REG POS RAL CAP TP/CNT TP	● SUIVRE LES DIRECTIVES D'INSPECTION DE BASE DU MANUEL DE REPARATION	Pour régler le papillon en position de ralenti
REG CALAGE ALLUMAGE*	● LE CONTROLE AUTOMATIQUE DU CALAGE D'ALLUMAGE EST EFFECTUE EN APPUYANT SUR ''DEPART''. ENSUITE, REGLER LE CALAGE D'ALLUMAGE A L'AIDE D'UNE LAMPE STROBOSCOPIQUE EN FAISANT TOURNER LE CAPTEUR DE POSITION DU VILEBREQUIN.	Au réglage du calage d'allumage initial
DETENTE PRESS D'ALIM	● LA POMPE D'ALIMENTATION S'ARRETE LORSQUE L'ON APPUIE SUR ''DEPART'' PENDANT QUE LE MOTEUR TOURNE AU RALENTI. ACTIONNER LE STARTER PLUSIEURS FOIS APRES CALAGE DU MOTEUR.	Pour dépressuriser des flexibles d'alimentation
COM AUTO INSTRUCT	● LE COEFFICIENT DE COMMANDE D'AUTO-INSTRUCTION DE RICHESSE DU MELANGE REVIENT AU COEFFICIENT D'ORIGINE.	Pour dépressuriser des flexibles d'alimentation
REG TR/MN RALENT CIBLE*	● MOTEUR AU RALENTI	Pour régler le régime de ralenti cible

*: Cette fonction n'est pas nécessaire dans le cadre de la procédure d'entretien habituelle.

MODE D'AUTODIAGNOSTIC

NEEC0034S05

DTC et DTC de 1er parcours

NEEC0034S0501

Pour les éléments ''DTC et DTC de 1er parcours'', se reporter au ''DIAGNOSTIC DES DEFAUTS — INDEX'', page EC-3010.

Données figées et données figées de 1er parcours

NEEC0034S0502

Elément de données figées*	Description
CODE DIAG DEFAUT [PXXXX]	● L'élément/le système de gestion moteur émet un code de défaut qui s'affiche sous la forme de ''PXXXX''. [Se reporter à ''Index alphabétique et numérique pour le DTC'' (EC-3010).]
SYS CARB-R1	● ''Etat du système d'injection de carburant'' lorsqu'un défaut est détecté. ● Affichage de l'un des modes suivants : ''MODE 2'': boucle ouverte causée par la détection d'un défaut du système ''MODE 3'': boucle ouverte causée par les conditions de conduite (enrichissement à l'accélération, enrichissement à la décélération) ''MODE 4'': boucle fermée, avec utilisation du signal de la (ou des) sonde(s) à oxygène comme retour pour la commande d'alimentation ''MODE 5'': boucle ouverte - conditions non encore remplies pour rétablir le fonctionnement en boucle fermée
VALEUR CHARGE CALC [%]	● Affichage de la valeur de charge calculée au moment de la détection d'un défaut.
TEMP LIQU REFR [°C]	● Affichage de la température du liquide de refroidissement au moment de la détection d'un défaut.
C-COR AIR/CAR-R1 [%]	● Lorsqu'un défaut est détecté, ''Correction de carburant de courte durée'' s'affiche. ● La correction de carburant à courte durée représente une compensation de régulation automatique dynamique ou instantanée au programme de base de carburant.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Elément de données figées*	Description
L-COR AIR/CAR-R1 [%]	● Lorsqu'un défaut est détecté, ''Correction de carburant de longue durée'' s'affiche. ● La correction de carburant à long terme représente une compensation beaucoup plus progressive au programme de base de carburant que la correction à court terme.
TR/MN MOT [tr/mn]	● Affichage du régime-moteur lorsqu'un défaut est détecté.
VITESSE VEHICL [km/h]	● Affichage de la vitesse du véhicule lorsqu'un défaut est détecté.
C/P PAP ABSOL [%]	● Affichage de l'angle d'ouverture de la soupape de papillon lorsqu'un défaut est détecté.
PLAN CAR BASE [ms]	● Affichage du barème de consommation au moment de la détection d'un défaut.
CAP TEMP ADMI [°C]	● Affichage de la température d'air d'admission au moment de la détection d'un défaut.

*: Eléments identiques à ceux des données figées de 1er parcours.

MODE DE CONTRÔLE DE DONNÉES

NEEC0034S06

Elément contrôlé [unité]	Signaux d'entrée de l'ECM	Signaux princi-paux	Description	Remarques
TR/MN MOT [tr/mn]	○	○	● Indication du régime-moteur calculé à partir du signal REF (signal 180°) du capteur de position de l'arbre à cames.	● La précision diminue si le régime-moteur tombe en dessous du tr/mn du régime de ralenti. ● Si le signal est interrompu alors que le moteur tourne, une valeur anor-male peut être indiquée.
DEBITMETRE-R1 [V]	○	○	● Affichage de la tension de signal du débitmètre d'air.	● Une fois le moteur arrêté, une cer-taine valeur est indiquée.
PLAN CAR BASE [ms]		○	● ''Plan de carburant de base'' indique la largeur d'impulsion d'injection du car-burant programmée dans l'ECM, avant toute correction à bord.	
ALPHA A/CARB-R1 [%]		○	● Indication de la valeur moyenne du fac-teur de correction de la régulation auto-matique de richesse de mélange air-carburant par cycle.	● Une fois le moteur arrêté, une cer-taine valeur est indiquée. ● Ces données comprennent égale-ment les données pour la commande d'instruction de la richesse de mélange air-carburant.
CAP TEMP MOT [°C]	○	○	● Affichage de la température du liquide de refroidissement du moteur (déter-minée par la tension du signal du capteur de température du liquide de refroidis-sement du moteur).	● Si le circuit du capteur de tempéra-ture du liquide de refroidissement du moteur est ouvert ou court-circuité, l'ECM passe en mode de sécurité. Affichage de la température du moteur déterminée par l'ECM.
S/O2 CH1 (R1) [V]	○	○	● Affichage de la tension du signal de la sonde à oxygène chauffé 1.	
S/O2 CH2 (R1) [V]	○		● Affichage de la tension du signal de la sonde à oxygène chauffé 2.	

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Elément contrôlé [unité]	Signaux d'entrée de l'ECM	Signaux principaux	Description	Remarques
MTR S/O2 CH1 (R1) [RICHE/PAUVRE]	○	○	● Affichage du signal de la sonde à oxygène chauffé 1 durant le contrôle de régulation automatique du rapport air-carburant : RICHE ... signifie que le mélange est devenu ''riche'', et la commande est affectée vers un mélange plus pauvre. PAUVRE ... signifie que le mélange est devenu trop pauvre et la commande est affectée vers un mélange plus riche.	● Lorsque la clé de contact est mise sur ''ON'', le message ''RICHE'' est affiché tant que le contrôle du rapport air-carburant n'a pas commencé. ● Lorsque la régulation automatique du mélange air-carburant est verrouillée, la valeur précédant immédiatement le verrouillage s'affiche de faç;on continue.
MTR S/O2 CH2 (R1) [RICHE/PAUVRE]	○		● Affichage du signal de la sonde à oxygène chauffé 2 : RICHE ... signifie que la teneur en oxygène en aval du catalyseur à 3 voies est relativement faible. PAUVRE ... signifie que la teneur en oxygène en aval du catalyseur à 3 voies est relativement importante.	● Une fois le moteur arrêté, une certaine valeur est indiquée.
CAP VIT VEHIC [km/h]	○	○	● Affichage de la vitesse du véhicule calculée à partir du signal de capteur de vitesse du véhicule.	
TENS BATTERIE [V]	○	○	● Affichage de la tension d'alimentation électrique de l'ECM.	
CAP PAPILLON [V]	○	○	● Affichage de la tension de signal du capteur de position de papillon.	
CAP TEMP ADMI [°C]	○	○	● Indication de la température d'air d'admission déterminée par la tension du signal du capteur de température d'air d'admission.	
SIGNAL DEMAR [MAR/ARR]	○	○	● Indication de l'état de [MAR/ARR] du signal de starter.	● Après avoir démarré le moteur, [ARR] s'affiche quel que soit le signal de starter.
POSIT RALENTI [MAR/ARR]	○	○	● Indication de la position de ralenti [MAR/ARR] calculée par l'ECM en fonction du signal du capteur de position de papillon.	
CON RALENTI [MAR/ARR]	○		● Indication de l'état mécanique [MAR/ARR] du contact de position de papillon fermé.	
SIGNAL CLIMAT [MAR/ARR]	○	○	● Indication de l'état [MAR/ARR] de l'interrupteur de climatiseur tel que déterminé par le signal de climatiseur.	
CON NEUTRE [MAR/ARR]	○	○	● Indication de l'état [MAR/ARR] du signal du contact de position de stationnement/point mort.	
SIG DIR ASSIS [MAR/ARR]	○	○	● Indication de l'état [MAR/ARR] du manocontact d'huile de direction assistée déterminé par le signal de pression d'huile de direction assistée.	

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Elément contrôlé [unité]	Signaux d'entrée de l'ECM	Signaux principaux	Description	Remarques
CONT TEMP AMB [MAR/ARR]	○		● Indique l'état [MAR/ARR] depuis le signal du contact de température d'air ambiant.	
CON ALLUMAGE [MAR/ARR]	○		● Indication de l'état [MAR/ARR] du contact d'allumage.	
IMPUL INJ-R1 [ms]		○	● Indication de la durée réelle des impulsions d'injection de carburant compensées par l'ECM en fonction des signaux d'entrée.	● Une fois le moteur arrêté, une certaine valeur calculée est indiquée.
CALAGE ALLUM [APMH]		○	● Indication du calage de l'allumage calculé par l'ECM en fonction des signaux d'entrée.	
VALEUR CHARGE CALC [%]			● ''Evaluation de charge'' montre la valeur du débit d'air actuel divisée par la valeur la plus haute de débit d'air.	
C/P PAP ABSOL [%]			● ''Capteur de position absolue de papillon '' montre le degré d'ouverture du papillon calculé par l'ECM, en fonction de la tension du signal émis par le capteur de position de papillon.	
DEBITMETRE AIR [g·m/s]			● Indication du débit d'air d'admission calculé par l'ECM en fonction de la tension du signal en tension délivré par le débitmètre d'air.	
IACV-AAC/V [%]		○	● Indication de la valeur de commande de la soupape IACV-AAC calculée par l'ECM en fonction des signaux d'entrée.	
S/COM VOL PURG [%]			● Indication de la valeur de commande volume de cartouche EVAP calculée par l'ECM en fonction des signaux d'entrée. ● L'ouverture s'élargit lorsque la valeur augmente.	
RELAIS CLIMAT [MAR/ARR]		○	● Indication de l'état du relais de climatiseur déterminé par l'ECM en fonction des signaux d'entrée.	
REL POMP ALI [MAR/ARR]		○	● Indication de l'état de la commande du relais de la pompe à carburant déterminé par l'ECM en fonction des signaux d'entrée.	
CH S/02 CH1 (R1) [MAR/ARR]			● Indication de l'état [MAR/ARR] du chauffage de la sonde à oxygène chauffé 1 déterminée par l'ECM en fonction des signaux d'entrée.	
CH S/O2 CH2 (R1) [MAR/ARR]			● Indication de l'état [MAR/ARR] du chauffage de la sonde à oxygène chauffé 2 déterminée par l'ECM en fonction des signaux d'entrée.	
TENSION [V]			● Tension mesurée par le capteur de tension.	

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Elément contrôlé [unité]	Signaux d'entrée de l'ECM	Signaux princi-paux	Description	Remarques
COURS APRES TEMOIN [km]			● Distance parcourue alors que le MI est activé	
Fréquence [ms] ou [Hz] ou [%]			● Amplitude, fréquence ou cycle d'impul-sions mesurés par le capteur d'impul-sions.	● Seul ''#'' est affiché si l'élément ne peut pas être mesuré. ● Les valeurs accompagnées du signe ''#'' sont temporaires. Elles sont iden-tiques à celles mesurées précédem-ment.

REMARQUE :
Tout élément contrôlé qui ne correspond pas au véhicule diagnostiqué est automatiquement effacé de l'affichage.

MODE DE CONTROLE DE DONNÉES (SPEC)

NEEC0034S12

Elément contrôlé [unité]	Signaux d'entrée de l'ECM	Signaux princi-paux	Description	Remarques
TR/MN MOT [tr/mn]	○	○	● Indication du régime-moteur calculé à partir du signal REF (signal 180°) du capteur de position de l'arbre à cames.	
DEBITMETRE-R1 [V]	○	○	● Affichage de la tension du signal de spécification du débitmètre d'air.	● Lorsque le moteur tourne, la gamme de spécification est indiquée.
PLAN CAR BASE [ms]		○	● ''Plan de carburant de base'' indique la largeur d'impulsion d'injection du car-burant programmée dans l'ECM, avant toute correction à bord.	● Lorsque le moteur tourne, la gamme de spécification est indiquée.
ALPHA A/CARB-R1 [%]		○	● La valeur moyenne du facteur de cor-rection par régulation automatique du mélange air/carburant par cycle est indiqué.	● Lorsque le moteur tourne, la gamme de spécification est indiquée. ● Ces données comprennent également les données pour la commande d'ins-truction de la richesse de mélange air-carburant.

NOTE:
Tout élément contrôlé qui ne correspond pas au véhicule diagnostiqué est automatiquement effacé de l'affichage.

MODE DE TEST ACTIF

NEEC0034S07

ELEMENT DE TEST	CONDITION	JUGEMENT	CONTROLER L'ELEMENT (REMISE EN ETAT)
INJECTION CAR-BUR	● Moteur : Retour à la condition de défaut originale ● Modifier la quantité de carburant injecté à l'aide de CONSULT-II.	Si les symptômes du défaut disparaissent, se reporter à la colonne CONTROLER L'ELE-MENT.	● Faisceau et connecteur ● Injecteurs de carburant ● Sonde à oxygène chauffé 1
CALAGE ALLUM	● Moteur : Retour à la condition de défaut originale ● Lampe stroboscopique : Réglage ● Retarder le calage de l'allumage au moyen de CONSULT-II.	Si les symptômes du défaut disparaissent, se reporter à la colonne CONTROLER L'ELE-MENT.	● Régler le calage d'allumage ini-tial

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

ELEMENT DE TEST	CONDITION	JUGEMENT	CONTROLER L'ELEMENT (REMISE EN ETAT)
OUVERTURE S/ IACV-AAC	● Moteur : faire chauffer le moteur, puis le faire tourner au ralenti. ● Modifier le pourcentage d'ouverture de la soupape IACV-AAC à l'aide de CONSULT-II.	Le régime-moteur change avec le pourcentage d'ouverture.	● Faisceau et connecteur ● Soupape IACV-AAC
EQUILIBR PUISSANCE	● Moteur : faire chauffer le moteur, puis le faire tourner au ralenti. ● Interrupteur de climatiseur sur ''OFF'' ● Levier de passage sur ''N'' ● Couper les signaux des injecteurs l'un après l'autre à l'aide de CONSULT-II.	Le moteur tourne mal ou s'arrête.	● Faisceau et connecteur ● Compression ● Injecteurs ● Transistor d'alimentation ● Bougies d'allumage ● Bobines d'allumage
TEMP LIQ REFR	● Moteur : Retour à la condition de défaut originale ● Modifier l'indication de la température du liquide de refroidissement du moteur à l'aide de CONSULT-II.	Si les symptômes du défaut disparaissent, se reporter à la colonne CONTROLER L'ELEMENT.	● Faisceau et connecteur ● Capteur de température du liquide de refroidissement du moteur ● Injecteurs de carburant
RELAIS POMPE D'ALIM	● Contact d'allumage : ON (moteur à l'arrêt) ● Mettre le relais de la pompe d'alimentation sur ''MAR'', puis sur ''ARR'' avec CONSULT-II, et écouter le bruit de fonctionnement.	Le relais de pompe à carburant produit un bruit de fonctionnement.	● Faisceau et connecteur ● Relais de pompe d'alimentation
SOUP COM VOL PURG	● Moteur : chauffer le moteur et le faire tourner à 1.500 tr/min ● Modifier le pourcentage d'ouverture de l'électrovanne de commande de volume de purge de cartouche EVAP à l'aide de CONSULT-II.	Le régime-moteur change avec le pourcentage d'ouverture.	● Faisceau et connecteur ● Electrovanne de commande de volume de purge de cartouche EVAP

DIAGNOSTIC EN TEMPS RÉEL EN MODE DE CONTRÔLE DES DONNÉES (RELEVÉ DES DONNÉES VÉHICULE)

NEEC0034S10

CONSULT-II offre deux types de déclenchement qui peuvent être sélectionnés en touchant ‘‘CONFIG’’ dans le mode ‘‘CONTROLE DE DONNEES’’.

1) ‘‘ENCLEN AUTO’’ (enclenchement automatique):

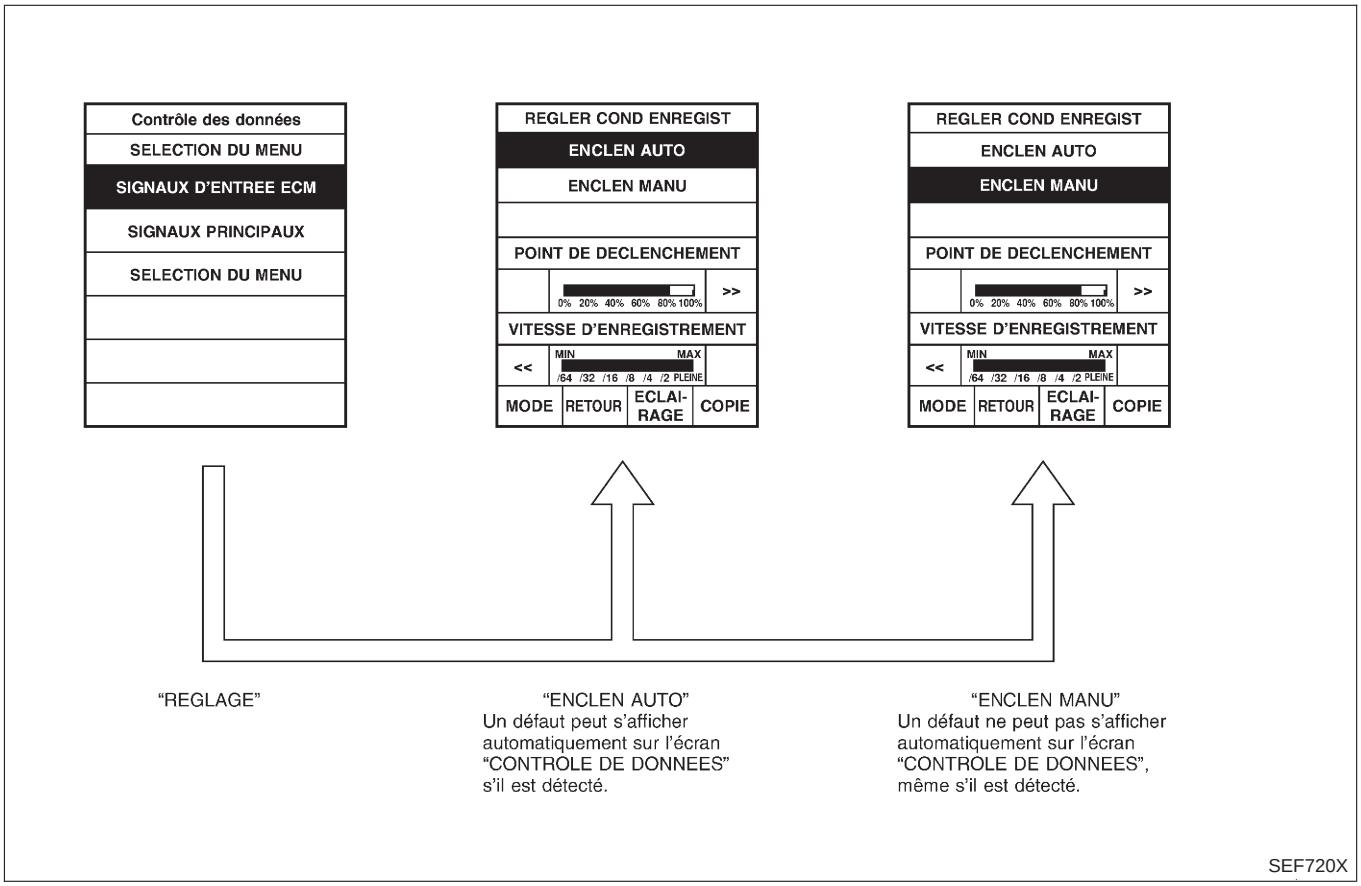
- Le défaut est identifié en temps réel sur l’écran de CONSULT-II.
  Autrement dit, le DTC/DTC de 1er parcours et l’élément de défaut sont affichés si l’ECM détecte le défaut.
  Au moment où un défaut est détecté par l’ECM, ‘‘CONTROLE’’ sur l’écran ‘‘CONTROLE DE DONNEES’’ change en ‘‘Enregistrement données ... xx%’’ comme indiqué à gauche, et la donnée après la détection du défaut est enregistrée. Puis, lorsque le pourcentage a atteint 100%, l’écran ‘‘DIAG TEMPS REEL’’ apparaît. Si ‘‘STOP’’ est touché sur l’écran pendant ‘‘Enregistrement données ... xx%’’, l’écran ‘‘DIAG TEMPS REEL’’ apparaît également.
  Le temps et la vitesse d’enregistrement après la détection du défaut peuvent être modifiés à l’aide de ‘‘POINT DE DECLENCHEMENT’’ et de ‘‘VITESSE D’ENREGISTREMENT’’. Se reporter au manuel d’utilisation de CONSULT-II.

2) ‘‘ENCLEN MANU’’ (Enclenchement manuel):

- Le DTC/DTC de 1er parcours et l’élément de défaut ne s’affichent pas automatiquement à l’écran de CONSULT-II même si l’ECM détecte un défaut.
  Les données peuvent être contrôlées continuellement même si un défaut est détecté.

Utiliser ces déclencheurs comme suit :

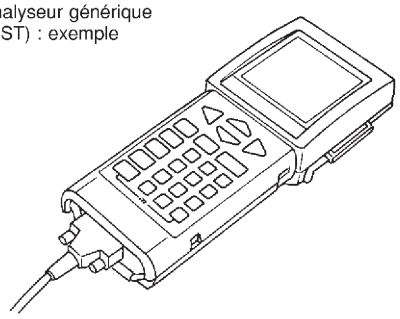
1) ‘‘ENCLEN AUTO’’



- Lorsqu’on essaie de détecter le DTC/DTC de 1er parcours en réalisant une ‘‘PROCEDURE DE CONFIRMATION DE DTC’’, veiller à sélectionner le mode ‘‘CONTROLE DE DONNEES (ENCLEN AUTO)’’. Le défaut peut être confirmé lors de sa détection.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

- Pour procéder à l'élimination des causes possibles, CONSULT-II doit être réglé en mode ''CONTROLE DE DONNEES (ENCLEN AUTO)'', particulièrement si le défaut se produit de faç;on intermittente.
  Lorsque l'inspection du circuit est effectuée en secouant avec précaution (ou en tordant) les connecteurs, pièces ou faisceau suspects selon la ''Procédure de confirmation de code de défaut (DTC)'', le DTC/DTC de 1er parcours s'affiche dès qu'un défaut est détecté. (se reporter à ''Essais de simulation de défaut'' dans ''COMMENT REALISER UN DIAGNOSTIC EFFICACE EN CAS D'INCIDENT ELECTRIQUE'', section GI.



2) ''ENCLEN MANU''

- Si le défaut s'affiche dès que ''CONTROLE DE DONNEES'' est sélectionné, réinitialiser CONSULT-II sur ''ENCLEN MANU''. En sélectionnant ''ENCLEN MANU'', on peut surveiller et enregistrer les données. Les données peuvent être utilisées pour d'autres diagnostics, tels que la comparaison avec la valeur obtenue en suivant des conditions normales de fonctionnement.

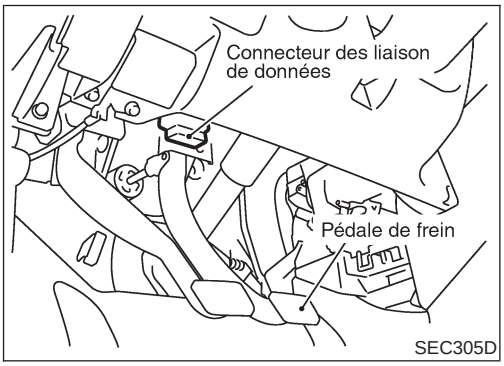
Analyseur générique (GST) : exemple

SEF139P



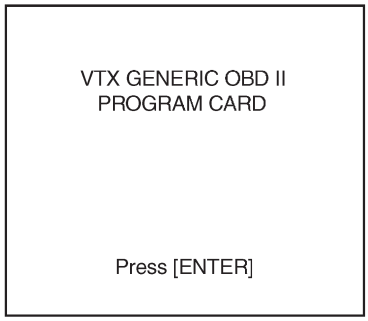
Analyseur générique (GST)

=NEEC0035

DESCRIPTION

NEEC0035S01

Conformément à la norme ISO 15031-4, l'analyseur générique GST, (outil d'analyse générique OBDII) offre les 8 fonctions décrites à la page suivante.
Le protocole de communication utilisé est la norme ISO9141.
Dans le présent manuel, l'appareil est indifféremment désigné ''GST'' ou ''analyseur générique'.

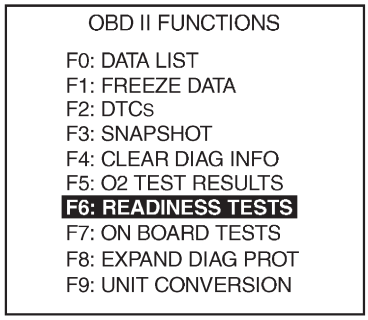


SEC305D

PROCÉDURE D'INSPECTION DE L'ANALYSEUR GÉNÉRIQUE GST

NEEC0035S02

1. Mettre le contact d'allumage sur OFF.
2. Connecter le ''GST'' au connecteur de diagnostic GST, situé sous le tableau de bord de gauche à proximité du couvercle de la boîte à fusibles.



Ecran d'exemple*

SEF398S

3. Mettre le contact d'allumage sur ON.
4. Ouvrir le programme conformément aux instructions affichées à l'écran ou décrites dans le manuel d'utilisation.

(*: Les écrans du GST pertinents dans cette section sont illustrés sous forme d'exemples.)

EXEMPLE D'ECRAN *

SEF416S

5. Utiliser chacun des modes de diagnostic conformément aux procédures d'entretien correspondantes.

Pour de plus amples informations, consulter le manuel d'utilisation fourni par le fabricant de l'appareil GST.

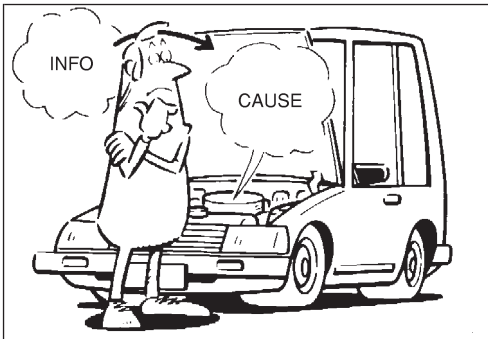
Analyseur générique (GST)

FONCTIONNEMENT



NEEC0035S03

Mode de test de diagnostic		Fonctionnement
MODE1	TESTS DE LECTURE	Ce mode permet d'accéder aux données de diagnostic liées au système antipollution du véhicule, qui comprennent les entrées et sorties analogiques, les entrées et sorties numériques et les informations concernant l'état du système.
MODE 2	(DONNEES FIGEES)	Ce mode permet d'accéder aux données de diagnostic liées au système antipollution qui ont été mémorisées par l'ECM lors de la détection d'une donnée figée [pour plus d'informations, se reporter à ''Données figées'' (EC-3079).]
MODE 3	DTC	Ce mode permet d'accéder aux codes de défaut du groupe motopropulseur liés au système antipollution et mémorisés par l'ECM.
MODE 4	EFFAC INFO DIAG	Ce mode permet d'effacer toutes les informations de diagnostic liées au système antipollution. Cela comprend : ● Effacement du numéro des codes de défaut (MODE 1) ● Effacement des codes de diagnostic (MODE 3) ● Effacement du code de défaut des données figées (MODE 1) ● Effacement des données figées (MODE 2) ● Réinitialisation de l'état du diagnostic de contrôle du système (MODE 1) ● Effacement des résultats du test de diagnostic de bord (MODES 6 et 7)
MODE 6	(TESTS DE BORD)	Ce mode permet d'accéder aux résultats des tests de diagnostic de bord de composants/systèmes spécifiques, qui ne font pas l'objet d'une surveillance permanente.
MODE 7	(TESTS DE BORD)	Ce mode permet aux équipement de test externes d'obtenir les résultats de diagnostic des composants/systèmes du groupe motopropulseur liés au système antipollution qui ne font pas l'objet d'une surveillance permanente en conditions normales d'utilisation.
MODE 8	—	—
MODE 9	(ETALONNAGE ID)	Ce mode permet aux équipements de test externes d'obtenir des informations propres au véhicule, comme par exemple le numéro d'identification du véhicule (VIN) et les codes d'identification d'étalonnage.

SEF907L

Introduction

NEEC0036

Le moteur est muni d'un ECM pour la vérification des systèmes principaux tels que le contrôle du carburant, le contrôle d'allumage, les systèmes d'admission d'air au ralenti, etc. L'ECM accepte des signaux d'entrée des capteurs et commande instantanément les actionneurs. Il est essentiel que les signaux d'entrée et de sortie soient corrects et stables. Il est également important qu'il n'y ait pas de problèmes comme une fuite au niveau de la conduite de dépression, des bougies d'allumage encrassées, ou tout autre problème lié au moteur.

Il est beaucoup plus difficile de faire le diagnostic d'un problème qui se manifeste de manière intermittente que celui d'un problème constant. La plupart des défauts intermittents sont le fait d'une mauvaise connexion électrique ou d'un câblage défectueux. En pareil cas, une vérification soigneuse des circuits suspects peut éventuellement éviter le remplacement de pièces qui n'étaient pas fautives.

Le contrôle visuel seul ne permet pas toujours de déterminer la cause des défauts. Il convient d'effectuer un essai sur route à l'aide de CONSULT-II (ou du GST) ou d'un testeur de circuit branché. Suivre la ''Procédure de travail'' à la page EC-3090.

Avant d'entreprendre les vérifications, prendre quelques minutes pour parler avec le client qui se plaint d'une mauvaise conduite. Le client peut fournir des renseignements utiles quant à ces problèmes, en particulier les problèmes se produisant de faç;on intermittente. Se renseigner sur les symptômes présents et sur les conditions dans lesquelles ils se présentent. Il convient d'utiliser une ''Fiche de diagnostic'' comme celle présentée à la page suivante.

Commencer le diagnostic en recherchant d'abord les problèmes ''conventionnels''. Ceci aidera à dépister les problèmes de conduite sur un véhicule équipé d'un moteur à commande électronique.

FICHE DE DIAGNOSTIC

NEEC0036S01

Plusieurs conditions de fonctionnement entraînent un défaut des composants du moteur. Une bonne connaissance de ces cas peut accélérer la procédure et en améliorer l'exactitude.

En règle générale, la capacité à cerner le problème dépend des explications de chaque client. Il est important de bien comprendre les symptômes ou les conditions liées à la plainte du client.

Il convient donc d'utiliser une fiche de diagnostic comme celle présentée à la page suivante pour récapituler les informations nécessaires à la recherche des pannes.

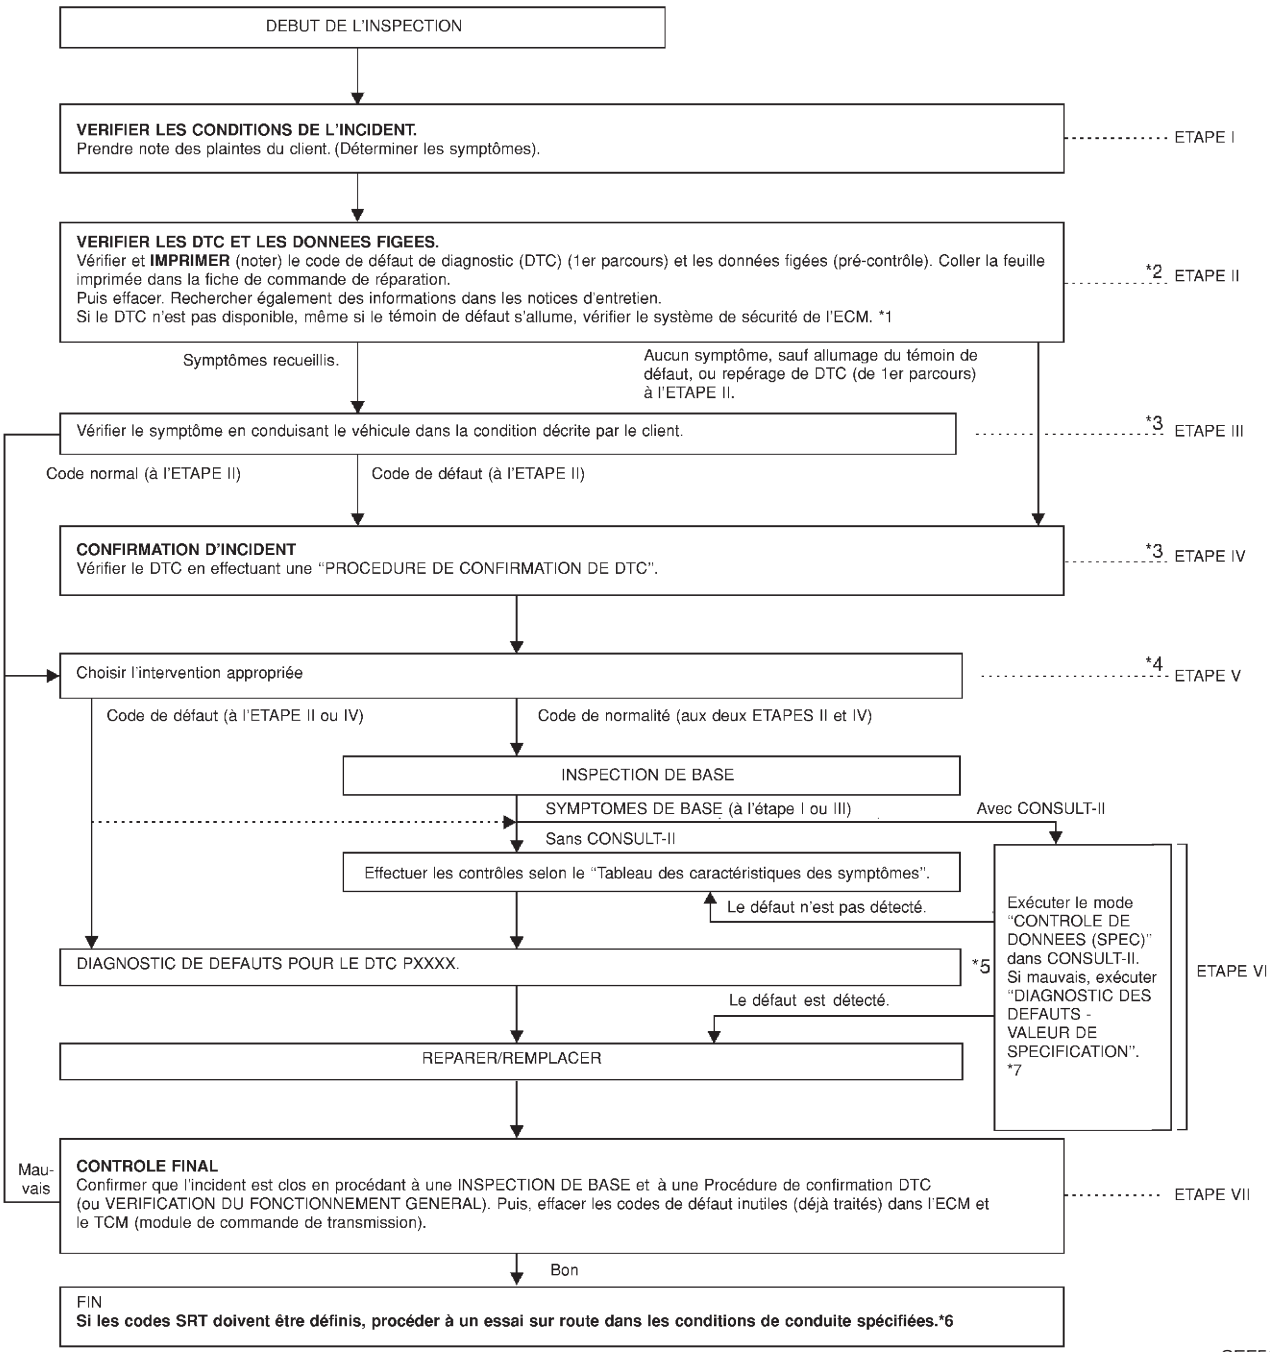
Certaines conditions peuvent entraîner l'allumage continu ou le clignotement de l'indicateur de défaut et la détection du DTC. Exemples :

- Le véhicule est tombé en panne d'essence, ce qui a causé des ratés d'allumage.
- Le bouchon de remplissage de carburant a été retiré ou mal vissé, permettant au carburant de s'évaporer dans l'atmosphère.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Exemple de fiche de diagnostic

NEEC0036S0101



Nom du client M./Mme/Mlle		Modèle et année	VIN
Moteur #		Transmission	Kilométrage
Date incident		Date de fabrication	Date d'entrée en service
Carburant et bouchon de remplissage de carburant		☐ Panne d'essence entraînant des ratés d'allumage ☐ Le bouchon de remplissage de carburant n'a pas été remis en place ou n'a pas été correctement vissé.	
Symptômes	☐ Aptitude au démarrage	☐ Démarrage impossible ☐ Pas de combustion ☐ Combustion partielle ☐ Combustion partielle à certaines positions seulement de l'accélérateur ☐ Combustion partielle NON affectée par la position du papillon ☐ Démarrage possible mais récalcitrant ☐ Autres [ ]	
	☐ Ralenti	☐ Pas de ralenti à vide ☐ Instable ☐ Ralenti accéléré ☐ Ralenti trop bas ☐ Autres [ ]	
	☐ Conduite	☐ Hésitation ☐ Afflux ☐ Détonation ☐ Manque de puissance ☐ Flammes à l'admission ☐ Flammes à l'échappement ☐ Autres [ ]	
	☐ Calage du moteur	☐ Au démarrage ☐ Au ralenti ☐ En accélération ☐ En décélération ☐ Peu après l'immobilisation ☐ Lors de l'application d'une charge	
Manifestation d'incident		☐ Peu après la livraison ☐ Récemment ☐ Le matin ☐ La nuit ☐ Dans la journée	
Fréquence		☐ Constamment ☐ Dans certaines conditions ☐ Parfois	
Conditions climatiques		☐ Sans effet	
	Conditions atmosphériques	☐ Ensoleillement ☐ Pluie ☐ Neige ☐ Autres [ ]	
	Température	☐ Chaud ☐ Tempérées ☐ Fraîches ☐ Froides ☐ Humides °C	
Conditions du moteur		☐ Froides ☐ Pendant la période d'échauffement ☐ Une fois le moteur chaud Régime du moteur 0 — 2 000 — 4 000 — 6 000 — 8 000 tr/mn	
Conditions de la route		☐ Cycle urbain ☐ Cycle banlieue ☐ Autoroute ☐ Tous terrains (montée/descente)	
Conditions de conduite		☐ Sans effet ☐ Au démarrage ☐ Au ralenti ☐ En conduite sportive ☐ En accélération ☐ A vitesse stabilisée ☐ En décélération ☐ En tournant (droite/gauche) Vitesse du véhicule 0 — 10 — 20 — 30 — 40 — 50 — 60 MPH	
Témoin d'anomalie de fonctionnement		☐ Allumé ☐ Eteint

DESCRIPTION DE LA PROCÉDURE

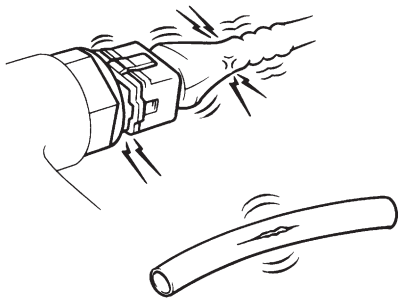
NEEC0037S01

ETAPE	DESCRIPTION
ETAPE I	Obtenir des renseignements détaillés sur les conditions et l'environnement dans lesquels le défaut/symptôme s'est produit en utilisant la ''FICHE DE CONTROLE DE DIAGNOSTIC'', illustrée à la page EC-3090.
ETAPE II	Avant de confirmer votre pronostic, vérifier et écrire (imprimer à l'aide de CONSULT-II ou de l'analyseur générique) le DTC (1er parcours) et les données figées (1er parcours), puis effacer le DTC et les données. (Se reporter à EC-3065). Le DTC (1er parcours) et les données figées (1er parcours) peuvent être utilisées en reproduisant le défaut lors des ETAPES III et IV. Etudier la relation entre la cause indiquée par le DTC (1er parcours), et le symptôme rapporté par le client (le ''Tableau des caractéristiques des symptômes'' sera utile. Voir EC-3108.) Chercher également des informations dans les notices d'entretien.
ETAPE III	Essayer de confirmer le symptôme et les conditions dans lesquelles le défaut se produit. La ''FICHE DE CONTROLE DE DIAGNOSTIC'' et les données figées sont utiles pour vérifier l'incident. Brancher CONSULT-II au véhicule, le régler en mode CONTROLE DE DONNEES (ECLEN AUTO) et vérifier les résultats du diagnostic en temps réel. Si l'incident ne peut être confirmé, procéder aux TESTS DE SIMULATION D'INCIDENT. (se reporter à la section GI). Si le code de défaut est détecté, passer directement à l'étape V.
ETAPE IV	Essayer de détecter le DTC (1er parcours) en conduisant et/ou en réalisant la ''Procédure de confirmation de code de défaut (DTC)''. Contrôler et lire le DTC (1er parcours) et les données figées (1er parcours) à l'aide de CONSULT-II ou du GST. Pendant la vérification du DTC (1er parcours), veiller à brancher CONSULT-II au véhicule en mode CONTROLE DE DONNEES (ENCLEN AUTO) et vérifier les résultats du diagnostic en temps réel. Si l'incident ne peut être confirmé, procéder aux ''Tests de simulation d'incident''. (se reporter à la section GI). Au cas où la ''PROCEDURE DE CONFIRMATION DE DTC'' serait indisponible, réaliser en remplacement une ''VERIFICATION DU FONCTIONNEMENT GENERAL''. Si le DTC (de 1er parcours) ne peut être affiché par ce dernier contrôle, il constitue néanmoins une ''vérification'' efficace. Un résultat ''MAUVAIS'' lors de la ''VERIFICATION DU FONCTIONNEMENT GENERAL'' équivaut à la détection d'un DTC (de 1er parcours).
ETAPE V	Prendre les mesures appropriées sur la base des résultats des étapes I à IV. Si le code de défaut s'affiche, passer au DIAGNOSTIC DES DEFAUTS POUR LE DTC PXXXX. Si le code normal est indiqué, passer au INSPECTION DE BASE. (Se reporter à EC-3092.) Si CONSULT-II est disponible, effectuer le mode ''CONTROLE DE DONNEES (SPEC)'' avec CONSULT-II et procéder au ''DIAGNOSTIC DES DEFAUTS — VALEUR DE SPECIFICATION'', EC-3127. (Si un défaut est détecté, procéder à ''REPARATION/REMPLACEMENT''.) Puis réaliser les inspections selon le tableau des caractéristiques des symptômes. (Se reporter à EC-3108.)
ETAPE VI	Déterminer où commencer le diagnostic en fonction de l'étude de la relation entre le symptôme et les causes possibles. Inspecter le système en cas de grippage mécanique, connecteurs desserrés, ou câblage endommagé à l'aide de ''Disposition des faisceaux''. Secouer doucement les connecteurs, composants ou faisceaux électriques correspondants, avec CONSULT-II en mode ''CONTROLE DE DONNEES (ENCLEN AUTO)''. Vérifier la tension aux bornes concernées de l'ECM ou vérifier les signaux de sortie des capteurs correspondants à l'aide de CONSULT-II. Se reporter à EC-3118. La ''Procédure de diagnostic'' de la section EC contient une description basée sur l'inspection en circuit ouvert. Une brève inspection du circuit est également nécessaire pour le contrôle du circuit dans la procédure de diagnostic. Pour de plus amples détails, se reporter à la section GI (''COMMENT ACCOMPLIR UN DIAGNOSTIC EFFICACE EN CAS D'INCIDENT ELECTRIQUE'', ''Inspection de circuit''). Réparer ou remplacer les pièces défectueuses.
ETAPE VII	Après avoir réparé le circuit ou remplacé un composant, faire tourner le moteur dans les mêmes conditions et circonstances que celles qui sont à l'origine du problème initialement décrit par le client. Effectuer la ''PROCEDURE DE CONFIRMATION DE CODE DE DIAGNOSTIC'' et vérifier que le code normal [Code de diagnostic n° P0000 ou 0505] est détecté. Si le défaut est toujours présent lors du contrôle final, effectuer l'ETAPE VI en utilisant une méthode différente de la précédente. Avant de rendre le véhicule au client, veiller à effacer les DTC (1er parcours) inutiles (déjà réparés) de l'ECM. (Se reporter à EC-3065.)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection de base

NEEC0038



Précaution :
Effectuer l'inspection de base sans appliquer de charge électrique ou mécanique.

- **La commande des phares n'est pas actionnée.**
- **L'interrupteur de climatiseur est à l'arrêt,**
- **L'interrupteur de désembuage de lunette arrière est sur ARRET.**
- **Le volant est dans la position droite, etc.**

1	DEBUT DE L'INSPECTION

1. Chercher dans les notices d'entretien toute indication de maintenance devant être effectuée, ou de réparation récente pouvant avoir un lien avec le problème.
2. Ouvrir le capot et vérifier :

- Que les connecteurs de faisceau ne sont pas mal branchés
- Que les flexibles à dépression ne sont pas fissurés, n'ont pas de défauts et sont bien raccordés
- Que les câbles ne sont pas desserrés, coincés ou coupés.

Tableau des priorités d'inspection des codes de défaut de diagnostic

NEEC0039

Si plusieurs codes de défaut sont affichés en même temps, effectuer les inspections nécessaires l'une après l'autre dans l'ordre de priorité établi par le tableau suivant.

Priorité	Eléments détectés (codes de défaut)
1	● P0101, P0102, P0103 Débitmètre d'air ● P0112, P0113, P0127 Capteur de température d'admission d'air ● P0117, P0118 Capteur de température moteur ● P0121, P0122, P0123 Capteur de position de papillon ● P0327, P0328 KS ● P0340 Capteur d'angle d'arbre à cames ● P0500 VSS ● P0605 ECM ● P1706 contact PNP
2	● P0031, P0032 Chauffage CH S/O2 CH1 ● P0037, P0038 Chauffage CH S/O2 CH2 ● P0132, P0133, P0134, P1143, P1144 CH S/O2 CH1 ● P0138, P0139, P1146, P1147 CH S/O2 CH2 P0335, P1336 Capteur CPV ● P0444, P0445 Electrovanne de commande de volume de purge de cartouche EVAP ● P0510 Contact CTP
3	● P0171, P0172 Fonctionnement du système d'injection de carburant ● P0300 - P0304 Raté d'allumage ● P0505 Système ISC ● P0420 Fonctionnement du catalyseur à trois voies

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Tableau de sécurité

=NEEC0040

L'ECM passe en mode de sécurité lorsque l'un des défauts suivants est détecté suite à un circuit ouvert ou à un court-circuit. Le témoin de défaut (MI) s'allume lorsque l'ECM passe en mode de sécurité

N° de DTC CONSULT-II GST	Eléments détectés	Condition de fonctionnement du moteur en mode de sécurité	
P0102 P0103	Circuit du débitmètre d'air	Le régime-moteur ne dépasse pas 2 400 tr/mn en raison de la coupure d'alimentation.	
P0112 P0113	Capteur de température d'air d'admission	L'ECM fonctionne dans la supposition que la température d'admission d'air est de 25°C.	
P0117 P0118	Circuit du capteur de température du liquide de refroidissement du moteur	La température du liquide de refroidissement du moteur est déterminée par l'ECM sur la base du laps de temps écoulé après avoir mis le contact d'allumage sur ON ou START. CONSULT-II affiche la température du liquide de refroidissement fixée par l'ECM.	
		Condition	Température du liquide de refroidissement du moteur fixée (affichage CONSULT-II)
		Au moment de la mise du contact d'allumage sur ON ou Start	40°C
		Plus de 4 minutes environ après mise du contact sur ON ou START	80°C
		Sauf comme indiqué ci-dessus	40 - 80°C (en fonction du temps écoulé)
P0122 P0123	Circuit du capteur de position de papillon	La position de papillon sera déterminée sur la base de la quantité de carburant injectée et du régime-moteur. Par conséquent, l'accélération sera faible.	
		Condition	Condition de conduite
		Moteur au ralenti	Normal
		Lors de l'accélération	Accélération faible
Impossible d'accéder à l'ECM	ECM	**Condition de déclenchement du système de sécurité de l'ECM** La fonction de calcul de l'ECM a été jugé défectueuse. Lorsque le système de sécurité s'enclenche (c'est-à-dire si l'ECM détecte une condition de défaut dans son unité centrale de traitement), le témoin de défaut (MI) du tableau de bord s'allume pour en avertir le conducteur. Il n'est toutefois pas possible d'accéder à l'ECM et de confirmer le code de défaut. **Gestion moteur sous système de sécurité** Lorsque le système de sécurité fonctionne, l'injection de carburant, le calage de l'allumage, la pompe à carburant et la soupape IACV-AAC sont toujours contrôlés, mais avec certaines limitations.	
			Fonctionnement du système de sécurité de l'ECM
		Régime-moteur	**Le régime-moteur ne dépasse pas 3 000 tr/mn.**
		Injection de carburant	Système d'injection multipoint simultanée
		Calage de l'allumage	Le calage de l'allumage est fixé sur la valeur prédéfinie
		Pompe à carburant	Le relais de la pompe à carburant est sur MARCHE lorsque le moteur tourne et sur ARRET lorsque le moteur cale
		Soupape IACV-AAC	Grand ouvert
		Remplacer l'ECM, après confirmation que l'ECM se trouve en mode de sécurité.

Valeur de référence de CONSULT-II en mode de contrôle de données

NEEC0042

Remarques :

- Les données de spécification constituent des valeurs de référence.
- Les données de spécification sont des valeurs de sortie/entrée qui sont détectées ou fournies par l'ECM au connecteur.

* Les données de spécification peuvent ne pas avoir de rapport direct avec les signaux/valeurs/fonctionnements de leurs composants. (par ex., régler le calage de l'allumage à l'aide d'une lampe stroboscopique avant de contrôler CALAGE ALLUM. Les données spécifiées peuvent être affichées même lorsque le calage de l'allumage est hors spécifications. Le CALAGE ALLUM' contrôle les données calculées par l'ECM selon les signaux d'entrée provenant du capteur d'angle d'arbre à cames et les autres capteurs qui concernent le calage de l'allumage.)

ELEMENT DE CONTROLE	CONDITION		SPECIFICATION
TR/MN MOT	• Compte-tours : Brancher • Faire tourner le moteur et comparer l'indication du compte-tours avec la valeur affichée par CONSULT-II		Valeur voisine de celle indiquée par CONSULT-II
DEBITMETRE-R1	• Moteur : une fois le moteur chaud • Interrupteur de climatiseur : ''OFF'' • Levier de changement de vitesses : ''N'' • A vide	Ralenti	0,9 - 1,8V
		2.500 tr/mn	1,9 - 2,3V
CAP TEMP MOT	• Moteur : une fois le moteur chaud		Plus de 70°C
S/O2 CH1 (R1)	• Moteur : une fois le moteur chaud	Maintenir le régime moteur à 2 000 tr/mn	0 - 0,3V ←→ Environ 0,6 - 1,0V
MTR S/O2 CH1 (R1)			PAUVRE ←→ RICHE Change plus de 5 fois pendant 10 secondes
S/O2 CH2 (R1)	• Moteur : une fois le moteur chaud	Montée rapide du régime moteur du ralenti jusqu'à 3 000 tr/mn	0 - 0,3V ←→ Environ 0,6 - 1,0V
MTR S/O2 CH2 (R1)			PAUVRE ←→ RICHE
CAP VIT VEHIC	• Faire tourner les roues motrices et comparer l'indication du compteur de vitesse avec la valeur affichée par CONSULT-II.		Vitesse proche de la valeur donnée par CONSULT-II
TENS BATTERIE	• Contact d'allumage : ON (moteur à l'arrêt)		11 - 14V
CAP PAPILLON	• Moteur : une fois le moteur chaud • Contact d'allumage : ON (moteur à l'arrêt)	Papillon entièrement fermé	0,2 - 0,8V
		Papillon entièrement ouvert	3,5 - 4,5V
SIGNAL DEMAR	• Contact d'allumage : ON → DEPART → ON		OFF → ON → OFF
CON RALENTI	• Moteur : une fois le moteur chaud • Contact d'allumage : ON (moteur à l'arrêt)	Soupape de papillon : position de ralenti	MAR
		Soupape de papillon : légèrement ouverte	ARRET
POSIT RALENTI	• Moteur : une fois le moteur chaud • Contact d'allumage : ON (moteur à l'arrêt)	Soupape de papillon : position de ralenti	MAR
		Soupape de papillon : légèrement ouverte	ARRET
SIGNAL CLIMAT	• Moteur : faire chauffer le moteur, puis le faire tourner au ralenti.	: ARRET	ARRET
		Interrupteur de climatiseur : ON (le compresseur fonctionne)	ON

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Valeur de référence de CONSULT-II en mode de contrôle de données

ELEMENT DE CONTROLE	CONDITION		SPECIFICATION
CON NEUTRE	● Contact d'allumage : ON	Levier de changement de vitesses : "N"	MAR
		Sauf ci-dessus	ARRET
SIG DIR ASSIS	● Moteur : faire chauffer le moteur, puis le faire tourner au ralenti.	Volant de direction en position point mort (direction avant)	ARRET
		Volant tourné	MAR
CON ALLUMAGE	● Contact d'allumage : ON → OFF → ON		ON → OFF → ON
IMPUL INJ-R1	● Moteur : une fois le moteur chaud ● Interrupteur de climatiseur : ARRET ● Levier de changement de vitesses : "N" ● A vide	Ralenti	2,5 - 3,3 ms
		2 000 tr/mn	2,4 - 3,2 ms
PLAN CAR BASE	● Moteur : une fois le moteur chaud ● Interrupteur de climatiseur : ARRET ● Levier de changement de vitesses : "N" ● A vide	Ralenti	0,8 - 1,2 ms
		2 000 tr/min	0,8 - 1,2 ms
CALAGE ALLUM	● Moteur : une fois le moteur chaud ● Interrupteur de climatiseur : ARRET ● Levier de changement de vitesses : "N" ● A vide	Ralenti	env. 15° avant P.M.H.
		2 000 tr/min	Supérieur à 30° avant P.M.H.
S/IACV/AAC	● Moteur : une fois le moteur chaud ● Interrupteur de climatiseur : ARRET ● Levier de changement de vitesses : "N" ● A vide	Ralenti	env. 30
		2000 tr/mn	—
S/COM VOL PURG	● Moteur : une fois le moteur chaud ● Interrupteur de climatiseur : ARRET ● A vide	Ralenti	0%
		2 000 tr/mn (plus de 200 secondes après démarrage moteur)	—
ALPHA A/CARB-R1	● Moteur : une fois le moteur chaud	Maintenir le régime moteur à 2 000 tr/mn	50 - 159%
RELAIS CLIMAT	● Interrupteur de climatiseur : OFF → ON		ARRET → MAR
REL POMP ALI	● Le contact d'allumage est mis sur ON' (fonctionne pendant 5 secondes) ● Le moteur tourne et démarre		MAR
	● Sauf comme indiqué ci-dessus		ARRET
CH S/02 CH1 (R1)	● Régime-moteur : inférieur à 3 600 tr/mn		MAR
	● Régime-moteur : supérieur à 3 600 tr/mn		ARRET

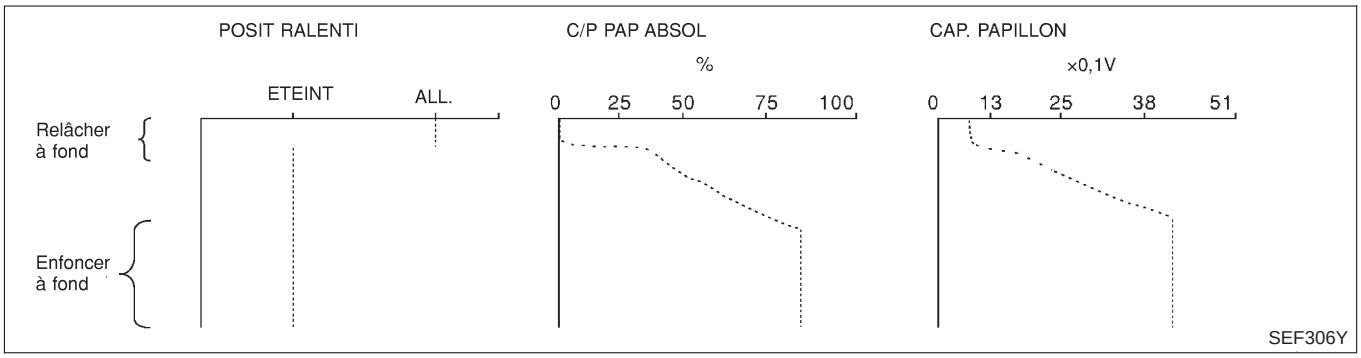
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Valeur de référence de CONSULT-II en mode de contrôle de données

ELEMENT DE CONTROLE	CONDITION		SPECIFICATION
CH S/O2 CH2 (R1)	● Régime-moteur : Au ralenti après avoir conduit pendant 2 minutes à une vitesse de 70 km/h ou plus		ON
	● Contact d'allumage : ON (moteur à l'arrêt)		ARRET
VAL CHARGE CALC	● Moteur : une fois le moteur chaud ● Interrupteur de climatiseur : ARRET ● Levier de changement de vitesses : "N" ● A vide	Ralenti	9,5 - 34,0
		2.500 tr/mn	13,9 - 24,9
C/P PAP ABSOL	● Moteur : Une fois chauffé, le moteur arrêté ● Contact d'allumage : ON	Soupape de papillon : entièrement fermée	0,0
		Soupape de papillon : entièrement ouverte	env. 80
DEBITMETRE AIR	● Moteur : une fois le moteur chaud ● Interrupteur de climatiseur : ARRET ● Levier de changement de vitesses : "N" ● A vide	Ralenti	0,9 - 5,8 g·m/s
		2.500 tr/mn	7,5 - 13,2 g·m/s
C/PRESS ABSOL	● Moteur : plus de 5 secondes après démarrage du moteur (une fois chauffé)		env. 1,2V

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Graphique de référence du capteur principal en mode de contrôle de données

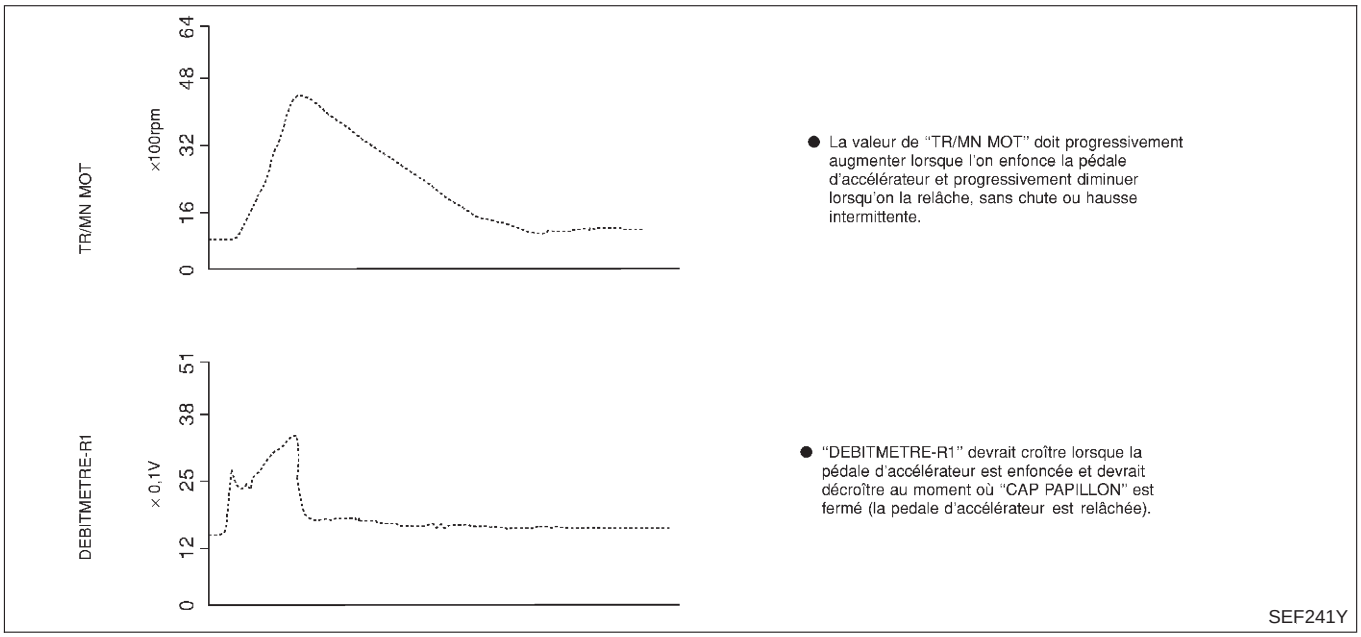


NEEC0043

Les courbes suivantes sont les courbes de référence principales des capteurs dans le mode ‘‘CONTROLE DE DONNEES’’.
(Sélectionner ‘‘ENCLEN MANU’’ dans ‘‘CONTROLE DES DONNEES’’ avec CONSULT-II. ‘‘Point de déclenchement’’ est réglé sur 100, ‘‘Vitesse d’enregistrement’’ est réglée sur MAXI.)

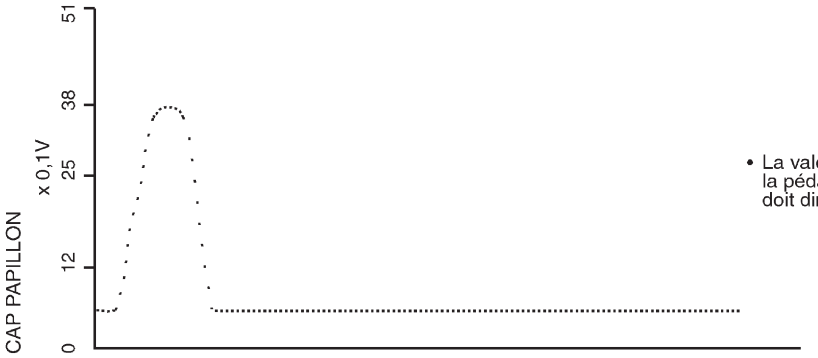
CAP PAPILLON, C/P PAP ABSOL, POSIT RALENTI

NEEC0043S01



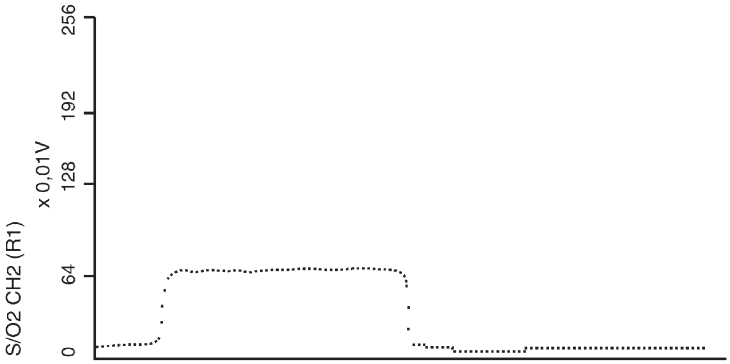
On trouvera ci-dessous les données pour ‘‘CAP PAPILLON’’, ‘‘C/P PAP ABSOL’’ et ‘‘POSIT RALENTI’’ quand on appuie sur la pédale d’accélérateur avec le contact d’allumage sur ON.
Le signal de ‘‘CAP PAPILLON’’ et ‘‘C/P PAP ABSOL’’ doit monter graduellement sans chute ou élévation intermittente après que ‘‘POSIT RALENTI’’ a changé de ‘‘ON’’ à ‘‘OFF’’.

TR/MN MOT, DEBITMETRE-R1, CAP PAPILLON, S/O2 CH2 (R1), S/O2 CH1 (R1), IMPUL INJ-R1

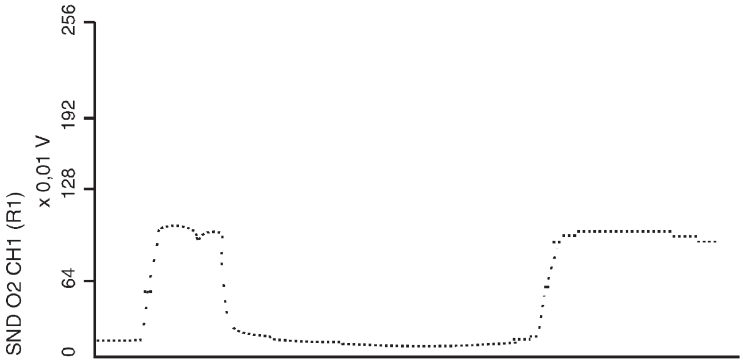


NEEC0043S02

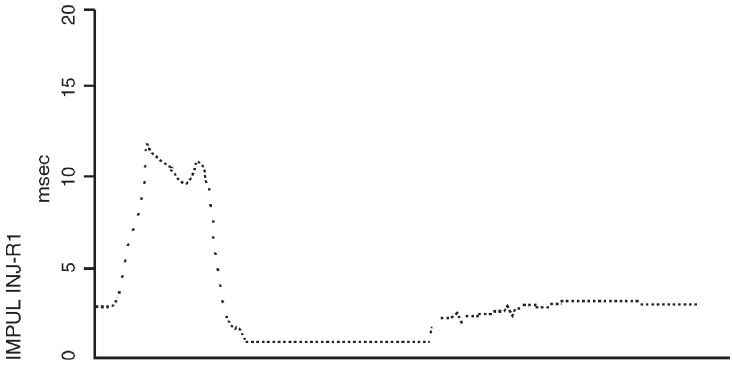
Ci-dessous se trouvent les données pour ‘‘TR/MN’’, ‘‘DEBITMETRE-R1’’, ‘‘CAP PAPILLON’’, ‘‘S/O2 CH2 (R1)’’, ‘‘S/O2 CH1 (R1)‘‘ et ‘‘IMPUL INJ-R1‘‘ au moment d’emballer le moteur rapidement jusqu’à 4 800 tr/mn à vide après avoir chauffé le moteur jusqu’à une température de fonctionnement normal.
Chaque valeur sert de référence, la valeur exacte peut varier.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

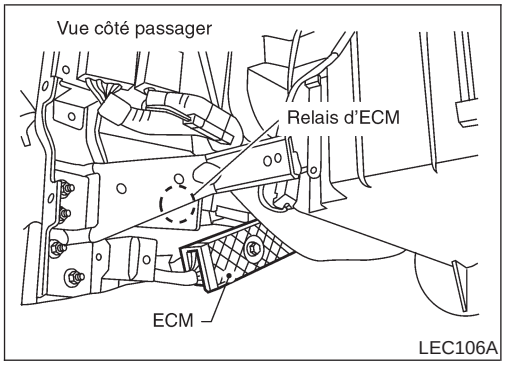


Graphique de référence du capteur principal en mode de contrôle de données

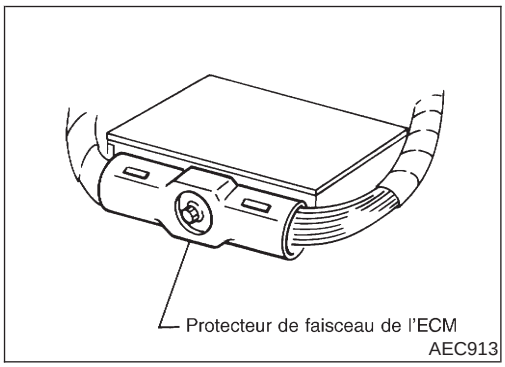


- La valeur ‘CAP PAPILLON‘ doit augmenter lorsque la pédale d’accélérateur est enfoncée et doit diminuer une fois relâchée.

- La valeur de ‘S/O2 CH2 (R1) ‘ peut augmenter immédiatement après enfoncement de la pédale d’accélérateur et diminuer après son relâchement.



- La valeur de ‘S/O2 CH1 (R1)‘ peut augmenter immédiatement après enfoncement de la pédale d’accélérateur et diminuer après son relâchement.



- La valeur ‘IMPUL INJ-R1‘ doit augmenter lors de l’enfoncement de la pédale d’accélérateur et doit diminuer lors de son relâchement.

Bornes de l'ECM et valeurs de référence

NEEC0044

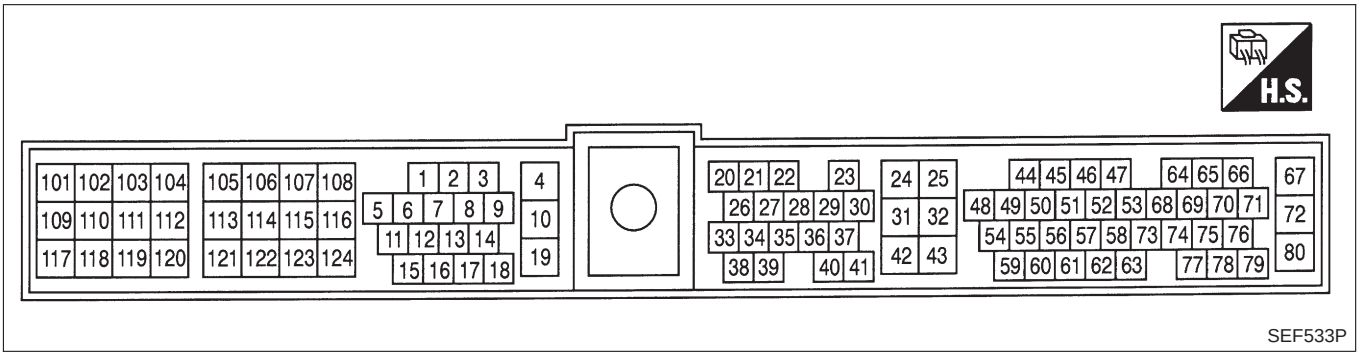
PRÉPARATION

NEEC0044S01

1. L'ECM se trouve derrière le panneau inférieur du tableau de bord. Pour cette inspection :

- Déposer le panneau inférieur du tableau de bord.

2. Déposer le protecteur de faisceau de l'ECM.



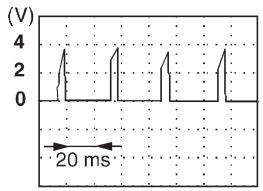
3. Effectuer toutes les mesures de tension avec le connecteur branché. Déployer la sonde du testeur comme indiqué pour faciliter les mesures.

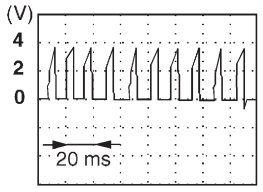
- Ouvrir le clip de fixation du faisceau pour faciliter le test.
- Faire très attention de ne pas toucher 2 bornes à la fois.
- Les données sont des valeurs de comparaison et peuvent ne pas être exactes.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

DISPOSITION DES BORNES DU CONNECTEUR DE FAISCEAU DE L'ECM

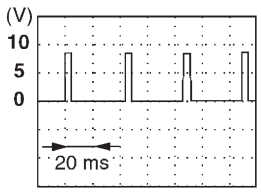
NEEC0044S02

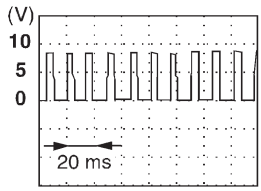


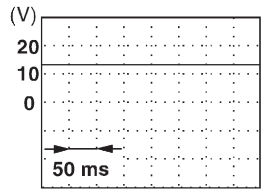


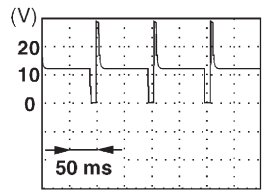
SEF533P

TABLEAU D'INSPECTION DE L'ECM









NEEC0044S03

les données de spécification sont des valeurs de référence et sont mesurées entre chaque borne et la masse.

CAUTION:
Ne pas utiliser de bornes de masse de l'ECM lors de la mesure de la tension d'entrée/de sortie. En agissant de la sorte, il est possible d'endommager le transistor de l'ECM. Utiliser une masse autre que les bornes de l'ECM, comme par exemple la prise de terre.

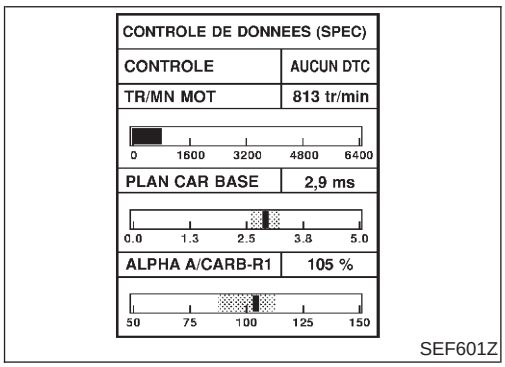
Description

NEEC1003

La valeur de spécification (SP) indique la tolérance de la valeur qui est affichée dans le mode ‘‘CONTROLE DE DONNEES (SPEC)’’ de CONSULT-II pendant un fonctionnent normal du système de gestion moteur. Lorsque la valeur indiquée dans le mode ‘‘CONTROLE DE DONNEES (SPEC)’’ est dans la fourchette des spécifications SP, le système de gestion moteur est confirmé comme bon. Lorsque la valeur indiquée dans le mode ‘‘CONTROLE DE DONNEES (SPEC)’’ n’est pas dans la fourchette de spécification SP, le système de gestion moteur peut avoir un défaut ou plus.
La valeur SP sert à détecter les défauts affectant le système de gestion du moteur, mais elle ne déclenche pas l’allumage du témoin MI.
La valeur SP s’affiche pour les trois éléments suivants :



- PLAN CAR BASE (largeur d’impulsion de l’injection de carburant programmée dans l’ECM, avant toute correction à bord)
- ALPHA A/CARB-R1/R2 (valeur moyenne du facteur de correction par régulation automatique du mélange air/carburant par cycle)
- DEBIMETRE-R1 (tension de signal du débitmètre d’air)

Conditions d’essai

NEEC1004

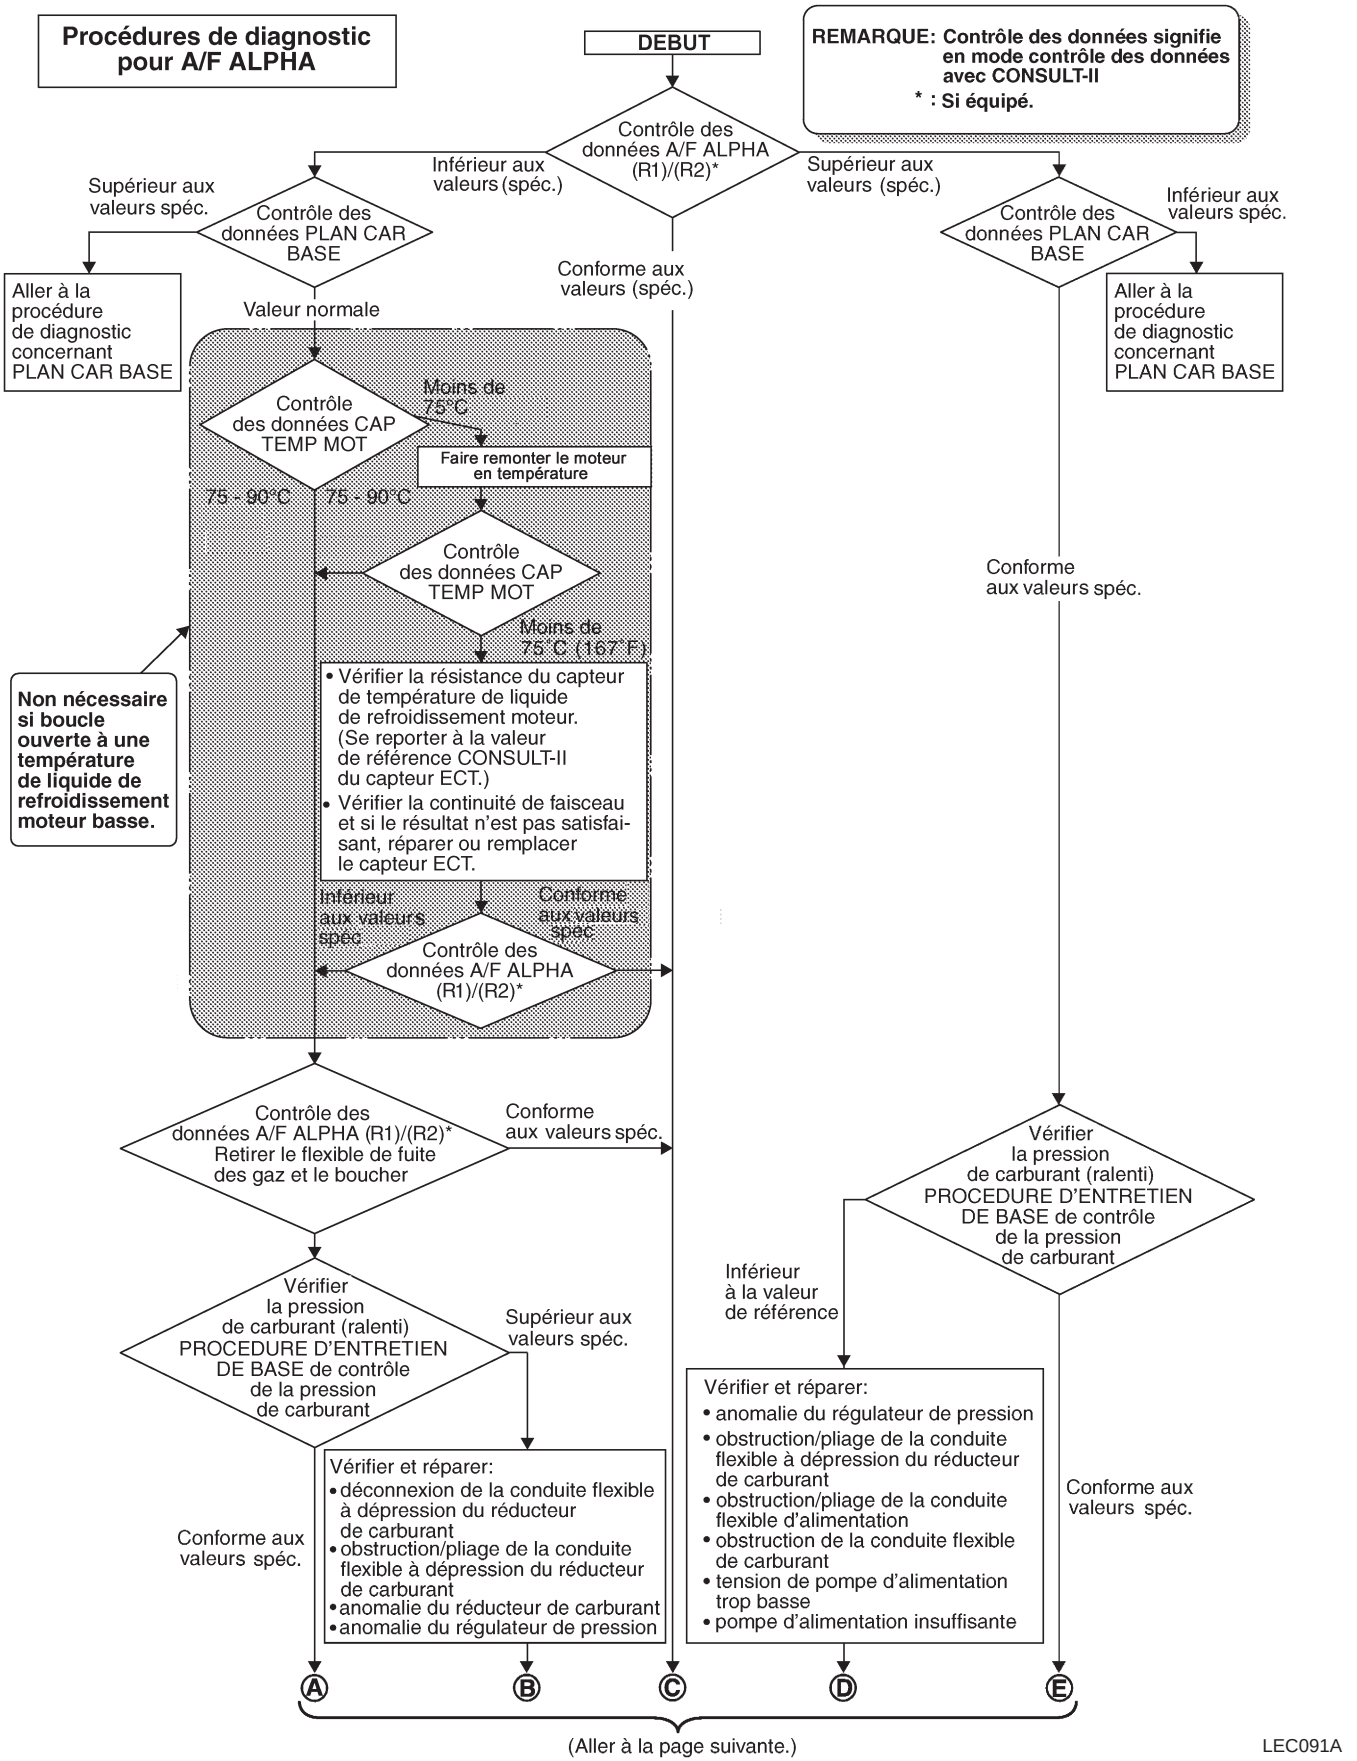
- Kilométrage effectué : plus de 5 000 km
- Pression atmosphérique : 101,3 kPa (1,013 mbar, 760,0 mmHg)±3 kPa (30 mbar, 22,5 mmHg)
- Température de l’air ambiant : 20 - 30°C
- Température du liquide de refroidissement du moteur : 75 - 95°C
- Transmission : montée en température*1
- Charge électrique : non appliquée*2
- Régime-moteur : Ralenti

*1: Pour les modèles avec T/A, une fois le moteur amené à sa température normale de fonctionnement, conduire le véhicule jusqu’à ce que ‘‘CAP TEMP LIQ’’ (signal du capteur de température du liquide de T/A) indique une valeur inférieure à 0,9V. Pour les modèles avec T/M, conduire le véhicule durant 5 minutes une fois le moteur amené à sa température normale de fonctionnement.
*2: Interrupteur de désembuage de lunette arrière, interrupteur de climatiseur, commande d’éclairage sur ‘‘ARRET’’. Ventilateurs de refroidissement arrêtés. Volant en position droit devant.

SEF601Z

Procédure d’inspection

NEEC1005



REMARQUE :
Effectuer le mode ‘‘CONTROLE DE DONNEES (SPEC)’’ en mode d’affichage maximal.

1. Effectuer ‘‘Inspection de base’’, EC-3093.
2. Vérifier que les conditions d’essai indiquées ci-dessus sont réunies.
3. Sélectionner ‘‘PLAN CAR BASE’’, ‘‘ALPHA A/CARB-R1’’ et ‘‘DEBITMETRE-R1’’ dans le mode ‘‘CONTROLE DE DONNEES (SPEC)’’ de CONSULT-II.
4. Vérifier que les éléments de contrôle sont dans les limites de la valeur SP.
5. Si les résultats ne sont pas conformes, effectuer une ‘‘Procédure de diagnostic’’, voir page EC-3128.

Description

NEEC0045

Il peut arriver que les incidents se produisent de manière intermittente. Dans bien des cas, le problème se résout lui-même (le fonctionnement normal de la pièce ou du circuit en cause se rétablit sans intervention). Il est important de savoir qu'il n'est pas rare que les symptômes décrits par les client n'apparaissent pas durant l'inspection du DTC (1er parcours). Il faut également savoir que les faux contacts électriques sont la cause la plus fréquente des incidents intermittents. Il en découle que les conditions dans lesquelles l'incident s'est produit peuvent ne pas apparaître clairement. C'est pourquoi les circuits contrôlés dans le cadre d'une procédure de diagnostic standard peuvent ne pas révéler la localisation exacte du problème.

SITUATIONS COURANTES DE COMPTE-RENDU D'INCIDENT INTERMITTENT

NEEC0045S01

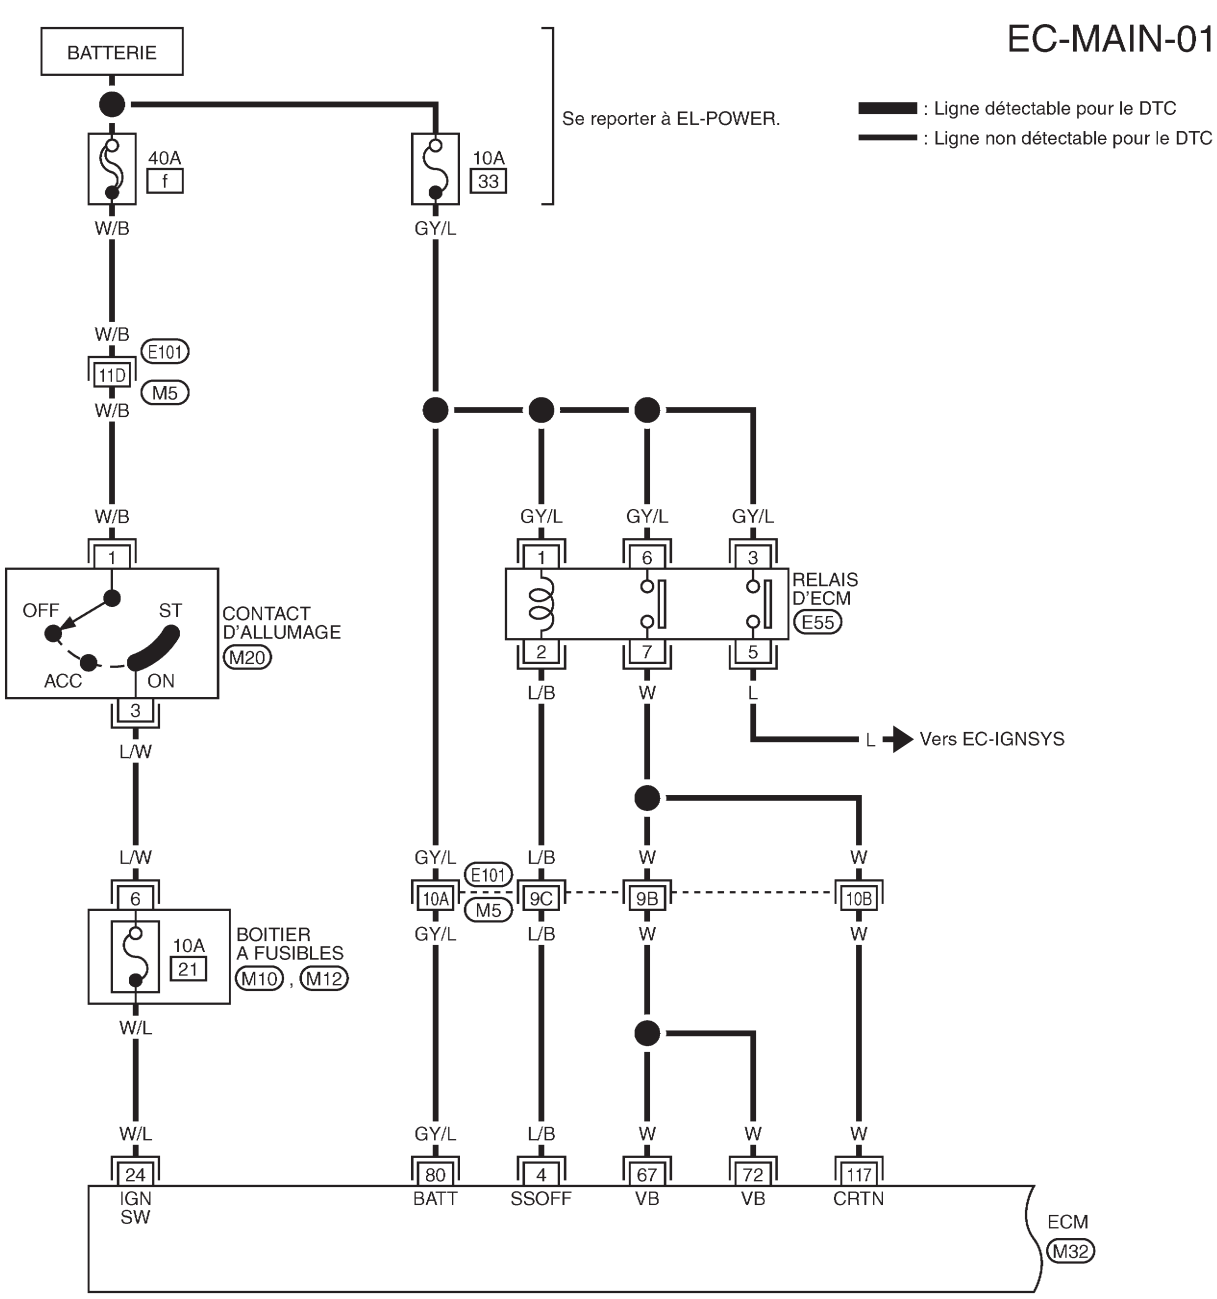
ETAPE de la procédure de travail	Situation
II	CONSULT-II est utilisé. Le paramètre d'occurrences indiqué sur l'écran des RESULTATS D'AUTODIAGNOSTIC est différent de '0'' ou '1t''.
III	Le symptôme rapporté par le client ne se reproduit pas.
IV	Le DTC (de 1er parcours) n'apparaît pas lors de la PROCEDURE DE CONFIRMATION DE DTC
VI	Le DIAGNOSTIC DES DEFAUTS pour le code PXXXX ne permet pas d'isoler le problème.

Procédure de diagnostic

NEEC0046

1	DEBUT DE L'INSPECTION
Effacer les DTC (1er parcours). Se reporter à ''COMMENT EFFACER LES CODES DE DIAGNOSTIC ANTIPOLLUTION'', EC-3065.	
▶	ALLER A 2.

2	CONTROLER LES BORNES DE MASSE
Vérifier que les bornes de masse ne sont pas corrodées ou en faux contact. Se reporter à la section GI ('INSPECTION DES MASSES'', ''Inspection du circuit'').	
BON ou MAUVAIS	
Bon ▶	ALLER A 3.
Mauvais ▶	Réparer ou remplacer.



3	LOCALISER L'INCIDENT ELECTRIQUE
Procéder aux ''Essais de simulation de défaut'' décrits dans la section GI.	
BON ou MAUVAIS	
Bon ▶	**FIN DE L'INSPECTION**
Mauvais ▶	Réparer ou remplacer.

BORNES DE L'ECM ET VALEURS DE RÉFÉRENCE

NEEC0048

les données de spécification sont des valeurs de référence et sont mesurées entre chaque borne et la masse.

ATTENTION :
Ne pas utiliser de bornes de masse de l'ECM lors de la mesure de la tension d'entrée/de sortie. En agissant de la sorte, il est possible d'endommager le transistor de l'ECM. Utiliser une masse autre que les bornes de l'ECM, comme par exemple la prise de terre.

Circuit d'alimentation électrique principale et de mise à la masse

PROCÉDURE DE DIAGNOSTIC

=NEEC0049

1	DEBUT DE L'INSPECTION
Démarrer le moteur. Le moteur tourne-t-il ? **Oui ou Non**	
Oui ▶	ALLER A 9.
Non ▶	ALLER A 2.

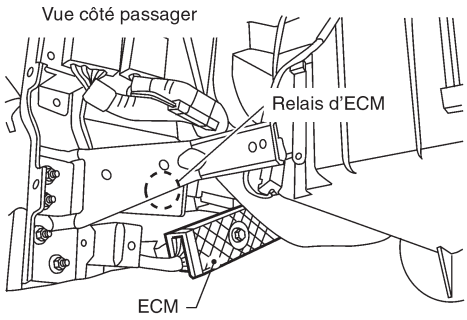
2	VERIFIER ALIMENTATION-I
1. Mettre le contact d'allumage sur 'OFF', puis sur 'ON'. 2. Contrôler la tension entre la borne 24 de l'ECM et la masse à l'aide de CONSULT-II ou du testeur.	

SEF600P

Tension : Tension de la batterie

BON ou MAUVAIS

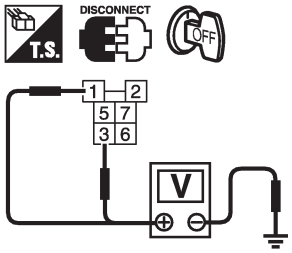
Bon ▶	ALLER A 4.
Mauvais ▶	ALLER A 3.



3	DETECTER LA PIECE DEFECTUEUSE
Contrôler les points suivants. ● Raccord à fusibles de 40A ● Connecteurs de faisceau E101, M5 ● Contact d'allumage ● Boîtier à fusibles M10, M12 ● fusible de 10A. ● Faisceau ouvert ou en court-circuit entre l'ECM et la batterie	
▶	Réparer le faisceau ou les connecteurs.

4	CONTROLER QUE LE CIRCUIT DE MASSE DE L'ECM N'EST PAS OUVERT ET QU'IL N'Y A PAS DE COURT-CIRCUIT-I
1. Mettre le contact d'allumage sur ''OFF''. 2. Débrancher le connecteur de faisceau de l'ECM. 3. Vérifier la continuité du faisceau entre les bornes 10, 19, 25, 32, 116, 124 de l'ECM et la masse de moteur. Se reporter au SCHEMA DE CABLAGE. **Il doit y avoir continuité.** 4. Vérifier également que le faisceau n'est pas en court-circuit à l'alimentation. **BON ou MAUVAIS**	
Bon ▶	ALLER A 5.
Mauvais ▶	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à l'alimentation.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



5	CONTROLER L'ALIMENTATION-II

1. Déconnecter le relais de l'ECM.

LEC106A

2. Vérifier la tension entre les bornes 1 et 3 du relais de l'ECM et la masse à l'aide de CONSULT-II ou du testeur.

SEC313D

Tension : Tension de la batterie

BON ou MAUVAIS

Bon	▶	ALLER A 7.
Mauvais	▶	ALLER A 6.

6	DETECTER LA PIECE DEFECTUEUSE

Contrôler les points suivants.
- Fusible de 10 A
- Faisceau ouvert ou en court-circuit entre le relais de l'ECM et la batterie

	▶	Réparer les faisceaux ou les connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

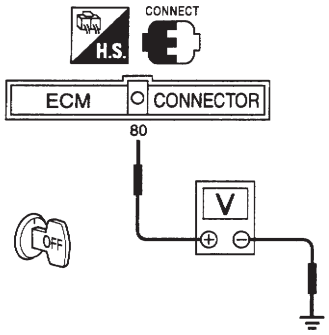
7	VERIFIER SI LE CIRCUIT DU SIGNAL DE SORTIE N'EST PAS OUVERT OU COURT-CIRCUITE

1. Vérifier la continuité du faisceau entre la borne 4 de l'ECM et la borne 2 du relais de l'ECM. Se reporter au schéma de câblage.
   Il doit y avoir continuité.
2. Vérifier également que le faisceau n'est pas en court-circuit à la masse ou à l'alimentation.

BON ou MAUVAIS

Bon	▶	Aller à ''SIGNAL D'ALLUMAGE'', EC-3387.
Mauvais	▶	ALLER A 8.

8	DETECTER LA PIECE DEFECTUEUSE



Contrôler les points suivants.
- Connecteurs de faisceau E101, M5
- Faisceau ouvert ou en court-circuit entre l'ECM et le relais de l'ECM

	▶	Réparer les faisceaux ou les connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

9	CONTROLER L'ALIMENTATION-II

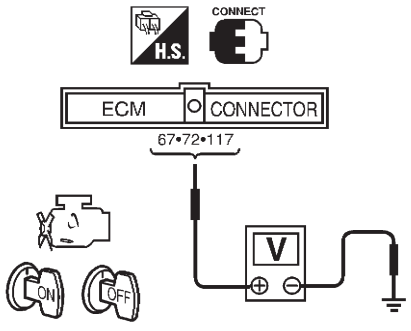
1. Arrêter le moteur.
2. Contrôler la tension entre la borne 80 de l'ECM et la masse à l'aide de CONSULT-II ou du testeur.

MEC698B

Tension : Tension de la batterie

BON ou MAUVAIS

Bon	▶	ALLER A 11.
Mauvais	▶	ALLER A 10.



10	DETECTER LA PIECE DEFECTUEUSE

Contrôler les points suivants.
- Connecteur de faisceaux E101, M5
- Fusible de 10 A
- Faisceau ouvert ou en court-circuit entre l'ECM et le fusible

	▶	Réparer le faisceau ou les connecteurs.

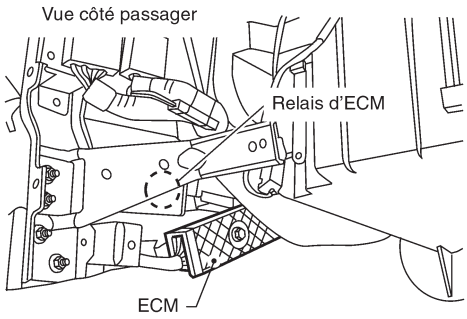
11	VERIFIER L'ALIMENTATION-III

1. Mettre le contact d'allumage sur 'OFF', puis sur 'ON'.
2. Vérifier la tension entre les bornes 67, 72, 117 de l'ECM et la masse à l'aide de CONSULT-II ou du testeur.

SEF121V

Tension :

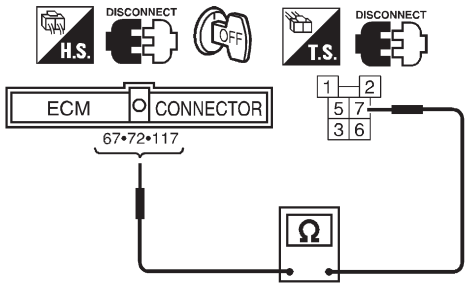
Après avoir mis le contact d'allumage sur 'OFF', il y aura tension de la batterie pendant quelques secondes avant que la tension ne retombe à 0 V.



BON ou MAUVAIS

Bon	▶	ALLER A 19.
Mauvais (il n'y a pas de tension de la batterie)	▶	ALLER A 12.
Mauvais (il y a tension de la batterie pendant plus de quelques secondes)	▶	ALLER A 18.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



12	VERIFIER LA CONTINUITE DU FAISCEAU ENTRE LE RELAIS DE L'ECM ET L'ECM

1. Débrancher le connecteur de faisceau de l'ECM.
2. Déconnecter le relais de l'ECM.

LEC106A

3. Vérifier la continuité du faisceau entre les bornes 67, 72, 117 de l'ECM et la borne 7 du relais d'ECM.

SEC267D

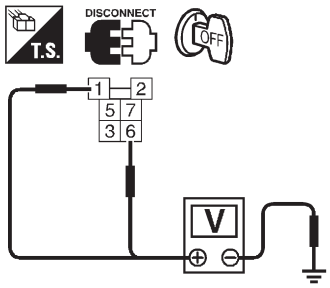
Il doit y avoir continuité.

4. Vérifier également que le faisceau n'est pas en court-circuit à la masse ou à l'alimentation.

BON ou MAUVAIS

Bon	▶	ALLER A 14.
Mauvais	▶	ALLER A 13.

13	DETECTER LA PIECE DEFECTUEUSE



Contrôler les points suivants.
- Connecteurs de faisceau E101, M5
- Faisceau ouvert ou en court-circuit entre l'ECM et le relais de l'ECM

	▶	Réparer le faisceau ou les connecteurs.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

14	VERIFIER LA TENSION ENTRE LE RELAIS DE L'ECM ET LA MASSE

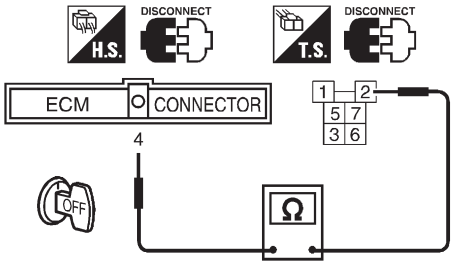
Vérifier la tension entre les bornes 1 et 6 du relais de l'ECM et la masse à l'aide de CONSULT-II ou du testeur.

SEC268D

Tension : Tension de la batterie

BON ou MAUVAIS

Bon	▶	ALLER A 16.
Mauvais	▶	ALLER A 15.



15	DETECTER LA PIECE DEFECTUEUSE

Contrôler les points suivants.
- Fusible de 10 A
- Faisceau ouvert ou en court-circuit entre le relais de l'ECM et le fusible

	▶	Réparer le faisceau ou les connecteurs.

16	CONTROLER LE CIRCUIT DU SIGNAL DE SORTIE

1. Vérifier la continuité du faisceau entre la borne 4 de l'ECM et la borne 2 du relais de l'ECM.

SEC269D

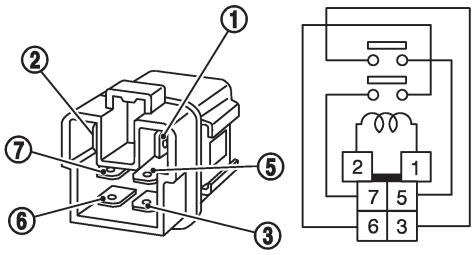
Il doit y avoir continuité.

2. Vérifier également que le faisceau n'est pas en court-circuit à la masse ou à l'alimentation.

BON ou MAUVAIS

Bon	▶	ALLER A 18.
Mauvais	▶	ALLER A 17.

17	DETECTER LA PIECE DEFECTUEUSE



Contrôler les points suivants.
- Connecteurs de faisceau E101, M5
- Faisceau ouvert ou en court-circuit entre l'ECM et le relais de l'ECM

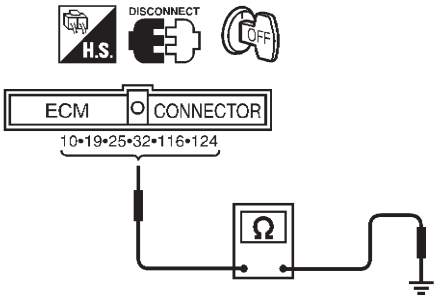
	▶	Réparer le faisceau ou les connecteurs.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

18	CONTROLER LE RELAIS DE L'ECM

1. Appliquer un courant continu de 12 V entre les bornes 1 et 2 du relais de l'ECM.
2. Vérifier la continuité entre les bornes 6 et 7 du relais d'ECM.

PBIB0077E



12 V (1 - 2) appliquée: il y a continuité.
Tension absente : pas de continuité

BON ou MAUVAIS

Bon	▶	ALLER A 19.
Mauvais	▶	Remplacer le relais de l'ECM.

19	CONTROLER LE CIRCUIT DE MISE A LA MASSE

1. Mettre le contact d'allumage sur ''OFF''.
2. Débrancher le connecteur de faisceau de l'ECM.
3. Vérifier la continuité du faisceau entre les bornes 10, 19, 25, 32, 116, 124 de l'ECM et la masse de moteur.

SEF119V

Il doit y avoir continuité.

4. Vérifier également que le faisceau n'est pas en court-circuit à l'alimentation.

BON ou MAUVAIS

Bon	▶	ALLER A 20.
Mauvais	▶	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à l'alimentation.

20	VERIFIER SI L'INCIDENT EST INTERMITTENT
Effectuer un ''DIAGNOSTIC DES DEFAUTS EN CAS INCIDENT INTERMITTENT'', voir page EC-3132.	
	▶ **FIN DE L'INSPECTION**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description

NEEC0136

DESCRIPTION DU SYSTÈME

NEEC0136S01

Capteur	Signal d'entrée à l'ECM	Fonctionnement de l'ECM	Actionneur
Capteur d'angle d'arbre à cames	Régime-moteur	Commande du chauffage de la sonde à oxygène chauffé 1	Chauffage de la sonde à oxygène chauffé 1

L'ECM effectue un contrôle MAR/ARR du chauffage de la sonde à oxygène chauffé 1 en fonction des conditions de fonctionnement du moteur.

FONCTIONNEMENT

NEEC0136S02

Régime-moteur	Chauffage de la sonde à oxygène chauffé 1
Supérieur à 3 600 tr/mn.	ARRET
Inférieur à 3 600 tr/mn.	MAR

Valeur de référence de CONSULT-II en mode de contrôle de données

NEEC0137

Les données de spécification sont des valeurs de référence.

ELEMENT DE CONTROLE	CONDITION	SPECIFICATION
CH S/02 CH1 (R1)	● Régime-moteur : Inférieur à 3 600 tr/mn.	MAR
	● Régime-moteur : Supérieur à 3 600 tr/mn	ARR

Bornes de l'ECM et valeurs de référence

NEEC0138

Les données de spécification sont des valeurs de référence et sont mesurées entre chaque borne et la masse.

ATTENTION :
Ne pas utiliser de bornes de masse de l'ECM lors de la mesure de la tension d'entrée/de sortie. En agissant de la sorte, il est possible d'endommager le transistor de l'ECM. Utiliser une masse autre que les bornes de l'ECM, comme par exemple la prise de terre.

N° DE BORNE	COULEUR DE CABLE	ELEMENT	CONDITION	DONNEES (tension de courant continu)
119	Y/R	Chauffage de la sonde à oxygène chauffé 1	**[Moteur en marche]** ● Le régime-moteur est inférieur à 3.600 tr/mn.	Environ 0,4V
			[Moteur en marche] ● Le régime-moteur est supérieur à 3.600 tr/mn.	TENSION DE LA BATTERIE (11 V - 14V)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Logique de diagnostic de bord

NEEC0139

N° de DTC	Nom de diagnostic des défauts	Condition de détection de DTC	Cause possible
P0031 0031	Circuit de commande de chauffage de la sonde à oxygène chauffé 1 faible	● L'ampérage actuel du circuit de chauffage de la sonde à oxygène chauffé 1 ne se situe pas dans l'échelle normale. (Le signal de tension envoyé à l'ECM par le chauffage de la sonde à oxygène chauffé 1 est excessivement faible.)	● Faisceau ou connecteurs (Le circuit du chauffage de la sonde à oxygène chauffé 1 est ouvert ou en court-circuit.) ● Chauffage de la sonde à oxygène chauffé 1
P0032 0032	Circuit de commande du chauffage de la sonde à oxygène chauffé 1 haut	● L'ampérage actuel du circuit de chauffage de la sonde à oxygène chauffé 1 ne se situe pas dans l'échelle normale. (Le signal de tension envoyé à l'ECM par le chauffage de la sonde à oxygène chauffé 1 est excessivement élevé.)	● Faisceau ou connecteurs (Le circuit du chauffage de la sonde à oxygène chauffé 1 est en court-circuit.) ● Chauffage de la sonde à oxygène chauffé 1

Procédure de confirmation de code de défaut (DTC)

NEEC0140

REMARQUE :

Si une ''Procédure de confirmation de DTC'' a précédé, toujours mettre le contact d'allumage sur la position ''OFF'' et attendre au moins 5 secondes avant de procéder à l'essai suivant.

CONDITIONS D'ESSAI :

Avant d'entamer la procédure qui suit, vérifier que la tension délivrée par la batterie soit supérieure à 11V au ralenti.

2

CONTROLE DE DONNEES	
CONTROLE	AUCUN DTC
TR/MN MOT	XXX tr/min

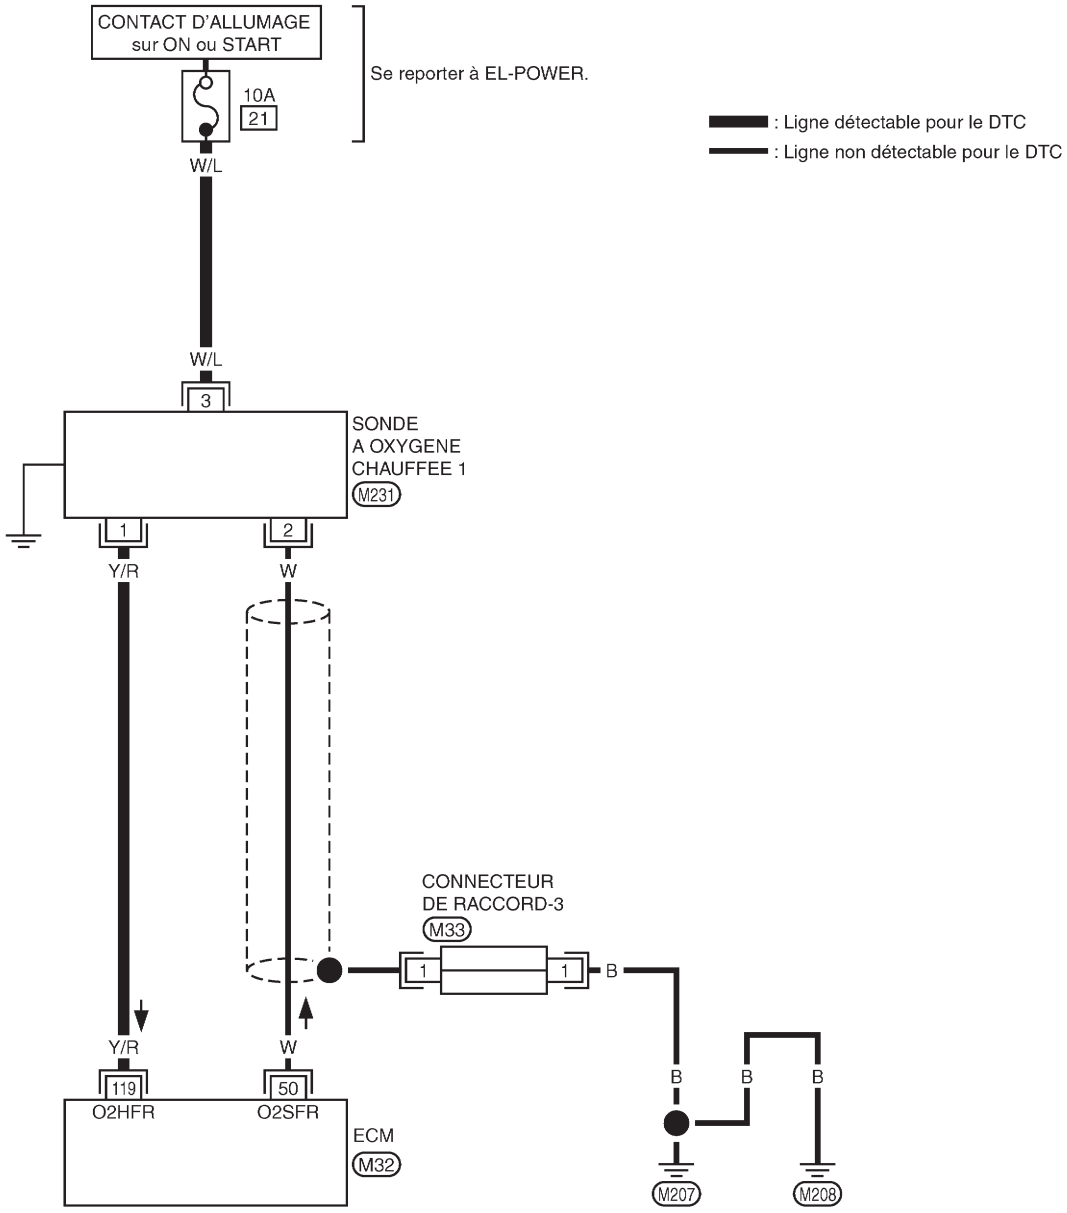
SEF058Y

Avec CONSULT-II

1) Mettre le contact d'allumage sur ON et mettre CONSULT-II en mode ''CONTROLE DE DONNEES''.
2) Démarrer le moteur et le faire tourner pendant au moins 6 secondes en régime de ralenti.
3) Si le DTC de 1er parcours est détecté, aller à ''Procédure de diagnostic'', page EC-3144.

Avec l'analyseur générique GST

1) Démarrer le moteur et le faire tourner pendant au moins 6 secondes en régime de ralenti.
2) Mettre le contact d'allumage sur OFF et attendre au moins 5 secondes.
3) Démarrer le moteur et le faire tourner pendant au moins 6 secondes en régime de ralenti.
4) Régler le GST en ''MODE 3''.
5) Si le DTC est détecté, effectuer une ''Procédure de diagnostic'', voir page EC-3144.



● **L'utilisation d'un analyseur générique GST impose d'effectuer une 'Procédure de confirmation de DTC'' deux fois plus qu'avec CONSULT-II du fait que l'analyseur générique GST ne peut pas afficher en MODE 7 (DTC de 1er parcours), en ce qui concerne ce diagnostic. C'est pourquoi il est vivement conseillé d'utiliser CONSULT-II.**

Description

NEEC0180

DESCRIPTION DU SYSTÈME

NEEC0180S01

Capteur	Signal d'entrée à l'ECM	Fonctionnement de l'ECM	Actionneur
Capteur d'angle d'arbre à cames	Régime-moteur	Commande du chauffage de la sonde à oxygène chauffé 2	Chauffage de la sonde à oxygène chauffé 2

L'ECM effectue un contrôle MARCHE/ARRET du chauffage de la sonde à oxygène chauffé 2 en fonction du régime-moteur.

FONCTIONNEMENT

NEEC0180S02

Régime-moteur tr/mn	Chauffage de la sonde à oxygène chauffé 2
Supérieur à 4 000	ARRET
Inférieur à 4 000	MAR

Valeur de référence de CONSULT-II en mode de contrôle de données

NEEC0181

Les données de spécification sont des valeurs de référence.

ELEMENT DE CONTROLE	CONDITION	SPECIFICATION
CH S/O2 CH2 (R1)	● Régime-moteur : Inférieur à 4 000 tr/mn [après avoir conduit pendant 2 minutes à la vitesse de 70 km/h ou plus]	MAR
	● Contact sur ON (moteur arrêté) ● Le régime-moteur est supérieur à 4 000 tr/mn.	ARR

Bornes de l'ECM et valeurs de référence

NEEC0182

Les données de spécification sont des valeurs de référence et sont mesurées entre chaque borne et la masse.

CAUTION:
Ne pas utiliser de bornes de masse de l'ECM lors de la mesure de la tension d'entrée/de sortie. En agissant de la sorte, il est possible d'endommager le transistor de l'ECM. Utiliser une masse autre que les bornes de l'ECM, comme par exemple la prise de terre.

N° DE BORNE	COULEUR DE CABLE	ELEMENT	CONDITION	DONNEES (tension de courant continu)
122	G/B	Chauffage de la sonde à oxygène chauffé 2	**[Moteur en marche]** ● Après avoir conduit pendant 2 minutes à une vitesse de 70 km/h ou plus	Environ 0,4V
			[Contact d'allumage sur ''ON''] ● Moteur arrêté	TENSION DE LA BATTERIE (11 V - 14V)

Logique de diagnostic de bord

NEEC0183

N° de DTC	Nom de diagnostic des défauts	Condition de détection de DTC	Cause possible
P0037 0037	Circuit de commande du chauffage de la sonde à oxygène chauffé 2 faible	● L'ampérage actuel du circuit du chauffage de la sonde à oxygène chauffé 2 ne se situe pas dans l'échelle normale. (Le signal de tension envoyé à l'ECM par le chauffage de la sonde à oxygène chauffé 2 est excessivement faible.)	● Faisceau ou connecteurs (Le circuit du chauffage de la sonde à oxygène chauffé 2 est ouvert ou en court-circuit.) ● Chauffage de la sonde à oxygène chauffé 2
P0038 0038	Circuit de commande du chauffage de la sonde à oxygène chauffé 2 élevé	● L'ampérage actuel du circuit du chauffage de la sonde à oxygène chauffé 2 ne se situe pas dans l'échelle normale. (Le signal de tension envoyé à l'ECM par le chauffage de la sonde à oxygène chauffé 2 est excessivement élevé.)	● Faisceau ou connecteurs (Le circuit du chauffage de la sonde à oxygène chauffé 2 est en court-circuit.) ● Chauffage de la sonde à oxygène chauffé 2

Procédure de confirmation de code de défaut (DTC)

NEEC0184

REMARQUE :

Si une ''Procédure de confirmation de DTC'' a précédé, toujours mettre le contact d'allumage sur la position OFF et attendre au moins 5 secondes avant de procéder à l'essai suivant.

CONDITIONS D'ESSAI :

Avant d'entamer la procédure qui suit, vérifier que la tension délivrée par la batterie est comprise entre 10,5 V au ralenti.

2

CONTROLE DE DONNEES	
CONTROLE	PAS DE DTC
TR/MN MOT	XXX TR/MN
CAP VIT VEHIC	XXX km/h
CAP PAPILLON	XXX V

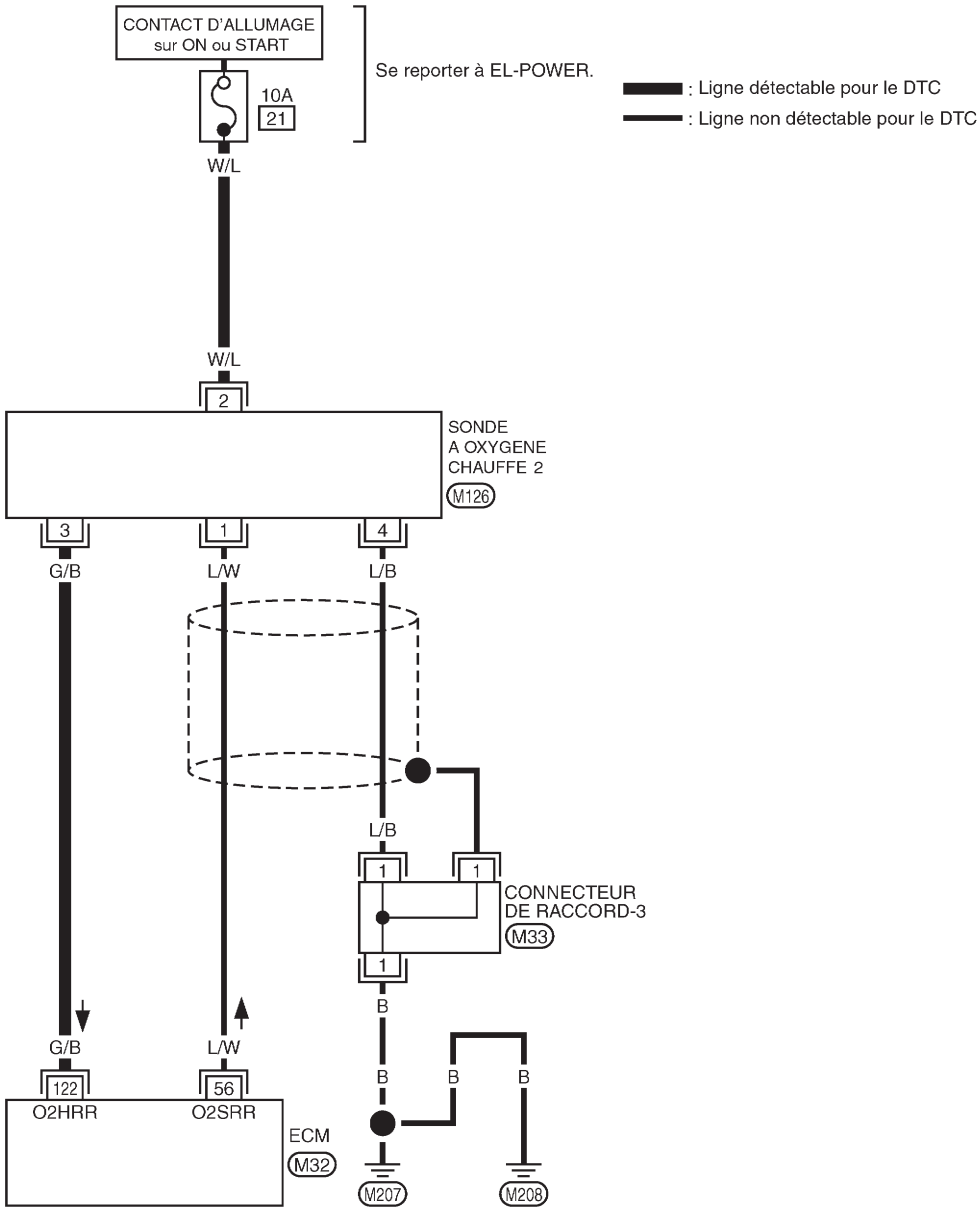
SEF175Y

Avec CONSULT-II

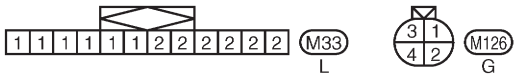
1) Mettre le contact d'allumage sur ON et mettre CONSULT-II en mode ''CONTROLE DE DONNEES''.
2) Démarrer le moteur et conduire le véhicule à une vitesse de plus de 70 km/h pendant 2 minutes consécutives.
3) Si le DTC de 1er parcours est détecté, aller à ''Procédure de diagnostic'', page EC-3150.

Avec l'analyseur générique GST

1) Démarrer le moteur.
2) Rouler à plus de 70 km/h pendant 2 minutes.
3) Arrêter le véhicule et laisser le moteur au ralenti pendant au moins 6 secondes.
4) Mettre le contact d'allumage sur OFF et attendre au moins 10 secondes.
5) Démarrer le moteur.
6) Rouler à plus de 70 km/h pendant 2 minutes.
7) Arrêter le véhicule et laisser le moteur au ralenti pendant au moins 6 secondes.
8) Régler le GST en ''MODE 3''.
9) Si le DTC est détecté, effectuer une ''Procédure de diagnostic'', voir page EC-3150.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



L’utilisation d’un analyseur générique GST impose d’effectuer une ‘‘Procédure de confirmation de DTC’’ deux fois plus qu’avec CONSULT-II du fait que l’analyseur générique GST ne peut pas afficher en MODE 7 (DTC de 1er parcours), en ce qui concerne ce diagnostic. C’est pourquoi il est vivement conseillé d’utiliser CONSULT-II.

Description des composants

NEEC0050

Le débitmètre d'air est situé dans le passage de l'air d'admission. Il mesure le débit d'admission en se basant sur une partie du débit d'admission total. Il consiste en un câble chaud alimenté en courant électrique depuis l'ECM. La température du câble chaud est contrôlée en partie par l'ECM. La chaleur produite par le câble chaud est réduite au fur et à mesure que l'air d'admission circule autour de lui. Plus il y a d'air, plus la perte de chaleur est importante.
Par conséquent, l'ECM doit fournir une alimentation électrique plus importante pour maintenir la température du câble chaud alors que le débit de l'air augmente. L'ECM détecte le débit de l'air grâce aux variations du courant électrique.

Valeur de référence de CONSULT-II en mode de contrôle de données

NEEC0051

Les données de spécification sont des valeurs de référence.

ELEMENT DE CONTROLE	CONDITION		SPECIFICATION
DEBITMETRE-R1	● Moteur : une fois le moteur chaud ● Interrupteur de climatiseur : ARRET ● Levier de changement de vitesses : "N" ● A vide	Ralenti	0,9 - 1,8V
		2 500 tr/mn	1,9 - 2,3V
VAL CHARGE CALC	● Moteur : une fois le moteur chaud ● Interrupteur de climatiseur : ARRET ● Levier de changement de vitesses : "N" ● A vide	Ralenti	9,5 - 34,0
		2 500 tr/mn	13,9 - 24,9
DEBITMETRE AIR	● Moteur : une fois le moteur chaud ● Interrupteur de climatiseur : ARRET ● Levier de changement de vitesses : "N" ● A vide	Ralenti	0,9 - 5,8 g·m/s
		2 500 tr/mn	7,5 - 13,2 g·m/s

Bornes de l'ECM et valeurs de référence

NEEC0052

Les données de spécification sont des valeurs de référence et sont mesurées entre chaque borne et la masse.

CAUTION:
Ne pas utiliser de bornes de masse de l'ECM lors de la mesure de la tension d'entrée/de sortie. En agissant de la sorte, il est possible d'endommager le transistor de l'ECM. Utiliser une masse autre que les bornes de l'ECM, comme par exemple la prise de terre.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Logique de diagnostic de bord

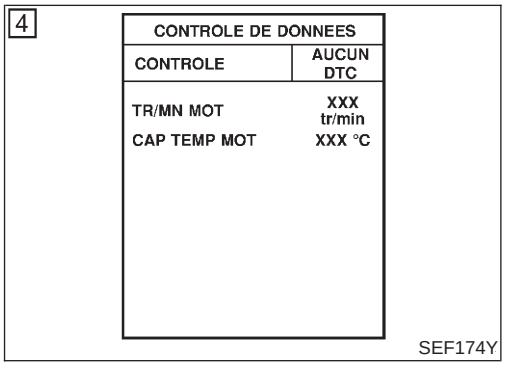
NEEC0053

N° de DTC	Le défaut est détecté quand ...		Eléments de contrôle (causes possibles)
P0101 0101	A)	Un signal de tension haute en provenance du capteur est envoyée à l'ECM sous une charge de conduite légère.	● Faisceau ou connecteurs (le circuit de capteur est ouvert ou court-circuité) ● Débitmètre d'air
P0101 0101	B)	Une tension basse en provenance du capteur est envoyée à l'ECM* sous une charge de conduite élevée.	● Faisceau ou connecteurs (le circuit de capteur est ouvert ou court-circuité) ● Fuites d'air d'admission ● Débitmètre d'air

*: Quand cette anomalie est détectée, l'ECM entre en mode de sécurité mode et le témoin MI s'allume.

MODE DE SÉCURITÉ

NEEC0053S01



Eléments détectés	Condition de fonctionnement du moteur en mode de sécurité
Circuit du débitmètre d'air	Le régime-moteur ne dépasse pas 2 400 tr/mn en raison de la coupure d'alimentation.

Procédure de confirmation de code de défaut (DTC)

NEEC0054

ATTENTION :
Toujours adapter sa vitesse aux exigences de sécurité.

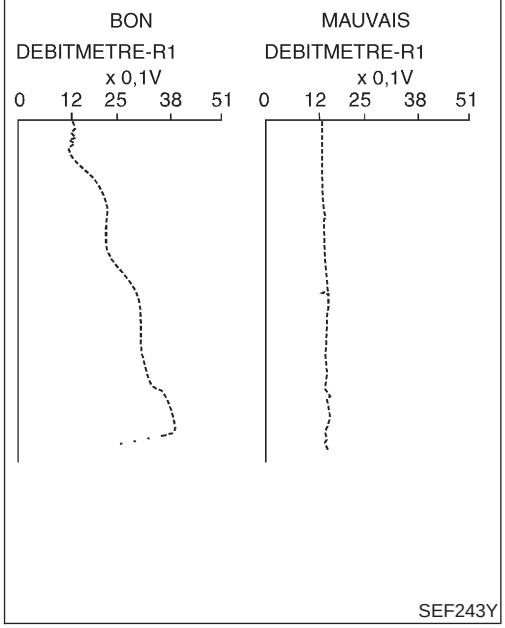
REMARQUE :
Si une ''Procédure de confirmation de DTC'' a précédé, toujours mettre le contact d'allumage sur la position OFF et attendre au moins 5 secondes avant de procéder à l'essai suivant.

PROCÉDURE DE DÉFAUT A

NEEC0054S03

REMARQUE :
Si le moteur ne démarre pas ou s'arrête rapidement, attendre au moins 10 secondes avec le moteur arrêté (contact d'allumage sur ''ON'') plutôt que de faire tourner le moteur au ralenti.

Avec CONSULT-II



1) Mettre le contact d'allumage sur ON.
2) Régler CONSULT-II en mode ''CONTROLE DE DONNEES''.
3) Démarrer le moteur et l'amener à température normale de fonctionnement.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

4) Faire tourner le moteur au ralenti pendant au moins 10 secondes.
5) Si le DTC de 1er parcours est détecté, aller à ''Procédure de diagnostic'', page EC -3157.

Avec l'analyseur générique GST
Suivre la procédure ''Avec CONSULT-II''.

6

SEF243Y

PROCÉDURE DE DÉFAUT B

NEEC0054S04

Avec CONSULT-II

1) Mettre le contact d'allumage sur ON.
2) Démarrer le moteur et l'amener à température normale de fonctionnement.
   S'il est impossible de démarrer le moteur, effectuer une ''Procédure de diagnostic'', page EC-3157.
3) Régler CONSULT-II en mode ''CONTROLE DE DONNEES''.
4) Vérifier la tension de ''DEBITMETRE AIR-R1'' avec ''CONTROLE DE DONNEES''.
5) Augmenter le régime-moteur jusqu'à environ 4 000 tr/mn.
6) Vérifier la montée de la tension linéaire en fonction des hausses de régime-moteur.
   Si les résultats ne sont pas conformes, effectuer une ''Procédure de diagnostic'', voir page EC-3157.
   Si le résultat est satisfaisant, passer à l'étape suivante.
7) Maintenir les conditions suivantes pendant au moins 10 secondes de suite.

TR/MN MOT	Plus de 2 000 tr/mn.
CAP PAPILLON	Plus de 3V
Levier de vitesses	Rapport adapté
Site de conduite	Rouler en montée (ce qui augmente la charge moteur) aide à maintenir les conditions requises pour cet essai

8) Si le DTC de 1er parcours est détecté, aller à ''Procédure de diagnostic'', page EC-3157.

Procédure de diagnostic

NEEC0057

1	DEBUT DE L'INSPECTION

Quel défaut (A, B, C ou D) est reproduit?

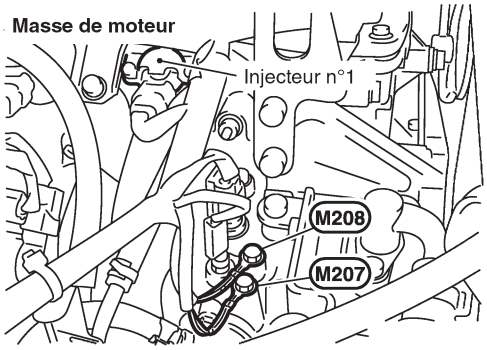
ANOMALIE	Type
A	I
B	II

MTBL1305

Type I ou Type II

Type I	▶	ALLER A 3.
Type II	▶	ALLER A 2.

2	CONTROLER LE SYSTEME D'ADMISSION



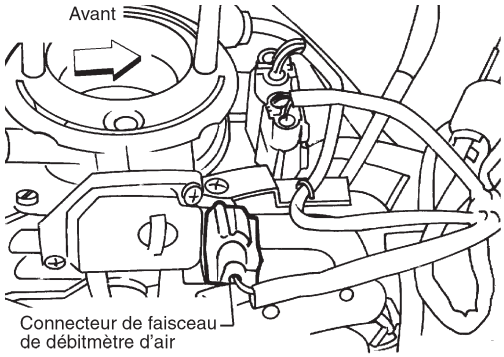
Contrôler ce qui suit en ce qui concerne le raccordement.
- Conduit d'air
- Filtre à air
- Flexibles de dépression
- Passage d'air d'aspiration du conduit d'air au collecteur

BON ou MAUVAIS

Bon	▶	ALLER A 3.
Mauvais	▶	Connecter à nouveau les pièces.

3	RESSERRER LES VIS DE MASSE

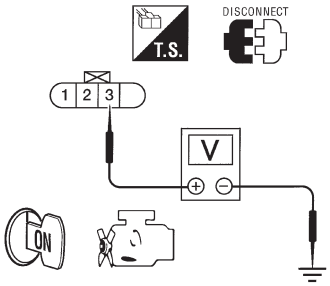
1. Mettre le contact d'allumage sur OFF.
2. Desserrer et resserrer les vis de masse du moteur.



SEC309D

	▶	ALLER A 4.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



4	CONTROLER L'ALIMENTATION ELECTRIQUE

1. Débrancher le connecteur de faisceau du débitmètre d'air.

AEC131A

2. Mettre le contact d'allumage sur ON.
3. Contrôler la tension entre la borne 3 et la masse à l'aide de CONSULT-II ou du testeur.

AEC691

Tension : Tension de la batterie

BON ou MAUVAIS

Bon	▶	ALLER A 6.
Mauvais	▶	ALLER A 5.

5	DETECTER LA PIECE DEFECTUEUSE

Contrôler les points suivants.
- Connecteurs de faisceau E101, M5
- Faisceau ouvert ou en court-circuit entre le relais de l'ECM et le débitmètre d'air
- Faisceau ouvert ou en court-circuit entre le débitmètre d'air et l'ECM

	▶	Réparer le faisceau ou les connecteurs.

6	CONTROLER LE CIRCUIT DE MISE A LA MASSE

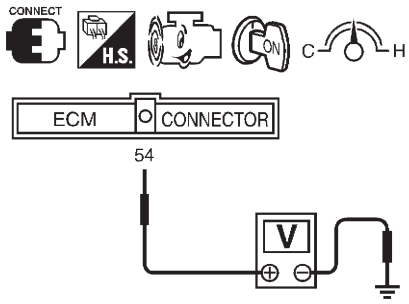
1. Mettre le contact d'allumage sur OFF.
2. Débrancher le connecteur de faisceau de l'ECM.
3. Vérifier la continuité du faisceau entre la borne 2 du débitmètre d'air et la borne 55 de l'ECM. Se reporter au schéma de câblage.
   Il doit y avoir continuité.
4. Vérifier également que le faisceau n'est pas en court-circuit à la masse ou à l'alimentation.

BON ou MAUVAIS

Bon	▶	ALLER A 7.
Mauvais	▶	Réparer les faisceaux ou les connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

7	CONTROLER LE CIRCUIT DE SIGNAL D'ENTREE



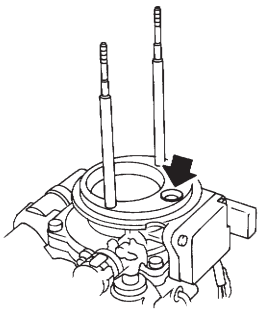
1. Vérifier la continuité du faisceau entre la borne 1 et la borne 54 de l'ECM. Se reporter au schéma de câblage.
   Il doit y avoir continuité.
2. Vérifier également que le faisceau n'est pas en court-circuit à la masse ou à l'alimentation.

BON ou MAUVAIS

Bon	▶	ALLER A 8.
Mauvais	▶	Réparer les faisceaux ou les connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

8	CONTROLER LE DEBITMETRE D'AIR

1. Brancher à nouveau tous les connecteurs de faisceau débranchés.
2. Mettre le contact d'allumage sur ON.
3. Démarrer le moteur et l'amener à température normale de fonctionnement.
4. Contrôler la tension entre la borne 54 de l'ECM (signal du débitmètre d'air) et la masse.



SEF326V

Conditions	Tension V
Contact d'allumage sur 'ON' (moteur arrêté.)	Moins de 1,0
Ralenti (Le moteur est monté en température jusqu'à atteindre une température de fonctionnement normale.)	0,9 - 1,8
2 500 tr/mn (Le moteur est monté en température jusqu'à atteindre une température de fonctionnement normale.)	1,9 - 2,3
Ralenti à environ 4 000 tr/mn*	1,3 - 1,7 à env. 3,0

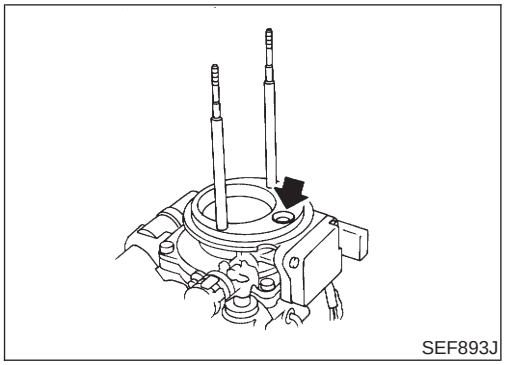
*: Vérifier la hausse de tension linéaire en réponse à des augmentations du régime du moteur à environ 4.000 tr/mn.

MTBL0326

5. Si la tension est hors norme, débrancher et rebrancher le connecteur du faisceau de débitmètre d'air. Puis, recommencer la vérification précédente.
6. Si le résultat n'est pas conforme, déposer le débitmètre du conduit d'air. Vérifier si le fil chaud n'est pas endommagé ou encrassé.

SEF893J

BON ou MAUVAIS



Bon	▶	ALLER A 9.
Mauvais	▶	Remplacer le débitmètre d'air.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

9	VERIFIER LE CIRCUIT DE BLINDAGE	
1. Mettre le contact d'allumage sur OFF. 2. Débrancher le connecteur de jonction -3. 3. Contrôler les points suivants. ● Continuité entre la borne 2 du connecteur de jonction-3 et la masse. ● Connecteur de jonction-3 (Se reporter à ''DISPOSITION DES FAISCEAUX'', dans la section EL.) **Il doit y avoir continuité.** 4. Vérifier également que le faisceau n'est pas en court-circuit à l'alimentation.		
BON ou MAUVAIS		
Bon	▶	ALLER A 10.
Mauvais	▶	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à l'alimentation.

10	VERIFIER SI L'INCIDENT EST INTERMITTENT	
Effectuer un ''DIAGNOSTIC DES DEFAUTS EN CAS INCIDENT INTERMITTENT'', voir page EC-3132.		
	▶	**FIN DE L'INSPECTION**

Avec CONSULT-II

1) Mettre le contact d'allumage sur ON.
2) Régler CONSULT-II en mode ''CONTROLE DE DONNEES''.
3) Attendre au moins 6 secondes.
4) Si le DTC de 1er parcours est détecté, aller à ''Procédure de diagnostic'', page EC-3165.
   Si le DTC de premier parcours est détecté, passer à l'étape suivante.
5) Démarrer le moteur et le laisser tourner au ralenti pendant au moins 6 secondes.
6) Si le DTC de 1er parcours est détecté, aller à ''Procédure de diagnostic'', page EC-3165.

Avec l'analyseur générique GST

Suivre la procédure ''Avec CONSULT-II''.

PROCÉDURE POUR DTC P0102

NEEC1552S02

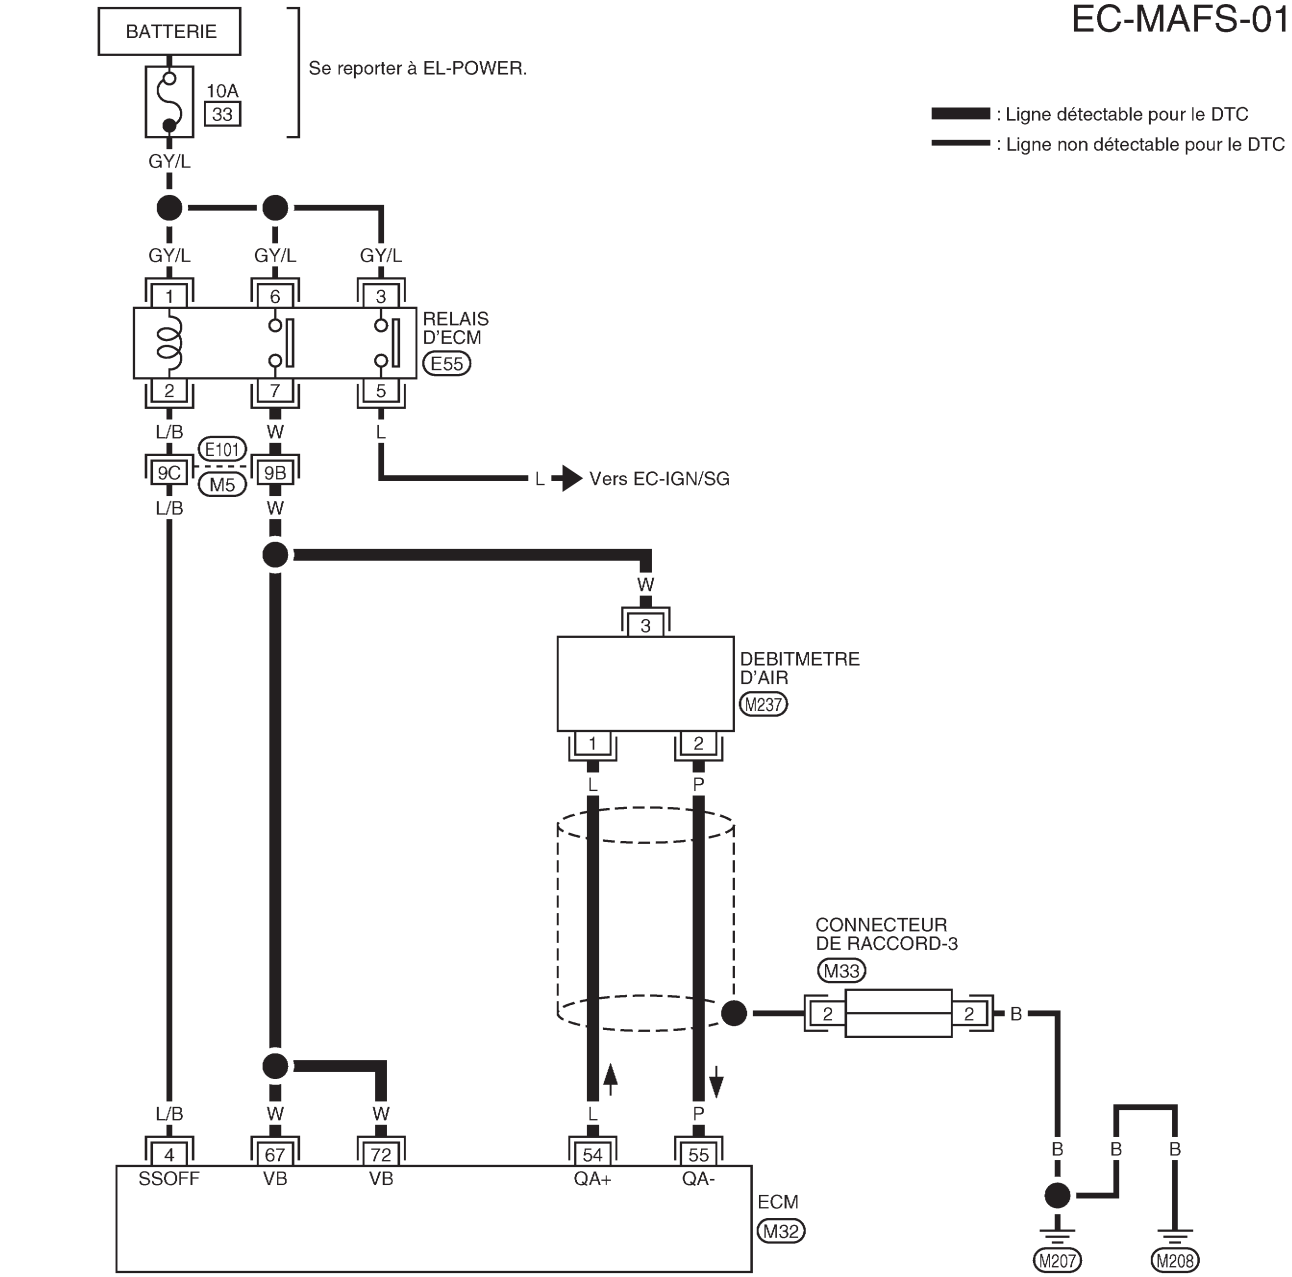
Avec CONSULT-II

1) Mettre le contact d'allumage sur ON.
2) Régler CONSULT-II en mode ''CONTROLE DE DONNEES''.
3) Démarrer le moteur et attendre 5 secondes au plus.
4) Si le DTC de 1er parcours est détecté, aller à ''Procédure de diagnostic'', page EC-3165.

Avec l'analyseur générique GST

Suivre la procédure ''Avec CONSULT-II''.

REMARQUE :



Si le DTC de 1er parcours est confirmé après plus de 5 secondes, il peut y avoir un défaut C.

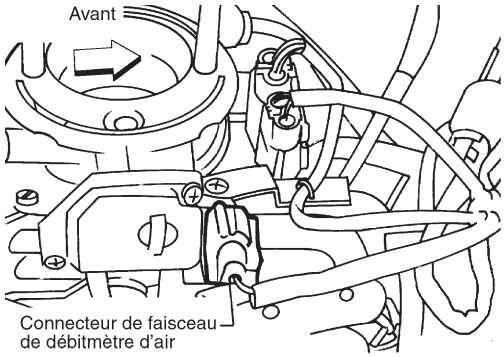
Procédure de diagnostic

NEEC1555

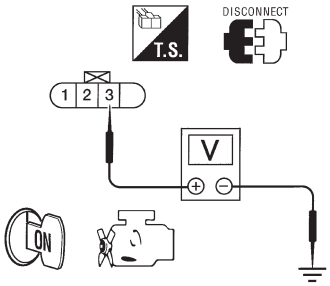
1	DEBUT DE L'INSPECTION	
Quel défaut (P0102, P0103) est reproduit? **P0102 ou P0103**		
P0103	▶	ALLER A 3.
P0102	▶	ALLER A 2.



2	CONTROLER LE SYSTEME D'ADMISSION	
Contrôler ce qui suit en ce qui concerne le raccordement. ● Conduit d'air ● Filtre à air ● Flexibles de dépression ● Passage d'air d'aspiration du conduit d'air au collecteur **BON ou MAUVAIS**		
Bon	▶	ALLER A 3.
Mauvais	▶	Connecter à nouveau les pièces.

3	RESSERRER LES VIS DE MASSE	
1. Mettre le contact d'allumage sur OFF. 2. Desserrer et resserrer les vis de masse du moteur.  SEC309D		
	▶	ALLER A 4.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



4	CONTROLER L'ALIMENTATION ELECTRIQUE

1. Débrancher le connecteur de faisceau du débitmètre d'air.

AEC131A

2. Mettre le contact d'allumage sur ON.
3. Contrôler la tension entre la borne 3 et la masse à l'aide de CONSULT-II ou du testeur.

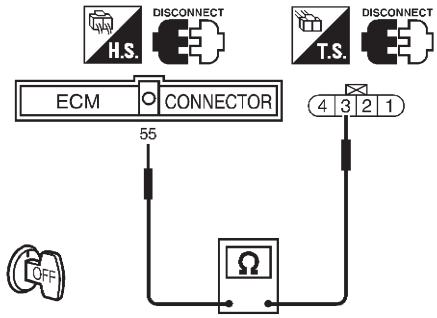
AEC691

Tension : Tension de la batterie

BON ou MAUVAIS

Bon	▶	ALLER A 6.
Mauvais	▶	ALLER A 5.

5	DETECTER LA PIECE DEFECTUEUSE



Contrôler les points suivants.
- Connecteurs de faisceau E101, M5
- Faisceau ouvert ou en court-circuit entre le relais de l'ECM et le débitmètre d'air
- Faisceau ouvert ou en court-circuit entre le débitmètre d'air et l'ECM

	▶	Réparer le faisceau ou les connecteurs.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

6	CONTROLER LE CIRCUIT DE MISE A LA MASSE

1. Mettre le contact d'allumage sur OFF.
2. Débrancher le connecteur de faisceau de l'ECM.
3. Vérifier la continuité du faisceau entre la borne 2 du débitmètre d'air et la borne 55 de l'ECM. Se reporter à EC-3165.

SEF124V

Il doit y avoir continuité.

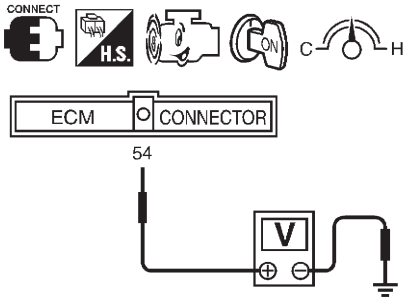
4. Vérifier également que le faisceau n'est pas en court-circuit à la masse ou à l'alimentation.

BON ou MAUVAIS

Bon	▶	ALLER A 7.
Mauvais	▶	Réparer les faisceaux ou les connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

7	CONTROLER LE CIRCUIT DE SIGNAL D'ENTREE

1. Vérifier la continuité du faisceau entre la borne 1 et la borne 54 de l'ECM. Se reporter au schéma de câblage.
   Il doit y avoir continuité.
2. Vérifier également que le faisceau n'est pas en court-circuit à la masse ou à l'alimentation.



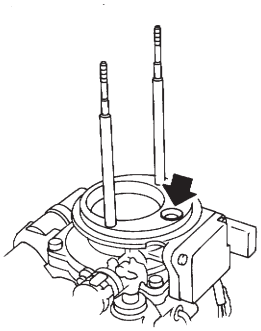
BON ou MAUVAIS

Bon	▶	ALLER A 8.
Mauvais	▶	Réparer les faisceaux ou les connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

8	CONTROLER LE DEBITMETRE D'AIR

1. Brancher à nouveau tous les connecteurs de faisceau débranchés.
2. Mettre le contact d'allumage sur ON.
3. Démarrer le moteur et l'amener à température normale de fonctionnement.
4. Contrôler la tension entre la borne 54 de l'ECM (signal du débitmètre d'air) et la masse.



SEF326V

Conditions	Tension V
Contact d'allumage sur 'ON' (moteur arrêté.)	Moins de 1,0
Ralenti (Le moteur est monté en température jusqu'à atteindre une température de fonctionnement normale.)	0,9 - 1,8
2 500 tr/mn (Le moteur est monté en température jusqu'à atteindre une température de fonctionnement normale.)	1,9 - 2,3
Ralenti à environ 4 000 tr/mn*	1,3 - 1,7 à env. 3,0

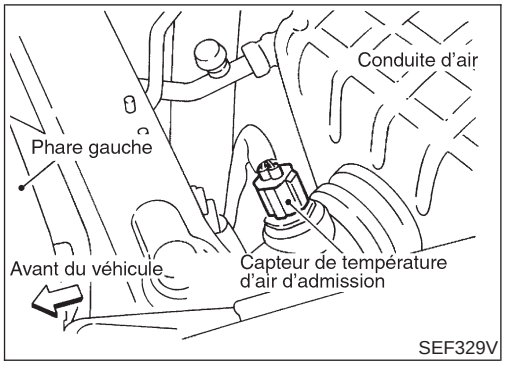
*: Vérifier la hausse de tension linéaire en réponse à des augmentations du régime du moteur à environ 4.000 tr/mn.

MTBL0326

5. Si la tension est hors norme, débrancher et rebrancher le connecteur du faisceau de débitmètre d'air. Puis, recommencer la vérification précédente.
6. Si le résultat n'est pas conforme, déposer le débitmètre du conduit d'air. Vérifier si le fil chaud n'est pas endommagé ou encrassé.

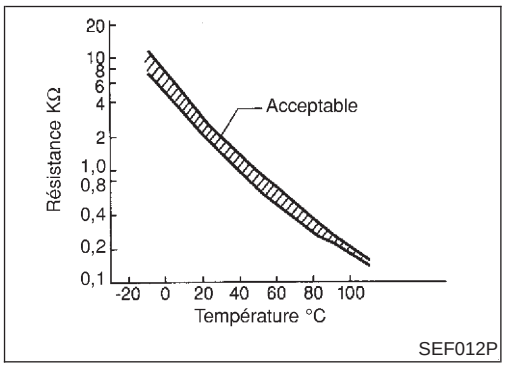
SEF893J

BON ou MAUVAIS



Bon	▶	ALLER A 9.
Mauvais	▶	Remplacer le débitmètre d'air.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



9	VERIFIER LE CIRCUIT DE BLINDAGE	
1. Mettre le contact d'allumage sur OFF. 2. Débrancher le connecteur de jonction-3. 3. Contrôler les points suivants. ● Vérifier la continuité la borne 2 du connecteur de jonction-3 et la masse. ● Connecteur de jonction-3 (Se reporter à ''DISPOSITION DES FAISCEAUX'', dans la section EL.) **Il doit y avoir continuité.** 4. Vérifier également que le faisceau n'est pas en court-circuit à l'alimentation.		
BON ou MAUVAIS		
Bon	▶	ALLER A 10.
Mauvais	▶	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à l'alimentation.

10	VERIFIER SI L'INCIDENT EST INTERMITTENT	
Effectuer un ''DIAGNOSTIC DES DEFAUTS EN CAS INCIDENT INTERMITTENT'', voir page EC-3132.		
	▶	**FIN DE L'INSPECTION**

Description des composants

NEEC0066

Le capteur de température d'air d'admission est installé dans le logement du conduit d'air. Le capteur détecte la température d'air d'admission et transmet un signal à l'ECM.

Le boîtier de capteur de température utilise une thermistance qui est sensible aux variations de température. La résistance électrique de la thermistance diminue au fur et à mesure que la température monte.

<Données de référence>

Température de l'air d'admission °C	Tension* V	Résistance kΩ
20	3,5	2,1 - 2,9
80	1,23	0,27 - 0,38

*: Ces données sont des valeurs de référence et sont mesurées entre la borne 61 de l'ECM (capteur de température d'air d'admission) et la masse.

ATTENTION :

Ne pas utiliser de bornes de masse de l'ECM lors de la mesure de la tension d'entrée/de sortie. En agissant de la sorte, il est possible d'endommager le transistor de l'ECM. Utiliser une masse autre que les bornes de l'ECM, comme par exemple la prise de terre.

Bornes de l'ECM et valeurs de référence

NEEC1556

N° DE BORNE	COULEUR DE CABLE	ELEMENT	CONDITION	DONNEES (tension de courant continu)
43	B	Masse de capteurs	**[Moteur en marche]** ● Régime de ralenti	Environ 0 V
61	P/B	Capteur de température d'air d'admission	**[Moteur en marche]**	Environ 0 - 4,8V La tension de sortie varie avec la température d'air d'admission.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Logique de diagnostic de bord

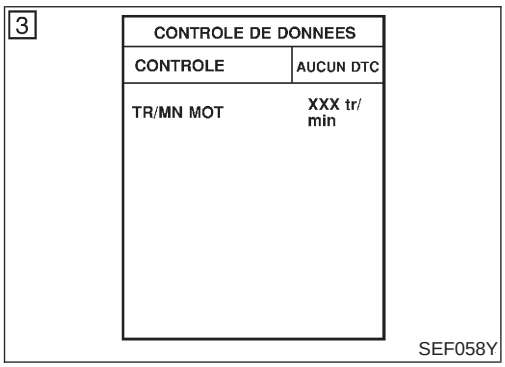
NEEC0067

N° de DTC	Nom de diagnostic des défauts	Condition de détection de DTC	Cause possible
P0112 0112	Faible entrée du circuit du capteur de température d'air d'admission	La tension reç;ue du capteur par l'ECM est excessivement basse.	● Faisceau ou connecteurs (le circuit de capteur est ouvert ou court-circuité) ● Capteur de température d'air d'admission
P0113 0113	Entrée élevée du circuit du capteur de température d'air d'admission	La tension reç;ue du capteur par l'ECM est excessivement élevée.	

MODE DE SÉCURITÉ

NEEC0067S01

Lorsque ce défaut est détecté, l'ECM passe en mode de sécurité et le témoin MI s'allume.



Condition de fonctionnement du moteur en mode de sécurité
L'ECM fonctionne dans la supposition que la température d'admission d'air est de 25°C.

Procédure de confirmation de code de défaut (DTC)

NEEC0068

REMARQUE :

Si une ''Procédure de confirmation de DTC'' a précédé, toujours mettre le contact d'allumage sur la position OFF et attendre au moins 5 secondes avant de procéder à l'essai suivant.

Description des composants

NEEC0072

Le capteur de température du liquide de refroidissement du moteur est utilisé pour détecter la température du liquide de refroidissement du moteur. Le capteur modifie un signal de tension de l'ECM. Le signal modifié retourne à l'ECM en tant qu'entrée de température du moteur. Le capteur utilise une thermistance qui est sensible aux variations de température. La résistance électrique de la thermistance diminue au fur et à mesure que la température monte.

<Données de référence>

Température du liquide de refroidissement du moteur °C	Tension* V	Résistance kΩ
-10 (14)	4,4	7,0 - 11,4
20	3,5	2,1 - 2,9
50	2,2	0,68 - 1,00
90	0,9	0,236 - 0,260

*: Ces données sont de valeurs de références et sont mesurées entre la borne 59 de l'ECM (capteur de température de liquide de refroidissement du moteur) et la masse.

ATTENTION :

Ne pas utiliser de bornes de masse de l'ECM lors de la mesure de la tension d'entrée/de sortie. En agissant de la sorte, il est possible d'endommager le transistor de l'ECM. Utiliser une masse autre que les bornes de l'ECM, comme par exemple la prise de terre.

Description des composants

NEEC0079

REMARQUE :
Si le DTC P0121, P0122 ou P0123 s'affiche avec le DTC P0510, réaliser d'abord le diagnostic des défauts pour le DTC P0510, EC-3321.

Le capteur de position de papillon répond aux mouvements de la pédale d'accélérateur. Ce capteur est une sorte de potentiomètre qui transforme la position de papillon en tension électrique qu'il transmet à l'ECM. De plus, le capteur détecte la vitesse d'ouverture et de fermeture de la soupape de papillon et transmet le signal de tension à l'ECM.
La position ralenti de la soupape de papillon est déterminée par l'ECM lorsqu'il reç;oit le signal provenant du capteur de position de papillon. Ce capteur commande certaines fonctions du moteur comme par exemple la coupure de l'alimentation. En revanche, les contacts de ''ralenti et de position plein gaz'', lesquels sont intégrés au capteur de position du papillon, ne servent pas à la commande du moteur.

Valeur de référence de CONSULT-II en mode de contrôle de données

NEEC0080

Les données de spécification sont des valeurs de référence.

ELEMENT DE CONTROLE	CONDITION		SPECIFICATION
CAP PAPILLON	• Contact d'allumage : ON (moteur à l'arrêt) • Moteur : une fois le moteur chaud	Soupape de papillon : entièrement fermée	0,2 - 0,8V
		Soupape de papillon : entièrement ouverte	3,5 - 4,5V

Procédure de diagnostic

NEEC0085

1	DEBUT DE L'INSPECTION

Quel défaut (A ou B) est reproduit ?

ANOMALIE	Type
A	A
B	B

MTBL1307

Type A ou B

Type A	▶	ALLER A 4.
Type B	▶	ALLER A 2.

2	REGLAGE DU CAPTEUR DE POSITION DE PAPILLON

1. Vérifier les points suivants : Se reporter à la "Procédure d'inspection de base", EC-3093.

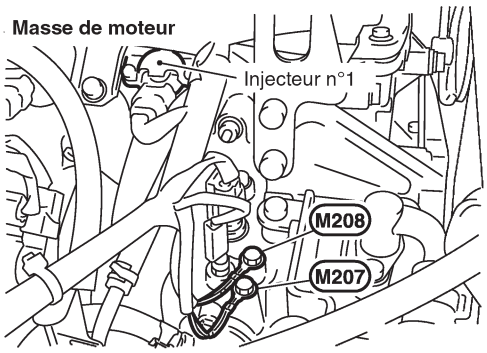
Eléments	Spécifications
Calage de l'allumage	15° ± 2° AV PMH
Ralenti de base	650 ± 50 tr/mn (en position 'N')
Réglage de la position fermée du contact de ralenti	Epaisseur de la cale d'épaisseur et condition du contact 0,1 mm : MARCHE 0,3 mm : ETEINT
Régime de ralenti cible	700 ± 50 tr/mn (en position 'N')

MTBL1315

BON ou MAUVAIS

Bon	▶	ALLER A 3.

3	CONTROLER LE SYSTEME D'ADMISSION



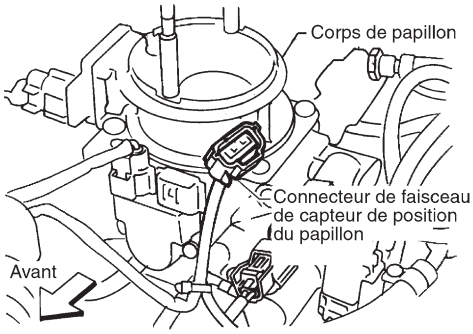
Contrôler ce qui suit en ce qui concerne le raccordement.
- Conduit d'air
- Filtre à air
- Flexibles de dépression
- Passage d'air d'aspiration du conduit d'air au collecteur d'admission

BON ou MAUVAIS

Bon	▶	ALLER A 4.
Mauvais	▶	Connecter à nouveau les pièces.

4	RESSERRER LES VIS DE MASSE

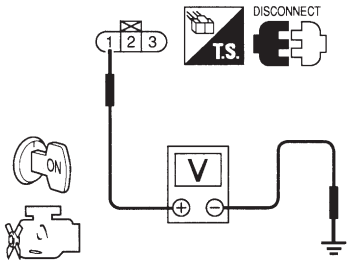
1. Mettre le contact d'allumage sur OFF.
2. Desserrer et resserrer les vis de masse du moteur.



SEC309D

	▶	ALLER A 5.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



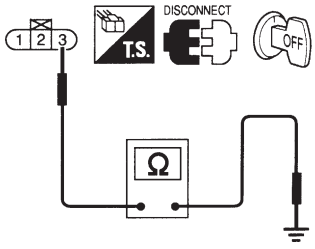
5	CONTROLER L'ALIMENTATION ELECTRIQUE

1. Débrancher le connecteur de faisceau du capteur de position de papillon.

SEF265S

2. Mettre le contact d'allumage sur ON.
3. Contrôler la tension entre la borne 1 et la masse à l'aide de CONSULT-II ou du testeur.

SEF564P



Tension : Environ 5 V

BON ou MAUVAIS

Bon	▶	ALLER A 6.
Mauvais	▶	Réparer le faisceau ou les connecteurs.

6	CONTROLER LE CIRCUIT DE MISE A LA MASSE

1. Mettre le contact d'allumage sur OFF.
2. Vérifier la continuité du faisceau entre la borne 3 du capteur de position de papillon et la masse du moteur. Se reporter au schéma de câblage.

SEF565P

Il doit y avoir continuité.

3. Vérifier également que le faisceau n'est pas en court-circuit à l'alimentation.

BON ou MAUVAIS

Bon	▶	ALLER A 8.
Mauvais	▶	ALLER A 7.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

7	DETECTER LA PIECE DEFECTUEUSE
Vérifier que le faisceau entre l'ECM et le capteur de position du papillon n'est pas ouvert ou en court-circuit.	
▶	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à l'alimentation.

8	CONTROLER LE CIRCUIT DE SIGNAL D'ENTREE

1. Débrancher le connecteur de faisceau de l'ECM.
2. Vérifier la continuité du faisceau entre la borne 23 et la borne 2 de l'ECM.
   Se reporter au schéma de câblage.
   Il doit y avoir continuité.
3. Vérifier également que le faisceau n'est pas en court-circuit à la masse ou à l'alimentation.

BON ou MAUVAIS

Bon (avec CONSULT-II)	▶	ALLER A 9.
Bon (sans CONSULT-II)	▶	ALLER A 10.
Mauvais	▶	Réparer les faisceaux ou les connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

9	CONTROLER LE CAPTEUR DE POSITION DE PAPILLON

Avec CONSULT-II

1. Brancher à nouveau tous les connecteurs de faisceau débranchés.
2. Démarrer le moteur et l'amener à température normale de fonctionnement.
3. Arrêter le moteur et mettre le contact d'allumage sur ON.
4. Régler CONSULT-II en mode ''CONTROLE DE DONNEES''.
5. Vérifier la tension du ''CAP PAPILLON'' dans les conditions suivantes.

CONTROLE DE DONNEES	
CONTROLE	PAS DE DTC
TR/MN MOT	XXX tr/mn
CAP TEMP EAU	XXX °C
CAP PAPILLON	XXX V

SEF179Y

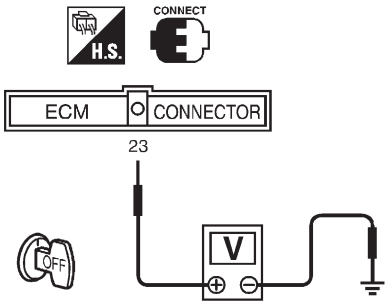
REMARQUE :
Les relevés doivent être effectués avec le capteur de position de papillon installé dans le véhicule.

Conditions du papillon	Tension V
Complètement fermé	0,2 - 0,8 (a)
Partiellement ouvert	Entre (a) et (b)
Complètement ouvert	3,5 - 4,5 (b)

MTBL0579

Si le résultat n'est pas satisfaisant, régler le contact de position de papillon fermé. Se reporter à la ''Procédure d'inspection de base'', EC-3093.

BON ou MAUVAIS



BON (Type B à l'étape 1)	▶	ALLER A 11.
BON (Type A ou C à l'étape 1)	▶	ALLER A 14.
Mauvais	▶	Remplacer le capteur de position de papillon. Pour le régler, effectuer une ''Inspection de base'', EC-3093.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

10	CONTROLER LE CAPTEUR DE POSITION DE PAPILLON

Sans CONSULT-II

1. Brancher à nouveau tous les connecteurs de faisceau débranchés.
2. Démarrer le moteur et l'amener à température normale de fonctionnement.
3. Arrêter le moteur et mettre le contact d'allumage sur ON.
4. Contrôler la tension entre la borne 23 de l'ECM (signal du capteur de position de papillon) et la masse dans les conditions suivantes.

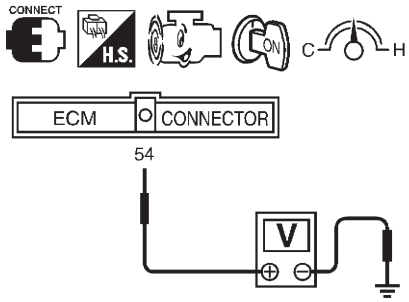
SEF767W

REMARQUE :
Les relevés doivent être effectués avec le capteur de position de papillon reposé sur le véhicule.

Conditions du papillon	Tension V
Complètement fermé	0,2 - 0,8 (a)
Partiellement ouvert	Entre (a) et (b)
Complètement ouvert	3,5 - 4,5 (b)

MTBL0579

Si le résultat n'est pas satisfaisant, régler le contact de position de papillon fermé. Se reporter à la procédure ''Inspection de base'', EC-3093.



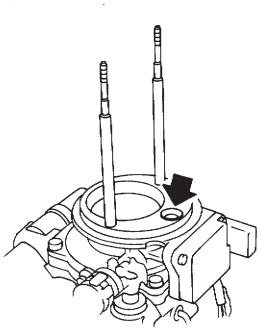
BON ou MAUVAIS

BON (Type B à l'étape 1) ▶	ALLER A 11.
BON (Type A ou C à l'étape 1) ▶	ALLER A 14.
Mauvais ▶	Remplacer le capteur de position de papillon. Pour le régler, effectuer une ''Inspection de base'', EC-3093.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

11	CONTROLER LE DEBITMETRE D'AIR

1. Mettre le contact d'allumage sur ON.
2. Démarrer le moteur et l'amener à température normale de fonctionnement.
3. Vérifier la tension entre la borne 54 de l'ECM (signal du débitmètre d'air) et la masse.



SEF326V

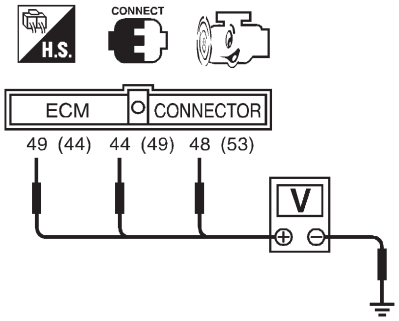
Conditions	Tension V
Contact d'allumage sur 'ON' (moteur arrêté.)	Moins de 1,0
Ralenti (Le moteur est monté en température jusqu'à atteindre une température de fonctionnement normale.)	0,9 - 1,8
2 500 tr/mn (Le moteur est monté en température jusqu'à atteindre une température de fonctionnement normale.)	1,9 - 2,3
Ralenti à environ 4 000 tr/mn*	1,3 - 1,7 à env. 3,0

*: Vérifier la hausse de tension linéaire en réponse à des augmentations du régime du moteur à environ 4.000 tr/mn.

MTBL0326

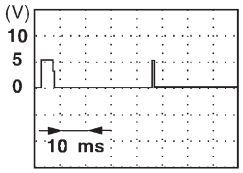
4. Si la tension est hors norme, débrancher et rebrancher le connecteur du faisceau de débitmètre d'air. Puis, recommencer la vérification précédente.
5. Si le résultat n'est pas conforme, déposer le débitmètre du conduit d'air. Vérifier si le fil chaud n'est pas endommagé ou encrassé.

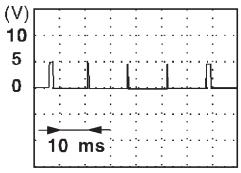
SEF893J



BON ou MAUVAIS

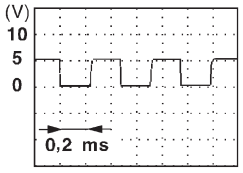
Bon	▶	ALLER A 12.
Mauvais	▶	Remplacer le débitmètre d'air.

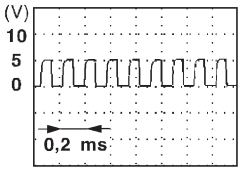




Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

12	CONTROLER LE CAPTEUR D'ANGLE D'ARBRE A CAMES





1. Démarrer le moteur et l'amener à température normale de fonctionnement.
2. Vérifier la tension entre les bornes 49 ou (44)* de l'ECM et la masse du moteur, les bornes 44, 48 ou (49, 53)* de l'ECM et la masse du moteur.

Borne 44, 48 ou (49, 53)* et masse de moteur

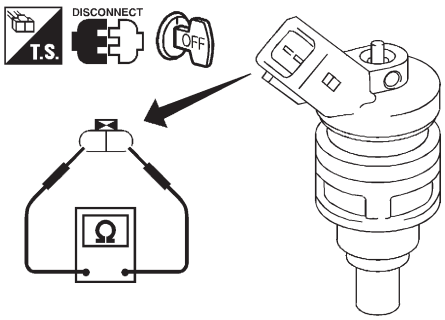
Condition	Ralenti	2 000 tr/mn
Tension	0,2 - 0,5V	0 - 0,5V
Signal d'impulsion		

Borne 49 ou (44)* et masse de moteur

Condition	Ralenti	2 000 tr/mn
Tension	Environ 2,5V	Environ 1,0V
Signal d'impulsion		

SEC273D

*: Modèle avec NATS (système antivol Nissan)



BON ou MAUVAIS

Bon	▶	ALLER A 13.
Mauvais	▶	Remplacer l'ensemble du distributeur avec le capteur d'angle d'arbre à cames.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

13	CONTROLER L'INJECTEUR DE CARBURANT

1. Débrancher le connecteur de faisceau de l'injecteur.
2. Vérifier la résistance entre les bornes comme indiqué sur l'illustration ci-contre.

SEF836Q

Résistance : 10 - 14Ω [à 25°C]

BON ou MAUVAIS

Bon	▶	ALLER A 14.
Mauvais	▶	Remplacer l'injecteur de carburant.

14	VERIFIER LE CIRCUIT DE BLINDAGE

1. Mettre le contact d'allumage sur OFF.
2. Retirer le connecteur de jonction-3.
3. Contrôler les points suivants.

- Continuité entre la borne 2 du connecteur de jonction-3 et la masse
- Connecteur de jonction-3

(Se reporter à ''DISPOSITION DES FAISCEAUX'', section EL.)

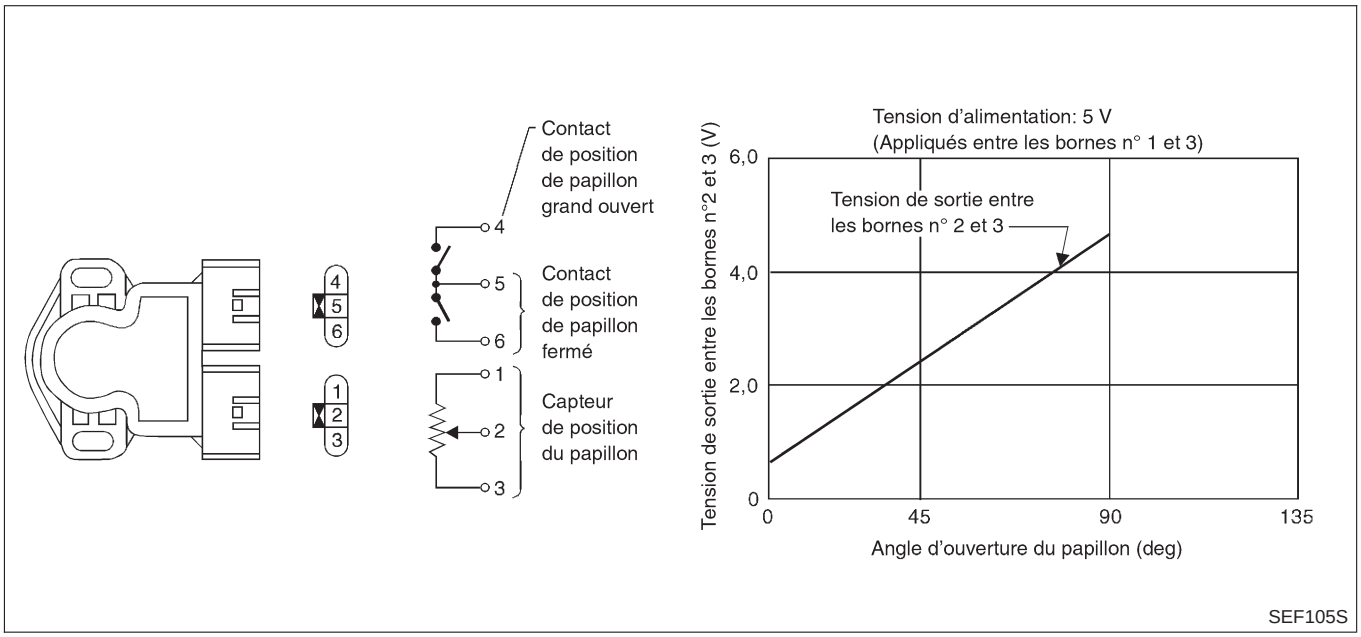
Il doit y avoir continuité.

4. Vérifier également que le faisceau n'est pas en court-circuit à l'alimentation.
5. Ensuite rebrancher le connecteur de jonction.

BON ou MAUVAIS

Bon	▶	ALLER A 15.
Mauvais	▶	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à l'alimentation.

15	VERIFIER SI L'INCIDENT EST INTERMITTENT
Effectuer un ''DIAGNOSTIC DES DEFAUTS EN CAS INCIDENT INTERMITTENT'', voir page EC-3132.	
▶	**FIN DE L'INSPECTION**



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description des composants

NEEC1558

REMARQUE :
Si le DTC P0121, P0122 ou P0123 s'affiche avec le DTC P0510, réaliser d'abord le diagnostic des défauts pour le DTC P0510, EC-3321.

Le capteur de position de papillon répond aux mouvements de la pédale d'accélérateur. Ce capteur est une sorte de potentiomètre qui transforme la position de papillon en tension électrique qu'il transmet à l'ECM. De plus, le capteur détecte la vitesse d'ouverture et de fermeture de la soupape de papillon et transmet le signal de tension à l'ECM.
La position ralenti de la soupape de papillon est déterminée par l'ECM lorsqu'il reç;oit le signal provenant du capteur de position de papillon. Ce capteur commande certaines fonctions du moteur comme par exemple la coupure de l'alimentation. En revanche, les contacts de 'ralenti et de position plein gaz', lesquels sont intégrés au capteur de position du papillon, ne servent pas à la commande du moteur.

Valeur de référence de CONSULT-II en mode de contrôle de données

NEEC1559

Les données de spécification sont des valeurs de référence.

ELEMENT DE CONTROLE	CONDITION		SPECIFICATION
CAP PAPILLON	• Contact d'allumage : ON (moteur à l'arrêt) • Moteur : une fois le moteur chaud	Soupape de papillon : entièrement fermée	0,2 - 0,8V
		Soupape de papillon : entièrement ouverte	3,5 - 4,5V
C/P PAP ABSOL	• Contact d'allumage : ON (moteur à l'arrêt) • Moteur : une fois le moteur chaud	Soupape de papillon : entièrement fermée	0,0
		Soupape de papillon : entièrement ouverte	env. 80

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Bornes de l'ECM et valeurs de référence

=NEEC1560

Les données de spécification sont des valeurs de référence et sont mesurées entre chaque borne et la masse.

ATTENTION :
Ne pas utiliser de bornes de masse de l'ECM lors de la mesure de la tension d'entrée/de sortie. En agissant de la sorte, il est possible d'endommager le transistor de l'ECM. Utiliser une masse autre que les bornes de l'ECM, comme par exemple la prise de terre.

N° DE BORNE	COU-LEUR DE CABLE	ELEMENT	CONDITION	DONNEES (tension de courant continu)
23	G	Capteur d'ouverture de papillon	**[Contact d'allumage sur ON]** ● **Pendant la montée en température** ● Pédale d'accélérateur entièrement relâchée	0,2 - 0,8V
			[Contact d'allumage sur ON] ● Pédale d'accélérateur enfoncée au maximum	3,5 - 4,5V
42	G/B	Alimentation des capteurs	**[Contact d'allumage sur ON]**	Environ 5 V
43	B	Masse de capteurs	**[Moteur en marche]** ● Régime de ralenti	Environ 0 V

Logique de diagnostic de bord

NEEC1561

N° de DTC	Nom de diagnostic des défauts	Condition de détection des défauts DTC	Cause possible
P0122 0122	Faible alimentation du circuit du capteur de position de papillon	Une tension anormalement basse provenant du capteur est adressée à l'ECM.*	● Faisceau ou connecteurs (le circuit de capteur est ouvert ou court-circuité) ● Capteur d'ouverture de papillon
P0123 0123	Alimentation élevée du circuit du capteur de position de papillon	Une tension excessivement élevée est en provenance du capteur est transmise à l'ECM.*	

*: Quand cette anomalie est détectée, l'ECM entre en mode de sécurité mode et le témoin MI s'allume.

Eléments détectés	Condition de fonctionnement du moteur en mode de sécurité	
Circuit du capteur de position de papillon	La position de papillon sera déterminée sur la base de la quantité de carburant injectée et du régime-moteur. Par conséquent, l'accélération sera faible.	
	Condition	Condition de conduite
	Moteur au ralenti	Normal
	Lors de l'accélération	Accélération faible

SEF012P

Description des composants

NEEC1565

Le capteur de température d'air d'admission est installé dans le logement du conduit d'air. Le capteur détecte la température d'air d'admission et transmet un signal à l'ECM.
Le boîtier de capteur de température utilise une thermistance qui est sensible aux variations de température. La résistance électrique de la thermistance diminue au fur et à mesure que la température monte.

<Données de référence>

Température de l'air d'admission °C	Tension* V	Résistance kΩ
20	3,5	2,1 - 2,9
80	1,23	0,27 - 0,38

*: Ces données sont des valeurs de référence et sont mesurées entre la borne 61 de l'ECM (capteur de température d'air d'admission) et la masse.

ATTENTION :
Ne pas utiliser de bornes de masse de l'ECM lors de la mesure de la tension d'entrée/de sortie. En agissant de la sorte, il est possible d'endommager le transistor de l'ECM. Utiliser une masse autre que les bornes de l'ECM, comme par exemple la prise de terre.

1) Attendre que la température du liquide de refroidissement du moteur soit inférieure à 90°C.

a) Mettre le contact d’allumage sur ON.

b) Régler CONSULT-II en mode ‘‘CONTROLE DE DONNEES’’.

c) Vérifier la température du liquide de refroidissement du moteur.

d) Si la température du liquide de refroidissement du moteur n’est pas inférieure à 90°C, mettre le contact d’allumage sur ‘‘OFF’’ et faire refroidir le moteur.

- La procédure suivante doit être effectuée avant que la température du liquide de refroidissement n’atteigne 90°C.

2) Mettre le contact d’allumage sur ON.

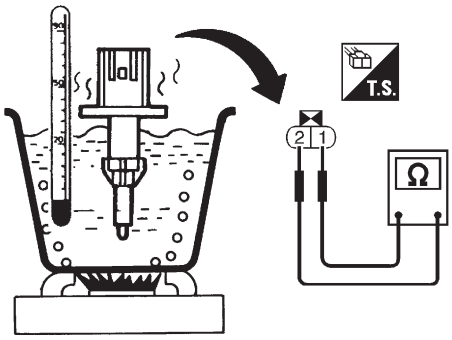
3) Régler CONSULT-II en mode ‘‘CONTROLE DE DONNEES’’.

4) Démarrer le moteur.

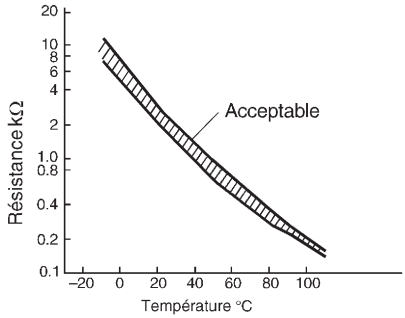
5) Rouler à plus de 70 km/h pendant 100 secondes.

6) Si le DTC de 1er parcours est détecté, aller à ‘‘Procédure de diagnostic’’, page EC-3207.

Avec l’analyseur générique GST



Suivre la procédure ‘‘Avec CONSULT-II’’.



Procédure de diagnostic

NEEC1569

1	CONTROLER LE CAPTEUR DE TEMPERATURE D'AIR D'ADMISSION

Vérifier la résistance comme indiqué sur l'illustration ci-contre.

SEF288D

Description des composants

NEEC0128

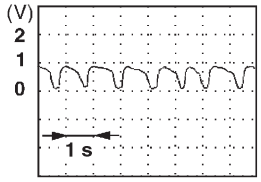
La sonde à oxygène chauffé 1 est placée dans le collecteur d'échappement. Elle détecte la quantité d'oxygène contenue dans les gaz d'échappement en comparaison avec l'air extérieur. La sonde à oxygène chauffé 1 dispose d'un tube à extrémité fermée en zirconium de céramique. La zircone produit une tension qui va d'environ 1 V dans des conditions de mélange plus riche à 0 V dans des conditions de mélange plus pauvre. Le signal de la sonde à oxygène chauffé 1 est envoyé à l'ECM. L'ECM règle la durée de l'impulsion d'injection pour obtenir le mélange idéal air-carburant. Le mélange idéal air-carburant est obtenu vers le changement radical de 1 V à 0 V.

Valeur de référence de CONSULT-II en mode de contrôle de données

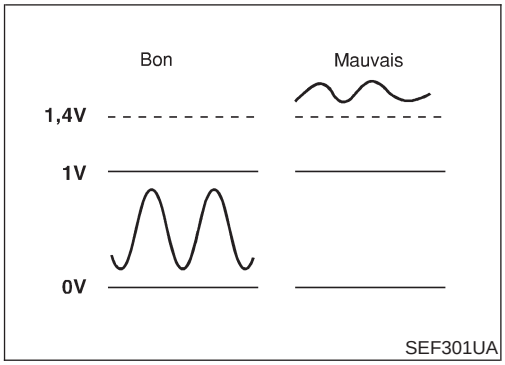
NEEC0129

Les données de spécification sont des valeurs de référence.

ELEMENT DE CONTROLE	CONDITION		SPECIFICATION
S/O2 CH1 (R1)	● Moteur : une fois le moteur chaud	Maintenir le régime moteur à 2 000 tr/mn	0 - 0,3V ←→ Env. 0,6 - 1,0V
MTR S/O2 CH1 (R1)			PAUVRE ←→ RICHE Change plus de 5 fois pendant 10 secondes



Bornes de l'ECM et valeurs de référence



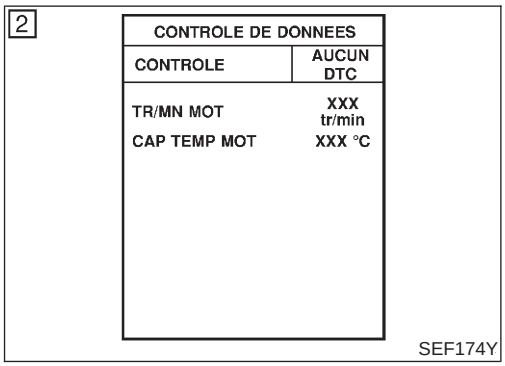
NEEC0130

Les données de spécification sont des valeurs de référence et sont mesurées entre chaque borne et la masse.

ATTENTION :

Ne pas utiliser de bornes de masse de l'ECM lors de la mesure de la tension d'entrée/de sortie. En agissant de la sorte, il est possible d'endommager le transistor de l'ECM. Utiliser une masse autre que les bornes de l'ECM, comme par exemple la prise de terre.

N° DE BORNE	COULEUR DE CABLE	ELEMENT	CONDITION	DONNEES (tension de courant continu)
50	W	Sonde à oxygène chauffé 1	**[Moteur en marche]** ● Après montée en température normale de fonctionnement et au régime moteur de 2.000 tr/mn.	0 - Environ 1,0V  SEF008W



Logique de diagnostic de bord

NEEC0131

Pour déterminer le défaut de fonctionnement, le diagnostic vérifie que la sortie de la sonde à oxygène chauffé 1 n'est pas anormalement haute.

N° de DTC	Le défaut est détecté quand ...	Eléments de contrôle (causes possibles)
P0134 0134	● La tension reç;ue du capteur par l'ECM est excessivement élevée.	● Faisceau ou connecteurs (le circuit de capteur est ouvert ou court-circuité) ● Sonde à oxygène chauffé 1

Procédure de confirmation de code de défaut (DTC)

NEEC0132

REMARQUE :

Si une ''Procédure de confirmation de DTC'' a précédé, toujours mettre le contact d'allumage sur la position OFF et attendre au moins 5 secondes avant de procéder à l'essai suivant.

