasser à la presse le roulement avant du pignon de renvoi.
- Déposer le pignon auxiliaire avant, l'entretoise et le plateau incurvé.

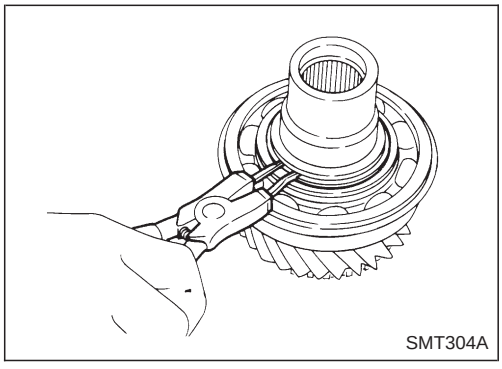
2. Chasser à la presse le roulement arrière du pignon de renvoi, puis déposer le pignon auxiliaire arrière, l'entretoise et le plateau incurvé.



INSPECTION

Pignon et arbre

- Vérifier si les pignons ne sont pas excessivement usés, ébréchés ou fêlés.
- Vérifier si l'arbre n'est pas fissuré ou usé.



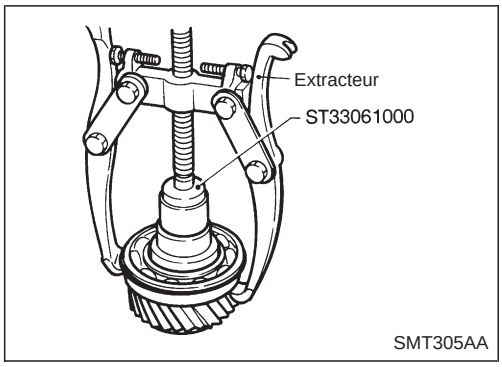
Roulement

- S'assurer que les roulements tournent librement et qu'ils sont exempts de bruits, fissures, piqûres ou usure.

REMONTAGE

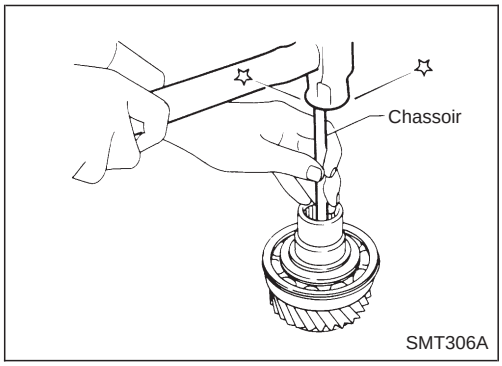
1. Reposer le pignon auxiliaire avant, le plateau incurvé et l'entretoise.
- Monter à la presse le roulement avant du pignon de renvoi.
2. Reposer le pignon auxiliaire arrière, le plateau incurvé et l'entretoise, puis monter à la presse le roulement arrière du pignon de renvoi.

Pignon principal



DEMONTAGE

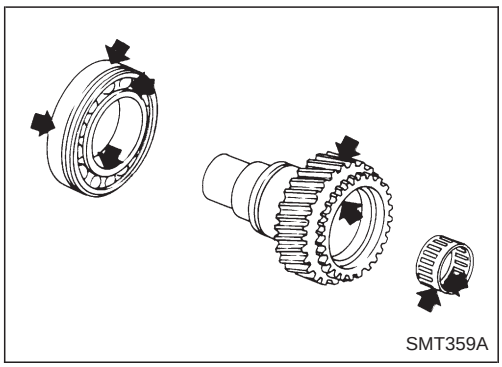
Roulement de pignon principal



1. Déposer le jonc d'arrêt.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

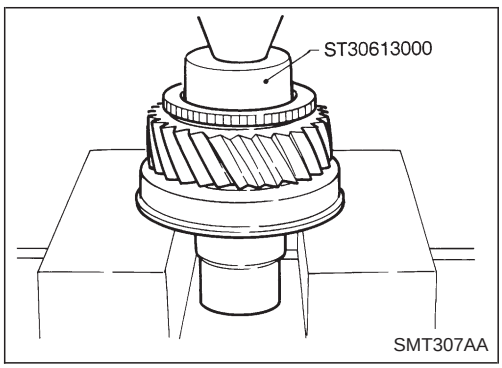
Pignon principal (Suite)



2. Extraire le roulement du pignon principal.

Bouchon

- **Toujours le remplacer par un bouchon neuf lorsqu'il est déposé.**

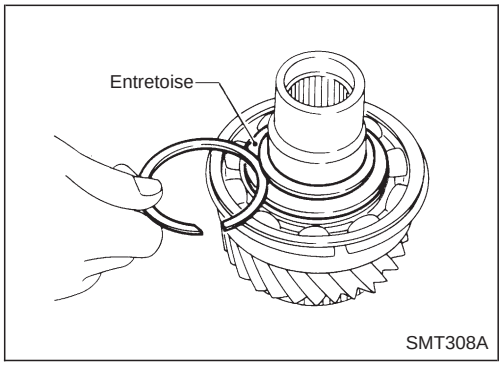


INSPECTION

Pignon et arbre

- Vérifier si les pignons ne sont pas excessivement usés, ébréchés ou fêlés.
- Vérifier si l'arbre n'est pas fissuré ou usé.

Roulement

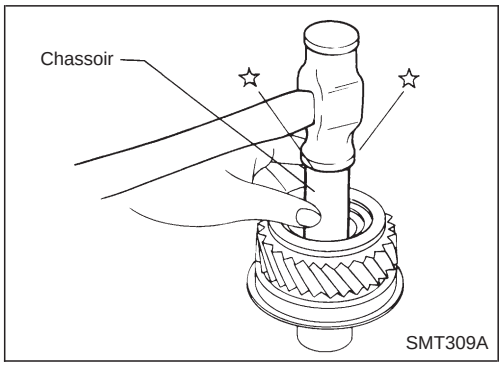


- S'assurer que les roulements tournent librement et qu'ils sont exempts de bruits, fissures, piqûres ou usure.

REMONTAGE

Roulement de pignon principal

1. Monter à la presse le roulement du pignon principal.

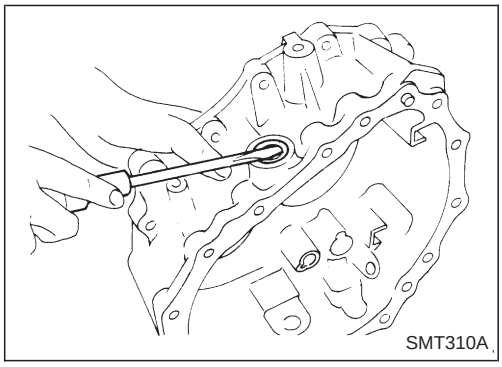


2. Choisir un jonc d'arrêt d'épaisseur adéquate, puis le monter.
   Jeu admissible entre le jonc d'arrêt et la rainure :
   0 à 0,15 mm
   Jonc d'arrêt disponible pour roulement de pignon principal :
   Se reporter aux SDS, TF-31.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

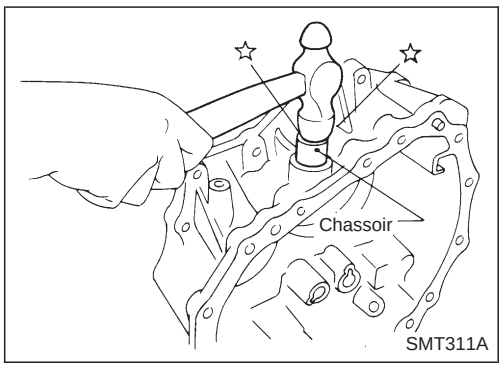
Pignon principal (Suite)

Bouchon



- Enduire le bouchon de produit d'étanchéité et le reposer.
  Produit d'étanchéité :
  Consulter ''Composants de la boîte'', TF-9.

Carter avant

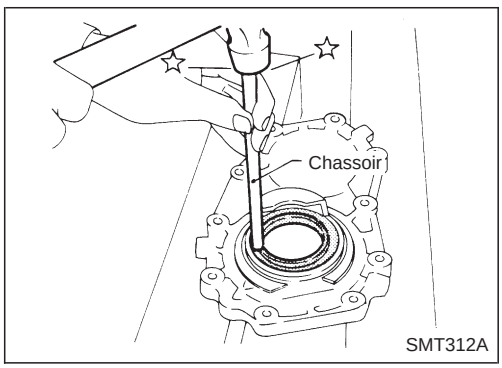


JOINT D'HUILE DE L'ARBRE DE PASSAGE DES VITESSES

Dépose

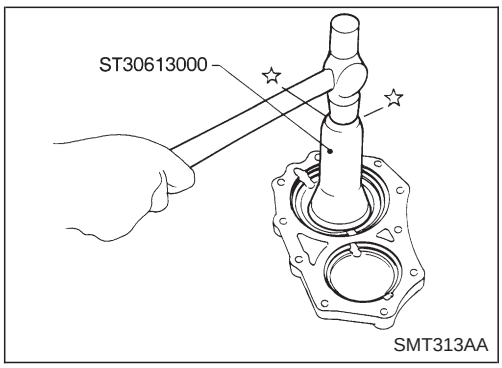
- A l'aide d'un tournevis, extraire l'ancien joint.
- Veiller à ne pas endommager le carter.
- Toujours le remplacer par un joint neuf lorsqu'il a été déposé.

Repose



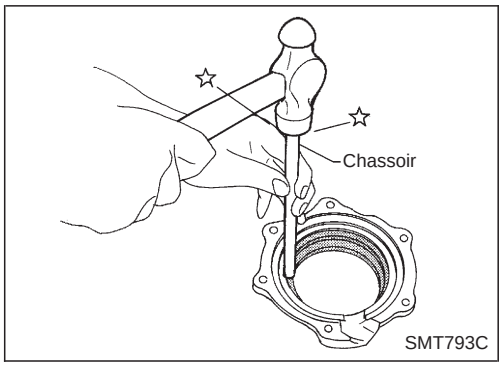
- Reposer le joint d'huile d'arbre de passage neuf jusqu'à ce qu'il arrive au ras du carter.
- Avant la repose, appliquer de la graisse à usages multiples sur la lèvre du joint.

Couvercle de carter avant



JOINT D'HUILE DE COUVERCLE

Dépose

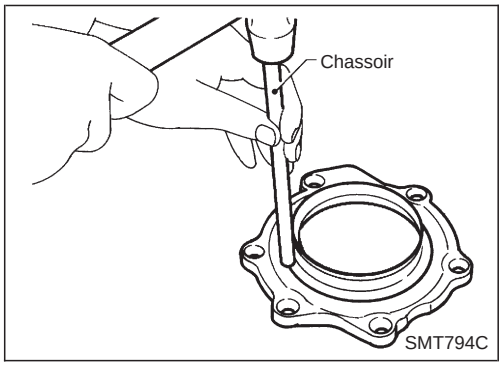


- Extraire le joint ancien par l'intérieur du couvercle de carter avant.
- Veiller à ne pas endommager le couvercle de carter avant.

Repose

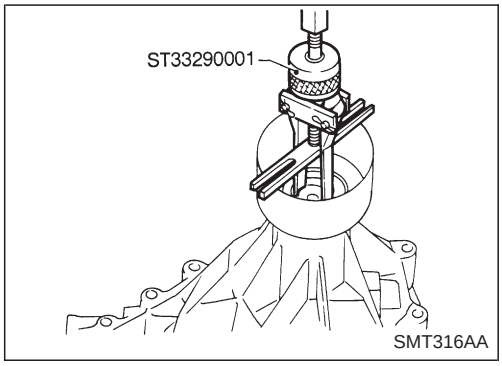
- Reposer le joint d'huile du couvercle de carter avant neuf jusqu'à ce qu'il soit à ras.
- Avant la repose, appliquer de la graisse à usages multiples sur la lèvre du joint.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Retenue de roulement

PUISOIR D'HUILE

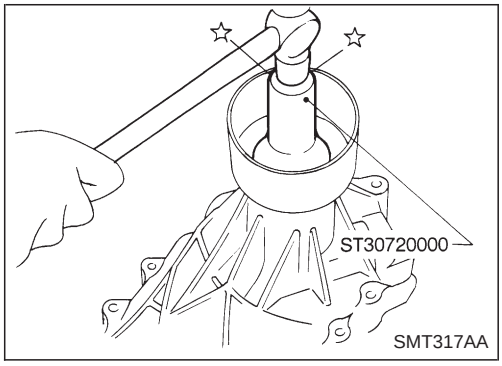


Dépose

- Extraire le puisoir d'huile par l'intérieur de la retenue de roulement.
- Veiller à ne pas endommager la retenue de roulement.

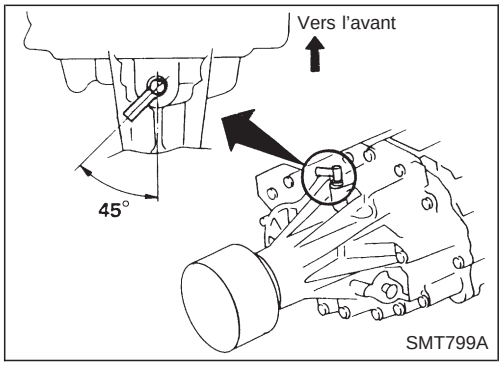
Repose

- Reposer le puisoir d'huile jusqu'à ce qu'il soit à ras.
- Veiller à ne pas endommager ou déformer le puisoir d'huile ou la retenue de roulement.
- Avant la repose, appliquer de la graisse à usages multiples sur la lèvre du joint.



Carter arrière

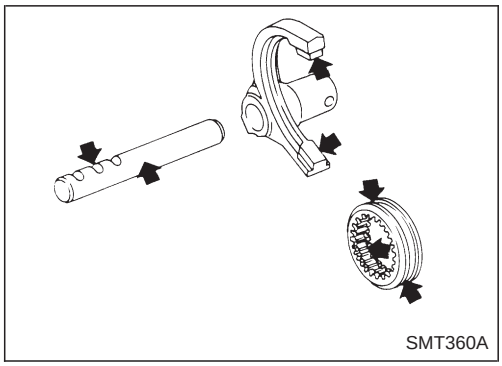
JOINT D'HUILE ARRIERE



Dépose

- Extraire le joint d'huile arrière.

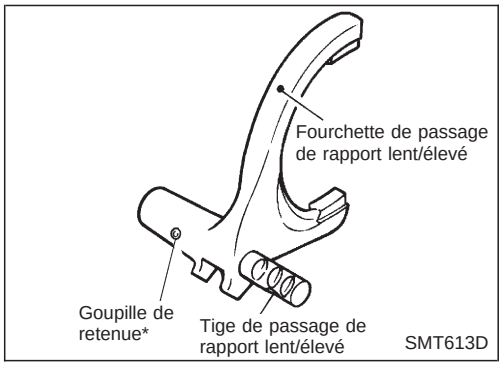
Repose



- Reposer le joint d'huile arrière neuf jusqu'à ce qu'il soit à ras.
- Avant la repose, appliquer de la graisse à usages multiples sur la lèvre du joint.

RENIFLARD

- Reposer comme indiqué dans l'illustration.
  Enduire de produit d'étanchéité :
  Consulter ''Composants du carter'', TF-8.



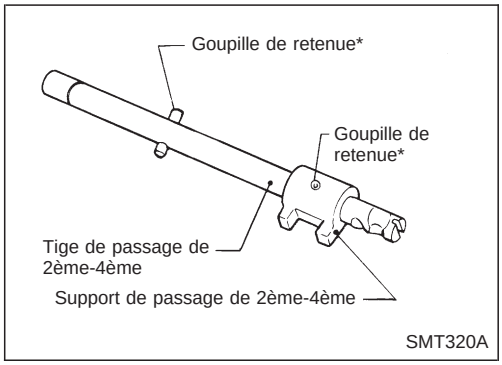
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SMT360A

Composants de la commande des vitesses

INSPECTION

- Vérifier que les surfaces de contact et de glissement ne présentent pas d'usure, d'éraflures, de saillies, ou d'autres défauts.

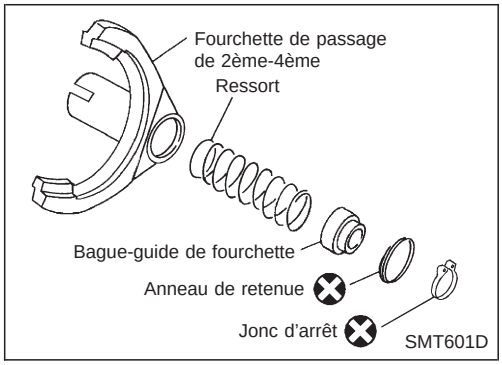


SMT613D

TIGE ET FOURCHETTE DE PASSAGE DE RAPPORT LENT/ELEVE

- Monter comme indiqué dans l'illustration.

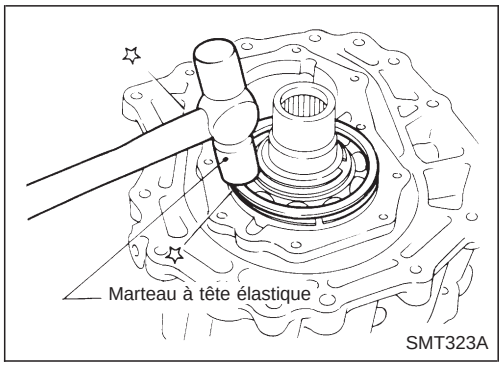
*La goupille de retenue est de la même taille que celle pour la tige de passage de 2ème-4ème.



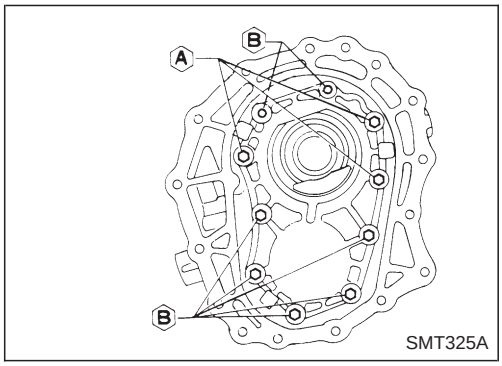
SMT320A

TIGE ET FOURCHETTE DE PASSAGE DE 2EME-4EME

- Monter comme indiqué dans l'illustration.



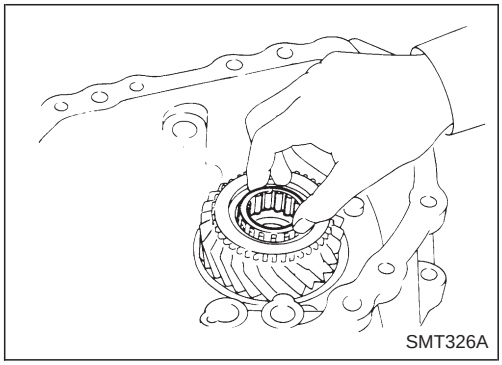
*Les goupilles de retenue sont de même taille.



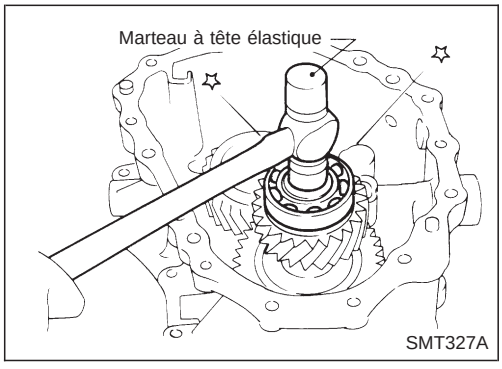
SMT601D

- **Veiller plus particulièrement au sens de la bague-guide de fourchette.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



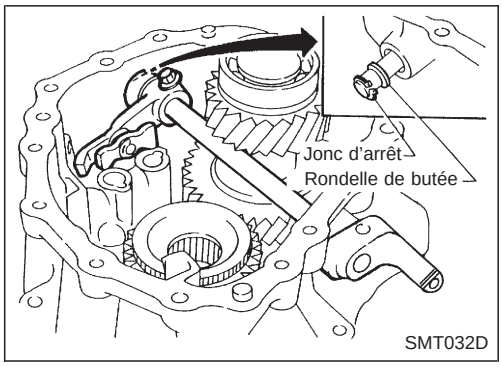
1. Remonter le carter avant.
a. Reposer le pignon principal en le frappant légèrement.



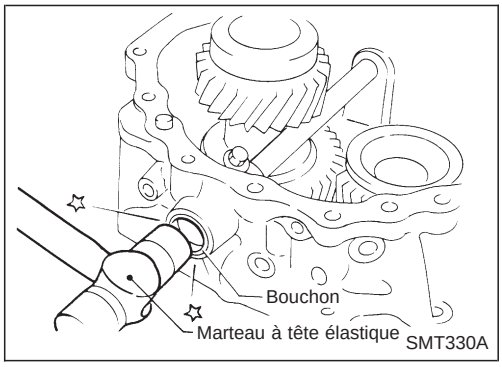
b. Enduire de produit d'étanchéité la surface d'appui et les boulons du couvercle de carter avant, puis monter l'ensemble sur le carter avant.

Produit d'étanchéité :
Consulter ''Composants du carter'', TF-8.

- **Ces dix boulons doivent être enduits de produit d'étanchéité.**
- **Couple de serrage**
  A : 16 - 21 N·m
  (1,6 - 2,1 kg-m)
  B : 19 - 24 N·m
  (1,9 - 2,4 kg-m)



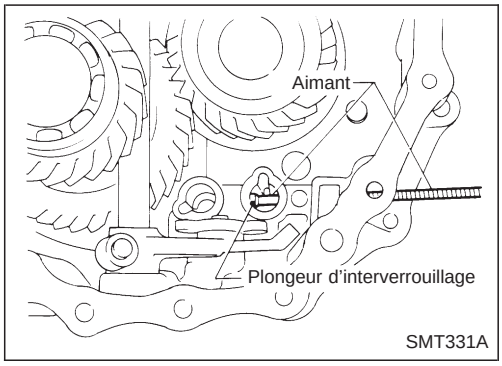
c. Appliquer de l'huile pour pignons sur le roulement à aiguilles, puis le reposer dans le pignon principal.



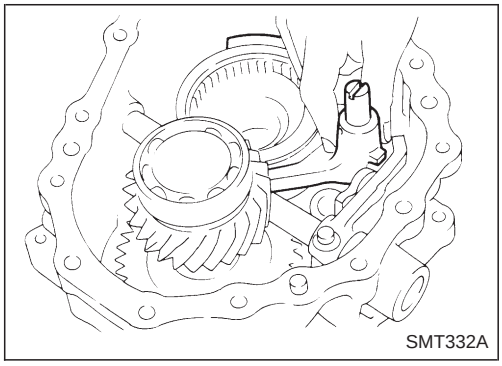
d. Reposer le pignon de renvoi en le frappant légèrement.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

e. Reposer l'arbre transversal et le levier de passage interne.

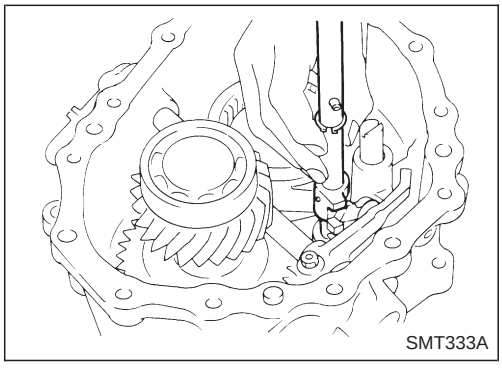


- **Lors du remplacement de l'arbre transversal, du levier de passage externe ou de la goupille d'arrêt du levier de passage externe, les remplacer comme un ensemble.**



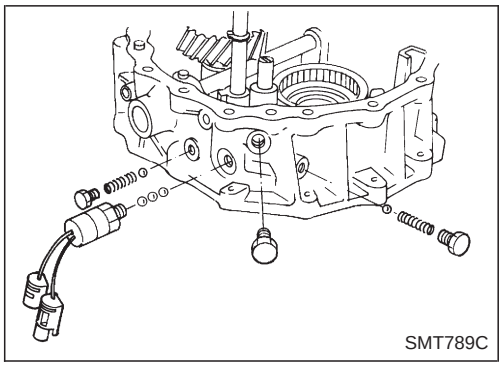
f. Enduire de produit d'étanchéité le bouchon, et l'installer sur le carter avant.

Produit d'étanchéité :



Consulter ''Composants de la commande des vitesses'', TF-10.

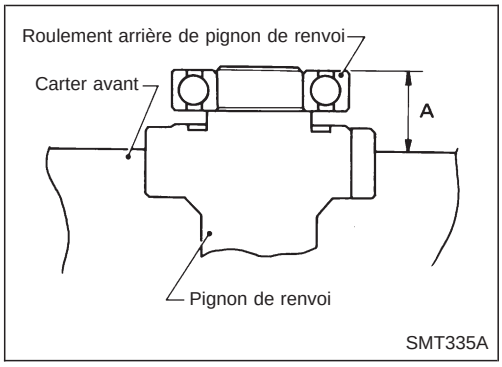
g. Introduire le plongeur d'interverrouillage dans le carter avant.



h. Reposer la fourchette et la tige de passage de rapport lent/élevé avec le manchon d'accouplement.

i. Reposer la tige de passage de 2ème-4ème.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



SMT789C

j. Reposer les contacts, les billes de verrouillage, les ressorts de verrouillage et les bouchons.

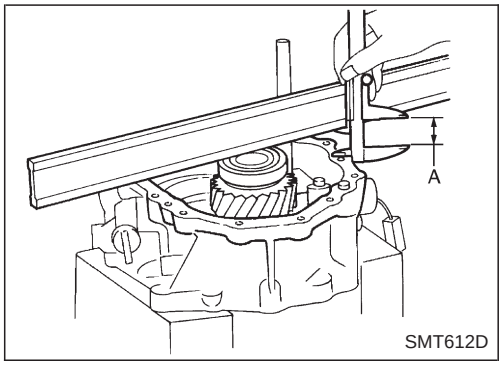
● **Enduire les contacts et les bouchons de produit d'étanchéité.**

Produit d'étanchéité:

Consulter ''Composants du carter'', TF-8.

SMT335A

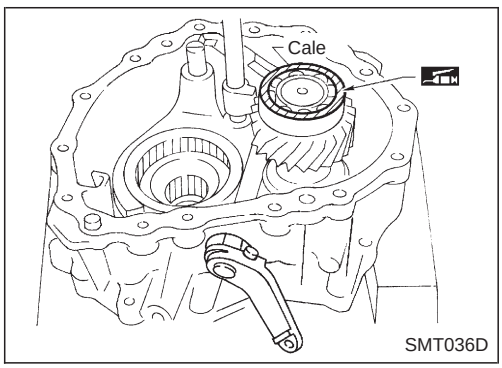
2. Choisir une cale de roulement arrière du pignon de renvoi.



Jeu axial du pignon de renvoi :

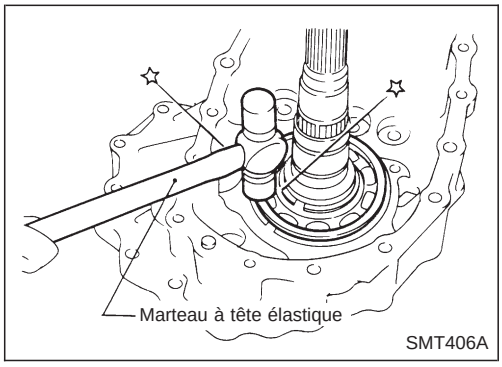
0 - 0,2 mm

Cale de roulement arrière du pignon de renvoi :



Se reporter aux SDS, TF-31.

a. Mesurer la distance ''A'' entre la surface supérieure du roulement arrière de pignon de renvoi et la surface d'appui du carter avant.

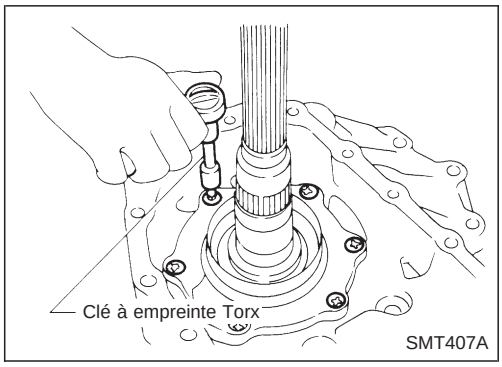


SMT612D

b. Choisir la cale adéquate en se servant du tableau des SDS. Se reporter aux SDS, TF-31.

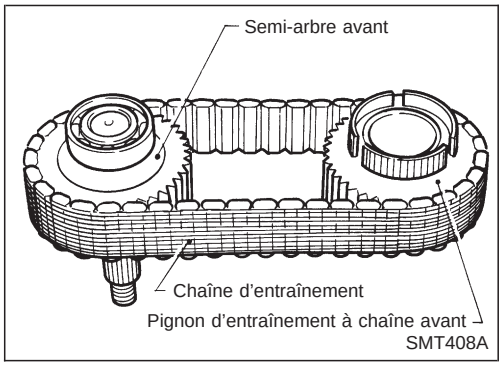
SMT036D

3. Placer la cale adéquate graissée sur le roulement arrière du pignon de renvoi.
4. Appliquer de l'huile pour pignons sur chaque pièce du carter avant.



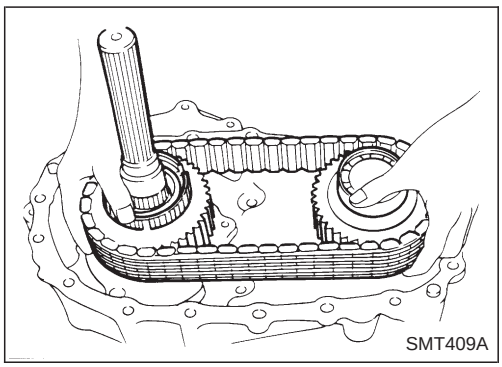
SMT406A

5. Remonter le carter central.

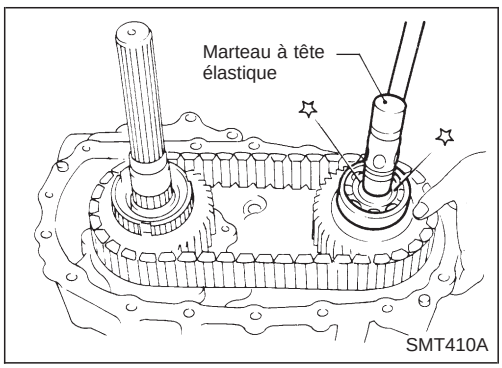


a. Reposer l'arbre secondaire sur le carter central en le frappant légèrement.

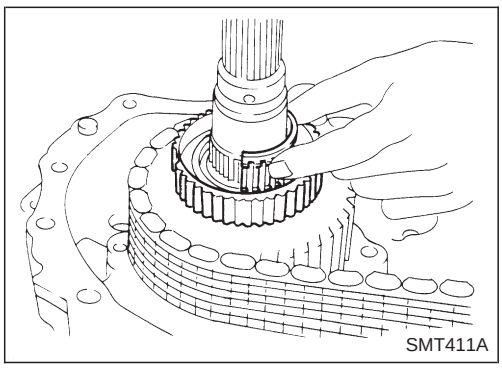
● **Appliquer de l'huile pour pignons sur le roulement avant de l'arbre secondaire.**



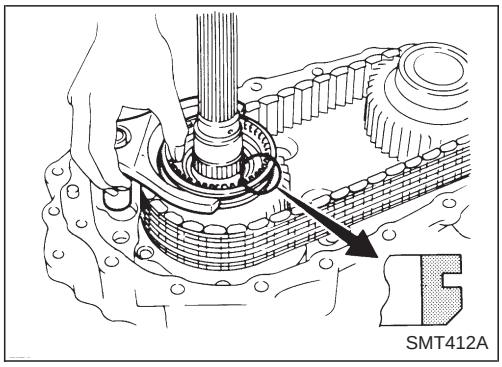
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



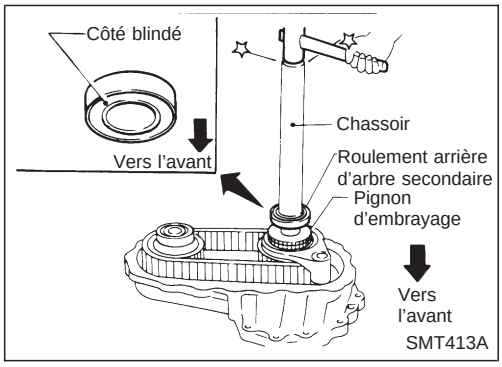
b. Reposer la retenue de roulement.



c. Poser la chaîne d'entraînement sur le pignon d'entraînement à chaîne avant et le semi-arbre avant, puis les placer dans le carter central.

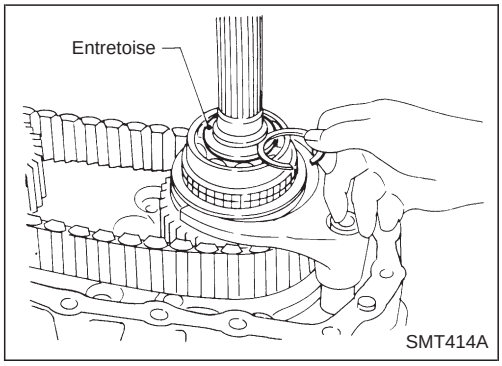


d. Reposer le semi-arbre avant en le frappant légèrement.
- **S'assurer que les arbres sont alignés dans le carter.**



e. Appliquer de l'huile pour pignons sur les roulements à aiguilles, puis les installer sur le pignon d'entraînement à chaîne avant.
- **Ces roulements à aiguilles seront reposés plus facilement si l'on fait tourner le pignon d'entraînement à chaîne avant durant leur montage.**

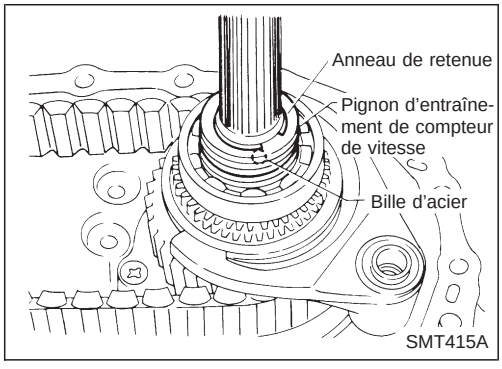
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



SMT412A

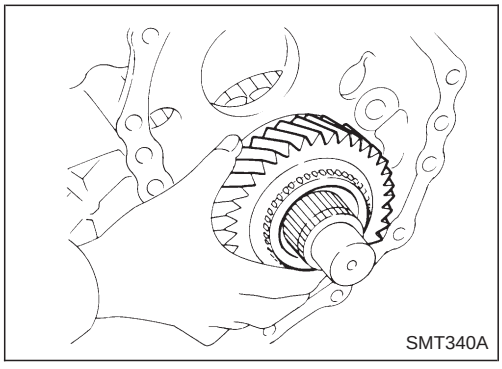
f. Reposer le manchon d'accouplement de 2ème-4ème avec la fourchette de passage de 2ème-4ème.
- **Veiller particulièrement à l'orientation du manchon d'accouplement.**

SMT413A



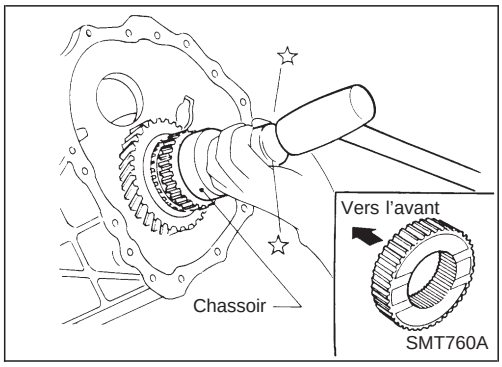
g. Reposer le pignon d'embrayage et le roulement arrière d'arbre secondaire.
- **Placer une cale en bois sous l'arbre secondaire afin de protéger le roulement avant de ce dernier.**

SMT414A



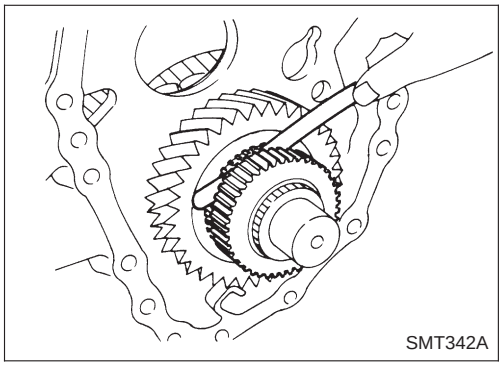
h. Reposer l'entretoise.
i. Choisir le jonc d'arrêt d'épaisseur adéquate, puis le monter.

Jeu admissible entre le jonc d'arrêt et la rainure :
0 - 0,15 mm
Jonc d'arrêt disponible pour roulement arrière d'arbre secondaire :
Se reporter aux SDS, TF-31.



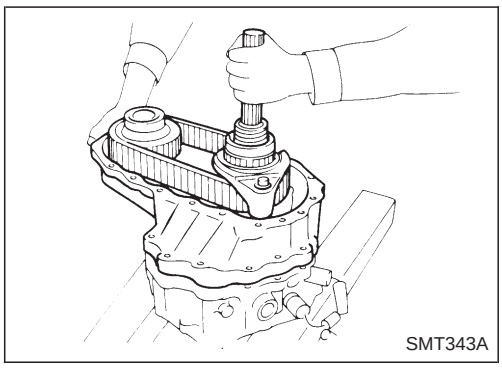
SMT415A

j. Reposer la bille d'acier, le pignon d'entraînement du compteur de vitesse et l'anneau de retenue.
- **La bille d'acier est la plus petite des billes de verrouillage pour cette unité.**

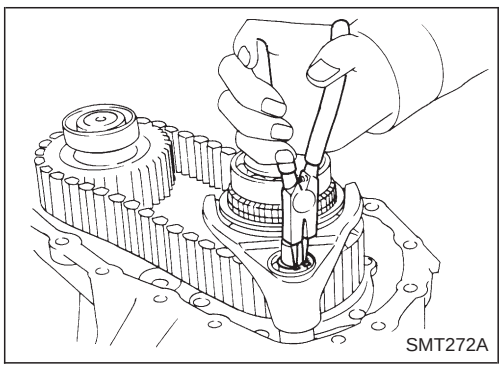


SMT340A

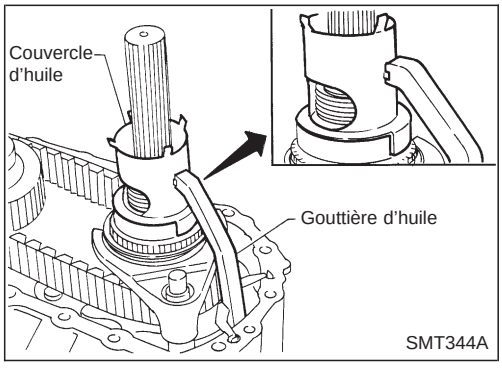
k. Reposer le pignon de rapport lent et son roulement sur l'arbre secondaire.
- **Appliquer de l'huile pour pignons sur le roulement à aiguilles.**



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

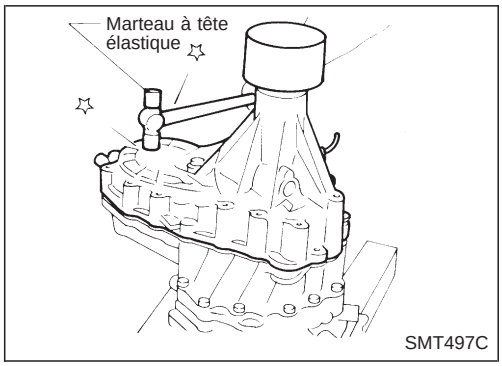


l. Reposer le moyeu de rapport lent/élevé et le jonc d'arrêt sur l'arbre secondaire.
- **Veiller particulièrement au sens du moyeu de rapport lent/élevé.**



m. Mesurer le jeu axial du pignon de rapport lent.
Standard : 0,2 - 0,35 mm

6. Enduire de produit d'étanchéité la surface d'appui, et placer le carter central sur le carter avant, puis serrer les boulons.
Produit d'étanchéité :
Consulter ''Composants du carter'', TF-8.



7. Reposer le jonc d'arrêt sur la tige de passage de 2ème-4ème.

8. Reposer la gouttière et le couvercle d'huile.
9. Appliquer de l'huile pour pignons sur chaque pièce du carter central.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

10. Enduire la surface d'appui de produit d'étanchéité et installer le carter arrière sur le carter central.
11. Reposer le contact 4 X 4.

- **Enduire la partie filetée du contact de produit d'étanchéité.**
  Produit d'étanchéité :
  Consulter ''Composants du carter'', TF-8.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Caractéristiques générales

Caractéristiques générales

MODELES AVEC MOTEUR TD25Ti

Destination		Europe
Modèle concerné		TD25Ti
Frein avant Type		Frein à disque CL28VD
Diamètre d'alésage du cylindre	mm	42,8 x 2
Dimension des plaquettes Longueur x largeur x épaisseur	mm	146,6 x 48,5 x 10
Diamètre extérieur du rotor x épaisseur	mm	277 x 26
Frein arrière Type		Frein à tambour LT30A
Diamètre d'alésage du cylindre de roue	mm	22,22
Dimension de la garniture Longueur x largeur x épaisseur	mm	296,0 x 50,0 x 6,1
Diamètre intérieur du tambour	mm	295
Diamètre d'alésage du maître-cylindre	mm	23,81
Vanne de commande Type		LSV (compensateur asservi)
Point de rupture x rapport de réduction	kPa (bar, kg/cm^2)	(Variable) x 0,15
Assistance de frein Modèle		M215T
Diamètre de diaphragme	mm	Primaire : 230 Secondaire : 205
Liquide de frein recommandé		DOT 4*1

*1: Consulter la section MA (''Liquides et lubrifiants'', ''LIQUIDES ET LUBRIFIANTS CONSEILLES'').

Inspection et réglage

FREIN A DISQUE

Unité : mm

Modèle de frein	CL28VD
Limite d'usure des plaquettes	
Epaisseur minimum	2,0
Limite de réparation du rotor	
Epaisseur minimum	24,0

FREIN A TAMBOUR

Unité : mm

Modèle de frein	LT30A
Limite d'usure de la garniture	
Epaisseur minimum	1,5
Limite de réparation du tambour	
Diamètre interne maximum	296,5
Limite de faux-rond	0,15

PEDALE DE FREIN

Unité : mm

Hauteur libre "H"*	
Conduite à gauche	209 - 219
Conduite à droite	203 - 213
Course complète "D" [en appliquant une force de 490 N (50 kg) alors que le moteur tourne]	120,0
Jeu "C" entre butée de pédale et extrémité filetée du contact de feu stop	0,3 - 1,0
Jeu libre de la pédale	
A la chape	1,0 - 3,0
Au patin de pédale	4 - 12

* : Mesurée de la surface du panneau de renfort de tablier au patin de pédale.

COMMANDE DE FREIN DE STATIONNEMENT

Type de commande		Levier à poignée	Levier central
Course du levier [en appliquant une force de 196 N (20 kg)]	2x2	8 - 10	—
	4x4	10 - 12	8 - 10
Course du levier lorsque le témoin s'allume		1

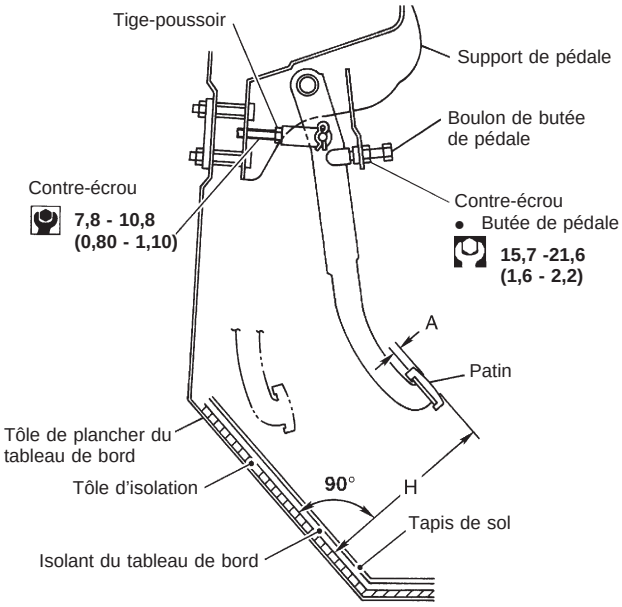
Conduite à gauche

Conduite à droite

: N·m (kg-m)

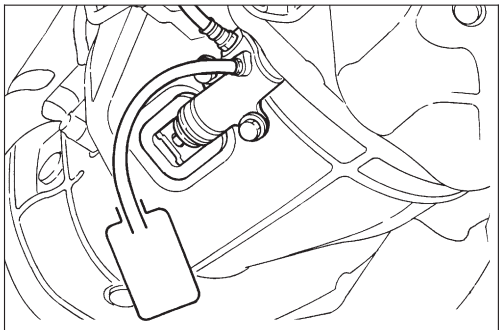


: N·m (kg-m)

SCL741-B

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Réglage de la pédale d'embrayage



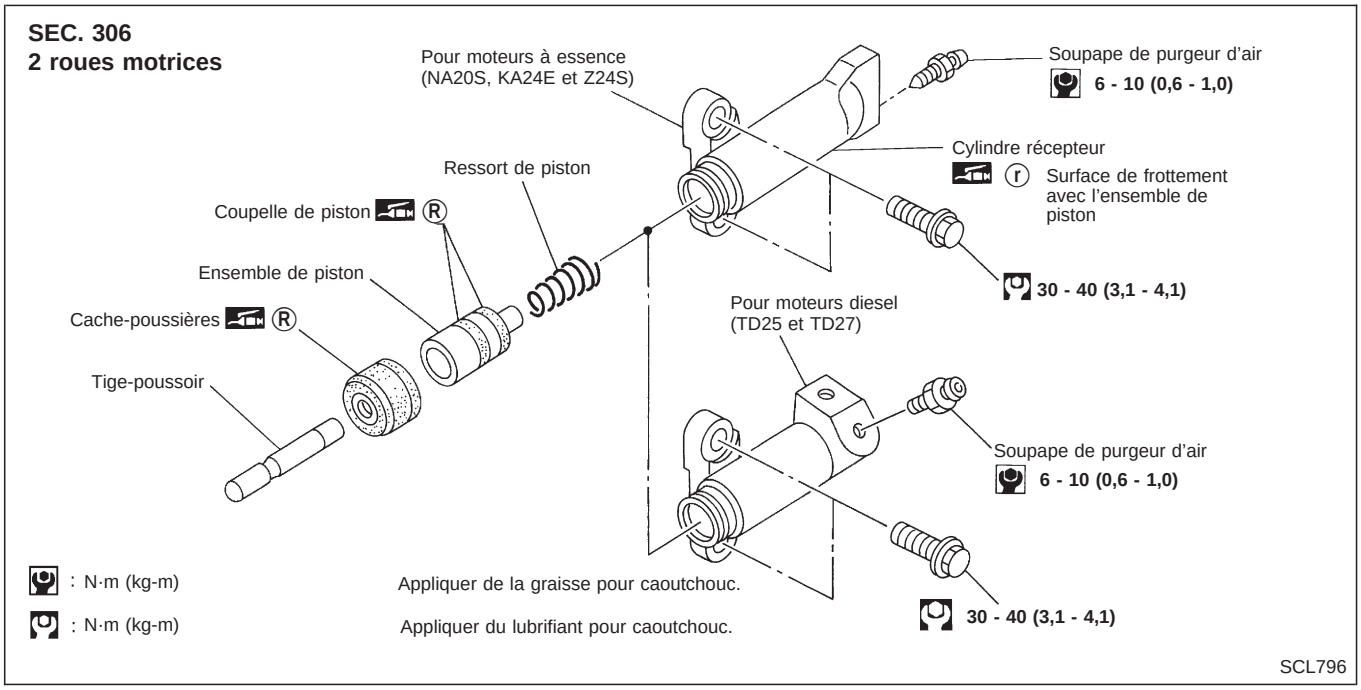
1. Régler la hauteur de la pédale en agissant sur la butée de pédale.
2. Régler le jeu libre de la pédale avec la tige de poussoir.

Hauteur de la pédale "H" (Mesure de la surface de la tôle d'isolation au patin de pédale) :
Conduite à gauche
Moteurs NA20S, KA24E, Z24S, TD25 et Z24S
221 - 231 mm
Moteurs TD25Ti et QD32
240 - 250 mm
Conduite à droite
Moteurs NA20S, KA24E, Z24S, TD25 et Z24S
195 - 205 mm
Moteurs TD25Ti et QD32
203 - 213 mm
Jeu libre de la pédale "A" :
1 - 1,5 mm

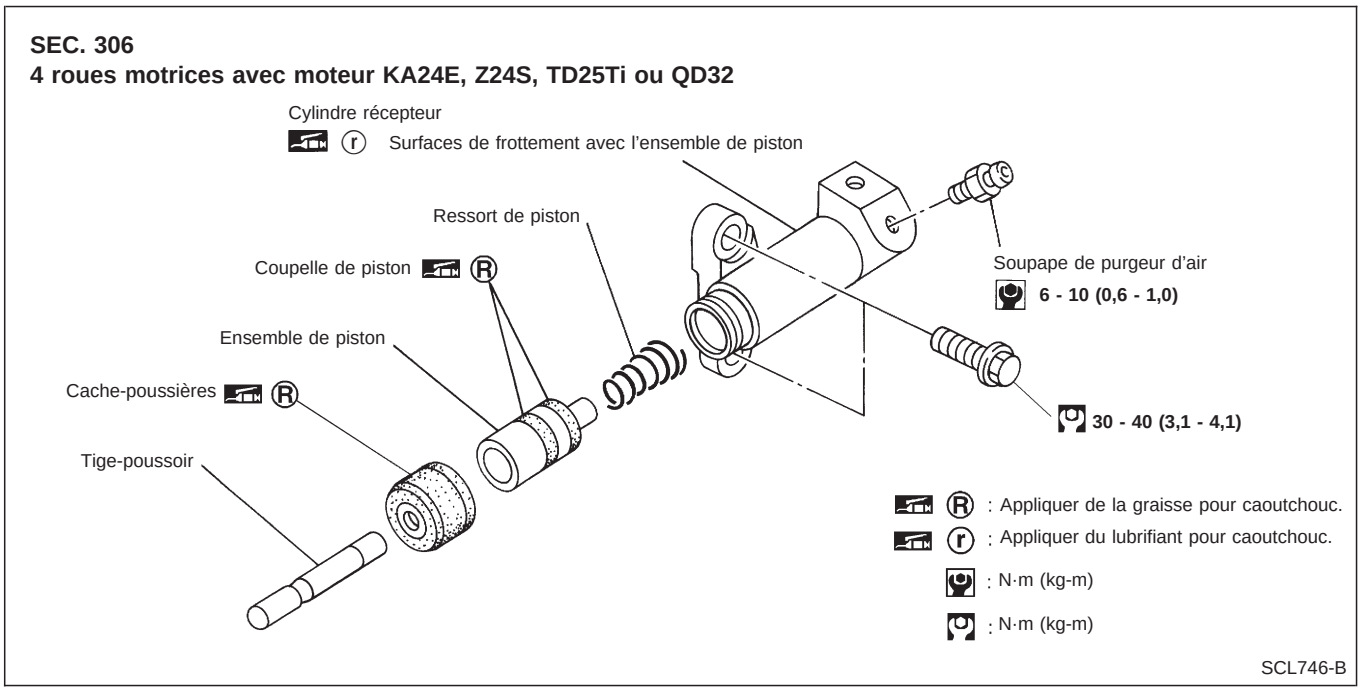
: N·m (kg-m)
: N·m (kg-m)

SCL742-B

Cylindre récepteur d'embrayage SCL203



Procédure de purge d'air

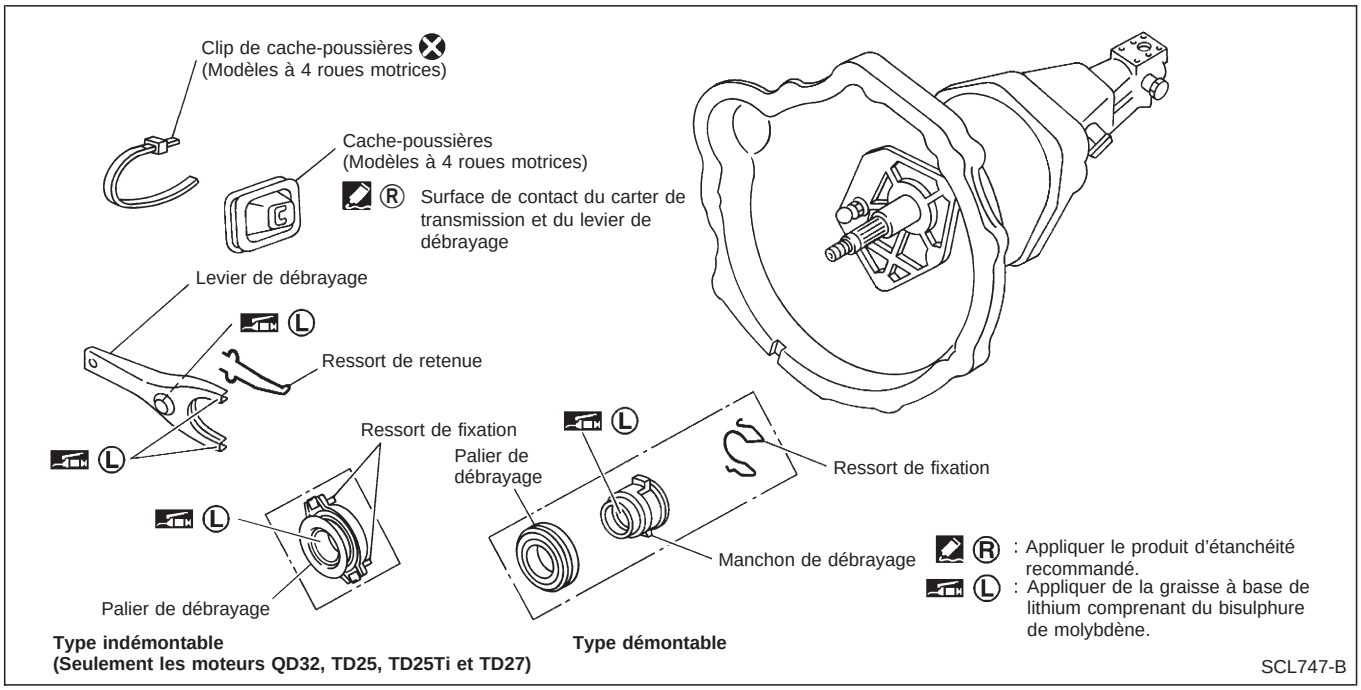


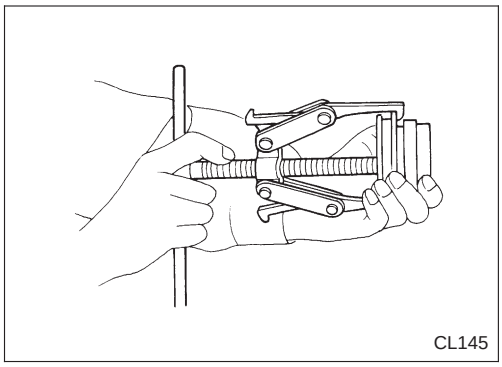
Purger l'air en suivant la méthode suivante.
Purger l'air du maître-cylindre (modèles avec conduite à droite uniquement) puis du cylindre récepteur.

1. Remplir le réservoir du maître-cylindre avec du liquide de frein neuf.
2. Connecter un flexible transparent en vinyle au purgeur d'air.
3. Enfoncer lentement la pédale d'embrayage sur toute sa course puis la relâcher complètement. Répéter cette opération plusieurs fois à 2 ou 3 secondes d'intervalle.
4. Ouvrir la purge d'air en enfonçant la pédale d'embrayage à fond.
5. Fermer le purgeur d'air.
6. Relâcher la pédale d'embrayage et attendre au moins 5 secondes.
7. Répéter les étapes 3 à 6 ci-dessus jusqu'à ce que le liquide de frein soit clair, sans bulles d'air.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Cylindre récepteur

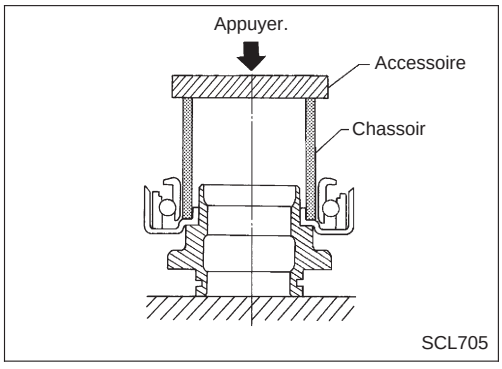


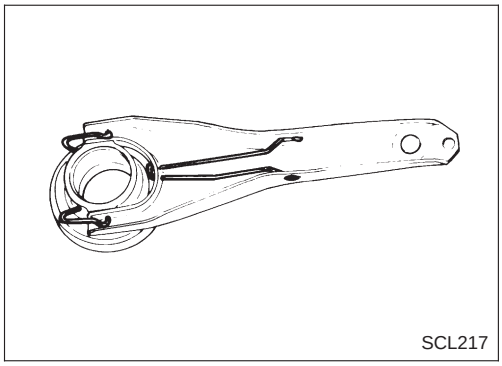


INSPECTION

- Vérifier si la surface de frottement du cylindre présente des traces d'usure, de rouille ou de détérioration. Remplacer si nécessaire.
- Vérifier si le piston et la coupelle présentent des signes d'usure ou de détérioration. Remplacer si nécessaire.
- Vérifier si le ressort de piston n'est pas usé ou endommagé. Remplacer si nécessaire.
- Vérifier si le cache-poussière n'est pas fêlé, déformé ou endommagé. Remplacer si nécessaire.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

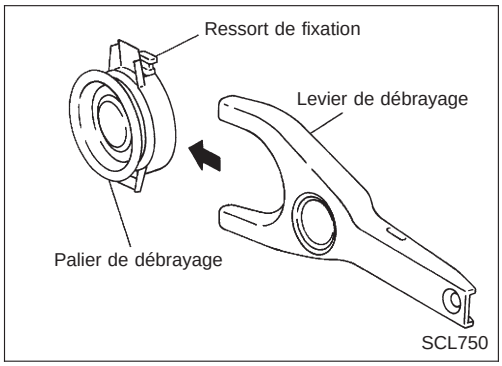




DEPOSE ET REPOSE

Type démontable

- Déposer le palier de débrayage.



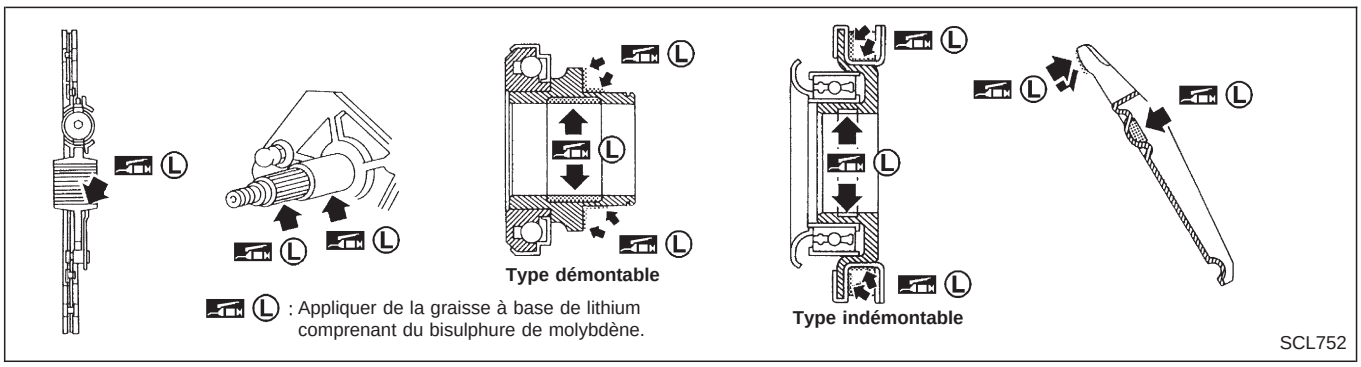
- Reposer le palier de débrayage avec le chassoir approprié.

- Installer le ressort de retenue et le ressort de fixation.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

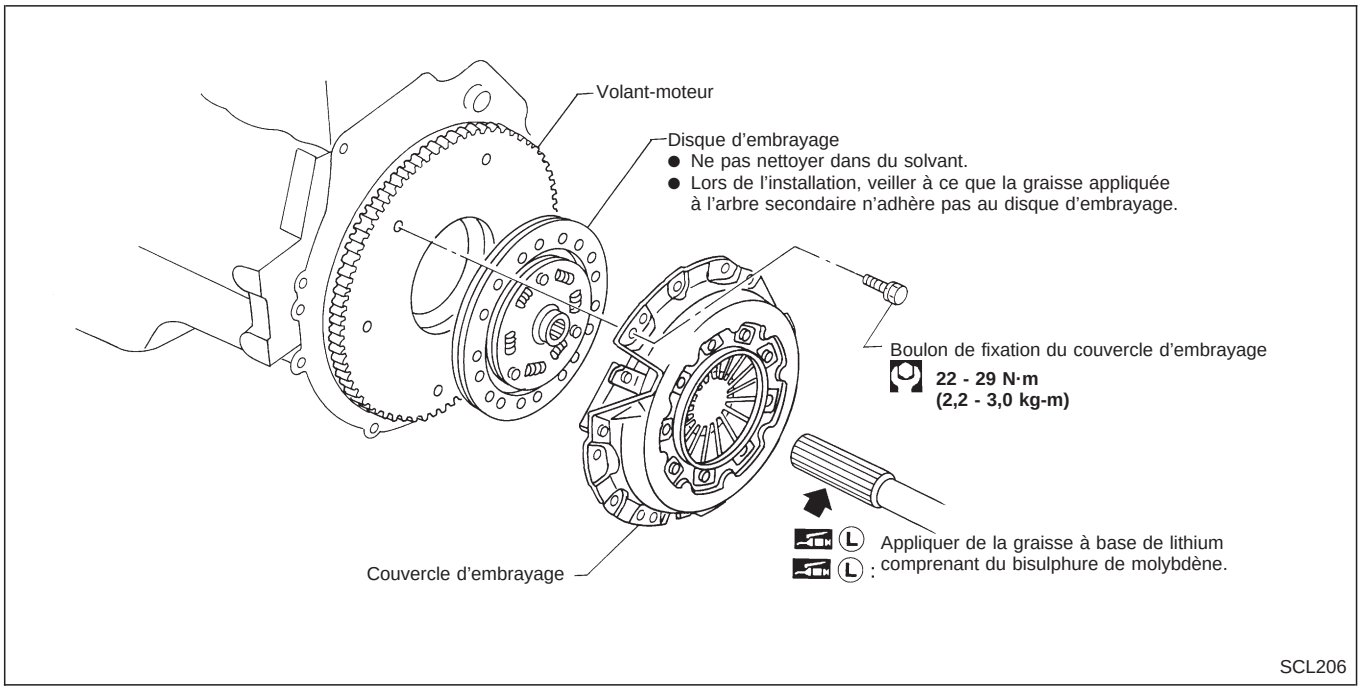
Type indémontable

- Insérer le levier de débrayage en respectant le sens indiqué par la flèche.

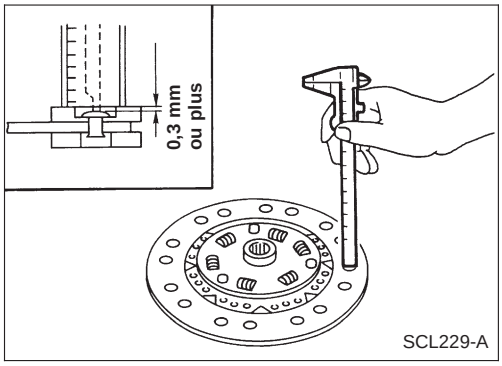


INSPECTION

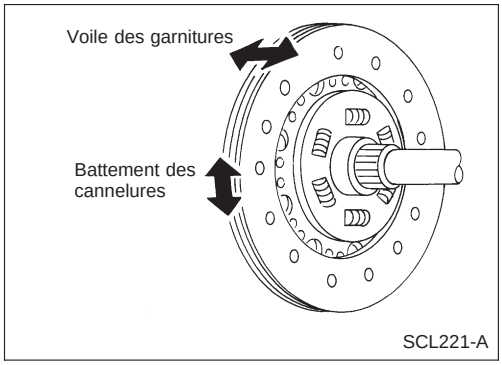
Vérifier les pièces suivantes, et les remplacer si nécessaire.



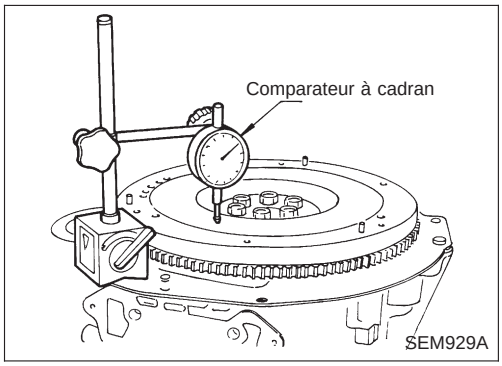
- Le palier de débrayage pour voir s'il tourne librement et s'il n'émet pas de bruits anormaux et ne présente pas de fêlures, de piqûres ou d'usure.
- Le manchon de débrayage et la surface de frottement du levier de débrayage pour voir si ces pièces ne présentent pas de traces d'usure, de rouille ou de détérioration.



LUBRIFICATION



- Enduire de graisse recommandée les surfaces de contact et de frottement.
- **Il ne faut pas mettre trop de lubrifiant, car ceci risque d'endommager les garnitures du disque d'embrayage.**

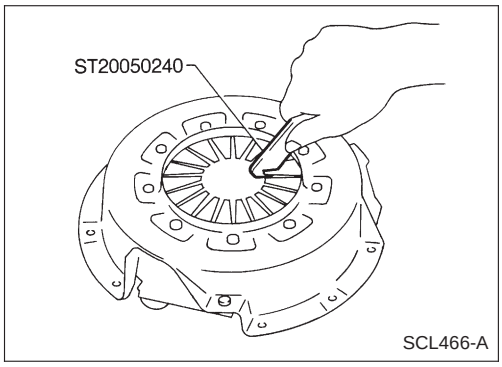


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Disque d'embrayage et volant-moteur

INSPECTION

- Contrôler le disque d'embrayage pour voir s'il n'y a pas de traces de brûlures, de décoloration, de fuites d'huile ou de graisse. Remplacer si nécessaire.
- Contrôler le disque d'embrayage pour voir si les garnitures ne sont pas usées.
  Limite d'usure de la surface des garnitures jusqu'aux têtes de rivets :
  0,3 mm
- Contrôler le disque d'embrayage et mesurer le battement des cannelures et le voile des garnitures.
  Battement maximum de cannelures (à la bordure extérieure du disque) :
  240 1,0 mm Sauf pour les moteurs TD25Ti et QD32
  250 1,0 mm Moteurs TD25Ti et QD32
  Limite de voile :
  0,7 mm Moteurs TD25 et TD27
  1,0 mm Sauf moteurs TD25 et TD27
  Distance du point de contrôle du voile, sauf pour les moteurs (depuis le centre du moyeu) :
  240 115 mm Sauf pour les moteurs TD25Ti et QD32
  250 120 mm Moteurs TD25Ti et QD32
- Vérifier si les surfaces de contact du disque d'embrayage et du volant-moteur ne sont pas légèrement brûlées ou décolorées. Réparer le volant-moteur au papier émeri.
- Contrôler le voile du volant-moteur.
  Limite de voile :
  Se reporter à la section EM (''Inspection'', ''BLOC-CYLINDRES'').



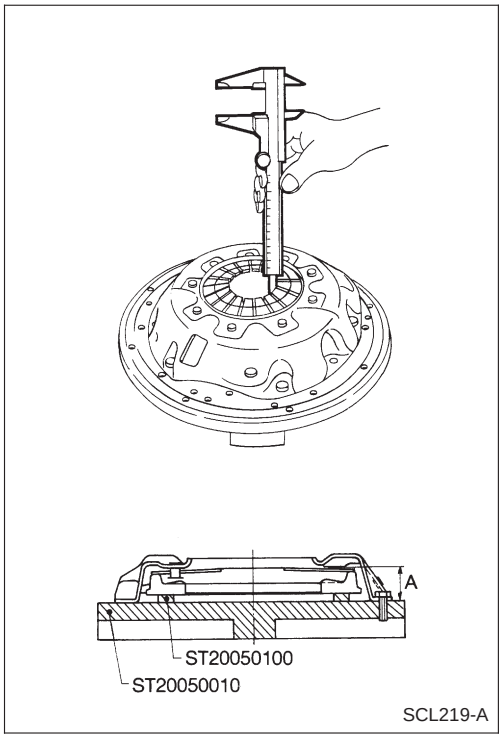
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Disque d'embrayage et volant-moteur (Suite)

REPOSE

- Enduire de graisse recommandée la surface de contact de la partie cannelée.

Trop de lubrifiant risque d'endommager le disque d'embrayage.



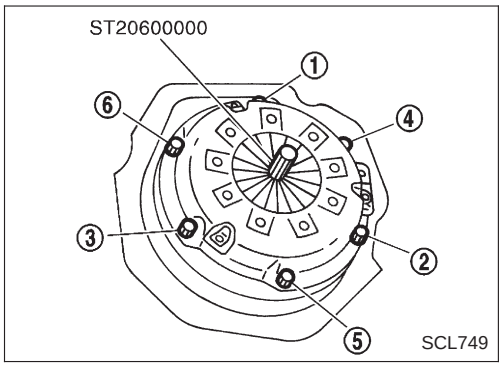
Couvercle d'embrayage

INSPECTION

- Corriger la différence de hauteur des ressorts de diaphragme à l'aide de l'outil spécial.

Limite d'irrégularité de hauteur :

250 0,5 mm Moteurs TD25Ti et QD32
240 0,5 mm Sauf pour les moteurs TD25 et TD27
0,7 mm Moteurs TD25 et TD27



- Placer l'outil spécial et contrôler la hauteur et l'irrégularité des ressorts de diaphragme.

Placer des calibres d'épaisseur de 0,2 mm sur les entretoises (ST20050100) lors de la vérification des modèles 240 ou 250.

Hauteur du ressort de diaphragme ''A'' :

240 37,5 - 39,5 mm Sauf moteurs TD25Ti et QD32
250 36,5 - 38,5 mm Moteur TD25Ti
37,0 - 39,0 mm Moteur QD32

- Contrôler les bagues de butée pour voir si elles ne sont pas usées ou endommagées en secouant l'ensemble de couvercle de haut en bas pour voir s'il est bruyant, ou en frappant légèrement sur les rivets et en écoutant le son émis. Remplacer l'ensemble de couvercle d'embrayage si nécessaire.
- Contrôler la surface de contact entre le plateau de pression et le disque d'embrayage pour voir s'il n'y a pas de légères brûlures ou de décolorations. Réparer le plateau de pression avec du papier émeri.
- Contrôler la surface de contact entre le plateau de pression et le disque d'embrayage pour voir s'il n'y a pas de déformations ou autres dommages. Remplacer si nécessaire.

REPOSE

- Introduire l'outil spécial dans le moyeu du disque d'embrayage pour la mise en place du couvercle et du disque d'embrayage.
- Veiller à ce qu'il n'y ait pas de graisse sur la garniture d'embrayage.
- Serrer les boulons dans l'ordre numérique, en deux étapes.

Première étape :
: 10 - 20 N·m (1,0 - 2,0 kg-m)
Etape finale :
: 22 - 29 N·m (2,2 - 3,0 kg-m)

Simpo PDF Merge and Split Unregistered Version - http://www.simopdf.com

Description

MOTEUR TD25Ti

Le système EGR est dessiné pour contrôler l'émission d'oxydes d'azote (NOx) en redistribuant les gaz d'échappement dans le collecteur d'admission par l'intermédiaire de la vanne de commande E.G.R. Pour le circuit électrique du système EGR, se reporter au ''SYSTEME DE PRECHAUFFAGE RAPIDE'' EC-1007b

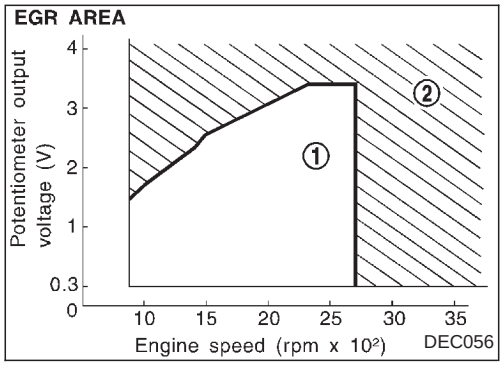

Schéma de circuit

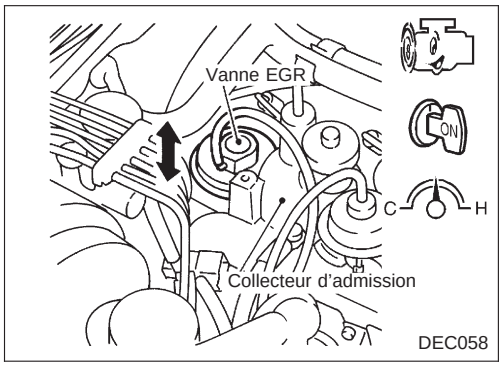


Fonctionnement

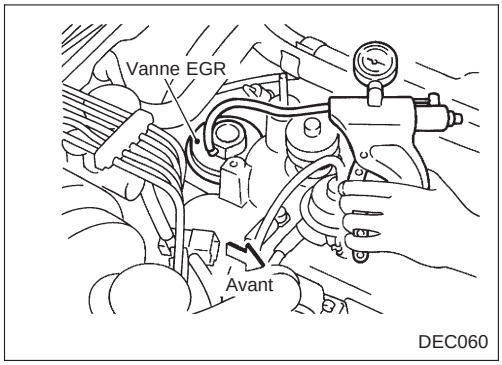
Température de réfrigérant ℃	Charge du moteur (Zone EGR)	Electrovanne de commande EGR	Vanne EGR	Débit de gaz EGR
Inférieur à 60	Tout	ARRET (Fermé)	Fermée	Non
Supérieur à 60	Charge légère (Zone ①)	MARCHE (Ouvert)	Ouvert	Oui
	Forte charge*1 (Zone ②)	ARRET (Fermé)	Fermée	Non

*1: Cela comprend également les conditions dans lesquelles le moteur est arrêté avec le contact d'allumage sur ON ou lorsque la pression atmosphérique est inférieure à 90,0 kPa (900 mbar, 675 mmHg).

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection du système

FONCTIONNEMENT GENERAL



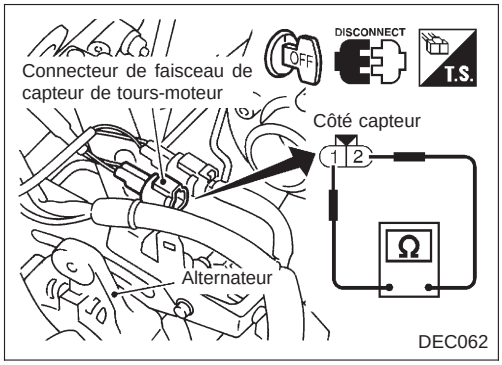
1. Démarrer le moteur et le laisser s'échauffer suffisamment.
2. S'assurer que le mouvement du diaphragme de la vanne EGR (utiliser les doigts pour s'assurer du mouvement de diaphragme de vanne EGR) satisfait aux conditions suivantes.

Au ralenti :

Le diaphragme ne bouge pas.

En emballant le moteur du ralenti à un régime de 1 000 à 2 700 tr/mn :

Le diaphragme bouge.



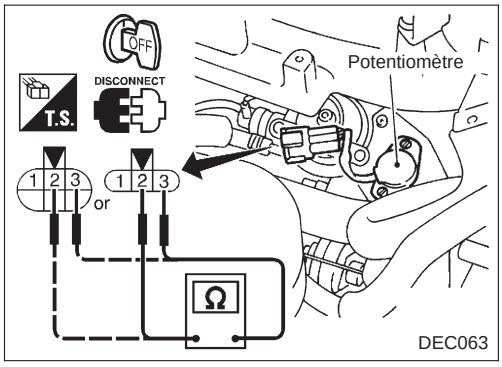
Inspection des composants

Vanne EGR

Appliquer une dépression à l'orifice de dépression de la vanne EGR à l'aide d'une pompe à vide manuelle.

Le diaphragme de la vanne EGR doit se soulever.

Si le résultat est mauvais, remplacer la vanne EGR.

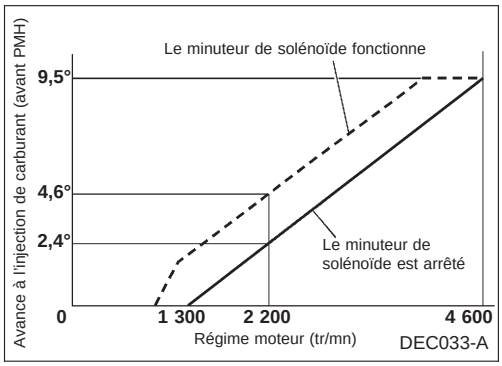


Capteur de régime moteur

1. Débrancher le connecteur de faisceau du capteur de régime moteur.
2. Vérifier la résistance entre les bornes ① et ②.

Résistance : environ 1,6 kΩ (à 25°C)

Si le résultat est mauvais, remplacer le capteur.



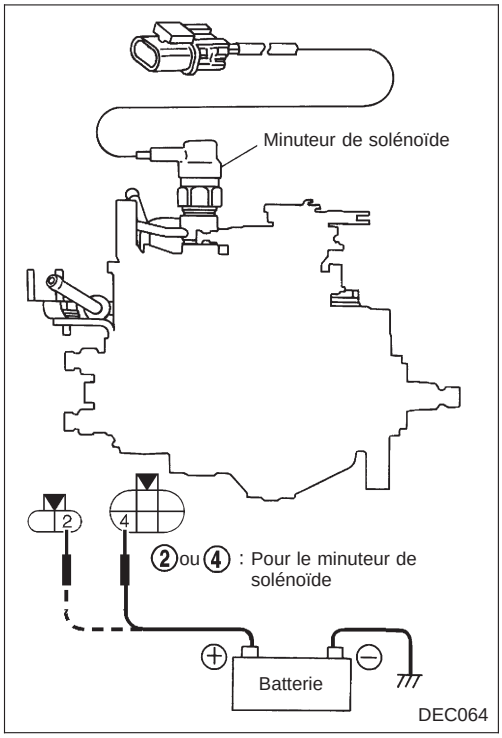
Potentiomètre

1. Débrancher le connecteur de faisceau du potentiomètre.
2. S'assurer que la résitance entre les bornes ② et ③ change lorsque l'accélérateur est utilisé.

Condition de la pédale d'accélérateur	Resistance kΩ (à 20°C)
Complètement relâchée	Environ 0,7
Partiellement enfoncé	0,7 - 5
Enfoncée à pleine course	Environ 5

Si le résultat est mauvais, remplacer le potentiomètre.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Fonctionnement

CARACTERISTIQUES DU MINUTEUR

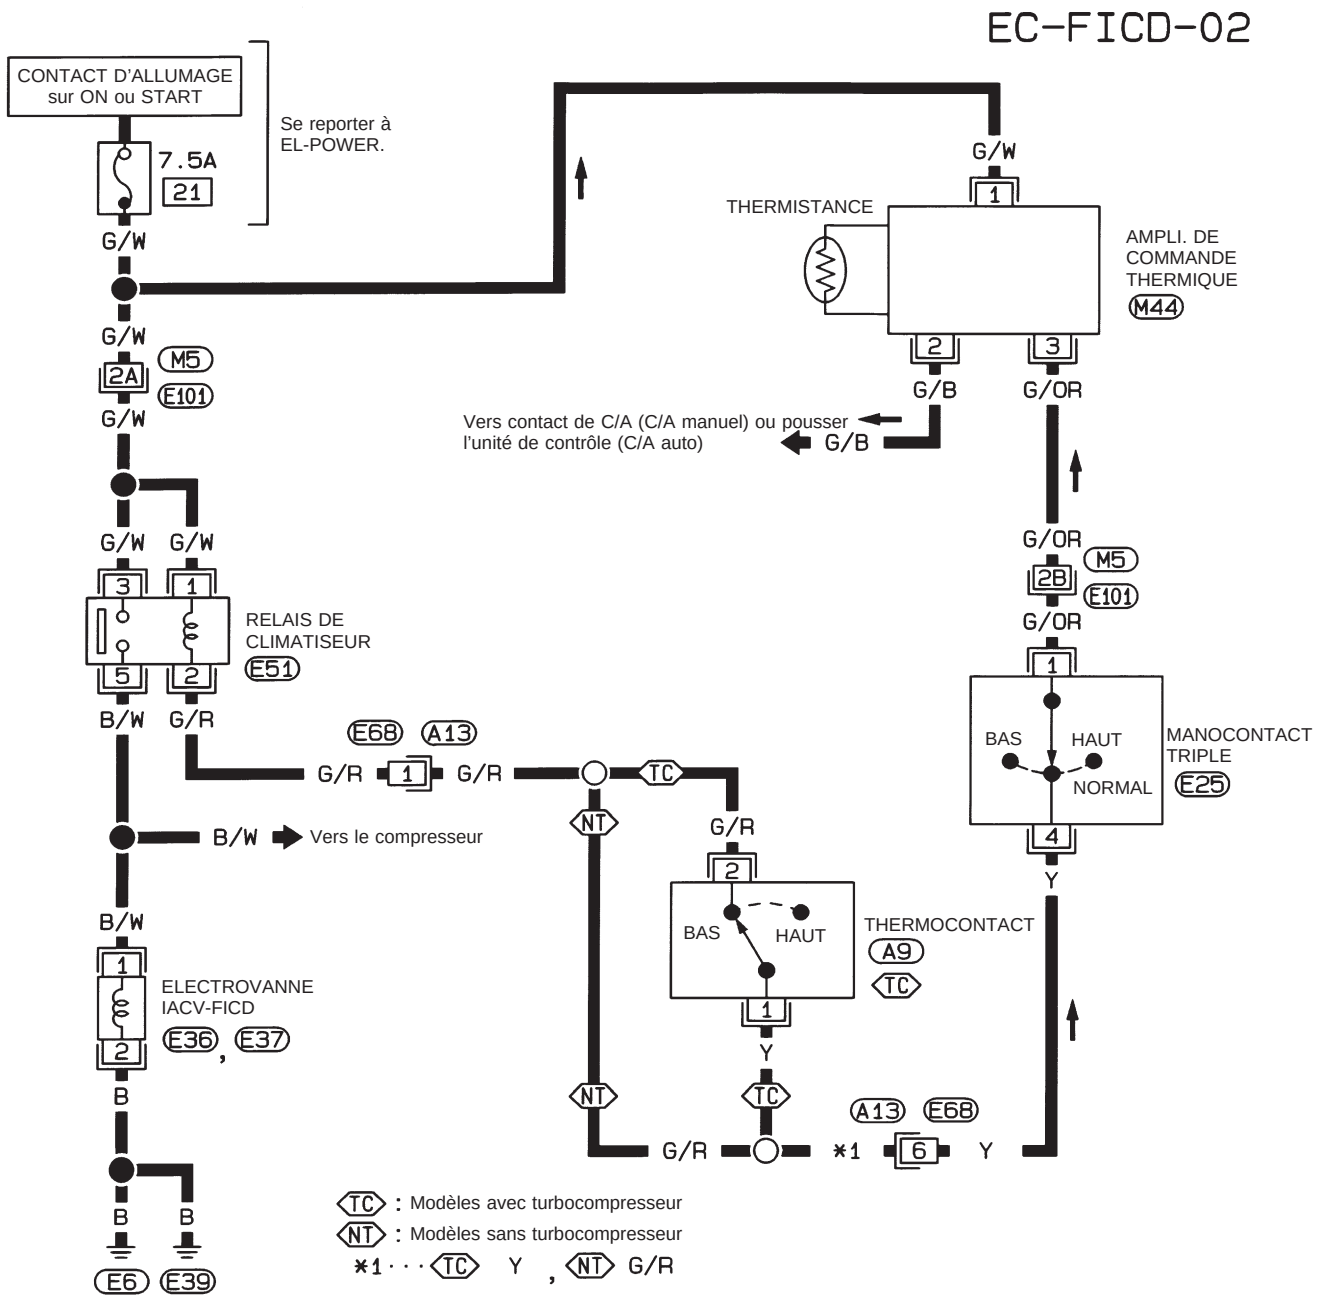
Les figures indiquent les différences de l'avance à l'injection de carburant par rapport au régime moteur lorsque le minuteur de solénoïde est actionné ou non.
Lorsque le minuteur de solénoïde s'enclenche, l'avance à l'injection progresse d'environ 2°. Ainsi, le démarrage à froid du moteur par temps froid est grandement amélioré.

Application :

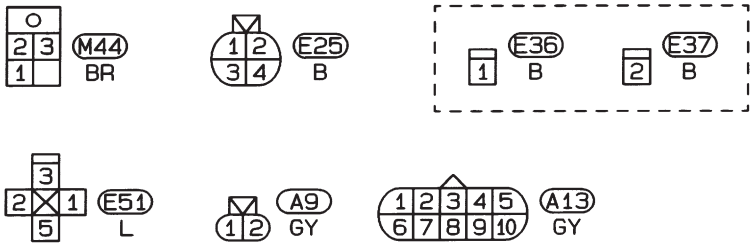
	N° de pièce	N° d'assemblage de pompe
TD25Ti	16700 3S900	104780-9010
	16700 3S901	104780-9020

Inspection

MINUTEUR DE SOLENOIDE



1. Débrancher le faisceau du minuteur de solénoïde et s'assurer que le solénoïde émet un bruit de déclic lorsque la batterie est branchée et débranchée.
   Si le solénoïde comporte un défaut, le remplacer.



Rebrancher le connecteur après contrôle.

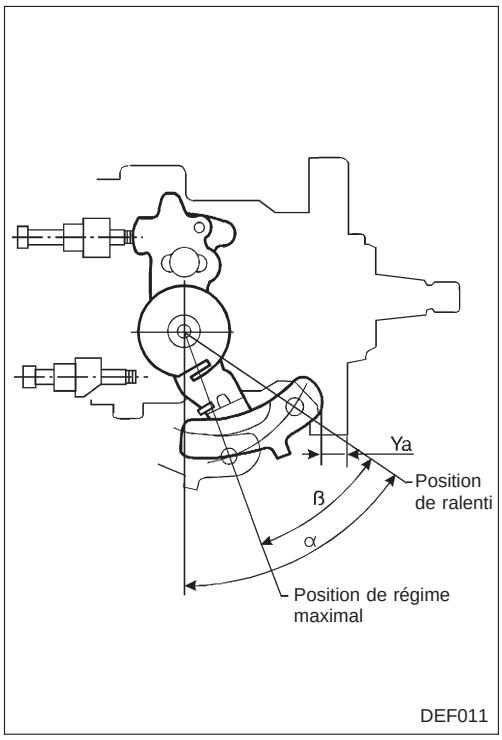
	2 000	63,7 - 69,7*	
	2 250	46,2*	
	2 500	13,7 - 19,7	
	2 750	Inférieur à 5,0	
Contact coupé Vanne magnétique	350	0	0 (0, 0)
Ralenti	350	6,9 - 11,9	0 (0, 0)
3 - 5 Solénoïde	Tension de déclenchement maxi : 8V Tension d'essai : 12 - 14V		

4. Dimensions	
K	3,2 - 3,4 mm
KF	5,7 - 5,9 mm
MS	0,6 - 0,8 mm
BCS	6,8 - 7,2 mm
Pré-course	0,08 - 0,12 mm
Angle du levier de commande	
α	51,0 - 59,0 degrés
β	31,0 - 41,0 degrés
γ	—



MARCHE : le minuteur de solénoïde est en marche. * : Valeur de référence
ARRET : le minuteur de solénoïde est arrêté.
Lorsque la position MARCHE-ARRET du chronomètre de solénoïde n'est pas indiquée dans les spécifications, c'est que la position est sur ARRET.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Calibrage standard de la pompe à injection (Suite)

Position de mesure de l'angle du levier de commande

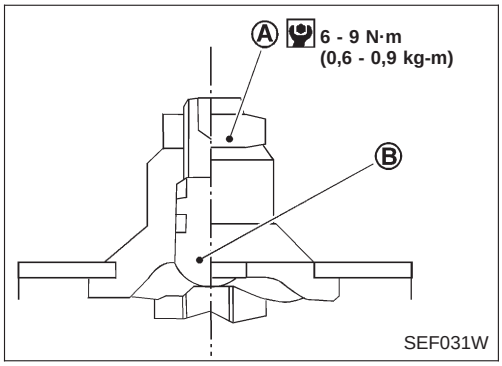
Mesurer les angles (α, β) du levier de commande.

Réglage du minuteur de charge

1. Régler l'arbre régulateur de façon à ce que le jeu entre l'extrémité du flasque et l'extrémité de l'arbre régulateur soit d'environ 3 mm, puis bloquer l'écrou.
2. Fixer le levier de commande dans une position respectant les conditions suivantes.
   Pression de suralimentation : 66,7±1,3 kPa (667±13 mbar, 500±10 mmHg)
   Régime de la pompe : 1 100 tr/mn
   Quantité de carburant injecté : 44,0±0,5 mℓ/1 000 course
3. Avec le levier de commande positionné comme décrit au numéro 2 ci-dessus, régler le manchon du régulateur de façon à ce que la course du minuteur soit conforme aux valeurs spécifiées (élément 2 - 7 du tableau de réglage de la pompe).
4. Fixer le levier de commande dans une position respectant les conditions suivantes et confirmer la course du minuteur.

Position du levier de commande			Valeurs spécifiées	
Régime de la pompe tr/mn	Quantité d'injection de carburant mℓ/1 000 course	Pression de suralimentation kPa (mbar, mmHg)	Course du minuteur mm	Valeur de reduction de la course du minuteur mm
1 100	44,0±1,0	66,7±1,3 (667±13, 500±10)	1,7±0,3	0,6*
1 100	20,0±2,5	66,7±1,3 (667±13, 500±10)	0,7±0,5	1,6*

* :Valeur de référence



Réglage du potentiomètre

1. Maintenir le levier de commande dans la position de ralenti.
2. Régler le potentiomètre de façon que la tension de sortie soit de 1,4±0,03V. Puis fixer le potentiomètre.
3. Après avoir réglé le potentiomètre, confirmer les spécifications de tension de sortie du potentiomètre à l'angle maximal du levier de commande ci-dessous.

Tension de sortie V	Angle du levier de commande	Remarques
1,4±0,03	Ralenti	Point de réglage
Supérieur à 9,5	Pleine course	Point de vérification

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Calibrage standard de la pompe à injection (Suite)

Réglage du compensateur de suralimentation (BCS)

1. Régler la quantité d'injection à pleine charge de la vitesse de pompe de 1 200 tr/mn à la valeur spécifiée du point de contrôle 2-3 dans le tableau de réglage de la pompe.
2. Régler les quantités d'injection du BCS de la vitesse de pompe de 800 tr/mn à la valeur spécifiée du point de contrôle 2-3 dans le tableau de réglage de la pompe.
3. Confirmer les quantités d'injection du NA de la vitesse de pompe de 500 tr/mn à la valeur spécifiée du point de contrôle 2-3 dans le tableau de réglage de la pompe.
4. Si le NA ci-dessus n'est pas comme spécifié, desserrer l'écrou Ⓐ et régler la vis Ⓑ de façon à ce que le NA satisfasse aux conditions, puis serrer l'écrou Ⓐ.

ATTENTION :
Ne pas serrer ou desserrer la vis Ⓑ de plus d'un tour.

A4	M1	—	: Masse de carrosserie
A4	M3	W/12	: Vers D1
A3	M4	W/12	: Vers D2 (modèles à 4 roues motrices)
A3	M5	Super raccord multiple	: Vers E101
B3	M6	W/24	: Vers N1
A3	M7	W/20	: Vers N2
B3	M9	L/4	: Relais de lève-glace électrique (modèles à 4 roues motrices)
B4	M10	—	: Boîtier à fusibles
B4	M11	GY/14	: Connecteur de liaison des données de diagnostic pour CONSULT
F3	M14	W/3	: Boîtier à fusibles
B3	M15	B/3	: Centrale de clignotants combinée
B2	M16	B/2	: Contact de feux de stop
C2	M17	Y/12	: Vers M18 (modèles à 4 roues motrices avec coussin gonflable)
B1	M18	Y/12	: Vers M17 (modèles à 4 roues motrices avec coussin gonflable)
A1	M19	W/6	: Vers R1
D3	M20	W/6	: Contact d'allumage
C1	M21	W/1	: Contact de frein de stationnement (type à manche)
D2	M23	BR/8	: Commande d'éclairage • Commande de clignotant
D2	M24	BR/4	: Commande d'éclairage
D3	M25	Y/6	: Câble spiralé (modèles à 4 roues motrices avec coussin gonflable)
D3	M26	W/6	: Câble spiralé (modèles à 2 roues motrices avec coussin gonflable)
D2	M27	B/1	: Commande d'avertisseur sonore
D2	M28	GY/8	: Contact d'essuie-glace et de lave-glace
D4	M31	GY/6	: Connecteur de raccord (moteur KA)
E3	M32	W/64	: ECM (moteur KA)
E4	M33	—	: Masse de carrosserie (moteur KA)
E3	M35	W/10	: Autoradio
F3	M36	W/6	: Autoradio (modèles avec 4 haut-parleurs et moteur KA)
E3	M37	B/2	: Allume-cigare
E3	M38	W/3	: Interrupteur de climatiseur (sans C/A automatique)
F3	M39	W/6	: Commutateur de ventilateur (sans C/A automatique)
E2	M40	W/2	: Eclairage de commutateur de ventilateur (sans C/A automatique)
E2	M41	W/8	: Interrupteur de feux de détresse
E1	M42	W/6	: Interrupteur de désembuage de lunette arrière
F2	M44	BR/4	: Amplificateur de commande thermique
G2	M45	BR/4	: Résistance du ventilateur
G2	M46	W/2	: Moteur de soufflerie
G3	M49	W/12	: Vers D31
G3	M50	W/6	: Vers D32 (modèles à 4 roues motrices)
G4	M51	W/8	: Minuterie de verrouillage de porte
G3	M52	W/2	: Rupteur
B4	M53	B/12	: Ensemble de témoin sonore
G3	M54	—	: Masse de carrosserie
A3	M56	-/2	: Diode (pour système de multi-télécommande)
B2	M57	-/2	: Diode (pour système de multi-télécommande)
C3	M59	W/10	: Vers M701 (modèles à 4 roues motrices)
C2	M60	W/12	: Vers M702 ou connecteur volant (modèles à 4 roues motrices)
D2	M63	W/3	: Commande de feu antibrouillard arrière
D3	M64	W/2	: Contact de clé (modèles à 4 roues motrices)
E3	M65	W/4	: Ampli. d'antenne NATS (moteur TD)
D4	M66	GY/20	: ECM (moteur TD)
D4	M67	GY/16	: ECM (moteur TD)
E3	M68	W/8	: IMMO NATS (moteur KA)
F3	M69	W/12	: IMMO NATS (moteur TD)
E2	M70	L/8	: Interrupteur de lave-phare
E1	M71	B/6	: Vers M410 (pour C/A automatique)
F1	M72	W/6	: Vers M411 (pour C/A automatique)

Faisceau auxiliaire (pour système de multi-télécommande)

C3	M701	W/10	: Vers M59
C3	M702	W/12	: Vers M60
C2	M703	W/12	: Boîtier de multi-télécommande
D3	M704	B/5	: Relais 1 de multi-télécommande
C3	M705	BR/6	: Relais 2 de multi-télécommande
C2	M706	B/5	: Relais 3 de multi-télécommande
C2	M707	B/5	: Relais 4 de multi-télécommande

Diode M56, M57

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

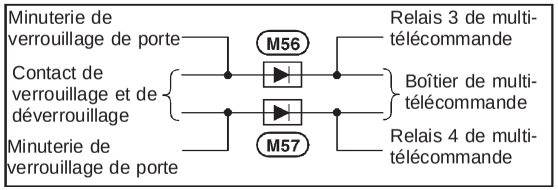
G4 (M1) — : Masse de carrosserie
A3 (M2) W/2 : Témoin sonore (moteur diesel sauf pour l'Europe et l'Australie)
G4 (M3) W/12 : Vers (D1)
G3 (M4) W/12 : Vers (D2) (avec lève-glace électrique)
G3 (M5) Super raccord multiple : Vers (E101)
F4 (M6) W/24 : Vers (N1)
G2 (M7) W/20 : Vers (N2) (pour l'Europe)
E4 (M9) L/4 : Relais de lève-glace électrique
F4 (M10) — : Boîtier à fusibles
E4 (M11) GY/14 : Connecteur de liaison des données de diagnostic pour CONSULT (moteur KA et pour l'Europe)
F4 (M12) B/12 : Connecteur de contrôle (moteur NA)
F4 (M13) B/10 : Connecteur de contrôle (moteur Z)
F3 (M14) W/3 : Boîtier à fusibles
E4 (M15) B/3 : Centrale de clignotants combinée
E3 (M16) B/2 : Contact de feux de stop
B1 (M17) Y/12 : Vers (M18) (modèles à 4 roues motrices avec coussin gonflable)
C1 (M18) Y/12 : Vers (M17) (modèles à 4 roues motrices avec coussin gonflable)
F1 (M19) W/6 : Vers (R1)
E1 (M20) W/6 : Contact d'allumage
D1 (M21) W/1 : Contact de frein de stationnement (type à manche)
F4 (M22) W6 : Module de commande de pompe à carburant (moteur NA et moteur Z)
D2 (M23) BR/8 : Commande d'éclairage
• Commande de clignotant
D2 (M24) BR/4 : Commande d'éclairage
D3 (M25) Y/6 : Câble spiralé (modèles à 4 roues motrices avec coussin gonflable)
D3 (M26) W/6 : Câble spiralé (modèles à 2 roues motrices pour l'Europe)
D3 (M27) B/1 : Commande d'avertisseur sonore
D2 (M28) GY/8 : Commande d'essuie-glace et de lave-glace
C4 (M29) W/12 : Boîtier de contrôle de préchauffage (moteur diesel sauf pour l'Europe)
C4 (M35) W/10 : Autoradio
C4 (M36) W/6 : Autoradio (modèles à cabine double pour l'Europe)
C3 (M37) B/2 : Allume-cigare
C2 (M38) W/3 : Interrupteur de C/A (pour l'Europe et l'Australie)
C2 (M39) W/6 : Commutateur de ventilateur (pour l'Europe et l'Australie)
B2 (M40) W/2 : Eclairage de commutateur de ventilateur (pour l'Europe et l'Australie)
D1 (M41) W/8 : Interrupteur de feux de détresse
B1 (M42) W/6 : Interrupteur de désembuage de lunette arrière (pour l'Europe et cabine double pour l'Australie)
C1 (M43) B/8 : Vers (M401) (sauf pour l'Europe et l'Australie)
B1 (M44) BR/4 : Amplificateur de commande thermique (pour l'Europe et l'Australie)
A2 (M45) BR/4 : Résistance du ventilateur
A2 (M46) W/2 : Moteur de soufflerie
A1 (M47) W/10 : Vers (F55) (moteur KA)
A2 (M48) W/24 : Vers (F54) (moteur KA)
A3 (M49) W/12 : Vers (D31)
A3 (M50) W/6 : Vers (D32) (avec lève-glace électrique)
G3 (M51) W/8 : Minuterie de verrouillage de porte (modèles à 4 roues motrices pour l'Europe et à cabine double catégorie ST pour l'Australie)
G3 (M52) W/2 : Rupteur (modèles à 4 roues motrices pour l'Europe et à cabine double catégorie ST pour l'Australie)
B3 (M53) B/12 : Ensemble de témoin sonore (pour l'Europe)
A3 (M54) — : Masse de carrosserie
A1 (M56) -/2 : Diode (pour système de multi-télécommande)
F2 (M57) -/2 : Diode (pour système de multi-télécommande)
F2 (M58) W/12 : Boîtier de multi-télécommande (modèles à 4 roues motrices pour l'Europe)
F2 (M61) W/16 : Vers (M708) ou connecteur volant (modèles à 4 roues motrices pour l'Europe)
D3 (M63) W/3 : Commande de feu antibrouillard arrière (pour l'Europe)
E2 (M64) W/2 : Contact de clé (modèles à 4 roues motrices pour l'Europe)
E2 (M65) W/4 : Ampli. d'antenne NATS (pour l'Europe)
D4 (M66) GY/20 : ECM (moteur diesel pour l'Europe)
D4 (M67) GY/16 : ECM (moteur diesel pour l'Europe)
B2 (M69) W/12 : IMMO NATS (pour l'Europe)

Compartiment moteur

(M220) GY/8 : Ampli. d'essuie-glace ou connecteur volant (moteur diesel pour l'Europe et l'Australie)
(M221) W/6 : Moteur d'essuie-glace (sauf moteur KA)

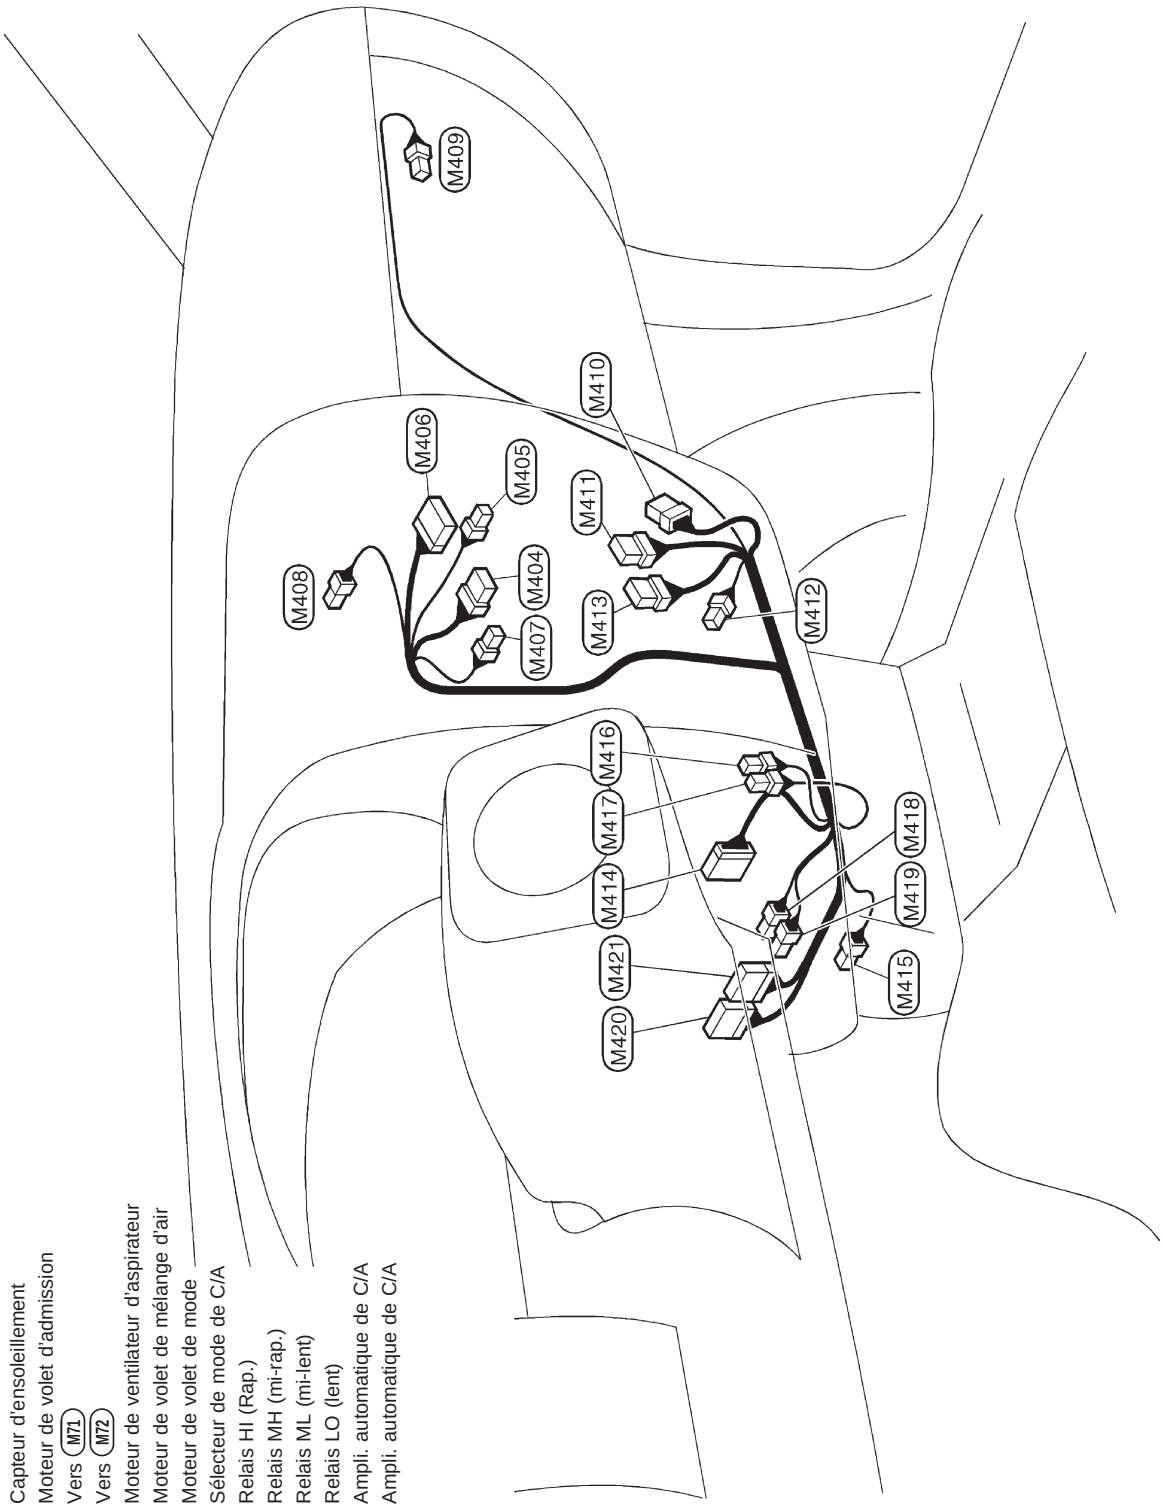


Faisceau auxiliaire (sauf pour l'Europe et l'Australie)

C1 (M401) B/8 : Vers (M43)
B1 (M402) BR/4 : Amplificateur de commande thermique (modèles avec C/A)
B3 (M403) W/2 : Eclairage de commutateur de ventilateur
B3 (M404) W/6 : Commutateur de ventilateur
B3 (M405) W/3 : Interrupteur de C/A (modèles avec C/A)

Faisceau auxiliaire (pour système de multi-télécommande)

D4 (M704) B/5 : Relais 1 de multi-télécommande
D3 (M705) BR/6 : Relais 2 de multi-télécommande
D4 (M706) B/5 : Relais 3 de multi-télécommande
E4 (M707) B/5 : Relais 4 de multi-télécommande
E2 (M708) W/16 : Vers (M61)



Diode (M56), (M57)

Utiliser le tableau ci-dessous pour déterminer la signification des codes de schémas de câblage.
Se reporter aux codes des schémas de câblage dans l'index pour connaître l'emplacement (le numéro de page) de chaque schéma de câblage.

Code	Section	Nom du schéma de câblage
ABS	BR	Système anti-enrayeur des freins
A/C, A	HA	Climatiseur automatique
A/C, M	HA	Climatiseur manuel
AUDIO	EL	Système audio
DEF	EL	Désembuage de lunette arrière et de rétroviseur de porte
DIMDIP	EL	Phares — avec système de mise en veilleuse des codes
D/LOCK	EL	Verrouillage électrique de porte
FICD	EC	Electrovanne IACV-FICD
GLOW	EC	Circuit de préchauffage rapide

Code	Section	Nom du schéma de câblage
ILL	EL	Eclairage
INT/L	EL	Plafonnier et spot de lecture
MULTI	EL	Système de multi-télécommande
POWER	EL	Disposition de l'alimentation électrique
SRS	RS	Système de retenue supplémentaire
TURN	EL	Clignotants et feux de détresse
WARN	EL	Témoins lumineux
WINDOW	EL	Lève-glace électrique

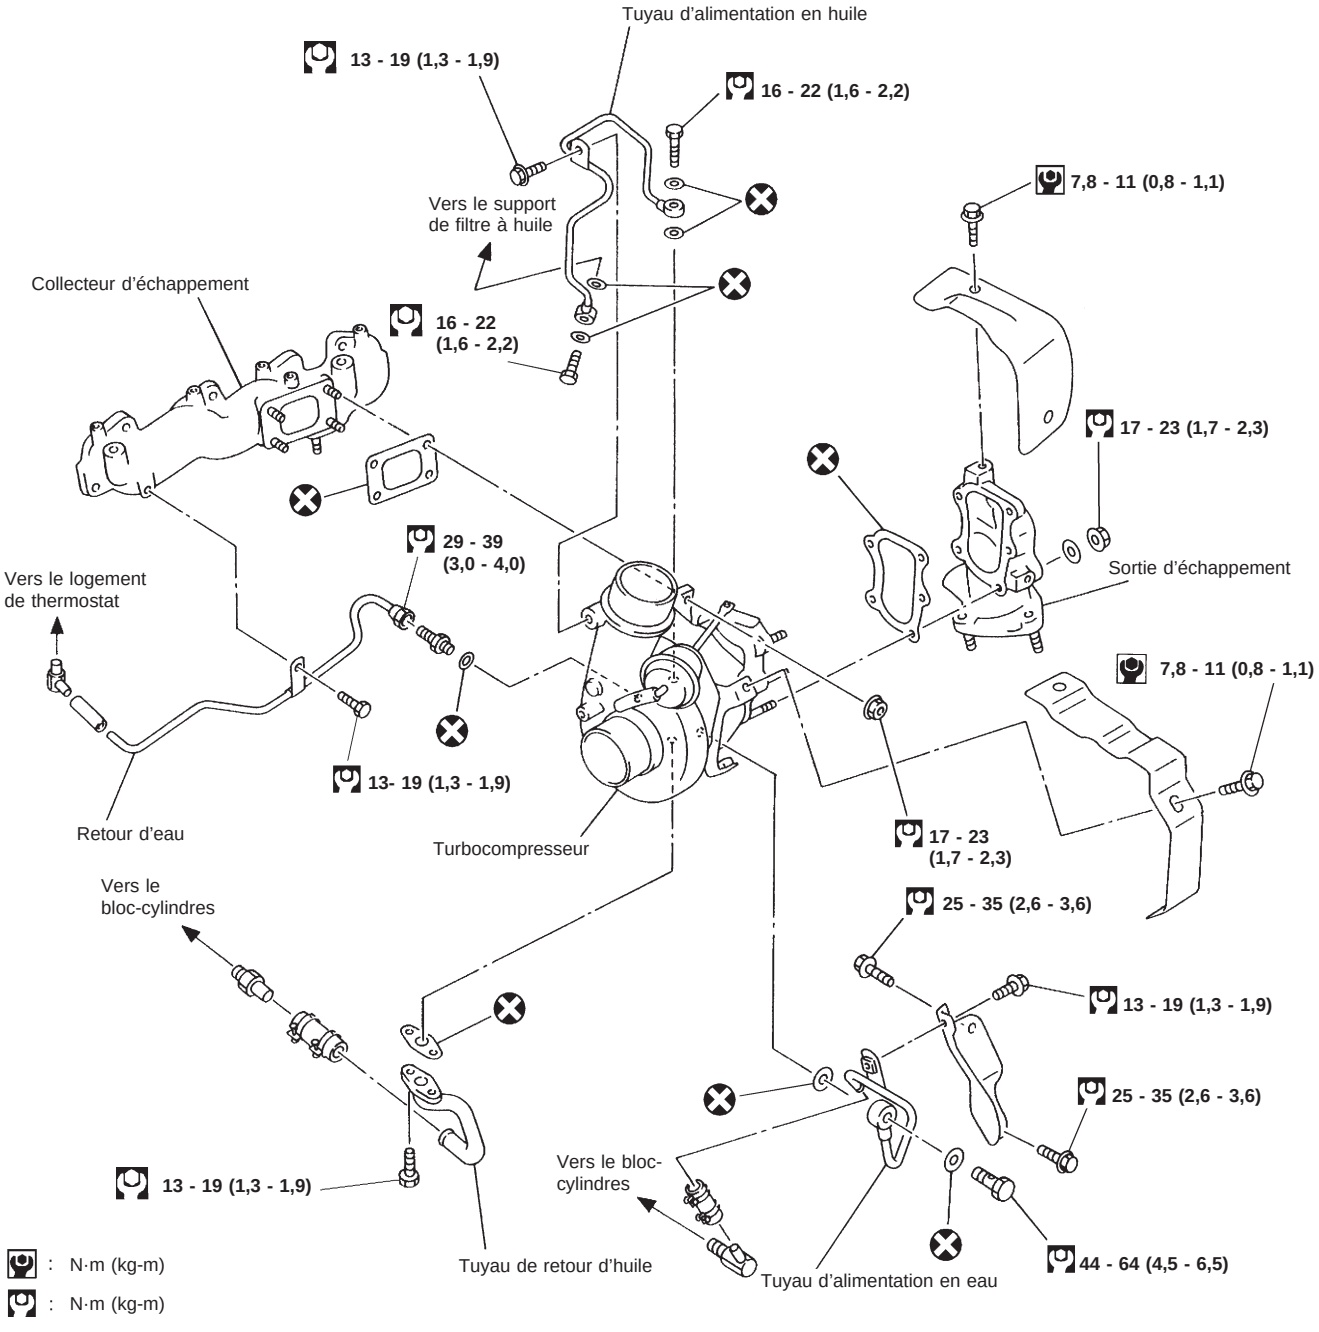
SEC. 140•144•150•230•275

DEM114

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Repose

1. Reposer le joint plat de carter d'huile avec la surface enduite face au bloc-cylindres et la partie en saillie face à l'arrière du moteur.
2. Serrer tous les boulons dans l'ordre inverse de la dépose. Se reporter à la page EM-1016 pour connaître le couple de serrage du carter d'huile et le sens de montage de la rondelle du bouchon de vidange.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SEC. 144

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Dépose et repose

Il ne faut pas démonter le turbocompresseur.

1. Vidanger le liquide de refroidissement.
2. Déposer les pièces suivantes :
- Composants du conduit d'air et du refroidisseur d'huile de suralimentation
- Déflecteurs de chaleur
- Tuyau d'échappement avant
- Tuyaux d'huile
- Conduits d'eau
3. Déposer le turbocompresseur du collecteur d'échappement.
4. Déposer les boulons de support du turbocompresseur.

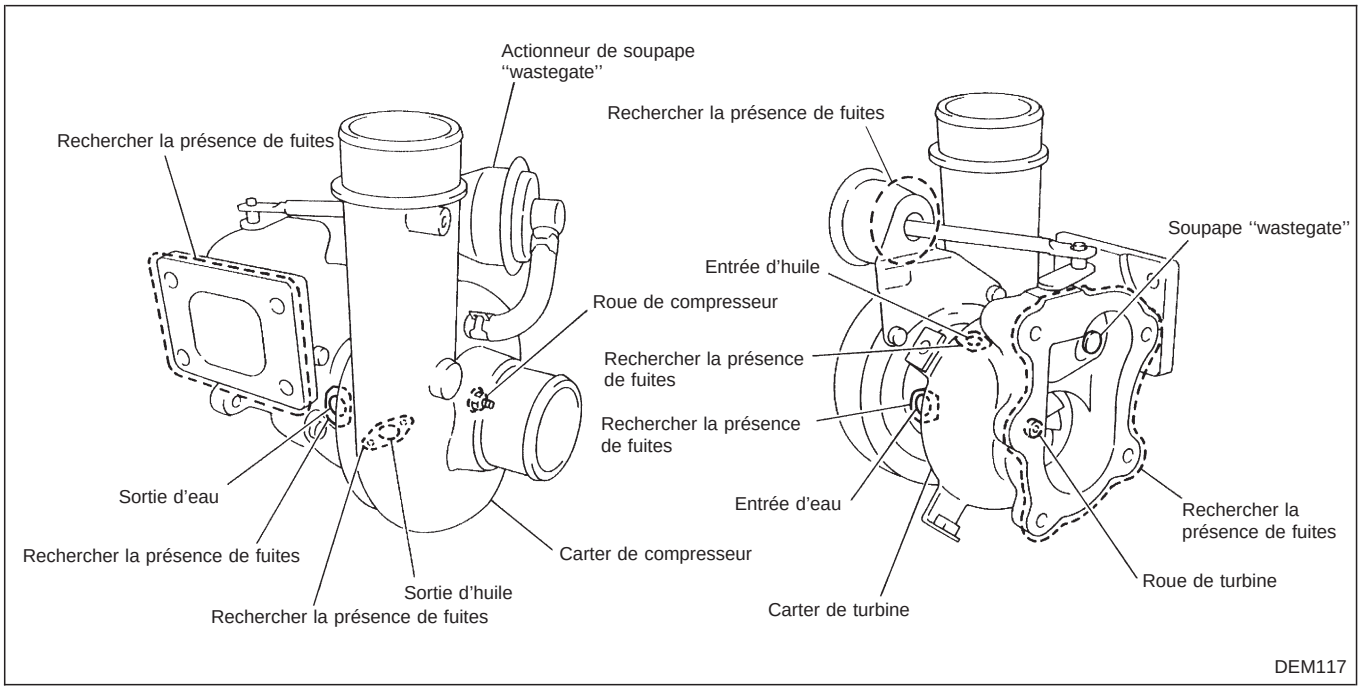
Inspection

Condition 1 : faible puissance du moteur

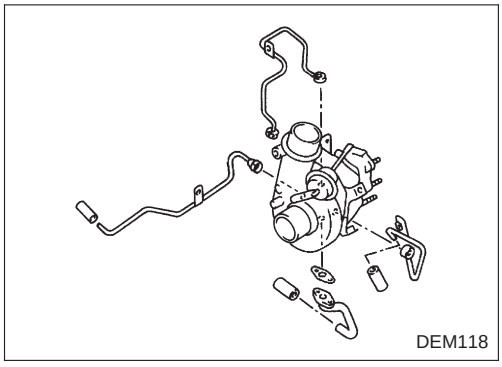
Cause probable	Rectification
Fuite d'huile au raccord du carter de compresseur et du tuyau d'admission/arrivée, ou au raccord de l'arrivée et du collecteur d'admission.	Fixer le raccord.
Fuite de gaz d'échappement au raccord du carter de turbine et du collecteur d'échappement, du tuyau de raccord ou du tube de sortie.	Fixer le raccord ou remplacer le joint plat.
Vanne de dérivation bloquée en position ouverte.	Remplacer l'ensemble du turbocompresseur.
Tourillon ou palier bloqué ou usé.	
Arbre cassé.	
Dépôt à l'arrière de la roue de turbine.	
Roue de turbine cassée.	

Condition 2 : puissance excessive du moteur

Cause probable	Rectification
Flexible de caoutchouc de commande de soupape de dérivation débranché ou fissuré.	Réparer ou remplacer le flexible en caoutchouc.
Vanne de dérivation bloquée en position fermée.	Remplacer l'ensemble du turbocompresseur.
La membrane de la commande est cassée.	



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

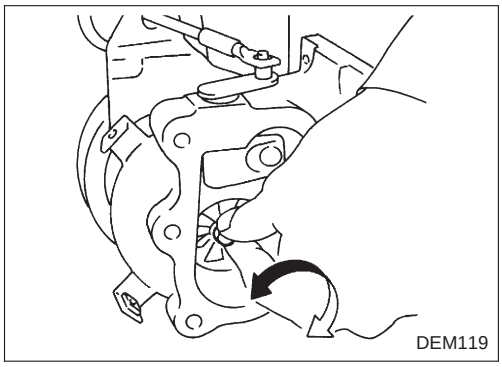


Inspection (Suite)

Condition 3 : consommation excessive d'huile ou dégagement d'une fumée bleue pâle par le pot d'échappement

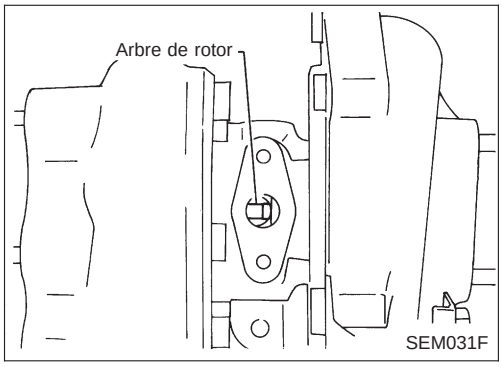
Cause probable	Rectification
Fuite d'huile au niveau du raccord du passage d'huile de lubrification.	Fixer le raccord.
Fuite d'huile au niveau du joint d'huile de la turbine.	Remplacer l'ensemble du turbocompresseur.
Fuite d'huile au niveau du joint d'huile de compresseur.	
Tourillon ou palier usé.	

Effectuer les vérifications suivantes. Si le résultat n'est pas satisfaisant, remplacer le turbocompresseur comme un ensemble.



TUYAUX D'HUILE ET D'EAU

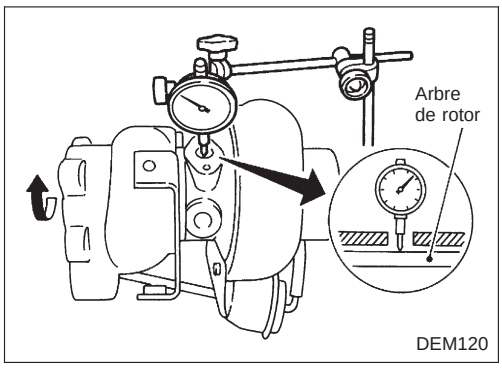
Vérifier si les tuyaux ne sont pas bouchés.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

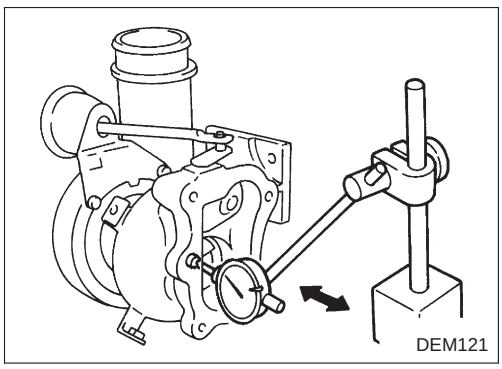
Inspection (Suite)

ARBRE DU ROTOR



DEM119

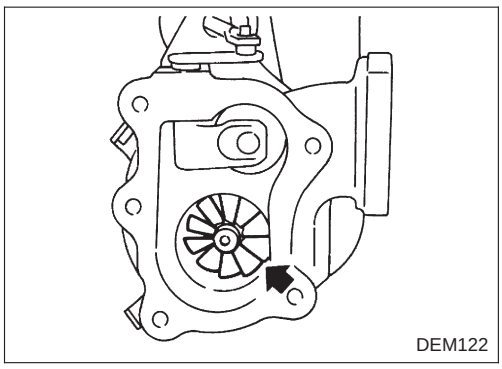
1. Vérifier si la rotation de l'arbre de rotor est bien régulière.



SEM031F

2. Vérifier si il n'y a pas de dépôts de calamine sur l'arbre de rotor.

DEM120



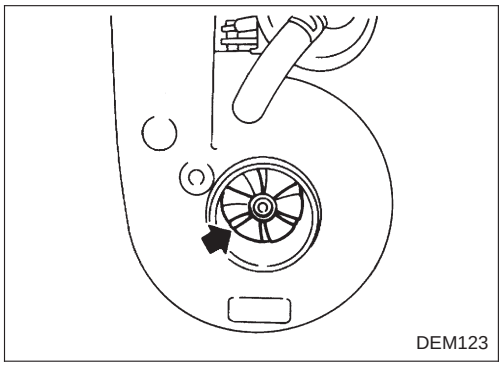
3. Mesurer le voile de l'arbre de rotor.
   Voile (Indication totale du comparateur) :
   Standard
   0,092 -0,128 mm

DEM121

4. Mesurer le jeu axial de l'arbre de rotor.
   Jeu axial :
   Standard
   0,02 - 0,06 mm

- **Ne pas laisser tourner les roues pendant la mesure du jeu axial.**

ROUE DE TURBINE

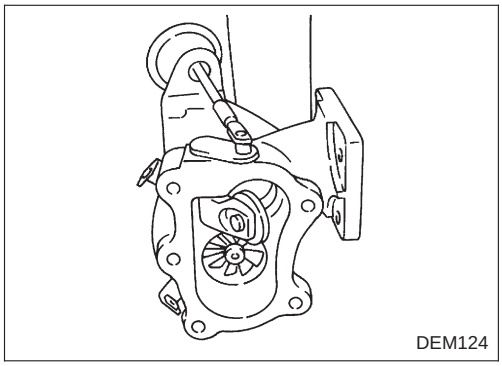


DEM122

Vérifier si la roue de turbine ne présente pas les anomalies suivantes :

- Présence d'huile
- Dépôts de calamine
- Ailettes déformées
- Points de contact avec le carter de turbine

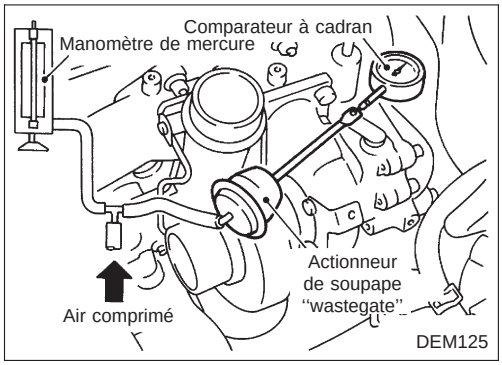
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Inspection (Suite)

DEM123

ROUE DU COMPRESSEUR



Vérifier si la roue de compresseur ne présente pas les anomalies suivantes :

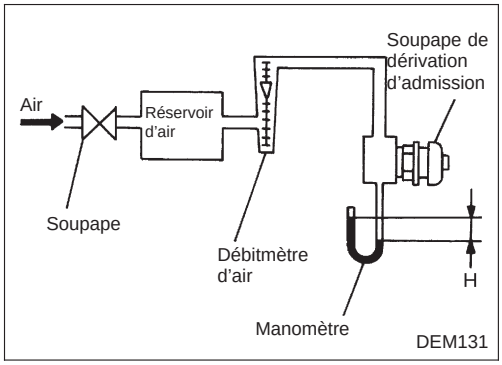
- Présence d'huile
- Ailettes déformées
- Points de contact avec le carter de compresseur

DEM124

SOUPAPE DE DECHARGE WASTEGATE

Enlever la goupille de retenue et vérifier qu'il n'y a pas de fissures sur la soupape ''wastegate'', qu'elle n'est pas déformée et que son mouvement est bien régulier. Vérifier si la surface du siège de soupape est bien régulière.

DEM125



COMMANDE DE SOUPAPE WASTEGATE

Contrôler le fonctionnement de l'actionneur de la soupape ''wastegate''.

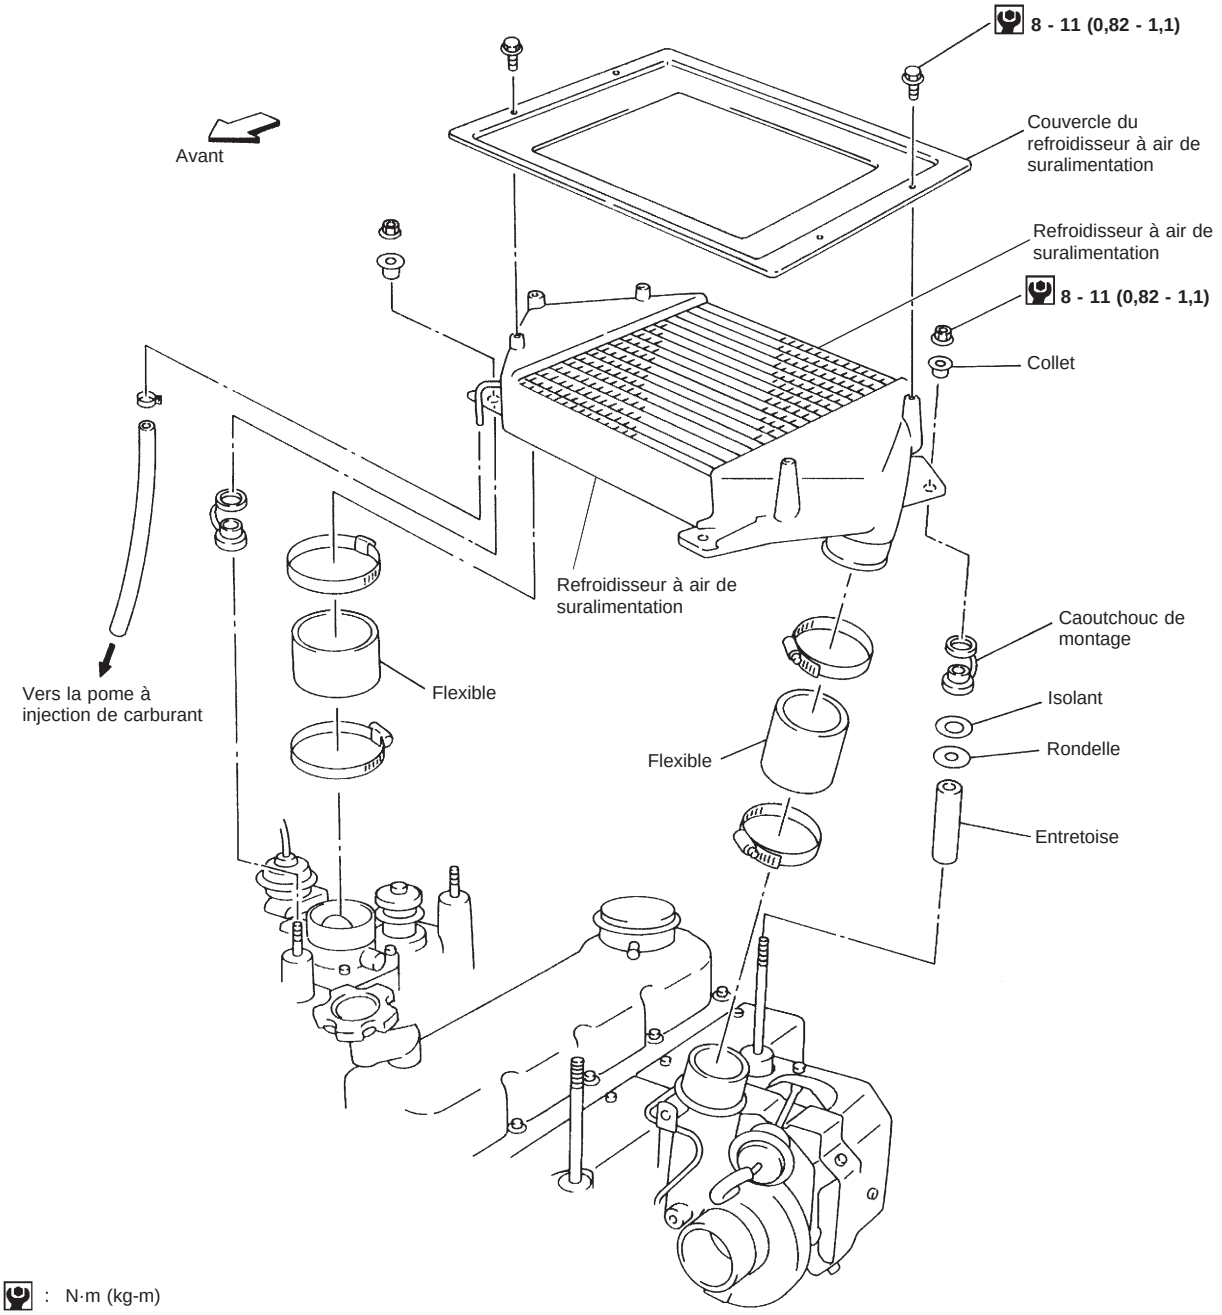
Ne pas appliquer une pression supérieure à 96,0 kPa (960 mbar, 720 mmHg) au diaphragme de l'actionneur.

Course/pression de l'actionneur de soupape ''wastegate''.

1,5 mm/80,0 - 85,3 kPa
(800 - 853 mbar, 600 - 640 mmHg)

DEM131

SOUPAPE DE DERIVATION D'ADMISSION



Contrôler la pression de décharge d'air de la soupape de dérivation d'admission.

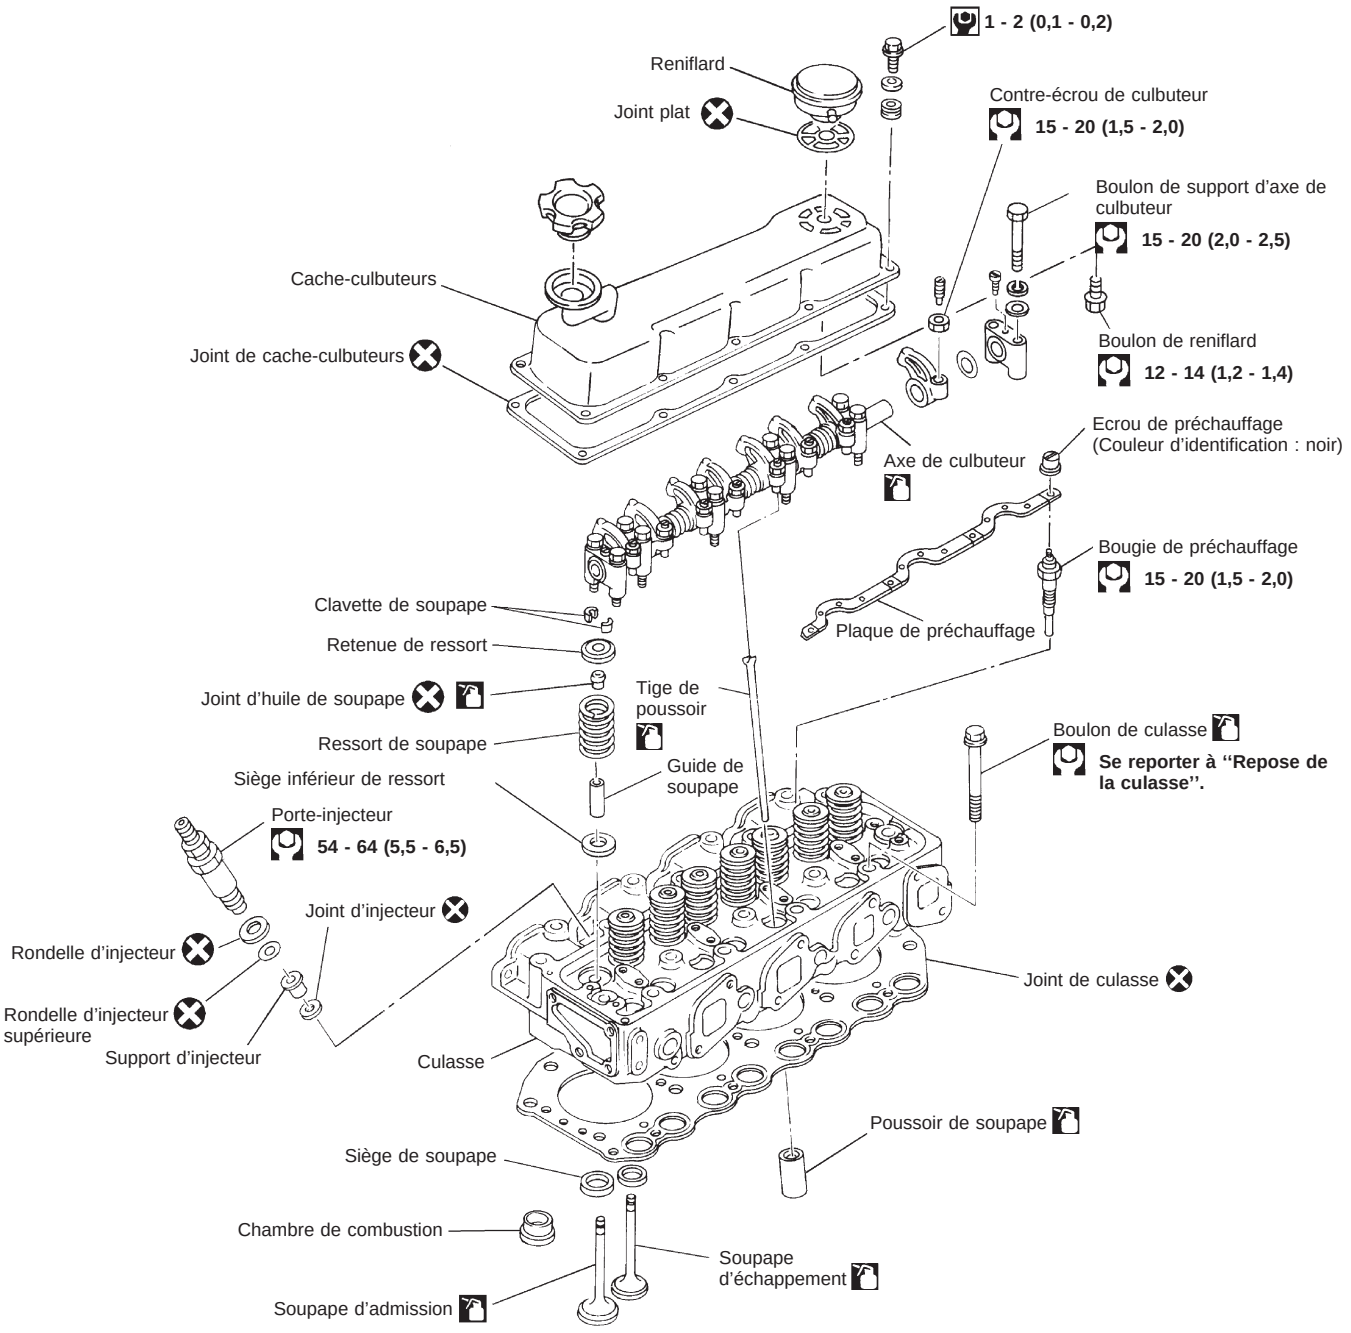
Lecture ''H'' du manomètre :

84,0 - 94,6 kPa (840 - 946 mbar, 630 - 710 mmHg) pour un débit d'air de 20 ℓ/min.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SEC. 144

DEM130



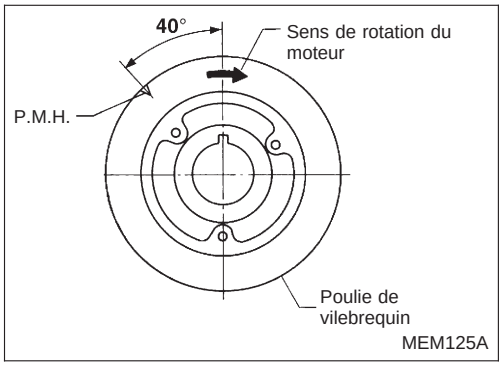
Inspection

Vérifier que les passages d'air du noyau du refroidisseur et les ailettes ne sont pas bouchés, ne fuient pas et ne sont pas déformés. Nettoyer ou remplacer le refroidisseur à air de suralimentation si nécessaire.

Veiller à ne pas déformer les ailettes du noyau.

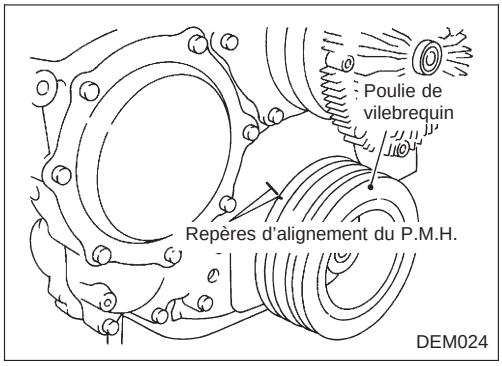
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SEC. 111•130•185•220



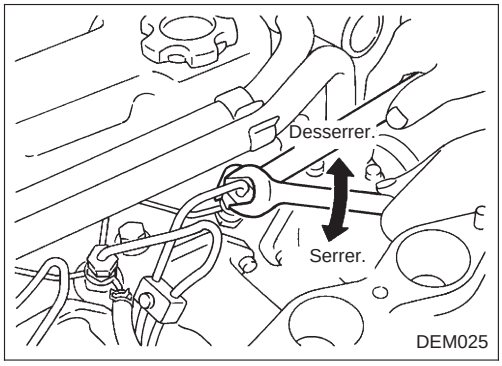
DEM116

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

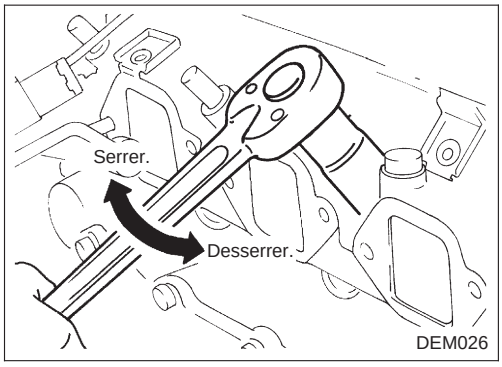


ATTENTION :

- **Lors du montage des pièces coulissantes tels que culbuteurs, arbre à cames et joint d'huile, veiller à appliquer une couche d'huile moteur neuve sur leurs surfaces de frottement.**
- **Lors du serrage des boulons de culasse et des boulons d'axe de culbuteurs, enduire d'huile moteur neuve les parties filetées et les faces d'assise des boulons.**

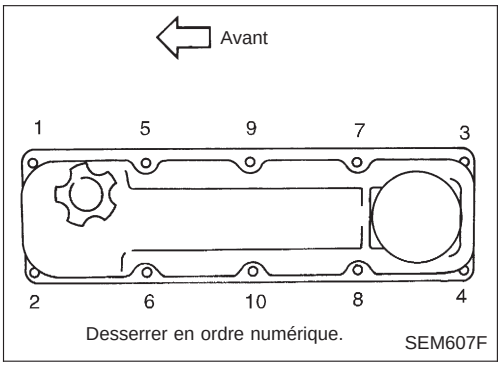


Dépose

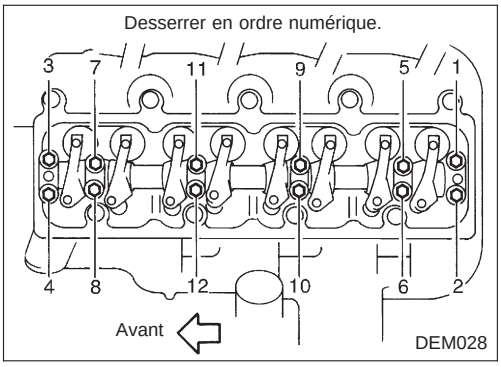


1. Placer le cylindre n° 1 au P.M.H. (point mort haut) dans sa course de compression.
2. Vidanger le liquide de refroidissement par les bouchons de vidange situés sur le bloc-cylindres et le radiateur.
3. Déposer les composants du conduit d'air et du refroidisseur à air de suralimentation.
4. Déposer le boulon de réglage de l'alternateur.
5. Déposer le couvercle de sortie d'échappement.
6. Débrancher le tuyau d'échappement de la sortie d'échappement.
7. Déposer les tuyaux d'huile et d'eau du turbocompresseur.
8. Déposer le turbocompresseur du collecteur d'échappement.
9. Débrancher le flexible de sortie de radiateur et le flexible d'entrée d'eau du logement de thermostat.

10. Déposer le tuyau d'injection de carburant et le tube de trop-plein.



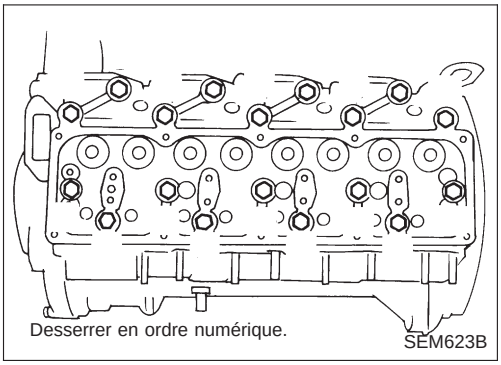
11. Déposer le porte-injecteur et le joint de l'injecteur supérieur à l'aide d'une douille de profondeur.



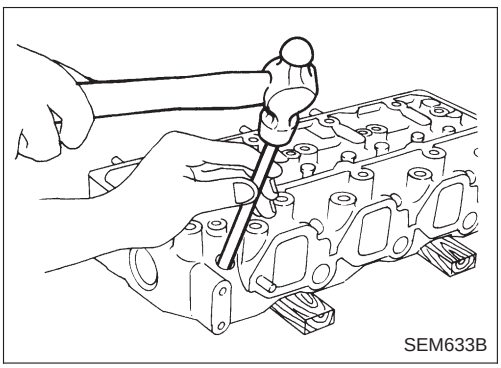
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Dépose (Suite)

12. Déposer le cache-culbuteurs.



13. Déposer l'axe des culbuteurs avec les culbuteurs.
14. Déposer les tiges de poussoirs.



15. Déposer les boulons de culasse dans l'ordre numérique, puis déposer la culasse.

Une dépose dans l'ordre incorrect peut entraîner une déformation ou une fêlure de la culasse.

Remontage

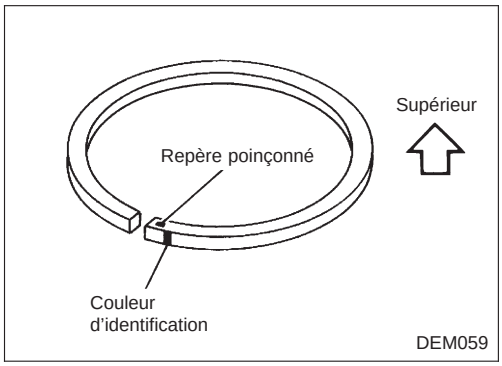
PISTON

Remonter les pistons, les axes de piston, les joncs d'arrêt et les bielles.

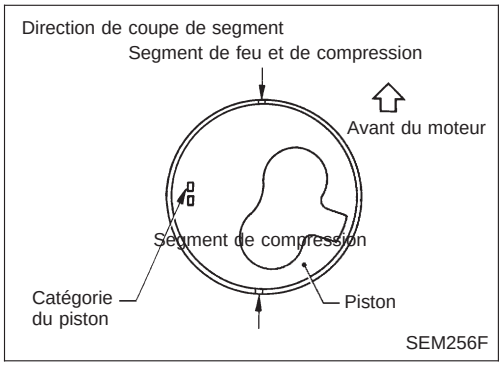


a. Les numéros qui sont matricés sur la bielle et le chapeau correspondent à chaque cylindre. On doit faire attention de ne pas intervertir les divers éléments, y compris les paliers.

b. Lors de l'introduction de l'axe de piston dans la bielle, chauffer le piston à l'aide d'un réchauffeur ou de l'eau chaude (environ 60 à 70°C), puis enduire d'huile moteur l'axe et le pied de bielle.
c. Après remontage, s'assurer que le piston bascule en douceur.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Remontage (Suite)



Reposer l'ensemble de pistons.

