When you read wiring diagrams:
- **Read GI section, "HOW TO READ WIRING DIAGRAMS".**
- **See EL section, "POWER SUPPLY ROUTING" for power distribution circuit.**

When you perform trouble diagnoses, read GI section, "HOW TO FOLLOW FLOW CHART IN TROUBLE DIAGNOSES".

Supplemental Restraint System (SRS) "AIR BAG"

The Supplemental Restraint System "AIR BAG", used along with a seat belt, helps to reduce the risk or severity of injury to the driver and front passenger in a frontal collision. The Supplemental Restraint System consists of air bag modules (located in the center of the steering wheel and in the instrument panel on the passenger side), a diagnosis sensor unit, a crash zone sensor (4WD models), warning lamp, wiring harness, and spiral cable.

The vehicle is equipped with a passenger air bag deactivation switch. Because no rear seat exists where a rear-facing child restraint can be placed, the switch is designed to turn off the passenger air bag so that a rear-facing child restraint can be used in the front passenger seat. The switch is located in the center of the instrument panel, near the ashtray. When the switch is turned to the ON position, the passenger air bag is enabled and could inflate in a frontal collision. When the switch is turned to the OFF position, the passenger air bag is disabled and will not inflate in a frontal collision. A passenger air bag OFF indicator on the instrument panel lights up when the passenger air bag is switched OFF. The driver air bag always remains enabled and is not affected by the passenger air bag deactivation switch.

Information necessary to service the system safely is included in the **RS section** of this Service Manual.

WARNING:

- **To avoid rendering the SRS inoperative, which could increase the risk of personal injury or death in the event of a collision which would result in air bag inflation, all maintenance should be performed by an authorized NISSAN dealer.**
- **Improper maintenance, including incorrect removal and installation of the SRS, can lead to personal injury caused by unintentional activation of the system.**
- **Do not use electrical test equipment on any circuit related to the SRS unless instructed to in this Service Manual. SRS wiring harnesses are covered with yellow insulation either just before the harness connectors or on the complete harness, for easy identification.**
- **The vehicle is equipped with a passenger air bag deactivation switch which can be operated by the customer. When the air bag is switched OFF, the passenger air bag is disabled and will not inflate in a frontal collision. When the passenger air bag is switched ON, the passenger air bag is enabled and could inflate in a frontal collision. After SRS maintenance or repair, make sure the passenger air bag deactivation switch is in the same position (ON or OFF) as when the vehicle arrived for service.**

Precautions

- Before proceeding with disassembly, thoroughly clean the outside of the transmission. It is important to prevent the internal parts from becoming contaminated by dirt or other foreign matter.
- Disassembly should be done in a clean work area.
- Use lint-free cloth or towels for wiping parts clean. Common shop rags can leave fibers that could interfere with the operation of the transmission.
- Place disassembled parts in order for easier and proper assembly.
- All parts should be carefully cleaned with a general purpose, non-flammable solvent before inspection or reassembly.
- Gaskets, seals and O-rings should be replaced anytime the transmission is disassembled.
- The valve body contains precision parts and requires extreme care when parts are removed and serviced. Place removed parts in order, on a parts rack, so they can be put back in the valve body in the same positions and sequences. Care will also prevent springs and small parts from becoming scattered or lost.
- Properly installed valves, sleeves, plugs, etc. will slide along their bores in the valve body under their own weight.
- Before assembly, apply a coat of recommended ATF to all parts. Apply petroleum jelly to protect O-rings and seals, or hold small bearings and washers in place during assembly. Do not use grease.
- Extreme care should be taken to avoid damage to O-rings, seals and gaskets when assembling.
- If A/T fluid contains frictional material (clutches, bands, etc.), replace radiator and flush cooler line using cleaning solvent and compressed air after repair of A/T. Refer to LC section ("Radiator", "ENGINE COOLING SYSTEM").
- After overhaul, refill the transmission with new ATF.
- When the A/T drain plug is removed, only some of the fluid is drained. Old A/T fluid will remain in torque converter and ATF cooling system. Always follow the procedures under "Changing A/T Fluid" in the MA section when changing A/T fluid.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Service Notice or Precautions

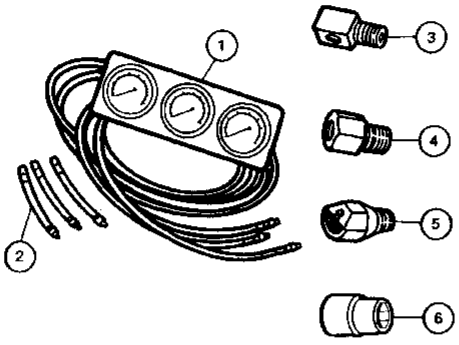
TORQUE CONVERTER SERVICE

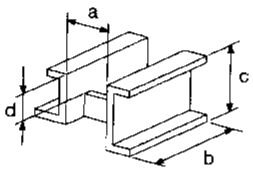
The torque converter should be replaced under any of the following conditions:

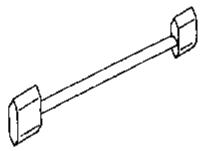
- External leaks in the hub weld area.
- Converter hub is scored or damaged.
- Converter pilot is broken, damaged or fits poorly into crankshaft.
- Steel particles are found after flushing the cooler and cooler lines.
- Pump is damaged or steel particles are found in the converter.
- Vehicle has TCC shudder and/or no TCC apply. Replace only after all hydraulic and electrical diagnoses have been made. (Converter clutch material may be glazed.)
- Converter is contaminated with engine coolant containing antifreeze.
- Internal failure of stator roller clutch.
- Heavy clutch debris due to overheating (blue converter).
- Steel particles or clutch lining material found in fluid filter or on magnet when no internal parts in unit are worn or damaged — indicates that lining material came from converter.

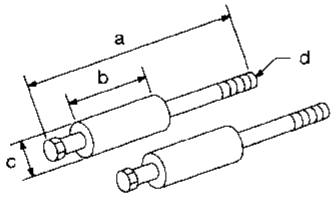
The torque converter should not be replaced if:

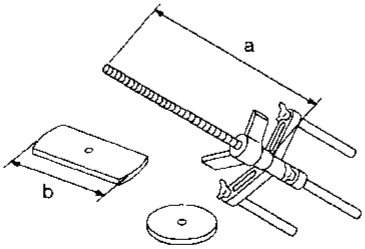
- The oil has an odor, is discolored, and there is no evidence of metal or clutch facing particles.
- The threads in one or more of the converter bolt holes are damaged.
- Transaxle failure did not display evidence of damaged or worn internal parts, steel particles or clutch plate lining material in unit and inside the fluid filter.
- Vehicle has been exposed to high mileage (only). The exception may be where the torque converter clutch dampener plate lining has seen excess wear by vehicles operated in heavy and/or constant traffic, such as taxi, delivery or police use.











ATF COOLER SERVICE

If A/T fluid contains frictional material (clutches, bands, etc.), replace radiator and flush cooler line using cleaning solvent and compressed air after repair of A/T. Refer to LC section ("Radiator", "ENGINE COOLING SYSTEM").

NOTES

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Shift Mechanism

The automatic transmission uses compact, dual planetary gear systems to improve power-transmission efficiency, simplify construction and reduce weight.
It also employs an optimum shift control and superwide gear ratios to improve starting performance and acceleration during medium and high-speed operation.
Two one-way clutches are also employed: one is used for the forward clutch and the other for the low clutch. These one-way clutches, combined with four accumulators, reduce shifting shock to a minimum.

CONSTRUCTION

Shift Mechanism (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

FUNCTION OF CLUTCH AND BRAKE

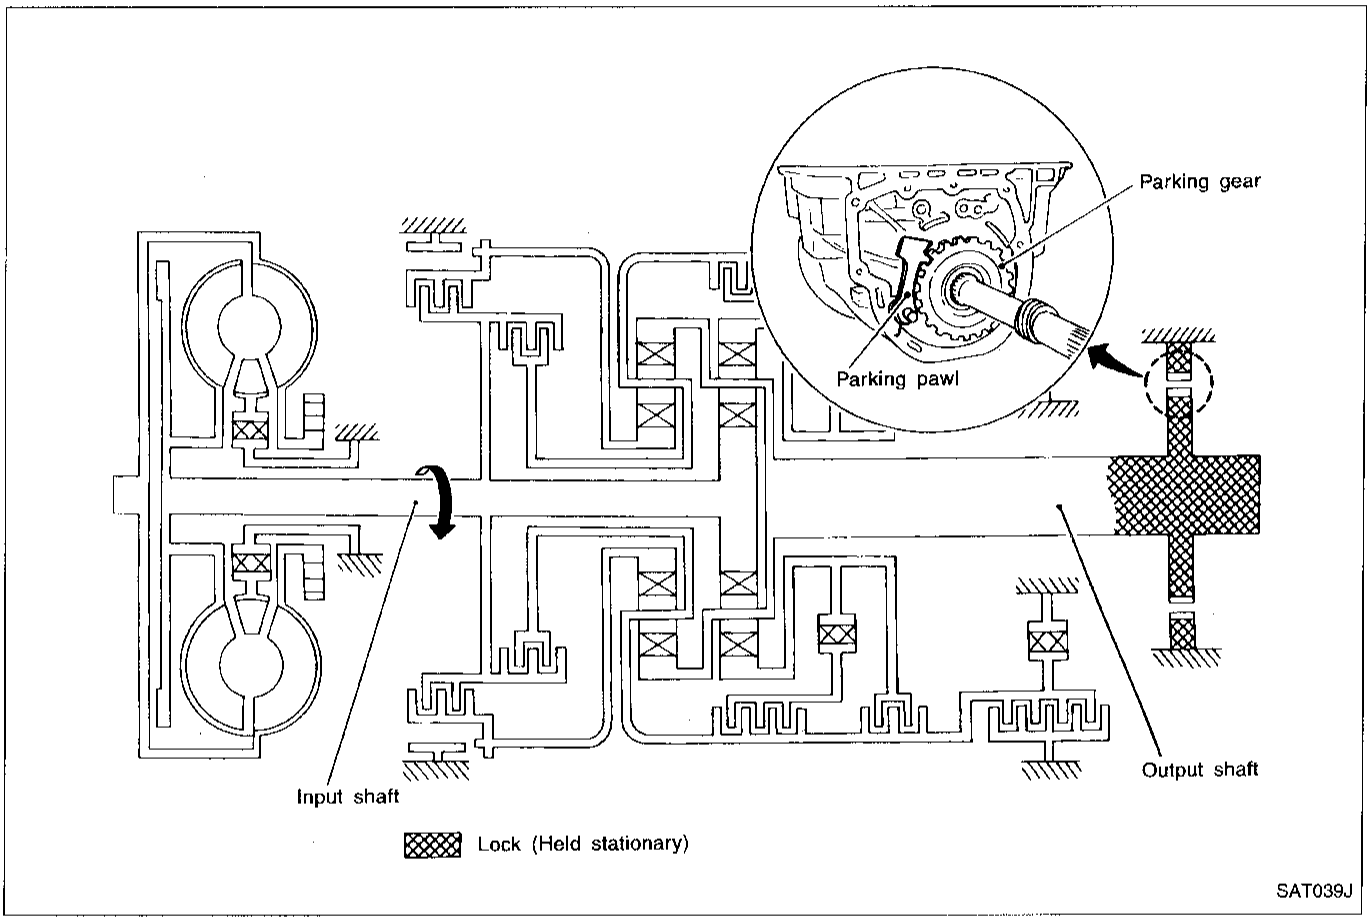
Clutch and brake components	Abbr.	Function
⑥ Reverse clutch	R/C	To transmit input power to front sun gear ⑨.
⑦ High clutch	H/C	To transmit input power to front planetary carrier ⑪.
⑯ Forward clutch	F/C	To connect front planetary carrier ⑪ with forward one-way clutch ⑰.
⑱ Overrun clutch	O/C	To connect front planetary carrier ⑪ with rear internal gear ⑭.
⑤ Brake band	B/B	To lock front sun gear ⑨.
⑰ Forward one-way clutch	F/O.C	When forward clutch ⑯ is engaged, to stop rear internal gear ⑭ from rotating in opposite direction.
⑲ Low one-way clutch	L/O.C	At D_1 position, to prevent rear internal gear ⑭ from rotating in opposite direction.
⑳ Low & reverse brake	L & R/B	To lock rear internal gear ⑭ (2, 1_2 and 1_1), to lock front planetary carrier ⑪ (R position).

CLUTCH AND BAND CHART

Shift position		Reverse clutch ⑥	High clutch ⑦	Forward clutch ⑯	Overrun clutch ⑱	Band servo 2nd apply	Band servo 3rd release	Band servo 4th apply	Forward one-way clutch ⑰	Low one-way clutch ⑲	Low & reverse brake ⑳	Lock-up	Remarks
P													PARK POSITION
R		○									○		REVERSE POSITION
N													NEUTRAL POSITION
D *4	1st			○	⊗				●	●			Automatic shift 1 ↔ 2 ↔ 3 ↔ 4
	2nd			○	*1 ◎	○			●				
	3rd		○	○	◎	*2 ⊗	⊗		●				
	4th		○	⊗		*3 ⊗	⊗	○				○	
2	1st			○	⊗				●	●			Automatic shift 1 ↔ 2
	2nd			○	○	○			●				
1	1st			○	○				●		○		Locks (held stationary) in 1st speed 1 ← 2
	2nd			○	○	○			●				

*1 : Operates when overdrive control switch is set in OFF position.
*2 : Oil pressure is applied to both 2nd "apply" side and 3rd "release" side of band servo piston. However, brake band does not contract because oil pressure area on the "release" side is greater than that on the "apply" side.
*3 : Oil pressure is applied to 4th "apply" side in condition *2 above, and brake band contracts.
*4 : A/T will not shift to 4th when overdrive control switch is set to OFF position.

○ : Operates.
◎ : Operates when throttle opening is less than 3/16, activating engine brake.
● : Operates during "progressive" acceleration.
⊗ : Operates but does not affect power-transmission.
⊗ : Operates when throttle opening is less than 3/16 but does not affect engine brake.



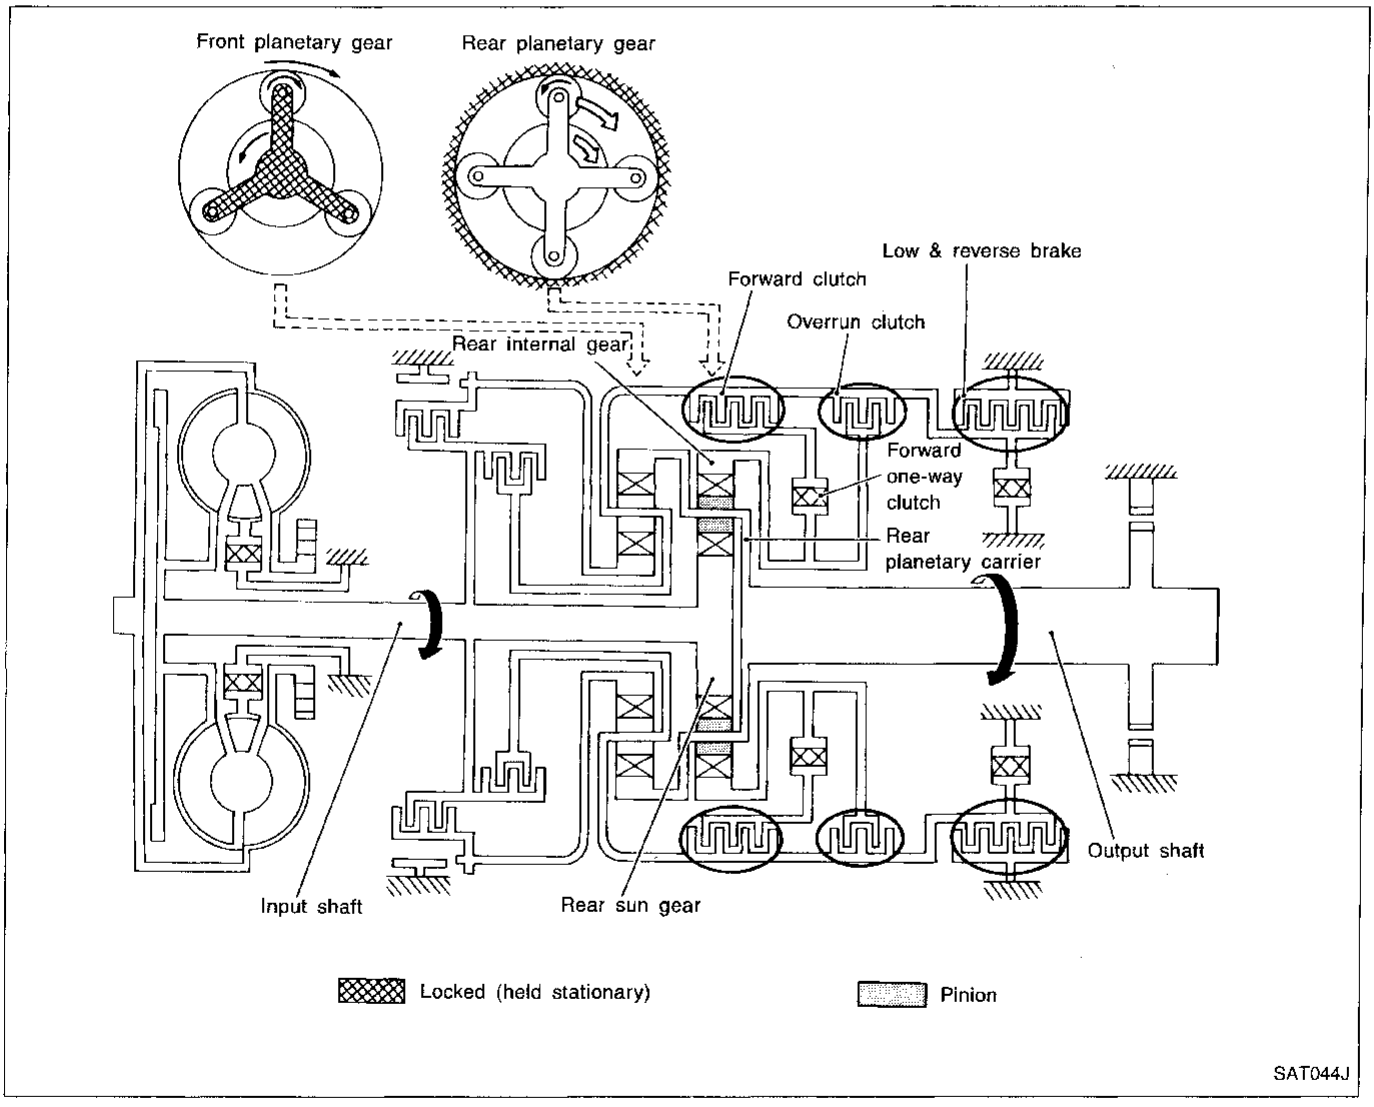
Shift Mechanism (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

POWER TRANSMISSION

"N" and "P" positions

- "N" position
  No control members operate. Power from the input shaft is not transmitted to the output shaft because the clutches do not operate.
- "P" position
  Similar to the "N" position, no control members operate. The parking pawl interconnected with the select lever engages with the parking gear to mechanically hold the output shaft so that the powertrain is locked.

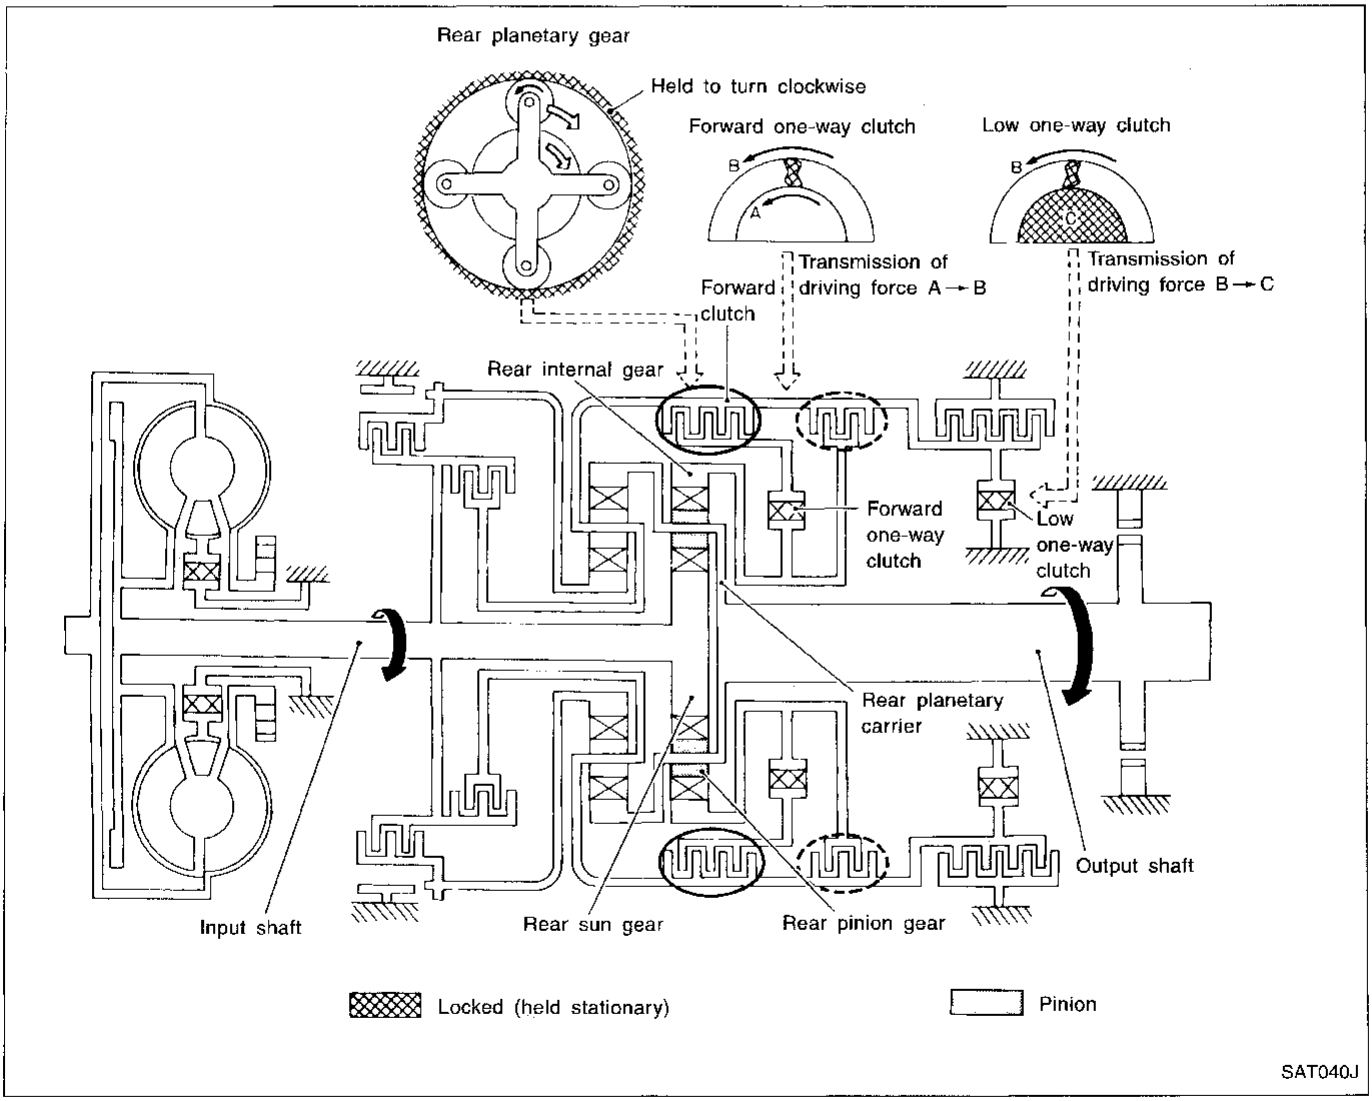


Shift Mechanism (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

"1_1" position

● **Forward clutch** ● **Forward one-way clutch** ● **Overrun clutch** ● **Low and reverse brake**	As overrun clutch engages, rear internal gear is locked by the operation of low and reverse brake. This is different from that of D_1 and 2_1.
Engine brake	Overrun clutch always engages, therefore engine brake can be obtained when decelerating.
Power flow	Input shaft ↓ Rear sun gear ↓ Rear planetary carrier ↓ Output shaft

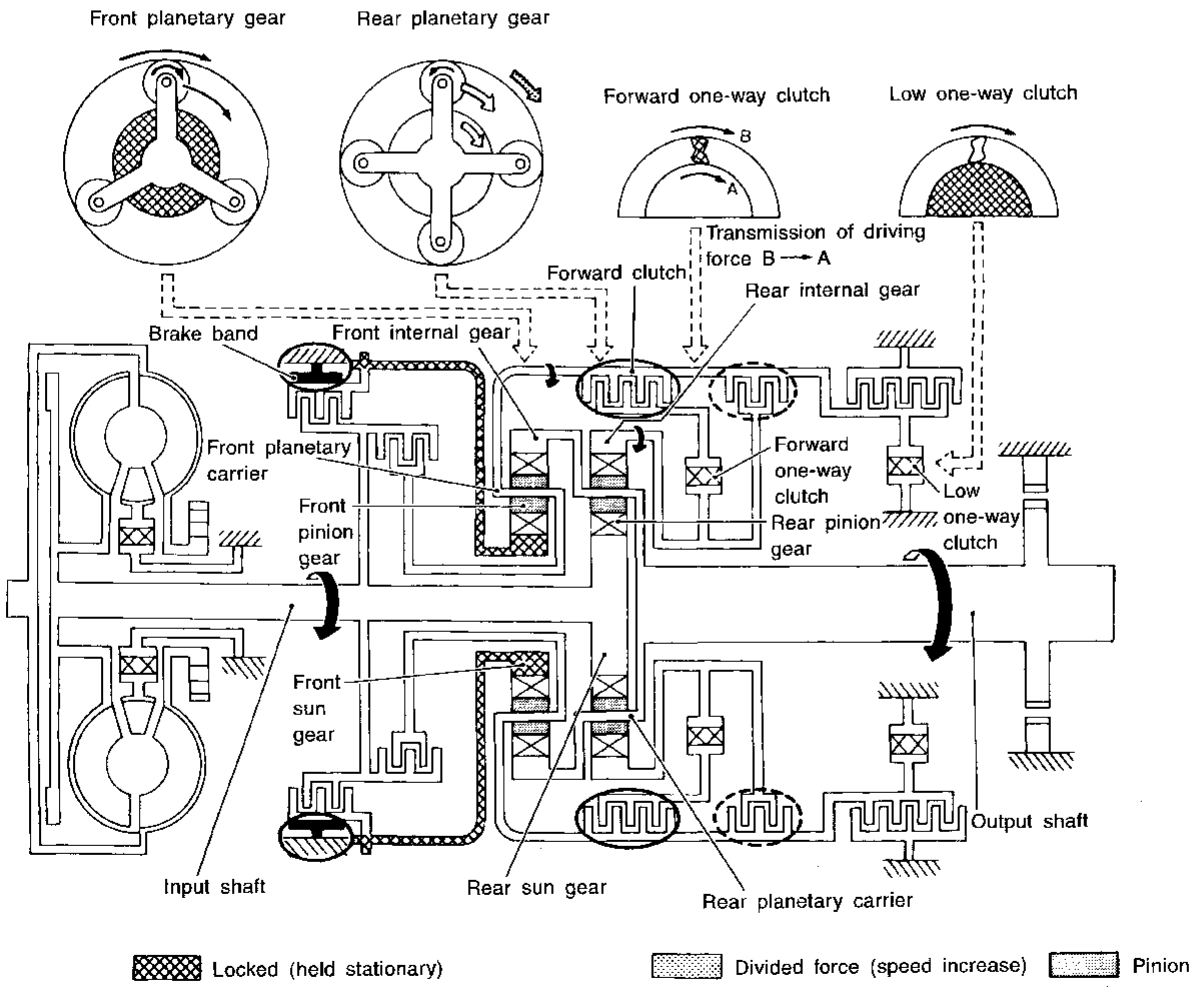


Shift Mechanism (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

"D_1" and "2_1" positions

• **Forward one-way clutch** • **Forward clutch** • **Low one-way clutch**	Rear internal gear is locked to rotate counterclockwise because of the functioning of these three clutches. (Start-up at D_1).
Overrun clutch engagement conditions (Engine brake)	D_1: Overdrive control switch "OFF" and throttle opening is less than 3/16 2_1: Throttle opening less than 3/16 At D_1 and 2_1 positions, engine brake is not activated due to free turning of low one-way clutch.
Power flow	Input shaft ↓ Rear sun gear ↓ Rear pinion gear ↓ Rear planetary carrier ↓ Output shaft

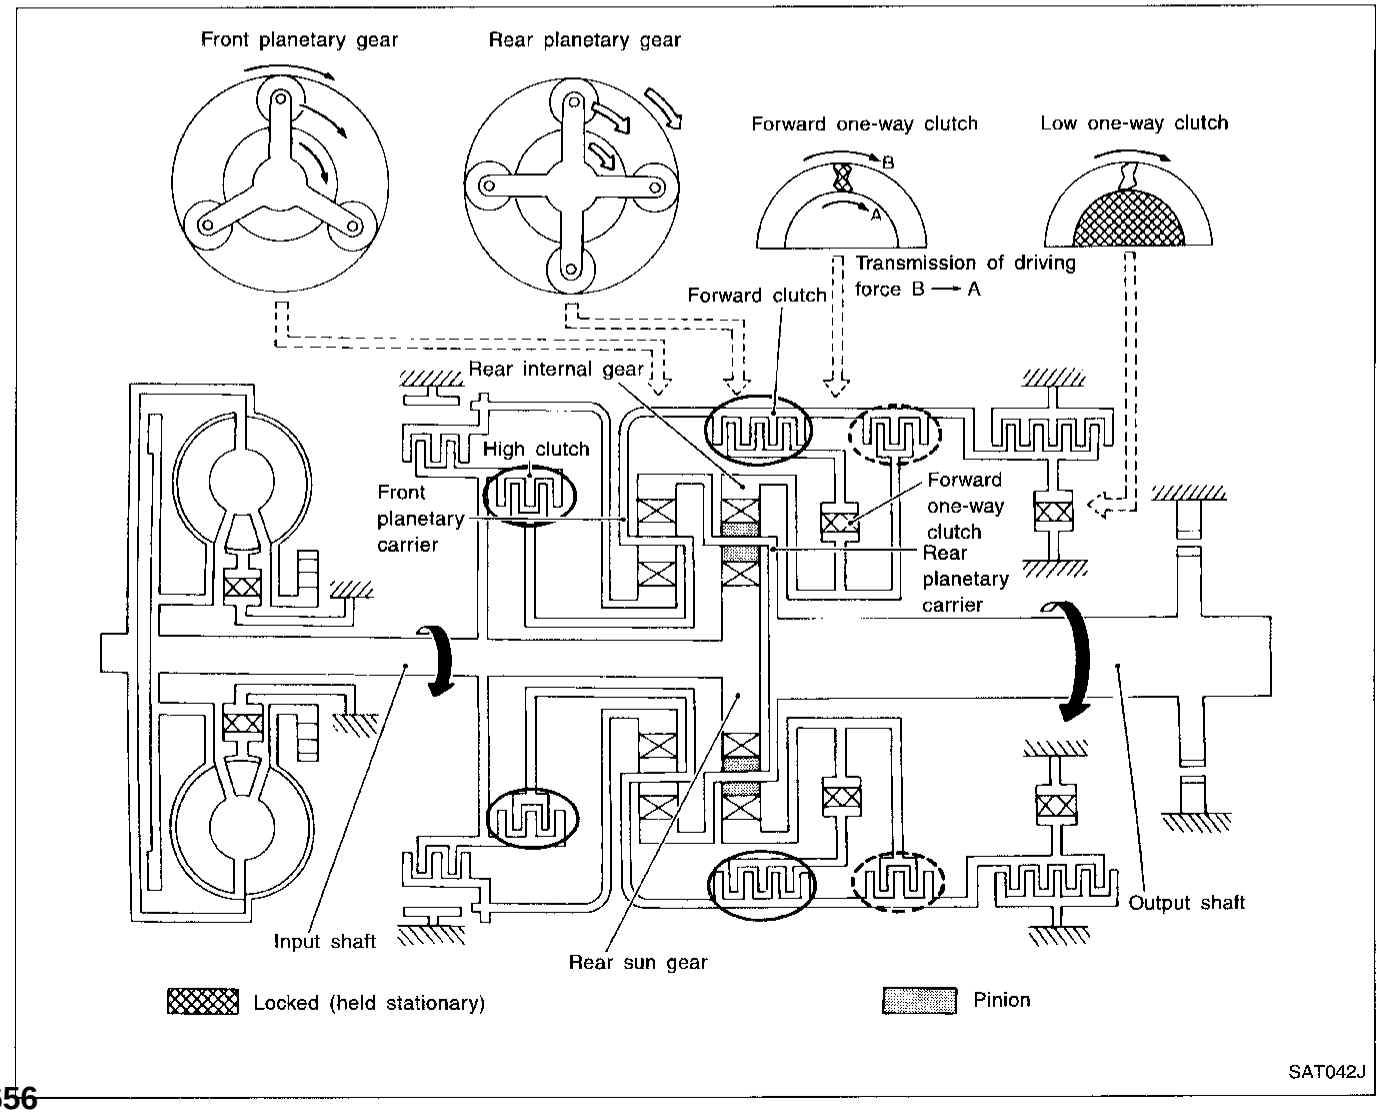


Shift Mechanism (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

"D_2", "2_2" and "1_2" positions

• **Forward clutch** • **Forward one-way clutch** • **Brake band**	Rear sun gear drives rear planetary carrier and combined front internal gear. Front internal gear now rotates around front sun gear accompanying front planetary carrier. As front planetary carrier transfers the power to rear internal gear through forward clutch and forward one-way clutch, this rotation of rear internal gear increases the speed of rear planetary carrier compared with that of the 1st speed.
Overrun clutch engagement conditions	D_2: Overdrive control switch "OFF" and throttle opening is less than 3/16 2_2: Throttle opening less than 3/16 1_2: Always engaged
Power flow	Input shaft → Rear sun gear Front internal gear → (Rear planetary carrier, Front internal gear) → Output Front planetary carrier Rear internal gear



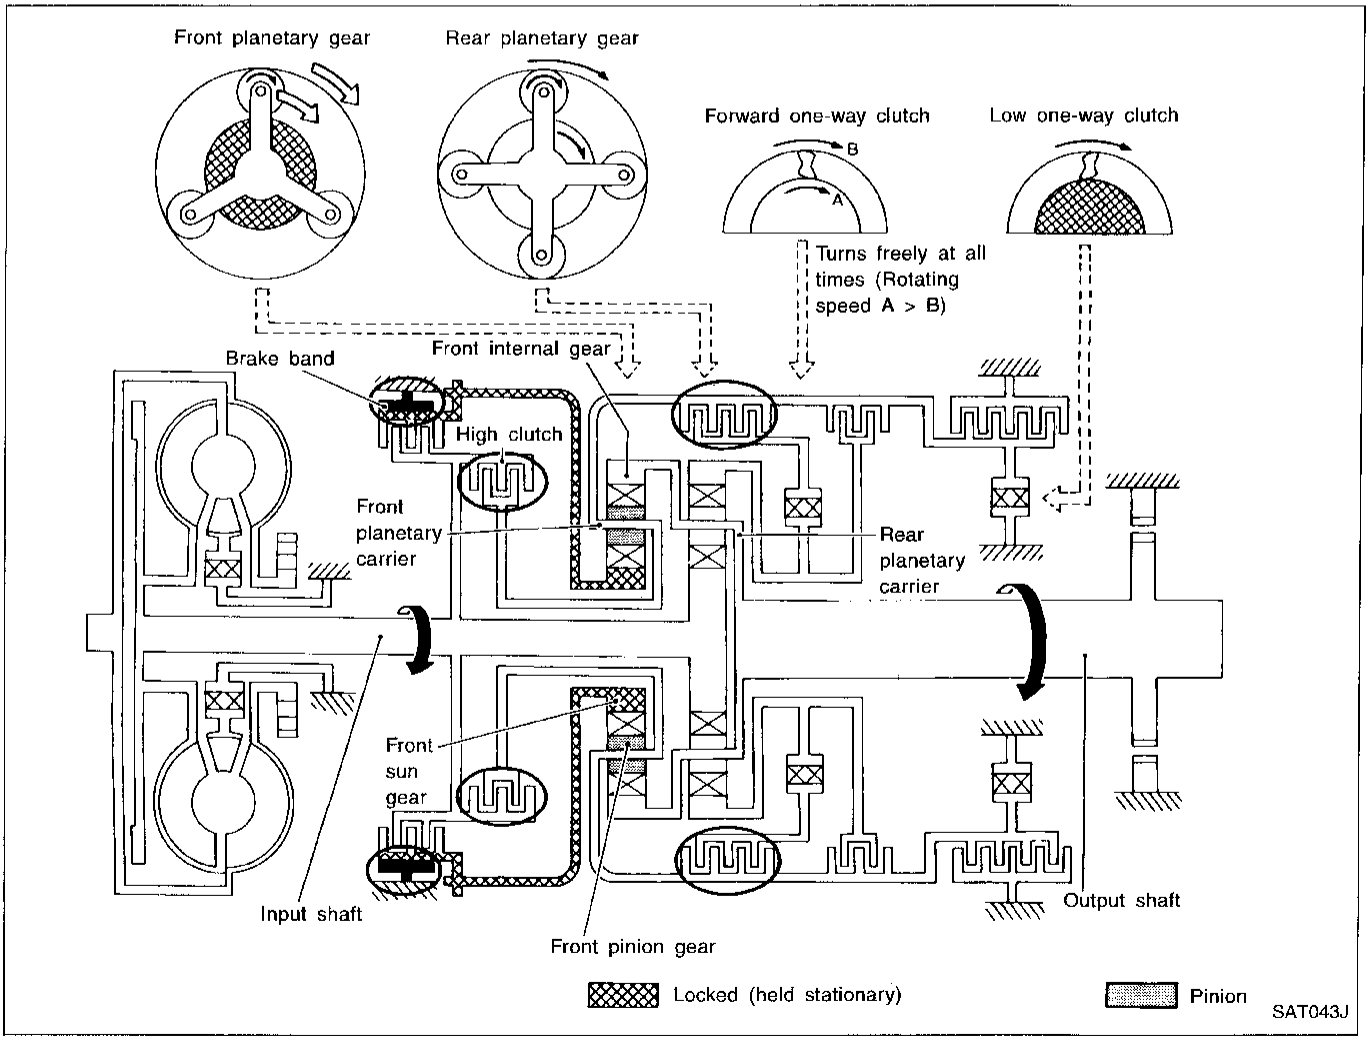
SAT041J

Shift Mechanism (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

"D_3" position

● **High clutch** ● **Forward clutch** ● **Forward one-way clutch**	Input power is transmitted to front planetary carrier through high clutch. And front planetary carrier is connected to rear internal gear by operation of forward clutch and forward one-way clutch. This rear internal gear rotation and another input (the rear sun gear) accompany rear planetary carrier to turn at the same speed.
Overrun clutch engagement conditions	D_3: Overdrive control switch "OFF" and throttle opening is less than 3/16 Throttle opening less than 3/16
Power flow	Input shaft → High clutch → Front planetary carrier → Forward clutch → Forward one-way clutch → Rear internal gear → Rear planetary carrier → Output Shaft Input shaft → Rear sun gear → Rear planetary carrier → Output Shaft

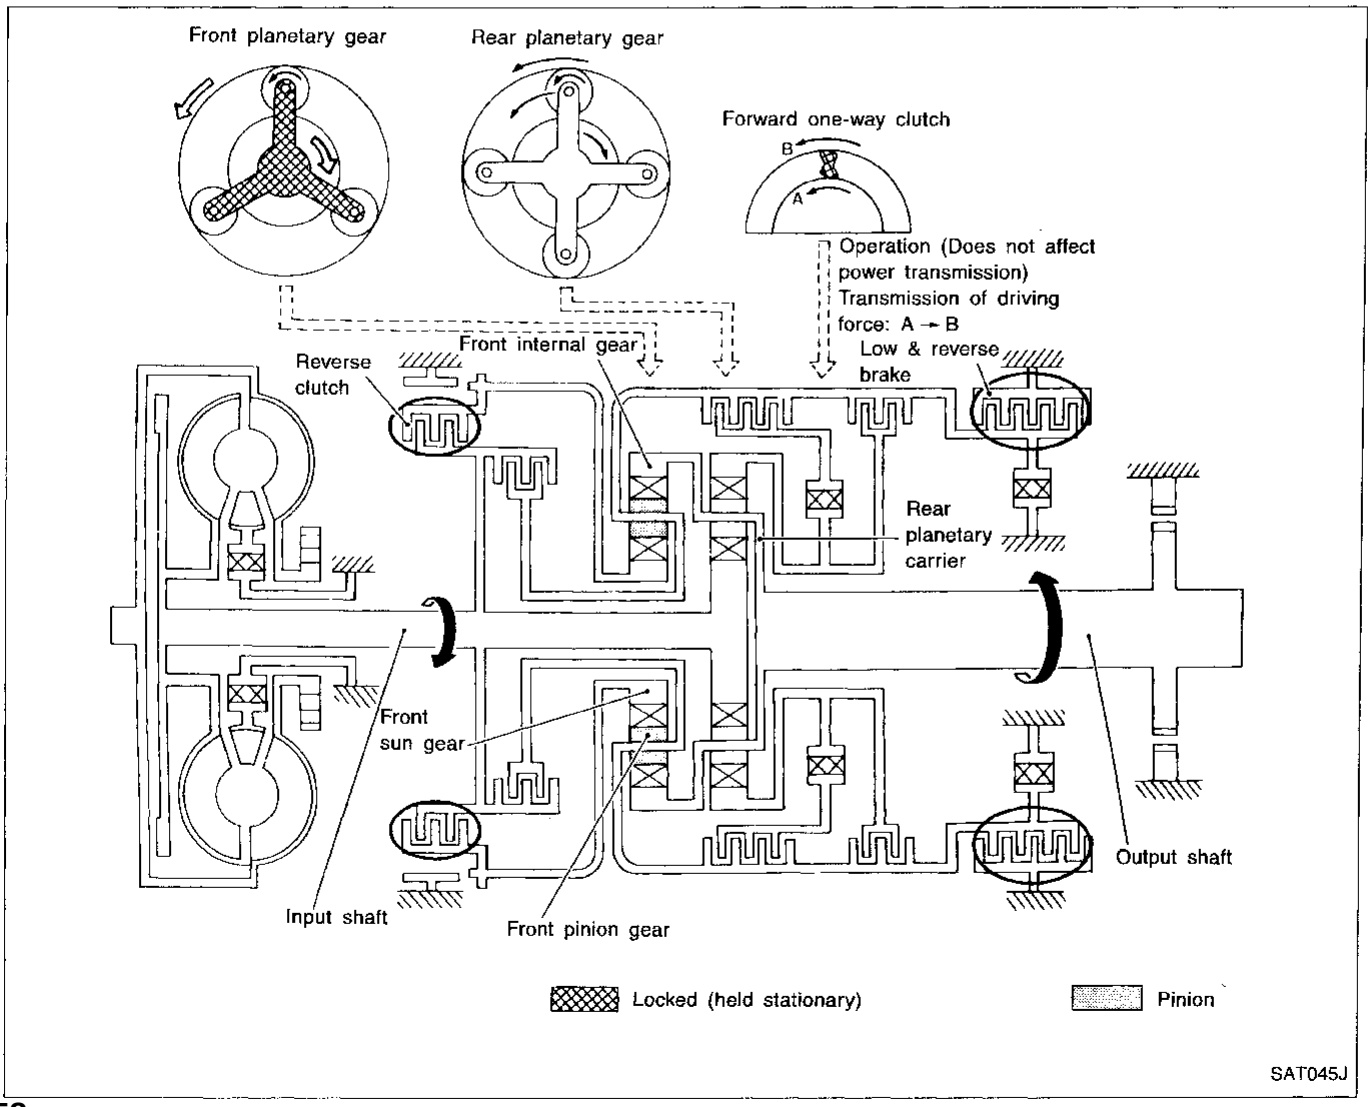


Shift Mechanism (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

"D_4" (OD) position

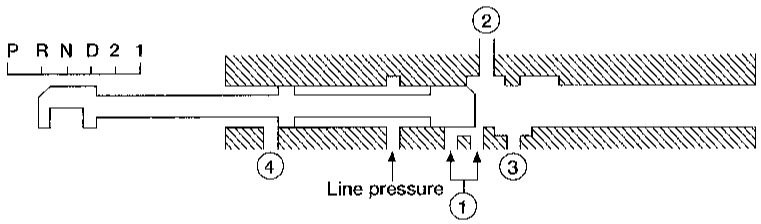
● **High clutch** ● **Brake band** ● **Forward clutch** (Does not affect power transmission)	Input power is transmitted to front carrier through high clutch. This front carrier turns around the sun gear which is fixed by brake band and makes front internal gear (output) turn faster.
Engine brake	At D_4 position, there is no one-way clutch in the power transmission line and engine brake can be obtained when decelerating.
Power flow	Input shaft ↓ High clutch ↓ Front planetary carrier ↓ Front pinion gear ↓ Front internal gear ↓ Rear planetary carrier ↓ Output shaft



Shift Mechanism (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

"R" position

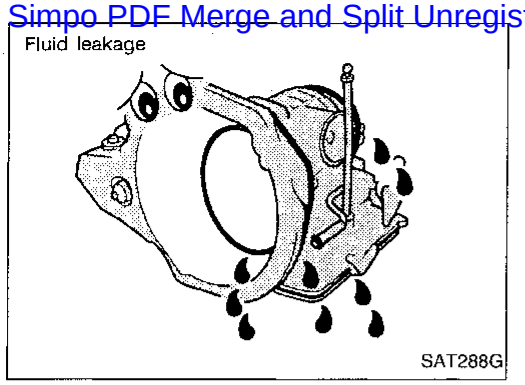


● **Reverse clutch** ● **Low and reverse brake**	Front planetary carrier is stationary because of the operation of low and reverse brake. Input power is transmitted to front sun gear through reverse clutch, which drives front internal gear in the opposite direction.
Engine brake	As there is no one-way clutch in the power transmission line, engine brake can be obtained when decelerating.
Power flow	Input shaft ↓ Reverse clutch ↓ Front sun gear ↓ Front pinion gear ↓ Front internal gear ↓ Output shaft

Shift Mechanism (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

FUNCTION OF CONTROL VALVES

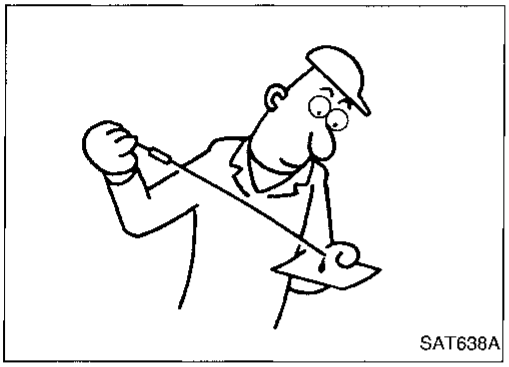


Valve Name	Function
Pressure regulator valve	Optimally controls oil under pressure discharged from oil pump in response to driving conditions.
Throttle valve	Regulates line pressure to throttle pressure corresponding with throttle opening.
Detent valve	Activates throttle valve via spring in response to changes in throttle opening, thereby regulating throttle pressure.
Pressure modifier valve	Serves as an auxiliary signal valve of pressure regulator valve to control line pressure in response to driving conditions.
Accumulator control valve	Regulates accumulator pressure to pressure corresponding with driving conditions.
Manual valve	Directs line pressure to each oil circuit selected by the selector lever position. Position / Circuit ① ② ③ ④ P R ○ N D ○ 2 ○ ○ 1 ○ ○ ○  Hydraulic pressure drains when the shift lever is in N and P.
● 1-2 shift valve ● 2-3 shift valve ● 3-4 shift valve	Provides automatic shift control in response to driving conditions, such as vehicle speed, throttle opening, etc. Shift control is accomplished by activating or deactivating the clutch, brakes, brake bands, etc.
2-3 throttle modifier valve	Controls line pressure to provide optimum shifting point (2nd → 3rd) during partial-open throttle. (2-3 throttle modulator pressure)
3-2 downshift valve	Delivers throttle pressure in a direction that overcomes 2-3 shift valve's governor pressure while shifting from "3rd" to "2nd" in the "D" position.
Kickdown modifier valve	Controls line pressure to provide optimum shifting points (1st → 2nd) and (2nd → 3rd) during kickdowns. (Kickdown modifier pressure)
4-2 relay valve	Operates in conjunction with the 4-2 sequence valve to prevent downshifting from 4th to 3rd, then to 2nd while directly shifting from 4th to 2nd.
4-2 sequence valve	Prevents 4th band servo "apply" pressure from draining during direct shifting from 4th to 2nd before high clutch "apply" pressure and band servo "release" pressure in the same oil circuit are drained.

Shift Mechanism (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Valve name	Function
3-2 timing valve	Engine speed increases in a short period of time at low engine speeds when accelerator is depressed during downshifts from D_3 to D_2. However, it takes longer for the engine to increase speed at high engine speeds. The 3-2 timing valve serves to delay the band servo "release" draining speed (At this point, the transmission is tentatively set in Neutral) during downshifts from D_3 to D_2 at speeds greater than those in the specifications, thereby providing smooth shifting.
1st reducing valve	Controls low & reverse brake "apply" pressure to relief shocks caused by engine brakes while shifting from 2nd to 1st in the 1 position.
Overrun clutch reducing valve	Controls pressure that operates the overrun clutch to relief shocks caused during engine braking. Line pressure acts on the overrun clutch reducing valve in the 1st or 2nd position to increase the pressure-regulating point with resultant high engine braking capabilities.
4th speed cut valve	Determines lock-up speed while operating in 4th gear.
● Torque converter clutch control valve ● Torque converter cluch solenoid valve	Activates or deactivates lock-up system.
Torque converter relief valve	Prevents abnormal increase of converter oil pressure.

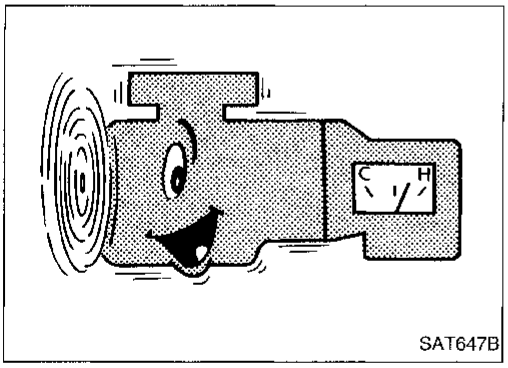


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

A/T Fluid Check

FLUID LEAKAGE CHECK

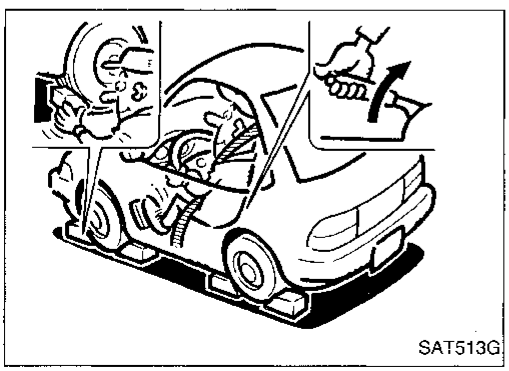
1. Clean area suspected of leaking, — for example, mating surface of converter housing and transmission case.
2. Start engine, apply foot brake, place selector lever in "D" position and wait a few minutes.
3. Stop engine.
4. Check for fresh leakage.



FLUID CONDITION CHECK

Fluid color	Suspected problem
Dark or black with burned odor	Wear of frictional material
Milky pink	Water contamination — Road water entering through filler tube or breather
Varnished fluid, light to dark brown and tacky	Oxidation — Over or under filling — Overheating

FLUID LEVEL CHECK

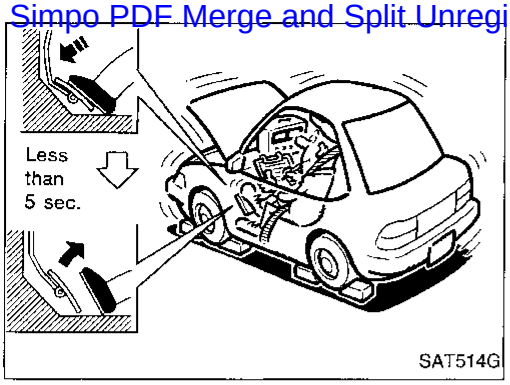


Refer to MA section ("Checking A/T Fluid", "CHASSIS AND BODY MAINTENANCE").

Stall Test

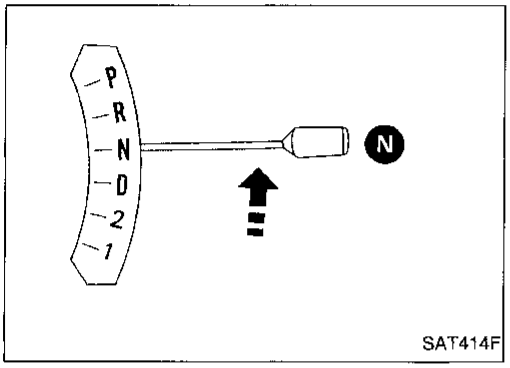
STALL TEST PROCEDURE

1. Check A/T and engine fluid levels. If necessary, add fluid.
2. Drive vehicle for approx. 10 minutes or until engine oil and ATF reach operating temperature.
   ATF operating temperature:
   50 - 80°C (122 - 176°F)



3. Set parking brake and block wheels.
4. Install a tachometer where it can be seen by driver during test.

- **It is good practice to put a mark on point of specified engine speed on indicator.**



Stall Test (Cont'd)

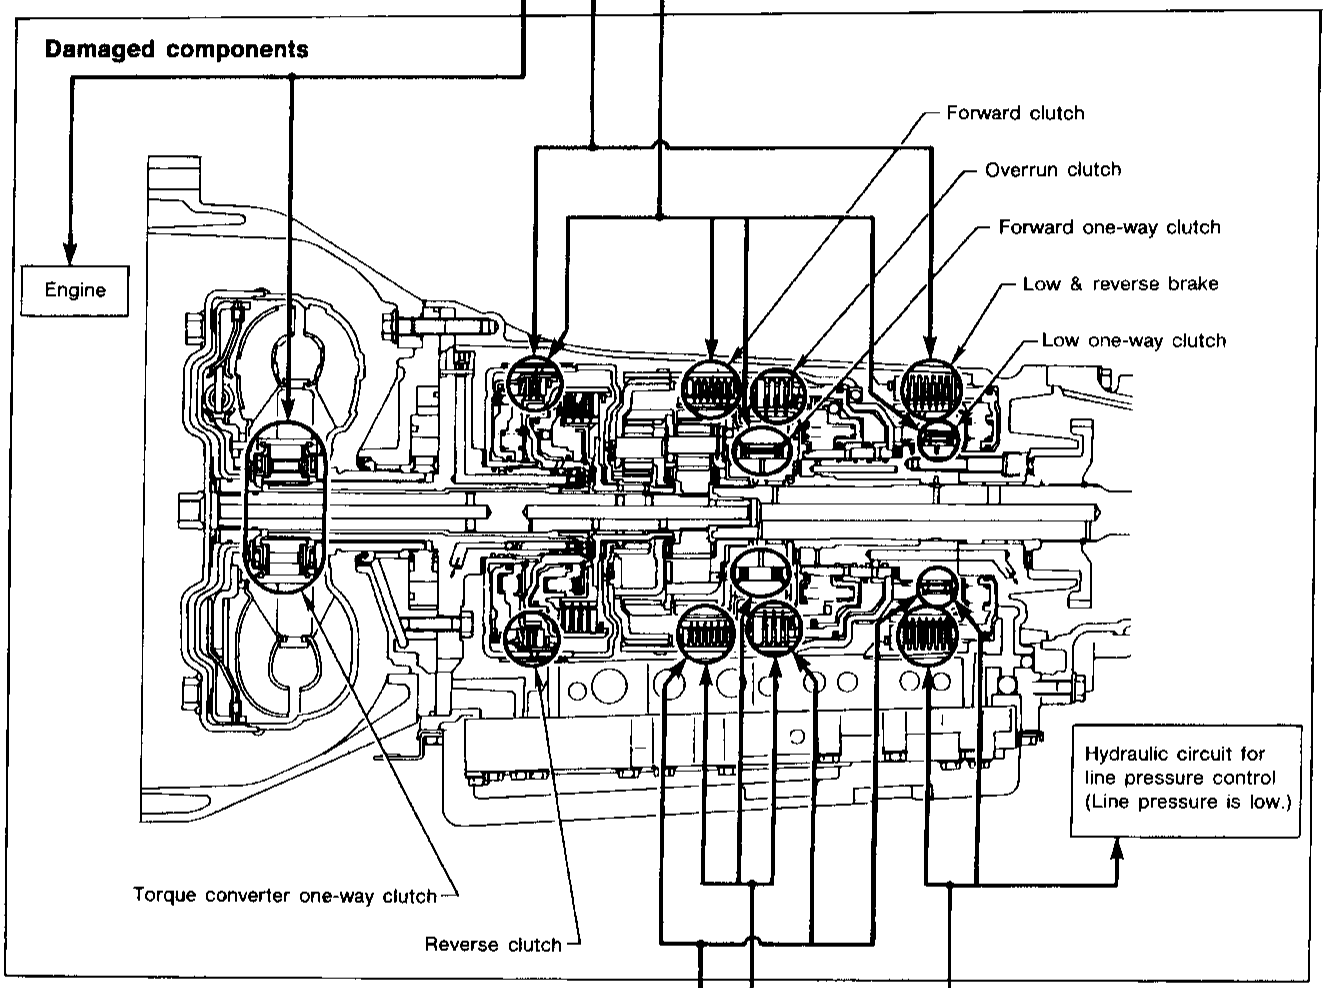
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SAT514G

5. Start engine, apply foot brake, and place selector lever in "D" position.
6. Accelerate to wide open throttle gradually while applying foot brake.
   - **During test, never hold throttle wide-open for more than 5 seconds.**
7. Quickly note the engine stall revolution and immediately release throttle.
   Stall revolution standard:
   2,100 - 2,300 rpm

SAT414F

8. Shift selector lever to "N" position.
9. Cool off ATF.
   - **Run engine at idle for at least one minute.**
10. Repeat steps 5 through 9 with selector lever in "2", "1" and "R" positions.



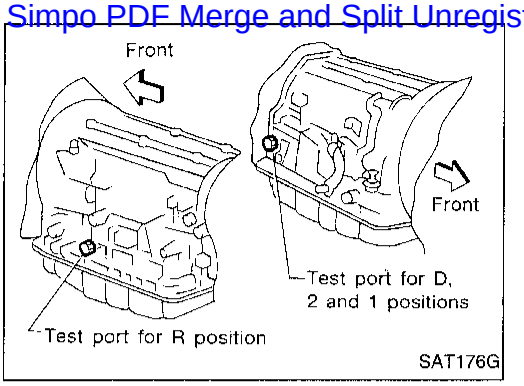
Stall Test (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

JUDGEMENT OF STALL TEST

Selector lever position	Judgement		
D	L	O	H
2	L	O	H
1	L	O	O
R	L	H	H

O : Stall revolution is normal.
H : Stall revolution is higher than specified.
L : Stall revolution is lower than specified.

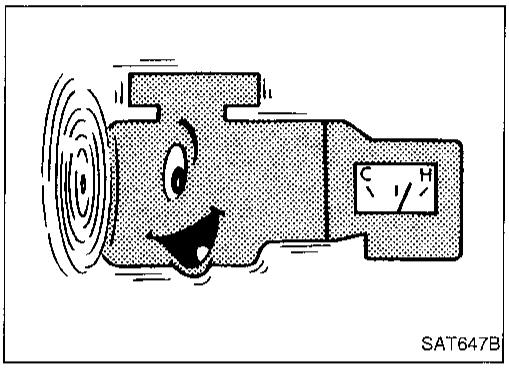


Clutches and brakes except high clutch and brake band are OK. (Condition of high clutch and brake band can not be confirmed by stall test.)

D	H	H	H	O
2	H	H	H	O
1	O	H	H	O
R	O	O	H	O
Selector lever position	Judgement			

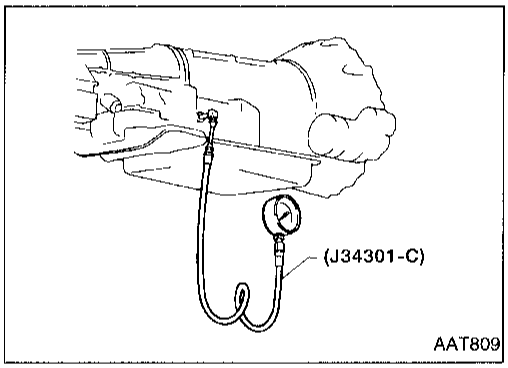
SAT161GA

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



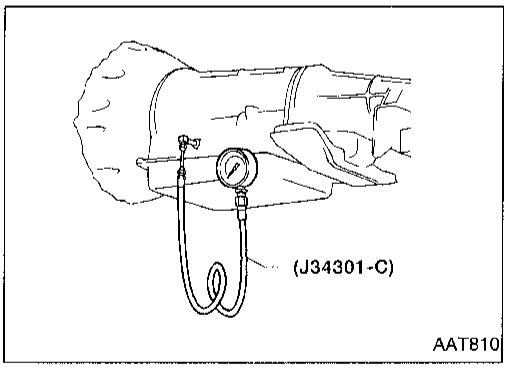
Line Pressure Test

PRESSURE TEST PORTS



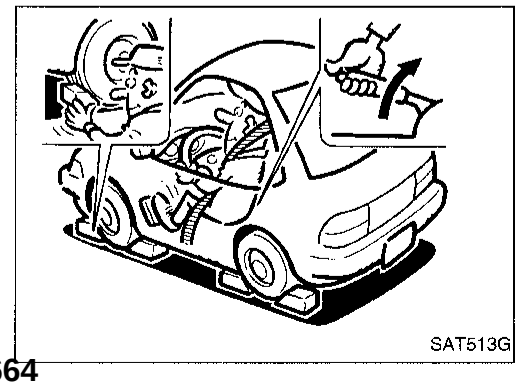
Location of line pressure test ports are shown in illustration.