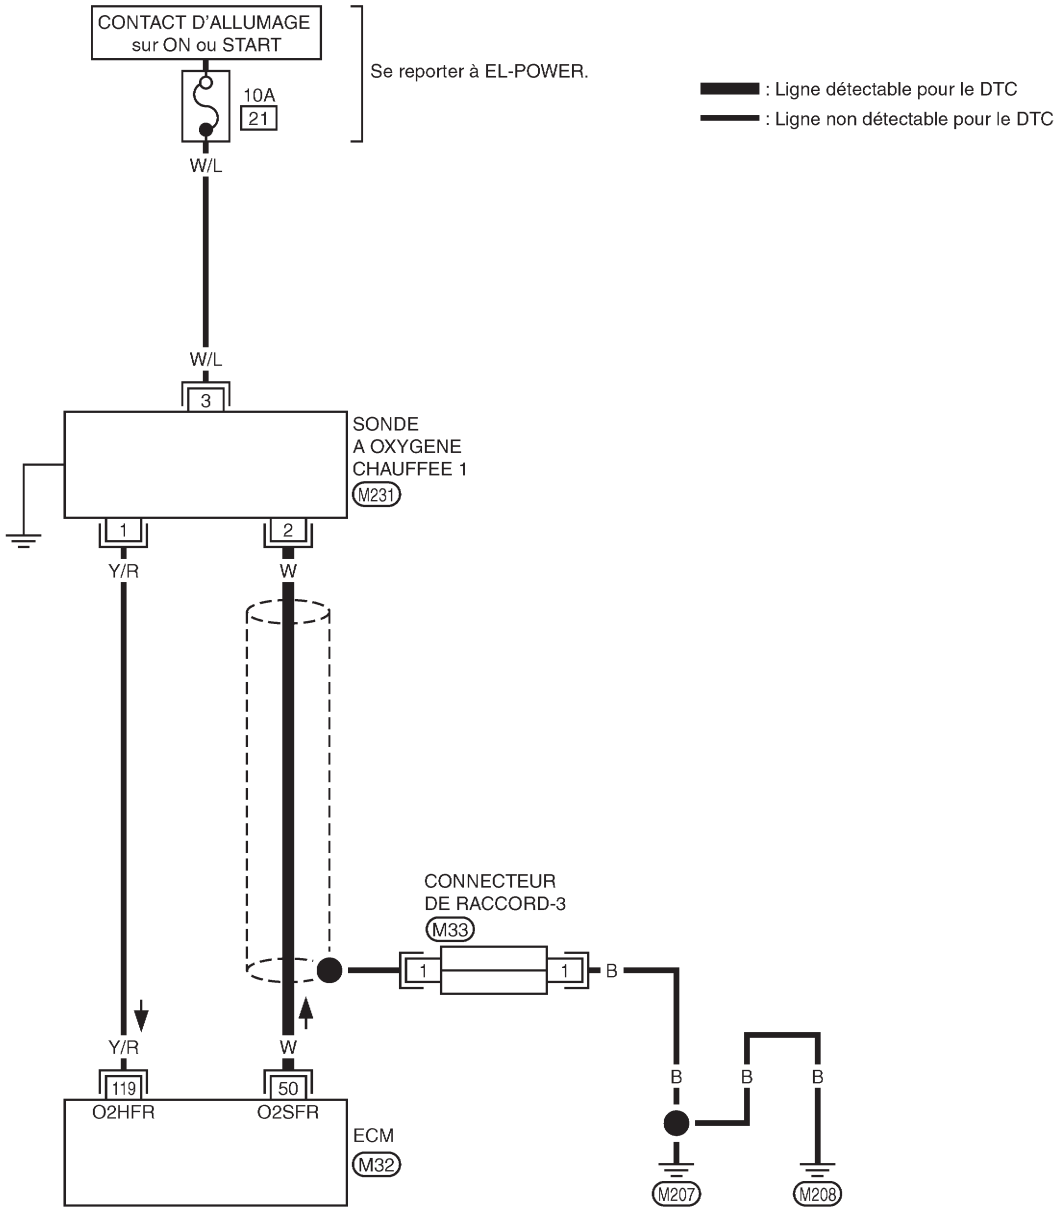
Avec CONSULT-II

1) Démarrer le moteur et l'amener à température normale de fonctionnement.
2) Mettre le contact d'allumage sur OFF et attendre au moins 5 secondes.
3) Mettre le contact d'allumage sur ON.
4) Régler CONSULT-II en mode ''CONTROLE DE DONNEES''.
5) Redémarrer le moteur et le laisser tourner au ralenti pendant 35 secondes.
6) Si le DTC de 1er parcours est détecté, aller à ''Procédure de diagnostic'', page EC-3212.

Avec l'analyseur générique GST

1) Démarrer le moteur et l'amener à température normale de fonctionnement.
2) Mettre le contact d'allumage sur OFF et attendre au moins 5 secondes.
3) Redémarrer le moteur et le laisser tourner au ralenti pendant 35 secondes.
4) Mettre le contact d'allumage sur OFF et attendre au moins 5 secondes.
5) Redémarrer le moteur et le laisser tourner au ralenti pendant 35 secondes.
6) Régler le GST en ''MODE 3''.
7) Si le DTC est détecté, effectuer une ''Procédure de diagnostic'', voir page EC-3212.

- **L'utilisation d'un analyseur générique GST impose d'effectuer une 'Procédure de confirmation de DTC'' deux**



fois plus qu'avec CONSULT-II du fait que l'analyseur générique GST ne peut pas afficher en MODE 7 (DTC de 1er parcours), en ce qui concerne ce diagnostic. C'est pourquoi il est vivement conseillé d'utiliser CONSULT-II.

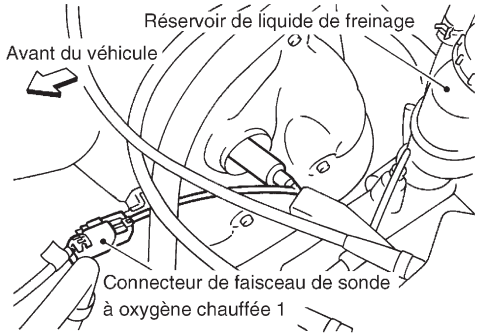
Procédure de diagnostic

NEEC0134

1	RESSERRER LA SONDE A OXYGENE CHAUFFE 1

1. Mettre le contact d'allumage sur OFF.
2. Desserrer et resserrer la sonde à oxygène chauffé 1.



SEF332VC

Couple de serrage :
40 - 60 N·m (4,1 - 6,1 kg-m)

	▶	ALLER A 2.

2	CONTROLER LE CIRCUIT DE SIGNAL D'ENTREE

1. Débrancher le connecteur de faisceau de la sonde à oxygène chauffé 1 et le connecteur de faisceau de l'ECM.

SEF331VC

2. Vérifier la continuité du faisceau entre la borne 50 de l'ECM et la borne 2. Se reporter au schéma de câblage.
   Il doit y avoir continuité.
3. Vérifier la continuité du faisceau entre la borne 50 (ou 2) de l'ECM et la masse. Se reporter au schéma de câblage.
   Il ne doit pas y avoir continuité.
4. Vérifier également que le faisceau n'est pas en court-circuit à l'alimentation.

BON ou MAUVAIS

Bon	▶	ALLER A 3.
Mauvais	▶	Réparer les faisceaux ou les connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

3	CONTROLER LE CONNECTEUR DE FAISCEAU

Vérifier qu'il n'y a pas d'eau dans le connecteur de faisceau de la sonde à oxygène chauffé 1.
Il ne doit pas y avoir d'eau.

BON ou MAUVAIS

Bon (avec CONSULT-II)	▶	ALLER A 4.
Bon (sans CONSULT-II)	▶	ALLER A 5.
Mauvais	▶	Réparer ou remplacer le connecteur de faisceau.

4	CONTROLER LA SONDE A OXYGENE CHAUFFE 1

Avec CONSULT-II

1. Brancher à nouveau tous les connecteurs de faisceau débranchés.
2. Démarrer le moteur et l'amener à température normale de fonctionnement.
3. Sélectionner ''ENCLEN MANU'' en mode ''CONTROLE DE DONNEES'', et régler le point de déclenchement à 100%.
4. Sélectionner ''S/O2 CH1 (R1)'' et ''MTR S/O2 CH1 (R1)'' dans la sélection d'élément.
5. Maintenir le régime-moteur à 2.000 tr/mn à vide au cours des étapes suivantes.
6. Appuyer sur ''DEPART'' sur l'écran de CONSULT-II.

CONTROLE DE DONNEES	
CONTROLE	AUCUN DTC

SEF298U

Logique de diagnostic de bord

NEEC0122

Pour déterminer le défaut de fonctionnement de la sonde à oxygène chauffé 1, ce diagnostic mesure le temps de réponse du signal de la sonde à oxygène chauffé 1. Le temps est compensé par l'opération du moteur (régime et charge), contrôle permanent de retour de carburant, et l'indice de température de la sonde à oxygène chauffé 1. L'évaluation consiste fondamentalement à observer si le temps compensé (indice de cycles de la sonde à oxygène chauffé 1) est anormalement long ou non.

N° de DTC	Le défaut est détecté quand ...	Eléments de contrôle (causes possibles)
P0133 0133	● Le temps de réponse au signal de tension en provenance de la sonde est plus long que prévu dans les spécifications.	● Faisceau ou connecteurs (le circuit de capteur est ouvert ou court-circuité) ● Sonde à oxygène chauffé 1 ● Chauffage de la sonde à oxygène chauffé 1 ● Pression de carburant ● Injecteurs ● Fuites d'air d'admission ● Fuites de gaz d'échappement ● PCV ● Débitmètre d'air

Procédure de confirmation de code de défaut (DTC)

NEEC0123

ATTENTION :
Toujours adapter sa vitesse aux exigences de sécurité.

REMARQUE :
Si une ''Procédure de confirmation de DTC'' a précédé, toujours mettre le contact d'allumage sur la position OFF et attendre au moins 5 secondes avant de procéder à l'essai suivant.

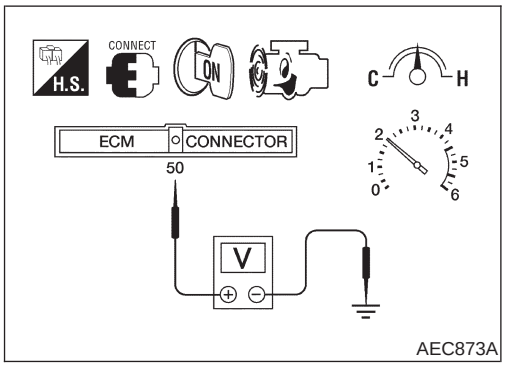
CONDITIONS D'ESSAI :

- **Toujours opérer à une température supérieure à -10°C.**
- **Avant d'entamer la procédure suivante, vérifier que la tension délivrée par la batterie est supérieure à 11V au ralenti.**

Avec CONSULT-II

1) Démarrer le moteur et l'amener à température normale de fonctionnement.
2) Arrêter le moteur et attendre au moins 5 secondes.
3) Mettre le contact d'allumage sur ON et sélectionner ''P0133 S/O2 CH1 (R1)'' ou ''S/O2 CH1'' dans le mode ''SUPPORT TRAVAIL DTC'' de CONSULT-II.
4) Appuyer sur ''DEPART''.
5) Démarrer le moteur et le laisser tourner au ralenti pendant au moins 3,0 minutes.

REMARQUE :
Ne jamais dépasser le régime de 3 600 tr/mn après cette étape. Si le régime-moteur dépasse cette limite, recommencer à l'étape 5.



6) Lorsque les conditions suivantes sont remplies, l'écran de CONSULT-II indique ''TEST EN COURS''. Maintenir les conditions indiquées jusqu'à ce que le message ''TEST EN COURS'' laisse place au message ''TERMINE'' (ceci prend environ 20 secondes.)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

TR/MN MOT	1.750 - 3.750 tr/mn
Vitesse du véhicule	Plus de 80 km/h
PLAN CAR BASE	3,5 - 15,5 ms
Levier de vitesses	Rapport adapté

Si ‘‘TEST EN COURS’’ ne s’affiche pas après 5 minutes, réessayer à partir de l’étape 2.

7) S’assurer que BON s’affiche après avoir appuyé sur ‘‘RESULT AUTO-DIAG’’. Si MAUVAIS s’affiche, se reporter à la ‘‘Procédure de diagnostic’’, EC-3219.

Vérification du fonctionnement général

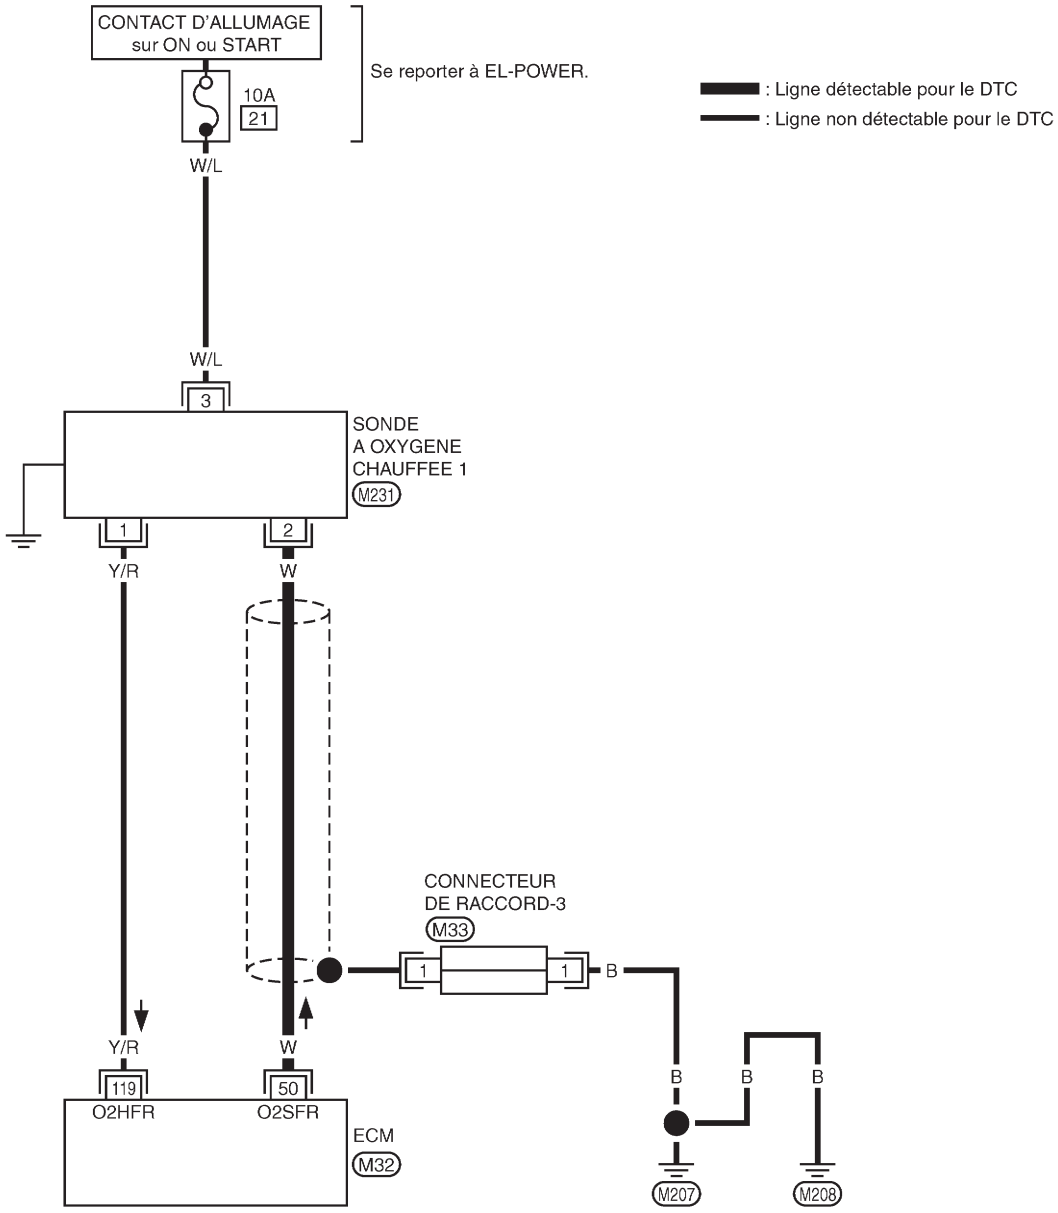
NEEC0124

Utiliser cette procédure pour vérifier le fonctionnement général du circuit de la sonde à oxygène chauffé 1. Au cours de ce contrôle, il est possible qu’un DTC de 1er parcours ne soit pas confirmé.

Avec l’analyseur générique GST

1) Démarrer le moteur et l’amener à température normale de fonctionnement.
2) Placer des sondes de voltmètre entre la borne 50 de l’ECM [signal de sonde à oxygène chauffé] 1 et la masse du moteur.
3) Procéder au contrôle suivant en maintenant constant le régime moteur à 2 000 tr/mn à vide.

- La tension varie entre 0 - 0,3V et 0,6 - 1,0V plus de cinq fois en 10 secondes.
  1 occurrence : 0 - 0,3 V → 0,6 - 1,0 V → 0 - 0,3 V
  2 occurrences : 0 - 0,3 V → 0,6 - 1,0 V → 0 - 0,3 V → 0,6 - 1,0 V → 0 - 0,3V



4) Si ‘‘MAUVAIS’’, effectuer une ‘‘Procédure de diagnostic’’, voir page EC-3219.

9	CONTROLER LA SONDE A OXYGENE CHAUFFE 1

Sans CONSULT-II

1. Brancher à nouveau tous les connecteurs de faisceau débranchés.
2. Démarrer le moteur et l'amener à température normale de fonctionnement.
3. Placer des sondes de voltmètre entre la borne 50 de l'ECM [signal de sonde à oxygène chauffé] 1 et la masse du moteur.

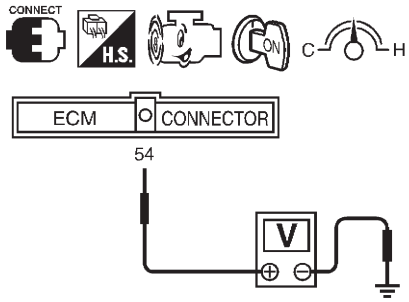
AEC873A

4. Procéder au contrôle suivant en maintenant constant le régime moteur à 2 000 tr/mn à vide.

- La tension varie entre 0 - 0,3V et 0,6 - 1,0V plus de cinq fois en 10 secondes.
  1 occurrence : 0 - 0,3V → 0,6 - 1,0V → 0 - 0,3V
  2 occurrences : 0 - 0,3V → 0,6 - 1,0V → 0 - 0,3V → 0,6 - 1,0V → 0 - 0,3V
- La tension maximale dépasse 0,6 V au moins une fois.
- La tension minimale tombe sous 0,3 V au moins une fois.
- La tension ne dépasse jamais 1,0 V.

ATTENTION :

- **Jeter toute sonde à oxygène chauffé tombée d'une hauteur supérieure à 0,5 m sur une surface dure telle qu'un plancher en béton, et la remplacer par une sonde neuve.**
- **Avant de reposer une nouvelle sonde à oxygène, nettoyer le filetage du système d'échappement à l'aide de l'outil de nettoyage pour filetage de sonde à oxygène J-43897-18 ou J-43897-12 et un lubrifiant antigrippant agréé.**



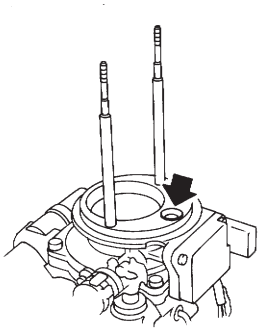
BON ou MAUVAIS

Bon	▶	ALLER A 10.
Mauvais	▶	Remplacer la sonde à oxygène chauffé 1.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

10	CONTROLER LE DEBITMETRE D'AIR

1. Mettre le contact d'allumage sur ON.
2. Démarrer le moteur et l'amener à température normale de fonctionnement.
3. Vérifier la tension entre la borne 54 de l'ECM (signal du débitmètre d'air) et la masse.



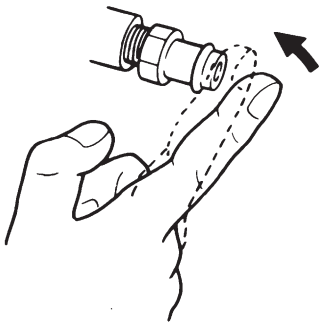
SEF326V

Conditions	Tension V
Contact d'allumage sur 'ON' (moteur arrêté.)	Moins de 1,0
Ralenti (Le moteur est monté en température jusqu'à atteindre une température de fonctionnement normale.)	0,9 - 1,8
2 500 tr/mn (Le moteur est monté en température jusqu'à atteindre une température de fonctionnement normale.)	1,9 - 2,3
Ralenti à environ 4 000 tr/mn*	1,3 - 1,7 à env. 3,0

*: Vérifier la hausse de tension linéaire en réponse à des augmentations du régime du moteur à environ 4.000 tr/mn.

MTBL0326

4. Si la tension est hors norme, débrancher et rebrancher le connecteur du faisceau de débitmètre d'air. Puis, recommencer la vérification précédente.
5. Si le résultat n'est pas conforme, déposer le débitmètre du conduit d'air. Vérifier si le fil chaud n'est pas endommagé ou encrassé.



SEF893J

BON ou MAUVAIS

Bon	▶	ALLER A 11.
Mauvais	▶	Remplacer le débitmètre d'air.

11	CONTROLER LA SOUPAPE PCV

1. Le moteur tournant au ralenti, déposer la soupape PCV du séparateur de reniflard.
2. Une soupape en bon état émet un sifflement lors du passage de l'air. Une forte succion doit être ressentie immédiatement lorsque l'on place un doigt sur l'orifice d'admission de la soupape.

SEC137A

BON ou MAUVAIS

Bon	▶	ALLER A 12.
Mauvais	▶	Réparer ou remplacer la soupape PCV.

12	VERIFIER LE CIRCUIT DE BLINDAGE

1. Mettre le contact d'allumage sur OFF.
2. Retirer le connecteur de jonction-3.
3. Contrôler les points suivants.

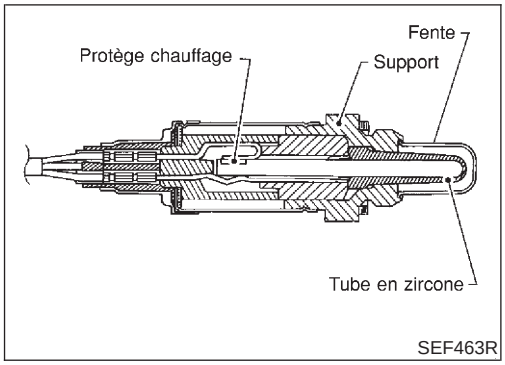
- Continuité entre la borne 1 du connecteur de jonction-3 et la masse
- Connecteur de jonction-3

(Se reporter à ''DISPOSITION DES FAISCEAUX'', dans la section EL.)

Il doit y avoir continuité.

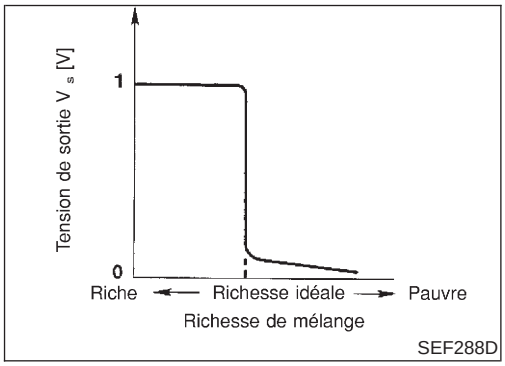
4. Vérifier également que le faisceau n'est pas en court-circuit à l'alimentation.
5. Ensuite, rebrancher le connecteur de jonction.

BON ou MAUVAIS



Bon	▶	ALLER A 13.
Mauvais	▶	Réparer les faisceaux ou connecteurs en circuit ouvert ou court-circuit.

13	VERIFIER SI L'INCIDENT EST INTERMITTENT



Effectuer un ''DIAGNOSTIC DES DEFAUTS EN CAS INCIDENT INTERMITTENT'', voir page EC-3132.

SEF463R

SEF288D

Description des composants

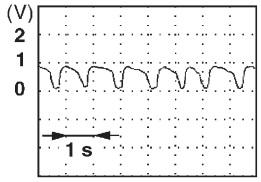
NEEC0094

La sonde à oxygène chauffé 1 est placée dans le collecteur d'échappement. Elle détecte la quantité d'oxygène contenue dans les gaz d'échappement en comparaison avec l'air extérieur. La sonde à oxygène chauffé 1 dispose d'un tube à extrémité fermée en zirconium de céramique. La zircone produit une tension qui va d'environ 1 V dans des conditions de mélange plus riche à 0 V dans des conditions de mélange plus pauvre. Le signal de la sonde à oxygène chauffé 1 est envoyé à l'ECM. L'ECM règle la durée de l'impulsion d'injection pour obtenir le mélange idéal air-carburant. Le mélange idéal air-carburant se produit vers le changement radical de 1 V à 0 V.

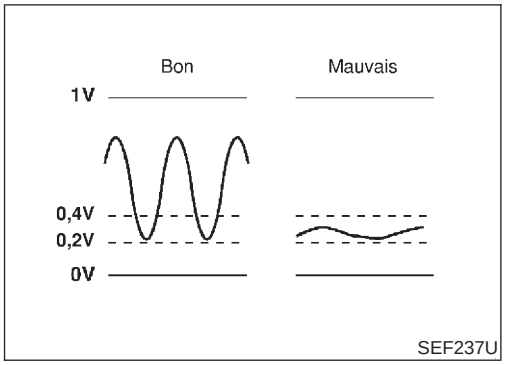
Valeur de référence de CONSULT-II en mode de contrôle de données

NEEC0095

Les données de spécification sont des valeurs de référence.



ELEMENT DE CONTROLE	CONDITION		SPECIFICATION
S/O2 CH1 (R1)	● Moteur : une fois le moteur chaud	Maintenir le régime-moteur à 2 000 tr/mn.	0 - 0,3 V ←→ Env. 0,6 - 1,0 V
MTR S/O2 CH1 (R1)			PAUVRE ←→ RICHE Change plus de 5 fois pendant 10 secondes



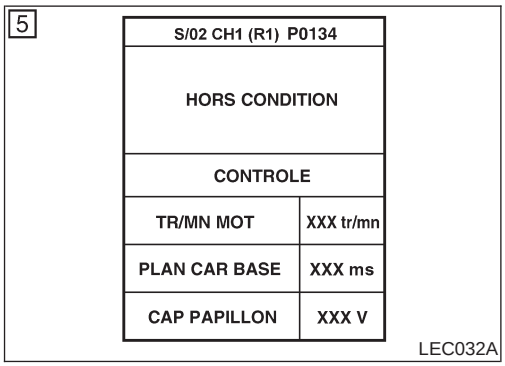
Bornes de l'ECM et valeurs de référence

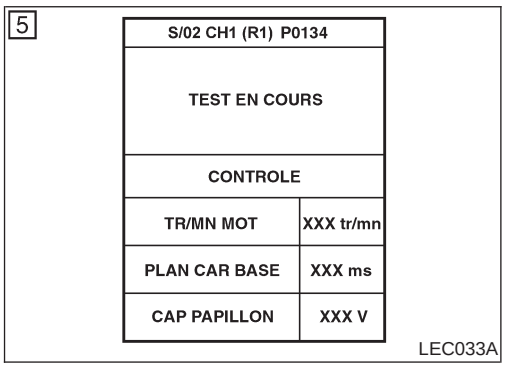
NEEC0096

Les données de spécification sont des valeurs de référence et sont mesurées entre chaque borne et la masse.

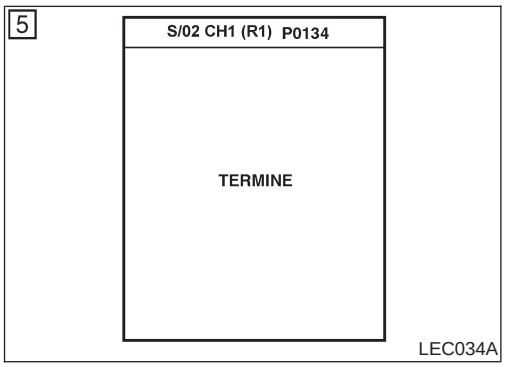
ATTENTION :
Ne pas utiliser de bornes de masse de l'ECM lors de la mesure de la tension d'entrée/de sortie. En agissant de la sorte, il est possible d'endommager le transistor de l'ECM. Utiliser une masse autre que les bornes de l'ECM, comme par exemple la prise de terre.

N° DE BORNE	COULEUR DE CABLE	ELEMENT	CONDITION	DONNEES (tension de courant continu)
50	W	Sonde à oxygène chauffé 1	**[Moteur en marche]** ● Après montée en température normale de fonctionnement et au régime moteur de 2.000 tr/mn.	0 - Environ 1,0 V  SEF008W





Logique de diagnostic de bord



NEEC0097

Lorsque le signal de la sonde à oxygène chauffé 1 n'est pas en entrée, les circuits de l'ECM détectent une tension continue d'environ 0,3V. En conséquence, le diagnostic a pour objet de vérifier le temps pendant lequel la tension de sortie est comprise entre 200 et 400 mV, et de vérifier que ce temps n'est pas anormalement long.

N° de DTC	Le défaut est détecté quand ...	Eléments de contrôle (causes possibles)
P0134 0134	● La tension en provenance du capteur avoisine constamment 0,3V.	● Faisceau ou connecteurs (le circuit de capteur est ouvert ou court-circuité) ● Sonde à oxygène chauffé 1

Procédure de confirmation de code de défaut (DTC)

NEEC0098

ATTENTION :
Toujours adapter sa vitesse aux exigences de sécurité.

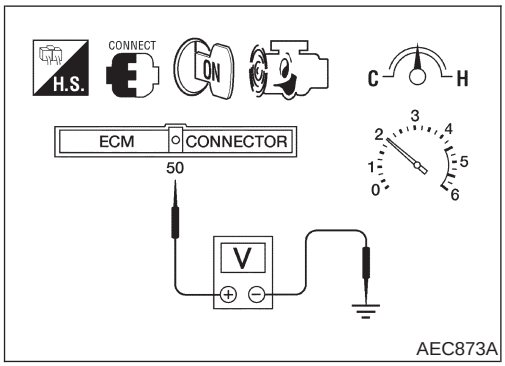
REMARQUE :
Si une ''Procédure de confirmation de DTC'' a précédé, toujours mettre le contact d'allumage sur la position OFF et attendre au moins 5 secondes avant de procéder à l'essai suivant.

CONDITIONS D'ESSAI :
Avant d'entamer la procédure suivante, vérifier que la tension délivrée par la batterie est supérieure à 11V au ralenti.

Avec CONSULT-II

1) Démarrer le moteur et l'amener à température normale de fonctionnement.
2) Sélectionner ''P0134 S/O2 CH1 (R1)'' ou ''S/O2 CH1'' dans le mode ''SUPPORT TRAVAIL DTC'' de CONSULT-II.
3) Appuyer sur ''DEPART''.
4) Laisser le moteur tourner au ralenti pendant au moins 3 minutes.

REMARQUE :
Ne jamais dépasser le régime de 3 600 tr/mn après cette étape. Si le régime-moteur dépasse cette limite, recommencer à l'étape 4.



5) Lorsque les conditions suivantes sont remplies, l'écran de CONSULT-II indique ''TEST EN COURS''. Maintenir les conditions indiquées jusqu'à ce que le message ''TEST EN COURS'' laisse place au message ''TERMINE'' (cela prend environ 10 à 60 secondes.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

TR/MN MOT	1.400 - 4.000 tr/mn
Vitesse du véhicule	64 - 130 km/h
PLAN CAR BASE	3,5 - 17 ms
Levier de vitesses	Rapport adapté

Si ‘‘TEST EN COURS’’ ne s’affiche pas après 5 minutes, réessayer à partir de l’étape 2.

6) S’assurer que BON s’affiche après avoir appuyé sur ‘‘RESULT AUTO-DIAG’’. Si MAUVAIS s’affiche, se reporter à la ‘‘Procédure de diagnostic’’, EC-3230.

Vérification du fonctionnement général

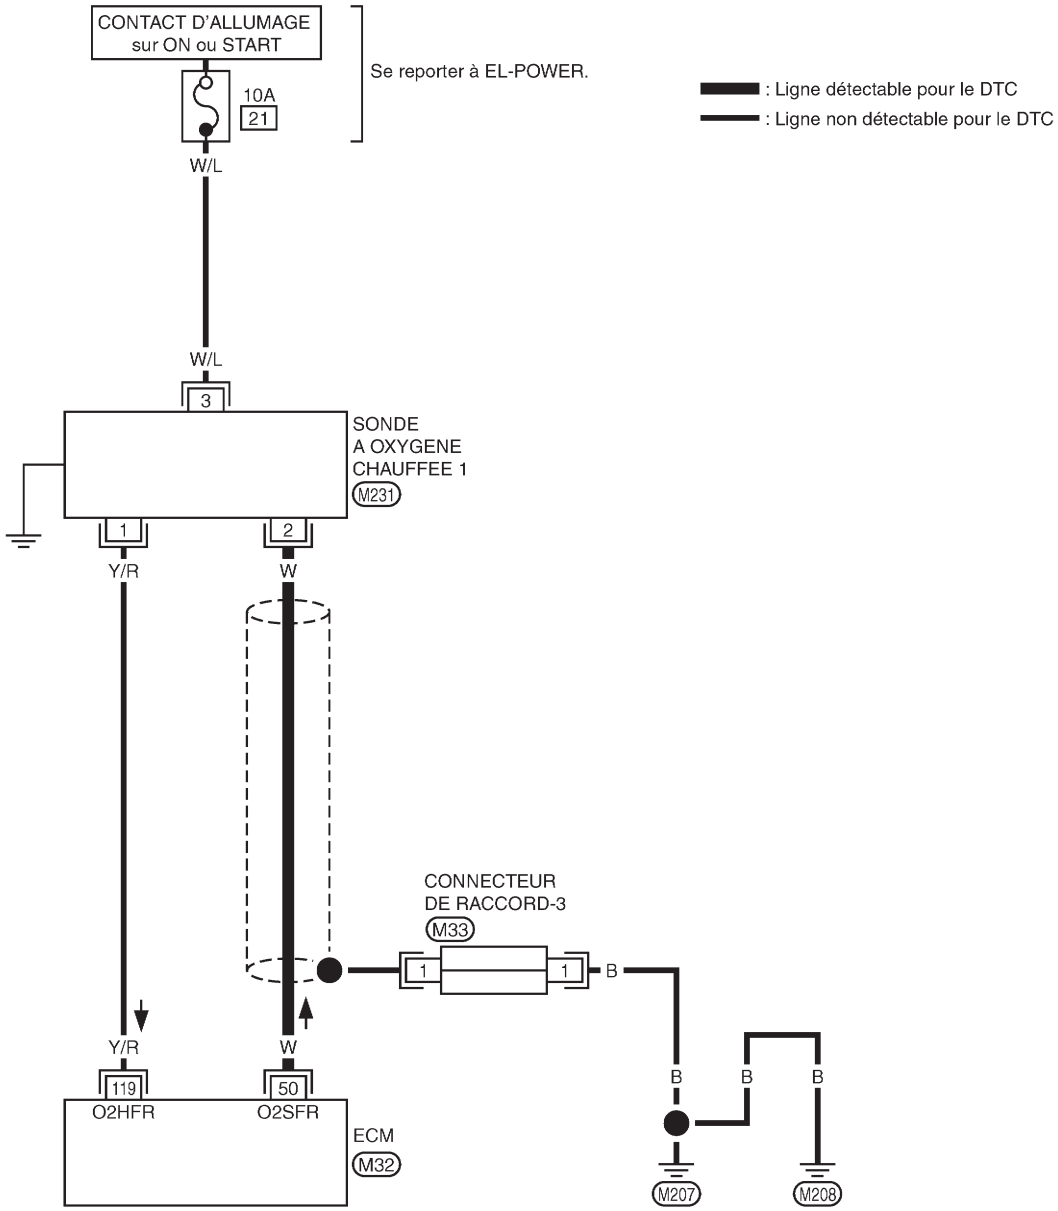
NEEC0099

Utiliser cette procédure pour vérifier le fonctionnement général du circuit de la sonde à oxygène chauffé 1. Au cours de ce contrôle, il est possible qu’un DTC de 1er parcours ne soit pas confirmé.

Sans CONSULT-II

1) Démarrer le moteur et l’amener à température normale de fonctionnement.
2) Placer des sondes de voltmètre entre la borne 50 de l’ECM [signal de sonde à oxygène chauffé] 1 et la masse du moteur.
3) Procéder au contrôle suivant en maintenant constant le régime moteur à 2 000 tr/mn à vide.

- La tension ne reste pas dans les limites de 0,2 à 0,4 V.



4) Si les résultats ne sont pas conformes, effectuer une ‘‘Procédure de diagnostic’’, voir page EC-3230.

Description des composants

NEEC0171

La sonde à oxygène chauffé 2, située en aval du catalyseur à trois voies, contrôle le niveau d'oxygène dans les gaz d'échappement. Même si les caractéristiques de commutation de la sonde à oxygène chauffé 1 sont modifiées, le rapport air-carburant est commandé à la stœchiométrie par le signal délivré par la sonde à oxygène chauffé 2

Cette sonde est en zircone céramique La zircone produit une tension qui va d'environ 1 V dans des conditions de mélange plus riche à 0 V dans des conditions de mélange plus pauvre.

En conditions normales, la sonde à oxygène chauffé 2 n'est pas utilisée pour la gestion moteur.

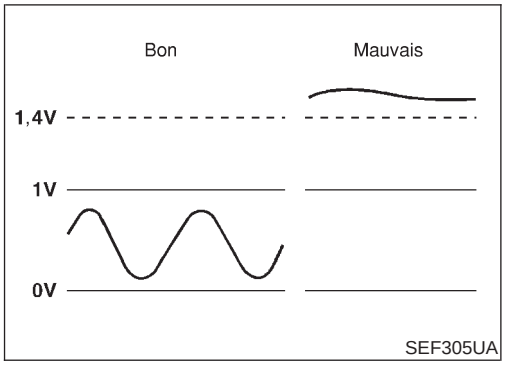
Valeur de référence de CONSULT-II en mode de contrôle de données

NEEC0172

Les données de spécification sont des valeurs de référence.

ELEMENT DE CONTROLE	CONDITION		SPECIFICATION
S/O2 CH2 (R1)	● Moteur : une fois le moteur chaud	Montée rapide du régime moteur du ralenti jusqu'à 3 000 tr/mn.	0 - 0,3 V ←→ Env. 0,6 - 1,0 V
MTR S/O2 CH2 (R1)			PAUVRE ←→ RICHE

Bornes de l'ECM et valeurs de référence



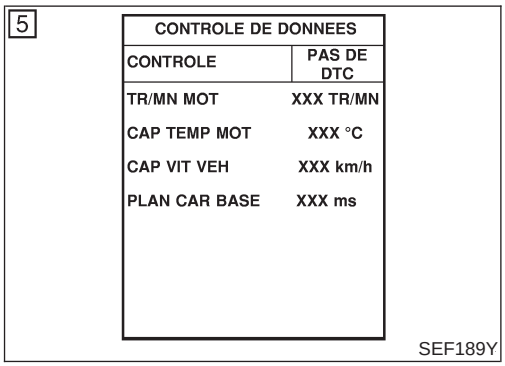
NEEC0173

Les données de spécification sont des valeurs de référence et sont mesurées entre chaque borne et la masse.

ATTENTION :
Ne pas utiliser de bornes de masse de l'ECM lors de la mesure de la tension d'entrée/de sortie. En agissant de la sorte, il est possible d'endommager le transistor de l'ECM. Utiliser une masse autre que les bornes de l'ECM, comme par exemple la prise de terre.

N° DE BORNE	COULEUR DE CABLE	ELEMENT	CONDITION	DONNEES (tension de courant continu)
56	L/W	Sonde à oxygène chauffé 2	**[Moteur en marche]** ● Après montée en température normale de fonctionnement et montée en régime du ralenti jusqu'à 3000 tr/mn.	0 - Environ 1,0 V

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Logique de diagnostic de bord

NEEC0174

La sonde à oxygène chauffé 2 possède une longueur d'interruption entre riche et pauvre beaucoup plus grande que la sonde à oxygène chauffé 1. La capacité de stockage d'oxygène avant le catalyseur à trois voies est la cause du temps d'interruption plus long. Pour estimer les défauts de fonctionnement de la sonde à oxygène chauffé 2, l'ECM contrôle si la tension du capteur est suffisamment élevée durant différentes conditions de conduite comme la coupure d'alimentation.

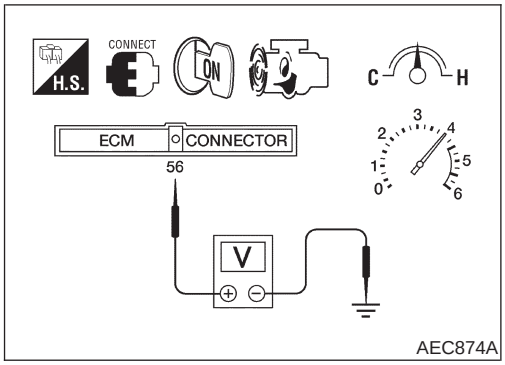
N° de DTC	Le défaut est détecté quand ...	Eléments de contrôle (causes possibles)
P0138 0138	● La tension reçue du capteur par l'ECM est excessivement élevée.	● Faisceau ou connecteurs (le circuit de capteur est ouvert ou court-circuité) ● Sonde à oxygène chauffé 2

Procédure de confirmation de code de défaut (DTC)

NEEC0175

REMARQUE :

Si une ''Procédure de confirmation de DTC'' a précédé, toujours mettre le contact d'allumage sur la position OFF et attendre au moins 5 secondes avant de procéder à l'essai suivant.



Avec CONSULT-II

1) Mettre le contact d'allumage sur ON et régler CONSULT-II en mode ''CONTROLE DE DONNEES''.
2) Démarrer le moteur et conduire le véhicule à une vitesse de plus de 70 km/h pendant 2 minutes consécutives.
3) Maintenir les conditions suivantes pendant au moins 5 secondes de suite.

TR/MN MOT	1100 - 3600 tr/mn
CAP VIT VEHIC	32 - 120 km/h
PLAN CAR BASE	3,5 - 15,5 ms
CAP TEMP MOT	Plus de 70°C
Levier de vitesses	Rapport adapté

4) Si le DTC de 1er parcours est détecté, aller à ''Procédure de diagnostic'', page EC-3237.

   La tension doit être supérieure à 0,56 V au moins une fois pendant la procédure.
   Si la tension est supérieure à 0,56 V à l'étape 4, il est inutile de procéder aux opérations décrites à l'étape 5.
6. Vérifier la tension en emballant le moteur jusqu'à 5 000 tr/mn à vide. Ou laisser le moteur tourner au ralenti pendant 10 minutes, puis vérifier la tension. Ou vérifier la tension lors du passage à 80 km/h en 3ème (T/M), ou en position D avec surmultipliée sur ARRET (T/A).
   La tension doit être inférieure à 0,54V au moins une fois.
   ATTENTION :
   - **Jeter toute sonde à oxygène chauffé tombée d'une hauteur supérieure à 0,5 m sur une surface dure telle qu'un plancher en béton, et la remplacer par une sonde neuve.**
   - **Avant de reposer une nouvelle sonde à oxygène, nettoyer le filetage du système d'échappement à l'aide de l'outil de nettoyage pour filetage de sonde à oxygène J-43897-18 ou J-43897-12 et un lubrifiant antigrippant agréé.**

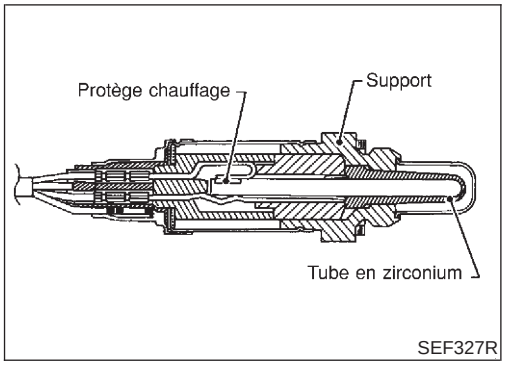
BON ou MAUVAIS

Bon	▶	ALLER A 9.
Mauvais	▶	Remplacer la sonde à oxygène chauffé 2.

9	VERIFIER LE CIRCUIT DE BLINDAGE

1. Mettre le contact d'allumage sur OFF.
2. Débrancher le connecteur de fonction-3.
3. Vérifier la continuité du faisceau entre la borne 1 du connecteur de jonction-3 et la masse. Se reporter au schéma de câblage.
   Il doit y avoir continuité.
4. Vérifier également que le faisceau n'est pas en court-circuit à l'alimentation.
5. Ensuite, rebrancher le connecteur de jonction-3.

BON ou MAUVAIS



Bon	▶	ALLER A 11.
Mauvais	▶	ALLER A 10.

10	DETECTER LA PIECE DEFECTUEUSE

Contrôler les points suivants.
- Connecteur de jonction-3 (Se reporter à ''DISPOSITION DES FAISCEAUX'', dans la section EL.)
- Faisceau ouvert ou en court-circuit entre le connecteur de jonction-3 et la masse du moteur

	▶	Réparer les faisceaux ou connecteurs en circuit ouvert ou court-circuit.

11	**VERIFIER SI L'INCIDENT EST INTERMITTENT**
Effectuer un ''DIAGNOSTIC DES DEFAUTS EN CAS D'INCIDENT INTERMITTENT'', voir page EC-3132.	
▶	**FIN DE L'INSPECTION**

Description des composants

NEEC0162

La sonde à oxygène chauffé 2, située en aval du catalyseur à trois voies, contrôle le niveau d'oxygène dans les gaz d'échappement. Même si les caractéristiques de commutation de la sonde à oxygène chauffé 1 sont modifiées, le rapport air-carburant est commandé à la st[009c]chiométrie par le signal délivré par la sonde à oxygène chauffé 2

Cette sonde est en zircone céramique La zircone produit une tension qui va d'environ 1 V dans des conditions de mélange plus riche à 0 V dans des conditions de mélange plus pauvre.

En conditions normales, la sonde à oxygène chauffé 2 n'est pas utilisée pour la gestion moteur.

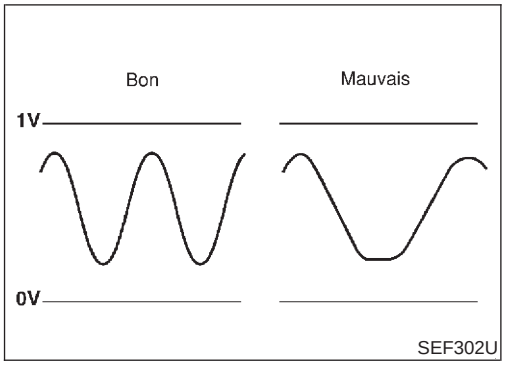
Valeur de référence de CONSULT-II en mode de contrôle de données

NEEC0163

Les données de spécification sont des valeurs de référence.

ELEMENT DE CONTROLE	CONDITION		SPECIFICATION
S/O2 CH2 (R1)	● Moteur : une fois le moteur chaud	Montée rapide du régime moteur du ralenti jusqu'à 3 000 tr/mn.	0 - 0,3 V ←→ Env. 0,6 - 1,0 V
MTR S/O2 CH2 (R1)			PAUVRE ←→ RICHE

Bornes de l'ECM et valeurs de référence



NEEC0164

Les données de spécification sont des valeurs de référence et sont mesurées entre chaque borne et la masse.

ATTENTION :
Ne pas utiliser de bornes de masse de l'ECM lors de la mesure de la tension d'entrée/de sortie. En agissant de la sorte, il est possible d'endommager le transistor de l'ECM. Utiliser une masse autre que les bornes de l'ECM, comme par exemple la prise de terre.

N° DE BORNE	COULEUR DE CABLE	ELEMENT	CONDITION	DONNEES (tension de courant continu)
56	L/W	Sonde à oxygène chauffé 2	**[Moteur en marche]** ● Après montée en température normale de fonctionnement et montée en régime du ralenti jusqu'à 3.000 tr/mn.	0 - Environ 1,0 V

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Logique de diagnostic de bord

NEEC0165

La sonde à oxygène chauffé 2 possède une longueur d'interruption entre riche et pauvre beaucoup plus grande que la sonde à oxygène chauffé 1. La capacité de stockage d'oxygène avant le catalyseur à trois voies est la cause du temps d'interruption plus long. Pour estimer les défauts de la sonde à oxygène chauffé 2, l'ECM contrôle si la réponse du capteur est plus rapide que ce qui est spécifié durant différentes conditions de conduite comme la coupure de carburant.

N° de DTC	Le défaut est détecté quand ...	Eléments de contrôle (causes possibles)
P0139 0139	● La sonde prend plus longtemps que la durée spécifiée pour réagir aux variations entre riche et pauvre.	● Faisceau ou connecteurs (le circuit de capteur est ouvert ou court-circuité) ● Sonde à oxygène chauffé 2 ● Pression de carburant ● Injecteurs ● Fuites d'air d'admission

Procédure de confirmation de code de défaut (DTC)

NEEC0166

ATTENTION :
Toujours adapter sa vitesse aux exigences de sécurité.

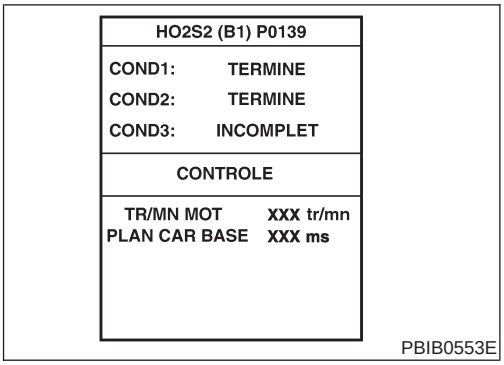
REMARQUE :
- **‘‘TERMINE‘ apparaît sur l’écran de CONSULT-II lorsque tous les tests ‘‘COND1’’, ‘‘COND2’’ et ‘‘COND3’’ sont terminés.**
- Si une ‘‘Procédure de confirmation de DTC’’ a précédé, toujours mettre le contact d’allumage sur la position ‘‘OFF’’ et attendre au moins 5 secondes avant de procéder à l’essai suivant.

CONDITIONS D’ESSAI :
Ne jamais arrêter le moteur au cours de cette procédure. Si le moteur est arrêté, recommencer cette procédure depuis l’étape 2 de ‘‘Procédure pour COND1’’.

AVEC CONSULT-II

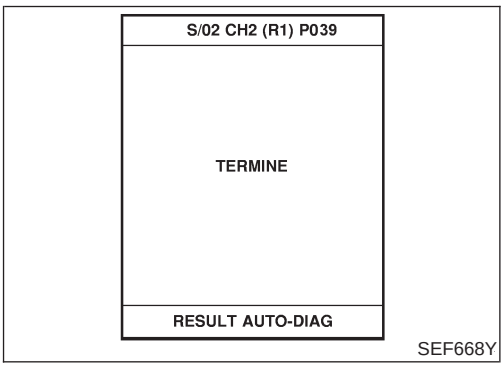
NEEC0166S01

Procédure pour COND1



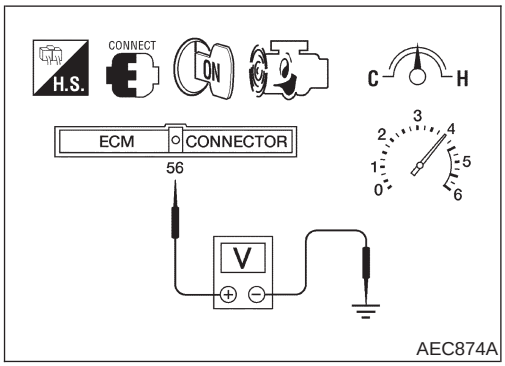
NEEC0166S0101

1. Démarrer le moteur et l’amener à température normale de fonctionnement.
2. Mettre le contact d’allumage sur ‘‘OFF’’ et attendre au moins 5 secondes.
3. Mettre le contact d’allumage sur ‘‘ON’’ et sélectionner ‘‘P0139 S/O2 CH2 (R1)’’ ou ‘‘S/O2 CH2’’ dans le mode ‘‘SUPPORT TRAVAIL DTC’’ de CONSULT-II.
4. Appuyer sur ‘‘DEPART’’.
5. Démarrer le moteur et le laisser tourner au ralenti pendant au moins 30 secondes.
6. Emballer le moteur à 2 000 tr/mn à 2 ou 3 reprises, à vide.
   Si ‘‘TERMINE’’ apparaît sur l’écran de CONSULT-II, passer à l’étape 2 de ‘‘Procédure pour COND3’’.
   Si ‘‘TERMINE’’ n’apparaît pas sur l’écran CONSULT-II, passer à l’étape suivante.
7. Rouler à plus de 70 km/h pendant 2 minutes.
8. Lorsque les conditions suivantes sont réunies, ‘‘TEST EN COURS’’ sera affiché dans ‘‘COND1’’ sur l’écran de CONSULT-II. Maintenir les conditions indiquées jusqu’à ce que le message ‘‘TEST EN COURS’’ laisse place au message ‘‘TERMINE’’ (cela prend environ 60 secondes.)



TR/MN MOT	Plus de 1000 tr/mn
PLAN CAR BASE	Plus de 1,0 ms
CAP TEMP LIQ REFR	70 - 105°C
Levier sélecteur	Rapport adapté

REMARQUE :
- **Si ‘‘TEST EN COURS’’ ne s’affiche pas après 5 minutes, recommencer à partir de l’étape 2 dans ‘‘Procédure pour COND1’’.**
- **Si TERMINE apparaît dès que l’écran de CONSULT-II affiche ‘‘COND2’’, avant même de réaliser la ‘‘Procédure pour COND2’’, il n’est pas nécessaire de réaliser l’étape 1 de la ‘‘Procédure pour COND2’’.**



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

PBIB0553E

SEF668Y

AEC874A

Procédure pour COND2

NEEC0166S0102

1. En conduisant, relâcher la pédale d'accélération complètement comme indiqué à l'étape 8 des conditions ci-dessus jusqu'à ce que ''COND2'' sur l'écran CONSULT-II passe de ''INCOMPLET'' à ''TERMINE'' (ceci prend environ 4 secondes.)

REMARQUE :
Si ''TERMINE'' apparaît dès que l'écran de CONSULT-II affiche ''COND3'', avant même de réaliser la ''Procédure pour COND3'', il n'est pas nécessaire de réaliser l'étape 1 de la ''Procédure pour COND3''.

Procédure pour COND3

NEEC0166S0103

1. Arrêter le véhicule et le laisser au ralenti jusqu'à ce que ''COND3'' passe de INCOMPLET à TERMINE sur l'écran de CONSULT-II (ceci prend environ 6 minutes au plus.)
2. Veiller à ce que ''BON'' soit affiché après avoir appuyé sur ''RESULT AUTODIAG''.
   Si ''MAUVAIS'' est affiché, se reporter à EC-3246, ''Procédure de diagnostic''.

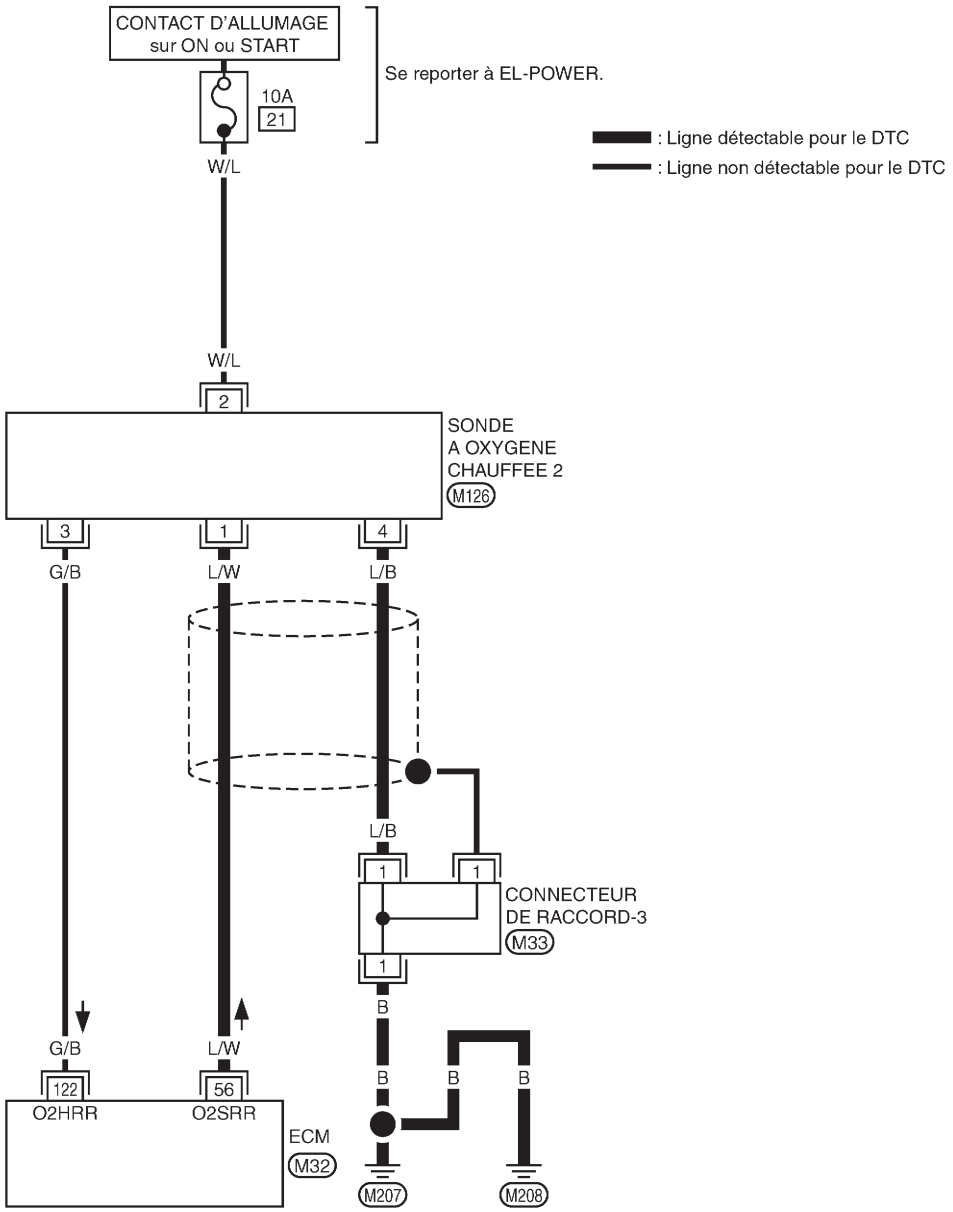
Vérification du fonctionnement général

NEEC0167

Utiliser cette procédure pour contrôler le fonctionnement général du circuit de la sonde à oxygène chauffé 2. Au cours de ce contrôle, il est possible qu'un DTC de 1er parcours ne soit pas confirmé.

ATTENTION :
Toujours adapter sa vitesse aux exigences de sécurité.

Sans CONSULT-II



1) Démarrer le moteur et conduire le véhicule à une vitesse de plus de 70 km/h pendant 2 minutes consécutives.
2) Arrêter le véhicule et laisser tourner le moteur.
3) Placer des sondes de voltmètre entre la borne 56 de l'ECM (signal de sonde à oxygène chauffé 2) et la masse du moteur
4) Vérifier la tension en emballant le moteur jusqu'à 4 000 tr/mn à vide et ce, au moins 10 fois.
   (appuyer sur la pédale d'accélérateur et la relâcher aussi vite que possible)
   La tension doit varier de plus de 0,06 V par seconde pendant la procédure.
   Si la tension est conforme à ce stade, il est inutile de procéder aux opérations décrites à l'étape 5.
5) Laisser le moteur tourner au ralenti pendant 10 minutes, puis vérifier la tension. Ou vérifier la tension lors du passage à 80 km/h en 3ème.
   La tension doit varier de plus de 0,06 V par seconde pendant la procédure.
6) Si les résultats ne sont pas conformes, effectuer une ''Procédure de diagnostic'', voir page EC-3246.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

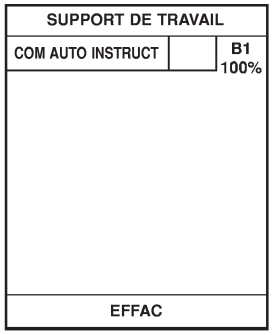
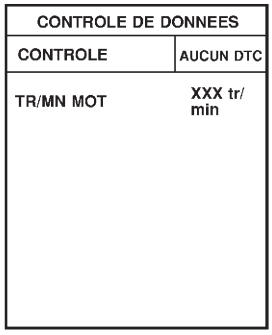
Logique de diagnostic de bord



NEEC0188

Grâce au contrôle d'auto-instruction du rapport de richesse de mélange air/combustible, le rapport de richesse de mélange actuel peut se rapprocher du rapport de richesse de mélange théorique fondée sur le signal de réponse du taux de richesse de mélange de la sonde à oxygène chauffé 1. L'ECM calcule la compensation nécessaire pour corriger l'écart entre le rapport actuel et le rapport théorique.
Dans le cas où la valeur de compensation est extrêmement importante (le dosage réel est trop pauvre), l'ECM juge que le système d'injection de carburant ne fonctionne pas correctement et déclenche l'allumage du témoin de défaut (MI) au tableau de bord (logique de détection de deux parcours).

Capteur	Signal d'entrée à l'ECM	Fonctionnement de l'ECM	Actionneur
Sonde à oxygène chauffé 1	Densité d'oxygène dans les gaz d'échappement (signal de régulation automatique de la richesse de mélange)	Commande de l'injection de carburant et de la richesse de mélange	Injecteurs



N° de DTC	Le défaut est détecté quand ...	Eléments de contrôle (causes possibles)
P0171 0171	● Le système d'injection ne fonctionne pas correctement. ● La compensation du rapport de mélange est trop importante (le rapport de mélange est trop pauvre)	● Fuites d'air d'admission ● Sonde à oxygène chauffé 1 ● Injecteurs ● Fuites de gaz d'échappement ● Pression de carburant incorrecte ● Manque de carburant ● Débitmètre d'air ● Verrouillage du PCV flexible incorrect

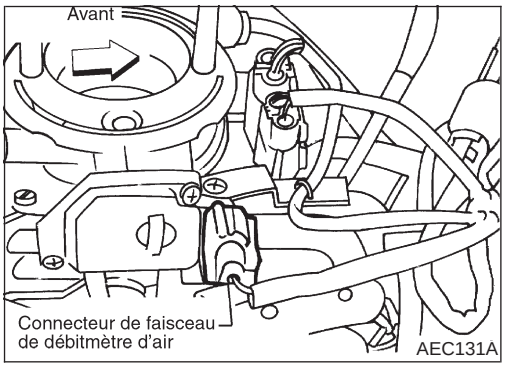
Procédure de confirmation de code de défaut (DTC)

NEEC0189



REMARQUE :
Si une ''Procédure de confirmation de DTC'' a précédé, toujours mettre le contact d'allumage sur la position OFF et attendre au moins 5 secondes avant de procéder à l'essai suivant.

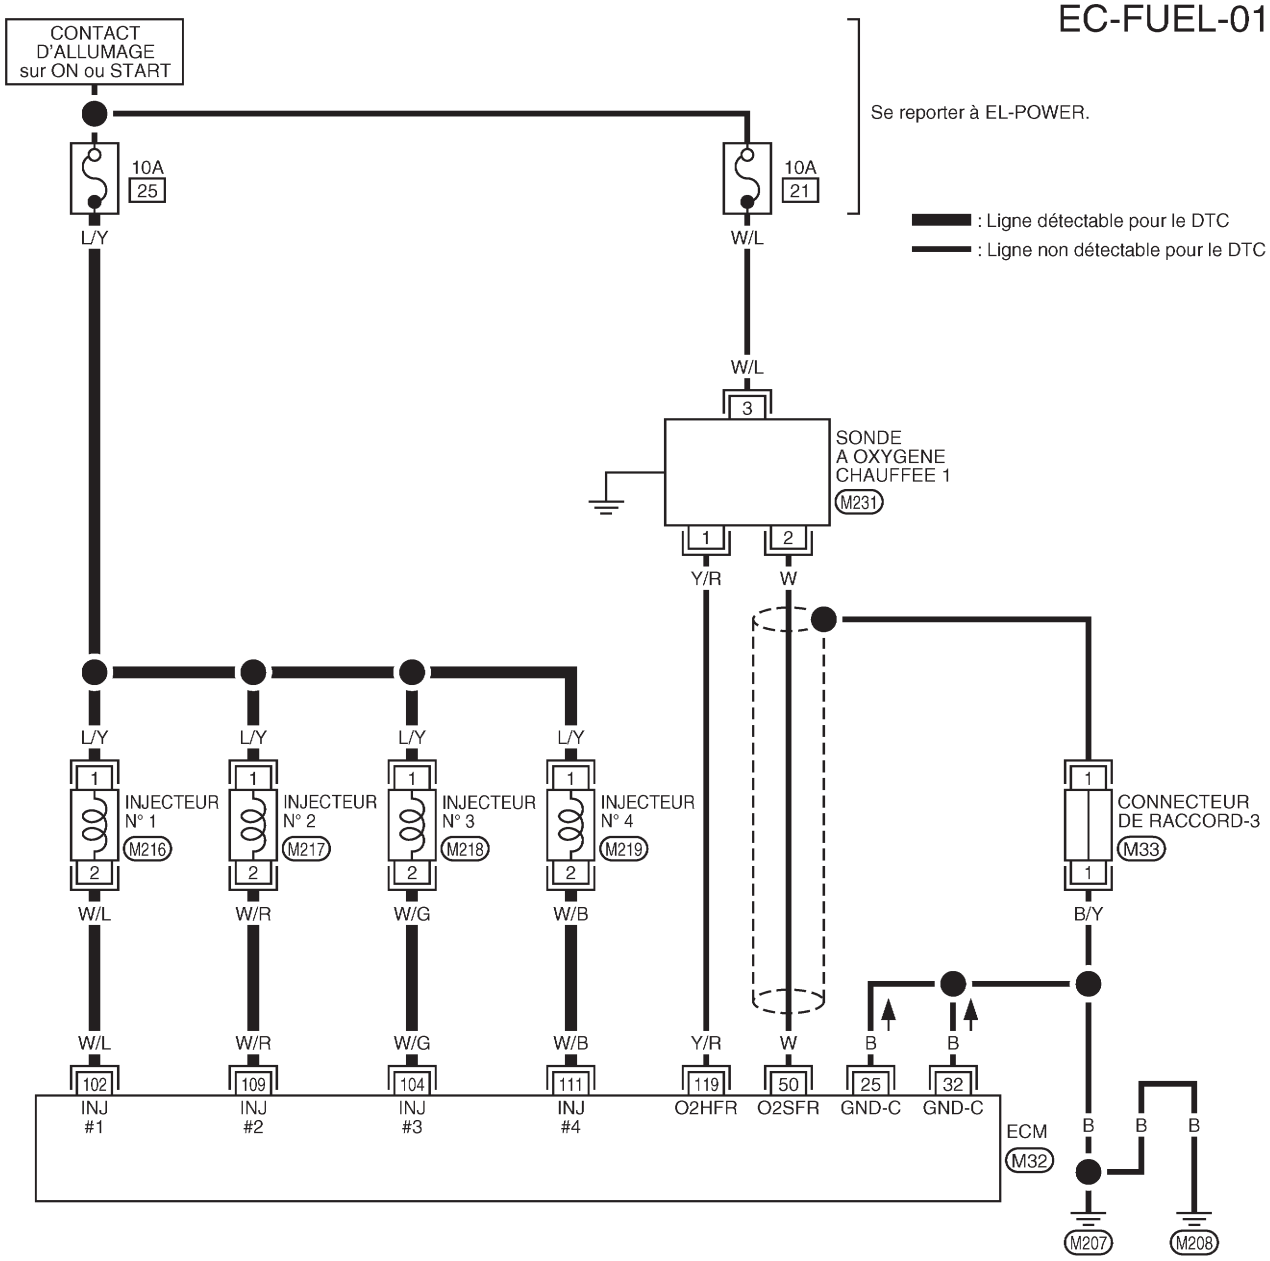
Avec CONSULT-II

1) Démarrer le moteur et l'amener à température normale de fonctionnement.
2) Mettre le contact d'allumage sur OFF et attendre au moins 5 secondes.
3) Mettre le contact sur la position ''ON'' et sélectionner ''CON AUTO INSTRUCT'' en mode ''SUPPORT TRAVAIL'' de CONSULT-II.
4) Effacer le coefficient de commande d'auto-instruction en appuyant sur ''EFFAC''.
5) Régler CONSULT-II en mode ''CONTROLE DE DONNEES''.
6) Démarrer le moteur et le laisser tourner au ralenti pendant au moins 10 minutes.
   Si un défaut existe, le DTC de 1er parcours P0171 doit être détecté à ce stade. Si tel est le cas, aller à ''Procédure de diagnostic'', EC-3255.

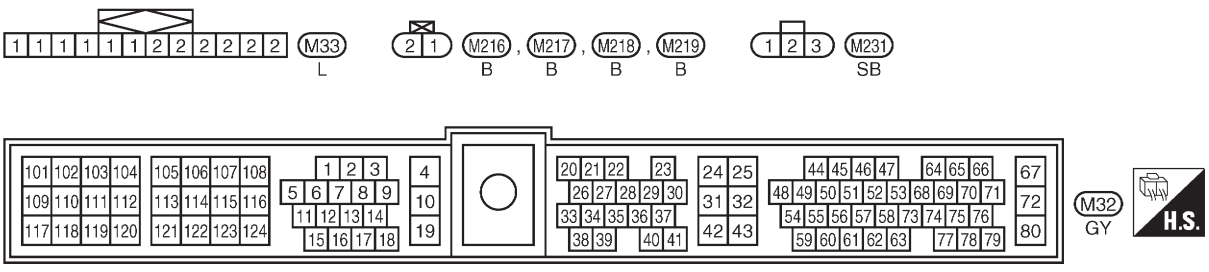
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

7) Si le moteur a du mal à démarrer à l'étape 6, le système d'injection est défectueux.
8) Actionner le starter avec la pédale d'accélérateur enfoncée. Si le moteur démarre, effectuer une ''Procédure de diagnostic'', page EC-3255. Si le moteur ne démarre pas, rechercher par une inspection visuelle une prise d'air à l'admission ou une fuite à l'échappement.

Avec l'analyseur générique GST



1) Démarrer le moteur et l'amener à température normale de fonctionnement.
2) Mettre le contact d'allumage sur OFF et attendre au moins 5 secondes.
3) Débrancher le connecteur de faisceau du débitmètre d'air. Puis redémarrer le moteur et le faire tourner pendant au moins 3 secondes au ralenti.
4) Eteindre le moteur et rebrancher le connecteur de faisceau du débitmètre d'air.
5) Régler le GST en ''MODE 7''. Vérifier que le DTC P0102 est bien détecté.
6) Régler le GST en ''MODE 4'' et effacer le DTC P0102.
7) Démarrer à nouveau le moteur et le faire tourner pendant au moins 10 minutes au ralenti.
8) Régler le GST en ''MODE 7''. Si un défaut existe, le DTC de 1er parcours P0171 doit être détecté à ce stade. Si tel est le cas, aller à ''Procédure de diagnostic'', EC-3255.
9) Si le moteur a du mal à démarrer à l'étape 8, le système d'injection est défectueux.
10) Actionner le starter avec la pédale d'accélérateur enfoncée. Si le moteur démarre, effectuer une ''Procédure de diagnostic'', page EC-3255. Si le moteur ne démarre pas, rechercher par une inspection visuelle une prise d'air à l'admission ou une fuite à l'échappement.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

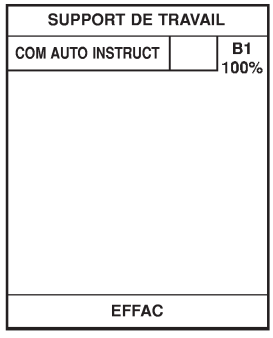
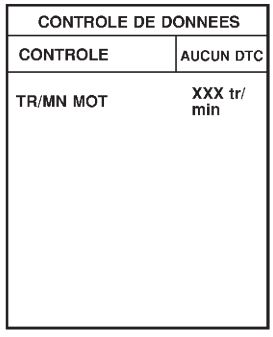
Logique de diagnostic de bord



NEEC0192

Grâce au contrôle d'auto-instruction du rapport de richesse de mélange air/combustible, le rapport de richesse de mélange actuel peut se rapprocher du rapport de richesse de mélange théorique fondée sur le signal de réponse du taux de richesse de mélange de la sonde à oxygène chauffé 1. L'ECM calcule la compensation nécessaire pour corriger l'écart entre le rapport actuel et le rapport théorique.
Dans le cas où la valeur de compensation est extrêmement importante (le dosage réel est trop riche), l'ECM juge que le système d'injection ne fonctionne pas correctement et allume le témoin MI (logique de détection à deux parcours).

Capteur	Signal d'entrée à l'ECM	Fonctionnement de l'ECM	Actionneur
Sonde à oxygène chauffé 1	Densité d'oxygène dans les gaz d'échappement (signal de régulation automatique de la richesse de mélange)	Commande de l'injection de carburant et de la richesse de mélange	Injecteurs



N° de DTC	Le défaut est détecté quand ...	Eléments de contrôle (causes possibles)
P0172 0172	● Le système d'injection ne fonctionne pas correctement. ● La compensation du rapport de mélange est trop importante (le rapport de mélange est trop riche).	● Sonde à oxygène chauffé 1 ● Injecteurs ● Fuites de gaz d'échappement ● Pression de carburant incorrecte ● Débitmètre d'air

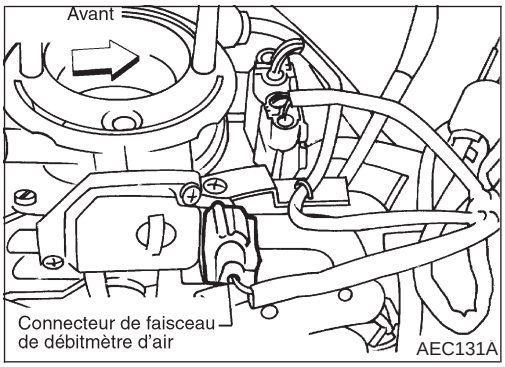
Procédure de confirmation de code de défaut (DTC)

NEEC0193



REMARQUE :
Si une ''Procédure de confirmation de DTC'' a précédé, toujours mettre le contact d'allumage sur la position OFF et attendre au moins 5 secondes avant de procéder à l'essai suivant.

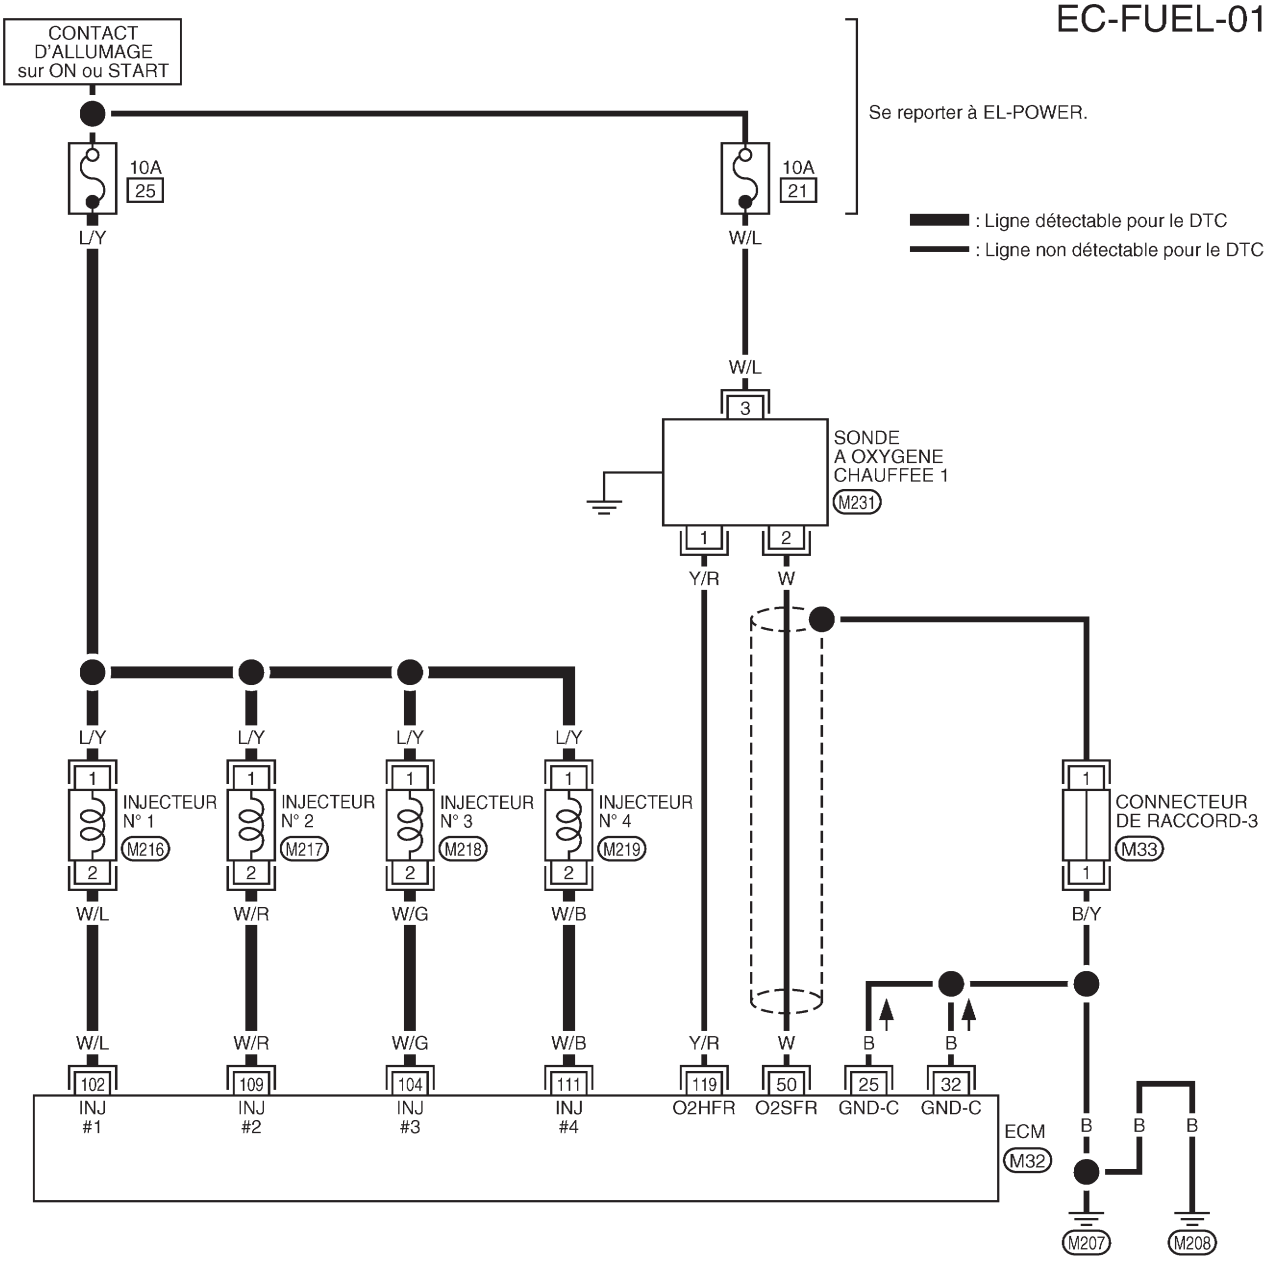
Avec CONSULT-II

1) Démarrer le moteur et l'amener à température normale de fonctionnement.
2) Mettre le contact d'allumage sur OFF et attendre au moins 5 secondes.
3) Mettre le contact sur la position ''ON'' et sélectionner ''CON AUTO INSTRUCT'' en mode ''SUPPORT TRAVAIL'' de CONSULT-II.
4) Effacer le coefficient de commande d'auto-instruction en appuyant sur ''EFFAC''.
5) Régler CONSULT-II en mode ''CONTROLE DE DONNEES''.
6) Démarrer le moteur et le laisser tourner au ralenti pendant au moins 10 minutes.
   Si un défaut existe, le DTC de 1er parcours P0172 doit être détecté à ce stade. Si tel est le cas, aller à ''Procédure de diagnostic'', EC-3262.

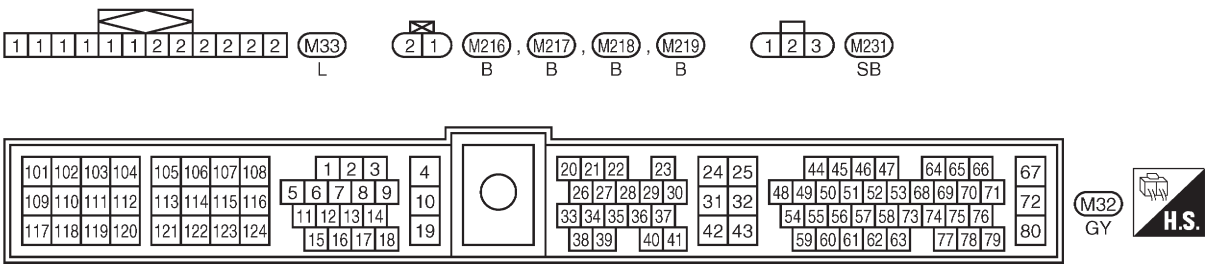
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

7) Si le moteur a du mal à démarrer à l'étape 6, le système d'injection est défectueux.
8) Actionner le starter avec la pédale d'accélérateur enfoncée. Si le moteur démarre, effectuer une ''Procédure de diagnostic'', EC-3262. Si le moteur ne démarre pas, enlever les prises d'allumage et vérifier l'encrassement, etc.

Avec l'analyseur générique GST



1) Démarrer le moteur et l'amener à température normale de fonctionnement.
2) Mettre le contact d'allumage sur OFF et attendre au moins 5 secondes.
3) Débrancher le connecteur de faisceau du débitmètre d'air. Puis redémarrer le moteur et le faire tourner pendant au moins 3 secondes au ralenti.
4) Eteindre le moteur et rebrancher le connecteur de faisceau du débitmètre d'air.
5) Régler le GST en ''MODE 7''. Veiller à ce que le DTC du 1er parcours P0102 soit détecté.
6) Régler le GST en ''MODE 4'' et effacer le DTC de 1er parcours P0102.
7) Démarrer à nouveau le moteur et le faire tourner pendant au moins 10 minutes au ralenti.
8) Régler le GST en ''MODE 7''. Si un défaut existe, le DTC de 1er parcours P0172 doit être détecté à ce stade. Si tel est le cas, aller à ''Procédure de diagnostic'', EC-3262.
9) Si le moteur a du mal à démarrer à l'étape 8, le système d'injection est défectueux.
10) Démarrer le moteur avec la pédale d'accélérateur enfoncée. Si le moteur démarre, effectuer une ''Procédure de diagnostic'', EC-3262. Si le moteur ne démarre pas, enlever les prises d'allumage et vérifier l'encrassement, etc.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

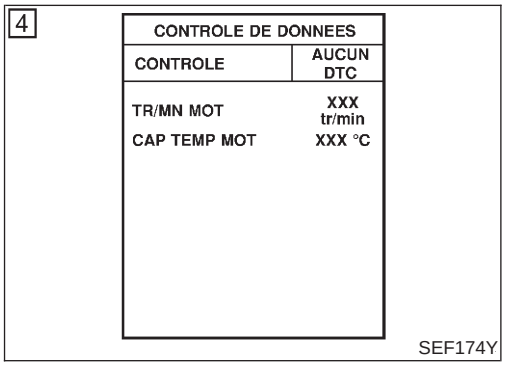
Logique de diagnostic de bord

NEEC0202



Lorsqu'il y a raté, le régime moteur subira des variations. Le régime-moteur varie suffisamment pour causer la variation du signal du capteur CPV, l'ECM est en mesure de déterminer si un raté d'allumage a lieu.

Capteur	Signal d'entrée à l'ECM	Fonctionnement de l'ECM
Capteur de position du vilebrequin (OBD)	Régime-moteur	Diagnostic de bord de raté d'allumage

La logique de détection des ratés d'allumage considère les deux points suivants.

1. Logique de détection de premier parcours (endommagement du catalyseur à 3 voies)
   Au premier parcours où une condition de raté, qui peut endommager le catalyseur à trois voies (TWC) à cause de la surchauffe, se produit, le témoin MI clignotera.
   Lorsqu'une condition de raté se produit, l'ECM contrôle les variations du signal du capteur CPV tous les 200 tours moteur.
   Lorsque la condition de raté diminue à un niveau où le catalyseur à trois voies ne sera pas endommagé, le témoin MI s'éteint.
   S'il se produit une autre condition de raté qui pourrait endommager le catalyseur à trois voies sur un second parcours, le témoin MI clignotera.
   Lorsque la condition de raté diminue à un niveau où le catalyseur à trois voies ne sera pas endommagé, le témoin MI restera allumé.
   S'il se produit une autre condition de raté qui pourrait endommager le catalyseur à trois voies, le témoin MI recommencera à clignoter.
2. Logique de détection de deux parcours (détérioration de la qualité de l'échappement)
   Pour les conditions de raté qui n'endommagent pas le catalyseur à trois voies (mais affectent les émissions du véhicule), le témoin MI ne s'allumera que lorsque le raté est détecté sur un second parcours. Dans cette situation, l'ECM contrôle le signal du capteur CPV tous les 1 000 tours moteur.
   Un défaut de raté peut être détecté sur tout cylindre isolé ou sur des cylindres multiples.

N° de DTC	Le défaut est détecté quand ...	Eléments de contrôle (causes possibles)
P0300 0300	• Ratés d'allumage sur plusieurs cylindres	• Bougie d'allumage inadaptée • Compression insuffisante • Pression de carburant incorrecte • Circuit d'injection ouvert ou en court-circuit • Injecteurs • Fuite d'air d'admission • Le circuit d'allumage secondaire est ouvert ou en court-circuit • Manque de carburant • Plateau d'entraînement/Volant-moteur • Sonde à oxygène chauffé 1 • Rotor de distribution inadapté
P0301 0301	• Ratés d'allumage au cylindre n° 1.	
P0302 0302	• Ratés d'allumage au cylindre n° 2.	
P0303 0303	• Ratés d'allumage au cylindre n° 3.	
P0304 0304	• Ratés d'allumage au cylindre n° 4.	

Procédure de confirmation de code de défaut (DTC)

NEEC0203

ATTENTION :
Toujours adapter sa vitesse aux exigences de sécurité.

REMARQUE :
Si une ''Procédure de confirmation de DTC'' a précédé, toujours mettre le contact d'allumage sur la position OFF et attendre au moins 5 secondes avant de procéder à l'essai suivant.

Avec CONSULT-II

1) Mettre le contact d'allumage sur ON et mettre CONSULT-II en mode ''CONTROLE DE DONNEES''.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

2) Démarrer le moteur et l'amener à température normale de fonctionnement.
3) Mettre le contact d'allumage sur OFF et attendre au moins 5 secondes.
4) Démarrer le moteur et rouler pendant au moins 3 minutes en restant entre 1 500 - 3 000 tr/mn.
   Limiter au maximum les variations de position de la pédale d'accélérateur.

REMARQUE :
Se reporter aux données figées pour les conditions de l'essai sur route.

5) Si le DTC de 1er parcours est détecté, aller à ''Procédure de diagnostic'', page EC-3267.

Avec l'analyseur générique GST
Suivre la procédure ''Avec CONSULT-II''.

Procédure de diagnostic

NEEC0204

1	CONTROLER QU'IL N'Y A PAS DE FUITE DE L'AIR D'ADMISSION

Description des composants

NEEC0206

Le capteur de détonation est monté sur le bloc-cylindres. Il capte la détonation du moteur à l'aide d'un élément piézo-électrique. Une vibration de détonation du bloc-cylindres est captée comme une pression vibrante. Cette pression est convertie en signal de tension et envoyée à l'ECM.

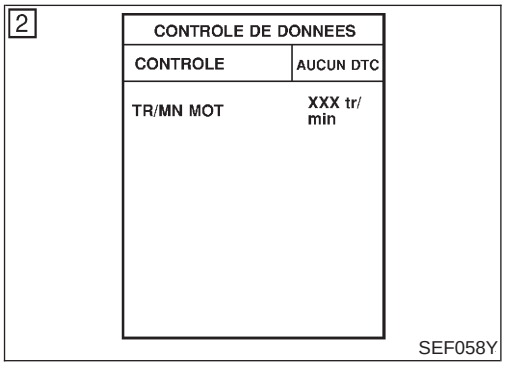
L'ECM ne mémorise pas les données figées concernant le capteur de détonation. Le MI ne s'allume pas s'il y a défaut du capteur de détonation.

Bornes de l'ECM et valeurs de référence

NEEC0207

Les données de spécification sont des valeurs de référence et sont mesurées entre chaque borne et la masse.

ATTENTION :



Ne pas utiliser de bornes de masse de l'ECM lors de la mesure de la tension d'entrée/de sortie. En agissant de la sorte, il est possible d'endommager le transistor de l'ECM. Utiliser une masse autre que les bornes de l'ECM, comme par exemple la prise de terre.

N° DE BORNE	COU-LEUR DE CA-BLE	ELEMENT	CONDITION	DONNEES (tension de courant continu)
64	W	Capteur de détonation	**[Moteur en marche]** ● Régime de ralenti	Environ 2,4V

Logique de diagnostic de bord

NEEC0208

N° de DTC	Nom de diagnostic des défauts	Condition de détection des défauts DTC	Cause possible
P0327 0327	Faible circuit d'entrée du capteur de déto-nation	La tension reç;ue du capteur par l'ECM est exces-sivement basse.	● Faisceau ou connecteurs (le circuit de capteur est ouvert ou court-circuité) ● Capteur de détonation
P0328 0328	Fort circuit d'entrée du capteur de déto-nation	La tension reç;ue du capteur par l'ECM est exces-sivement élevée.	

Procédure de confirmation de code de défaut (DTC)

NEEC0209

REMARQUE :

Si une 'Procédure de confirmation de DTC'' a précédé, toujours mettre le contact d'allumage sur la position OFF et attendre au moins 5 secondes avant de procéder à l'essai suivant.

CONDITIONS D'ESSAI :

Avant d'entamer la procédure qui suit, vérifier que la tension délivrée par la batterie est supérieure à 10 V au ralenti.

Avec CONSULT-II

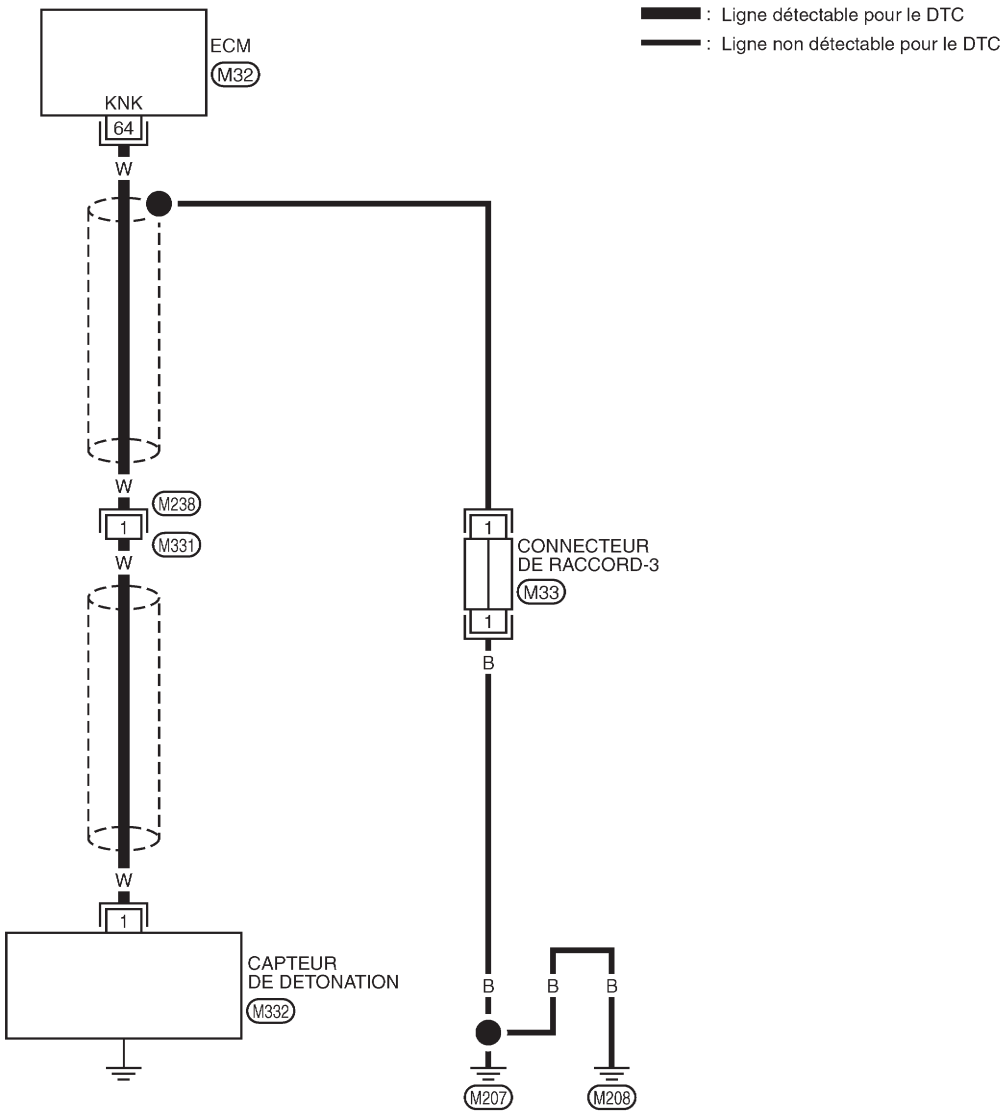
1) Mettre le contact d'allumage sur ON et régler CONSULT-II en

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

mode ‘‘CONTROLE DE DONNEES’’.

2) Démarrer le moteur et le faire tourner pendant au moins 5 secondes au régime de ralenti.
3) Si le DTC est détecté, effectuer une ‘‘Procédure de diagnostic’’, voir page EC-3275.

Avec l’analyseur générique GST



Suivre la procédure ‘‘Avec CONSULT-II’’.

Description des composants

NEEC0213

Le capteur de position du vilebrequin (OBD) est situé sur carter de boîte-pont face aux dents de pignon (dentures) du volant-moteur ou du plateau d'entraînement. Cela permet de détecter la fluctuation de la révolution du moteur.

La capteur comprend un aimant permanent, un noyau, et une bobine.

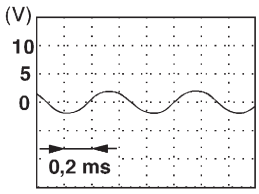
Lorsque le moteur tourne, la succession de dents et de vides de la roue dentée entraîne une variation de l'espacement avec le capteur.

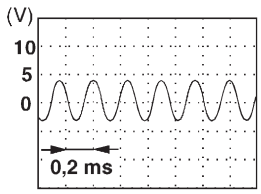
Cette variation d'espacement entraîne une variation du champ magnétique près du capteur.

Cette variation du champ magnétique entraîne une variation de la tension fournie par le capteur.

L'ECM reçoit le signal de tension et détecte les variations du régime-moteur.

Ce capteur ne joue aucun rôle direct dans le système de gestion du moteur. Il est utilisé exclusivement à des fins de diagnostic de bord.





Bornes de l'ECM et valeurs de référence

NEEC0214

Les données de spécification sont des valeurs de référence et sont mesurées entre chaque borne et la masse.

ATTENTION :

Ne pas utiliser de bornes de masse de l'ECM lors de la mesure de la tension d'entrée/de sortie. En agissant de la sorte, il est possible d'endommager le transistor de l'ECM. Utiliser une masse autre que les bornes de l'ECM, comme par exemple la prise de terre.

Description des composants

NEEC0220

Le capteur d'angle d'arbre à cames est un élément central du système de commande du moteur. Il contrôle le régime moteur ainsi que la position des pistons. Les signaux d'entrée qu'il transmet au système de gestion moteur servent à commander l'injection, l'avance à l'allumage et d'autres fonctions.

Le capteur d'angle d'arbre à cames est muni d'un plaque de rotor et un circuit de génération d'ondes. La plaque de rotor comporte 360 fentes pour un signal 1° (POS) et 4 fentes pour un signal 180° (REF). Le circuit de génération d'ondes se compose de diodes lumineuses (LED) et de photodiodes.

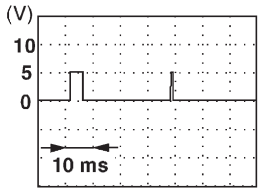
La plaque de rotor se situe entre le LED et la photodiode. Le LED émet un signal lumineux à la photodiode. Lorsque la plaque de rotor tourne, les fentes bloquent la lumière et génèrent des impulsions de forme brute. Ces impulsions sont converties en signaux allumé-éteint par le circuit de génération d'ondes et sont envoyées à l'ECM.

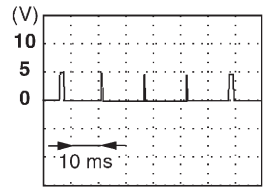
Le distributeur ne peut être réparé et doit être remplacé comme un tout, à l'exception du couvercle du distributeur et de la tête de rotor.

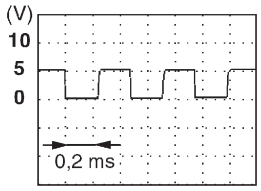
Bornes de l'ECM et valeurs de référence

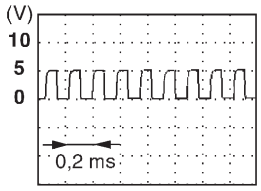
NEEC0221

Les données de spécification sont des valeurs de référence et sont mesurées entre chaque borne et la masse.









ATTENTION :

Ne pas utiliser de bornes de masse de l'ECM lors de la mesure de la tension d'entrée/de sortie. En agissant de la sorte, il est possible d'endommager le transistor de l'ECM. Utiliser une masse autre que les bornes de l'ECM, comme par exemple la prise de terre.

Logique de diagnostic de bord

NEEC1050

L'ECM contrôle la fréquence de commutation des sondes à oxygène chauffé 1 et 2.
Un catalyseur à trois voies présentant une importante capacité d'accumulation de l'oxygène indique que la fréquence de commutation de la sonde à oxygène chauffé 2 (arrière) est faible. A mesure que la capacité d'accumulation de l'oxygène augmente, la fréquence de commutation de la sonde à oxygène chauffé 2 augmentera également.
Lorsque le taux de fréquence des sondes à oxygène chauffé 1 et 2 approche d'une valeur limite déterminée, le défaut du catalyseur à trois voies est diagnostiqué.

N° de DTC	Le défaut est détecté quand ...	Eléments de contrôle (causes possibles)
P0420 0420	• Le catalyseur à 3 voies ne fonctionne pas correctement. • La capacité d'accumulation de l'oxygène du catalyseur à 3 voies est insuffisante.	• Catalyseur trois voies • Tuyau d'échappement • Fuites d'air d'admission • Injecteurs • Fuites des injecteurs • Bougie d'allumage • Mauvais calage de l'allumage

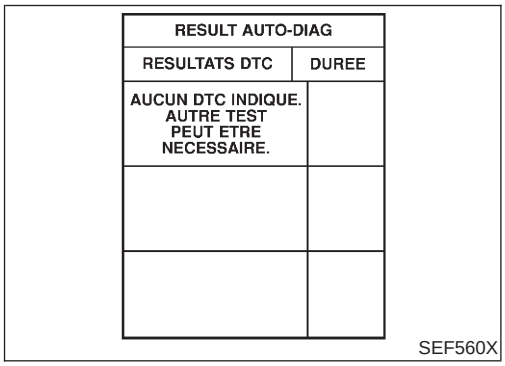
Procédure de confirmation de code de défaut (DTC)

NEEC1051

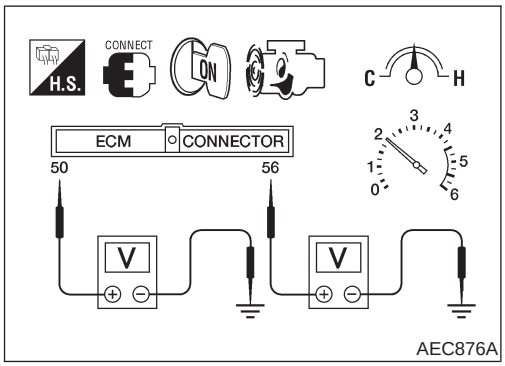
REMARQUE :
Si une ''Procédure de confirmation de DTC'' a précédé, toujours mettre le contact d'allumage sur la position ''OFF'' et attendre au moins 5 secondes avant de procéder à l'essai suivant.

CONDITIONS D'ESSAI :



- **Ouvrir le capot du moteur avant de commencer la procédure suivante.**
- **Ne pas maintenir le régime-moteur plus longtemps que le minutage spécifié ci-dessous.**

Avec CONSULT-II



1) Mettre le contact d'allumage sur ''ON''.
2) Sélectionner ''CONFIRMATION DTC & SRT'' puis mettre CONSULT-II en mode ''SUPPORT TRAVAIL SRT''.
3) Démarrer le moteur.
4) Emballer le moteur jusqu'à 2 500 à 3 000 tr/mn et maintenir ce régime pendant 3 minutes consécutives, puis relâcher complètement la pédale d'accélération.
   Si ''INCMP'' de ''CATALYSEUR'' change en ''CMPLT'', passer à l'étape 7.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

5) Attendre 5 secondes au ralenti.
6) Emballer le moteur jusqu'à 2 500 à 3 500 tr/mn et le maintenir jusqu'à ce que CATALYSEUR passe de INCOMPLET à TERMINE (ceci prend environ 5 minutes.)

7) Sélectionner le mode ''RESULT AUTO-DIAG'' sur CONSULT-II.
Si le DTC de 1er parcours est détecté, effectuer une ''PROCEDURE DE DIAGNOSTIC'', page EC-3297. Si TERMINE n'apparaît pas, arrêter le moteur et laisser refroidir le ''CAP TEMP REFR'' jusqu'à moins de 70°C et puis effectuer à nouveau les tests à partir de l'étape 1.

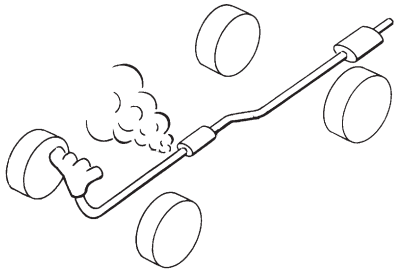
Vérification du fonctionnement général

NEEC0242

Utiliser cette procédure pour vérifier le fonctionnement général du catalyseur à trois voies. Au cours de ce contrôle, il est possible qu'un DTC de 1er parcours ne soit pas confirmé.

Sans CONSULT-II

1) Démarrer le moteur et conduire le véhicule à une vitesse de plus de 70 km/h pendant 2 minutes consécutives.
2) Arrêter le véhicule et laisser tourner le moteur.
3) Placer les sondes du voltmètre entre les bornes 50 (signal de la sonde à oxygène chauffé 1), 56 (signal de la sonde à oxygène chauffé 2) et la masse du moteur.
4) Maintenir le régime-moteur constant à 2 000 tr/mn à vide.
5) Vérifier que la fréquence de commutation de la tension (entre maxi. et mini.) entre la borne 56 de l'ECM et la masse du moteur est très inférieure à celle de la tension entre la borne 50 de l'ECM et la masse du moteur.
Rapport entre fréquences de commutation = A/B
A : Fréquence de commutation de la tension de la sonde à oxygène chauffé 2
A : Fréquence de commutation de la tension de la sonde à oxygène chauffé 1
Ce rapport doit être inférieur à 0,75.
Si le rapport est supérieur à la valeur indiquée ci-dessus, cela indique que le catalyseur à 3 voies ne fonctionne pas correctement.



REMARQUE :
Si la tension à la borne 50 ne varie pas périodiquement plus de 5 fois en l'espace de 10 secondes à l'étape 4, effectuer avant toute chose un diagnostic pour le code de défaut DTC P0133 (voir EC-3216.)

BON ou MAUVAIS

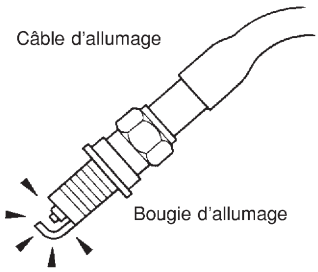
Bon	▶	ALLER A 5.
Mauvais	▶	Régler le calage d'allumage.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

5	CONTROLER LES INJECTEURS

1. Se reporter au schéma de câblage pour injecteurs, EC-3396.
2. Eteindre le moteur, puis mettre le contact d'allumage sur ON.
3. Vérifier la tension entre les bornes 102, 104, 109 et 111 de l'ECM et la masse à l'aide de CONSULT-II ou du testeur.

LEC041A



La batterie doit émettre une tension.

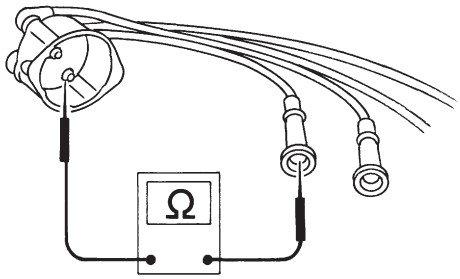
BON ou MAUVAIS

Bon	▶	ALLER A 6.
Mauvais	▶	Réaliser la ''Procédure de diagnostic'' pour l'INJECTEUR, EC-3397.

6	CONTROLER L'ETINCELLE D'ALLUMAGE

1. Déconnecter le fil d'allumage de la bougie.
2. Raccorder une bougie en bon état de fonctionnement au fil d'allumage.
3. Poser l'extrémité de la bougie sur une masse appropriée et actionner le starter.
4. Vérifier qu'une étincelle se produit.

SEF282G



BON ou MAUVAIS

Bon	▶	ALLER A 8.
Mauvais	▶	ALLER A 7.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

7	CONTROLER LES FILS D'ALLUMAGE

1. Vérifier que les fils ne sont pas cassés ou endommagés, que les bornes ne sont pas brûlées et qu'ils s'adaptent bien.
2. Mesurer la résistance des fils vers leur borne de couvercle de distributeur. Faire bouger chaque fil lors du test afin de vérifier s'il n'y a pas de coupures intermittentes.

SEF174P

Résistance :
13,6 - 18,4 kΩ/m

Si la résistance est supérieure à la spécification données ci-dessus, inspecter la connexion entre le fil d'allumage et le couvercle du distributeur. Nettoyer la connexion ou remplacer le fil d'allumage par un exemplaire neuf.

BON ou MAUVAIS

Bon	▶	Vérifier la bobine d'allumage, le transistor d'alimentation et leurs circuits. Se reporter à EC-3387.
Mauvais	▶	Remplacer.

8	CONTROLER L'INJECTEUR

1. Mettre le contact d'allumage sur OFF.
2. Déposer l'ensemble d'injecteur. Se reporter à EC-3037.
   Garder le flexible d'alimentation et tous les injecteurs raccordés à la galerie de l'injecteur.
3. Débrancher le connecteur de faisceau du capteur d'angle d'arbre à cames.
4. Mettre le contact d'allumage sur ON.
   Veiller à ce que le carburant ne coule pas de l'injecteur.

BON ou MAUVAIS

Bon (pas d'écoulement)	▶	ALLER A 9.
Mauvais (écoulements)	▶	Remplacer le(s) injecteur(s) dont s'écoule le carburant.

9	VERIFIER SI L'INCIDENT EST INTERMITTENT

Effectuer un ''DIAGNOSTIC DES DEFAUTS EN CAS INCIDENT INTERMITTENT'', voir page EC-3132.

Panne réparée.	▶	**FIN DE L'INSPECTION**
Panne non réparée.	▶	Remplacer le catalyseur à trois voies.

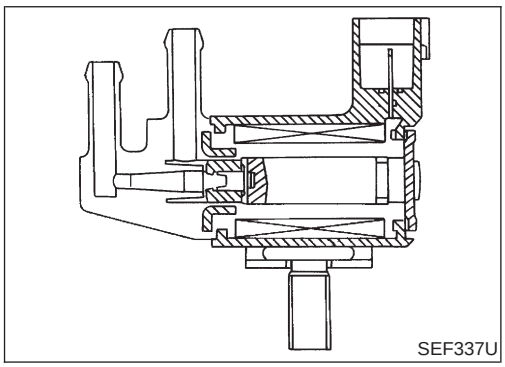
Description



DESCRIPTION DU SYSTÈME

NEEC0248

NEEC0248S01

Capteur	Signal d'entrée à l'ECM	Fonction de l'ECM	Actionneur
Capteur d'angle d'arbre à cames	Régime-moteur	Commande de volume de purge de cartouche EVAP	Electrovanne de commande de volume de purge de cartouche EVAP
Débitmètre d'air	Quantité d'air d'admission		
Capteur de température du liquide de refroidissement du moteur	Température du liquide de refroidissement du moteur		
Contact d'allumage	Signal de démarrage		
Capteur d'ouverture de papillon	Position de papillon		
Contact de position de papillon	Position de papillon fermé		
Sonde à oxygène chauffé 1	Densité d'oxygène dans les gaz d'échappement (signal de régulation automatique de la richesse de mélange)		
Capteur de vitesse du véhicule	Vitesse du véhicule		

Ce système commande le débit des vapeurs de carburant venant de la cartouche EVAP. La commande du débit se fait par régulation de l'ouverture du by-pass de l'électrovanne de commande de volume de purge de cartouche EVAP. L'électrovanne de commande de volume de purge de cartouche EVAP opère par cycles MARCHE/ARRET en réponse au signal envoyé pas l'ECM. L'ouverture de la soupape varie pour optimiser la gestion moteur. La valeur optimale programmée dans l'ECM est déterminée en tenant compte de diverses conditions du moteur. Lorsque le moteur fonctionne, le débit de vapeur de carburant de la cartouche EVAP est régulé en fonction de la variation du débit d'air.

SEF337U

DESCRIPTION DES COMPOSANTS

NEEC0248S02

L'électrovanne de commande de volume de purge de cartouche EVAP fonctionne par cycles MARCHE/ARRET pour commander le débit de vapeur de carburant de la cartouche EVAP. L'électrovanne de commande de volume de purge de cartouche EVAP bouge en fonction des impulsions MARCHE/ARRET qui lui sont transmises par l'ECM. Plus l'impulsion ON est longue, plus la quantité de vapeur de carburant passant à travers la soupape est importante.

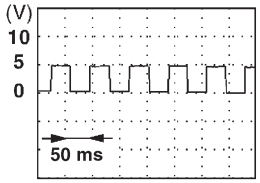
Description des composants

NEEC0272



Le capteur de vitesse du véhicule est monté dans la boîte-pont. Il contient un générateur d'impulsions qui délivre le signal de vitesse du véhicule au compte-tours. Le compte-tours envoie alors un signal à l'ECM.

Bornes de l'ECM et valeurs de référence

NEEC0273

Les données de spécification sont des valeurs de référence et sont mesurées entre chaque borne et la masse.

ATTENTION :
Ne pas utiliser de bornes de masse de l'ECM lors de la mesure de la tension d'entrée/de sortie. En agissant de la sorte, il est possible d'endommager le transistor de l'ECM. Utiliser une masse autre que les bornes de l'ECM, comme par exemple la prise de terre.

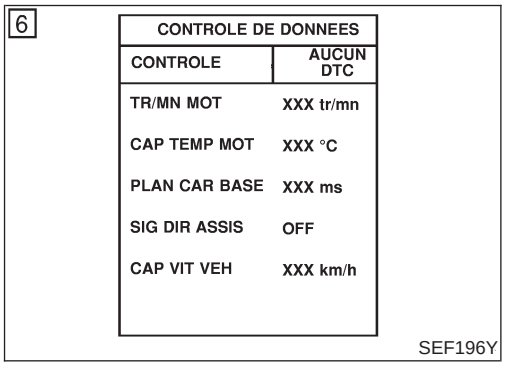
N° DE BORNE	COULEUR DE CABLE	ELEMENT	CONDITION	DONNEES (tension de courant continu)
29	W/L	Capteur de vitesse du véhicule	**[Moteur en marche]** ● Lever le véhicule ● En 2nde ● La vitesse du véhicule est de 40 km/h	1 - 4V  SEF003W

Logique de diagnostic de bord

NEEC0274

N° de DTC	Le défaut est détecté quand ...	Eléments de contrôle (causes possibles)
P0500 0500	● Le signal d'environ 0 km/h du capteur de vitesse du véhicule est envoyé à l'ECM même lorsque le véhicule est conduit.	● Faisceau ou connecteur (le circuit du capteur de vitesse du véhicule est ouvert ou en court-circuit) ● Capteur de vitesse du véhicule

Procédure de confirmation de code de défaut (DTC)



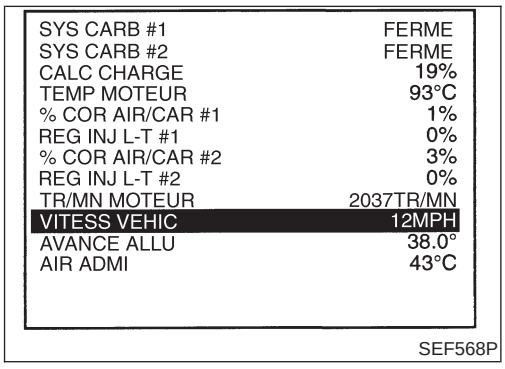
NEEC0275

ATTENTION :
Toujours adapter sa vitesse aux exigences de sécurité.

REMARQUE :
Si une ''Procédure de confirmation de DTC'' a précédé, toujours mettre le contact d'allumage sur la position OFF et attendre au moins 5 secondes avant de procéder à l'essai suivant.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

CONDITIONS D'ESSAI :
L'essai peut être conduit sur route ou à l'atelier, roues motrices sur chandelles. Si l'essai sur route apparaît plus facile, il n'est pas nécessaire de mettre le véhicule sur chandelles.



Avec CONSULT-II

1) Faire tourner le moteur.
2) Lire le signal du capteur de vitesse de véhicule sur le CONSULT-II en mode ''CONTROLE DE DONNEES''. La vitesse indiquée sur l'écran CONSULT-II doit être supérieure à 10 km/h lorsque les roues tournent avec un rapport adapté enclenché.
3) Si les résultats ne sont pas conformes, effectuer une ''Procédure de diagnostic'', voir page EC-3313.
   Si le résultat est satisfaisant, passer à l'étape suivante.
4) Régler CONSULT-II en mode ''CONTROLE DE DONNEES''.
5) Chauffer le moteur à sa température normale de fonctionnement.
6) Maintenir les conditions suivantes pendant au moins 1 minute.

TR/MN MOT	1.800 - 6.000 tr/mn
CAP TEMP MOT	Plus de 70°C
PLAN CAR BASE	7 - 15 ms
Levier de vitesses	Rapport adapté
SIG DIR ASSIS	ARR

7) Si le DTC de 1er parcours est détecté, aller à ''Procédure de diagnostic'', page EC-3313.

Vérification du fonctionnement général

NEEC0276

Utiliser cette procédure pour vérifier le fonctionnement général du circuit de la soupape de commande de mise à l'air libre de la cartouche EVAP. Au cours de ce contrôle, il est possible qu'un DTC de 1er parcours ne soit pas confirmé.

Avec l'analyseur générique GST

1) Soulever les roues motrices.
2) Démarrer le moteur.
3) Lire le signal du capteur de vitesse du véhicule en 'MODE 1'', avec le GST.
   La vitesse du capteur de vitesse indiquée par GST devrait

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

pouvoir dépasser 10 km/h lorsque les roues tournent avec la position de transmission adéquate.

4) Si les résultats ne sont pas conformes, effectuer une ‘‘Procédure de diagnostic’’, voir page EC-3313.

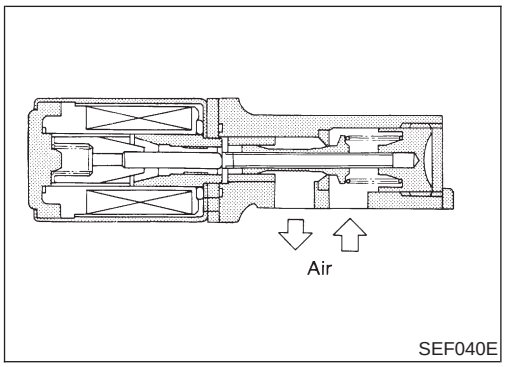
Description



DESCRIPTION DU SYSTÈME

NEEC1594

NEEC1594S01

Capteur	Signal d'entrée à l'ECM	Fonctionnement de l'ECM	Actionneur
Capteur d'angle d'arbre à cames	Régime-moteur	Contrôle de l'air au ralenti	Soupape IACV-AAC
Débitmètre d'air	Quantité d'air d'admission		
Capteur de température du liquide de refroidissement du moteur	Température du liquide de refroidissement du moteur		
Contact d'allumage	Signal de démarrage		
Capteur d'ouverture de papillon	Position de papillon		
Contact de stationnement/point mort (PNP)	Position de point mort		
Interrupteur de climatiseur	Fonctionnement du climatiseur		
Manocontact d'huile de direction assistée	Signal de charge de direction assistée		
Batterie	Tension de la batterie		
Capteur de vitesse du véhicule	Vitesse du véhicule		
Capteur de température d'air d'admission	Température de l'air d'admission		

Ce système commande automatiquement le régime de ralenti du moteur à un niveau spécifié. Le régime de ralenti est contrôlé par un réglage précis de la quantité d'air qui est admise directement par la soupape AAC, sans passer par le papillon. La soupape AAC opère par cycles MARCHE/ARRET en réponse au signal envoyé pas l'ECM. Le capteur d'angle d'arbre à cames détecte la vitesse réelle du moteur et envoie un signal à l'ECM. L'ECM commande alors le temps ON/OFF de la soupape IACV-AAC afin que le régime-moteur coïncide avec la valeur cible mémorisée dans l' ECM. Le régime-moteur cible est la vitesse la plus basse à laquelle le moteur peut fonctionner de façon stable. La valeur optimale mémorisée dans l'ECM est déterminée en tenant compte des diverses conditions du moteur à savoir : la durée de réchauffement, la décélération, et la charge du moteur (fonctionnement du climatiseur, de la direction assistée et du ventilateur de refroidissement).

SEF040E

DESCRIPTION DES COMPOSANTS

NEEC1594S02

La soupape AAC est actionnée par les impulsions ON/OFF transmises par l'ECM. Plus l'impulsion ON est longue, plus la quantité de vapeur de carburant passant à travers la soupape est importante. Plus la quantité d'air qui passe à travers la soupape est grande et plus le régime du moteur est élevé.

CONTROLE	AUCUN DTC
TR/MN MOT	XXX tr/min

SEF058Y

PROCEDURE DE DEFAUT A

NEEC1598S01

CONDITIONS D’ESSAI :

Avant d’entamer la procédure qui suit, vérifier que la tension délivrée par la batterie est supérieure à 10,5V avec le contact d’allumage sur ON.

Avec CONSULT-II

1) Mettre le contact d’allumage sur ON.
2) Régler CONSULT-II en mode ‘‘CONTROLE DE DONNEES’’.
3) Démarrer le moteur et le faire tourner pendant au moins 2 secondes au régime de ralenti.
4) Si le DTC de 1er parcours est détecté, aller à ‘‘Procédure de diagnostic’’, page EC-3319.

Avec l’analyseur générique GST

Suivre la procédure ‘‘Avec CONSULT-II’’.

4

CONTROLE DE DONNEES	
CONTROLE	AUCUN DTC
TR/MN MOT	XXX tr/min
CAP TEMP MOT	XXX °C

SEF174Y

PROCEDURE DE DEFAUT B

NEEC1598S02

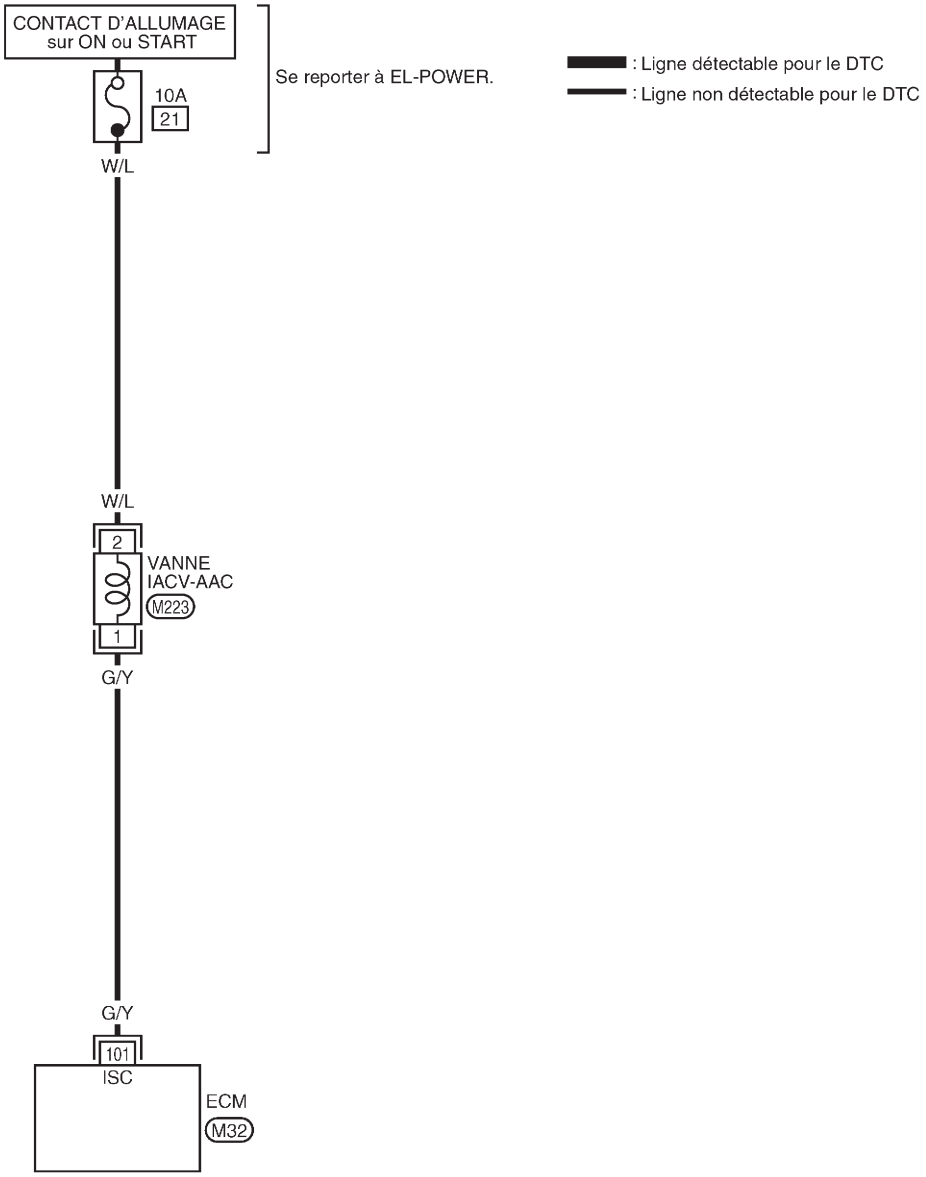
CONDITIONS D’ESSAI :

- **Avant d’entamer la procédure qui suit, s’assurer que la tension délivrée par la batterie est supérieure à 11V au ralenti.**
- **Toujours opérer à une température supérieure à —10°C.**

Avec CONSULT-II

1) Démarrer le moteur et l’amener à température normale de fonctionnement.
2) Mettre le contact d’allumage sur OFF et attendre au moins 5 secondes.
3) Mettre à nouveau le contact d’allumage sur ON et régler CONSULT-II en mode ‘‘CONTROLE DE DONNEES’’.
4) Démarrer le moteur et le laisser tourner au ralenti pendant au moins 6 minutes.
5) Si le DTC de 1er parcours est détecté, aller à ‘‘Procédure de diagnostic’’, page EC-3319.

Avec l’analyseur générique GST



Suivre la procédure ‘‘Avec CONSULT-II’’.

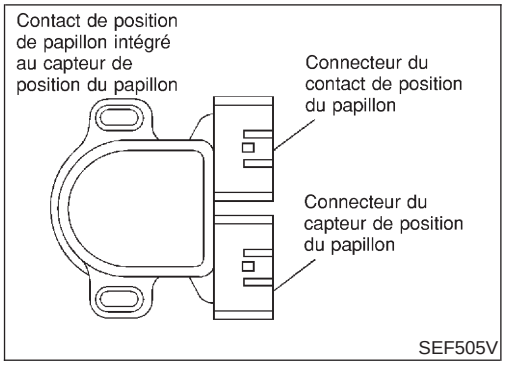
4	CONTROLER LA SOUPAPE IACV-AAC

Débrancher le connecteur de faisceau de la soupape IACV-AAC.
- Vérifier la résistance de la soupape IACV-AAC

SEC284D

Résistance : Environ 10 Ω [à 25°C]
- Vérifier que le plongeur ne s'agrippe pas ou ne colle pas.
- Vérifier qu'il n'y a pas de ressort cassé.

BON ou MAUVAIS



Bon	▶	ALLER A 5.
Mauvais	▶	Remplacer la soupape IACV-AAC.

5	VERIFIER SI L'INCIDENT EST INTERMITTENT

Effectuer un ''DIAGNOSTIC DES DEFAUTS EN CAS D'INCIDENT INTERMITTENT'', voir page EC-3132.

	▶	**FIN DE L'INSPECTION**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description des composants

NEEC0287

Le boîtier de capteur de position de papillon comprend un contact de position de papillon fermé et un contact de position de papillon grand ouvert.
Lorsque la soupape de papillon est en position fermée, le contact de position de papillon fermé envoie un signal de tension à l'ECM. L'ECM n'exploite ce signal que pour ouvrir ou fermer la soupape de commande de purge de cartouche EVAP lorsque le capteur de position de papillon est défectueux.

Bornes de l'ECM et valeurs de référence

NEEC0288

Les données de spécification sont des valeurs de référence et sont mesurées entre chaque borne et la masse.

ATTENTION :
Ne pas utiliser de bornes de masse de l'ECM lors de la mesure de la tension d'entrée/de sortie. En agissant de la sorte, il est possible d'endommager le transistor de l'ECM. Utiliser une masse autre que les bornes de l'ECM, comme par exemple la prise de terre.

N° DE BORNE	COU-LEUR DE CABLE	ELEMENT	CONDITION	DONNEES (tension de courant continu)
28	LG/B	Contact de ralenti (position de ralenti)	**[Contact d'allumage sur ON]** ● **Pendant la montée en température** ● Pédale d'accélérateur relâchée	TENSION DE LA BATTE-RIE (11 V - 14 V)
			[Contact d'allumage sur ON] ● Pédale d'accélérateur enfoncée	Environ 0 V

Logique de diagnostic de bord

Procédure de confirmation de code de défaut (DTC)

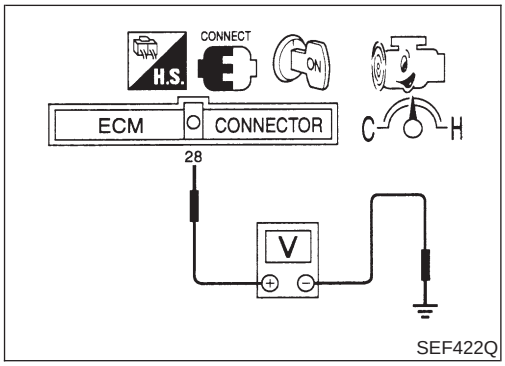
=NEEC0290

ATTENTION :
Toujours adapter sa vitesse aux exigences de sécurité.

REMARQUE :
Si une ‘‘Procédure de confirmation de DTC’’ a précédé, toujours mettre le contact d’allumage sur la position OFF et attendre au moins 5 secondes avant de procéder à l’essai suivant.

Avec CONSULT-II

1) Démarrer le moteur et l’amener à température normale de fonctionnement.
2) Sélectionner ‘‘CON RALENTI’’ dans le mode ‘‘CONTROLE DE DONNEES’’ de CONSULT-II et vérifier la valeur dans les conditions suivantes.



Condition	Indication du signal
Soupape de papillon : position de ralenti	MAR
Soupape de papillon : légèrement ouverte	ARR

Si le résultat n’est pas satisfaisant, aller à ‘‘Procédure de diagnostic’’, EC-3325.
Si le résultat est satisfaisant, passer à l’étape suivante.

3) Régler CONSULT-II en mode ‘‘CONTROLE DE DONNEES’’.
4) Rouler pendant au moins 5 secondes de suite dans les conditions suivantes.

CAP PAPILLON	Plus de 2,5 V
CAP VIT VEHIC	Plus de 4 km/h
Levier de vitesses	Rapport adapté
Conditions de conduite	Rouler en montée (ce qui augmente la charge moteur) aide à maintenir les conditions requises pour cet essai

5) Si le DTC de 1er parcours est détecté, aller à ‘‘Procédure de diagnostic’’, page EC-3325.

SEF422Q

Vérification du fonctionnement général

NEEC0291

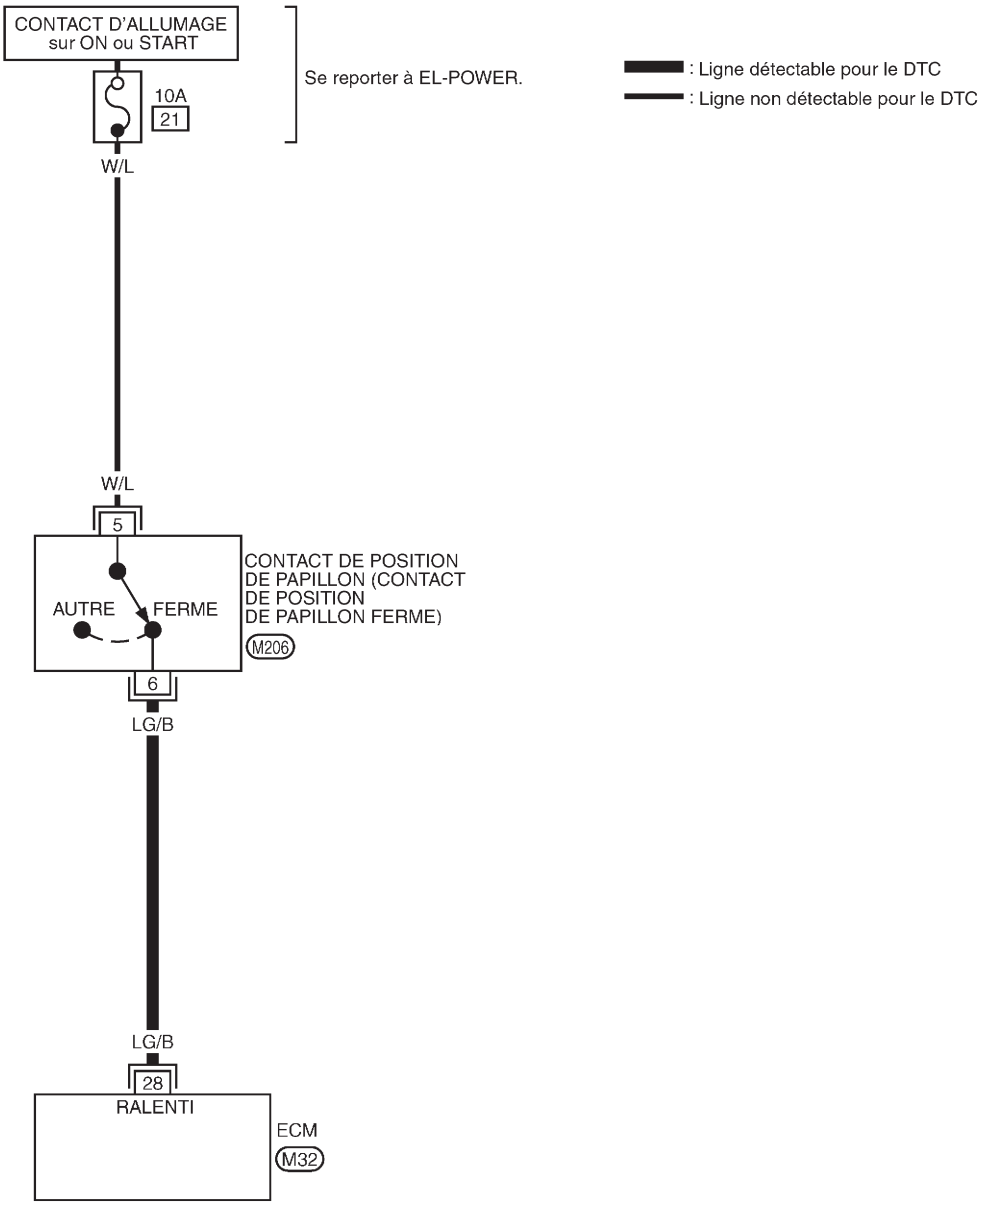
Utiliser cette procédure pour vérifier le fonctionnement général du circuit de contact de position de papillon fermé. Au cours de ce contrôle, il est possible qu’un DTC de 1er parcours ne soit pas confirmé.

Sans CONSULT-II

1) Démarrer le moteur et l’amener à température normale de fonctionnement.
2) Contrôler la tension entre la borne 28 de l’ECM (signal du contact de position de papillon fermé) et la masse dans les conditions suivantes.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Condition	Tension
Au ralenti	Tension de la batterie
A 2000 tr/mn	Environ 0 - 1 V



3) Si les résultats ne sont pas conformes, effectuer une ‘‘Procédure de diagnostic’’, voir page EC-3325.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

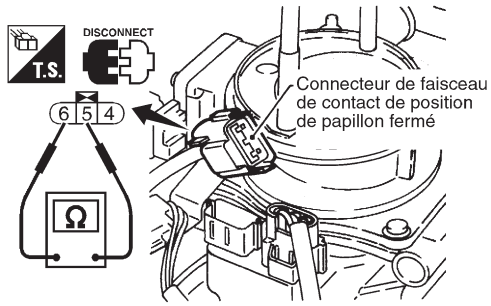
6	CONTROLER LE CONTACT DE POSITION DE PAPILLON FERME

Avec CONSULT-II

1. Démarrer le moteur et l'amener à température normale de fonctionnement.
2. Eteindre le moteur et mettre le contact d'allumage sur ON.
3. Régler CONSULT-II en mode ''CONTROLE DE DONNEES''.
4. Vérifier l'état du paramètre ''CON RALENTI'' dans les conditions suivantes.

CONTROLE DE DONNEES	
CONTROLE	PAS DE DTC
TR/MN MO T	XXX tr/mn
CAP TEMP MOT	XXX °C
CON RALENTI	MAR

Conditions du papillon	POS PAP FRM
Complètement fermé	MAR
Partiellement ouvert ou complètement ouvert	ARR



SEF721Z

REMARQUE :
Le relevé doit être effectué avec le contact de position de papillon fermé posé sur le véhicule.
Si le résultat n'est pas satisfaisant, régler le contact de position de papillon fermé. Se reporter à la procédure ''Inspection de base', EC-3093.

5. S'il est impossible de régler le contact de position de papillon fermé dans ''Inspection de base'', remplacer le contact de position de papillon fermé.

Sans CONSULT-II

1. Démarrer le moteur et l'amener à température normale de fonctionnement.
2. Mettre le contact d'allumage sur OFF.
3. Débrancher le connecteur de faisceau du contact de position de papillon.
4. Vérifier la continuité entre les bornes 6 et 5 dans les conditions suivantes.

SEF159S

Conditions de papillon	Continuité
Complètement fermé	Oui
Partiellement ouvert ou complètement ouvert	Non

MTBL0299

REMARQUE :
Le contrôle de continuité doit être effectué avec le contact de position de papillon fermé posé sur le véhicule.
Si le résultat n'est pas satisfaisant, régler le contact de position de papillon fermé. Se reporter à la procédure ''Inspection de base'', EC-3093.

5. S'il est impossible de régler le contact de position de papillon fermé dans ''Inspection de base'', remplacer le contact de position de papillon fermé.

BON ou MAUVAIS

Bon	▶	ALLER A 7.
Mauvais	▶	Remplacer le contact de position de papillon.

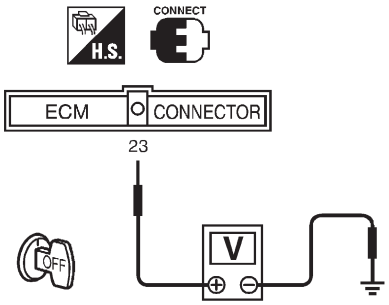
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

7	CONTROLER LE CAPTEUR DE POSITION DE PAPILLON

Avec CONSULT-II

1. Démarrer le moteur et l'amener à température normale de fonctionnement.
2. Eteindre le moteur et mettre le contact d'allumage sur ON.
3. Régler CONSULT-II en mode ''CONTROLE DE DONNEES''.
4. Vérifier la tension du 'CAP PAPILLON'dans les conditions suivantes.

CONTROLE DE DONNEES	
CONTROLE	AUCUN DTC
CAP TEMP MOT	XXX °C
CAP VIT VEHIC	XXX km/h
CAP PAPILLON	XXX V



SEF198Y

REMARQUE :
Les relevés doivent être effectués avec le capteur de position de papillon reposé sur le véhicule.
Si le résultat n'est pas satisfaisant, régler le contact de position de papillon fermé. Se reporter à la procédure ''Inspection de base'', EC-3093.

5. S'il est impossible de régler le contact de position de papillon fermé en suivant la procédure d'inspection de base, remplacer le capteur de position de papillon.

Sans CONSULT-II

1. Démarrer le moteur et l'amener à température normale de fonctionnement.
2. Eteindre le moteur et mettre le contact d'allumage sur ON.
3. Contrôler la tension entre la borne 23 de l'ECM (signal du capteur de position de papillon) et la masse dans les conditions suivantes.

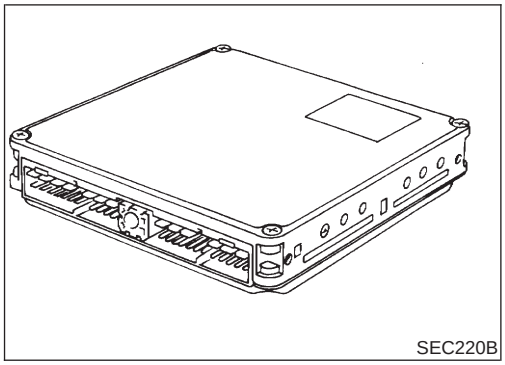
SEF767W

Conditions du papillon	Tension V
Complètement fermé	0,15 - 0,85 (a)
Partiellement ouvert	Entre (a) et (b)
Complètement ouvert	3,5 - 4,7 (b)

MTBL0329

REMARQUE :
Les relevés doivent être effectués avec le capteur de position de papillon reposé sur le véhicule.
Si le résultat n'est pas satisfaisant, régler le contact de position de papillon fermé. Se reporter à la procédure ''Inspection de base'', EC-3093.

4. S'il est impossible de régler le contact de position de papillon fermé en suivant la procédure d'inspection de base, remplacer le capteur de position de papillon.



BON ou MAUVAIS

Bon	▶	ALLER A 8.
Mauvais	▶	Remplacer le capteur de position de papillon.

SEF463R

SEF288D

Description des composants

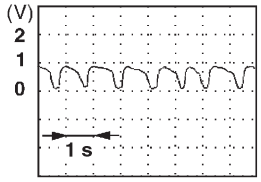
NEEC0103

La sonde à oxygène chauffé 1 est placée dans le collecteur d'échappement. Elle détecte la quantité d'oxygène contenue dans les gaz d'échappement en comparaison avec l'air extérieur. La sonde à oxygène chauffé 1 dispose d'un tube à extrémité fermée en zirconium de céramique. La zircone produit une tension qui va d'environ 1 V dans des conditions de mélange plus riche à 0 V dans des conditions de mélange plus pauvre. Le signal de la sonde à oxygène chauffé 1 est envoyé à l'ECM. L'ECM règle la durée de l'impulsion d'injection pour obtenir le mélange idéal air-carburant. Le mélange idéal air-carburant se produit vers le changement radical de 1 V à 0 V.

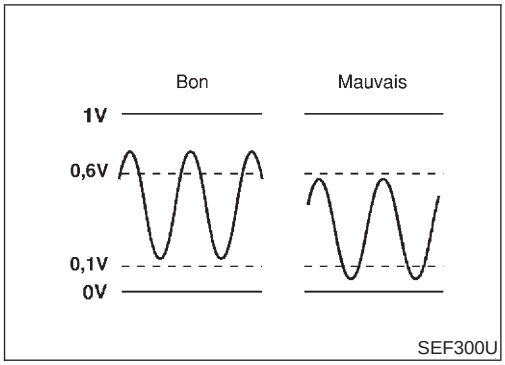
Valeur de référence de CONSULT-II en mode de contrôle de données

NEEC0104

Les données de spécification sont des valeurs de référence.



ELEMENT DE CONTROLE	CONDITION		SPECIFICATION
S/O2 CH1 (R1)	● Moteur : une fois le moteur chaud	Maintenir le régime-moteur à 2 000 tr/mn.	0 - 0,3 V ←→ Env. 0,6 - 1,0 V
MTR S/O2 CH1 (R1)			PAUVRE ←→ RICHE Change plus de 5 fois pendant 10 secondes



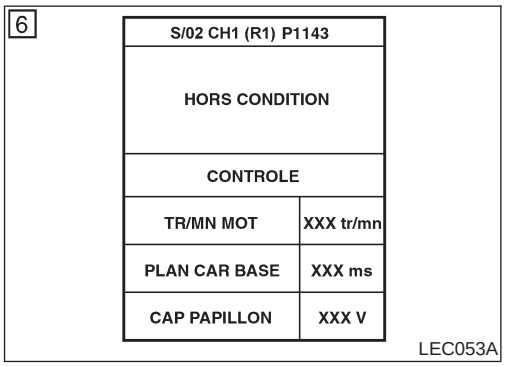
Bornes de l'ECM et valeurs de référence

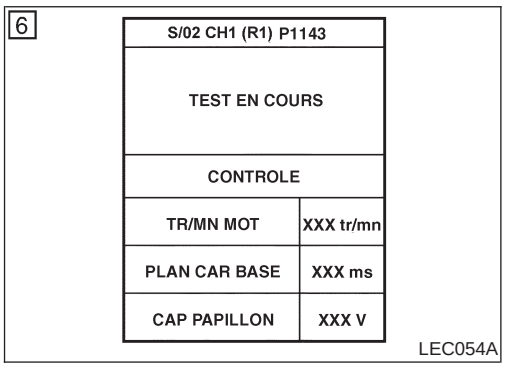
NEEC0105

Les données de spécification sont des valeurs de référence et sont mesurées entre chaque borne et la masse.

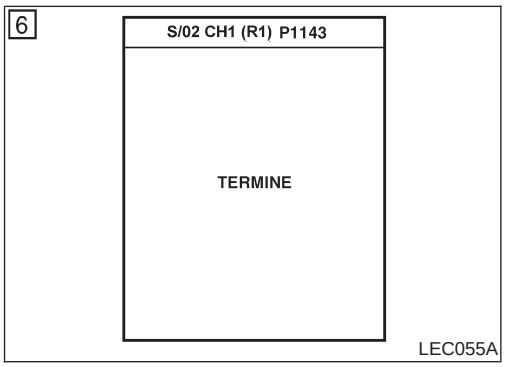
ATTENTION :
Ne pas utiliser de bornes de masse de l'ECM lors de la mesure de la tension d'entrée/de sortie. En agissant de la sorte, il est possible d'endommager le transistor de l'ECM. Utiliser une masse autre que les bornes de l'ECM, comme par exemple la prise de terre.

N° DE BORNE	COULEUR DE CABLE	ELEMENT	CONDITION	DONNEES (tension de courant continu)
50	W	Sonde à oxygène chauffé 1	**[Moteur en marche]** ● Après montée en température normale de fonctionnement et au régime moteur de 2.000 tr/mn.	0 - Environ 1,0V  SEF008W





Logique de diagnostic de bord



NEEC0106

Pour estimer le défaut, le signal de sortie de la sonde à oxygène chauffé 1 est contrôlé pour déterminer si la sortie ‘‘riche’’ est suffisamment élevée et si la sortie ‘‘pauvre’’ est suffisamment basse. Le défaut est détecté lorsque ces deux sorties dérivent vers l’appauvrissement.

N° de DTC	Le défaut est détecté quand ...	Eléments de contrôle (causes possibles)
P1143 1143	● Les tensions maxi. et mini. reç;ues de la sonde ne sont pas conformes aux valeurs spécifiées.	● Sonde à oxygène chauffé 1 ● Commande de la sonde à oxygène chauffé 1 chauffage ● Pression de carburant ● Injecteurs ● Fuites d’air d’admission

Procédure de confirmation de code de défaut (DTC)

NEEC0107

ATTENTION :

Toujours adapter sa vitesse aux exigences de sécurité.

REMARQUE :

Si une ‘‘Procédure de confirmation de DTC’’ a précédé, toujours mettre le contact d’allumage sur la position OFF et attendre au moins 5 secondes avant de procéder à l’essai suivant.

CONDITIONS D’ESSAI :

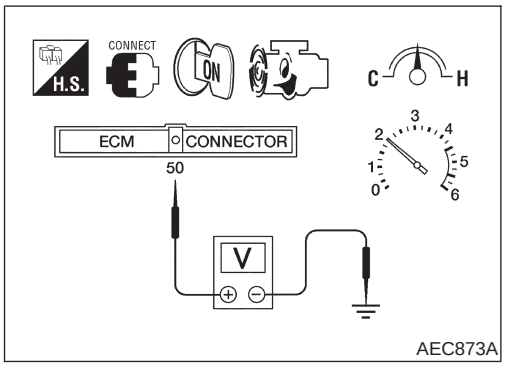
- **Toujours opérer à une température supérieure à -10°C.**
- **Avant d’entamer la procédure suivante, vérifier que la tension délivrée par la batterie est supérieure à 11V au ralenti.**

Avec CONSULT-II

1) Démarrer le moteur et l’amener à température normale de fonctionnement.
2) Arrêter le moteur et attendre au moins 5 secondes.
3) Mettre le contact d’allumage sur ON et sélectionner ‘‘P1143 S/O2 CH1 (R1)’’ de ‘‘S/O2 CH1’’ dans le mode ‘‘SUPPORT TRAVAIL DTC’’ de CONSULT-II.
4) Appuyer sur ‘‘DEPART’’.
5) Démarrer le moteur et le laisser tourner au ralenti pendant au moins 3,0 minutes.

REMARQUE :

Ne jamais dépasser le régime de 3 600 tr/mn après cette étape. Si le régime-moteur dépasse cette limite, recommencer à l’étape 5.



6) Lorsque les conditions suivantes sont remplies, l’écran de CONSULT-II indique ‘‘TEST EN COURS’’. Maintenir les conditions indiquées jusqu’à ce que le message ‘‘TEST EN COURS’’ laisse place au message ‘‘TERMINE’’ (ceci prend environ 50 secondes.)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

TR/MN MOT	1200 - 3150 tr/mn
Vitesse du véhicule	Moins de 100 km/h
PLAN CAR BASE	3,5 - 15 ms
Levier de vitesses	Rapport adapté

Si ‘‘TEST EN COURS’’ ne s’affiche pas après 5 minutes, réessayer à partir de l’étape 2.

7) S’assurer que BON s’affiche après avoir appuyé sur ‘‘RESULT AUTO-DIAG’’. Si MAUVAIS s’affiche, se reporter à la ‘‘Procédure de diagnostic’’, EC-3335.

Vérification du fonctionnement général

NEEC0108

Utiliser cette procédure pour vérifier le fonctionnement général du circuit de la sonde à oxygène chauffé 1. Au cours de ce contrôle, il est possible qu’un DTC de 1er parcours ne soit pas confirmé.

Sans CONSULT-II

1) Démarrer le moteur et l’amener à température normale de fonctionnement.
2) Placer des sondes de voltmètre entre la borne 50 de l’ECM (signal de sonde à oxygène chauffé 1) et la masse du moteur.
3) Procéder au contrôle suivant en maintenant constant le régime moteur à 2 000 tr/mn à vide.

- La tension maximale dépasse 0,6 V au moins une fois.
- La tension minimale dépasse 0,1 V au moins une fois.

4) Si les résultats ne sont pas conformes, effectuer une ‘‘Procédure de diagnostic’’, voir page EC-3335.

SEF288D

Description des composants

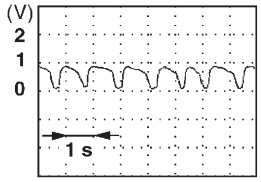
NEEC0111

La sonde à oxygène chauffé 1 est placée dans le collecteur d'échappement. Elle détecte la quantité d'oxygène contenue dans les gaz d'échappement en comparaison avec l'air extérieur. La sonde à oxygène chauffé 1 dispose d'un tube à extrémité fermée en zirconium de céramique. La zircone produit une tension qui va d'environ 1 V dans des conditions de mélange plus riche à 0 V dans des conditions de mélange plus pauvre. Le signal de la sonde à oxygène chauffé 1 est envoyé à l'ECM. L'ECM règle la durée de l'impulsion d'injection pour obtenir le mélange idéal air-carburant. Le mélange idéal air-carburant se produit vers le changement radical de 1 V à 0 V.

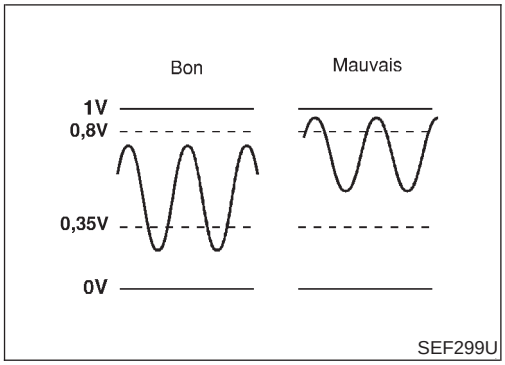
Valeur de référence de CONSULT-II en mode de contrôle de données

NEEC0112

Les données de spécification sont des valeurs de référence.



ELEMENT DE CONTROLE	CONDITION		SPECIFICATION
S/O2 CH1 (R1)	● Moteur : une fois le moteur chaud	Maintenir le régime-moteur à 2 000 tr/mn.	0 - 0,3 V ←→ Env. 0,6 - 1,0 V
MTR S/O2 CH1 (R1)			PAUVRE ←→ RICHE Change plus de 5 fois pendant 10 secondes



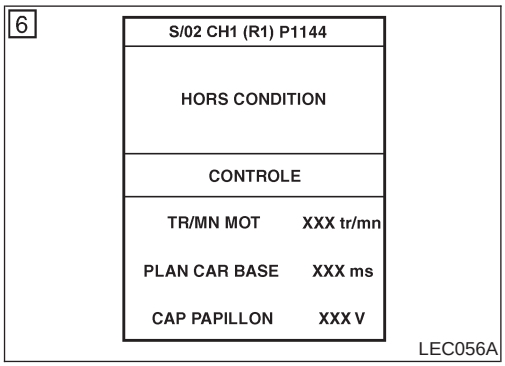
Bornes de l'ECM et valeurs de référence

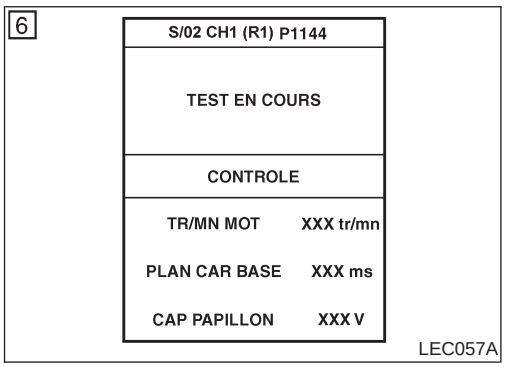
NEEC0113

Les données de spécification sont des valeurs de référence et sont mesurées entre chaque borne et la masse.

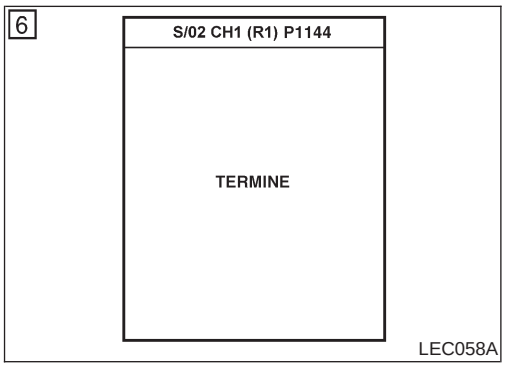
ATTENTION :
Ne pas utiliser de bornes de masse de l'ECM lors de la mesure de la tension d'entrée/de sortie. En agissant de la sorte, il est possible d'endommager le transistor de l'ECM. Utiliser une masse autre que les bornes de l'ECM, comme par exemple la prise de terre.

N° DE BORNE	COULEUR DE CABLE	ELEMENT	CONDITION	DONNEES (tension de courant continu)
50	W	Sonde à oxygène chauffé 1	**[Moteur en marche]** ● Après montée en température normale de fonctionnement et au régime moteur de 2.000 tr/mn.	0 - Environ 1,0V  SEF008W





Logique de diagnostic de bord



NEEC0114

Pour estimer le défaut, la sortie de la sonde à oxygène chauffé 1 est contrôlée pour déterminer si la sortie ‘‘riche’’ est suffisamment élevée et si la sortie ‘‘pauvre’’ est suffisamment basse. Le défaut est détecté lorsque ces deux sorties dérivent vers l’enrichissement.

N° de DTC	Le défaut est détecté quand ...	Eléments de contrôle (causes possibles)
P1144 1144	● Les tensions maxi. et mini. reçues de la sonde dépassent les valeurs spécifiées.	● Sonde à oxygène chauffé 1 ● Chauffage de la sonde à oxygène chauffé 1 ● Pression de carburant ● Injecteurs

Procédure de confirmation de code de défaut (DTC)

NEEC0115

ATTENTION :
Toujours adapter sa vitesse aux exigences de sécurité.

REMARQUE :
Si une ‘‘Procédure de confirmation de DTC’’ a précédé, toujours mettre le contact d’allumage sur la position OFF et attendre au moins 5 secondes avant de procéder à l’essai suivant.

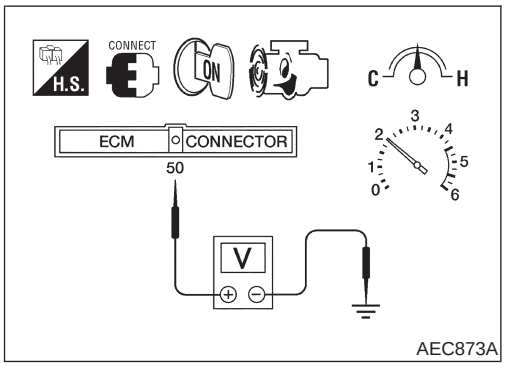
CONDITIONS D’ESSAI:

- **Toujours opérer à une température supérieure à -10°C.**
- **Avant d’entamer la procédure suivante, vérifier que la tension délivrée par la batterie est supérieure à 11 V au ralenti.**

Avec CONSULT-II

1) Démarrer le moteur et l’amener à température normale de fonctionnement.
2) Arrêter le moteur et attendre au moins 5 secondes.
3) Mettre le contact d’allumage sur ON et sélectionner ‘‘P1144’ S/O2 CH1 (R1)‘ de ‘‘S/O2 CH1’’ dans le mode ‘‘SUPPORT TRAVAIL DTC’’ de CONSULT-II.
4) Appuyer sur ‘‘DEPART’’.
5) Démarrer le moteur et le laisser tourner au ralenti pendant au moins 3,0 minutes.

REMARQUE :
Ne jamais dépasser le régime de 3 600 tr/mn après cette étape. Si le régime-moteur dépasse cette limite, recommencer à l’étape 5.



6) Lorsque les conditions suivantes sont remplies, l’écran de CONSULT-II indique ‘‘TEST EN COURS’’. Maintenir les conditions indiquées jusqu’à ce que le message ‘‘TEST EN COURS’’ laisse place au message ‘‘TERMINE’’ (ceci prend environ 50 secondes.)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

TR/MN MOT	1200 - 3150 tr/mn
Vitesse du véhicule	Moins de 100 km/h
PLAN CAR BASE	3,5 - 15 ms
Levier de vitesses	Rapport adapté

Si ‘‘TEST EN COURS’’ ne s’affiche pas après 5 minutes, réessayer à partir de l’étape 2.

7) S’assurer que BON s’affiche après avoir appuyé sur ‘‘RESULT AUTO-DIAG’’. Si MAUVAIS s’affiche, se reporter à la ‘‘Procédure de diagnostic’’, EC-3343.

Vérification du fonctionnement général

NEEC0116

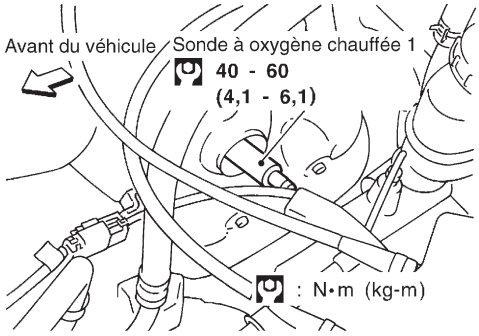
Utiliser cette procédure pour vérifier le fonctionnement général du circuit de la sonde à oxygène chauffé 1 (avant). Au cours de ce contrôle, il est possible qu’un DTC de 1er parcours ne soit pas confirmé.

Sans CONSULT-II

1) Démarrer le moteur et l’amener à température normale de fonctionnement.
2) Placer des sondes de voltmètre entre la borne 50 de l’ECM (signal de sonde à oxygène chauffé 1) et la masse du moteur.
3) Procéder au contrôle suivant en maintenant constant le régime moteur à 2 000 tr/mn à vide.

- La tension maximale tombe sous 0,8 V au moins une fois.
- La tension minimale tombe sous 0,35 V au moins une fois.

4) Si les résultats ne sont pas conformes, effectuer une ‘‘Procédure de diagnostic’’, voir page EC-3343.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

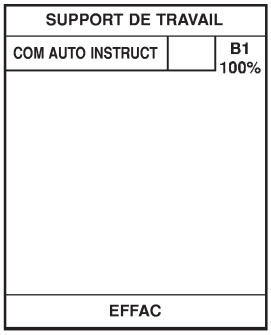
Procédure de diagnostic

NEEC0117

1	RESSERRER LA SONDE A OXYGENE CHAUFFE 1

1. Mettre le contact d'allumage sur OFF.
2. Desserrer et resserrer la sonde à oxygène chauffé 1.

SEF332VC



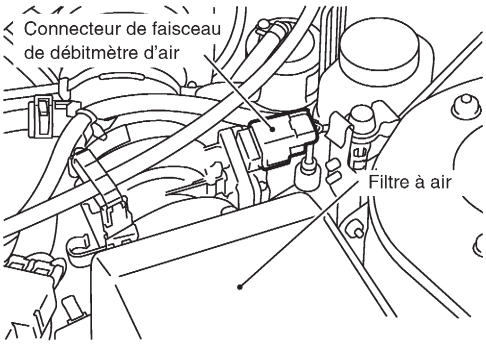
Couple de serrage :
40 - 60 N·m (4,1 - 6,1 kg-m)

▶	ALLER A 2.

2	EFFACER LES DONNEES D'AUTO-INSTRUCTION

Avec CONSULT-II

1. Démarrer le moteur et l'amener à température normale de fonctionnement.
2. Sélectionner ''COM AUTO INSTRUCT'' en mode ''TEST ACTIF'' de CONSULT-II.
3. Effacer le coefficient de commande d'auto-instruction en appuyant sur ''EFFAC''.



SEF215Z

4. Faire tourner le moteur pendant au moins 10 minutes au ralenti.
   Le DTC de 1er parcours P0172 est-il détecté ? Est-il difficile de démarrer le moteur ?

Sans CONSULT-II

1. Démarrer le moteur et l'amener à température normale de fonctionnement.
2. Mettre le contact d'allumage sur OFF.
3. Débrancher le connecteur de faisceau du débitmètre d'air, redémarrer et faire tourner le moteur pendant au moins 3 secondes au ralenti.

SEF293W

4. Eteindre le moteur et rebrancher le connecteur de faisceau du débitmètre d'air.
5. Vérifier que le DTC de 1er parcours P0102 est bien affiché.
6. Effacer le DTC de 1er parcours. Se reporter à ''COMMENT EFFACER LES CODES DE DIAGNOSTIC ANTIPOLLUTION'', EC-3065.
7. Vérifier que le DTC P0000 est bien affiché.
8. Faire tourner le moteur pendant au moins 10 minutes au ralenti.
   Le DTC de 1er parcours P0171 est-il détecté ? Est-il difficile de démarrer le moteur ?

Oui ou Non

Oui	▶	Réaliser le diagnostic des défauts pour DTC P0172. Se reporter à EC-3260.
Non	▶	ALLER A 3.

3	CONTROLER LE CONNECTEUR DE FAISCEAU

1. Mettre le contact d'allumage sur OFF.
2. Débrancher le connecteur de faisceau de la sonde à oxygène chauffé 1.
3. Vérifier si de l'eau n'a pas pénétré dans le connecteur de faisceau.
   Il ne doit pas y avoir d'eau.

BON ou MAUVAIS

Bon	▶	ALLER A 4.
Mauvais	▶	Réparer ou remplacer le connecteur de faisceau.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description des composants

NEEC0144

La sonde à oxygène chauffé 2, située en aval du catalyseur à trois voies, contrôle le niveau d'oxygène dans les gaz d'échappement. Même si les caractéristiques de commutation de la sonde à oxygène chauffé 1 sont modifiées, le rapport air-carburant est commandé à la stœchiométrie par le signal délivré par la sonde à oxygène chauffé 2

Cette sonde est en zircone céramique La zircone produit une tension qui va d'environ 1 V dans des conditions de mélange plus riche à 0 V dans des conditions de mélange plus pauvre.

En conditions normales, la sonde à oxygène chauffé 2 n'est pas utilisée pour la gestion moteur.

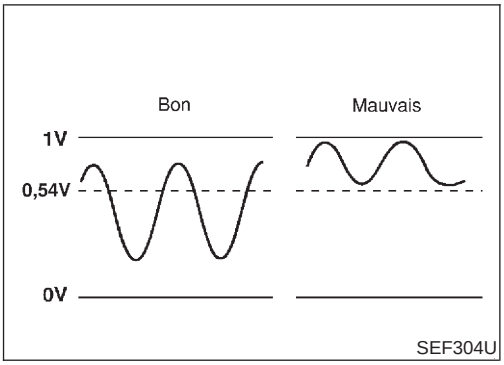
Valeur de référence de CONSULT-II en mode de contrôle de données

NEEC0145

Les données de spécification sont des valeurs de référence.

ELEMENT DE CONTROLE	CONDITION		SPECIFICATION
S/O2 CH2 (R1)	● Moteur : une fois le moteur chaud	Montée rapide du régime moteur du ralenti jusqu'à 3 000 tr/mn	0 - 0,3V ←→ Env. 0,6 - 1,0V
MTR S/O2 CH2 (R1)			PAUVRE ←→ RICHE

Bornes de l'ECM et valeurs de référence



NEEC0146

Les données de spécification sont des valeurs de référence et sont mesurées entre chaque borne et la masse.

ATTENTION :
Ne pas utiliser de bornes de masse de l'ECM lors de la mesure de la tension d'entrée/de sortie. En agissant de la sorte, il est possible d'endommager le transistor de l'ECM. Utiliser une masse autre que les bornes de l'ECM, comme par exemple la prise de terre.

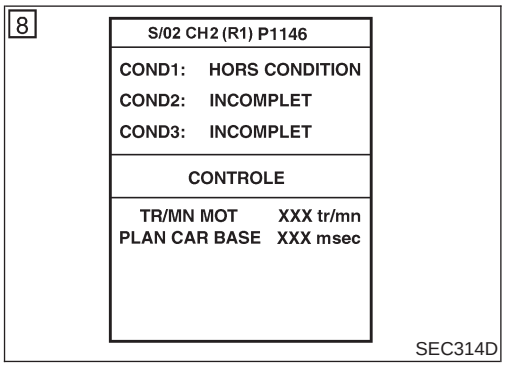
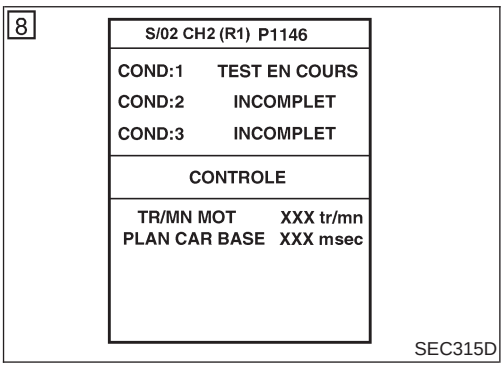
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



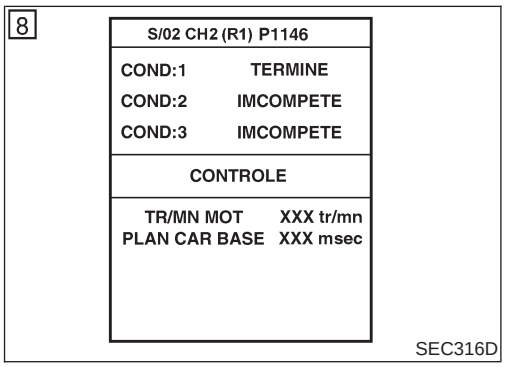
SEF304U

Logique de diagnostic de bord



NEEC0147

La sonde à oxygène chauffé 2 possède une longueur d'interruption entre riche et pauvre beaucoup plus grande que la sonde à oxygène chauffé 1. La capacité de stockage d'oxygène avant le catalyseur à trois voies est la cause du temps d'interruption plus long. Pour estimer les défauts de fonctionnement de la sonde à oxygène chauffé 2, l'ECM contrôle si la tension minimale du capteur est suffisamment basse durant les différentes conditions de conduite comme par exemple la coupure de carburant.



N° de DTC	Le défaut est détecté quand ...	Eléments de contrôle (causes possibles)
P1146 1146	● La tension minimale en provenance de la sonde n'atteint pas les valeurs spécifiées.	● Faisceau ou connecteurs (le circuit de capteur est ouvert ou court-circuité) ● Sonde à oxygène chauffé 2 ● Pression de carburant ● Injecteurs

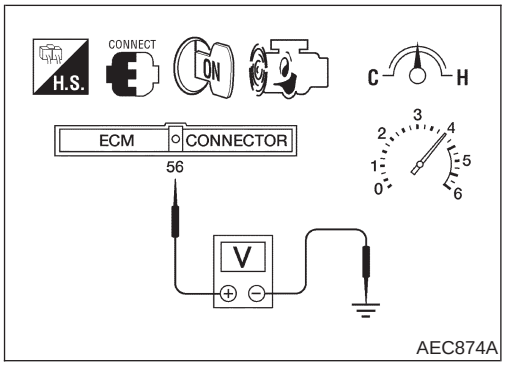
PBIB0556E

Procédure pour COND2

NEEC0148S0102

1. En conduisant, relâcher la pédale d’accélération complètement comme indiqué à l’étape 8 des conditions ci-dessus jusqu’à ce que ‘‘COND2’’ sur l’écran CONSULT-II passe de INCOMPLET à TERMINE (ceci prend environ 4 secondes).

REMARQUE :
Si ‘‘TERMINE‘ apparaît dès que l’écran de CONSULT-II affiche ‘‘COND3’’, avant même de réaliser la ‘‘Procédure pour COND3’’, il n’est pas nécessaire de réaliser l’étape 1 de la ‘‘Procédure pour COND3’’.



SEC775C

Procédure pour COND3

NEEC0148S0103

1. Arrêter le véhicule et le laisser au ralenti jusqu’à ce que ‘‘COND3’’ passe de INCOMPLET à TERMINE sur l’écran de CONSULT-II (ceci prend environ 6 minutes au plus).
2. Veiller à ce que ‘‘BON’’ soit affiché après avoir appuyé sur ‘‘RESULT AUTODIAG’’.
   Si c’est ‘‘MAUVAIS’’ qui est affiché, se reporter à EC-3353, ‘‘Procédure de diagnostic’’.

AEC874A

Vérification du fonctionnement général

NEEC0149

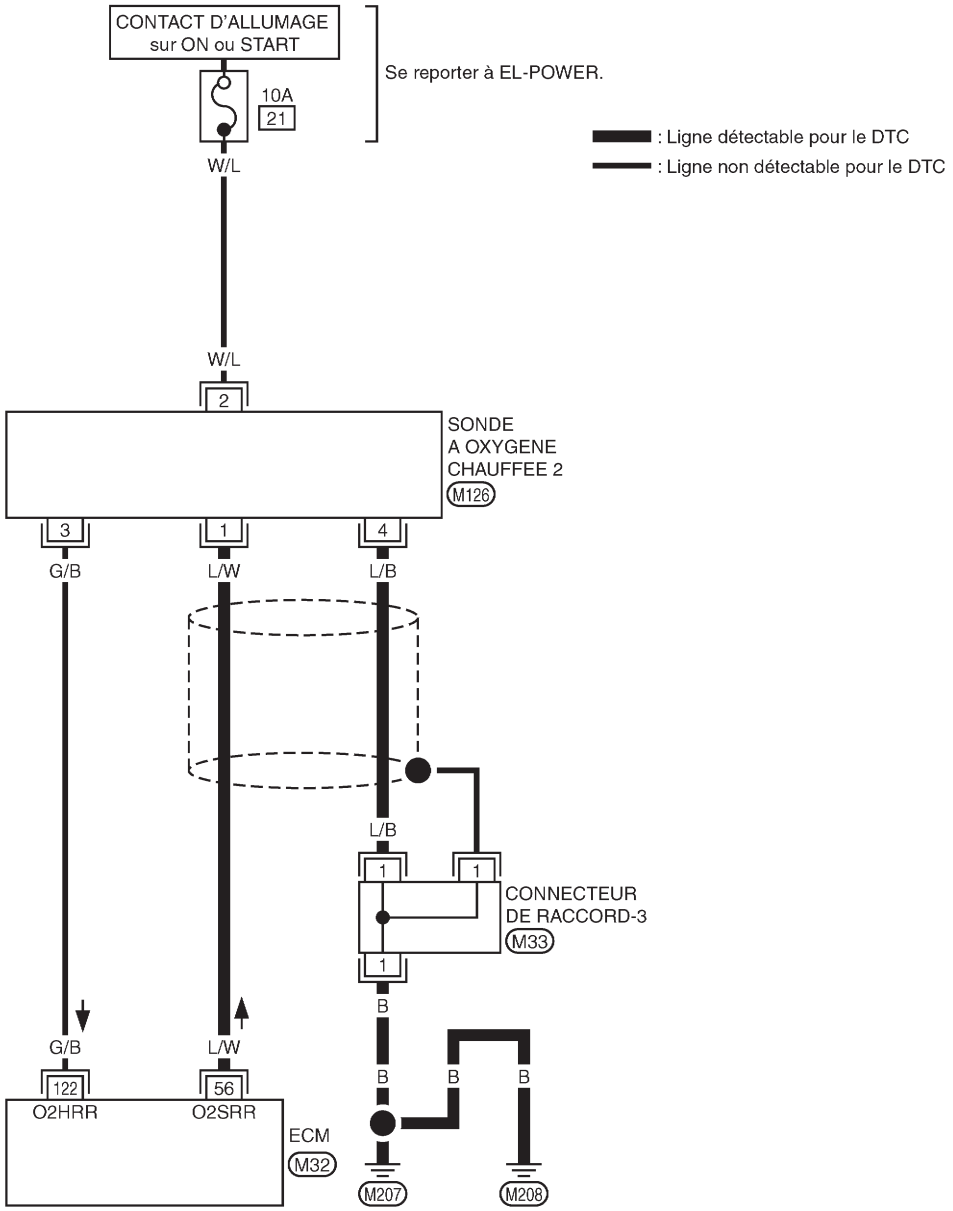
Utiliser cette procédure pour contrôler le fonctionnement général du circuit de la sonde à oxygène chauffé 2. Au cours de ce contrôle, il est possible qu’un DTC de 1er parcours ne soit pas confirmé.

ATTENTION :
Toujours adapter sa vitesse aux exigences de sécurité.

Ⓧ Sans CONSULT-II

1) Démarrer le moteur et conduire le véhicule à une vitesse de plus de 70 km/h pendant 2 minutes consécutives.
2) Arrêter le véhicule et laisser tourner le moteur.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



3) Placer des sondes de voltmètre entre la borne 56 de l'ECM (signal de sonde à oxygène chauffé 2) et la masse du moteur.
4) Vérifier la tension en emballant le moteur jusqu'à 4 000 tr/mn à vide et ce, au moins 10 fois.
(appuyer sur la pédale d'accélérateur et la relâcher aussi vite que possible)
La tension doit être inférieure à 0,54 V au moins une fois pendant la procédure.
Si la tension est conforme à ce stade, il est inutile de procéder aux opérations décrites à l'étape 5.
5) Laisser le moteur tourner au ralenti pendant 10 minutes, puis vérifier la tension. Ou vérifier la tension lors du passage à 80 km/h en 3ème.
La tension doit être inférieure à 0,54 V au moins une fois pendant la procédure.
6) Si les résultats ne sont pas conformes, effectuer une ''Procédure de diagnostic'', voir page EC-3353.

▶	**FIN DE L'INSPECTION**

Description des composants

NEEC0153

La sonde à oxygène chauffé 2, située en aval du catalyseur à trois voies, contrôle le niveau d'oxygène dans les gaz d'échappement. Même si les caractéristiques de commutation de la sonde à oxygène chauffé 1 sont modifiées, le rapport air-carburant est commandé à la stœchiométrie par le signal délivré par la sonde à oxygène chauffé 2

Cette sonde est en zircone céramique La zircone produit une tension qui va d'environ 1 V dans des conditions de mélange plus riche à 0 V dans des conditions de mélange plus pauvre.

En conditions normales, la sonde à oxygène chauffé 2 n'est pas utilisée pour la gestion moteur.

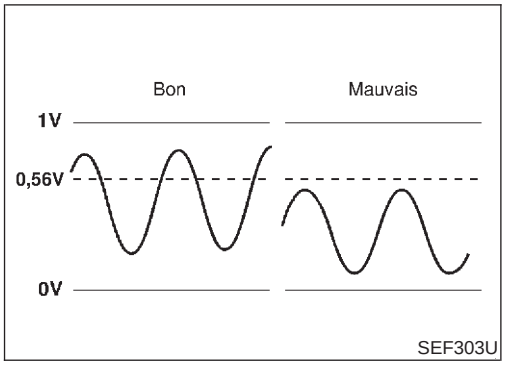
Valeur de référence de CONSULT-II en mode de contrôle de données

NEEC0154

Les données de spécification sont des valeurs de référence.

ELEMENT DE CONTROLE	CONDITION		SPECIFICATION
S/O2 CH2 (R1)	● Moteur : une fois le moteur chaud	Montée rapide du régime moteur du ralenti jusqu'à 3 000 tr/mn.	0 - 0,3 V ←→ Env. 0,6 - 1,0 V
MTR S/O2 CH2 (R1)			PAUVRE ←→ RICHE

Bornes de l'ECM et valeurs de référence



NEEC0155

Les données de spécification sont des valeurs de référence et sont mesurées entre chaque borne et la masse.

ATTENTION :
Ne pas utiliser de bornes de masse de l'ECM lors de la mesure de la tension d'entrée/de sortie. En agissant de la sorte, il est possible d'endommager le transistor de l'ECM. Utiliser une masse autre que les bornes de l'ECM, comme par exemple la prise de terre.

N° DE BORNE	COULEUR DE CABLE	ELEMENT	CONDITION	DONNEES (tension de courant continu)
56	L/W	Sonde à oxygène chauffé 2	**[Moteur en marche]** ● Après montée en température normale de fonctionnement et montée rapide en régime du ralenti jusqu'à 3.000 tr/mn	0 - Environ 1,0V

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SEF303U

Logique de diagnostic de bord

NEEC0156

La sonde à oxygène chauffé 2 possède une longueur d'interruption entre riche et pauvre beaucoup plus grande que la sonde à oxygène chauffé 1. La capacité de stockage d'oxygène avant le catalyseur à trois voies est la cause du temps d'interruption plus long. Pour estimer les défauts de fonctionnement de la sonde à oxygène chauffé 2, l'ECM contrôle si la tension maximale du capteur est suffisamment élevée durant les différentes conditions de conduite comme par exemple la coupure de carburant.

N° de DTC	Le défaut est détecté quand ...	Eléments de contrôle (causes possibles)
P1147 1147	● La tension maximale en provenance de la sonde n'atteint pas les valeurs spécifiées.	● Faisceau ou connecteurs (le circuit de capteur est ouvert ou court-circuité) ● Sonde à oxygène chauffé 2 ● Pression de carburant ● Injecteurs ● Fuites d'air d'admission

Procédure de confirmation de code de défaut (DTC)

NEEC0157

ATTENTION :
Toujours adapter sa vitesse aux exigences de sécurité.

REMARQUE :

- **''TERMINE'' apparaît sur l'écran de CONSULT-II lorsque tous les tests ''COND1'', ''COND2'' et ''COND3'' sont terminés.**
- Si une ''Procédure de confirmation de DTC'' a précédé, toujours mettre le contact d'allumage sur la position ''OFF'' et attendre au moins 5 secondes avant de procéder à l'essai suivant.

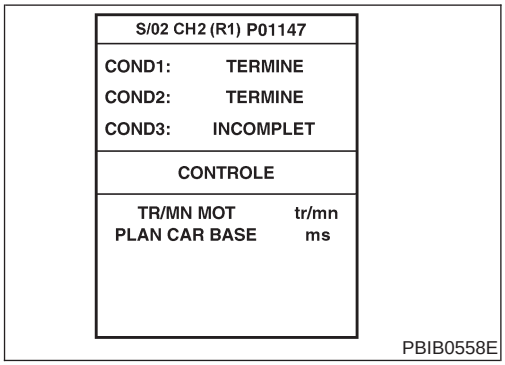
CONDITIONS D'ESSAI :
Ne jamais arrêter le moteur au cours de cette procédure. Si le moteur est arrêté, recommencer cette procédure depuis l'étape 2 de ''Procédure pour COND1''.

AVEC CONSULT-II

NEEC0157S01

Procédure pour COND1

NEEC0157S0101



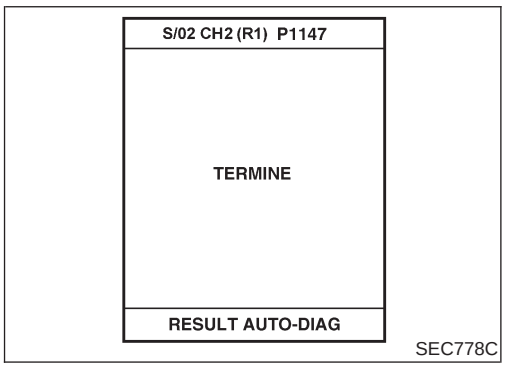
1. Démarrer le moteur et l'amener à température normale de fonctionnement.
2. Mettre le contact d'allumage sur ''OFF'' et attendre au moins 5 secondes.
3. Mettre le contact d'allumage sur ON et sélectionner ''P1147 S/O2 CH2 (R1)'' de ''S/O2 CH2'' dans le mode ''SUPPORT TRAVAIL DTC'' de CONSULT-II.
4. Appuyer sur ''DEPART''.
5. Démarrer le moteur et le laisser tourner au ralenti pendant au moins 30 secondes.
6. Emballer le moteur à 2 000 tr/mn à 2 ou 3 reprises, à vide.
   Si TERMINE apparaît sur l'écran de CONSULT-II, passer à l'étape 2 de ''Procédure pour COND3''.
   Si TERMINE n'apparaît pas sur l'écran CONSULT-II, passer à l'étape suivante.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

7. Rouler à plus de 70 km/h pendant 2 minutes.
8. Lorsque les conditions suivantes sont réunies, ‘‘TEST EN COURS’’ sera affiché dans ‘‘COND1’’ sur l’écran de CONSULT-II. Maintenir les conditions indiquées jusqu’à ce que le message ‘‘TEST EN COURS’’ laisse place au message ‘‘TERMINE’’ (cela prend environ 60 secondes.)

TR/MN MOT	Plus de 1000 tr/mn
PLAN CAR BASE	Plus de 1,0 ms
CAP TEMP LIQ REFR	70 - 105°C
Levier sélecteur	Rapport adapté

REMARQUE :
- **Si ‘‘TEST EN COURS’’ ne s’affiche pas après 5 minutes, recommencer à partir de l’étape 2 dans ‘‘Procédure pour COND1’’.**
- **Si TERMINE apparaît dès que l’écran de CONSULT-II affiche ‘‘COND2’’, avant même de réaliser la ‘‘Procédure pour COND2’’, il n’est pas nécessaire de réaliser l’étape 1 de la ‘‘Procédure pour COND2’’.**



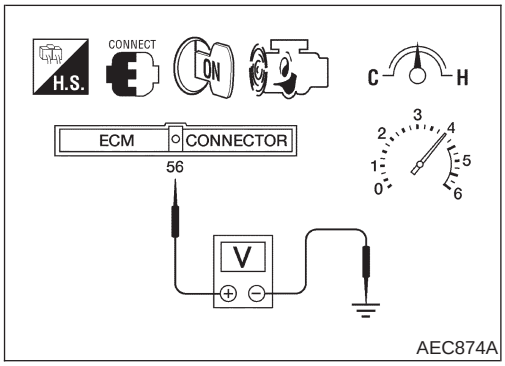
PBIB0558E

Procédure pour COND2

NEEC0157S0102

1. En conduisant, relâcher la pédale d’accélération complètement comme indiqué à l’étape 8 des conditions ci-dessus jusqu’à ce que ‘‘COND2’’ sur l’écran CONSULT-II passe de INCOMPLET à TERMINE (ceci prend environ 4 secondes.)

REMARQUE :
Si TERMINE apparaît dès que l’écran de CONSULT-II affiche ‘‘COND3’’, avant même de réaliser la ‘‘Procédure pour COND3’’, il n’est pas nécessaire de réaliser l’étape 1 de la ‘‘Procédure pour COND3’’.



SEC778C

Procédure pour COND3

NEEC0157S0103

1. Arrêter le véhicule et le laisser au ralenti jusqu’à ce que ‘‘COND3’’ passe de INCOMPLET à TERMINE sur l’écran de CONSULT-II (ceci prend environ 6 minutes au plus.)
2. Veiller à ce que ‘‘BON’’ soit affiché après avoir appuyé sur ‘‘RESULT AUTODIAG’’.
   Si ‘‘MAUVAIS’’ est affiché, se reporter à EC-3364, ‘‘Procédure de diagnostic’’.

AEC874A

Vérification du fonctionnement général

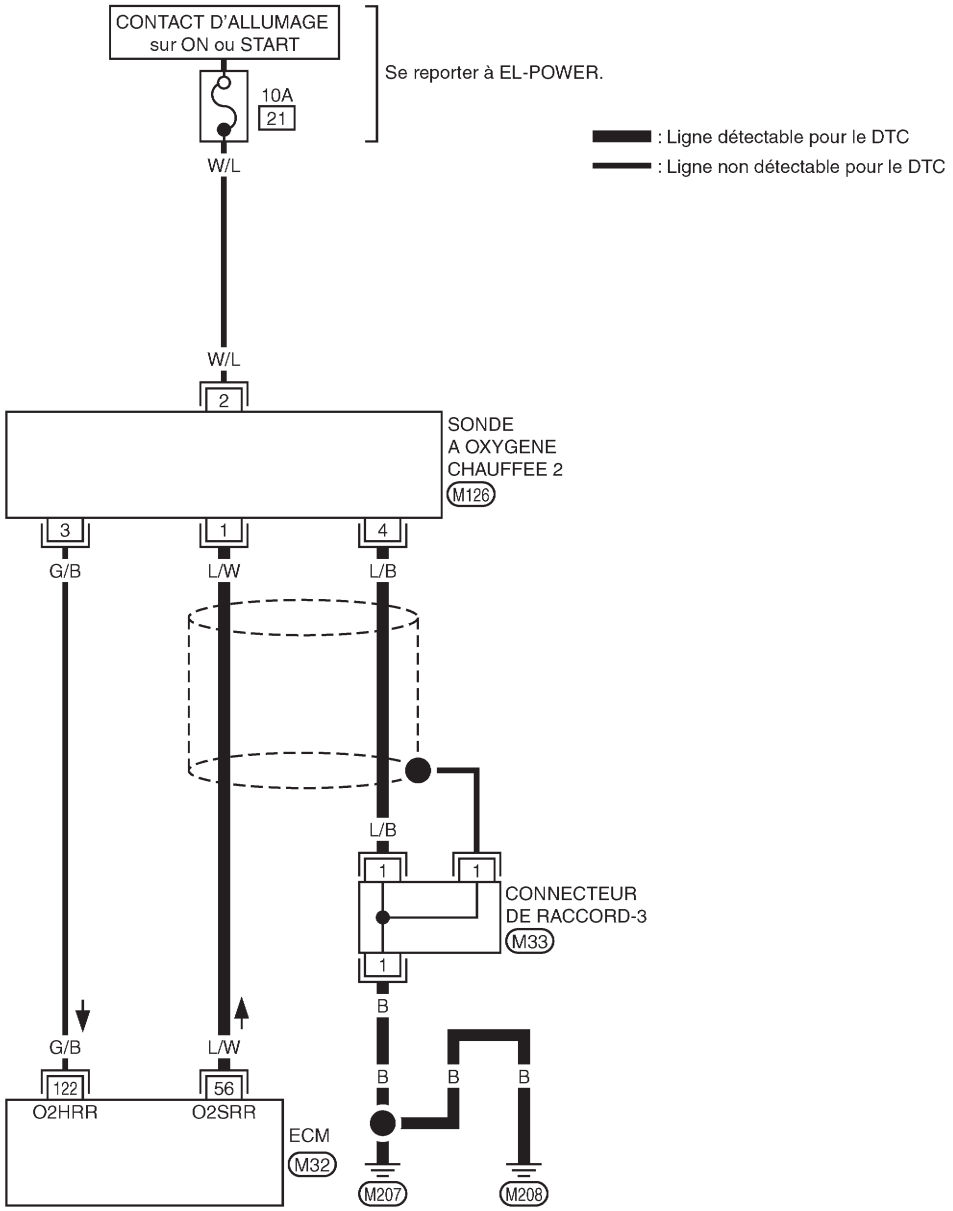
NEEC0158

Utiliser cette procédure pour vérifier le fonctionnement général du circuit de la sonde à oxygène chauffé arrière. Au cours de ce contrôle, il est possible qu’un DTC de 1er parcours ne soit pas confirmé.

ATTENTION :
Toujours adapter sa vitesse aux exigences de sécurité.

Ⓧ Sans CONSULT-II

1) Démarrer le moteur et conduire le véhicule à la vitesse de 70 km/h pendant 2 minutes consécutives.
2) Arrêter le véhicule et laisser tourner le moteur.



3) Placer des sondes de voltmètre entre la borne 56 de l'ECM (signal de sonde à oxygène chauffé 2) et la masse du moteur.
4) Vérifier la tension en emballant le moteur jusqu'à 4 000 tr/mn à vide et ce, au moins 10 fois.
(appuyer sur la pédale d'accélérateur et la relâcher aussi vite que possible)
La tension doit être supérieure à 0,56 V au moins une fois pendant la procédure.
Si la tension est conforme à ce stade, il est inutile de procéder aux opérations décrites à l'étape 5.
5) Laisser le moteur tourner au ralenti pendant 10 minutes, puis vérifier la tension. Ou vérifier la tension lors du passage à 80 km/h en 3ème.
La tension doit être supérieure à 0,56 V au moins une fois pendant la procédure.
6) Si les résultats ne sont pas conformes, effectuer une ''Procédure de diagnostic'', voir page EC-3364.

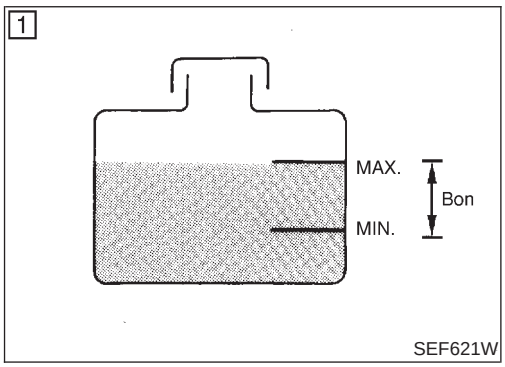
Logique de diagnostic de bord



NEEC1534

Si le ventilateur de refroidissement ou tout autre composant du système de refroidissement est défectueux, la température du moteur augmente.
Lorsque la température du liquide de refroidissement du moteur atteint un degré de température anormalement élevé, un défaut est indiqué.