ATTENTION :

- **Tendre les segments de piston suffisamment pour qu'ils puissent s'adapter dans les rainures de piston.**
- **Toujours installer les segments de piston neufs en dirigeant leurs repères vers le haut.**

	Couleur d'identification
Segment de feu	Jaune
Segment de compression	Rouge

- **Reposer le segment de piston n° 1 de telle sorte que sa coupe soit orientée vers l'axe de piston ; puis reposer les segments de pistons de façon à ce que leurs coupes se trouvent à 180° les unes des autres.**

Alignement des roues avant

ANGLE DE BRAQUAGE DES ROUES AVANT

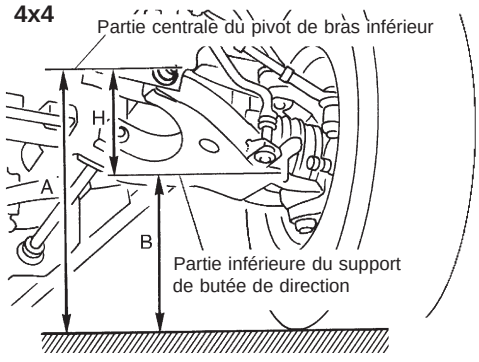
1. Mettre les roues dans la position de marche en ligne droite. Puis pousser le véhicule vers l'avant jusqu'à ce que les roues avant reposent correctement sur la jauge d'angle de braquage.
2. Tourner le volant à bout de course vers la droite et vers la gauche et mesurer l'angle de braquage.

- Pour les modèles avec direction assistée, tourner le volant à bout de course et appliquer une force (à la circonférence du volant) de 98 à 147 N (10 à 15 Kg) avec le moteur au ralenti.
- **Ne pas maintenir le volant en butée pendant plus de 15 secondes.**

Angle de braquage des roues (braquage total) :
Se reporter aux SDS, FA-1003.

3. Régler le boulon de butée si nécessaire.

Longueur standard "L_1" (2 roues motrices) :
20 mm
Contre-écrou de boulon de butée :
: 39 - 49 N·m (4,0 - 5,0 kg-m)



Longueur standard "L_2" (4 roues motrices) :
Sauf pneu 255/70R15 : 26 mm
Pneu 255/70R15 : 30,0 mm
Contre-écrou de boulon de butée :
: 76 - 98 N·m (7,8 - 10,0 kg-m)

AVANT-PROPOS

Ce manuel contient les travaux d'entretien et de réparation concernant les véhicules NISSAN PICKUP, série des modèles D22.

A des fins de sécurité et pour que le rendement des véhicules concernés soit optimal, prière de lire ce manuel complètement. Avant de commencer à entreprendre des travaux, il est particulièrement important d'avoir parfaitement assimilé les PRECAUTIONS signalées dans la section GI.

Toutes les informations contenues dans ce manuel sont basées sur les données de production les plus récentes au moment de la réalisation du manuel. Nous nous réservons le droit de modifier les caractéristiques et les méthodes de travail à n'importe quel moment et sans avis préalable.

NOTE IMPORTANTE DE SECURITE

Un entretien correctement effectué est essentiel, aussi bien pour la sécurité des mécaniciens que pour le fonctionnement adéquat du moteur. Les méthodes d'entretien reprises dans ce manuel de réparation sont décrites de telle manière que le travail puisse être effectué en sécurité et avec précision. Les entretiens varient selon les procédures, les connaissances du technicien et l'outillage, ainsi que les pièces disponibles. Dès lors, toute personne utilisant les procédures d'entretien, un outillage ou des pièces qui ne sont pas spécifiquement recommandées par NISSAN doit auparavant être absolument certain que ceci n'entraîne de danger ni pour sa propre sécurité, ni pour celle du moteur.

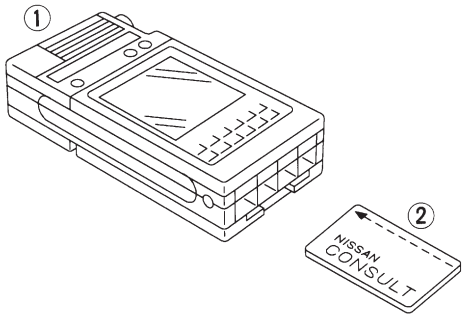
Précautions pour le turbocompresseur



La turbine du turbocompresseur tourne à des vitesses rapides et atteint des températures très élevées. Il est donc essentiel de maintenir une alimentation en huile propre vers le turbocompresseur et de suivre toutes les instructions d'entretien et de fonctionnement.
Pour que le système fonctionne bien, suivre la méthode indiquée ci-dessous.

1. Utiliser toujours l'huile conseillée. Suivre les instructions pour vidanger en temps utile l'huile et pour compléter le niveau.
2. Eviter d'accélérer à un régime élevé immédiatement après le démarrage.
3. Si le moteur a fonctionné à un régime élevé pendant une période de temps prolongée, le laisser tourner au ralenti pendant quelques minutes avant de l'arrêter.

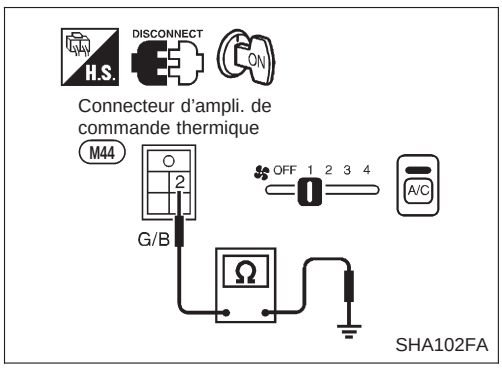
Vérification de l'alimentation électrique principale et du circuit de mise à la masse

VERIFICATION DU FUSIBLE DE L'ALIMENTATION ELECTRIQUE DU SYSTEME DE C/A

Vérifier les fusibles suivants.

- Fusible de 15A (n° 19 et 20) du moteur de soufflerie.
- Fusible de 7,5A (n° 21) de l'ampli. de commande thermique.

Pour de plus amples détails sur le circuit, se reporter au ''Schéma de câblage''.



VERIFICATION DE L'AMPLI. DE COMMANDE THERMIQUE

Vérification du circuit d'alimentation électrique

Vérifier le circuit d'alimentation électrique de l'ampli. de commande thermique lorsque le contact d'allumage est sur ''ON''.

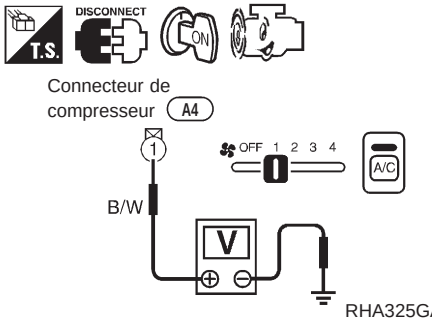
1. Débrancher le connecteur de faisceau de l'ampli. de commande thermique.
2. Brancher le voltmètre du côté faisceau.
3. Mesurer la tension entre la borne ① et la masse de carrosserie.

Borne du voltmètre		Tension
⊕	⊖	
①	Masse de carrosserie	Environ 12V

Vérification du circuit de mise à la masse

Vérifier le circuit de mise à la masse de la carrosserie de l'ampli. de commande thermique avec le contact d'allumage sur ''ON'', l'interrupteur de C/A sur ''ON'' et le commutateur de ventilateur sur MARCHE.

1. Débrancher le connecteur de faisceau de l'ampli. de commande thermique.
2. Brancher l'ohmmètre du côté faisceau.
3. Vérifier la continuité entre la borne ② et la masse de carrosserie.



Borne d'ohmmètre		Continuité
⊕	⊖	
②	Masse de carrosserie	Oui

Si le circuit de mise à la masse ne fonctionne pas correctement, vérifier les points suivants.

- Interrupteur de C/A (se reporter à HA-1010).
- Commutateur de ventilateur (se reporter à HA-1010).
- Faisceau ouvert ou court-circuité entre l'ampli. de commande thermique et l'interrupteur de C/A
- Faisceau ouvert ou court-circuité entre l'interrupteur de C/A et le commutateur de ventilateur
- Circuit de mise à la masse du commutateur de ventilateur

Procédure de diagnostic

SYMPTOME : l'embrayage magnétique ne s'enclenche pas lorsque l'interrupteur de C/A et le commutateur de ventilateur sont enclenchés.

- **Effectuer la VERIFICATION PRELIMINAIRE 1 avant de se reporter à l'organigramme suivant.**

A

VERIFIER L'ALIMENTATION ELECTRIQUE DU COMPRESSEUR.
Débrancher le connecteur de faisceau du compresseur.
Y a-t-il une tension d'environ 12 volts entre la borne ① du faisceau de compresseur et la masse de carrosserie ?

Oui → Vérifier les points suivants.
- Bobine d'embrayage magnétique
- Protecteur thermique

Mauvais → Remplacer l'embrayage magnétique. Se reporter à HA-1091.

Non ↓

B

Note

Vérifier la continuité du circuit entre la borne ⑤ du faisceau de relais de C/A et la borne ① du faisceau de compresseur.
Il doit y avoir continuité.
Si le résultat est satisfaisant, vérifier que le faisceau n'est pas court-circuité.

Bon ↓

C

VERIFIER L'ALIMENTATION ELECTRIQUE DU RELAIS DE C/A.
Y a-t-il une tension d'environ 12 volts entre la borne ③ du faisceau de relais de C/A et la masse de carrosserie ?

Non → Vérifier le circuit de l'alimentation électrique et le fusible de 7,5A (n° 21, situé dans le boîtier à fusibles).
(Se reporter à "DISPOSITION DE L'ALIMENTATION ELECTRIQUE" dans la section EL et à son schéma de câblage).

Oui ↓

D

VERIFIER L'ALIMENTATION ELECTRIQUE DU RELAIS DE C/A.
Y a-t-il une tension d'environ 12 volts entre la borne ① du faisceau de relais de C/A et la masse de carrosserie ?

Oui → Vérifier le circuit de l'alimentation électrique et le fusible de 7,5A (n° 21, situé dans le boîtier à fusibles).
(Se reporter à "DISPOSITION DE L'ALIMENTATION ELECTRIQUE" dans la section EL et à son schéma de câblage).

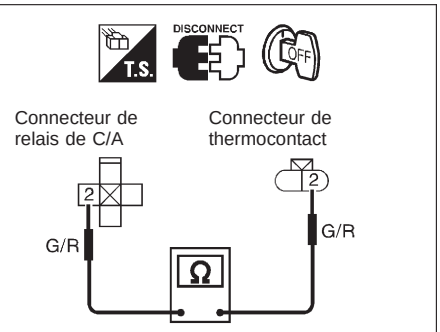
Non ↓

VERIFIER LE RELAIS DE C/A APRES L'AVOIR DECONNECTE.
Se reporter à HA-1010.

Mauvais → Remplacer le relais de C/A.

Bon ↓

Reconnecter le relais de C/A.



Ⓐ

F

RHA981G

G

RHA328GA

Ⓐ

E — Note

Vérifier la continuité du circuit entre la borne n° ② du faisceau de relais de C/A et la borne n° ② du faisceau de thermocontact.
Il doit y avoir continuité.
Si le résultat est satisfaisant, vérifier que le faisceau n'est pas court-circuité.

Bon ↓

F — Note

Vérifier la continuité du circuit entre la borne n° ① du faisceau du thermocontact et la borne n° ④ du faisceau de manocontact triple.
Il doit y avoir continuité.
Si le résultat est satisfaisant, vérifier que le faisceau n'est pas court-circuité.

Bon ↓

VERIFIER LE THERMOCONTACT.
Se reporter à HA-1011.

↓

VERIFIER LE MANOCONTACT TRIPLE.
Se reporter à HA-1011.

Mau-vais → Vérifier la quantité de la charge de réfrigérant.

Bon ↓

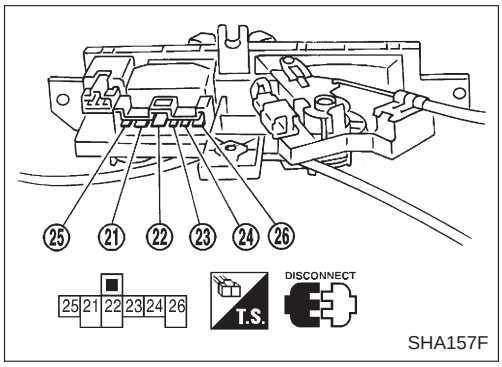
Vérifier la quantité de la charge de réfrigérant. → Bon ↓ Remplacer le manocontact triple.

Bon ↓

G — Note

Vérifier la continuité du circuit entre la borne n° ① du faisceau du manocontact triple et la borne n° ③ du faisceau de l'ampli. de commande thermique.
Il doit y avoir continuité.
Si le résultat est satisfaisant, vérifier que le faisceau n'est pas court-circuité.

Bon ↓



VERIFIER L'ALIMENTATION ELECTRIQUE ET LE CIRCUIT DE MASSE DE L'AMPLI. DE COMMANDE THERMIQUE.
Se reporter à HA-1011.

Bon ↓

Remplacer l'ampli. de commande thermique.

Note :
Si le résultat est mauvais ou ''Non'' après la vérification de la continuité du circuit, réparer le faisceau ou le connecteur.

Introduction

Le système de contrôle automatique de température (ATC) permet une régulation automatique de la température d'air déchargé et du volume d'air déchargé (vitesse de soufflerie).
Le volet de sortie d'air, le volet d'admission et l'embrayage magnétique du compresseur sont contrôlés par l'opération manuelle de chaque commande.

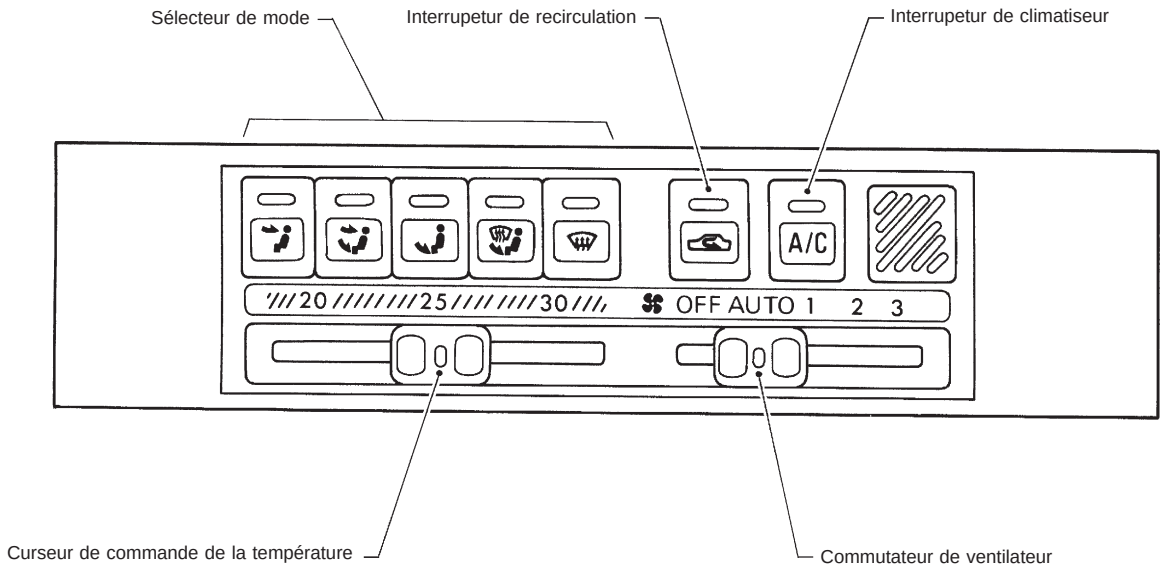
Caractéristiques

Commande de volet de mélange d'air (contrôle de température automatique).
Le volet de mélange d'air est contrôlé automatiquement afin que la température à l'intérieur du véhicule soit atteinte et maintenue à la température désirée par l'utilisateur. Pour une température de référence donnée, la position du volet de mélange d'air dépendra de : la température ambiante, la température de l'habitacle, l'importance de l'ensoleillement, la température de référence et les signaux de l'interrupteur de C/A.

Contrôle de la vitesse du ventilateur
Lorsque la commande du commutateur du ventilateur est sur la position Auto, la vitesse de soufflerie est automatiquement contrôlée selon : la température de l'air ambiant, la température de l'habitacle, la quantité d'ensoleillement, la température choisie et les signaux de l'interrupteur de C/A. Elle est aussi contrôlée par l'opération manuelle de la commande du commutateur du ventilateur.

Commande de vitesse de ventilateur ou démarrage
Lorsque la température du réfrigérant moteur est basse, la position du volet de sortie d'air est détectée par le microcontact et si ce dernier est mis sur B/L, FOOT ou FOOT/DEF, la vitesse de la soufflerie est contrôlée pour empêcher une grande quantité d'air froid d'être emmagasinée par le plancher.

Commande du volet de sortie
Elle peut être sélectionnée en faisant fonctionner le sélecteur de mode.



Commande de volet d'admission d'air
Elle peut être sélectionnée en changeant la position de l'interrupteur REC.

Commande de l'embrayage magnétique du compresseur
Lorsque l'interrupteur de C/A est sur marche, le transmetteur détecte la température de l'évaporateur. L'amplificateur de commande thermique contrôle le fonctionnement marche-arrêt de l'embrayage selon la température de l'évaporateur.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Fonctionnement des commandes

Climatiseur automatique

RHA602DA

COMMUTATEUR DE VENTILATEUR

Ce commutateur commande la MISE EN MARCHE et l'ARRET du ventilateur et contrôle sa vitesse.

SELECTEUR DE MODE

Ces interrupteurs permettent à l'air de sortie de circuler.

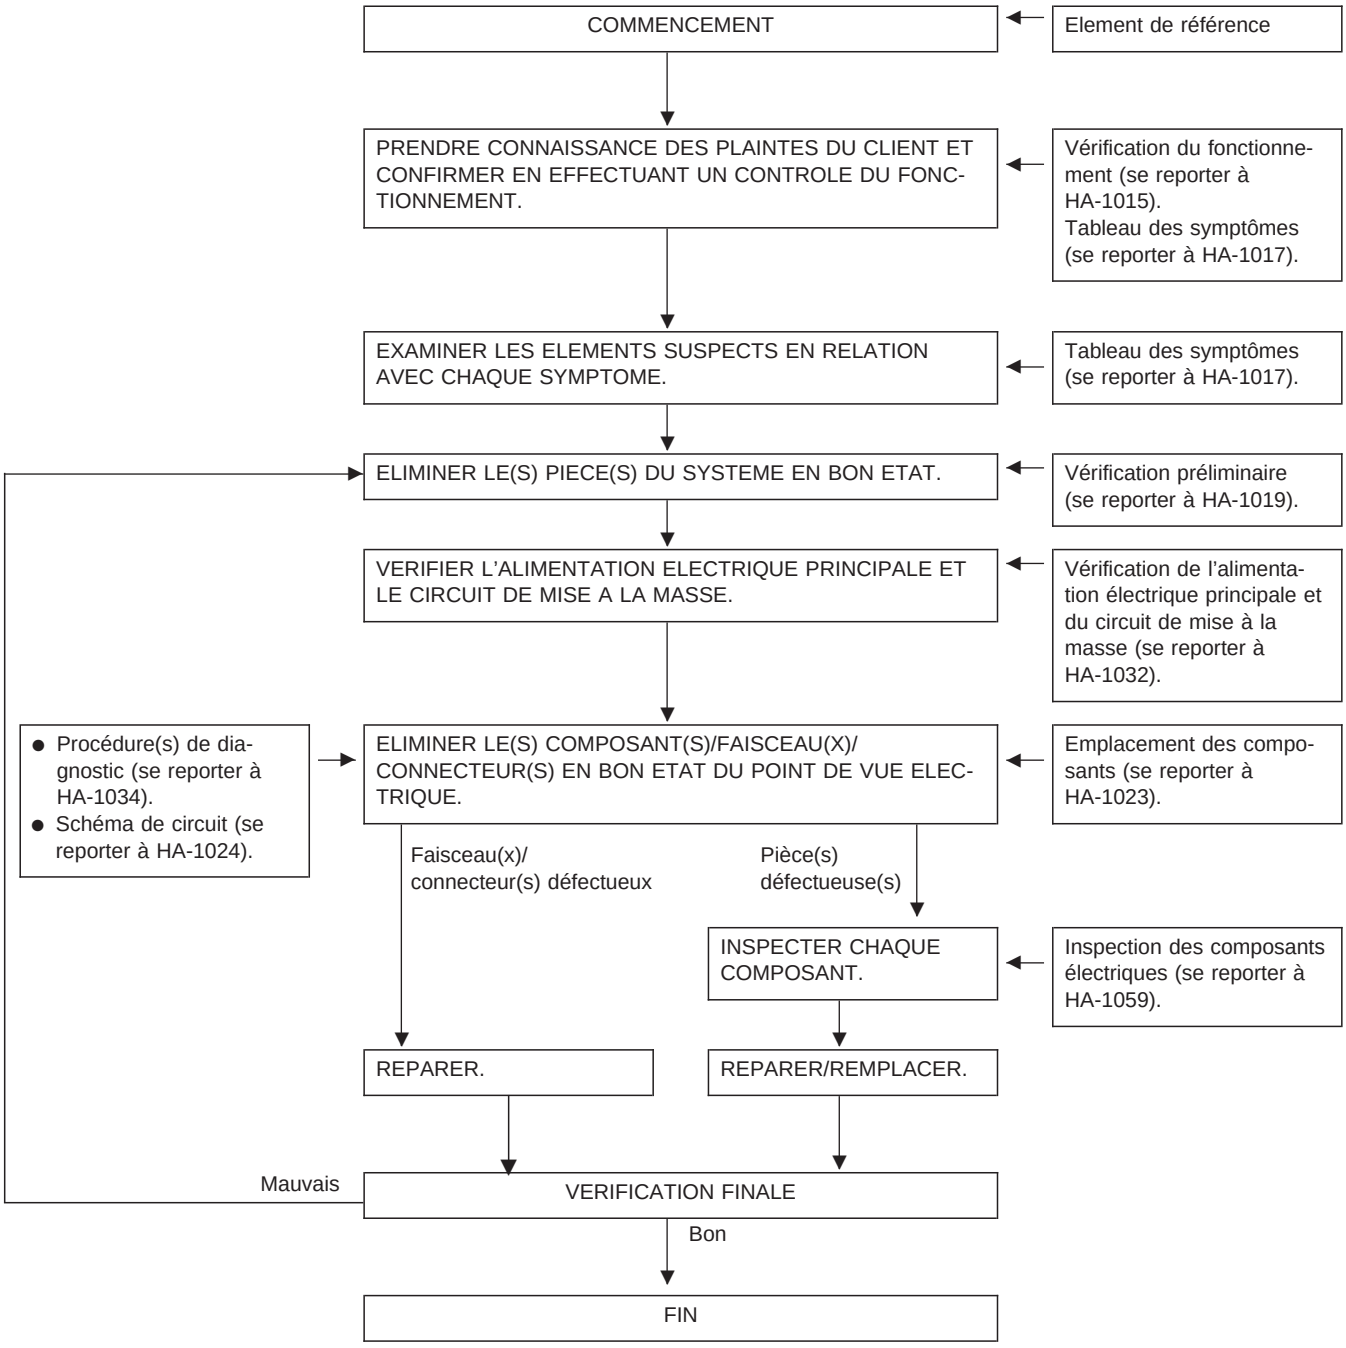
CURSEUR DE COMMANDE DE LA TEMPERATURE

Ce curseur permet de régler la température de l'air de sortie.

COMMANDE DE RECIRCULATION

Position ARRET :
L'air extérieur est aspiré à l'intérieur du compartiment passager.
Position MARCHE :
L'air intérieur circule à nouveau dans le véhicule.

INTERRUPTEUR DE CLIMATISEUR



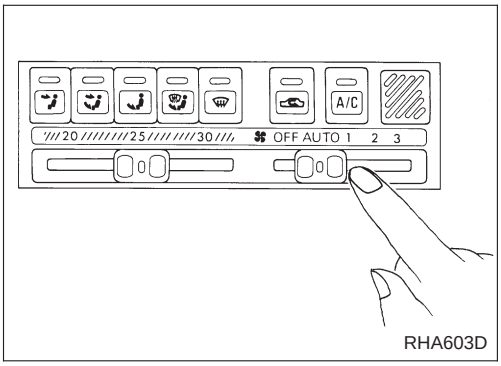
Démarrer le moteur, placer le commutateur de ventilateur sur la position voulue (de Auto à 3) puis appuyer sur l'interrupteur de C/A pour mettre le climatiseur en marche. Le témoin s'allumera lorsque le climatiseur se met en marche. Pour arrêter le climatiseur, appuyer de nouveau sur l'interrupteur pour qu'il retrouve sa position originale.

La fonction de refroidissement d'air du climatiseur n'est effective que lorsque le moteur tourne.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

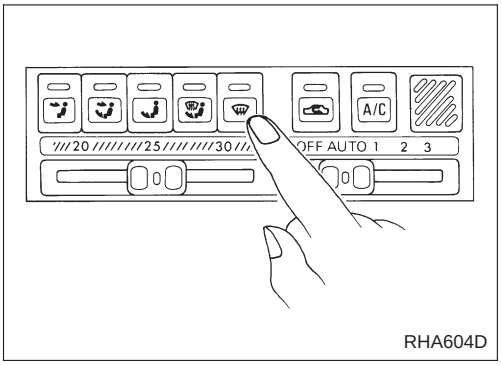
Comment effectuer un diagnostic des défauts permettant une réparation rapide et efficace

ORGANIGRAMME



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Vérification du fonctionnement



L'objet du contrôle de fonctionnement est de confirmer que le système est dans l'état qui doit être le sien. Les systèmes à contrôler sont la soufflerie, le mode (air de décharge), l'air d'admission, la diminution de température, l'augmentation de température et l'interrupteur de C/A.

CONDITIONS :

Moteur en marche et à température normale de fonctionnement.

RHA603D

RHA604D

Débit d'air de décharge

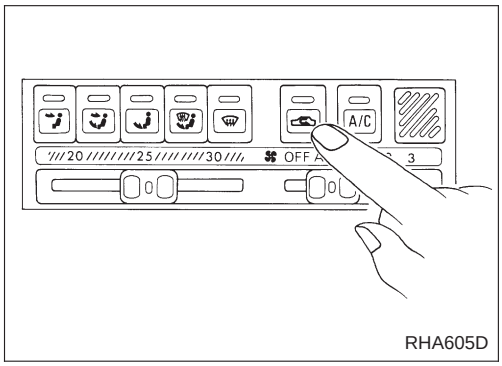
	Tableau de bord	Plancher	Dégivreur
	100%	–	–
	70%	30%	–
	40%	60%	–
	40%	30%	30%
	–	–	100%

RHA937G

PROCEDURE :

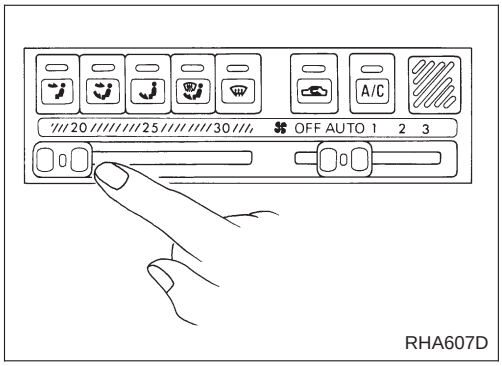
1. Vérifier la soufflerie.



1) Mettre le commutateur de ventilateur sur AUTO.
   La soufflerie devrait fonctionner à la vitesse AUTO.
2) Puis amener le commutateur à la vitesse 1.
3) Continuer de vérifier la vitesse de soufflerie jusqu'à ce que toutes les vitesses aient été vérifiées.
4) Laisser la soufflerie en vitesse 3.

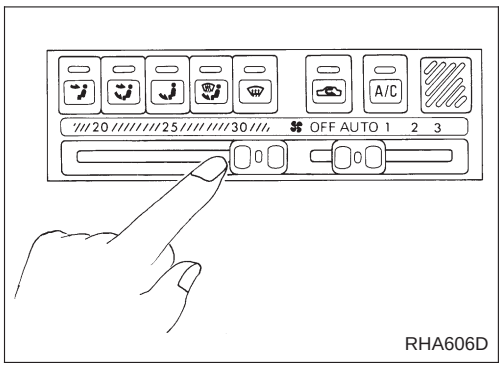
2. Vérifier l'air de décharge

1) Appuyer sur le bouton .
   L'indicateur VENT devrait s'allumer.
2) S'assurer que tout l'air alimenté sort par les sorties du tableau de bord.
3) Appuyer sur le bouton .
   L'indicateur B/L (bi-niveau) doit s'allumer.
4) S'assurer que l'air de décharge sort par les sorties au tableau de bord et au plancher.
5) Appuyer sur le bouton .
   L'indicateur FOOT (plancher) doit s'allumer.
6) S'assurer que l'air de décharge sort par les sorties au plancher.
7) Appuyer sur le bouton .
   L'indicateur F/D (plancher/dévigrage) doit s'allumer.
8) S'assurer que l'air de décharge sort par les sorties au plancher avec un peu d'air s'échappant des sorties du dégivreur.
9) Apuyer sur le bouton .
   Le témoin DEF (dévigrage) doit s'allumer.
10) S'assurer que tout l'air dispensé sort par les sorties du dégivreur.



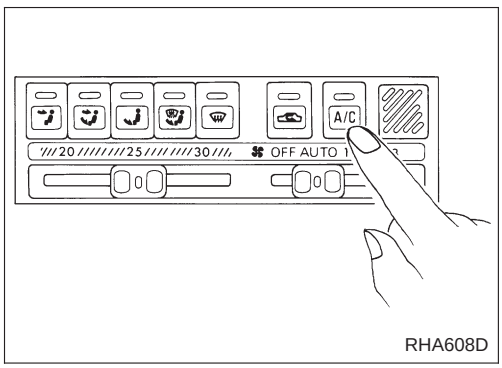
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Vérification du fonctionnement (Suite)



3. Vérifier la recirculation

1) Appuyer sur le bouton .
   Le témoin de RECIRCULATION doit s'allumer.
2) Etre attentif au changement de position du volet d'admission d'air (le bruit de la soufflerie doit se modifier légèrement).



4. Vérifier la diminution de la température.

1) Amener le curseur de commande de la température à la position de FROID maxi.
2) Vérifier la présence d'air froid aux sorties d'air de décharge.

5. Vérifier l'augmentation de la température.

1) Amener le curseur de commande de la température à la position de chaud maxi.
2) Vérifier la présence d'air chaud aux sorties d'air de décharge.

6. Vérifier l'interrupteur de C/A.

Régler le curseur de commande du ventilateur sur la position désirée (de AUTO à 3) et appuyer sur l'interrupteur de C/A pour mettre en marche le climatiseur.
Le témoin s'allumera lorsque le climatiseur se met en marche.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

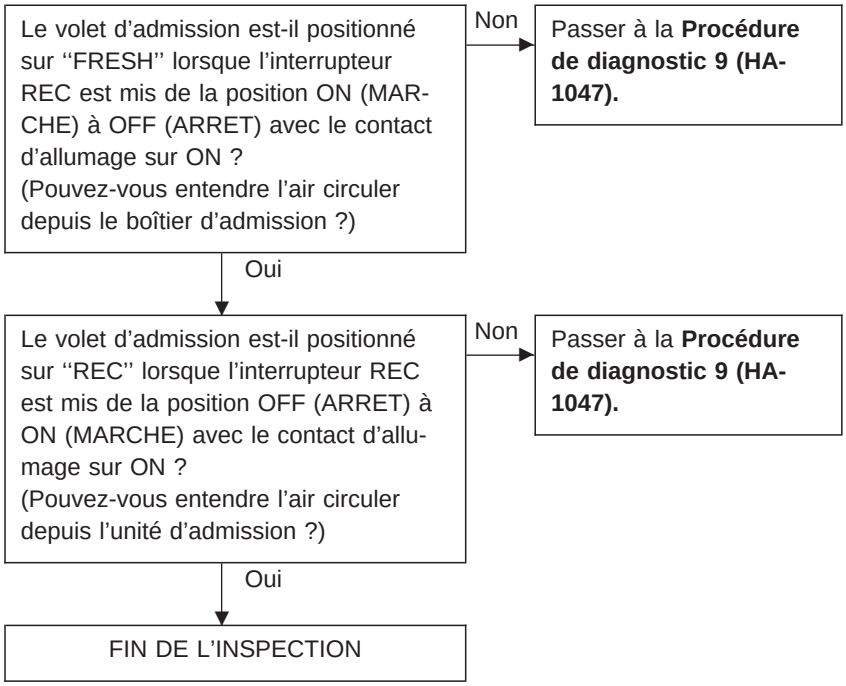
Résistance de contrôle

Les résistances de contôle sont utilisées pour les diagnostics de défaut du fonctionnement du moteur de soufflerie et pour le fonctionnement du moteur de volet de mélange d'air. Utiliser une résistance de contrôle lors de l'inspection des parties avec C/R *1, C/R *2 dans l'organigramme.

ATTENTION :
Sélectionner les résistances de contrôle dont les valeurs de résistance correspondent à celles indiquées dans le tableau ci-dessous, et les brancher aux connecteurs respectifs.

	Résistance de contrôle	Capteur de température ambiante	Capteur de l'habitacle	Puissance en watts (W)
Vérification du fonctionnement du moteur de soufflerie	C/R *1	1 000Ω	1 500Ω	1/4W
Vérification du fonctionnement du moteur de volet de mélange d'air	C/R *2		2 490Ω	



1. Débrancher les connecteurs de faisceau du capteur de température ambiante et de capteur d'habitacle.
2. Brancher la résistance de contrôle au connecteur de faisceau du capteur de température ambiante et au connecteur de faisceau du capteur d'habitacle lors de l'inspection des parties avec C/R *1, C/R *2 dans l'organigramme des diagnostics de défauts.
3. Mettre le contact sur ''ON''.
4. Mettre l'interrupteur de C/A sur ON (MARCHE).
5. Placer le commutateur VENT sur ON (MARCHE).
6. Tenir le capteur d'ensoleillement à l'abris de la lumière du soleil en le couvrant.

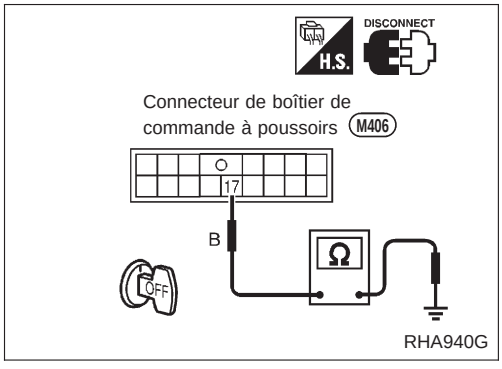
Vérification de l’alimentation électrique principale et du circuit de mise à la masse

VERIFICATION DU CIRCUIT D’ALIMENTATION ELECTRIQUE DU SYSTEME DE C/A AUTOMATIQUE

Vérifier le circuit d’alimentation du système de climatisation automatique.

Se reporter à ‘‘DISPOSITION DE L’ALIMENTATION ELECTRIQUE’’ dans la section EL et ‘‘Schéma de câblage’’.

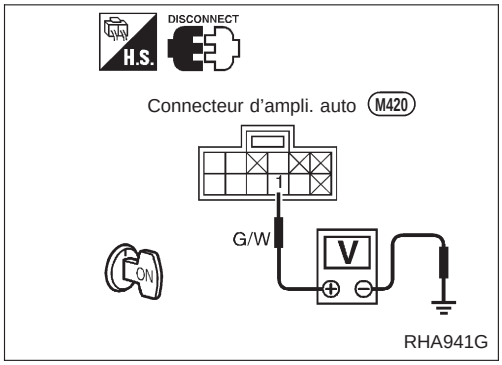


VERIFICATION DU BOITIER DE COMMANDE A POUSSOIRS

Vérifier le circuit d’alimentation électrique du boîtier de commande à poussoirs avec le contact d’allumage sur ACC.

1. Débrancher le connecteur de faisceau du boîtier de commande à poussoirs.
2. Brancher le voltmètre du côté faisceau.
3. Mesurer la tension entre la borne ⑭ et la masse de carrosserie.

Borne du voltmètre		Tension
⊕	⊖	
⑭	Masse de carrosserie	Environ 12V



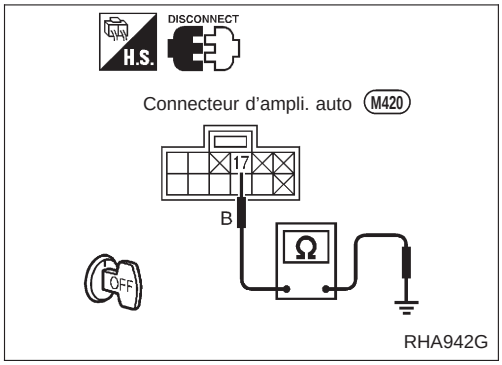
Vérifier le circuit de masse de carrosserie du boîtier de commande à poussoirs avec le contact d’allumage sur ON.

1. Débrancher le connecteur de faisceau du boîtier de commande à poussoirs.
2. Brancher l’ohmmètre du côté faisceau.
3. Vérifier la continuité entre la borne ⑰ et la masse de carrosserie.

Borne d’ohmmètre		Continuité
⊕	⊖	
⑰	Masse de carrosserie	Oui

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Vérification de l’alimentation électrique principale et du circuit de mise à la masse (Suite)

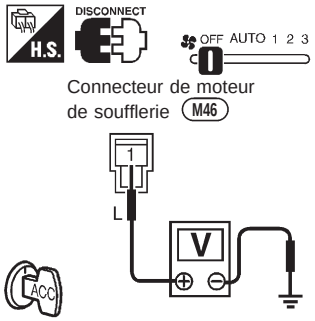


VERIFICATION DE L’AMPLIFICATEUR AUTOMATIQUE

Vérifier le circuit d’alimentation électrique de l’ampli. auto., après avoir mis le contact d’allumage sur ON.

1. Débrancher le connecteur de faisceau de l’amplificateur automatique.
2. Brancher le voltmètre du côté faisceau.
3. Mesurer la tension entre la borne ① et la masse de carrosserie.

Borne du voltmètre		Tension
⊕	⊖	
①	Masse de carrosserie	Environ 12V



Vérifier le circuit de masse de carrosserie de l’ampli. auto alors que le contact d’allumage est mis sur ‘‘OFF’’.

1. Débrancher le connecteur de faisceau de l’amplificateur automatique.
2. Brancher l’ohmmètre du côté faisceau.
3. Vérifier la continuité entre la borne ⑰ et la masse de carrosserie.

Borne d’ohmmètre		Continuité
⊕	⊖	
⑰	Masse de carrosserie	Oui

Procédure de diagnostic 1

SYMPTOME : le moteur de soufflerie ne tourne pas du tout (commutateur du ventilateur ''AUTO'', ''1'', ''2'', ''3'')

- **Effectuer la VERIFICATION PRELIMINAIRE 2 avant de se reporter à l'organigramme ci-dessous.**

A

VERIFIER L'ALIMENTATION ELECTRIQUE DU MOTEUR DE SOUFFLERIE.
Débrancher le connecteur de faisceau du moteur de soufflerie.
Y a-t-il une tension d'environ 12 volts entre la borne ① du faisceau de moteur de soufflerie et la masse de carrosserie ?

Mauvais → Vérifier les fusibles de 15A (n° 19, 20) dans le boîtier à fusibles (se reporter à ''DISPOSITION DE L'ALIMENTATION ELECTRIQUE'' dans la section EL et à son schéma de câblage).

Bon ↓

B

Vérifier la continuité du circuit entre la borne ② du faisceau de moteur de soufflerie et la masse de carrosserie.

Mauvais → Rebrancher le connecteur de faisceau du moteur de soufflerie.

Bon ↓

VERIFIER LE MOTEUR DE SOUFFLERIE.

Mauvais ↓

Remplacer le moteur de soufflerie.

C

VERIFIER LE CIRCUIT DU MOTEUR DE SOUFFLERIE ENTRE LE MOTEUR DE SOUFFLERIE ET LA RESISTANCE.
Y a-t-il une tension d'environ 12 volts entre la borne ① du faisceau de résistance et la masse de carrosserie ?

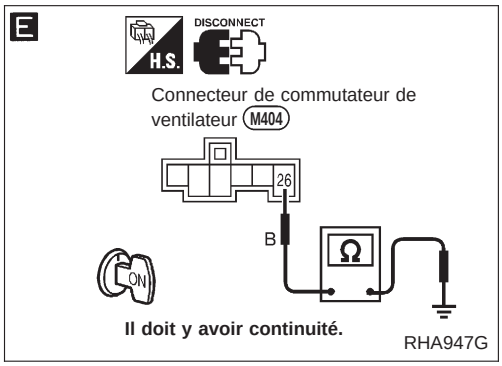
Mauvais → Débrancher les connecteurs de faisceau du moteur de soufflerie et de la résistance.

D

Note

Vérifier la continuité du circuit entre la borne ② du faisceau de moteur de soufflerie et la borne ① du faisceau de résistance.

Bon ↓



Ⓐ

(Passer à la page suivante).

Note :
Si le résultat est mauvais ou ''Non'' après la vérification de la continuité du circuit, réparer le faisceau ou le connecteur.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic 1 (Suite)

Ⓐ

DEBRANCHER LA RESISTANCE ET LA VERIFIER.
Mau-vais → Remplacer la résistance.

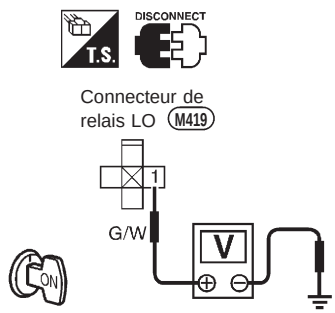
Bon

DEBRANCHER LE COMMUTATEUR DE VENTILATEUR ET LE VERIFIER (se reporter à Inspection des composants électriques) (HA-1059).
Mau-vais → Remplacer le commutateur de ventilateur.

Bon

E Note

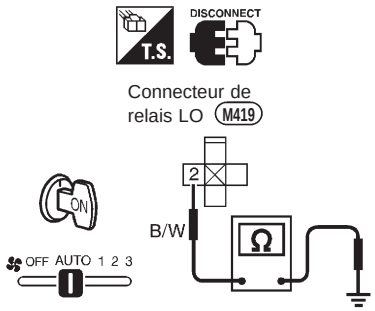
Vérifier la continuité du circuit entre la borne ㉖ du faisceau du commutateur de ventilateur et la masse de carrosserie.



Bon

Remplacer le moteur de soufflerie.

Note :
Si le résultat est mauvais ou ''Non'' après la vérification de la continuité du circuit, réparer le faisceau ou le connecteur.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

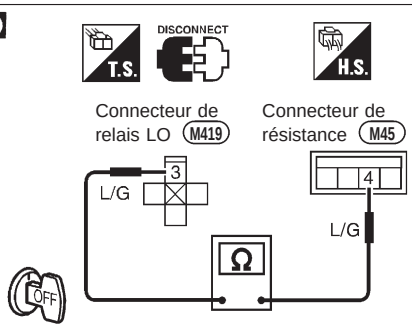
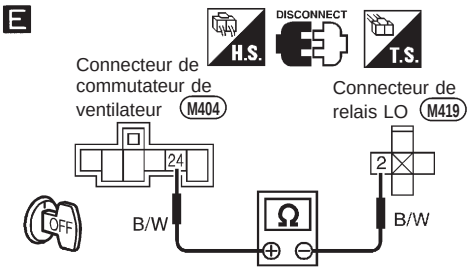
RHA948G

B



RHA949G

C



RHA950G

D

RHA951G

E

La continuité doit exister lorsque les fils conducteurs d'essai sont connectés comme indiqué, et ne doit pas exister lorsque les fils conducteurs d'essai sont inversés.

RHA952G

Procédure de diagnostic 2

SYMPTOME : le moteur de soufflerie ne tourne pas du tout quand la vitesse du ventilateur est sur AUTO (fonctionne seulement sur vitesse 1, 2 ou 3).

A

VERIFIER L'ALIMENTATION ELECTRIQUE DU RELAIS LO (LENT) DE CLIMATISEUR.
Débrancher le connecteur de faisceau du relais de position LO (lent)
Y a-t-il une tension d'environ 12 volts entre la borne n° ① du faisceau du relais de position LO (lent) et la masse de carrosserie ?

Mauvais → Vérifier le fusible de 7,5A (n° 21) dans le boîtier à fusibles (se reporter à "DISPOSITION DE L'ALIMENTATION ELECTRIQUE" dans la section EL et à son schéma de câblage).

Bon ↓

B

Vérifier la continuité du circuit entre la borne n° ② du faisceau de relais de position LO (lent) et la masse de carrosserie.

Mauvais → DEBRANCHER LE COMMUTATEUR DE VENTILATEUR ET LE VERIFIER (se reporter à Inspection des composants électriques). (HA-1059)

Bon ↓

Bon → Mauvais → Remplacer le commutateur de ventilateur.

E

Note
Vérifier la continuité du circuit entre la borne n° ② du faisceau de relais de position LO (lent) et la borne ㉔ du faisceau du commutateur de ventilateur.

C

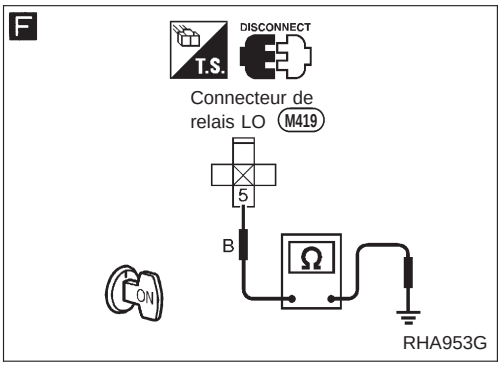
VERIFIER L'ALIMENTATION ELECTRIQUE DU RELAIS DE POSITION LO (LENT).
Y a-t-il une tension d'environ 12 volts entre la borne n° ③ du faisceau du relais de position LO (lent) et la masse de carrosserie ?

Mauvais → D

Bon ↓

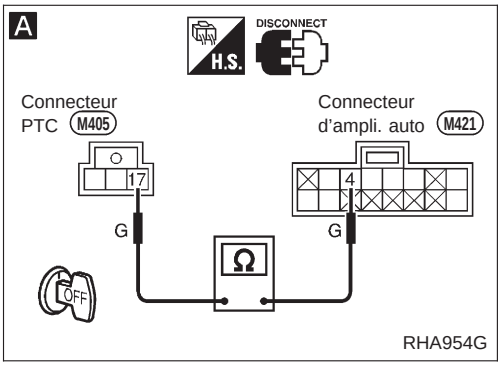
Ⓐ
(Passer à la page suivante).

D



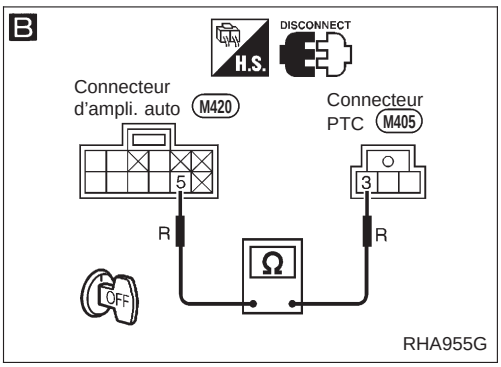
Note
Vérifier la continuité du circuit entre la borne n° ④ du faisceau de résistance et entre la borne n° ③ du faisceau de relais de position LO (lent).

Note :
Si le résultat est mauvais ou "Non" après la vérification de la continuité du circuit, réparer le faisceau ou le connecteur.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic 2 (Suite)



F

A

B

Ⓐ

F — Note

Vérifier la continuité du circuit entre la borne n° ⑤ du faisceau de relais de position LO (lent) et la masse de carrosserie.

Bon ↓

VERIFIER LE RELAIS DE POSITION LO (LENT) APRES L'AVOIR DEBRANCHE.

Mauvais → Remplacer le relais de position LO (lent).

Procédure de diagnostic 3

SYMPTOME : la vitesse du ventilateur du moteur de soufflerie ne change pas lorsque la vitesse du ventilateur est sur AUTO [la vitesse du ventilateur est sur HI (rapide) ou MH (mi-rapide)].

C/R *1

VERIFIER L'AMP. AUTO ET LE PTC.
Brancher la résistance de contrôle (se reporter à HA-1019).
La vitesse du ventilateur du moteur de soufflerie change-t-elle lorsque le PTC est déplacé de 20°C à 30°C ?

Mauvais → A — Note

VERIFIER LE CIRCUIT DU PTC ENTRE LE PTC ET L'AMPLI. AUTO.
Débrancher les connecteurs de faisceau du TPC et de l'ampli. auto.
Vérifier la continuité du circuit entre la borne n° ⑰ du faisceau de PTC et la borne n° ④ du faisceau de l'ampli. auto.

Bon ↓

B — Note

Vérifier la continuité du circuit entre la borne n° ③ du faisceau de PTC et la borne n° ⑤ du faisceau de l'ampli. auto.

Bon ↓

VERIFIER LE PTC (se reporter à HA-1068).

Mauvais → Remplacer le PTC.

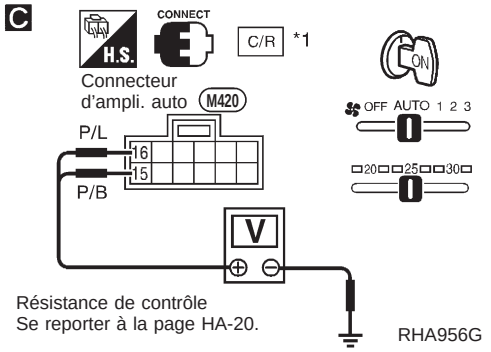
Bon ← Rebrancher le connecteur de faisceau du PTC.

Bon ↓

VERIFIER LE CIRCUIT DU CAPTEUR.

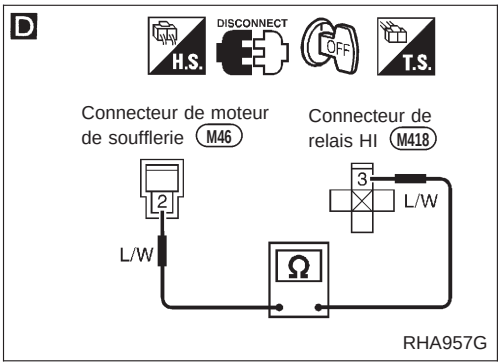
	Comment réparer
Circuit du capteur de température ambiante	Passer à la "Procédure de diagnostic 11".
Circuit du capteur d'habitacle	Passer à la "Procédure de diagnostic 12".

Ⓐ



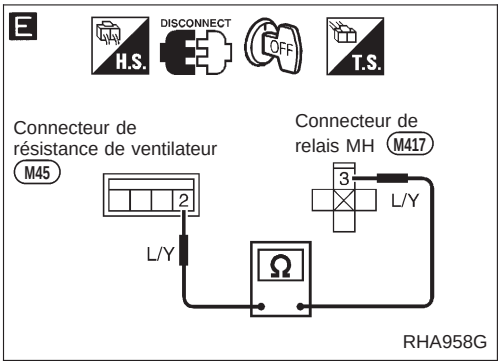
(Passer à la page suivante).

Note :
Si le résultat est mauvais ou "Non" après la vérification de la continuité du circuit, réparer le faisceau ou le connecteur.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic 3 (Suite)



C

D

E

Ⓐ

C

VERIFIER L'AMP. AUTO
Brancher la résistance de contrôle (se reporter à HA-1019).
Y a-t-il une tension d'environ 12 V entre les bornes n° ⑮, ⑯ du faisceau de l'ampli. auto. et la masse de carrosserie ?

Mauvais → Remplacer l'amplificateur automatique.

Bon

VERIFIER LE RELAIS DE POSITION HI (RAPIDE) OU MH (MI-RAPIDE) APRES L'AVOIR DEBRANCHE (se reporter à HA-1060).

Mauvais → Remplacer le relais de position HI (rap.) ou de position MH (mi-rap.).

Bon

D

Note

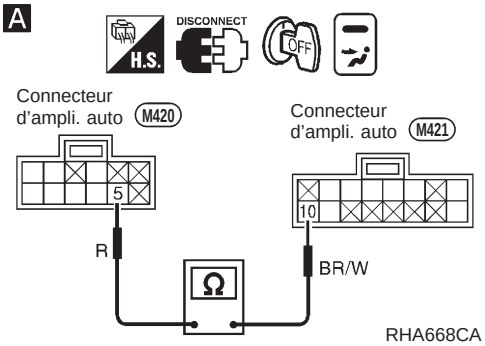
Y a-t-il continuité entre la borne n° ② du faisceau de moteur de soufflerie et la borne n° ③ du relais de position HI (rap.) ou MH (mi-rap.) ?

Oui

E

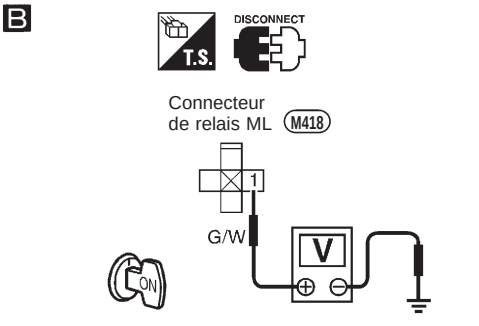
Note

Y a-t-il continuité entre la borne n° ② du faisceau de la résistance et la borne n° ③ du faisceau de relais de position MH (mi-rap.) ?



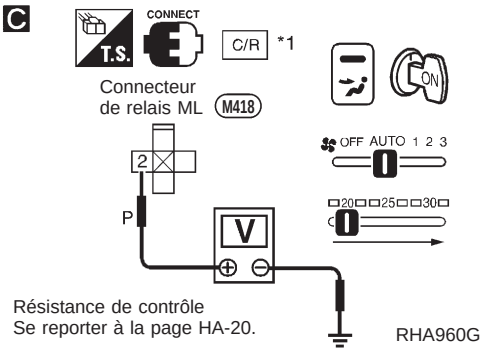
Oui

Remplacer l'amplificateur automatique.

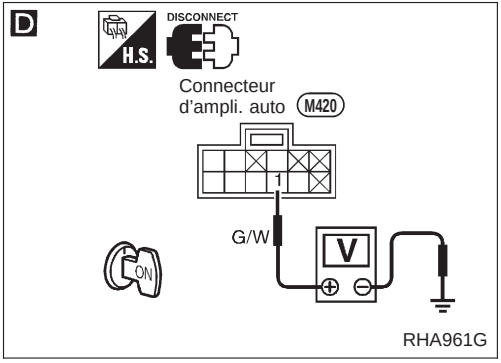


Note :
Si le résultat est mauvais ou "Non" après la vérification de la continuité du circuit, réparer le faisceau ou le connecteur.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



A



B

C

D

Procédure de diagnostic 4

SYMPTOME : la vitesse du ventilateur du moteur de soufflerie ne change pas lorsque la vitesse du ventilateur est sur AUTO [la vitesse du ventilateur est sur LO (lent)].

A

VERIFIER LE TRANSMETTEUR THERMIQUE.
Débrancher le connecteur de faisceau de l'amplificateur automatique.
La résistance entre les bornes n° (10) et (5) de l'ampli. auto est-elle inférieure à environ 940Ω ?

Bon → **B**

Mauvais →

VERIFIER LE CIRCUIT DU TRANSMETTEUR THERMIQUE.
Passer **à Procédure de diagnostic 14 (HA-1054).**

B

VERIFIER L'ALIMENTATION ELECTRIQUE DU RELAIS DE POSITION ML (MI-LENT).
Débrancher le relais de position ML (mi-lent).
Y a-t-il une tension d'environ 12 volts entre la borne n° (1) du faisceau du relais de position ML (mi-lent) et la masse de carrosserie ?

Bon →

Rebrancher le relais ML (mi-lent).

Mauvais →

Vérifier le fusible de 7,5A (n° 21) dans le boîtier à fusibles (se reporter à "DISPOSITION DE L'ALIMENTATION ELECTRIQUE" dans la section EL et à son schéma de câblage).

C

VERIFIER L'AMP. AUTO
Brancher la résistance de contrôle (se reporter à HA-1019).
Y a-t-il une tension d'environ 0 volts entre la borne n° (2) du faisceau de relais de position ML (mi-lent) et la masse lorsque vous déplacez le PTC de 20°C à 30°C ?

Mauvais →

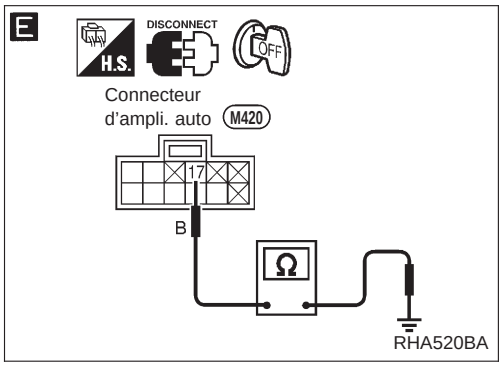
Remplacer le relais de position ML (mi-lent).

Bon →

D

VERIFIER L'ALIMENTATION ELECTRIQUE DE L'AMPLI. AUTO.
Débrancher le connecteur de faisceau de l'amplificateur automatique.
Y a-t-il une tension d'environ 12 V entre la borne n° (1) du faisceau de l'ampli. auto. et la masse de carrosserie ?

Mauvais →



Vérifier le fusible de 7,5A (n° 21) dans le boîtier à fusibles (se reporter à "DISPOSITION DE L'ALIMENTATION ELECTRIQUE" dans la section EL et à son schéma de câblage).

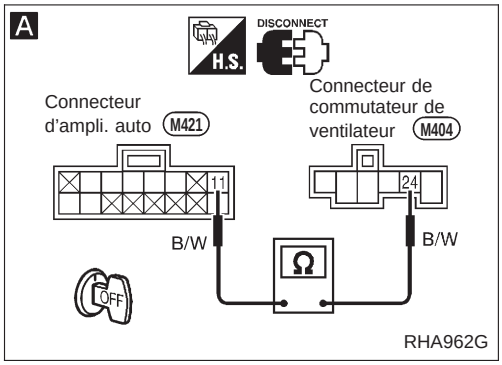
Bon →

(A)
(Passer à la page suivante).

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic 4 (Suite)

Ⓐ



E

Note

VERIFIER LE CIRCUIT DE MASSE DE L'AMPLI. AUTO
Y a-t-il continuité entre la borne n° (17) du faisceau de l'ampli. auto. et la masse de carrosserie ?

Bon

Remplacer l'amplificateur automatique.

Procédure de diagnostic 5

SYMPTOME : la commande de vitesse de ventilateur au démarrage ne fonctionne pas.

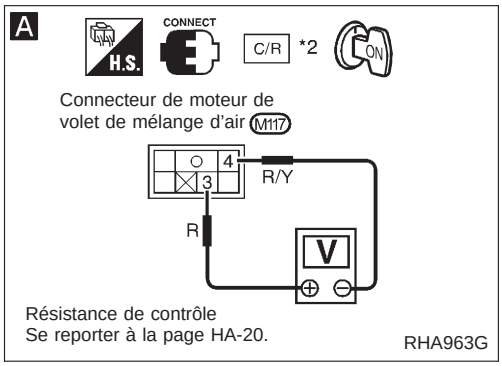
VERIFIER LE CIRCUIT DU TRANSMETTEUR THERMIQUE.
Passer à la **Procédure de diagnostic 14 (HA-1054).**

Mauvais → Remplacer l'ampli. auto, le transmetteur thermique de moteur ou le microcontact.

Bon

A

Note



VERIFIER LE CIRCUIT DE MASSE DE L'AMPLI. AUTO
Débrancher l'ampli. auto et le connecteur de faisceau du commutateur de ventilateur.
Vérifier la continuité du circuit entre la borne n° (11) du faisceau de l'ampli. auto et la borne n° (24) du faisceau du commutateur de ventilateur.

Bon

Remplacer l'amplificateur automatique.

Note :
Si le résultat est mauvais ou "Non" après la vérification de la continuité du circuit, réparer le faisceau ou le connecteur.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic 6

SYMPTOME : il y a trop de différence entre la température du PTC et celle de l'habitacle.

- **Effectuer la VERIFICATION PRELIMINAIRE 2 avant de se reporter à l'organigramme ci-dessous.**

A

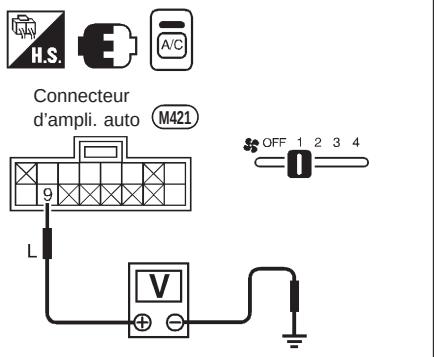
C/R *2

VERIFIER LE RHEOSTAT (PBR).
Brancher la résistance de contrôle (se reporter à HA-1019).
Y a-t-il une tension d'environ 5 V entre les bornes n° ④ et ③ du faisceau du moteur de volet de mélange d'air lorsque le PTC est mis sur 25°C ?

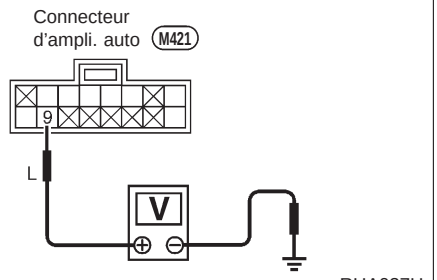
Mauvais → VERIFIER LE PTC (se reporter à HA-1068).

Bon → Ⓐ (Passer à la page suivante).

VERIFIER LE PTC (se reporter à HA-1068).
Bon → VERIFIER LE RHEOSTAT (PBR). Se reporter à Réglage du capteur.
Mauvais → Remplacer le PTC.



VERIFIER LE RHEOSTAT (PBR). Se reporter à Réglage du capteur.
Bon → Remplacer l'amplificateur automatique.
Mauvais → VERIFIER LE MECANISME DU VOLET DE MELANGE D'AIR. Se reporter à ''Réglage de la timonerie de commande'' (se reporter à HA-1067).



VERIFIER LE MECANISME DU VOLET DE MELANGE D'AIR. Se reporter à ''Réglage de la timonerie de commande'' (se reporter à HA-1067).
Bon → Remplacer le PBR.
Mauvais → Réparer ou régler.

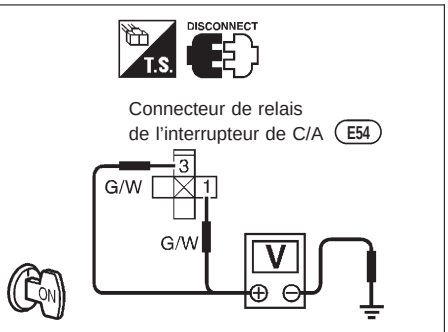
Procédure de diagnostic 6 (Suite)



B

RHA037H

C

RHA964G

Ⓐ

VERIFIER LE FONCTIONNEMENT DU MOTEUR D'ASPIRATEUR.
Le moteur d'aspirateur tourne-t-il ? (Se reporter à HA-1070).

Mauvais → Ⓒ (Passer à la page suivante).

Bon

VERIFIER LE CAPTEUR D'HABITACLE ET LE CAPTEUR DE TEMPERATURE AMBIANTE (se reporter à Composants d'entrée du système de commande) (HA-1068).

Mauvais → Remplacer le capteur d'habitacle ou le capteur d'air ambiant.

Bon

VERIFIER LE CAPTEUR D'ENSOLEILLEMENT.
Passer à la **Procédure de diagnostic 13 (HA-1053).**

Mauvais → Remplacer le capteur d'ensoleillement ou l'ampli. auto.

Bon

B

VERIFIER LE FONCTIONNEMENT DE L'AMP. AUTO
Y a-t-il une tension d'environ 12 V entre la borne n° ⑨ du faisceau de l'ampli. auto. et la masse de carrosserie lorsque l'interrupteur de C/A est sur marche ?
Y a-t-il une tension d'environ 0 volts entre la borne n° ⑨ du faisceau de l'ampli. auto et la masse lorsque l'interrupteur de C/A est sur arrêt ?

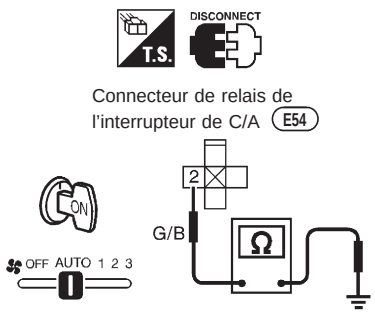
Mauvais → C

Bon

Remplacer l'amplificateur automatique.

C

VERIFIER L'ALIMENTATION ELECTRIQUE DU RELAIS DE L'INTERRUPTEUR DE C/A.
Débrancher le relais de l'interrupteur de C/A.
Y a-t-il une tension d'environ 12 volts entre la borne n° ③ du faisceau du relais de l'interrupteur de C/A et la masse de carrosserie ?



Bon → Ⓑ (Passer à la page suivante).

Mauvais → Vérifier le fusible de 7,5A (n° 21) dans le boîtier à fusibles. (Se reporter à "DISPOSITION DE L'ALIMENTATION ELECTRIQUE" dans la section EL et à son schéma de câblage).

C

Procédure de diagnostic 8

SYMPTOME : la sortie d'air ne change pas.

- **Effectuer la vérification de l'alimentation électrique principale et du circuit de mise à la masse avant de se référer à l'organigramme suivant.**

A

VERIFIER LE CONTACT DE POSITION DU MOTEUR DE VOLET DE MODE.

1. Enclencher le contact VENT alors que le contact d'allumage est mis sur la position "ON".
2. Couper le contact.
   Débrancher le connecteur du boîtier de commande à poussoirs.
3. Vérifier si la continuité existe entre chaque borne du connecteur du faisceau du boîtier de commande à poussoirs et la masse de carrosserie.
4. Suivre les procédures ci-dessus pour vérifier la continuité à partir de chacun des autres modes, comme indiqué dans le tableau.

Commande de mode	N° de borne ⊕	N° de borne ⊖	Continuité
VENT	① ou ②	Masse de carrosserie	Oui
B/L (BI-NIVEAU)	② ou ③		
FOOT (PLANCHER)	③ ou ④		
F/D (PLAN/DEG)	④ ou ⑤		
DEF (DEG)	⑤ ou ⑥		

Mauvais → Débrancher le connecteur de faisceau du moteur de volet de mode.

Bon

VERIFIER LA TRINGLE LATERALE.

B

Note

VERIFIER LE CIRCUIT DE MASSE DE CARROSSERIE DU MOTEUR DE VOLET DE MODE.

Y a-t-il continuité entre la borne n° ⑰ du faisceau du moteur de volet de mode et la masse de carrosserie ?

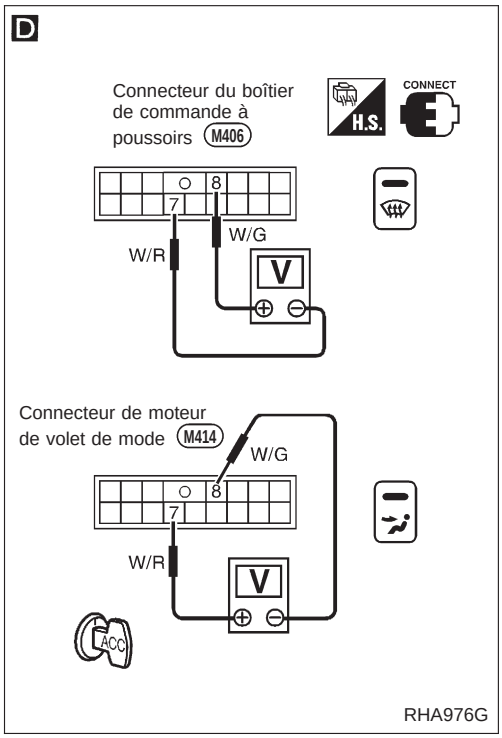
Bon

C

Note

Vérifier la continuité du circuit entre chaque borne du boîtier de commande à poussoirs et sur le moteur du volet de mode.

N° de borne ⊕ (Boîtier de commande à poussoirs)	N° de borne ⊖ (Moteur de volet de mode)	Continuité
①	①	Oui
②	②	
③	③	
④	④	
⑤	⑤	
⑥	⑥	
⑦	⑦	
⑧	⑧	



Bon

Ⓐ
(Passer à la page suivante).

Procédure de diagnostic 10

SYMPTOME : l'embrayage magnétique ne s'enclenche pas lorsque l'interrupteur de C/A et le commutateur de ventilateur sont enclenchés.

A

VERIFIER L'ALIMENTATION ELECTRIQUE DU COMPRESSEUR.
Débrancher le connecteur de faisceau du compresseur.
Y a-t-il une tension d'environ 12 volts entre la borne (1) du faisceau de compresseur et la masse de carrosserie ?

Oui → Vérifier les points suivants.
- Bobine d'embrayage magnétique
- Protecteur thermique

Mauvais → Remplacer l'embrayage magnétique. Se reporter à HA-1091.

Non

B — Note

Vérifier la continuité du circuit entre la borne (5) du faisceau de relais de C/A et la borne (1) du faisceau de compresseur.
Il doit y avoir continuité.
Si le résultat est satisfaisant, vérifier que le faisceau n'est pas court-circuité.

Bon

C

VERIFIER L'ALIMENTATION ELECTRIQUE DU RELAIS DE C/A.
Y a-t-il une tension d'environ 12 volts entre la borne (3) du faisceau de relais de C/A et la masse de carrosserie ?

Non → Vérifier le circuit de l'alimentation électrique et le fusible de 7,5A (n° 21, situé dans le boîtier à fusibles) (se reporter à "DISPOSITION DE L'ALIMENTATION ELECTRIQUE" dans la section EL et à son schéma de câblage).

Oui

D

VERIFIER L'ALIMENTATION ELECTRIQUE DU RELAIS DE C/A.
Y a-t-il une tension d'environ 12 volts entre la borne (1) du faisceau de relais de C/A et la masse de carrosserie ?

Oui → Vérifier le circuit de l'alimentation électrique et le fusible de 7,5A (n° 21, situé dans le boîtier à fusibles) (se reporter à "DISPOSITION DE L'ALIMENTATION ELECTRIQUE" dans la section EL et à son schéma de câblage).

Non

VERIFIER LE RELAIS DE C/A APRES L'AVOIR DECONNECTE.
Se reporter à HA-1060.

Mauvais → Remplacer le relais de C/A.

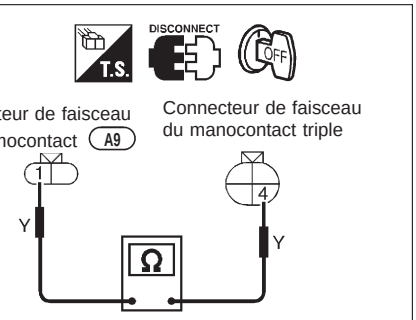
Bon

Reconnecter le relais de C/A.

E — Note

Vérifier la continuité du circuit entre la borne n° (2) du faisceau de relais de C/A et la borne n° (2) du faisceau de thermocontact.
Il doit y avoir continuité.
Si le résultat est satisfaisant, vérifier que le faisceau n'est pas court-circuité.

Bon



(A)
(Passer à la page suivante).

Note :
Si le résultat est mauvais ou "Non" après la vérification de la continuité du circuit, réparer le faisceau ou le connecteur.

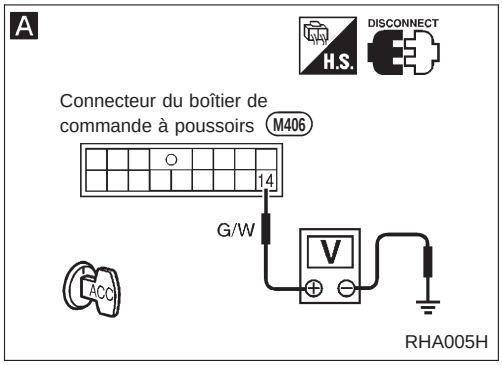
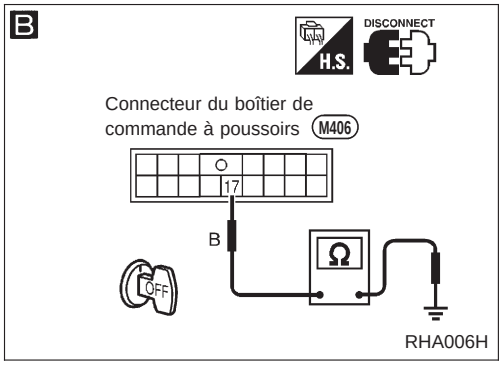
PROCEDURE DE DIAGNOSTIC 15-2



VERIFIER LE FONCTIONNEMENT DE L'EMBRAYAGE MAGNETIQUE.
L'embrayage magnétique fonctionne-t-il normalement lorsque le moteur, l'interrupteur de C/A et le commutateur de ventilateur sont en marche ?



Mauvais → Passer à la ''Procédure de diagnostic 10'' (se reporter à HA-1048.)

Bon ↓

Remplacer l'amplificateur de commande incorporé dans le boîtier de commande à poussoirs.

PROCEDURE DE DIAGNOSTIC 15-3

Mettre le contact d'allumage et la commande d'éclairage sur OFF.

↓

Débrancher le connecteur de faisceau du boîtier de commande à poussoirs.

↓

A

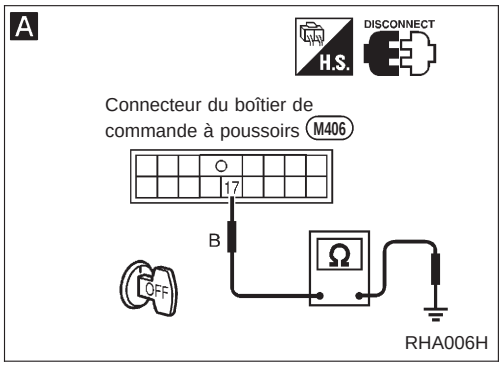
VERIFIER L'ALIMENTATION ELECTRIQUE DU BOITIER DE COMMANDE A POUSSOIRS.
Est-ce qu'il y a une tension d'environ 12 volts entre la borne (14) du faisceau du boîtier de commande à poussoirs et la masse de carrosserie ?

Mauvais → Vérifier le fusible de 7,5A (n° 21) dans le boîtier à fusibles (se reporter à ''DISPOSITION DE L'ALIMENTATION ELECTRIQUE'' dans la section EL et à son schéma de câblage).

Bon ↓

B

Note



VERIFIER LE CIRCUIT DE MASSE DE CARROSSERIE DU BOITIER DE COMMANDE A POUSSOIRS.
Y a-t-il continuité entre la borne (17) du faisceau du boîtier de commande à poussoirs et la masse de carrosserie ?

Bon ↓

Remplacer l'amplificateur de commande incorporé dans le boîtier de commande à poussoirs.

Note :
Si le résultat est mauvais ou ''Non'' après la vérification de la continuité du circuit, réparer le faisceau ou le connecteur.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

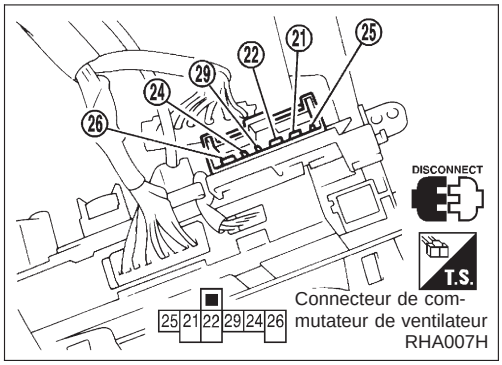
PRCEDURE DE DIAGNOSTIC 15-4

Mettre le contact d'allumage et la commande d'éclairage sur OFF.

↓

Débrancher le connecteur de faisceau du boîtier de commande à poussoirs.

↓



A — Note

VERIFIER LE CIRCUIT DE MASSE DE CARROSSERIE DU BOITIER DE COMMANDE A POUSSOIRS.
Y a-t-il continuité entre la borne ⑰ du faisceau du boîtier de commande à poussoirs et la masse de carrosserie ?

↓ Bon

Remplacer l'amplificateur de commande incorporé dans le boîtier de commande à poussoirs.

Note :
Si le résultat est mauvais ou "Non" après la vérification de la continuité du circuit, réparer le faisceau ou le connecteur.

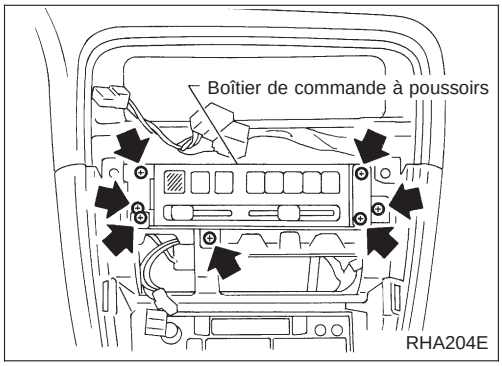
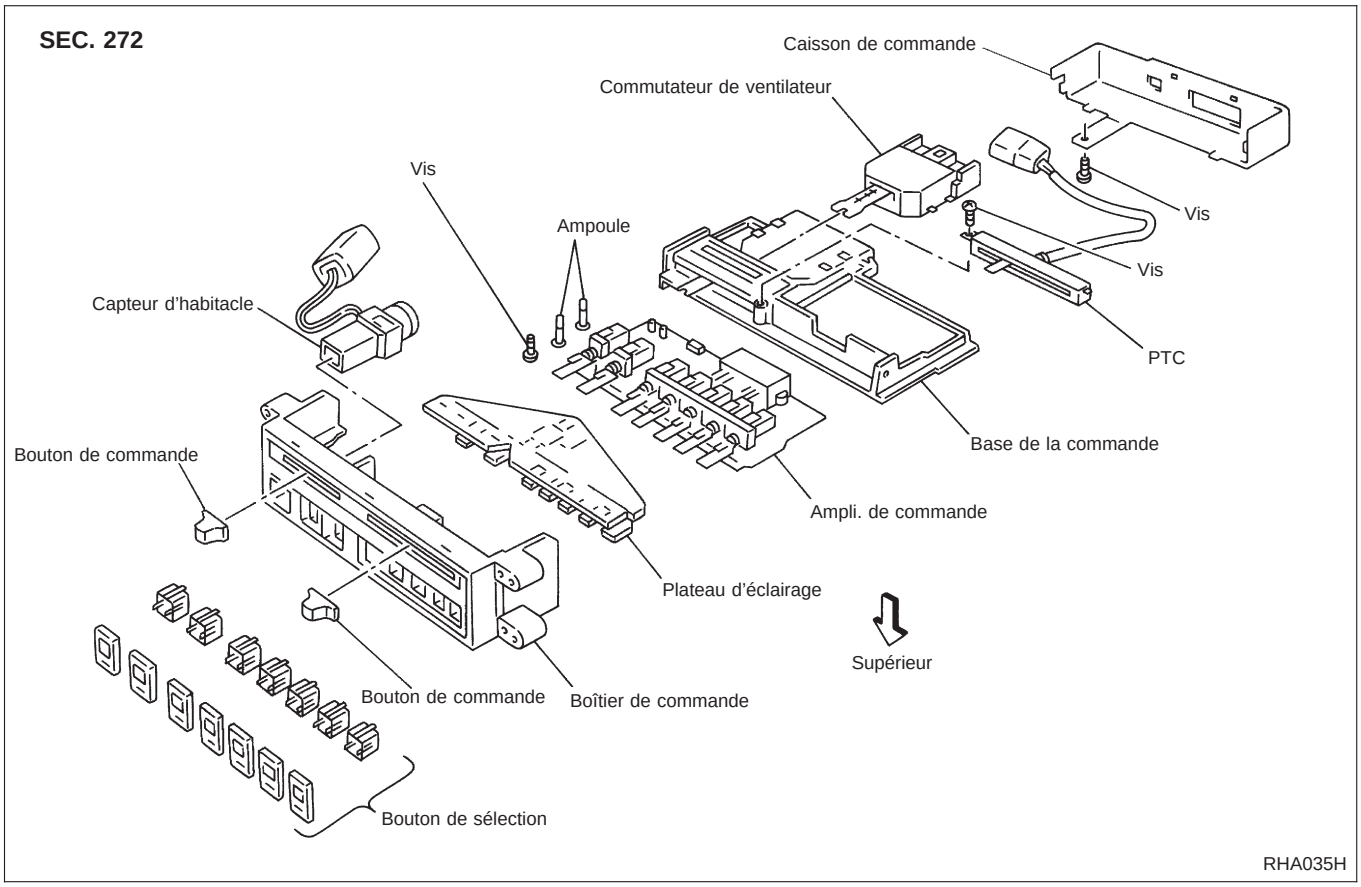
MOTEUR DU VOLET D'ADMISSION

Le moteur de volet d'admission est installé sur le boîtier d'admission. Lorsque la position du volet est déterminée par une pression sur l'interrupteur ''REC'' sur le tableau de bord, le moteur tourne et l'entrée d'air change.

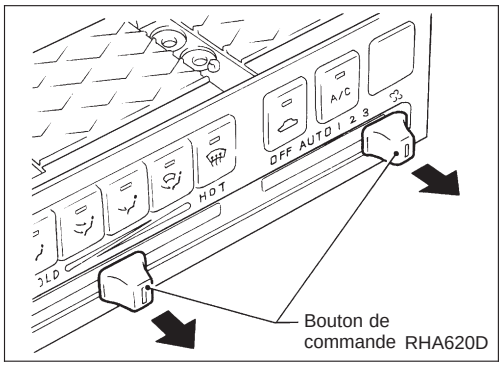


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



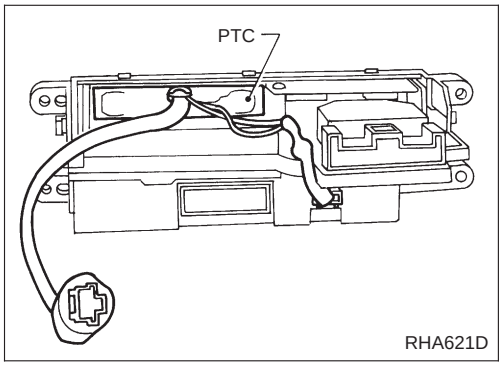
Dépose et repose

1. Déposer le couvercle de tableau de bord C.



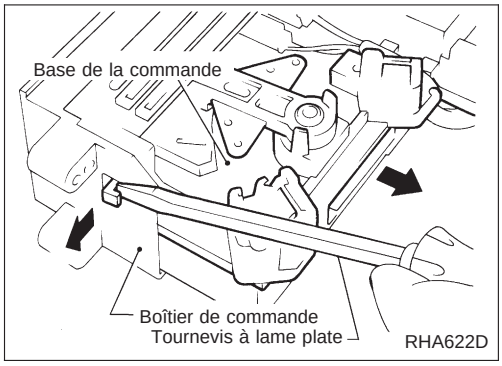
2. Déposer la radio.
3. Déposer les 7 vis du boîtier de commande à poussoirs et son support.
4. Débrancher les connecteurs de faisceau du boîtier de commande à poussoirs, du capteur de l'habitacle et du PTC.
5. Déposer le boîtier de commande à poussoirs.
6. La repose se fait dans l'ordre contraire de la dépose.

Révision — Ensemble de boîtier de commande à poussoirs



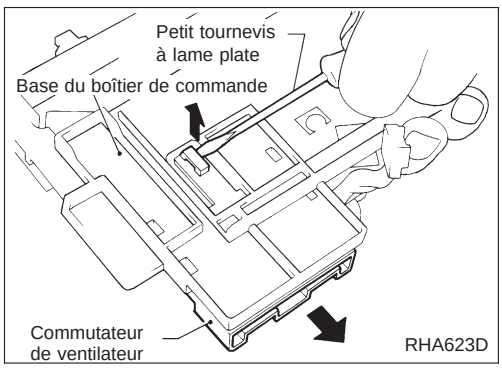
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Révision — Ensemble de boîtier de commande à poussoirs (Suite)



1. Déposer les boutons de commande.

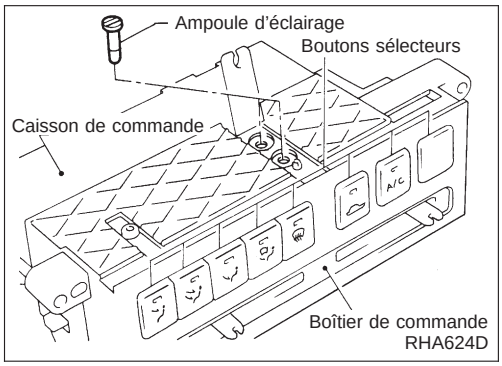
Envelopper les boutons d'un chiffon et tirer dans la direction indiquée par la flêche comme indiqué sur la figure à gauche. Veiller à ne pas rayer les boutons lors de la dépose.



2. Déposer le PTC et débrancher les connecteurs de faisceau de l'éclairage.

3. Déposer la base de la commande.

Défaire les crochets de chaque extrémité du boîtier de commande et déposer la base du boîtier de commande en le déplaçant dans la direction indiquée par la flèche.



4. Déposer le commutateur de ventilateur.

5. Déposer l'ampoule d'éclairage.

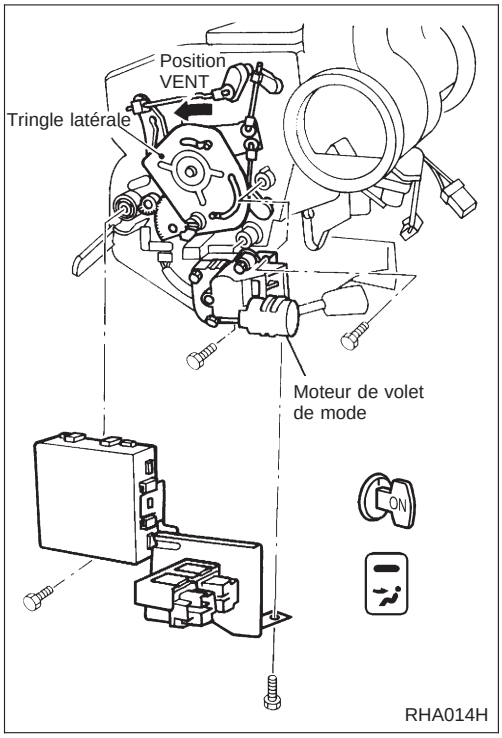
Envelopper la garniture d'un chiffon et déposer les boutons en utilisant des circlips ou des outils similaires. Veiller à ne pas rayer la surface de la garniture.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Révision — Ensemble de boîtier de commande à poussoirs (Suite)

6. Déposer les boutons sélecteurs.
7. Déposer le boîtier de commande.
8. Déposer la plaque d'éclairage.

Veiller à ne pas rayer l'ampli. de commande lors de la dépose de la plaque minéralogique.

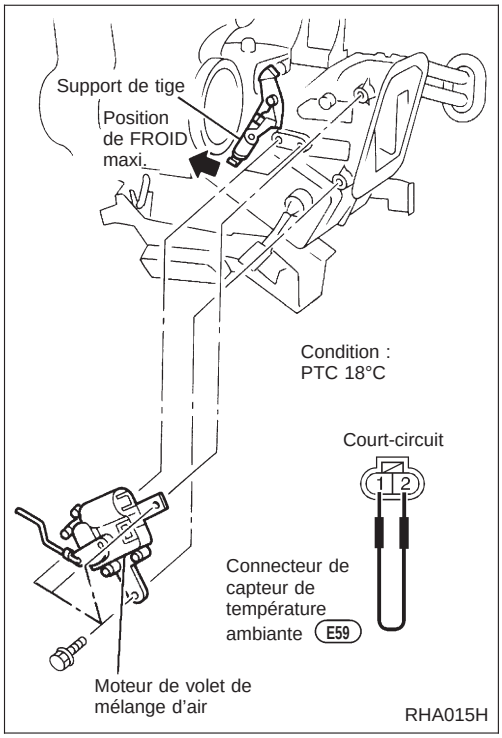


9. Déposer la plaque de finition.
10. Déposer l'ampli. de commande.

Veiller à ne pas endommager le substrat lors de la dépose.

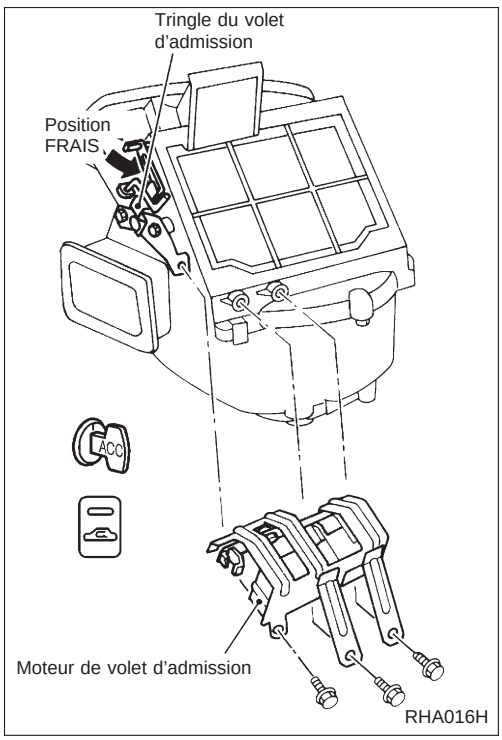
11. Débrancher le câble de commande de la température.
12. La repose se fait dans l'ordre contraire de la dépose.

Réglage de la timonerie de commande



VOLET DE MODE

1. Déposer l'amplificateur auto. et le support de relais.
2. Déplacer manuellement la tringle latérale et maintenir le volet de mode en mode VENT.
3. Reposer le moteur de volet de mode sur l'unité de chauffage et le connecter sur le faisceau de C/A automatique.
4. Mettre le contact d'allumage sur ''ON''.
5. Placer l'interrupteur VENT sur ON.
6. Attacher la tige du moteur de volet de mode au support de tige de la tringle latérale.
7. Positionner l'interrupteur DEF sur ON. Vérifier si la tringle latérale fonctionne en pleine ouverture. Mettre aussi le commutateur du ventilateur sur marche afin de vérifier que la tringle latérale fonctionne en pleine ouverture.

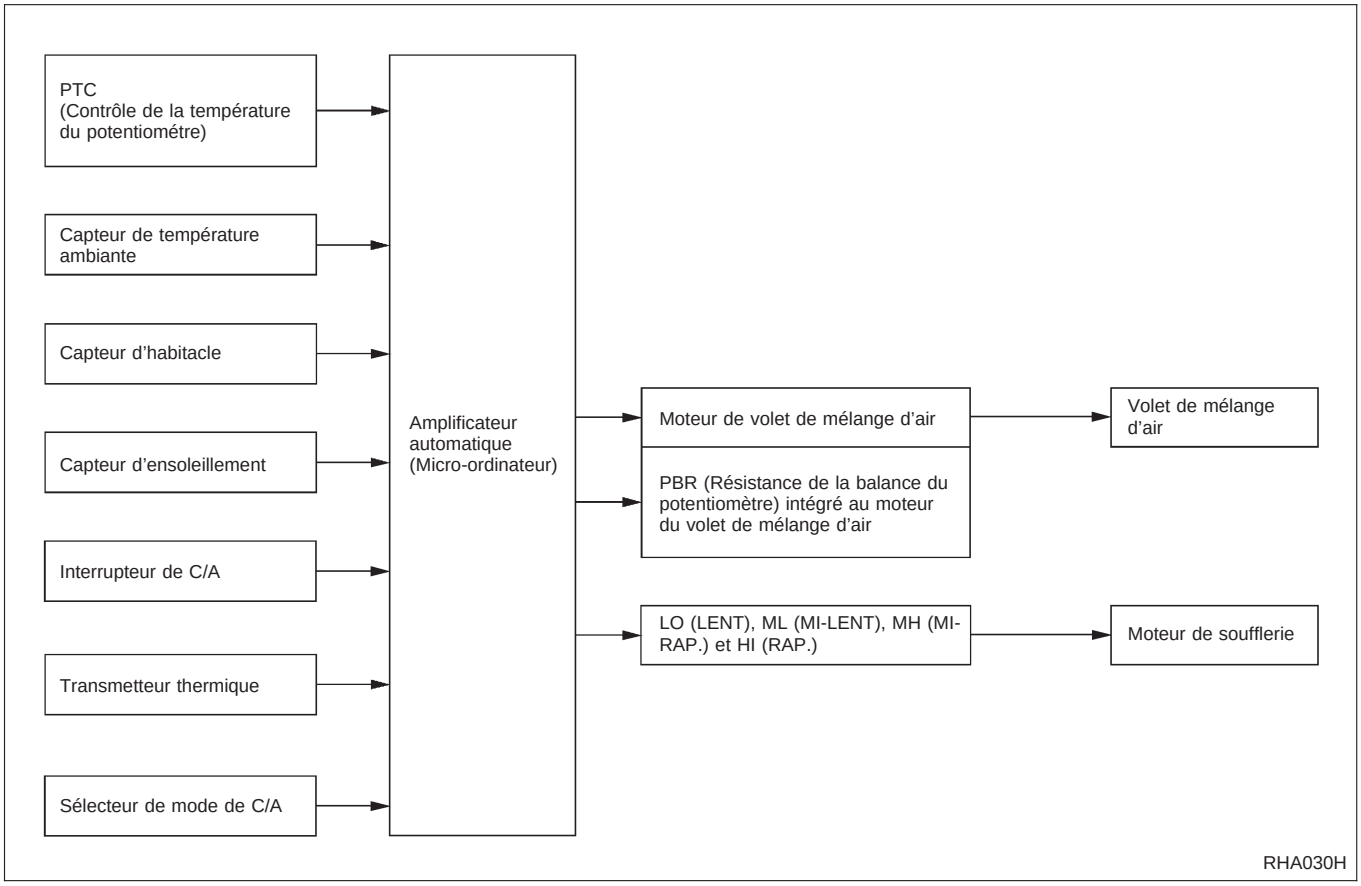


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

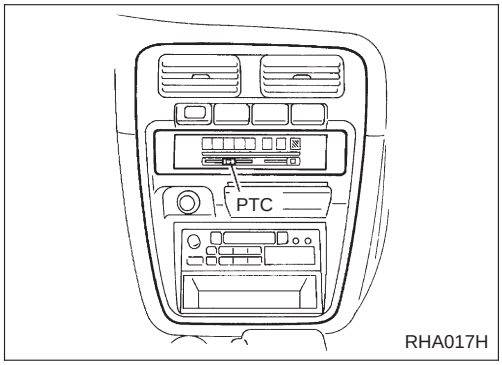
Réglage de la timonerie de commande (Suite)

VOLET DE MELANGE D'AIR

1. Reposer le moteur de volet de mélange d'air sur l'unité de chauffage et le connecter sur le faisceau de C/A automatique.
2. Débrancher le connecteur de faisceau du capteur de température ambiante et brancher les bornes ⑤ et ㊺ avec un câble volant.
3. Mettre le PTC à 18°C et le moteur de volet de mélange d'air sur la position de FROID maxi.
4. Déplacer le curseur de volet de mélange d'air à la main et le maintenir sur la position FROID maxi.
5. Fixer le curseur de volet de mélange d'air au support de tige.
6. Vérifier si le volet de mélange d'air fonctionne correctement quand le PTC se déplace de 18 à 32°C.



VOLET D'ADMISSION



1. Brancher le connecteur du faisceau du moteur de volet d'admission avant la dépose du moteur de volet d'admission.
2. Mettre le contact d'allumage sur ''ON''.
3. Eteindre l'interrupteur REC.
4. Mettre le curseur de volet d'admission sur la position FRE et reposer le moteur de volet d'admission sur l'unité d'admission.
5. Vérifier si le volet d'admission fonctionne correctement lorsque l'interrupteur de recyclage REC est mis sur ''ON'' et ''OFF''.

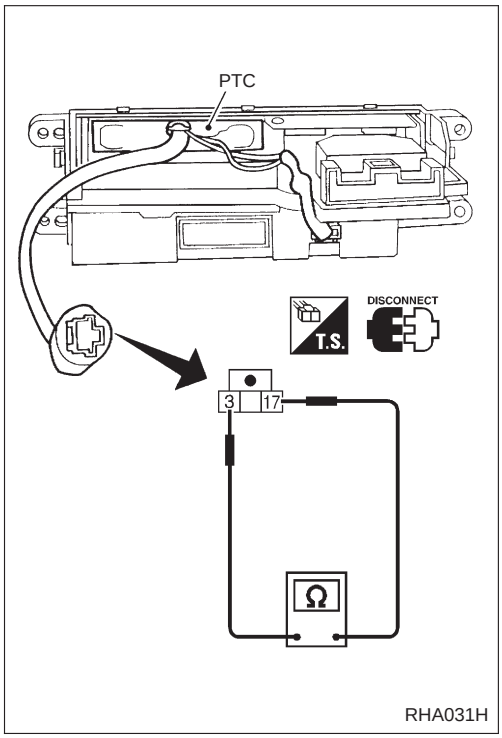
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Aperçu général du système de commande

Le système de commande se compose de a) capteurs d'admission et contacts, b) ampli. auto. (micro-ordinateur), et c) composants de sortie. La relation entre ces composants est décrite sur le schéma ci-dessous.

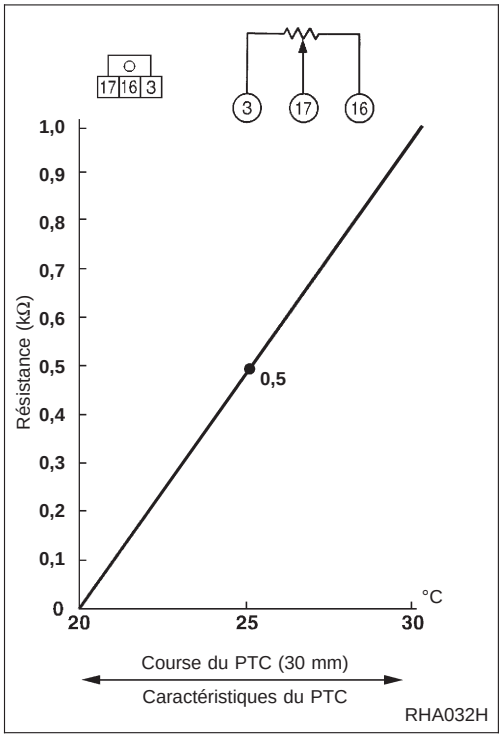
Composants d'entrée du système de commande

CONTROLE DE TEMPERATURE PAR POTENTIOMETRE (PTC)



Le PTC est intégré au boîtier de commande. Il est munie d'une résistance variable qui change selon la température de référence. Cette résistance est branchée au curseur de réglage de la température.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Composants d'entrée du système de commande (Suite)

PTC (potentiomètre)

Après avoir débranché le connecteur de faisceau PTC, calculer la résistance entre les bornes ③ et ⑰ du côté du faisceau PTC.

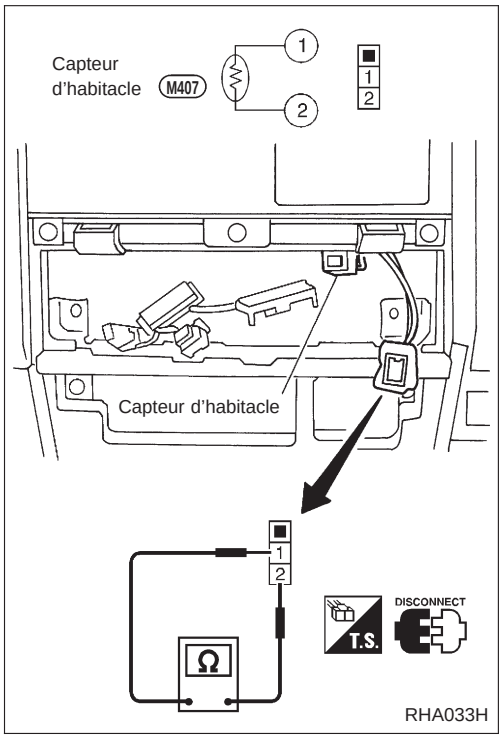
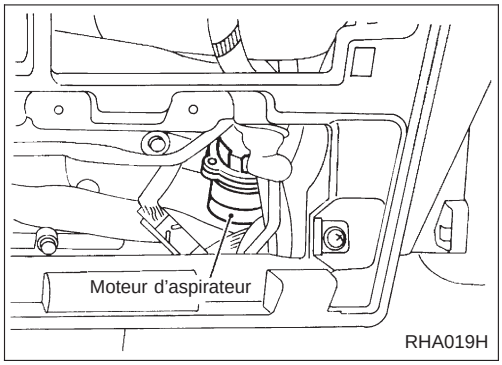
RHA032H

CAPTEUR D'HABITACLE



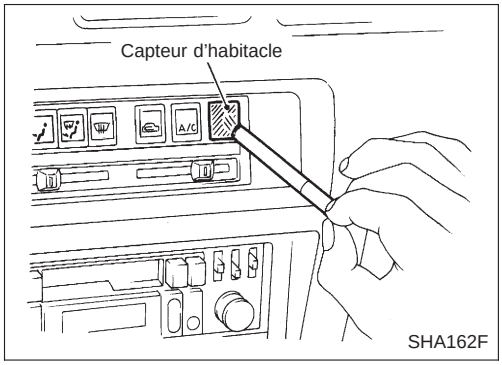
Le capteur de l'habitacle est attaché au côté droit du boîtier de commande. Il convertit les variations de température de l'air de l'habitacle aspiré par un aspirateur en une valeur de résistance, qui est alors entrée dans l'ampli. auto.

RHA018H



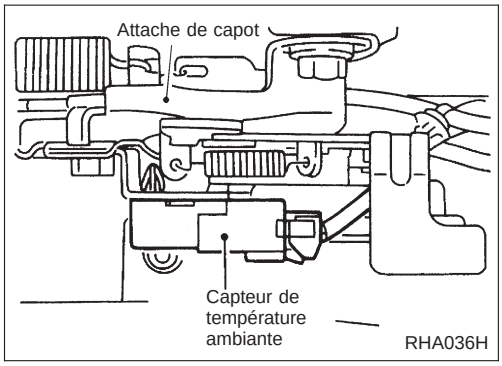
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Composants d'entrée du système de commande (Suite)



Après avoir débranché le connecteur du faisceau du capteur d'habitacle, mesurer la résistance entre les bornes ① et ② du côté du faisceau du capteur, à l'aide du tableau ci-dessous.

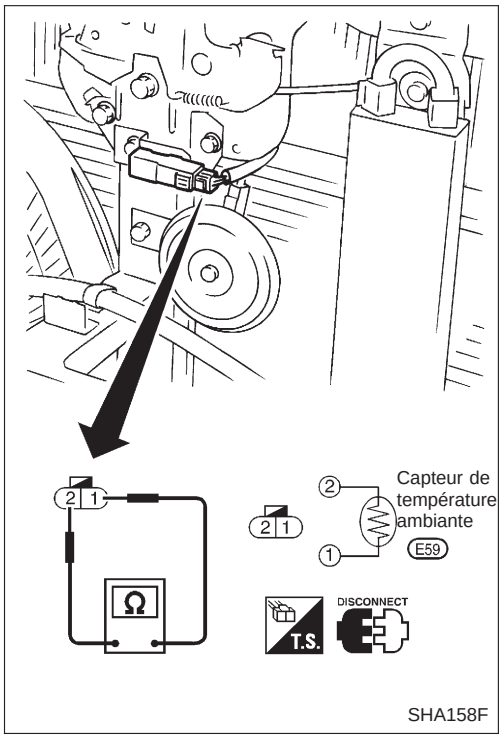
Température °C	Résistance kΩ
0	6,0
5	4,95
10	3,99
15	3,24
20	2,65
25	2,19
30	1,81
35	1,51
40	1,27



MOTEUR D'ASPIRATEUR

Le moteur d'aspirateur est situé à l'avant de l'unité de chauffage. Le moteur d'aspirateur fait circuler l'air du compartiment en continu dans le capteur d'habitacle lorsque le contact d'allumage est sur ON.

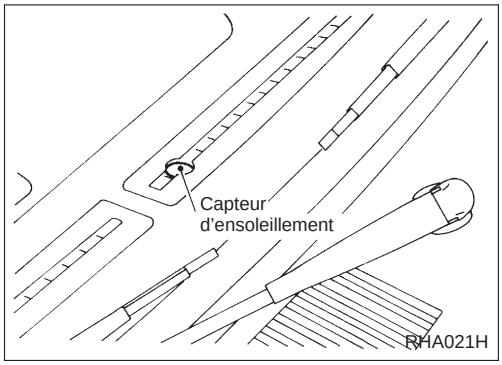
Vérifier si la fumée est correctement aspirée dans le capteur d'habitacle lorsque une cigarette allumée est déplacée près du capteur.



CAPTEUR DE TEMPERATURE AMBIANTE

Le capteur d'air ambiant est situé sur l'appui d'attache de capot. Il détecte la température ambiante et la convertit en une valeur de résistance qui est ensuite entrée dans l'amplificateur auto.

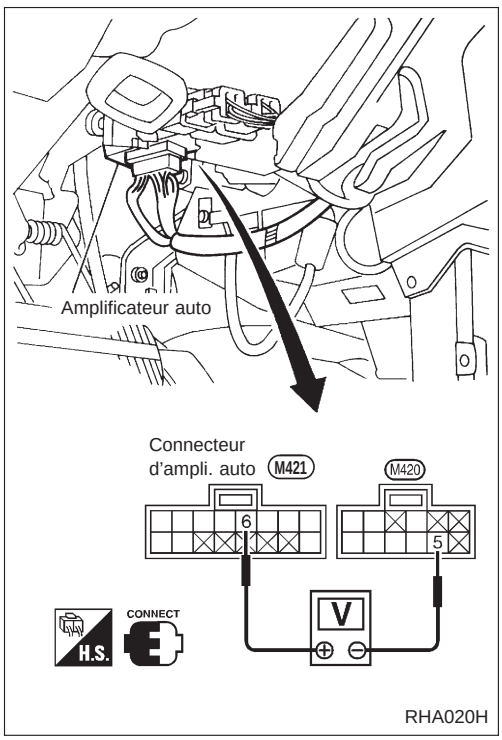
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Composants d'entrée du système de commande (Suite)

SHA158F

Après avoir déconnecté le connecteur de faisceau du capteur de température ambiante, mesurer la résistance entre les bornes ① et ② côté faisceau du capteur, en se référant au tableau ci-dessous.



Température °C	Résistance kΩ
−20	9,98
−10	5,57
0	3,26
10	1,98
20	1,25
25	1,00
30	0,81
40	0,54

RHA021H

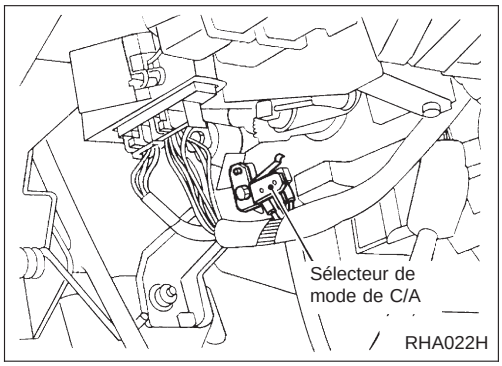
CAPTEUR D'ENSOLEILLEMENT

Le capteur d'ensoleillement est situé au centre de la grille du dégivreur. Il détecte le niveau d'ensoleillement pénétrant à travers le pare-brise à l'aide d'une photodiode et le convertit en une valeur courante qui est ensuite entrée dans l'amplificateur auto.

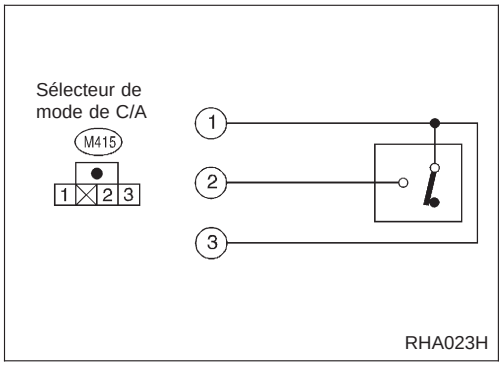
RHA020H

Mesurer la tension entre les bornes ⑤ et ⑥ côté faisceau du climatiseur automatique, au moyen du tableau ci-dessous.

Courant d'entrée mA	Tension de sortie V
0	5,00
0,1	4,09
0,2	3,18
0,3	2,27
0,4	1,36
0,5	0,45



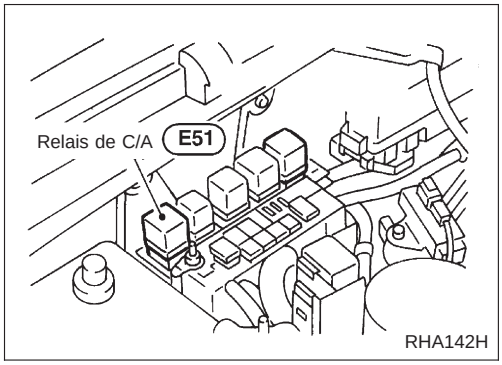
- **Vérifier le fonctionnement du capteur d'ensoleillement en s'assurant qu'il est directement exposé aux rayons du soleil.**



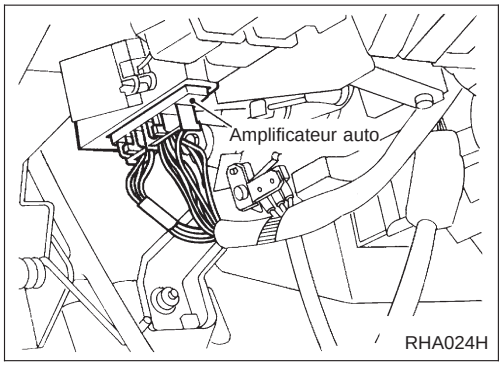
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Composants d'entrée du système de commande (Suite)

SELECTEUR DE MODE DE C/A



Le sélecteur de mode C/A se trouve autour de la tringle latérale de l'unité de chauffage et active la tringle en fonction de la position du sélecteur de mode.
Le fonctionnement du sélecteur de mode de C/A est indiqué ci-dessous :



Fonctionnement du sélecteur de mode de C/A

MODE		VENT	B/L (BI-NIVEAU)	FOOT (PLAN-CHER)	FOOT/ DEF (PLAN-CHER/ DEG)	DEF (DEG)
N° de borne	①	○	○	○	○	○
	②	○				○
	③		○	○	○	

RELAIS DE L'INTERRUPTEUR DE C/A

Le relais de l'interrupteur de C/A est situé sur le côté gauche du compartiment moteur. Lorsque l'interrupteur de C/A et le commutateur du ventilateur sont en marche, le relais de l'interrupteur de C/A fonctionne et transmet des signaux de fonctionnement du C/A à l'amplificateur auto.

Amplificateur automatique du système de commande (ampli. auto)

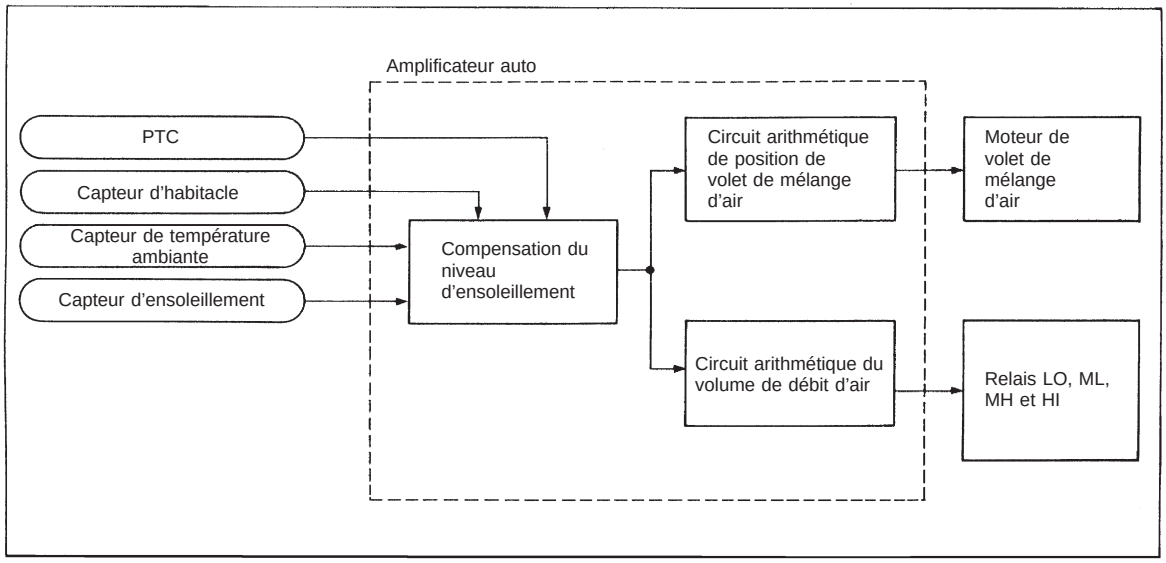
L'amplificateur auto. est équipé d'un micro-ordinateur qui traite les données transmises par les différents capteurs et qui sont nécessaires au bon fonctionnement de la climatisation. Le moteur de volet de mélange d'air et le moteur de soufflerie sont alors contrôlés.
Les signaux des différents sélecteurs et du PTC (contrôle de température du potentiomètre) sont directement entrés dans l'amplificateur auto.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Amplificateur automatique du système de commande (ampli. auto) (Suite)

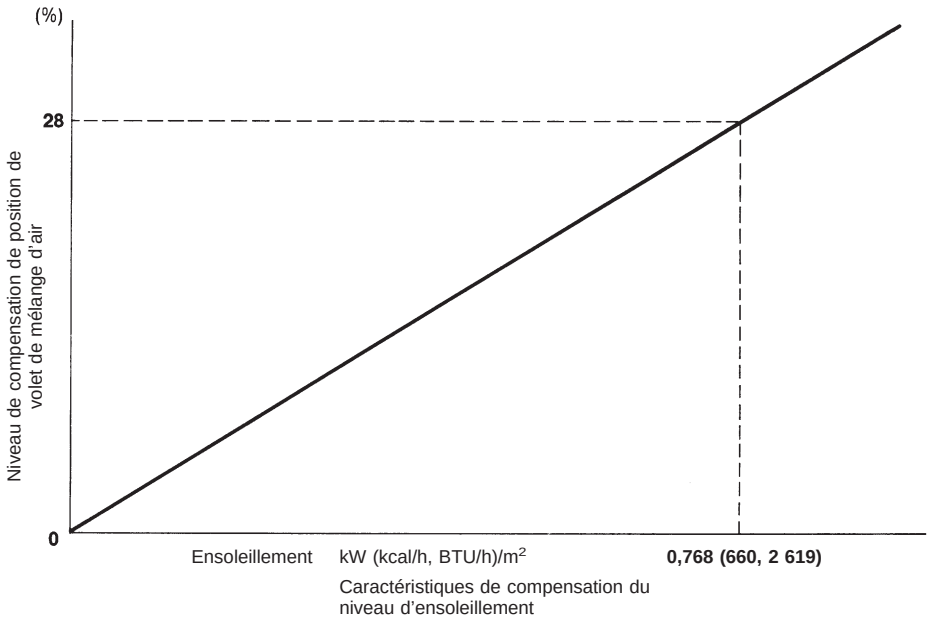
TRAITEMENT DES ENTREES DE NIVEAU D'ENSOLEILLEMENT

L'ampli. auto. comprend également un circuit de traitement qui calcule les moyennes des variations de niveau d'ensoleillement détectées sur une certaine durée. Cela permet d'éviter que le fonctionnement du système ATC (contrôle de température automatique) ne soit affecté par des changements soudains dus à des variations légères ou rapides du niveau d'ensoleillement détecté.



Supposons par exemple que l'on conduise le long d'une route bordée par des groupes de grands arbres espacés. Le niveau d'ensoleillement détecté par le capteur d'ensoleillement variera à chaque fois que la lumière du soleil sera cachée par les arbres. Le circuit de traitement calcule une moyenne du niveau d'ensoleillement détecté sur une certaine durée de façon à ce que l'effet (insignifiant) des arbres obstruant momentanément la lumière n'influent pas sur le fonctionnement de système ATC. De plus, si l'on pénètre dans un long tunnel, le système détectera une variation dans le niveau d'ensoleillement et réagira en conséquence.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



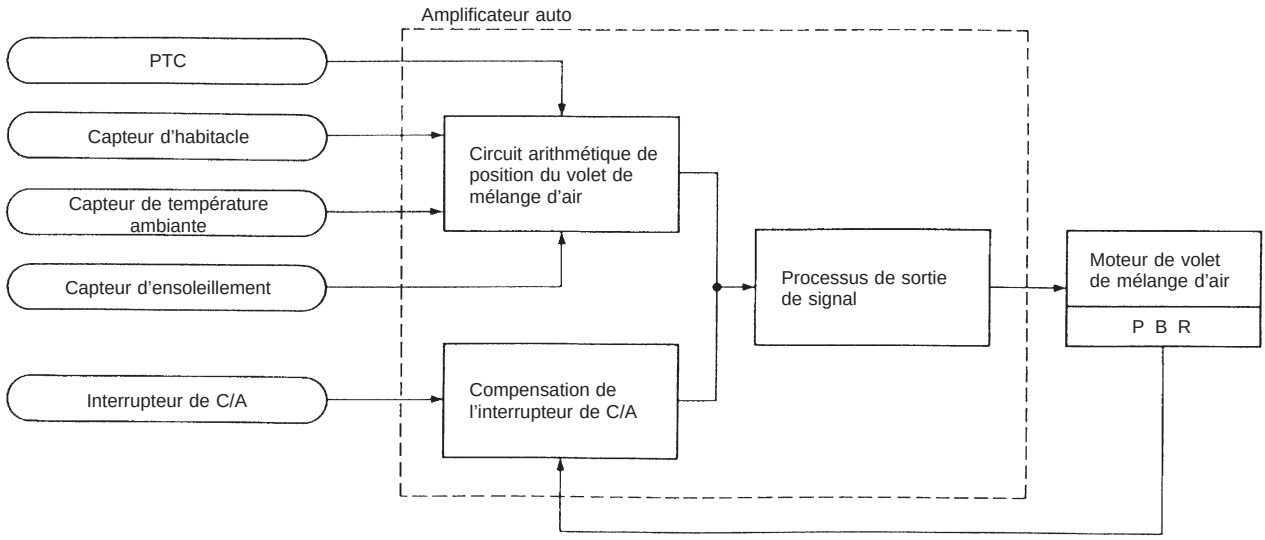
Amplificateur automatique du système de commande (ampli. auto) (Suite)

COMPENSATION DU NIVEAU D'ENSOLEILLEMENT

L'amplificateur auto. compense l'ensoleillement en changeant la position du volet de mélange d'air et le volume du débit d'air en fonction de la quantité d'ensoleillement détectée par le capteur d'ensoleillement. Lorsque la quantité d'ensoleillement est importante, le volet de mélange d'air se déplace vers le côté ''FROID''. Avec ce mouvement du volet de mélange d'air, le volume de débit d'air changera aussi.

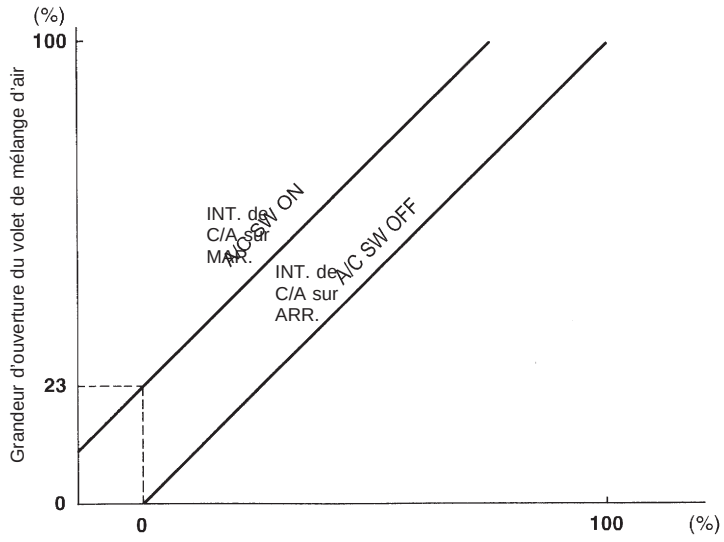
SHA492CB

Caractéristiques de compensation du niveau d'ensoleillement



SHA493CA

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Amplificateur automatique du système de commande (ampli. auto) (Suite)

COMPENSATION DE L'INTERRUPTEUR DE C/A

L'amplificateur auto. modifie la position du volet de mélange d'air et le volume du débit d'air suite à un signal émis par l'interrupteur de C/A.
Lorsque l'interrupteur de C/A est en marche, l'amplificateur automatique compense le signal d'entrée du PBR (moteur de volet de mélange d'air) et fait bouger le volet de mélange d'air vers le côté ''CHAUD''.

SHA494CB

Valeurs arithmétiques de la position du volet de mélange d'air

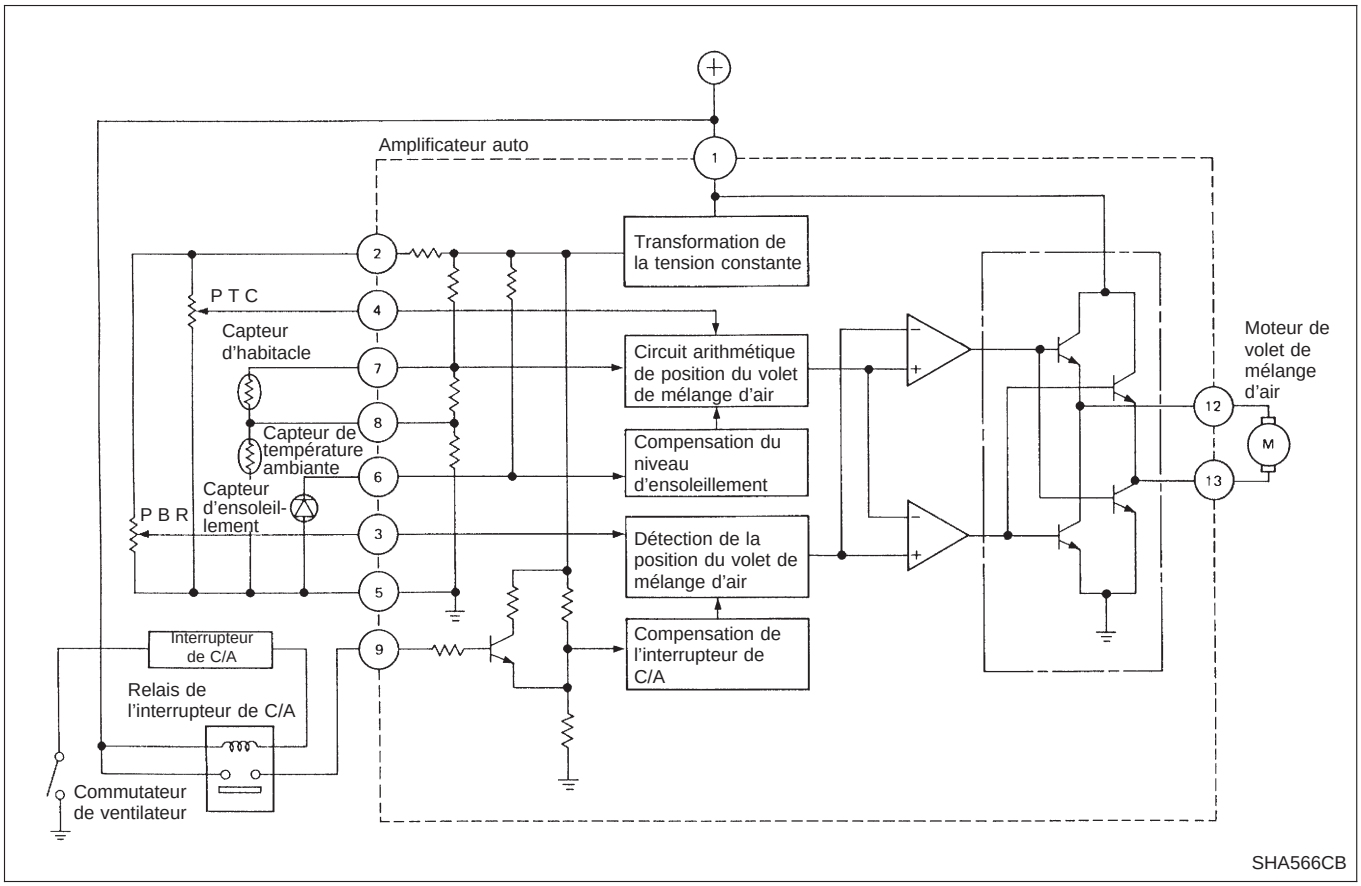
Composants de sortie du système de commande

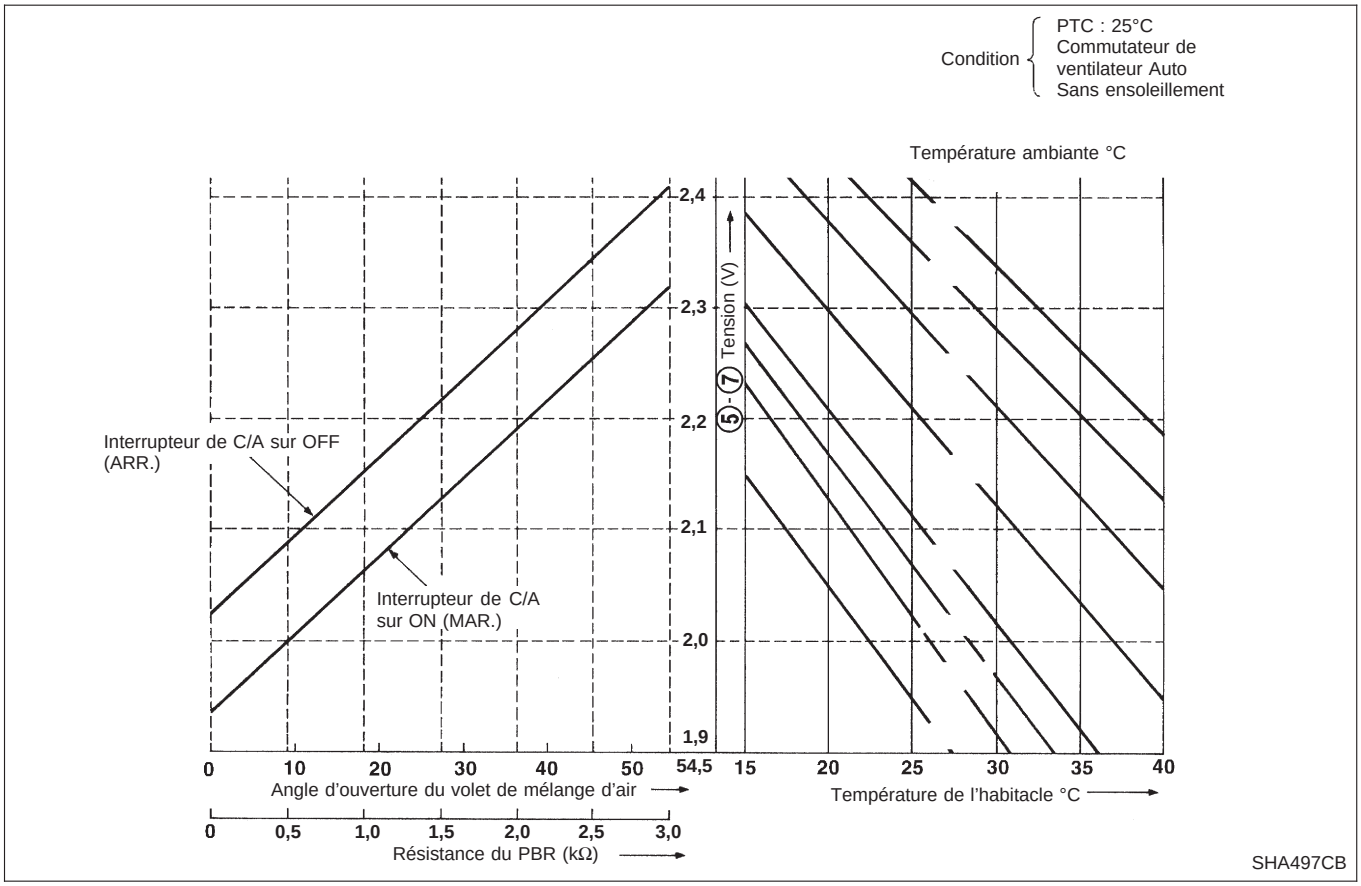


COMMANDE DE VOLET DE MELANGE D'AIR (commande de température automatique)

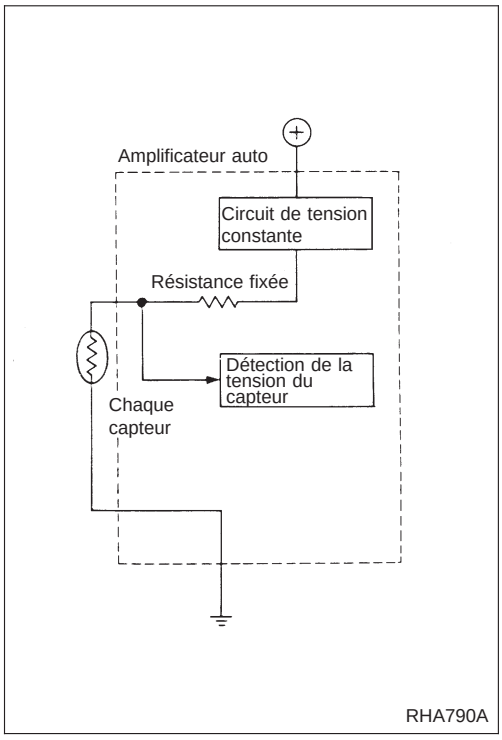
Composants

Les composants du système de commande du volet de mélange d'air sont :
1) Amplificateur automatique
2) Capteur de température ambiante
3) Capteur de l'habitacle
4) Capteur d'ensoleillement
5) Moteur de volet de mélange d'air (PBR)
6) Interrupteur de climatiseur

Fonctionnement du système



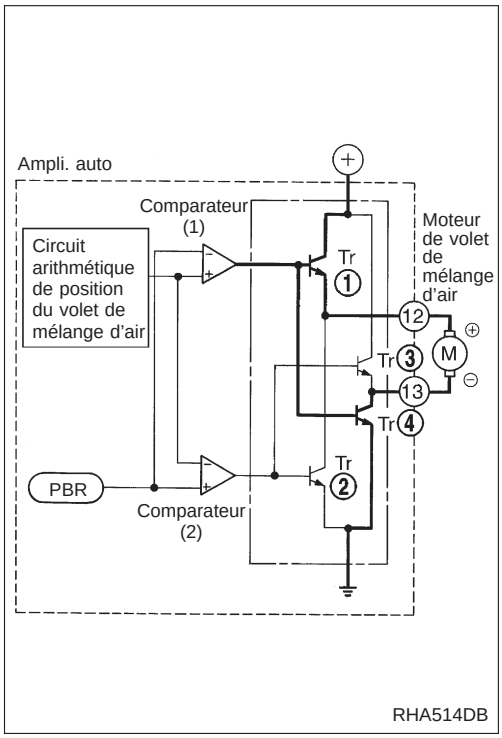
Le volet de mélange d'air est contrôlé automatiquement afin que la température à l'intérieur du véhicule soit maintenue à la température prédéterminée. La température sélectionnée par le PTC (commande de température par potentiomètre) et la température détectée par le capteur de l'habitacle et par le capteur de l'air ambiant sont compensés par le signal du capteur d'ensoleillement. L'amplificateur auto. détermine alors la position du volet de mélange d'air. La position du volet de mélange d'air détectée par le PBR est compensé par le fonctionnement marche-arrêt de l'interrupteur de C/A. La position du volet de mélange d'air déterminée par l'amplificateur auto est comparée avec celle détectée par le PBR. L'amplificateur auto. transmet alors le signal au moteur de volet de mélange d'air pour l'activer.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Composants de sortie du système de commande (Suite)

Caractéristique de la commande de volet de mélange d'air



PROCESSUS D'ENTREE DE SIGNAL DE CAPTEUR

L'amplificateur auto. détecte la tension produite par chaque capteur, le PBR et la résistance fixée. La résistance fixée est intégré à l'amplificateur auto. Une tension de 12 volts est d'abord convertie à environ 5 volts par le circuit de tension constante d' où elle est appliquée à la ligne de masse de l'amplificateur auto. via la résistance fixée et le capteur. De cette manière, l'ampli. auto. commande les tensions de la résistance fixée, de chaque capteur et du PBR pour déterminer les entrées du capteur.

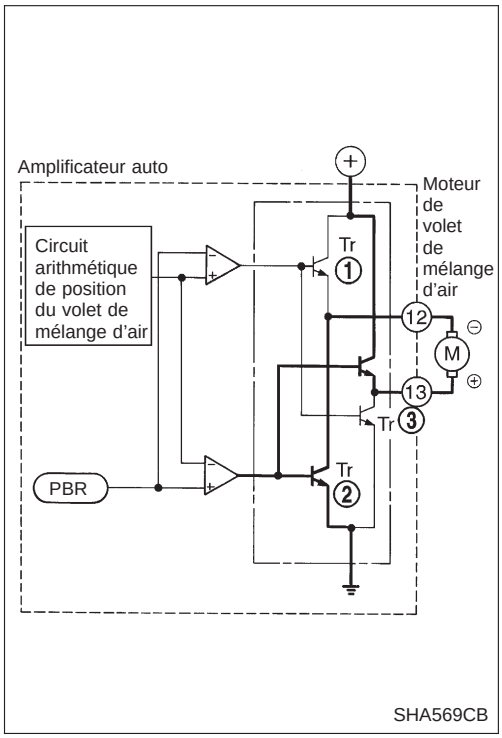
Composants de sortie du système de commande (Suite)

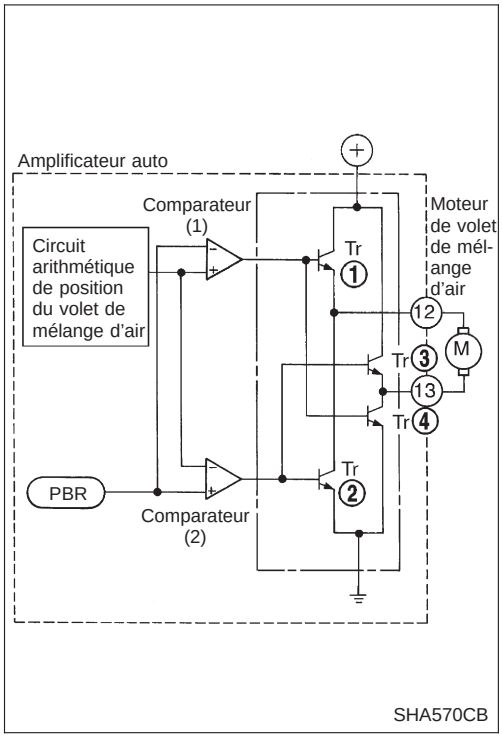
FONCTIONNEMENT DU MOTEUR DU VOLET DE MELANGE D'AIR

RHA514DB

- Exemple ①
  Lorsque la température du véhicule est moins élevée que la température de référence.
  Lorsque la température du véhicule est faible, la résistance du capteur de l'habitacle est élevée et la tension d'entrée de l'amplificateur automatique devient élevée. Il en résulte que la tension du circuit arithmétique de la position du volet de mélange d'air devient aussi élevée.
  Lorsque cette tension est plus élevée que la tension du PBR, le comparateur (1), les bornes ① et ④ sont activées.
  Par conséquent, la borne n° ⑫ devient ⊕ et la borne n° ⑬ devient ⊖. Le moteur de volet de mélange d'air tourne dans le sens des aiguilles d'une montre et le volet de mélange d'air bouge en direction du côté ''HOT'' (CHAUD).

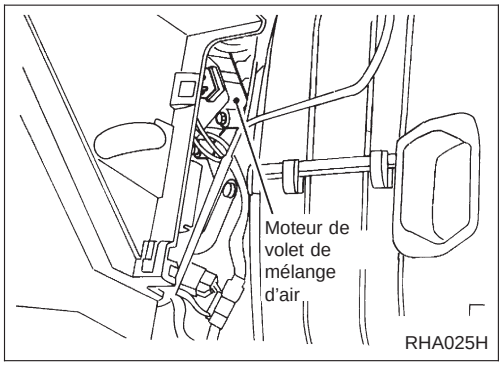


SHA568CB



Comme le volet de mélange bouge vers le côté ''HOT'' (CHAUD), la tension du PBR devient plus basse et, par conséquent, devient égale à celle émise par le circuit arithmétique de la position du volet de mélange d'air. Il en résulte que le comparateur (1) s'arrête de même que le moteur de volet de mélange d'air.

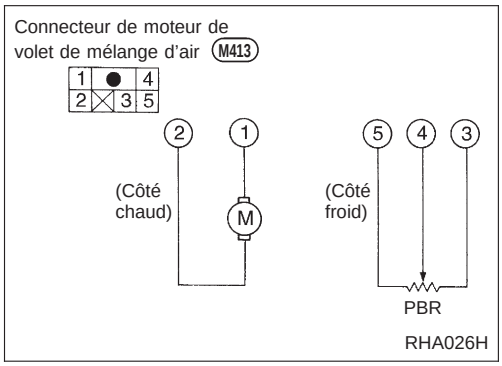
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Composants de sortie du système de commande (Suite)

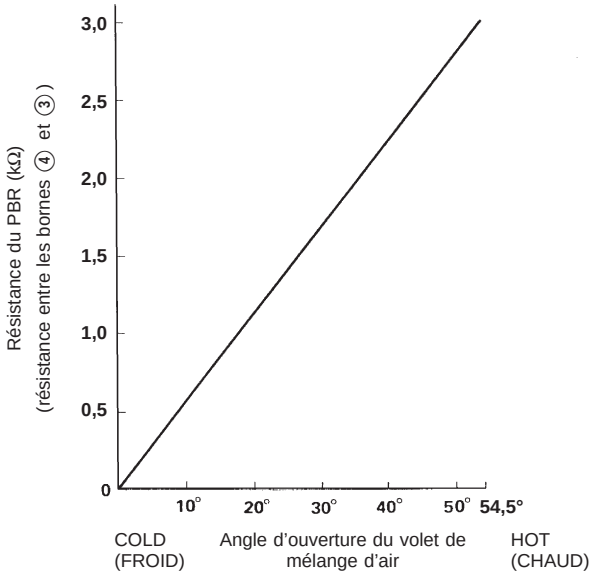
- Exemple ②
  Lorsque la température du véhicule est plus élevée que la température de référence.
  Lorsque la température du véhicule est élevée, la résistance du capteur de l'habitacle est faible et la tension d'entrée de l'amplificateur automatique devient faible. Il en résulte que la tension du circuit arithmétique de la position du volet de mélange d'air devient aussi basse.
  Lorsque cette tension est moins élevée que la tension du PBR, le comparateur (2), les bornes ② et ③ sont activées. Par conséquent, la borne n° ⑬ devient ⊕ et la borne n° ⑫ devient ⊖. Le moteur de volet de mélange d'air tourne dans le sens inverse des aiguilles d'une montre et le volet de mélange d'air bouge en direction du côté ''COLD'' (FROID).

Comme le volet de mélange d'air bouge vers le côté ''COLD'' (FROID), la tension du PBR devient plus basse et par conséquent devient égale à celle émise par le circuit arithmétique de la position du volet de mélange d'air. Il en résulte que le comparateur (2) s'arrête de même que le moteur de volet de mélange d'air.



MOTEUR DE VOLET DE MELANGE D'AIR

Le moteur de volet de mélange d'air est attaché à l'unité de chauffage. La rotation permet au volet de mélange d'air de s'ouvrir à la position déterminée par l'amplificateur auto. La rotation du moteur est alors transmise via un arbre. La position du volet de mélange d'air est alors transmise en retour à l'amplificateur auto. via le moteur du volet de mélange d'air du rhéostat (PBR).



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

COMMANDE DE LA VITESSE DU VENTILATEUR

Composants

Les composants du système de commande de vitesse du ventilateur sont :
1) Amplificateur automatique
2) Capteur d'habitacle
3) Capteur de température ambiante
4) Capteur d'ensoleillement
5) Relais de l'interrupteur de C/A
6) Interrupteur de C/A
7) Commutateur de ventilateur
8) Moteur de soufflerie
9) Résistance
10) Relais HI (rap.), MH (mi-rap.), ML (mi-lent) et LO (lent)

Fonctionnement du système

La vitesse du ventilateur de soufflerie est automatiquement contrôlée afin que la température à l'intérieur du véhicule soit maintenue à la température prédéterminée.
La température sélectionnée par le PTC (commande de température par potentiomètre) et la température détectée par le capteur de l'habitacle et par le capteur de l'air ambiant sont compensés par le signal du capteur d'ensoleillement. L'amplificateur auto. détermine alors la vitesse du ventilateur depuis le fonctionnement marche-arrêt de l'interrupteur de C/A. La décision de la vitesse du ventilateur par l'amplificateur auto active le relais de ventilateur et le moteur de ventilateur de soufflerie tourne. Lorsque l'interrupteur de C/A est sur marche, la vitesse du ventilateur est activée en 4 étapes ; HI (rap.), MH (mi-rap.), ML (mi-lent) et LO (lent). Lorsque l'interrupteur de C/A est sur arrêt, la vitesse du ventilateur est activée en 3 étapes, MH (mi-rap.), ML (mi-lent) et LO (lent).

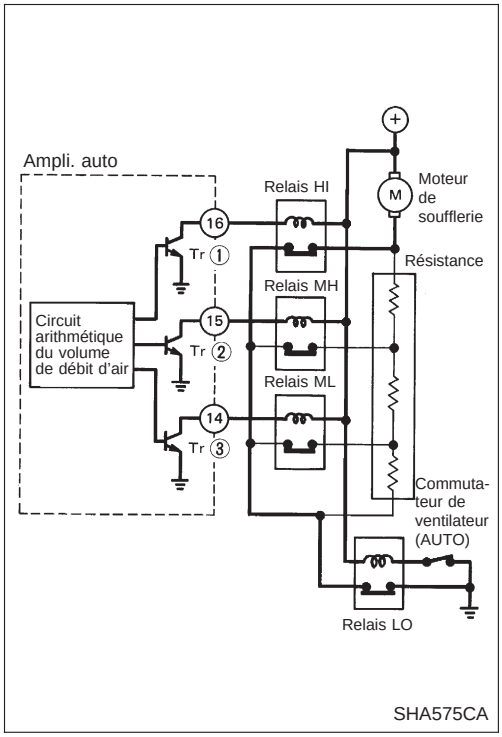
SHA573CC

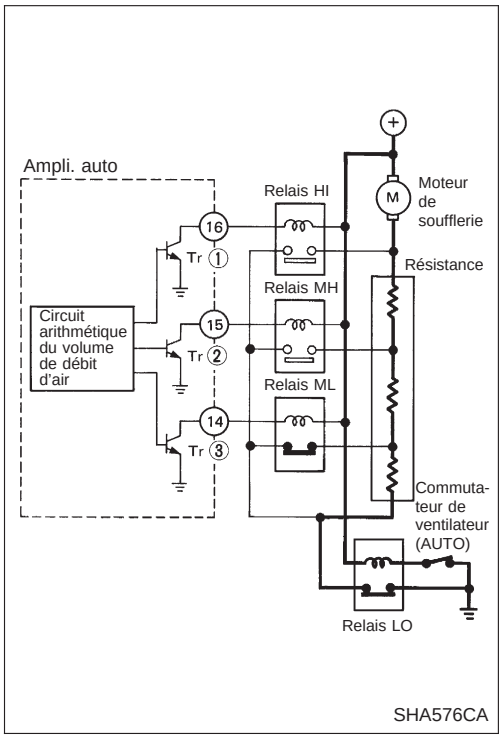
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Composants de sortie du système de commande (Suite)



Les signaux de chaque capteur, le PTC, l'interrupteur de C/A, etc. sont envoyés au circuit arithmétique du volume du débit d'air de l'amplificateur auto. Le débit d'air est déterminé par ce circuit.

(1) Lorsque le volume du débit d'air est mis sur ML (mi-lent)
Le circuit arithmétique du volume du débit d'air alimente la borne ③, qui allume le relais de position ML (mi-lent). Ainsi, le moteur de soufflerie tourne en position ML (mi-lent).



SHA574CA

(2) Une fois mis sur la position HI (rap.)
Le circuit arithmétique du volume du débit d'air alimente la borne ①, qui allume le relais de position HI (rap.). Ainsi, le moteur de soufflerie tourne en position HI (rap.). Les bornes ② et ③ reçoivent aussi du courant ; ceci a pour résultat d'alimenter les relais des positions ML (mi-lent) et MH (mi-rapide).