- **Line pressure plugs are hexagon-headed bolts.**
- **Always replace line pressure plugs as they are self-sealing bolts.**



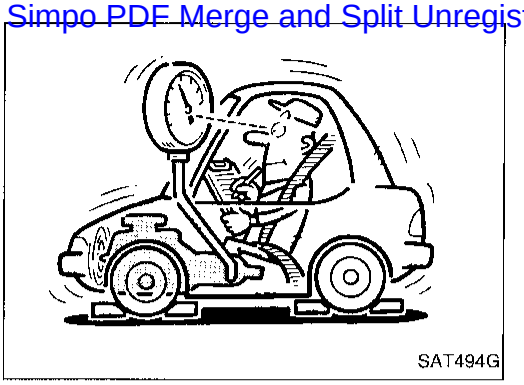
LINE PRESSURE TEST PROCEDURE

1. Check A/T and engine fluid levels. If necessary, add more fluids.
2. Drive vehicle for approx. 10 minutes or until engine oil and ATF reach operating temperature.
   ATF operating temperature:
   50 - 80°C (122 - 176°F)



3. Install pressure gauge to line pressure port.

— D, 2 and 1 positions —



— R position —

4. Set parking brake and block wheels.
- **Continue to depress brake pedal fully while performing line pressure test at stall speed.**

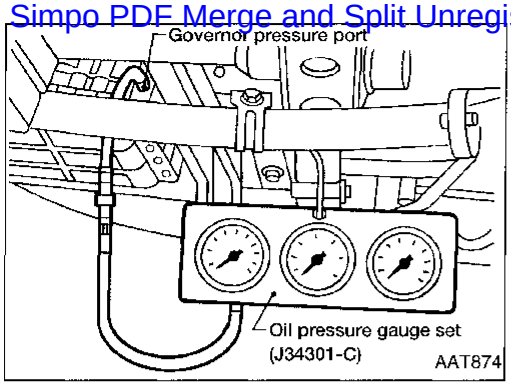
Line Pressure Test (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SAT494G

5. Start engine and measure line pressure at idle and stall speed.
- **When measuring line pressure at stall speed, follow the stall test procedure.**

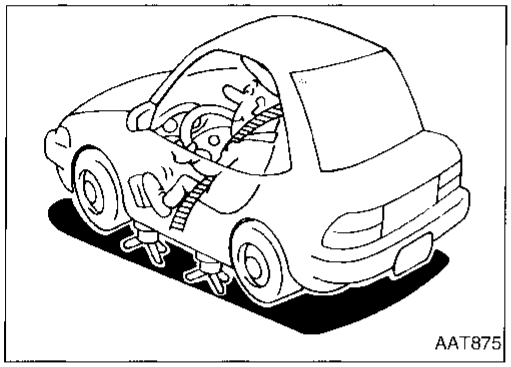
Line pressure:



Engine speed rpm	Line pressure kPa (kg/cm^2, psi)		
	D position (Overdrive control switch ON and OFF)	2 and 1 positions	R position
Idle	471 - 510 (4.8 - 5.2, 68 - 74)	422 - 461 (4.3 - 4.7, 61 - 67)	736 - 775 (7.5 - 7.9, 107 - 112)
Stall	912 - 991 (9.3 - 10.1, 132 - 144)	883 - 961 (9.0 - 9.8, 128 - 139)	1,442 - 1,520 (14.7 - 15.5, 209 - 220)

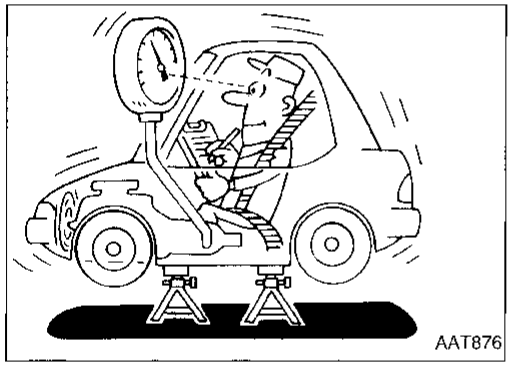
JUDGEMENT OF LINE PRESSURE TEST

Judgement		Suspected parts
At idle	Line pressure is low in all positions.	● Oil pump wear ● Control piston damage ● Pressure regulator valve or plug sticking ● Spring for pressure regulator valve damaged ● Fluid pressure leakage between oil strainer and pressure regulator valve ● Clogged strainer
	Line pressure is low in particular position.	● Fluid pressure leakage between manual valve and particular clutch. ● For example, line pressure is: — Low in "R" and "1" positions, but — Normal in "D" and "2" positions. Therefore, fluid leakage exists at or around low & reverse brake circuit. Refer to CLUTCH AND BAND CHART, AT-13.
	Line pressure is high.	● Maladjustment of throttle position sensor ● Fluid temperature sensor damaged ● Line pressure solenoid valve sticking ● Short circuit of line pressure solenoid valve circuit ● Pressure modifier valve sticking ● Pressure regulator valve or plug sticking
At stall speed	Line pressure is low.	● Maladjustment of throttle position sensor ● Control piston damaged ● Line pressure solenoid valve sticking ● Short circuit of line pressure solenoid valve circuit ● Pressure regulator valve or plug sticking ● Pressure modifier valve sticking ● Pilot valve sticking



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Line Pressure Test (Cont'd)



Governor pressure testing

1. Check A/T and engine fluid levels. If necessary, add fluid.
2. Drive vehicle for approx. 10 minutes or until engine oil and ATF reach operating temperature.
   ATF operating temperature:
   50 - 80°C (122 - 176°F)
3. Install pressure gauge to governor pressure port.

4. Jack up front and rear wheels.
5. Set selector lever in "D" position and gradually depress accelerator pedal.

- **Be careful of rotating wheels.**

Governor pressure:

- **Governor pressure is not generated when vehicle is stopped.**
- **Governor pressure rises gradually in response to vehicle speed.**

Vehicle speed	Governor pressure kPa (kg/cm^2 psi)
0 km/h (0 MPH)	0 (0, 0)
29 km/h (18 MPH)	102.4 - 141.6 (1.22 - 1.26, 17 - 18)
57 km/h (35 MPH)	233.5 - 284.5 (2.40 - 2.90, 34 - 41)
86 km/h (53 MPH)	350.6 - 409.4 (3.58 - 4.18, 51 - 60)

If not, check governor valve assembly. Refer to AT-81.

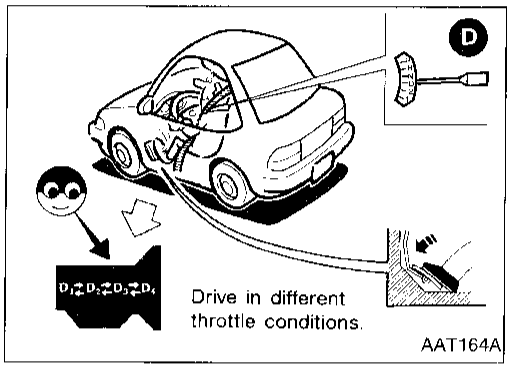
Road Test

Perform road tests using "Symptom Chart". Refer to AT-30.

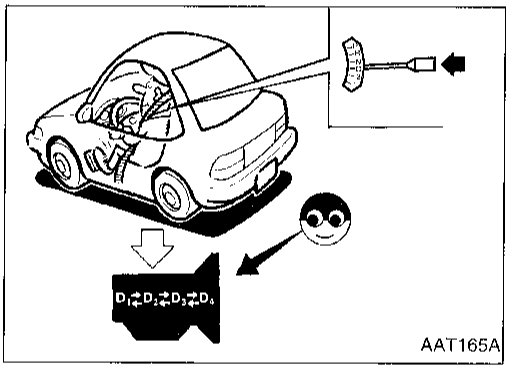
"P" POSITION

1. Place selector lever in "P" position and start the engine. Stop the engine and repeat the procedure in all positions, including "N" position.
2. Stop vehicle on a slight upgrade and place selector lever in "P" position. Release parking brake to make sure vehicle remains locked.

"R" POSITION



1. Manually move selector lever from "P" or "R", and note shift quality.
2. Drive vehicle in reverse long enough to detect slippage or other abnormalities.



Road Test (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

"N" POSITION

1. Manually move selector lever from "R" and "D" to "N" and note shift quality.
2. Release parking brake with selector lever in "N" position. Lightly depress accelerator pedal to make sure vehicle does not move. (When vehicle is new or soon after clutches have been replaced, vehicle may move slightly. This is not a problem.)

"D" POSITION

1. Manually shift selector lever from "N" to "D" position, and note shift quality.
2. Using the shift schedule as a reference, drive vehicle in "D" position. Record, on Symptom Chart, respective vehicle speeds at which up-shifting and down-shifting occur. These speeds are to be read at three different throttle positions (light, half and full), respectively. Also determine the timing at which shocks are encountered during shifting and which clutches are engaged.
3. Determine, whether lock-up properly occurs while driving vehicle in proper gear position and at proper speeds.
4. Check to determine if shifting to overdrive gear cannot be made while overdrive control switch is OFF.
5. Drive vehicle at 65 to 80 km/h (40 to 50 MPH) with half to light throttle position (D_3 position). Fully depress accelerator pedal to make sure transmission downshifts from 3rd to 2nd gear.
6. Drive vehicle at 35 to 45 km/h (22 to 28 MPH) with half to light throttle position (D_2 position). Fully depress accelerator pedal to make sure transmission downshifts from 2nd to 1st gear.

"2" POSITION

1. Shift to "2" position and make sure vehicle starts in 1st gear.
2. Increase vehicle speed to make sure transmission upshifts from 1st to 2nd gear.
3. Further increase vehicle speed. Make sure transmission does not upshift to 3rd gear.
4. Drive vehicle at 35 to 45 km/h (22 to 28 MPH) with throttle at half to light position (2_2 position). Fully depress accelerator pedal to make sure transmission downshifts from 2nd to 1st gear.
5. Drive vehicle at idle in "2" position to make sure that transmission downshifts to 1st gear.
6. Move selector lever to "D" position and drive vehicle at 40 to 50 km/h (25 to 31 MPH). Then, move selector lever to "2" position to make sure transmission downshifts to 2nd gear.

"1" POSITION

1. Place selector lever in "1" position and accelerate. Make sure transmission does not shift from 1st to 2nd gear although vehicle speed increases.
2. While driving vehicle in "1" position, release accelerator pedal to make sure that engine compression acts as a brake.
3. Place selector lever in "D" or "2" position and drive vehicle at 20 to 30 km/h (12 to 19 MPH). Then move selector lever to "1" position to make sure transmission downshifts to 1st gear.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Symptom Chart

Numbers are arranged in order of the inspection.
Perform inspections starting with number one and work up.
Numbers in the OFF VEHICLE columns indicate that the transmission must be removed from the vehicle to perform the inspection.

: Valve suspected to be malfunctioning

		ON VEHICLE																	
		Oil level and oil quality	Control linkage	Inhibitor switch and wiring	Throttle wire	Engine idling speed	Line pressure	Control valve	4th speed cut valve	Pressure regulator valve	Pressure modifier valve	1-2 shift valve	2-3 shift valve	3-4 shift valve	Accumulator control valve	3-2 downshift valve	2-3 throttle modifier valve

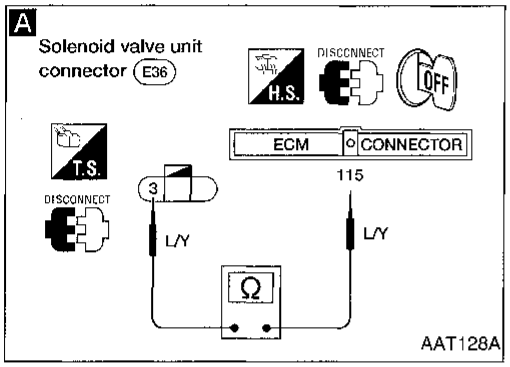
Torque Converter Clutch Solenoid Valve

When the malfunction indicator lamp indicates DTC P1550 (0904), perform "TROUBLE DIAGNOSIS FOR DTC P1550" in EC section.



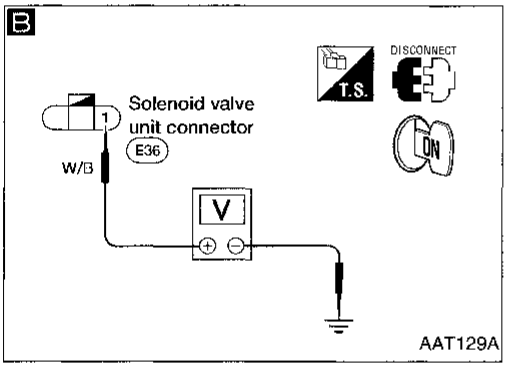
A

CHECK GROUND CIRCUIT.
1. Turn ignition switch OFF.
2. Disconnect ECM harness connector and torque converter clutch solenoid valve harness connector.
3. Check resistance between solenoid valve unit harness terminal (3) and ECM harness terminal (115).

Resistance:
Approximately 0Ω

NG → Repair or replace harness between ECM and torque converter clutch solenoid valve.

OK ↓



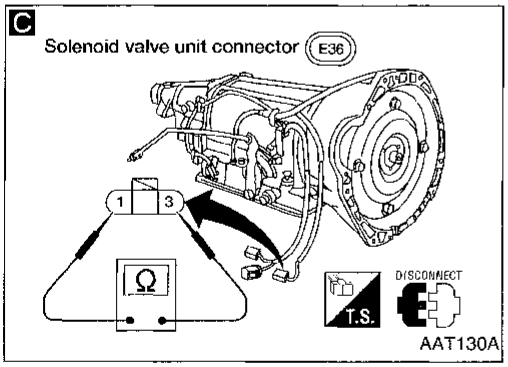
B

CHECK POWER SOURCE CIRCUIT.
1. Turn ignition switch ON.
2. Check voltage between solenoid valve unit harness terminal (1) and ground.

Voltage:
Battery voltage

NG → Check the following items:
- Ignition switch and fuse Refer to EL section ("POWER SUPPLY ROUTING").
- Harness continuity between fuse and torque converter clutch solenoid valve.

OK ↓



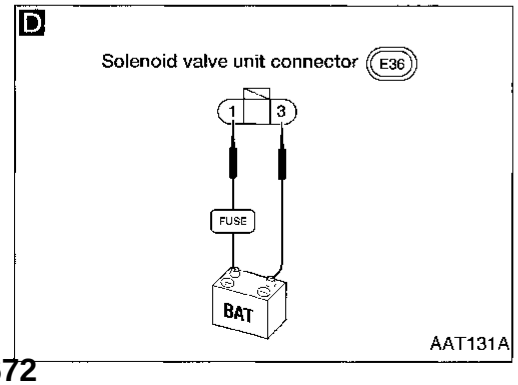
C

CHECK TORQUE CONVERTER CLUTCH SOLENOID VALVE (RESISTANCE).
Check resistance between torque converter clutch solenoid valve terminals (1) and (3).

Resistance:
Approximately 25Ω

NG → Replace torque converter clutch solenoid valve.

OK ↓

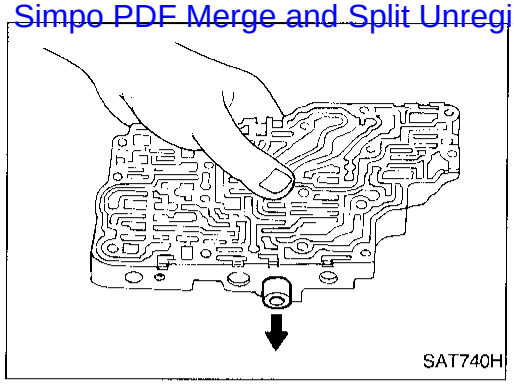


D

CHECK TORQUE CONVERTER CLUTCH SOLENOID VALVE (OPERATION).
1. Remove torque converter clutch solenoid valve. Refer to AT-45.
2. Check torque converter clutch solenoid valve operation.

NG → Replace torque converter clutch solenoid valve.

OK ↓



Ⓐ

(Go to next page.)

Torque Converter Clutch Solenoid Valve (Cont'd)

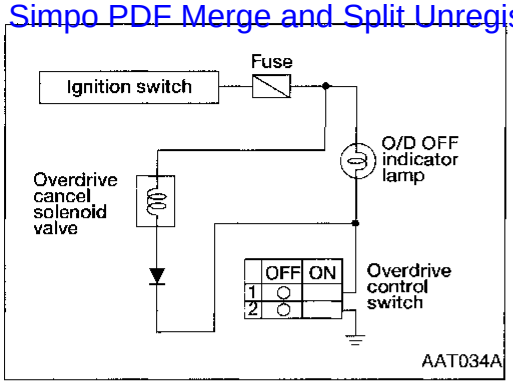
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

(A)

CHECK CONTROL VALVE.
1. Disassemble control valve assembly. Refer to AT-70.
2. Check torque converter clutch control valve.
- Valve, and sleeve slide along valve bore under their own weight.
- Valve, and sleeve are free from burrs, dents and scratches.
- Control valve springs are free from damage, deformation and fatigue.
- Hydraulic line is free from obstacles.

NG → Repair control valve.

OK ↓

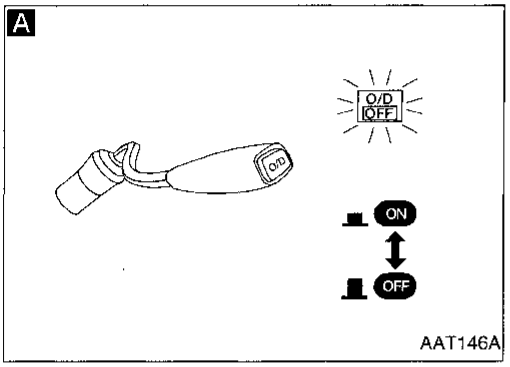


Is malfunction eliminated?

No → Check control valve again. Repair or replace control valve assembly.

Yes ↓

INSPECTION END



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Component Inspection

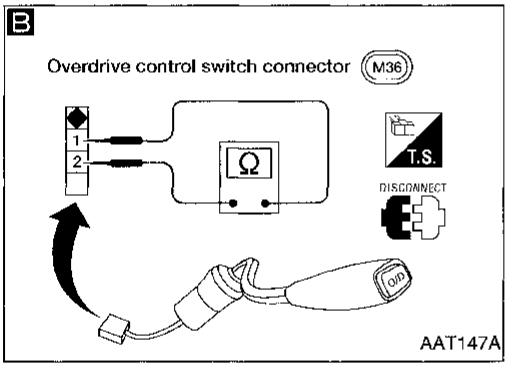
OVERDRIVE CONTROL SWITCH AND OVERDRIVE CANCEL SOLENOID VALVE

A

CHECK O/D OFF INDICATOR LAMP CIRCUIT.

1. Turn ignition switch ON. (Do not start engine.)
2. Set overdrive control switch OFF. **O/D OFF indicator lamp should come on.**

OK → Go to C.



NG

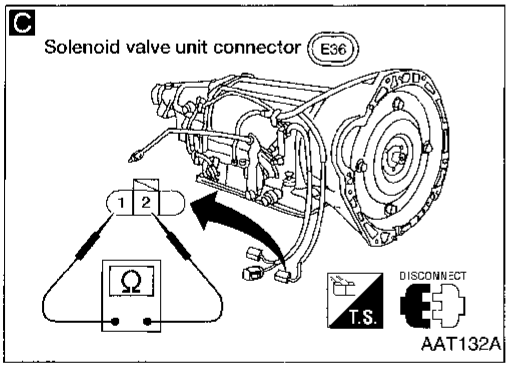
Check the following items:

- O/D OFF indicator lamp
  Refer to EL section ("METER AND GAUGES").
- Ignition switch and fuse
  Refer to EL section ("POWER SUPPLY ROUTING").

OK

B

CHECK OVERDRIVE CONTROL SWITCH.



Check continuity between overdrive control switch terminals ① and ②.

Overdrive control switch position	Continuity
ON	No
OFF	Yes

NG → Replace overdrive control switch.

OK

C

CHECK OVERDRIVE CANCEL SOLENOID VALVE.

Check resistance between overdrive cancel solenoid valve terminals ① and ②.

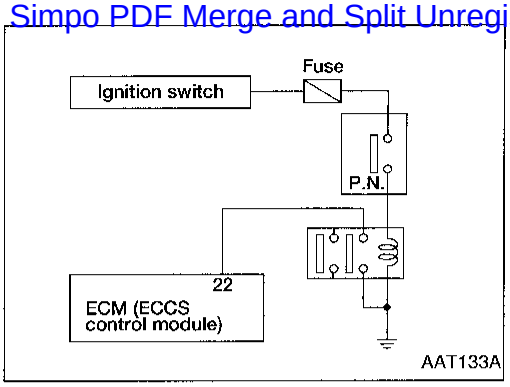
Resistance:
Approximately 25Ω

NG → Replace overdrive cancel solenoid valve.

OK

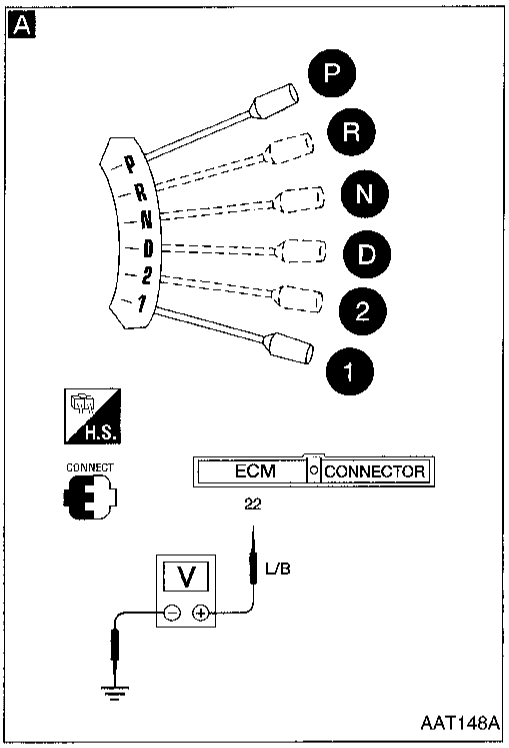
Check the following items:

- Harness continuity between fuse and overdrive cancel solenoid valve
- Harness continuity between overdrive cancel solenoid valve and overdrive control switch
- Condition of diode



OK

INSPECTION END



Component Inspection (Cont'd)

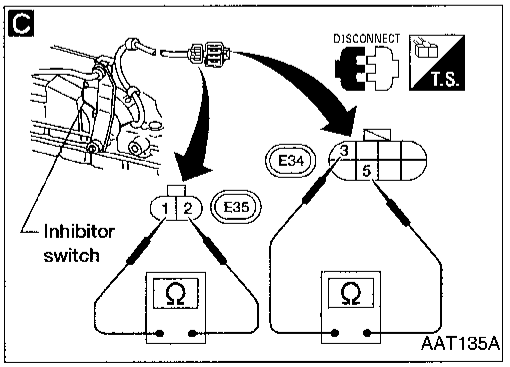
INHIBITOR SWITCH



AAT133A

AAT148A

AAT134A

AAT135A

A

CHECK INHIBITOR SWITCH CIRCUIT.
1. Turn ignition switch ON. (Do not start engine.)
2. Check voltage between ECM terminal (22) and ground while moving selector lever through each position.
   "P", "N" position: 0V
   "R", "D", "2", "1" position: Approx. 5V

OK → INSPECTION END.

NG ↓

B

CHECK POWER SUPPLY FOR INHIBITOR SWITCH.
1. Disconnect inhibitor switch harness connector.
2. Turn ignition switch ON. (Do not start engine.)

Do approx. 12 volts exist between inhibitor switch harness terminal (1) and body ground?

No → Check 10A fuse (No. 11, located in the fuse block), harness and connector. Refer to EL section ("Wiring Diagram", "POWER SUPPLY ROUTING").

Yes ↓

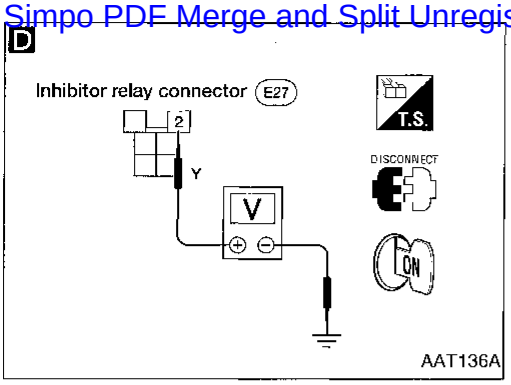
C

CHECK INHIBITOR SWITCH.
- Check continuity in "N", "P" and "R" positions.
- With manual lever held in each position, turn manual shaft 1.5° in both directions. (When manual lever is in each position, continuity normally exists within 1.5° range.) If continuity does not exist equally in either direction, properly adjust inhibitor switch. Refer to AT-47.

NG → Replace inhibitor switch.

Position	Terminal No.			
	①	②	③	⑤
Park/neutral position	○	○		
R			○	○

OK ↓



Reconnect inhibitor switch harness connector.

Ⓐ
(Go to next page.)

Component Inspection (Cont'd)

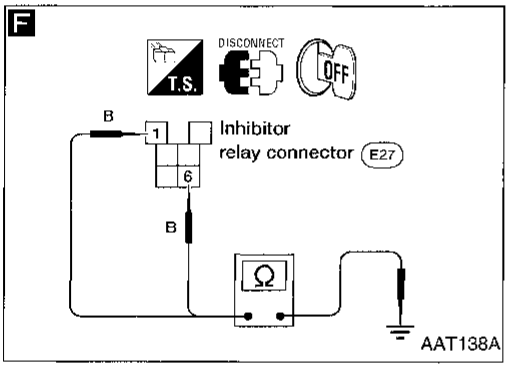
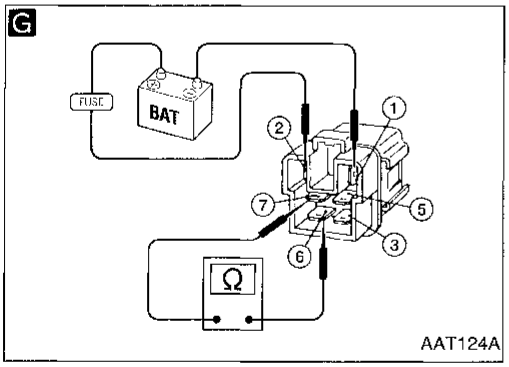
D



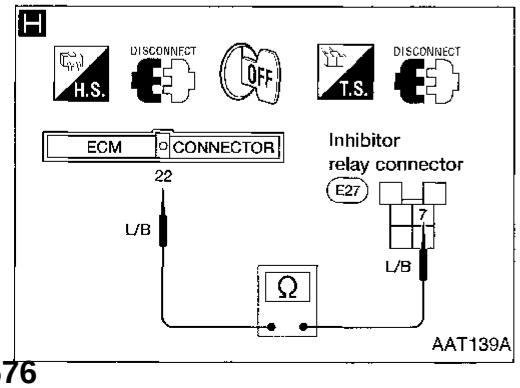
AAT136A

E



AAT137A

F



AAT138A

G

AAT124A

H

AAT139A

Ⓐ

D **CHECK POWER SUPPLY FOR INHIBITOR RELAY.**

1. Turn ignition switch ON.
2. Disconnect inhibitor relay harness connector.
3. Put selector lever in "P" or "N" position.

Do approx. 12 volts exist between inhibitor relay harness terminal ② and body ground?

No → **E**

1. Turn ignition switch OFF.
2. Disconnect inhibitor switch harness connector. Check circuit continuity between inhibitor switch harness terminal ② and inhibitor relay harness terminal ②.

Continuity should exist.

If OK, check harness for short.

Yes ↓

F **CHECK BODY GROUND CIRCUIT FOR INHIBITOR RELAY.**

1. Turn ignition switch OFF.
2. Does continuity exist between inhibitor relay terminals ①, ⑥ and body ground?

Continuity should exist.

NG → Repair harness or connector.

OK ↓

G **CHECK INHIBITOR RELAY.**

Check continuity between terminals ⑥ and ⑦.

Condition	Continuity
12V direct current supply between terminals ① and ②	Yes
No current supply	No

NG → Replace inhibitor relay.

OK ↓

H

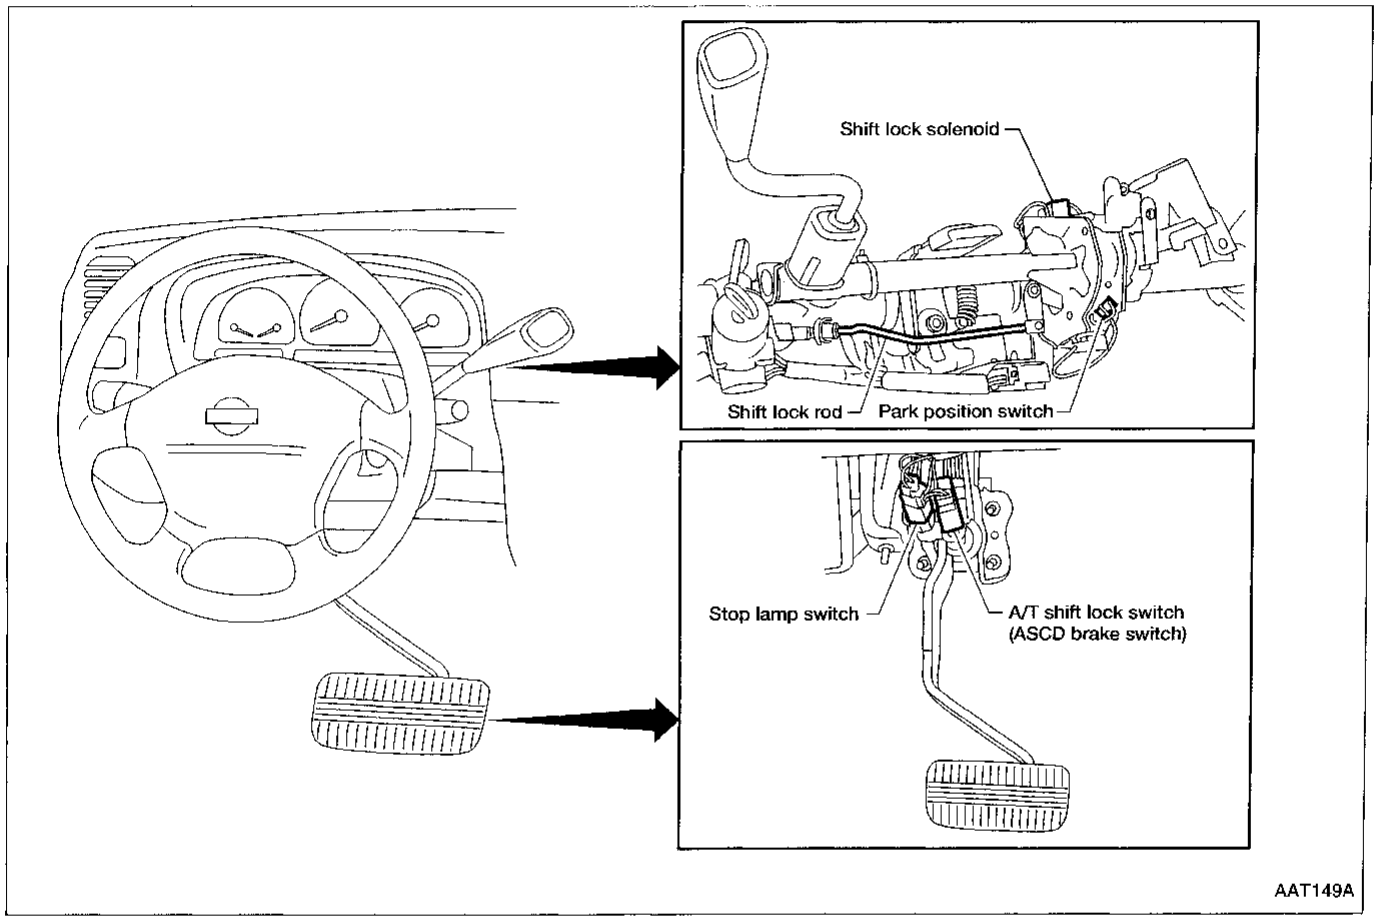
1. Turn ignition switch OFF.
2. Check circuit continuity between ECM harness terminal ㉒ and inhibitor relay harness terminal ⑦.

Continuity should exist.

If OK, check harness for short.

NG → Repair harness or connector.

OK ↓



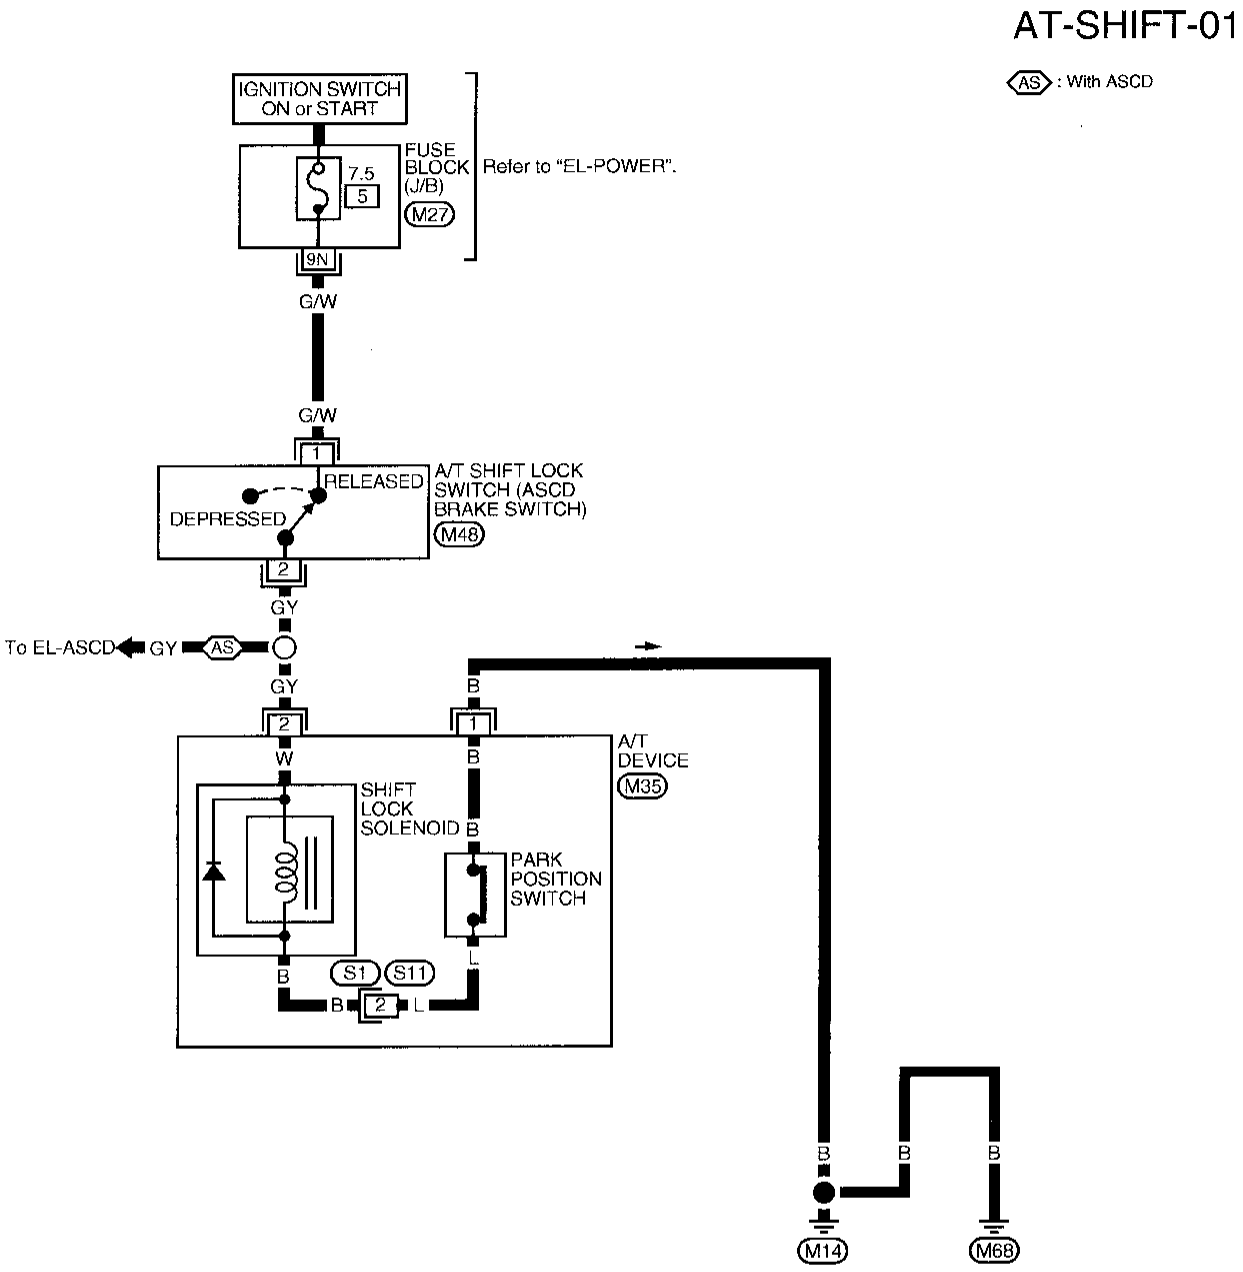
Replace ECM.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

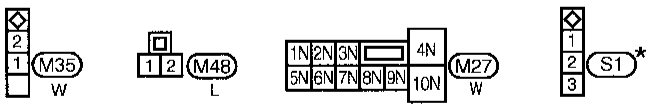
Description

- The mechanical key interlock mechanism also operates as a shift lock:
  With the key switch turned to ON, the selector lever cannot be shifted from "P" (park) to any other position unless the brake pedal is depressed.
  With the key removed, the selector lever cannot be shifted from "P" to any other position.
  The key cannot be removed unless the selector lever is placed in "P".
- The shift lock and key interlock mechanisms are controlled by the ON-OFF operation of the shift lock solenoid and by the operation of the rotator and slider located inside the key cylinder, respectively.

Shift Lock System Electrical Parts Location



Removal — Shift Lock Solenoid



1. Remove lower instrument cover LH and knee protector.
2. Remove steering column covers.
3. Disconnect A/T device connector.
4. Remove two screws and two nuts attaching steering column.
5. Disconnect shift lock rod.
6. Remove shift control cable.
7. Remove two bolts attaching shift control tube and remove shift control tube.
8. Remove two screws from shift lock solenoid and two screws from park position switch.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Wiring Diagram

AT-SHIFT-01

* : This connector is not shown in "HARNESS LAYOUT" of EL section.

AAT069A

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostic Procedure

SYMPTOM 1:

- **Selector lever cannot be moved from "P" position with key in ON position and brake pedal applied.**
- **Selector lever can be moved from "P" position with key in ON position and brake pedal released.**
- **Selector lever can be moved from "P" position when key is removed from key cylinder.**

SYMPTOM 2:

- **Ignition key cannot be removed when selector lever is set to "P" position.**
- **Ignition key can be removed when selector lever is set to any position except "P".**

Check selector lever position indicator and selector lever for damage.

NG → Check selector lever. Refer to "ON-VEHICLE SERVICE — Inhibitor Switch and Control Cable Adjustment", AT-47.

OK ↓

A

CHECK POWER SOURCE.

1. Turn ignition switch ON. (Do not start engine.)
2. Check voltage between A/T shift lock switch (ASCD brake switch) harness connector terminal ① and ground.

Voltage: Battery voltage

NG → Check the following items:

- 7.5A fuse (No. 5, located in the fuse block)
- Harness for short or open between fuse and A/T shift lock switch (ASCD brake switch) harness connector terminal ①
- Ignition switch (Refer to EL section.)

OK ↓

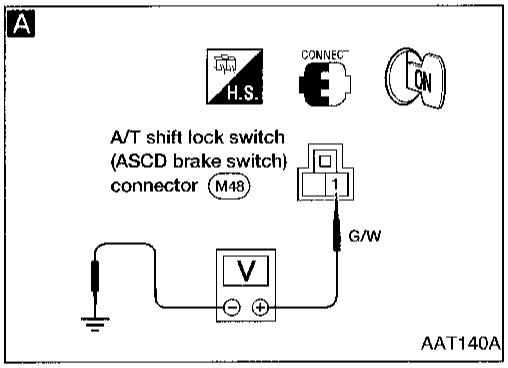
B

CHECK INPUT SIGNAL

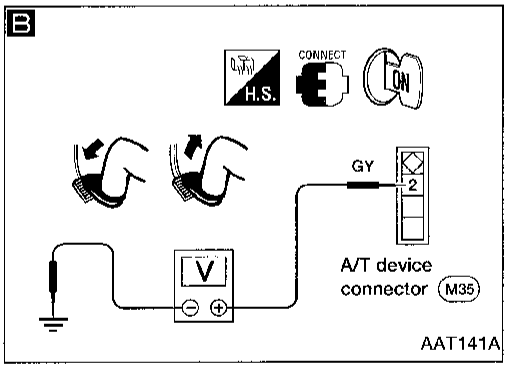
[A/T SHIFT LOCK SWITCH (ASCD brake switch)].

1. Turn ignition switch ON. (Do not start engine.)
2. Check voltage between A/T device harness connector terminal ② and ground.

Brake pedal	Voltage
Depressed	0V
Released	Battery voltage



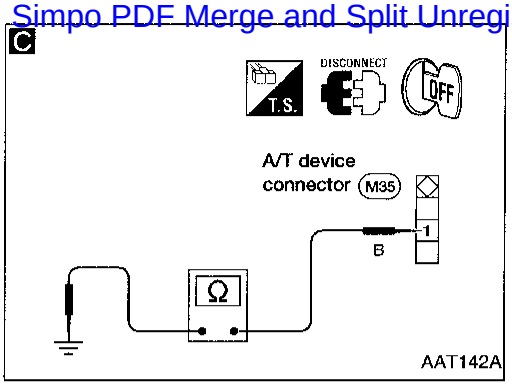
NG → Check the following items:



- Harness for short or open between A/T device harness connector terminal ② and A/T shift lock switch (ASCD brake switch) harness connector terminal ②
- A/T shift lock switch (ASCD brake switch) (Refer to "Component Check", AT-44.)

OK ↓

Ⓐ



(Go to next page.)

Diagnostic Procedure (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Ⓐ

C

CHECK GROUND CIRCUIT.
1. Turn ignition switch OFF.
2. Disconnect A/T device harness connector.
3. Check continuity between A/T device harness connector terminal ① and ground.
   Continuity should exist.
   If OK, check harness for short to ground and short to power.

NG → Repair harness or connector.

OK ↓

CHECK PARK POSITION SWITCH.
(Refer to "Component Check", AT-44.)

NG → Replace park position switch.

OK ↓

CHECK SHIFT LOCK SOLENOID.
(Refer to "Component Check", AT-44.)

NG → Replace shift lock solenoid.

OK ↓

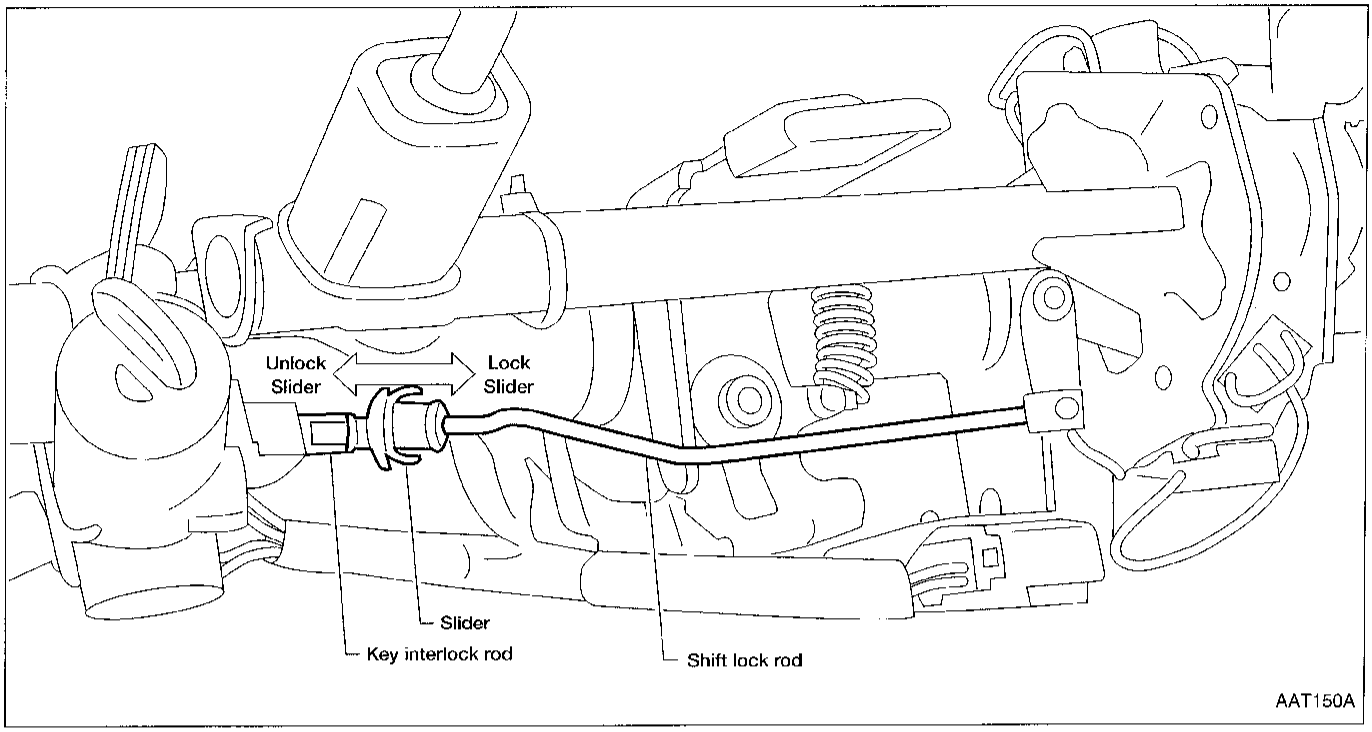
Reconnect A/T device harness connector.

↓

Turn ignition switch from OFF to ON position. (Do not start engine.)

↓

Recheck shift lock operation.

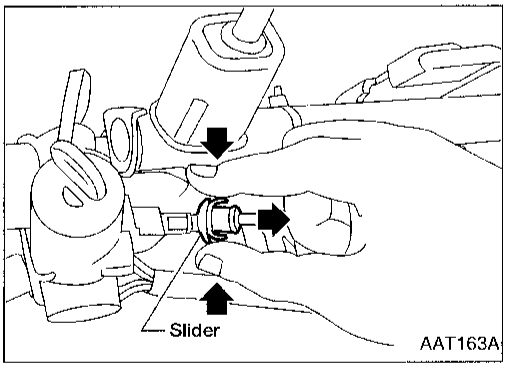


NG → 1. Perform A/T device input/output signal inspection test.
2. If NG, recheck harness connector connection.

OK ↓

INSPECTION END

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

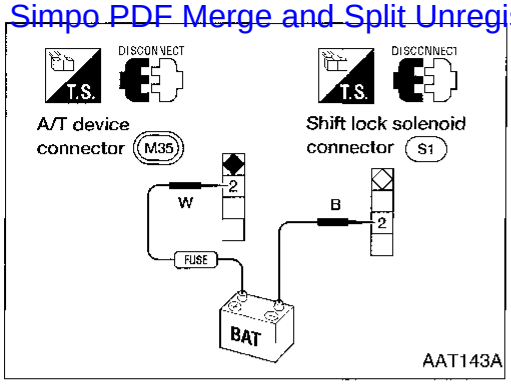


Shift Lock Rod

REMOVAL

1. Turn ignition key to ACC position.
2. Unlock slider by squeezing lock tabs.
3. Remove shift lock rod from key interlock rod.

- For removal of key interlock rod, refer to ST section ("Disassembly and Assembly", "STEERING WHEEL AND STEERING COLUMN".)

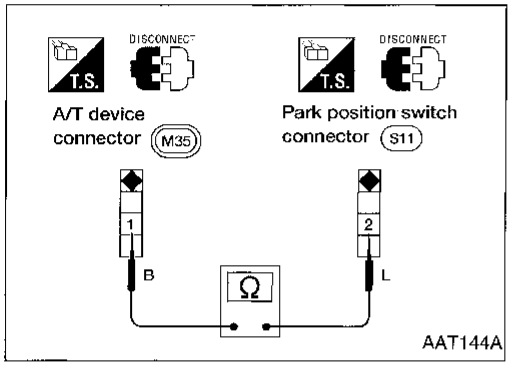


INSTALLATION AND ADJUSTMENT

1. Place selector lever in Park "P" position.
2. Turn ignition key to ACC position.
3. Insert shift lock rod into slider.
4. Grab key interlock rod and push toward shift lock rod to adjust.

Do not hold shift lock rod.

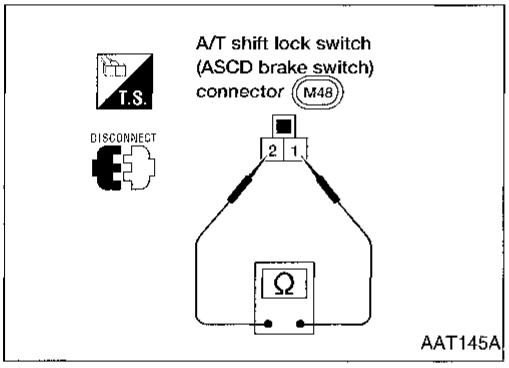
5. Lock slider into position.
6. Test shift lock operation.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Component Check

SHIFT LOCK SOLENOID

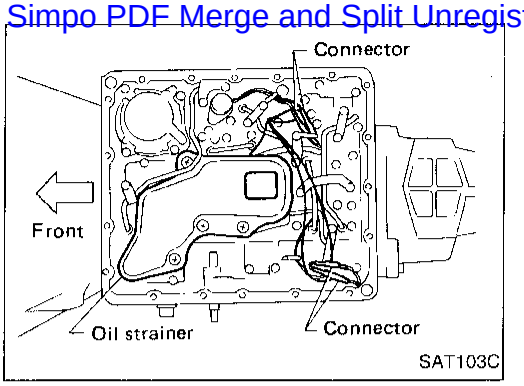


- Check operation by applying battery voltage to A/T device harness terminal ② and shift lock solenoid harness terminal ②.

PARK POSITION SWITCH

- Check continuity between A/T device harness terminal ① and park position switch harness terminal ②

Condition	Continuity
When selector lever is set in "P" position and selector lever button is released	Yes
Except above	No

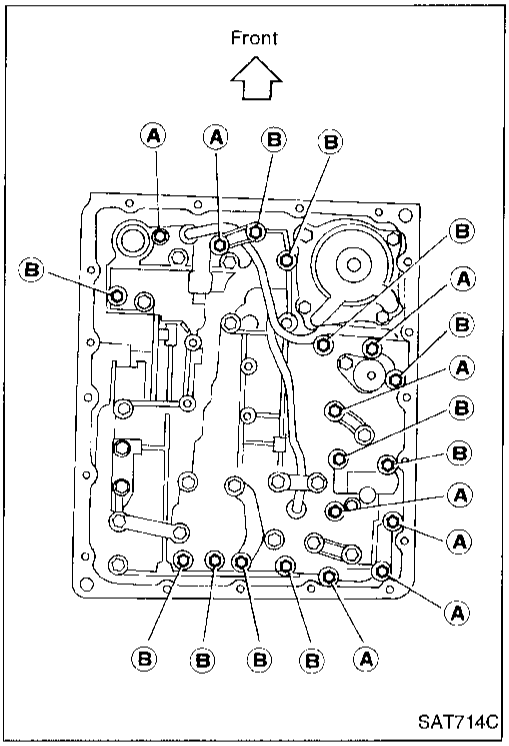


A/T SHIFT LOCK SWITCH (ASCD BRAKE SWITCH)

- Check continuity between terminals ① and ②

Condition	Continuity
When brake pedal is depressed	No
When brake pedal is released	Yes

Check A/T shift lock switch (ASCD brake switch) after adjusting brake pedal. Refer to BR section ("Adjustment", BRAKE PEDAL AND BRACKET").

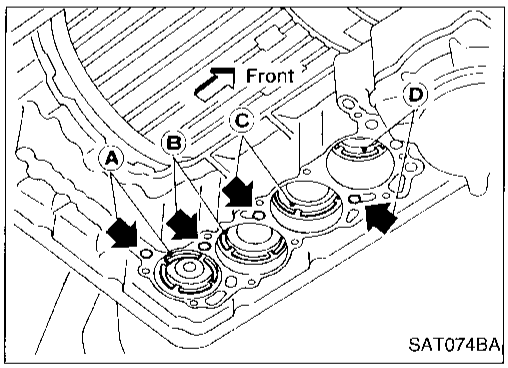


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Control Valve Assembly and Accumulators

Removal

1. Drain ATF from drain plug.
2. Remove oil pan and gasket.
3. Remove oil strainer.
4. Disconnect harness connector.



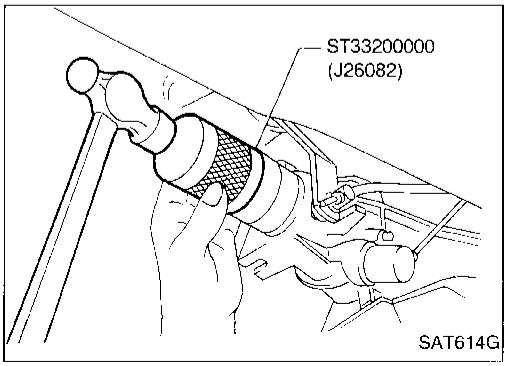
5. Remove control valve assembly by removing fixing bolts.

Bolt length and location

Bolt symbol	ℓ mm (in)
Ⓐ	33 (1.30)
Ⓑ	45 (1.77)

Be careful not to drop manual valve out of valve body.

6. Remove solenoids and valves from valve body if necessary.
7. Remove terminal cord assembly if necessary.

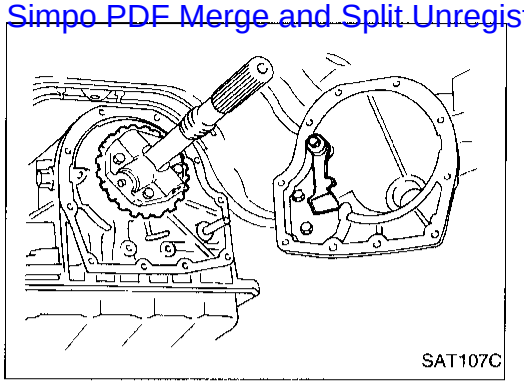


8. Remove accumulators Ⓐ, Ⓑ, Ⓒ and Ⓓ by applying compressed air if necessary.

Hold each piston with a rag.

9. Reinstall any part removed.

- **Always use new sealing parts.**
- **After installing control valve assembly, make sure that selector lever can be moved to all positions.**

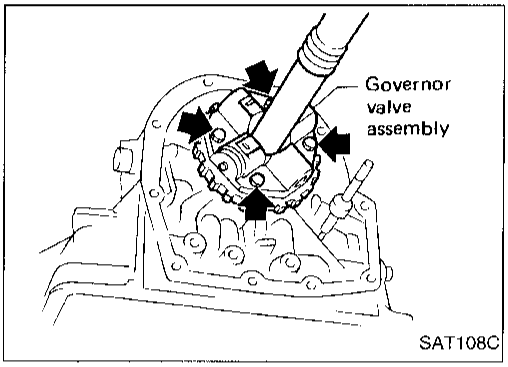


Rear Oil Seal Replacement

1. Remove propeller shaft from vehicle. Refer to PD section ("Removal and Installation", "PROPELLER SHAFT").
2. Remove rear oil seal.
3. Install rear oil seal.

- **Apply ATF before installing.**

4. Reinstall any part removed.

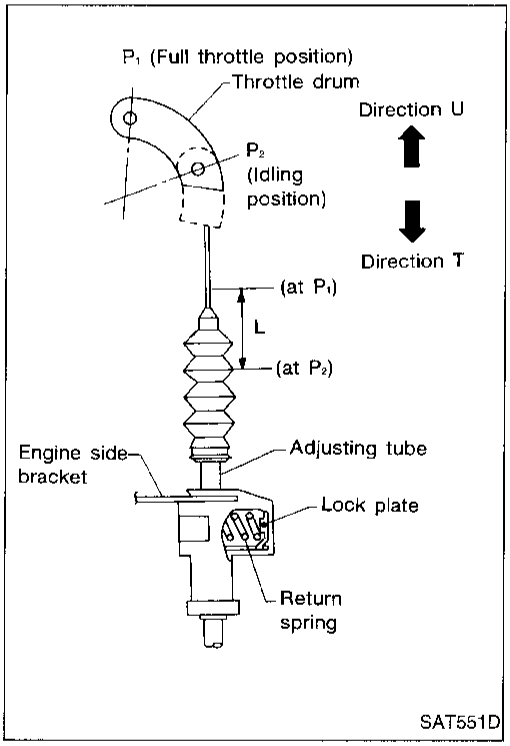


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SAT107C

Parking Components Inspection

1. Remove propeller shaft from vehicle. Refer to PD section ("Removal and Installation", "PROPELLER SHAFT").
2. Support A/T assembly with a jack.
3. Remove rear engine mounting member.
4. Remove rear extension from transmission case.
5. Replace parking components if necessary.
6. Reinstall any part removed.

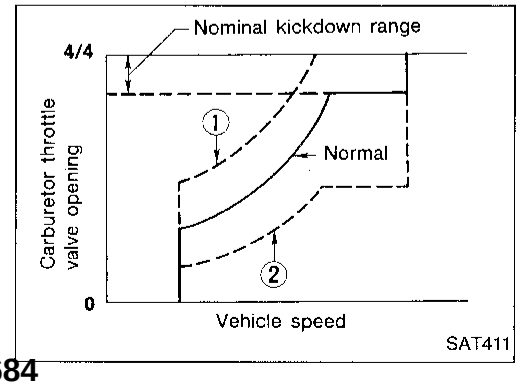


- **Always use new sealing parts.**

SAT108C

Governor Valve

1. Remove propeller shaft from vehicle. Refer to PD section ("Removal and Installation", "PROPELLER SHAFT").
2. Support A/T assembly with a jack.
3. Remove rear engine mounting member from A/T assembly.
4. Remove rear extension from transmission case.
5. Remove governor valve assembly.
6. Inspect and repair governor valve assembly. Refer to REPAIR FOR COMPONENT PARTS, AT-81.



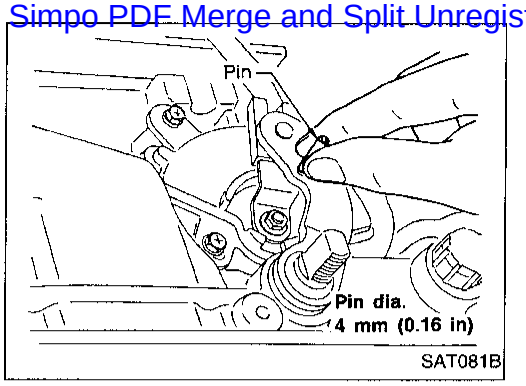
SAT551D

Throttle Wire Adjustment

1. Turn ignition switch OFF.
2. While pressing lock plate, move adjusting tube in Direction T.
3. Release lock plate. (Adjusting tube is locked at this time.)
4. Move throttle drum from P_2 (Idling position) to P_1 (Full throttle position) quickly and release.
5. Ensure that throttle wire stroke "L" is within the specified range, between full throttle and idle.

   Throttle wire stroke "L":
   39 - 43 mm (1.54 - 1.69 in)

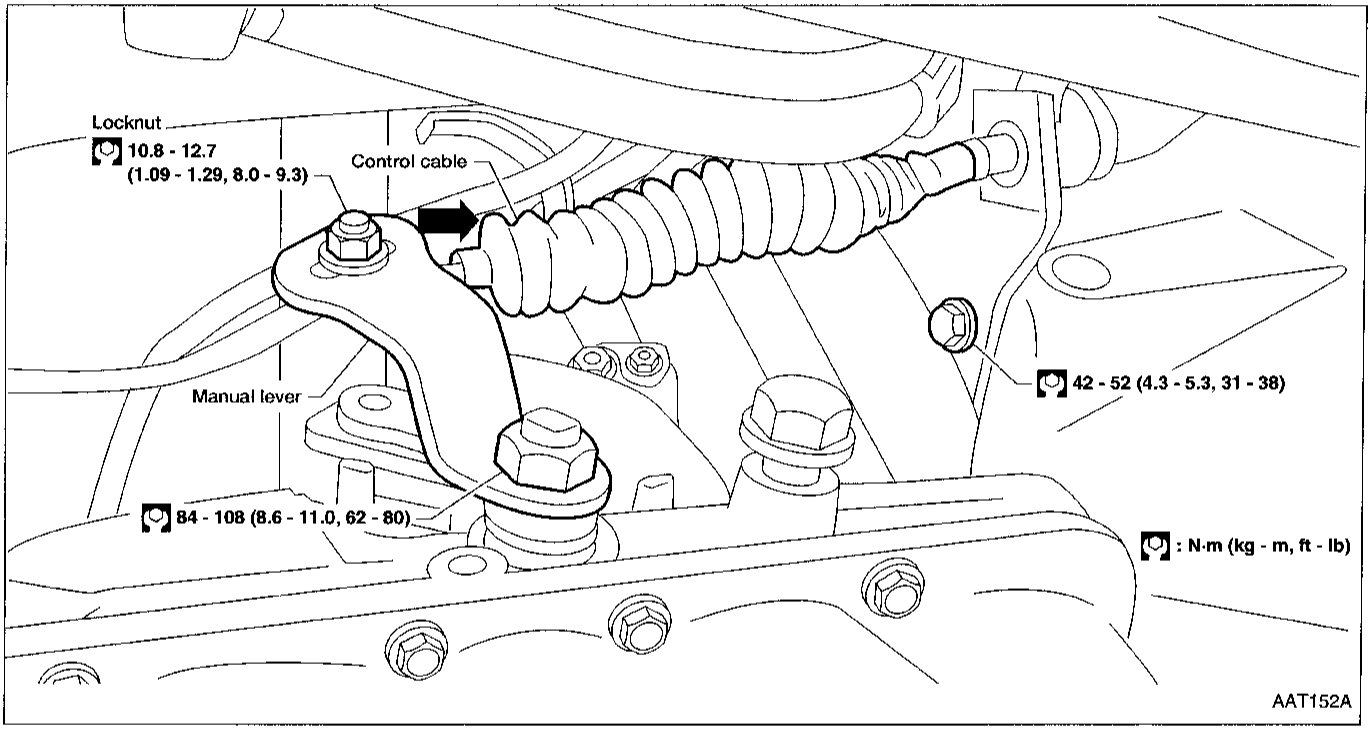
- **Adjust throttle wire stroke after accelerator wire is installed and adjusted.**
- **When connecting throttle wire to throttle drum, do not use tools. Manually hook wire.**
- **Put mark on throttle wire for measuring wire stroke.**



SAT411

If throttle wire stroke is improperly adjusted, the following problems may arise.