N° de DTC	Le défaut est détecté quand ...	Contrôler les points suivants (causes possibles)
P1217 1217	● Le liquide de refroidissement atteint une température excessive.	● Ventilateur de refroidissement (entraîné par le vilebrequin) Flexible de radiateur ● Radiateur ● Bouchon de radiateur ● Pompe à eau ● Thermostat ● Capteur de température du liquide de refroidissement du moteur Pour plus d'informations, se reporter à ''11 CAUSES PRINCIPALES DE SURCHAUFFE'', page EC-3374.

ATTENTION :
Lorsqu'un défaut est indiqué, veiller à remplacer le liquide de refroidissement. Se reporter à la section MA, ''Remplacer le liquide de refroidissement du moteur''. Remplacer également l'huile moteur.

1) **Faire le plein du radiateur jusqu'au niveau spécifié en versant 2 litres de liquide de refroidissement par minute. Veiller à utiliser un liquide de refroidissement contenant une richesse de mélange appropriée. Se reporter à la section MA ''Richesse de mélange de liquide de refroidissement antigel''.**
2) **Après avoir fait le plein de liquide de refroidissement, faire tourner le moteur pour s'assurer que l'on n'entend aucun bruit d'écoulement d'eau.**

Vérification du fonctionnement général

NEEC1535

AVERTISSEMENT :
Ne jamais déposer le bouchon de radiateur lorsque le moteur est chaud. Le liquide haute pression s'échappant du radiateur peut occasionner de sérieuses brûlures.
Entourer le bouchon d'un chiffon épais. Retirer le bouchon avec précaution en le tournant d'un quart de tour pour permettre à la pression de s'échapper. Puis tourner le bouchon à fond.

1) Contrôler le niveau de liquide de refroidissement dans le réservoir et dans le radiateur.
   Laisser le moteur refroidir avant de vérifier le niveau de liquide de refroidissement.
   Si le niveau du liquide de réfrigérant dans le réservoir et/ou dans le radiateur est au-dessous de la limite correcte, sauter les étapes suivantes et passer directement à la ''Procédure de diagnostic'', page EC-3371.
2) Vérifier si le client a fait le plein de liquide de refroidissement ou non. Si le client a fait le plein de liquide de refroidissement, sauter les étapes suivantes et passer à la ''Procédure de diagnostic'', page EC-3371.

Mauvais	▶	Remplacer le capteur de température du liquide de refroidissement du moteur.

5	CONTROLER LES 11 CAUSES PRINCIPALES
Si la cause ne peut pas être identifiée, aller à ''11 CAUSES PRINCIPALES DE SURCHAUFFE'', page EC-3374.	
▶	**FIN DE L'INSPECTION**

Effectuer le CONTROLE FINAL en effectuant la procédure suivante après la réparation.

1. Faire chauffer le moteur. Faire tourner le moteur pendant au moins 20 minutes. Observer la jauge de la température du liquide de refroidissement moteur sur le panneau de bord. Si la jauge indique une température anormalement élevée, il se peut qu'une autre pièce soit défectueuse.
2. Arrêter le véhicule et et laisser tourner le moteur au ralenti. Vérifier que les systèmes d'admission et d'échappement ne présentent pas de fuites en écoutant si un bruit s'échappe ou en effectuant un contrôle visuel des composants.
3. Laisser refroidir le moteur et effectuer un contrôle visuel pour détecter les fuites d'huile et de liquide de refroidissement éventuelles. Ensuite, réaliser la ''VERIFICATION DU FONCTIONNEMENT GENERAL''.

Description des composants

NEEC0327

Le capteur de position du vilebrequin (OBD) est situé sur carter de boîte-pont face aux dents de pignon (dentures) du volant-moteur ou du plateau d'entraînement. Cela permet de détecter la fluctuation de la révolution du moteur.

La capteur comprend un aimant permanent, un noyau, et une bobine.

Lorsque le moteur tourne, la succession de dents et de vides de la roue dentée entraîne une variation de l'espacement avec le capteur.

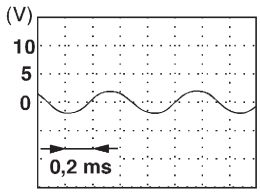
Cette variation d'espacement entraîne une variation du champ magnétique près du capteur.

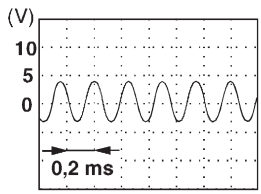
Cette variation du champ magnétique entraîne une variation de la tension fournie par le capteur.

L'ECM reç;oit le signal de tension et détecte les variations du régime-moteur.

Ce capteur ne joue aucun rôle dans le système de gestion du moteur.

Il est utilisé exclusivement à des fins de diagnostic de bord.





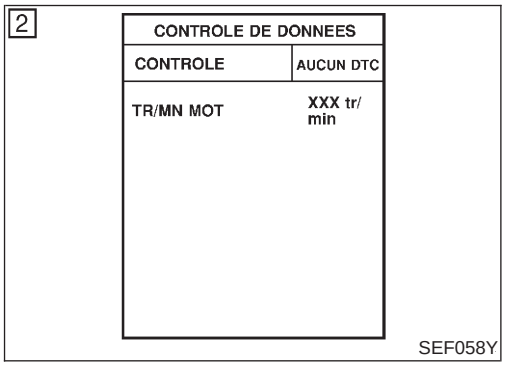
Bornes de l'ECM et valeurs de référence

NEEC0328

Les données de spécification sont des valeurs de référence et sont mesurées entre chaque borne et la masse.

ATTENTION :

Ne pas utiliser de bornes de masse de l'ECM lors de la mesure de la tension d'entrée/de sortie. En agissant de la sorte, il est possible d'endommager le transistor de l'ECM. Utiliser une masse autre que les bornes de l'ECM, comme par exemple la prise de terre.



N° DE BORNE	COULEUR DE CABLE	ELEMENT	CONDITION	DONNEES (tension du courant alternatif)
43	B	Masse de capteurs	**[Moteur en marche]** ● **Pendant la montée en température** ● Régime de ralenti	Environ 0 V

Description des composants

NEEC0319

BOBINE D'ALLUMAGE ET TRANSISTOR D'ALIMENTATION

NEEC0319S01

Le signal d'allumage envoyé par l'ECM est délivré au transistor d'alimentation qui l'amplifie. Le transistor d'alimentation ouvre et coupe le circuit primaire de la bobine d'allumage. Ce fonctionnement intermittent induit la tension élevée correcte dans le circuit secondaire de la bobine.
Le distributeur ne peut être réparé et doit être remplacé comme un ensemble, à l'exception du couvercle du distributeur et de la tête du rotor.

REMARQUE :
La vis du rotor qui fixe la tête du rotor de distribution à l'arbre du distributeur doit être convenablement serrée.

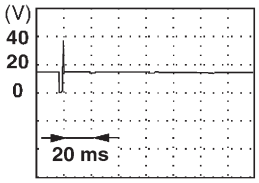
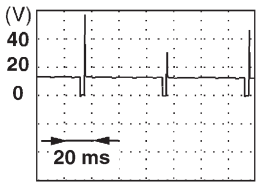
Description des composants

NEEC0435





L'injecteur de carburant est une électrovanne précise de petite dimension. Quand l'ECM fournit une masse au circuit de l'injecteur, la bobine située dans l'injecteur est alimentée en courant. La bobine alimentée tire la soupape à bille et permet au carburant de couler par l'injecteur dans le collecteur d'admission. La quantité de carburant injectée est déterminée par la durée de l'impulsion d'injection. La durée d'impulsion correspond au temps durant lequel l'injecteur reste ouvert. L'ECM commande la durée d'impulsion d'injection basée sur les besoins en carburant du moteur.

Bornes de l'ECM et valeurs de référence

NEEC0437

Les données de spécification sont des valeurs de référence et sont mesurées entre chaque borne et la masse.

ATTENTION :
Ne pas utiliser de bornes de masse de l'ECM lors de la mesure de la tension d'entrée/de sortie. En agissant de la sorte, il est possible d'endommager le transistor de l'ECM. Utiliser une masse autre que les bornes de l'ECM, comme par exemple la prise de terre.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

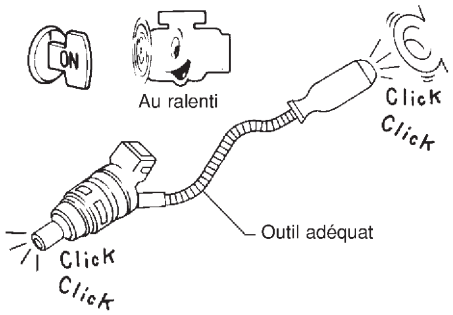
Procédure de diagnostic

NEEC0438

1	CONTROLER LE FONCTIONNEMENT GENERAL

Avec CONSULT-II

1. Démarrer le moteur.
2. Effectuer ‘‘EQUILIBR PUISSANCE’’ en mode ‘‘TEST ACTIF’’ avec CONSULT-II.



TEST ACTIF	
EQUILIBRE PUISSANCE	
CONTROLE	
TR/MN MOT	XXX tr/mn
DEBITMETRE-R1	XXX V
VANNE IACV-AAC	XXX %

SEF981Z

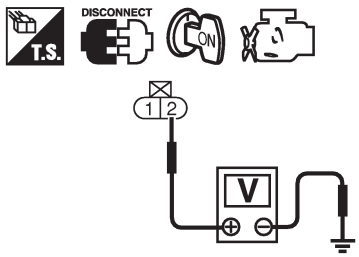
3. Vérifier que chaque circuit produit une baisse momentanée du régime-moteur.

Sans CONSULT-II

1. Démarrer le moteur.
2. Contrôler le bruit de fonctionnement de chaque injecteur.

MEC703B

On doit entendre un cliquetis.



BON ou MAUVAIS

Bon	▶	**FIN DE L’INSPECTION**
Mauvais	▶	ALLER A 2.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

2	CONTROLER L'ALIMENTATION ELECTRIQUE

1. Arrêter le moteur.
2. Débrancher le connecteur de faisceau de l'injecteur.
3. Mettre le contact d'allumage sur ON.
4. Contrôler la tension entre la borne 2 de l'injecteur et la masse à l'aide de CONSULT-II ou du testeur.

SEC277D

Tension : Tension de la batterie

BON ou MAUVAIS

Bon	▶	ALLER A 4.
Mauvais	▶	ALLER A 3.

3	DETECTER LA PIECE DEFECTUEUSE

Contrôler les points suivants.
- Fusible de 10 A
- Faisceau ouvert ou en court-circuit entre l'injecteur et le fusible

	▶	Réparer le faisceau ou les connecteurs.

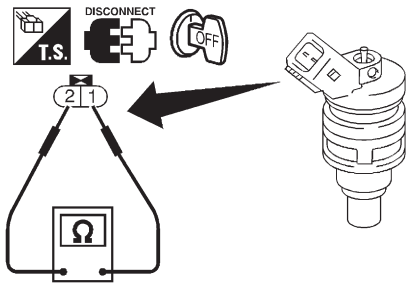
4	CONTROLER LE CIRCUIT DU SIGNAL DE SORTIE

1. Mettre le contact d'allumage sur OFF.
2. Débrancher le connecteur de faisceau de l'ECM.
3. Vérifier la continuité du faisceau entre la borne 1 de l'injecteur et les bornes 102, 104, 109, 111 de l'ECM. Se reporter au Schéma de câblage.
   Il doit y avoir continuité.
4. Vérifier également que le faisceau n'est pas en court-circuit à la masse ou à l'alimentation.

BON ou MAUVAIS

Bon	▶	ALLER A 6.
Mauvais	▶	ALLER A 5.

5	DETECTER LA PIECE DEFECTUEUSE



Vérifier que le faisceau n'est pas ouvert ou en court-circuit entre l'ECM et l'injecteur.

	▶	Réparer les faisceaux ou les connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

6	CONTROLER L'INJECTEUR

1. Débrancher le connecteur de faisceau de l'injecteur.
2. Vérifier la résistance entre les bornes comme indiqué sur l'illustration ci-contre.

SEC278D

Résistance : 7,3 - 9,9Ω [à 25°C]

BON ou MAUVAIS

Bon	▶	ALLER A 7.
Mauvais	▶	Remplacer l'injecteur.

7	VERIFIER SI L'INCIDENT EST INTERMITTENT
Effectuer un ''DIAGNOSTIC DES DEFAUTS EN CAS D'INCIDENT INTERMITTENT'', voir page EC-3132.	
	▶ **FIN DE L'INSPECTION**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Valeur de référence de CONSULT-II en mode de contrôle de données

NEEC0441

Les données de spécification sont des valeurs de référence.

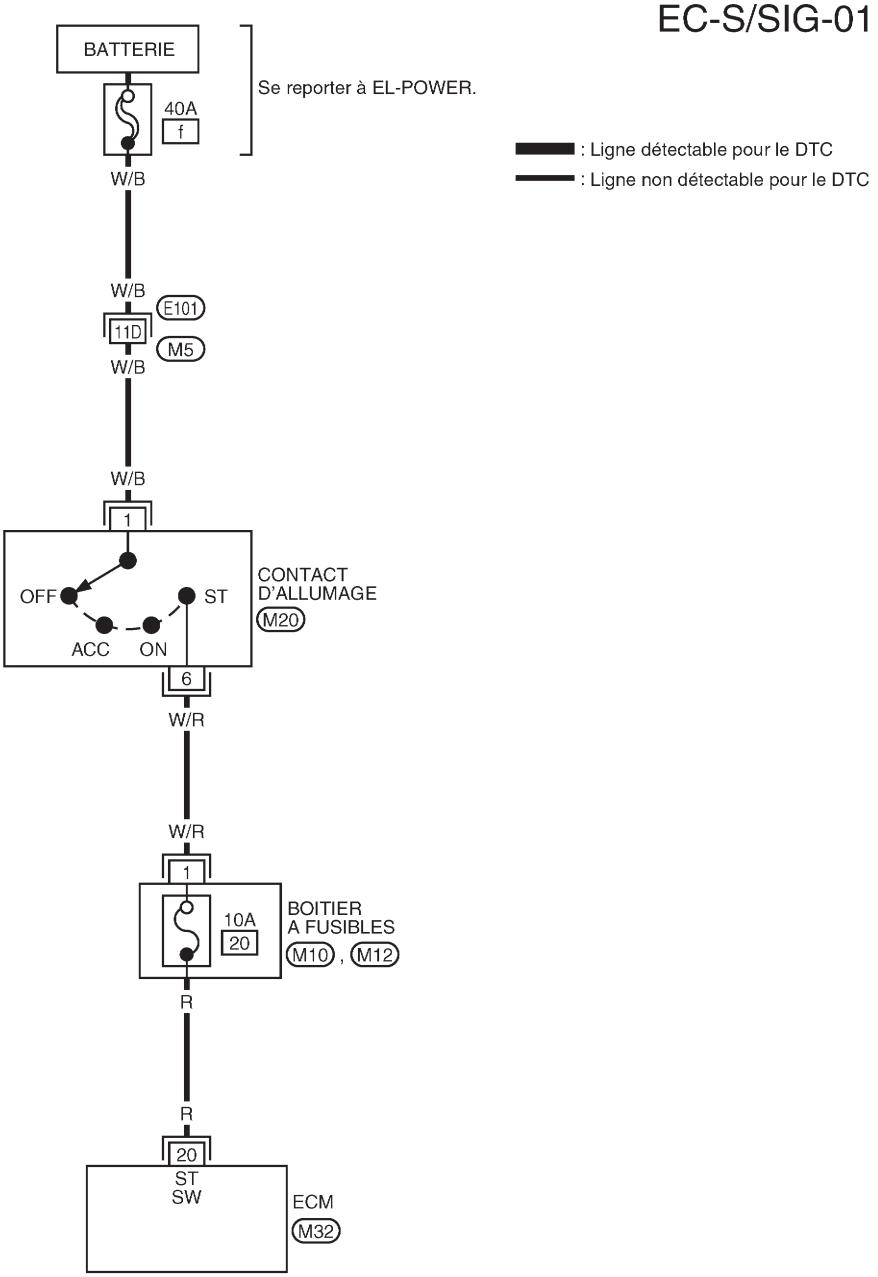
ELEMENT DE CONTROLE	CONDITION	SPECIFICATION
SIGNAL DE MAR	● Contact d'allumage : ON → START → ON	ARR → MAR → ARR

Bornes de l'ECM et valeurs de référence

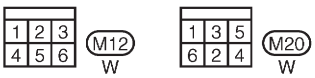
NEEC0442

Les données de spécification sont des valeurs de référence et sont mesurées entre chaque borne et la masse.

ATTENTION :
Ne pas utiliser de bornes de masse de l'ECM lors de la mesure de la tension d'entrée/de sortie. En agissant de la sorte, il est possible d'endommager le transistor de l'ECM. Utiliser une masse autre que les bornes de l'ECM, comme par exemple la prise de terre.



N° DE BORNE	COU-LEUR DE CABLE	ELEMENT	CONDITION	DONNEES (tension de courant continu)
20	R	Signal de démarrage	**[Contact d'allumage sur "ON"]**	Environ 0 V
			[Contact d'allumage sur "START"]	TENSION DE LA BATTE-RIE (11 V - 14 V)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description du système

NEEC0444

Capteur	Signal d'entrée à l'ECM	Fonctionnement de l'ECM	Actionneur
Capteur d'angle d'arbre à cames	Régime-moteur	Commande de pompe à carburant	Relais de pompe d'alimentation
Contact d'allumage	Signal de démarrage		

L'ECM actionne la pompe à carburant pendant plusieurs secondes après que le contact d'allumage a été établi afin d'améliorer l'aptitude du moteur au démarrage. Si l'ECM reç;oit un signal à 180° venant du capteur d'angle d'arbre à cames, il sait que le moteur tourne, et il actionne alors la pompe. Si le signal à 180° n'est pas reç;u quand le contact est établi, le moteur cale. L'ECM arrête la pompe et empêche la batterie de se décharger, renforç;ant ainsi la sécurité. L'ECM n'entraîne pas directement la pompe à carburant. Il commande l'état de MARCHE/ARRET du relais de la pompe à carburant, qui à son tour commande la pompe à carburant.

Condition	Fonctionnement de la pompe à carburant
Le contact d'allumage est mis sur ON	Fonctionne pendant 5 secondes.
Le moteur tourne et démarre	Fonctionne.
Sauf comme indiqué ci-dessus	S'arrête.

Description des composants

NEEC0501

La pompe à carburant avec régulateur de carburant est du type intégré dans le réservoir (la pompe et le régulateur se trouvent dans le réservoir à carburant).

Description des composants

NEEC0451

Le manocontact d'huile de direction assistée est relié au tuyau haute-pression de la direction assistée et détecte la charge de la direction assistée. Lorsqu'une charge de direction assistée est détectée, le manocontact la signale à l'ECM. L'ECM règle la soupape IACV-AAC pour augmenter le régime de ralenti et pour tenir compte de la charge augmentée.

Valeur de référence de CONSULT-II en mode de contrôle de données

NEEC0452

Les données de spécification sont des valeurs de référence.

ELEMENT DE CONTROLE	CONDITION		SPECIFICATION
SIG DIR ASSIS	● Moteur : faire chauffer le moteur, puis le faire tourner au ralenti.	Volant de direction en position point mort (direction avant)	ARRET

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

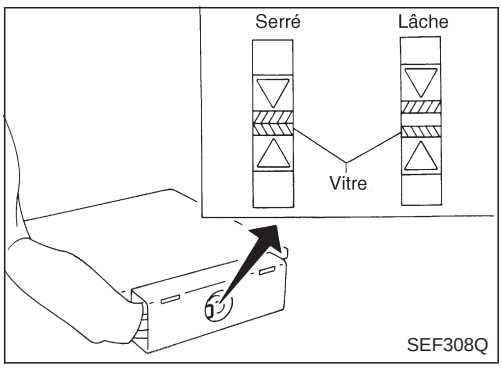
SEF706Y

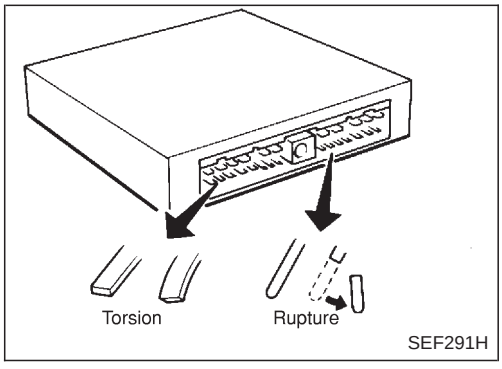
Précautions

- **Toujours utiliser une batterie de 12 volts comme source d'alimentation.**
- **Ne pas débrancher la batterie lorsque le moteur tourne.**
- **Avant de brancher ou débrancher le connecteur du faisceau d'ECM, couper le contact et débrancher la borne négative de la batterie. On évitera ainsi d'endommager l'ECM dans la mesure où la tension de batterie est appliquée à l'ECM, même si le contact d'allumage est coupé.**
- **Avant la dépose de toute pièce, couper le contact et déconnecter le câble de masse de la batterie.**



SEC220B

- **Ne pas démonter l'ECM.**
- **Lorsqu'une borne de batterie est débranchée, la mémoire retourne à la valeur de l'ECM.**
  L'ECM commence alors l'autodiagnostic à la valeur initiale. Le fonctionnement du moteur peut varier légèrement lorsque la borne est déconnectée. Ceci ne signifie toutefois pas qu'il y ait un problème. Ne pas remplacer les pièces en cas de variation mineure.



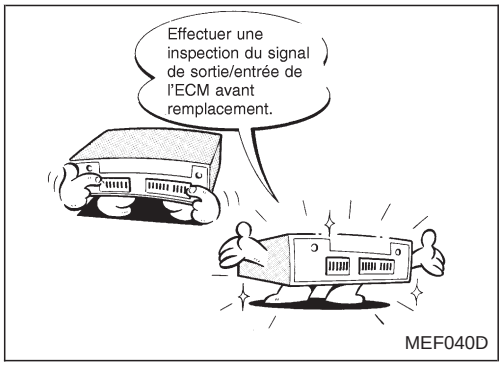
SEF665S

- **Lorsque l'ECM est détaché pour contrôle, veiller à ce que son châssis reste connecté à la masse.**

SEF308Q

- **Lors du branchement du connecteur de faisceau du système de gestion moteur, serrer le boulon de fixation jusqu'à ce que l'espace entre les indicateurs oranges disparaisse.**
  :3,0 - 5,0 N·m (0,3 kgm - 0,5 kgm)

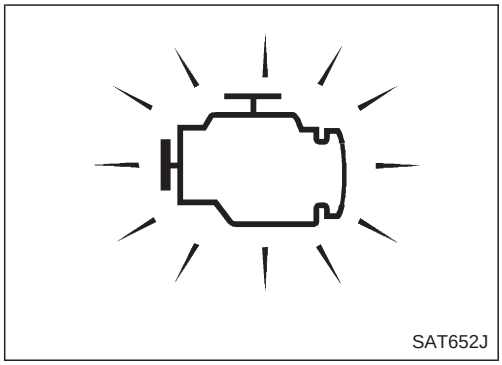
SEF291H



- **Lors du branchement ou du débranchement des connecteurs à broches de l'ECM, veiller à ne pas endommager (tordre ou casser) les bornes à broches.**
  Veiller à ce qu'aucune des bornes à broches de l'ECM ne soit pliée ou cassée au moment où l'on rebranche les connecteurs à broches.
- **Veiller à la qualité du branchement des connecteurs du faisceau de l'ECM.**
  Une connexion de mauvaise qualité peut entraîner le développement d'une tension extrêmement élevée dans le circuit, capable d'endommager les circuits intégrés.
- **Veiller à ce que le faisceau de l'ECM se trouve à plus de**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

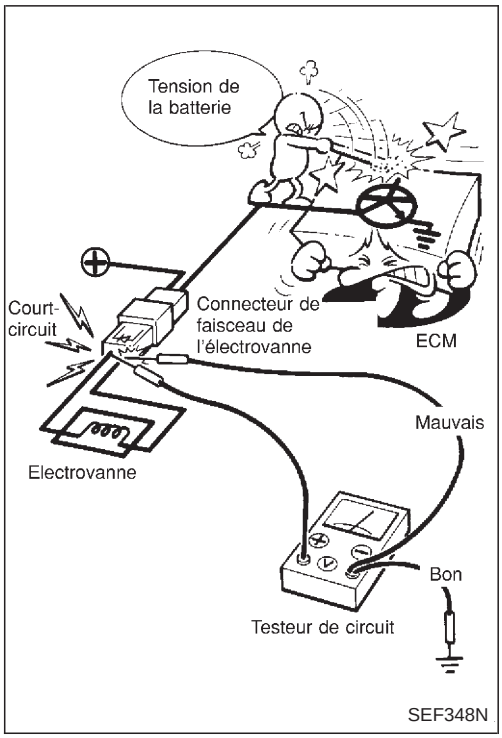
Précautions (Suite)



10 cm du faisceau voisin afin d'éviter tout dysfonctionnement du système ECM dû aux signaux parasites induits, une dégradation du fonctionnement des circuits intégrés, etc.

- **Maintenir au sec les pièces du système de gestion moteur et les harnais.**

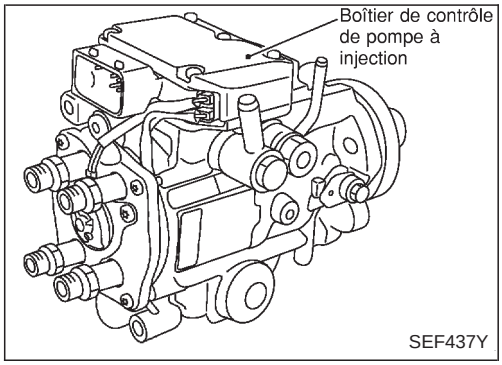
MEF040D



- **Avant de reposer l'ECM, effectuer une inspection des bornes et des valeurs de référence et s'assurer que l'ECM fonctionne correctement. Consulter la page EC-3495.**

SAT652J

- **Le contact de filtre à carburant est fournis sauf pour l'Europe.**
  Si le témoin de défaut (MIL) s'allume ou clignote de manière irrégulière alors que le moteur tourne, le filtre à carburant contient éventuellement de l'eau. Vidanger l'eau du filtre à carburant. Consulter la page EC-3454. Si cela ne résout pas le problème, effectuer les procédures de diagnostic de défaut spécifiées.
- **Après avoir effectué chaque DIAGNOSTIC DES DEFAUTS, effectuer une ''Procédure de confirmation de DTC (code de défaut de diagnostic)'' ou une ''Vérification du fonctionnement général''.**
  Le DTC ne devrait pas s'afficher dans la ''Procédure de confirmation de DTC'' si la réparation est terminée. La '' Vérification du fonctionnement général'' devrait produire un bon résultat si la réparation a été effectuée.

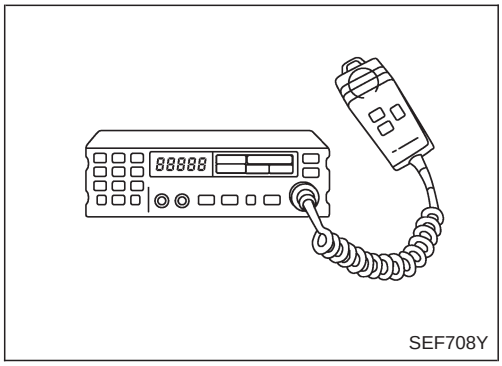


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Précautions (Suite)

SEF348N

- **Lors de la mesure des signaux de l'ECM à l'aide d'un testeur de circuit, ne jamais approcher une sonde de testeur d'une autre sonde.**
  La mise en contact accidentelle des deux sondes entraîne un court-circuit et endommage le transistor de puissance de l'ECM.
- **Lors de la mesure de la tension d'entrée/sortie, ne pas utiliser les bornes de masse de l'ECM sous peine d'endommager le transistor de l'ECM. Utiliser une autre masse que celle des bornes de l'ECM.**



SEF437Y

- **Ne pas débrancher le connecteur du faisceau de la pompe lorsque le moteur tourne.**
- **Ne pas démonter la pompe d'injection de carburant à commande électronique.**
  Si "MAUVAIS", prendre les mesures nécessaires.
- **Ne pas démonter l'injecteur.**
  En cas de résultat "MAUVAIS", remplacer l'injecteur.
- **Ne pas heurter ni dérégler le capteur d'angle du vilebrequin (PMH).**

SEF709Y

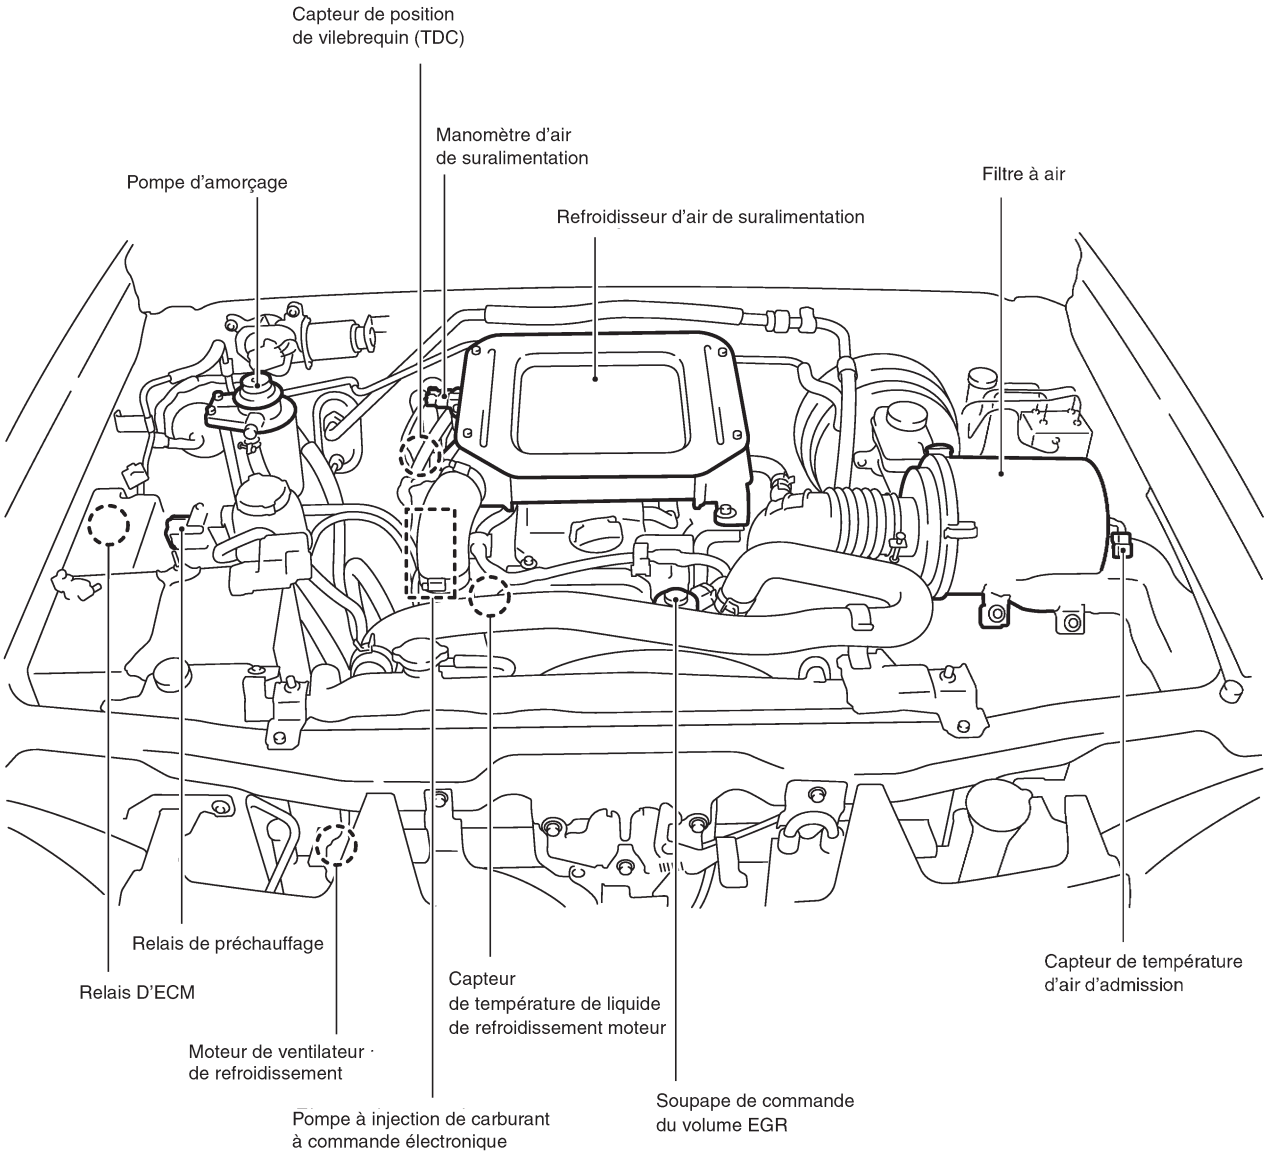
- **Ne pas appuyer sur la pédale d'accélérateur lors du démarrage.**
- **Immédiatement après le démarrage, ne pas emballer le moteur inutilement.**
- **Ne pas emballer le moteur avant de couper le contact.**

SEF708Y

- **La repose d'une C.B. ou d'un téléphone mobile peut, selon son emplacement, affecter défavorablement les systèmes de contrôle électronique. Veiller par conséquent à respecter ce qui suit.**

1) **Eloigner le plus possible l'antenne de l'ECM.**
2) **Veiller à ce que le câble d'antenne se trouve à plus de 20 cm du faisceau de câbles des systèmes de commande électroniques.**
   Veiller à ce que ce câble ne soit jamais parallèle au faisceau sur une grande longueur.
3) **Régler l'antenne et la ligne d'alimentation de manière à**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Précautions (Suite)

pouvoir maintenir au plus petit niveau le taux d'onde stationnaire.

4) Veiller à connecter la radio à la masse de carrosserie du véhicule.

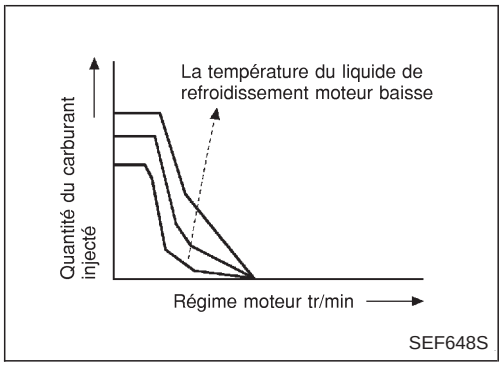
Système de commande d'injection de carburant

DESCRIPTION



Description du système

Trois types de commande de l'injection de carburant sont fournis pour adapter l'état de marche du moteur: commande normale, de ralenti et de démarrage. L'ECM détermine la commande d'injection de carburant appropriée. Pour chaque contrôle, la quantité de carburant injectée est compensée pour améliorer le rendement du moteur.
Un échange de signaux sous forme d'impulsions s'effectue entre l'ECM et la pompe d'injection à commande électronique (unité de commande intégrée). Le boîtier de commande de la pompe d'injection de carburant réalise un contrôle de fonction sur la soupape de décharge (intégrée à la pompe d'injection de carburant) en fonction des signaux d'entrée pour compenser la quantité de carburant injectée à la valeur prédéfinie.

Commande de démarrage

Tableau des signaux d'entrée/sortie

Capteur	Signal d'entrée à l'ECM	Fonction de l'ECM	Actionneur
Capteur de température du liquide de refroidissement moteur	Température du liquide de refroidissement moteur	Commande de l'injection de carburant (commande de démarrage)	Pompe d'injection de carburant à commande électronique
Capteur d'angle de vilebrequin (PMH)	Régime du moteur		
Contact d'allumage	Signal de démarrage		

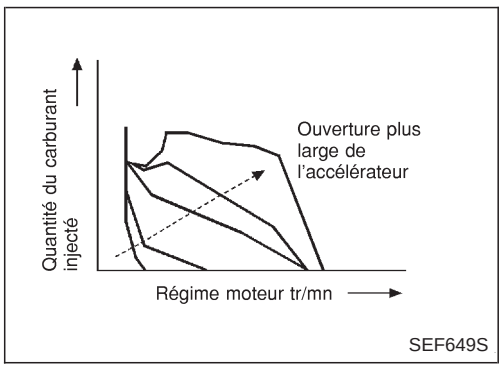
Quand l'ECM reçoit un signal de départ du contact d'allumage, l'ECM adapte le système d'injection de carburant à la commande de démarrage. La quantité de carburant injectée au moment du démarrage correspond à une valeur de programme préétablie dans l'ECM. Le programme est déterminé par le régime du moteur et la température du liquide de refroidissement moteur.
Pour faciliter le démarrage dans des conditions de moteur froid, la quantité de carburant injectée augmente au fur et à mesure où la température du liquide de refroidissement diminue. L'ECM termine la commande de démarrage lorsque la vitesse du moteur atteint la valeur spécifique, et transmet le contrôle à la commande normale ou de ralenti.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Système de commande d'injection de carburant (Suite)

Commande de régime ralenti

Tableau des signaux d'entrée/sortie



Capteur	Signal d'entrée à l'ECM	Fonction de l'ECM	Actionneur
Capteur de température du liquide de refroidissement moteur	Température du liquide de refroidissement moteur	Commande de l'injection de carburant (commande de régime ralenti)	Pompe d'injection de carburant à commande électronique
Capteur d'angle de vilebrequin (PMH)	Régime du moteur		
Contact de stationnement/point mort (PNP)	Position du rapport		
Batterie	Tension de la batterie		
Contact de position d'accélérateur	Position de ralenti		
Capteur de vitesse du véhicule	Vitesse du véhicule		
Interrupteur de climatiseur	Signal du climatiseur		
Capteur de température d'air d'admission	Température de l'air d'admission		

Quand l'ECM détermine que le régime moteur est au ralenti, le système d'injection de carburant est adapté à la commande de ralenti. L'ECM régle la quantité de carburant injectée correspondant aux changements de charge appliqués au moteur pour maintenir un régime moteur constant. L'ECM fournit aussi rapidement au système une commande du régime ralenti en fonction de la température du liquide de refroidissement du moteur et du signal de l'interrupteur de chauffage rapide.

Commande normale

Tableau des signaux d'entrée/sortie

Capteur	Signal d'entrée à l'ECM	Fonction de l'ECM	Actionneur
Capteur d'angle de vilebrequin (PMH)	Régime du moteur	Commande de l'injection de carburant (commande normale)	Pompe d'injection de carburant à commande électronique
Capteur de position d'accélérateur	Position de l'accélérateur		
Capteur de vitesse du véhicule	Vitesse du véhicule		

La quantité de carburant injectée dans des conditions de conduite normales est déterminée par les signaux du capteur. Le capteur d'angle de vilebrequin (PMH) détecte le régime du moteur et le capteur de position d'accélérateur détecte la position de l'accélérateur. Ces capteurs envoient des signaux à l'ECM.

Les données d'injection de carburant, prédéterminée en corrélation avec différentes vitesses du moteur et positions d'accélérateur, sont enregistrées dans la mémoire de l'ECM, selon un certain schéma. L'ECM détermine la quantité optimale de carburant à injecter en utilisant les signaux du capteur par comparaison avec le schéma.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Système de commande d'injection de carburant (Suite)

Contrôle de la quantité maximale

Tableau des signaux d'entrée/sortie

Capteur	Signal d'entrée à l'ECM	Fonction de l'ECM	Actionneur
Capteur de température du liquide de refroidissement moteur	Température du liquide de refroidissement moteur	Commande de l'injection de carburant (contrôle de la quantité maximale)	Pompe d'injection de carburant à commande électronique
Capteur d'angle de vilebrequin (PMH)	Régime du moteur		
Capteur de position d'accélérateur	Position de l'accélérateur		

Le débit d'injection maximal dépend du régime moteur, de la quantité d'air admise, de la température du liquide de refroidissement du moteur et de la position de la pédale d'accélérateur, le tout en fonction des conditions de marche.
Ceci évite l'injection d'une quantité trop importante de carburant lorsque la densité de l'air décroît avec l'altitude ou lorsque le système est en panne.

Commande de décélération

Tableau des signaux d'entrée/sortie

Capteur	Signal d'entrée à l'ECM	Fonction de l'ECM	Actionneur
Contact de position d'accélérateur	Position de l'accélérateur	Commande de l'injection de carburant (commande de décélération)	Pompe d'injection de carburant à commande électronique
Capteur d'angle de vilebrequin (PMH)	Régime du moteur		

Pour un meilleur rendement énergétique, l'ECM envoie un signal de coupure à la pompe d'injection à commande électronique pendant la décélération. L'ECM détermine le temps de décélération selon les signaux de la commande de position de l'accélérateur et le capteur de position de vilebrequin (PMH).

Système de commande d'avance de l'injection de carburant

DESCRIPTION

Le calage théorique de l'injection en fonction du régime moteur et du débit d'injection est mémorisé à l'avance dans la cartographie de l'ECM. L'ECM et le boîtier de commande de la pompe d'injection échangent des signaux et effectuent une régulation automatique pour une programmation optimale de l'injection conformément au plan.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Commande de coupure du climatiseur

DESCRIPTION

Tableau des signaux d'entrée/sortie

Capteur	Signal d'entrée à l'ECM	Fonction de l'ECM	Actionneur
Interrupteur de climatiseur	Signal 'ON' du climatiseur	Commande de coupure du climatiseur	Relais de climatiseur
Capteur de position d'accélérateur	Position de l'accélérateur		
Capteur de vitesse du véhicule	Vitesse du véhicule		
Capteur de température du liquide de refroidissement moteur	Température du liquide de refroidissement moteur		

Description du système

Ce système permet d'améliorer les accélérations en cas de fonctionnement de la climatisation.
Lorsque la pédale de l'accélérateur est enfoncée à fond, le climatiseur s'arrête pendant quelques secondes.
Lorsque la température du liquide de refroidissement moteur monte excessivement, le climatiseur est coupé jusqu'à ce que la température du liquide de refroidissement du moteur revienne à la normale.

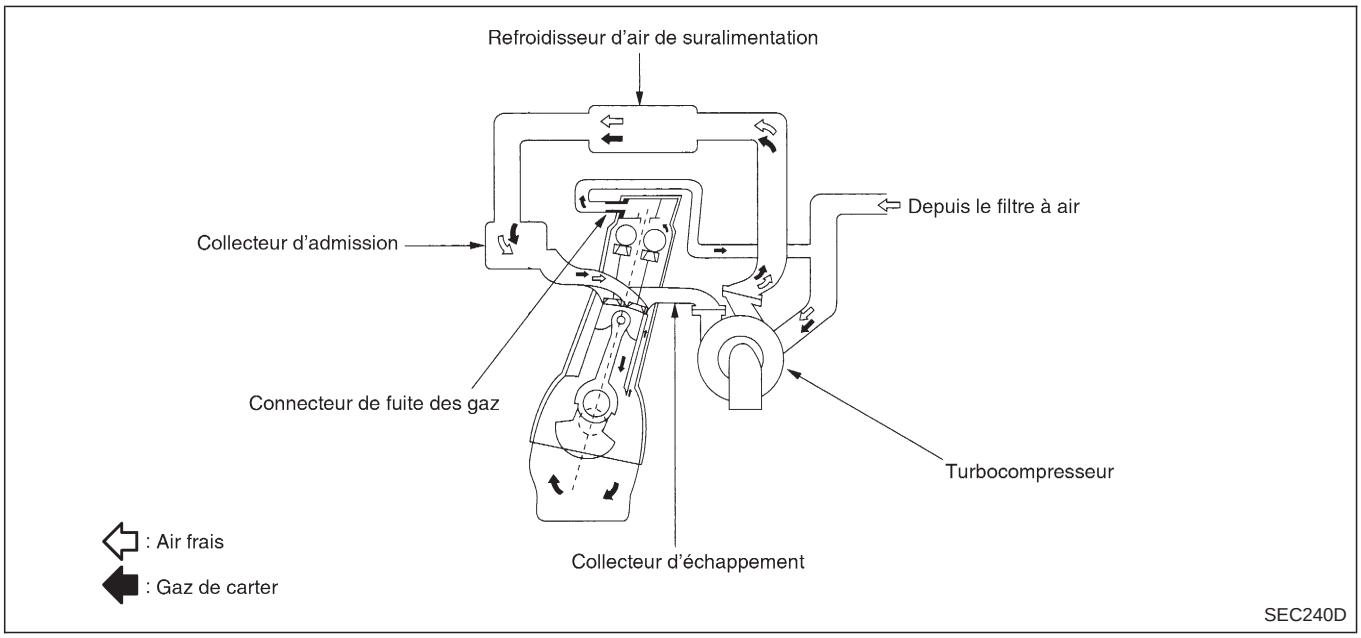
Commande de coupure d'alimentation (à vide et à régime élevé du moteur)

DESCRIPTION

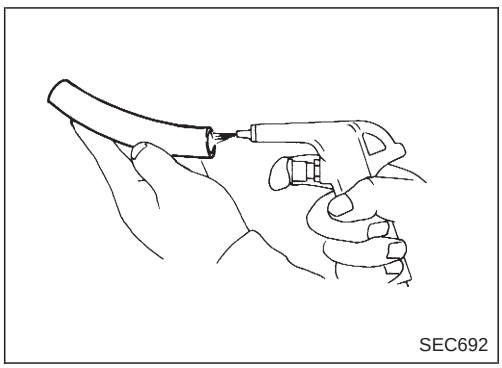
Tableau des signaux d'entrée/sortie

Capteur	Signal d'entrée à l'ECM	Fonction de l'ECM	Actionneur
Capteur de vitesse du véhicule	Vitesse du véhicule	Commande de coupure de carburant	Pompe d'injection de carburant à commande électronique
Contact de stationnement/point mort (PNP)	Position de point mort		
Contact de position d'accélérateur	Position de l'accélérateur		
Capteur de température du liquide de refroidissement moteur	Température du liquide de refroidissement moteur		
Capteur d'angle de vilebrequin (PMH)	Régime du moteur		

Si le régime moteur dépasse 2 700 tr/mn à vide (par exemple, au point mort et régime supérieur à 2 700 tr/mn), l'alimentation en carburant est coupée au bout de quelques instants. Le moment exact de la coupure d'alimentation varie selon le régime du moteur. La coupure de l'alimentation de carburant est maintenue jusqu'à ce que le régime du moteur atteigne 1 500 tr/mn, puis l'alimentation de carburant est rétablie.



REMARQUE :
Cette fonction diffère de la commande de décélération décrite au chapitre ''Système de commande d'injection de carburant'', page EC-3439.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Système de ventilation du carter moteur

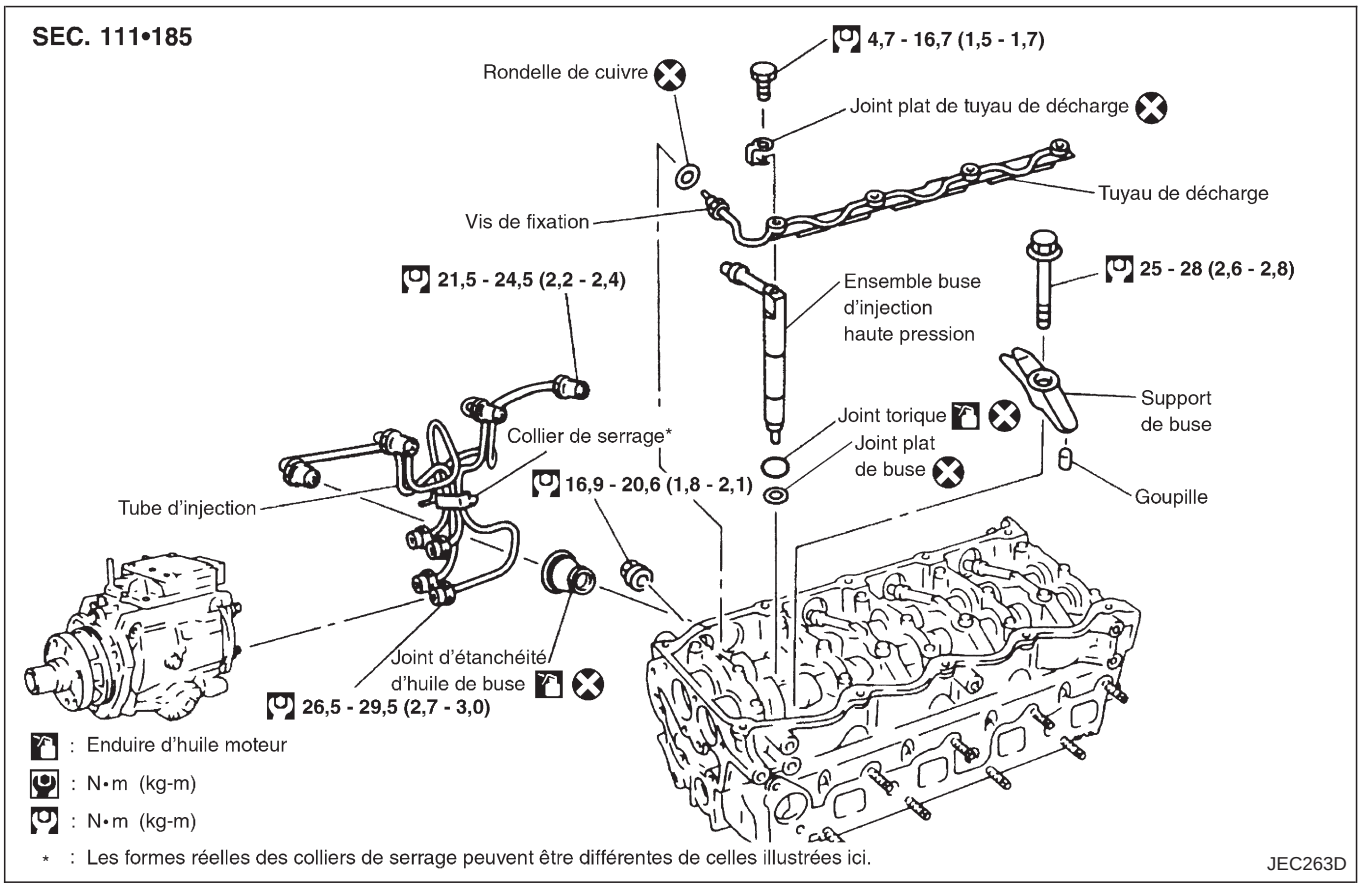
DESCRIPTION

Ce système réinjecte les gaz perdus dans la conduite d'admission d'air après séparation de l'huile par le séparateur monté dans le cache-culbuteurs.

INSPECTION

Flexible de ventilation

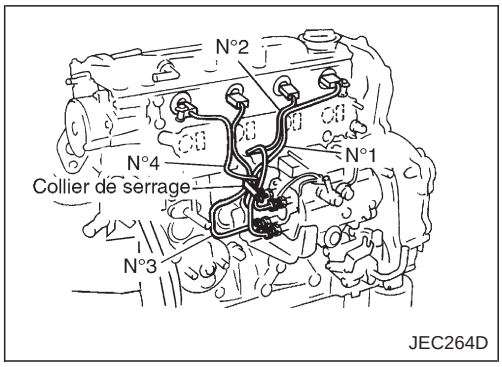
1. Vérifier les flexibles et les raccords de flexible pour déceler toute présence de fuites.
2. Débrancher tous les flexibles et les nettoyer à l'air comprimé. Remplacer tous les flexibles qui ne peuvent pas être débouchés.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Tube d'injection et injecteur

DEPOSE ET REPOSE



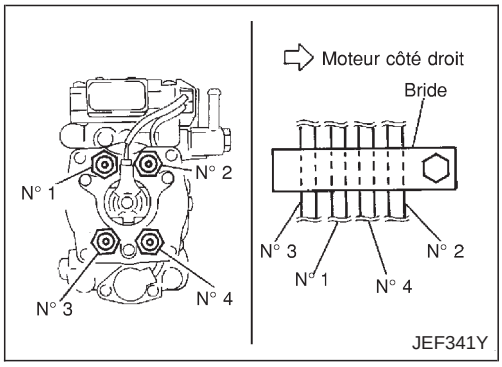
PRECAUTION :

- **Ne pas démonter l'ensemble injecteurs. Si le résultat n'est pas satisfaisant, remplacer l'ensemble injecteur.**
- **Obturer l'écrou évasé avec un capuchon ou un chiffon de façon que la poussière ne puisse pas pénétrer à l'intérieur de l'injecteur. Couvrir la tête de l'injecteur pour protéger l'aiguille.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Tube d'injection et injecteur (Suite)

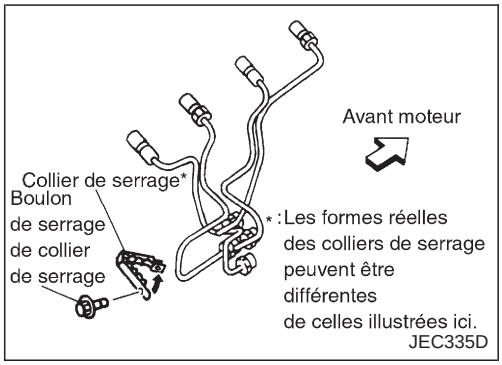
Tube d'injection



Dépose

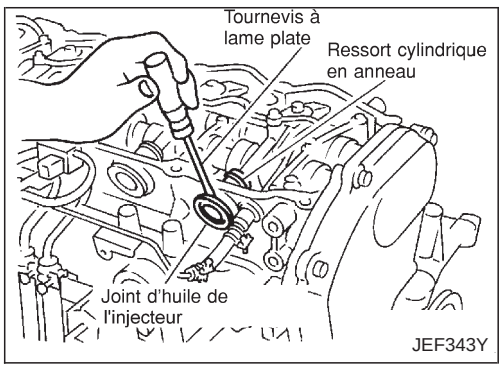
1. Marquer les n° des cylindres vers les tuyaux à injection, puis les déconnecter.

● **Effectuer le marquage à un endroit approprié et de manière à ce qu'il ne puisse pas être effacé par le carburant, etc.**



2. Déposer les brides puis débrancher les tubes l'un après l'autre.

● Le collecteur d'admission est ôté pour explication dans la figure.



Repose

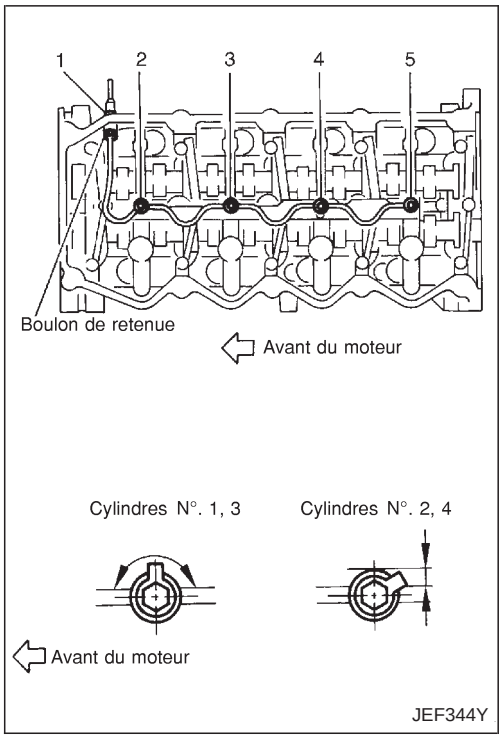
1. En se référant à la figure et aux marquages qui ont été faits pour la repose, connecter les tubes à injection à tous les cylindres.
2. Raccorder provisoirement les tubes à la tête du cylindre uniquement en vissant 2 à 3 tours. S'assurer que tous les tubes peuvent être raccordés également au côté de la pompe.
3. Serrer ensuite les écrous évasés du côté de la culasse et du côté de la pompe, en commençant par le côté opposé à vous.

4. Attacher le collier du tube à injection dans la direction indiquée sur la figure.
5. Insérer le boulon de serrage du collier (type à 4 tuyaux) de l'arrière à l'avant du moteur.

Joint d'huile d'injecteur

Dépose

Soulever la bride du joint avec la lame d'un tournevis, par exemple, puis la déposer.



Repose

1. Une fois l'ensemble d'injecteur à haute pression reposé, pousser le joint du côté de la culasse jusqu'à ce qu'il entre en contact avec la bride.
2. S'assurer que le ressort cylindrique en anneau du joint sur l'ensemble d'injecteur à haute pression ne tombe pas.

● **Remplacer le joint à huile par une pièce neuve lorsque l'ensemble d'injecteur à haute pression est déposé (il n'est pas nécessaire de remplacer le joint à huile lorsque seuls les tubes à injection sont déposés).**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

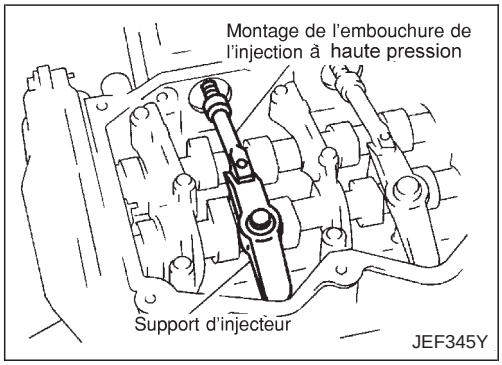
Tube d'injection et injecteur (Suite)

Tube de décharge

Dépose

Desserrer et déposer les boulons de montage et les écrous évasés dans l'ordre inverse des numéros de la figure.

- Lorsque les écrous évasés sont desserrés, maintenir la tête des boulons de retenue hexagonaux (tête à l'intérieur) à l'aide d'une clé.



Repose

1. Serrer les écrous évasés et les boulons de montage dans l'ordre numérique indiqué sur la figure.

- Lorsque les écrous évasés sont serrés, maintenir la tête des boulons de retenue hexagonaux (tête à l'intérieur) à l'aide d'une clé.

2. Pour éviter des interférences avec le cache-culbuteurs, placer le joint d'étanchéité dans la zone indiquée par la flèche, puis serrer les boulons de montage (être particulièrement attentif aux cylindres n° 2 et 4).

- **Après repose du tube de décharge, vérifier son étanchéité à l'air.**
- Le serrage des boulons peut entraîner la rupture du joint du tube de décharge. Cependant, cela n'affecte pas le bon fonctionnement.

Ensemble d'injecteur à haute pression

Dépose

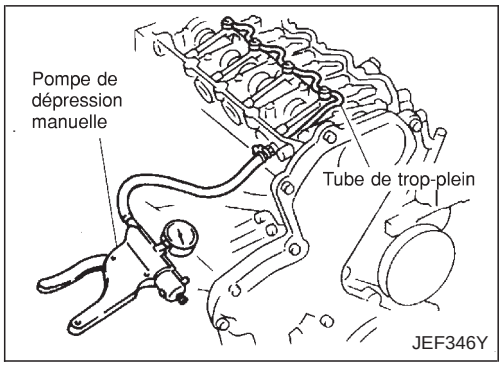
1. Déposer le support d'embouchure, puis tirer l'ensemble d'injecteur à haute pression en le tournant dans le sens des aiguilles d'une montre/le sens inverse.
2. Sortir la rondelle en cuivre de la culasse en utilisant par exemple la lame d'un tournevis.

PRECAUTION :

Ne pas démonter l'embouchure de l'injecteur à haute pression.

Repose

1. Introduire le joint de l'injecteur dans l'alésage de la culasse.
2. Placer le joint torique dans la rainure de l'injecteur, puis insérer l'ensemble injecteur dans la culasse.



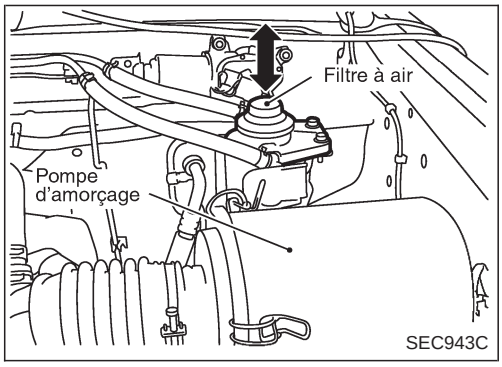
ESSAI ET REGLAGE

ATTENTION :

Lorsqu'on utilise un appareil d'essai pour injecteur, il faut veiller à ne pas laisser le carburant diesel vaporisé par l'injecteur être en contact avec les mains ou avec le corps, et il faut s'assurer que les yeux sont correctement protégés par des lunettes de travail.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

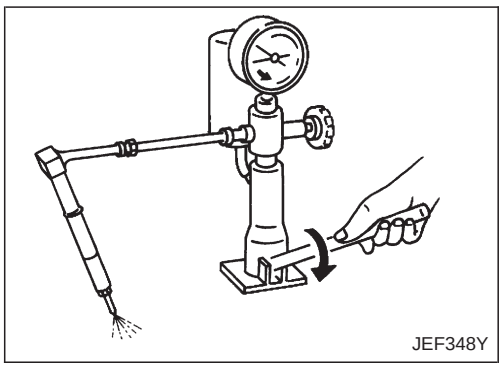
Tube d'injection et injecteur (Suite)



Contrôle de l'étanchéité à l'air du tube de décharge

Avant de remonter le cache-culbuteurs, effectuer le contrôle de la manière suivante.

1. Brancher la pompe à vide manuelle au flexible de décharge.
2. Vérifier que l'étanchéité à l'air subsiste lorsque la dépression indiquée ci-après est appliquée.



Pression normale :

−53,3 kPa à −66,7 kPa (−533 mbar à −667 mbar, −400 mmHg à −500 mmHg)

Purge d'air de la conduite d'alimentation en carburant

Lorsque la réparation est effectuée, purger l'air de la conduite en actionnant la pompe d'amorçage vers le haut et vers le bas jusqu'à sentir une résistance. Consulter la page EC-3454.

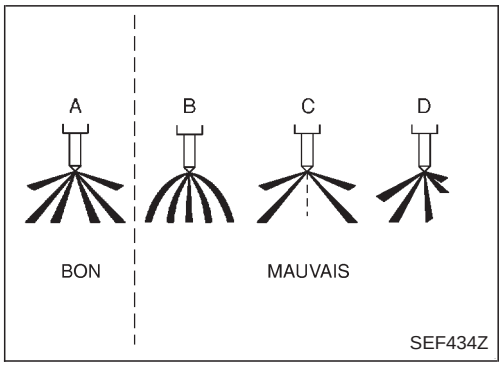
Essai de pression d'injection

1. Raccorder l'ensemble injecteur à l'appareil de test et purger l'air par le raccord conique.
2. Pomper lentement la poignée de l'appareil (une fois par seconde) et surveiller le manomètre.
3. Prendre note de la valeur indiquée par le manomètre, lorsque la pression d'injection commence juste à chuter.

Pression d'injection initiale :

Neuf

18 500 - 20 500 kPa (185 - 205 bar, 189 - 209 kg/cm^2)



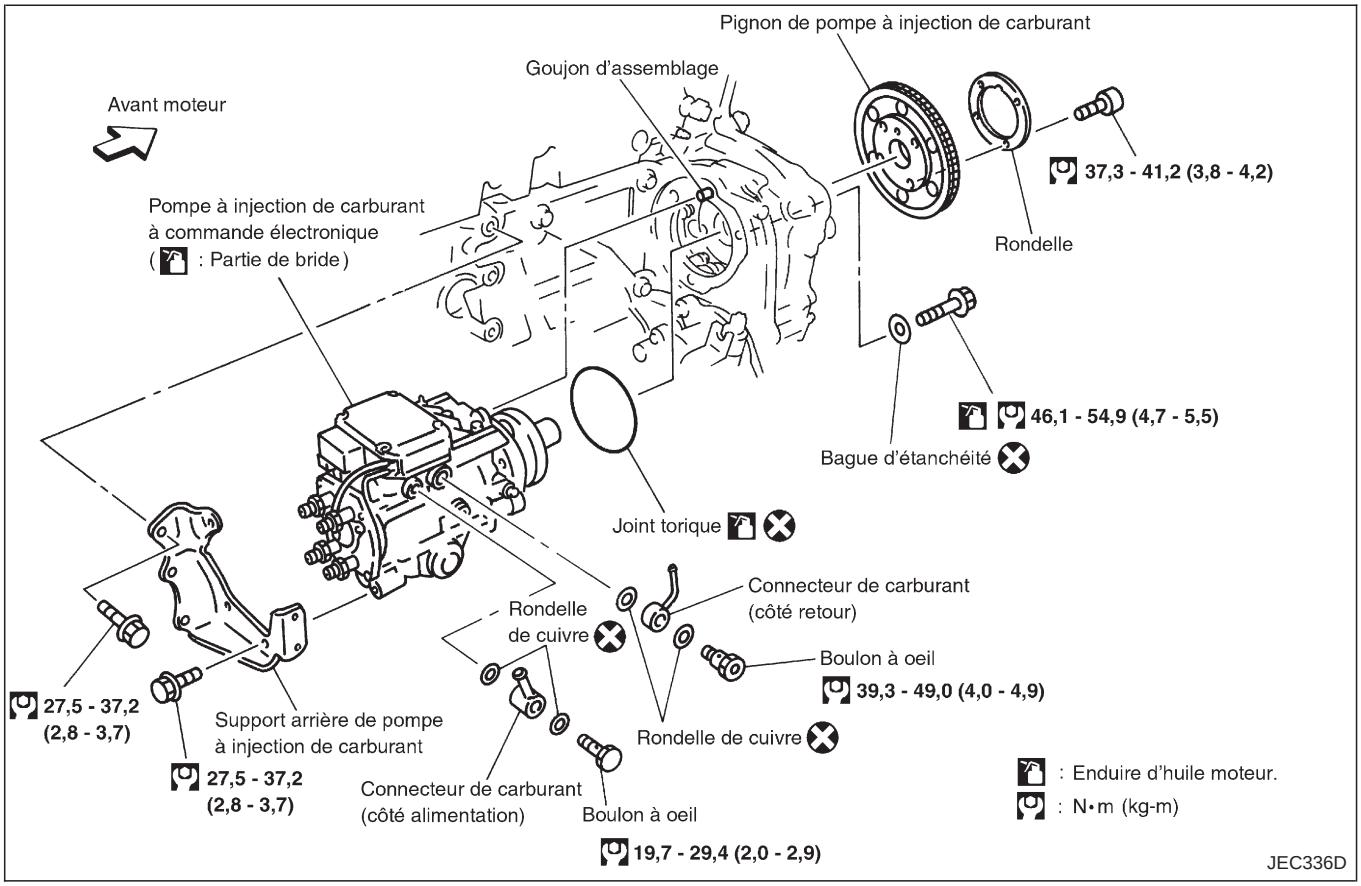
Limite

16 200 kPa (162 bar, 165 kg/cm^2)

- L'ensemble injecteur fournit 2 niveaux de pression d'injection. Cependant, le jugement devrait être fait à la première étape de la pression de l'ouverture de soupape.

Vérifier systématiquement la pression d'injection initiale à l'aide d'un injecteur neuf.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



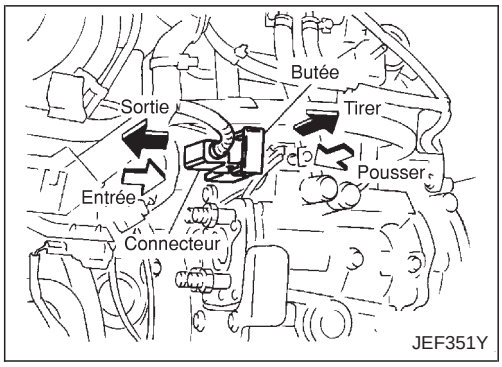
Tube d'injection et injecteur (Suite)

Essai du jet d'injection

1. Contrôler le cône d'injection en pompant une fois par seconde la poignée du contrôleur d'injecteurs.
   Formes de jet d'injection incorrectes :
   Le jet n'est pas droit et manque de puissance (cas B de l'illustration).
   Le carburant goutte (cas C de l'illustration).
   Le jet n'est pas uniforme (cas D de l'illustration).
2. Si la forme du jet n'est pas correcte, remplacer l'ensemble injecteur.

Pompe d'injection de carburant à commande électronique

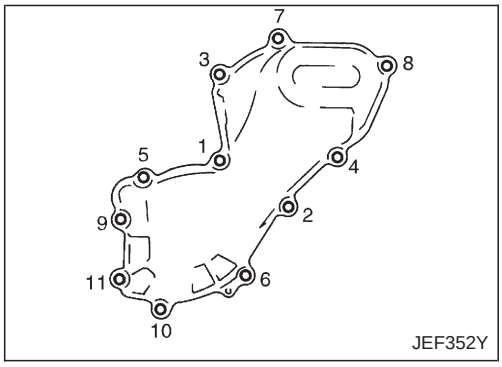
DEPOSE ET REPOSE



Dépose

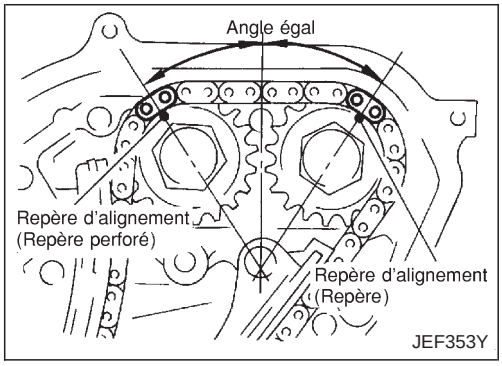
1. Déposer les pièces indiquées ci-dessous.

- Capot du moteur
- Liquide de refroidissement du moteur (vidange)
- Protection du moteur
- Tuyau de chauffage sous le collecteur d'admission
- Tubes à injection
- Garde-boue droit (avec sous-protection)
- Roue avant droite



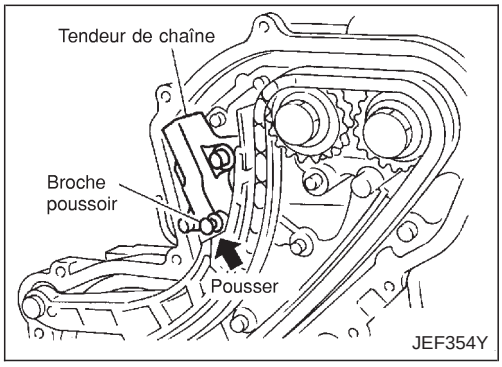
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Pompe d'injection de carburant à commande électronique (Suite)



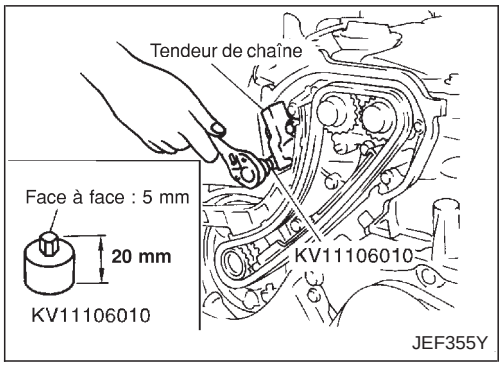
2. Déconnecter les flexibles d'alimentation de la pompe d'injection de carburant.
3. Débrancher le connecteur de faisceau de la pompe d'injection de carburant.
- Débrancher le connecteur en tirant complètement sa butée.
- Lorsque la butée est entièrement tirée, le connecteur est également débranché. Pour la repose, appuyer d'abord sur le milieu du connecteur, puis appuyer sur la butée jusqu'à ce qu'elle se verrouille, signe que le connecteur est raccordé.

4. Déposer le support arrière de la pompe d'injection.

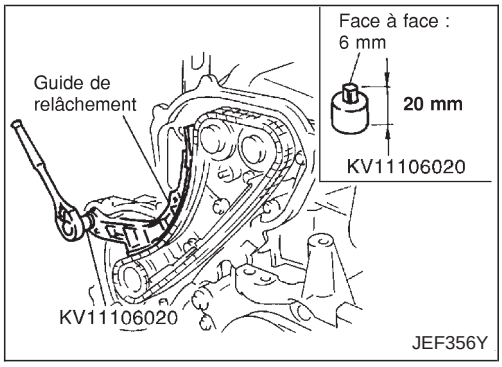


5. Déposer le boîtier de la chaîne avant.
- Déplacer le réservoir de liquide de direction assistée du support.
- Desserrer et déposer les boulons de montage dans l'ordre inverse des numéros indiqués sur la figure.
- Comme pour les boulons 6, 10, et 11, déposer avec la rondelle de caoutchouc car il n'y a pas suffisamment d'espace pour déposer uniquement les boulons.

PRECAUTION :
Pour éviter que des corps étrangers ne pénètrent dans le moteur, couvrir l'ouverture durant la dépose du boîtier de la chaîne avant.

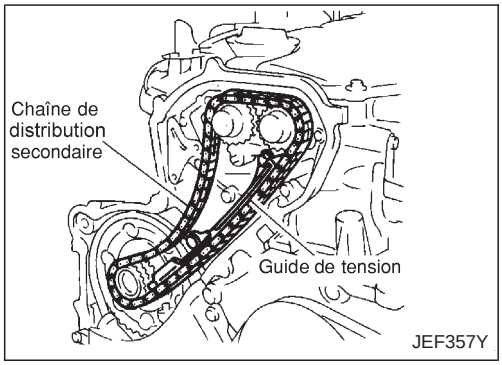


6. Régler le cylindre n°1 à la position point mort haut.
- Tourner la poulie de vilebrequin dans le sens des aiguilles d'une montre, puis aligner la marque d'alignement (marque perforée) de la roue dentée d'arbre à cames sur la position indiquée sur la figure.
- Il n'y a aucun indicateur sur la poulie de vilebrequin.
- Il n'est pas nécessaire de marquer la chaîne secondaire de distribution pour la dépose car cela peut être fait à l'aide de la couleur de lien pour la repose. Cependant, la marque de réglage sur la roue de la pompe d'injection de carburant est difficile à voir ; la marquer si nécessaire.

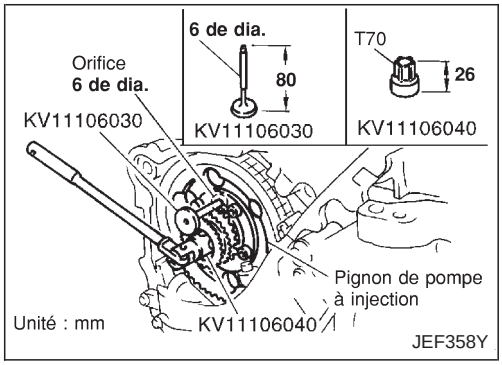


7. Déposer le tendeur de chaîne.
a. Appuyer sur le piston du tendeur de chaîne, puis le fixer avec un outil tel qu'une broche-poussoir.

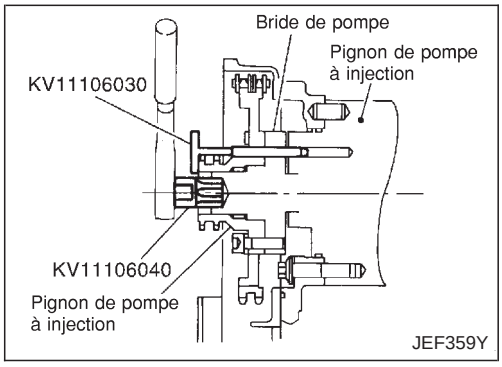
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Pompe d'injection de carburant à commande électronique (Suite)

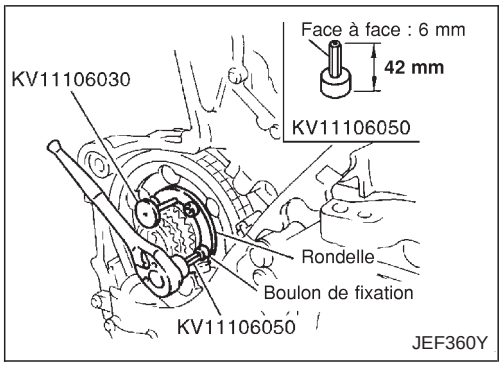


b. En utilisant la clé hexagonale (face à face : 5 mm) (outil spécial), déposer les boulons de montage, puis déposer le tendeur de chaîne.
- Un outil polyvalent peut également être utilisé.

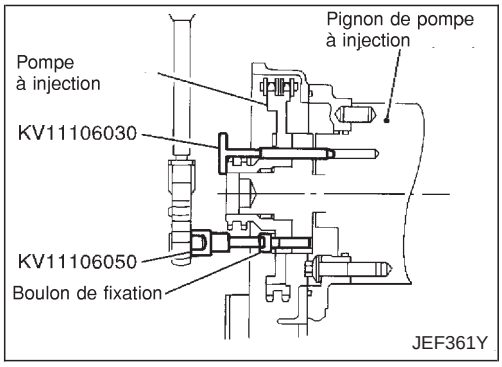


8. Déposer le guide de relâchement de la chaîne de distribution.
- En utilisant la clé hexagonale (face à face : 6 mm, type court) (outil spécial), déposer les boulons de montage, puis déposer le guide de relâchement de la chaîne de distribution.

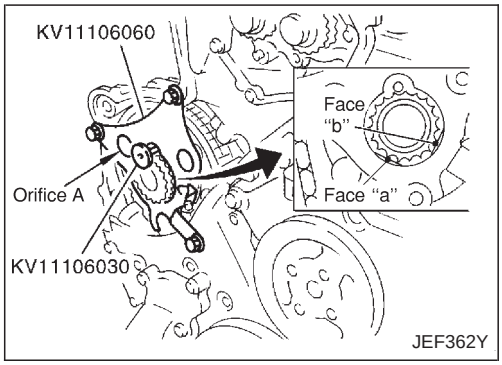
9. Déposer le guide de tension de chaîne de distribution.
10. Déposer la chaîne de distribution secondaire.
- Seule la chaîne de distribution peut être déposée sans déposer les pignons.



11. Fixer le pignon de la pompe d'injection de carburant.
a. Insérer la goupille d'arrêt de positionnement dans l'orifice de cm de diamètre du pignon de la pompe d'injection de carburant.
b. En utilisant la clé Torx (outil spécial), tourner progressivement le manche de la pompe pour régler la position de l'orifice du pignon de la pompe d'injection de carburant.
c. Insérer la goupille d'arrêt de positionnement dans le corps de la pompe d'injection de carburant pour fixer le pignon.

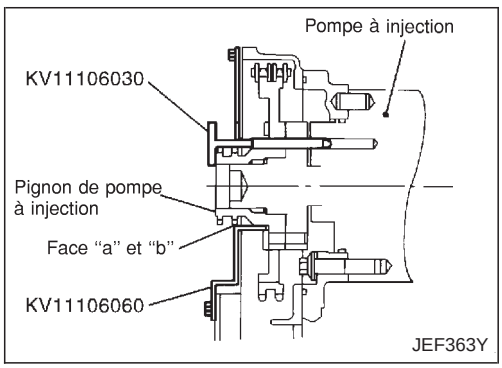


- Insérer la goupille d'arrêt de positionnement jusqu'à ce que sa bride entre en contact avec le pignon de la pompe d'injection de carburant.
d. Retirer la clé Torx (outil spécial).

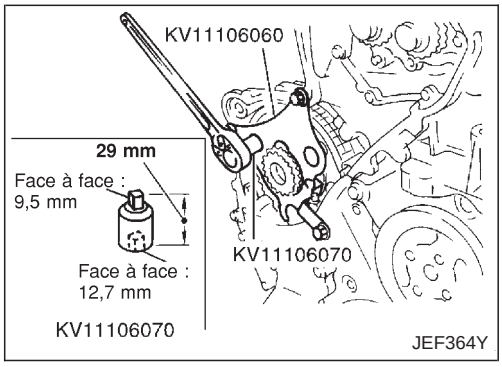


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Pompe d'injection de carburant à commande électronique (Suite)

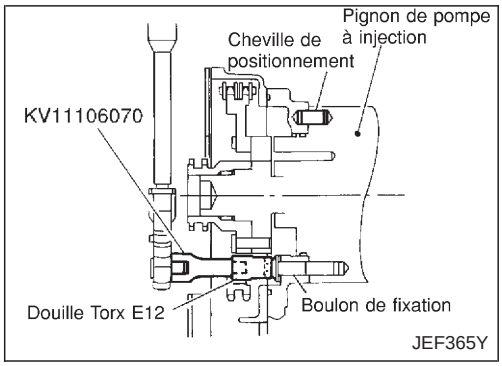


12. En utilisant la clé hexagonale (face à face : 6 mm, type long) (outil spécial), déposer les boulons de montage du pignon de la pompe d'injection de carburant.
- Il n'est pas nécessaire d'enlever la rondelle du pignon de la pompe d'injection de carburant.



13. En utilisant le support de pignon (outil spécial), maintenir le pignon de la pompe d'injection de carburant pour éviter qu'il ne tombe.
- Une fois le support de pignon posé, si la goupille d'arrêt de positionnement interfère, la tirer d'environ 10 mm, puis l'installer.
- Une fois le support de pignon reposé temporairement, insérer la barre d'extension (outil spécial) et la douille Torx dans les trois orifices A. Après avoir positionné les orifices, serrer les boulons de montage du support. (se reporter à l'étape 14 concernant l'outil)
- La longueur des boulons de montage du support de pignon doit être d'environ 15 mm (longueur de filetage M6).
- S'assurer que les faces a et b du support de pignon sont en contact avec le côté du bas du pignon sur 15 mm (côté du petit diamètre).

PRECAUTION :
Ne pas déposer le support de pignon tant que la pompe d'injection de carburant n'est pas installée.
- Une fois le support de pignon reposé, ôter la goupille d'arrêt de positionnement (outil spécial) du pignon de la pompe d'injection de carburant.

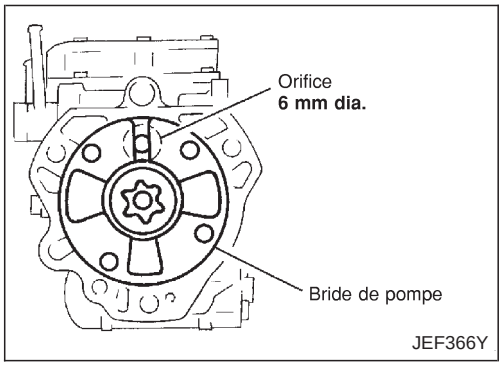


14. En utilisant la barre d'extension (outil spécial : longueur totale 43 mm) et la douille Torx (Q6-E12 : disponible dans le commerce), déposer les boulons de montage, puis déposer la pompe d'injection de carburant vers l'arrière du moteur.
- Même après avoir déposé tous les boulons de montage, la pompe d'injection de carburant est toujours maintenue par une cheville de positionnement.

PRECAUTION :
Ne pas démonter ou régler la pompe d'injection de carburant.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

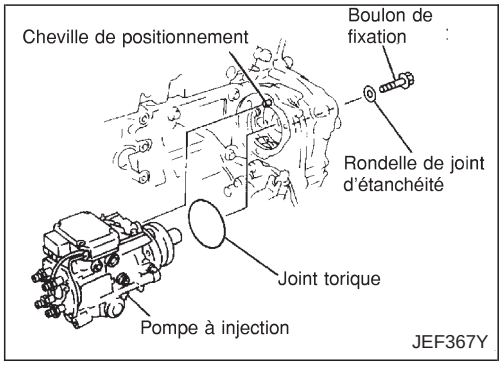
Pompe d'injection de carburant à commande électronique (Suite)



15. Déposer les boulons de montage de la pompe d'injection de carburant.

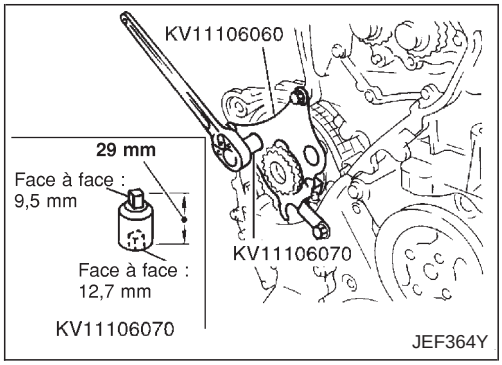
- Le joint des boulons de montage ne peut être réutilisé.

PRECAUTION :



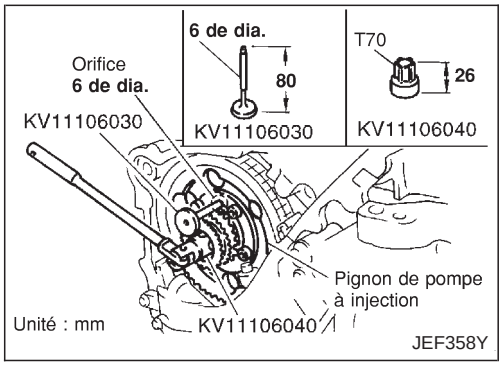
Pendant la dépose, veiller à ne pas laisser tomber le joint dans le moteur.

Repose



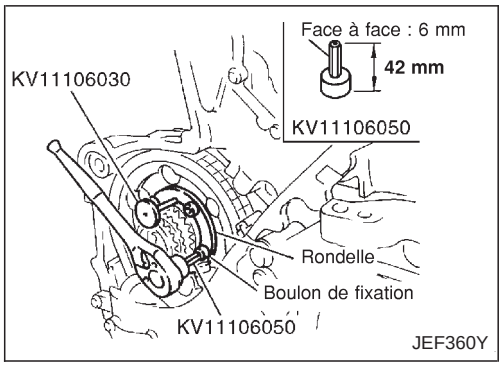
- Il n'est pas nécessaire de régler la distribution d'injection en modifiant l'angle de repose qui était réalisé avec la pompe d'injection de carburants traditionnelle. La position de repose peut être facilement fixée par la cheville de positionnement et les boulons de montage.

1. Avant de reposer la pompe d'injection de carburant, vérifier que l'entaille de sa bride et l'orifice de 6 mm de diamètre situé sur la carrosserie sont alignés.



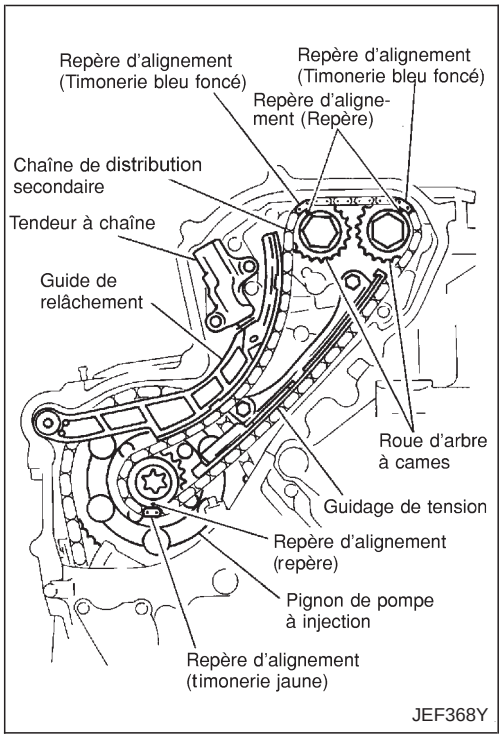
2. Insérer la pompe d'injection de carburant sur la position de montage de la partie arrière du moteur.

- Régler la position du support de la pompe d'injection de carburant sur la cheville de positionnement, puis l'installer.



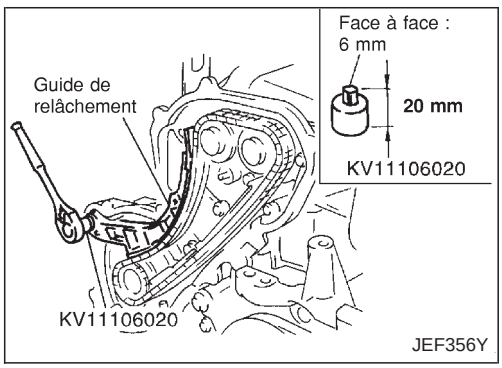
3. En utilisant la barre d'extension (outil spécial) et la douille Torx, serrer les boulons de montage de la pompe d'injection de carburant.
4. Déposer le support du pignon (outil spécial).

5. En utilisant la clé Torx (outil spécial), tourner progressivement le manche de la pompe pour régler la position de la bride. Puis, insérer la goupille d'arrêt de positionnement dans l'orifice de cm de diamètre du pignon de la pompe d'injection de carburant via la bride de la pompe et le corps de la pompe.
6. Retirer la clé Torx (outil spécial).



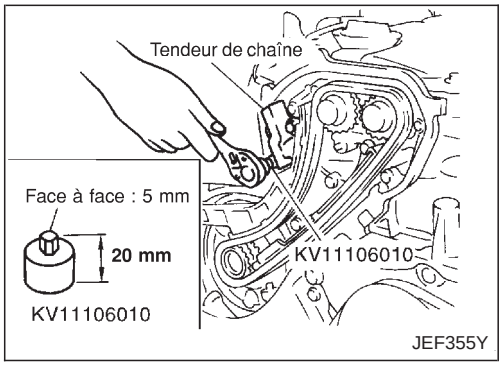
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Pompe d'injection de carburant à commande électronique (Suite)



7. En utilisant la clé hexagonale (face à face : 6 mm, type long) (outil spécial), serrer le boulon de montage du pignon.
- Lorsque le joint du pignon de la pompe d'injection de carburant est déposé, l'installer avec la marque F (avant) face à l'avant du moteur.

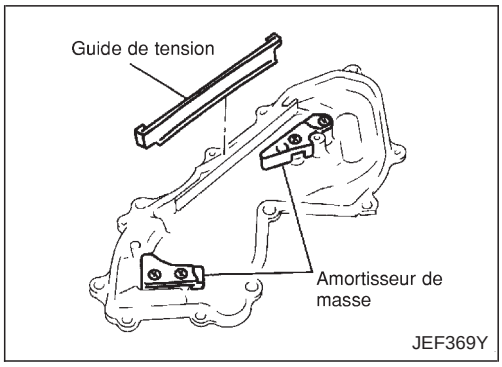
8. Tirer la goupille d'arrêt de positionnement (outil spécial).



9. Reposer la chaîne de distribution secondaire.
- Aligner les repères d'alignement des pignons et ceux de la chaîne, puis l'installer.
- L'illustration indique l'état de la repose et les noms de la chaîne de distribution secondaire et d'autres éléments relatifs.

10. Reposer le guide de tension de la chaîne de distribution.
- Le boulon supérieur de repose est plus long que le boulon inférieur.

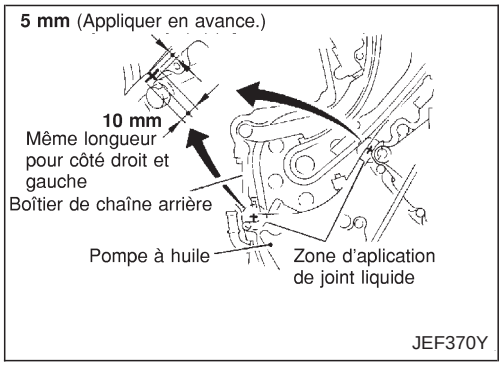
11. En utilisant une clé hexagonale (face à face : 6 mm, type court) (outil spécial), installer le guide de relâchement de la chaîne de distribution.



12. Reposer le tendeur de chaîne.
a. Appuyer sur le piston du tendeur de chaîne, puis le maintenir avec un outil tel qu'une broche-poussoir, et l'installer.
b. En utilisant une clé hexagonale (face à face : 5 mm) (outil spécial), serrer les boulons de montage.
- La repose est possible également via un outil polyvalent.

c. Tirer l'outil tel qu'une broche-poussoir qui maintient le piston.
- **S'assurer que la marque de réglage des roues et la chaîne de distribution soient alignées.**

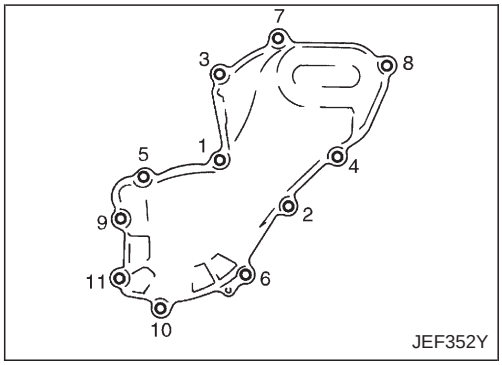
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Pompe d'injection de carburant à commande électronique (Suite)

13. Reposer le boîtier de la chaîne avant.

a. Reposer le guide de tension à l'arrière du boîtier de la chaîne avant.

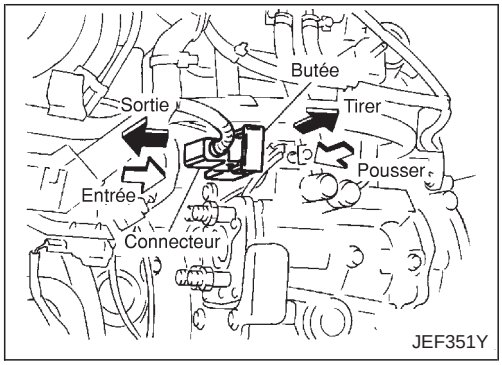


- Si le boîtier de la chaîne avant est secoué, le guide de tension peut tomber. Par conséquent, lors de la repose du boîtier de la chaîne avant, le maintenir verticalement.

b. Appliquer du produit Three Bond 1207C (KP510 00150) aux deux extrémités de la zone de voûte de la pompe à huile (surface de contact du boîtier de la chaîne arrière) comme indiqué sur la figure.

c. Reposer le boîtier de la chaîne avant.

- Aligner la cheville de positionnement du boîtier de la pompe à huile sur l'orifice de la goupille, puis l'installer.
- Reposer les boulons 6, 10 et 11 (indiqués sur la figure) avec une rondelle de caoutchouc sur le boîtier de la chaîne avant.



d. Serrer les boulons de fixation dans l'ordre numérique indiqué sur la figure.

e. Après avoir serré tous les boulons, serrer à nouveau les boulons de montage suivant l'ordre numérique indiqué sur la figure.

14. Monter le support arrière de la pompe d'injection.

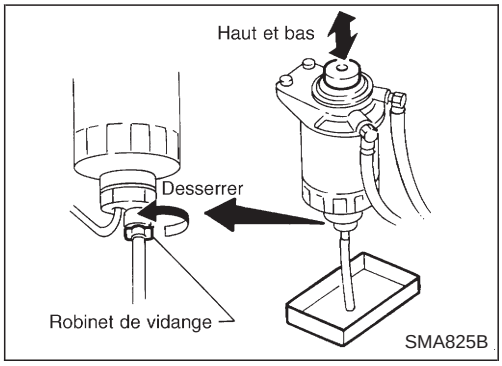
- Serrer tous les boulons temporairement, puis les serrer fortement avec la face de montage bien en contact avec la pompe d'injection de carburant et le support de la pompe.

15. Raccorder le connecteur de faisceau de la pompe d'injection de carburant.

- Insérer fermement le connecteur de faisceau jusqu'à ce que la butée se verrouille.
- Pousser le connecteur d'abord à moitié, puis appuyer sur la butée jusqu'à ce qu'elle se verrouille, de sorte que le connecteur soit raccordé.

16. Raccorder les flexibles d'alimentation.

- Lorsque les flexibles sont déconnectées du côté de la galerie de carburant, insérer jusqu'à ce qu'ils soient en contact avec la soupape, puis installer solidement le collier.



17. Reposer les autres composants dans l'ordre inverse de la repose.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Purge d'air

Pour purger l'air, actionner la pompe d'amorçage.

- **Lorsque l'air est complètement sorti, la pompe d'amorçage devient brusquement difficile à actionner. Arrêter de pomper.**
- **Si la purge de l'air ne peut pas être effectuée en actionnant la pompe d'amorçage (la pompe d'amorçage ne présente de résistance à aucun moment), débrancher le flexible d'alimentation en carburant qui se trouve entre le filtre à carburant et la pompe d'injection. Réaliser ensuite l'opération décrite ci-dessus, et s'assurer que le carburant sort bien (utiliser un récipient, etc. de manière à ne pas déverser de carburant; ne pas laisser le carburant entrer en contact avec le moteur et d'autres pièces). Rebrancher le flexible puis purger à nouveau.**
- **Démarrer le moteur et le laisser tourner au ralenti pendant au moins une minute après avoir purgé l'air.**

Vidange de l'eau

SAUF POUR L'EUROPE

- Si l'indicateur de défaut (MIL) s'allume ou clignote pendant la marche du moteur, vidanger l'eau comme suit.

1. Desserrer le bouchon de vidange et vidanger l'eau.
   En desserrant le bouchon de vidange de quatre ou cinq tours, on permet à l'eau de commencer à s'évacuer.
   Ne pas enlever le bouchon de vidange en le desserrant trop.
   Si l'eau ne s'écoule pas correctement, actionnez la pompe d'amorçage d'un mouvement vertical.
   Quantité d'eau lorsque l'indicateur MIL clignote :
   90 mℓ - 150 mℓ

PRECAUTION :

Lorsque l'eau est évacuée, le carburant est également évacué. Utiliser un bac, etc. pour éviter une adhérence du carburant aux parties en caoutchouc comme par exemple l'isolant de montage du moteur.

Ne pas serrer trop fort le robinet de drainage d'eau. Ceci endommagerait le filetage du robinet, entraînant une fuite d'eau ou de carburant.

2. Purger l'air du filtre à carburant. Consulter la page EC-3455.
3. Démarrer le moteur, puis vérifier que l'indicateur MIL s'éteint.

POUR L'EUROPE.

1. Desserrer le bouchon de vidange et vidanger l'eau.
   En desserrant le bouchon de vidange de quatre ou cinq tours, on permet à l'eau de commencer à s'évacuer.
   Ne pas enlever le bouchon de vidange en le desserrant trop.
   Si l'eau ne s'écoule pas correctement, actionnez la manette de pompe d'amorçage d'un mouvement vertical.

PRECAUTION :

Lorsque l'eau est évacuée, le carburant est également éva-

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Vidange de l'eau (Suite)

cué. Utiliser un bac, etc. pour éviter une adhérence du carburant aux parties en caoutchouc comme, par exemple, l'isolant de montage du moteur.
Ne pas serrer trop fort le robinet de drainage d'eau. Ceci endommagerait le filetage du robinet, entraînant une fuite d'eau ou de carburant.

2. Purger l'air du filtre à carburant. Consulter la page EC-3455.

Apprentissage de position de ralenti du capteur de position d'accélérateur

DESCRIPTION

'L'apprentissage de position de ralenti du capteur de position d'accélérateur'' est une opération servant à effacer la la position d'auto-instruction 'complètement fermé' de l'accélérateur.
Il doit être exécuté à chaque fois que le connecteur de faisceaux du capteur de position d'accélérateur ou l'ECM est débranché.

Procédure de mise en œuvre

Avec CONSULT-II

1. Mettre le contact d'allumage sur ''ON''.
2. Sélectionner "SIG POS ACC COUP" (signal position accélérateur OFF) en mode ''TEST ACTIF'' de CONSULT-II.
3. Appuyer sur ''EFFAC''.

Sans CONSULT-II

1. Démarrer le moteur et l'amener à température normale de fonctionnement.
2. Laisser le moteur tourner au ralenti pendant 10 minutes.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Logique de détection DTC/MIL

Lorsqu'un défaut est détecté, le code de défaut (DTC) est enregistré dans la mémoire de l'ECM.
Le témoin MIL s'allume à chaque fois que l'ECM détecte un défaut. Pour les éléments du diagnostic qui provoque l'allumage du témoin MIL, se référer à ''DIAGNOSTIC DES DEFAUTS — INDEX'', page EC-3427.

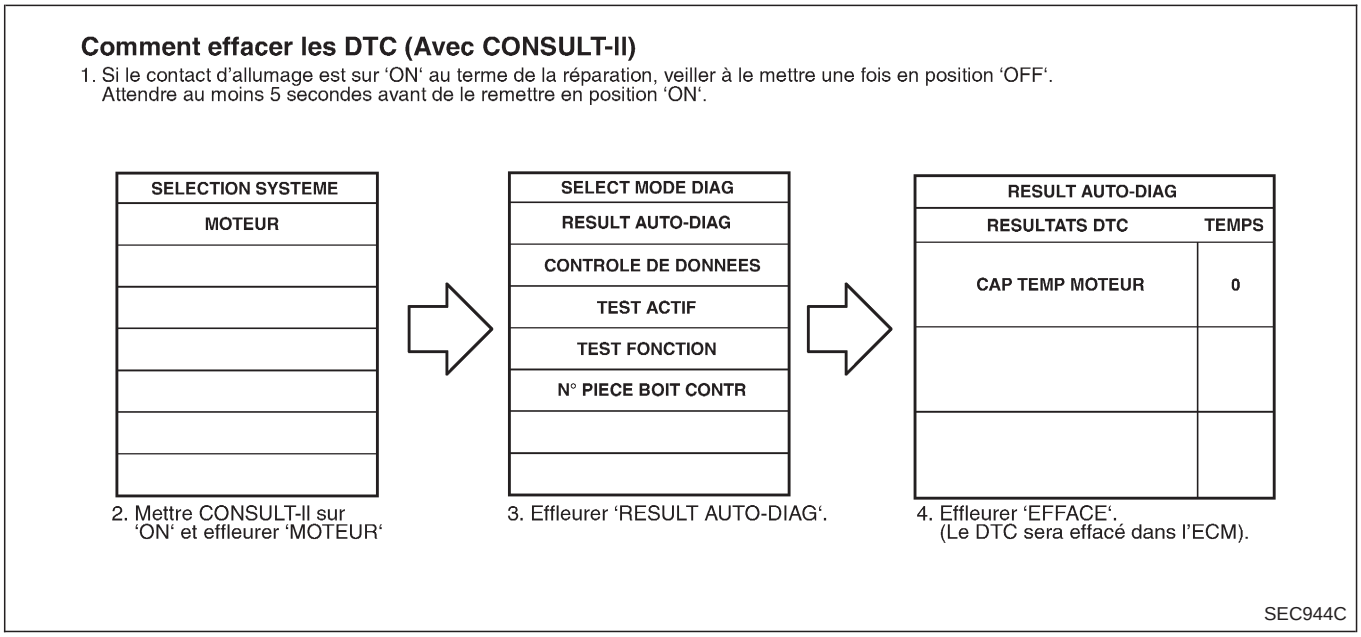
Code de défaut de diagnostic (DTC)

COMMENT LIRE LE DTC

Les méthodes suivantes permettent la lecture des DTC.

Sans CONSULT-II

L'ECM affiche le DTC par un ensemble de nombres à 4 chiffres avec un éclairage du témoin MIL dans le mode II de test de diagnostic (résultats de l'autodiagnostic). Exemple : 0407, 1004, etc.



Avec CONSULT-II

CONSULT-II affiche le DTC dans le mode "RESULTATS AUTO-DIAG" (résultats de l'autodiagnostic). Exemples : ''CAP POS VIL (PMH)'', etc.

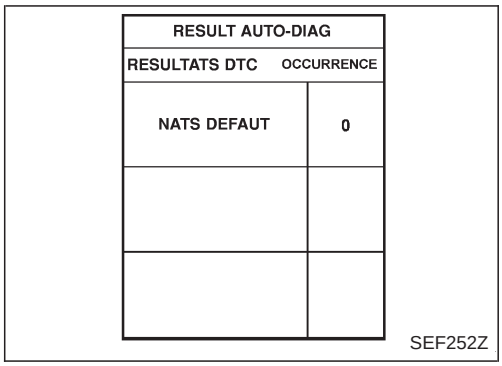
COMMENT EFFACER LE DTC

Comment effacer les DTC (Avec CONSULT-II)

1. Si le contact d'allumage est sur ''ON'' après la réparation, veiller à le tourner une fois sur ''OFF''. Attendre 5 secondes au moins et le remettre en position ''ON'' (moteur arrêté).
2. Appuyer sur ''MOTEUR''.
3. Appuyer ''RESULTATS AUTO-DIAG''.
4. Appuyer sur ''EFFAC'' (Le DTC sera effacé dans l'ECM.)

Les codes de diagnostic de dépollution dans l'ECM peuvent être effacés en touchant ''EFFAC'' en mode ''RESULT AUTO-DIAG'' du CONSULT-II.

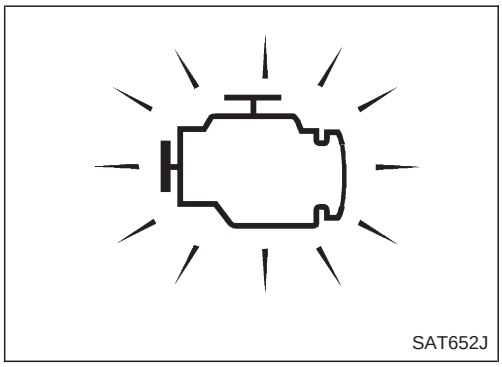
Comment effacer les DTC (sans CONSULT-II)



1. Si le contact d'allumage est sur ''ON'' après la réparation, veiller à le tourner une fois sur ''OFF''. Attendre 5 secondes au moins et le remettre en position ''ON'' (moteur arrêté).
2. Passer le test de diagnostic du Mode II en Mode I par l'intermédiaire du connecteur de diagnostic (Se reporter à la page EC-3459.)

Les codes de diagnostic de dépollution dans l'ECM peuvent être effacés en changeant le mode de test de diagnostic.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Code de défaut de diagnostic (DTC) (Suite)

- **Si la batterie est déconnectée, les codes de diagnostic de dépollution seront perdus après environ 24 heures.**
- **Il est plus facile et plus rapide d'effacer les codes de diagnostic avec CONSULT-II plutôt que de passer dans le mode de test de diagnostic par le connecteur de liaison des données.**

NATS (Système Antivol NISSAN)

- **Si le témoin de sécurité s'allume lorsque le contact d'allumage est sur ''ON'' ou que ''NATS DEFAUT'' (défaut NATS) est affiché sur l'écran de ''RESULTATS AUTO-DIAG'', passer dans le mode de résultats d'autodiagnostic avec CONSULT-II en utilisant une carte de programme NATS. Se référer à ''NATS (système antivol Nissan)'' dans la section EL.**
- **Confirmer qu'aucun résultat d'autodiagnostic NATS n'est affiché avant d'appuyer sur ''EFFAC'' dans le mode ''RESULTATS AUTO-DIAG'' du CONSULT-II.**
- **Lorsque l'on remplace l'ECM, il est nécessaire de procéder à l'initialisation du système NATS et à l'enregistrement de tous les codes d'identification des clés de contact NATS à l'aide du CONSULT-II et de la carte de programme NATS .**
  S'assurer par conséquent que le client a bien remis toutes ses clés. Concernant les procédures d'initialisation du NATS et l'enregistrement des numéros d'identification des clés de contact NATS, se reporter au manuel d'entretien du NATS CONSULT-II pour NATS.

Témoin de défaut (MIL)

DESCRIPTION

Le témoin MIL est situé sur le tableau de bord.

1. Il s'allume lorsque le contact est mis sur la position ON, moteur arrêté. Ceci est un contrôle d'ampoule.
- Si le témoin MIL ne s'allume pas, se reporter à la section EL ('TEMOINS D'AVERTISSEMENT') ou à la page EC-3691

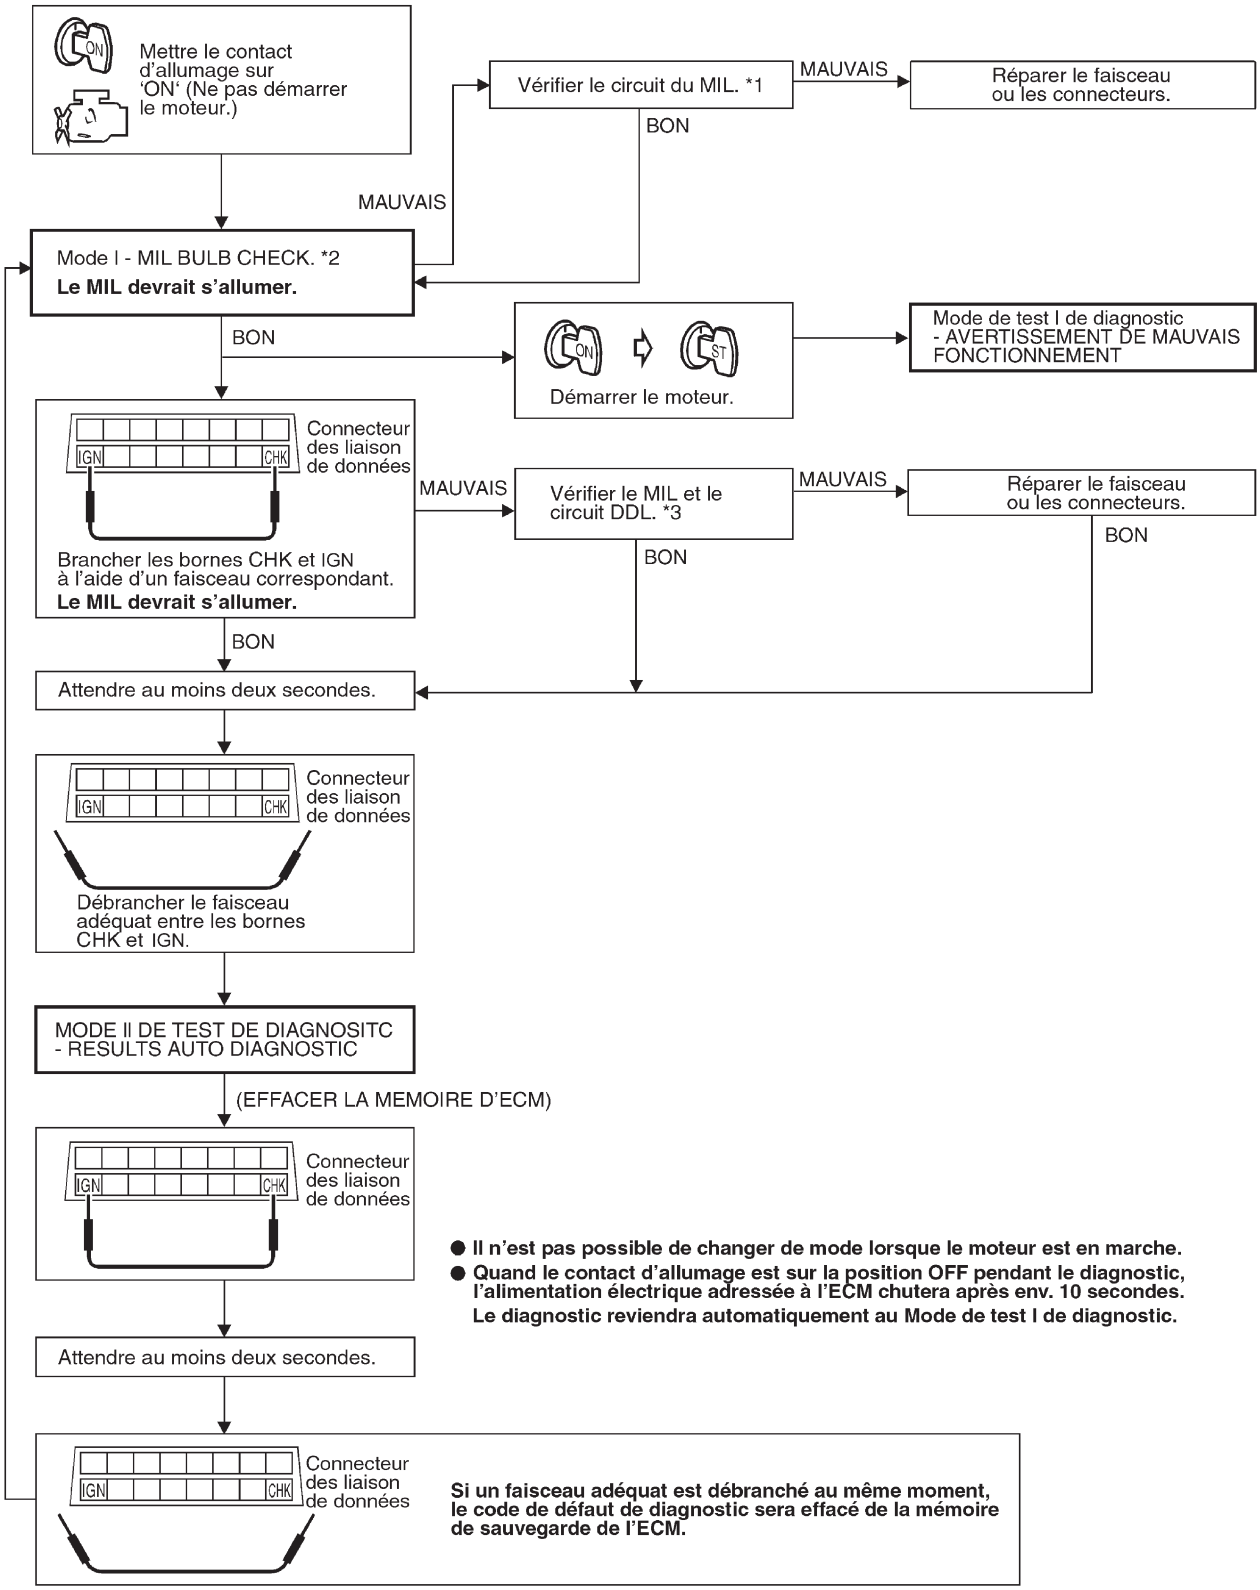
2. Le témoin MIL doit s'éteindre lorsque le moteur démarre.
   S'il reste allumé, le système de diagnostic de bord a probablement détecté un problème au niveau de la gestion moteur.

Le contact de filtre à carburant est fourni, sauf pour l'Europe.
Si le témoin de défaut (MIL) s'allume ou clignote de manière irrégulière après démarrage du moteur, le filtre à carburant contient éventuellement de l'eau. Vidanger l'eau du filtre à carburant. Consulter la page EC-3455.

Fonctions du système de diagnostic de bord

Le système de diagnostic de bord comprend les trois fonctions suivantes.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Témoin de défaut (MIL) (Suite)

Mode de diagnostic	Etats CLE et MOTEUR	Fonction	Explication de la fonction
Mode I	Contact d'allumage sur ON  Moteur arrêté 	VERIFICATION DE L'AMPOULE	Pour vérifier si l'ampoule du MIL est endommagée (grillée, circuit ouvert, etc.). Si le témoin MIL ne fonctionne pas, vérifier le circuit du témoin MIL (Se reporter à la page EC-3691.)
	Moteur en marche 	DEFAUT ATTENTION :	Ceci est une condition de conduite habituelle. Lorsque l'ECM détecte un défaut, le témoin MIL s'allume pour informer le conducteur qu'un défaut a été détecté.
Mode II	Contact d'allumage sur ON  Moteur arrêté 	RESULTATS DE L'AUTODIAGNOSTIC	Cette fonction permet de lire les DTC.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Témoin de défaut (MIL) (Suite)

COMMENT CHANGER DE MODE DE DIAGNOSTIC

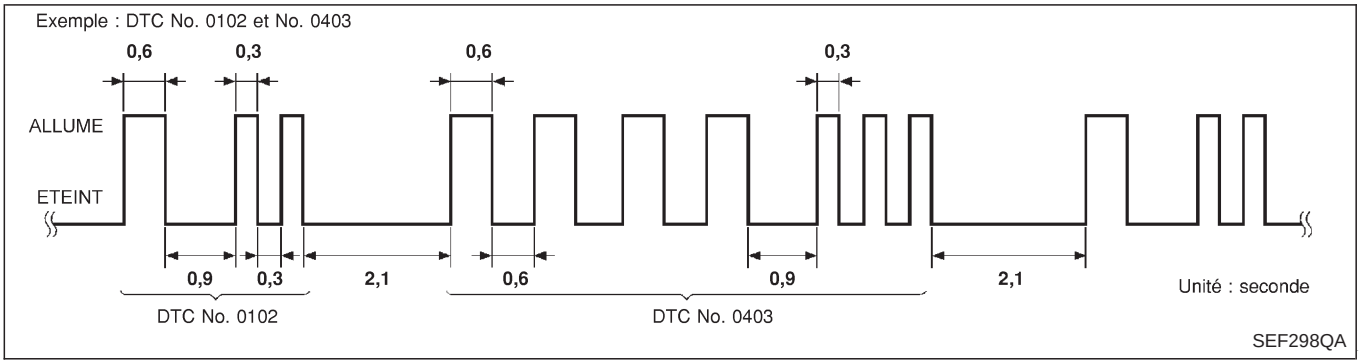
SEC945C

*1 : EC-3691 *2 : EC-3458 *3 : EC-3691

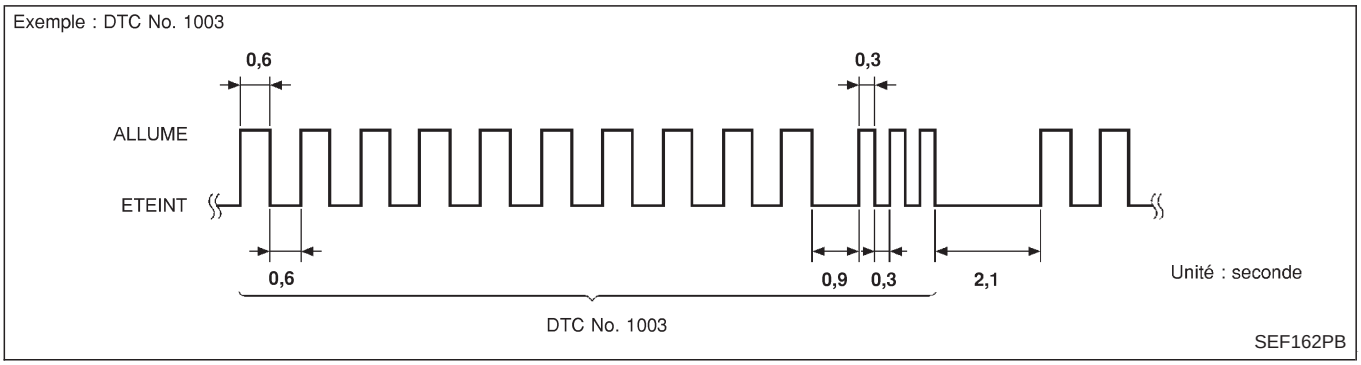
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Témoin de défaut (MIL) (Suite)

Mode de diagnostic I — Vérification de l'ampoule



Dans ce mode, le témoin MIL du tableau de bord doit rester allumé. S'il demeure éteint, vérifier l'ampoule. Se référer à la section EL, ''TEMOINS D'AVERTISSEMENT'' ou à la page EC-3691.



Mode de diagnostic I — Avertissement de défaut de fonctionnement

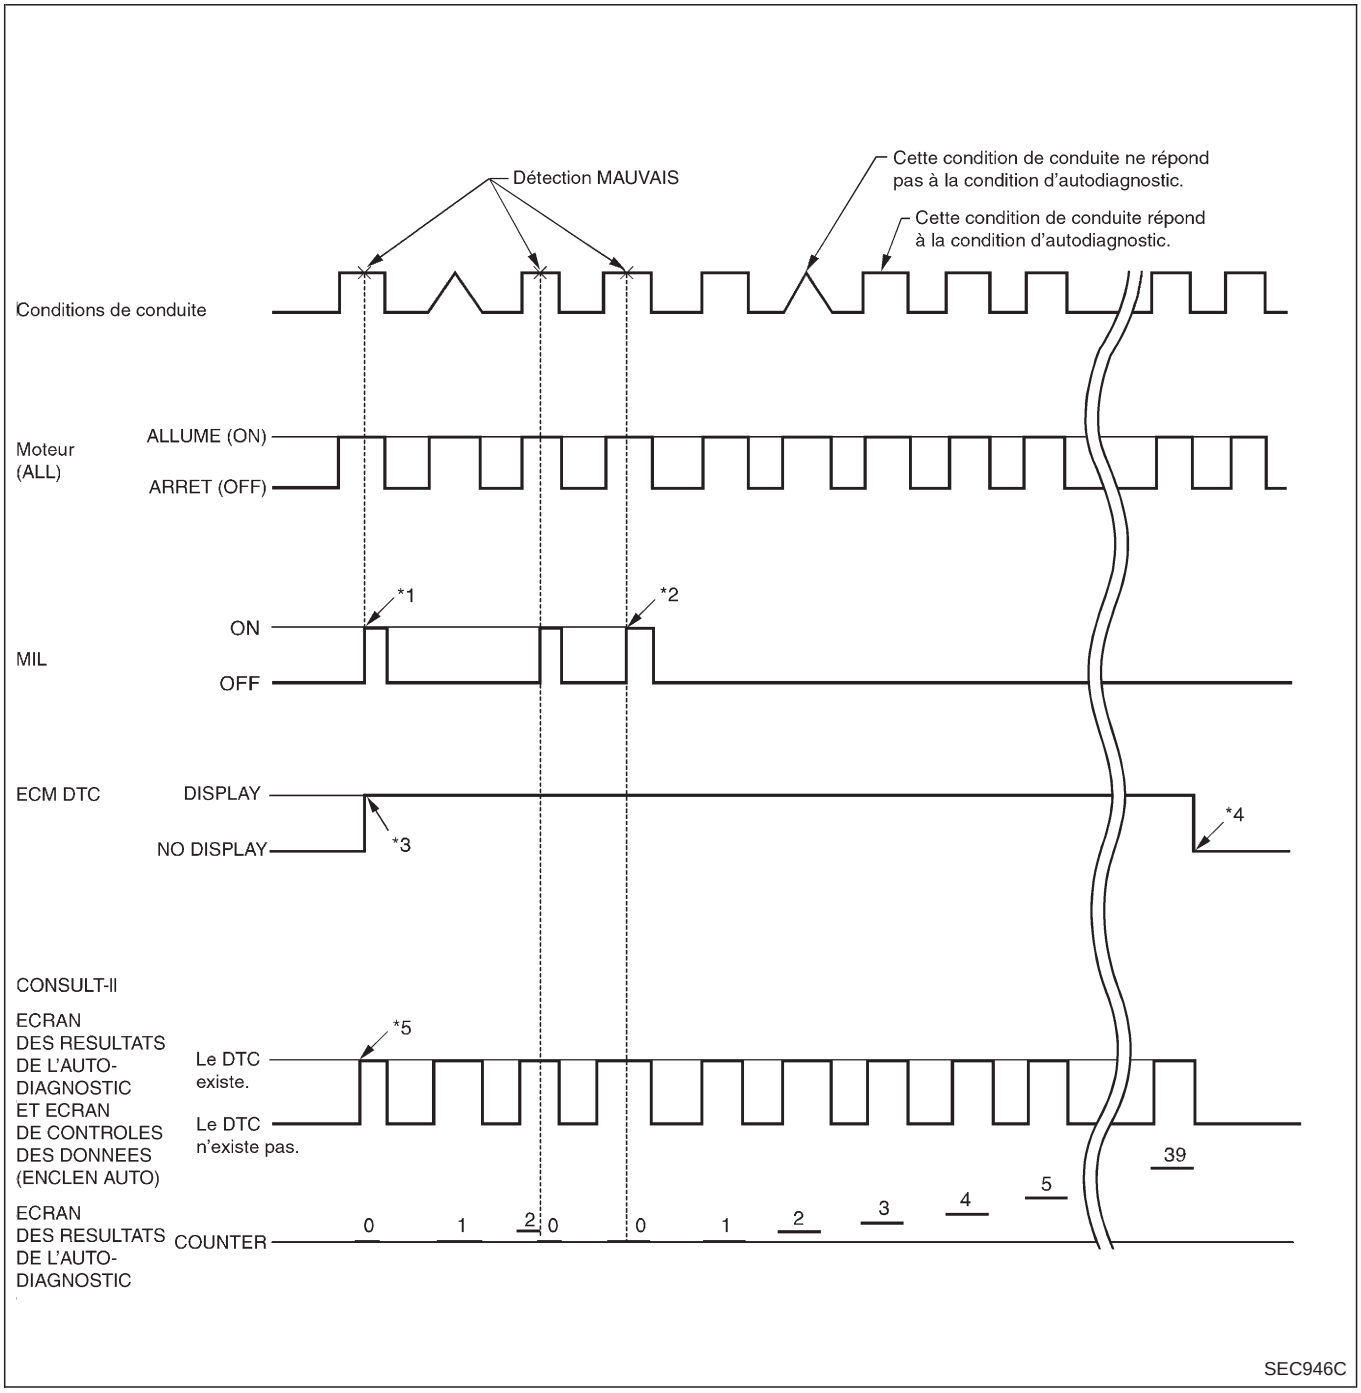
MIL	Condition
ALLUME	Lorsqu'un défaut est détecté ou que l'unité centrale de l'ECM est défectueuse.
ETEINT	Pas de défaut.

Mode de diagnostic II — Résultat d'autodiagnostic

Dans ce mode, le DTC est indiqué par le nombre de clignotements du témoin MIL comme indiqué ci-dessous.

Les deux premiers chiffres du code sont indiqués par des impulsions d'allumage longues (0,6 seconde) et les deux derniers chiffres par des impulsions d'allumage courtes (0,3 seconde). Par exemple, le témoin MIL clignote 10 fois pendant 6 secondes (0,6 s x 10 fois) et puis il clignote 3 fois pendant environ 1 seconde (0,3 s x 3 fois). Le code de défaut (DTC) est ''1003''.
De cette manière, toutes les anomalies détectées sont classées par leurs numéros de code de défaut. Le code ''0505'' ne signale pas un défaut répertorié (voir DIAGNOSTIC DE DEFAUT — INDEX, page EC-3427).

Comment effacer le mode II de test de diagnostic (résultats de l'autodiagnostic)



Les codes de défaut peuvent être effacés de la mémoire de sauvegarde de l'ECM par simple passage d'un mode de diagnostic à l'autre, c'est-à-dire du Mode II au Mode I (se référer à ''Comment changer de mode de diagnostic'', page EC-3460).

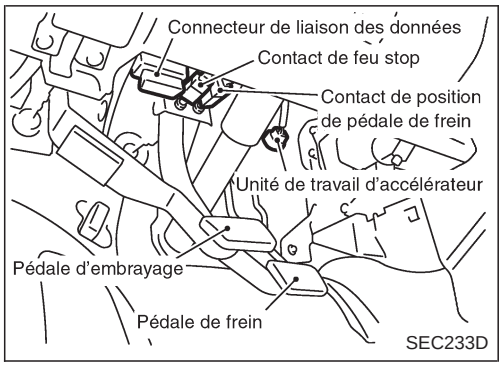
- **Si la batterie est débranchée, les codes de défaut disparaissent de la mémoire de sauvegarde après 24 heures environ.**
- **Veiller à ne pas effacer la mémoire enregistrée avant de commencer les diagnostics de défaut.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Témoin de défaut (MIL) (Suite)

Relation existant entre témoin MIL, DTC, CONSULT-II et les conditions de conduite

*1 : Lorsqu'un défaut est détecté, le témoin MIL s'allume.

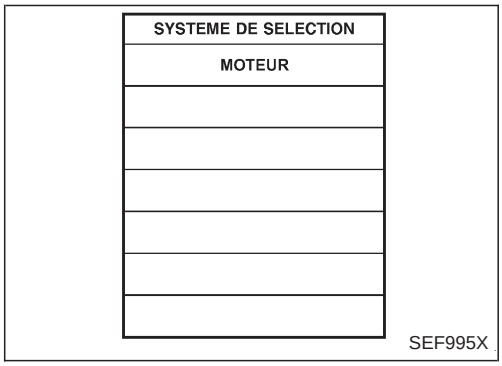


*2 : Lorsque le même défaut est détecté dans deux conditions de conduite consécutives, le témoin MI reste allumé.

*3 : Lorsqu'un défaut est détecté pour la première fois, le DTC est enregistré dans l'ECM.

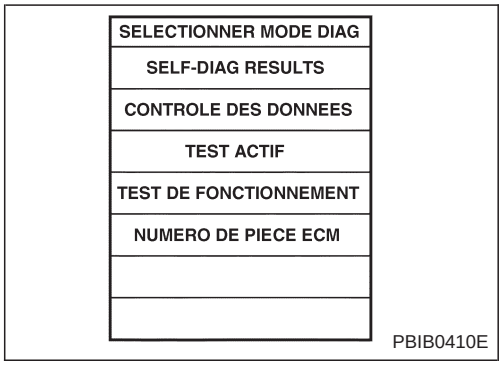
*4 : Le DTC ne s'affichera plus si le véhicule est conduit 40 fois sans que le défaut se reproduise. (le DTC reste encore dans l'ECM).

*5 : Tous les écrans peuvent afficher les pannes, à l'exception des "RESULTATS D'AUTODIAGNOSTIC ET CONTROLE DE DONNEES (DECLEN AUTO). Le mode "CONTROLE DE DONNEES" (DECLEN AUTO) permet l'affichage du défaut au moment où il est détecté.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

CONSULT-II



PROCEDURE D'INSPECTION CONSULT-II

1. Mettre le contact d'allumage sur 'OFF'.
2. Connecter CONSULT-II au connecteur de diagnostic, situé sous le tableau de bord, côté conducteur.

3. Mettre le contact d'allumage sur 'ON'.
4. Appuyer ''DEPART''.
5. Appuyer sur ''MOTEUR''.
6. Effectuer chaque mode de diagnostic en fonction de chaque procédure d'entretien.

Pour de plus amples informations, voir le Manuel d'utilisation de CONSULT-II.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

CAP POS ACCEL [V]	○	○	● La tension du signal du capteur de position d'accélérateur est affichée.	
CNT ACCEL FOND [MAR/ARR]	○	○	● Indique l'état [MARCHE/ARRET] du signal de contact de position de l'accélérateur.	
CNT ACCEL COUP [MAR/ARR]	○	○	● Indique l'état [MARCHE/ARRET] du signal de contact de position de l'accélérateur.	
SOUPAPE/FUITE [°CA]		○	● La position de commande de la soupape de décharge (envoyée par la pompe d'injection de carburant) est affichée.	
TENS BATTERIE [V]	○	○	● La tension d'alimentation électrique de l'ECM est affichée.	
I/C INT/A T/S [V]	○	○	● Affichage de la tension du signal du capteur de température d'air d'admission.	
CON NEUTRE [MAR/ARR]	○	○	● Indique l'état [MAR/ARR] depuis le signal du contact de stationnement/point mort.	
SIGNAL DEMAR [MAR/ARR]	○	○	● Indique l'état de [MAR/ARR] du signal de démarreur.	● Après avoir démarré le moteur, l'état [OFF] est affiché quel que soit le signal de démarreur.
SIGNAL CLIMAT [MAR/ARR]	○	○	● Indique l'état [MARCHE/ARRET] de l'interrupteur de climatiseur de la manière déterminée par le signal du climatiseur.	
CNT FREIN [MAR/ARR]	○	○	● Indique l'état [MAR/ARR] du signal du contact de feu stop.	
CONT FREIN2 [MAR/ARR]	○	○	● Indique la condition [MAR/ARR] à partir du contact de position de la pédale de frein.	
CNT ALL [MAR/ARR]	○	○	● Indique l'état [MAR/ARR] du signal du contact d'allumage.	
INT CHAUF [MAR/ARR]	○		● Indique l'état [MAR/ARR] du signal de l'interrupteur de chauffage rapide.	

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

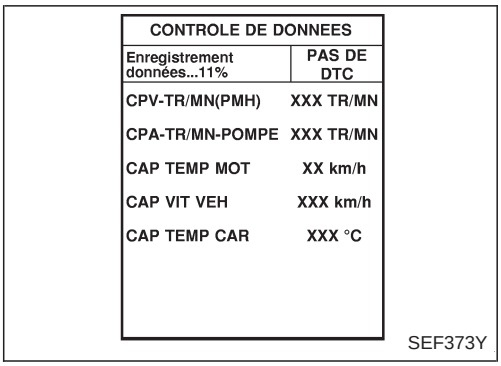
CONSULT-II (Suite)

Elément contrôlé [Unité]	Signaux d'entrée de l'ECM	Signaux principaux	Description	Remarques
TURBO BST SEN [kPa]	○		● La pression d'air de suralimentation (détermnée par le signal de tension envoyé à l'ECM) s'affiche.	
COUP/C DECELER [MAR/ARR]		○	● L'état [MAR/ARR] du signal de coupure de carburant en cas de décélération (envoyé par l'ECM) est affiché.	
INJ TIMG C/V [%]		○	● Le facteur de marche de la soupape de commande d'avance de l'injection (envoyé par la pompe d'injection de carburant) est affiché.	
RELAIS CLIMAT [MAR/ARR]		○	● Indique l'état du relais de climatiseur déterminé par l'ECM en fonction des signaux d'entrée.	
RELS PRECHAUFF [MAR/ARR]		○	● La condition de contrôle du relais de préchauffage (déterminée par l'ECM en fonction des signaux d'entrée) est affichée.	
VENTIL RADIATEUR [MAR/ARR]		○	● Indique la condition de la commande des ventilateurs de refroidissement (déterminée par l'ECM à partir du signal d'entrée). ● ON ... En marche. OFF ... A l'arrêt	
SOUP COMM VOL EGR [niveau]		○	● Indique l'état de la valeur de commande du volume EGR calculé par l'ECM en fonction des signaux d'entrée. ● L'ouverture s'élargit lorsque la valeur augmente.	
CAP BARO [kPa]	○		● La pression atmosphérique (déterminée sur la base du signal en tension du capteur de pression intégré à l'ECM) est affichée.	

REMARQUE :
Tout élément contrôlé qui ne correspond pas au véhicule diagnostiqué est automatiquement effacé de l'affichage.

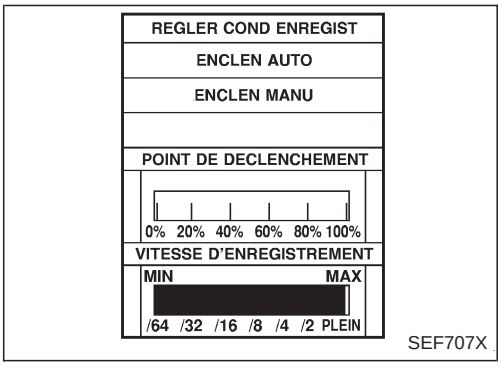
MODE TEST ACTIF

ELEMENT DE TEST	CONDITION	JUGEMENT	VERIFIER L'ELEMENT (REMISE EN ETAT)
VENTIL RADIATEUR	● Contact d'allumage : ON ● Mettre le ventilateur de radiateur sur ''ON'', puis sur ''OFF'', avec CONSULT-II.	Le ventilateur de radiateur tourne puis s'arrête.	● Faisceau et connecteur ● Moteur du ventilateur de radiateur ● Relais du ventilateur de radiateur
SIG POS ACC COUP	● Effacer de l'ECM la position d'auto-instruction 'complètement fermé' de l'accélérateur, détectée par le capteur de position d'accélérateur.		



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

CONSULT-II (Suite)



ELEMENT DE TEST	CONDITION	JUGEMENT	VERIFIER L'ELEMENT (REMISE EN ETAT)
REL PRECHAUFF	● Contact d'allumage : ON (moteur à l'arrêt) ● Mettre le relais du préchauffage en marche 'ON' puis à l'arrêt 'OFF' avec CONSULT-II et écouter le bruit de fonctionnement.	Le relais de préchauffage émet un bruit de fonctionnement.	● Faisceau et connecteur ● Relais de préchauffage
INJ TIMING*1	● moteur : retour à la condition de défaut originale ● Retarder le calage de l'injection au moyen de CONSULT-II.	Si les symptômes du défaut disparaissent, voir la colonne VERIFIER L'ELEMENT.	● Pompe d'injection de carburant à commande électronique
SOUP COMM VOL EGR	● Contact d'allumage : ON ● Modifier le pourcentage d'ouverture de la soupape de commande du volume EGR avec CONSULT-II.	La soupape de commande de volume EGR émet un bruit de fonctionnement.	● Faisceau et connecteur ● Soupape de contrôle de volume EGR

*1 : Avec cet élément, le code de défaut DTC 0707 ''P7·RPNG CLG INJ/C'' peut être détecté. L'effacer dans ce cas, car il ne s'agit pas d'un défaut.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SEF373Y

SEF707X

CONSULT-II (Suite)

DIAGNOSTIC EN TEMPS REEL EN MODE DE CONTROLE DE DONNEES

CONSULT-II offre deux types de déclenchement qui peuvent être sélectionnés en touchant ''CONFIG'' dans le mode ''CONTROLE DE DONNEES''.

1) ''ENCLEN AUTO'' :

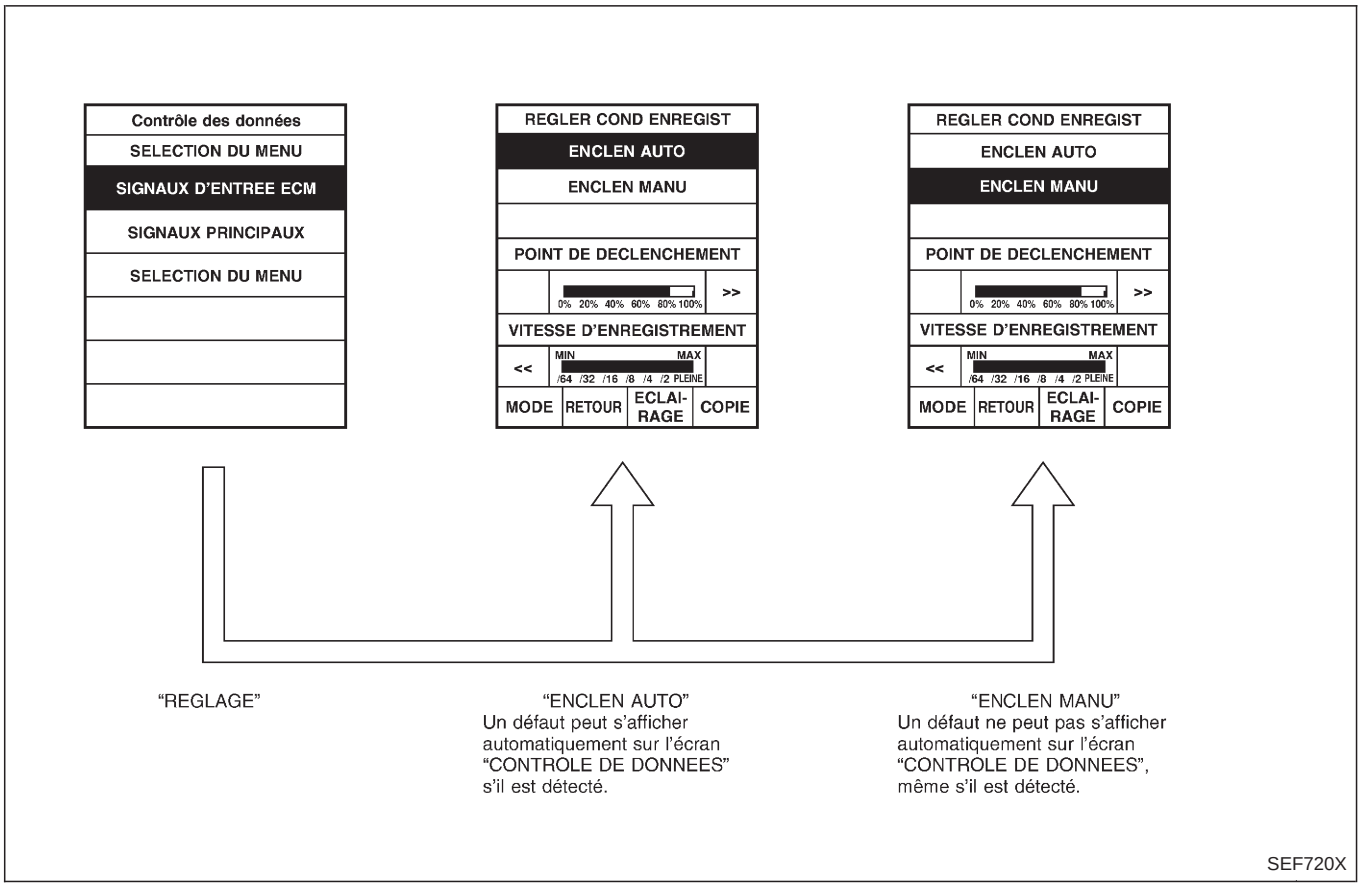
- Le défaut est identifié en temps réel à l'écran d'affichage de CONSULT-II.
  Autrement dit, le DTC est affiché si le défaut a été détecté par l'ECM.
  Au moment où un défaut est détecté par l'ECM, ''CONTROLE'' sur l'écran ''CONTROLE DE DONNEES'' change en ''Enregistrement données ... xx%'' comme indiqué à gauche, et la donnée après la détection du défaut est enregistrée. Lorsque 100% est atteint, l'écran ''DIAG TEMPS REEL'' apparaît. Si ''STOP'' est touché sur l'écran pendant '' Enregistrement données ... xx%'', l'écran ''DIAG TEMPS REEL'' apparaît également.
  Le temps d'enregistrement après la détection du défaut et la vitesse d'enregistrement peuvent être changés avec ''Point de déclenchement'' et ''Vitesse d'enregistrement''. Se reporter au MANUEL D'UTILISATION DE CONSULT-II

2) ''ENCLEN MANU'' (enclenchement manuel) :

- Le DTC ne s'affiche pas automatiquement à l'écran de CONSULT-II même si l'ECM détecte un défaut.
  Le CONTROLE DE DONNEES peut être effectué en permanence même si un défaut est détecté.

Utiliser ces possibilités de déclenchement comme suit :

1) ''ENCLEN AUTO''



- Lorsqu'on essaie de détecter le DTC en réalisant une ''Procédure de confirmation de DTC'', veiller à sélectionner le mode ''CONTROLE DE DONNEES (ENCLEN AUTO)''. Le défaut peut être confirmé au moment où il est détecté.
- Pour procéder à l'élimination des causes possibles, CONSULT-II doit être réglé en mode ''CONTROLE DE DONNEES (ENCLEN AUTO)'', particulièrement si le défaut se produit de façon intermittente.
  Lors du contrôle du circuit en secouant (ou en tordant) avec précaution les connecteurs, pièces ou faisceau suspects dans la ''Procédure de confirmation de DTC'', le DTC sera affiché dès que le défaut se produira (se référer à la section GI, ''Essais de simulation de défaut'' dans ''COMMENT REALISER UN DIAGNOSTIC EFFICACE EN CAS D'INCIDENT ELECTRIQUE'').

2) ''ENCLEN MANU''

- Si le défaut s'affiche dès que le ''CONTROLE DE DONNEES'' est sélectionné, régler le CONSULT-II sur ''ENCLEN MANU''. Il est possible de vérifier et d'enregistrer les données en sélectionnant ''ENCLEN MANU''. Les données peuvent être utilisées pour d'autres diagnostics, telle que la comparaison de la valeur avec des conditions normales de fonctionnement.

SEF907L

Introduction

Le moteur dispose d'un ECM pour contrôler les principaux systèmes tel que la commande d'injection, la commande de l'avance à l'injection de carburant, le système de commande de préchauffage, etc. L'ECM accepte les signaux d'entrée des capteurs et contrôle instantanément la pompe d'injection de carburant à commande électronique. Il est essentiel que les signaux d'entrée et de sortie soient corrects et stables. En même temps, il est important qu'il n'y ait aucun problème tel que fuites de dépression ou autres problèmes affectant le moteur.

Il est beaucoup plus difficile de faire le diagnostic d'un problème qui se manifeste de manière intermittente que celui d'un problème constant. La plupart des défauts intermittents sont le fait d'une mauvaise connexion électrique ou d'un câblage défectueux. En pareil cas, une vérification soigneuse des circuits suspects peut éventuellement éviter le remplacement de pièces qui n'étaient pas fautives.

Le contrôle visuel seul ne permet pas toujours de déterminer la cause des défauts. Il convient d'effectuer un essai sur route à l'aide de CONSULT-II ou d'un testeur de circuit branché. Suivre ''Procédure de travail'', page EC-3471.

Avant d'entreprendre les vérifications, prendre quelques minutes pour parler à un client qui se plaint d'une mauvaise conduite. Le client peut fournir des renseignements utiles quant à ces problèmes, en particulier les problèmes se produisant de façon intermittente. Se renseigner sur les symptômes présents et sur les conditions dans lesquelles ils se présentent. Il convient d'utiliser une ''Fiche de diagnostic'' comme celle présentée à la page suivante.

Commencer le diagnostic en recherchant d'abord les problèmes ''conventionnels''. Ceci aidera à dépister les problèmes de conduite sur un véhicule à moteur à commande électronique.

FICHE DE DIAGNOSTIC

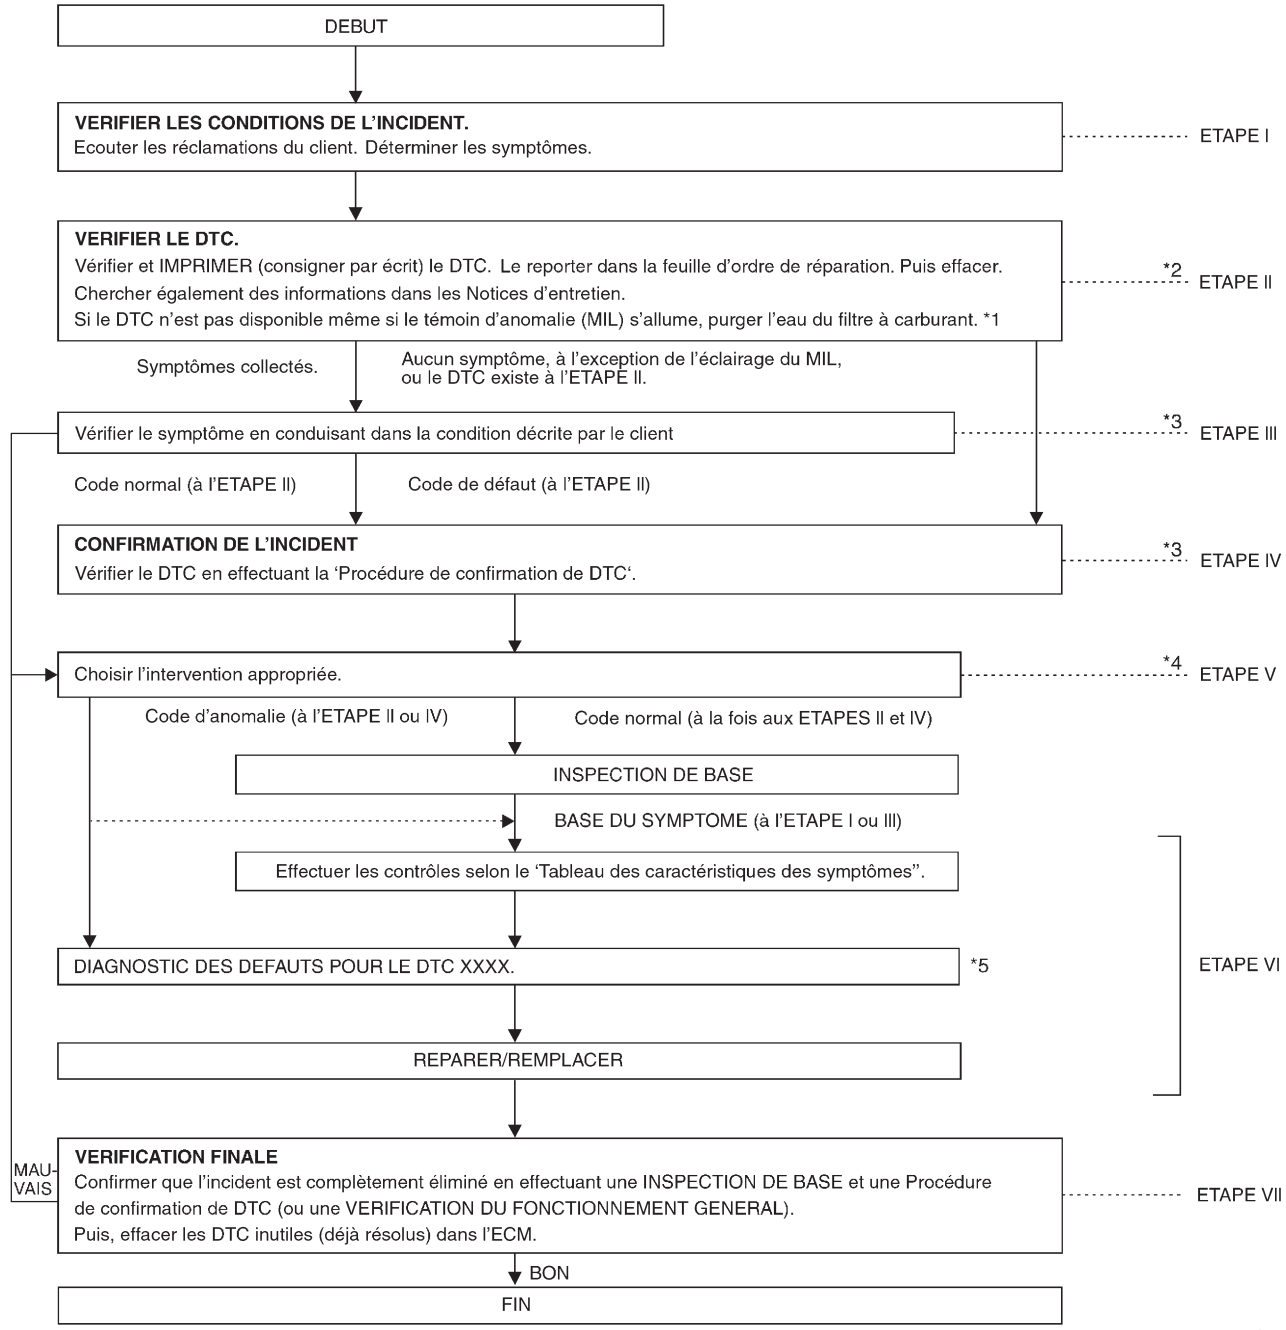
Il existe plusieurs conditions de fonctionnement qui conduisent vers le défaut des composants du moteur. Une bonne connaissance de ces cas peut accélérer la procédure et en améliorer l'exactitude.

En règle générale, la capacité à cerner le problème dépend de chaque client. Il est important de bien comprendre les symptômes ou les conditions liées à la plainte du client.

L'utilisation d'une fiche de contrôle de diagnostic (voir ci-dessous) permet de classer toutes les informations nécessaires au dépistage des pannes.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Introduction (Suite)



Exemple de fiche de contrôle de diagnostic

Nom du client M./Mme/Mlle		Modèle et année	Immatriculation
Moteur		Trans.	Kilométrage
Date incident		Date de construction	Date d'entrée en service
Symptômes	☐ Démarrage	☐ Impossible de démarrer ☐ Pas de combustion ☐ Combustion partielle ☐ Combustion partielle provoquée par la position du papillon ☐ Combustion partielle quand le moteur est froid ☐ Démarrage possible mais difficile ☐ autres [ ]	
	☐ Ralenti	☐ Pas de ralenti accéléré ☐ Instable ☐ Ralenti accéléré ☐ Ralenti bas ☐ Autres [ ]	
	☐ Conduite	☐ Bronchement ☐ Irrégularités ☐ Détonation ☐ Manque de puissance ☐ Autres [ ]	
	☐ Calage du moteur	☐ Au démarrage ☐ Au ralenti ☐ En accélération ☐ En décélération ☐ Peu après l'immobilisation ☐ Lors de l'application d'une charge	
Manifestation de l'incident		☐ Juste après la livraison ☐ Récemment ☐ Le matin ☐ Le soir ☐ Dans la journée	
Fréquence		☐ Tout le temps ☐ Dans certaines circonstances ☐ Parfois	
Conditions climatiques		☐ Pas affecté	
	Temps	☐ Agréable ☐ Pluie ☐ Neige ☐ Autres [ ]	
	Température	☐ Très chaude ☐ Chaude ☐ Fraîche ☐ Froide ☐ Humide °F	
Conditions du moteur		☐ A froid ☐ Pendant le réchauffement ☐ Après le réchauffement Régime du moteur 0 2,000 4,000 6,000 8,000	
Conditions de la route		☐ En ville ☐ Dans les faubourgs ☐ Sur les grandes routes ☐ Tout terrain (haut/bas)	
Conditions de conduite		☐ Pas affecté ☐ Au démarrage ☐ Au ralenti ☐ Avec le moteur emballé ☐ En accélération ☐ En vitesse de croisière ☐ En décélération ☐ En tournant (DR/GA) Vitesse du véhicule 0 10 20 30 40 50 60	
TEMOIN LUMINEUX DE DEFAUT		☐ Mis en marche ☐ Pas mis en marche

Organigramme de travail

SEF374YC

*1 Se référer à la section MA ('Contrôle et remplacement du filtre à carburant et purge de l'eau ', 'ENTRETIEN DU MOTEUR').

*2 Si le paramètre d'occurrence des 'RESULT AUTO-DIAG' (résultats d'autodiagnostic) est différent de '0', effectuer un 'DIAGNOSTIC DES DEFAUTS EN CAS D'INCIDENT INTERMITTENT', voir page EC-3501.

*3 Si le défaut ne peut pas être vérifié, effectuer un 'DIAGNOSTIC DES DEFAUTS EN CAS D'INCIDENT INTERMITTENT', voir page EC-3501.

*4 S'il n'est pas possible de réaliser l'autodiagnostic, vérifier le circuit d'alimentation électrique principal et de mise à la masse. Se référer à 'DIAGNOSTIC DES DEFAUTS DE L'ALIMENTATION ELECTRIQUE', page EC-3502.

*5 Si l'organe défectueux ne peut être trouvé, effectuer un 'DIAGNOSTIC DES DEFAUTS EN CAS D'INCIDENT INTERMITTENT', voir page EC-3501.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

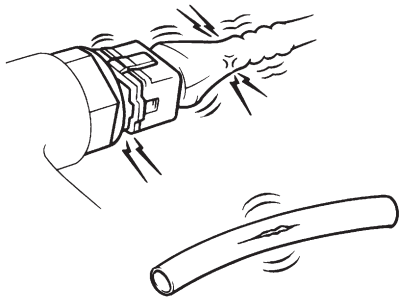
Organigramme de travail (Suite)

DESCRIPTION DE LA PROCEDURE

ETAPE	DESCRIPTION
ETAPE I	Obtenir des renseignements détaillés sur les conditions et l'environnement dans lesquels le défaut/ symptôme s'est produit en utilisant la ''FICHE DE DIAGNOSTIC'', voir page EC-3470.
ETAPE II	Avant de confirmer la cause, vérifier le DTC et le noter (l'imprimer avec CONSULT-II), puis effacer le DTC. Consulter la page EC-3457. Si le défaut ne peut pas être vérifié, effectuer un ''DIAGNOSTIC DES DEFAUTS EN CAS D'INCIDENT INTERMITTENT'', voir page EC-3501. Etudier la relation entre la cause, spécifiée par le DTC, et le symptôme décrit par le client. (le ''Tableau des caractéristiques des symptômes'' sera utile, se reporter à la page EC-3479). Vérifier également toutes les notices d'entretien liées à la vérification pour information.
ETAPE III	Essayer de confirmer le symptôme et les conditions dans lesquelles le défaut se produit. La ''FICHE DE DIAGNOSTIC'' est utile pour vérifier le défaut. Brancher CONSULT-II au véhicule, le régler en mode ''CONTROLE DE DONNEES (ENCLEN AUTO)'' et contrôler les résultats de diagnostic de bord en temps réel. Si le défaut ne peut pas être vérifié, effectuer un ''DIAGNOSTIC DES DEFAUTS EN CAS D'INCIDENT INTERMITTENT'', voir page EC-3501. Si le code de défaut est détecté, sauter l'étape IV et effectuer l'étape V.
ETAPE IV	Essayer de connaître le DTC en effectuant la ''Procédure de confirmation de DTC''. Vérifier et lire le code de défaut à l'aide de CONSULT-II. Pendant la vérification DTC, s'assurer que CONSULT-II est adapté sur le véhicule en mode ''CONTROLE DE DONNEES'' (DECLEN AUTO) et vérifier les résultats de diagnostic en temps réel. Si le défaut ne peut pas être vérifié, effectuer un ''DIAGNOSTIC DES DEFAUTS EN CAS D'INCIDENT INTERMITTENT'', voir page EC-3501. Au cas où la ''Procédure de confirmation de DTC'' serait indisponible, réaliser une ''Vérification du fonctionnement général'' à la place. Le DTC ne peut être affiché par ce contrôle. Cependant, ce ''contrôle'' simplifié constitue un autre moyen efficace. Un résultat négatif de la ''Vérification du fonctionnement général'' équivaut à une détection du DTC.
ETAPE V	Prendre les mesures appropriées sur la base des résultats des étapes I à IV. Si le code de défaut est indiqué, passer au DIAGNOSTIC DES DEFAUTS POUR LE DTC XXXX. Si le code normal est indiqué, procéder à l'inspection de base, voir page EC-3473. Puis effectuer les inspections conformément au tableau des caractéristiques des symptômes. Consulter la page EC-3479.
ETAPE VI	Déterminer où commencer le diagnostic en fonction de l'étude de la relation entre le symptôme et les causes possibles. Inspecter le système en cas de grippage mécanique, connecteurs desserrés, ou câblage endommagé à l'aide de ''Disposition des faisceaux''. Secouer doucement les connecteurs, composants ou faisceaux électriques correspondants, avec CONSULT-II en mode ''CONTROLE DE DONNEES (ENCLEN AUTO)''. Vérifier la tension aux bornes concernées de l'ECM ou vérifier les signaux de sortie des capteurs associés avec CONSULT-II. Se référer à la page EC-3495 ou EC-3492. La ''Procédure de diagnostic'' de la section EC contient une description basée sur l'inspection en circuit ouvert. Une brève inspection du circuit est également nécessaire pour le contrôle du circuit dans la procédure de diagnostic. Pour les détails, se reporter à la section GI (''Inspection du circuit'', ''COMMENT ACCOMPLIR UN DIAGNOSTIC EFFICACE EN CAS D'INCIDENT ELECTRIQUE''). Réparer ou remplacer les pièces défectueuses. Si l'organe défectueux ne peut être trouvé, effectuer un ''DIAGNOSTIC DES DEFAUTS EN CAS D'INCIDENT INTERMITTENT'', voir page EC-3501.
ETAPE VII	Après avoir réparé le circuit ou remplacé un composant, vous devez faire tourner le moteur dans les mêmes conditions et circonstances qui sont à l'origine du problème initialement décrit par le client. Effectuer une ''Procédure de confirmation de code de défaut (DTC)'' et vérifier si le code normal (DTC N° 0505) est détecté. Si le défaut est toujours présent lors du contrôle final, effectuer l'ETAPE VI en utilisant une méthode différente de la précédente. Avant de rendre le véhicule au client, veiller à effacer le DTC inutile (déjà enregistré) dans l'ECM. (Consulter la page EC-3457.)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection de base



Précaution :
Effectuer une inspection de base sans appliquer de charge électrique ou mécanique :

- **Boîte de vitesses au point mort,**
- **Interrupteur de chauffage rapide sur ‘‘OFF’’ (arrêt),**
- **Commande des phares pas actionnée,**
- **Interrupteur de climatiseur sur ‘‘OFF’’ (arrêt),**
- **Interrupteur de désembuage arrière sur ‘‘OFF’’ (arrêt).**
- **Volant en position droite, etc.**

1	DEBUT DE L’INSPECTION

1. Vérifier dans les rapports d’atelier si des travaux de réparation récents pourraient avoir un rapport avec le problème.
2. Vérifier si des travaux d’entretien programmés arrivent à échéance, en particulier pour le filtre à carburant ou pour le filtre à air. Consulter la section MA.
3. Ouvrir le capot et vérifier :

● Que les connecteurs de faisceau ne sont pas mal branchés
● Que les flexibles à dépression ne sont pas fissurés, n’ont pas de défauts et sont bien raccordés
● Que les câbles ne sont pas desserrés, coincés ou coupés.

SEF142I

4. Démarrer le moteur et le faire chauffer jusqu’à ce qu’il atteigne sa température de fonctionnement normale.

▶	PASSER A L’ETAPE 2.

	PREPARATION POUR LE CONTROLE DU REGIME RALENTI
	Avec CONSULT-II Brancher ‘‘CONSULT-II’’ au connecteur de liaison des données.
	Sans CONSULT-II Brancher le compte-tours sur le véhicule.
▶	PASSER A L’ETAPE 3.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection de base (Suite)

3	CONTROLE DU REGIME RALENTI

Avec CONSULT-II

1.Sélectionner ‘‘CPV·TR/MN (PMH)’’ (capteur angle vilebrequin) dans le mode ‘‘CONTROLE DE DONNEES’’ de CONSULT-II.

2. Relever le régime ralenti.

CONTROLE DE DONNEES	
CONTROLE	PAS DE DTC
CPV-TR/MN (PMH)	XXX TR/MN

SEF817Y

Sans CONSULT-II

Contrôler le régime ralenti.

750±25 tr/mn

Bon ou mauvais

Bon	►	**FIN DE L’INSPECTION**
Mauvais	►	PASSER A L’ETAPE 4.

4	PURGE DE L’AIR DU SYSTEME D’ALIMENTATION EN CARBURANT

1. Arrêter le moteur.
2. A l’aide d’une pompe d’amorçage, purger l’air du système d’alimentation. Se référer à ‘‘Purge de l’air’’, page EC-3455.

	►	PASSER A L’ETAPE 5.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection de base (Suite)

5	NOUVEAU CONTROLE DU REGIME RALENTI

Avec CONSULT-II

1.Démarrer le moteur et le laisser tourner au ralenti.
2. Sélectionner ‘‘CPV·TR/MN (PMH)’’ (capteur angle vilebrequin) dans le mode ‘‘CONTROLE DE DONNEES’’ de CONSULT-II.
3. Relever le régime ralenti.

CONTROLE DE DONNEES	
CONTROLE	PAS DE DTC

Valeur de référence de CONSULT-II en mode de contrôle de données

Remarques :
- Les données de spécification sont des valeurs de référence.
- Les données de spécification sont des valeurs de sortie/entrée détectées ou transmises au connecteur par l'ECM

* Les données de spécification peuvent ne pas avoir de rapport direct avec les signaux/valeurs/fonctionnements de leurs composants.

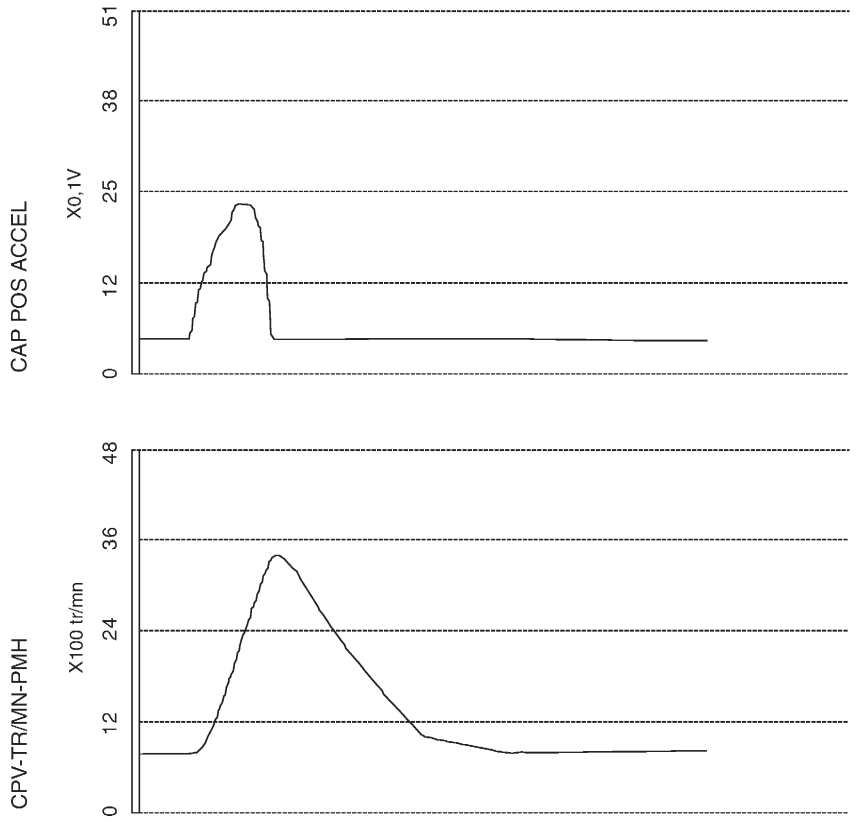
ELEMENT DE CONTROLE	CONDITION		SPECIFICATION
CPV·TR/MN (PMH)	● Compte-tours : Brancher ● Faire tourner le moteur et comparer l'indication du compte-tours avec la valeur affichée par CONSULT-II.		Valeur voisine de cette indiquée par CONSULT-II.
CPA·TR/MN-POMPE			
CAP TEMP MOT	● moteur : Une fois le moteur chaud		Supérieur à 80°C
CAP VIT VEH	● Faire tourner les roues motrices et comparer l'indication du compteur de vitesse avec la valeur affichée par CONSULT-II.		Valeur voisine de cette indiquée par CONSULT-II.
CAP TEMP CARB	● moteur : Une fois le moteur chaud		Plus de 40°C
CAP POS ACCEL	● Contact d'allumage : ON (moteur à l'arrêt)	Pédale d'accélérateur Complètement relâchée	0,29 V - 0,79 V
		Pédale d'accélérateur enfoncée au maximum	Environ 3,48 V - 4,64 V
CNT ACCEL FOND	● Contact d'allumage : ON (moteur à l'arrêt)	Pédale d'accélérateur enfoncée au maximum	ON
		Sauf ci-dessus	OFF
CNT ACCEL COUP	● Contact d'allumage : ON (moteur à l'arrêt)	Pédale d'accélérateur Complètement relâchée	ON
		Pédale d'accélérateur légèrement ouverte	OFF
SOUPAPE/FUITE (soupape de décharge)	● moteur : Une fois le moteur chaud	Régime de ralenti	Environ 13°CA
TENS BATTERIE	● Contact d'allumage : ON (moteur à l'arrêt)		11 V - 14 V
I/C INT/A T/S	● Contact d'allumage : ON		Température de l'air d'admission Environ 0°C : Environ 4,2 V Environ 20°C : Environ 3,5 V
CON NEUTRE	● Contact d'allumage : ON	Levier de changement de vitesses : Position de stationnement/point mort	ON
		Sauf ci-dessus	OFF
SIGNAL DE DEMARRAGE	● Contact d'allumage : Contact d'allumage : ''ON'' → ''START'' → ''ON''		ARR → MAR → ARR
SIGNAL CLIMAT	● moteur : faire chauffer le moteur, puis le faire tourner au ralenti.	Interrupteur de climatiseur : OFF	OFF
		Interrupteur de climatiseur : ON (Le compresseur fonctionne).	ON
CONT FREIN	● Contact d'allumage : ON	Pédale de frein enfoncée	ON
		Pédale de frein libre	OFF
CONT FREIN2	● Contact d'allumage : ON	Pédale de frein enfoncée	ON
		Pédale de frein libre	OFF
CNT ALL	● Contact d'allumage : ON → OFF		MAR → ARR
INT CHAUF	● Contact d'allumage : ON	Interrupteur de chauffage rapide ON	ON
		Interrupteur de chauffage rapide : OFF	OFF
TURBO BST SEN	● moteur : Une fois le moteur chaud ● Levier de changement de vitesses : Position de point mort	Régime de ralenti	Environ Pression atmosphérique
		Le régime moteur est de 2 000 tr/mn.	Environ 106,0 kPa

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Valeur de référence de CONSULT-II en mode de contrôle de données (Suite)

ELEMENT DE CONTROLE	CONDITION		SPECIFICATION
COUP/C DECELER	● moteur : Une fois le moteur chaud	Régime de ralenti	OFF
INJ TIMG C/V (commande avance injection)	● moteur : faire chauffer le moteur, puis le faire tourner au ralenti.		Environ 50 % - 70 %
RELAIS CLIMAT	● moteur : faire chauffer le moteur, puis le faire tourner au ralenti.	Interrupteur de climatiseur : OFF	OFF
		Interrupteur de climatiseur : ON (Le compresseur fonctionne).	ON
REL PRECHAUFF	● Consulter la page EC-3665.		
VENTIL RADIATEUR	● Lorsque le ventilateur de refroidissement est arrêté.		OFF
	● Lorsque le ventilateur fonctionne.		ON (marche)
SOUP COMM VOL EGR	● moteur : Une fois le moteur chaud ● Interrupteur de climatiseur : ‘‘OFF’’ ● Levier de changement de vitesses : Position de point mort ● A vide	Après 1 minute au ralenti	Plus de 10 paliers
		Montée rapide du régime moteur du ralenti jusqu’à 3.200 tr/mn	0 degré
CAP BARO	● Contact d’allumage : ON		Altitude Environ 0 m : Environ 100,62 kPa (1,0062 bar, 1,026 kg/cm^2) Environ 1 000 m : Environ 88,95 kPa (0,8895 bar, 0,907 kg/cm^2) Environ 1 500 m : Environ 83,16 kPa (0,8316 bar, 0,848 kg/cm^2) Environ 2 000 m : Environ 78,36 kPa (0,7836 bar, 0,799 kg/cm^2)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



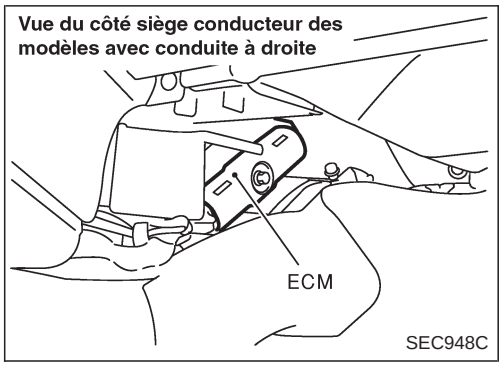
Graphique de référence du capteur principal en mode de contrôle des données

Les courbes suivantes sont les courbes de référence principales des capteurs dans le mode ‘‘CONTROLE DE DONNEES’’ (contrôle des données).

CAP POS ACCEL, ‘‘CPV·TR/MN (PMH)’’

Les courbes suivantes de ‘‘CAP POS ACCEL’’ et ‘‘CPV·TR/MN (PMH)’’ sont valables lorsque le moteur est accéléré rapidement jusqu’à 3 000 tr/min à vide, après que la température de fonctionnement normale a été atteinte.

Chaque valeur sert de référence, la valeur exacte peut varier.



- La valeur de ‘CAP POS ACCEL‘ doit augmenter lorsque la pédale d’accélérateur est enfoncée et doit diminuer une fois relâchée.

- La valeur ‘CPV-TR/MN-PMH‘ doit augmenter progressivement lorsque la pédale d’accélérateur est enfoncée et doit diminuer progressivement une fois la pédale relâchée sans provoquer de baisse ou de hausse intermittente.

SEC947C

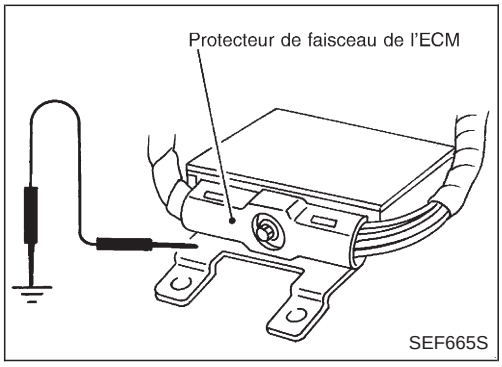
Bornes de l'ECM et valeurs de référence

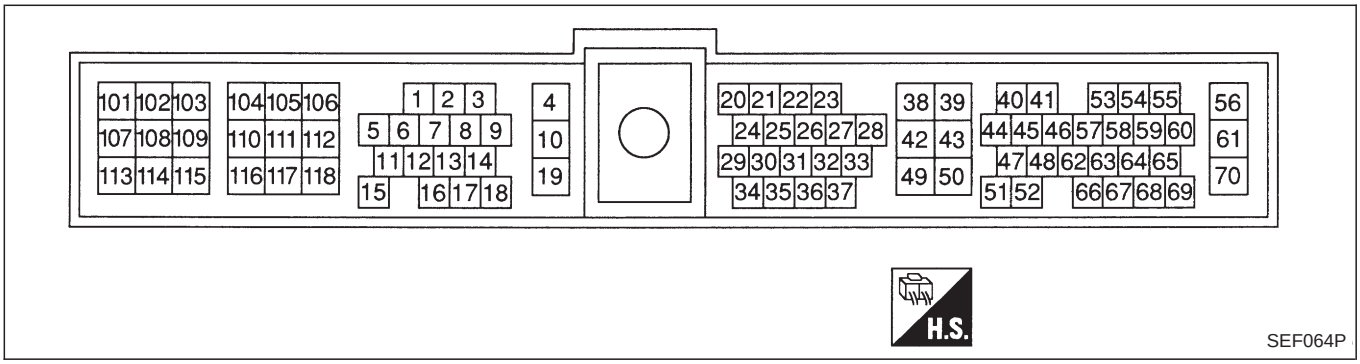
PREPARATION



1. L'ECM se trouve derrière le tableau de bord inférieur. Déposer pour cela la protection sous le tableau de bord côté conducteur.

2. Déposer la protection du faisceau de l'ECM.

3. Effectuer toutes les mesures de la tension, le connecteur étant branché. Les sondes prolongées de la façon illustrée ci-contre permettent d'effectuer les tests plus facilement.
   - Ouvrir la bride de fixation du faisceau pour faciliter le test.
   - Faire très attention de ne pas toucher 2 bornes à la fois.
   - Les données sont des valeurs de comparaison et peuvent ne pas être exactes.



S'assurer que l'ECM est correctement mis à la masse avant le contrôle.

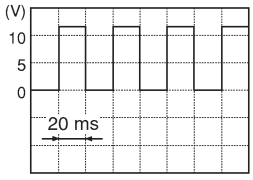
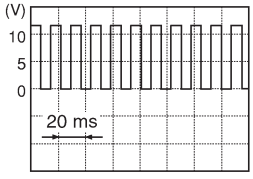
DISPOSITION DES BORNES DU CONNECTEUR DE FAISCEAU DE L'ECM





SEF064P

TABLEAU D'INSPECTION DE L'ECM

Remarques : Données de référence relevées entre chaque borne et la masse.

PRECAUTION :

Lors de la mesure de la tension d'entrée/sortie, ne pas utiliser les bornes de masse de l'ECM sous peine d'endommager le transistor de l'ECM. Utiliser une autre masse que celle des bornes de l'ECM.

BORNE N°	COULEUR DE CABLE	ELEMENT	CONDITION	DONNEE (tension continue ou impulsion)
4	G	Relais d'ECM (arrêt automatique)	Contact d'allumage sur "ON" Contact d'allumage "OFF" └ Pendant quelques secondes après avoir mis le contact d'allumage sur "OFF"	Environ 0,9 V

Description

Il peut arriver que les incidents se produisent de manière intermittente. Dans bien des cas, le problème se résout lui-même (le fonctionnement normal de l'organe ou du circuit en cause se rétablit sans intervention). Il est important de réaliser que, souvent, les symptômes décrits par les clients ne se produisent pas lors des contrôles du DTC. Il faut également savoir que les faux contacts électriques sont la cause la plus fréquente des incidents intermittents. Il en découle que les conditions dans lesquelles l'incident s'est produit peuvent ne pas apparaître clairement. C'est pourquoi les circuits contrôlés dans le cadre d'une procédure de diagnostic standard peuvent ne pas révéler la localisation exacte du problème.

SITUATIONS COURANTES DE COMPTE RENDU D'INCIDENT INTERMITTENT

ETAPE de la Procédure de travail	Situation
II	CONSULT-II est utilisé. Le paramètre d'occurrence indiqué dans l'écran ''RESULT AUTO-DIAG'' (résultats d'autodiagnostic) est différent de ''0''.
III	Le symptôme rapporté par le client ne se répète pas.
IV	Le DTC n'apparaît pas lors de la procédure de confirmation de DTC.
VI	La Procédure de diagnostic pour le code XXXX ne permet pas d'isoler le problème.

Procédure de diagnostic

1	**DEBUT DE L'INSPECTION**
Effacer les DTC. Se référer à ''COMMENT EFFACER LES DTC'', page EC-3457	
►	PASSER A L'ETAPE 2.

2	**VERIFIER LES BORNES DE MASSE**
Vérifier que les bornes de masse ne sont pas corrodées ou en faux contact. Se référer à la section GI (''INSPECTION DES MASSES'', ''Inspection du circuit'').	
Bon ou mauvais	
Bon ►	PASSER A L'ETAPE 3.
Mauvais ►	Réparer ou remplacer.

3	**LOCALISER L'INCIDENT ELECTRIQUE**
Procéder aux 'Essais de simulation de défaut' décrits dans la section GI.	
Bon ou mauvais	
Bon ►	**FIN DE L'INSPECTION**
Mauvais ►	Réparer ou remplacer.

PROCEDURE DE DIAGNOSTIC

1	DEBUT DE L'INSPECTION
Démarrer le moteur. Le moteur tourne-t-il ? **Oui ou Non**	
Oui ▶	PASSER A L'ETAPE 14.
Non ▶	PASSER A L'ETAPE 2.

2	VERIFIER LE CIRCUIT D'ALIMENTATION DE L'ECM I

1. Mettre le contact d'allumage sur ''ON''.
2. Vérifier la tension entre la borne 38 de l'ECM et la masse au CONSULT-II ou au contrôleur.

Tension : Tension de la batterie

SEF397Y

Bon ou mauvais

Bon ▶	PASSER A L'ETAPE 4.
Mauvais ▶	PASSER A L'ETAPE 3.

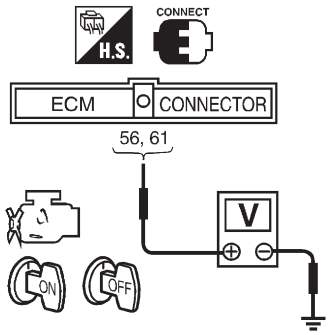
3	DETECTER LA PIECE DEFECTUEUSE
Vérifier les points suivants. ● Connecteurs de faisceau M47, F55 (modèles avec conduite à droite) ● Connecteur de boîte à fusibles (J/B) M10, M12 ● Fusible de 10A ● Faisceau ouvert ou court-circuit entre l'ECM et le fusible	
▶	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

4	VERIFIER SI LE CIRCUIT DE MASSE DE L'ECM EST OUVERT OU EN COURT-CIRCUIT

1. Mettre le contact d'allumage sur ''OFF''.
2. Débrancher le connecteur de faisceau de l'ECM.
3. Vérifier la continuité du faisceau entre les bornes 39, 43, 106, 112 et 118 de l'ECM et la masse de moteur. Se référer au schéma de câblage.
   Il doit y avoir continuité.
4. Vérifier également que le faisceau n'est pas ouvert ou en court-circuit à l'alimentation.

Bon ou mauvais

Bon ▶	PASSER A L'ETAPE 6.
Mauvais ▶	PASSER A L'ETAPE 5.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Circuit d'alimentation électrique principal et de mise à la masse (Suite)

5	DETECTER LA PIECE DEFECTUEUSE
Vérifier si le faisceau n'est pas ouvert ou en court-circuit entre le relais de l'ECM et la masse du moteur.	
▶	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

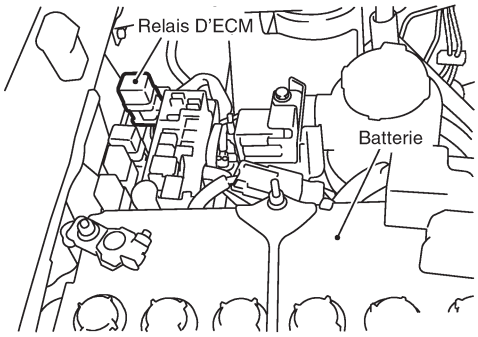
6	VERIFIER LE CIRCUIT D'ALIMENTATION DE L'ECM II

1. Rebrancher le connecteur de faisceau de l'ECM
2. Mettre le contact d'allumage sur ''OFF'' puis sur ''ON''.
3. Vérifier la tension entre les bornes 56, 61 de l'ECM et la masse avec le CONSULT-II ou un contrôleur.

Tension:
Une fois le contact d'allumage sur 'Off', la tension de la batterie subsiste pendant quelques secondes. then drop to approximately 0V.

SEC949C

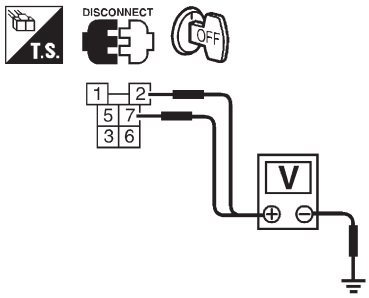
Bon ou mauvais



Bon ▶	Vérifier le circuit d'alimentation de la pompe d'injection de carburant. Se référer à la ''Procédure de diagnostic'', page EC-3599.
Mauvais (pas de tension batterie) ▶	PASSER A L'ETAPE 7.
Mauvais (la tension batterie est présente pendant plus de quelques secondes) ▶	PASSER A L'ETAPE 13.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Circuit d'alimentation électrique principal et de mise à la masse (Suite)



7	VERIFIER LE CIRCUIT D'ALIMENTATION DE L'ECM III

1. Débrancher le relais d'ECM.

SEC950C

2. Vérifier la tension entre les bornes 2, 7 du relais et la masse avec le CONSULT-II ou avec un contrôleur.

Tension: Tension de la batterie

SEC241D

Bon ou mauvais

Bon	▶	PASSER A L'ETAPE 9.
Mauvais	▶	PASSER A L'ETAPE 8.

8	DETECTER LA PIECE DEFECTUEUSE

Vérifier les points suivants.
- Fusible de 20 A
- Faisceau ouvert ou en court-circuit entre le relais de l'ECM et le fusible

	▶	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

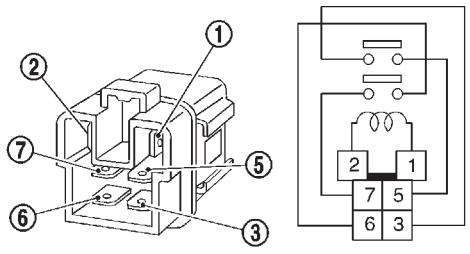
9	VERIFIER SI LE CIRCUIT DE SIGNAL DE SORTIE EST OUVERT OU EN COURT-CIRCUIT

1. Débrancher le connecteur de faisceau de l'ECM.
2. Vérifier la continuité du faisceau entre la borne 4 de l'ECM et la borne 1 du relais d'ECM. Se référer au schéma de câblage.
   Il doit y avoir continuité.
3. Vérifier également que le faisceau n'est pas ouvert ou en court-circuit à l'alimentation.

Bon ou mauvais

Bon	▶	PASSER A L'ETAPE 11.
Mauvais	▶	PASSER A L'ETAPE 10.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Circuit d'alimentation électrique principal et de mise à la masse (Suite)

10	DETECTER LA PIECE DEFECTUEUSE
Vérifier les points suivants. ● Connecteurs de faisceaux E101, M5 ● Connecteurs de faisceaux M48, F54 (Modèles à conduite à droite) ● Faisceau ouvert ou en court-circuit entre l'ECM et le relais l'ECM	
▶	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

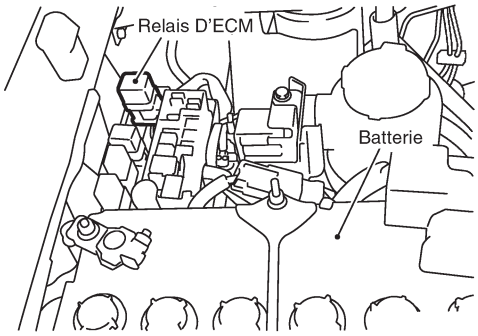
11	VERIFIER LE CIRCUIT IV D'ALIMENTATION DE L'ECM
1. Vérifier la continuité du faisceau entre les bornes 56, 61 de l'ECM et la borne 6 du relais d'ECM. Se référer au schéma de câblage. **Il doit y avoir continuité.** 2. Vérifier également que le faisceau n'est pas ouvert ou en court-circuit à l'alimentation.	
Bon ou mauvais	
Bon ▶	PASSER A L'ETAPE 13.
Mauvais ▶	PASSER A L'ETAPE 12.

12	DETECTER LA PIECE DEFECTUEUSE
Vérifier les points suivants. ● Connecteurs de faisceaux E101, M5 ● Connecteurs de faisceaux M47, F55 (modèles à conduite à droite) ● Faisceau ouvert ou en court-circuit entre l'ECM et le relais l'ECM	
▶	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

13	VERIFIER LE RELAIS D'ECM.
1. Appliquer une tension continue de 12 V entre les bornes 1 et 2 du relais d'ECM. 2. Vérifier la continuité entre les bornes 3 et 5, 7 et 6 du relais d'ECM	

Condition	Continuité
Courant continu de 12V entre les bornes 1 et 2 du relais	Oui
ETEINT	Non

SEF296X



Bon ou mauvais	
Bon ▶	PASSER A L'ETAPE 18.
Mauvais ▶	Remplacer le relais d'ECM.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Circuit d'alimentation électrique principal et de mise à la masse (Suite)

14	VERIFIER LE CIRCUIT V D'ALIMENTATION DE L'ECM

1. Mettre le contact d'allumage sur ''OFF''.
2. Débrancher le relais d'ECM.

SEC950C

3. Débrancher le connecteur de faisceau de l'ECM.
4. Vérifier la continuité du faisceau entre les bornes 56, 61 de l'ECM et la borne 6 du relais d'ECM. Se référer au schéma de câblage.
   Il doit y avoir continuité.
5. Vérifier également que le faisceau n'est pas ouvert ou en court-circuit à l'alimentation.

Bon ou mauvais

Bon	▶	PASSER A L'ETAPE 16.
Mauvais	▶	PASSER A L'ETAPE 15.

15	DETECTER LA PIECE DEFECTUEUSE

Vérifier les points suivants.
- Connecteurs de faisceaux M101, M5
- Connecteurs de faisceaux M47, F55 (modèles à conduite à droite)
- Faisceau ouvert ou en court-circuit entre l'ECM et le relais l'ECM

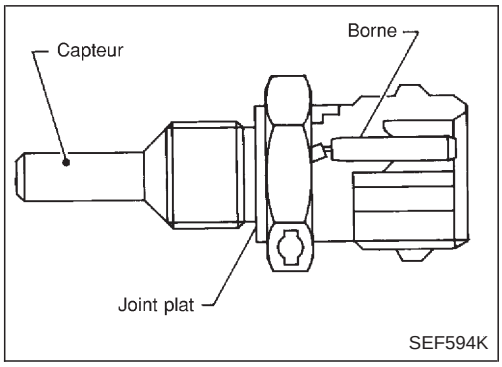
	▶	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

16	VERIFIER SI LE CIRCUIT DE MASSE DE L'ECM EST OUVERT OU EN COURT-CIRCUIT

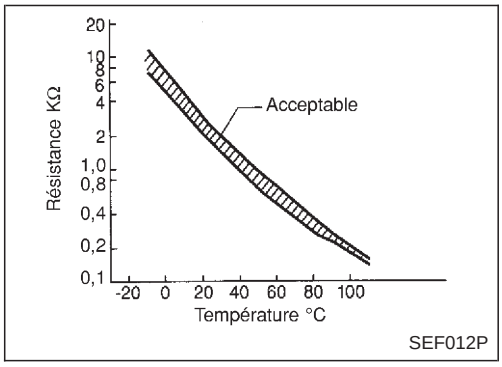
1. Vérifier la continuité du faisceau entre les bornes 39, 43, 106, 112 et 118 de l'ECM et la masse de moteur. Se référer au schéma de câblage.
   Il doit y avoir continuité.
2. Vérifier également que le faisceau n'est pas ouvert ou en court-circuit à l'alimentation.

Bon ou mauvais

Bon	▶	PASSER A L'ETAPE 18.
Mauvais	▶	PASSER A L'ETAPE 17.