SHA575CA

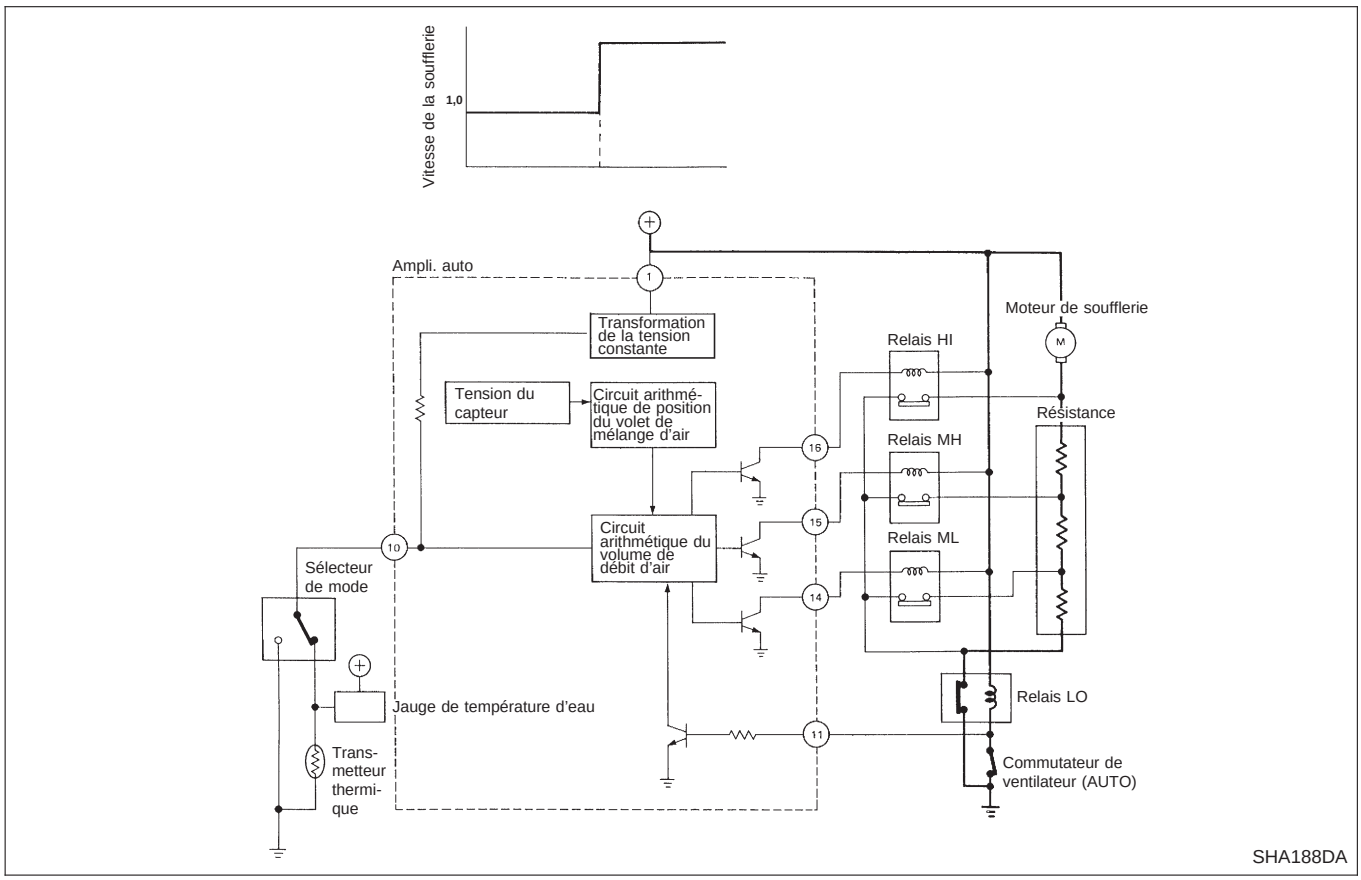
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Composants de sortie du système de commande (Suite)

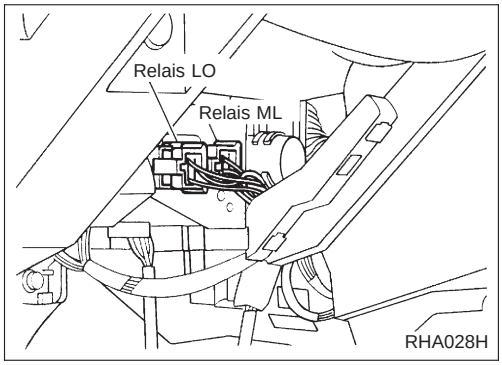
(3) Une fois mis sur la position LO (lent)

Le circuit arithmétique du volume du débit d'air n'alimente pas les bornes ①, ② et ni ③.

Seul le relais de position LO (lente) s'allume entraînant ainsi le moteur de soufflerie en position LO (lent).



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

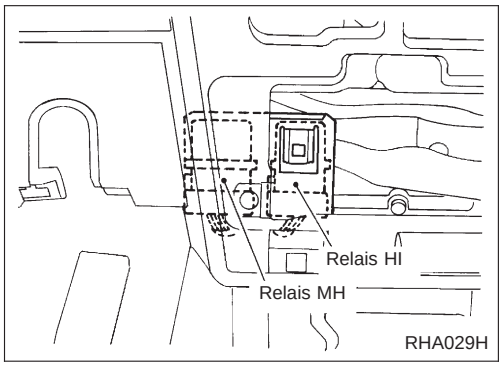


Composants de sortie du système de commande (Suite)

COMMANDE DE VITESSE DE VENTILATEUR AU DEMARRAGE

Le système de commande du ventilateur au démarrage est ainsi désigné pour empêcher un excès d'air froid d'être évacué après que le moteur a été démarré lorsque la température du refrigérant moteur est basse. Les composants reliés à ce système sont le microcontact de capteur de température d'eau, les relais de position HI (rap.), MH (mi-rap.), ML (mi-lent), LO (lent), le moteur de soufflerie, la résistance et l'amplificateur auto.

Lorsque la commande du ventilateur est sur AUTO, le microcontact sur ON (soit B/L, FOOT, ou FOOT/DEF) et la température du réfrigérant moteur en dessous de 50 °C, la vitesse de la soufflerie est fixée à la position LO (lent).



RELAIS LO (lent), ML (mi-lent), MH (mi-rap.) et HI (rap.)

Les relais de position LO (lent) et ML (mi-lent) sont situés sur le support de l'amplificateur auto, et les relais de position MH (mi-rap.) et HI (rap.) à l'arrière de l'unité de radio. Chaque relais de ventilateur marche en fonction du volume du débit d'air déterminé par ampli. auto. Le moteur de soufflerie fonctionne alors en conséquence.

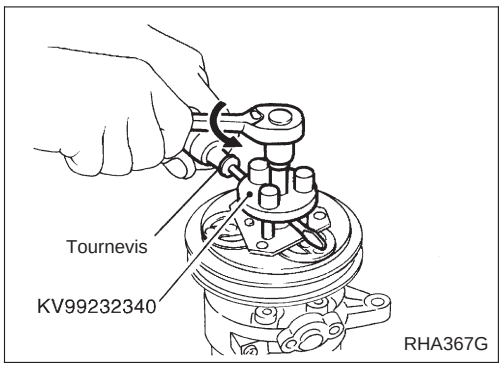
Fixation du compresseur

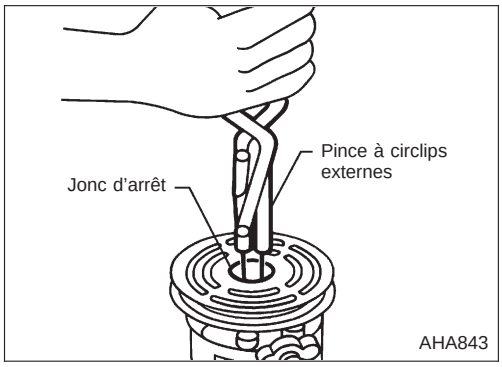
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Compresseur — Modèle DKV-14C (marque ZEXEL)

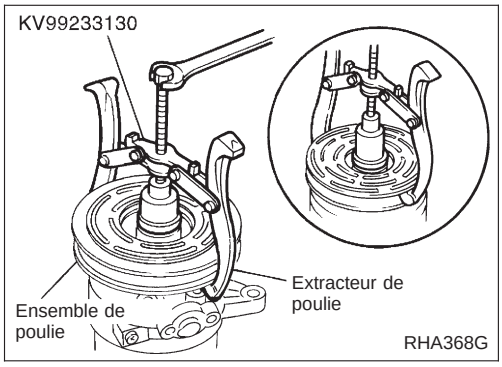


Embrayage de compresseur — Modèle DKV-14C (marque ZEXEL)

DEPOSE

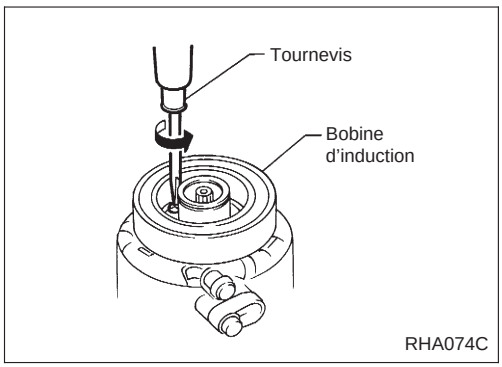


- Lors de la dépose du boulon central, immobiliser le disque d'embrayage avec une clé pour disque d'embrayage.

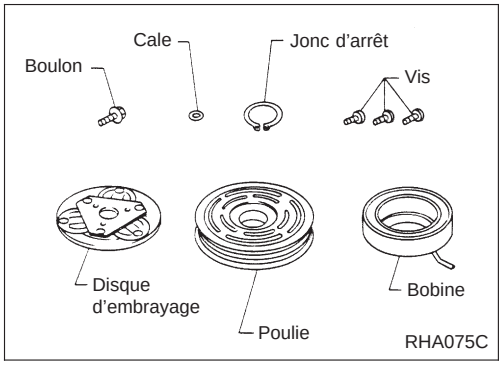


- Déposer le disque d'embrayage à l'aide de l'outil spécial KV99232340.
  Introduire les trois ergots de l'outil d'immobilisation dans le disque d'embrayage. Tourner l'outil dans le sens des aiguilles d'une montre afin de l'accrocher au plateau. Ensuite, serrer le boulon central pour déposer le disque d'embrayage.
  Lors du serrage du boulon central, insérer une barre ronde (tournevis, etc.) entre deux des ergots (comme illustré ci-contre) pour empêcher le disque d'embrayage de tourner. Après avoir déposé le disque d'embrayage, retirer les cales du semi-arbre ou du disque d'embrayage.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Embrayage de compresseur — Modèle DKV-14C (marque ZEXEL) (Suite)



- Retirer le jonc d'arrêt à l'aide d'une pince à circlips externes.

- Dépose de la poulie
  Utiliser n'importe quel extracteur de poulie en vente dans le commerce. Positionner son centre à l'extrémité du semi-arbre, puis déposer la poulie.
  Pour les poulies montées à la presse :
  Afin d'éviter de déformer la rainure de la poulie, placer les mâchoires de l'extracteur sous la rainure de la poulie (et non dans la rainure).
  Pour les poulies attachées à la machine :
  Aligner la rainure de l'extracteur sur la rainure de la poulie, puis déposer la poulie.

- Déposer la bride du faisceau de la bobine d'induction à l'aide d'un tournevis.
- Retirer les trois vis de fixation de la bobine d'induction et la déposer.

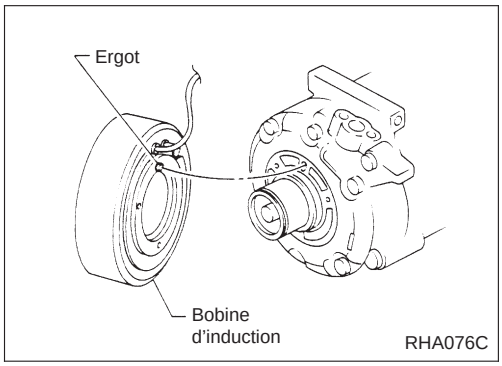
INSPECTION

Disque d'embrayage

Si la surface de friction montre des signes d'altération causés par un échauffement excessif, remplacer le disque d'embrayage et la poulie.

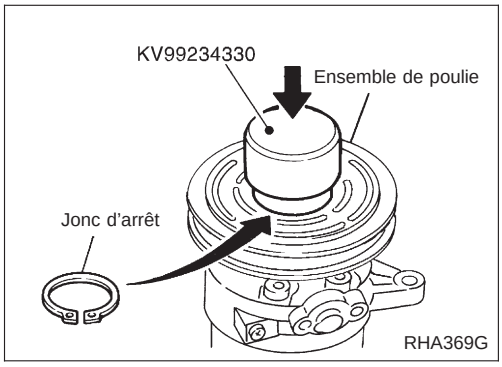
Poulie

Vérifier l'apparence de l'ensemble de la poulie. Si la surface de contact de la poulie comporte des rayures excessives, la poulie et le disque d'embrayage doivent être remplacés. Les surfaces de contact de l'ensemble de poulie doivent être nettoyées avec un dissolvant approprié avant la repose.



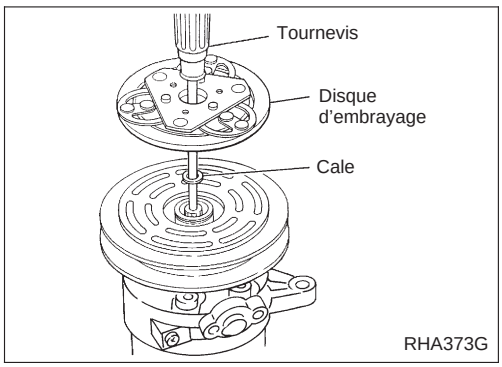
Bobine

Vérifier si la bobine ne présente pas de raccords desserrés ou d'isolation fissurée.

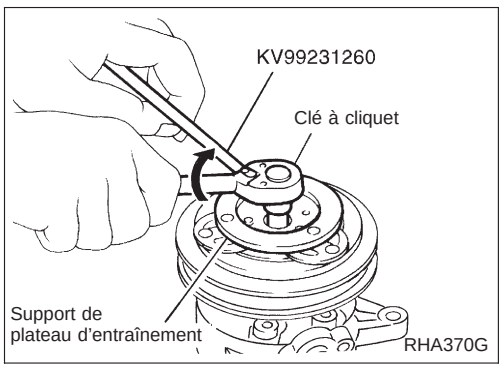


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Embrayage de compresseur — Modèle DKV-14C (marque ZEXEL) (Suite)

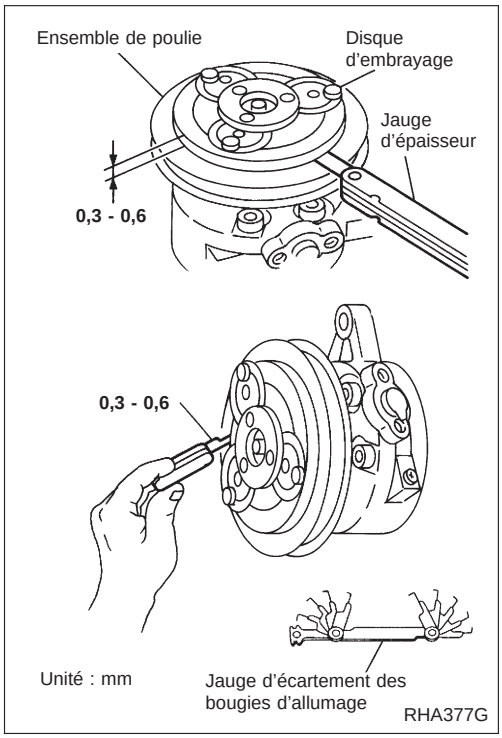


REPOSE



- Reposer la bobine d'induction.
- **Veiller à aligner l'ergot de la bobine avec le trou avant du compresseur.**
- Reposer le clip du faisceau de la bobine d'induction à l'aide d'un tournevis.

- Reposer l'ensemble de poulie à l'aide de l'outil de repose et d'une presse manuelle, puis reposer le jonc d'arrêt à l'aide d'une pince à circlips.



- Reposer le disque d'embrayage sur le semi-arbre avec la ou les cales d'origine. Appuyer sur le disque d'embrayage à la main.

- En utilisant le support pour empêcher le plateau d'entraînement de tourner, serrer les boulons au couple suivant : 12 à 15 N·m (1,2 à 1,5 kg-m).
- **Après avoir serré le boulon, contrôler que la poulie tourne librement.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Embrayage de compresseur — Modèle DKV-14C (marque ZEXEL) (Suite)

- Vérifier le jeu tout autour de la périphérie du disque d'embrayage.

  Jeu entre disque et poulie :
  0,3 - 0,6 mm

  Si le jeu spécifié n'est pas obtenu, remplacer l'entretoise de réglage et régler à nouveau.

RODAGE

Toujours effectuer un rodage lorsque l'on remplace l'embrayage de compresseur. Pour ce faire, enfoncer et relâcher l'embrayage une trentaine de fois environ. Le rodage augmente le couple transmis.

Protecteur thermique — Modèle DKV-14C (marque ZEXEL)

INSPECTION

- Lors de l'entretien, empêcher la pénétration de substances étrangères dans le compresseur.
- Vérifier la continuité entre les deux bornes.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Entretien dans des conditions de conduite sévères (pour moteur TD25Ti seulement)

Les intervalles d'entretien indiqués aux pages précédentes sont donnés pour des conditions d'utilisation normales. Si le véhicule est principalement utilisé dans les conditions de conduite sévères suivantes, il est nécessaire d'augmenter la fréquence d'entretien indiquée dans le tableau.

Conditions de conduite sévères

A — Conduite dans un environnement poussiéreux
B — Conduite répétée sur de courtes distances
C — Tirage d'une remorque ou d'une caravane
D — Ralenti excessif
E — Conduite dans des conditions climatiques extrêmement difficiles ou dans des endroits où les températures ambiantes sont soit extrêmement basses, soit extrêmement élevées
F — Conduite dans des régions très humides ou montagneuses
G — Conduite sur des chaussées recouvertes de sel ou d'autres matériaux corrosifs
H — Conduite sur des routes inégales et/ou boueuses ou dans le désert
I — Conduite avec usage fréquent des freins ou dans des régions montagneuses
J — Conduite fréquente sur des surfaces inondées

Opérations d'entretien : Vérifier = Vérifier et corriger ou remplacer si nécessaire.

Condition de conduite	Elément d'entretien	Opérations d'entretien	Intervalle d'entretien — Kilométrage annuel		Page de référence
			Moins de 30 000 km	Plus de 30 000 km	
A B C D	Huile moteur	Remplacer	Tous les 5 000 km ou 3 mois	Tous les 5 000 km	MA-1009
	Filtre à huile moteur				MA-27
A	Filtre d'épurateur d'air (type à papier visqueux)	Remplacer	Tous les 20 000 km ou 12 mois	Tous les 30 000 km	MA-1010

A . C . . . G H I .	Plaquettes de freins, disques et autres composants de freins	Inspecter	Tous les 10 000 km ou 6 mois	Tous les 15 000 km	MA-39
	Garnitures de freins, tambours et autres composants de freins				MA-39
. . . . . F	Liquide de frein	Remplacer	Tous les 20 000 km ou 12 mois	Tous les 30 000 km	MA-38
. . C . . . . H . .	Huile de boîte de transfert et d'engrenage de différentiel standard	Remplacer	Tous les 30 000 km ou 18 mois	Tous les 30 000 km	MA-36, 37
	Huile pour pignon de différentiel à glissement limité (LSD)*1	Remplacer			MA-37
	Semi-arbre	Inspecter	Tous les 10 000 km ou 6 mois	Tous les 15 000 km	*2
. . . . . G H . .	Pignon de direction et timonerie, essieu, pièces de suspension et arbre de transmission	Inspecter			MA-36, 41
	Système d'échappement	Inspecter			MA-35
. . . . . G H . J	Points de graissage de la timonerie de direction, des arbres de transmission et de la suspension	Lubrifier			MA-37
. . . . . J	Graisse pour roulement de roue avant	Inspecter			*3
	Graisse pour moyeu de roue libre	Inspecter			

*1 : Pignon de différentiel intégré à l'unité de verrouillage du différentiel
*2 : "ESSIEU AVANT — Semi-arbre" à la section FA
*3 : "Roulement des roues avant" à la section FA, "Moyeu débrayable manuel — 4 X 4 —" et "Moyeu débrayable automatique — 4 X 4 —" à la section FA

Entretien en cas de conduite tout-terrain (pour modèles à 4 roues motrices seulement)

En cas de conduite tout-terrain dans le sable, la boue ou l'eau aussi profonde que le moyeu de roue, les pièces suivantes devront alors subir des entretiens plus fréquents :

▲ Plaquettes de freins et disques
▲ Garniture de freins et tambours
▲ Canalisations et flexibles de freins
▲ Graisse pour roulement de roue et graisse pour moyeu de roue libre
▲ Graisse pour moyeu de roue libre
▲ Huile de boîte de différentiel, de boîte de vitesses et de boîte de transfert
▲ Timonerie de la direction
▲ Arbre primaire et semi-arbre avant
▲ Filtre à air
▲ Carter d'embrayage (voir si l'eau pénètre. Se reporter à MA-37).

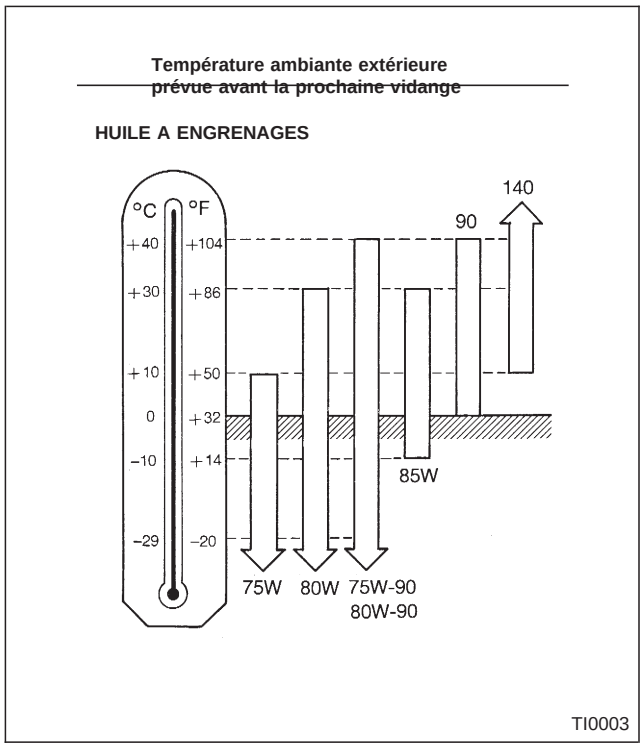
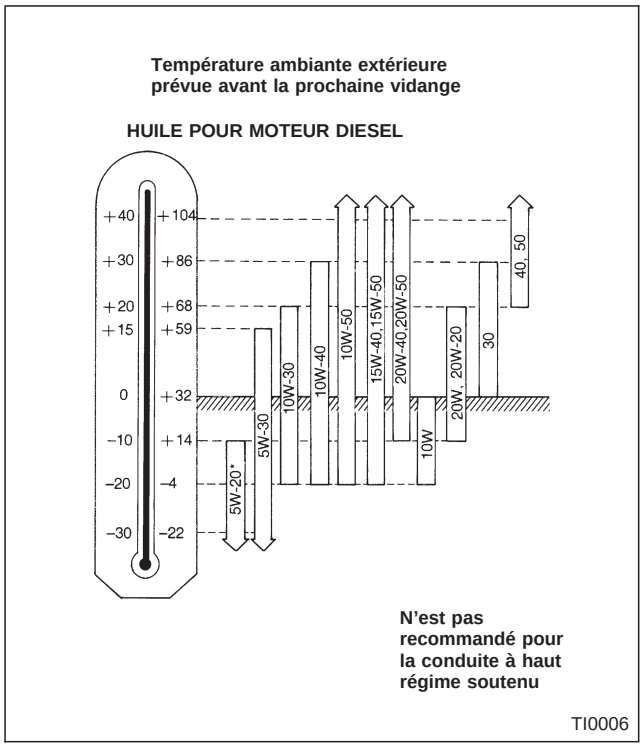
	QD32 & TD25Ti	6,0	
Circuit de refroidissement (avec réservoir)			
	NA20S	6,8	Liquide de refroidissement antigel (à base d'éthylène glycol) ou eau douce
	Z24S	Avec C/A 8,9 Sans C/A 8,7	
	KA24E	6,7	
	TD25 & TD27	9,5	
	TD25Ti	10,6	
	QD32	9,4. 10,2*4	
Huile pour boîte de vitesses manuelle	FS5R30A	4 roues motrices 5,1	API GL-4*1
	FS5W71C	2 roues motrices 2,0 4 roues motrices 4,9	
Huile de boîte de transfert	TX10A	2,2	Matic "D" Nissan, huile pour boîte de vitesses automatique équivalent*2 ou API GL-4*1
Huile de boîte de différentiel			
Avant :	R180A	1,3	Différentiel standard : API GL-5*1 Pignon de différentiel à glissement limité (LSD) : huile pour engrenages hypoïdes LSD (n° de pièce : KLD31-14002) ou équivalent*3
Arrière :	C200	1,3	
	H233B	2,8	
Liquide pour direction assistée		—	Type DEXRON™ IIE, DEXRON™ III ou équivalent
Liquide de frein et d'embrayage		—	Pour l'Europe : DOT 3 ou DOT 4 (US FMVSS n° 116)*5 Sauf pour l'Europe : DOT 3 (US FMVSS n° 116)
Graisse pour arbre primaire		—	NLGI n° 2 (à base de savon de lithium comprenant du bisulfure de molybdène)
Graisse à usage multiple		—	NLGI n° 2 (à base de savon de lithium)



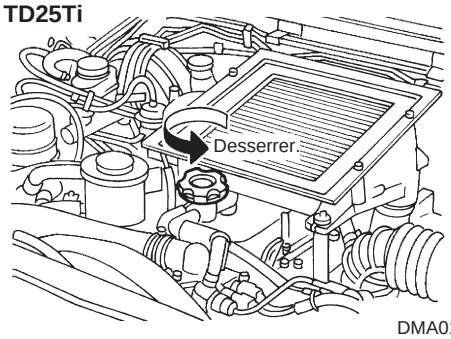
*1 : Pour plus de détails, se reporter à "Indice de viscosité SAE".
*2 : Pour de plus amples informations sur les marques de liquide correctes, y compris l'ATF du type DEXRON™III/MERCON™, consulter un concessionnaire Nissan.
*3 : API GL-5, SAE 140 et 10% de la quantité de modificateur de friction de LSD (n° de pièce : 38469-C6000) sont des équivalents.
*4 : Pour l'Australie ou modèles avec climatiseur.
*5 : Ne jamais mélanger DOT 3 et DOT 4 (DOT 3 est rempli en atelier).

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Indice de viscosité SAE

- **Pour les pays tempérés et froids : l'huile 10W-30 convient, avec une température ambiante supérieure à −20°C.**
- **Pour des régions très chaudes : les huiles 20W-20, 20W-40 et 20W-50 conviennent.**



- **Pour des régions tempérées et froides : l'huile 75W-90 pour la boîte de transfert et l'huile 80W-90 pour le différentiel conviennent.**
- **Pour les pays très chauds : l'huile 90 convient à une température ambiante inférieure à 40°C.**
- **Pour tout type de région : l'huile 75W-90 est préférable pour la boîte de vitesse.**

- **Pour les pays froids : l'huile 10W-30 est préférable.**
  Pour les modèles équipés d'un turbocompresseur, l'huile 5W-20 n'est pas recommandée et 5W-30 ne devrait être utilisée qu'en dessous de 0°.
- **Pour les pays tempérés et très chauds : les huiles 20W-40 et 20W-50 conviennent.**

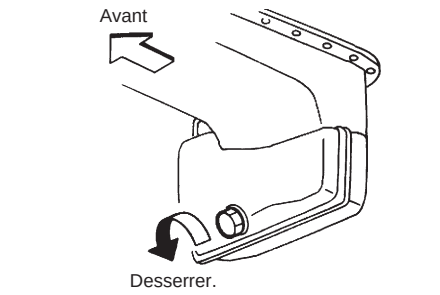
TD25Ti

DMA018



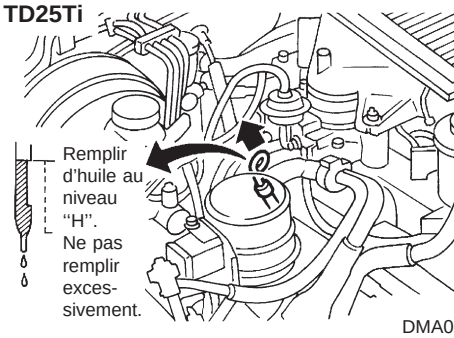
Remplacement de l’huile moteur

AVERTISSEMENT :

- **Prendre garde de ne pas se brûler car l’huile moteur est très chaude.**
- **Les contacts prolongés et répétés avec les huiles moteur usagées peuvent provoquer des cancers de la peau ; éviter tout contact direct avec les huiles moteur usagées. En cas de contact avec la peau, laver soigneusement avec du savon ou un produit de nettoyage pour les mains aussi rapidement que possible.**

1. Réchauffer le moteur, et vérifier si les composants du moteur ne présentent pas de fuites d’huile.
2. Déposer le bouchon de vidange et le bouchon de remplissage d’huile et laisser l’huile se vidanger.
3. Vidanger l’huile et faire le plein d’huile moteur neuve.
   Catégorie d’huile : ACEA B3
   Viscosité :
   Voir ‘‘LIQUIDES ET LUBRIFIANTS CONSEILLES’’ à la section MA de l’édition originale du Manuel de Réparation.
   Contenance en huile de remplissage (environ) :
   Sans remplacement du filtre à huile
   TD25Ti 6,0 ℓ
   Avec remplacement du filtre à huile
   TD25Ti 6,7 ℓ

TD25Ti



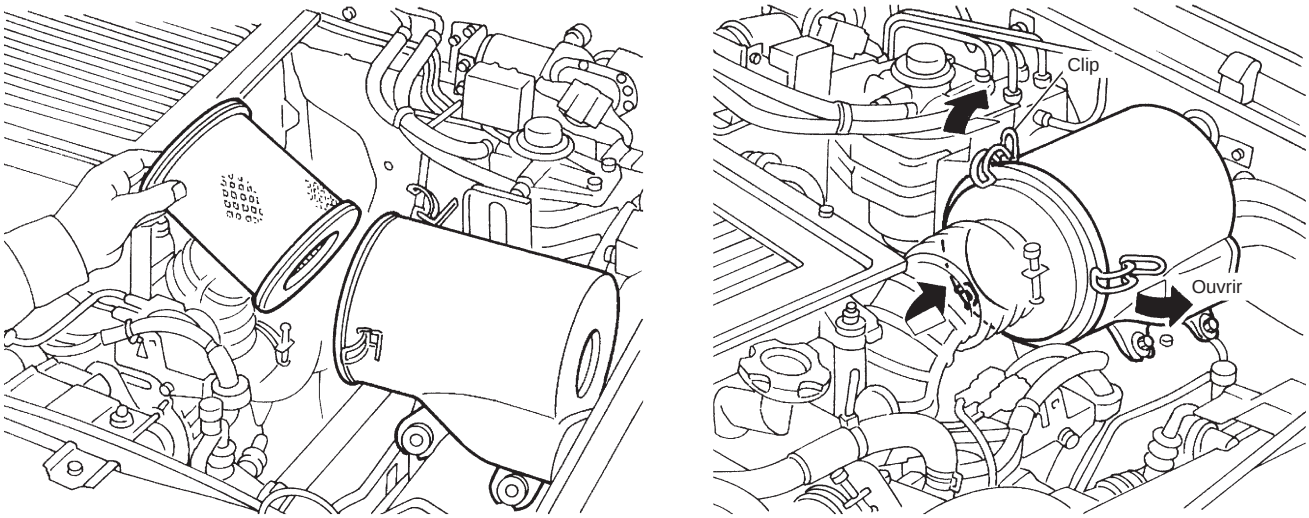
DMA019

ATTENTION :

- **Veiller à nettoyer le bouchon de vidange et le reposer avec une rondelle neuve.**
  Bouchon de vidange :
  : 54 - 59 N·m (5,5 - 6,0 kg-m)
- **La capacité de remplissage varie selon la température de l’huile et le temps de vidange. Utiliser ces valeurs en tant que références et veiller à contrôler à l’aide de la jauge lors du changement d’huile.**

TD25Ti

DMA020



4. Contrôler le niveau d’huile.
5. Démarrer le moteur. Vérifier s’il n’y a pas de fuite d’huile autour du bouchon de vidange et du filtre à huile.
6. Faire tourner le moteur pendant quelques minutes, puis couper le contact. Vérifier le niveau d’huile après 10 minutes.

Contenance en liquide de refroidissement (avec réservoir)
TD25Ti 10,6ℓ
Contenance du réservoir (pour niveau MAX.)
0,6ℓ

SYSTEME DE RETENUE

SECTION RS

TABLE DES MATIERES

PRECAUTION 1002
Système de retenue supplémentaire (SRS) ‘‘COUSSIN GONFLABLE’’ (modèles à 4 roues motrices) 1002
Système de retenue supplémentaire (SRS) ‘‘COUSSIN GONFLABLE’’ (modèles à 2 roues motrices) 1002

DIAGNOSTICS DES DEFAUTS - Système de retenue supplémentaire (SRS) - Modèles à 4 roues motrices..... 1003
Schéma de câblage - SRS -..... 1003
Diagnostics de défaut : le SRS ne fonctionne pas en mode de Diagnostic en utilisant le contact de porte 1005

Lors de la lecture des schémas de câblage :
- **Lire dans la section GI, ‘‘COMMENT LIRE LES SCHEMAS DE CABLAGE’’**
- **Voir la section EL, ‘‘DISTRIBUTION DE L’ALIMENTATION ELECTRIQUE’’ pour connaître les circuits de distribution de l’alimentation électrique.**

Se reporter aux chapitres ‘‘COMMENT LIRE LES ORGANIGRAMMES DANS LES DIAGNOSTICS DE DEFAUTS’’ et ‘‘COMMENT ACCOMPLIR UN DIAGNOSTIC EFFICACE POUR UN INCIDENT ELECTRIQUE’’ pour effectuer les diagnostics des défauts.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Système de retenue supplémentaire (SRS) ‘‘COUSSIN GONFLABLE’’ (modèles à 4 roues motrices)

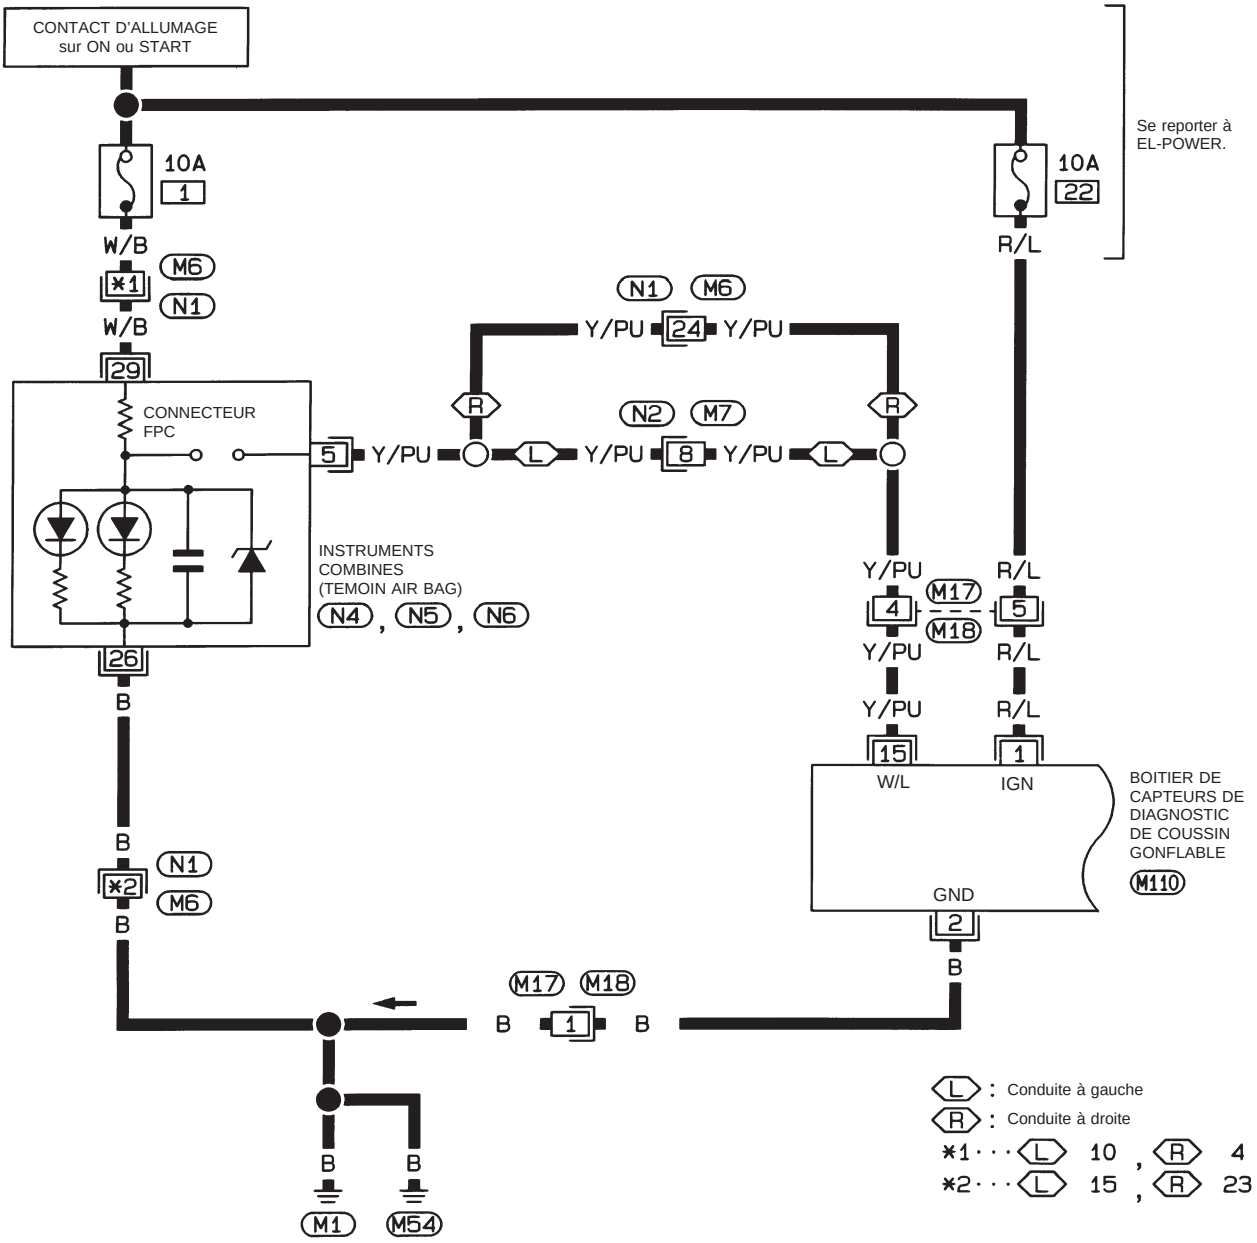
Utilisé avec une ceinture de sécurité, le coussin gonflable du système de retenue supplémentaire contribue à réduire les risques et la gravité des blessures subies par le conducteur en cas de collision frontale. Le système de retenue supplémentaire se compose d’un module de coussin gonflable (air bag) (situé dans le moyeu du volant), d’un boîtier de capteurs de diagnostic, d’un témoin lumineux, d’un faisceau de câblage et d’un câble spiralé.

AVERTISSEMENT :

- **Pour ne pas affecter le fonctionnement du SRS, ce qui augmenterait les risques de blessures graves ou mortelles en cas de collision entraînant le déploiement du coussin gonflable, toutes les opérations d’entretien doivent être effectuées par un concessionnaire NISSAN agréé.**
- **Un entretien incorrect, y compris une mauvaise dépose ou repose du SRS, pourra entraîner des risques de blessures dues au déploiement accidentel du système.**
- **Ne pas utiliser d’équipement d’essai électrique sur les circuits connexes au SRS, sauf instructions données dans ce Manuel de Réparation. Les faisceaux de câblage du SRS sont recouverts d’une gaine d’isolation de couleur jaune soit juste devant les connecteurs de faisceau soit sur le faisceau en entier pour faciliter leur identification.**

Système de retenue supplémentaire (SRS) ‘‘COUSSIN GONFLABLE’’ (modèles à 2 roues motrices)

Utilisé avec une ceinture de sécurité, le coussin gonflable du système de retenue supplémentaire contribue à réduire les risques et la gravité des blessures subies par le conducteur en cas de collision frontale. Le système de retenue supplémentaire se compose d’un module de coussin gonflable (air bag) (situé dans le moyeu du volant), d’un boîtier de capteurs de diagnostic, d’un témoin lumineux, d’un faisceau de câblage et d’un câble spiralé.



AVERTISSEMENT :

SRS265-G

Diagnostics de défaut : le SRS ne fonctionne pas en mode de Diagnostic en utilisant le contact de porte

PROCEDURE DE DIAGNOSTIC 11 (pour l'Europe)

A

Débrancher les deux câbles de la batterie et contrôler la tension de cette dernière à l'aide du multimètre.
- Est-ce que la tension de la batterie est de plus de 9V ?

Non → Charger la batterie.

Oui ↓

B

Déposer le contact de porte côté conducteur et vérifier la continuité entre les bornes ① et ③ du connecteur de contact de porte côté conducteur dans les conditions suivantes.

Condition	Il y a continuité
Le contact de porte est enfoncé (la porte est fermée).	NON
Le contact de porte est déclenché (la porte est ouverte).	OUI

Non → Remplacer le contact de porte côté conducteur.

Oui ↓

C

Vérifier la continuité entre la borne ③ du connecteur du contact de porte côté conducteur et la masse de carrosserie.
- Y a-t-il continuité ?

Non → Remplacer ou réparer le faisceau.

Oui ↓

Remplacer le boîtier de capteurs de diagnostic.

↓

Aller à ''Vérification du fonctionnement du SRS''.

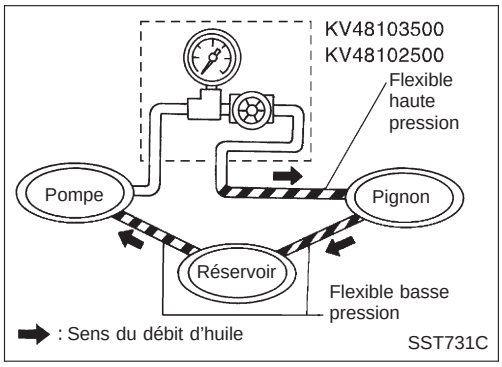
<SUPPLEMENT-I>

DIRECTION



SECTION ST

AVIS DE MODIFICATION :
Des modèles équipés du moteur TD25Ti ont été récemment ajoutés.

TABLE DES MATIERES

ENTRETIEN SUR LE VEHICULE 1002
Contrôle du système hydraulique (pour direction assistée) 1002
VOLANT ET COLONNE DE DIRECTION 1003
Démontage et remontage 1003
Inspection 1004
CARACTERISTIQUES ET VALEURS DE REGLAGE (SDS) 1005
Inspection et réglage 1005

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Contrôle du système hydraulique (pour direction assistée)

Vérifier la tension de la courroie d'entraînement, la poulie motrice ainsi que la pression de gonflage des pneus, avant de commencer.

1. Disposer l'outil spécial. Ouvrir la soupape de coupure. Purger l'air hors du circuit. Se reporter à ''Purge du système hydraulique''.
2. Faire tourner le moteur au ralenti ou à 1 000 tr/mn.

- **S'assurer que la température du liquide contenu dans le réservoir atteint environ 60 à 80°.**

AVERTISSEMENT :

Réchauffer le moteur alors que la soupape de coupure est entièrement ouverte. Si le moteur est démarré avec la soupape de coupure fermée, la pression de liquide dans la pompe de direction assistée augmentera à son maximum. Ceci fera augmenter la température du liquide de façon anormale.

3. Vérifier la pression alors que le volant est tourné à bout de course vers la gauche ou vers la droite avec le moteur à un ralenti de 1 000 tr/mn.

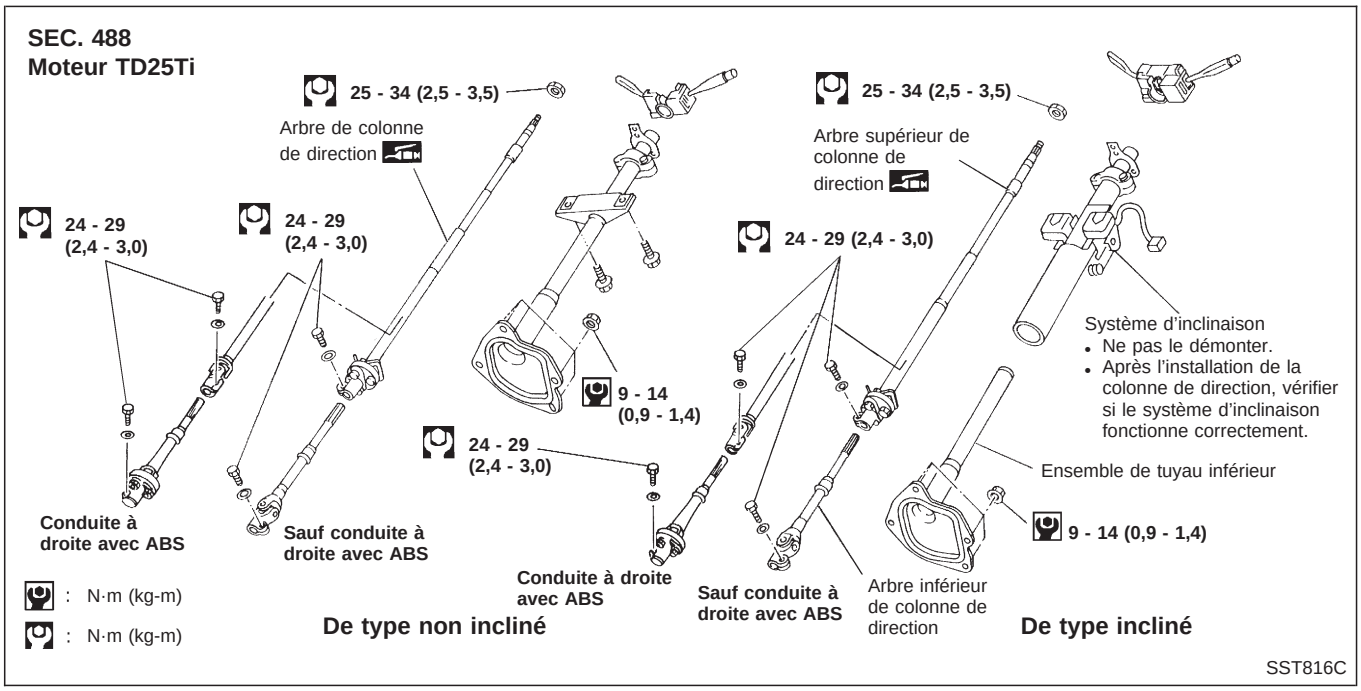
ATTENTION :

Ne pas maintenir le volant de direction à bout de course pendant plus de 15 secondes.

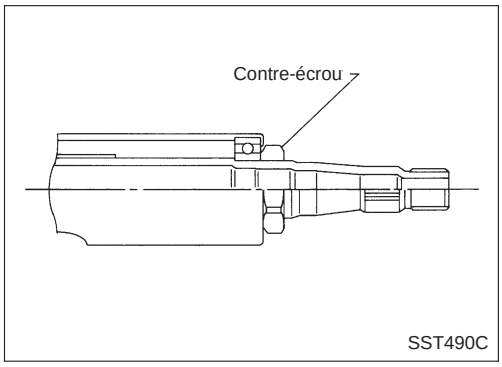
Pression maximum de la pompe à huile :
Moteur TD25Ti 8 140 - 8 728 kPa (81,4 - 87,3 bar, 83 - 89 kg/cm^2) au ralenti

4. Si la pression de direction assistée est en dessous de la pression standard, fermer lentement la soupape de coupure et vérifier la pression.

ATTENTION :



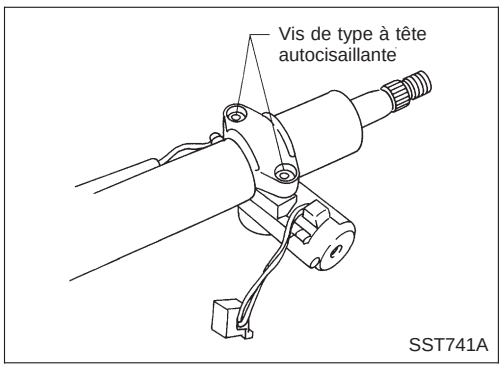
Ne pas laisser la soupape de coupure fermée pendant plus de 15 secondes.



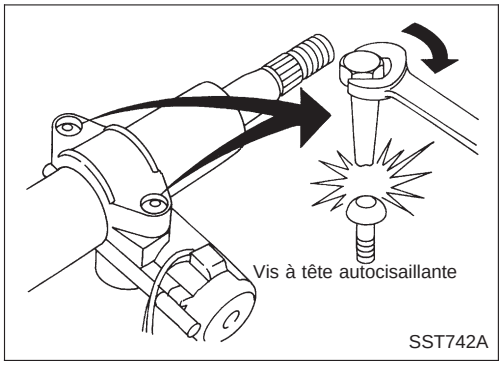
- Lorsque la pression atteint son maximum, le boîtier est endommagé. Contrôler le mécanisme de direction assistée. Se reporter à ''BOITIER DE DIRECTION ASSISTEE'' (modèle : PB59K).
- Si la pression reste en dessous de la pression standard, la pompe est endommagée. Contrôler la pompe de direction assistée. Se reporter à ''POMPE A HUILE DE DIRECTION ASSISTEE''.

5. Si la pression de direction assistée est supérieure à la pression standard, c'est que la soupape de commande de débit de la pompe de direction assistée est endommagée. Contrôler la pompe de direction assistée. Se reporter à ''POMPE A HUILE DE DIRECTION ASSISTEE''.
6. Après la vérification du système hydraulique, déposer l'outil spécial et faire l'appoint de liquide selon les besoins. Puis effectuer une purge d'air complète du circuit. Se reporter à ''Purge du système hydraulique''.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Démontage et remontage

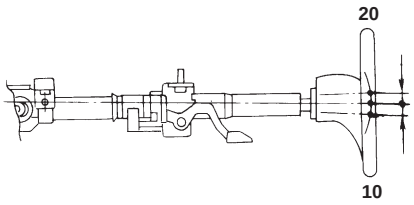


- Lors du montage et du démontage, déverrouiller l'antivol de direction à l'aide de sa clé.
- Déposer la commande combinée.
- Monter le contre-écrou sur l'arbre de colonne de direction et serrer le boulon conformément au couple de serrage spécifié.

Contre-écrou :
: 25 - 34 N·m (2,5 - 3,5 kg-m)

- Verrouillage de direction

a. Briser les vis à tête autocisaillante à l'aide d'une perceuse ou d'un outil approprié quelconque.

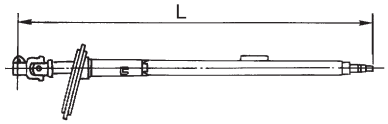


b. Reposer des vis à tête autocisaillante, puis les serrer jusqu'à rupture de la tête.

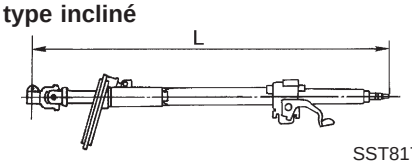
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Démontage et remontage (Suite)

Système d'inclinaison



Après avoir remonté la colonne de direction, vérifier le fonctionnement du mécanisme d'inclinaison.



Unité : mm

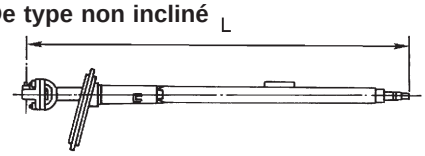
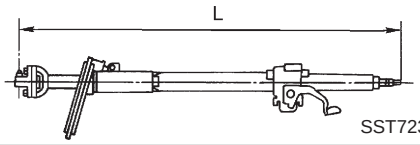
Conduite à droite avec ABS
De type non incliné



De type incliné



SST817C

Sauf conduite à droite avec ABS
De type non incliné

De type incliné

SST723CA

Inspection

- Si le volant ne tourne pas en douceur, vérifier la colonne de direction comme indiqué ci-après et remplacer les pièces endommagées.

a. Vérifier si les roulements de la colonne ne sont pas endommagés ou usés de manière inégale. Lubrifier avec de la graisse à usages multiples recommandée ou remplacer la colonne de direction comme un ensemble, si nécessaire.

b. Vérifier si la jupe de colonne de direction n'est ni déformée ni brisée. Remplacer si nécessaire.

- Lorsque le véhicule a subi une légère collision, vérifier la dimension ''L''. Si la valeur trouvée n'est pas dans les limites spécifiées, remplacer la colonne de direction comme un ensemble.

Longueur de la colonne ''L'' :
Conduite à droite avec ABS
895,0 - 896,6 mm
Sauf conduite à droite avec ABS
863,1 - 864,7 mm

Procédure de diagnostic 1 (capteur de roue ou rotor)

Codes de panne n° 21, 22, 25, 26, 31, 32, 35, 36 ou 18

DEBUT DE L'INSPECTION

1. Débrancher les connecteurs de l'actionneur de l'ABS, le boîtier électrique et le capteur de roue selon le numéro de code de défaut. Contrôler si les bornes ne sont pas endommagées ou les connexions débranchées. Puis rebrancher les connecteurs.
2. Effectuer de nouveau l'autodiagnostic.
   Est-ce que la lampe témoin s'allume à nouveau?

Non → FIN DE L'INSPECTION

Oui

A

VERIFICATION ELECTRIQUE DU CAPTEUR DE ROUE.

1. Débrancher l'actionneur de l'ABS et le connecteur du boîtier électrique.
2. Vérifier la résistance entre l'actionneur de l'ABS et les bornes du connecteur (E4) (côté carrosserie) du boîtier électrique.
   Code n° 21 ou 22 (roue avant droite)
   Bornes (4) et (5)
   Code n° 25 ou 26 (roue avant gauche)
   Bornes (6) et (7)
   Code n° 31 ou 32 (roue arrière droite 4 roues motrices)
   Bornes (8) et (9)
   Code n° 35 ou 36 (roues arrière 2 roues motrices, roue arrière gauche 4 roues motrices)
   Bornes (8) et (9) (roues arrière 2 motrices)
   Bornes (1) et (2) (roue arrière gauche 4 roues motrices)
   Résistance :
   Avant 1,44 - 1,76 kΩ
   Arrière (2 roues motrices) 1,22 - 1,48 kΩ
   Arrière (4 roues motrices) 1,44 - 1,76 kΩ

Bon → (A) (passer à la page suivante).

Mauvais

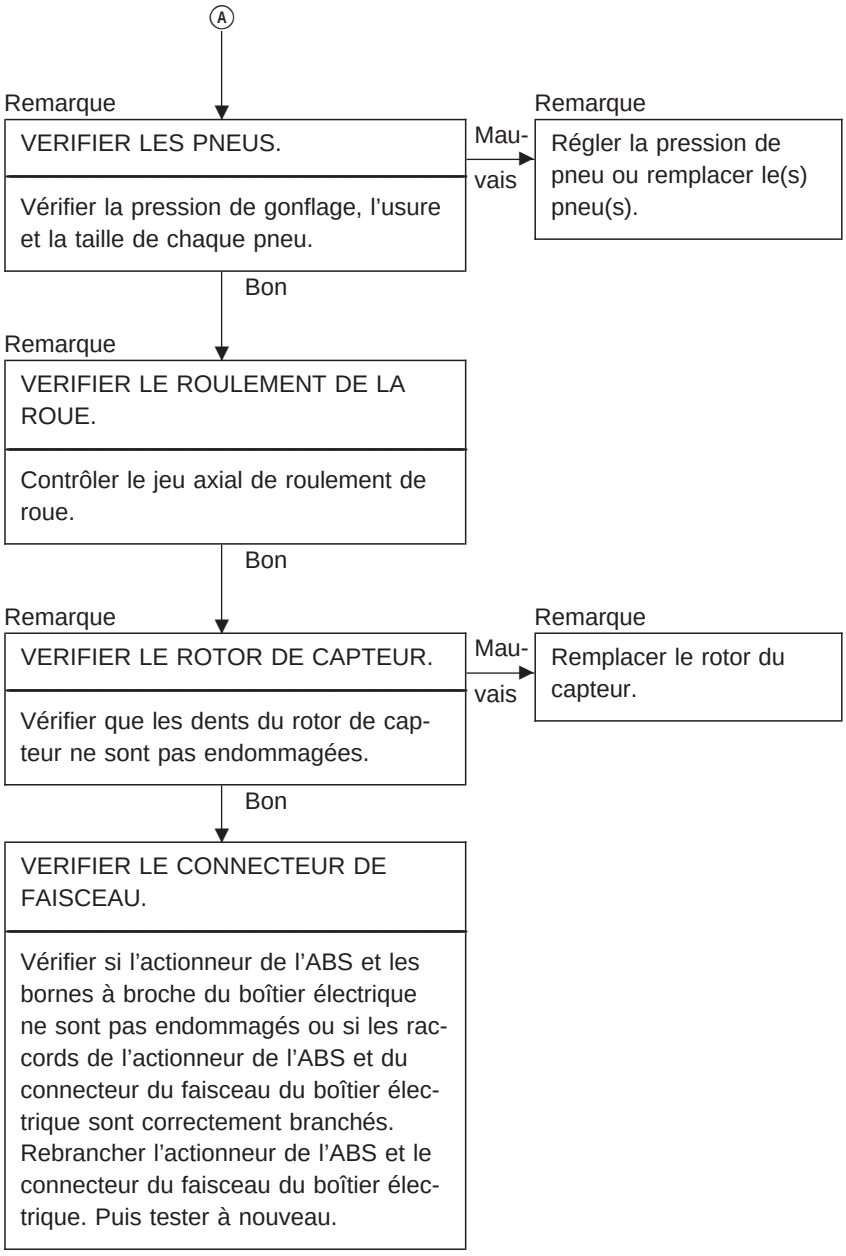
B

VERIFICATION DU CAPTEUR DE ROUE

Vérifier la résistance de chaque capteur.
Résistance :
Avant 1,44 - 1,76 kΩ
Arrière (2 roues motrices) 1,22 - 1,48 kΩ
Arrière (4 roues motrices) 1,44 - 1,76 kΩ

Bon → Vérifier les points suivants.
- Connecteurs de faisceau (E4), (E31), (E15), (BR5) et (C5)
- Faisceau ouvert ou court-circuité entre les connecteurs de capteur de roue, l'actionneur de l'ABS et le boîtier électrique

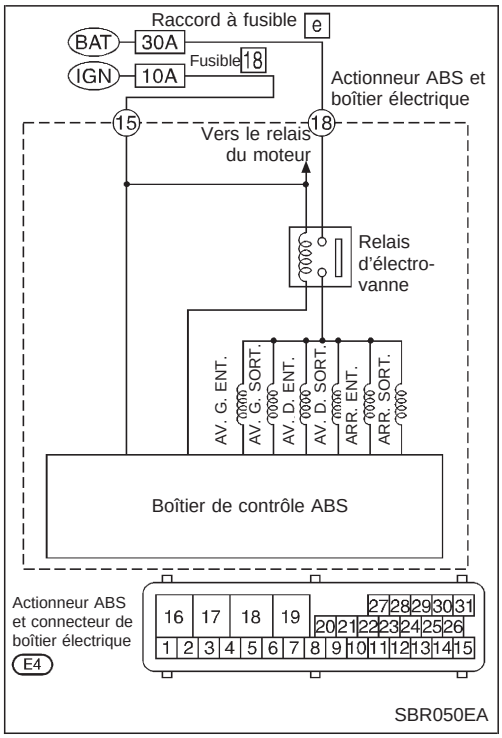
Si le résultat est mauvais, réparer le faisceau ou les connecteurs.



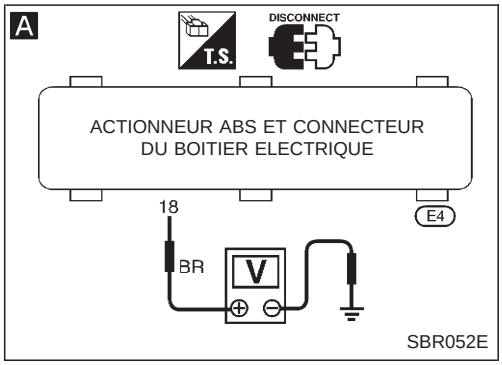
Mauvais

REMPLACER.

Remplacer le capteur de roue.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Procédure de diagnostic 1 (capteur de roue ou rotor) (suite)

Remarque : La position de la roue doit être signalée par les numéros de code à l'exception du code n° 18 (rotor du capteur).

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic 2 (électrovanne d'actionneur d'ABS et relais d'électrovanne)

Code de panne n° 41, 45, 55, 42, 46, 56, 63

VERIFIER LE RACCORD A FUSIBLE.

Vérifier le raccord à fusible e de 30 A. Pour la disposition des raccords à fusibles, se reporter au chapitre ''DISPOSITION DE L'ALIMENTATION ELECTRIQUE'' dans la section EL.

Mauvais → (A) (passer à la page suivante).

Bon ↓

VERIFIER LE FUSIBLE.

Vérifier le fusible 18 de 10A. Pour la disposition du fusible, se reporter au chapitre ''DISPOSITION DE L'ALIMENTATION ELECTRIQUE'' dans la section EL.

Mauvais → (B) (passer à la page suivante).

Bon ↓

VERIFIER LE CONNECTEUR.

1. Débrancher l'actionneur de l'ABS et le connecteur du boîtier électrique. Vérifier les bornes pour voir s'il n'y a pas de dommages ou de connexions desserrées. Puis rebrancher le connecteur.
2. Effectuer de nouveau l'autodiagnostic.
   Est-ce que la lampe témoin s'allume à nouveau ?

Non → Fin de l'inspection

Oui ↓

VERIFIER L'ACTIONNEUR ABS ET LE CIRCUIT DE MISE A LA MASSE DU BOITIER ELECTRIQUE.

Se reporter à ACTIONNEUR ABS ET MISE A LA MASSE DU BOITIER ELECTRIQUE et Vérification du circuit de mise à la masse. Se reporter à l'Edition Générale de ce Manuel de Réparation.

Mauvais → Réparer le faisceau et le connecteur.

Bon ↓

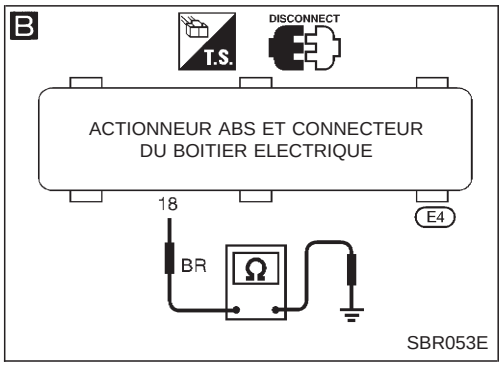
A

VERIFIER LE CIRCUIT DE L'ALIMENTATION ELECTRIQUE DU RELAIS DE L'ELECTROVANNE.

1. Débrancher l'actionneur de l'ABS et le connecteur du boîtier électrique.
2. Vérifier la résistance entre l'actionneur de l'ABS et la borne (18) du connecteur (côté carrosserie) (E4) du boîtier électrique et la masse.
   Il doit y avoir tension de la batterie.

Mauvais → Vérifier les points suivants.
- Connecteur de faisceau (E4)
- Faisceau ouvert ou court-circuité entre l'actionneur de l'ABS, le boîtier électrique et le raccord à fusible

Si le résultat n'est pas satisfaisant, réparer le faisceau ou le connecteur.



Bon ↓

REMPLACER.

Remplacer l'actionneur de l'ABS et le boîtier électrique.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic 2 (électrovanne d'actionneur d'ABS et relais d'électrovanne) (suite)

Ⓐ

REMPLACER.

Remplacer le raccord à fusible.
Le raccord à fusible saute-t-il lorsque le contact d'allumage est sur "ON" ?

Non → Fin de l'inspection

Oui

B

VERIFIER LE CIRCUIT DE L'ALIMENTATION ELECTRIQUE DU RELAIS DE L'ELECTROVANNE.

1. Débrancher l'actionneur de l'ABS et le connecteur du boîtier électrique.
2. Vérifier la continuité entre l'actionneur de l'ABS et la borne (18) du connecteur (côté carrosserie) (E4) du boîtier électrique et la masse.
   Il doit y avoir continuité.

Mauvais → Vérifier les points suivants.
- Connecteur de faisceau (E4)
- Faisceau ouvert ou court-circuité entre l'actionneur de l'ABS, le boîtier électrique et le raccord à fusible

Si le résultat n'est pas satisfaisant, réparer le faisceau ou le connecteur.

Bon

REMPLACER.

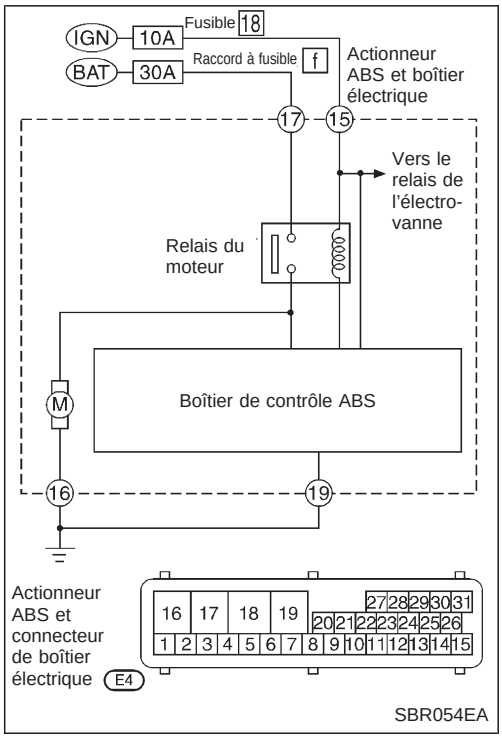
Remplacer l'actionneur de l'ABS et le boîtier électrique.

Ⓑ

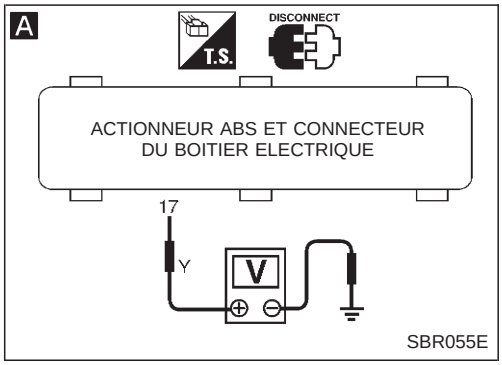
REMPLACER.

Remplacer le fusible.
Le fusible saute-t-il lorsque le contact d'allumage est mis sur "ON" ?

Oui → Vérifier les points suivants.
- Connecteur de faisceau (E4)
- Faisceau ouvert ou court-circuité entre l'actionneur de l'ABS, le boîtier électrique et le fusible



Si le résultat n'est pas satisfaisant, réparer le faisceau ou le connecteur.



Non

FIN

FIN DE L'INSPECTION

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic 3 (relais de moteur ou moteur)

Code de panne n° 61

VERIFIER LE RACCORD A FUSIBLE.

Vérifier le raccord à fusible f de 30 A. Pour la disposition des raccords à fusibles, se reporter au chapitre "DISPOSITION DE L'ALIMENTATION ELECTRIQUE" dans la section EL.

Mauvais → Ⓐ (passer à la page suivante).

Bon ↓

VERIFIER LE CONNECTEUR.

1. Débrancher l'actionneur de l'ABS et le connecteur du boîtier électrique. Vérifier les bornes pour voir s'il n'y a pas de dommages ou de connexions desserrées. Puis rebrancher le connecteur.
2. Effectuer de nouveau l'autodiagnostic.
   Est-ce que la lampe témoin s'allume à nouveau ?

Non → FIN DE L'INSPECTION

Oui ↓

A

VERIFIER LE CIRCUIT D'ALIMENTATION ELECTRIQUE DU RELAIS DE MOTEUR.

1. Débrancher l'actionneur de l'ABS et le connecteur du boîtier électrique.
2. Vérifier la résistance entre l'actionneur de l'ABS et la borne ⑰ du connecteur E4 (côté carrosserie) du boîtier électrique et la masse.
   Il doit y avoir tension de la batterie.

Mauvais → Vérifier les points suivants.
- Connecteur de faisceau E4
- Faisceau ouvert ou court-circuité entre l'actionneur de l'ABS, le boîtier électrique et le raccord à fusible

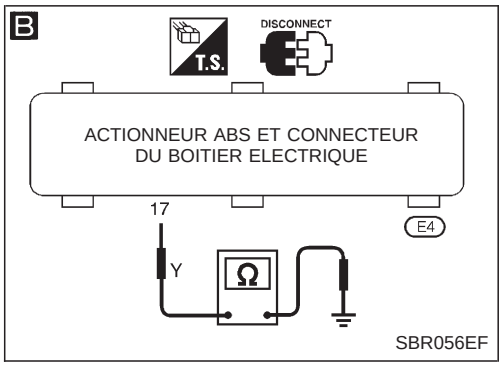
Si le résultat n'est pas satisfaisant, réparer le faisceau ou le connecteur.

Bon ↓

VERIFIER L'ACTIONNEUR ABS ET LA MISE A LA MASSE DU BOITIER ELECTRIQUE.

Se reporter à "ACTIONNEUR ABS ET MASSE DU BOITIER ELECTRIQUE" dans le chapitre "Vérification du circuit de mise à la masse". Se reporter à l'Edition Générale de ce Manuel de Réparation.

Mauvais → Réparer le faisceau et les bornes.



Bon ↓

REMPLACER.

Remplacer l'actionneur de l'ABS et le boîtier électrique.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic 3 (relais de moteur ou moteur) (suite)

Ⓐ

REMPLACER.

Remplacer le raccord à fusible.
Le raccord à fusible saute-t-il lorsque le contact d'allumage est mis sur "ON" ?

Non → Fin de l'inspection

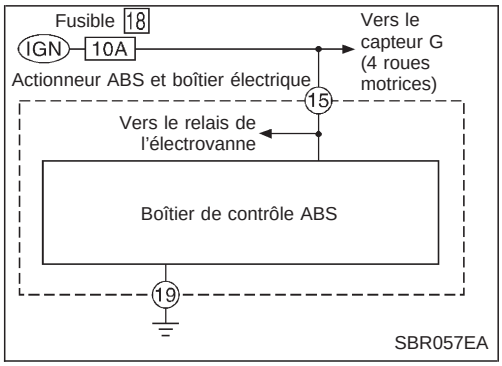
Oui

B

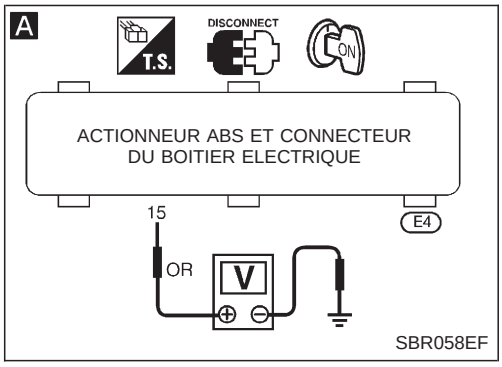
VERIFIER LE MOTEUR DE L'ACTIONNEUR ABS ET LE CIRCUIT DE L'ALIMENTATION ELECTRIQUE DU MOTEUR.

1. Débrancher le câble de la batterie, l'actionneur de l'ABS et le connecteur E4 du boîtier électrique.
2. Vérifier la continuité entre l'actionneur de l'ABS et la borne 17 du connecteur E4 (côté carrosserie) du boîtier électrique et la masse.
   Il ne doit pas y avoir continuité.

Mauvais → Vérifier les points suivants :
- Connecteur de faisceau E4
- Faisceau ouvert ou court-circuité entre l'actionneur de l'ABS, le boîtier électrique et le raccord à fusible



Si le résultat n'est pas satisfaisant, réparer le faisceau ou le connecteur.



Bon

VERIFIER LE CONNECTEUR DE FAISCEAU.

Vérifier si l'actionneur de l'ABS et les bornes à broche du boîtier électrique ne sont pas endommagés ou si les raccords de l'actionneur de l'ABS et du connecteur du faisceau du boîtier électrique sont correctement branchés.
Rebrancher l'actionneur de l'ABS et le connecteur du faisceau du boîtier électrique. Puis tester à nouveau.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic 4 (basse tension)

Code de panne n° 57

VERIFIER LE CONNECTEUR.

1. Débrancher l'actionneur de l'ABS et le connecteur du boîtier électrique. Vérifier les bornes pour voir s'il n'y a pas de dommages ou de connexions desserrées. Puis rebrancher le connecteur.
2. Effectuer de nouveau l'autodiagnostic.
   Est-ce que la lampe témoin s'allume à nouveau ?

Non → Fin de l'inspection

Oui ↓

A

VERIFIER L'ALIMENTATION ELECTRIQUE DU BOITIER DE CONTROLE ABS.

1. Débrancher l'actionneur de l'ABS et le connecteur du boîtier électrique.
2. Vérifier la résistance entre l'actionneur de l'ABS et la borne (15) du connecteur (E4) (côté carrosserie) du boîtier électrique et la masse.
   La tension de la batterie doit exister quand le contact d'allumage est mis sur ''ON''.

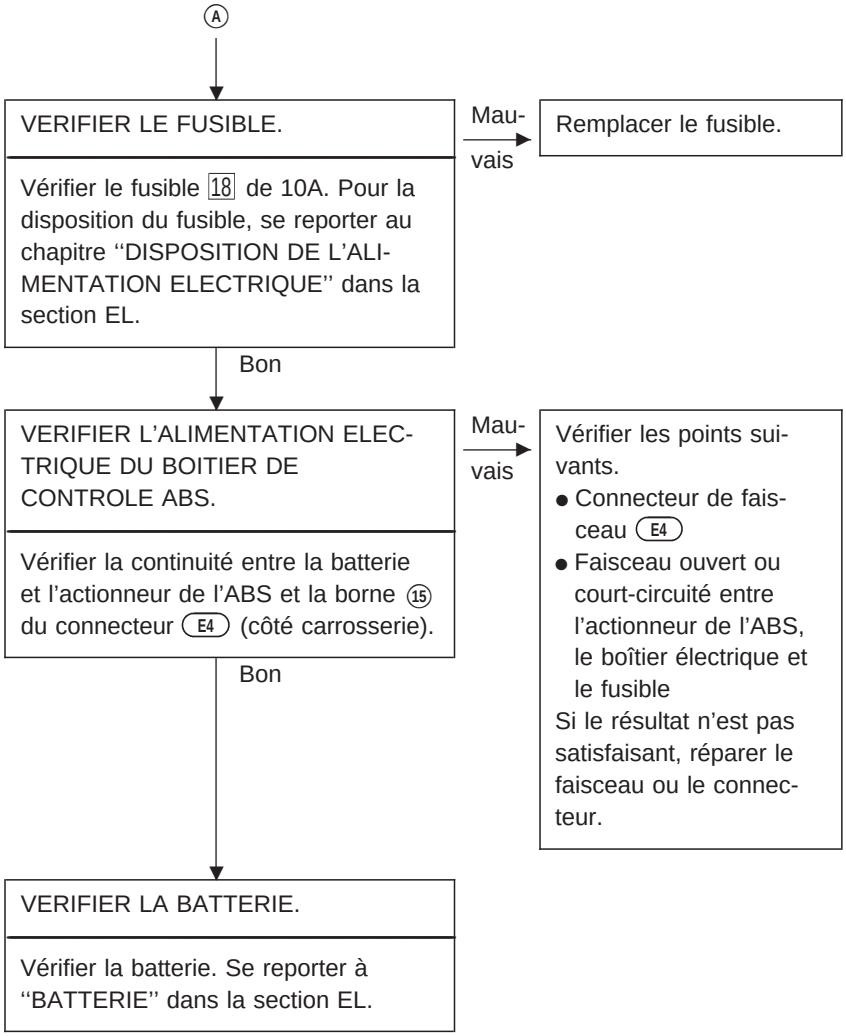
Mauvais → (A) (Passer à la page suivante).

Bon ↓

VERIFIER LA MISE A LA MASSE DU BOITIER DE CONTROLE ABS.

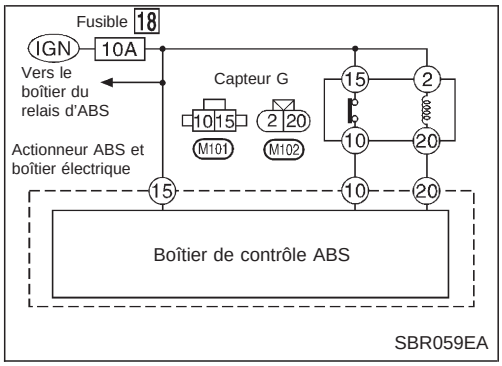
Se reporter à ''ACTIONNEUR ABS ET MASSE DU BOITIER ELECTRIQUE'' dans le chapitre ''Vérification du circuit de mise à la masse''. Se reporter à l'Edition Générale de ce Manuel de Réparation.

Mauvais → Réparer le faisceau et le connecteur.

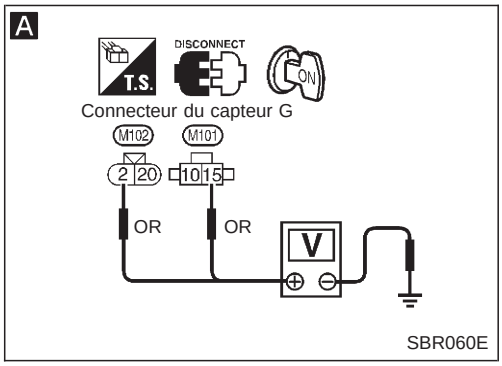


Bon ↓

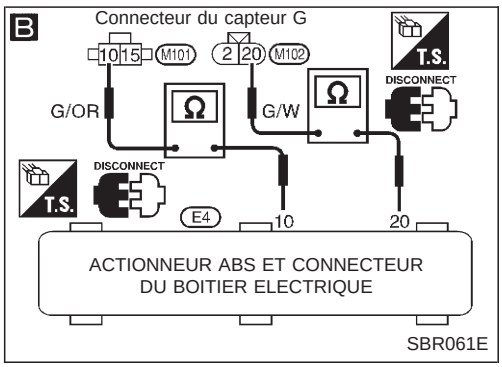
VERIFIER LE CONNECTEUR DE FAISCEAU.



Vérifier si l'actionneur de l'ABS et les bornes à broche du boîtier électrique ne sont pas endommagés ou si les raccords de l'actionneur de l'ABS et du connecteur du faisceau du boîtier électrique sont correctement branchés. Rebrancher l'actionneur de l'ABS et le connecteur du faisceau du boîtier électrique. Puis tester à nouveau.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Procédure de diagnostic 4 (basse tension) (suite)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic 5 (capteur G)

Code de panne n° 17

VERIFIER LE CIRCUIT DE L'ALIMENTATION ELECTRIQUE DU CAPTEUR G.

Vérifier le fusible 18 de 10A. Pour la disposition du fusible, se reporter au chapitre "DISPOSITION DE L'ALIMENTATION ELECTRIQUE" dans la section EL.

Mauvais → Remplacer le fusible.

Bon ↓

VERIFIER LE CONNECTEUR.

1. Débrancher l'actionneur de l'ABS et le connecteur du boîtier électrique. Vérifier les bornes pour voir s'il n'y a pas de dommages ou de connexions desserrées. Puis rebrancher le connecteur.
2. Effectuer de nouveau l'autodiagnostic.
   Est-ce que la lampe témoin s'allume de nouveau ?

Non → FIN DE L'INSPECTION

Oui ↓

VERIFIER LE CAPTEUR DE G.

Se reporter à CAPTEUR G dans l'Inspection des composants électriques, BR-2028.

Mauvais → Remplacer le capteur de G.

Bon ↓

A

VERIFIER LE CIRCUIT DE L'ALIMENTATION ELECTRIQUE DU CAPTEUR G.

1. Débrancher le connecteur du capteur G.
2. Vérifier la tension entre les bornes (2), (15) des connecteurs (côté carrosserie) (M101), (M102) du capteur G et la masse.
   Il doit y avoir tension de la batterie.

Mauvais → Vérifier les points suivants.
- Connecteurs de faisceau (M101), (M102) et (E4)
- Faisceau ouvert ou court-circuité entre le capteur G, l'actionneur de l'ABS et le boîtier électrique

Si le résultat est mauvais, réparer le faisceau ou les connecteurs.

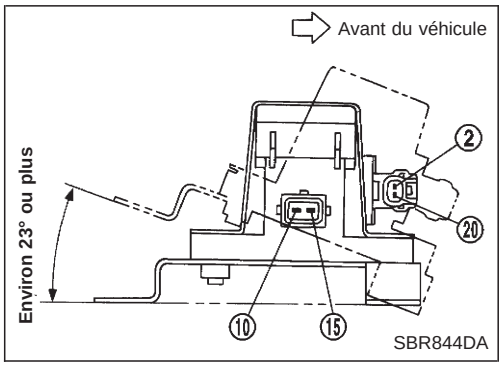
Bon ↓

B

VERIFIER LA MASSE DU CAPTEUR G.

1. Débrancher l'actionneur de l'ABS, le connecteur du boîtier électrique et les connecteurs du capteur G.
2. Vérifier la continuité entre l'actionneur ABS et les bornes (10), (20) du connecteur (E4) du boîtier électrique (côté carrosserie) et les bornes (10), (20) des connecteurs (M101), (M102) du capteur G (côté carrosserie).
   Il doit y avoir continuité.

Mauvais → Vérifier les points suivants.
- Connecteurs de faisceau (M101), (M102) et (E4)
- Faisceau ouvert ou court-circuité entre le capteur G, l'actionneur de l'ABS et le boîtier électrique



Si le résultat est mauvais, réparer le faisceau ou les connecteurs.

Bon ↓

VERIFIER LE CONNECTEUR DE FAISCEAU.

Vérifier si l'actionneur de l'ABS et les bornes à broche du boîtier électrique ne sont pas endommagés ou si les raccords de l'actionneur de l'ABS et du connecteur du faisceau du boîtier électrique sont correctement branchés. Rebrancher l'actionneur de l'ABS et le connecteur du faisceau du boîtier électrique. Puis tester à nouveau.

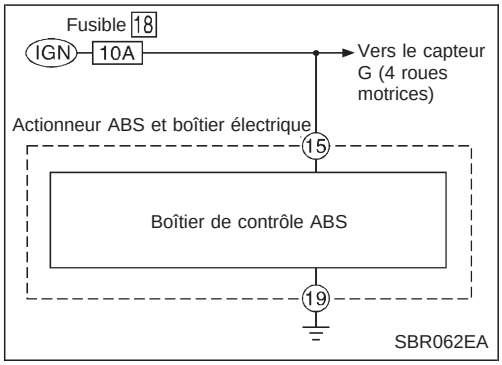
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic 5 (capteur G) (suite)

INSPECTION DES COMPOSANTS ELECTRIQUES

Capteur G

PRECAUTION :



Le capteur G est facilement abîmé s'il subit un impact. Veiller à ne pas le faire tomber ou le cogner.

1. Calculer la résistance entre les bornes ⑩ et ⑮ du connecteur de l'unité du capteur G.

Position du capteur G	Résistance entre les bornes ⑩ et ⑮	Position du contact du capteur G
Reposé dans le véhicule	1,4 - 1,6 kΩ	"ON"
Incliné comme indiqué ci-contre	4,7 - 5,5 kΩ	"OFF"

2. Calculer la résistance entre les bornes ② et ⑳ du connecteur de l'unité du capteur G.

Résistance :	70 - 124 Ω

Procédure de diagnostic 6 (boîtier de contrôle)

Code de panne n° 71

VERIFIER LE CONNECTEUR.

1. Débrancher l'actionneur de l'ABS et le connecteur du boîtier électrique. Contrôler si les bornes ne sont pas endommagées ou les connexions débranchées. Puis rebrancher le connecteur.
2. Effectuer de nouveau l'autodiagnostic.
   Est-ce que la lampe témoin s'allume à nouveau ?

Non → FIN DE L'INSPECTION

Oui ↓

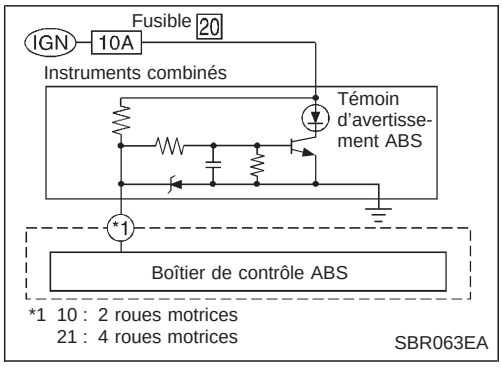
CONTROLE DE L'ALIMENTATION ELECTRIQUE DU BOITIER DE CONTROLE ABS

Vérifier la tension. Se reporter A à la procédure de diagnostic 4, BR-2025.

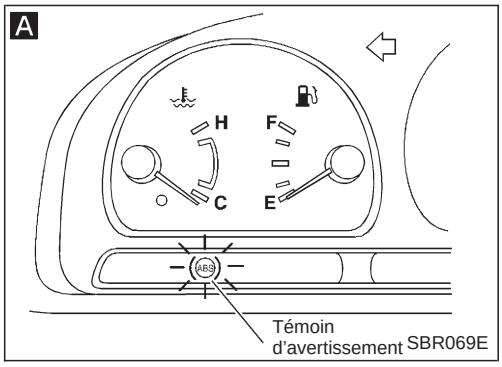
↓

VERIFIER LES RESULTATS DE L'AUTODIAGNOSTIC

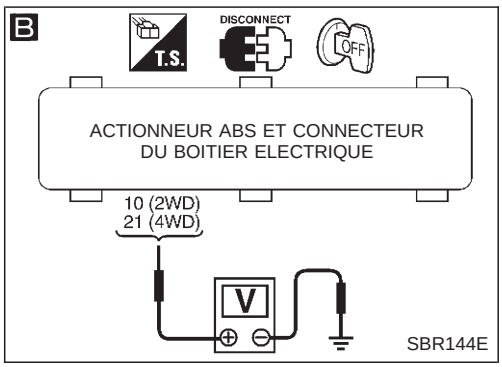
Est-ce que le témoin indique à nouveau le code n° 71 ?



Oui → Remplacer l'actionneur de l'ABS et le boîtier électrique.



Non ↓



INSPECTION

Inspecter le système selon le n° de code.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic 12 (le témoin ne s'allume pas quand le contact d'allumage est sur ON.)

VERIFIER LE FUSIBLE.

Vérifier le fusible 20 de 10A. Pour la disposition du fusible, se reporter au chapitre ''DISPOSITION DE L'ALIMENTATION ELECTRIQUE'' dans la section EL.

Mauvais → Remplacer le fusible.

Bon ↓

A

VERIFIER SI LE TEMOIN LUMINEUX FONCTIONNE.

Débrancher l'actionneur de l'ABS et le connecteur du boîtier électrique.
La lampe témoin s'allume-t-elle ?

Oui → Ⓐ (passer à la page suivante).

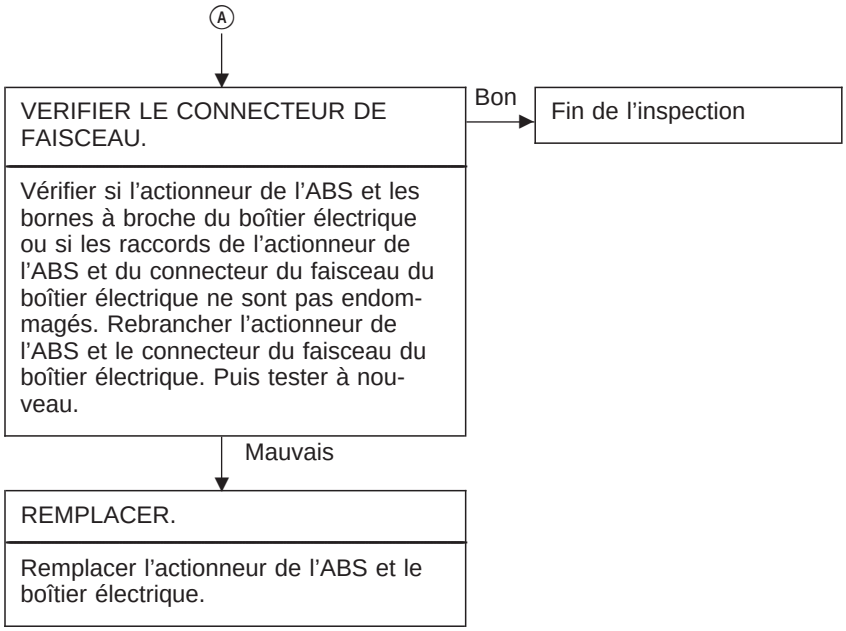
No ↓

B

VERIFIER SI LE FAISCEAU N'EST PAS EN COURT-CIRCUIT.

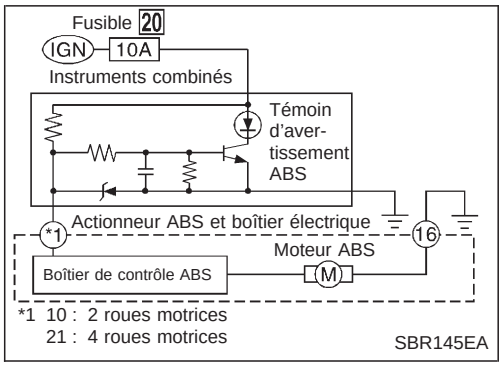
1. Débrancher l'actionneur de l'ABS et le connecteur du boîtier électrique.
2. Vérifier la résistance entre l'actionneur de l'ABS et la borne ⑩ (2 roues motrices) ou ㉑ (4 roues motrices) du connecteur E4 (côté carrosserie) du boîtier électrique et la masse.
   Il ne doit pas y avoir tension de la batterie.

Mauvais → Réparer le faisceau ou le connecteur.

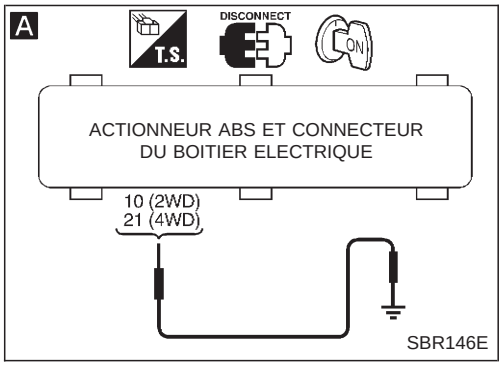


Bon ↓

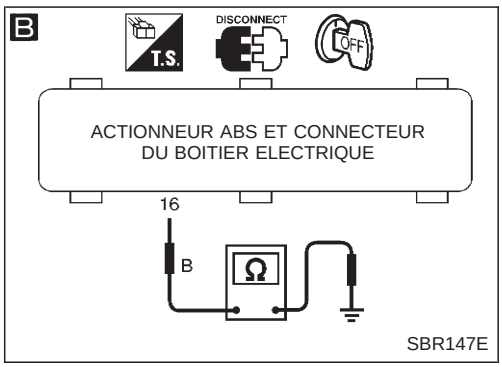
VERIFIER LES INSTRUMENTS COMBINES.



Vérifier les instruments combinés. Se reporter à ''TEMOINS LUMINEUX'' dans la section EL.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Procédure de diagnostic 12 (le témoin ne s'allume pas quand le contact d'allumage est sur ON.) (suite)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic 13 (le témoin reste allumé lorsque le contact d'allumage est sur ON.)

A

CONTROLER LA LAMPE TEMOIN.

1. Débrancher l'actionneur de l'ABS et le connecteur du boîtier électrique.
2. Brancher le câble adéquat entre l'actionneur de l'ABS et la borne (10) (2 roues motrices) ou (21) (4 roues motrices) du connecteur (E4) (côté carrosserie) du boîtier électrique et la masse.
   Le témoin lumineux ne devrait pas fonctionner.

Mauvais → Réparer les instruments combinés. Vérifier les points suivants.
- Connecteur de faisceau (E4)
- Faisceau ouvert ou court-circuité entre l'actionneur de l'ABS, le boîtier électrique et le fusible

Si le résultat n'est pas satisfaisant, réparer le faisceau ou le connecteur.

Bon ↓

VERIFIER LE CONNECTEUR DE FAISCEAU.

Vérifier si l'actionneur de l'ABS et les bornes à broche du boîtier électrique ne sont pas endommagés ou si les raccords de l'actionneur de l'ABS et du connecteur du faisceau du boîtier électrique sont correctement branchés. Rebrancher l'actionneur de l'ABS et le connecteur du faisceau du boîtier électrique. Puis tester à nouveau.

Bon → Fin de l'inspection

Mauvais ↓

B

VERIFIER LA MISE A LA MASSE DE L'ABS.

1. Mettre le contact d'allumage sur "OFF".
2. Débrancher l'actionneur de l'ABS et le connecteur du boîtier électrique.
3. Vérifier la continuité entre l'actionneur de l'ABS et la borne (16) du connecteur (E4) du boîtier électrique (côté carrosserie) et la masse.
   Il doit y avoir continuité.

Mauvais → Vérifier les points suivants.
- Connecteur de faisceau (E4)
- Faisceau ouvert ou court-circuité entre l'actionneur de l'ABS, le boîtier électrique et la masse

Si le résultat n'est pas satisfaisant, réparer le faisceau ou le connecteur.

Bon ↓

REMPLACER.

Remplacer l'actionneur de l'ABS et le boîtier électrique.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Caractéristiques générales

MODELES A 2 ROUES MOTRICES

Destination	Europe	
Modèle concerné	Avec ABS	Sans ABS
Frein avant		
Type	Frein à disque CL28VD	
Diamètre d'alésage du cylindre mm	42,8 x 2	
Dimension des plaquettes Longueur x largeur x épaisseur mm	146,6 x 48,5 x 10,0	
Diamètre extérieur du rotor x épaisseur mm	260 x 26	
Frein arrière		
Type	Frein à tambour LT26B	
Diamètre d'alésage du cylindre de roue mm	23,81	
Dimension de la garniture Longueur x largeur x épaisseur mm	249,6 x 50 x 5,5	
Diamètre intérieur du tambour mm	260	
Diamètre d'alésage du maître-cylindre mm	25,4	23,81
Vanne de commande		
Type	LSV (compensateur asservi)	
Point de rupture x rapport de réduction kPa (bar, kg/cm^2)	(Variable) x 0,15	
Assistance de frein		
Modèle	M195T	
Diamètre du diaphragme mm	Primaire : 205 Secondaire : 180	
Liquide de frein recommandé	DOT 4*	

* Ne jamais mélanger DOT 3 et DOT 4 (DOT 3 est rempli en atelier).

CARROSSERIE ET GARNITURE

SECTION BT

AVIS DE MODIFICATION :

- Le tableau de bord a été modifié.
- La garniture latérale de la carrosserie a été changée.
- Le revêtement de plafond a été changé.
- Un strapontin a été ajouté.
- Une fonction anti-pincement a été ajoutée à la vitre conducteur.

TABLE DES MATIERES

PRECAUTIONS 2002
''COUSSIN GONFLABLE'' et ''PRETENSIONNEUR DE CEINTURE DE SECURITE'' du système de retenue supplémentaire (SRS) 2002

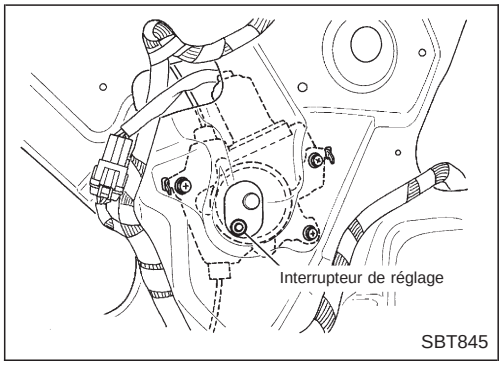
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

‘‘COUSSIN GONFLABLE’’ et ‘‘PRETENSIONNEUR DE CEINTURE DE SECURITE’’ du système de retenue supplémentaire (SRS)

Utilisé conjointement avec une ceinture de sécurité, les systèmes de retenue supplémentaire tels que le ‘‘COUSSIN GONFLABLE’’ et le ‘‘PRETENSIONNEUR DE CEINTURE DE SECURITE’’ permettent de réduire les risques de blessures graves subies par le conducteur et le passager avant lors de collisions frontales. La composition du système de retenue supplémentaire disponible sur le MODELE D22 NISSAN est la suivante (la composition variera en fonction de la destination et de l’équipement optionnel) :
Un module de coussin gonflable côté conducteur (situé dans le moyeu du volant), un module de coussin gonflable côté passager avant (situé sur le tableau de bord, côté passager), un prétensionneur de ceintures de sécurité, un boîtier de capteurs de diagnostic, un témoin avertisseur, un faisceau de câblage et un câble spiralé.
Toute information nécessaire à l’entretien du système en toute sécurité est comprise dans le **section RS** de ce Manuel de Réparation.

ATTENTION :

- **Pour ne pas affecter le fonctionnement du SRS, ce qui augmenterait les risques de blessures graves ou mortelles en cas de collision entraînant le déploiement du coussin gonflable, toutes les opérations d’entretien doivent être effectuées par un concessionnaire NISSAN agréé.**
- **Un entretien incorrect, y compris une dépose et une repose incorrectes du système de retenue supplémentaire, peut être à l’origine de blessures provoquées par une activation involontaire du système. Pour la dépose du câble spiralé et du module de coussin gonflable, se reporter à la section RS.**
- **Ne pas utiliser d’équipement d’essai électrique sur les circuits connexes du SRS sauf si indiqué dans le Manuel de Réparation. Le câble spiralé et les faisceaux de câblage (à l’exception du ‘‘PRETENSIONNEUR DE CEINTURE DE SECURITE’’) recouverts d’une gaine d’isolation jaune placée juste avant les connecteurs de faisceau ou couvrant l’ensemble du faisceau sont reliés au SRS.**



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Réglage de l'interrupteur de limite de porte avant (côté conducteur seulement)

CONDITIONS DE REGLAGE

Après avoir effectué chacune des opérations suivantes, régler l'interrupteur de limite (avec moteur intégré).

- Dépose et repose du régulateur
- Dépose du moteur de régulateur
- Fonctionnement du régulateur comme un ensemble indépendant
- Dépose et repose de la vitre de la porte
- Dépose et repose de la glissière

PROCEDURES DE REGLAGE

Après la repose des pièces, proceder comme suit :

1. Fermer la vitre complètement.
2. Appuyer sur l'interrupteur de réglage et ouvrir complètement la vitre.
3. Relâcher l'interrupteur de réglage. Après s'être assurer que l'interrupteur de réglage est revenu à sa position initiale, fermer la vitre complètement.
4. L'interrupteur de limite est desormais réglé.

PRECAUTION :

Faire attention d'ouvrir et de fermer manuellement la fenêtre. (Ne pas utiliser les procédures d'ouvertures automatiques.)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

PRECAUTION :

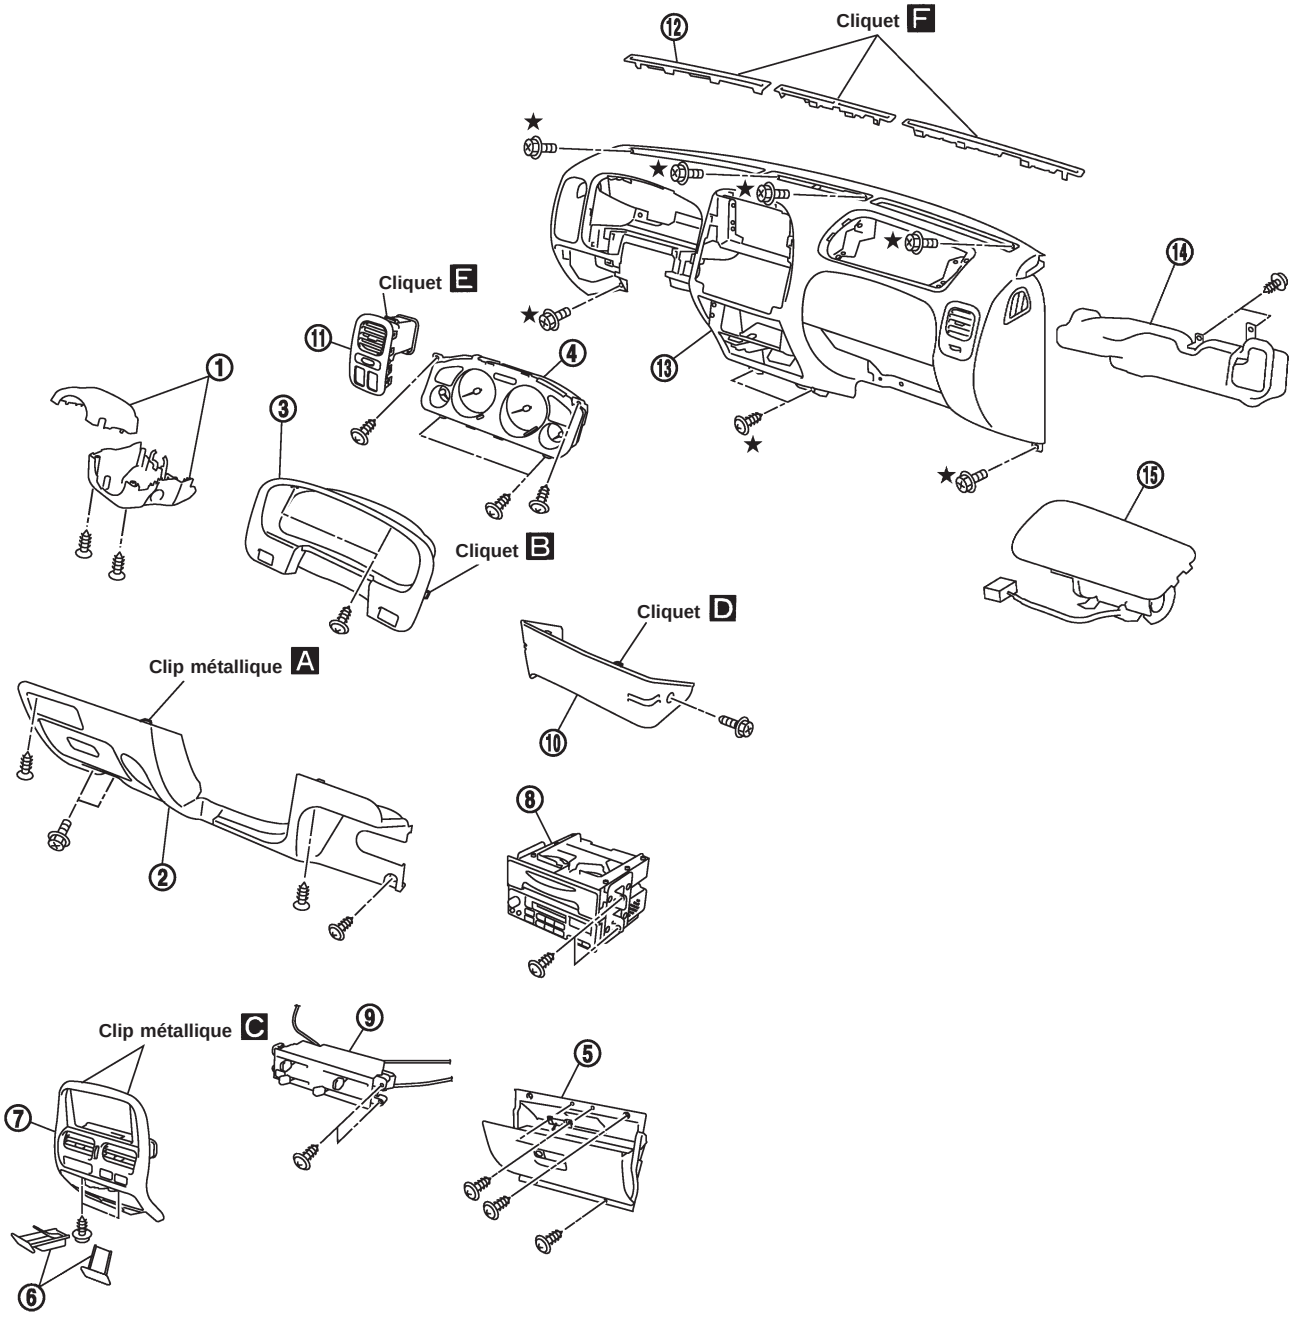
- **Débrancher les deux bornes de la batterie à l'avance.**
- **Débrancher à l'avance le connecteur du module de coussin gonflable.**
- **Veiller à ne pas érafler les garnitures et autres pièces.**
- **Ne pas altérer ou forcer l'ouverture du couvercle du coussin gonflable pour ne pas affecter les performances du coussin gonflable.**

DEPOSE — Tableau de bord

Tableau de bord	Instruments combinés	Commande audio	Chauffage et commande de C/A

Déposer le module de coussin gonflable côté conducteur et le volant de direction.
Se reporter à ''SYSTEME DE RETENUE SUPPLEMENTAIRE'' à la section RS pour plus de détails.

Incliner complètement la colonne de direction vers le bas



1. Couvercle de colonne de direction
   - Déposer les vis.
2. Tableau de bord inférieur côté conducteur. — A
   - Déposer les vis et boulons.
3. Couvercle de tableau de bord A — B
   - Déposer les vis.
4. Instruments combinés
   - Déposer les vis puis déconnecter les connecteurs de faisceau.
5. Ensemble de boîte à gants
   - Déposer les vis.
   - Puis débrancher le connecteur de module de coussin gonflable côté passager.
   - Puis enlever le support de module de coussin gonflable de passager.
     Se reporter à ''SYSTEME DE RETENUE SUPPLEMENTAIRE'' à la section RS pour plus de détails.
6. Déposer le cendrier.
7. Couvercle de tableau de bord C — C
   - Déposer les vis puis déconnecter les connecteurs de faisceau.
8. Système audio et magnétocassette de poche
   - Déposer les vis puis déconnecter les connecteurs de faisceau.
9. Chauffage et commande de C/A
   - Débrancher le câble de commande de la température et les connecteurs de faisceau.
10. Centre inférieur du couvercle de support de tableau de bord — D
    - Déposer les vis.
11. Grille de ventilateur côté conducteur — E
12. Grille de dégivreur — F

Déposer la garniture du montant avant.
Se reporter à l'Garniture latérale et garniture de plancher'' dans le chapître ''GARNITURE INTERIEURE'' pour plus de détails, BT-2007.

13. Tableau de bord
    - Déposer les vis et boulons.
14. Conduit d'air coté passager
    - Déposer les vis.
15. Module de coussin gonflable passager
    - Se reporter à ''SYSTEME DE RETENUE SUPPLEMENTAIRE'' à la section RS pour plus de détails.

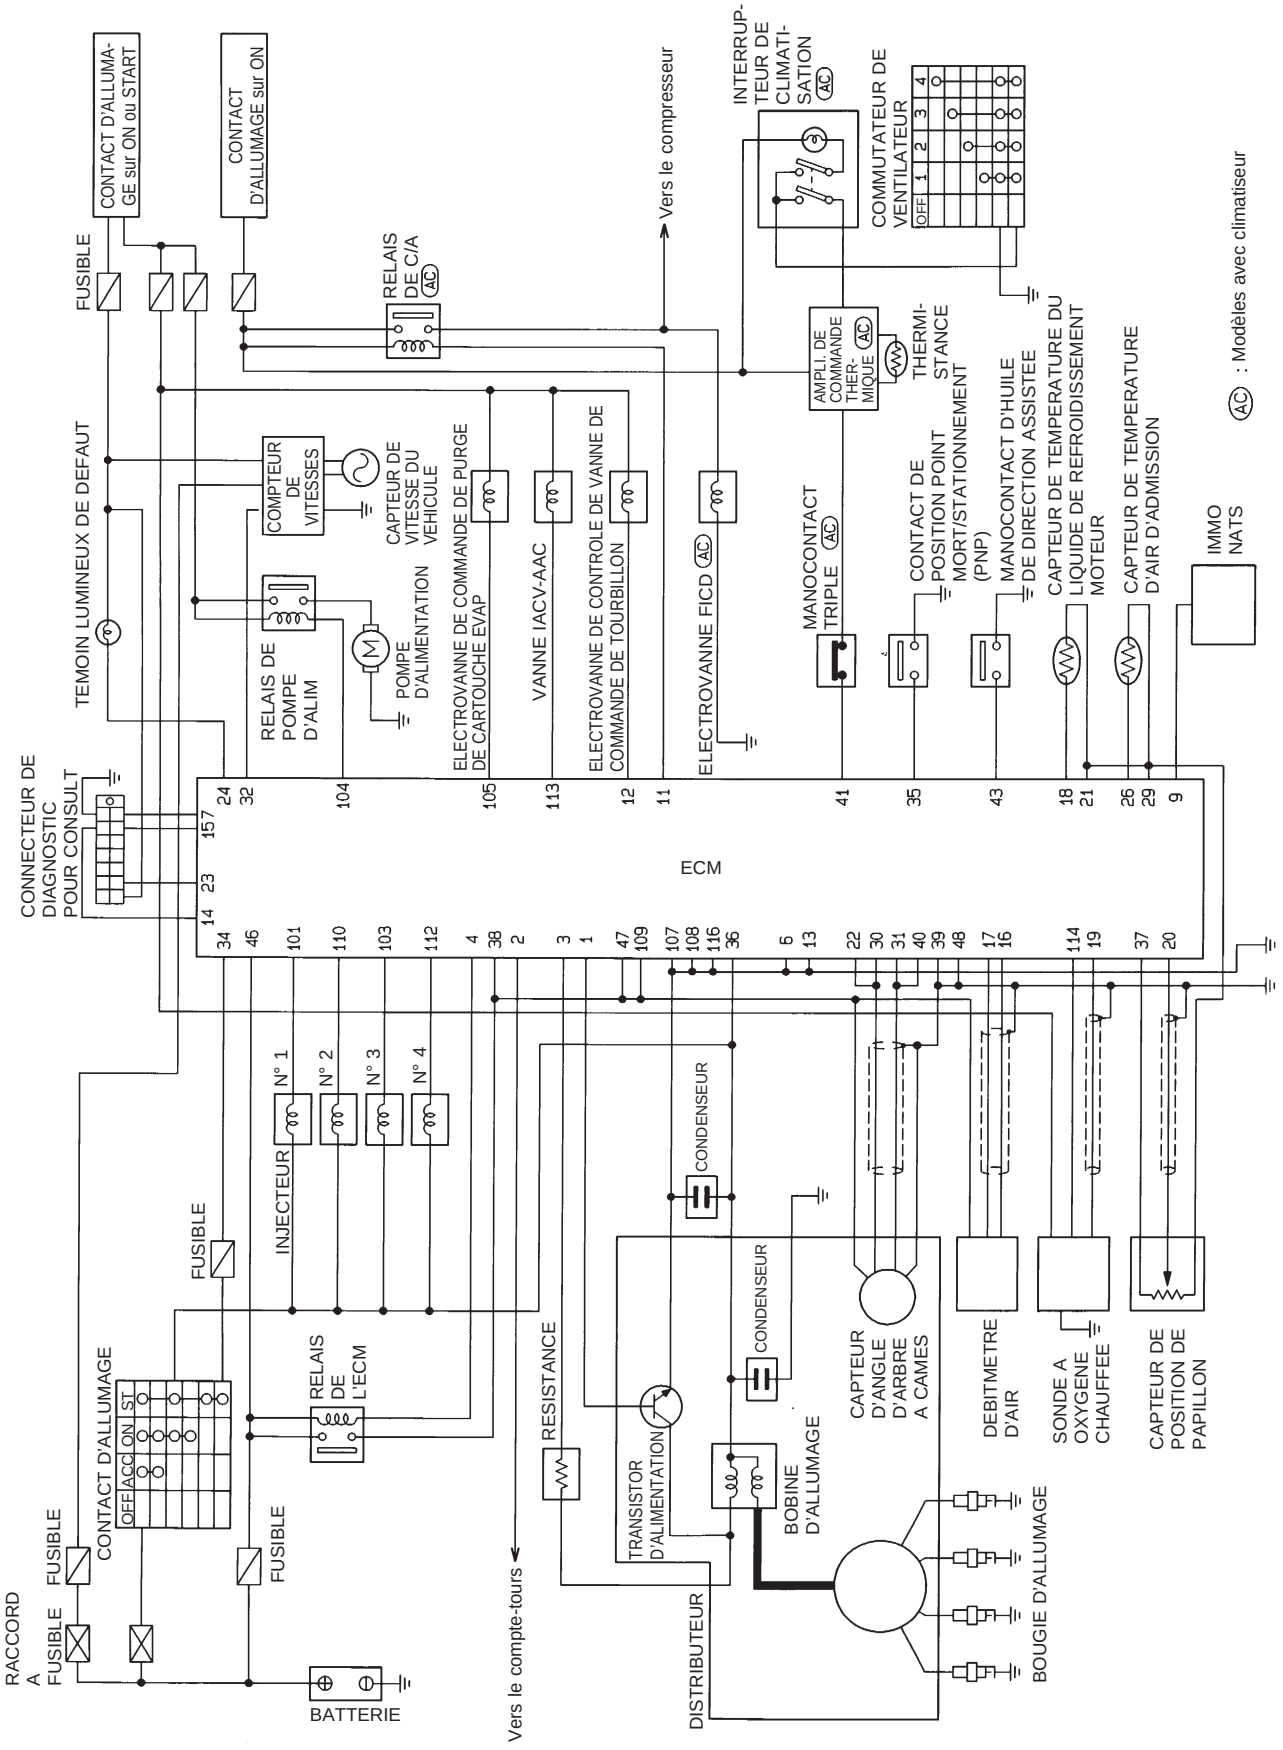
Lecture des schémas de câblage :
- **Lire la section GI : ‘‘ COMMENT LIRE LES SCHEMAS DE CABLAGE’’**
- **Voir la section EL, ‘‘DISPOSITION DE L’ALIMENTATION ELECTRIQUE’’ pour connaître les circuits de distribution de l’alimentation électrique.**

Pour le diagnostic des pannes, lire la section GI ‘‘ COMMENT LIRE LES ORGANIGRAMMES DANS LES DIAGNOSTICS DES DEFAUTS‘ ET ‘‘COMMENT ACCOMPLIR UN DIAGNOSTIC EFFICACE EN CAS D’INCIDENT ELECTRIQUE‘

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

‘‘COUSSIN GONFLABLE’’ (AIR BAG) et ‘‘PRETENSIONNEUR DE CEINTURE DE SECURITE’’ du système de retenue supplémentaire (SRS)



Utilisé conjointement avec une ceinture de sécurité, les systèmes de retenue supplémentaire tels que le ‘‘COUSSIN GONFLABLE’’ et le ‘‘PRETENSIONNEUR DE CEINTURE DE SECURITE’’ permettent de réduire les risques de blessures graves subies par le conducteur et le passager avant lors de collision frontale. La composition du système de retenue supplémentaire disponible sur le MODELE D22 NISSAN est la suivante (la composition variera en fonction de la destination et de l’équipement optionnel) :
Le système de retenue supplémentaire se compose d’un module de coussin gonflable côté conducteur (situé dans le moyeu du volant), d’un module de coussin gonflable côté passager (situé sur le tableau de bord, côté passager), de prétensionneurs de ceinture de sécurité, d’un boîtier de capteurs de diagnostic, d’un témoin d’avertissement, d’un faisceau de câblage et d’un câble spiralé.
Les informations nécessaires à l’entretien sans danger du système se trouvent à la **section RS** de ce Manuel de Réparation.

ATTENTION :

- **Afin de ne pas affecter le bon fonctionnement du SRS, ce qui augmenterait les risques de blessures graves ou mortelles en cas de collision entraînant le déploiement du coussin gonflable, toutes les opérations d’entretien devront être effectuées par un concessionnaire NISSAN agréé.**
- **Un entretien incorrect, y compris une dépose et une installation incorrectes du SRS, pourra entraîner des risques de blessures causées par le déploiement imprévu du système. Pour la dépose du câble spiralé et du module de coussin gonflable, se reporter à la section RS.**
- **Ne pas utiliser d’équipement d’essai électrique sur tout circuit connexe au SRS sauf si indiqué dans ce Manuel de Réparation. Le câble spiralé et les faisceaux de câblage (à l’exception du ‘‘PRETENSIONNEUR DE CEINTURE DE SECURITE’’) recouverts d’une gaine d’isolation jaune placée juste avant les connecteurs de faisceau ou couvrant l’ensemble du faisceau sont reliés au SRS.**

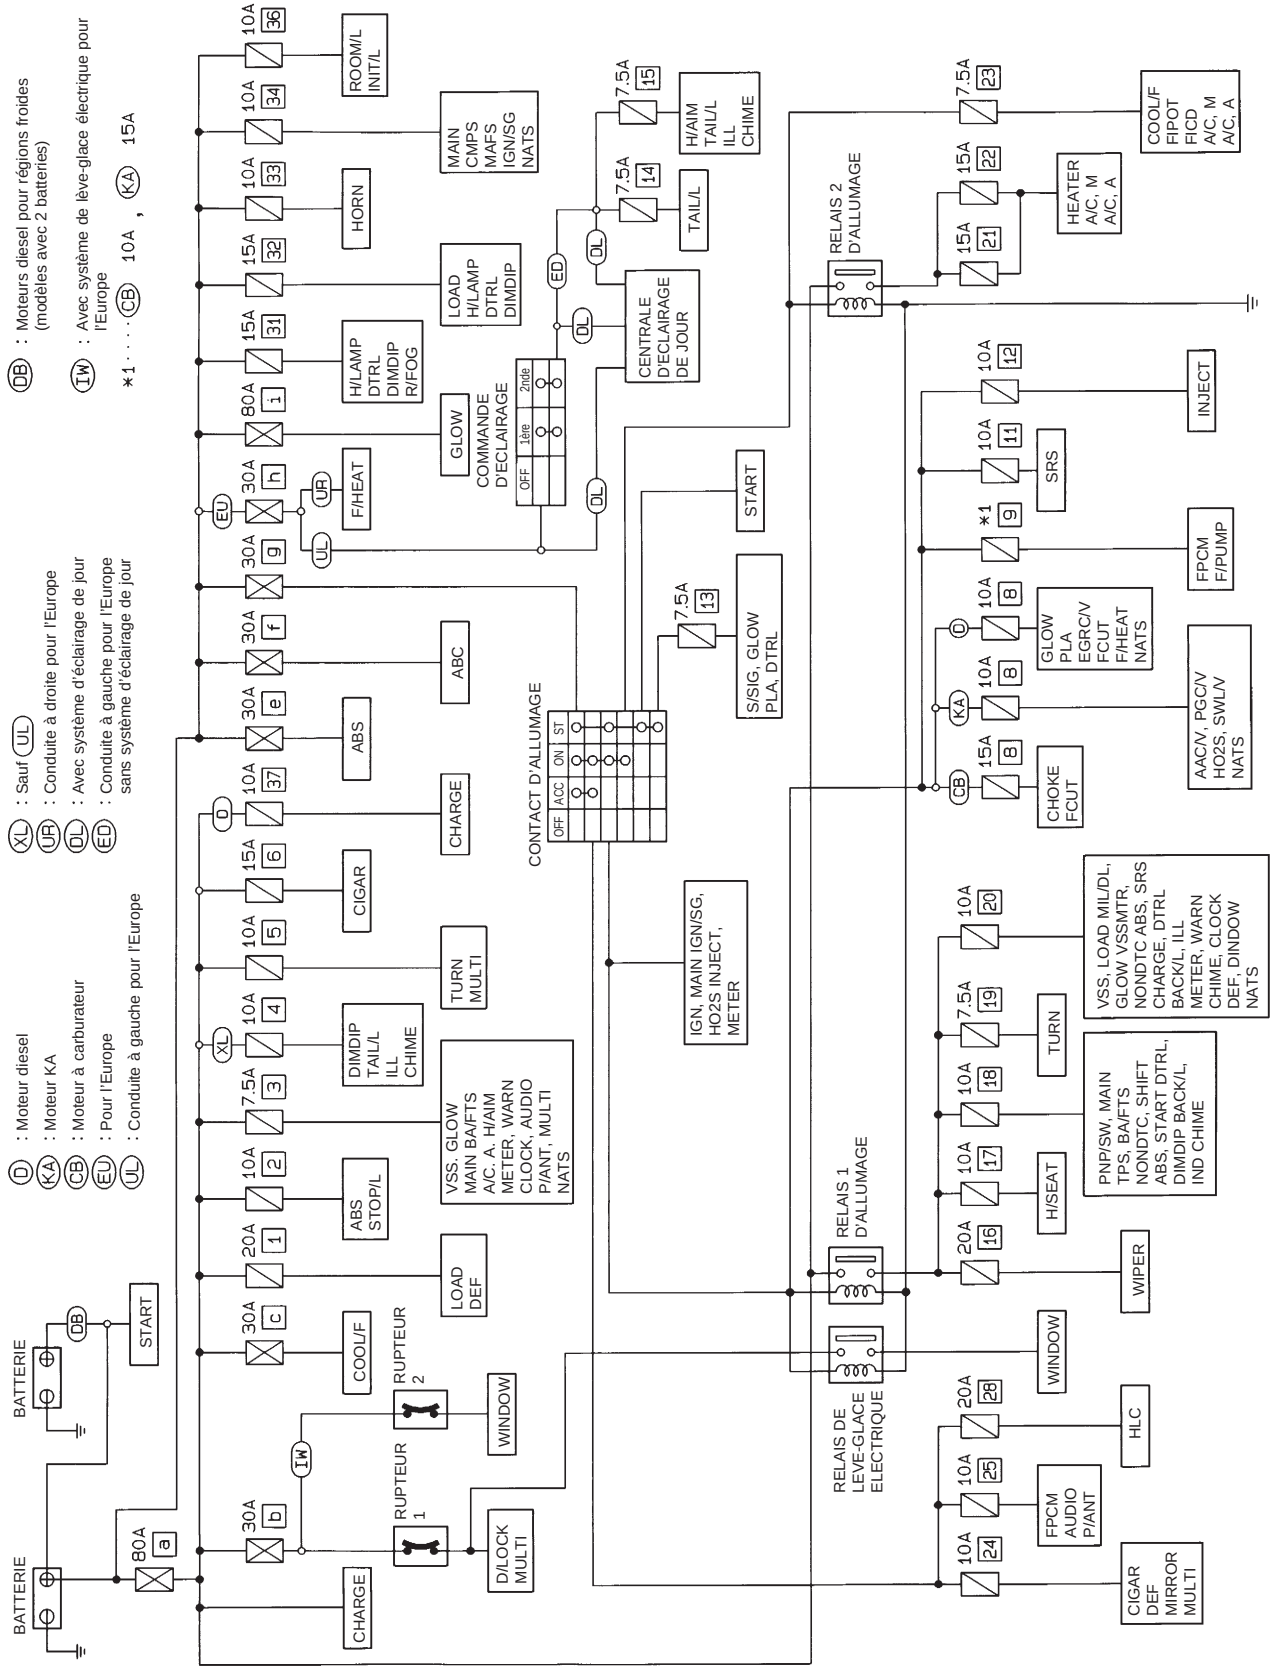
‘‘COUSSIN GONFLABLE’’ et ‘‘PRETENSIONNEUR DE CEINTURE DE SECURITE’’ du système de retenue supplémentaire (SRS)



Utilisés avec une ceinture de sécurité, le COUSSIN GONFLABLE et le PRETENSIONNEUR DE CEINTUREDE SECURITE du système de retenue supplémentaire contribuent à réduire les risques et la gravité des blessures subies par le conducteur et le passager avant lors de collisions frontales. La composition du système de retenue supplémentaire disponible sur le MODELE D22 NISSAN est la suivante (la composition variera en fonction de la destination et de l’équipement optionnel) :
Un module de coussin gonflable côté conducteur (situé dans le moyeu du volant), un module de coussin gonflable côté passager avant (situé sur le tableau de bord, côté passager), un prétensionneur de ceintures de sécurité, un boîtier de capteurs de diagnostic, un témoin d’avertissement, un faisceau de câblage et un câble spiralé.
Toute information nécessaire à l’entretien du système en toute sécurité est comprise dans le **section RS** de ce Manuel de Réparation.

ATTENTION :

- **Pour ne pas affecter le fonctionnement du SRS, ce qui augmenterait les risques de blessures graves ou mortelles en cas de collision entraînant le déploiement du coussin gonflable, toutes les opérations d’entretien doivent être effectuées par un concessionnaire NISSAN agréé.**
- **Un entretien incorrect, y compris une dépose et une repose incorrectes du système de retenue supplémentaire (SRS), peut être à l’origine de blessures provoquées par une activation involontaire du système. Pour la dépose du câble spiralé et du module de coussin gonflable, se reporter à la section RS.**
- **Ne pas utiliser d’équipement d’essai électrique sur les circuits connexes du SRS sauf si indiqué dans ce Manuel de Réparation. Le câble spiralé et les faisceaux de câblage (à l’exception du ‘‘PRETENSIONNEUR DE CEINTURE DE SECURITE’’) recouverts d’une gaine d’isolation jaune placée juste avant les connecteurs de faisceau ou couvrant l’ensemble du faisceau sont reliés au SRS.**

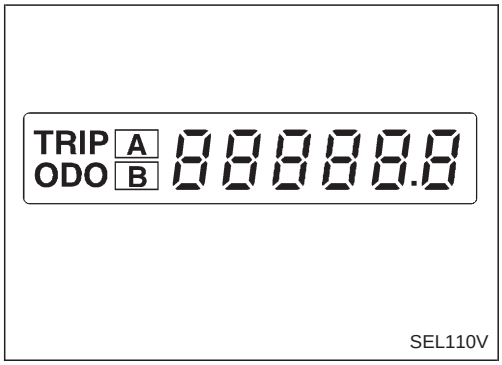
Description du système des instruments combinés



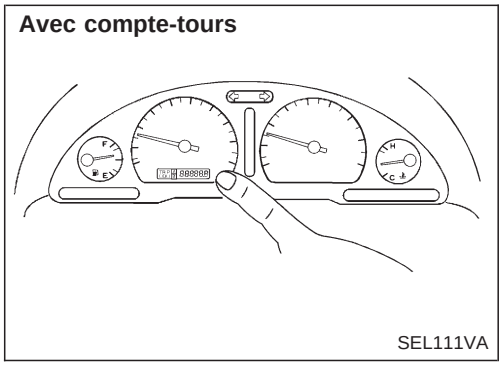
INSTRUMENTS COMBINES

Le compteur de vitesse, le compteur kilométrique/journalier, le compte-tours, la jauge de réservoir à carburant et la jauge de température d'eau sont entièrement contrôlés par le boîtier de commande des instruments combinés.

Fonctionnement des instruments/jauges et contrôle des segments de compteur kilométrique/journalier en mode de Diagnostic.

FONCTION DE DIAGNOSTIC

- Les segments du compteur kilométrique/journalier peuvent être vérifiés en mode diagnostic.
- Les instruments/Jauges peuvent être vérifiés en mode de diagnostic.

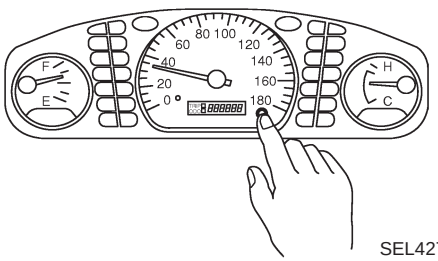


COMMENT PASSER EN MODE DE DIAGNOSTIC

1. Mettre le contact d'allumage sur ON et faire passer le compteur kilométrique/journalier en position ''TRIP A'' ou ''TRIP B''.
2. Couper le contact d'allumage.
3. Mettre le contact d'allumage sur ON tout en poussant sur le bouton de réglage du compteur kilométrique/journalier.
4. Vérifier que le compteur kilométrique journalier indique ''000,0''.
5. Appuyer sur le bouton de réglage du compteur kilométrique/journalier plus de trois fois en 5 secondes.
6. Tous les segments du compteur kilométrique/journalier numérique sont en marche.

NOTE : Si certains segments ne sont pas activés, le boîtier de commande des instruments combinés doit être remplacé.

A ce stade, les instruments combinés sont en mode de diagnostic.

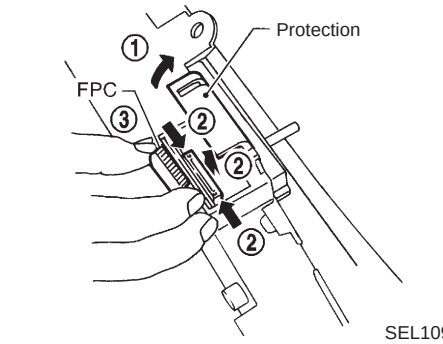


7. Appuyer sur le bouton de réglage du compteur kilométrique/journalier. Lorsque le bouton de réglage du compteur électrique/journalier est enclenché, l'indication de chaque instrument/jauge devrait être comme celle illustrée à gauche, s'il n'y a pas de défaut.

NOTE : Il faut environ 1 minute pour que l'indicateur de la jauge de réservoir à carburant se stabilise.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

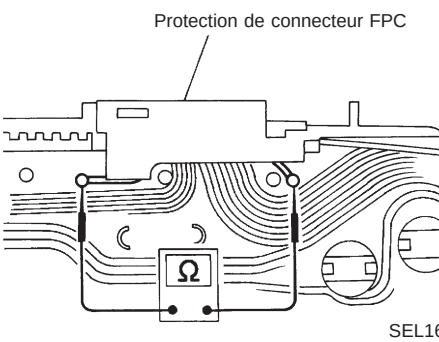
Fonctionnement des instruments/jauges et contrôle des segments de compteur kilométrique/journalier en mode de Diagnostic. (suite)



Sans compte-tours

SEL427W

Circuit imprimé souple (FPC) (modèles avec compte-tours)



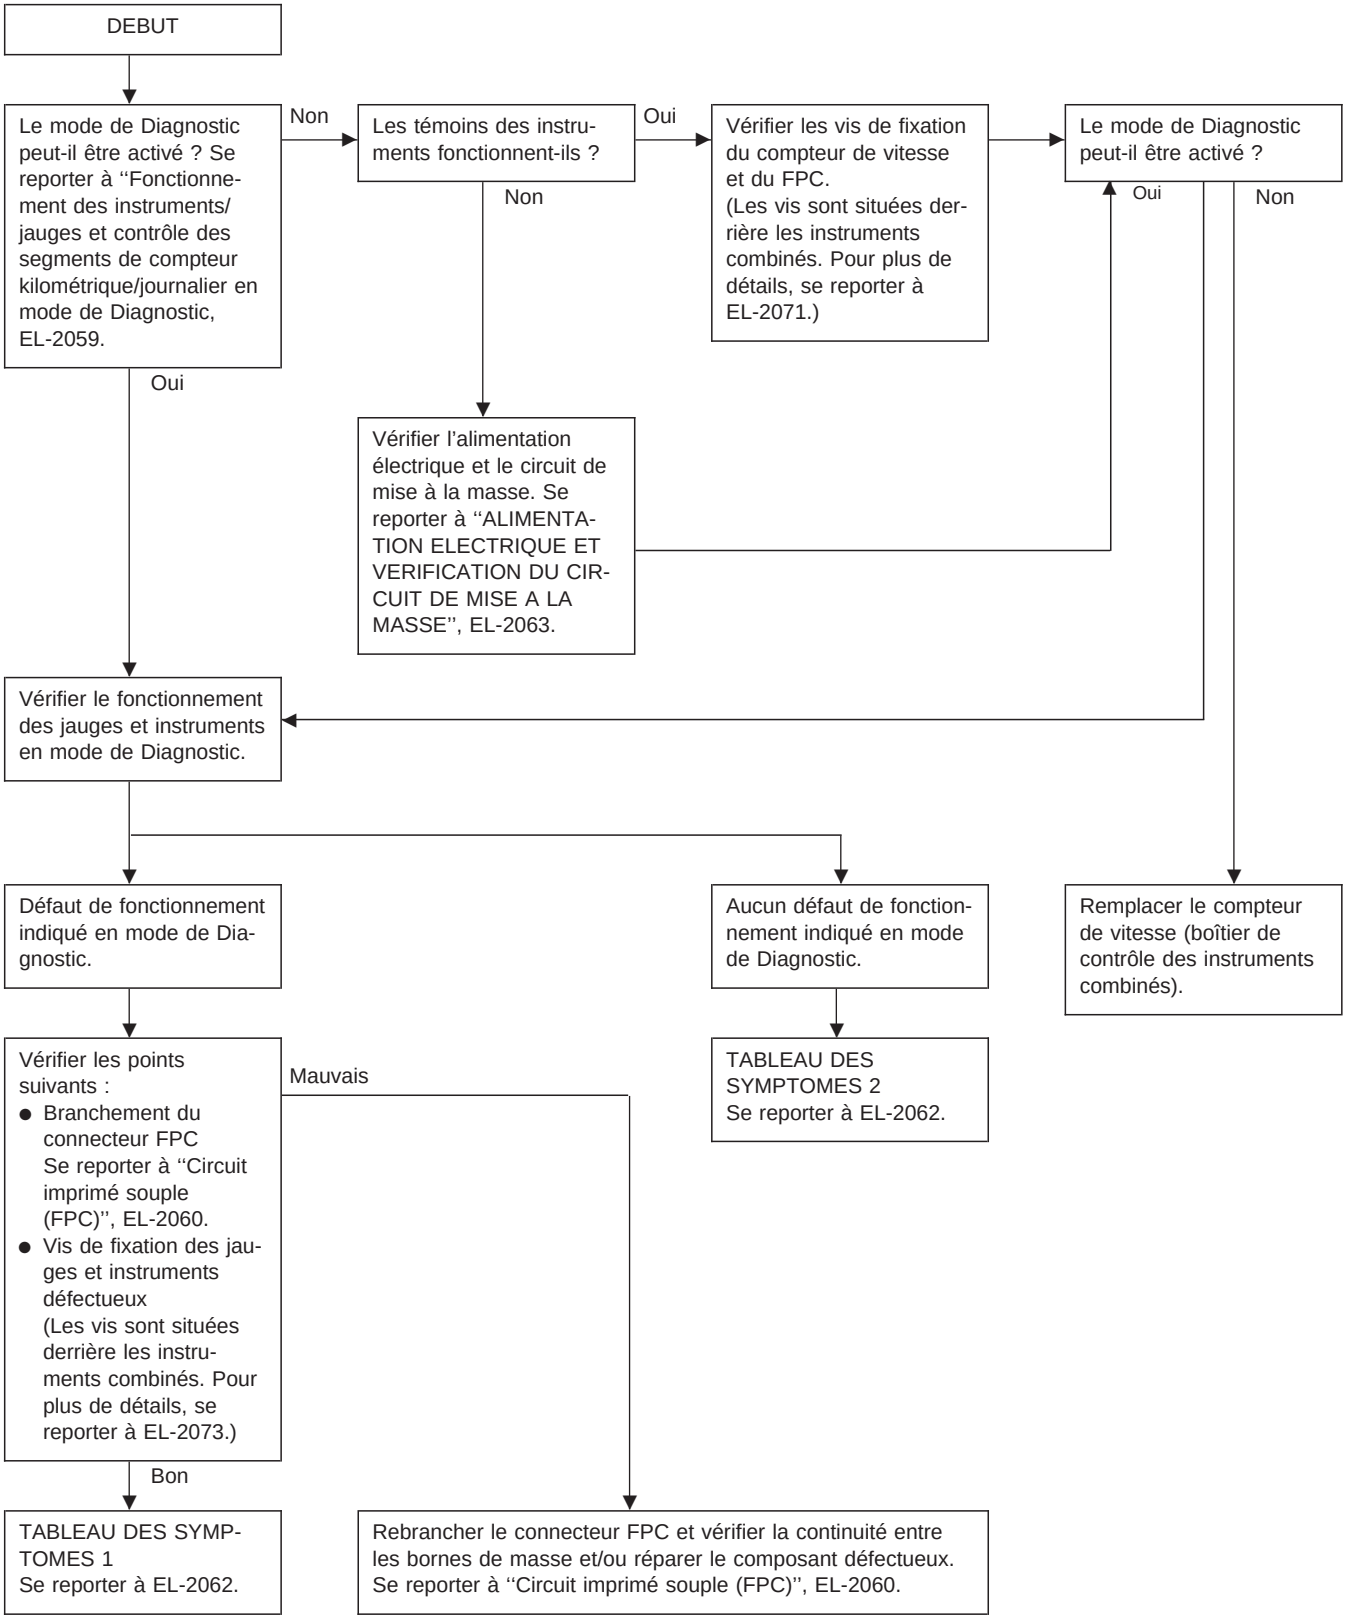
Le compte-tours, la jauge de réservoir à carburant et la jauge de température d'eau sont connectés au boîtier de commande des instruments combinés (compteur de vitesse) par le connecteur du circuit imprimé souple (FPC). Lors du remplacement ou de la dépose/repose des instruments combinés (compteur de vitesse), débrancher et rebrancher le connecteur FPC en procédant comme suit :

SEL109V

DEBRANCHER

1. Ouvrir la protection du connecteur.
2. Retirer le fermoir du connecteur en maintenant ses deux extrémités et en le tirant vers le haut.
3. Débrancher le FPC en le tirant vers le haut.

SEL162V



BRANCHER

1. Insérer le FPC dans le connecteur puis fermer le connecteur en poussant le FPC vers le bas.
2. Vérifier si le FPC est correctement branché.
3. Vérifier la continuité aux bornes de masse pour s'assurer que le FPC est fermement branché.
   Résistance : 0Ω
4. Fermer la protection du connecteur.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostics des défauts/Modèles avec compte-tours

VERIFICATION PRELIMINAIRE

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

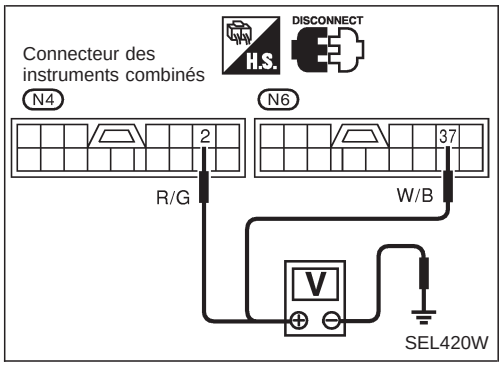
Diagnostics des défauts/Modèles avec compte-tours (suite)

Avant de commencer les diagnostics de défaut ci-dessous, effectuer la VERIFICATION PRELIMINAIRE, EL-2061.

TABLEAU DES SYMPTOMES 1 (DEFAUT DE FONCTIONNEMENT INDIQUE EN MODE DE DIAGNOSTIC)

Symptôme	Causes possibles	Ordre de réparation
Le compteur de vitesse et/ou le compteur kilométrique/journalier indiquent un défaut en mode de Diagnostic.	● Compteur de vitesse (boîtier de contrôle des instruments combinés)	● Remplacer le compteur de vitesse (boîtier de contrôle des instruments combinés).
Instruments multiples/jauges présentent un défaut en mode de Diagnostic.		
Le compte-tours, la jauge de réservoir à carburant ou la jauge de température d'eau indique un défaut en mode de Diagnostic.	● Instruments/Jauges ● Compteur de vitesse (boîtier de contrôle des instruments combinés)	1. Vérifier la résistance des jauges et instruments défectueux. Si la résistance est mauvaise, remplacer la jauge/l'instrument. Se reporter à ''CONTROLE DE LA RESISTANCE DES INSTRUMENTS ET JAUGES'', EL-2073. 2. Si la résistance est correcte, remplacer le compteur de vitesses (boîtier de contrôle des instruments combinés).

TABLEAU DES SYMPTOMES 2 (AUCUN DEFAUT DE FONCTIONNEMENT INDIQUE EN MODE DE DIAGNOSTIC



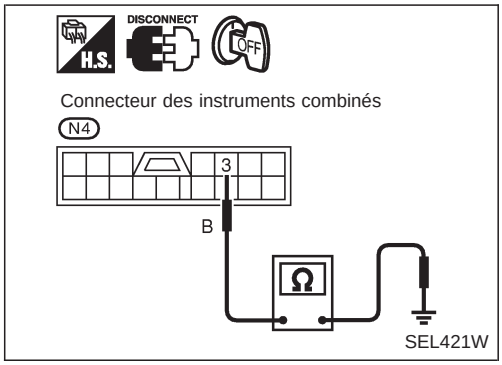
Symptôme	Causes possibles	Ordre de réparation
Le compteur de vitesse et le compteur kilométrique/journalier sont défectueux.	1. Capteur - Compteur de vitesse et compteur kilométrique/journalier 2. Connecteur FPC 3. Compteur de vitesse (boîtier de contrôle des instruments combinés)	1. Vérifier le capteur de vitesse du véhicule. INSPECTION/CAPTEUR DE VITESSE DU VEHICULE (Se reporter à EL-2064.) 2. Vérifier le connecteur FPC. Se reporter à ''CIRCUIT IMPRIME SOUPLE (FPC)'', EL-2060. 3. Remplacer le compteur de vitesse (boîtier de contrôle des instruments combinés).
Plusieurs jauges/instruments sont défectueux (sauf le compteur de vitesse, le compteur kilométrique/journalier).	1. Connecteur FPC 2. Compteur de vitesse (boîtier de contrôle des instruments combinés)	1. Vérifier le connecteur FPC. Se reporter à ''CIRCUIT IMPRIME SOUPLE (FPC)'', EL-2060. 2. Remplacer le compteur de vitesse (boîtier de contrôle des instruments combinés).
Le compte-tours, la jauge de réservoir à carburant ou la jauge de température d'eau est défectueux.	1. Capteur/Signal de régime moteur - Compte-tours - Jauge de carburant - Jauge de temp. d'eau 2. Connecteur FPC 3. Compteur de vitesse (boîtier de contrôle des instruments combinés)	1. Vérifier le capteur de défauts des jauges et instruments. INSPECTION/SIGNAL DE REGIME MOTEUR (Se reporter à EL-2064.) INSPECTION/JAUGE DE RESERVOIR A CARBURANT (Se reporter à EL-102.) INSPECTION/TRANSMETTEUR THERMIQUE (Se reporter à EL-2066.) 2. Vérifier le connecteur FPC. Se reporter à ''CIRCUIT IMPRIME SOUPLE (FPC)'', EL-2060. 3. Remplacer le compteur de vitesse (boîtier de contrôle des instruments combinés).

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostics des défauts/Modèles avec compte-tours (suite)

CONTROLE DE L'ALIMENTATION ELECTRIQUE ET DU CIRCUIT DE MISE A LA MASSE

Vérification du circuit de l'alimentation électrique



Bornes		Position du contact d'allumage		
⊕	⊖	OFF	ACC	ON
②	Masse	Tension de la batterie	Tension de la batterie	Tension de la batterie
㊲	Masse	0V	0V	Tension de la batterie

Si le résultat n'est pas satisfaisant, vérifier les points suivants ..

- Fusible de 7,5A [n° 3, situé dans le boîtier à fusibles (J/B)]
- Fusible de 10 A [n° 20, situé dans le boîtier à fusibles (J/B)]
- Faisceau ouvert ou court-circuité entre le fusible et les instruments combinés

Vérification du circuit de masse

Bornes	Il y a continuité
③ - Masse	Oui

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostics des défauts/Modèles avec compte-tours (suite)

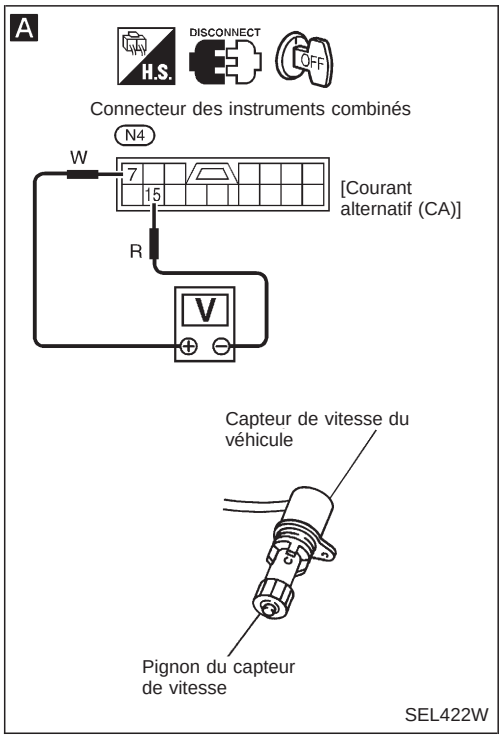
INSPECTION/CAPTEUR DE VITESSE DU VEHICULE

A

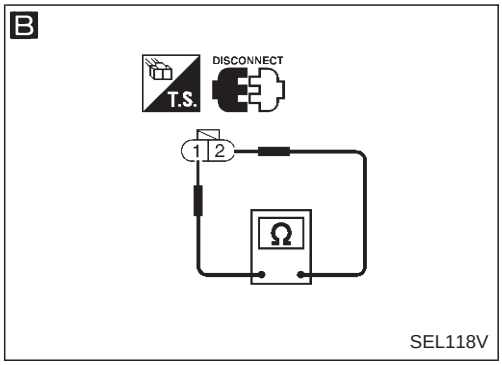
VERIFICATION DE LA SORTIE DU CAPTEUR DE VITESSE DU VEHICULE.
1. Déposer le capteur de vitesse du véhicule de la transmission.
2. Vérifier la tension entre les bornes ⑦ et ⑮ des instruments combinés tout en tournant rapidement le pignon du capteur de vitesse.
Tension : environ 0,5V

Bon → Le capteur de vitesse du véhicule fonctionne correctement.

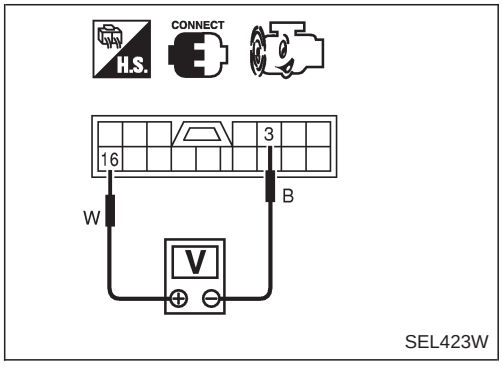
Mauvais ↓



B



VERIFICATION DU CAPTEUR DE VITESSE DU VEHICULE.
Vérifier la résistance entre les bornes ① et ② du capteur de vitesse du véhicule.
Résistance : environ 250Ω



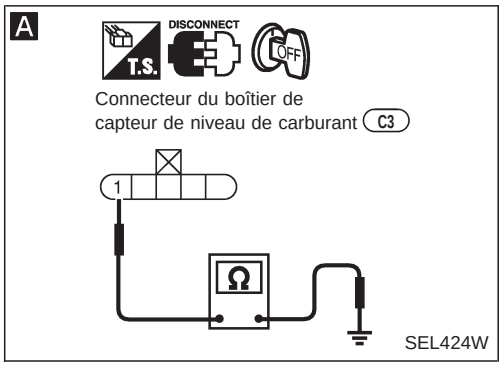
Mauvais → Remplacer le capteur de vitesse du véhicule.

Bon ↓

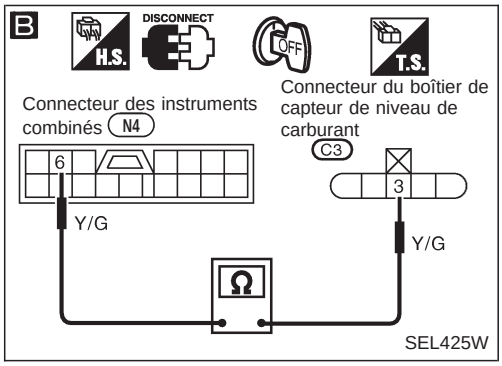
Vérifier le faisceau ou le connecteur entre le compteur de vitesse et le capteur de vitesse du véhicule.