- When the throttle drum fully-open position "P_1" is too far toward Direction T, the shift schedule will be as shown by ② in the figure, and the kickdown range will greatly increase.
- When the throttle drum fully-open position "P_1" is too far toward Direction U, the shift schedule will be as shown by ① in the figure, and kickdown will not occur.

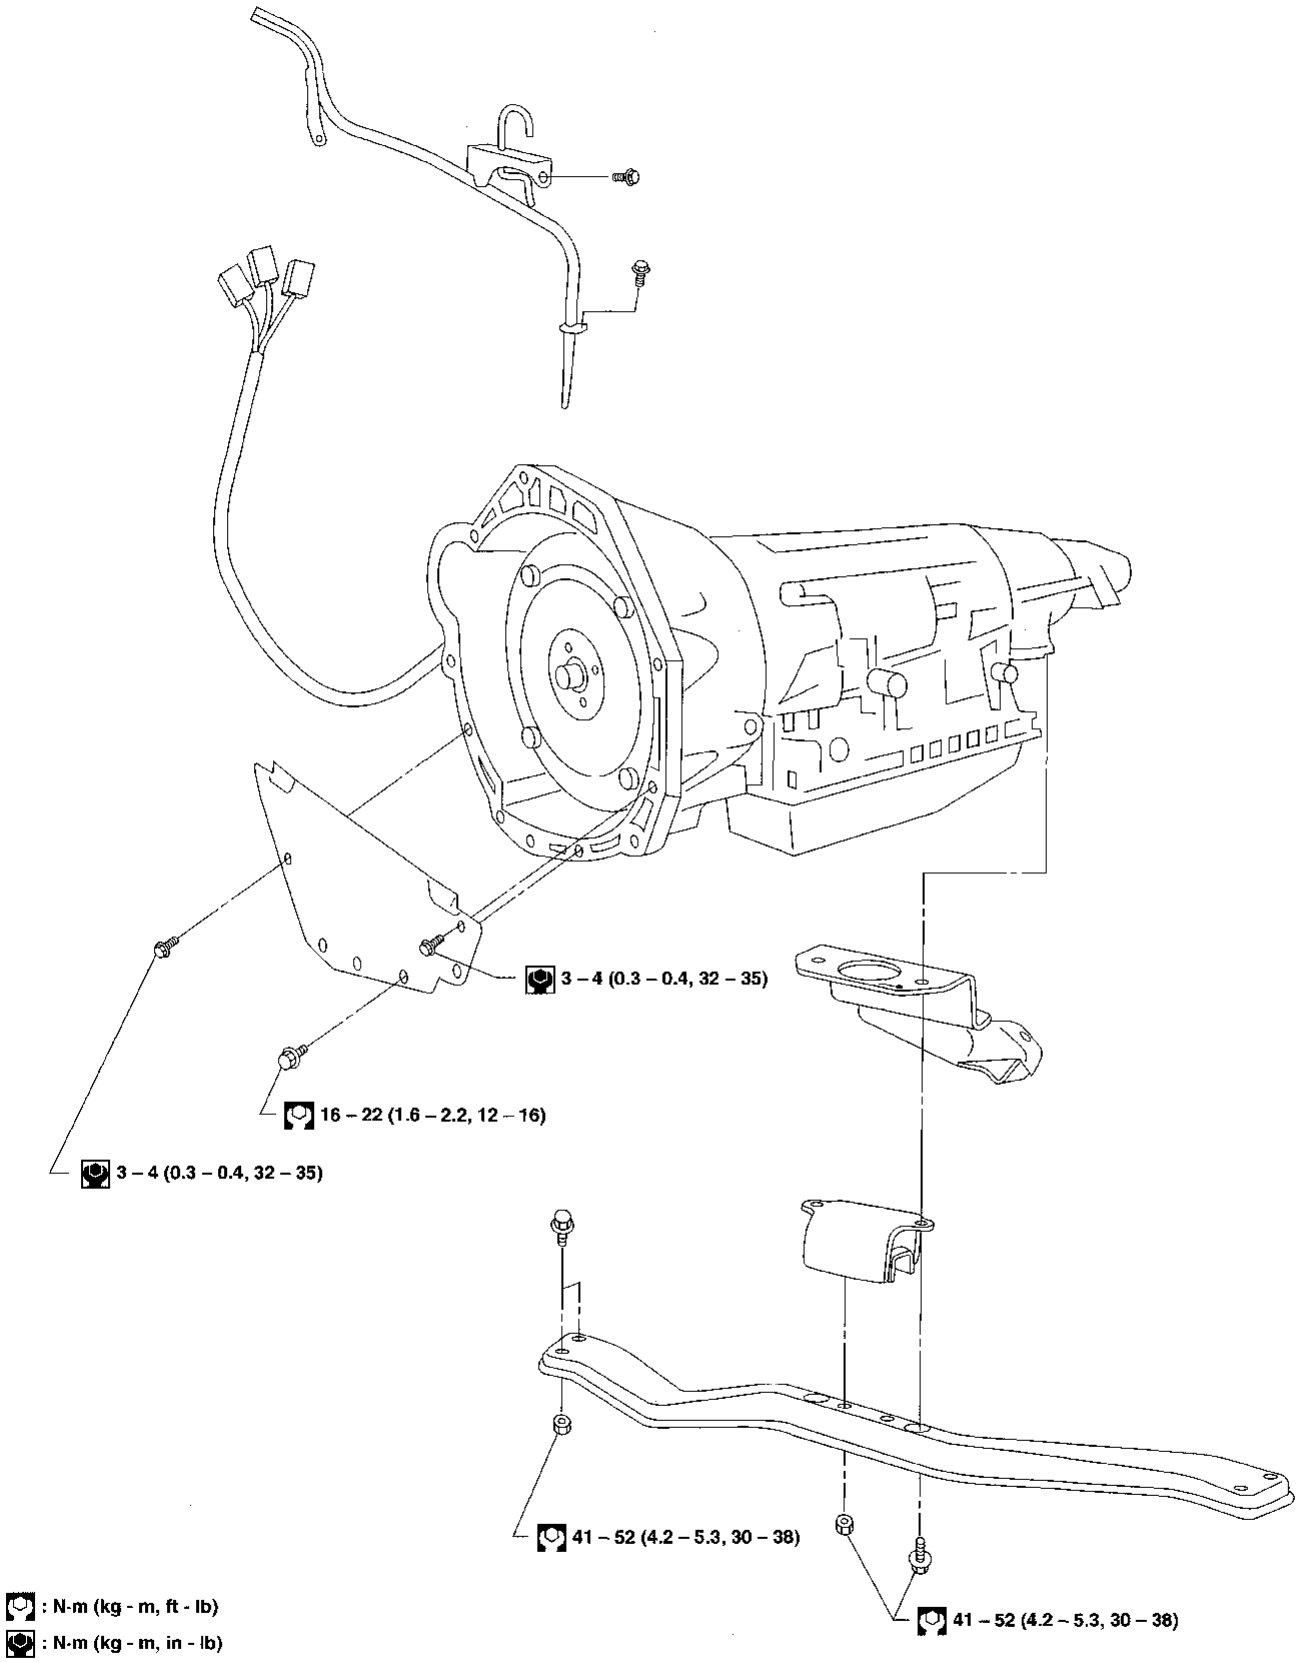


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inhibitor Switch Adjustment

1. Remove control linkage and manual lever from manual shaft.
2. Set manual shaft in "N" position.
3. Loosen inhibitor switch fixing bolts.
4. Insert pin into adjustment holes in both inhibitor switch and manual as near vertical as possible.
5. Tighten inhibitor switch fixing bolts.
6. Remove pin.
7. Reinstall any part removed.
8. Adjust control linkage. Refer to "Manual Control Linkage Adjustment".
9. Check continuity of inhibitor switch. Refer to AT-37.

Control Cable Adjustment



Move the selector lever from the "P" position to "1" position. You should be able to feel the detents in each position.
If the detents cannot be felt, the linkage needs adjustment.

1. Place selector lever in "P" position.
2. Loosen control cable lock nut and place manual shaft in "P" position.
3. Push control cable in the direction of the arrow shown in the illustration by specified force.
   Specified force: 19.6 N (2.0 kg, 4.4 lb)
4. Return control cable in the opposite direction of the arrow for 1.0 mm (0.039 in).
5. Tighten control cable lock nut.
6. Move selector lever from "P" to "1" position again. Make sure that selector lever moves smoothly.
7. Apply grease to contacting areas of selector lever and control cable. Install any part removed.

- **Make sure that the starter operates when the selector lever is placed in the "N" or "P" position.**
- **Make sure that the transmission is locked properly when the selector lever is placed in the "P" position.**

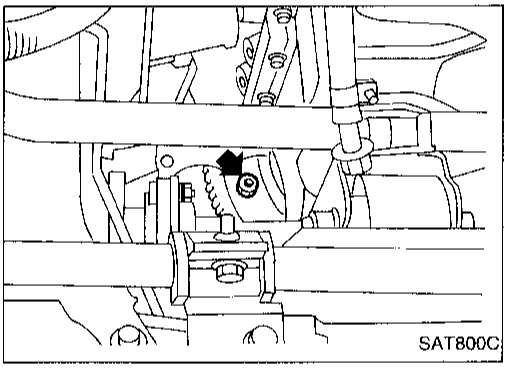
SEC. 112 • 200 • 310

AAT151A

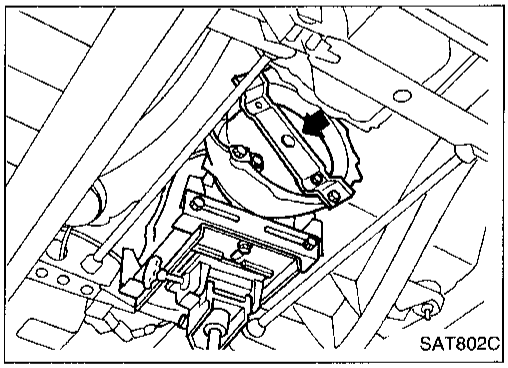
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Removal

CAUTION:
Before separating the A/T assembly from engine, first remove the crankshaft position sensor (OBD) from the assembly. Be careful not to damage sensor edge.
NOTE: To prevent oil spills, drain A/T fluid before removing A/T assembly or insert plug into rear oil seal after removing rear propeller shaft.

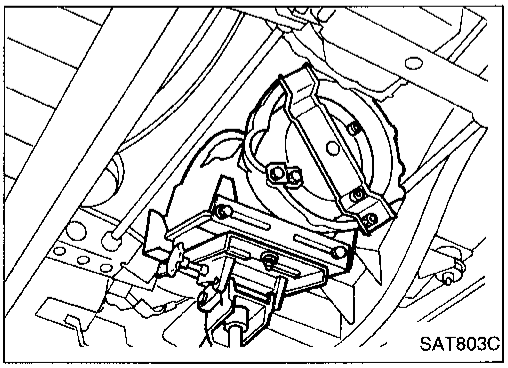
1. Disconnect battery negative terminal.
2. Remove fluid charging pipe from A/T assembly and plug opening.
3. Remove oil cooler pipe from A/T assembly and plug opening.
4. Remove A/T vent hose.
5. Remove propeller shaft.
   Refer to PD section ("Removal and Installation", "PROPELLER SHAFT").



- **Be careful not to damage spline, sleeve yoke and rear oil seal.**

6. Remove A/T control cable from manual shaft.
7. Disconnect A/T harness connectors and vehicle speed sensor harness connector.
8. Disconnect throttle wire from A/T assembly.

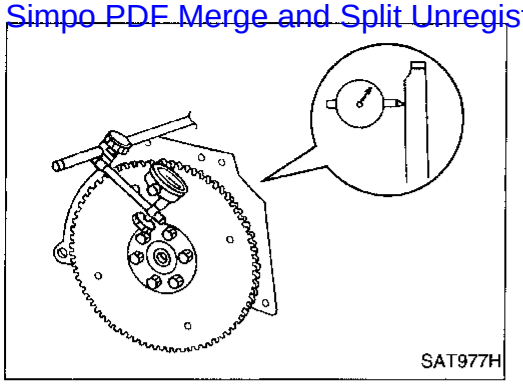
SAT800C



9. Remove starter motor.
10. Remove bolts securing torque converter to drive plate.

- **Rotate crankshaft to gain access to securing bolts.**

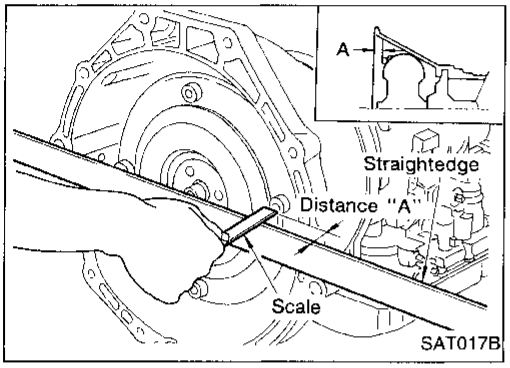
SAT802C



11. Support A/T assembly with a jack.
12. Remove rear mounting bracket from body and A/T assembly.
    Refer to EM section ("ENGINE REMOVAL").
13. Remove bolts securing A/T assembly to engine.
14. Pull A/T assembly backwards.

- **Secure torque converter to prevent it from dropping.**
- **Secure A/T assembly to a jack.**

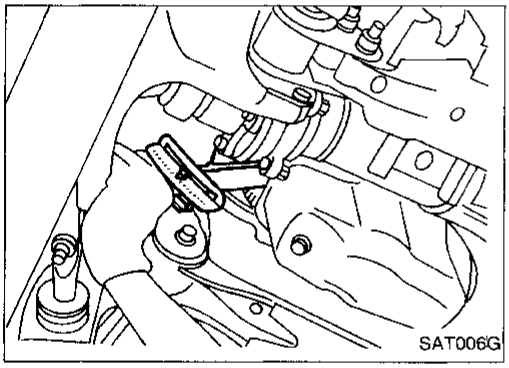
SAT803C



15. Slant and lower A/T assembly.

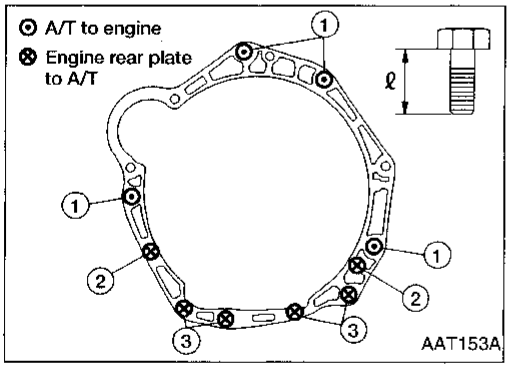
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SAT977H



Installation

1. Check drive plate runout.
   CAUTION:
   Do not allow any magnetic materials to contact the ring gear teeth.
   Maximum allowable runout:
   Refer to EM section ("Inspection", "CYLINDER BLOCK").
   If this runout is out of specification, replace drive plate with ring gear.



SAT017B

2. When connecting torque converter to transmission, measure distance "A" to be certain that they are correctly assembled.
   Distance "A":
   26.0 mm (1.024 in) or more

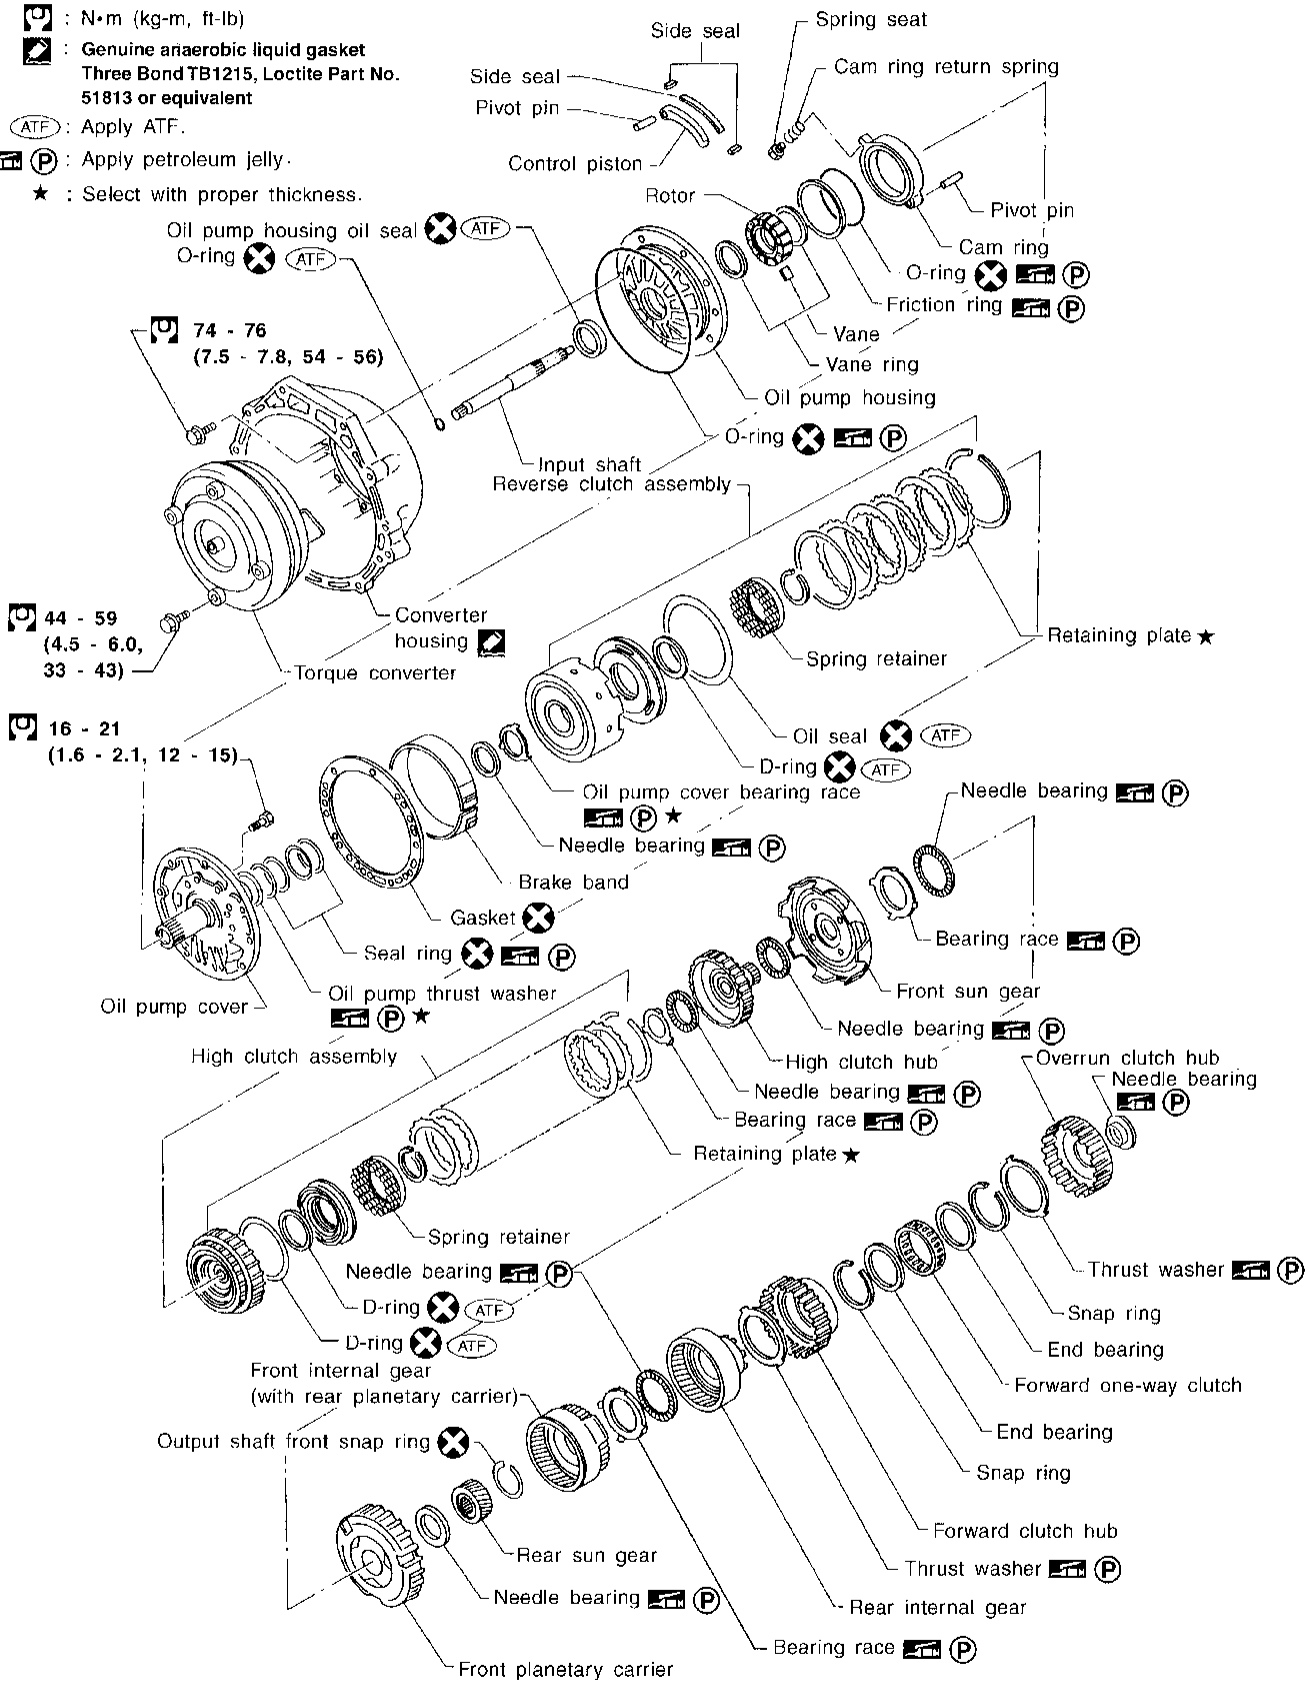
SAT006G

3. Install converter to drive plate.
- **With converter installed, rotate crankshaft several turns to check that transmission rotates freely without binding.**

AAT153A

4. Tighten bolts securing transmission.

Bolt No.	Tightening torque N·m (kg-m, ft-lb)	Bolt length "ℓ" mm (in)
①	39 - 49 (4.0 - 5.0, 29 - 36)	43 (1.69)
②	3 - 4 (0.3 - 0.4, 2.2 - 2.9)	16 (0.63)
③	16 - 22 (1.6 - 2.2, 12 - 16)	16 (0.63)



SAT638A

5. Reinstall any part removed.
6. Adjust control cable. Refer to AT-47.
7. Adjust throttle wire. Refer to AT-46.
8. Adjust inhibitor switch. Refer to AT-47.
9. Refill transmission with ATF and check fluid level.
10. Move selector lever through all positions to be sure that transmission operates correctly.
    With parking brake applied, allow engine to idle. Move selector lever through "N" to "D", to "2", to "1" and to "R". A slight shock should be felt through hand gripping the selector each time the transmission is shifted.
11. Perform road test. Refer to "ROAD TEST", AT-28.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

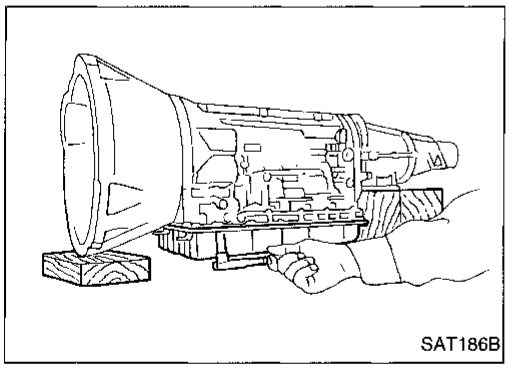
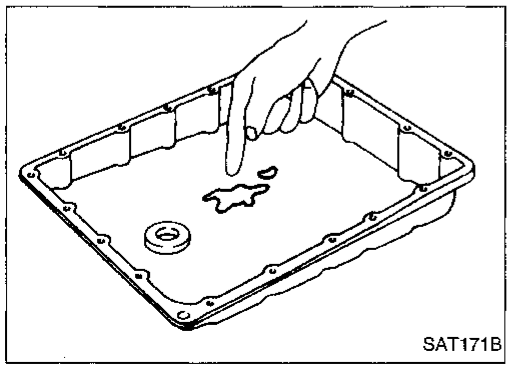
SAT018B

1. Removing torque converter by holding it firmly and turning while pulling straight out.



SAT019BA

2. Check torque converter one-way clutch.
a. Insert Tool into spline of one-way clutch inner race.
b. Hook bearing support unitized with one-way clutch outer race with suitable wire.
c. Check that one-way clutch inner race rotates only clockwise with Tool while holding bearing support with wire.

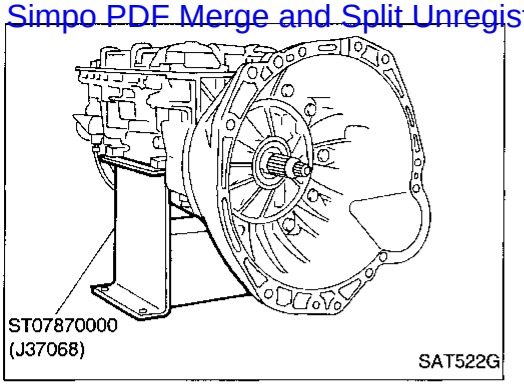


SAT021B

3. Remove inhibitor switch from transmission case.

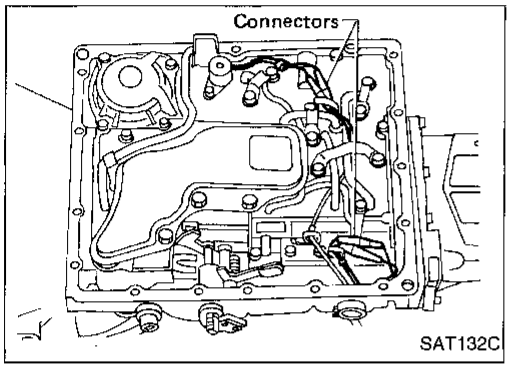
SAT186B

4. Separate the oil pan and transmission case.
a. Drain ATF from drain plug.
b. Raise oil pan by placing wooden blocks under converter housing and adapter case.
c. Remove oil pan and gasket.



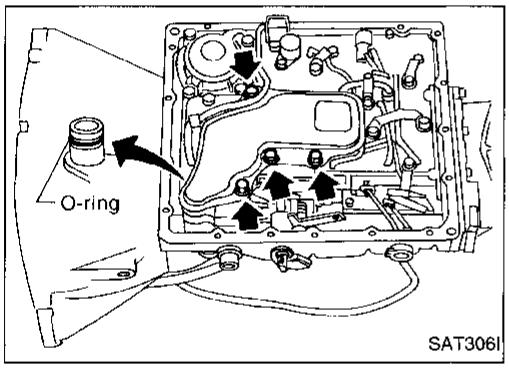
- **Always place oil pan straight down so that foreign particles inside will not move.**
- **Do not reuse oil pan bolts.**

SAT171B

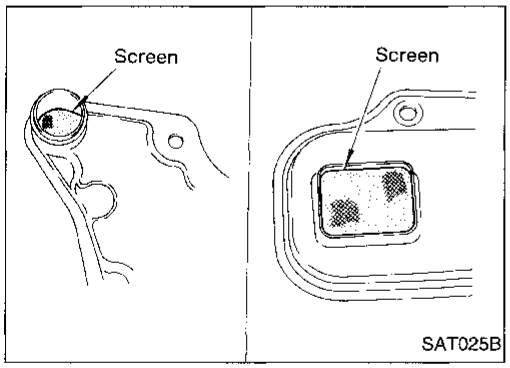


5. Check foreign materials in oil pan to help determine cause of malfunction. If the fluid is very dark, smells burned, or contains foreign particles, the frictional material (clutches, band) may need replacement. A tacky film that will not wipe clean indicates varnish buildup. Varnish can cause valves, servo, and clutches to stick and may inhibit pump pressure.

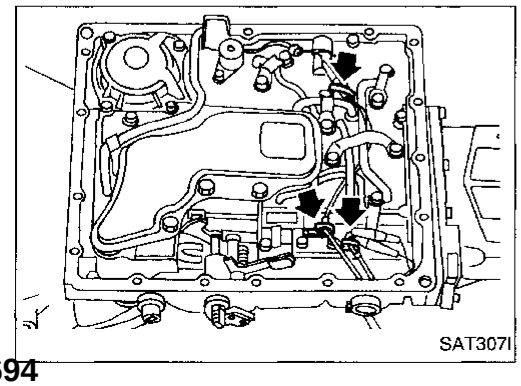
- **If frictional material is detected, replace radiator after repair of A/T. Refer to LC section ("Radiator", "ENGINE COOLING SYSTEM").**



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

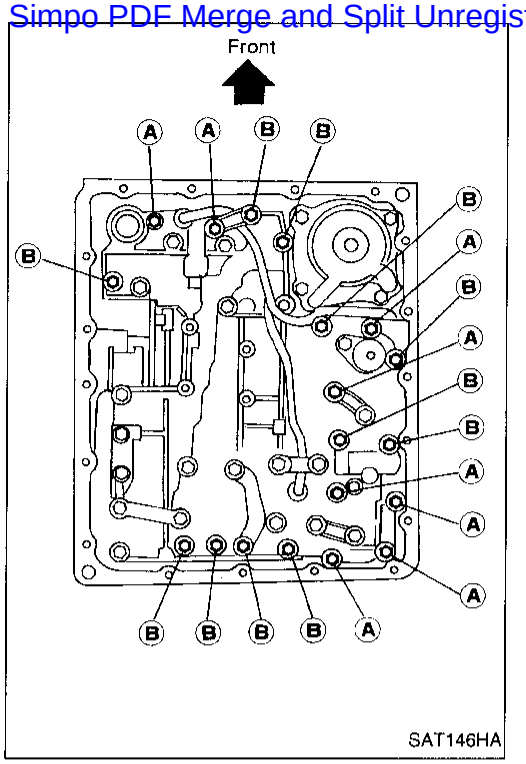


6. Place transmission into Tool with the control valve facing up.



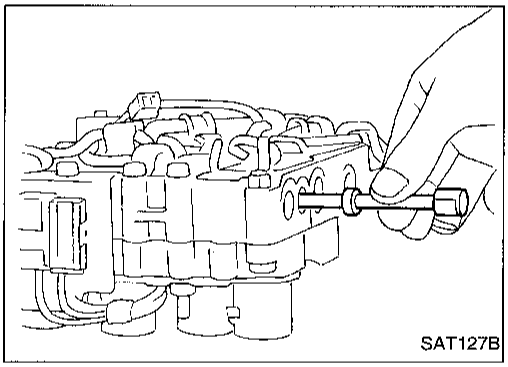
7. Remove torque converter clutch solenoid valve and overdrive cancel solenoid valve connectors.

8. Remove oil strainer.
a. Remove oil strainer from control valve assembly. Then remove O-ring from oil strainer.

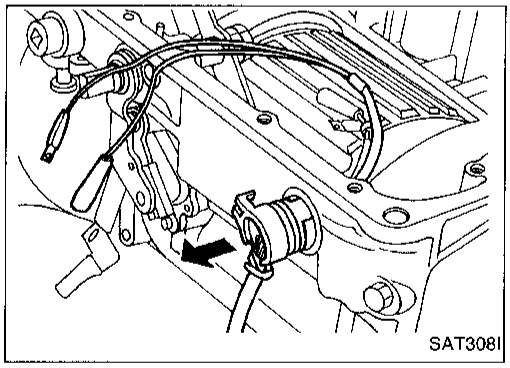


b. Check oil strainer screen for damage.

9. Remove control valve assembly.
a. Straighten terminal clips to free terminal cords then remove terminal clips.

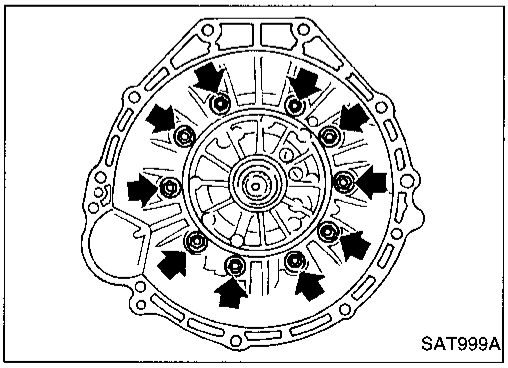


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



SAT146HA

b. Remove bolts Ⓐ and Ⓑ, and remove control valve assembly from transmission.



Bolt	ℓ mm (in)

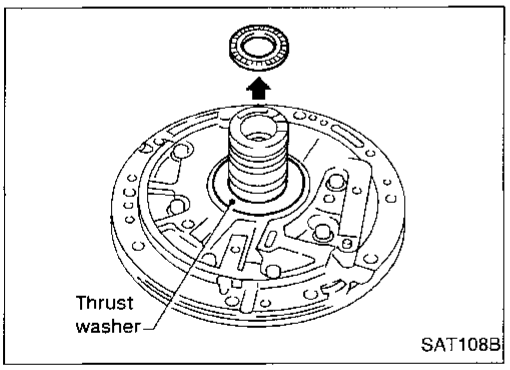
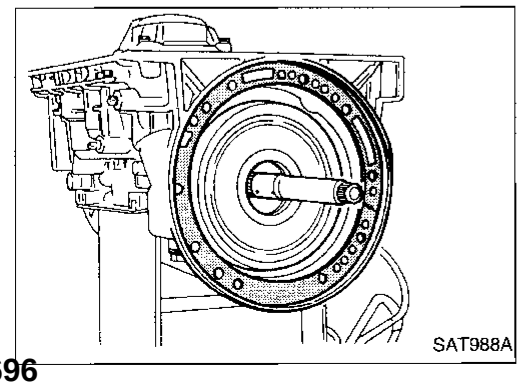
12. Remove O-ring from input shaft.



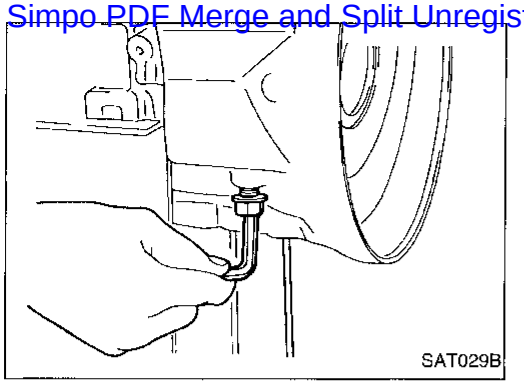
SAT027B

13. Remove oil pump assembly.
a. Attach Tool to oil pump assembly and extract it evenly from transmission case.



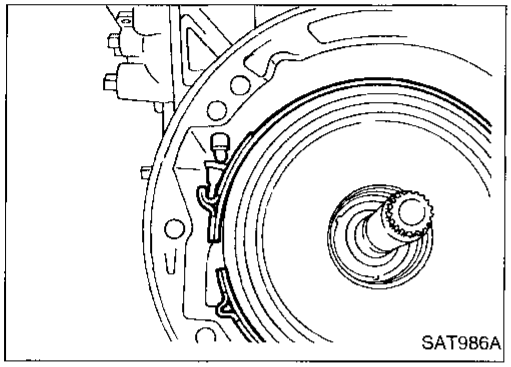
SAT028B

b. Remove O-ring from oil pump assembly.
c. Remove traces of sealant from oil pump housing.
- **Be careful not to scratch pump housing.**



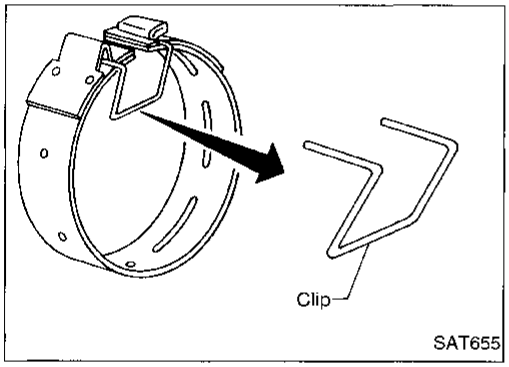
SAT108B

d. Remove needle bearing and thrust washer from oil pump assembly.



SAT988A

14. Remove input shaft and oil pump gasket.

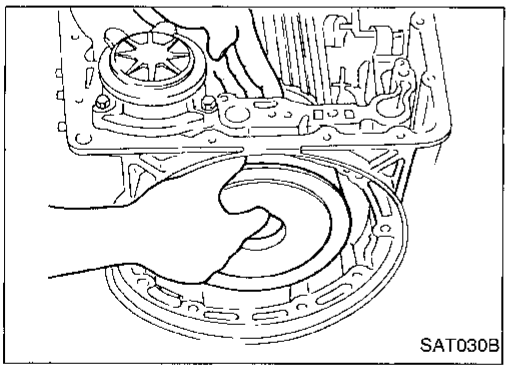


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

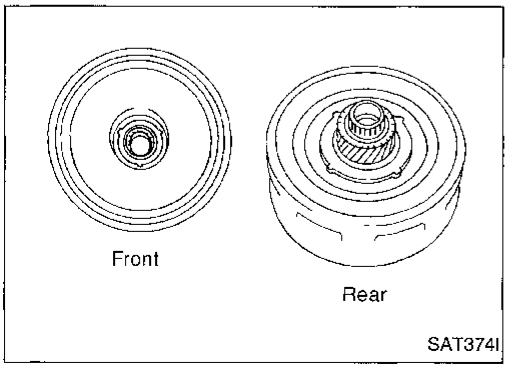
SAT029B

15. Remove brake band and band strut.
a. Loosen lock nut and remove band servo anchor end pin from transmission case.

SAT986A



b. Remove brake band and band strut from transmission case.

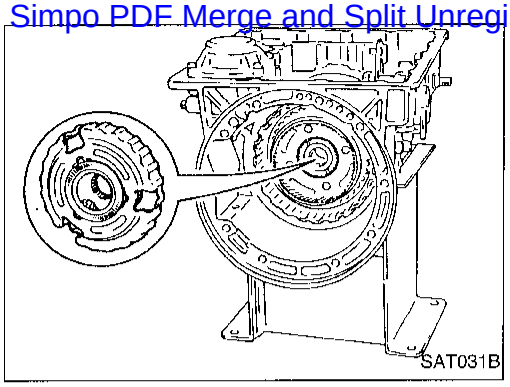


SAT655

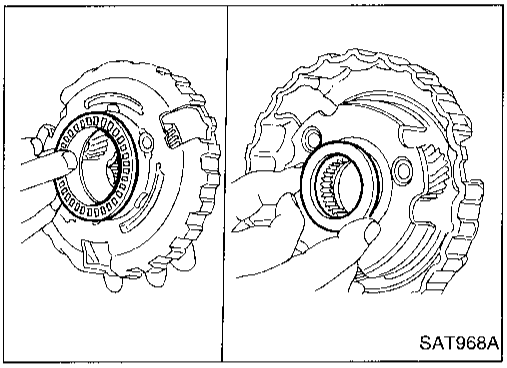
- **To prevent brake linings from cracking or peeling, do not stretch the flexible band unnecessarily. When removing the brake band, always secure it with a clip as shown in the figure at left. Leave the clip in position after removing the brake band.**

c. Check brake band facing for damage, cracks, wear and burns.

SAT030B

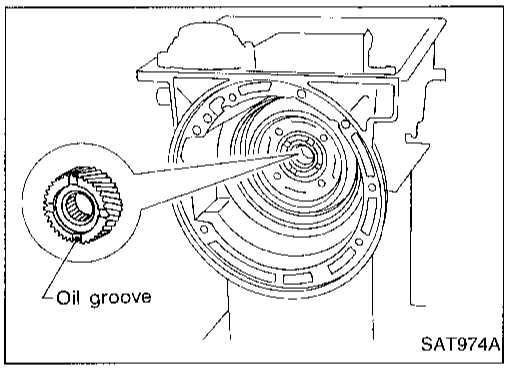


16. Remove front side clutch and gear components.
a. Remove clutch pack (reverse clutch, high clutch and front sun gear) from transmission case.

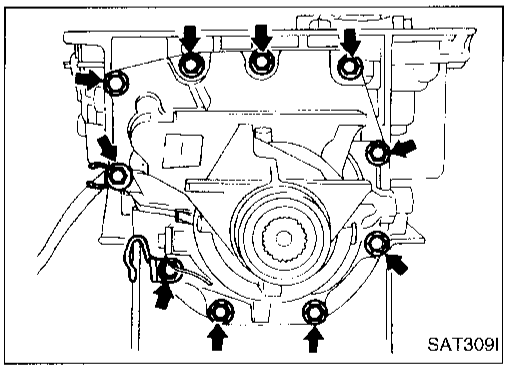


SAT374I

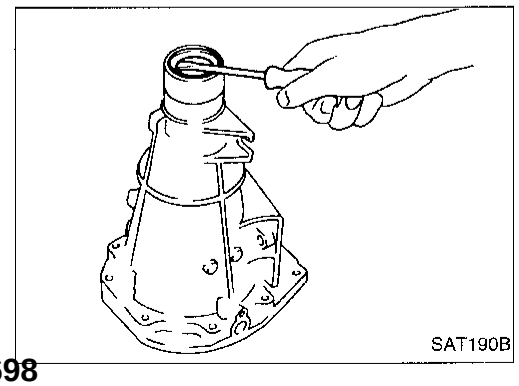
b. Remove front bearing race from clutch pack.
c. Remove rear bearing race from clutch pack.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

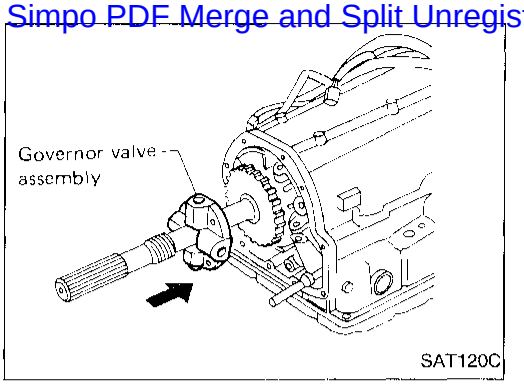


d. Remove front planetary carrier from transmission case.

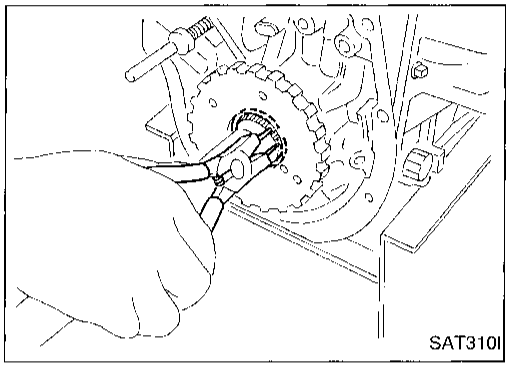


e. Remove front needle bearing from front planetary carrier.
f. Remove rear bearing from front planetary carrier.

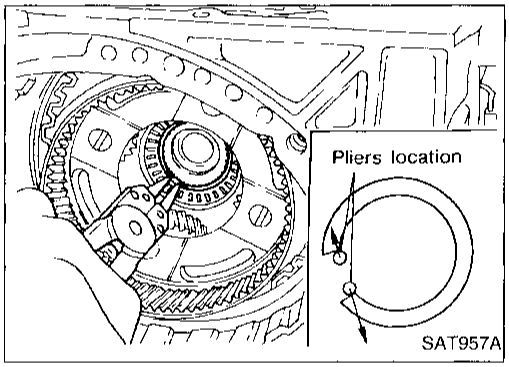
g. Remove rear sun gear from transmission case.



17. Remove rear extension case.
a. Remove rear extension case from transmission case.
b. Remove rear extension gasket from transmission case.

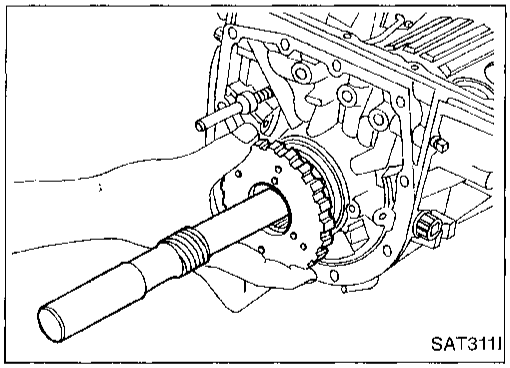


c. Remove oil seal from rear extension case.
- **Do not remove oil seal unless it is to be replaced.**

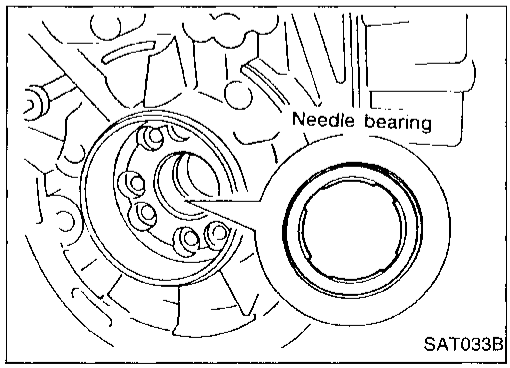


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

18. Remove output shaft and parking gear.
a. Remove governor valve assembly.

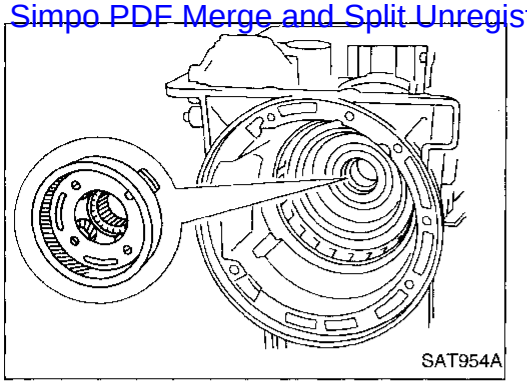


b. Remove rear snap ring from output shaft.

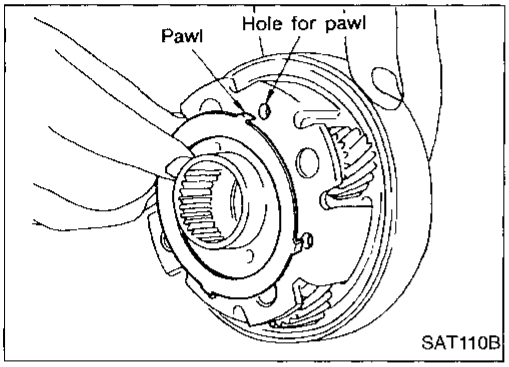


c. Slowly push output shaft all the way forward.
- **Do not use excessive force.**

d. Remove snap ring from output shaft.



e. Remove output shaft and parking gear as a unit from transmission case.
f. Remove parking gear from output shaft.



g. Remove needle bearing from transmission case.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

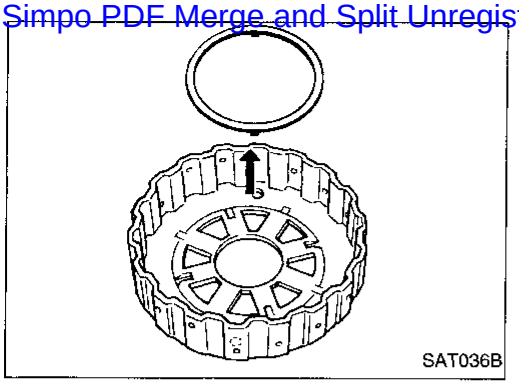
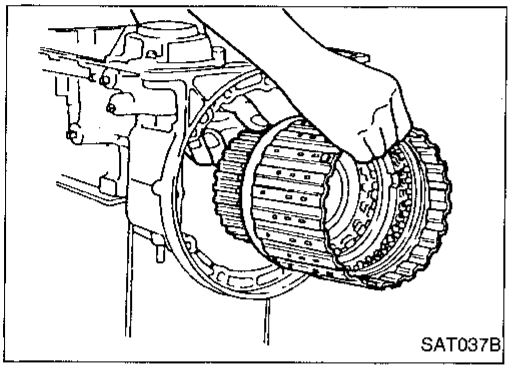
SAT111B

c. Remove needle bearing from rear internal gear.



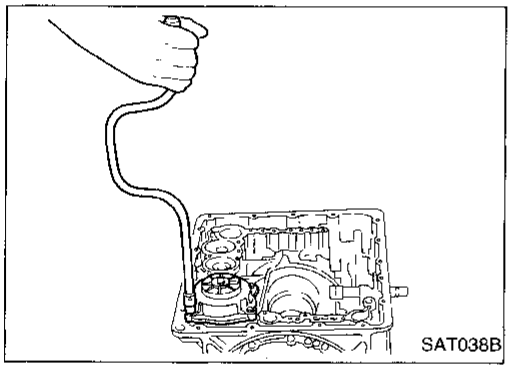
SAT951A

d. Remove rear internal gear, forward clutch hub and overrun clutch hub as a set from transmission case.



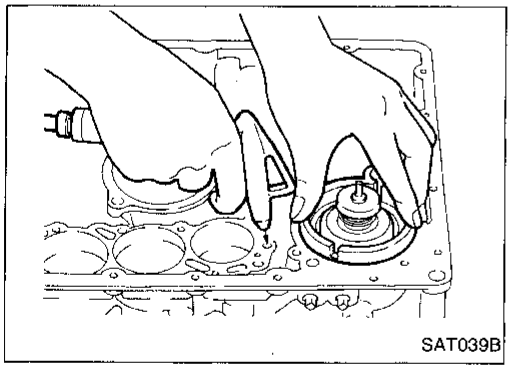
SAT682H

e. Remove needle bearing from overrun clutch hub.
f. Remove overrun clutch hub from rear internal gear and forward clutch hub.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SAT036B

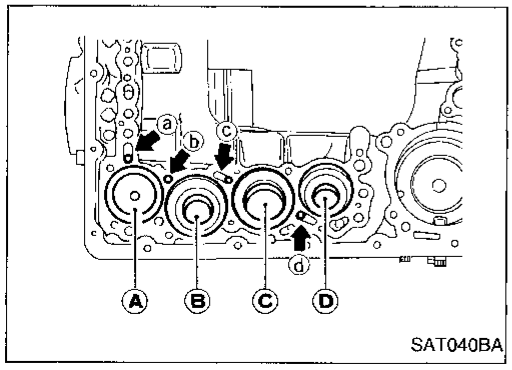


g. Remove thrust washer from overrun clutch hub.

SAT037B

h. Remove forward clutch assembly from transmission case.

SAT038B



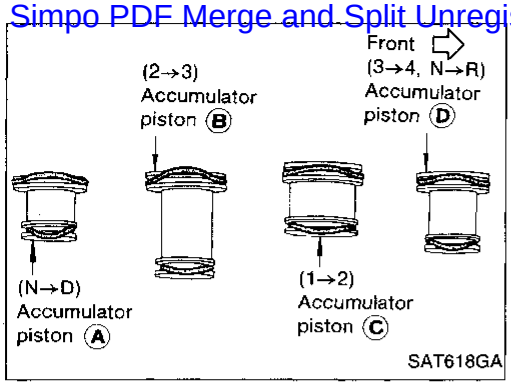
20. Remove band servo and accumulator components.
a. Remove band servo retainer from transmission case.

SAT039B

b. Apply compressed air to oil hole until band servo piston comes out of transmission case.

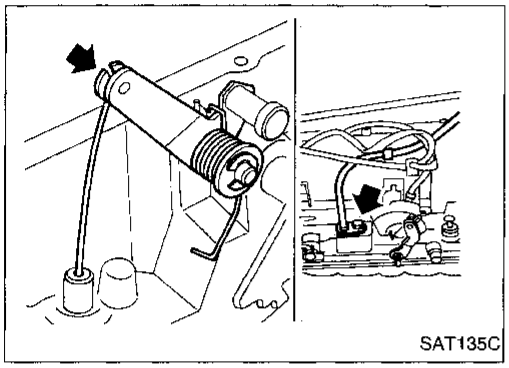
- **Hold piston with a rag and gradually direct air to oil hole.**

c. Remove return springs.



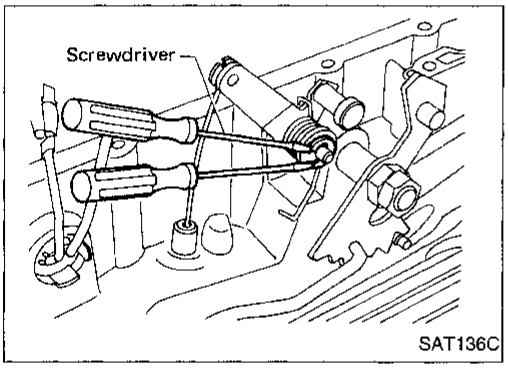
SAT040BA

d. Remove springs from accumulator pistons Ⓐ, Ⓑ, Ⓒ and Ⓓ.
e. Apply compressed air to each oil hole until piston comes out.

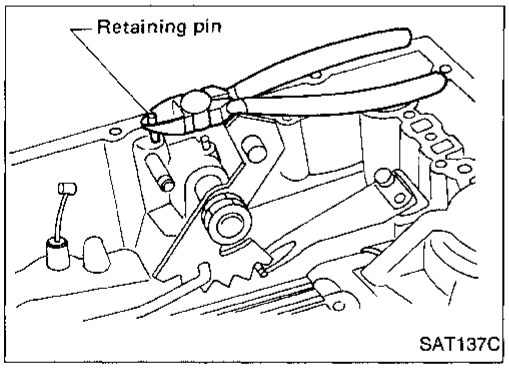


- **Hold piston with a rag and gradually direct air to oil hole.**

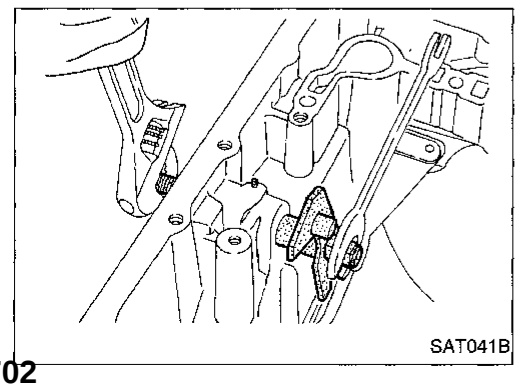
Identification of accumulator pistons	Ⓐ	Ⓑ	Ⓒ	Ⓓ
Identification of oil holes	ⓐ	ⓑ	ⓒ	ⓓ



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

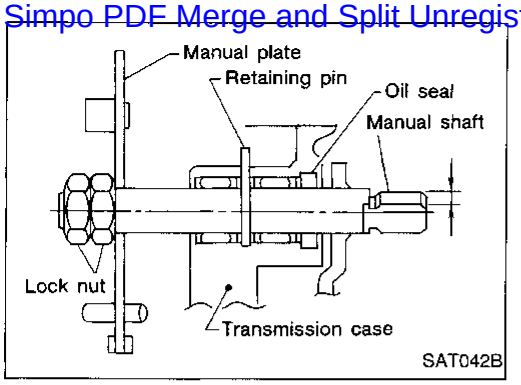


f. Remove O-ring from each piston.

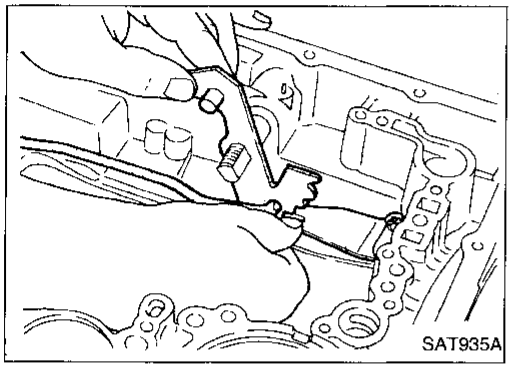


21. Remove throttle wire components if necessary.
a. Remove throttle wire from A/T assembly.

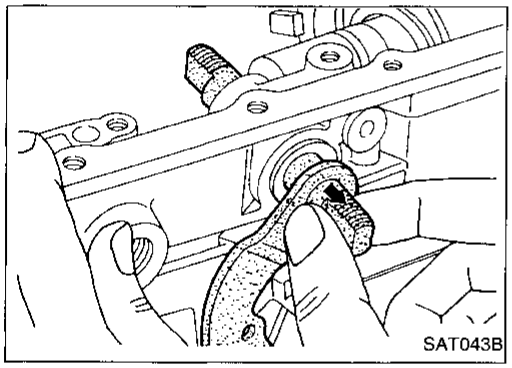
b. Remove throttle lever shaft E-ring.
c. Remove return spring.
d. Remove throttle lever.



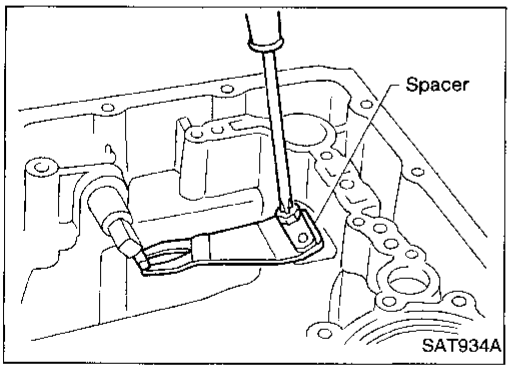
e. Remove throttle lever shaft retaining pin and throttle lever shaft.



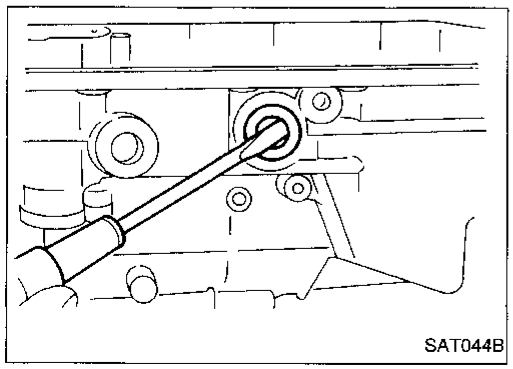
22. Remove manual shaft components, if necessary.
a. Hold width across flats of manual shaft (outside the transmission case) and remove lock nut from shaft.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

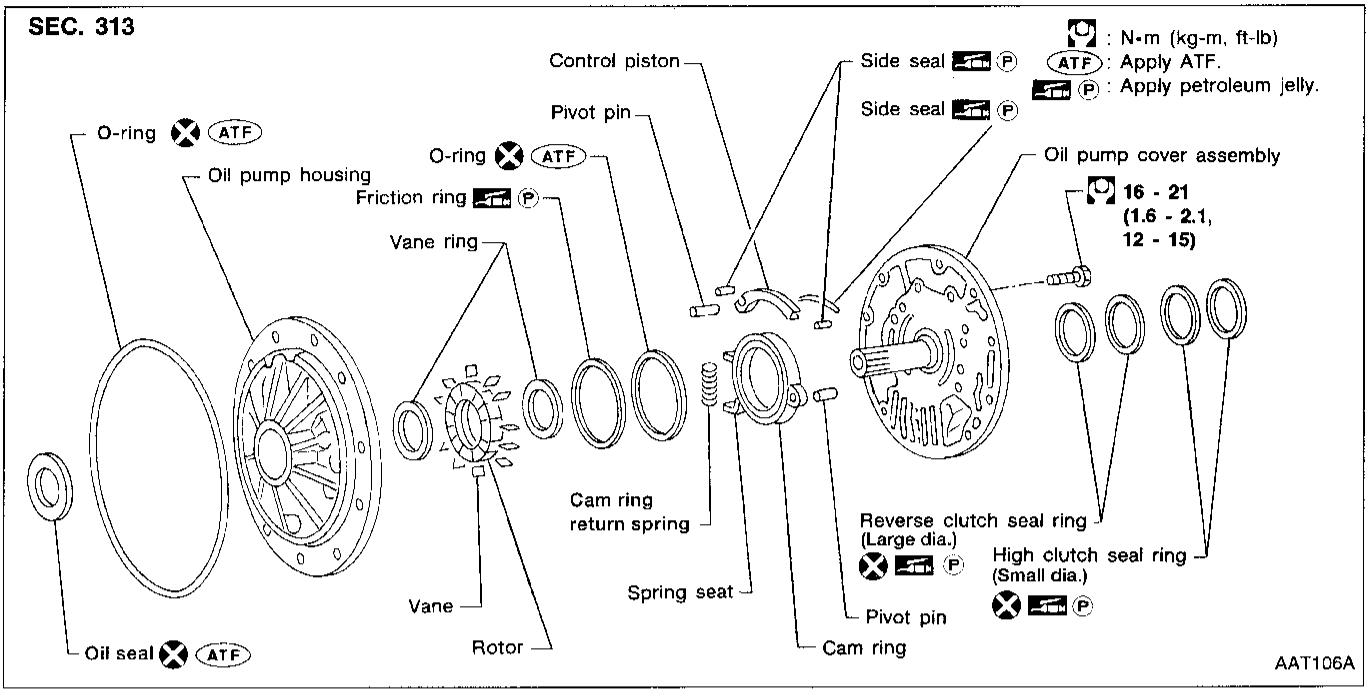


b. Remove retaining pin from transmission case.

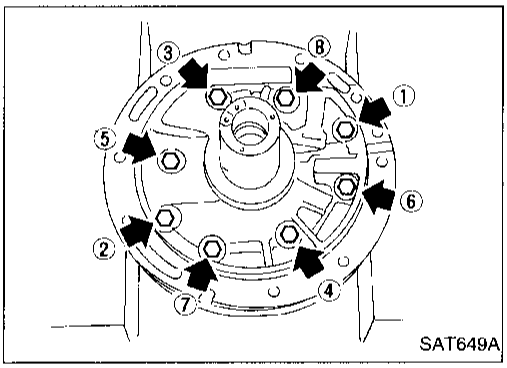


c. While pushing detent spring down, remove manual plate and parking rod from transmission case.

d. Remove manual shaft from transmission case.

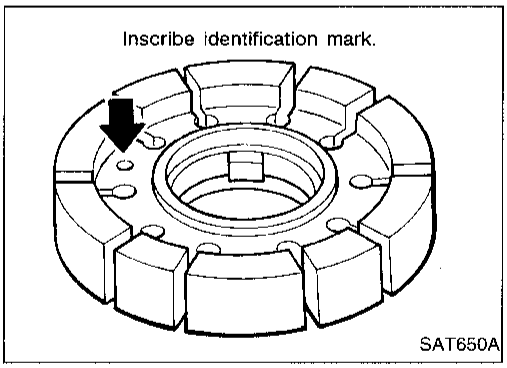


e. Remove spacer and detent spring from transmission case.