17	DETECTER LA PIECE DEFECTUEUSE



Vérifier si le faisceau n'est pas ouvert ou en court-circuit entre le relais de l'ECM et la masse du moteur.

	▶	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

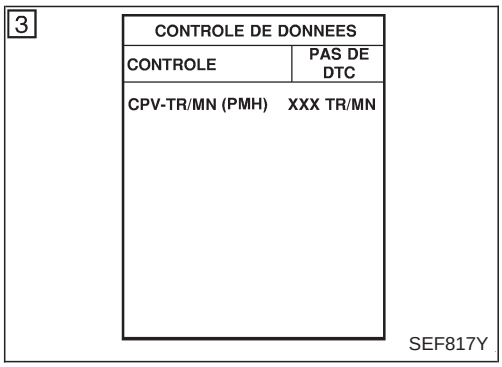
18	VERIFIER SI L'INCIDENT EST INTERMITTENT
Se référer à ''DIAGNOSTIC DES DEFAUTS EN CAS D'INCIDENT INTERMITTENT'', page EC-3502.	
	▶ **FIN DE L'INSPECTION**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description

Le capteur de température du liquide de refroidissement du moteur (ECTS) est utilisé pour détecter la température du liquide de refroidissement du moteur. Le capteur modifie un signal de tension depuis l'ECM. Le signal modifié retourne à l'ECM en tant qu'entrée de température du moteur. Le capteur utilise une thermistance qui est sensible au changement de température. La résistance électrique de la thermistance diminue au fur et à mesure que la température monte.

<Données de référence>



Température de liquide de refroidissement du moteur °C	Tension* (V)	Résistance (kΩ)
−10	4,4	7,0 - 11,4
20	3,5	2,1 - 2,9
50	2,3	0,68 - 1,0
90	1,0	0,236 - 0,260

* : Valeurs de référence relevées entre la borne 19 de l'ECM (capteur de température de liquide de refroidissement) et la masse.

PRECAUTION :
Lors de la mesure de la tension d'entrée/sortie, ne pas utiliser les bornes de masse de l'ECM sous peine d'endommager le transistor de l'ECM. Utiliser une autre masse que celle des bornes de l'ECM.

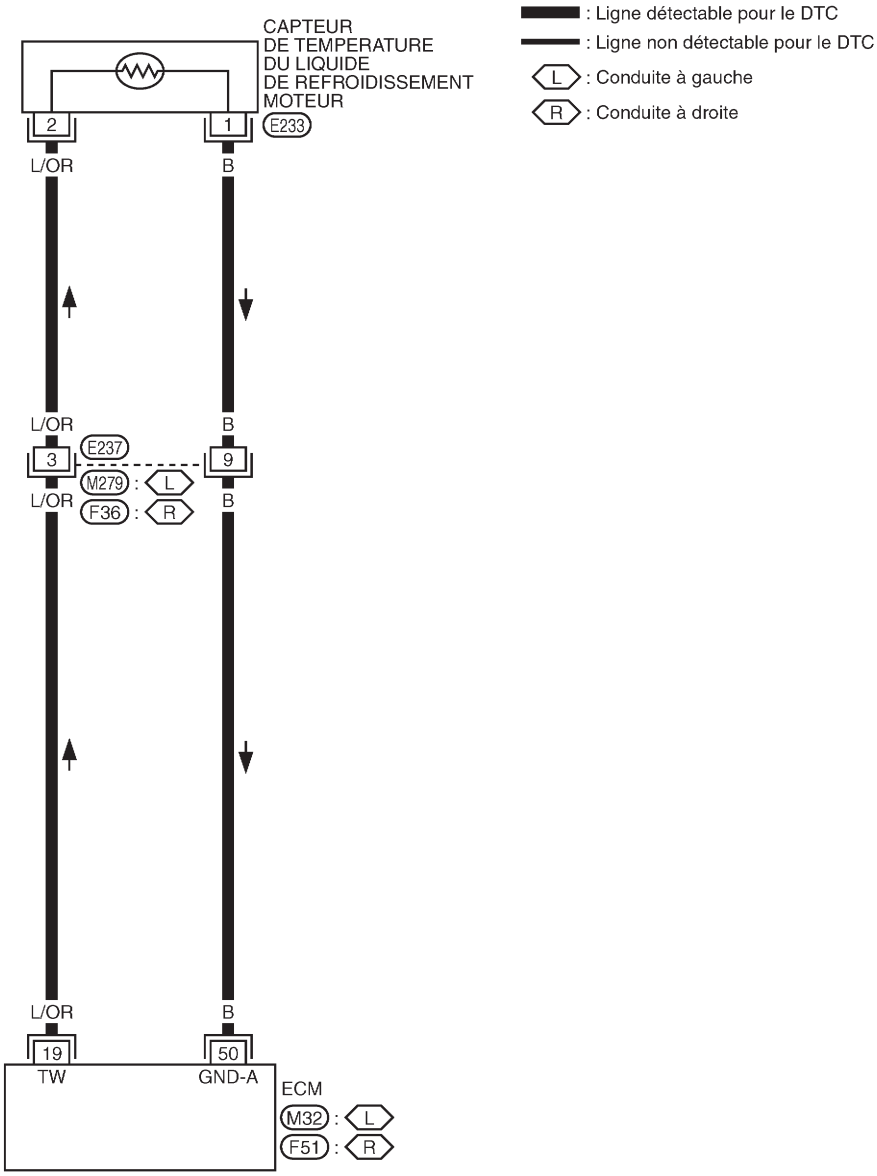
Logique de diagnostic de bord

Le défaut est détecté quand ...	Eléments de contrôles (causes possibles)
● Une tension excessivement haute ou basse du capteur est appliquée à l'ECM.	● Faisceau ou connecteurs (le circuit du capteur est ouvert ou en court-circuit) ● Capteur de température du liquide de refroidissement moteur

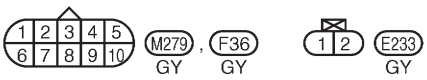
Procédure de confirmation de code de défaut (DTC)

AVEC CONSULT-II

1) Mettre le contact d'allumage sur ''ON''.
2) Régler CONSULT-II en mode ''CONTROLE DE DONNEES''.
3) Attendre au moins 5 secondes.
4) Si le DTC est détecté, effectuer une ''Procédure de diagnostic'', voir page EC-3514.



SANS CONSULT-II



1) Mettre le contact d'allumage sur ''ON'', puis attendre 5 secondes au moins.
2) Mettre le contact d'allumage sur ''OFF'', attendre au moins 5 secondes, puis remettre le contact sur ''ON''.
3) Effectuer le ''Test de diagnostic mode II (résultats d'autodiagnostic)'' avec l'ECM.
4) Si le DTC est détecté, effectuer une ''Procédure de diagnostic'', voir page EC-3514.

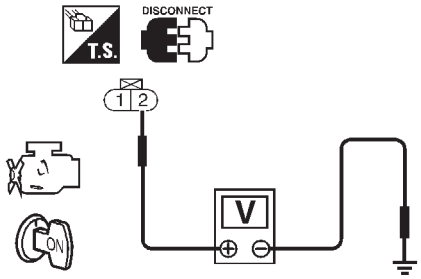
Procédure de diagnostic



1	VERIFIER LE CIRCUIT D'ALIMENTATION DU CAPTEUR

1. Mettre le contact d'allumage sur ''OFF''.
2. Débrancher le connecteur de faisceau du capteur de température du liquide de refroidissement moteur.

SEC230D

3. Mettre le contact d'allumage sur ''ON''.
4. Vérifier la tension entre la borne e du capteur de température et la masse avec le CONSULT-II ou avec un contrôleur.

Tension : environ 5V

SEF401Y

Bon ou mauvais

Bon	▶	PASSER A L'ETAPE 3.
Mauvais	▶	PASSER A L'ETAPE 2.

2	DETECTER LA PIECE DEFECTUEUSE

Vérifier les points suivants.
- Connecteurs de faisceaux E237, M279 (conduite à gauche)
- Connecteurs de faisceaux E237, F36 (conduite à droite)
- Faisceau ouvert ou en court-circuit entre le capteur de température du liquide de refroidissement du moteur et l'ECM.

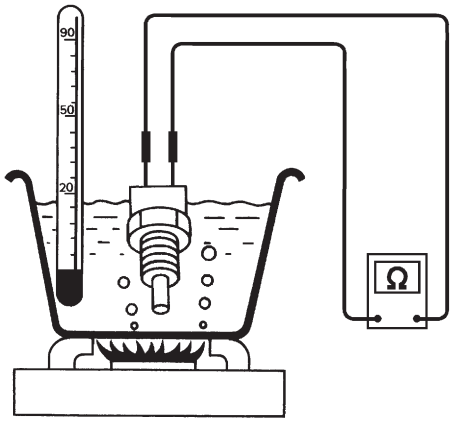
	▶	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

3	VERIFIER SI LE CIRCUIT DE MASSE DU CAPTEUR DE TEMPERATURE EST OUVERT OU EN COURT-CIRCUIT

1. Mettre le contact d'allumage sur ''OFF''.
2. Vérifier la continuité du faisceau entre la borne 1 du capteur et la masse du moteur. Se référer au schéma de câblage.
   Il doit y avoir continuité.
3. Vérifier également que le faisceau n'est pas ouvert ou en court-circuit à l'alimentation.

Bon ou mauvais

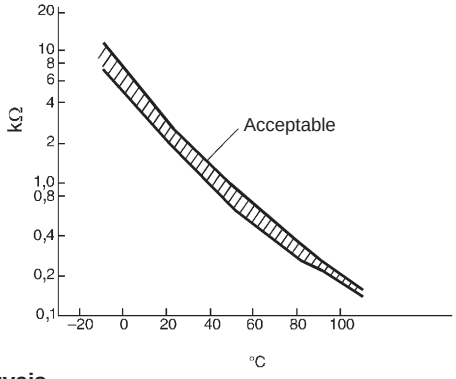
Bon	▶	PASSER A L'ETAPE 5.
Mauvais	▶	PASSER A L'ETAPE 4.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic (Suite)

4	DETECTER LA PIECE DEFECTUEUSE
Vérifier les points suivants. ● Connecteurs de faisceaux E237, M279 (conduite à gauche) ● Connecteurs de faisceaux E237, F36 (conduite à droite) ● Faisceau ouvert ou en court-circuit entre le capteur de température du liquide de refroidissement du moteur et l'ECM.	
▶	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

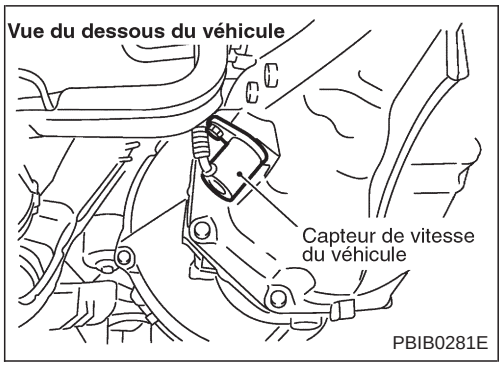


5	VERIFIER LE CAPTEUR DE TEMPERATURE DE LIQUIDE DE REFROIDISSEMENT

1. Déposer le capteur de température de liquide de refroidissement du moteur
2. Vérifier la résistance entre les bornes 1 et 2 du capteur de température comme indiqué sur l'illustration.

Données de référence

Température °C	Résistance kΩ
20	2,1 - 2,9
50	0,68 - 1,00
90	0,236 - 0,260



SEF304X-R

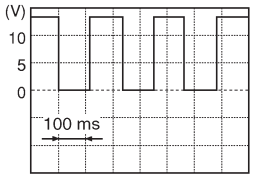
Bon ou mauvais

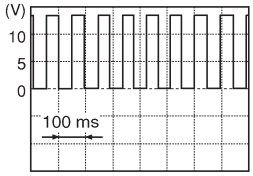
Bon	▶	PASSER A L'ETAPE 6.
Mauvais	▶	Remplacer le capteur de température du liquide de refroidissement moteur.

6	VERIFIER SI L'INCIDENT EST INTERMITTENT
Se référer à ''DIAGNOSTIC DES DEFAUTS EN CAS D'INCIDENT INTERMITTENT'', page EC-3502.	
▶	**FIN DE L'INSPECTION**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description



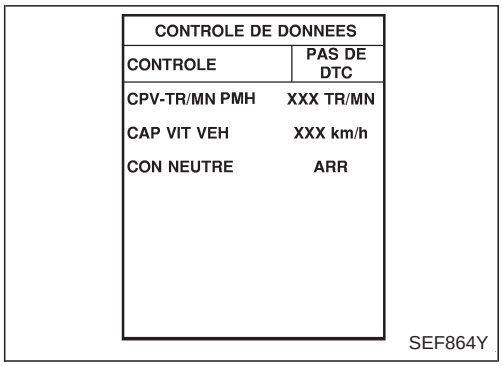


Le capteur de vitesses du véhicule est monté dans la boîte/pont. Il contient un générateur d'impulsions qui délivre le signal de vitesse du véhicule au compte-tours. Le compte-tours envoie alors un signal à l'ECM.

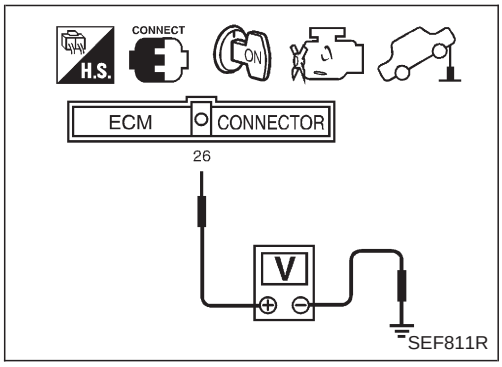
Bornes de l'ECM et valeurs de référence

Données de référence relevées entre chaque borne et la masse.

PRECAUTION :



Lors de la mesure de la tension d'entrée/sortie, ne pas utiliser les bornes de masse de l'ECM sous peine d'endommager le transistor de l'ECM. Utiliser une autre masse que celle des bornes de l'ECM.



BORNE N°	COULEUR DE CABLE	ELEMENT	CONDITION	DONNEE (tension continue ou impulsion)
26	W/L	Capteur de vitesse du véhicule	Moteur en marche. └ Lever le véhicule Levier de sélection sur 1er rapport La vitesse du véhicule est de 10 km/h	Environ 4,6 V  SEF257Z
			Moteur en marche. └ Lever le véhicule En seconde La vitesse du véhicule est de 30 km/h.	Environ 2,2 V  SEF258Z

Logique de diagnostic de bord

Le défaut est détecté quand ...	Eléments de contrôles (causes possibles)
● Le signal d'environ 0 km/h du capteur de vitesse du véhicule est envoyé à l'ECM même lorsque le véhicule est conduit.	● Faisceau ou connecteur (le circuit du capteur de vitesse du véhicule est ouvert ou en court-circuit). ● Capteur de vitesse du véhicule

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

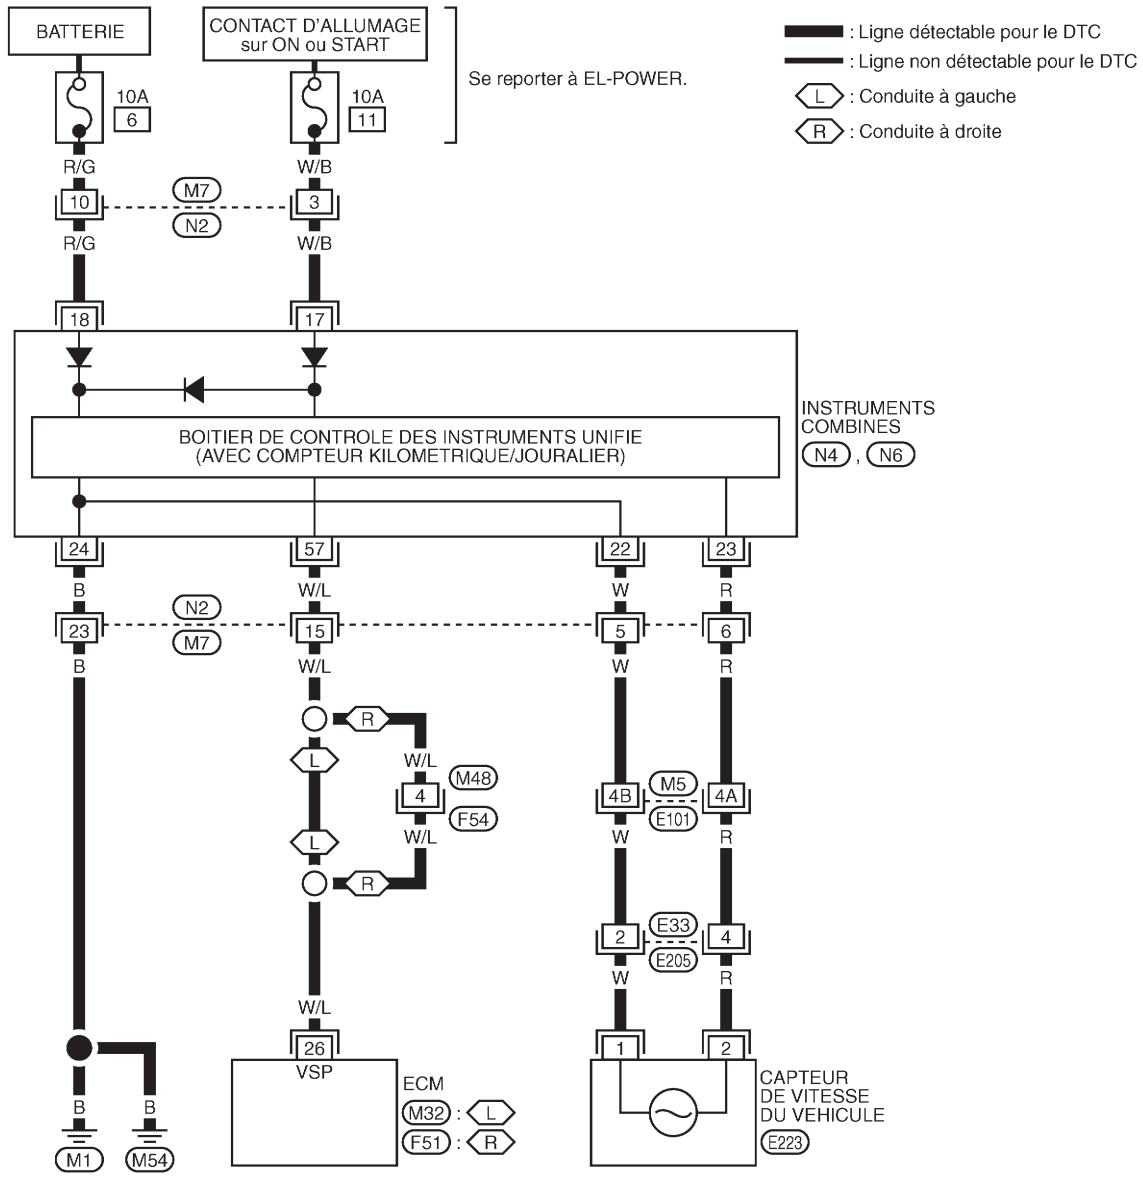
Vérification du fonctionnement général

Utiliser cette procédure pour vérifier le fonctionnement général du circuit du capteur de vitesse du véhicule. Pendant ce contrôle, il se peut que le DTC ne soit pas confirmé.

AVEC CONSULT-II

1) Soulever le véhicule.
2) Démarrer le moteur.
3) Lire le signal du capteur de vitesse de véhicule sur le CONSULT-II en mode ‘‘CONTROLE DE DONNEES’’.
   La vitesse du véhicule indiquée par CONSULT-II devrait pouvoir dépasser 10 km/h lorsque les roues tournent avec la position de transmission adéquate.
4) Si les résultats ne sont pas conformes, effectuer une ‘‘Procédure de diagnostic’’, voir page EC-3520.

SANS CONSULT-II



1) Soulever le véhicule.
2) Démarrer le moteur.
3) Faire tourner la roue motrice à la main.
4) Vérifier la tension entre la borne 26 de l’ECM et la masse avec un contrôleur.
   La tension devrait varier entre 0 V et 4,8 V.
5) Si ‘‘MAUVAIS’’, effectuer une ‘‘Procédure de diagnostic’’, voir page EC-3520.

Procédure de diagnostic

1	VERIFIER SI LE CIRCUIT DU SIGNAL D'ENTREE DU CAPTEUR DE VITESSE DU VEHICULE EST OUVERT OU EN COURT-CIRCUIT
1. Mettre le contact d'allumage sur ''OFF''. 2. Débrancher le connecteur de faisceau de l'ECM et le connecteur de faisceau du combiné d'instruments. 3. Vérifier la continuité du faisceau entre la borne 26 de l'ECM 26 et la borne du combiné d'instruments 57 (modèles avec compte-tours) ou 28 (modèles sans compte-tours). Se référer au schéma de câblage. **Il doit y avoir continuité.** 4. Vérifier également que le faisceau n'est pas ouvert ou en court-circuit à l'alimentation.	
Bon ou mauvais	
Bon ▶	PASSER A L'ETAPE 3.
Mauvais ▶	PASSER A L'ETAPE 2.

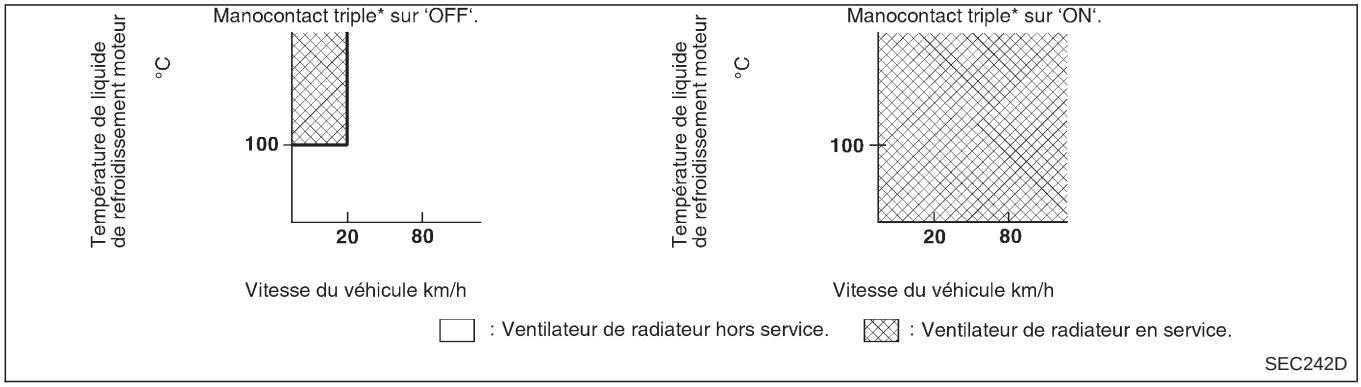
2	DETECTER LA PIECE DEFECTUEUSE
Vérifier les points suivants. ● Connecteurs de faisceaux N2, M7 ● Connecteurs de faisceaux M48, F54 (conduite à droite) ● Faisceau ouvert ou en court-circuit entre l'ECM et le combiné d'instruments	
▶	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

3	VERIFIER LE FONCTIONNEMENT DU COMPTEUR DE VITESSE
S'assurer que le compteur de vitesse fonctionne correctement.	
Bon ou mauvais	
Bon ▶	PASSER A L'ETAPE 5.
Mauvais ▶	PASSER A L'ETAPE 4.

4	VERIFIER SI LE CIRCUIT DU COMPTEUR DE VITESSE EST OUVERT OU EN COURT-CIRCUIT
Vérifier les points suivants. ● Connecteurs de faisceaux N2, M7 ● Connecteurs de faisceaux M5, E101 ● Connecteurs de faisceaux E33, E205 ● Faisceau ouvert ou en court-circuit entre le combiné d'instruments et le capteur de vitesse du véhicule	
Bon ou mauvais	
Bon ▶	Vérifier le capteur de vitesse du véhicule et le combiné d'instruments. Se référer à la section EL.
Mauvais ▶	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

5	VERIFIER SI L'INCIDENT EST INTERMITTENT
Se référer à ''DIAGNOSTIC DES DEFAUTS EN CAS D'INCIDENT INTERMITTENT'', page EC-3502.	
▶	**FIN DE L'INSPECTION**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Description

DESCRIPTION DU SYSTEME

Capteur	Signal d'entrée à l'ECM	Fonction d'ECM	Actionneur
Capteur de vitesse du véhicule	Vitesse du véhicule	Commande du ventilateur de radiateur	Relais du ventilateur de radiateur
Capteur de température du liquide de refroidissement moteur	Température du liquide de refroidissement moteur		
Interrupteur de climatiseur	Signal ''ON'' du climatiseur		

L'ECM contrôle le ventilateur de refroidissement en fonction de la vitesse du véhicule, de la température du liquide de refroidissement du moteur. Le système de commande est à deux positions [MAR/ARR].

FONCTIONNEMENT

Bornes de l'ECM et valeurs de référence

Données de référence relevées entre chaque borne et la masse.

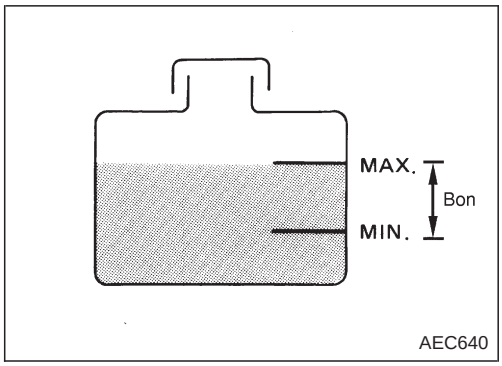
PRECAUTION :

Lors de la mesure de la tension d'entrée/sortie, ne pas utiliser les bornes de masse de l'ECM sous peine d'endommager le transistor de l'ECM. Utiliser une autre masse que celle des bornes de l'ECM.

BORNE N°	COULEUR DE CABLE	ELEMENT	CONDITION	DONNEES (tension continue)
14	G/B	Relais du ventilateur de radiateur	Moteur en marche. └ Le ventilateur de radiateur est à l'arrêt	TENSION BATTERIE (11 V - 14 V)
			Moteur en marche. └ Le ventilateur de radiateur est en marche	Environ 0,1 V

Logique de diagnostic de bord

Ce diagnostic contrôle de façon continue la température du liquide de refroidissement moteur.
Si le ventilateur de refroidissement ou tout autre composant du système de refroidissement est défectueux, la température moteur augmentera.
Lorsque la température du liquide de refroidissement moteur atteint un degré de température anormalement élevé, un défaut est indiqué.



Le défaut est détecté quand ...	Eléments de contrôles (causes possibles)
● Le ventilateur de radiateur ne fonctionne pas correctement (surchauffe). ● Le système de ventilateur de radiateur ne fonctionne pas correctement (surchauffe). ● Le liquide de refroidissement moteur a été ajouté dans le système sans que la procédure de remplissage soit respectée.	● Faisceau ou connecteurs (Le circuit du ventilateur de refroidissement est ouvert ou en court-circuit). ● Ventilateur de radiateur ● Flexible de radiateur ● Radiateur ● Bouchon du radiateur ● Pompe à eau ● Thermostat ● Courroie de ventilateur ● Capteur de température du liquide de refroidissement moteur Pour plus d'informations, se reporter à ''12 CAUSES PRINCIPALES DE SURCHAUFFE'', page EC-3532.

PRECAUTION :

Lorsqu'un défaut est indiqué, veiller à remplacer le liquide de refroidissement en suivant la procédure indiquée à la section MA (''Remplacement du liquide de refroidissement moteur'', ''ENTRETIEN DU MOTEUR''). Remplacer également l'huile moteur.

1) **Faire le plein du radiateur jusqu'au niveau spécifié en versant 2 litres de liquide de refroidissement par minute. Veiller à utiliser un liquide de refroidissement contenant une richesse de mélange appropriée. Se référer à la section MA (''Richesse de mélange de liquide de refroidissement antigel'', ''LIQUIDES ET LUBRIFIANTS RECOMMANDES'').**
2) **Après avoir fait le plein de liquide de refroidissement, faire tourner le moteur pour s'assurer que l'on entend aucun bruit d'écoulement d'eau.**

Vérification du fonctionnement général

Utiliser cette procédure pour vérifier le fonctionnement général du ventilateur de radiateur. Pendant ce contrôle, il se peut que le DTC ne soit pas confirmé.

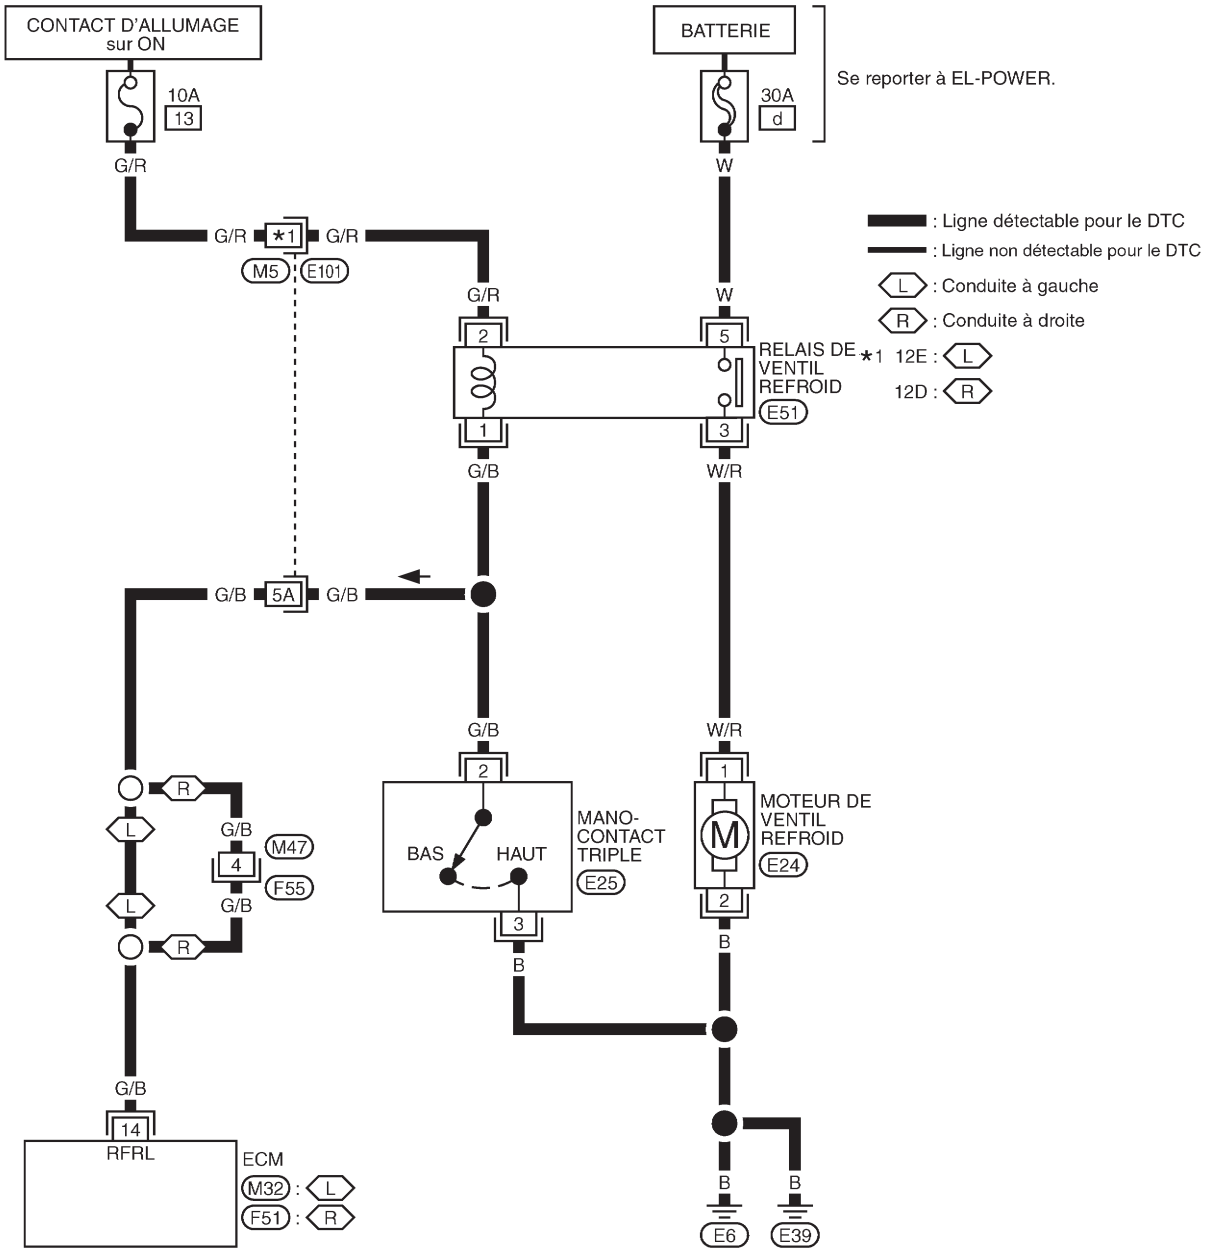
ATTENTION :

Ne jamais déposer le bouchon de radiateur lorsque le moteur est chaud. Le liquide haute pression s'échappant du radiateur peut occasionner de sérieuses brûlures.

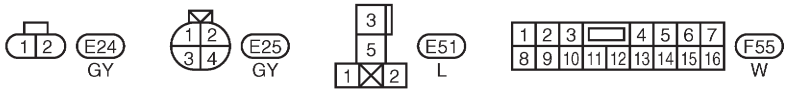
Entourer le bouchon d'un chiffon épais. Retirer le bouchon avec précaution en le tournant d'un quart de tour pour permettre à la pression de s'échapper. Puis tourner le bouchon à fond.

AVEC CONSULT-II

1) Contrôler le niveau de liquide de refroidissement dans le réservoir et dans le radiateur.
   Laisser le moteur refroidir avant de vérifier le niveau de liquide de refroidissement.
   Si le niveau du liquide de réfrigérant dans le réservoir et/ou dans le radiateur est au-dessous de la limite correcte, sauter les étapes suivantes et passer directement à la ''Procédure de diagnostic'', page EC-3525.
2) Confirmer si le client a fait le plein de liquide de refroidissement ou non. Si le client a fait le plein de liquide de refroidissement, sauter les étapes suivantes et passer à la ''Procédure de diagnostic'', page EC-3525.
3) Mettre le contact d'allumage sur ''ON''.
4) Effectuer le test ''VENTIL RADIATEUR'' (ventilateur radiateur) dans le mode ''TEST ACTIF'' de CONSULT-II et s'assurer que les ventilateurs fonctionnent en touchant ''ON'' (MARCHE) ou ''OFF'' (ARRET).
   Si les résultats ne sont pas conformes, effectuer une ''Procédure de diagnostic'', voir page EC-3525.



SANS CONSULT-II



1) Contrôler le niveau de liquide de refroidissement dans le réservoir et dans le radiateur.
   Laisser le moteur refroidir avant de vérifier le niveau de liquide de refroidissement.
   Si le niveau du liquide de réfrigérant dans le réservoir et/ou dans le radiateur est au-dessous de la limite correcte, sauter les étapes suivantes et passer directement à la ''Procédure de diagnostic'', page EC-3525.
2) Confirmer si le client a fait le plein de liquide de refroidissement ou non. Si le client a fait le plein de liquide de refroidissement, sauter les étapes suivantes et passer à la ''Procédure de diagnostic'', page EC-3525.
3) Débrancher le connecteur de faisceau du capteur de température du liquide de refroidissement moteur.
4) Brancher la résistance de 150Ω sur le connecteur de faisceau du capteur de température du liquide de refroidissement moteur.
5) Démarrer le moteur et s'assurer que le ventilateur de radiateur fonctionne.
   Faire attention de ne pas laisser le moteur surchauffer.
6) Si les résultats ne sont pas conformes, effectuer une ''Procédure de diagnostic'', voir page EC-3525.

1. Mettre le contact d'allumage sur ''OFF''.
2. Débrancher le relais de ventilateur de radiateur 1.

SEC954C

3. Mettre le contact d'allumage sur ''ON''.
4. Vérifier la tension entre les bornes 2 et 5 du relais de ventilateur de radiateur et la masse avec CONSULT-II ou avec un contrôleur.

Tension: Tension de la batterie

SEC161D

Bon ou mauvais

Bon	▶	PASSER A L'ETAPE 6.
Mauvais	▶	PASSER A L'ETAPE 5.

5	DETECTER LA PIECE DEFECTUEUSE

Vérifier les points suivants.
- Connecteurs de faisceaux M5, E101
- Fusible de 10 A
- Raccord à fusible de 30 A
- Faisceau ouvert ou en court-circuit entre le relais de ventilateur de refroidissement et le fusible
- Faisceau ouvert ou en court-circuit entre le relais de ventilateur de radiateur et la batterie

	▶	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic (Suite)

6	VERIFIER SI LE CIRCUIT DE MASSE DU VENTILATEUR DE REFROIDISSEMENT EST OUVERT OU EN COURT-CIRCUIT

1. Mettre le contact d'allumage sur ''OFF''.
2. Débrancher le connecteur du faisceau du moteur de ventilateur de refroidissement.

SEC232D

3. Vérifier la continuité de faisceau entre la borne 3 du relais de ventilateur et les bornes 1 du moteur de ventilateur, les bornes 2 du moteur de ventilateur et la masse de la carrosserie. Se référer au schéma de câblage.
   Il doit y avoir continuité.
4. Vérifier également que le faisceau n'est pas ouvert ou en court-circuit à l'alimentation.

Bon ou mauvais

Bon	►	PASSER A L'ETAPE 7.
Mauvais	►	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

7	VERIFIER SI LE CIRCUIT DU SIGNAL DE SORTIE DU VENTILATEUR DE REFROIDISSEMENT EST OUVERT OU EN COURT-CIRCUIT

1. Débrancher le connecteur de faisceau de l'ECM.
2. Débrancher le connecteur de faisceau du manocontact triple.
3. Vérifier la continuité du faisceau entre la borne 14 de l'ECM et la borne 1 du relais de ventilateur de refroidissement, la borne 1 du relais de ventilateur de refroidissement et la borne 2 du manocontact triple, la borne 3 du manocontact triple et la masse. Se référer au schéma de câblage.
   Il doit y avoir continuité.
4. Vérifier également que le faisceau n'est pas ouvert ou en court-circuit à l'alimentation.

Bon ou mauvais

Bon	►	PASSER A L'ETAPE 9.
Mauvais	►	PASSER A L'ETAPE 8.

8	DETECTER LA PIECE DEFECTUEUSE

Vérifier les points suivants.
- Connecteurs de faisceaux M5, E101
- Connecteurs de faisceaux M47, F55 (conduite à droite)
- Faisceau ouvert ou en court-circuit entre le relais du ventilateur de refroidissement et l'ECM
- Faisceau ouvert ou en court-circuit entre le relais de ventilateur de refroidissement et le manocontact triple
- Faisceau ouvert ou en court-circuit entre le manocontact triple et la masse.

	►	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

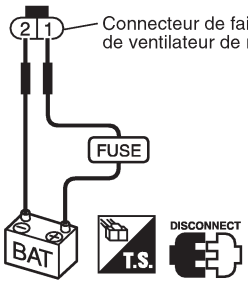
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic (Suite)

9	VERIFIER LE RELAIS DE VENTILATEUR DE REFROIDISSEMENT

Vérifier la continuité entre les bornes 3 et 5 du relais de ventilateur de refroidissement, dans les conditions suivantes.

Conditions	Continuité
Alimentation en courant continu de 12 V entre les bornes 1 et 2	Oui
Pas d'alimentation en courant	Non



SEC340C

Bon ou mauvais

Bon	▶	PASSER A L'ETAPE 10.
Mauvais	▶	Remplacer le relais de ventilateur de radiateur.

10	CONTROLER LE MOTEUR DE VENTILATEUR DE REFROIDISSEMENT

Appliquer une tension de batterie entre les bornes suivantes et vérifier le fonctionnement.

Fournir la tension de batterie: ventilateur de refroidissement en service

SEC162D

Bon ou mauvais

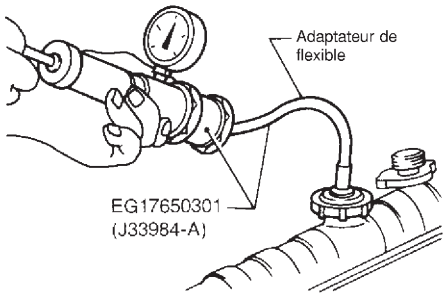
Bon	▶	PASSER A L'ETAPE 11.
Mauvais	▶	Remplacer le moteur du ventilateur de radiateur.

11	VERIFICATION DU MANOCONTACT TRIPLE

Se reporter à la section HA.

Bon ou mauvais

Bon	▶	PASSER A L'ETAPE 12.
Mauvais	▶	Remplacer le manocontact triple.



12	VERIFIER SI L'INCIDENT EST INTERMITTENT
Effectuer un ''DIAGNOSTIC DES DEFAUTS POUR INCIDENT INTERMITTENT'', voir page EC-3502.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic (Suite)

13	VERIFIER SI LE SYSTEME DE REFROIDISSEMENT A DES FUITES

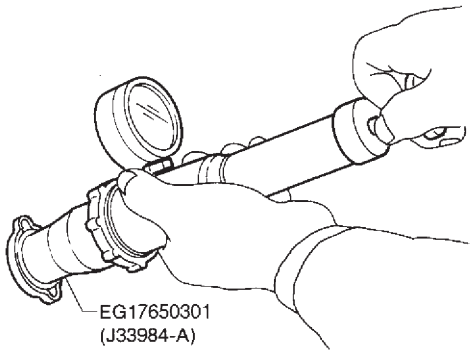
Augmenter la pression du système de refroidissement à l'aide d'un testeur, et vérifier si la pression chute.
Pression d'essai : 157 kPa (1,57 bar, 1,6 kg/cm^2)
PRECAUTION :
Une pression supérieure à celle spécifiée pourrait endommager le radiateur.

SLC754A

La pression ne doit pas chuter.

Bon ou mauvais

Bon	▶	PASSER A L'ETAPE 15.
Mauvais	▶	PASSER A L'ETAPE 14.



14	DETECTER LA PIECE DEFECTUEUSE

Vérifier si les éléments suivants ne fuient pas.
- Flexible
- Radiateur
- Pompe à eau (se référer à la section LC, ''Pompe à eau''.)

	▶	Réparer ou remplacer.

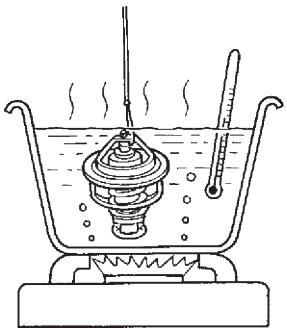
15	VERIFIER LE BOUCHON DE RADIATEUR

Appliquer une pression sur le bouchon de radiateur avec un contrôleur et en vérifier la pression de décharge.

SLC755A

Pression d'ouverture du bouchon de radiateur :
79 - 98 kPa (0,78 - 0,98 bar, 0,8 - 1,0 kg/cm^2)

Bon ou mauvais



Bon	▶	PASSER A L'ETAPE 16.
Mauvais	▶	Remplacer le bouchon de radiateur.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

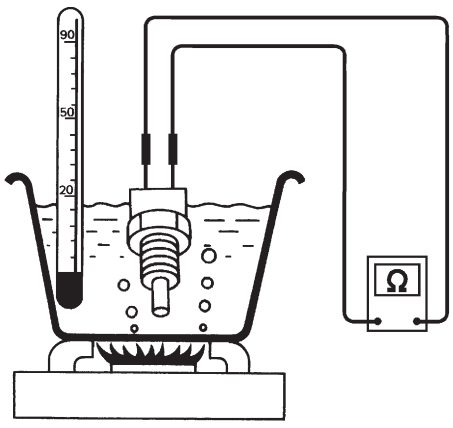
Procédure de diagnostic (Suite)

16	VERIFIER LE THERMOSTAT

1. Déposer le thermostat.
2. Vérifier l'assise de la soupape à température ambiante normale.
   Il doit avoir une bonne assise.
3. Vérifier la température d'ouverture de soupape et la levée de soupape.

SLC343

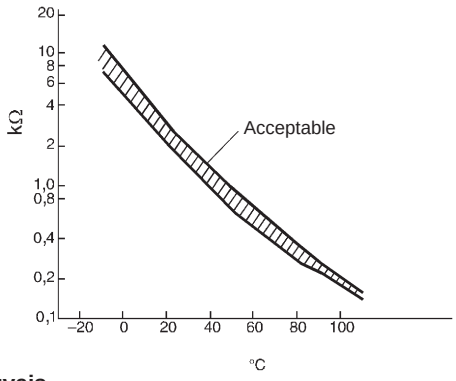
Température d'ouverture de vanne
82°C [standard]
Levée de soupape :
Plus de 10 mm/ 95°C



4. Vérifier si la soupape est fermée à 5°C au-dessous de la température d'ouverture de la vanne. Pour plus de détails, consulter la section LC, ''Thermostat''.

Bon ou mauvais

Bon	▶	PASSER A L'ETAPE 17.
Mauvais	▶	Remplacer le thermostat



17	VERIFIER LE CAPTEUR DE TEMPERATURE DE LIQUIDE DE REFROIDISSEMENT

1. Déposer le capteur de température du liquide de refroidissement moteur.
2. Vérifier la résistance entre les bornes 1 et 2 du capteur de température du liquide de refroidissement moteur, comme le montre l'illustration.

Données de référence

Température °C	Résistance kΩ
20	2,1 - 2,9
50	0,68 - 1,00
90	0,236 - 0,260

SEF304X-R

Bon ou mauvais

Bon	▶	PASSER A L'ETAPE 18.
Mauvais	▶	Remplacer le capteur de température du liquide de refroidissement moteur.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

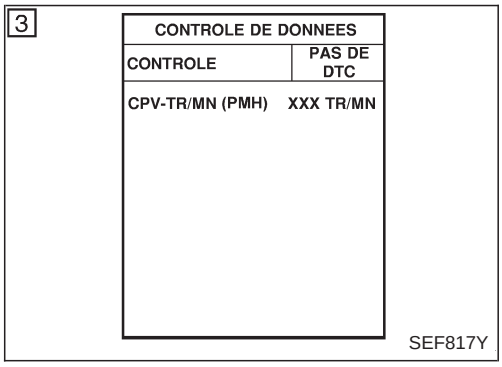
Description des composants

Le capteur de température d'air d'admission est fixé au logement de canalisation d'air. Le capteur détecte la température d'air d'admission et transmet un signal à l'ECM.
L'élément utilisé pour la détection de la température est une thermistance, laquelle est sensible aux variations de température. La résistance électrique de cette thermistance chute en réponse à l'élévation de la température.

<Données de référence>



Température de l'air d'admission °C	Voltage* V	Résistance kΩ
20	3,5	2,1 - 2,9
80	1,24	0,27 - 0,38

* : Ces données sont des valeurs de référence et sont mesurées entre la borne 36 de l'ECM (capteur de température de l'air d'admission) et la masse.

PRECAUTION :
Lors de la mesure de la tension d'entrée/sortie, ne pas utiliser les bornes de masse de l'ECM sous peine d'endommager le transistor de l'ECM. Utiliser une autre masse que celle des bornes de l'ECM, comme la prise de terre.

Logique de diagnostic de bord

Le défaut est détecté quand ...	Eléments de contrôles (causes possibles)
Une tension anormalement basse ou élevée provenant du capteur est adressée à l'ECM.	● Faisceau ou connecteurs (le circuit de capteur est ouvert ou en court-circuit). ● Capteur de température d'air d'admission

Procédure de confirmation de code de défaut (DTC)

AVEC CONSULT-II

1) Mettre le contact d'allumage sur ''ON''.
2) Régler CONSULT-II en mode ''CONTROLE DE DONNEES''.
3) Attendre au moins 5 secondes.
4) Si le DTC est détecté, effectuer une ''Procédure de diagnostic'', voir page EC-3539.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description

DESCRIPTION DU SYSTEME

L'ECM et l'ensemble de la pompe d'injection de carburant à commande électronique (abrégé ensuite en pompe d'injection) communiquent en temps réel (échange de signaux).
L'ECM transmet les signaux de la quantité d'injection de carburant cible, d'avance à l'injection de carburant cible, de vitesse du moteur, etc., et reçoit les signaux de vitesse de la pompe et de la température du carburant, etc. du boîtier de commande de la pompe d'injection.
Avec ces signaux, la pompe d'injection commande de manière optimale le débit d'injection et l'avance de l'injection au niveau de la soupape de décharge et de la soupape de commande.
La pompe d'injection possède un système de diagnostic intégré qui détecte les défauts des capteurs ou des actionneurs qui se trouvent dans la pompe. Ces informations concernant le défaut sont transférées via la ligne (circuit) du boîtier de commande de la pompe d'injection vers l'ECM.

COMMANDE DU DEBIT D'INJECTION

En fonction de la valeur théorique envoyée par l'ECM, le débit d'injection dépend de la commande de la soupape de décharge de la pompe d'injection et de la modification du temps d'ouverture de l'aiguille.

COMMANDE D'AVANCE A L'INJECTION DE CARBURANT

Sur la base de la valeur théorique envoyée par l'ECM, l'avance de l'injection dépend, en fonction du tarage ressort du système d'avance, du cycle de fonctionnement de la soupape de commande d'avance qui se trouve dans la pompe d'injection et du réglage de la pression dans la chambre haute pression du piston du système d'avance.

CAPTEUR DE TEMPERATURE DU CARBURANT

Le capteur relève la température du carburant dans la pompe d'injection et calibre le débit d'injection en fonction de la température du carburant.

CAPTEUR DE LA POSITION DE L'ANNEAU A CAME

Le capteur détecte le passage du bossage qui se trouve sur l'anneau à came de la pompe d'injection à l'aide d'un élément semi-conducteur à réluctance variable. Le capteur de position de l'anneau à cames assure la synchronisation de l'anneau à cames, et détecte l'avance réelle. Le boîtier de commande de la pompe d'injection mesure la révolution de la pompe d'injection grâce au signal du capteur de position de l'anneau à cames.

Valeur de référence de CONSULT-II en mode de contrôle de données

Remarques : Les données de spécification sont des valeurs de référence.

ELEMENT DE CONTROLE	CONDITION		SPECIFICATION
CAP TEMP CARB	● moteur : Une fois le moteur chaud		Plus de 40°C
SOUPAPE/FUITE (soupape de décharge)	● moteur : Une fois le moteur chaud	Ralenti	Environ 13°CA
INJ TIMG C/V (commande avance injection)	● moteur : faire chauffer le moteur, puis le faire tourner au ralenti.		Environ 50 - 70%
COUP/C DECELER	● moteur : Une fois le moteur chaud	Ralenti	OFF
CAP BARO	● Contact d'allumage : ON		Altitude Environ 0 m : Environ 100,62 kPa (1,0062 bar, 1,026 kg/cm^2) Environ 1000 m : Environ 88,95 kPa (0,8895 bar, 0,907 kg/cm^2) Environ 1 500 m : Environ 83,16 kPa (0,8316 bar, 0,848 kg/cm^2) Environ 2 000 m : Environ 78,36 kPa (0,7836 bar, 0,799 kg/cm^2)

Bornes de l'ECM et valeurs de référence

Données de référence relevées entre chaque borne et la masse.

PRECAUTION :

Lors de la mesure de la tension d'entrée/sortie, ne pas utiliser les bornes de masse de l'ECM sous peine d'endommager le transistor de l'ECM. Utiliser une autre masse que celle des bornes de l'ECM.

BORNE N°	COULEUR DE CABLE	ELEMENT	CONDITION	DONNEES (tension continue)
33	G/Y	Pompe d'injection de carburant à commande électronique	Moteur en marche. └ **Pendant la montée en température** Régime de ralenti	Environ 2,4 V
40	PU	Pompe d'injection de carburant à commande électronique	Moteur en marche. └ **Pendant la montée en température** Régime de ralenti	Environ 2,4 V
52	L/W	Pompe d'injection de carburant à commande électronique	Moteur en marche. └ Régime de ralenti	Environ 0,1 V
53	L/R	Pompe d'injection de carburant à commande électronique	Moteur en marche. └ Régime de ralenti	Environ 0,45 V
			Moteur en marche. └ Le régime moteur est de 2 000 tr/mn.	Environ 0,7 V

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Logique de diagnostic de bord

Le défaut est détecté quand ...	Eléments de contrôles (causes possibles)
● Le capteur de température de carburant (intégré à la pompe d'injection) envoie un signal tension incorrect au circuit électronique de la pompe.	● Faisceau ou connecteurs (le circuit électronique de la pompe d'injection est ouvert ou en court-circuit) ● Pompe d'injection de carburant à commande électronique

2

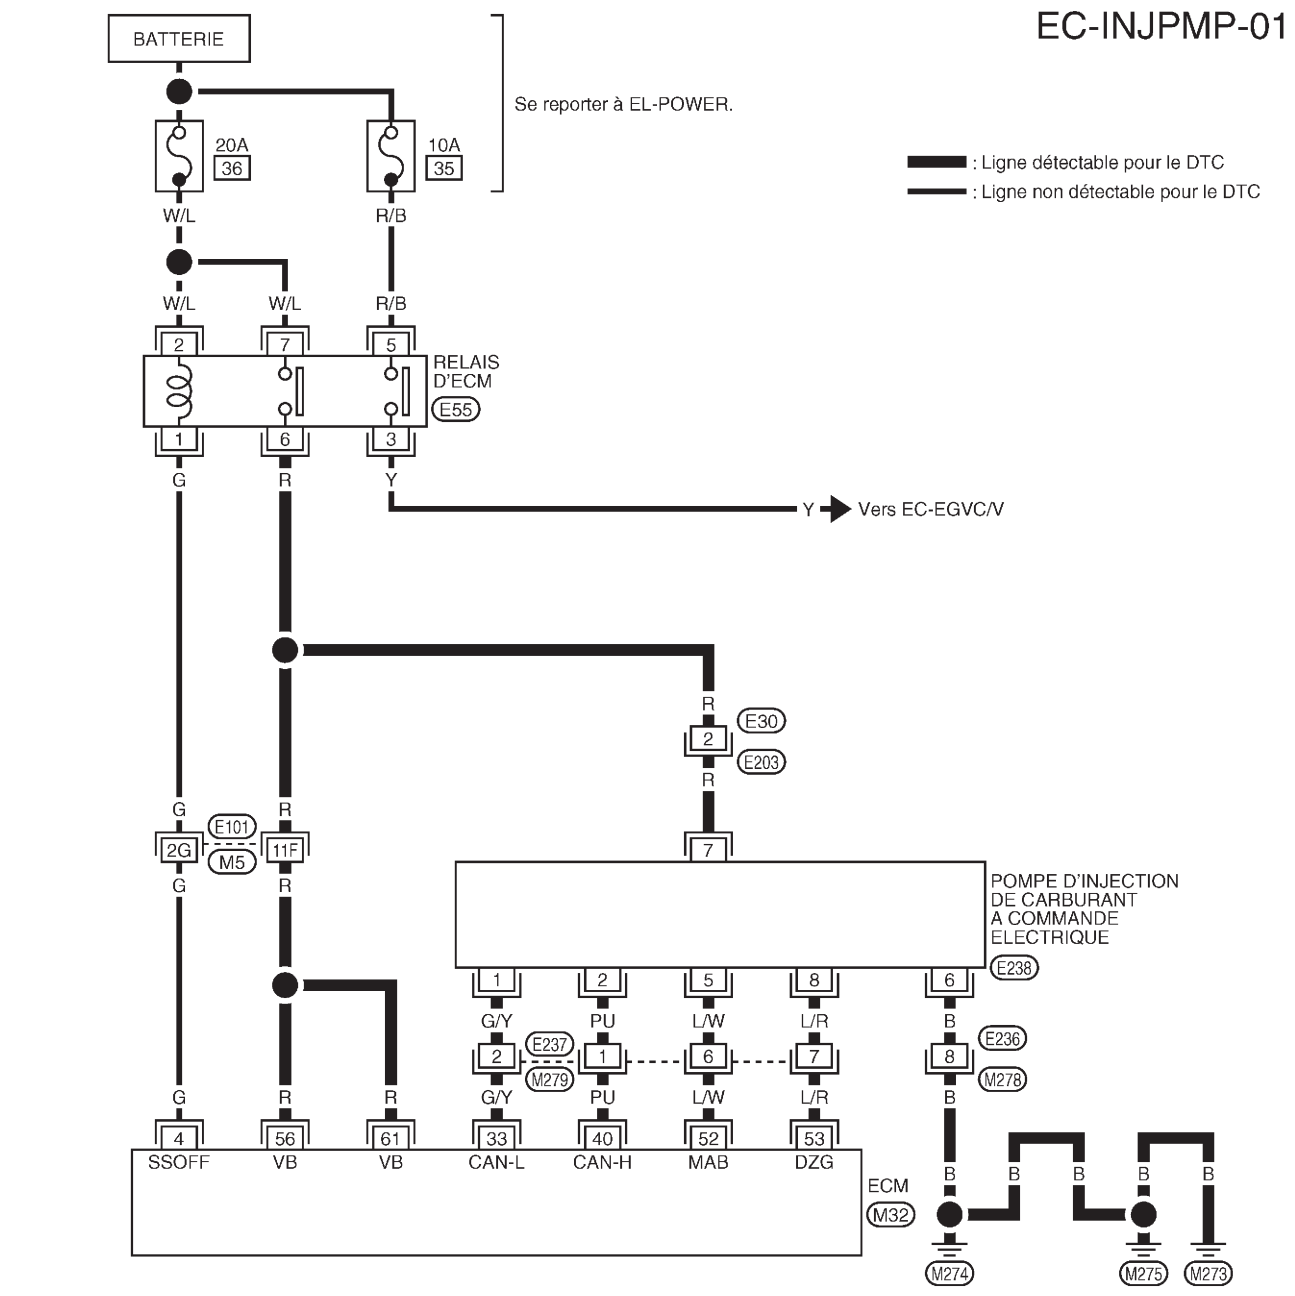
CONTROLE DE DONNEES	
CONTROLE	PAS DE DTC
CPV-TR/MN (PMH)	XXX TR/MN

SEF817Y

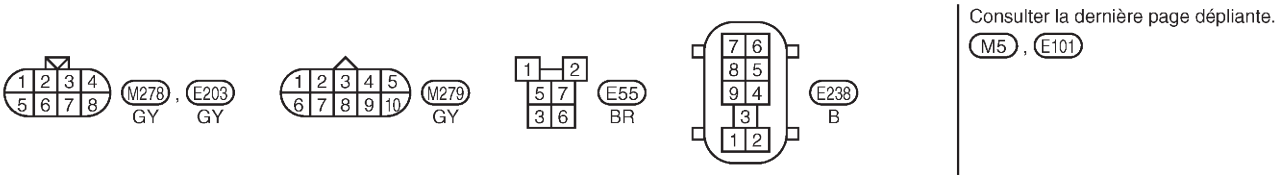
Procédure de confirmation de code de défaut (DTC)

AVEC CONSULT-II

1) Mettre le contact d'allumage sur 'ON', puis attendre au moins 2 secondes.
2) Régler CONSULT-II en mode ''CONTROLE DE DONNEES''.
3) Démarrer le moteur et le faire tourner pendant au moins 2 secondes au régime ralenti.
   (si le moteur ne tourne pas, mettre le contact d'allumage sur "START" pendant 2 secondes au moins)
4) Si le DTC est détecté, effectuer une ''Procédure de diagnostic'', voir page EC-3546.



SANS CONSULT-II



1) Mettre le contact d'allumage sur ''ON'', puis attendre au moins 2 secondes.
2) Démarrer le moteur et le faire tourner pendant au moins 2 secondes au régime ralenti.
   (si le moteur ne tourne pas, mettre le contact d'allumage sur ''DEPART'' pendant 2 secondes au moins)
3) Mettre le contact d'allumage sur ''OFF'', attendre au moins 5 secondes, puis remettre le contact sur ''ON''.
4) Effectuer le ''Test de diagnostic mode II (résultats d'autodiagnostic)'' avec l'ECM.
5) Si le DTC est détecté, effectuer une ''Procédure de diagnostic'', voir page EC-3546.

Description

L'unité de fonctionnement de l'accélérateur est installée sur l'extrémité supérieure de la pédale d'accélération. Le capteur détecte la position de l'accélérateur et envoie un signal à l'ECM. L'ECM utilise le signal pour déterminer la quantité de carburant à injecter.
Le contact d'accélérateur détecte si la pédale d'accélérateur est entièrement relâchée ou complètement enfoncée et envoie le signal correspondant à l'ECM. L'ECM détermine les conditions de ralenti du moteur. Ces signaux sont aussi utilisés pour le diagnostic du capteur de position d'accélérateur.

Valeur de référence de CONSULT-II en mode de contrôle de données

Les données de spécification sont des valeurs de référence.

ELEMENT DE CONTROLE	CONDITION		SPECIFICATION
CAP POS ACCEL	● Contact d'allumage : ON (moteur à l'arrêt)	Pédale d'accélérateur libre	0,29 - 0,79V
		Pédale d'accélérateur enfoncée	3,48 V - 4,64 V
CNT ACCEL FOND	● Contact d'allumage : ON (moteur à l'arrêt)	Pédale d'accélérateur enfoncée au maximum	MAR
		Sauf ci-dessus	ARR
CNT ACCEL COUP	● Contact d'allumage : ON (moteur à l'arrêt)	Pédale d'accélérateur Complètement relâchée	MAR
		Pédale d'accélérateur légèrement ouverte	ARR

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Bornes de l'ECM et valeurs de référence

Données de référence relevées entre chaque borne et la masse.

PRECAUTION :
Lors de la mesure de la tension d'entrée/sortie, ne pas utiliser les bornes de masse de l'ECM sous peine d'endommager le transistor de l'ECM. Utiliser une autre masse que celle des bornes de l'ECM comme la prise de terse.

BORNE N°	COULEUR DE CABLE	ELEMENT	CONDITION	DONNEES (tension continue)
23	W	Capteur de position d'accélérateur	Contact d'allumage sur "ON" └ Pédale d'accélérateur entièrement relâchée	0,29 - 0,79 V
			Contact d'allumage sur "ON" └ Pédale d'accélérateur complètement enfoncée	3,48 V - 4,64 V
31	Y	Contact de position d'accélérateur (au ralenti)	Contact d'allumage sur "ON" └ Pédale d'accélérateur entièrement relâchée	TENSION BATTERIE (11 V - 14 V)
			Contact d'allumage sur "ON" └ Pédale d'accélérateur enfoncée	Environ 0 V
32	G	Contact de position d'accélérateur (accélération maximale)	Contact d'allumage sur "ON" └ Pédale d'accélérateur relâchée	Environ 0 V
			Contact d'allumage sur "ON" └ Pédale d'accélérateur complètement enfoncée	TENSION BATTERIE (11 V - 14 V)
48	OR/L	Alimentation électrique du capteur de position d'accélérateur	Contact d'allumage sur "ON"	Environ 5 V
51	B/W	Masse du capteur de position d'accélérateur	Moteur en marche. └ **Pendant la montée en température** Régime de ralenti	Environ 0 V

Logique de diagnostic de bord

Le défaut est détecté quand ...	Eléments de contrôles (causes possibles)
● La relation entre le signal du capteur de position et le contact d'accélérateur dans la plage d'action normale de la pédale n'est pas correcte.	● Faisceau ou connecteurs (le circuit de capteur est ouvert ou en court-circuit). ● Capteur de position d'accélérateur ● Contact de position d'accélérateur

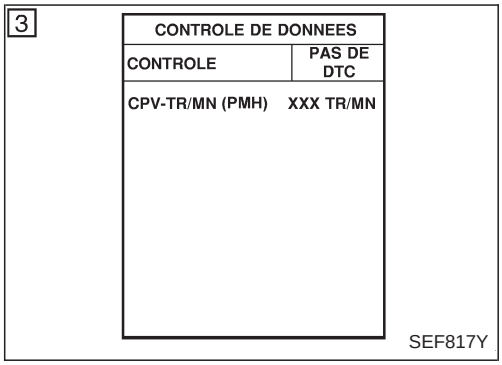
	▶	**FIN DE L'INSPECTION**



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Logique de diagnostic de bord

Le défaut est détecté quand ...	Eléments de contrôles (causes possibles)
● Une tension extrêmement élevée est envoyée à l'ECM par le capteur de pression d'air de suralimentation lorsque le moteur tourne.	● Système d'air d'admission ● Système de turbocompresseur ● Capteur de pression d'air de suralimentation ● Faisceau ou connecteurs (Le circuit du capteur de pression d'air de suralimentation est en court-circuit.)

Procédure de confirmation de code de défaut (DTC)

REMARQUE :
Si le code DTC 0406 ''VOL AIR ADMI'' s'affiche avec le code DTC 0905 ''PRESSION TURBO'', effectuer un diagnostic des défauts pour le code DTC 0905 ''PRESSION TURBO'' en premier lieu. (Se reporter à la page EC-3643.)

Avec CONSULT-II

1) Mettre le contact d'allumage sur ''ON''.
2) Régler CONSULT-II en mode ''CONTROLE DE DONNEES''.
3) Démarrer le moteur et l'amener à température normale de fonctionnement.
4) Conduire le véhicule.
5) Maintenir le régime moteur à plus de 4 000 tr/min pendant 10 secondes au minimum.
6) Si le DTC est détecté, effectuer une ''Procédure de diagnostic'', voir page EC-3565.

SANS CONSULT-II

1) Démarrer le moteur et l'amener à température normale de fonctionnement.
2) Conduire le véhicule.
3) Maintenir le régime moteur à plus de 4 000 tr/min pendant 10 secondes au minimum.
4) Arrêter le véhicule.
5) Mettre le contact d'allumage sur ''OFF'', attendre au moins 5 secondes, puis remettre le contact sur ''ON''.
6) Effectuer le ''Test de diagnostic mode II (résultats d'autodiagnostic)'' avec l'ECM.
7) Si le DTC est détecté, effectuer une ''Procédure de diagnostic'', voir page EC-3565.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

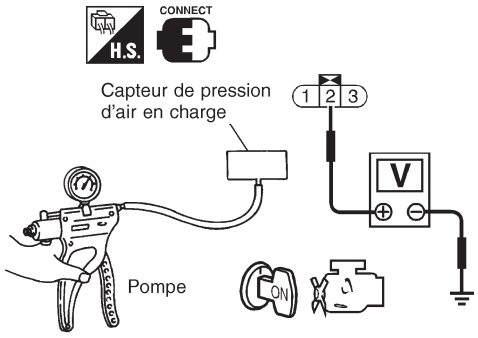
Procédure de diagnostic

1	VERIFIER LE SYSTEME D'AIR D'ADMISSION

Ecouter pour déceler une fuite d'air d'admission ou de colmatage après le capteur de température d'air d'admission.

Bon ou mauvais

Bon	▶	PASSER A L'ETAPE 2.
Mauvais	▶	Réparer ou remplacer.



2	VERIFIER LE CAPTEUR DE PRESSION D'AIR DE SURALIMENTATION

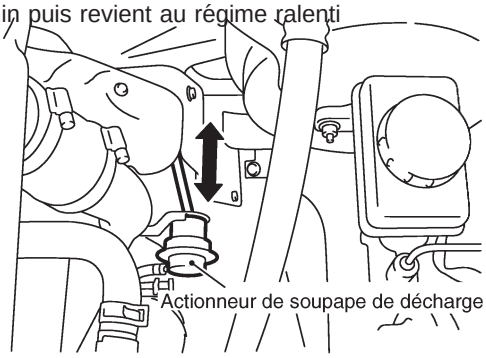
1. Déposer le capteur de pression d'air de suralimentation avec son connecteur de faisceau branché.
2. Mettre le contact d'allumage sur ''ON''.
3. Appliquer une pression au capteur de pression d'air de suralimentation avec une pompe génératrice de pression comme indiqué sur l'illustration.

PRECAUTION :

- **Toujours étalonner la jauge de la pompe au moment de l'utiliser.**
- **Effectuer la vérification à température ambiante [10°C - 30°C].**

4. Vérifier la tension de sortie entre la borne 2 du capteur d'air de suralimentation et la masse du moteur.

Pression (Relative à la pression atmosphérique)	Tension V
0 kPa (0 mbar, 0 mmHg)	1,9 - 3,0
+40 kPa (400 mbar, 300 mmHg)	La tension devrait être entre 0,6 et 1,0V supérieure à la valeur mesurée ci-dessus.



SEF449Z

Bon ou mauvais

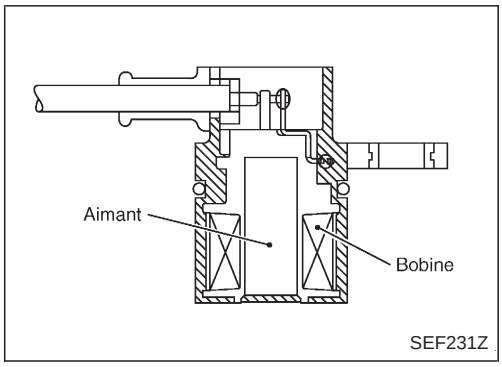
Bon	▶	PASSER A L'ETAPE 3.
Mauvais	▶	Remplacer le capteur de pression d'air de suralimentation

3	VERIFIER LE FONCTIONNEMENT GENERAL DU TURBOCOMPRESSEUR

1. Démarrer le moteur et le laisser tourner au ralenti.
2. S'assurer que la tige de l'actionneur de commande de la soupape de décharge du turbocompresseur se déplace lorsque le moteur tourne jusqu'à 3 000 tr/min puis revient au régime ralenti

SEC255D

Bon ou mauvais



Bon	▶	PASSER A L'ETAPE 4.
Mauvais	▶	Se reporter à la section EM ''Inspection du Turbocompresseur''.

►	FIN DE L'INSPECTION

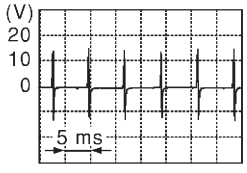
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description

Le capteur d'angle du vilebrequin (PMH) contrôle le régime moteur grâce au signal généré par la rotation d'une plaque avec 3 bossages fixée sur la poulie du vilebrequin. Le signal de sortie est détecté à 70° avant le PMH et envoyé à l'ECM. Le signal du capteur est utilisé pour les contrôles d'injection de carburant et d'avance d'injection de carburant.

Valeur de référence de CONSULT-II en mode de contrôle de données

Les données de spécification sont des valeurs de référence.

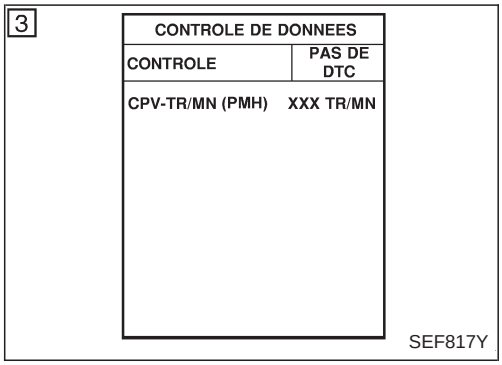


ELEMENT DE CONTROLE	CONDITION	SPECIFICATION
CPV·TR/MN (PMH)	● Compte-tours : Brancher ● Faire tourner le moteur et comparer l'indication du compte-tours avec la valeur affichée par CONSULT-II.	Valeur voisine de cette indiquée par CONSULT-II.

Bornes de l'ECM et valeurs de référence

Données de référence relevées entre chaque borne et la masse.

PRECAUTION :



Lors de la mesure de la tension d'entrée/sortie, ne pas utiliser les bornes de masse de l'ECM sous peine d'endommager le transistor de l'ECM. Utiliser une autre masse que celle des bornes de l'ECM.

BORNE N°	COULEUR DE CABLE	ELEMENT	CONDITION	DONNEE (tension continue ou impulsion)
44	Y	Capteur d'angle de vilebrequin (PMH)	Moteur en marche. └ **Pendant la montée en température** Régime de ralenti	Environ 0,04 V  SEF333Y
			Moteur en marche. └ **Pendant la montée en température** Le régime moteur est de 2 000 tr/mn.	Environ 0,04 V  SEF334Y
47	BR	Masse du capteur d'angle du vilebrequin (PMH)	Moteur en marche. └ **Pendant la montée en température** Régime de ralenti	Environ 0 V

Logique de diagnostic de bord

L'ECM vérifie si la tension de la batterie est dans la tolérance exigée par le système de gestion moteur.

Le défaut est détecté quand ...	Eléments de contrôles (causes possibles)
● La tension reçue par l'ECM est anormalement élevée.	● Démarrage avec des câbles de dépannage incorrect ● Batterie ● Alternateur ● ECM

Procédure de confirmation de code de défaut (DTC)

Avec CONSULT-II

1) Vérifier les points suivants.
● Les câbles de connexion sont branchés pour le démarrage à l'aide d'une batterie auxiliaire.
● La batterie ou l'alternateur a été remplacé(e).
Si ''oui'' pour un des éléments ou les deux, sauter les étapes suivantes et effectuer la ''Procédure de diagnostic'', voir page EC-3574.
2) Vérifier si la cosse de la borne positive de la batterie est branchée correctement. Si le résultat n'est pas satisfaisant, la reconnecter correctement.
3) Vérifier que l'alternateur fonctionne correctement. Se référer à la section EL (''SYSTEME DE CHARGE'').
4) Mettre le contact sur ''ON'' et régler CONSULT-II en mode ''CONTROLE DE DONNEES''.
5) Attendre 1 minute.
6) Si le DTC est détecté, effectuer une ''Procédure de diagnostic'', voir page EC-3574.
Si le DTC n'est pas détecté, passer à l'étape suivante.
7) Démarrer le moteur et le laisser tourner au ralenti pendant 1 minute.
8) Si le DTC est détecté, effectuer une ''Procédure de diagnostic'', voir page EC-3574.

Sans CONSULT-II

1) Vérifier les points suivants.
● Les câbles volants sont branchés pour le démarrage par batterie auxiliaire
● La batterie ou l'alternateur a été remplacé(e).
Si ''oui'' pour un des éléments ou les deux, sauter les étapes suivantes et effectuer la ''Procédure de diagnostic'', voir page EC-3574.
2) Vérifier si la cosse de la borne positive de la batterie est branchée correctement. Si le résultat n'est pas satisfaisant, la reconnecter correctement.
3) Vérifier que l'alternateur fonctionne correctement. Se référer à la section EL (''SYSTEME DE CHARGE'').
4) Mettre le contact d'allumage sur ''ON'' et attendre 1 minute.
5) Mettre le contact sur ''OFF'', attendre 5 secondes, puis remettre le contact sur ''ON''.
6) Effectuer le ''Test de diagnostic mode II (résultats d'autodiagnostic)'' avec l'ECM.
7) Si le DTC est détecté, effectuer une ''Procédure de diagnostic'', voir page EC-3574.
Si le DTC n'est pas détecté, passer à l'étape suivante.
8) Démarrer le moteur et le laisser tourner au ralenti pendant 1 minute.
9) Mettre le contact sur ''OFF'', attendre 5 secondes, puis remettre le contact sur ''ON''.
10) Effectuer le ''Test de diagnostic mode II (résultats d'autodiagnostic)'' avec l'ECM.
11) Si le DTC est détecté, effectuer une ''Procédure de diagnostic'', voir page EC-3574.

Mauvais	▶	Réparer ou remplacer les pièces défectueuses.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description

DESCRIPTION DU SYSTEME

L'ECM et l'ensemble de la pompe d'injection de carburant à commande électronique (abrégé ensuite en pompe d'injection) communiquent en temps réel (échange de signaux).
L'ECM transmet les signaux de la quantité d'injection de carburant cible, d'avance à l'injection de carburant cible, de vitesse du moteur, etc., et reçoit les signaux de vitesse de la pompe et de la température du carburant, etc. du boîtier de commande de la pompe d'injection.
Avec ces signaux, la pompe d'injection commande de manière optimale le débit d'injection et l'avance de l'injection au niveau de la soupape de décharge et de la soupape de commande.
La pompe d'injection possède un système de diagnostic intégré qui détecte les défauts des capteurs ou des actionneurs qui se trouvent dans la pompe. Ces informations concernant le défaut sont transférées via la ligne (circuit) du boîtier de commande de la pompe d'injection vers l'ECM.

COMMANDE DU DEBIT D'INJECTION

En fonction de la valeur théorique envoyée par l'ECM, le débit d'injection dépend de la commande de la soupape de décharge de la pompe d'injection et de la modification du temps d'ouverture de l'aiguille.

COMMANDE DE L'AVANCE A L'INJECTION DE CARBURANT

Sur la base de la valeur théorique envoyée par l'ECM, l'avance de l'injection dépend, en fonction du tarage ressort du système d'avance, du cycle de fonctionnement de la soupape de commande d'avance qui se trouve dans la pompe d'injection et du réglage de la pression dans la chambre haute pression du piston du système d'avance.

CAPTEUR DE TEMPERATURE DU CARBURANT

Le capteur relève la température du carburant dans la pompe d'injection et calibre le débit d'injection en fonction de la température du carburant.

CAPTEUR DE LA POSITION DE L'ANNEAU A CAME

Le capteur détecte le passage du bossage qui se trouve sur l'anneau à came de la pompe d'injection à l'aide d'un élément semi-conducteur à réluctance variable. Le capteur de position de l'anneau à cames assure la synchronisation de l'anneau à cames, et détecte l'avance réelle. Le boîtier de commande de la pompe d'injection mesure la révolution de la pompe d'injection grâce au signal du capteur de position de l'anneau à cames.

Description

DESCRIPTION DU SYSTEME

L'ECM et l'ensemble de la pompe d'injection de carburant à commande électronique (abrégé ensuite en pompe d'injection) communiquent en temps réel (échange de signaux).
L'ECM transmet les signaux de la quantité d'injection de carburant cible, d'avance à l'injection de carburant cible, de vitesse du moteur, etc., et reçoit les signaux de vitesse de la pompe et de la température du carburant, etc. du boîtier de commande de la pompe d'injection.
Avec ces signaux, la pompe d'injection commande de manière optimale le débit d'injection et l'avance de l'injection au niveau de la soupape de décharge et de la soupape de commande.
La pompe d'injection possède un système de diagnostic intégré qui détecte les défauts des capteurs ou des actionneurs qui se trouvent dans la pompe. Ces informations concernant le défaut sont transférées via la ligne (circuit) du boîtier de commande de la pompe d'injection vers l'ECM.

COMMANDE DU DEBIT D'INJECTION

En fonction de la valeur théorique envoyée par l'ECM, le débit d'injection dépend de la commande de la soupape de décharge de la pompe d'injection et de la modification du temps d'ouverture de l'aiguille.

COMMANDE DE L'AVANCE A L'INJECTION DE CARBURANT

Sur la base de la valeur théorique envoyée par l'ECM, l'avance de l'injection dépend, en fonction du tarage ressort du système d'avance, du cycle de fonctionnement de la soupape de commande d'avance qui se trouve dans la pompe d'injection et du réglage de la pression dans la chambre haute pression du piston du système d'avance.

CAPTEUR DE TEMPERATURE DU CARBURANT

Le capteur relève la température du carburant dans la pompe d'injection et calibre le débit d'injection en fonction de la température du carburant.

CAPTEUR DE LA POSITION DE L'ANNEAU A CAME

Le capteur détecte le passage du bossage qui se trouve sur l'anneau à came de la pompe d'injection à l'aide d'un élément semi-conducteur à réluctance variable. Le capteur de position de l'anneau à cames assure la synchronisation de l'anneau à cames, et détecte l'avance réelle. Le boîtier de commande de la pompe d'injection mesure la révolution de la pompe d'injection grâce au signal du capteur de position de l'anneau à cames.

6	DETECTER LA PIECE DEFECTUEUSE
Vérifier les points suivants. ● Connecteurs de faisceaux E237, M279 (conduite à gauche) ● Connecteurs de faisceaux E237, F36 (conduite à droite) ● Faisceau ouvert ou en court-circuit entre la pompe d'injection et l'ECM	
►	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

7	VERIFIER SI L'INCIDENT EST INTERMITTENT
Se référer à ''DIAGNOSTIC DES DEFAUTS EN CAS D'INCIDENT INTERMITTENT'', page EC-3502	

Bon ou mauvais

Bon	►	Remplacer la pompe d'injection de carburant.
Mauvais	►	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description

DESCRIPTION DU SYSTEME

L'ECM et l'ensemble de la pompe d'injection de carburant à commande électronique (abrégé ensuite en pompe d'injection) communiquent en temps réel (échange de signaux).
L'ECM transmet les signaux de la quantité d'injection de carburant cible, d'avance à l'injection de carburant cible, de vitesse du moteur, etc., et reçoit les signaux de vitesse de la pompe et de la température du carburant, etc. du boîtier de commande de la pompe d'injection.
Avec ces signaux, la pompe d'injection commande de manière optimale le débit d'injection et l'avance de l'injection au niveau de la soupape de décharge et de la soupape de commande.
La pompe d'injection possède un système de diagnostic intégré qui détecte les défauts des capteurs ou des actionneurs qui se trouvent dans la pompe. Ces informations concernant le défaut sont transférées via la ligne (circuit) du boîtier de commande de la pompe d'injection vers l'ECM.

COMMANDE DU DEBIT D'INJECTION

En fonction de la valeur théorique envoyée par l'ECM, le débit d'injection dépend de la commande de la soupape de décharge de la pompe d'injection et de la modification du temps d'ouverture de l'aiguille.

COMMANDE DE L'AVANCE A L'INJECTION DE CARBURANT

Sur la base de la valeur théorique envoyée par l'ECM, l'avance de l'injection dépend, en fonction du tarage ressort du système d'avance, du cycle de fonctionnement de la soupape de commande d'avance qui se trouve dans la pompe d'injection et du réglage de la pression dans la chambre haute pression du piston du système d'avance.

CAPTEUR DE TEMPERATURE DU CARBURANT

Le capteur relève la température du carburant dans la pompe d'injection et calibre le débit d'injection en fonction de la température du carburant.

CAPTEUR DE LA POSITION DE L'ANNEAU A CAME

Le capteur détecte le passage du bossage qui se trouve sur l'anneau à came de la pompe d'injection à l'aide d'un élément semi-conducteur à réluctance variable. Le capteur de position de l'anneau à cames assure la synchronisation de l'anneau à cames, et détecte l'avance réelle. Le boîtier de commande de la pompe d'injection mesure la révolution de la pompe d'injection grâce au signal du capteur de position de l'anneau à cames.

Procédure de diagnostic (Suite)

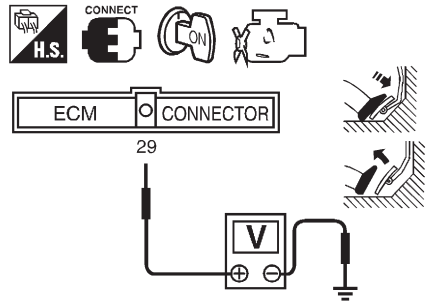
	VERIFIER LE FONCTIONNEMENT DU CONTACT DE POSITION DE LA PEDALE DE FREIN.

Avec CONSULT-II

1. Sélectionner ‘‘CONT FREIN2’’ avec CONSULT-II en mode ‘‘CONTROLE DE DONNEES’’.
2. Vérifier le signal ‘‘CONT FREIN2’’ dans les conditions suivantes.



CONTROLE DES DONNEES	
CONTROLE	AUCUN DTC
COMMANDE DE FREIN	ON

Conditions	OFF ACCEL SW
Pédale de frein relâchée	ARR
Pédale de frein enfoncée	MAR

SEC258D

Sans CONSULT-II

Vérifier la tension entre la borne 29 de l’ECM et la masse dans les conditions suivantes.

Conditions	Tension (Borne ECM 435)
Pédale de frein relâchée	Tension de batterie
Pédale de frein enfoncée	Environ 0V

SEC259D

Bon ou mauvais

Bon	▶	PASSER A L’ETAPE 14.
Mauvais	▶	PASSER A L’ETAPE 9.

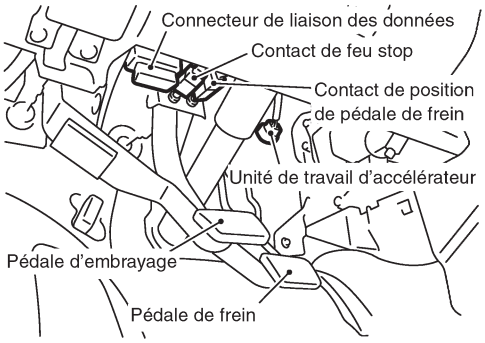
3	**VERIFIER LE CIRCUIT DU CONTACT DU FEU STOP**

Vérifier le fonctionnement du feu stop en appuyant sur le contact du feu stop puis en le relâchant.

Contact de feux de stop	Feux de stop
Complètement relâchée	Eteints
Enfoncée	Allumés

MTBL0443

Bon ou mauvais

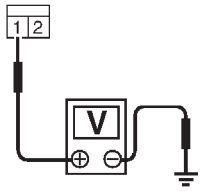


Bon	▶	PASSER A L’ETAPE 6.
Mauvais	▶	PASSER A L’ETAPE 4.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic (Suite)

4	VERIFIER LE CIRCUIT D'ALIMENTATION DU CONTACT DU FEU STOP



1. Mettre le contact d'allumage sur ''OFF''.
2. Débrancher le connecteur de faisceau du contact de feux de stop.

SEC233D

3. Mettre le contact d'allumage sur ''ON''.
4. Vérifier la tension entre la borne 1 du contact du feu stop et la masse avec le CONSULT-II ou avec un contrôleur.

Tension : tension de la batterie

SEF435Y

Bon ou mauvais

Bon	▶	PASSER A L'ETAPE 6.
Mauvais	▶	PASSER A L'ETAPE 5.

5	DETECTER LA PIECE DEFECTUEUSE

Vérifier les points suivants.
- Fusible de 10 A
- Faisceau en circuit ouvert ou en court-circuit entre le contact de feu stop et le fusible.

	▶	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic (Suite)

6	VERIFIER SI LE CIRCUIT DU SIGNAL D'ENTREE DU CONTACT DU FEU STOP EST OUVERT OU EN COURT-CIRCUIT

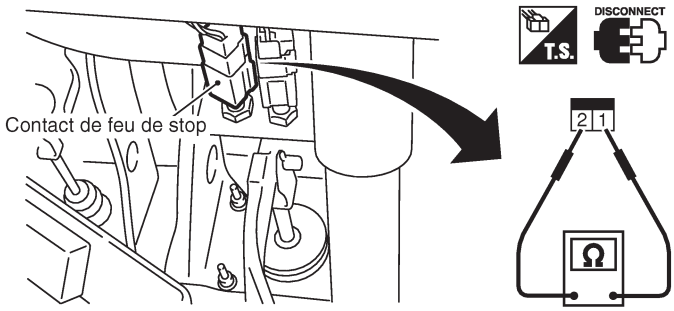
1. Mettre le contact d'allumage sur ''OFF''.
2. Débrancher le connecteur de faisceau de l'ECM.
3. Débrancher le connecteur de faisceau du contact de feux de stop.

SEC233D

4. Vérifier la continuité du faisceau entre la borne 17 de l'ECM et la borne 2 du connecteur de contact de feux stop. Se reporter au schéma de câblage.
   Il doit y avoir continuité.
5. Vérifier également que le faisceau n'est pas ouvert ou en court-circuit à l'alimentation.

Bon ou mauvais

Bon	▶	PASSER A L'ETAPE 8.
Mauvais	▶	PASSER A L'ETAPE 7.



7	DETECTER LA PIECE DEFECTUEUSE

Vérifier les points suivants.
- Connecteurs de faisceaux M48, F54 (conduite à droite)
- Faisceau ouvert ou en court-circuit entre le contact du feu stop et l'ECM..

	▶	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

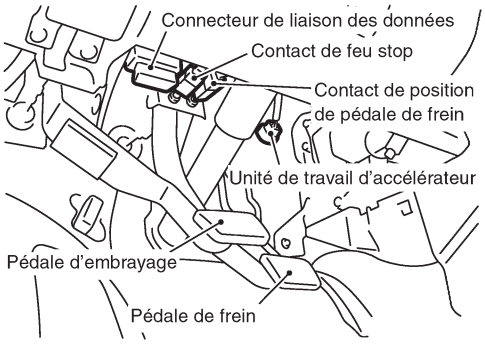
8	VERIFIER LE CONTACT DE FEUX DE STOP

Vérifier la continuité entre les bornes 1 et 2 du contact de feux de stop dans les conditions suivantes.

Conditions	Continuité
Pédale de frein complètement relâchée	Ne doit pas exister.
Pédale de frein enfoncée	Doit exister.

SEC260D

Bon ou mauvais



Bon	▶	PASSER A L'ETAPE 14.
Mauvais	▶	Remplacer le contact de feux de stop.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic (Suite)

9	CONTROLER SI LE CIRCUIT DE MASSE DU CONTACT DE POSITION DE LA PEDALE DE FREIN N'EST PAS OUVERT OU EN COURT-CIRCUIT

1. Mettre le contact d'allumage sur ''OFF''.
2. Débrancher le connecteur de faisceau du contact de position de la pédale de frein.

SEC233D

3. Vérifier la continuité du faisceau entre la borne 2 du contact de position de pédale de frein et la masse. Se reporter au schéma de câblage.
   Il doit y avoir continuité.
4. Vérifier également que le faisceau n'est pas en circuit ouvert ou en court-circuit à l'alimentation.

Bon ou mauvais

Bon	►	PASSER A L'ETAPE 11.
Mauvais	►	PASSER A L'ETAPE 10.

10	DETECTER LA PIECE DEFECTUEUSE

Vérifier les points suivants.
- Connecteurs de faisceaux M48, F54 (conduite à droite)
- Faisceau ouvert ou en court-circuit entre le contact de position de la pédale de frein et la masse.

	►	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

11	CONTROLER SI LE CIRCUIT DU SIGNAL D'ENTREE DU CONTACT DE POSITION DE LA PEDALE DE FREIN N'EST PAS OUVERT OU EN COURT-CIRCUIT.

1. Débrancher le connecteur de faisceau de l'ECM.
2. Vérifier la continuité du faisceau entre la borne 29 de l'ECM et la borne 1 du contact de position de pédale de frein. Se référer au schéma de câblage.
   Il doit y avoir continuité.
3. Vérifier également que le faisceau n'est pas ouvert ou en court-circuit à l'alimentation.

Bon ou mauvais

Bon	►	PASSER A L'ETAPE 13.
Mauvais	►	PASSER A L'ETAPE 12.

12	DETECTER LA PIECE DEFECTUEUSE

Vérifier les points suivants.
- Connecteurs de faisceaux F55, M47 (conduite à droite)
- Faisceau ouvert ou en court-circuit entre le contact de position de la pédale de frein et l'ECM.

	►	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic (Suite)

13	CONTROLER LE CONTACT DE POSITION DE LA PEDALE DE FREIN

Vérifier la continuité entre les bornes 1 et 2 du contact de la position de la pédale de frein dans les conditions suivantes.

Conditions	Continuité
Pédale de frein complètement relâchée	Ne doit pas exister.
Pédale de frein enfoncée	Doit exister.

SEC261D

Bon ou mauvais

Bon	▶	PASSER A L'ETAPE 14.
Mauvais	▶	Remplacer le contact de position de la pédale de frein.

Procédure de diagnostic

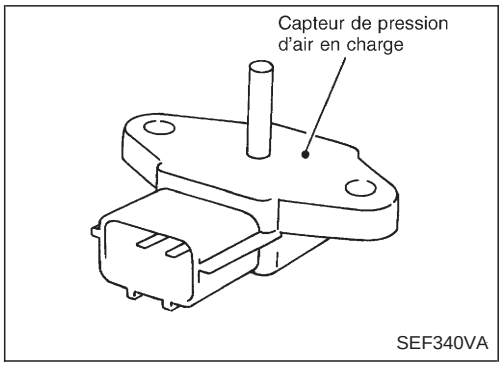
1	DEBUT DE L'INSPECTION

Avec CONSULT-II

1. Mettre le contact d'allumage sur ''ON''.
2. Sélectionner le mode ''RESULTATS AUTO-DIAG'' sur CONSULT-II.
3. Appuyer ''EFFAC''.
4. Effectuer de nouveau une ''Procédure de confirmation de DTC'', voir page EC-3642.
5. Le défaut est-il toujours affiché ?

Sans CONSULT-II

1. Mettre le contact d'allumage sur ''ON''.
2. Effacer les données de la mémoire du mode II de diagnostic (résultats de l'autodiagnostic).
3. Effectuer de nouveau une ''Procédure de confirmation de DTC'', voir page EC-3642.
4. Effectuer le ''Test de diagnostic mode II (résultats d'autodiagnostic)''.
5. Le DTC 0903 est-il de nouveau affiché ?



Oui ou Non		
Oui	▶	PASSER A L'ETAPE 2.
Non	▶	**FIN DE L'INSPECTION** 2

	REMPLACER l'ECM.

1. Remplacer l'ECM.
2. Initialiser le système NATS et enregistrer tous les codes de clés de contact NATS. Se reporter à la page EC-3458. (Modèles avec NATS)
3. Effectuer ''l'Apprentissage de position de ralenti du capteur de position d'accélérateur'' de la ''PROCEDURE D'ENTRETIEN DE BASE''. Consulter la page EC-3456.

	▶	**FIN DE L'INSPECTION**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description des composants

Le capteur de la pression d'air de suralimentation mesure la pression de l'air du turbocompresseur. La tension de sortie du capteur envoyée à l'ECM augmente avec la pression. Dans les conditions normales, le capteur de la pression d'air de suralimentation n'est pas utilisé par le système de gestion moteur.

Bornes de l'ECM et valeurs de référence

Données de référence relevées entre chaque borne et la masse.

PRECAUTION :

Lors de la mesure de la tension d'entrée/sortie, ne pas utiliser les bornes de masse de l'ECM sous peine d'endommager le transistor de l'ECM. Utiliser une autre masse que celle des bornes de l'ECM.

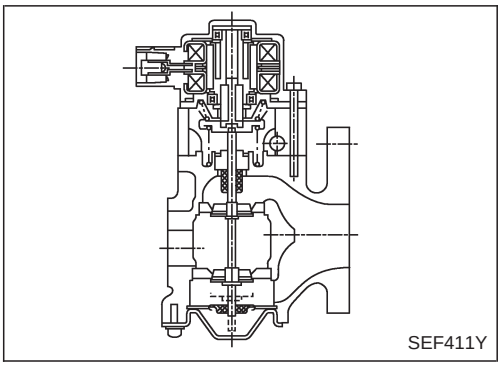
Interrupteur de climatiseur	Fonctionnement de climatiseur		
Contact de position stationnement/ point mort (PNP)	Signal de position de stationnement/ point mort		
Capteur de pression atmosphérique (intégré dans l'ECM)	Pression atmosphérique :		

Ce système commande le débit des gaz d'échappement recyclés depuis le collecteur d'échappement vers le collecteur d'admission. La commande du débit se fait par variation de l'ouverture du by-pass de la soupape de commande de volume de l'EGR. Un moteur pas-à-pas intégré à la soupape ouvre celle-ci par étapes en fonction d'impulsions transmises par l'ECM. L'ouverture de la soupape varie pour optimiser la gestion moteur. La valeur optimale programmée dans l'ECM est déterminée en tenant compte de diverses conditions moteur.
La soupape de commande de volume de l'EGR reste fermée dans les conditions suivantes.



- Moteur arrêté
- Démarrage du moteur
- Moteur froid
- Température trop élevée du moteur
- Régime moteur élevé
- Papillon en position plein gaz
- Tension de la batterie faible
- Pression atmosphérique basse

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description (Suite)

DESCRIPTION DES COMPOSANTS

SEF411Y

Soupape de contrôle de volume de l'EGR

La soupape de commande de volume EGR utilise un moteur pas-à-pas pour réguler le débit des gaz d'échappement recyclés depuis le collecteur d'échappement. Ce moteur dispose d'enroulements à 4 phases. Il est commandé par des signaux d'impulsion de sortie envoyés par l'ECM. Deux enroulements sont activés et désactivés l'un après l'autre. Chaque fois qu'une impulsion d'excitation est émise, la soupape s'ouvre ou se ferme pour modifier le débit de gaz. Lorsqu'aucune variation du débit de gaz n'est nécessaire, l'ECM ne transmet aucune impulsion. Un signal de tension particulier est émis de telle sorte que la soupape reste dans la même position d'ouverture.

Valeur de référence de CONSULT-II en mode de contrôle de données

Les données de spécification sont des valeurs de référence.

ELEMENT DE CONTROLE	CONDITION		SPECIFICATION
SOUP COMM VOL EGR	● moteur : Une fois le moteur chaud ● Interrupteur de climatiseur : ''OFF'' ● Levier de changement de vitesses : Position de point mort ● A vide	Après 1 minute au ralenti	Plus de 10 paliers
		Montée en régime rapide jusqu'à 3 200 tr/mn	0 degré

Bornes de l'ECM et valeurs de référence

Données de référence relevées entre chaque borne et la masse.

PRECAUTION :

Lors de la mesure de la tension d'entrée/sortie, ne pas utiliser les bornes de masse de l'ECM sous peine d'endommager le transistor de l'ECM. Utiliser une autre masse que celle des bornes de l'ECM.

BORNE N°	COULEUR DE CABLE	ELEMENT	CONDITION	DONNEES (tension continue)

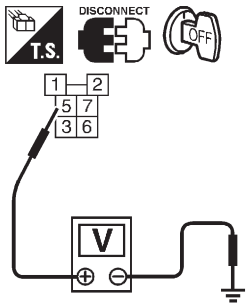
2. Débrancher le relais d'ECM.

SEC950C

3. Vérifier la tension entre la borne 3 du relais d'ECM et les bornes 2 et 5 de la soupape de commande du volume EGR . Se référer au schéma de câblage.
   Il doit y avoir continuité.

Bon ou mauvais

Bon	▶	PASSER A L'ETAPE 4.
Mauvais	▶	PASSER A L'ETAPE 3.



3	DETECTER LA PIECE DEFECTUEUSE

Vérifier les points suivants.
- Connecteurs de faisceaux E101, M5
- Connecteurs de faisceaux M278, E236(conduite à gauche)
- Connecteurs de faisceaux M47, F55 (conduite à droite)
- Connecteurs de faisceaux F35, E236 (conduite à droite)
- Faisceau entre la soupape de commande de volume EGR et le relais d'ECM en circuit ouvert ou en court-circuit

	▶	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

4	VERIFIER LE CIRCUIT D'ALIMENTATION DE LA SOUPAPE DE COMMANDE DE VOLUME EGR III

Contrôler la tension entre la borne 5 du relais de l'ECM et la masse à l'aide de CONSULT-II ou du testeur.

Tension: Tension de la batterie

SEC167D

Bon ou mauvais

Bon	▶	PASSER A L'ETAPE 6.
Mauvais	▶	PASSER A L'ETAPE 5.

Procédure de diagnostic (Suite)

5	DETECTER LA PIECE DEFECTUEUSE
Vérifier les points suivants. ● Fusible de 10 A ● Faisceau ouvert ou en court-circuit entre le relais d'ECM et la batterie	
►	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

6	VERIFIER LE RELAIS D'ECM.

1. Appliquer une tension continue de 12 V entre les bornes 1 et 2 du relais d'ECM.
2. Vérifier la continuité entre les bornes 3 et 5, 6 et 7 du relais d'ECM

Condition	Continuité
Courant continu de 12V entre les bornes 1 et 2 du relais	Oui
ETEINT	Non

SEF296X

Bon ou mauvais

Bon ►	PASSER A L'ETAPE 7.
Mauvais ►	Remplacer le relais d'ECM.

7	VERIFIER SI LE CIRCUIT DU SIGNAL DE SORTIE DE LA SOUPAPE DE COMMANDE DE VOLUME EGR EST OUVERT OU EN COURT-CIRCUIT

1. Mettre le contact d'allumage sur ''OFF''.
2. Débrancher le connecteur de faisceau de l'ECM.
3. Vérifier la continuité du faisceau entre les bornes de l'ECM et les bornes de la soupape de commande du volume EGR, comme suit.
   Se référer au schéma de câblage.

Borne TCM	Soupape de commande de volume de l'EGR
103	1
105	3
109	6
115	4

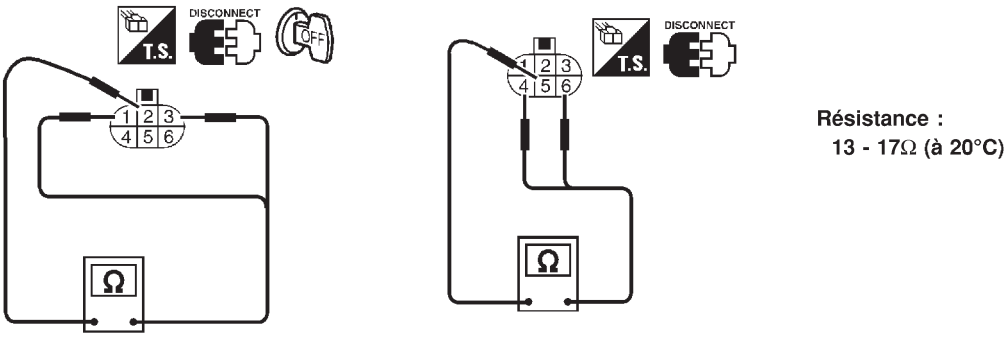
MTBL0442

Il doit y avoir continuité.

4. Vérifier également que le faisceau n'est pas en circuit ouvert ou en court-circuit à l'alimentation.

Bon ou mauvais

Bon ►	PASSER A L'ETAPE 9.
Mauvais ►	PASSER A L'ETAPE 8.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic (Suite)

8	DETECTER LA PIECE DEFECTUEUSE
Vérifier les points suivants. ● Connecteurs de faisceaux E236, M278 (conduite à gauche) ● Connecteurs de faisceaux E236, F35 (conduite à droite) ● Faisceau ouvert ou en court-circuit entre l'ECM et la soupape de commande de volume EGR	
	► Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

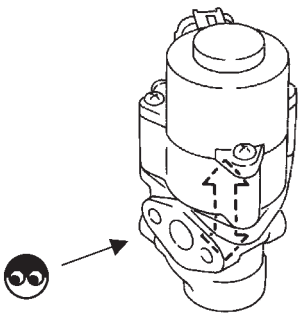
9	VERIFIER LA SOUPAPE DE COMMANDE DE VOLUME EGR I

Vérifier la résistance entre la borne 2 de la soupape de commande du volume EGR et les bornes 1, 3, la borne 5 et les bornes 4, 6.

Résistance :
13 - 17Ω (à 20°C)

SEF414Y

Bon ou mauvais



Bon (avec CONSULT-II)	►	PASSER A L'ETAPE 10.
Bon (sans CONSULT-II)	►	PASSER A L'ETAPE 11.
Mauvais	►	Remplacer la soupape de commande du volume EGR.

10	VERIFIER LA SOUPAPE DE COMMANDE DU VOLUME EGR II

Avec CONSULT-II

1. Déposer la soupape de commande de volume d'EGR
2. Rebrancher le connecteur de faisceau de l'ECM et le connecteur de la soupape de commande du volume EGR.
3. Mettre le contact d'allumage sur ''ON''.
4. Effectuer le test ''SOUP COMM VOL EGR'' dans le mode ''TEST ACTIF'' de CONSULT-II.
5. Vérifier que l'axe de la soupape de commande de volume EGR se déplace effectivement d'avant en arrière en fonction des étapes d'ouverture demandées.

►	**FIN DE L'INSPECTION**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description

DESCRIPTION DU SYSTEME

L'ECM et l'ensemble de la pompe d'injection de carburant à commande électronique (abrégé ensuite en pompe d'injection) communiquent en temps réel (échange de signaux).
L'ECM transmet les signaux de la quantité d'injection de carburant cible, d'avance à l'injection de carburant cible, de vitesse du moteur, etc., et reçoit les signaux de vitesse de la pompe et de la température du carburant, etc. du boîtier de commande de la pompe d'injection.
Avec ces signaux, la pompe d'injection commande de manière optimale le débit d'injection et l'avance de l'injection au niveau de la soupape de décharge et de la soupape de commande.
La pompe d'injection possède un système de diagnostic intégré qui détecte les défauts des capteurs ou des actionneurs qui se trouvent dans la pompe. Ces informations concernant le défaut sont transférées via la ligne (circuit) du boîtier de commande de la pompe d'injection vers l'ECM.

COMMANDE DU DEBIT D'INJECTION

En fonction de la valeur théorique envoyée par l'ECM, le débit d'injection dépend de la commande de la soupape de décharge de la pompe d'injection et de la modification du temps d'ouverture de l'aiguille.

COMMANDE DE L'AVANCE A L'INJECTION DE CARBURANT

Sur la base de la valeur théorique envoyée par l'ECM, l'avance de l'injection dépend, en fonction du tarage ressort du système d'avance, du cycle de fonctionnement de la soupape de commande d'avance qui se trouve dans la pompe d'injection et du réglage de la pression dans la chambre haute pression du piston du système d'avance.

CAPTEUR DE TEMPERATURE DU CARBURANT

Le capteur relève la température du carburant dans la pompe d'injection et calibre le débit d'injection en fonction de la température du carburant.

CAPTEUR DE LA POSITION DE L'ANNEAU A CAME

Le capteur détecte le passage du bossage qui se trouve sur l'anneau à came de la pompe d'injection à l'aide d'un élément semi-conducteur à réluctance variable. Le capteur de position de l'anneau à cames assure la synchronisation de l'anneau à cames, et détecte l'avance réelle. Le boîtier de commande de la pompe d'injection mesure la révolution de la pompe d'injection grâce au signal du capteur de position de l'anneau à cames.

Logique de diagnostic de bord

Le défaut est détecté quand ...	Eléments de contrôles (causes possibles)
● Le système de coupure du carburant ne fonctionne pas correctement.	● Faisceau ou connecteurs (le circuit électronique de coupure du carburant est ouvert ou en court-circuit) ● Commande électronique de carburant

2

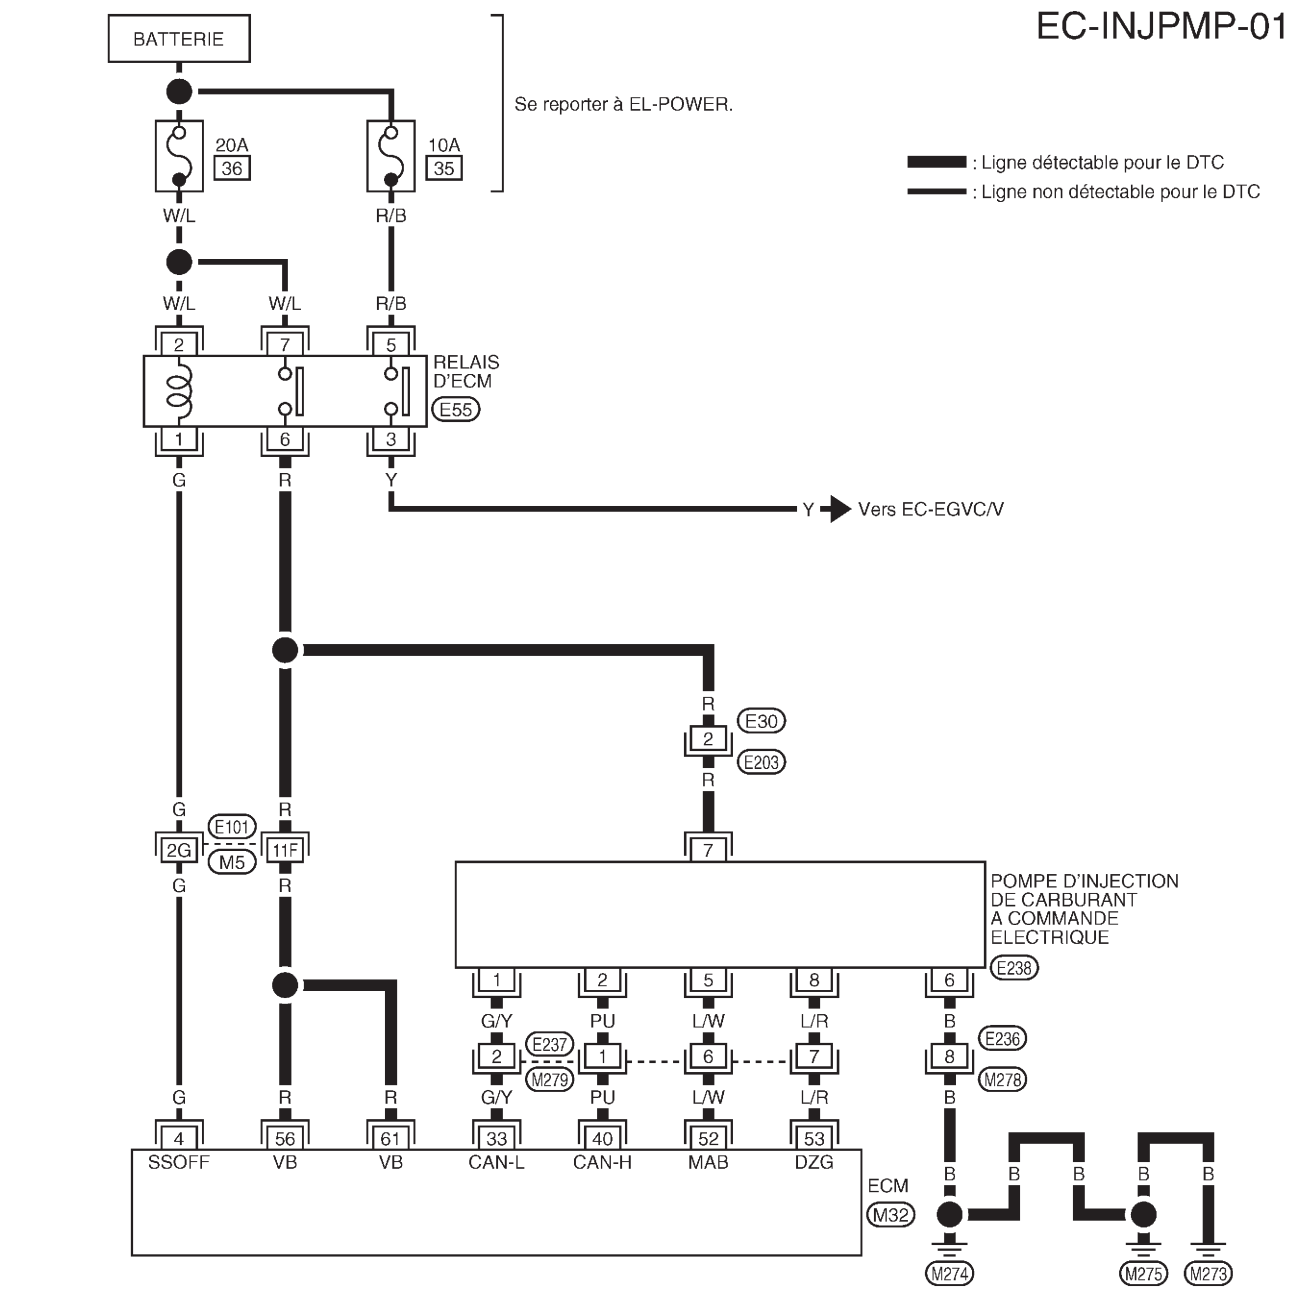
CONTROLE DE DONNEES	
CONTROLE	PAS DE DTC
CPV-TR/MN (PMH)	XXX TR/MN

SEF817Y

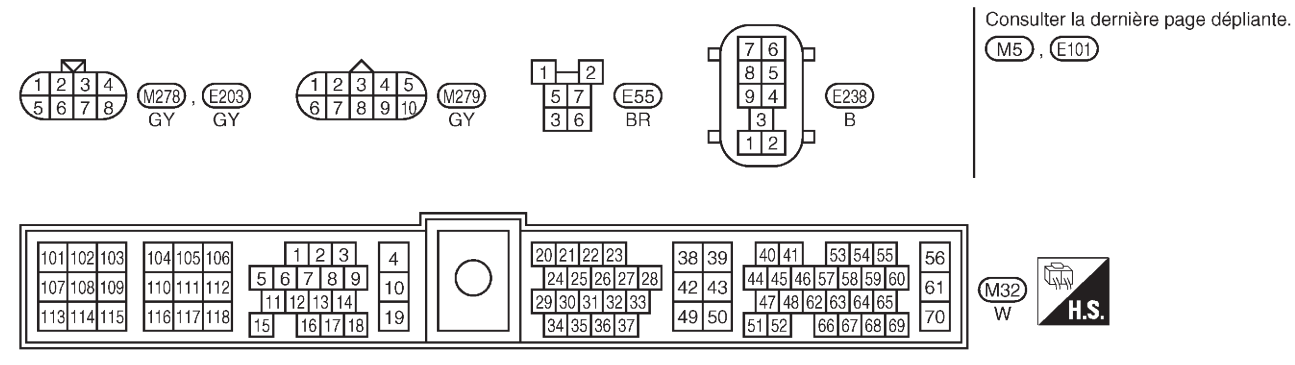
Procédure de confirmation de code de défaut (DTC)

AVEC CONSULT-II

1) Mettre le contact d'allumage sur ''ON'', puis attendre au moins 2 secondes.
2) Régler CONSULT-II en mode ''CONTROLE DE DONNEES''.
3) Démarrer le moteur et le faire tourner pendant au moins 2 secondes au régime ralenti.
   (si le moteur ne tourne pas, mettre le contact d'allumage sur ''START'' pendant 2 secondes au moins)
4) Mettre le contact d'allumage sur ''OFF'', attendre au moins 5 secondes, puis remettre le contact sur ''ON''.
5) Si le DTC est détecté, effectuer une ''Procédure de diagnostic'', voir page EC-3663.



SANS CONSULT-II



1) Mettre le contact d'allumage sur ''ON'', puis attendre au moins 2 secondes.
2) Démarrer le moteur et le faire tourner pendant au moins 2 secondes au régime ralenti.
   (si le moteur ne tourne pas, mettre le contact d'allumage sur ''START'' pendant 2 secondes au moins)
3) Mettre le contact d'allumage sur ''OFF'', attendre au moins 5 secondes, puis remettre le contact sur ''ON''.
4) Effectuer le ''Test de diagnostic mode II (résultats d'autodiagnostic)'' avec l'ECM.
5) Si le DTC est détecté, effectuer une ''Procédure de diagnostic'', voir page EC-3663.

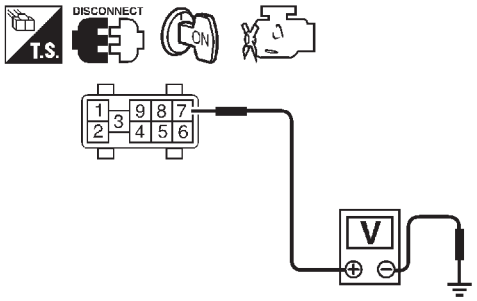
Procédure de diagnostic



1	VERIFIER LE CIRCUIT D'ALIMENTATION DE LA POMPE D'INJECTION A COMMANDE ELECTRONIQUE

1. Mettre le contact d'allumage sur ''OFF''.
2. Débrancher le connecteur de la pompe d'injection.

SEC228D

3. Mettre le contact d'allumage sur ''ON''.
4. Vérifier la tension entre la borne 7 de la pompe et la masse.

Tension : tension de la batterie

SEF438Y

Bon ou mauvais

Bon	▶	PASSER A L'ETAPE 3.
Mauvais	▶	PASSER A L'ETAPE 2.

2	DETECTER LA PIECE DEFECTUEUSE

Vérifier les points suivants.
- Connecteurs de faisceaux E30, E203
- Connecteurs de faisceaux E101, M5
- Connecteurs de faisceaux M47, F55 (conduite à droite)
- Faisceau en circuit ouvert ou en court-circuit entre la pompe d'injection et l'ECM
- Faisceau en circuit ouvert ou en court-circuit entre la pompe d'injection et le relais d'ECM

	▶	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

3	VERIFIER SI LE CIRCUIT DE MASSE DE LA POMPE D'INJECTION EST OUVERT OU EN COURT-CIRCUIT

1. Mettre le contact d'allumage sur ''OFF''.
2. Vérifier la continuité du faisceau entre la borne 6 de la pompe d'injection et la masse. Se référer au schéma de câblage.
   Il doit y avoir continuité.
3. Vérifier également que le faisceau n'est pas ouvert ou en court-circuit à l'alimentation.

Bon ou mauvais

Bon	▶	PASSER A L'ETAPE 5.
Mauvais	▶	PASSER A L'ETAPE 4.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

4	DETECTER LA PIECE DEFECTUEUSE
Vérifier les points suivants. ● Connecteurs de faisceaux E236, M278 (conduite à gauche) ● Connecteurs de faisceaux E236, F35 (conduite à droite) ● Faisceau ouvert ou en court-circuit entre la pompe d'injection et la masse du moteur	
►	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

5	VERIFIER SI LA LIGNE DE COMMUNICATION EST OUVERTE OU EN COURT-CIRCUIT

1. Vérifier la continuité entre les bornes suivantes. Se reporter au schéma de câblage.

Pompe à injection de carburant à commande électronique	ECM
1	33
2	40
5	52
8	53

MTBL0444

Il doit y avoir continuité.

2. Vérifier également que le faisceau n'est pas ouvert ou en court-circuit à l'alimentation.

Bon ou mauvais

Bon	►	PASSER A L'ETAPE 7.
Mauvais	►	PASSER A L'ETAPE 6.

6	DETECTER LA PIECE DEFECTUEUSE
Vérifier les points suivants. ● Connecteurs de faisceaux E237, M279 (conduite à gauche) ● Connecteurs de faisceaux E237, F36 (conduite à droite) ● Faisceau en circuit ouvert ou en court-circuit entre la pompe d'injection et l'ECM	
►	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

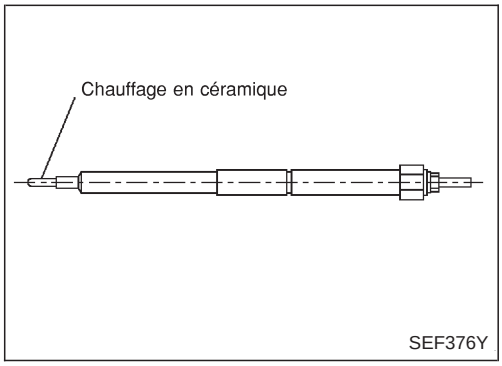
7	VERIFIER SI L'INCIDENT EST INTERMITTENT
Se référer à ''DIAGNOSTIC DES DEFAUTS EN CAS D'INCIDENT INTERMITTENT'', page EC-3502.	

Bon ou mauvais

Bon	►	Remplacer la pompe d'injection de carburant.
Mauvais	►	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description



DESCRIPTION DU SYSTEME

Capteur	Signal d'entrée à l'ECM	Fonction de l'ECM	Actionneur
Capteur d'angle de vilebrequin (PMH)	Régime du moteur	Commande de préchauffage	Témoin de préchauffage, Relais de préchauffage ↓ Bougies de préchauffage
Capteur de température du liquide de refroidissement moteur	Température du liquide de refroidissement moteur		

Lorsque la température du liquide de refroidissement du moteur est supérieure à 75°C environ, le relais de préchauffage est coupé, désactivant le préchauffage rapide jusqu'à ce que la température du liquide de refroidissement retombe en dessous de 55°C environ.
Lorsque la température du liquide de refroidissement du moteur est inférieure à 75°C environ :

- Contact d'allumage : ''ON''
  Après que le contact d'allumage a été mis sur 'ON', le relais de préchauffage se met en marche pour une certaine durée qui dépend de la température du liquide de refroidissement moteur, permettant alors au courant de passer à travers les bougies de préchauffage.
- Démarrage
  Le relais de préchauffage se met en marche, permettant au courant de passer à travers les bougies de préchauffage.
- Démarrage
  Après le démarrage du moteur, le courant continue de passer par les bougies de préchauffage (mode post-préchauffage) pendant une certaine durée correspondant à la température du liquide de refroidissement moteur.
  Lorsque le régime moteur est supérieur à 4 800 tr/min environ, le courant des bougies de préchauffage est coupé.

Au moment où le relais de préchauffage est activé, le témoin de préchauffage s'allume pendant un certain temps en fonction de la température du liquide de refroidissement.

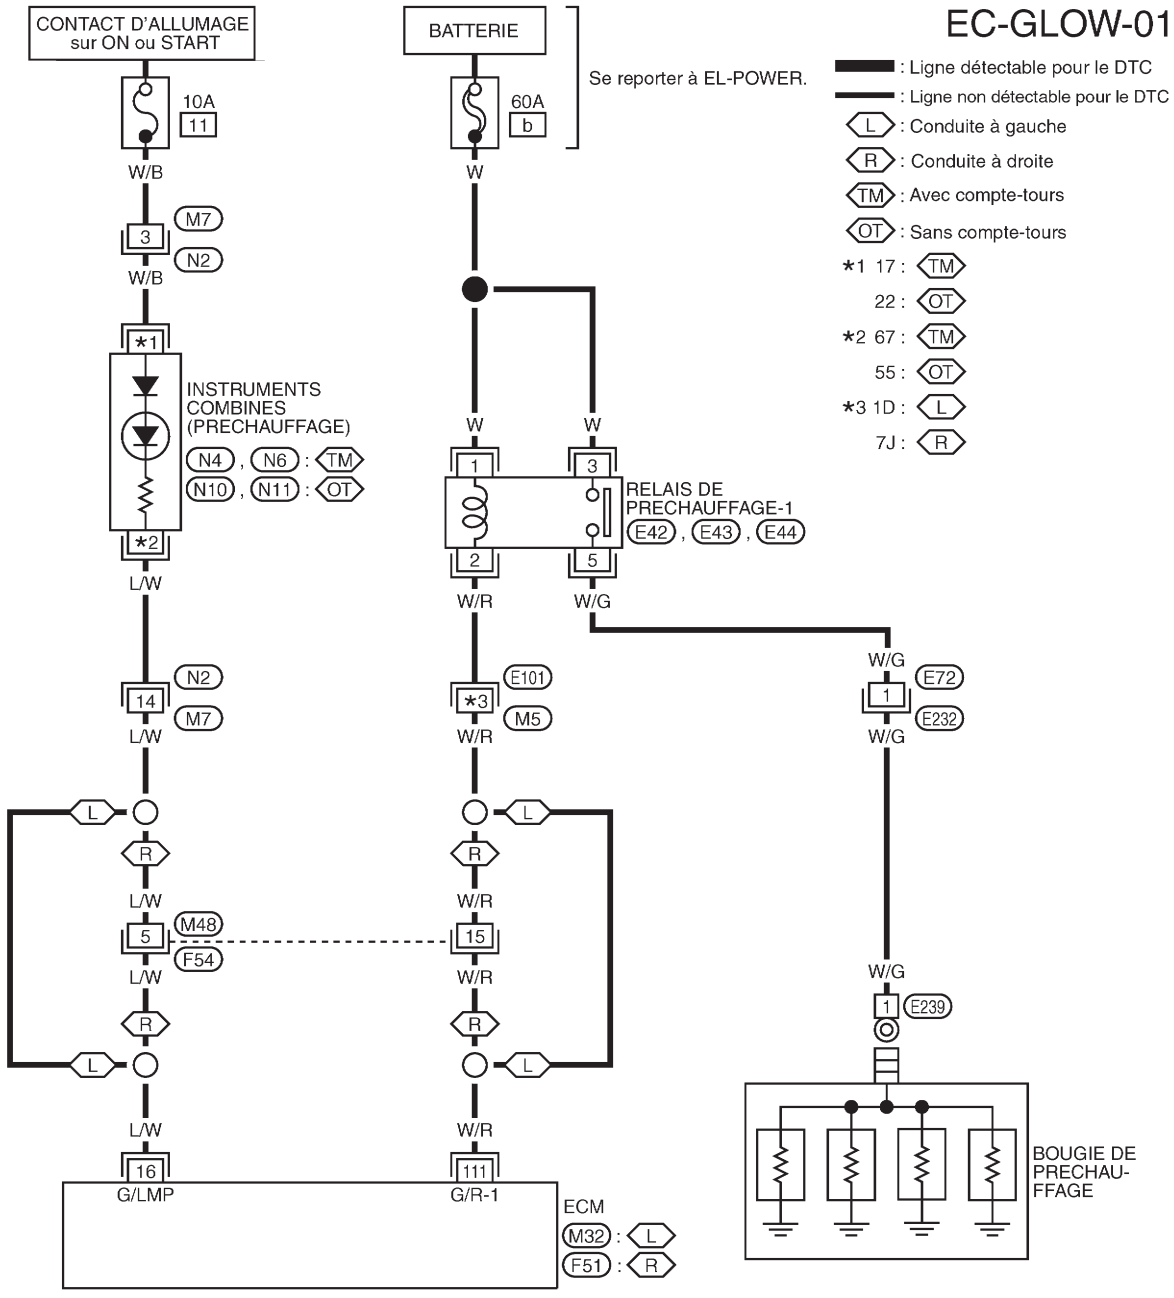
DESCRIPTION DES COMPOSANTS

Bougie de préchauffage

- La bougie de préchauffage est fournie avec un élément de chauffage en céramique pour obtenir une résistance à haute température. Il s'allume en réponse à un signal envoyé par l'ECM, permettant au courant de passer à travers la bougie de préchauffage en passant par le relais de préchauffage.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Bornes de l'ECM et valeurs de référence



Données de référence relevées entre chaque borne et la masse.

PRECAUTION :
Lors de la mesure de la tension d'entrée/sortie, ne pas utiliser les bornes de masse de l'ECM sous peine d'en endommager le transistor de l'ECM. Utiliser une autre masse que celle des bornes de l'ECM.

Bon ou mauvais

Bon ▶	PASSER A L'ETAPE 13.
Mauvais ▶	PASSER A L'ETAPE 12.

12	DETECTER LA PIECE DEFECTUEUSE
Vérifier les points suivants. ● Raccord à fusibles de 60 A ● Faisceau ouvert ou en court-circuit entre le relais de préchauffage et la batterie	
▶	Réparer le faisceau ou les connecteurs.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic (Suite)

13	VERIFIER SI LE CIRCUIT DU SIGNAL DE SORTIE DU RELAIS DE PRECHAUFFAGE EST OUVERT OU EN COURT-CIRCUIT

1. Débrancher le connecteur de faisceau de l'ECM.
2. Vérifier la continuité du faisceau entre la borne 111 de l'ECM et la borne du relais de préchauffage. Se référer au schéma de câblage.
   Il doit y avoir continuité.
3. Vérifier également que le faisceau n'est pas ouvert ou en court-circuit à l'alimentation.

Bon ou mauvais

Bon ▶	PASSER A L'ETAPE 15.
Mauvais ▶	PASSER A L'ETAPE 14.

14	DETECTER LA PIECE DEFECTUEUSE

Vérifier les points suivants.
- Connecteurs de faisceaux E101, M5
- Connecteurs de faisceaux M48, F54 (conduite à droite)
- Faisceau ouvert ou en court-circuit entre le relais de préchauffage et l'ECM

▶	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

15	VERIFIER SI LE FAISCEAU ENTRE LE RELAIS ET LES BOUGIES DE PRECHAUFFAGE EST OUVERT OU EN COURT-CIRCUIT

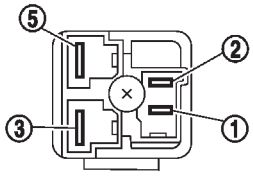
1. Débrancher le connecteur de faisceau de la bougie de préchauffage.
2. Vérifier la continuité du faisceau entre la borne 5 du relais de préchauffage et les connecteurs de bougie de préchauffage. Se référer au schéma de câblage.
   Il doit y avoir continuité.
3. Vérifier également que le faisceau n'est pas ouvert ou en court-circuit à l'alimentation.

Bon ou mauvais

Bon ▶	PASSER A L'ETAPE 16.
Mauvais ▶	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

16	DETECTER LA PIECE DEFECTUEUSE

Vérifier les points suivants.
- Connecteurs de faisceaux E72, E232
- Faisceau ouvert ou en court-circuit entre le relais et les bougies de préchauffage



▶	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

Procédure de diagnostic (Suite)

18	VERIFIER LES BOUGIES DE PRECHAUFFAGE

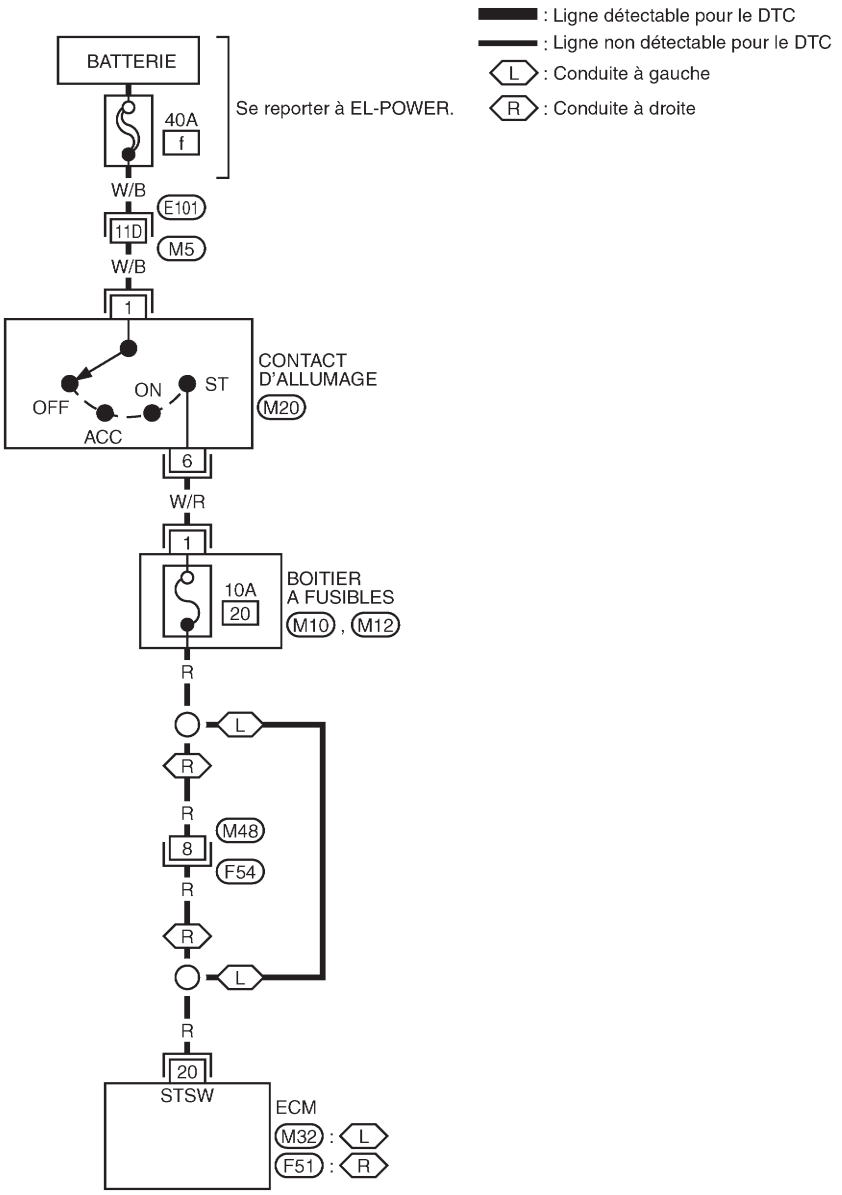
1. Déposer la barre de connexion des bougies de préchauffage.
2. Vérifier la résistance des bougies de préchauffage.

Résistance:
Environ 0,8 Ω
(à 20˚C)

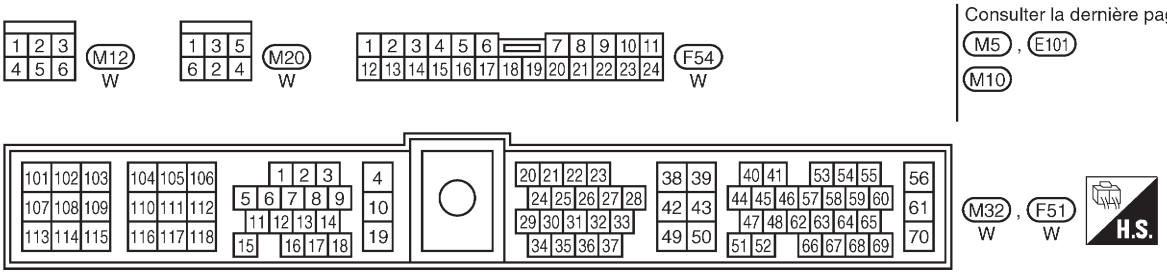
SEC253D

REMARQUE :
- **Ne pas cogner la résistance chauffante de la bougie de préchauffage. Si elle a reçu un coup, remplacer la bougie de préchauffage par une pièce neuve.**
- **Si une bougie de préchauffage est tombée d'une hauteur de 0,1 m ou plus, la remplacer.**
- **Si le logement d'une bougie de préchauffage est calaminé, le nettoyer avec un alésoir ou un outil approprié.**
- **Serrer à la main la bougie de préchauffage en la tournant deux ou trois fois, puis serrer à l'aide d'un outil jusqu'au couple spécifié.**
  : 1,4 - 2,2 N·m (0,15 kgm - 0,22 kgm)

Bon ou mauvais



Bon	▶	PASSER A L'ETAPE 19.
Mauvais	▶	Remplacer la bougie de préchauffage défectueuse.



19	VERIFIER SI L'INCIDENT EST INTERMITTENT
Se référer à ''DIAGNOSTIC DES DEFAUTS EN CAS D'INCIDENT INTERMITTENT'', page EC-3502.	
▶	**FIN DE L'INSPECTION**

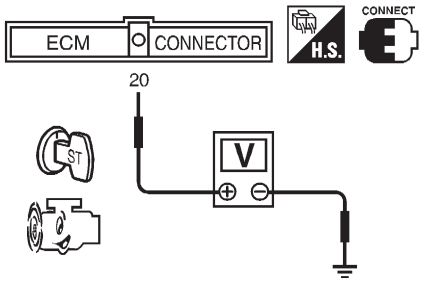
Procédure de diagnostic

1	VERIFIER LE FONCTIONNEMENT GENERAL DU SIGNAL DE DEMARRAGE

Avec CONSULT-II

1. Mettre le contact d'allumage sur ''ON''.
2. Faire le test ''SIGNAL DEMAR'' (signal de démarrage) dans le mode ''CONTROLE DE DONNEES'' de CONSULT-II dans les conditions suivantes.



CONTROLE DES DONNEES	
EN COURS DE CONTROLE	AUCUN DTC
SIGNAL DE DEMARRAGE	OFF

Condition	'SIGNAL DE DEMARRAGE'
Contact d'allumage sur 'ON'	OFF
Contact d'allumage sur 'START'	ON

SEC254D

Sans CONSULT-II

Vérifier la tension entre la borne 20 de l'ECM et la masse dans les conditions suivantes.

Conditions	Tension
Contact d'allumage sur "START".	Tension de la batterie
Autres positons	Environ 0 V

SEF415Y

BON OU MAUVAIS

Bon	▶	**FIN DE L'INSPECTION**
Mauvais	▶	PASSER A L'ETAPE 2

	VERIFIER LE CIRCUIT DU SIGNAL D'ENTREE DU SIGNAL DE DEMARRAGE

1. Mettre le contact d'allumage sur ''OFF''.
2. Débrancher le connecteur de faisceau de l'ECM et le connecteur de faisceau du contact d'allumage.
3. Vérifier la continuité du faisceau entre la borne 20 de l'ECM et la borne 6 du contact d'allumage. Se référer au schéma de câblage.
   Il doit y avoir continuité.
4. Vérifier également que le faisceau n'est pas ouvert ou en court-circuit à l'alimentation.

BON OU MAUVAIS

Bon	▶	PASSER A L'ETAPE 4.
Mauvais	▶	PASSER A L'ETAPE 3.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic (Suite)

3	DETECTER LA PIECE DEFECTUEUSE
Vérifier les points suivants. ● Connecteurs de faisceaux M48, F54 (conduite à droite) ● Fusible 10 A ● Connecteurs M10 et M12 du boîtier à fusibles (J/B) ● Faisceau ouvert ou court-circuit entre l'ECM et le contact d'allumage	
►	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

4	VERIFIER SI L'INCIDENT EST INTERMITTENT
Se référer à ''DIAGNOSTIC DES DEFAUTS EN CAS D'INCIDENT INTERMITTENT'', page EC-3502.	
►	**FIN DE L'INSPECTION**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description

Lorsque la boîte de vitesses est au point mort, le contact de stationnement/point mort est fermé. L'ECM détecte la position du fait qu'il y a continuité de ligne (signal ''ON'').

Valeur de référence de CONSULT-II en mode de contrôle de données

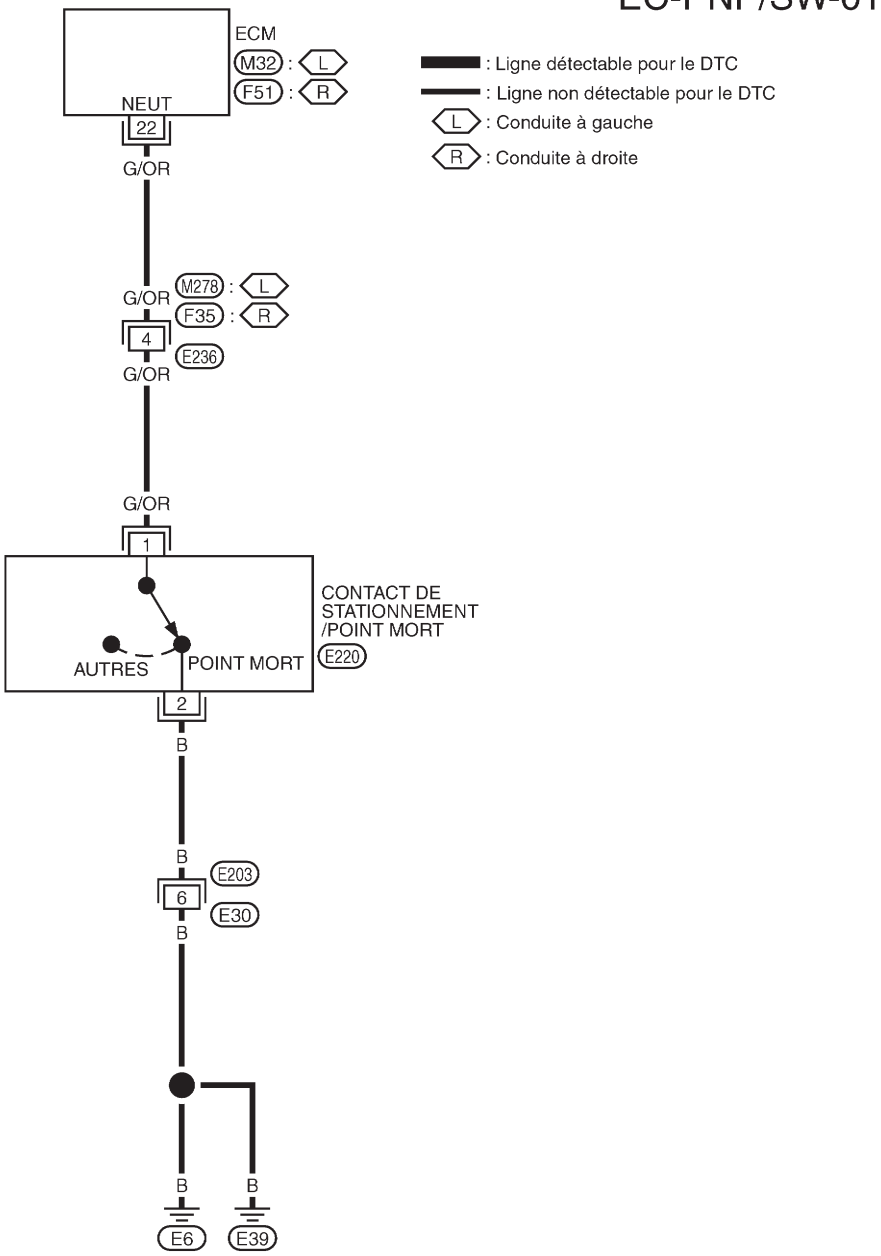
Les données de spécification sont des valeurs de référence.

ELEMENT DE CONTROLE	CONDITION		SPECIFICATION
CON NEUTRE	● Contact d'allumage : ON	Levier de changement de vitesses : Position de stationnement/point mort	ON
		Sauf ci-dessus	OFF (contact ouvert)

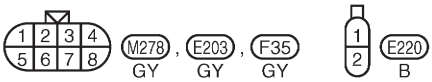
Bornes de l'ECM et valeurs de référence

Données de référence relevées entre chaque borne et la masse.

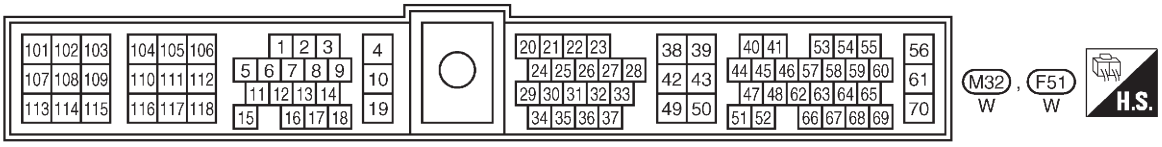
PRECAUTION :



Lors de la mesure de la tension d'entrée/sortie, ne pas utiliser les bornes de masse de l'ECM sous peine d'en endommager le transistor. Utiliser une autre masse que celle des bornes de l'ECM.



BORNE N°	COULEUR DE CABLE	ELEMENT	CONDITION	DONNEES (tension continue)
22	G/OR	Contact de position stationnement/point mort	Contact d'allumage sur ''ON'' └ Boîte de vitesses sur ''Point mort'' (modèles T/M)	Environ 0 V
			Contact d'allumage sur ''ON'' └ Autres positions	TENSION BATTERIE (11 V - 14 V)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Schéma de câblage

EC-PNP/SW-01

GEC287A

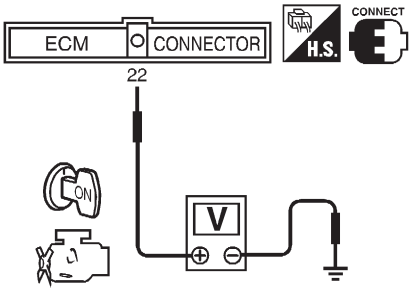
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic

1	VERIFIER LE FONCTIONNEMENT GENERAL

Avec CONSULT-II

1. Mettre le contact d'allumage sur ''ON''.
2. Sélectionner ''CON NEUTRE'' (contact PNP) dans le mode ''CONTROLE DE DONNEES'' de CONSULT-II.
3. Vérifier le signal ''CON NEUTRE'' dans les conditions suivantes.



Contrôle des données	
CONTROLE	Aucun DTC
CON NEUTRE	ON

Position du levier de vitesses	CON NEUTRE
Position de point mort	MAR
Sauf position ci-dessus	ARR

SEF049Y

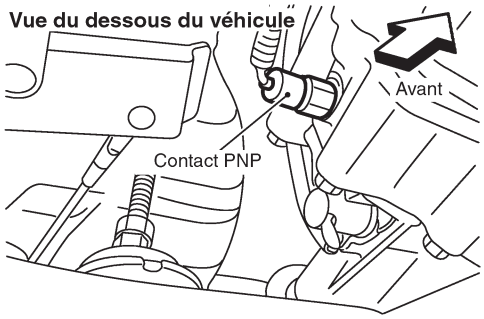
Sans CONSULT-II

1. Mettre le contact d'allumage sur ''ON''.
2. Vérifier la tension entre la borne 22 de l'ECM et la masse dans les conditions suivantes.

Condition (Position de boîte de vitesses)	Tension V
Position de point mort	Environ 0V
Sauf position ci-dessus	Tension de batterie

SEF419Y

BON OU MAUVAIS



Bon	▶	**FIN DE L'INSPECTION**
Mauvais	▶	PASSER A L'ETAPE 2.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic (Suite)

2	VERIFIER SI LE CIRCUIT DU CONTACT PNP EST OUVERT OU EN COURT-CIRCUIT

1. Mettre le contact d'allumage sur ''OFF''.
2. Débrancher le connecteur de faisceau du contact de stationnement/point mort (PNP).

SEC170D

3. Vérifier la continuité du faisceau entre la borne 2 du contact PNP et la masse de la carrosserie. Se reporter au schéma de câblage.
   Il doit y avoir continuité.
4. Vérifier également que le faisceau n'est pas en circuit ouvert ou en court-circuit à l'alimentation.

Bon ou mauvais

Bon	►	PASSER A L'ETAPE 4.
Mauvais	►	PASSER A L'ETAPE 3.

3	DETECTER LA PIECE DEFECTUEUSE

Vérifier les points suivants.
- Connecteurs de faisceaux E203, E30
- Faisceau ouvert ou en court-circuit entre le contact PNP et la masse de carrosserie

	►	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

4	VERIFIER SI LE CIRCUIT DU SIGNAL D'ENTREE DU CONTACT PNP EST OUVERT OU EN COURT-CIRCUIT

1. Débrancher le connecteur de faisceau de l'ECM.
2. Vérifier la continuité du faisceau entre la borne 22 de l'ECM et la borne 1 du contact PNP. Se référer au schéma de câblage.
   Il doit y avoir continuité.
3. Vérifier également que le faisceau n'est pas ouvert ou en court-circuit à l'alimentation.

Bon ou mauvais

Bon	►	PASSER A L'ETAPE 6.
Mauvais	►	PASSER A L'ETAPE 5.

5	DETECTER LA PIECE DEFECTUEUSE

Vérifier les points suivants.
- Connecteurs de faisceaux M278, E236 (conduite à gauche)
- Connecteurs de faisceaux F35, E236 (conduite à droite)
- Faisceau ouvert ou court-circuit entre le contact PNP et l'ECM

	►	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

6	VERIFIER LE CONTACT DE STATIONNEMENT/POINT MORT (PNP)

Se référer à la section MT (''VERIFIER CONTACT DE POSITION'').

Bon ou mauvais

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic (Suite)

Bon	►	PASSER A L'ETAPE 7.
Mauvais	►	Remplacer le contact de stationnement/point mort

7		**VERIFIER SI L'INCIDENT EST INTERMITTENT**
Se référer à ''DIAGNOSTIC DES DEFAUTS EN CAS D'INCIDENT INTERMITTENT'', page EC-3502.		
	►	**FIN DE L'INSPECTION**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description des composants

L'interrupteur de chauffage rapide se trouve en bas du tableau de bord. Il permet d'accélérer le fonctionnement du chauffage lorsque le moteur est froid.
Lorsque l'ECM reçoit le signal ''ON'' (marche) de l'interrupteur, il fait passer le régime moteur à 1 100 tr/min - 1 200 tr/min afin que le moteur chauffe rapidement.
Le système fonctionne lorsque les conditions suivantes sont réunies.

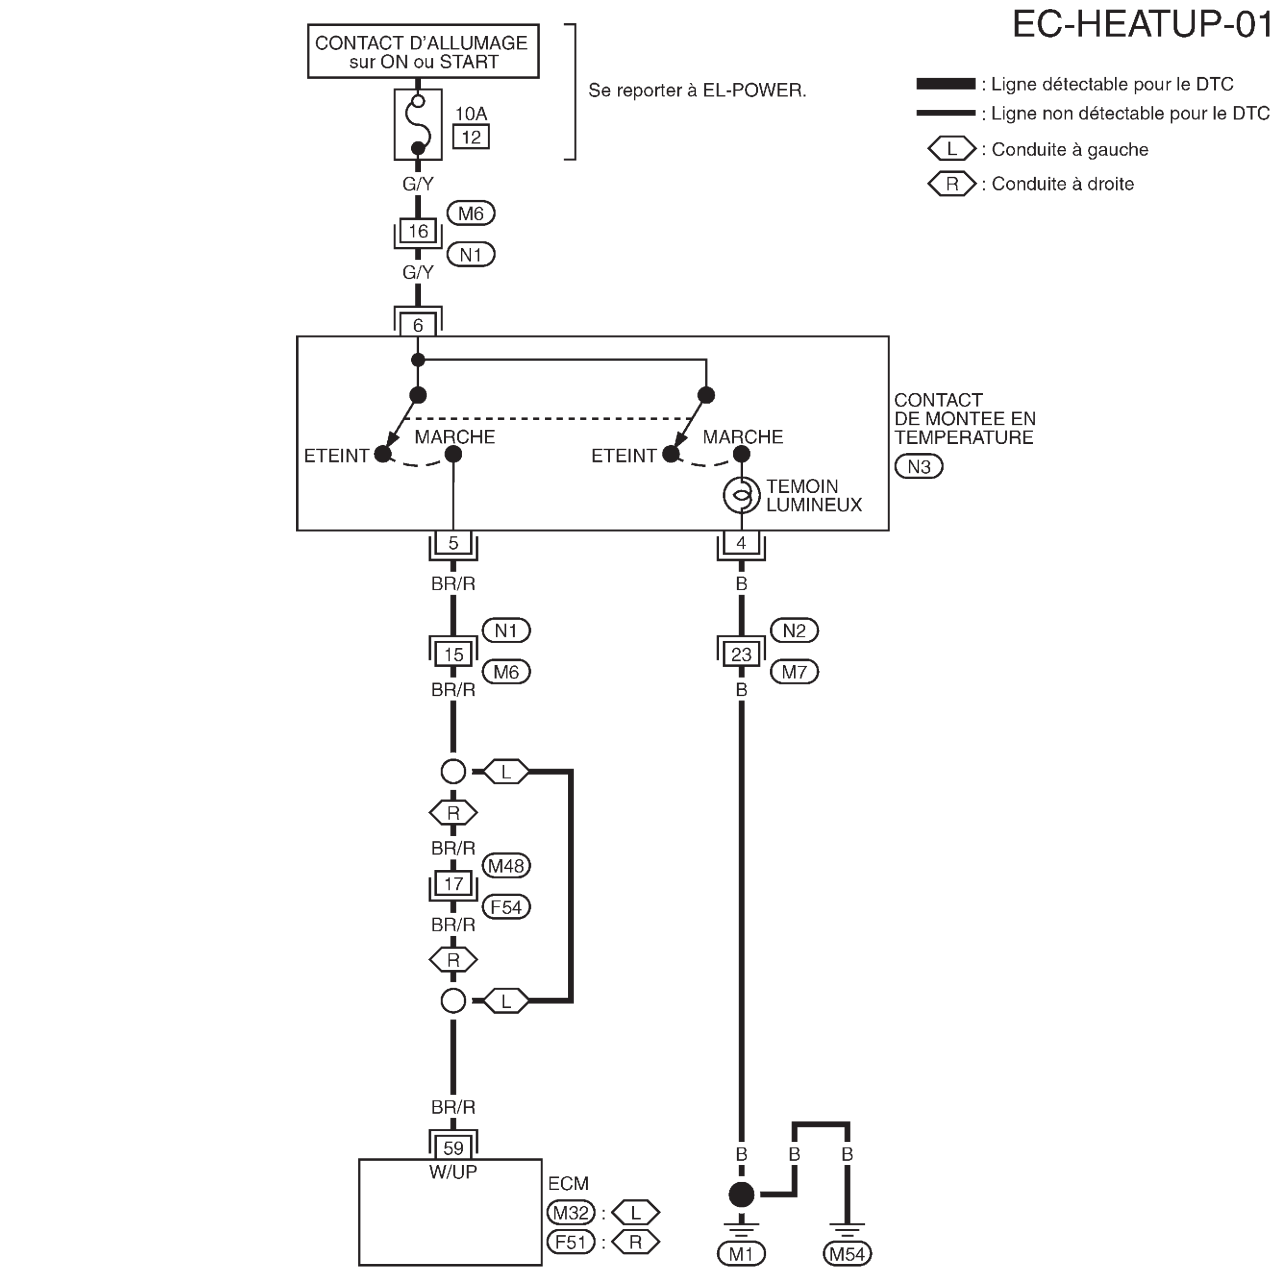
Interrupteur de chauffage rapide	ON
Température du liquide de refroidissement moteur	Inférieure à 105°C
Levier de boîte de vitesses	Positions ''P'' ou ''N''
Pédale d'accélérateur	Complètement relâchée

Valeur de référence de CONSULT-II en mode de contrôle de données

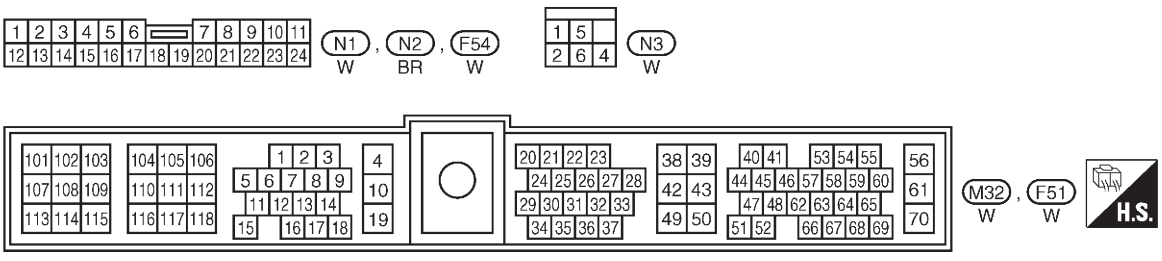
Les données de spécification sont des valeurs de référence.

ELEMENT DE CONTROLE	CONDITION		SPECIFICATION
INT CHAUF	● Contact d'allumage : ON	Interrupteur de chauffage rapide : MAR	ALLUME
		Interrupteur de chauffage rapide : ARR	ETEINT

Bornes de l'ECM et valeurs de référence



Données de référence relevées entre chaque borne et la masse.



PRECAUTION :
Lors de la mesure de la tension d'entrée/sortie, ne pas utiliser les bornes de masse de l'ECM sous peine d'endommager le transistor de l'ECM. Utiliser une autre masse que celle des bornes de l'ECM.

BORNE N°	COULEUR DE CABLE	ELEMENT	CONDITION	DONNEE (tension continue ou impulsion)
59	BR/R	Interrupteur de chauffage rapide	Contact d'allumage sur ''ON'' └ Interrupteur de chauffage rapide sur ''OFF'' (arrêt),	OV
			Contact d'allumage sur ''ON'' └ Interrupteur de chauffage rapide sur ''ON'' (marche),	TENSION BATTERIE (11 V - 14 V)

Procédure de diagnostic

1	DEBUT DE L'INSPECTION
CONSULT-II est-il disponible ?	
Oui ou Non	
Oui ▶	PASSER A L'ETAPE 2.
Non ▶	PASSER A L'ETAPE 3.

	VERIFICATION DU FONCTIONNEMENT GENERAL I

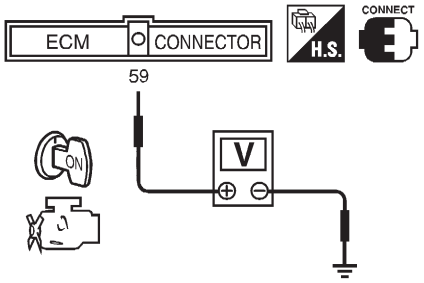
Avec CONSULT-II

1. Mettre le contact d'allumage sur ''ON''.
2. Faire le test ''INT CHAUF'' dans le mode ''CONTROLE DE DONNEES'' de CONSULT-II dans les conditions suivantes.

Contrôle des données	
CONTROLE	Aucun DTC
INT CHAUF	OFF

Conditions	INT CHAUF
Contact de réchauffement sur "OFF".	OFF
Contact de réchauffement sur "ON"	ON

SEF302Z



Bon ou mauvais

Bon ▶	PASSER A L'ETAPE 4.
Mauvais ▶	PASSER A L'ETAPE 5.

3	VERIFICATION DU FONCTIONNEMENT GENERAL I

Sans CONSULT-II

1. Mettre le contact d'allumage sur ''ON''.
2. Vérifier la tension entre la borne 59 de l'ECM et la masse dans les conditions suivantes.

Conditions	Tension
Contact de réchauffement sur "OFF".	Environ 0V
Contact de réchauffement sur "ON"	Tension de batterie

SEF303Z

Bon ou mauvais

Bon ▶	PASSER A L'ETAPE 4.
Mauvais ▶	PASSER A L'ETAPE 5.

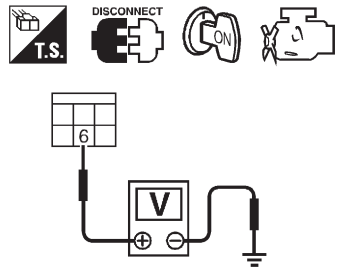
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic (Suite)

4	VERIFICATION DU FONCTIONNEMENT GENERAL II

Vérifier le témoin en mettant l'interrupteur de chauffage sur ''ON'' et ''OFF''.

Contact de montée en température	Témoin
MAR	Eclairé
ARR	Non éclairé



MTBL1314

BON OU MAUVAIS

Bon	▶	**FIN DE L'INSPECTION**
Mauvais	▶	PASSER A L'ETAPE 10.

5	VERIFIER LE CIRCUIT D'ALIMENTATION DE L'INTERRUPTEUR DE CHAUFFAGE RAPIDE

1. Interrupteur de chauffage rapide sur ''OFF'' (arrêt).
2. Mettre le contact d'allumage sur ''OFF''.
3. Débrancher le connecteur de faisceau de l'interrupteur de chauffage rapide.
4. Mettre le contact d'allumage sur ''ON'' (marche).
5. Vérifier la tension entre la borne 6 de l'interrupteur de mise en température et la masse avec le CONSULT-II ou avec un testeur.

Tension: Tension de la batterie

SEF304Z

BON OU MAUVAIS

Bon	▶	PASSER A L'ETAPE 7.
Mauvais	▶	PASSER A L'ETAPE 6.

6	DETECTER LA PIECE DEFECTUEUSE

Vérifier les points suivants.
- Connecteurs de faisceaux N1, M6
- Fusible de 10 A
- Faisceau en circuit ouvert ou en court-circuit entre l'interrupteur de chauffage rapide et le fusible.

	▶	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

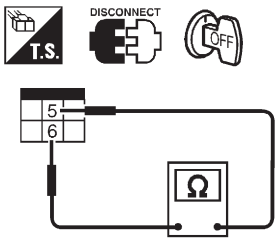
Procédure de diagnostic (Suite)

7	VERIFIER SI LE CIRCUIT DU SIGNAL D'ENTREE DE L'INTERRUPTEUR DE CHAUFFAGE RAPIDE EST OUVERT OU EN COURT-CIRCUIT II

1. Mettre le contact d'allumage sur ''OFF''.
2. Débrancher le connecteur de faisceau de l'ECM.
3. Vérifier la continuité du faisceau entre la borne 59 de l'ECM et la borne 5 de l'interrupteur de chauffage rapide. Se reporter au schéma de câblage.
   Il doit y avoir continuité.
4. Vérifier également que le faisceau n'est pas ouvert ou en court-circuit à l'alimentation.

BON OU MAUVAIS

Bon	▶	PASSER A L'ETAPE 9.
Mauvais	▶	PASSER A L'ETAPE 8.



8	DETECTER LA PIECE DEFECTUEUSE

Vérifier les points suivants.
- Connecteurs de faisceaux N1, M6
- Connecteurs de faisceaux M48, F54 (conduite à droite)
- Faisceau ouvert ou en court-circuit entre l'interrupteur de chauffage rapide et l'ECM.

	▶	Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit à la masse ou à l'alimentation.

9	VERIFIER L'INTERRUPTEUR DE CHAUFFAGE RAPIDE

Vérifier la continuité entre les bornes 5 et 6 de l'interrupteur de chauffage rapide dans les conditions suivantes.

Conditions	Continuité
Contacteur de montée en température sur 'OFF'	Ne doit pas exister
Contacteur de montée en température sur 'ON'	Doit exister

SEF305Z

Bon ou mauvais

Bon	▶	PASSER A L'ETAPE 13.
Mauvais	▶	Remplacer l'interrupteur de chauffage rapide.

10	VERIFIER SI LE CIRCUIT DE MASSE DU TEMOIN DE L'INTERRUPTEUR DE CHAUFFAGE EST OUVERT OU EN COURT-CIRCUIT

1. Mettre l'interrupteur de chauffage rapide sur ''OFF'' (arrêt),
2. Mettre le contact d'allumage sur ''OFF''.
3. Débrancher le connecteur de faisceau de l'interrupteur de chauffage rapide.
4. Vérifier la continuité du faisceau entre la borne 4 de l'interrupteur de chauffage rapide et la masse.
   Se référer au schéma de câblage.
   Il doit y avoir continuité.
5. Vérifier également que le faisceau n'est pas en court-circuit à l'alimentation.

Bon ou mauvais

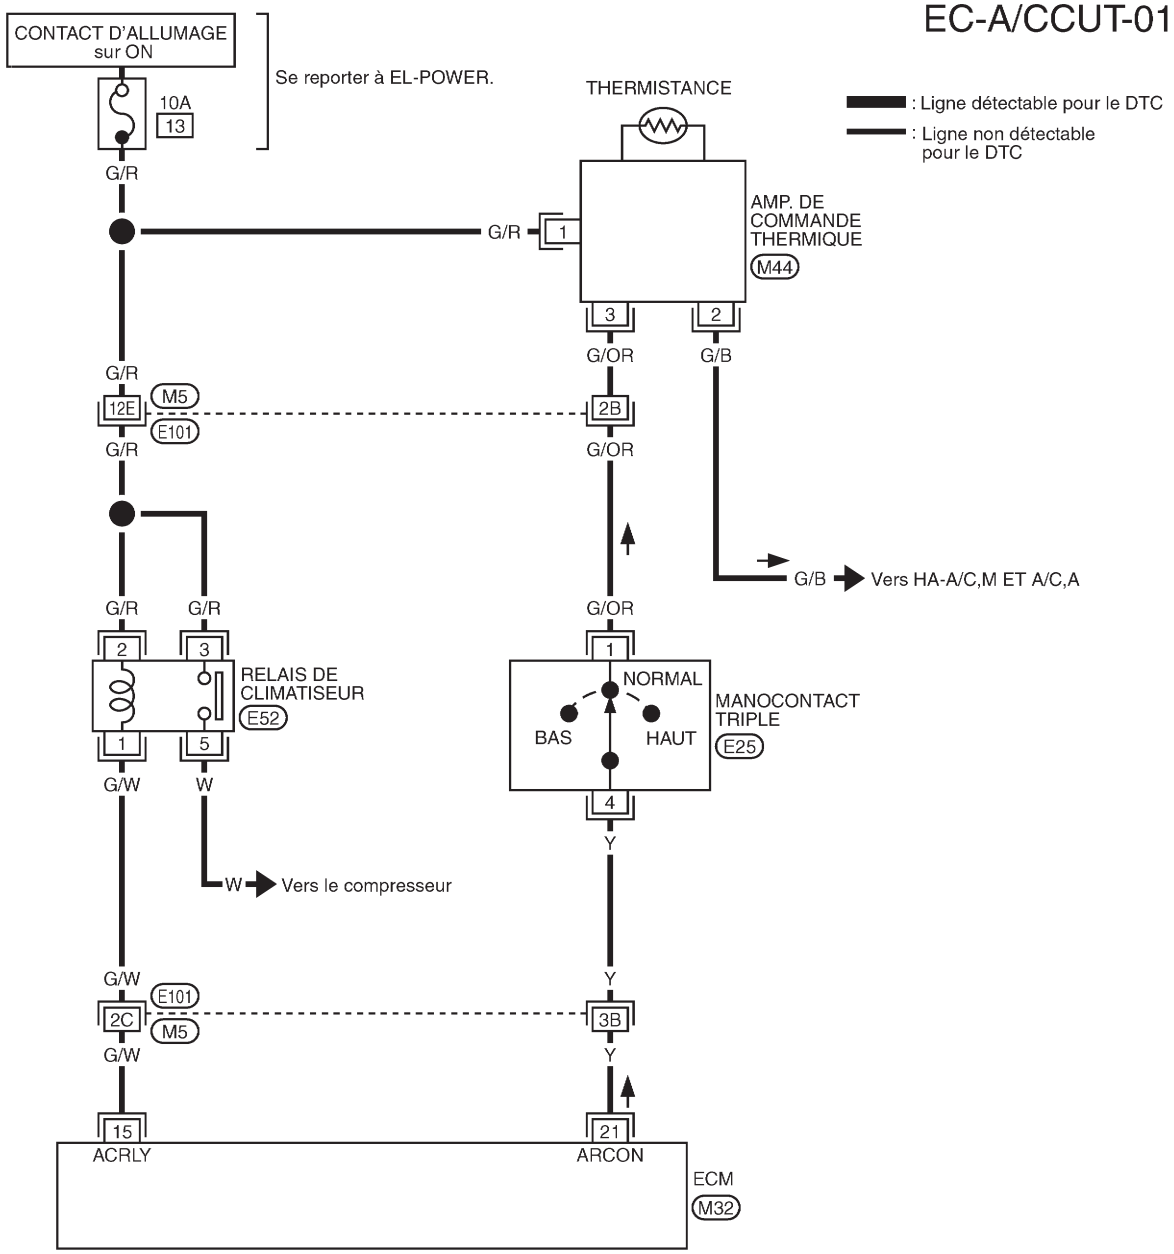
Bon	▶	PASSER A L'ETAPE 12.
Mauvais	▶	PASSER A L'ETAPE 11.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic (Suite)

11	DETECTER LA PIECE DEFECTUEUSE
Vérifier les points suivants. ● Connecteurs de faisceaux N2, M7 ● Faisceau ouvert ou en court-circuit entre l'interrupteur de chauffage rapide et la masse.	
►	Réparer les faisceaux ou connecteurs en circuit ouvert ou court-circuit.

12	VERIFIER LE TEMOIN DE L'INTERRUPTEUR DE CHAUFFAGE
Appliquer une tension de 12 V entre les bornes 4 et 6 de l'interrupteur de chauffage rapide. **Le témoin doit s'allumer.**	
Bon ou mauvais	
Bon ►	PASSER A L'ETAPE 13.
Mauvais ►	Remplacer l'interrupteur de chauffage rapide.



13	VERIFIER SI L'INCIDENT EST INTERMITTENT
Se référer à ''DIAGNOSTIC DES DEFAUTS EN CAS D'INCIDENT INTERMITTENT'', page EC-3502.	
►	**FIN DE L'INSPECTION**

SYSTEME ELECTRIQUE

SECTION EL

AVIS DE MODIFICATION :

- Les schémas de câblage ont été modifiés.
- Les intruments combinés ont été changés.
- Les phares ont été changés.
- La commande de réglage des faisceaux a été ajoutée.
- Les lave-phares ont été ajoutés.
- Une caractéristique de rappel de feux de détresse a été ajouté au système de télécommande à fonctions multiples.
- Le Système antivol Nissan (NATS) a été changé.

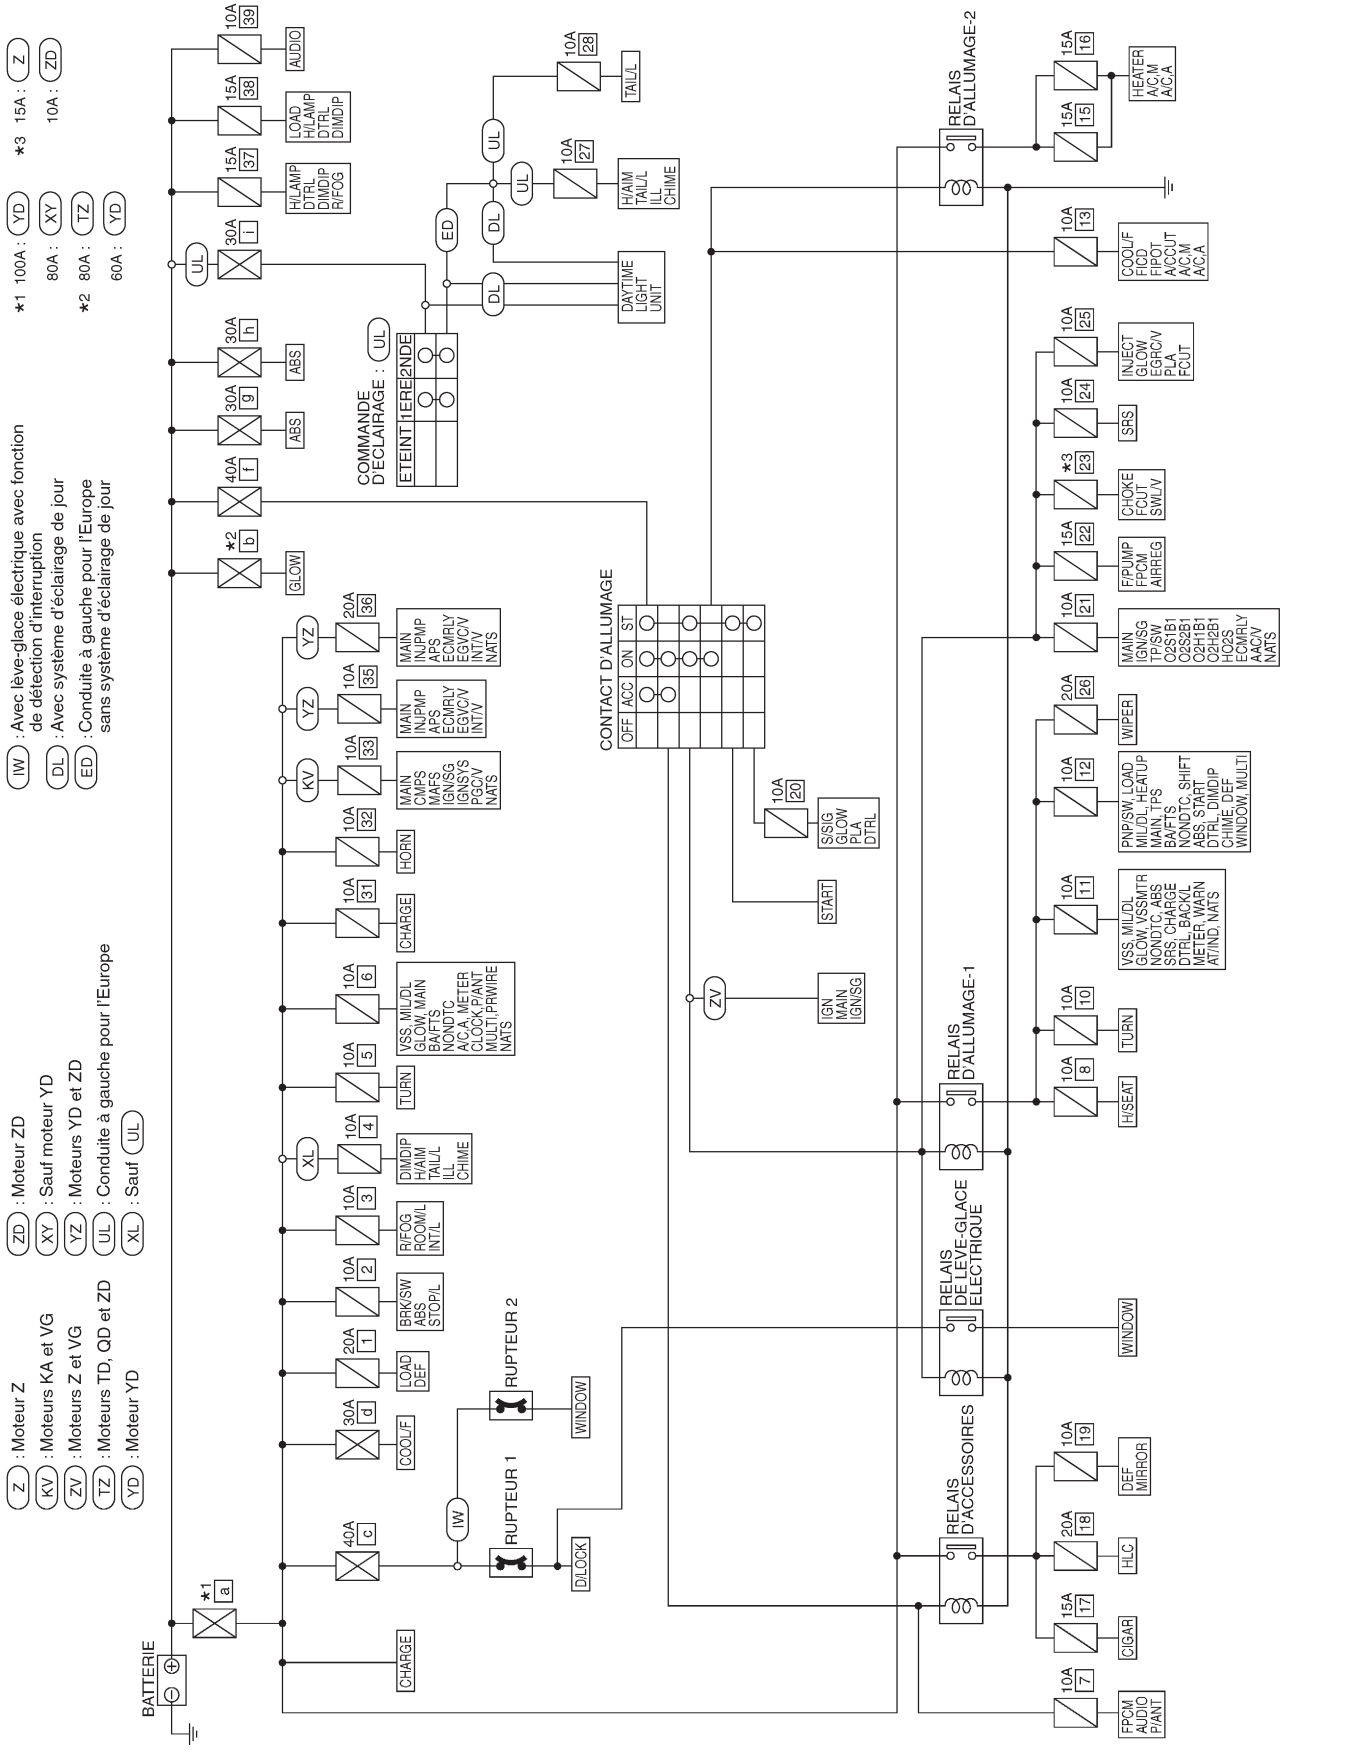
Système de retenue supplémentaire (SRS) ‘‘COUSSIN GONFLABLE’’ et ‘‘PRETENSIONNEUR DE CEINTURE DE SECURITE’’



Utilisés avec une ceinture de sécurité, le COUSSIN GONFLABLE et le PRETENSIONNEUR DE CEINTURE DE SECURITE du système de retenue supplémentaire contribuent à réduire les risques et la gravité des blessures subies par le conducteur et le passager avant lors de collisions frontales. Le système SRS disponible sur le MODELE NISSAN D22 se compose des éléments suivants (la composition varie selon le pays de destination et l’équipement optionnel) :
Un module de coussin gonflable côté conducteur (situé dans le moyeu du volant), un module de coussin gonflable côté passager avant (situé sur le tableau de bord, côté passager), un prétensionneur de ceintures de sécurité, un boîtier de capteurs de diagnostic, un témoin d’avertissement, un faisceau de câblage et un câble spiralé.
Toute information nécessaire à l’entretien du système en toute sécurité est comprise dans la **section RS** de ce Manuel de Réparation.

ATTENTION :

- **Pour ne pas affecter le fonctionnement du SRS, ce qui augmenterait les risques de blessures graves ou mortelles en cas de collision entraînant le déploiement du coussin gonflable, toutes les opérations d’entretien doivent être effectuées par un concessionnaire NISSAN agréé.**
- **Un entretien incorrect, y compris une dépose et une repose incorrectes du système de retenue supplémentaire (SRS), peut être à l’origine de blessures provoquées par une activation involontaire du système. Pour la dépose du câble spiralé et du module de coussin gonflable, se reporter à la section RS.**
- **Ne pas utiliser d’équipement d’essai électrique sur les circuits connexes du SRS sauf si indiqué dans ce Manuel de Réparation. Le faisceau de câblage du SRS peut être identifié à l’aide d’un connecteur de faisceau jaune.**

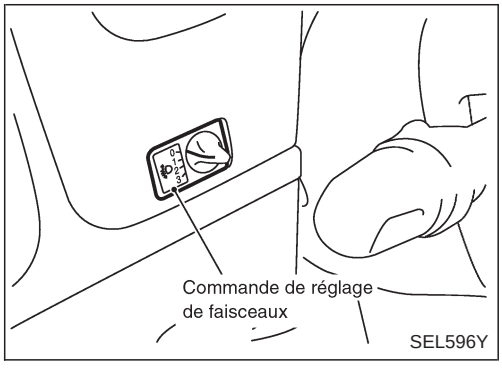
Remplacement des ampoules



Le phare est de type faisceau semi-étanche utilisant une ampoule halogène remplaçable. L'ampoule peut être remplacée depuis le compartiment moteur sans avoir à déposer le phare du véhicule.

- **Lors de la manipulation de la lampe halogène, ne toucher que le culot en plastique. Ne jamais toucher l'ampoule en verre.**

1. Débrancher le câble de batterie.
2. Débrancher le connecteur de faisceau à l'arrière de l'ampoule.
3. Enlever le capuchon en caoutchouc.
4. Poussez et tournez la goupille de retenue pour la desserrer.
5. Retirer l'ampoule du phare avec précaution. Ne pas secouer ou tourner l'ampoule pour l'enlever.
6. Reposer les pièces dans l'ordre inverse de la dépose.

PRECAUTION :

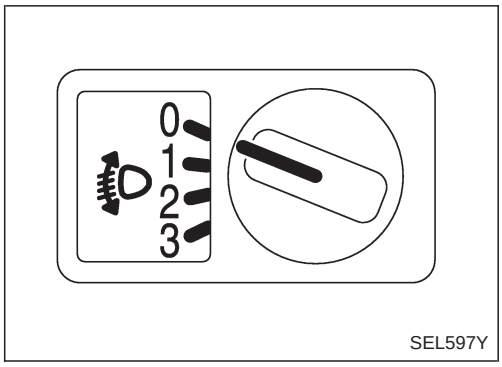
Ne pas laisser le réflecteur de phare sans ampoule pendant une période prolongée. La poussière, l'humidité, la fumée, etc. pénétrant dans le corps du phare peuvent affecter les performances du phare. L'ampoule de phare ne doit être déposée de l'optique que juste avant le remplacement de l'ampoule.

Réglage des faisceaux

Lors du réglage des faisceaux, utiliser une machine de réglage, un écran de protection de réglage ou un appareil de contrôle des projecteurs. Le dispositif de réglage de projecteurs doit être en bon état, calibré et opérant tel que décrit dans le manuel de fonctionnement.

En l'absence de dispositif de réglage, le réglage des faisceaux doit être effectué comme indiqué ci-dessous :

Pour plus de détails, consulter la réglementation du pays concerné.



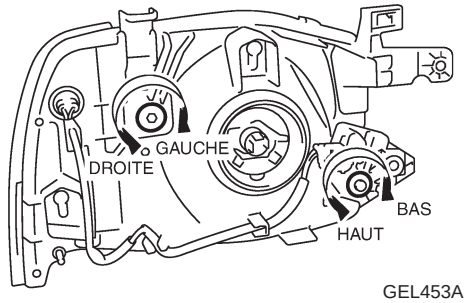
a. Tous les pneumatiques doivent être correctement gonflés.

b. Amener le véhicule ainsi que l'appareil d'essai sur une seule et même surface parfaitement plane.

c. S'assurer que le véhicule est à vide (liquide de refroidissement, huile moteur au bon niveau et réservoir de carburant plein) à l'exception du conducteur (ou poids équivalent mis à la place du conducteur).

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Réglage des faisceaux (Suite)



SEL597Y

PRECAUTION :

Vérifier que le commutateur de réglage des faisceaux est en position ‘‘0’’ lors du réglage des faisceaux sur les véhicules équipés d’un dispositif de contrôle de réglage des faisceaux.

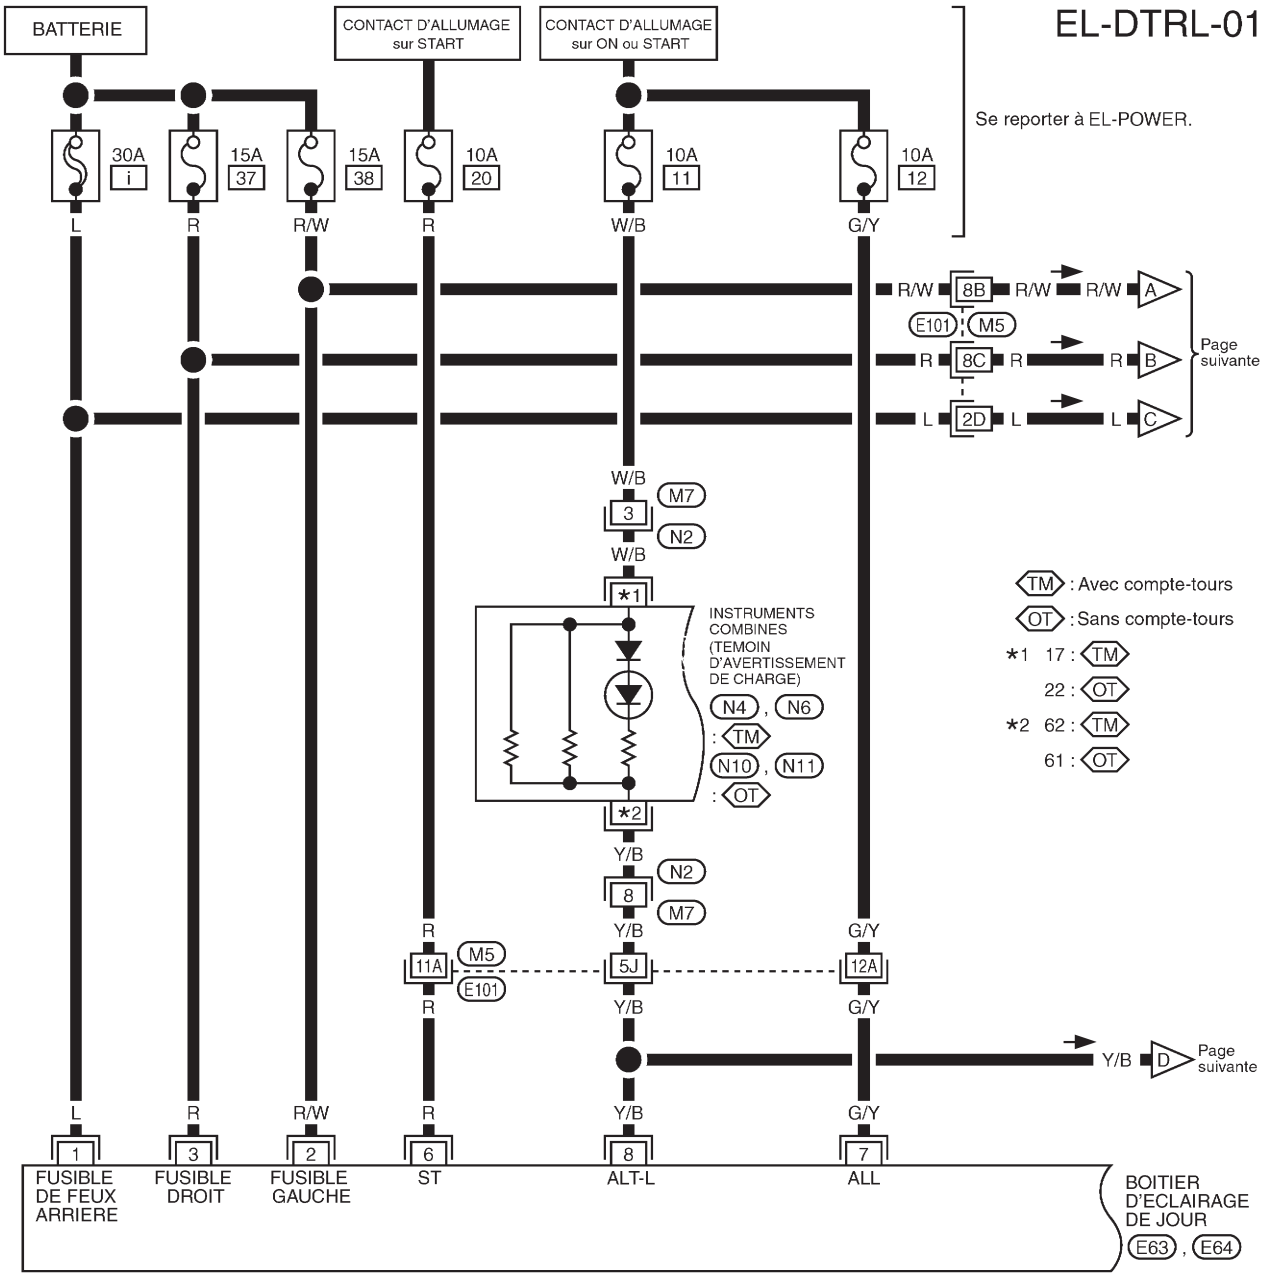
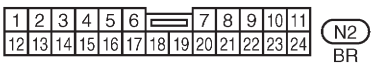
SEL254I

Feu de code

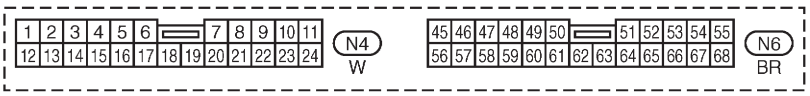
1. Tourner les feux de codes sur ON.
2. Utiliser des vis de réglage pour effectuer le réglage des faisceaux.