INSPECTION/SIGNAL DE REGIME MOTEUR (modèles avec compte-tours)

Moteur	Points à vérifier	Bornes ⊕	Bornes ⊖	Explication
Moteur contrôlé par l'ECM	Tension du courant continu	⑯	③	Tr/mn élevé = tension élevée Tr/mn faible = basse tension La tension variera en fonction du régime moteur.
Carburateur	Tension du courant alternatif			
Moteurs diesel TD27 et QD32				



Si le résultat n'est pas satisfaisant, vérifier les points suivants ..



Moteur	Points à vérifier
Moteur contrôlé par l'ECM	● Faisceau ouvert ou court-circuité et raccord
Carburateur	● Faisceau ouvert ou court-circuité et raccord ● Résistance etc.
Moteurs diesel TD27 et QD32	● Faisceau ouvert ou court-circuité et raccord ● Capteur de régime moteur etc.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostics des défauts/Modèles avec compte-tours (suite)

INSPECTION/CAPTEUR DE NIVEAU DE CARBURANT

A

VERIFIER LE CIRCUIT DE MISE A LA MASSE DU BOITIER DU CAPTEUR DE NIVEAU DE CARBURANT.
Vérifier la continuité du faisceau entre la borne (1) du boîtier du capteur de niveau de carburant et la masse.
Il doit y avoir continuité.

Mauvais → Réparer le faisceau ou le connecteur.

Bon ↓

VERIFIER LES BOITIERS DE CAPTEUR DE NIVEAU DE CARBURANT.
Se reporter à ''CONTROLE DU BOITIER DU CAPTEUR DE NIVEAU DE CARBURANT'' (EL-2073).

Mauvais → Réparer ou remplacer. Se reporter à la section FE.

Bon ↓

B

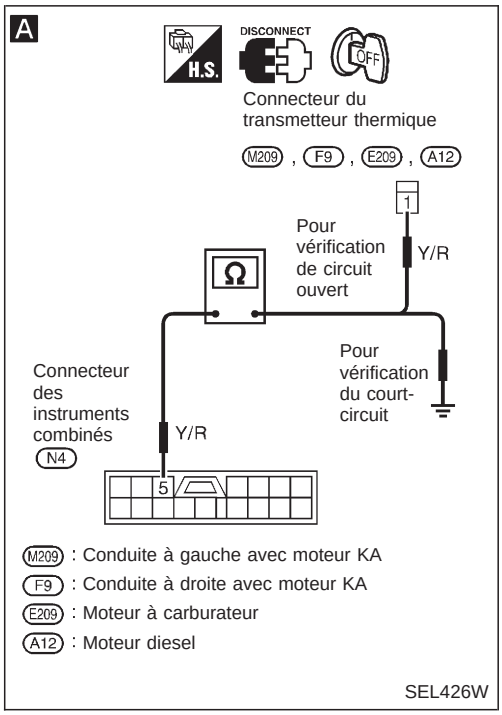
VERIFIER LE FAISCEAU.
1. Débrancher le connecteur N4 des instruments combinés et le connecteur du boîtier du capteur de niveau de carburant.
2. Vérifier la continuité du faisceau entre la borne (6) des instruments combinés et la borne (3) du boîtier du capteur de niveau de carburant.

Il doit y avoir continuité.

3. Vérifier la continuité entre la borne (6) des instruments combinés et la masse.

Il ne doit pas y avoir continuité.

Mauvais → Réparer le faisceau ou le connecteur.



Bon ↓

Le capteur de niveau de carburant fonctionne correctement.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostics des défauts/Modèles avec compte-tours (suite)

INSPECTION/TRANSMETTEUR THERMIQUE

VERIFIER LE TRANSMETTEUR THERMIQUE.
Se reporter à "VERIFICATION DU TRANSMETTEUR THERMIQUE" (EL-2074).

Mauvais → Réparer ou remplacer.

Bon ↓

A

VERIFIER LE FAISCEAU.

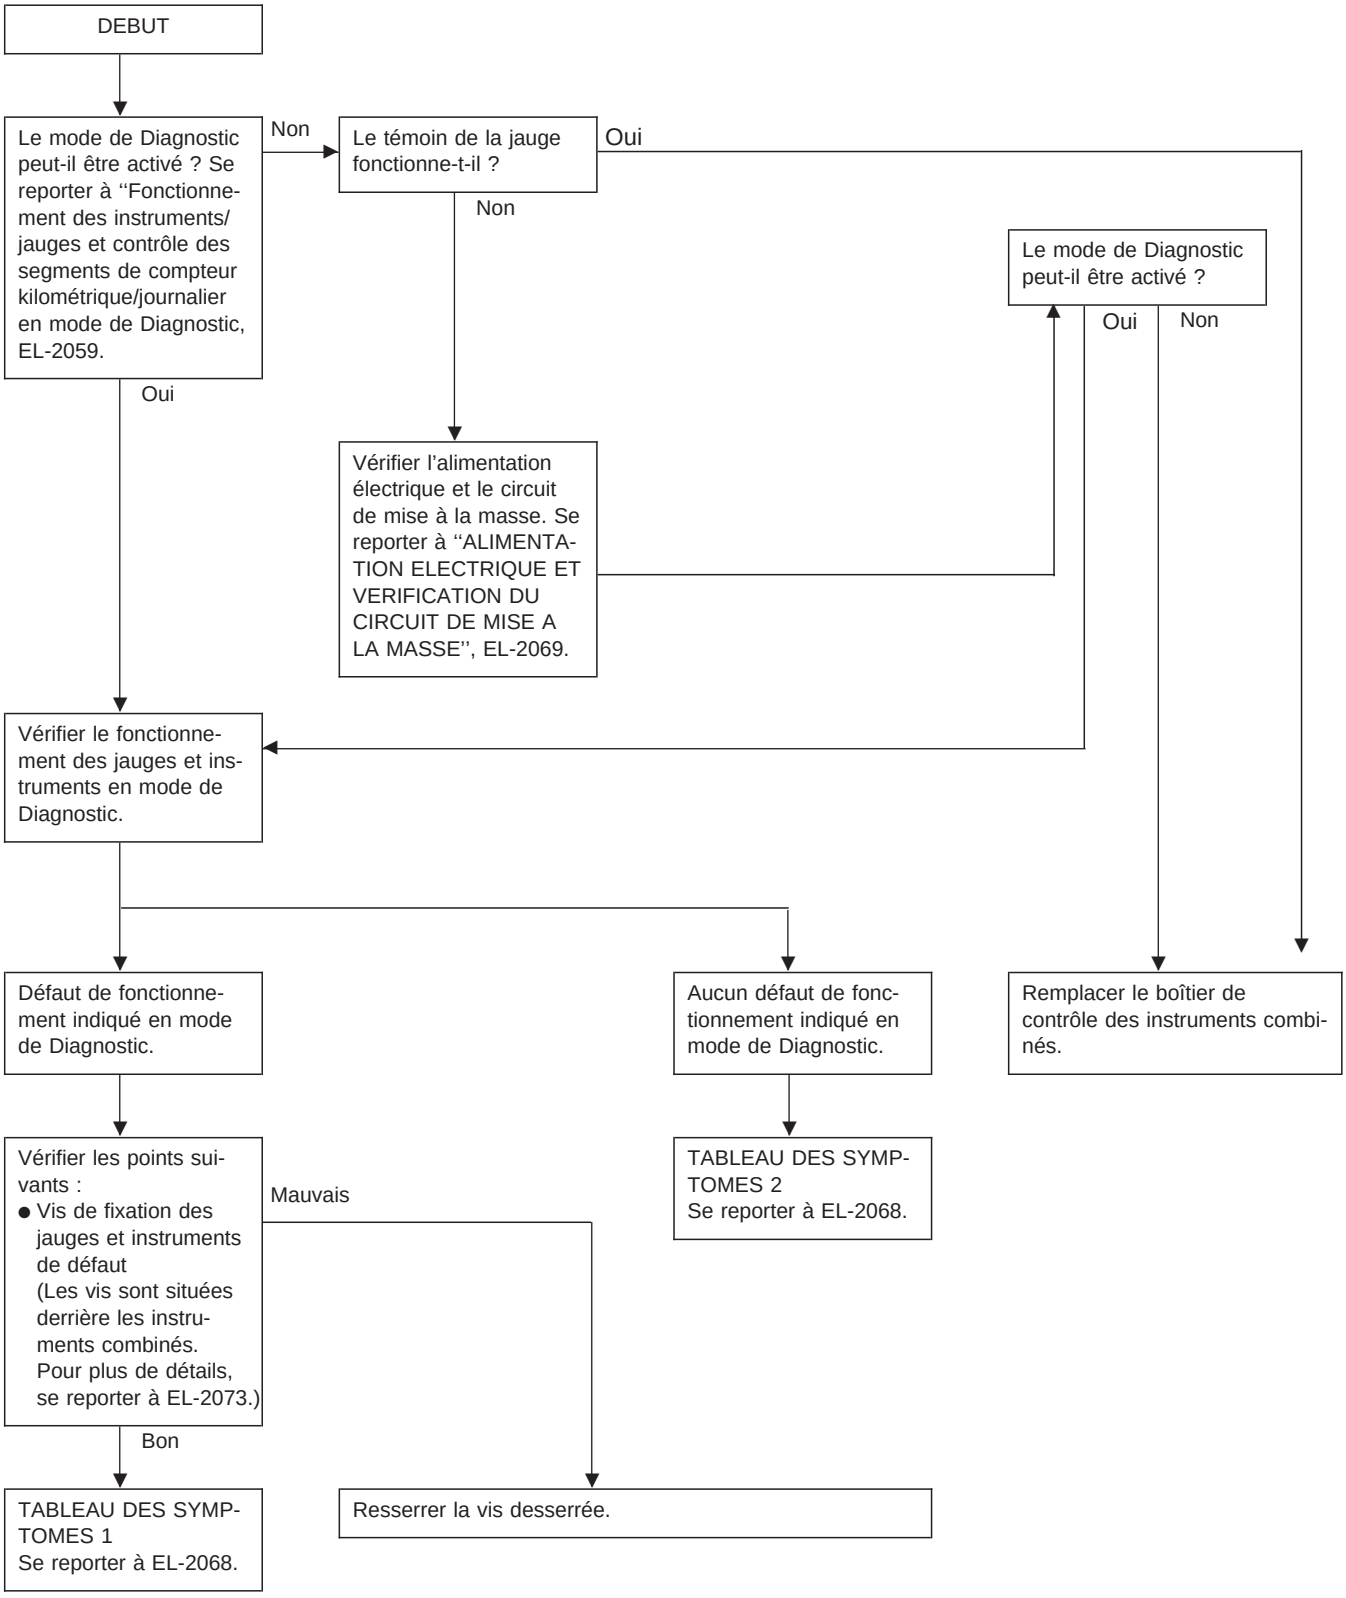
1. Débrancher le connecteur N4 des instruments combinés ainsi que le connecteur du transmetteur thermique.
2. Vérifier la continuité du faisceau entre la borne 5 des instruments combinés et la borne 1 du transmetteur thermique.

Il doit y avoir continuité.

3. Vérifier la continuité entre la borne 5 des instruments combinés et la masse.

Il ne doit pas y avoir continuité.

Mauvais → Réparer le faisceau ou le connecteur.



Bon ↓

Le transmetteur thermique fonctionne correctement.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostics des défauts/Modèles sans compte-tours

VERIFICATION PRELIMINAIRE

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

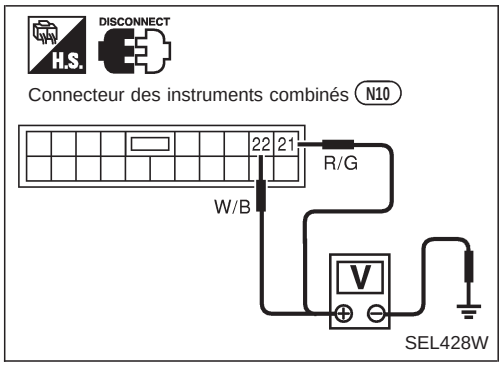
Diagnostics des défauts/Modèles sans compte-tours (suite)

Avant de commencer les diagnostics de défaut ci-dessous, effectuer la VERIFICATION PRELIMINAIRE, EL-2067.

TABLEAU DES SYMPTOMES 1 (DEFAUT DE FONCTIONNEMENT INDIQUE EN MODE DE DIAGNOSTIC)

Symptôme	Causes possibles	Ordre de réparation
Le compteur kilométrique/ journalier indique(nt) un défaut en mode de Diagnostic.	● Boîtier de contrôle des instruments combinés	● Remplacer le boîtier de contrôle des instruments combinés.
Instruments multiples/jauges présentent un défaut en mode de Diagnostic.		
Le compteur de vitesse, le compte-tours, la jauge de réservoir à carburant ou la jauge de température d'eau indique un défaut en mode de Diagnostic.	● Instruments/Jauges ● Boîtier de contrôle des instruments combinés	1. Vérifier la résistance des jauges et instruments défectueux. Si la résistance est ne fonctionne pas, remplacer la jauge/l'instrument. Se reporter à ''CONTROLE DE LA RESISTANCE DES INSTRUMENTS/JAUGES'', EL-2073. 2. Si la résistance est correcte, remplacer le boîtier de contrôle des instruments combinés.

TABLEAU DES SYMPTOMES 2 (AUCUN DEFAUT DE FONCTIONNEMENT INDIQUE EN MODE DE DIAGNOSTIC)



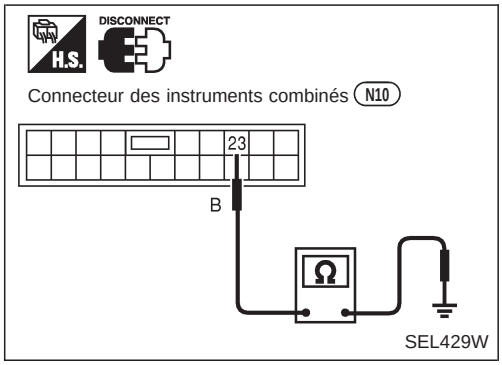
Symptôme	Causes possibles	Ordre de réparation
Le compteur de vitesse, le compte-tours, la jauge de réservoir à carburant ou la jauge de température d'eau indique un défaut.	1. Capteur - Signal de vitesse du véhicule - Jauge de carburant - Jauge de temp. d'eau 2. Boîtier de contrôle des instruments combinés	1. Vérifier le capteur pour les jauges et instruments défectueux. INSPECTION/CAPTEUR DE VITESSE DU VEHICULE (Se reporter à EL-2070.) INSPECTION/CAPTEUR DE NIVEAU DE CARBURANT (Se reporter à EL-2065.) INSPECTION/TRANSMETTEUR THERMIQUE (Se reporter à EL-2072.) 2. Remplacer le boîtier de contrôle des instruments combinés.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostics des défauts/Modèles sans compte-tours (suite)

CONTROLE DE L'ALIMENTATION ELECTRIQUE ET DU CIRCUIT DE MISE A LA MASSE

Vérification du circuit de l'alimentation électrique

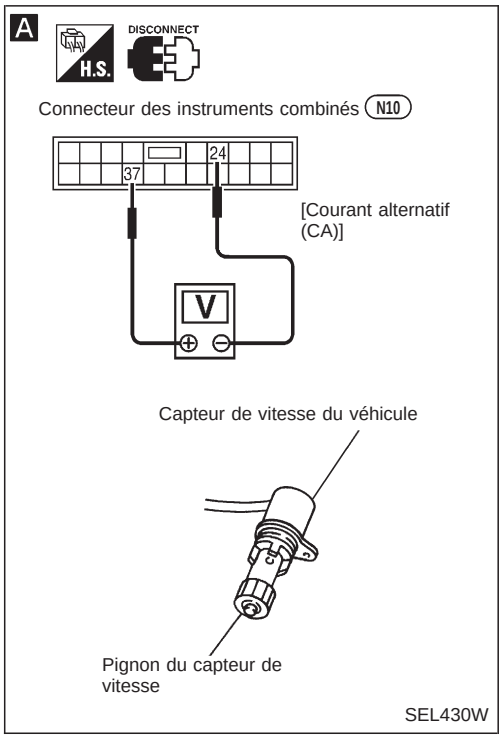


Bornes		Position du contact d'allumage		
⊕	⊖	OFF	Acc	ON
21	Masse	Tension de la batterie	Tension de la batterie	Tension de la batterie
22	Masse	0V	0V	Tension de la batterie

Si le résultat n'est pas satisfaisant, vérifier les points suivants ..

- Fusible de 7,5A [n° 3, situé dans le boîtier à fusibles (J/B)]
- Fusible de 10 A [n° 20, situé dans le boîtier à fusibles (J/B)]
- Faisceau ouvert ou court-circuité entre le fusible et les instruments combinés

Vérification du circuit de masse



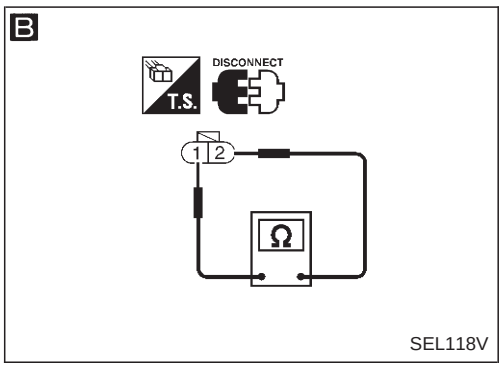
Bornes	Il y a continuité
23 - Masse	Oui

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostics des défauts/Modèles sans compte-tours (suite)

INSPECTION/CAPTEUR DE VITESSE DU VEHICULE

A



VERIFICATION DE LA SORTIE DU CAPTEUR DE VITESSE DU VEHICULE.

1. Déposer le capteur de vitesse du véhicule de la transmission.
2. Vérifier la tension entre les bornes ㉔ et ㊲ des instruments combinés tout en tournant rapidement le pignon du capteur de vitesse.
   Tension : environ 0,5V

Bon → Le capteur de vitesse du véhicule fonctionne correctement.

Mauvais ↓

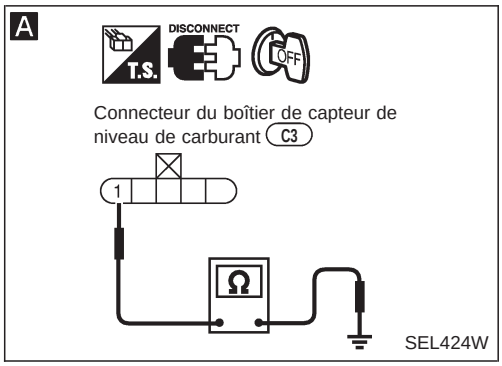
B

VERIFICATION DU CAPTEUR DE VITESSE DU VEHICULE.

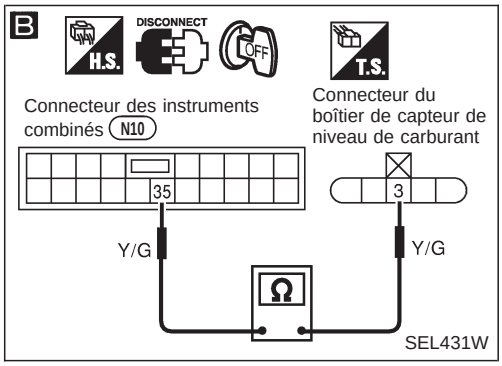
Vérifier la résistance entre les bornes ① et ② du capteur de vitesse du véhicule.

Résistance : environ 250Ω

Mauvais → Remplacer le capteur de vitesse du véhicule.



Bon ↓



Vérifier le faisceau ou le connecteur entre le compteur de vitesse et le capteur de vitesse du véhicule.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostics des défauts/Modèles sans compte-tours (suite)

INSPECTION/CAPTEUR DE NIVEAU DE CARBURANT

A

VERIFIER LE CIRCUIT DE MISE A LA MASSE DU BOITIER DU CAPTEUR DE NIVEAU DE CARBURANT.
Vérifier la continuité du faisceau entre la borne (1) du boîtier du capteur de niveau de carburant et la masse.
Il doit y avoir continuité.

Mauvais → Réparer le faisceau ou le connecteur.

Bon ↓

VERIFIER LE BOITIER DE CAPTEUR DE NIVEAU DE CARBURANT.
Se reporter à ''CONTROLE DU BOITIER DU CAPTEUR DE NIVEAU DE CARBURANT'' (EL-2073).

Mauvais → Réparer ou remplacer. Se reporter à la section FE.

Bon ↓

B

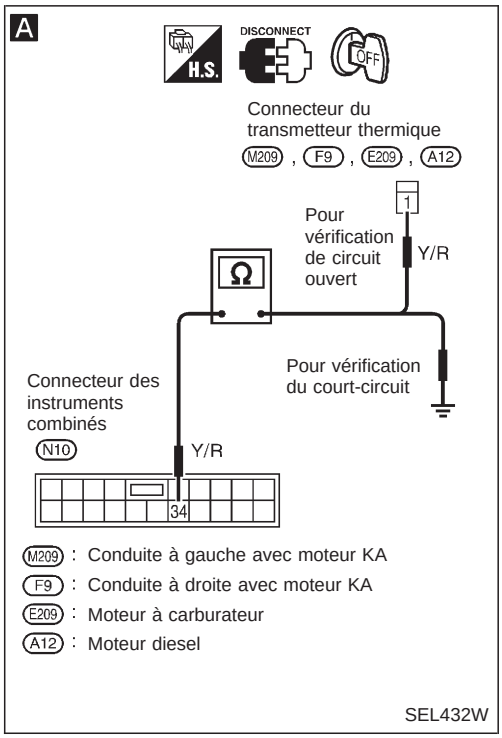
VERIFIER LE FAISCEAU.
1. Débrancher le connecteur (N10) des instruments combinés et le connecteur du boîtier du capteur de niveau de carburant.
2. Vérifier la continuité du faisceau entre la borne (35) des instruments combinés et la borne (3) du boîtier du capteur de niveau de carburant.

Il doit y avoir continuité.

3. Vérifier la continuité entre la borne (35) des instruments combinés et la masse.

Il ne doit pas y avoir continuité.

Mauvais → Réparer le faisceau ou le connecteur.



Bon ↓

Le capteur de niveau de carburant fonctionne correctement.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostics des défauts/Modèles sans compte-tours (suite)

INSPECTION/TRANSMETTEUR THERMIQUE

VERIFIER LE TRANSMETTEUR THERMIQUE.
Se reporter à "VERIFICATION DU TRANSMETTEUR THERMIQUE" (EL-(EL-2074).

Mauvais → Réparer ou remplacer.

Bon ↓

A

VERIFIER LE FAISCEAU.

1. Débrancher le connecteur N10 des instruments combinés ainsi que le connecteur du transmetteur thermique.
2. Vérifier la continuité du faisceau entre la borne 34 des instruments combinés et la borne 1 du transmetteur thermique.

Il doit y avoir continuité.

3. Vérifier la continuité entre la borne 34 des instruments combinés et la masse.

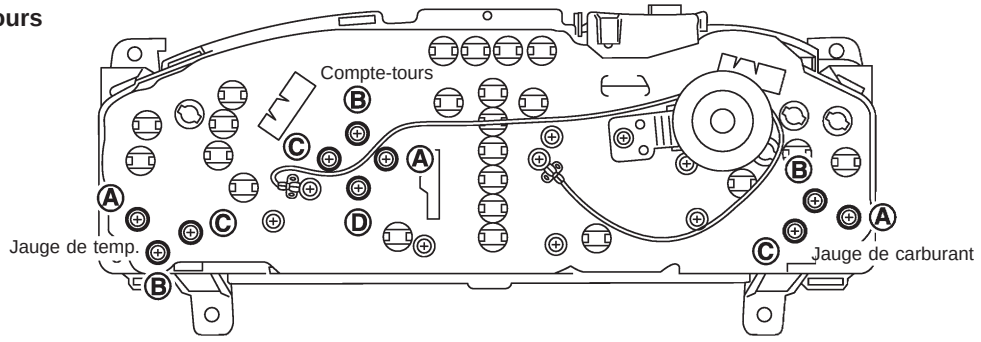
Il ne doit pas y avoir continuité.

Mauvais → Réparer le faisceau ou le connecteur.

Bon ↓

Le transmetteur thermique fonctionne correctement.

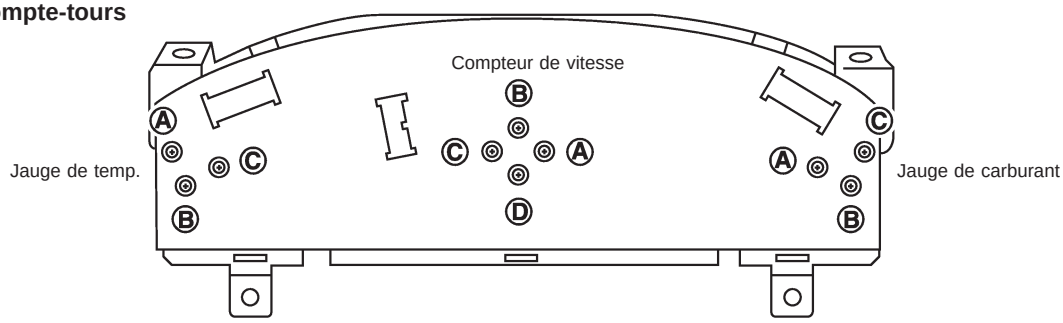
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Inspection des composants électriques

CONTROLE DE LA RESISTANCE DES INSTRUMENTS/JAUGES

1. Débrancher le connecteur FPC (Instruments combinés avec compte-tours). Se reporter à EL-2060.
2. Vérifier la résistance entre les bornes (points des vis de repose) des jauges/instruments après la dépose des jauges/instruments.



Vis		Résistance Ω
Compte-tours	Jauge Carburant/ Temp.	
A - C	A - C	Environ 140 - Environ 260
B - D	B - C	Environ 230 - Environ 310

Diagnostics des défauts/Sans fonction de détection d'interruption

Symptôme	Cause possible	Ordre de réparation
Aucun des lève-glaces électriques ne peut être actionné en utilisant n'importe quelle commande.	1. Raccord à fusible de 30A et rupteur 1 2. Masses (M1) et (M54) 3. Relais de lève-glace électrique 4. Circuit de l'interrupteur principal de lève-glace électrique ouvert ou en court-circuit	1. Vérifier le raccord à fusible de 30A (lettre [b], situé dans le raccord à fusible et le boîtier à fusibles) et le rupteur 1,situé dans le boîtier à fusibles. Mettre le contact d'allumage sur ON'' et vérifier qu'une tension positive de la batterie est appliquée à la borne (1) de l'interrupteur principal de lève-glace électrique et à la borne (5) des interrupteurs auxiliaires. 2. Vérifier les masses (M1) et (M54). 3. Vérifier le relais de lève-glace électrique. 4. Vérifier que le faisceau n'est pas ouvert ou court-circuité entre l'interrupteur principal et le relais de lève-glace électrique.
Le lève-glace électrique côté conducteur ne peut pas être actionné, mais les autres lève-glaces peuvent être actionnés.	1. Circuit du régulateur de lève-glace électrique du conducteur 2. Régulateur de lève-glace électrique du conducteur	1. Vérifier que le faisceau n'est pas ouvert ou court-circuité entre l'interrupteur principal et le régulateur de lève-glace électrique. 2. Vérifier le régulateur de lève-glace électrique côté conducteur.
Un ou plusieurs lève-glace électrique, sauf celui côté conducteur, ne peut pas être actionné.	1. Interrupteur auxiliaire de lève-glace électrique 2. Régulateur de lève-glace électrique du passager 3. Interrupteur principal de lève-glace électrique 4. Circuit de l'alimentation électrique	1. Vérifier les interrupteurs auxiliaires de lève-glace électrique. 2. Vérifier le régulateur du lève-glace électrique défectueux. 3. Vérifier l'interrupteur principal de lève-glace électrique. 4-1. Vérifier que les faisceaux ne sont pas ouverts ou court-circuités entre l'interrupteur principal et les interrupteurs auxiliaires de lève-glaces électriques. 4-2. Vérifier que les faisceaux ne sont pas ouverts ou court-circuités entre les interrupteurs auxiliaires et le régulateur de lève-glace électrique.
Le lève-glace électrique du passager ne peut pas être actionné à l'aide de l'interrupteur principal de lève-glace mais peut l'être à l'aide des interrupteurs auxiliaires.	1. Interrupteur principal de lève-glace électrique	1. Vérifier l'interrupteur principal de lève-glace électrique.
La fonction auto. du lève-glace électrique du conducteur ne peut être actionnée à l'aide de l'interrupteur principal de lève-glace électrique.	1. Interrupteur principal de lève-glace électrique	1. Vérifier l'interrupteur principal de lève-glace électrique.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description du système/Avec fonction de détection d'interruption

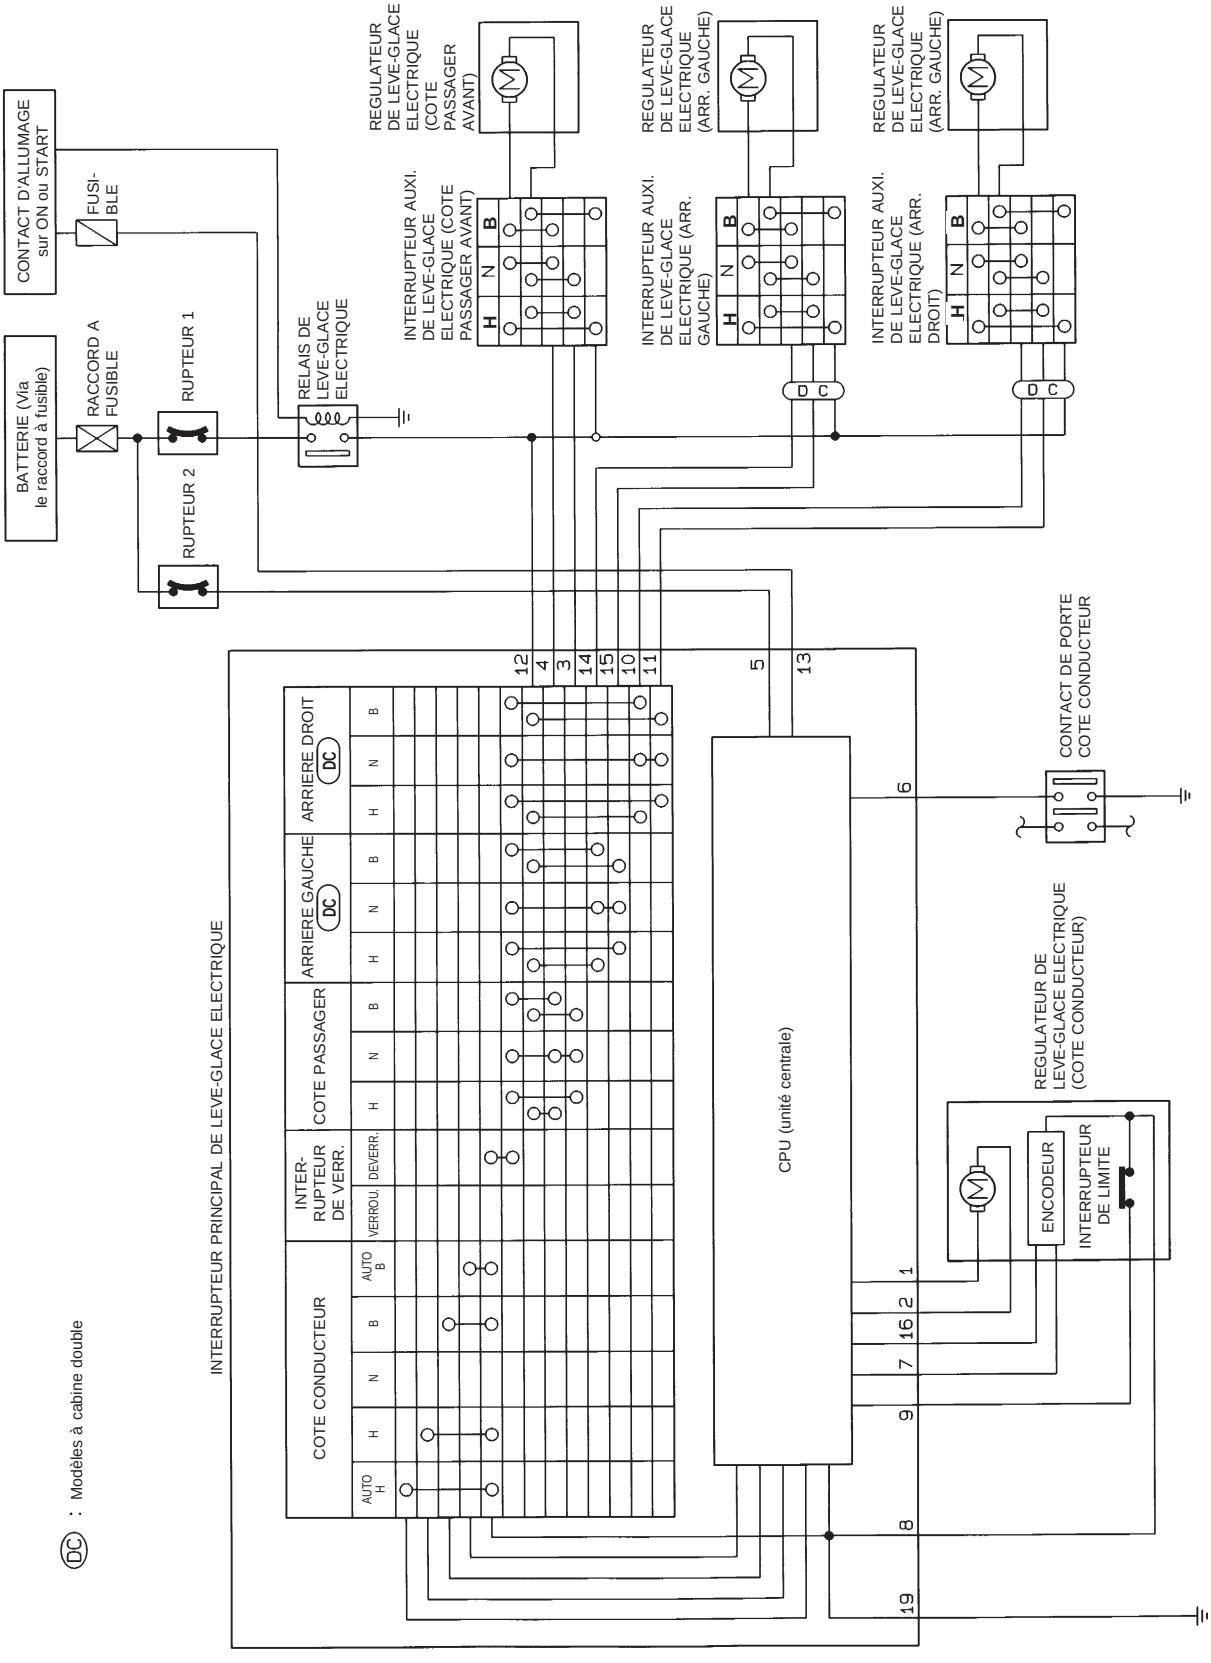
VUE D'ENSEMBLE

Le système de lève-glace électrique consiste en
- une unité centrale de traitement (combinée avec l'interrupteur principal de lève-glace électrique)
- quatre régulateurs de lève-glace électrique

Lorsque le contact d'allumage est sur la position ''ON'', le lève-glace électrique peut être actionné en fonction de la position de l'interrupteur principal/auxiliaire de lève-glace électrique.

CONDITION DE FONCTIONNEMENT

- Les lève-glaces électriques peuvent être baissés ou montés avec chacun des interrupteurs auxiliaires ou avec l'interrupteur principal situé dans la garniture de porte du conducteur avec le contact d'allumage sur ''ON'' et l'interrupteur de verrouillage de lève-glace électrique situé dans la garniture de porte du conducteur en position de déverrouillage.
- Lorsque l'interrupteur de verrouillage de lève-glace électrique est en position de verrouillage, aucune vitre ne peut être baissée ou montée à l'exception de la vitre du conducteur.
- Lorsque le contact d'allumage est sur la position ''ON'', appuyer ou tirer à fond l'interrupteur automatique (interrupteur principal) pour ouvrir ou fermer complètement la vitre du conducteur et le relâcher ; il est nécessaire de le tenir. La vitre s'ouvrira/se fermera complètement. Pour arrêter la vitre, tirer/appuyer sur l'interrupteur et le relâcher.
- Après avoir mis le contact d'allumage sur la position ''OFF'', la vitre côté conducteur peut être abaissée ou levée pendant 15 minutes. La commande de la minuterie qui alimente en courant après que le contact d'allumage a été mis sur la position ''OFF'' sera annulée lorsque la porte côté conducteur est fermée (sauf modèles pour l'Europe).



FONCTION DE DETECTION D'INTERRUPTION

L'unité centrale de traitement (CPU) (combinée avec l'interrupteur principal de lève-glace électrique) contrôle le fonctionnement du moteur du régulateur de lève-glace électrique et la position du lève-glace électrique (complètement fermée ou autre) de la vitre du conducteur par des signaux en provenance de l'encodeur et du contact de limite dans le régulateur du lève-glace électrique avant (côté conducteur).
Lorsque l'unité centrale de traitement (CPU) (combinée avec l'interrupteur principal de lève-glace électrique) détecte une interruption durant le fonctionnement suivant de fermeture de porte du conducteur,
- fonctionnement de fermeture automatique lorsque le contact d'allumage est sur ''ON''
- fonctionnement de fermeture automatique durant le fonctionnement de la minuterie de lève-glace électrique
- fonctionnement de fermeture manuelle durant le fonctionnement de la minuterie de lève-glace électrique

L'unité centrale de traitement (CPU) (combinée avec l'interrupteur principal de lève-glace électrique) contrôle le fonctionnement du moteur du régulateur de lève-glace électrique du conducteur pour l'ouverture et la vitre sera baissée d'environ 150 mm.

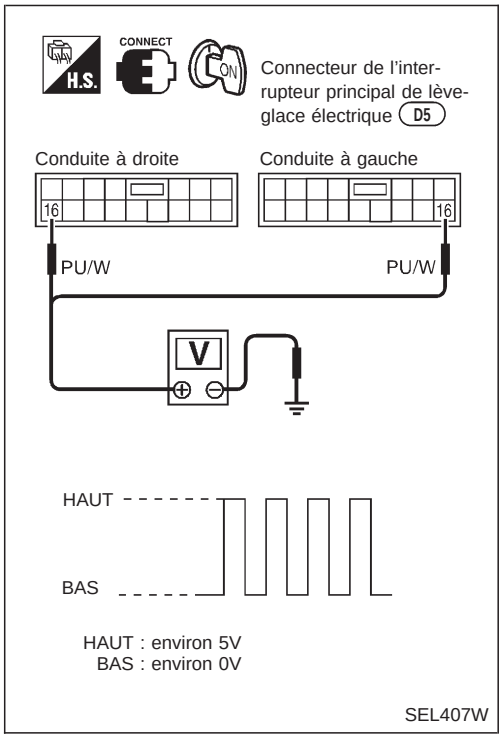
Diagnostics des défauts/Avec fonction de détection d'interruption



Symptôme	Cause possible	Ordre de réparation
Aucun des lève-glaces électriques ne peut être actionné en utilisant n'importe quelle commande.	1. Fusible de 10A, raccord à fusible de 30A 2. Circuit de la masse 3. Interrupteur principal de lève-glace électrique	1. Vérifier le fusible de 10A [n° 20, situé dans le boîtier à fusibles (J/B)], le raccord à fusible de 30A (lettre b, situé dans le fusible et la boîte de raccord à fusible). 2. Vérifier le circuit de mise à la masse de la borne (19) de l'interrupteur principal de lève-glace électrique. 3. Vérifier l'interrupteur principal de lève-glace électrique.
Le lève-glace électrique côté conducteur ne peut pas être actionné, mais les autres lève-glaces peuvent être actionnés.	1. Circuit du régulateur de lève-glace électrique du conducteur 2. Régulateur de lève-glace électrique du conducteur 3. (M52) Rupteur 2 4. (M52) Circuit du rupteur 2 5. Circuit de l'interrupteur principal de lève-glace électrique	1. Vérifier que le faisceau n'est pas ouvert ou court-circuité entre l'interrupteur principal et le régulateur de lève-glace électrique côté conducteur. 2. Vérifier le régulateur de lève-glace électrique côté conducteur. 3. Vérifier le rupteur 2 (M52). 4. Vérifier le faisceau entre le rupteur 2 (M52) et le raccord à fusible de 30A (lettre b, situé dans le fusible et la boîte de raccord à fusible). 5-1. Vérifier le faisceau entre la borne (13) de l'interrupteur principal de lève-glace électrique et le fusible de 10A [n° 20, situé dans le boîtier à fusibles (J/B)]. 5-2. Vérifier le faisceau entre la borne (5) de l'interrupteur principal de lève-glace électrique et le rupteur (M52).
Un ou plusieurs lève-glace électrique, sauf celui côté conducteur, ne peut pas être actionné.	1. Interrupteurs auxiliaires de lève-glace 2. Régulateurs de lève-glace électrique 3. Interrupteur principal de lève-glace électrique 4. Circuit de lève-glace électrique	1. Vérifier les interrupteurs auxiliaires de lève-glace électrique. 2. Vérifier le régulateur de lève-glace électrique. 3. Vérifier l'interrupteur principal de lève-glace électrique. 4-1. Vérifier que les faisceaux ne sont pas ouverts ou court-circuités entre l'interrupteur principal et les interrupteurs auxiliaires de lève-glaces électriques. 4-2. Vérifier que les faisceaux ne sont pas ouverts ou court-circuités entre les interrupteurs auxiliaires et le régulateur de lève-glace électrique.
Les lève-glaces électriques, excepté celui du conducteur, ne peuvent pas être actionnés à l'aide de l'interrupteur principal de lève-glace mais peuvent l'être à l'aide des interrupteurs auxiliaires.	1. Interrupteur principal de lève-glace électrique	1. Vérifier l'interrupteur principal de lève-glace électrique.
La mise en marche automatique du lève-glace électrique côté conducteur ne fonctionne pas correctement.	1. Interrupteur principal de lève-glace électrique 2. Encodeur et interrupteur de limite	1. Vérifier l'interrupteur principal de lève-glace électrique. 2. Vérifier l'encodeur et l'interrupteur de limite. (EL-2124)
La commande de la minuterie qui alimente en courant après que le contact d'allumage a été mis sur la position OFF ne fonctionne pas correctement (sauf modèles pour l'Europe)	1. Circuit du contact de porte côté conducteur 2. Contact de porte côté conducteur 3. Circuit du signal du contact d'allumage ON 4. Interrupteur principal de lève-glace électrique	1. Vérifier le faisceau entre le contact de porte du conducteur et l'interrupteur principal de lève-glace électrique. 2. Vérifier le contact de porte côté conducteur. 3. Vérifier le circuit du signal ON du contact d'allumage à l'interrupteur principal de lève-glace électrique. 4. Vérifier l'interrupteur principal de lève-glace électrique.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostics des défauts/Avec fonction de détection d'interruption (suite)

ENCODEUR ET INTERRUPTEUR DE LIMITE

VERIFIER LE MECANISME DE COULISSEMENT DE VITRE DE PORTE
Vérifier les points suivants.
- Obstacles dans la vitre, moulure de la vitre, etc.
- Moulure de la vitre usée ou déformée
- Guillotine de porte trop penchée vers l'intérieur ou l'extérieur
- Régulateur de vitre de porte

Mauvais → Déposer les obstacles ou réparer le mécanisme de coulissement de vitre de porte.

Bon ↓

A

VERIFIER L'ALIMENTATION ELECTRIQUE DE L'INTERRUPTEUR DE LIMITE
1. Débrancher le connecteur du régulateur de lève-glace électrique côté conducteur.
2. Mettre le contact d'allumage sur ON.
3. Vérifier la tension entre la borne (9) de l'interrupteur principal de lève-glace électrique et la masse.
   Il doit y avoir une tension d'environ 5V.

Mauvais → Remplacer l'interrupteur principal de lève-glace électrique.

Bon ↓

VERIFIER LE FONCTIONNEMENT DE L'INTERRUPTEUR DE LIMITE
1. Couper le contact.
2. Brancher le connecteur du régulateur de lève-glace électrique côté conducteur.
3. Mettre le contact d'allumage sur ON.
4. Vérifier la tension entre la borne (9) de l'interrupteur principal de lève-glace électrique et la masse pendant l'opération de fermeture du lève-glace électrique.

N° de borne	Condition	Tension (DCV)
(9)	Environ 15 mm sous la position complètement fermée à la position complètement fermée	Environ 5
	Autres positions	Environ 0

Bon → B

VERIFIER L'ENCODEUR
Mesurer la tension entre la borne (16) de l'interrupteur principal de lève-glace électrique et la masse avec un oscilloscope alors que le lève-glace électrique est en position de fermeture automatique.
Si le résultat est mauvais, remplacer le moteur du régulateur de lève-glace électrique (côté conducteur).
Si le résultat est bon, remplacer l'interrupteur principal de lève-glace électrique.

Mauvais ↓

REGLER L'INTERRUPTEUR DE LIMITE
Régler l'interrupteur de limite. Se reporter à la section BT. Mesurer la tension entre la borne (9) de l'interrupteur principal de lève-glace électrique et la masse pendant l'opération de fermeture du lève-glace électrique au moins dix fois.

N° de borne	Condition	Tension (DCV)
(9)	Environ 15 mm sous la position complètement fermée à la position complètement fermée	Environ 5
	Autres positions	Environ 0

Mauvais → Remplacer le moteur du régulateur de lève-glace électrique (côté conducteur).

Bon ↓

B

VERIFIER L'ENCODEUR
Mesurer la tension entre la borne (16) de l'interrupteur principal de lève-glace électrique et la masse avec un oscilloscope alors que le lève-glace électrique est en position de fermeture automatique.

Mauvais → Remplacer le moteur du régulateur de lève-glace électrique (côté conducteur).

Bon ↓

Remplacer l'interrupteur principal de lève-glace électrique.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description du système

L'alimentation est permanente
- à travers le raccord à fusible de 30A (Lettre [b], situé dans le raccord à fusible et le boîtier à fusibles)
- vers le rupteur 1 (borne ① du boîtier à fusibles)
- à travers le rupteur 1 (borne ⑦ du boîtier à fusibles)
- à la borne ⑪ de la centrale de commande intelligente.

La masse est fournie à la borne ⑱ de la centrale de commande intelligente à travers les masses de carrosserie (M1) et (M54).

ENTREE

Lorsque le contact de verrou. et déverrou. de porte (interrupteur principal de lève-glace électrique) est sur la position ''LOCKED'' (VERR), le signal de masse est fourni
- à la borne ④ de la centrale de commande intelligente
- à travers la borne ⑭ du contact de verrou. et déverrou. de porte
- à la borne ③ du contact de verrou. et déverrou. de porte
- à travers les masses de carrosserie (M1) et (M54).

Lorsque le contact de verrou. et déverrou. de porte (interrupteur principal de lève-glace) est sur la position ''UNLOCKED'' (DEVERR), le signal de masse est fourni
- à la borne ⑤ de la centrale de commande intelligente
- à travers la borne ⑦ du contact de verrou. et déverrou. de porte
- à la borne ③ du contact de verrou. et déverrou. de porte
- à travers les masses de carrosserie (M1) et (M54).

Le cylindre de clé côté conducteur et le contact du bouton de verrouillage côté conducteur sont connectés au capteur de verrouillage au moyen d'une tige. Quand le contact du bouton de verrouillage est sur la position de contact ''UNLOCKED'' (DEVERR.), le signal de masse est fourni
- à la borne ② de la centrale de commande intelligente
- à travers la borne ② de contact du bouton de verrouillage
- à travers la borne ① de contact du bouton de verrouillage côté conducteur
- à travers les masses de carrosserie (M1) et (M54).

Quand le contact du bouton de verrouillage est sur la position ''LOCKED'' (VERR.), le signal de masse est interrompu.

Le verrouillage de porte fonctionne en fonction des conditions du contact de verrouillage et déverrouillage de porte (interrupteur principal de lève-glace) et du contact de bouton de verrouillage.

SORTIE

Déverrouillage

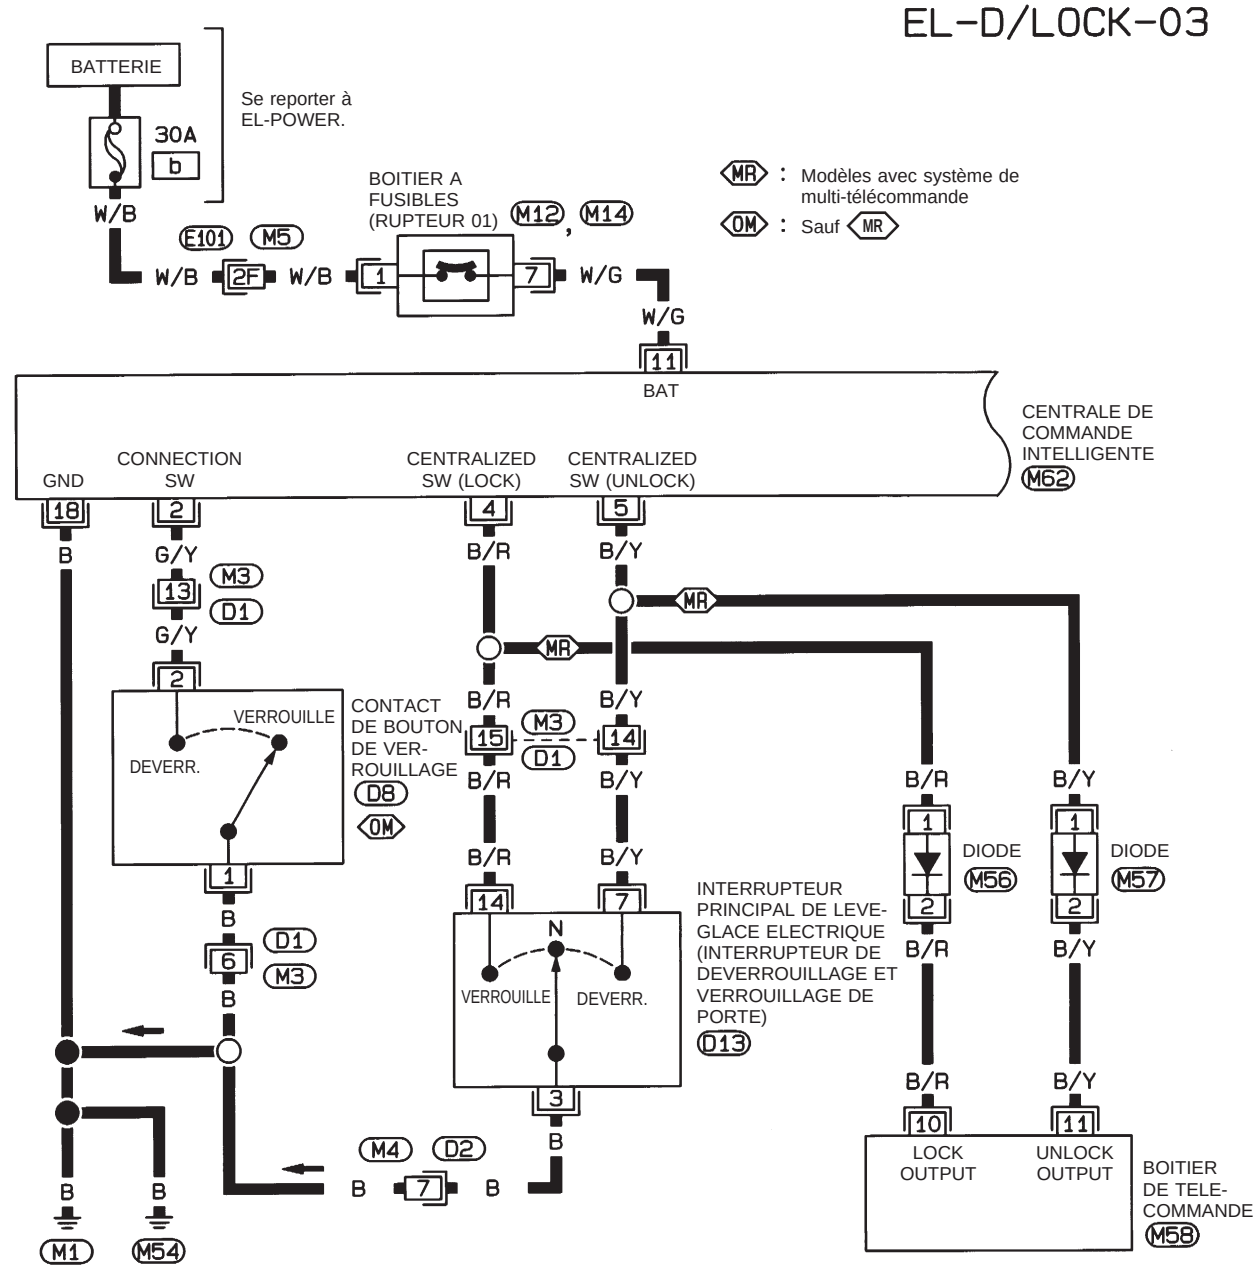
La masse est fournie
- vers l'actionneur de verrouillage de porte côté passager, vers la borne ① de l'actionneur de verr. des portes arrière gauche et droite (cabine double)
- à travers la borne ⑮ de la centrale de commande intelligente

L'alimentation est fournie
- vers l'actionneur de verrouillage de porte côté passager, vers la borne ② de l'actionneur de verr. des portes arrière gauche et droite (cabine double)
- à travers la borne ⑯ de la centrale de commande intelligente

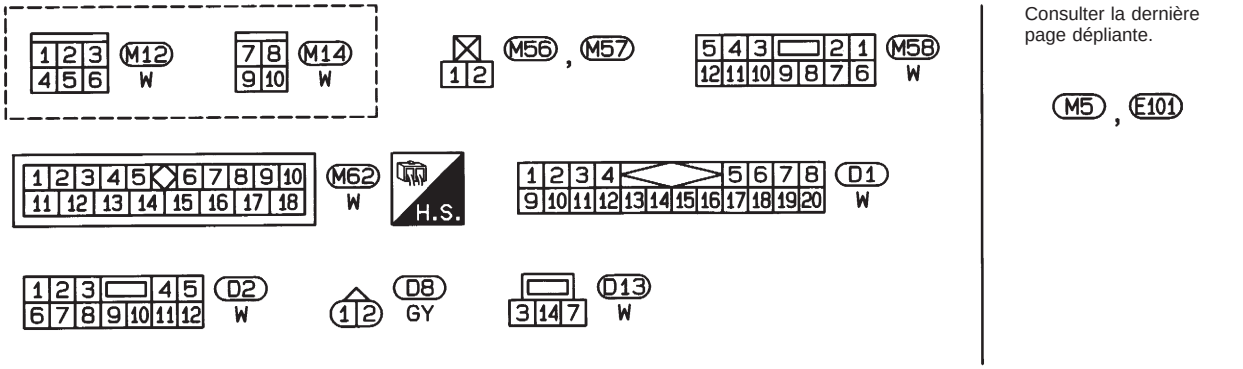
Les portes sont alors déverrouillées.

Verrouillage

La masse est fournie
- vers l'actionneur de verrouillage de porte côté passager, vers la borne ② de l'actionneur de verr. des portes arrière gauche et droite
- à travers la borne ⑯ de la centrale de commande intelligente



L'alimentation est fournie
- vers l'actionneur de verrouillage de porte côté passager, vers la borne ① de l'actionneur de verr. des portes arrière gauche et droite
- à travers la borne ⑮ de la centrale de commande intelligente



Les portes sont alors verrouillées.

VERIFICATION DU SIGNAL D'ENTREE DE LA COMMANDE DE VERROUILLAGE ET DE DEVERROUILLAGE DE PORTES.

1. Débrancher le connecteur de la centrale de commande intelligente.
2. Vérifier la continuité entre la borne ④ ou ⑤ du boîtier de la centrale et la masse.

Bornes	Position du contact de verrouillage et de déverrouillage	Il y a continuité
④ - Masse	Verrou.	Oui
	N et Déverrouillage	Non
⑤ - Masse	Déverrou.	Oui
	N et Verrouillage	Non

Bon → Le contact de verrouillage et de déverrouillage fonctionne correctement.

Mauvais ↓

B

VERIFICATION DE LA COMMANDE DE VERROUILLAGE ET DE DEVERROUILLAGE DE PORTES

1. Débrancher le connecteur de contact de verrouillage et de déverrouillage de porte.
2. Vérifier la continuité entre les bornes de l'interrupteur principal de lève-glace (Contact de verrouillage/ déverrouillage de porte).

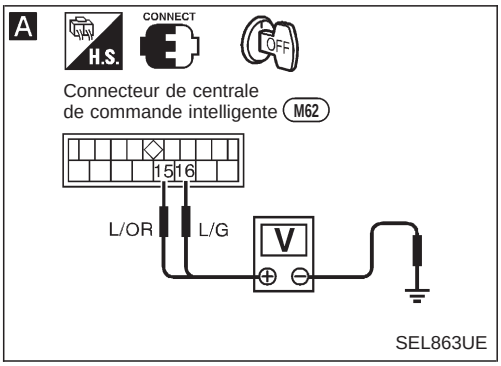
Condition	Bornes		
	3	7	14
Verrou.	○	—	○
N	Absence de continuité		
Déverrou.	○	— ○	

Mauvais → Remplacer le contact de verrouillage et déverrouillage de porte.

Bon ↓

Vérifier les points suivants.

- Circuit de mise à la masse pour le contact de verrouillage et de déverrouillage de porte
- Faisceau en circuit ouvert ou court-circuit entre le contact de verrouillage et déverrouillage de porte et le connecteur de la centrale de commande intelligente



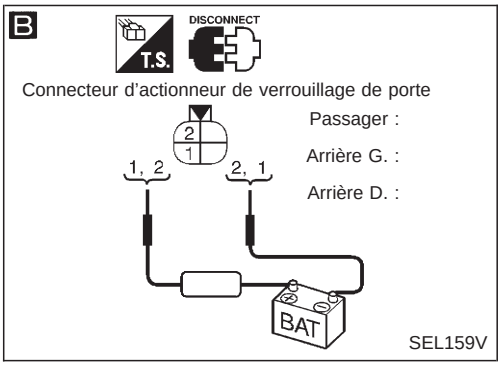
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostic des défauts (suite)

PROCEDURE DE DIAGNOSTIC 2

(Contrôle de l'actionneur de verrouillage de porte)

A



VERIFIER LE CIRCUIT DE L'ACTIONNEUR DE VERROUILLAGE DE PORTE.
Vérifier la tension de l'actionneur de verrouillage de porte.

Position du contact de bouton de verrouillage	Bornes ⊕	Bornes ⊖	Tension V
Verrou.	⑮	Masse	Tension de la batterie
Déverrou.	⑯	Masse	

Mauvais → Remplacer la minuterie de verrouillage des portes. (Avant de remplacer le boîtier de contrôle, effectuer la PROCEDURE DE DIAGNOSTIC 1.)

Bon ↓

B

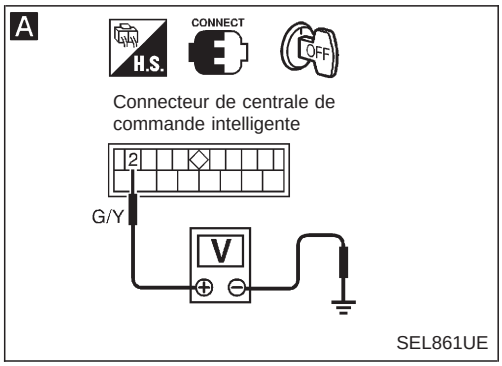
VERIFIER L'ACTIONNEUR DE VERROUILLAGE DE PORTE.
1. Débrancher le connecteur de l'actionneur de verrouillage de porte.
2. Appliquer une tension de 12V sur l'actionneur du dispositif de verrouillage, puis vérifier le fonctionnement.

Fonctionnement de l'actionneur de verrouillage de porte	Bornes ⊕	Bornes ⊖
Déverrou. → Verrou.	①	②
Verrou. → Déverrou.	②	①

Mauvais → Remplacer l'actionneur de verrouillage de porte.

Bon ↓

Réparer le faisceau entre le connecteur de la centrale de commande intelligente et l'actionneur de verrouillage de porte.



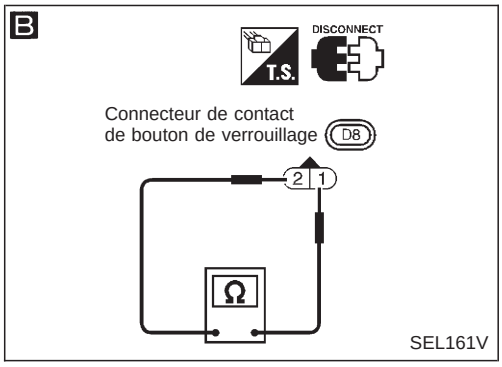
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostic des défauts (suite)

PROCEDURE DE DIAGNOSTIC 3

(Vérification du contact du bouton de verrouillage, côté conducteur)

A



VERIFIER LE SIGNAL D'ENTREE DU CONTACT DU BOUTON DE VERROUILLAGE.
Vérifier la tension entre la borne ② de la centrale de commande intelligente et la masse.

Position du contact de bouton de verrouillage	Tension V
Verrou.	Environ 12
Déverrou.	0

Bon → Le bouton de verrouillage de porte du conducteur fonctionne correctement.

Mauvais ↓

B

VERIFIER LE CONTACT DU BOUTON DE VERROUILLAGE.
1. Débrancher le connecteur de contact de bouton de verrouillage de porte côté conducteur.
2. Vérifier la continuité des bornes du contact du bouton de verrouillage.

Bornes	Condition	Il y a continuité
① - ②	Verrouillé	Non
	Déverrouillé	Oui

Mauvais → Remplacer le contact de bouton de verrouillage.

Bon ↓

Vérifier les points suivants.
- Circuit de mise à la masse pour le contact de bouton de verrouillage
- Faisceau en circuit ouvert ou court-circuit entre le contact de verrouillage de porte et la centrale de commande intelligente

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description du système

FONCTION

Le système de contrôle de la multi-télécommande est doté des fonctions suivantes.
- Verrouillage de porte
- Déverrouillage de porte
- Rappel de feux de détresse

FONCTIONNEMENT DU VERROUILLAGE

Pour verrouiller la porte à l'aide de la multi-télécommande, il faut que les deux signaux suivants soient reçus.
- Contact de clé sur OFF (quand la clé d'allumage n'est pas dans le cylindre de contact d'allumage).
- Tous les contacts de portes FERMES

Quand le signal de ''LOCK'' (VERR.) est entré dans le boîtier de contrôle de la multi-télécommande (l'antenne du système est combinée avec le boîtier de contrôle de la multi-télécommande), la masse est fournie
- à travers la borne ⑩ de la multi-télécommande
- vers la borne ④ de la centrale de commande intelligente et
- vers la borne ⑥ du relais de verrouillage de porte.

La centrale de commande intelligente fonctionne alors pour verrouiller les portes (sauf celle du conducteur) et le relais de verrouillage de porte est alimenté en courant pour verrouiller la porte du conducteur.

FONCTIONNEMENT DU DEVERROUILLAGE

Pour déverrouiller la porte à l'aide de la multi-télécommande, il faut que les deux signaux suivants soient reçus.
- Contact de clé sur OFF (quand la clé d'allumage n'est pas dans le cylindre de contact d'allumage)

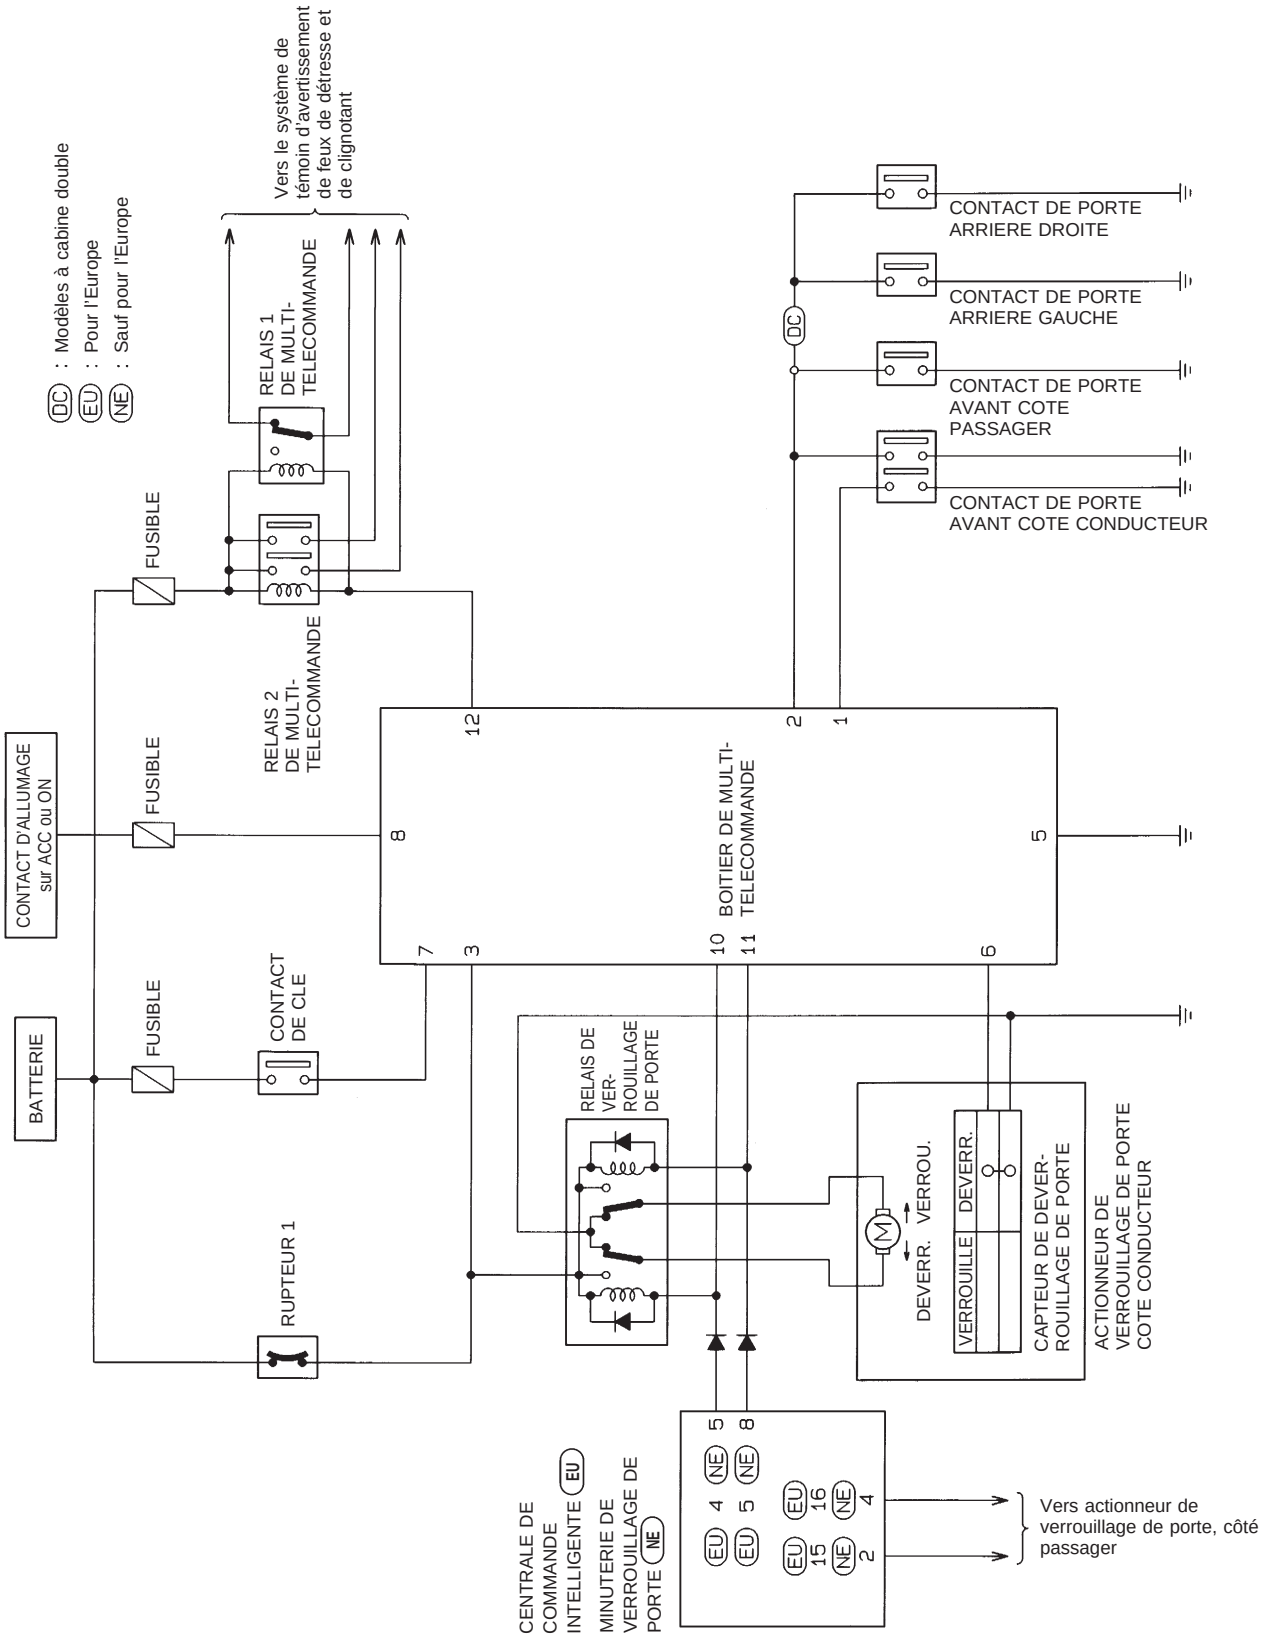
Quand le signal de ''UNLOCK'' (DEVERR.) est entré dans le boîtier de contrôle de la multi-télécommande (l'antenne du système est combinée avec le boîtier de contrôle de la multi-télécommande), la masse est fournie
- à travers la borne ⑪ de la multi-télécommande
- vers la borne ⑤ de la centrale de commande intelligente et
- vers la borne ⑤ du relais de verrouillage de porte.

La centrale de commande intelligente fonctionne alors pour déverrouiller les portes (sauf celle du conducteur) et le relais de verrouillage de porte est alimenté en courant pour déverrouiller la porte du conducteur.

RAPPEL DE FEUX DE DETRESSE

Quand les portes sont verrouillées ou déverrouillées par la multi-télécommande, la masse est fournie
- vers la borne ① du relais 1 et 2 de multi-télécommande
- à travers la borne ⑫ de la multi-télécommande.

Puis les relais sont activés et les feux de détresse clignotent comme suit
- Fonctionnement de verrouillage : clignote une fois
- Fonctionnement du déverrouillage : clignote deux fois



SAISIE DU CODE D'IDENTIFICATION DE LA MULTI-TELECOMMANDE

Un maximum de quatre télécommandes peut être enregistré. Toute tentative pour entrer la télécommande effacera les codes d'identification entrés précédemment. Il faut par conséquent s'assurer que le propriétaire du véhicule a remis toutes les multi-télécommandes lorsqu'une saisie de code d'identification est effectuée. Pour entrer la saisie du code d'identification, il faut que les signaux suivants soient intégrés au boîtier de contrôle de la multitélécommande.
- Signal ''LOCKED'' (FERME) côté conducteur (depuis le capteur de déverrouillage de porte du conducteur)
- Signal ''LOCKED'' (FERME) de contact de porte
- Signal de contact de clé (INSEREE/RETIREE)
- Alimentation électrique des accessoires
- Signal de la multi-télécommande

Pour connaître la procédure détaillée, se reporter à ''Procédure d'entrée du code d'identification'' dans la section EL-2142.

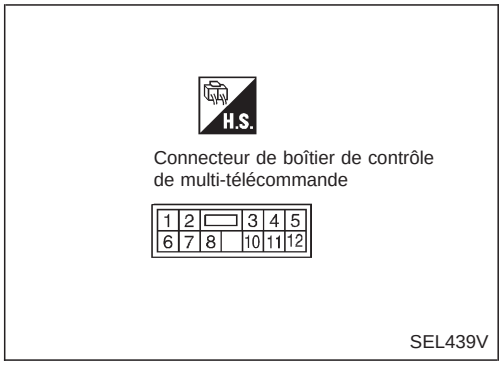
Diagnostics des défauts

ORGANIGRAMME

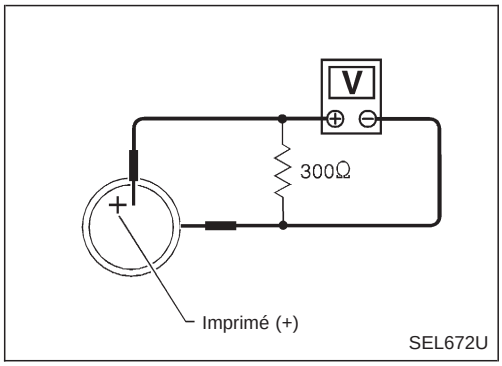
Symptôme	Cause possible	Diagnostic/procédure d'entretien
Aucune porte ne peut être verrouillée ou déverrouillée par la multi-télécommande. (Voir NOTE).	1. Batterie de la télécommande 2. Contact de clé (insérer) 3. Contact de porte 4. Circuit d'alimentation électrique pour le boîtier de contrôle de la multi-télécommande 5. Circuit de masse du boîtier de contrôle de la multi-télécommande 6. Télécommande	1. Vérifier la pile de la télécommande. Se reporter à EL-2139. 2. Vérifier le signal du contact de clé (insérer) à la borne ⑦ du boîtier de la multi-télécommande. 3. Vérifier le signal du contact de porte aux bornes du boîtier de contrôle de multi-télécommande. 4. S'assurer qu'il y a une tension de la batterie à la borne ③ du boîtier de contrôle de multi-télécommande. 5. Vérifier la continuité entre la borne ⑤ du boîtier de contrôle de multi-télécommande et la masse. 6. Remplacer la multi-télécommande. Se reporter à EL-2142.
La porte du conducteur ne peut pas être verrouillée ou déverrouillée par l'actionnement de la multi-télécommande.	Circuit de l'actionneur de verrouillage de porte du conducteur	Vérifier le circuit de l'actionneur de verrouillage de porte latérale. Se reporter à EL-2140.
Les portes autres que celle du conducteur ne peuvent pas être verrouillées ou déverrouillées par l'actionnement de la multi-télécommande. (Si le système de verrouillage électrique de porte ne fonctionne pas correctement, vérifier le système de verrouillage électrique de porte.)	Signal de verr./déverr. de la centrale de commande intelligente	● Lorsque le verrouillage n'est pas possible : Vérifier la continuité entre la borne ⑩ du boîtier de commande de la multi-télécommande et la borne ④ de la centrale de commande intelligente. ● Quand le déverrouillage n'est pas possible : Vérifier la continuité entre la borne ⑪ du boîtier de commande de la multi-télécommande et la borne ⑤ de la centrale de commande intelligente.
Le rappel de feux de détresse ne fonctionne pas correctement.	1. Fusible de 10A 2. Relais 1 et 2 de la multi-télécommande 3. Circuit du rappel de feux de détresse	1. Vérifier le fusible de 10A (n° 5, situé dans le boîtier à fusibles). 2. Vérifier le relais 1 et 2 de multi-télécommande. 3. Vérifier si le faisceau est ouvert ou en court-circuit entre les relais et la borne ⑫ de la multi-télécommande.
Le nouveau code d'identification de la multi-télécommande ne peut pas être entré.	1. Batterie de la télécommande 2. Contact de clé (insérer) 3. Contact de porte 4. Capteur de déverrouillage de porte côté conducteur 5. Circuit d'alimentation électrique des accessoires du boîtier de contrôle de multi-télécommande 6. Télécommande	1. Vérifier la pile de la télécommande. Se reporter à EL-2139. 2. Vérifier le signal du contact de clé (insérer) à la borne ⑦ du boîtier de la multi-télécommande. 3. Vérifier le signal du contact de porte aux bornes ① et ② du boîtier de contrôle de multi-télécommande. 4. Vérifier le signal de capteur de déverrouillage de porte (côté conducteur) à la borne ⑥ du boîtier de contrôle de la multi-télécommande. 5. S'assurer qu'il y a une tension de la batterie à la borne ⑧ du boîtier de contrôle de multi-télécommande lorsque le contact d'allumage est sur la position ACC. 6. Remplacer la multi-télécommande. Se reporter à EL-2142.

Se reporter au ''TABLEAU D'INSPECTION DU BOITIER DE CONTROLE DE MULTI-TELECOMMANDE'' de la page suivante pour vérifier les signaux du boîtier de contrôle.

NOTE :



- Vérifier toujours la pile de la télécommande avant de remplacer la télécommande.
- Le fonctionnement de déverrouillage de la multi-télécommande ne fonctionne pas lorsque la clé est insérée dans le cylindre.
- Le fonctionnement du verrouillage de la multi-télécommande ne fonctionne pas quand la clé est insérée dans le cylindre ou si l'une des portes est ouverte.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

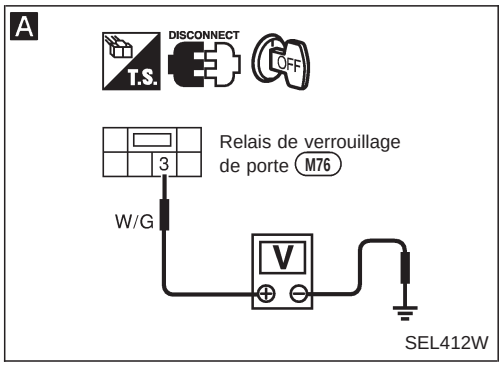
Diagnostics des défauts (suite)

TABLEAU D'INSPECTION DU BOITIER DE CONTROLE DE MULTI-TELECOMMANDE

N° de borne	Connexions	Condition		Tension V (valeurs approximatives)
1	Contact de porte côté conducteur	Porte côté conducteur	Ouverte	0
			Fermée	14
2	Contact de porte (toutes les portes)	L'une des portes est ouverte		0
		Toutes les portes sont fermées		12
3	Alimentation (BATT.)	—		12
5	Masse	—		—
6	Capteur de déverrouillage de porte côté conducteur	Porte côté conducteur	Verrouillée	5
			Déverrouillée	0
7	Contact de clé (insérer)	La clé est dans le cylindre de contact d'allumage		12
		La clé n'est pas dans le cylindre de contact d'allumage		0
8	Alimentation électrique des accessoires	Contact d'allumage	OFF	0
			ACC ou ON	12
10	Signal de verrouillage	Le bouton "LOCK" (VERR.) de la télécommande est enclenché (Toutes les portes sont fermées et la clé ne se trouve pas dans le cylindre de contact d'allumage)		0
		A l'exception des conditions ci-dessus.		12
11	Signal de déverrouillage	Le bouton "UNLOCK" (DEVERR.) de la télécommande est enclenché (la clé n'est pas dans le cylindre de contact d'allumage).		0
		A l'exception des conditions ci-dessus.		12
12	Relais 1, 2 de la multi-télécommande	Le bouton "LOCK/UNLOCK" (VERR./DEVERR.) de la télécommande est enclenché (Toutes les portes sont fermées et la clé ne se trouve pas dans le cylindre de contact d'allumage)		0
		A l'exception des conditions ci-dessus.		12

VERIFICATION DE LA PILE DE LA MULTI-TELECOMMANDE

Déposer la pile et mesurer la tension à travers les bornes positive et negative de la pile, ⊕ et ⊖.



Mesure aux bornes		Valeur (tension) standard
⊕	⊖	
Borne positive de la pile ⊕	Borne négative ⊖ de la pile	2,5 - 3,0V

Remarque :
La télécommande ne fonctionne pas si la pile n'est pas correctement installée.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostics des défauts (suite)

VERIFICATION DE L'ACTIONNEUR DE VERROUILLAGE DE PORTE COTE CONDUCTEUR

CONTROLER LE RELAIS DE VERROUILLAGE DE PORTE.
Se reporter à EL-2141.

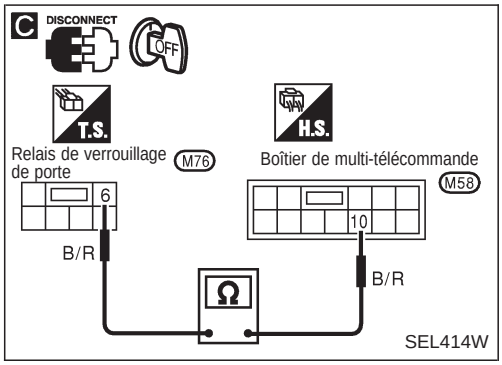
Mauvais → Remplacer le relais.

Bon ↓

A

VERIFIER L'ALIMENTATION ELECTRIQUE DU RELAIS DE VERROUILLAGE DE PORTE.
Vérifier la tension entre la borne ③ du relais de verrouillage de porte et la masse.
La tension de la batterie devrait être présente.

Mauvais → Vérifier les points suivants.
- le raccord à fusible de 30A (lettre b, situé dans le raccord à fusible et la boîte à fusibles) (n° 3, situé dans le raccord à fusible et la boîte de raccord à fusible).
- Vérifier si le faisceau est ouvert ou en court-circuit entre le raccord à fusible et le relais.



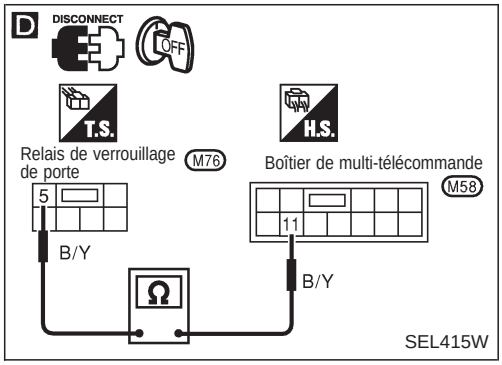
Bon ↓

B

VERIFIER LE CIRCUIT DE MISE A LA MASSE DU RELAIS DE VERROUILLAGE DE PORTE.
Vérifier la continuité entre la borne ② du relais de verrouillage de porte et la masse.
Il doit y avoir continuité.

Mauvais → Réparer le faisceau.

Bon ↓

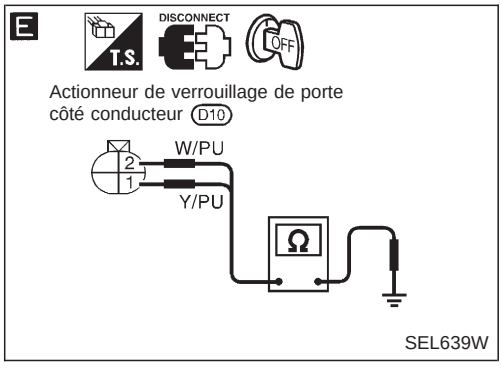


C

VERIFIER LE SIGNAL DE VERROUILLAGE DU RELAIS DE VERROUILLAGE DE PORTE.
Vérifier la continuité entre la borne ⑥ du relais de verrouillage de porte et la borne ⑩ du boîtier de contrôle de la multi-télécommande.
Il doit y avoir continuité.

Mauvais → Vérifier si le faisceau est ouvert ou en court-circuit entre le relais de verrouillage de porte et la multitélécommande.

Bon ↓



D

VERIFIER LE SIGNAL DE DEVERROUILLAGE DU RELAIS DE VERROUILLAGE DE PORTE.
Vérifier la continuité entre la borne ⑤ du relais de verrouillage de porte et la borne ⑪ du boîtier de contrôle de la multi-télécommande.
Il doit y avoir continuité.

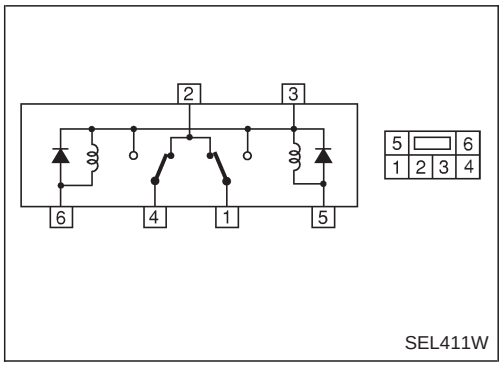
Mauvais → Vérifier si le faisceau est ouvert ou en court-circuit entre le relais de verrouillage de porte et la multitélécommande.

Bon ↓

E

VERIFIER LE CIRCUIT DE LA COMMANDE DE VERROUILLAGE DE PORTE.
1. Brancher les relais.
2. Débrancher le connecteur de verrouillage de porte côté conducteur.
3. Vérifier la continuité entre l'actionneur de verrouillage de porte du conducteur et le relais de verrouillage de porte.
Il doit y avoir continuité.

Mauvais → Vérifier si le faisceau est ouvert ou en court-circuit entre le relais de verrouillage de porte et l'actionneur de verrouillage de porte.



Bon ↓

Remplacer l'actionneur de verrouillage de porte.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

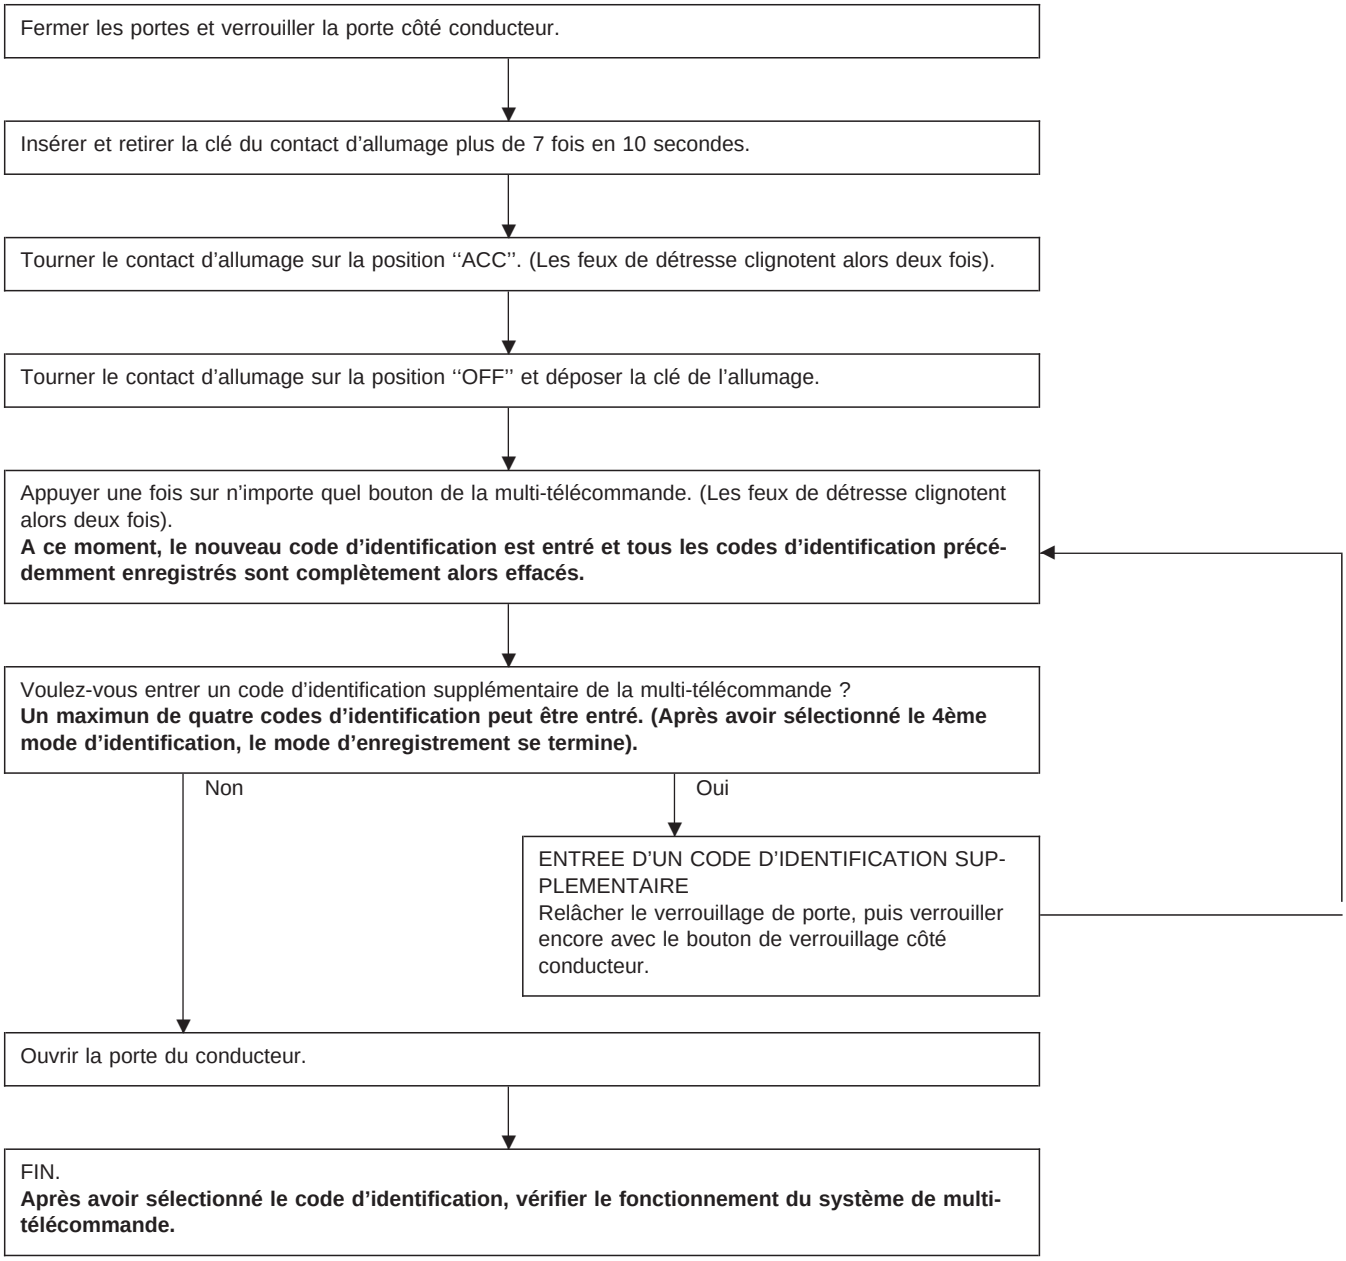
Diagnostics des défauts (suite)

CONTROLE DU RELAIS DE VERROUILLAGE DE PORTE

Condition		Continuité entre les bornes					
		1	2	3	4	5	6
Il n'y a pas tension de la batterie entre chaque borne.	③ et ⑤	○	○				
	③ et ⑥		○		○		
Il y a tension de la batterie entre chaque borne.	③ et ⑤	○		○			
	③ et ⑥			○	○		
Toujours				○		○	○

PRECAUTION :
Tout en appliquant une tension de la batterie aux bornes du relais, introduire le fusible dans le circuit.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



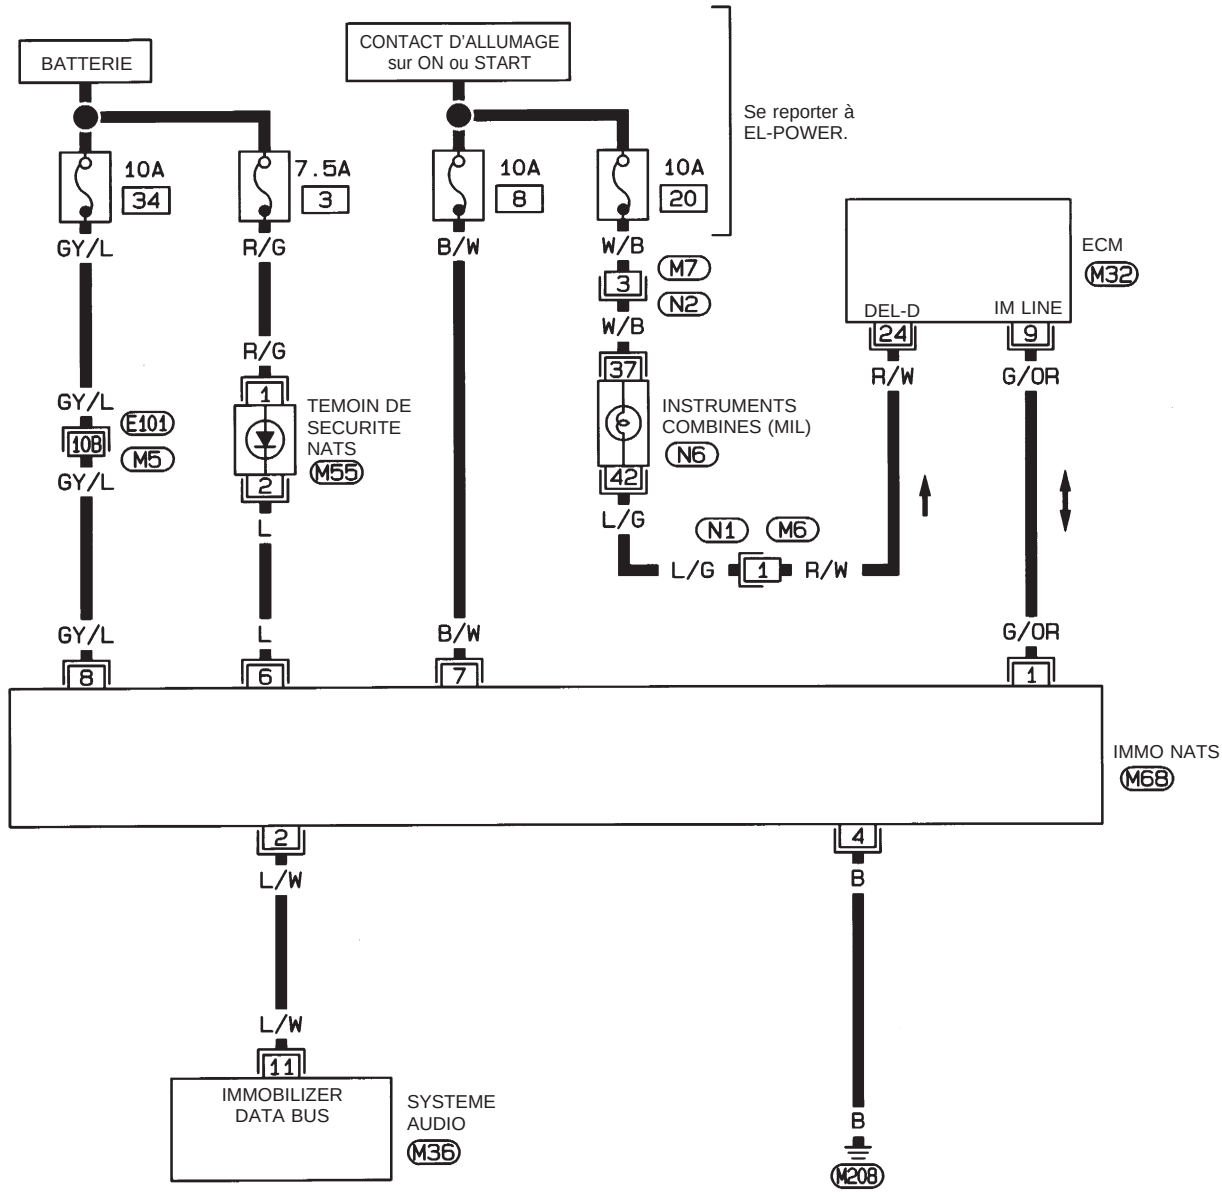
Procédure d’entrée du code d’identification

Remarque :
Un maximum de quatre télécommandes peut être entré. Toute tentative pour entrer la télécommande effacera les codes d’identification entrés précédemment. Il faut par conséquent s’assurer que le propriétaire du véhicule a remis toutes les multi-télécommandes lorsqu’une saisie de code d’identification est effectuée.

Entrer le code d’identification (ID) manuellement lorsque :
- la multi-télécommande ou le boîtier de contrôle est remplacé.
- une multi-télécommande supplémentaire est activée.

Pour entrer le code d’identification, suivre les procédures ci-dessous.

PROCEDURE



NOTE :
- **S’il est nécessaire d’activer plus de deux nouvelles télécommandes, répéter la ‘‘Procédure d’entrée de code d’identification supplémentaire’’ pour chaque nouvelle télécommande.**
- **Tout code d’identification entré après la désactivation du mode de ‘‘programmation’’ ne sera pas accepté.**

E4 (M11) GY/14 : Connecteur de diagnostic pour CONSULT (avec coussin gonflable, ABS ou ECM)
F3 (M12) W/6 : Boîtier à fusibles
F4 (M113) B/10 : Connecteur de contrôle (moteur Z)
F3 (M14) W/4 : Boîtier à fusibles
C4 (M15) B/3 : Centrale de clignotants combinée
E3 (M16) B/2 : Contact de feu de stop
F1 (M19) W/6 : Vers (R1)
E3 (M20) W/6 : Contact d'allumage
D1 (M21) W/1 : Contact de frein de stationnement (type à manche)
F4 (M22) W6 : Module de commande de pompe à carburant (moteur Z)
D2 (M23) BR/8 : Commande d'éclairage
● Commande de clignotants
D2 (M24) BR/4 : Commande d'éclairage
D3 (M25) Y/7 : Câble spiralé (avec coussin gonflable)
D3 (M27) B/1 : Commande d'avertisseur sonore (sans coussin gonflable)
D2 (M28) GY/8 : Commande de l'essuie-glace et de lave-glace
D4 (M29) W/12 : Boîtier de contrôle de préchauffage (moteur TD27 sauf pour l'Australie et moteur QD)
D4 (M30) W/16 : Boîtier de contrôle de préchauffage (moteur TD27 pour l'Australie)
C1 (M35) W/10 : Système audio
C1 (M36) W/6 : Système audio (modèles à cabine double)
C3 (M37) B/2 : Allume-cigare
C3 (M38) W/3 : Interrupteur de C/A (sans C/A automatique)
C2 (M39) W/6 : Commutateur de ventilateur (sans C/A automatique)
C2 (M40) W/2 : Eclairage de l'interrupteur de ventilateur (sans C/A automatique)
C2 (M41) W/8 : Interrupteur de feux de détresse
C2 (M42) W/6 : Interrupteur de désembuage (avec système de lève-glace électrique et pour l'Europe)
A2 (M43) Y/2 : Module de coussin gonflable côté passager

B1 (M44) BR/4 : Amplificateur de commande thermique
A2 (M45) BR/4 : Résistance de ventilateur (sans C/A automatique)
A2 (M46) W/2 : Moteur de soufflerie
A2 (M47) W/16 : Vers (F55) (moteur KA)
A2 (M48) W/24 : Vers (F54) (moteur KA)
A3 (M49) W/20 : Vers (D31)
A3 (M50) W/6 : Vers (D32) (avec lève-glace électrique)
B3 (M51) W/8 : Minuterie de verrouillage de porte (avec système de lève-glace électrique pour l'Europe)
G3 (M52) W/2 : Rupteur 2 (pour l'Europe)
B4 (M53) W/8 : Minuterie de ceinture de sécurité (pour l'Australie)
A3 (M54) — : Masse de carrosserie
B1 (M55) W/2 : Témoin de sécurité NATS (pour l'Europe)
A1 (M56) –/2 : Diode (pour système de multi-télécommande)
F2 (M57) –/2 : Diode (pour système de multi-télécommande)
F2 (M58) W/12 : Boîtier de multi-télécommande (pour l'Europe sauf cabine simple)
C4 (M59) BR/6 : Relais 2 de multi-télécommande
C4 (M60) B/5 : Relais 1 de multi-télécommande
C4 (M61) B/2 : Connecteur volant (pour l'Europe sauf cabine simple)
B4 (M62) W/18 : Centrale de commande intelligente (pour l'Europe)
D3 (M63) W/3 : Interrupteur de feu antibrouillard arrière (pour l'Europe)
E3 (M64) W/2 : Contact de clé (pour l'Europe sauf modèles avec cabine simple)
E2 (M65) W/4 : Ampli. d'antenne NATS (pour l'Europe)
D4 (M66) GY/20 : ECM (moteur diesel sauf pour l'Europe)
D4 (M67) GY/16 : ECM (moteur diesel sauf pour l'Europe)
E1 (M70) W/24 : TCM (module de commande de transmission) (modèles avec T/A)
E1 (M71) GY/24 : TCM (module de commande de transmission) (modèles avec T/A)
D1 (M72) –/6 : Connecteur 2 de raccord (modèles avec T/A)
E1 (M73) W/4 : Dispositif de commande T/A (modèles avec T/A)
B1 (M74) W/2 : Capteur de température d'air d'admission (avec C/A automatique)
B1 (M75) B/2 : Capteur d'ensoleillement (avec C/A automatique)
B4 (M76) W/6 : Relais de verrouillage de porte (pour l'Europe sauf cabine simple)
E4 (M78) L/2 : Contact de frein de verrouillage de passage (modèles avec T/A)

D4 (M80) Y/20 : Boîtier de capteurs de diagnostic de coussin gonflable (air bag)
A4 (M83) L/10 : Diode (moteur KA)
A1 (M84) BR/2 : Résistance (modèles avec T/A)
G3 (M85) SMJ : Vers (E104) (modèles avec T/A)
D3 (M86) BR/10 : Moteur de volet de mode (avec C/A automatique)
D3 (M87) W/2 : Capteur d'habitacle (avec C/A automatique)
B3 (M88) GY/20 : Ampli. automatique de C/A (avec C/A automatique)
B3 (M90) L/2 : Moteur d'aspiration (avec C/A automatique)
B3 (M91) B/6 : Moteur de volet de mélange d'air (avec C/A automatique)
C1 (M92) W/4 : Ampli. de commande de ventilateur (avec C/A automatique)
B1 (M93) W/4 : Moteur de volet d'admission (avec C/A automatique)
C1 (M94) W/12 : Vers (M95) (avec coussin gonflable)
C1 (M95) W/12 : Vers (M94) (avec coussin gonflable)

Compartiment moteur

M221 W/6 : Moteur de l'essuie-glace (sauf moteur KA)

Utiliser l'organigramme ci-dessous pour trouver chaque signification de code de schéma de câblage.
Consulter le code du schéma de câblage dans l'index alphabétique pour trouver l'emplacement (numéro de page) de chaque schéma de câblage.

Code	Section	Signification
AAC/V	EC	Vanne IACV-AAC
ABS	BR	Système anti-enrayeur des freins
A/C, M	HA	Climatiseur
A/C, A	HA	Climatiseur automatique
AT/IND	EL	Voyant de boîte auto
AUDIO	EL	Audio
BACK/L	EL	Feux de recul
BA/FTS	AT	BATT/Capteur de température de liquide de boîte automatique et alimentation électrique du module de commande de transmission (TCM)
CHARGE	EL	Système de charge
CHIME	EL	Carillon d'alarme
STAR-TER	EC	Starter automatique
CIGAR	EL	Allume-cigare
MONTRE	EL	Montre
CMPS	EC	Capteur d'angle d'arbre à cames
COOL/F	LC	Commande du ventilateur de refroidissement
DEF (DEG)	EL	Désembuage de lunette arrière et de rétroviseur
DIMDIP	EL	Phares — Avec système de mise en veilleuse des codes
D/LOCK	EL	Verrouillage élec. de porte
DTRL	EL	Phare — Avec système d'éclairage de jour
ECTS	EC	Capteur de température du moteur
EGRC/V	EC	EGRC — Electrovanne
ENGSS	T/A	Signal du régime moteur
FCUT	EC	Electrovanne de coupure de carburant
F/HEAT	EC	Système de chauffage de carburant
FICD	EC	Electrovanne FICD
FIPOT	EC	Pot ISC-FI
FPCM	EC	Module de commande de la pompe à carburant
F/PUMP	EC	Pompe d'alimentation
GLOW	EC	Système de préchauffage rapide

Code	Section	Signification
H/AIM	EL	Commande de réglage des faisceaux
CHAUF-FAGE	HA	Dispositif de chauffage
H/LAMP	EL	Phares
HLC	EL	Lave-phares
HO2S	EC	Sonde à oxygène chauffée
AVER-TISSEUR SONORE	EL	Avertisseur sonore
H/SEAT	EL	Siège chauffant
ALL	EC	Système d'allumage
IGN/SG	EC	Signal d'allumage
ILL	EL	Eclairage
INJECT	EC	Injecteur
INT/L	EL	Spot de lecture
KS	EC	Capteur de détonation
LOAD	EC	Signal de charge électrique
LPSV	T/A	Electrovanne de pression de canalisation
MAFS	EC	Débitmètre d'air
MAIN	EC, AT	Circuit d'alimentation électrique principal et de mise à la masse
METER	EL	Compteur de vitesse, compte-tours, jauges de température et de carburant
MIL/DL	EC	Témoin de défaut (MIL) et connecteur de diagnostic pour CONSULT
MIRROR	EL	Rétroviseur de porte électrique
MULTI	EL	Système de multitélécommande
NATS	EL	Système antivol Nissan
NONDTC	AT	Eléments non détectables
OVRCSV	AT	Electrovanne d'embrayage à roue libre
P/ANT	EL	Antenne électrique
PGC/V	EC	Electrovanne de commande de purge de cartouche EVAP
PLA	EC	Commande d'avance à charge partielle
PNP/SW	EC	Contact de position de stationnement/point mort

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Code	Section	Signification
POWER	EL	Disposition de l'alimentation électrique
PST/SW	EC	Manocontact d'huile de direction assistée
R/FOG	EL	Feu antibrouillard arrière
ROOM/L	EL	Plafonnier
SHIFT	AT	Système de verrouillage de passage de vitesse
SSV/A	AT	Electrovanne A de passage
SSV/B	AT	Electrovanne B de passage
SRS	RS	Système de retenue supplémentaire
S/SIG	EC	Signal de démarrage
START	EL	Système de démarrage
STOP/L	EL	Feu de stop
SWL/V	EC	Electrovanne de contrôle de vanne de commande de tourbillon

Code	Section	Signification
TAIL/L	EL	Feux de stationnement, éclairage de plaque minéralogique et feux arrière
TCV	AT	Electrovanne d'embrayage de convertisseur de couple
TPS	EC, AT	Capteur de position de papillon
TURN	EL	Clignotants et feux de détresse
VSS	EC	Capteur de vitesse du véhicule
VSSAT	AT	Capteur de vitesse du véhicule T/A (capteur de régime)
VSSMTR	T/A	Compteur du capteur de vitesse du véhicule
WARN	EL	Témoins d'avertissement
WINDOW	EL	Lève-glace électrique
WIPER	EL	Essuie-glace et lave-glace avant

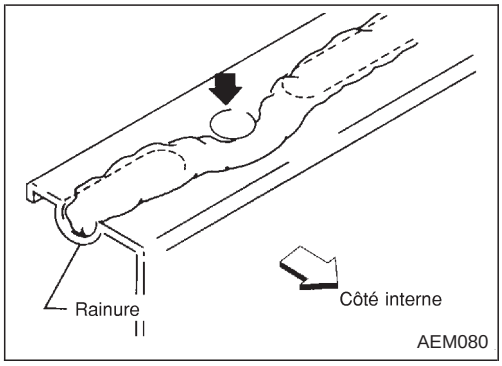
Pièces nécessitant un serrage angulaire

- Utiliser une clé angulaire pour le serrage final des pièces suivantes :
  (1) Boulons de culasse
  (2) Ecrous de chapeau de bielle
- Ne pas utiliser une valeur de serrage pour le serrage final.
- Les valeurs de serrage de ces pièces s'appliquent à une étape préliminaire.
- S'assurer que le filetage et les surfaces de siège sont propres et enduits d'une couche d'huile-moteur.

Procédé d'application du joint liquide

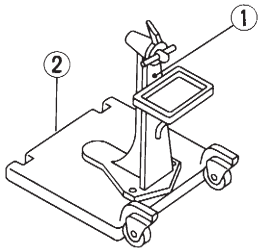


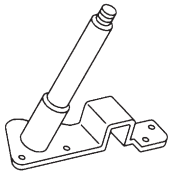
a. Retirer toute trace de joint liquide des surfaces de contact et des rainures à l'aide d'un grattoir. Veiller également à enlever toute trace d'huile.

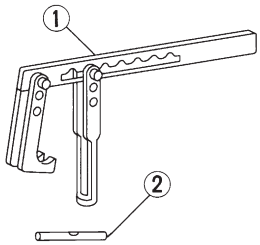
b. Appliquer une couche régulière de joint liquide sur les surfaces de contact. (Utiliser du joint liquide d'origine ou un produit équivalent.
- **Pour le carter d'huile, veiller à ce que le diamètre du joint liquide se situe entre 3,5 et 4,5 mm.**
- **Pour les autres pièces, le joint liquide doit respecter un diamètre de 2,0 à 3,0 mm.**

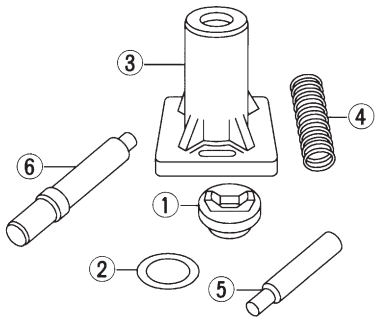
c. Appliquer du joint liquide autour des surfaces intérieures des orifices de boulons (sauf indication contraire).

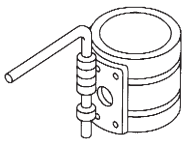
d. Le montage doit être fait dans les 5 minutes qui suivent l'application du joint.











e. Attendre au moins 30 minutes avant de faire le plein d'huile moteur et de liquide de refroidissement.

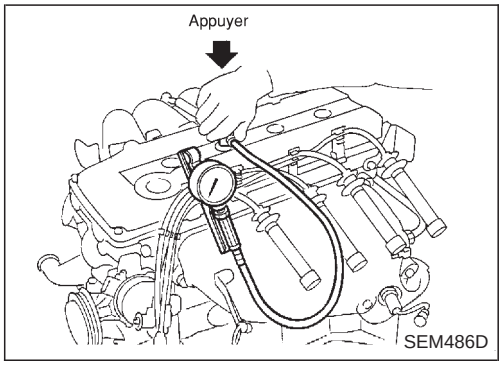
SEM976F

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Mesure de la pression de compression

1. Faire chauffer le moteur.
2. Mettre le contact d'allumage sur OFF.
3. Dépressuriser le carburant.
   Se reporter à la section EC (''Décharge de la pression d'alimentation'', PROCEDURE D'ENTRETIEN DE BASE).
4. Déposer toutes les bougies d'allumage.

- **Nettoyer la zone autour de la bougie à l'air comprimé avant de la retirer.**

5. Débrancher le connecteur de faisceau du capteur d'angle d'arbre à cames du distributeur.
6. Débrancher la totalité des connecteurs de faisceau d'injecteur à carburant.

7. Adapter un compressiomètre au cylindre n°1.
8. Enfoncer à fond la pédale d'accélérateur de façon à ce que la soupape de papillon soit grand ouvert.
9. Faire démarrer le moteur et noter la valeur la plus haute enregistrée par la jauge.
10. Mesurer chaque cylindre comme indiqué ci-dessus.

- **Toujours utiliser une batterie ayant sa pleine charge pour obtenir le régime moteur spécifié.**

Pression de la compression : kPa (bar, kg/cm^2)/tr/min

Standard

1 226 (12,26, 12,5)/300

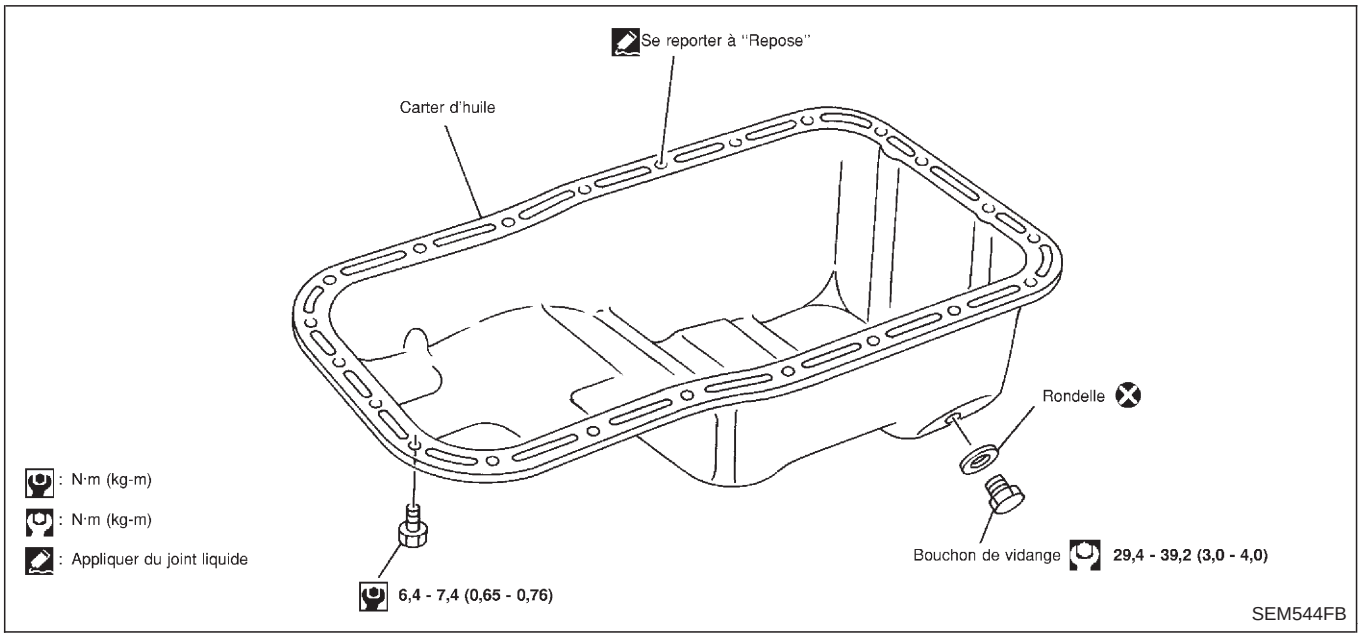
Minimum

1 030 (10,30, 10,5)/300

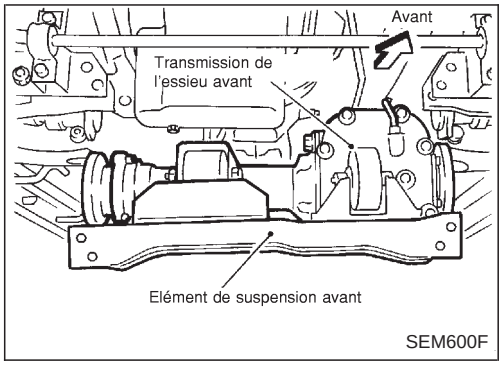
Limite de différence entre les cylindres

98 (0,98, 1,0)/300

11. En cas de compression basse dans l'un des cylindres :
    a. Déposer de l'huile moteur en petite quantité sur les cylindres à travers les orifices des bougies d'allumage.
    b. Tester à nouveau la compression.



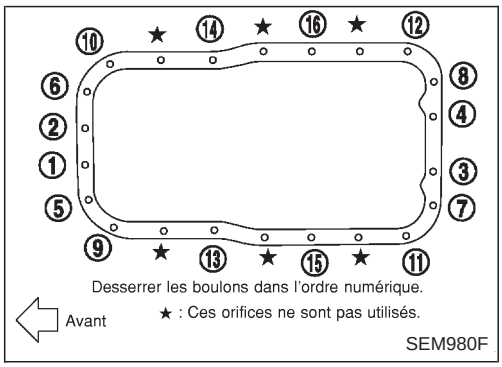
- **Si le graissage améliore la compression du cylindre, il se peut que les segments de piston soient usés ou endommagés. Si tel est le cas, remplacer après vérification.**
- **Si la pression reste à un niveau bas, il se peut qu'une soupape accroche ou ait une mauvaise assise. Inspecter et réparer la soupape et le siège de soupape. (Se reporter aux SDS, EM-2053 et EM-2056.) En cas d'endommagement excessif de la soupape et du siège de soupape, remplacer.**
- **En cas de pression basse constante dans deux cylindres côte à côte :**
  a. Fuite possible du joint de culasse
  b. Endommagement des composants de la soupape des deux cylindre. Inspecter et réparer si nécessaire.



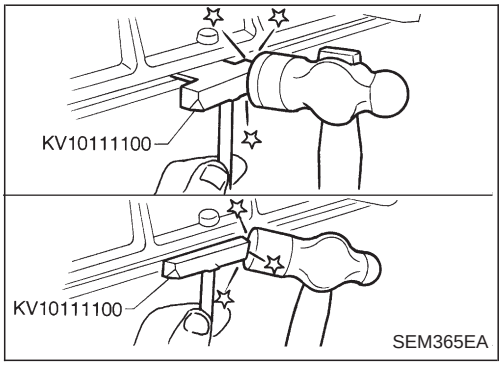
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Mesure de la pression de compression (suite)

12. Rebrancher le fusible de pompe à carburant, la totalité des connecteurs de faisceau des injecteurs à carburant, et le connecteur de faisceau du capteur de position d'arbre à cames sur le distributeur puis reposer les bougies d'allumage.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

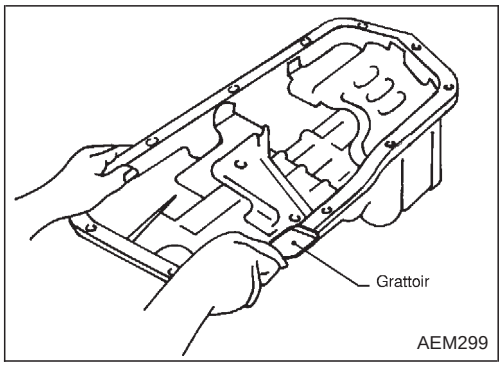


Dépose

1. Lever le véhicule et le poser sur des chandelles de sécurité.
2. Déposer le carénage inférieur du moteur.
3. Vidanger l'huile moteur.
4. Déposer la transmission de l'essieu avant en même temps que l'élément de fixation du différentiel. Se reporter à la section PD ("Dépose et repose", "Transmission de l'essieu avant")M pour les modèles 4x4 uniquement.
5. Déposer l'élément de suspension avant.

6. Déposer les boulons du carter d'huile.

7. Déposer le carter d'huile.

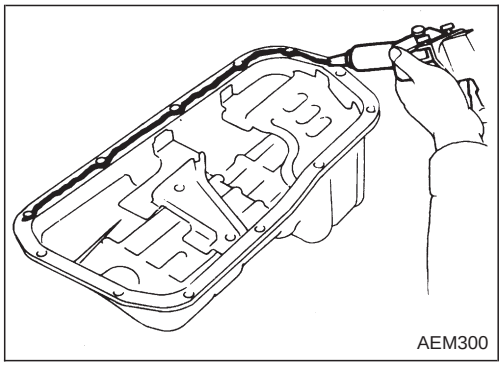


a. Insérer l'outil entre le bloc-cylindres et le carter d'huile.

- **Veiller à ne pas endommager les surfaces de contact en aluminium.**
- **Ne pas insérer le tournevis au risque d'endommager le flasque du carter d'huile.**

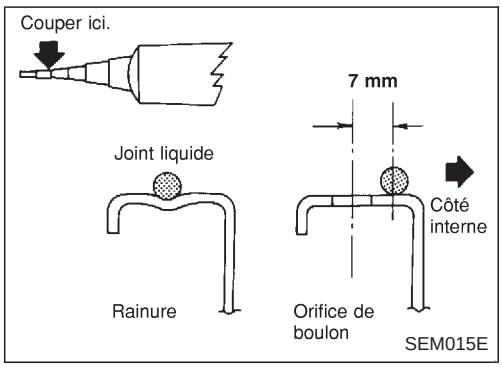
b. Faire coulisser l'outil en tapant sur le côté à l'aide d'un marteau.

8. Retirer le carter d'huile de l'avant.



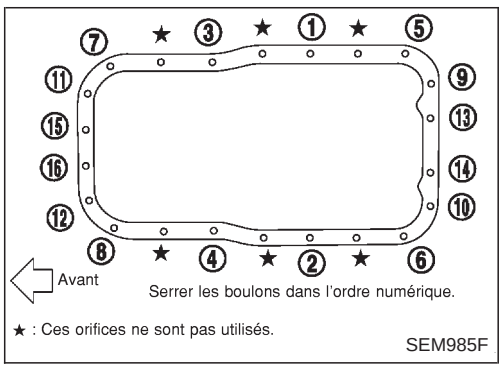
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Repose



1. Utiliser un grattoir pour déposer toutes traces de joint liquide ancien des surfaces de contact du carter d'huile.

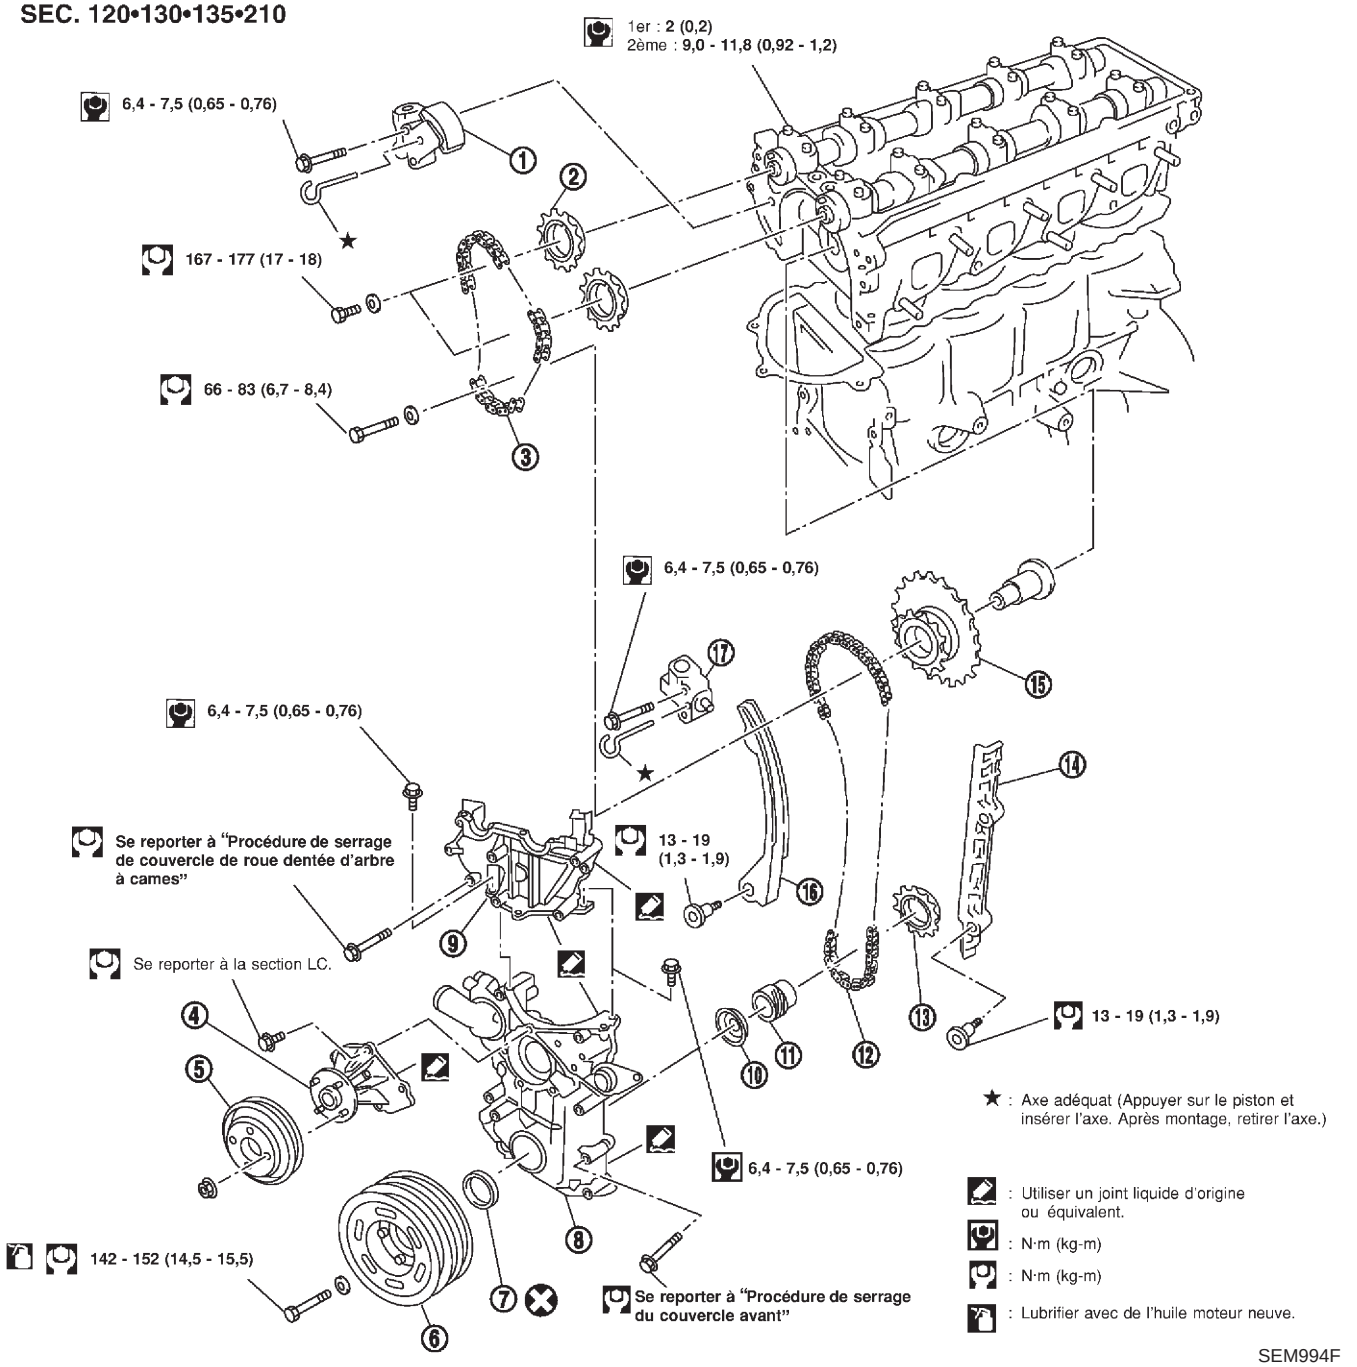
- **Enlever également toute trace de joint liquide de la surface de contact du bloc-cylindres.**



2. Appliquer un cordon uniforme de joint liquide sur la surface d'appui du carter d'huile (inférieur).

- **Utiliser le joint liquide d'origine ou un produit équivalent.**
- **Appliquer dans la rainure de la surface de contact.**
- **Tolérer un jeu de 7 mm autour de l'orifice de boulon.**

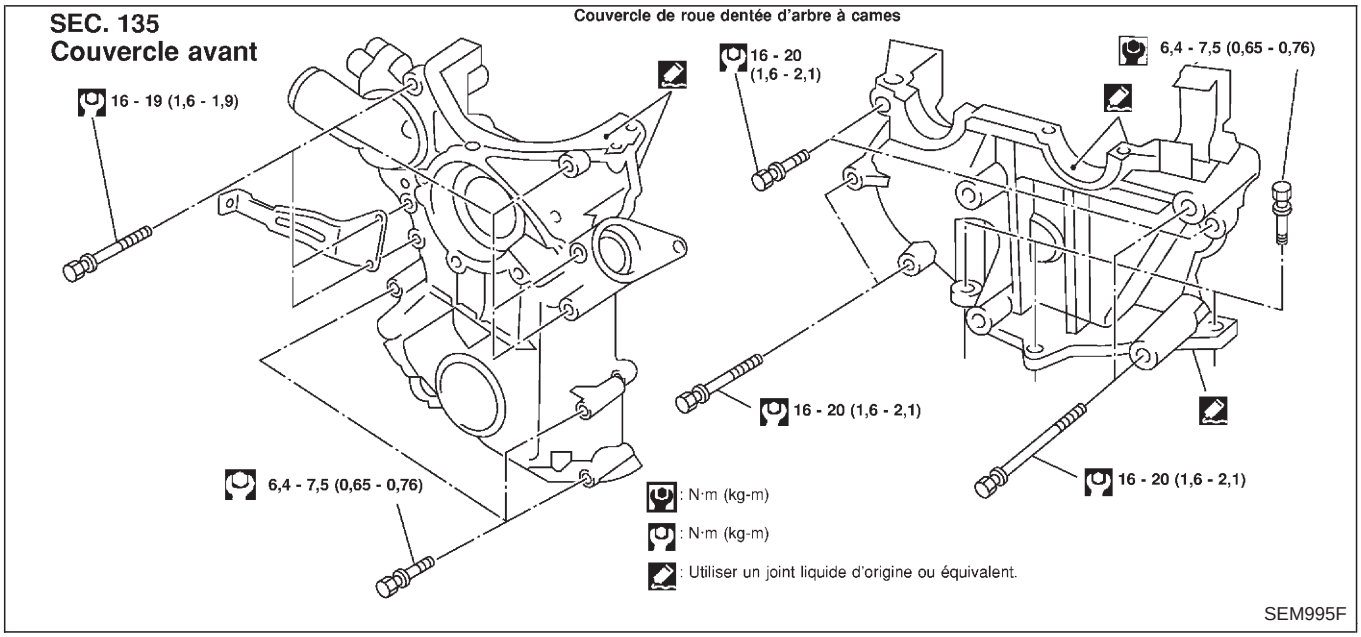
- **Veiller à ce que le diamètre du joint liquide se situe entre 3,5 et 4,5 mm.**
- **L'assemblage doit être effectué dans les 5 minutes qui suivent l'application du produit.**



3. Reposer le carter d'huile.

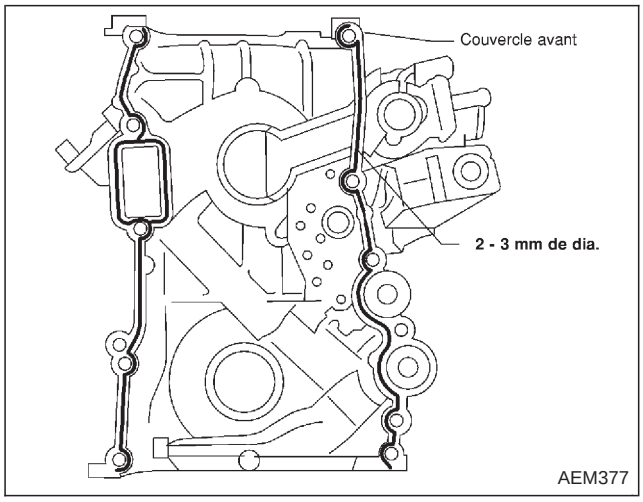
- **Serrer les boulons du carter d'huile dans l'ordre numérique de l'illustration.**
  : 5,9 - 6,9 (0,6 - 0,7 kg-m)
- **Attendre au moins 30 minutes avant de faire le plein d'huile moteur.**

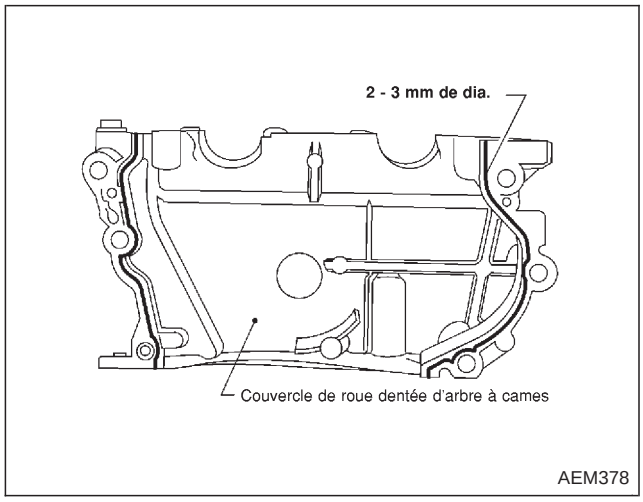
4. Reposer les pièces dans l'ordre inverse de la dépose.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SEC. 120•130•135•210





① Tendeur de chaîne de distribution supérieur
② Roue dentée de cames
③ Chaîne de distribution supérieure

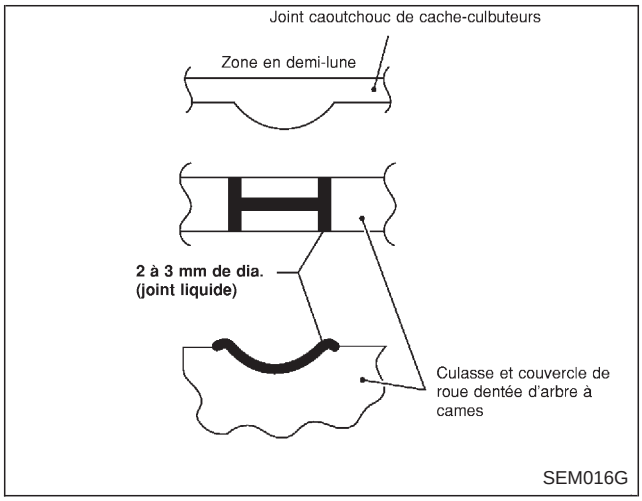
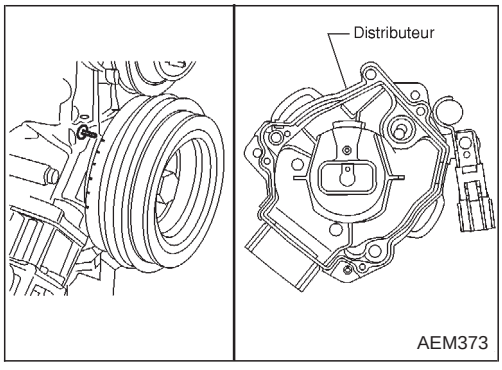
⑰ Tendeur de chaîne de distribution inférieure



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

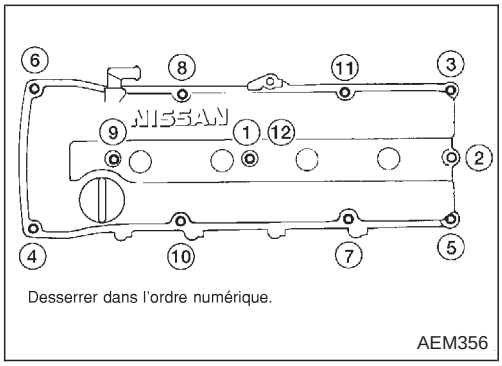
Zone d'application de joint liquide

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Dépose

PRECAUTION :

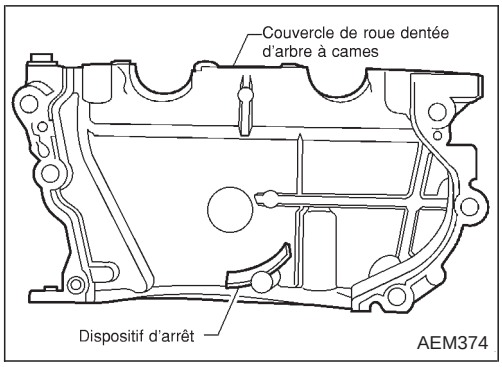


- **Après avoir déposé la chaîne de distribution, ne pas faire pivoter le vilebrequin et l'arbre à cames séparément au risque d'endommager les têtes de piston avec les soupapes**
- **Lors de la repose des tendeurs de chaîne ou autres pièces coulissantes, lubrifier les surfaces de contact avec de l'huile moteur neuve.**
- **Enduire les filetages de boulon et les surfaces d'appui d'huile moteur lors de la repose des roues dentées d'arbre à cames et de la poulie de vilebrequin.**
- **Ne pas éclabousser la courroie d'entraînement de liquide de refroidissement.**

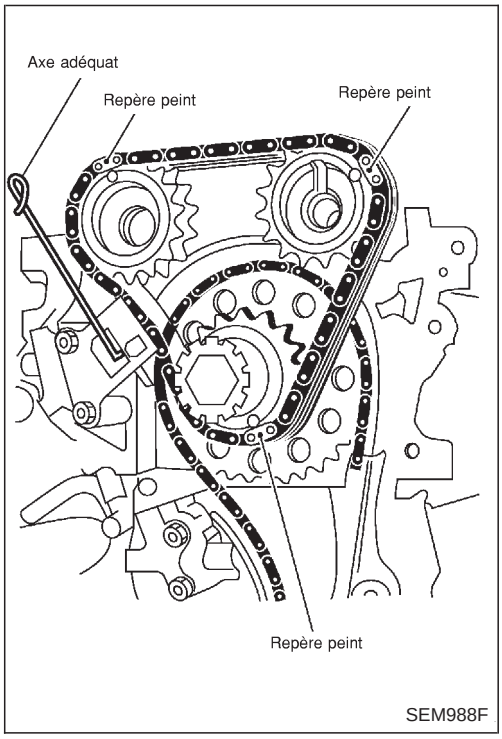
CHAINE DE DISTRIBUTION SUPERIEURE

1. Déposer l'ensemble du conduit d'air.
2. Retirer les flexibles à dépression, les connecteurs de faisceau électriques et les colliers des faisceaux.
3. Déposer la courroie d'entraînement de direction assistée.
4. Déposer la pompe de direction assistée et la mettre de côté.
5. Déposer le support de pompe de direction assistée.
6. Déposer également le support de poulie de tension.
7. Retirer les câbles et les bougies d'allumage.

8. Régler le piston n°1 au PMH sur sa course de compression.

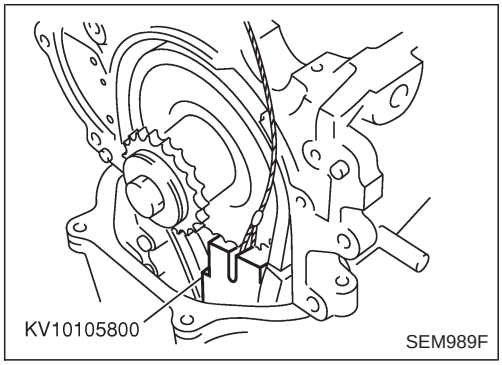


9. Déposer les cache-culbuteurs.



Déposer dans l'ordre numérique comme indiqué sur l'illustration.

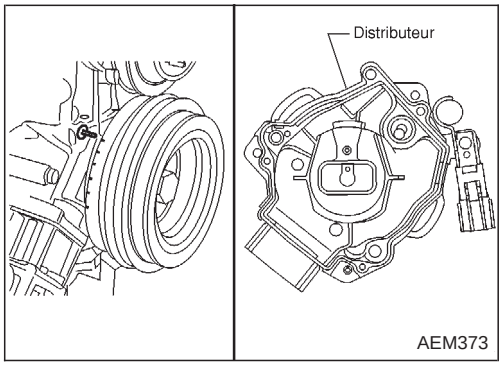
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Dépose (suite)

10. Déposer le couvercle de roue dentée d'arbre à cames.

11. Déposer le tendeur de chaîne supérieure.
    (Enfoncer le piston et insérer une goupille adéquate dans l'orifice prévu à cet effet.)
12. Essuyer la timonerie de la chaîne de distribution près des repères de calage sur les roues dentées. Faire des repères à la peinture sur la chaîne de distribution pour les faire coïncider avec les repères de calage de la roue dentée de cames et de renvoi.
13. Retirer les boulons de la roue dentée de cames, la roue dentée de cames et la chaîne de distribution supérieure.



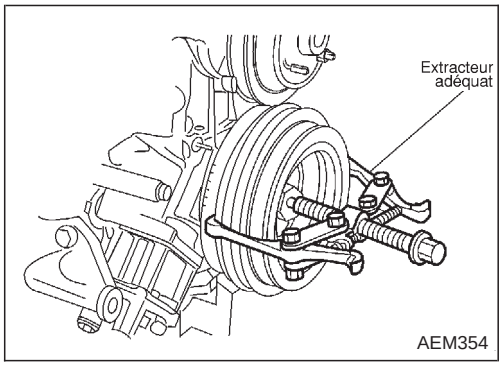
ROUE DENTEE DE RENVOI

1. Déposer la chaîne de distribution supérieure.
   Se reporter à ''Dépose'', ''Chaîne de distribution supérieure'', EM-2016.
2. Maintenir la chaîne de distribution inférieure avec un outil adéquat pour éviter que le ressort de la chaîne de distribution ne ressorte.

- **Exécuter cette étape uniquement si le couvercle inférieur n'est pas déposé.**

3. Déposer le roue dentée de renvoi.

CHAINE DE DISTRIBUTION INFERIEURE

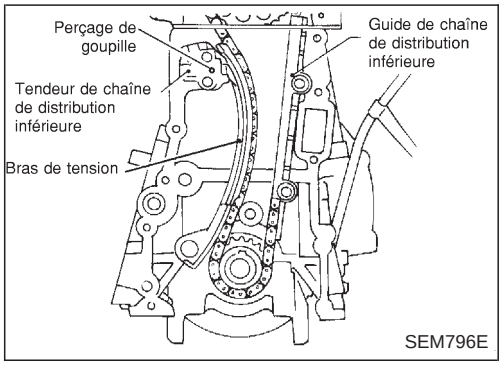


1. Pour vidanger le liquide, retirer le bouchon de vidange et ouvrir le robinet. Se reporter à la section MA du manuel de réparation.
2. Vidanger l'huile moteur du bouchon de vidange du carter d'huile.
3. Déposer les pièces suivantes :

- Courroie d'entraînement d'alternateur
- Courroie d'entraînement du compresseur d'A/C
- Ventilateur de refroidissement avec accouplement
- Capot de radiateur

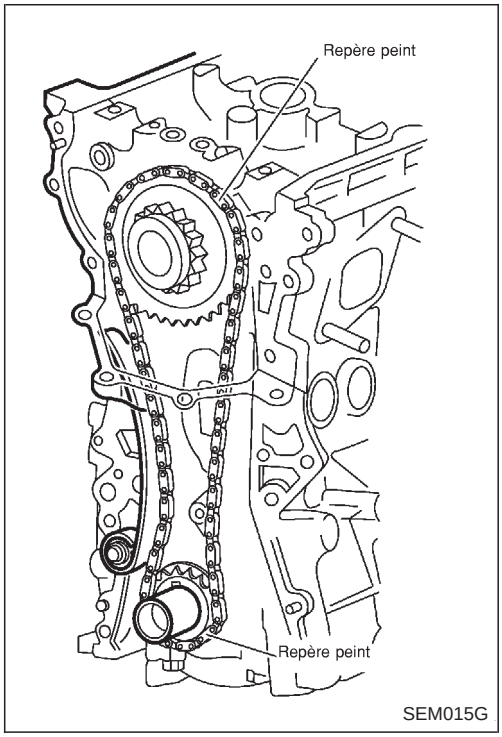
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Dépose (suite)



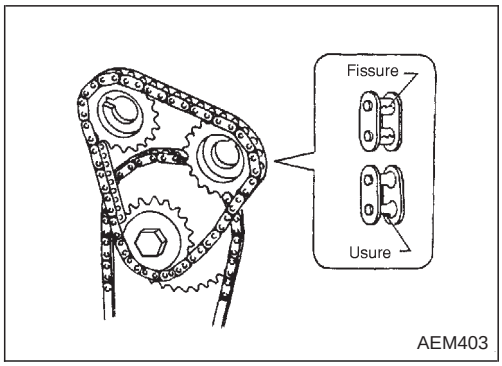
4. Déposer et mettre de côté le compresseur d'A/C. Déposer également la poulie de tension et le support.
5. Régler le piston n°1 au PMH de sa course de compression.
6. Déposer le distributeur.
7. Déposer la poulie du vilebrequin.

8. Déposer le carter d'huile.
- **Se reporter à ''Dépose'' dans CARTER D'HUILE (EM-2012).**



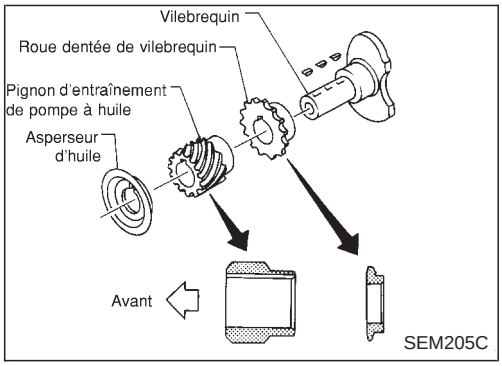
9. Déposer la pompe à huile et l'arbre de transmission du distributeur, puis la crépine d'huile du pick-up.
10. Déposer la couvercle avant.

PRECAUTION :
Veiller à ne pas fissurer ou endommager le joint de culasse.



11. Déposer les pièces suivantes :
- Tendeur de chaîne de distribution inférieure (enfoncer le piston et insérer la goupille adéquate dans l'orifice).
- Bras de tension de chaîne
- Guide de chaîne de distribution inférieure

12. Déposer la chaîne de distribution supérieure et la roue dentée de renvoi.
- **Se reporter à CHAINE DE DISTRIBUTION SUPERIEURE (EM-2016) et ROUE DENTEE DE RENVOI (EM-2017) dans ''Dépose''.**



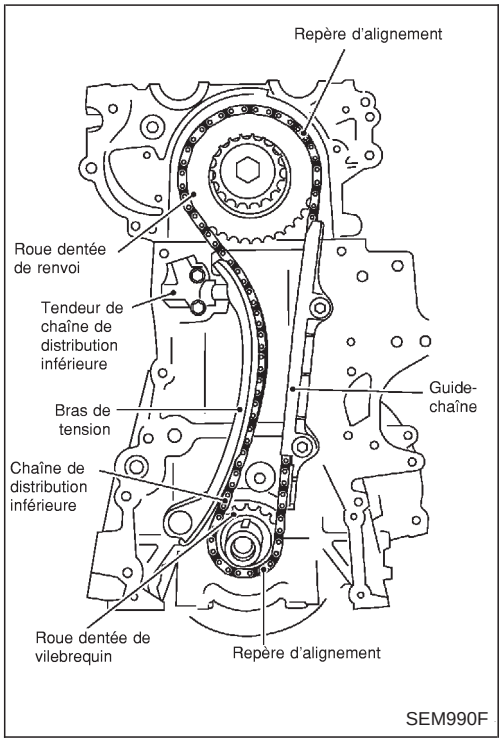
13. Essuyer la timonerie de la chaîne de distribution près des repères de calage sur les roues dentées. Faire des repères à la peinture sur la roue dentée de vilebrequin pour les faire coïncider avec les repères de calage de la roue dentée de cames et de renvoi.
14. Déposer la chaîne de distribution inférieure et la roue dentée de renvoi.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection

Vérifier l'absence de fissures et d'usure excessive au niveau des chaînons. Remplacer la chaîne si nécessaire.