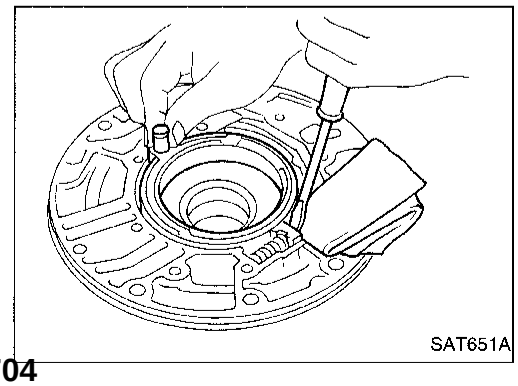


f. Remove oil seal from transmission case.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

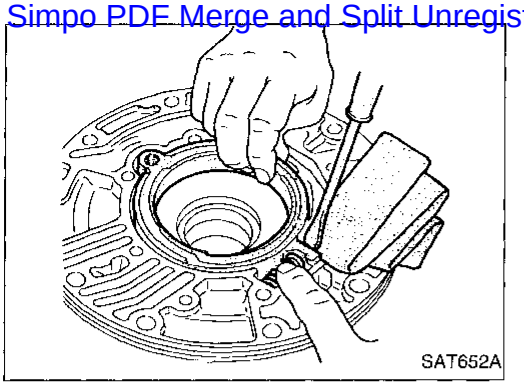


Oil Pump

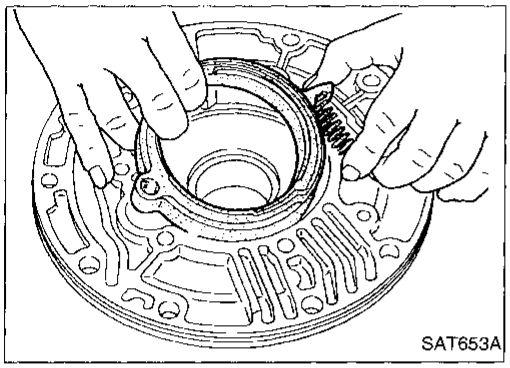


DISASSEMBLY

1. Loosen bolts in numerical order and remove oil pump cover.

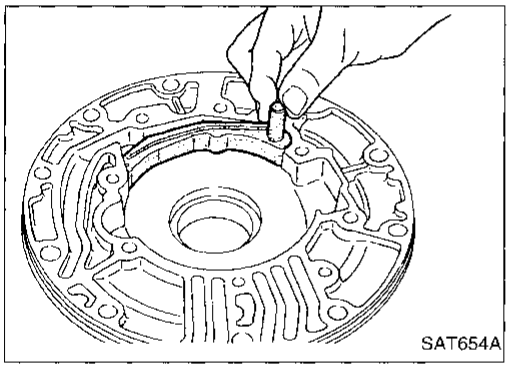


2. Remove rotor, vane rings and vanes.
- **Inscribe a mark on back of rotor for identification of fore-aft direction when reassembling rotor. Then remove rotor.**



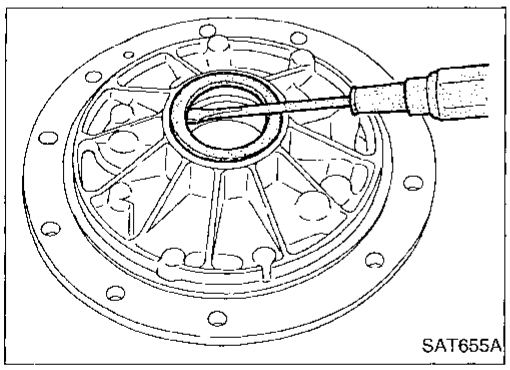
3. While pushing on cam ring, remove pivot pin.
- **Be careful not to scratch oil pump housing.**

Oil Pump (Cont'd)



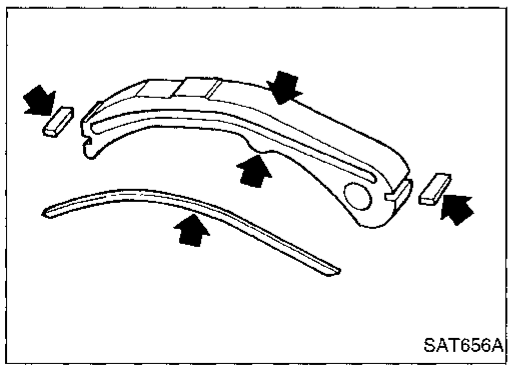
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SAT652A



4. While holding cam ring and cam ring return spring, lift out cam ring return spring.
   - **Be careful not to damage oil pump housing.**
   - **Hold cam ring return spring to prevent it from jumping.**

SAT653A



5. Remove cam ring and cam ring return spring from oil pump housing.

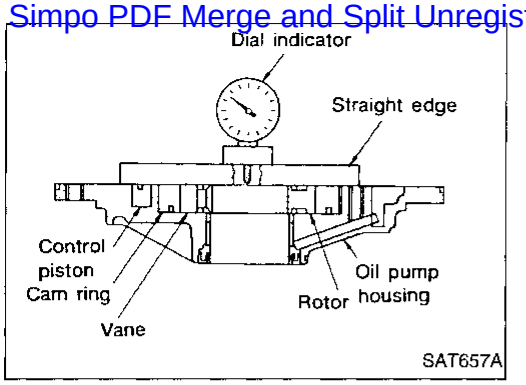
SAT654A

6. Remove pivot pin from control piston and remove control piston assembly.

SAT655A

7. Remove oil seal from oil pump housing.
   - **Be careful not to scratch oil pump housing.**

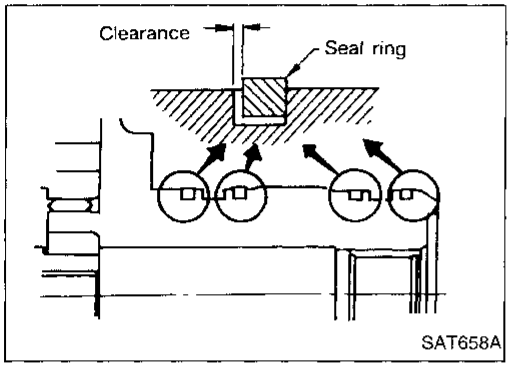
SAT656A



INSPECTION

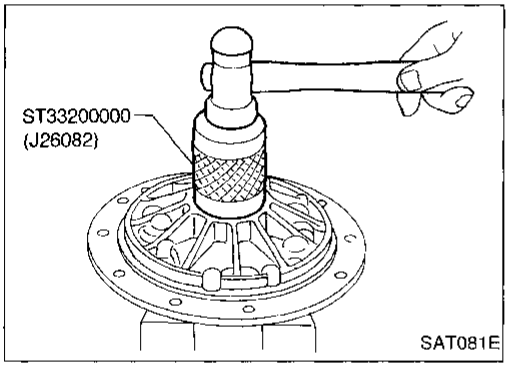
Oil pump cover, rotor, vanes, control piston, side seals, cam ring and friction ring

- Check for wear and damage.



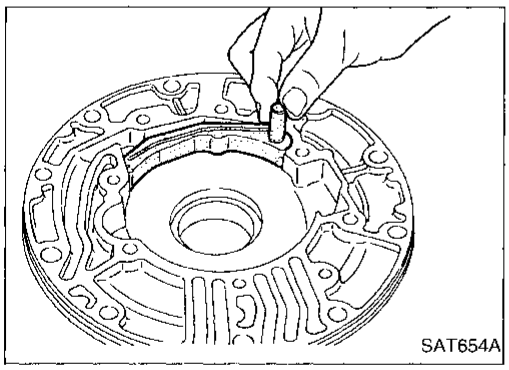
Oil Pump (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



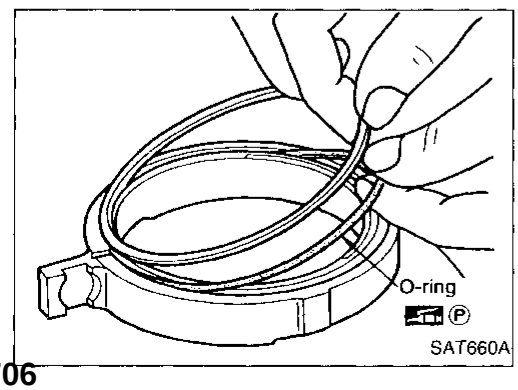
Side clearances

- Measure side clearances between end of oil pump housing and cam ring, rotor, vanes and control piston in at least four places along their circumferences. Maximum measured values should be within specified ranges.
- **Before measuring side clearance, check that friction rings, O-ring, control piston side seals and cam ring return spring are removed.**
  Standard clearance (Cam ring, rotor, vanes and control piston):
  Refer to SDS, AT-125.
- If not within standard clearance, replace oil pump assembly except oil pump cover assembly.



Seal ring clearance

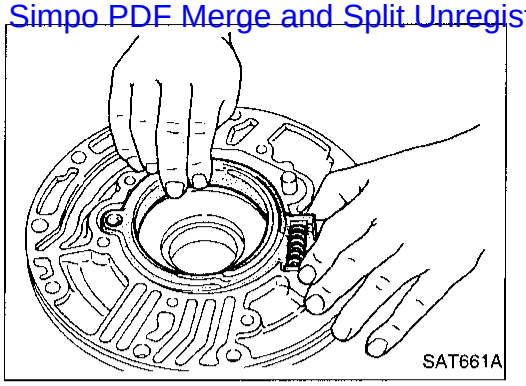
- Measure clearance between seal ring and ring groove.
  Standard clearance:
  0.10 - 0.25 mm (0.0039 - 0.0098 in)
  Wear limit:
  0.25 mm (0.0098 in)
- If not within wear limit, replace oil pump cover assembly.



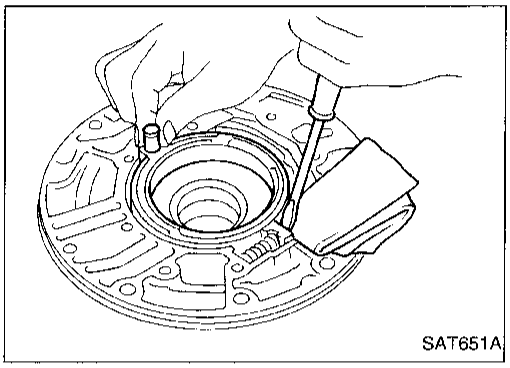
ASSEMBLY

1. Drive oil seal into oil pump housing.
- **Apply ATF to outer periphery and lip surface.**

2. Install cam ring in oil pump housing as follows:
a. Install side seal on control piston.
- **Pay attention to its direction — black surface faces toward control piston.**
- **Apply petroleum jelly to side seal.**

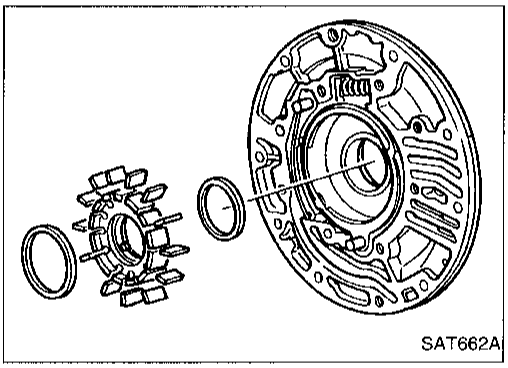


b. Install control piston on oil pump.



c. Install O-ring and friction ring on cam ring.
- **Apply petroleum jelly to O-ring.**

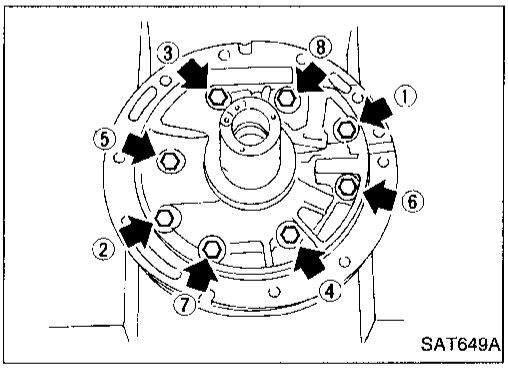
Oil Pump (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SAT661A

d. Assemble cam ring, cam ring return spring and spring seat. Install spring by pushing it against pump housing.



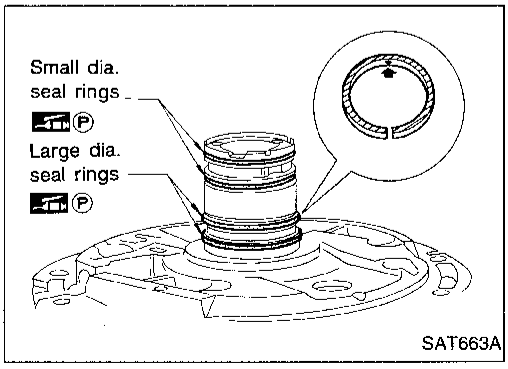
SAT651A

e. While pushing on cam ring install pivot pin.

SAT662A

3. Install rotor, vanes and vane rings.

- **Pay attention to direction of rotor.**



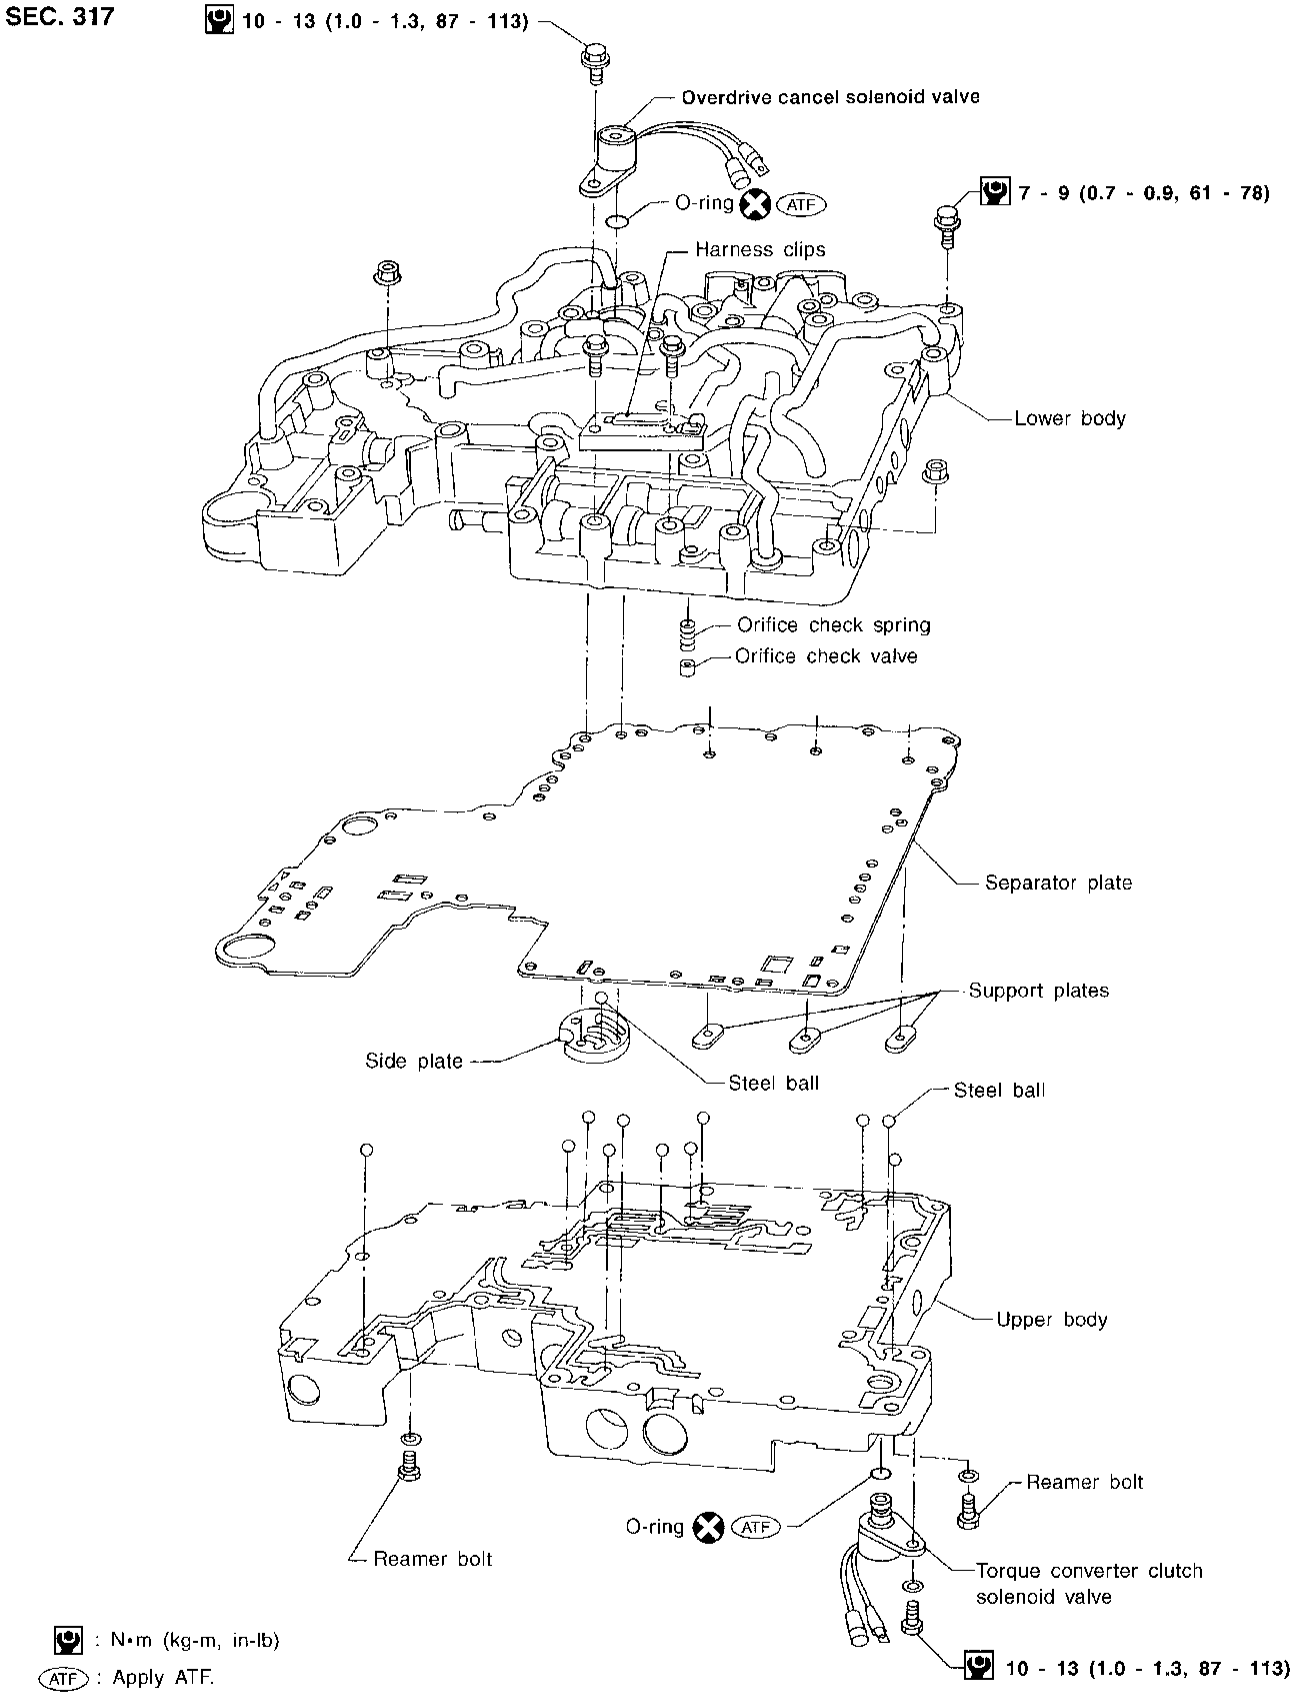
SAT649A

4. Install oil pump housing and oil pump cover.

a. Wrap masking tape around splines of oil pump cover assembly to protect seal. Position oil pump cover assembly in oil pump housing assembly, then remove masking tape.

b. Tighten bolts in numerical order as shown.

SAT663A



5. Install seal rings carefully after packing ring grooves with petroleum jelly. Press rings down into jelly for a close fit.

- **Seal rings come in two different diameters. Check fit carefully in each groove.**
  Small dia. seal ring:
  No mark
  Large dia. seal ring:
  Yellow mark in area shown by arrow
- **Do not spread gap of seal ring excessively while installing. It may deform ring.**

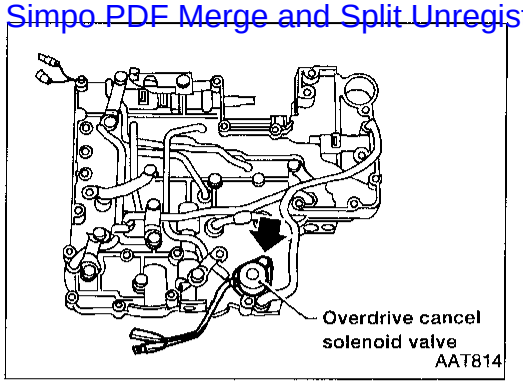
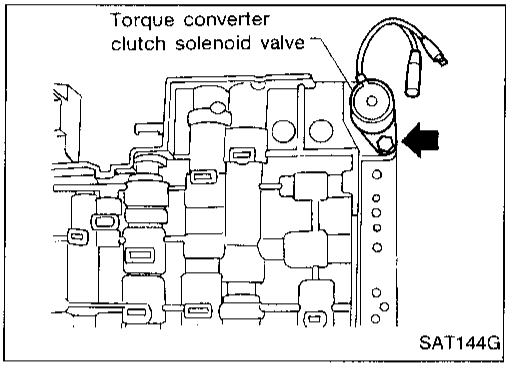
Control Valve Assembly

SEC. 317

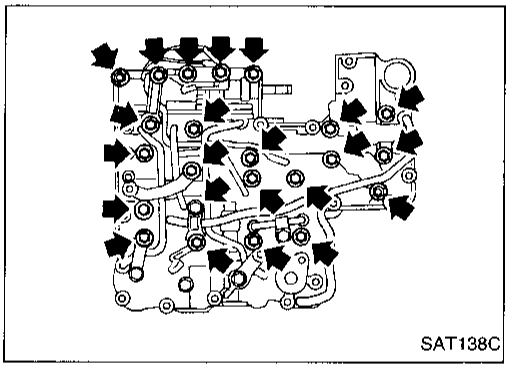


AAT107A



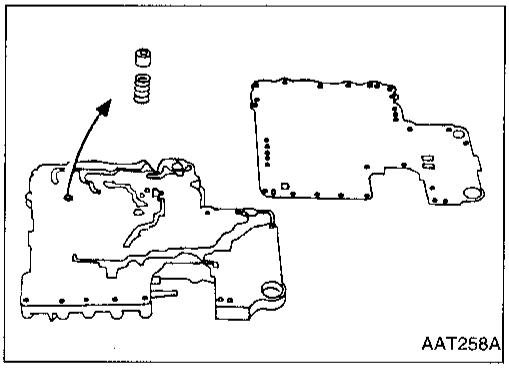
Control Valve Assembly (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

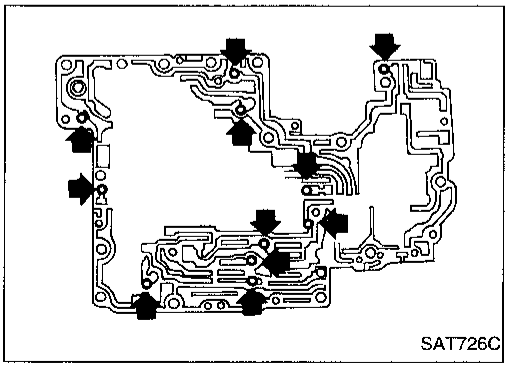


DISASSEMBLY

1. Remove solenoids.
a. Remove overdrive cancel solenoid valve and side plate from lower body.
b. Remove O-ring from solenoid.

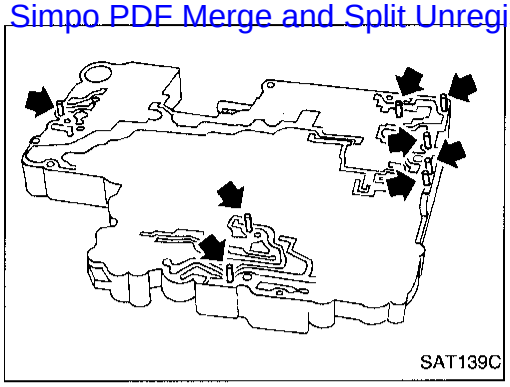


c. Remove torque converter clutch solenoid valve from upper body.
d. Remove O-ring from solenoid valve.



2. Disassemble upper and lower bodies.
a. Place upper body facedown, and remove bolts, reamer bolts, side plate and support plates.
b. Remove lower body and separator plate as a unit from upper body.

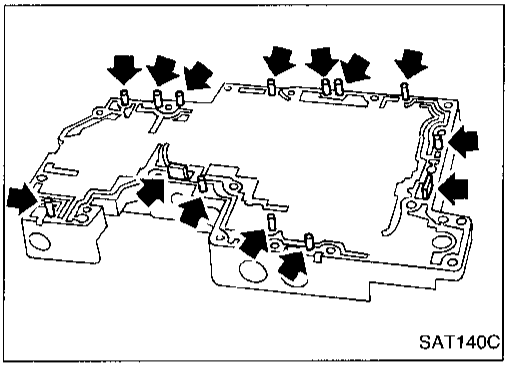
- **Be careful not to drop orifice check valve, spring and steel balls.**



c. Place lower body facedown, and remove separator plate.
d. Remove orifice check valve and orifice check spring.

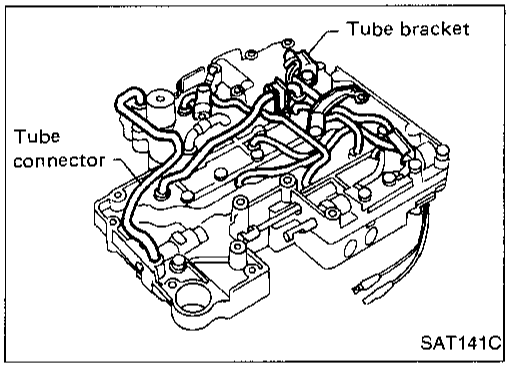
e. Check to see that steel balls are properly positioned in upper body and side plate, then remove them from upper body.

Control Valve Assembly (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

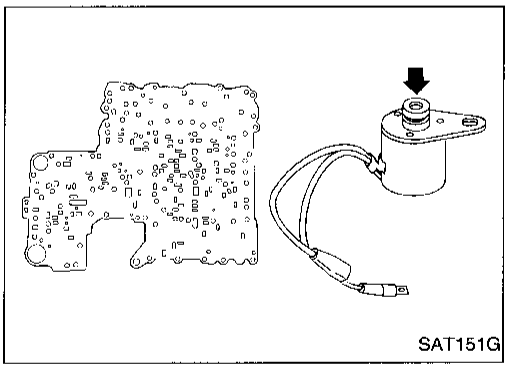
SAT139C



INSPECTION

Lower and upper bodies

- Check to see that there are pins and retainer plates in lower body.

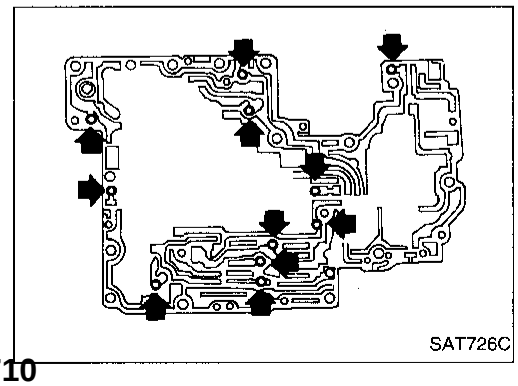


SAT140C

- Check to see that there are pins and retainer plates in upper body.
- **Be careful not to lose these parts.**

SAT141C

- Check to make sure that oil circuits are clean and free from damage.
- Check tube brackets and tube connectors for damage.



SAT151G

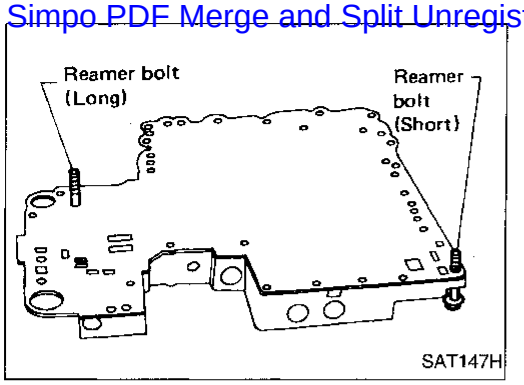
Separator plates

- Check to make sure that separator plate is free of damage and not deformed and oil holes are clean.

Overdrive cancel solenoid valve and torque converter clutch solenoid valve

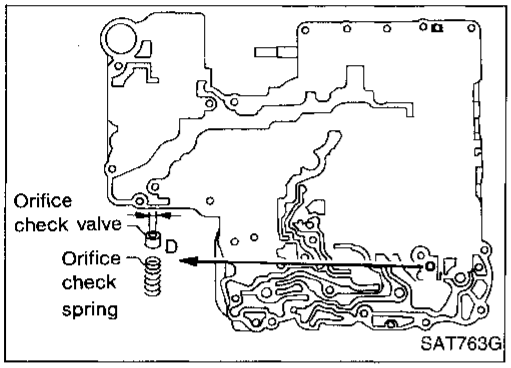
- Check that filter is not clogged or damaged.
- Measure resistance. Refer to "Component Inspection", AT-36.

SAT726C



ASSEMBLY

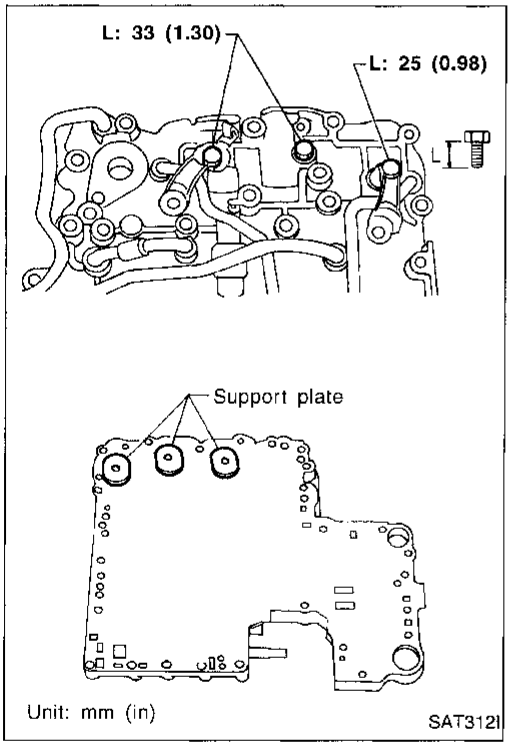
1. Install upper and lower bodies.



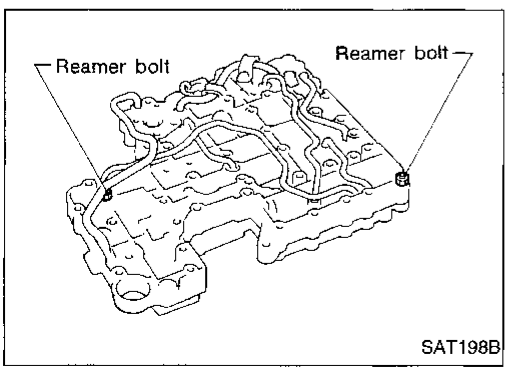
a. Place oil circuit of upper body faceup. Install steel balls in their proper positions.

Control Valve Assembly (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



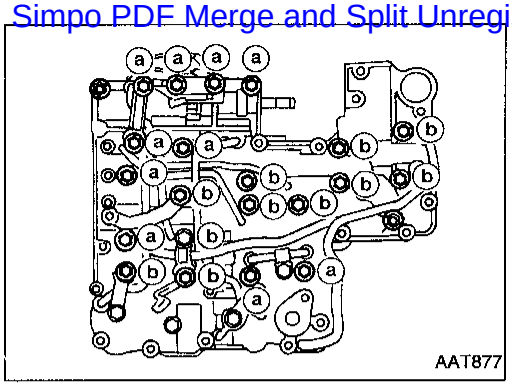
b. Install reamer bolts from bottom of upper body.



c. Place oil circuit of lower body faceup. Install orifice check spring, orifice check valve.

D: mm (in)
2.0 (0.079)

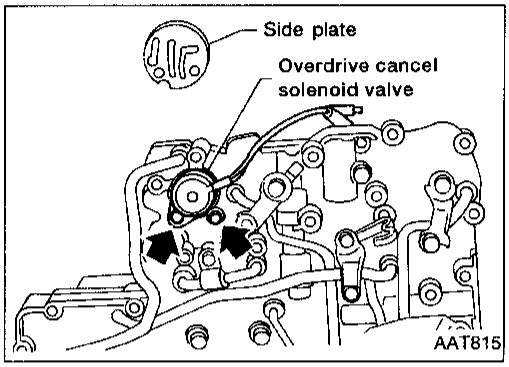
d. Install separator plate on lower body.
e. Temporarily install support plates, side plate (with steel ball) and tube brackets.



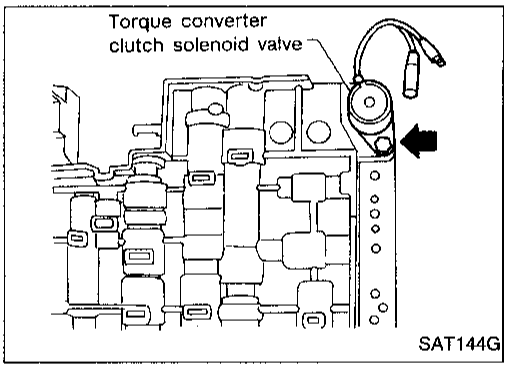
f. Temporarily assemble lower and upper bodies, using reamer bolt as a guide.

- **Be careful not to dislocate or drop steel balls, orifice check spring and orifice check valve.**

Control Valve Assembly (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

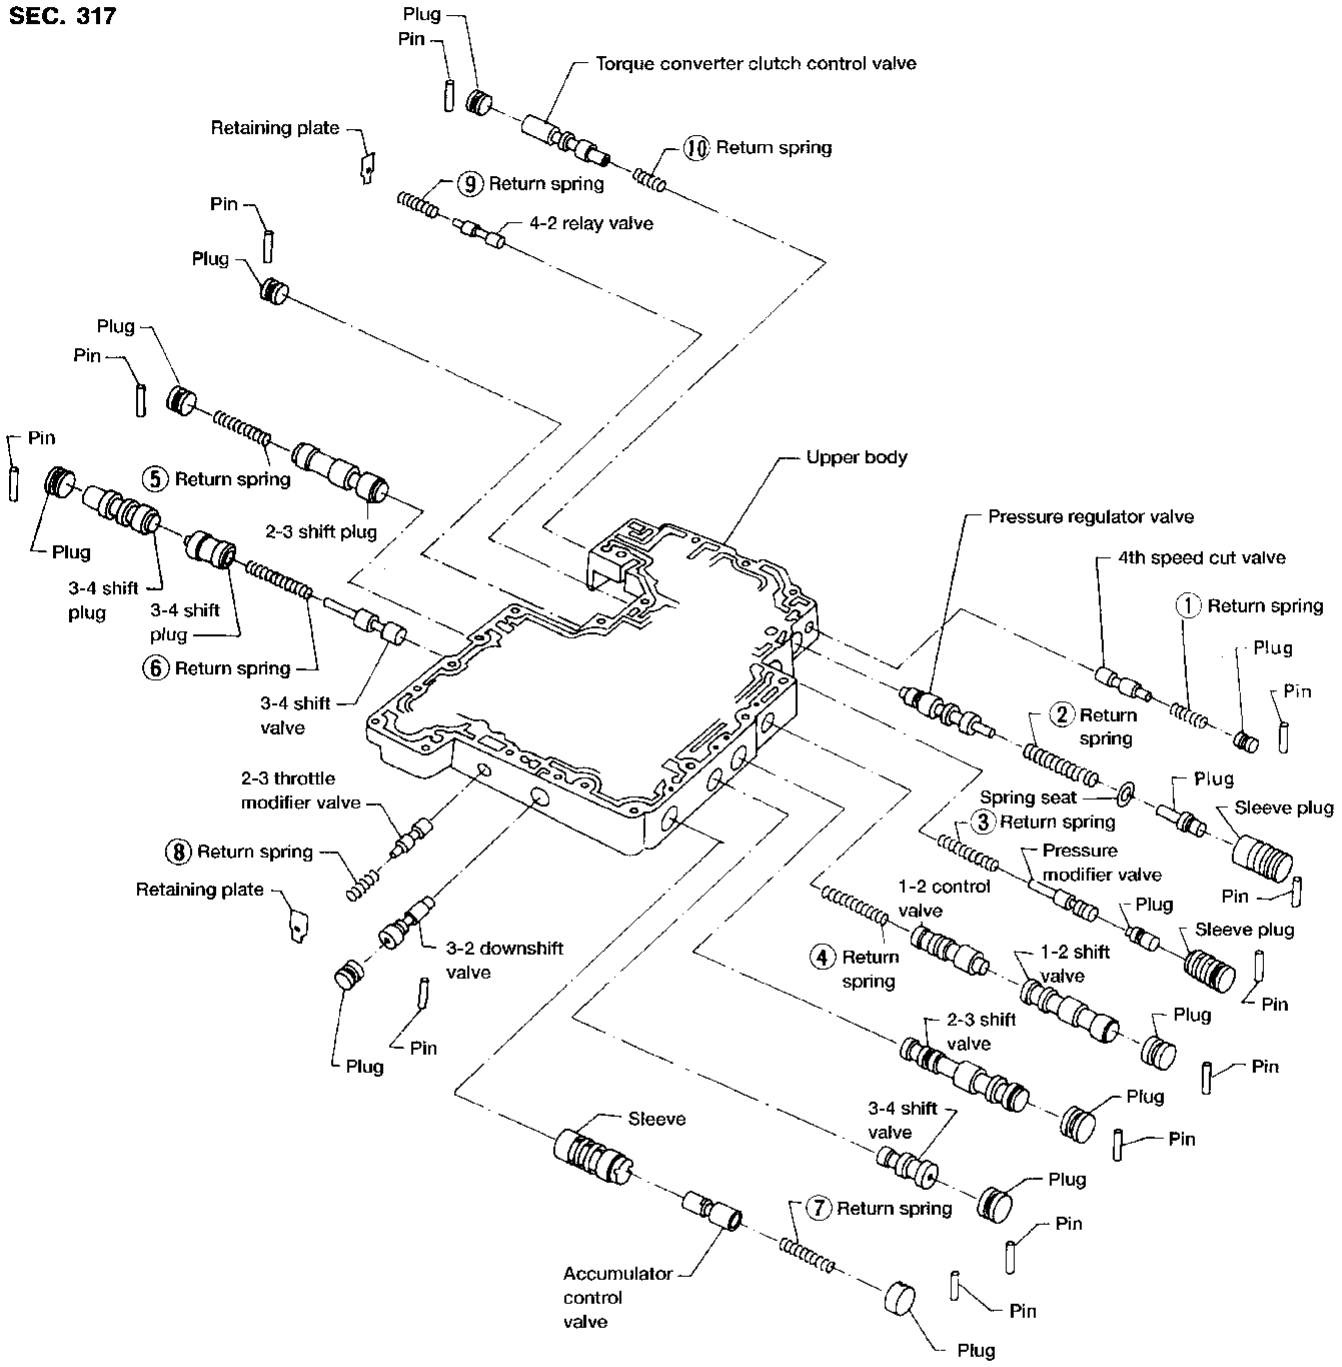


g. Install and temporarily tighten bolts and tube brackets in their proper locations.

Bolt length and location:

		Bolt symbol	
		ⓐ	ⓑ
Bolt length	mm (in)	45 (1.77)	33 (1.30)

2. Install solenoids.
a. Attach O-ring and install overdrive cancel solenoid valve and side plate onto lower body.



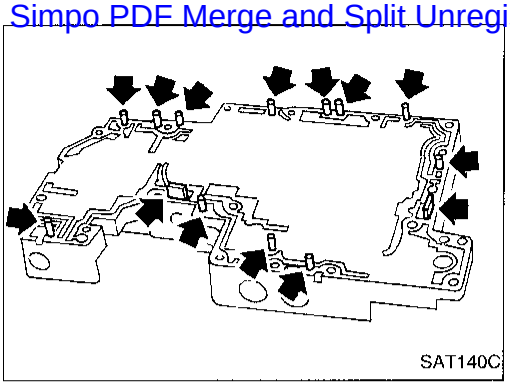
b. Attach O-ring and install torque converter clutch solenoid valve onto upper body.
3. Tighten bolt.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Control Valve Upper Body

SEC. 317

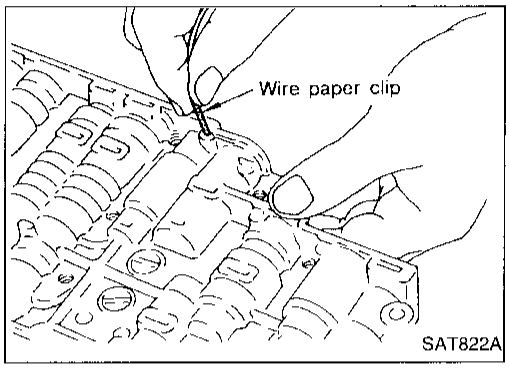
Apply ATF to all components before their installation.



AAT040A

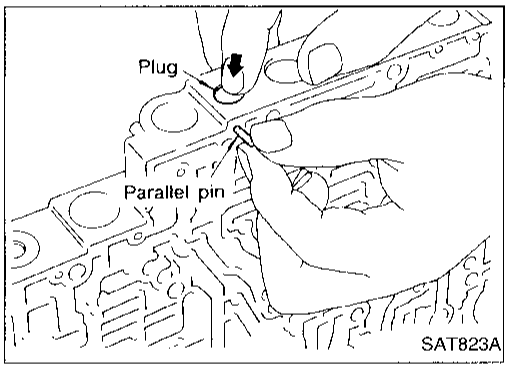
Numbers preceding valve springs correspond with those shown in Return Springs Chart on SDS, AT-123.

Control Valve Upper Body (Cont'd)



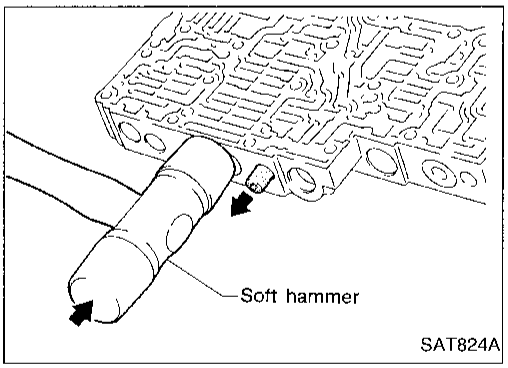
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

DISASSEMBLY

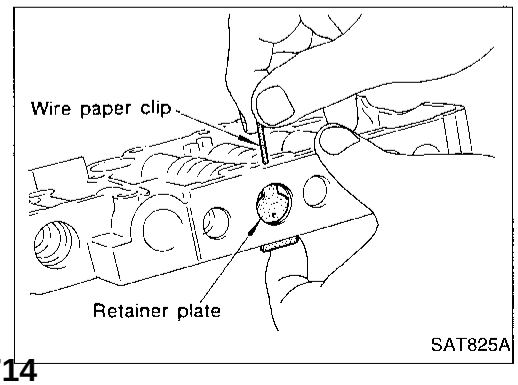


1. Remove valves at parallel pins.

- **Do not use a magnetic pick-up tool.**



a. Use a wire paper clip to push out parallel pins.

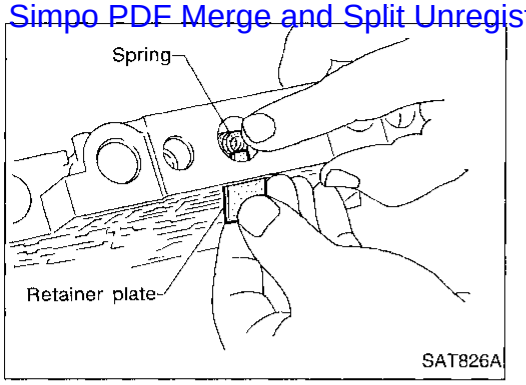


b. Remove parallel pins while pressing their corresponding plugs and sleeves.

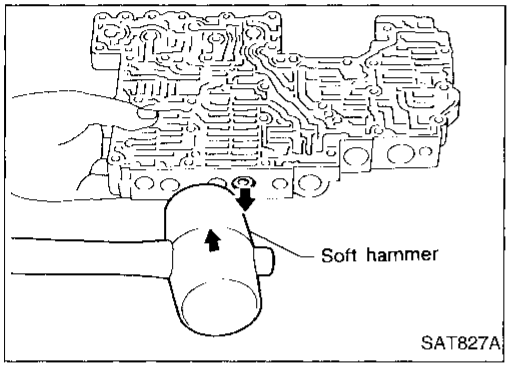
- **Remove plug slowly to prevent internal parts from jumping out.**

c. Place mating surface of valve facedown, and remove internal parts.

- **If a valve is hard to remove, place valve body facedown and lightly tap it with a soft hammer.**
- **Be careful not to drop or damage valves and sleeves.**



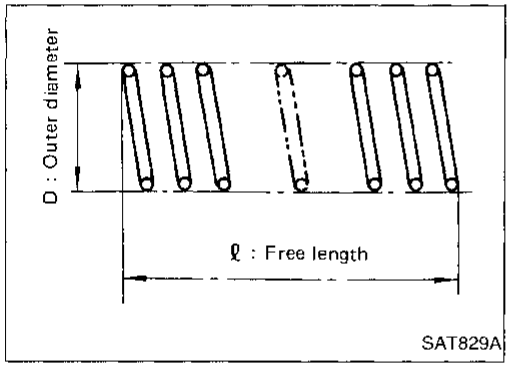
2. Remove valves at retainer plates.



a. Pry out retainer plate with wire paper clip.

Control Valve Upper Body (Cont'd)

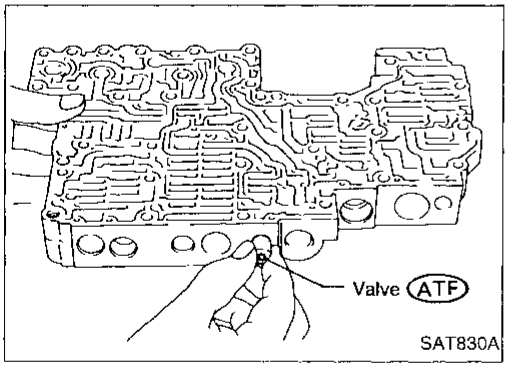
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



b. Remove retainer plates while holding spring.

c. Place mating surface of valve facedown, and remove internal parts.

- **If a valve is hard to remove, lightly tap valve body with a soft hammer.**
- **Be careful not to drop or damage valves, sleeves, etc.**

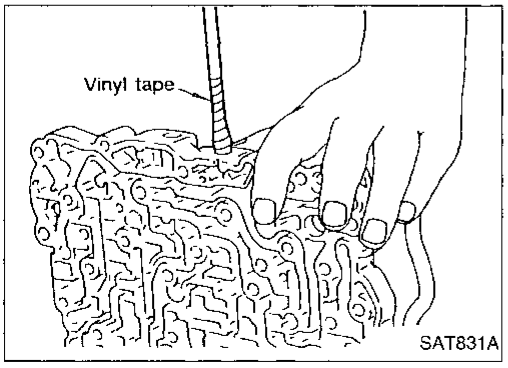


INSPECTION

Valve springs

- Measure free length and outer diameter of each valve spring. Also check for damage or deformation.
  Inspection standard:
  Refer to SDS, AT-123.
- Replace valve springs if deformed or fatigued.

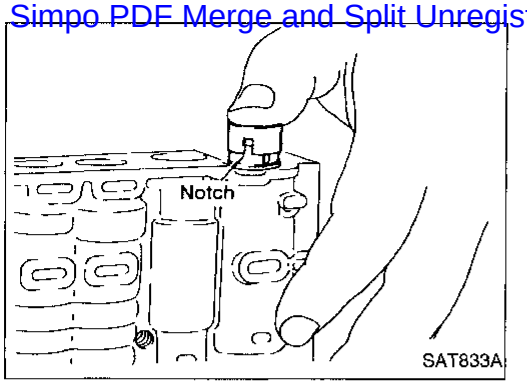
Control valves



- Check sliding surfaces of valves, sleeves and plugs.

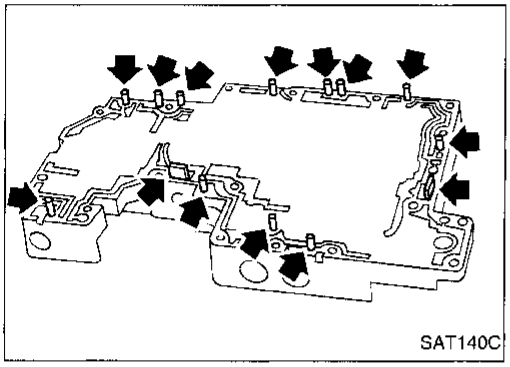
ASSEMBLY

1. Lubricate the control valve body and all valves with ATF. Install control valves by sliding them carefully into their bores.



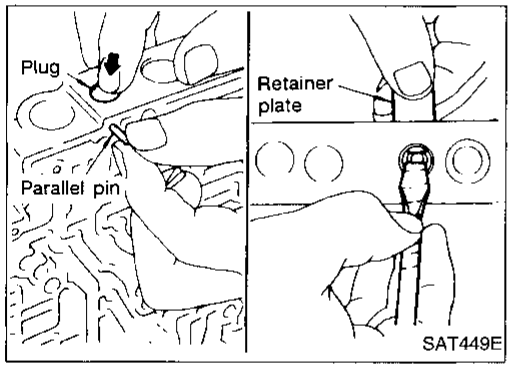
- **Be careful not to scratch or damage valve body.**

- Wrap a small screwdriver with vinyl tape and use it to insert the valves into proper position.



Control Valve Upper Body (Cont'd)

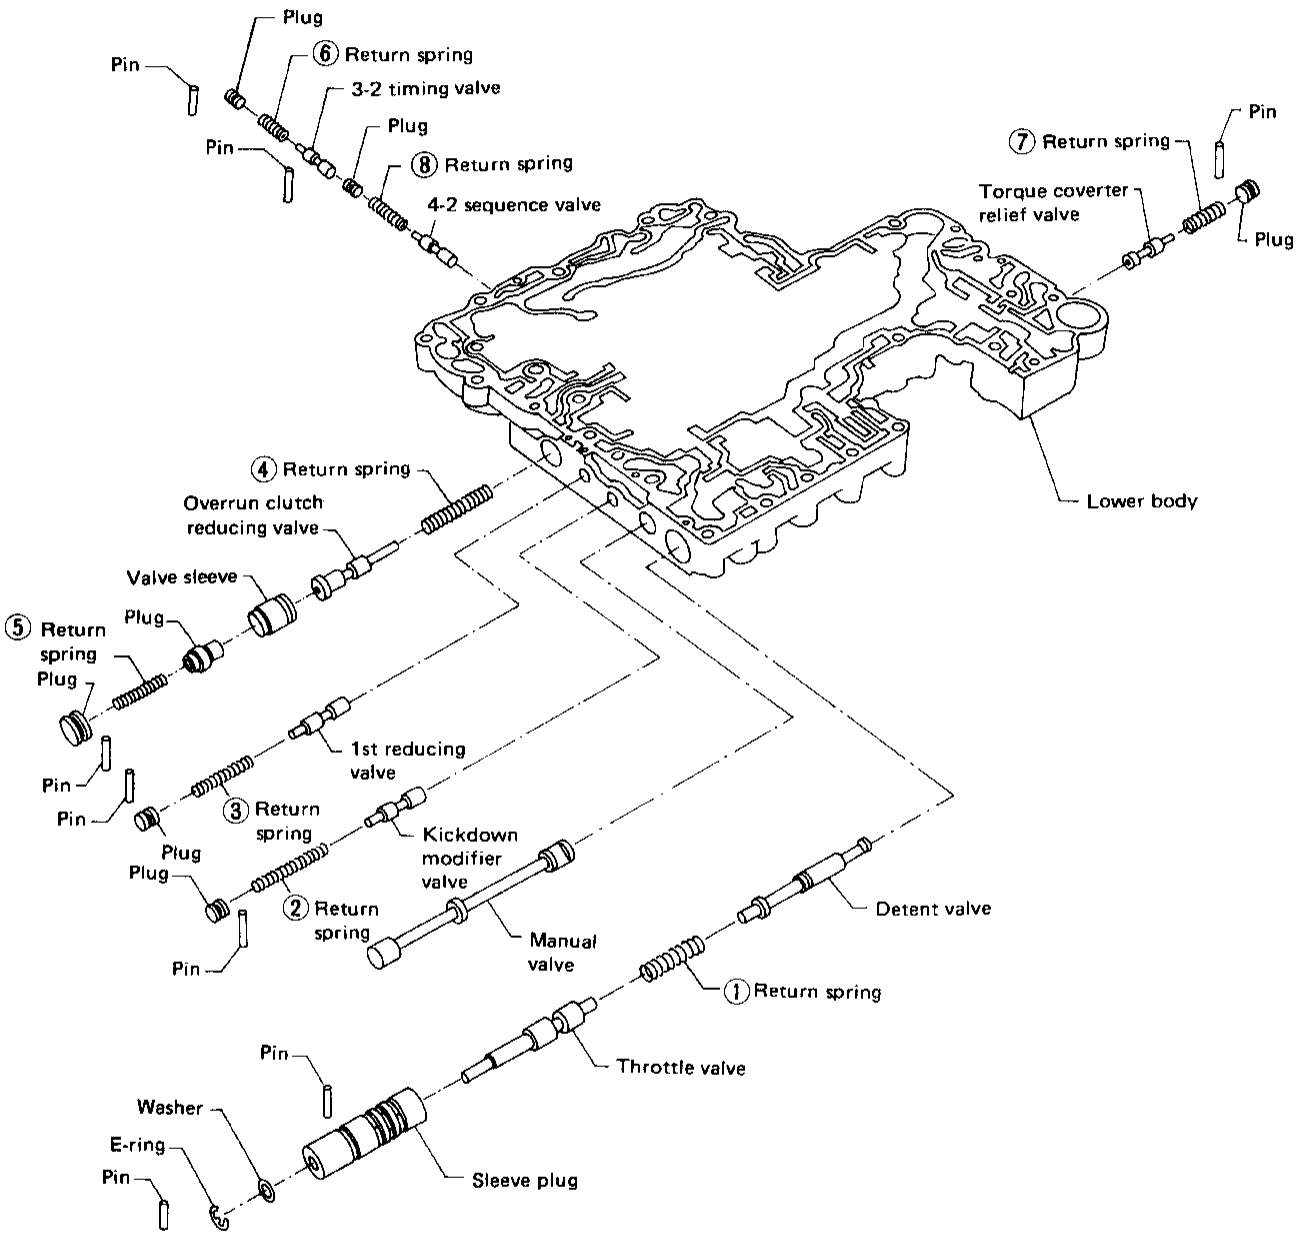
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Accumulator control plug

- Align protrusion of accumulator control sleeve with notch in plug.
- Align parallel pin groove in plug with parallel pin, and install accumulator control valve.

2. Install parallel pins and retainer plates.

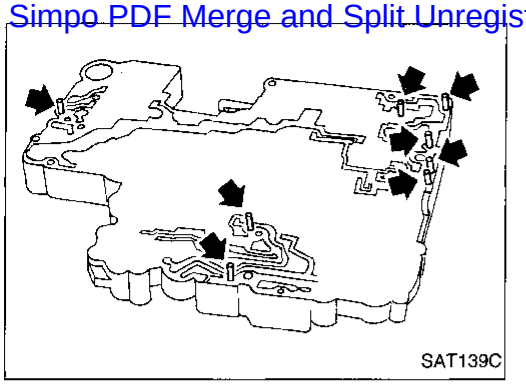


- While pushing plug, install parallel pin.
- Insert retainer plate while pushing spring.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Control Valve Lower Body

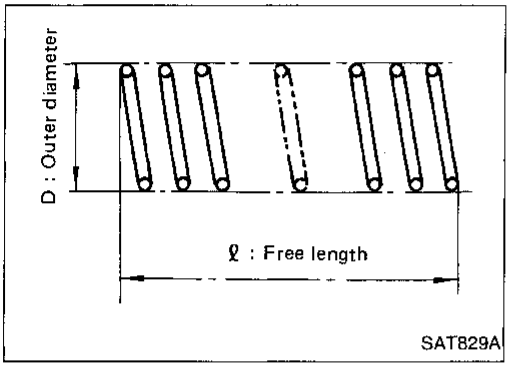
SEC. 317



Apply ATF to all components before their installation.

SAT752GA

Numbers preceding valve springs correspond with those shown in Return Springs Chart on SDS, AT-123.



Control Valve Lower Body (Cont'd)

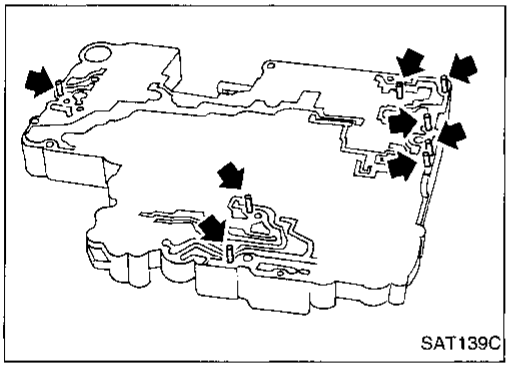
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SAT139C

DISASSEMBLY

1. Remove valves at parallel pins.
2. Remove valves at retainer plates.
   For removal procedures, refer to "DISASSEMBLY", "Control Valve Upper Body," AT-76.

SAT829A



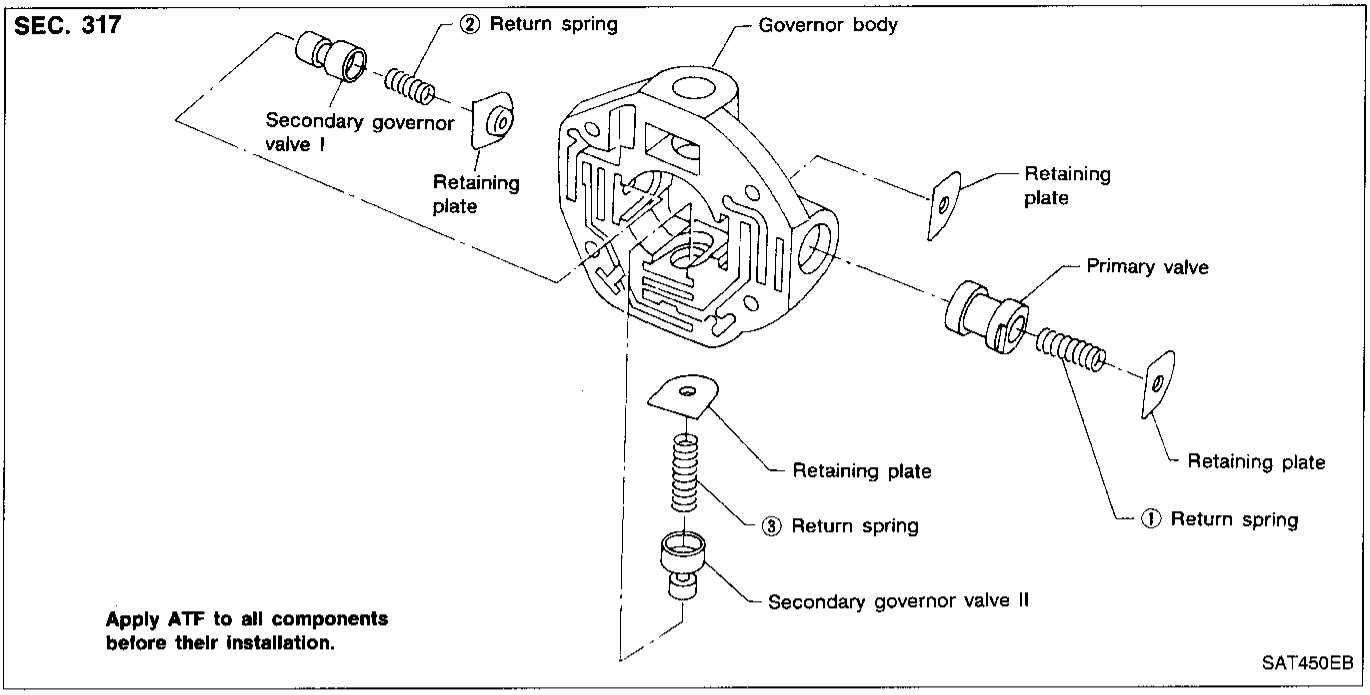
INSPECTION

Valve springs

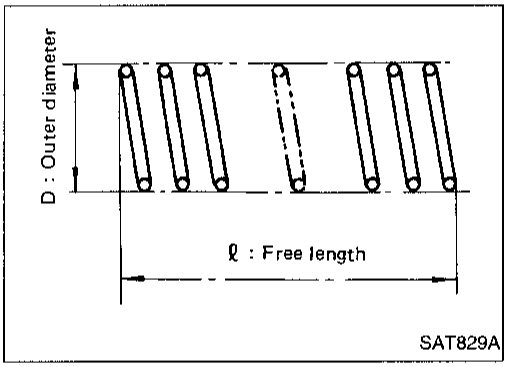
- Check each valve spring for damage and deformation. Also measure free length and outer diameter.
  Inspection standard:
  Refer to SDS, AT-123.
- Replace valve springs if deformed or fatigued.

Control valves

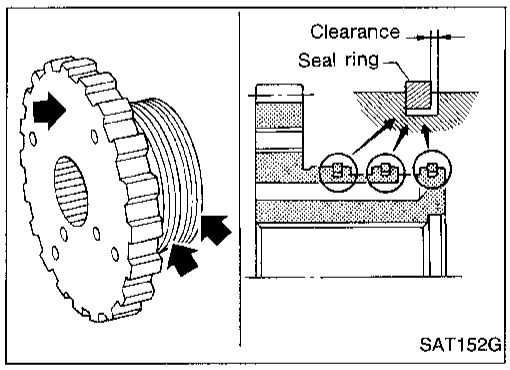
- Check sliding surfaces of control valves, sleeves and plugs for damage.



SAT139C



ASSEMBLY



- Install control valves.
  For installation procedures, refer to "ASSEMBLY", "Control Valve Upper Body," AT-77.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Governor Valve Assembly

INSPECTION

Valve springs

- Measure free length and outer diameter of each valve spring. Also check for damage or deformation.

  Inspection standard:

  Refer to SDS, AT-123.

Governor valves and valve body

- Check governor valves and valve body for indication of burning or scratches.

Parking Gear

INSPECTION

- Check contacting surface of parking gear and ring groove areas for wear.
- Measure clearance between seal ring and ring groove.