- **Commencer par serrer la vis de réglage à fond puis régler en desserrant progressivement la vis.**



- **Régler les phares de manière à ce que l'axe principal du faisceau soit parallèle à la ligne centrale de la carrosserie et aligné sur le point P de l'illustration.**
- **La figure à gauche montre le profil de réglage des faisceaux pour une conduite sur la partie droite de la route ; pour une conduite sur la partie gauche de la route, le profil de réglage des faisceaux est inversé.**
- **Les lignes pointillées dirigées vers le point P de l'illustration représentent le centre de chaque phare.**



"H" : Ligne centrale horizontale des phares
"W_L" : Distance entre les axes des phares
"L" : 5 000 mm

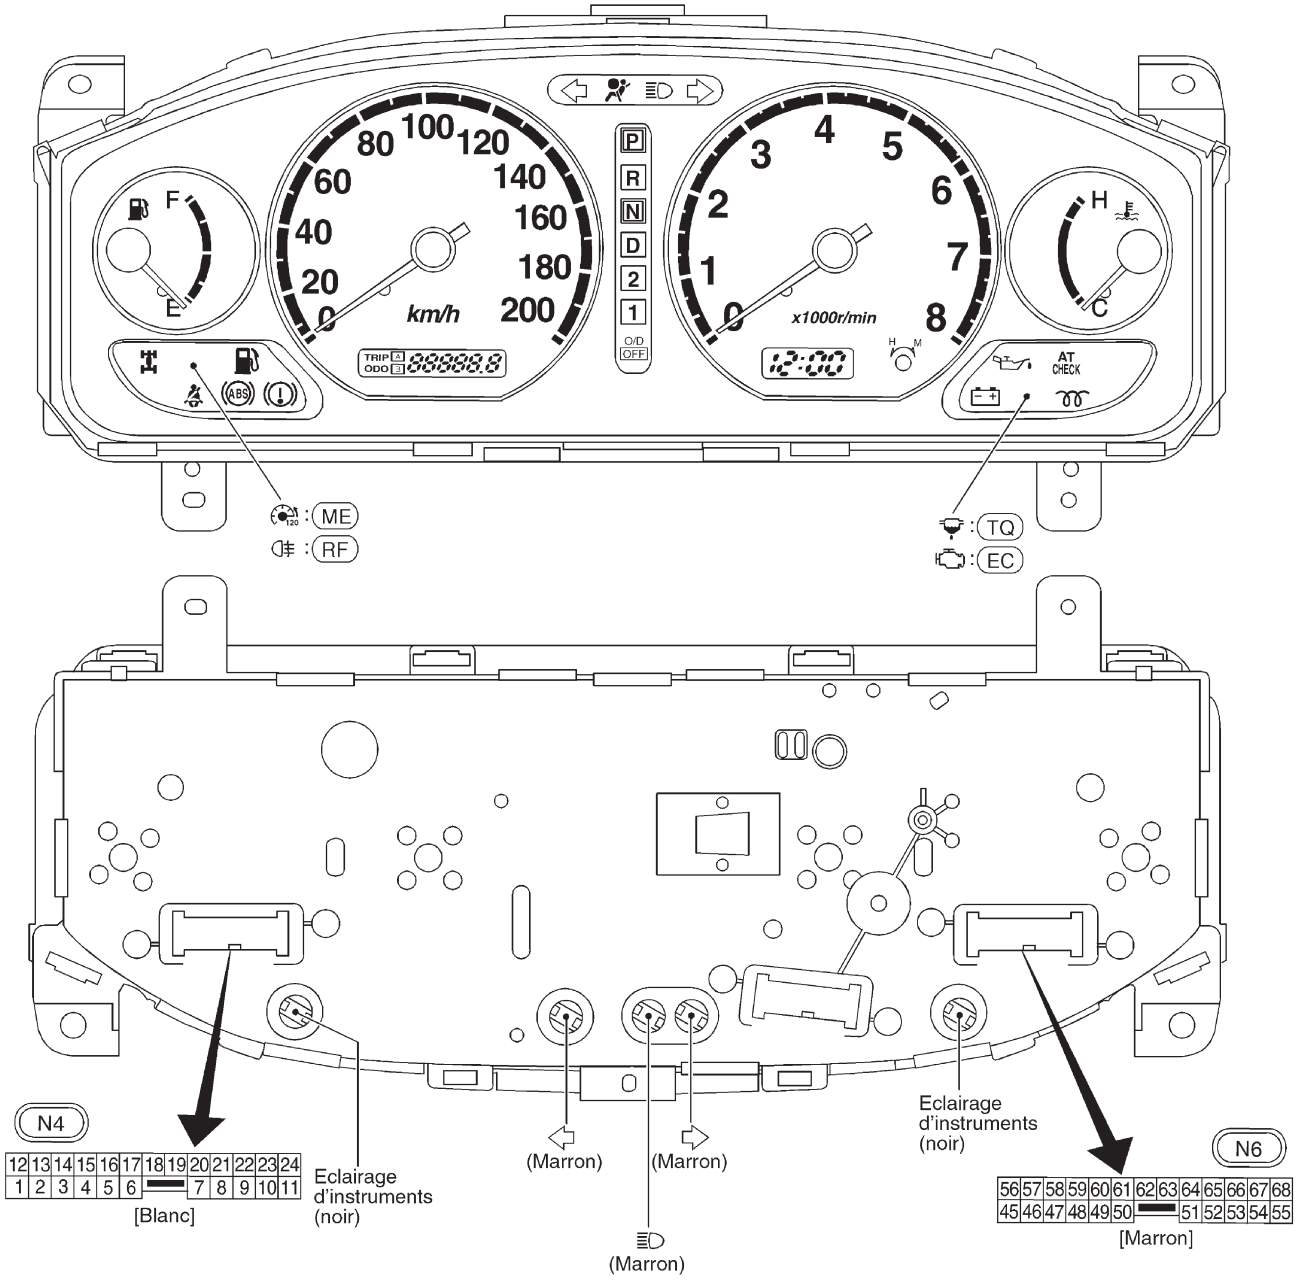
Description du système

INSTRUMENTS COMBINES

●Le compteur de vitesse, le compteur kilométrique/journalier, le compte-tours, la jauge de réservoir à carburant et la jauge de température d'eau sont entièrement contrôlés par le boîtier de commande des instruments combinés.

- Un compteur kilométrique/journalier numérique a été adopté.
  *Les données du compteur kilométrique sont conservées, même lorsque le câble de la batterie est débranché. Les données du compteur journalier sont effacées lorsque le câble de la batterie est débranché.
- Les segments du compteur kilométrique/journalier peuvent être vérifiés en mode diagnostic.
- Les instruments/jauges peuvent être vérifiés en mode de diagnostic.



COMMENT MODIFIER L'AFFICHAGE DU COMPTEUR KILOMETRIQUE/JOURNALIER

Remarque :
Mettre le contact d'allumage sur ON pour actionner le compteur kilométrique/journalier.

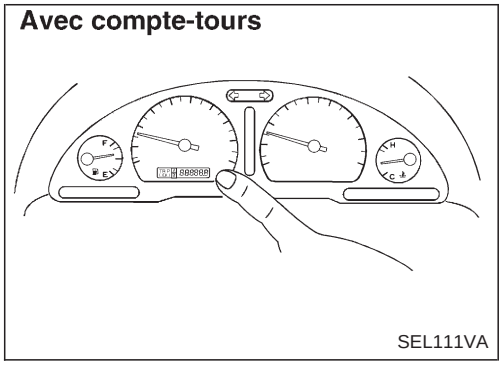
Fonctionnement des instruments/jauges et contrôle des segments de compteur kilométrique/journalier en mode de diagnostic.

FONCTION DE DIAGNOSTIC

- Les segments du compteur kilométrique/journalier peuvent être vérifiés en mode diagnostic.
- Les instruments/Jauges peuvent être vérifiés en mode de diagnostic.

COMMENT PASSER EN MODE DE DIAGNOSTIC

1. Mettre le contact d'allumage sur ON et faire passer le compteur kilométrique/journalier en position ''TRIP A'' ou ''TRIP B''.
2. Couper le contact d'allumage.
3. Mettre le contact d'allumage sur ON tout en poussant sur le bouton de réglage du compteur kilométrique/journalier.
4. Vérifier que le compteur kilométrique journalier indique ''000,0''.
5. Appuyer sur le bouton de réglage du compteur kilométrique/journalier plus de trois fois en 5 secondes.

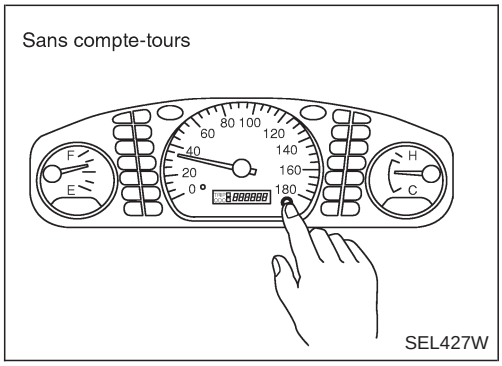


SEL110V

6. Tous les segments du compteur kilométrique/journalier numérique sont en marche.

NOTE : Si certains segments ne se mettent pas en marche, il convient de remplacer le boîtier de commande des instruments combinés ainsi que le compteur kilométrique/journalier.

A ce stade, les instruments combinés sont en mode de diagnostic.



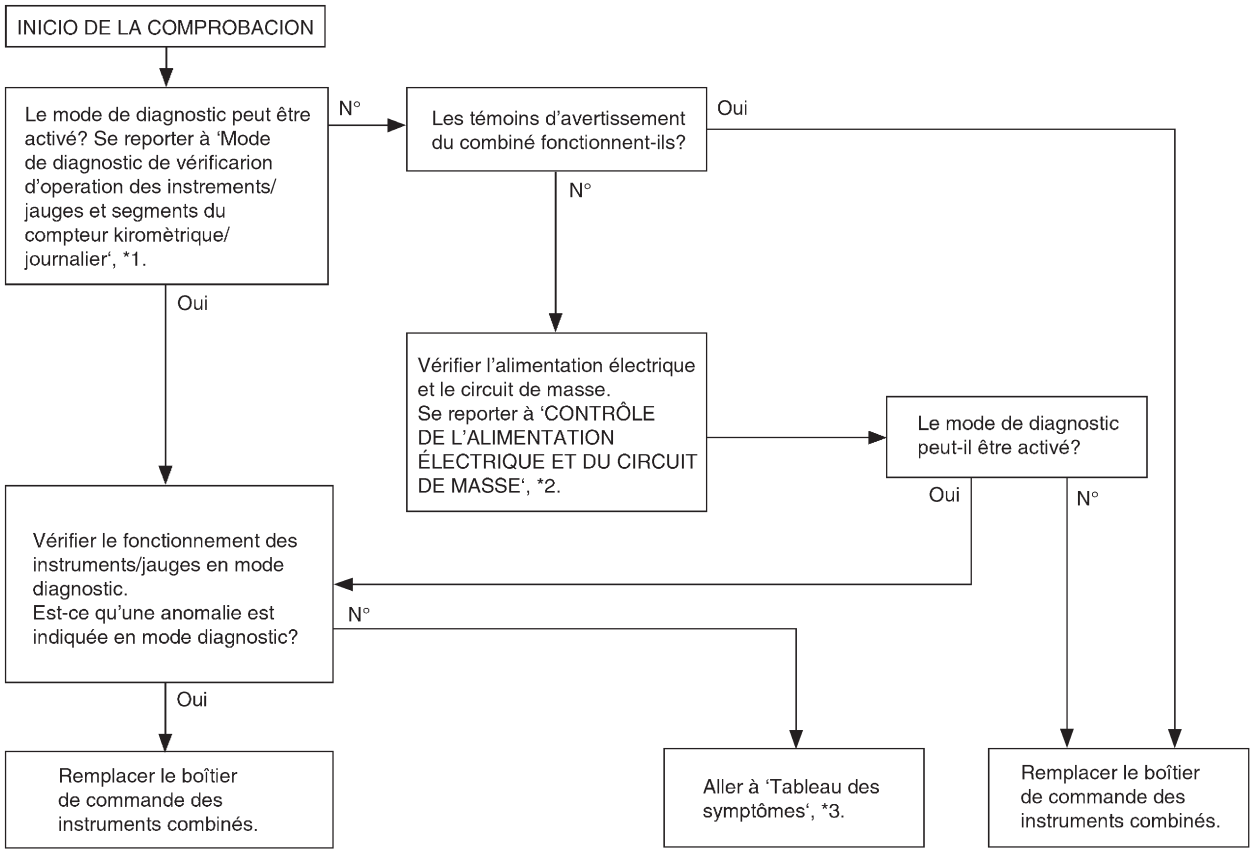
Avec compte-tours

SEL111VA

7. Appuyer sur le bouton de réglage du compteur kilométrique/journalier. Lorsque le bouton de réglage du compteur électrique/journalier est enclenché, l'indication de chaque instrument/jauge devrait être comme celle illustrée à gauche, s'il n'y a pas de défaut.

NOTE : Il faut environ quelques secondes pour que l'indicateur de la jauge de réservoir à carburant se stabilise.

Sans compte-tours



SEL427W

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostics de défaut/Avec compte-tours

VERIFICATION PRELIMINAIRE

SEL269Y

*1 : Se reporter à ''Fonctionnement des instruments/jauges et contrôle des segments de compteur kilométrique/ journalier en mode de diagnostic (EL-3071)

*2 : ALIMENTATION ELECTRIQUE ET VERIFICATION DU CIRCUIT DE MISE A LA MASSE (EL-0)

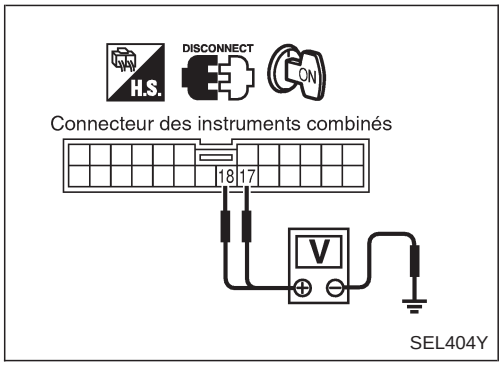
*3 : Tableau des symptômes (EL- 0)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostics de défaut/Avec compte-tours (Suite)

ORGANIGRAMME

Symptôme	Causes possibles	Ordre de réparation
Le compte-tours, la jauge à carburant ou la jauge de température d'eau est défectueux.	1. Signal du capteur - Signal de vitesse du véhicule - Jauge de carburant - Jauge de température d'eau 2. Boîtier de contrôle des instruments combinés	1. Vérifier le capteur de défauts des jauges et instruments. INSPECTION/ CAPTEUR DE VITESSE DU VEHICULE (se reporter à la section EL ''Capteur de vitesse du véhicule'' dans le Manuel de réparation original.) INSPECTION/INSPECTION DU BOITIER DE CAPTEURS DE NIVEAU DE CARBURANT/TRANSMETTEUR THERMIQUE 2. Remplacer le boîtier de contrôle des instruments combinés.
Plusieurs instruments/jauges sont défectueux (sauf le compteur kilométrique/ journalier)		



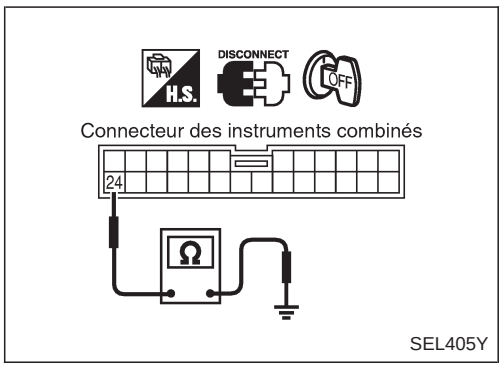
Avant de commencer le diagnostic décrit ci-dessous, effectuer la VERIFICATION PRELIMINAIRE, EL-3072

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostics de défaut/Avec compte-tours (Suite)

CONTROLE DE L'ALIMENTATION ELECTRIQUE ET DU CIRCUIT DE MISE A LA MASSE

Vérification du circuit de l'alimentation électrique

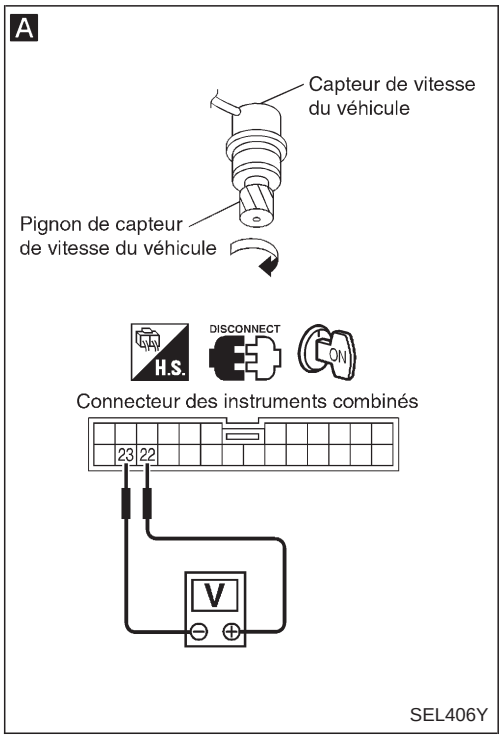


Bornes		Position du contact d'allumage		
⊕	⊖	OFF	ACC	ON
⑱ (R/G)	Masse	Tension de la batterie	Tension de la batterie	Tension de la batterie
⑰ (W/B)	Masse	0V	0V	Tension de la batterie

Si le résultat n'est pas satisfaisant, vérifier les points suivants .

- Fusible de 10A [n° 11, situé dans le boîtier à fusibles(J/B)].
- Fusible de 10A [n° 6, situé dans le boîtier à fusibles(J/B)].
- Faisceau en circuit ouvert ou court-circuité entre le fusible et les instruments combinés

Vérification du circuit de masse



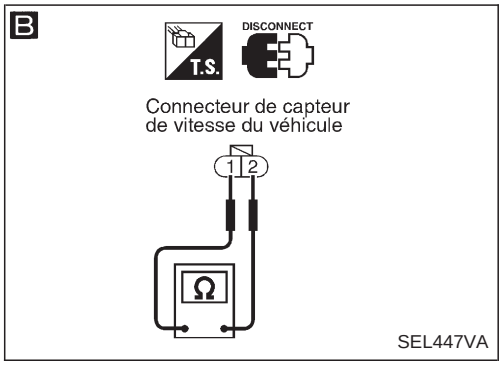
Bornes	Il y a continuité
㉔ - Masse (B)	Oui

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostics de défaut/Avec compte-tours (Suite)

INSPECTION/CAPTEUR DE VITESSE DU VEHICULE

Sans ABS pour le Moyen-Orient et sauf pour le Moyen-Orient

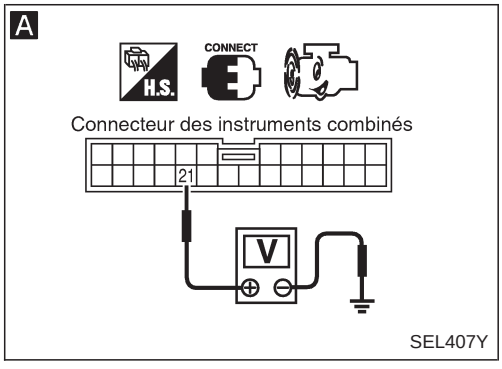


A

VERIFICATION DE LA SORTIE DU CAPTEUR DE VITESSE DU VEHICULE.
1. Déposer le capteur de vitesse du véhicule de la transmission.
2. Vérifier la tension entre le connecteur (N4) des bornes (22) (W) et (23) (R) des instruments combinés tout en tournant rapidement le pignon du capteur de vitesse.
   Tension : Environ 0,5V

Bon → Le capteur de vitesse du véhicule fonctionne correctement.

Mauvais ↓



B

VERIFICATION DU CAPTEUR DE VITESSE DU VEHICULE.
Vérifier la résistance entre les bornes de connecteur (E223) de capteur de vitesse du véhicule ① (W) et ② (R).
Résistance : Environ 250Ω

Mauvais → Remplacer le capteur de vitesse du véhicule.

Bon ↓

Vérifier que le faisceau ne soit ni en circuit ouvert ni cout-circuité entre les instruments combinés et le capteur de vitesse du véhicule.

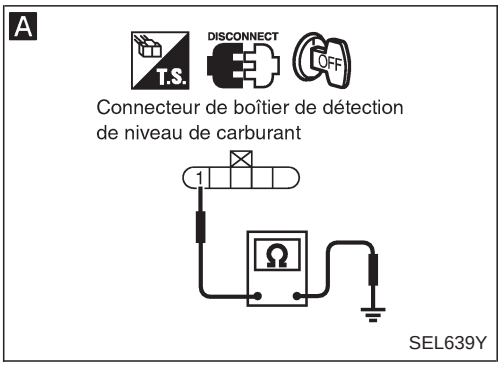
INSPECTION/SIGNAL DE REGIME MOTEUR

A

VERIFIER SORTIE ECM.
1. Démarrer le moteur.
2. Vérifier la tension entre les bornes (21) (W) des instruments combinés et la masse au ralenti et à 2 000 tr/mn.
   Tr/mn élevé = tension élevée
   Tr/mn faible = tension basse
   La tension variera en fonction du régime moteur.

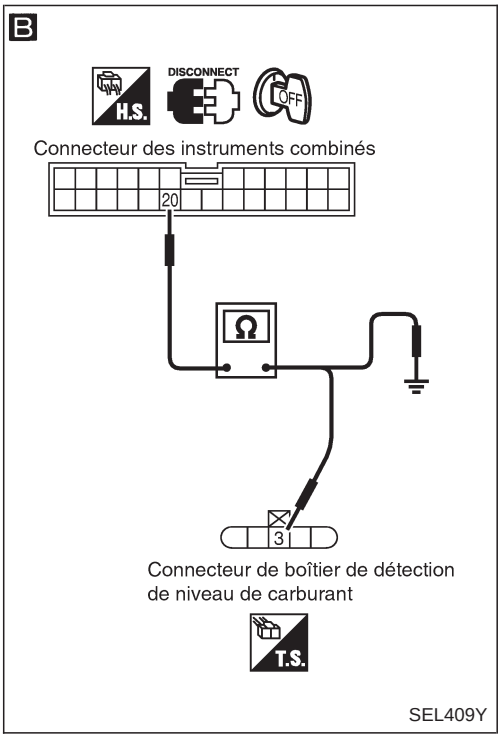
Bon → Le signal de régime moteur est bon.

Mauvais ↓



Vérifier les points suivants.
- Faisceau en circuit ouvert ou court-circuit entre l'ECM et les instruments combinés.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Diagnostics de défaut/Avec compte-tours (Suite)

INSPECTION/BOITIER DE CAPTEURS DE NIVEAU DE CARBURANT

A

B

A

VERIFIER LE CIRCUIT DE MISE A LA MASSE DU BOITIER DU CAPTEUR DE NIVEAU DE CARBURANT.
Vérifier la continuité du faisceau entre la borne ① (B) de connecteur C3 du boîtier du capteur de niveau de carburant et la masse
Il doit y avoir continuité.

Mauvais → Réparer le faisceau ou le connecteur.

Bon ↓

CONTROLE DES BOITIERS DE JAUGE
Se référer à la section EL "BOITIER DE CAPTEURS DE NIVEAU DE CARBURANT" du manuel de réparation, n° de publication SM7F-0D22G1.

Mauvais → Réparer ou remplacer. Se référer à la section FE du manuel de réparation, n° de publication SM7F-0D22G1.

Bon ↓

B

CONTROLER LE FAISCEAU POUR DETECTER LES CIRCUITS OUVERTS OU LES COURTS-CIRCUITS

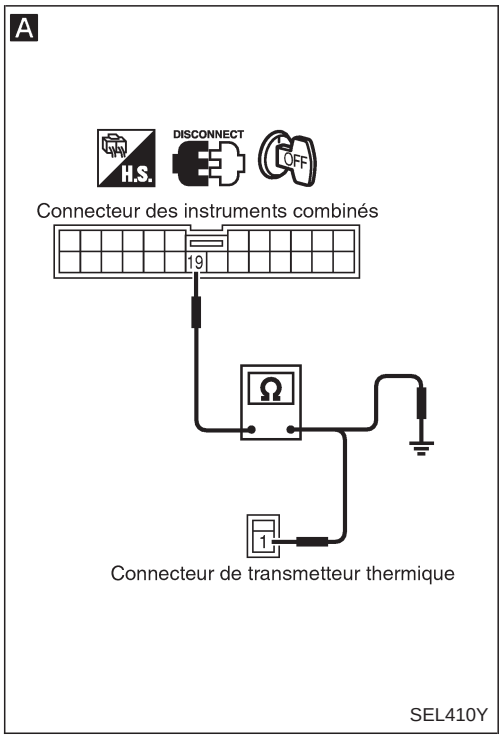
1. Débrancher le connecteur des instruments combinés et le connecteur du boîtier du capteurs de niveau de carburant.
2. Vérifier la continuité entre la borne ⑳ (Y/G) de connecteur des instruments combinés et la borne ③ (Y/G) du connecteur C3 du boîtier de capteurs de niveau.

Il doit y avoir continuité.

3. Vérifier la continuité entre la borne ⑳ (Y/G) des instruments combinés et la masse.

Il ne doit pas y avoir continuité.

Mauvais → Réparer le faisceau ou le connecteur.



Bon ↓

Le boîtier de capteurs de niveau de carburant fonctionne correctement.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostics de défaut/Avec compte-tours (Suite)

INSPECTION/TRANSMETTEUR THERMIQUE

VERIFIER LE TRANSMETTEUR THERMIQUE.
Se référer à la section ''TRANSMETTEUR THERMIQUE'' dans la publication originale du manuel de réparation, N°SM7F-0D22G1.

Mauvais → Réparer ou remplacer.

Bon ↓

A

CONTROLER LE FAISCEAU POUR DETECTER LES CIRCUITS OUVERTS OU LES COURTS-CIRCUITS

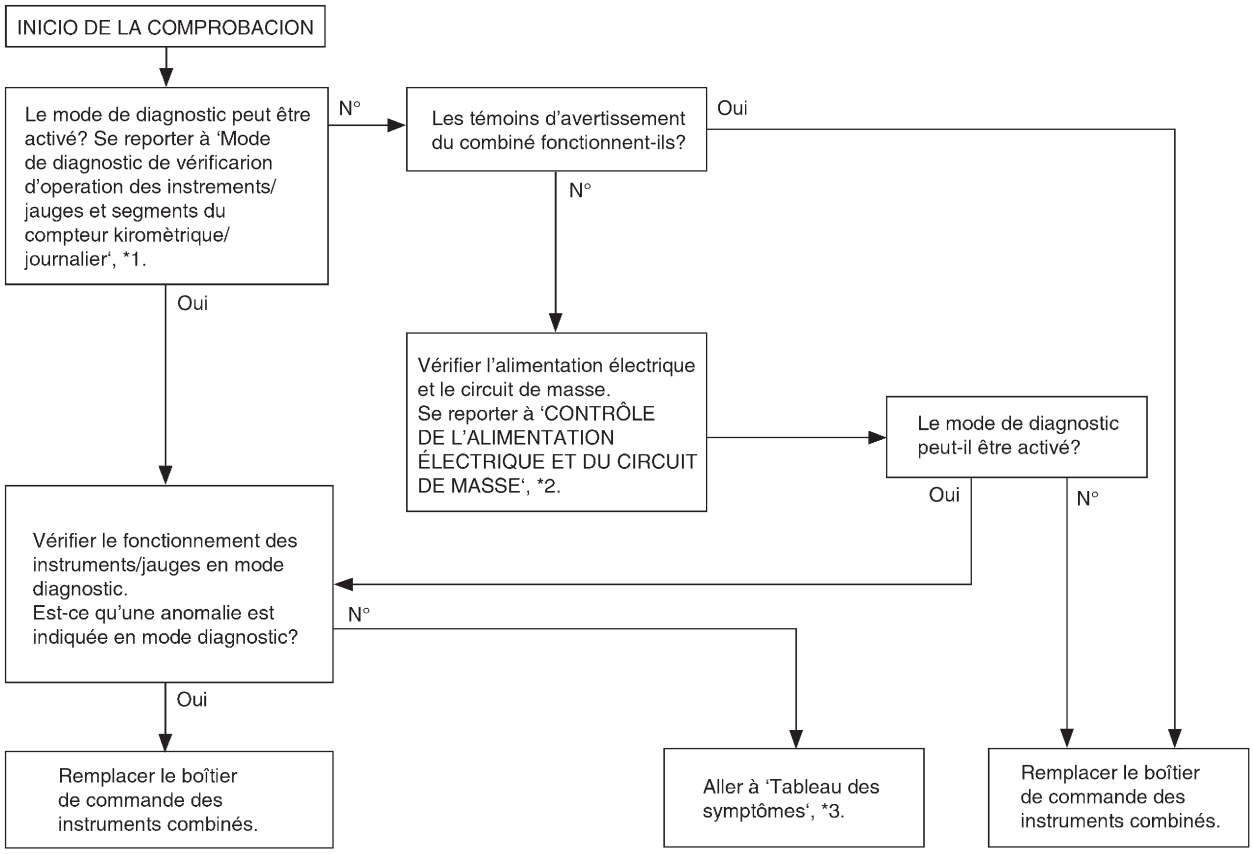
1. Débrancher le connecteur des instruments combinés ainsi que le connecteur du transmetteur thermique.
2. Vérifier la continuité entre la borne ⑲ (Y/R) de connecteur des instruments combinés et la borne ① du connecteur E9, M209, E209 du transmetteur thermique.

Il doit y avoir continuité.

3. Vérifier la continuité entre la borne ⑲ (Y/R) des instruments combinés et la masse.

Il ne doit pas y avoir continuité.

Mauvais → Réparer le faisceau ou le connecteur.



Bon ↓

Le transmetteur thermique fonctionne correctement.

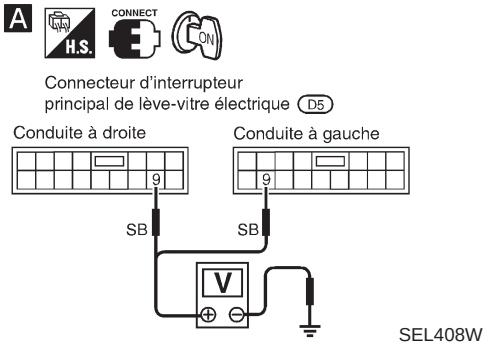
Diagnostic des défauts/Sans fonction de détection d'interruption

Symptôme	Cause possible	Ordre de réparation
Aucun des lève-vitres électriques ne peut être actionné quelle que soit la commande utilisée.	1. Raccord à fusible de 40A et rupteur de circuit 1. 2. Masses (M1) et (M54) 3. Relais de lève-vitre électrique 4. Circuit de l'interrupteur principal de lève-vitre électrique ouvert ou en court-circuit	1. Vérifier le raccord à fusible de 40A (lettre C, situé dans le raccord à fusible et la boîtier à fusibles) et le rupteur-1, situé dans le boîtier à fusibles. Mettre le contact d'allumage sur "ON" et vérifier qu'une tension positive de la batterie est appliquée à la borne ① de l'interrupteur principal de lève-vitre électrique et à la borne ⑤ des interrupteurs auxiliaires. 2. Vérifier les masses (M1) et (M54). 3. Vérifier le relais de lève-vitre électrique. 4. Vérifier que le faisceau ne soit ni en circuit ouvert ni court-circuité entre l'interrupteur principal et le relais de lève-vitre électrique.
Le lève-vitre électrique côté conducteur ne peut pas être actionné, mais les autres lève-vitres peuvent être actionnés.	1. Circuit du régulateur de lève-vitre électrique du conducteur 2. Régulateur de lève-vitre électrique du conducteur	1. Vérifier que le faisceau ne soit ni en circuit ouvert ni court-circuité entre l'interrupteur principal et le régulateur de lève-vitre électrique. 2. Vérifier le régulateur de lève-vitre électrique côté conducteur.
Un ou plusieurs lève-vitre électrique, sauf celui côté conducteur, ne peut pas être actionné.	1. Interrupteur auxiliaire de lève-vitre électrique 2. Régulateur de lève-vitre électrique du passager 3. Interrupteur principal de lève-vitre électrique 4. Circuit de lève-vitre électrique	1. Vérifier les interrupteurs auxiliaires de lève-vitre électrique. 2. Vérifier le régulateur du lève-vitre électrique défectueux. 3. Vérifier l'interrupteur principal de lève-vitre électrique. 4-1. Vérifier que les faisceaux ne soient pas en circuit ouvert ni court-circuités entre l'interrupteur principal et les interrupteurs auxiliaires de lève-vitre électriques. 4-2. Vérifier que les faisceaux ne soient ni en circuit ouvert ni court-circuités entre les interrupteurs auxiliaires et le régulateur de lève-vitre électrique.
Le lève-vitre électrique côté passager ne peut pas être actionné à l'aide de l'interrupteur principal de lève-vitre mais peut l'être à l'aide des interrupteurs auxiliaires.	1. Interrupteur principal de lève-vitre électrique	1. Vérifier l'interrupteur principal de lève-vitre électrique.
La fonction automatique du lève-vitre électrique côté conducteur ne peut être actionnée à l'aide de l'interrupteur principal de lève-vitre électrique.	1. Interrupteur principal de lève-vitre électrique	1. Vérifier l'interrupteur principal de lève-vitre électrique.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostic des défauts/Avec fonction de détection d'interruption



Symptôme	Cause possible	Ordre de réparation
Aucun des lève-vitres électriques ne peut être actionné quelle que soit la commande utilisée.	1. Fusible de 10A, raccord à fusible de 40A 2. Circuit de la masse 3. Interrupteur principal de lève-vitre électrique	1. Vérifier le fusible de 10A [n° 12, situé dans la boîte à fusible (J/B)], le raccord à fusible de 40A (lettre C , situé dans la boîte de raccord à fusible). 2. Vérifier le circuit de mise à la masse de la borne de l'interrupteur principal de lève-vitre électrique 19. 3. Vérifier l'interrupteur principal de lève-vitre électrique.
Le lève-vitre électrique côté conducteur ne peut pas être actionné, mais les autres lève-vitres peuvent être actionnés.	1. Circuit du régulateur de lève-vitre électrique côté conducteur 2. Régulateur de lève-vitre électrique côté conducteur 3. (M52) Rupteur 2 4. (M52) Circuit du rupteur 2 5. Circuit de l'interrupteur principal de lève-vitre électrique	1. Vérifier que le faisceau ne soient ni en circuit ouvert ni court-circuité entre l'interrupteur principal et le régulateur de lève-vitre électrique côté conducteur. 2. Vérifier le régulateur de lève-vitre électrique côté conducteur. 3. Vérifier le rupteur 2 (M52). 4. Vérifier le faisceau entre (M52) le rupteur 2 et le raccord à fusible de 40A (lettre C , situé dans la boîte à fusible et à raccord à fusible). 5-1. Vérifier le faisceau entre la borne (13) de l'interrupteur principal de lève-vitre électrique et le fusible de 10A [n° 12, situé dans le boîtier à fusible(J/B)]. 5-2. Vérifier le faisceau entre la borne (5) de l'interrupteur principal de lève-vitre électrique et le rupteur (M52).
Un ou plusieurs lève-vitre électrique, sauf celui côté conducteur, ne peut être actionné.	1. Interrupteurs auxiliaires de lève-vitre 2. Régulateurs de lève-vitre électrique 3. Interrupteur principal de lève-vitre électrique 4. Circuit de lève-vitre électrique	1. Vérifier les interrupteurs auxiliaires de lève-vitre électrique. 2. Vérifier le régulateur de lève-vitre électrique. 3. Vérifier l'interrupteur principal de lève-vitre électrique. 4-1. Vérifier que les faisceaux entre l'interrupteur principal de lève-vitre et l'interrupteur auxiliaire de lève-vitre ne soient ni en circuit ouvert ni cout-circuités. 4-2. Vérifier que les faisceaux entre l'interrupteur auxiliaire de lève-vitre et le régulateur de lève-vitre ne soient ni en circuit ouvert ni court-circuités.
Les lève-vitre électriques, excepté celui du conducteur, ne peuvent pas être actionnés à l'aide de l'interrupteur principal de lève-vitre mais peuvent l'être à l'aide des interrupteurs auxiliaires.	1. Interrupteur principal de lève-vitre électrique	1. Vérifier l'interrupteur principal de lève-vitre électrique.
La mise en marche automatique du lève-vitre électrique côté conducteur ne fonctionne pas correctement.	1. Interrupteur principal de lève-vitre électrique 2. Encodeur et interrupteur de fin de course.	1. Vérifier l'interrupteur principal de lève-vitre électrique. 2. Vérifier l'encodeur et l'interrupteur de fin de course. (EL-0)
Le temporisateur qui permet l'alimentation électrique après que le contact d'allumage ait été mis sur la position OFF ne fonctionne pas correctement. (Sauf modèles pour l'Europe)	1. Circuit du contact de porte côté conducteur 2. Contact de porte côté conducteur 3. Circuit du signal du contact d'allumage ON 4. Interrupteur principal de lève-vitre électrique	1. Vérifier le faisceau entre le contact de porte du conducteur et l'interrupteur principal de lève-vitre électrique. 2. Vérifier le contact de porte côté conducteur. 3. Vérifier le circuit du signal du contact d'allumage (sur ON) à l'interrupteur principal de lève-vitre électrique. 4. Vérifier l'interrupteur principal de lève-vitre électrique.

Diagnostic des défauts/Avec fonction de détection d'interruption (Suite)

ENCODEUR ET INTERRUPTEUR DE FIN DE COURSE

A

B

VERIFIER LE MECANISME DE COULISSEMENT DE VITRE DE PORTE
Vérifier les points suivants.
- Obstacles dans la vitre, moulure de la vitre, etc.
- Moulure de la vitre usée ou déformée
- Guillotine de porte trop penchée vers l'intérieur ou l'extérieur
- Régulateur de vitre de porte

Mauvais → Retirer les obstacles ou réparer le mécanisme de coulissement de vitre de porte.

Bon ↓

A

VERIFIER L'ALIMENTATION ELECTRIQUE DE L'INTERRUPTEUR DE FIN DE COURSE
1. Débrancher le connecteur du régulateur de lève-vitre électrique côté conducteur.
2. Mettre le contact d'allumage sur ON.
3. Vérifier la tension entre la borne ⑨ de l'interrupteur principal de lève-vitre électrique et la masse.
   Il doit y avoir environ 5V.

Mauvais → Remplacer l'interrupteur principal de lève-vitre électrique.

Bon ↓

VERIFIER LE FONCTIONNEMENT DE L'INTERRUPTEUR DE FIN DE COURSE
1. Couper le contact.
2. Brancher le connecteur du régulateur de lève-vitre électrique côté conducteur.
3. Mettre le contact d'allumage sur ON.
4. Vérifier la tension entre la borne ⑨ de l'interrupteur principal de lève-vitre électrique et la masse pendant l'opération de fermeture du lève-vitre électrique.

N° de borne	Condition	Tension (DCV)
⑨	Environ 15 mm au dessous de la position complètement fermée à la position fermée	Environ 5
	Autres positions	Environ 0

Bon → B

B

VERIFIER L'ENCODEUR
Mesurer la tension entre la borne ⑯ de l'interrupteur principal de lève-vitre électrique et la masse avec un oscilloscope pendant l'opération de fermeture automatique du lève-vitre électrique.
Si le résultat est mauvais, remplacer le moteur du régulateur de lève-vitre électrique (côté conducteur).
Si le résultat est bon, remplacer l'interrupteur principal de lève-vitre électrique.

Mauvais ↓

REGLER L'INTERRUPTEUR DE FIN DE COURSE
Régler l'interrupteur de fin de course. Se reporter à la section BT. Mesurer la tension entre la borne ⑨ de l'interrupteur principal de lève-vitre électrique et la masse pendant l'opération de fermeture du lève-vitre électrique au moins dix fois.

N° de borne	Condition	Tension (DCV)
⑨	Environ 15 mm au dessous de la position complètement fermée à la position fermée	Environ 5
	Autres positions	Environ 0

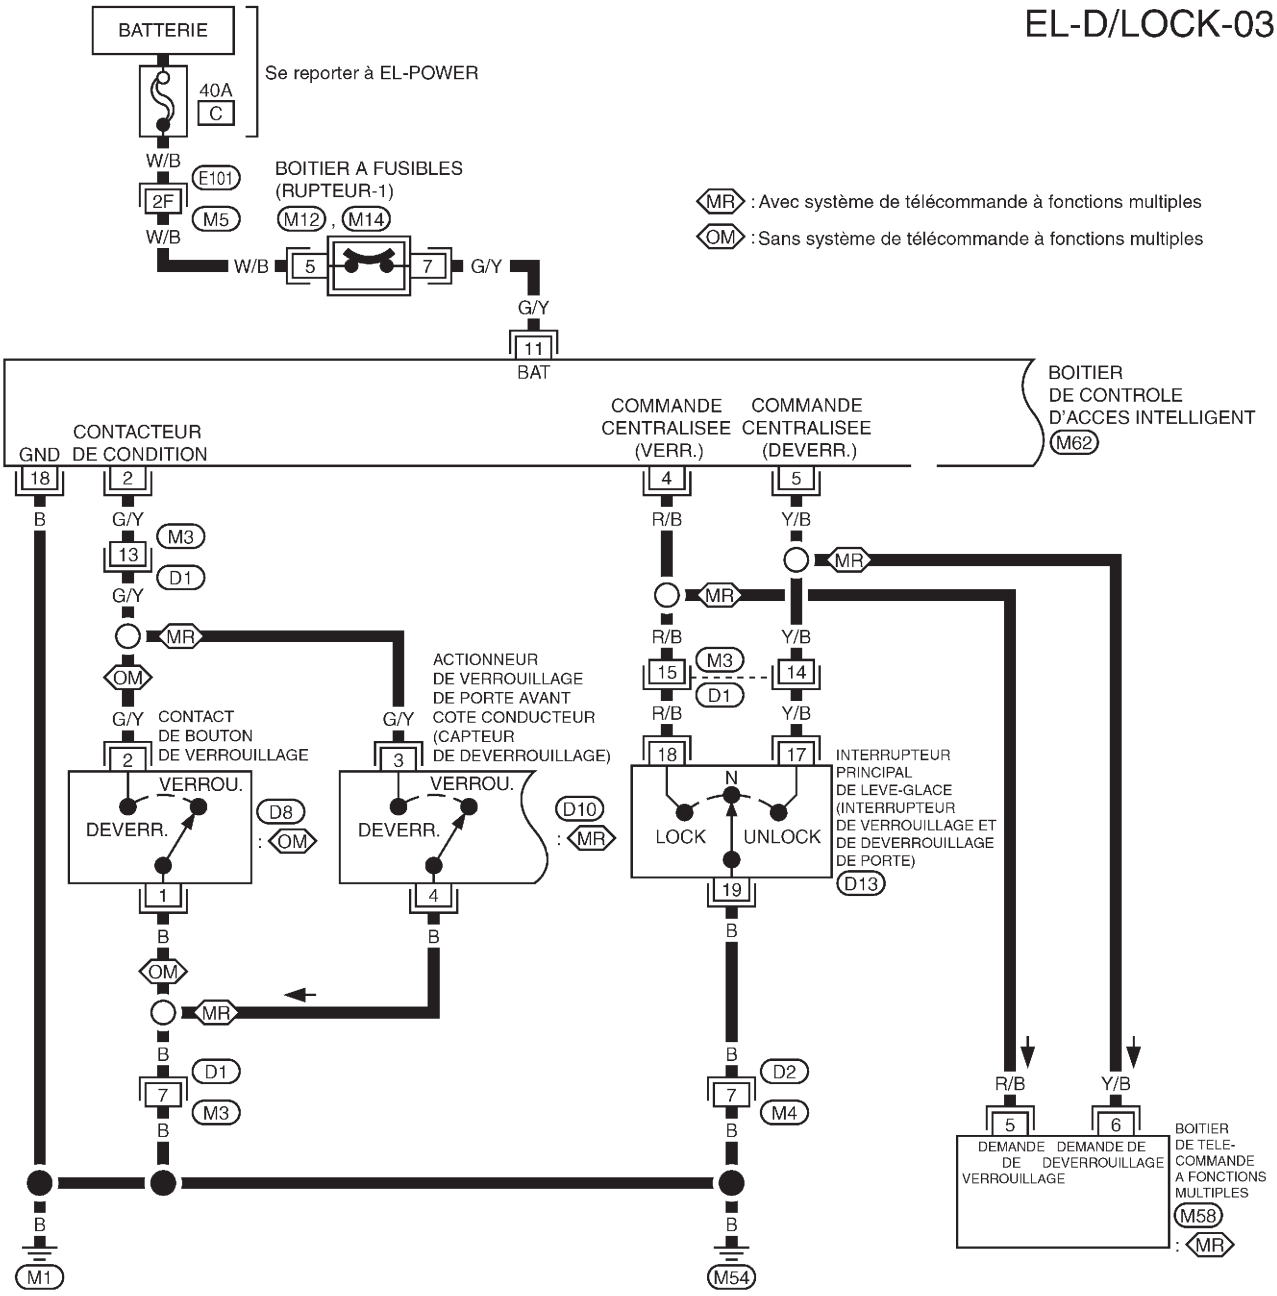
Mauvais → Remplacer le moteur du régulateur de lève-vitre électrique (côté conducteur).

Bon ↓

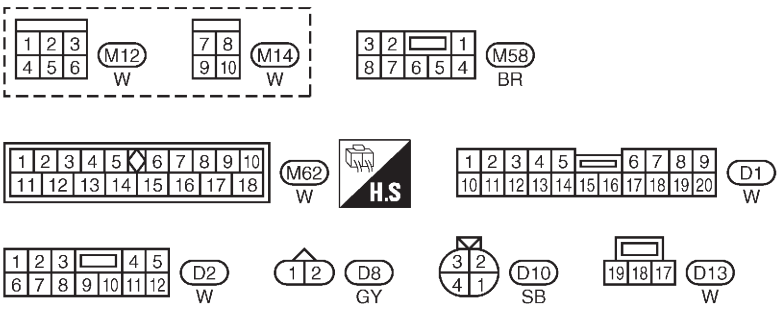
B

VERIFIER L'ENCODEUR
Mesurer la tension entre la borne ⑯ de l'interrupteur principal de lève-vitre électrique et la masse avec un oscilloscope pendant l'opération de fermeture automatique du lève-vitre électrique.

Mauvais → Remplacer le moteur du régulateur de lève-vitre électrique (côté conducteur).



Bon ↓



Remplacer l'interrupteur principal de lève-vitre électrique.

Description du système

FONCTION

Le système de télécommande à fonctions multiples est doté des fonctions suivantes.

- Verrouillage de porte
- Déverrouillage de porte
- Rappel de feux de détresse

FONCTIONNEMENT DU VERROUILLAGE

Lorsque le signal de fermeture (LOCK) est envoyé à l'unité de contrôle de télécommande à fonctions multiples (l'antenne du système est combinée avec l'unité de contrôle de télécommande à fonctions multiples), la masse est fournie

- à travers la borne ⑤ de l'unité de contrôle de télécommande à fonctions multiples
- à la borne ④ de la centrale de commande intelligente.

La borne de la centrale de commande intelligente fourni alors l'alimentation et la masse à chacun des actionneurs de fermeture de porte.

FONCTIONNEMENT DU DEVERROUILLAGE

Lorsque le signal d'ouverture (UNLOCK) est envoyé à l'unité de contrôle de télécommande à fonctions multiples (l'antenne du système est combinée avec l'unité de contrôle de télécommande à fonctions multiples), la masse est fournie

- à travers la borne ⑥ de la télécommande à fonctions multiples
- à la borne ⑤ de la centrale de commande intelligente.

La borne de la centrale de commande intelligente fourni alors l'alimentation et la masse à chacun des actionneurs de fermeture de porte.

RAPPEL DE FEUX DE DETRESSE

Lorsque les portes sont verrouillées ou déverrouillées (signal provenant du capteur de déverrouillage de la porte conducteur) par la télécommande à fonctions multiples, l'alimentation est fournie

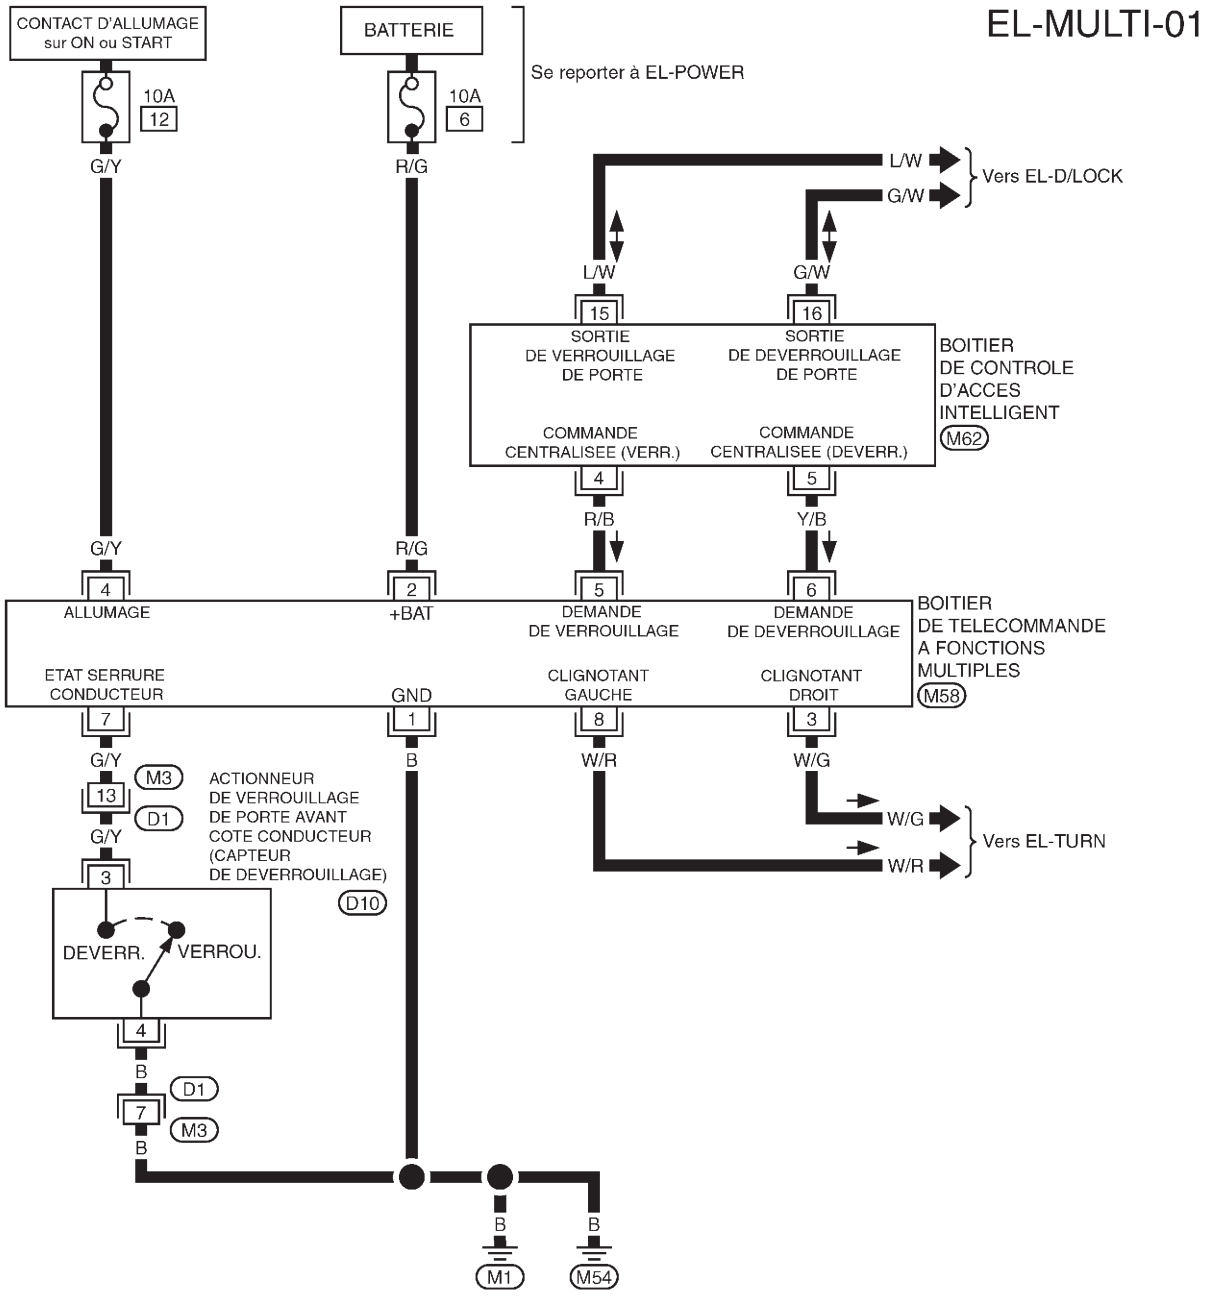
- à travers les bornes ③ et ⑧ de la télécommande à fonctions multiples
- aux feux de détresse.

Les feux de détresse clignotent alors de la façon suivante.

- Verrouillage : un clignotement
- Déverrouillage : deux clignotements

SAISIE DU CODE D'IDENTIFICATION DE LA TELECOMMANDE MULTI-TELECOMMANDE

Un maximum de quatre télécommandes peut être entré. Toute tentative pour introduire une télécommande effacera les codes d'identification entrés précédemment. Il faut par conséquent s'assurer que le propriétaire du véhicule a remis toutes les télécommandes à fonctions multiples lorsqu'une saisie de code d'identification est effectuée.



Pour saisir le code d'identification, il faut que les signaux suivants soient transmis au boîtier de contrôle de la télécommande à fonctions multiples.

- Signal du contact d'allumage ON
- Alimentation électrique de la batterie
- Signal de la télécommande à fonctions multiples

Pour la procédure détaillée, se reporter à ''Procédure d'entrée du code d'identification'' dans la section EL-0

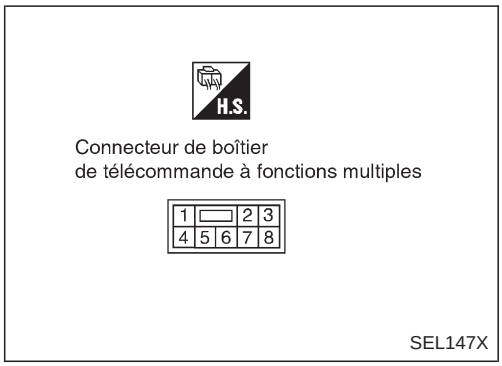
Diagnostics des défauts

ORGANIGRAMME

Symptôme	Cause possible	Diagnostic/procédure d'entretien
Aucune porte ne peut être verrouillée ou déverrouillée par commande à distance. (Voir NOTE).	1. Système de verrouillage électrique de porte 2. Batterie de la télécommande 3. Circuit de Verr./déverr. de porte 4. Circuit de l'alimentation électrique de l'allumage pour l'unité de contrôle de télécommande à fonctions multiples 5. Circuit d'alimentation électrique pour l'unité de contrôle de télécommande à fonctions multiples 6. Circuit de masse pour le boîtier de contrôle de télécommande à fonctions multiples 7. Télécommande	1. Vérifier le fonctionnement du verrouillage électrique de porte. 2. Vérifier la pile de la télécommande. Se reporter à la page EL-0. 3. Vérifier que les faisceaux ne soient ni en circuit ouvert ni court-circuités entre l'unité de télécommande à fonctions multiples et la centrale de commande intelligente. 4. S'assurer qu'une tension existe à la borne ④ de l'unité de contrôle de télécommande à fonctions multiples lorsque le contact d'allumage est sur la position ALL. 5. S'assurer qu'une tension existe à la borne ② de l'unité de contrôle de télécommande à fonctions multiples. 6. Vérifier la continuité entre la borne ① de l'unité de contrôle de télécommande à fonctions multiples et la masse. 7. Remplacer la télécommande à fonctions multiples. Se reporter à la page EL-0
Le témoin de feux de détresse ne fonctionne pas correctement.	1. Sortie de témoin de feux de détresse vers les feux de détresse 2. Circuit du témoin de feux de détresse 3. Capteur de déverrouillage de porte côté conducteur	1. Vérifier la sortie de témoin de feux de détresse vers les feux de détresse aux bornes ③ et ⑧ de l'unité de contrôle de télécommande à fonctions multiples. 2. Vérifier que le faisceau ne soit ni en circuit ouvert ni court-circuité entre les témoins d'avertissement des feux de détresse et l'unité de contrôle de télécommande à fonctions multiples. 3. Vérifier le signal de capteur de déverrouillage de porte (côté conducteur) à la borne ⑦ de l'unité de contrôle de télécommande à fonctions multiples.
Le nouveau code d'identification de la télécommande à fonctions multiples ne peut pas être entré.	1. Pile de la télécommande 2. Circuit d'alimentation électrique de l'allumage du boîtier de contrôle de télécommande à fonctions multiples 3. Capteur de déverrouillage de porte côté conducteur 4. Télécommande	1. Vérifier la pile de la télécommande. Se reporter à la page EL- 0 2. S'assurer qu'une tension existe à la borne ④ de l'unité de contrôle de télécommande à fonctions multiples lorsque le contact d'allumage est sur la position ALL. 3. Vérifier le signal de capteur de déverrouillage de porte (côté conducteur) à la borne ⑦ de l'unité de contrôle de télécommande à fonctions multiples. 4. Remplacer la télécommande à fonctions multiples. Se reporter à la page EL- 0

Se reporter au ''TABLEAU D'INSPECTION DU BOITIER DE CONTROLE DE TELECOMMANDE MULTI-TELECOMMANDE'' de la page suivante pour vérifier les signaux du boîtier de contrôle.
NOTE :



- Le fonctionnement du verrouillage de la télécommande ne fonctionne pas quand la clé d'allumage est sur la position ''ON''.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostics des défauts (Suite)

TABLEAU D'INSPECTION DU BOITIER DE CONTROLE DE TELECOMMANDE MULTI-TELECOMMANDE

Borne N°	Connexions	Condition		Tension (V) (valeurs approximatives)
1	Masse	—		—
2	Alimentation électrique (BAT)	—		12
3	Témoin d'avertissement des feux de détresse de droite	Le bouton LOCK (VERR.)/UNLOCK (DEVERR.) de la télécommande est enclenché (Toutes les portes sont fermées et la clé ne se trouve pas dans le cylindre de contact d'allumage)		12
		Autres que celles ci-dessus.		0
4	Alimentation électrique de l'allumage	Contact d'allumage	OFF	0

		Autres que celles ci-dessus.		0

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure d'entrée du code d'identification

Activation du mode d'enregistrement :

Le véhicule doit avoir été déverrouillé soit par la télécommande à fonctions multiples, soit par un signal Bon du transpondeur (TP) venant du système d'immobilisation du véhicule.
Préparation : - S'assurer que toutes les portes se déverrouillent.
- S'assurer que l'on dispose de toutes les télécommandes à fonctions multiples à enregistrer.
- S'assurer que les piles de la multi-télécommande ne sont pas usées.
- S'assurer qu'aucune source d'émission d'ondes n'est en activité à proximité du véhicule.
- S'assurer que la batterie du véhicule est chargée.

↓

Tourner le contact d'allumage exactement six fois successivement de la position ''LOCK'' (verrouillage) à la position ''ON'' (contact) en 10 secondes, et ramener le contact d'allumage en position ''LOCK'' (en laissant la clé dans le contact d'allumage).

↓

Après 2 secondes, le mode d'enregistrement est activé. Les clignotants clignotent deux fois successivement. — Mauvais → (retour)

↓ Bon

Procéder au mode d'enregistrement.

REMARQUE
Le mode d'enregistrement est activé quand :
- Le contact d'allumage est mis sur la position ''ON''.
- 4 télécommandes à fonctions multiples ont été enregistrées par le système.
- Aucun signal d'entrée de télécommande à fonctions multiples ou de contact d'allumage n'est reçu pendant 120 secondes.

Mode enregistrement

Enfoncer et maintenir enfoncé le bouton ''DEVERROUILLAGE'' de la télécommande à fonctions multiples.

↓

Enfoncer le bouton VERROUILLAGE 3 fois.

↓

Relâcher le bouton ''DEVERROUILLAGE''.

→ Si le code de la télécommande à fonctions multiples est enregistré correctement, les clignotants vont clignoter une fois. — Mauvais → (retour)

↓

Voulez-vous enregistrer une autre télécommande à fonctions multiples ? (max. 4)

Bon ← (depuis Si le code…)

Non ↓

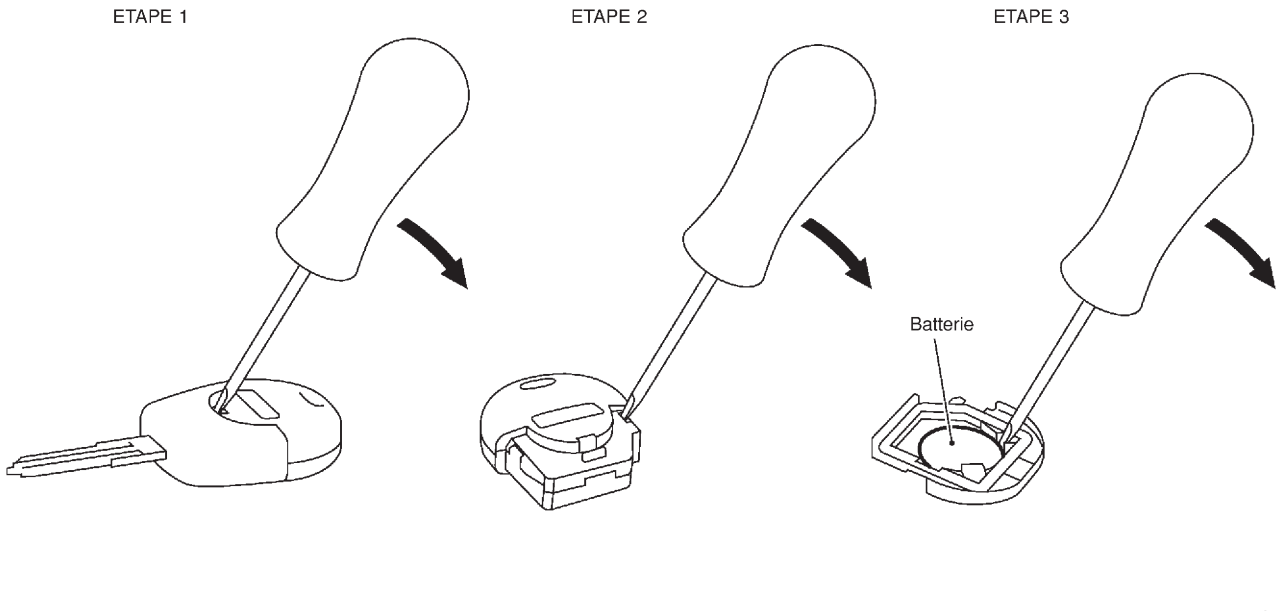
Oui → (retour)

Après enregistrement des n° nécessaires des télécommande(s), confirmer le(s) code(s) d'identification en mettant le contact d'allumage sur la position ON.

→ Si l'enregistrement des télécommandes à fonctions multiples a été effectué correctement, les clignotants vont clignoter deux fois.

Bon ↓ Mauvais → (retour)

Retirer la clé de contact du contact d'allumage et confirmer le fonctionnement de toutes les télécommandes à fonctions multiples en verrouillant et déverrouillant les portes du véhicule avec chaque télécommande tour à tour.

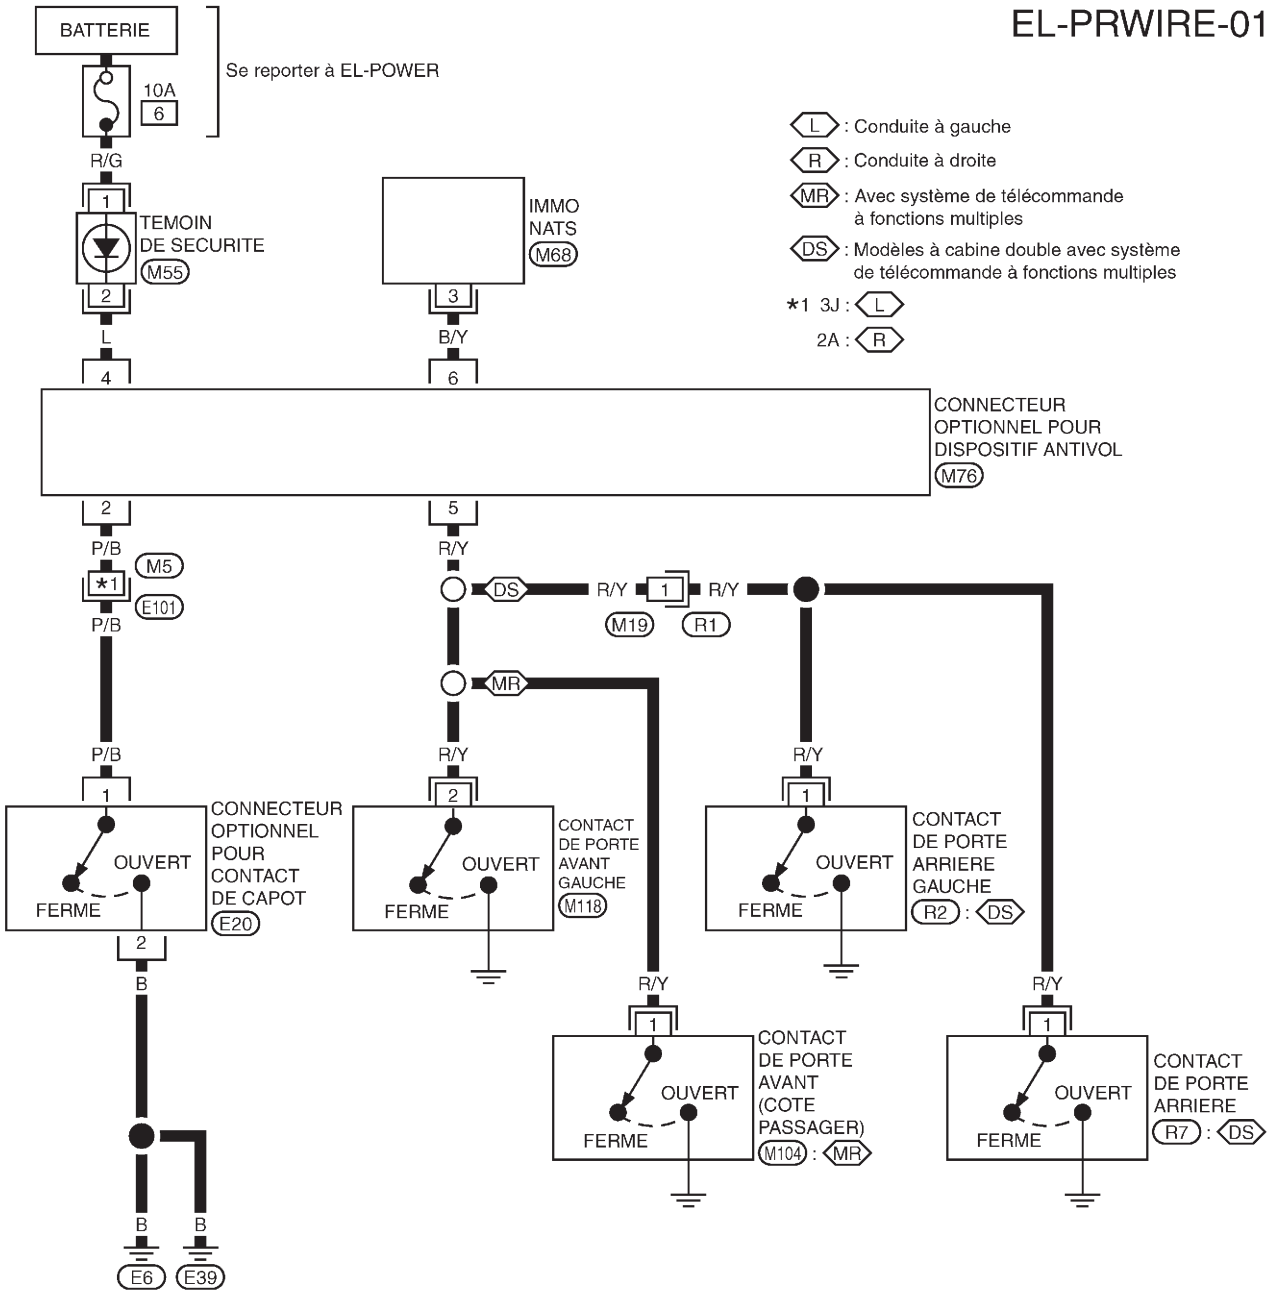


↓

FIN

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Remplacement de la pile de la télécommande à fonctions multiples



REMARQUE :
- **Veiller à ne pas toucher au tableau de circuit ou à la borne batterie.**
- **La télécommande est étanche. Toutefois, en cas de contact avec l'eau, essuyer immédiatement.**
- **Appuyer deux ou trois fois sur le bouton de la télécommande pour vérifier son fonctionnement après en avoir remplacé la pile.**

Emplacement des composants et des connecteurs de faisceau

NOTE :
Si le client fait état d'un problème de 'non démarrage', demander à ce que TOUTES LES CLES soient amenées au concessionnaire au cas où le NATS serait en cause.

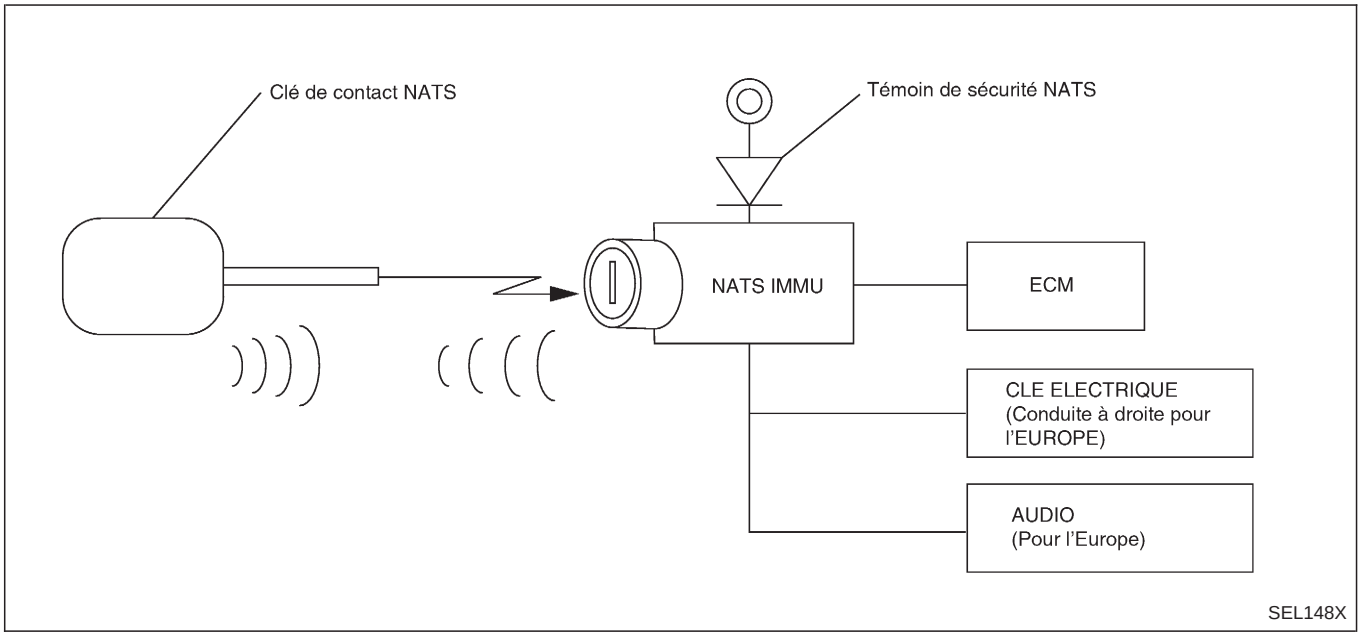
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description du système

Le système NATS présente les fonctions d'immobilisation suivantes :

- Comme seules les clés de contact NATS dont les numéros d'identification ont été enregistrés dans l'ECM et IMMO de NATS permettent de démarrer le moteur, le vol du véhicule sans une clé enregistrée NATS sera empêché grâce à NATS.
  Cela signifie que le système NATS immobilisera le véhicule si quelqu'un tente de le démarrer sans utiliser une clé NATS enregistrée.
- Cette version de système NATS est dotée d'un boîtier de prise de sécurité pour améliorer les performances antivol (modèles à conduite à droite pour l'Europe). Le boîtier de prise de sécurité a son propre numéro d'identification, qui est enregistré dans l'IMMO du système NATS. En conséquence, si le boîtier de prise de sécurité est remplacé, une initialisation du système doit être effectuée.
- Quand un défaut de fonctionnement du boîtier de prise de sécurité est détecté :
  — Le témoin de sécurité s'allume pendant environ 15 minutes après que le contact d'allumage ait été mis sur ON.
  — Quand le boîtier de prise de sécurité est affecté d'un défaut de fonctionnement et que le témoin de sécurité est allumé, il est impossible de démarrer le moteur. Le moteur peut cependant être démarré une seule fois, quand le témoin de sécurité s'éteint, environ 15 minutes après que le contact d'allumage a été tourné sur la position ON.
- Les deux numéros d'identification des clés délivrées initialement ont été enregistrés dans le système NATS.
  A la demande du propriétaire du véhicule, un maximum de cinq identifications de clé peut être enregistré dans le système NATS.
- Le témoin de sécurité NATS (Témoin de sécurité NATS) clignote lorsque le contact d'allumage est sur la position ''OFF'' ou ''ACC'' . De cette façon, le système NATS indique à toute personne extérieure que le véhicule est équipé d'un système antivol.
- Quand le système NATS détecte un défaut, le témoin de sécurité s'allume de la façon suivante.

Condition ALL sur ON et	Avec boîtier de prise de sécurité	Sans boîtier de prise de sécurité
	Témoin de sécurité	Témoin de sécurité
Défaut de fonctionnement NATS (excepté boîtier de prise de sécurité) détecté	1. 6 clignotements 2. Reste allumé après que le contact d'allumage est été mis sur ON	Reste allumé
Seul le défaut de fonctionnement du boîtier de prise de sécurité est détecté	Reste allumé **pendant environ 15 minutes** après que le contact d'allumage est été mis sur ON.	—
Défaut de fonctionnement du NATS et d'accessoires du moteur détecté	1. 6 clignotements 2. Reste allumé après que le contact d'allumage est été mis sur ON	Reste allumé
Immédiatement après l'initialisation du NATS	6 clignotements	—

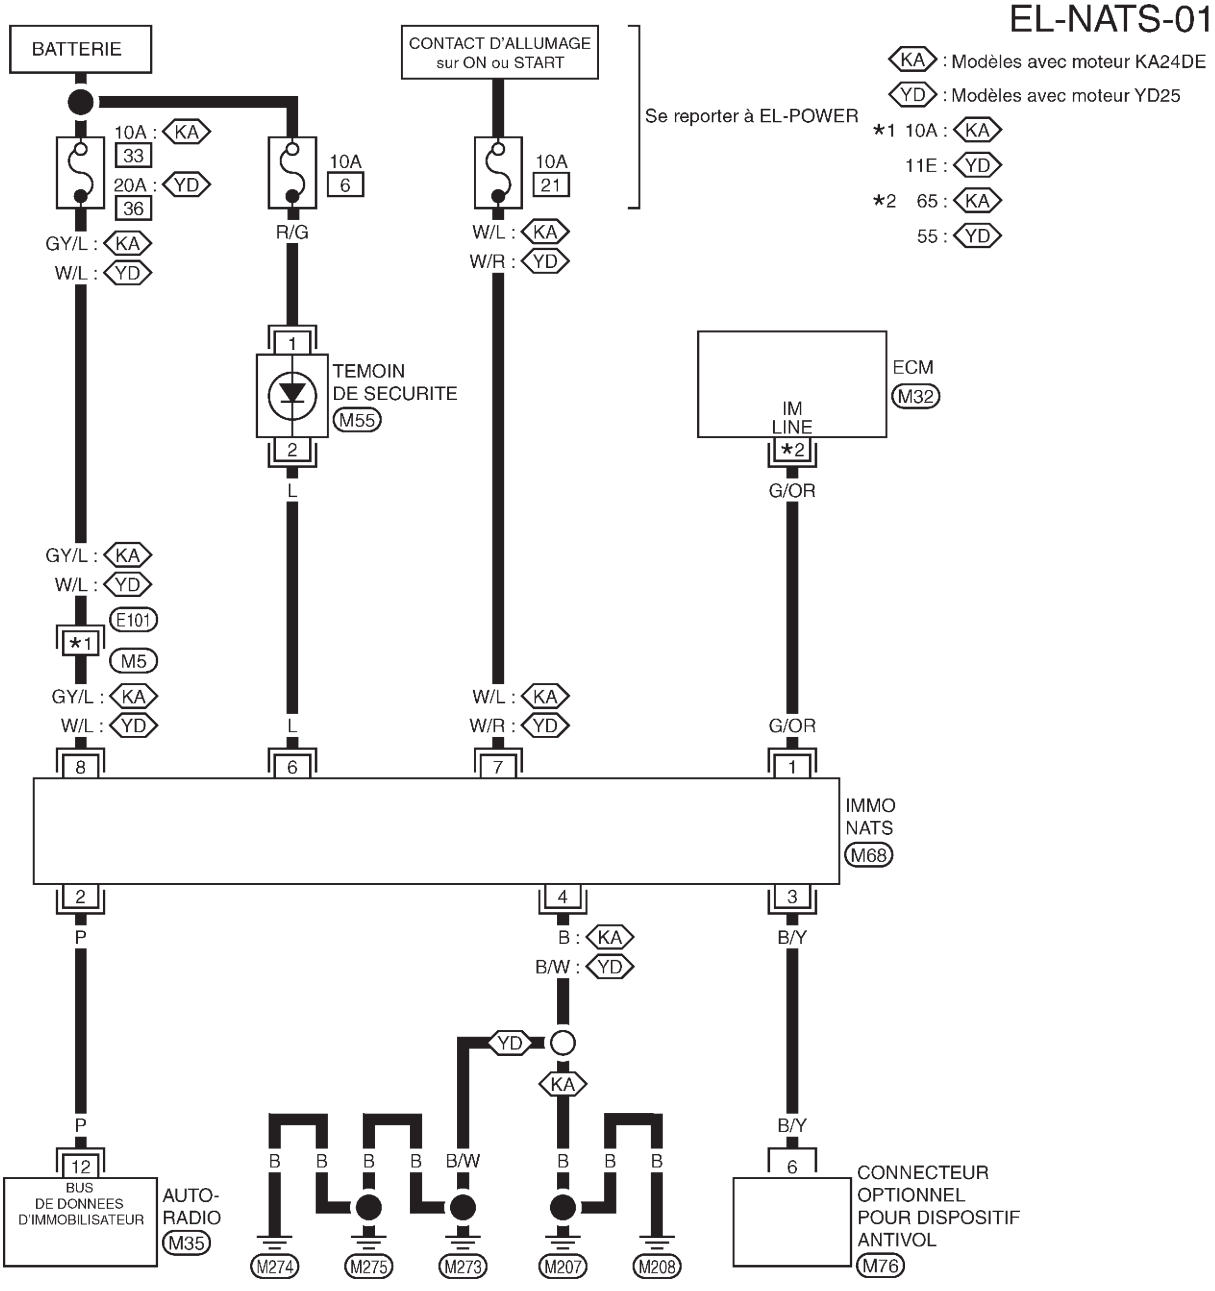


- Le diagnostic des défauts du système NATS, l'initialisation du système et l'enregistrement de numéros d'identification de clés NATS supplémentaires doivent être effectués à l'aide du matériel CONSULT-II et du logiciel CONSULT-II NATS.
  Concernant les procédures d'initialisation du NATS et l'enregistrement de numéros d'identification de clés de contact NATS, se reporter au manuel d'entretien du NATS CONSULT-II pour NATS.
- **Lors de la réparation d'une panne du système NATS (indiquée par l'allumage du témoin de sécurité) ou lors de l'enregistrement du numéro d'identification d'une autre clé de contact NATS, il est nécessaire de ré-enregistrer le numéro d'identification de la clé d'origine. C'est pourquoi il est indispensable que le propriétaire du véhicule restitue TOUTES LES CLES.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Composition du système

Le NATS offre les fonctions d'immobilisation suivantes :



- Clé de contact NATS
- Un boîtier de commande d'immobilisation NATS (IMMO NATS), situé dans le canon de clé de contact
- Un module de contrôle du moteur (ECM)
- Un boîtier de prise de sécurité (Modèle à conduite à droite pour l'Europe)
- Témoin de sécurité NATS

CONSULT-II

PROCEDURE D'INSPECTION AVEC CONSULT-II

1. Couper le contact.
2. Insérer la carte programme NATS dans CONSULT-II.

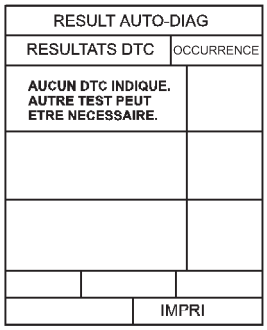
Carte programme
AEN00A/B

3. Connecter CONSULT-II sur le connecteur de liaison des données situé derrière le couvercle de boîte à fusibles.
4. Mettre le contact d'allumage sur ON.
5. Appuyer sur ''DEPART''.
6. Effectuer chaque mode d'essai de diagnostic conformément à chaque procédure d'entretien.

Pour de plus amples informations, se reporter au manuel d'utilisation CONSULT-II, NATS.

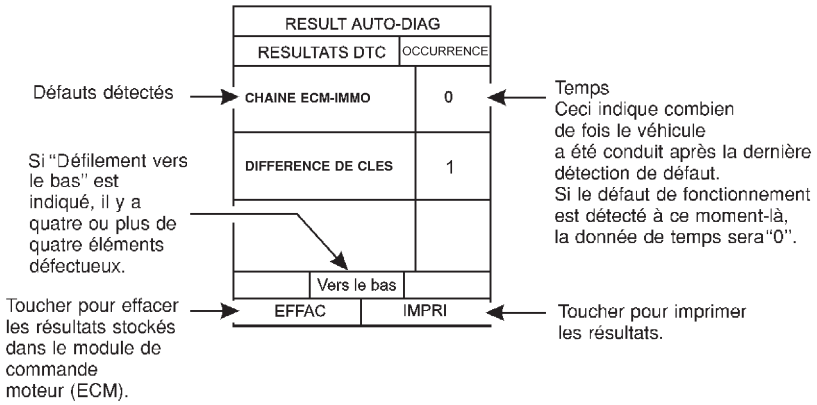
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

CONSULT-II (Suite)



FONCTION DE MODE D'ESSAI DE DIAGNOSTIC DE CONSULT-II

MODE D'ESSAI DE DIAGNOSTIC DE CONSULT-II	Description
INITIALISATION B/C	Lors du remplacement de l'un des composants suivants, il est nécessaire d'initialiser le B/C. (Clé de contact NATS/IMMO/ECM/boîtier de prise de sécurité)
RESULTATS DE L'AUTODIAGNOSTIC	Les éléments détectés (affichés sur l'écran) sont indiqués dans le tableau ci-dessous.



NOTE :
Lorsqu'une nouvelle initialisation est effectuée, tous les numéros d'identification enregistrés auparavant seront effacés. Par conséquent, toutes les clés de contact NATS doivent être ré-enregistrées. Le moteur ne peut être démarré avec une clé non enregistrée. Dans ce cas, le système peut indiquer ''DIFFERENCE DE CLES'' ou ''MODE VERR'', comme résultat d'autodiagnostic affiché sur l'écran de CONSULT-II.
Quand l'initialisation est effectuée (conduite à droite), le témoin de sécurité clignote six fois pour confirmer la reconnaissance de l'identification du boîtier de prise de sécurité.

COMMENT LIRE LES RESULTATS D'AUTODIAGNOSTIC

D

SEL156XB

E

SEL610Y

A

Confirmer les RESULTATS D'AUTODIAGNOSTIC ''LIGNE ECM-IMMO'' * affichés sur l'écran de CONSULT-II.

* : Exceptionnellement, ''LIGNE ECM-IMMO'' peut être mémorisé comme résultat d'autodiagnostic au cours de l'enregistrement de la clé, même si le système fonctionne correctement.

↓ Bon

B

VERIFIER LE CIRCUIT DE L'ALIMENTATION ELECTRIQUE DE L'IMMO.
Vérifier la tension entre la borne ⑧ (W/L)du connecteur M68 de l'IMMO (témoin) et la masse.
Tension : Tension de la batterie

Mauvais → Vérifier les éléments suivants :
- Fusible de 20A (n° 36, situé dans le boîtier de raccord à fusibles et à fusibles) (Moteurs diesel)
- Fusible de 10A (n° 33, situé dans le boîtier de raccord à fusibles ou à fusibles) (Moteurs essence)
- Faisceau ouvert ou court-circuité entre le fusible et le connecteur de l'IMMO

N° de pièce de réf. : C1

↓ Bon

C

VERIFIER SI LE SIGNAL DU CONTACT D'ALLUMAGE EST ALLUME.
Vérifier la tension entre la borne ⑦ du connecteur M68 de l'IMMO et la masse lorsque le contact d'allumage est sur la position ''ON''.
Tension : Tension de la batterie

Mauvais → Vérifier les éléments suivants :
- Fusible de 10A (n° 21, situé dans le boîtier à fusibles et à raccord à fusibles)
- Faisceau ouvert ou court-circuité entre le fusible et le connecteur de l'IMMO

N° de pièce de réf. : C2

↓ Bon

D

VERIFIER LE CIRCUIT DE MISE A LA MASSE DE L'IMMO.
Vérifier la continuité du faisceau entre les bornes ④ du connecteur M68 de l'IMMO et la masse.
Il doit y avoir continuité.

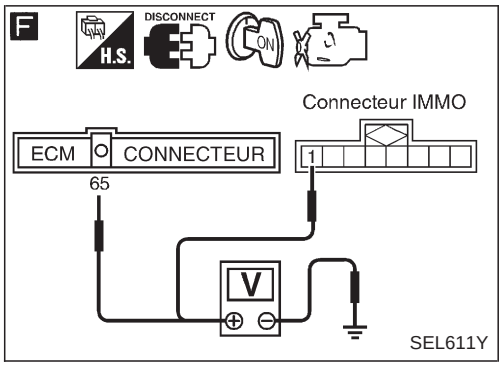
Mauvais → Réparer le faisceau.
N° de pièce de réf. : C3

↓ Bon

E

VERIFIER SI LA LIGNE DE COMMUNICATION EST EN CIRCUIT OUVERT.
Vérifier la continuité du faisceau entre les bornes suivantes de l'ECM et de l'IMMO.
Borne ⑥⑤ (G/OR) du connecteur M32 de l'ECM ou borne ① (G/OR) du connecteur M68 de l'IMMO
Il doit y avoir continuité.

Mauvais → Réparer le faisceau.
N° de pièce de réf. : C4



↓ Bon

Ⓐ

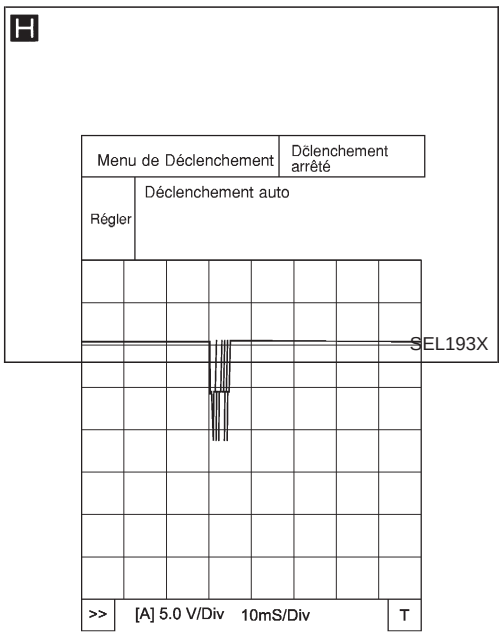
Diagnostics des défauts (Suite)



F

G

H

Ⓐ

F

VERIFIER SI LA LIGNE DE COMMUNICATION AVEC LA BATTERIE EST EN COURT-CIRCUIT.

1. Débrancher le connecteur de l'ECM et le connecteur de l'IMMO.
2. Mettre le contact d'allumage sur ''ON''.
3. Vérifier la tension entre les bornes 65 (G/OR) du connecteur M32 ou la borne 1 (G/OR) du connecteur M68 de l'IMMO et la masse.
   Il ne doit pas y avoir de tension.

Mauvais → Réparer le faisceau. **N° de pièce de réf. : C4**

Bon

G

VERIFIER SI LA LIGNE DE COMMUNICATION AVEC LA MASSE EST EN COURT-CIRCUIT

1. Débrancher le connecteur de l'ECM et le connecteur de l'IMMO.
2. Couper le contact.
3. Vérifier la continuité du faisceau entre la borne 65 (G/OR) du connecteur M32 de l'IMMO et la borne 1 (G/OR) du connecteur M68 de l'ECM et la masse.
   Il ne doit pas y avoir continuité.

Mauvais → Réparer le faisceau. **N° de pièce de réf. : C4**

Bon

H

VERIFICATION DU SIGNAL ALLANT DE L'ECM A L'IMMO

1. Vérifier le signal entre la borne 65 (G/OR) du connecteur M32 de l'ECM et la masse avec CONSULT-II ou un oscilloscope quand le contact d'allumage est sur la position ON.
2. S'assurer que les signaux qui sont indiqués sur l'illustration ci-dessous peuvent être détectés pendant 750 ms juste après que le contact d'allumage est tourné sur ''ON''.

Mauvais →
- L'ECM est défectueux.
1. Remplacer l'ECM. **N° de pièce de réf. : B**
2. Effectuer l'initialisation avec CONSULT-II. Pour la procédure d'initialisation, se reporter au ''Manuel d'utilisation de CONSULT-II, NATS''

Bon

- L'IMMO est défectueux.
1. Remplacer l'IMMO. **N° de pièce de réf. : A**
2. Effectuer l'initialisation avec CONSULT-II. Pour la procédure d'initialisation, se reporter au ''Manuel d'utilisation de CONSULT-II, NATS''.

Contrôle de court-circuit

SEL162XA

A

Confirmer les RESULTATS D'AUTO-DIAGNOSTIC ''LIGNE IMMO-CLE'' affichés sur l'écran de CONSULT-II.

Bon

VERIFICATION DE LA PUCE D'IDENTIFICATION DE CLE DE CONTACT NATS.
Démarrer le moteur avec une autre clé de contact NATS enregistrée.
Le moteur démarre-t-il ?

Oui →
- Mauvais fonctionnement de la puce d'identification de la clé.
1. Remplacer la clé de contact. **N° de pièce de réf. : E**
2. Effectuer l'initialisation avec CONSULT-II. Pour la procédure d'initialisation, se reporter au ''Manuel d'utilisation de CONSULT-II, NATS''.

Non

Est-ce que ce véhicule est équipé d'un boîtier de sécurité (modèles à conduite à droite pour l'Europe) ?

Non →
- L'IMMO est défectueux.
1. Remplacer l'IMMO. **N° de pièce de réf. A**
2. Effectuer l'initialisation avec CONSULT-II. Pour la procédure d'initialisation, se reporter au ''Manuel d'utilisation de CONSULT-II, NATS''.

Oui

VERIFIER LE BRANCHEMENT DU CONNECTEUR DE FAISCEAU.
Vérifier le branchement des connecteurs de faisceau suivants (M68), (N12).
Le moteur démarre-t-il ?

Oui → Le système fonctionne normalement. (Le défaut est causé par le branchement incorrect d'un connecteur).

Non

B

VERIFIER LE CIRCUIT DE MASSE DU BOITIER DE SECURITE.
Vérifier la continuité entre la borne ① (B/W) du boîtier de prise de sécurité et la masse.
Il doit y avoir continuité.

Non → Réparer le faisceau. **N° de pièce de réf. : C6**

Oui

C **D**

VERIFIER LE CIRCUIT D'INTERFACE.
1. Vérifier la continuité entre les bornes ② (P) du connecteur (M68) de faisceau et la borne ⑦ du boîtier de commande. (Contrôler les circuits ouverts.) **Il doit y avoir continuité.**
2. Vérifier la continuité entre la borne ② (P) du connecteur (M68) de boîtier de commande et la masse. (Contrôler tout court-circuit.) **Il ne doit pas y avoir continuité.**

Non → Réparer le faisceau. **N° de pièce de réf. : C5**

Oui

Mauvais fonctionnement du boîtier de prise de sécurité.
1. Remplacer le boîtier de sécurité. **N° de pièce de réf. : G**
2. Effectuer l'initialisation avec CONSULT-II. Pour la procédure d'initialisation, se reporter au ''Manuel d'utilisation de CONSULT-II, NATS''

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

PROCEDURE DE DIAGNOSTIC 5

Résultats de l’autodiagnostic : ‘‘CONTRAD ID IMMO-ECM’’ affiché sur l’écran de CONSULT-II

A

RESULT AUTO-DIAG	
RESULTATS DTC	HEURE
CONTRAD ID IMM/ECM	0

SEL166X

B

INITIALISATION IMMO
PANNE D’INITIALISATION
Ensuite le contact d’allumage est sur ‘‘ARR’’ et ‘‘MAR’’. Après confirmation de AUTO-DIAG et du mot de passe, recommencer initialisation B/C.

SEL566W

A

S’assurer que ‘‘CONTRAD ID IMMO-ECM*’’ de RESULTAT AUTO-DIAG est affiché sur l’écran de CONSULT-II.

* ‘‘ID DISCORD, IMM-ECM’’ : Le code d’identification enregistré de l’IMMO est en contradiction avec celui de l’ECM.

↓

EFFECTUER L’INITIALISATION.
Effectuer l’initialisation avec CONSULT-II.
Réenregistrer tous les numéros d’identification de clé de contact NATS.
Pour la procédure d’initialisation, se reporter au ’’Manuel d’utilisation de CONSULT-II, NATS’’.

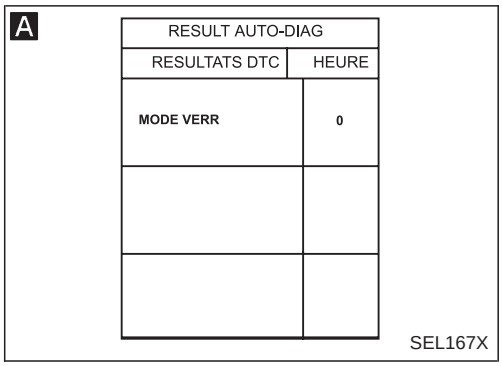
Initialisation incomplète ou ratée de CONSULT-II → B

- L’ECM est défectueux.

1. Remplacer l’ECM. **N° de pièce de réf. : B**
2. Effectuer l’initialisation avec CONSULT-II. Pour la procédure d’initialisation, se reporter au ’’Manuel d’utilisation de CONSULT-II, NATS’’.

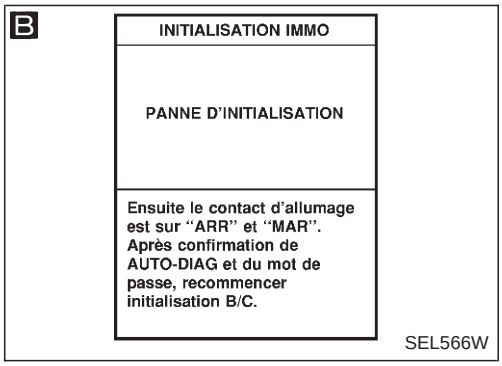
↓ INITIALISATION achevée

Démarrer le moteur. (FIN)
(L’initialisation du système n’a pas été terminée. **N° de pièce de réf. : F**)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostics des défauts (Suite)



PROCEDURE DE DIAGNOSTIC 6

Résultats de l’autodiagnostic : ‘‘MODE VERR’’ affiché sur l’écran de CONSULT-II

A

B

A

S’assurer que ’’MODE VERR’’ de RESULTAT AUTO-DIAG est affiché sur l’écran de CONSULT-II.

1. Couper le contact.
2. Mettre le contact d’allumage à l’aide d’une clé enregistrée. (Ne pas démarrer le moteur). Attendre 5 secondes.
3. Couper le contact d’allumage.
4. Répéter à deux reprises les étapes 2 et 3 (trois cycles au total).
5. Démarrer le moteur.

Le moteur démarre-t-il ?

Oui → Le système fonctionne normalement. (Le système n’est plus en ’’MODE VERR’’).

Non

VERIFIER L’INSTALLATION DE L’IMMO NATS. Se reporter à ’’Comment remplacer l’IMMO NATS’’ dans la section EL-0.

Mauvais → Reposer correctement l’IMMO NATS.

Bon

EFFECTUER L’INITIALISATION. Effectuer l’initialisation avec CONSULT-II. Pour la procédure d’initialisation, se reporter au ‘‘Manuel d’utilisation de CONSULT-II, NATS’’. Le système peut-il être initialisé ?
Remarque : Si la procédure d’initialisation est inachevée ou échoue, CONSULT-II affiche le message B sur l’écran.

Oui → Le système fonctionne normalement.

Non

Passer à la PROCEDURE DE DIAGNOSTIC 4, EL-3160 pour contrôler ‘‘LIGNE IMMO-CLE’’.

Diagnostics des défauts (Suite)

PROCEDURE DE DIAGNOSTIC 7

''TEMOIN DE SECURITE NE S'ALLUME PAS''

Vérifier le fusible de 10A (n° 6, situé dans le boîtier à fusibles).

Mauvais → Remplacer le fusible.

Bon ↓

INITIALISATION NATS
1) Monter le fusible de 10A.
2) Effectuer l'initialisation avec CONSULT-II.
Pour l'exécution de la procédure d'initialisation, se reporter au ''Manuel d'utilisation CONSULT-II NATS''.

↓

Mettre le contact d'allumage sur ''OFF''.

↓

Démarrer le moteur et mettre le contact d'allumage sur ''OFF''.

↓

Vérifier l'allumage du témoin de sécurité.

Bon → FIN

Mauvais ↓

A

Vérifier la tension entre la borne ① (R/G) du connecteur M55 du témoin de sécurité et la masse.
Tension : Tension de la batterie

Mauvais → Vérifier si le faisceau est ouvert ou en court-circuit entre le fusible et le témoin de sécurité.

Bon ↓

VERIFIER LE TEMOIN.

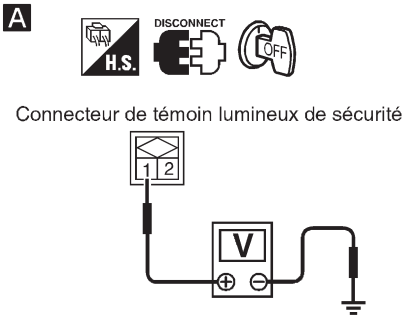
Mauvais → Réparer le faisceau.

Bon ↓

B

VERIFICATION DU FONCTIONNEMENT DE L'IMMO NATS.
1. Brancher le connecteur M68 de l'IMMO NATS.
2. Débrancher le connecteur M55 du témoin de sécurité.
3. Vérifier la continuité entre la borne ⑥ (L) du connecteur M68 de l'IMMO NATS et la masse.
Il doit y avoir continuité par intermittence.

Mauvais → L'IMMO NATS est défectueux. Remplacer l'IMMO.

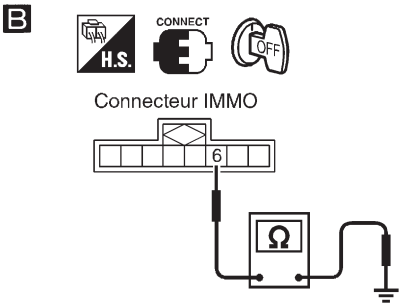


↓

Effectuer l'initialisation avec CONSULT-II.
Pour l'exécution de la procédure d'initialisation, se reporter au ''Manuel d'utilisation CONSULT-II NATS''.

Bon ↓

Vérifier que le faisceau ne soit ni en circuits ouvert ni court-circuités entre le témoin de sécurité et l'IMMO NATS.



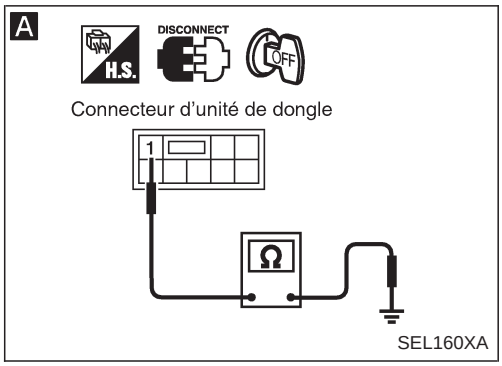
A

Connecteur de témoin lumineux de sécurité

SEL931UC

B

Connecteur IMMO



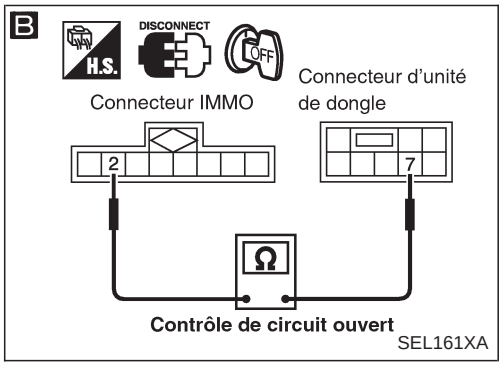
SEL164XA

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostics des défauts (Suite)

PROCEDURE DE DIAGNOSTIC 8

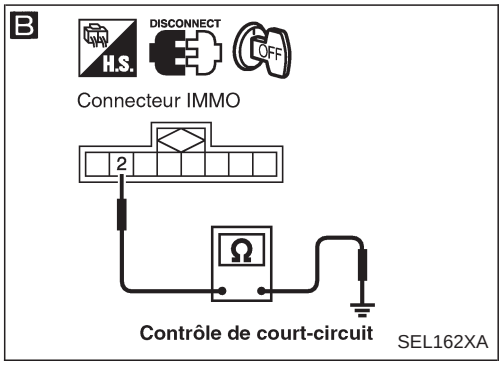
A



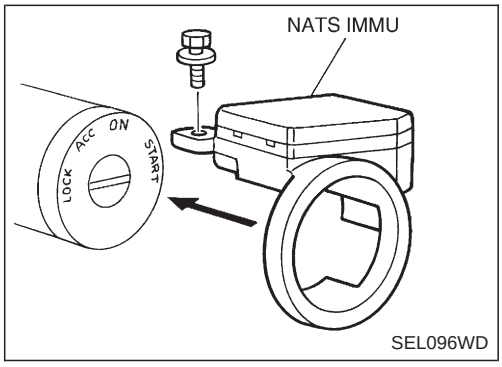
VERIFIER LE CIRCUIT DE MASSE DU BOITIER DE SECURITE.
Vérifier la continuité entre la borne ① (B/W) du connecteur (N12) de boîtier de prise de sécurité et la masse.
Il doit y avoir continuité.

Non → Réparer le faisceau.
N° de pièce de réf. : C6

Oui ↓



B

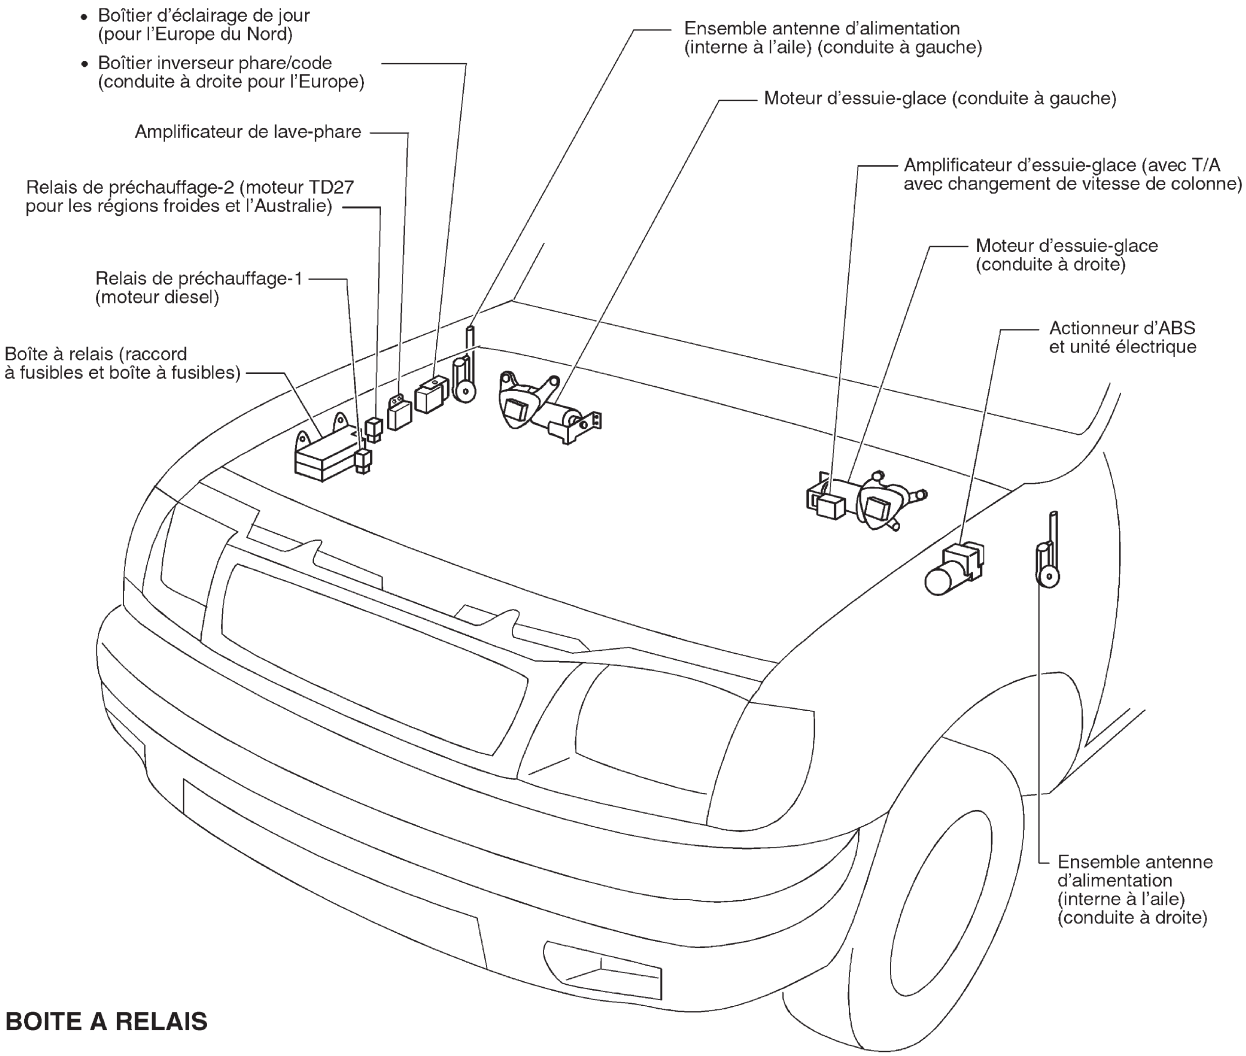


VERIFIER LE CIRCUIT D'INTERFACE.
1. Vérifier la continuité entre la borne ② (P) du connecteur (M68) de l'IMMO et la borne ⑦ (P) du connecteur (N12) du boîtier de commande de prise de sécurité et la masse.
   (Contrôler tout circuit ouvert)
   Il doit y avoir continuité.
2. Vérifier la continuité entre la borne ② (P) du connecteur (M68) de l'IMMO et la masse. (Contrôler tout court-circuit)
   Il doit y avoir continuité.

Non → Réparer le faisceau.
N° de pièce de réf. : C5

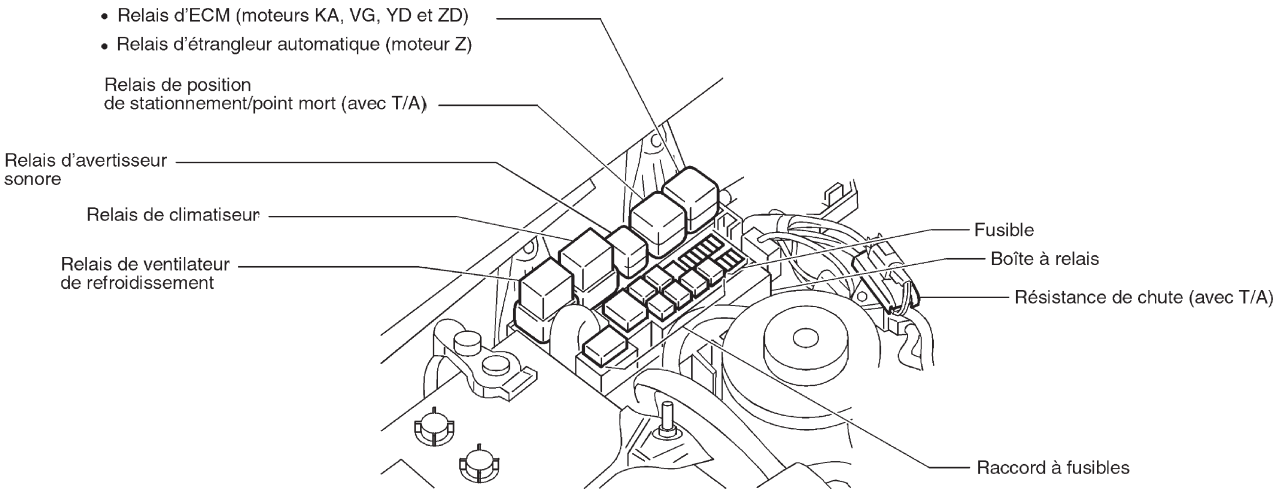
Oui ↓

Mauvais fonctionnement du boîtier de prise de sécurité.
1. Remplacer le boîtier de sécurité.
   N° de pièce de réf. : G
2. Effectuer l'initialisation avec CONSULT-II.
   Pour la procédure d'initialisation, se reporter au ''Manuel d'utilisation de CONSULT-II, NATS''.



Comment remplacer l'IMMO NATS

NOTE :



- **Si l'IMMO NATS n'est pas installé correctement, le système NATS ne fonctionnera pas correctement et RESULT AUTO-DIAG sur l'écran de CONSULT-II affichera ''MODE VERR''.**

D2 (M28) GY/8 : Commande d'avertisseur sonore (sans coussin gonflable) E1 (M71) GY/24
D4 (M29) W/12 : Commande de lave-glace et d'essuie-glace avant E1 (M73) W/4
D4 (M30) W/16 : Boîtier de contrôle de préchauffage (moteur TD27 sans ER sauf pour l'Australie et Moteur QD) B1 (M74) W/2
C1 (M35) W/16 : Boîtier de contrôle de préchauffage (moteur TD27 pour l'Australie) B1 (M75) B/2
C3 (M37) B/2 : Autoradio (pour l'Europe) F2 (M76) W/6
C3 (M38) W/3 : Allume-cigare E4 (M78) L/2
C2 (M39) W/6 : Interrupteur de climatisation (sans climatisation automatique) C4 (M79) Y/12
C2 (M40) W/2 : Commutateur de ventilateur (sans climatisation automatique) C4 (M80) Y/20
C2 (M41) W/8 : Eclairage de commutateur de ventilateur (sans climatisation automatique) D4 (M81) Y/12
C2 (M42) W/6 : Interrupteur de feux de détresse A2 (M43) Y/2
B1 (M44) BR/4 : Contact de désembuage (sauf modèles sans essuie-glace intermittent pour l'Australie) E4 (M82) B/2
A2 (M45) BR/4 : Module de coussin gonflable côté passager A4 (M83) L/10
Amplificateur de commande thermique A1 (M84) BR/2
Résistance de ventilateur (sans climatisation automatique)
G3 (M85) GY/6 : Moteur de soufflerie
D3 (M86) BR/10 : Vers (F55) (Moteurs KA, VG, YD et ZD)
D3 (M87) W/2 : Vers (F54) (Moteurs KA, VG, YD et ZD)
B3 (M88) GY/20 : Vers (D31)
B3 (M89) GY/16 : Vers (D32) (Avec lève-glace électrique)
B3 (M90) L/2 : Minuterie de verrouillage de porte (avec lève-glace électrique sauf pour l'Europe)
B3 (M91) B/6 : Rupteur-2 (pour l'Europe)
C1 (M92) W/4 : Masse de carrosserie
B1 (M93) W/4 : Témoin de sécurité (pour l'Europe)
G3 (M94) BR/3 : Diode (moteur Z)
G3 (M95) GY/3 : Diode (moteur Z)
G3 (M96) W/3 : Boîtier de télécommande à fonctions multiples (pour l'Europe)
E4 (M97) W/2 : Relais de désembuage (sauf modèles sans essuie-glace intermittent pour l'Australie)
C1 (M98) W/12 : Relais de feu antibrouillard arrière (pour l'Europe)
Boîtier de contrôle d'accès intelligent (pour l'Europe)
Commande de feu antibrouillard arrière (pour l'Europe)
ECM (moteur diesel avec EGR)
ECM (moteur diesel avec EGR)
IMMO NATS (pour l'Europe)
TCM (module de commande de transmission) (avec T/A avec moteur VG)
TCM (module de commande de transmission) (avec T/A avec moteur KA)
TCM (module de commande de transmission) (avec T/A avec moteur KA)
Dispositif de T/A (avec T/A avec levier de changement de colonne)
Capteur de température d'air d'admission (avec climatisation automatique)
Sonde d'ensoleillement (avec climatisation automatique)
Connecteur optionnel pour le dispositif antivol (pour l'Europe)
Contact de verrouillage de changement de vitesses (avec T/A)
Boîtier de capteurs de diagnostic de coussin gonflable (avec coussin gonflable pour l'Europe et l'Australie)
Boîtier de capteurs de diagnostic de coussin gonflable (avec coussin gonflable)
Boîtier de capteurs de diagnostic de coussin gonflable (avec coussin gonflable pour l'Europe et l'Australie)
Contact de position de pédale de frein (moteur YD)
Diode (moteur KA)
Résistance (avec T/A)
Unité de travail d'accélérateur (YD25)
Rrétroviseur de porte à mode (avec climatisation automatique)
Capteur d'habitacle (avec climatisation automatique)
Moteur d'aspiration (avec climatisation automatique)
Volet de mélange d'air (avec climatisation automatique)
Amp. de commande de ventilateur (Avec climatisation automatique)
Moteur de volet d'admission (avec climatisation automatique)
Capteur de position d'accélérateur (moteur ZD)
Contact de position d'accélérateur (moteur ZD)
Commande d'accélérateur (F/C) (moteur ZD)
Contact Kick-down (avec T/A avec moteur VG)
Autoradio (via le faisceau auxiliaire) (sauf pour l'Europe)

Utiliser l'organigramme ci-dessous pour trouver chaque signification de code de schéma de câblage.
Consulter le code du schéma de câblage dans l'index alphabétique pour trouver l'emplacement (numéro de page) de chaque schéma de câblage.

Code	Section	Nonm du schéma de câblage
AAC/V	EC	Soupape IACV-AAC
ABS	BR	Système anti-enrayeur des freins
A/C, A	HA	Climatiseur automatique
A/C, M	HA	Climatiseur manuel
ACC/SW	EC	Contact d'accélérateur
A/CCOT	EC	Commande de climatiseur
AIRREG	EC	IACV-Régulateur d'air
APS	EC	Capteur de position d'accélérateur
AT/IND	EL	Voyant de boîte automatique
AUDIO	EL	Audio
BACK/L	EL	Feux de recul
BA/FTS	AT	BATT/capteur de température de liquide de T/A et alimentation du TCM (boîtier de commande de transmission)
BOOTS	EC	Capteur de suralimentation du turbocompresseur
BRK/SW	EC	Signal de contact de frein
CHARGE	EL	Système de charge
CHIME	EL	Témoin sonore
CHBonE	EC	Starter automatique
CIGAR	EL	Allume-cigare
CKPS	EC	Capteur de position de vilebrequin
MONTRE	EL	Montre
CMPS	EC	Capteur d'angle d'arbre à cames
COOL/F	LC, EC	Commande du ventilateur de refroidissement
DEF	EL	Désembuage de lunette arrière et de rétroviseur
DIMDIP	EL	Phares — Avec système de mise en veilleuse des codes
D/LOCK	EL	Verrouillage élec. de porte
DTRL	EL	Phare — Avec système d'éclairage de jour
ECMRLY	EC	Relais ECM
ECTS	EC	Capteur de température de liquide de refroidissement moteur
EGRC/V	EC	EGRC — Electrovanne
EGVC/V	EC	Soupape de contrôle de volume EGR

Code	Section	Nonm du schéma de câblage
EMauvaisSS	AT	Signal du régime moteur
FCUT	EC	Electrovanne de coupure de carburant
FICD	EC	Electrovanne FICD
FIPOT	EC	Pot ISC-FI
FPCM	EC	Module de commande de la pompe à carburant
F/PUMP	EC	Pompe d'alimentation en carburant
GLOW	EC	Système de préchauffage rapide
H/AIM	EL	Commande de réglage des faisceaux
HEATER	HA	Dispositif de chauffage
CHAUFFAGE	EC	Interrupteur de chauffage
H/LAMP	EL	Phares
HLC	EL	Lave-phares
HO2S	EC	Sonde à oxygène chauffée
AVERTISSEUR SONORE	EL	HORN
H/SEAT	EL	Siège chauffant
IATS	EC	Capteur de température d'air d'admission
IGN	EC	Système d'allumage
IGN/SG	EC	Signal d'allumage
ILL	EL	Eclairage
INJECT	EC	Injecteur
INJPMP	EC	Pompe à injection à carburant à commande électronique
INT/L	EL	Spot de lecture
INT/V	EC	Electrovanne de commande d'air d'admission
KS	EC	Capteur de détonation
LOAD	EC	Signal de charge électrique
LPSV	AT	Electrovanne de pression de canalisation
MAFS	EC	Débitmètre d'air
MAIN	EC, AT	Circuit d'alimentation électrique principal et de mise à la masse

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Code	Section	Nonm du schéma de câblage
METER	EL	Compteur de vitesse, compte-tours, jauges de température et de carburant
MIL/DL	EC	MIL et connecteurs de diagnostic
MIRROR	EL	Rétroviseur de porte électrique
MULTI	EL	Système de multitélécommande
NATS	EL	Système antivol Nissan
NONDTC	AT	Eléments non détectables
O2H1B1	EC	Réchauffeur de sonde à oxygène chauffée 1 (avant)
O2H2B1	EC	Réchauffeur de sonde à oxygène chauffée 2 (arrière)
O2S1B1	EC	Sonde à oxygène chauffée 1
O2S2B1	EC	Sonde à oxygène chauffée 2
OVRCSV	AT	Electrovanne d'embrayage à roue libre
P/ANT	EL	Antenne électrique
PGC/V	EC	Electrovanne de commande de purge de cartouche EVAP
PLA	EC	Commande d'avance à charge partielle
PNP/SW	EC	Contact de position de stationnement/point mort
POWER	EL	Disposition de l'alimentation électrique
PRWIRE	EL	Système d'alarme antivol (précâblé)
PST/SW	EC	Manocontact d'huile de direction assistée
R/FOG	EL	Feu antibrouillard arrière

Code	Section	Nonm du schéma de câblage
ROOM/L	EL	Plafonnier
SHIFT	AT	Système de verrouillage de passage de vitesse
SSV/A	AT	Electrovanne A de passage
SSV/B	AT	Electrovanne B de passage
SRS	RS	Système de retenue supplémentaire
S/SIG	EC	Signal de démarrage
START	EL	Système de démarrage
STOP/L	EL	Feu de stop
SWL/V	EC	Electrovanne de contrôle de vanne de commande de tourbillon
TAIL/L	EL	Feux de stationnement, éclairage de plaque d'immatriculation et feux arrière
TCV	AT	Electrovanne d'embrayage de convertisseur de couple
TPS	EC, AT	Capteur de position de papillon
TP/SW	EC	Capteur de position de papillon
CLIGNOTANT	EL	Clignotants et feux de détresse
VSS	EC	Capteur de vitesse du véhicule
VSSA/T	AT	Capteur de vitesses de véhicule T/A (capteur de tours)
VSSMTR	AT	Compteur du capteur de vitesse du véhicule
WARN	EL	Témoins d'avertissement
WINDOW	EL	Lève-vitre électrique
WIPER	EL	Essuie-glace et lave-vitre avant

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

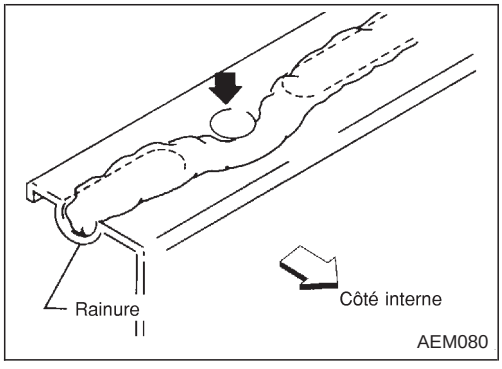
Pièces nécessitant un serrage angulaire

- Utiliser une clé angulaire pour le serrage final des pièces de moteur suivantes :

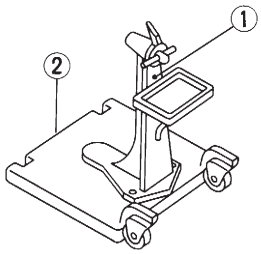
a) Boulons de culasse
b) Boulons de chapeau de palier principal (séries YD)
c) Ecrous de chapeau de bielle (séries KA et YD)
d) Boulons de poulie de vilebrequin (séries YD)

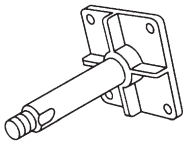


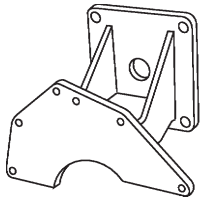
- Ne pas utiliser une valeur de serrage pour le serrage final.
- La valeur de serrage de ces pièces est valable pour une étape préliminaire.
- S'assurer que le filetage et les surfaces de siège sont propres et enduits d'une couche d'huile-moteur.

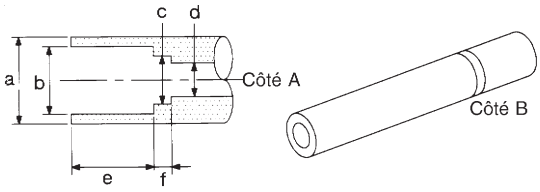
Procédé d'application du joint liquide

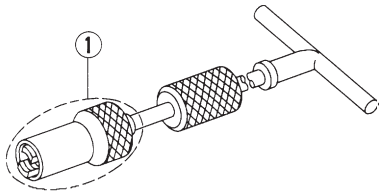
1. **Utiliser un grattoir pour déposer toutes les traces de l'ancien joint liquide des surfaces de contact et des rainures. Nettoyer également toutes les taches d'huile présentes sur ces zones.**
2. **Appliquer un cordon régulier de joint liquide sur les surfaces de contact (utiliser un joint liquide d'origine ou équivalent).**

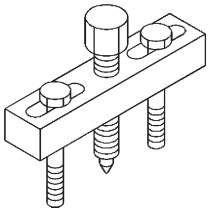












- S'assurer que l'épaisseur de joint liquide correspond à la valeur spécifiée dans ce manuel.

3. **Appliquer du joint liquide autour du côté interne des orifices de boulons (sauf indication contraire).**
4. **Le montage doit être fait dans les 5 minutes qui suivent l'application du joint.**
5. **Attendre au moins 30 minutes avant de faire le plein d'huile moteur et de liquide de refroidissement.**

Dépistage des pannes de bruit, vibration et dureté (NVH) — Bruit de moteur

SEM862G

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Dépistage des pannes de bruit, vibration et dureté (NVH) — Bruit de moteur (Suite)

Utiliser l'organigramme ci-dessous pour trouver la cause du symptôme.

1. Situer l'endroit où le bruit se produit.
2. Vérifier le type de bruit.
3. Préciser les conditions de fonctionnement du moteur.
4. Vérifier la source du bruit spécifié.

Si nécessaire, réparer ou remplacer ces pièces.

Emplacement du bruit	Type de bruit	Conditions de fonctionnement du moteur						Source du bruit	Elément à vérifier	Page de référence
		Avant montée en température du moteur	Après montée en température du moteur	Au démarrage	Au ralenti	Au lancement	Lors de la conduite			
Extrémité du moteur Cache-culbuteurs Culasse	Bruit sec ou cliquetis	C	A	—	A	B	—	Bruit de poussoir	Jeu de soupape	EM-3062
	Bruit de ferraille	C	A	—	A	B	C	Bruit des paliers d'arbre à cames	Jeu du tourillon d'arbre à cames Voile de l'arbre à cames	EM-3052, 3051
Poulie de vilebrequin Bloc-cylindre (côté du moteur) Carter d'huile	Claquement ou détonation	—	A	—	B	B	—	Bruit de l'axe de piston	Jeu entre le piston et l'axe de piston Jeu de la bague de bielle	EM-3074, 3082
	Claquement ou bruit sec	A	—	—	B	B	A	Bruit de claquement de piston	Jeu entre piston et alésage Jeu latéral des segments Ouverture de segment de piston Courbure et torsion des bielles	EM- 3074, 3075, 3076, 3075
	Détonation	A	B	C	B	B	B	Bruit de palier de bielle	Jeu de la bague de bielle (pied de bielle) Jeu de palier de bielle (tête de bielle)	EM-3082, 3080
	Détonation	A	B	—	A	B	C	Bruit du palier principal	Jeu d'huile du palier principal Voile de vilebrequin	EM-3078, 3078

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

1. Faire chauffer le moteur.
2. Couper le contact.
3. Utiliser CONSULT-II pour vérifier qu'il n'y ait pas d'erreur de codes pour les éléments d'autodiagnostic. Se reporter à ''DIAGNOSTIC DES DEFAUTS — INDEX'' dans la section EC.

- Ne pas débrancher CONSULT-II avant la fin de cette opération ; il sera utilisé pour le contrôle moteur tr/mn et détecter les erreurs à la fin.

4. Débrancher la borne négative de la batterie.
5. Pour éviter que le carburant soit injecté pendant l'inspection, déposer le fusible de la pompe à injection de carburant [ENG CONT3 (20A)] du boîtier à fusibles à droite dans le compartiment moteur.
6. Déposer les bougies de préchauffage de chaque cylindre.

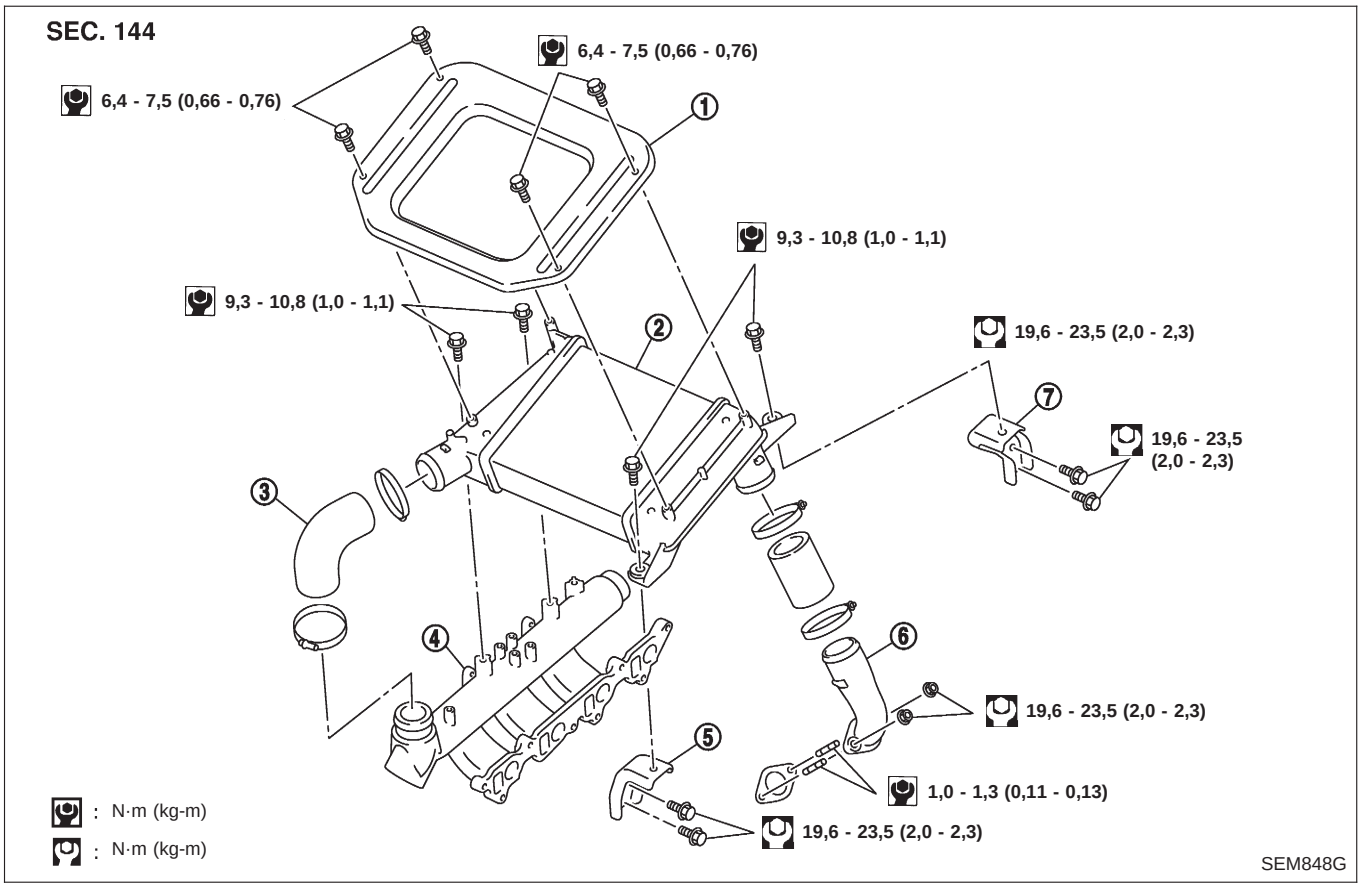
- **Avant la dépose, nettoyer la zone environnante pour éviter que des corps étrangers n'entrent dans le moteur.**
- **Enlever avec précaution la bougie de préchauffage pour éviter tout endommagement ou toute casse.**
- **Manipuler avec soins pour éviter d'heurter les bougies de préchauffage.**

7. Reposer un adaptateur (SST) pour l'installation des orifices des bougies de préchauffage et connecter la jauge de compression pour le moteur diesel.
   : 18 - 21 N·m (1,8 - 2,2 kg-m)
8. Connecter la borne négative de la batterie.
9. Placer le contact d'allumage sur ''START'' et démarrer le moteur. Quand l'aiguille de la jauge se stabilise, lire la pression de compression et le régime (tr/mn) du moteur. Répéter les étapes ci-dessus pour chaque cylindre.

- **Toujours utiliser une batterie en charge pleine pour obtenir le régime moteur spécifié.**

Unité : kPa (bar, kg/cm^2)/tr/mn

Standard	Minimum	Limite de différence entre les cylindres
3 100 (31,00, 31,6)/200	2 500 (25,00, 25,5)/200	490 (4,90, 5,0)/200



- Quand le régime (tr/mn) du moteur est en dehors de la position spécifiée, vérifier la densité spécifique du liquide de batterie. Mesurer à nouveau après correction.
- Si les tr/mn du moteur dépassent la limite, contrôler le jeu de soupape et les composants de la chambre de combustion (soupapes, sièges de soupape, joints de culasse, segments, pistons, alésages de cylindre, côtés interne et externe du bloc-cylindre) et mesurer à nouveau.

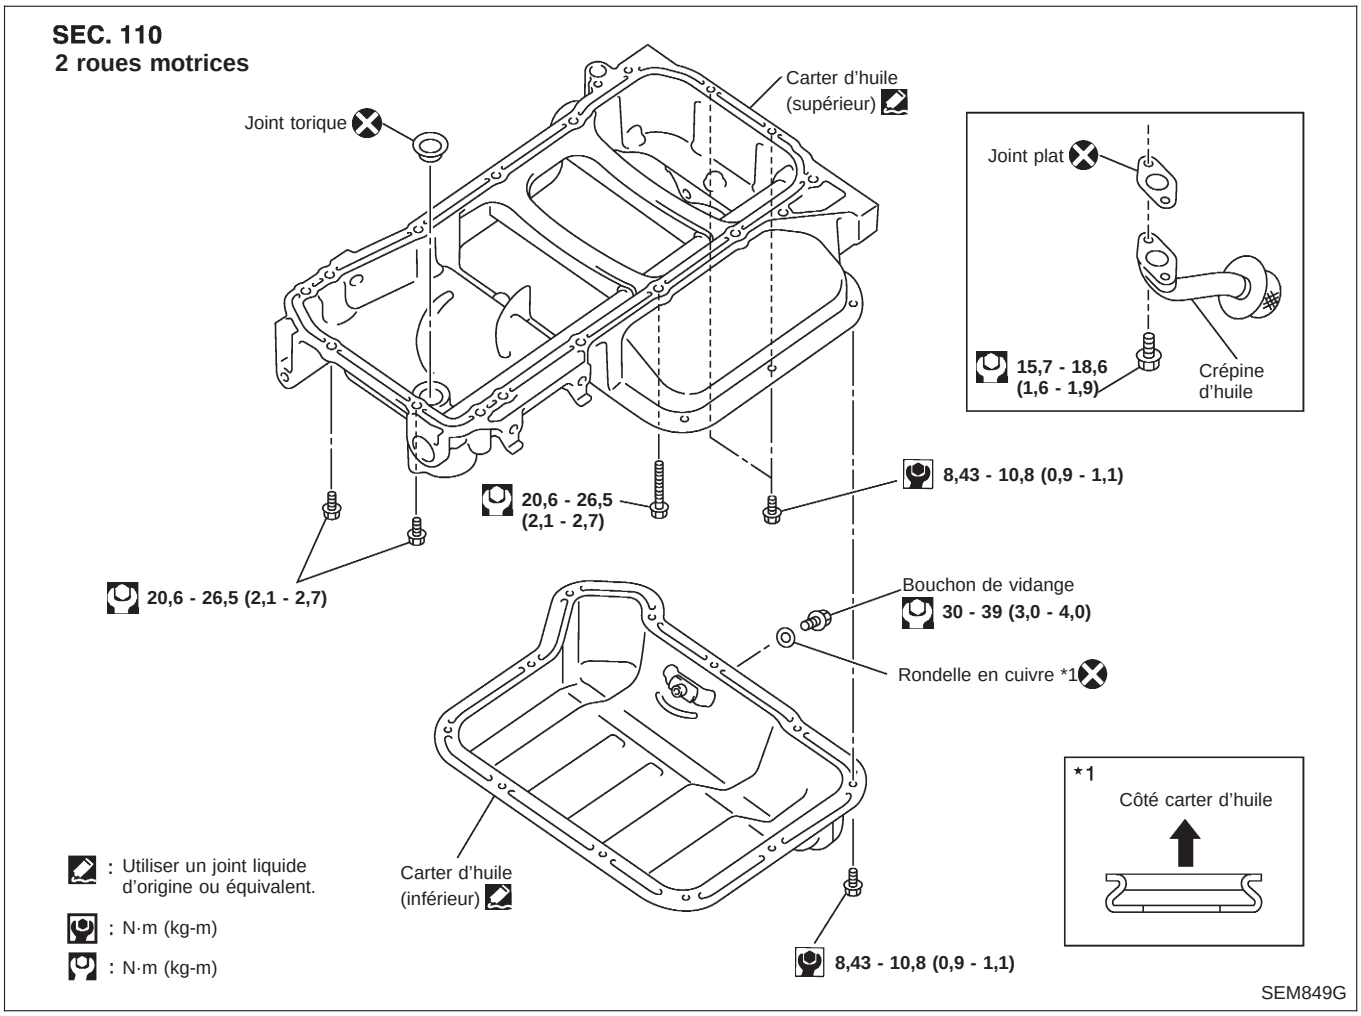
10. Compléter cette opération comme suit :

a. Tourner le contact d'allumage sur ''OFF''.
b. Débrancher la borne négative de la batterie.
c. Reposer les bougies de préchauffage.
d. Reposer le fusible de la pompe à injection de carburant [ENG CONT3 (20A)].
e. Connecter la borne de batterie négative.
f. Utiliser CONSULT-II pour vérifier qu'il n'y a pas d'erreur de code pour les éléments de l'autodiagnostic. Se reporter à ''Diagnostic des défauts — INDEX'' dans la section EC.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

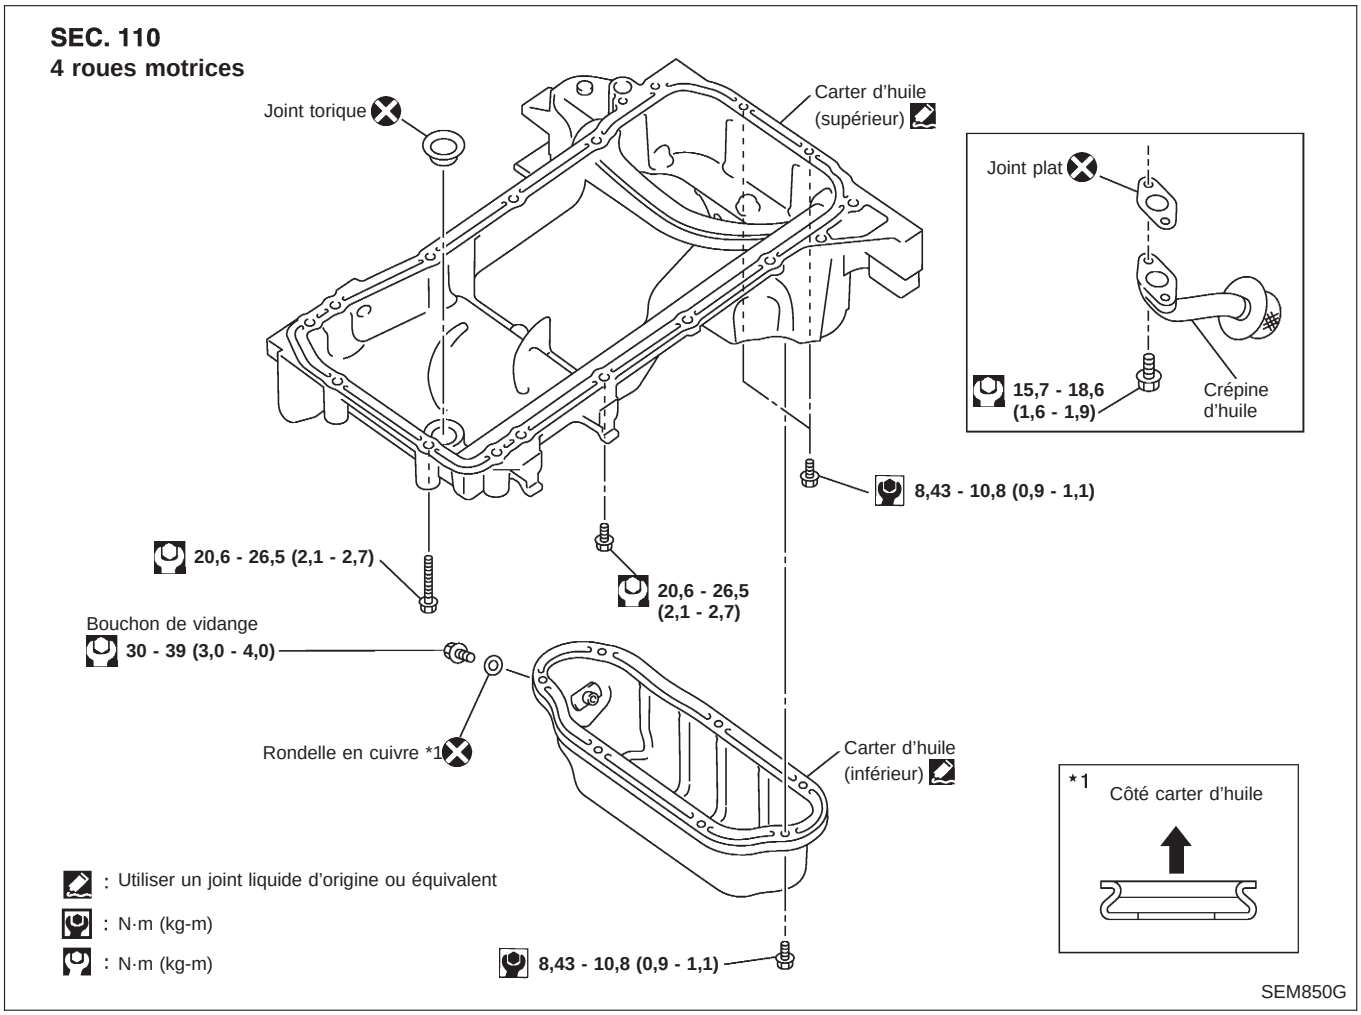
Dépose et repose

1. Couvercle du refroidisseur à air de suralimentation
2. Refroidisseur d'air de suralimentation
3. Flexible d'entrée d'air
4. Collecteur d'admission
5. Support
6. Tuyau d'entrée d'air
7. Support



Inspection

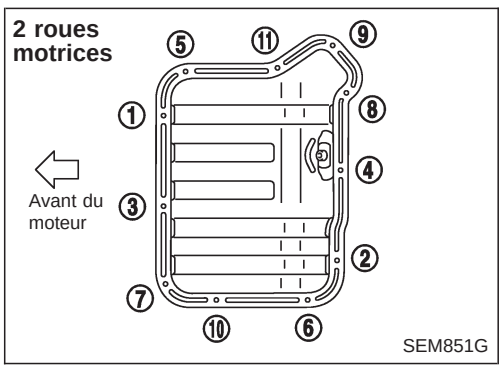
Vérifier que les passages d'air du noyau du refroidisseur et les ailettes ne sont pas bouchés, ne fuient pas et ne sont pas déformés. Nettoyer ou remplacer le refroidisseur d'air de suralimentation si nécessaire.



- **Veiller à ne pas déformer les ailettes du noyau.**
- **Pour la procédure de nettoyage du noyau de refroidisseur d'air de suralimentation, se reporter à ''VERIFICATION DU RADIATEUR'' dans la section LC.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Composants

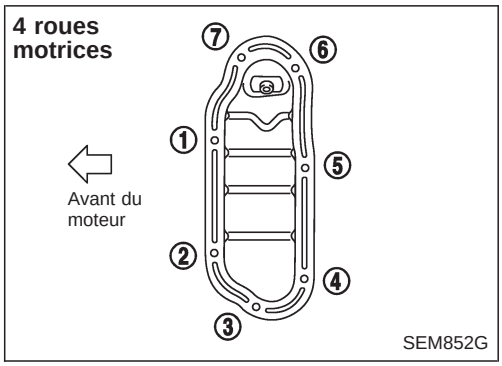


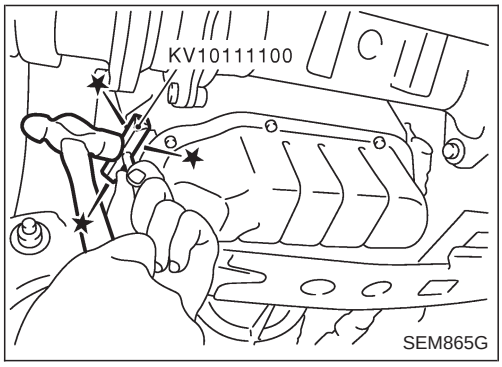
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Dépose

AVERTISSEMENT :
Pour éviter tout risque de brûlures, ne jamais vidanger l'huile moteur lorsque le moteur est chaud.

1. Lever le véhicule et placer des chandelles de sécurité comme support.
2. Déposer le couvercle inférieur du moteur.
3. Vidanger l'huile moteur.





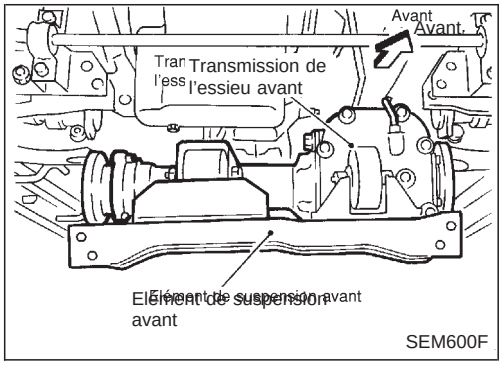
4. Déposer les boulons du carter d'huile inférieur.

- Desserrer les boulons dans l'ordre inverse de celui indiqué sur l'illustration.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

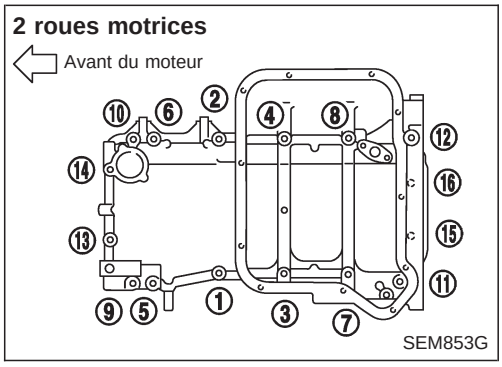
Dépose (Suite)

5. Déposer le carter d'huile inférieur.



a. Insérer l'outil entre le carter d'huile supérieur et le carter d'huile inférieur.

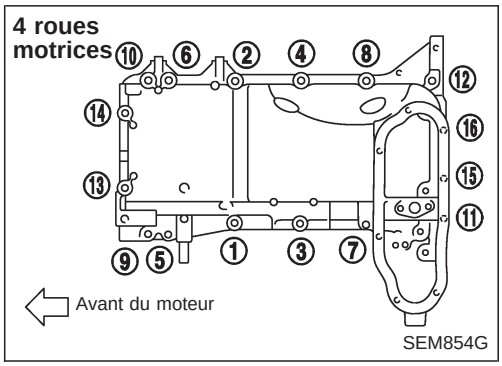
- **Prendre garde de ne pas endommager la surface de contact en aluminium.**
- **Ne pas insérer de tournevis pour ne pas déformer la bride du carter d'huile.**



b. Faire coulisser l'outil en tapant sur le côté de l'outil avec un marteau.

c. Déposer le carter d'huile inférieur.

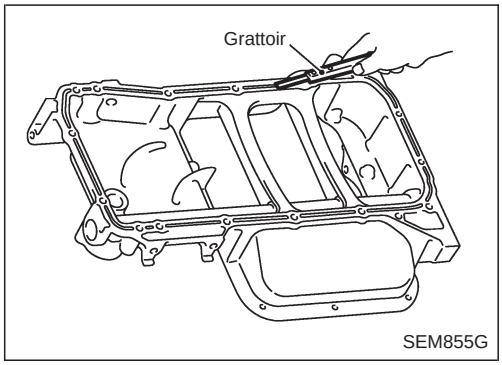
6. Déposer la crépine d'huile.
7. Déposer le compresseur et le support du climatiseur.
8. Déposer le côté gauche de l'extrémité de la barre d'accouplement — modèles 2 roues motrices uniquement.



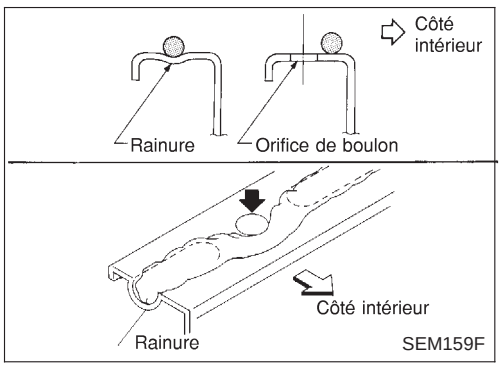
9. Déposer la transmission de l'essieu avant ainsi que l'élément de fixation de différentiel. Se reporter à la section PD (''Dépose et repose'', ''Transmission de l'essieu avant'') — modèles 4 roues motrices uniquement.
10. Déposer le boulon de l'élément de suspension avant (droit & gauche) — modèles 4 roues motrices uniquement.

11. Déposer les boulons du carter d'huile supérieur dans l'ordre contraire de l'ordre indiqué.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

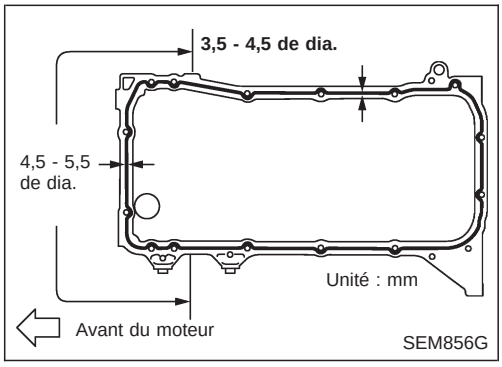


Dépose (Suite)



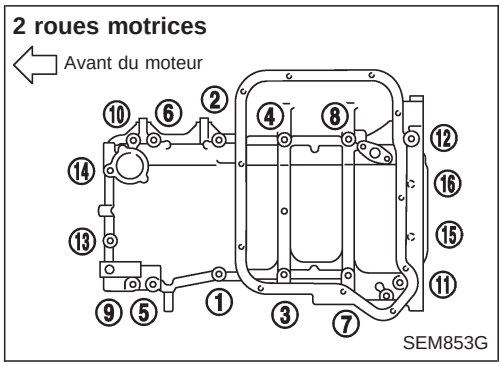
12. Déposer le carter d'huile supérieur.
a. Insérer un outil à la taille adéquate dans le cran du carter d'huile supérieur.
- **Prendre garde de ne pas endommager la surface de contact d'aluminum.**
- **Ne pas insérer de tournevis pour ne pas déformer la bride du carter d'huile.**

b. Faire riper le carter d'huile supérieur en bougeant l'outil de haut en bas.
c. Déposer le carter d'huile supérieur.
- **Faire attention de ne pas laisser le boulons n°15 et 16 tomber dans le carter de boîte-pont.**

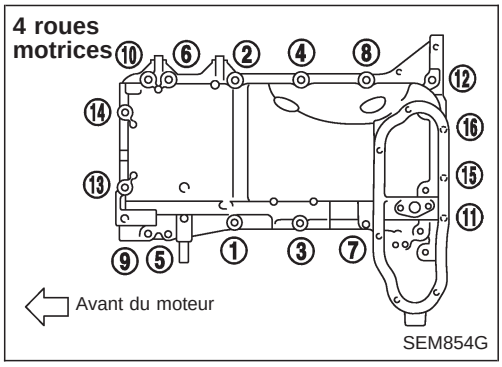


Repose

1. Reposer le carter d'huile supérieur.
a. Utiliser un grattoir pour enlever l'ancien joint liquide des surfaces de contact.
- **Retirer aussi l'ancien joint liquide des surfaces de contact du bloc-cylindre, du couvercle avant et du carter d'huile inférieur.**
- **Retirer le joint plat usé de l'orifice de boulon et du filetage.**



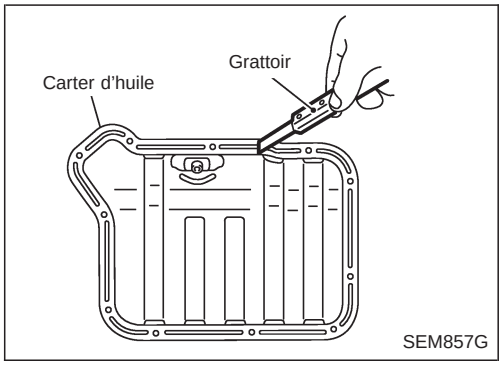
b. Appliquer un cordon régulier de joint liquide sur la surface de contact du carter d'huile.
- **Utiliser le joint liquide d'origine ou un produit équivalent.**



- **Appliquer du joint liquide sur les endroits indiqués sur l'illustration.**
- **Vérifier que la largeur du joint liquide est de 3,5 à 4,5 mm ou 4,5 à 5,5 mm comme indiqué sur l'illustration. (S'assurer que le diamètre du cordon de silicone soit différent autour de l'avant du véhicule.)**
- **Le montage doit être fait dans les 5 minutes qui suivent l'application du joint.**

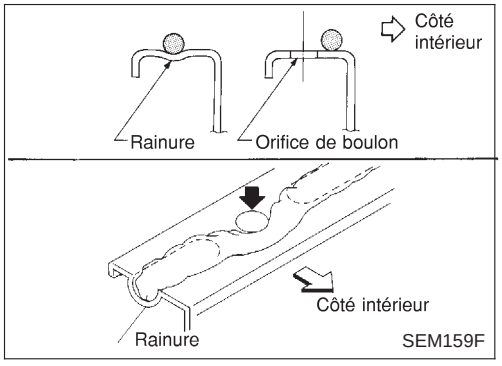
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Repose (Suite)



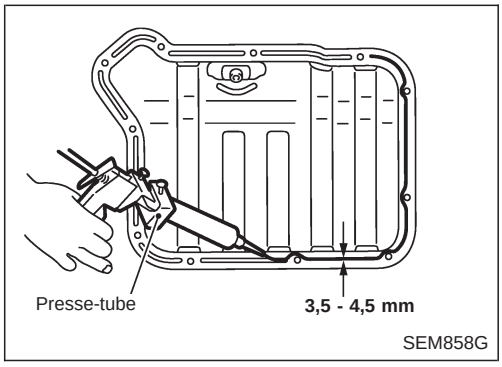
c. Reposer le carter d'huile supérieur.
- Serrer les boulons en suivant l'ordre numérique.
- La dimension des boulons varie en fonction de l'emplacement de la pose. Se reporter à ce qui suit et utiliser les boulons appropriés.

Modèles 2 roues motrices :
M6 x 12 mm : Boulon n° 11, 14
M6 x 30 mm : Boulon n° 15, 16
M8 x 25 mm : Boulon n° 1, 5, 9, 13
M8 x 60 mm : Boulon n° 2, 3, 4, 6, 7, 8, 10, 12



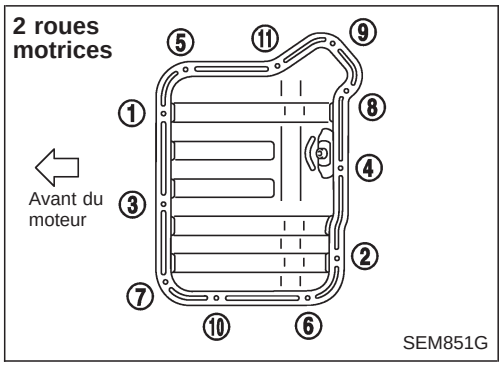
Modèles 4 roues motrices :
M6 x 30 mm : Boulon n° 15, 16
M8 x 25 mm : Boulon n° 1, 2, 4, 5, 8, 9
M8 x 60 mm : Boulon n° 3, 6, 7, 10, 11, 12, 13, 14

- La longueur de la tige sous le collet du boulon est la longueur de la partie filetée (la partie de guidage n'est pas incluse).

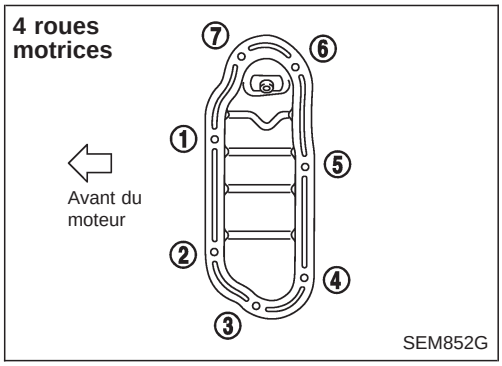


2. Reposer le compresseur et le support du climatiseur.
: 56,9 - 65,7 N·m (5,9 - 6,7 kg-m)
3. Reposer les courroies d'entraînement.
4. Reposer la crépine d'huile.

5. Reposer le carter d'huile inférieur.
a. Utiliser un grattoir pour enlever l'ancien joint liquide des surfaces de contact.
- **Retirer aussi l'ancien joint liquide des surfaces de contact du carter d'huile supérieur.**



b. Appliquer un cordon régulier de joint liquide sur la surface de contact du carter d'huile inférieur.
- **Utiliser le joint liquide d'origine ou un produit équivalent.**

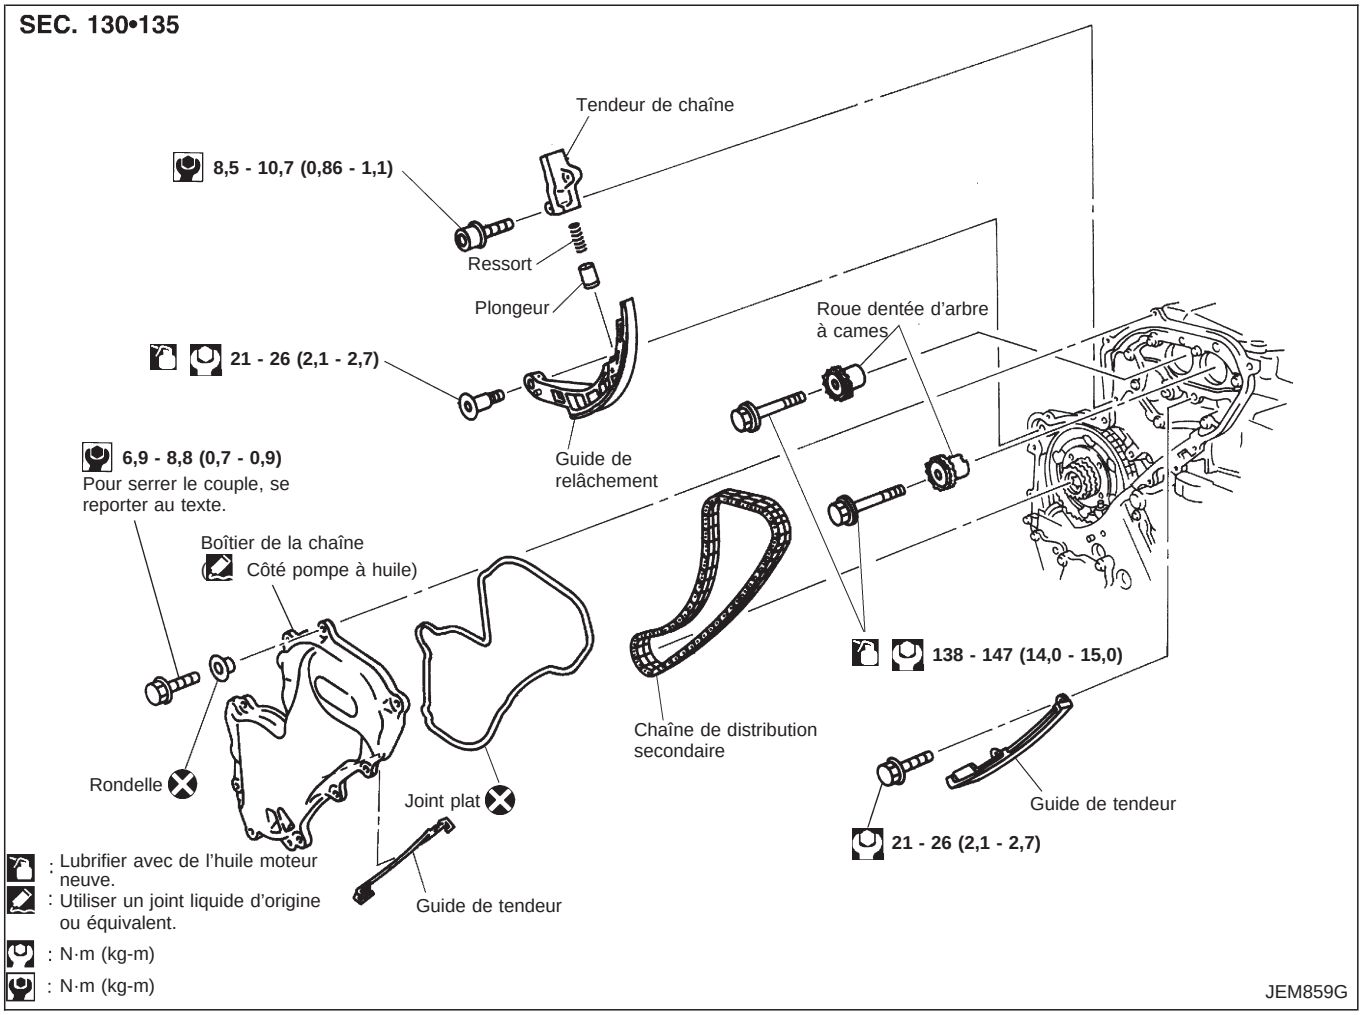


- **S'assurer que la largeur du joint liquide est de 3,5 à 4,5 mm.**
- **Le montage doit être fait dans les 5 minutes qui suivent l'application du joint.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Repose (Suite)

c. Reposer le carter d'huile inférieur.
- **Serrer dans l'ordre numérique indiqué sur l'illustration.**
- **Attendre au moins 30 minutes avant de remplir d'huile moteur.**



6. Reposer dans l'ordre inverse de la dépose.

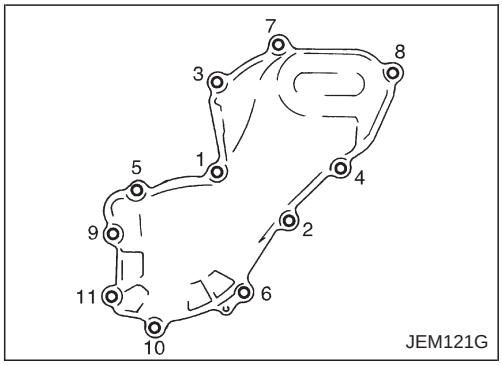
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Chaîne de distribution secondaire

PRECAUTION :

- **Après avoir déposé la chaîne de distribution, ne pas faire tourner séparément le vilebrequin et l'arbre à cames car les soupapes heurteraient les têtes de piston.**
- **Lors de la repose des arbres à cames, tendeurs de chaîne, joints d'huile, ou d'autres pièces coulissantes, lubrifier les surfaces de contact avec de l'huile moteur neuve.**
- **Appliquer de l'huile moteur neuve sur les boulons de filetage et les surfaces d'appui lors de la repose des pignons d'arbre à cames, de la poulie de vilebrequin, et des supports d'arbre à cames.**
- **Ne pas renverser de liquide de refroidissement moteur sur les courroies d'entraînement.**

DEPOSE

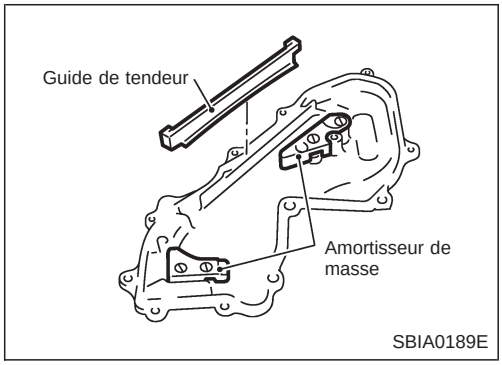


- Concernant le travail préparatif pour la dépose/repose de la chaîne de distribution secondaire en vue de déposer/reposer la pompe à injection de carburant, se reporter à la section EC, ''Pompe à injection de carburant à commande électronique''.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Chaîne de distribution secondaire (Suite)

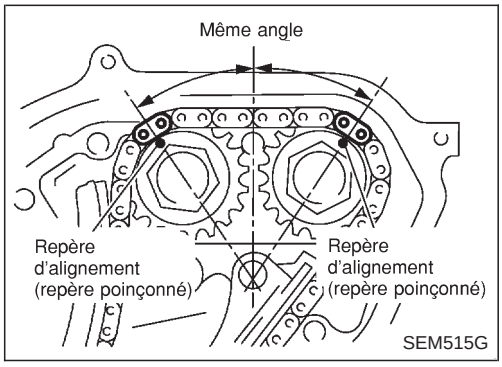
- Concernant le travail préparatif pour la dépose/repose de la chaîne de distribution secondaire en vue de la dépose/repose de l'arbre à cames, se reporter à EM-3048, ''ARBRE A CAMES''.



1. Vidanger l'huile moteur.
2. Vidanger le liquide de refroidissement en déposant les bouchons de vidange du bloc-cylindre. Se reporter à la section LC, ''Remplacement du liquide de refroidissement du moteur''.
3. Déposer le tube de guidage de l'EGR.
4. Déposer les flexibles inférieur et supérieur.
5. Déposer la protection de radiateur et le radiateur. Se reporter à la section LC, ''DEPOSE ET REPOSE'', ''Radiateur''.

JEM121G

6. Déposer le boîtier de la chaîne avant.



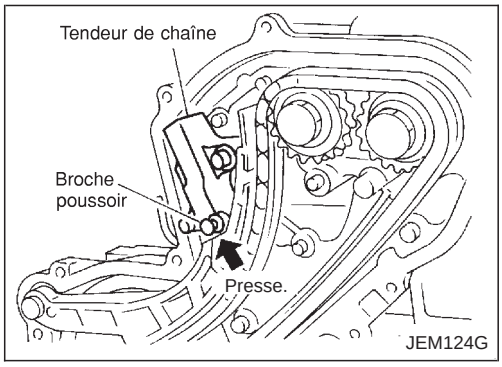
- Séparer le réservoir de liquide de direction assistée du support.
- Desserrer les boulons de fixation dans l'ordre inverse de celui indiqué sur l'illustration et les déposer.
- Déposer tous les boulons avec la rondelle de caoutchouc car l'espace est limité pour les retirer.

SBIA0189E

PRECAUTION :

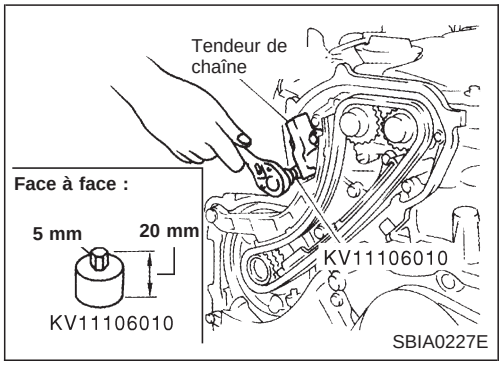
- **Pendant la dépose du carter de chaîne avant, couvrir les ouvertures pour éviter que des corps étrangers n'entrent dans le moteur.**
- **Ne pas déposer les deux amortisseurs de masse au dos du couvercle.**

SEM515G



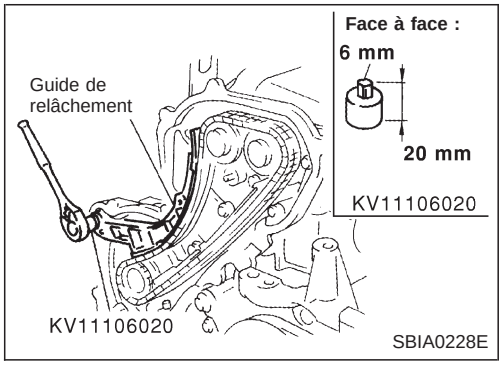
7. Placer le piston n° 1 à son PMH dans sa course de compression.

- Tourner la poulie de vilebrequin dans le sens des aiguilles d'une montre pour que le repère d'alignement (repère poinçonné) sur chaque roue dentée d'arbre à cames soit dans la position indiquée sur l'illustration.
- **Aucune indication de position n'apparait sur la poulie de vilebrequin.**
- **Lors de la repose, des correspondances de couleurs peuvent être utilisées sur la chaîne de distribution secondaire comme repères d'alignement. La présence de repère n'est pas nécessaire pour la dépose ;**

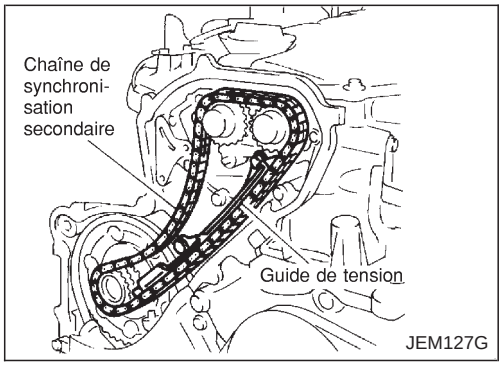


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Chaîne de distribution secondaire (Suite)



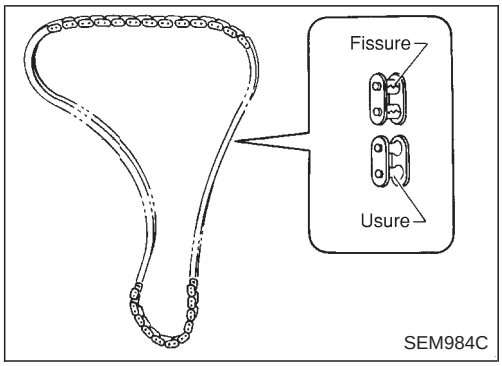
toutefois, faire des repères d'alignement comme exigé parce qu'il se peut que le repère d'alignement sur la roue dentée de la pompe à injection de carburant ne soit pas facile à voir.



8. Déposer le tendeur de chaîne.
a. Pousser le plongeur du tendeur de chaîne et le maintenir enfoncé grâce à une broche poussoir.

b. Utiliser une clé à tête hexagonale [face à face : 5 mm, SST] pour déposer les boulons en vue de déposer le tendeur de chaîne.

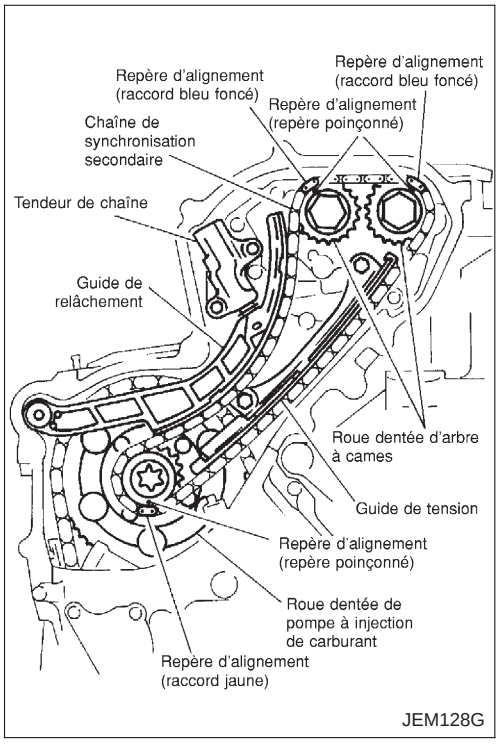
9. Déposer le guide du mouvement de la courroie de distribution.
- Utiliser une clé à tête hexagonale (face à face : 6 mm, SST) pour déposer les boulons en vue de déposer le guide de relâchement de chaîne de distribution.



10. Déposer le guide de tension de la courroie de distribution.
11. Déposer chaîne de distribution secondaire.
- Seule la chaîne de distribution peut être déposée sans déposer les pignons.

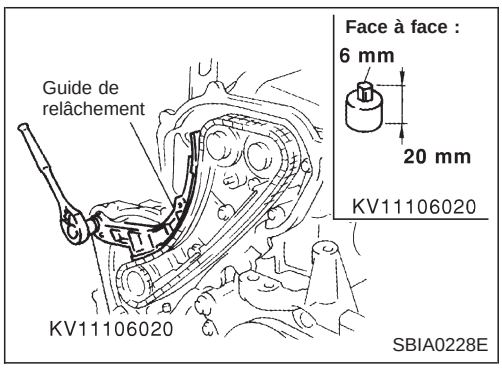
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Chaîne de distribution secondaire (Suite)

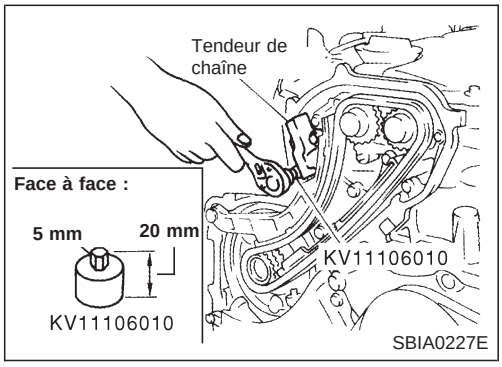


INSPECTION

Contrôler la présence de fissures ou les signes d'usure excessive sur les chaînons. Remplacer la chaîne si nécessaire.

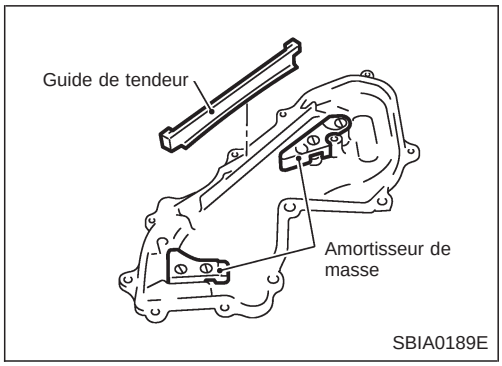


REPOSE



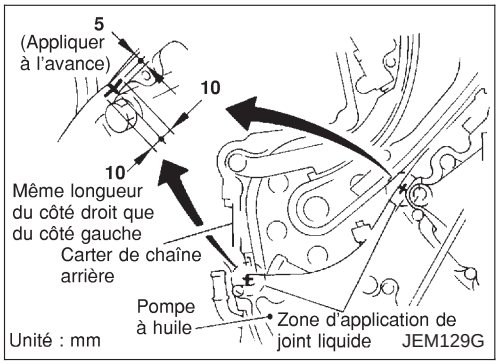
1. Reposer la chaîne de distribution secondaire.
- Lors de la repose, faire correspondre les repères d'alignement sur les pignons avec les repères d'alignement de couleurs (correspondances colorées) sur la chaîne.
2. Reposer le guide de tension de la courroie de distribution.
- Le boulon supérieur a une tige plus longue que le boulon inférieur.

3. Utiliser une clé à tête hexagonale (face à face : 6 mm, SST) pour reposer le guide de relâchement de chaîne de distribution.



4. Reposer le tendeur de chaîne.
a. Pousser le plongeur du tendeur de chaîne. Tout en le maintenant enfoncé grâce à une broche poussoir, reposer le tendeur de chaîne.
b. Utiliser une clé à tête hexagonale (face à face : 5 mm, SST) pour serrer les boulons.
c. Extraire la broche poussoir, etc. en maintenant le plongeur.
- **S'assurer à nouveau que les repères d'alignement sur les pignons et les repères d'alignement colorés sur la chaîne de distribution sont alignés.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

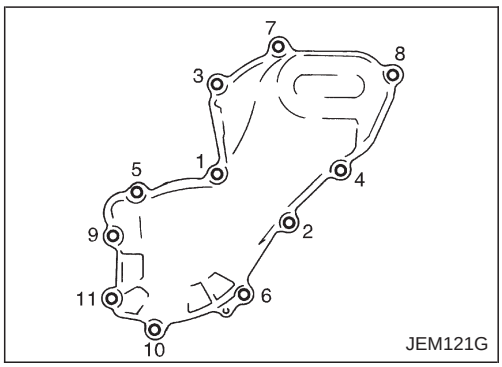


Chaîne de distribution secondaire (Suite)

5. Reposer le boîtier de la chaîne avant.

a. Reposer le guide de tension sur l'arrière de la surface du boîtier de la chaîne avant.

- Maintenir le boîtier de la chaîne avant verticalement lors de la repose. Le guide de tension risque de s'enlever si le boîtier de la chaîne avant est incliné.



b. Enduire de joint liquide spécifié (se reporter à EM-3003, ''Procédure d'application du joint liquide''.) les deux extrémités des zones arquées (aux endroits où le boîtier de la chaîne arrière est contigu) comme indiqué indiqué sur l'illustration.

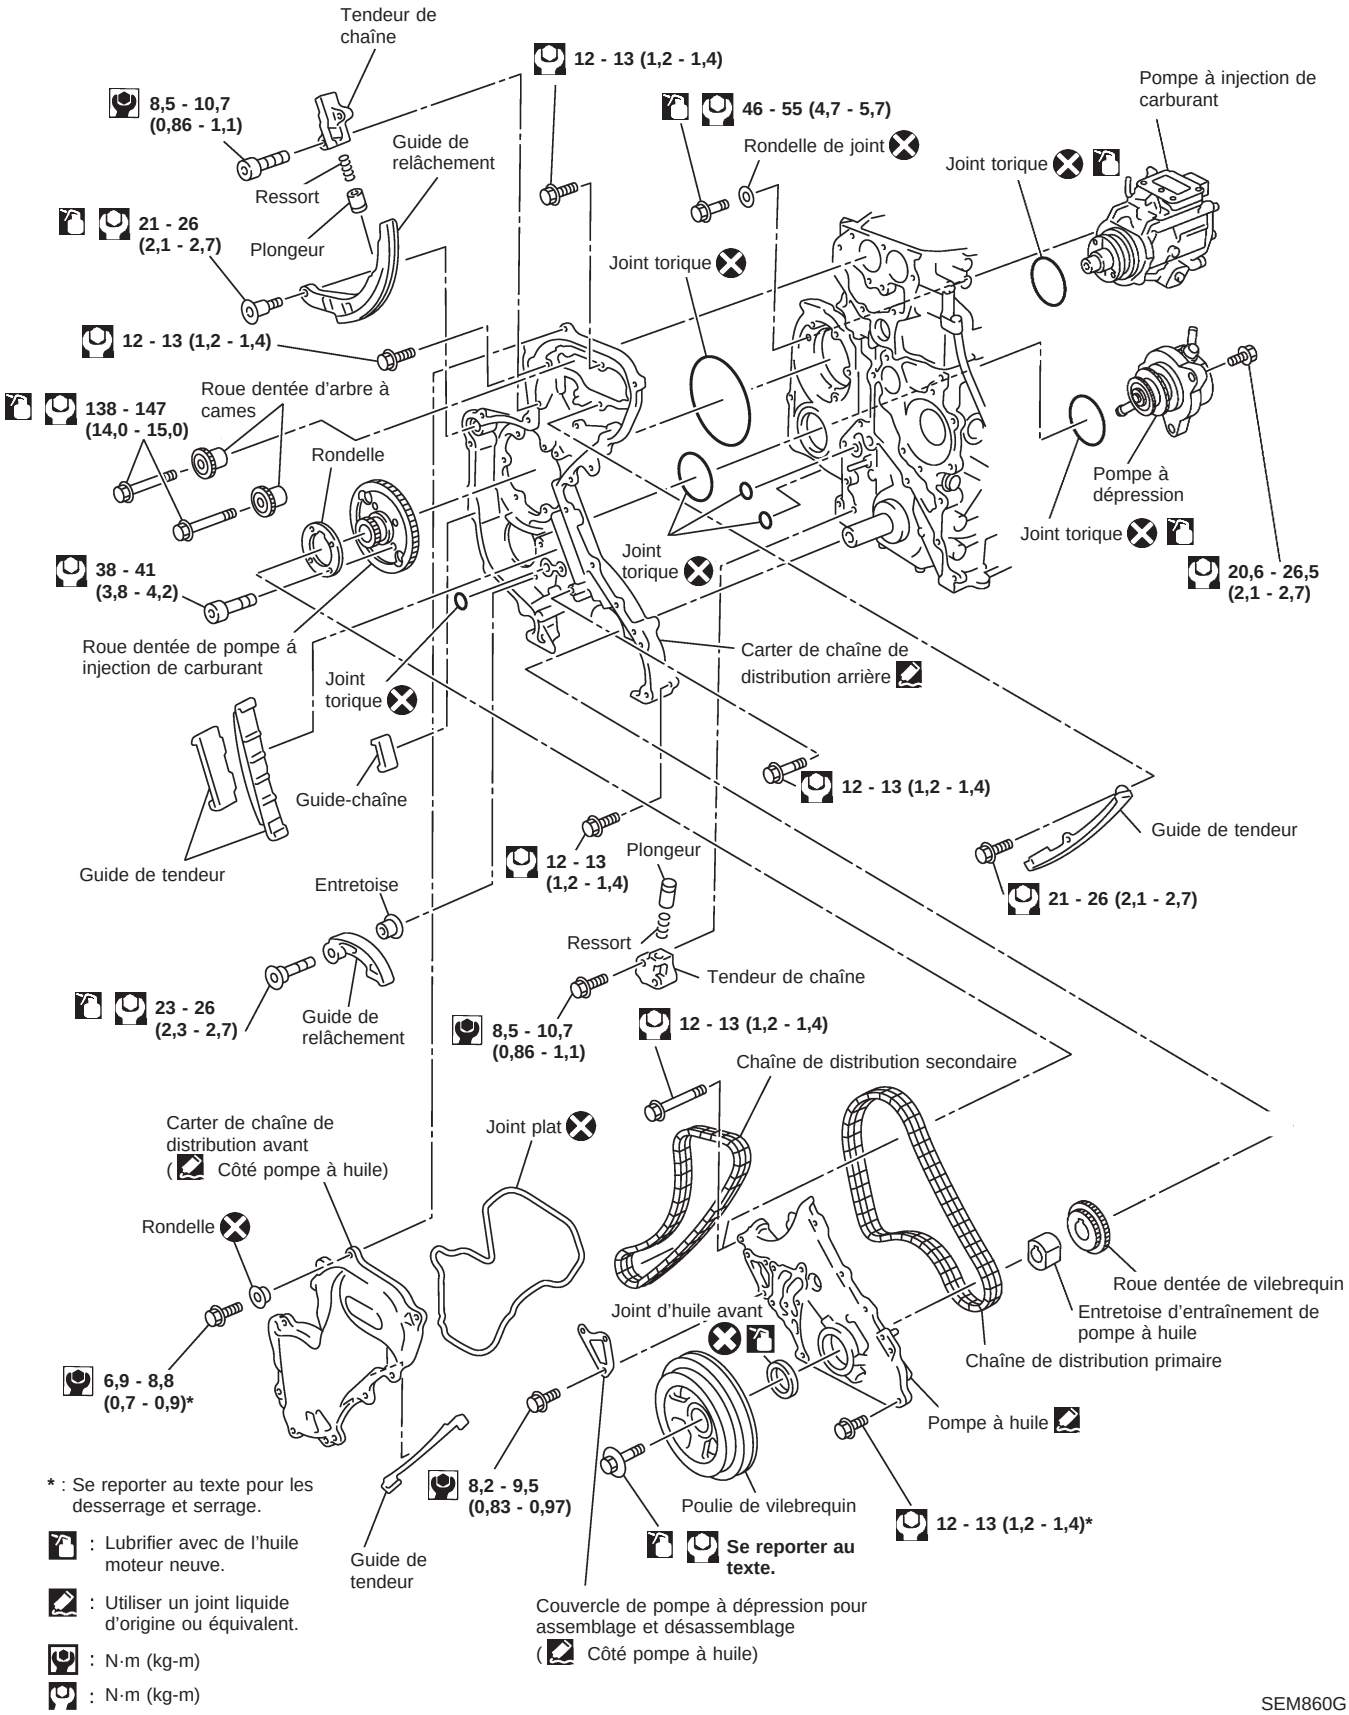
c. Reposer le nouveau joint plat du boîtier de la chaîne dans la rainure du boîtier de la chaîne.

d. Reposer le boîtier de la chaîne avant.

- Lors de la repose, aligner la cheville de positionnement sur le boîtier de pompe à huile avec le perçage de goupille.

- Reposer tous les boulons avec la rondelle de caoutchouc sur boîtier de la chaîne avant.

e. Serrer les boulons de fixation selon l'ordre numérique indiqué sur l'illustration.



f. Après le serrage de tous les boulons, resserrer les boulons n° 1, 2, et 6.

6. Ensuite, reposer dans l'ordre inverse de celui de la dépose.

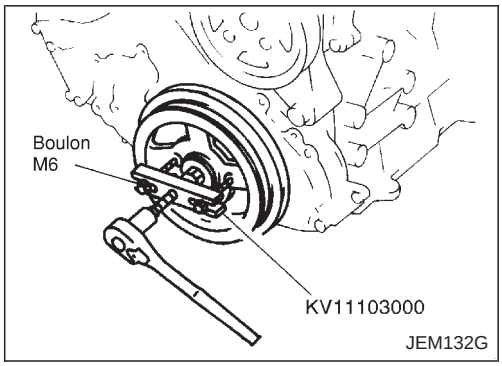
Chaîne de distribution primaire (Suite)

PRECAUTION :

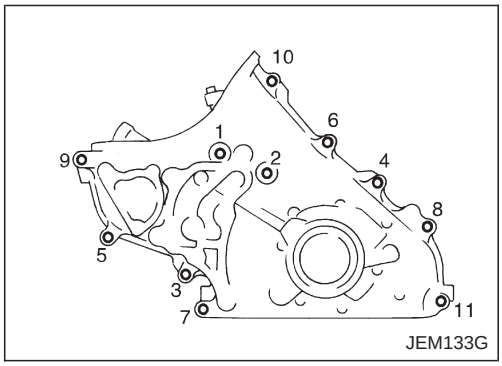
- **Après avoir déposé la chaîne de distribution, ne pas faire tourner séparément le vilebrequin et l'arbre à cames car les soupapes heurteraient les têtes de piston.**
- **Lors de la repose des arbres à cames, tendeurs de chaîne, joints d'huile, ou d'autres pièces coulissantes, lubrifier les surfaces de contact avec de l'huile moteur neuve.**
- **Appliquer de l'huile moteur neuve sur les boulons de filetage et les surfaces d'appui lors de la repose des pignons d'arbre à cames, de la poulie de vilebrequin, et des supports d'arbre à cames.**
- **Ne pas renverser de liquide de refroidissement moteur sur les courroies d'entraînement.**

DEPOSE

1. Déposer le refroidisseur à air de suralimentation et le support.
2. Déposer le cache-culbuteurs. Se reporter à EM-3046, ''Dépose et repose'', ''CACHE-CULBUTEURS''.
3. Déposer le tube de guidage de l'EGR.
4. Déposer la protection de radiateur et le radiateur. Se reporter à la section LC, ''DEPOSE ET REPOSE'', ''Radiateur''.
5. Déposer la poulie de tension, le support de poulie de tension et les courroies d'entraînement.
6. Déposer les carters d'huile supérieur et inférieur. Se reporter à EM-3016, ''Dépose et repose'', ''CARTER D'HUILE''.
7. Enlever le tube d'injection.
   Se reporter à la section EC, ''Tube d'injection et injecteur''.
8. Déposer la chaîne de distribution secondaire et les pièces associées.
   Se reporter à EM-3022, ''Chaîne de distribution secondaire''.
9. Lors de la dépose du boîtier de la chaîne arrière, déposer les roues dentées d'arbre à cames.
   Se reporter à la section EM-3048, ''ARBRE A CAMES''.



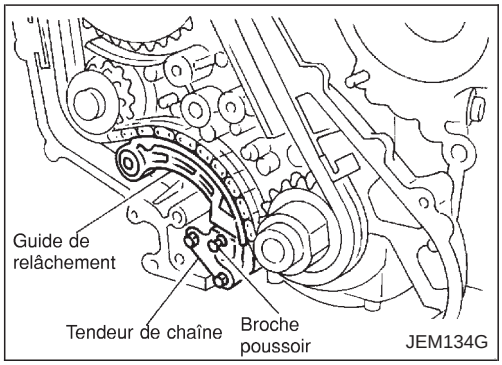
10. Déposer la poulie de vilebrequin.



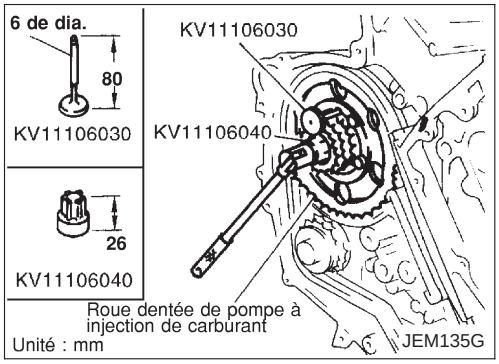
a. Tenir la poulie de vilebrequin avec l'outil de maintien de poulie (SST).
b. Desserrer le boulon de fixation de poulie de vilebrequin et extraire le boulon d'environ 10 mm.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Chaîne de distribution primaire (Suite)



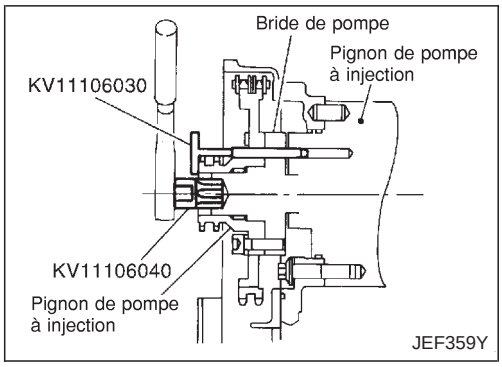
c. Déposer la poulie de vilebrequin á l'aide d'un extracteur de poulie (SST).
- Fixer la poulie de vilebrequin au moyen de deux boulons M6 avec une longueur de tige d'environ 60 mm.



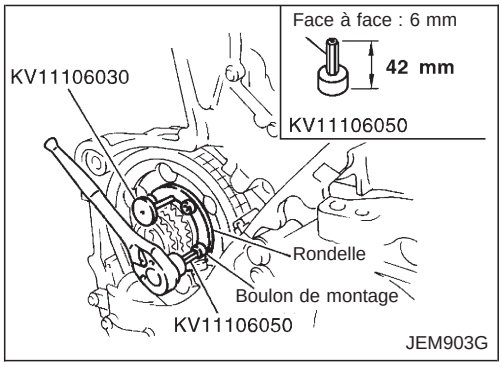
11. Déposer la pompe à huile.
- Desserrer les boulons dans l'ordre inverse de celui indiqué sur l'illustration et les déposer.
- Utiliser la fraise pour joint (SST) etc. pour la dépose.