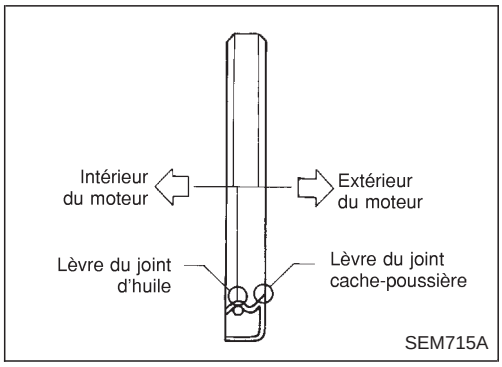
Repose



CHAINE DE DISTRIBUTION INFERIEURE

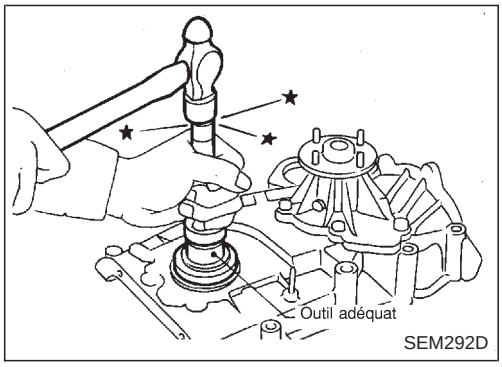
1. Reposer la roue dentée de vilebrequin, le pignon d'entraînement de pompe à huile et l'aspersoir d'huile.
- **Vérifier que les repères d'alignements de la roue dentée de vilebrequin sont dirigés vers l'avant du moteur.**
2. Reposer la roue dentée de renvoi et la chaîne de distribution inférieure en s'aidant des repères d'alignement et des repères peints placés lors de la procédure de dépose.

PRECAUTION :

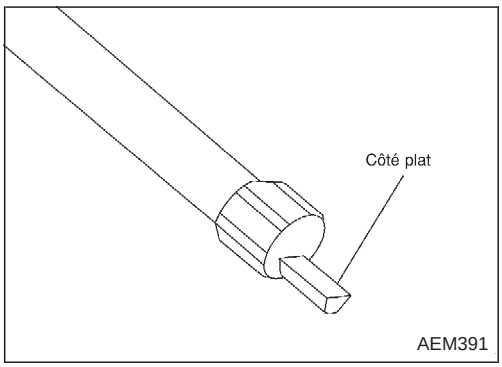


Veiller à ne pas fissurer ou endommager le joint de culasse.

3. Reposer le guide-chaîne et le bras de tension de la chaîne.
4. Reposer le tendeur de chaîne inférieure et la goupille retenant le piston du corps du tendeur.



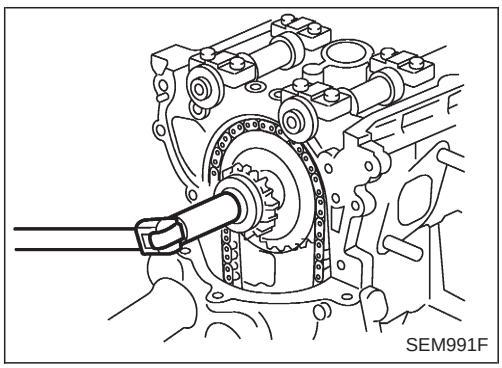
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Repose (suite)

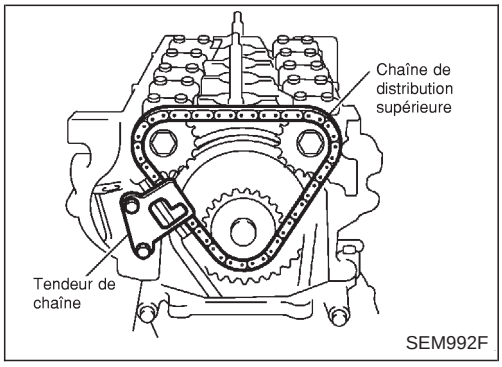
5. Reposer le couvercle avant.
- Retirer toute trace de joint liquide du bloc-cylindres et des surfaces de contact à l'aide d'un grattoir ou d'un autre outil adéquat.
- Reposer le joint d'huile avant neuf dans le couvercle avant.
- **Appliquer un cordon uniforme de joint liquide sur le couvercle avant. (Se reporter à EM-2015).**
- **Utiliser le joint liquide d'origine ou un produit équivalent.**
- **Veiller à bien reposer le joint d'huile avant neuf. Se reporter à EM-2022.**
- Enduire également le joint de culasse de joint liquide.
- Reposer le couvercle avant sur le moteur.

6. Reposer la crépine et le carter d'huile. Se reporter à ''Repose'' dans CARTER D'HUILE.



7. Reposer la pompe à huile et l'arbre de transmission du distributeur.
- **Veiller à ce que le côté plat de l'arbre de transmission du distributeur soit face au moteur. Dans le cas contraire le distributeur ne serait pas en phase.**

8. Reposer les pièces suivantes :
- Poulie de vilebrequin
- Compresseur d'A/C et support de poulie de tension

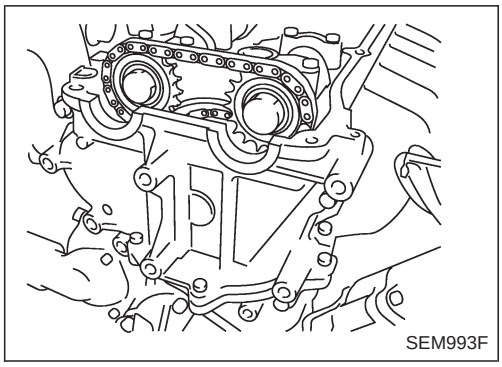


ROUE DENTEE DE RENVOI

1. Reposer la chaîne de distribution inférieure.
- **Se reporter à CHAINE DE DISTRIBUTION INFERIEURE (EM-2019) dans''Repose''.**

2. Reposer la roue dentée de renvoi et le boulon.

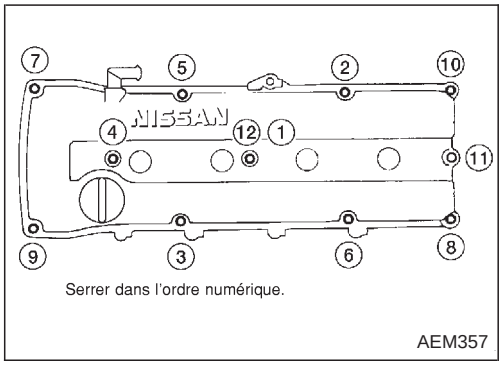
CHAINE DE DISTRIBUTION SUPERIEURE



1. Reposer la chaîne de distribution inférieure et la roue dentée de renvoi.
- **Se reporter à CHAINE DE DISTRIBUTION INFERIEURE (EM-2019) dans ROUE DENTEE DE RENVOI (EM-2020) dans ''Repose''.**

2. Reposer la chaîne de distribution supérieure et les pignons, en respectant les repères peints lors de la dépose.
3. Reposer le tendeur de chaîne. Retirer la goupille de maintien du tendeur de piston dans l'alésage du tendeur.

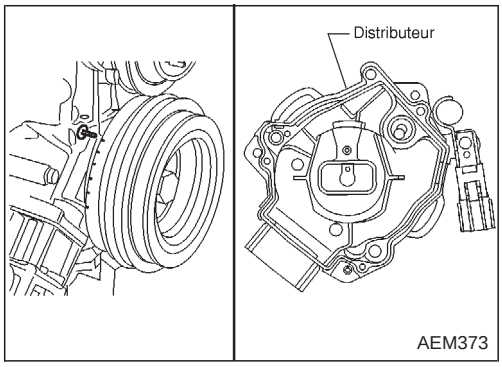
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Repose (suite)

SEM993F

4. Reposer le couvercle de la roue dentée d'arbre à cames.
- Retirer toute trace de joint liquide des surfaces de contact du bloc moteur et du couvercle de roue dentée d'arbre à cames au moyen d'un grattoir.
- Appliquer un cordon uniforme de joint liquide sur le couvercle. Se reporter à EM-2015.
- Enduire également le joint de culasse de joint liquide.
- **Utiliser le joint liquide d'origine ou un produit équivalent.**



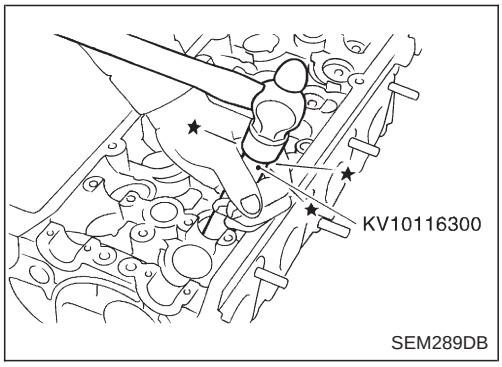
PRECAUTION :
- **Veiller à ne pas fissurer ou endommager le joint de culasse.**
- **Veiller à ce que la chaîne de distribution supérieure ne glisse ni ne saute lors de la repose du couvercle de roue dentée d'arbre à cames.**

5. Reposer le joint plat de cache-culbuteurs.
- Enduire la culasse et le couvercle de roue dentée d'arbres à cames de joint liquide. Se reporter à EM-2015.

Serrer dans l'ordre numérique.
AEM357

6. Reposer le cache-culbuteurs. Serrer les boulons dans un ordre numérique.
: 8 - 11 (0,8 - 1,1 kg-m)

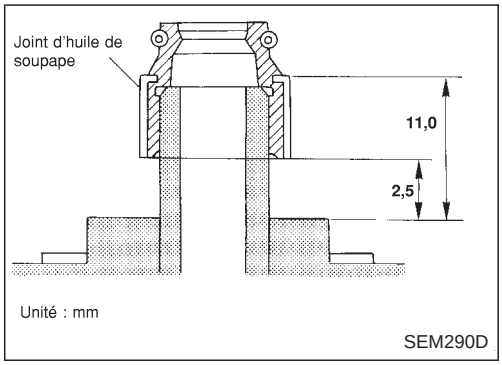
AEM373



7. Reposer le distributeur dans l'alignement suivant.
8. Reposer les flexibles à dépression, les connecteurs de faisceau électrique et les colliers de faisceau.
9. Reposer dans l'ordre inverse de la dépose.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

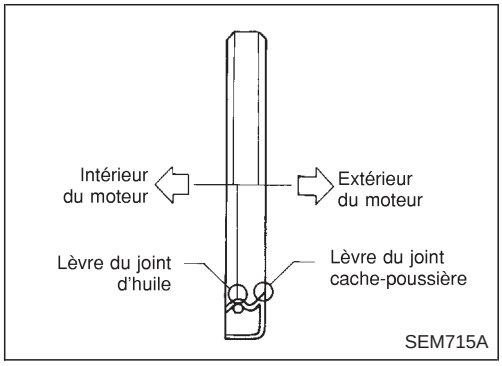
JOINT D'HUILE DE SOUPAPE



1. Déposer les cache-culbuteurs.
2. Déposer l'arbre à cames. Se reporter à CHAINE DE DISTRIBUTION (EM-2014).
3. Retirer le ressort de soupape ainsi que le joint d'huile de soupape à l'aide d'un outil spécialisé ou tout autre outil adéquat.

Le piston en question doit être réglé à son PMH pour éviter que la soupape ne tombe.

SEM289DB

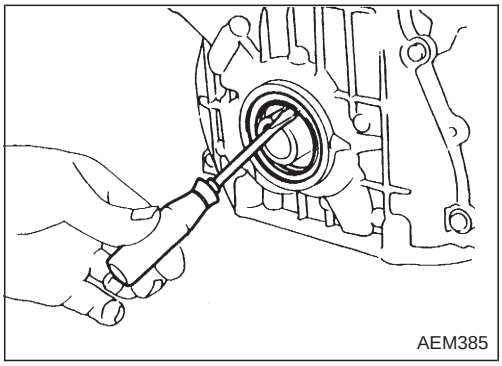


4. Mettre de l'huile moteur sur le nouveau joint d'étanchéité de soupape et poser le joint à l'aide de l'outil spécial.

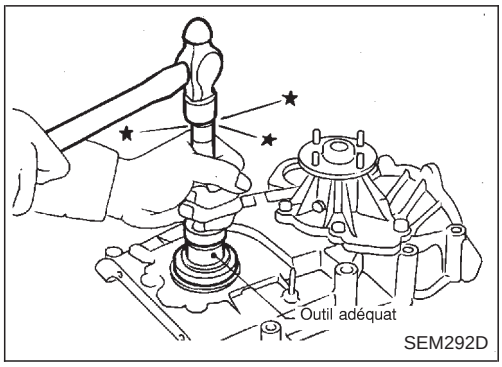
SEM290D

SENS DE MONTAGE DU JOINT D'ETANCHEITE D'HUILE

- Reposer le joint d'étanchéité d'huile neuf comme indiqué.



SEM715A

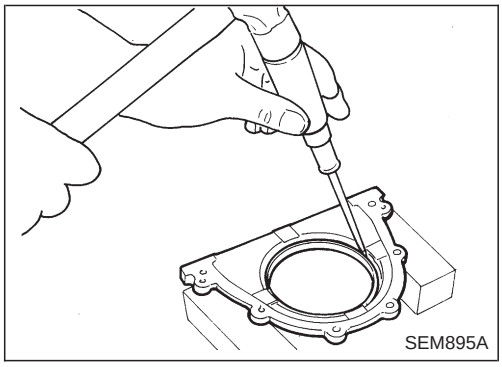


JOINT D'HUILE AVANT

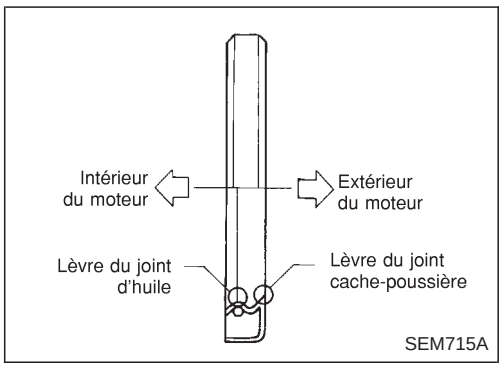
1. Retirer la protection de radiateur et la poulie de vilebrequin.
2. Déposer le joint d'étanchéité d'huile avant.

- **Prendre garde à ne pas rayer le couvercle avant.**

AEM385



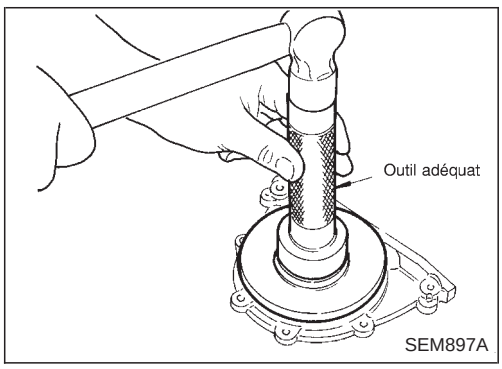
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

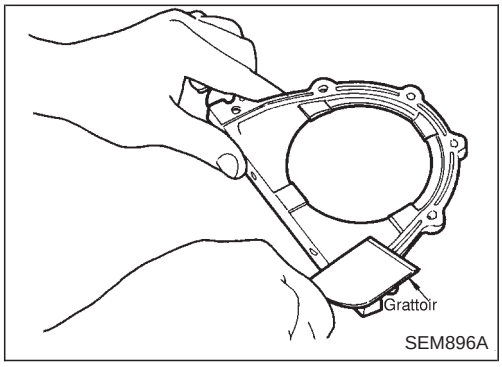


3. Appliquer de l'huile moteur sur le nouveau joint d'étanchéité d'huile et monter le joint à l'aide d'un outil adéquat.

JOINT D'HUILE ARRIERE

1. Déposer le volant-moteur ou le plateau d'entraînement.
2. Déposer la retenue de joint d'huile arrière.
3. Retirer le joint d'étanchéité d'huile arrière de la retenue.

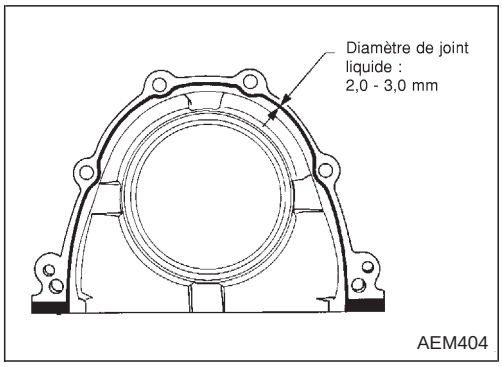




- **Veiller à ne pas érafler la retenue de joint d'huile arrière.**

4. Appliquer de l'huile moteur sur le nouveau joint d'étanchéité d'huile et monter le joint à l'aide d'un outil adéquat.

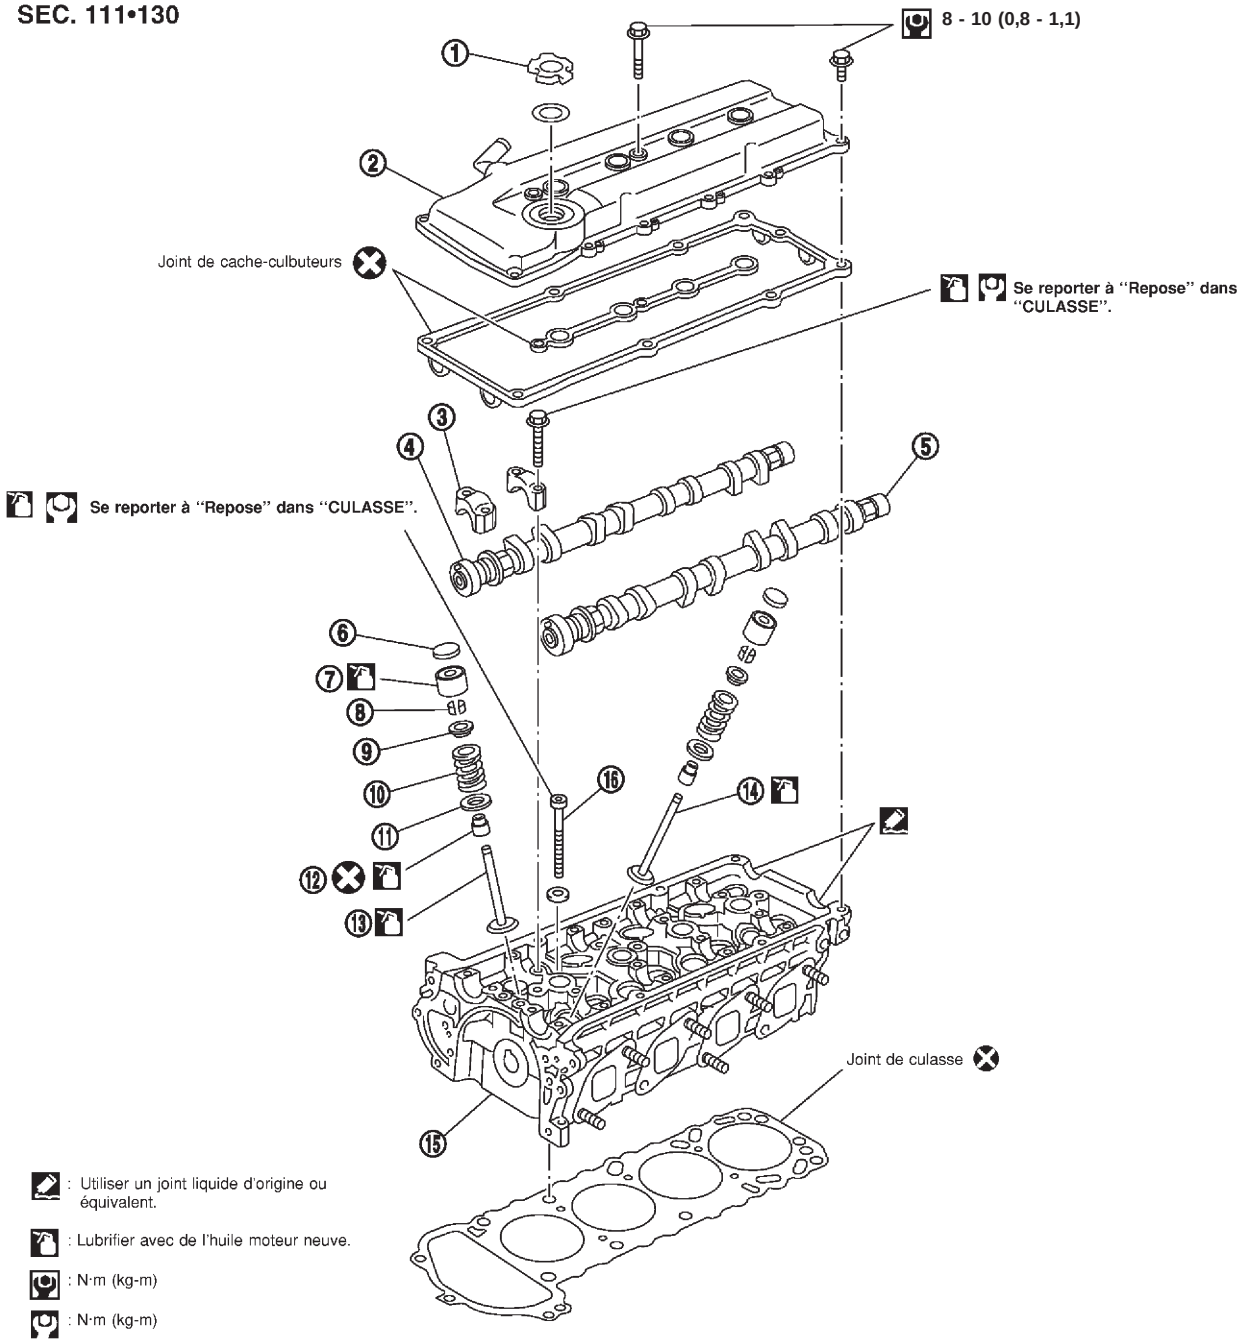
- **Reposer le joint d'étanchéité d'huile neuf comme indiqué.**



5. Reposer la bague de retenue arrière du joint d'huile.

a. Avant de procéder à la repose de la retenue de joint d'huile arrière, retirer toute trace de joint liquide de la surface de contact à l'aide d'un grattoir.

- **Enlever également toute trace de joint liquide de la surface de contact du bloc-cylindres.**



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

b. Appliquer un cordon régulier de joint liquide sur la surface de contact de la retenue de joint d'huile arrière.
- **Utiliser le joint liquide d'origine ou un produit équivalent.**
- **Enduire le périmètre intérieur des orifices de boulon.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

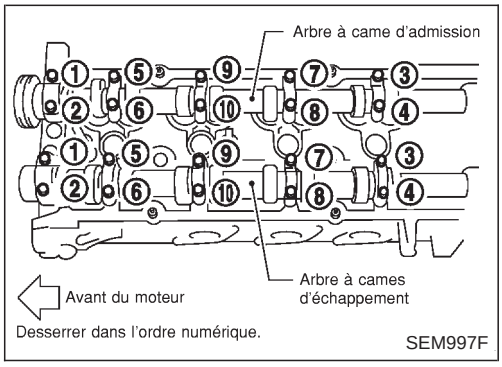
⑯ Boulon de culasse

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



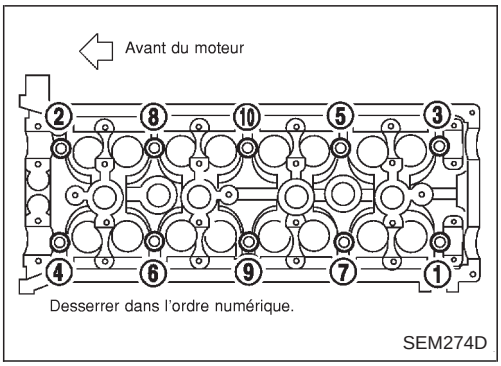
PRECAUTION :

- **Lors de la repose des arbres à cames, tendeurs de chaîne, joints d'huile, ou d'autres pièces coulissantes, lubrifier les surfaces de contact avec de l'huile moteur neuve.**
- **Appliquer de l'huile moteur neuve sur les parties filetées et les surfaces d'appui lors de la repose de la culasse, de la roue dentée d'arbre à cames, de la poulie de vilebrequin et du support de l'arbre à cames.**
- **Attacher des étiquettes sur les poussoirs de soupapes afin de ne pas les mélanger par la suite.**
- **Avant de procéder à la dépose de l'arbre à cames et des roue dentées de renvoi, marquer les pièces à la peinture pour une synchronisation ultérieure.**

Dépose

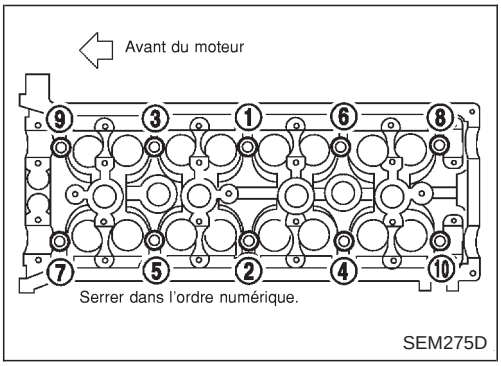
1. Vidanger le liquide du radiateur et du bloc-cylindres. Se reporter à la section MA (''Remplacement du liquide de refroidissement du moteur'', ENTRETIEN DU MOTEUR).
2. Déposer la chaîne de distribution supérieure et la roue dentée de renvoi.

- **Se reporter à CHAINE DE DISTRIBUTION SUPERIEURE (EM-2016) et ROUE DENTEE DE RENVOI (EM-2017), ''Dépose'', CHAINE DE DISTRIBUTION.**
- **Pour tout réajustement lors de la dépose/repose de la culasse, identifier les roues dentées d'arbre à cames, la chaîne de distribution supérieure, la chaîne de distribution inférieure et les roues dentées d'arbre à cames à la peinture.**



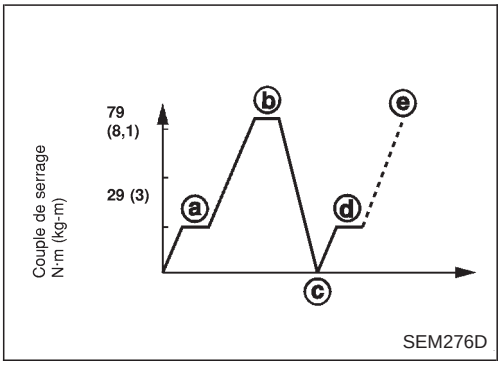
3. Déposer les supports d'arbre à cames et les arbre à cames.

- **Repérer les positions originales de chaque pièce en vue du remontage.**



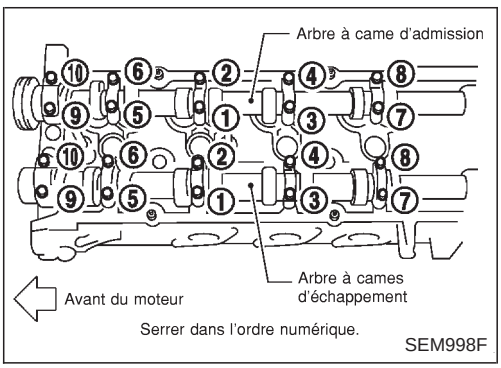
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Dépose (suite)



4. Déposer les boulons de culasse dans l'ordre numérique.
- **Un non respect de l'ordre de dépose des boulons pourrait voiler ou fissurer la culasse.**
- **Desserrer les boulons de culasse en 2 ou 3 étapes successives.**
5. Déposer la culasse et le joint de culasse.

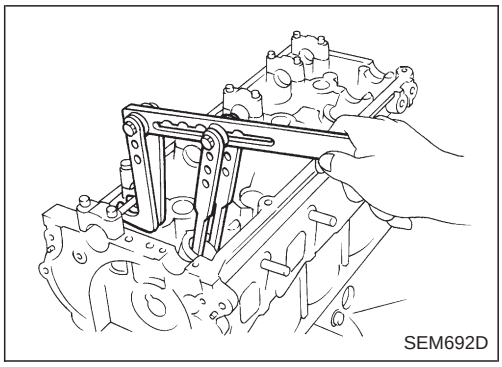
Repose



1. Serrer les boulons de culasse dans l'ordre numérique en respectant la procédure suivante :

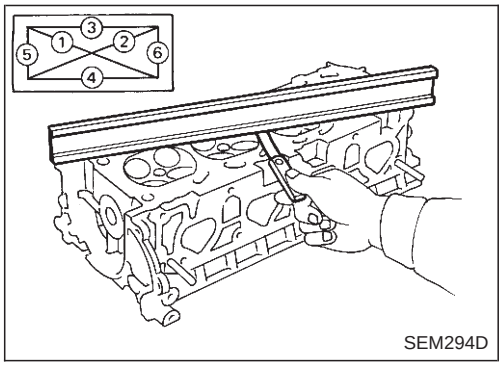
a. Serrer tous les boulons de 29 N·m (3,0 kg-m).
b. Serrer tous les boulons de 79 N·m (8,1 kg-m).

c. Desserrer entièrement tous les boulons.
d. Serrer tous les boulons de 25 à 34 N·m (2,5 à 3,5 kg-m).
e. Visser chaque boulon de 86 à 91° dans le sens des aiguilles d'une montre. Sans clé angulaire, repérer chaque boulon de culasse côté moteur. Visser ensuite chaque boulon de culasse de 86 à 91° dans le sens des aiguilles d'une montre.



2. Reposer les arbres à cames et leurs supports dans l'ordre indiqué en respectant la procédure suivante :

a. Régler les arbres et les supports d'arbre à cames.
b. Serrer tous les boulons de 2 N·m (0,2 kg-m).
c. Serrer tous les boulons de 9,1 à 11,7 N·m (0,92 à 1,2 kg-m).
- Appliquer de l'huile moteur neuve sur les parties filetées des boulons et les surfaces d'appui.



3. Reposer la chaîne de distribution supérieure et la roue dentée de renvoi.
- Se reporter à CHAINE DE DISTRIBUTION SUPERIEURE (EM-2020) et ROUE DENTEE DE RENVOI (EM-2020), ''Repose'', CHAINE DE DISTRIBUTION.
4. Faire le plein de liquide de refroidissement. Se reporter à la section MA (''Remplacement du liquide de refroidissement moteur'', ENTRETIEN DU MOTEUR).

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SEM692D

Démontage

1. Déposer la tubulure d'admission et le collecteur d'échappement. Se reporter à COMPOSANTS EXTERNES (EM-2007).
2. Déposer les divers éléments de la soupape.
3. Déposer le joint d'huile de soupape à l'aide d'un outil adéquat.

SEM294D

Inspection

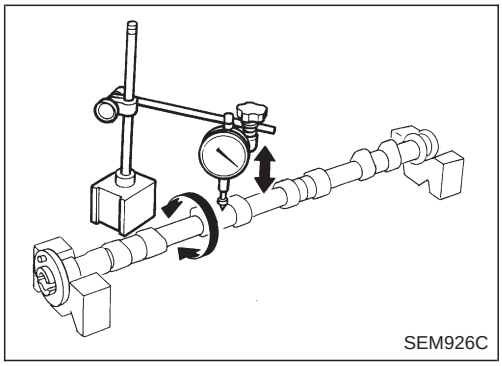
DEFORMATION DE LA CULASSE

Nettoyer la surface de la culasse.
Utiliser une règle et une jauge d'épaisseur fiables pour contrôler la planéité de la surface de culasse.
Vérifier les 6 endroits indiqués sur l'illustration.

Planéité de la surface de la culasse :
Standard Inférieure à 0,03 mm
Limite 0,1mm

Si la valeur est au delà de la limite spécifiée, la rectifier ou la remplacer.

Limite de rectification :
La limite de la rectification de la culasse est déterminée par la rectification du bloc-cylindres.
L'étendue de la rectification de la culasse est A.
L'étendue de la rectification du bloc-cylindres est B.



La limite maximum est :
A + B = 0,2 mm

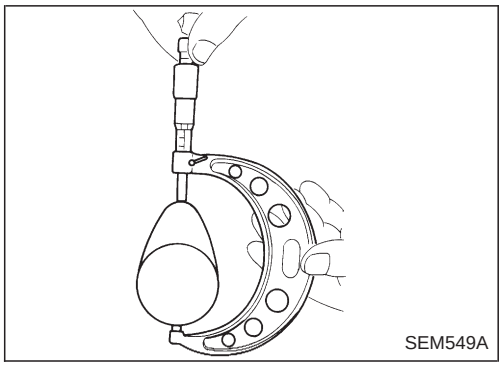
Après rectification de la culasse, vérifier manuellement la rotation de l'arbres à cames. En cas de résistance, remplacer la culasse.

Hauteur nominale de la culasse :
126,3 - 126,5 mm

VERIFICATION VISUELLE DE L'ARBRE DE CAMES

Vérifier que l'arbre à cames n'est pas éraflé, grippé ou rayé.

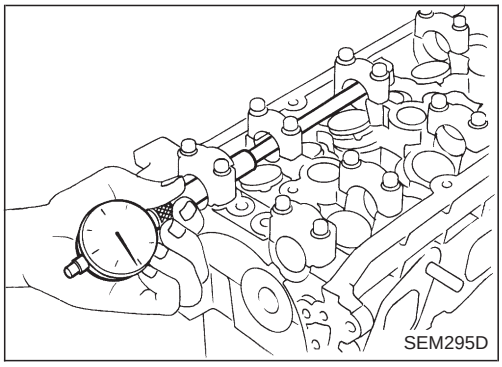
SEM926C



VOILE DE L'ARBRE A CAMES

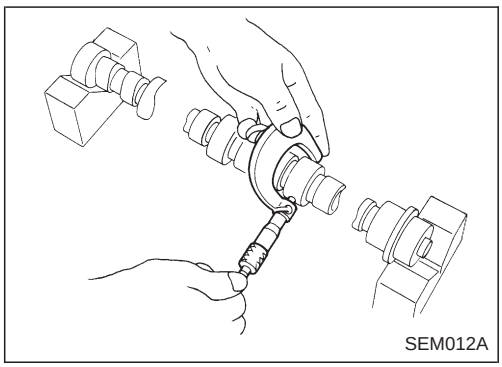
1. Mesurer le voile du vilebrequin au tourillon central.
   Voile (indication totale de la jauge) :
   Standard
   Inférieure à 0,02 mm
   Limite
   0,04 mm
2. Si la valeur excède la limite, remplacer l'arbre à cames.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Inspection (suite)

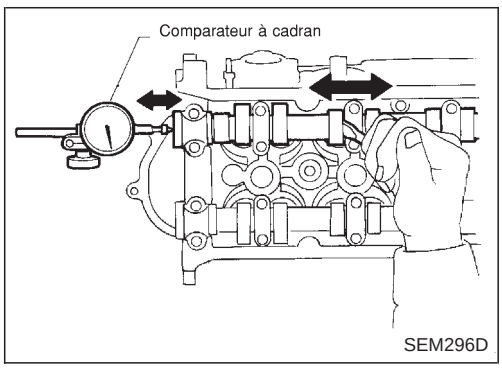
HAUTEUR DE CAMES DE L'ARBRE A CAMES



SEM549A

1. Mesurer la hauteur de cames de l'arbre à cames.
   Hauteur standard des cames :
   Admission 42,505 - 42,695 mm
   Echappement 40,905 - 41,095 mm
   Limite d'usure de hauteur de came
   Admission/échappement
   0,2 mm
2. Si l'usure dépasse la limite, remplacer l'arbre à cames.

JEU DU TOURILLON D'ARBRE A CAMES



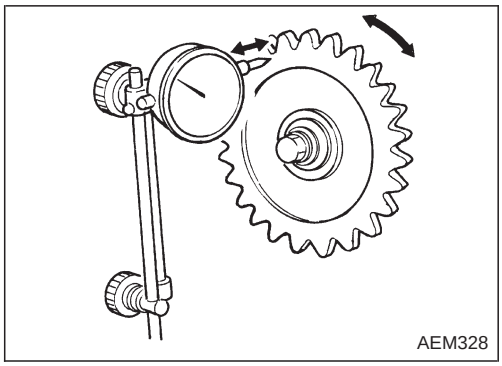
SEM295D

1. Reposer le support d'arbre à cames et serrer les boulons au couple spécifié.
2. Mesurer le diamètre interne du roulement d'arbre à cames.
   Diamètre interne standard :
   tourillons n°1 à 5
   28,000 - 28,025 mm

SEM012A

3. Mesurer le diamètre externe du tourillon d'arbre à cames.
   Diamètre externe standard :
   tourillons n°1 à 5
   27,935 - 27,955 mm
4. Si le jeu dépasse la limite, remplacer l'arbre de cames et/ou la culasse.
   Jeu du tourillon d'arbre à cames :
   Standard 0,045 - 0,090 mm
   Limite 0,12 mm

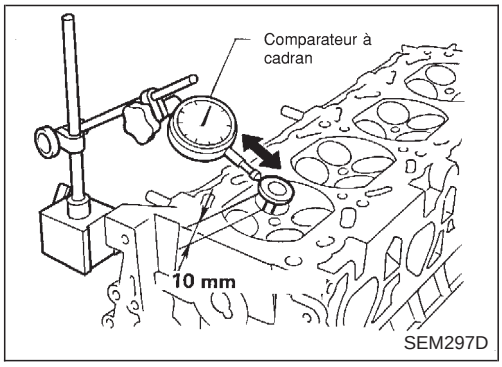
JEU AXIAL DE L'ARBRE A CAMES



SEM296D

1. Reposer l'arbre à cames sur la culasse.
2. Mesurer le jeu axial de l'arbre à cames.
   Jeu axial de l'arbre à cames :
   Standard
   0,070 - 0,148 mm
   Limite
   0,2 mm
3. Si le jeu axial est supérieur à la limite, remplacer l'arbre à cames et mesurer de nouveau son jeu axial.
4. Si le jeu axial dépasse la limite après avoir remplacé l'arbre à cames, remplacer la culasse.

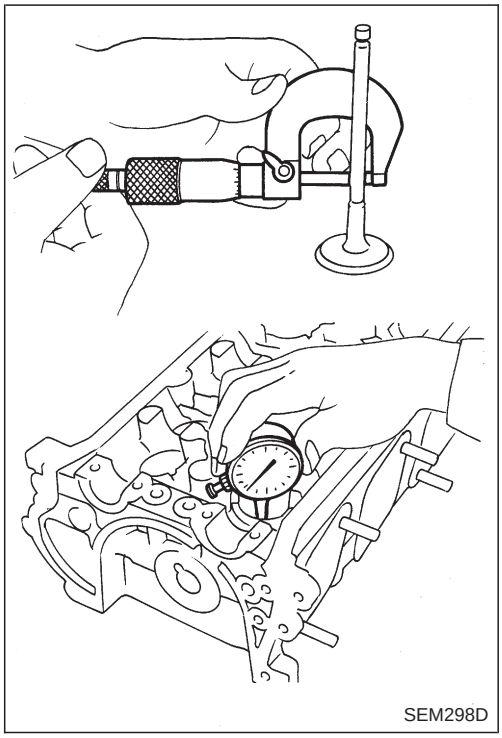
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Inspection (suite)

VOILE DE ROUE DENTEE D'ARBRE A CAMES

AEM328



1. Reposer la roue dentée sur l'arbre à cames.
2. Mesurer le voile de la roue dentée d'arbre à cames.
   Voile (indication totale de la jauge) :
   Limite 0,15 mm
3. Si la valeur excède la limite, remplacer la roue dentée d'arbre à cames.

JEU DU GUIDE DE SOUPAPE

SEM297D

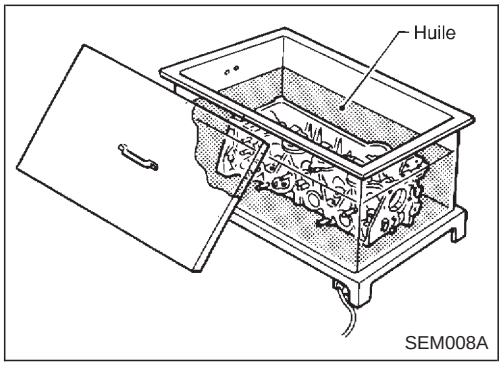
1. Mesurer la déflexion comme indiqué sur l'illustration. (Usure quasi-unidirectionnelle de la soupape et du guide de soupape.)
   Limite de déflexion de la soupape (indication du comparateur à cadran) :
   Admission/échappement
   0,2 mm

SEM298D

2. Si la valeur dépasse la limite, vérifier le jeu de guide de soupape à la soupape.

a. Mesurer le diamètre de la queue de soupape et le diamètre interne du guide de soupape.
b. Vérifier que le jeu est dans les spécifications.

Jeu entre la soupape et le guide de soupape = diamètre interne du guide de soupape - diamètre de queue de soupape :



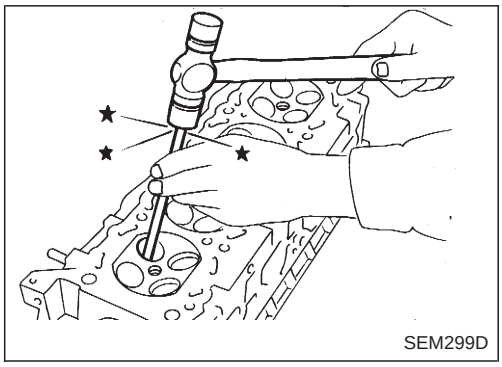
Unité : mm

	Standard	Limite
Admission	0,020 - 0,053	0,08
Echappement	0,040 - 0,073	0,1

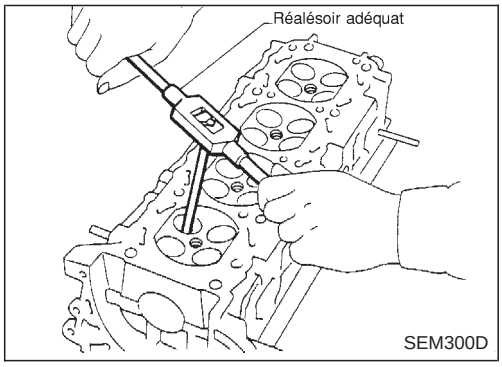
c. Si la valeur dépasse la limite, remplacer la soupape et mesurer le jeu à nouveau.

- Si le jeu continue à dépasser la limite après avoir remplacé la soupape, remplacer le guide de soupape.

REMPLACEMENT DU GUIDE DE SOUPAPE



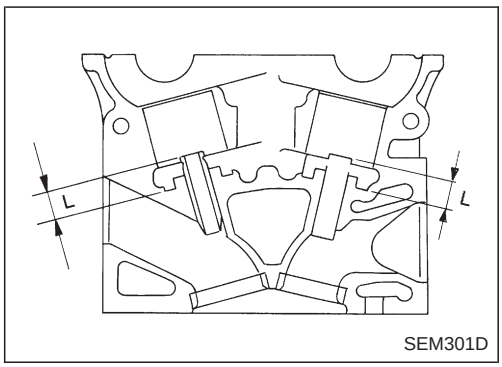
SEM008A



1. Pour déposer le guide de soupape, chauffer la culasse à une température comprise entre 120° et 140° en la plongeant dans de l'huile chauffée.

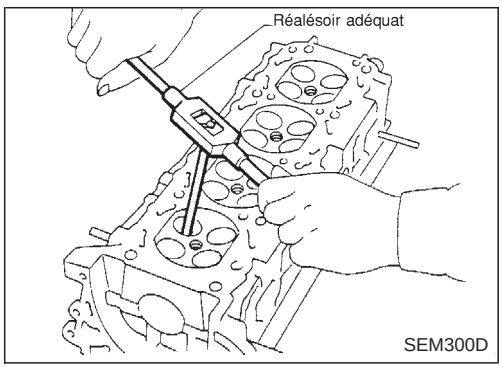
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (suite)



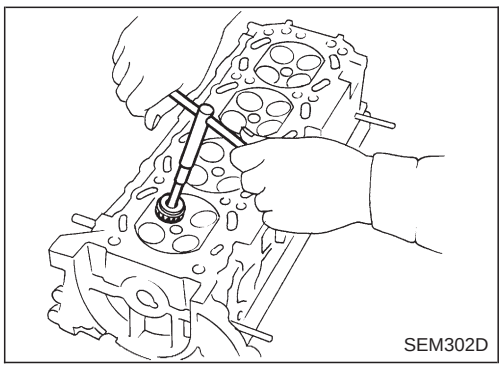
SEM299D

2. Chasser le guide de soupape à la presse [à une pression de 20 kN (2 tonnes)] ou avec un marteau et un outil approprié.



SEM300D

3. Aléser l'orifice du guide de soupape de la culasse.
   Diamètre de l'orifice de guide de soupape (pour les pièces de rechange) :
   Admission/échappement
   11,175 - 11,196 mm



SEM301D

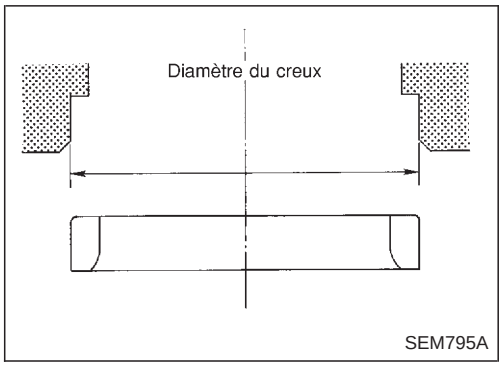
4. Chauffer la culasse à une température comprise entre 120° et 140° et enfoncer la soupape d'entretien dans la culasse.
   Saillie L :
   13,3 - 13,9 mm

SEM300D

5. Aléser le guide de soupape.
   Dimensions de finition :
   Admission/échappement
   7,000 - 7,018 mm

SEM302D

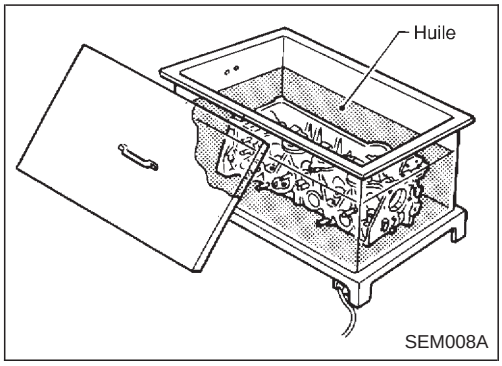
SIEGES DE SOUPAPE



Vérifier si les sièges de soupapes ne sont pas usés au niveau de la surface de contact. Rectifier ou remplacer si l'usure est excessive.

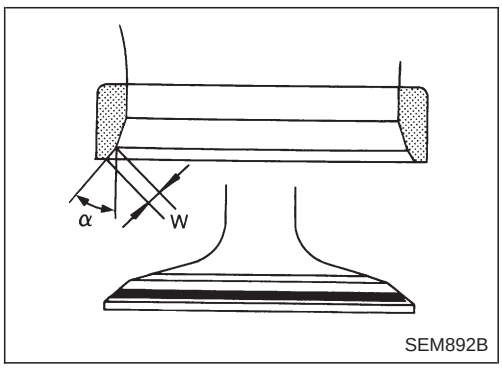
- **Avant de réparer les sièges de soupape, vérifier l'état de la soupape et du guide de soupape. Les remplacer s'ils sont usés. Puis rectifier le siège de soupape.**
- **Utiliser les deux mains afin de couper de manière uniforme.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Inspection (suite)

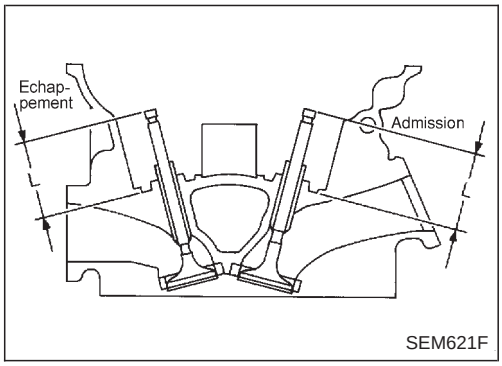
REMPLACEMENT DU SIEGE DE SOUPAPE POUR LES PIECES DE RECHANGE



1. Aléser le siège usagé jusqu'à ce qu'il s'affaisse. Ne pas descendre au-delà du fond du creux de la culasse. Pour cela, régler la butée de profondeur de l'outil.
2. Aléser le creux de la culasse.
   Alésage le siège de la soupape
   Surdimension [0,5 mm] :
   Admission 38,000 - 38,016 mm
   Echappement 32,700 - 32,716 mm

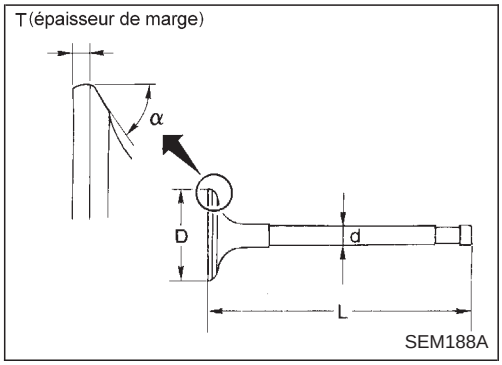
Utiliser le centre du guide de soupape pour l'alésage afin de garantir le bon ajustage du siège de soupape.

3. Chauffer la culasse à une température comprise entre 120° et 140°.
4. Emmancher le siège de soupape jusqu'à ce qu'il s'ajuste sur la partie supérieure.



5. Couper ou affûter le siège de soupape à l'aide d'un outil adéquat aux dimensions spécifiées dans les SDS (caractéristiques et valeurs de réglage).
6. Après avoir coupé, recouvrir le siège de soupape d'une pâte abrasive.
7. Vérifier l'état d'assise de la soupape.
   Angle d'assise du siège "α" :
   45°15' - 45°45' degrés
   Largeur de contact W :
   Admission
   1,48 - 1,63 mm

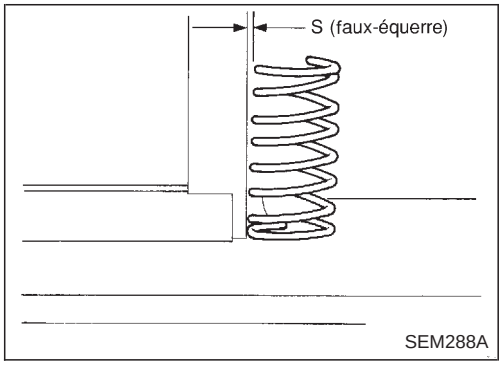
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Inspection (suite)

Echappement
1,8 - 2,0 mm

SEM621F

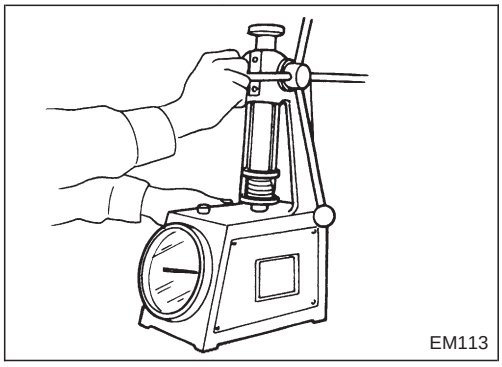


8. Utiliser une jauge de profondeur pour mesurer la distance entre la surface de fixation du siège de ressort de culasse et de l'extrémité de la queue de soupape. Si la distance est plus courte que celle spécifiée, effectuer à nouveau l'étape 5 décrite ci-dessus pour la régler. Si elle est plus longue, remplacer le siège de soupape par un siège neuf.
   Limite de rectification du siège de soupape L :
   Admission 42,02 - 42,52 mm
   Echappement 42,03 - 42,53mm

SEM188A

DIMENSIONS DE LA SOUPAPE

Vérifier les dimensions de chaque soupape. Pour les dimensions, se reporter aux SDS (caractéristiques et valeurs de réglage)(EM-2053).
Lorsque la tête de la soupape présente une usure de 0,5 mm en terme de marge d'épaisseur, remplacer la soupape.
La marge autorisée pour la queue de soupape est de 0,2 mm maximum.



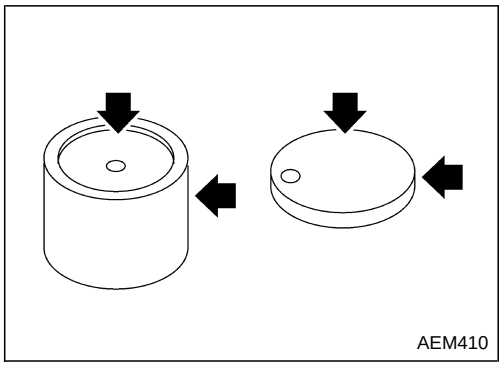
SEM288A

RESSORT DE SOUPAPE

Equerrage

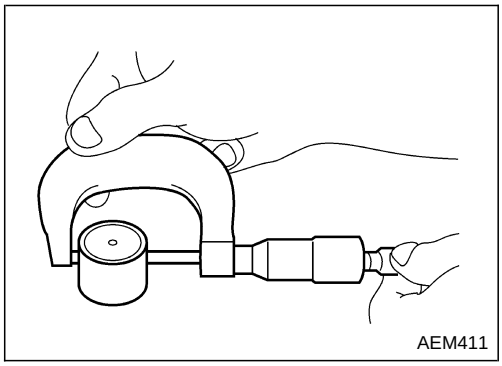
1. Mesurer la dimension S.
   Faux-équerre S :
   maximum 2,2 mm
2. Si la valeur excède la limite, remplacer le ressort.

EM113



Pression

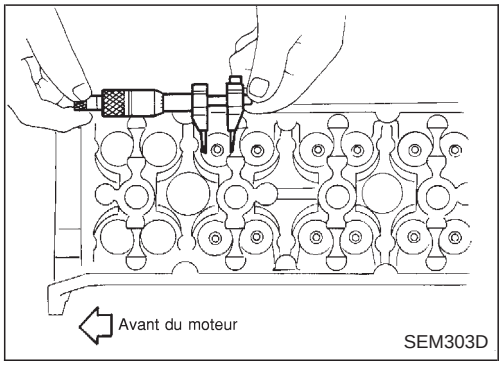
Vérifier la pression de la soupape de contrôle au niveau de la hauteur de ressort spécifiée.
Pression : N (kg) à la hauteur mm
Standard
418,0 (42,6) à 29,17
Limite
393,0 (40,1) à 29,17
Si la valeur excède la limite, remplacer le ressort.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (suite)

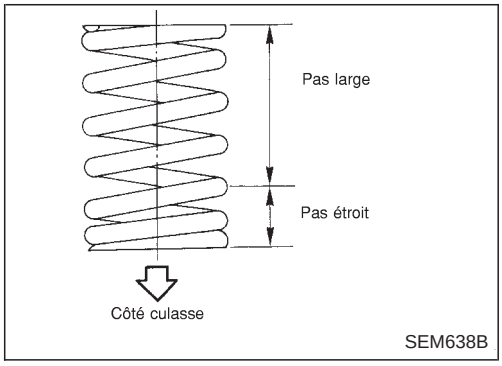
LEVE-SOUPAPE ET CALE DE SOUPAPE



AEM410

1. Contrôler visuellement si les surfaces de contact et de glissement ne sont pas usées ou éraflées.

AEM411

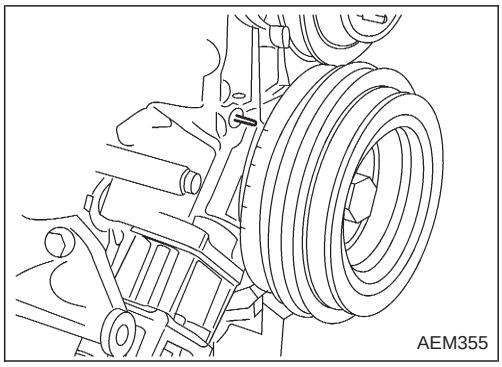


2. Vérifier le diamètre du lève-soupape et de l'alésage du guide de lève-soupape.

Diamètre externe du lève-soupape :
33,960 - 33,975 mm

SEM303D

Diamètre de l'alésage du lève-soupape :
34,000 - 34,021 mm
Jeu entre le lève-soupape et le guide de lève-soupape: 0,025 - 0,061 mm
Si le diamètre ou le jeu dépasse la limite, remplacer le lève-soupape ou la culasse.



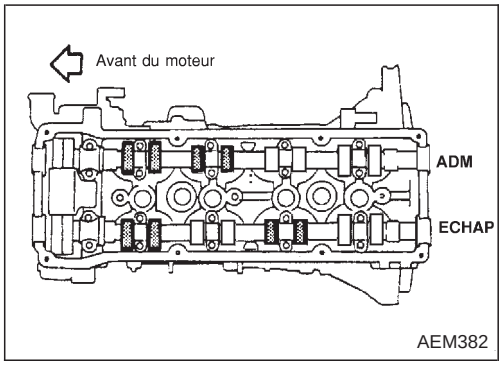
SEM638B

Remontage

1. Reposer les composants de la soupape.

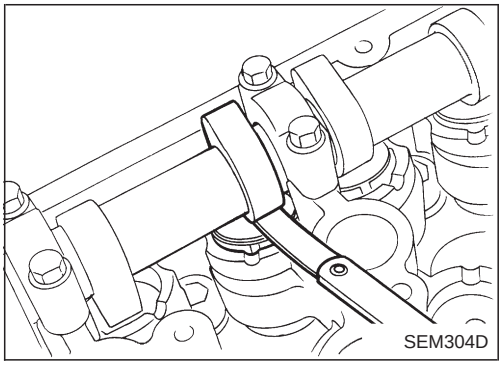
- **Toujours utiliser un joint d'huile de soupape neuf. Se reporter à REMPLACEMENT DU JOINT D'ETANCHEITE D'HUILE (EM-2022).**
- **Avant de reposer le joint d'huile de soupape, reposer le siège du ressort de soupape.**
- **Reposer le ressort de soupape externe (type de pas irrégulier) avec le côté du pas étroit vers le côté culasse.**
- **Après avoir installé les composants de la soupape, taper l'alésage de la soupape avec un maillet à tête plastique pour garantir le bon ajustage.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Jeu de la soupape

VERIFICATION



Vérifier le jeu de la soupape lorsque le moteur est chaud mais sans qu'il ne tourne.

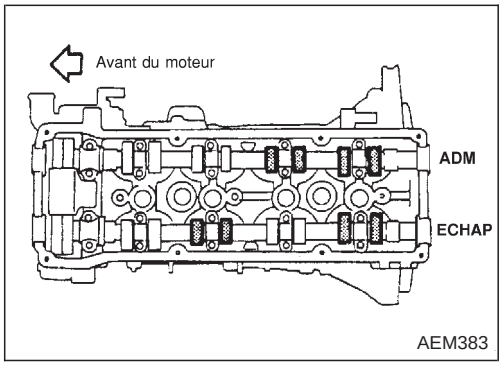
1. Déposer le cache-culbuteurs et toutes les bougies d'allumage.
2. Engager le cylindre n°1 au PMH sur la course de compression.

- Aligner le pointeur avec le repère du TDC sur la poulie de vilebrequin.
- Vérifier que les lève-soupapes sur le cylindre n°1 sont desserrés et que les lève-soupapes sur le n°4 sont serrées.
  Si ce n'est pas le cas, tourner le vilebrequin d'un tour complet (360°) et l'aligner comme indiqué ci-dessus.

3. Vérifier uniquement ceux dont les soupapes sont indiquées sur l'illustration.

4. A l'aide d'une jauge d'épaisseur, mesurer le jeu entre le lève-soupape et l'arbre à cames.

- Enregistrer les mesures de jeu de la soupape qui ne sont pas conformes aux spécifications. Elles seront utilisées ultérieurement pour déterminer la cale de réglage de remplacement nécessaire.



Jeu de la soupape (à chaud) :

Admission

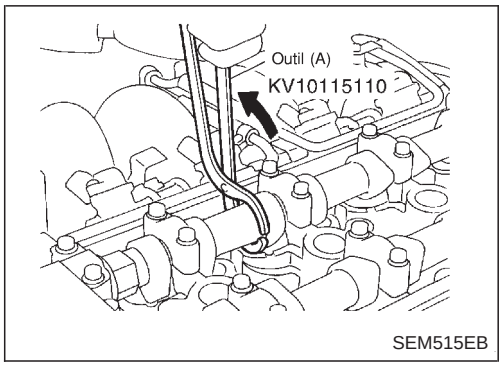
0,31 - 0,39 mm

Echappement

0,33 - 0,41 mm

5. Tourner le vilebrequin d'un tour complet (360°) et aligner la marque sur la poulie du vilebrequin à l'aide d'un pointeur.
6. Vérifier ceux dont les soupapes sont indiquées sur l'illustration.

- Utiliser la même procédure que celle mentionnée dans l'étape 4.



7. Si tous les jeux de soupape sont conformes aux spécifications, reposer les pièces suivantes.

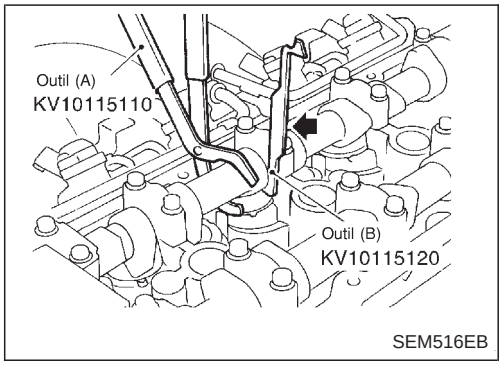
- Cache-culbuteurs
- Toutes les bougies d'allumage

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Jeu de la soupape (suite)

REGLAGE

SEM515EB



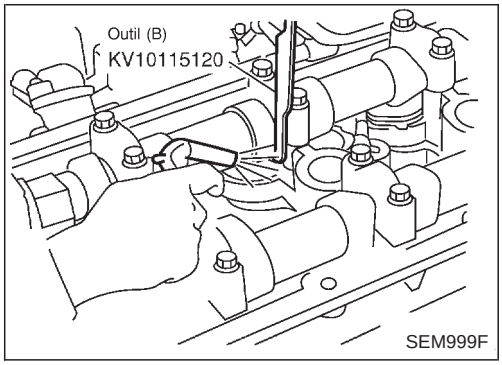
Régler le jeu de la soupape lorsque le moteur est froid.

1. Tourner le vilebrequin pour positionner le bossage de cames sur l'arbre à cames de la soupape qui doit être réglée vers le haut.
2. Placer l'outil spécial (A) autour de l'arbre à cames comme indiqué sur l'illustration.
3. Faire tourner l'outil spécial (A) de telle sorte que le lève-soupape soit poussé vers le bas.

Avant de placer l'outil spécial (A), faire tourner l'encoche vers le centre de la culasse (voir l'illustration) afin de simplifier la dépose ultérieure de la cale.

PRECAUTION :

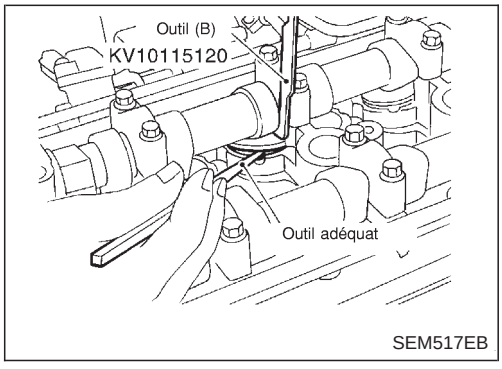
Veiller à ne pas endommager la surface de came avec l'outil spécial (A).



SEM516EB

4. Placer l'outil spécial (B) entre l'arbre à cames et le bord du lève-soupape pour retenir le lève-soupapes.

PRECAUTION :

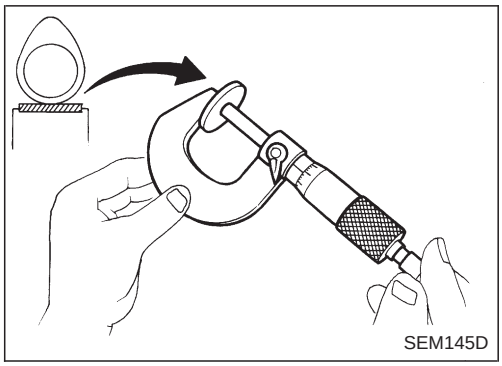


- **L'outil spécial (B) doit être placé le plus près possible du support de l'arbre à cames.**
- **Veiller à ne pas endommager la surface de came avec l'outil spécial (B).**

5. Déposer l'outil spécial (A).

SEM999F

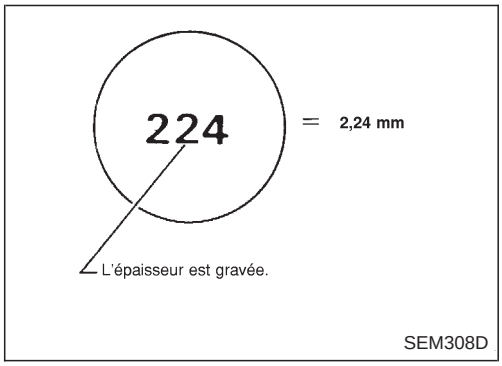
6. Faire tourner la cale de réglage jusqu'à ce que l'orifice soit visible. Insuffler de l'air dans l'orifice pour dissocier la cale de réglage du lève-soupape.



SEM517EB

7. Déposer la cale de réglage à l'aide d'un petit tournevis et d'un aimant.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

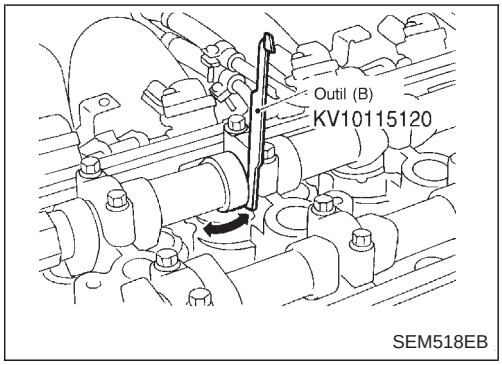


Jeu de la soupape (suite)

SEM145D

8. Déterminer la taille de la cale de réglage comme suit.
a. Déterminer l'épaisseur de la cale déposée à l'aide d'un micromètre.
b. Calculer l'épaisseur de la cale de réglage neuve, ainsi le jeu de la soupape sera conforme aux valeurs spécifiées.
R = épaisseur de la cale déposée N = épaisseur de la cale neuve M = valeur mesurée du jeu de la soupape

Admission et échappement :



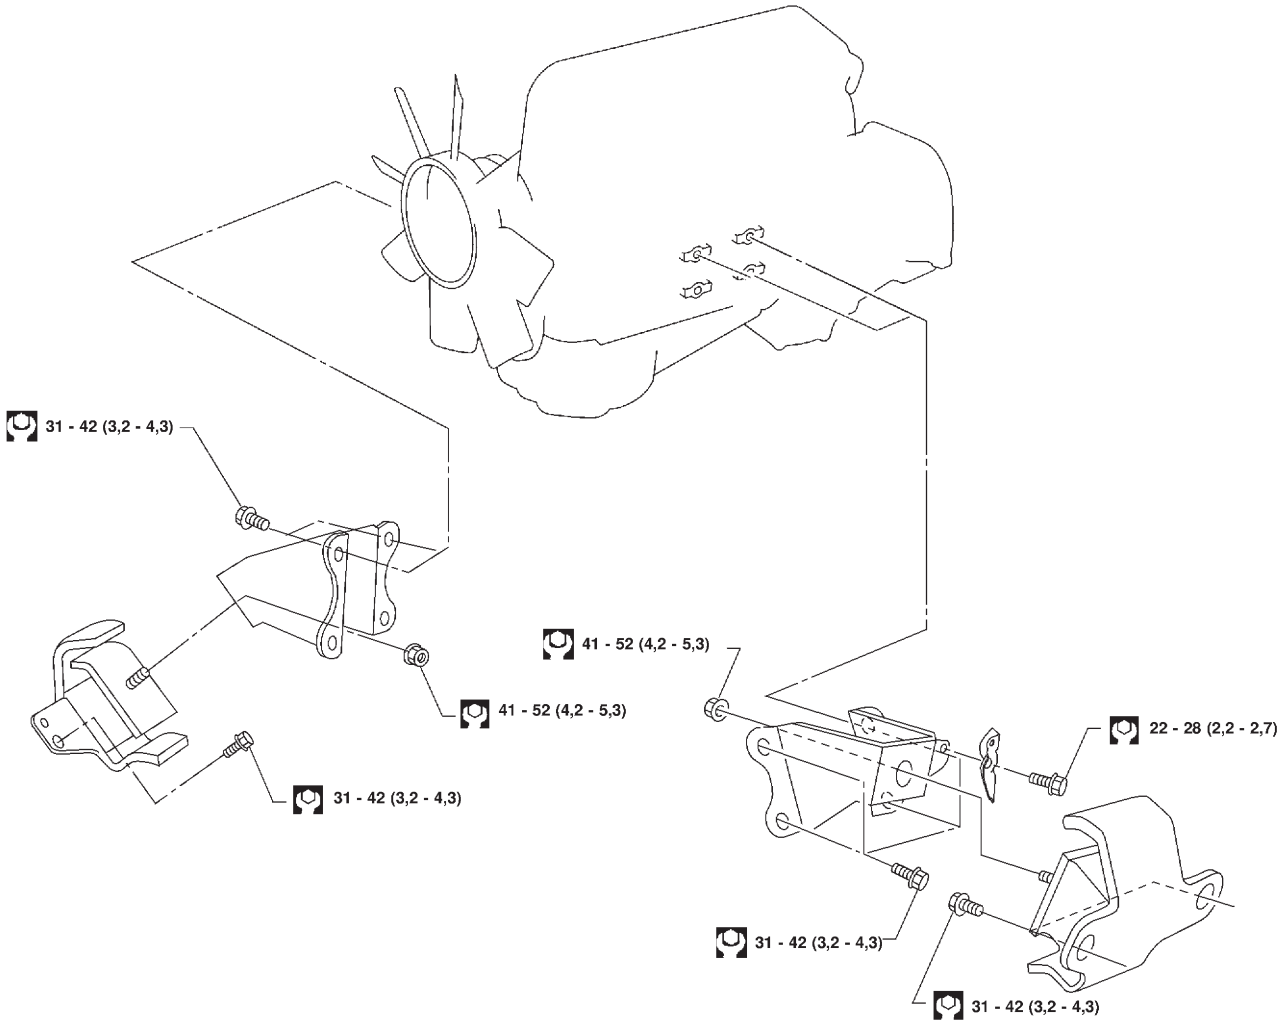
N = R + [M - 0,37 mm]

SEM308D

Les épaisseurs de cale disponibles vont de 1,96 mm à 2,68 mm, par incrémentations de 0,02 mm.

c. Sélectionner une cale neuve ayant une épaisseur la plus proche possible de la valeur calculée.
Se reporter aux SDS (caractéristiques et valeurs de réglage), EM-2055.

SEM518EB



9. Reposer la cale neuve à l'aide d'un outil adéquat.

- **Reposer en positionnant la surface sur laquelle l'épaisseur est poinçonnée vers le bas.**

10. Placer l'outil spécial (A) comme indiqué dans les étapes 2 et 3.
11. Déposer l'outil spécial (B).
12. Déposer l'outil spécial (A).
13. Vérifier à nouveau le jeu de la soupape.
Se reporter à VERIFICATION (EM-2035).

SEC. 112

: N·m (kg-m)

AEM398

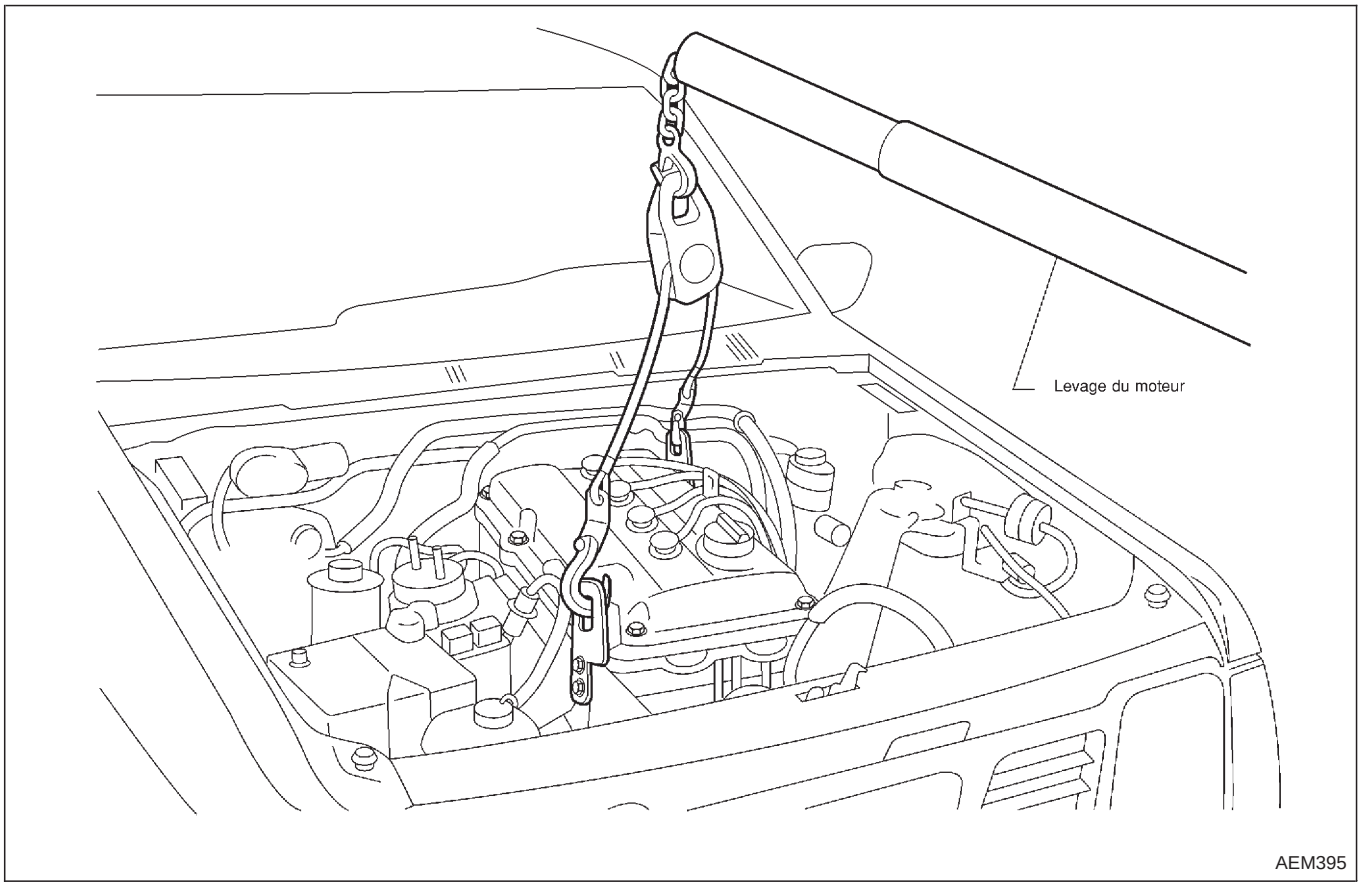
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

ATTENTION :

- **Placer le véhicule sur une surface plane et dure.**
- **Placer des cales à l'avant et à l'arrière des roues arrière.**
- **Ne pas déposer le moteur jusqu'au refroidissement complet du système d'échappement.**
  Sinon, les risques de brûlure seraient élevées et/ou un incendie pourraient rompre les canalisations de carburant.
- **Avant de débrancher le flexible à carburant, dépressuriser le carburant. Se reporter à la section EC (Relâchement de la pression de carburant, PROCEDURE D'ENTRETIEN DE BASE).**
- **S'assurer de soulever le moteur et la transmission de manière sécurisée.**
- **Pour les moteurs qui ne sont pas équipés d'élingues de moteur, fixer les boulons et les élingues décrits dans le CATALOGUE DES PIECES DETACHEES.**

PRECAUTION :

- **Lors de la levée du moteur, s'assurer de nettoyer les pièces environnantes. Faire particulièrement attention au boîtier du câble d'accélérateur, aux conduites de frein et au maître-cylindre de frein.**
- **Lors de la levée du moteur, toujours utiliser les élingues de manière sécurisée.**
- **Pour les modèles 4x4, appliquer du produit d'étanchéité entre le moteur et la transmission. Se reporter à la section MT (''Dépose et repose'').**



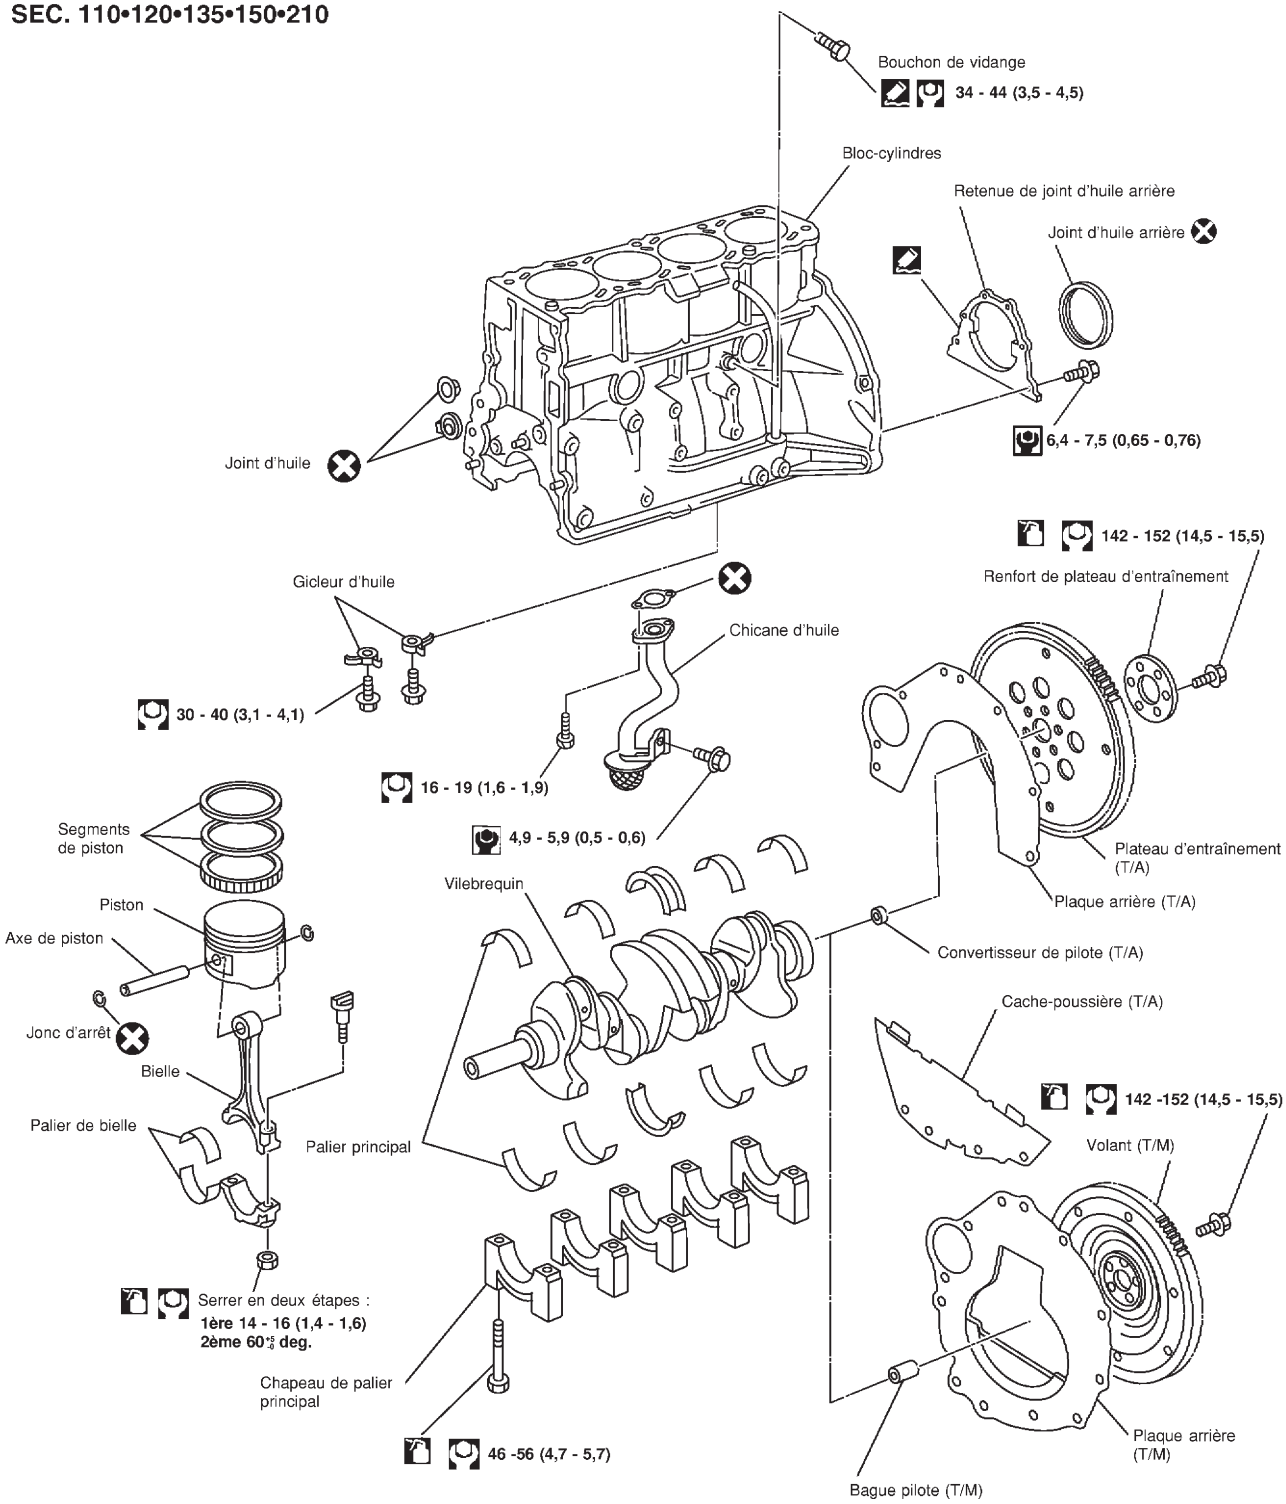
Dépose

1. Déposer le liquide de refroidissement du bloc-moteur et du radiateur. Se reporter à la section MA (''Remplacement du liquide de refroidissement moteur'' , ENTRETIEN DU MOTEUR).
2. Dépressuriser le carburant. Se reporter à la section EC (''Dépressurisation du carburant'', PROCEDURE D'ENTRETIEN DE BASE).
3. Déposer le câble négatif de la batterie.
4. Déposer le capot. Se reporter à à la section BT.
5. Déposer le filtre à air et le conduit d'air.
6. Déposer le courroie d'entraînement de direction assistée, la courroie d'entraînement de l'alternateur et la courroie d'entraînement du compresseur de climatisation.
7. Déposer le radiateur. Se reporter à la section LC (''Radiateur'', SYSTEME DE REFROIDISSEMENT DU MOTEUR).
8. Déposer la protection thermique du collecteur d'échappement.
9. Débrancher le système d'échappement du collecteur d'échappement.
10. Déposer le compresseur de climatisation de son support. Se reporter à la section HA (Fixation du compresseur, PROCEDURES D'ENTRETIEN).
11. Débrancher le câble d'accélérateur, les flexibles à dépression, les connecteurs électriques, les flexibles de chauffage et le flexible d'assistance à dépression.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Dépose (suite)

12. Déposer la pompe de direction assistée côté moteur.
13. Déposer la transmission. Se reporter à la section MT ou AT (“Dépose”,DEPOSE ET REPOSE).
14. Déposer les supports de moteur gauche et droit.
15. Déposer le moteur.



Repose

- Reposer dans l’ordre inverse de la dépose.

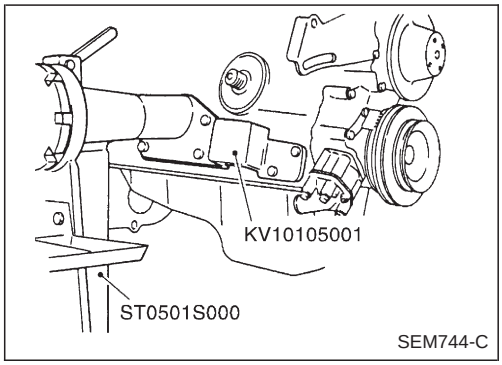
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SEC. 110•120•135•150•210

: Lubrifier avec de l'huile moteur neuve.

: Utiliser un joint liquide d'origine ou équivalent.

: N·m(kg-m)

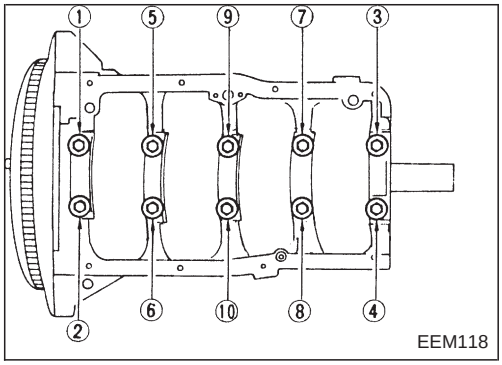


: N·m (kg-m)

SEM014G

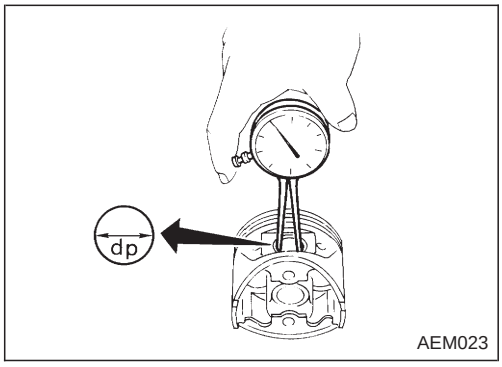
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

PRECAUTION :



- **Lors de la repose des pièces mobiles (paliers, pistons, etc...), lubrifier les surfaces de contact avec de l'huile moteur neuve.**
- **Placer les pièces déposées telles que les roulements et les chapeaux de palier dans le bon ordre et dans le bon sens.**
- **Lors de la repose des écrous de bielle et des boulons de chapeau de palier principal, appliquer de l'huile moteur neuve aux filetages et à la surface d'assise.**
- **Ne laisser aucun matériel magnétique rentrer en contact avec les dents de la couronne dentée du volant ou du plateau d'entraînement.**

Démontage



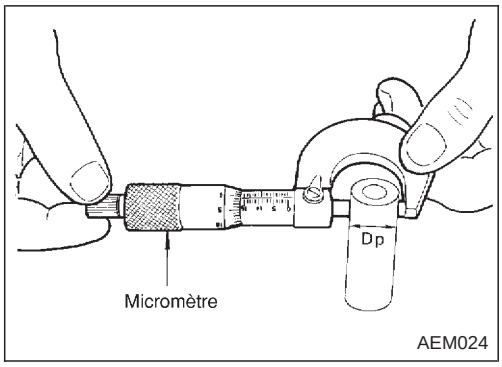
PISTON ET VILEBREQUIN

1. Placer le moteur sur un plan de travail.
2. Vidanger le liquide de refroidissement et l'huile.
3. Déposer le carter d'huile.
4. Déposer la chaîne de distribution. Se reporter à ''Dépose'' dans CHAINE DE DISTRIBUTION (EM-2016).
5. Déposer la pompe à eau.
6. Déposer la culasse.
7. Déposer les pistons avec les bielles.

8. Déposer les chapeaux de palier et le vilebrequin.

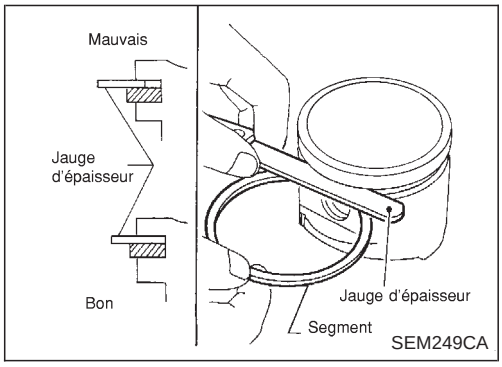
- **Avant de déposer les chapeaux de palier, mesurer le jeu axial du vilebrequin. Se reporter à EM-.2051**
- **Les boulons doivent être desserrés en deux ou trois étapes.**

Inspection



JEU DU PISTON ET DE L'AXE DE PISTON

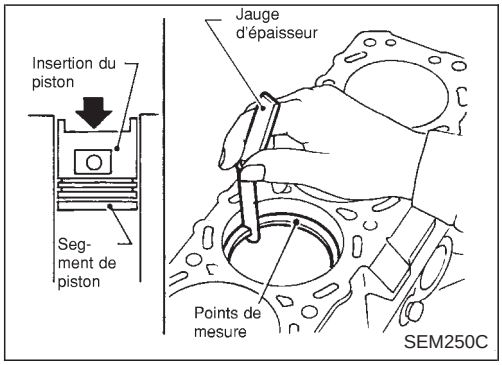
1. Mesurer le diamètre interne de l'orifice de l'axe de piston ''dp''.



Diamètre standard ''dp'' :
20,993 - 20,999 mm

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (suite)

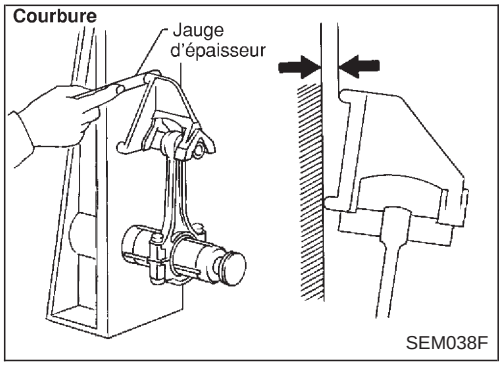


2. Mesurer le diamètre externe de l'axe de piston ''Dp''.
   Diamètre standard ''dp'' :
   20,989 - 21,001 mm
3. Calculer le jeu de l'axe de piston.
   dp - Dp = de -0,002 à 0,01 mm
   Si la valeur est supérieure à la valeur ci-dessus, remplacer l'ensemble de piston avec l'axe.

JEU LATERAL DES SEGMENTS DE PISTON

Jeu latéral :
Segment de feu 0,04 - 0,08 mm
Segment de compression 0,03 - 0,07 mm
Limite maxi. de jeu latéral : 0,1 mm

Si elle est en dehors des limites spécifiées, remplacer le segment de piston.
Si le jeu est supérieur à la limite maxi. avec un segment neuf, remplacer le piston.



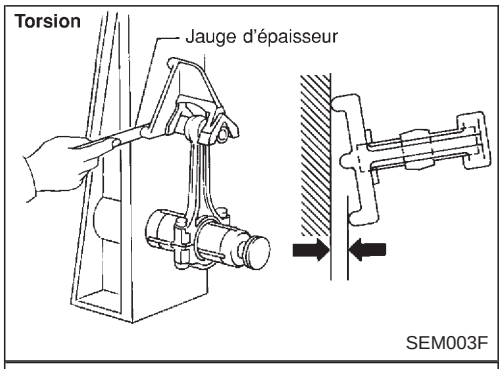
ECARTEMENT DE SEGMENT DE PISTON

Ecartement :
Segment de feu
0,28 - 0,52 mm
Segment de compression
0,45 - 0,69 mm
(R ou T est perforé sur l'anneau.)
0,55 - 0,70 mm
(N est perforé sur l'anneau.)
Segment racleur
0,20 - 0,69 mm
Limite maxi. d'écartement :
Se reporter aux SDS, EM-2059.

S'il est en dehors des limites spécifiées, remplacer le segment de piston. Si l'écartement dépasse la limite maxi. , aléser à nouveau le cylindre et utiliser le piston et les segments de piston surdimensionnés. Se reporter aux SDS, EM-2059.

- Lors du remplacement du piston, vérifier si le bloc-cylindre n'est pas éraflé ou grippé. Si des éraflures ou grippages sont détectés, remplacer le bloc-cylindre.

COURBURE ET TORSION DES BIELLES

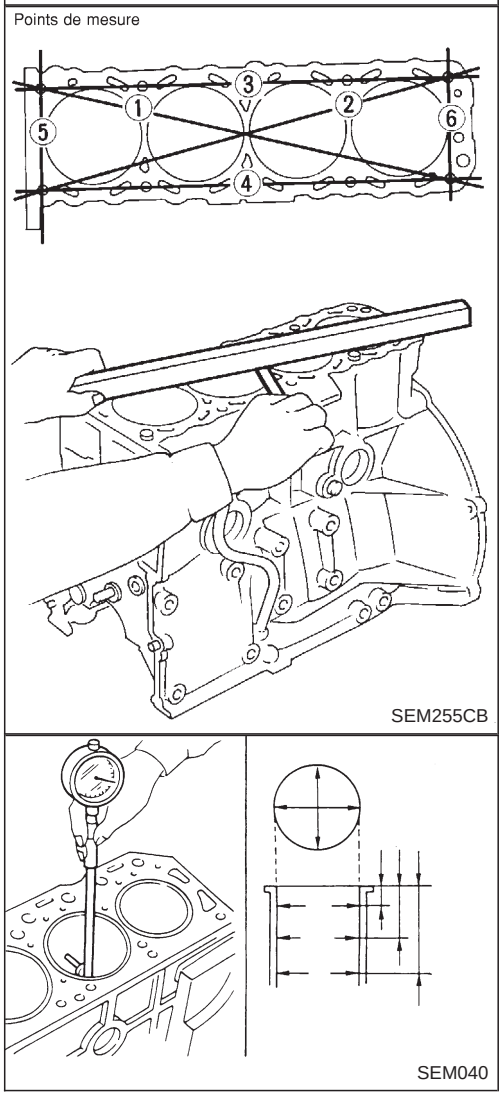


Courbure :
Limite 0,15 mm
tous les 100 mm
Torsion :
Limite 0,30 mm
tous les 100 mm

En cas de dépassement de ces valeurs, remplacer l'ensemble de bielle

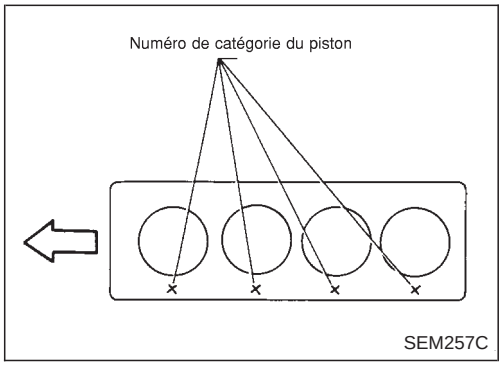
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (suite)



DEFORMATION ET USURE DU BLOC-CYLINDRE

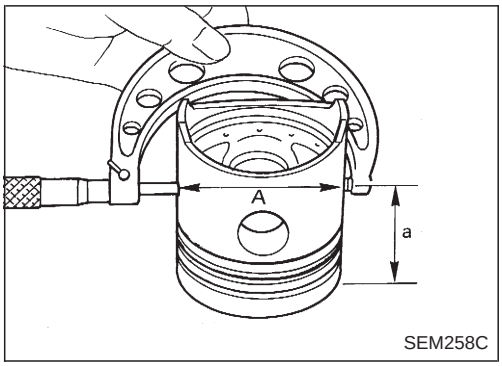
1. Nettoyer la partie supérieure du bloc-cylindre.
   Utiliser une règle fiable et une jauge d'épaisseur pour vérifier la planéité de la surface du bloc-cylindre. Vérifier les six positions indiquées sur l'illustration.
   Limite :
   0,1 mm
2. Si elle est en dehors des limites spécifiées, la rectifier.
   La limite pour la rectification du bloc-cylindre est déterminée par la rectification de la culasse.



La valeur à rectifier de la culasse est A
La valeur à rectifier de la culasse est B
La limite maxi. est comme suit :
A + B = 0,2 mm
Hauteur nominale du bloc-cylindre à partir du centre de vilebrequin :
246,95 - 247,05 mm

3. Remplacer le bloc-cylindre si nécessaire.

JEU DU PISTON A ALESER



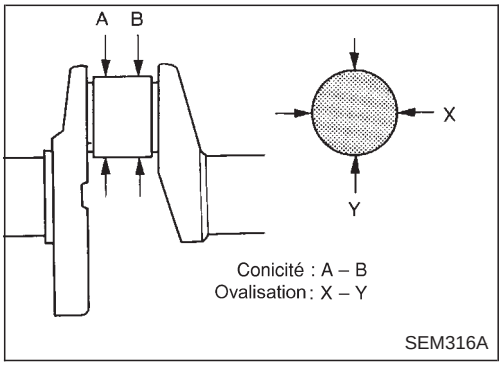
1. A l'aide d'une jauge pour alésage, mesurer l'alésage de cylindre pour déterminer l'usure, l'ovalisation et la conicité.
   Diamètre interne standard :
   Se reporter aux SDS, EM-2057.
   Limite d'usure : 0,2 mm
   Ovalisation standard (X- Y) : 0,015 mm
   Conicité (A-B) standard : 0,010 mm
   Si elle dépasse la limite, aléser à nouveau tous les cylindres. Remplacer le bloc-cylindre si nécessaire.
2. Vérifier l'absence d'éraflures et de grippage. Si des grippages sont détectés, affûter le cylindre.

- **Si le bloc-cylindre et le piston sont remplacés, faire correspondre la catégorie du piston avec le numéro de catégorie situé sur la surface supérieure du bloc-cylindre.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (suite)

3. Mesurer le diamètre de la jupe de piston.
   Diamètre de piston A :
   Se reporter aux SDS, EM-2059.
   Point de mesure ''a'' (distance en partant du haut) :
   Environ 48 mm
4. Vérifier que le jeu du piston à aléser se trouve dans la fourchette spécifiée.
   Jeu du piston à aléser B :
   0,020 - 0,040 mm
5. Déterminer la surdimension du piston selon le degré d'usure du cylindre.



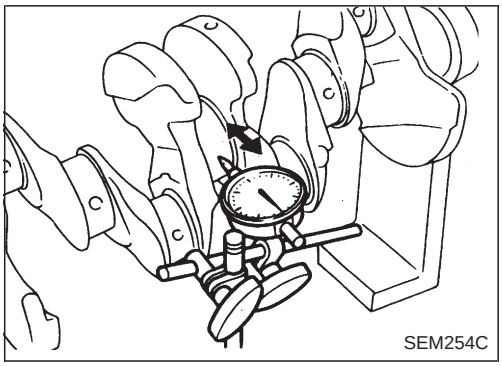
Pistons surdimensionnés pour entretien. Se reporter aux SDS, EM-2059.

6. La taille de l'alésage de cylindre est déterminée en ajoutant le jeu du piston à aléser au diamètre de piston A.
   Calcul de la taille de réalésage :
   D = A + B - C où,
   D : diamètre d'alésage
   A : diamètre de piston mesuré
   B : jeu du piston à aléser
   C : tolérance de finition 0,02 mm
7. Reposer les chapeaux de palier principal et serrer les boulons au couple spécifié. Cela empêchera la déformation des alésages de cylindre.
8. Couper les alésages de cylindres.

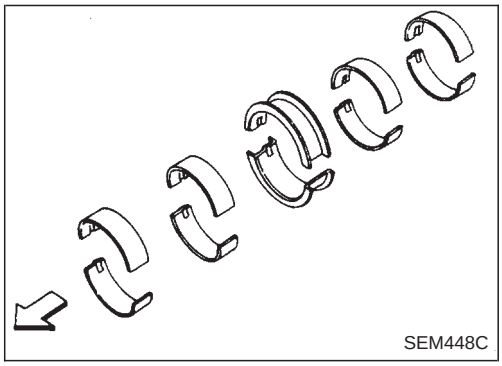
- **Lorsqu'un cylindre a besoin d'un réalésage, tous les autres cylindres doivent aussi être réalésés.**
- **Couper petit à petit l'alésage de cylindre. Couper par tranche de 0,05 mm.**

9. Affûter les cylindres pour obtenir le jeu spécifié du piston à aléser.
10. Mesurer l'alésage de finition du cylindre en recherchant s'il y a ovalisation ou conicité.

- **La mesure doit être prise une fois que l'alésage du cylindre est refroidi.**



VILEBREQUIN



1. Vérifier si le vilebrequin principal et les manetons ne sont pas rayés, usés ou fendus.
2. Mesurer les tourillons pour vérifier la conicité et l'ovalisation avec un micromètre.
   Ovalisation (X- Y):
   Tourillon Inférieur à 0,01 mm
   Maneton Inférieur à 0,005 mm
   Conicité (A- B) :
   Tourillon Inférieur à 0,01 mm
   Maneton Inférieur à 0,005 mm

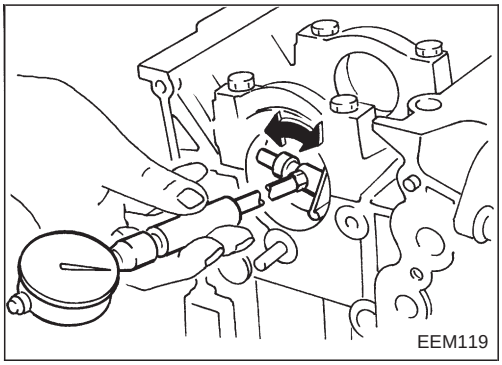
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (suite)

SEM254C

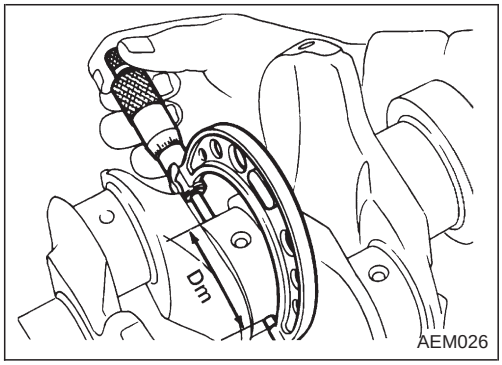
3. Mesurer le voile du vilebrequin.
   Voile (indication totale de la jauge) :
   Inférieur à 0,10 mm

SEM448C



JEU DE PALIER

- Utiliser la méthode A ou la méthode B. La méthode A est préférable car c'est la plus précise.



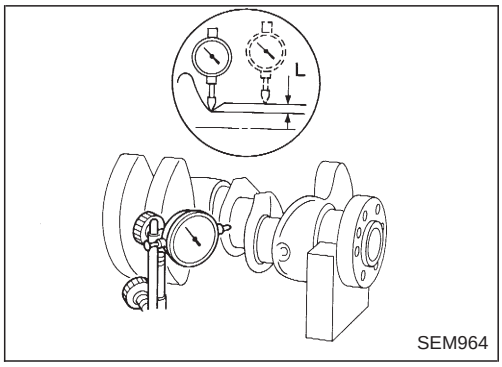
Méthode A (à l'aide de la jauge pour alésage et du micromètre)

Palier principal

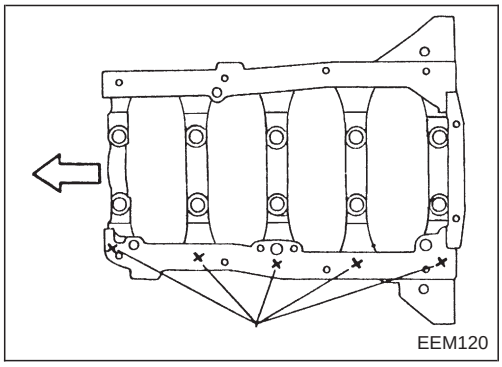
1. Engager les paliers principaux dans leur bonne position sur le bloc-cylindre et sur le chapeau de palier principal.

EEM119

2. Reposer le chapeau de palier principal sur le bloc-cylindre.
- **Serrer tous les boulons dans le bon ordre en deux ou trois étapes. Se reporter à EM-2041 et EM-2050.**
3. Mesurer le diamètre interne A de chaque palier principal.

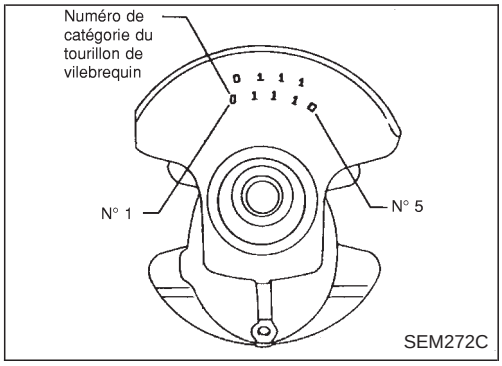


AEM026



4. Mesurer le diamètre externe ''Dm'' de chaque tourillon de vilebrequin.
5. Calculer le jeu de palier principal.
   Jeu du palier principal = A- Dm
   Standard :
   0,020 - 0,047 mm
   Limite :
   0,1 mm
6. Si la valeur excède la limite, remplacer le palier.
7. Si le jeu ne peut être réglé dans les valeurs standard de palier, affûter le tourillon de vilebrequin et utiliser une taille inférieure de palier.

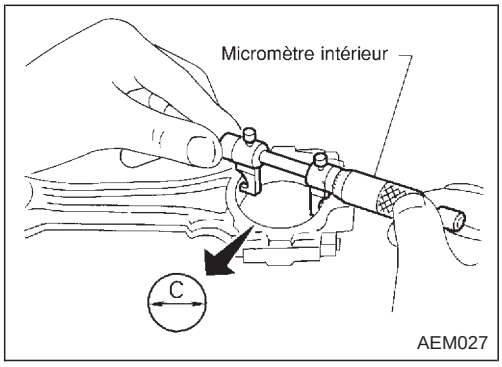
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Inspection (suite)

a. Lors de l'affûtage du tourillon de vilebrequin, confirmer que la dimension L est supérieure à la limite spécifié en le faisant rouler.
L : 0,1 mm
b. Se reporter aux SDS, EM-2060 et EM-2061 pour l'affûtage et les pièces de rechange disponibles pour le vilebrequin.

8. Si le vilebrequin est réutilisé, mesurer le jeu du palier principal et sélectionner l'épaisseur du palier principal.
Si le vilebrequin ou le bloc-cylindre est remplacé, sélectionner l'épaisseur des paliers principaux comme suit :
a. Le numéro de catégorie de chaque tourillon de bloc-cylindres est poinçonné sur le bloc-cylindre respectif. Ces numéros sont poinçonnés soi ten chiffres arabes soit en chiffres romains.

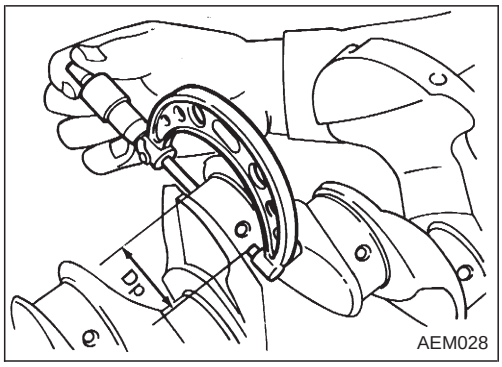


b. Le numéro de catégorie de chaque tourillon de vilebrequin est poinçonné sur le vilebrequin. Ces numéros sont poinçonnés soit en chiffres arabes soit en chiffres romains.
c. Sélectionner le palier principal avec l'épaisseur adéquate selon le tableau ou l'exemple suivant.

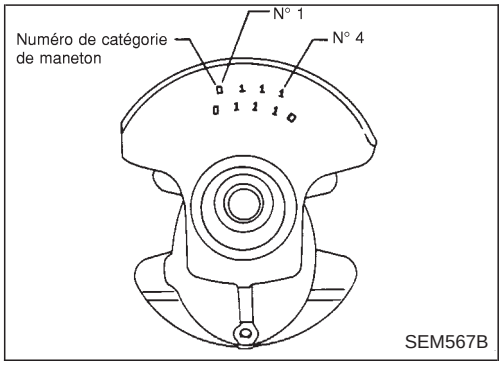
Par exemple :
Numéro de catégorie du tourillon sur le bloc-cylindre : 1
Numéro de catégorie du tourillon de vilebrequin : 2
Numéro de catégorie du palier principal= 1 + 2
= 3 (jaune)

Numéro de catégorie et couleur d'identification du palier principal :

		Numéro de catégorie du tourillon sur le bloc-cylindre		
		0	1	2
Numéro de catégorie du tourillon de vilebrequin	0	0 (noir)	1 (marron)	2 (vert)
	1 ou I	1 (marron)	2 (vert)	3 (jaune)
	2 ou II	2 (vert)	3 (jaune)	4 (bleu)



Palier de bielle (tête de bielle)

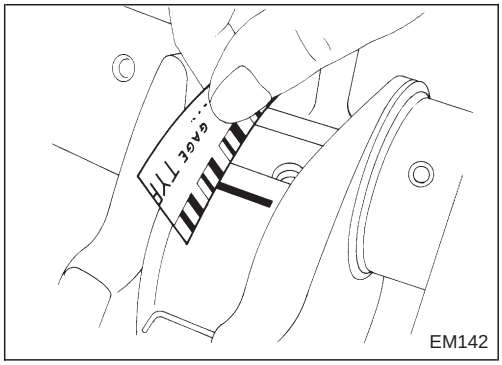


1. Reposer le palier de bielle sur la bielle et le chapeau de bielle.
2. Reposer le chapeau de bielle sur la bielle.
● **Serrer les boulons au couple spécifié.**
3. Mesurer le diamètre interne C de chaque palier.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (suite)

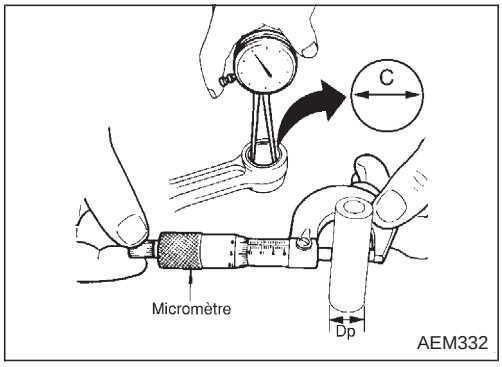
4. Mesurer le diamètre externe ‘‘Dp’’ de chaque tourillon de vilebrequin.
5. Calculer le jeu de palier de bielle.
   Jeu de palier de bielle = C - Dp:
   Standard
   0,010 - 0,035 mm
   Limite
   0,09 mm
6. Si la valeur excède la limite, remplacer le palier.
7. Si le jeu ne peut pas être réglé conformément aux valeurs standard d’un des paliers, affûter le tourillon de vilebrequin et utiliser un palier de taille inférieure. Se reporter à l’étape 5 de JEU DE ROULEMENT, EM-2046.



8. Si le vilebrequin est remplacé, sélectionner le palier de bielle selon le tableau suivant.

Numéro de catégorie de palier de bielle

Ces numéros sont poinçonnés soit en chiffres arabes soit en chiffres romains.

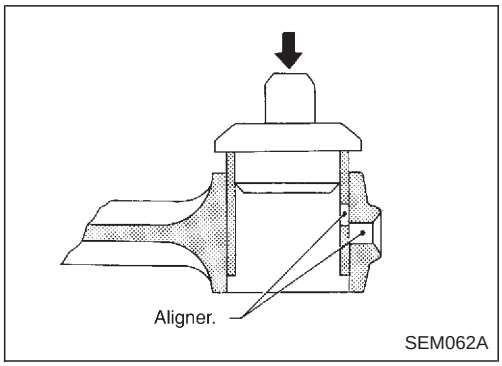


Numéro de catégorie de maneton	Numéro de catégorie de palier de bielle
0	0
1 ou I	1
12 ou II	2

Méthode B (à l’aide d’une cale en plastique)

PRECAUTION :

- **Ne pas tourner le vilebrequin ou la bielle lorsque la cale en plastique est en phase d’insertion.**
- **Lorsque le jeu de palier dépasse les limites spécifiées, s’assurer que le palier correct a été reposé. Puis, si un jeu de palier excessif est détecté, utiliser un palier principal plus épais de telle sorte que le jeu de palier spécifié soit obtenu.**



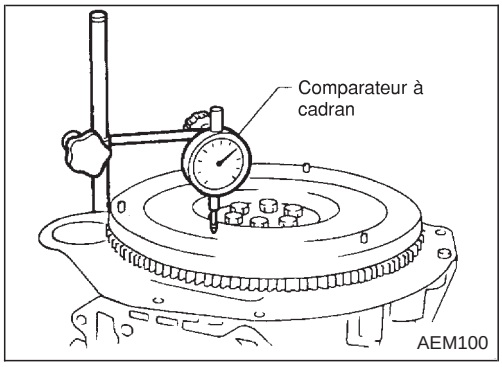
JEU DE BAGUE DE BIELLE (pied de bielle)

1. Mesurer le diamètre interne C de la bague.
2. Mesurer le diamètre externe de l’axe de piston ‘‘Dp’’.
3. Calculer le jeu de bague de bielle.
   C - Dp =
   0,005 - 0,017 mm (standard)
   0,023 mm (limite)
   Si la valeur n’est pas conforme aux spécifications, remplacer l’ensemble de bielle et/ou l’ensemble de pignon avec l’axe.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (suite)

REMPLACEMENT DE LA BAGUE DE BIELLE (pied de bielle)



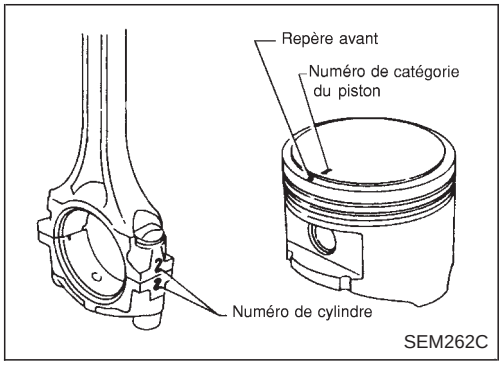
1. Enfoncer la bague de pied de bielle jusqu'à ce qu'il soit au même niveau que la surface d'extrémité de bielle.

S'assurer d'aligner les orifices d'huile.

2. Aléser la bague jusqu'à ce que le jeu avec l'axe de piston soit conforme aux spécifications.

Jeu entre la bague de bielle et l'axe de piston :
0,005 - 0,017 mm

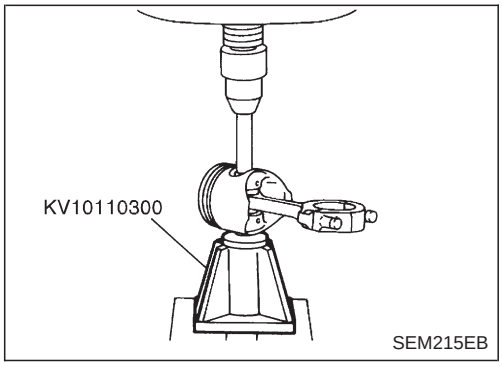
VOLANT/VOILE DU PLATEAU D'ENTRAINEMENT



Voile (indication totale de la jauge) :
Volant (modèle à boîte manuelle)
Inférieure à 0,15 mm
Plateau d'entraînement (modèle avec T/A)
Inférieure à 0,15 mm

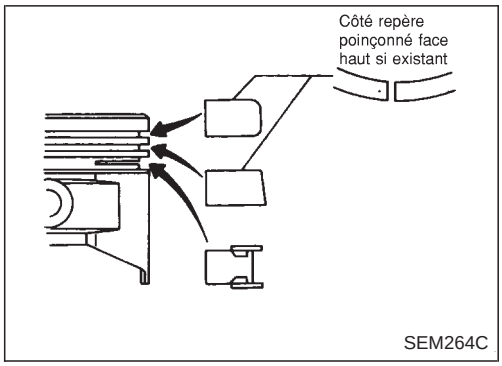
PRECAUTION :

- **Veiller à ne pas endommager les dents de la couronne dentée.**
- **Vérifier que le plateau d'entraînement n'est pas déformé et fendu.**
- **Ne laisser aucun matériel magnétique rentrer en contact avec les dents de la couronne dentée.**
- **Ne pas rectifier le volant. Remplacer si nécessaire.**



Remontage

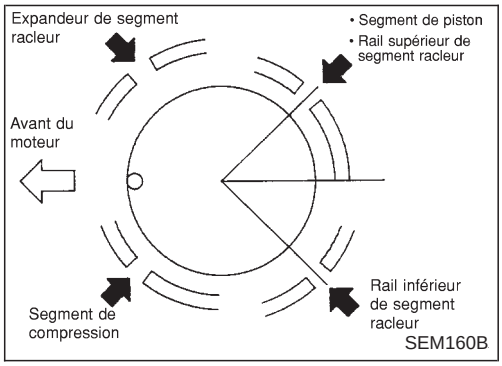
PISTON



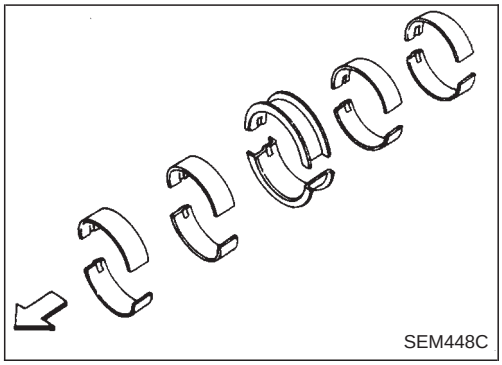
1. Chauffer le piston à une température comprise entre 60° et 70° et monter le piston, l'axe de piston et la bielle.

- **Aligner le sens du piston et de la bielle.**
- **Les numéros poinçonnés sur la bielle et le chapeau correspondent à chaque cylindre.**
- **Après le montage, s'assurer que la bielle bouge librement.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



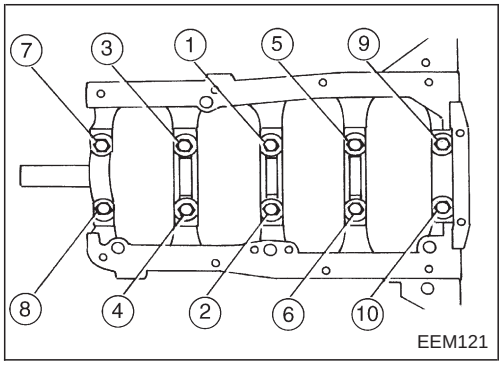
Remontage (suite)



2. Engager les segments de piston tel que cela est indiqué.

PRECAUTION :

- **Lorsque les segments de piston ne sont pas remplacés, s'assurer que les segments de piston sont montés dans leurs positions d'origine.**
- **Lorsque des segments de piston sont en cours de remplacement et qu'il n'y a aucun repère poinçonné, les segments de piston peuvent être monté avec l'une ou l'autre face vers le haut.**

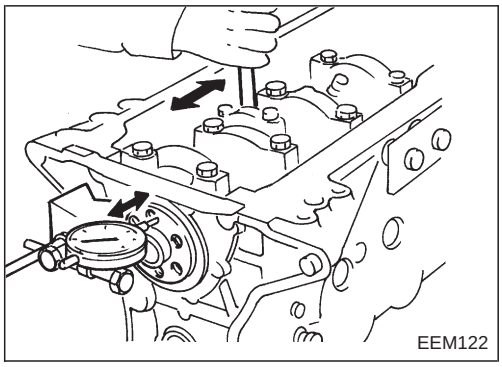


3. Aligner les segments de piston de telle sorte que les écartements soient dans la position indiquée.

VILEBREQUIN

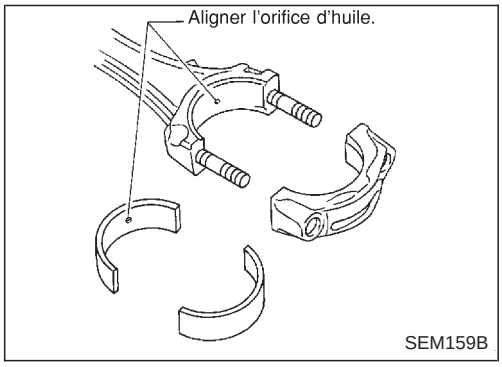
1. Engager les paliers principaux dans leur bonne position sur le bloc-cylindre et sur les chapeaux de palier principal.

- **Confirmer que les bons paliers principaux sont utilisés. EM-2046.**
- **Appliquer de l'huile moteur neuve aux surfaces de palier.**



2. Reposer le vilebrequin et les chapeaux de palier principal et serrer les boulons au couple spécifié. Se reporter à EM-2041.

- **Appliquer de l'huile moteur neuve sur les parties filetées des boulons et les surfaces d'appui.**
- **Avant de serrer les boulons de chapeau de palier, placer le chapeau de palier dans sa position correcte en mettant le vilebrequin dans une position axiale.**
- **Serrer les boulons de chapeau de palier petit à petit en deux ou trois étapes. Commencer par le palier central et continuer vers l'extérieur comme indiqué sur l'illustration.**
- **Après avoir fixé les boulons de chapeau de palier, confirmer la rotation du vilebrequin en le faisant tourner légèrement à la main.**

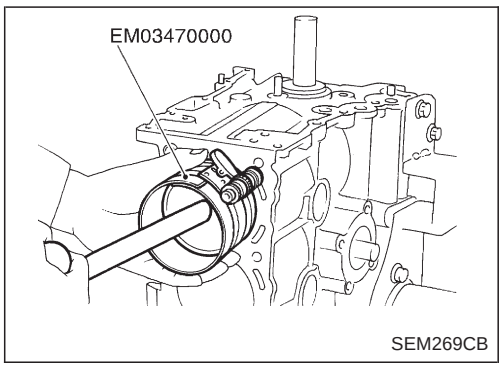


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Remontage (suite)

EEM122

3. Mesurer le jeu axial du vilebrequin.
   Jeu axial du vilebrequin :
   Standard
   0,05 - 0,18 mm
   Limite
   0,3 mm

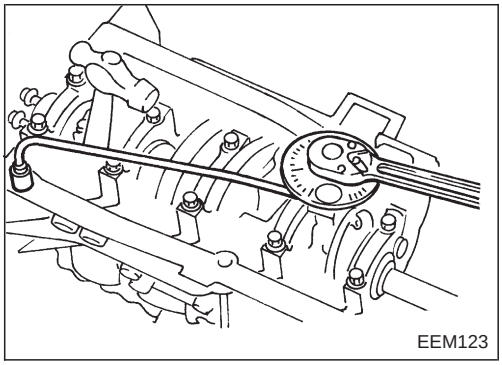


Si la valeur est au-delà de la limite, remplacer le palier n°3 par un neuf.

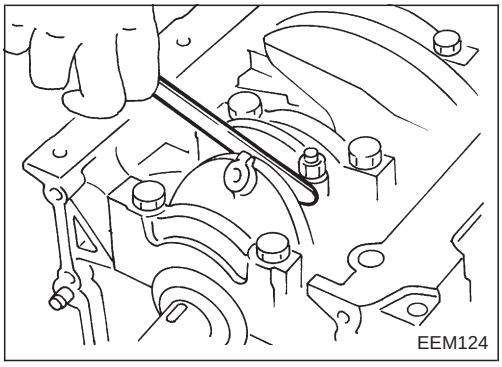
SEM159B

4. Reposer les paliers de bielle dans les bielles et les chapeaux de bielle.

- **Confirmer que les bons paliers sont utilisés. Se reporter à EM-2048.**
- **Reposer les paliers de telle sorte que l'orifice d'huile dans la bielle soit aligné avec l'orifice d'huile du palier.**
- **Appliquer de l'huile moteur neuve aux surfaces de palier, aux parties filetées des boulons et aux surfaces d'assise.**



SEM269CB



5. Reposer les pistons avec les bielles.

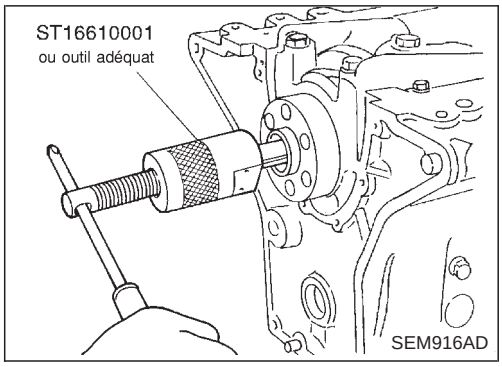
a. Les reposer dans les cylindres correspondants avec l'outil spécial.

- **Disposer de telle sorte que le repère avant sur la tête de piston soit face à l'avant du moteur.**
- **S'assurer que la bielle n'érafle pas la paroi du cylindre.**
- **S'assurer que les boulons de bielle n'érafle pas les tourillons de vilebrequin.**
- **Appliquer de l'huile moteur neuve aux segments de piston et à la surface de glissement du piston.**

EEM123

b. Reposer les chapeaux de palier de bielle.
Serrer les écrous de chapeau de bielle en suivant la procédure suivante.
   Ecrou de palier de bielle :
   (1) Serrer entre 14 et 16 N·m (1,4 à 1,6 kg-m).
   (2) Serrer les boulons à 60^{+5}_{0} degrés dans le sens des aiguilles d'une montre avec une clé angulaire.
   S'il n'y a pas de clé angulaire disponible, les serrer entre 38 et 44 N·m (3,9 à 4,5 kg-m).

EEM124



6. Mesurer le jeu latéral de la bielle.
   Jeu latéral de la bielle :
   Standard
   0,2 - 0,4 mm
   Limite
   0,6 mm

Si la valeur est supérieure à la limite, remplacer la bielle et/ou le vilebrequin.

AVANT-PROPOS

Ce manuel contient les travaux d'entretien et de réparation concernant les véhicules NISSAN PICKUP, série des modèles D22.

A des fins de sécurité et pour que le rendement des véhicules concernés soit optimal, prière de lire ce manuel complètement. Avant de commencer à entreprendre des travaux, il est particulièrement important d'avoir parfaitement assimilé les PRECAUTIONS signalées dans la section GI.

Toutes les informations contenues dans ce manuel sont basées sur les données de production les plus récentes au moment de la réalisation du manuel. Nous nous réservons le droit de modifier les caractéristiques et les méthodes de travail à n'importe quel moment et sans avis préalable.

NOTE IMPORTANTE DE SECURITE

Un entretien correctement effectué est essentiel, aussi bien pour la sécurité des mécaniciens que pour le fonctionnement adéquat du moteur. Les méthodes d'entretien reprises dans ce manuel de réparation sont décrites de telle manière que le travail puisse être effectué en sécurité et avec précision. Les entretiens varient selon les procédures, les connaissances du technicien et l'outillage, ainsi que les pièces disponibles. Dès lors, toute personne utilisant les procédures d'entretien, un outillage ou des pièces qui ne sont pas spécifiquement recommandées par NISSAN doit auparavant être absolument certain que ceci n'entraîne de danger ni pour sa propre sécurité, ni pour celle du moteur.

Pour que l'entretien puisse être exécuté en toute sécurité et de manière correcte, il importe que les précautions suivantes soient rigoureusement prises. Ces précautions ne sont pas indiquées dans chaque section.

SGI646

''COUSSIN GONFLABLE'' et ''PRETENSIONNEUR DE CEINTURE DE SECURITE'' du système de retenue supplémentaire (SRS)

Utilisé conjointement avec une ceinture de sécurité, les systèmes de retenue supplémentaire tels que le ''COUSSIN GONFLABLE'' et le ''PRETENSIONNEUR DE CEINTURE DE SECURITE'' permettent de réduire les risques de blessures graves subies par le conducteur et le passager avant lors de collision frontale. La composition du système de retenue supplémentaire disponible sur le MODELE D22 NISSAN est la suivante (la composition variera en fonction de la destination et de l'équipement optionnel) :

Le système de retenue supplémentaire se compose d'un module de coussin gonflable côté conducteur (situé dans le moyeu du volant), d'un module de coussin gonflable côté passager (situé sur le tableau de bord, côté passager), de prétensionneurs de ceinture de sécurité, d'un boîtier de capteurs de diagnostic, d'un témoin d'avertissement, d'un faisceau de câblage et d'un câble spiralé.

Les informations nécessaires à l'entretien sans danger du système se trouvent à la **section RS** de ce Manuel de Réparation.

ATTENTION :

- **Pour ne pas affecter le fonctionnement du SRS, ce qui augmenterait les risques de blessures graves ou mortelles en cas de collision entraînant le déploiement du coussin gonflable (air bag), toutes les opérations d'entretien doivent être effectuées par un concessionnaire NISSAN agréé.**
- **Un entretien incorrect, y compris une mauvaise dépose ou repose du SRS, peut entraîner des risques de blessures dus au déploiement accidentel du système. Pour la dépose du câble spiralé et du module de coussin gonflable, se reporter à la section RS.**
- **Ne pas utiliser d'équipement d'essai électrique sur les circuits connexes du SRS sauf sur indication de ce manuel de réparation. Le câble spiralé et les faisceaux de câblage (à l'exception du ''PRETENSIONNEUR DE CEINTURE DE SECURITE'') recouverts d'une gaine d'isolation jaune placée juste avant les connecteurs de faisceau ou couvrant l'ensemble du faisceau sont reliés au SRS.**

Codes de schéma de câblage (codes de cellule)

Utiliser l'organigramme ci-dessous pour trouver chaque signification de code de schéma de câblage.
Consulter le code du schéma de câblage dans l'index alphabétique pour trouver l'emplacement (numéro de page) de chaque schéma de câblage.

Code	Section	Nom du schéma de câblage
AAC/V	EC	Soupape IACV-AAC
ABS	BR	Système anti-enrayeur des freins
A/C	HA	Climatiseur
AUDIO	EL	Système Audio
BACK/L	EL	Feux de recul
BUZZER	EL	Témoin sonore
CHARGE	EL	Système de charge
STAR-TER	EC	Starter automatique
CMPS	EC	Capteur d'angle d'arbre à cames
COOL/F	LC	Commande du ventilateur de refroidissement
DEF	EL	Désembuage de lunette arrière
D/LOCK	EL	Verrouillage électrique de porte
ECTS	EC	Capteur de température du moteur
PGC/V	EC	Electrovanne de commande de purge de cartouche
FCUT	EC	Electrovanne de coupure de carburant
FICD	EC	Electrovanne FICD
FIPOT	EC	Pot ISC-FI
FPCM	EC	Module de commande de la pompe à carburant
F/PUMP	EC	Pompe d'alimentation
F/RTN	EC	Electrovanne de commande de retour de carburant
GLOW	EC	Système de préchauffage rapide
H/LAMP	EL	Phares
HEAT	HA	Chauffage
HO2S	EC	Sonde à oxygène chauffée
HORN	EL	Avertisseur sonore, allume-cigare, montre
IATS	EC	Capteur de température d'air d'admission
IDLE	EC	Commande IACV-montée en ralenti
IGN	EC	Système d'allumage
IGN/SG	EC	Signal d'allumage

Code	Section	Nom du schéma de câblage
ILL	EL	Eclairage
INJECT	EC	Injecteur
INT/L	EL	Eclairages intérieur et auxiliaire
MAFS	EC	Débitmètre d'air
MAIN	EC	Circuit d'alimentation électrique principal et de mise à la masse
METER	EL	Compteur de vitesse, compte-tours et capteur de température et jauge de carburant
MIL/DL	EC	Témoin de défaut (MIL) et connecteur de diagnostic pour CONSULT
MIRROR	EL	Rétroviseur de porte électrique
P/ANT	EL	Antenne électrique
PLA	EC	Commande d'avance à charge partielle
PNP/SW	EC	Contact de position de stationnement/point mort
POWER	EL	Disposition de l'alimentation électrique
PST/SW	EC	Manocontact d'huile de direction assistée
SRS	RS	Système de retenue supplémentaire
S/SIG	EC	Signal de démarrage
START	EL	Système de démarrage
STOP/L	EL	Feu de stop
SWL/V	EC	Electrovanne de commande de vanne de tourbillon
TAIL/L	EL	Feux de stationnement, éclairage de plaque minéralogique et feux arrière
TPS	EC	Capteur de position de papillon
TURN	EL	Clignotant et feux de détresse
VSS	EC	Capteur de vitesse du véhicule
WARN	EL	Témoins d'avertissement
WINDOW	EL	Lève-glace électrique
WIPER	EL	Essuie-glace et lave-glace avant

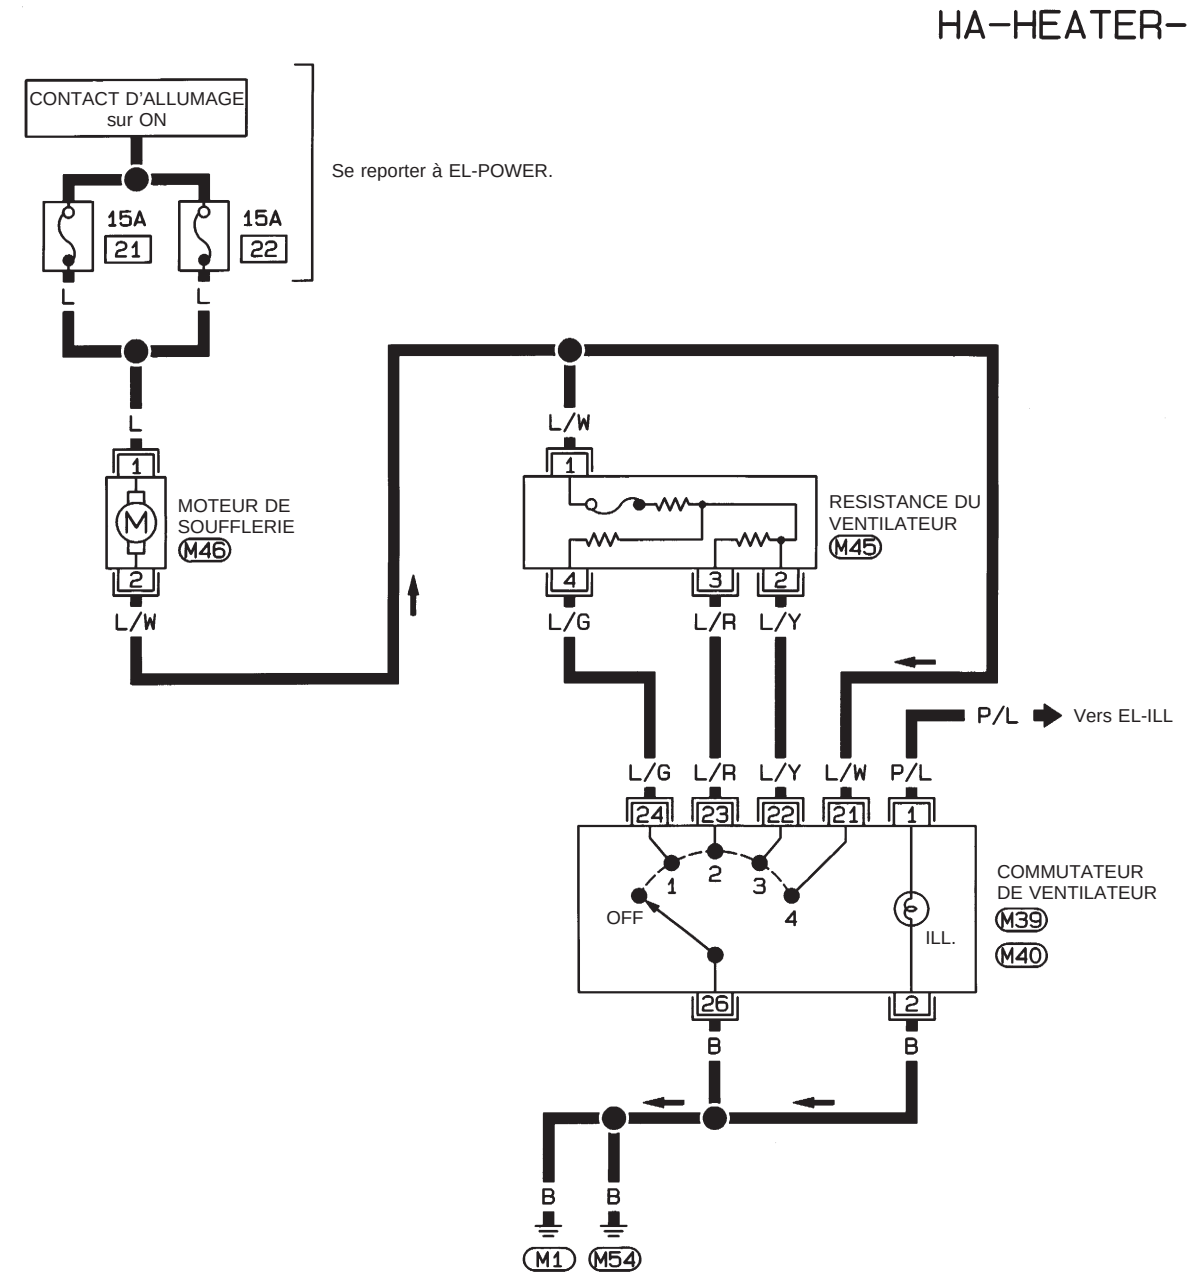
Lire la section GI : '' COMMENT LIRE LES SCHEMAS DE CABLAGE''
Voir la section EL, ''DISPOSITION DE L'ALIMENTATION ELECTRIQUE'' pour connaître les circuits de distribution de l'alimentation électrique.
Se reporter aux chapitres '' COMMENT LIRE LES ORGANIGRAMMES DANS LES DIAGNOSTICS DES DEFAUTS' ET ''COMMENT EFFECTUER UN DIAGNOSTIC EFFICACE EN CAS D'INCIDENT ELECTRIQUE' à la section GI pour effectuer le diagnostic des défauts.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

‘‘COUSSIN GONFLABLE’’ (AIR BAG) et ‘‘PRETENSIONNEUR DE CEINTURE DE SECURITE’’ du Système de retenue supplémentaire (SRS)

Utilisé conjointement avec une ceinture de sécurité, les systèmes de retenue supplémentaire tels que le ‘‘COUSSIN GONFLABLE’’ et le ‘‘PRETENSIONNEUR DE CEINTURE DE SECURITE’’ permettent de réduire les risques de blessures graves subies par le conducteur et le passager avant lors de collisions frontales. La composition du système SRS disponible pour le MODELE NISSAN D22 est la suivante (la composition varie selon les pays et l’équipement optionnel) :
Un module de coussin gonflable côté conducteur (situé dans le moyeu du volant), un module de coussin gonflable côté passager avant (situé sur le tableau de bord, côté passager), un prétensionneur de ceintures de sécurité, un boîtier de capteurs de diagnostic, un témoin d’avertissement, un faisceau de câblage et un câble spiralé.
Les informations nécessaires pour entretenir le système en toute sécurité sont fournies dans la **section RS** de ce manuel de réparation.

ATTENTION :



- **Pour ne pas affecter le fonctionnement du SRS, ce qui augmenterait les risques de blessures graves ou mortelles en cas de collision entraînant le déploiement du coussin gonflable, toutes les opérations d’entretien doivent être effectuées par un concessionnaire NISSAN agréé.**
- **Un entretien incorrect, y compris une dépose et une repose incorrectes du système de retenue supplémentaire (SRS), peut être à l’origine de blessures provoquées par une activation involontaire du système. Pour la dépose du câble spiralé et du module de coussin gonflable, se reporter à la section RS.**
- **Ne pas utiliser d’équipement d’essai électrique sur les circuits connexes du SRS sauf si indiqué dans le Manuel de Réparation. Le câble spiralé et les faisceaux de câblage (à l’exception du ‘‘PRETENSIONNEUR DE CEINTURE DE SECURITE’’) recouverts d’une gaine d’isolation jaune placée juste avant les connecteurs de faisceau ou couvrant l’ensemble du faisceau sont reliés au SRS.**

Embrayage magnétique

PROCEDURE DE DIAGNOSTIC

Sauf pour les moteurs KA

SYMPTOME : L'embrayage magnétique ne s'enclenche pas lorsque l'interrupteur de climatiseur et le commutateur de ventilateur sont enclenchés.

A

VERIFIER L'ALIMENTATION ELECTRIQUE DU COMPRESSEUR.
Débrancher le connecteur de faisceau du compresseur.
Y a-t-il une tension d'environ 12 volts entre la borne (1) du faisceau de compresseur et la masse de carrosserie ?

Oui → Vérifier les points suivants.
- Bobine d'embrayage magnétique
- Protecteur thermique (sauf pour le Moyen-Orient)

Mauvais → Remplacer l'embrayage magnétique. Se reporter à la page HA-1091 du MANUEL DE REPARATION D22 n° de publication SM8F-0D22EOE.

Non

B

Remarque

Vérifier la continuité du circuit entre la borne (5) du faisceau de relais de climatiseur et la borne (1) du faisceau de compresseur.
Il doit y avoir continuité.
Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité.

Bon

C

VERIFIER L'ALIMENTATION ELECTRIQUE DU RELAIS DE CLIMATISEUR.
Y a-t-il une tension d'environ 12 volts entre les bornes (1), (3) du faisceau de relais de C/A et la masse de carrosserie ?

Non → Vérifier le circuit de l'alimentation électrique et le fusible de 7,5A (n° 23, situé dans le boîtier à fusibles).
Se reporter à "DISPOSITION DE L'ALIMENTATION ELECTRIQUE" à la section EL et au schéma de câblage.

Oui

VERIFIER LE RELAIS DE CLIMATISEUR APRES L'AVOIR DECONNECTE.
Se reporter à la page HA-2022.

Mauvais → Remplacer le relais de climatiseur.

Bon

Reconnecter le relais de climatiseur.

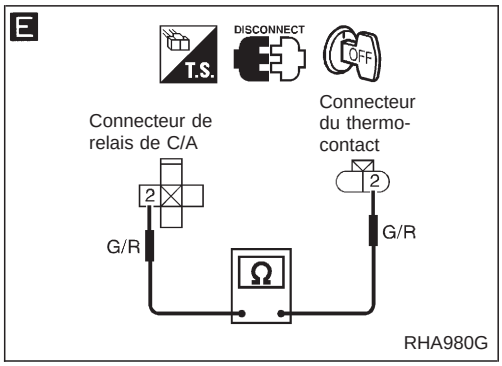
Moteurs TD25 et TD25Ti → (A) (Passer à la page suivante).

Sauf pour les moteurs TD25 et TD25Ti

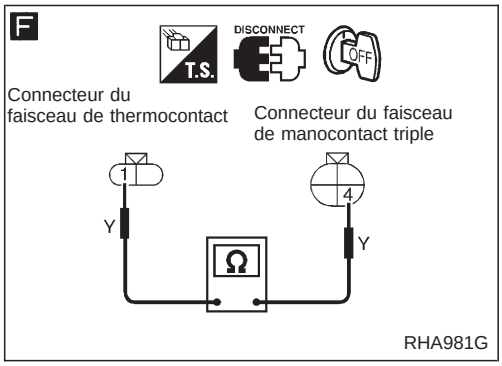
D

Remarque

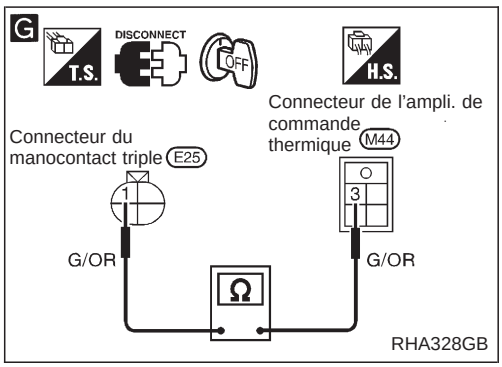
Vérifier la continuité du circuit entre la borne (2) du faisceau de relais C/A et la borne (4) du faisceau de manocontact triple.
Il doit y avoir continuité.
Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité.



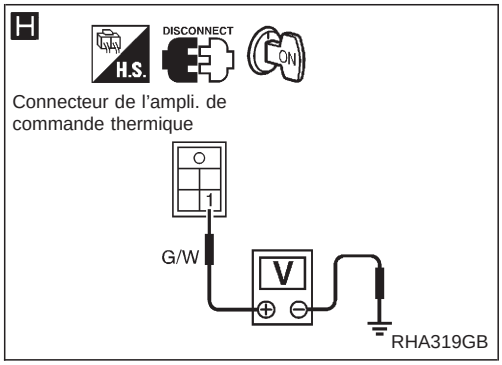
Bon



(B) (Passer à la page suivante).



Remarque :
Si le résultat est mauvais ou "Non" après la vérification de la continuité du circuit, réparer le faisceau ou le connecteur.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Embrayage magnétique (suite)

Ⓐ

E Remarque

Vérifier la continuité du circuit entre la borne n° ② du faisceau de relais de C/A et la borne n° ② du faisceau de thermocontact.
Il doit y avoir continuité.
Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité.

Bon ↓

VERIFIER LE THERMOCONTACT. Se reporter à la page HA-2023. → Mauvais → Remplacer le thermocontact.

Bon ↓

F Remarque

Vérifier la continuité du circuit entre la borne n° ① du faisceau du thermocontact et la borne n° ④ du faisceau de manocontact triple.
Il doit y avoir continuité.
Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité.

Bon ↓

Ⓑ Non ↓

VERIFIER LE MANOCONTACT TRIPLE. Se reporter à la page HA-2023. → Mauvais → Vérifier la quantité de remplissage de réfrigérant. → Bon → Remplacer le manocontact triple.

Bon ↓

G Remarque

Vérifier la continuité du circuit entre la borne n° ① du faisceau du manocontact triple et la borne n° ③ du faisceau de l'ampli. de commande thermique.
Il doit y avoir continuité.
Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité.

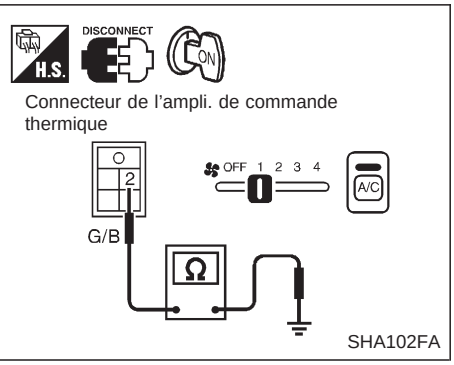
Bon ↓

H

VERIFIER L'ALIMENTATION ELECTRIQUE DE L'AMPLI. DE COMMANDE THERMIQUE.
Y a-t-il une tension d'environ 12 volts entre la borne ① du faisceau de l'ampli. de commande thermique et la masse de carrosserie ?

Non → Vérifier le circuit de l'alimentation électrique et le fusible de 7,5A (n° 23, situé dans le boîtier à fusibles).
(Se reporter à "DISPOSITION DE L'ALIMENTATION ELECTRIQUE" dans la section EL et au schéma de câblage.)

Oui ↓



Ⓒ
(Passer à la page suivante).

Remarque :
Si le résultat est mauvais ou "Non" après la vérification de la continuité du circuit, réparer le faisceau ou le connecteur.

Vérifier la continuité du circuit entre la borne ② du faisceau de l'ampli. de commande thermique et la masse de carrosserie.
Il doit y avoir continuité.
Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité.

Bon → Remplacer l'ampli. de commande thermique.

Mauvais ↓

J — Remarque

Vérifier la continuité du circuit entre la borne ② du faisceau de l'ampli. de commande thermique et la borne ⑬ du faisceau de l'interrupteur de climatiseur.
Il doit y avoir continuité.
Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité.

Bon ↓

VERIFIER L'INTERRUPTEUR DE CLIMATISEUR.
Se reporter à la page HA-2022.

Mauvais → Remplacer l'interrupteur de climatiseur.

Bon ↓

K — Remarque

Vérifier la continuité du circuit entre la borne ⑫ du faisceau de l'interrupteur de climatiseur et la borne ㉕ du faisceau de commutateur de ventilateur.
Il doit y avoir continuité.
Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité.