  Standard clearance:

  0.15 - 0.40 mm (0.0059 - 0.0157 in)

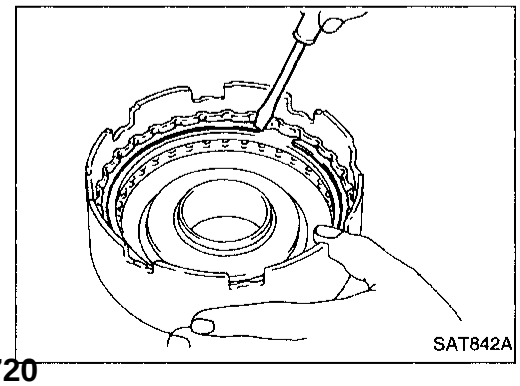
  Wear limit:

  0.40 mm (0.0157 in)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Reverse Clutch

DISASSEMBLY

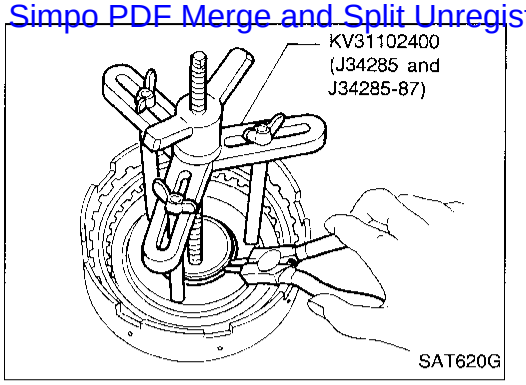


1. Check operation of reverse clutch.

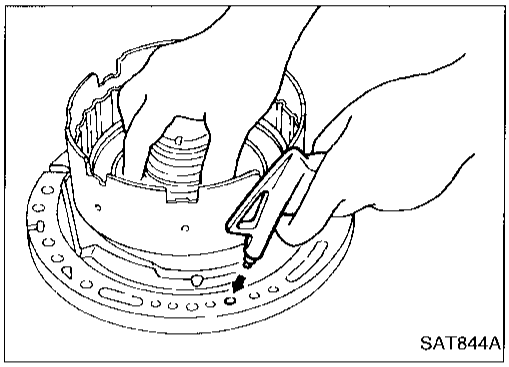
a. Install seal ring onto oil pump cover and install reverse clutch. Apply compressed air to oil hole.

b. Check to see that retaining plate moves to snap ring.

c. If retaining plate does not contact snap ring,



- D-ring might be damaged.
- Oil seal might be damaged.
- Fluid might be leaking past piston check ball.

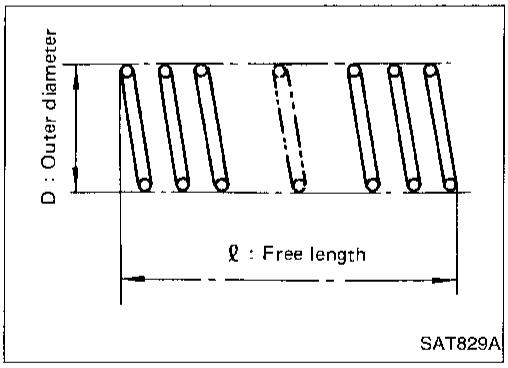


2. Remove snap ring, drive plates, driven plates, retaining plate and dish plate.

Reverse Clutch (Cont'd)

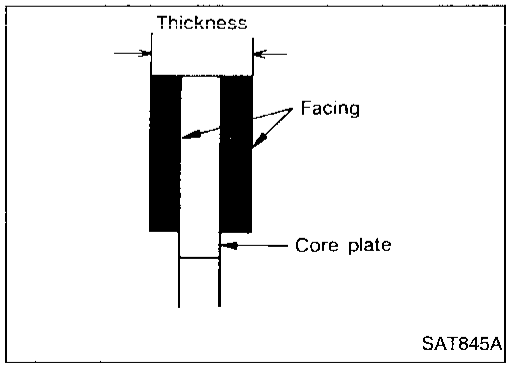
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

3. Remove snap ring from clutch drum while compressing clutch springs.
   - **Set Tool directly over springs.**
   - **Do not expand snap ring excessively.**
4. Remove spring retainer and return spring.



5. Install seal ring onto oil pump cover and install reverse clutch drum. While holding piston, gradually apply compressed air to oil hole until piston is removed.
   - **Do not apply compressed air abruptly.**
6. Remove D-ring and oil seal from piston.

INSPECTION



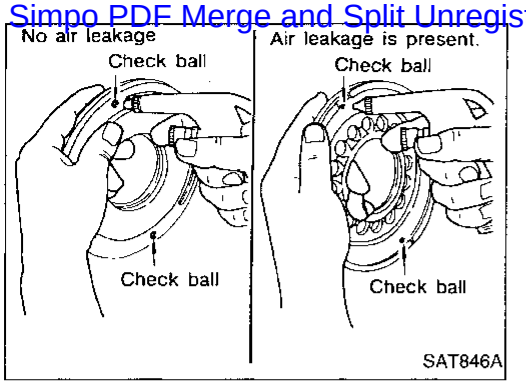
Reverse clutch snap ring and spring retainer

- Check for deformation, fatigue and damage.

Reverse clutch return springs

- Check for deformation and damage. Also measure free length and outside diameter.
  Inspection standard:
  Refer to SDS, AT-123.

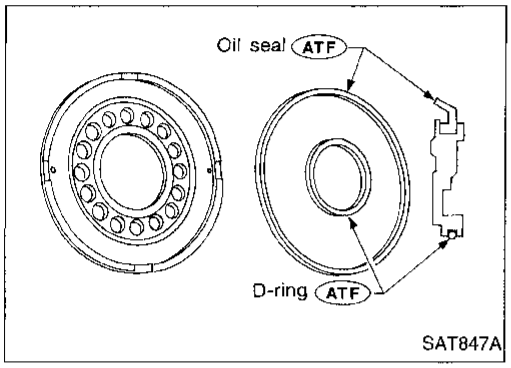
Reverse clutch drive plates



- Check facing for burns, cracks and damage.
- Measure thickness of facing.
  Thickness of drive plate:
  Standard value 1.90 - 2.05 mm (0.0748 - 0.0807 in)
  Wear limit 1.80 mm (0.0709 in)
- If not within wear limit, replace.

Reverse clutch dish plate

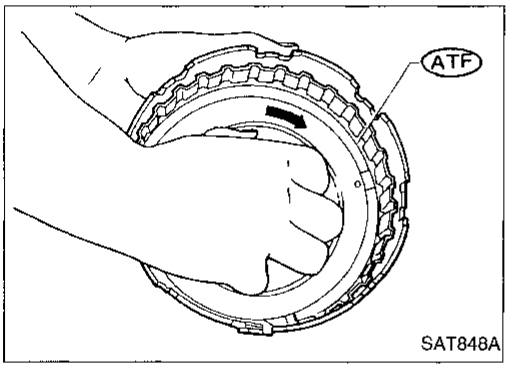
- Check for deformation and damage.



Reverse Clutch (Cont'd)

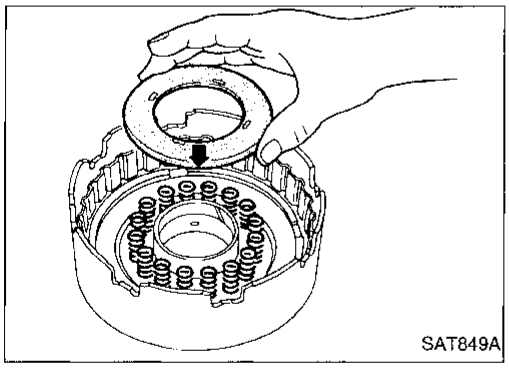
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Reverse clutch piston



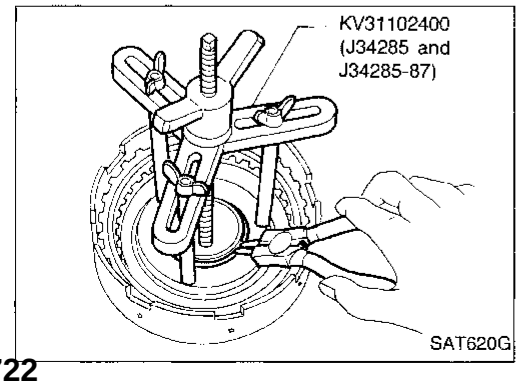
- Shake piston to assure that balls are not seized.
- Apply compressed air to check ball oil hole opposite the return spring to assure that there is no air leakage.
- Also apply compressed air to oil hole on return spring side to assure that air leaks past ball.

ASSEMBLY



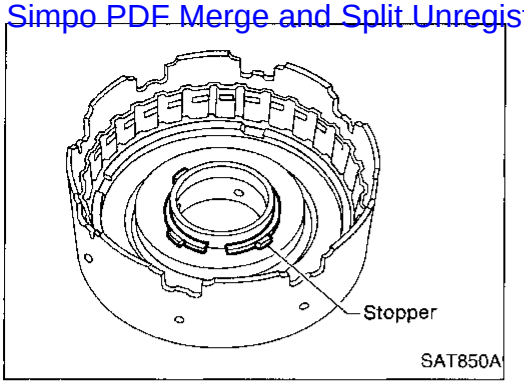
1. Install D-ring and oil seal on piston.

- **Apply ATF to both parts.**
- **Take care with the direction of oil seal.**

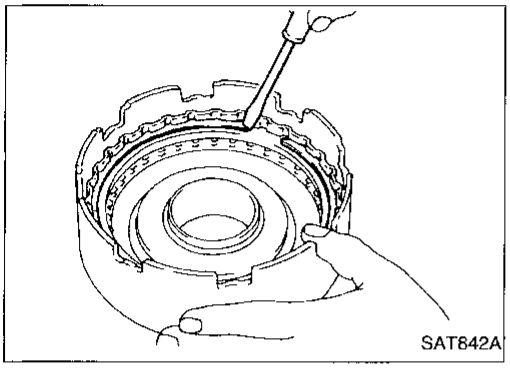


2. Install piston assembly by turning it slowly and evenly.

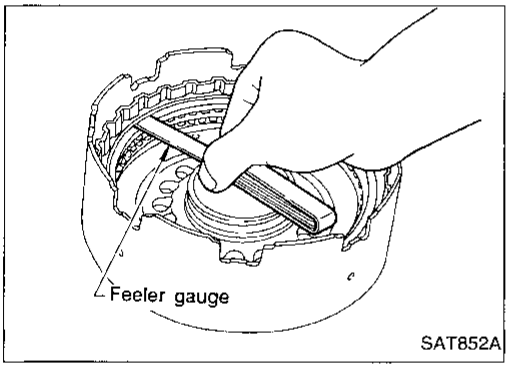
- **Apply ATF to inner surface of drum.**



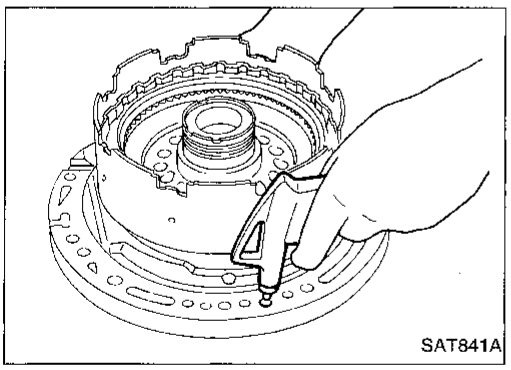
3. Install return springs and spring retainer.



4. Set Tool on spring retainer and install snap ring while compressing clutch springs.

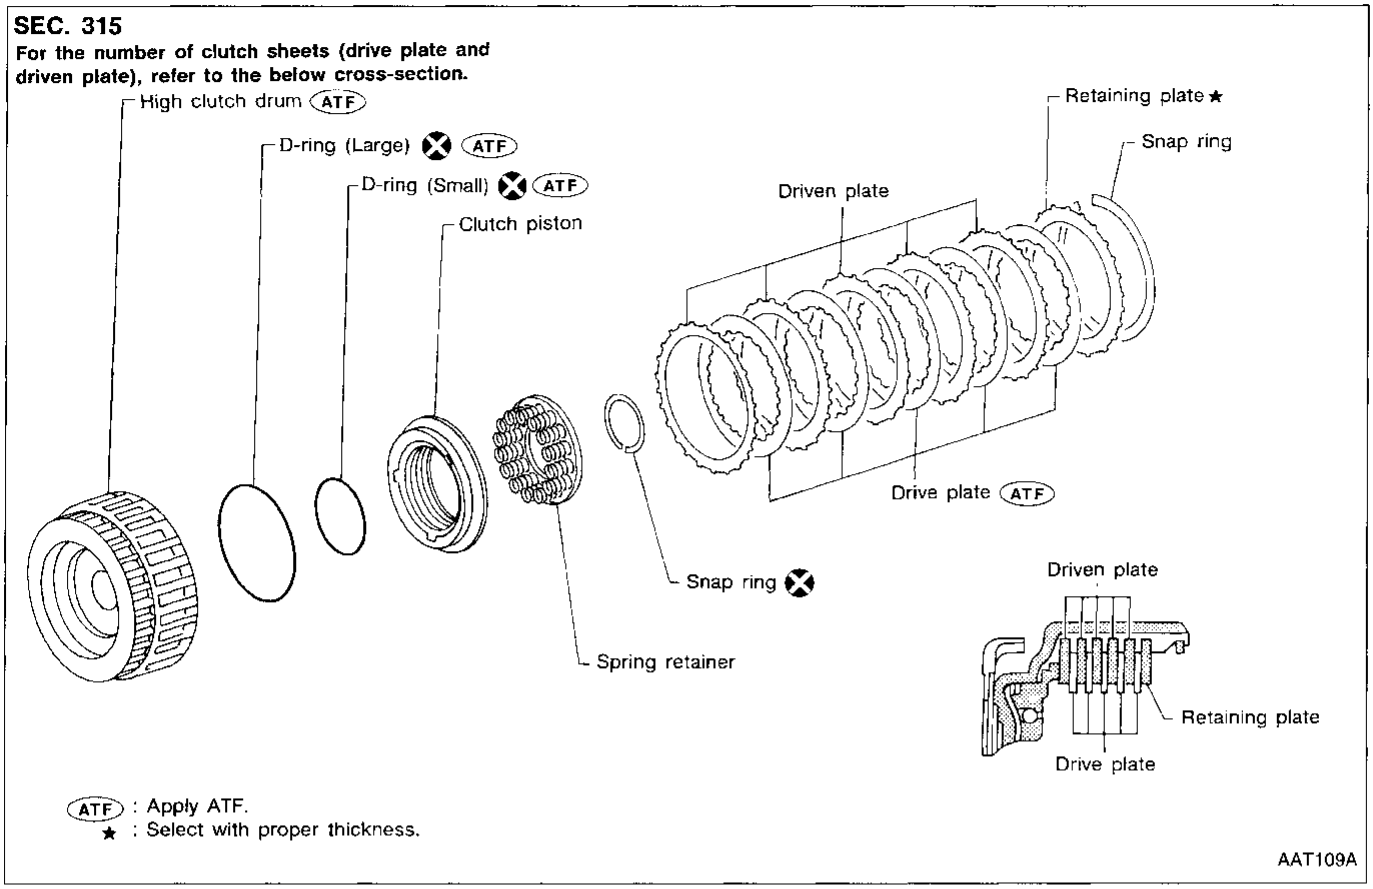


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

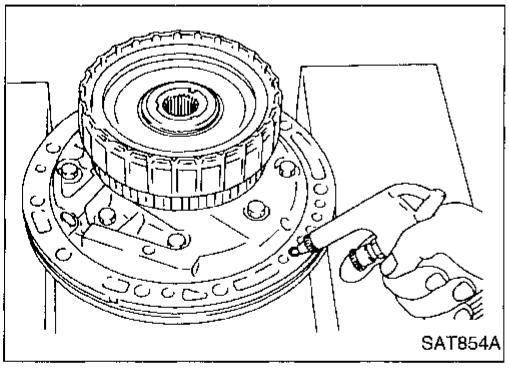


- **Do not align snap ring gap with spring retainer stopper.**

5. Install drive plates, driven plates, retaining plate and dish plate.
6. Install snap ring.



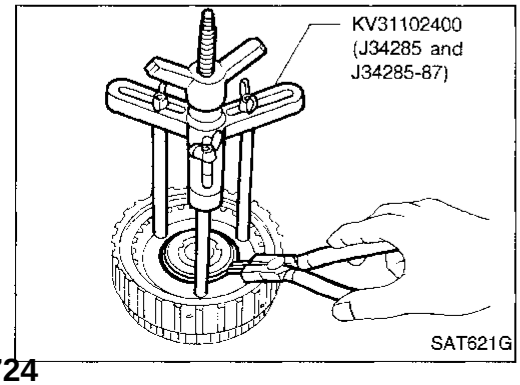
7. Measure clearance between retaining plate and snap ring. If not within allowable limit, select proper retaining plate.
   Specified clearance:
   Standard
   0.5 - 0.8 mm (0.020 - 0.031 in)
   Allowable limit
   1.2 mm (0.047 in)
   Retaining plate:
   Refer to SDS, AT-124.



8. Check operation of reverse clutch.
   Refer to "DISASSEMBLY", "Reverse Clutch", AT-82.

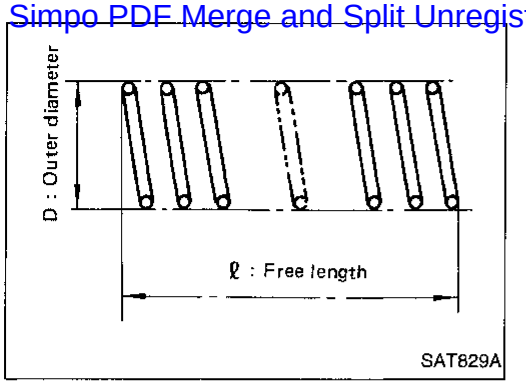
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

High Clutch

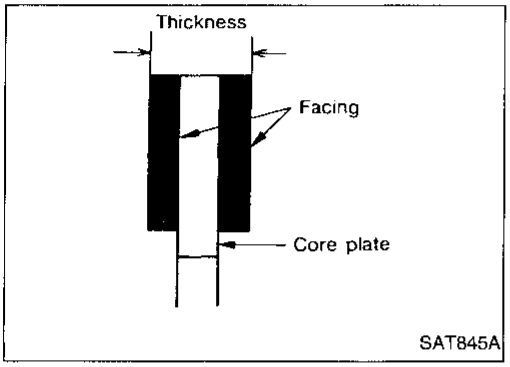


DISASSEMBLY AND ASSEMBLY

Service procedures for high clutch are essentially the same as those for reverse clutch, with the following exceptions:

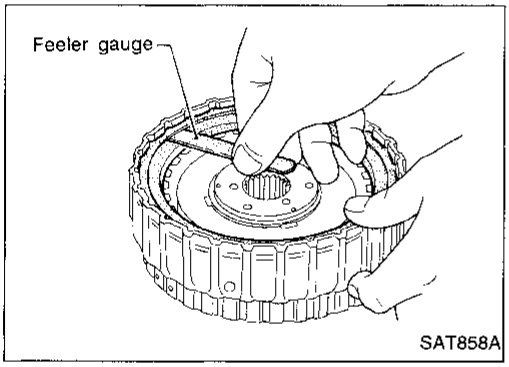


- Check of high clutch operation



- Removal and installation of return spring

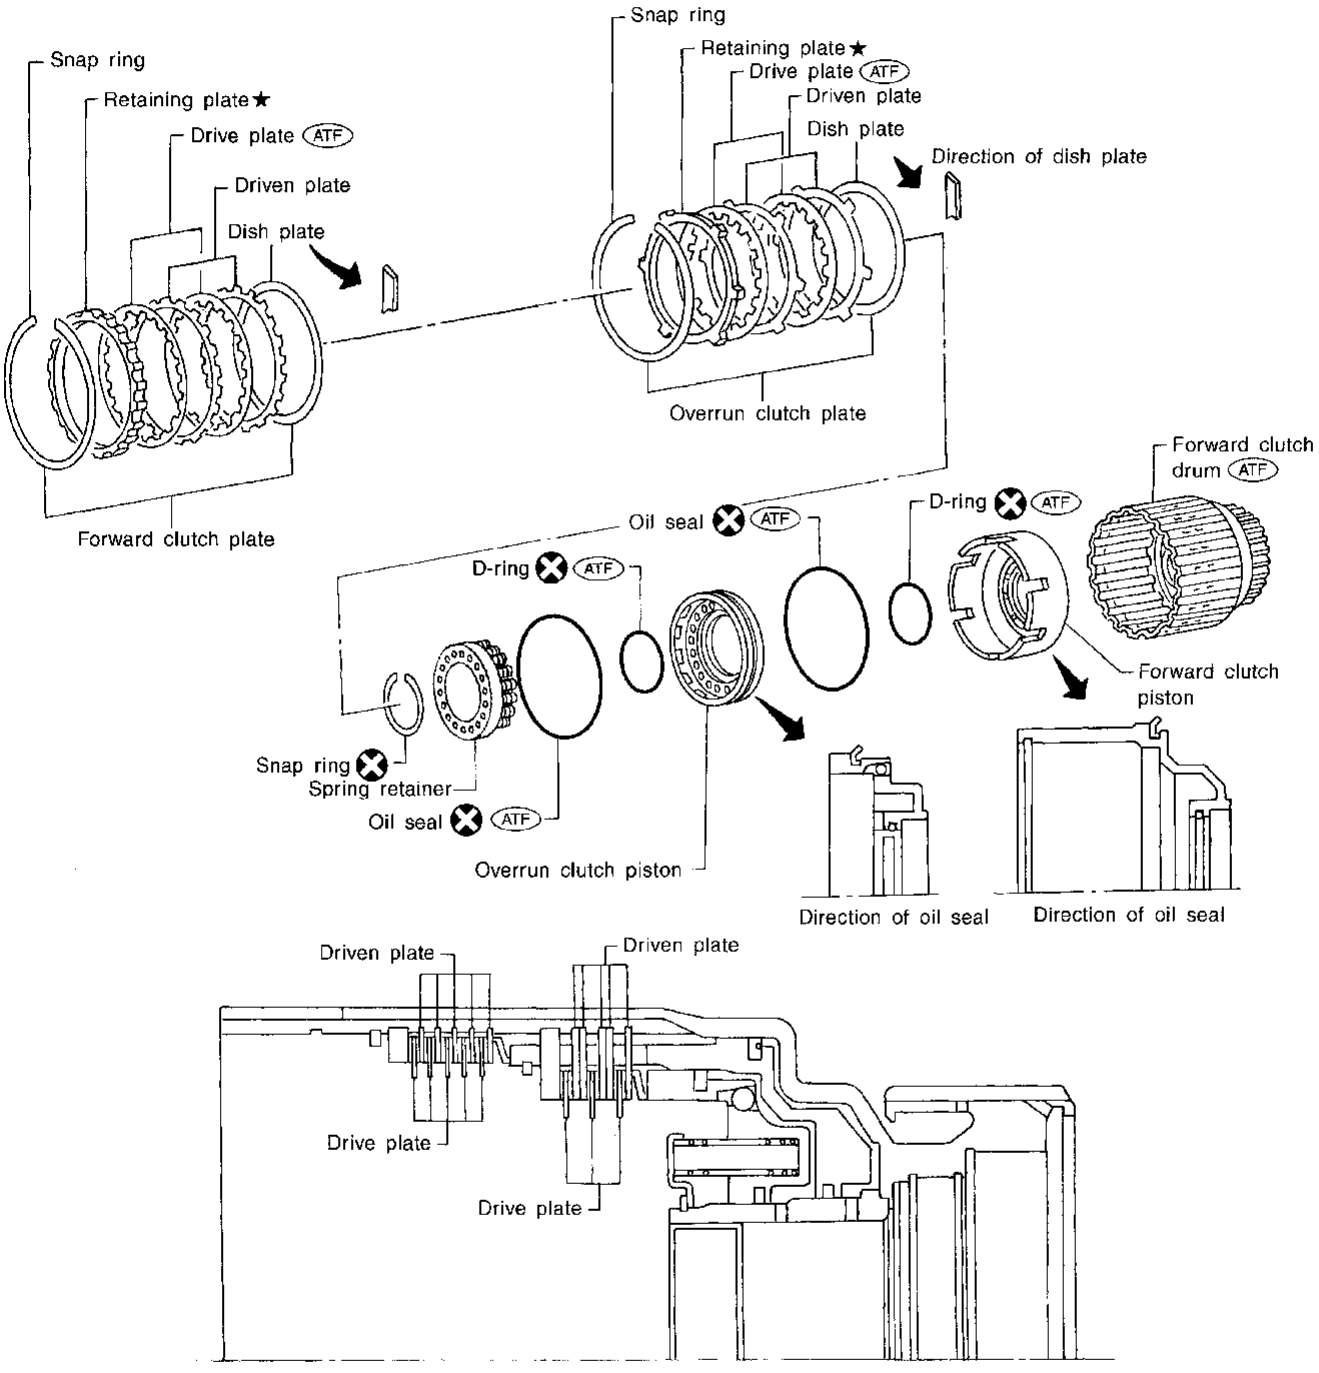
High Clutch (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

- Inspection of high clutch return springs
  Inspection standard:
  Refer to SDS, AT-123.

- Inspection of high clutch drive plate
  Thickness of drive plate:
  Standard
  1.52 - 1.67 mm (0.0598 - 0.0657 in)
  Wear limit
  1.40 mm (0.0551 in)



- Measurement of clearance between retaining plate and snap ring
  Specified clearance:
  Standard
  1.8 - 2.2 mm (0.071 - 0.087 in)
  Allowable limit
  2.8 mm (0.110 in)
  Retaining plate:
  Refer to SDS, AT-124.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

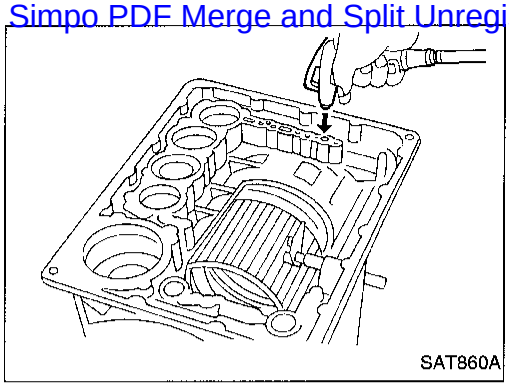
Forward and Overrun Clutches

SEC. 315

For the number of clutch sheets (drive plate and driven plate), refer to the below cross-section.

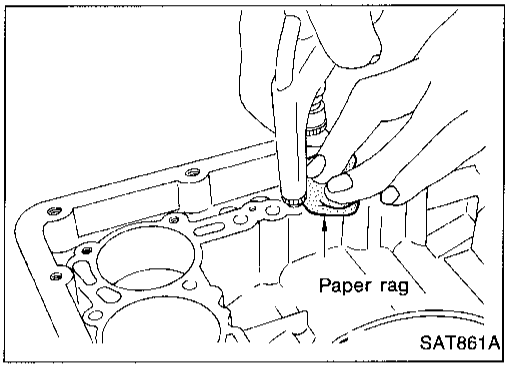
(ATF) : Apply ATF.
★ : Select with proper thickness.

AAT110A



Forward and Overrun Clutches (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

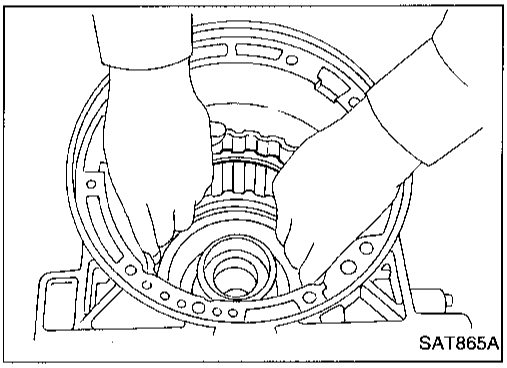


DISASSEMBLY AND ASSEMBLY

Service procedures for forward and overrun clutches are essentially the same as those for reverse clutch, with the following exceptions:

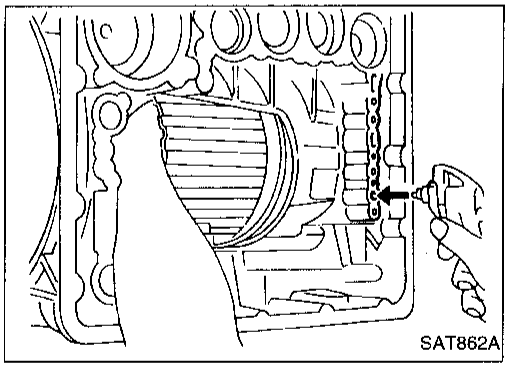
- Check of forward clutch operation.

SAT860A



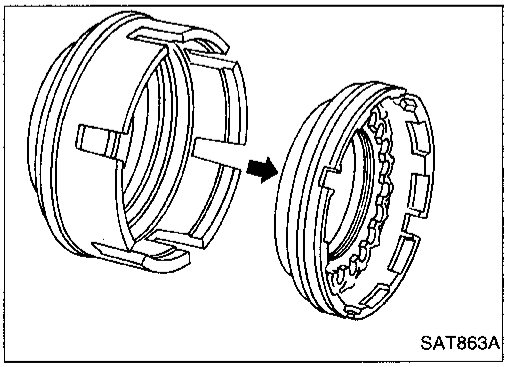
- Check of overrun clutch operation.

SAT861A



- Removal of forward clutch drum

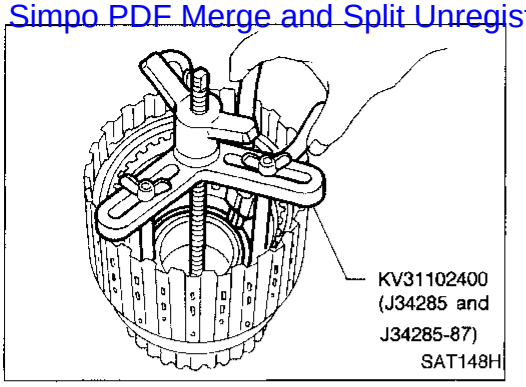
Remove forward clutch drum from transmission case by holding snap ring.



SAT865A

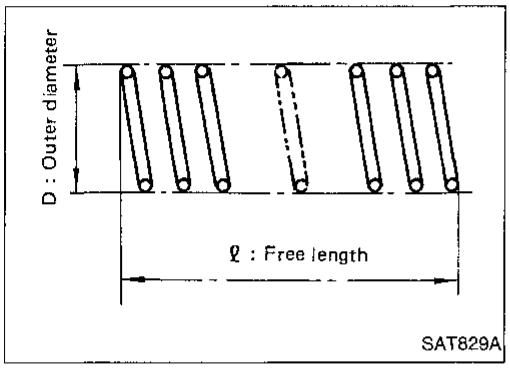
- Removal of forward clutch and overrun clutch pistons

1. While holding overrun clutch piston, gradually apply compressed air to oil hole.



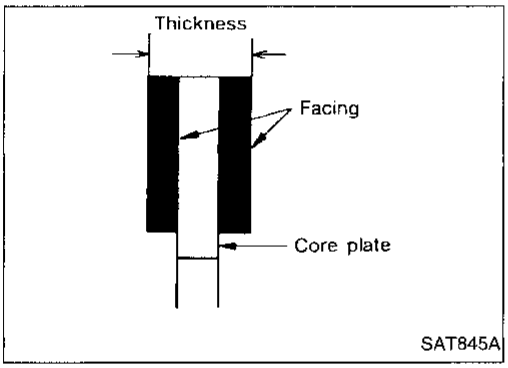
SAT862A

2. Remove overrun clutch from forward clutch.



SAT863A

Forward and Overrun Clutches (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

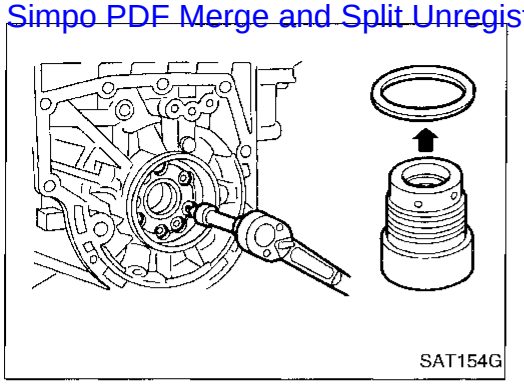
Low & Reverse Brake

DISASSEMBLY

1. Check operation of low and reverse brake.

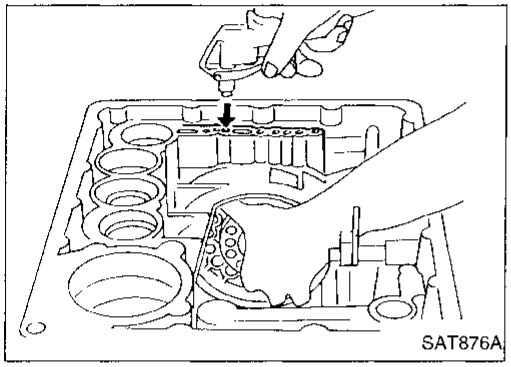
a. Install seal ring onto oil pump cover and install reverse clutch. Apply compressed air to oil hole.

b. Check to see that retaining plate moves to snap ring.



c. If retaining plate does not contact snap ring,

- D-ring might be damaged.
- Oil seal might be damaged.
- Fluid might be leaking past piston check ball.



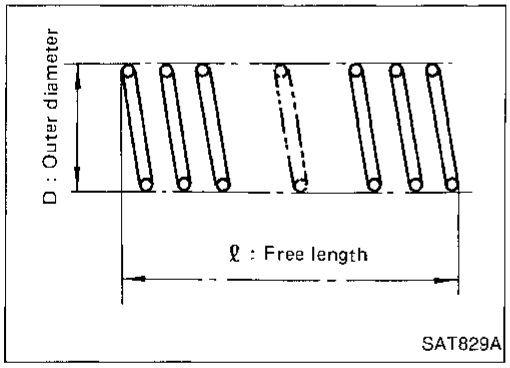
2. Remove snap ring, low & reverse brake drive plates, driven plates and dish plate.

Low & Reverse Brake (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SAT154G

3. Remove low one-way clutch inner race, spring retainer and return spring from transmission case.
4. Remove seal rings from low one-way clutch inner race.
5. Remove needle bearing from low one-way clutch inner race.

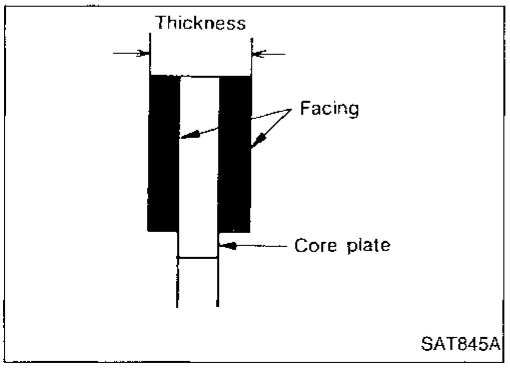


SAT876A

6. Remove low & reverse brake piston using compressed air.
7. Remove oil seal and D-ring from piston.

INSPECTION

Low & reverse brake snap ring and spring retainer



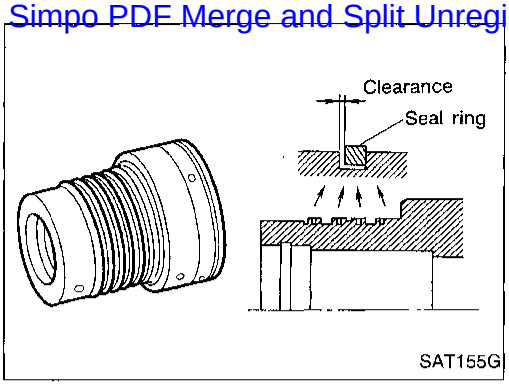
- Check for deformation, or damage.

SAT829A

Low & reverse brake return springs

- Check for deformation or damage. Also measure free length and outside diameter.
  Inspection standard:
  Refer to SDS, AT-123.

SAT845A



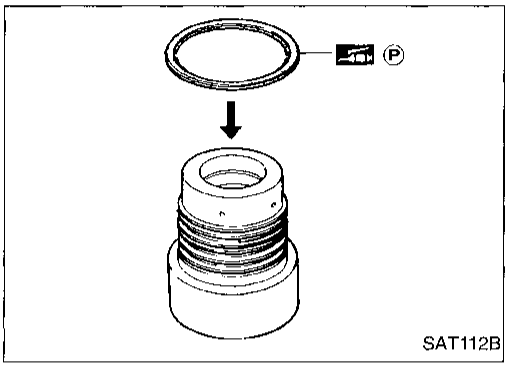
Low & reverse brake drive plates

- Check facing for burns, cracks or damage.
- Measure thickness of facing.
  Thickness of drive plate:
  Standard value
  1.52 - 1.67 mm (0.0598 - 0.0657 in)
  Wear limit
  1.4 mm (0.055 in)
- If not within wear limit, replace.

Low & Reverse Brake (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Low one-way clutch inner race

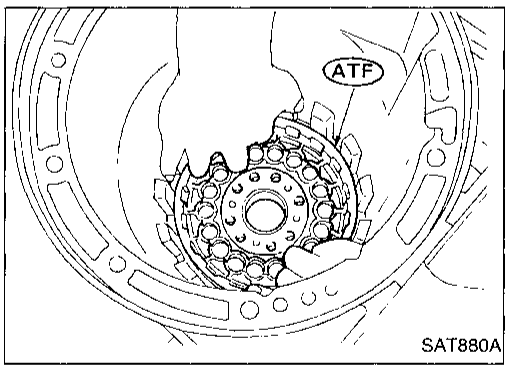


- Check frictional surface of inner race for wear or damage.
- Install new seal rings onto low one-way clutch inner race.
- **Be careful not to expand seal ring gap excessively.**
- Measure seal ring-to-groove clearance.

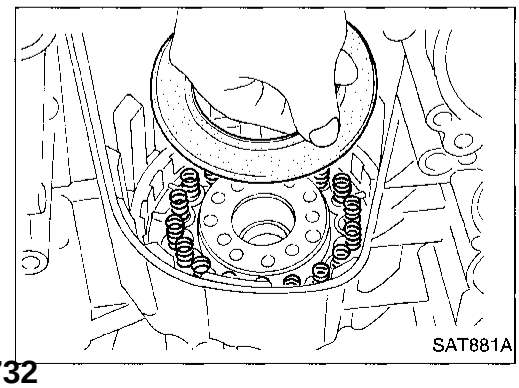
  Inspection standard:

  Standard value 0.10 - 0.25 mm (0.0039 - 0.0098 in)

  Allowable limit 0.25 mm (0.0098 in)
- If not within allowable limit, replace low one-way clutch inner race.

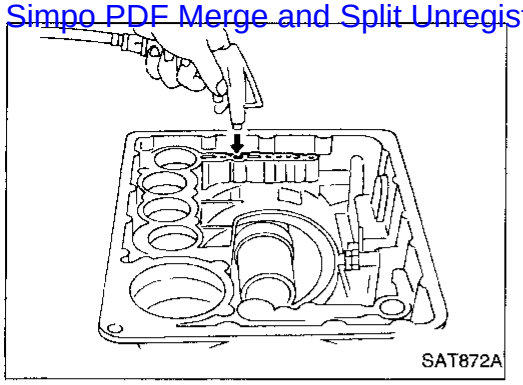


ASSEMBLY

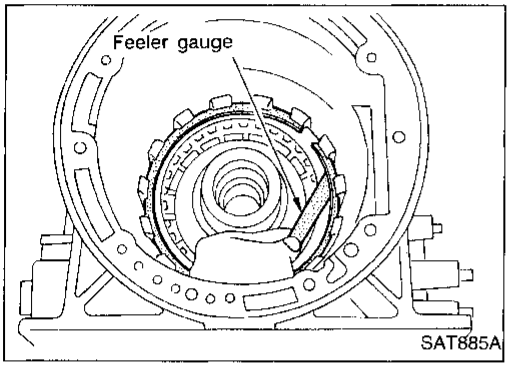


1. Install needle bearing onto one-way clutch inner race.
- **Pay attention to its direction — black surface faces to rear side.**
- **Apply petroleum jelly to thrust washers.**

2. Install oil seal and D-ring onto piston.
- **Apply ATF to oil seal and D-ring.**



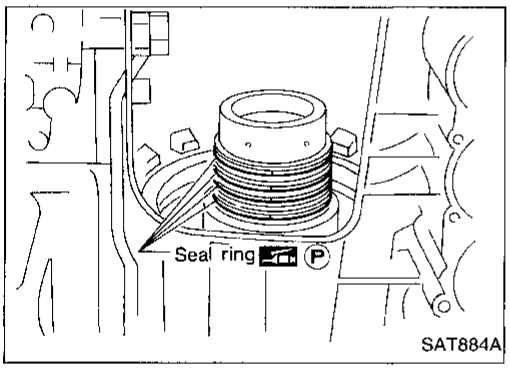
3. Install piston by rotating it slowly and evenly.
- **Apply ATF to inner surface of transmission case.**



4. Install return springs, spring retainer and low one-way clutch inner race onto transmission case.
5. Install dish plate, low & reverse brake drive plates, driven plates and retaining plate.
6. Install snap ring on transmission case.

Low & Reverse Brake (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

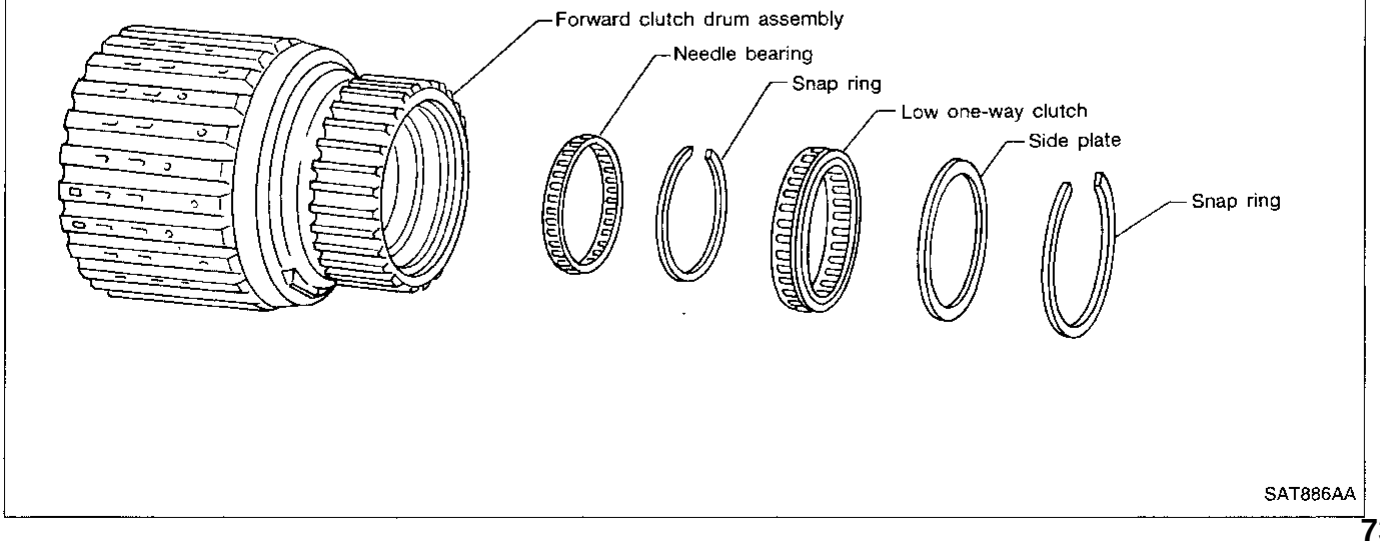


SAT872A

7. Check operation of low & reverse brake clutch piston. Refer to "DISASSEMBLY", AT-92.

SAT885A

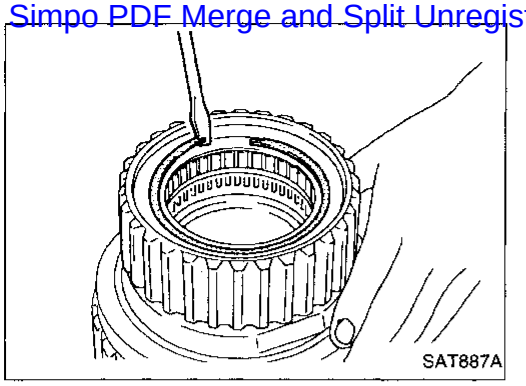
8. Measure clearance between retaining plate and snap ring. If not within allowable limit, select proper retaining plate.
   Specified clearance:
   Standard
   0.5 - 0.8 mm (0.020 - 0.031 in)
   Allowable limit
   2.3 mm (0.091 in)
   Retaining plate:
   Refer to SDS, AT-124.



SAT884A

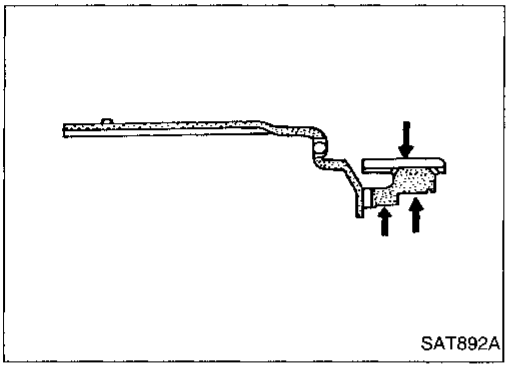
9. Install low one-way clutch inner race seal ring.
- **Apply petroleum jelly to seal ring.**
- **Make sure seal rings are pressed firmly into place and held by petroleum jelly.**

Forward Clutch Drum Assembly



SEC. 315

SAT886AA

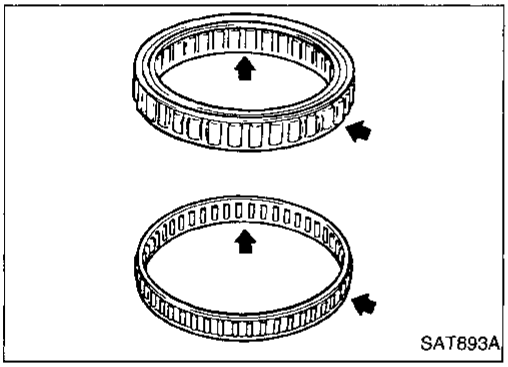


Forward Clutch Drum Assembly (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SAT887A

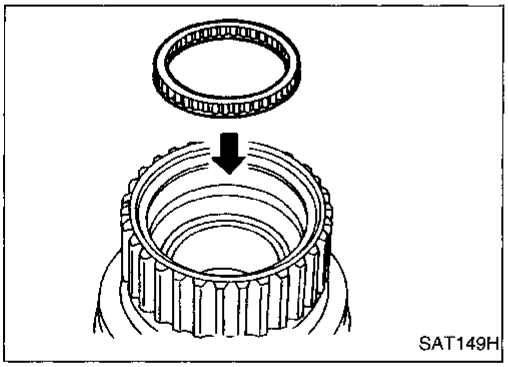
DISASSEMBLY



1. Remove snap ring from forward clutch drum.
2. Remove side plate from forward clutch drum.
3. Remove low one-way clutch from forward clutch drum.
4. Remove snap ring from forward clutch drum.
5. Remove needle bearing from forward clutch drum.

SAT892A

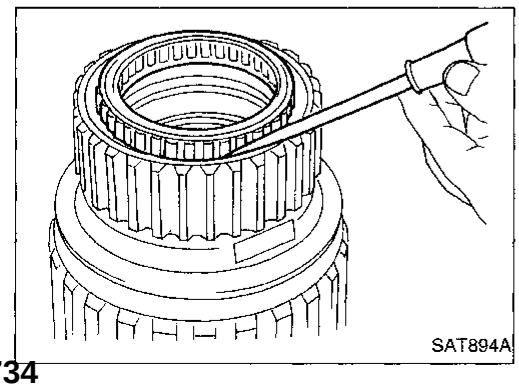
INSPECTION



Forward clutch drum

- Check spline portion for wear or damage.
- Check frictional surfaces of low one-way clutch and needle bearing for wear or damage.

SAT893A

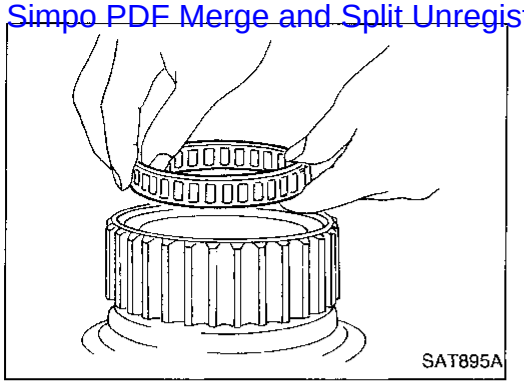


Needle bearing and low one-way clutch

- Check frictional surface for wear or damage.

SAT149H

ASSEMBLY

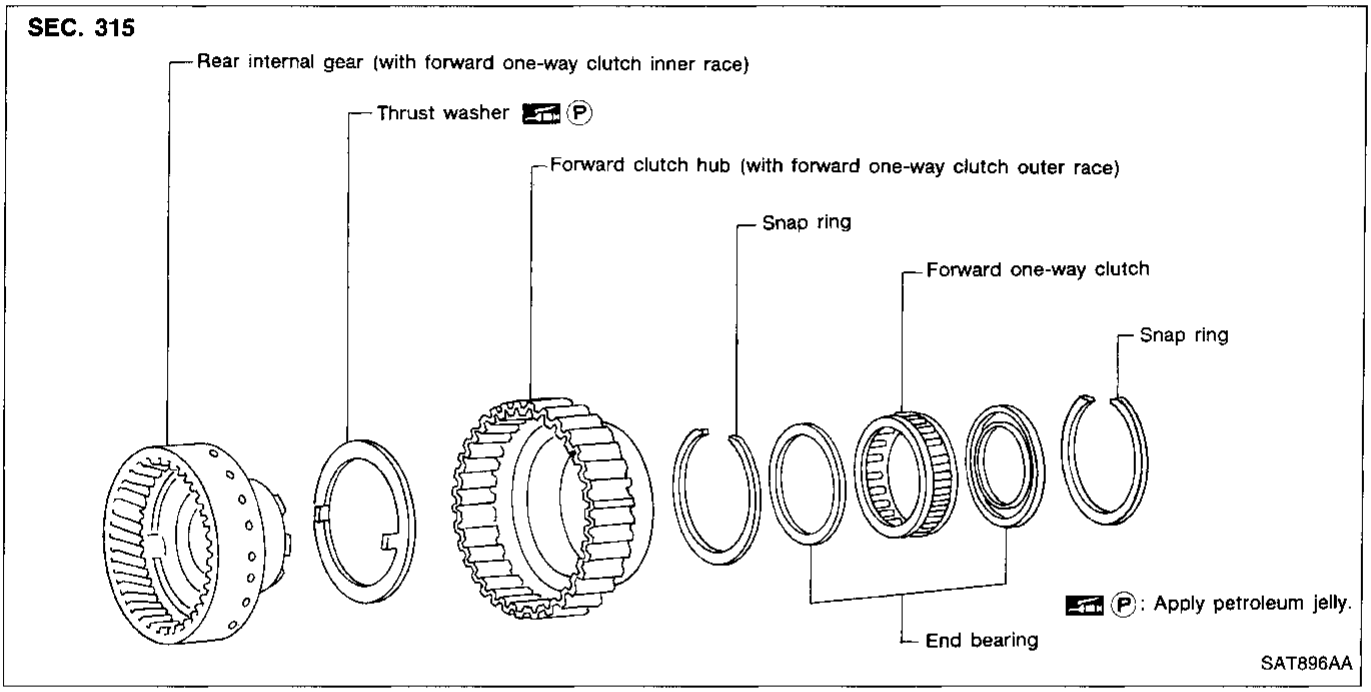


1. Install needle bearing in forward clutch drum.
2. Install snap ring onto forward clutch drum.

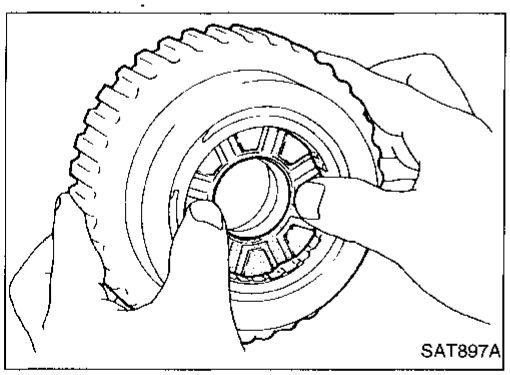
SAT894A

3. Install low one-way clutch onto forward clutch drum by pushing the roller in evenly.

Forward Clutch Drum Assembly (Cont'd)



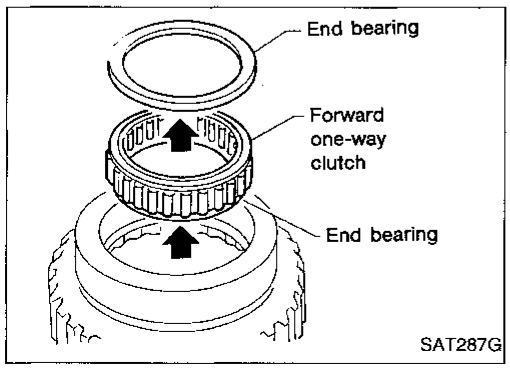
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



SAT895A

- **Install low one-way clutch with flange facing rearward.**

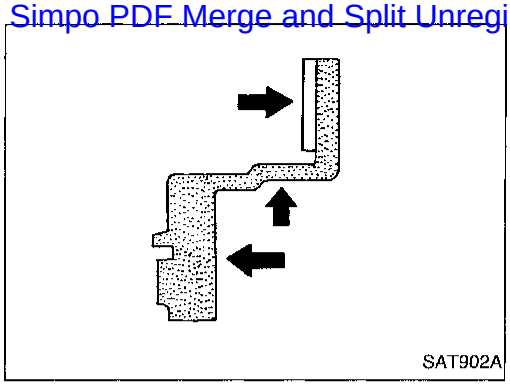
4. Install side plate onto forward clutch drum.
5. Install snap ring onto forward clutch drum.



Rear Internal Gear and Forward Clutch Hub

SAT897A

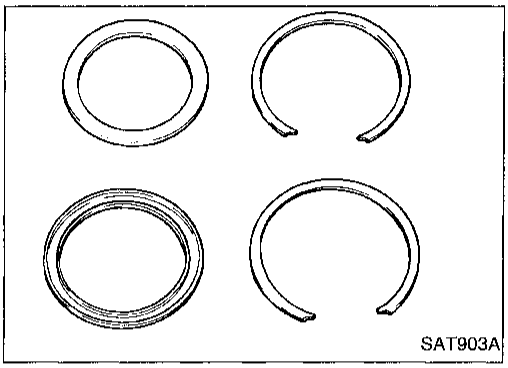
DISASSEMBLY



1. Remove rear internal gear by pushing forward clutch hub forward.
2. Remove thrust washer from rear internal gear.
3. Remove snap ring from forward clutch hub.
4. Remove end bearing.

5. Remove forward one-way clutch and end bearing as a unit from forward clutch hub.
6. Remove snap ring from forward clutch hub.

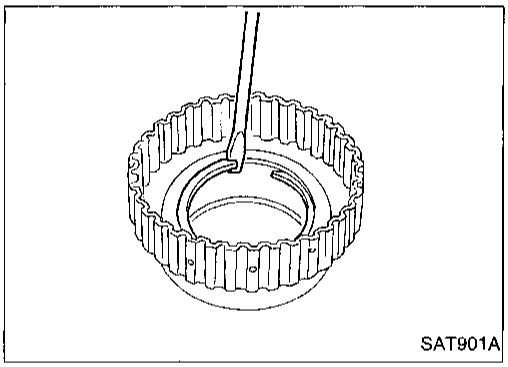
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Rear Internal Gear and Forward Clutch Hub (Cont'd)

SAT902A

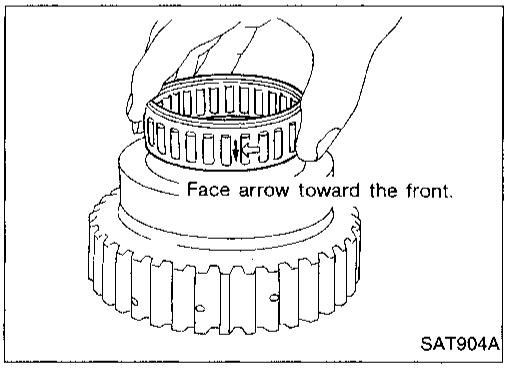
INSPECTION



Rear internal gear and forward clutch hub

- Check gear for excessive wear, chips or cracks.
- Check frictional surfaces of forward one-way clutch and thrust washer for wear or damage.
- Check spline for wear or damage.

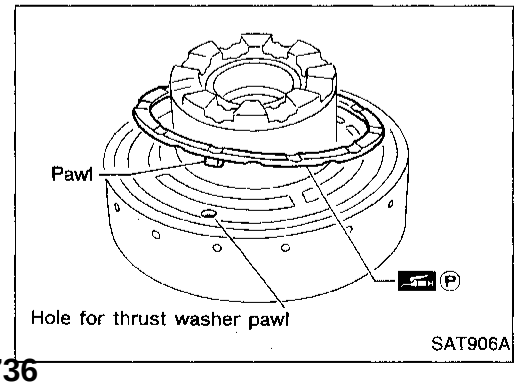
SAT903A



Snap ring and end bearing

- Check for deformation or damage.

SAT901A

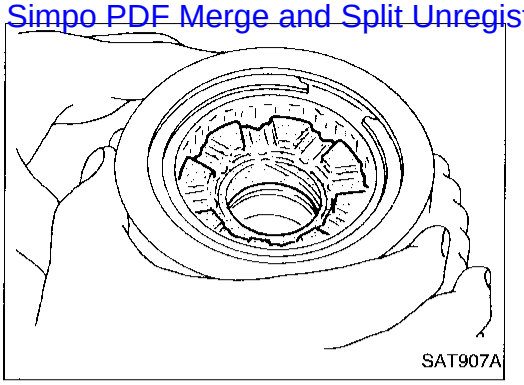


ASSEMBLY

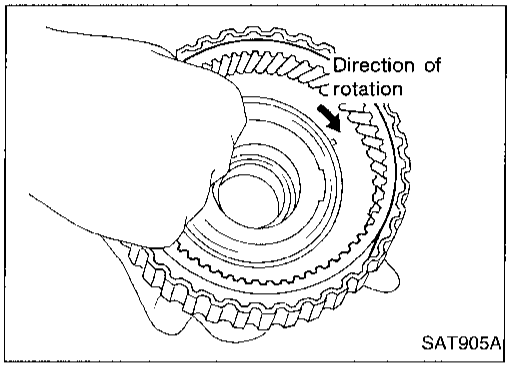
1. Install snap ring onto forward clutch hub.
2. Install end bearing.

SAT904A

3. Install forward one-way clutch onto clutch hub.
- **Install forward one-way clutch with flange facing rearward.**
4. Install end bearing.
5. Install snap ring onto forward clutch hub.



SAT906A

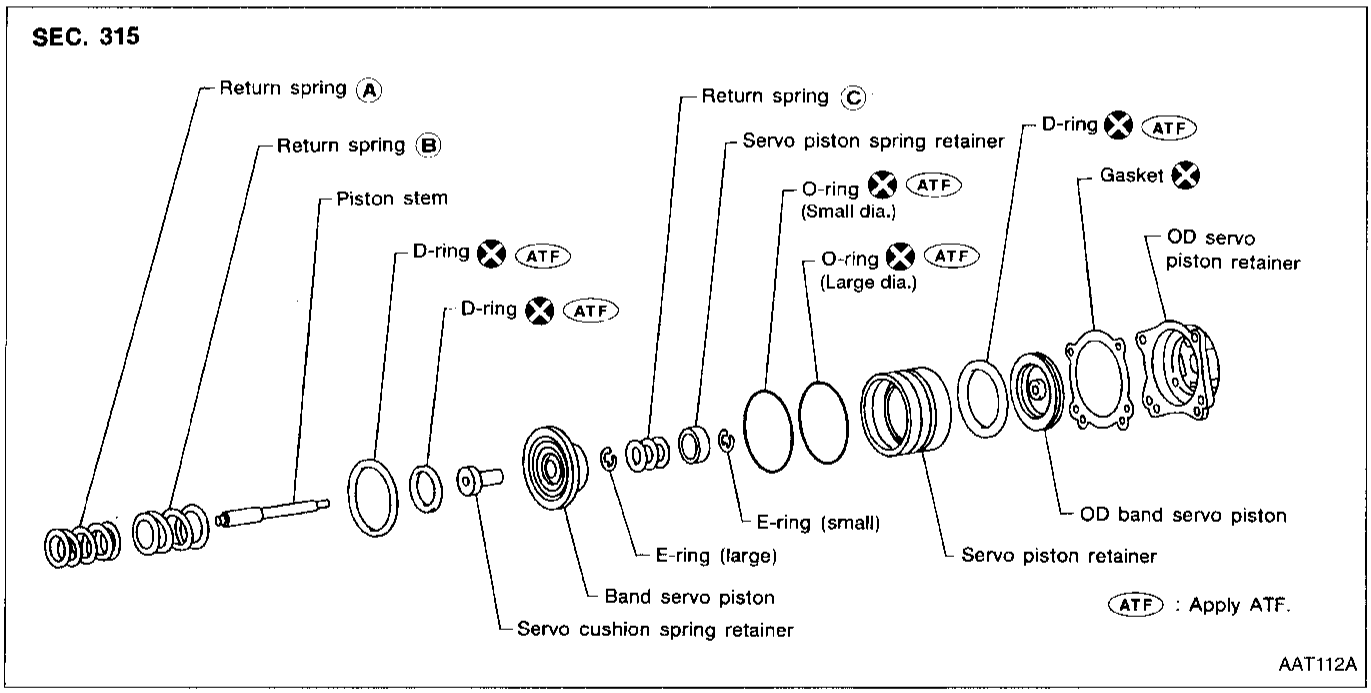


6. Install thrust washer onto rear internal gear.
- **Apply petroleum jelly to thrust washer.**
- **Securely insert pawls of thrust washer into holes in rear internal gear.**

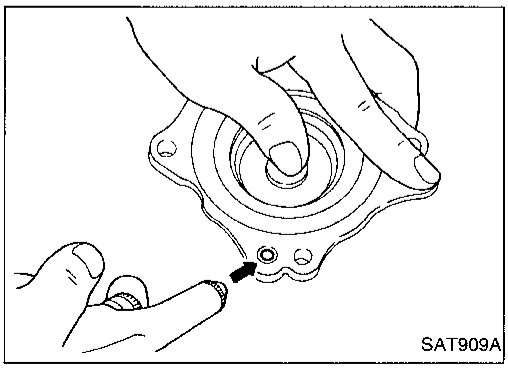
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Rear Internal Gear and Forward Clutch Hub (Cont'd)

SAT907A



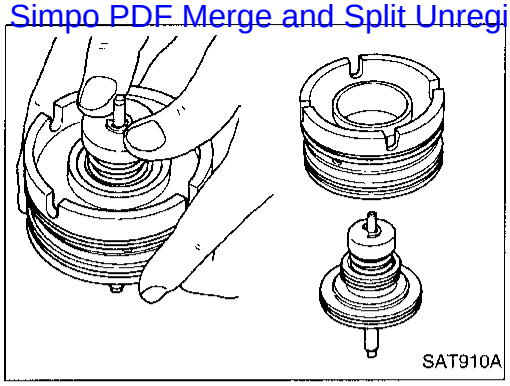
7. Position forward clutch hub in rear internal gear.