12. Déposer le joint d'huile avant de la pompe à huile.
- Découper le joint de la surface arrière de la pompe à huile avec un tournevis à lame plate.
- **Prendre garde de ne pas endommager la pompe à huile.**

13. Déposer le tendeur de chaîne.
- Lors de la dépose du tendeur de chaîne, pousser le manchon du tendeur de chaîne et le maintenir enfoncé grâce à une broche poussoir, etc.

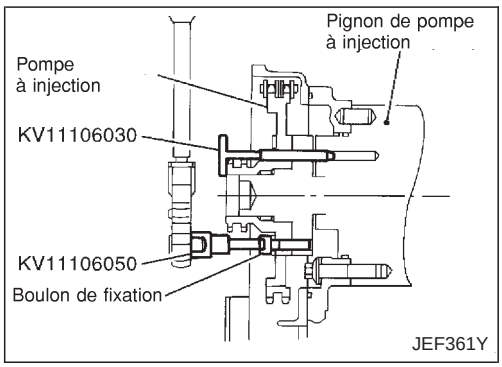


14. Déposer le guide du mouvement de la chaîne de distribution.

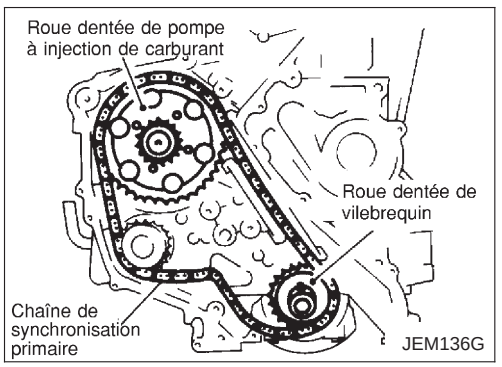


15. Maintenir le pignon de la pompe à injection de carburant.
a. Insérer la goupille d'arrêt de positionnement (SST) dans l'orifice de 6mm de diamètre sur le pignon de la pompe à injection de carburant.
b. Utiliser une clé TORX (SST) pour tourner le manche de la pompe petit à petit pour régler la position du pignon de la pompe à injection de carburant pour que les orifices soient alignés.
c. Insérer la goupille d'arrêt de positionnement à travers le pignon de la pompe à injection de carburant sur le corps de la pompe à injection de carburant pour fixer le pignon.
- Insérer la goupille d'arrêt de positionnement jusqu'à ce que la bride entre en contact avec le pignon de la pompe à injection de carburant.

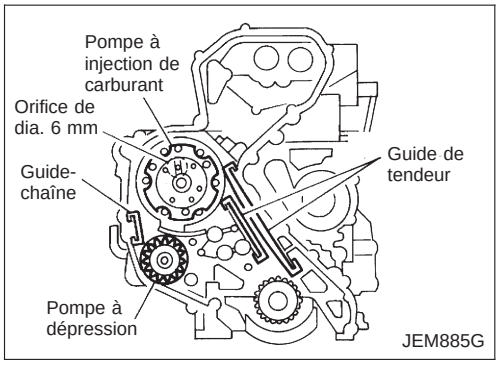
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



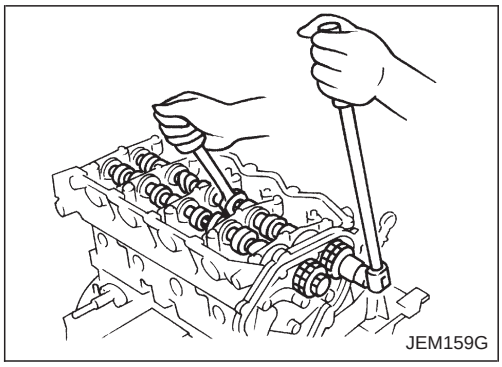
Chaîne de distribution primaire (Suite)



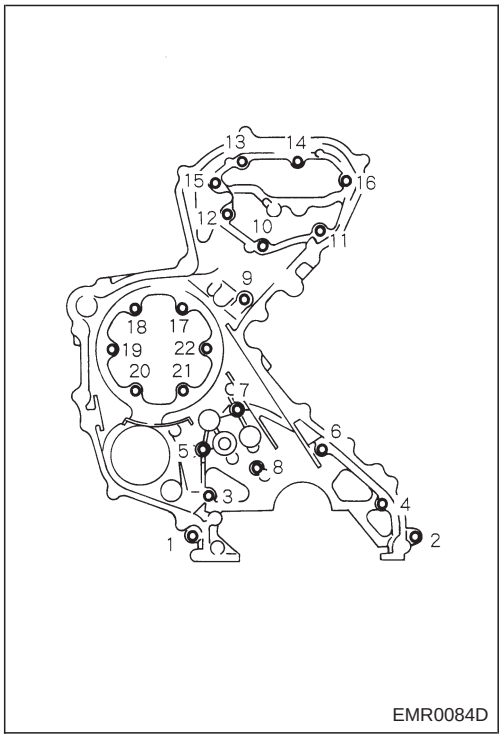
d. Déposer la clé TORX (SST).



16. Utiliser une clé hexagonale (face à face : 6 mm, de type long) (SST) pour déposer les boulons de montage du pignon de la pompe à injection de carburant.
    - Il n'est pas nécessaire de déposer la rondelle du pignon de la pompe à injection de carburant.



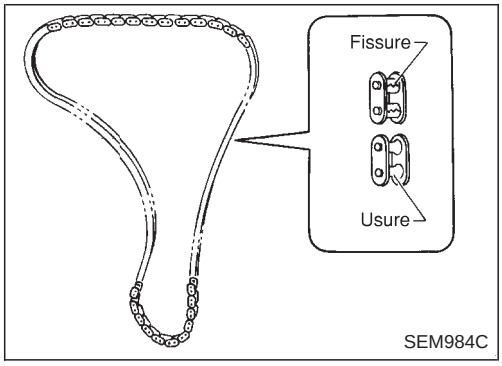
17. Déposer la chaîne de distribution primaire avec le pignon de la pompe à injection de carburant et la roue dentée de vilebrequin.



18. Déposer le guide-chaîne et les guides de tension.
19. Déposer la pompe à dépression.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Chaîne de distribution primaire (Suite)



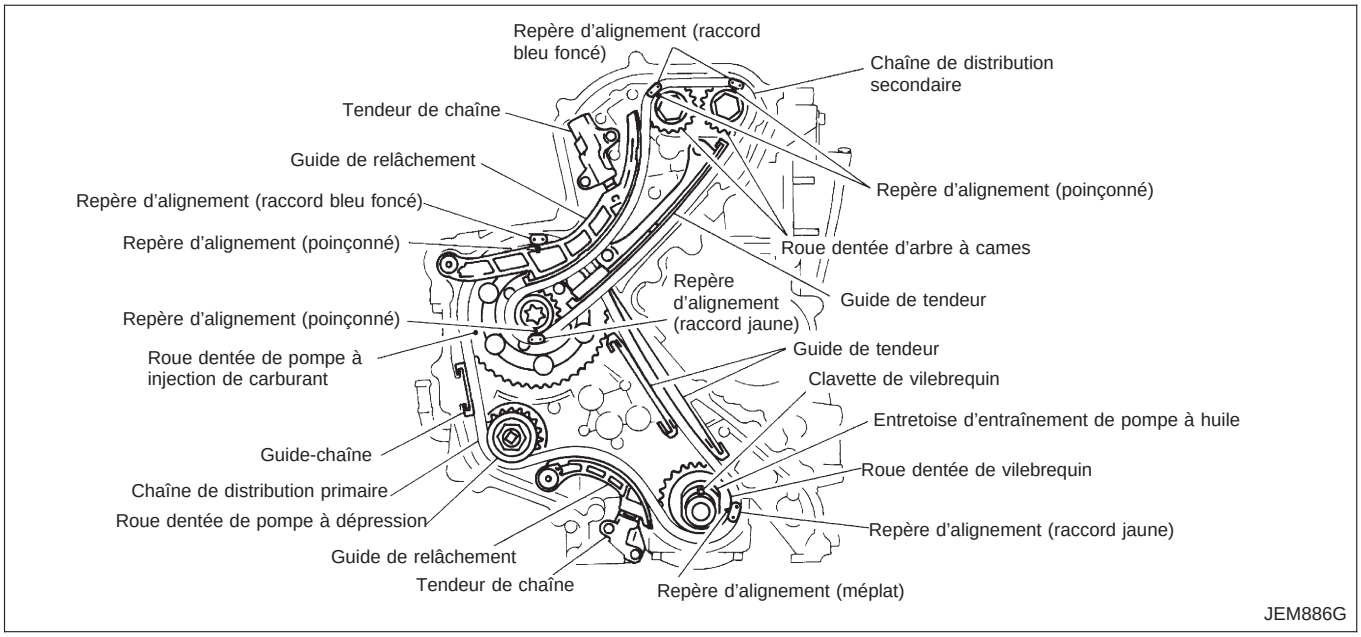
JEM159G

20. Déposer les roues dentées d'arbre à cames.
- Desserrer les boulons de repose des roues dentées d'arbre à cames en maintenant la portion hexagonale de l'arbre à cames.

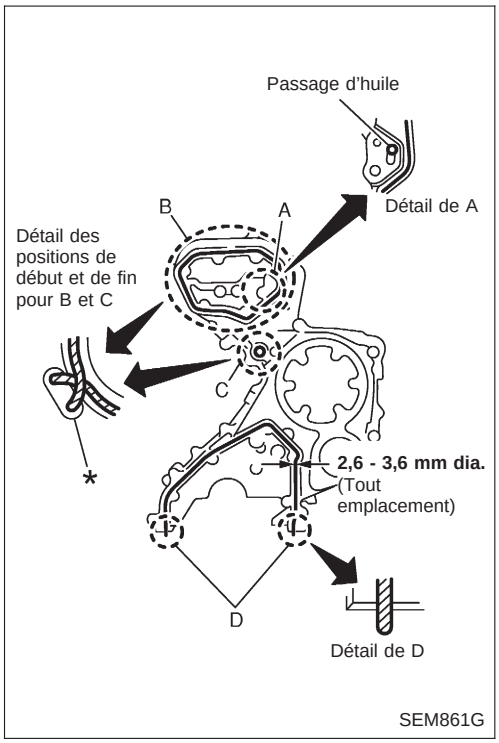
EMR0084D

21. Déposer le boîtier de la chaîne arrière.
- Desserrer les boulons de fixation dans l'ordre inverse de celui indiqué sur l'illustration et les déposer.
- Utiliser la fraise pour joint (SST) pour la dépose.

SEM984C



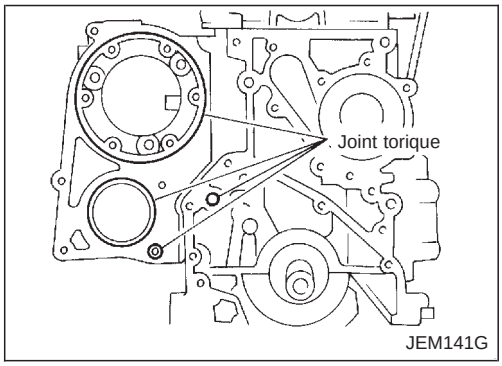
INSPECTION



Contrôler la présence de fissures ou les signes d'usure excessive sur les chaînons. Remplacer la chaîne si nécessaire.

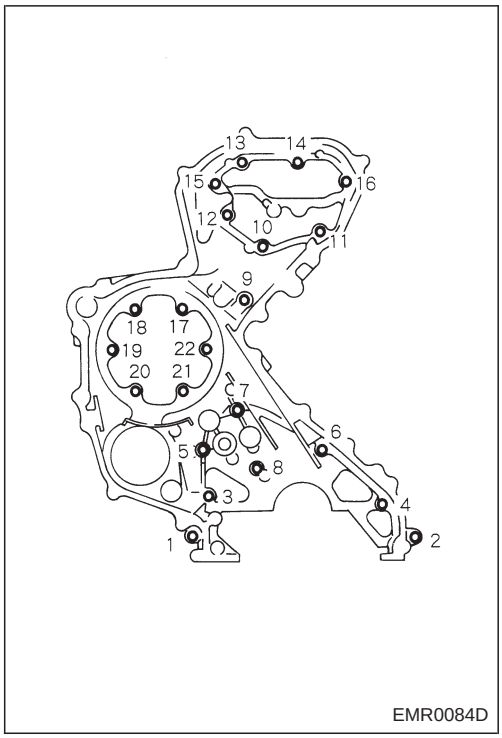
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Chaîne de distribution primaire (Suite)



REPOSE

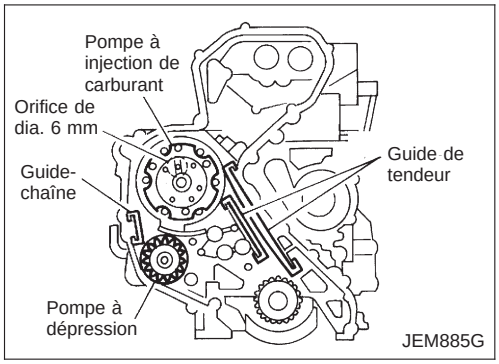
1. Reposer le boîtier de la chaîne arrière.



a. Appliquer un cordon régulier de joint liquide spécifié (se reporter à EM-3003, ''Procédure d'application du joint liquide''.) aux endroits indiqués sur l'illustration.
A : Appliquer le cordon pour qu'il ne dépasse pas dans le passage de l'huile
B, C : Minimiser la zone de chevauchement du cordon, au début et à la fin du cordon comme indiqué sur l'illustration. Appliquer pour que la portion marquée * dépasse à l'extérieur sans que celle-ci ne soit visible de l'extérieur après le montage du moteur.
D : Laisser le début et la fin du cordon dépasser légèrement de la surface du carter.

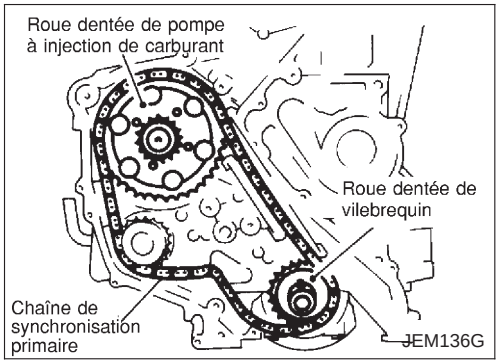
b. Reposer les quatre joints toriques sur les rainures du bloc-cylindre et du support de la pompe à injection de carburant.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



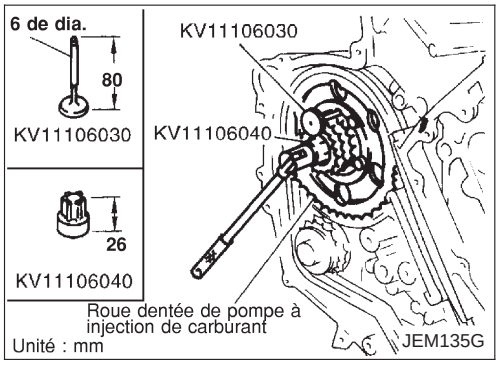
Chaîne de distribution primaire (Suite)

c. Reposer le boîtier de la chaîne arrière.
- Lors de la repose, aligner la cheville de positionnement avec le perçage de goupille.



d. Serrer les boulons selon l'ordre numérique indiqué sur l'illustration.
- Reposer les quatre types de boulons suivants en se reportant à l'illustration.
  16 mm : Boulon n° 1, 2, 16, 17, 18, 19, 20, 21, 22
  20 mm : Boulon n° 3, 4, 6, 9, 10, 11, 13, 14
  25 mm : Boulon n° 12, 15
  35 mm : Boulon n° 5, 7, 8
- La longueur de la tige sous le collet du boulon est la longueur de la partie filetée (la partie de guidage n'est pas incluse).

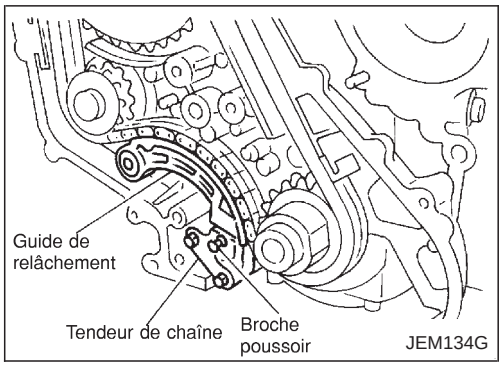
e. Après le serrage de tous les boulons, resserrer dans le même ordre.



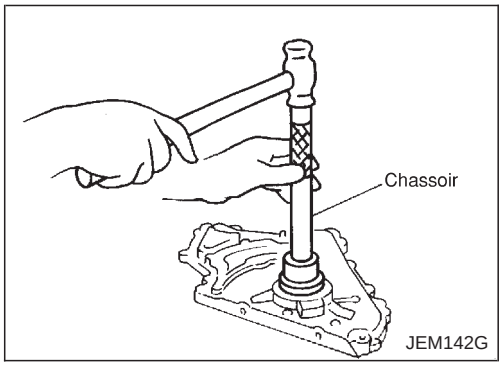
2. Reposer la pompe à dépression.
- Avant la repose, s'assurer que le cran sur la bride de la pompe à injection de carburant et le trou de 6 mm de diamètre sur le corps de la pompe sont alignés.

3. Reposer le guide-chaîne et les guides de tension.
4. Reposer la roue dentée de vilebrequin en l'alignant avec la clavette de vilebrequin sur le côté le plus éloigné.

5. Reposer la chaîne de distribution primaire avec le pignon de la pompe à injection de carburant.
- Lors de la repose, faire correspondre les repères d'alignement sur les pignons avec les repères d'alignement de couleurs (correspondances colorées) sur la chaîne.
- Reposer la rondelle de pignon de la pompe à injection de carburant avec la surface marquée ''F'' (repère avant) orienté vers l'avant du moteur.

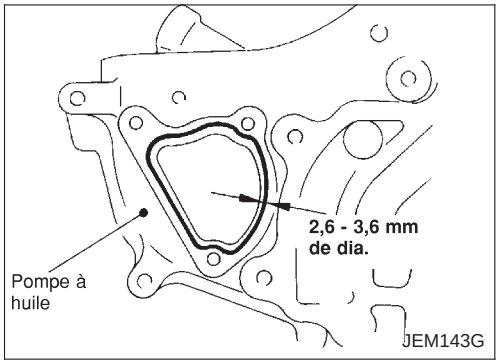


6. Reposer la chaîne de distribution sur le pignon de la pompe à dépression et à travers le guide-chaîne.

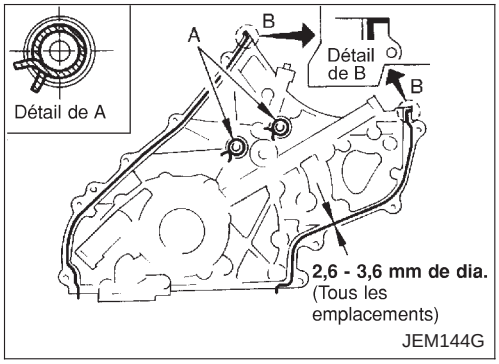


7. Utiliser la goupille d'arrêt de positionnement (SST) pour maintenir le pignon de la pompe à injection de carburant et reposer le boulon pour fixer le pignon.
- Utiliser une clé TORX (SST) pour tourner le manchon petit à petit pour régler la position de la bride de la bride de la pompe. Insérer la goupille d'arrêt de positionnement (SST) dans l'orifice de 6mm dans le diamètre sur le pignon de la pompe à injection de carburant pour que la goupille d'arrêt traverse la bride de la pompe jusqu'au corps de la pompe. Pendant que la goupille d'arrêt est en place, reposer les boulons.

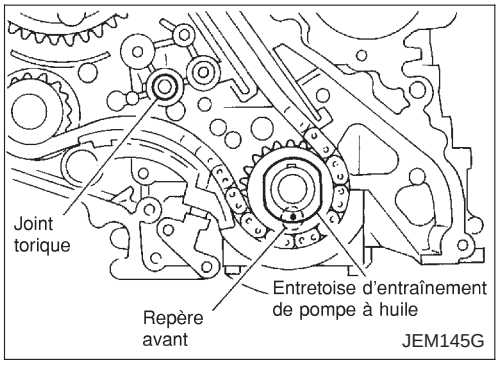
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Chaîne de distribution primaire (Suite)



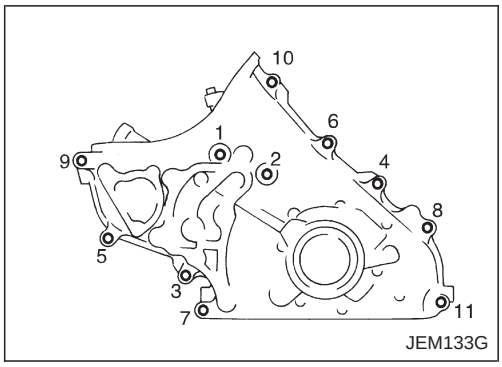
8. Reposer le guide de la tension de la courroie de distribution.
9. Reposer le tendeur de chaîne.
- Pousser le plongeur du tendeur de chaîne. Tout en maintenant le plongeur enfoncé grâce à une broche poussoir, etc., reposer le tendeur de chaîne.
- Après la repose, extraire la broche poussoir en maintenant le plongeur.
- **S'assurer à nouveau que les repères d'alignement sur les pignons et les repères d'alignement colorés sur la chaîne de distribution sont alignés.**



10. Reposer le joint d'huile avant sur la pompe à huile.
- Utiliser un poussoir adéquat (62 mm de dia.) pour pousser le joint jusqu'à ce qu'il touche le fond.
- **Ne pas toucher les lèvres du joint d'huile. S'assurer qu'il n'y ait pas de corps étrangers sur la surface du joint.**

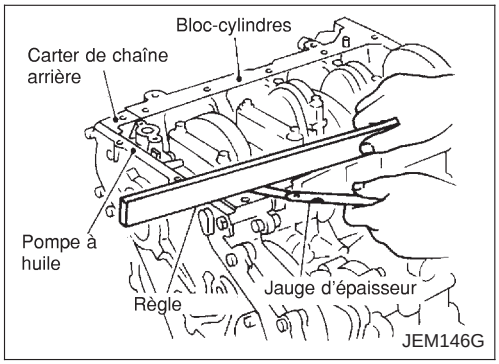
11. Reposer le couvercle de la pompe à dépression (pour l'ouverture de la pompe à dépression lors de repose et dépose) sur la pompe à huile si le couvercle est déposé.
- Appliquer un cordon régulier de joint liquide spécifié (se reporter à EM-3003, ''Procédure d'application du joint liquide''.) comme indiqué sur l'illustration.
- Appliquer du joint liquide sur la surface latérale de la pompe à huile.

12. Reposer la pompe à huile.
a. Appliquer un cordon régulier de joint liquide spécifié (se reporter à EM-3003, ''Procédure d'application du joint liquide''.) aux endroits indiqués sur l'illustration.
A : Laisser le début et la fin du cordon dépasser légèrement de la surface.
B : Appliquer du joint liquide le long de l'extrémité supérieure de la pompe à huile.



b. Reposer l'entretoise d'entraînement de la pompe à huile sur le vilebrequin.
- Reposer avec le repère avant (repère poinçonné) orienté vers l'avant du moteur.

c. Reposer le joint torique sur la rainure du carter de chaîne arrière.

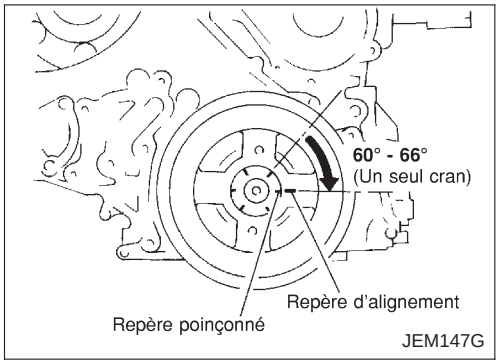


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Chaîne de distribution primaire (Suite)

d. Reposer la pompe à huile.
- Lors de la repose, aligner le rotor interne dans la direction des deux plateaux de parement de l'entretoise d'entraînement de la pompe à huile.
- Lors de la repose, aligner la cheville de positionnement avec le perçage de goupille.

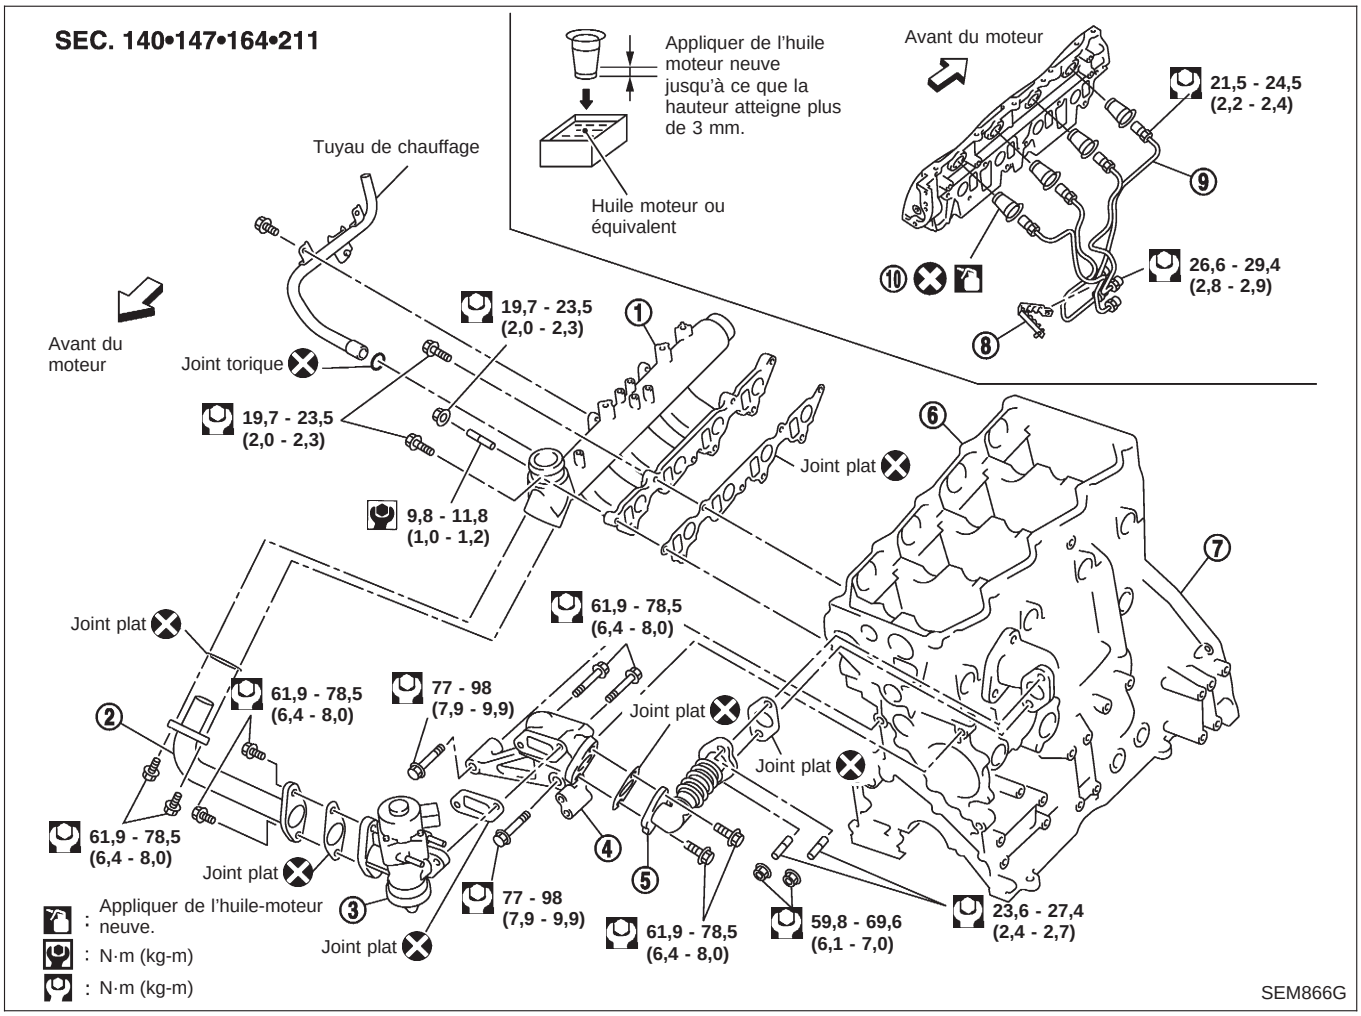
e. Serrer les boulons de fixation selon l'ordre numérique indiqué sur l'illustration.
f. Après le serrage de tous les boulons, resserrer dans le même ordre.



13. Vérifier les écartements sur la surface de montage du carter d'huile supérieur.
- Avec une règle et une jauge d'épaisseur, mesurer les écartements entre les emplacements des pièces suivantes :

Standard :

Carter de pompe à huile et chaîne arrière
−0,14 à 0,14 mm
Carter de chaîne arrière et bloc-cylindre
−0,25 à 0,13 mm



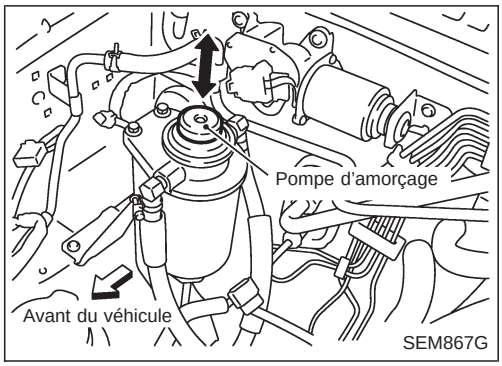
- Si la valeur mesurée est en dehors des limites ci-dessus, reposer à nouveau.

14. Reposer la poulie de vilebrequin.
a. Reposer la poulie de vilebrequin sur le vilebrequin.
b. Tenir la poulie de vilebrequin avec l'outil de maintien de poulie (SST).
c. Serrer le boulon de 20 à 29 N·m (2,0 à 3,0 kg-m).
d. Faire un repère d'alignement sur la poulie de vilebrequin qui s'aligne avec un des repères poinçonnés sur le boulon.
e. Serrer à nouveau le boulon de fixation sur 60° - 66° [cible : 60° (tourner d'un cran)].
15. Reposer la chaîne de distribution secondaire et les pièces associées.
Se reporter à EM-3025, ''Chaîne de distribution secondaire'', ''REPOSE''.
16. Ensuite, reposer dans l'ordre inverse de celui de la dépose.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Dépose et repose

1. Collecteur d'admission
2. Tube de guidage de l'EGR
3. Soupape de commande de volume de l'EGR
4. Entretoise de l'EGR
5. Tuyau de l'EGR
6. Culasse
7. Bloc-cylindre
8. Collier du tube d'injection
9. Tube d'injection
10 Joint à huile de l'injecteur



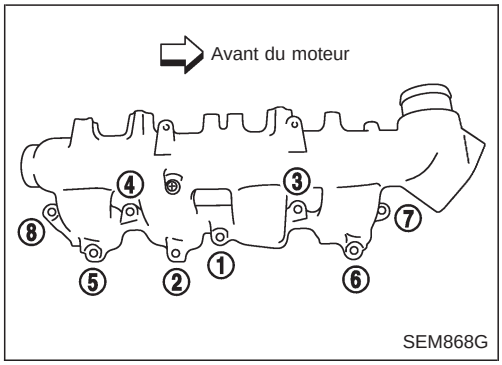
DEPOSE

1. Vidanger le liquide de refroidissement. Se reporter à la section LC, ''Remplacement du liquide de refroidissement du moteur''.
2. Déposer le refroidisseur d'air de suralimentation. Se reporter à EM-3015, ''Dépose et repose''.
3. Déposer la soupape de commande de volume de l'EGR, de l'entretoise de l'EGR et du tube de guidage de l'EGR.
4. Déposer les tuyaux d'injection de carburant et le collecteur d'admission.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Dépose et repose (Suite)

TUYAUTERIE D'ALIMENTATION



Dépose

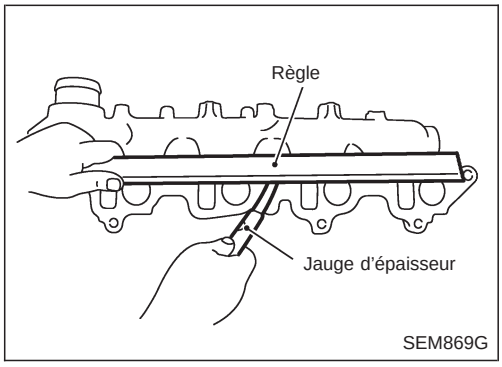
- Pour empêcher le carburant de déborder, boucher l'ouverture du flexible avec un bouchon aveugle après l'avoir débranché.
- **Prendre garde de ne pas renverser de carburant dans le compartiment moteur.**

Repose

Après la réparation, purger l'air des tuyaux en tirant vers le haut et poussant vers le bas la pompe d'amorçage jusqu'à sentir une résistance.
Pour une purge d'air supplémentaire, actionner le démarreur tout en actionnant la pompe d'amorçage vers le haut et vers le bas. Ne pas actionner le démarreur pendant plus de 10 secondes à la fois.

COLLECTEUR D'ADMISSION

Dépose



- Desserrer les boulons et écrous dans l'ordre inverse de celui indiqué sur l'illustration.

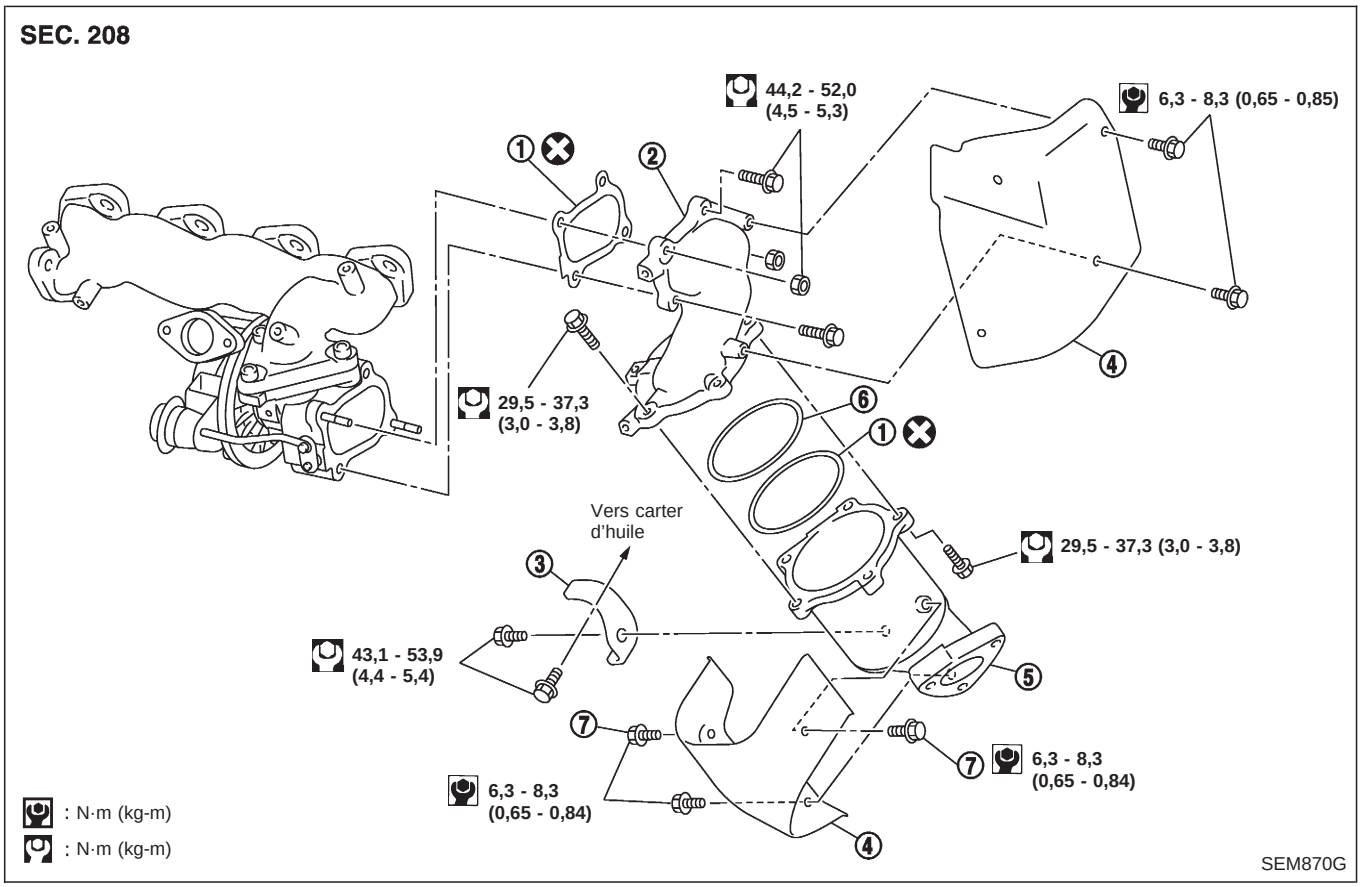
Repose

- Lorsque les boulons filetés sont retirés, reposer en fonction du couple suivant :
  : 10 - 11 N·m (1,0 - 1,2 kg-m)
- Serrer les boulons de fixation selon l'ordre numérique indiqué sur l'illustration.

SOUPAPE DE COMMANDE DE VOLUME DE L'EGR

- **Manipuler avec précaution pour éviter tout choc.**
- **Ne pas démonter ni régler.**

Inspection



COLLECTEUR D'ADMISSION

Contrôler la déformation sur la surface de montage avec une règle et une jauge d'épaisseur.

Limite : 0,1 mm

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Dépose et repose

1. Joint plat
2. Sortie des gaz d'échappement
3. Gousset
4. Isolateur
5. Catalyseur
6. Chapeau de joint plat
7. Goupille d'arrêt

TRAVAIL PREPARATIF

Déposer les pièces suivantes :

- Refroidisseur d'air de suralimentation
- Conduit d'air, tuyau d'entrée d'air
- Isolateurs du catalyseur
- Couvercle de collecteur d'échappement
- Tuyau avant de l'échappement (débrancher)
  Se reporter à ''Dépose et repose'' dans la section FE, ''SYSTEME D'ECHAPPEMENT''.
- Tuyau d'entrée d'huile
- Collecteur d'échappement
- Convertisseur du catalyseur et ensemble turbocompresseur

CATALYSEUR

Dépose

PRECAUTION :
Ne pas démonter.

Repose

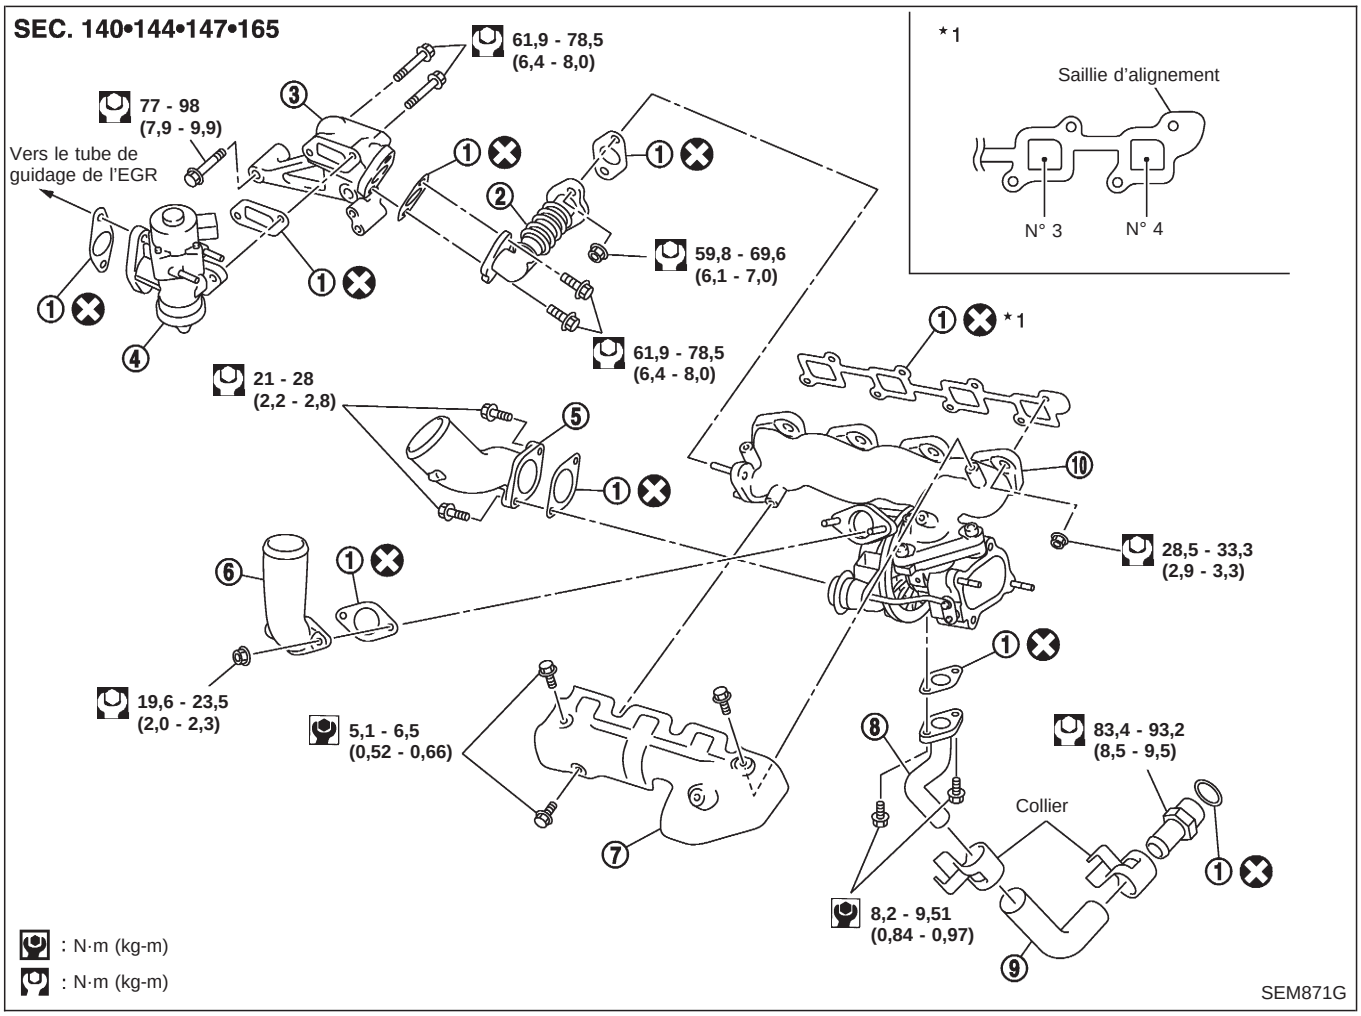
Reposer deux goupilles d'arrêt sur les deux côtés du catalyseur. Prendre garde de ne pas mélanger les goupilles d'arrêt avec les boulons de fixation de l'isolateur.

Goupille d'arrêt du catalyseur :
Boulon à bride (noir)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Dépose et repose (Suite)

Boulon de fixation de l'isolateur :
Boulon à rondelle (argent ou jaune)



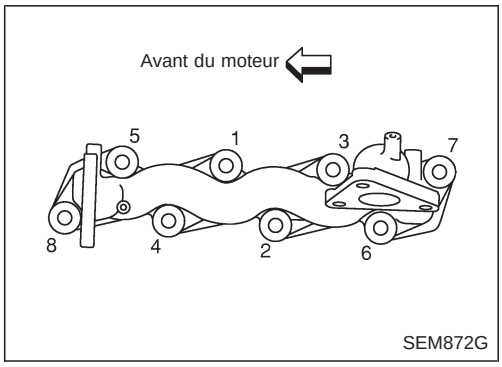
GOUSSET

Repose

Pousser les goussets contre le carter d'huile et le catalyseur et serrer temporairement les boulons de fixation. Ensuite le serrer au couple spécifié.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Dépose et repose



1. Joint plat
2. Tuyau de l'EGR
3. Entretoise de l'EGR
4. Soupape de commande de volume de l'EGR
5. Tuyau d'entrée d'air
6. Entrée d'air
7. Couvercle de collecteur d'échappement
8. Tuyau de sortie d'huile
9. Flexible de retour d'huile
10. Collecteur d'échappement et ensemble turbocompresseur

TRAVAIL PREPARATIF

Déposer les pièces suivantes :

- Refroidisseur d'air de suralimentation
- Conduit d'air, tuyau d'entrée d'air
- Isolateurs du catalyseur
- Couvercle de collecteur d'échappement
- Tuyau avant de l'échappement (débrancher)
  Se reporter à ''Dépose et repose'' dans la section FE, ''SYSTEME D'ECHAPPEMENT''.
- Tuyaux d'entrée et de sortie d'huile
- Couvercle de collecteur d'échappement
- Catalyseur et ensemble turbocompresseur (mettre de côté jusqu'à ce que le collecteur d'échappement soit déposé.)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Dépose et repose (Suite)

COLLECTEUR D'ECHAPPEMENT ET TURBOCOMPRESSEUR

Dépose

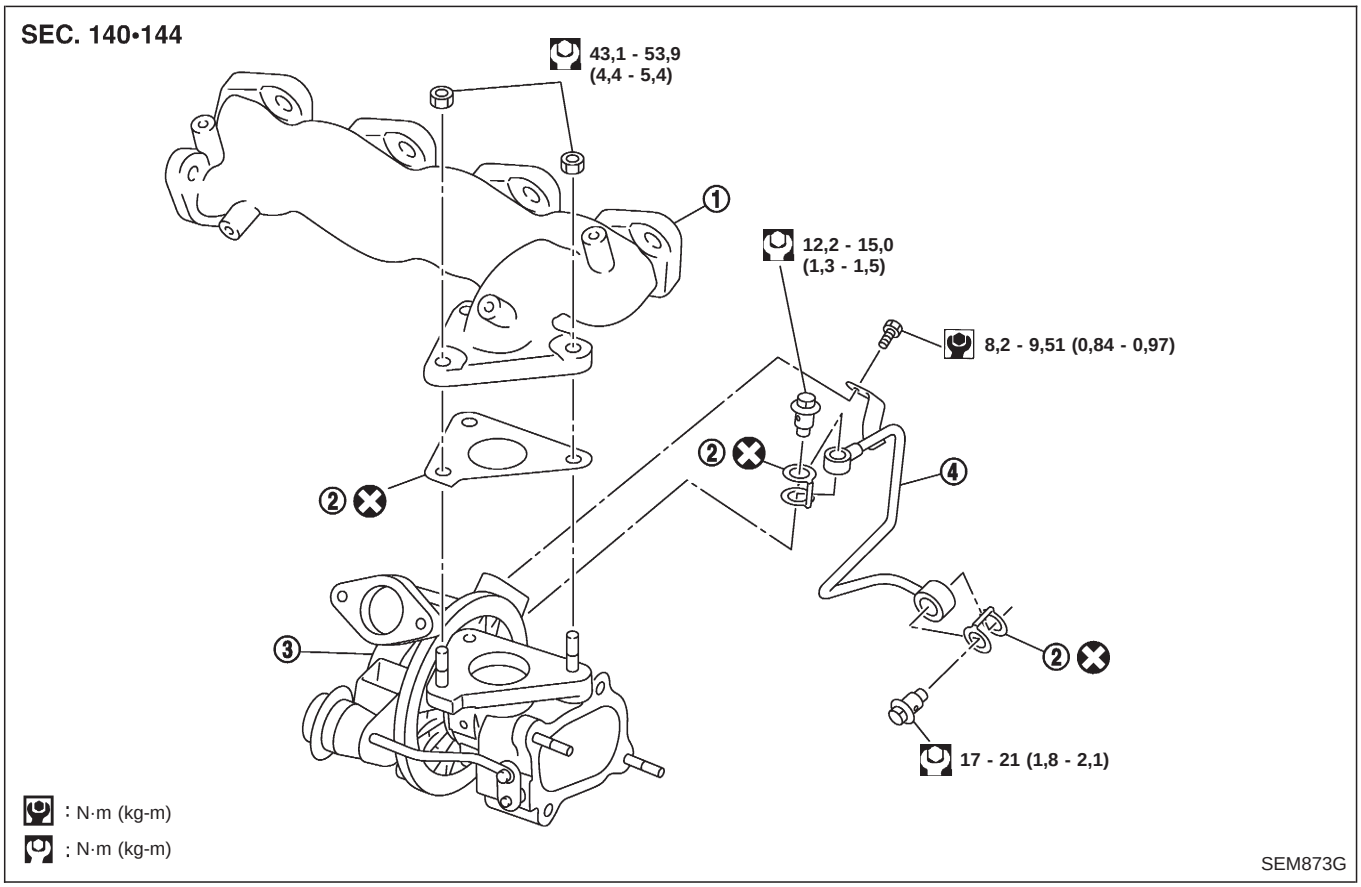
- Desserrer les écrous de fixation du collecteur d'échappement dans l'ordre inverse spécifié sur l'illustration.
- Après avoir déposé le collecteur d'échappement, extraire l'ensemble du catalyseur et du turbocompresseur.

PRECAUTION :
Prendre garde de ne pas déformer les tuyaux du turbocompresseur pendant l'extraction de l'ensemble.

Repose

- Lorsque le boulon fileté est déposé, le serrer au couple suivant :
  : 12,7 - 16,7 N·m (1,3 - 1,7 kg-m)
- Serrer les écrous de fixation du collecteur d'échappement selon la procédure suivante :

a) Serrer les écrous dans l'ordre spécifié sur l'illustration.
b) Resserrer les écrous 1 à 4.



JOINT PLAT DU COLLECTEUR D'ECHAPPEMENT

Repose

Reposer le joint de manière à ce que les saillies d'alignement se trouvent face à l'orifice n° 4.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

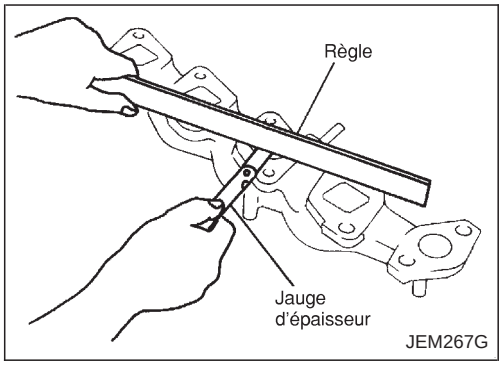
Démontage et remontage

1. Collecteur d'échappement
2. Joint plat
3. Turbocompresseur
4. Tuyau d'entrée d'huile

TURBOCOMPRESSEUR

Démontage

Après avoir appliqué du lubrifiant de montage (Lucen, etc.) sur les écrous de fixation, vérifier que le lubrifiant ait bien pénétré, et ensuite desserrer les écrous pour les déposer.



PRECAUTION :

Ne pas démonter ou régler le corps du turbocompresseur.

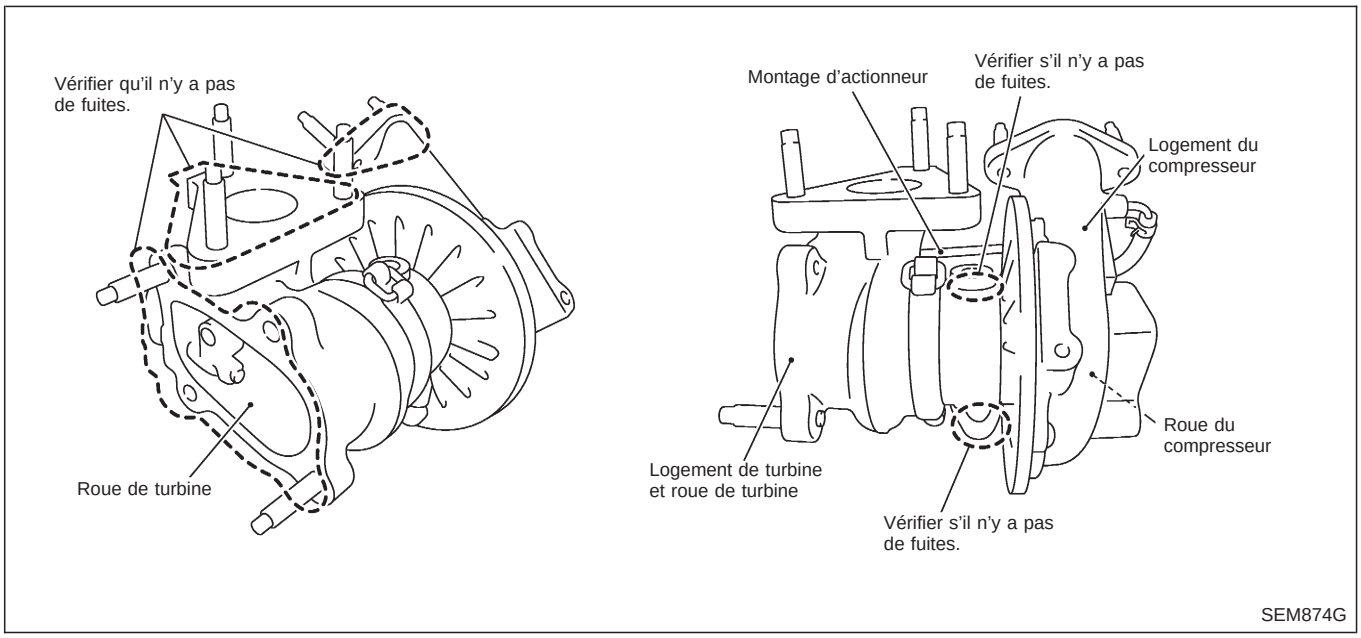
Remontage

Lorsque le boulon fileté est déposé, le serrer au couple suivant :

: 24 - 27 N·m (2,4 - 2,8 kg-m)

Inspection

Collecteur d'échappement



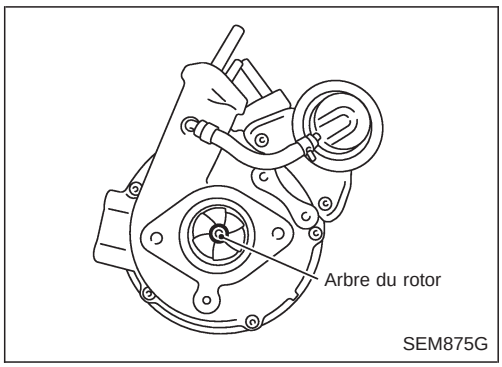
Contrôler la déformation sur la surface de montage dans les six directions en utilisant une règle et une jauge d'épaisseur.

Limite : 0,3 mm

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

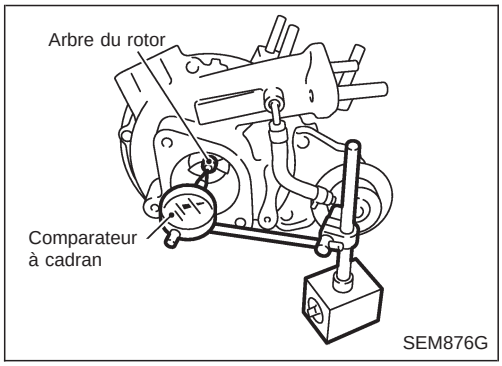
Inspection (Suite)

TURBOCOMPRESSEUR



PRECAUTION :

Lorsque la roue du compresseur, la roue de la turbine ou l'arbre du rotor est endommagé, enlever tous les fragments et corps étrangers qui sont restés dans les passages suivants afin d'empêcher une défaillance secondaire :



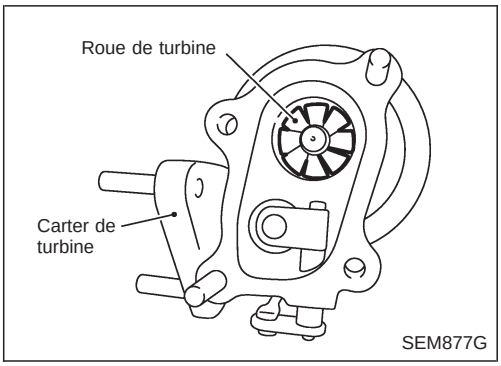
Côté aspiration : Entre le turbocompresseur et le filtre à air

Côté échappement : Entre le turbocompresseur et le catalyseur

Arbre du rotor

- Vérifier si l'arbre du rotor tourne facilement sans aucune résistance lorsque vous le faites tourner du bout des doigts.
- Vérifier que l'arbre du rotor n'est pas desserré lorsqu'il se déplace verticalement ou horizontalement.
- Vérifier que l'arbre du rotor n'interfère pas avec le logement du compresseur.

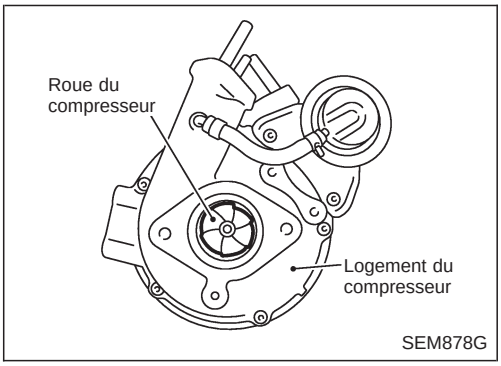
Jeu axial de l'arbre du rotor



Placer un comparateur à cadran à l'extrémité de l'arbre du rotor dans la direction axiale afin de mesurer le jeu axial.

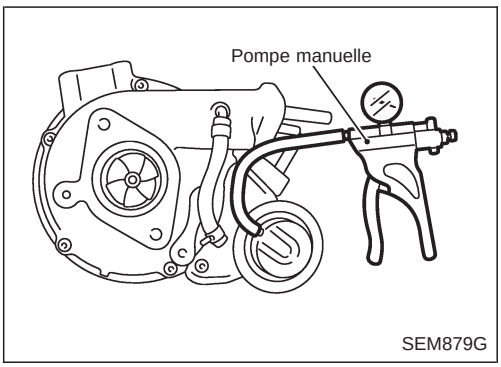
- Vérifier que l'arbre du rotor n'interfère pas avec le logement du compresseur.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Inspection (Suite)

Roue de turbine



- Contrôler qu'il n'y a pas d'adhésion d'huile.
- Contrôler qu'il n'y a pas d'accumulation de carbone.
- Vérifier si les lames de la roue de la turbine ne sont pas courbées ou cassées.
- Vérifier si la roue de la turbine n'interfère pas avec le logement de la turbine.

Roue du compresseur

- Contrôler qu'il n'y a pas d'adhésion d'huile à l'intérieur du conduit d'air.
- Vérifier si la roue du compresseur n'interfère pas avec le logement du compresseur.
- Vérifier si la roue n'est pas voilée ou cassée.

Actionneur de la soupape Wastegate

- Connecter la pompe manuelle à l'actionneur, et contrôler que la tige se déplace sans difficulté en conformité avec la pression suivante.
- Pression à appliquer sur l'actionneur afin de déplacer l'extrémité de la tige comme suit :

  Standard (Quantité de pression/course de la tige)

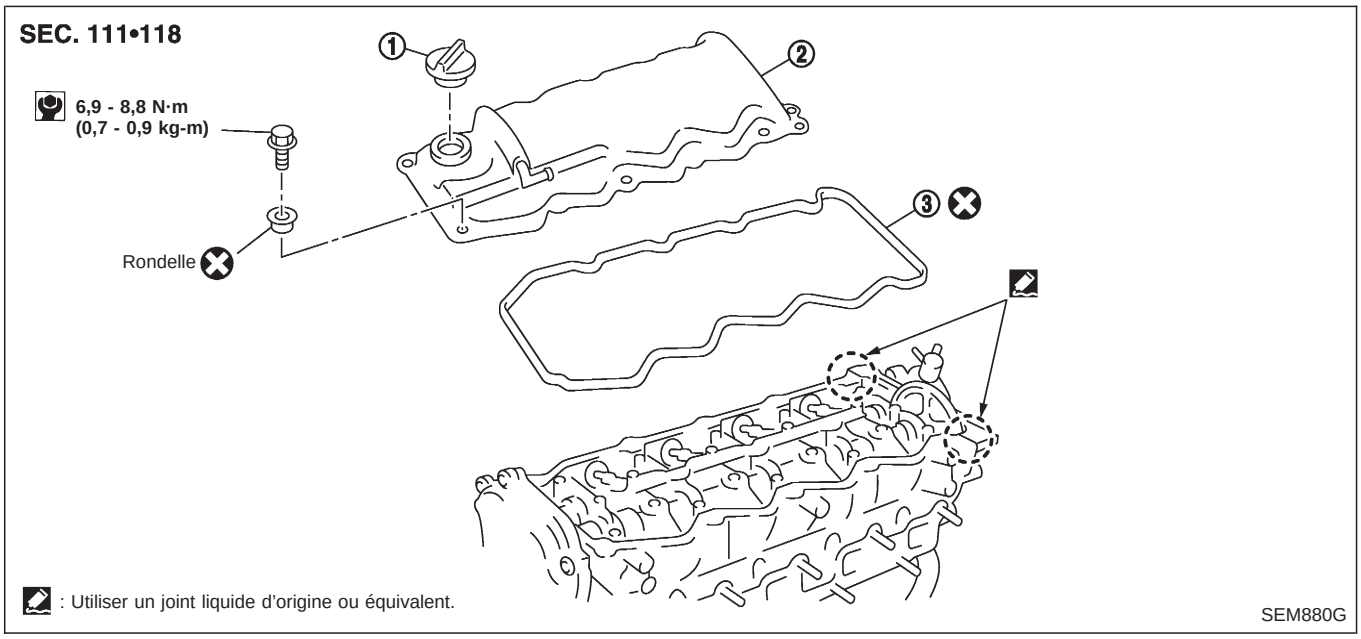
  143,7 - 152,9 kPa
  (1 437 - 1 529 mbar, 1 077,8 - 1 146,8 mmHg)
  161,4 - 174,8 kPa
  (1 614 - 1 748 mbar, 1 210,5 - 1 311,0 mmHg)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (Suite)

Diagnostic des défauts du turbochargeur

Contrôle préliminaire :

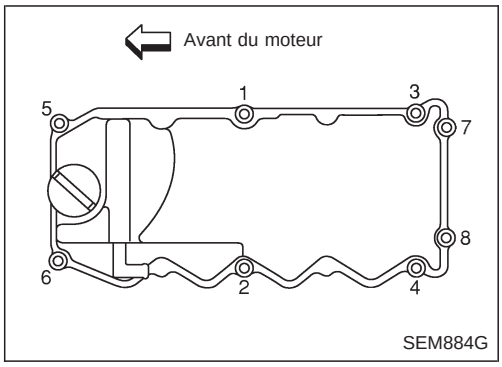


- Vérifier si le niveau d'huile du moteur est entre le MIN et MAX de la jauge. (Lorsque la quantité d'huile du moteur est supérieure au maximum (MAX), l'huile coule dans le conduit d'entrée via le passage de gaz de carter, et la panne du turbocompresseur est mal interprétée.)
- Demander au client si il/elle fait toujours tourner le véhicule au ralenti pour refroidir l'huile après la conduite.
- Remplacer l'ensemble du turbocompresseur lorsque un dysfonctionnement est trouvé après avoir inspecté les unités spécifiées dans le tableau ci-dessous.
- Si aucun défaut n'est trouvé après inspections des unités, estimer que le corps du turbocompresseur ne présente aucune panne. Contrôler à nouveau les autres pièces.

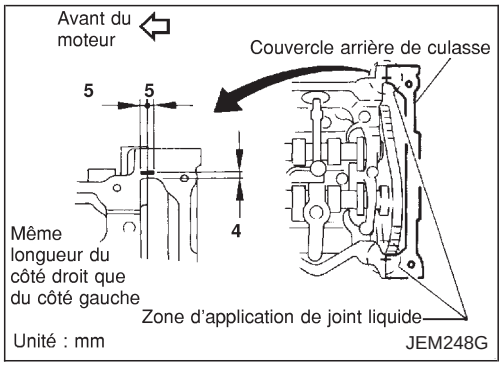
Elément d'inspection	Résultat de l'inspection	Symptôme (lorsque chaque élément d'inspection s'accorde à chaque résultat d'inspection)			
		Fuite d'huile	Fumée	Bruit	Courant insuffisant/ panne d'accélération
Roue de turbine	Fuites d'huile.	△	◎	△	△
	Accumulation de carbone.	△	◎	○	○
	Friction avec le logement.	△	○	◎	○
	Les ailettes sont tordues ou cassées.			◎	◎
Roue du compresseur	L'intérieur du conduit d'air est fortement contaminé par de l'huile.	○	○		
	Friction avec le logement.	△	○	◎	○
	Les ailettes sont tordues ou cassées.			◎	◎
Après vérification de la turbine et du compresseur, inspecter le jeu axial de l'arbre du rotor.	Il y a une résistance lorsque l'arbre du rotor est tourné du bout des doigts.		△	△	○
	L'arbre du rotor résiste parfois à tourner du bout des doigts.				◎
	Il y a trop de jeu dans le palier.	△	△	○	△
Orifice de retour d'huile	Le carbone ou la boue s'est accumulé(e) dans le trou d'huile usagée.	△	◎	△	△

◎: Grande possibilité
○ : Moyenne possibilité
△ : Faible possibilité

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Dépose et repose



1. Bouchon de remplissage d'huile
2. Cache-culbuteurs
3. Joint plat

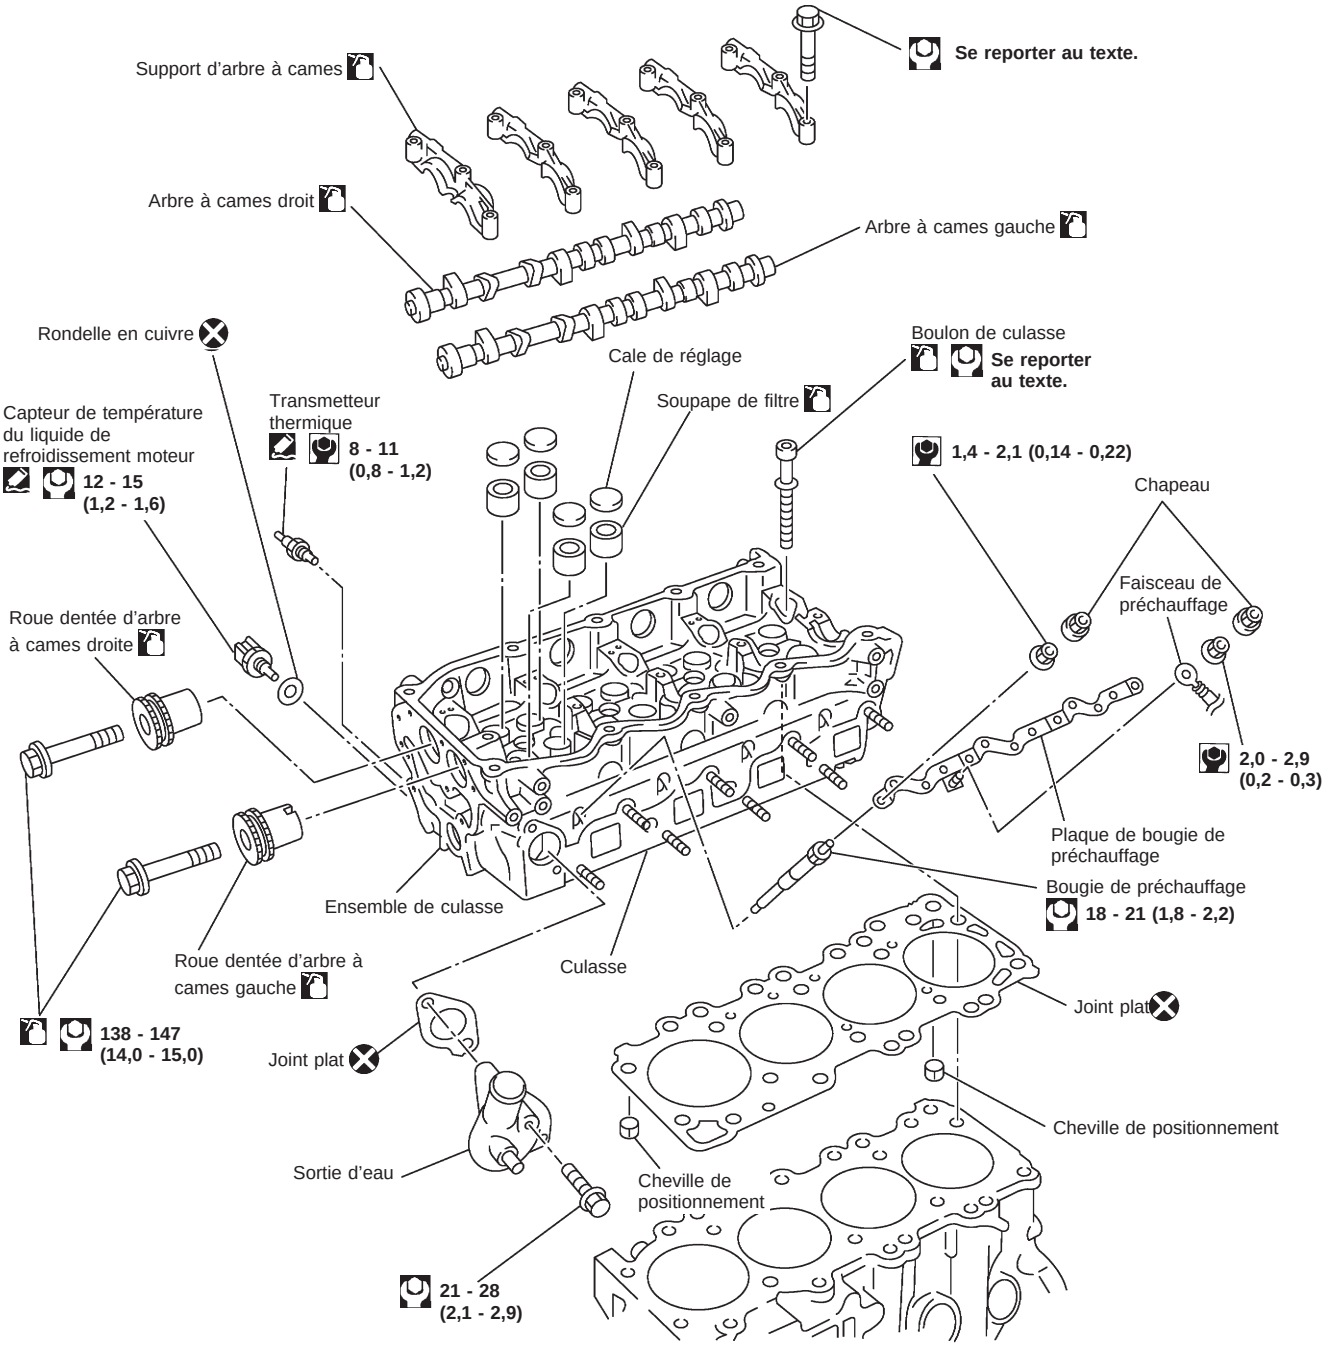
TRAVAIL PREPARATIF

Déposer les pièces du moteur suivantes.
- Refroidisseur d'air de suralimentation
- Support du refroidisseur d'air de suralimentation

CACHE-CULBUTEURS

Dépose

Desserrer les boulons dans l'ordre inverse de celui indiqué sur l'illustration et les déposer.



Repose

- Serrer les boulons selon l'ordre numérique indiqué sur l'illustration.
- Resserrer au même couple et dans le même ordre que celui ci-dessus.

- Appliquer 3,0 mm de dia. de joint liquide spécifié (se reporter à EM-3003, ''Procédure d'application du joint liquide''.) aux endroits indiqués sur l'illustration.
- Reposer dans l'ordre inverse de la dépose.

Composants

SEC. 111•210•220•253

★ : Sélectionner avec l'épaisseur adéquate.

: Lubrifier avec de l'huile de moteur neuve.

: Utiliser du joint liquide d'origine ou équivalent.

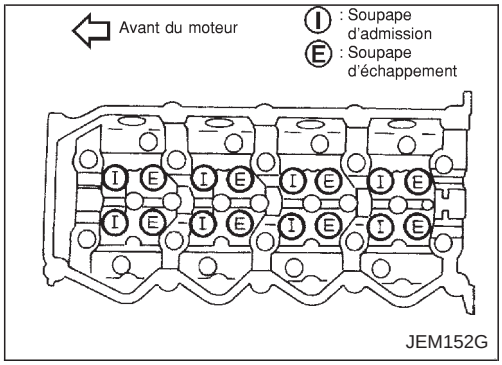
: N•m (kg-m)

: N•m (kg-m)

SEM887G

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Composants (Suite)

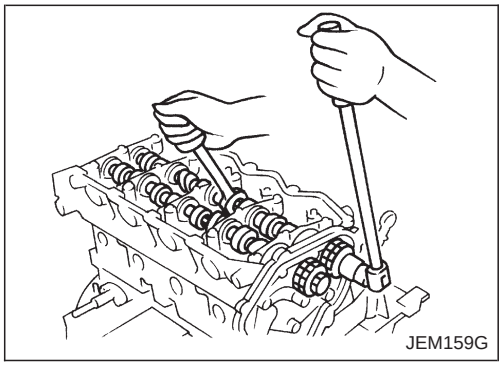


PRECAUTION :

- **Lors de la repose des arbres à cames, tendeurs de chaîne, joints d'huile, ou d'autres pièces coulissantes, lubrifier les surfaces de contact avec de l'huile moteur neuve.**
- **Appliquer de l'huile moteur neuve sur les parties filetées et les surfaces d'appui lors de la repose de la culasse, de la roue dentée d'arbre à cames, de la poulie de vilebrequin et du support de l'arbre à cames.**
- **Attacher des étiquettes sur les poussoirs de soupapes afin de ne pas les mélanger par la suite.**

Dépose

1. Vidanger le liquide de refroidissement. Se reporter à la section LC, ''Remplacement du liquide de refroidissement du moteur''.
2. Déposer le collecteur d'échappement, Turbocompresseur. Se reporter à EM-3040, ''Dépose et repose''.
3. Déposer le collecteur d'admission. Se reporter à EM-3036, ''Dépose et repose''.

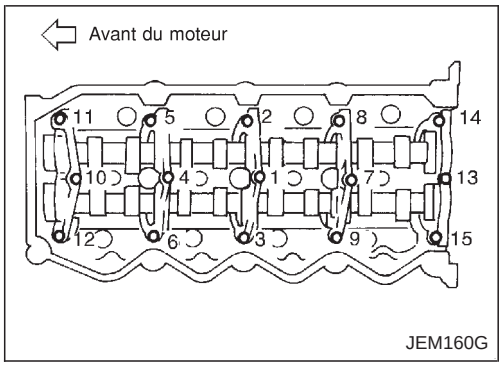


- **Appliquer de la peinture sur les roues dentées d'arbre à cames pour l'alignement pendant la repose.**

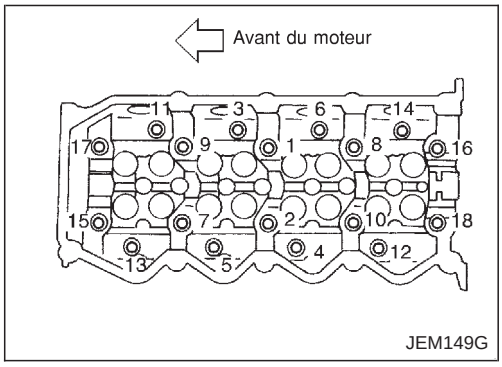
ARBRE A CAMES

1. Déposer les pièces suivantes en se référant aux parties appropriées dans cette section.

- Couvercle du refroidisseur d'air de suralimentation
- Refroidisseur d'air de suralimentation et support du refroidisseur de l'air de suralimentation
- Tube de guidage de l'EGR et l'entretoise de l'EGR
- Cache-culbuteurs
- Tube de trop-plein
- Tube d'injection
- Joint à huile de l'injecteur
- Ensemble d'injecteur à haute pression
- Chaîne de distribution secondaire et pièces associées



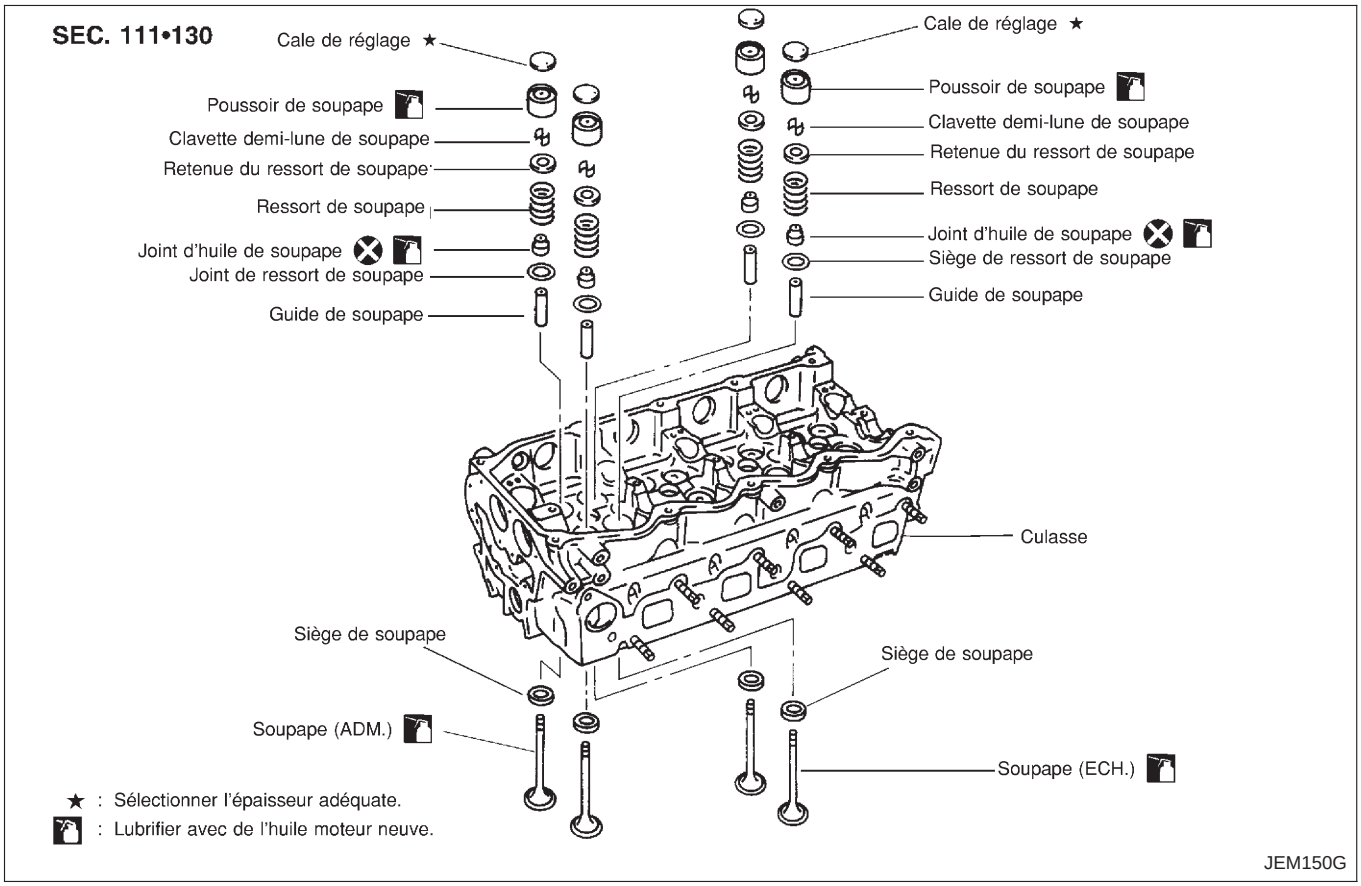
2. Déposer les roues dentées d'arbre à cames.



- Tout en fixant la partie hexagonale de l'arbre à cames avec une clé ayant une largeur de 21 mm entre les plateaux de parement, desserrer le boulon de la roue dentée d'arbre à cames.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

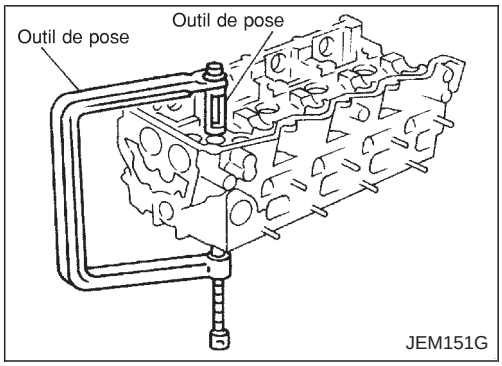
Dépose (Suite)



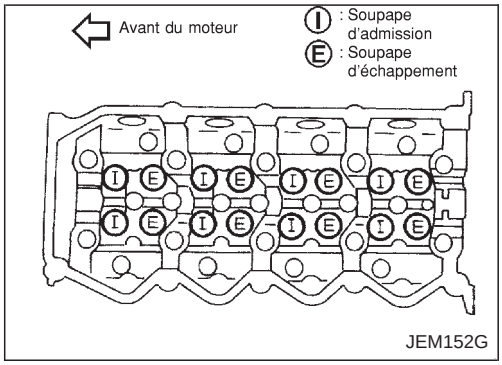
3. Déposer les arbres à cames.
- Desserrer les boulons du support en plusieurs étapes dans l'ordre inverse de celui indiqué sur l'illustration et les déposer.
4. Enlever les cales de réglage et les poussoirs de soupapes.
- Confirmer les bons emplacements de chaque pièce déposée. Les garder soigneusement afin d'éviter qu'elles ne se mélangent.
- **Pour la repose, s'assurer de faire des repères sur le support de l'arbre à cames avant la dépose.**

CULASSE

- Desserrer les boulons dans l'ordre inverse de celui indiqué sur l'illustration et les déposer.
- **Prendre garde de ne pas endommager les têtes des bougies de préchauffage qui s'avancent hors de la surface inférieure de la culasse. Pour ne pas endommager les bougies de préchauffage, soit les déposer auparavant, soit soutenir la culasse avec des blocs de bois pour créer un espace en dessous de la surface inférieure.**

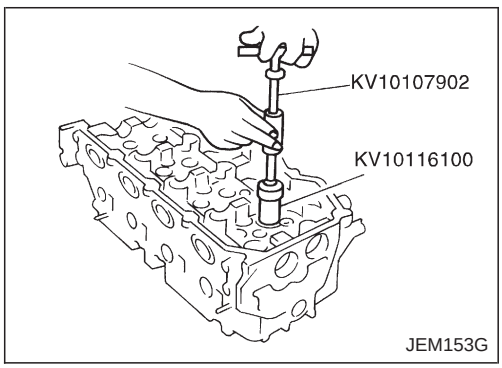


Démontage



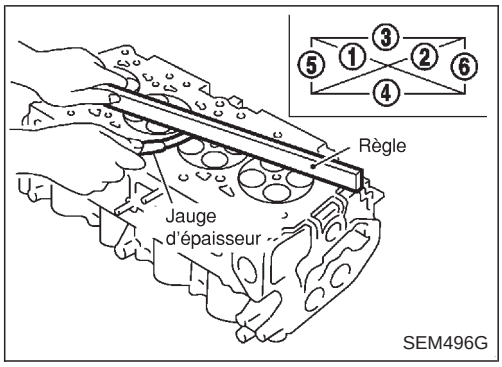
1. Enlever les cales de réglage et les poussoirs de soupapes. Confirmer les bons emplacements de chaque pièce déposée. Les mettre de côté pour éviter de les mélanger.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Démontage (Suite)

2. Déposer les clavettes de soupape.
- Compresser le ressort de soupape avec un compresseur de ressort de soupape, et déposer la clavette de soupape avec une main aimantée.
3. Enlever la coupelle du ressort de soupape et les ressorts de soupape.
4. Pousser la queue de la soupape vers la chambre de combustion, et déposer la soupape.
- Avant de déposer les soupapes, vérifier le jeu du guide de soupape. Se reporter à EM-3053, ‘‘JEU DU GUIDE DE SOUPAPE’’.
- Confirmer les bons emplacements de chaque soupape. Les ranger soigneusement afin d’éviter qu’elles ne se mélangent.



- Pour la disposition des soupapes d’admission et d’échappement, se reporter à l’illustration.

5. Déposer les joints d’huile de soupape.
- Utiliser un extracteur de joint d’huile de soupape (SST) pour la dépose.
6. Enlever les sièges du ressort de soupape.
7. Lors de la dépose des sièges de soupape, vérifier le contact du siège du ressort. Se reporter à EM-3054.
8. Avant la dépose des guides de soupape, vérifier le jeu du guide de soupape. Se reporter à EM-3053, ‘‘JEU DU GUIDE DE SOUPAPE’’.
9. Déposer les bougies de préchauffage.
- **Pour éviter tout endommagement, les bougies de préchauffage devrait être déposées uniquement si nécessaire.**
- **Manipuler la soupape avec précaution pour éviter les chocs. (Si la chute est d’environ 100 mm ou plus haute, toujours la remplacer par une neuve.)**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection

DEFORMATION DE LA CULASSE

Nettoyer la surface de la culasse. Utiliser une règle et une jauge d'épaisseur fiables pour contrôler l'égalité de la surface de la culasse. Vérifier les 6 endroits indiqués sur l'illustration.

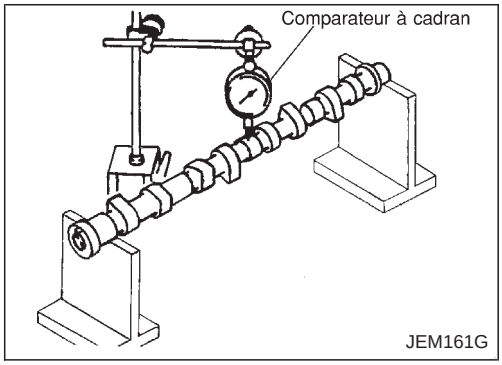
Egalité de la surface de la culasse : Limite 0,1 mm

Si au delà de la limite spécifiée, la rectifier ou la remplacer.

La limite de la rectification de la culasse est déterminée par la rectification du bloc-cylindre.

Limite de rectification :

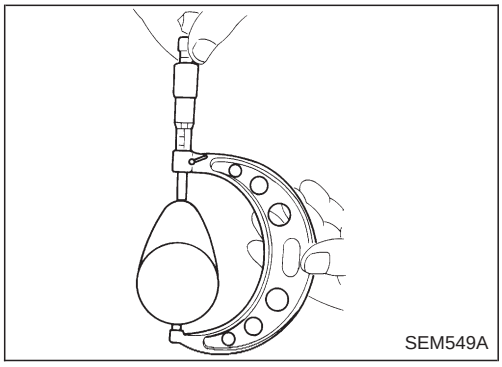
L'etendue de la rectification de la culasse est ''A''.
L'etendue de la rectification du bloc-cylindre est ''B''.



La limite maximum est : A + B = 0,07 mm

Après rectification de la culasse, vérifier à la main que l'arbre à cames tourne librement. S'il y a résistance, la culasse doit être remplacée.

Hauteur nominale de la culasse :
153,9 - 154,1 mm

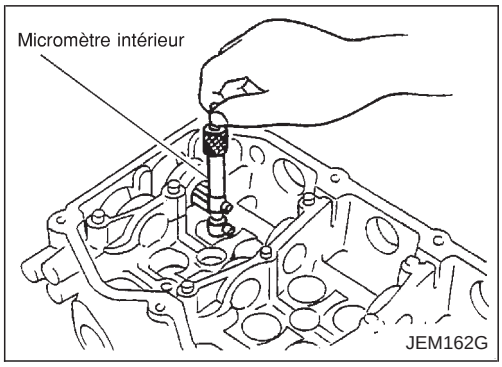


VERIFICATION VISUELLE DE L'ARBRE DE CAMES

Vérifier que l'arbre à cames n'est pas éraflé, grippé ou rayé.

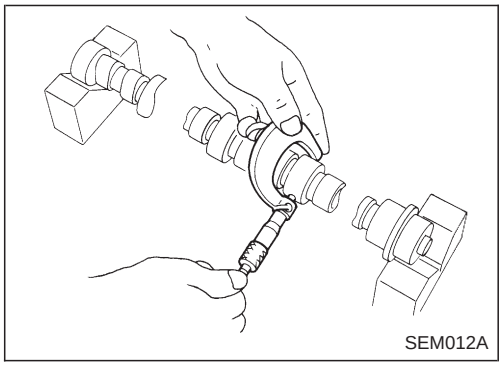
VOILE DE L'ARBRE A CAMES

1. Placer des blocs en V sur un établi et le support de l'arbre à cames aux tourillons n° 1 et n° 5.
2. Placer la jauge à cadran de manière perpendiculaire au tourillon de l'arbre à cames n° 3.
3. Tourner l'arbre à cames à la main dans une direction et mesurer la valeur du voile sur la jauge à cadran.
   Voile (indication totale du comparateur) : Limite 0,02 mm
4. Si la valeur excède la limite, remplacer l'arbre à cames.



HAUTEUR DE CAMES DE L'ARBRE A CAMES

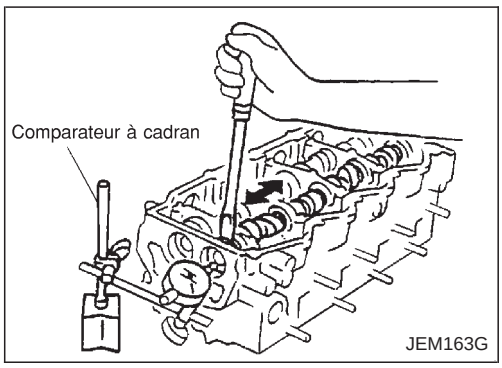
1. Mesurer la hauteur de cames de l'arbre à cames.
   Hauteur standard des cames :
   Admission
   39,505 - 39,695 mm
   Echappement
   39,905 - 40,095 mm
   Limite d'usure des cames:
   0,15mm
2. Si l'usure dépasse la limite, remplacer l'arbre à cames.



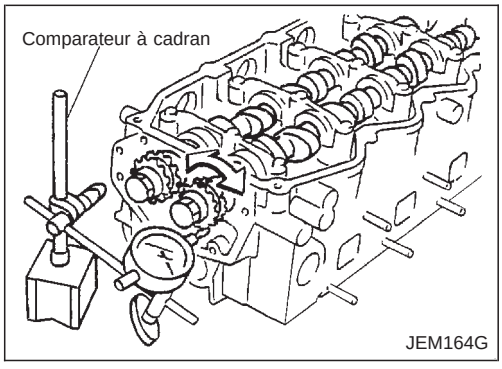
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (Suite)

JEU DU TOURILLON D'ARBRE A CAMES



1. Reposer le support d'arbre à cames et serrer les boulons au couple spécifié.
2. Mesurer le diamètre interne du roulement d'arbre à cames.
   Diamètre interne standard :
   N° 1 : 30,500 - 30,521 mm
   N° 2, 3, 4, 5 : 24,000 - 24,021 mm

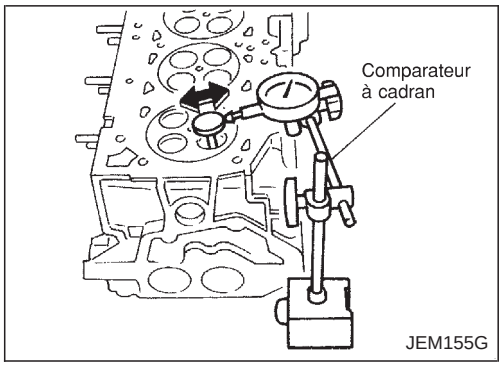


3. Mesurer le diamètre externe du tourillon d'arbre à cames.
   Diamètre externe standard :
   N° 1 : 30,435 - 30,455 mm
   N° 2, 3, 4, 5 : 23,935 - 23,955 mm
4. Si le jeu dépasse la limite, remplacer l'arbre de cames et/ou la culasse.
   Jeu du tourillon d'arbre à cames :
   Standard
   N° 1 - 5 : 0,045 - 0,086 mm
   Limite
   0,045 - 0,086 mm

JEU AXIAL DE L'ARBRE A CAMES

1. Reposer l'arbre à cames sur la culasse.
2. Mesurer le jeu axial de l'arbre à cames.
   Jeu axial de l'arbre à cames :
   Standard
   0,070 - 0,148 mm
   Limite
   0,24 mm

- Si la valeur dépasse la limite, remplacer l'arbre à cames et mesurer à nouveau.
- Si la mesure excède une nouvelle fois la limite, remplacer la culasse.



VOILE DE ROUE DENTEE D'ARBRE A CAMES

1. Reposer la roue dentée sur l'arbre à cames.
2. Mesurer le voile de la roue dentée d'arbre à cames.
   Voile (indication totale du comparateur) : Moins de 0,15 mm
3. Si la valeur excède la limite, remplacer la roue dentée d'arbre à cames.

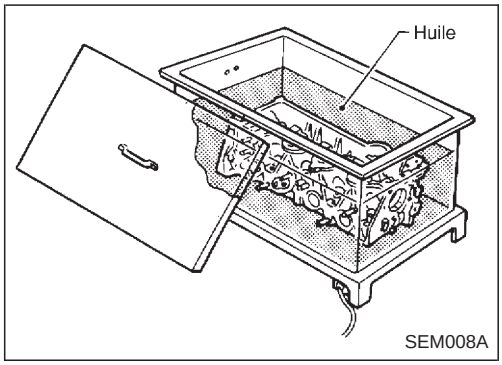
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (Suite)

JEU DU GUIDE DE SOUPAPE

1. Vérifier si le diamètre de la queue de soupape est dans la plage spécifiée.
2. Pousser la soupape d'environ 25 mm vers la chambre de combustion. Faire balancer la soupape dans la direction de la jauge à cadran pour mesure le voile.

- Cette inspection doit être effectuée avant de déposer les guides de soupape.
- La moitié de la mesure du voile sur la jauge à cadran représente le jeu du guide de soupape.

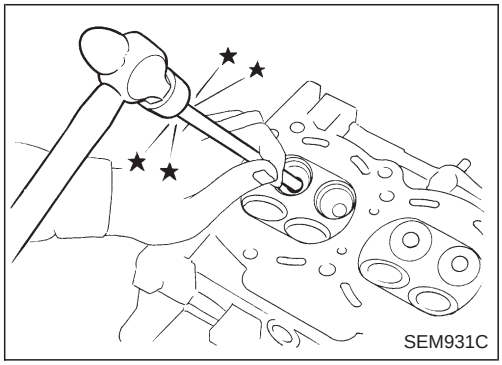


Standard :
Admission 0,020 - 0,053 mm
Echappement 0,040 - 0,073 mm

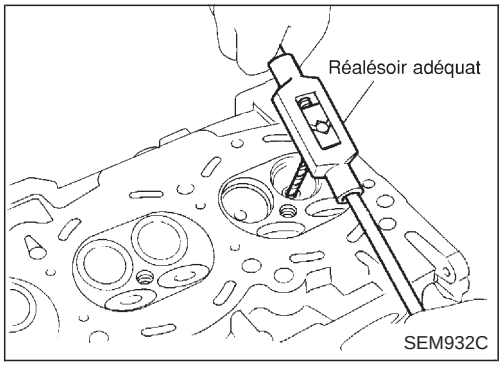
3. Si la valeur dépasse la limite, vérifier le jeu de guide de soupape à la soupape.

a. Mesurer le diamètre de la queue de soupape et le diamètre interne du guide de soupape.
b. Vérifier que le jeu est dans les spécifications.

Limite du jeu du guide de soupape à la soupape :
Admission 0,08 mm
Echappement 0,1 mm



c. Si la valeur dépasse la limite, remplacer la valve ou le guide de soupape.

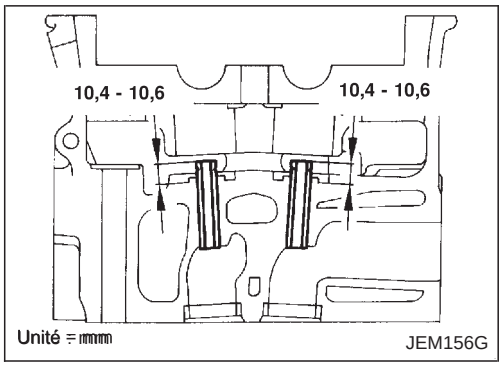


REMPLACEMENT DU GUIDE DE SOUPAPE

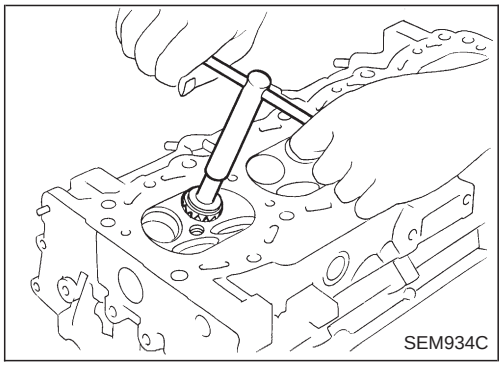
- Lorsqu'un guide de soupape est déposé, le remplacer avec un guide de soupape surdimensionné (0,2 mm).

1. Pour déposer le guide de la soupape, chauffer la culasse de 110 à 130°C en la faisant tremper dans de l'huile chauffée.

2. Chasser le guide de soupape à la presse [à une pression de 20 kN (2 tonnes)] ou avec un marteau et un outil approprié.



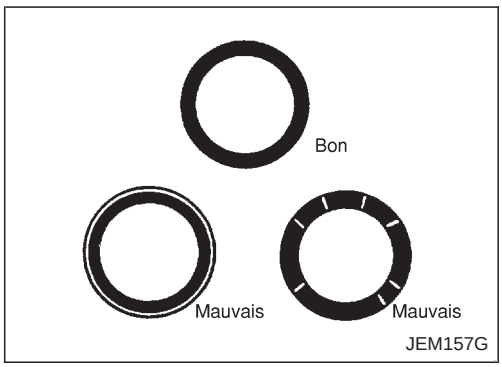
3. Aléser l'orifice du guide de soupape de la culasse.

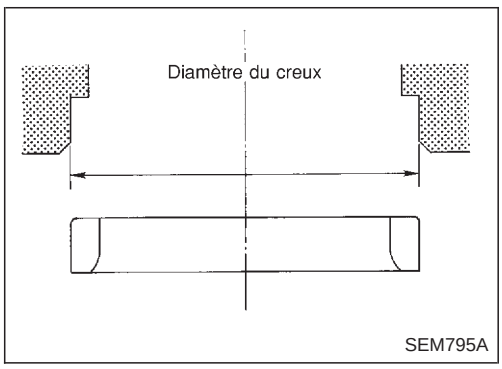


Diamètre de l'orifice de guide de soupape (pour les pièces détachées) :
10,175 - 10,196 mm

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (Suite)





4. Chauffer la culasse de 110 à 130°C et pousser le guide de soupape de service dans la culasse.
   Saillie "L" :
   10,4 - 10,6 mm
5. Aléser le guide de soupape.
   Dimensions de finition:
   6,000 - 6,018 mm

SIEGES DE SOUPAPE

- Avant de commencer cette vérification, confirmer que la taille de la soupape et des guides de soupapes est conforme aux spécifications.
- Appliquer de la peinture rouge sur les surfaces de contact du siège des soupapes et sur les surfaces des soupapes afin d'examiner les conditions des surfaces de contact.
- Vérifier si la peinture sur les surfaces de contact est uniforme sur toute la circonférence.
- Si des indications anormales apparaissent, meuler la soupape et contrôler à nouveau le contact. Si des indications anormales persistent encore, remplacer le siège de soupape.

REMPLACER LE SIEGE DE SOUPAPE PAR DES PIECES DETACHEES

1. Aléser l'ancien siège jusqu'à ce qu'il tombe. Ne pas descendre au-delà du fond du creux de la culasse. Pour cela, régler la butée de profondeur de l'outil.
2. Aléser le diamètre du creux de la culasse pour l'entretien du siège de soupape.
   Surdimensionné (0,5 mm) :
   Admission 30,500 - 30,516 mm
   Echappement 29,500 - 29,516 mm
   Veiller à aléser en cercles concentriques par rapport au centre du guide de soupape.

Cela permettra au siège de soupape de s'adapter correctement.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

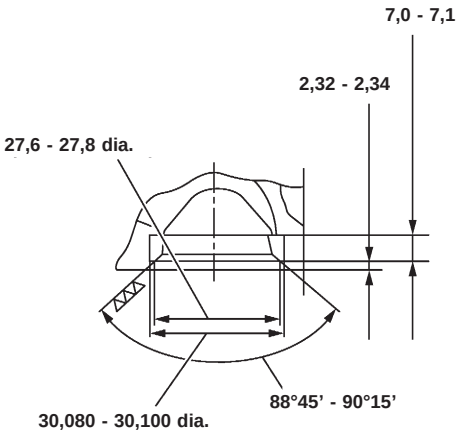
Inspection (Suite)

3. Chauffer la culasse de 110 à 120°C en la faisant tremper dans de l'huile chauffée.
4. Faire refroidir suffisamment le siège de soupape avec de la neige carbonique. Forcer le siège de soupape à rentrer dans la culasse.

AVERTISSEMENT :

Ne pas toucher le siège de soupape refroidi à mains nues.

5. Tailler ou fraiser le siège de soupape en utilisant un outil adéquat aux dimensions comme indiqué dans le SDS (EM-3095).

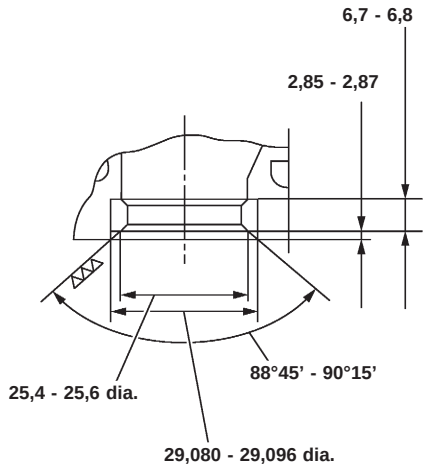


PRECAUTION :

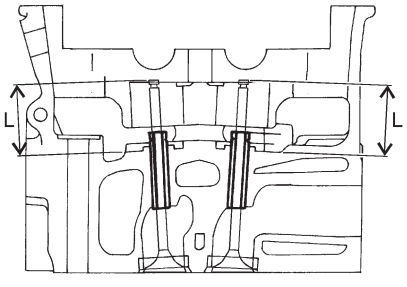
Utiliser la fraise pour siège de soupape correctement. En maintenant fermement le manche de la fraise avec les deux mains, pousser la fraise vers le bas sur la circonférence totale de la surface de contact et exécuter la découpe en une seule fois. Une mauvaise pression ou une découpe en plusieurs fois peut résulter en une surface irrégulière du siège de surface.

6. Après la découpe, roder les sièges de soupape avec un composant abrasif.
7. Vérifier la condition de l'assise de la soupape. Se reporter à EM-3054, ''Sièges de soupape''.

Admission



Unité : mm



SEM888G

Echappement

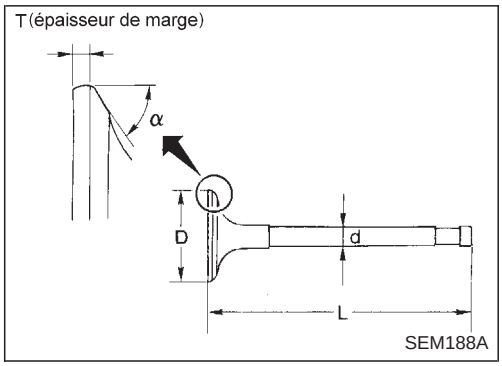
Unité : mm

SEM889G

JEM253G

8. Utiliser une jauge de profondeur pour mesurer la distance entre la surface de montage du siège du ressort de la culasse et l'extrémité de la queue de soupape. Si la distance est plus courte que spécifiée, répéter l'étape 5 ci-dessus pour la régler. Si elle est plus longue, remplacer le siège de soupape par une pièce neuve.

Limite de rectification du siège de soupape ''L'' :

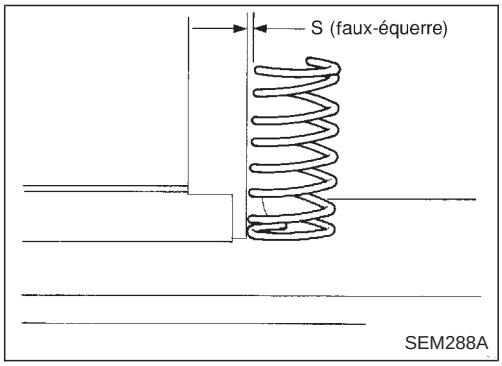


Admission 36,53 - 36,98 mm

Echappement 36,53 - 37,01 mm

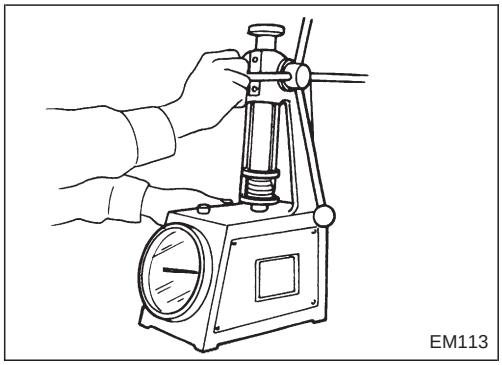
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (Suite)



DIMENSIONS DE LA SOUPAPE

Vérifier les dimensions de chaque soupape. Pour les dimensions, consulter les SDS. Lorsque l'épaisseur de marge de la tête de soupape est usée au-delà de 0,5 mm, remplacer la soupape.

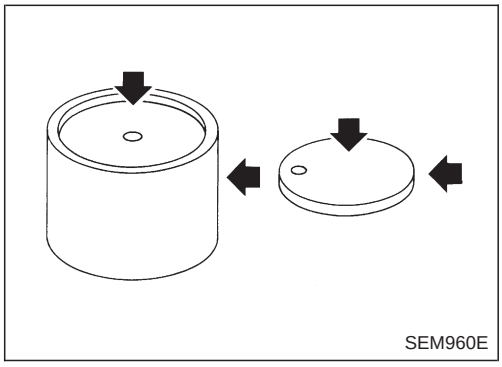


La tolérance de rectification de la queue de soupape est de 0,2 mm maximum.

RESSORT DE SOUPAPE

Equerrage

1. Mesurer la dimension ''S''.
   Faux-équerre ''S'' :
   Limite 1,9 mm
2. Si la valeur excède la limite, remplacer le ressort.

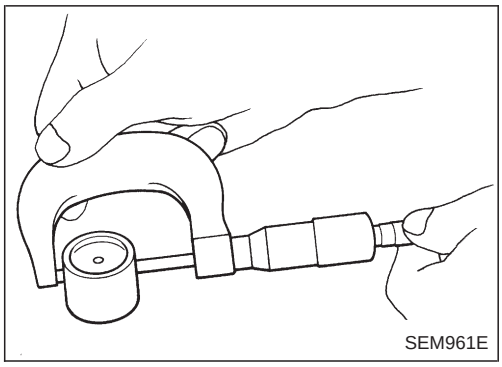


Pression

Vérifier la pression du ressort de soupape à la hauteur de ressort spécifiée.

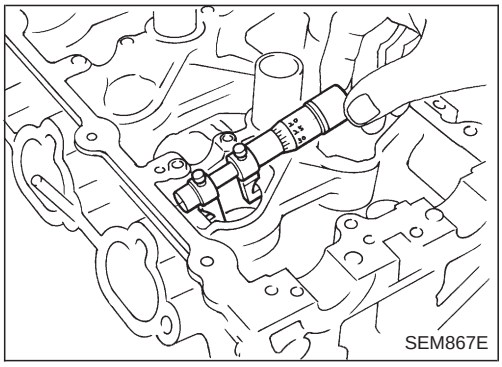
Standard :
Hauteur libre 43,7 mm
Hauteur de repose 32,82 mm
Charge de repose 184 - 208 N (18,77 - 21,22 kg)
Hauteur pendant l'ouverture de la soupape 24,82 mm
Charge avec ouverture de la soupape 320 - 360 N (32,65 - 36,73 kg)

Si la valeur excède le standard, remplacer le ressort.



POUSSOIR DE SOUPAPE

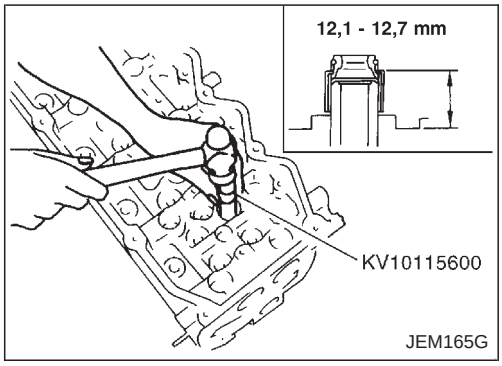
1. Vérifier si les surfaces de contact et de glissement ne sont pas excessivement usées ou éraflées.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (Suite)

SEM961E



2. Vérifier le diamètre du poussoir de soupape et de l'alésage du guide de poussoir de soupape.

Diamètre externe du poussoir de soupape :
29,960 - 29,975 mm

SEM867E

Diamètre de l'alésage du guide de poussoir :
30,000 - 30,021 mm
Jeu entre poussoir et guide de poussoir :
Standard 0,025 - 0,061 mm

- Si la valeur est en dehors des limites, remplacer le poussoir de soupape et/ou la culasse en se reportant aux valeurs spécifiées pour le diamètre externe et le diamètre de l'alésage.

JEM165G

Remontage

1. Reposer le joint d'huile de soupape.

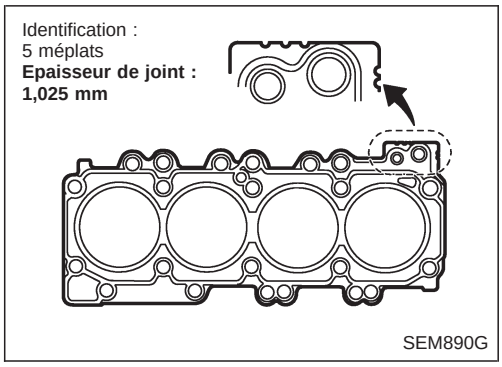
- Utiliser le chassoir de joint d'huile de soupape (SST) pour reposer et obtenir les dimensions indiquées sur l'illustration. La dimension sur l'illustration correspond à la dimension avant de reposer le siège du ressort de soupape.
- Des pièces différentes doivent être utilisées en fonction de la disposition du joint d'huile de soupape. Les identifier par la couleur du caoutchouc.

Pour l'admission : Noir
Pour l'échappement : Marron

- **Toujours utiliser un nouveau joint d'huile de soupape.**
- **Avant la repose du joint d'huile de soupape, reposer le siège du ressort de soupape.**

2. Reposer les autres pièces des composants de la soupape. Se reporter à ''DEMONTAGE'', EM-3049.

- Après avoir reposé les clavettes de soupape, taper légèrement sur l'extrémité de la queue de soupape avec un maillet en plastique pour s'assurer qu'elle s'emboîte bien.



Repose

- **Avant repose, enlever l'ancien joint liquide de la surface de contact de toute les pièces sur lesquelles il a été appliqué.**

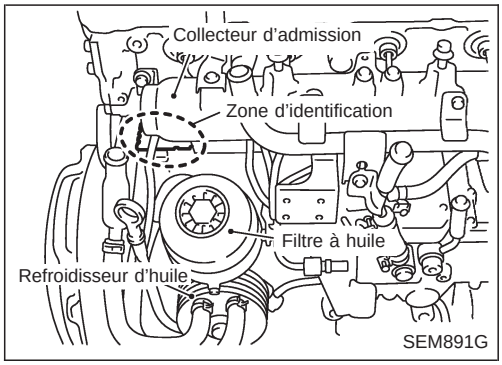
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Repose (Suite)

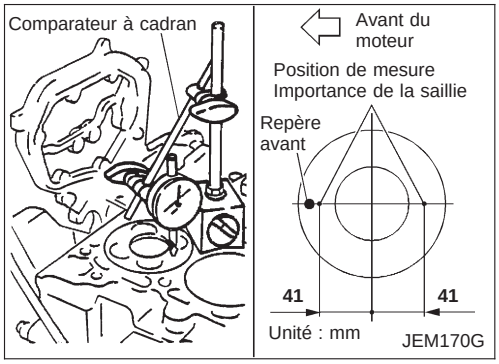
SELECTION DU JOINT DE CULASSE

- Sélectionner et reposer le joint de culasse avec l'épaisseur appropriée selon la procédure suivante :

Lors du remplacement du joint seul :



- Reposer un joint de la même épaisseur que celui qui a été enlevé.
- Identifier l'épaisseur du joint par le nombre de crans et orifices sur le côté arrière droit.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Repose (Suite)

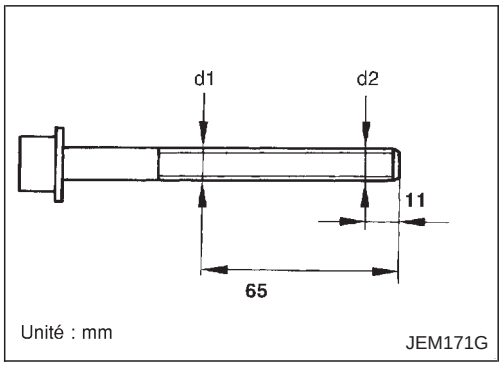
Epaisseur du joint* mm	Numéro de catégorie	Nombre de crans
0,900	1	0
0,925	2	1
0,950	3	2
0,975	4	3
1,000	5	4
1,025	6	5

* : Mesuré avec les boulons de culasse serrés

- L'épaisseur du joint peut être identifiée à l'emplacement indiqué sur l'illustration par le nombre de crans avant la dépose.

Lorsque les pièces suivantes ont été réparées/remplacées :

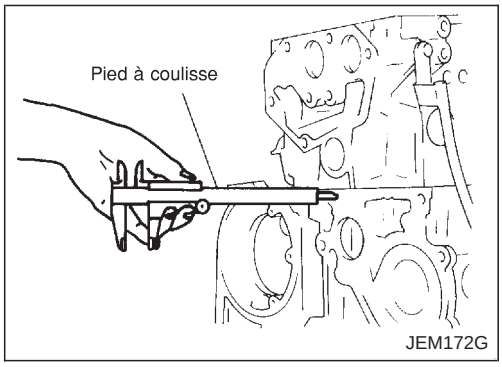
- Avec la surface supérieure du bloc-cylindres et/ou la masse du tourillon de l'axe du vilebrequin
- Avec le bloc-cylindres, les pistons, les bielles, et/ou le vilebrequin remplacés



1. Placer le piston au point proche de PMH.
2. Placer une jauge à cadran à l'endroit indiqué sur l'illustration. Tourner graduellement le vilebrequin et régler l'échelle de la jauge sur ''0'' où l'avancée du piston est maximisée.
3. Déplacer le support de la jauge à cadran de façon à ce que le bout de la jauge à cadran puisse entrer en contact avec le bloc-cylindres. Lire la différence.
4. Prendre les mesures à deux endroits par cylindre, ce qui fait huit endroits pour quatre cylindres. Sélectionner le joint sur la base de l'avancée maximale de huit mesures.

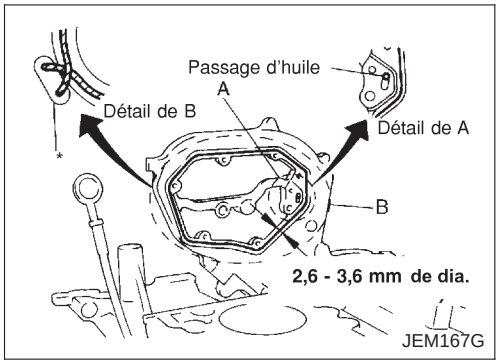
Saillie de piston mm	Epaisseur du joint* mm	Identification
		Nombre de crans
Moins de 0,255	0,900	0
Moins de 0,255 - 0,280	0,925	1
Moins de 0,280 - 0,305	0,950	2
Moins de 0,305 - 0,330	0,975	3
Moins de 0,330 - 0,355	1,000	4
Plus de 0,355	1,025	5

* : Mesuré avec les boulons de culasse serrés



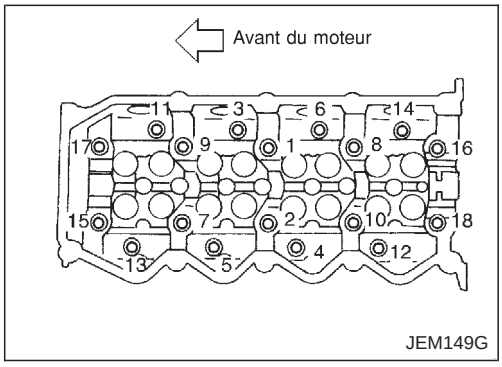
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Repose (Suite)



CONTROLE DE LA DEFORMATION DU BOULON DE CULASSE

- Mesurer le diamètre externe de la zone filetée, d1 et d2, aux points spécifiés sur l'illustration.
- Lorsque le point en collet est identifié à un point autre que les points spécifiés, mesurer au point comme pour d1.
- Calculer la différence entre d1 et d2. Si la valeur dépasse la limite, remplacer par des neufs.
  Limite : 0,15 mm

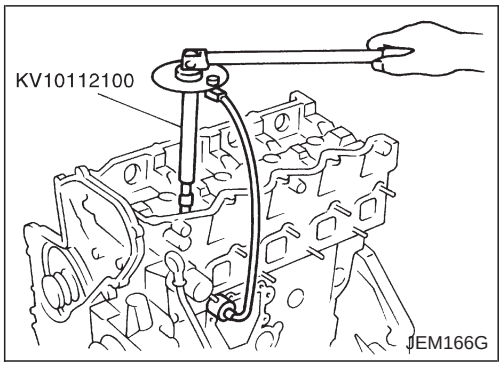


CONTROLE DE LA DIFFERENCE ENTRE LA CULASSE ET LE BLOC

- Après repose de la culasse, mesurer la dimension depuis la surface de l'extrémité avant du bloc-cylindres jusqu'à celle de la culasse.
  Standard : 23,53 - 24,07 mm
- Si la différence excède cette fourchette, contrôler le réglage des chevilles de positionnement et de la culasse.

APPLICATION DE JOINT LIQUIDE SUR LE BOITIER DE LA CHAINE ARRIERE

Appliquer un cordon régulier de joint liquide spécifié (se reporter à EM-3003, ''Procédure d'application du joint liquide''.) sur la surface indiquée sur l'illustration.
A : Appliquer un cordon de manière à ce qu'il ne dépasse pas dans le passage d'huile.
B : Diminuer les parties du cordon qui dépassent, avec le début et la fin du cordon comme sur l'illustration.
Appliquer le joint pour que la portion marquée * dépasse à l'extérieur sans que celle-ci ne soit visible de l'extérieur après le montage du moteur.



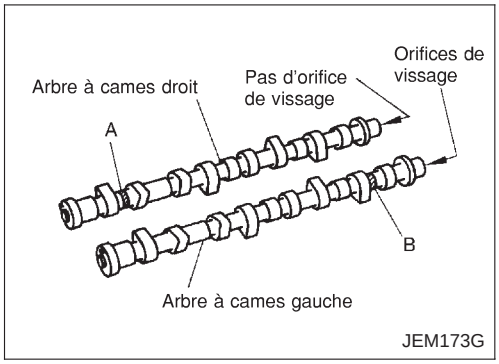
REPOSE DE LA CULASSE

- Serrer les boulons dans l'ordre numérique comme indiqué sur l'illustration selon la procédure suivante :

1. Appliquer de l'huile moteur sur les parties filetées des boulons et les surfaces d'appui.
2. Serrer les boulons de 35 à 44 N·m (3,5 à 4,5 kg-m).
3. Serrer de 180° à 185° [cible : 180°] (serrage angulaire).
4. Desserrer complètement à 0 N·m (0 kg-m) dans l'ordre inverse de celui qui est indiqué sur l'illustration.
5. Serrer les boulons de 35 à 44 N·m (3,5 à 4,5 kg-m).
6. Serrer de 90° à 95° [cible : 90°] (serrage angulaire).

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Repose (Suite)



7. Serrer à nouveau de 90° à 95° (cible : 90°) (serrage angulaire).

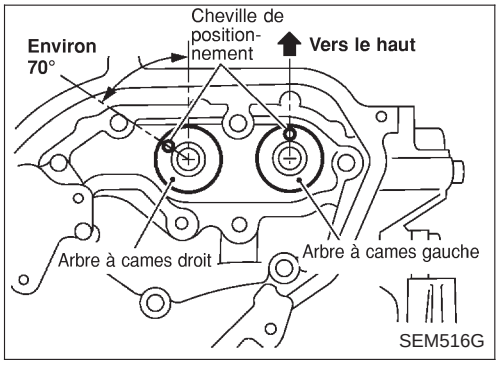
- **Lorsqu'aucune clé angulaire n'est utilisée, peindre une marque d'alignement sur la tête du boulon de culasse et la surface de la culasse avant de serrer. Contrôler l'angle avec un rapporteur.**

REPOSE DE LA BOUGIE DE PRECHAUFFAGE

- **Pour éviter tout endommagement, la bougie de préchauffage devrait être déposée uniquement si nécessaire.**
- **La manipuler avec précaution pour éviter les chocs. (Lorsque la chute est d'environ 100 mm ou plus, toujours la remplacer par une neuve.)**
- **Avant la repose, enlever le dépôt de carbone de l'orifice de montage de la bougie de préchauffage avec un alésoir.**

REPOSE DE L'ARBRE A CAMES

1. Reposer les poussoirs de soupapes et les cales de réglage.



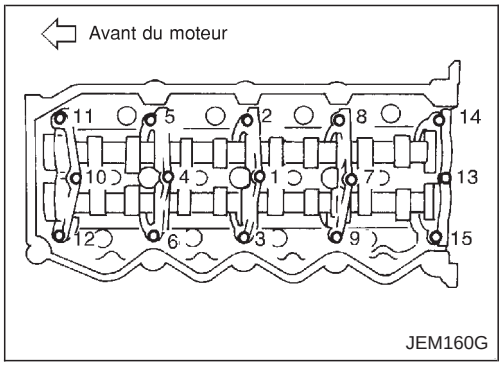
- Reposer aux emplacements corrects (aux mêmes emplacements qu'avant la dépose).

2. Reposer les arbres à cames.

- Identifier les arbres à cames à l'aide de la position de la marque peinte ainsi que les orifices de vissage à l'extrémité arrière.

  Arbre à cames droit : La peinture est à l'emplacement A sans orifice de vissage

  Arbre à cames gauche : La peinture est à l'emplacement B avec orifice de vissage.

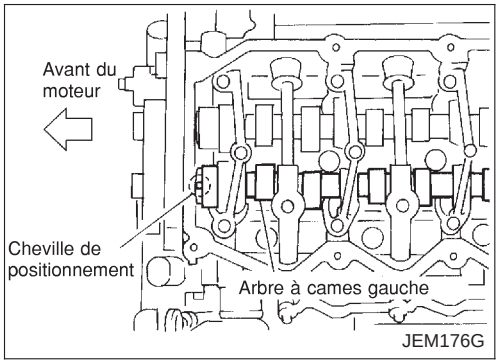


- Reposer de manière à ce que les chevilles de positionnement soient placées dans les directions indiquées sur l'illustration.

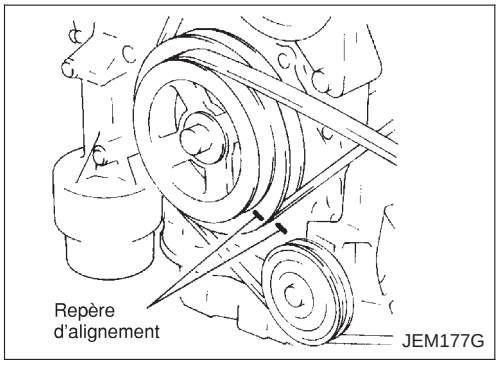
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Repose (Suite)

3. Reposer les supports d'arbre à cames.
- Reposer correctement, en identifiant les supports par le n° de tourillon et le repère avant sur la surface supérieure.



4. Serrer les boulons dans l'ordre indiqué sur l'illustration selon la procédure suivante :



a. Serrer à 2,0 N·m (0,2 kg-m).
- S'assurer que les pièces de soutien de l'arbre à cames (sur le côté arrière) soient reposés fermement dans leurs pièces d'appui sur la culasse.

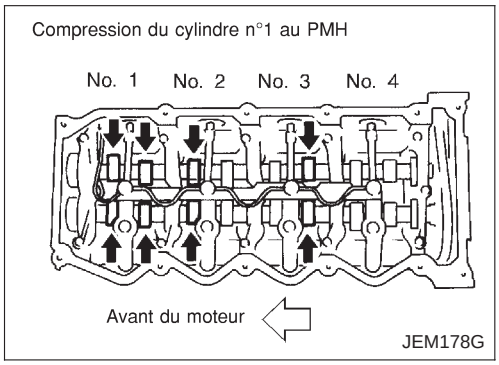
b. Serrer à 6 N·m (0,6 kg-m).
c. Serrer à 12 - 13 N·m (1,2 - 1,4 kg-m).

5. Reposer les roues dentées de l'arbre à cames.
- Les roues de l'arbre à cames sont habituellement utilisées pour la gauche et la droite.
- Aligner la roue de l'arbre à cames et la cheville de positionnement sur l'arbre à cames, et reposer.
- En maintenant la partie hexagonale de l'arbre à cames avec une clé, serrer le boulon retenant la roue dentée de l'arbre à cames.

6. Avant de reposer le tube de trop-plein après avoir reposé la chaîne de distribution secondaire, vérifier et régler le jeu de soupape. Se reporter à EM-3062, ''Jeu de soupape''.
7. Ensuite, reposer dans l'ordre inverse de la dépose.

Jeu de soupape

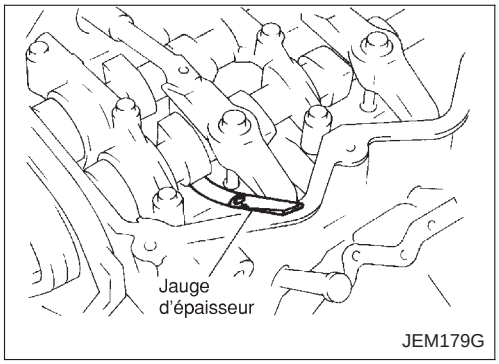
CONTROLE



Vérifier le jeu de soupape lorsque le moteur est froid et à l'arrêt.

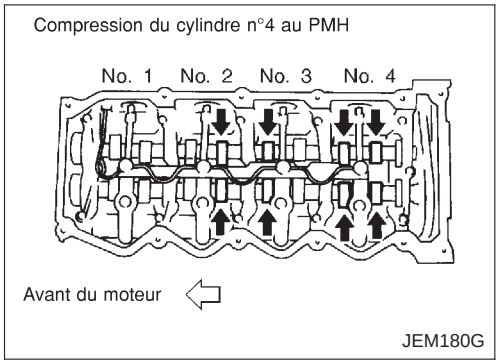
1. Placer le piston n° 1 au PMH sur sa course de compression.
- Tourner la poulie de vilebrequin dans le sens des aiguilles d'une montre de sorte que la cheville de positionnement sur l'arbre à cames gauche soit orientée vers le haut (le n° d'indicateur de position, etc, est fourni sur la poulie du vilebrequin).

2. Faire un repère d'alignement à la peinture, etc. sur la poulie du vilebrequin et sur la pompe à huile en tant qu'indicateur d'angle.



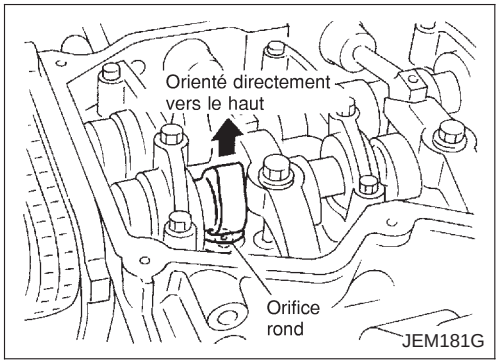
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Jeu de soupape (Suite)



3. Vérifier uniquement les soupapes indiquées sur l'illustration.

Angle de vilebrequin	Soupape							
	N° 1		N° 2		N° 3		N° 4	
	ADM.	ECHAP.	ADM.	ECHAP.	ADM.	ECHAP.	ADM.	ECHAP.
PMH n°1 (Course de compression)	○	○	○			○		



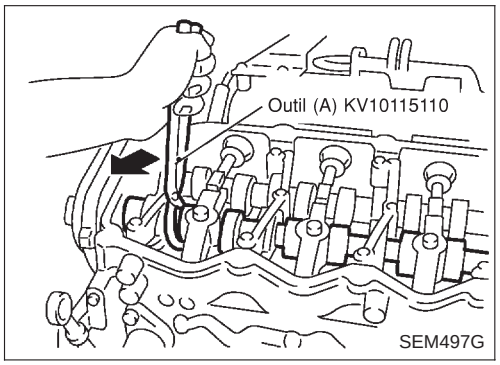
- A l'aide d'une jauge d'épaisseur, mesurer le jeu entre le poussoir de soupape et l'arbre à cames.
- Enregistrer les mesures de tous les jeux de la soupape qui sont en dehors des limites spécifiées. Elles seront utilisées plus tard pour déterminer les remplacements nécessaires des cales de réglage.

Jeu de soupape pour vérification :
Intake
0,24 - 0,32 mm
Echappement
0,26 - 0,34 mm

4. Faire pivoter le vilebrequin dans le sens des aiguilles d'une montre une fois pour mettre le piston n°4 sur le TDC sur la course de compression.
5. Vérifier uniquement les soupapes indiquées sur l'illustration.

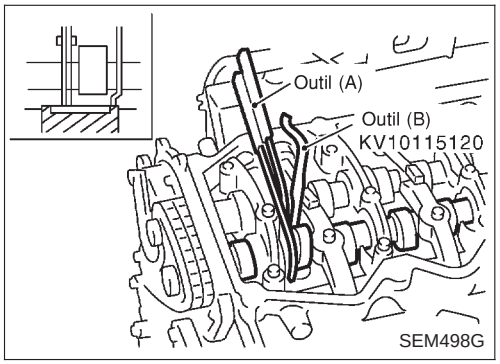
Angle de vilebrequin	Soupape							
	N° 1		N° 2		N° 3		N° 4	
	ADM.	ECHAP.	ADM.	ECHAP.	ADM.	ECHAP.	ADM.	ECHAP.
PMH n°4 (course de compression)				○	○		○	○

REGLAGE



Vérifier le jeu de soupape lorsque le moteur est froid.

1. Tourner le vilebrequin pour positionner vers le haut le lobe de la came sur l'arbre à cames de la soupape.
2. Placer l'outil (A) autour de l'arbre à cames comme indiqué sur l'illustration.
   Avant de placer l'outil (A) (SST), faire tourner le cran vers le centre de la culasse (voir illustration), pour simplifier la dépose de la cale plus tard.

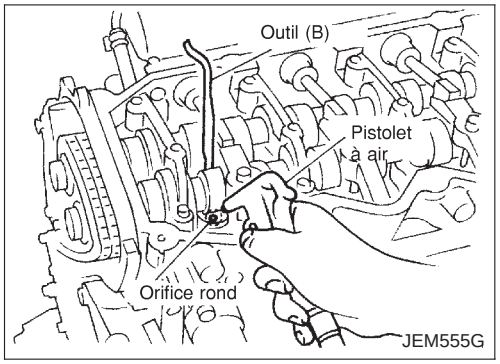


PRECAUTION :
Prendre garde de ne pas endommager la surface de la came avec l'outil (A).

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

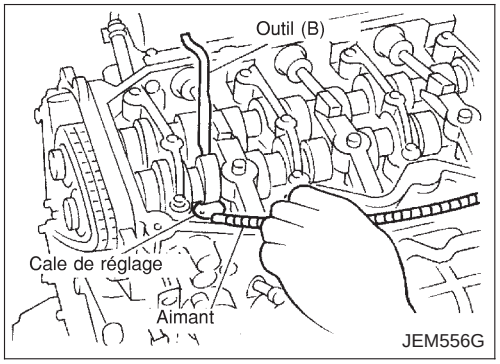
Jeu de soupape (Suite)

3. Faire tourner l'outil (A) (voir illustration) pour que le poussoir de soupape soit poussé vers le bas.



4. Placer l'outil (B) (SST) entre l'arbre à cames et le bord du poussoir de soupape pour maintenir le poussoir de soupape.

PRECAUTION :



- **L'outil (B) doit être placé aussi près que possible du support de l'arbre à cames.**
- **Prendre garde de ne pas endommager la surface de la came avec l'outil (B).**

5. Déposer l'outil (A).

6. Souffler de l'air dans l'orifice pour séparer la cale de réglage du poussoir de soupape.

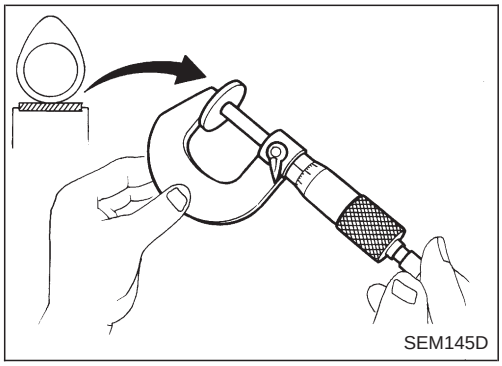
- **Pour éviter de renverser de l'huile moteur, essuyer l'huile complètement auparavant. Porter des lunettes de protection, etc. pendant le travail si nécessaire.**

7. Déposer la cale de réglage à l'aide d'un petit tournevis et d'un doigt aimanté.
8. Déterminer la taille de la cale de réglage de remplacement en fonction de la formule.

- A l'aide d'un micromètre, déterminer l'épaisseur de la cale déposée.
- Calculer l'épaisseur de la cale de réglage neuve pour que le jeu de la soupape soit dans les valeurs spécifiées.

R = Epaisseur de la cale déposée
N = Epaisseur de la cale neuve
M = Jeu de la soupape mesuré

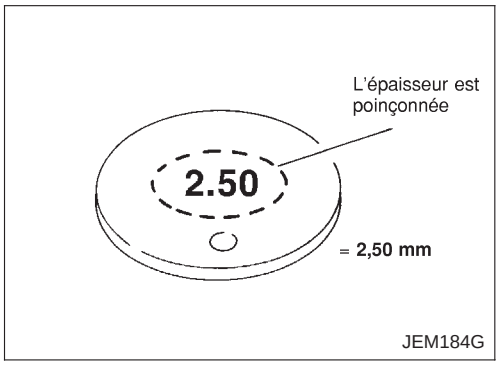
Admission :



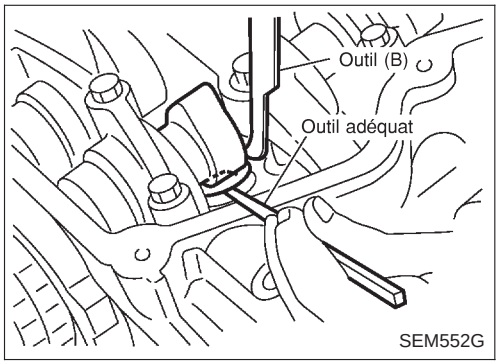
N = R + (M − 0,28 mm)

Echappement :

N = R + (M − 0,30 mm)



33 tailles de cales sont disponibles de 2,10 mm à 2,74 mm, par étapes de 0,02 mm.



- Sélectionner la cale neuve avec une épaisseur aussi proche que possible de la valeur calculée.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Jeu de soupape (Suite)

9. Reposer la cale neuve à l'aide d'un outil adéquat.
- **Reposer avec la surface sur laquelle l'épaisseur est poinçonnée tournée vers le bas.**

10. Placer l'outil (A) comme mentionné dans les étapes 2 et 3.
11. Déposer l'outil (B).
12. Déposer l'outil (A).
13. Vérifier à nouveau le jeu de soupape.

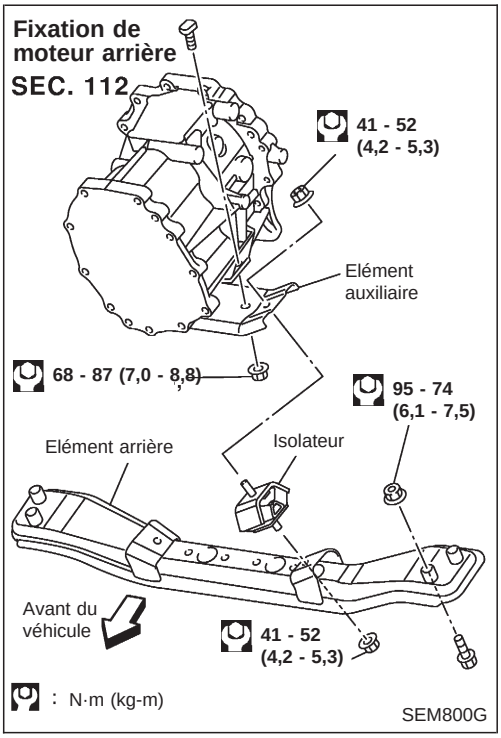
Jeu de soupape :

Unité : mm

	Froid	Chaud* (données de référence)
Admission	0,24 - 0,32	0,29 - 0,37
Echappement	0,26 - 0,34	0,33 - 0,41

* : Approximativement 80° C

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Fixation de moteur avant

SEC. 112

Fixation de moteur arrière

SEC. 112

AVERTISSEMENT :

- **Garer le véhicule sur une surface plane et dure.**
- **Placer des cales à l'avant et à l'arrière des roues arrière.**
- **Ne pas déposer le moteur jusqu'à ce que le système d'échappement ait complètement refroidi. Sinon vous risquez de vous brûler et/ou un incendie pourrait se déclarer dans la canalisation de carburant.**
- **S'assurer de lever le moteur et la transmission de manière sûre.**
- **Pour les moteurs qui ne sont pas équipés d'élingues de moteur, utiliser les élingues et les boulons de levage appropriés décrits dans le CATALOGUE DES PIECES DETACHEES.**

PRECAUTION :

- **Lors de levage du moteur, prendre garde de ne pas heurter des pièces adjacentes, particulièrement les suivantes : le boîtier du câble d'accélérateur, la conduite de frein, et le maître-cylindre de frein.**
- **En levant le moteur, utiliser toujours des élingues de moteur de manière sûre.**
- **Pour les modèles 4X4, enduire de produit d'étanchéité la zone figurant entre le moteur et la transmission. Se reporter à la section MT (''Dépose et repose'').**
- **Pour le couple de serrage, se reporter aux sections M/T et PD.**
- **Avant de séparer le moteur et la transmission, déposer le capteur de position de vilebrequin (capteur PMH) de l'ensemble.**
- **S'assurer de ne jamais endommager l'extrémité du cap-**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

teur de position de vilebrequin (capteur PMH) ou la dent de la couronne dentée.

Dépose

Préparation

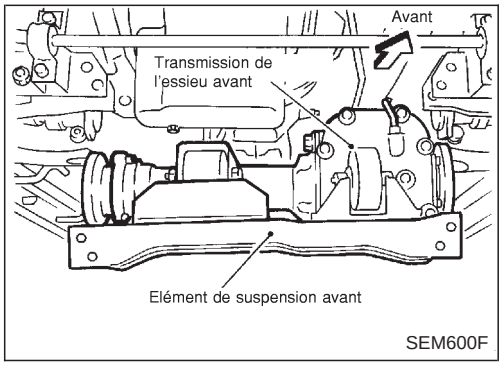
1. Vidanger le liquide de refroidissement des bouchons de vidange du radiateur.
2. Déposer les pièces suivantes :

- Capot du moteur
- Refroidisseur d'air de suralimentation
- Sous protecteur
- Batterie
- Capot de radiateur
- Radiateur
- Courroie secondaire
- Ventilateur de refroidissement
- Tuyau avant d'échappement

Compartiment moteur (gauche)

3. Déposer le conduit d'air et le boîtier de filtre à air.
4. Débrancher les connecteurs de faisceau de l'alternateur et du compresseur du climatiseur.
5. Déposer l'alternateur.
6. Déposer les boulons de repose. Déplacer le compresseur du climatiseur. Utiliser une corde pour l'ancrer temporairement au côté du véhicule.
7. Débrancher et déplacer le flexible de chauffage, reposer le capuchon sur le flexible pour éviter que le liquide de refroidissement ne se repande.
8. Déposer l'isolateur thermique.

Compartiment de moteur (droit)



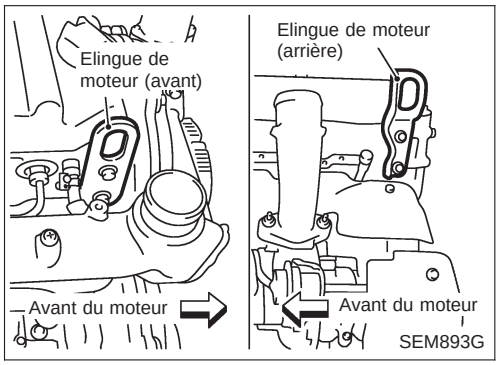
9. Déposer l'alimentation du carburant et les flexibles de carburant.

PRECAUTION :
Reposer les capuchons immédiatement pour éviter les fuites de carburant.

10. Déposer tous les connecteurs de faisceau sur le moteur, et placer les faisceaux sur le côté du véhicule.

Sous le plancher du véhicule

11. Déposer le démarreur.
12. Déposer l'arbre de transmission avant.
13. Déposer la transmission de l'essieu avant ainsi que l'élément de suspension de différentiel. Se reporter à la section PD (''Dépose et repose'', ''Transmission de l'essieu avant'') — modèles 4 roues motrices uniquement.

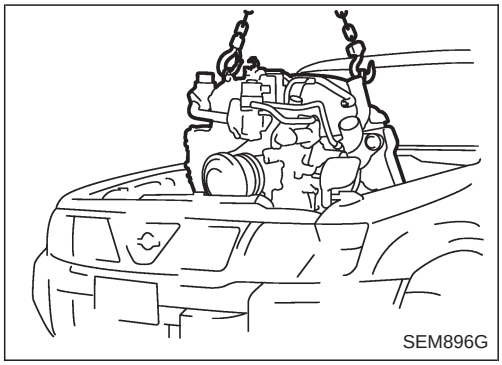


14. Déposer les boulons de montage pour assurer la transmission du moteur.

1) Lever le dessus de la transmission avec un cric, et réinstaller les pièces du montant arrière du véhicule.
2) Placer le cric devant la transmission.
3) Déposer les boulons de montage qui restent pour assurer la transmission du moteur.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Dépose (Suite)



Opération de dépose

15. Reposer les élingues de moteur (pièces détachées standard) sur l'avant gauche et l'arrière droite.
    : 29,5 - 37,3 N·m (3,0 - 3,8 kg-m)

AVERTISSEMENT :
Pour les moteurs qui ne sont pas équipés d'élingues de levage moteur, utiliser les élingues et les boulons de levage appropriés décrits dans le CATALOGUE DES PIECES DETACHEES.

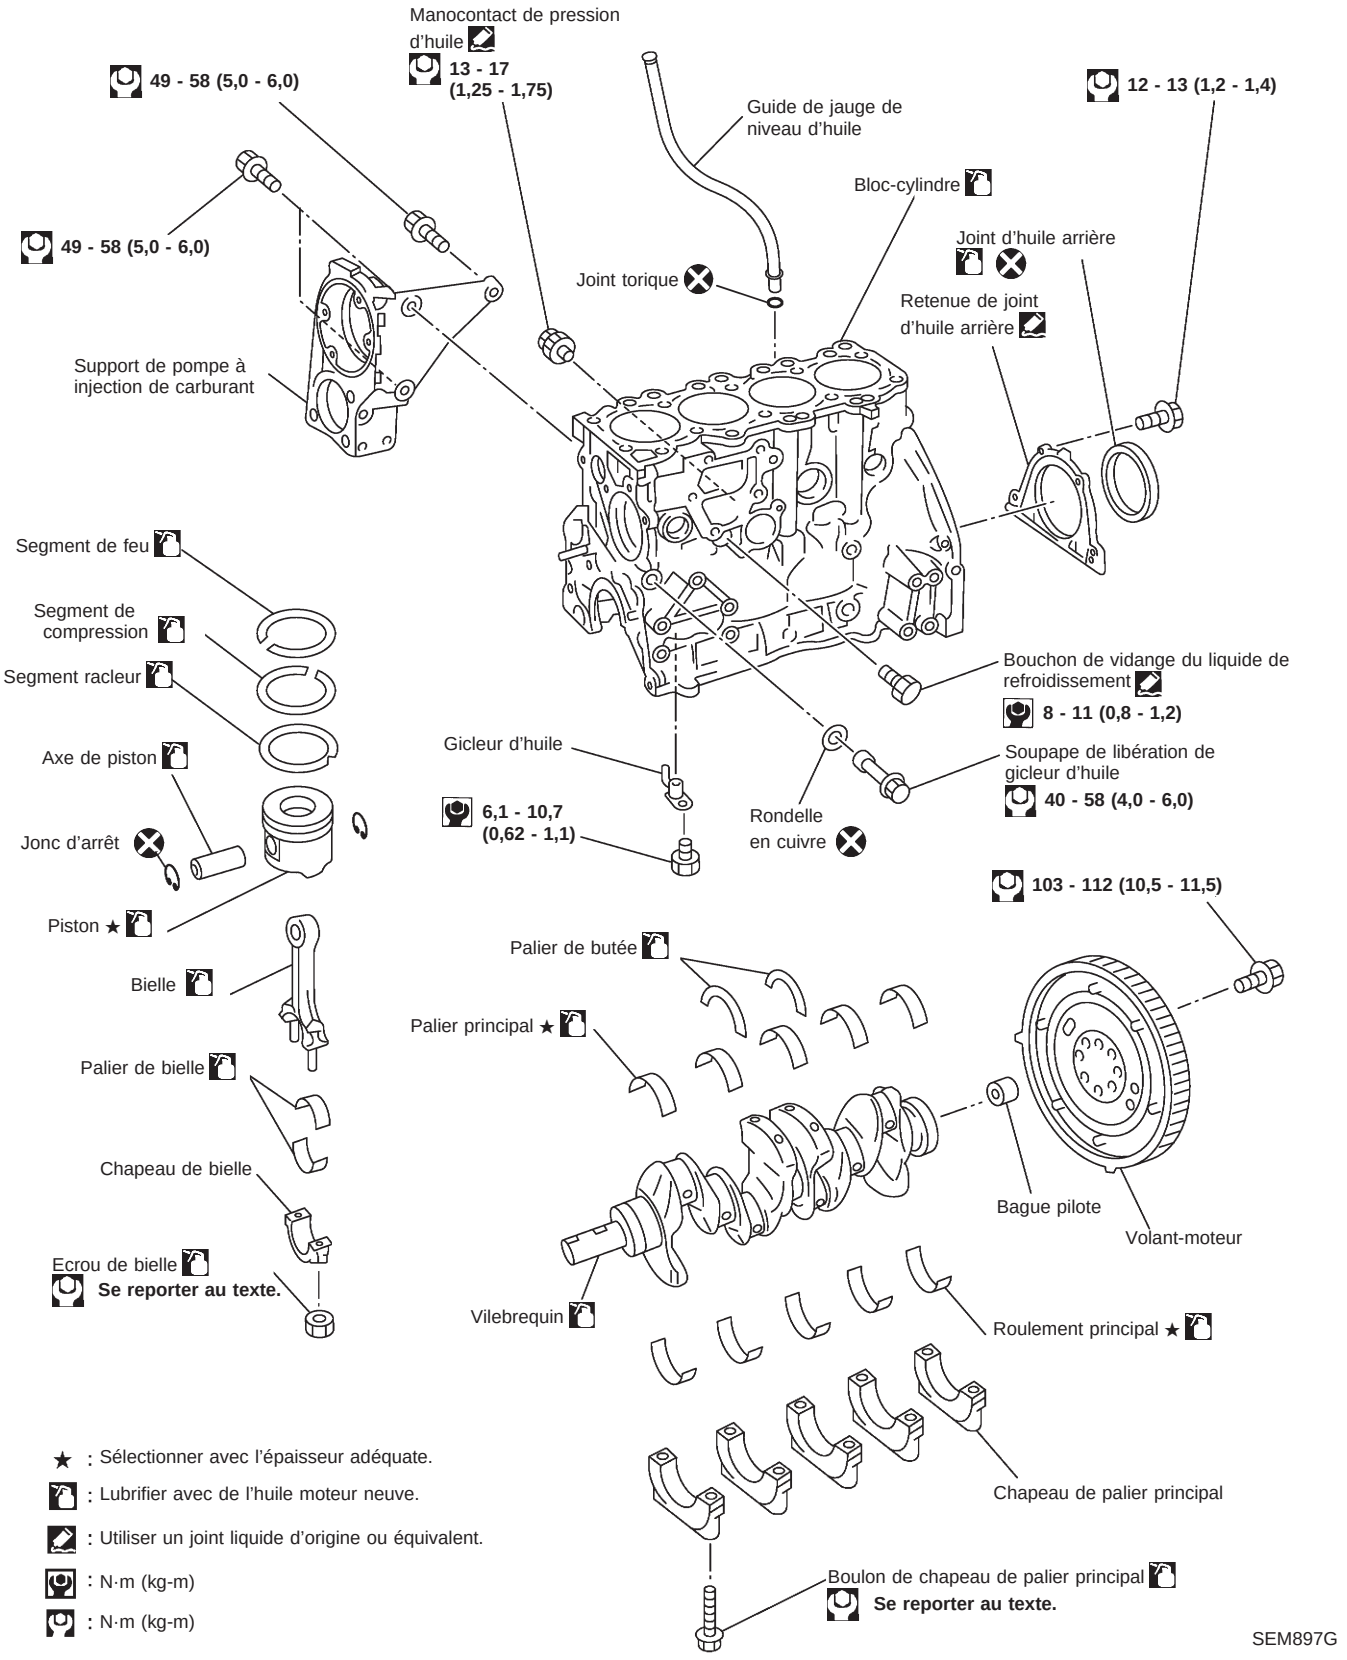
16. Accrocher les palans à l'élingue pour maintenir la position.
17. Déposer les écrous d'installation des isolateurs du montant du moteur gauche et droite.
18. Déposer le capteur de position de vilebrequin (capteur PMH) de la transmission.

19. Séparer le moteur et la transmission, déposer le moteur.

PRECAUTION :
- **Pendant l'opération, vérifier que tous les câbles nécessaires et les tuyaux sont débranchés.**
- **Eviter une interférence avec les pièces sur le véhicule.**

Repose

Reposer le moteur dans l'ordre inverse de la dépose.
- Eloigner chaque isolateur de montant de l'adhérence et des dommages causés par l'huile.
- Quant à l'emplacement de l'axe de positionnement, insérer l'axe correctement dans l'orifice de la pièce de surface.
- Pour que les isolateurs ne se tordent pas, serrer les boulons de maintien et les écrous du support du moteur.



Inspection

- Avant de démarrer le moteur, vérifier les niveaux du liquide de refroidissement, de l'huile moteur, et autres liquides de fonctionnement, et si nécessaire, les remplir jusqu'au niveau spécifié.
- Démarrer le moteur, et vérifier qu'il n'y a pas de bruit ou de vibration anormale.
- Réchauffer le moteur à une température suffisante, et vérifier s'il n'y pas de fuite de liquide de refroidissement, de graisse, de carburant, ou de gaz d'échappement.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Composants

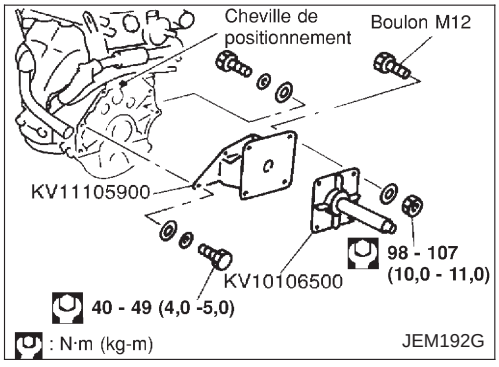
SEC. 110•120•186

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Dépose et repose

PRECAUTION :

- **Au moment de la repose des roulements, pistons, ou autres pièces coulissantes, lubrifier les surfaces de contact avec de l'huile moteur neuve.**
- **Placer les pièces déposées telles que les roulements et les chapeaux de roulements dans le bon ordre et dans la bonne direction.**
- **Lors de la repose de l'écrou de la bielle, et des boulons du chapeau de palier principal, appliquer de l'huile moteur neuve aux filetages et surfaces d'assise.**
- **Ne laisser aucun matériau magnétique entrer en contact avec la plaque de signal du volant moteur.**
- **Ne pas déposer la plaque de signal à l'arrière.**
- **Ne pas placer le côté de la plaque de signal orienté vers le bas.**
- **Manipuler avec précaution pour ne pas endommager la plaque de signal [particulièrement les 4 emplacements sur les saillies pour le signal du capteur de position de vilebrequin (capteur PMH)].**



Démontage

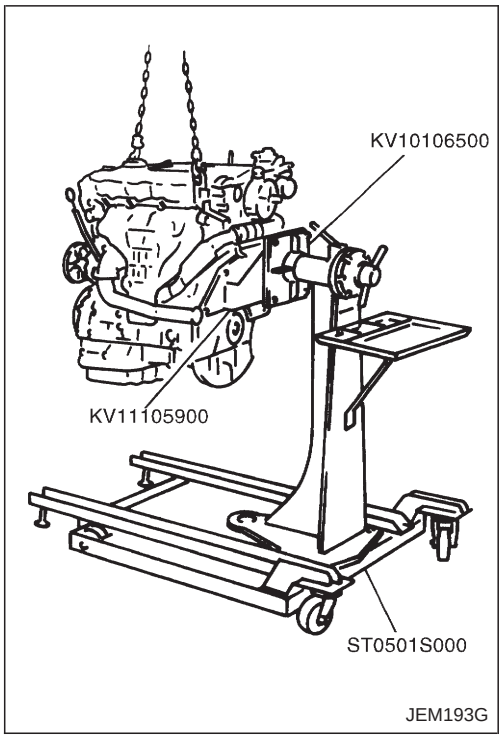
PISTON ET VILEBREQUIN

1. Déposer le moteur. Se reporter à EM-3066 ''DEPOSE DU MOTEUR''.
2. Placer le moteur sur un plan de travail.

a. Déposer le volant-moteur.

- Maintenir la couronne dentée avec le dispositif d'arrêt de la couronne dentée (KV10105630, KV10105610). Ensuite, desserrer les boulons de sécurité avec la douille TORX (taille : Q8 E20, outillage en vente dans le commerce) et les déposer. Comme alternative, tenir la poulie du vilebrequin avec un support de poulie (SST) pour déposer le volant-moteur.

b. Reposer la fixation auxiliaire du moteur (SST) sur la surface arrière du bloc-cylindre.

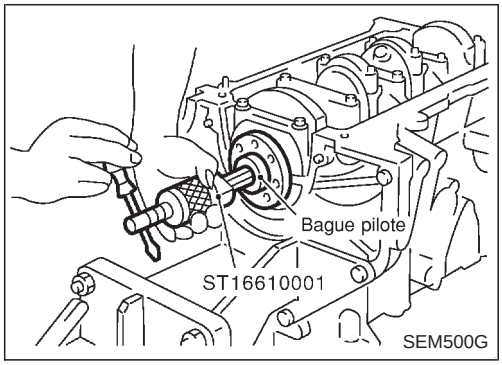


- Pour reposer, aligner l'orifice sur la fixation auxiliaire avec la cheville de positionnement sur le bloc-cylindres.
- Il y a cinq boulons sur la fixation auxiliaire.

c. Reposer la fixation du moteur (SST).

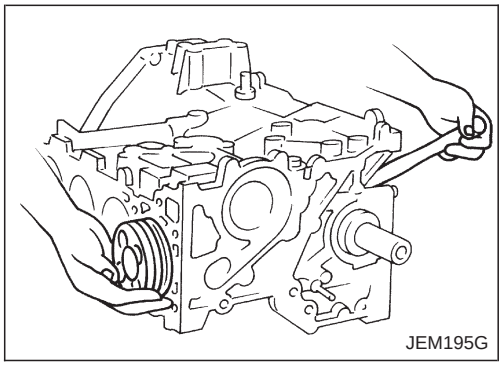
- Les quatre séries de boulons et d'écrous sont des produits à usages multiples.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Démontage (Suite)

d. Soulever le moteur et le placer sur le support de moteur (SST).
- Une autre méthode est de mettre la fixation auxiliaire de moteur et la fixation de moteur sur le support de moteur avant et ensuite de reposer le moteur.

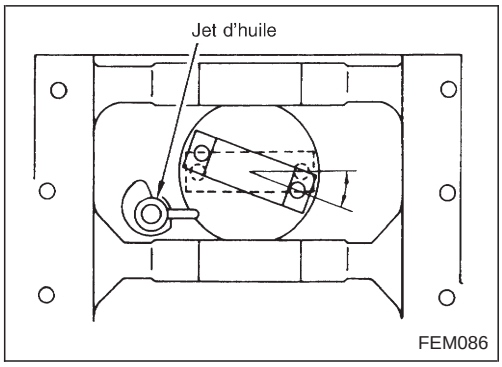


3. Vidanger l'huile moteur et le liquide de refroidissement du moteur.
4. Déposer les pièces suivantes et les pièces associées :
- Collecteur d'échappement
- Ensemble turbocompresseur
- Tube d'injection
- Collecteur d'admission
- Pompe à eau
- Carter d'huile (supérieur et inférieur)
- Soupape de commande de volume de l'EGR et tuyau de l'EGR & ensemble de tube de guidage de l'EGR
- Chaîne de distribution secondaire
- Pompe à injection de carburant
- Chaîne de distribution primaire
- Cache-culbuteurs
- Pompe à dépression
- Assemblage de l'embouchure d'injection à haute pression
- Arbre à cames
- Culasse
- Thermostat, tuyaux d'eau
- Refroidisseur d'huile
- Supports des composants secondaires

5. Déposer le support de pompe à injection de carburant.

6. Si le remplacement de la bague pilote est nécessaire, la déposer en utilisant l'extracteur de bague pilote (SST).
7. Déposer la retenue de joint d'huile arrière.
- Insérer un tournevis à lame plate entre le chapeau de roulement principal et la retenue du joint d'huile arrière pour déposer le dispositif de retenue.

8. Déposer le joint de l'huile arrière de la retenue de joint d'huile arrière.
- Perforer à l'aide d'un tournevis à lame plate.
- **Veiller à ne pas endommager la retenue du joint d'huile arrière.**

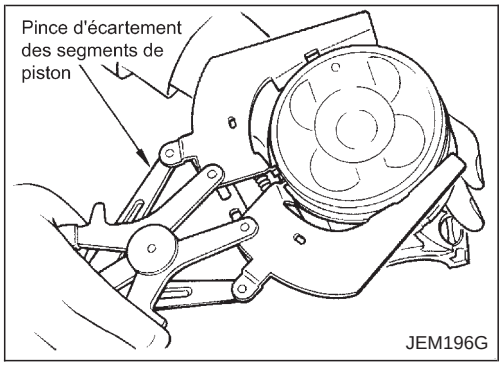


9. Déposer le piston et l'ensemble de bielle.

a. Placer l'axe de vilebrequin pour la dépose dans une position proche du PMB.
b. Déposer les chapeaux de bielle.
c. Pousser le piston et l'ensemble de bielle vers la culasse en utilisant la poignée d'un marteau.
- Avant d'enlever le piston et l'ensemble de la bielle, vérifier le jeu latéral de la bielle. Se reporter à EM-3074 ''JEU LATERAL DE LA BIELLE''.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Démontage (Suite)

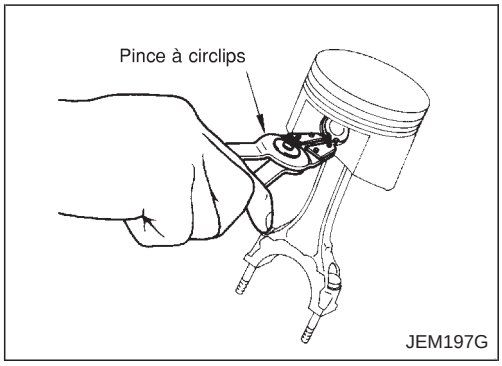


PRECAUTION :

Pour déposer le piston et la bielle, empêcher la tête de la bielle d'interférer avec le jet d'huile.

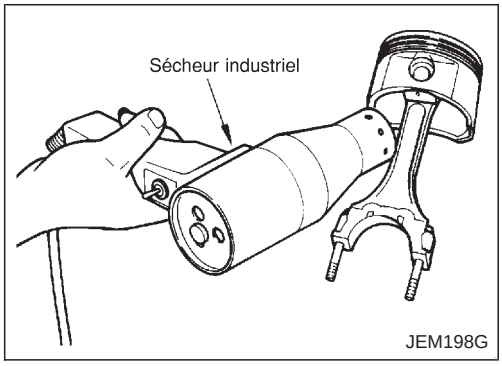
10. Déposer les paliers de bielle de la bielle et du chapeau de bielle.

- Faire des séries des pièces déposées en fonction du n° de cylindre pour éviter de les mélanger.



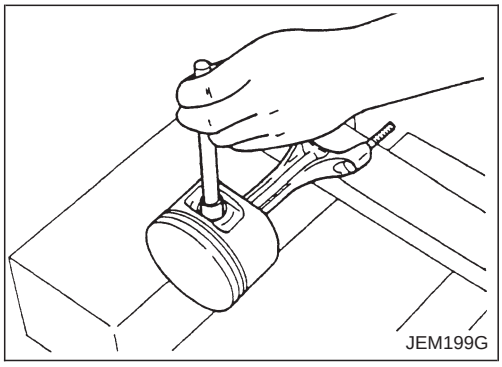
11. Déposer les segments de piston des pistons.

- Utiliser des pinces d'écartement de segment de piston (outillage en vente dans le commerce).
- **Eviter de griffer les pistons pendant la dépose.**
- **Prendre garde de ne pas endommager les segments de piston en les écartant de manière excessive.**



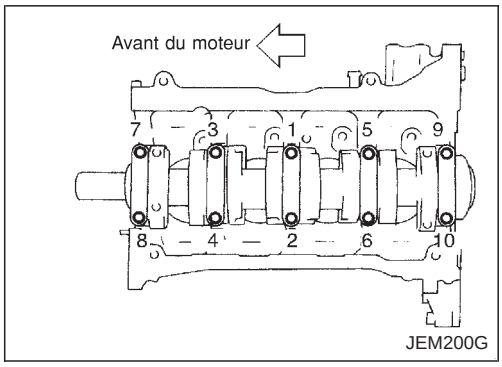
PRECAUTION :

- **Si les segments de piston ne sont pas remplacés, s'assurer que les segments de piston sont reposés dans leur position originale.**

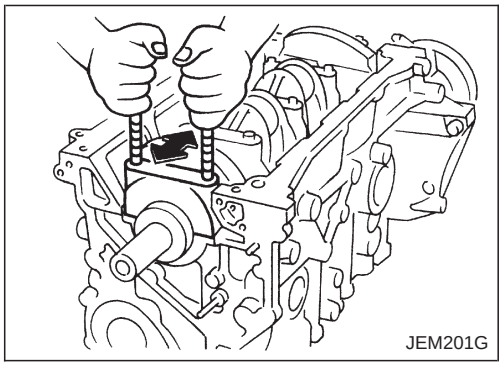


12. Déposer les pistons des bielles.

a. Déposer les joncs d'arrêt à l'aide des pinces pour jonc d'arrêt.



b. En utilisant un séchoir industriel, chauffer les pistons jusqu'à 60 à 70°C.

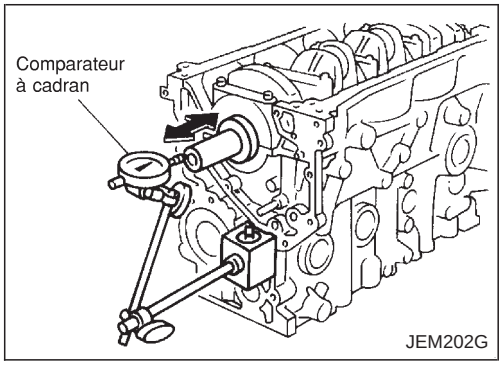


c. Extraire l'axe de piston en poussant avec une tige d'environ 26 mm de diamètre.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Démontage (Suite)

13. Déposer les boulons du chapeau de roulement principal.
- Avec une douille TORX (taille : E-14, outillage en vente dans le commerce), desserrer les boulons du chapeau de palier principal en plusieurs étapes dans l'ordre inverse de celui indiqué sur l'illustration et les déposer.
- Avant de desserrer les boulons de chapeau de roulement principal, mesurer le jeu axial du vilebrequin. Se reporter à EM-3073, ''JEU AXIAL DU VILEBREQUIN''.

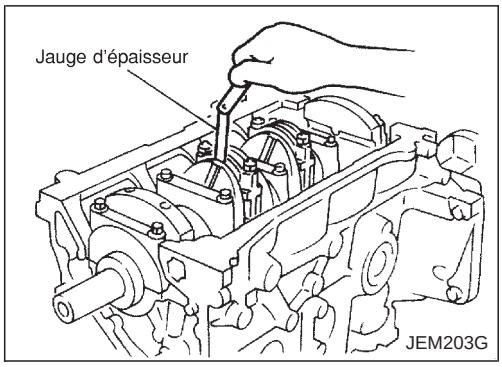


14. Déposer les chapeaux de roulement principal.
- A l'aide des boulons du chapeau de roulement principal, déposer en déplaçant le chapeau de roulement d'avant en arrière.

15. Déposer le vilebrequin.
16. Enlever les paliers principaux et de butée hors des bloc-cylindres et des chapeau de roulement principal.
- **Noter les bons emplacements de repose des pièces démontées. Les ranger soigneusement afin d'éviter qu'ils ne se mélangent.**

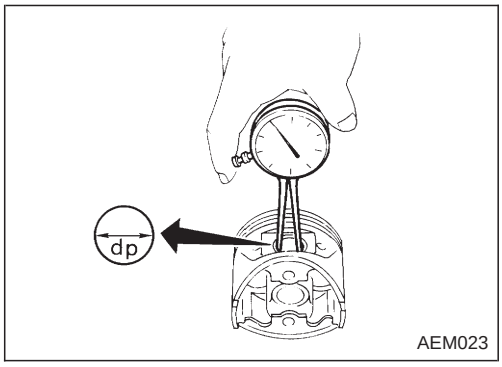
17. Déposer l'injecteur d'huile.
18. Déposer le soupape de contrôle du jet d'huile.

Inspection



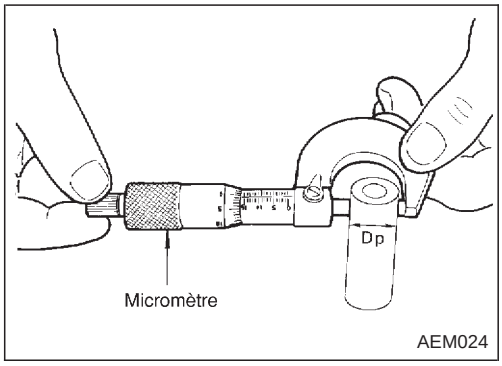
JEU AXIAL DU VILEBREQUIN

- Mesurer la distance de déplacement du vilebrequin avec la jauge à cadran lorsque le vilebrequin est déplacé complètement d'avant en arrière.
  Standard : 0,085 - 0,25 mm
  Limite : 0,30 mm
- Si la valeur dépasse la limite, remplacer les paliers de butée par des pièces neuves et mesurer de nouveau. Si la mesure excède de nouveau la limite, remplacer le vilebrequin par une pièce neuve.



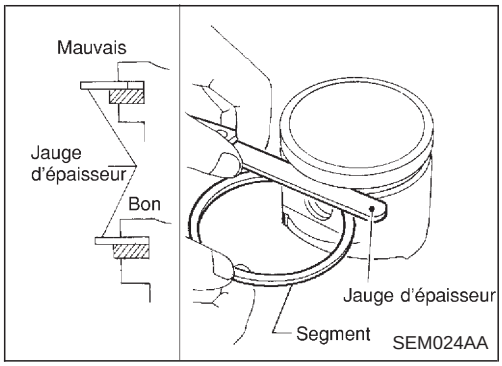
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (Suite)



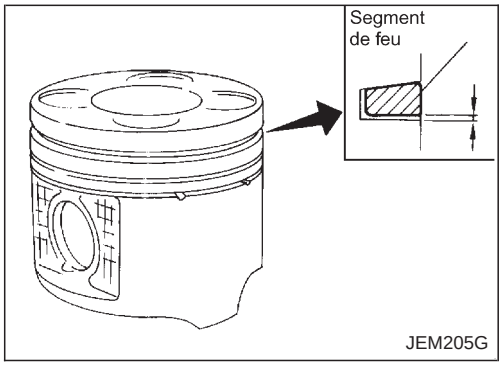
JEU LATERAL DE LA BIELLE

- Mesurer le jeu latéral entre la bielle et le bras du vilebrequin avec la jauge d'épaisseur.
  Standard : 0,200 - 0,350 mm
  Limite : 0,4 mm
- Si la valeur dépasse la limite, remplacer la bielle et mesurer à nouveau. Si la mesure excède de nouveau la limite, remplacer le vilebrequin.



JEU ENTRE LE PISTON ET L'AXE DE PISTON

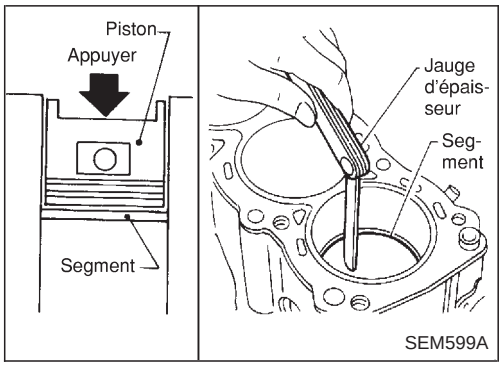
1. Mesurer le diamètre interne de l'axe du trou de piston ''dp''.
   Diamètre standard ''dp'' :
   27,997 - 28,005 mm



2. Mesurer le diamètre externe de l'axe de piston ''Dp''.
   Diamètre standard ''Dp'' :
   27,994 - 28,000 mm
3. Calculer l'ajustement serré de l'axe de piston au piston.
   Dp − dp = 0,002 - 0,006 mm

S'il est supérieur à la valeur ci-dessus, remplacer l'ensemble du piston avec l'axe.

JEU LATERAL DES SEGMENTS DE PISTON

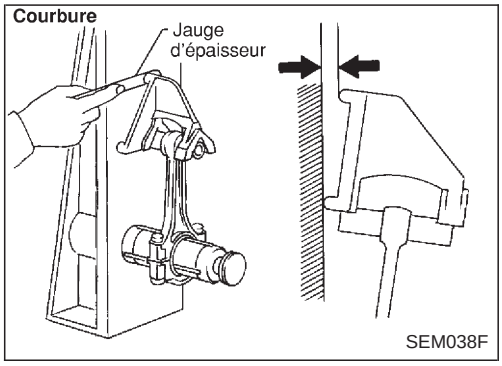


Jeu latéral :
Segment de feu
0,050 - 0,090 mm
Segment de compression
0,050 - 0,090 mm
Segment racleur
0,030 - 0,070 mm
Limite maximum de jeu latéral :
Segment de feu 0,1 mm
Segment de compression 0,1 mm

- Pour mesurer le jeu latéral du segment de feu, aligner les circonférences externes du segment et du piston tout en pressant le segment vers le haut contre la surface supérieure de la gorge pour segment. Dans ces conditions, mesurer le jeu entre le segment et la surface inférieure de la gorge pour segment.
- Remplacer les segments de piston si la valeur n'est pas conforme aux spécifications. Si le jeu dépasse la limite maximum avec le segment neuf, remplacer le piston.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (Suite)

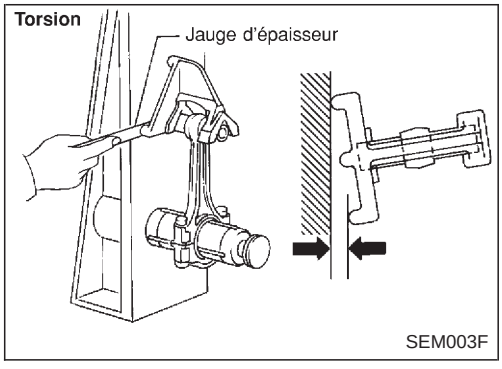


ECARTEMENT DE SEGMENT DE PISTON

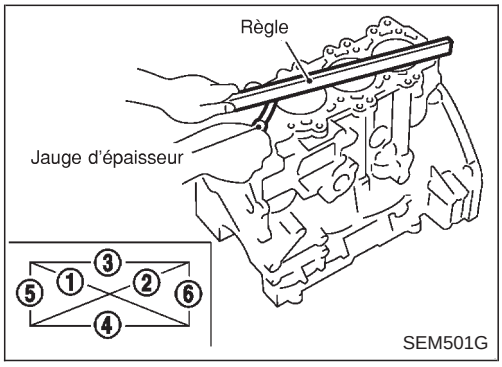
Ecartement :
Segment de feu 0,21 - 0,31 mm
Segment de compression 0,37 - 0,52 mm
Segment racleur 0,30 - 0,55 mm
Limite maximum de coupe de segment :
Segment de feu 1,0 mm
Segment de compression 1,0 mm
Segment racleur 1,0 mm

Remplacer les segments de piston si la valeur n'est pas conforme aux spécifications. Si l'écartement est toujours supérieur à la limite même avec un segment neuf, faire ce qui suit. Aléser à nouveau le cylindre et utiliser un piston et des segments de pistons surdimensionnés.

Se reporter aux SDS (EM-3097).



- Lors du changement du piston, vérifier que la surface du bloc-cylindres n'est pas éraflée ou grippée. Si elle est éraflée ou grippée, roder à nouveau ou remplacer le bloc-cylindres.

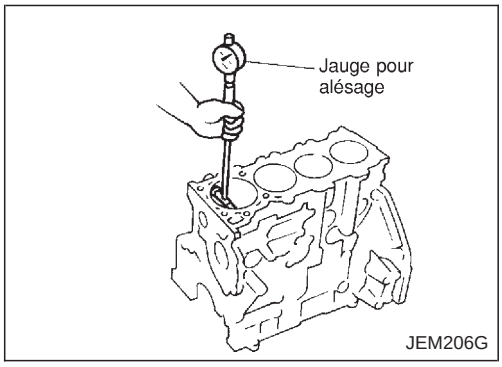


COURBURE ET TORSION DES BIELLES

Courbe :
Limite 0,12 mm
sur une longueur de 100 mm
Torsion :
Limite 0,12 mm
sur une longueur de 100 mm

En cas de dépassement de ces valeurs, remplacer l'ensemble de bielle.

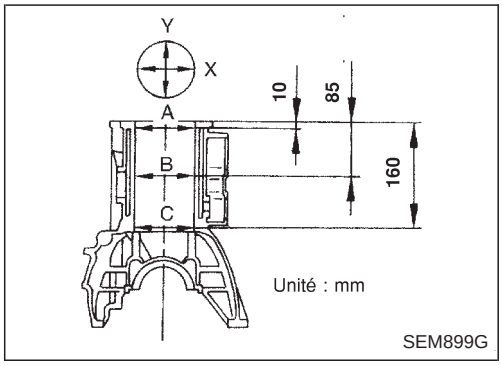
DEFORMATION ET USURE DU BLOC-CYLINDRES



- Nettoyer la surface supérieure du bloc-cylindres. Utiliser une règle et une jauge d'épaisseur fiables pour contrôler la planéité de la surface du bloc-cylindres. Effectuer le contrôle dans les six positions indiquées sur l'illustration.
  Limite de déformation : 0,04 mm
- Si la valeur n'est pas conforme aux spécifications, la rectifier. La limite de la rectification du bloc-cylindres est déterminée par la réctification de la culasse dans le moteur.

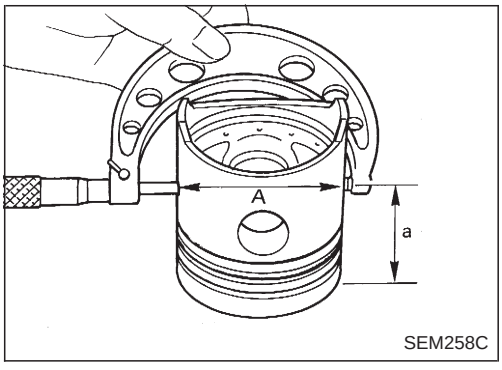
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (Suite)



Limite de rectification :
La quantité de rectification de la culasse est ‘‘A’’.
La quantité de rectification du bloc-cylindres est ‘‘B’’.
La limite maximum est la suivante :
A + B = 0,07 mm
Hauteur nominale du bloc-cylindres depuis le centre du vilebrequin :
252,95 - 253,05 mm

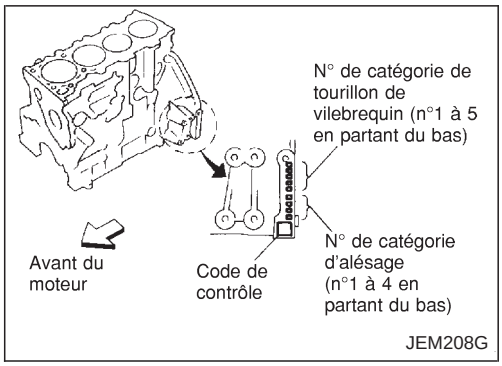
- Si nécessaire, remplacer le bloc-cylindres.

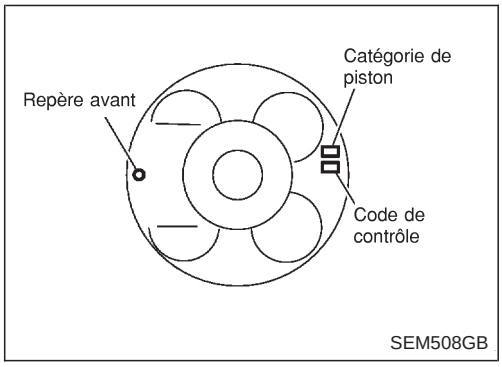


JEU ENTRE LE PISTON ET L’ALESAGE

1. A l’aide d’un comparateur à cadran, mesurer l’alésage du cylindre dans les directions X et Y aux points A, B et C pour rechercher usure, faux-rond ou conicité.
   Diamètre intérieur de l’alésage du cylindre
   Standard
   89,000 - 89,030 mm
   Limite d’usure
   0,07 mm
   Réaléser tous les cylindres quand la limite est dépassée. Remplacer le bloc-cylindres si nécessaire.
   Faux-rond (X - Y) :
   Limite 0,015 mm
   Conicité (C - A)
   Limite 0,010 mm

2. Rechercher toutes traces de rayures et de grippage. S’il est grippé, le roder.





3. Mesurer le diamètre de jupe de piston.
   Diamètre de piston ‘‘A’’ :
   Standard
   88,940 - 88,970 mm
   Point de mesure ‘‘a’’ (Distance à partir du sommet) :
   59,0 mm
4. Vérifier que le jeu entre le piston et l’alésage est conforme aux spécifications.

- Calculer le jeu en utilisant le diamètre externe au niveau de la jupe de piston et le diamètre externe du cylindre (direction de X, point B) :
  Jeu entre le piston et l’alésage = alésage de cylindre − diamètre de piston ‘‘A’’
  Standard (température ambiante 20°C) :
  0,050 - 0,070 mm
- Si la valeur est en dehors de la plage spécifiée, remplacer le piston et l’ensemble d’axe de piston.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (Suite)

- Si le bloc-cylindres ou les pistons sont remplacés par des neufs, sélectionner le piston comme suit :

Lors de l'usage d'un bloc-cylindres neuf :

- Identifier la classe d'alésage du cylindre (n° 1, 2, ou 3) sur la surface arrière gauche du bloc-cylindres et sélectionner le piston correspondant à cette catégorie.
- Le n° de pièce du piston est spécifié avec l'axe du piston comme un ensemble.

Lors de la réutilisation d'un bloc-cylindres déposé :

- Mesurer le diamètre interne de l'alésage du bloc-cylindres.
- Déterminer l'alésage en comparant les mesures avec les valeurs sous ''Type d'alésage de cylindre'' dans le tableau ci-dessous. Sélectionner un piston de la même taille.

Sélection appropriée des pistons :

Unité : mm

Catégorie (perforée)	1	2	3
Diamètre interne de l'alésage du cylindre	89,000 - 89,010	89,010 - 89,020	89,020 - 89,030
Diamètre externe du piston	88,940 - 88,950	88,950 - 88,960	88,960 - 88,970

5. Déterminer la surdimension du piston en fonction de l'étendue de l'usure du cylindre.

- **Des pistons surdimensionnés de 0,25 et 0,5 (Surdimensionnement de 0,25 mm, 0,5 mm) sont disponibles en pièces détachées. Se reporter aux SDS, EM-3097. Lors de l'utilisation d'un piston surdimensionné, roder le cylindre pour que le jeu entre le piston et le cylindre soit à la valeur spécifiée. S'assurer d'utiliser le segment de piston surdimensionné approprié pour le piston surdimensionné.**

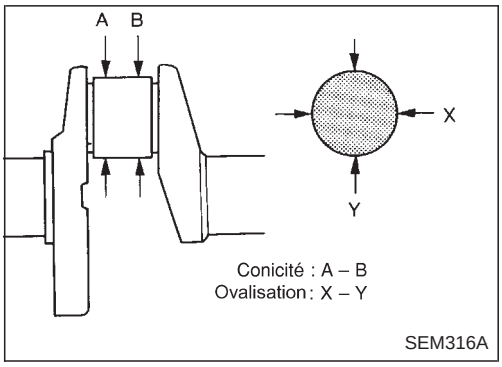
6. La dimension de l'alésage de cylindre est déterminée en ajoutant le jeu entre le piston et l'alésage au diamètre du piston ''A''.

Calcul du réalésage : D = A + B − C

où,
D : Diamètre alésé
A : Diamètre de piston mesuré
B : Jeu entre piston et alésage
C : Tolérance de finition 0,02 mm

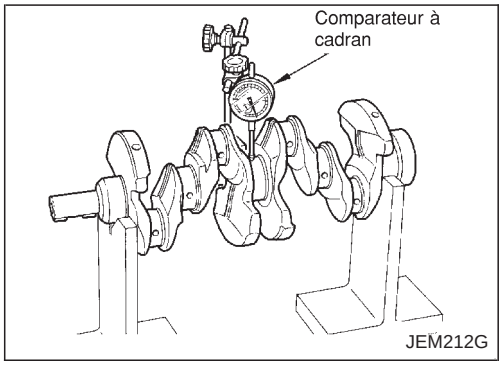
7. Aléser les cylindres.

- **Quand un cylindre doit être alésé, tous les autres cylindres doivent également l'être.**
- **Ne pas aléser trop profondément un cylindre en une fois. Rectifier seulement 0,05 mm dans le diamètre en une seule fois.**



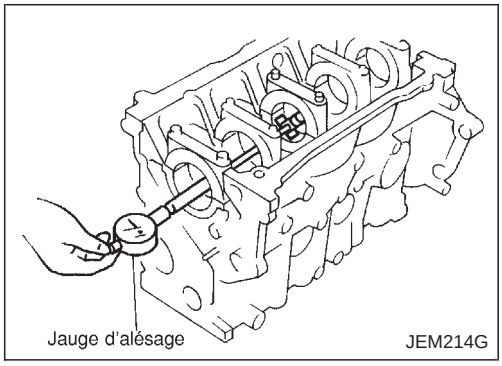
8. Roder les cylindres pour obtenir le jeu spécifié du piston à l'alésage.
9. Mesurer l'alésage final du cylindre en recherchant s'il y a un faux-rond ou une conicité.

- **La mesure doit être prise une fois que l'alésage du cylindre a refroidi.**



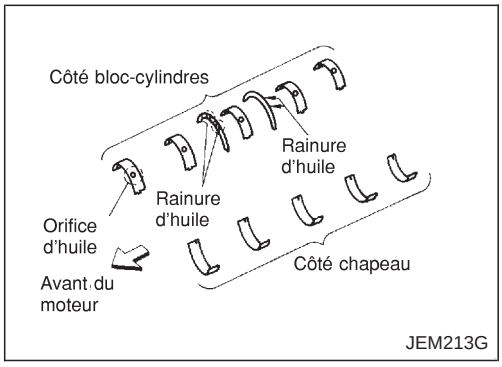
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (Suite)



VILEBREQUIN

1. Vérifier si les tourillons principaux et manetons de vilebrequin ne sont pas rayés, usés ou fissurés.
2. Mesurer les tourillons avec un micromètre, pour rechercher conicité ou faux-rond.
   Faux-rond (X - Y) :
   Standard
   0,003 mm
   Limite
   0,005 mm
   Conicité (A - B) :
   Standard
   0,003 mm
   Limite
   0,005 mm



3. Mesurer le voile du vilebrequin au tourillon (central) n° 3
   Voile (Indication totale du comparateur) :
   Standard 0,05 mm
   Limite, 0,10 mm

DIAMETRE INTERIEUR DU BOITIER DU PALIER PRINCIPAL

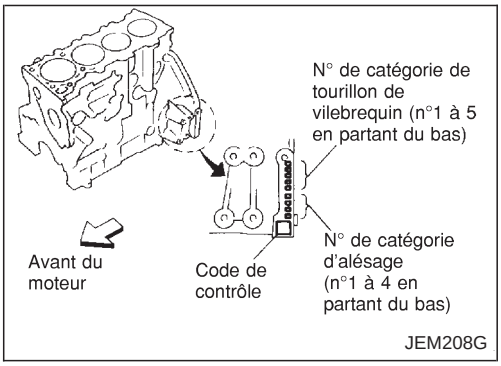
- Sans reposer les paliers principaux, reposer les bouchons du roulement principal et serrer les boulons au couple spécifié.
- Mesurer le diamètre interne du logement du roulement principal avec une jauge d'alésage.
  Standard :
  66,654 - 66,681 mm de dia.
- Si la mesure n'est pas dans la fourchette spécifiée, remplacer le bloc-cylindres et les chapeaux du roulement principal.

JEU DE PALIER

- Utiliser l'une des méthodes suivantes, néanmoins, la méthode ''A'' donne des résultats plus sûr et est préférable.

Méthode A (avec une jauge d'alésage et un micromètre)

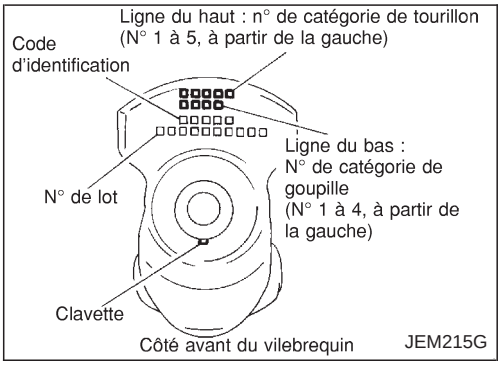
Palier principal



1. Reposer les paliers principaux sur le bloc-cylindre et les chapeaux de palier principal, et serrer les boulons au couple spécifié. Puis mesurer le diamètre interne des paliers principaux.
   Jeu d'huile = diamètre interne du palier − diamètre externe du tourillon de vilebrequin

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (Suite)



Standard : 0,039 - 0,066 mm

2. Si la valeur est en dehors de la plage spécifiée, sélectionner les paliers principaux pour obtenir le jeu d'huile spécifié, correspondant aux mesures du diamètre interne du logement du palier principal et du diamètre externe du tourillon de vilebrequin.