Bon ↓

VERIFIER LE COMMUTATEUR DE VENTILATEUR.
Se reporter à la page HA-2022.

Mauvais → Remplacer le commutateur de ventilateur.

Bon ↓

L — Remarque

Vérifier la continuité du circuit entre la borne ㉖ du faisceau de commutateur de ventilateur et la masse de carrosserie.
Il doit y avoir continuité.
Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité.

Remarque :
Si le résultat est mauvais ou ''Non'' après la vérification de la continuité du circuit, réparer le faisceau ou le connecteur.

Introduction

Le système de contrôle de température automatique (ATC) régule automatiquement la température intérieure du véhicule. L'utilisateur choisit une ''température de référence'' qui sert de base au mode de régulation indépendamment des variations de la température extérieure. Ceci est possible grâce à l'utilisation d'un micro-ordinateur, appelé également amplificateur automatique, qui reçoit les signaux d'entrée émis par différents capteurs. L'ampli. auto. utilise ces signaux d'entrée (y compris celui de la température de référence) pour contrôler automatiquement le volume d'air de sortie ainsi que la température et la distribution de l'air du système ATC.

Caractéristiques

Commande de volet de mélange d'air

Le volet de mélange d'air est contrôlé automatiquement afin que la température de l'habitacle soit atteinte et maintenue à la température réglée par l'utilisateur. Pour une température de référence donnée, la position du volet de mélange d'air dépendra de : la température ambiante, la température de l'habitacle, l'importance de l'ensoleillement et la température d'air d'admission.

Contrôle de la vitesse du ventilateur

La vitesse de la soufflerie est automatiquement régulée en fonction de la température de référence, de la température ambiante, de la température de l'habitacle, de la température d'air d'admission, de la quantité d'ensoleillement et de la position du volet de mélange d'air.

Lorsque l'on règle l'interrupteur de ventilateur sur ''AUTO'', le moteur de soufflerie augmente progressivement le volume du débit d'air.

Lorsque la température du liquide de refroidissement moteur est basse, le fonctionnement du moteur de soufflerie est retardé pour empêcher l'air frais de circuler.

Commande de volet d'admission d'air

La position du volet d'admission sera déterminée par : la température ambiante, la température de l'habitacle et par l'état de marche ou d'arrêt du compresseur.

Commande du volet de sortie

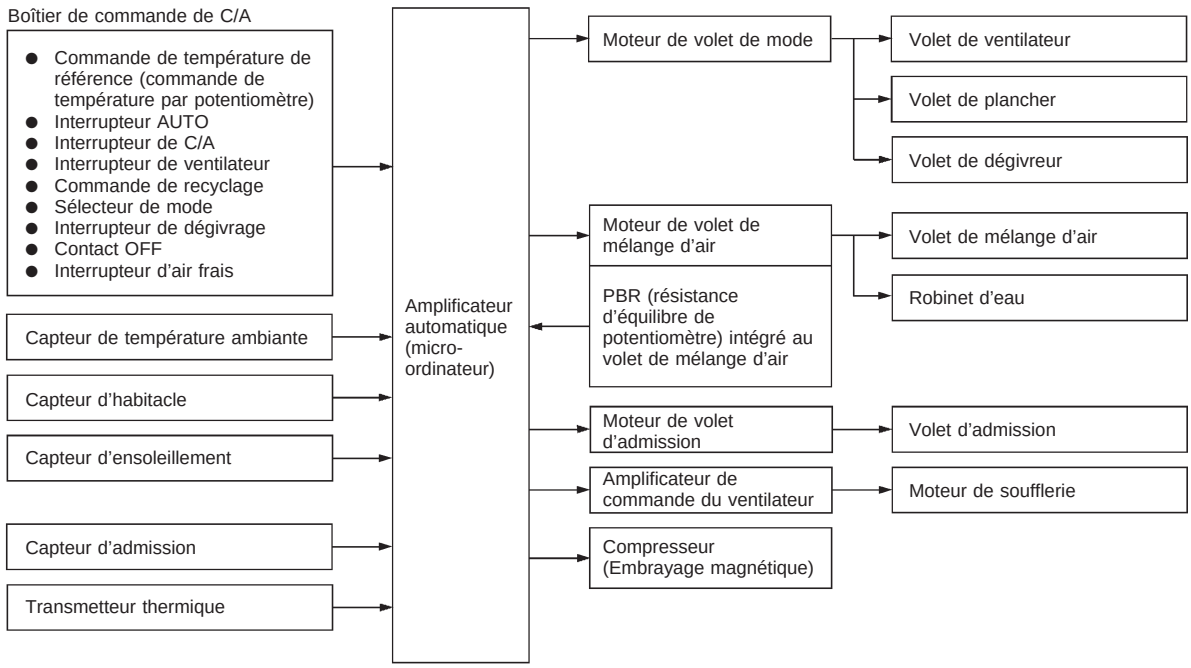
La position du volet de sortie sera déterminée par : la température ambiante, la température de l'habitacle, la température d'air d'admission et la quantité d'ensoleillement.

Commande d'embrayage magnétique

Le fonctionnement du compresseur (MAR.-ARR.) est automatiquement contrôlé par le capteur de température ambiante pour empêcher le compresseur d'être endommagé sous des températures ambiantes très froides.

Système d'autodiagnostic

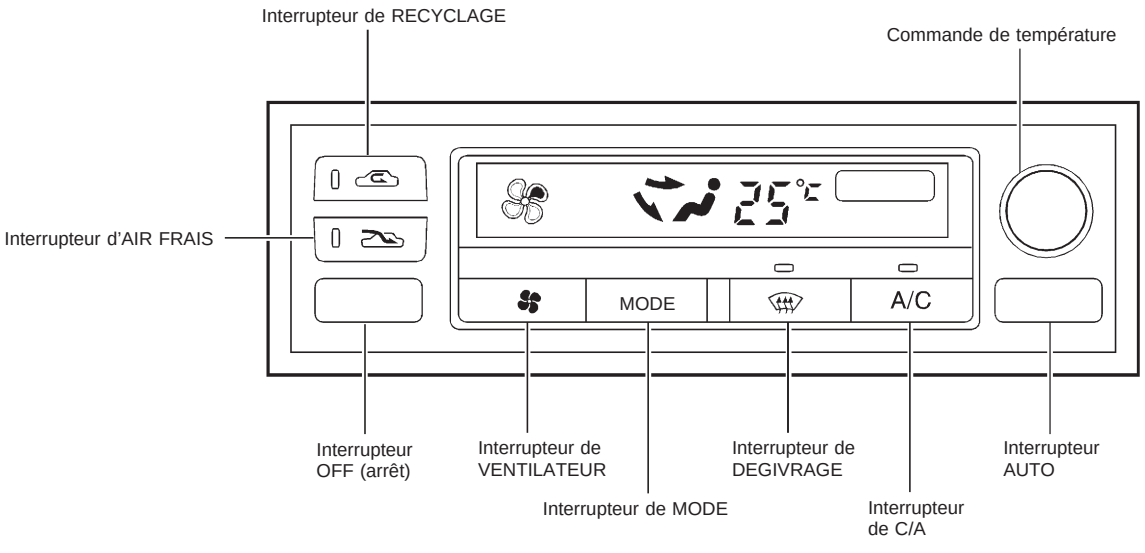
Le système d'autodiagnostic consiste en cinq étapes. On peut accéder à chaque étape en poussant les contacts de l'amplificateur automatique.



Fonction de mémoire

Lorsque le contact d'allumage est sur OFF, l'amplificateur automatique met en mémoire la température de référence et les entrées des différents contacts. Lorsque le contact d'allumage est sur ON, le système commence à fonctionner avec les informations enregistrées. Le système compense alors immédiatement pour les conditions de fonctionnement réelles.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Aperçu général du système de commande

Le système de commande se compose de capteurs d'admission, de contacts, d'un amplificateur automatique (micro-ordinateur), et de composants de sortie. La relation entre ces composants est décrite sur le schéma ci-dessous :

RHA467H

Fonctionnement des commandes

RHA468H

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Fonctionnement des commandes (suite)

Ecran d'affichage

Affiche la position de fonctionnement du système.

Interrupteur AUTO

Le compresseur, les volets d'admission, le volet de mélange d'air, les volets de sortie et la vitesse de la soufflerie sont contrôlés automatiquement afin d'atteindre et de maintenir la température de l'habitacle sur la température de référence sélectionnée par l'opérateur.

Commande de temperature (commande de température par potentiomètre)

Augmente ou réduit la température de référence.

Interrupteur OFF (arrêt)

Le compresseur et la soufflerie sont éteints, les volets d'admission sont réglés sur la position d'air de sortie et les volets de sortie d'air sont mis sur la position ''plancher'' (80% plancher et 20% dégivrage).

Interrupteur de VENTILATEUR

Commande manuelle de la vitesse de soufflerie. Quatre vitesses sont disponibles pour la commande manuelle (comme indiqué sur l'écran d'affichage) :
lent , mi-lent , mi-rapide , rapide

Interrupteur de RECYCLAGE

Position ARRET : reprise de commande automatique.
Position MARCHE : l'air intérieur circule à nouveau dans le véhicule.

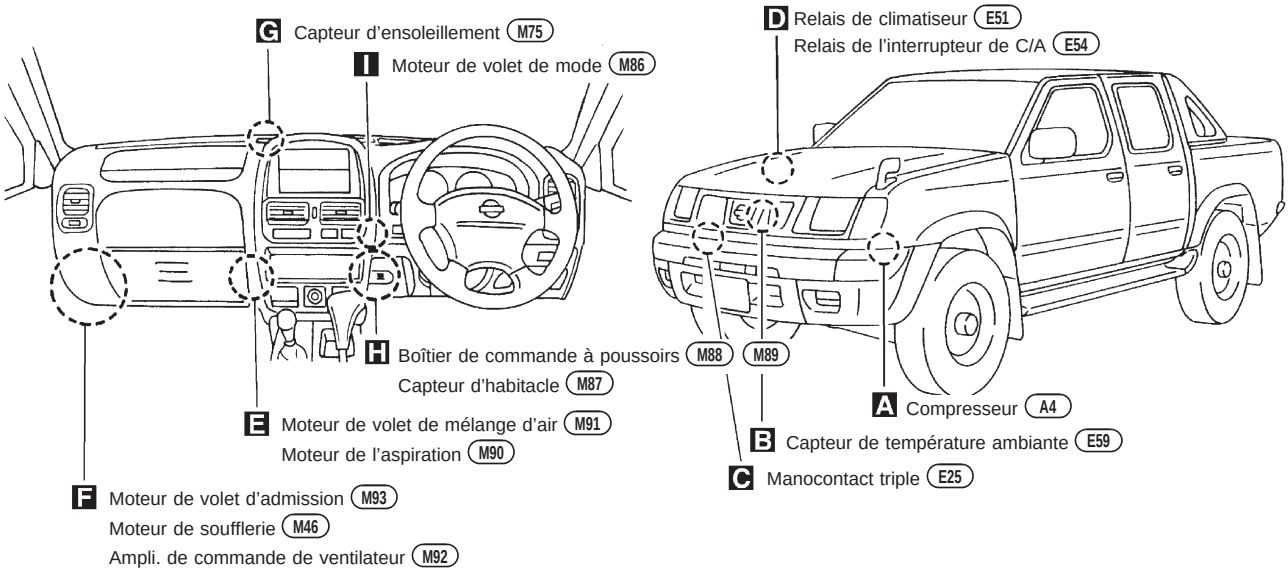
Interrupteur de DEGIVRAGE

Positionne les volets de sortie d'air sur la position de dégivrage. Règle également les volets d'admission sur la position d'air extérieur.

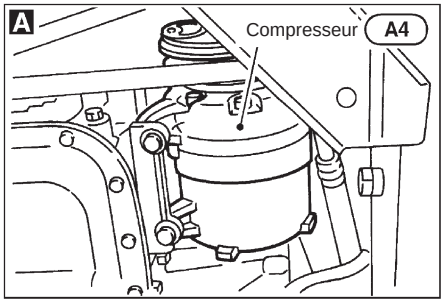
Interrupteur de MODE

Commande les sorties de décharge d'air.

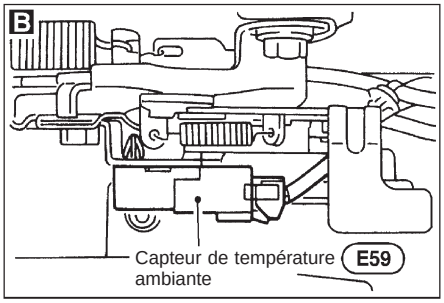
Interrupteur d'AIR FRAIS



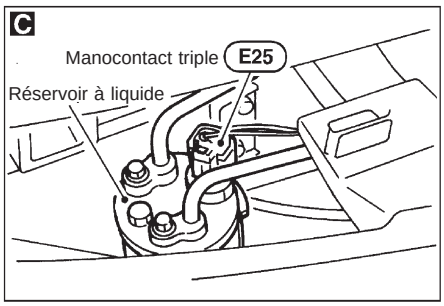
Position ARRET : reprise de commande automatique.
Position MARCHE : l'air extérieur est aspiré à l'intérieur du compartiment passager.



Interrupteur de climatiseur (C/A)



Commande manuelle du fonctionnement du compresseur. Quand le témoin de l'interrupteur de C/A s'allume, cela signifie que le compresseur est en train de fonctionner.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

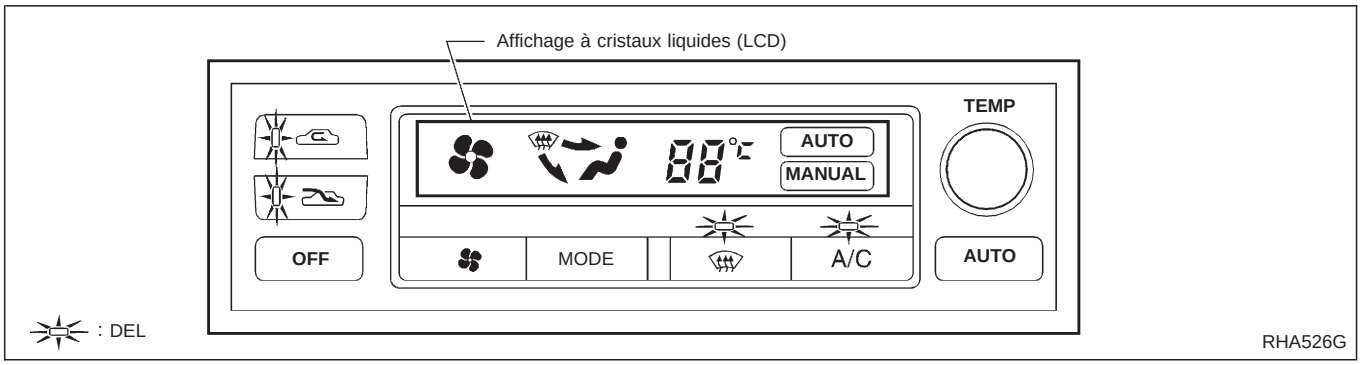
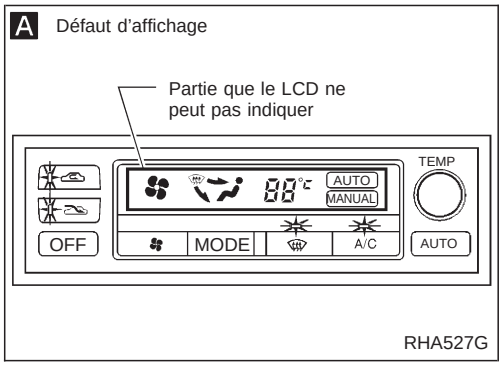
Autodiagnostic

INTRODUCTION ET DESCRIPTION GENERALE



Le système d'autodiagnostic effectue un diagnostic des capteurs, des moteurs de volet, du moteur de soufflerie, etc, par ligne de système. Pour de plus amples détails, se reporter aux sections applicables (composants). Passer du contrôle normal au système d'autodiagnostic se fait en démarrant le moteur (tourner le contact d'allumage de ''OFF'' à ''ON'') et appuyer sur l'interrupteur '' OFF '' pendant au moins 5 secondes. L'interrupteur '' OFF '' doit être actionné dans les 5 secondes après avoir démarré le moteur (contact d'allumage sur ''ON''). Ce système pourra être annulé soit en appuyant sur l'interrupteur AUTO (AUTO), soit en coupant le contact d'allumage. On peut passer d'une étape à l'autre en tourant la commande de température dans le sens des aiguilles d'une montre ou dans le sens inverse des aiguilles d'une montre, selon le souhait.
En outre, pour passer de l'ETAPE 4 au mode MECANISME AUXILIAIRE, appuyer sur l'interrupteur (ventilateur).



Remarque :
Pour l'ETAPE 4, le moteur doit être en marche pour que le compresseur puisse fonctionner.

Autodiagnostic (suite)

PROCEDURE ETAPE PAR ETAPE

Mettre le contact d'allumage sur ON.

↓

Passer en mode autodiagnostic. Dans les 5 secondes après avoir démarré le moteur (contact d'allumage sur "ON"), appuyer sur l'interrupteur OFF pendant au moins 5 secondes.

↓

A

ETAPE 1 - LES DEL ET LES LCD SONT VERIFIES.
Les DEL et les afficheurs à cristaux liquides s'allument-ils ?

Non → L'interrupteur OFF, DEL ou les afficheurs à cristaux liquides sont défectueux. Remplacer l'ampli. auto. (C/A).

Oui ↓

Tourner la commande de température dans le sens des aiguilles d'une montre.

↓

L'autodiagnostic passe-t-il à l'ETAPE 2 ?

Non → Commande de température défectueuse. Remplacer l'ampli. auto. (C/A).

Oui ↓

Tourner la commande de température dans le sens inverse des aiguilles d'une montre.

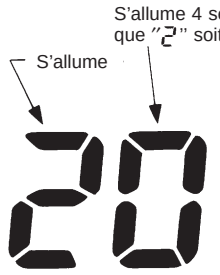
↓

L'autodiagnostic retourne t-il à l'ETAPE 1 ?

Non → Commande de température défectueuse. Remplacer l'ampli. auto. (C/A).

Oui ↓

Tourner la commande de température dans le sens des aiguilles d'une montre.



↓

Ⓐ

Autodiagnostic (suite)

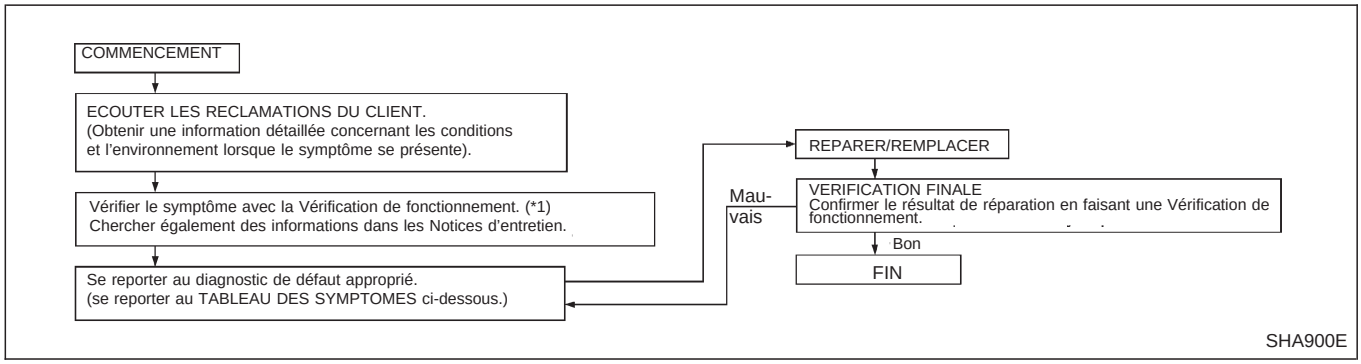
MECANISME AUXILIAIRE : Condensateur de réglage de la température

Ce condensateur ajustable compense les différences de ±3°C entre la température de référence (affichée numériquement) et la température ressentie par le conducteur.
Le condensateur ajustable fonctionne comme suit :

- Commencer l'ETAPE 4 du mode d'autodiagnostic.
- Appuyer sur l'interrupteur (ventilateur) pour mettre le système en mode auxiliaire.
- Tourner la commande de température dans le sens des aiguilles d'une montre ou dans le sens inverse des aiguilles d'une montre, selon le souhait. La température varie de 1°C à chaque fois que l'un des interrupteurs est actionné.



Lorsque le câble de la batterie est débranché, le fonctionnement du condensateur ajustable est annulé. La température de référence devient celle de la situation initiale, par ex. 0°C.

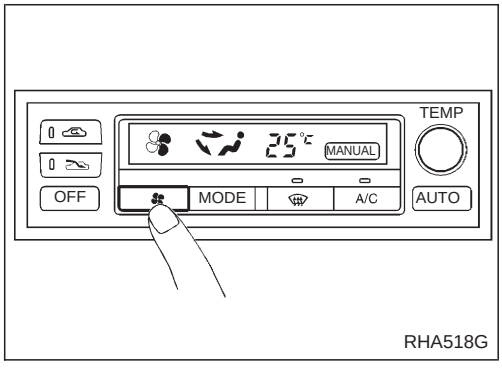
Vérification du fonctionnement

L'objet du contrôle de fonctionnement est de confirmer que le système fonctionne correctement.

CONDITIONS

- **Moteur en marche et à température normale de fonctionnement.**



RHA517G

PROCEDURE

1. Vérifier la fonction de mémoire.

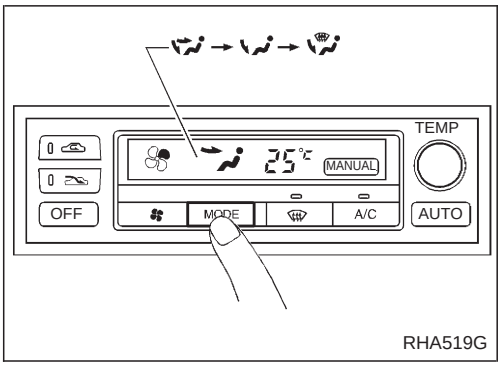
a. Régler la température à 25°C.
b. Appuyer sur l'interrupteur OFF (ARRET).
c. Mettre le contact d'allumage sur OFF.
d. Mettre le contact d'allumage sur ON.
e. Appuyer sur l'interrupteur AUTO.
f. Vérifier que la température de référence ne varie pas par rapport à la température précédente.
g. Appuyer sur l'interrupteur OFF (ARRET).

Si le résultat n'est pas satisfaisant, aller à la procédure de diagnostic de défaut qui concerne la fonction de mémoire (HA-2080).
Si le résultat est bon, poursuivre avec le contrôle suivant.

RHA518G

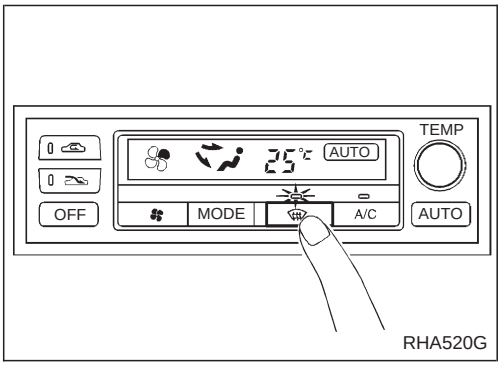
2. Vérifier la soufflerie.

a. Appuyer une fois sur l'interrupteur de ventilateur.
La soufflerie doit fonctionner à basse vitesse.
L'une des pales du symbole de ventilateur doit être allumée .
b. Appuyer sur l'interrupteur de ventilateur une nouvelle fois, et continuer à vérifier la vitesse de la soufflerie ainsi que le symbole du ventilateur jusqu'à ce que toutes les vitesses soient contrôlées.
c. Laisser la soufflerie sur vitesse MAXI .



Si le résultat n'est pas satisfaisant, aller à la procédure de diagnostic de défaut qui concerne le moteur de soufflerie (HA-2066).
Si le résultat est bon, poursuivre avec le contrôle suivant.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Vérification du fonctionnement (suite)

3. Vérifier l'air de décharge

a. Appuyer à quatre reprises sur le sélecteur de mode puis sur le bouton DEF (dégivrage).

RHA519G

RHA520G

Débit d'air de décharge

Sélecteur de mode	Sortie/distribution d'air		
	Visage	Plancher	Dégivreur
	100% (100%)	–	–
	60% (55%)	40% (45%)	–
	–	80% (100%)	20% (–)
	–	60% (65%)	40% (35%)
	–	–	100% (100%)

( ): Pour conduite à droite

RHA654FH

b. S'assurer que l'air de décharge sort en conformité avec le tableau de distribution d'air ci-à gauche.

Se reporter à ''Débit d'air de décharge'' (HA-15 dans le Manuel de Réparation D22, n° de Publication SM8F-0D22E0E).

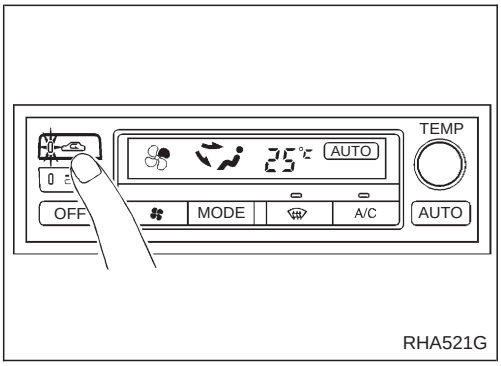
NOTE :

Vérifier que l'embrayage de compresseur est engagé (inspection visuelle) et que le volet d'admission est sur FRESH lorsque l'interrupteur DEF est actionné.

La position du volet d'admission d'air sera vérifiée à l'étape suivante.

Si le résultat n'est pas satisfaisant, aller à la procédure de diagnostic de défaut qui concerne le moteur de volet de mode (HA-2050).

Si le résultat est bon, poursuivre avec le contrôle suivant.

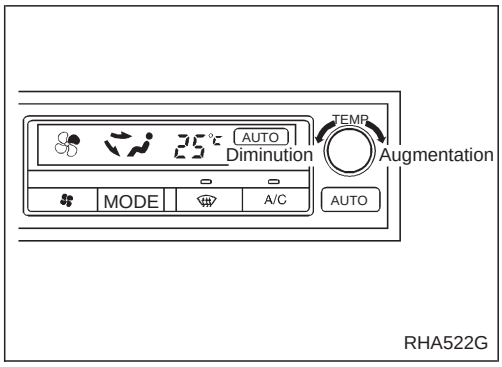


4. Vérifier le recyclage

a. Appuyer sur l'interrupteur REC .
Le voyant de recyclage doit s'allumer.

b. Etre attentif au changement de position du volet d'admission d'air (le bruit de la soufflerie doit se modifier légèrement).

Si le résultat n'est pas satisfaisant, aller à la procédure de diagnostic de défaut qui concerne le moteur de volet d'admission (HA-2061).



Si le résultat est bon, poursuivre avec le contrôle suivant.

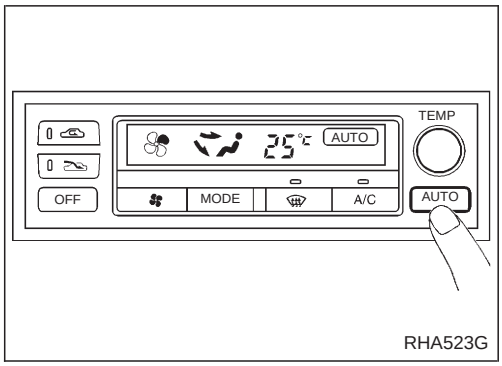
RHA521G

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Vérification du fonctionnement (suite)

5. Vérifier la commande de température

a. Tourner la commande de température dans le sens inverse des aiguilles d'une montre jusqu'à ce que 18°C soit affiché.
b. Vérifier la présence d'air froid aux sorties d'air de décharge.



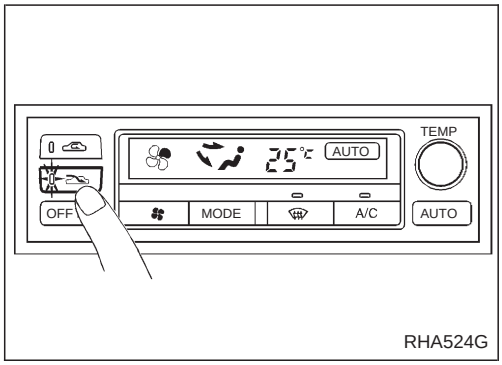
Si le résultat n'est pas satisfaisant, aller à la procédure de diagnostic de défaut qui concerne le refroidissement insuffisant (HA-2076).
Si le résultat est bon, poursuivre avec le contrôle suivant.

c. Tourner la commande de température dans le sens des aiguilles d'une montre jusqu'à ce que 32°C soit affiché.
d. Vérifier la présence d'air chaud aux sorties d'air de décharge.

Si le résultat n'est pas satisfaisant, aller à la procédure de diagnostic de défaut qui concerne le chauffage insuffisant (HA-2077).
Si le résultat est bon, poursuivre avec le contrôle suivant.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Vérification du fonctionnement (suite)

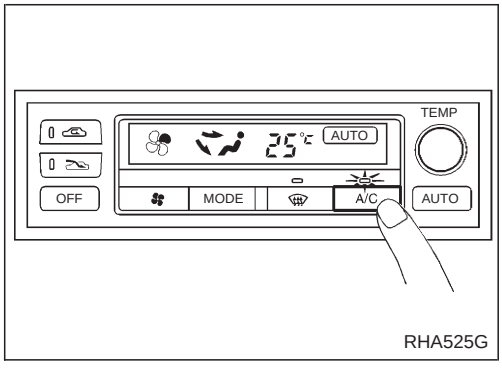


RHA523G

6. Vérifier le mode AUTO

a. Appuyer sur l'interrupteur AUTO.
b. L'affichage doit indiquer AUTO.
Vérifier que l'embrayage du compresseur s'engage (inspection auditive ou visuelle).
(L'air de décharge et la vitesse de soufflerie dépendront des températures ambiante, de l'habitacle et de référence).

Si le résultat n'est pas satisfaisant, aller à la procédure de diagnostic de défaut qui concerne le système de C/A (HA-2046).
Si le résultat est bon, poursuivre avec le contrôle suivant.
Puis si nécessaire, aller à la procédure de diagnostic de défaut qui concerne l'embrayage magnétique (HA-2069).



RHA524G

7. Vérifier l'interrupteur FRESH (FRAIS)

a. Appuyer sur l'interrupteur FRE.
Le voyant FRESH doit s'allumer.
b. Etre attentif au changement de position du volet d'admission d'air (le bruit de la soufflerie doit se modifier légèrement).

Si le résultat n'est pas satisfaisant, aller à la procédure de diagnostic de défaut qui concerne le moteur de volet d'admission (HA-2061).
Si le résultat est bon, poursuivre avec le contrôle suivant.

RHA525G

8. Vérifier l'interrupteur de climatisation.

a. Appuyer sur l'interrupteur C/A.
Le voyant A/C doit s'allumer.
b. Vérifier que l'embrayage du compresseur est engagé.

Si le résultat n'est pas satisfaisant, aller à la procédure de diagnostic de défaut qui concerne le système de C/A (HA-2046).
Si le résultat est bon, poursuivre avec le contrôle suivant.
Si tous les contrôles de fonctionnement sont satisfaisants (le symptôme ne peut pas être répété), aller à ''Essai de simulation des problèmes'' (section GI) et effectuer un test comme décrit dans l'environnement des conditions de conduite simulées. Si le symptôme apparaît, se reporter au ''TABLEAU DES SYMPTOMES'' (HA-2041) et effectuer les procédures de diagnostic de défaut correspondantes.

RHA470H

DESCRIPTION DES COMPOSANTS

Amplificateur automatic (Amp. auto)

L'ampli. auto. est équipé d'un micro-ordinateur qui traite les données transmises par les différents capteurs et qui sont nécessaires au bon fonctionnement de la climatisation. Le moteur de volet de mélange d'air, moteur de volet de mode, moteur de volet d'admission, moteur de soufflerie et le compresseur sont alors commandés.
L'ampli. auto. est intégré aux mécanismes de commande. Les signaux venant de plusieurs contacts et la commande de température par le potentiomètre (PTC) sont envoyés directement à l'amplificateur auto.
Les fonctions d'autodiagnostic sont également intégrées dans l'amplificateur automatique afin de permettre un contrôle rapide des pannes du système de climatisation.

Commande de temperature par potentiomètre (PTC)

Le PTC est intégré dans l'amplificateur auto. de C/A. Il peut être réglé à un intervalle de 1°C dans la gamme de température de18°C à 32°C en tournant la commande de température. La température de référence est affichée sur l'écran numérique.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

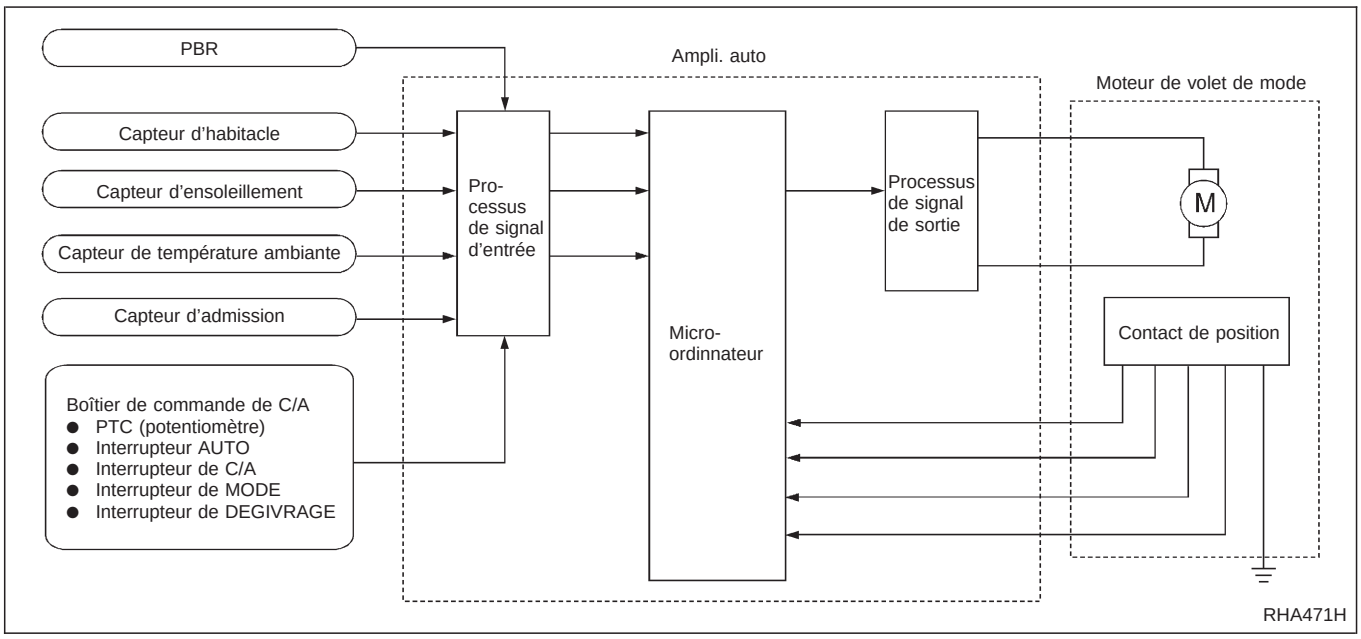
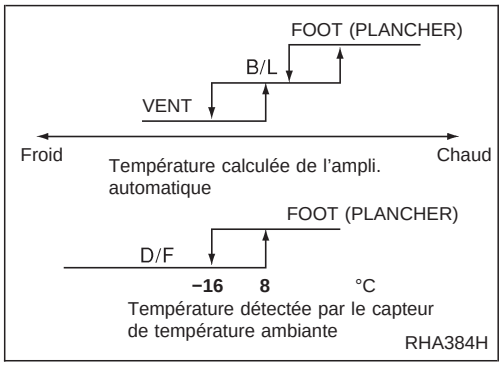
Moteur de volet de mode (suite)

DESCRIPTION DU SYSTEME

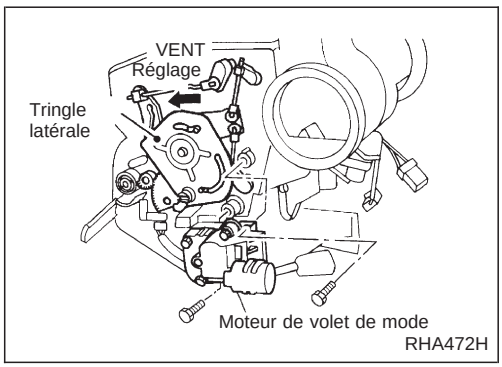


Composants



Les composants du système de commande de volet de mode sont :

1) Amplificateur automatique
2) Moteur de volet de mode
3) Capteur d'habitacle
4) Capteur de température ambiante
5) Capteur d'ensoleillement
6) Capteur d'admission

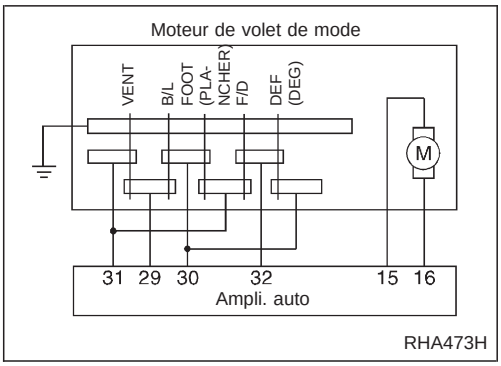


Fonctionnement du système

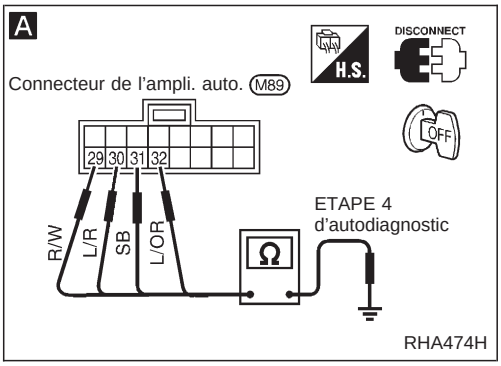
L'ampli. auto. calcule les conditions de sortie de l'air en fonction de la température ambiante et de la température de l'habitacle. Les conditions de sortie calculées sont alors corrigées pour l'ensoleillement afin de déterminer la sortie d'air par laquelle l'air est déchargé dans l'habitacle.

Caractéristique de la commande de volet de mode

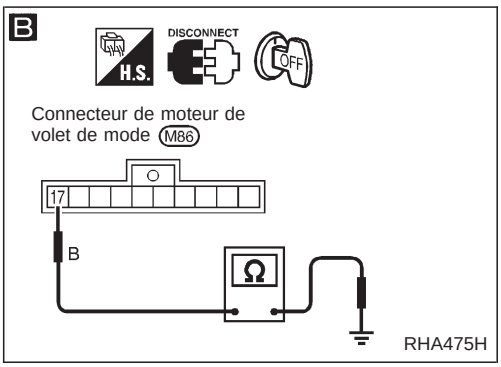
DESCRIPTION DES COMPOSANTS



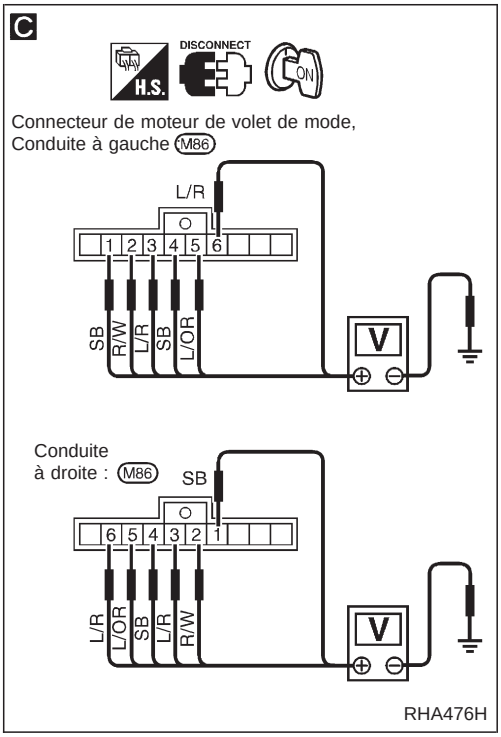
Le moteur du volet de mode est fixé au dispositif de chauffage. Le moteur tourne de façon à assurer l'écoulement de l'air à travers la bouche d'air déterminée par l'amplificateur auto. La rotation du moteur est transmise à une tringle qui active le volet de mode.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Moteur de volet de mode (suite)



PROCEDURE DE DIAGNOSTIC

SYMPTOME : le moteur de volet de mode ne fonctionne pas normalement.

A

VERIFIER LE CONTACT DE POSITION DU MOTEUR DE VOLET DE MODE.

1. Passer au code n° 41 de l'ETAPE 4 de l'autodiagnostic.
2. Débrancher le connecteur de faisceau de l'ampli. auto après avoir mis le contact d'allumage sur "OFF".
3. Vérifier si la continuité existe entre les bornes (29), (31) du connecteur du faisceau d'ampli. automatique et la masse de carrosserie.
4. A l'aide de la procédure ci-dessus, vérifier la continuité en d'autres modes, comme indiqué dans le tableau.

N° de code	Condition	N° de borne ⊕	N° de borne ⊖	Il y a continuité
41	VENT	(29) ou (31)	Masse de carrosserie	Oui
42 ou 43	B/L	(29) ou (30)		
44	FOOT (PLANCHER)	(30) ou (31)		
45	D/F	(31) ou (32)		
46	DEF (DEG)	(30) ou (32)		

Mauvais → Débrancher le connecteur de faisceau du moteur de volet de mode.

Bon → FIN DE L'INSPECTION

B

Remarque

VERIFIER LE CIRCUIT DE MASSE DE CARROSSERIE DU MOTEUR DE VOLET DE MODE.
Y a-t-il continuité entre la borne n° (17) du faisceau du moteur de volet de mode et la masse de carrosserie ?

Oui → Reconnecter le connecteur de faisceau de l'ampli. auto.

C

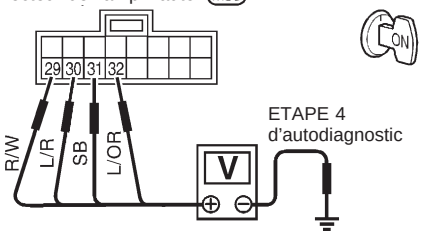
VERIFIER LA SOURCE D'ALIMENTATION DU CIRCUIT DE COMMANDE DE MOTEUR DE VOLET DE MODE.
Y a-t-il une tension d'environ 5 V. entre les bornes du faisceau de moteur de volet de mode et la masse de carrosserie ?

N° de borne ⊕	N° de borne ⊖	Tension
(1)	Masse de carrosserie	Environ 5V
(2)		
(3)		
(4)		
(5)		
(6)		

Oui → Reconnecter le connecteur de faisceau du moteur de volet de mode.

Non → (B)

(A) (Passer à la page suivante).



Remarque :
Si le résultat est mauvais ou "Non" après la vérification de la continuité du circuit, réparer le faisceau ou le connecteur.

Ⓐ

D

VERIFIER LE CONTACT DE POSITION DU MOTEUR DE VOLET DE MODE.
Régler sur l'ETAPE 4 de l'autodiagnostic.
Mesurer la tension à travers les bornes de faisceau de l'ampli. auto et la masse de carrosserie.

N° de code	Condition	N° de borne ⊕				N° de borne ⊖
		(29)	(30)	(31)	(32)	
41	VENT	0V	5V	0V	5V	Masse de carrosserie
43 ou 42	B/L	0V	0V	5V	5V	
44	FOOT (PLANCHER)	5V	0V	0V	5V	
45	D/F	5V	5V	0V	0V	
46	DEF (DEG)	5V	0V	5V	0V	

0V : Environ 0V
5V : Environ 5V

Bon

Mauvais

Remplacer le moteur de volet de mode.

F

VERIFIER LA SORTIE DE L'AMPLIFICATEUR AUTOMATIQUE.
Y a-t-il une tension d'environ 10,5 V entre les bornes (15) et (16) du faisceau de l'ampli. auto. lorsque le n° de code est passé de "41" à "42" ou si le n° de code est passé de "46" à "41"?

N° de code	Fonctionnement du moteur de volet de mode	N° de borne (15)	N° de borne (16)	Tension V
41→42	VENT → B/L	⊕	⊖	Environ 10,5
46→41	DEF → VENT	⊖	⊕	
–	Arrêt	–	–	0

Non → Remplacer l'amplificateur automatique.

Oui

Remplacer le moteur de volet de mode.

Ⓑ

E

Remarque

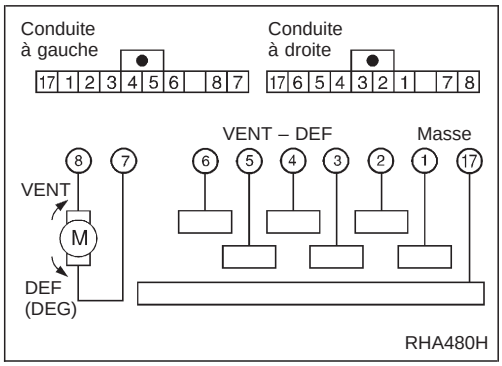
Vérifier la continuité du circuit entre chaque borne de l'ampli. auto. et du moteur de volet de mode.

N° de borne ⊕	N° de borne ⊖	Il y a continuité
Ampli. auto	Moteur de volet de mode	
(29)	(2)	Oui
(30)	(3) ou (6)	
(31)	(1) ou (4)	
(32)	(5)	

Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité.

Bon

Remplacer l'amplificateur automatique.



Remarque :
Si le résultat est mauvais ou "Non" après la vérification de la continuité du circuit, réparer le faisceau ou le connecteur.

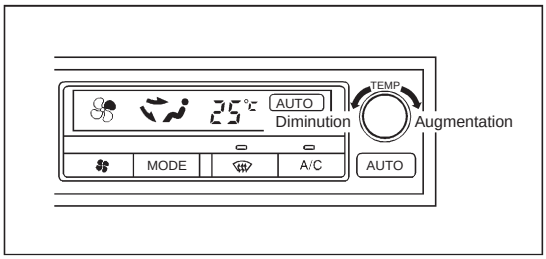
Moteur de volet de mélange d'air



PROCEDURE DE DIAGNOSTIC DE DEFAUT DU VOLET DE MELANGE D'AIR

SYMPTOME :

- **La température de l'air de décharge ne change pas.**
- **Le moteur de volet de mélange d'air ne fonctionne pas.**

Ordre de l'inspection

1. Confirmer la présence du symptôme en exécutant la vérification de fonctionnement suivante.

VERIFICATION DE FONCTIONNEMENT

Augmentation de la température

a. Tourner la commande de hausse de température jusqu'à ce que 32°C soit affiché.
b. Vérifier la présence d'air chaud aux sorties d'air de décharge.

Diminution de la température

a. Tourner le bouton de commande de baisse de température jusqu'à ce que 18°C soit affiché.
b. Vérifier la présence d'air froid aux sorties d'air de décharge.

Si le résultat est bon (le symptôme ne peut pas être répété), effectuer une vérification complète du fonctionnement. (*12).
Si le résultat est mauvais (le symptôme est confirmé), continuer avec l'ETAPE 2 suivante.

2. Rechercher les bulletins d'entretien.
3. Effectuer l'ETAPE 1 de l'autodiagnostic. (*1)
   - Bon
4. Effectuer l'ETAPE 2 de l'autodiagnostic. (*2)
   - Mauvais → Se reporter au circuit du capteur de défaut approprié. (*2)
   - Bon
5. Effectuer l'ETAPE 4 de l'autodiagnostic. (*3)
   - Bon **La cause ne peut pas être confirmée par autodiagnostic.**
   - Mauvais → Vérifier la timonerie du volet de mélange d'air. (*11)
     - Bon → Aller à la PROCEDURE DE DIAGNOSTIC DU MOTEUR DE VOLET DE MELANGE D'AIR. (*10)
     - Mauvais → Réparer ou régler la timonerie de commande. (*11)
6. Vérifier le circuit du capteur de température ambiante. (*4)
   - Bon
7. Vérifier le circuit du capteur de l'habitacle. (*5)
   - Bon
8. Vérifier le circuit du capteur d'ensoleillement. (*5)
   - Bon
9. Vérifier le circuit du capteur d'admission. (*6)
   - Bon
10. Vérifier le circuit PBR du moteur de volet de mélange d'air. (*8)

Si le symptôme existe toujours, effectuer une vérification complète de fonctionnement (*12) et vérifier s'il y a d'autres symptômes. [Se reporter au tableau de symptômes, (*9)] Existe-t-il un autre symptôme ?

- Oui → Se reporter au Diagnostic de défaut de symptômes connexes.
  Un autre symptôme existe.
- Non → Remplacer l'amplificateur automatique. → FIN DE L'INSPECTION

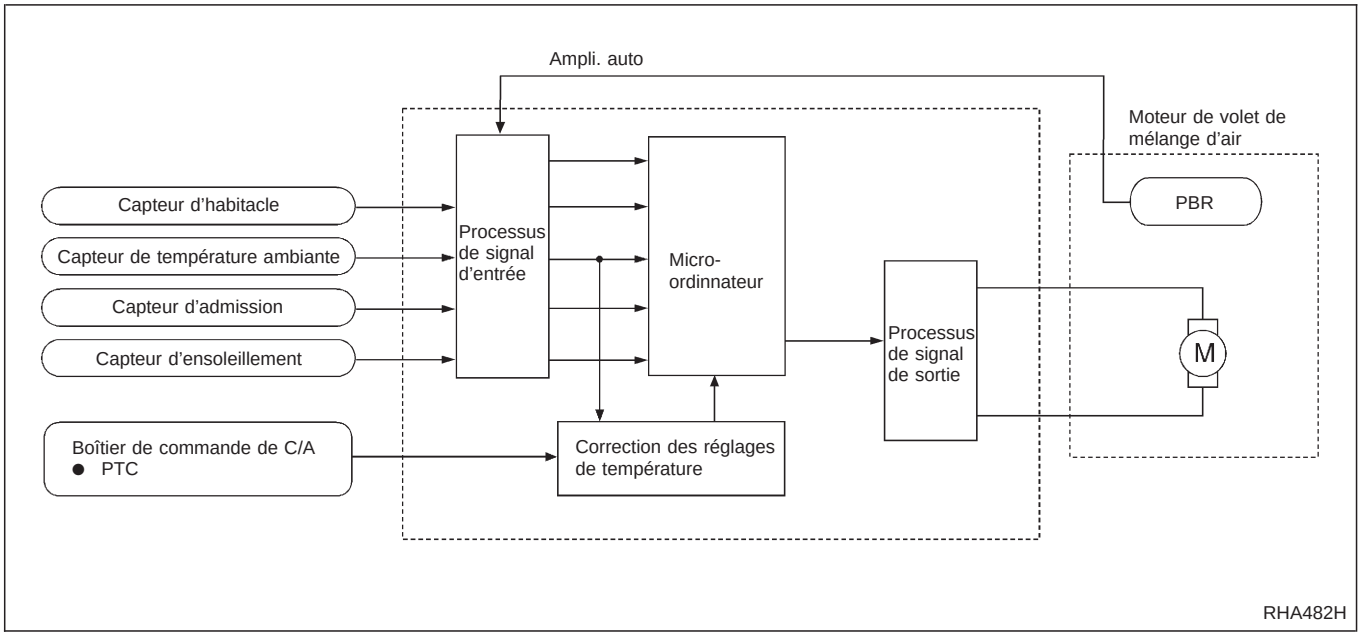
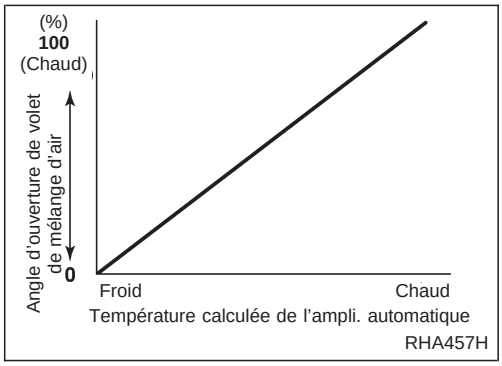
Moteur de volet de mélange d'air (suite)



DESCRIPTION DU SYSTEME

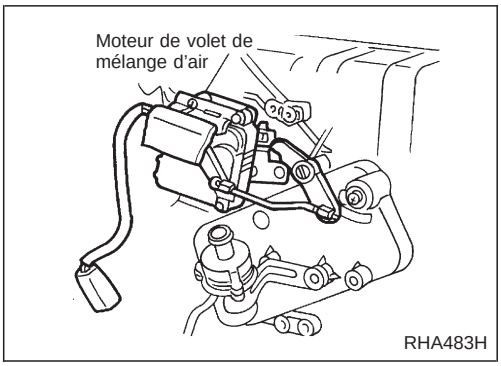


Composants

Les composants du système de commande du volet de mélange d'air sont :
1) Amplificateur automatique
2) Moteur de volet de mélange d'air (PBR)
3) Capteur d'habitacle
4) Capteur de température ambiante
5) Capteur d'ensoleillement
6) Capteur d'admission

Fonctionnement du système

La température de référence par la commande de température par potentiomètre (PTC) est compensée par le circuit de correction de température de façon à déterminer une température de référence.
L'ampli. auto actionnera le moteur de volet de mélange d'air et règle le système de climatisation d'air à la position HOT ou COLD, selon la relation entre les conditions (température ciblée, charge solaire, température d'habitacle et température ambiante) et les conditions (position du volet de mélange d'air et température d'air d'admission).
Lorsque la température souhaitée est réglée à 18°C ou 32°C, la position d'ouverture du volet de mélange d'air reste en position de froid maxi. ou de chaud maxi.

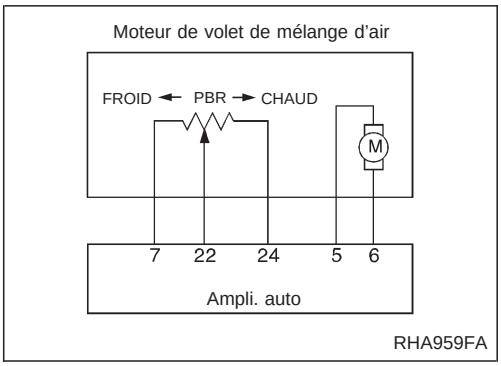


Caractéristique de la commande de volet de mélange d'air

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Moteur de volet de mélange d’air (suite)

DESCRIPTION DES COMPOSANTS



Le moteur de volet de mélange d’air est attaché au dispositif de chauffage. La rotation permet au volet de mélange d’air de s’ouvrir ou de se fermer à la position déterminée par l’amplificateur auto. La rotation du moteur est alors transmise via un arbre et la position du volet de mélange d’air est alors transmise en retour à l’amplificateur auto. via le PBR intégré au moteur du volet de mélange d’air PBR.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Moteur de volet de mélange d'air (suite)

PROCEDURE DE DIAGNOSTIC

SYMPTOME : le moteur de volet de mélange d'air ne fonctionne pas normalement.

EST-CE QUE LE PBR FONCTIONNE NORMALEMENT ?
Se reporter à ETAPE 2 de l'autodiagnostic.

Non → Ⓐ (Passer à la page suivante).

Oui ↓

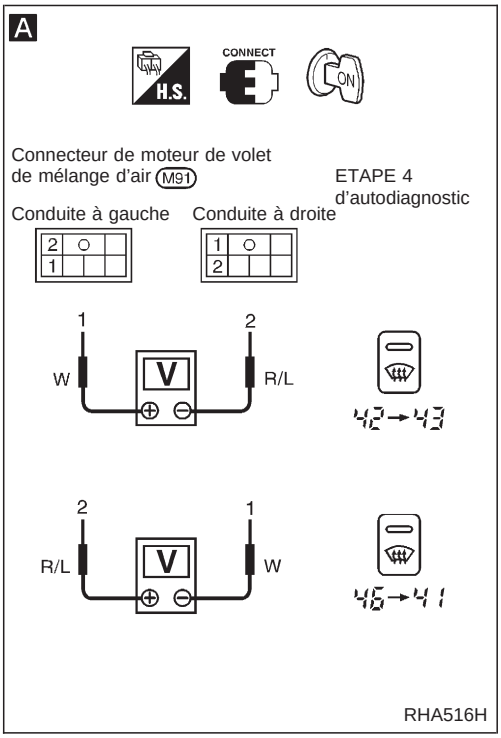
A

VERIFIER LA SORTIE DE L'AMPLIFICATEUR AUTOMATIQUE.
Régler sur l'ETAPE 4 de l'autodiagnostic.
Y a-t-il une tension d'environ 10,5 V entre les bornes ① et ② du faisceau du moteur de volet de mélange d'air lorsque le n° de code est passé de "42" à "43" ou de "46" à "41" ?

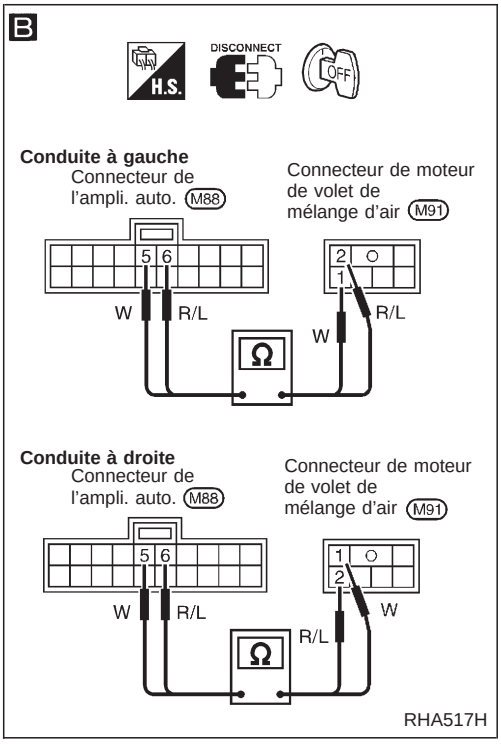
N° de code	Fonctionnement du volet de mélange d'air	N° de borne ①	N° de borne ②	Tension V
42 → 43	Froid → Chaud	⊕	⊖	Environ 10,5
46 → 41	Chaud → Froid	⊖	⊕	
–	Arrêt.	–	–	0

Non → Débrancher les connecteurs de faisceau de l'ampli. auto et du moteur de volet de mélange d'air.

B



Remarque
Vérifier la continuité du circuit entre la borne n° ⑤ (⑥) du faisceau de l'ampli. auto et la borne n° ① (②) du faisceau de moteur de volet de mélange d'air.
Il doit y avoir continuité.
Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité.

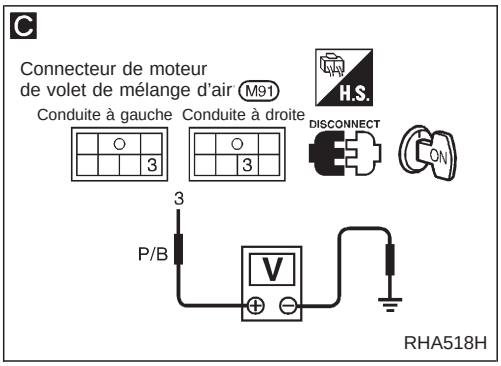


Bon ↓

Remplacer l'amplificateur automatique.

Oui ↓

Remplacer le moteur de volet de mélange d'air.



Remarque :
Si le résultat est mauvais ou "Non" après la vérification de la continuité du circuit, réparer le faisceau ou le connecteur.

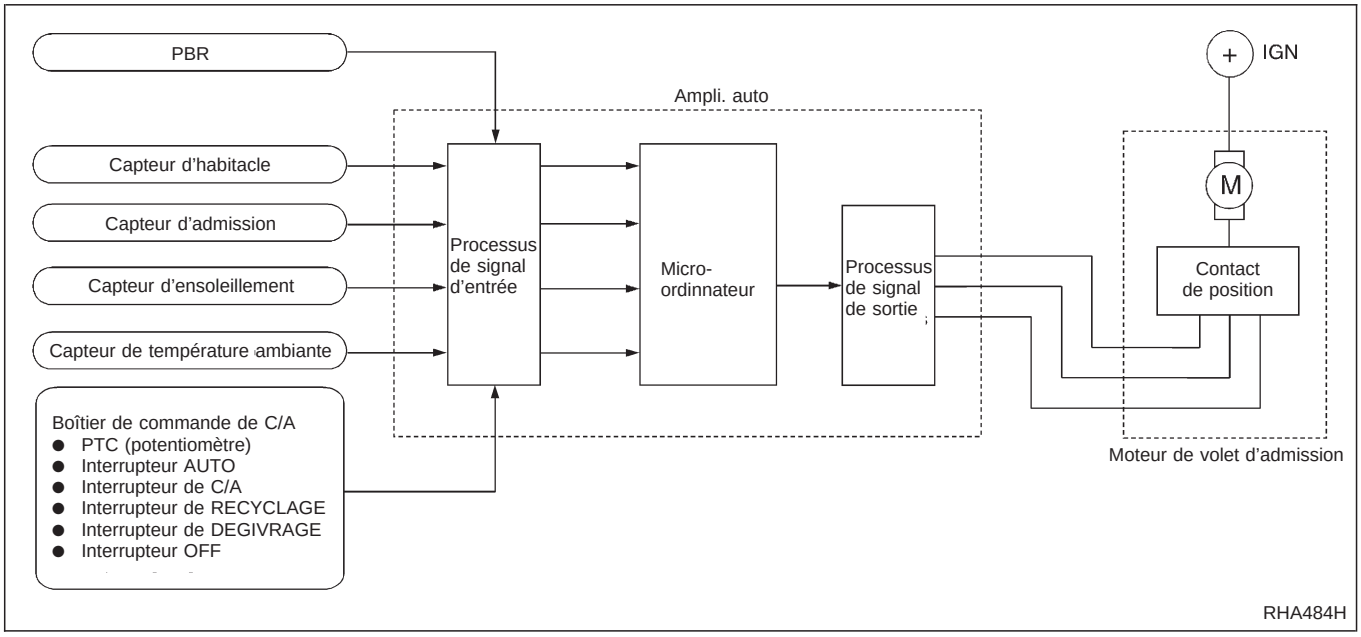
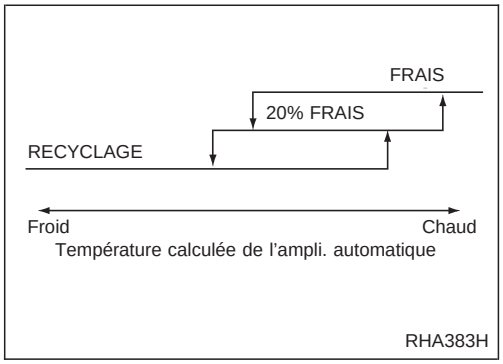
Moteur de volet d'admission (suite)



DESCRIPTION DU SYSTEME

Composants



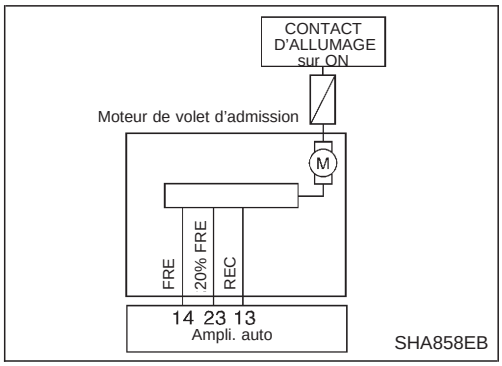
Les composants du système de commande de volet d'admission sont :
1) Ampli. auto
2) Moteur de volet d'admission
3) Moteur de volet de mode
4) Capteur d'habitacle
5) Capteur de température ambiante
6) Capteur d'ensoleillement
7) Capteur d'admission

Fonctionnement du système

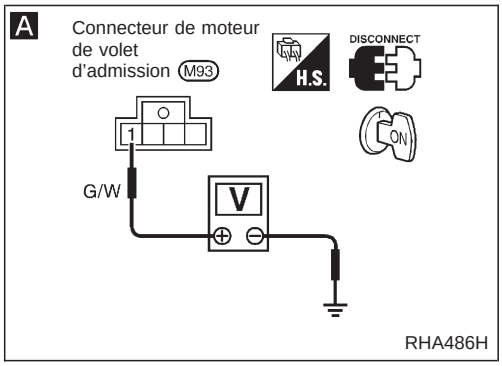
La commande de volet d'admission détermine la position du volet d'admission à partir de la température ambiante, de la température d'air d'admission et de la température à l'intérieur du véhicule. Lorsque les interrupteurs A/C, DEGIVRAGE ou OFF sont enfoncés, l'ampli auto. règle le volet d'admission sur ''Fresh'' (Frais).

Caractéristique de la commande de volet d'admission

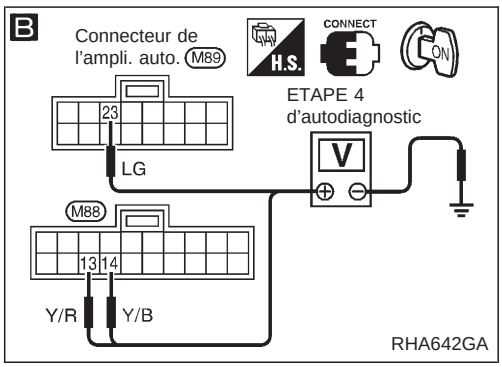
DESCRIPTION DES COMPOSANTS



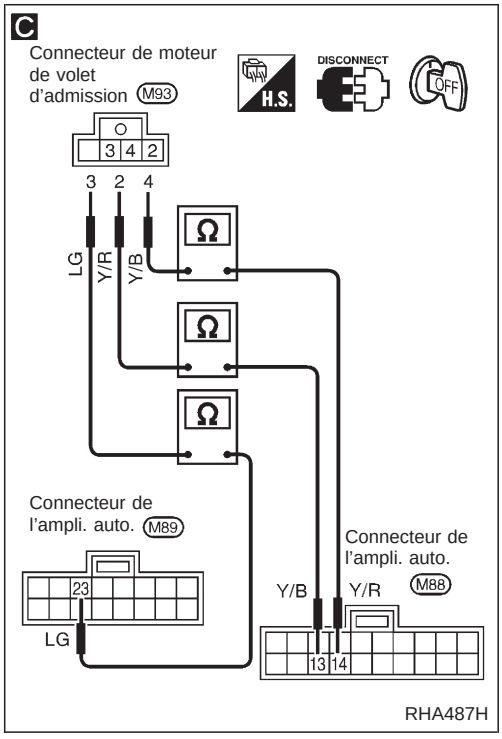
Le moteur de volet d'admission est monté sur le boîtier d'admission. Il tourne de façon à assurer l'admission de l'air à travers les bouches d'air déterminées par l'amplificateur auto. La rotation du moteur est transmise à un curseur qui active le volet d'admission.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Moteur de volet d'admission (suite)



PROCEDURE DE DIAGNOSTIC

SYMPTOME : le moteur de volet d'admission ne fonctionne pas normalement.

A

VERIFIER L'ALIMENTATION ELECTRIQUE DU MOTEUR DE VOLET D'ADMISSION.
Débrancher le connecteur de faisceau du moteur du volet d'admission.
Y a-t-il une tension d'environ 12 volts entre la borne n° ① du faisceau du moteur de volet d'admission et la masse de carrosserie ?

Non → Vérifier le circuit de l'alimentation électrique et le fusible de 7,5A (n° 23, situé dans le boîtier à fusibles).

Oui ↓

B

VERIFIER LA SORTIE DE L'AMPLI. AUTO.
Régler sur l'ETAPE 4 de l'autodiagnostic.
Mesurer la tension à travers les bornes de faisceau de l'ampli. auto et la masse de carrosserie.

N° de code	N° de borne ⊕	N° de borne ⊖	Condition	Tension V
41 42	⑬	Masse de carrosserie	REC	0
	㉓			12
	⑭			12
43	⑬		20% FRE	12
	㉓			0
	⑭			12
44 45 46	⑬		FRE	12
	㉓			12
	⑭			0

0V : Environ 0V
12V : Environ 12V

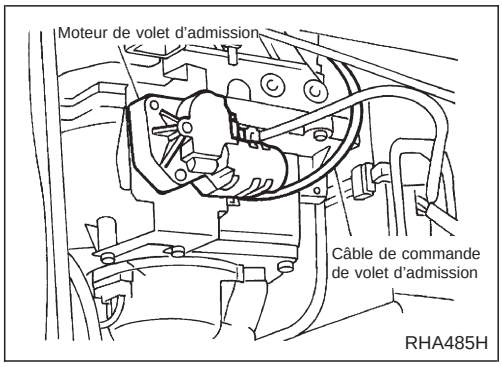
Mauvais → **C**

Vérifier la continuité du circuit entre chaque borne de l'ampli. auto. et du moteur de volet d'admission.

N° de borne ⊕	N° de borne ⊖	
Ampli. auto	Moteur de volet d'admission	Il y a continuité
⑬	②	Oui
㉓	③	
⑭	④	

Bon → Remplacer l'amplificateur automatique.

Bon ↓



Remplacer le moteur du volet d'admission.

Remarque :
Si le résultat est mauvais ou ''Non'' après la vérification de la continuité du circuit, réparer le faisceau ou le connecteur.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Moteur de volet d'admission (suite)

REGLAGE DE LA TIMONERIE DE COMMANDE

Volet d'admission

1. Reposer le moteur de volet d'admission sur le boîtier d'admission et le connecter sur le faisceau principal.
2. Passer au code n° 41 de l'ETAPE 4 de l'autodiagnostic. Se reporter à la page HA-2039.
3. Déplacer la timonerie du volet d'admission à la main et la maintenir en position REC.
4. Fixer le câble de commande du volet d'admission. Se reporter à la page HA-54 du MANUEL DE REPARATION D22, n° de publication SM8F-0D22E0E.
5. S'assurer que le volet d'admission fonctionne correctement lorsqu'on passe du code n° 41 au code n° 46 en actionnant l'interrupteur DEF.

41	42	43	44	45	46
REC		20% FRE	FRE

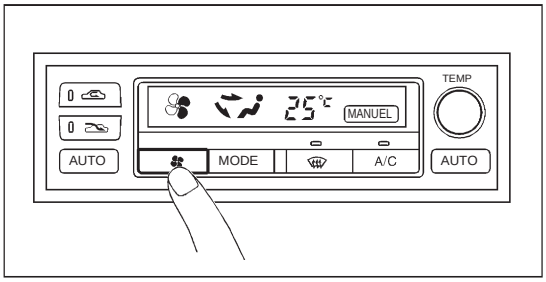
Moteur de soufflerie



PROCEDURE DE DIAGNOSTIC DE DEFAUT DU MOTEUR DE SOUFFLERIE

SYMPTOME :

- **Le fonctionnement du moteur de soufflerie est défectueux.**
- **Le moteur de soufflerie ne fonctionne pas bien lorsqu'il est hors du démarrage de la commande de vitesse du ventilateur.**

Ordre de l'inspection

1. Confirmer la présence du symptôme en exécutant la vérification de fonctionnement suivante.

VERIFICATION DE FONCTIONNEMENT – Soufflerie

a. Appuyer une fois sur l'interrupteur de ventilateur.
La soufflerie doit fonctionner à basse vitesse.
L'une des pales du symbole de ventilateur doit être allumée.

b. Appuyer sur l'interrupteur de ventilateur une nouvelle fois, et continuer à vérifier la vitesse de la soufflerie ainsi que le symbole du ventilateur jusqu'à ce que toutes les vitesses soient contrôlées.

c. Laisser la soufflerie en vitesse MAX.

Si le résultat est bon (le symptôme ne peut pas être répété), effectuer une vérification complète du fonctionnement. (*10).
Si le résultat est mauvais (le symptôme est confirmé), continuer avec l'ETAPE 2 suivante.

2. Rechercher les bulletins d'entretien.
3. Effectuer l'ETAPE 1 de l'autodiagnostic. (*1)
Bon
4. Effectuer l'ETAPE 2 de l'autodiagnostic. (*2)
Mauvais → Se reporter au circuit du capteur de défaut approprié. (*2)
Bon
5. Effectuer l'ETAPE 4 de l'autodiagnostic. (*3)
La vitesse du moteur se soufflerie change-t-elle selon chaque n° de code?
Non → Aller à la PROCEDURE DE DIAGNOSTIC DU MOTEUR DE SOUFFLERIE. (*4)

N° de code	41	42	43	44	45	46
Régime de moteur de soufflerie	Lent	Mi-rapide	Mi-lent			Rapide

Oui
6. La température du liquide de refroidissement moteur est-elle inférieure à 50°C et la température ambiante inférieure à15°C?
Non → Le fonctionnement du moteur de soufflerie est normal.
Oui
7. Le moteur de soufflerie fonctionne-t-il au démarrage de la commande de vitesse de soufflerie?
Non → Aller à la PROCEDURE DE DIAGNOSTIC DU MOTEUR DE SOUFFLERIE. (*4)
Oui
La cause ne peut pas être confirmée par autodiagnostic.
8. Vérifier le circuit du capteur de température ambiante. (*5)
Bon
9. Vérifier le circuit du capteur de l'habitacle. (*6)
Bon
10. Vérifier le circuit du capteur d'ensoleillement. (*7)
Bon
11. Vérifier le circuit du capteur d'admission. (*8)
Bon
12. Vérifier le circuit PBR du moteur de volet de mélange d'air. (*9)
Bon
Si le symptôme existe toujours, effectuer une vérification (*10) de fonctionnement complète et vérifier s'il y a d'autres symptômes. [Se reporter au Tableau des symptômes, (*11)]. Existe-t-il un autre symptôme ?
Oui → Se reporter au Diagnostic de défaut de symptômes connexes.
Non
Remplacer l'amplificateur automatique. → FIN DE L'INSPECTION

Bon → Vérifier le circuit de commande du transmetteur thermique.
Se reporter à la section EL (''Contrôle du transmetteur thermique '', ″INSTRUMENTS ET JAUGES'').

Un autre symptôme existe.

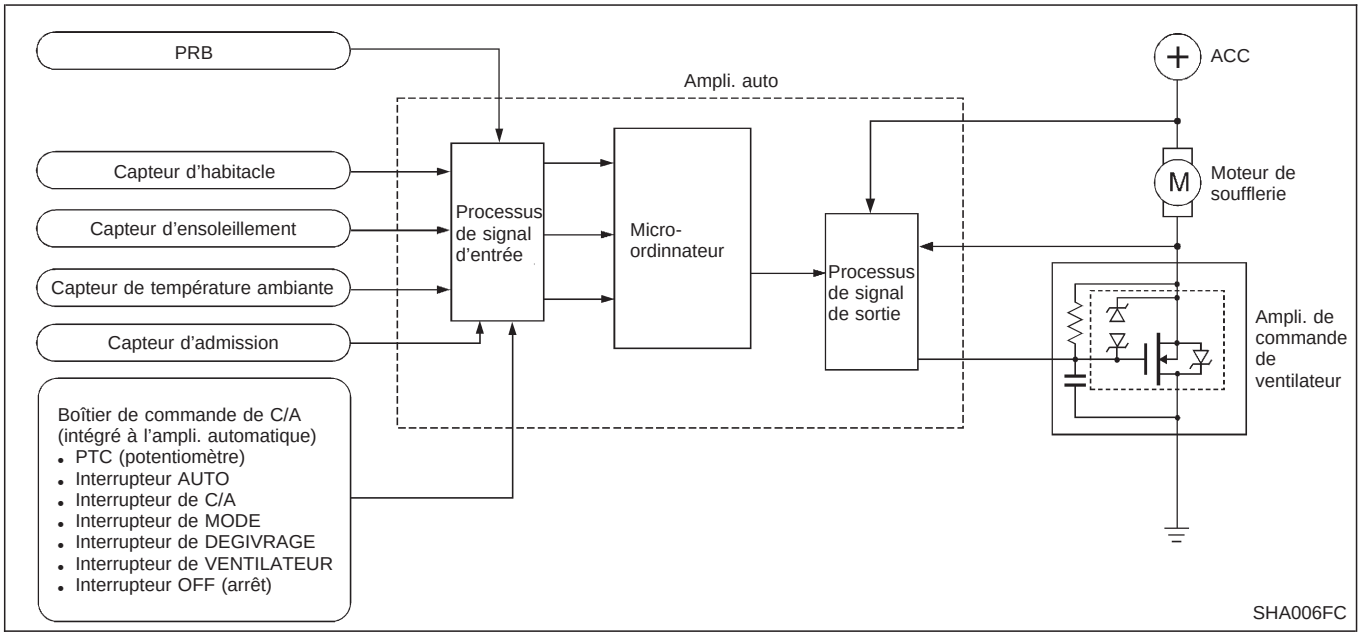
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Moteur de soufflerie (suite)

DESCRIPTION DU SYSTEME

Composants

Les composants du système de commande de vitesse du ventilateur sont :
1) Ampli. auto
2) Ampli. de commande de ventilateur
3) PBR
4) Capteur d'habitacle
5) Capteur de température ambiante
6) Capteur d'ensoleillement
7) Capteur d'admission

Fonctionnement du système

Mode automatique

En mode automatique, le régime du moteur de soufflerie est calculé par l'ampli. auto sur la base des entrées venant du PBR, du capteur d'habitacle, du capteur d'ensoleillement, du capteur d'admission et du capteur de température ambiante. La tension appliquée au moteur de soufflerie est approximativement comprise entre 5 V. (vitesse minimum) et 12 V. (vitesse maximum).
Pour réguler la vitesse de la soufflerie (dans une gamme de 5 V. à 12 V.), l'ampli. auto. adresse un signal à l'amplificateur de commande de ventilateur. En fonction de cette tension, l'amplificateur de commande de ventilateur contrôle la tension du moteur de soufflerie.

Commande de vitesse de ventilateur au démarrage

Démarrage ''A FROID'' (mode automatique)

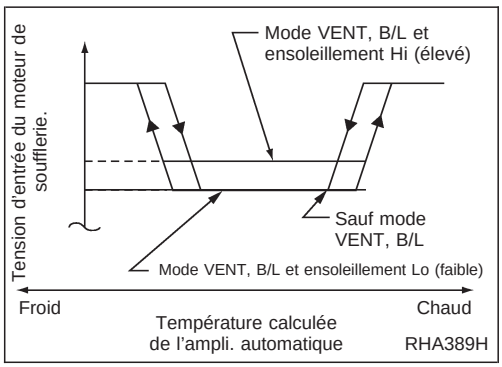
En cas de démarrage à froid (température du liquide de refroidissement moteur inférieure à 50°C), la soufflerie ne fonctionnera pas pendant une brève période de temps (jusqu'à 150 secondes). La durée exacte de ce délai initial dépend de la température ambiante et de la température du liquide de refroidissement moteur.
Dans les cas les plus extrêmes (température ambiante très basse), le délai initial de soufflerie sera de 150 secondes, comme décrit ci-dessus. Après ce délai, la soufflerie fonctionnera à vitesse lente jusqu'à ce que la température du liquide de refroidissement moteur augmente au-dessus de 55°C ; c'est à ce moment que le régime de la soufflerie augmentera jusqu'au régime désiré

Démarrage dans des conditions normales ou ''A CHAUD'' (mode automatique)

La soufflerie fonctionnera immédiatement après que l'interrupteur AUTO a été enfoncé. La soufflerie atteindra progressivement la vitesse voulue en 3 secondes ou moins (le temps réel dépend de la vitesse de la soufflerie voulue).

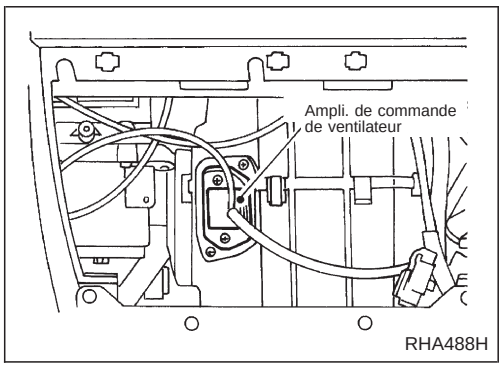
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Moteur de soufflerie (suite)



Compensation de la vitesse de soufflerie

Niveau d'ensoleillement



Lorsque la température à l'intérieur du véhicule et la température de référence sont très proches, la soufflerie fonctionnera à vitesse réduite. La vitesse réduite varie en fonction du niveau d'ensoleillement. En cas d'ensoleillement élevé, la vitesse à bas régime de la soufflerie sera la vitesse lente ''normale'' (environ 6 V.). En cas d'ensoleillement faible ou inexistant, la vitesse de la soufflerie chutera en mode de basse vitesse ''lente'' (environ 5 V).

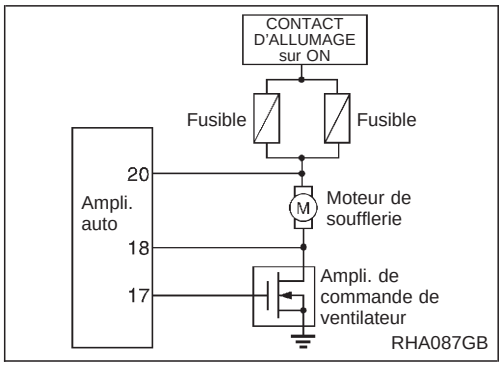
Température ambiante

Lorsque la température ambiante est dans la plage ''modérée'' [10 - 15°C], la tension de la soufflerie calculée sera compensée (réduite) par 3,5 V. (en fonction de la vitesse de la soufflerie). Dans les plages de température ambiante ''extrême'' [en-dessous de 0°C et au-dessus de 20°C], la tension de la soufflerie calculée et souhaitée n'est pas du tout compensée). Dans les plages de température ambiante situées entre les plages ''modérée'' et ''extrême'' [0 - 10°C et 15 - 20°C], la quantité de compensation (pour une vitesse de soufflerie donnée) varie en fonction de la température ambiante.

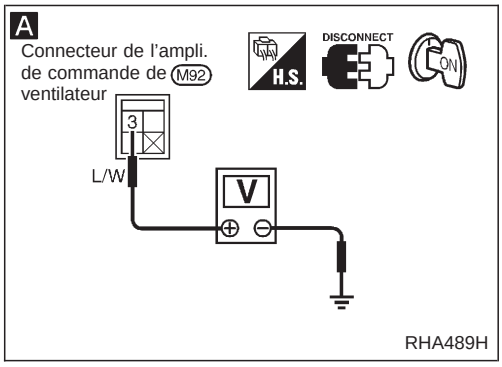
Caractéristiques de la commande de vitesse de ventilateur

DESCRIPTION DES COMPOSANTS

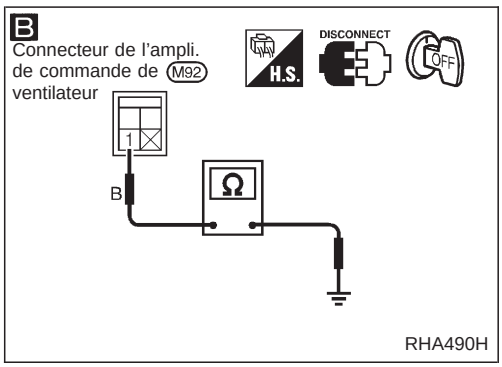
Amplificateur de commande du ventilateur



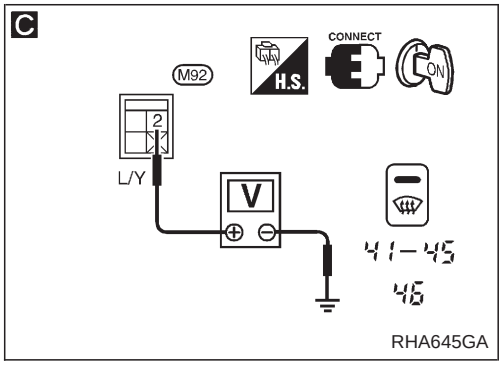
L'amplificateur de commande du ventilateur est situé sur l'ensemble de refroidissement. L'ampli. de commande de ventilateur reçoit une tension positive à la grille en provenance de l'ampli. auto. afin de maintenir continuellement la tension du moteur de ventilateur de soufflerie dans une plage de 5 à 12 V. (environ).



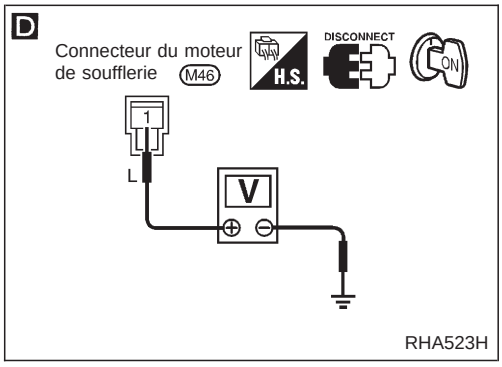
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Moteur de soufflerie (suite)



PROCEDURE DE DIAGNOSTIC



SYMPTOME : le moteur de soufflerie ne fonctionne pas bien au démarrage de la commande de vitesse du ventilateur.

A

VERIFIER L'ALIMENTATION ELECTRIQUE DE L'AMPLIFICATEUR DE COMMANDE DU VENTILATEUR.
Débrancher le connecteur de faisceau de l'ampli. de commande de ventilateur.
Y a-t-il une tension d'environ 12 volts entre la borne ③ du faisceau de l'ampli. de commande de ventilateur et la masse de carrosserie?

Non → **D**

Oui ↓

B

Remarque

VERIFIER LE CIRCUIT DE MASSE DE CARROSSERIE DE L'AMPLIFICATEUR DE COMMANDE DU VENTILATEUR.
Y a-t-il continuité entre la borne n° ① de l'ampli. de commande de ventilateur et la masse de carrosserie ?

Oui ↓

Reconnecter le connecteur de faisceau de l'ampli. de commande de ventilateur.

C

VERIFIER LA SORTIE DE L'AMPLI. AUTO.
Régler sur l'ETAPE 4 de l'autodiagnostic.
Mesurer la tension à travers la borne ② du faisceau de l'ampli. de commande de ventilateur et la masse de carrosserie.

N° de code	N° de borne ⊕	N° de borne ⊖	Tension
41 - 45	②	Masse de carrosserie	Env. 2,5 - 3V
46	②	Masse de carrosserie	Env. 9 - 10V

Mauvais → Ⓐ (Passer à la page suivante).

Bon ↓

Remplacer l'amplificateur de commande du ventilateur.

D

VERIFIER L'ALIMENTATION ELECTRIQUE DU MOTEUR DE SOUFFLERIE.
Débrancher le connecteur de faisceau du moteur de soufflerie.
Y a-t-il une tension d'environ 12 volts entre la borne n° ① du faisceau du moteur de soufflerie et la masse de carrosserie ?

Oui → **E**

Non → Vérifier le circuit d'alimentation électrique et les fusibles de 15 A (N° 21 et 22, situés dans le boîtier à fusibles).

E

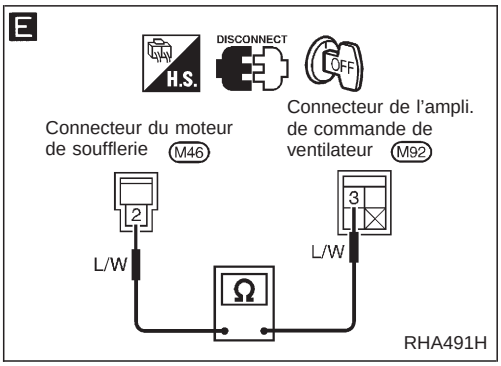
Remarque

Vérifier la continuité du circuit entre la borne ② du faisceau du moteur de soufflerie et la borne ③ du faisceau d'ampli. de commande de ventilateur.

Bon ↓

VERIFIER LE MOTEUR DE SOUFFLERIE.
(Se reporter à HA-2068.)

Mauvais ↓



Remplacer le moteur de soufflerie.

Remarque :
Si le résultat est mauvais ou ''Non'' après la vérification de la continuité du circuit, réparer le faisceau ou le connecteur.

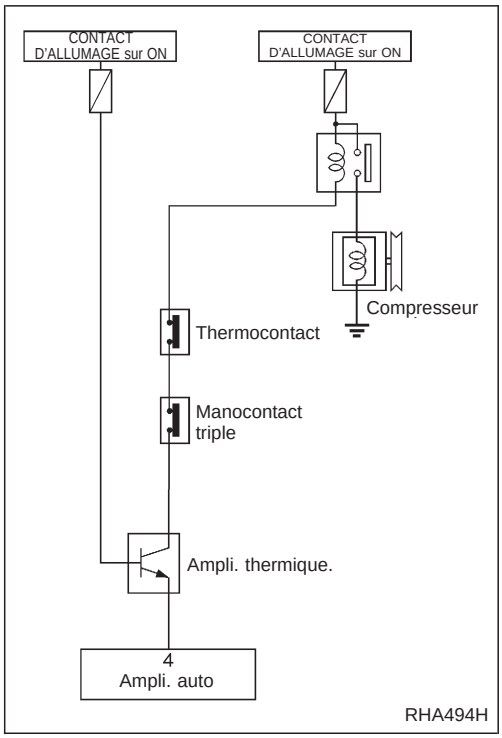
Embrayage magnétique (suite)

DESCRIPTION DU SYSTEME

L'amplificateur auto. contrôle le fonctionnement du compresseur par la température ambiante et les signaux reçus de l'ECM.

Commande de protection de basse température

L'amplificateur auto. détermine le fonctionnement ''MARCHE'' ou''ARRET'' du compresseur en fonction du signal détecté par le capteur de température ambiante.
Le compresseur fonctionne lorsque la température ambiante est supérieure à 1°C. Le compresseur ne fonctionne pas lorsque la température ambiante est inférieure à −2°C.

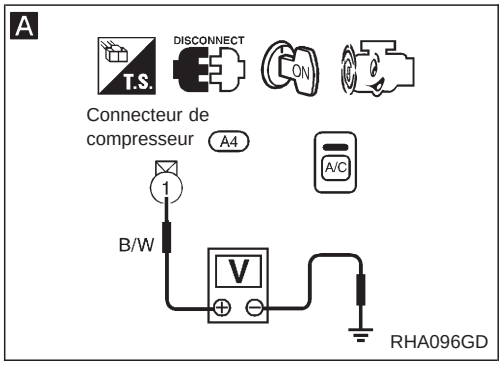


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Embrayage magnétique (suite)

PROCEDURE DE DIAGNOSTIC

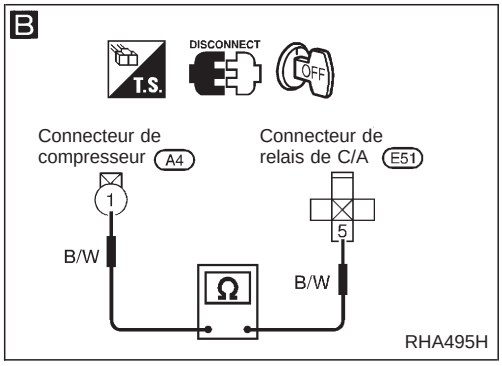
SYMPTOME : l'embrayage magnétique ne s'enclenche pas lorsque les interrupteurs de climatiseur et de ventilateur sont sur ''ON''.



A

VERIFIER L'ALIMENTATION ELECTRIQUE DU COMPRESSEUR.
Débrancher le connecteur de faisceau du compresseur.
Y a-t-il une tension d'environ 12 volts entre la borne ① du faisceau de compresseur et la masse de carrosserie ?

Oui → Vérifier la bobine de l'embrayage magnétique.
Mauvais → Remplacer l'embrayage magnétique. Se reporter à la page HA-1091 du MANUEL DE REPARATION D22, n° de Publication SM8F-0D22E0E.



Non → Déconnecter le relais de climatiseur.

B Remarque

VERIFIER LA CONTINUITE DU CIRCUIT ENTRE LA BORNE ⑤ DU FAISCEAU DE RELAIS DE C/A ET LA BORNE ① DU FAISCEAU DE COMPRESSEUR.
Il doit y avoir continuité.
Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité.

Bon →

C

VERIFIER L'ALIMENTATION ELECTRIQUE DU RELAIS DE CLIMATISEUR.
Déconnecter le relais de climatiseur.
Y a-t-il une tension d'environ 12 volts entre les bornes ①, ③ du faisceau de relais de C/A et la masse de carrosserie ?

Non → VERIFIER LE CIRCUIT D'ALIMENTATION ELECTRIQUE ET LE FUSIBLE DE 7,5A (N° 23) DANS LE BOITIER A FUSIBLE. Se reporter à la section EL (''Schéma de câblage'', ''DISPOSITION DE L'ALIMENTATION ELECTRIQUE'').

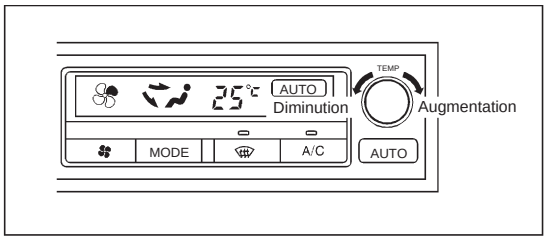
Refroidissement insuffisant



PROCEDURE DE DIAGNOSTIC DE DEFAUT DU REFROIDISSEMENT INSUFFISANT

SYMPTOME :

- **Refroidissement insuffisant.**

Ordre de l'inspection

1. Confirmer la présence du symptôme en exécutant la vérification de fonctionnement suivante.

VERIFICATION DE FONCTIONNEMENT – Diminution de la température
a. Tourner la commande de température jusqu'à ce que 18°C soit affiché.
b. Vérifier la présence d'air froid aux sorties d'air de décharge.

Si le résultat est bon (le symptôme ne peut pas être répété), effectuer une vérification complète du fonctionnement. (*11).
Si le résultat est mauvais (le symptôme est confirmé), continuer avec l'ETAPE 2 suivante.

2. Rechercher les bulletins d'entretien.
3. Effectuer l'ETAPE 1 de l'autodiagnostic. (*1)

Bon

4. Effectuer l'ETAPE 2 de l'autodiagnostic. (*2)
   - Mauvais → Se reporter au circuit du capteur de défaut approprié. (*2)

Bon

5. Effectuer l'ETAPE 4 de l'autodiagnostic. (*3)
   - Mauvais → **Se reporter aux éléments défectueux approriés.**
     - Vérifier le circuit de moteur de volet de mode (*12) et de moteur de volet de mélange d'air. (*4)
     - Vérifier le circuit du volet d'admission. (*5)
     - Vérifier le circuit du moteur de soufflerie. (*6)
     - Vérifier le circuit d'embrayage magnétique. (*7)

Bon

6. Vérifier la tension de la courroie de compresseur. Se reporter à la section MA (''Vérification des courroies d'entraînement'', ''ENTRETIEN DU MOTEUR'').
   - Mauvais → Régler ou remplacer la courroie de compresseur.

Bon

7. Vérifier le fonctionnement du volet de mélange d'air. (*8)
   - Mauvais → Régler ou remplacer la timonerie de commande de volet de mélange d'air.

Bon

8. Vérifier le fonctionnement du moteur du ventilateur de refroidissement.
   - Mauvais → Se reporter à la section EC.

Bon

9. Vérifier la pression du cycle de réfrigération avec manomètre de collecteur branché.
   - Mauvais → Effectuer les Diagnostics d'essai de rendement. Se reporter à (*9).

Bon

10. Vérifier la présence de givre sur la bobine de l'evaporateur.
    - Mauvais (Gel). → Remplacer le compresseur.

(Ne gèle pas).

Bon

11. Vérifier s'il y a des fuites d'air dans les conduites.
    - Mauvais → Réparer les fuites d'air.

Bon

12. Effectuer le réglage du condensateur de la tempéraure. (*10)
    (1) Régler sur MECANISME AUXILIAIRE en mode d'autodiagnostic.
    (2) Tourner la commande de température dans le sens inverse des aiguilles d'une montre, selon le souhait.

Bon

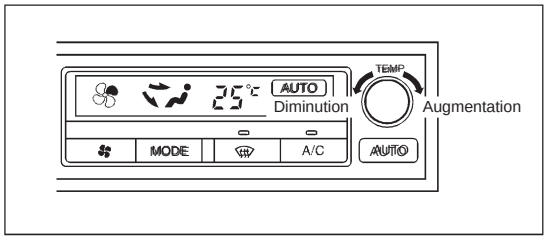
Chauffage insuffisant



PROCEDURE DE DIAGNOSTIC DE DEFAUT DU CHAUFFAGE INSUFFISANT

SYMPTOME :

- **Chauffage insuffisant.**

Ordre de l'inspection

1. Confirmer la présence du symptôme en exécutant la vérification de fonctionnement.

VERIFICATION DE FONCTIONNEMENT – Diminution de la température

a. Tourner la commande de température jusqu'à ce que 18°C soit affiché.
b. Vérifier la présence d'air froid aux sorties d'air de décharge.

Si le résultat est bon (le symptôme ne peut pas être répété), effectuer une vérification complète du fonctionnement. (*1).
Si le résultat est mauvais (le symptôme est confirmé), continuer avec l'ETAPE 2 suivante.

2. Rechercher les bulletins d'entretien.
3. Effectuer l'ETAPE 1 de l'autodiagnostic. (*2)

Bon

4. Effectuer l'ETAPE 2 de l'autodiagnostic. (*3)

Mauvais → Se reporter au circuit du capteur de défaut approprié. (*3)

Bon

5. Effectuer l'ETAPE 4 de l'autodiagnostic. (*4)

Mauvais → **Se reporter aux éléments défectueux appropriés.**
- Vérifier le circuit de moteur de volet de mode (*11) et de moteur de volet de mélange d'air. (*5)
- Vérifier le circuit de volet d'admission. (*6)
- Vérifier le circuit du moteur de soufflerie. (*7)

Bon

6. Vérifier les points suivants:
   - Niveau de liquide de refroidissement (se reporter à la section MA).
   - Présence de fuites ou de nœuds sur les flexibles.
   - Bouchon de radiateur. Se reporter à la section LC. (''CIRCUIT DE REFROIDISSEMENT DU MOTEUR'').
   - Air dans le circuit de refroidissement.

Mauvais → Réparer ou remplacer si nécessaire.

Bon

7. Vérifier le fonctionnement du volet de mélange d'air et du robinet d'eau. Se reporter à (*8).

Mauvais → Aller à la PROCEDURE DE DIAGNOSTIC DE DEFAUT DU MOTEUR DE VOLET DE MELANGE D'AIR. (*9)

Bon

8. Vérifier s'il y a des fuites d'air dans les conduites.

Mauvais → Réparer les fuites.

Bon

9. Vérifier au toucher les températures d'entrée et de sortie du chauffage.

Entrée très chaude
Sortie chaude

Vérifier la repose du thermostat.
(Se reporter à la section LC)

Mauvais → Vérifier si les flexibles de chauffage sont correctement installés.

Mauvais → Réparer ou remplacer si nécessaire. Effectuer un nouvel essai.

Bon

Remarque

Remplacer le thermostat. Se reporter à la section LC. (''Thermostat'', ''CIRCUIT DE REFROIDISSEMENT DU MOTEUR''). Effectuer un nouvel essai.

Entrée très chaude
Sortie chaude → Le système est BON

Les deux flexibles sont chauds

Bon

Remarque

Purger le noyau de chauffage, vidanger et remplir avec du liquide de refroidissement.
(Se reporter à la section MA). Effectuer un nouvel essai.

Entrée très chaude
Sortie chaude → Le système est BON

Les deux flexibles sont chauds

Remplacer le noyau du chauffage. Faire le plein de liquide de refroidissement moteur.
(Se reporter à la section MA). Effectuer un nouvel essai.

Entrée très chaude
Sortie chaude → Le système est BON

Remarque : Pour éviter un entretien inutile du système de chauffage, effectuer d'abord le REGLAGE DE LA TEMPERATURE A L'AIDE DU CONDENSATEUR AJUSTABLE.
Se reporter ''MECANISME AUXILIAIRE'', ''Autodiagnostic''. (*10)

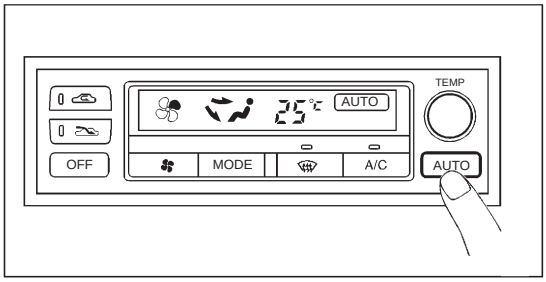
Autodiagnostic



PROCEDURE DE DIAGNOSTIC DE DEFAUT DE L'AUTODIAGNOSTIC

SYMPTOME :

- **Il n'est pas possible d'effectuer l'autodiagnostic.**

Ordre de l'inspection

1. Confirmer la présence du symptôme en exécutant la vérification de fonctionnement.

VERIFICATION DE FONCTIONNEMENT – Mode AUTO

a. Appuyer sur l'interrupteur AUTO.
b. L'affichage doit indiquer AUTO.
Vérifier que l'embrayage du compresseur s'engage (inspection auditive ou visuelle).
(L'air de décharge et la vitesse de soufflerie dépendront des températures ambiante, de l'habitacle et de référence). **Si le résultat est bon (le symptôme ne peut pas être répété), effectuer une vérification complète du fonctionnement. (*7).**
Si le résultat est mauvais (le symptôme est confirmé), continuer avec l'ETAPE 2 suivante.

2. Rechercher les bulletins d'entretien.
3. Vérifier l'alimentation électrique principale et le circuit de masse. (*1)

Bon — **La cause ne peut pas être confirmée par autodiagnostic.**

4. Vérifier le circuit du capteur de température ambiante. (*2)

Bon

5. Vérifier le circuit du capteur de l'habitacle. (*3)

Bon

6. Vérifier le circuit du capteur d'ensoleillement. (*4)

Bon

7. Vérifier le circuit du capteur d'admission d'air. (*5)

Bon

8. Vérifier le circuit PBR du moteur de volet de mélange d'air. (*6)

Bon

Si le symptôme existe toujours, effectuer une vérification complète de fonctionnement (*7) et vérifier s'il y a d'autres symptômes. [Se reporter au tableau des symptômes, (*8)].
Existe-t-il un autre symptôme ?

Non

Remplacer l'amplificateur automatique.

FIN DE L'INSPECTION

Oui

Se reporter au Diagnostic de défaut de symptômes connexes.

Un autre symptôme existe.

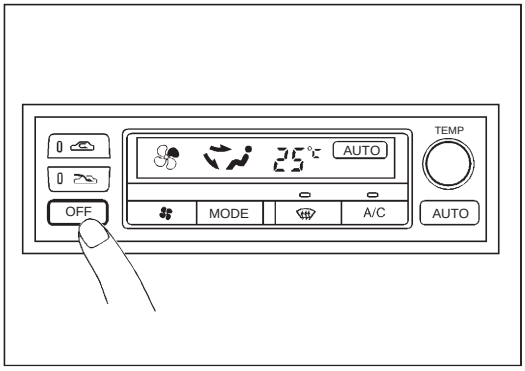
Fonction de mémoire



PROCEDURE DE DIAGNOSTIC DE DEFAUT DE LA FONCTION DE MEMOIRE

SYMPTOME :

- **La fonction de mémoire ne fonctionne pas.**

Ordre de l'inspection

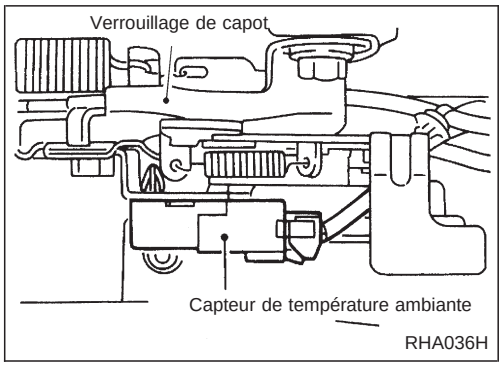
1. Confirmer la présence du symptôme en exécutant la vérification de fonctionnement suivante.

VERIFICATION DE FONCTIONNEMENT – Fonction de mémoire

a. Régler la température à 25°C.
b. Appuyer sur l'interrupteur OFF (ARRET).
c. Mettre le contact d'allumage sur ''OFF''.
d. Mettre le contact d'allumage sur ''ON''.
e. Appuyer sur l'interrupteur AUTO.
f. Vérifier que la température de référence ne varie pas par rapport à la température précédente.
g. Appuyer sur l'interrupteur OFF (ARRET).

Si le résultat est bon (le symptôme ne peut pas être répété), effectuer une vérification complète du fonctionnement. (*2).
Si le résultat est mauvais (le symptôme est confirmé), continuer avec l'ETAPE 2 suivante.

2. Rechercher les bulletins d'entretien.
3. Vérifier l'alimentation électrique principale et le circuit de masse. (*1)



Bon

4. Remplacer l'amplificateur automatique.
5. VERIFICATION FINALE
   Se reporter à la procédure étape par étape de l'autodiagnostic (*3) et effectuer l'ETAPE 2 d'autodiagnostic.
   S'assurer que le code n° 20 est affiché.

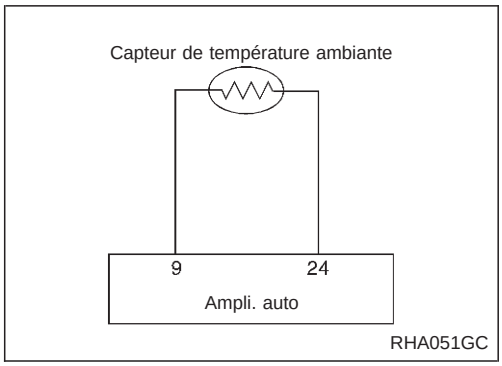
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Capteur de température ambiante

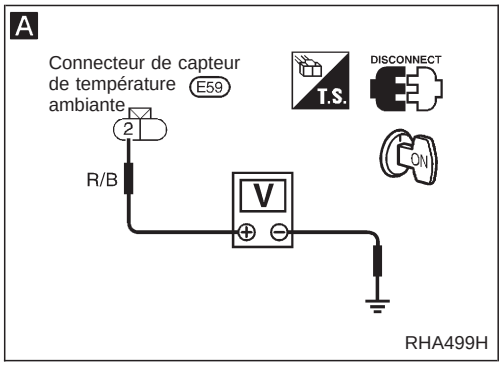
DESCRIPTION DES COMPOSANTS

Le capteur de température ambiante est fixé devant le condenseur côté conducteur. Il détecte la température ambiante et la convertit en une valeur de résistance qui est ensuite entrée dans l'amplificateur auto.

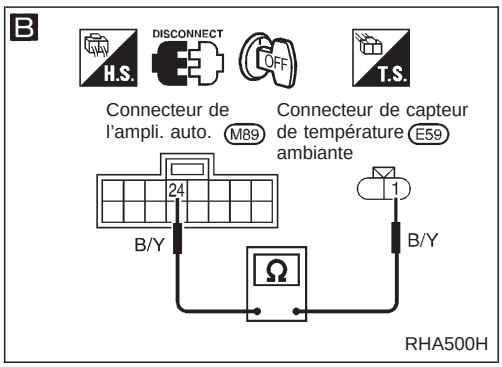
TRAITEMENT DES ENTREES DE TEMPERATURE AMBIANTE



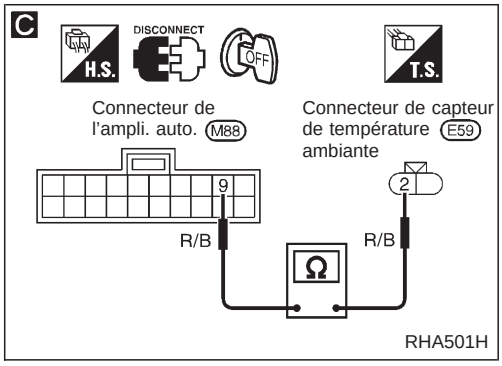
L'ampli. auto. comprend un ''circuit de traitement'' des entrées provenant du capteur de température ambiante. Cependant, lorsque la température détectée par le capteur de température ambiante augmente rapidement, le circuit de traitement retarde le fonctionnement de l'ampli. auto. Il permet à l'amplificateur auto. de détecter une augmentation de température de 0,33°C pour 100 secondes seulement.
Imaginons par exemple que l'on s'arrête pour prendre une tasse de café après avoir conduit à grande vitesse. Même si la température ambiante n'a pas changée, la température détectée par le capteur de température ambiante augmentera. C'est parce que la chaleur du compartiment moteur peut passer à travers la grille avant, où se situe le capteur de température ambiante.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Capteur de température ambiante (suite)



PROCEDURE DE DIAGNOSTIC

SYMPTOME : le circuit du capteur de température ambiante est ouvert ou court-circuité. (21 ou 21 A/C LED est indiqué par l'ampli. automatique comme un résultat de l'ETAPE 2 de l'autodiagnostic.)

A

VERIFIER LE CIRCUIT DU CAPTEUR DE TEMPERATURE AMBIANTE ENTRE LE CAPTEUR ET L'AMPLIFICATEUR AUTOMATIQUE.
Débrancher le connecteur de faisceau du capteur de température ambiante.
Y a-t-il une tension d'environ 5 V entre la borne n° ② du faisceau du capteur de température ambiante et la masse de carrosserie ?

Non → Débrancher le connecteur de faisceau de l'amplificateur automatique.

C

Remarque

Vérifier la continuité du circuit entre la borne n° ② du faisceau du capteur de température ambiante et la borne n° ⑨ du faisceau de l'ampli. auto.

Bon → Remplacer l'amplificateur automatique.

Oui

Débrancher le connecteur de faisceau de l'amplificateur automatique.

B

Remarque

Vérifier la continuité du circuit entre la borne n° ① du faisceau du capteur de température ambiante et la borne n° ㉔ du faisceau de l'ampli. auto.

Bon

VERIFIER LE CAPTEUR DE TEMPERATURE AMBIANTE.
(Se reporter à HA-2083).

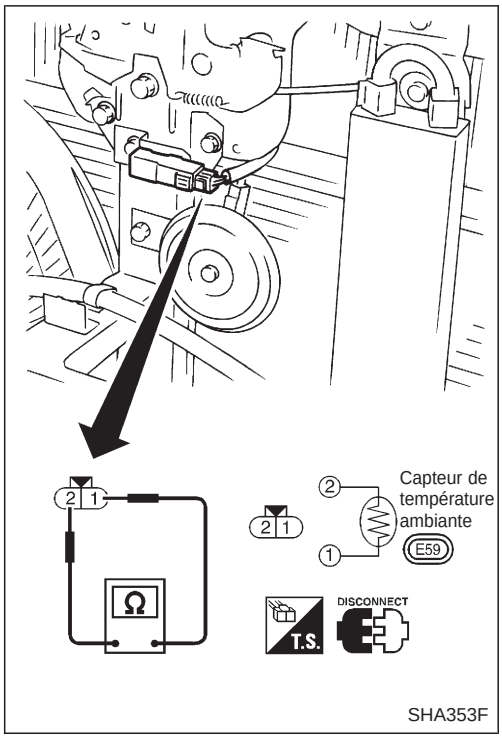
Mauvais → Remplacer le capteur de température ambiante.

Bon

Remplacer l'amplificateur automatique.

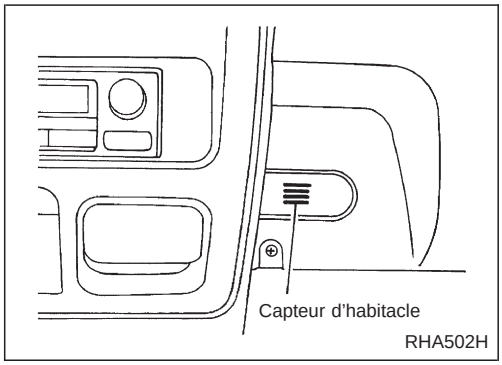
Remarque :
Si le résultat est mauvais ou ''Non'' après la vérification de la continuité du circuit, réparer le faisceau ou le connecteur.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Capteur de température ambiante (suite)

INSPECTION DES COMPOSANTS



Capteur de température ambiante

Après avoir déconnecté le connecteur de faisceau du capteur de température ambiante, mesurer la résistance entre les bornes ① et ② côté faisceau du capteur, en se référant au tableau ci-dessous.

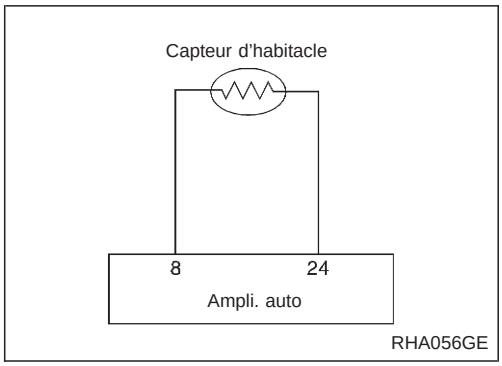
Température °C	Résistance kΩ
−20	9,98
−10	5,57
0	3,26
10	1,98
20	1,25
25	1,00
30	0,81
40	0,54

SHA353F

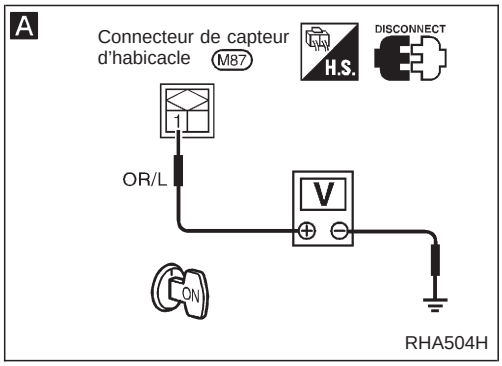
RHA502H

Capteur d'habitacle

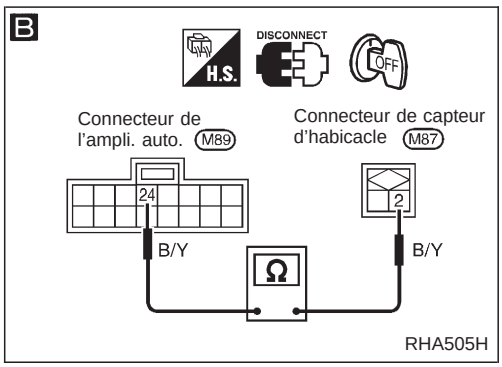
DESCRIPTION DES COMPOSANTS



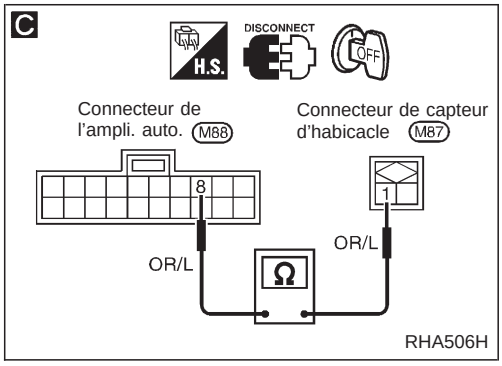
Le capteur d'habitacle est situé dans le panneau inférieur des instruments. Il convertit les variations de température de l'air du compartiment dispensé depuis l'aspiration. Celle-ci est ensuite entrée dans l'amplificateur auto.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Capteur d'habitacle (suite)



PROCEDURE DE DIAGNOSTIC

SYMPTOME : le circuit du capteur d'habitacle est ouvert ou court-circuité. (22 ou 22 A/C LED est indiqué par l'ampli. automatique comme un résultat de l'ETAPE 2 de l'autodiagnostic.)

A

VERIFIER LE CIRCUIT DU CAPTEUR D'HABITACLE ENTRE LE CAPTEUR D'HABITACLE ET L'AMPLI. AUTO.
Débrancher le connecteur de faisceau du capteur d'habitacle.
Y a-t-il une tension d'environ 5 V entre la borne n° ① du faisceau du capteur d'habitacle et la masse de carrosserie ?

Non → Débrancher le connecteur de faisceau de l'amplificateur automatique.

Oui → Débrancher le connecteur de faisceau de l'amplificateur automatique.

C

Remarque

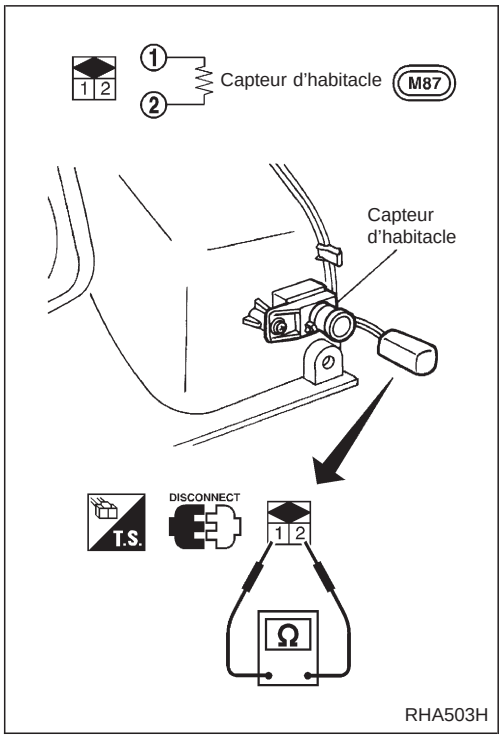
Vérifier la continuité du circuit entre la borne n° ① du faisceau du capteur d'habitacle et la borne n° ⑧ du faisceau de l'ampli. auto.

Bon → Remplacer l'amplificateur automatique.

B

Remarque

Vérifier la continuité du circuit entre la borne n° ② du faisceau du capteur d'habitacle et la borne n° ㉔ du faisceau de l'ampli. auto.



Bon → VERIFIER LE CAPTEUR D'HABITACLE.
(Se reporter à HA-2085).

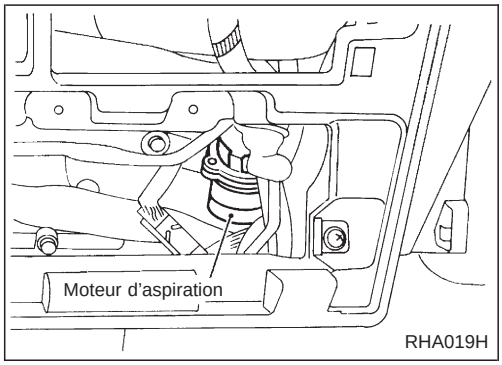
Mauvais → Remplacer le capteur d'habitacle.

Bon → Remplacer l'amplificateur automatique.

Remarque :
Si le résultat est mauvais ou ''Non'' après la vérification de la continuité du circuit, réparer le faisceau ou le connecteur.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

RHA503H



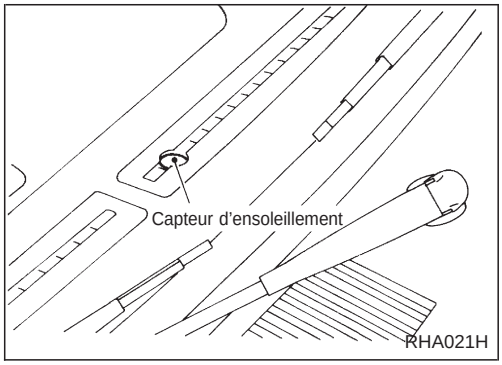
Capteur d'habitacle (suite)

INSPECTION DES COMPOSANTS

Capteur d'habitacle

Après avoir débranché le connecteur du faisceau du capteur d'habitacle, mesurer la résistance entre les bornes ① et ② du côté du faisceau du capteur, à l'aide du tableau ci-dessous.

Température °C	Résistance kΩ
0	6,0
5	4,95
10	3,99
15	3,24
20	2,65
25	2,19
30	1,81
35	1,51
40	1,27



RHA019H

Moteur d'aspiration

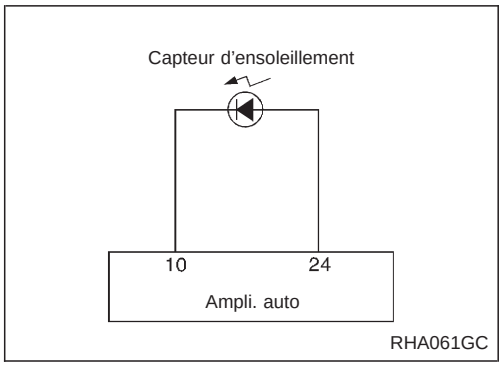
DESCRIPTION DES COMPOSANTS

Le moteur d'aspirateur est situé à l'avant du dispositif de chauffage. Le moteur d'aspirateur fait circuler l'air du compartiment en continu dans le capteur d'habitacle lorsque le contact d'allumage est sur ON.
Vérifier si la fumée est correctement aspirée dans le capteur d'habitacle lorsqu'une cigarette allumée est déplacée près du capteur.

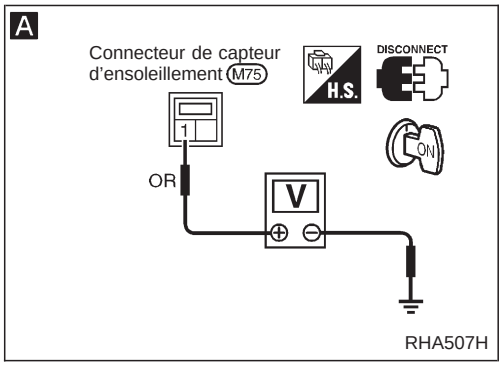
RHA021H

Capteur d'ensoleillement

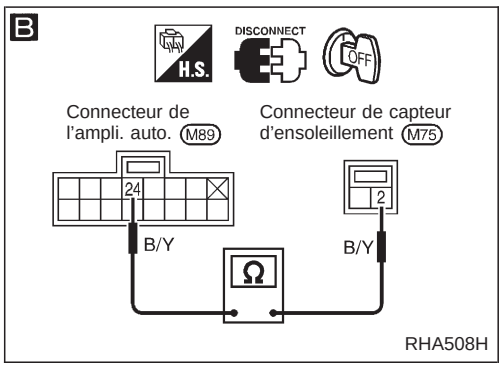
DESCRIPTION DES COMPOSANTS



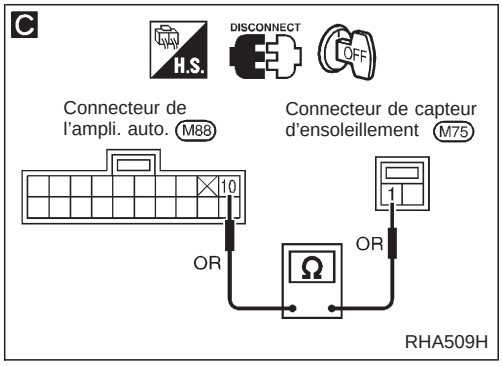
Le capteur d'ensoleillement est situé sur la grille du dégivreur central. Il détecte le niveau d'ensoleillement pénétrant à travers le pare-brise à l'aide d'une photodiode et le convertit en une valeur courante qui est ensuite entrée dans l'amplificateur auto.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Capteur d'ensoleillement (suite)



PROCEDURE DE DIAGNOSTIC

SYMPTOME : le circuit du capteur d'ensoleillement est ouvert ou court-circuité. (25 ou 25 A/C LED est indiqué par l'ampli. automatique comme un résultat de l'ETAPE 2 de l'autodiagnostic.)

A

VERIFIER LE CIRCUIT DU CAPTEUR D'ENSOLEILLEMENT ENTRE LE CAPTEUR ET L'AMPLIFICATEUR AUTOMATIQUE.
Débrancher le connecteur de faisceau du capteur d'ensoleillement.
Y a-t-il une tension d'environ 5 V entre la borne n° ① du faisceau du capteur d'ensoleillement et la masse de carrosserie ?

Non → Débrancher le connecteur de faisceau de l'amplificateur automatique.

Débrancher le connecteur de faisceau de l'amplificateur automatique.

C

Remarque

Vérifier la continuité du circuit entre la borne n° ① du faisceau du capteur d'ensoleillement et la borne n° ⑩ du faisceau de l'ampli. auto.

Bon → Remplacer l'amplificateur automatique.

Oui

B

Remarque

Vérifier la continuité du circuit entre la borne n° ② du faisceau du capteur d'ensoleillement et la borne n° ㉔ du faisceau de l'ampli. auto.

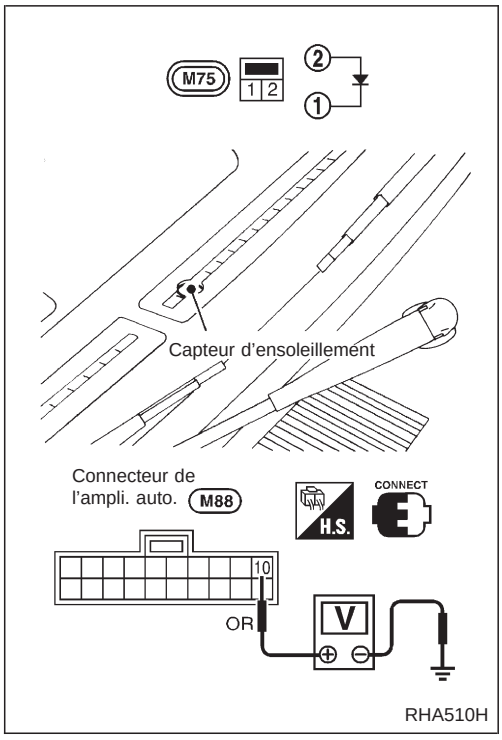
Bon

VERIFIER LE CAPTEUR D'ENSOLEILLEMENT.
(Se reporter à HA-2087.)

Mauvais → Remplacer le capteur d'ensoleillement.

Bon

Remplacer l'amplificateur automatique.

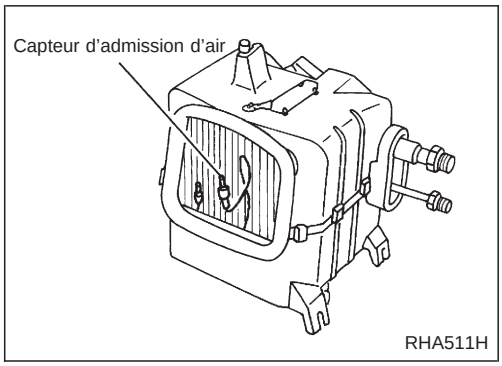


Remarque :
Si le résultat est mauvais ou ''Non'' après la vérification de la continuité du circuit, réparer le faisceau ou le connecteur.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Capteur d'ensoleillement (suite)

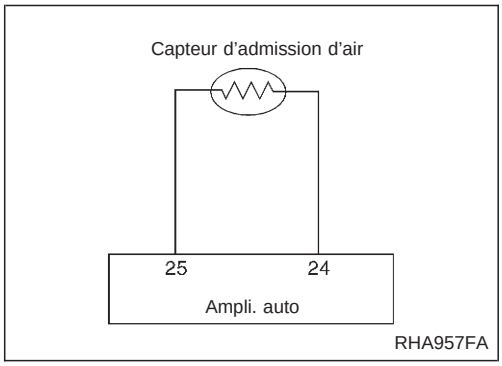
INSPECTION DES COMPOSANTS



Capteur d'ensoleillement

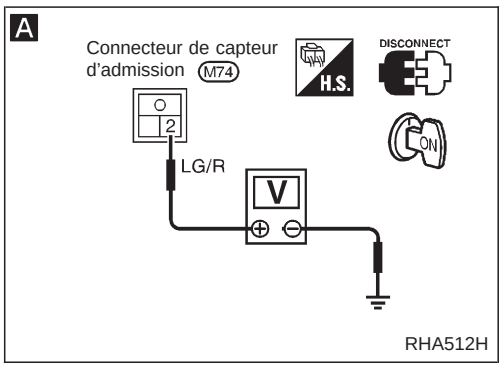
Mesurer la tension entre la borne ⑩ de l'ampli. auto. et la masse de carrosserie.

- **Vérifier le fonctionnement du capteur d'ensoleillement en s'assurant qu'il est directement exposé aux rayons du soleil.**

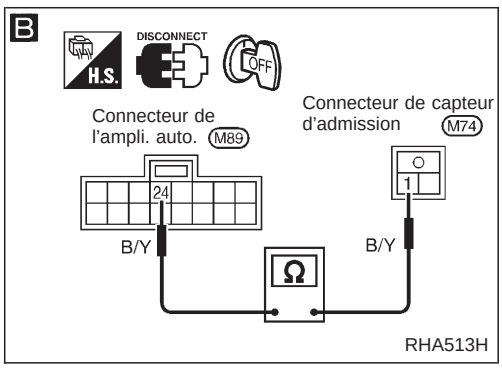


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

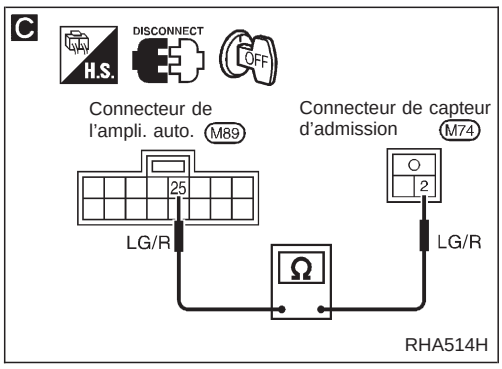
Capteur d'admission d'air



DESCRIPTION DES COMPOSANTS



La capteur d'admission d'air est placé sur l'unité de refroidissement. Il convertit la température de l'air après son passage dans l'évaporateur en une valeur de résistance. Cette valeur est alors entrée dans l'ampli. auto.



PROCEDURE DE DIAGNOSTIC

SYMPTOME : le circuit du capteur d'admission d'air est ouvert ou court-circuité.

A

VERIFIER LE CIRCUIT DU CAPTEUR D'ADMISSION D'AIR ENTRE LE CAPTEUR D'ADMISSION ET L'AMPLI. AUTO.
Débrancher le connecteur de faisceau du capteur d'admission d'air.
Y a-t-il une tension d'environ 5 V entre la borne (2) du faisceau du capteur d'admission d'air et la masse de carrosserie ?

Non → Débrancher le connecteur de faisceau de l'amplificateur automatique.

C

Remarque

Vérifier la continuité du circuit entre la borne n° (2) du faisceau du capteur d'admission d'air et la borne n° (25) du faisceau de l'ampli. auto.
Il doit y avoir continuité.
Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité.

Bon → Remplacer l'amplificateur automatique.

Oui → Débrancher le connecteur de faisceau de l'amplificateur automatique.

B

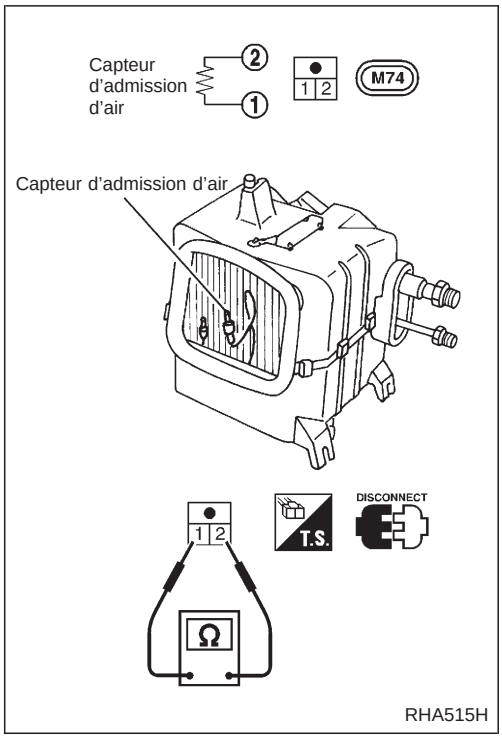
Remarque

Vérifier la continuité du circuit entre la borne n° (1) du faisceau du capteur d'admission d'air et la borne n° (24) du faisceau de l'ampli. auto.
Il doit y avoir continuité.
Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité.

Bon → VERIFIER LE CAPTEUR D'ADMISSION D'AIR.
(Se reporter à HA-2089).

Mauvais → Remplacer le capteur d'admission d'air.

Bon → Remplacer l'amplificateur automatique.



Remarque :
Si le résultat est mauvais ou ''Non'' après la vérification de la continuité du circuit, réparer le faisceau ou le connecteur.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Capteur d'admission d'air (suite)

INSPECTION DES COMPOSANTS

Capteur d'admission d'air

Après avoir déconnecté le connecteur de faisceau du capteur d'admission d'air, mesurer la résistance entre les bornes ㉕ et ㉔ côté faisceau du capteur, en se reportant au tableau ci-dessous.

Température °C	Résistance kΩ
−20	16,2
−10	9,8
0	6,0
10	3,94
20	2,64
25	2,12
30	1,82
40	1,27

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

‘‘COUSSIN GONFLABLE’’ (AIR BAG) et ‘‘PRETENSIONNEUR DE CEINTURE DE SECURITE’’ du système de retenue supplémentaire (SRS)

Utilisé conjointement avec une ceinture de sécurité, les systèmes de retenue supplémentaire tels que le ‘‘COUSSIN GONFLABLE’’ et le ‘‘PRETENSIONNEUR DE CEINTURE DE SECURITE’’ permettent de réduire les risques de blessures graves subies par le conducteur et le passager avant lors de collisions frontales. La composition du système de retenue supplémentaire disponible sur le MODELE D22 NISSAN est la suivante (la composition variera en fonction de la destination et de l’équipement optionnel) :
Le système de retenue supplémentaire se compose d’un module de coussin gonflable côté conducteur (situé dans le moyeu du volant), d’un module de coussin gonflable côté passager (situé sur le tableau de bord, côté passager), de prétensionneurs de ceinture de sécurité, d’un boîtier de capteurs de diagnostic, d’un témoin d’avertissement, d’un faisceau de câblage et d’un câble spiralé.
Les informations nécessaires à l’entretien sans danger du système se trouvent à la **section RS** de ce Manuel de Réparation.

ATTENTION :

- **Afin de ne pas affecter le bon fonctionnement du SRS, ce qui augmenterait les risques de blessures graves ou mortelles en cas de collision entraînant le déploiement du coussin gonflable, toutes les opérations d’entretien devront être effectuées par un concessionnaire NISSAN agréé.**
- **Un entretien incorrect, y compris une dépose et une installation incorrectes du SRS, pourra entraîner des risques de blessures causées par le déploiement imprévu du système. Pour la dépose du câble spiralé et du module de coussin gonflable, se reporter à la section RS.**
- **Ne pas utiliser d’équipement d’essai électrique sur tout circuit connexe au SRS sauf si indiqué dans ce Manuel de Réparation. Le câble spiralé et les faisceaux de câblage (à l’exception du ‘‘PRETENSIONNEUR DE CEINTURE DE SECURITE’’) recouverts d’une gaine d’isolation jaune placée juste avant les connecteurs de faisceau ou couvrant l’ensemble du faisceau sont reliés au SRS.**

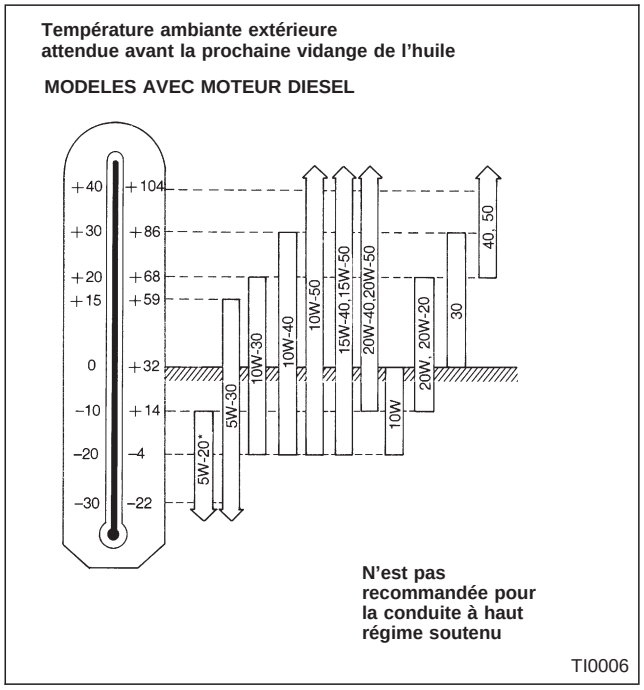
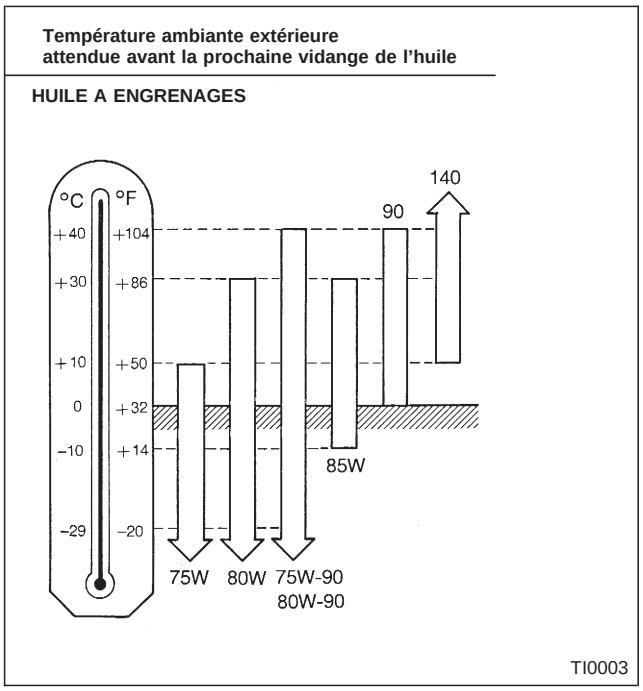
	TD25Ti	6,0	
Circuit de refroidissement (avec réservoir)			
	TD25	9,5	Liquide de refroidissement antigel (à base d'éthylène glycol)
	TD25Ti	10,6	
Huile pour boîte de vitesses manuelle	FS5R30A	4 roues motrices 5,1	API GL-4, Viscosité SAE 75W-90 uniquement
	FS5W71C	2 roues motrices 2,0 4 roues motrices 4,9	
Huile de boîte de différentiel			
Avant :	R180A	1,3	Différentiel standard : API GL-5*1 Pignon de différentiel à glissement limité (LSD) : huile pour engrenages hypoïdes LSD (N° de pièce : KLD31-14002) ou équivalent*2
Arrière :	C200	1,3	
	H233B	2,8	
Liquide pour direction assistée		—	Type DEXRON™ IIE, DEXRON™ III ou équivalent
Liquide de frein et d'embrayage		—	DOT 3 ou DOT 4 (US FMVSS N°116)*3
Graisse pour arbre de transmission		—	NLGI N° 2 (à base de savon de lithium comprenant du bisulfure de molybdène)
Graisse à usage multiple		—	NLGI N° 2 (à base de savon de lithium)



*1 : Pour de plus amples détails, se reporter à ''Indice de viscosité SAE''.
*2 : API GL-5, SAE 140 et 10% de la quantité de modificateur de friction de LSD (n° de pièce : 38469-C6000) sont des équivalents.
*3 : Ne jamais mélanger DOT 3 et DOT 4. (DOT 3 est rempli en usine.)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Indice de viscosité SAE

- **Pour les pays tempérés et froids : l'huile 10W-30 convient, avec une température ambiante supérieure à −20°C.**
- **Pour des régions très chaudes : les huiles 20W-20, 20W-40 et 20W-50 conviennent.**

- **Pour les pays froids : l'huile 10W-30 est préférable.**
  Pour les modèles équipés d'un turbocompresseur, l'huile 5W-20 n'est pas recommandée et l'huile 5W-30 ne doit être utilisée qu'en dessous de 0°.
- **Pour les pays tempérés et très chauds : les huiles 20W-40 et 20W-50 conviennent.**

- **Pour des régions tempérées et froides : l'huile 75W-90 pour la boîte de transfert et l'huile 80W-90 pour le différentiel conviennent.**
- **Pour les pays très chauds : l'huile 90 convient à une température ambiante inférieure à 40°C.**

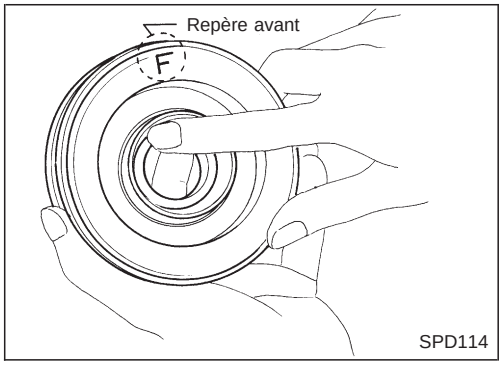
Démontage

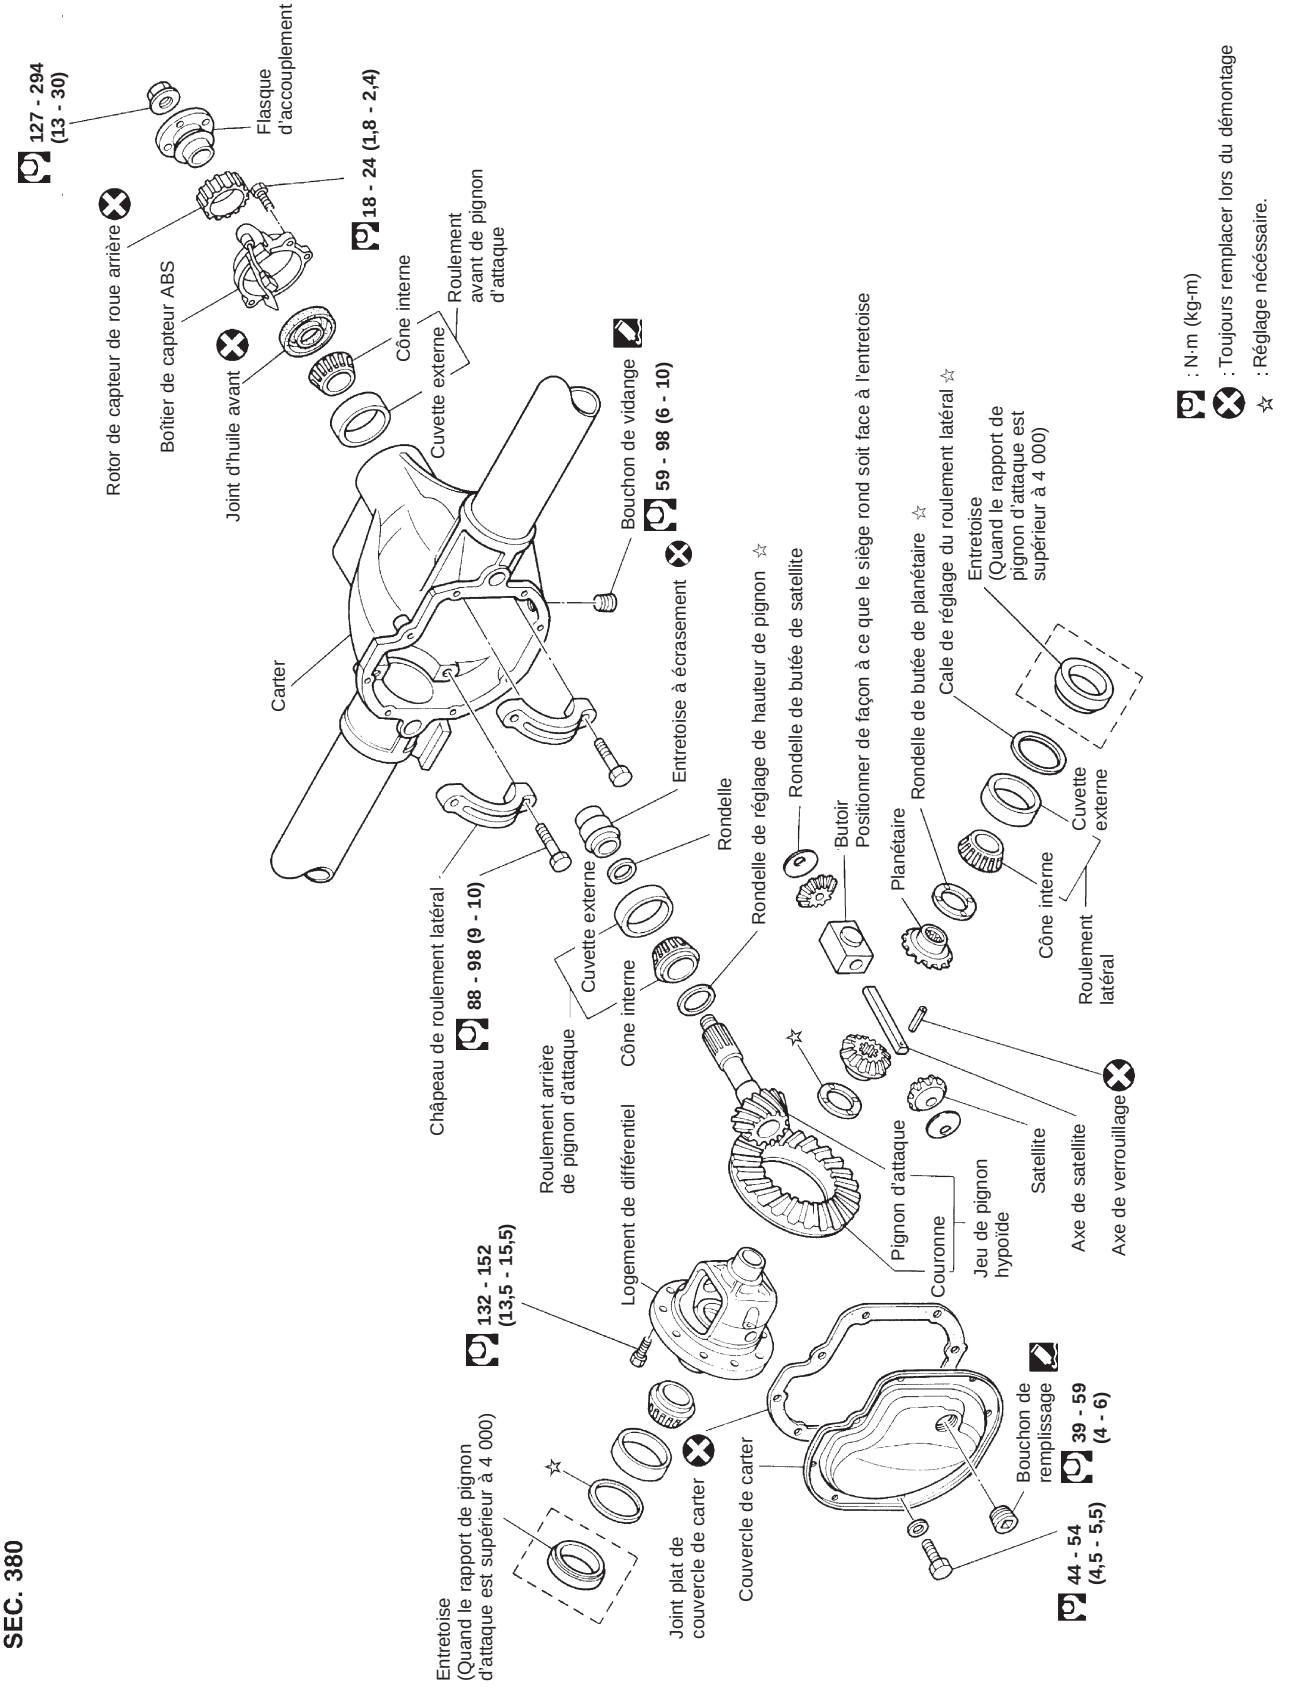
ROULEMENT CENTRAL



1. Placer les marques de repères sur les flasques, puis séparer le second tube du premier tube.

2. Placer les marques de repères sur le flasque et l'arbre.
3. Fixer la fourchette de flasque avec un étau et déposer le contre-écrou.
4. Déposer la fourchette de flasque à l'aide d'un extracteur.