SAT905A

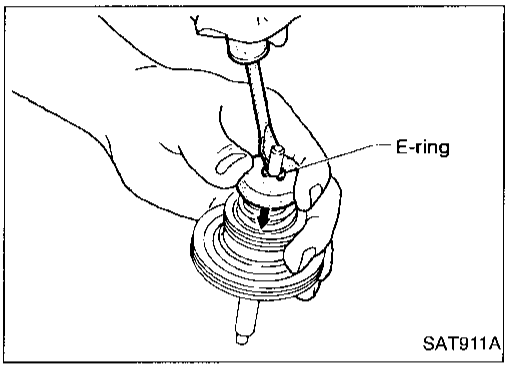
8. After installing, check to assure that forward clutch hub rotates clockwise.

Band Servo Piston Assembly



SAT909A

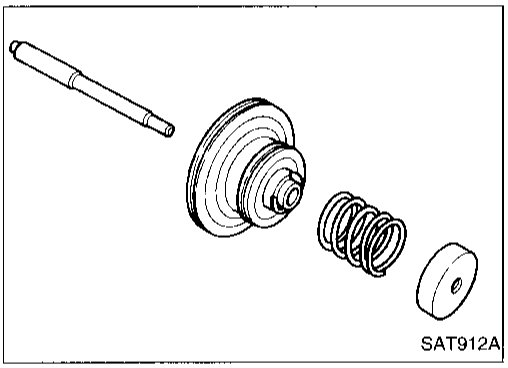
DISASSEMBLY



1. Block one oil hole in OD servo piston retainer and the center hole in OD band servo piston.
2. Apply compressed air to the other oil hole in piston retainer to remove OD band servo piston from retainer.
3. Remove D-ring from OD band servo piston.

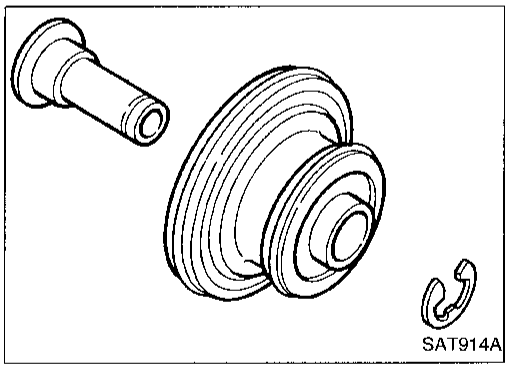
Band Servo Piston Assembly (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

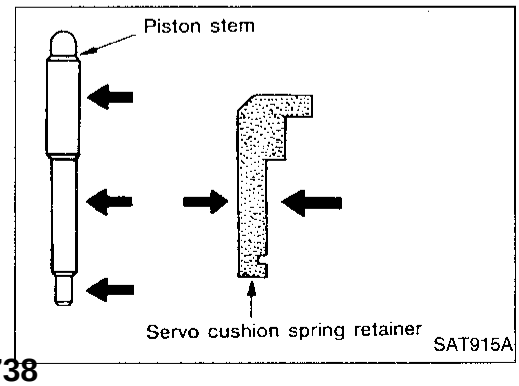


SAT910A

4. Remove band servo piston assembly from servo piston retainer by pushing it forward.



SAT911A



5. Place piston stem end on a wooden block. While pushing servo piston spring retainer down, remove E-ring.

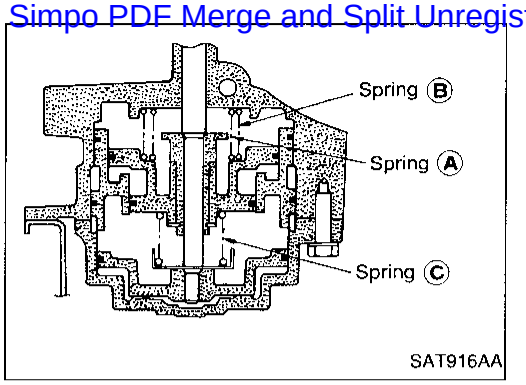
SAT912A

6. Remove servo piston spring retainer, return spring Ⓒ and piston stem from band servo piston.

SAT914A

7. Remove E-ring from band servo piston.
8. Remove servo cushion spring retainer from band servo piston.
9. Remove D-rings from band servo piston.
10. Remove O-rings from servo piston retainer.

SAT915A



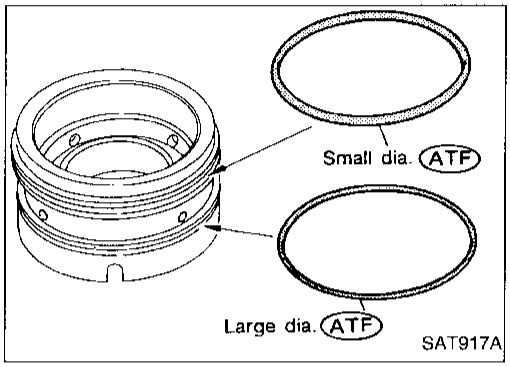
INSPECTION

Pistons, retainers and piston stem

- Check frictional surfaces for abnormal wear or damage.

Band Servo Piston Assembly (Cont'd)

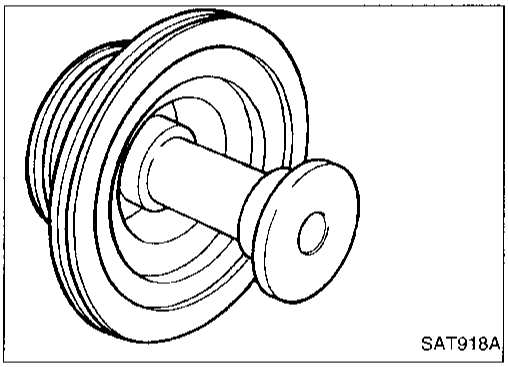
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



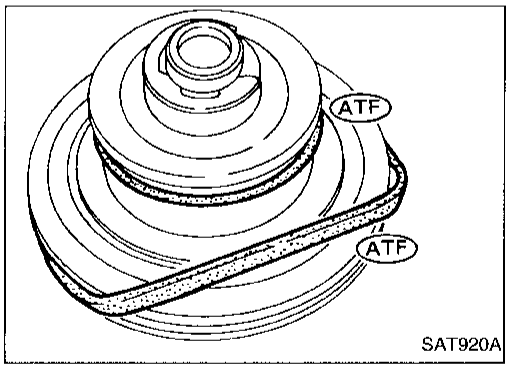
SAT916AA

Return springs

- Check for deformation or damage. Measure free length and outer diameter.



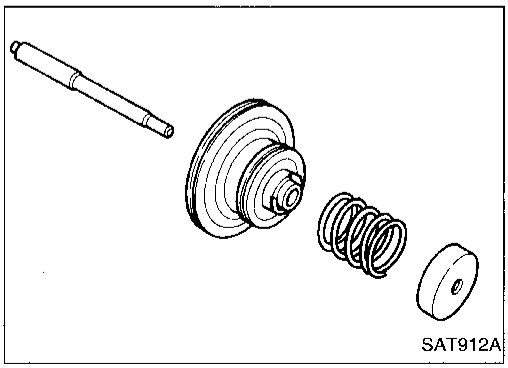
Inspection standard:
Refer to SDS, AT-123.



SAT917A

ASSEMBLY

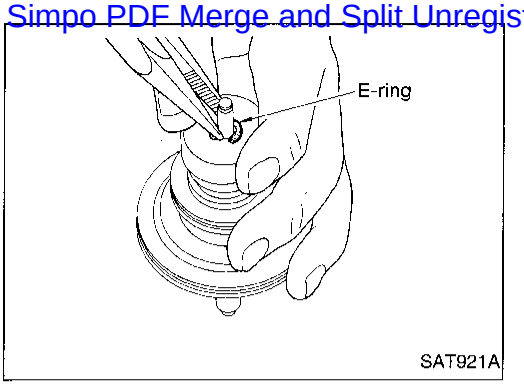
1. Install O-rings onto servo piston retainer.
- **Apply ATF to O-rings.**
- **Pay attention to position of each O-ring.**



SAT918A

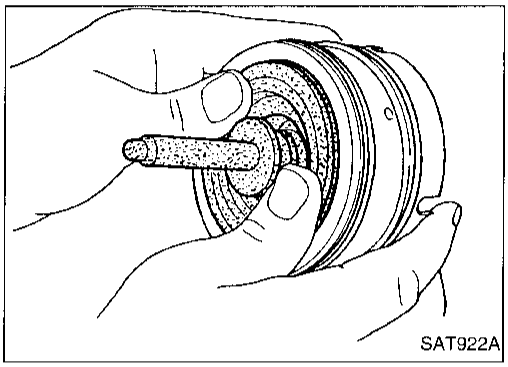
2. Install servo cushion spring retainer onto band servo piston.

SAT920A



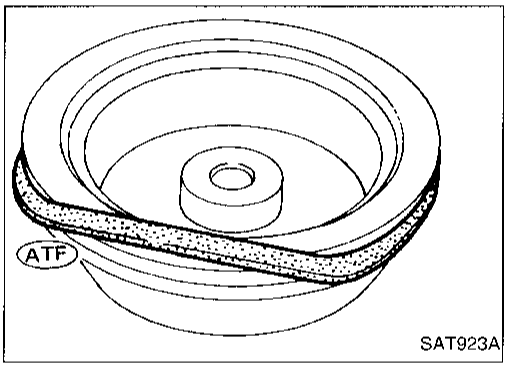
3. Install E-ring onto servo cushion spring retainer.
4. Install D-rings onto band servo piston.
- **Apply ATF to D-rings.**

SAT912A

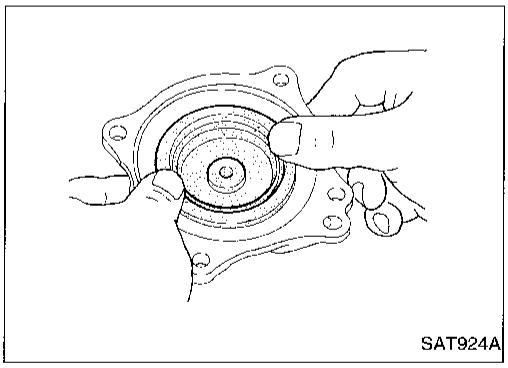


5. Install servo piston spring retainer, return spring Ⓒ and piston stem onto band servo piston.

Band Servo Piston Assembly (Cont'd)

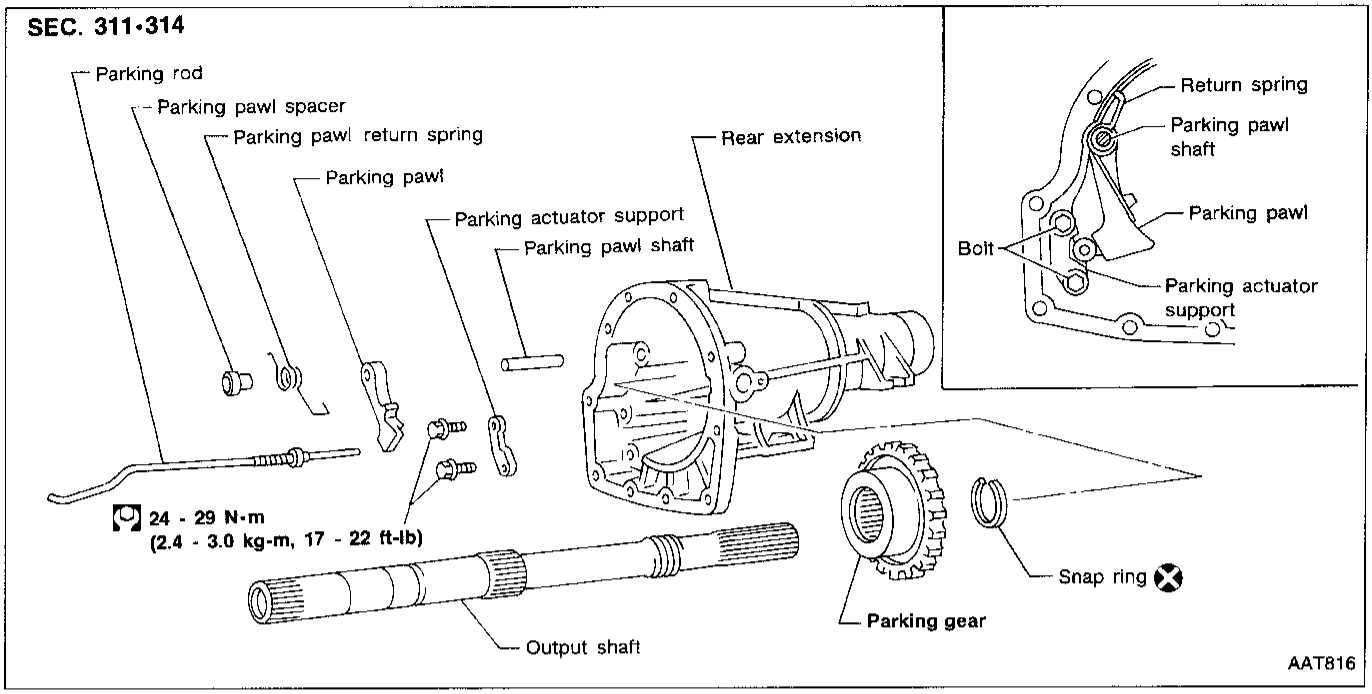


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

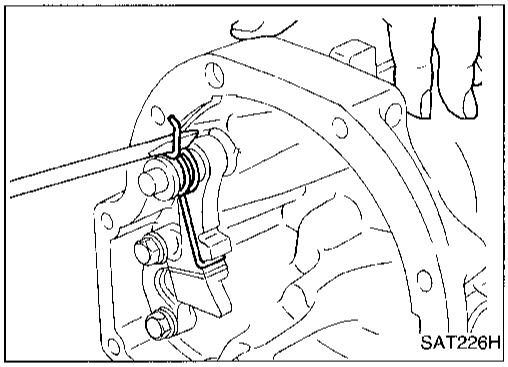


6. Place piston stem end on a wooden block. While pushing servo piston spring retainer down, install E-ring.

7. Install band servo piston assembly onto servo piston retainer by pushing it inward.

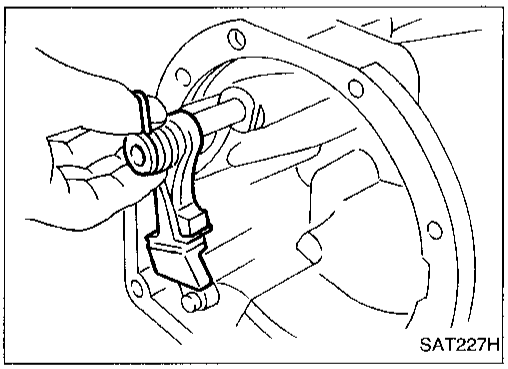


8. Install D-ring on OD band servo piston.
- **Apply ATF to D-ring.**

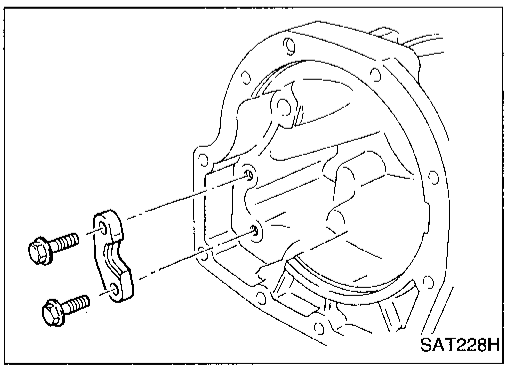


9. Install OD band servo piston onto OD servo piston retainer by pushing it inward.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

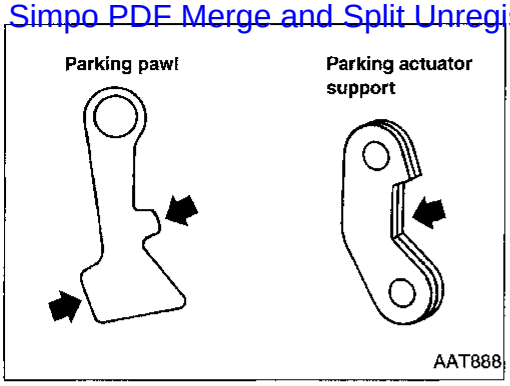


Parking Pawl Components



DISASSEMBLY

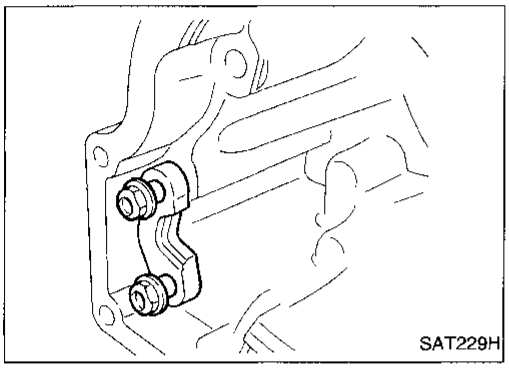
1. Slide return spring to the front of rear extension flange.



2. Remove return spring, pawl spacer and parking pawl from rear extension.
3. Remove parking pawl shaft from rear extension.

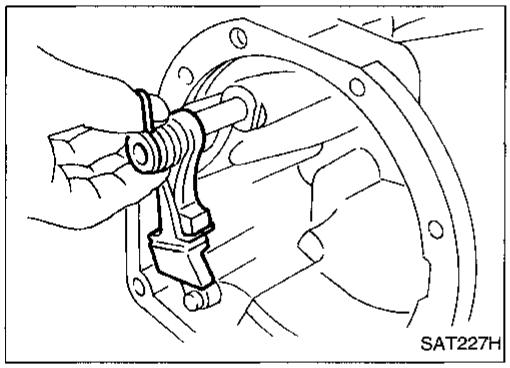
4. Remove parking actuator support from rear extension.

Parking Pawl Components (Cont'd)



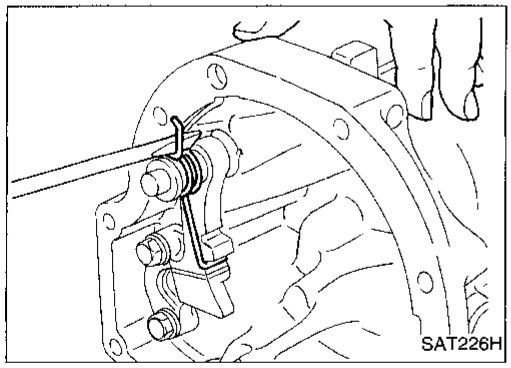
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

INSPECTION



Parking pawl and parking actuator support

- Check contact surface of parking rod and parking gear for wear.



ASSEMBLY

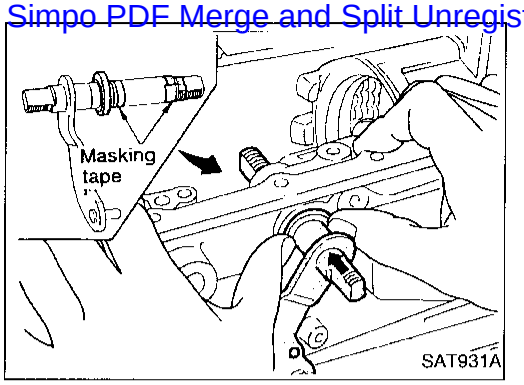
1. Install parking actuator support onto rear extension.
2. Insert parking pawl shaft into rear extension.

3. Install return spring, pawl spacer and parking pawl onto parking pawl shaft.

4. Bend return spring upward and install it onto rear extension.

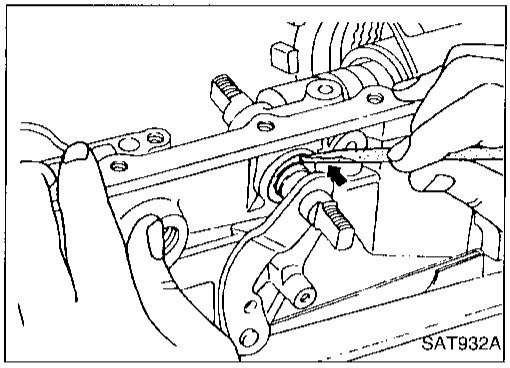
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Assembly (1)



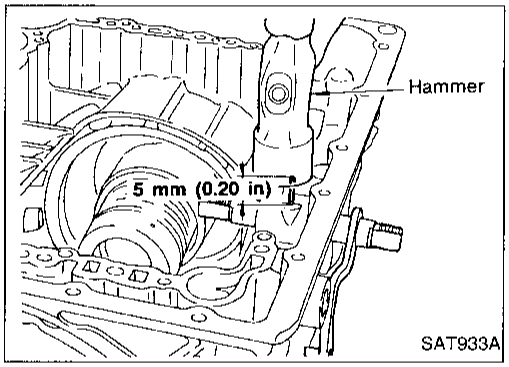
1. Install manual shaft components.

a. Install oil seal onto manual shaft.

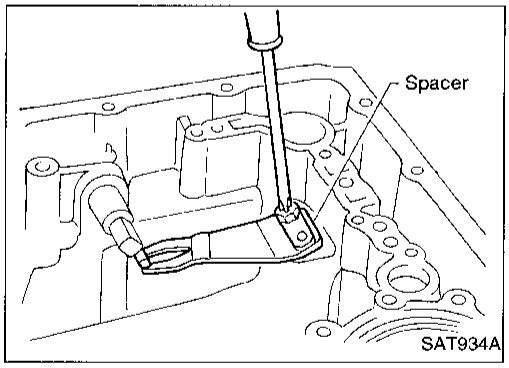


- **Apply ATF to oil seal.**
- **Wrap threads of manual shaft with masking tape.**

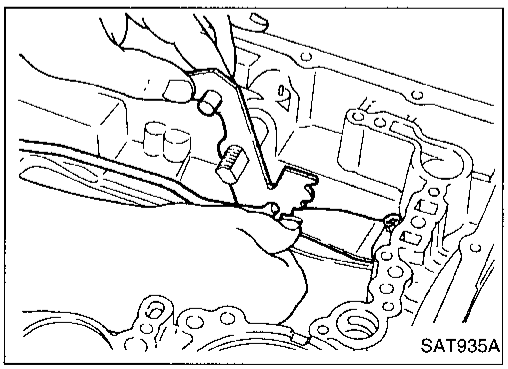
b. Insert manual shaft and oil seal as a unit into transmission case.



c. Remove masking tape.

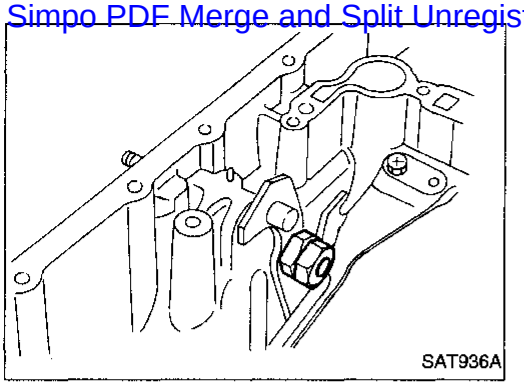


d. Push oil seal evenly and install it onto transmission case.

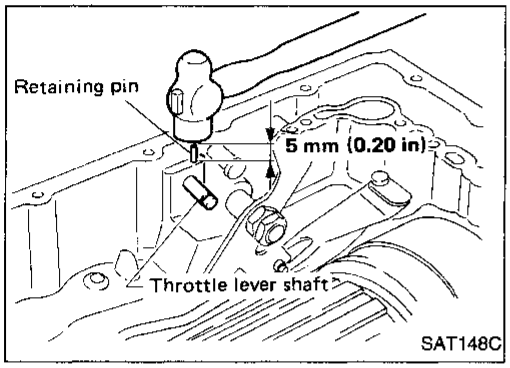


e. Align groove in shaft with drive pin hole; then drive pin into position as shown in figure at left.

f. Install detent spring and spacer.



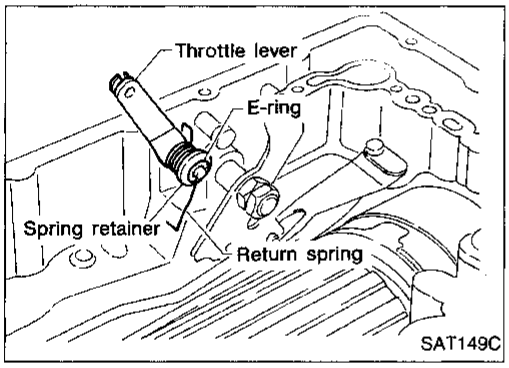
g. While pushing detent spring down, install manual plate onto manual shaft.



Assembly (1) (Cont'd)

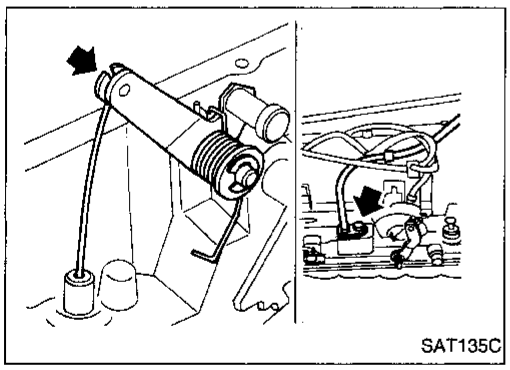
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

h. Install lock nuts onto manual shaft.



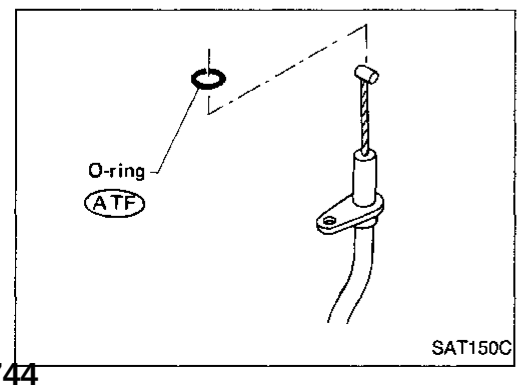
SAT936A

2. Install throttle lever components.
a. Install throttle lever shaft.
b. Align groove in shaft with drive pin hole, then drive pin into position as shown in figure at left.



SAT148C

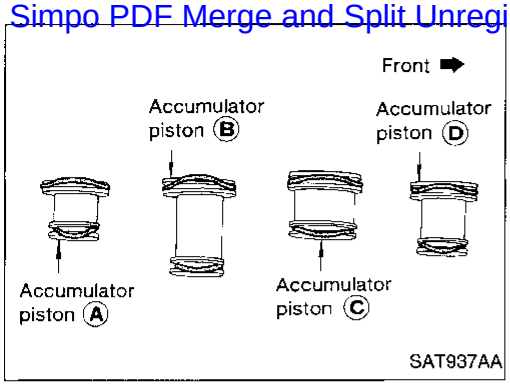
c. Install throttle lever, return spring, spring retainer and E-ring.



SAT149C

d. Install throttle wire.

SAT135C

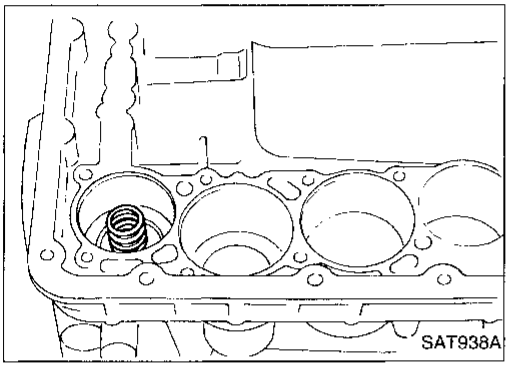


- **Apply ATF to O-ring.**

SAT150C

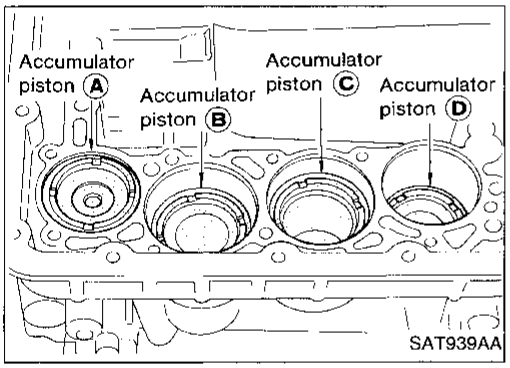
Assembly (1) (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



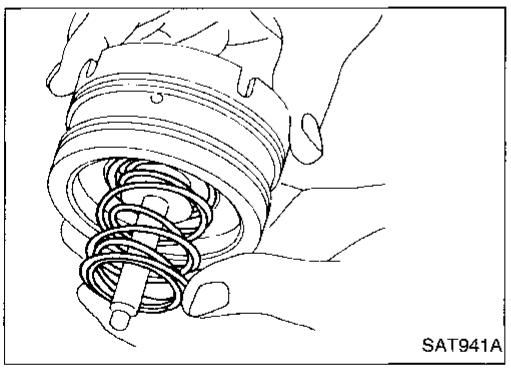
3. Install accumulator piston.

a. Install O-rings onto accumulator piston.



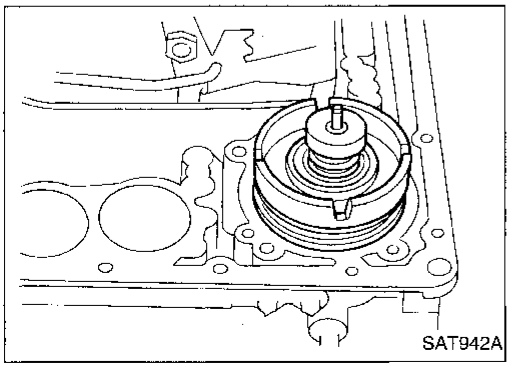
- **Apply ATF to O-rings.**

Accumulator piston O-rings:
Refer to SDS, AT-123.



b. Install return spring for accumulator Ⓐ onto transmission case.

Free length of return spring:
Refer to SDS, AT-123.



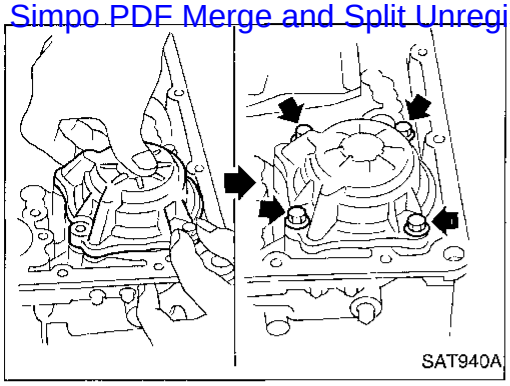
c. Install accumulator pistons Ⓐ, Ⓑ, Ⓒ and Ⓓ.

- **Apply ATF to transmission case.**

4. Install band servo piston.

a. Install return springs onto band servo piston.

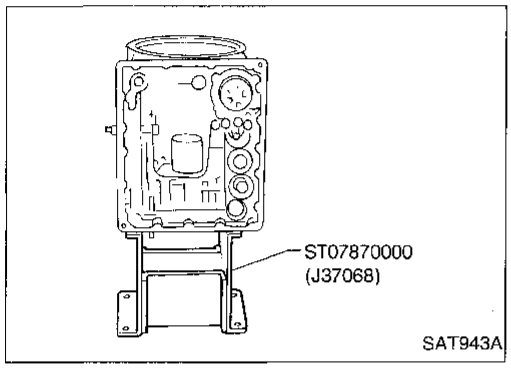
b. Install band servo piston onto transmission case.



- **Apply ATF to O-ring of band servo piston and transmission case.**

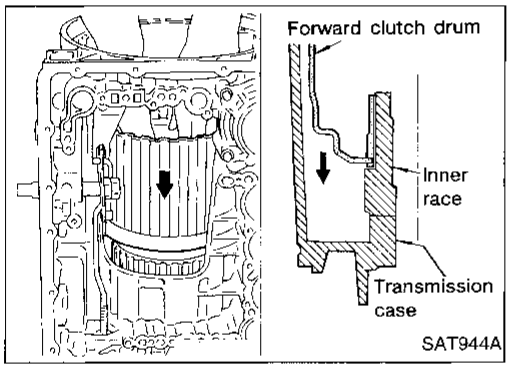
c. Install gasket for band servo onto transmission case.

Assembly (1) (Cont'd)

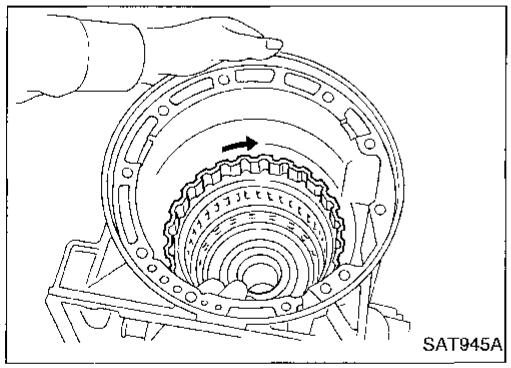


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

d. Install OD servo piston retainer onto transmission case.

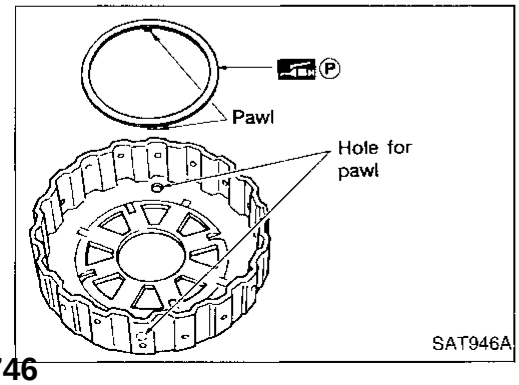


5. Install rear side clutch and gear components.

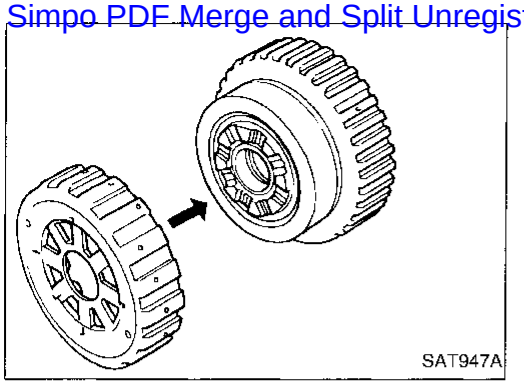


a. Place transmission case in vertical position.

b. Slightly lift forward clutch drum assembly and slowly rotate it clockwise until its hub passes fully over the clutch inner race inside transmission case.

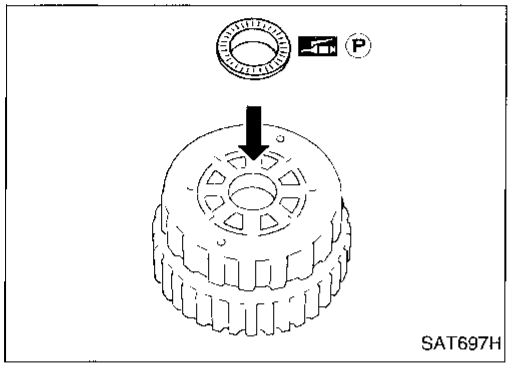


c. Check to be sure that rotation direction of forward clutch assembly is correct.

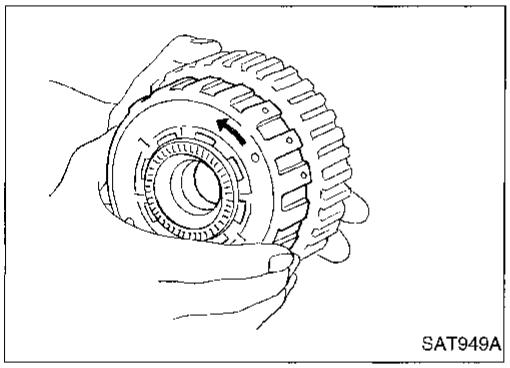


d. Install thrust washer onto front of overrun clutch hub.

- **Apply petroleum jelly to the thrust washer.**
- **Insert pawls of thrust washer securely into holes in overrun clutch hub.**

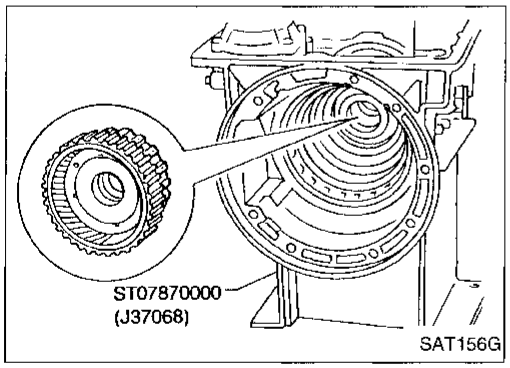


Assembly (1) (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

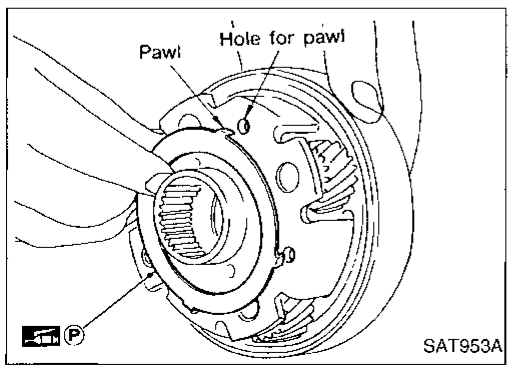
SAT947A



e. Install overrun clutch hub onto rear internal gear assembly.

SAT697H

f. Install needle bearing onto rear of overrun clutch hub.
- **Apply petroleum jelly to needle bearing.**

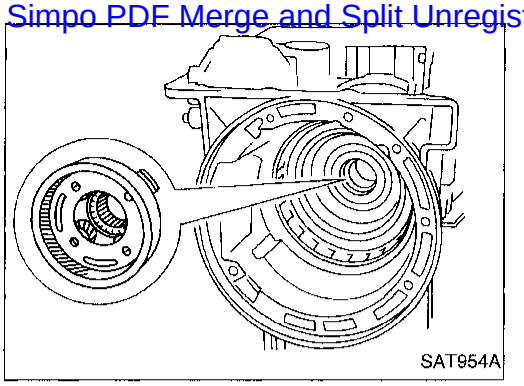


SAT949A

g. Check that overrun clutch hub rotates as shown while holding forward clutch hub.

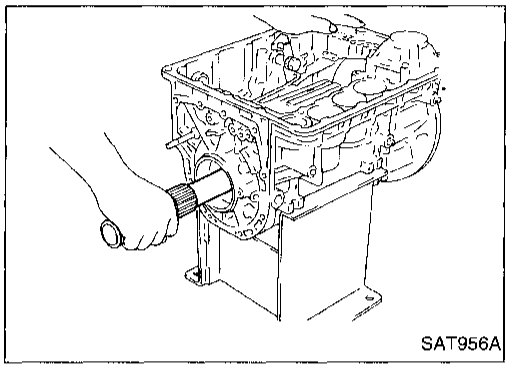
SAT156G

h. Place transmission case into horizontal position.
i. Install rear internal gear, forward clutch hub and overrun clutch hub as a unit onto transmission case.



SAT953A

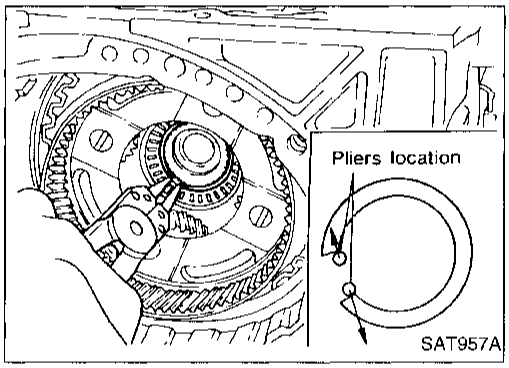
j. Install needle bearing onto rear internal gear.
- **Apply petroleum jelly to needle bearing.**



k. Install bearing race onto rear of front internal gear.
- **Apply petroleum jelly to bearing race.**
- **Securely engage pawls of bearing race with holes in front internal gear.**

Assembly (1) (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

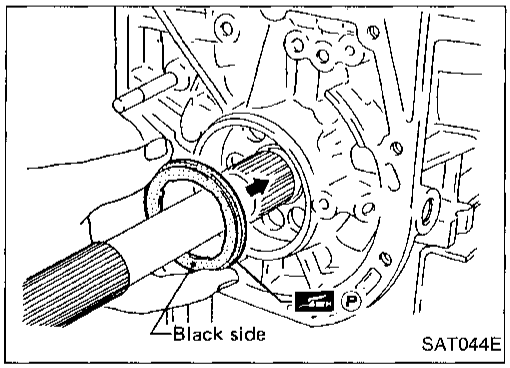


SAT954A

I. Install front internal gear on transmission case.

SAT956A

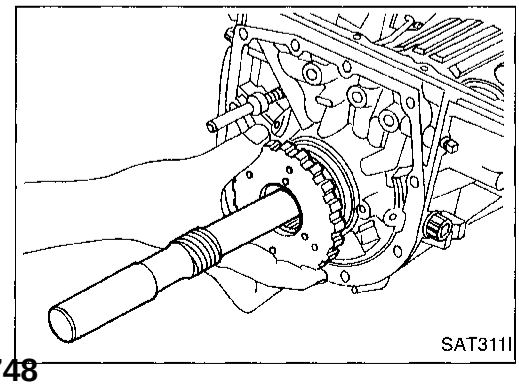
6. Install output shaft and parking gear.
a. Insert output shaft from rear of transmission case while slightly lifting front internal gear.



- **Do not force output shaft against front of transmission case.**

SAT957A

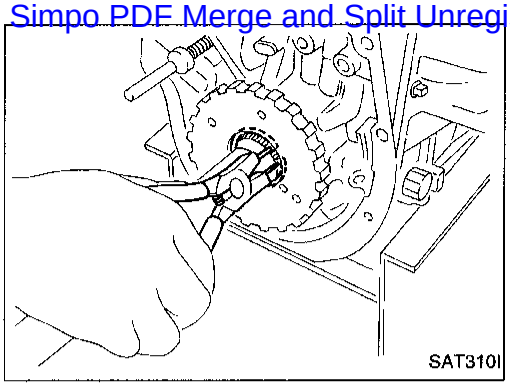
b. Carefully push output shaft against front of transmission case. Install snap ring on front of output shaft.



- **Check to be sure output shaft cannot be removed in rear direction.**

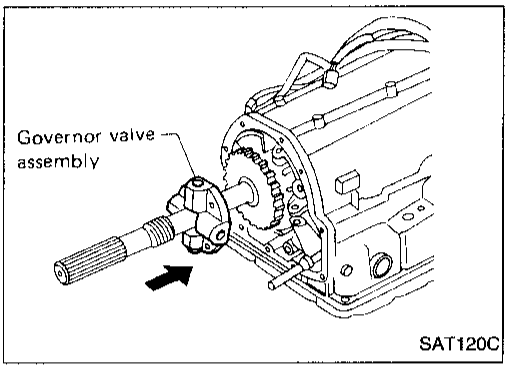
SAT044E

c. Install needle bearing on transmission case.



- **Pay attention to its direction — black side faces the rear.**
- **Apply petroleum jelly to needle bearing.**

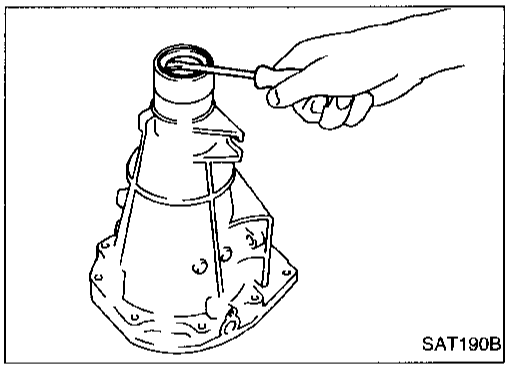
SAT311I



d. Install parking gear on transmission case.

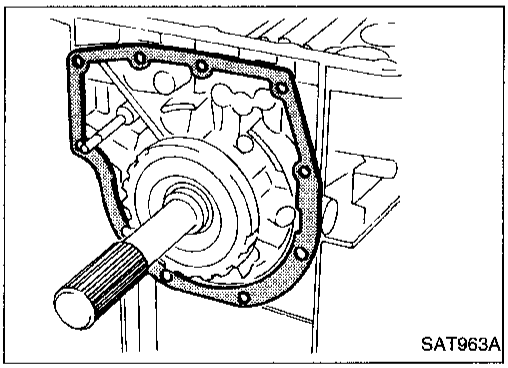
Assembly (1) (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

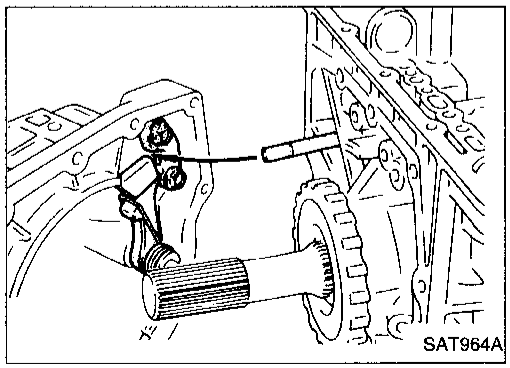


SAT310I

e. Install snap ring on rear of output shaft.
- **Check to be sure output shaft cannot be removed in forward direction.**



SAT120C

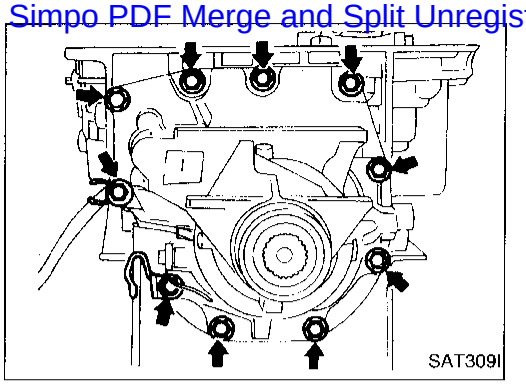


f. Install governor valve assembly on oil distributor.

SAT190B

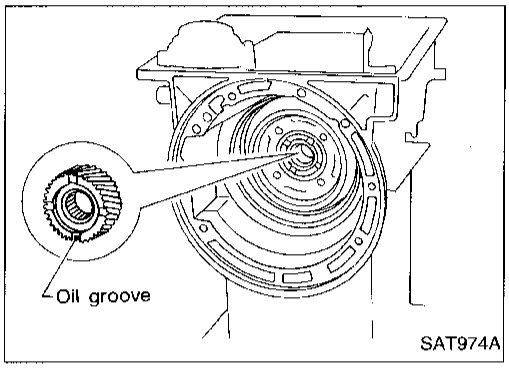
7. Install rear extension case.
a. Install oil seal on rear extension case.
- **Apply ATF to oil seal.**

SAT963A



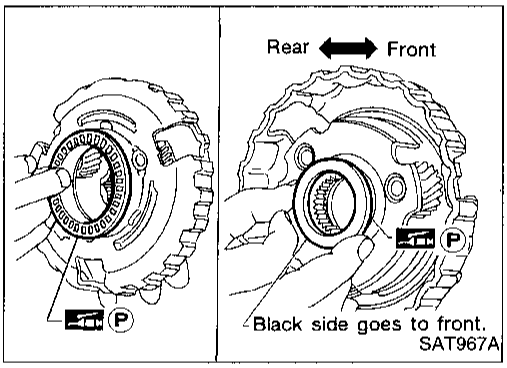
b. Install rear extension gasket on transmission case. Refer to AT-51.

SAT964A



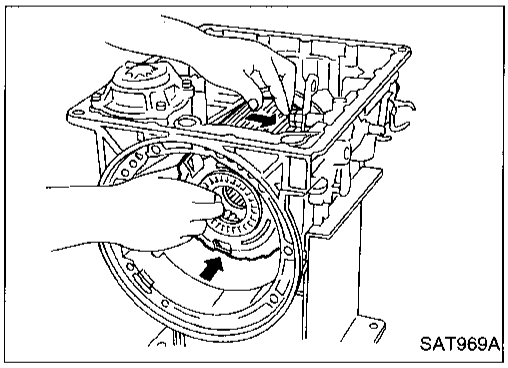
c. Install parking rod on transmission case.

Assembly (1) (Cont'd)

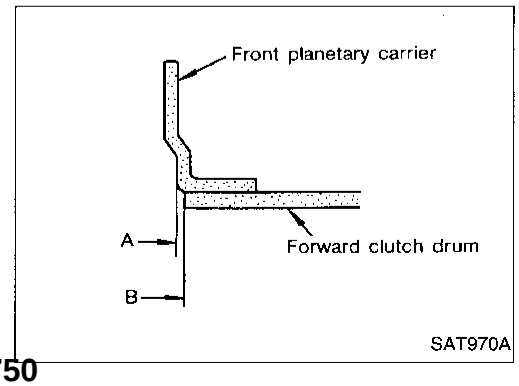


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

d. Install rear extension case on transmission case. Tighten bolts to specified torque.
: 20 - 25 N·m (2.0 - 2.5 kg-m, 14 - 18 ft-lb)

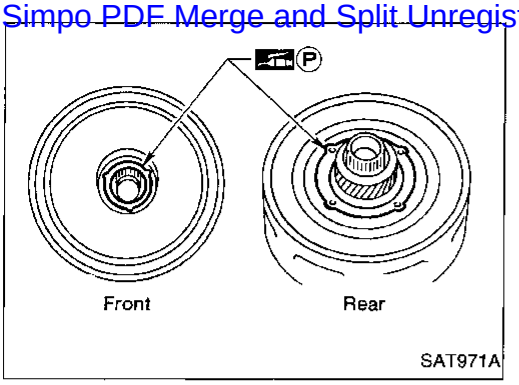


8. Install front side clutch and gear components.
a. Install rear sun gear on transmission case.
- **Pay attention to its direction.**



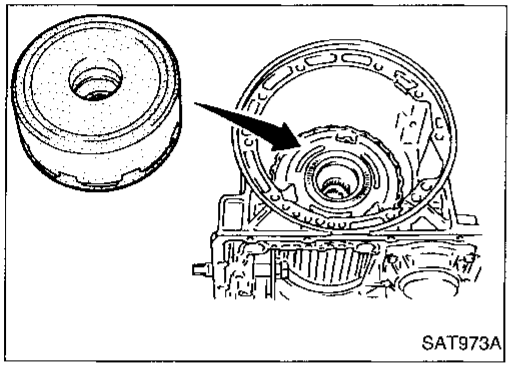
b. Install needle bearing on front of front planetary carrier.
- **Apply petroleum jelly to needle bearing.**

c. Install needle bearing on rear of front planetary carrier.
- **Apply petroleum jelly to needle bearing.**
- **Pay attention to its direction — black side faces the front.**



d. While rotating forward clutch drum clockwise, install front planetary carrier on forward clutch drum.

- **Check that portion A of front planetary carrier protrudes approximately 2 mm (0.08 in) beyond portion B of forward clutch assembly.**

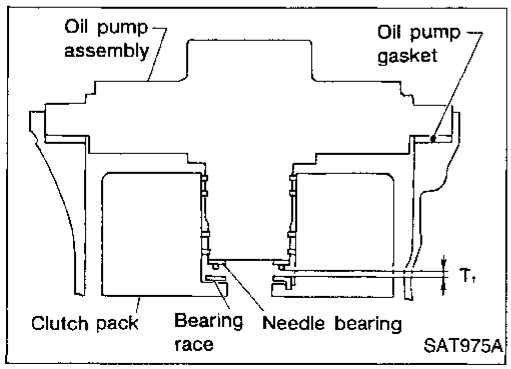


Assembly (1) (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

e. Install bearing races on front and rear of clutch pack.
- **Apply petroleum jelly to bearing races.**
- **Securely engage pawls of bearing races with holes in clutch pack.**

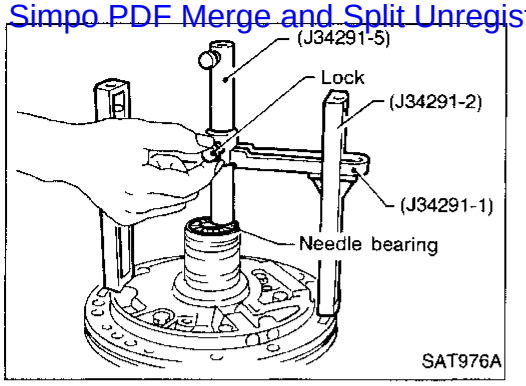
f. Place transmission case in vertical position.



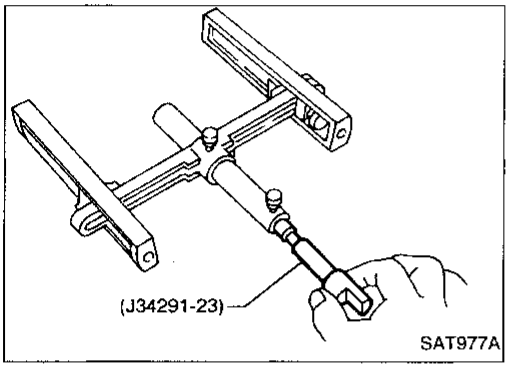
g. Install clutch pack into transmission case.

Adjustment

When any parts listed in the following table are replaced, total end play or reverse clutch end play must be adjusted.

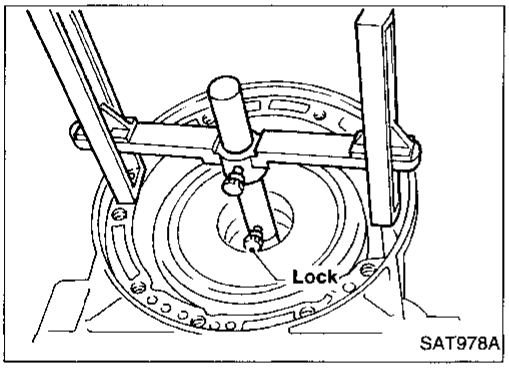


Part name	Item	
	Total end play	Reverse clutch end play
Transmission case	●	●
Low one-way clutch inner race	●	●
Overrun clutch hub	●	●
Rear internal gear	●	●
Rear planetary carrier	●	●
Rear sun gear	●	●
Front planetary carrier	●	●
Front sun gear	●	●
High clutch hub	●	●
High clutch drum	●	●
Oil pump cover	●	●
Reverse clutch drum	—	●

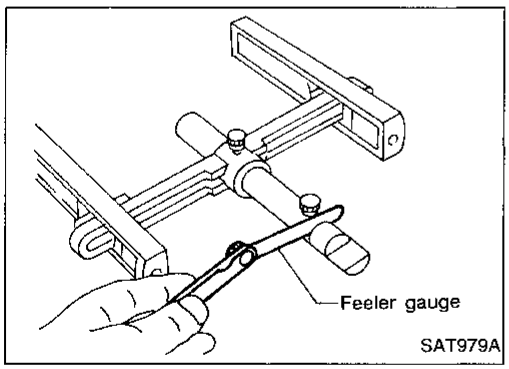


1. Adjust total end play.
   Total end play "T_1":
   0.25 - 0.55 mm (0.0098 - 0.0217 in)

Adjustment (Cont'd)



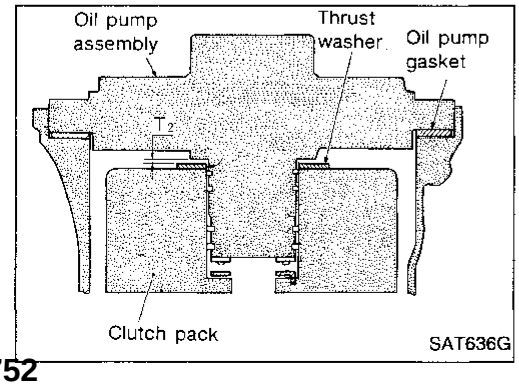
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



a. With original needle bearing installed, place J34291-1 (bridge), J34291-2 (legs) and the J34291-5 (gauging cylinder) onto oil pump. The long ends of legs should be placed firmly on machined surface of oil pump assembly and gauging cylinder should rest on top of the needle bearing. Lock gauging cylinder in place with set screw.

b. Install J34291-23 (gauging plunger) into gauging cylinder.

c. With original bearing race installed inside reverse clutch drum, place shim selecting gauge with its legs on machined surface of transmission case (no gasket) and allow gauging plunger to rest on bearing race. Lock gauging plunger in place with set screw.

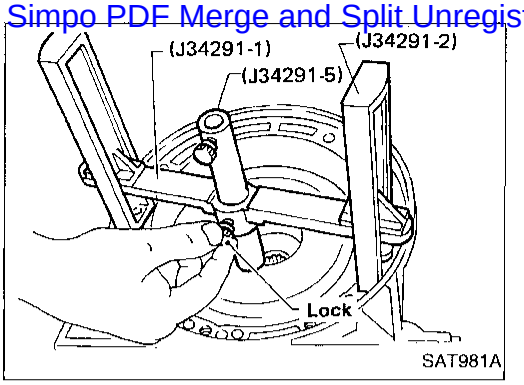


d. Remove Tool and use feeler gauge to measure gap between gauging cylinder and gauging plunger. This measurement should give exact total end play.

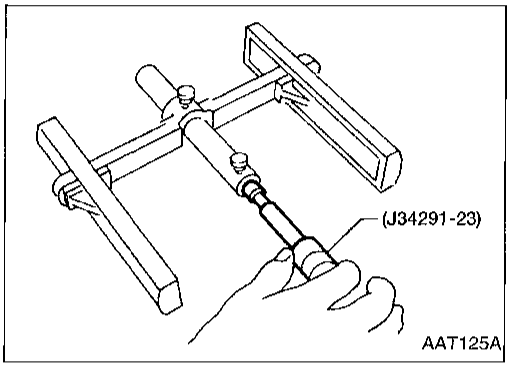
Total end play "T_1":
0.25 - 0.55 mm (0.0098 - 0.0217 in)

- If end play is out of specification, decrease or increase thickness of oil pump cover bearing race as necessary.

Available oil pump cover bearing race:
Refer to SDS, AT-125.

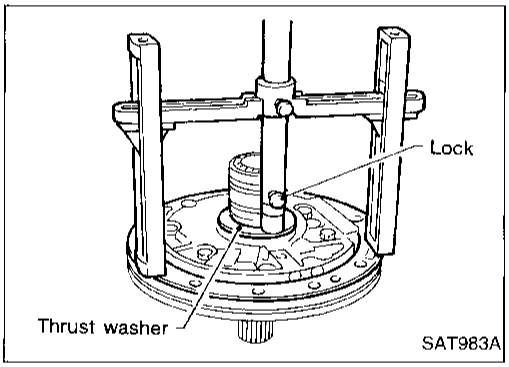


2. Adjust reverse clutch drum end play.

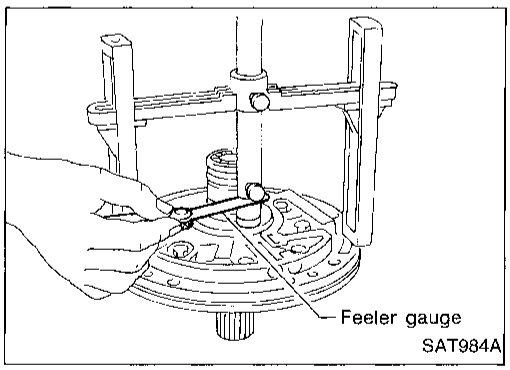


Reverse clutch drum end play "T_2":
0.55 - 0.90 mm (0.0217 - 0.0354 in)

Adjustment (Cont'd)



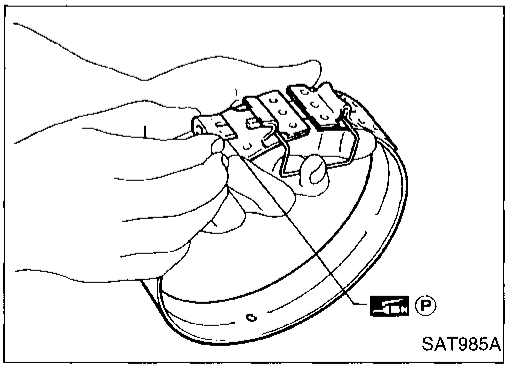
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



a. Place J34291-1 (bridge), J34291-2 (legs) and J34291-5 (gauging cylinder) on machined surface of transmission case (no gasket) and allow gauging cylinder to rest on front thrust surface of reverse clutch drum. Lock cylinder in place with set screw.

b. Install J34291-23 (gauging plunger) into gauging cylinder.

c. With original thrust washer installed on oil pump, place shim setting gauge legs onto machined surface of oil pump assembly and allow gauging plunger to rest on thrust washer. Lock plunger in place with set screw.



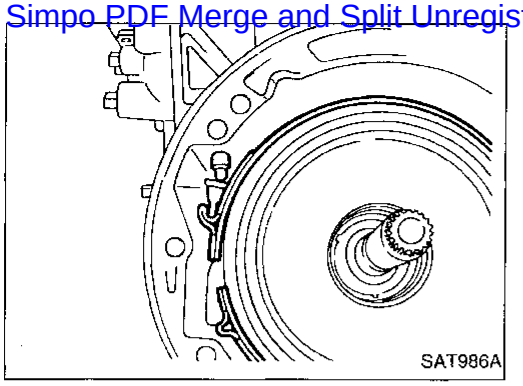
d. Use feeler gauge to measure gap between gauging plunger and gauging cylinder. This measurement should give you exact reverse clutch drum and play.

Reverse clutch drum end play "T_2":
0.55 - 0.90 mm (0.0217 - 0.0354 in)

- If end play is out of specification, decrease or increase thickness of oil pump thrust washer as necessary.

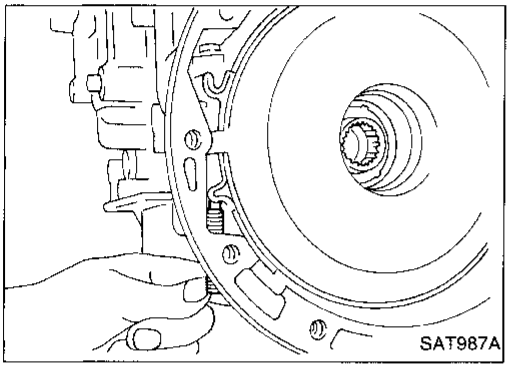
Available oil pump thrust washer:
Refer to SDS, AT-125.