Lorsque l'on utilise un bloc-cylindres et un vilebrequin neuf

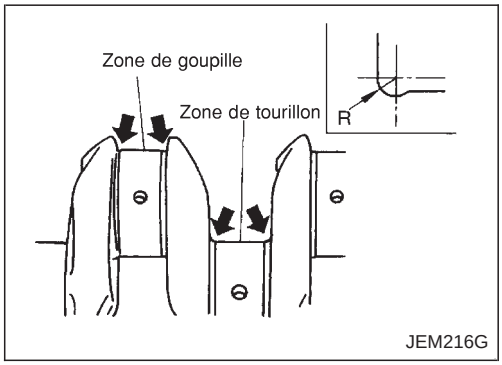
1) Identifier la classe du logement de palier (n° 0, 1, ou 2) sur la surface gauche arrière du bloc-cylindres, et déterminer la catégorie applicable sur la ligne ''Catégorie'' dans le tableau ci-dessous.
2) Identifier la classe de tourillon (n° 0, 1, ou 2) sur la surface avant du vilebrequin, et déterminer la catégorie applicable dans la colonne ''Catégorie'' du tableau.
3) Le palier principal à utiliser (STD 0 à STD 4) est indiqué dans la case où la ligne et la colonne se croisent.

Lorsque l'on réutilise le bloc-cylindres et le vilebrequin déposés

1) Mesurer le diamètre interne du boîtier du palier principal de bloc-cylindres.
2) Sélectionner la case applicable correspondant à la mesure sur la ligne ''Diamètre interne du logement de palier principal du bloc-cylindres'' dans le tableau.
3) Mesurer le diamètre externe du tourillon du vilebrequin.
4) Sélectionner la case applicable à la mesure dans la colonne ''Diamètre extérieur du tourillon de vilebrequin'' dans le tableau.
5) Le palier principal à utiliser (STD 0 à STD 4) est indiqué dans la case où la ligne et la colonne se croisent.

Sélection appropriée du palier principal

Unité : mm



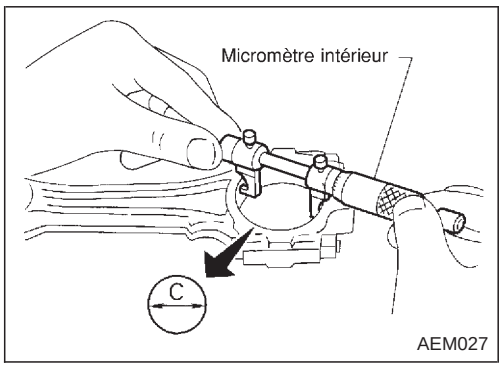
Diamètre intérieur du logement du palier principal du bloc-cylindres			66,654 - 66,663	66,663 - 66,672	66,672 - 66,681
Diamètre externe du tourillon de vilebrequin	Catégorie (perforée)		0	1	2
62,967 - 62,975	0	● N° de catégorie de palier ● Epaisseur de palier ● Jeu d'huile ● Couleur d'identification	STD 0 1,816 - 1,820 0,039 - 0,066 Noir	STD 1 1,820 - 1,824 0,039 - 0,066 Marron	STD 2 1,824 - 1,828 0,039 - 0,066 Vert
62,959 - 62,967	1	● N° de catégorie de palier ● Epaisseur de palier ● Jeu d'huile ● Couleur d'identification	STD 1 1,820 - 1,824 0,039 - 0,066 Marron	STD 2 1,824 - 1,828 0,039 - 0,066 Vert	STD 3 1,828 - 1,832 0,039 - 0,066 Jaune
62,951 - 62,959	2	● N° de catégorie de palier ● Epaisseur de palier ● Jeu l'huile ● Couleur d'identification	STD 2 1,824 - 1,828 0,039 - 0,066 Vert	STD 3 1,828 - 1,832 0,039 - 0,066 Jaune	STD 4 1,832 - 1,836 0,039 - 0,066 Bleu

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (Suite)

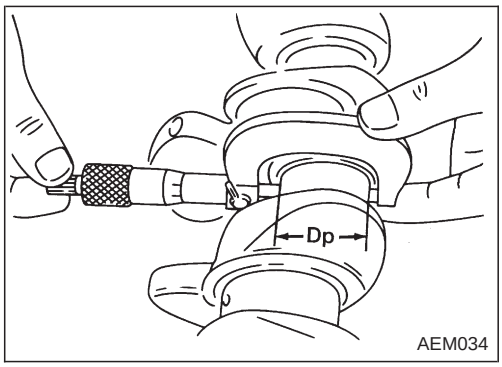
3. Lorsque l'on ne peut pas obtenir le jeu d'huile spécifié avec des paliers principaux de taille standard, utiliser des paliers sous-dimensionnés.

- Lorsqu'un palier sous-dimensionné est utilisé, mesurer le diamètre interne du palier quand le palier est reposé. Meuler le tourillon de vilebrequin pour que le jeu d'huile spécifié soit obtenu.



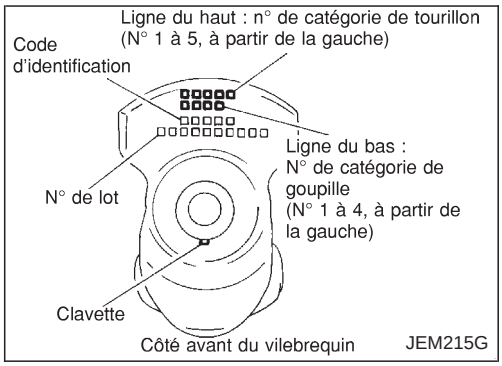
Palier sous-dimensionné

Unité : mm



Taille	Epaisseur
US 0,25	1,949 - 1,953

PRECAUTION :
Lors du meulage du tourillon de vilebrequin pour utiliser un palier sous-dimensionné, éviter d'endommager le filet R.



Palier de bielle (tête de bielle)

1. Reposer le palier de bielle sur la bielle et le chapeau.
2. Reposer le chapeau de bielle sur la bielle.
   Serrer les boulons au couple spécifié.
3. Mesurer le diamètre intérieur ''C'' de la bielle.
   Diamètre intérieur:
   Standard 55,000 - 55,013 mm

4. Mesurer le diamètre extérieur ''Dp'' de chaque maneton de vilebrequin.
5. Calculer le jeu de palier de bielle.
   Jeu de palier de bielle = C − Dp
   Standard : 0,031 - 0,061 mm
6. Remplacer le palier si les limites sont dépassées.

Lors de l'utilisation de bielles et de vilebrequin neufs :

- Identifier la classe de diamètre de l'axe (n° 0, 1, ou 2) sur la surface avant du vilebrequin et sélectionner le palier de bielle de la même catégorie.
- Il n'y a pas de graduation pour le diamètre intérieur de la tête de bielle.

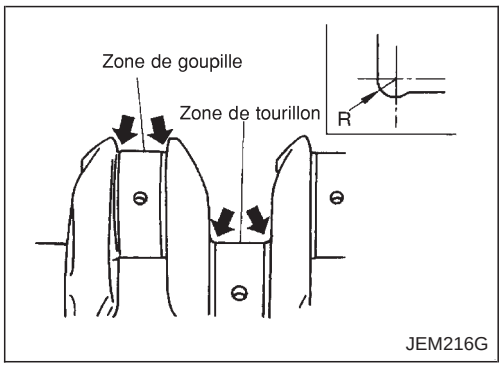
Lors de la réutilisation du vilebrequin et de la bielle déposés

- Mesurer le diamètre intérieur de la tête de bielle et s'assurer qu'elle se trouve dans la plage spécifiée.
- Mesurer le diamètre extérieur de l'axe du vilebrequin.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (Suite)

- Déterminer la classe de l'axe de vilebrequin en comparant la mesure dans la colonne ''Diamètre extérieur de l'axe du vilebrequin'' dans le tableau ci-dessous. Choisir des paliers de la même catégorie.



Sélection appropriée du palier de bielle

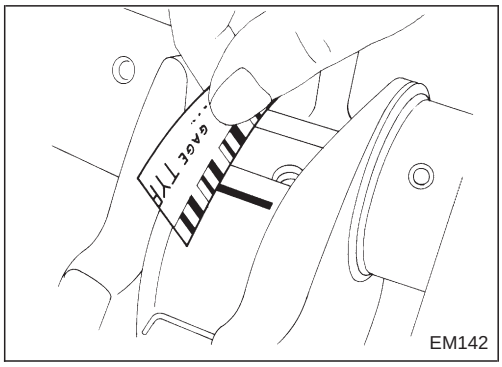
Unité : mm

Diamètre extérieur de la tête de bielle		55,000 - 55,013	
Diamètre extérieur de l'axe de vilebrequin	Catégorie (perforé)	0 (non perforé)	
51,968 - 51,974	0	● N° de catégorie de palier ● Epaisseur de palier ● Jeu d'huile ● Couleur d'identification	STD 0 1,492 - 1,496 0,031 - 0,061 Noir
51,961 - 51,968	1	● N° de catégorie de palier ● Epaisseur de palier ● Jeu d'huile ● Couleur d'identification	STD 1 1,496 - 1,500 0,031 - 0,061 Marron
51,954 - 51,961	2	● N° de catégorie de palier ● Epaisseur de palier ● Jeu d'huile ● Couleur d'identification	STD 2 1,500 - 1,504 0,031 - 0,061 Vert

7. Si le jeu ne peut pas être ajusté au standard de n'importe quel palier, meuler le tourillon de vilebrequin et utiliser un palier sous-dimensionné.

- Lorsqu'un palier sous-dimensionné est utilisé, mesurer le diamètre intérieur du palier quand le palier est reposé. Meuler les axes pour obtenir le jeu d'huile spécifié.

Palier sous-dimensionné



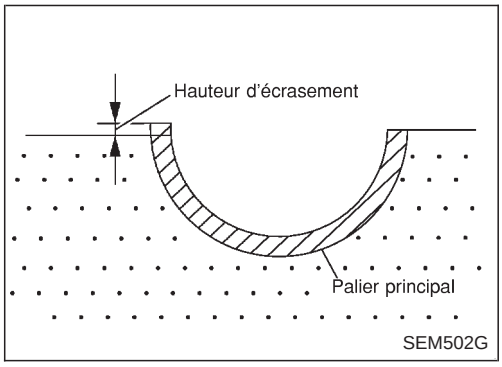
Unité : mm

Taille	Epaisseur
US 0,08	1,536 - 1,540
US 0,12	1,556 - 1,560
US 0,25	1,621 - 1,625

PRECAUTION :
Lors du meulage du tourillon de vilebrequin pour utiliser un palier sous-dimensionné, éviter d'endommager le filet R.
Taille standard R :
1,5 - 1,7 mm

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

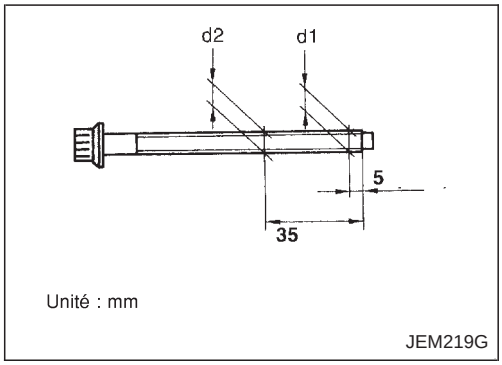
Inspection (Suite)



EM142

Méthode B (utilisation de la cale plastique)

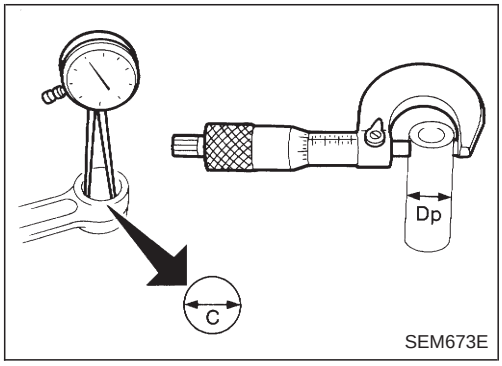
PRECAUTION :



- **Ne pas tourner le vilebrequin ni la bielle pendant l'insertion de la cale en plastique.**
- **Lorsque le jeu de palier dépasse la limite spécifiée, s'assurer que le bon palier a bien été reposé. Si le jeu de palier est incorrect, utiliser un palier principal sous-dimensionné ou plus épais pour assurer le jeu spécifié.**

SEM502G

HAUTEUR D'ECRASEMENT DU PALIER PRINCIPAL

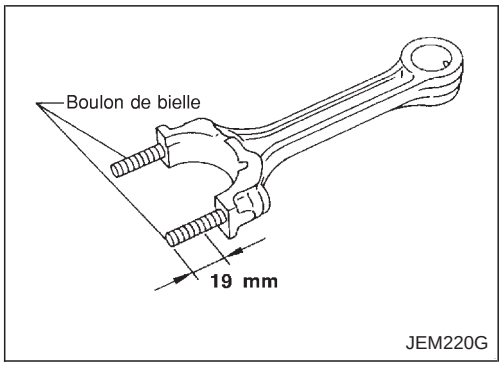


- Lorsque le chapeau de palier est enlevé, après avoir été serré au couple spécifié et une fois les paliers principaux reposés, le bout du palier doit être en saillie.
  Standard : Il doit y avoir une hauteur d'écrasement
- Si la norme n'est pas respectée, remplacer les paliers principaux.

JEM219G

DEFORMATION DU BOULON DU CHAPEAU DU PALIER PRINCIPAL

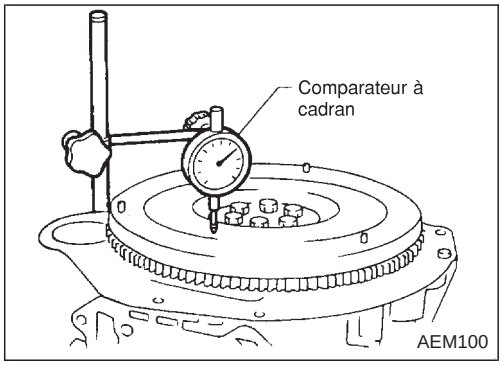
- Mesurer le diamètre externe de la zone filetée, d1 et d2, aux points spécifiés sur l'illustration.
- Lorsque le point en collet est identifié à un point autre que les points spécifiés, mesurer au point comme pour d2.
- Calculer la différence entre d1 et d2.
  Limite : 0,13 mm



SEM673E

JEU DE LA BAGUE DE BIELLE (PIED DE BIELLE)

1. Mesurer le diamètre intérieur ''C'' de la bague.
   Diamètre intérieur ''C'' :
   Standard 28,026 - 28,038 mm
2. Mesurer le diamètre extérieur ''Dp'' de l'axe de piston.
   Diamètre extérieur ''Dp'' :
   Standard 27,994 - 28,000 mm
3. Calculer le jeu de la bague de bielle.
   Jeu de la bague de bielle = C − Dp
   Standard : 0,026 - 0,044 mm
   Limite : 0,057 mm
   Si le jeu dépasse la valeur limite, remplacer l'ensemble de bielle et/ou l'ensemble piston avec l'axe.

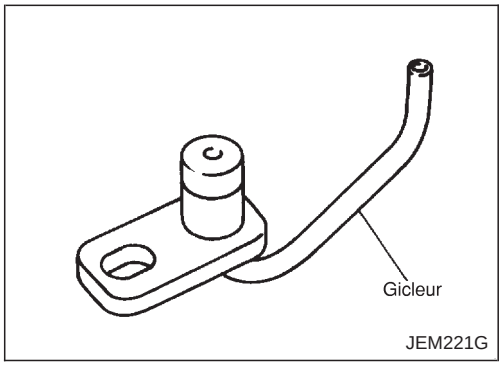


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (Suite)

DEFORMATION DU BOULON DE LA BIELLE

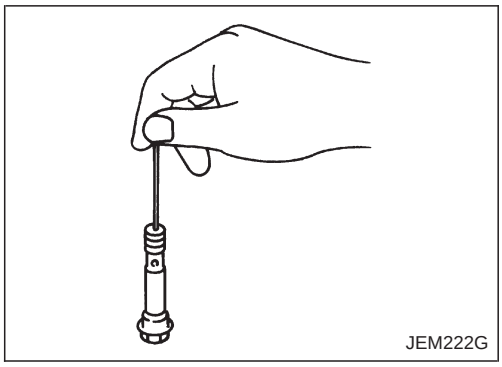
- Reposer des écrous aux boulons de la bielle. Vérifier si l'écrou peut être vissé à la main sans accroc sur les parties filetées des boulons jusqu'au dernier filetage du boulon.
- Si l'écrou ne se visse pas facilement, mesurer le diamètre externe de la partie filetée du boulon au point spécifié sur l'illustration.
- Si un point en collet est identifié, mesurer au niveau de ce point.
  Standard : 8,90 - 9,00 mm de dia.
  Limite : 8,75 mm de dia.
- Si la mesure excède la limite, remplacer les boulons et écrous de la bielle.



VOILE DU VOLANT MOTEUR

Voile (Indication totale du comparateur) :
Moins de 0,15 mm

PRECAUTION :



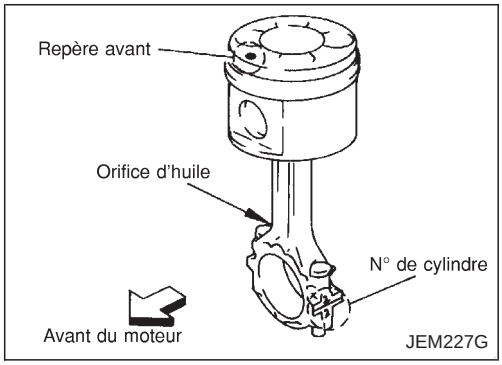
- **La plaque de signal est intégrée à l'ensemble du volant moteur. Prendre garde de ne pas endommager la plaque de signal, particulièrement les dents.**
- **Vérifier que la plaque de signal n'est pas endommagée ou fissurée.**
- **Ne jamais placer l'ensemble de volant moteur avec la plaque de signal orientée vers le bas.**
- **Maintenir tout objet magnétique hors de portée de la plaque de signal.**
- **Ne laisser aucun matériau magnétique en contact avec les dents de la plaque de signal.**

GICLEUR D'HUILE

- Vérifier que le gicleur n'est pas déformé ou endommagé.
- Vérifier que le passage d'huile n'est pas bouché en insufflant de l'air par le côté du gicleur.
- En cas d'anormalités, nettoyer ou remplacer.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

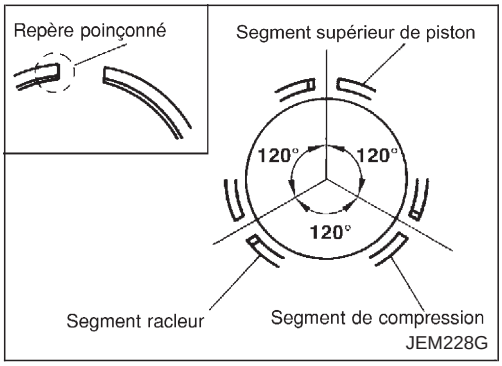
JEM222G



SOUPAPE DE DECHARGE DU JET D'HUILE

A l'aide d'une tige en résine propre, appuyer sur le clapet de retenue dans la soupape de décharge. Vérifier qu'elle revienne bien à sa position initiale sans résistance.

Remontage

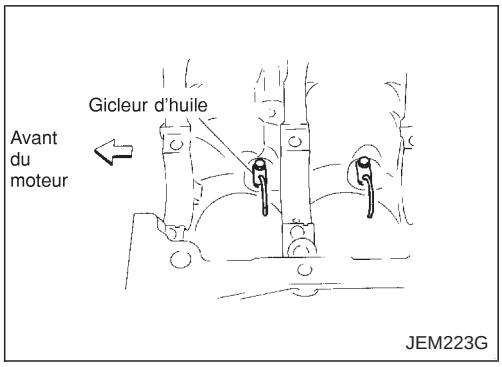


PISTON

1. A l'aide d'une pince à circlips, reposer les joncs d'arrêt sur les rainures du côté arrière du piston.
- Reposer fermement pour l'insérer complètement dans la rainure.
2. Reposer le piston sur la bielle.
- Chauffer le piston avec un séchoir industriel jusqu'à 60 à 70°C pour que l'axe de piston s'enfonce facilement avec le doigt. Ensuite, insérer l'axe de piston en commençant par l'avant du piston dans le piston et dans la bielle.

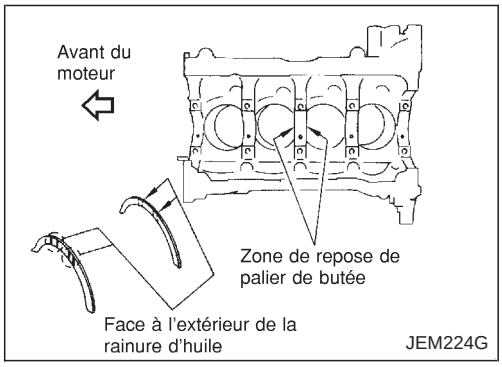
JEM227G

- Monter pour que le repère avant sur la surface supérieure du piston et le n° de cylindre poinçonné sur la bielle soient dans la position indiquée par l'illustration.
3. Reposer les joncs d'arrêt sur l'avant du piston.
- Se reporter à l'étape 1. ci-dessus pour les remarques concernant la repose.
- Après repose, vérifier que la bielle se déplace sans à-coups.
4. Reposer les segments de piston en utilisant les pinces d'écartement de segments de piston (outillage en vente dans le commerce).
- **Faire très attention de ne pas endommager le piston.**



JEM228G

- Reposer le segment de feu et le segment de compression avec la surface perforée orientée vers le haut.
  Repère d'identification
  Segment de feu R
  Segment de compression 2R
- Reposer les segments de manière à ce que les trois orifices fermés se trouvent à 120° l'un de l'autre.
- Les orifices fermés ne doivent pas se trouver dans des directions spécifiques, pour autant que chacun soit placé avec un écart de 120°.

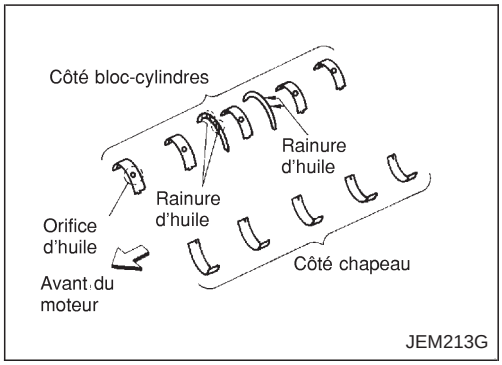


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Remontage (Suite)

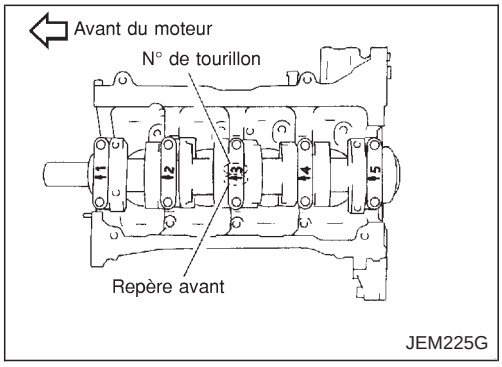
VILEBREQUIN

1. Souffler suffisamment d'air dans le passage de liquide de refroidissement, le passage d'huile dans le bloc-cylindres, et dans le carter de vilebrequin, et dans l'alésage des cylindres afin d'éliminer tous corps étrangers.
2. Reposer les soupapes de décharge du jet d'huile.
3. Reposer les jets d'huile.



4. Reposer les paliers principaux et les paliers de poussée.

a. Déposer les débris, les impuretés, l'huile des endroits sur le bloc-cylindres et sur les chapeaux de paliers principaux où les paliers sont reposés.



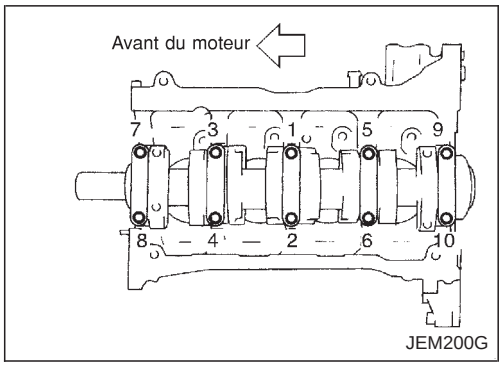
b. Reposer le palier de butée de chaque côté du logement du bloc-cylindres n° 3.

- Reposer les paliers de butée avec la rainure d'huile orientée vers le bras de vilebrequin (extérieur).

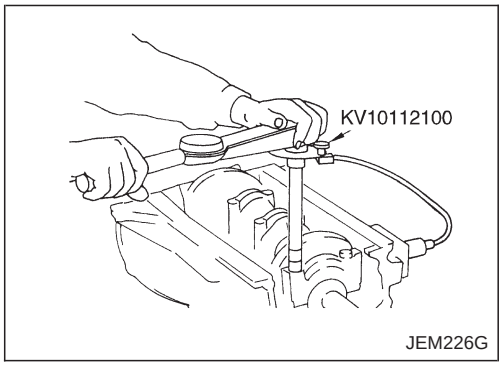
c. S'assurer de reposer les paliers principaux dans la bonne direction.

- S'assurer que ceux avec des orifices d'huile ou rainures d'huile sont montés sur le côté du bloc-cylindres, et ceux sans orifices d'huile ou rainures sur le côté du chapeau principal.
- Avant la repose, appliquer de l'huile-moteur sur les surfaces avant (internes) des paliers. Ne pas appliquer d'huile sur les surfaces arrière, mais bien les nettoyer.
- Aligner les crans de butée sur les paliers et procéder à la repose.
- S'assurer que les orifices d'huile sur le bloc-cylindres et ceux des paliers correspondants sont alignés.

5. Reposer le vilebrequin sur le bloc-cylindres.



- S'assurer que le vilebrequin tourne sans à-coups à la main.

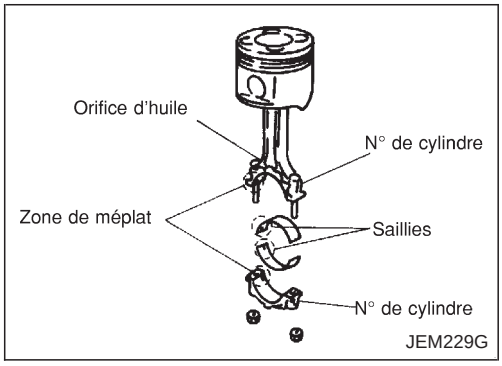


6. Reposer les chapeaux de palier principal.

- Identifier les chapeaux de palier principal à l'aide de la marque perforée. Reposer de façon correcte en faisant correspondre le n° de tourillon sur le chapeau de palier et le tourillon, avec le repère avant orienté vers l'avant.
- Les chapeaux de roulement principal sont généralement traités avec le bloc-cylindres. Par conséquent, les chapeaux et le bloc-cylindres devraient être remplacés comme un ensemble.

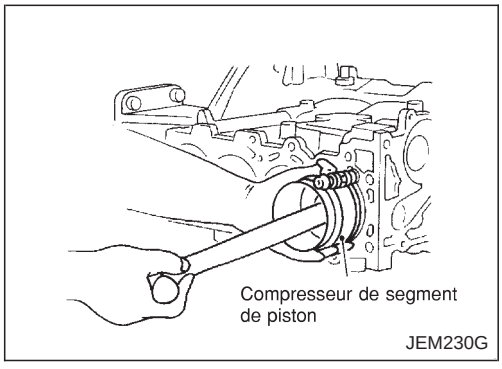
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Remontage (Suite)



7. Vérifier que les boulons du chapeau de palier principal ne sont pas déformés.
   Se reporter à EM-3082, ‘‘DEFORMATION DU BOULON DU CHAPEAU DE PALIER PRINCIPAL’’.
8. Serrer les boulons de chapeau de palier principal selon la procédure suivante :

a. Appliquer de l’huile moteur sur la partie filetée et la surface d’appui de chaque boulon.
b. Serrer de 25 à 30 N·m (2,5 à 3,1 kg-m) dans l’ordre numérique indiqué sur illustration.
c. Placer des marques d’alignement (avec de la peinture) sur chaque boulon et sur le bouchon de palier principal, toutes dans la même direction (en utilisant un rapporteur).
d. Ensuite, serrer de 90° à 95° (cible : 90°).

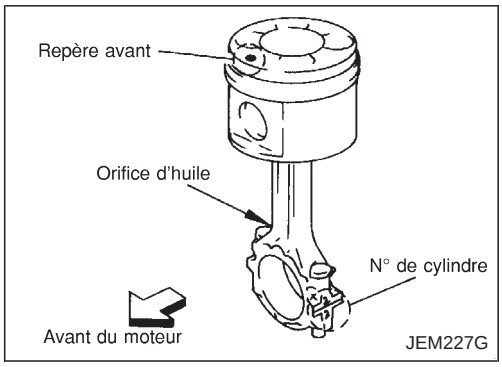


- **Toujours utiliser une clé angulaire (SST) ou un rapporteur pendant le serrage angulaire. Eviter les serrages sur la base de simples contrôles visuels.**
- **Après avoir serré les boulons au couple spécifié, s’assurer que le vilebrequin tourne sans à-coups.**
- **Vérifier le jeu axial du vilebrequin. Se reporter à EM-3073, ‘‘JEU AXIAL DU VILEBREQUIN’’.**

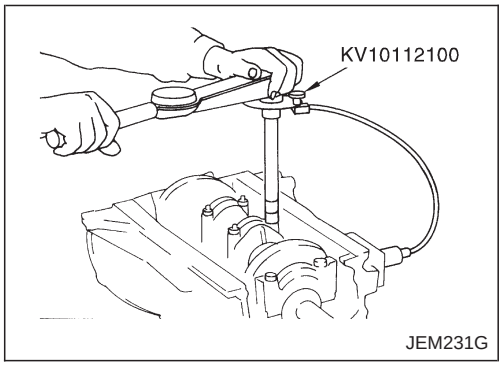
9. Contrôler le diamètre extérieur des boulons de la bielle. Se reporter à EM-3083, ‘‘DEFORMATION DU BOULON DE LA BIELLE’’.
10. Reposer le piston sur la bielle.

11. Reposer le palier de bielle sur la bielle et le chapeau de bielle.

- Avant la repose, appliquer de l’huile-moteur sur la surface avant intérieure du palier. N’appliquer aucune huile sur la surface arrière, mais bien la nettoyer.
- Aligner les crans d’arrêt sur la bielle et les saillies du roulement et procéder à la repose.

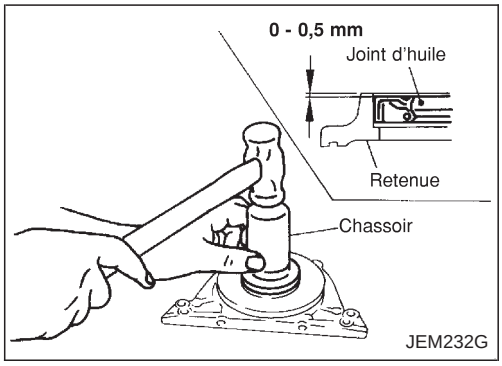


12. Reposer le piston et l’ensemble de la bielle sur le vilebrequin.

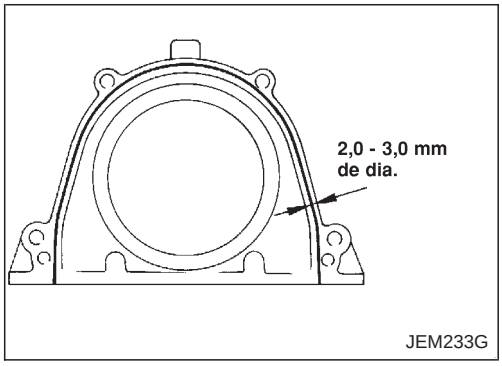


- Régler l’axe du vilebrequin de l’emplacement de montage au PMB.
- Faire correspondre le n° de cylindre de la bielle à la position du cylindre.
- En utilisant le compresseur de segment de piston (outillage en vente dans le commerce), reposer de manière à ce que la marque vers l’avant sur la surface supérieure du piston soit orientée vers l’avant du moteur.

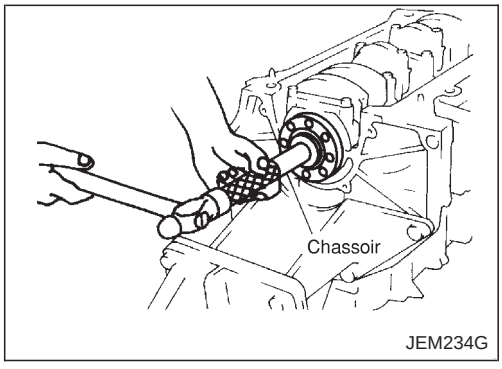
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Remontage (Suite)

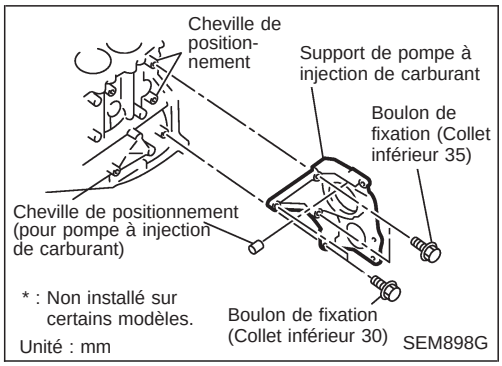


13. Reposer les chapeaux de bielle.
- Faire correspondre le n° de cylindre à la bielle et celà sur le chapeau.
- S'assurer que le repère avant du chapeau de bielle soit orienté vers l'avant du véhicule.



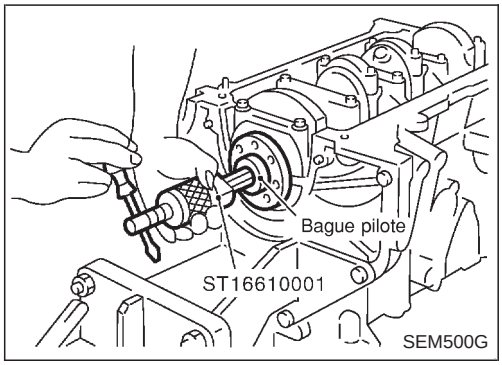
14. Serrer les écrous de bielle en suivant la procédure suivante.
a. Appliquer de l'huile moteur neuve sur les filets et les surfaces d'appui des boulons.
b. Serrer de 29 à 30 N·m (2,9 à 3,1 kg-m).
c. Desserrer totalement à 0 N.m (0 kg-m).
d. Serrer de 19 à 20 N·m (1,9 à 2,1 kg-m).
e. Serrer de 120° à 125° (objectif : 120°). (serrage angulaire)
- **Toujours utiliser soit une clé angulaire soit un rapporteur pour le serrage angulaire. Eviter tout serrage basé seulement sur un contrôle visuel.**
- Après avoir serré les écrous, vérifier que le vilebrequin tourne facilement.
- Vérifier le jeu latéral de la bielle. Se reporter à EM-3074 ''JEU LATERAL DE LA BIELLE''.

15. Installer soigneusement le joint d'huile arrière dans la bague de retenue de joint d'huile arrière.
- A l'aide d'un poussoir (105 mm dia.), l'enfoncer de manière à respecter les cotes indiquées sur l'illustration.
- Eviter de l'installer de travers. L'enfoncer perpendiculairement à son axe.



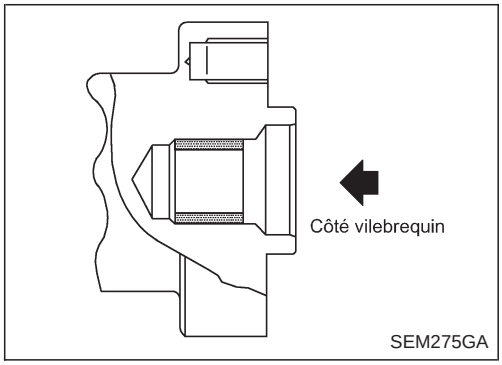
16. Reposer la bague de retenue arrière du joint d'huile.
- Appliquer un cordon de joint liquide approprié (se reporter à EM-3003, ''Procédure d'application du joint liquide''.) aux endroits indiqués sur l'illustration.

17. Reposer la bague pilote.
- L'enfoncer avec le poussoir (de 19 mm de dia environ).



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Remontage (Suite)



18. Reposer le support de pompe à injection de carburant.
- Aligner le support avec les chevilles de positionnement du bloc à installer.
- Les deux écrous utilisés pour les chevilles de positionnement ont une plus grande longueur sous tête que les autres.
- Vérifier la longueur de saillie des chevilles de positionnement pour la pompe à injection de carburant.
  Standard : 13,0 - 15,0 mm
19. Reposer les éléments du moteur dans l'ordre inverse de démontage.
- Serrer les écrous maintenant les supports des éléments complémentaires (compresseur de climatiseur, alternateur au couple spécifié.
  : 57 - 65 N·m (5,8 - 6,7 kg-m)
20. Déposer le moteur du support moteur dans l'ordre inverse de montage.
21. Reposer le volant-moteur.
- En maintenant la couronne dentée avec le goupille d'arrêt à bague (SST), serrer les boulons de sécurité à l'aide d'une clé TORX (taille : Q8 E20, Outillage en vente dans le commerce).
- Serrer les boulons de manière uniforme et entrecroisée.

REMPLACEMENT DE LA BAGUE PILOTE

1. Déposer la bague pilote à l'aide de l'outil de dépose approprié.

2. Reposer la bague pilote comme illustré.

SYSTEME DE COMMANDE D'ACCELERATEUR, D'ALIMENTATION ET D'ECHAPPEMENT

SECTION FE

AVIS DE MODIFICATION :

- Les informations concernant le moteur KA24DE ont été ajoutées pour l'Europe. Pour les informations non inclues ici, se reporter à la section concernant le moteur KA24E.
- Le moteur YD25DDTi a été ajouté.

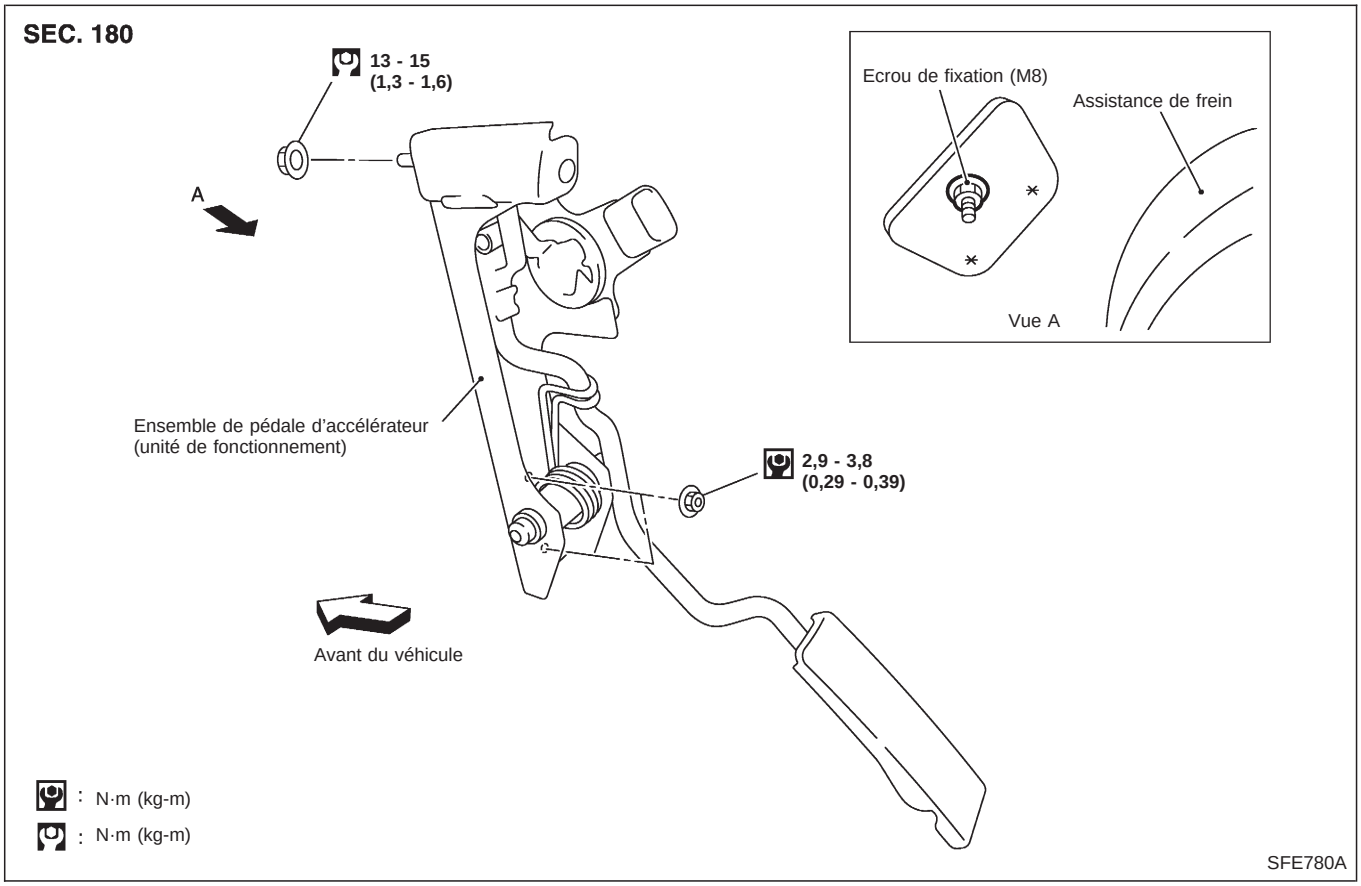

TABLE DES MATIERES

SYSTEME DE COMMANDE D'ACCELERATEUR 3002
Dépose et repose 3002
SYSTEME D'ALIMENTATION 3003
SYSTEME D'ECHAPPEMENT 3005

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Dépose et repose

Moteur YD25DDTi

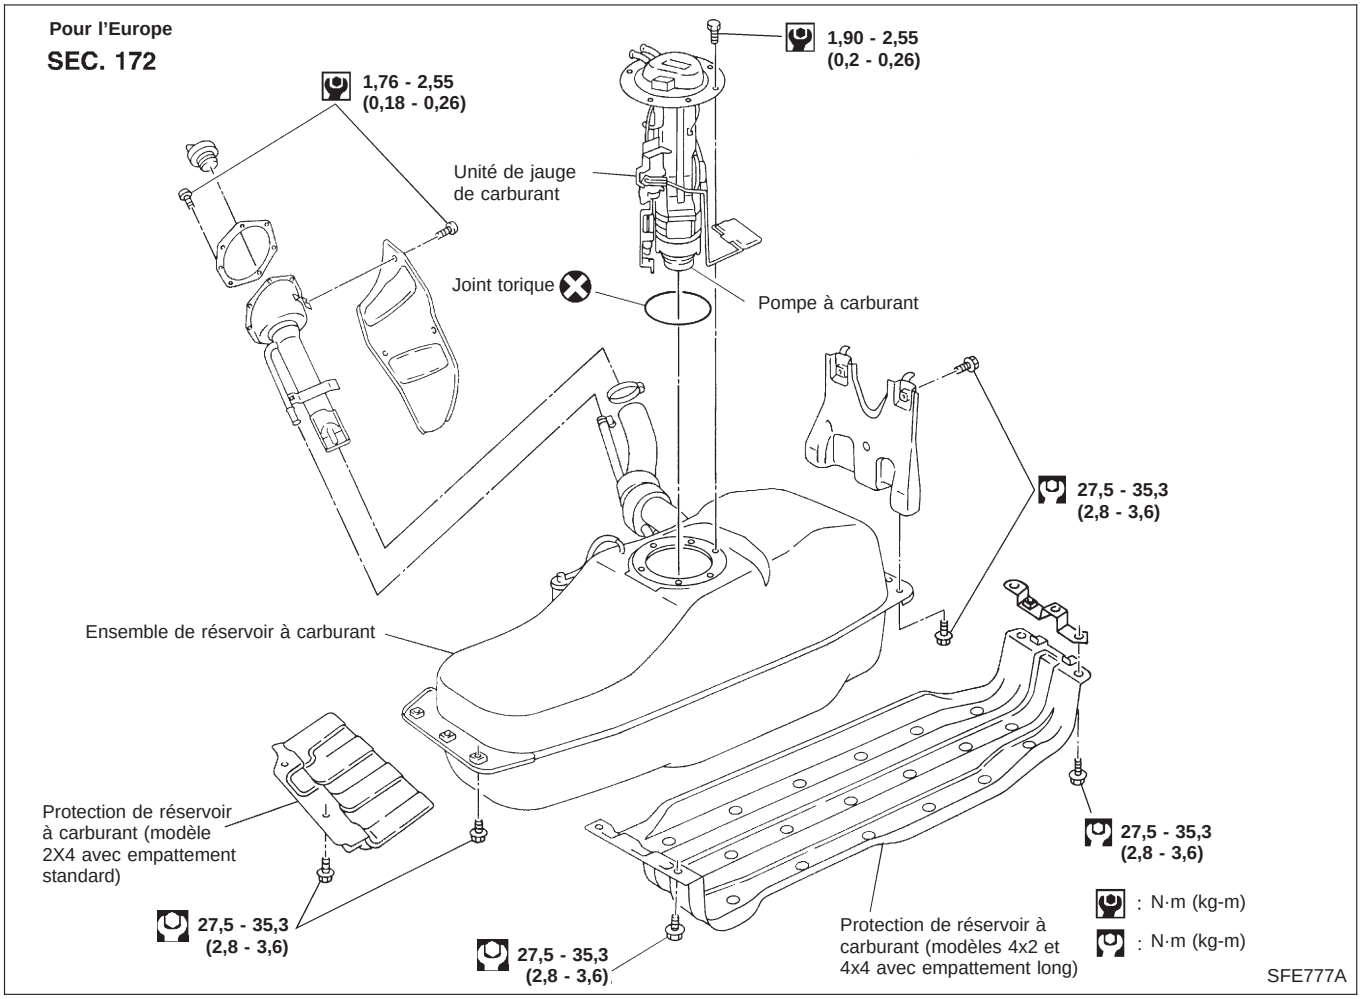
DEPOSE

1. Déposer le connecteur de faisceau.
2. Desserrer les écrous, et déposer l'ensemble de pédale d'accélérateur.

PRECAUTION :

- **Ne pas démonter l'ensemble de pédale d'accélérateur. Ne pas déposer les capteurs et les contacts de l'ensemble.**
- **Eviter les impacts dus aux chutes, etc. lors des manipulations.**
- **Protéger l'ensemble de pédale d'accélérateur de toute humidité.**
- **Ne pas serrer la vis de réglage (peinte en blanc) du boîtier d'accélérateur.**
- **Lorsque le connecteur de faisceau du capteur d'accélérateur est débranché, effectuer ''Initialisation de la position débrayée de la pédale d'accélérateur''. Se reporter à ''Procédure d'entretien de base'' dans la section EC.**

REPOSE



Reposer dans l'ordre inverse de la dépose.

INSPECTION APRES LA REPOSE

- Vérifier que la pédale d'accélérateur effectue toute sa course sans à-coups.
- Vérifier que la pédale d'accélérateur revienne bien dans sa position initiale.
- Pour l'inspection électrique du boîtier d'accélérateur, se reporter à la section EC, ''DTC 0403 CAPTEUR DE POSITION DE LA PEDALE D'ACCELERATEUR''.
- Vérifier que le tambour du boîtier d'accélérateur peut être complètement ouvert.

SERIE DES MODELES D22

AVANT-PROPOS

Ce supplément contient des informations sur les opérations d'entretien nécessaires, ainsi que les caractéristiques qui se rapportent à la nouvelle version des séries D22.

Toutes les informations, illustrations et caractéristiques contenues dans ce supplément sont basées sur les derniers renseignements disponibles au moment de la publication. Si le véhicule NISSAN ne répond pas aux caractéristiques indiquées dans ce supplément, consulter son concessionnaire NISSAN.

Nous nous réservons tous droits d'effectuer des changements dans les caractéristiques et les méthodes, à tout moment et sans préavis.

AVANT-PROPOS

Ce manuel contient les travaux d'entretien et de réparation concernant les véhicules NISSAN PICKUP, série des modèles D22.

A des fins de sécurité et pour que le rendement des véhicules concernés soit optimal, prière de lire ce manuel complètement. Avant de commencer à entreprendre des travaux, il est particulièrement important d'avoir parfaitement assimilé les PRECAUTIONS signalées dans la section GI.

Toutes les informations contenues dans ce manuel sont basées sur les données de production les plus récentes au moment de la réalisation du manuel. Nous nous réservons le droit de modifier les caractéristiques et les méthodes de travail à n'importe quel moment et sans avis préalable.

NOTE IMPORTANTE DE SECURITE

Un entretien correctement effectué est essentiel, aussi bien pour la sécurité des mécaniciens que pour le fonctionnement adéquat du moteur. Les méthodes d'entretien reprises dans ce manuel de réparation sont décrites de telle manière que le travail puisse être effectué en sécurité et avec précision. Les entretiens varient selon les procédures, les connaissances du technicien et l'outillage, ainsi que les pièces disponibles. Dès lors, toute personne utilisant les procédures d'entretien, un outillage ou des pièces qui ne sont pas spécifiquement recommandées par NISSAN doit auparavant être absolument certain que ceci n'entraîne de danger ni pour sa propre sécurité, ni pour celle du moteur.

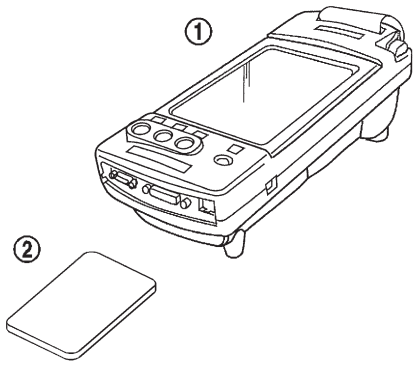
Remplacement de la pile à hydrure composée de nickel

CONSULT-II se compose d'une pile à hydrure composée de nickel. Lors du remplacement de la pile, respecter les points suivants :

ATTENTION :

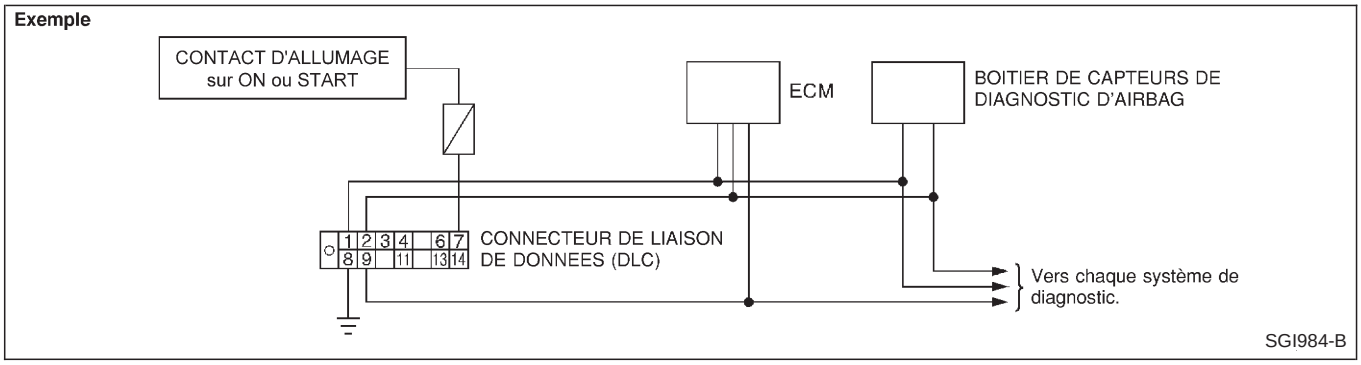


Remplacer la pile à hydrure composé de nickel uniquement avec une véritable pile CONSULT-II. L'utilisation d'une autre pile peut entraîner un risque de feu ou d'explosion. Un mauvais traitement de la pile peut entraîner un risque de feu ou de brûlure chimique. Ne pas recharger, démonter ou jeter au feu.

Veiller à placer la pile hors de portée des enfants et mettre les piles usées au rebut conformément aux réglementations locales.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Equipement de vérification



Pour commander les accessoires ci-dessous, contacter un distributeur NISSAN.

Nom de l'outil	Description
NISSAN CONSULT-II ① Unité CONSULT-II (Software de testeur interne : version Resident 3,2.0)et accessoires ② Carte programme AED01B-1 pour diagnostic, AEN00A/00B pour NATS. Afin de confirmer la meilleure combinaison de ces softwares, se reporter au manuel d'utilisation de CONSULT-II.	 SGI083A

NOTE :

- **CONSULT-II doit être utilisé conjointement avec une carte programme. CONSULT-II ne nécessite pas de procédure de charge (initialisation).**
- **S'assurer que CONSULT-II est éteint avant de reposer ou de déposer la carte programme.**

Circuit (DLC) du connecteur de diagnostic pour CONSULT-II

SGI984-B

PROCEDURE D'INSPECTION

Si CONSULT-II ne peut pas effectuer un diagnostic correct du système, vérifier les points suivants :

Symptôme	Elément à contrôler
CONSULT-II ne peut accéder à aucun système.	● Circuit d'alimentation électrique (borne 8) du connecteur de diagnostic pour CONSULT-II (borne 7) et circuit de mise à la masse (borne 8) (Pour le détail du circuit, se reporter au ''Schéma de câblage des connecteurs de liaison des données et MIL'' dans la section EC) ● Câble CONSULT-II DDL
CONSULT-II ne peut accéder à aucun système individuel. (Mais peut accéder à d'autres systèmes.)	● Carte de programme de CONSULT-II (Vérifier la carte de programme CONSULT-II correspondant au système. Se reporter à "Equipement de vérification" ci-dessus). ● Alimentation électrique et circuit de mise à la masse du boîtier de commande du système (pour le circuit détaillé, se reporter au schéma de câblage de chaque système). ● Circuit ouvert ou court-circuit entre le système et le connecteur de diagnostic pour CONSULT-II DLC (pour le circuit détaillé, se reporter au schéma de câblage de chaque système).

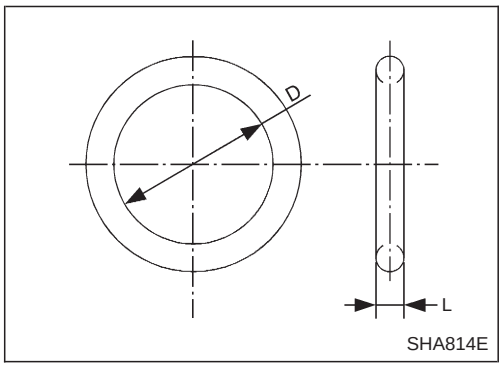
Précautions pour les raccords de réfrigérant

Un nouveau type de raccord de réfrigérant a été introduit pour chaque conduit de réfrigération sauf pour les parties suivantes.

- Soupape d'expansion à unité de refroidissement



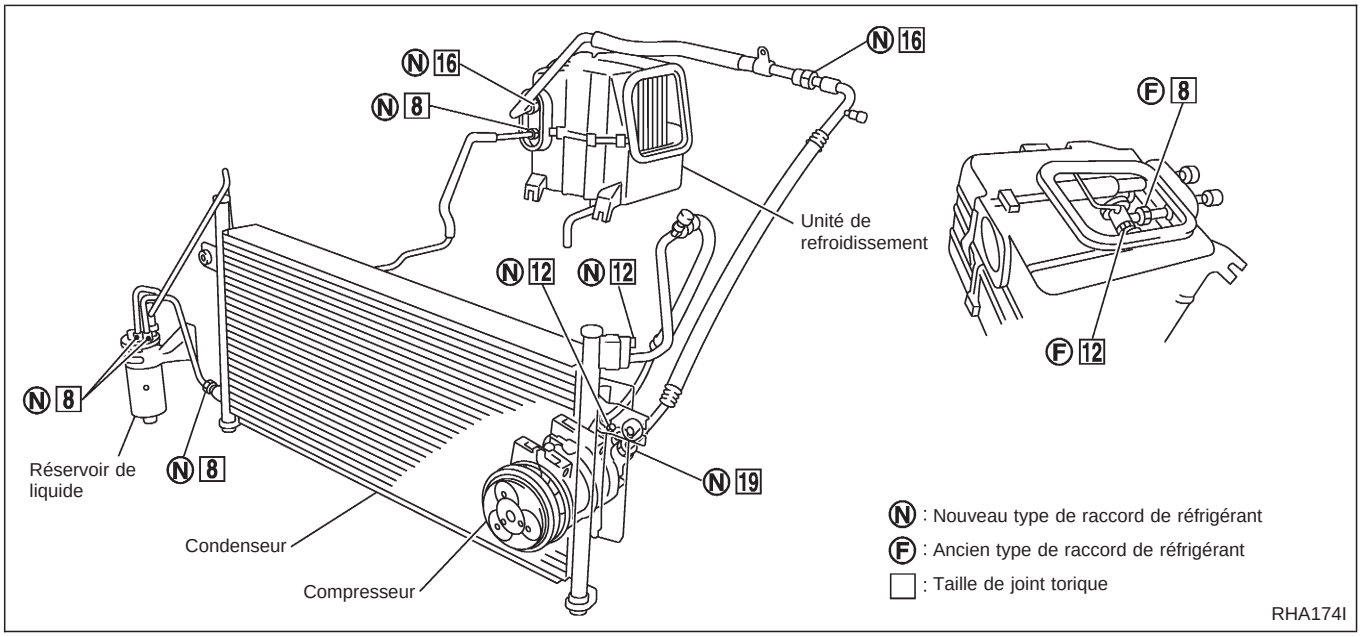
CARACTERISTIQUES DU NOUVEAU TYPE DE RACCORD DE REFRIGERANT

- Le joint torique a été déplacé. Il est désormais fourni avec une rainure pour une repose adéquate. Ceci élimine les risques de voir le joint torique être coincé ou endommagé dans la partie de raccordement. Le sens d'étanchéité du joint torique est maintenant vertical, en relation avec la surface de contact de la partie de raccordement, de façon à améliorer les caractéristiques de l'étanchéité.
- La force de réaction du joint torique n'apparaîtra pas dans le sens qui entraîne l'extraction du joint, facilitant ainsi les raccords de tuyauterie.

PRECAUTION :

Les nouveaux et les anciens raccords de liquide de refroidissement utilisent des configurations de joint torique différentes. Ne pas mélanger les joints toriques car ils ne sont pas interchangeables. Si un joint torique inadéquat est reposé, le liquide de refroidissement fuira au niveau ou autour du raccord.

Numéros et caractéristiques des pièces de joint torique



Type de raccord	Taille de joint torique	Numéro de pièce	D mm	L mm

Embrayage magnétique

Conduite à gauche avec moteurs KA, YD

SYMPTOME : L'embrayage magnétique ne s'enclenche pas lorsque l'interrupteur de climatiseur et le commutateur de ventilateur sont enclenchés.

A

VERIFIER L'ALIMENTATION ELECTRIQUE DU COMPRESSEUR.
Débrancher le connecteur de faisceau du compresseur.
Y a-t-ilune tension d'environ 12 volts entre la borne n° ① du faisceau de compresseur et la masse de carrosserie ?

Oui → Vérifier les points suivants.
- Bobine d'embrayage magnétique
- Protecteur thermique (moteur KA sauf pour le Moyen-Orient)

Se reporter à HA-3019.

Mauvais → Remplacer l'embrayage magnétique. Se reporter au manuel de réparation D22, n° de publication SM8F-0D22E0E.

Non ↓

B

Remarque

Vérifier la continuité du circuit entre la borne ⑤ du faisceau de relais de climatiseur et la borne n° ① du faisceau de compresseur.
Il doit y avoir continuité.
Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité.

Bon ↓

C

VERIFIER L'ALIMENTATION ELECTRIQUE DU RELAIS DE CLIMATISEUR.
Y a-t-il une tension d'environ 12 volts entre la borne n° ③ du faisceau de relais de climatiseur et la masse de carrosserie ?

Non → Vérifier le circuit de l'alimentation électrique et le fusible de 10A (n° 13, situé dans le boîtier à fusibles).
(Se reporter à ''DISPOSITION DE L'ALIMENTATION ELECTRIQUE'' dans la section EL et au schéma de câblage).

Oui ↓

D

VERIFIER L'ALIMENTATION ELECTRIQUE DU RELAIS DE CLIMATISEUR.
Y a-t-il une tension d'environ 12 volts entre la borne n° ② du faisceau de compresseur et la masse de carrosserie ?

Non → Vérifier le circuit de l'alimentation électrique et le fusible de 10A (n° 13, situé dans le boîtier à fusibles).
(Se reporter à ''DISPOSITION DE L'ALIMENTATION ELECTRIQUE'' dans la section EL et au schéma de câblage).

Oui ↓

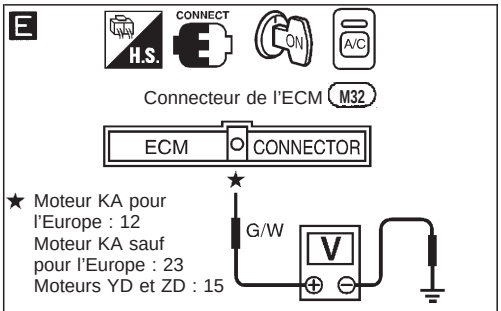
VERIFIER LE RELAIS DE CLIMATISEUR APRES L'AVOIR DEBRANCHE.
Se reporter à HA-3019.

Mauvais → Remplacer le relais de climatiseur.

Bon ↓

Rebrancher le relais de climatiseur.

↓



Ⓐ
(Passer à la page suivante).

Remarque :
Si le résultat affiche mauvais ou ''Non'' après la vérification de la continuité du circuit, réparer le faisceau ou le connecteur.

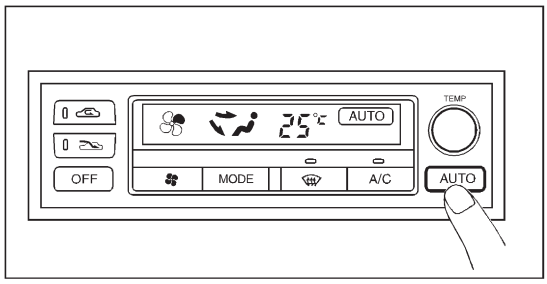
Embrayage magnétique



PROCEDURE DE DIAGNOSTIC DE DEFAUT DE L'EMBRAYAGE MAGNETIQUE

SYMPTOME :

- **L'embrayage magnétique ne s'enclenche pas.**

Ordre de l'inspection

1. Confirmer la présence du symptôme en exécutant la vérification de fonctionnement suivante.

VERIFICATION DE FONCTIONNEMENT - Mode AUTO

a. Appuyer sur la touche AUTO.
b. L'affichage doit indiquer AUTO.
Vérifier que l'embrayage du compresseur est engagé.
(Inspection auditive ou visuelle).
(L'air de décharge et la vitesse de soufflerie dépendront des températures ambiante, de l'habitacle et de référence).

Si le résultat est satisfaisant (le symptôme ne peut pas être répété), effectuer une vérification complète du fonctionnement (*10).
Si le résultat n'est pas satisfaisant, (le symptôme est confirmé), continuer avec L'ETAPE 2 suivante.

2. Rechercher les bulletins d'entretien.
3. Effectuer L'ETAPE 1 de l'autodiagnostic. (*1)
Bon
4. Effectuer L'ETAPE 2 de l'autodiagnostic. (*2)
Mauvais → Se reporter au circuit du capteur de défaut approprié. (*2)
Bon
5. Effectuer L'ETAPE 4 de l'autodiagnostic. (*3)
Mauvais → Vérifier le mécanisme de l'embrayage magnétique.
Bon → Aller à PROCEDURE DE DIAGNOSTIC DE L'EMBRAYAGE MAGNETIQUE. (*11)
Mauvais → Vérifier la pression de réfrigérant. (*12)
Bon
La cause ne peut pas être confirmée par autodiagnostic.
6. Vérifier le circuit du capteur de température ambiante. (*5)
Bon
7. Vérifier le circuit du capteur de l'habitacle. (*6)
Bon
8. Vérifier le circuit du capteur d'ensoleillement. (*7)
Bon
9. Vérifier le circuit du capteur d'admission. (*8)
Bon
10. Vérifier le circuit PBR du moteur de volet de mélange d'air. (*9)
Bon
Si le symptôme existe toujours, effectuer une vérification (*10) de fonctionnement complète et vérifier s'il y a d'autres symptômes. [Se reporter au tableau des symptômes, (*4).] Existe-t-il un autre symptôme ?
Oui → Se reporter au diagnostic de défaut de symptômes connexes.
Un autre symptôme existe.
Non
Remplacer l'amplificateur automatique. → FIN DE L'INSPECTION

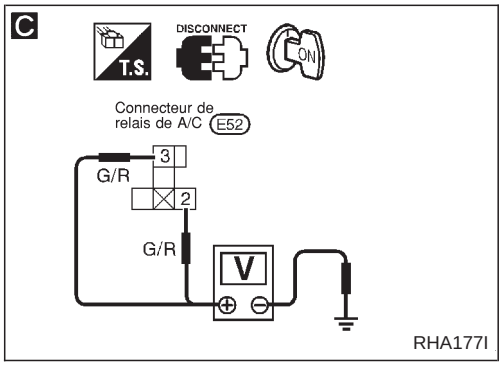
Embrayage magnétique (Suite)



PROCEDURE DE DIAGNOSTIC

SYMPTOME : L'embrayage magnétique ne s'enclenche pas lorsque l'interrupteur de climatiseur et le commutateur de ventilateur sont enclenchés.

A

VERIFIER L'ALIMENTATION ELECTRIQUE DU COMPRESSEUR.
Débrancher le connecteur de faisceau du compresseur.
Y a-t-il une tension d'environ 12 volts entre la borne n° ① du faisceau de compresseur et la masse de carrosserie ?

Oui → Vérifier la bobine de l'embrayage magnétique.
Mauvais → Remplacer l'embrayage magnétique. Se reporter au manuel de réparation D22, n° de publication SM8F-0D22E0E.

Non → Débrancher le relais de climatiseur.

B

Remarque

VERIFIER LA CONTINUITE DU CIRCUIT ENTRE LA BORNE N° ⑤ DU FAISCEAU DE RELAIS DE CLIMATISEUR ET LA BORNE N° ① DU FAISCEAU DE COMPRESSEUR.
Il doit y avoir continuité.
Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité.

Bon

C

VERIFIER L'ALIMENTATION ELECTRIQUE DU RELAIS DE CLIMATISEUR.
Débrancher le relais de climatiseur.
Y a-t-il une tension d'environ 12 volts entre les bornes n° ②, ③ du faisceau de relais de climatiseur et la masse de carrosserie ?

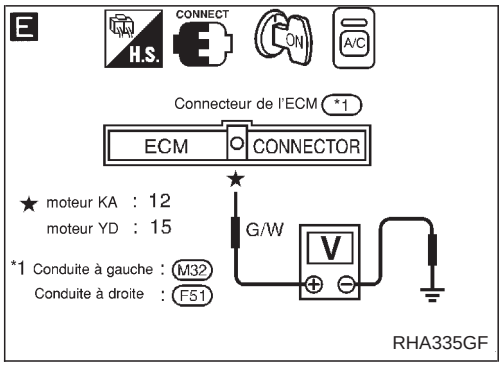
Non → VERIFIER LE CIRCUIT DE L'ALIMENTATION ELECTRIQUE ET LE FUSIBLE DE 10A (N° 13) DANS LE BOITIER A FUSIBLES.
Se reporter à la section EL (''Schéma de câblage'', ''DISPOSITION DE L'ALIMENTATION ELECTRIQUE'').

Oui

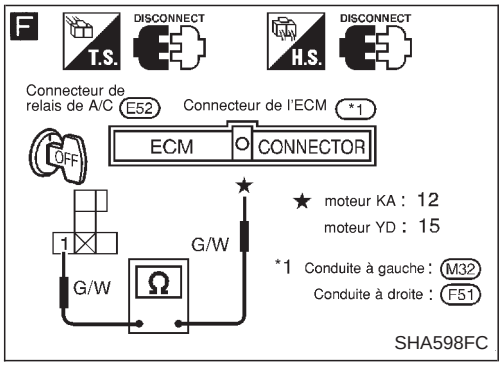
VERIFIER LE RELAIS DE CLIMATISEUR APRES L'AVOIR DEBRANCHE.
Se reporter à la page HA-3029.

Mauvais → Remplacer le relais de climatiseur.

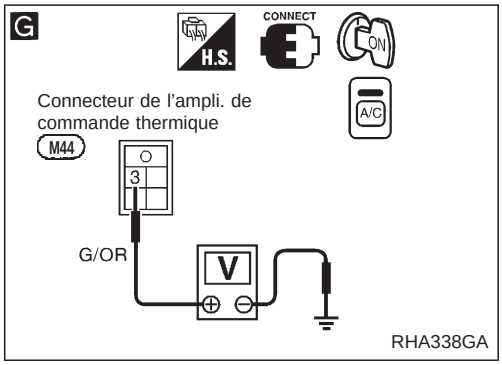
Bon



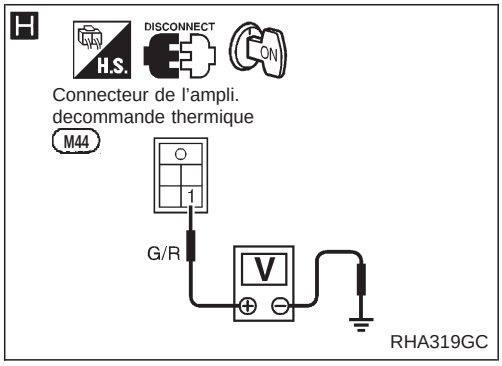
Ⓐ



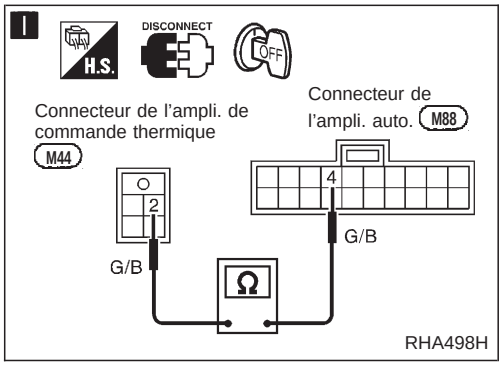
(Passer à la page suivante).



Remarque :
Si le résultat affiche mauvais ou ''Non'' après la vérification de la continuité du circuit, réparer le faisceau ou le connecteur.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Embrayage magnétique (Suite)

Ⓐ

E Remarque

VERIFIER LE CIRCUIT COTE BOBINE DU RELAIS DE CLIMATISEUR.
Y a-t-il une tension d'environ 12 volts entre la borne n° ⑫ ou ⑮ du faisceau de l'ECM et la masse de carrosserie ?

Non → **F** Remarque

Vérifier la continuité du circuit entre la borne ① du faisceau de relais de climatiseur et la borne n° ⑫ ou ⑮ du faisceau de l'ECM.
Il doit y avoir continuité.
Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité.

Oui ↓

G Remarque

VERIFIER LA TENSION DE L'AMPLI. DE COMMANDE THERMIQUE.
Y a-t-il une tension d'environ 12 volts entre la borne n° ③ du faisceau de l'ampli. de commande thermique et la masse de carrosserie ?

Non → Ⓑ (Passer à la page suivante).

Oui ↓

H

VERIFIER L'ALIMENTATION ELECTRIQUE DE L'AMPLI. DE COMMANDE THERMIQUE.
Y a-t-il une tension d'environ 12 volts entre la borne n° ① du faisceau de l'ampli. de commande thermique et la masse de carrosserie ?

Non → Vérifier le circuit de l'alimentation électrique et le fusible de 10A (n° 13, situé dans le boîtier à fusibles.)
(Se reporter à "DISPOSITION DE L'ALIMENTATION ELECTRIQUE" dans la section EL et au schéma de câblage).

Oui ↓

Remarque

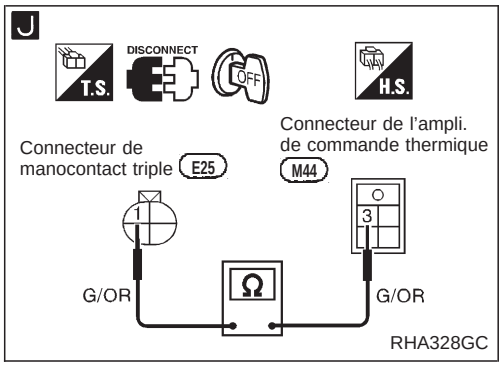
VERIFIER L'AMPLI. DE COMMANDE THERMIQUE.
Se reporter au manuel de réparation D22, n° de publication SM8F-0D22E0E.

Mauvais → Remplacer l'ampli. de commande thermique.

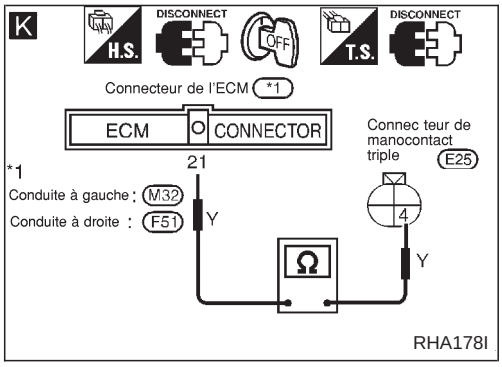
Bon ↓

I Remarque

Vérifier la continuité entre la borne n° ② du faisceau de l'ampli. de commande thermique et la borne n° ④ de l'ampli. auto. de climatiseur.
Il doit y avoir continuité.
Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité.



Bon ↓



Remplacer l'amplificateur automatique.

Remarque :
Si le résultat affiche mauvais ou "Non" après la vérification de la continuité du circuit, réparer le faisceau ou le connecteur.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Embrayage magnétique (Suite)

(B)

J Remarque

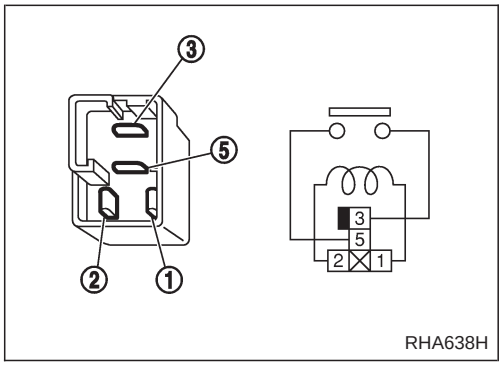
Vérifier la continuité du circuit entre la borne n° (3) du faisceau de l'ampli. de commande thermique et la borne n° (1) du faisceau de manocontact triple.
Il doit y avoir continuité.
Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité.

↓ Bon

VERIFIER LE MANOCONTACT TRIPLE.
Se reporter au manuel de réparation D22, n° de publication SM9F-D22BE0E.

Mauvais → Remplacer le manocontact triple.

↓ Bon



K Remarque

Vérifier la continuité du circuit entre la borne n° (4) du faisceau de manocontact triple et la borne n° (21) du faisceau de l'ECM.
Il doit y avoir continuité.
Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité.

↓ Bon

Remplacer l'ECM.

Remarque :
Si le résultat affiche mauvais ou ''Non'' après la vérification de la continuité du circuit, réparer le faisceau ou le connecteur.

INSPECTION DES COMPOSANTS ELECTRIQUES

Relais de climatiseur

Vérifier la continuité entre les bornes 3 et 5.

Conditions	Il y a continuité
Alimentation en courant continu de 12 volts entre les bornes 1 et 2	Oui
Aucune alimentation électrique	Non

Si le résultat n'est pas satisfaisant, remplacer le relais.

RHA179I

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Vérification des fuites de réfrigérant

PROCEDURE DE VERIFICATION

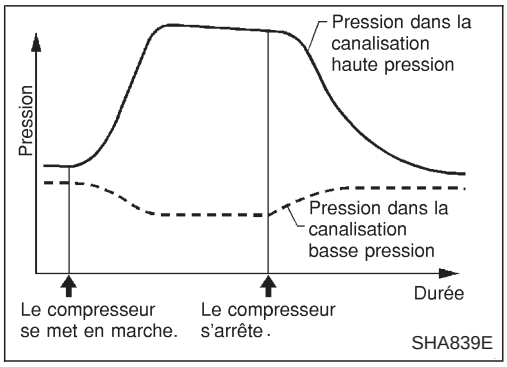
Pour éviter une lecture fausse ou inexacte, s'assurer qu'il n'y a aucune vapeur de réfrigérant ou de fumée de cigarettes à proximité du véhicule. Effectuer le test d'étanchéité dans un lieu calme (à l'abri des courants d'air et du vent) de sorte que le réfrigérant qui fuit ne se disperse pas.

1. Arrêter le moteur.
2. Brancher un jeu de manomètre de collecteur de climatiseur adéquat aux orifices d'entretien du climatiseur.
3. Vérifier si la pression du réfrigérant du climatiseur atteint un minimum de 345 kPa (3,452 bar, 3,52 kg/cm^2) au dessus de 16°C. Si la pression est inférieure à la valeur spécifiée, purger le circuit et le recharger avec la quantité spécifiée de réfrigérant.
   REMARQUE : A des températures inférieures à 16°C, les fuites peuvent ne pas être détectées si le système n'atteint pas 345 kPa (3,452 bar, 3,52 kg/cm^2).
4. Conduire le test d'étanchéité de haut en bas en allant de ⓐ à ⓝ. Se reporter à la page HA-3030.

Effectuer avec précaution un test d'étanchéité dans les zones suivantes. Nettoyer le composant à contrôler et déplacer la sonde du détecteur de fuites tout autour du raccord/composant.

- **Compresseur**
  Vérifier les raccordements des flexibles de haute et basse pression, du limiteur de pression et du segment circulaire d'étanchéité.
- **Réservoir de liquide**
  Vérifier le manocontact, le raccordement du tube, les joints de soudure et les fixations des bougies de fusibles.
- **Soupapes d'entretien**
  Vérifier tout autour des soupapes d'entretien. S'assurer que les couvercles de soupapes d'entretien sont bien fixés sur les soupapes (afin d'éviter les fuites).
  REMARQUE : Après avoir déposé le jeu de manomètre de collecteur de climatiseur des soupapes d'entretien, essuyer toute trace de résidus sur les soupapes afin d'éviter une lecture fausse du détecteur.
- **Unité de refroidissement (évaporateur)**
  Mettre le ventilateur de soufflerie en position rapide pendant au moins 15 secondes pour éviter toute trace de réfrigérant de l'unité de refroidissement. Introduire la sonde du détecteur de fuite dans le flexible de vidange aussitôt après avoir coupé le contact. (Laisser la sonde à l'intérieur pendant au moins dix secondes.)

5. Si le détecteur détecte une fuite, vérifier au moins une fois en soufflant de l'air comprimé dans la zone de fuite suspectée avant de recommencer la vérification.
6. Ne pas arrêter lorsque une première fuite est trouvée. Continuer de vérifier qu'il n'existe pas d'autres fuites dans les autres composants du circuits.
7. Faire démarrer le moteur.
8. Régler la commande du climatiseur comme suit :
   a. Interrupteur de climatiseur sur MARCHE
   b. Mode facial

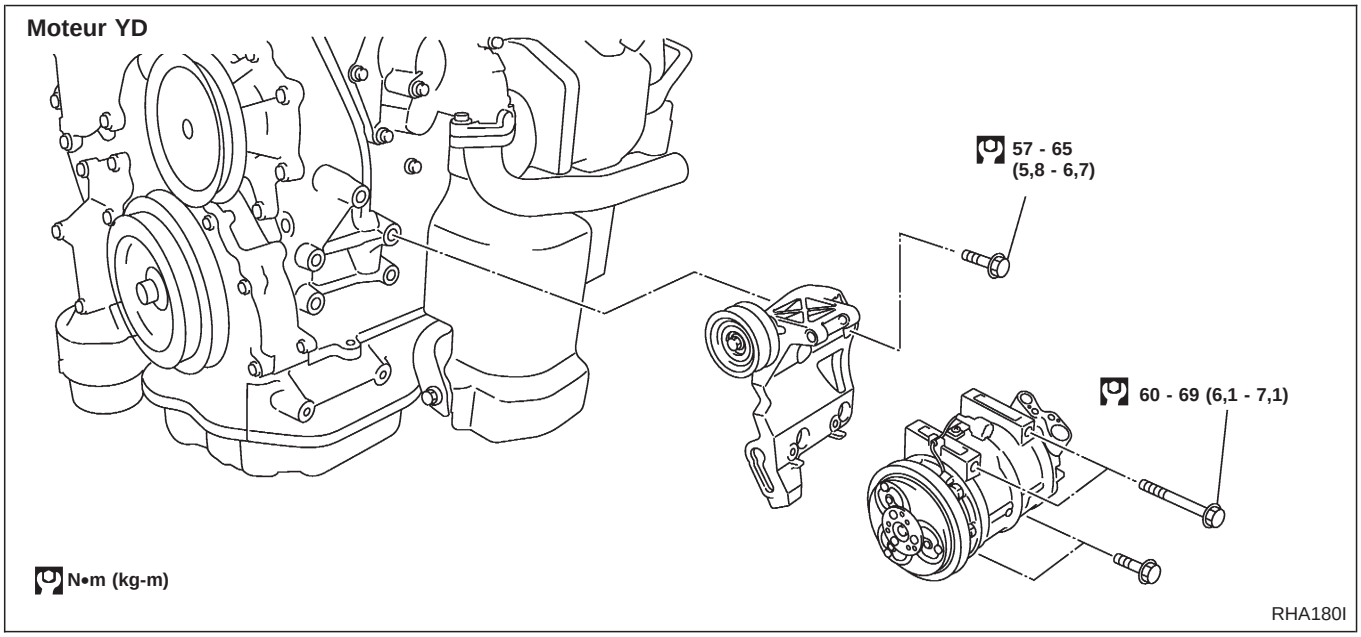


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Vérification des fuites de réfrigérant (Suite)

c. Touche de recyclage de l'air sur MARCHE
d. Température de froid. maxi.
e. Vitesse élevée du ventilateur

9. Faire tourner le moteur à un régime de 1500 tr/mn pendant au moins 2 minutes.
10. Arrêter le moteur et effectuer à nouveau une recherche de fuites éventuelles en répétant les étapes 4 à 6 décrites ci-dessus.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Les fuites de réfrigérant doivent être contrôlées immédiatement après l'arrêt du moteur. Commencer par détecter les fuites sur les canalisations haute pression. La pression dans la canalisation haute pression chute progressivement après que la circulation du réfrigérant s'est arrêtée et la pression dans la canalisation basse pression augmente progressivement comme décrit sur la courbe. Il est plus facile de détecter des fuites lorsque la pression est élevée.

11. Délester le circuit de A/C en utilisant un équipement de récupération de réfrigérant. Réparer les rapports ou composants comportant des fuites.
12. Purger et recharger le circuit de A/C, puis procéder à un test d'étanchéité pour vérifier qu'il n'y a pas de fuites de réfrigérant.
13. Effectuer le test de performance de A/C pour s'assurer que le système fonctionne correctement.

Vérification de la pression d'huile

AVERTISSEMENT :

- **Veiller à ne pas se brûler, car le moteur et l'huile risquent d'être très chauds.**
- **La pression d'huile doit être vérifiée au ''point mort''.**

1. Vérifier le niveau d'huile.
2. Déposer le manocontact d'huile.
3. Reposer le manomètre.
4. Démarrer le moteur et le faire chauffer à la température de fonctionnement normale.
5. Vérifier la pression d'huile sans imposer de charge au moteur.

Régime du moteur tr/min	Pression approximative de débit kPa (bar, kg/cm^2)
Régime de ralenti	Minimum 140 (1,40, 1,43)
2 000	Minimum 270 (2,69, 2,75)
4 000	Minimum 430 (4,29, 4,38)

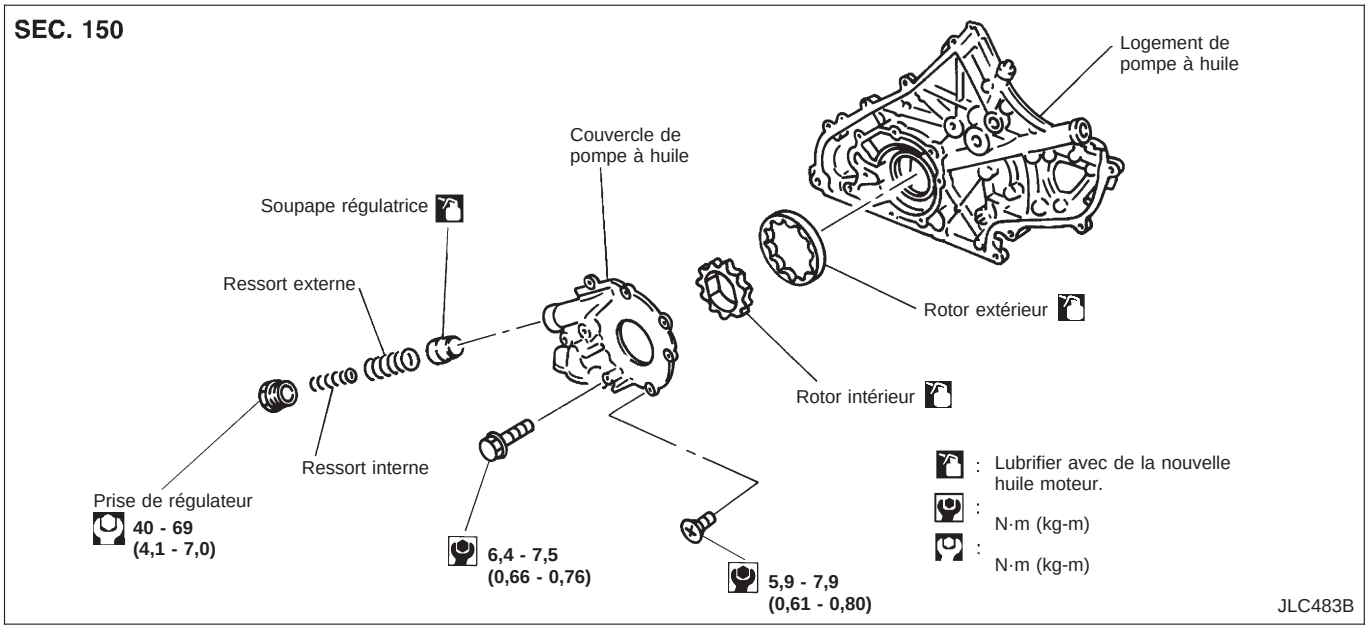
Si la différence est trop grande, vérifier les fuites éventuelles des passages d'huile et de la pompe à huile.

6. Après inspections, reposer le manocontact d'huile comme suit.

a. Retirer l'ancien joint adhérant au manocontact et au moteur.
b. Appliquer du joint liquide garanti d'origine ou équivalent au filetage et serrer.

: 13 - 17 N·m (1,25 - 1,75 kg-m)

Pompe à huile



DEPOSE ET REPOSE

- **Lors de la repose de la pompe à huile, appliquer de l'huile moteur sur les rotors.**

Se reporter à ''Chaîne de distribution primaire'' dans la section EM.

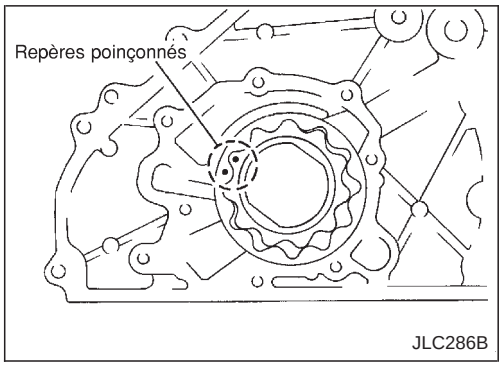
Reposer toutes les pièces déposées dans l'ordre inverse de la dépose.

DEMONTAGE ET REMONTAGE

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

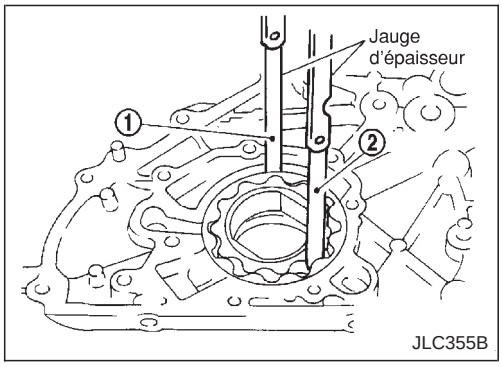
Pompe à huile (Suite)

INSPECTION DE LA POMPE A HUILE



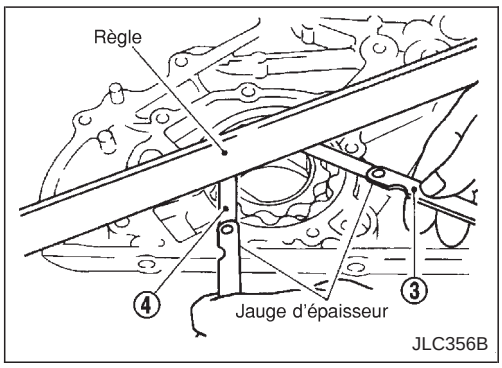
- **Reposer les rotors externe et interne avec les repères d'alignement sur le couvercle de la pompe à huile.**

En utilisant une jauge d'épaisseur, une règle et un micromètre, vérifier les jeux suivants :

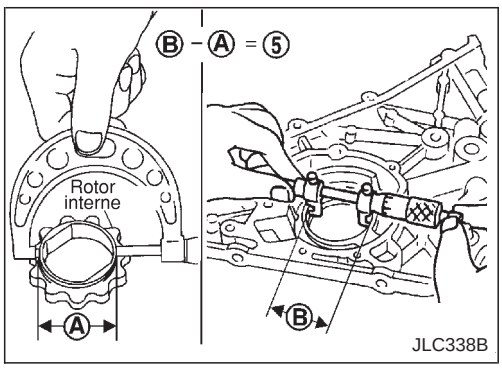


Unité : mm

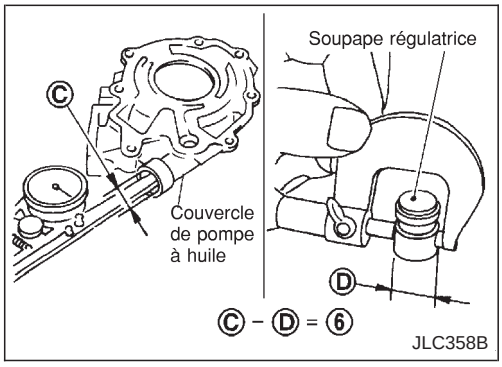
Jeu radial du logement du rotor extérieur **1**	0,114 - 0,260
Jeu à l'arête du rotor intérieur au rotor extérieur **2**	Inférieur à 0,180
Jeu axial du logement du rotor intérieur **3**	0,050 - 0,090
Jeu axial du logement du rotor extérieur **4**	0,030 - 0,190
Jeu du rotor intérieur à la partie du logement **5**	0,045 - 0,091



- **Si le jeu à l'arête (2) dépasse la limite, remplacer le couple de rotors.**
- **Si les jeux de logement de rotors (1, 3, 4, 5) dépassent la limite, remplacer l'ensemble de logement de pompe à huile.**



JLC286B



JLC355B

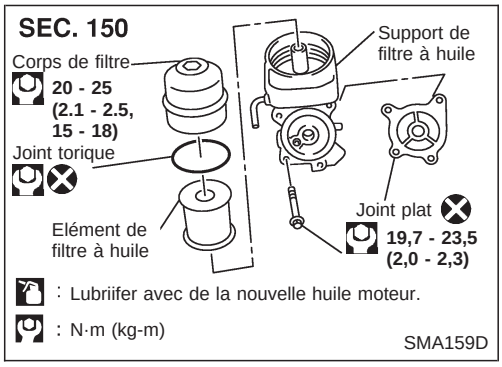
JLC356B

JLC338B

JLC358B

VERIFICATION DE LA SOUPAPE REGULATRICE

1. Vérifier visuellement si les composants ne sont pas usés ou endommagés.
2. Vérifier la surface de glissement de la soupape régulatrice de pression d'huile et le ressort de soupape.
3. Enduire la soupape régulatrice d'huile moteur. Vérifier qu'elle chute en douceur dans l'orifice de soupape sous l'effet de son propre poids.



Si endommagés, remplacer l'ensemble de soupape régulatrice ou le logement de pompe à huile.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Pompe à huile (Suite)

4. Vérifier le jeu entre la soupape régulatrice et le couvercle de pompe à huile.
   Jeu 6 :
   6 : 0,040 - 0,097 mm

Si le jeu dépasse la limite, remplacer le logement de pompe à huile.

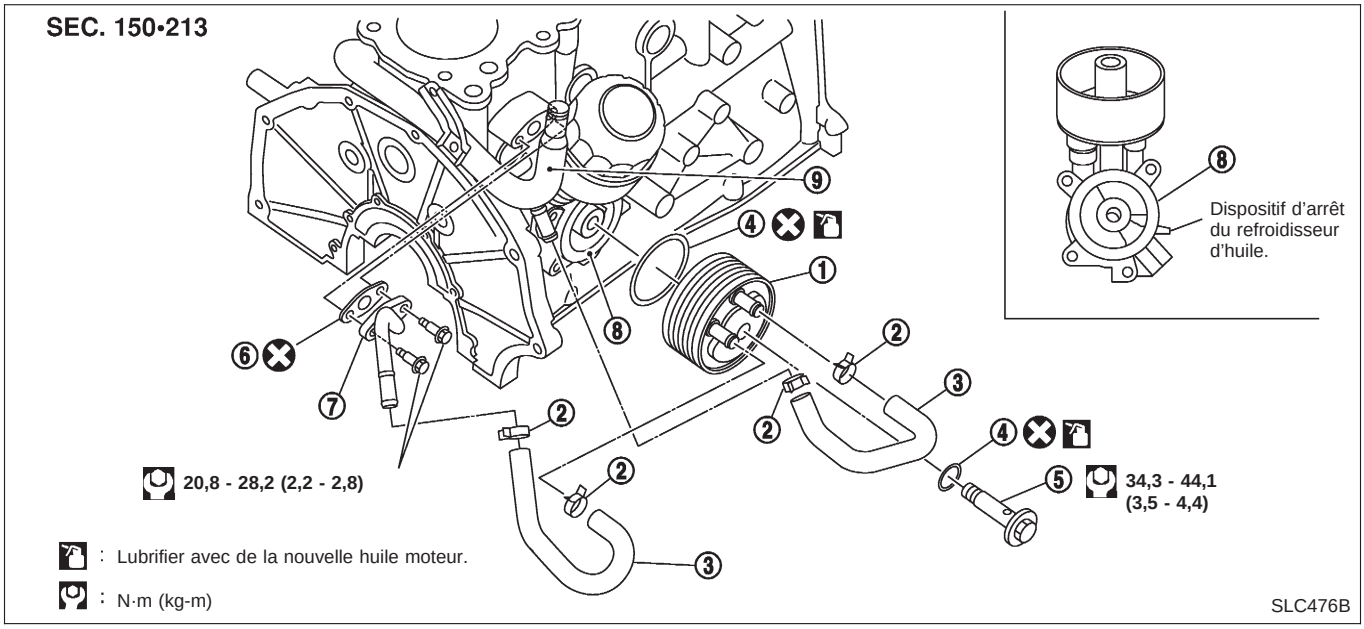
Support de filtre à huile

DEPOSE

1. Dépose du filtre à huile. Se reporter à ‘‘Changement du filtre à huile’’ dans la section MA.
2. Desserrer les écrous de montage du support de filtre à huile afin de purger l’huile.

● Placez une cuvette ou un chiffon pour récupérer l’huile.

3. Déposer le support de filtre huile.



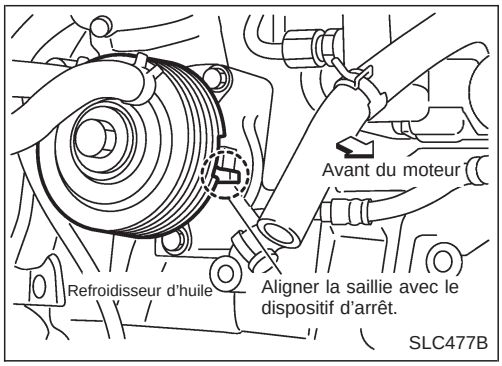
INSTALLATION

1. Retirer complètement tout objet étranger adhérant aux surfaces de montage (bloc-cylindre et côtés du support).
2. Reposer la pompe à eau avec un joint neuf.
3. Reposer le filtre à d’huile. Se reporter à ‘‘Changement du filtre à huile’’ dans la section MA.

FILTRE A HUILE

Le filtre à huile est un élément type. Se reporter à ‘‘Changement du filtre à huile’’ dans la section MA.

Refroidisseur d’huile



1. Refroidisseur d’huile
2. Collier
3. Flexible d’eau
4. Joint torique
5. Boulon de raccord
6. Joint plat
7. Connecteur de flexible d’eau
8. Support de filtre à huile
9. Tuyau de chauffage

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Refroidisseur d’huile (Suite)

DEPOSE ET REPOSE

1. Vidanger le liquide de refroidissement.
   Se reporter au chapitre ‘‘Changement du liquide de refroidissement’’ dans la section MA.

2. Reposer toutes les pièces déposées dans l’ordre inverse de la dépose.

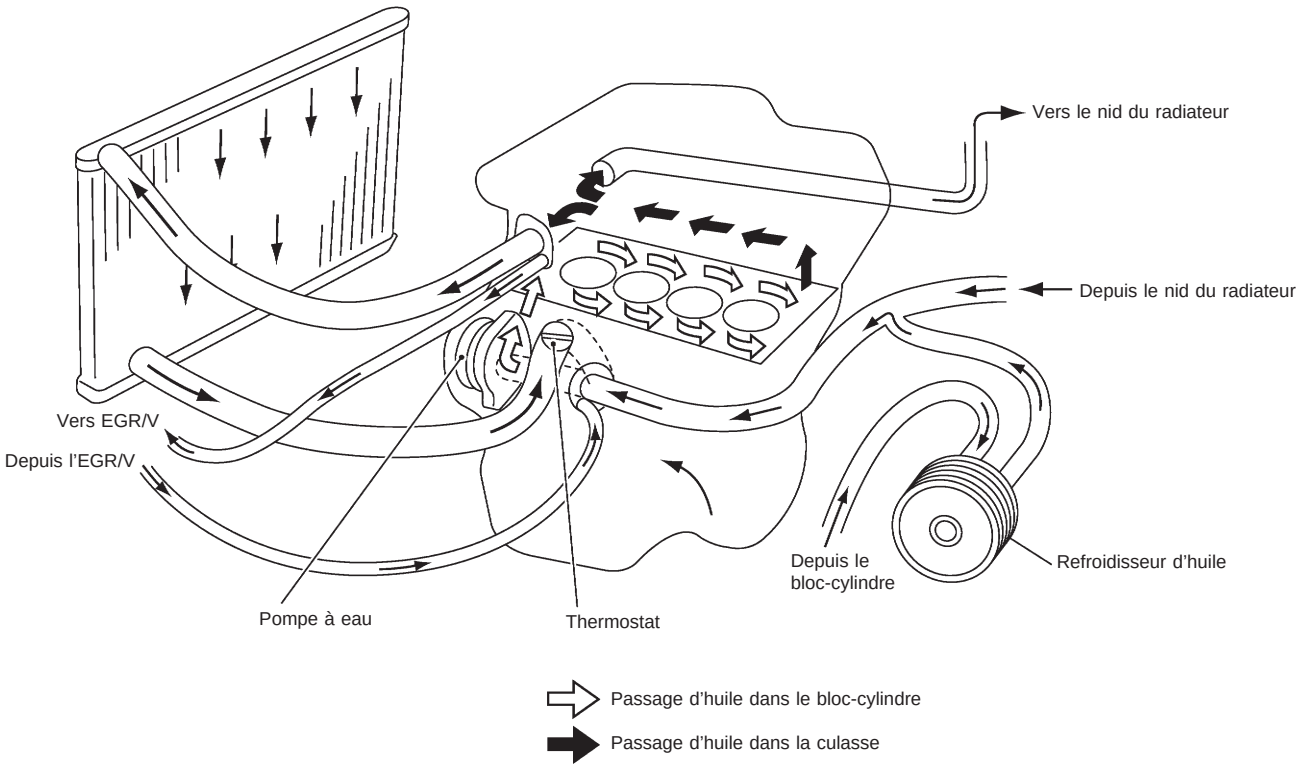
- Vérifier qu’aucun objet étranger n’adhére sur les plans d’installation du refroidisseur d’huile ou bloc.
- Serrer les boulons de raccord après avoir aligner le dispositif d’arrêt sur le côté du bloc-cylindre avec la saillie du refroidisseur d’huile.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

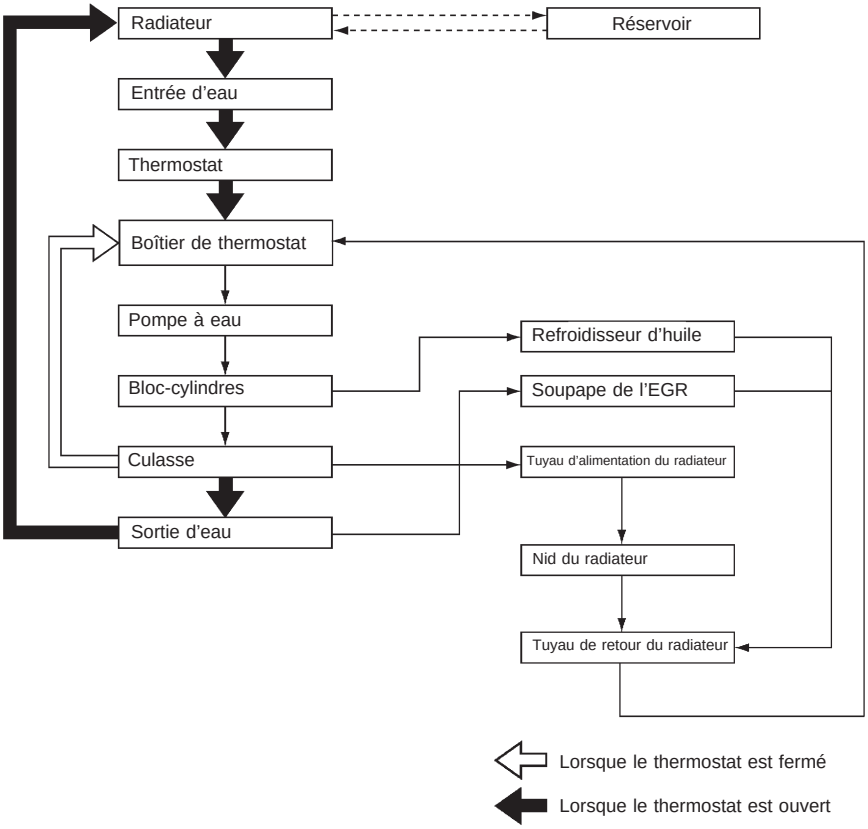
Analyse des causes de surchauffe

TABLEAU DE DEPISTAGE DES PANNES

	Symptôme		Eléments à vérifier	
Dysfonctionnement d'éléments du circuit de refroidissement	Transfert de chauffage de pauvre qualité	Défaut de la pompe à eau	Courroie d'entraînement usée ou desserrée	—
		Thermostat bloqué sur la position de fermeture	—	
		Ailettes endommagées	Obstruction ou encrassement par poussière ou papier	
			Dommage mécanique	
		Obturation ou encrassement du tuyau de refroidissement du radiateur	Excès de particules étrangères (rouille, saleté, sable, etc.)	
	Débit d'air réduit	Le ventilateur de refroidissement ne fonctionne pas.	—	—
		Résistance élevée à la rotation de ventilateur		
		Ailettes de ventilateur endommagées		
	Protection de radiateur endommagée	—	—	—
	Richesse de mélange du liquide de refroidissement inadéquate	—	—	—
	Qualité pauvre du liquide de refroidissement	—	—	—
	Liquide de refroidissement insuffisant	Fuites de liquide de refroidissement	Flexible de refroidissement	Collier désserré
				Flexible fissuré
			Pompe à eau	Mauvaise étanchéité
			Bouchon de radiateur	Desserré
				Mauvaise étanchéité
			Radiateur	Dommage, détérioration ou mauvaise fixation du joint torique
				Réservoir de radiateur fissuré
				Nid du radiateur fissuré
			Réservoir	Réservoir fissuré
		Trop-plein de réservoir	Fuites de gaz d'échappement dans le circuit de refroidissement	Détérioration de culasse
				Détérioration du joint de culasse



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

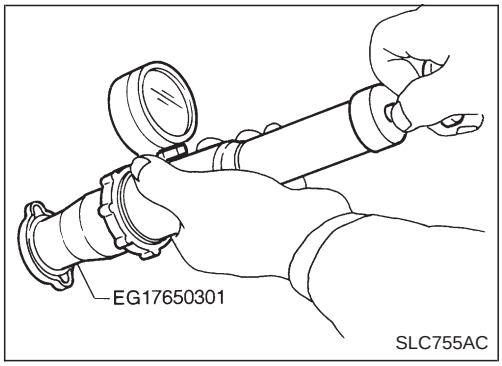


Analyse des causes de surchauffe (Suite)

	Symptôme		Eléments à vérifier	
Sauf le dysfonctionnement d'éléments du circuit de refroidissement	—	Surcharge du moteur	Conduite forcée	Régime moteur élevé sans charge
				Conduite en première vitesse pendant une durée prolongée
				Conduite à vitesse très rapide
			Défaut du système de transmission	—
			Monte de roues et pneus de taille incorrecte	
			Grippage des freins	
			Calage de l'allumage inadéquat	
	Débit d'air bloqué ou restreint	Bouclier bouché	—	—
		Grille de radiateur bloquée	Installation du bouclier de radiateur du véhicule	
			Obstruction ou encrassement par boue, papier ou autre matériau	
		Radiateur bloqué	—	
		Condenseur obstrué	—	
		Pose d'un feu antibrouillard large		

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

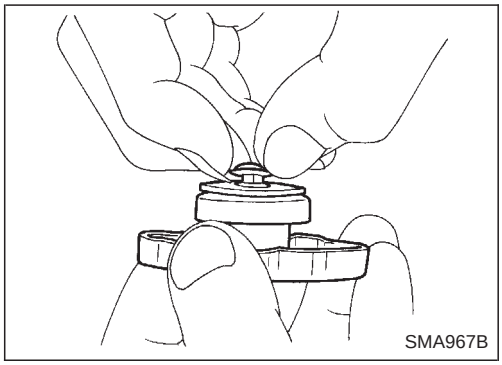
Circuit de refroidissement



SLC478B

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Vérification du circuit

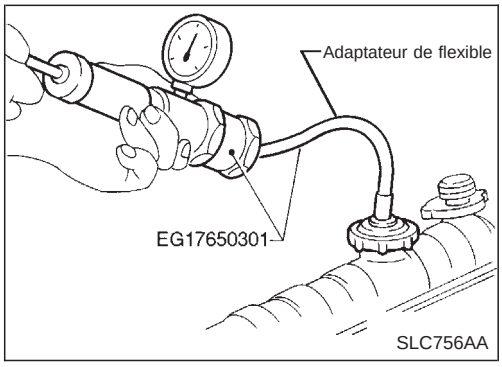


AVERTISSEMENT :
Ne jamais déposer le bouchon de radiateur lorsque le moteur est chaud. Ceci peut entraîner des brûlures graves provoquées par le liquide sous haute pression s'échappant du radiateur.
Enrouler un chiffon épais autour du bouchon et déposer doucement le bouchon en le tournant d'abord d'un quart de tour pour permettre à la pression de s'échapper, puis en le tournant à bout de course pour le déposer.

VERIFICATION DU BOUCHON DE RADIATEUR

Pour contrôler le bouchon de radiateur, exercer une pression sur le bouchon de radiateur avec un testeur.

Pression de décharge du bouchon de radiateur :
Standard
78 - 98 kPa
(0,78 - 0,98 bar, 0,8 - 1,0 kg/cm^2)
Limite
59 kPa (0,59 bar, 0,6 kg/cm^2)



Tirer sur la soupape à dépression pour l'ouvrir.
Vérifier qu'elle se referme totalement une fois relâchée.

- Vérifier que la soupape à dépression n'est pas salie ou endommagée avec le siège de soupape.
- Déplacer la soupape à dépression pour vérifier que l'ouverture et la fermeture de la soupape s'effectue sans problème.

PRECAUTION :

- **S'assurer de procèder aux contrôles lorsque le moteur a refroidi.**
- **Avant de brancher le bouchon de radiateur au testeur, appliquer de l'eau ou du liquide de refroidissement longue durée (LLC) au joint de bouchon..**
- Replacer le bouchon de radiateur si le fonctionnement de la soupape de dépression est anormal ou si la pression d'ouverture de la soupape est en dehors de la fourchette standard.

VERIFICATION DE L'ETANCHEITE DU CIRCUIT DE REFROIDISSEMENT

Vérifier s'il n'y a pas de fuites en exerçant une pression sur le circuit de refroidissement à l'aide d'un testeur.

Pression d'essai :
157 kPa (1,57 bar, 1,6 kg/cm^2)

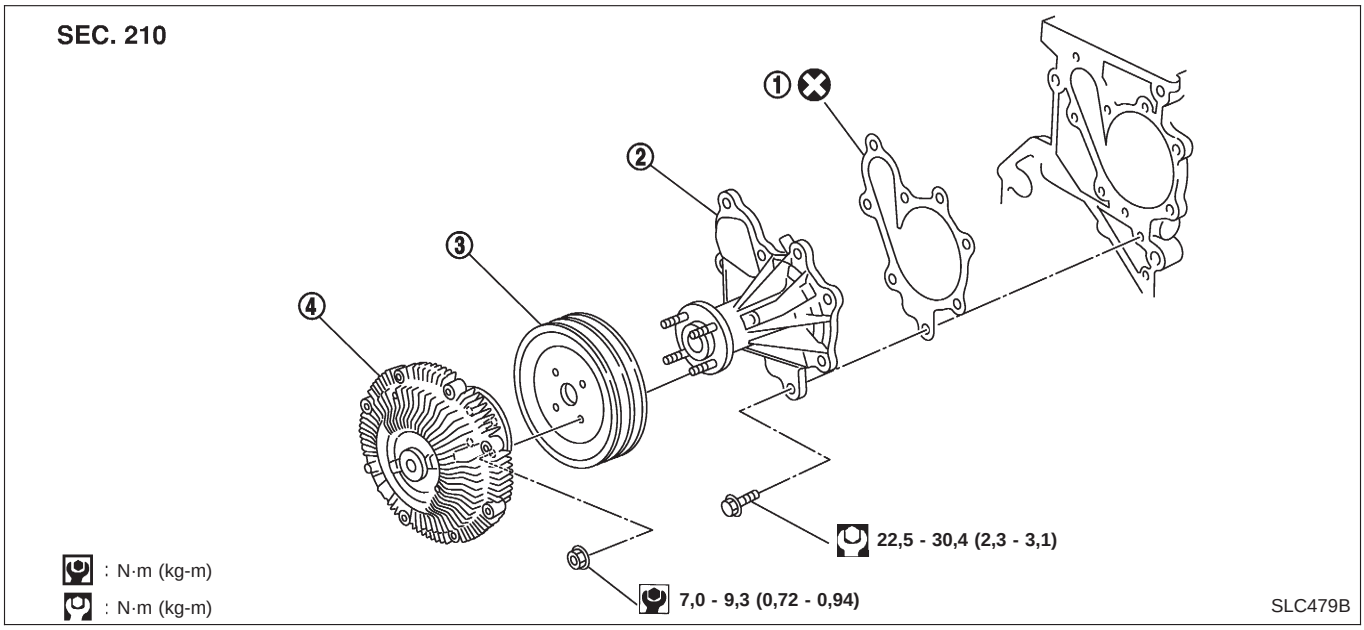
PRECAUTION :

- **Une pression supérieure à celle spécifiée peut abîmer le radiateur.**
- **S'assurer de procéder aux contrôles lorsque le moteur a refroidi.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Vérification du circuit (Suite)

●Utiliser un adaptateur de flexible entre le testeur de capuchon et le goulot de remplissage pour éviter au goulot de remplissage du radiateur d'être déformé.



- Si des anormalités sont trouvées, réparer ou remplacer les pièces qui fonctionnent mal.

Pompe à eau

DEPOSE ET REPOSE

PRECAUTION :

- **Lors de la dépose de l'ensemble de pompe à eau, veiller à ne pas renverser de liquide de refroidissement sur la courroie d'entraînement.**
- **La pompe à eau ne peut pas être démontée et doit être remplacée dans sa totalité.**
- **Après avoir reposé la pompe à eau, rebrancher le flexible et le fixer correctement avec un collier, puis vérifier qu'il n'y a pas de fuites à l'aide d'un testeur de bouchon de radiateur.**

1. Joint plat
2. Pompe à eau
3. Poulie de la pompe à eau.
4. Accouplement de ventilateur

DEPOSE

1. Vidanger le liquide de refroidissement du moteur. Se reporter au chapitre ''Changement du liquide de refroidissement'' dans la section MA.
2. Déposer le bouclier du radiateur.
3. Déposer le ventilateur et l'accouplement.
4. Déposer les courroies d'entraînement. Se reporter à la section EM, ''Courroie d'entraînement''.
5. Déposer la poulie de la pompe à eau.
6. Déposer la pompe à eau.

INSPECTION

- Vérifier qu'il n'y ait pas de rouille ou de salissure adhérant à la pompe à eau ou aux ailettes.

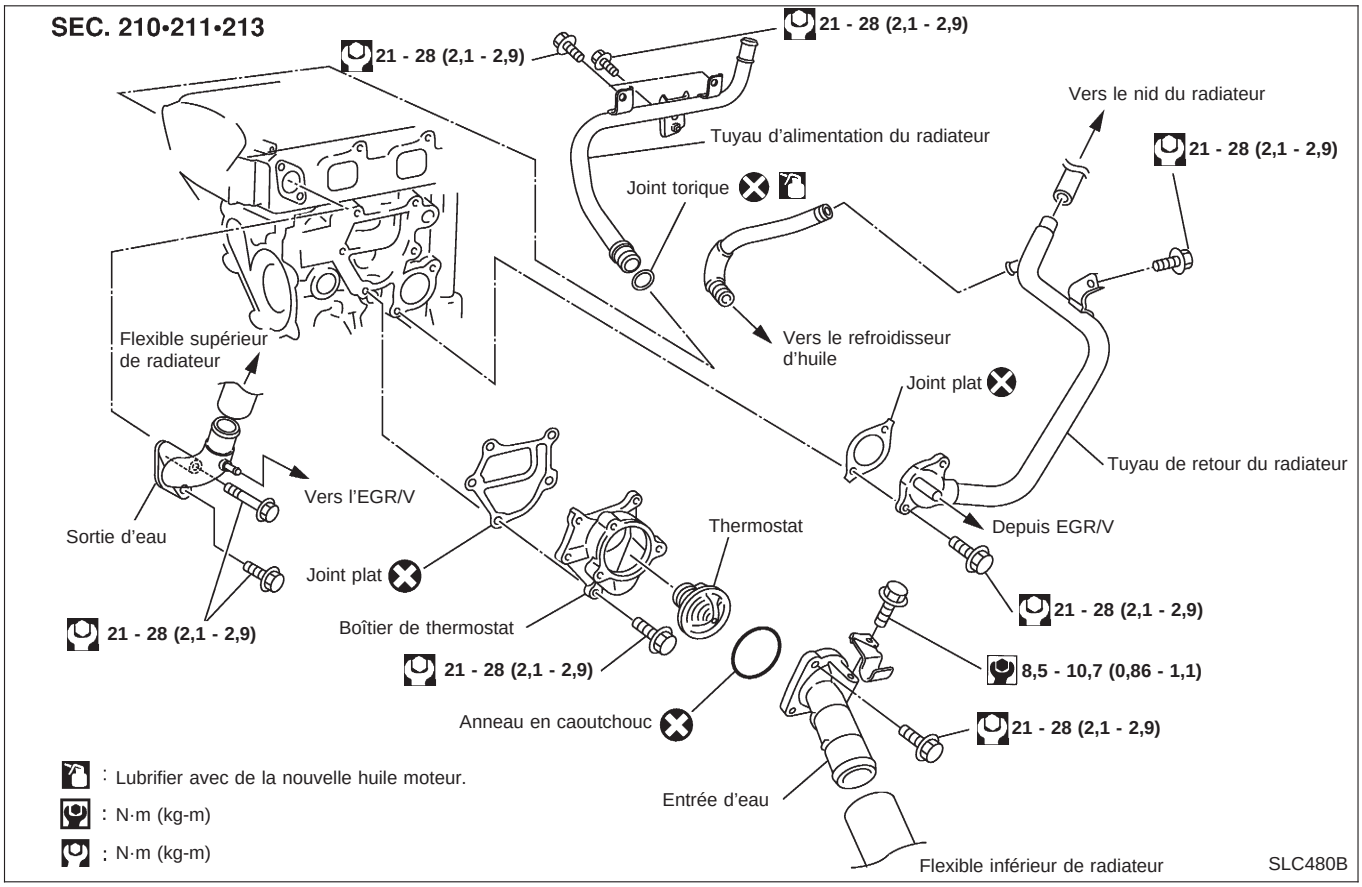
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Pompe à eau (Suite)

- Tourner l'arbre de la pompe à la main et vérifier que la pompe tourne sans dureté ni jeu.

PRECAUTION :

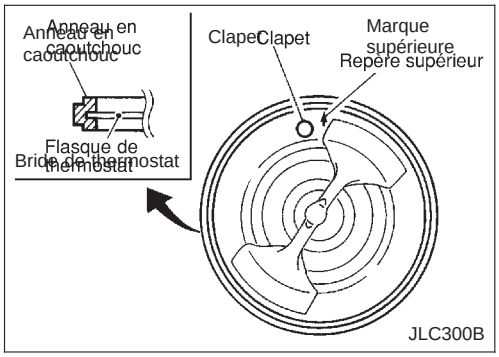
Ne pas démonter l'accouplement du ventillateur.



REPOSE

- Reposer les pièces dans l'ordre inverse de la dépose.
- Reposer la poulie de la pompe à eau en positionnant la marque frontale (marquage blanc destiné à éviter les erreurs à la repose) face à l'avant du moteur. Se reporter à la figure de la page précédente.

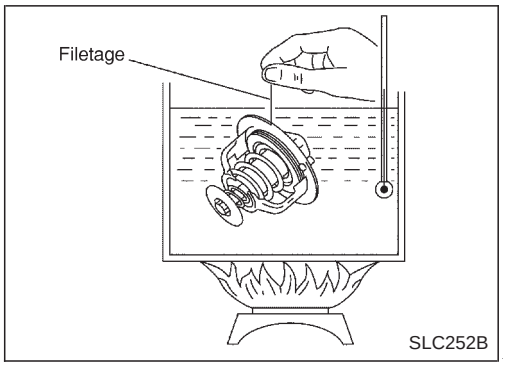
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Thermostat et tuyauterie d'eau

DEPOSE ET REPOSE

- **Veiller à ne pas renverser de liquide de refroidissement sur le compartiment moteur. Placer un chiffon pour absorber le liquide de refroidissement.**

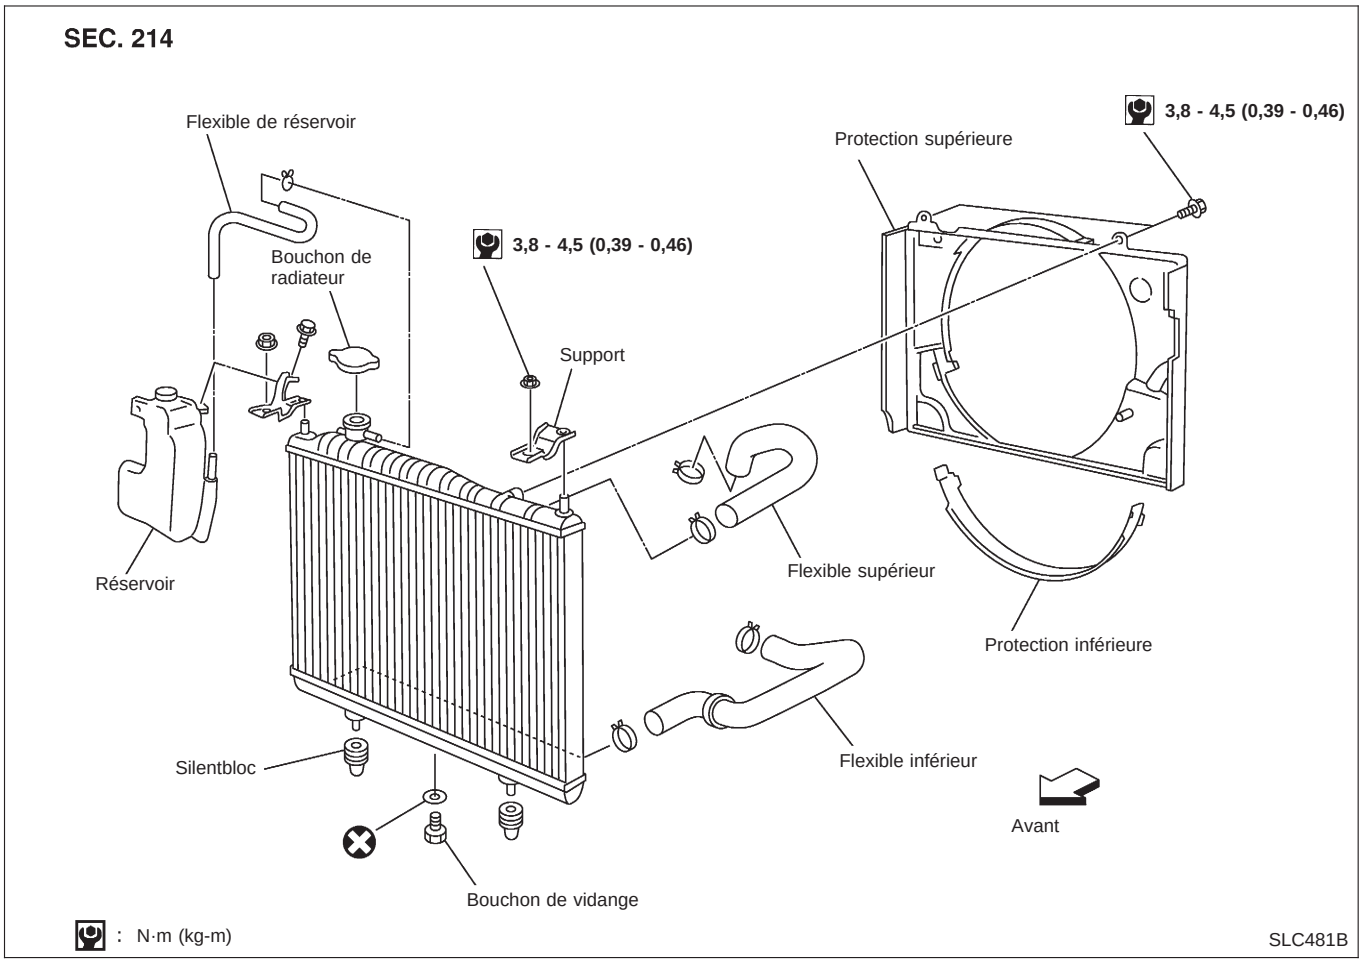


1. Vidanger le liquide de refroidissement du moteur. Se reporter au chapitre ''Changement du liquide de refroidissement'' dans la section MA.
2. Déposer l'élément d'entrée d'eau.
3. Déposer le thermostat.

4. Reposer le thermostat en plaçant le clapet vers le haut.
- **Monter avec soin le joint coutchouc à la bride de thermostat en s'assurant qu'il reste en place.**
5. Après la repose et reremplissage en liquide de refroidissement, faire tourner le moteur pendant quelques minutes et vérifier qu'il n'y a pas de fuites d'huile.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Thermostat et tuyauterie d'eau (Suite)



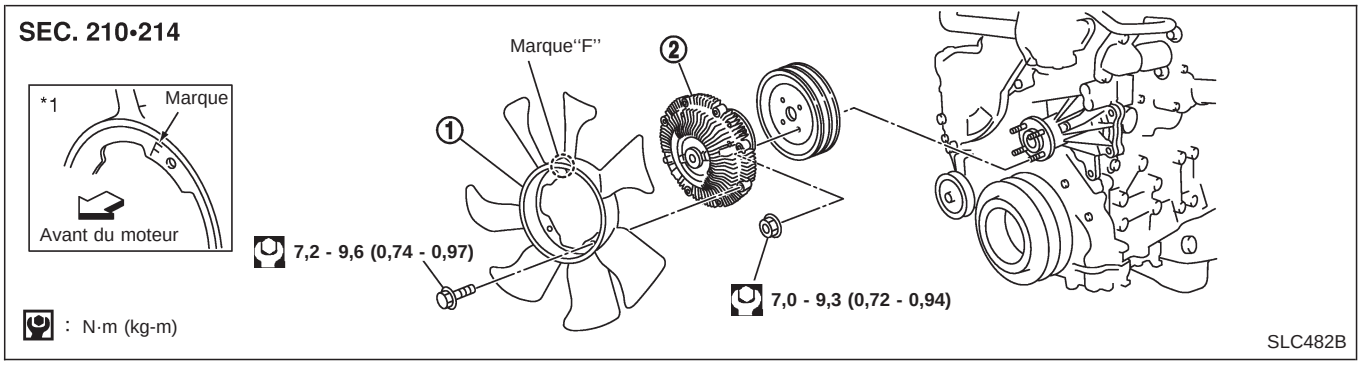
INSPECTION

1. Vérifier l'état du siège de soupape à température ambiante. Il doit avoir une bonne assise.
2. Vérifier la température d'ouverture de la soupape et sa course maximum vers le haut.

	Standard
Température d'ouverture de la soupape	Supérieure à 80 - 84°C
Levée de soupape	Supérieure à 10 mm/95°C

3. Vérifier ensuite si la soupape se ferme à 5°C en dessous de la température d'ouverture de la soupape.

Radiateur

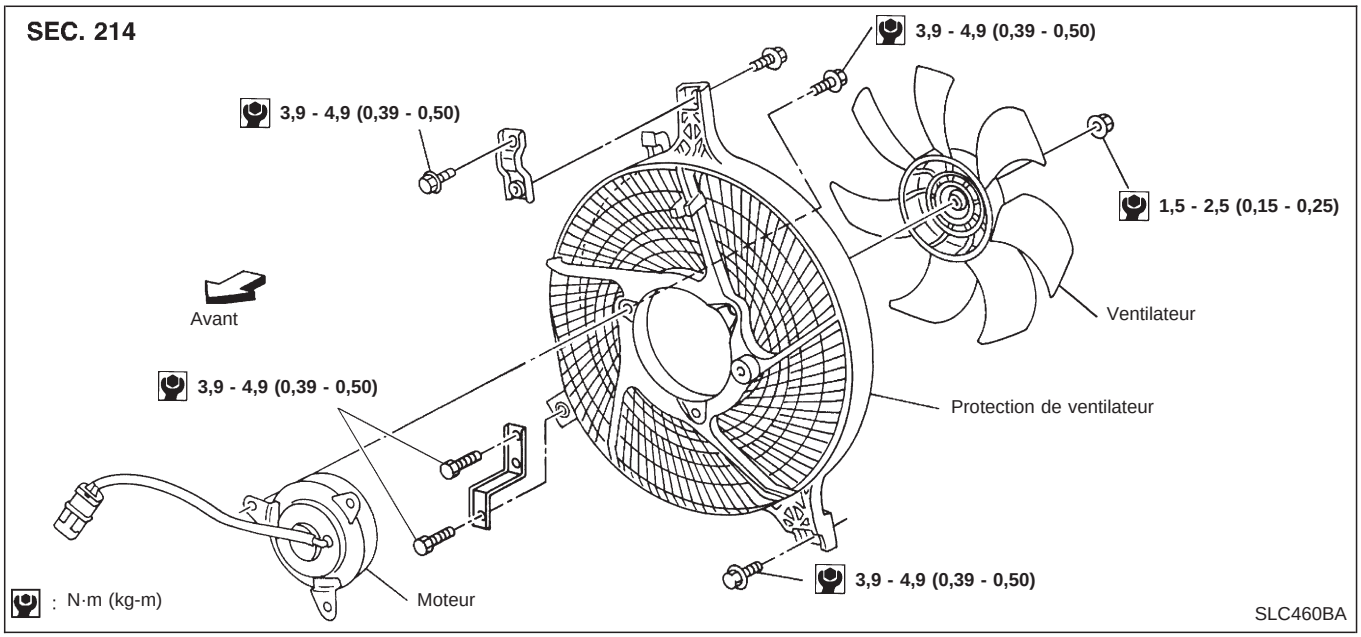


DEPOSE ET REPOSE

1. Déposer le couvercle inférieur.
2. Vidanger le liquide de refroidissement du moteur. Se reporter à la section MA ''Remplacement du liquide de refroidissement moteur''.
3. Déposer la protection (inférieure) du radiateur.
4. Déposer la protection (supérieure) du radiateur.
5. Débrancher le flexible (inférieur et supérieur) du radiateur.
6. Débrancher le flexible du réservoir.
7. Déposer le radiateur.
8. Après avoir réparé ou remplacé le radiateur, reposer toutes les pièces déposées dans l'ordre inverse de leur dépose.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Ventilateur de refroidissement (entraîné par vilebrequin)



DEMONTER ET REPOSER

1. Ventilateur de refroidissement
2. Accouplement de ventilateur

- Ne pas relâcher la tension de la courroie d'entraînement lors de la dépose du ventilateur/de la poulie de pompe à eau.
- L'accouplement de ventilateur ne peut pas être démonté et devra être remplacé comme un ensemble. Si le repère avant Ⓕ existe, reposer le ventilateur de façon à ce que le côté indiqué par le repère Ⓕ soit disposé face vers l'avant.
- Un alignement correct de ces composants est indispensable. Un alignement incorrect provoquera une oscillation de ces derniers et pourra éventuellement déclencher un détachement du ventilateur de la pompe à eau, occasionnant ainsi des dégâts importants.

Ventilateur de refroidissement (entraîné par moteur)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Ventilateur de refroidissement (entraîné par moteur) (Suite)

DEPOSE ET REPOSE

1. Déposer la grille avant.
2. Débrancher le connecteur de faisceau du moteur de ventilateur de refroidissement.
3. Déposer le ventilateur de refroidissement.

PRECAUTION :

Prendre soin de ne pas érafler ou endommager le condenseur de climatiseur.

4. Reposer dans l'ordre inverse de la dépose.

SYSTEME DE COMMANDE DE VENTILATEUR DE REFROIDISSEMENT

Les ventilateurs de radiateur sont contrôlés par l'ECM. Pour plus de détails, se reporter à la section EC ''DTC 0208 SURCHAUFFE''.

Circuit de lubrification du moteur

VERIFICATION DE LA PRESSION D'HUILE

Régime du moteur tr/min	Pression approximative de débit kPa (bar, kg/cm^2)
Régime de ralenti	Supérieure à 140 (1,40, 1,43)
2.000	Supérieure à 270 (2,69, 2,75)
4.000	Supérieure à 430 (4,29, 4,38)

POMPE A HUILE

Unité : mm

Jeu radial du logement du rotor extérieur **1**	0,114 - 0,260
Jeu à l'arête du rotor intérieur au rotor extérieur **2**	Inférieur à 0,180
Jeu axial du logement du rotor intérieur **3**	0,050 - 0,090
Jeu axial du logement du rotor supérieur **4**	0,030 - 0,190
Jeu du rotor intérieur à la partie brasée du logement **5**	0,045 - 0,091

SOUPAPE REGULATRICE DE POMPE A HUILE

Unité : mm

Jeu du régulateur de soupape au couvercle de pompe à huile **6**	0,040 - 0,097

Circuit de refroidissement du moteur

RADIATEUR

Unité : kPa (bar, kg/cm^2)

Pression de décharge du bouchon	Standard	78 - 98 (0,78 - 0,98, 0,8 - 1,0)
	Limite	59 (0,59, 0,6)
Pression d'essai de fuite		157 (1,57, 1,6)

THERMOSTAT

Température d'ouverture de la soupape	Supérieure à 80 - 84°C (176 - 183°F)
Levée de soupape	Supérieure à 10 mm/95°C

Le programme d'entretien est présenté dans les tableaux ci-dessous. En fonction des conditions météorologiques et atmosphériques, des différents revêtements, des habitudes personnelles de conduite et de l'utilisation du véhicule, un programme d'entretien complémentaire ou plus fréquent peut être nécessaire.

Les entretiens périodiques au-delà du dernier mentionné dans les tableaux doivent continuer de manière similaire.

Programme d'entretien pour les moteurs essence (kilométrage annuel < 30 000 km/an)

MOTEUR KA24DE

Programme d'entretien dans des conditions de conduite sévères (kilométrage annuel 30 000 km/an)

La périodicité de l'entretien présentée dans les pages précédentes s'applique pour des conditions de fonctionnement normale. Si le véhicule est principalement utilisé dans les conditions de conduite difficiles suivantes, il est nécessaire d'augmenter la fréquence d'entretien comme indiquée dans le tableau.

A — Conduite dans un environnement poussiéreux
B — Conduite répétée sur de courtes distances
C — Traction d'une remorque ou d'une caravane
D — Ralenti excessif
E — Conduite dans des conditions climatiques extrêmement difficiles ou dans des endroits où les températures ambiantes sont soit extrêmement basses, soit extrêmement élevées
F — Conduites répétées à vitesses élevées et/ou avec une forte charge moteur

Condition de conduite						Elément d'entretien		OPERATIONS D'ENTRETIEN	FREQUENCE D'ENTRETIEN	Pages de réference

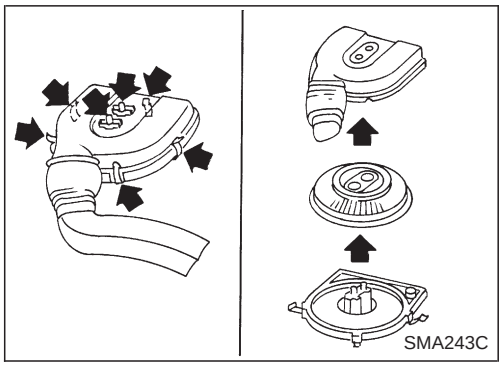
Liquides et lubrifiants

		Contenance (approximative) Litre	Liquides et lubrifiants recommandés
Huile moteur (remplissage)			
Avec filtre à huile			
	KA24DE	4x2 3,6 4x4 4,1	Moteur diesel : API SG, SH ou SJ*1 ILSAC de qualité GF-I ou GF-II*1 Moteur diesel : API CD, CE, CF, CF-4 pour moteur TD*1, *5 ACEA B3-96, 98 ou ACEA B3/E3 96, 98 pour moteur TD*4 API CF-4 pour moteur YD*1, *5 ACEA 98-B1 pour moteur YD
	YD25DDTi	4x2 5,6 4x4 4,3*7	
Sans filtre à huile			
	KA24DE	4x2 3,3 4x4 3,8	
	YD25DDTi	4x2 5,3 4x4 4,0*7	
Circuit de refroidissement (avec réservoir)			
	KA24DE	6,9	Liquide de refroidissement antigel Nissan d'origine (L2N) ou équivalent*6
	YD25DDTi	8,6	
Huile pour boîte de vitesses manuelle	FS5R30A	4x2 2,8 4x4 5,1	API GL-4, Viscosité SAE 75W-85 seulement
	FS5W71C	4x2 2,0 4x4 4,9	
Huile de boîte de transfert	TX10A	2,2	Nissan ATF d'origine ou équivalent*2 ou API GL-4*1
Huile de boîte de différentiel			
Avant	R180A	1,3	Engrenage standard de différentiel : API GL-5*1 Engrenage de différentiel à glissement limité (LSD) : Huile pour engrenage hypoïde LSD (Pièce No. : KLD31-14002) ou équivalent*3
Arrière	C200	1,3	
Liquide pour direction assistée		—	Type DEXRON™ III ou équivalent
Liquide de frein et d'embrayage		—	DOT 3 ou DOT 4 (U.S. FMVSS No. 116)
Graisse pour arbre de transmission		—	NLGI No. 2 (à base de savon de lithium)
Graisse à usages multiples		—	NLGI No. 2 (à base de savon de lithium)

*1 : Pour de plus amples détails, se reporter à ''Indice de viscosité SAE''.
*2 : Consulter un concessionnaire Nissan pour de plus amples informations sur les marques de liquides correctes, et les marques commerciales appropriées de fluides de transmission automatique DEXRON™ III/MERCON™.
*3 : API GL-5, SAE 140 et 10% du volume du modificateur de friction LSD (Pièce No. : 38469-C6000) sont équivalents.
*4 : Si les huiles ACEA B3-96, 98 ne sont pas disponibles, les huiles API CD, CE, CF, CF-4 peuvent être employées. Cependant, les huiles ACEA sont fortement recommandées si possible.
*5 : Ne jamais utiliser la qualité d'huile CG-4.
*6 : Utiliser du liquide de refroidissement antigel d'origine Nissan ou un équivalent de même qualité, afin d'éviter la formation possible de corrosion d'aluminium dans le système de refroidissement du moteur qui pourrait être causée par un liquide de refroidissement moteur d'une autre origine. **Noter que toute réparation du système de liquide de refroidissement moteur avec du liquide qui n'est pas d'origine peut ne pas être couverte par la garantie même si de tels incidents se produisent pendant la période de garantie.**
*7 : Y compris les modèles 4x4 apparence 4x2.

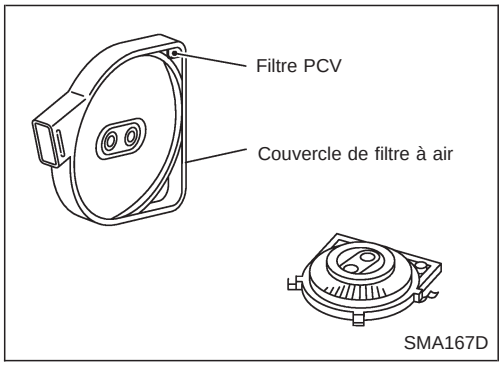
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Indice de viscosité SAE

SLIA0015E

- **Pour les pays froids et tempérés : 75W-90 pour la boîte de transfert et 80W-90 pour le différentiel sont préférables.**
- **Pour les pays chauds : 90 convient pour des températures ambiantes inférieures à 40°C.**
- **Pour les pays très chauds : 140 pour le différentiel est préférable.**



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SMA243C

Remplacement du filtre à air

TYPE A PAPIER VISQUEUX

Le filtre à papier visqueux ne nécessite pas de nettoyage entre deux changements.

SMA167D

Remplacement du filtre de ventilation positive du carter (PCV)

Déposer le couvercle de filtre à air et retirer le filtre PCV logé à l'intérieur. Installer ensuite le nouveau filtre PCV.

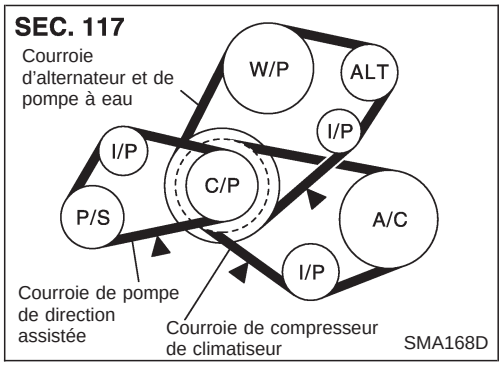
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Vérification des couples de serrage

Le contrôle doit se faire lorsque le moteur est froid.

BOULONS ET ECROUS DE COLLECTEURS

Admission



: 19,7 - 23,5 N·m (2,0 - 2,3 kg-m)

Echappement

: 28,5 - 33,3 N·m (2,9 - 3,3 kg-m)

ECROU DE LIGNE D'ECHAPPEMENT

: 41 - 48,0 N·m (4,1 - 4,9 kg-m)

Vérification des courroies d'entraînement

INSPECTION

- Avant de faire des contrôles sur le moteur, s'assurer que le moteur ait refroidi ; attendre environ 30 minutes après que le moteur ait été arrêté.
- Contrôler visuellement tout usure, dommage, fissure des courroies au niveau des surfaces de contact et des arêtes.
- Vérifier la déflexion de la courroie d'entraînement en appliquant 98 N au point indiqué ▼.
- **Lors du contrôle de la déflection de la courroie juste après installation, ajuster la courroie d'abord à la valeur spécifiée. Tourner ensuite le vilebrequin au minimum de 2 tours, réajuster à la valeur spécifiée pour éviter des variations de déflexion entre deux poulies.**
- **Serrer le contre-écrou de poulie de tension et mesurer la déflection une fois tendue.**

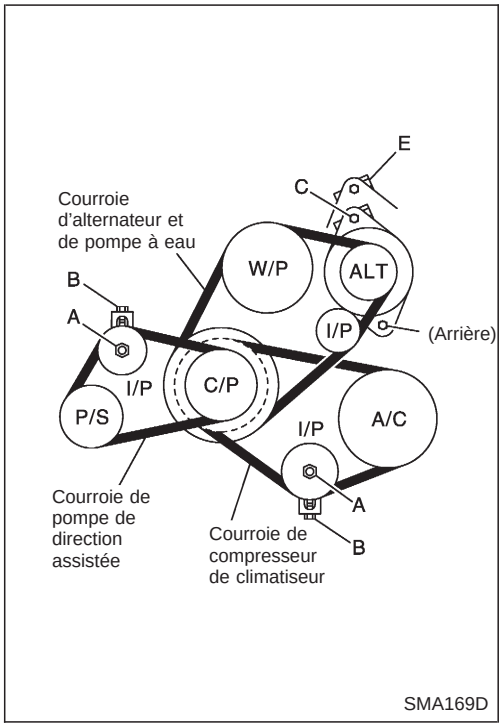
Déflection de courroie d'entraînement :

Courroie	Déflection de la courroie sous une force de 98 N* mm		
	Neuve	Ajustée	Limite du réajustement
Courroie de compresseur de climatiseur	7 - 8	9,5 - 10,5	12,0
Courroie d'alternateur & et de pompe à eau	6,5 - 7,5	8 - 9,5	12,5
Courroie de direction assistée	6,5 - 7,5	8 - 10	11,5

*: Quand le moteur est froid.

AJUSTEMENT

- Ajuster les courroies avec les éléments mentionnés ci-dessous.



Courroie	Methode de serrage des courroies pour ajustage
Courroie de compresseur de climatiseur	Ecrou d'ajustage sur la poulie de tension
Courroie d'alternateur et de pompe à eau	Ecrou d'ajustage sur l'alternateur
Courroie de direction assistée	Ecrou d'ajustage sur la poulie de tension

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Vérification des courroies d'entraînement (Suite)

PRECAUTION :

- **Quand une courroie de rechange est installée, ajuster à la valeur spécifiée dans la colonne ''Neuve'' en raison de son adaptabilité insuffisante à la gorge de la poulie.**
- **Si la courroie de déflection est en dehors de la ''Limite du réajustement'', ajuster à la valeur ''Ajustée''.**
- **Lors du contrôle de la déflection de la courroie juste après installation, ajuster la courroie d'abord à la valeur spécifiée. Ensuite, après avoir tourné le vilebrequin au minimum de 2 tours, réajuster la courroie à la valeur spécifiée pour éviter une variation de déflection entre les poulies.**
- **S'assurer que les courroies épousent la gorge des poulies lors de l'installation.**
- **Manipuler avec précaution pour éviter de graisser les courroies avec de l'huile ou du liquide de refroidissement, etc...**
- **Ne pas tourner ni plier les courroies avec force.**

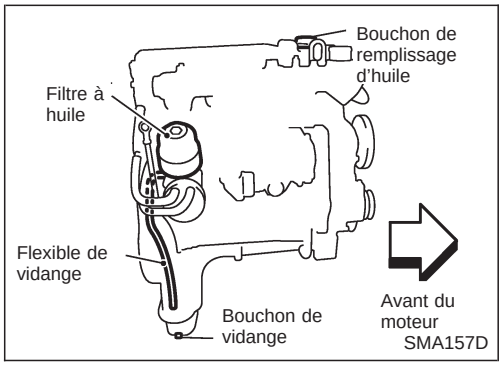
Courroie de compresseur de climatiseur et de pompe de direction assistée

1. Desserrer le contre-écrou de la poulie de tension (A).
2. Tourner l'écrou d'ajustage (B) pour régler.
   - Se référer à MA-3011, ''Inspection'' pour les valeurs d'ajustage.
3. Serrer le contre-écrou (A).

   Ecrou A :

   : 30,4 - 39,2 N·m (3,1 - 3,9 kg-m)

Courroie d'alternateur et de pompe à eau



1. Desserrer le contre-écrou d'ajustage (C).
2. Desserrer l'écrou de fixation de l'alternateur (D) (Arrière).
3. Tourner l'écrou (E) pour ajuster.
   - Se référer à MA-3011, ''Inspection'' pour les valeurs d'ajustage.
4. Serrer dans l'ordre l'écrou (C) puis l'écrou (D).

   Ecrou C :

   : 19,6 - 23,4 N·m (2,0 - 2,3 kg-m)

   Ecrou D :

   : 45,1 - 59,7 N·m (4,6 - 6,0 kg-m)

Remplacement de l'huile moteur

ATTENTION :

- **Faire attention aux risques de brûlures car l'huile moteur est chaude.**
- **Les contacts prolongés et répétés avec les huiles moteur usagées peuvent provoquer des cancers de la peau ; éviter tout contact direct avec les huiles moteur usagées. En cas de contact, laver soigneusement avec du savon ou un nettoyant à main aussi rapidement que possible.**

1. Mettre le véhicule horizontal.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

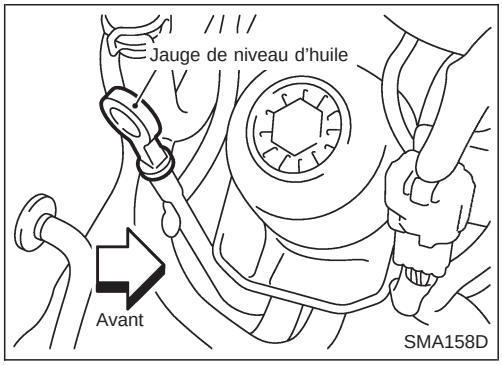
Remplacement de l'huile moteur (Suite)

2. Faire chauffer le moteur, et contrôler toute fuite d'huile des éléments du moteur.
3. Arrêter le moteur et attendre au minimum 10 minutes.
4. Déposer le bouchon de vidange et le bouchon de remplissage d'huile.
5. Vidanger l'huile et faire le plein d'huile moteur neuve.

Viscosité et caractéristiques de l'huile :

- **API CD, CE, CF ou CF-4 (Sauf pour l'Europe)**
- **API CF-4 ou ACEA 98-B1 (Pour l'Europe)**
  Se référer à MA-3008, ''LIQUIDES ET LUBRIFIANTS CONSEILLES''.

Contenance en huile de remplissage (environ) :



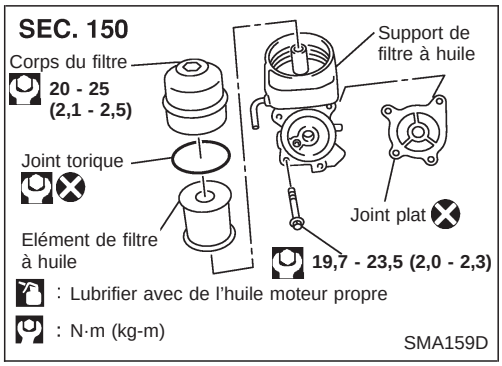
Unité : ℓ

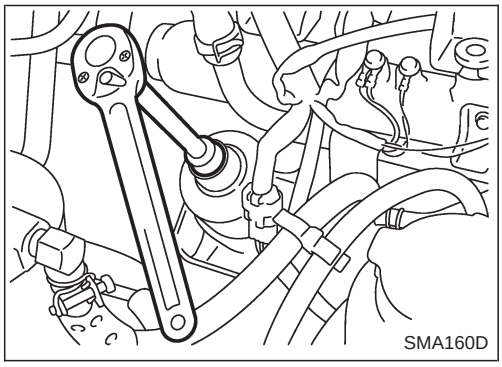
		4x2	4x4*
Vidanger et remplir de nouveau	Sans remplacement du filtre à huile	5,3	4,0
	Avec remplacement du filtre à huile	5,6	4,3
Sécher le moteur (révision du moteur)		6,3	5,0

*: Inclus les modèles 4x4 apparence 4x2

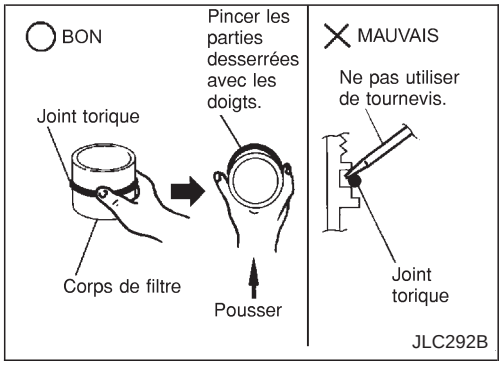
PRECAUTION :

- **Veiller à nettoyer le bouchon de vidange et le reposer avec une rondelle neuve.**
  Bouchon de vidange :
  : 29 - 39 N·m (3,0 - 4,0 kg-m)
- **La capacité de remplissage varie selon la température de l'huile et le temps de vidange. N'utiliser ces spécifications que comme référence. Toujours utiliser la jauge pour déterminer si la quantité adéquate d'huile est dans le moteur.**





6. Vérifier le niveau d'huile de la manière suivante.



a. Démarrer le moteur et vérifier s'il n'y a pas de fuites d'huile autour du bouchon de vidange et du filtre à huile.

b. Faire tourner le moteur pendant quelques minutes, puis couper le contact. Attendre au minimum 10 minutes vérifier le niveau d'huile.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Remplacement du filtre à huile

DEPOSE

1. Placer un récipient pour récupérer l'huile sous la partie inférieure du flexible de vidange avant de déposer le corps du filtre.
2. A l'aide d'une clé hexagonale [largeur entre pans : 24 mm], desserrer le corps du filtre d'environ 4 tours.
3. Déposer le corps du filtre, puis les éléments du filtre à huile.
4. Retirer le joint torique du corps du filtre.

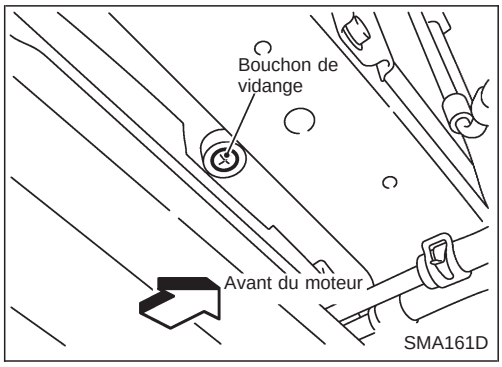
● Pousser sur le joint dans un sens, soulever la partie décollée avec vos doigts, et retirer le joint torique du corps du filtre.

PRECAUTION :

Ne pas utiliser de fils métalliques ou de tournevis plats, etc. qui pourraient endommager le corps du filtre.

INSTALLATION

1. Retirer tous corps étrangers adhérant à l'intérieur du corps du filtre et sur la surface de montage du joint torique (côté corps du filtre et côté support).
2. Reposer l'élément de filtre à huile et le joint torique sur le corps de filtre.



● Pousser complètement l'élément de filtre à huile dans le corps de filtre à huile.

3. Reposer le corps de filtre sur le support de filtre à huile.
   : 20 - 25 N·m (2,0 - 2,6 kg-m)
4. Faire chauffer le moteur, et vérifier s'il n'y a pas de fuites d'huile et contrôler le niveau d'huile.

PRECAUTION :

Si l'huile moteur se répand sur le moteur ou sur la carrosserie, l'essuyer complètement.

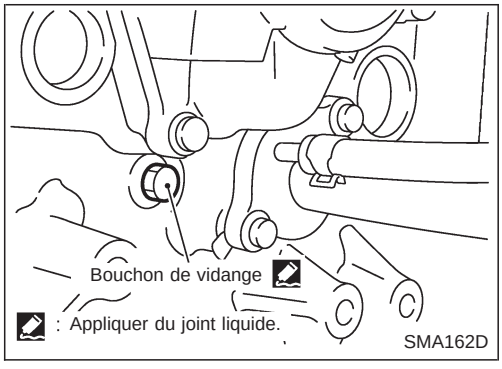
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Remplacement du liquide de refroidissement du moteur

Pour éviter tout risque de brûlures, ne vidanger jamais le liquide de refroidissement lorsque le moteur est chaud.

—VIDANGE DU LIQUIDE DE REFROIDISSEMENT—

1. Placer le système de climatisation comme suit pour éviter au liquide de refroidissement de rester dans le système.



a. Mettre la clé de contact sur “ON” et régler la commande de température sur la position de chaud maximum.

b. Patienter 10 secondes avant de mettre le contact d’allumage sur ‘‘OFF’’.

2. Ouvrir le bouchon de vidange au bas du radiateur et retirer le bouchon de remplissage du radiateur pour vidanger le liquide de refroidissement.
3. Déposer le réservoir, vidanger le liquide de refroidissement, puis nettoyer le réservoir.

- **Veiller à ce que le liquide de refroidissement ne coule pas sur les courroies d’entraînement.**

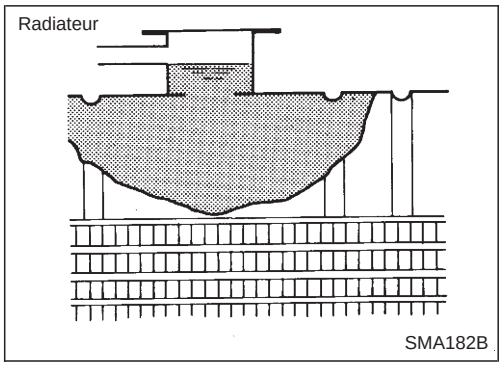
4. Retirer le bouchon de purge du bloc-cylindres.
5. Vérifier si le liquide de refroidissement vidangé présente des traces de rouille, de corrosion ou de décoloration. Si le liquide est contaminé, rincer le circuit de refroidissement du moteur, se référer à MA-3016, ‘‘RINÇAGE DU CIRCUIT DE REFROIDISSEMENT’’.

—REMPLISSAGE DE LIQUIDE DE REFROIDISSEMENT—

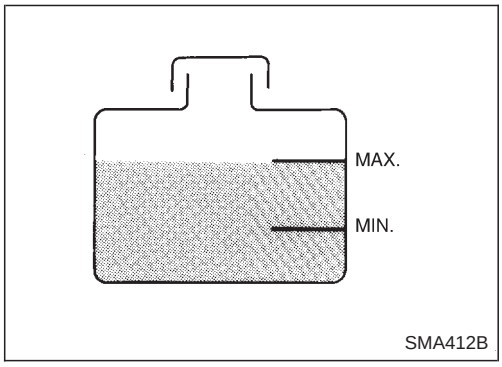
1. Reposer le réservoir, le bouchon de vidange du radiateur, et les bouchons de vidange du bloc-cylindres.

- Appliquer du produit d’étanchéité sur le filetage du bouchon de vidange du bloc-cylindres.
  : 8 - 11 N·m (0,8 - 1,2 kg-m)

2. Remplir le radiateur de liquide de refroidissement par le goulot de remplissge du bouchon de radiateur à une vitesse maximum de 2ℓ/min.



- **Utiliser du liquide de refroidissement antigel d’origine NISSAN ou équivalent mélangé avec de l’eau (distillée ou déminéralisée).**



Se référer à MA-3008, ‘‘LIQUIDES ET LUBRIFIANTS CONSEILLES’’.

PRECAUTION :

Si la vitesse de remplissage est trop importante, il se peut que de l’air s’introduise avec le liquide de refroidissement. S’assurer de respecter les vitesses de remplissage de liquide de refroidissement indiquées ci-dessus.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Remplacement du liquide de refroidissement du moteur (Suite)

Capacité en liquide de refroidissement
Capacité du réservoir :
0,7 ℓ

3. Remplir le réservoir jusqu'au repère MAX.
4. Faire chauffer le moteur à une température de fonctionnement normal sans que le bouchon du radiateur soit en place.

- **Si le liquide de refroidissement déborde de l'orifice de remplissage du radiateur, installer un bouchon de remplissage.**

5. Faire tourner le moteur à 3 000 tr/mn pendant 10 secondes puis revenir au régime de ralenti avec le bouchon de radiateur fermé.

- Répéter l'opération deux ou trois fois.

Surveiller la jauge de température du liquide de refroidissement pour éviter que le moteur ne surchauffe.

6. Arrêter le moteur et le laisser refroidir.

- Refroidir à l'aide d'un ventilateur pour réduire le temps de refroidissement.
- Si nécessaire, remplir le radiateur jusqu'au goulot de remplissage.

7. Remplir le réservoir avec du liquide de refroidissement jusqu'au repère ''MAX.''.
8. Répéter la procédure de l'étape 4 à l'étape 7 deux fois ou plus avec le bouchon de radiateur installé jusqu'à ce que le niveau de liquide de refroidissement ne diminue plus.
9. Vérifier si le circuit de refroidissement a des fuites lorsque le moteur tourne.
10. Faire chauffer le moteur, et vérifier le bruit d'écoulement du liquide de refroidissement tout en emballant le moteur du ralenti à 3 000 tours et en réglant la commande de température sur différentes positions entre ''COOL'' et ''HOT''.

- Le robinet d'eau du chauffage doit émettre des bruits.

11. Si un bruit se fait entendre, purger l'air du circuit de refroidissement en répétant les étapes 4 à 7 jusqu'à ce que le niveau du liquide de refroidissement ne diminue plus.

- **Nettoyer l'excédent de liquide de refroidissement moteur.**

— RINÇAGE DU CIRCUIT DE REFROIDISSEMENT —

1. Remplir le radiateur et le réservoir d'eau et reposer le bouchon de radiateur.
2. Le moteur doit tourner pour être amené à sa température normale de fonctionnement.
3. Lancer le moteur deux ou trois fois à vide.
4. Arrêter le moteur et attendre qu'il refroidisse.
5. Vidanger l'eau.
6. Répéter les étapes 1 à 5 jusqu'à ce que de l'eau claire s'écoule du radiateur.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

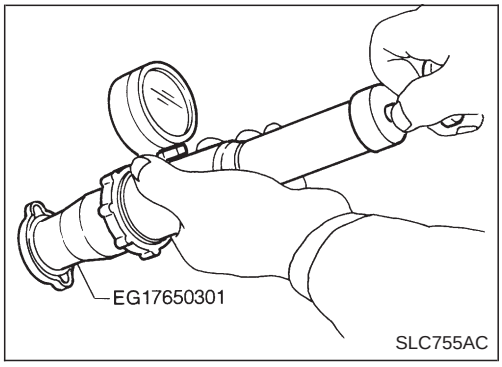
Vérification du circuit de refroidissement

ATTENTION :
Ne jamais retirer le bouchon de radiateur lorsque le moteur est encore chaud ; de serieuses brûlures pourraient être causées par un jet de liquide sous pression s'échappant du radiateur.
Envelopper le bouchon d'un épais chiffon et le retirer précautionneusement en le tournant d'abord d'un quart de tour afin de permettre à la pression accumulée de s'échapper puis en le dévissant totalement.

CONTROLE DES FLEXIBLES ET COLLIERS DU CIRCUIT DE REFROIDISSEMENT

Vérifier l'état général des flexibles et des colliers et voir s'il n'y a pas de fuites, de fissures, d'effilochages ou autres déteriorations ni de raccords desserrés.

VERIFICATION DU RADIATEUR



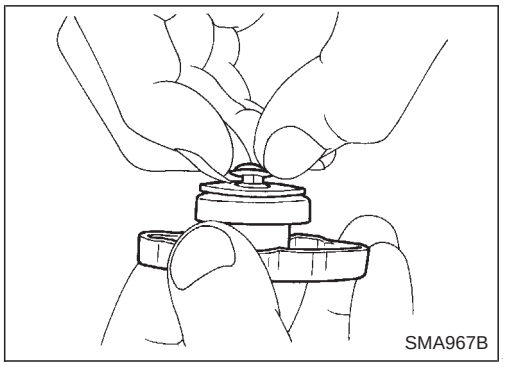
Vérifier si le radiateur est encrassé ou couvert de boue. Si nécessaire, nettoyer le radiateur comme suit.

- S'assurer de ne pas tordre ou endommager les ailettes du radiateur.
- Lorsque le radiateur est nettoyé sans dépose, retirer toutes les pièces environnantes tel que le ventilateur de refroidissement, la protection de ventilateur et l'avertisseur sonore. Puis entourer de bande adhésive le faisceau et les connecteurs afin de les imperméabiliser.

1. Verser de l'eau par le biais de flexible sur le côté arrière du noyau de radiateur de haut en bas.
2. Verser à nouveau de l'eau sur toutes les surfaces du noyau de radiateur une fois par minute.
3. Arrêter de laver si aucun liquide tâché ne coule du radiateur.
4. Insuffler de l'air dans le côté arrière du noyau de radiateur de haut en bas.

- Utiliser de l'air comprimé à moins de 490 kPa.

5. Insuffler à nouveau de l'air dans toutes les surfaces du noyau de radiateur une fois par minute jusqu'à que l'eau ne gicle plus.



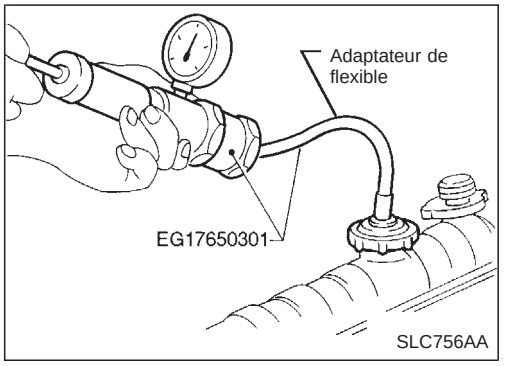
VERIFIER LE BOUCHON DU RADIATEUR

Pour vérifier le bouchon de radiateur, exerçer une pression au niveau du bouchon à l'aide d'un testeur.

Pression d'ouverture du bouchon de radiateur :
Standard
78 - 98 kPa
(0,78 - 0,98 bar, 0,8 - 1,0 kg/cm^2)
Limite
59 kPa (0,59 bar, 0,6 kg/cm^2)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SMA967B



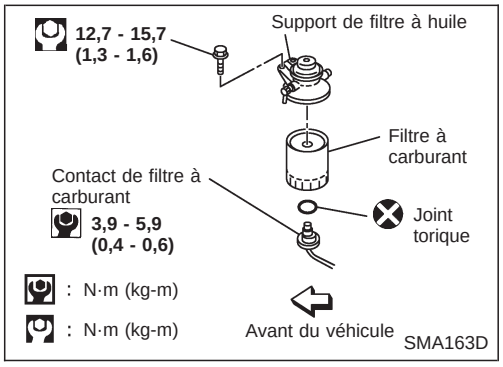
Vérification du circuit de refroidissement (Suite)

Tirer sur la soupape à dépression pour l'ouvrir.
Vérifier qu'elle se referme totalement une fois relâchée.

- Contrôler que la soupape à dépression n'ait pas été contaminé ou endommagée dans son logement.
- Déplacer la soupape à dépression et contrôler que les opérations d'ouverture et de fermeture se fassent nomalement.

PRECAUTION :

- **S'assurer que le moteur ait refroidi pour procéder aux contrôles.**
- **Avant de raccorder le testeur au radiateur, appliquer de l'eau ou du liquide de refroidissement longue durée (LLC) au joint.**
- Remplacer le bouchon de radiateur si des anomalies sont trouvées sur la soupape de dépression ou si la pression d'ouverture de la soupape est en dehors de la plage normale.



VERIFICATION DE FUITES DU CIRCUIT DE REFROIDISSEMENT

Vérifier s'il n'y a pas de fuites en appliquant une pression au circuit de refroidissement à l'aide du testeur de bouchon.

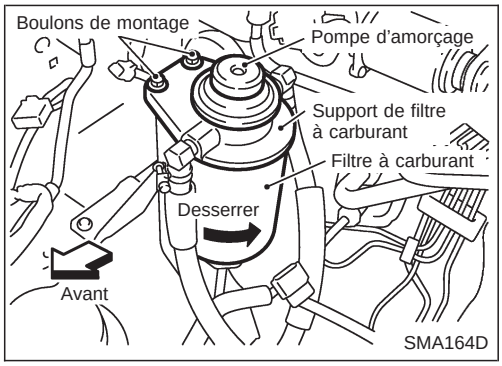
Pression d'essai :
157 kPa (1,57 bar, 1,6 kg/cm^2)

PRECAUTION :

- **Une pression supérieure à la pression spécifiée peut abîmer le radiateur.**
- **S'assurer que le moteur ait refroidi pour procéder aux contrôles.**
- **Utiliser un adaptateur de flexible entre le testeur de bouchon et le goulot de remplissage pour éviter toute déformation du goulot de remplissage.**
- **Si des anormalités sont trouvées, réparer ou remplacer les pièces défectueuses.**

Vérification et remplacement du filtre à carburant et vidange de l'eau

Prendre garde de ne pas renverser de carburant dans le compartiment moteur. Placer un chiffon pour absorber le carburant.

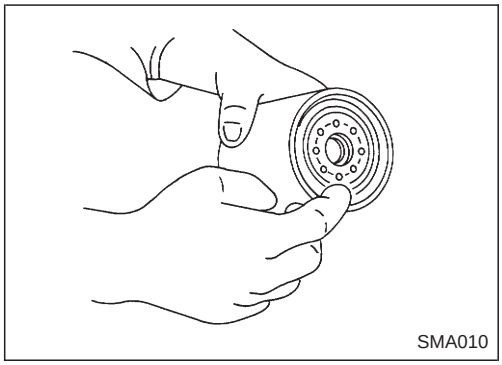


VERIFICATION DU FILTRE A CARBURANT

Contrôler le filtre à carburant et vérifier s'il n'y a pas de fuites de carburant, de dommages et d'autres anomalies.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Vérification et remplacement du filtre à carburant et vidange de l'eau (Suite)

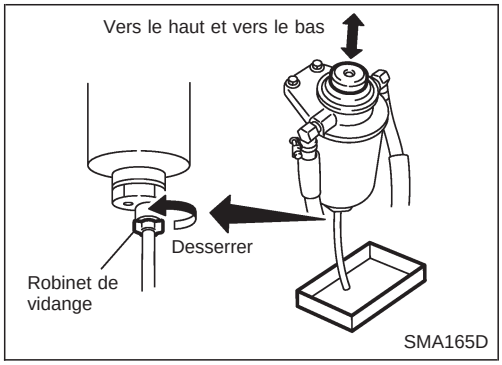


REMPLACEMENT DU FILTRE A CARBURANT

1. Débrancher le connecteur de faisceau et vidanger le carburant.
2. Retirer les deux écrous de repose. Retirer le filtre à carburant et le support du filtre à carburant du support latéral du véhicule. (Il n'est pas nécessaire de débrancher le flexible d'alimentation.)
3. Déposer le filtre à carburant à l'aide d'une clé à bande pour filtre.
4. Déposer le filtre à carburant et son capteur.

PRECAUTION :

Déposer le filtre à carburant sans renverser de carburant. Si du liquide a été renversé, nettoyer immédiatement. Faire surtout attention à ne pas renverser de carburant sur l'isolant de montage du moteur.

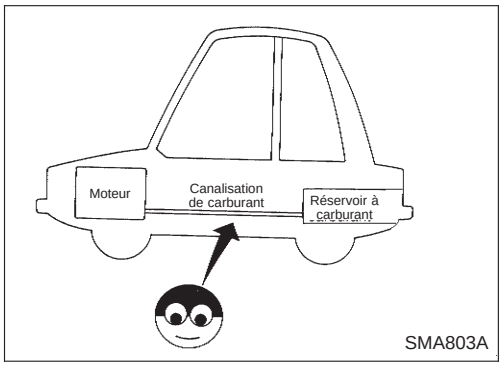


5. Essuyer la surface de montage du nouveau filtre à carburant sur le support de filtre et graisser légèrement sur le joint caoutchouc du filtre à carburant.
6. Visser le filtre à carburant jusqu'à ce qu'une légère résistance soit ressentie, puis le serrer de plus de 2/3 de tour supplémentaire.
7. Reposer le capteur du filtre à carburant sur le filtre à carburant neuf.
8. Purger l'air du filtre de carburant.

Se reporter à ''Purge d'air'' dans la section EC.

9. Démarrer le moteur et rechercher la présence de fuites.

VIDANGE DE L'EAU

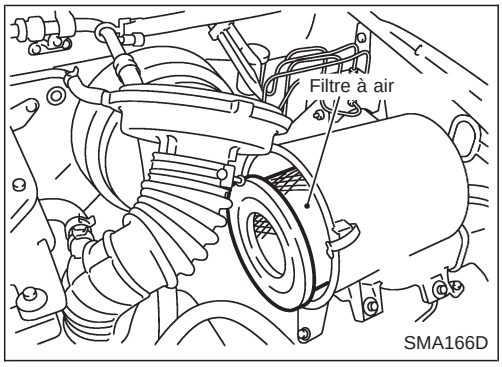


1. Vidanger l'eau comme suit.
   Desserrer le robinet de vidange et vidanger l'eau à l'aide de la pompe d'amorçage.
   Desserrer le robinet de vidange de quatre à cinq tours provoque le début de la vidange de l'eau. Ne pas déposer le robinet de vidange en le desserrant excessivement.

2. Purger l'air.

Se reporter à ''Purge d'air'' dans la section EC.

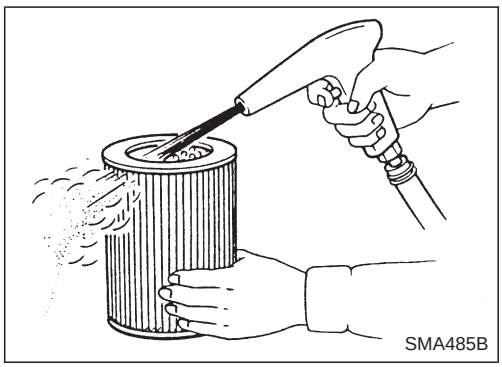
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Vérification des canalisations d'alimentation

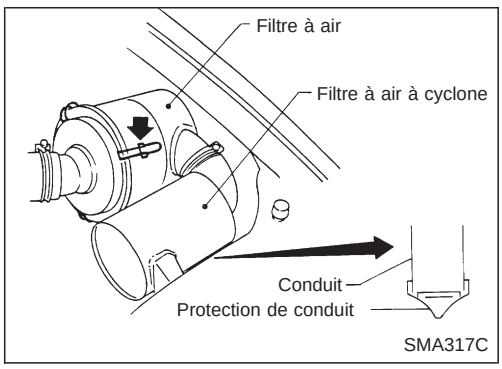
Vérifier les canalisations d'alimentation et le réservoir qui doivent être bien fixés, n'avoir ni fuites, ni fissures, ni dommages, ni raccords desserrés, ni usure, ni détériorations.

PRECAUTION :



Maintenir les pièces propres en utilisant de l'air comprimé lors du remontage.

Nettoyage et remplacement du filtre à air



TYPE A PAPIER VISQUEUX

Le filtre à air à papier visqueux ne nécessite pas de nettoyage entre deux changements.

TYPE A PAPIER SEC

Nettoyer ou remplacer les pièces plus souvent en cas de conduite dans des environnements poussiéreux.

Contrôler le filtre à air à cyclone

Retirer la protection de la canalisation et contrôler l'encrassement de la canalisation. Retirer la poussière.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

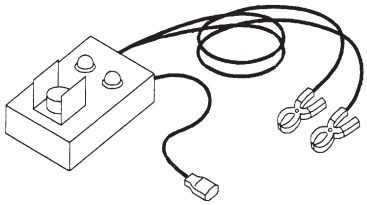
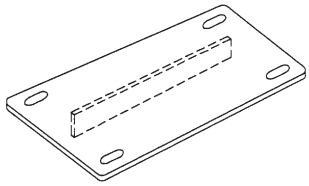
‘‘COUSSIN GONFLABLE’’ et ‘‘PRETENSIONNEUR DE CEINTURE DE SECURITE’’ du système de retenue supplémentaire (SRS)

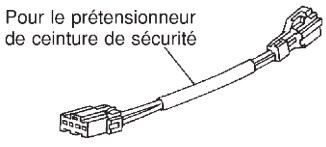
Utilisés avec une ceinture de sécurité, le ‘‘COUSSIN GONFLABLE’’ et le ‘‘PRETENSIONNEUR DE CEINTURE DE SECURITE’’ du système de retenue supplémentaire contribuent à réduire les risques et la gravité des blessures subies par le conducteur et le passager avant en cas de collision frontale. La composition du SRS disponible pour le MODELE D22 est la suivante (la composition varie selon les pays et l’équipement en option) :
module de coussin gonflable côté conducteur (situé dans le moyeu du volant), module de coussin gonflable passager avant (situé sur le tableau de bord côté passager), prétensionneurs de ceinture de sécurité, boîtier de capteurs de diagnostic, témoin, faisceau de câblage et câble spiralé.

ATTENTION :

- **Pour ne pas affecter le fonctionnement du SRS, ce qui augmenterait les risques de blessures graves ou mortelles en cas de collision entraînant le déploiement du coussin gonflable, toutes les opérations d’entretien doivent être effectuées par un concessionnaire NISSAN agréé.**
- **Un entretien incorrect, y compris une mauvaise dépose ou repose du SRS, peut entraîner des risques de blessures dus au déploiement accidentel du système.**
- **Ne pas utiliser d’équipement d’essai électrique sur les circuits connexes du SRS sauf sur indication de ce manuel de réparation. Le faisceau de câblage du SRS peut être identifié à l’aide d’un connecteur de faisceau jaune.**



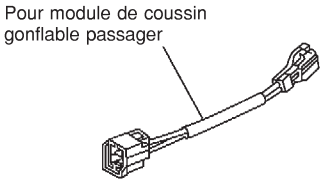


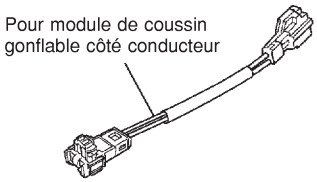


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Précautions pour l'entretien du ''COUSSIN GONFLABLE'' (AIR BAG) et du ''PRETENSIONNEUR DE CEINTURE DE SECURITE'' du système de retenue supplémentaire.

●Ne pas utiliser d'équipement d'essai électrique pour vérifier le SRS, sauf instructions contraires données dans ce manuel de réparation.
●Avant de procéder à l'entretien du SRS, couper le contact, débrancher les câbles de masse de la batterie et attendre au moins 3 minutes.
Le coussin gonflable et le prétensionneur de ceinture de sécurité peuvent encore se déployer dans un délai de trois minutes environ après que les câbles aient été débranchés. Attendre par conséquent au moins 3 minutes avant de travailler sur les connecteurs ou les câbles du SRS.





- Le circuit du capteur de diagnostic doit toujours être reposé avec ses marques de flèche ''⇦'' dirigées vers l'avant du véhicule pour un fonctionnement adéquat. Vérifier également que le boîtier de capteurs de diagnostic ne présente pas de fissures, déformations ou traces de rouille avant de le reposer. Le remplacer le cas échéant.
- Le câble spiralé doit être aligné avec le point mort car le nombre de tours qu'il peut faire est limité. Ne pas tenter de tourner le volant ou la colonne de direction après la dépose du pignon de direction.
- Manipuler le module de coussin gonflable avec précaution. Toujours placer les modules de coussin gonflable conducteur et passager avec le côté rembourré dirigé vers le haut.
- Exécuter l'auto-diagnostic pour contrôler que l'ensemble du SRS fonctionne normalement après avoir remplacé n'importe quel composant.
- Après le déploiement du coussin gonflable, l'ensemble de tableau de bord avant devra être remplacé si endommagé.

Dépose et repose — Boîtier de capteurs de diagnostic

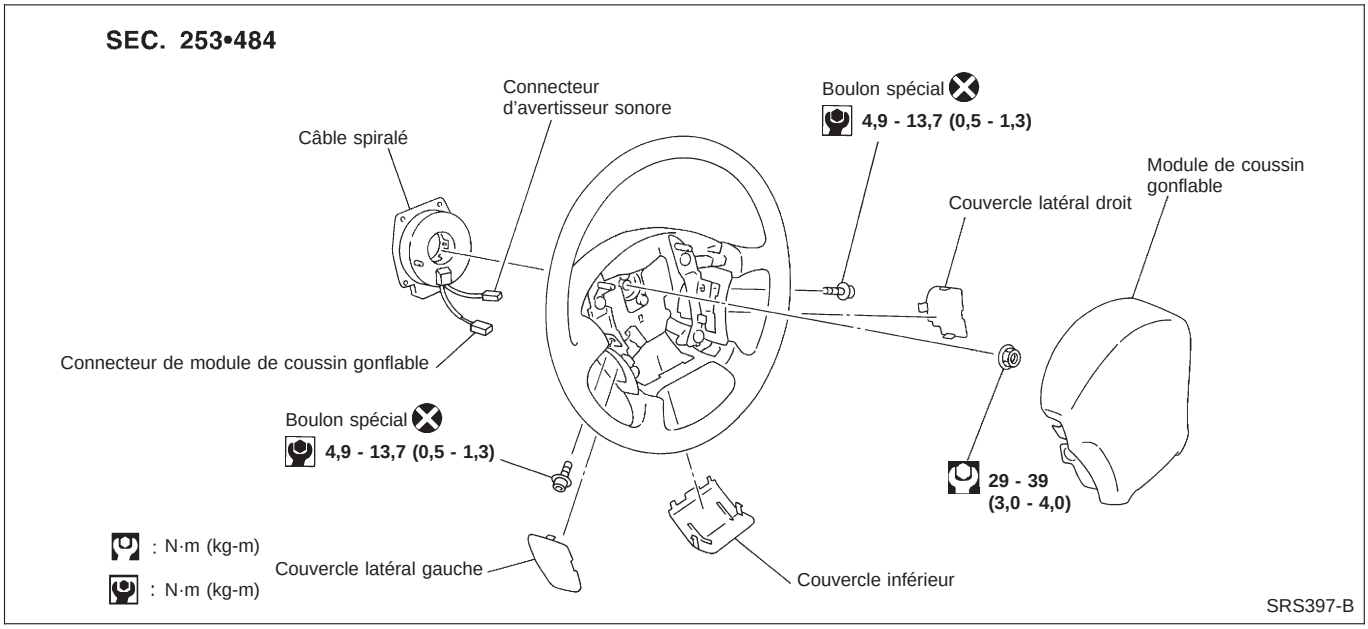
PRECAUTION :

- **Avant de procéder à l'entretien du SRS, couper le contact, débrancher les câbles de masse de la batterie et attendre au moins 3 minutes.**
- **Ne pas réutiliser les boulons usés après la dépose : les remplacer par de nouveaux boulons.**
- **Vérifier que le boîtier de capteurs de diagnostic est reposé correctement.**
- **Vérifier que le boîtier de capteurs de diagnostic n'est pas déformé, bosselé, fissuré ou rouillé. S'il est visiblement endommagé, le remplacer par un neuf.**
- **Vérifier que les supports du boîtier de capteurs de diagnostic ne sont pas déformés ou rouillés.**
- **Après avoir remplacé le boîtier de capteurs de diagnostic, vérifier le fonctionnement du SRS et effectuer son autodiagnostic. Se reporter à ''Auto-diagnostic'' pour plus de détails (RS-3021).**
- **Ne pas essayer de démonter le boîtier de capteurs de diagnostic.**
- **Remplacer le boîtier de capteurs de diagnostic, s'il est tombé ou a subi un choc.**

DEPOSE DU BOITIER DE CAPTEURS DE DIAGNOSTIC

1. Débrancher les connecteurs de module de coussin gonflable côté conducteur et côté passager. Débrancher également le connecteur de prétensionneur de ceinture de sécurité (modèles destinés au Moyen-Orient).
2. Déposer le tableau de bord. Se reporter au manuel de réparation (N° de pub. SM9F-D22BE0E), ''TABLEAU DE BORD'' dans la section BT.
3. Déposer la conduite d'air.
4. Débrancher le connecteur du boîtier de capteurs de diagnostic.
5. Déposer le boulon de masse et les boulons spéciaux du boîtier de capteurs de diagnostic à l'aide de l'EMBOUT TORX DE SECURITE (Taille T50).
   Puis déposer le boîtier de capteurs de diagnostic.

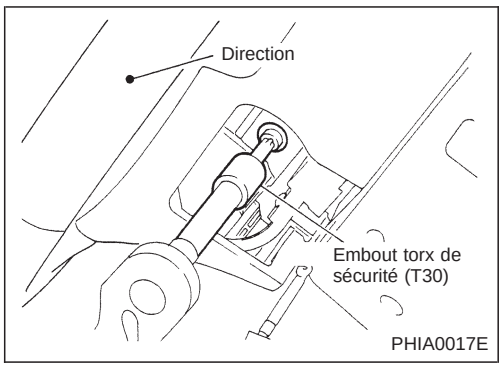
NOTE :



- **Pour la repose, procéder dans l'ordre inverse de la dépose.**
- **Après remplacement, effectuer l'auto-diagnostic du SRS. Se reporter à ''Autodiagnostic'' pour plus de détails (RS-3021).**

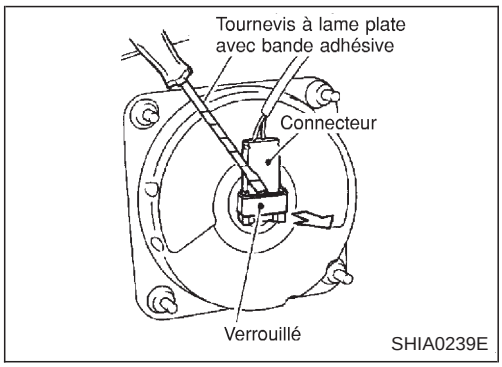
PRECAUTION :

- **Ne pas réutiliser les anciens boulons hexagonaux et les boulons de masse; les remplacer respectivement par de nouveaux boulons.**



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

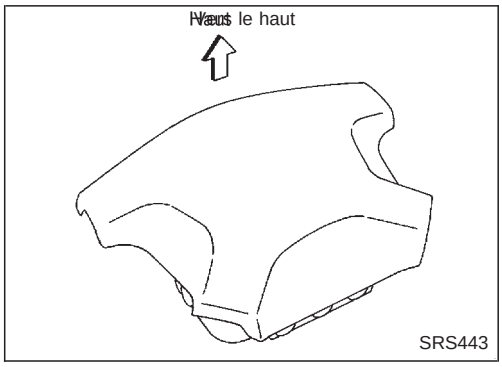
Dépose — Module de coussin gonflable du conducteur et câble spiralé



PRECAUTION :

- **Avant de procéder à l'entretien du SRS, couper le contact, débrancher les câbles de masse de la batterie et attendre au moins 3 minutes.**
- **Toujours se positionner sur le côté du module de coussin gonflable.**

1. Déposer le couvercle latéral. A l'aide d'un TOURNEVIS A EMPREINTE ANTI-EFFRACTION POUR VIS TORX (Taille T50), déposer les boulons spéciaux gauche et droit. Le module de coussin gonflable peut alors être déposé.
2. Déposer le couvercle inférieur.

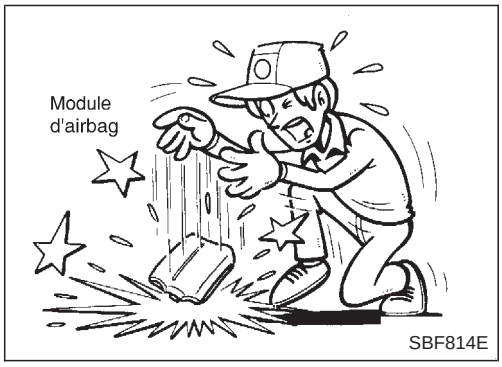


3. Débrancher le connecteur de faisceau de coussin gonflable. Déposer ensuite le module de coussin gonflable côté conducteur.

PRECAUTION :

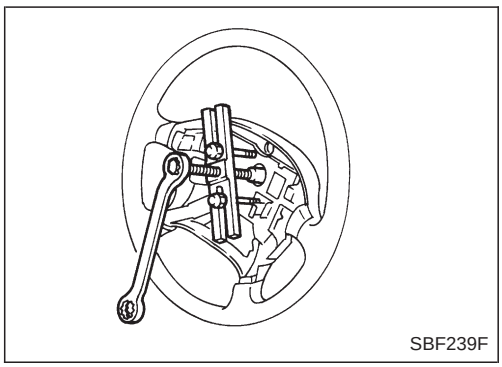
Lors de la dépose du connecteur du module de coussin gonflable côté conducteur, insérer le dispositif de blocage à l'aide d'un tournevis à lame plate recouvert de bande adhésive isolante. Puis appuyer sur le dispositif de blocage.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Dépose — Module de coussin gonflable du conducteur et câble spiralé (Suite)

SRS443

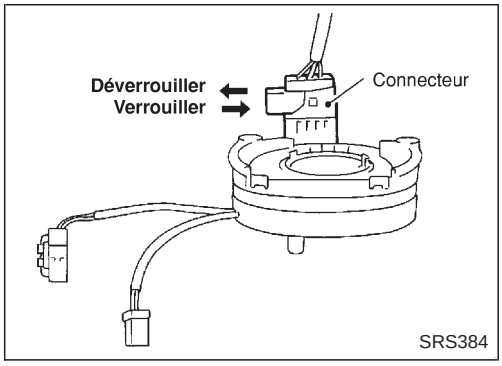


PRECAUTION :

- **Toujours poser le module de coussin gonflable avec la garniture dirigée vers le haut.**
- **Ne pas tenter de démonter le module de coussin gonflable.**
- **Ne pas réutiliser les boulons une fois déposés ; les remplacer par des neufs.**
- **Ne pas introduire d'objets (tournevis, etc.) dans le connecteur du module de coussin gonflable.**

SBF814E

- **Remplacer le module de coussin gonflable s'il est tombé ou s'il a subi un choc.**
- **Ne pas exposer le module de coussin gonflable à des températures supérieures à 90°C.**
- **Ne pas laisser de l'huile, de la graisse ou de l'eau entrer en contact avec le module de coussin gonflable.**



SBF239F

3. Régler le volant en position neutre.
4. Débrancher le connecteur d'avertisseur sonore et retirer les écrous.
5. A l'aide d'un extracteur de volant, déposer le volant. Veiller à ne pas trop serrer le boulon de l'extracteur sur le volant.