5. Déposer le roulement central à l'aide d'un outil spécial et d'une presse.
   Numéro de l'outil : ST30031000

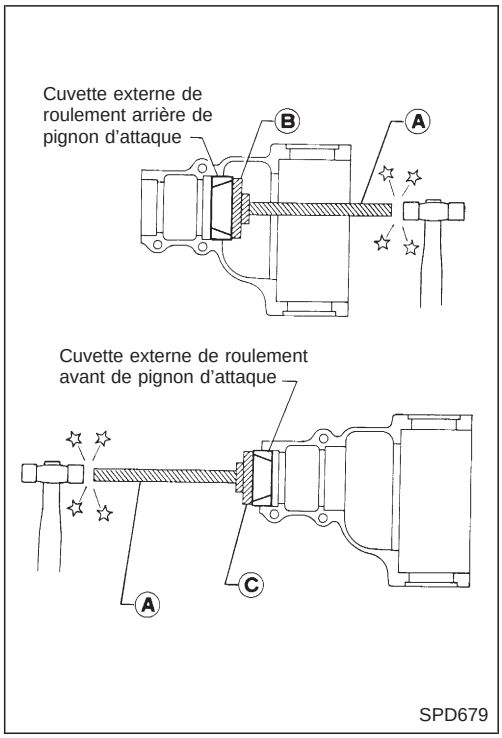


Remontage

ROULEMENT CENTRAL

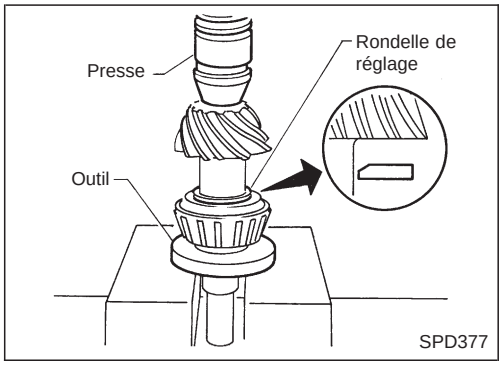
- Lors de la repose du roulement central, disposer la marque ''F'' située au centre du roulement vers l'avant du véhicule.
- **Enduire d'une couche de graisse au lithium (à usages multiples) contenant du bisulfure de molybdène sur l'extrémité du centre du roulement et les deux cotés de la rondelles.**
- Estamper l'écrou. Toujours utiliser un écrou neuf.
- Aligner les marques de repères lors de l'assemblage des tubes.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



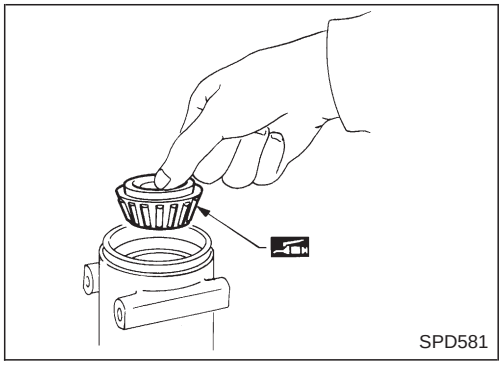
Modèle à 2 satéllites

SEC. 380

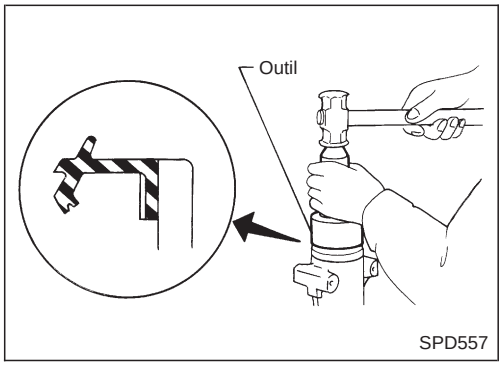


SPD510A

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

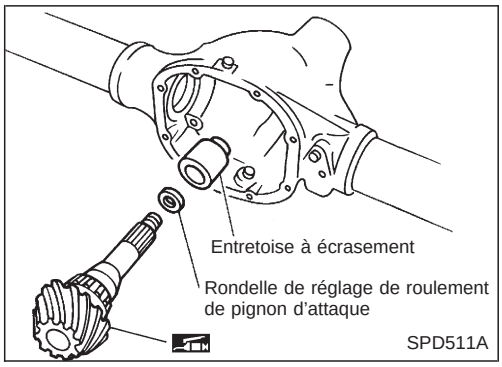


Support de différentiel

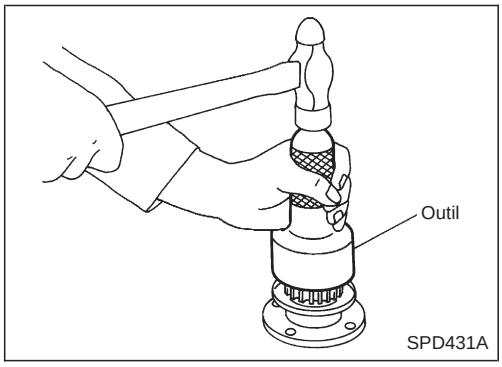


1. Enfoncer à la presse les cuvettes externes de roulement avant et arrière à l'aide des outils spéciaux.
   Numéro des outils :
   - Ⓐ **ST30611000**
   - Ⓑ **ST30621000**
   - Ⓒ **ST30613000**

2. Selectionner une rondelle de réglage de hauteur de pignon. Se reporter à ''REGLAGE'' dans le Manuel de Réparation de l'édition générale.
3. Reposer la rondelle de réglage de hauteur de pignon sur le pignon d'attaque, monter à la presse le cône interne de roulement, à l'aide de la presse et de l'outil spécial.
   Numéro de l'outil : ST30031000

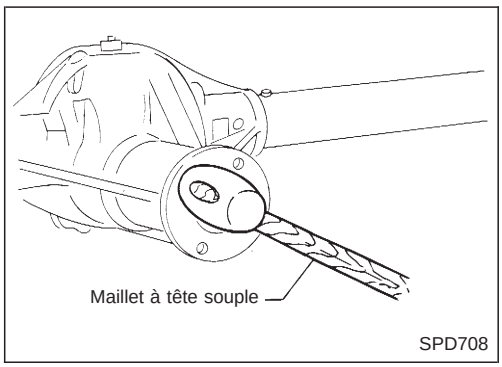


4. Placer le cône interne de roulement avant de pignon d'attaque dans le carter de pont.

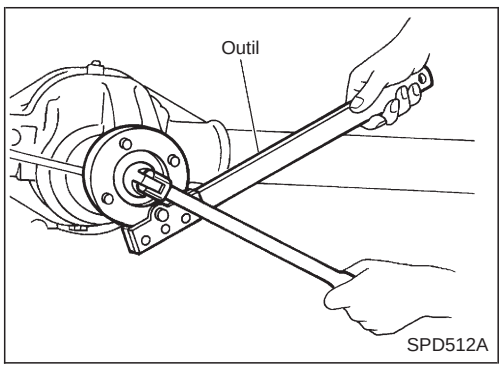


5. Remplir les creux entre les lèvres du joint d'huile de graisse à usages multiples. Repose du joint d'huile avant
   Numéro de l'outil : KV38100500

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

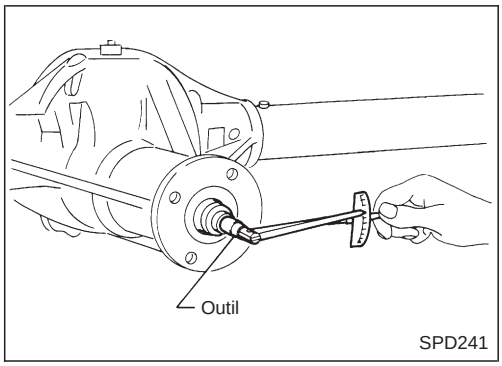


Support de différentiel (suite)



6. Placer l'entretoise de roulement de pignon d'attaque, la rondelle de réglage de roulement de pignon d'attaque et le pignon d'attaque dans le carter de pont.

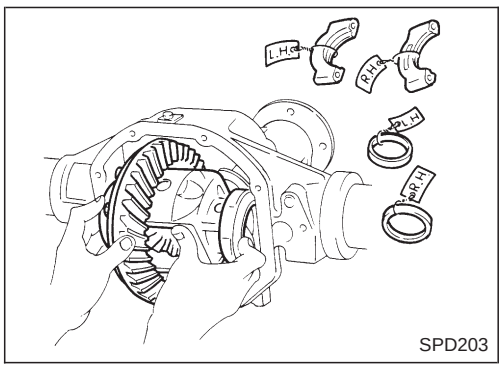
7. Introduire le rotor de capteur dans le flasque d'accouplement à l'aide de l'outil.
   Numéro de l'outil : ST30720000
8. Repose du boîtier de capteurs d'ABS dans le carter de pont.



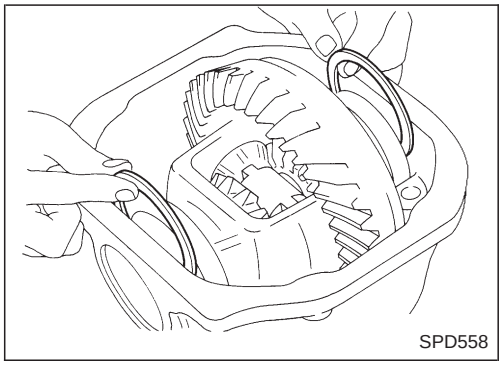
9. Introduire le flasque d'accouplement dans le pignon d'attaque en le tapant légèrement avec un maillet à tête souple.

10. Serrer l'écrou de pignon à 127 N·m (13 kg-m).
Eliminer toutes traces d'huile ou de graisse du filetage de pignon d'attaque et de l'écrou de pignon.
Outil numéro : KV38108300

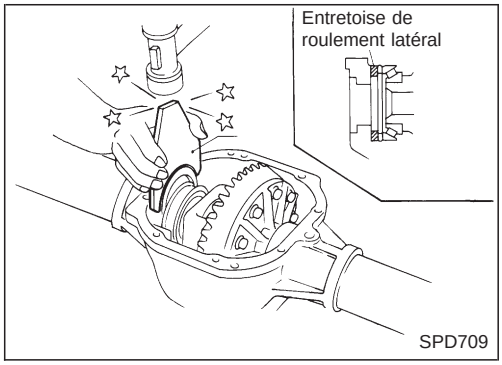
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Support de différentiel (suite)

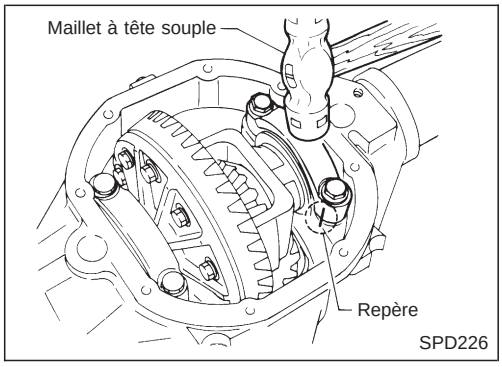


11. Tourner le pignon d'attaque de plusieurs tours dans les deux sens et mesurer la précharge de roulement de pignon.
    Numéro de l'outil : ST3127S000
    Précharge de roulement du pignon (avec le joint avant) :
    1,1 - 1,4 N·m
    (11 - 14 kg-cm)
    Précharge de roulement du pignon (sans le joint avant) :
    1,0 - 1,3 N·m
    (10 - 13 kg-cm)



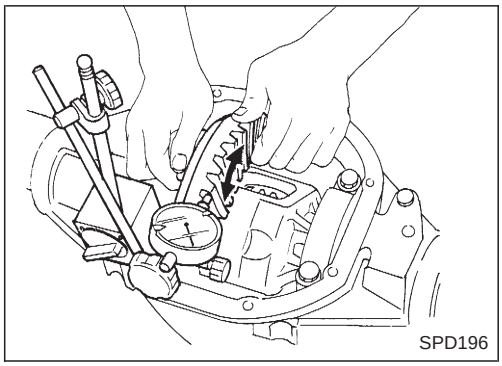
Si la précharge de roulement du pignon est hors des spécifications, remplacer la rondelle de réglage de roulement du pignon et l'entretoise avec des pièces d'épaisseur différentes.

12. Selectionner une rondelle de réglage de roulement latéral. Se reporter à ''REGLAGE'' dans le Manuel de Réparation de l'édition générale.
13. Monter l'ensemble du logement différentiel avec les cages extérieures de roulement dans le carter de pont.



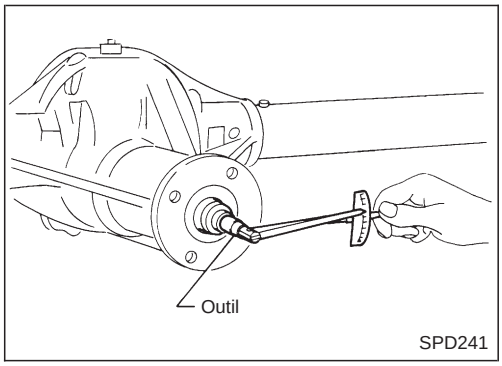
14. Monter les rondelles de réglage de roulement du côté gauche et droit situées entre le roulement latéral et le carter.

15. Guider l'entretoise dans le roulement à l'aide de l'outil.
    Numéro de l'outil : KV38100600



PRECAUTION :
L'entretoise se place différement selon les modèles. Se reporter à PD-2007.

16. Aligner les repères sur le chapeau de roulement latéral avec ceux situés sur le carter de pont et monter le chapeau de roulement sur le carter de pont.



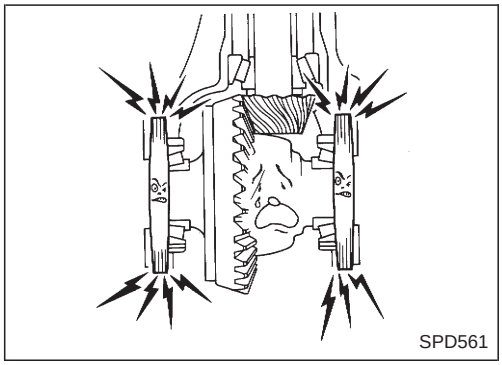
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Support de différentiel (suite)

SPD196

17. Mesurer le battement entre la couronne et le pignon d'attaque à l'aide d'un comparateur à cadran.
    Battement entre le pignon d'attaque et la couronne :
    0,13 - 0,18 mm
- Si le battement est trop petit, diminuer l'épaisseur de la cale de droite et augmenter l'épaisseur de la cale de gauche de la même valeur.
  Si le battement est trop grand, procéder de manière inverse.

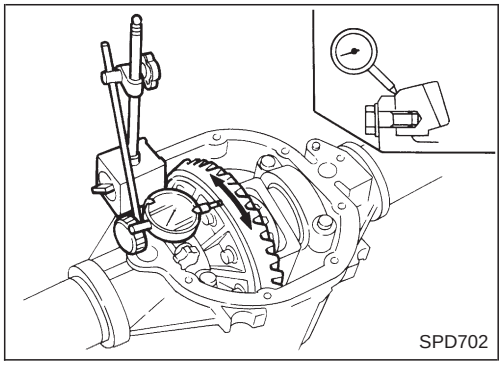
Ne jamais changer le nombre de cales car cela changerait la précharge de roulement.



SPD241

18. Vérifier la précharge totale avec l'outil.

Lors de la vérification, tourner le pignon d'attaque plusieurs fois dans les deux sens pour asseoir les rouleaux de roulement correctement.



Précharge totale :
P_1 + [0,3 à 1,5 N·m (3 à 15 kg-cm)]
P_1 : Précharge de roulement de pignon
Se reporter aux SDS, PD-2014.
Numéro de l'outil : ST3127S000

SPD561

- Si la précharge est trop grande, enlever le même nombre de cale de chaque coté.
- Si la précharge est trop petite, ajouter le même nombre de cale de chaque coté.

Ne jamais ajouter ou enlever un nombre différent de câles de chaque côté car cela changerait le battement entre la couronne et le pignon d'attaque.

19. Vérifier à nouveau le battement entre la couronne et le pignon d'attaque car celui-ci peut changer avec l'augmentation ou la diminution de l'épaisseur de cales.

SPD702

20. Contrôler le voile de la couronne à l'aide d'un comparateur.
    Limite de voile :
    0,05 mm
- Si le battement varie de manière excessive en plusieurs endroits, les variations proviennent parfois de la présence de corps étrangers entre la couronne et le logement de differentiel.
- Si le battement varie fortement alors que le voile de la couronne se trouve dans les limites spécifiées, il faut remplacer le jeu de pignon hypoïdes ou le logement de différentiel.

21. Contrôler le contact entre les dents.
    Se reporter à ''REGLAGE'' dans le Manuel de Réparation initial.
22. Remonter le couvercle arrière et le joint plat.

‘‘COUSSIN GONFLABLE’’ du système de retenue supplémentaire (SRS)

Utilisé avec une ceinture de sécurité, le ‘‘Coussin gonflable’’ du système de retenue supplémentaire contribue à réduire les risques et la gravité des blessures subies par le conducteur et le passager avant en cas de collisions frontales. La composition du SRS disponible pour le MODELE D22 est la suivante (la composition varie selon les pays et l’équipement en option) :
Un système de retenue supplémentaire du côté conducteur (situé dans le moyeu du volant), un système de retenue supplémentaire du côté passager (situé sur le tableau de bord, côté passager), un boîtier de capteurs de diagnostic, un témoin d’avertissement, d’un faisceau de câblage et d’un câble spiralé.

ATTENTION :

- **Pour ne pas affecter le fonctionnement du SRS, ce qui augmenterait les risques de blessures graves ou mortelles en cas de collision entraînant le déploiement du coussin gonflable, toutes les opérations d’entretien doivent être effectuées par un concessionnaire NISSAN agréé.**
- **Un entretien incorrect, y compris une dépose et une repose incorrectes du système de retenue supplémentaire (SRS), pourra entraîner des blessures dues au déploiement accidentel du système.**
- **Ne pas utiliser d’équipement d’essai électrique sur les circuits connexes du SRS sauf si indiqué dans le Manuel de Réparation. Le câble spiralé et les faisceaux de câblage équipés d’une gaine d’isolation jaune soit juste devant les connecteurs de faisceau, soit sur le faisceau tout entier, sont reliés au SRS.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Precautions pour l'entretien des ceintures de sécurité

PRECAUTION :

- **Ne pas démonter la boucle ou l'ensemble de la ceinture de sécurité.**
- **Remplacer les boulons d'ancrage s'ils sont déformés ou usés.**
- **Ne pas huiler la languette et la boucle.**
- **Ne pas réparer les composants de l'ensemble de ceinture de sécurité dont l'état est suspect. Remplacer l'ensemble complet de ceinture de sécurité.**
- **Si les sangles sont coupées, usées ou endommagées, remplacer l'ensemble de ceinture de sécurité.**
- **Lors du remplacement de l'ensemble de ceinture de sécurité, utiliser un ensemble de ceinture de sécurité d'origine.**

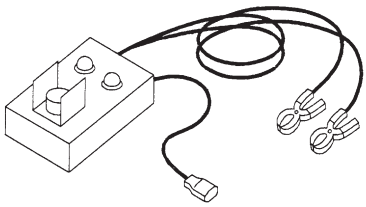
APRES UNE COLLISION

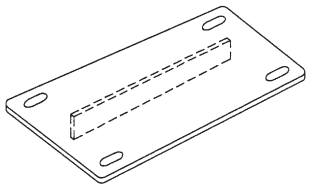
ATTENTION :

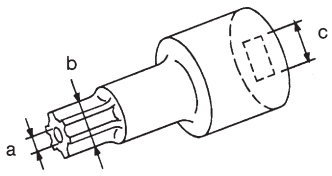
Après chaque collision, inspecter toutes les ceintures de sécurité ainsi que les enrouleurs et toutes les autres pièces connexes.

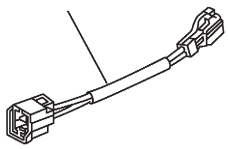
NISSAN recommande que toutes les ceintures de sécurité en service lors d'une collision soient remplacées à moins que la collision soit mineure et que les ceintures de sécurité ne montrent aucun dommage et continuent de fonctionner correctement. Le non-respect de ces consignes peut entraîner de graves blessures lors d'une collision. Les ceintures de sécurité non-utilisées lors d'une collision doivent être aussi remplacées si un quelconque dommage ou un fonctionnement incorrect est remarqué.

Remplacer les ceintures de sécurité si :









- La ceinture de sécurité était utilisée lors d'une collision (sauf pour les accidents mineurs et les ceintures, enrouleurs et boucles qui ne montrent aucun dommage et qui continuent de fonctionner correctement).
- La ceinture de sécurité est endommagée dans un accident (par ex. sangle vrillée, guide ou enrouleur tordu, etc.)
- Les points d'attache des ceintures de sécurité sont endommagés dans un accident. Inspecter les zones de point d'attache pour vérifier s'il n'ya pas de dommages ou de distorsions et réparer si nécéssaire avant la repose d'un nouvel ensemble de ceinture de sécurité.
- Les boulons d'ancrages sont déformés ou usés.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Précautions pour l'entretien du ''COUSSIN GONFLABLE'' (AIR BAG) et du ''PRETENSIONNEUR DE CEINTURE DE SECURITE'' du système de retenue supplémentaire (SRS).

- Ne pas utiliser d'équipement d'essai électrique pour vérifier le SRS, sauf instructions contraires données dans ce Manuel de Réparation.
- Avant de procéder à l'entretien du SRS, couper le contact, débrancher les deux câbles de la batterie et attendre au moins 3 minutes.
  Le coussin gonflable peut encore se déployer pendant un délai de 3 minutes environ après que les câbles ont été débranchés. Attendre par conséquent au moins 3 minutes avant de travailler sur les connecteurs ou les câbles du SRS.
- Le boîtier de capteurs de diagnostic doit toujours être installé en prenant soin d'orienter les flèches ''⇦'' vers l'avant du véhicule. Vérifier également que le boîtier de capteurs de diagnostic ne présente pas de fissures, déformations ou traces de rouille avant de le reposer. Le remplacer le cas échéant.
- Le câble spiralé doit être aligné avec le point mort car le nombre de tours qu'il peut faire est limité. Ne pas tenter de tourner le volant ou la colonne de direction après la dépose du pignon de direction.
- Manipuler le module de coussin gonflable avec précaution. Toujours placer les modules de coussin gonflable conducteur et passager avec le côté rembourré dirigé vers le haut.
- Exécuter l'autodiagnostic pour contrôler que l'ensemble du SRS fonctionne normalement après avoir remplacé n'importe quel composants.
- Après le déploiement du coussin gonflable, l'ensemble de tableau de bord avant devra être remplacé s'il est endommagé.

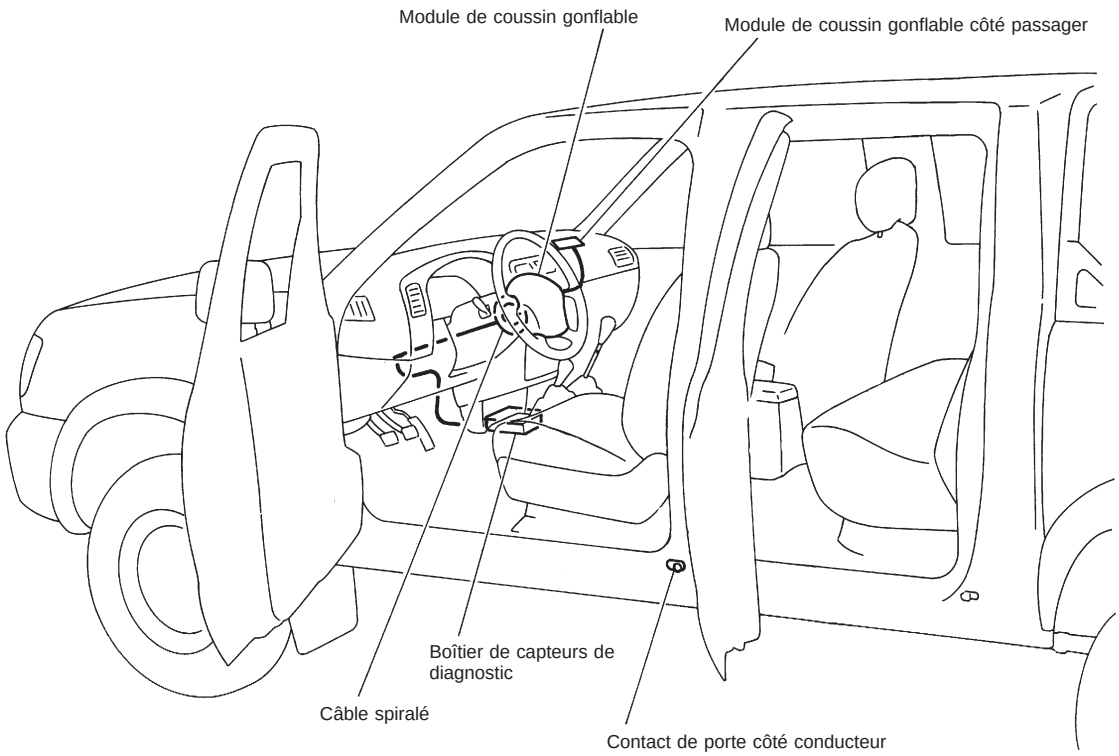
Description

Le coussin gonflable se déploie lorsque le boîtier de capteurs de diagnostic est activé alors que le contact d'allumage est sur la position ''ON'' ou ''START''.

Les configurations du système SRS varie selon les équipements optionnels du véhicule et sa destination.



NRS087

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Disposition des composants du SRS

SEC. 240•251•253•484•680

Les configurations du système SRS varie selon les équipements optionnels du véhicule et sa destination.

NRS088

SRS296

Points d'entretien

PRECAUTION :

Ne pas utiliser d'équipement d'essai électrique sur les circuits connexes au SRS.

1. Vérifier le fonctionnement du témoin d'avertissement ''AIR BAG''.
   Après avoir tourné la clé de contact sur ''ON'', le témoin d'avertissement ''AIR BAG'' s'allume. Le témoin d'avertissement ''AIR BAG'' s'éteindra après environ 7 secondes si aucun défaut n'est détecté. Si l'une des conditions suivantes affectant le témoin d'avertissement ''AIR BAG'' se produit, vérifier immédiatement le système de coussin gonflable. Se reporter à RS-2031 pour plus de détails.
- Le témoin d'avertissement ''AIR BAG'' ne s'allume pas lorsque le contact d'allumage est mis sur ''ON''.
- Le témoin d'avertissement ''AIR BAG'' ne s'éteint pas dans les 7 secondes après que le contact d'allumage est mis sur ''ON''.
- La lampe témoin d'avertissement ''AIR BAG'' clignote après environ 7 secondes après la mise sur ''ON'' du contact d'allumage.

2. Contrôler visuellement les composants du SRS.

(1) Boîtier de capteurs de diagnostic
- Vérifier que le boîtier de capteurs de diagnostic et le support ne sont pas bosselés, fissurés ou déformés.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

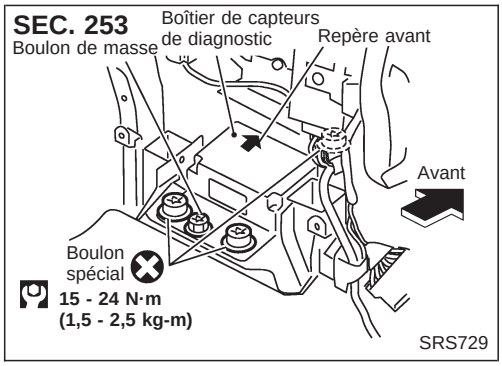
Points d'entretien (suite)

- Vérifier que les connecteurs ne sont pas endommagés et les bornes déformées.

(2) Module de coussin gonflable et volant de direction
- Déposer le module de coussin gonflable du volant de direction, du tableau de bord ou du dossier de siège. Vérifier que le cache du faisceau et les connecteurs ne sont pas endommagés, les bornes déformées et le faisceau coincé.
- Reposer le module de coussin gonflable côté conducteur sur le volant pour vérifier s'il est correctement monté ou aligné sur le volant.
- Vérifier que le volant ne présente pas un jeu excessif.
- Reposer le module de coussin gonflable passager sur le tableau de bord pour vérifier s'il est correctement monté ou aligné sur le tableau de bord.

(3) Câble spiralé
- Vérifier que le câble spiralé n'est pas bosselé, fissuré ou déformé.
- Vérifier que les connecteurs et la bande de protection ne sont pas endommagés.
- Vérifier que le volant est exempt de tout bruit, point de force et qu'il tourne librement.

(4) Faisceau principal et faisceau de coussin gonflable
- Vérifier que les connecteurs ne sont pas desserrés ou endommagés et que les bornes ne sont pas déformées.
- Vérifier que les faisceaux ne coincent pas et qu'ils ne sont pas usés par le frottement ou coupés.



PRECAUTION :
Remplacer les boulons usagés et le boulon de masse par des neufs.

Dépose et repose — Boîtier de capteurs de diagnostic

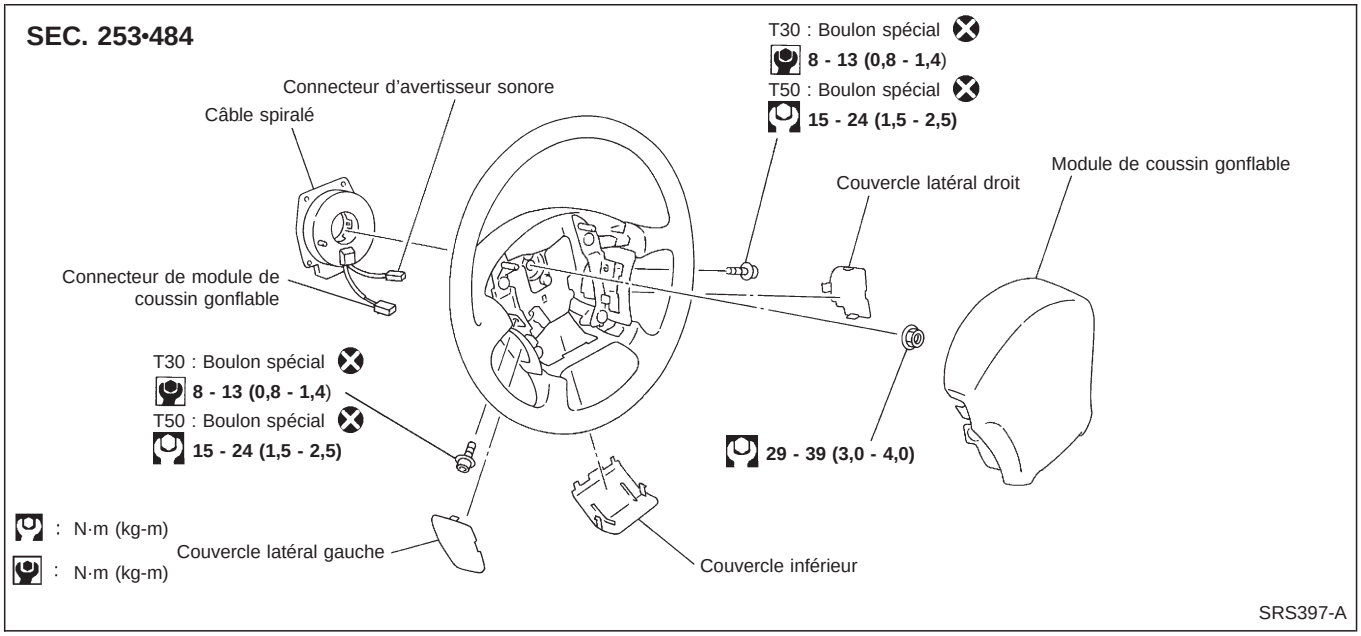
PRECAUTION :
- **Avant d'effectuer l'entretien du SRS, couper le contact d'allumage (''OFF''), débrancher les deux câbles de la batterie et attendre au moins trois minutes.**
- **Ne pas utiliser de boulons et écrous enduits d'agent adhésif usagés pour le remontage ; remplacer les avec des neufs.**
- **Vérifier que le boîtier de capteurs de diagnostic est reposé correctement.**
- **Vérifier que le boîtier de capteurs de diagnostic n'est pas déformé, bosselé, fissuré ou rouillé. S'il est visiblement endommagé, le remplacer par un neuf.**
- **Vérifier que les supports du boîtier de capteurs de diagnostic ne sont pas déformés ou rouillés.**
- **Après avoir remplacé le boîtier de capteurs de diagnostic, vérifier le fonctionnement du SRS et effectuer son autodiagnostic. Se reporter au chapitre ''Autodiagnostic'' pour plus de détails.2027**
- **Ne pas essayer de démonter le boîtier de capteurs de diagnostic.**
- **Remplacer le boîtier de capteurs de diagnostic, s'il est tombé ou a subi un choc.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Dépose et repose — Boîtier de capteurs de diagnostic (suite)

DEPOSE DU BOITIER DE CAPTEURS DE DIAGNOSTIC

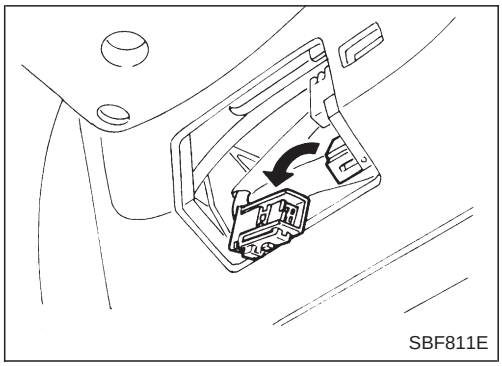
1. Débrancher les connecteurs de module de coussin gonflable côté conducteur et côté passager.
2. Déposer le tableau de bord. Se reporter à ‘‘TABLEAU DE BORD’’ dans la section BT.
3. Déposer la conduite d’air.
4. Débrancher le connecteur du boîtier de capteurs de diagnostic.
5. Déposer le boulon de masse et les boulons spéciaux du boîtier de capteurs de diagnostic à l’aide de l’EMBOUT TORX DE SECURITE (Taille T50).
   Puis déposer le boîtier de capteurs de diagnostic.



NOTE :

- **Pour la repose, procéder dans l’ordre inverse de la dépose.**
- **Après remplacement, effectuer l’autodiagnostic du SRS. Se reporter à ‘‘Autodiagnostic’’ pour plus de détails (RS-2027).**

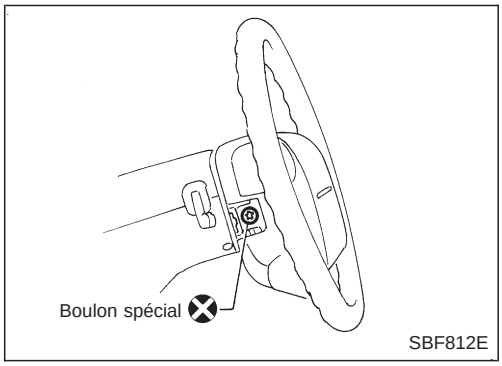
PRECAUTION :



- **Ne pas réutiliser les boulons spéciaux et le boulon de masse une fois déposés ; les remplacer par des boulons spéciaux et un boulon de masse neufs enduits d’agent d’adhésivité.**

Dépose — Module de coussin gonflable et câble spiralé

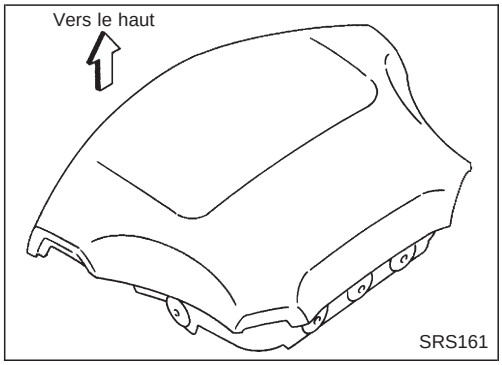
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Dépose — Module de coussin gonflable et câble spiralé (suite)

SBF811E

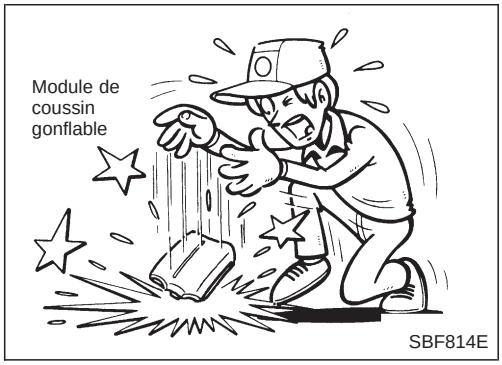
PRECAUTION :



- **Avant de procéder à l'entretien du SRS, couper le contact, débrancher les deux câbles de la batterie et attendre au moins 3 minutes.**
- **Toujours se positionner sur le côté du module de coussin gonflable.**

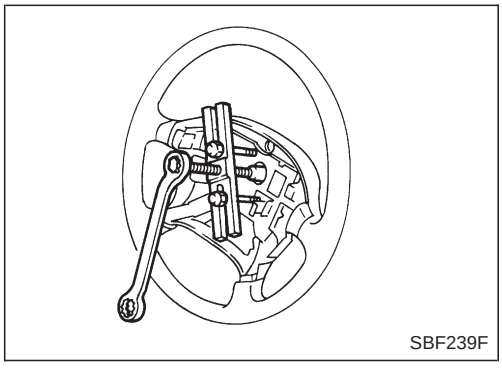
1. Déposer le couvercle inférieur du volant de direction et débrancher le connecteur du module de coussin gonflable.

SBF812E



2. Déposer le couvercle latéral. Déposer les boulons de droit et de gauche à l'aide de l'EMBOUT TORX DE SECURITE (Taille T50) ou de la DOUILLE TORX DE SECURITE (Taille T30). Le module de coussin gonflable peut alors être déposé.

SRS161



PRECAUTION :

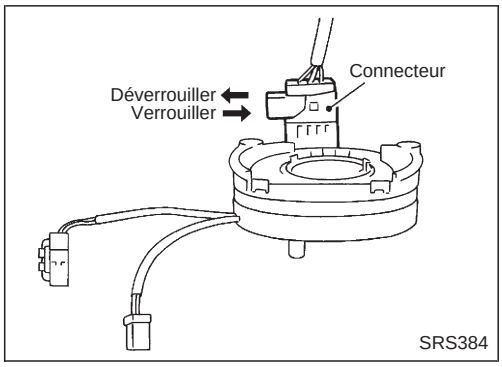
- **Toujours poser le module de coussin gonflable avec la garniture dirigée vers le haut.**
- **Ne pas tenter de démonter le module de coussin gonflable.**
- **Les boulons spéciaux sont revêtus d'une couche d'agent d'adhésivité. Ne pas réutiliser les boulons une fois déposés ; les remplacer par des neufs.**
- **Ne pas introduire d'objets (tournevis, etc.) dans le connecteur du module de coussin gonflable.**

SBF814E

- **Remplacer le module de coussin gonflable s'il est tombé ou s'il a subi un impact.**
- **Ne pas exposer le module de coussin gonflable à des températures supérieures à 90°C.**
- **Ne pas laisser de l'huile, de la graisse ou de l'eau venir en contact avec le module de coussin gonflable.**

SBF239F

3. Régler le volant en position neutre.
4. Débrancher le connecteur d'avertisseur sonore et retirer les écrous.
5. A l'aide d'un extracteur de volant, déposer le volant. Veiller à ne pas trop serrer le boulon de l'extracteur sur le volant.



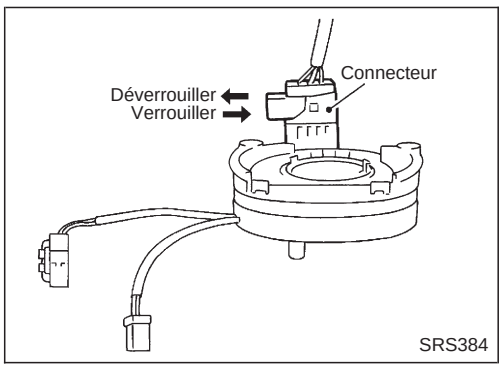
PRECAUTION :

- **Ne pas taper ou heurter le volant de direction.**

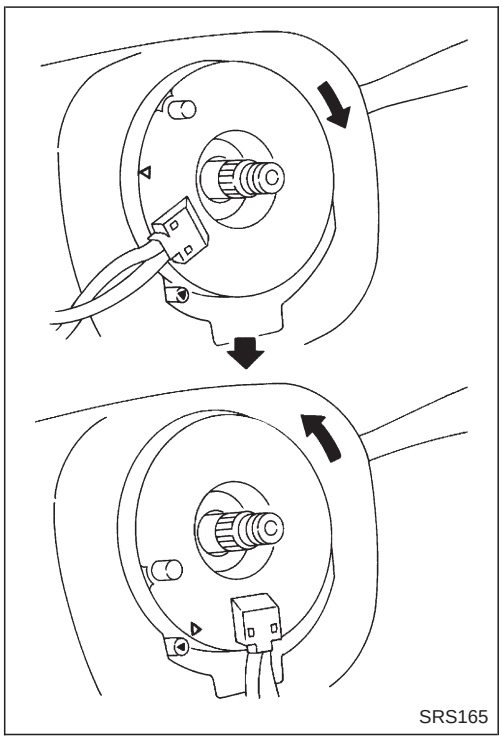
6. Déposer le cache de colonne de direction.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Dépose — Module de coussin gonflable et câble spiralé (suite)



7. Démonter les quatres vis. Puis déverrouiller le connecteur de câble spiralé et le déconnecter. Le câble spiralé peut alors être déposé.

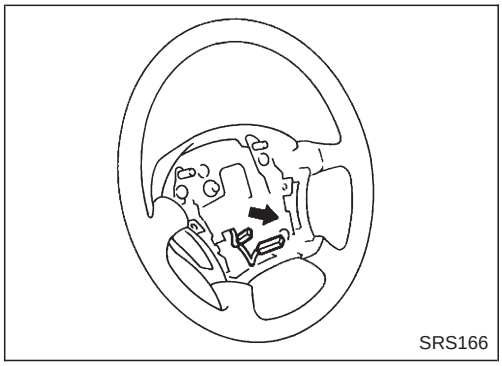


PRECAUTION :

- **Ne pas essayer de démonter le câble spiralé.**
- **Ne pas lubrifier le câble spiralé.**

Repose — Module de coussin gonflable du conducteur et câble spiralé

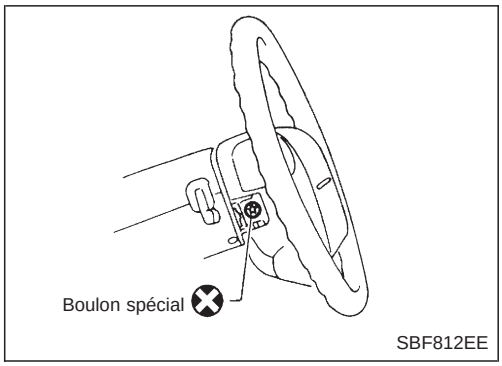
1. Positionner les roues avant en ligne droite.
2. Brancher le connecteur du câble spiralé. Puis verrouiller le connecteur et resserrer les vis. Reposer le cache de colonne de direction.



3. S'assurer que le câble spiralé est sur la position neutre. Pour obtenir la position neutre, le tourner d'environ 2,5 tours vers la gauche à partir de la position de butée droite. Aligner les deux repères( ).

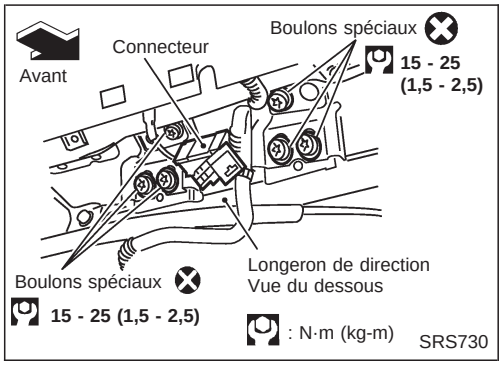
PRECAUTION :

- **Un câble spiralé mal monté risque de se rompre lorsque le volant est tourné.**
  Par ailleurs, la timonerie de direction étant déconnectée, le câble risquera de se rompre si l'on tourne le volant au delà d'un nombre limité de tours.
  Le câble spiralé peut effectuer jusqu'à 2,5 tours vers la droite et la gauche depuis la position neutre.



4. Brancher le connecteur de câble spiralé et serrer les vis. Reposer le cache de colonne de direction.

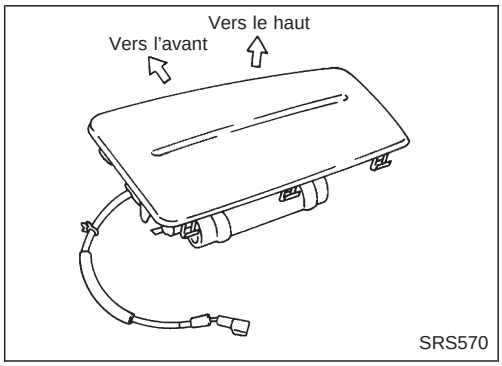
5. Reposer le volant, les goupilles de guidage du câble spiralé de réglage du volant, puis tirer le câble spiralé à travers celles-ci.
6. Brancher le connecteur d'avertisseur sonore et engager le câble spiralé dans les cliquets du volant. Ecarter le connecteur du module de coussin gonflable de l'orifice du couvercle inférieur du volant.
7. Serrer l'écrou.
   : 29 - 39 (3,0 - 4,0 kg-m)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

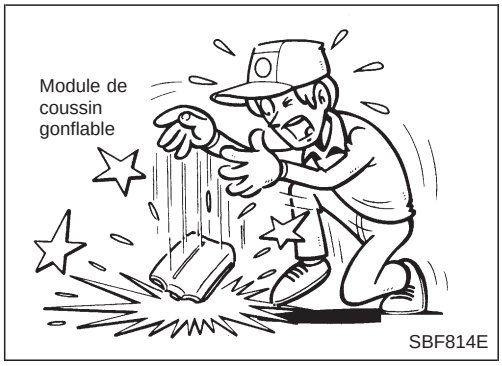
Repose — Module de coussin gonflable du conducteur et câble spiralé (suite)

8. Mettre le module de coussin gonflable en position et le fixer avec des boulons spéciaux neufs.
- **Toujours effectuer l'entretien du module de coussin gonflable depuis le côté.**
9. Brancher le connecteur du module de coussin gonflable.
10. Reposer tous les couvercles.
11. Exécuter l'autodiagnostic afin de s'assurer du fonctionnement normal du SRS (utiliser CONSULT ou contrôler le témoin d'avertissement). Se reporter à RS-2027
    Avant d'effectuer l'autodiagnostic, brancher les deux câbles de batterie.
12. Braquer le volant à fond vers la gauche, puis vers la droite pour s'assurer que le câble spiralé est en position neutre.
    Si le témoin d'avertissement de coussin gonflable clignote ou reste allumé (en mode Utilisateur), cela signifie que le câble spiralé peut se rompre en raison de sa position incorrecte. Effectuer l'autodiagnostic de nouveau (en utilisant le CONSULT ou le témoin d'avertissement). Si un défaut est trouvé, remplacer le câble spiralé par un neuf.
13. Procéder à un nouvel autodiagnostic pour s'assurer qu'aucun défaut de fonctionnement n'est détecté.



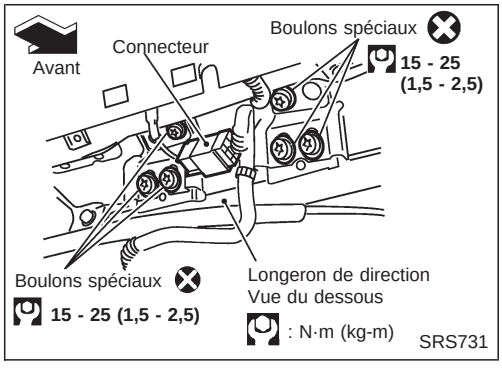
Dépose — Module de coussin gonflable du passager avant

PRECAUTION :
- **Avant de procéder à l'entretien du SRS, couper le contact d'allumage, déconnecter les deux câbles de la batterie et attendre au moins 3 minutes.**
- **Toujours se positionner sur le côté du module de coussin gonflable ou en dessous de celui-ci.**
1. Déposer la boîte à gants. Se reporter à ''TABLEAU DE BORD'' dans la section BT pour plus de détails.
2. Déconnecter le connecteur du module de coussin gonflable du passager.
3. Déposer les boulons et les boulons spéciaux du module de coussin gonflable côté passager avant à l'aide d'un EMBOUT TORX DE SECURITE (taille 50).
4. Déposer l'ensemble de tableau de bord. Se reporter à ''TABLEAU DE BORD'' dans la section BT pour plus de détails.
5. Déposer le conduit d'air du tableau de bord.
6. Déposer les boulons des côtés droit et gauche du module de coussin gonflable du passager avant. Puis enlever le module de coussin gonflable de l'ensemble du tableau de bord.
- Le module de coussin gonflable est lourd et doit être saisi des deux mains lors de la dépose.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Dépose — Module de coussin gonflable du passager avant (suite)



PRECAUTION :

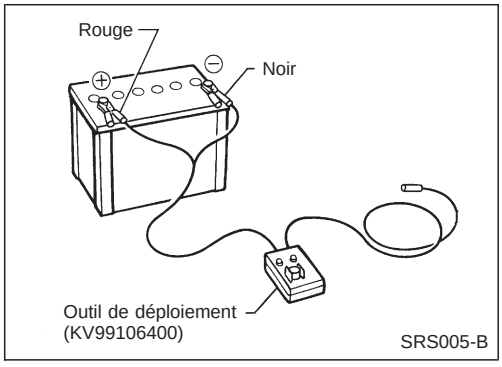
- **Toujours poser le module de coussin gonflable avec la garniture dirigée vers le haut.**
- **Ne pas tenter de démonter le module de coussin gonflable.**
- **Les boulons spéciaux sont revêtus d'une couche d'agent d'adhésivité. Ne pas réutiliser les boulons usés après la dépose : les remplacer par de nouveaux boulons à revêtement.**
- **Ne pas introduire d'objets (tournevis, etc.) dans le connecteur du module de coussin gonflable.**

- **Remplacer le module de coussin gonflable s'il est tombé ou s'il a subi un impact.**
- **Ne pas exposer le module de coussin gonflable à des températures supérieures à 90°C.**
- **Ne pas laisser de l'huile, de la graisse ou de l'eau venir en contact avec le module de coussin gonflable.**

Repose — Module de coussin gonflable du passager avant

- **Toujours se positionner sur le côté du module de coussin gonflable ou en dessous de celui-ci.**

1. Reposer le module de coussin gonflable du passager avant dans le tableau de bord.
2. Reposer le conduit d'air sur le tableau de bord.
3. Reposer le tableau de bord.



- S'assurer que le faisceau n'est pas coincé entre la partie arrière du module de coussin gonflable et le longeron de direction.

4. Monter le module de coussin gonflable côté passager avant sur le longeron de direction.
5. Brancher le connecteur du module de coussin gonflable.
6. Reposer la boîte à gants.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Mise au rebut du module de coussin gonflable

- Avant de mettre au rebut le module de coussin gonflable, ou des véhicules équipés de tels systèmes, déployer lesdits systèmes. S'ils ont déjà été déployés lors d'un accident, les mettre au rebut en se reportant au chapitre ''MISE AU REBUT DU MODULE DE COUSSIN GONFLABLE (AIR BAG)'' (RS-2016).
- Lors du déploiement du module de coussin gonflable, toujours utiliser l'outil spécial ; outil de déploiement KV99106400.
- Se tenir à une distance minimum de 5 m lors du déploiement du module de coussin gonflable.
- Le déploiement du module de coussin gonflable s'accompagne d'une détonation bruyante et d'un dégagement de fumée. La fumée n'est pas nocive, mais on veillera toutefois à ne pas l'inhaler en raison de ses propriétés irritantes pouvant être à l'origine d'un étouffement.
- Ne jamais déployer plus d'un module de coussin gonflable à la fois.
- En raison de la température élevée des composants du module de coussin gonflable, ne pas toucher le module pendant au moins 30 minutes après le déploiement.
- Veiller à porter des gants lors de la manipulation d'un module de coussin gonflable déployé.
- Ne jamais asperger d'eau un module de coussin gonflable.
- Se nettoyer les mains correctement une fois le travail fini.
- Garer le véhicule à l'extérieur dans un espace libre d'au moins 6 mètres de rayon avant de déployer un module de coussin gonflable monté sur le véhicule.
- Utiliser un voltmètre pour s'assurer que la batterie du véhicule est chargée à fond.
- Ne pas mettre au rebut le module de coussin gonflable non déployé.

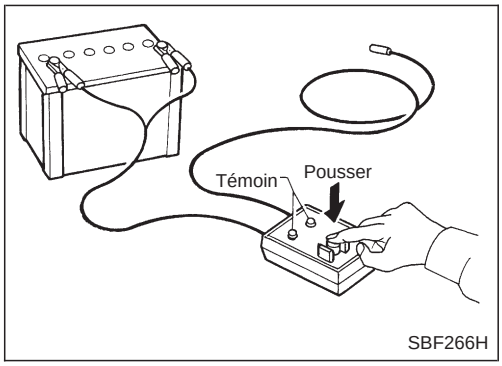
VERIFICATION DE L'OUTIL DE DEPLOIEMENT

Branchement sur la batterie

PRECAUTION :

La batterie doit débiter 9,6 V ou plus.

Sortir la batterie du véhicule et la placer sur une cale en bois dur à environ 5 m du véhicule.



- Débrancher la batterie du véhicule et attendre 3 minutes avant toute opération.
- Brancher le clip rouge de l'outil de déploiement à la borne positive de batterie et le clip noir à la borne négative.

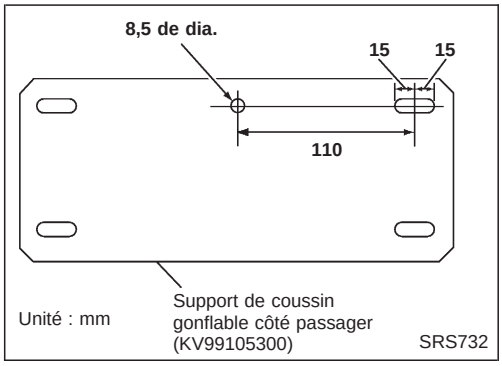
Veiller à respecter les polarités. Le témoin à la droite de l'outil, sur lequel est indiqué ''alimentation de l'outil de déploiement'', doit s'allumer en vert. Si le témoin de droite s'allume en rouge, inverser les polarités à la batterie.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Mise au rebut du module de coussin gonflable (suite)

Vérification de l'outil de déploiement

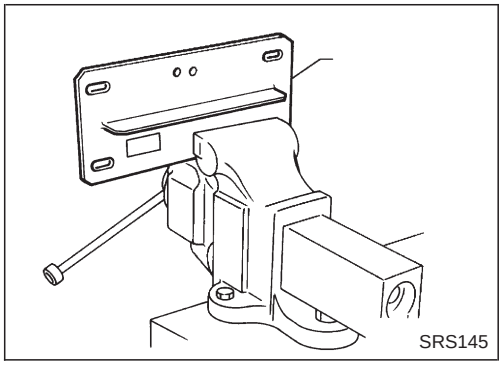
SBF266H



Appuyer sur l'interrupteur de l'outil de déploiement pour l'amener en position ''MARCHE''. Le témoin à la gauche de l'outil, sur lequel est indiqué ''tension du connecteur de coussin gonflable'' doit s'allumer. S'il ne s'allume pas, remplacer l'outil.

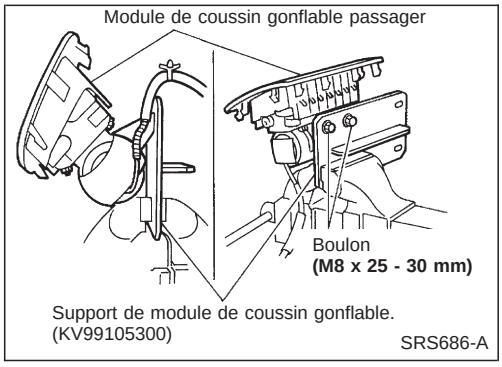
Tableau de fonctionnement des témoins de l'outil de déploiement de coussin gonflable (batterie branchée)

Position de la commande	Témoin gauche, vert* ''TENSION DU CONNECTEUR DE COUSSIN GONFLABLE (AIR BAG)''.	Témoin de droite, vert* ''OUTIL DE DEPLOIEMENT SOUS TENSION''
OFF	OFF	ON
ON	ON	ON



* : Si ce témoin s'allume en rouge, l'outil est mal connecté à la batterie. Inverser le sens des polarités et s'assurer que le témoin s'allume en vert.

Déploiement du module de coussin gonflable côté passager (hors du véhicule)

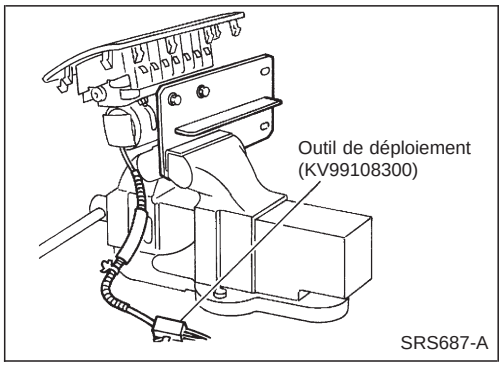


SRS732

1. Faire un orifice de 8,5 mm de diamètre dans le support de coussin gonflable passager (outil spécial : KV99105300) à l'endroit signalé par l'illustration de gauche.

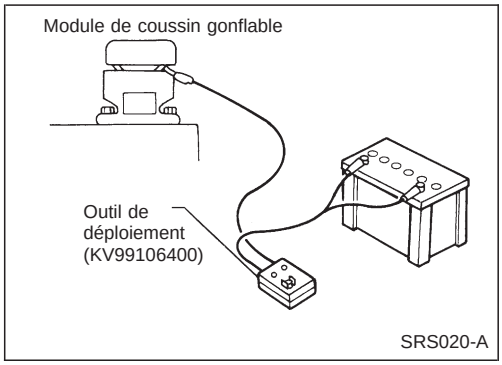
SRS145

2. Fixer fermement le support de coussin gonflable côté passager (SST : KV99105300) dans un étau.



SRS686-A

3. Aligner les deux trous du support du coussin gonflable passager (maintenu dans un étau) et du module de coussin gonflable passager et les fixer avec des boulons (M8 x 25 - 30 mm).

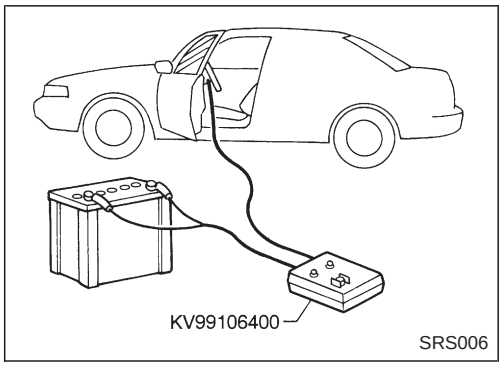


PRECAUTION :
Si un jeu subsiste entre le module de coussin gonflable passager et le support de coussin gonflable passager, insérer une cale de bois afin de stabiliser le module de coussin gonflable.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Mise au rebut du module de coussin gonflable (suite)

4. Connecter l'adaptateur de l'outil de deploiement (SST : KV99108300) sur le connecteur de l'outil de déploiement (SST : KV99106400) et sur les deux cotés du module de coussin gonflable.
5. Brancher le clip rouge de l'outil de déploiement à la borne positive de batterie et le clip noir à la borne négative.
6. Le témoin à la droite de l'outil, sur lequel est indiqué ''outil de déploiement sous tension'', doit s'allumer en vert et non en rouge.
7. Appuyer sur l'interrupteur de l'outil de déploiement. Le témoin à la gauche de l'outil, sur lequel est indiqué ''tension du connecteur de coussin gonflable'' doit s'allumer et le module de coussin gonflable se déployer.



PRECAUTION :

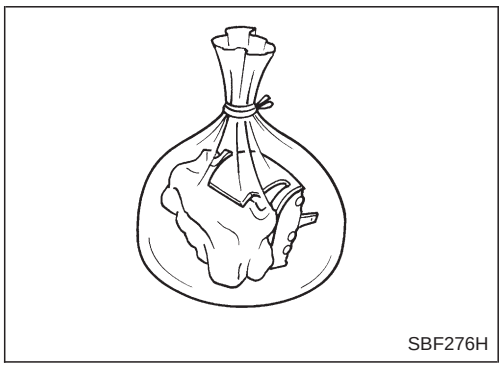
- **Ne pas se tenir face au module de coussin gonflable lors du déploiement.**
- **Rester éloigner du module de coussin gonflable d'au moins cinq mètres.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Mise au rebut du module de coussin gonflable (suite)

DEPLOIEMENT DU MODULE DE COUSSIN GONFLABLE (AIR BAG) INSTALLE SUR LE VEHICULE

Lors de la mise au rebut du véhicule, déployer les modules de coussins gonflables alors qu'ils sont toujours installés dans le véhicule.



PRECAUTION :

Lors du déploiement du module de coussin gonflable, s'assurer que le véhicule est vide.

1. Débrancher les deux câbles de batterie du véhicule et attendre 3 minutes.
2. Débrancher le connecteur des modules de coussin gonflable.
3. Brancher l'outil de déploiement (outil spécial : KV99106400) sur le module de coussin gonflable.
   Pour le module de coussin gonflable du passager avant, fixer l'adaptateur de l'outil de déploiement [outil spécial : KV99108300] sur le connecteur de l'outil.
4. Brancher le clip rouge de l'outil de déploiement à la borne positive de batterie et le clip noir à la borne négative.
5. Le témoin à la droite de l'outil, sur lequel est indiqué ''outil de déploiement sous tension'', doit s'allumer en vert et non en rouge.
6. Appuyer sur l'interrupteur de l'outil de déploiement. Le témoin à la gauche de l'outil, sur lequel est indiqué ''tension du connecteur de coussin gonflable'' doit s'allumer et le module de coussin gonflable se déployer.

PRECAUTION :

Ne jamais déployer plus d'un module de coussin gonflable ou prétensionneur de ceinture de sécurité à la fois.

MISE AU REBUT DU MODULE DE COUSSIN GONFLABLE (AIR BAG)

Les modules de coussin gonflable déployés sont très chauds. Avant de mettre le module de coussin gonflable au rebut, attendre au moins 30 minutes. Les placer dans des sacs en plastique hermétiques avant de les mettre au rebut.

PRECAUTION :

- **Ne jamais asperger d'eau un module de coussin gonflable déployé.**
- **Veiller à porter des gants lors de la manipulation d'un module de coussin gonflable déployé.**
- **Le déploiement du coussin gonflable ne dégage pas de gaz nocifs. Toutefois veiller à ne pas inhaler le gaz en raison de ses propriétés irritantes pouvant être à l'origine d'un étouffement.**
- **Ne pas tenter de démonter le module de coussin gonflable.**
- **Un module de coussin gonflable ne peut pas être réutilisé.**
- **Se nettoyer les mains correctement une fois le travail fini.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Introduction des diagnostics de défauts

PRECAUTION :

- **Ne pas utiliser d'équipement d'essai électrique pour vérifier les connecteurs de faisceau du SRS, sauf instructions contraires données dans ce Manuel de Réparation. Les faisceaux de câblage du SRS sont facilement identifiables grâce à une gaine de protection de faisceau jaune ou à une bande d'isolation jaune placée sur les connecteurs de faisceau.**
- **Ne pas essayer de réparer, épisser ou modifier le faisceau de câblage du SRS. Si le faisceau est endommagé, le remplacer par un neuf.**
- **Maintenir le circuit de masse dans un état de propreté satisfaisant.**

FONCTION DE DIAGNOSTIC

Les résultats de l'autodiagnostic du SRS peuvent être lus à l'aide du témoin d'avertissement ''AIR BAG'' et/ou de CONSULT. La lecture de ces résultats peut avoir lieu grâce aux deux modes suivants — ''Mode utilisateur'' et ''Mode de diagnostic''.
Le mode Utilisateur est exclusivement conçu pour le client (conducteur). Ce mode avertit le conducteur de la présence d'un défaut dans le système en actionnant le témoin d'avertissement ''AIR BAG''.
Le mode de Diagnostic permet au technicien de localiser et d'inspecter la pièce défectueuse.
Les applications des modes témoin d'avertissement ''AIR BAG'' et CONSULT sont comme suit :

	Mode utilisateur	Mode de diagnostic	Type d'affichage
Témoin d'avertissement ''AIR BAG''	X	X	Fonctionnement MAR/ ARR.

MODE DE DIAGNOSTIC POUR CONSULT

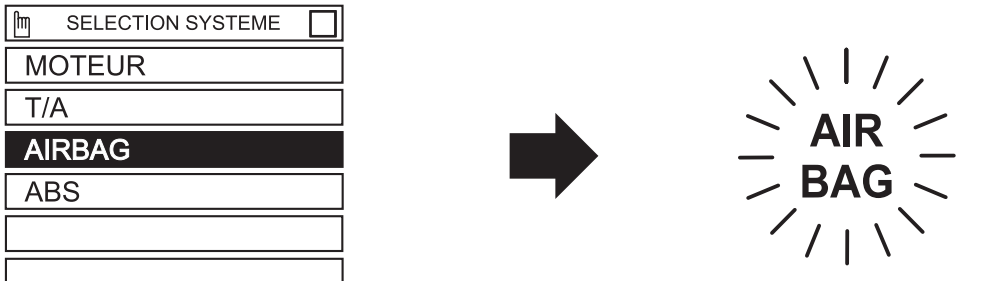
- ''AUTO-DIAG [COURANT]''
  Un résultat d'autodiagnostic courant (également indiqué par le clignotement du témoin en mode de Diagnostic) s'affiche en temps réel sur l'écran de CONSULT. Cela signifie qu'une pièce défectueuse doit être réparée.
  ''AUTO-DIAG [PASSE]''
  Les résultats de diagnostic précédemment mémorisés sont affichés sur l'écran de CONSULT. Les résultats enregistrés sont gardés en mémoire tant que celle-ci n'a pas été effacée.
- ''ENREG DIAG DEFAUT''
  Avec ''ENREG DIAG DEFAUT'', les résultats de diagnostic précédemment effacés peuvent être rappelés et affichés à nouveau sur l'écran CONSULT.
- ''No IDENT BOIT CONTR''

Pour chaque modèle, le boîtier de capteurs de diagnostic est assorti d'un numéro de classification propre et individuel. Ce numéro s'affichera sur l'écran CONSULT, comme illustré sur la figure de gauche. Lors du remplacement du boîtier de capteurs de diagnostic, se reporter au numéro de pièce pour une bonne compatibilité. Après la repose, il est possible de vérifier si le boîtier de remplacement est approprié en confirmant ce numéro de classification sur l'écran CONSULT. La codification du boîtier de capteurs de diagnostic dépend de la configuration du SRS.

Pour le MODELE D22, les numéros de la codification du boîtier de capteur de diagnostic se présente de la manière suivante.

MODELE	No IDENT BOIT CONT EL
Coussin gonflable simple	5A0B
Coussin gonflable double	5A0A

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



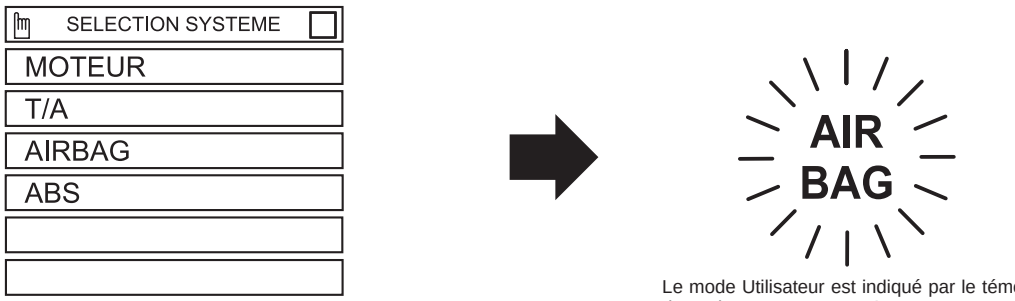
Introduction des diagnostics de défauts (suite)

COMMENT CHANGER LE MODE D'AUTODIAGNOSTIC

Avec CONSULT

Du mode Utilisateur au mode de Diagnostic.

Le système passe automatiquement du mode Utilisateur en mode de Diagnostic lorsque l'on sélectionne l'option AIRBAG sur l'écran ''SELECTION SYSTEME''.



Le mode Diagnostic est indiqué par le témoin d'avertissement ''AIR BAG''.

FCXSS03

Du mode de Diagnostic au mode Utilisateur.

Pour revenir sur le mode Utilisateur à partir du mode de Diagnostic, appuyer sur la touche ''BACK'' (RETOUR) de CONSULT, jusqu'à ce que ''SELECTION SYSTEME'' s'affiche.

Le mode Utilisateur est indiqué par le témoin d'avertissement ''AIR BAG''.

FCXSS04

SRS168

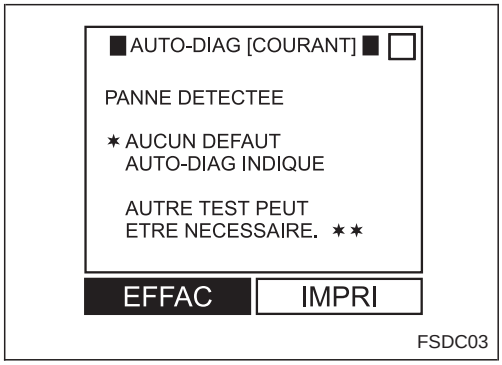
Sans CONSULT

Du mode Utilisateur au mode de Diagnostic.

Le mode de Diagnostic est activé uniquement lorsqu'un défaut est détecté, en appuyant au moins 5 fois dans un délai de 7 secondes sur le contact de la porte du conducteur après avoir mis le contact d'allumage sur ''ON''. Le SRS ne passera pas en mode de Diagnostic si aucun défaut n'est détecté.

Du mode de Diagnostic au mode Utilisateur.

Une fois le défaut réparé, couper le contact d'allumage pendant au moins 1 seconde avant de le rétablir . Le mode de Diagnostic retourne au mode Utilisateur. Si l'on doit passer du mode de Diagnostic au mode Utilisateur pendant la procédure de détection du défaut, couper le contact d'allumage, puis le rétablir et appuyer au moins 5 fois dans un délai de 7 secondes sur le contact de la porte du conducteur.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Introduction des diagnostics de défauts (suite)

COMMENT EFFACER LES RESULTATS DE L'AUTODIAGNOSTIC

Avec CONSULT

''AUTO-DIAG [COURANT]''.
Le résultat d'autodiagnostic courant s'affiche en temps réel sur l'écran de CONSULT. Une fois le défaut complètement éliminé, aucun défaut de fonctionnement n'est plus détecté sur l'écran ''AUTO-DIAG [COURANT]''.

- ''AUTO-DIAG'' [PASS]''
  Revenir sur l'écran CONSULT ''AUTO-DIAG [COURANT]'' en appuyant sur la touche ''BACK'' (RETOUR) de CONSULT et en sélectionnant ''AUTO-DIAG [COURANT]'' dans ''SELECTION MODE DIAG''. Appuyer sur ''EFFAC'' en mode ''AUTO-DIAG [COURANT]''.

NOTE :
Si le défaut mémorisé en mode ''AUTO-DIAG [PASSE]'' n'est pas effacé, le mode Utilisateur indiquera un défaut de système par le biais du témoin d'avertissement, même si le défaut a été complètement éliminé.

- ''ENREG DIAG DEFAUT''
  La mémoire du mode ''ENREGIS DIAG DEFAUT'' ne peut pas être effacée.

Sans CONSULT

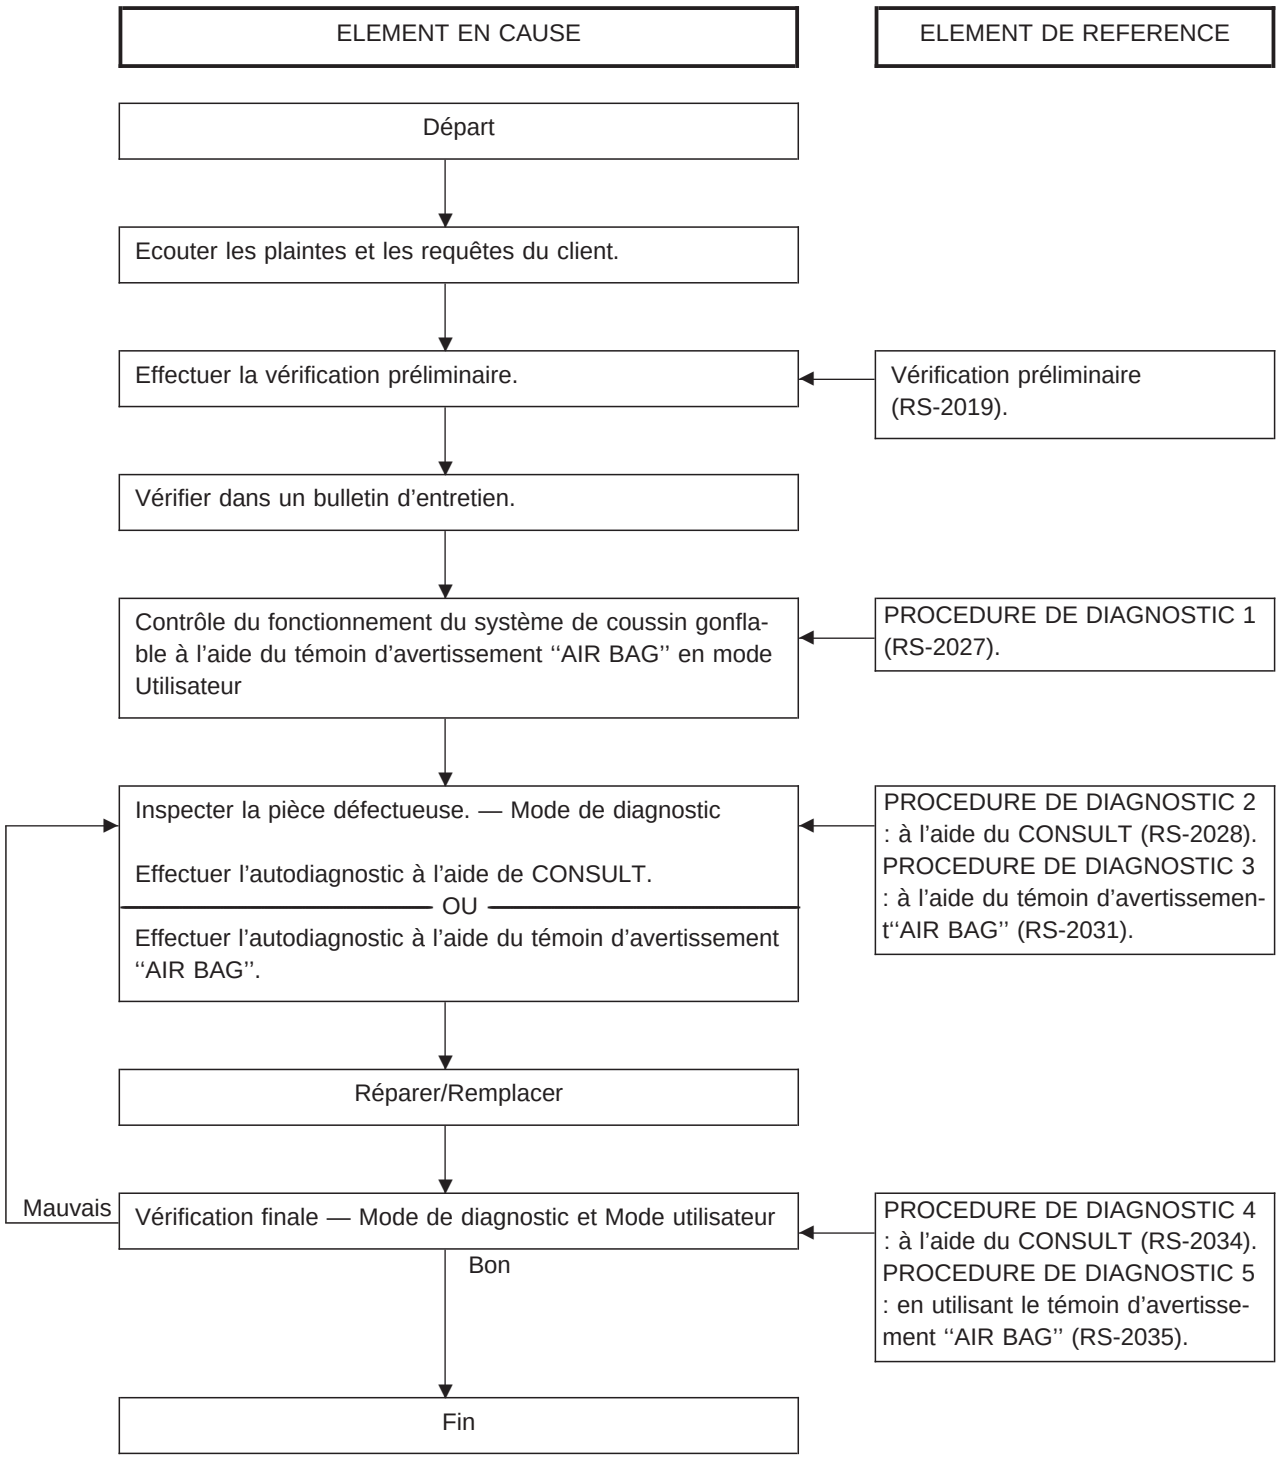
Une fois le défaut éliminé, passer du mode de Diagnostic au mode Utilisateur en coupant le contact pendant au moins 1 seconde avant de le rétablir. Le résultat de l'autodiagnostic est alors effacé.

Comment effectuer les diagnostics des défauts pour une réparation rapide et correcte

Une bonne compréhension des conditions de mauvais fonctionnement peut permettre de localiser la panne plus rapidement et avec plus de précision.
En général, chaque client appréhende différemment une panne. Il est indispensable de bien comprendre les symptômes ou les conditions de la plainte d'un client.

INFORMATIONS FOURNIES PAR LE CLIENT

QUOI	Modèle de véhicule
QUAND	Date, fréquences
OU	Etat de la route
COM-MENT	Conditions de fonctionnement, symptômes



VERIFICATION PRELIMINAIRE

Vérifier que les pièces suivantes sont en bon état.
- Batterie [se reporter à la section EL (''BATTERIE'') du Manuel de Réparation].
- Fusible [se reporter à la section EL (''Fusible'', ''DISPOSITION DE L'ALIMENTATION ELECTRIQUE'') du Manuel de Réparation].
- Connexions des composants du système au faisceau

Autodiagnostic

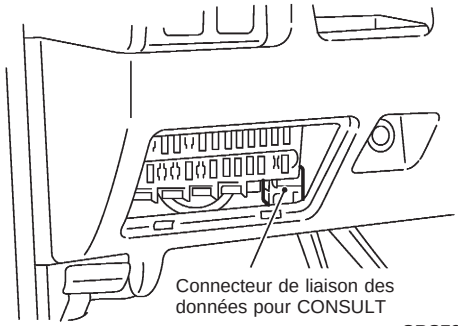
PROCEDURE DE DIAGNOSTIC 1 (sans CONSULT)

Vérifier le fonctionnement du SRS à l'aide du témoin d'avertissement ''AIR BAG'' — Mode Utilisateur

1. Le témoin d'avertissement ''AIR BAG'' s'allume lorsque l'on tourne le contact d'allumage de la position ''OFF'' sur ''ON''.
2. Comparer le fonctionnement du témoin ''AIR BAG'' au tableau ci-dessous.

Fonctionnement du témoin d'avertissement ''AIR BAG'' — Mode utilisateur —	Conditions du SRS	Elément de référence
 MRS095A	Aucun défaut n'est détecté. Aucune démarche supplémentaire n'est nécessaire.	—
 MRS096A	Le système est défectueux et a besoin d'être réparé comme indiqué.	Aller à PROCEDURE DE DIAGNOSTIC 2, ou 3 (RS-2028 ou 2031).
 MRS097A	Le coussin gonflable est déployé.	Voir à DIAGNOSTIC DE COLLISION (RS-2044).
	Le fusible de coussin gonflable, le boîtier de capteurs de diagnostic ou le faisceau est défectueux et doit être réparé.	Aller à la PROCEDURE DE DIAGNOSTIC 9 (RS-2042).
 MRS098A	Un des défauts suivants s'est manifesté et doit être réparé. ● Le fusible des instruments combinés est grillé. ● Le circuit du témoin d'avertissement ''AIR BAG'' est ouvert ou en court-circuit. ● Le boîtier de capteurs de diagnostic est défectueux.	Aller à la PROCEDURE DE DIAGNOSTIC 10 (RS-2042).

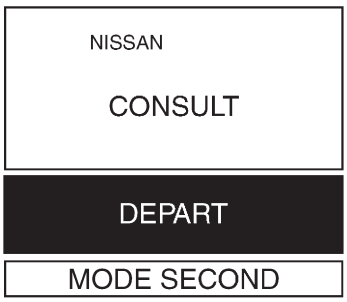
NOTE :
Si le fonctionnement du témoin d'avertissement ''AIR BAG'' diffère du fonctionnement spécifié plus haut, se reporter à Fonctionnement du témoin d'avertissement ''AIR BAG'' — Mode de diagnostic —, PROCEDURE DE DIAGNOSTIC 3 (étape 4), RS-2031



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

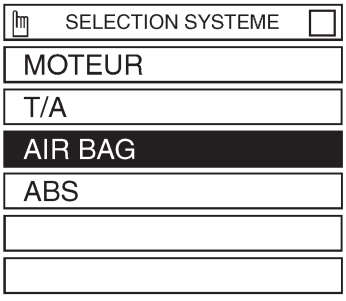
Autodiagnostic (suite)

PROCEDURE DE DIAGNOSTIC 2 (avec CONSULT)



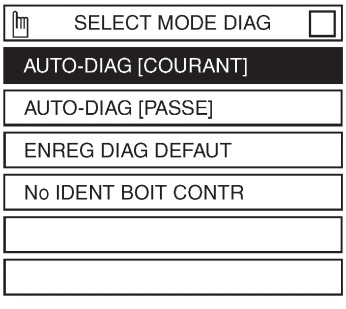
Inspection des pièces défectueuses du SRS à l'aide de CONSULT — Mode de diagnostic

1. Mettre le contact d'allumage sur ''OFF''.
2. Brancher ''CONSULT'' au connecteur de liaison des données.



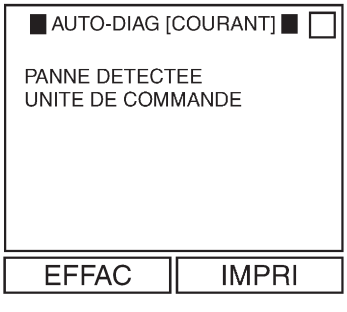
SRS733

3. Mettre le contact d'allumage sur ''ON''.
4. Appuyer sur ''DEPART''.



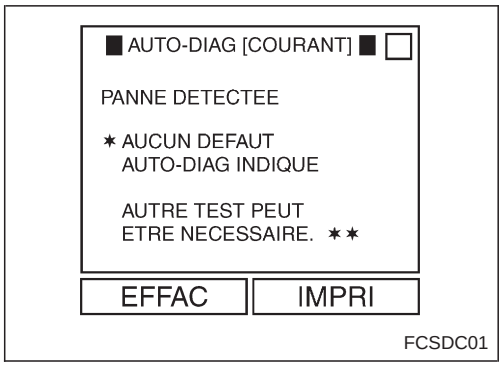
FCNCS01A

5. Appuyer sur ''AIR BAG''.



FCSSE01A

6. Appuyer sur ''AUTO-DIAG [COURANT]''.



FCSDM01

7. Les codes de diagnostic sont affichés dans ''AUTO-DIAG [COURANT]''.

FCSDC02

SimpoPDF Merge and Split Unregistered Version - http://www.simpopdf.com

Autodiagnostic (suite)

Si aucun défaut de fonctionnement n'est détecté en ''AUTO-DIAG [COURANT]'', même si un défaut de fonctionnement est détecté par le témoin d'avertissement ''AIR BAG'', vérifier la tension de la batterie.

Si la tension de la batterie est inférieure à 9 V, recharger la batterie. Puis aller à la PROCEDURE DE DIAGNOSTIC 4 pour effectuer un contrôle final, page RS-2034.

Si la tension de la batterie est normale, aller à la PROCEDURE DE DIAGNOSTIC 6, page RS-2038 afin d'effectuer le diagnostic des cas suivants :

- Le résusltat d'autodiagnostic (précédemment mémorisé) n'a pas été effacé après réparation.
- Défaut de fonctionnement intermittent du SRS.

8. Appuyer sur ''IMPRI''.
9. Comparer les codes de diagnostic au TABLEAU DES CODES DE DIAGNOSTIC CONSULT, page RS-2030.
10. Pour revenir sur le mode Utilisateur à partir du mode de Diagnostic, appuyer sur la touche ''BACK'' (RETOUR) de CONSULT, jusqu'à ce que ''SELECTION SYSTEME'' s'affiche, puis éteindre CONSULT.
11. Couper le contact, puis débrancher le CONSULT ainsi que les deux câbles de la batterie.
12. Réparer le système comme indiqué dans ''Ordre de réparation'' dans le TABLEAU DE CODE DE DIAGNOSTIC DU CONSULT, qui correspond au résultat de l'autodiagnostic. Pour la procédure de remplacement des pièces, se reporter à RS-2007.
13. Après avoir réparé le système, aller à la PROCEDURE DE DIAGNOSTIC 4 pour effectuer un contrôle final, page RS-2034.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Autodiagnostic (suite)

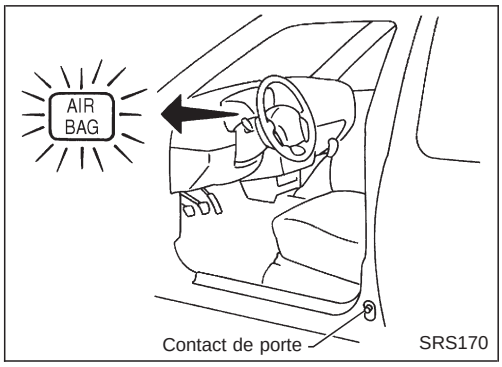


TABLEAU DES CODES DE DIAGNOSTIC CONSULT (''AUTO-DIAG [COURANT]'')

Elément de diagnostic	Explication		Ordre de réparation **Vérifier le système SRS à chaque remplacement de pièce.**
AUCUN DEFAUT AUTO-DIAG INDIQUE	Lorsque le défaut de fonctionnement est indiqué par le témoin d'avertissement ''AIR BAG'' en mode Utilisateur.	● Tension de la batterie basse (moins de 9 V).	● Voir à PROCEDURE DE DIAGNOSTIC 4 (RS-2034) après avoir chargé la batterie.
		● Le résusltat d'autodiagnostic (''AUTO-DIAG [PASSE]'') (précédemment mémorisé) n'a pas été effacé après réparation. ● Un défaut intermittent a été détecté dans le passé.	● Aller à la PROCEDURE DE DIAGNOSTIC 6 (RS-2038).
	● Aucun défaut n'est détecté.		● Aller à la PROCEDURE DE DIAGNOSTIC 4 (RS-2034).
MODULE AIR BAG [OUVERT]	● Le circuit du module de coussin gonflable du coté conducteur est ouvert (y compris le câble spiralé).		1. Inspecter visuellement la connexion du faisceau de câblage. 2. Remplacer le faisceau s'il est visiblement endommagé. 3. Remplacer le câble spiralé. 4. Remplacer le module de coussin gonflable côté conducteur. (Il doit être déployé avant la mise au rebut). 5. Remplacer le boîtier de capteurs de diagnostic. 6. Remplacer le faisceau correspondant.
MODULE AIR BAG [COURT TENS BATT]	● Le circuit du module de coussin gonflable du coté conducteur est court-circuité à un circuit d'alimentation électrique (y compris le câble spiralé).		
MODULE AIR BAG [COURT-CIRC MASSE]	● Le circuit du module de coussin gonflable côté conducteur est en court-circuit à la masse (y compris le câble spiralé).		
MODULE AIR BAG [COURT-CIRC]	● Les circuits du module de coussin gonflable côté conducteur sont court-circuités les uns avec les autres.		
MODULE A/B PASSAG [COURT TENS BATT]	● Le circuit du module de coussin gonflable côté passager avant est court-circuité à un circuit d'alimentation électrique.		1. Inspecter visuellement la connexion du faisceau de câblage. 2. Remplacer le faisceau s'il est visiblement endommagé. 3. Remplacer le module de coussin gonflable côté passager avant. (Il doit être déployé avant la mise au rebut). 4. Remplacer le boîtier de capteurs de diagnostic. 5. Remplacer le faisceau correspondant.
MODULE A/B PASSAG [OUVERT]	● Le circuit du module de coussin gonflable côté passager avant est ouvert.		
MODULE A/B PASSAG [COURT-CIRC-MASSE]	● Le circuit du module de coussin gonflable côté passager avant est court-circuité à la masse.		
MODULE A/B PASSAG [COURT-CIRC]	● Les circuits du module de coussin gonflable avant côté passager sont court-circuités les uns avec les autres.		
UNITE DE COMMANDE	● Le boîtier de capteurs de diagnostic est défectueux.		1. Vérifier visuellement les connexions de faisceau de câblage. 2. Remplacer le faisceau s'il est visiblement endommagé. 3. Remplacer le boîtier de capteurs de diagnostic. 4. Remplacer le faisceau correspondant.

*** Suivre les procédures dans l'ordre numérique lors de la réparation des pièces défectueuses. Vérifier que le défaut de fonctionnement est éliminé à l'aide du témoin d'avertissement de coussin gonflable ou de CONSULT après chaque réparation. Si le défaut subsiste, passer à l'étape suivante. Aucune réparation supplémentaire n'est requise si le défaut a disparu.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

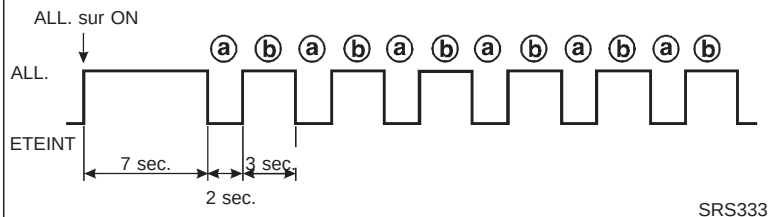
Autodiagnostic (suite)

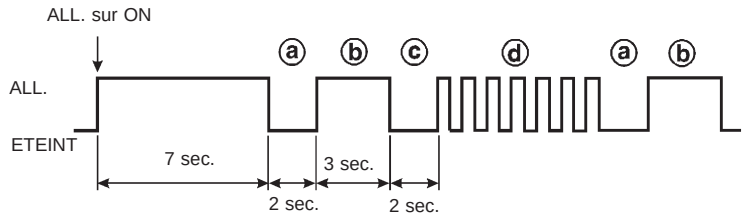
PROCEDURE DE DIAGNOSTIC 3 (⊗ sans CONSULT)

Inspection des pièces défectueuses du SRS à l'aide du témoin d'avertissement ''AIR BAG'' — Mode de diagnostic

NOTE :

Le SRS ne passera pas en mode de Diagnostic si aucun défaut n'est détecté en mode Utilisateur.





1. Ouvrir la portière du conducteur.
2. Mettre le contact d'allumage de la position ''OFF'' sur ''ON''.
3. Appuyer sur le contact de porte côté conducteur au moins 5 fois en 7 secondes après avoir mis le contact d'allumage sur ''ON''.
   Le SRS est maintenant en mode de Diagnostic.
4. Le témoin d'avertissement ''AIR BAG'' fonctionne en mode de Diagnostic comme suit :

NOTE :

Si le SRS ne passe pas en mode de Diagnostic même si un défaut a été detecté en mode Utilisateur, se reporter à PROCEDURE DE DIAGNOSTIC 11, à la page RS-2043.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Autodiagnostic (suite)

N°	Séquence de clignotement du témoin d'avertissement ''AIR BAG'' — Mode de Diagnostic —		Conditions du SRS
1	 SRS333	⓪a à ⓪b sont répétés.	● Les résultats de diagnostic (précédemment mémorisés) n'ont pas été effacés, même après que le système a été réparé. ● Un défaut intermittent a été détecté dans le passé. Aller à la PROCEDURE DE DIAGNOSTIC 7 (RS-2038).
2	 SRS341	⓪a à ⓪d sont répétés. ⓪b — Signal de coussin gonflable côté conducteur et passager (permet d'identifier les défauts de fonctionnement du coussin gonflable côté conducteur et/ou passager). ⓪d — Indique le composant défectueux. Le nombre de clignotements varie selon le composant défectueux (0,5 sec. ALLUME et 0,5 sec. ETEINT. L'état ETEINT représente un clignotement).	Le système est défectueux et a besoin d'être réparé.

5. La pièce défectueuse est identifiée par le nombre de clignotements (partie ⓪d). Comparer le nombre de clignotements au TABLEAU DE CODES DE CLIGNOTEMENT DU TEMOIN D'AVERTISSEMENT ''AIR BAG'', page RS-2033, et localiser le composant défectueux.
6. Couper le contact et débrancher les deux câbles de masse de la batterie.
7. Réparer le système selon l'''Ordre de réparation'' du TABLEAU DE CODES DE CLIGNOTEMENT DU TEMOIN D'AVERTISSEMENT ''AIR BAG'' correspondant au code de clignotement. Pour la procédure de remplacement des pièces, se reporter à RS-2007.
8. Après avoir réparé le système, aller à la PROCEDURE DE DIAGNOSTIC 5, page RS-2035.

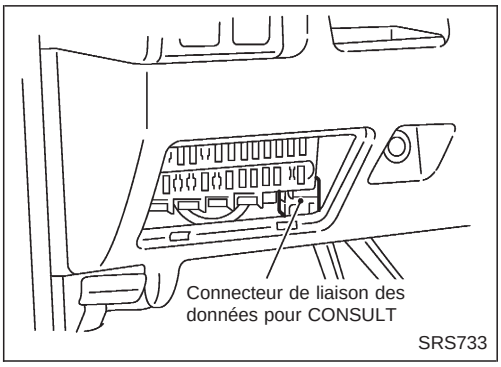
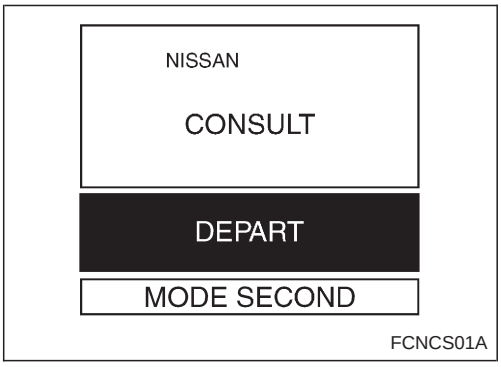
Aucune réparation supplémentaire n'est requise si le défaut a disparu.**



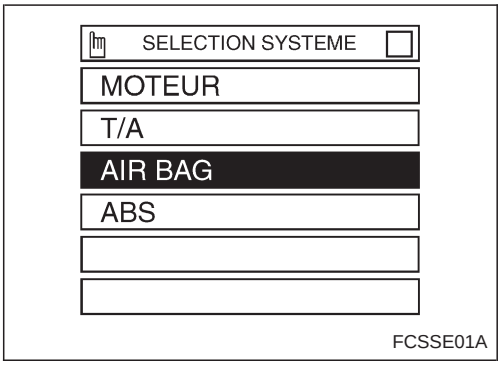
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Autodiagnostic (suite)

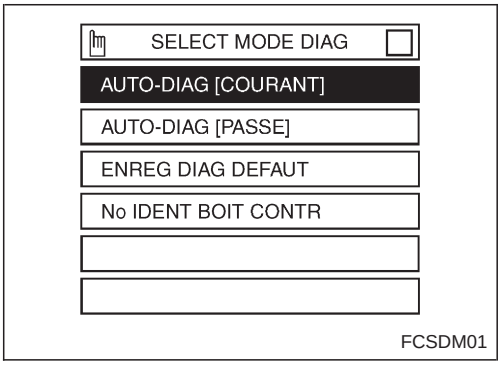


PROCEDURE DE DIAGNOSTIC 4 (avec CONSULT)

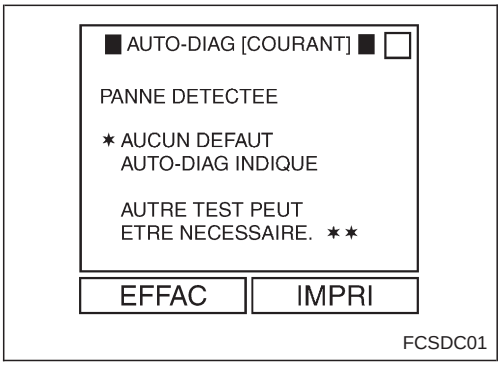
Vérification finale après réparation du SRS à l'aide de CONSULT — mode de Diagnostic



1. Après avoir réparé le SRS, brancher les deux câbles de la batterie.
2. Brancher CONSULT au connecteur de liaison de données.
3. Mettre le contact d'allumage de la position ''OFF'' sur ''ON''.

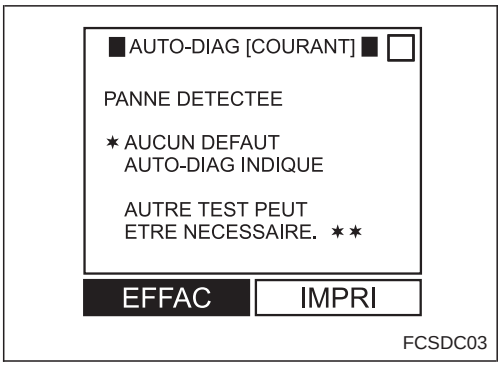


4. Appuyer sur ''DEPART''.



5. Appuyer sur ''AIR BAG''.

6. Appuyer sur ''AUTO-DIAG [COURANT]''.

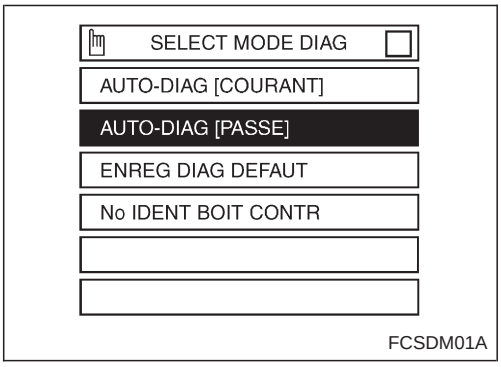


7. Si aucun défaut n'est détecté dans ''AUTO-DIAG [COURANT]'', cela signifie que la réparation du SRS est achevée. Passer à l'étape 8.
(Lorsque le défaut n'apparaît pas que dans le système de prétensionneur de coussin gonflable, aller à l'étape 11).

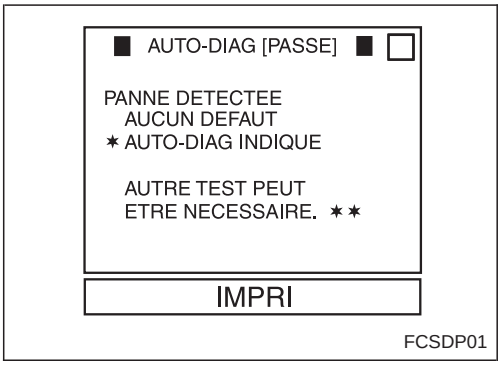
Si un défaut est détecté dans ''AUTO-DIAG [COURANT]'', le composant défectueux n'a pas été complètement réparé ou un autre composant défectueux a été détecté. Voir à PROCEDURE DE DIAGNOSTIC 2, à la page RS-2028, et réparer complètement la pièce défectueuse.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Autodiagnostic (suite)

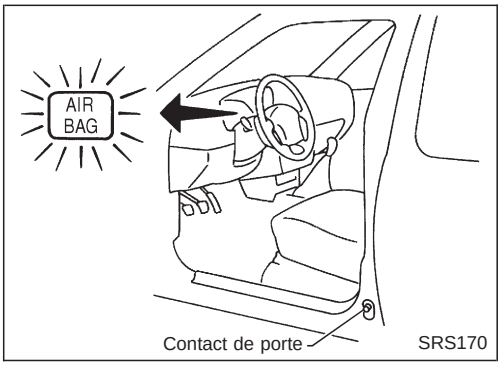


8. Appuyer sur ‘‘EFFAC’’.



NOTE :

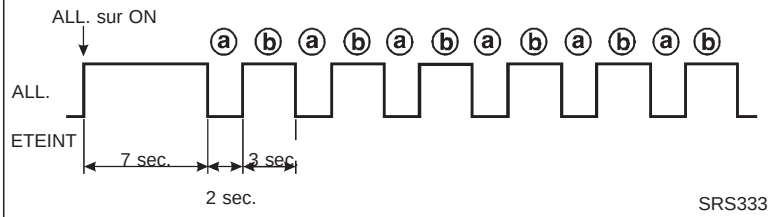
Appuyer sur ‘‘EFFAC’’ pour effacer le défaut de la mémoire (‘‘AUTO-DIAG [PASSE]’’).

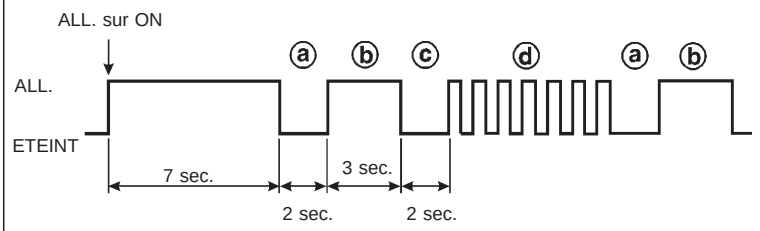


Si le défaut mémorisé en mode ‘‘AUTO-DIAG [PASSE]’’ n’est pas effacé, le mode Utilisateur indiquera un défaut de système par le biais du témoin d’avertissement, même si le défaut a été complètement éliminé.

9. Appuyer sur la touche ‘‘BACK’’ (RETOUR) de CONSULT pour sélectionner ‘‘AUTO-DIAG [PASSE]’’ sur l’écran ‘‘SELECT MODE DIAG’’. Appuyer sur ‘‘AUTO-DIAG [PASSE]’’.

10. S’assurer qu’aucun défaut de fonctionnement n’est détecté en ‘‘AUTO-DIAG [PASSE]’’.
11. Appuyer sur la touche ‘‘RETOUR’’ du CONSULT jusqu’à ce que ‘‘SELECTION SYSTEME’’ apparaisse, puis éteindre et débrancher le CONSULT.
12. Mettre le contact d’allumage sur ‘‘OFF’’.
13. Aller à PROCEDURE DE DIAGNOSTIC 1, à la page RS-2027 pour vérifier le fonctionnement du SRS à l’aide du témoin d’avertissement ‘‘AIR BAG’’ en mode Utilisateur.





PROCEDURE DE DIAGNOSTIC 5 (⊗ sans CONSULT)

Vérification finale après réparation du SRS à l’aide du témoin d’avertissement ‘‘AIR BAG’’ — Mode de Diagnostic et mode Utilisateur

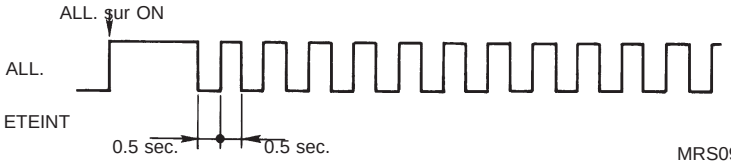
1. Après avoir réparé le SRS, brancher les deux câbles de la batterie.
2. Ouvrir la portière du conducteur.
3. Mettre le contact d’allumage de la position ‘‘OFF’’ sur ‘‘ON’’.
4. Le témoin d’avertissement ‘‘AIR BAG’’ fonctionne en mode de Diagnostic comme suit :

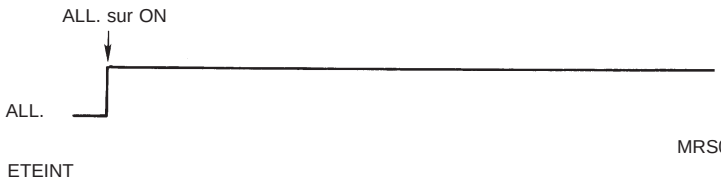
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Autodiagnostic (suite)

N°	Séquence de clignotement du témoin d'avertissement ''AIR BAG'' — Mode de Diagnostic —	Conditions du SRS
1	 SRS333 ⓪a à ⓪b sont répétés.	Aucun défaut n'est détecté ou la réparation est achevée. Aucune démarche supplémentaire n'est nécessaire.
2	 SRS341 ⓪a à ⓪d sont répétés. ⓪b — Signal de coussin gonflable côté conducteur et passager (permet d'identifier les défauts de fonctionnement du coussin gonflable côté conducteur et/ou passager). ⓪d — Indique le composant défectueux. Le nombre de clignotements varie selon le composant défectueux (0,5 sec. ALLUME et 0,5 sec. ETEINT. L'état ETEINT représente un clignotement).	Le système est défectueux et a besoin d'être réparé.

NOTE :
Si le boîtier de capteurs de diagnostic est remplacé par un boîtier neuf, le témoin d'avertissement ''AIR BAG'' fonctionnera en mode Utilisateur. La vérification du fonctionnement du témoin d'avertissement ''AIR BAG'' en mode de Diagnostic n'est pas nécessaire. Passer à l'étape 6.





5. Si le témoin d'avertissement ''AIR BAG'' fonctionne conformément à la séquence n° 1 du tableau précédent, couper le contact d'allumage pour passer du mode de Diagnostic en mode Utilisateur et pour effacer le défaut de la mémoire. Puis passer à l'étape 6.

   Si le témoin ''AIR BAG'' fonctionne de la façon indiquée au point 2 du tableau ci-avant, cela signifie que la pièce défectueuse n'est pas complètement réparée ou qu'un autre défaut est détecté. Voir à PROCEDURE DE DIAGNOSTIC 3, à la page RS-2031, et réparer complètement la pièce défectueuse.
6. Tourner le contact d'allumage sur ''ON''. Le témoin d'avertissement ''AIR BAG'' fonctionne en mode Utilisateur. Comparer le fonctionnement du témoin d'avertissement ''AIR BAG'' au tableau ci-dessous.

NOTE :
S'il est nécessaire de passer du mode de Diagnostic au mode Utilisateur quand un défaut est détecté, tourner le contact d'allumage de ''OFF'' sur ''ON''. Puis appuyer sur le contact de porte côté conducteur au moins 5 fois en 7 secondes après avoir mis le contact d'allumage sur ''ON''. Le SRS est maintenant en mode Utilisateur.

	Le coussin gonflable est déployé.	Aller à DIAGNOSTIC DE COLLISION (RS-2044)
	Le fusible de coussin gonflable, le boîtier de capteurs de diagnostic ou le faisceau est défectueux et doit être réparé.	Aller à PROCEDURE DE DIAGNOSTIC 9 (RS-2042)
	Un des défauts suivants s'est manifesté et doit être réparé. ● Le fusible des instruments combinés est grillé. ● Le circuit du témoin d'avertissement ''AIR BAG'' est ouvert ou en court-circuit. ● Le boîtier de capteurs de diagnostic est défectueux.	Aller à la PROCEDURE DE DIAGNOSTIC 10 (RS-2042).

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Autodiagnostic (suite)

PROCEDURE DE DIAGNOSTIC 6 (suite de la PROCEDURE DE DIAGNOSTIC 2)

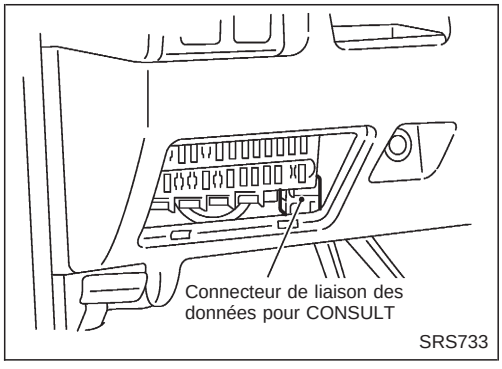
Inspection d'un défaut enregistré du SRS

Est-ce le premier entretien du SRS ? — Non → Le message ''AUTO-DIAG [PASSE]'' (entré précédemment) est toujours présent dans la mémoire. Aller à la PROCEDURE DE DIAGNOSTIC 4 (RS-2034).

Oui → **Aller à la PROCEDURE DE DIAGNOSTIC 8 (RS-2038).**

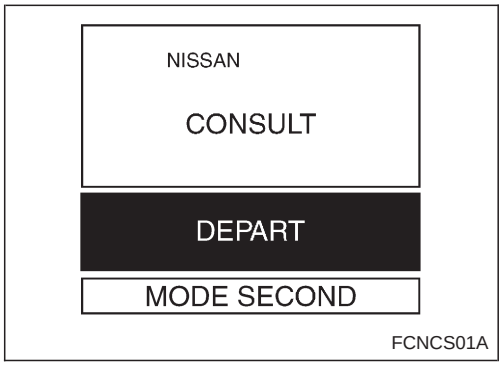
PROCEDURE DE DIAGNOSTIC 7 (suite de la PROCEDURE DE DIAGNOSTIC 3) (sans CONSULT)

Inspection d'un défaut enregistré du SRS



Est-ce le premier entretien du SRS ? — Non → Les résultats de diagnostic (précédemment mémorisés) n'ont pas été effacés, même après que le système a été réparé. Aller à la PROCEDURE DE DIAGNOSTIC 5, étape 5 (RS-2035).

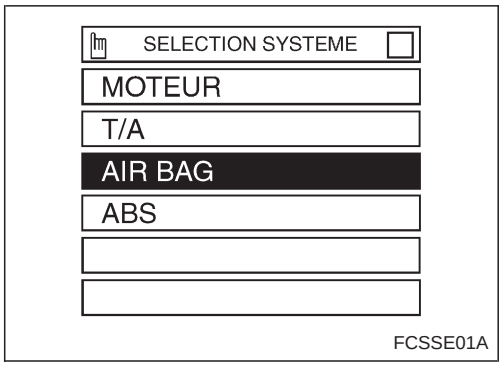
Oui → **Aller à la PROCEDURE DE DIAGNOSTIC 8 (RS-2038).** L'inspection ne peut pas être poursuivie sans CONSULT.



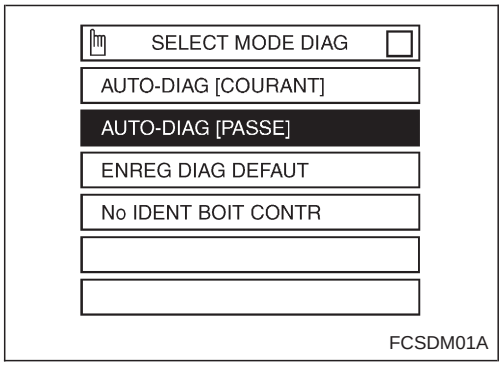
PROCEDURE DE DIAGNOSTIC 8 (avec CONSULT)

Inspection d'un défaut intermitent du SRS à l'aide de CONSULT — Mode de diagnostic

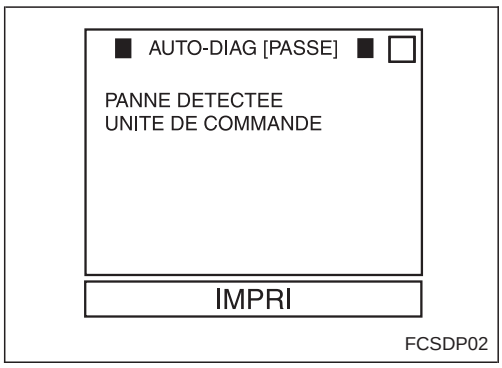
1. Mettre le contact d'allumage sur ''OFF''.
2. Brancher ''CONSULT'' au connecteur de liaison des données.



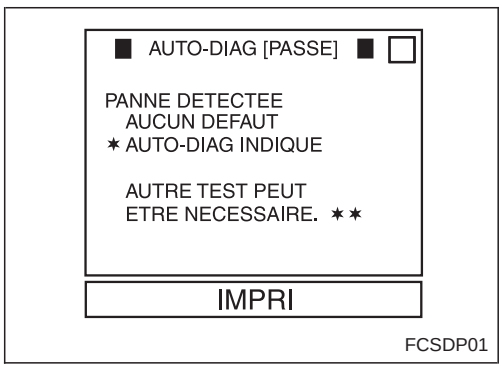
3. Mettre le contact d'allumage sur ''ON''.
4. Appuyer sur ''DEPART''.



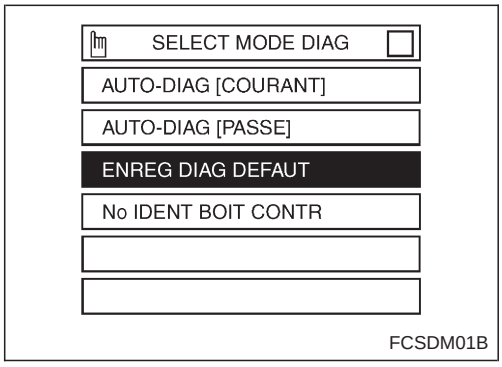
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Autodiagnostic (suite)



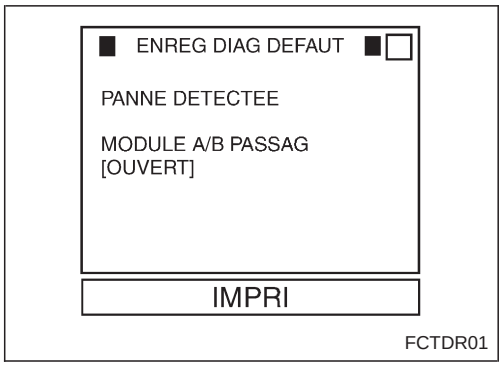
5. Appuyer sur ‘‘AIR BAG’’.



6. Appuyer sur ‘‘AUTO-DIAG [PASSE]’’.

7. Si les codes de diagnostic s’affichent dans ‘‘AUTO-DIAG [PASSE]’’, passer à l’étape 10.

Si aucun défaut de fonctionnement n’est détecté en ‘‘AUTO-DIAG [PASSE]’’, appuyer sur ‘‘RETOUR’’ et revenir à ‘‘SELECT MODE DIAG’’.



8. Appuyer sur ‘‘ENREG DIAG DEFAUT’’.

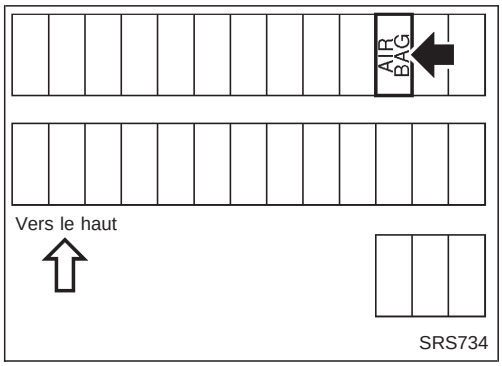
NOTE :
La fonction ‘‘ENREGIST DIAG DEFAUT’’ permet d’afficher sur l’écran CONSULT les résultats de diagnostic précédemment effacés lors de la remise à zéro du système.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Autodiagnostic (suite)

9. Le code de diagnostic est affiché dans ‘‘ENREG DIAG DEFAUT’’.
10. Appuyer sur ‘‘IMPRI’’.
11. Comparer les codes de diagnostic avec le TABLEAU DES CODES DE DIAGNOSTIC DE DEFAUT DE FONCTIONNEMENT INTERMITTENT, RS-2041.
12. Appuyer sur la touche ‘‘RETOUR’’ du CONSULT jusqu’à ce que l’écran ‘‘SELECTION SYSTEM’’ apparaisse, puis éteindre le CONSULT.
13. Couper le contact, puis débrancher le CONSULT ainsi que les deux câbles de la batterie.
14. Réparer le système comme indiqué dans ‘‘Ordre de réparation’’ dans le TABLEAU DES CODES DE DIAGNOSTIC POUR PROBLEMES INTERMITTENTS, qui correspond au résultat d’autodiagnostic. Pour la procédure de remplacement des pièces, se reporter à RS-2007.
15. Aller à PROCEDURE DE DIAGNOSTIC 4, RS-2034.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Autodiagnostic (suite)

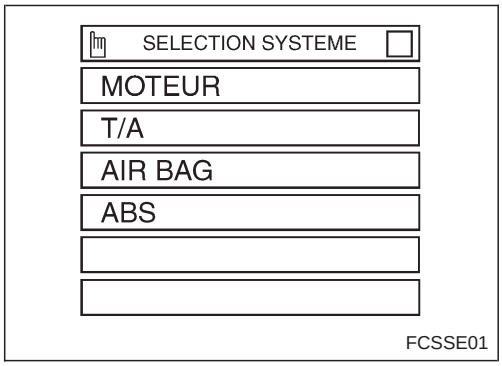


TABLEAU DES CODES DE DIAGNOSTIC DE DEFAUT DE FONCTIONNEMENT INTERMITTENT (''AUTO-DIAG [PASSE]'' ou ''ENREGIST DIAG DEFAUT'')

Elément de diagnostic	Explication		Ordre de réparation
AUCUN DEFAUT AUTO-DIAG INDIQUE.	Lorsque le défaut de fonctionnement est indiqué par le témoin d'avertissement ''AIR BAG'' en mode Utilisateur.	● Tension de la batterie basse (moins de 9V)	● Voir à PROCEDURE DE DIAGNOSTIC 4 (RS-2034) après avoir chargé la batterie.
	● Aucun défaut n'est détecté.		● Aller à la PROCEDURE DE DIAGNOSTIC 4 (RS-2034).
MODULE AIR BAG [OUVERT]	● Le circuit du module de coussin gonflable est ouvert (y compris le câble spiralé).		1. Inspecter visuellement la connexion du faisceau de câblage. 2. Remplacer le faisceau s'il est visiblement endommagé. 3. Si les résultats de la vérification du faisceau sont bons, remplacé le câble spiralé, le boîtier de capteurs de diagnostic et le module de coussin gonflable du coté conducteur (avant de le déposer, il doit être déployé)
MODULE AIR BAG [COURT TENS BATT]	● Le circuit du module de coussin gonflable du coté conducteur est court-circuité à un circuit d'alimentation (y compris le câble spiralé).		
MODULE AIR BAG [COURT-CIRC MASSE]	● Le circuit du module de coussin gonflable du coté conducteur est court-circuit à la masse (y compris le câble spiralé).		
MODULE AIR BAG [COURT-CIRC]	● Les circuits du module de coussin gonflable côté conducteur sont court-circuités les uns avec les autres.		
MODULE A/B PASSAG [COURT TENS BATT]	● Le circuit du module de coussin gonflable côté passager avant est court-circuité à un circuit d'alimentation électrique.		1. Inspecter visuellement la connexion du faisceau de câblage. 2. Remplacer le faisceau s'il est visiblement endommagé. 3. Si les résultats de la vérification sont bons, remplacer le boîtier de capteurs de diagnostic et le module de coussin gonflable du coté passager (avant de le déposer, il doit être déployé)
MODULE A/B PASSAG [OUVERT]	● Le circuit du module de coussin gonflable côté passager avant est ouvert.		
MODULE A/B PASSAG [COURT-CIRC MASSE]	● Le circuit du module de coussin gonflable côté passager avant est court-circuité à la masse.		
MODULE A/B PASSAG [COURT-CIRC]	● Les circuits du module de coussin gonflable avant côté passager sont court-circuités les uns avec les autres.		
UNITE DE COMMANDE	● Le boîtier de capteurs de diagnostic est défectueux.		1. Inspecter visuellement la connexion du faisceau de câblage. 2. Remplacer le faisceau s'il est visiblement endommagé. 3. Si la connexion du faisceau est normale, remplacer le boîtier de capteurs de diagnostic.

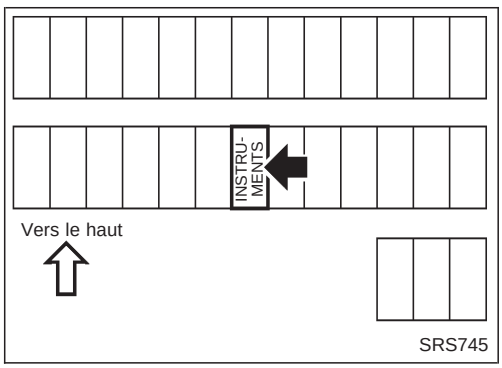
* Suivre les procédures dans l'ordre numérique lors de la réparation des pièces défectueuses, puis procéder au contrôle final du système.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostics des défauts du témoin d'avertissement ''AIR BAG''

PROCEDURE DE DIAGNOSTIC 9

SYMPTOME : le témoin d'avertissement ''AIR BAG'' ne s'éteint pas.



Le module de coussin gonflable est-il déployé ?
- Oui → Remplacer le module de coussin gonflable et le boîtier de capteurs de diagnostic. Se reporter à DIAGNOSTIC DE COLLISION, (RS-2044).
- Non ↓

Le fusible (''AIR BAG'') du SRS fonctionne-t-il correctement ?
- Non → Remplacer le fusible et mettre le contact d'allumage sur ON. Si le fusible ''AIR BAG'' du SRS est à nouveau grillé, réparer le faisceau connexe.
- Oui ↓

Brancher CONSULT et appuyer sur ''DEPART''.
● Est-ce que ''AIRBAG'' s'affiche sur l'écran CONSULT ?
- Non → Remplacer le boîtier de capteurs de diagnostic.
- Oui ↓

Est-ce que la connexion de faisceau entre le témoin et le boîtier de capteurs de diagnostic est bonne ?
- Non → Brancher le connecteur du témoin et du boîtier de capteurs de diagnostic correctement. Si le témoin ne s'éteint toujours pas, remplacer le faisceau.
- Oui ↓

Remplacer le boîtier de capteurs de diagnostic.

PROCEDURE DE DIAGNOSTIC 10

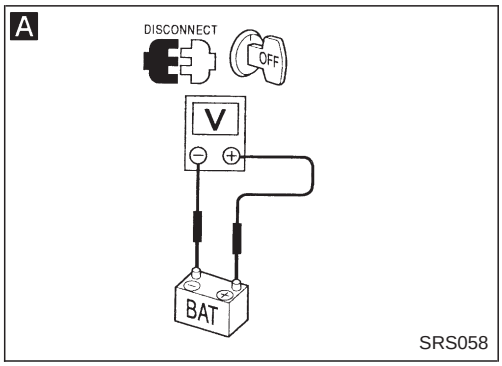
SYMPTOME : le témoin d'avertissement ''AIR BAG'' ne s'allume pas.

Le fusible des instruments combinés fonctionne-t-il correctement ?
- Non → Remplacer le fusible et mettre le contact d'allumage sur ON. Si le fusible des instruments combinés, réparer le faisceau correspondant.
- Oui ↓

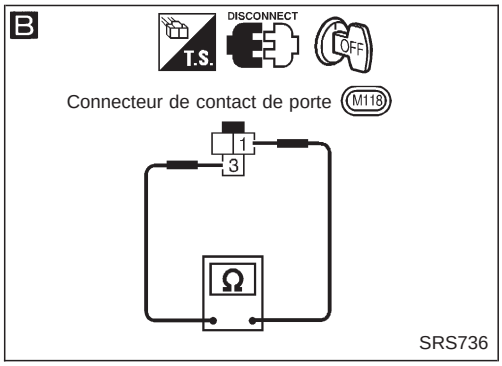
Est-ce que la DEL du témoin d'avertissement fonctionne correctement ?
- Non → Remplacer la DEL du témoin d'avertissement.
- Oui ↓

1. Débrancher le connecteur du boîtier de capteurs de diagnostic.
2. Mettre le contact d'allumage sur ON.

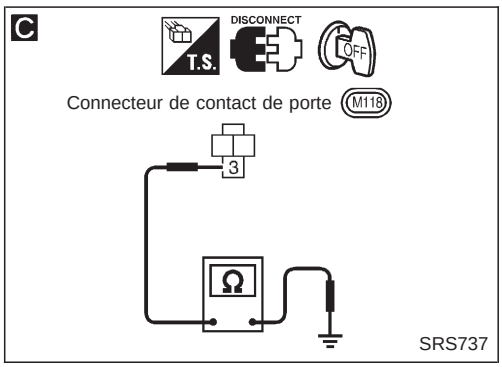
● Le témoin d'avertissement s'allume-t-il ?
- Non → Brancher le connecteur du témoin d'avertissement et du boîtier de capteurs de diagnostic correctement. Si le témoin ne s'allume toujours pas, remplacer le faisceau.
- Oui ↓



Remplacer le boîtier de capteurs de diagnostic.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Diagnostics des défauts du témoin d'avertissement ''AIR BAG'' (suite)

PROCEDURE DE DIAGNOSTIC 11 (Modèles pour l'Europe et munis d'un système de multi-télécommande)

SYMPTOME : le SRS ne passe pas en mode de Diagnostic.

A

Débrancher les deux câbles de la batterie et contrôler la tension de cette dernière à l'aide du multimètre.
- Est-ce que la tension de la batterie est de plus de 9V ?

Non → Charger la batterie.

Oui ↓

B

Déposer le contact de porte côté conducteur et vérifier la continuité entre les bornes ⑴ et ⑶ du connecteur de contact de porte côté conducteur dans les conditions suivantes.

Condition	Il y a continuité
Le contact de porte est enfoncé (la porte est fermée).	NON
Le contact de porte est relâché (la porte est ouverte).	OUI

Non → Remplacer le contact de porte côté conducteur.

Oui ↓

C

Vérifier la continuité du faisceau entre la borne ⑶ du connecteur du contact de porte côté conducteur et la masse de carrosserie.
- Y a-t-il continuité ?

Non → Remplacer ou réparer le faisceau.

Oui ↓

Remplacer le boîtier de capteurs de diagnostic.

↓

Aller à la PROCEDURE DE DIAGNOSTIC 1 (RS-2027).

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

COLLISION FRONTALE

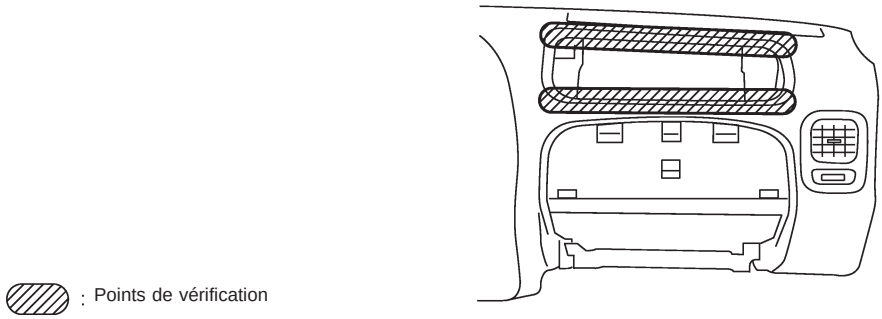
Procéder de la façon suivante pour réparer le SRS en cas de collision frontale.

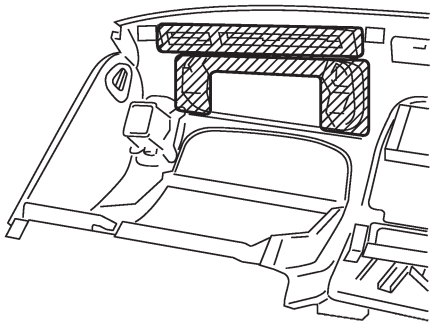
Lorsque le SRS est activé lors d'une collision :

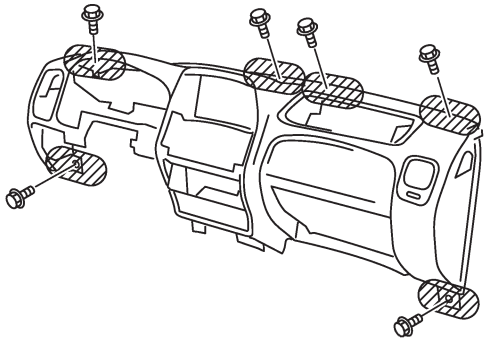
⑪ Remplacer le boîtier de capteurs de diagnostic.
⑫ Déposer les modules de coussins gonflables.
⑬ Contrôler les composants du SRS à l'aide du tableau ci-dessous :
- Remplacer les composants du SRS qui montrent des signes visibles de dommages (bosses, fissures, déformation).

⑭ Monter des modules de coussins gonflables neufs.
⑮ Effectuer un autodiagnostic à l'aide de CONSULT et du témoin d'avertissement ''AIR BAG''. Se reporter à ''Autodiagnostic'' pour plus de détails (RS-2027). S'assurer que l'ensemble du SRS fonctionne correctement.

Lorsque le SRS n'est pas activé lors d'une collision :







⑪ Contrôler les composants du SRS à l'aide du tableau ci-dessous :
- Remplacer les composants du SRS qui montrent des signes visibles de dommages (bosses, fissures, déformation).

⑫ Effectuer un autodiagnostic à l'aide de CONSULT et du témoin d'avertissement ''AIR BAG''. Se reporter à ''Autodiagnostic'' pour plus de détails (RS-2027). S'assurer que l'ensemble du SRS fonctionne correctement.

Inspection du SRS

Pièce	Le SRS est activé.	Le SRS n'est PAS activé.
Module de coussin gonflable (côté conducteur et passager)	REMPLACER Reposer le module de coussin gonflable en utilisant des boulons neufs.	1. Déposer le module de coussin gonflable. Vérifier que le cache du faisceau et les connecteurs ne sont pas endommagés, les bornes déformées et le faisceau coincé. 2-1. Reposer le module de coussin gonflable côté conducteur sur le volant et vérifier s'il est correctement monté et aligné sur le volant. 2-2. Reposer le module de coussin gonflable côté passager sur le tableau de bord et vérifier s'il est correctement monté sur le tableau de bord. 3. Si l'on ne constate aucun dommage, reposer le composant en utilisant des boulons neufs enduits d'agent d'adhésivité. 4. En cas de dommage — REMPLACER. Le coussin gonflable doit être déployé avant d'être mis au rebut.
Boîtier de capteurs de diagnostic	REMPLACER Reposer le boîtier de capteurs de diagnostic en utilisant des boulons neufs.	1. Vérifier que le boîtier et son support ne sont pas bosselés, fissurés ou déformés. 2. Vérifier que les connecteurs ne sont pas endommagés et les bornes déformées. 3. Si aucun dommage n'est trouvé, reposer l'ensemble avec des boulons neufs. 4. En cas de dommage — REMPLACER. Reposer le boîtier de capteurs de diagnostic en utilisant des boulons neufs enduits d'agent d'adhésivité.
Volant	1. Vérifier visuellement si le volant de direction n'est pas déformé. 2. Vérifier que le faisceau (intégré au volant) et les connecteurs ne sont pas endommagés et les bornes déformées. 3. Monter le module de coussin gonflable pour en contrôler l'alignement avec le volant. 4. Vérifier que le volant ne présente pas un jeu excessif. 5. Si l'on ne constate aucun dommage, reposer le volant. 6. En cas de dommage — REMPLACER.	
Câble spiralé	1. Contrôler visuellement que le câble spiralé et la commande combinée ne sont pas endommagés. 2. Vérifier que les connecteurs, le câble plat et la bande de protection sont en bon état. 3. Vérifier que le volant est exempt de tout bruit, point de force et qu'il tourne librement. 4. Si l'on ne constate aucun dommage, reposer le câble spiralé. 5. En cas de dommage — REMPLACER.	
Faisceau et connecteurs	1. Vérifier si les connecteurs sont bien branchés, s'ils ne sont pas endommagés et si les bornes ne sont pas déformées. 2. Vérifier que le faisceau ne coince pas et qu'il n'est pas effiloché, coupé ou déformé. 3. Si l'on ne constate aucun dommage, reposer le faisceau et les connecteurs. 4. En cas de dommage — REMPLACER la partie du faisceau endommagée. Ne pas essayer de réparer, épisser ou modifier le faisceau du SRS.	
Tableau de bord	Se reporter au tableau de la page suivante.	

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Pièce	Le SRS est activé	Le SRS n'est PAS activé.
Tableau de bord	1. Lors du déploiement du coussin gonflable passager, vérifier que les composants suivants ne sont pas pliés, déformés ou fissurés. ● Orifice du module de coussin gonflable passager	
	 : Points de vérification SRS738	
	● Supports du module de coussin gonflable passager	
	 : Points de vérification SRS739	
	● Fixations du tableau de bord	
	 : Points de vérification SRS740	
	2. Si l'on ne constate aucun dommage, reposer le tableau de bord. 3. En cas de dommage, REMPLACER le tableau de bord et les boulons.

CARROSSERIE ET GARNITURE

SECTION BT

AVIS DE MODIFICATION :

- L'extrémité avant de la carrosserie a été modifiée.
- L'extérieur a été changé.

TABLE DES MATIERES

EXTREMITES DE LA CARROSSERIE.....3002
Extrémité avant de la carrosserie.....3002

EXTERIEUR.....3006

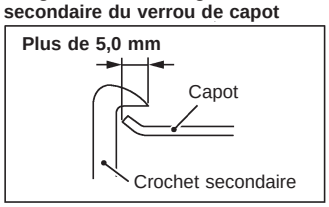
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Extrémité avant de la carrosserie

- Couvrir le capot avec un chiffon ou tout autre matériel de protection lors de sa dépose ou de sa repose. La carrosserie sera ainsi protégée contre les rayures.
- La garniture de pare-chocs est en plastique. Ne pas forcer excessivement et veiller à éviter tout contact avec de l'huile.
- Réglage du capot : Régler à hauteur des charnières.
- Réglage du verrouillage de capot de moteur : Après le réglage, vérifier le fonctionnement de la commande de verrouillage de capot. Appliquer une couche de graisse sur le mécanisme d'enclenchement des serrures de capot.
- Ouverture du capot : Ne pas tenter de plier le câble en le forçant. Cela augmenterait l'effort nécessaire pour déverrouiller le capot.

DEPOSE — Ensemble pare-chocs avant

① Démonter les clips fixant la grille avant et la déposer. A
② Déposer les boulons qui fixent les montants à gauche et à droite du pare-chocs. B
③ Déposer les boulons qui fixent la garniture de pare-chocs (inférieure) à gauche et à droite. C
④ Déposer les boulons qui fixent les supports latéraux à gauche et à droite du pare-chocs. D
⑤ Déposer les boulons qui fixent les montants latéraux à gauche et à droite du pare-chocs. E
⑥ Déposer l'ensemble du pare-chocs.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

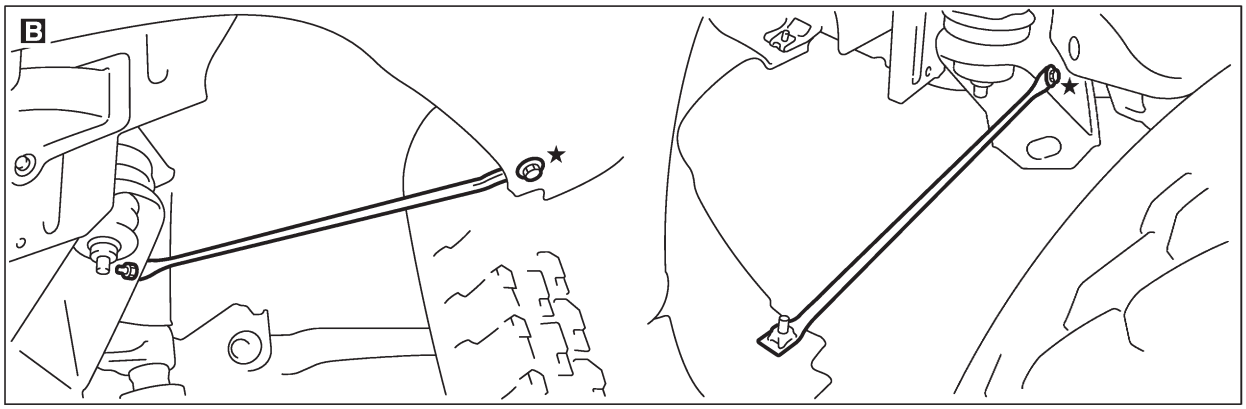
Extrémité avant de la carrosserie (Suite)

SEC. 261•620•623•650•656

Réglage du verrouillage de capot de moteur
- Régler le capot de façon à ce que le verrou primaire s'enclenche 1 à 1,5 mm plus bas que l'aile.
- Après avoir réglé le verrou de capot, régler le caoutchouc de butée.
- Lors du montage du verrou de capot, veiller à ce qu'il ne soit pas penché. La gâche doit être positionnée au centre du verrou primaire de capot.
- Après le réglage, s'assurer que le verrou primaire et le verrou secondaire fonctionnent correctement.

Longueur d'accrochage du crochet secondaire du verrou de capot

Réglage du caoutchouc de butée
- Régler de façon à ce que le capot soit aligné sur l'aile. La déflexion est alors d'environ 2 mm.



[**La hauteur libre du** caoutchouc de butée est d'env. 13 mm.]

DIAGNOSTIC DES DEFAUTS - DESCRIPTION GENERALE 3107
Tableau des priorités d'inspection des codes de défaut de diagnostic 3107
Tableau de sécurité 3108
Tableau des caractéristiques des symptômes 3109
Valeur de référence de CONSULT-II en mode de contrôle de données 3114
Graphique de référence du capteur principal en mode de contrôle de données 3117
Bornes de l'ECM et valeurs de référence 3119
DIAGNOSTIC DES DEFAUTS - VALEUR DE SPECIFICATION 3128
Description 3128
Conditions d'essai 3128
Procédure d'inspection 3128
Procédure de diagnostic 3129
DIAGNOSTIC DES DEFAUTS POUR UN INCIDENT INTERMITTENT 3132
Description 3132
Procédure de diagnostic 3132
DIAGNOSTIC DES DEFAUTS POUR L'ALIMENTATION 3133
Circuit d'alimentation électrique principale et de mise à la masse 3133
DTC P0031, P0032 CHAUFFAGE CH1 S/O2 3142
Description 3142
Valeur de référence de CONSULT-II en mode de contrôle de données 3142
Bornes de l'ECM et valeurs de référence 3142
Logique de diagnostic de bord 3143
Procédure de confirmation de code de défaut (DTC) 3143
Schéma de câblage 3144
Procédure de diagnostic 3145
DTC P0037, P0038 CHAUFFAGE S/O2 CH2 3147
Description 3147
Valeur de référence de CONSULT-II en mode de contrôle de données 3147
Bornes de l'ECM et valeurs de référence 3147
Logique de diagnostic de bord 3148
Procédure de confirmation de code de défaut (DTC) 3148
Schéma de câblage 3150
Procédure de diagnostic 3151
DTC P0101 DEBITMETRE D'AIR 3153
Description des composants 3153
Valeur de référence de CONSULT-II en mode de contrôle de données 3153
Bornes de l'ECM et valeurs de référence 3153
Logique de diagnostic de bord 3154
Procédure de confirmation de code de défaut (DTC) 3154
Vérification du fonctionnement général 3155
Schéma de câblage 3157
Procédure de diagnostic 3158
DTC P0102, P0103 DEBITMETRE D'AIR 3162
Description des composants 3162
Valeur de référence de CONSULT-II en mode de contrôle de données 3162
Bornes de l'ECM et valeurs de référence 3163
Logique de diagnostic de bord 3163
Procédure de confirmation de code de défaut (DTC) 3163
Schéma de câblage 3165
Procédure de diagnostic 3166
DTC P0112, P0113 CAPTEUR DE TEMPERATURE D'AIR D'ADMISSION 3171
Description des composants 3171
Bornes de l'ECM et valeurs de référence 3171
Logique de diagnostic de bord 3172
Procédure de confirmation de code de défaut (DTC) 3172
Schéma de câblage 3173
Procédure de diagnostic 3174
DTC P0117, P0118 CAPTEUR DE TEMPERATURE MOTEUR 3176
Description des composants 3176
Valeur de référence de CONSULT-II en mode de contrôle de données 3176
Bornes de l'ECM et valeurs de référence 3176
Logique de diagnostic de bord 3177
Procédure de confirmation de code de défaut (DTC) 3178
Schéma de câblage 3179
Procédure de diagnostic 3180
DTC P0121 CAPTEUR DE POSITION DE PAPILLON 3182
Description des composants 3182
Valeur de référence de CONSULT-II en mode de contrôle de données 3182
Bornes de l'ECM et valeurs de référence 3183
Logique de diagnostic de bord 3183
Procédure de confirmation de code de défaut (DTC) 3184
Schéma de câblage 3186
Procédure de diagnostic 3187
DTC P0122, P0123 CAPTEUR DE POSITION DE PAPILLON 3194
Description des composants 3194

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Valeur de référence de CONSULT-II en mode de contrôle de données 3194
Bornes de l'ECM et valeurs de référence 3195
Logique de diagnostic de bord 3195
Procédure de confirmation de code de défaut (DTC) 3196
Schéma de câblage 3197
Procédure de diagnostic 3198
DTC P0127 CAPTEUR DE POSITION DE PAPILLON 3205
Description des composants 3205
Bornes de l'ECM et valeurs de référence 3205
Logique de diagnostic de bord 3206
Procédure de confirmation de code de défaut (DTC) 3207
Procédure de diagnostic 3208
DTC P0132 SONDE A OXYGENE CHAUFFE 1 3209
Description des composants 3209
Valeur de référence de CONSULT-II en mode de contrôle de données 3209
Bornes de l'ECM et valeurs de référence 3209
Logique de diagnostic de bord 3210
Procédure de confirmation de code de défaut (DTC) 3210
Schéma de câblage 3212
Procédure de diagnostic 3213
DTC P0133 SONDE A OXYGENE CHAUFFE 1 3216
Description des composants 3216
Valeur de référence de CONSULT-II en mode de contrôle de données 3216
Bornes de l'ECM et valeurs de référence 3216
Logique de diagnostic de bord 3217
Procédure de confirmation de code de défaut (DTC) 3217
Vérification du fonctionnement général 3218
Schéma de câblage 3219
Procédure de diagnostic 3220
DTC P0134 SONDE A OXYGENE CHAUFFE 1 3227
Description des composants 3227
Valeur de référence de CONSULT-II en mode de contrôle de données 3227
Bornes de l'ECM et valeurs de référence 3227
Logique de diagnostic de bord 3228
Procédure de confirmation de code de défaut (DTC) 3228
Vérification du fonctionnement général 3229
Schéma de câblage 3230
Procédure de diagnostic 3231
DTC P0138 SONDE A OXYGENE CHAUFFE 2 3234
Description des composants 3234
Valeur de référence de CONSULT-II en mode de contrôle de données 3234
Bornes de l'ECM et valeurs de référence 3234
Logique de diagnostic de bord 3235
Procédure de confirmation de code de défaut (DTC) 3235
Vérification du fonctionnement général 3236
Schéma de câblage 3237
Procédure de diagnostic 3238
DTC P0139 SONDE A OXYGENE CHAUFFE 2 3242
Description des composants 3242
Valeur de référence de CONSULT-II en mode de contrôle de données 3242
Bornes de l'ECM et valeurs de référence 3242
Logique de diagnostic de bord 3243
Procédure de confirmation de code de défaut (DTC) 3244
Vérification du fonctionnement général 3245
Schéma de câblage 3246
Procédure de diagnostic 3247
DTC P0171 SYSTEME D'INJECTION FONCTIONNEMENT 3253
Logique de diagnostic de bord 3253
Procédure de confirmation de code de défaut (DTC) 3253
Schéma de câblage 3255
Procédure de diagnostic 3256
DTC P0172 SYSTEME D'INJECTION FONCTIONNEMENT 3260
Logique de diagnostic de bord 3260
Procédure de confirmation de code de défaut (DTC) 3260
Schéma de câblage 3262
Procédure de diagnostic 3263
DTC P0300 - P0304 RATES D'ALLUMAGE DES CYLINDRES N° 4 - 1, RATES D'ALLUMAGE DE CYLINDRES MULTIPLES 3267
Logique de diagnostic de bord 3267
Procédure de confirmation de code de défaut (DTC) 3267
Procédure de diagnostic 3268
DTC P0327, P0328 CAPTEUR DE DETONATION 3276
Description des composants 3276
Bornes de l'ECM et valeurs de référence 3276
Logique de diagnostic de bord 3276
Procédure de confirmation de code de défaut (DTC) 3276
Schéma de câblage 3278
Procédure de diagnostic 3279
DTC P0335 CAPTEUR DE POSITION DE VILEBREQUIN (OBD) 3281
Description des composants 3281

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Bornes de l'ECM et valeurs de référence 3281
Logique de diagnostic de bord 3282
Procédure de confirmation de code de défaut (DTC) 3282
Schéma de câblage 3283
Procédure de diagnostic 3284
DTC P0340 CAPTEUR D'ANGLE D'ARBRE A CAMES 3287
Description des composants 3287
Bornes de l'ECM et valeurs de référence 3287
Logique de diagnostic de bord 3289
Procédure de confirmation de code de défaut (DTC) 3290
Schéma de câblage 3291
Procédure de diagnostic 3292
DTC P0420 FONCTION DU CATALYSEUR A TROIS VOIES 3296
Logique de diagnostic de bord 3296
Procédure de confirmation de code de défaut (DTC) 3296
Vérification du fonctionnement général 3297
Procédure de diagnostic 3298
DTC P0444, P0445 ELECTROVANNE DE COMMANDE DE VOLUME DE PURGE DE CARTOUCHE EVAP 3301
Description 3301
Valeur de référence de CONSULT-II en mode de contrôle de données 3302
Bornes de l'ECM et valeurs de référence 3302
Logique de diagnostic de bord 3303
Procédure de confirmation de code de défaut (DTC) 3304
Schéma de câblage 3305
Procédure de diagnostic 3306
DTC P0500 SIGNAL DE VITESSE DU VEHICULE 3309
Description des composants 3309
Bornes de l'ECM et valeurs de référence 3309
Logique de diagnostic de bord 3309
Procédure de confirmation de code de défaut (DTC) 3309
Vérification du fonctionnement général 3310
Schéma de câblage 3312
Procédure de diagnostic 3314
DTC P0505 SYSTEME ISC 3315
Description 3315
Valeur de référence de CONSULT-II en mode de contrôle de données 3316
Bornes de l'ECM et valeurs de référence 3317
Logique de diagnostic de bord 3317
Procédure de confirmation de code de défaut (DTC) 3318
Schéma de câblage 3319
Procédure de diagnostic 3320
DTC P0510 CONTACT CTP 3322
Description des composants 3322
Bornes de l'ECM et valeurs de référence 3322
Logique de diagnostic de bord 3322
Procédure de confirmation de code de défaut (DTC) 3323
Vérification du fonctionnement général 3323
Schéma de câblage 3325
Procédure de diagnostic 3326
DTC P0605 ECM 3331
Description des composants 3331
Logique de diagnostic de bord 3331
Procédure de confirmation de code de défaut (DTC) 3331
Procédure de diagnostic 3332
DTC P1143 SONDE A OXYGENE CHAUFFE 1 3333
Description des composants 3333
Valeur de référence de CONSULT-II en mode de contrôle de données 3333
Bornes de l'ECM et valeurs de référence 3333
Logique de diagnostic de bord 3334
Procédure de confirmation de code de défaut (DTC) 3334
Vérification du fonctionnement général 3335
Procédure de diagnostic 3336
DTC P1144 SONDE A OXYGENE CHAUFFE 1 3341
Description des composants 3341
Valeur de référence de CONSULT-II en mode de contrôle de données 3341
Bornes de l'ECM et valeurs de référence 3341
Logique de diagnostic de bord 3342
Procédure de confirmation de code de défaut (DTC) 3342
Vérification du fonctionnement général 3343
Procédure de diagnostic 3344
DTC P1146 SONDE A OXYGENE CHAUFFE 2 3349
Description des composants 3349
Valeur de référence de CONSULT-II en mode de contrôle de données 3349
Bornes de l'ECM et valeurs de référence 3349
Logique de diagnostic de bord 3350
Procédure de confirmation de code de défaut (DTC) 3350
Vérification du fonctionnement général 3351
Schéma de câblage 3353
Procédure de diagnostic 3354
DTC P1147 SONDE A OXYGENE CHAUFFE 2 3360

Numéro de l'outil Nom de l'outil	Description
KV111060S0 Kit de dépose/repose de la pompe à injection de carburant	 NT814

"COUSSIN GONFLABLE" (AIR BAG) du système de retenue supplémentaire (SRS)

Utilisé conjointement avec une ceinture de sécurité, les systèmes de retenue supplémentaire, tel que le "COUSSIN GONFLABLE", permettent de réduire les risques de blessures graves subies par le conducteur et le passager avant dans certains types de collision. La composition du système SRS disponible sur la NISSAN MODELE D22 se présente comme suit (la composition varie selon la destination et l'équipement optionnel):
Module de coussin gonflable côté chauffeur (situés dans le moyeu du volant), un boîtier de capteurs de diagnostic, un témoin d'avertissement, un faisceau de câblage et un câble spiralé.
Les informations nécessaires à l'entretien sans danger du système se trouvent à la **section RS** du Manuel de Réparation D22, Annexe VI.
ATTENTION :

- Pour ne pas affecter le fonctionnement du SRS, ce qui augmenterait les risques de blessures graves ou mortelles en cas de collision entraînant le déploiement de l'airbag, toutes les opérations d'entretien doivent être effectuées par un concessionnaire NISSAN agréé.
- Un entretien inadapté, y compris la dépose et la repose incorrectes du système SRS, peut être à l'origine de blessures physiques causées par le déclenchement intempestif du système. Pour la dépose du câble spiralé et du module d'airbag, se reporter à la section RS.
- Ne pas utiliser d'équipement d'essai électrique sur les circuits connexes au SRS, sauf instructions contraires données dans ce manuel de réparation. Le faisceau de câblage du SRS peut être identifié à l'aide d'un connecteur de faisceau jaune.