Assembly (2)



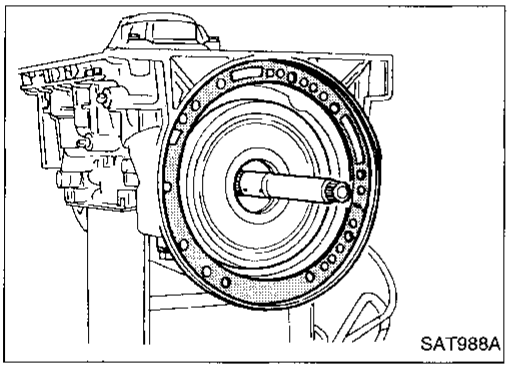
1. Place transmission case into horizontal position.
2. Install brake band and band strut.

a. Install band strut on brake band.



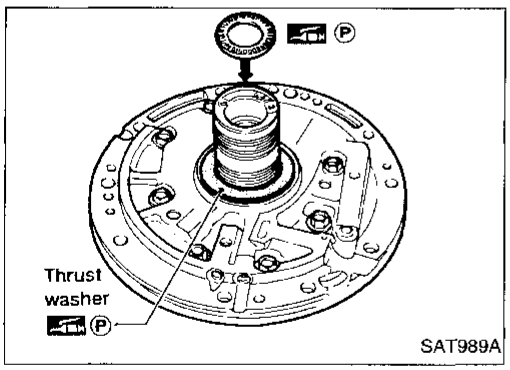
- **Apply petroleum jelly to band strut.**

Assembly (2) (Cont'd)



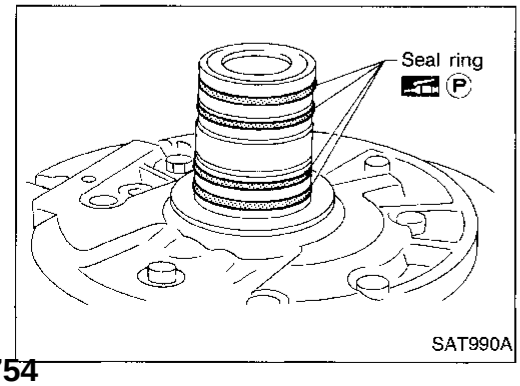
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

b. Place brake band around reverse clutch drum, and insert band strut into end of band servo piston stem.



c. Install anchor end bolt on transmission case. Then, tighten anchor end bolt just enough so that reverse clutch drum (clutch pack) will not tilt forward.

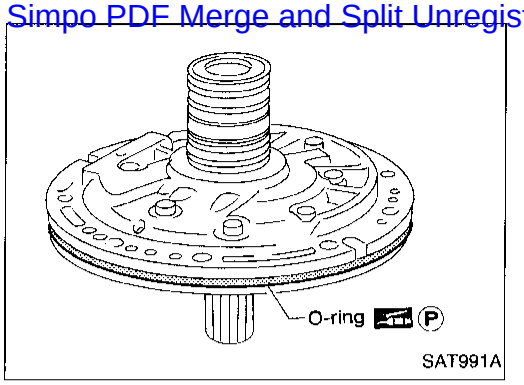
3. Install input shaft on transmission case.
- **Pay attention to its direction — O-ring groove side faces front.**



4. Install gasket on transmission case.

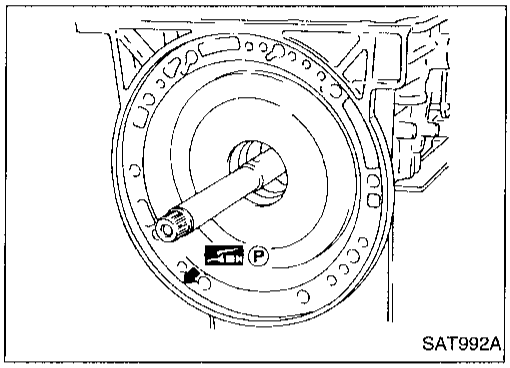
5. Install oil pump assembly.

a. Install needle bearing on oil pump assembly.
- **Apply petroleum jelly to the needle bearing.**



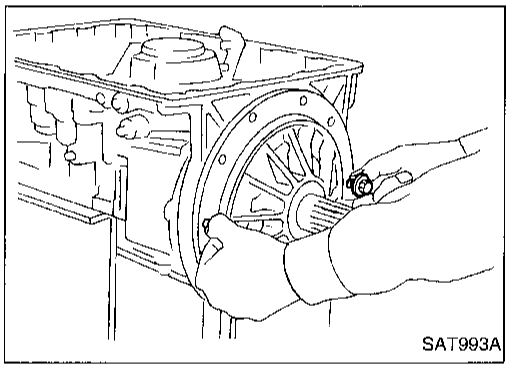
b. Install selected thrust washer on oil pump assembly.
- **Apply petroleum jelly to thrust washer.**

c. Carefully install seal rings into grooves and press them into the petroleum jelly so that they are a tight fit.



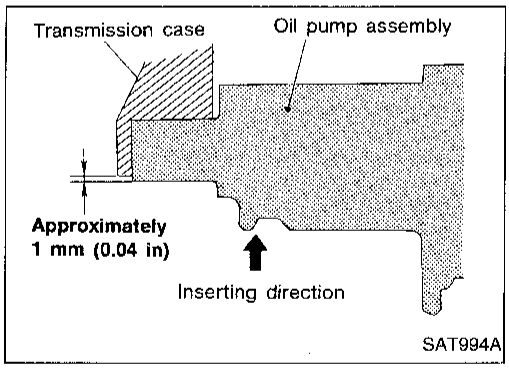
Assembly (2) (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



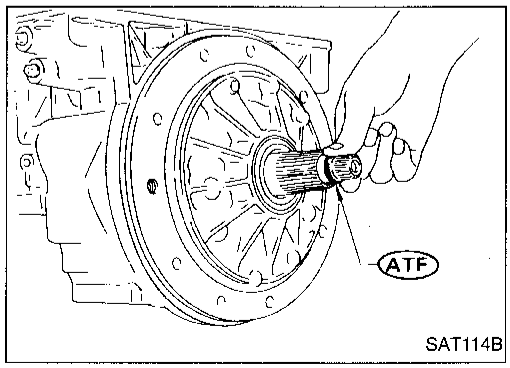
SAT991A

d. Install O-ring on oil pump assembly.
- **Apply petroleum jelly to O-ring.**



SAT992A

e. Apply petroleum jelly to mating surface of transmission case and oil pump assembly.

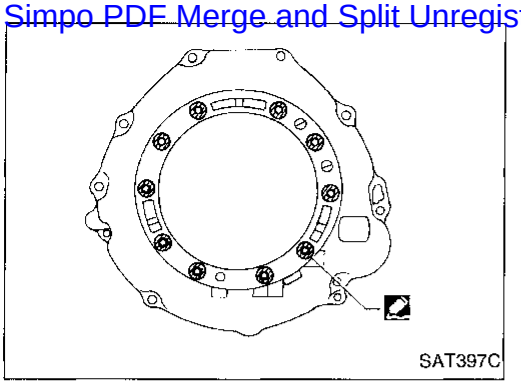


SAT993A

f. Install oil pump assembly.
- **Install two converter housing securing bolts in bolt holes in oil pump assembly as guides.**

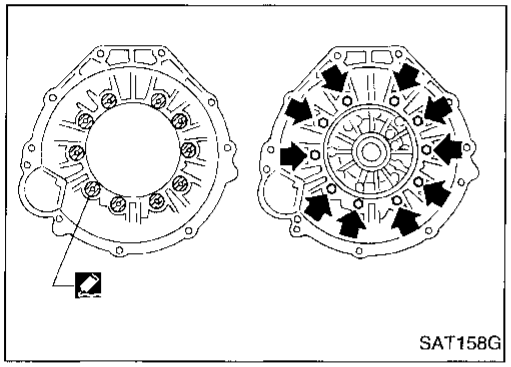
SAT994A

- **Insert oil pump assembly to the specified position in transmission, as shown at left.**



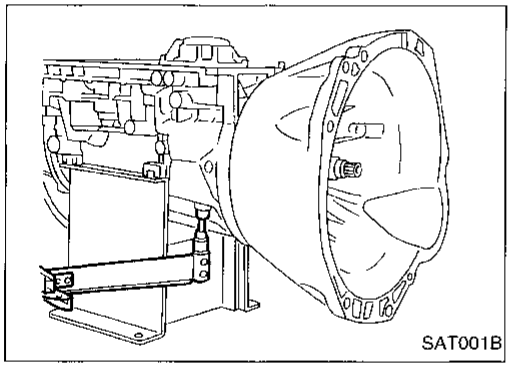
SAT114B

6. Install O-ring on input shaft.
- **Apply ATF to O-rings.**

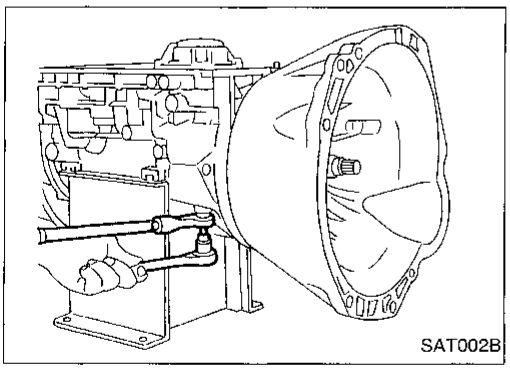


Assembly (2) (Cont'd)

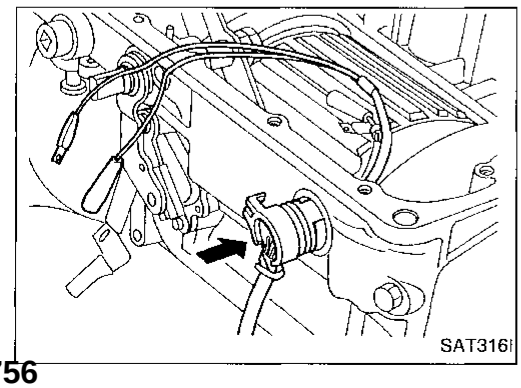
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



7. Install converter housing.
a. Apply genuine anaerobic liquid gasket Three Bond TB1215, Loctite Part No. 51813 or equivalent around bolt holes in converter housing.



- **Do not apply too much sealant.**



b. Apply genuine anaerobic liquid gasket Three Bond TB1215, Loctite Part No. 51813 or equivalent to seating surfaces of bolts that secure front of converter housing.
c. Install converter housing on transmission case.

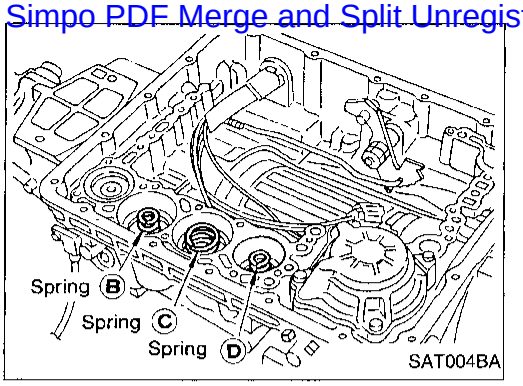
8. Adjust brake band.
a. Tighten anchor end bolt to specified torque.
Anchor end bolt:
: 4 - 6 N·m (0.4 - 0.6 kg-m, 35 - 52 in-lb)
b. Back off anchor end bolt two and a half turns.

c. While holding anchor end pin, tighten lock nut.

9. Install terminal cord assembly.
a. Install O-ring on terminal cord assembly.

- **Apply petroleum jelly to O-ring.**

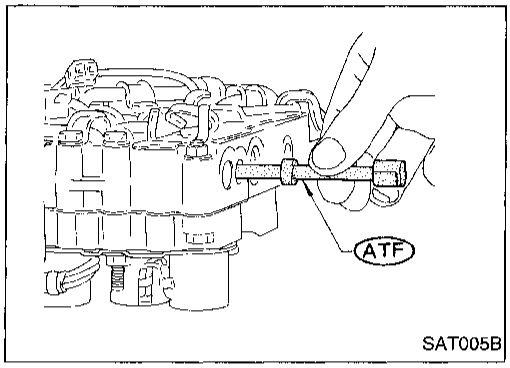
b. Compress terminal cord assembly stopper and install terminal cord assembly on transmission case.



Assembly (2) (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

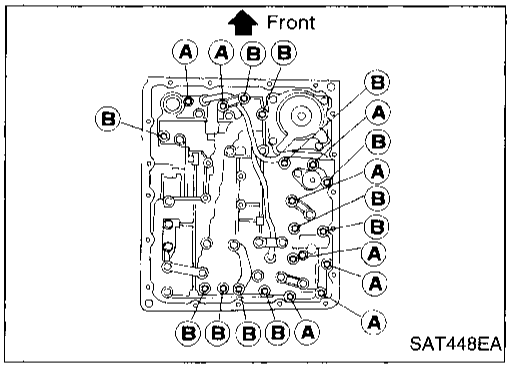
10. Install control valve assembly.



a. Install accumulator piston return springs Ⓑ, Ⓒ and Ⓓ.

Free length of return springs:
Refer to SDS, AT-123.

b. Install manual valve on control valve.

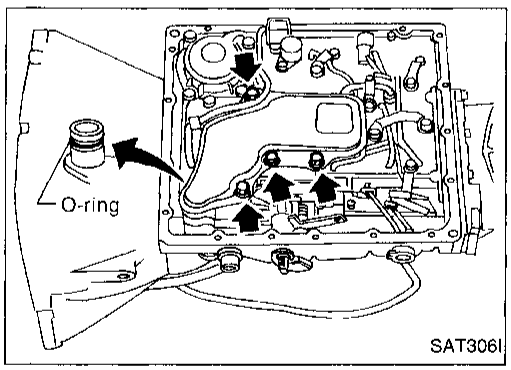


- **Apply ATF to manual valve.**

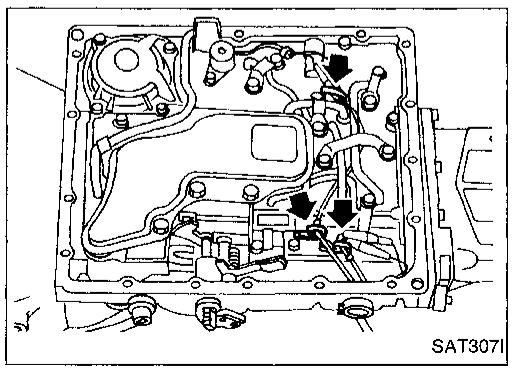
c. Install control valve assembly on transmission case.

d. Install connector tube brackets and tighten bolts Ⓐ and Ⓑ.

- **Check that terminal assembly harness does not catch.**



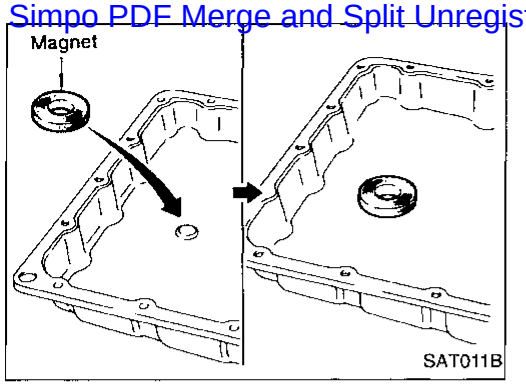
Bolt	ℓ mm (in)
Ⓐ	33 (1.30)
Ⓑ	45 (1.77)



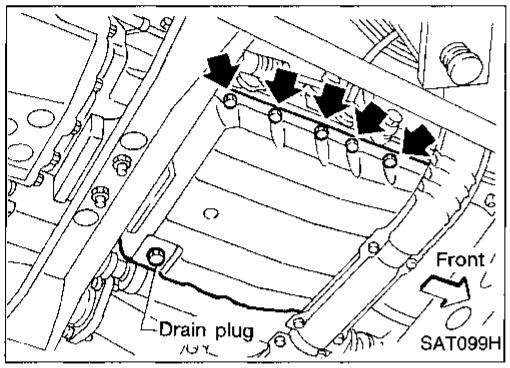
e. Install O-ring on oil strainer.

- **Apply petroleum jelly to O-ring.**

f. Install oil strainer on control valve.

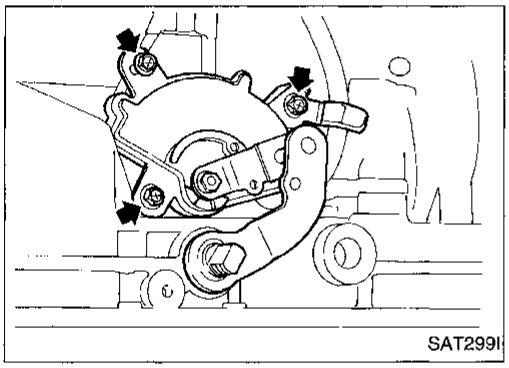


g. Securely fasten terminal harness with clips.

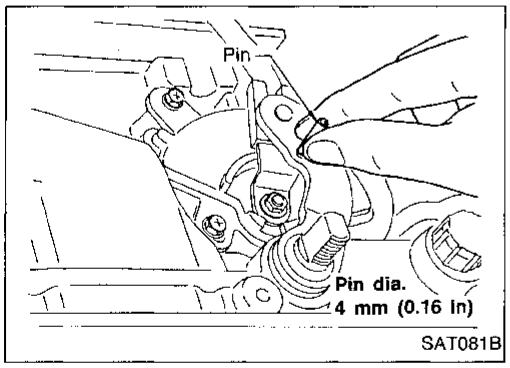


Assembly (2) (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

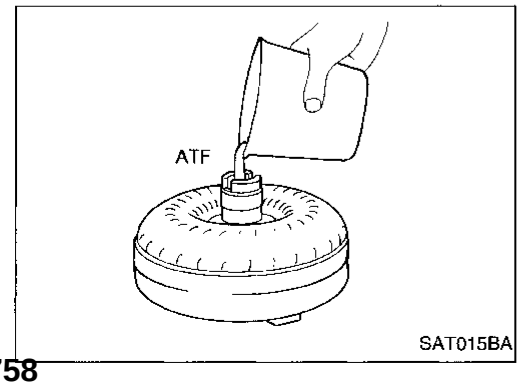


11. Install oil pan.
a. Attach a magnet to oil pan.



b. Install new oil pan gasket on transmission case.
c. Install oil pan and bracket on transmission case.

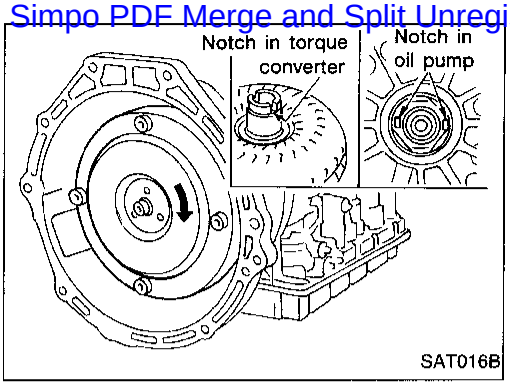
- **Always replace oil pan bolts; they are self-sealing bolts.**
- **Before installing bolts, remove traces of sealant and oil from mating surface and thread holes.**
- **Tighten four bolts in a criss-cross pattern to prevent dislocation of gasket.**



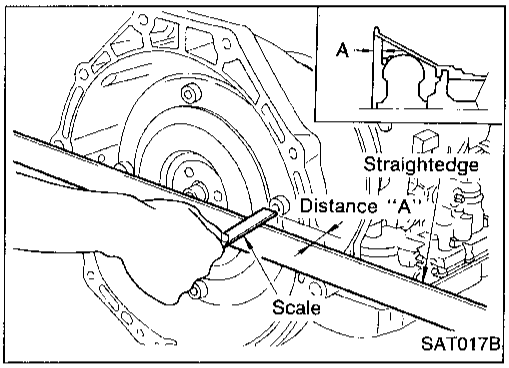
d. Tighten drain plug.

12. Install inhibitor switch.
a. Check that manual shaft is in "1" position.
b. Temporarily install inhibitor switch on manual shaft.
c. Move manual shaft to "N".

d. Use a 4 mm (0.16 in) pin for this adjustment.
1) Insert the pin straight into the manual shaft adjustment hole.
2) Rotate inhibitor switch until the pin can also be inserted straight into hole in inhibitor switch.
e. Tighten inhibitor switch fixing bolts.
f. Remove pin from adjustment hole after adjusting inhibitor switch.



13. Install torque converter.
a. Pour ATF into torque converter.



- **Approximately 2 liters (2-1/8 US qt, 1-3/4 lmp qt) of fluid are required for a new torque converter.**
- **When reusing old torque converter, add the same amount of fluid as was drained.**

Assembly (2) (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

b. Install torque converter while aligning notches and oil pump.

c. Measure distance A to check that torque converter is in proper position.

Distance "A":
26.0 mm (1.024 in) or more

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

General Specifications

Automatic transmission model	RL4R01A
Transmission model code number	49X11
Stall torque ratio	2.0 : 1
Transmission gear ratio	
1st	2.785
2nd	1.545
Top	1.000
OD	0.694
Reverse	2.272
Recommended fluid	Nissan Matic "D" (Continental U.S. and Alaska) or Genuine Nissan Automatic Transmission Fluid (Canada)*1
Fluid capacity ℓ (US qt, Imp qt)	7.9 (8-3/8, 7)

*1: Refer to MA section ("Fluids and Lubricants", "RECOMMENDED FLUIDS AND LUBRICANTS").

Specifications and Adjustment

SHIFT SCHEDULE

Vehicle speed when shifting gears

When you read wiring diagrams:
- **Read GI section, "HOW TO READ WIRING DIAGRAMS".**
- **See EL section, "POWER SUPPLY ROUTING" for power distribution circuit.**

When you perform trouble diagnoses, read GI section, "HOW TO FOLLOW FLOW CHART IN TROUBLE DIAGNOSES" and "HOW TO PERFORM EFFICIENT DIAGNOSIS FOR AN ELECTRICAL INCIDENT".

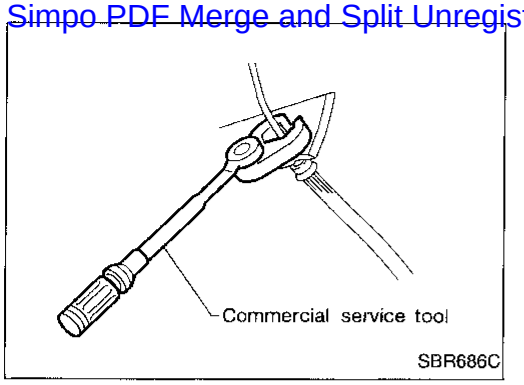
Supplemental Restraint System (SRS) "AIR BAG"

The Supplemental Restraint System "AIR BAG", used along with a seat belt, helps to reduce the risk or severity of injury to the driver and front passenger in a frontal collision. The Supplemental Restraint System consists of air bag modules (located in the center of the steering wheel and in the instrument panel on the passenger side), a diagnosis sensor unit, a crash zone sensor (4WD models), warning lamp, wiring harness and spiral cable.



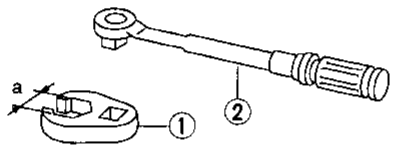
The vehicle is equipped with a passenger air bag deactivation switch. Because no rear seat exists where a rear-facing child restraint can be placed, the switch is designed to turn off the passenger air bag so that a rear-facing child restraint can be used in the front passenger seat. The switch is located in the center of the instrument panel, near the ashtray. When the switch is turned to the ON position, the passenger air bag is enabled and could inflate in a frontal collision. When the switch is turned to the OFF position, the passenger air bag is disabled and will not inflate in a frontal collision. A passenger air bag OFF indicator on the instrument panel lights up when the passenger air bag is switch OFF. The driver air bag always remains enabled and is not affected by the passenger air bag deactivation switch.

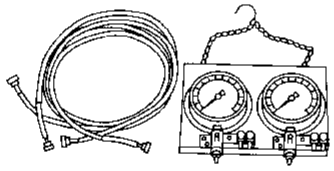
Information necessary to service the system safely is included in the **RS section** of this Service Manual.

WARNING:

- **To avoid rendering the SRS inoperative, which could increase the risk of personal injury or death in the event of a collision which would result in air bag inflation, all maintenance should be performed by an authorized NISSAN dealer.**
- **Improper maintenance, including incorrect removal and installation of the SRS, can lead to personal injury caused by unintentional activation of the system.**
- **Do not use electrical test equipment on any circuit related to the SRS unless instructed to in this Service Manual. SRS wiring harnesses are covered with yellow insulation either just before the harness connectors or on the complete harness, for easy identification.**
- **The vehicle is equipped with a passenger air bag deactivation switch which can be operated by the customer. When the passenger air bag is switched OFF, the passenger air bag is disabled and will not inflate in a frontal collision. When the passenger air bag is switched ON, the passenger air bag is enabled and could inflate in a frontal collision. After SRS maintenance or repair, make sure the passenger air bag deactivation switch is in the same position (ON or OFF) as when the vehicle arrived for service.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com





Precautions for Brake System

- **Use brake fluid DOT 3.**
- **Never reuse drained brake fluid.**
- **Be careful not to splash brake fluid on painted areas; it may cause paint damage. If brake fluid is splashed on painted areas, wash it away with water immediately.**
- **To clean master cylinder parts, disc brake caliper parts or wheel cylinder parts, use clean brake fluid.**
- **Never use mineral oils such as gasoline or kerosene. They will ruin rubber parts of the hydraulic system.**
- **Use flare nut wrench when removing and installing brake tubes.**
- **Always torque brake lines when installing.**

WARNING:

- **Clean brakes with a vacuum dust collector to minimize the hazard of airborne materials.**

Commercial Service Tools

Tool name	Description	
① Flare nut crowfoot ② Torque wrench	 NT360	Removing and installing each brake piping **a: 10 mm (0.39 in)**
Brake fluid pressure gauge	 NT151	Measuring brake fluid pressure

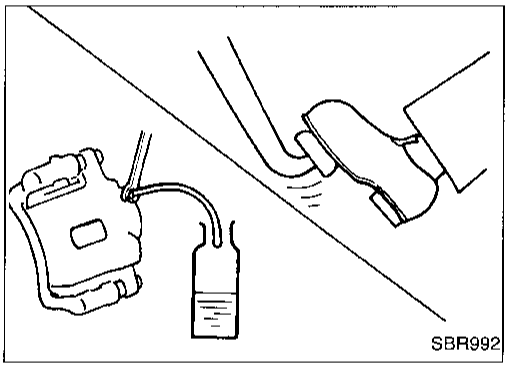
Checking Brake Fluid Level

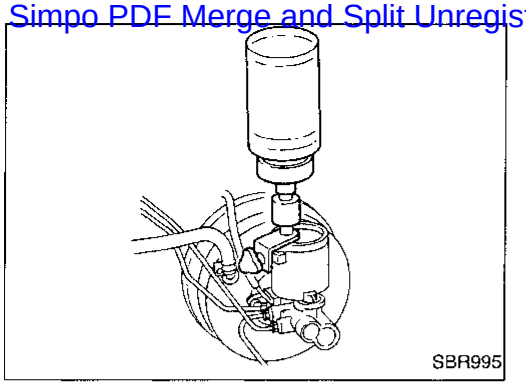


- Check fluid level in reservoir tank. It should be between Max and Min lines on reservoir tank.
- If fluid level is extremely low, check brake system for leaks.
- If the brake warning lamp comes on, check brake fluid level switch and parking brake switch.

Checking Brake Line

CAUTION:
If leakage occurs around joints, retighten or, if necessary, replace damaged parts.

1. Check brake lines (tubes and hoses) for cracks, deterioration or other damage. Replace any damaged parts.
2. Check for oil leakage by fully depressing brake pedal while engine is running.

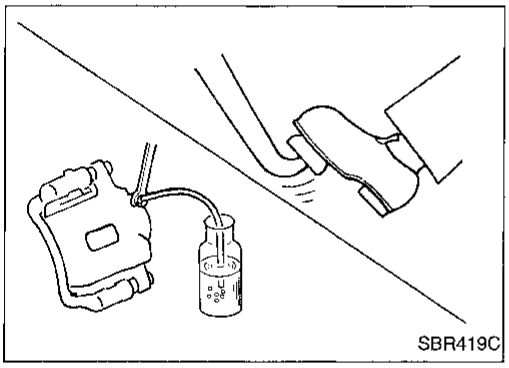


Changing Brake Fluid

CAUTION:

- **Refill with new brake fluid DOT 3.**
- **Always keep fluid level higher than minimum line on reservoir tank.**
- **Never reuse drained brake fluid.**
- **Be careful not to splash brake fluid on painted areas; it may cause paint damage. If brake fluid is splashed on painted areas, wash it away with water immediately.**

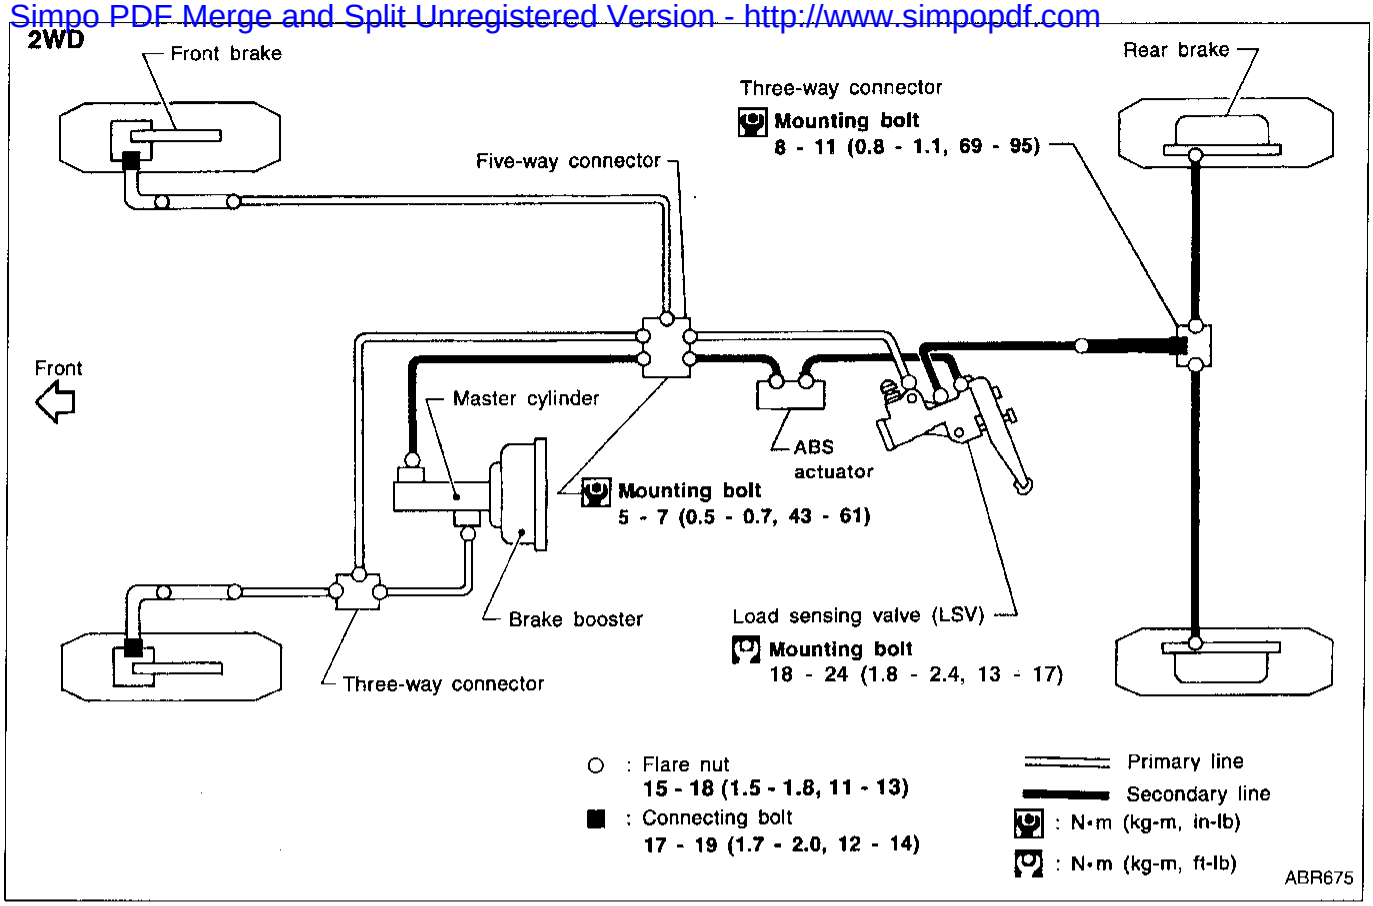
1. Clean inside of reservoir tank, and refill with new brake fluid.
2. Connect a vinyl tube to each air bleeder valve.
3. Drain brake fluid from each air bleeder valve by depressing brake pedal.
4. Refill until brake fluid comes out of each air bleeder valve. Use same procedure as in bleeding hydraulic system to refill brake fluid. Refer to "Bleeding Brake System", BR-6.



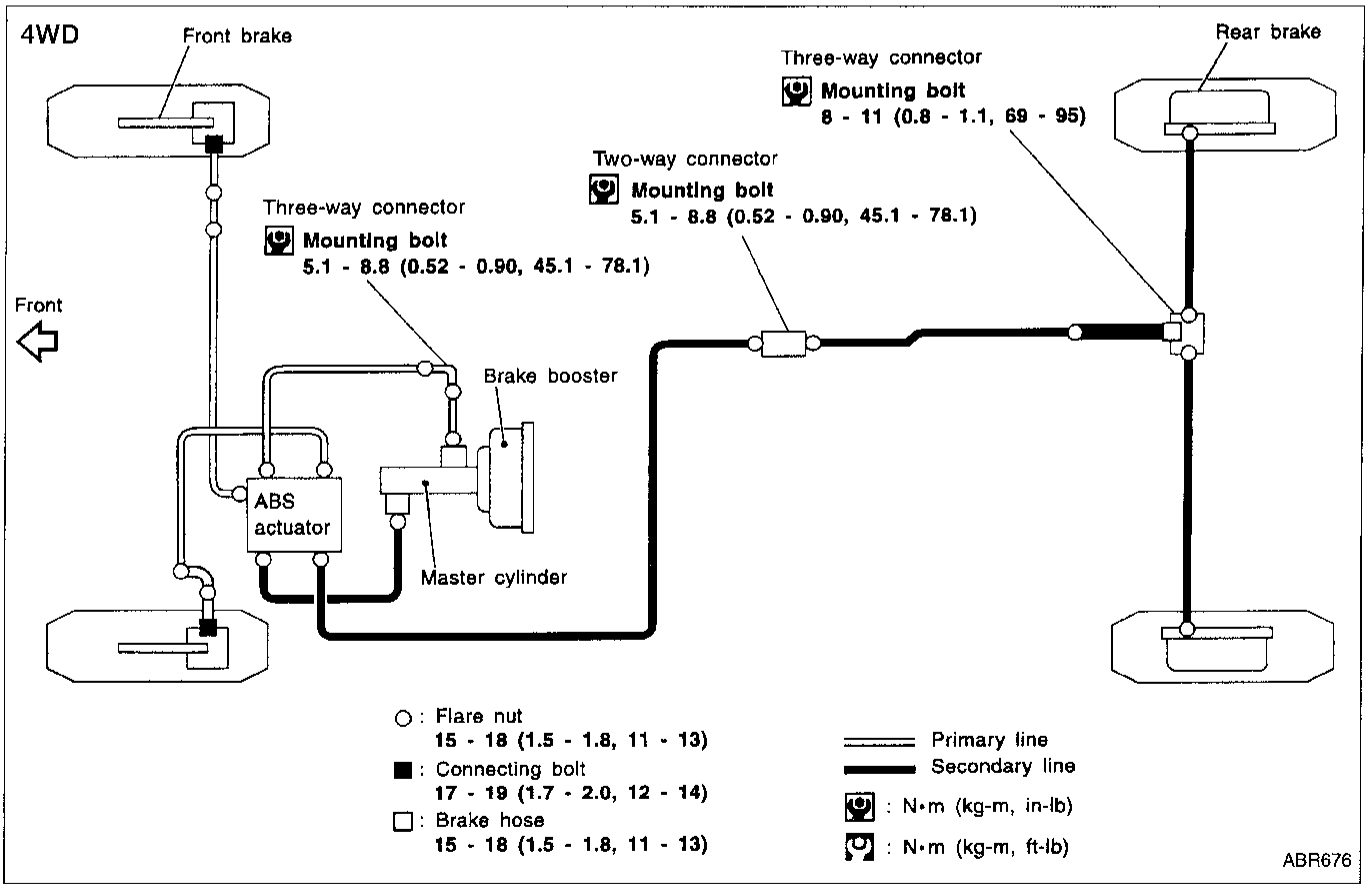
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SBR995

Bleeding Brake System

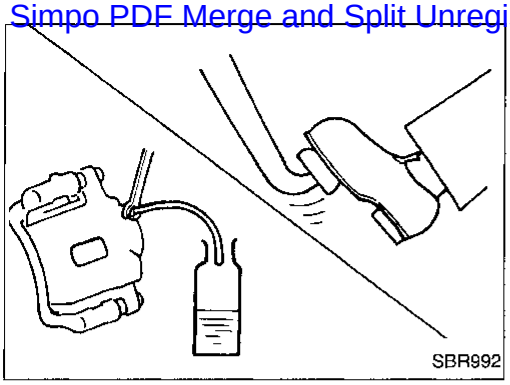


CAUTION:



- **Carefully monitor brake fluid level at master cylinder during bleeding operation.**
- **If master cylinder is suspected to have air inside, bleed air from master cylinder first. Refer to "Installation", "MASTER CYLINDER", BR-16.**
- **Fill reservoir with new brake fluid DOT 3. Make sure it is full at all times while bleeding air out of system.**
- **Place a container under master cylinder to avoid spillage of brake fluid.**
- **Turn ignition switch OFF and disconnect ABS actuator (2WD)/ABS actuator and electric unit (4WD) connector or battery cable.**
- Bleed air in the following order.
  a. LSV air bleeder (Models equipped with LSV)
  b. Left rear brake
  c. Right rear brake
  d. Left front brake
  e. Right front brake
  f. ABS actuator (2WD) or ABS actuator and electric unit (4WD)

SBR419C



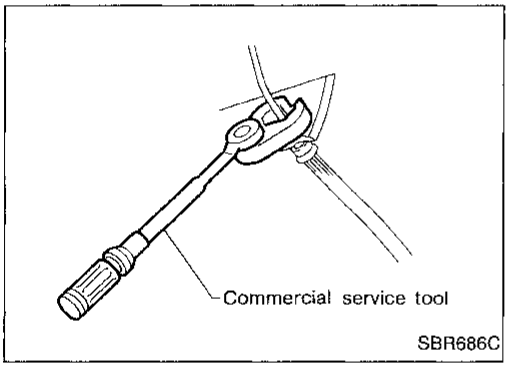
1. Connect a transparent vinyl tube to air bleeder valve.
2. Fully depress brake pedal several times.
3. With brake pedal depressed, open air bleeder valve to release air.
4. Close air bleeder valve.
5. Release brake pedal slowly.
6. Repeat steps 2 through 5 until clear brake fluid comes out of air bleeder valve.
7. Tighten air bleeder to the specified torque.
   : 7 - 9 N·m (0.7 - 0.9 kg-m, 61 - 78 in-lb)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SBR992

REMOVAL



CAUTION:

- **Be careful not to splash brake fluid on painted areas; it may cause paint damage. If brake fluid is splashed on painted areas, wash it away with water immediately.**
- **All hoses must be free from excessive bending, twisting and pulling.**

1. Connect vinyl tube to air bleeder valve.
2. Drain brake fluid from each air bleeder valve by depressing brake pedal.
3. Remove flare nut connecting brake tube and hose, then withdraw lock spring.
4. Cover openings to prevent entrance of dirt whenever disconnecting brake line.

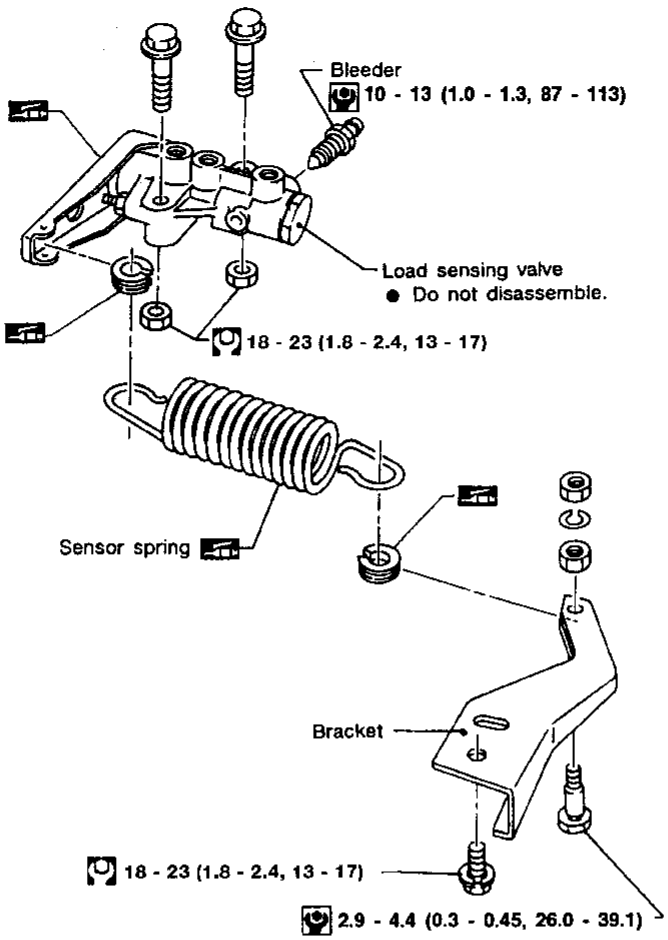
INSPECTION

Check brake lines (tubes and hoses) for cracks, deterioration or other damage. Replace any damaged parts.

SBR686C

INSTALLATION

CAUTION:



- **Refill with new brake fluid DOT 3.**
- **Never reuse drained brake fluid.**

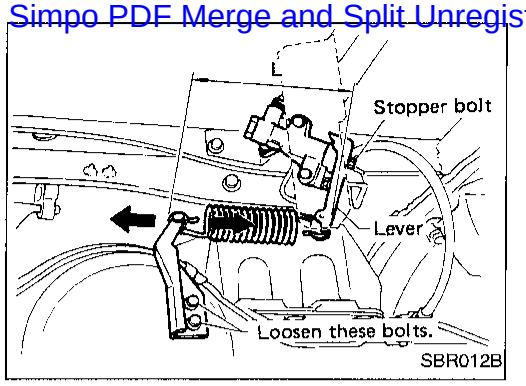
1. Tighten all flare nuts and connecting bolts.
   Flare nut:
   : 15 - 18 N·m (1.5 - 1.8 kg-m, 11 - 13 ft-lb)
   Connecting bolt:
   : 17 - 19 N·m (1.7 - 2.0 kg-m, 12 - 14 ft-lb)
2. Refill until new brake fluid comes out of each air bleeder valve.
3. Bleed air. Refer to "Bleeding Brake System", BR-6.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Load Sensing Valve (2WD)

Load Sensing Valve
SEC. 462

REMOVAL AND INSTALLATION



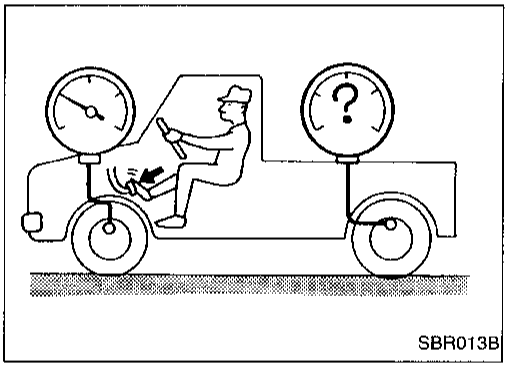
CAUTION:

- **Refill with new brake fluid DOT 3.**
- **Be careful not to splash brake fluid on painted areas; it may cause paint damage. If brake fluid is splashed on painted areas, wash it away with water immediately.**

1. Replace damaged load sensing valve linkage as an assembly.
2. When disassembling, apply multi-purpose grease to linkage.
3. Tighten all flare nuts and bolts.
   : 15 - 18 N·m (1.5 - 1.8 kg-m, 11 - 13 ft-lb)
4. Bleed air. Refer to "Bleeding Brake System", BR-6.

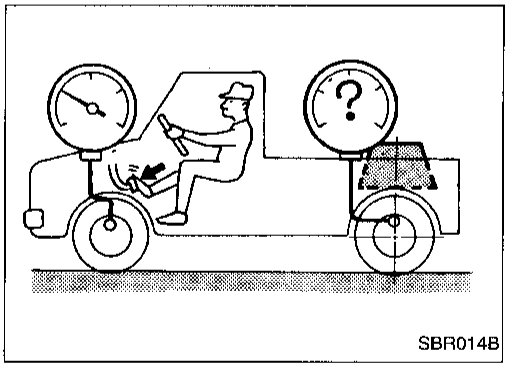
Load Sensing Valve (2WD) (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



INSPECTION

1. Ensure vehicle is unladen condition*.
   * Fuel, radiator coolant and engine oil full. Spare tire, jack, hand tools and mats in designated positions.
2. Have a driver sit in the driver's seat and one person sit on the rear of the vehicle. Then have the person on the rear of the vehicle slowly get off. This is necessary to stabilize suspension deflection.
3. Adjust length "L" as follows:

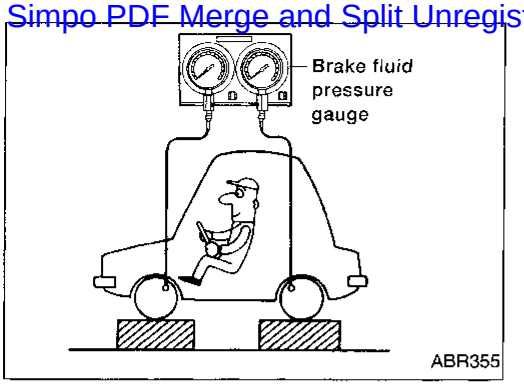


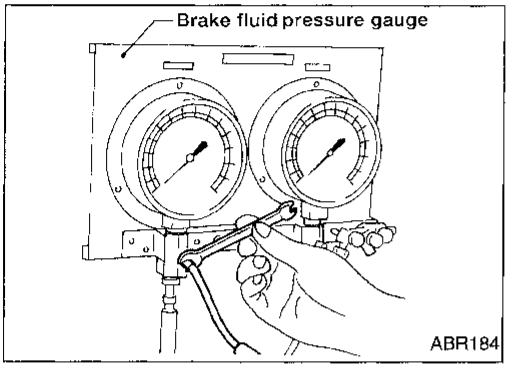
a. Loosen stopper bolt locknut.
b. Pull lever against stopper bolt and adjust by turning stopper bolt.
c. Tighten stopper bolt locknut.

Length "L":
Approx. 203 mm (7.99 in)

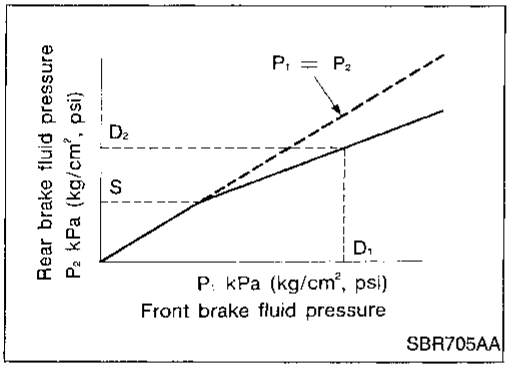
4. Install pressure gauge to front and rear brake air bleeder.
5. Bleed air from the Tool.
6. Raise front brake pressure to 4,904 kPa (49.0 bar, 50 kg/cm^2, 711 psi) and 9,807 kPa (98.1 bar, 100 kg/cm^2, 1,422 psi) and check rear brake pressure.

Rear brake pressure:
Refer to table below.





7. Set down weight slowly over axle center so that sensor spring length becomes the same as when in loaded condition (refer to table below). Check rear brake pressure in the same way described in step 6.



Unit: kPa (bar, kg/cm^2, psi)

Front brake pressure	Rear brake pressure	
	Unladen condition L = 203 mm (7.99 in)	Loaded condition L = 208.0 mm (8.19 in)
4,904 (49.0, 50, 711)	1,667 - 2,648 (16.7 - 26.5, 17 - 27, 242 - 384)	3,334 - 4,315 (33.3 - 43.2, 34 - 44, 483 - 626)
9,807 (98.1, 100, 1,422)	2,844 - 3,825 (28.4 - 38.2, 29 - 39, 412 - 555)	3,629 - 5,590 (36.3 - 55.9, 37 - 57, 526 - 811)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Proportioning Valve (4WD)

INSPECTION

CAUTION:

- **Carefully monitor brake fluid level at master cylinder.**
- **Use new brake fluid "DOT 3".**
- **Be careful not to splash brake fluid on painted areas; it may cause paint damage. If brake fluid is splashed on paint areas, wash it away with water immediately.**
- **Depress pedal slowly when raising front brake pressure.**
- **Check rear brake pressure 2 seconds after front brake pressure reaches specified value.**
- **Disconnect harness connector from ABS actuator and electric unit before checking.**

1. Remove front LH tire.
2. Connect tool to air bleeders on front LH brake caliper and rear LH or RH brake wheel cylinder.
3. Install front LH tire.

Before installing front LH tire, confirm the tool is not touching the front LH wheel.

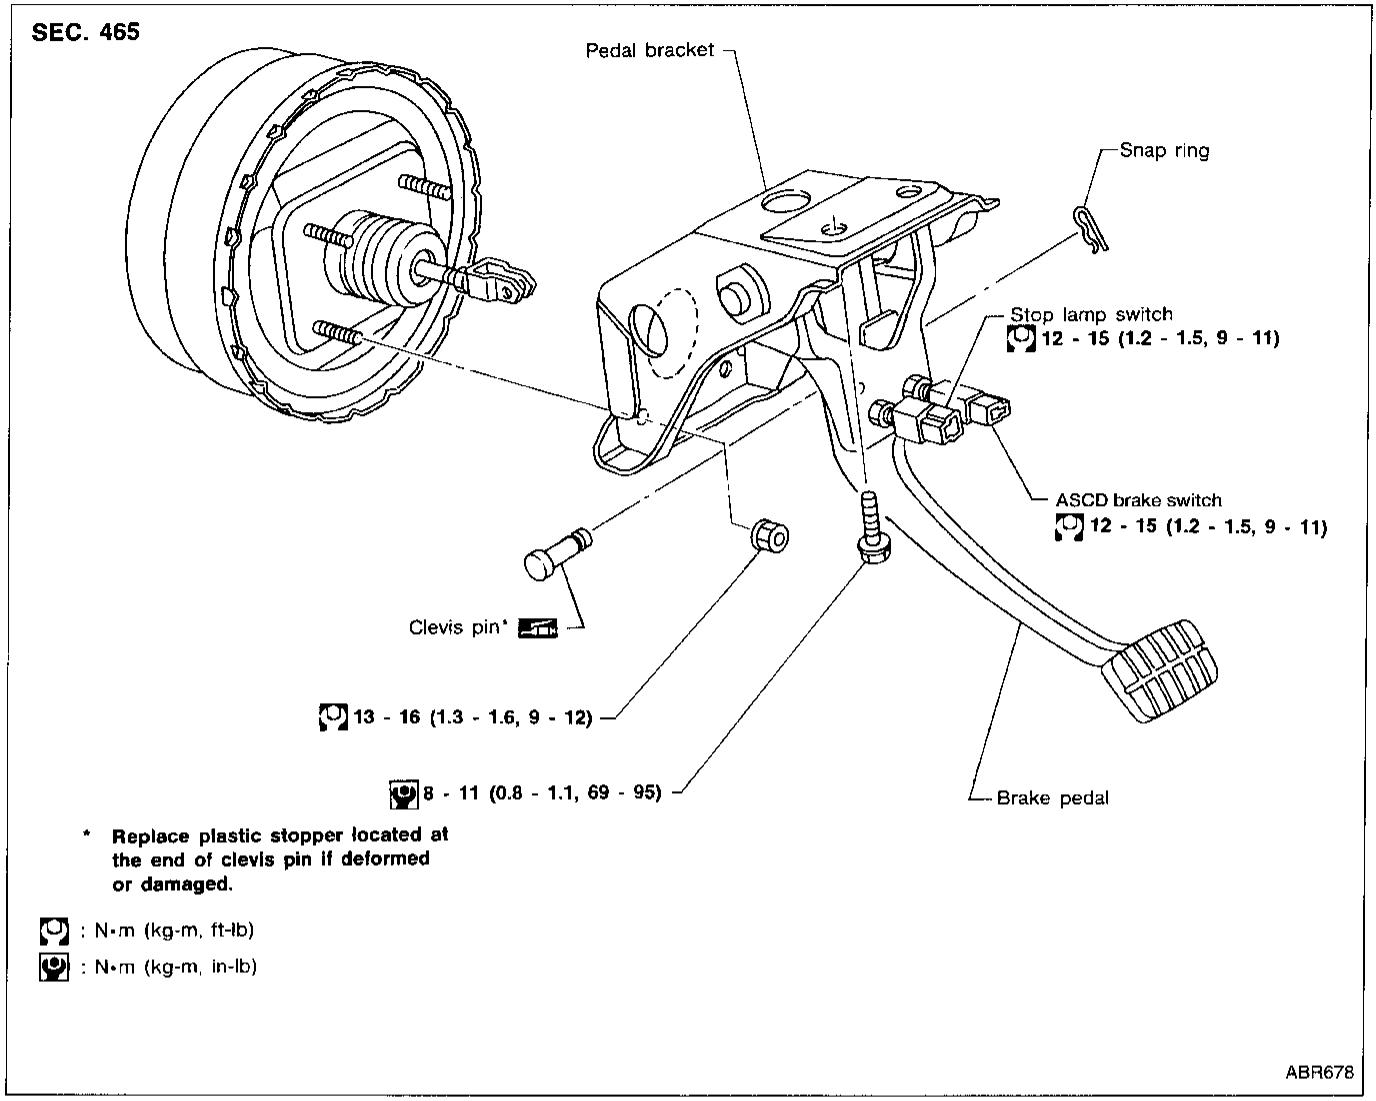
4. Bleed air from the tool.
5. Check fluid pressure by depressing brake pedal.

Unit: kPa (kg/cm², psi)

Applied pressure (Front brake)	D_1	6,375 (65, 924)
Output pressure (Rear brake)	D_2	3,334 - 3,825 (34 - 39, 484 - 555)

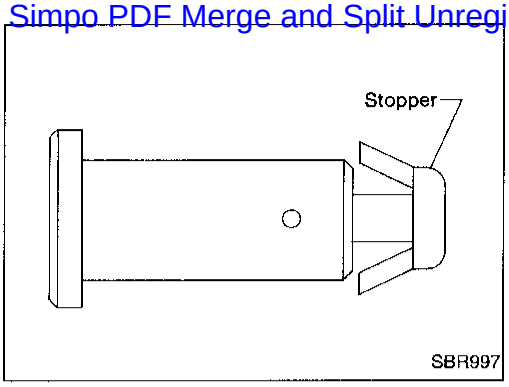
If output pressure is out of specifications, replace master cylinder assembly.

6. Bleed air after disconnecting the tool. Refer to "Bleeding Brake System", BR-6.
7. Install front LH tire.



REMOVAL AND INSTALLATION

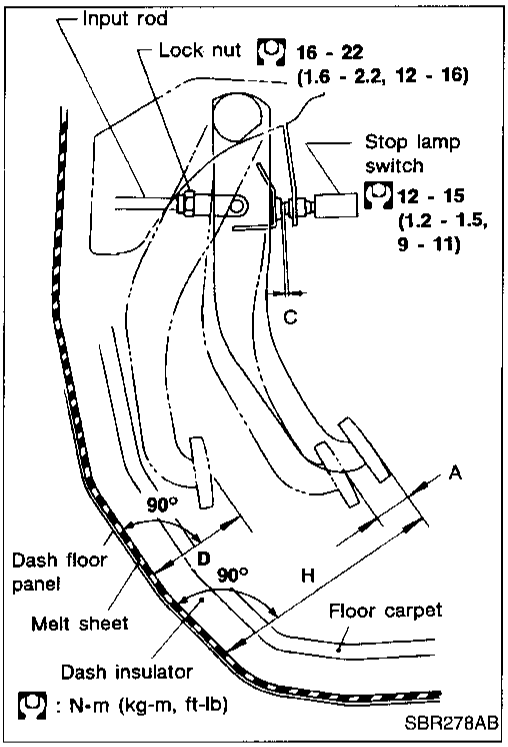
Always replace together with master cylinder as an assembly.



- Refer to "MASTER CYLINDER", BR-14.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

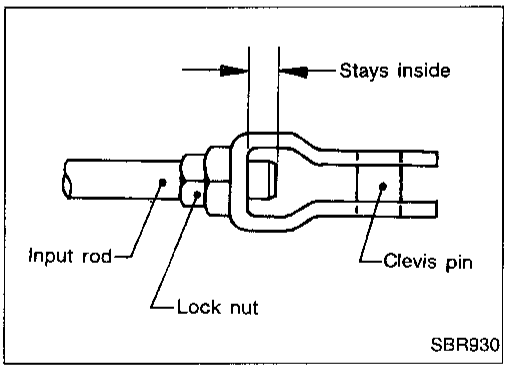
Removal and Installation



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection

Check brake pedal for following items:



- Brake pedal bend
- Clevis pin deformation
- Crack of any welded portion
- Crack or deformation of clevis pin stopper

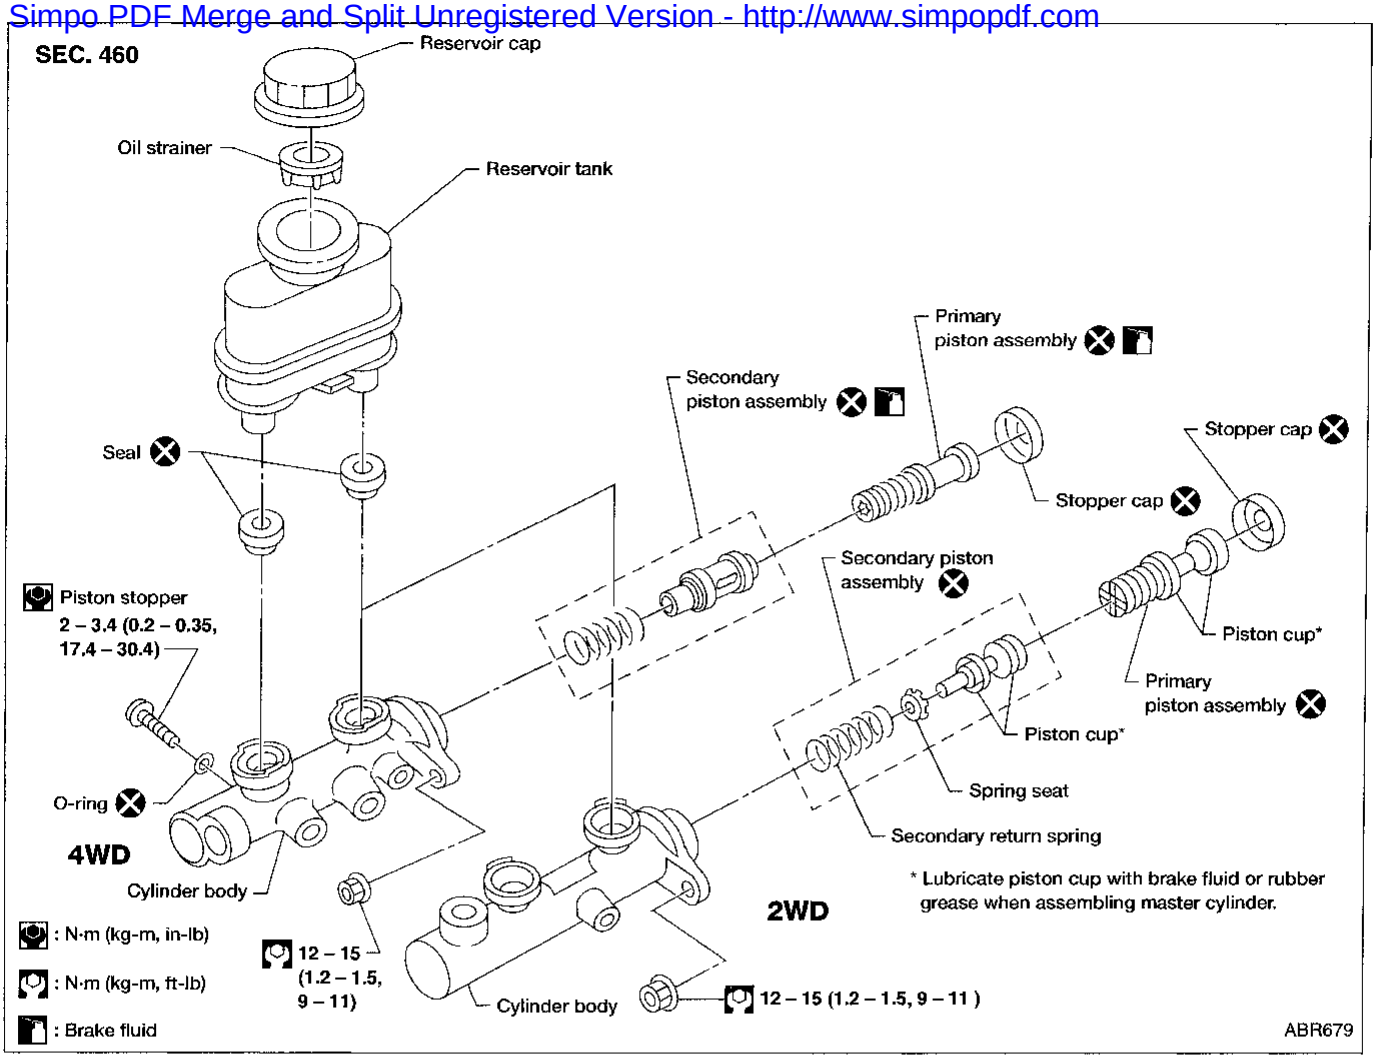
Adjustment

Check brake pedal free height from melt sheet.

H: Free height
Refer to SDS, BR-95.
D: Depressed height
Refer to SDS, BR-95.
Under force of 490 N (50 kg, 110 lb) with engine running
C: Clearance between pedal stopper and threaded end of stop lamp switch
0.3 - 1.0 mm (0.012 - 0.039 in)
A: Pedal free play at clevis
1 - 3 mm (0.04 - 0.12 in)

If necessary, adjust brake pedal free height.