PRECAUTION :

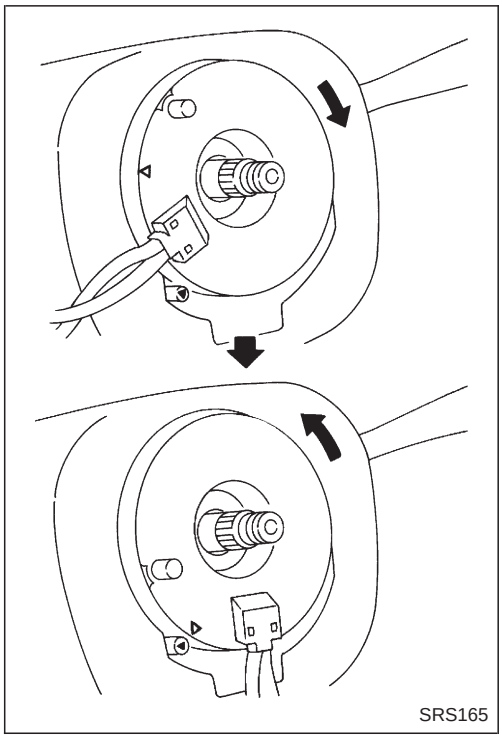
- **Ne pas taper ou heurter le volant de direction.**

6. Déposer le couvercle de colonne de direction.

SRS384

7. Déposer les quatre vis. Puis déverrouiller le connecteur de câble spiralé et le déconnecter. Le câble spiralé peut alors être déposé.

PRECAUTION :



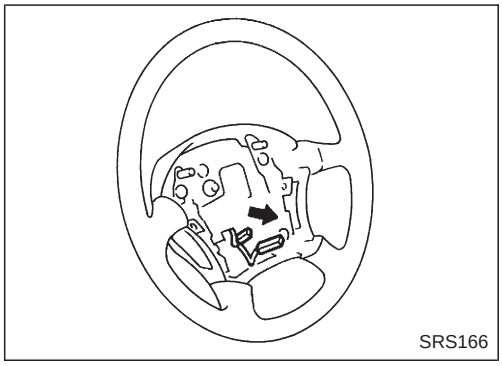
- **Ne pas essayer de déposer le câble spiralé.**
- **Ne pas lubrifier le câble spiralé.**

Repose — Module de coussin gonflable du conducteur et câble spiralé

1. Positionner les roues avant en ligne droite.
2. Brancher le connecteur du câble spiralé. Puis verrouiller le connecteur et resserrer les vis. Reposer le couvercle de colonne de direction.

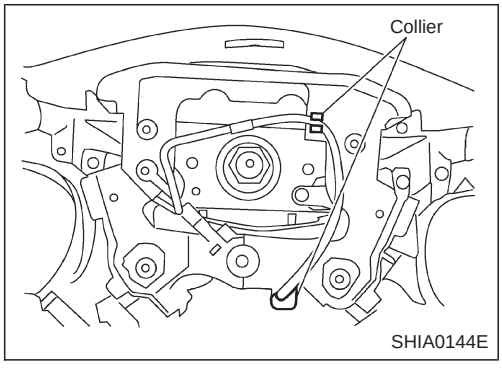
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Repose — Module de coussin gonflable du conducteur et câble spiralé (Suite)



SRS165

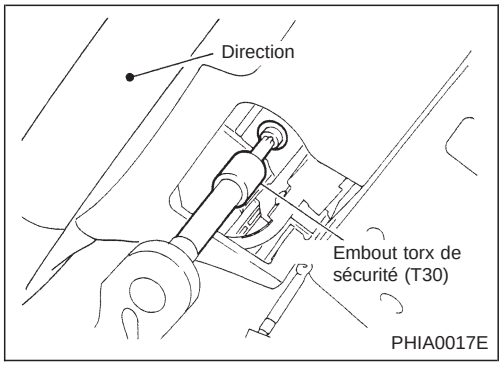
3. S'assurer que le câble spiralé est sur la position neutre. Pour obtenir la position neutre, le tourner d'environ 2,5 tours vers la gauche à partir de la position de butée droite. Aligner les deux marques (⧖).



PRECAUTION :

- **Un câble spiralé mal monté risque de se rompre lorsque le volant est tourné.**
  Par ailleurs, la timonerie de direction étant déconnectée, le câble risque de se rompre si l'on tourne le volant au delà d'un nombre limité de tours.
  Le câble spiralé peut effectuer jusqu'à 2,5 tours vers la droite et la gauche depuis la position neutre.

4. Brancher le connecteur de câble spiralé et serrer les vis. Reposer le couvercle de colonne de direction.



SRS166

5. Reposer le volant, les goupilles de guidage du câble spiralé de réglage du volant, puis tirer le câble spiralé à travers celles-ci.
6. Brancher le connecteur d'avertisseur sonore et engager le câble spiralé dans les cliquets du volant. Ecarter le connecteur du module de coussin gonflable de l'orifice du couvercle inférieur du volant.
7. Serrer l'écrou.
   ⧖: 29 - 39 (3,0 - 4,0 kg-m)

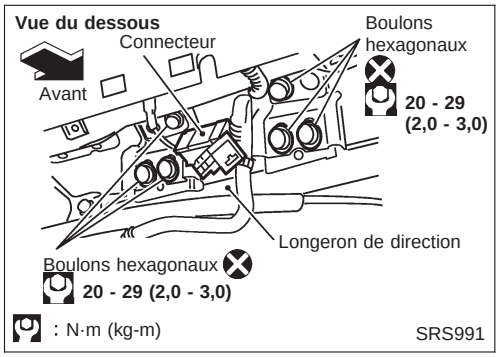
SHIA0144E

8. Fixer le faisceau de module de coussin gonflable et le connecteur de faisceau au collier.
9. Brancher le connecteur du module de coussin gonflable et de l'avertisseur sonore.

PHIA0017E

10. Mettre le module de coussin gonflable en position et le fixer avec des boulons spéciaux neufs.

- **Toujours effectuer l'entretien du module de coussin gonflable depuis le côté.**



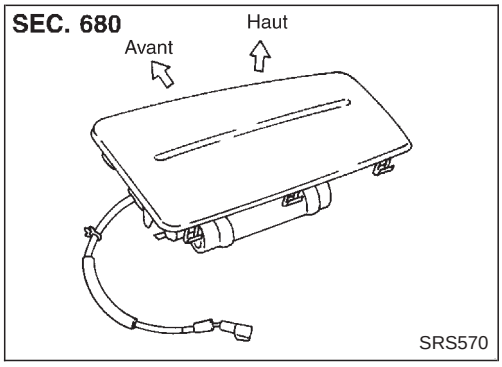
11. Reposer tous les couvercles.
12. Exécuter l'autodiagnostic afin de s'assurer du fonctionnement normal du SRS. (Utiliser CONSULT ou contrôler le témoin d'avertissement). Se reporter à RS-3021.
    Avant d'effectuer l'autodiagnostic, brancher les deux câbles de batterie.
13. Braquer le volant à fond vers la gauche, puis vers la droite pour s'assurer que le câble spiralé est en position neutre.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Repose — Module de coussin gonflable du conducteur et câble spiralé (Suite)

Si le témoin d'avertissement de coussin gonflable clignote ou reste allumé (en mode utilisateur), cela signifie que le câble spiralé peut se rompre en raison de sa position incorrecte. Effectuer l'autodiagnostic de nouveau (en utilisant CONSULT-II ou le témoin). Si un défaut est trouvé, remplacer le câble spiralé par un neuf.

14. Procéder à un nouvel autodiagnostic pour s'assurer qu'aucun défaut de fonctionnement n'est détecté.



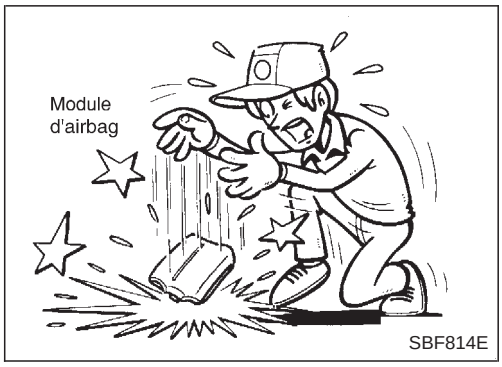
Dépose — module de coussin gonflable avant côté passager

PRECAUTION :

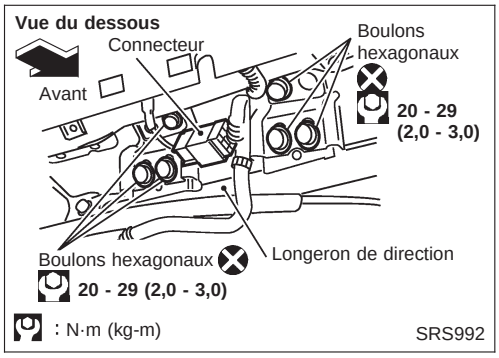
- **Avant de procéder à l'entretien du SRS, couper le contact, débrancher les câbles de masse de la batterie et attendre au moins 3 minutes.**
- **Toujours se positionner sur le côté du module de coussin gonflable ou en dessous de celui-ci.**

1. Déposer la boîte à gants. Se reporter à ''TABLEAU DE BORD'' dans la section BT du manuel de réparation (N° de publicationSM9F-D22BE0E) pour plus de détails.
2. Déconnecter le connecteur du module de coussin gonflable du passager.
3. Déposer les boulons et les boulons spéciaux hexagonaux du module de coussin gonflable du passager avant à l'aide d'un EMBOUT TORX DE SECURITE (taille T30).
4. Déposer l'ensemble de tableau de bord. Se reporter au manuel de réparation(N° de pub. SM9F-D22BE0E) ''TABLEAU DE BORD'' dans la section BT pour plus de détails.
5. Déposer le conduit d'air du tableau de bord.
6. Déposer les boulons des cotés droit et gauche du coussin gonflable du passager avant. Puis enlever le module de coussin gonflable de l'ensemble du tableau de bord.

- Le module de coussin gonflable est lourd et doit être saisi à deux mains lors de la dépose.



PRECAUTION :



- **Toujours poser le module de coussin gonflable avec la garniture dirigée vers le haut.**
- **Ne pas tenter de démonter le module de coussin gonflable.**
- **Ne pas réutiliser les boulons une fois déposés ; les remplacer par des neufs.**
- **Ne pas introduire d'objets (tournevis, etc.) dans le connecteur du module de coussin gonflable.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Dépose — module de coussin gonflable avant côté passager (Suite)

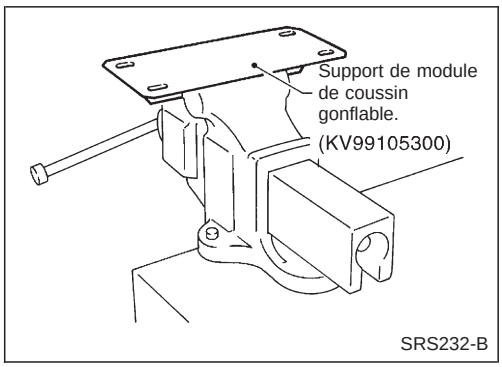
- **Remplacer le module de coussin gonflable s'il est tombé ou s'il a subi un choc.**
- **Ne pas exposer le module de coussin gonflable à des températures supérieures à 90°C.**
- **Ne pas laisser de l'huile, de la graisse ou de l'eau être en contact avec le module de coussin gonflable.**

Repose — Module de coussin gonflable du passager avant

- **Toujours se positionner sur le côté du module de coussin gonflable ou en dessous de celui-ci.**

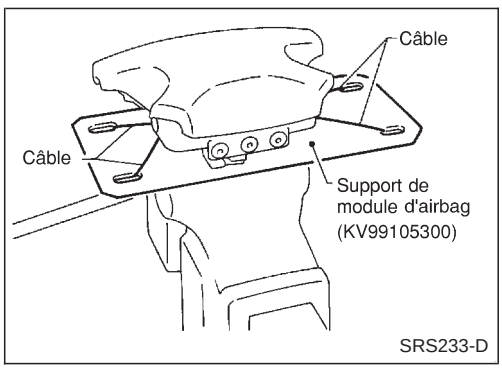
1. Reposer le module de coussin gonflable du passager avant dans le tableau de bord.
2. Reposer le conduit d'air sur le tableau de bord.
3. Reposer le tableau de bord.

- S'assurer que le faisceau n'est pas coincé entre la partie arrière du module de coussin gonflable et le longeron de direction.



4. Monter le module de coussin gonflable côté passager avant sur le longeron de direction.
5. Brancher le connecteur du module de coussin gonflable.
6. Reposer la boîte à gants.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Mise au rebut du module de coussin gonflable et du prétensionneur de ceinture de sécurité

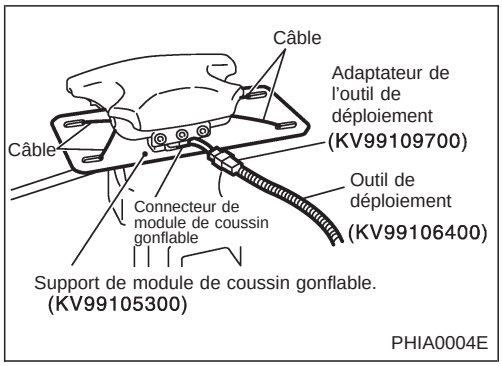
●Avant de mettre au rebut le module de coussin gonflable et le prétensionneur de ceinture de sécurité, ou des véhicules équipés de tels systèmes, déployer lesdits systèmes. Si ces systèmes ont déjà été déployés lors d'un accident, les mettre au rebut en se reportant au chapitre ''MISE AU REBUT DU MODULE DE COUSSIN GONFLABLE (AIR BAG) ET DU PRETENSIONNEUR DE CEINTURE DE SECURITE'' (RS-3014).

- Lors du déploiement du module de coussin gonflable et du prétensionneur, toujours utiliser l'outil spécial ; outil de déploiement KV99106400.
- Se tenir à une distance minimum de 5 m lors du déploiement du module de coussin gonflable et du prétensionneur.
- Le déploiement du module de coussin gonflable et du prétensionneur de ceinture de sécurité s'accompagne d'une détonation bruyante et d'un dégagement de fumée. La fumée n'est pas nocive, mais on veillera toutefois à ne pas l'inhaler en raison de ses propriétés irritantes pouvant être à l'origine de suffocations.
- Ne jamais déployer plus d'un module de coussin gonflable à la fois.
- En raison de la température élevée des composants du module de coussin gonflable, ne pas toucher le module pendant au moins 30 minutes après le déploiement. Une fois le prétensionneur de ceinture de sécurité déployé, attendre 10 minutes avant de le toucher.
- Veiller à porter des gants lors de la manipulation d'un module de coussin gonflable et d'un prétensionneur de ceinture de sécurité déployés.
- Ne jamais verser d'eau sur un module de coussin gonflable ou un prétensionneur de ceinture de sécurité déployé.
- Se nettoyer les mains correctement une fois le travail fini.
- Garer le véhicule à l'extérieur dans un espace libre d'au moins 6 mètres de rayon avant de déployer un module de coussin gonflable ou un prétensionneur de ceinture de sécurité monté sur le véhicule.
- Utiliser un voltmètre pour s'assurer que la batterie du véhicule est chargée à fond.
- Ne pas mettre au rebut le module de coussin gonflable et le prétensionneur de ceinture de sécurité non déployés.

SRS232-B

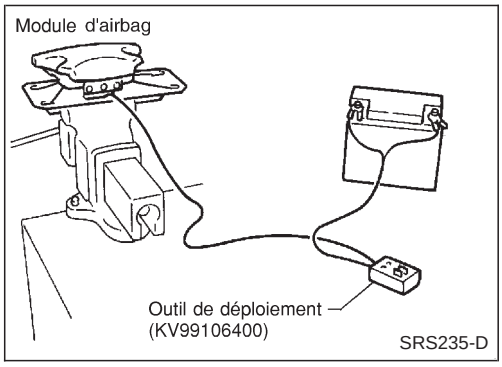
SRS233-D

PROCEDURE DE DEPLOIEMENT DU MODULE DE COUSSIN GONFLABLE (A L'EXTERIEUR DU VEHICULE)



A moins que le véhicule ne soit envoyé à la casse, il est déconseillé de déployer le coussin gonflable à l'intérieur du véhicule. Cette manœuvre peut endommager l'intérieur du véhicule.
Immobiliser le support de module de coussin gonflable (SST : KV99105300) dans un étau fixé sur une base solide pendant le déploiement.

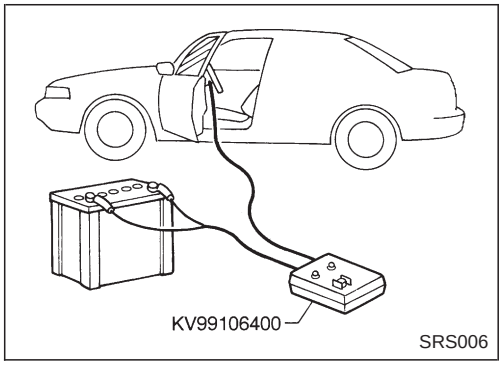
Déploiement du module de coussin gonflable du conducteur (extérieur du véhicule)



1. A l'aide d'un câble, fixer le module de coussin gonflable au diamètre du support du module de coussin gonflable.
2. Fixer solidement dans un étau le support de module de coussin gonflable. (Outil spécial : KV99105300) assorti du module.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Mise au rebut du module de coussin gonflable et du prétensionneur de ceinture de sécurité (Suite)



3. Brancher l'adaptateur de l'outil de déploiement (SST : KV99109700) à l'outil de déploiement (SST : KV99106400) et au connecteur du module de coussin gonflable.

4. Brancher le clip rouge de l'outil de déploiement à la borne positive de batterie et le clip noir à la borne négative.
5. Le témoin à la droite de l'outil, sur lequel est indiqué ''outil de déploiement sous tension'', doit s'allumer en vert et non en rouge.
6. Appuyer sur l'interrupteur de l'outil de déploiement. Le témoin à la gauche de l'outil, sur lequel est indiqué ''tension du connecteur de coussin gonflable'' doit s'allumer et le module de coussin gonflable se déployer.

PRECAUTION :
Se tenir à une distance minimum de 5 m lors du déploiement du module de coussin gonflable du conducteur.

DEPLOIEMENT DU MODULE DE COUSSIN GONFLABLE (AIR BAG) ET DU PRETENSIONNEUR DE CEINTURE DE SECURITE INSTALLES SUR LE VEHICULE

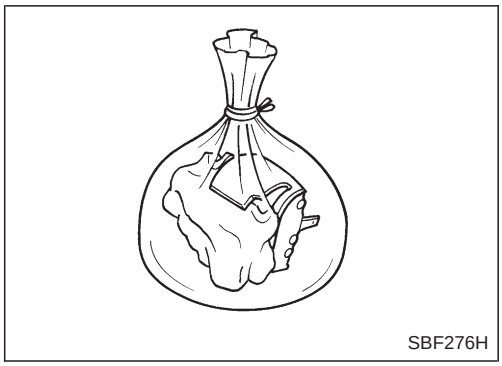
Lors de la mise au rebut du véhicule, déployer les modules de coussins gonflables et les prétensionneurs installés sur le véhicule.

PRECAUTION :
Lors du déploiement du module de coussin gonflable ou du prétensionneur, s'assurer que le véhicule est vide.

1. Débrancher le câble de masse du véhicule et attendre 3 minutes.
2. Débrancher le connecteur des modules de coussin gonflable et des prétensionneurs de ceintures de sécurité.
3. Brancher l'outil de déploiement (SST : KV99106400) au module de coussin gonflable ou au prétensionneur de ceinture de sécurité.
   Sur le module de coussin gonflable du conducteur, brancher l'adaptateur de l'outil de déploiement (SST : KV99109700) au connecteur de l'outil.
   Sur le module de coussin gonflable côté passager, brancher l'adaptateur à l'outil de déploiement (SST : KV99108300) au

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Mise au rebut du module de coussin gonflable et du prétensionneur de ceinture de sécurité (Suite)



connecteur de l'outil. Pour le prétensionneur de ceinture de sécurité, brancher l'adaptateur de l'outil de déploiement (SST : KV99108200) au connecteur de l'outil.

4. Brancher le clip rouge de l'outil de déploiement à la borne positive de batterie et le clip noir à la borne négative.
5. Le témoin à la droite de l'outil, sur lequel est indiqué ''outil de déploiement sous tension'', doit s'allumer en vert et non en rouge.
6. Appuyer sur l'interrupteur de l'outil de déploiement. Le témoin de gauche de l'outil, sur lequel est indiqué '''tension du connecteur de coussin gonflable'' doit s'allumer et le module de coussin gonflable ou le prétensionneur de ceinture de sécurité se déployer.

PRECAUTION :

Ne jamais déployer plus d'un module de coussin gonflable ou prétensionneur de ceinture de sécurité à la fois.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SBF276H

Mise au rebut du module de coussin gonflable et du prétensionneur de ceinture de sécurité (Suite)

MISE AU REBUT DU MODULE DE COUSSIN GONFLABLE (AIR BAG) ET DU PRETENSIONNEUR DE CEINTURE DE SECURITE

Les modules de coussins gonflables et les prétensionneurs de ceinture de sécurité déployés sont très chauds. Avant de les mettre au rebut, attendre au moins 30 minutes et 10 minutes respectivement. Les placer dans des sacs en plastique hermétiques avant de les mettre au rebut.

PRECAUTION :

- **Ne jamais asperger d'eau un module de coussin gonflable ou un prétensionneur de ceinture de sécurité déployés.**
- **Veiller à porter des gants lors de la manipulation d'un module de coussin gonflable et d'un prétensionneur de ceinture de sécurité déployés.**
- **Le déploiement du coussin gonflable ne dégage pas de gaz nocifs. Toutefois veiller à ne pas inhaler le gaz en raison de ses propriétés irritantes pouvant être à l'origine de suffocation.**
- **Ne pas essayer de démonter le module de coussin gonflable et le prétensionneur de ceinture de sécurité.**
- **Le module de coussin gonflable et le prétensionneur de ceinture de sécurité ne peuvent être réutilisés.**
- **Se nettoyer les mains correctement une fois le travail fini.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Introduction des diagnostics des défauts

PRECAUTION :

- **Ne pas utiliser d'équipement d'essai électrique sur les circuits connexes du SRS sauf sur indication de ce manuel de réparation. Le faisceau de câblage du SRS peut être identifié à l'aide d'un connecteur de faisceau jaune.**
- **Ne pas essayer de réparer, épisser ou modifier le faisceau de câblage du SRS. Si le faisceau est endommagé, le remplacer par un neuf.**
- **Maintenir le circuit de masse dans un état de propreté satisfaisant.**

FONCTION DE DIAGNOSTIC

Les résultats de l'autodiagnostic du SRS peuvent être lus à l'aide du témoin d'avertissement ''AIR BAG'' et/ou de CONSULT-II. La lecture de ces résultats peut être réalisée dans les deux modes suivants — ''Mode utilisateur'' et ''Mode de diagnostic''.
Le mode utilisateur est exclusivement conçu pour le client (conducteur). Ce mode indique au conducteur l'existence d'un défaut dans le système à l'aide du témoin d'avertissement de l''AIR BAG''.
Le mode de diagnostic permet au technicien de localiser et d'inspecter la pièce défectueuse.
Les modes d'applications du témoin d'avertissement ''AIR BAG'' et CONSULT-II sont les suivantes:

	Mode utilisateur	Mode de diagnostic	Type d'affichage
Témoin d'avertissement ''AIR BAG''	X	X	Fonctionnement MAR./ ARR.
CONSULT-II	—	X	Contrôle

NOTE :
Un défaut dans le prétensionneur de ceinture de sécurité est indiqué par le témoin d'avertissement ''AIR BAG''.

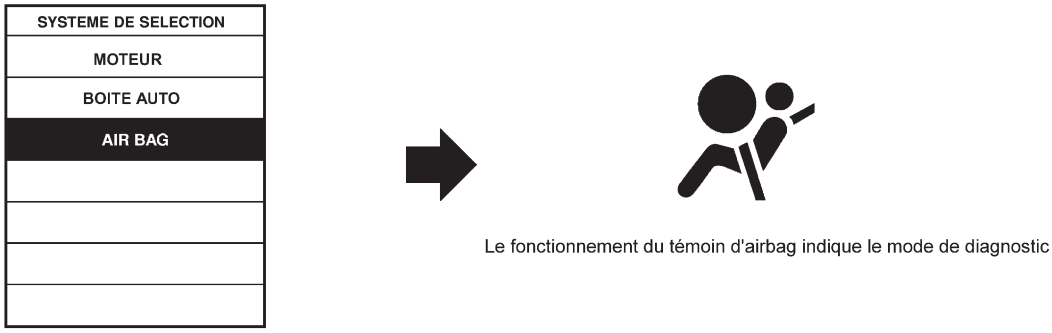
MODE DE DIAGNOSTIC POUR CONSULT-II

- ''AUTO-DIAG [COURANT]''
  Un résultat d'autodiagnostic courant (également indiqué par le clignotement du témoin en mode de diagnostic) s'affiche en temps réel sur l'écran de CONSULT-II. Cela signifie qu'une pièce défectueuse doit être réparée.
- ''AUTO-DIAG [PASSE]''
  Les résultats d'autodiagnostic précédemment enregistrés dans la mémoire sont affichés sur l'écran du CONSULT-II. Les résultats enregistrés sont gardés en mémoire tant que celle-ci n'a pas été effacée.
- ''ENREG DIAG DEFAUT''
  La fonction ''ENREG DIAG DEFAUT'' permet d'afficher sur l'écran CONSULT-II les résultats de diagnostic précédemment effacés lors de la remise à zéro du système.
- ''N° IDENT BOIT CONTR''
  Pour chaque modèle, le boîtier de capteurs de diagnostic est assorti d'un numéro de classification propre et individuel. Ce nombre s'affiche sur l'écran CONSULT-II, comme décrit ci-à gauche. Lors du remplacement du boîtier de capteurs de diagnostic, se reporter au numéro de pièce pour une bonne compatibilité. Après la repose, il est possible de vérifier si le boîtier de remplacement est approprié en confirmant ce numéro d'identification sur l'écran du CONSULT-II.

Pour le MODELE NISSAN D22, le numéro d'identification du boîtier de capteurs de diagnostic se présente de la manière suivante :

MODELE	N° IDENT BOIT CONT EL
Coussin gonflable simple	5A37
Coussin gonflable simple et prétensionneur de ceinture de sécurité	5A39
Coussin gonflable double	5A38
Coussins gonflables doubles et prétensionneur de ceinture de sécurité	5A3A

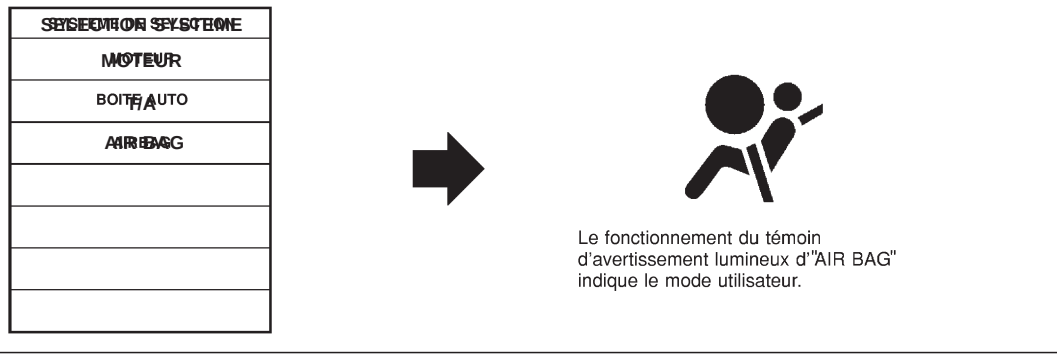
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Introduction des diagnostics des défauts (Suite)

COMMENT CHANGER LE MODE D'AUTODIAGNOSTIC

Avec CONSULT-II



Du mode utilisateur au mode de diagnostic.

Le système passe automatiquement du mode utilisateur en mode de diagnostic lorsque l'on sélectionne l'option ''AIR BAG'' sur l'écran ''SELECTION SYSTEME''.

Du mode de diagnostic au mode utilisateur.

Appuyer sur la touche ''BACK'' (RETOUR) de CONSULT-II jusqu'à l'affichage de ''SELECTION SYSTEME'' afin de passer du mode utilisateur en mode de diagnostic ; le mode de diagnostic passe automatiquement au mode utilisateur.

Sans CONSULT-II

Du mode utilisateur au mode de diagnostic.

Le mode diagnostique s'allume seulement quand on détecte un défaut, en mettant le contact d'allumage comme suit :

1) Mettre le contact d'allumage sur ''ON''.
2) Une fois que le témoin d'avertissement ''AIR BAG'' est allumé pendant 7 secondes, mettre le contact d'allumage sur ''OFF'' en moins d'un seconde.
3) Attendre plus de 3 secondes.
4) Répéter à deux reprises les étapes 1 à 3 (3 cycles au total).
5) Mettre le contact d'allumage sur ''ON''.

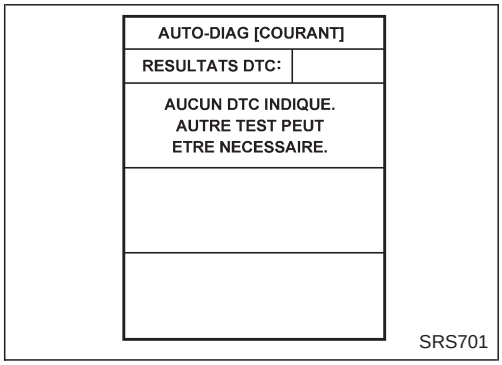
Le SRS ne passe pas en mode de diagnostic si aucun défaut n'est détecté.

Du mode de diagnostic au mode utilisateur.

Une fois le défaut réparé, couper le contact d'allumage pendant au moins 1 seconde avant de le rétablir . Le mode de diagnostic retourne au mode utilisateur.

S'il est nécessaire de passer du mode de diagnostic au mode utilisateur quand un défaut est détecté, tourner le contact d'allumage comme suit :

1) Mettre le contact d'allumage sur ''ON''.
2) Une fois que le témoin d'avertissement ''AIR BAG'' est allumé pendant 7 secondes, mettre le contact d'allumage sur ''OFF'' en moins d'un seconde.
3) Attendre plus de 3 secondes.
4) Répéter à deux reprises les étapes 1 à 3 (3 cycles au total).
5) Mettre le contact d'allumage sur ''ON''.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Introduction des diagnostics des défauts (Suite)

COMMENT EFFACER LES RESULTATS DE L'AUTODIAGNOSTIC

Avec CONSULT-II

- ''AUTO-DIAG [COURANT]''
  Le résultat d'autodiagnostic courant s'affiche en temps réel sur l'écran de CONSULT-II. Une fois le défaut complètement éliminé, aucun défaut de fonctionnement n'est plus détecté sur l'écran ''AUTO-DIAG [COURANT]''.

- ''AUTO-DIAG [PASSE]''
  Revenir sur l'écran CONSULT-II ''AUTO-DIAG [COURANT]'' en appuyant sur la touche ''BACK'' (RETOUR) de CONSULT-II et en sélectionnant ''AUTO-DIAG [COURANT]'' dans ''SELECTION MODE DIAG''. Appuyer sur ''EFFAC'' en mode ''AUTO-DIAG [COURANT]''

NOTE :
Si le défaut mémorisé en mode ''AUTO-DIAG [PASSE]'' n'est pas effacé, le mode utilisateur indique le défaut du système par le biais du témoin d'avertissement, même si le défaut a été complètement éliminé.

- ''ENREG DIAG DEFAUT''

  La mémoire du mode ''ENREG DIAG DEFAUT'' ne peut pas être effacée.

Sans CONSULT-II

Une fois le défaut éliminé, passer du mode de diagnostic au mode utilisateur en coupant le contact pendant au moins 1 seconde avant de le rétablir. Le résultat de l'autodiagnostic est alors effacé.

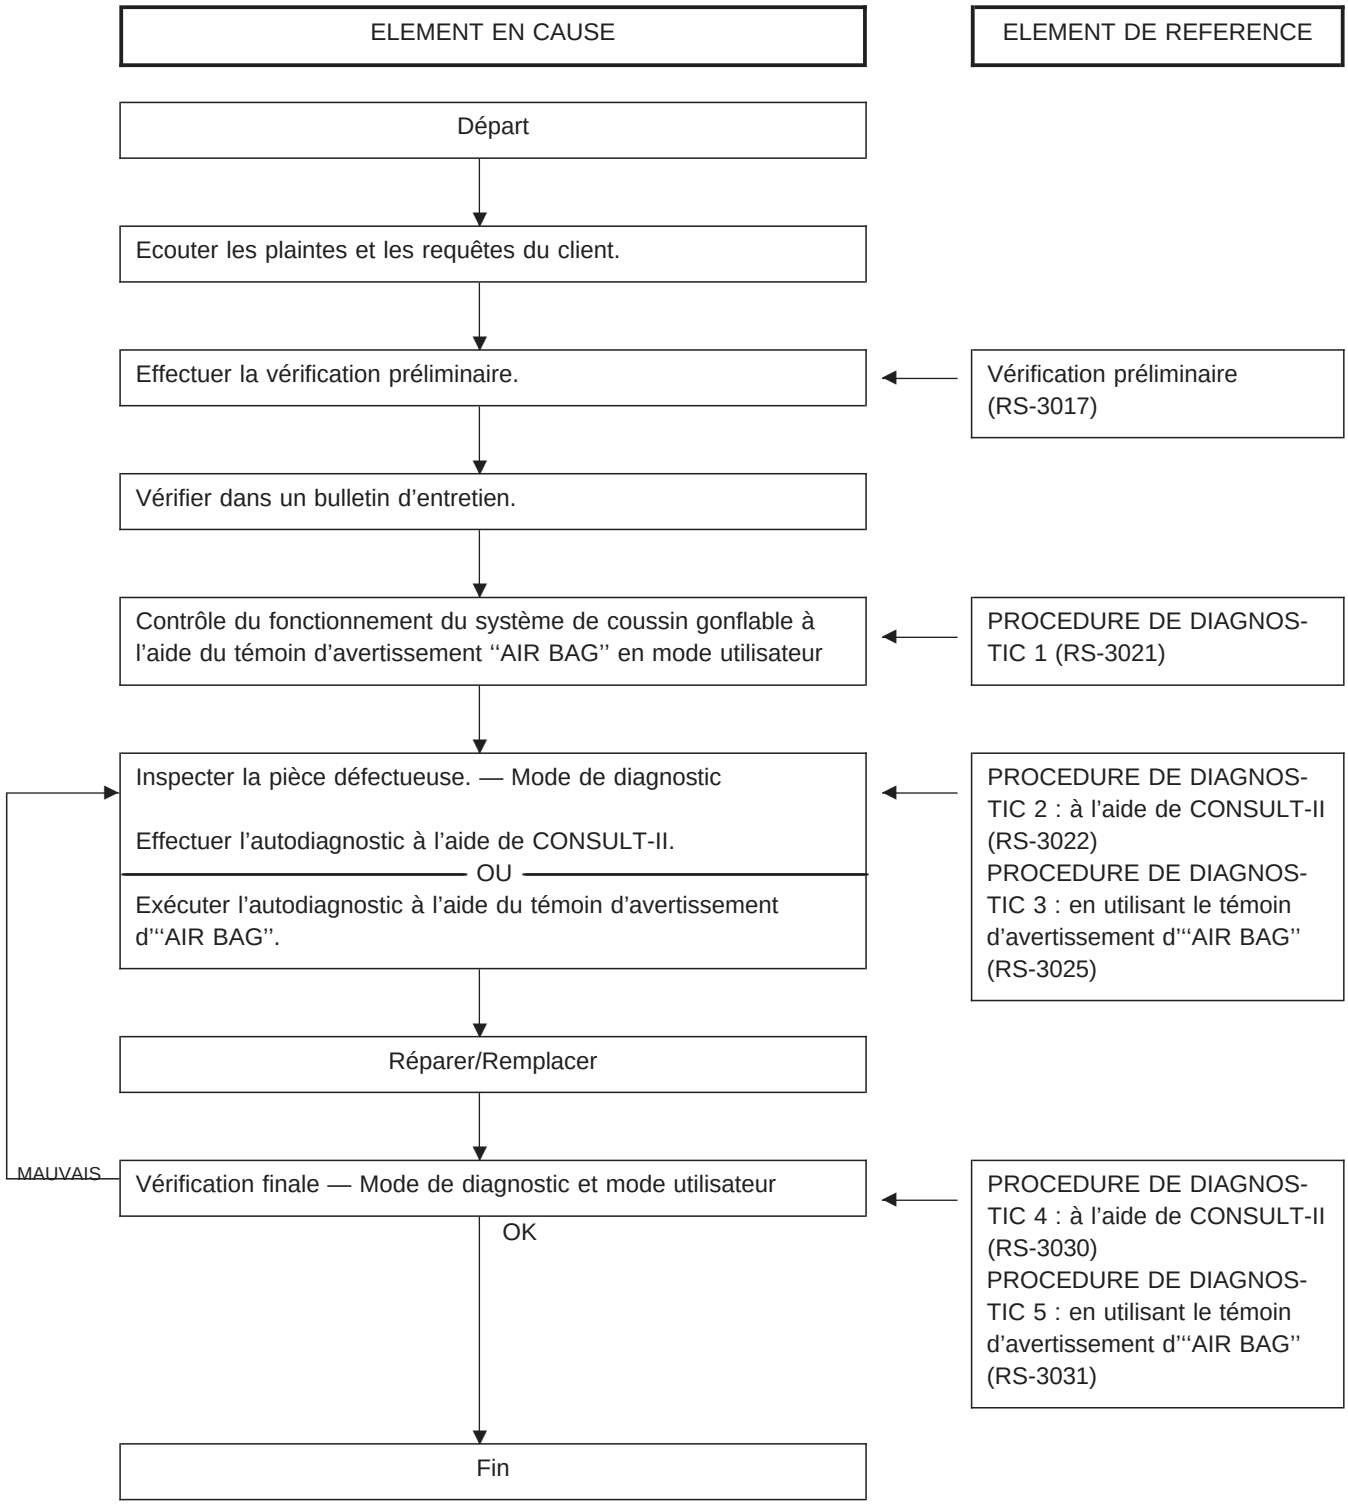
Comment effectuer les diagnostics de défaut pour effectuer une réparation rapide et précise

Une bonne compréhension des conditions de mauvais fonctionnement peut permettre de localiser la panne plus rapidement et avec plus de précision.
En général, chaque client appréhende différemment une panne. Il est indispensable de bien comprendre les symptômes ou les conditions de la plainte d'un client.

INFORMATIONS FOURNIES PAR LE CLIENT

QUOI	.....	Modèle de véhicule
QUAND	.....	Date, fréquences
OU	.....	Etat de la route
COMMENT	.....	Conditions de fonctionnement, symptômes

VERIFICATION PRELIMINAIRE



Vérifier que les pièces suivantes sont en bon état :
- Batterie [se reporter à la section EL (''BATTERIE'') du manuel de réparation].
- Fusible [se reporter à la section EL (''Fusible'', ''DISPOSITION DE L'ALIMENTATION ELECTRIQUE'') du manuel de réparation].
- Connexions des composants du système au faisceau

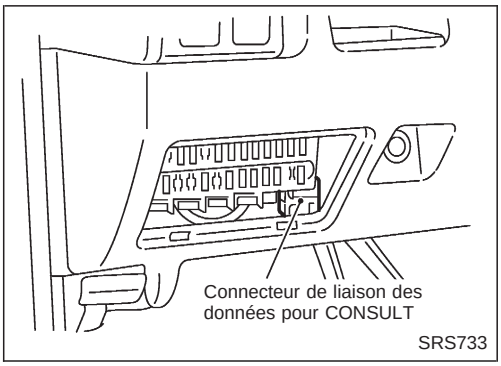
Autodiagnostic

PROCEDURE DE DIAGNOSTIC 1 (⊗ sans CONSULT-II)

Vérifier le fonctionnement du SRS à l'aide du témoin d'avertissement ''AIR BAG'' — Mode utilisateur

1. le témoin d'avertissement ''AIR BAG'' s'allume lorsque l'on tourne le contact d'allumage de la position ''OFF'' sur ''ON''.
2. Comparer le fonctionnement du témoin d'avertissement ''AIR BAG'' au tableau ci-dessous.

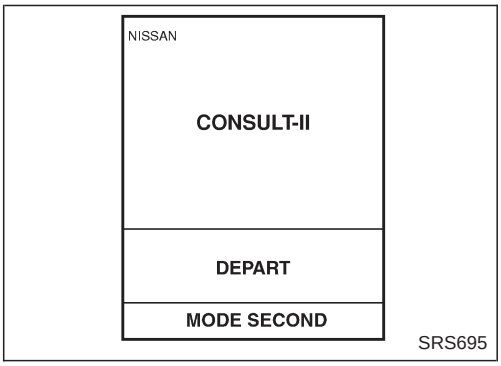
Fonctionnement du témoin d'avertissement ''AIR BAG'' — Mode utilisateur —	Conditions du SRS	Elément de référence
 MRS095A	Aucun défaut n'est détecté. Aucune démarche supplémentaire n'est nécessaire.	—
 MRS096A	Le système est défectueux et a besoin d'être réparé comme indiqué.	Aller à la PROCEDURE DE DIAGNOSTIC 2 ou 3 (RS-3022 ou 3025).
 MRS097A	Le coussin gonflable est déployé. Le prétensionneur de ceinture de sécurité est déployé.	Aller à DIAGNOSTIC DE COLLISION (RS-3042).
	Le fusible de coussin gonflable, le boîtier de capteurs de diagnostic ou le faisceau est défectueux et doit être réparé.	Aller à la PROCEDURE DE DIAGNOSTIC 9 (RS-3040).
 MRS098A	Un des défauts suivants s'est manifesté et doit être réparé. ●Le fusible de la jauge est grillé. ●le circuit du témoin d'avertissement ''AIR BAG'' est en court-circuit ou en circuit ouvert. ●Le boîtier de capteurs de diagnostic est défectueux.	Aller à PROCEDURE DE DIAGNOSTIC 10 (RS-3041)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

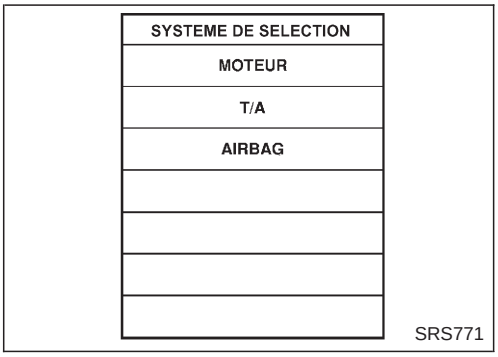
Autodiagnostic (Suite)

PROCEDURE DE DIAGNOSTIC 2 (avec CONSULT-II)



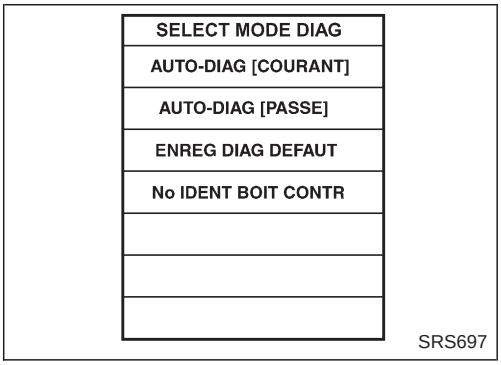
Inspection des pièces défectueuses du SRS à l'aide de CONSULT-II — Mode de diagnostic

1. Mettre le contact d'allumage sur ''OFF''.
2. Brancher CONSULT-II au connecteur de liaison de données.



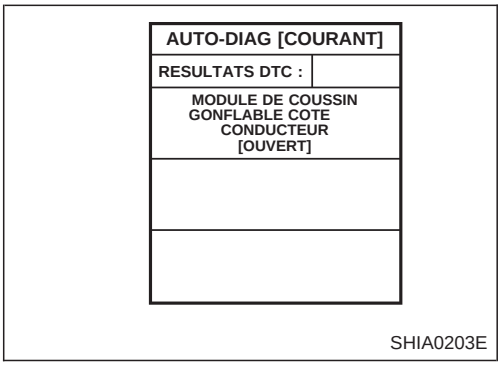
SRS733

3. Mettre le contact d'allumage sur ''ON''.
4. Appuyer sur ''DEPART''.



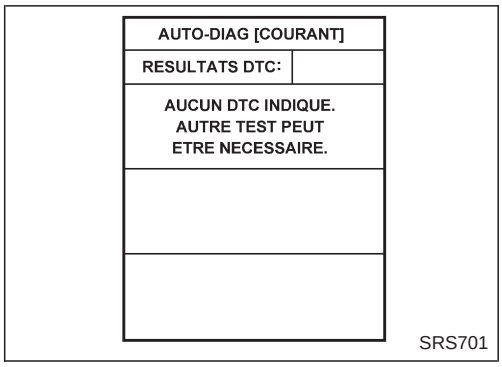
SRS695

5. Appuyer sur ''AIR BAG''.



SRS771

6. Appuyer sur ''AUTO-DIAG [COURANT]''.



SRS697

7. Les codes de diagnostic sont affichés dans ''AUTO-DIAG [COURANT]''.

SHIA0203E

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Autodiagnostic (Suite)

Si aucun défaut de fonctionnement n'est détecté en ''AUTO-DIAG [COURANT]'', même si un défaut de fonctionnement est détecté par le témoin d'avertissement ''AIR BAG'', vérifier la tension de la batterie.

Si la tension de la batterie est inférieure à 9 V, recharger la batterie. Puis aller à la PROCEDURE DE DIAGNOSTIC 4 pour effectuer un contrôle final, page RS-3030

Si la tension de la batterie est normale, aller à la PROCEDURE DE DIAGNOSTIC 6, page RS-3036 afin d'effectuer le diagnostic des cas suivants :

- Le résultat d'autodiagnostic (précédemment mémorisé) n'a pas été effacé après réparation.
- Défaut de fonctionnement intermittent du SRS.

8. Appuyer sur ''IMPRI''.
9. Comparer les codes de diagnostic au TABLEAU DES CODES DE DIAGNOSTIC CONSULT-II, page RS-3024.
10. Appuyer sur la touche ''RETOUR'' sur CONSULT-II jusqu'à l'affichage de ''SELECTION SYSTEME'' afin de revenir en mode utilisateur depuis le mode de diagnostic.
11. Mettre le contact d'allumage sur ''OFF'', et débrancher CONSULT-II et les deux câbles de la batterie.
12. Réparer le système comme décrit dans l''Ordre de réparation'' du TABLEAU DES CODES DE DIAGNOSTIC DE CONSULT-II, correspondant au résultat de l'autodiagnostic. Pour la procédure de remplacement des pièces des composants, se reporter à RS-3005 et ''Dépose et repose'' dans la section RS du manuel de réparation (N° de pub. SM9F-D22BE0E) pour plus de détails.
13. Après avoir réparé le système, aller à la PROCEDURE DE DIAGNOSTIC 4 pour effectuer un contrôle final, page RS-3030.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Autodiagnostic (Suite)

TABLEAU DES CODES DE DIAGNOSTIC DE CONSULT-II (''AUTO-DIAG [COURANT]'')

Elément de diagnostic	Explication		Ordre de réparation **Vérifier le système SRS à chaque remplacement de pièce.**
AUCUN DTC N'EST DETECTE	Lorsque le défaut de fonctionnement est indiqué par le témoin d'avertissement ''AIR BAG'' en mode utilisateur	●Tension de la batterie basse (moins de 9 V)	●Aller à PROCEDURE DE DIAGNOSTIC 4 (RS-3030) après avoir chargé la batterie.
		●Le résultat d'autodiagnostic ''AUTO-DIAG [PASSE]'' (précédemment mémorisé) n'a pas été effacé après réparation. ●Un défaut intermittent a été détecté dans le passé.	●Aller à la PROCEDURE DE DIAGNOSTIC 6 (RS-3036).
	●Aucun défaut n'est détecté.		●Aller à la PROCEDURE DE DIAGNOSTIC 4 (RS-3030).
MODULE DE COUSSIN GONFLABLE COTE CONDUCTEUR [OUVERT]	●Le circuit du module de coussin gonflable côté conducteur est ouvert. (Câble spiralé inclus)		1. Inspecter visuellement le branchement du faisceau de câblage. 2. Remplacer le faisceau s'il est visiblement endommagé. 3. Remplacer le câble spiralé. 4. Remplacer le module de coussin gonflable côté conducteur. (Avant la mise au rebut, ce dernier doit être déployé.) 5. Remplacer le boîtier de capteurs de diagnostic. 6. Remplacer le faisceau correspondant.
MODULE DE COUSSIN GONFLABLE COTE CONDUCTEUR [COURT TENS BATT]	●Le circuit du module de coussin gonflable côté conducteur est en court-circuit avec un circuit d'alimentation électrique. (Câble spiralé inclus		
MODULE DE COUSSIN GONFLABLE COTE CONDUCTEUR [COURT-CIRC MASSE]	●Le circuit du module de coussin gonflable côté passager avant est court-circuité à la masse. (Câble spiralé inclus)		
MODULE DE COUSSIN GONFLABLE COTE CONDUCTEUR [COURT-CIRC]	●Les circuits du module de coussin gonflable côté conducteur sont court-circuités les uns avec les autres.		
MODULE A/B PASSAG [COURT TENS BATT]	●Le circuit du module de coussin gonflable côté passager avant est en court-circuit avec un circuit d'alimentation électrique.		1. Inspecter visuellement la connexion du faisceau de câblage. 2. Remplacer le faisceau s'il est visiblement endommagé. 3. Remplacer le module de coussin gonflable côté passager avant. (Avant la mise au rebut, ce dernier doit être déployé.) 4. Remplacer le boîtier de capteurs de diagnostic. 5. Remplacer le faisceau correspondant.
MODULE A/B PASSAG [OUVERT]	●Le circuit du module de coussin gonflable côté passager avant est ouvert.		
MODULE A/B PASSAG [COURT-CIRC MASSE]	●Le circuit du module de coussin gonflable côté passager avant est court-circuité à la masse.		
MODULE A/B PASSAG [COURT-CIRC]	●Les circuits du module de coussin gonflable avant côté passager sont court-circuités les uns avec les autres.		
PRE-TEN AVANT GAUCHE [OUVERT]	●Le circuit du prétensionneur de ceinture de sécurité gauche est ouvert.		1. Vérifier visuellement les connexions de faisceau de câblage. 2. Remplacer le faisceau s'il est visiblement endommagé. 3. Remplacer la ceinture de sécurité gauche. (La désactiver avant de la mettre au rebut). 4. Remplacer le boîtier de capteurs de diagnostic. 5. Remplacer le faisceau correspondant.
PRE-TEN AVANT GAUCHE [COURT TENS BATT]	●Le circuit du prétensionneur de ceinture de sécurité gauche est en court-circuit avec un circuit d'alimentation.		
PRE-TEN AVANT GAUCHE [COURT-CIRC MASSE]	●Le circuit du prétensionneur de ceinture de sécurité gauche est court-circuité à la masse.

Autodiagnostic (Suite)

Elément de diagnostic	Explication	Ordre de réparation **Vérifier le système SRS à chaque remplacement de pièce.**
PRE-TEN AVANT DROIT [OUV/COURT TENS BATT]	●Le circuit du prétensionneur de ceinture de sécurité droit est ouvert ou il y a court-circuit avec certains circuits d'alimentation.	1. Vérifier visuellement les connexions de faisceau de câblage. 2. Remplacer le faisceau s'il est visiblement endommagé. 3. Remplacer la ceinture de sécurité droite. (La désactiver avant de la mettre au rebut). 4. Remplacer le boîtier de capteurs de diagnostic. 5. Remplacer le faisceau correspondant.
PRE-TEN AVANT DROIT [COURT TENS BATT]	●Le circuit du prétensionneur de ceinture de sécurité droit est en court-circuit avec un circuit d'alimentation.	
PRE-TEN AVANT DROIT [COURT-CIRC MASSE]	●Le circuit du prétensionneur droit avant est court-circuité à la masse.	

*** Suivre les procédures dans l'ordre numérique lors de la réparation des pièces défectueuses. Vérifier que le défaut de fonctionnement est éliminé à l'aide du témoin de coussin gonflable ou de CONSULT-II après chaque réparation. Si le défaut subsiste, passer à l'étape suivante. Aucune réparation supplémentaire n'est requise si le défaut a disparu.**

PROCEDURE DE DIAGNOSTIC 3 ⊗ sans CONSULT-II)

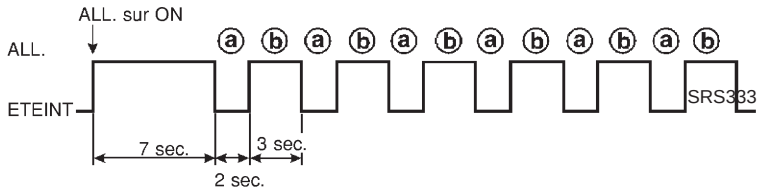
Inspection des pièces défectueuses du SRS à l'aide du témoin d'avertissement ''AIR BAG'' — Mode de diagnostic

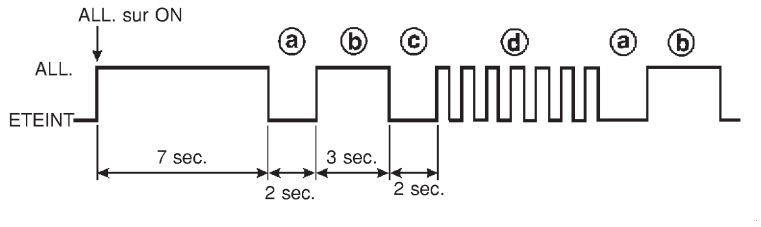
NOTE :

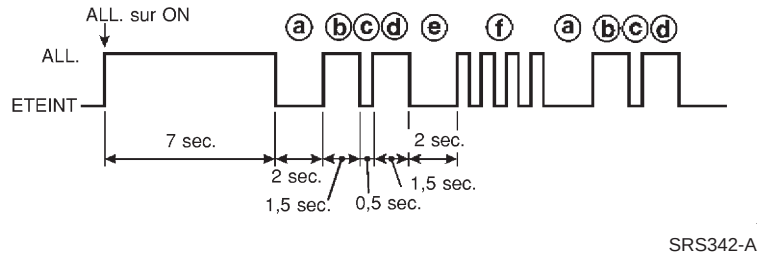
Le SRS ne passera pas en mode de diagnostic si aucun défaut n'est détecté en mode utilisateur.

1. Mettre le contact d'allumage sur ''ON''.
2. Une fois que le témoin d'avertissement ''AIR BAG'' est allumé pendant 7 secondes, mettre le contact d'allumage sur ''OFF'' en moins d'un seconde.
3. Attendre plus de 3 secondes.
4. Répéter à deux reprises les étapes 1 à 3 (3 cycles au total).
5. Mettre le contact d'allumage sur ''ON''.
   Le SRS est maintenant en mode de diagnostic.
6. Le témoin d'avertissement ''AIR BAG'' fonctionne en mode de diagnostic comme suit :

NOTE :







Si le SRS ne passe pas en mode de diagnostic même si un défaut a été detecté en mode utilisateur, vérifier la tension de la batterie

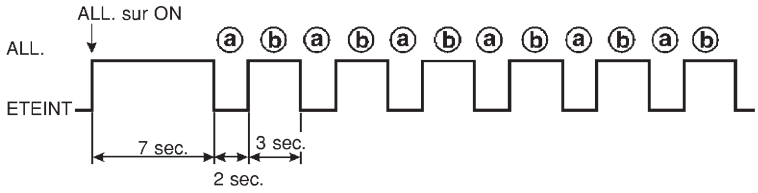
Si la tension de la batterie est inférieure à 9 V, recharger la batterie. Aller ensuite à la PROCEDURE DE DIAGNOSTIC 5, page RS-3031

Si la tension de la batterie est normale, remplacer le boîtier de capteurs de diagnostic.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Autodiagnostic (Suite)

N°	Séquence de clignotement du témoin d'avertissement "AIR BAG" — Mode de diagnostic —		Conditions du SRS
1		La séquence ⓐ ⓑ est répétée.	● Les résultats de diagnostic (précédemment mémorisés) n'ont pas été effacés, même après que le système a été réparé. ● Un défaut intermittent a été détecté dans le passé. Aller à la PROCEDURE DE DIAGNOSTIC 7 (RS-3036).
2		La séquence de ⓐ à ⓓ est répétée. ⓑ — Repère du coussin gonflable côté conducteur/passager et du prétensionneur de ceinture de sécurité (pour l'identification d'un défaut de fonctionnment du coussin gonflable côté conducteur/passager et/ou du prétensionneur de ceinture de sécurité) ⓓ — Indique le composant défectueux. Le nombre de clignotements varie selon le composant défectueux (0,5 sec. ALLUME et 0,5 sec. ETEINT est considéré comme un clignotement.)	Le système est défectueux et a besoin d'être réparé.
3		La séquence de ⓐ à ⓕ est répétée. ⓑ, ⓒ, ⓓ — Repères du coussin gonflable latéral (pour l'identification d'un défaut de fonctionnement du coussin gonflable latéral) ⓕ — Indique le composant défectueux. Le nombre de clignotements varie selon le composant défectueux (0,5 sec. ALLUME et 0,5 sec. ETEINT est considéré comme un clignotement.)	



7. Le composant défectueux est indiqué par le nombre de clignotements (pièce ⓓ ou ⓕ). Comparer le nombre de clignotements à celui indiqué dans le TABLEAU DE CODES DE CLIGNOTEMENT DU TEMOIN "AIR BAG", page RS-3027, et localiser le composant défectueux.
8. Couper le contact et débrancher les deux câbles de la batterie.

Diagnostics des défauts du témoin d'avertissement ''AIR BAG''

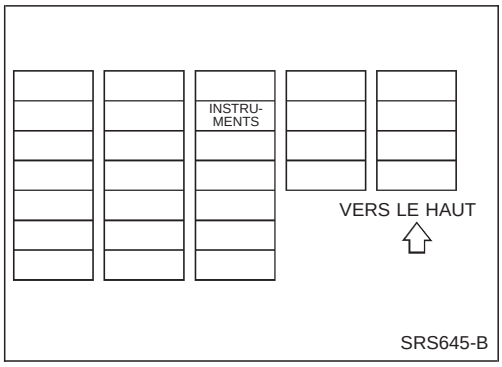
PROCEDURE DE DIAGNOSTIC 9

SYMPTOME : le témoin d'avertissement ''AIR BAG'' ne s'éteint pas.

Le module de coussin gonflable est-il déployé ?
- Oui → Se reporter à DIAGNOSTIC DE COLLISION, (RS-3042).
- Non ↓

Le fusible (''AIR BAG'') du SRS fonctionne-t-il correctement ?
- Non → Remplacer le fusible.
- Oui ↓

Brancher CONSULT-II et appuyer sur ''DEPART''.
- ● Est-ce que ''AIR BAG'' s'affiche sur l'écran CONSULT-II?



Non → Vérifier visuellement le branchement du faisceau de câblage du boîtier de capteurs de diagnostic. Si la vérification du branchement du faisceau est satisfaisante, remplacer le boîtier de capteurs de diagnostic.

Oui ↓

Est-ce que la connexion de faisceau entre le témoin et le boîtier de capteurs de diagnostic est bonne ?
- Non → Brancher le connecteur du témoin et du boîtier de capteurs de diagnostic correctement. Si le témoin ne s'éteint toujours pas, remplacer le faisceau.
- Oui ↓

Remplacer le boîtier de capteurs de diagnostic.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostics des défauts du témoin d'avertissement ''AIR BAG'' (Suite)

PROCEDURE DE DIAGNOSTIC 10

SYMPTOME : le témoin d'avertissement ''AIR BAG'' ne s'allume pas.

Le fusible du témoin fonctionne-t-il correctement ?

Non → Remplacer le fusible et mettre le contact d'allumage sur ON. Si le fusible des instruments combinés est grillé, réparer le faisceau correspondant.

Oui ↓

1. Débrancher le connecteur du boîtier de capteurs de diagnostic.
2. Mettre le contact d'allumage sur ''ON''.

●Le témoin s'allume-t-il ?

Non → Brancher le connecteur du témoin et du boîtier de capteurs de diagnostic correctement. Si le témoin ne s'allume toujours pas, remplacer le faisceau.

Oui ↓

Remplacer le boîtier de capteurs de diagnostic.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

POUR COLLISION FRONTALE

Procéder de la façon suivante pour réparer le SRS en cas de collision frontale.

Si le SRS (à l'exception du coussin gonflable latéral) est activé lors d'une collision :

① remplacer le boîtier de capteurs de diagnostic.
② Déposer les modules de coussins gonflables (à l'exception du module de coussin gonflable latéral)
③ Contrôler les composants du SRS à l'aide du tableau ci-dessous :
- Remplacer les composants du SRS qui montrent des signes visibles de dommages (bosses, fissures, déformation).

④ Reposer les nouveaux modules de coussin gonflable (à l'exception du module de coussin gonflable latéral).
⑤ Effectuer un autodiagnostic à l'aide de CONSULT et du témoin d'avertissement ''AIR BAG''. Se reporter à ''Autodiagnostic'' pour plus de détails (RS-3021). S'assurer que l'ensemble du SRS fonctionne correctement.

Lorsque le SRS n'est pas activé lors d'une collision :

① Contrôler les composants du SRS à l'aide du tableau ci-dessous :
- Remplacer les composants du SRS qui montrent des signes visibles de dommages (bosses, fissures, déformation).

② Effectuer un autodiagnostic à l'aide de CONSULT et du témoin d'avertissement ''AIR BAG''. Se reporter à ''Autodiagnostic'' pour plus de détails (RS-3021). S'assurer que l'ensemble du SRS fonctionne correctement.

Inspection du SRS

Pièce	Le SRS est activé (à l'exception du module de coussin gonflable latéral).	Le SRS n'est PAS activé.
Module de coussin gonflable (côté conducteur et passager)	REMPLACER Reposer le module de coussin gonflable en utilisant des boulons neufs.	1. Déposer le module de coussin gonflable. Vérifier que le cache du faisceau et les connecteurs ne sont pas endommagés, les bornes déformées et le faisceau coincé. 2-1. Reposer le module de coussin gonflable côté conducteur sur le volant et vérifier s'il est correctement monté et aligné sur le volant. 2-2. Reposer le module de coussin gonflable côté passager sur le tableau de bord et vérifier s'il est correctement monté sur le tableau de bord. 3. Si aucun dommage n'est trouvé, reposer l'ensemble avec des boulons neufs. 4. En cas de dommage — REMPLACER. Le coussin gonflable doit être déployé avant d'être mis au rebut.
Ensemble de prétensionneur de ceinture de sécurité	REMPLACER Reposer le prétensionneur de ceinture de sécurité en utilisant des boulons neufs.	1. Déposer les prétensionneurs de ceinture de sécurité. Vérifier que le cache du faisceau et les connecteurs ne sont pas endommagés, les bornes déformées et le faisceau coincé. 2. Vérifier que les ceintures ne sont pas endommagées et que les ancrages ne sont pas desserrés. 3.Vérifier le bon fonctionnement des enrouleurs. 4.Si l'on ne constate aucun dommage, reposer en utilisant des boulons neufs enduits de produit adhésif. 5.En cas de dommage — REMPLACER. Reposer le prétensionneur de ceinture de sécurité en utilisant des boulons neufs enduits de produit adhésif. Les prétensionneurs de ceintures de sécurité doivent être déployés avant d'être mis au rebut.
Boîtier de capteurs de diagnostic	REMPLACER Reposer le boîtier de capteurs de diagnostic en utilisant des boulons neufs.	1. Vérifier que le boîtier et son support ne sont pas bosselés, fissurés ou déformés. 2. Vérifier que les connecteurs ne sont pas endommagés et les bornes déformées. 3. Si aucun dommage n'est trouvé, reposer l'ensemble avec des boulons neufs. 4. En cas de dommage — REMPLACER. Reposer le boîtier de capteurs de diagnostic en utilisant des boulons neufs.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Pièce	Le SRS est activé (à l'exception du module de coussin gonflable latéral).	Le SRS n'est PAS activé.
Volant	1. Vérifier visuellement si le volant de direction n'est pas déformé. 2. Vérifier que le faisceau (intégré au volant) et les connecteurs ne sont pas endommagés et les bornes déformées. 3. Monter le module de coussin gonflable pour en contrôler l'alignement avec le volant. 4. Vérifier que le volant ne présente pas un jeu excessif. 5. Si l'on ne constate aucun dommage, reposer le volant. 6. En cas de dommage — REMPLACER.	
Câble spiralé	1. Contrôler visuellement que le câble spiralé et la commande combinée ne sont pas endommagés. 2. Vérifier que les connecteurs, le câble plat et la bande de protection sont en bon état. 3. Vérifier que le volant est exempt de tout bruit, point de force et qu'il tourne librement. 4. Si l'on ne constate aucun dommage, reposer le câble spiralé. 5. En cas de dommage — REMPLACER.	
Faisceau et connecteurs	1. Vérifier si les connecteurs sont bien branchés, s'ils ne sont pas endommagés et si les bornes ne sont pas déformées. 2. Vérifier que le faisceau ne coince pas et qu'il n'est pas effiloché, coupé ou déformé. 3. Si l'on ne constate aucun dommage, reposer le faisceau et les connecteurs. 4. En cas de dommage — REMPLACER la partie du faisceau endommagée. Ne pas essayer de réparer, épisser ou modifier le faisceau du SRS.	
Tableau de bord	1. Vérifier que le tableau de bord n'est pas courbé, déformé ou fissuré. 2. Vérifier que les supports du module latéral côté passager ne sont pas bosselés, fissurés ou déformés. 3. Si aucun dommage n'est trouvé, reposer l'ensemble avec des boulons neufs. 4. En cas de dommage — REMPLACER.

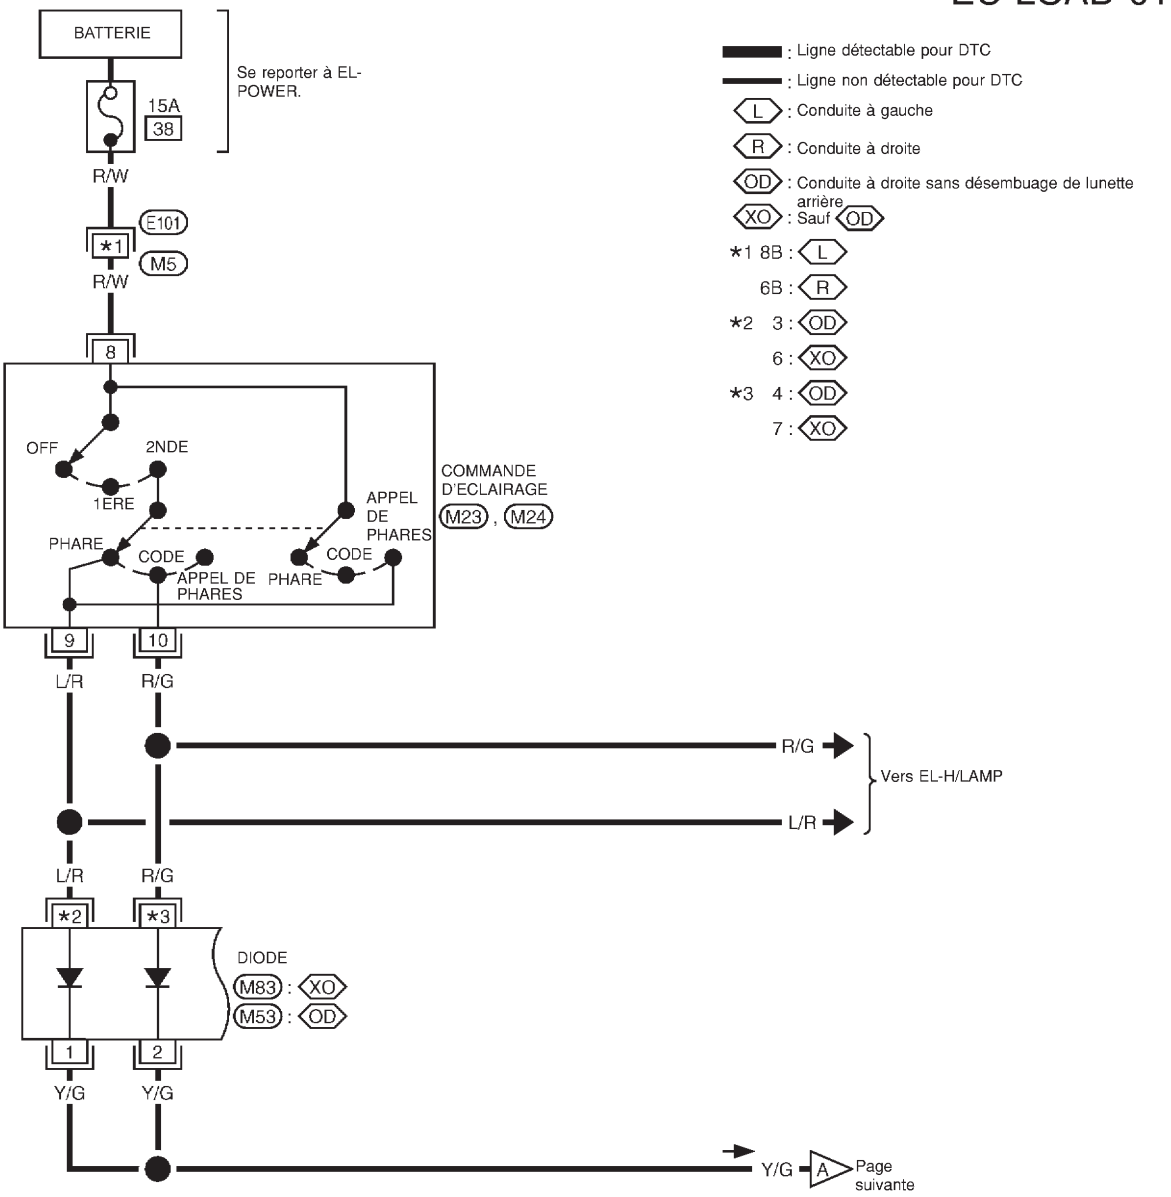
Pour l'étude des schémas de câblage :
- **Lire la section GI, "COMMENT LIRE LES SCHEMAS DE CABLAGE''.**
- **Voir la section EL, "DISPOSITION DE L'ALIMENTATION ELECTRIQUE'' pour le circuit de distribution électrique.**

Lorsque l'on procède au diagnostic des défauts, lire la section GI, "COMMENT LIRE LES ORGANIGRAMMES DANS LES DIAGNOSTICS DES DEFAUTS'' et "COMMENT ACCOMPLIR UN DIAGNOSTIC EFFICACE EN CAS D'INCIDENT ELECTRIQUE''.

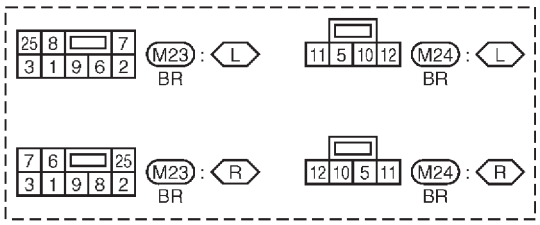
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

AIRBAG et PRETENSIONNEUR DE CEINTURE DE SECURITE du système de retenue supplémentaire (SRS)

Les éléments du système de retenue supplémentaire comme l'AIRBAG et le PRETENSIONNEUR DE CEINTURE DE SECURITE, utilisés avec une ceinture de sécurité, aident à réduire les risques ou la gravité des blessures du conducteur et du passager avant lors de certains types de collision. Le système de retenue supplémentaire disponible sur les modèles NISSAN D22 se compose comme suit (la composition varie en fonction de la destination du véhicule et de ses équipements optionnels) :
module d'airbag conducteur (situé dans le moyeu du volant), module d'airbag passager avant (situé sur le tableau de bord côté passager), prétensionneurs de ceinture de sécurité, boîtier de capteurs de diagnostic, témoin, faisceau de câblage et câble spiralé.
Les informations nécessaires à l'entretien du système en toute sécurité se trouvent dans la **section RS** de ce manuel de réparation.



ATTENTION :



- **Pour ne pas affecter le fonctionnement du SRS, ce qui augmenterait les risques de blessures graves ou mortelles en cas de collision entraînant le déploiement de l'airbag, toutes les opérations d'entretien doivent être effectuées par un concessionnaire NISSAN agréé.**
- **Un entretien incorrect ainsi qu'une mauvaise dépose ou repose du système de retenue supplémentaire (SRS) peuvent entraîner des risques de blessures dues au déclenchement accidentel du système. Pour la dépose du câble spiralé et du module d'airbag, se reporter à la section RS.**
- **Ne pas utiliser d'équipement d'essai électrique sur les circuits liés au SRS sauf instruction contraire dans ce manuel de réparation. Le câble spiralé et les faisceaux de câblage (sauf PRETENSIONNEUR DE CEINTURE DE SECURITE) recouverts d'un isolant jaune, soit juste avant les connecteurs de faisceau, soit sur la totalité du faisceau, sont reliés au SRS.**

Procédure de diagnostic

1	VERIFIER LE FONCTIONNEMENT GENERAL

1. Faire démarrer le moteur et l'amener à température normale de fonctionnement.
2. Contrôler le régime de ralenti.
   700±50 tr/min
   Si MAUVAIS, régler le régime de ralenti.
3. Mettre la commande de climatisation sur MARCHE, et mettre la commande de réglage de ventilation sur la vitesse 4.
4. Vérifier à nouveau le régime de ralenti.

MEF634E

850 tr/min ou plus

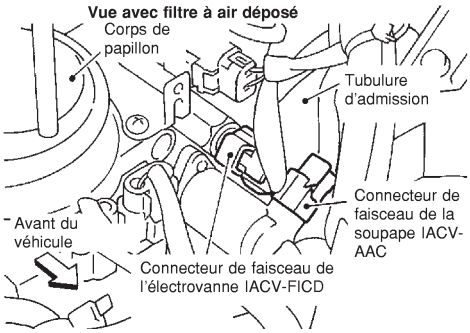
BON ou MAUVAIS

BON ▶	**FIN DE L'INSPECTION**
MAUVAIS ▶	PASSER A L'ETAPE 2.

2	VERIFIER LE FONCTIONNEMENT DE LA CLIMATISATION

Vérifier que le compresseur de climatiseur fonctionne normalement.

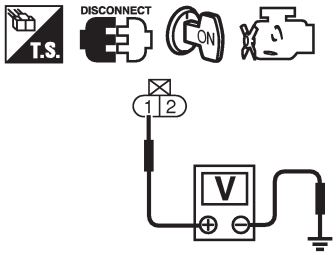
BON ou MAUVAIS



BON ▶	PASSER A L'ETAPE 3.
MAUVAIS ▶	Se reporter à "Tableau des symptômes" dans DIAGNOSTIC DES DEFAUTS, section HA.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic (Suite)



3	VERIFIER L'ALIMENTATION ELECTRIQUE

1. Arrêter le moteur.
2. Débrancher le connecteur de faisceau de l'électrovanne IACV-FICD.

SEF342V

3. Faire démarrer le moteur, puis mettre la commande de A/C sur MARCHE et mettre la commande de réglage de ventilation sur la vitesse 4.
4. Vérifier la tension entre la borne 1 et la masse à l'aide de CONSULT-II ou du testeur.

SEC281D

Tension : tension de la batterie

BON ou MAUVAIS

BON ▶	PASSER A L'ETAPE 5.
MAU-VAIS ▶	PASSER A L'ETAPE 4.

4	DETECTER LA PIECE DEFECTUEUSE

Contrôler les points suivants.
Connecteurs de faisceau E101, M5
Vérifier que le faisceau n'est ni ouvert, ni en court-circuit entre l'électrovanne IACV-FICD et le relais de climatisation

	Réparer les faisceaux et connecteurs en circuit ouvert ou en court-circuit avec la masse ou l'alimentation.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic (Suite)

5 CONTROLER LE CIRCUIT DE MISE A LA MASSE

1. Mettre le contact d'allumage sur OFF.
2. Vérifier la continuité du faisceau comme suit.

Type	Nom de la borne	Condition			
Modèle avec climatisation manuelle	Borne 5 de relais de climatiseur	+	Il ne doit pas y avoir continuité.	-	Il doit y avoir continuité.
	Borne 2 de contact de température ambiante	-		+	
	Borne 1 de diode et borne 9 d'ECM	Il doit y avoir continuité.			
	Borne 2 de contact de température ambiante et borne 9 d'ECM	Il doit y avoir continuité.			
	Borne 1 de contact de température ambiante et masse	Il ne doit pas y avoir continuité.			
Modèle avec climatisation auto	Borne 5 de relais de climatiseur	+	Il ne doit pas y avoir continuité.	-	Il doit y avoir continuité.
	Borne 9 d'ECM	-		+	
	Borne 4 de diode et borne 27 d'ampli. auto de A/C	Il doit y avoir continuité.			
	Borne 27 d'ampli. auto de A/C et borne 9 d'ECM	Il ne doit pas y avoir continuité.			

MTBL1755

Il doit y avoir continuité.

3. Vérifier également que le faisceau n'est pas en court-circuit avec la masse ou avec l'alimentation.

BON ou MAUVAIS

Bon ▶	PASSER A L'ETAPE 7.
MAU-VAIS ▶	PASSER A L'ETAPE 6.

6 DETECTER LA PIECE DEFECTUEUSE

CLIMATISEUR MANUEL

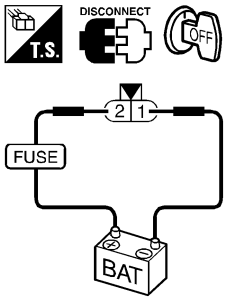
Effectuer les vérifications ci-dessous.

Electrovanne IACV-FICD
Commande de température ambiante
Diode M53
Connecteurs de faisceau M5, E101
Vérifier que le faisceau n'est ni ouvert, ni en court-circuit entre le relais de climatisation et la commande de température ambiante.
Vérifier que le faisceau n'est ni ouvert, ni en court-circuit entre la diode M53 et l'ECM
Vérifier que le faisceau n'est ni ouvert, ni en court-circuit entre le contact de température ambiante et l'ECM
Vérifier que le faisceau n'est ni ouvert, ni en court-circuit entre le contact de température ambiante et la masse

CLIMATISEUR AUTOMATIQUE

Effectuer les vérifications ci-dessous.

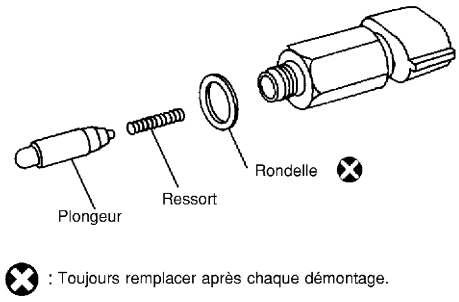
Connecteurs de faisceau E101, M5
Electrovanne IACV-FICD
Diode M83
Vérifier que le faisceau n'est ni ouvert, ni en court-circuit entre le relais de climatisation et l'ECM
Vérifier que le faisceau n'est ni ouvert, ni en court-circuit entre la diode M83 et l'amplificateur auto de A/C
Vérifier que le faisceau n'est ni ouvert, ni en court-circuit entre l'amplificateur auto de A/C et l'ECM



▶ Réparer les faisceaux ou connecteurs en circuit ouvert ou en court-circuit avec l'alimentation.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic (Suite)



7	VERIFIER L'ELECTROVANNE IACV-FICD

Débrancher le connecteur de faisceau de l'électrovanne IACV-FICD.

SEF610Y

Ecouter s'il y a un cliquetis lorsque l'on applique une tension direct de 12V aux bornes.
Vérifier que le plongeur n'est ni grippé, ni collant.
Vérifier que le ressort n'est pas cassé.

SEC953D

BON ou MAUVAIS

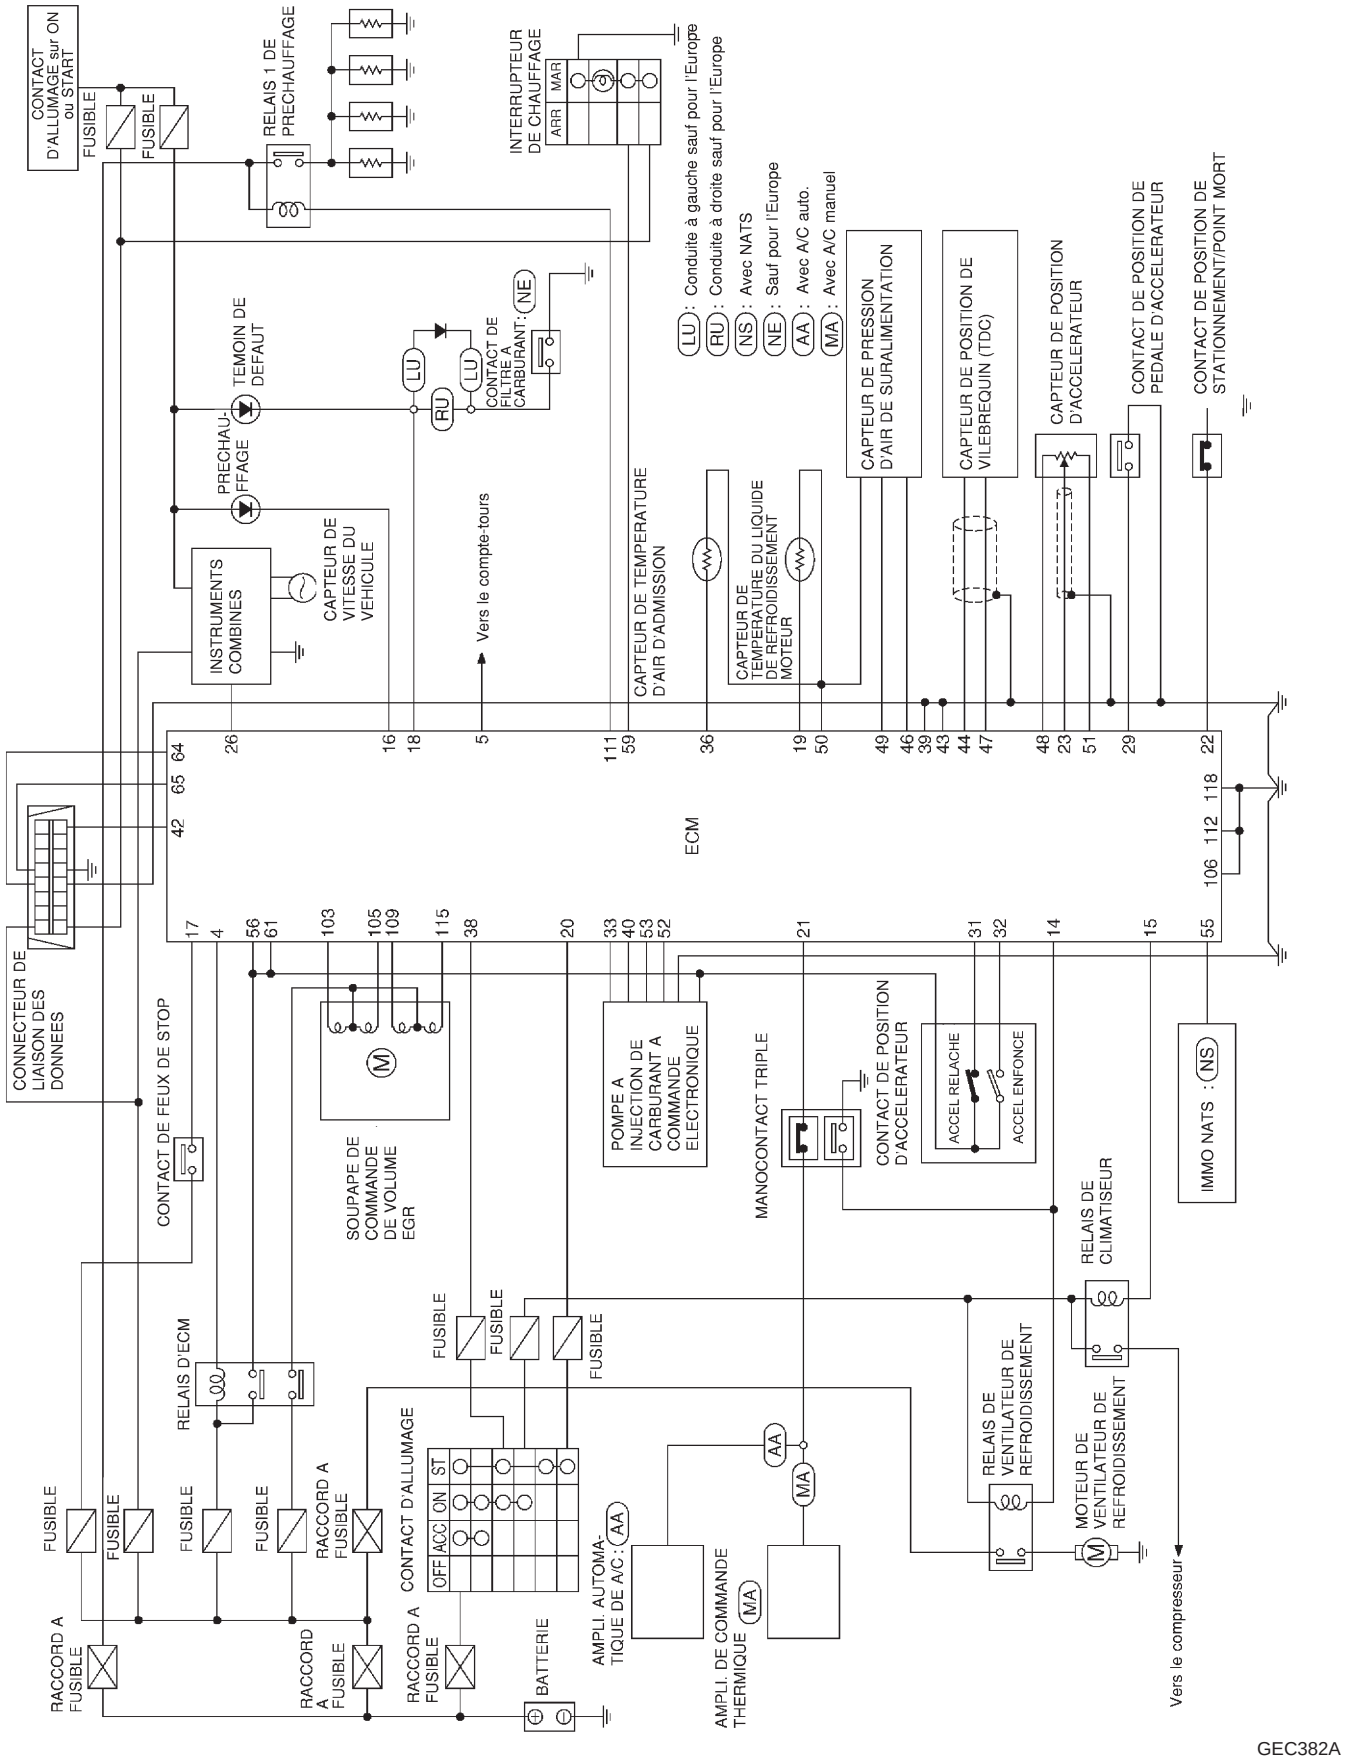
BON ▶	PASSER A L'ETAPE 8.
MAU-VAIS ▶	Remplacer l'électrovanne IACV-FICD.

8	VERIFIER LE CONTACT DE TEMPERATURE AMBIANTE

Se reporter à la section HA, 'DIAGNOSTIC DES DEFAUTS''.

BON ou MAUVAIS

BON ▶	PASSER A L'ETAPE 9.
MAU-VAIS ▶	Replacer le contact de température ambiante.



9	VERIFIER SI L'INCIDENT EST INTERMITTENT

Effectuer "DIAGNOSTIC DES DEFAUTS EN CAS D'INCIDENT INTERMITTENT", dans la section EC-192 du manuel de réparation (n° de publication SM1E-1D22FG1).

▶	**FIN DE L'INSPECTION**

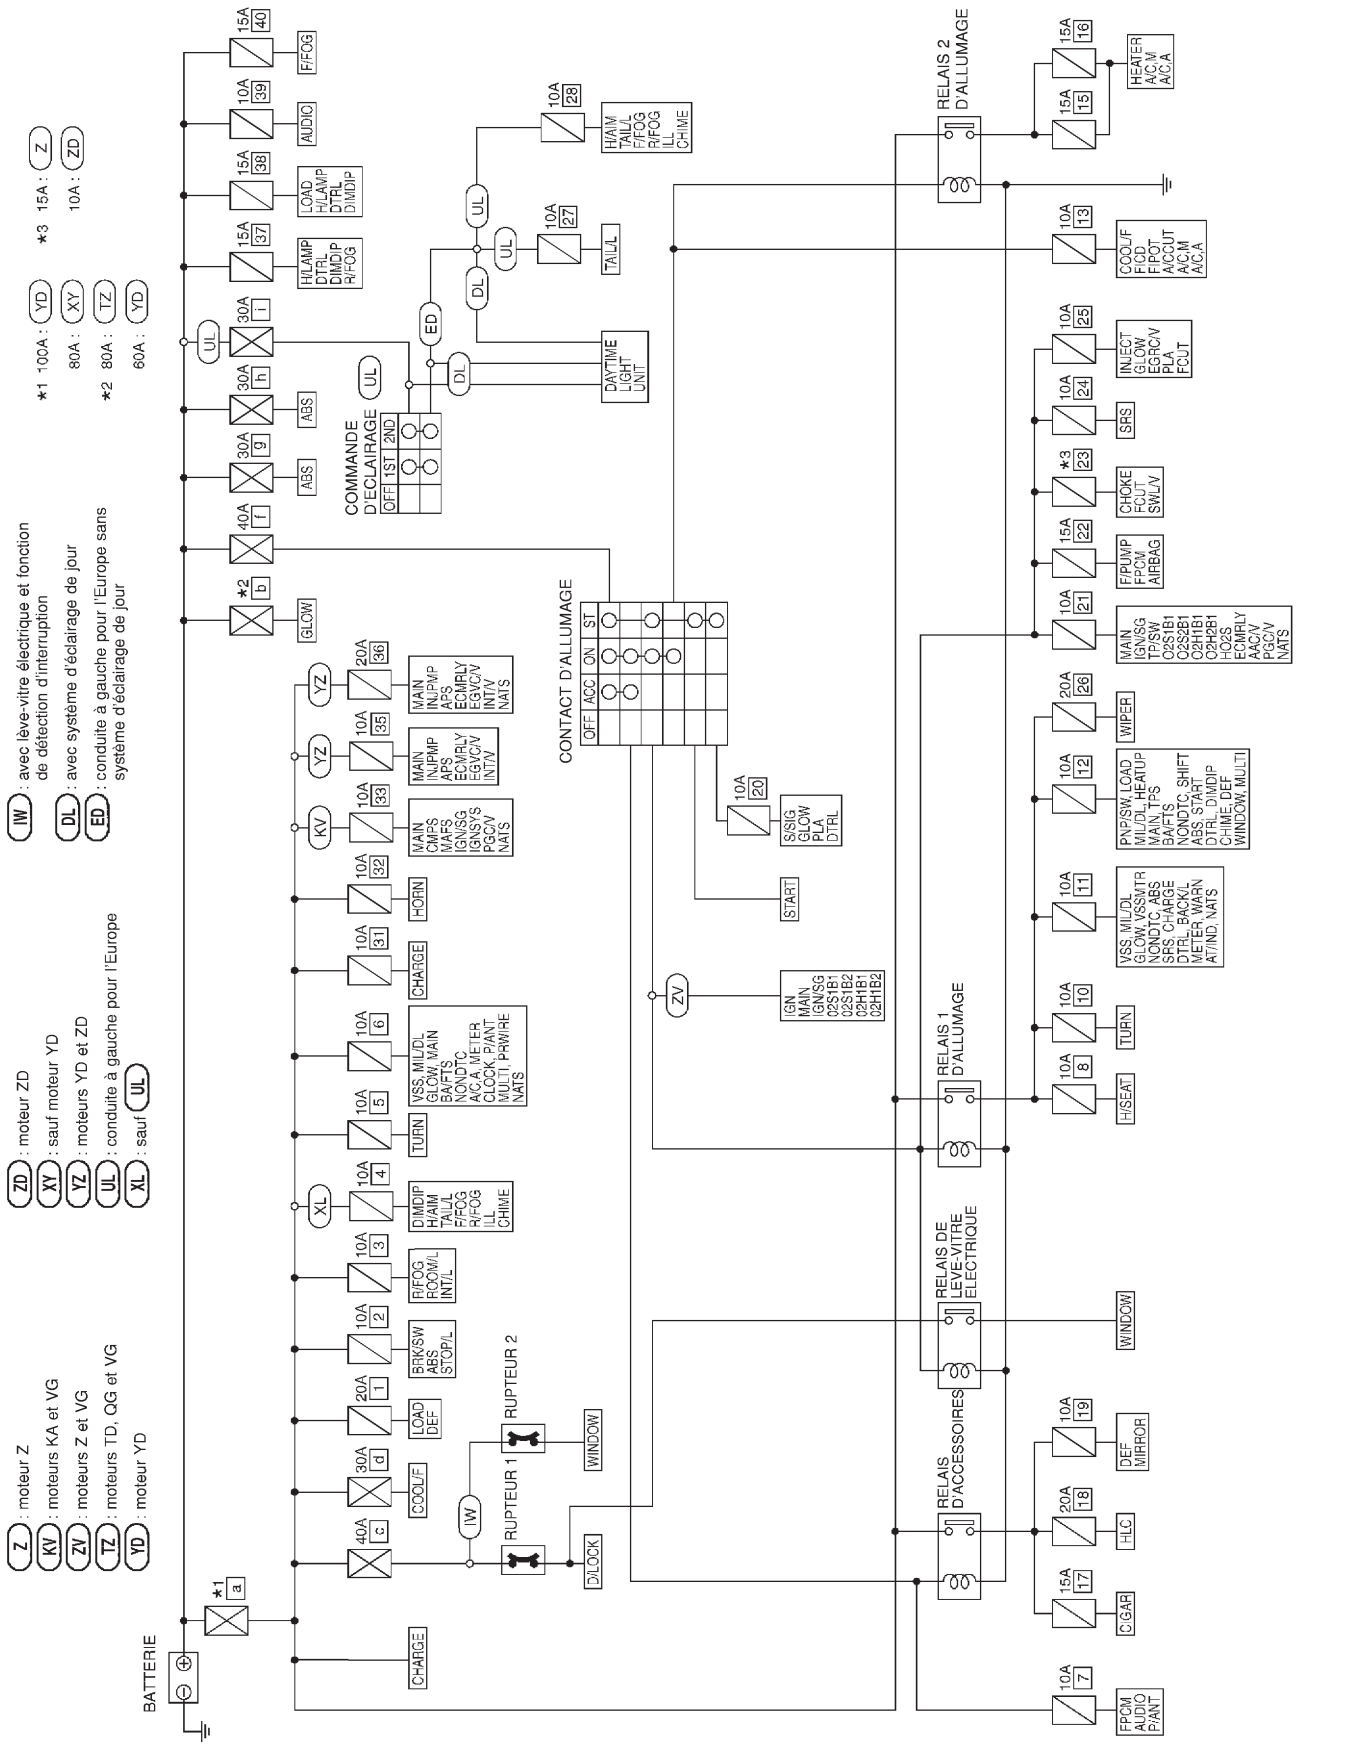
Système de retenue supplémentaire (SRS) AIRBAG et PRETENSIONNEUR DE CEINTURE DE SECURITE

Utilisés avec une ceinture de sécurité, l'AIRBAG et le PRETENSIONNEUR DE CEINTURE DE SECURITE du système de retenue supplémentaire contribuent à réduire les risques et la gravité des blessures subies par le conducteur et le passager avant lors de collisions frontales. Le système SRS disponible sur le MODELE NISSAN D22 se compose des éléments suivants (la composition varie selon le pays de destination et l'équipement optionnel) :

Un module d'airbag côté conducteur (situé dans le moyeu du volant), un module d'airbag côté passager avant (situé sur le tableau de bord, côté passager), un prétensionneur de ceintures de sécurité, un boîtier de capteurs de diagnostic, un témoin avertisseur, un faisceau de câblage et un câble spiralé.



ATTENTION :

- **Pour ne pas affecter le fonctionnement du SRS, ce qui augmenterait les risques de blessures graves ou mortelles en cas de collision entraînant le déploiement de l'airbag, toutes les opérations d'entretien doivent être effectuées par un concessionnaire NISSAN agréé.**
- **Un entretien incorrect, y compris une dépose et une repose incorrectes du système de retenue supplémentaire (SRS), peut être à l'origine de blessures provoquées par une activation involontaire du système.**
- **Ne pas utiliser d'équipement d'essai électrique sur les circuits connexes du SRS sauf si indiqué dans ce Manuel de Réparation. Le faisceau de câblage du SRS peut être identifié à l'aide d'un connecteur de faisceau jaune.**

F4 M11 W/16 : Connecteur de liaison de données
F3 M12 W/6 : Boîtier à fusibles
F3 M14 W/4 : Boîtier à fusibles
C4 M15 B/3 : Boîtier de clignotants combiné
E3 M16 B/2 : Contact de feux de stop
A3 M17 L/4 : Relais de feux antibrouillards avant (pour l'Europe)
F1 M19 W/6 : Vers R1
E3 M20 W/6 : Contact d'allumage
D1 M21 W/1 : Commande de frein de stationnement (type à manche)
D2 M23 BR/8 : Commande d'éclairage, commande de clignotant
D2 M24 BR/4 : Commande d'éclairage
D3 M25 Y/7 : Câble spiralé (avec airbag)
D3 M27 B/1 : Commande d'avertisseur sonore (sans airbag)
D2 M28 GY/8 : Commande d'essuie-glace et de lave-vitre
D4 M29 W/12 : Boîtier de commande de préchauffage (moteur TD sans EGR et moteur QD)
C1 M35 W/16 : Système audio (pour l'Europe)
C1 M36 W/4 : Vers le faisceau auxiliaire de chargeur de CD (pour l'Europe)
C3 M37 B/2 : Allume-cigare
C3 M38 W/3 : Commande de A/C (sans A/C auto.)
C2 M39 W/6 : Commande de réglage de ventilation (sans A/C auto.)
C2 M40 W/2 : Eclairage de la commande de réglage de ventilation (sans A/C auto.)
C2 M41 W/8 : Interrupteur de feux de détresse
C2 M42 W/6 : Interrupteur de désembuage (sauf pour les modèles non-équipés d'essuie-glace intermittents)
A2 M43 Y/2 : Module d'airbag, côté passager
B1 M44 BR/4 : Amplificateur de commande thermique (sans A/C auto.)
A2 M45 BR/4 : Résistance de ventilateur (sans A/C auto.)
A2 M46 W/2 : Moteur de soufflerie
A2 M47 W/16 : Vers F55 (moteurs KA, VG, YD et ZD)
A2 M48 W/24 : Vers F54 (moteurs KA, VG, YD et ZD)
A3 M49 W/20 : Vers D31
A3 M50 W/6 : Vers D32 (avec lève-vitre électrique)
B3 M51 W/8 : Minuterie de verrouillage de porte (avec lève-vitre électrique sauf pour l'Europe)
G3 M52 W/2 : Rupteur 2 (pour l'Europe)
A3 M53 L/4 : Diode (moteur KA sans essuie-glace intermittent pour l'Australie)
A3 M54 — : Masse de carrosserie
B/1 M55 W/2 : Témoin de sécurité (pour l'Europe)
F2 M58 BR/8 : Boîtier de contrôle de télécommande à fonctions multiples (pour l'Europe)
C4 M59 BR/6 : Relais de désembuage (sauf pour les modèles non-équipés d'essuie-glace intermittents)
C3 M60 L/4 : Relais de feux antibrouillards arrière (pour l'Europe)
C4 M61 W/4 : Relais de feux antibrouillards avant (moteur ZD)
B4 M62 W/18 : Boîtier de commande d'accès intelligent (pour l'Europe)
D3 M64 L/4 : Interrupteur de feux antibrouillards avant (moteur ZD)
D3 M65 W/6 : Interrupteur de feux antibrouillard avant et arrière (pour l'Europe)
D4 M66 GY/20 : ECM (moteur diesel avec EGR)
D4 M67 GY/16 : ECM (moteur diesel avec EGR)
E3 M68 W/8 : IMMO NATS (pour l'Europe)
E2 M69 W/48 : TCM (module de commande de transmission) (moteur VG avec T/A)
E1 M70 W/24 : TCM (module de commande de transmission) (moteur KA avec T/A)
E1 M71 GY/24 : TCM (module de commande de transmission) (moteur KA avec T/A)
E1 M73 W/4 : Dispositif de T/A (T/A avec colonne de passage)
B1 M74 W/2 : Capteur de température d'air d'admission (avec A/C auto.)
B1 M75 B/2 : Sonde d'ensoleillement (avec A/C auto.)
F2 M76 W/6 : Connecteur optionnel de système d'alarme antivol (pour l'Europe)
E4 M78 L/2 : Contact de frein de verrouillage de passage (avec T/A)
C4 M79 Y/12 : Boîtier de capteurs de diagnostic d'airbag (modèles avec airbag pour l'Europe et l'Australie)
C4 M80 Y/20 : Boîtier de capteurs de diagnostic d'airbag (modèles avec airbag)
D4 M81 Y/12 : Boîtier de capteurs de diagnostic d'airbag (modèles avec airbag pour l'Europe et l'Australie)
B2 M82 B/2 : Contact de position de pédale de frein (moteur YD)
A4 M83 L/10 : Diode (moteur KA sans essuie-glace intermittent pour l'Australie)
A1 M84 BR/2 : Résistance (avec T/A)
G3 M85 GY/6 : Boîtier d'accélérateur (moteur YD)
D3 M86 BR/10 : Moteur de volet de mode (avec A/C auto.)
D3 M87 W/2 : Capteur de l'habitacle (avec A/C auto.)
B3 M88 GY/20 : Ampli. auto. de A/C (avec A/C auto.)
B3 M89 GY/16 : Ampli. auto. de A/C (avec A/C auto.)
B3 M90 L/2 : Moteur d'aspirateur (avec A/C auto.)
B3 M91 B/6 : Moteur de volet de mélange d'air (avec A/C auto.)
C1 M92 W/4 : Amplificateur de commande de ventilateur (avec A/C auto.)
B1 M93 W/4 : Moteur de volet d'admission (avec A/C automatique)
G3 M94 BR/3 : Capteur de position d'accélérateur (moteur ZD)
G3 M95 GY/3 : Contact de position d'accélérateur (moteur ZD)
G3 M96 W/3 : Contact d'accélérateur (C/C) (moteur ZD)
E4 M97 W/2 : Contact de kick-down (T/A avec moteur VG)
C1 M98 W/12 : Système audio (au travers du faisceau auxiliaire) (sauf pour l'Europe)

Compartiment moteur

M221 W/6 : Moteur d'essuie-glace (moteurs TD et QD)

Utiliser l'organigramme ci-dessous pour trouver chaque signification de code de schéma de câblage.
Consulter le code du schéma de câblage dans l'index alphabétique pour trouver l'emplacement (numéro de page) de chaque schéma de câblage.

Code	Section	Nom du schéma de câblage
AAC/V	EC	Soupape IACV-AAC
A/C, A	HA	Climatisation automatique
A/C, M	HA	Climatisation manuelle
A/CCUT	EC	Commande de climatisation
AIRREG	EC	IACV-Régulateur d'air
AUDIO	EL	Audio
BACK/L	EL	Feux de recul
CHIME	EL	Témoin sonore
CMPS	EC	Capteur d'angle d'arbre à cames
COOL/F	LC, EC	Commande du ventilateur de refroidissement

AVANT-PROPOS

Ce manuel contient les travaux d'entretien et de réparation concernant les véhicules NISSAN PICKUP, série des modèles D22.

A des fins de sécurité et pour que le rendement des véhicules concernés soit optimal, prière de lire ce manuel complètement. Avant de commencer à entreprendre des travaux, il est particulièrement important d'avoir parfaitement assimilé les PRECAUTIONS signalées dans la section GI.

Toutes les informations contenues dans ce manuel sont basées sur les données de production les plus récentes au moment de la réalisation du manuel. Nous nous réservons le droit de modifier les caractéristiques et les méthodes de travail à n'importe quel moment et sans avis préalable.

NOTE IMPORTANTE DE SECURITE

Un entretien correctement effectué est essentiel, aussi bien pour la sécurité des mécaniciens que pour le fonctionnement adéquat du moteur. Les méthodes d'entretien reprises dans ce manuel de réparation sont décrites de telle manière que le travail puisse être effectué en sécurité et avec précision. Les entretiens varient selon les procédures, les connaissances du technicien et l'outillage, ainsi que les pièces disponibles. Dès lors, toute personne utilisant les procédures d'entretien, un outillage ou des pièces qui ne sont pas spécifiquement recommandées par NISSAN doit auparavant être absolument certain que ceci n'entraîne de danger ni pour sa propre sécurité, ni pour celle du moteur.

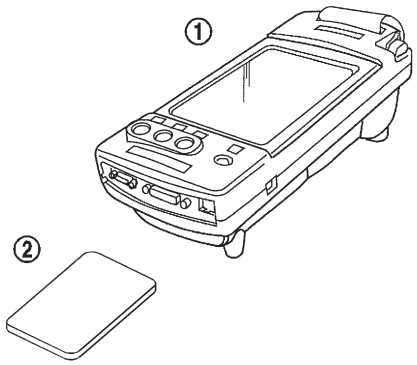
Remplacement de la pile à hydrure composé de nickel

CONSULT-II contient une pile à hydrure composé de nickel. Lors du remplacement de la pile, respecter les points suivants :

ATTENTION :

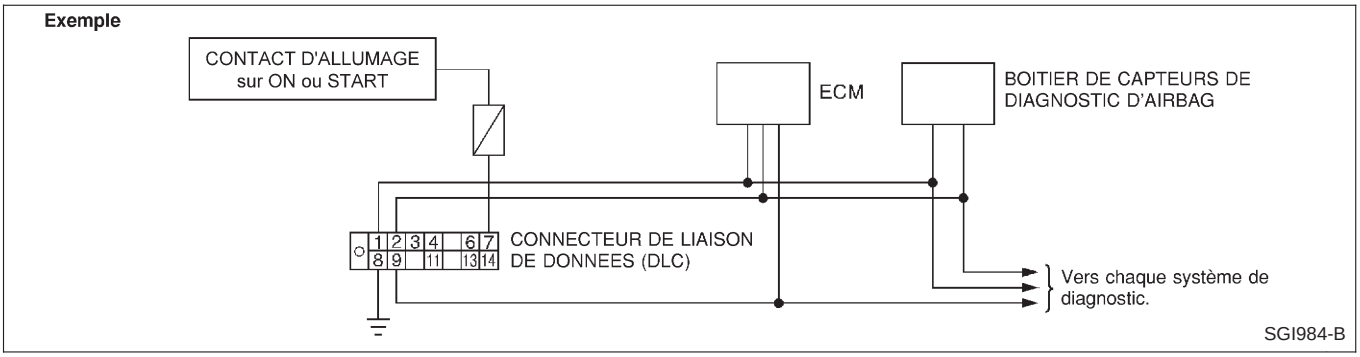


Remplacer la pile à hydrure composé de nickel uniquement avec une véritable pile pour boîtier CONSULT-II. L'utilisation d'une autre pile peut entraîner un risque d'incendie ou d'explosion. Un mauvais traitement de la pile peut entraîner un risque de feu ou de brûlure chimique. Ne pas recharger, démonter ou jeter au feu.

Veiller à placer la pile hors de portée des enfants et mettre les piles usées au rebut conformément aux réglementations locales.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Equipement de vérification



Pour commander les accessoires ci-dessous, contacter un distributeur NISSAN.

Nom de l'outil	Description
NISSAN CONSULT-II ① Boîtier CONSULT-II (logiciel interne du testeur : version résidente 3.3.0) et accessoires ② Carte programme AED01C pour diagnostique, AEN00A/00B pour NATS. Afin de confirmer la meilleure combinaison de ces logiciels, se reporter au manuel d'utilisation de CONSULT-II.	 SGI083A

NOTE :

- **CONSULT-II doit être utilisé conjointement avec une carte programme. CONSULT-II ne nécessite pas de procédure de charge (initialisation).**
- **S'assurer que CONSULT-II est éteint avant de reposer ou de déposer la carte programme.**

Circuit du connecteur de liaison de données (DLC) de CONSULT-II

PROCEDURE D'INSPECTION

Si CONSULT-II ne peut pas effectuer un diagnostic correct du système, vérifier les points suivants :

Symptôme	Elément à contrôler
CONSULT-II ne peut accéder à aucun système.	● Circuit d'alimentation électrique (borne 7) du connecteur de diagnostic pour CONSULT-II (borne 7) et circuit de mise à la masse (borne 8) (Pour le détail du circuit, se reporter au ''Schéma de câblage des connecteurs de liaison de données et MIL'' dans la section EC.) ● Câble DDL CONSULT-II
CONSULT-II ne peut accéder à aucun système individuel. (Mais peut accéder à d'autres systèmes.)	● Carte de programme de CONSULT-II (Vérifier la carte de programme CONSULT-II correspondant au système. Se reporter à ''Equipement de vérification'' ci-dessus). ● Alimentation électrique et circuit de mise à la masse du boîtier de commande du système (Pour le circuit détaillé, se reporter au schéma de câblage de chaque système.) ● Circuit ouvert ou court-circuit entre le système et le connecteur de liaison de données de CONSULT-II (Pour le circuit détaillé, se reporter au schéma de câblage de chaque système.)

CHAUFFAGE & CLIMATISATION

SECTION HA

AVIS DE MODIFICATION :

- Le compresseur a été remplacé (moteur KA).
- Le réfrigérant a été changé.
- Le bouchon de fusible fixé au réservoir de liquide a été éliminé.
- La soupape de décharge de pression a été ajouté au compresseur.
- Les schémas de câblage ont été modifiés.
- L'ampli. de commande thermique du climatiseur auto. a été supprimé et le diagnostic de défauts de l'embrayage magnétique a été modifié.
- La soupape de décharge de pression a été ajouté au compresseur (moteurs KA24DE et YD25DDT).
- La quantité de réfrigérant a été modifiée (moteur YD25DDT). Se reporter à SDS.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

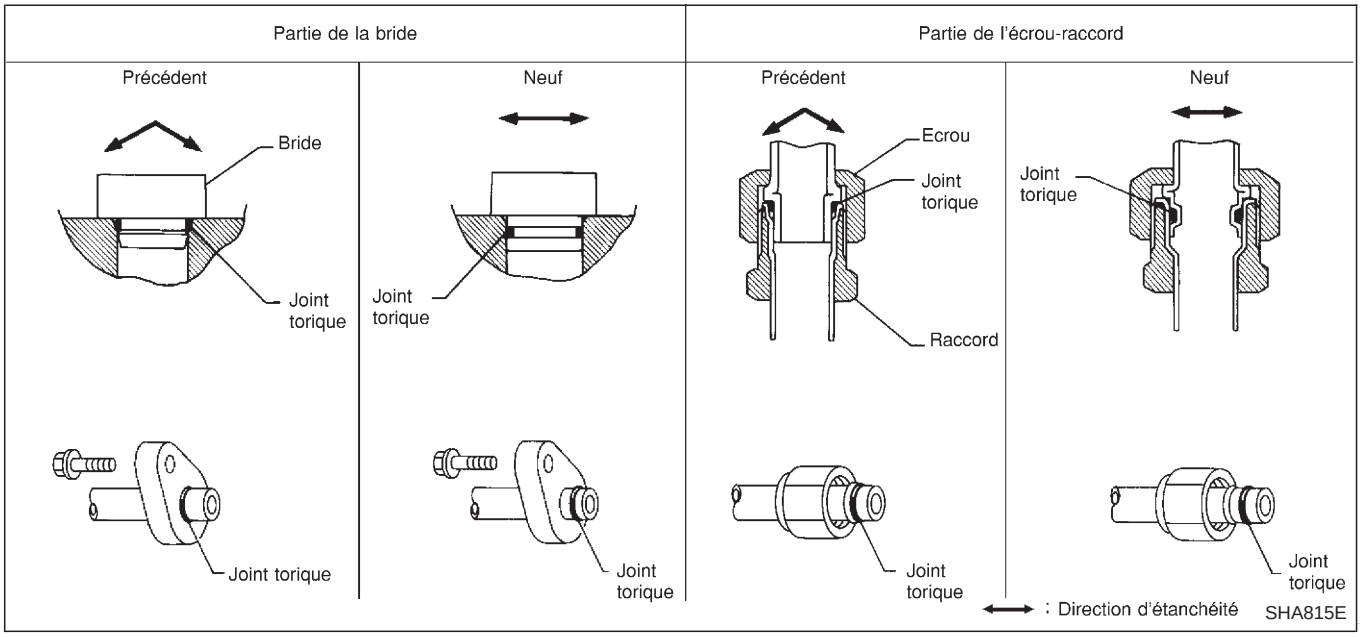
Système de retenue supplémentaire (SRS) AIRBAG et PRETENSIONNEUR DE CEINTURE DE SECURITE

Utilisés conjointement avec une ceinture de sécurité, les éléments du système de retenue supplémentaire tels que l'AIRBAG et le PRETENSIONNEUR DE CEINTURE DE SECURITE permettent de réduire les risques de blessures graves subies par le conducteur et le passager avant dans certains types de collision frontales. La composition du système SRS disponible pour le MODELE NISSAN D22 est la suivante (la composition varie selon les pays et les équipements optionnels) :
Un module d'airbag conducteur (situé dans le moyeu du volant), un module d'airbag passager (situé sur le tableau de bord côté passager), des prétensionneurs de ceintures de sécurité, un boîtier de capteurs de diagnostic, un témoin d'avertissement, un faisceau de câblage et un câble spiralé.

ATTENTION :

- **Pour ne pas affecter le fonctionnement du SRS, ce qui augmenterait les risques de blessures graves, voire mortelles, en cas de collision entraînant le déploiement de l'airbag toutes les opérations d'entretien doivent être effectuées par un concessionnaire NISSAN agréé.**
- **Un entretien incorrect, y compris une dépose et une repose incorrectes du système de retenue supplémentaire (SRS), peut être à l'origine de blessures provoquées par le déploiement involontaire du système.**
- **Ne pas utiliser d'équipement d'essai électrique sur les circuits connexes du SRS, sauf si indiqué dans ce manuel de réparation. Les faisceaux de câblage SRS peuvent être identifiés par la couleur jaune des connecteurs de faisceaux**

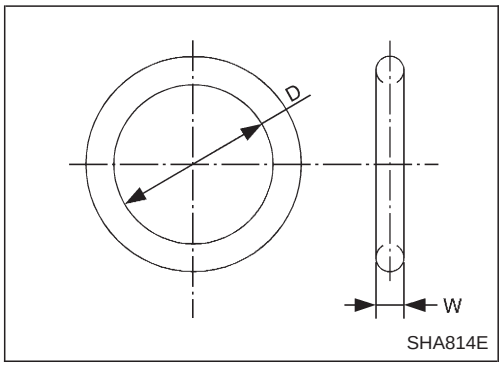
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Précautions concernant les raccords de réfrigérant

Un nouveau type de raccord de réfrigérant a été introduit pour chaque conduit de réfrigération sauf pour les parties suivantes.

- Soupape d'expansion à unité de refroidissement



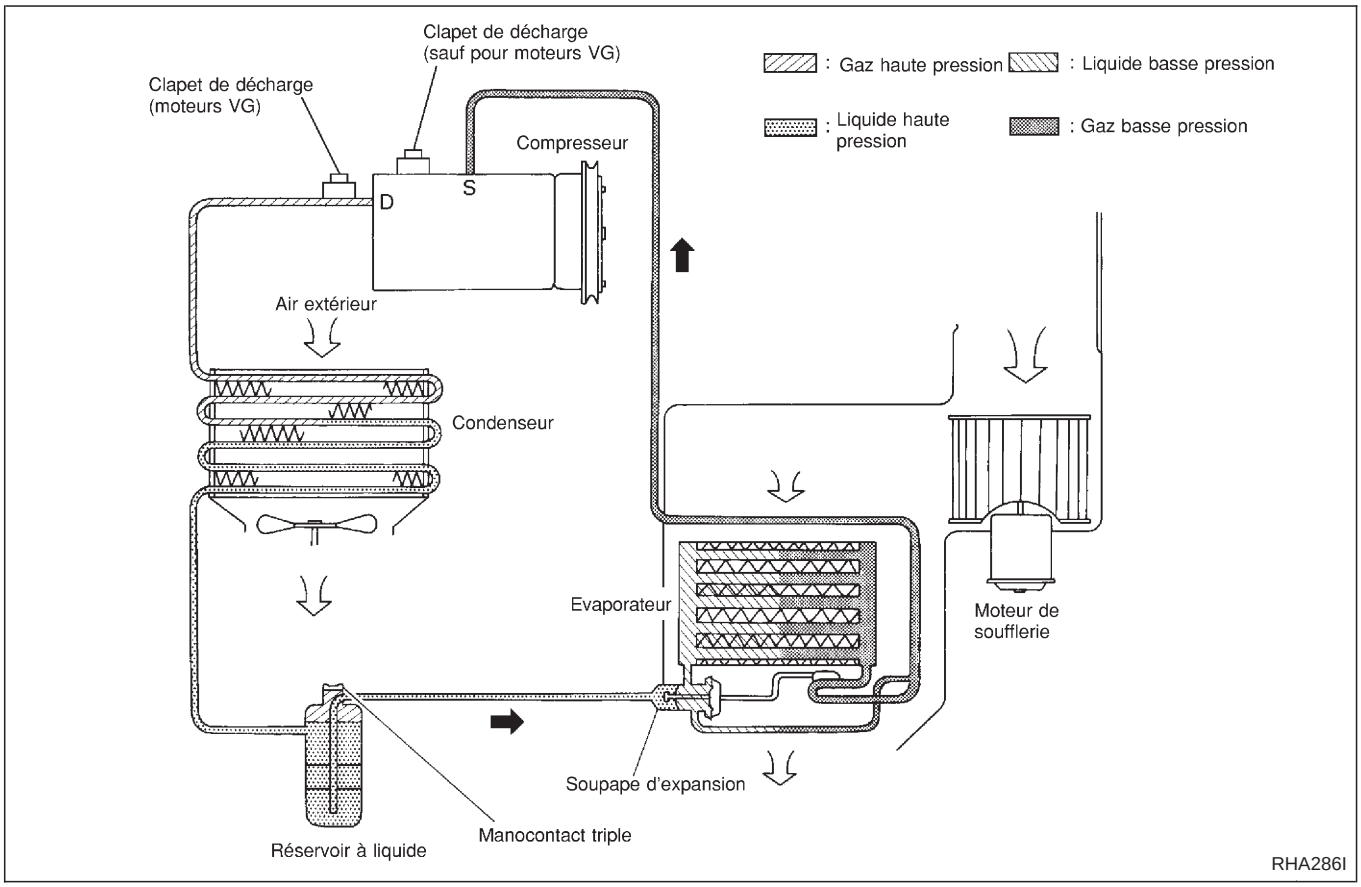
CARACTERISTIQUES DU NOUVEAU TYPE DE RACCORD DE REFRIGERANT

- Le joint torique a été déplacé. Il est désormais fourni avec une rainure pour une repose adéquate. Ceci élimine les risques de voir le joint torique être coincé ou endommagé dans la partie de raccordement. Le sens d'étanchéité du joint torique est maintenant vertical, en relation avec la surface de contact de la partie de raccordement, de façon à améliorer les caractéristiques de l'étanchéité.
- La force de réaction du joint torique n'apparaîtra pas dans le sens qui entraîne l'extraction du joint, facilitant ainsi les raccords de tuyauterie.

PRECAUTION :

Les nouveaux et les anciens raccords de liquide de refroidissement utilisent des configurations de joint torique différentes. Ne pas mélanger les joints toriques car ils ne sont pas interchangeables. Si un joint torique inadéquat est reposé, le liquide de refroidissement fuira au niveau ou autour du raccord.

Numéros et caractéristiques des pièces de joint torique



Type de raccord	Taille de joint torique	Numéro de pièce	D mm	W mm
Neuf	8	92471 N8210	6,8	1,87

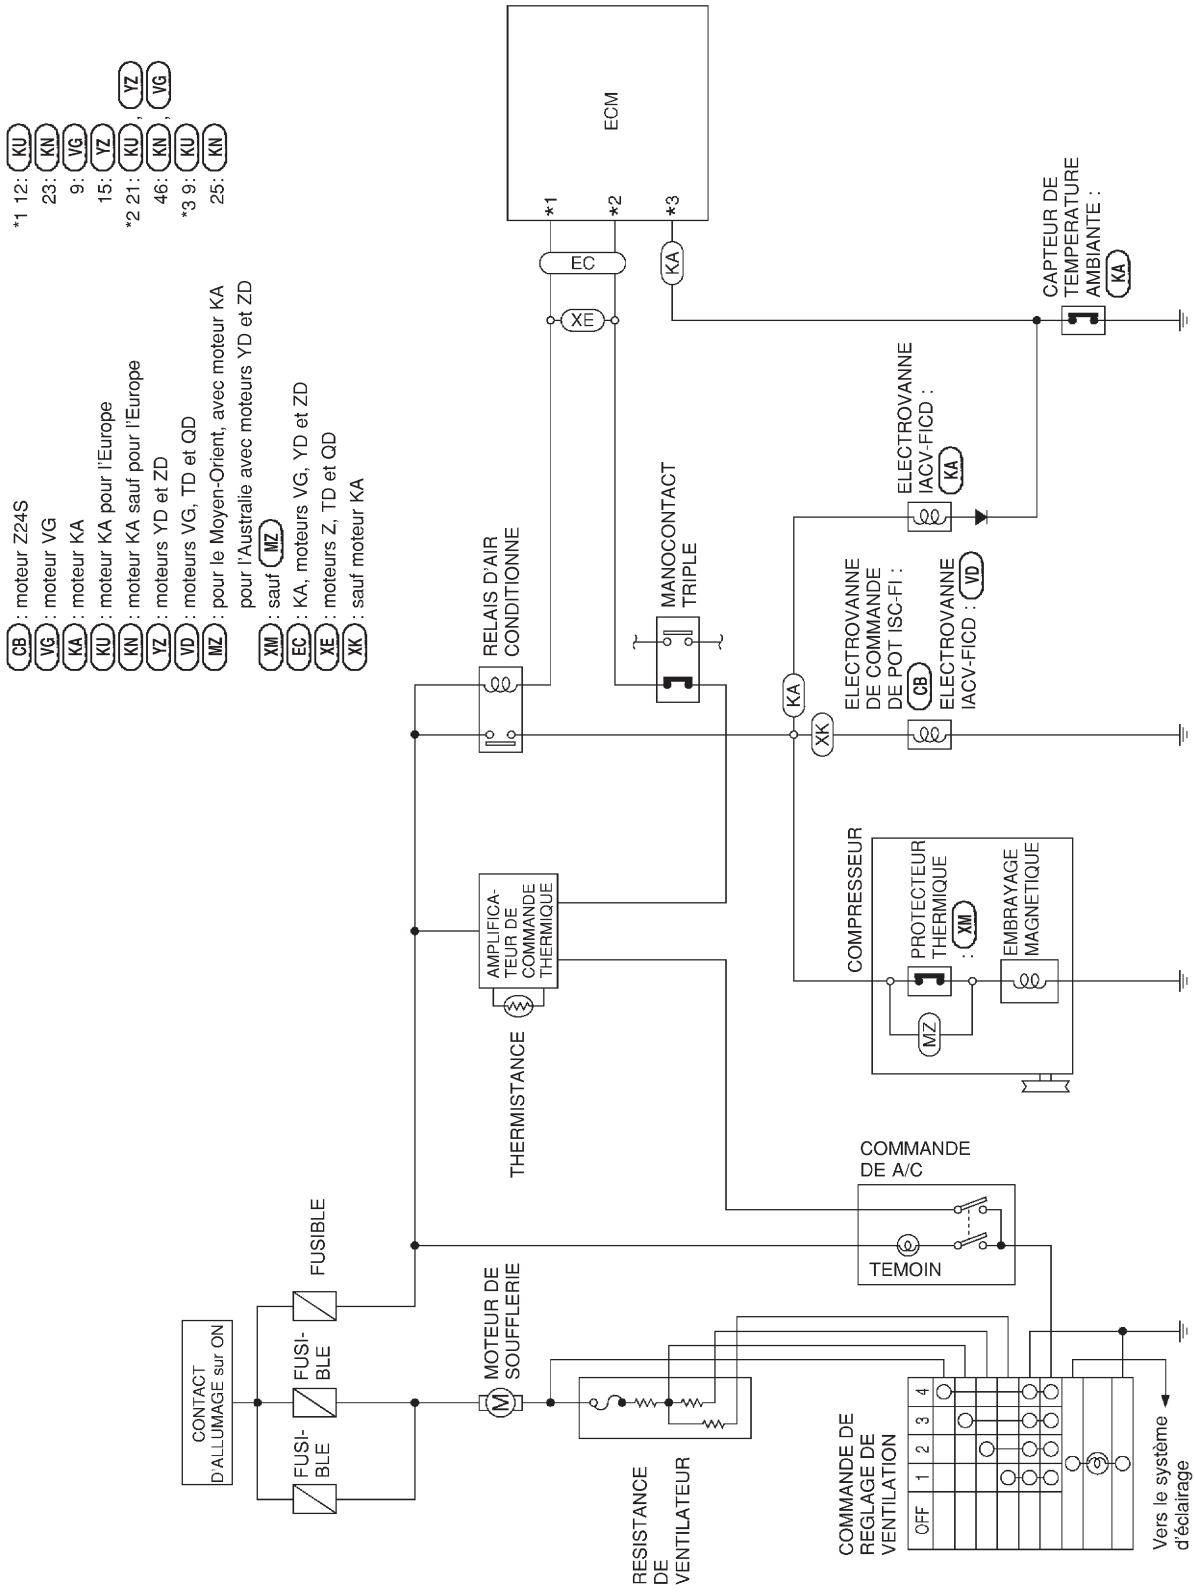
Cycle de refroidissement



PROTECTION DU SYSTEME DE REFRIGERANT

Le système de réfrigérant est aussi protégé par une soupape de décharge de pression située sur le compresseur (sauf pour moteur VG) ou un flexible haute pression (moteur VG). Lorsque la pression du réfrigérant dans le système augmente de manière inhabituelle [plus de 3 727 kPa (37,3 bar, 38 kg/cm^2)], l'orifice de sortie sur la soupape de décharge de pression s'ouvre automatiquement et libère le réfrigérant dans l'atmosphère.

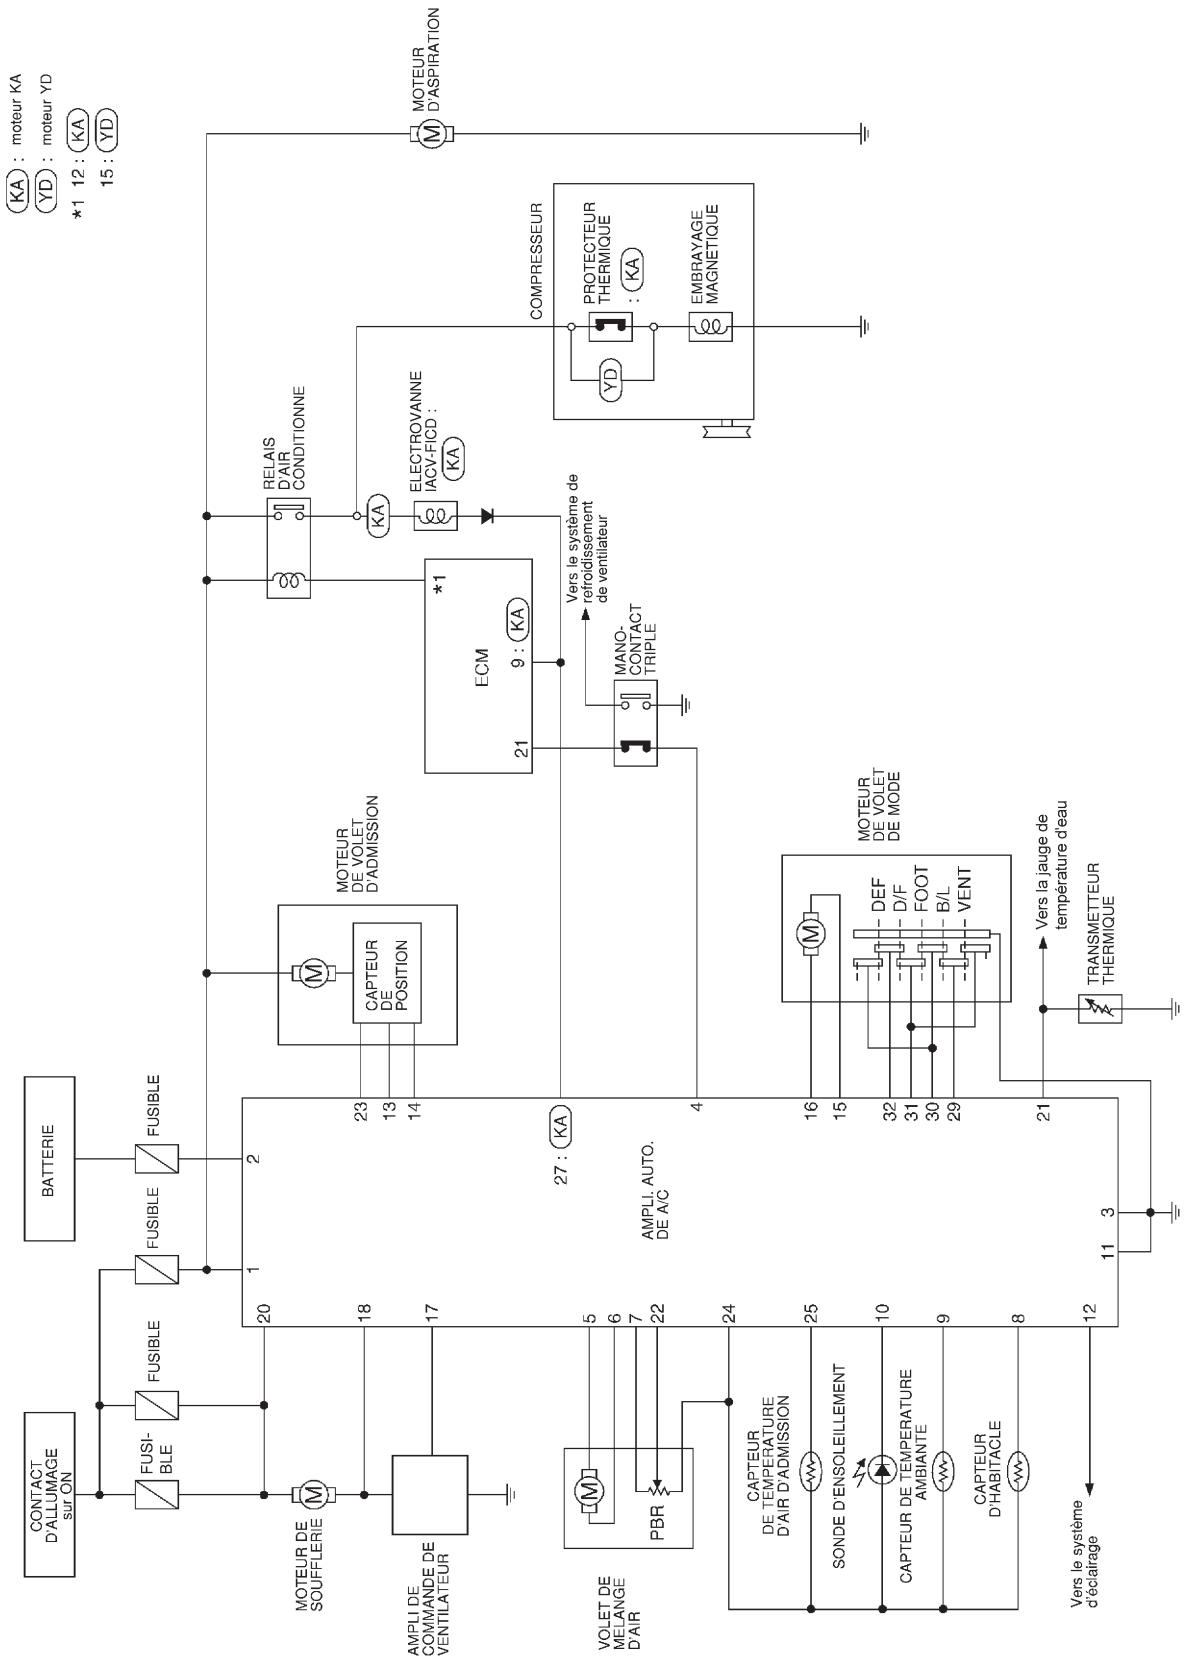
Système de retenue supplémentaire (SRS) AIRBAG et PRETENSIONNEUR DE CEINTURE DE SECURITE



Utilisés conjointement avec une ceinture de sécurité, les éléments du système de retenue supplémentaire tels que l'AIRBAG et le PRETENSIONNEUR DE CEINTURE DE SECURITE permettent de réduire les risques de blessures graves subies par le conducteur et le passager avant dans certains types de collision frontales. La composition du système SRS disponible pour le MODELE NISSAN D22 est la suivante (la composition varie selon les pays et les équipements optionnels) :
Un module d'airbag conducteur (situé dans le moyeu du volant), un module d'airbag passager (situé sur le tableau de bord côté passager), des prétensionneurs de ceintures de sécurité, un boîtier de capteurs de diagnostic, un témoin d'avertissement, un faisceau de câblage et un câble spiralé.

ATTENTION :

- **Pour ne pas affecter le fonctionnement du SRS, ce qui augmenterait les risques de blessures graves, voire mortelles, en cas de collision entraînant le déploiement de l'airbag toutes les opérations d'entretien doivent être effectuées par un concessionnaire NISSAN agréé.**
- **Un entretien incorrect, y compris une dépose et une repose incorrectes du système de retenue supplémentaire (SRS), peut être à l'origine de blessures provoquées par le déploiement involontaire du système.**
- **Ne pas utiliser d'équipement d'essai électrique sur les circuits connexes du SRS, sauf si indiqué dans ce manuel de réparation. Les faisceaux de câblage SRS peuvent être identifiés par la couleur jaune des connecteurs de faisceaux**

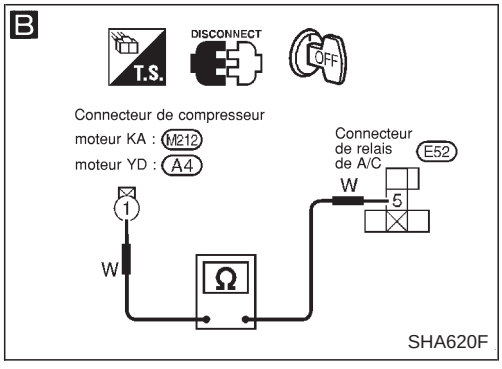
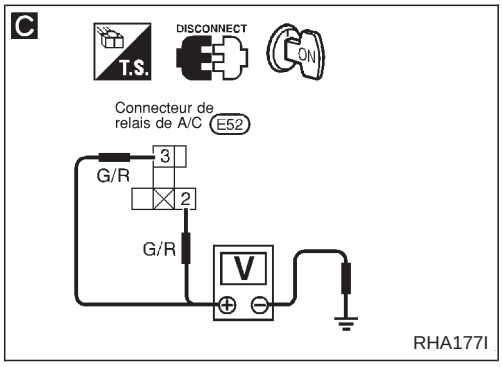
Embrayage magnétique (Suite)

PROCEDURE DE DIAGNOSTIC



SYMPTOME : L'embrayage magnétique ne s'enclenche pas lorsque l'interrupteur de climatiseur et le commutateur de ventilateur sont enclenchés.



SHA843F

RHA176I

SHA620F

RHA177I

A

VERIFIER L'ALIMENTATION ELECTRIQUE DU COMPRESSEUR.
Débrancher le connecteur de faisceau du compresseur.
Existe-t'il une tension d'environ 12 volts entre la borne n°① du faisceau du compresseur et la masse de carrosserie ?

Oui → Vérifier la bobine de l'embrayage magnétique.
Mauvais → Remplacer l'embrayage magnétique. Se reporter à HA-64.

Non → Débrancher le relais de climatiseur.

B Remarque

VERIFIER LA CONTINUITE DU CIRCUIT ENTRE LA BORNE N°⑤ DU FAISCEAU DE RELAIS DE A/C ET LA BORNE N°① DE FAISCEAU DE COMPRESSEUR.
Il doit y avoir continuité.
Si le résultat est BON, vérifier si le faisceau n'est pas court-circuité.

BON →

C

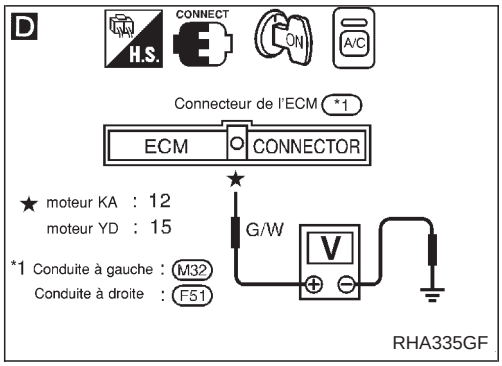
VERIFIER L'ALIMENTATION ELECTRIQUE DU RELAIS DE CLIMATISEUR.
Débrancher le relais de climatiseur.
Existe-t'il une tension d'environ 12 volts entre les bornes n° ②, ③ et la masse de carrosserie?

Non → VERIFIER LE CIRCUIT DE L'ALIMENTATION ELECTRIQUE ET LE FUSIBLE DE 10A (N° 13) DANS LE BOITIER A FUSIBLES.
Se reporter à la section EL (''Schéma de câblage'', ''DISPOSITION DE L'ALIMENTATION ELECTRIQUE'').

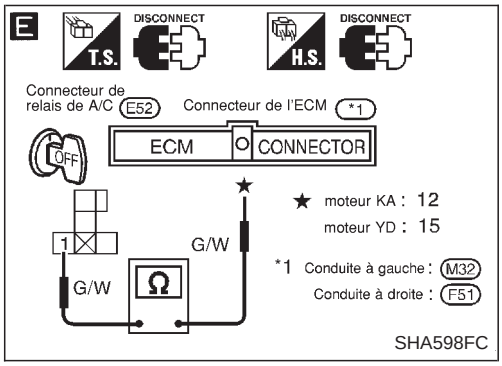
Oui →

VERIFIER LE RELAIS DE CLIMATISEUR APRES L'AVOIR DEBRANCHE.
Se reporter à HA-4025.

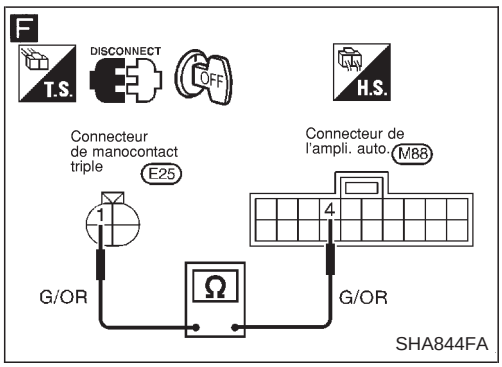
Mauvais → Remplacer le relais de climatiseur.



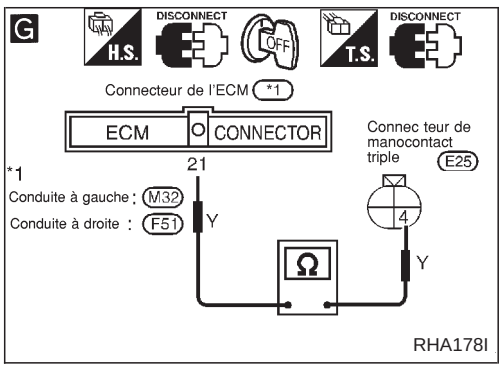
BON →



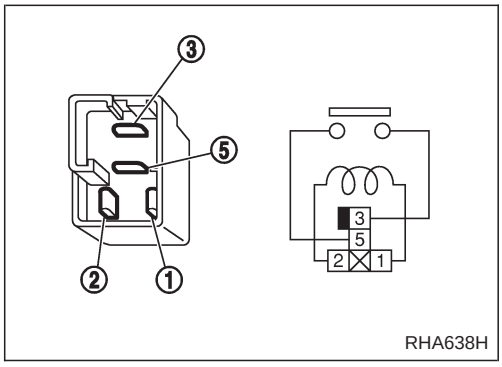
Ⓐ
(Passer à la page suivante).



Remarque :
Si le résultat affiche mauvais ou ''Non'' après la vérification de la continuité du circuit, réparer le faisceau ou le connecteur.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Embrayage magnétique (Suite)

A

D Remarque

VERIFIER LE CIRCUIT COTE BOBINE DU RELAIS DE CLIMATISEUR.
Existe-t-il une tension d'environ 12 volts entre la borne n°⑫ ou ⑮ du faisceau ECM et la masse de carrosserie ?

Non → **E** Remarque

Vérifier la continuité du circuit entre la borne n°① du faisceau de relais de A/C et les bornes n°⑫ et ⑮ du faisceau d'ECM.
Il doit y avoir continuité.
Si le résultat est BON, vérifier si le faisceau n'est pas court-circuité.

Oui

F Remarque

Vérifier la continuité du circuit entre la borne n°④ du faisceau de l'ampli. auto. et la borne n°① du faisceau de manocontact triple.
Il doit y avoir continuité.
Si le résultat est BON, vérifier si le faisceau n'est pas court-circuité.

BON

VERIFIER LE MANOCONTACT TRIPLE.
Se reporter à HA-2022.

Mauvais → Remplacer le manocontact triple.

BON

G Remarque

Vérifier la continuité du circuit entre la borne n°④ du faisceau de manocontact triple et la borne n°㉑ du faisceau d'ECM.
Il doit y avoir continuité.
Si le résultat est BON, vérifier si le faisceau n'est pas court-circuité.

BON

Vérifier l'ECM.

Remarque :
Si le résultat affiche mauvais ou ''Non'' après la vérification de la continuité du circuit, réparer le faisceau ou le connecteur.

INSPECTION DES COMPOSANTS ELECTRIQUES

Relais de climatiseur

Vérifier la continuité entre les bornes 3 et 5.

Conditions	Il y a continuité
Alimentation en courant continu de 12 volts entre les bornes 1 et 2.	Oui
Aucune alimentation électrique	Non

Si le résultat n'est pas satisfaisant, remplacer le relais.

Faisceau principal

TABLEAU DE BORD — CONDUITE A GAUCHE

HEL082C

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Faisceau principal (Suite)

A4 (M1) — : Masse de carrosserie
A4 (M2) W/12 : Avertisseur sonore (moteur diesel sauf pour l'Europe et le Moyen-Orient)
A4 (M3) W/20 : Vers (D1)
A3 (M4) W/12 : Vers (D2) (avec lève-vitre électrique)
A3 (M5) SMJ : Vers (E101)
A3 (M6) W/24 : Vers (N1)
B3 (M7) BR/24 : Vers (N2)
A2 (M8) -/2 : Diode (moteur diesel sauf pour l'Europe et le Moyen-Orient)
C4 (M9) L/4 : Relais de pompe à carburant (moteur KA)
B4 (M10) — : Boîtier à fusibles
B4 (M11) W/16 : Connecteur de liaison de données
B3 (M12) W/6 : Boîtier à fusibles
B3 (M14) W/4 : Boîtier à fusibles
E3 (M15) B/3 : Boîtier de clignotants combiné
C3 (M16) B/2 : Contact de feux de stop
A4 (M17) L/4 : Relais de feu antibrouillard avant (moteur YD pour l'Europe)
B4 (M18) W/6 : Non utilisé (moteur QD avec T/A)
A2 (M19) W/6 : Vers (R1)
D3 (M20) W/6 : Contact d'allumage
D2 (M21) W/1 : Commande de frein de stationnement (type à manche)
D2 (M23) BR/8 : Commande d'éclairage
• Commande de clignotant
D2 (M24) BR/4 : Commande d'éclairage
D3 (M25) Y/7 : Câble spiralé (avec airbag)
C3 (M26) L/2 : Contact de vérification de T/A
D2 (M27) B/1 : Commande d'avertisseur sonore (sans airbag)
D2 (M28) GY/8 : Commande d'essuie-glace et de lave-vitres
D3 (M29) W/12 : Boîtier de commande de préchauffage (moteur TD sauf régions froides et moteur QD)
C3 (M30) W/16 : Boîtier de commande de préchauffage (moteur TD pour régions froides)
D4 (M31) GY/6 : Connecteur de raccord 1 (moteur KA)
D4 (M32) SMJ : ECM (moteurs KA, YD et ZD)
D4 (M33) — : Connecteur de raccord 3 (moteur KA pour l'Europe)
F3 (M34) W/2 : Eclairage de cendrier (avec moteur à essence pour le Moyen-Orient)
E1 (M35) W/10 : Système audio (pour l'Europe)
E1 (M36) W/4 : Pour le faisceau auxiliaire du chargeur de CD (pour l'Europe sauf pour modèles à double cabine sans lève-vitre électrique)
F3 (M37) B/2 : Allume-cigare
G2 (M38) W/3 : Commande d'A/C (sans A/C auto.)
G2 (M39) W/6 : Commande de réglage de ventilation (sans A/C auto.)
E2 (M40) W/2 : Eclairage de la commande de réglage de ventilation (sans A/C auto.)
E2 (M41) W/8 : Interrupteur de feux de détresse
E2 (M42) W/6 : Interrupteur de désembuage (pour l'Europe ou double cabine sauf pour le Moyen-Orient)
G1 (M43) Y/2 : Module d'airbag passager avant
F1 (M44) BR/4 : Amplificateur de commande thermique (sans A/C auto.)
G2 (M45) BR/4 : Résistance de ventilateur (sans A/C auto.)
G2 (M46) W/2 : Moteur de soufflerie
G3 (M49) W/20 : Vers (D31)
G3 (M50) W/6 : Vers (D32) (avec lève-vitre électrique)
F3 (M51) W/8 : Minuterie de verrouillage de porte (avec lève-vitre électrique sauf pour l'Europe)
G3 (M52) W/2 : Rupteur 2 (pour l'Europe et moteur KA pour le Moyen-Orient — sauf pour modèles à double cabine sans lève-vitre électrique)
B4 (M53) L/4 : Diode (moteur KA pour l'Europe)
G3 (M54) — : Masse de carrosserie
F1 (M55) W/2 : Témoin de défaut (avec NATS)
C3 (M58) BR/8 : Boîtier de contrôle de télécommande à fonctions multiples (pour l'Europe)
F3 (M59) BR/6 : Relais de désembuage (pour l'Europe ou cabine double sauf pour le Moyen-Orient)
F4 (M60) L/4 : Relais de feu antibrouillard arrière (pour l'Europe)
F4 (M60) L/4 : Relais de feux antibrouillards avant (moteur ZD)
F3 (M62) W/18 : Boîtier de commande d'accès intelligent (pour l'Europe)
D3 (M63) W/3 : Interrupteur de feux antibrouillards avant (moteur ZD)
D2 (M65) W/6 : Interrupteur de feux antibrouillards (pour l'Europe)
E3 (M68) W/8 : IMMO NATS (pour l'Europe)
B2 (M69) W/48 : TCM (boîtier de commande de transmission) (moteur QD avec T/A)
B2 (M70) W/24 : TCM (boîtier de commande de transmission) (moteur KA avec T/A)
B2 (M71) GY/24 : TCM (boîtier de commande de transmission) (moteur KA avec T/A)
B2 (M72) -/6 : Connecteur de raccord 2 (avec T/A)
F1 (M74) W/2 : Capteur de température d'air d'admission (avec A/C auto.)
F1 (M75) B/2 : Sonde d'ensoleillement (avec A/C auto.)
C2 (M76) W/6 : Connecteur optionnel (pour l'Europe) (pour le système d'alarme antivol)
C3 (M78) L/2 : Contact de frein de verrouillage de passage (modèles avec T/A)
E4 (M79) Y/12 : Boîtier de capteurs de diagnostic d'airbag (pour ceinture de sécurité à prétensionneur)
E4 (M80) Y/20 : Boîtier de capteurs de diagnostic d'airbag
F4 (M81) Y/12 : Boîtier de capteurs de diagnostic d'airbag (pour ceinture de sécurité à prétensionneur)
C3 (M82) B/2 : Contact de position de pédale de frein (YD25)
B5 (M83) L/10 : Diode (moteur KA sauf pour l'Europe)
A3 (M84) BR/2 : Résistance (avec A/T)
C2 (M85) GY/6 : Boîtier d'accélérateur (YD25)
E3 (M86) BR/10 : Moteur de volet de mode (avec A/C auto.)
E3 (M87) W/2 : Capteur de l'habitacle (avec A/C auto)
F3 (M88) GY/20 : Amplificateur auto. d'A/C (avec A/C auto.)
G3 (M89) GY/16 : Amplificateur auto d'A/C (avec A/C auto.)
G3 (M90) L/2 : Moteur d'aspirateur (avec A/C auto.)
G2 (M91) B/6 : Moteur de volet de mélange d'air (avec A/C auto.)
F1 (M92) W/4 : Amplificateur de commande de ventilateur (avec A/C auto.)
F1 (M93) W/4 : Moteur de volet d'admission (avec A/C auto.)
C2 (M94) BR/3 : Capteur de position d'accélérateur (ZD30)
C2 (M95) GY/3 : Contact de position d'accélérateur (ZD30)
C2 (M96) W/3 : Contact d'accélérateur (C/C) (ZD30)
E1 (M98) W/12 : Système audio (au travers du faisceau auxiliaire) (sauf pour l'Europe)

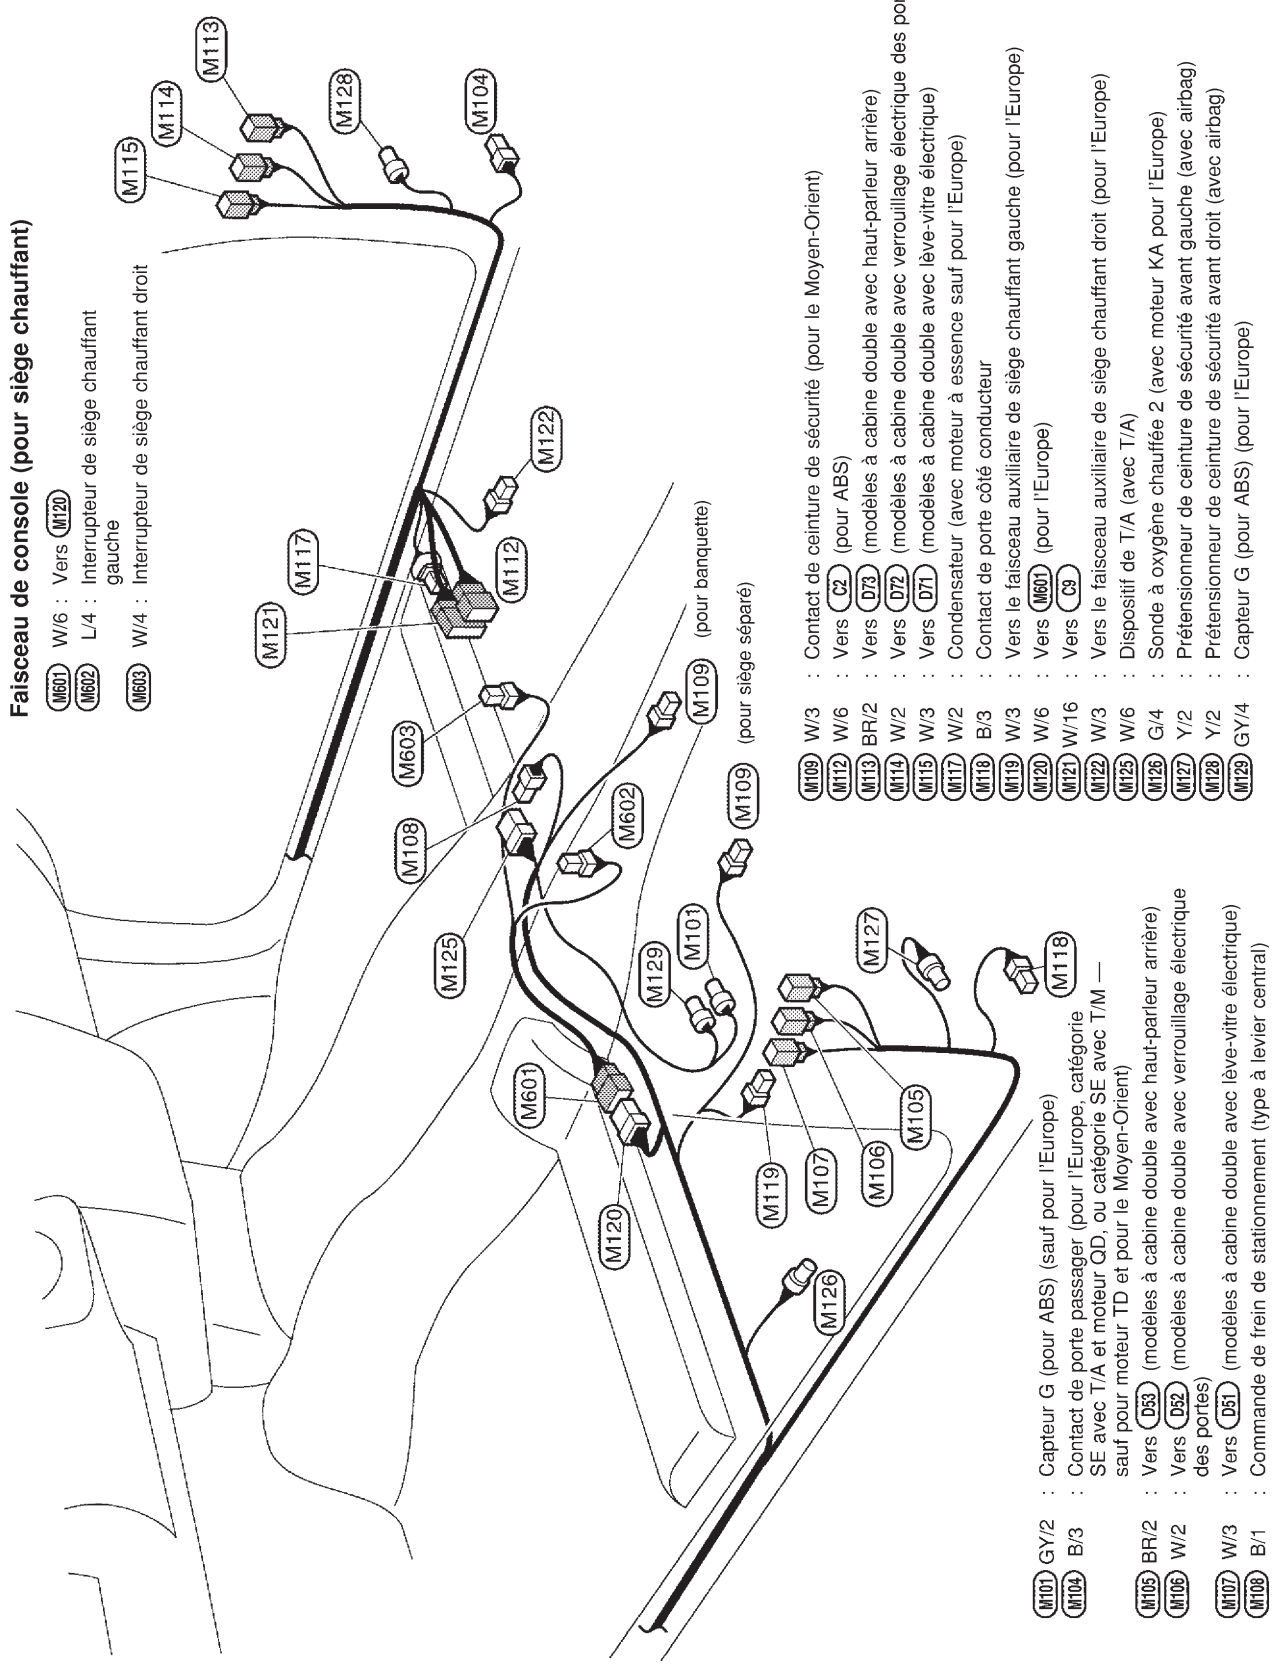
G4 (M1) — : Masse de carrosserie
G4 (M3) W/20 : Vers (D1)
G4 (M4) W/12 : Vers (D2) (avec lève-vitre électrique)
G3 (M5) SMJ : Vers (E101)
F4 (M6) W/24 : Vers (N1)
G2 (M7) BR/24 : Vers (N2)
E4 (M9) L/4 : Relais de pompe à carburant (moteurs KA et VG)
F4 (M10) — : Boîtier à fusibles
F4 (M11) W/16 : Connecteur de liaison de données
F3 (M12) W/6 : Boîtier à fusibles
F3 (M14) W/4 : Boîtier à fusibles
C4 (M15) B/3 : Centrale de clignotants combinée
E3 (M16) B/2 : Contact de feux de stop
A3 (M17) L/4 : Relais de feux antibrouillards avant (pour l'Europe)
F1 (M19) W/6 : Vers (R1)
E3 (M20) W/6 : Contact d'allumage
D1 (M21) W/1 : Commande de frein de stationnement (type à manche)
D2 (M23) BR/8 : Commande d'éclairage
• Commande de clignotants
D2 (M24) BR/4 : Commande d'éclairage
D3 (M25) Y/7 : Câble spiralé (avec airbag)
D3 (M27) B/1 : Commande d'avertisseur sonore (sans airbag)
D2 (M28) GY/8 : Commande d'essuie-glace et de lave-vitres
D4 (M29) W/12 : Boîtier de commande de préchauffage (moteur TD sans EGR et moteur QD)
C1 (M35) W/16 : Système audio (pour l'Europe)
C1 (M36) W/4 : Vers le faisceau auxiliaire du chargeur de CD (pour l'Europe sauf pour modèles à double cabine sans lève-vitre électrique)
C3 (M37) B/2 : Allume-cigare
C3 (M38) W/3 : Commande de climatisation (sans A/C auto.)
C2 (M39) W/6 : Commande de réglage de ventilation (sans A/C auto.)
C2 (M40) W/2 : Eclairage du commutateur de ventilateur (sans A/C auto.)
C2 (M41) W/8 : Interrupteur de feux de détresse
C2 (M42) W/6 : Interrupteur de désembuage (pour l'Europe ou modèles à cabine king ou cabine double)
A2 (M43) Y/2 : Module d'airbag, côté passager
B1 (M44) BR/4 : Amplificateur de thermorégulation (sans A/C auto.)
A2 (M45) BR/4 : Résistance de ventilateur (sans A/C auto.)
A2 (M46) W/2 : Moteur de soufflerie
A2 (M47) W/16 : Vers (F55) (moteurs KA, VG, YD et ZD)
A2 (M48) W/24 : Vers (F54) (moteurs KA, VG, YD et ZD)

A3 (M49) W/20 : Vers (D31)
A3 (M50) W/6 : Vers (D32) (avec lève-vitre électrique)
B3 (M51) W/8 : Minuterie de verrouillage de porte (avec verrouillage électrique des portes sauf pour l'Europe)
G3 (M52) W/2 : Rupteur 2 (pour l'Europe sauf pour modèles à double cabine sans lève-vitre électrique)
A3 (M53) L/4 : Diode (cabine simple avec moteur KA)
A3 (M54) — : Masse de carrosserie
B1 (M55) W/2 : Témoin de défaut (pour l'Europe)
F2 (M58) BR/8 : Boîtier de contrôle de télécommande à fonctions multiples (pour l'Europe)
C4 (M59) BR/6 : Relais de désembuage (pour l'Europe ou modèles à cabine king ou cabine double)
C3 (M60) L/4 : Relais de feu antibrouillard arrière (pour l'Europe)
C4 (M61) W/4 : Relais de feux antibrouillards avant (moteur ZD)
B4 (M62) W/18 : Boîtier de commande d'accès intelligent (pour l'Europe)
D3 (M64) L/6 : Commande de feux antibrouillards (moteur ZD)
D3 (M65) W/6 : Interrupteur de feux antibrouillard avant et arrière (pour l'Europe)
D4 (M66) GY/20 : ECM (moteur diesel avec EGR)
D4 (M67) GY/16 : ECM (moteur diesel avec EGR)
E3 (M68) W/8 : IMMO NATS (pour l'Europe)
E1 (M70) W/24 : TCM (boîtier de commande de transmission) (modèles avec T/A)
E1 (M71) GY/24 : TCM (boîtier de commande de transmission) (avec T/A)
E1 (M73) W/4 : Dispositif de T/A (T/A avec colonne de passage)
B1 (M74) W/2 : Capteur de température d'air d'admission (avec A/C auto.)
B1 (M75) B/2 : Sonde d'ensoleillement (avec A/C auto.)
F2 (M76) W/6 : Connecteur optionnel pour le système d'alarme antivol (pour l'Europe)
E4 (M78) L/2 : Contact de frein de verrouillage de passage (modèles avec T/A)
C4 (M79) Y/12 : Boîtier de capteurs de diagnostic d'airbag (avec airbag pour l'Europe et l'Australie)
C4 (M80) Y/20 : Boîtier de capteurs de diagnostic d'airbag (avec airbag)
D4 (M81) Y/12 : Boîtier de capteurs de diagnostic d'airbag (avec airbag pour l'Europe et l'Australie)



E4 (M82) B/2 : Contact de position de pédale de frein (moteur YD)
A4 (M83) L/10 : Diode (modèles à cabine double et moteur KA)
A1 (M84) BR/2 : Résistance (modèlesavec T/A)
G3 (M85) GY/6 : Boîtier d'accélérateur (moteur YD)
D3 (M86) BR/10 : Moteur de volet de mode (avec A/C auto.)
D3 (M87) W/2 : Capteur de l'habitacle (avec A/C auto.)
B3 (M88) GY/20 : Amplificateur auto. d'A/C (avec A/C auto.)
B3 (M89) GY/16 : Amplificateur auto. d'A/C (avec A/C auto.)
B3 (M90) L/2 : Moteur d'aspirateur (avec A/C auto.)
B3 (M91) B/6 : Moteur de volet de mélange d'air (avec A/C auto.)
C1 (M92) W/4 : Amplificateur de commande de ventilateur (avec A/C auto.)
B1 (M93) W/4 : Moteur de volet d'admission (avec A/C auto.)
G3 (M94) BR/3 : Capteur de position d'accélérateur (moteur ZD)
G3 (M95) GY/3 : Contact de position d'accélérateur (moteur ZD)
G3 (M96) W/3 : Contact d'accélérateur (C/C) (moteur ZD)
C1 (M98) W/12 : Système audio (au travers du faisceau auxiliaire) (sauf pour l'Europe)

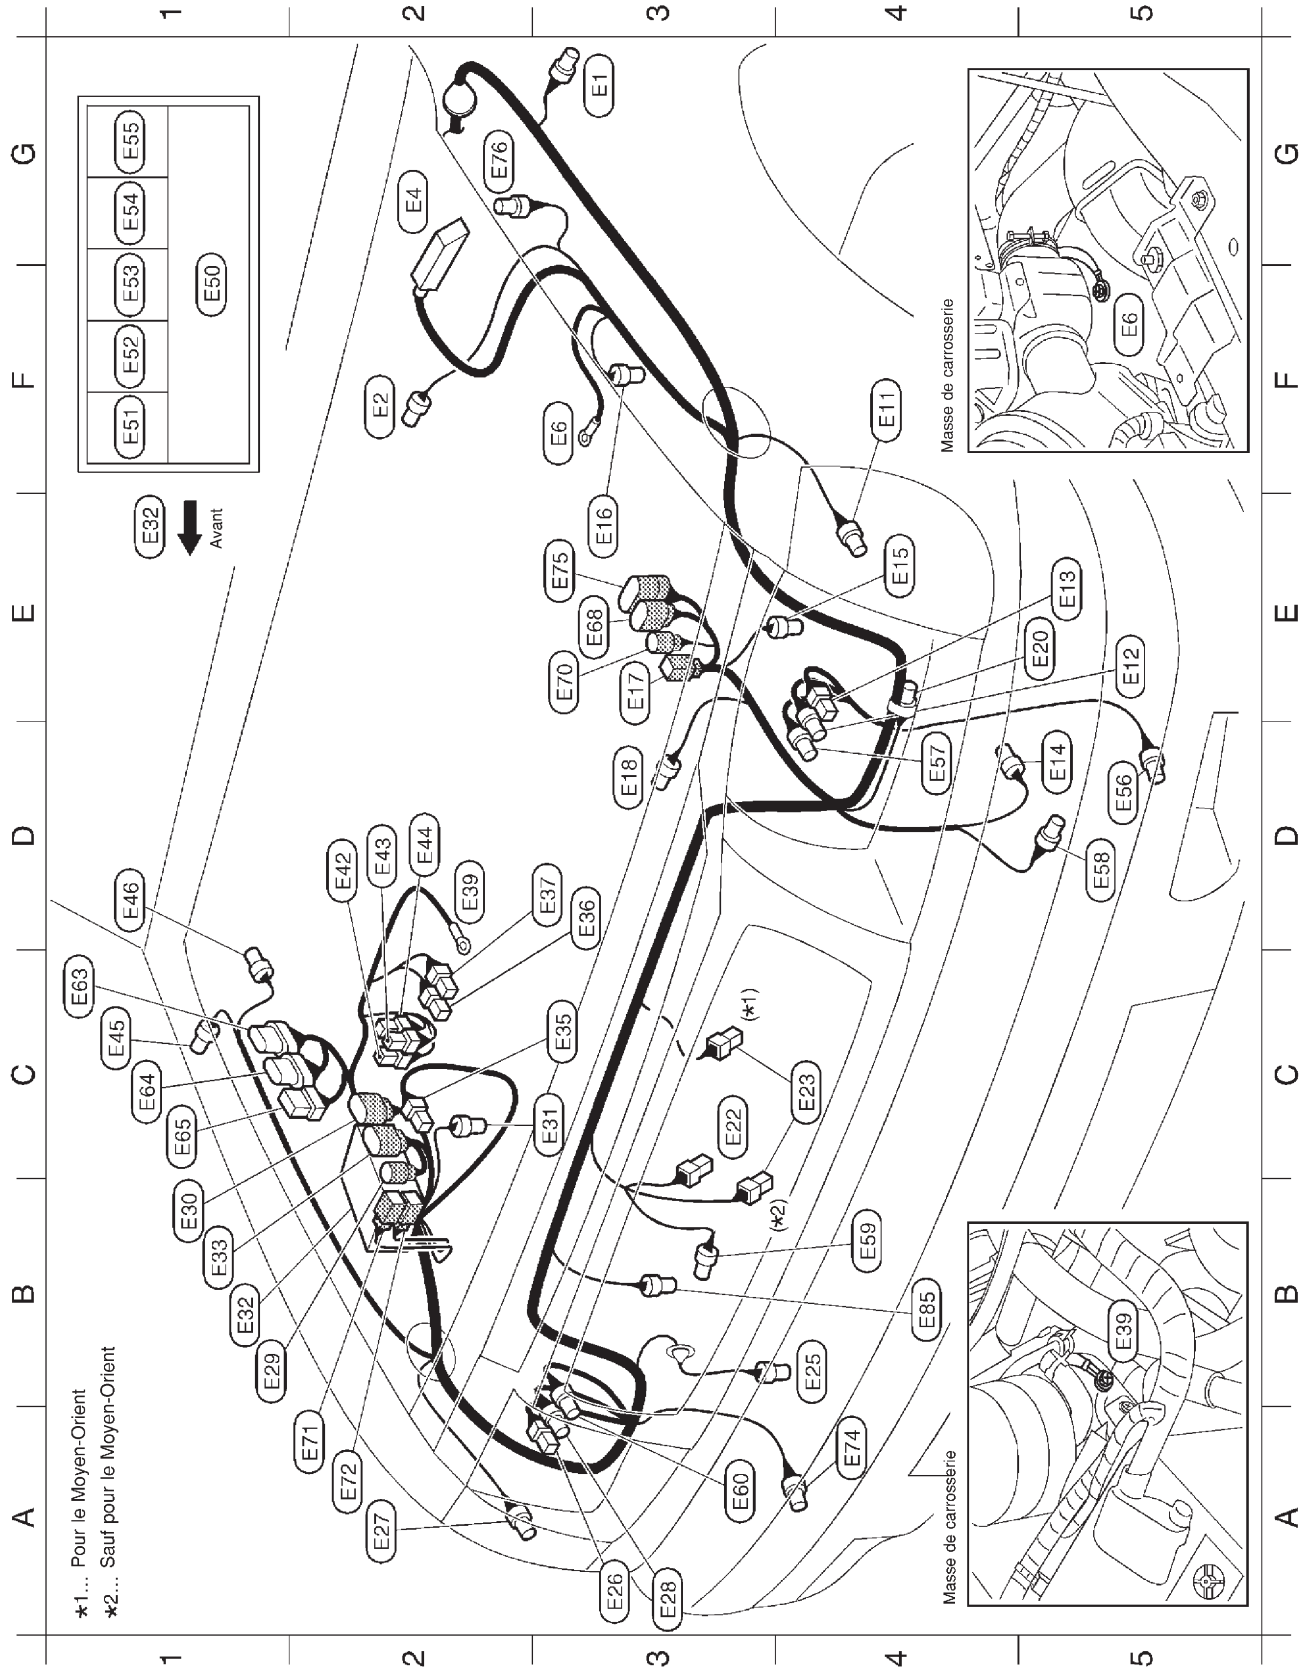
Faisceau de compartiment moteur (Suite)

G3 E1 GY/2 : Clignotant latéral gauche (avec phare à faisceaux multiples)
F2 E2 GY/2 : Contact de niveau de liquide de frein
G3 E4 B/31 : Actionneur ABS et boîtier électrique (pour ABS)
E4 E6 — : Masse de carrosserie
F4 E11 GY/3 : Bloc optique avant gauche (sans phare à faisceaux multiples)
E5 E12 GY/3 : Bloc optique avant gauche (avec phare à faisceaux multiples)
E5 E13 B/3 : Phare gauche
D5 E14 GY/2 : Moteur de lave-vitres
E3 E15 BR/2 : Capteur de roue avant gauche (pour ABS)
E3 E16 GY/2 : Capteur de température d'air d'admission (moteur KA pour l'Europe)
D4 E20 GY/2 : Connecteur optionnel (pour contact de capot) (pour l'Europe)
B3 E22 B/1 : Avertisseur sonore (grave)
C4 E23 B/1 : Avertisseur sonore (aigu)
B4 E25 GY/4 : Manocontact triple
A3 E26 B/3 : Phare droit
A2 E27 GY/3 : Bloc optique avant droit (sans phare à faisceaux multiples)
A3 E28 GY/3 : Bloc optique avant droit (avec phare à faisceaux multiples)
B2 E29 GY/2 : Vers E204
B2 E30 GY/8 : Vers E203
C3 E31 GY/2 : Capteur de roue avant droite (pour ABS)
B1 E32 — : Boîte de relais (boîte de fusibles et de raccord à fusibles)
C2 E33 SB/8 : Vers E205
C2 E34 B/1 : Batterie
D2 E39 — : Masse de carrosserie
C3 E40 B/2 : Manocontact d'huile de direction assistée (pour l'Europe)
D2 E41 B/1 : Connecteur optionnel (pour feux antibrouillards avant) (pour l'Europe)
C1 E45 GY/2 : Clignotant latéral droit (avec phare à faisceaux multiples)
D1 E46 GY/3 : Antenne électrique (pour le Moyen-Orient et l'Europe)
E1 E50 — : Boîte de fusibles et de raccord à fusibles
D1 E51 L/4 : Relais de ventilateur de refroidissement (moteur KA pour le Moyen-Orient et l'Europe)

D1 E52 L/4 : Relais de climatisation
E1 E53 W/3 : Relais d'avertisseur sonore
E1 E54 BR/6 : Relais de position de stationnement/point mort (avec T/A)
E1 E55 BR/6 : Relais de l'ECM (moteur KA)
D4 E57 -/3 : Moteur de réglage des faisceaux gauche (pour le Moyen-Orient et l'Europe)
D5 E58 GY/2 : Moteur de lave-phares (pour l'Europe)
C4 E59 B/2 : Non utilisé (pour l'Europe)
A3 E60 -/3 : Moteur de réglage du faisceau de phare droit (pour le Moyen-Orient et l'Europe)
C1 E63 SB/6 : Boîtier d'éclairage de jour (avec système d'éclairage de jour)
B1 E64 SB/8 : Boîtier d'éclairage de jour (avec système d'éclairage de jour)
B1 E65 W/6 : Amplificateur de lave-phares (pour l'Europe)
C3 E69 BR/2 : Contact de température ambiante (moteur KA)
D3 E85 GY/2 : Moteur de ventilateur de refroidissement (moteur KA pour le Moyen-Orient et l'Europe)

COMPARTIMENT PASSAGER



E101 SMJ : Vers M5

Vérification 5003

CARACTERISTIQUES ET VALEURS DE REGLAGE (SDS) 5005
Culasse 5005
Bloc-cylindres 5005
Piston, segment de piston et axe de piston 5006

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

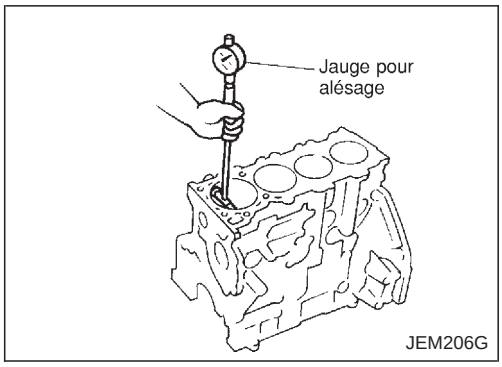
Vérification

DEFORMATION DE LA CULASSE

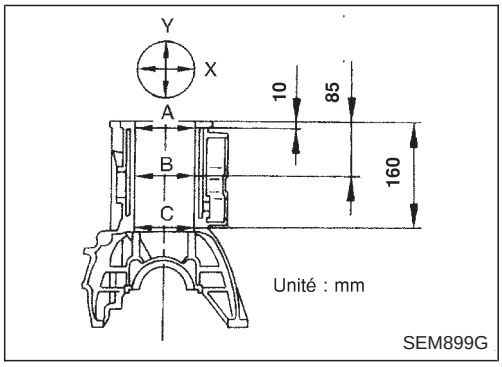
Nettoyer la surface de la culasse. Utiliser une règle et une jauge d'épaisseur fiables pour contrôler l'égalité de la surface de la culasse. Vérifier les 6 points indiqués sur l'illustration.

Planéité de la surface de la culasse :
Limite de 0,1 mm

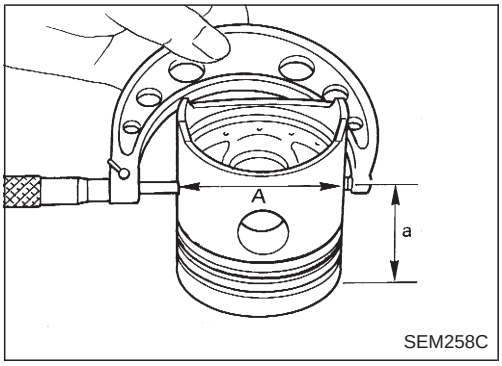
Si la valeur est hors limite, corriger ou remplacer.



La limite de la rectification de la culasse est déterminée par la rectification du bloc-cylindres.



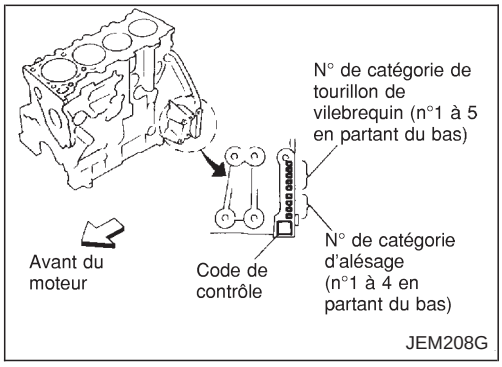
Limite de rectification :
L'étendue de rectification de la culasse est ''A''.
L'étendue de rectification du bloc-cylindres est ''B''.
La limite maximum est : A + B = 0,07 mm



Après avoir rectifié la culasse, vérifier à la main que l'arbre à cames tourne sans à-coup. En cas de résistance, la culasse doit être remplacée.

Hauteur nominale de culasse :
153,9 - 154,1 mm

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

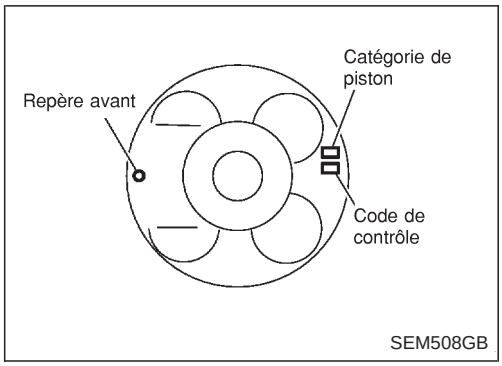


Vérification

JEU DU PISTON A ALESER

1. A l'aide d'un comparateur à cadran, mesurer l'alésage du cylindre dans les directions X et Y aux points A, B et C pour rechercher usure, faux-rond ou conicité.
   Diamètre interne de l'alésage de cylindre :
   Standard
   89,000 - 89,030 mm
   Limite d'usure
   0,07 mm
   Si la valeur est hors limite, réaléser tous les cylindres. Remplacer le bloc-cylindres si nécessaire.
   Ovalisation (différence entre X et Y) :
   Limite de 0,015 mm
   Conicité (différence entre A et C) :
   Limite de 0,010 mm
2. Rechercher toutes traces de rayures et de grippage. En cas de grippage, rectifier.
3. Mesurer le diamètre de la jupe de piston.
   Diamètre du piston "A" :
   Standard
   88,925 - 88,955 mm
   Point de mesure "a" (distance depuis la partie supérieure) :
   59,0 mm
4. Vérifier que le jeu entre le piston et l'alésage est conforme aux spécifications.

- Calculer le jeu en utilisant le diamètre externe au niveau de la jupe de piston et le diamètre interne du cylindre (direction X, point B) :
  Jeu du piston à aléser = alésage de cylindre - diamètre du piston "A"
  Standard (à une température ambiante de 20°C) :
  0,065 - 0,085 mm
- Si la valeur est hors de la gamme spécifiée, remplacer le piston et l'axe de piston.



- Si le bloc-cylindres ou les pistons sont remplacés par des pièces neuves, sélectionner le piston comme suit :

Lors de l'utilisation d'un bloc-cylindres neuf :

- Identifier la catégorie de l'alésage du cylindre (n°1, 2, ou 3) sur la surface gauche à l'arrière du bloc-cylindres et sélectionner un piston de catégorie identique.
- Le numéro de pièce est commun au piston et à l'axe de piston comme un ensemble.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Vérification (Suite)

Lors de la réutilisation d'un bloc-cylindres déposé :

- Mesurer le diamètre interne de l'alésage du bloc-cylindres.
- Déterminer l'alésage en comparant les mesures avec les valeurs sous ''Type d'alésage de cylindre'' dans le tableau ci-dessous. Sélectionner un piston de la même taille.

Raccord approprié pour pistons :

Unité : mm

Catégorie (perforée)	1	2	3
Type d'alésage de cylindre	89,000 - 89,010	89,010 - 89,020	89,020 - 89,030
Diamètre externe du piston	88,925 - 88,935	88,935 - 88,945	88,945 - 88,955

5. Déterminer la surdimension du piston en fonction de l'étendue de l'usure du cylindre.

- **Les pistons surdimensionnés de 0,25 et 0,5 (surdimension de 0,25 mm, 0,5 mm) sont disponibles en tant que pièces détachées. Se reporter aux SDS, EM-5006. Lors de l'utilisation d'un piston surdimensionné, roder le cylindre pour que le jeu entre le piston et le cylindre soit à la valeur spécifiée. S'assurer d'utiliser le segment de piston surdimensionné approprié au piston surdimensionné.**

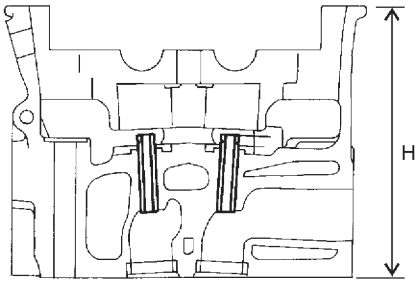
6. La dimension de l'alésage de cylindre est déterminée en ajoutant le jeu du piston à aléser au diamètre du piston ''A''.

Calcul de la dimension du réalésage : D = A + B - C
où
D : diamètre d'alésage
A : diamètre du piston mesuré
B : jeu du piston à aléser
C : tolérance de finition 0,02 mm

7. Aléser les cylindres.

- **Tous les cylindres doivent être alésés en même temps.**
- **Ne pas aléser trop profondément un cylindre en une fois. Ne pas rectifier de plus de 0,05 mm de diamètre environ à chaque fois.**

8. Roder les cylindres pour obtenir le jeu spécifié du piston à l'alésage.
9. Mesurer l'alésage final du cylindre en vérifiant qu'il n'y a pas d'ovalisation ou de conicité.



- **La mesure doit être prise une fois que l'alésage du cylindre a refroidi.**

SERIE DES MODELES D22

AVANT-PROPOS

Ce supplément contient des informations sur les opérations d'entretien nécessaires, ainsi que les caractéristiques qui se rapportent à la nouvelle version des séries D22.

Toutes les informations, illustrations et caractéristiques contenues dans ce supplément sont basées sur les derniers renseignements disponibles au moment de la publication. Si le véhicule NISSAN ne répond pas aux caractéristiques indiquées dans ce supplément, consulter son concessionnaire NISSAN.

Nous nous réservons tous droits d'effectuer des changements dans les caractéristiques et les méthodes, à tout moment et sans préavis.

AVANT-PROPOS

Ce manuel contient les travaux d'entretien et de réparation concernant les véhicules NISSAN PICKUP, série des modèles D22.

A des fins de sécurité et pour que le rendement des véhicules concernés soit optimal, prière de lire ce manuel complètement. Avant de commencer à entreprendre des travaux, il est particulièrement important d'avoir parfaitement assimilé les PRECAUTIONS signalées dans la section GI.

Toutes les informations contenues dans ce manuel sont basées sur les données de production les plus récentes au moment de la réalisation du manuel. Nous nous réservons le droit de modifier les caractéristiques et les méthodes de travail à n'importe quel moment et sans avis préalable.

NOTE IMPORTANTE DE SECURITE

Un entretien correctement effectué est essentiel, aussi bien pour la sécurité des mécaniciens que pour le fonctionnement adéquat du moteur. Les méthodes d'entretien reprises dans ce manuel de réparation sont décrites de telle manière que le travail puisse être effectué en sécurité et avec précision. Les entretiens varient selon les procédures, les connaissances du technicien et l'outillage, ainsi que les pièces disponibles. Dès lors, toute personne utilisant les procédures d'entretien, un outillage ou des pièces qui ne sont pas spécifiquement recommandées par NISSAN doit auparavant être absolument certain que ceci n'entraîne de danger ni pour sa propre sécurité, ni pour celle du moteur.

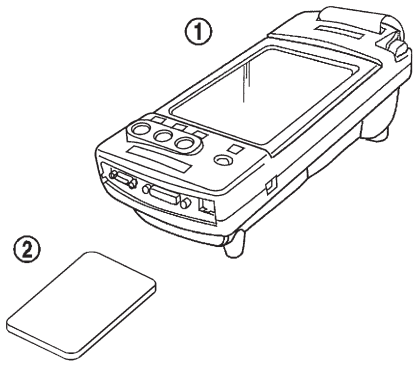
x : S'applique

Remplacement de la batterie à hydrure composé de nickel

CONSULT-II est équipé d'une batterie à hydrure composé de nickel. Lors du remplacement de la batterie, respecter les points suivants :

ATTENTION :

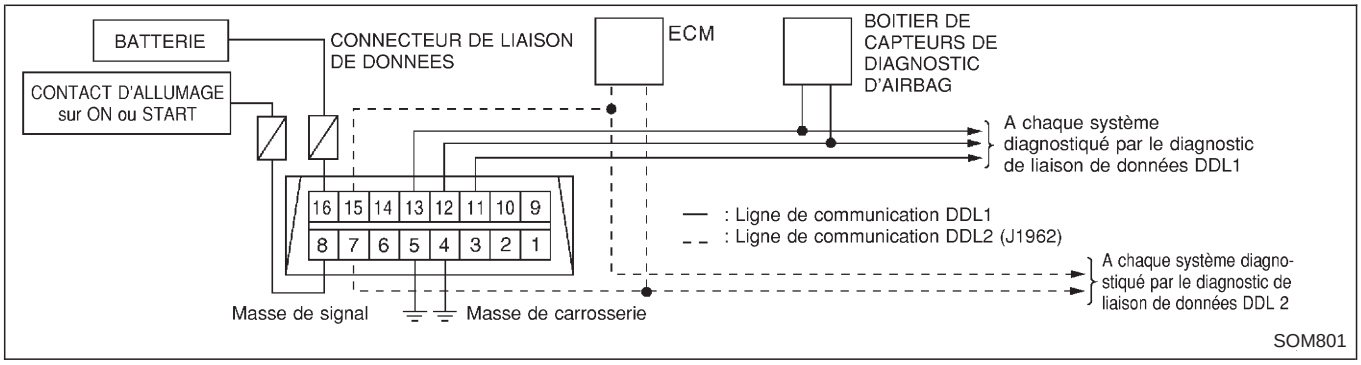


Remplacer la batterie à hydrure composé de nickel uniquement avec une batterie d'origine pour CONSULT-II. L'utilisation d'une batterie autre peut entraîner un risque d'incendie ou d'explosion. Un mauvais traitement de la batterie peut entraîner un risque d'incendie ou de brûlure chimique. Ne pas recharger, démonter ou jeter au feu.

Veiller à placer la batterie hors de portée des enfants et mettre les batteries usées au rebut conformément aux réglementations locales.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Equipement de vérification



Lors de la commande des équipements suivants, contacter votre concessionnaire NISSAN.

Nom de l'outil	Description
CONSULT-II NISSAN ① Boîtier CONSULT-II (logiciel interne du testeur : version résidente 3.3.0) et accessoires ② Carte programme AED01C pour diagnostique, AEN00A/00B pour NATS. Afin de confirmer la meilleure combinaison de ces logiciels, se reporter au manuel d'utilisation de CONSULT-II.	 SGI083A

NOTE :

- **CONSULT-II doit être utilisé conjointement avec une carte programme. CONSULT-II ne nécessite pas de procédure de charge (initialisation).**
- **S'assurer que CONSULT-II est éteint avant de reposer ou de déposer la carte programme.**

Circuit de connecteur de liaison de données (DLC) de CONSULT-II

PROCEDURE D'INSPECTION

Si CONSULT-II ne peut établir de diagnostic correctement, vérifier les éléments suivants.

Symptôme	Elément à contrôler
CONSULT-II ne peut accéder à aucun système.	● Circuit d'alimentation électrique (borne 8) et circuit de mise à la masse (borne 4) du connecteur de liaison de données de CONSULT-II (Pour le circuit détaillé, se reporter à la section EC ''Témoin de défaut et connecteur de liaison de données''.) ● Câble de diagnostic de liaison de données de CONSULT-II
CONSULT-II ne peut accéder à l'un des système (mais peut accéder à d'autres systèmes).	● Carte de programme CONSULT-II (Vérifier que la carte de programme CONSULT-II correspond au système. Se reporter ''Equipement de vérification'' ci-dessus.) ● Alimentation électrique et circuit de mise à la masse du boîtier de commande du système (Pour le circuit détaillé, se reporter au schéma de câblage de chaque système.) ● Circuit ouvert ou court-circuit entre le système et le connecteur de liaison de données de CONSULT-II (Pour le circuit détaillé, se reporter au schéma de câblage de chaque système.)