"COUSSIN GONFLABLE" (AIR BAG) et "PRETENSIONNEUR DE CEINTURE DE SECURITE" du (SRS)"

NEEC0002

Utilisé conjointement avec une ceinture de sécurité, les systèmes de retenue supplémentaire tels que le "COUSSIN GONFLABLE" et le "PRETENSIONNEUR DE CEINTURE DE SECURITE" permettent de réduire les risques de blessures graves subies par le conducteur et le passager avant dans une collision frontale. La composition du système SRS disponible sur la NISSAN MODELE D22 se présente comme suit (la composition varie selon la destination et l'équipement optionnel.) :
Module de coussin gonflable côté chauffeur (situé dans le moyeu du volant), module de coussin gonflable côté passager avant (sur le tableau de bord du côté passager), prétensionneurs de ceinture de sécurité, boîtier de capteurs de diagnostic, témoin d'avertissement, faisceau de câblage et câble spiralé.
Les informations nécessaires à l'entretien sans danger du système se trouvent à la **section RS** de ce Manuel de Réparation.

ATTENTION :

- **Pour ne pas affecter le fonctionnement du SRS, ce qui augmenterait les risques de blessures graves ou mortelles en cas de collision entraînant le déploiement du coussin gonflable, toutes les opérations d'entretien doivent être effectuées par un concessionnaire NISSAN agréé.**
- **Un entretien inadapté, y compris la dépose et la repose incorrectes du système SRS, peut être à l'origine de blessures physiques causées par le déclenchement intempestif du système. Pour la dépose du câble spiralé et du module d'airbag, se reporter à la section RS.**
- **Ne pas utiliser d'équipement d'essai électrique sur les circuits connexes au SRS, sauf instructions contraires données dans ce manuel de réparation. Le faisceau de câblage du SRS peut être identifié à l'aide d'un connecteur de faisceau jaune.**

Précautions pour le système de diagnostic de bord (OBD) du moteur

NEEC0003

Le boîtier ECM est doté d'un système de diagnostic de bord. Il déclenche l'allumage du témoin de défaut (MI) pour avertir le conducteur d'un dysfonctionnement responsable d'une détérioration de la qualité des gaz d'échappement.

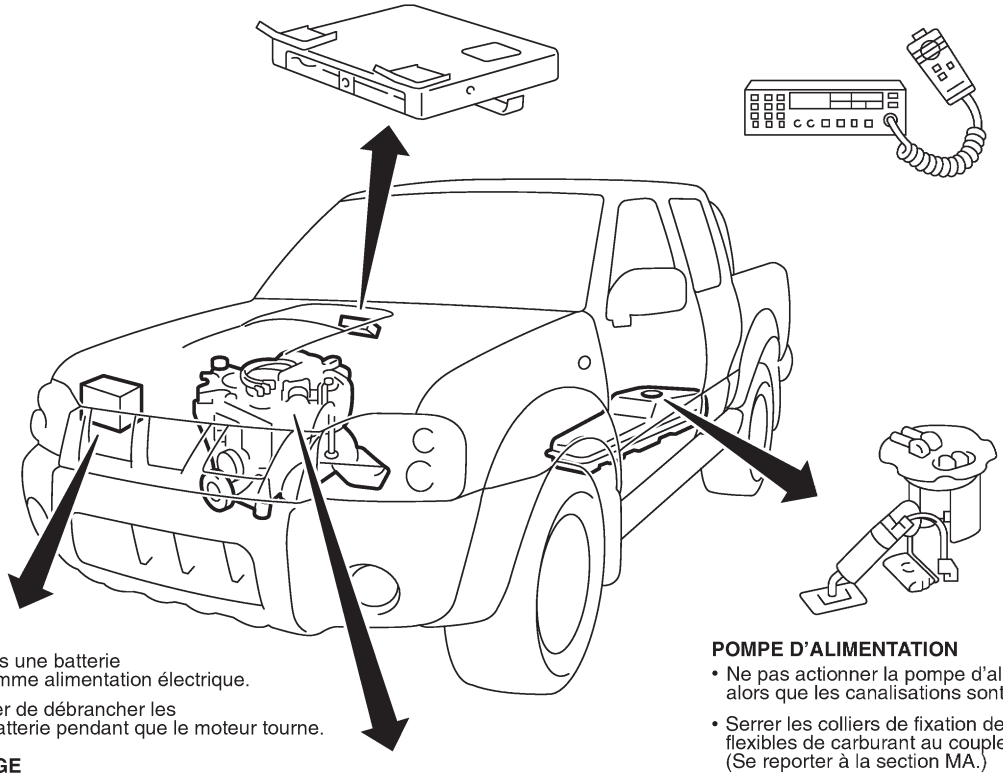
ATTENTION :

- **Veiller à mettre le contact d'allumage sur OFF et à déconnecter la borne négative de la batterie avant de réaliser toute opération de réparation ou d'inspection. La mise en court-circuit ou circuit ouvert des contacts, capteurs, électrovannes, etc. entraîne l'allumage du témoin de défaut (MI).**
- **Veiller à brancher et verrouiller soigneusement les connecteurs après l'opération. Un circuit ouvert dû à un connecteur desserré (déverrouillé) active le témoin lumineux MI. (s'assurer que le connecteur soit exempt d'eau, de graisse, de saleté, de bornes tordues, etc.)**
- **Il est possible que certains systèmes et composants, notamment ceux liés au diagnostic de bord (OBD), utilisent des connecteurs électriques d'un nouveau type, à verrouillage coulissant.**
  Pour leur description et la marche à suivre pour les débrancher, se reporter à la section EL, "CONNECTEUR DE FAISCEAU".
- **Veiller à brancher et verrouiller soigneusement les connecteurs après l'opération. Le frottement d'un faisceau sur un support, par exemple, risque de causer l'allumage du témoin de défaut (MI), suite à l'apparition d'un court-circuit.**
- **Veiller à connecter soigneusement les tuyaux en caoutchouc après l'opération. Un tuyau en caoutchouc mal raccordé entraîne un défaut de fonctionnement du système d'injection de carburant, ou autre, qui active le témoin de défaut MI.**
- **Après réparation, veiller à effacer les codes de défaut de l'ECM avant de restituer le véhicule à son propriétaire.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Alimentation et système antipollution

NEEC0004



ECM

- Ne pas démonter l'ECM.
- Si une borne de la batterie est débranchée, la mémoire revient à la valeur de l'ECM.
  L'ECM lancera alors un autocontrôle à sa valeur initiale. Le fonctionnement du moteur peut varier légèrement lorsque la borne est déconnectée. Ceci ne signifie toutefois pas qu'il y ait un problème. Ne pas remplacer les pièces en cas de variation mineure.

EQUIPEMENT SANS CABLE

- Lors de l'installation d'une radio CB, ou d'un téléphone portable, veiller à respecter les points suivants pour éviter de perturber les systèmes de commande électroniques.

1) Eloigner l'antenne le plus possible des boîtiers de contrôle électroniques.
2) Eloigner le câble d'alimentation de l'antenne de plus de 20 cm des faisceaux électriques des boîtiers électroniques.
   Veiller à ce que cette ligne ne soit jamais parallèle au faisceau sur une grande longueur.
3) Régler l'antenne et la ligne d'alimentation de manière à pouvoir maintenir au plus petit niveau le taux d'onde stationnaire.
4) Veiller à mettre l'autoradio à la masse par rapport à la carrosserie.

BATTERIE

- Utiliser toujours une batterie de 12 volts comme alimentation électrique.
- Ne pas essayer de débrancher les câbles de la batterie pendant que le moteur tourne.

AU DEMARRAGE

- Ne pas enfoncer la pédale d'accélérateur lors du démarrage.
- Immédiatement après le démarrage, ne pas emballer le moteur inutilement.
- Ne pas emballer le moteur avant de couper le contact.

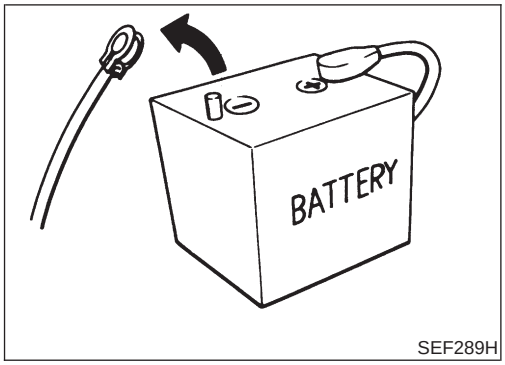
MANIPULATION DU FAISCEAU D'ECM

- Manipuler le débitmètre d'air avec soin pour éviter de le détériorer.
- Ne pas démonter le débitmètre d'air.
- Ne pas nettoyer le débitmètre d'air avec un détergent.
- Ne pas démonter la soupape IACV-AAC.
- Une fuite, même légère, dans le système d'admission d'air peut causer de sérieux problèmes.
- Ne pas cogner ou secouer le capteur de position d'arbre à cames ou le capteur de position de vilebrequin (OBD).

POMPE D'ALIMENTATION

- Ne pas actionner la pompe d'alimentation alors que les canalisations sont vides.
- Serrer les colliers de fixation des conduites flexibles de carburant au couple spécifié. (Se reporter à la section MA.)

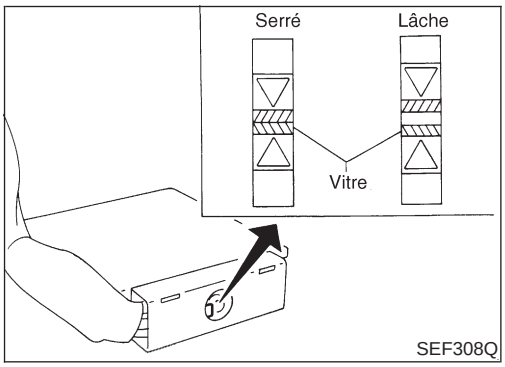
MANIPULATION DU FAISCEAU D'ECM



- Brancher correctement les connecteurs de faisceau d'ECM.
  Une mauvaise connexion peut engendrer de très hautes tensions (afflux) sur la bobine et sur le condensateur, susceptibles par conséquent d'endommager les CI (circuits intégrés).
- Eloigner le faisceau d'ECM de 10 cm au moins des faisceaux électriques adjacents afin d'éviter toute détérioration du système de commande du moteur suite à la réception de parasites externes, un mauvais fonctionnement des CI (circuits intégrés), etc.
- Garder les pièces du système de commande du moteur et les faisceaux secs.
- Avant la dépose de toute pièce, couper le contact et déconnecter le câble de masse de la batterie.

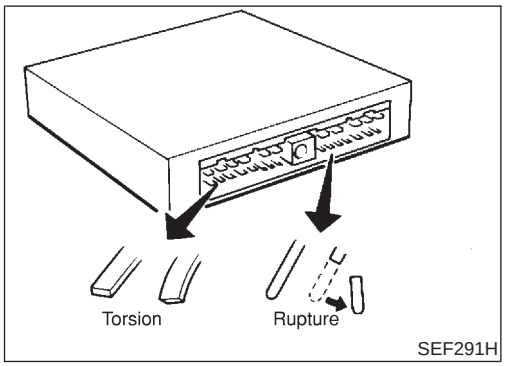
SEC304D

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



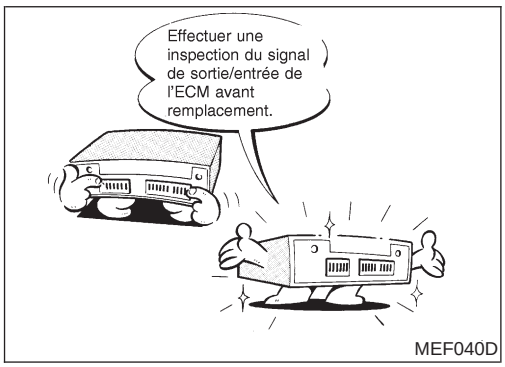
Précautions

NEEC0005



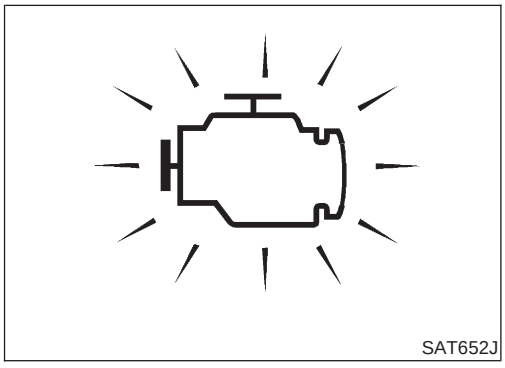
SEF289H

- **Avant de brancher ou de débrancher le connecteur du faisceau de l'ECM, couper le contact et débrancher la borne négative de la batterie. Dans le cas contraire, l'ECM peut être endommagé car la tension de la batterie est appliquée à l'ECM même si le contact d'allumage est coupé.**



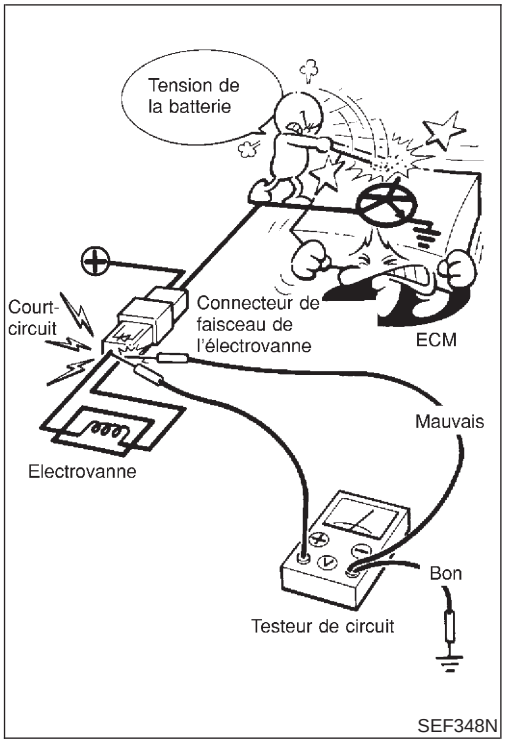
SEF308Q

- **Lors du branchement du connecteur de faisceau de l'ECM, serrer le boulon de fixation jusqu'à ce que l'espace entre les indicateurs oranges disparaisse.**
  : 3 - 5 N·m (0,3 - 0,5 kg-m)



SEF291H

- **Lors du branchement ou du débranchement des connecteurs à broches de l'ECM, veiller à ne pas endommager (tordre ou casser) les bornes à broches.**
  Veiller à ce qu'aucune des bornes à broches de l'ECM ne soit pliée ou cassée au moment de rebrancher les connecteurs à broches.



MEF040D

- **Avant de reposer l'ECM, effectuer une inspection des bornes et des valeurs de référence et s'assurer que l'ECM fonctionne correctement. Consulter la page EC-3118.**

SAT652J

- **Après avoir effectué chaque DIAGNOSTIC DES DEFAUTS, effectuer une ''Procédure de confirmation de DTC (code de défaut de diagnostic)'' ou une ''Vérification du fonctionnement général''.**
  Le DTC ne devrait pas s'afficher dans la ''Procédure de confirmation de DTC'' si la réparation est terminée. La ''Vérification du fonctionnement général'' devrait produire un bon résultat si la réparation a été effectuée.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

- **Lors de la mesure des signaux de l'ECM à l'aide d'un testeur de circuit, ne jamais laisser les deux sondes de testeur se toucher.**
  La mise en contact accidentelle de sondes entraîne un court-circuit et endommage le transistor d'alimentation de l'ECM.
- **Ne pas utiliser de bornes de masse de l'ECM lors de la mesure de la tension d'entrée/de sortie. En agissant de la sorte, il est possible d'endommager le transistor de l'ECM. Utiliser une masse autre que les bornes de l'ECM, comme par exemple la prise de terre.**

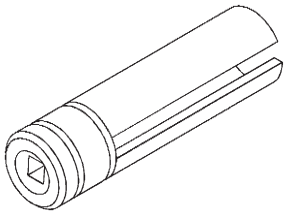
Schémas de câblage et diagnostic des défauts

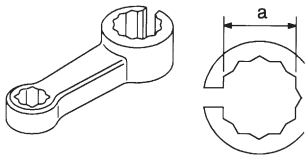
NEEC0006

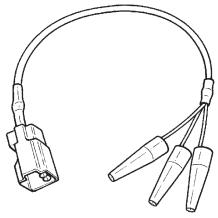
Pour l'étude des schémas de câblage, se reporter aux sections suivantes :

- section GI, ''COMMENT LIRE LES SCHEMAS DE CABLAGE''.
- section EL, ''DISPOSITION DE L'ALIMENTATION ELECTRIQUE''.

Pour le diagnostic des défauts, se reporter aux sections suivantes :







- section GI, ''Comment suivre des groupes de tests dans les diagnostics des défauts''.
- section GI, ''COMMENT EFFECTUER UN DIAGNOSTIC EFFICACE EN CAS D'INCIDENT ELECTRIQUE''

Principe de base du système d'injection multipoint

NEEC0014S02

La quantité de carburant injectée depuis l'injecteur de carburant est déterminée par l'ECM. L'ECM commande la durée d'ouverture de la soupape (durée d'impulsion d'injection). La quantité de carburant injectée est une valeur programmée dans la mémoire de l'ECM. Cette valeur est prédéterminée par les conditions de marche du moteur. Ces conditions sont déterminées par les signaux d'entrée (pour le régime-moteur et l'air d'admission) en provenance du capteur d'angle d'arbre à cames et du débitmètre d'air.

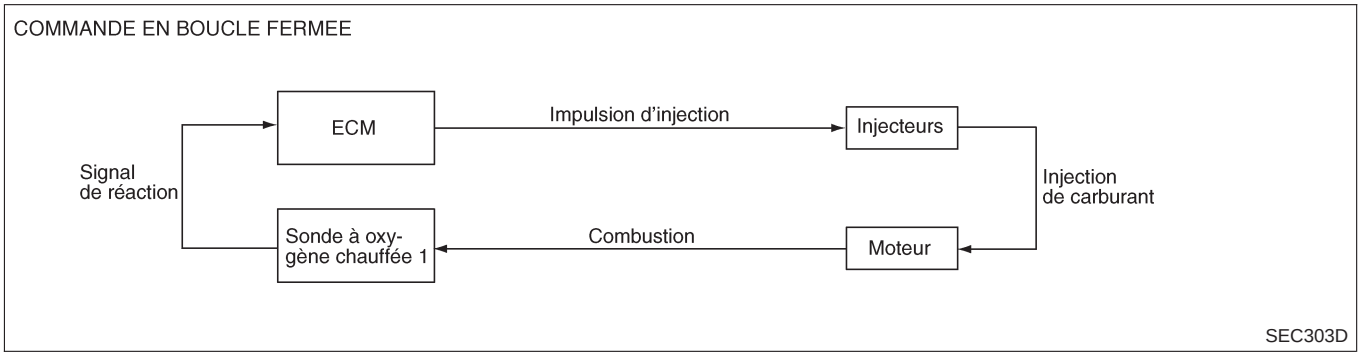
Compensation des variations des valeurs d'injection de carburant

NEEC0014S03

En outre, la quantité de carburant injectée est compensée pour améliorer les performances du moteur dans les différentes conditions de fonctionnement énumérées ci-après.

<Augmentation de la quantité de carburant>

- Pendant la période d'échauffement
- Au démarrage
- Pendant l'accélération
- Lorsque le moteur est chaud
- Fonctionnement à forte charge, à grande vitesse



<Diminution de la quantité de carburant>

- Pendant la décélération
- Lorsque le moteur tourne à haut régime

Commande de régulation automatique de la richesse de mélange (commande en boucle fermée)

NEEC0014S04

Le système de régulation automatique de la richesse de mélange fournit le mélange optimal d'air et de carburant pour améliorer la conduite et le contrôle antipollution. Le catalyseur à trois voies peut mieux réduire les émissions de CO, HC et NOx. Ce système utilise une sonde à oxygène chauffé 1 dans le collecteur d'échappement pour contrôler si le fonctionnement du moteur est riche ou pauvre. L'ECM règle la durée d'impulsion de l'injection en fonction du signal de tension de la sonde. Pour de plus amples informations sur la sonde à oxygène chauffé 1, se reporter à la page EC-3226. La richesse de mélange est ainsi maintenue dans des proportions stoechiométriques (mélange de carburant et d'air idéal).
Cette étape est désignée comme étant la condition de commande en boucle fermée.
La sonde à oxygène chauffé 2 est située en aval du catalyseur à trois voies. Même si les caractéristiques de commutation de la sonde à oxygène chauffé 1 sont modifiées, le rapport air-carburant est contrôlé de manière stœchiométrique par le signal de la sonde à oxygène chauffé 2.

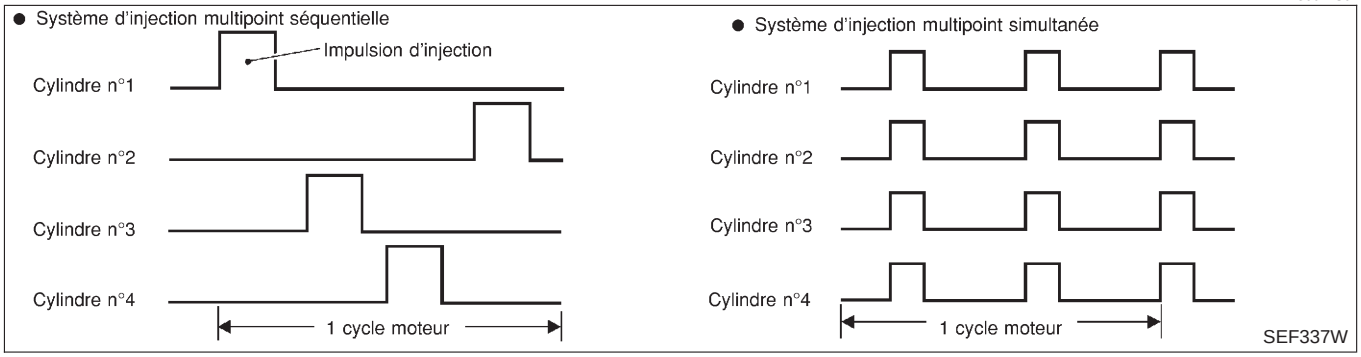
Commande en boucle ouverte

NEEC0014S05

La condition de commande en boucle ouverte se rapporte à la détection de l'une des conditions suivantes par l'ECM. La commande de régulation automatique s'interrompt afin de maintenir une combustion de carburant stabilisée.

- Décélération et accélération
- Fonctionnement à forte charge, à grande vitesse
- Dysfonctionnement de la sonde à oxygène chauffé 1 ou de son circuit
- Activation insuffisante de la sonde à oxygène chauffé 1 à basse température du liquide de refroidissement du moteur
- Température élevée du liquide de refroidissement du moteur
- Pendant la période d'échauffement
- Au démarrage

Commande d'auto-instruction de richesse du mélange



NEEC0014S06

Le système de commande de régulation automatique de la richesse de mélange contrôle le signal de richesse de mélange transmis par la sonde à oxygène chauffé 1. Ce signal de régulation est ensuite transmis à l'ECM. L'ECM règle la richesse de mélange de base le plus près possible de la richesse de mélange théorique. Cependant, la richesse de mélange de base n'est pas nécessairement réglée selon les normes d'origine. Les différences de construction (c.-à-d. le film chaud du débitmètre d'air) et les modifications des caractéristiques lors du fonctionnement (c.-à-d. le colmatage d'un injecteur) affectent directement la richesse de mélange.
En conséquence, ce système contrôle la différence entre la richesse de mélange réelle et la richesse de mélange idéale. Ceci est alors calculé en termes de ''durée d'impulsion d'injection'' pour compenser automatiquement la différence entre les deux richesses.
La ''correction de carburant'' désigne la valeur de compensation du signal de réponse par rapport à la durée d'injection de base. Cette correction peut être une compensation à court terme ou à long terme.
La ''correction de carburant de courte durée'' représente une compensation utilisée pour maintenir le mélange à sa valeur théorique. Le signal émis par la sonde à oxygène chauffé 1 indique si la richesse du mélange est ELEVEE ou FAIBLE par rapport à la valeur théorique. Il déclenche alors une réduction du volume de carburant si le mélange est riche, et un enrichissement s'il est pauvre.
La ''correction de carburant de longue durée'' représente une compensation entretenue pour corriger une dérive permanente de la correction de courte durée par rapport à la valeur centrale. Un tel écart peut se produire du fait de différences entre moteurs, de l'usure due au temps et de changements dans l'environnement d'utilisation.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Avance à l'injection de carburant

NEEC0014S07

Deux types de système sont utilisés.

Système d'injection de carburant multipoint séquentielle

NEEC0014S0701

Le carburant est injecté dans chaque cylindre durant chaque cycle moteur, en fonction de l'ordre d'allumage. Ce système est utilisé lorsque le moteur tourne.

Système d'injection de carburant multipoint simultanée

NEEC0014S0702

Le carburant est injecté simultanément dans les quatre cylindres deux fois par cycle moteur. En d'autres termes, des signaux d'impulsion de même durée sont transmis simultanément par l'ECM.
Les quatre injecteurs reçoivent ainsi les signaux deux fois par cycle moteur.
Ce système est utilisé au démarrage et/ou lorsque le système de sécurité (CPU) est actif.

Coupure de l'alimentation en carburant

NEEC0014S08

L'alimentation de carburant à chaque cylindre est coupée lors de la décélération ou du surrégime.

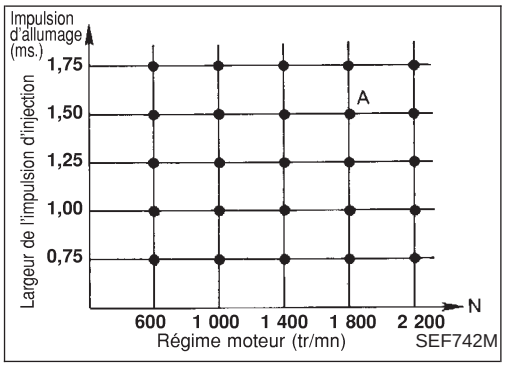
Système d'allumage du distributeur (DI)

DESCRIPTION

NEEC0015

Tableau des signaux d'entrée/de sortie

NEEC0015S01



Capteur	Signal d'entrée à l'ECM	Fonctionnement de l'ECM	Actionneur

Batterie	Tension de la batterie		

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Système d'allumage du distributeur (DI)

Description du système

NEEC0015S02

Le calage de l'allumage est contrôlé par l'ECM de manière à maintenir le meilleur mélange air-carburant dans toutes les conditions de marche du moteur. Les données de calage de l'allumage sont mémorisées dans l'ECM. Ces données sont représentées sur le schéma ci-dessus.
L'ECM reçoit un certain nombre d'informations telles la durée des impulsions d'injection ainsi que les signaux transmis par le capteur de position d'arbre à cames. A partir de ces informations, des signaux d'allumage sont transmis au transistor d'alimentation.
par exemple, N : 1,800 tr/mn, Impulsion d'allumage : 1,50 ms
A°APMH
Dans les circonstances suivantes, l'ECM révise le calage de l'allumage en fonction des autres informations qui se trouvent dans sa mémoire.

- Au démarrage
- Pendant la période d'échauffement
- Au ralenti
- A la tension de la batterie faible
- Pendant l'accélération

Le système de retardement du capteur de détonation n'est conçu que pour fonctionner en cas d'urgence. Le calage de l'allumage de base est programmé dans la zone anti-détonation, à condition que le carburant recommandé soit utilisé par temps sec. Le système de retard ne fonctionne pas dans des conditions de conduite normale.
En cas de détonation du moteur, le capteur de détonation contrôle les circonstances. Le signal est envoyé à l'ECM. L'ECM retarde le calage de l'allumage pour éliminer la circonstance ayant causé la détonation.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Commande de coupure du climatiseur

DESCRIPTION

=NEEC0016

Tableau des signaux d'entrée/ sortie

NEEC0016S01

Capteur	Signal d'entrée à l'ECM	Fonctionnement de l'ECM	Actionneur
Interrupteur de climatiseur	Signal ''ON' du climatiseur	Commande de coupure du climatiseur	Relais de climatiseur
Capteur d'ouverture de papillon	Angle d'ouverture du papillon		
Capteur d'angle d'arbre à cames	Régime-moteur		
Capteur de température du liquide de refroidissement du moteur	Température du liquide de refroidissement du moteur		
Contact d'allumage	Signal de démarrage		
Capteur de vitesse du véhicule	Vitesse du véhicule		
Manocontact d'huile de direction assistée	Fonctionnement de la direction assistée		

Description du système

NEEC0016S02

Ce système permet d'améliorer le fonctionnement du moteur pendant le fonctionnement du climatiseur.
Le climatiseur s'éteint dans les conditions suivantes.

- Pédale d'accélérateur enfoncée au maximum.
- A l'actionnement du démarreur.
- Lorsque le liquide de refroidissement atteint une température excessive.
- Lors de l'utilisation de la direction assistée et du climatiseur à faible régime-moteur ou en relâchant complètement l'accélérateur.
- Lorsque le régime-moteur est excessivement bas.

Commande de coupure de l'alimentation en carburant (à vide et à régime-moteur élevé)

DESCRIPTION

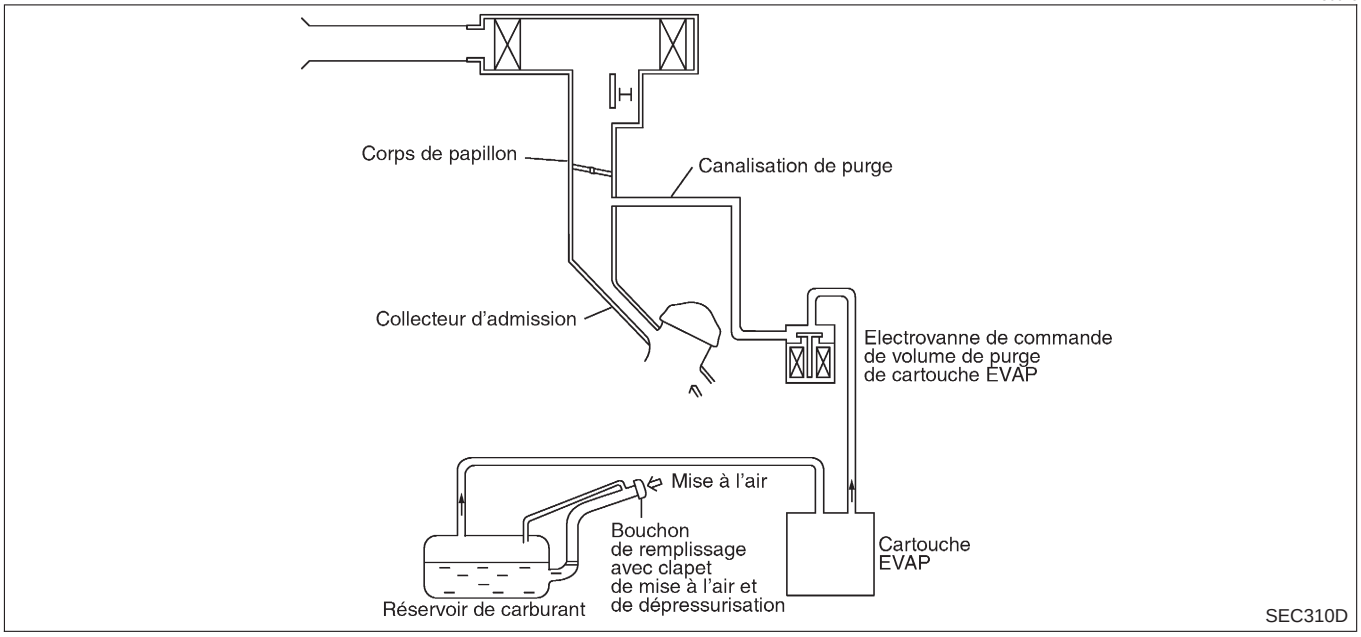
NEEC0017

Tableau des signaux d'entrée/de sortie

NEEC0017S01

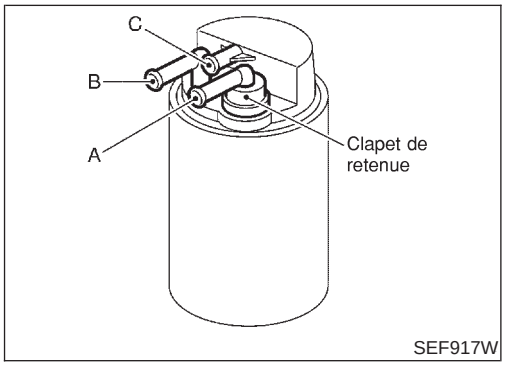
Capteur	Signal d'entrée à l'ECM	Fonctionnement de l'ECM	Actionneur
Capteur de vitesse du véhicule	Vitesse du véhicule	Commande de coupure de l'alimentation en carburant	Injecteurs
Contact de stationnement/point mort (PNP)	Position de point mort		
Capteur d'ouverture de papillon	Position de papillon		
Capteur d'angle d'arbre à cames	Régime-moteur		

Si le régime moteur dépasse 3 000 tr/mn à vide (par exemple, au point mort et régime supérieur à 3 000 tr/mn), l'alimentation en carburant est coupée au bout de quelques instants. Le moment exact de la coupure d'alimentation varie selon le régime-moteur.
La coupure d'alimentation est maintenue jusqu'à ce que le régime-moteur retombe à 1 500 tr/mn, point auquel la coupure d'alimentation est annulée.



REMARQUE :
Cette fonction diffère de la commande de décélération décrite au chapitre ''Système d'injection multipoint (MFI)'' à la page EC-3025.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Système de contrôle des évaporations de carburant

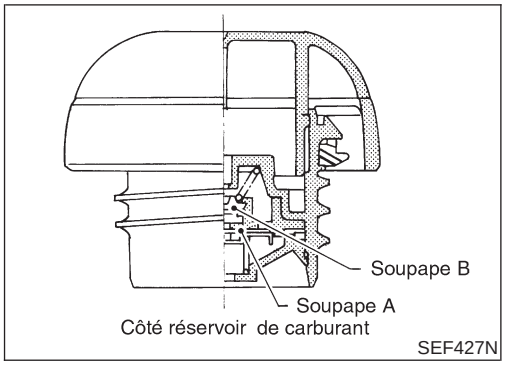
DESCRIPTION

=NEEC0018

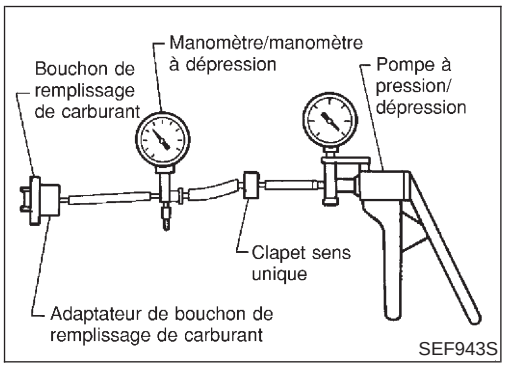
Le système de contrôle des évaporations de carburant est utilisé pour réduire les vapeurs d'hydrocarbure émises dans l'atmosphère par le système d'alimentation. Les vapeurs d'hydrocarbures sont réduites grâce à l'activation des charbons qui se trouvent dans la cartouche EVAP.
Les vapeurs de carburant issues du réservoir étanche sont transférées dans la cartouche EVAP, laquelle contient des charbons actifs, et y sont emmagasinées lorsque le moteur est arrêté ou lorsque le plein du réservoir est fait.
Lorsque le moteur tourne, les vapeurs emmagasinées dans la cartouche EVAP sont purgées par l'air et passent dans le collecteur d'admission via la canalisation sous l'effet de la dépression.
L'électrovanne de commande de volume de purge de cartouche EVAP est contrôlée par l'ECM. Quand le moteur tourne, la quantité de vapeur contrôlée par l'électrovanne de commande de volume de purge de cartouche EVAP est régulée proportionnellement à l'augmentation du débit d'air.
L'électrovanne de commande de volume de purge de cartouche EVAP ferme également la canalisation de purge à la décélération et au ralenti.

INSPECTION

NEEC0019



Cartouche EVAP



NEEC0019S01

Contrôler la cartouche EVAP comme suit :

1. Bloquer l'orifice B. Souffler par l'orifice A et vérifier que l'air passe sans encombre par l'orifice C avec la résistance du clapet de retenue.
2. Bloquer l'orifice A. Souffler par l'orifice B et vérifier que l'air passe sans encombre par l'orifice C.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Soupape de décharge de dépression du réservoir à carburant (intégrée au bouchon de remplissage de carburant)

NEEC0019S03

1. Nettoyer soigneusement le logement de la soupape.
2. Contrôler la pression d'ouverture de la soupape et la dépression.

   Pression :

   16,0 - 20,0 kPa (0,16 - 0,20 bar, 0,163 - 0,204 kg/cm^2)

   Dépression :

   -6,0 à -3,5 kPa (-0,06 à -0,35 bar, -0,061 à -0,036 kg/cm^2)
3. Si les données sont hors spécification, remplacer le bouchon de remplissage de carburant comme un ensemble.

ATTENTION :

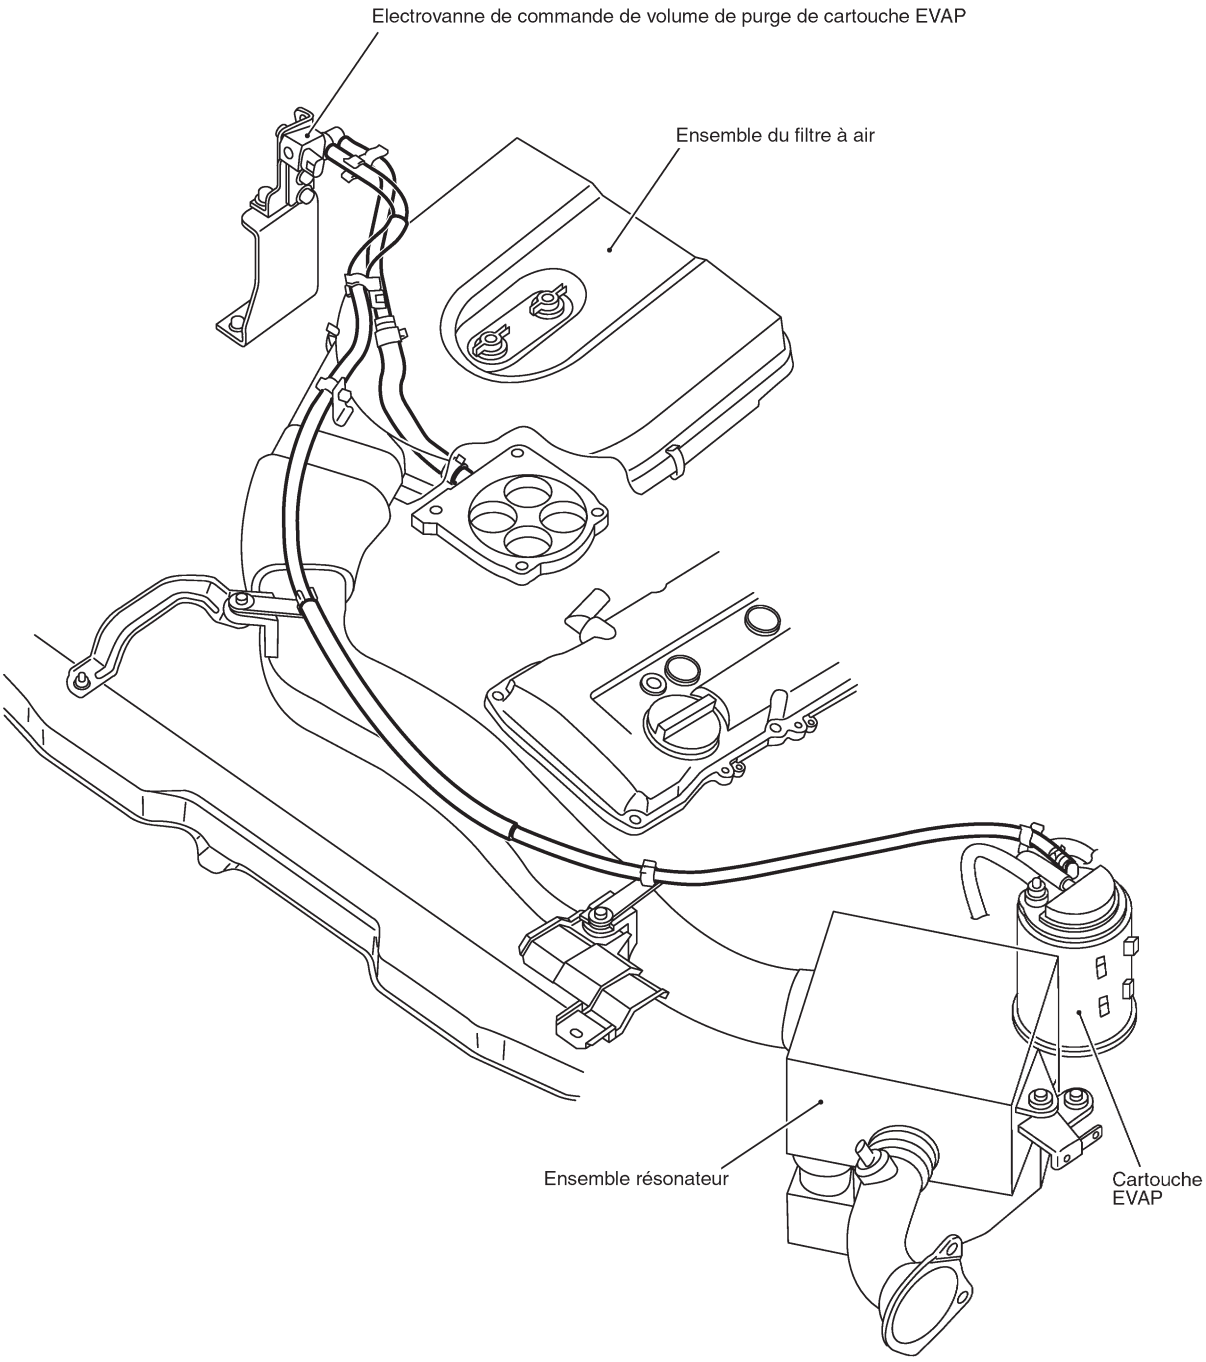
Utiliser uniquement un bouchon de remplissage du réservoir à carburant NISSAN d'origine comme pièce de rechange. Si un bouchon de remplissage du réservoir à carburant incorrect est utilisé, le MI peut s'allumer.

Electrovanne de commande de volume de purge de cartouche d'évaporations de carburant (EVAP)

NEEC0019S06

Consulter la page EC-3300.

Contrôler les canalisations d'évaporation EVAP



NEEC0019S13

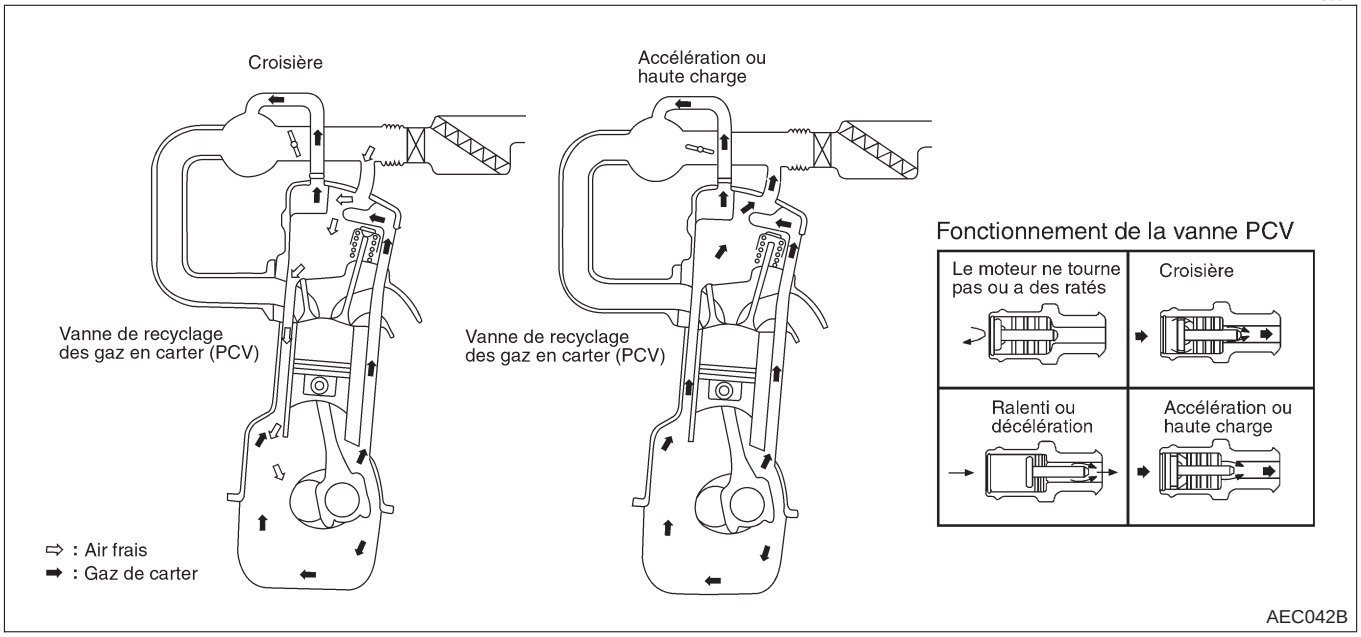
1. Inspecter visuellement les canalisations d'évaporation pour détecter d'éventuelles fuites, fissures, dommages, raccords desserrés, traces de frottements et de détérioration.
2. Vérifier si la soupape de décharge de dépression se trouvant sur le bouchon de remplissage du réservoir à carburant n'est pas bouchée, collée, etc. Se reporter à la page EC-3031.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SCHÉMA DU CIRCUIT D'ÉVAPORATION DE CARBURANT

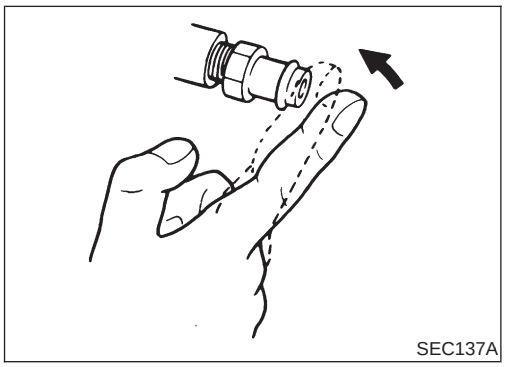
=NEEC0020

REMARQUE :
L'utilisation d'eau savonneuse ou de solvant est à proscrire pendant l'installation des flexibles de dépression ou de purge.



SEC266D

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Recyclage des gaz du carter

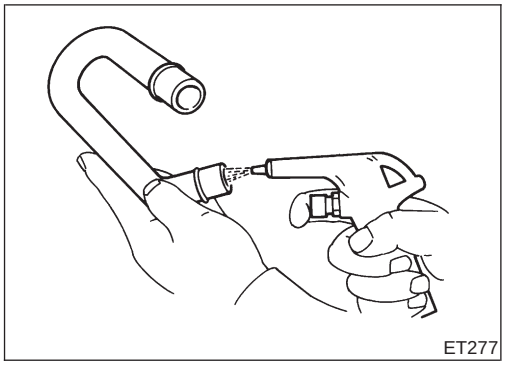
DESCRIPTION

NEEC0022

Ce système renvoie les gaz du carter vers le collecteur d'admission.
La soupape de recyclage des gaz du carter (PCV) permet d'acheminer les gaz du carter au collecteur d'admission.
Durant le fonctionnement du moteur, lorsque le papillon est partiellement ouvert, le collecteur d'admission aspire les gaz du carter par la soupape PCV.
En condition normale, la soupape a une capacité suffisante pour aspirer tous les gaz du carter ainsi qu'une petite quantité d'air de ventilation.
L'air de ventilation est alors aspiré du conduit d'air dans le carter. Durant cette opération, l'air passe à travers le flexible qui raccorde les conduites d'admission au cache-culbuteurs.
Quand le papillon est grand ouvert, le niveau de dépression à l'intérieur du collecteur est insuffisant pour aspirer les gaz du carter par la soupape. Les gaz traversent donc le raccord de flexible dans le sens opposé.
Sur les véhicules présentant une quantité excessive de gaz de carter, la soupape n'est pas suffisante pour le déroulement normal de l'opération. Ceci est dû au fait que, quelles que soient les conditions de fonctionnement, une partie des gaz traverse le raccord de flexible et va au collecteur d'admission.

INSPECTION

NEEC0023



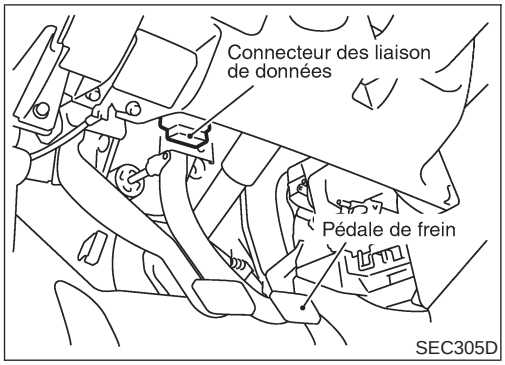
Soupape PCV (recyclage des gaz du carter)

NEEC0023S01

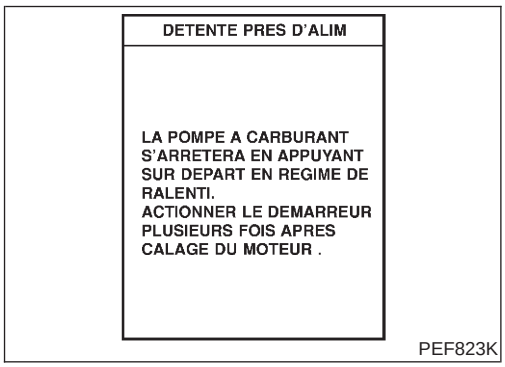
Le moteur tournant au ralenti, déposer la soupape PCV du séparateur de reniflard. Une soupape en bon état émet un sifflement lors du passage de l'air. Une forte succion doit être ressentie immédiatement lorsque l'on place un doigt sur l'orifice d'admission de la soupape.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

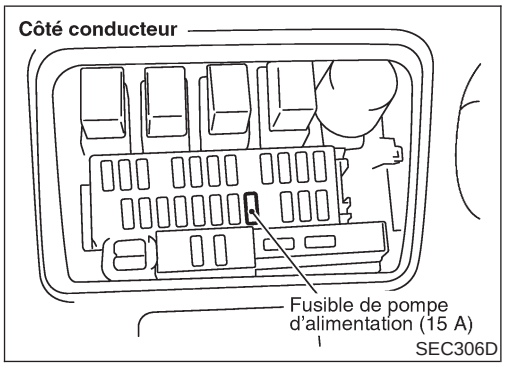
Recyclage des gaz du carter



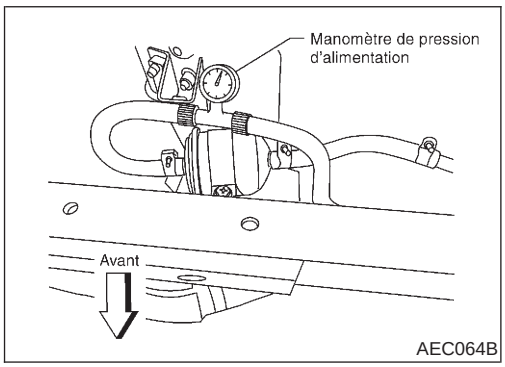
ET277



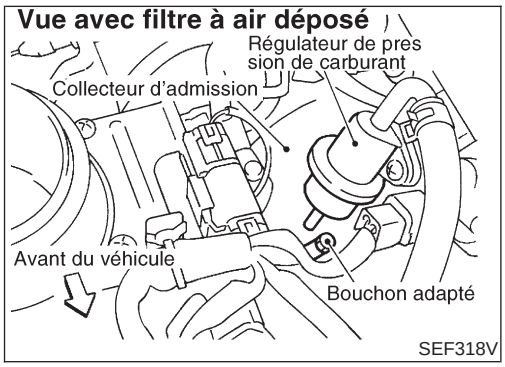
Flexible de ventilation



NEEC0023S02



1. Contrôler les flexibles et les raccords de flexible pour déceler toute présence de fuites.
2. Débrancher tous les flexibles et les nettoyer à l'air comprimé. Remplacer tous les flexibles qui ne peuvent pas être débouchés.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Détente de la pression de carburant

NEEC0024

Avant de déconnecter les flexibles d'alimentation, toujours relâcher la pression de carburant pour éliminer les risques d'accident.

AVEC CONSULT-II

NEEC0024S01

1. Démarrer le moteur.
2. Exécuter ''DETENTE PRES D'ALIM'' avec CONSULT-II en mode ''SUPPORT TRAVAIL''.
3. Après que le moteur a calé, le relancer deux ou trois fois afin de dépressuriser le carburant.
4. Mettre le contact d'allumage sur OFF.

SANS CONSULT-II

NEEC0024S02

1. Déposer le fusible de pompe à carburant.
2. Démarrer le moteur.
3. Après que le moteur a calé, le relancer deux ou trois fois afin de dépressuriser le carburant.
4. Couper le contact d'allumage et raccorder le fusible de pompe à carburant.

Contrôle de la pression de carburant

NEEC0025

- **Toujours utiliser des colliers neufs pour rebrancher une canalisation d'alimentation.**
- **Veiller à ce que la vis de collier n'entre pas en contact avec des pièces voisines.**
- **Utiliser un tournevis dynamométrique pour serrer les colliers.**
- **Utiliser un manomètre pour contrôler la pression du carburant.**
- **Ne pas contrôler la pression de carburant lorsque le système est en marche : l'indication donnée par le manomètre de pression de carburant pourrait être erronée.**

1. Relâcher la pression de carburant jusqu'à zéro.
2. Déconnecter le flexible d'alimentation entre le filtre et le tuyau de carburant (côté moteur).
3. Poser le manomètre entre le filtre et le tuyau de carburant.
4. Démarrer le moteur et vérifier s'il n'y a pas de fuites de carburant.
5. Lire la valeur indiquée par le manomètre.

   Au ralenti :

   Avec le flexible à dépression connecté

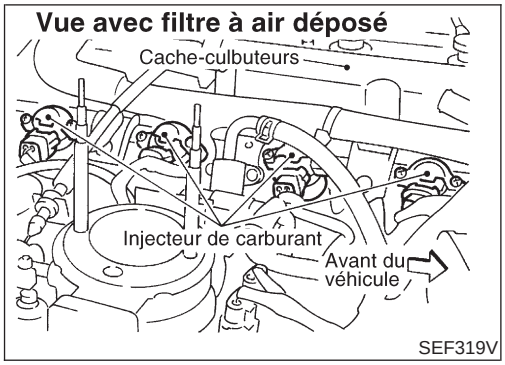
   Approximativement 235 kPa (2,35 bar, 2,4 kg/cm^2)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

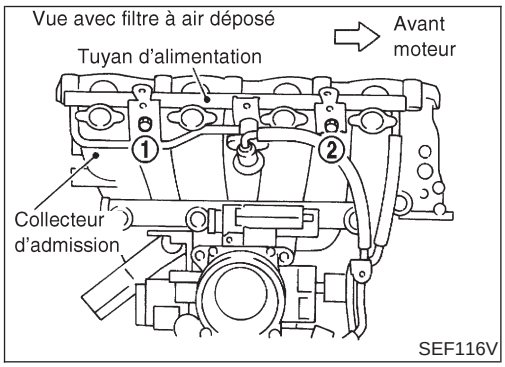
Avec le flexible à dépression déconnecté

Approximativement 294 kPa (2,94 bar, 3,0 kg/cm^2)

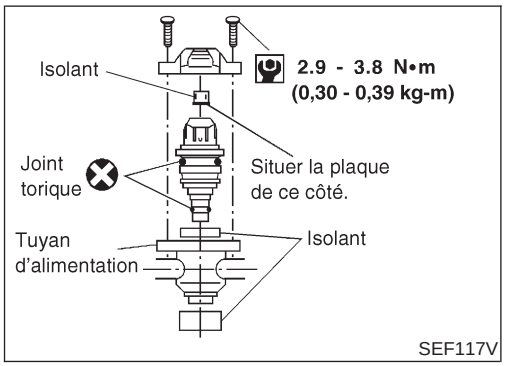
Si les résultats ne sont pas satisfaisants, procéder à la "Vérification du régulateur de pression de carburant, page EC-3036.



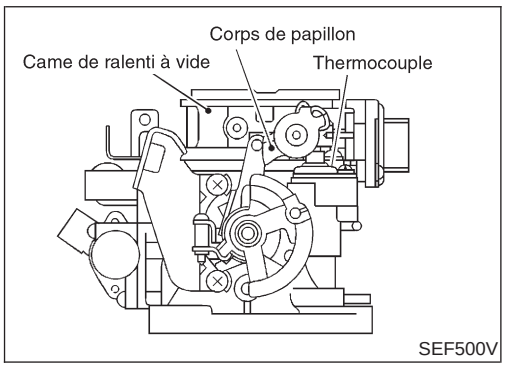
Vérification du régulateur de pression de carburant



NEEC0026



1. Arrêter le moteur et déconnecter le flexible à dépression du régulateur de pression de carburant du collecteur d'admission.
2. Boucher le collecteur d'admission avec un bouchon de caoutchouc.
3. Connecter une source de dépression variable au régulateur de pression de carburant.
4. Démarrer le moteur et lire la valeur indiquée par le manomètre au moment où la dépression change.



La pression du carburant doit diminuer parallèlement à l'augmentation de la dépression. Si les résultats ne sont pas satisfaisants, remplacer le régulateur de pression de carburant.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Injecteur

DÉPOSE ET REPOSE

NEEC0027

1. Relâcher la pression de carburant jusqu'à zéro.
2. Déposer l'ensemble de tuyaux d'injecteur avec les injecteurs du collecteur d'admission.
3. Déposer les injecteurs de l'ensemble de tuyaux d'injecteur.

- Pousser l'extrémité de l'injecteur.
- Ne pas tirer sur le connecteur.

4. Poser l'injecteur sur l'ensemble du tuyau de carburant.

a. Nettoyer la partie extérieure de l'extrémité de l'injecteur.
b. Utiliser des joints toriques neufs.

Toujours remplacer les joints toriques par des joints neufs.
Graisser les joints toriques avec une petite quantité d'huile moteur.

5. Reposer les injecteurs avec l'ensemble du tuyau de carburant sur le collecteur d'admission.
   Serrer dans l'ordre numérique indiqué sur la figure.

a. D'abord).
b. Ensuite).

6. Reposer les flexibles d'alimentation sur l'ensemble du tuyau de carburant.
7. Reposer tous les composants déposés dans l'ordre inverse de la repose.

ATTENTION :
Après repose des injecteurs dans l'ensemble tuyaux de carburant, vérifier l'étanchéité.

Came de ralenti accéléré (FIC)

DESCRIPTION DES COMPOSANTS

NEEC0502

Le FIC est monté sur le corps du papillon afin de maintenir un régime-moteur adéquat lorsque le moteur est froid. Il est commandé par la variation du volume de la cire située dans l'élément thermique. L'élément thermique est commandé par la température du liquide de refroidissement du moteur.
Pour inspection, se reporter à ''DIAGNOSTIC DES DEFAUTS-GENERALITES'', ''Inspection de base'', à la page EC-3092.

Réglage du régime de ralenti/calage d'allumage/richesse de mélange de ralenti

NEEC0028

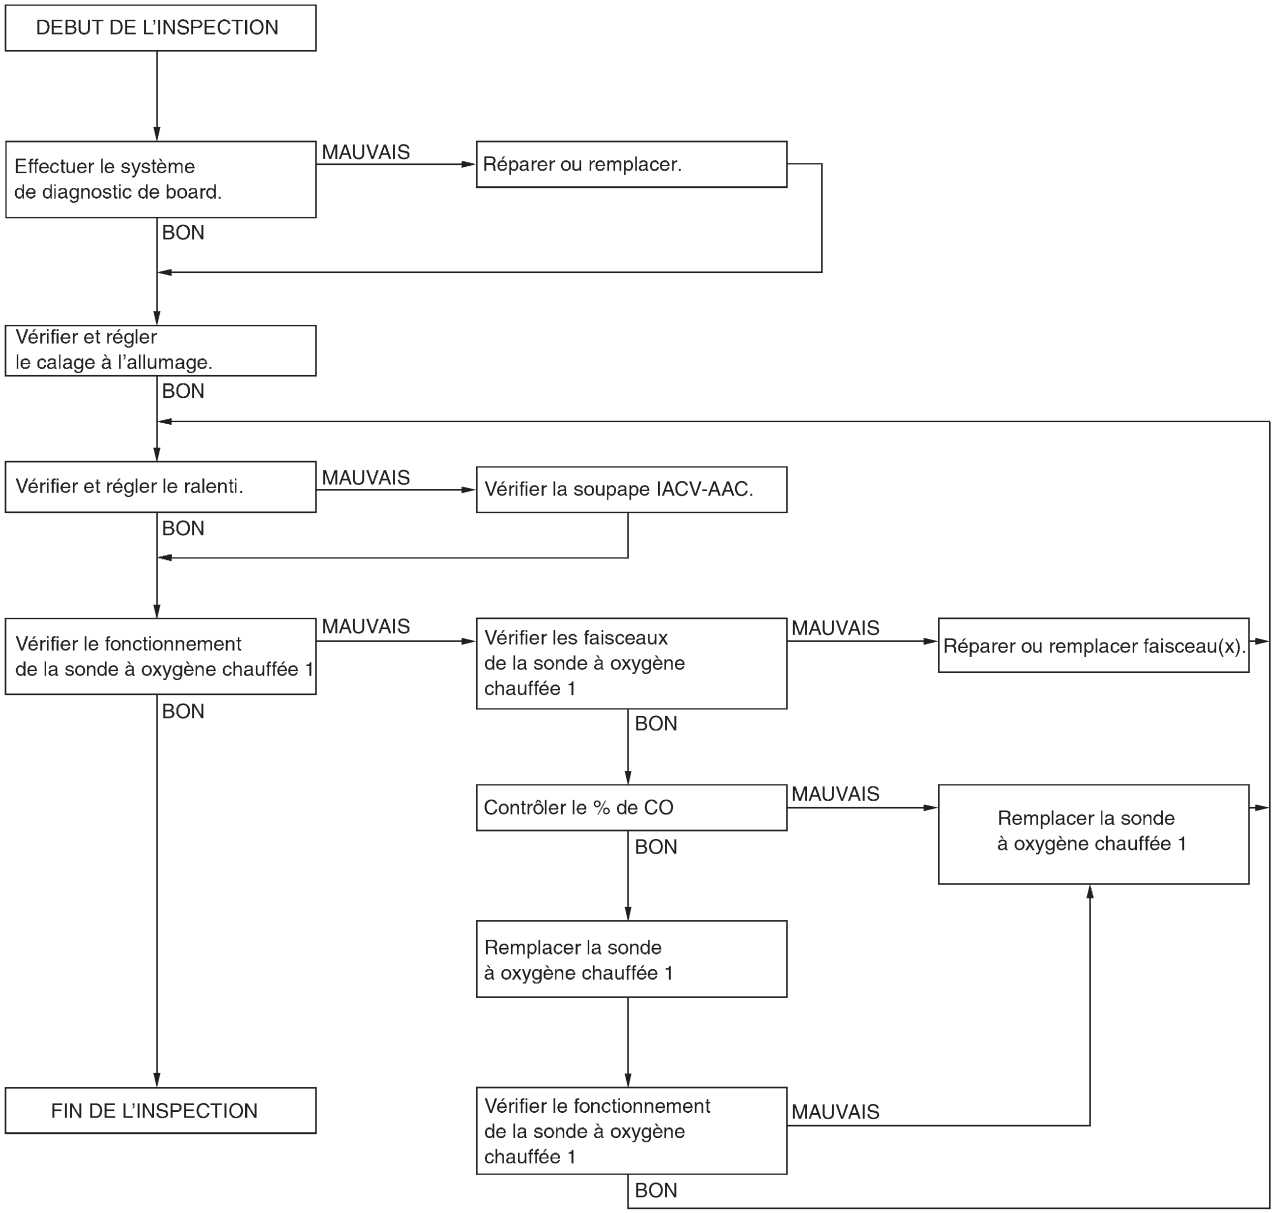
NEEC0028S05

PRÉPARATION

- **S'assurer que les pièces suivantes sont en bon état.**

a) **Batterie**
b) **Système d'allumage**
c) **Niveaux d'huile moteur et de liquide de refroidissement**
d) **Fusibles**
e) **Connecteur de faisceau de l'ECM**
f) **Flexibles de dépression**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



g) **Système d'admission d'air (bouchon de remplissage d'huile, jauge de niveau d'huile, etc.)**
h) **Pression de carburant**
i) **Compression du moteur**
j) **Soupape de papillon**
k) **Système EVAP**

- **Sur les modèles équipés d'un climatiseur, effectuer les contrôles lorsque le climatiseur est sur ''OFF''.**
- **Pour mesurer le pourcentage de CO, insérer la sonde sur plus de 40 cm dans la conduite arrière d'échappement.**
- **Eteindre les phares et arrêter la soufflerie de chauffage.**
- **Aligner les roues avant en position de marche en ligne droite.**

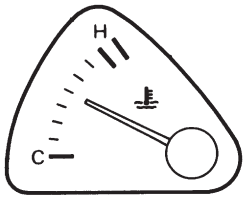
Réglage du régime de ralenti/calage d'allumage/richesse de mélange de ralenti



PROCÉDURE D'INSPECTION

=NEEC0028S02

1	DEBUT DE L'INSPECTION

1. Contrôler visuellement les points suivants :
- Filtre à air bouché
- Etanchéité des flexibles et du conduit
- Connecteurs électriques
- Joint d'étanchéité (collecteur d'admission, tête de cylindre, système d'échappement)
- Fonctionnement du papillon et du capteur de position de papillon

2. Démarrer le moteur et le laisser chauffer jusqu'à ce que l'indicateur de température du liquide de refroidissement du moteur soit au milieu du cadran de la jauge.
   S'assurer que le régime-moteur reste inférieur à 1 000 tr/mn.

SEF810K

3. Ouvrir le capot et faire tourner le moteur à environ 2 000 tr/mn pendant environ 2 minutes à vide.
4. S'assurer qu'aucun DTC ne s'affiche à l'aide de CONSULT-II ou de l'analyseur générique DTS.

- **Si le véhicule contient une pièce fonctionnant hors des limites de conception spécifiées et que le MI ne s'allume pas, la pièce ne doit pas être remplacée avant que le test d'émissions ne soit effectué, à moins qu'il ait été déterminé que la pièce en question a été modifiée ou manipulée de telle sorte que le diagnostic n'est plus en mesure de détecter le dysfonctionnement qui en résulte.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Introduction

NEEC0029

L'ECM est équipé d'un système de diagnostic de bord qui détecte les défauts liés aux capteurs et aux actionneurs du moteur. En outre, l'ECM enregistre diverses informations de diagnostic liées au système antipollution, y compris :

Code de défaut de diagnostic (DTC)	Mode 3 de l'ISO 15031-5
Données figées	Mode 2 de l'ISO 15031-5
Code de test de lecture du système (SRT)	Mode 1 de l'ISO 15031-5
Code de défaut de diagnostic de 1er parcours (DTC de 1er parcours)	Mode 7 de l'ISO 15031-5
Données figées de 1er parcours	
Valeurs et limites de test	Mode 6 de l'ISO 15031-5
Codes d'identification d'étalonnage	Mode 9 de l'ISO 15031-6

Les informations énumérées ci-dessus peuvent être contrôlées en effectuant les procédures indiquées dans le tableau suivant.

X : Applicable —: Non applicable

	DTC	DTC de 1er parcours	Données figées	Données figées de 1er parcours	Code SRT	Valeur de test
CONSULT-II	X	X	X	X	X	—
GST	X	X*1	X	—	X	X

*1: DTC de 1er parcours pour les autodiagnostics concernant les éléments SRT ne peuvent pas être affichés sur l'écran GST.

Le témoin de défaut (MI) situé sur le tableau de bord s'allume lorsque le même défaut est détecté à l'occasion de deux parcours consécutifs (logique de détection de deux parcours), ou lorsque l'ECM se met en mode de sécurité Se reporter à EC-3107.)

Logique de détection de deux parcours

NEEC0030

Lorsqu'un défaut est détecté pour la première fois, le DTC de 1er parcours et les données figées de 1er parcours sont mémorisés par l'ECM. Le témoin MI ne s'allume pas à cette étape. <1er parcours>
Si le même défaut est à nouveau détecté lors du parcours suivant, le DTC et les données figées sont enregistrés dans la mémoire de l'ECM, et le témoin MI s'allume. Le témoin MI s'allume lorsque le DTC est enregistré. <2eme parcours> Le ''parcours'' dans la ''Logique de détection de deux parcours'' correspond à un mode de conduite dans lequel un autodiagnostic est mené pendant que le véhicule roule. Certains défauts détectés par le diagnostic de bord entraînent l'allumage ou la mise en clignotement du témoin MI par l'ECM et la mémorisation du code de défaut et des données figées et ce, dès le premier parcours, comme détaillé ci-après.

Informations de diagnostic de dépollution

NEEC0031

DTC ET DTC DE 1ER PARCOURS

NEEC0031S01

Le DTC de 1er parcours (de numéro identique à celui du DTC) s'affiche en fonction du dernier résultat d'autodiagnostic obtenu. Si la mémoire de l'ECM a été effacée précédemment, et si le DTC de 1er parcours ne s'est pas représenté, le DTC de 1er parcours ne s'affiche pas. Lorsqu'un défaut est détecté pour la première fois, le DTC de 1er parcours et les données figées de 1er parcours sont mémorisés par l'ECM. Le témoin MI ne s'allume pas à cette étape (logique de détection de deux parcours). Si le même défaut n'est pas détecté lors du 2ème parcours (avec les conditions de conduite requises), le DTC de 1er parcours est effacé de la mémoire de l'ECM. Si le même défaut est détecté lors du 2ème parcours, le DTC de 1er parcours ainsi que le DTC sont enregistrés dans la mémoire de l'ECM et le témoin MI s'allume. En d'autres termes, le DTC est enregistré dans la mémoire de l'ECM et le témoin MI s'allume lorsque le même défaut se produit lors de 2 parcours consécutifs. Si le DTC de 1er parcours est mémorisé et si une opération ne relevant pas du diagnostic est effectuée entre le 1er et le 2ème parcours, seul le DTC de 1er parcours subsiste en mémoire. Pour les défauts provoquant l'allumage ou le clignotement du témoin MI dès le 1er parcours, le DTC et le DTC de 1er parcours sont mémorisés par l'ECM.

Les procédures pour effacer le DTC et le DTC de 1er parcours de la mémoire de l'ECM sont décrites dans ''Comment effacer les codes de diagnostic de dépollution''. Se reporter à EC-3064.

Pour les anomalies pour lesquelles des DTC de 1er parcours sont affichés, se reporter à la page EC-3062.

Ces éléments sont requis par des régulations légales afin de contrôler continuellement le système/composant. En outre, les paramètres testés de manière non permanente sont également affichés sur CONSULT-II.

Le DTC de 1er parcours est spécifié dans le mode 7 de ISO 15031-5. La détection du DTC du 1er parcours n'entraîne pas l'allumage du témoin de défaut MI ; le conducteur n'est donc pas averti de la présence d'un problème. Cependant, la détection du DTC de 1er parcours n'empêche pas le véhicule d'être testé, par exemple pendant les tests d'Inspection/Entretien (I/E).

Lorsqu'un DTC de 1er parcours est détecté, vérifier, imprimer ou consigner par écrit, puis effacer le DTC (de 1er parcours) et les données figées conformément aux instructions de la ''Procédure de travail'', Etape II, détaillée page EC-3090. Effectuer ensuite une ''Procédure de confirmation de DTC'' ou une ''Vérification du fonctionnement général'' pour tenter de faire resurgir le problème. Si le problème se reproduit, l'élément nécessite une réparation.

Comment lire le DTC et le DTC de 1er parcours

NEEC0031S0101

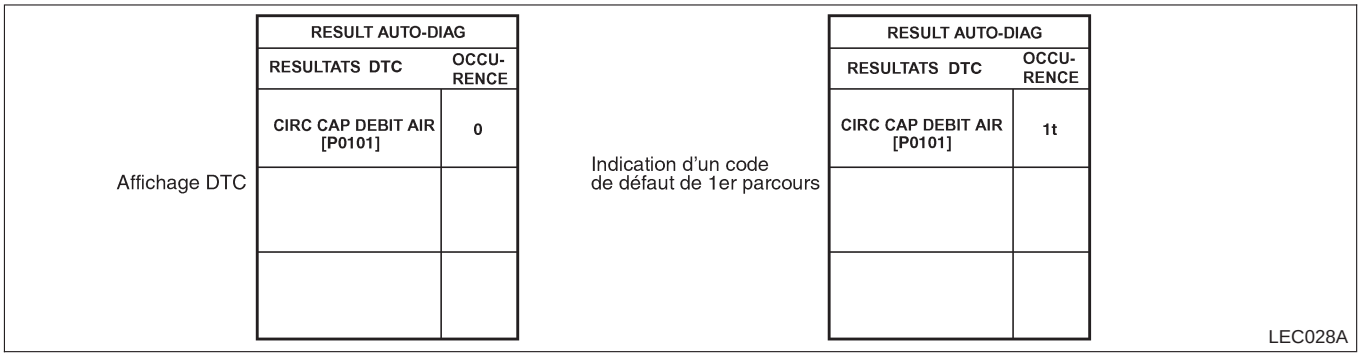
Les méthodes suivantes permettent la lecture des DTC et des DTC de 1er parcours.

Avec CONSULT-II

Avec l'analyseur générique GST

CONSULT-II ou GST (analyseur générique) Exemples : P0340 etc.

Ces codes de défaut sont prescrits par la norme ISO15031-5.



(CONSULT-II indique également le système ou la pièce défectueuse)

- **Numéro de code de défaut de 1er parcours identique au numéro de code de défaut.**
- **L'affichage d'un DTC indique un défaut. Cependant l'analyseur générique GST n'indique pas si ce défaut est toujours présent ou s'il s'est produit dans le passé et n'est plus d'actualité. CONSULT-II a la capacité d'identifier la nature du défaut comme indiqué ci-après. C'est pourquoi il est vivement conseillé de l'utiliser (si on en dispose).**

L'illustration ci-dessous montre l'affichage d'un DTC par CONSULT-II. Le DTC ou le DTC de 1er parcours d'un défaut s'affiche dans le mode RESULT AUTO-DIAG de CONSULT-II. Le paramètre d'occurrence indique combien de fois le véhicule a été conduit après la dernière détection du DTC.

Si le DTC est détecté au moment du diagnostic, le paramètre est égal à ''0''.

Si un DTC de 1er parcours a été enregistré dans la mémoire de l'ECM, le paramètre est égal à ''[1t]''.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

DONNÉES FIGÉES ET DONNÉES FIGÉES DE 1ER PARCOURS

NEEC0031S02

L'ECM enregistre les conditions de conduite telles que le statut du système d'alimentation, la valeur de charge calculée, la température du liquide de refroidissement du moteur, la correction de carburant à court et long terme, le régime-moteur, la vitesse du véhicule, l'ouverture de la soupape de papillon, le programme de carburant de base et la température de l'air d'admission au moment où un défaut est détecté.
Les données mémorisées par l'ECM en même temps que le DTC de 1er parcours sont appelées données figées de 1er parcours. Les données mémorisées en même temps que le DTC sont appelées données figées et sont affichées par CONSULT-II ou par l'analyseur générique GST. Les données figées de 1er parcours ne peuvent être affichées que par CONSULT-II et non par l'analyseur générique GST. Pour plus de détails, se reporter à la page EC-3078.
Un seul ensemble de données figées (les données figées de 1er parcours ou les données figées) peut être mémorisé par l'ECM. Les données figées de 1er parcours sont mémorisées par l'ECM en même temps que le DTC de 1er parcours. Les données figées de 1er parcours ne sont pas classées par priorité et sont mises à jour chaque fois qu'un DTC de 1er parcours est détecté. En revanche, dès lors que les données figées (détection de 2ème parcours/allumage du témoin MI) sont mémorisées par l'ECM, les données figées de 1er parcours sont automatiquement effacées. Ne pas oublier que l'ECM ne peut mémoriser qu'un seul ensemble de données figées à la fois. L'ordre de priorité de mise à jour des données par l'ECM est le suivant.

Priorité	Eléments	
1	Données figées	Raté d'allumage — DTC: P0300 - P0304 Fonctionnement du système d'injection de carburant — DTC: P0171, P0172
2		Sauf éléments ci-dessus
3	Données figées de 1er parcours	

Par exemple, un défaut de fonctionnement de l'EGR (priorité : 2) a été détecté et les données figées ont été mémorisées durant le 2ème parcours. Par la suite, lorsqu'un raté d'allumage (priorité : 1) est détecté lors d'un autre parcours, les données figées seront mises à jour depuis le défaut de fonctionnement de l'EGR jusqu'au raté d'allumage. Les données figées de 1er parcours sont mises à jour chaque fois qu'un nouveau défaut de fonctionnement est détecté. Il n'existe pas de priorité pour les données figées de 1er parcours. Toutefois, dès lors que des données figées sont mémorisées par l'ECM, les données figées de 1er parcours sont effacées (car l'ECM ne peut mémoriser qu'un seul ensemble de données, qu'elles soient figées ou figées de 1er parcours). Si des données figées sont déjà mémorisées par l'ECM alors que de nouvelles données figées, présentant la même priorité, sont générées, les données initiales restent inchangées.
Les données figées de 1er parcours ainsi que les données figées (en même temps que les DTC) sont effacées lorsque la mémoire de l'ECM est réinitialisée. Les procédures pour effacer la mémoire de l'ECM sont décrites dans ''Comment effacer les codes de diagnostic de dépollution''. Se reporter à EC-3064.

CODE DE TEST DE LECTURE DU SYSTÈME (SRT)

NEEC0031S03

Le code de test de lecture du système (SRT) fait l'objet d'une spécification en mode 1 de la norme ISO 15051-5.
En tant que partie d'un test amélioré d'émissions pour l'Inspection et l'Entretien (I/E), certains états exigent le statut de SRT soit utilisé pour indiquer si l'ECM a achevé l'autodiagnostic des systèmes et composants principaux d'émission. L'achèvement de l'autodiagnostic doit être vérifié avant de continuer l'inspection des émissions.
Si, lors d'une inspection de l'état des émissions, un ou plusieurs éléments du SRT indiquent ''incomplet'', signe que le véhicule n'est pas conforme aux normes, utiliser les informations du présent manuel de réparation afin de régler le SRT sur ''complet''.
Dans la majorité de cas, l'ECM termine automatiquement son cycle d'autodiagnostic au cours d'une utilisation normale et le statut du SRT indique ''complet'' pour chaque système d'application. Ceci fait, le SRT conserve son statut de ''complet'' jusqu'à ce que la mémoire de l'autodiagnostic soit effacée.
Il arrive que certaines parties du test d'autodiagnostic ne puissent pas être accomplies en raison des habitudes de conduite du client ; le SRT indique ''incomplet'' pour ces éléments.

REMARQUE :
Le SRT indique aussi ''incomplet'' si la mémoire d'autodiagnostic est effacée pour une raison quelconque ou si l'alimentation électrique de la mémoire de l'ECM est coupée pendant plusieurs heures.

Si, durant l'inspection de l'état des émissions, le SRT indique ''complet'' pour tous les éléments du test, l'inspecteur continue ses tests d'émissions. Cependant, si le SRT indique ''incomplet'' pour un ou plusieurs éléments, le véhicule est renvoyé à son propriétaire sans avoir subi de test.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

REMARQUE :
Il en va de même si le témoin de défaut est sur ‘‘ON’’ durant l’inspection de l’état des émissions, et ce même si le SRT indique ‘‘complet’’ pour tous les éléments du test. Il est par conséquent important de vérifier le SRT (‘‘complet’’) et l’absence de DTC avant l’inspection.

Ce manuel de réparation contient des procédure de réparation et des informations utiles pour effectuer un test sur route complet permettant à l’ECM de compléter le SRT.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Elément SRT

NEEC0031S0308

Le tableau ci-dessous indique les éléments d'autodiagnostic requis pour régler le SRT sur ''CMPLT''.

Elément SRT (indication CONSULT-II)	Priorité de performance *	Eléments d'autodiagnostic requis pour régler le SRT sur ''CMPLT''	N° de DTC correspondant
SYST CAT 3V-R1	3	Fonctionnement du catalyseur à 3 voies	P0420
CH S/02	2	Sonde à oxygène chauffé 1	P0132
		Sonde à oxygène chauffé 1	P0133
		Sonde à oxygène chauffé 1	P0134
		Sonde à oxygène chauffé 1	P1143
		Sonde à oxygène chauffé 1	P1144
		Sonde à oxygène chauffé 2	P0138
		Sonde à oxygène chauffé 2	P0139
		Sonde à oxygène chauffé 2	P1146
		Sonde à oxygène chauffé 2	P1147
CH S/02 CH	1	Chauffage de la sonde à oxygène chauffé 1	P0031, P0032
		Chauffage de la sonde à oxygène chauffé 2	P0037, P0038

*: Si l'exécution de plusieurs EGR est requise, reproduire les conditions de conduite [procédure de confirmation de code de défaut (DTC)] une par une, sur la base de la priorité pour les modèles à l'aide de CONSULT-II.

Réglage de l'allumage SRT

NEEC0031S0310

Une fois que l'autodiagnostic a été réalisé au moins une fois, le SRT est réglé sur ''complet''. Le SRT est complet lorsque le résultat est BON ou MAUVAIS. Le réglage de l'allumage diffère dans les deux cas, comme indiqué dans le tableau ci-dessous.

Résultats de l'autodiagnostic		Exemple				
		Diagnostic	Allumage ARR — MAR — ARR	Allumage ARR — MAR — ARR	Allumage ARR — MAR — ARR	Allumage ARR — MAR — ARR
Tout est BON	Cas 1	P0400	BON (1)	— (1)	BON (2)	— (2)
		P0402	BON (1)	— (1)	— (1)	BON (2)
		P1402	BON (1)	BON (2)	— (2)	— (2)
		SRT de l'EGR	''complet''	''complet''	''complet''	''complet''
	Cas 2	P0400	BON (1)	— (1)	— (1)	— (1)
		P0402	— (0)	— (0)	BON (1)	— (1)
		P1402	BON (1)	BON (2)	— (2)	— (2)
		SRT de l'EGR	''incomplet''	''incomplet''	''complet''	''complet''
MAUVAIS	Cas 3	P0400	Bon	Bon	—	—
		P0402	—	—	—	—
		P1402	Mauvais	—	Mauvais	MAUVAIS (MAUVAIS consécutifs)
		DTC (de 1er parcours)	DTC de 1er parcours	—	DTC de 1er parcours	DTC (=MI ''ON'')
		SRT de l'EGR	''incomplet''	''incomplet''	''incomplet''	''complet''

BON : l'autodiagnostic est exécuté et le résultat est satisfaisant.
MAUVAIS : l'autodiagnostic est exécuté et le résultat n'est pas satisfaisant.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

— : l'autodiagnostic n'est pas effectué.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Lorsque les résultats de tous les autodiagnostics relatifs au SRT sont satisfaisants dans le même cycle, (allumage Arrêt-Marche-Arrêt), le SRT indique ‘‘complet’’.

→ Cas 1 ci-dessus

Lorsque les résultats de tous les autodiagnostics relatifs au SRT sont satisfaisants durant des cycles différents, le SRT indique ‘‘complet’’ quand les autodiagnostics respectifs indiquent au moins un ‘‘BON’’ résultat.

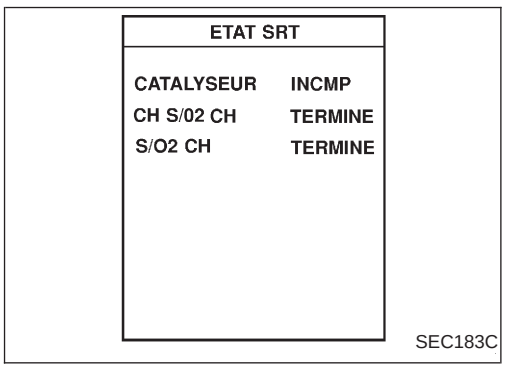
→ Cas 2 ci-dessus

Si au moins un autodiagnostic lié au SRT affiche un résultat non satisfaisant lors de 2 cycles consécutifs, le SRT indique lui aussi ‘‘complet’’.

→ Cas 3 ci-dessus

Le tableau ci-dessus montre que le nombre minimal de cycles pour régler le SRT sur ‘‘incomplet’’ est de un (1) pour chaque autodiagnostic (cas 1 et 2) ou de deux (2) pour un des autodiagnostics (cas 3). Cependant, lors de la préparation pour l’inspection de l’état des émissions, il n’est pas nécessaire d’exécuter deux fois chaque autodiagnostic (cas 3) pour les raisons suivantes :

- Le SRT indique ‘‘complet’’ lorsque l’autodiagnostic correspondant présente un (1) résultat satisfaisant.
- L’inspection des émissions ne requiert ‘‘complet’’ de SRT qu’avec de bons résultats d’autodiagnostic.
- Lorsque, durant les conditions de conduite SRT, un DTC de 1er parcours (MAUVAIS) est détecté avant que ‘‘complet’’ de SRT ne s’affiche, la mémoire d’autodiagnostic doit être effacée de l’ECM après réparation.
- Si le DTC de 1er parcours est effacé, tout le SRT indique ‘‘incomplet’’.



REMARQUE :
Le SRT peut être réglé sur ‘‘complet’’ conjointement avec le(s) DTC. Par conséquent, le contrôle DTC doit toujours précéder l’inspection de l’état des émissions, même si le code SRT indique ‘‘complet’’.

Comment afficher les codes SRT

NEEC0031S0301

1. **Avec CONSULT-II**
   Avec CONSULT-II, sélectionner ‘‘ETAT SRT’’ en mode ‘‘CONFIRMATION DE DTC’’I.
   Pour les éléments dont les codes SRT sont réglés, ‘‘complet’’ s’affiche à l’écran CONSULT-II ; pour les éléments dont les codes SRT ne sont pas réglés, ‘‘incomplet’’ s’affiche.
2. **Avec l’analyseur générique GST**
   Sélection du mode 1 avec un analyseur générique GST.

L’illustration ci-dessous montre l’affichage d’un code SRT par CONSULT-II.
‘‘INCMP’’ signifie que l’autodiagnostic est incomplet et que le SRT n’est pas réglé. ‘‘CMPLT’’ signifie que l’autodiagnostic est complet et que le SRT est réglé.

Comment régler les codes SRT

=NEEC0031S0302

Pour régler tous les codes SRT, il faut que l'autodiagnostic des éléments indiqués précédemment ait été effectué au moins une fois. Chaque diagnostic peut nécessiter une longue période d'utilisation du véhicule dans diverses conditions.

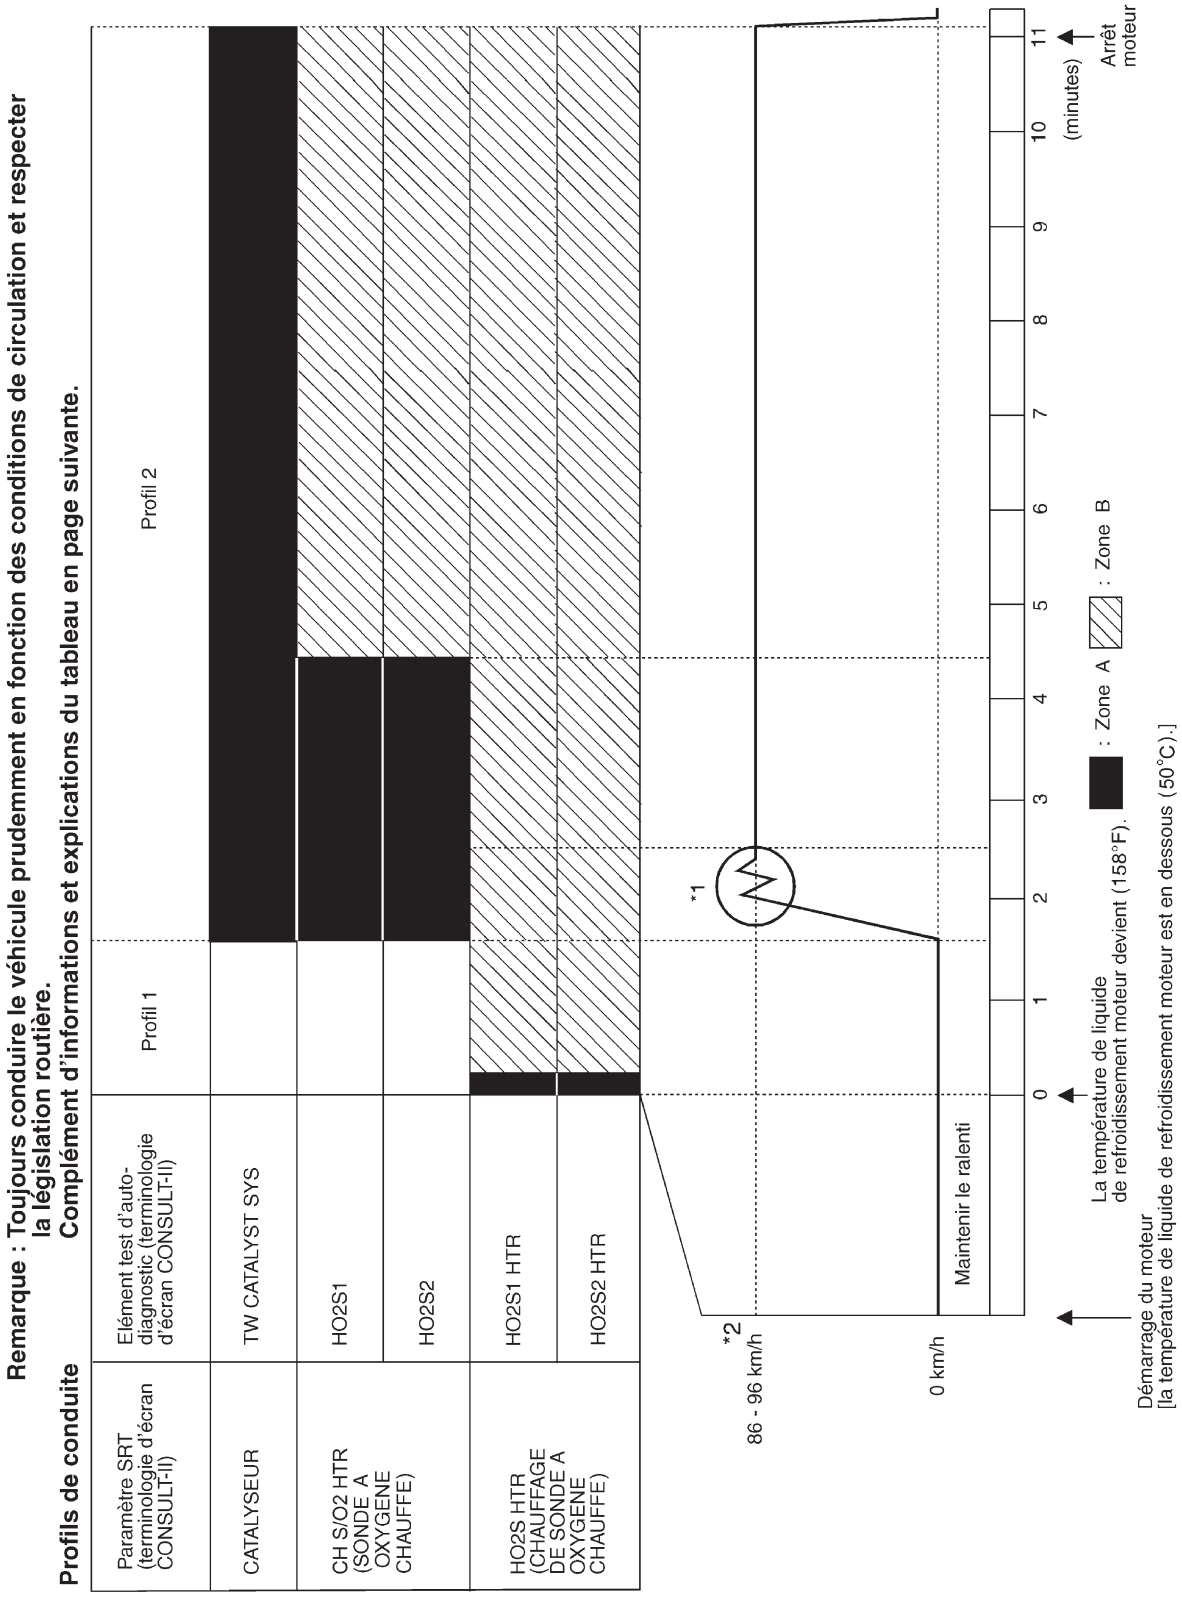
Avec CONSULT-II

Réaliser la procédure correspondante de confirmation de code de défaut (DTC) l'une après l'autre sur la base de la ''Priorité de performance'' du tableau se trouvant à EC-3056.

Sans CONSULT-II

La page suivante détaille les conditions de conduite les plus efficaces dans lesquelles les codes SRT peuvent être correctement réglés: EC-3060. Ces conditions de conduite doivent être suivies au moins une fois pour régler tous les codes SRT.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Conditions de conduite

NEEC0031S0303

Remarque : Toujours conduire le véhicule prudemment en fonction des conditions de circulation et respecter la législation routière.

Profils de conduite — Complément d'informations et explications du tableau en page suivante.

CH S/O2 HTR (SONDE A OXYGENE CHAUFFE)	HO2S1		
	HO2S2		
HO2S HTR (CHAUFFAGE DE SONDE A OXYGENE CHAUFFE)	HO2S1 HTR		
	HO2S2 HTR		

SEC300D

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

- La durée requise pour chaque diagnostic varie en fonction de l'état de la chaussée, des conditions climatiques, de l'altitude, des habitudes de conduite de chacun, etc.
  La zone A correspond au laps de temps requis le plus court pour le diagnostic sous des conditions normales*.
  La zone B correspond au laps de temps dans lequel le diagnostic peut toujours être effectué s'il ne l'est pas encore à l'échéance de la zone A.

*: Les conditions normales sont caractérisées comme suit :

- Niveau de la mer
- Route sans déclivité
- Température de l'air ambiant : 20 - 30°C
- C'est dans ces conditions normales que le diagnostic est effectué le plus rapidement.
  Le diagnostic peut également être effectué dans des conditions différentes (par exemple : température ambiante autre que 20 - 30°C].

Condition 1 :

- **Le moteur est démarré et la température du liquide de refroidissement est de -10 à 35°C (la tension entre la borne 59 de l'ECM et la masse est de 3,0 - 4,3 V).**
- **Le moteur doit rester au ralenti jusqu'à ce que la température du liquide de refroidissement dépasse 70°C (tension entre la borne 59 de l'ECM et de la masse inférieure à 1,4 V).**

Condition 2 :

- La reprise d'une conduite à vitesse stabilisée, après une éventuelle interruption, permet de mener à bien chaque diagnostic. Dans ce cas, la durée nécessaire au diagnostic peut être prolongée.

*1: Accélérer jusqu'à la vitesse de 90 km/h, puis relâcher la pédale d'accélérateur et attendre pendant au moins 10 secondes. Accélérer de nouveau jusqu'à la vitesse de 90 km/h.
*2: Il est conseillé de vérifier la vitesse du véhicule au CONSULT-II ou à l'analyseur générique GST.

Vitesse suggérée de passage au rapport supérieur pour les véhicules avec T/M

Le tableau ci-après indique les vitesses conseillées de passage à chaque rapport supérieur. Ces vitesses sont optimales pour la consommation et les performances du véhicule. Les vitesses réelles de passage au rapport supérieur peuvent varier en fonction des conditions de circulation, du climat et des habitudes de conduite de chacun.

	Pour une accélération normale dans des régions à basse altitude [moins de 1,219 m]:		Pour une accélération rapide dans des régions à basse et haute altitude [plus de 1,219 m]:
Changement de vitesses	Vitesse d'accélération en km/h	Passage vitesse de CROISIERE	
1ère à 2nde	24	24	24
2nde à 3ème	40	29	40
3ème à 4ème	58	48	64
4ème à 5ème	64	63	72

Vitesse maximale conseillée pour chaque vitesse

Passer à un rapport inférieur si le moteur ne tourne pas souplement ou si vous devez accélérer.
Ne jamais dépasser la vitesse maximale conseillée (indiquée ci-dessous) dans quelque rapport. Pour conduite sur route plane, utiliser le rapport conseillé pour la vitesse concernée. Toujours respecter les limitations de vitesse indiquées sur les panneaux routiers et adapter la conduite à l'état de la chaussée afin d'assurer la sécurité. Ne pas suremballer le moteur en passant à un rapport de vitesse inférieur; ceci pourrait endommager le moteur ou entraîner la perte du contrôle sur le volant.

Rapport de vitesse	2WD (mode AUTO)
1ère	50
2ème	95

VALEUR DU TEST ET LIMITE DU TEST (GST UNIQUEMENT - NE S'APPLIQUE PAS A CONSULT-II)

NEEC0031S04

Les informations suivantes font l'objet d'une spécification en mode 6 de la norme ISO J15031-5.
La valeur de test est un paramètre utilisé pour déterminer si le test de diagnostic d'un système/circuit est ''BON'' ou ''MAUVAIS'' pendant l'examen de l'ECM en cours d'autodiagnostic. La limite de test est une valeur de référence qui représente une valeur maximum ou minimum et qui est comparée avec la valeur de test obtenue.
Les éléments pour lesquels ces données (valeur et limite de test) sont affichées sont les mêmes que ceux des codes SRT.
Ces données (valeur et limite de test) sont spécifiées par un code d'identification de test (TID) et un code d'identification de composant (CID) et peuvent être affichées à l'écran du GST.

*3: Ces numéros sont prescrits par l'ISO 15031-6.
*4: Ces derniers ne sont pas affichés avec GST.

COMMENT EFFACER LES CODES DE DIAGNOSTIC DE DÉPOLLUTION

NEEC0031S06

Comment effacer les codes de défaut (avec CONSULT-II)

NEEC0031S0601

1. Si le contact d'allumage est toujours sur ON une fois la réparation terminée, veiller à le mettre sur OFF. Attendre au moins 5 secondes puis le remettre sur ON (moteur arrêté).
2. Mettre CONSULT-II sur ''ON'', puis appuyer sur la touche ''MOTEUR''.
3. Appuyer sur ''RESULT AUTO-DIAG''.
4. Appuyer sur ''EFFAC''. (Le DTC sera effacé dans l'ECM.)

Comment effacer les DTC (Avec CONSULT-II)

1. Si le contact d'allumage est sur 'ON' au terme de la réparation, veiller à le mettre une fois en position 'OFF'. Attendre au moins 5 secondes avant de le remettre en position 'ON' (moteur arrêté).

SELECTION SYSTEME
MOTEUR

2. Mettre CONSULT-II sur 'ON' et effleurer 'MOTEUR'.

SELECT MODE DIAG
SUPPORT TRAVAIL
RESULT AUTO-DIAG
CONTROLE DE DONNEES
CONTROLE DE DONNEES (SPEC)
TEST ACTIF
CONFIRMATION SRT
N° PIECE BOIT CONTR

3. Effleurer 'RESULT AUTO-DIAG'

RESULT AUTO-DIAG	
RESULTATS DTC	OCCU-RENCE
CIRC CAP DEBIT AIR [P0101]	0

4. Effleurer 'EFFAC'. (Le DTC sera effacé dans l'ECM).

SEC312D

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Les codes de diagnostic antipollution peuvent être effacés en appuyant sur ‘‘EFFAC’’ en mode de ‘‘RESULTATS D’AUTODIAGNOSTIC’’ de CONSULT-II.

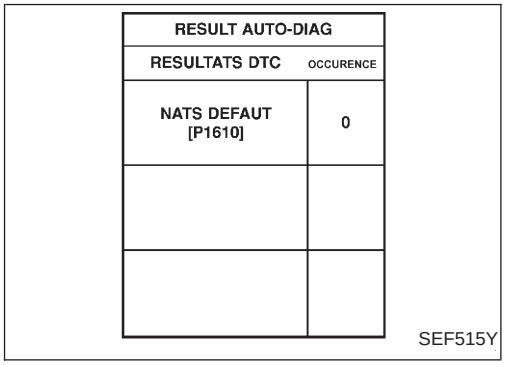
Comment effacer les codes de défaut (avec GST)

NEEC0031S0602

1. Si le contact d’allumage est toujours sur ON une fois la réparation terminée, veiller à le mettre sur OFF. Attendre au moins 5 secondes puis le remettre sur ON (moteur arrêté).
2. Mettre l’analyseur générique GST en mode 4.

Les codes de diagnostic de dépollution dans l’ECM peuvent être effacés en sélectionnant le mode 4 de l’analyseur générique GST.

REMARQUE :



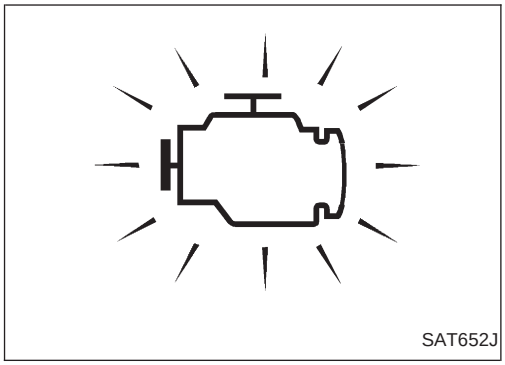
- **Si la batterie est déconnectée, les codes de diagnostic de dépollution seront perdus après environ 24 heures.**
- **Les données suivantes sont effacées lorsque la mémoire de l’ECM est réinitialisée.**

1) Codes de défaut de diagnostic
2) Codes de défaut de diagnostic de 1er parcours
3) Données figées
4) Données figées de 1er parcours
5) Codes de test de lecture du système (SRT)
6) Valeurs de test
7) Autres

Les procédures de travail à appliquer sont expliquées, avec des exemples de codes de défaut à l’appui. Veiller à ce que toutes les données énumérées ci-dessus, et pas seulement les codes de défaut, soient effacées de la mémoire de l’ECM lors de ces procédures de travail.

NVIS (système d’immobilisation de véhicule Nissan — NATS)

NEEC1601



- **Si le témoin de sécurité s’allume lorsque le contact d’allumage est sur ‘‘ON’’ ou que ‘‘DEFAUT NATS’’ est affiché sur l’écran de ‘‘RESULT AUTO-DIAG’’, passer dans le mode de résultats d’autodiagnostic avec CONSULT-II en utilisant une carte de programme NATS. Se reporter à ‘‘NVIS (système d’immobilisation de véhicule Nissan — NATS)’’ dans la section EL.**
- **Confirmer qu’aucun résultat d’autodiagnostic NVIS (NATS) n’est affiché avant d’appuyer sur ‘‘EFFAC’’ dans le mode ‘‘RESULT AUTO-DIAG’’ de CONSULT-II.**
- **Lorsque l’on remplace l’ECM, il est nécessaire de procéder à l’initialisation du système NVIS (NATS) et à l’enregistrement de tous les codes d’identification des clés de contact NVIS (NATS) à l’aide du CONSULT-II et de la carte de programme NATS.**
  S’assurer par conséquent que le client a bien remis toutes ses clés. Concernant les procédures d’initialisation du NVIS (NATS) et l’enregistrement de numéros d’identification de clés de contact NVIS (NATS), se reporter au manuel d’entretien de CONSULT-II pour IVIS/NVIS.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Témoin de défaut (MI)

DESCRIPTION

NEEC0032

SAT652J

Le témoin MI est situé sur le tableau de bord.

1. Il s'allume lorsque le contact est mis sur la position ON, moteur arrêté. Ceci est une vérification au moyen de l'ampoule.

- Si le témoin MI ne s'allume pas, se reporter à la section EL (''TEMOINS D'AVERTISSEMENT'') ou se reporter à la page EC-3422.

2. Le témoin MI doit s'éteindre lorsque le moteur démarre.
   S'il reste allumé, le système de diagnostic de bord a probablement détecté un problème au niveau de la gestion moteur.

Fonctionnement du système de diagnostic de bord

NEEC0032S07

Le système de diagnostic de bord comprend les quatre fonctions suivantes.

Mode de test de diagnostic	Etat de CLE et de MOT.	Fonctionnement	Explication de la fonction
Mode I	Contact d'allumage sur ''ON''  Moteur arrêté 	VERIFICATION DE L'AMPOULE	Pour vérifier si l'ampoule du MI est endommagée (grillée, circuit ouvert, etc.). Si le témoin MI ne fonctionne pas, vérifier le circuit du témoin MI
	Moteur en marche 	AVERTISSEMENT DE DEFAUT	Ceci est une condition de conduite habituelle. Lorsque un défaut est détecté deux fois dans deux cycles de conduite consécutifs (logique de détection de deux parcours), le témoin MI s'allumera afin d'informer le conducteur qu'il en a détecté un. Les défauts suivants seront indiqués au moyen de l'allumage ou du clignotement du témoin MI dans le 1er parcours. ● ''Raté d'allumage (dommage possible au catalyseur 3 voies)'' ● ''Commande en boucle fermée'' ● Mode de sécurité

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Témoin de défaut (MI)

Mode de test de diagnostic	Etat de CLE et de MOT.	Fonctionnement	Explication de la fonction
Mode II	Contact d'allumage sur ''ON''  Moteur arrêté 	RESULTATS DE L'AUTODIAGNOSTIC	Cette fonction fait apparaître les DTC et des DTC de 1er parcours.
	Moteur en marche 	CONTROLE DE LA SONDE A OXYGENE CHAUFFE 1	Cette fonction fait apparaître le mélange de carburant (riche ou pauvre), contrôlé par la sonde à oxygène chauffé 1.

Le témoin MI clignote sans DTC

NEEC0032S0701

Si l'ECM se trouve en mode II de test de diagnostic, il peut arriver que le témoin MI clignote alors que le moteur tourne. Dans ce cas, vérifier le mode de test de diagnostic ECM. Comment changer de mode de diagnostic. La procédure à suivre pour changer de mode de test de diagnostic (fonction) est expliquée plus loin, avec un complément d'information sur les fonctions évoquées ci-dessus Comment changer de mode de diagnostic. Les codes de diagnostic de dépollution suivant sont effacés lorsque la mémoire de l'ECM est réinitialisée.

1. Codes de défaut de diagnostic
2. Codes de défaut de diagnostic de 1er parcours
3. Données figées
4. Données figées de 1er parcours
5. Codes de test de lecture du système (SRT)
6. Valeurs de test
7. Autres

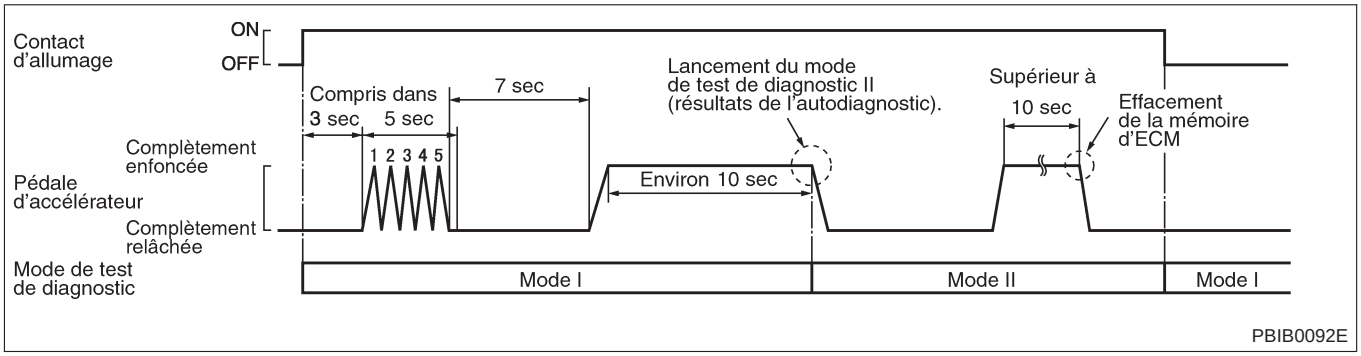
Comment changer le mode de test de diagnostic

NEEC0032S08

REMARQUE :

- **Il est mieux de mesurer le temps avec précision avec une montre.**
- **Il n'est pas possible de passer au mode diagnostic lorsque le circuit du capteur de la position de la pédale de l'accélérateur a un défaut.**
- **L'ECM retourne toujours au mode de diagnostic I après avoir mis le contact d'allumage sur ''OFF''.**

Comment régler le mode II de test de diagnostic (résultats de l'autodiagnostic)



NEEC0032S0801

1. Vérifier que la pédale de l'accélérateur est complètement relâchée, que le contact d'allumage est sur ''ON'' et attendre 3 secondes.
2. Répéter la procédure suivante rapidement cinq fois en moins de 5 secondes.

1) Enfoncer la pédale de l'accélérateur au maximum.
2) Relâcher complètement la pédale de l'accélérateur.

3. Attendre pendant 7 secondes et ensuite enfoncer la pédale de l'accélérateur au maximum et la maintenir environ 10 secondes jusqu'au moment où le témoin MI commence à clignoter.
4. Relâcher complètement la pédale de l'accélérateur.
   ECM a commencé le mode II de test de diagnostic (Résultats de l'autodiagnostic).

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Comment régler le mode II de test de diagnostic (Contrôle de la sonde à oxygène chauffé 1)

NEEC0032S0802

1. Régler l'ECM sur Mode II de test de diagnostic (Résultats de l'autodiagnostic). Se reporter à Comment passer au mode II de test de diagnostic (résultats de l'autodiagnostic).
2. Démarrer le moteur.
   L'ECM est entré en mode II de test de diagnostic (contrôle de la sonde à oxygène chauffé 1).
   L'ECM commence le contrôle de la sonde à oxygène chauffé 1 depuis le capteur d'essai 1.

Comment effacer le mode II de test de diagnostic (résultats de l'autodiagnostic)

NEEC0032S0804

1. Régler l'ECM dans le mode II de test de diagnostic (résultats de l'autodiagnostic). Se reporter à Comment passer au mode II de test de diagnostic (résultats de l'autodiagnostic).
2. Enfoncer la pédale de l'accélérateur au maximum et la maintenir pendant plus de 10 secondes. Les codes de diagnostic de dépollution ont été effacés de la mémoire de sauvegarde de l'ECM.
3. Relâcher la pédale de l'accélérateur au maximum et confirmer que DTC 0000 est affiché.

Mode de diagnostic I — Vérification de l'ampoule

NEEC0032S09

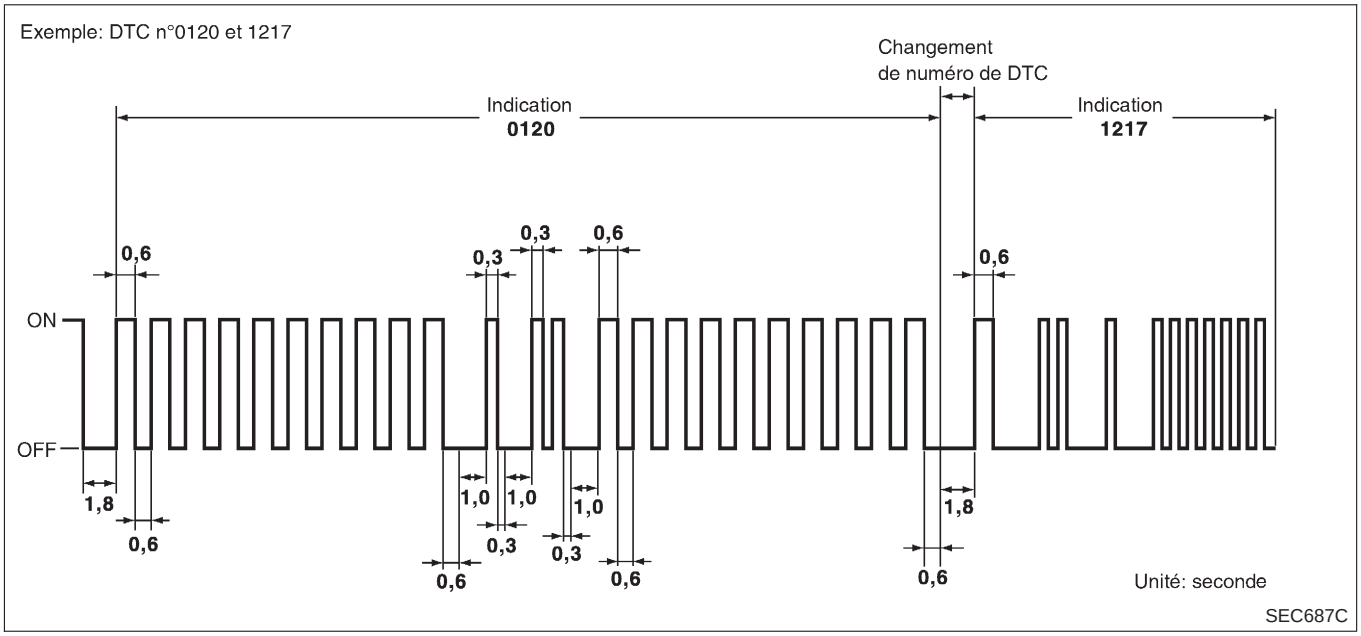
Dans ce mode, le témoin MI du tableau de bord doit rester allumé. S'il demeure éteint, vérifier l'ampoule. Se reporter à ''TEMOINS D'AVERTISSEMENT'', à la page EC-3422.

Mode de diagnostic I — Avertissement de défaut de fonctionnement

NEEC0032S10

MI	Condition
MARCHE	Un défaut est détecté ou l'unité centrale de l'ECM est défectueuse.
ARRET	Pas de défaut.

- Ces numéros de DTC sont identifiés en mode II d'essai de diagnostic (RESULTATS DE L'AUTODIAGNOSTIC)



Mode de diagnostic II — Résultat d'autodiagnostic

NEEC0032S11

Dans ce mode, le DTC et le DTC de 1er parcours sont indiqués par le nombre de clignotements du témoin MI comme indiqué ci-dessous.
Le DTC et le DTC de 1er parcours sont indiqués simultanément. Si le témoin MI ne s'allume pas en mode I de test de diagnostic (avertissement de défaut), tous les éléments indiqués sont des DTC de 1er parcours. Lorsqu'un seul code est indiqué quand le témoin MI s'allume en mode II de test de diagnostic (RESULTATS DE L'AUTODIAGNOSTIC), c'est qu'il s'agit d'un code de défaut classique ; lorsque plusieurs codes sont indiqués, il peut s'agir soit de DTC, soit de DTC de 1er parcours. Numéro de code de défaut identique au numéro de code de défaut de 1er parcours. Ces codes peuvent être identifiés à l'aide de CONSULT-II ou de l'analyseur générique GST. Se reporter à l'exemple ci-dessous pour la procédure à suivre pour lire les codes de défaut.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Témoin de défaut (MI)

Chaque DTC est identifié par des clignotements qui composent un nombre à quatre chiffres. Le ‘‘zéro’’ est indiqué par dix clignotements. L’intervalle de temps utilisé pour indiquer le chiffre des milliers est de 1,2 seconde, décomposé en un cycle ALLUME (0,6 seconde) - ETEINT (0,6 seconde).
Les chiffres des centaines et inférieurs sont indiqués par un cycle de 0,6 seconde, décomposé en un cycle ALLUME (0,3 seconde) - ETEINT (0,3 seconde).
Le passage des milliers aux centaines, et ainsi de suite, est indiqué par une pause (ETEINT) de 1,0 seconde. Autrement dit, le chiffre suivant apparaît à l’écran 1,3 seconde après que le chiffre précédent a disparu.
Le passage d’un code défaut à un autre est indiqué par une pause (ETEINT) de 1,8 seconde.
De cette manière, tous les défauts détectés sont classés selon leur numéro de code de défaut. Le DTC ‘‘0000’’ ne se rapporte à aucun défaut. (voir ‘‘DIAGNOSTIC DE DEFAUT — INDEX’’, page EC-3010.)

Comment effacer le mode II de test de diagnostic (résultats de l’autodiagnostic)

NEEC0032S1101

Le DTC peut être effacé de la mémoire de sauvegarde dans l’ECM en enfonç;ant la pédale de l’accélérateur. Se reporter à Comment changer le mode de test de diagnostic.

- **Si la batterie est déconnectée, le DTC sera effacé de la mémoire de sauvegarde après environ 24 heures.**
- **Veiller à ne pas effacer la mémoire enregistrée avant de procéder aux diagnostics de défaut.**

Mode II de test de diagnostic — Contrôle de la sonde à oxygène chauffé 1

NEEC0032S12

Dans ce mode, le témoin MI indique l’état du mélange air-carburant (pauvre ou riche), lequel est contrôlé par la sonde à oxygène chauffé 1.

MI	Richesse de mélange de carburant dans les gaz d’échappement	Condition de contrôle de régulation automatique de la richesse de mélange air/carburant
MARCHE	Pauvre	Contrôle par boucle fermée
ARRET	Riche	
*Reste ALLUME ou ETEINT	Toute condition	Contrôle par boucle ouverte

*: Maintient les conditions juste avant de passer en boucle ouverte.

Pour vérifier le fonctionnement de la sonde à oxygène chauffé 1, démarrer le moteur en mode II de test de diagnostic et le faire chauffer jusqu’à ce que l’indicateur de température du liquide de refroidissement du moteur pointe sur le milieu du cadran de la jauge.
Faire tourner le moteur à 2 000 tr/mn pendant environ 2 minutes à vide. Puis s’assurer que le MI s’allume plus de 5 fois en 10 secondes avec un régime-moteur de 2 000 tr/mn à vide.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Tableau opérationnel du diagnostic de bord (OBD)

NEEC0033

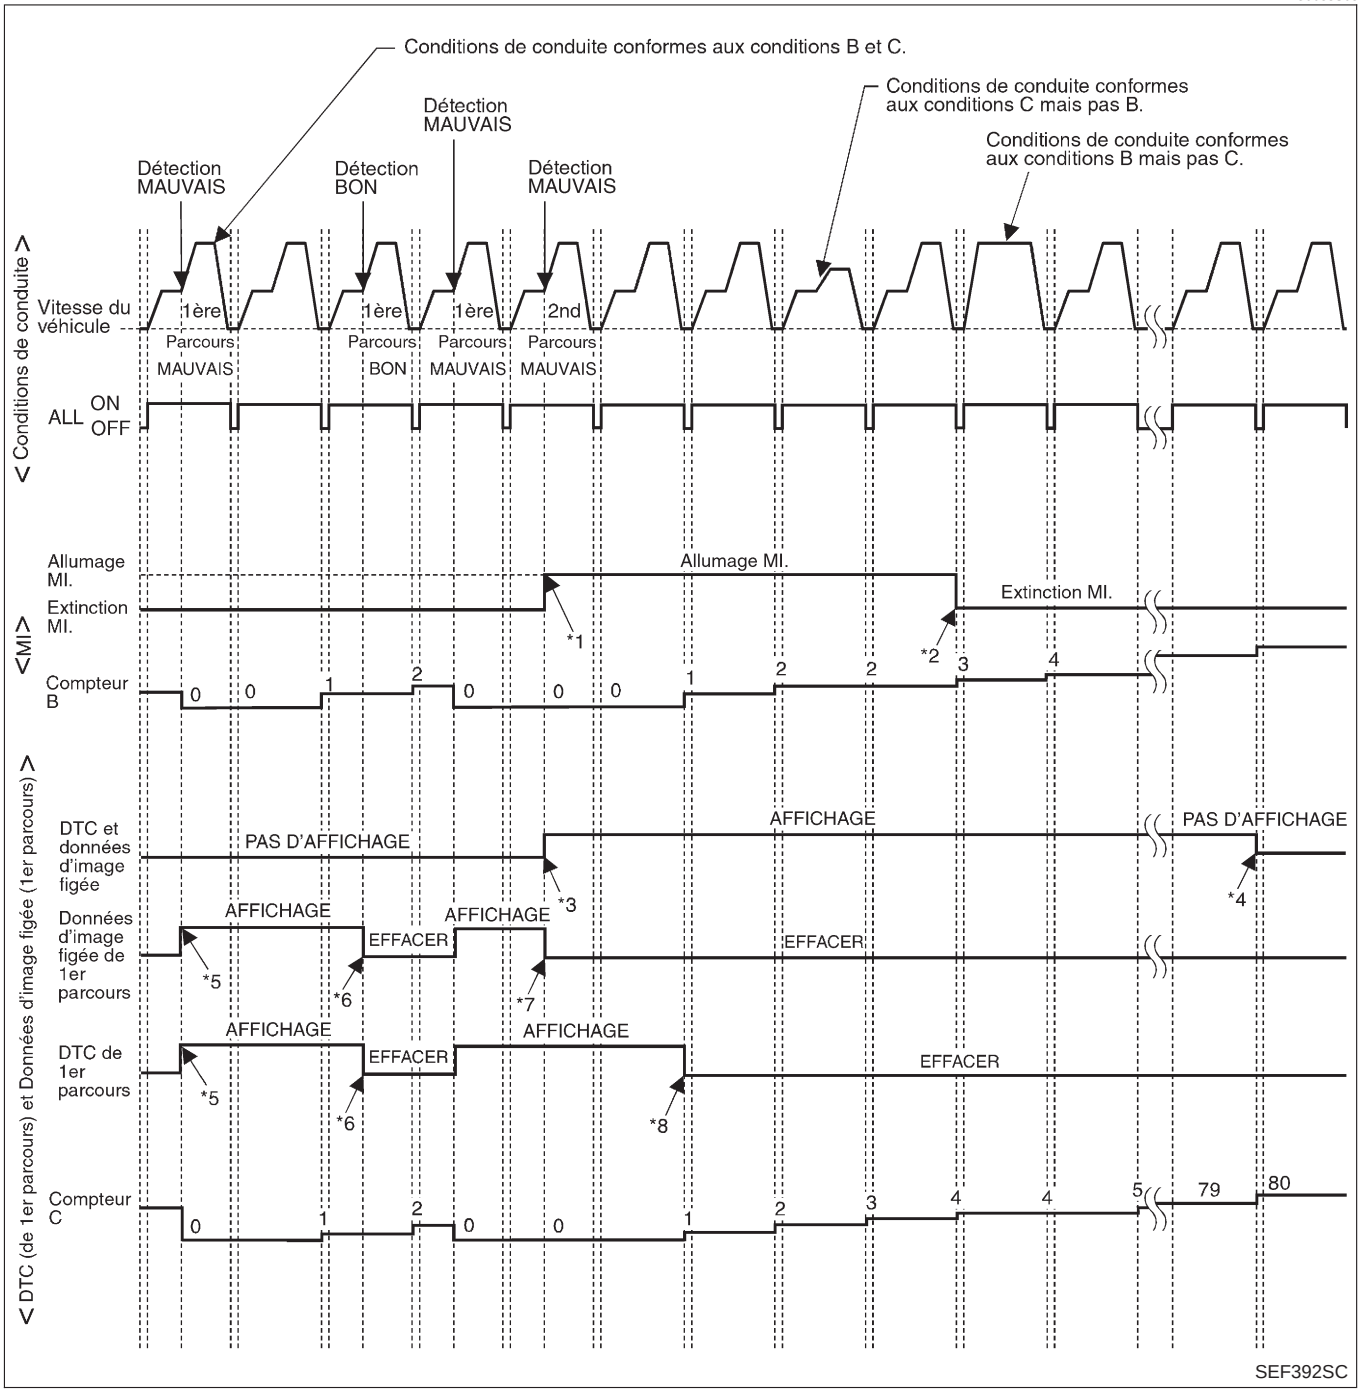
RELATION EXISTANT ENTRE TÉMOIN MI, DTC DE 1ER PARCOURS, DTC ET PARAMÈTRES DÉTECTABLES

NEEC0033S01

- Lorsqu'un défaut est détecté pour la première fois, le DTC de 1er parcours et les données figées de 1er parcours sont mémorisés par l'ECM.
- Lorsque le même défaut est détecté deux fois de suite au cours de deux parcours consécutifs, le DTC et les données figées sont mémorisés par l'ECM, et le témoin MI s'allume. Pour de plus amples informations, se reporter à ''Logique de détection de deux parcours'', page EC-3052.
- Le témoin MI s'éteint après que le véhicule a accompli 3 parcours sans défaut. Un parcours n'est pris en compte que lorsque les conditions de conduite enregistrées sont reproduites (telles que mémorisées dans l'ECM). Si un autre défaut est détecté lors du décompte, le compteur est remis à zéro.
- Le DTC et les données figées ne sont plus affichés après que le véhicule a accompli 40 parcours (conditions de conduite A) sans répétition du même défaut (sauf pour les ratés d'allumage et le système d'injection de carburant). Pour les ratés d'allumage et le système d'injection de carburant, le DTC et les données figées ne sont plus affichés après que le véhicule a accompli 80 parcours (conditions de conduite C) sans répétition du même défaut. Le paramètre d'occurrences ''OCCURRENCES'' indiqué en mode ''RESULTATS D'AUTODIAGNOSTIC'' de CONSULT-II comptabilise le nombre de parcours accompli par le véhicule.
- Le DTC de 1er parcours n'est pas affiché lorsque le résultat de l'autodiagnostic est ''BON'' lors du second parcours.

TABLEAU RÉCAPITULATIF

NEEC0033S02



Eléments	Système d'injection de carburant	Raté d'allumage	Autre
MI (éteint)	3 (conditions de conduite B)	3 (conditions de conduite B)	3 (conditions de conduite B)
DTC, données figées (sans affichage)	80 (conditions de conduite C)	80 (conditions de conduite C)	40 (conditions de conduite A)
DTC de 1er parcours (effacement)	1 (conditions de conduite C), *1	1 (conditions de conduite C), *1	1 (conditions de conduite B)
Données figées de 1er parcours (effacement)	*1, *2	*1, *2	1 (conditions de conduite B)

Pour en savoir plus sur les conditions de conduite B et C dans ''Système d'injection'' et ''Raté d'allumage'', se reporter à EC-3072.
Pour plus d'informations sur les conditions de conduite A et B dans ''Autres'', se reporter à EC-3074.
*1: Lorsqu'une situation normale (BON) est détectée, l'affichage s'efface.
*2: Il y a effacement au moment de la détection du même défaut lors du 2ème parcours.

LIENS ENTRE LE MI, LE DTC, LE DTC DE 1ER PARCOURS ET LES CONDITIONS DE CONDUITE POUR "RATÉ D'ALLUMAGE" <DÉTÉRIORATION DE LA QUALITÉ D'ÉCHAPPEMENT>, "SYSTÈME D'INJECTION"

=NEEC0033S03

*1: Lorsque le même défaut est détecté lors de deux parcours consécutifs, le témoin MI s'allume.

*2: Le témoin MI s'éteint après que le véhicule a accompli 3 parcours (conditions de conduite B) sans défaut.

*3: Lorsque le même défaut est détecté lors de deux parcours consécutifs, le DTC et les données figées sont mémorisés par l'ECM.

*4: Le DTC et les données figées ne sont plus affichés après que le véhicule a accompli 80 parcours (conditions de conduite C) sans répétition du même défaut (le DTC et les données figées restent néanmoins dans la mémoire de l'ECM).

*5: Lorsqu'un défaut est détecté pour la première fois, le DTC de 1er parcours et les données figées de 1er parcours sont mémorisées par l'ECM.

*6: Le DTC de 1er parcours et les données figées de 1er parcours sont effacés lorsque la situation normale (BON) est détectée.

*7: Lorsque le même défaut est détecté lors d'un second parcours consécutif, les données figées du 1er parcours sont effacées.

*8: Après mémorisation du DTC par l'ECM, le DTC de 1er parcours est effacé lorsque le véhicule accomplit un parcours (conditions de conduite C) sans répétition du même défaut.

EXPLICATION DES CONDITIONS DE CONDUITE POUR ‘‘RATÉ D’ALLUMAGE <DÉTÉRIORATION DE LA QUALITÉ DE L’ÉCHAPPEMENT>’’, ‘‘SYSTÈME D’INJECTION DE CARBURANT’’

NEEC0033S04

Conditions de conduite B

NEEC0033S0401

Les conditions de conduite B correspondent aux paramètres de fonctionnement suivants :
Tous les composants et systèmes doivent être contrôlés au moins une fois par le système OBD.

- Le compteur B est effacé dès lors qu’un défaut est détecté une fois, quelles que soient les conditions de conduite.
- Le compteur B est majoré d’une unité lorsqu’aucun défaut n’est détecté dans les conditions de conduite B.
- Le témoin MI s’éteint lorsque le compteur B atteint 3. (*2 dans ‘‘TABLEAU OPERATIONNEL DU DIAGNOSTIC DE BORD OBD’’)

Conditions de conduite C

NEEC0033S0402

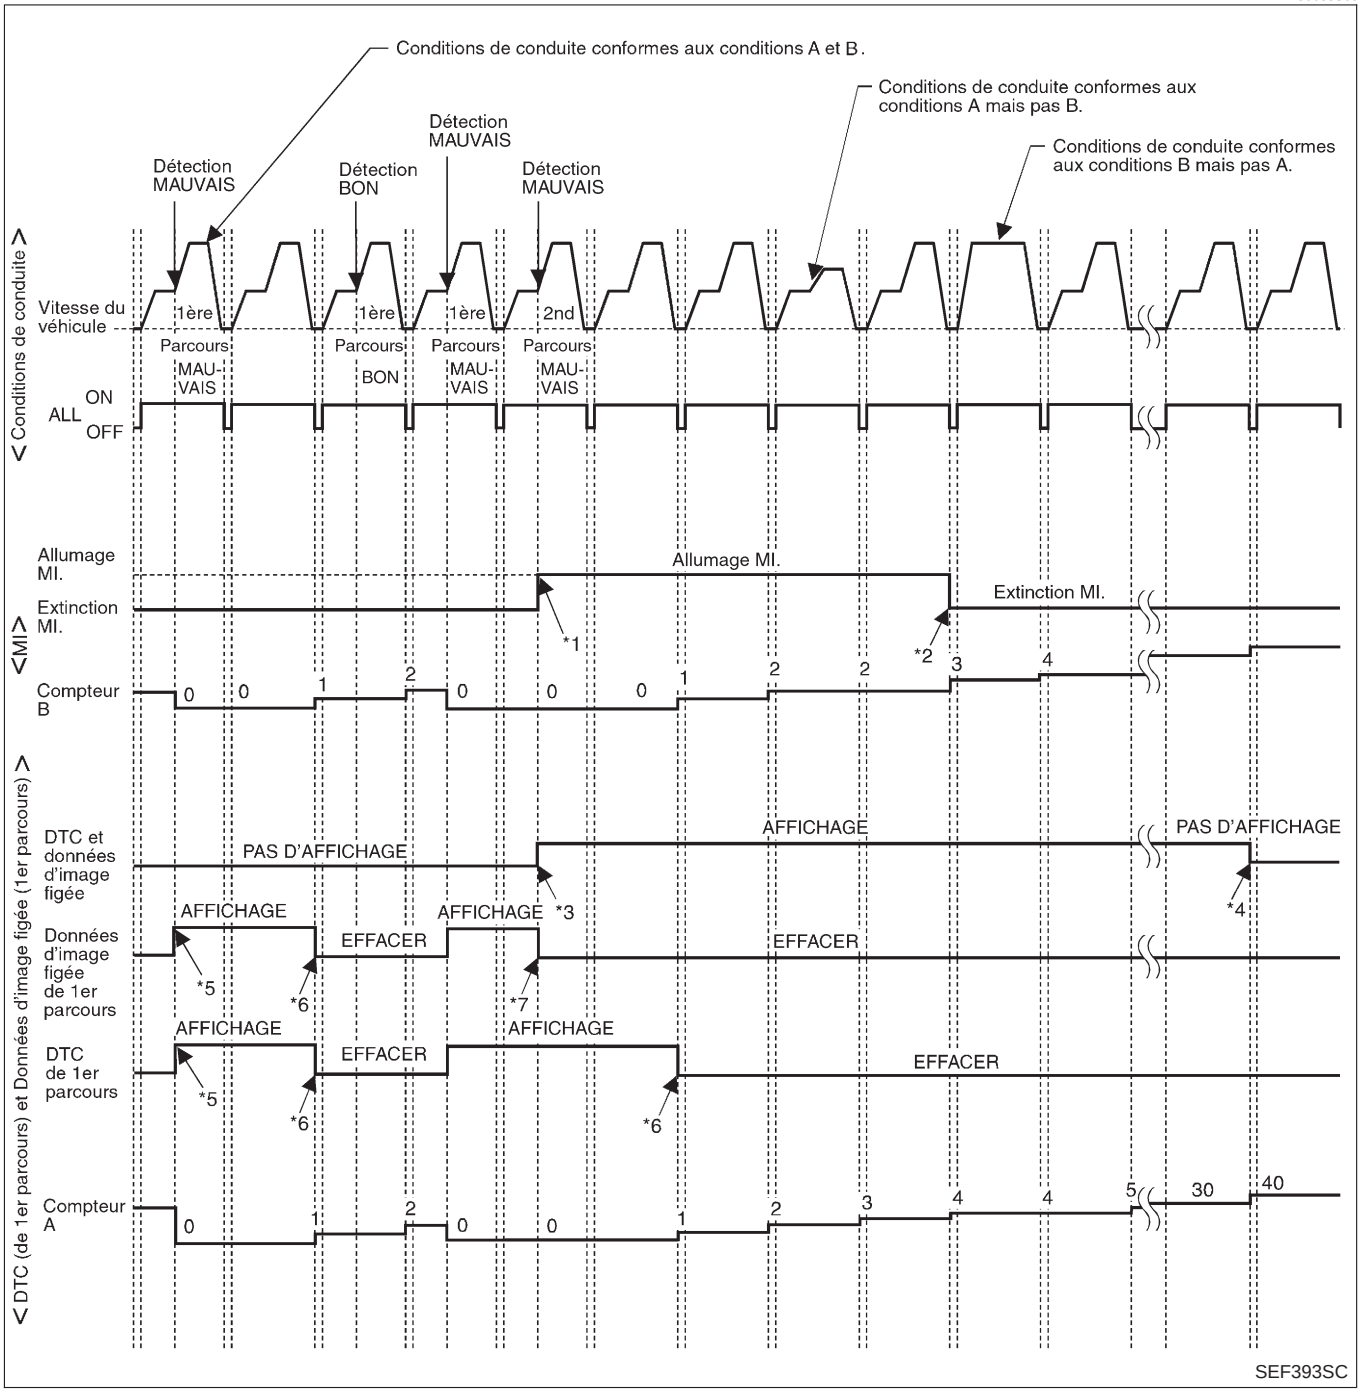
Les conditions de conduite C correspondent aux paramètres de fonctionnement suivants :

1) Les conditions suivantes doivent être reproduites simultanément :
   Régime-moteur : (régime-moteur dans les données figées) ±375 tr/min
   Valeur de charge calculée : (valeur de charge calculée dans les données figées) × (1±0,1) [%]

Température (T) du liquide de refroidissement du moteur

- Lorsque les données figées indiuent une valeur inférieure á 70°C, ‘‘T’’ doit être inférieure à 70°C.
- Lorsque les données figées indiquent une valeur supérieure ou égale à 70°C, ‘‘T’’ devrait être supérieure ou égale à 70°C.

Exemples :
Si les données figées mémorisées sont les suivantes :
Régime-moteur : 850 tr/mn, Valeur de charge calculée : 30,
Température du liquide de refroidissement : 80°C
Pour répondre aux conditions de conduite C, le véhicule doit rouler en reproduisant les conditions suivantes :
Régime-moteur : 475 - 1,225 tr/mn, Valeur de charge calculée : 27-33,
Température du liquide de refroidissement : supérieure à 70°C



- Les données du compteur C sont effacées lors de la détection du défaut quelles que soient les conditions (1).
- Le compteur C est majoré d’une unité lorsque le même défaut n’est pas détecté dans (1).
- Le DTC n’est plus affiché après que le compteur C a atteint 80.
- Après mémorisation du DTC par l’ECM, le DTC de 1er parcours est effacé dès que le compteur C n’enregistre plus le même défaut.

LIENS ENTRE LE TÉMOIN MI, LE DTC, LE DTC DE 1ER PARCOURS ET LES CONDITIONS DE CONDUITE SAUF POUR "RATÉ D'ALLUMAGE <DÉTÉRIORATION DE LA QUALITÉ DES ÉMISSIONS>", "SYSTÈME D'INJECTION DE CARBURANT"

NEEC0033S05

*1: Lorsque le même défaut est détecté lors de deux parcours consécutifs, le témoin MI s'allume.

*2: Le témoin MI s'éteint après que le véhicule a accompli 3 parcours (conditions de conduite B) sans défaut.

*3: Lorsque le même défaut est détecté lors de deux parcours consécutifs, le DTC et les données figées sont mémorisés par l'ECM.

*4: Le DTC et les données figées ne sont plus affichés après que le véhicule a accompli 40 parcours (conditions de conduite A) sans répétition du même défaut (le DTC et les données figées restent néanmoins dans la mémoire de l'ECM).

*5: Lorsqu'un défaut est détecté pour la première fois, le DTC de 1er parcours et les données figées de 1er parcours sont mémorisées par l'ECM.

*6: Le DTC de 1er parcours est effacé après que le véhicule a accompli un parcours (conditions de conduite B) sans répétition du même défaut.

*7: Lorsque le même défaut est détecté lors d'un second parcours consécutif, les données figées du 1er parcours sont effacées.

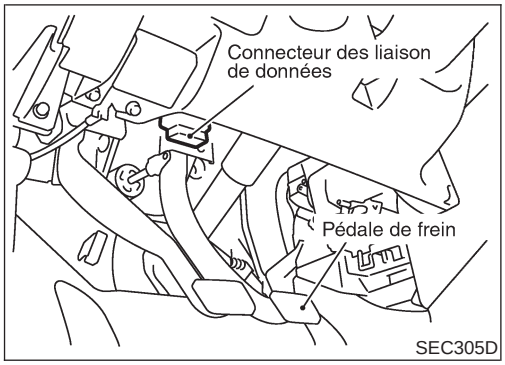
EXPLICATION DES CONDITIONS DE CONDUITE SAUF POUR ''RATÉ D'ALLUMAGE <DÉTÉRIORATION DE LA QUALITÉ DES ÉMISSIONS>'', ''SYSTÈME D'INJECTION DE CARBURANT''

NEEC0033S06

Conditions de conduite A

NEEC0033S0601

- Les données du compteur A sont effacées lors de la détection du défaut quelles que soient les conditions (1) à (4).
- Le compteur A est majoré lorsque les conditions (1) à (4) sont remplies sans répétition du même défaut.
- Le DTC n'est plus affiché après que le compteur A a atteint 40.



Conditions de conduite B

NEEC0033S0602

Les conditions de conduite B correspondent aux paramètres de fonctionnement suivants :
Tous les composants et systèmes doivent être contrôlés au moins une fois par le système OBD.

- Le compteur B est effacé dès lors qu'un défaut est détecté une fois, quelles que soient les conditions de conduite.
- Le compteur B est majoré d'une unité lorsqu'aucun défaut n'est détecté dans les conditions de conduite B.
- Le témoin MI s'éteint lorsque le compteur B atteint 3 (*2 dans ''TABLEAU OPERATIONNEL DU DIAGNOSTIC DE BORD OBD'').

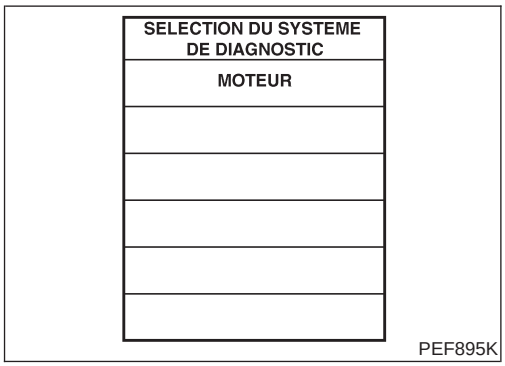
CONSULT-II

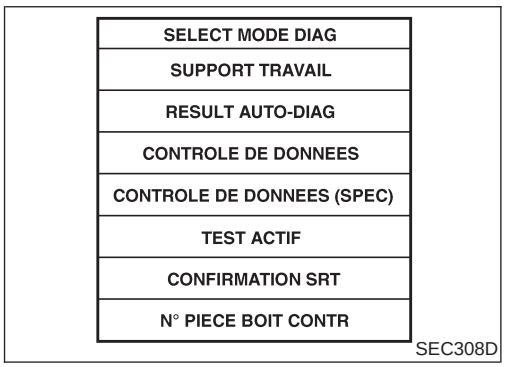
=NEEC0034

PROCÉDURE D’INSPECTION AVEC CONSULT-II



NEEC0034S01

1. Mettre le contact d’allumage sur OFF.
2. Brancher ‘‘CONSULT-II’’ au connecteur de diagnostic, situé derrière le couvercle de la boîte à fusibles.



PBR455D

3. Mettre le contact d’allumage sur ‘‘ON’’.
4. Appuyer sur ‘‘DEPART’’.

PEF895K

5. Appuyer sur ‘‘MOTEUR’’.

SEC308D

6. Effectuer chaque mode de test de diagnostic en fonction de chaque procédure d’entretien.

Pour de plus amples informations, se reporter au manuel d’utilisation de CONSULT-II.

*1: Ce paramètre comprend les DTC de 1er parcours.

*2: Ce mode comprend les données figées de 1er parcours ou les données figées. Les paramètres sont affichés par CONSULT-II en mode de données figées uniquement si un DTC de 1er parcours ou un DTC est détecté. Pour plus de détails, se reporter à EC-3054.

FONCTIONNEMENT

NEEC0034S03

Mode de test de diagnostic	Fonctionnement
Support de travail	Les indications fournies par CONSULT-II permettent au mécanicien de procéder plus rapidement et plus précisément aux réglages de certains dispositifs.
Résultats de l'autodiagnostic	Les résultats de l'autodiagnostic (par exemple DTC de 1er parcours, DTC et données de figées de 1er parcours ou données figées) peuvent être aisément lus et effacés. *1
Contrôle de données	Les informations d'entrée/de sortie de l'ECM peuvent être lues.
Contrôle de données (SPEC)	Les spécifications d'entrée/de sortie du programme de base de carburant, le mélange air-carburant, la soupape de contrôle air-carburant par régulation automatique et les autres paramètres de contrôle de données peuvent être lus.
TEST ACTIF	Mode de test de diagnostic dans lequel CONSULT-II pilote certains actionneurs indépendamment de l'ECM et modifie certains paramètres dans des limites spécifiées.
Confirmation de SRT	Mode permettant de confirmer le statut des tests de contrôle du système et les états/résultats de l'autodiagnostic.
Test de fonctionnement	Ce mode est utilisé afin d'informer aux clients lorsque la condition de leur véhicule a besoin des opérations d'entretien périodiques.
Numéro de pièce de l'ECM	Les n° de référence des composants de l'ECM peuvent être lus.

*1 Les codes de diagnostic antipollution suivants sont effacés lorsque la mémoire de l'ECM est réinitialisée.

1) Codes de défaut de diagnostic
2) Codes de défaut de diagnostic de 1er parcours

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

3) Données figées
4) Données figées de 1er parcours
5) Codes de test de lecture du système (SRT)
6) Valeurs de test
7) Autres