1. Loosen lock nut and adjust pedal free height by turning brake booster input rod. Then tighten lock nut.



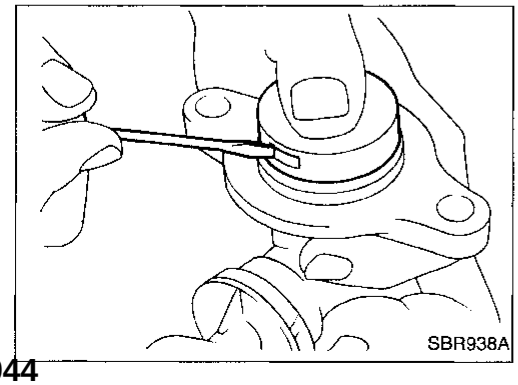
- **Make sure that the tip of input rod stays inside.**

2. Loosen lock nut and adjust clearance "C" with stop lamp switch respectively. Then tighten lock nut.
3. Check pedal free play.

- **Make sure that stop lamp is off when pedal is released.**

4. Check brake pedal's depressed height while engine is running. If lower than specification, check for leaks, air in system, or damage to components (master cylinder, wheel cylinder, etc.). Then make necessary repairs.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

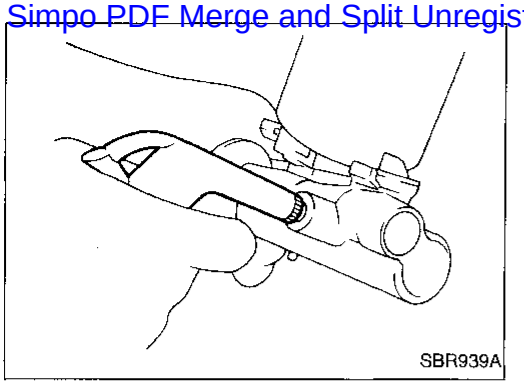


Removal

CAUTION:

- **Be careful not to splash brake fluid on painted areas; it may cause paint damage. If brake fluid is splashed on painted areas, wash it away with water immediately.**
- **In the case of brake fluid leakage from the master cylinder, disassemble the cylinder. Then check piston cups for deformation or scratches and replace necessary parts.**

1. Connect a vinyl tube to air bleeder valve.
2. Drain brake fluid from each air bleeder valve, depressing brake pedal to empty fluid from master cylinder.
3. Remove brake pipe flare nuts.
4. Remove master cylinder mounting nuts.

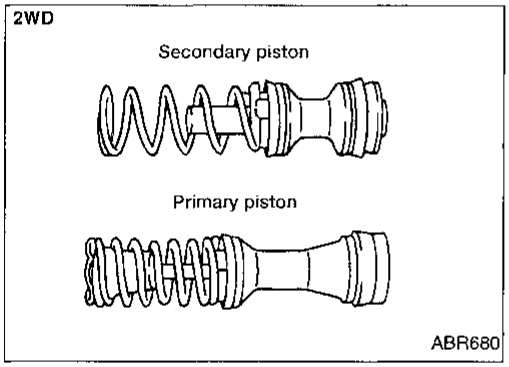


Disassembly

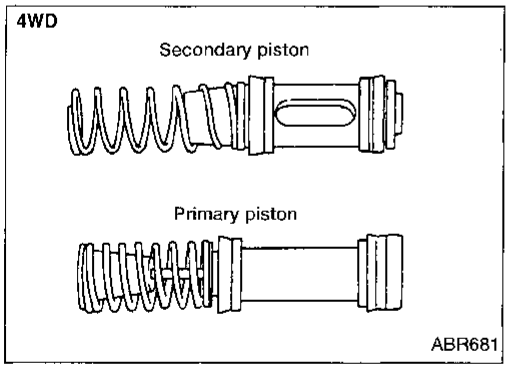
1. Bend claws of stopper cap outward.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Disassembly (Cont'd)



2. Remove piston assemblies.

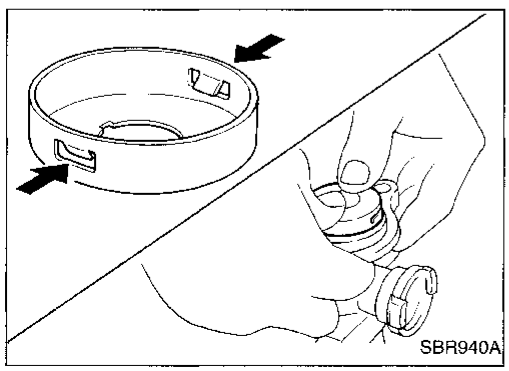


- **If it is difficult to remove secondary piston assembly, gradually apply compressed air through fluid outlet.**

3. Draw out reservoir tank.

Inspection

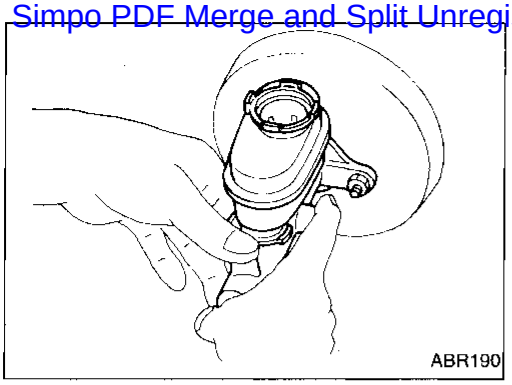
Check master cylinder inner wall for pin holes or scratches. Replace if damaged.



Assembly

1. Insert secondary piston assembly. Then insert primary piston assembly.

- **Pay attention to direction of piston cups in figure at left. Also, insert pistons squarely to avoid scratches on cylinder bore.**

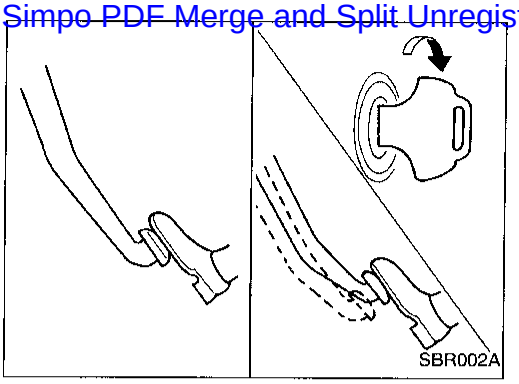


2. Install stopper cap.

- **Before installing stopper cap, ensure that claws are bent inward.**

3. Push reservoir tank seals into cylinder body.
4. Push reservoir tank into cylinder body.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

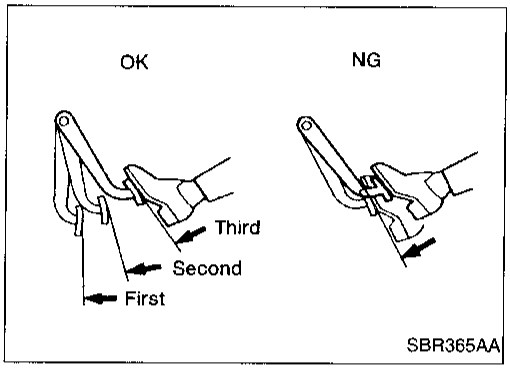


Installation

CAUTION:

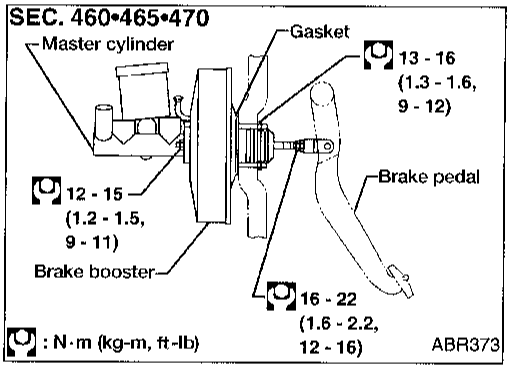
- **Refill with new brake fluid DOT 3.**
- **Never reuse drained brake fluid.**

1. Place master cylinder onto brake booster and secure mounting nuts lightly.
2. Tighten mounting nuts.
   : 12 - 15 N·m (1.2 - 1.5 kg-m, 9 - 11 ft-lb)
3. Fill up reservoir tank with new brake fluid.
4. Plug all ports on master cylinder with fingers to prevent air suction while releasing brake pedal.
5. Have driver depress brake pedal slowly several times until no air comes out of master cylinder.
6. Fit brake lines to master cylinder.
7. Tighten flare nuts.
   : 15 - 18 N·m (1.5 - 1.8 kg-m, 11 - 13 ft-lb)
8. Bleed air from brake system. Refer to “Bleeding Brake System”, BR-6.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

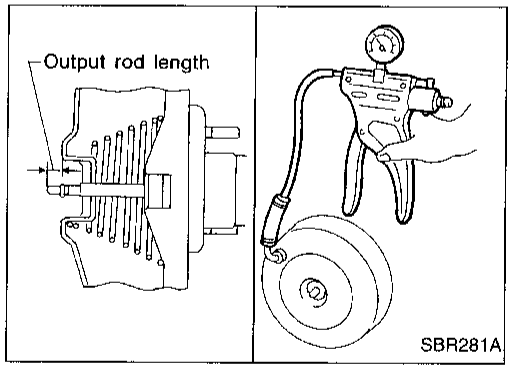
On-vehicle Service



OPERATING CHECK

- Depress brake pedal several times with engine off. After exhausting vacuum, make sure there is no change in pedal stroke.
- Depress brake pedal, then start engine. If pedal goes down slightly, operation is normal.

AIRTIGHT CHECK

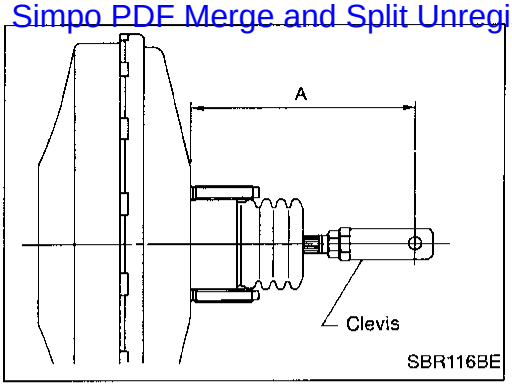


- Start engine, and stop it after one or two minutes. Depress brake pedal several times slowly. Booster is airtight if pedal stroke is less each time.
- Depress brake pedal while engine is running, and stop engine with pedal depressed. The pedal stroke should not change after holding pedal down for **30 seconds**.

Removal

CAUTION:

- **Be careful not to splash brake fluid on painted areas; it may cause paint damage. If brake fluid is splashed on painted areas, wash it away with water immediately.**
- **Be careful not to deform or bend brake pipes during removal of booster.**



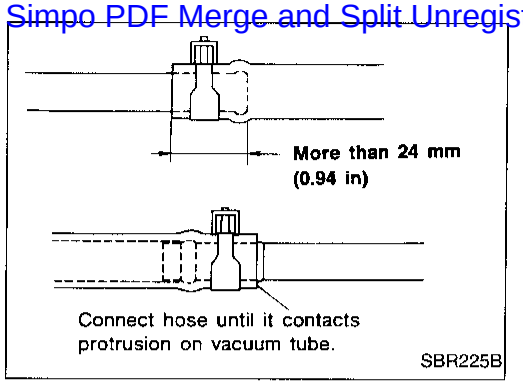
Inspection

OUTPUT ROD LENGTH CHECK

1. Apply vacuum of −66.7 kPa (−667 mbar, −500 mmHg, −19.69 inHg) to brake booster with a hand vacuum pump.
2. Check output rod length.
   Specified length:
   10.275 - 10.525 mm (0.4045 - 0.4144 in)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Installation

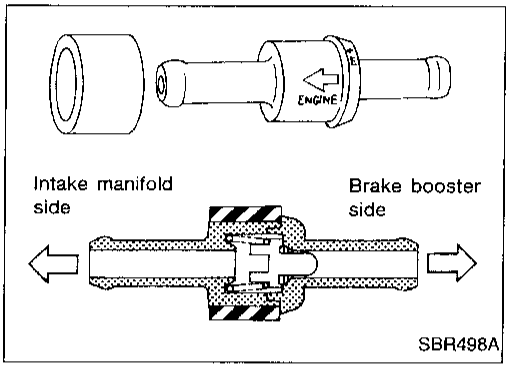


CAUTION:

- **Be careful not to deform or bend brake pipes during installation of booster.**
- **Replace clevis pin if damaged.**
- **Refill with new brake fluid DOT 3.**
- **Never reuse drained brake fluid.**
- **Take care not to damage brake booster mounting bolt thread when installing. Due to the narrow angle of installation, the threads can be damaged by the dash panel.**

A: 2WD
160 mm (6.30 in)
4WD
165 mm (6.50 in)

1. Before fitting booster, temporarily adjust clevis to dimension shown.
2. Fit booster, then secure mounting nuts (brake pedal bracket to brake booster) lightly.
3. Connect brake pedal and booster input rod with clevis pin.
4. Secure mounting nuts.
   : 13 - 16 N·m (1.3 - 1.6 kg-m, 9 - 12 ft-lb)
5. Install master cylinder. Refer to "Installation", "MASTER CYLINDER", BR-16.
6. Adjust brake pedal height and free play. Refer to BR-13.
7. Secure lock nut for clevis.
   : 16 - 22 N·m (1.6 - 2.2 kg-m, 12 - 16 ft-lb)
8. Bleed air. Refer to "Bleeding Brake System", BR-6.

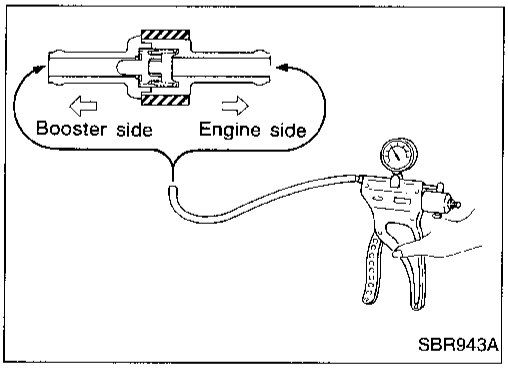


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Removal and Installation

CAUTION:
When installing vacuum hoses, pay attention to the following points.

- **Do not apply any oil or lubricants to vacuum hose and check valve.**
- **Insert vacuum tube into vacuum hose as shown.**



- **Install check valve, paying attention to its direction.**

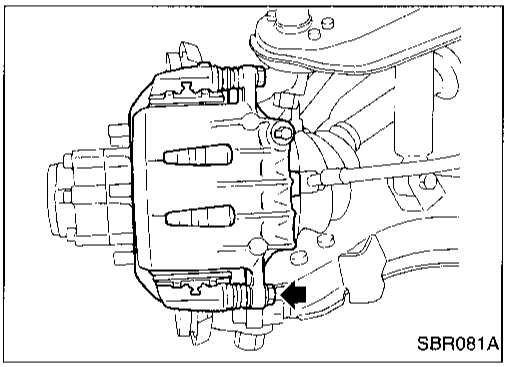
Inspection

HOSES AND CONNECTORS

Check vacuum lines, connections and check valve for airtightness, improper attachment chafing and deterioration.

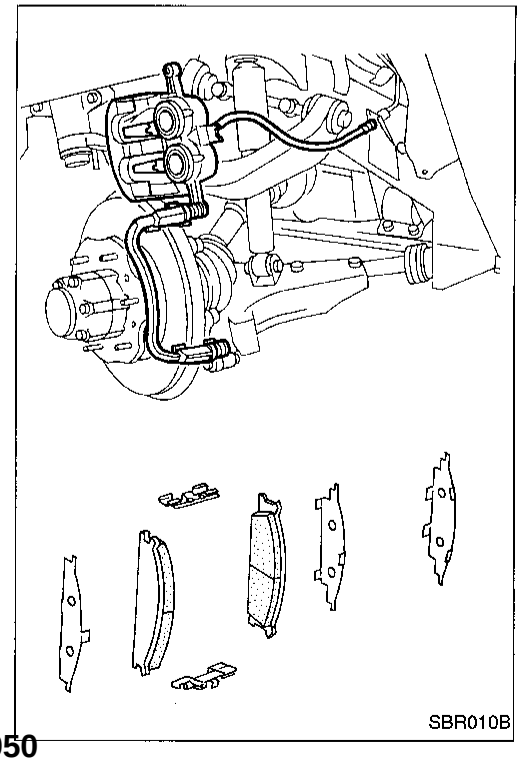
CHECK VALVE

Check vacuum with a vacuum pump.



Connect to booster side	Vacuum should exist.
Connect to engine side	Vacuum should not exist.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

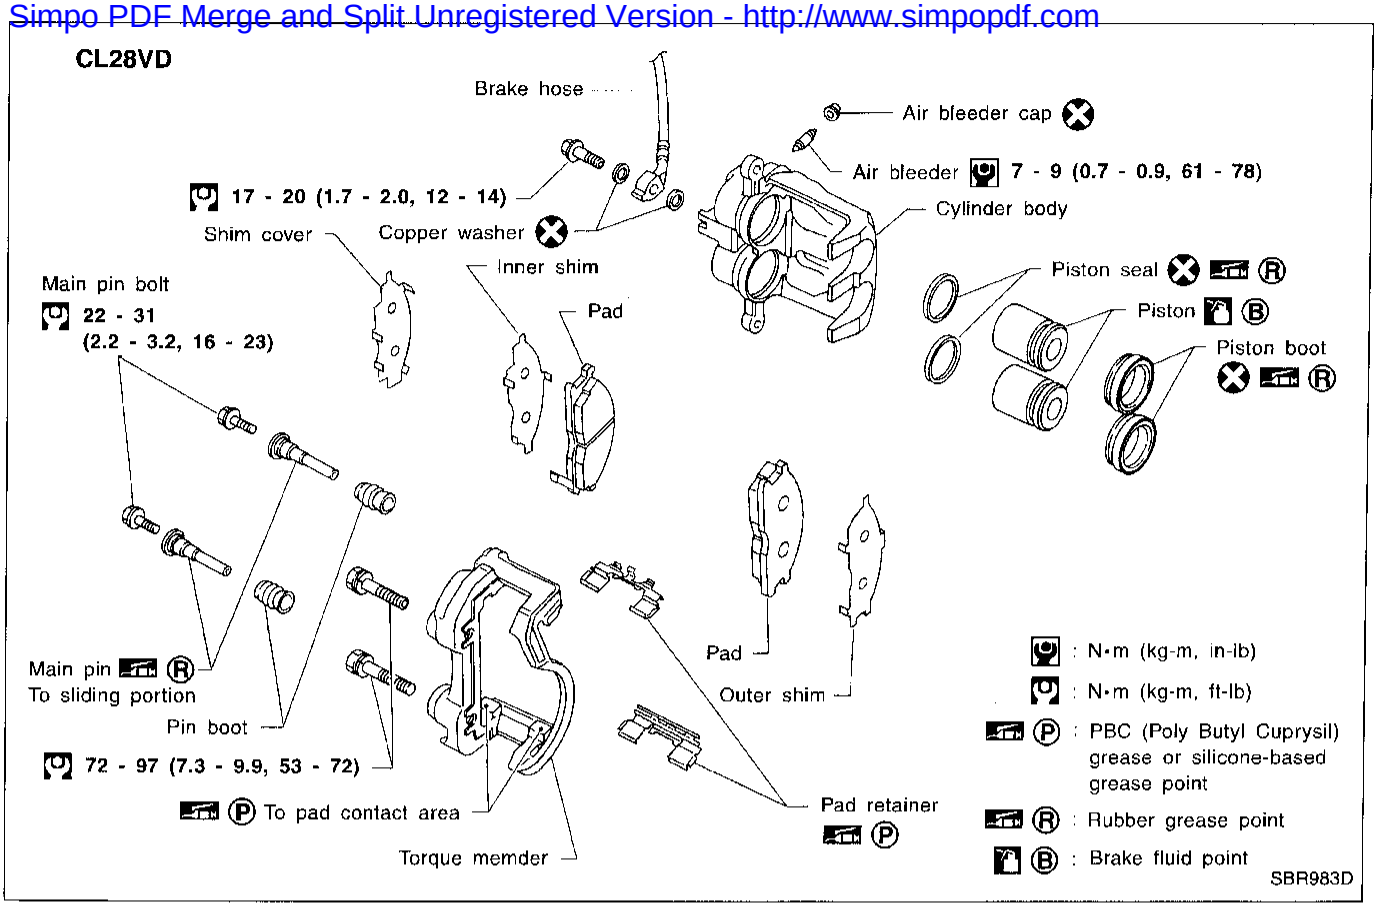


Pad Replacement

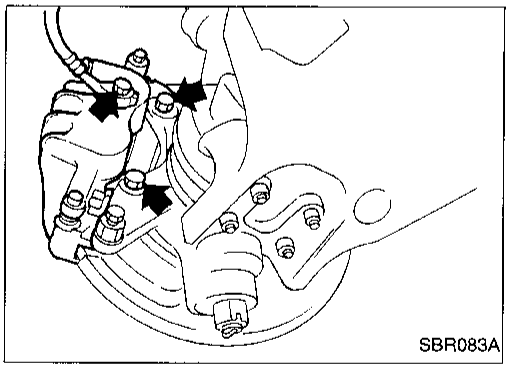
WARNING:
Clean brake pads with a vacuum dust collector to minimize the hazard of airborne materials.

CAUTION:
- **When cylinder body is open, do not depress brake pedal or caliper piston will pop out.**
- **Be careful not to damage piston boot or get oil on rotor. Always replace shims when replacing pads.**
- **If shims are rusted or show peeling of the rubber coat, replace them with new shims.**
- **It is not necessary to remove connecting bolt except for disassembly or replacement of caliper assembly. In this case, suspend cylinder body with wire so as not to stretch brake hose.**

SBR081A



1. Remove master cylinder reservoir cap.
2. Remove lower pin bolt.



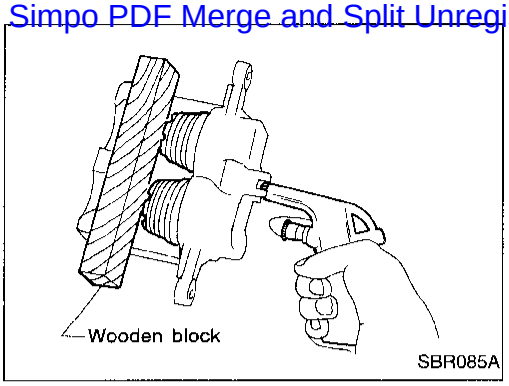
SBR010B

3. Open cylinder body upward. Then remove pad retainers, return spring and inner and outer shims.
   Standard pad thickness:
   10 mm (0.39 in)
   Pad wear limit:
   2.0 mm (0.079 in)

- **Carefully monitor brake fluid level because brake fluid will return to reservoir when pushing back piston.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Removal



WARNING:
Clean brake pads with a vacuum dust collector to minimize the hazard of airborne materials.

CAUTION:
Suspend caliper assembly with wire so as not to stretch brake hose.

Remove torque member fixing bolts and connecting bolt.

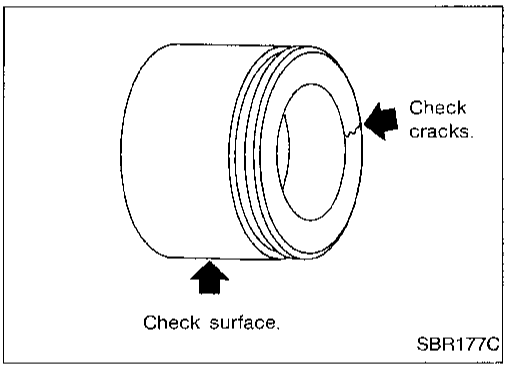
- **It is not necessary to remove connecting bolt except for disassembly or replacement of caliper assembly. In this case, suspend caliper assembly with wire so as not to stretch brake hose.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Disassembly

WARNING:
Do not place your fingers in front of piston.

CAUTION:
- **Do not scratch or score cylinder wall.**
- **CL28VD type front disc brake uses plastic pistons, handle them carefully.**



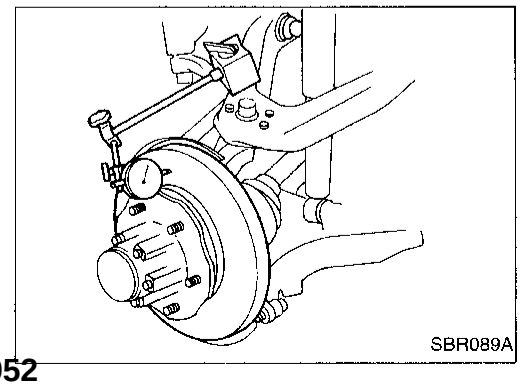
1. Push out pistons and dust covers with compressed air. Use a wooden block so that both pistons come out evenly.
2. Remove piston seals with a suitable tool.

Inspection — Caliper

CYLINDER BODY

- Check inside surface of cylinders for scores, rust, wear, damage or presence of foreign objects. If any of the above conditions are observed, replace cylinder body.
- Minor damage from rust or foreign objects may be eliminated by polishing the surface with a fine emery sandpaper. Replace cylinder body if necessary.

CAUTION:
Use brake fluid to clean. Never use mineral oil.



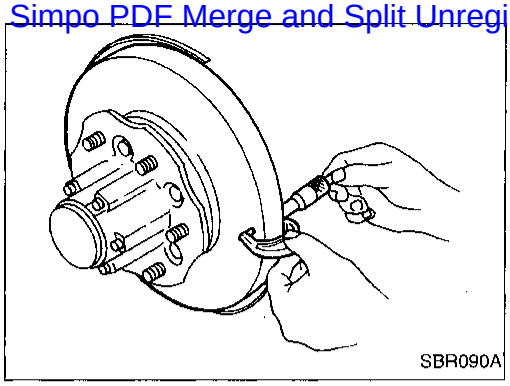
PISTON

CAUTION:
Piston sliding surface is plated. Do not polish with emery sandpaper even if rust or foreign objects are stuck to sliding surface.

Check pistons for uneven surface, chips or cracks. Replace if any of these conditions are observed.

SLIDE PIN, PIN BOLT AND PIN BOOT

Check for wear, cracks or other damage. Replace if any of these conditions are observed.



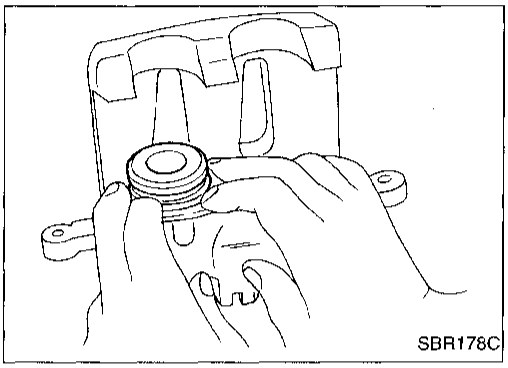
Inspection — Rotor

RUNOUT

1. Check runout using a dial indicator.
- **Make sure that wheel bearing axial end play is within the specifications before measuring. Refer to FA section ("Front Wheel Bearing", "ON-VEHICLE SERVICE").**
  Maximum runout:
  0.07 mm (0.0028 in)
2. If the runout is out of specification, machine rotor with on-car brake lathe ("MAD, DL-8700", "AMMCO 700 and 705" or equivalent).

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SBR090A



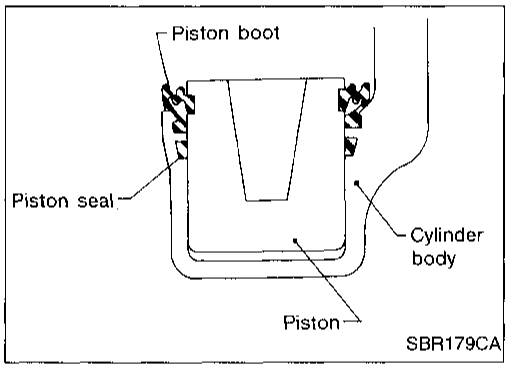
Inspection — Rotor (Cont'd)

THICKNESS

Thickness variation (At least 8 positions):
Maximum 0.02 mm (0.0008 in)

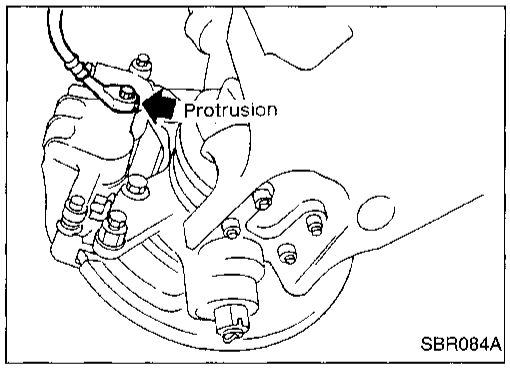
If thickness variation exceeds the specification, machine rotor with on-car brake lathe.

Rotor repair limit:
24.0 mm (0.945 in)



SBR178C

Assembly



1. Insert piston seal into groove on cylinder body.
2. With piston boot fitted to piston, insert piston boot into groove on cylinder body and install piston.
3. Properly secure piston boot.

CAUTION:

- **Secure dust seal properly.**
- **Lubricate with new brake fluid before installing plastic pistons into cylinder body.**

SBR179CA

SBR084A

Installation

CAUTION:

- **Refill with new brake fluid DOT 3.**
- **Never reuse drained brake fluid.**

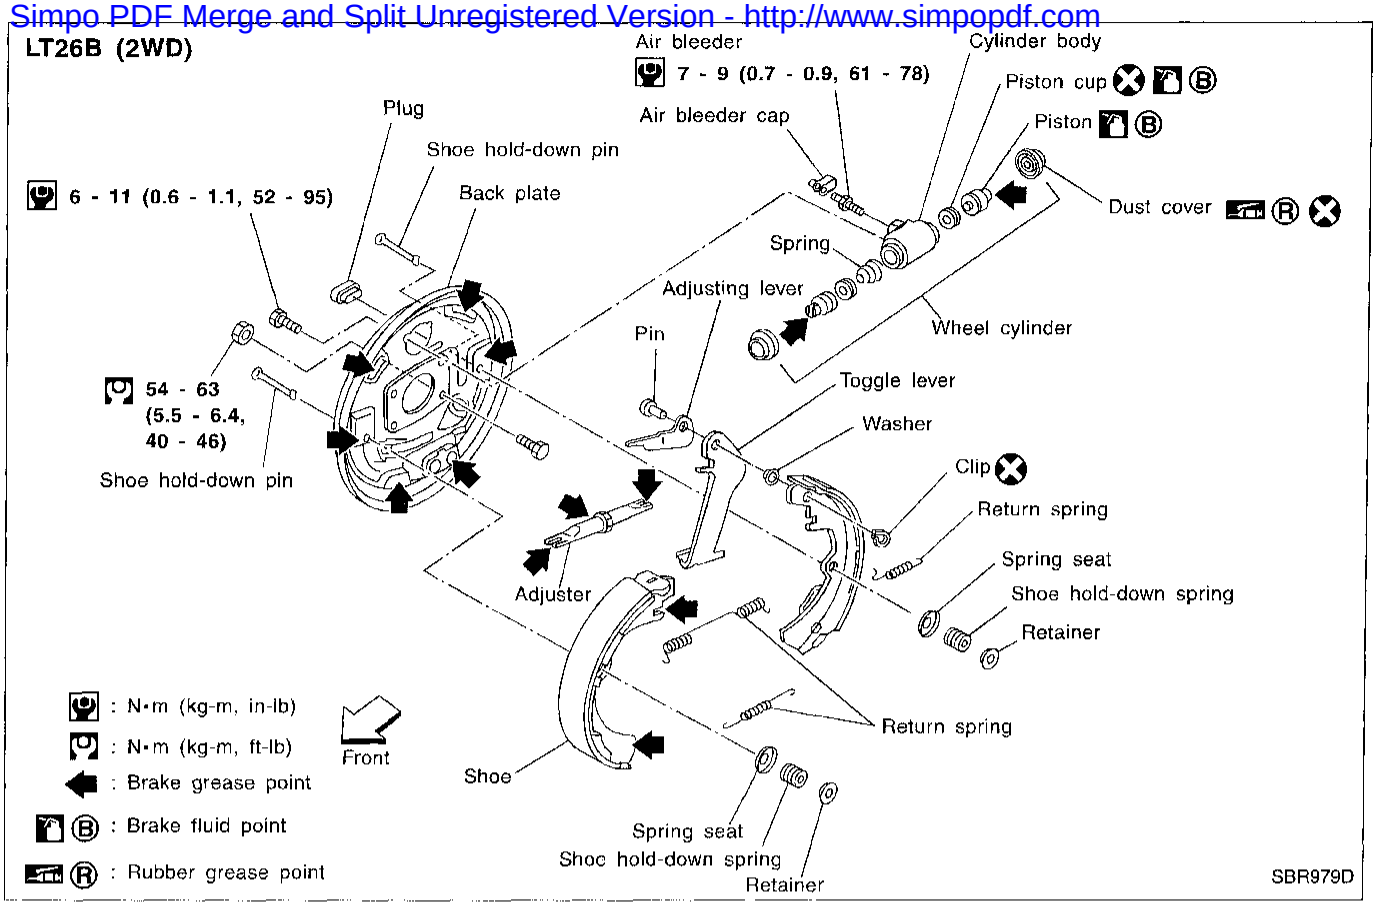
1. Install caliper assembly.
2. Install brake hose to caliper securely.
3. Install all parts and secure all bolts.
4. Bleed air. Refer to "Bleeding Brake System", BR-6.

Brake Burnishing Procedure

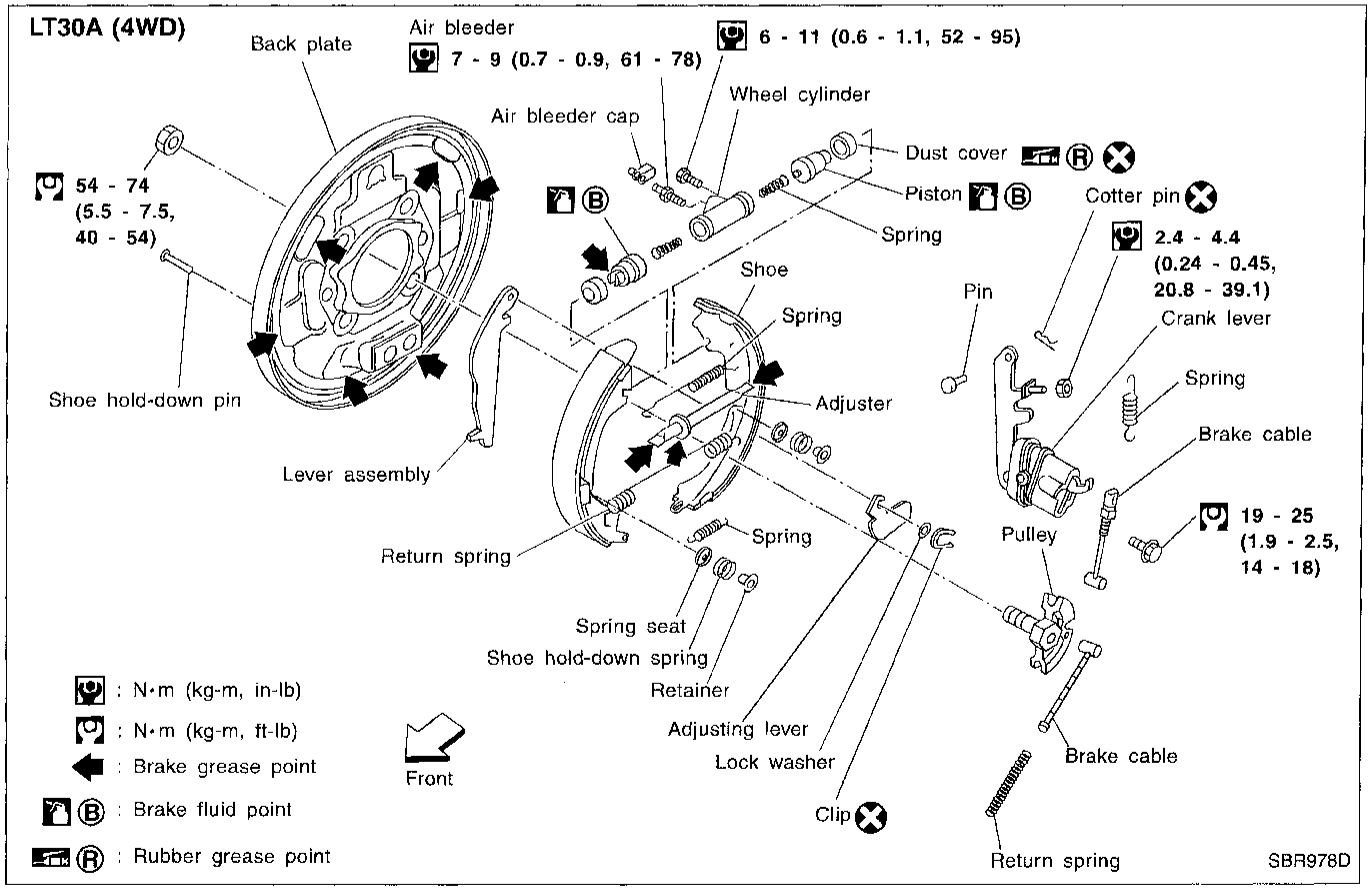
When experiencing soft brake pedal feel at very low mileage, or after replacing the rotor, burnish the brake pad contact surfaces according to the following procedure.

CAUTION:

Only perform this procedure under safe road and traffic conditions. Use extreme caution.



1. Drive the vehicle on a straight smooth road at 50 km/h (31 MPH).

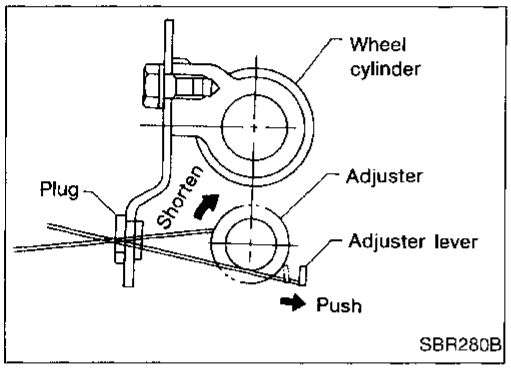


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Brake Burnishing Procedure (Cont'd)

2. Use medium brake pedal/foot effort to bring the vehicle to a complete stop from 50 km/h (31 MPH). Adjust brake pedal/foot pressure such that vehicle stopping time equals 3 to 5 seconds.
3. To cool the brake system, drive the vehicle at 50 km/h (31 MPH) for 1 minute without stopping.
4. Repeat steps 1 to 3, 10 times or more to complete the burnishing procedure.

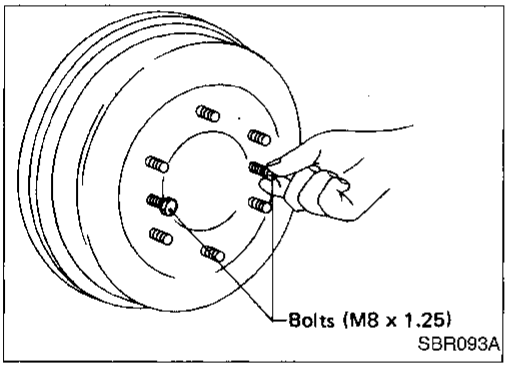
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



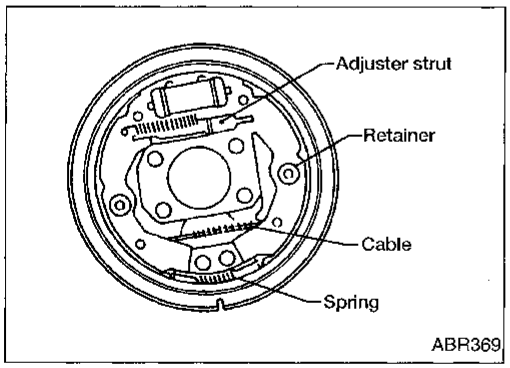
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Removal

WARNING:
Clean brake lining with a vacuum dust collector to minimize the hazard of airborne materials.



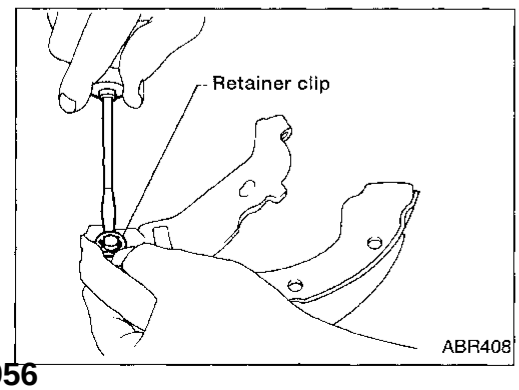
CAUTION:
Make sure parking brake lever is completely released.



1. Release parking brake lever fully, then remove drum.

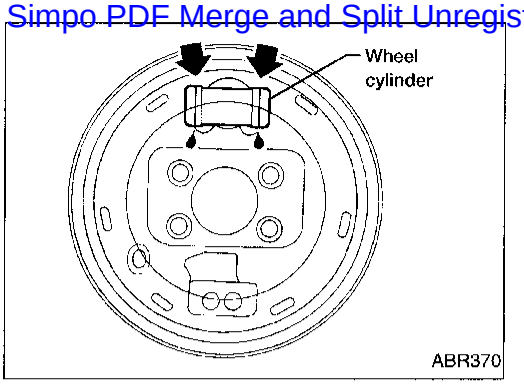
- **If drum is hard to remove, the following procedure should be carried out.**

a. **Remove plug. Then shorten adjuster to make clearance between brake shoe and drum.**



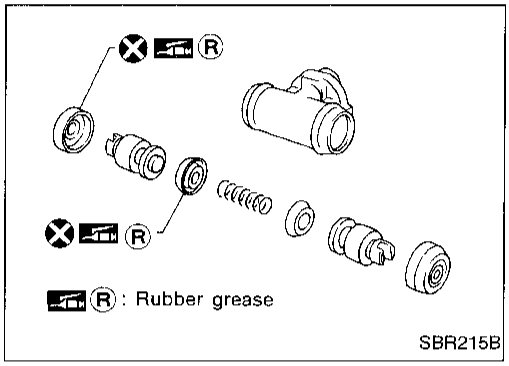
b. **Install two bolts as shown. Tighten the two bolts gradually.**

2. After removing retainer, remove spring by rotating shoes.



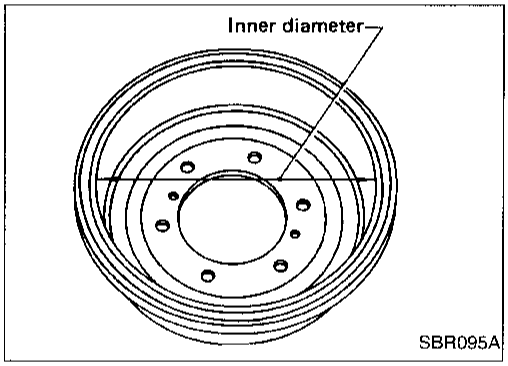
- **Be careful not to damage wheel cylinder piston boots.**
- **Be careful not to damage parking brake cable when separating it.**

3. Remove adjuster.
4. Disconnect parking brake cable from toggle lever.



5. Remove retainer clip with a suitable tool. Then separate toggle lever and brake shoe.

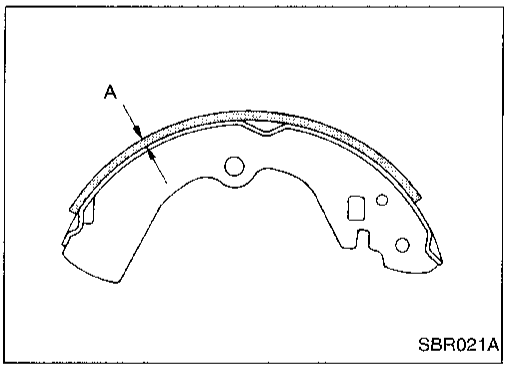
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Inspection — Wheel Cylinder

- Check wheel cylinder for leakage.
- Check for wear, damage and loose conditions. Replace if any such conditions exists.

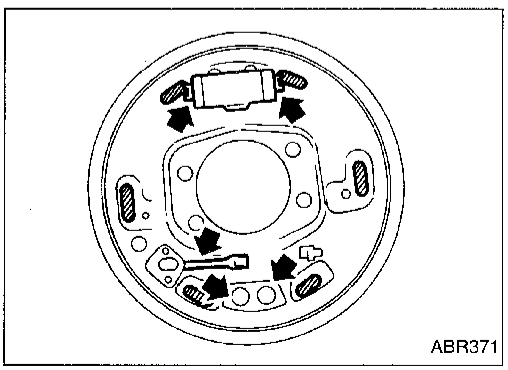
Wheel Cylinder Overhaul



- Check all internal parts for wear, rust and damage. Replace if necessary.
- Pay attention not to scratch cylinder when installing pistons.

Inspection — Drum

Maximum inner diameter (Repair limit):
LT26B 261.5 mm (10.30 in)
LT30A 296.5 mm (11.67 in)

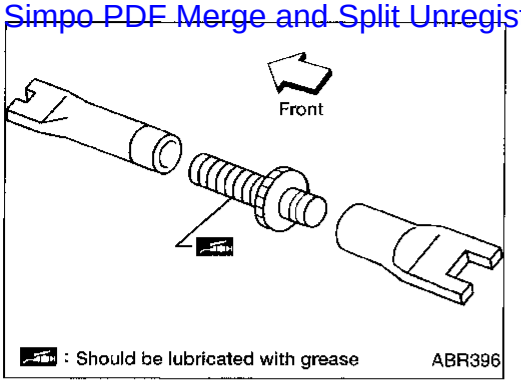


- Contact surface should be finished with No. 120 to 150 emery sandpaper.
- Using a brake lathe, machine brake drum if it shows score marks, partial wear or stepped wear.
- After brake drum has been completely reconditioned or replaced, check drum and shoes for proper contact pattern.

Inspection — Lining

Check lining thickness.

Standard lining thickness:
LT26B 5.5 mm (0.217 in)
LT30A 6.1 mm (0.240 in)
Lining wear limit (A):
LT26B 1.5 mm (0.059 in)
LT30A 1.5 mm (0.059 in)



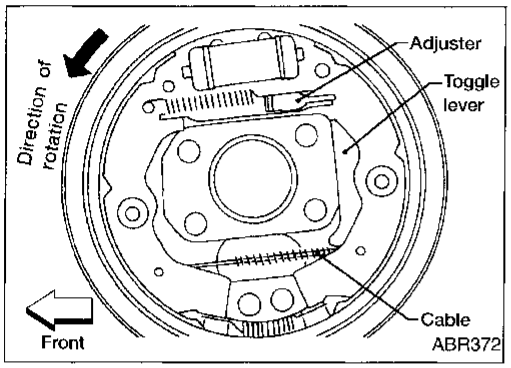
Installation

- **Always perform shoe clearance adjustment. Refer to BR-30.**

1. Fit toggle lever to brake shoe with retainer clip.
2. Apply brake grease to the contact areas shown at left.

Installation (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



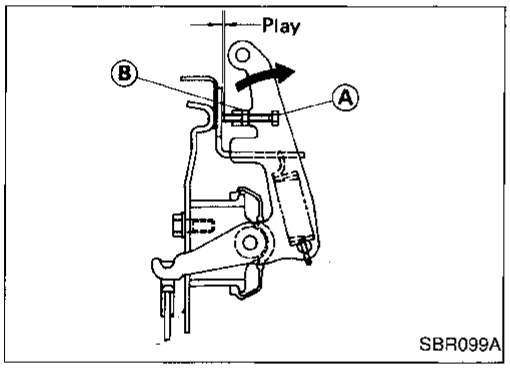
3. Shorten adjuster by rotating it.

- **Pay attention to direction of adjuster.**

Wheel	Screw
Left	Left-hand thread
Right	Right-hand thread

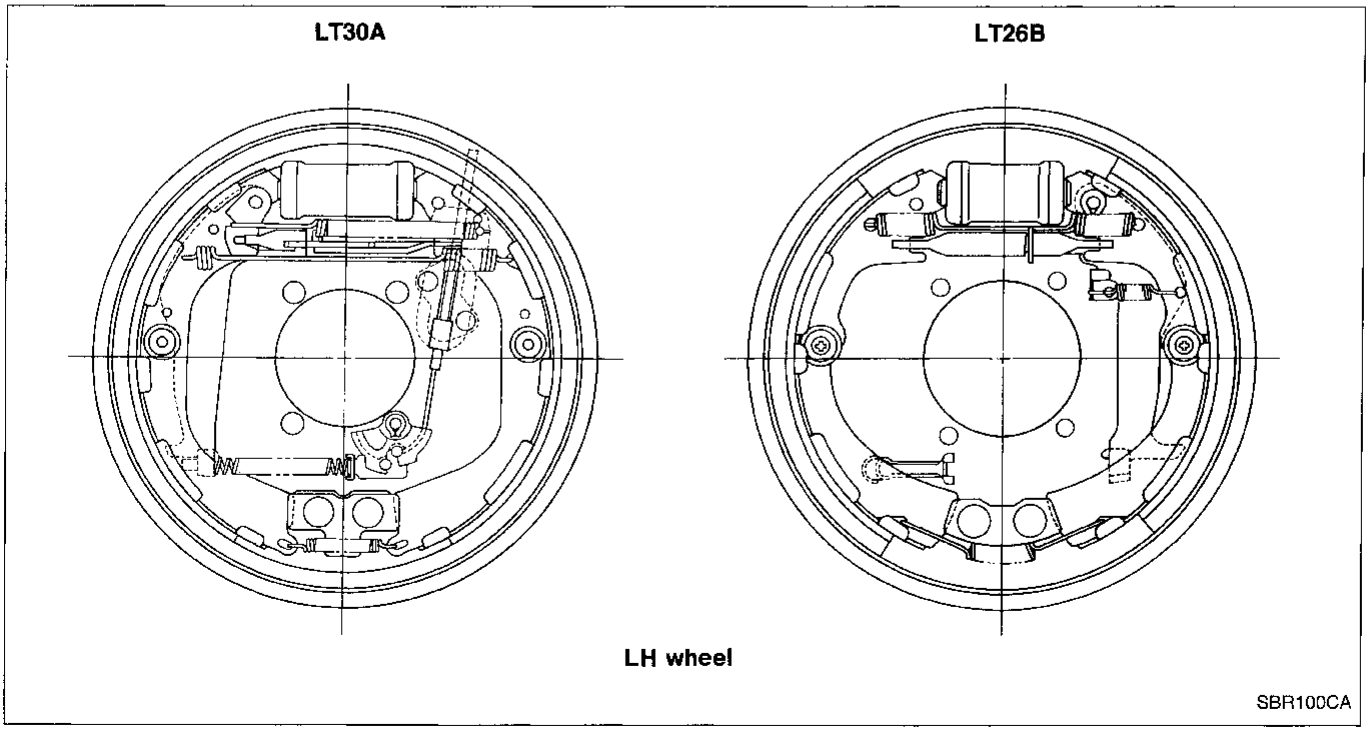
4. Connect parking brake cable to toggle lever.
5. Install all parts.

- **Be careful not to damage wheel cylinder piston boots.**



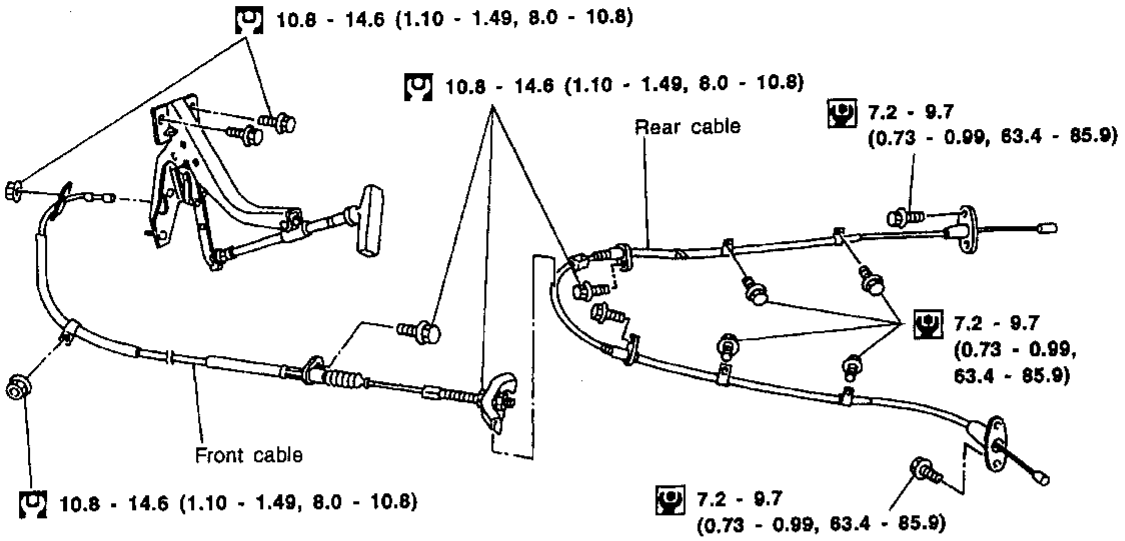
6. Check all parts are installed properly.

- **After installation is completed, adjust shoe-to-drum clearance.**



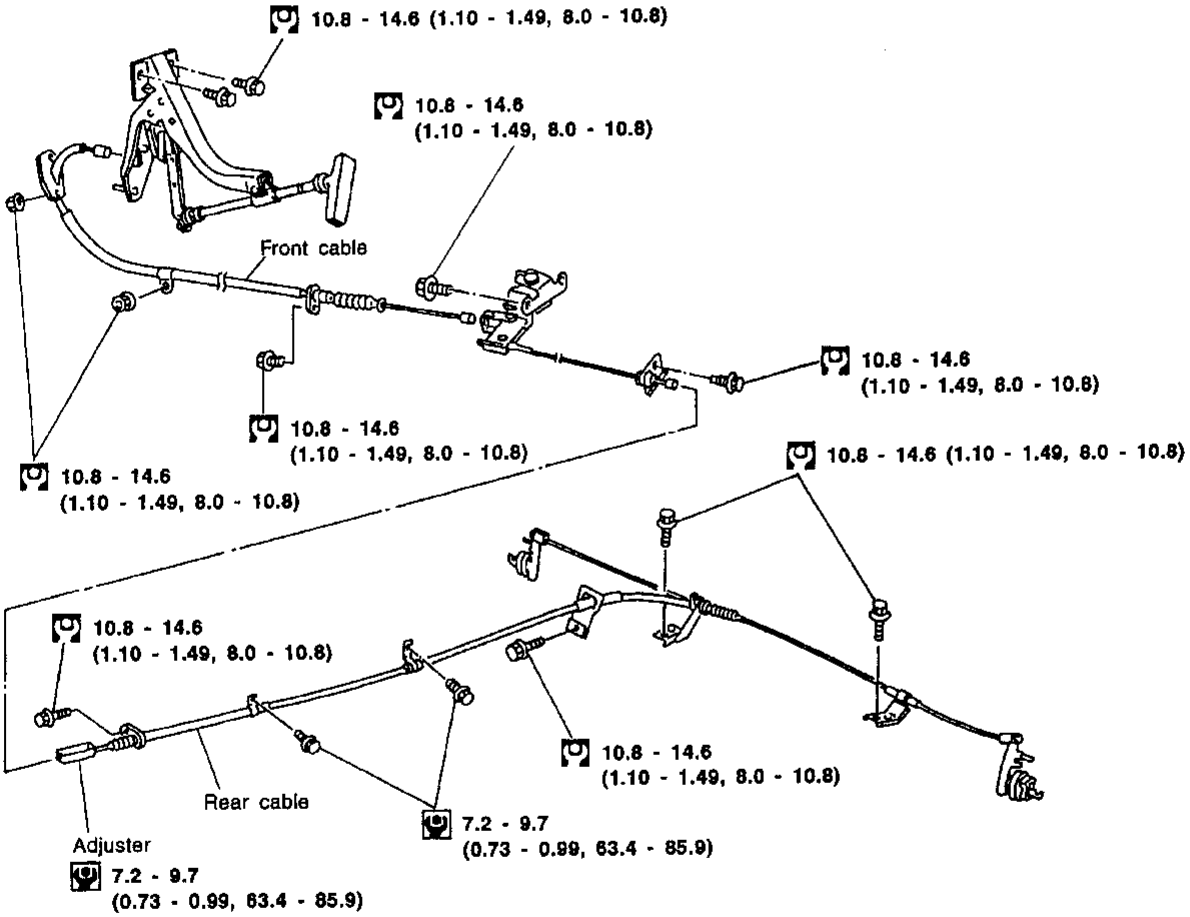
7. Install brake drum.
8. When installing new wheel cylinder or overhauling wheel cylinder, bleed air. Refer to "Bleeding Brake System", BR-6.
9. Adjust parking brake. Refer to BR-30.

- Install all the parts by referring to the figure below.



LT30A model

- After installing crank lever on back plate, make sure that there is no play between crank lever and back plate. If play exists, adjust bolt Ⓐ and lock nut Ⓑ.



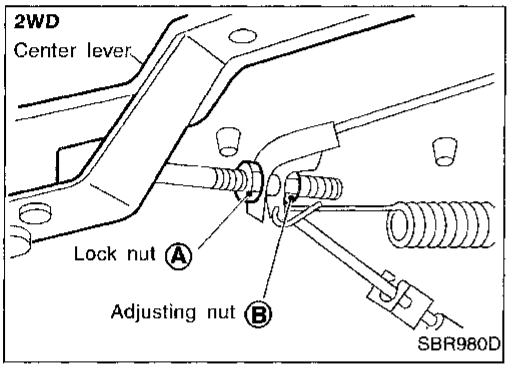
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

2WD

4WD Stick type

: N•m (kg-m, in-lb)
: N•m (kg-m, ft-lb)

ABR682

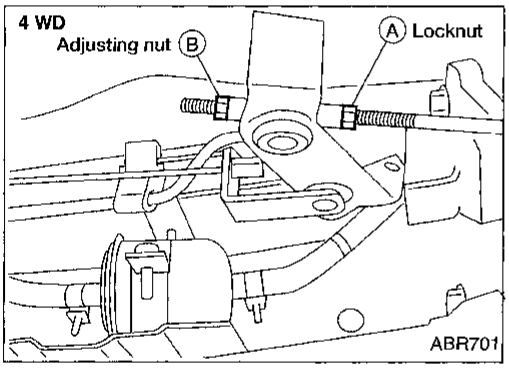


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

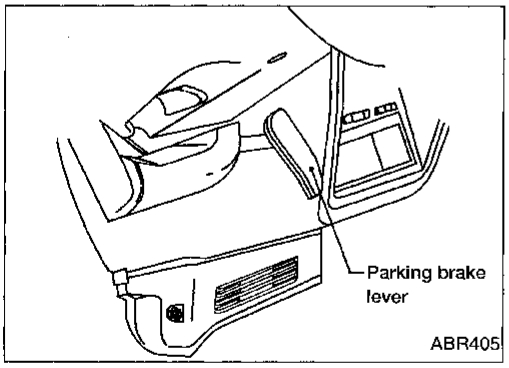
Removal and Installation

- Be careful not to damage cable.
- Make sure there is no free play after installation.

Inspection



1. Check control lever for wear or other damage. Replace if necessary.
2. Check wires for discontinuity or deterioration. Replace if necessary.
3. Check warning lamp and switch. Correct if necessary.
4. Check part at each connecting portion and, if found deformed or damaged, replace.



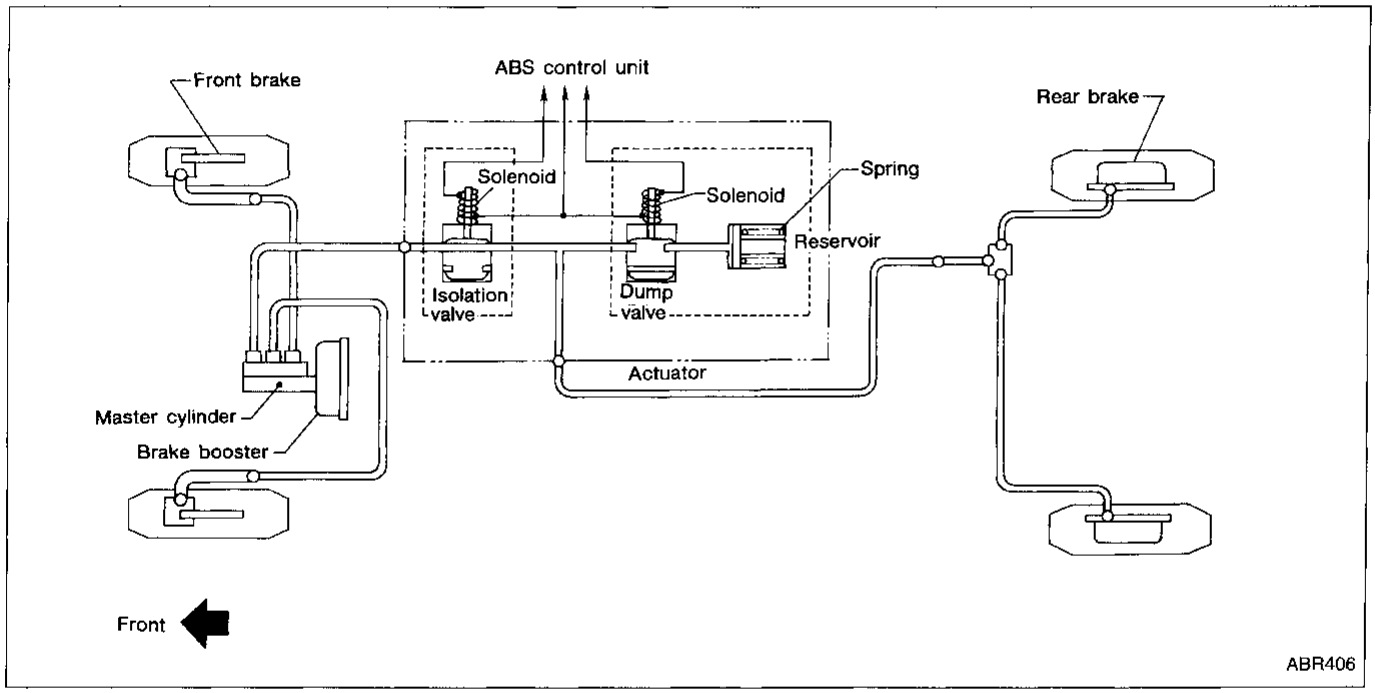
Adjustment

Adjust parking brake as follows:

1. Fully release parking brake lever.
2. Loosen Ⓐ and rotate Ⓑ until parking brake cable loosens.
3. Depress brake pedal several times until clicking sound does not occur from rear brakes.
4. Adjust clearance between rear brake shoe and drum.
5. Adjust parking brake lever stroke by rotating Ⓑ.
6. Pull parking brake lever with specified force. Check lever stroke and ensure smooth operation.
7. Readjust clearance between rear brake shoe and drum.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

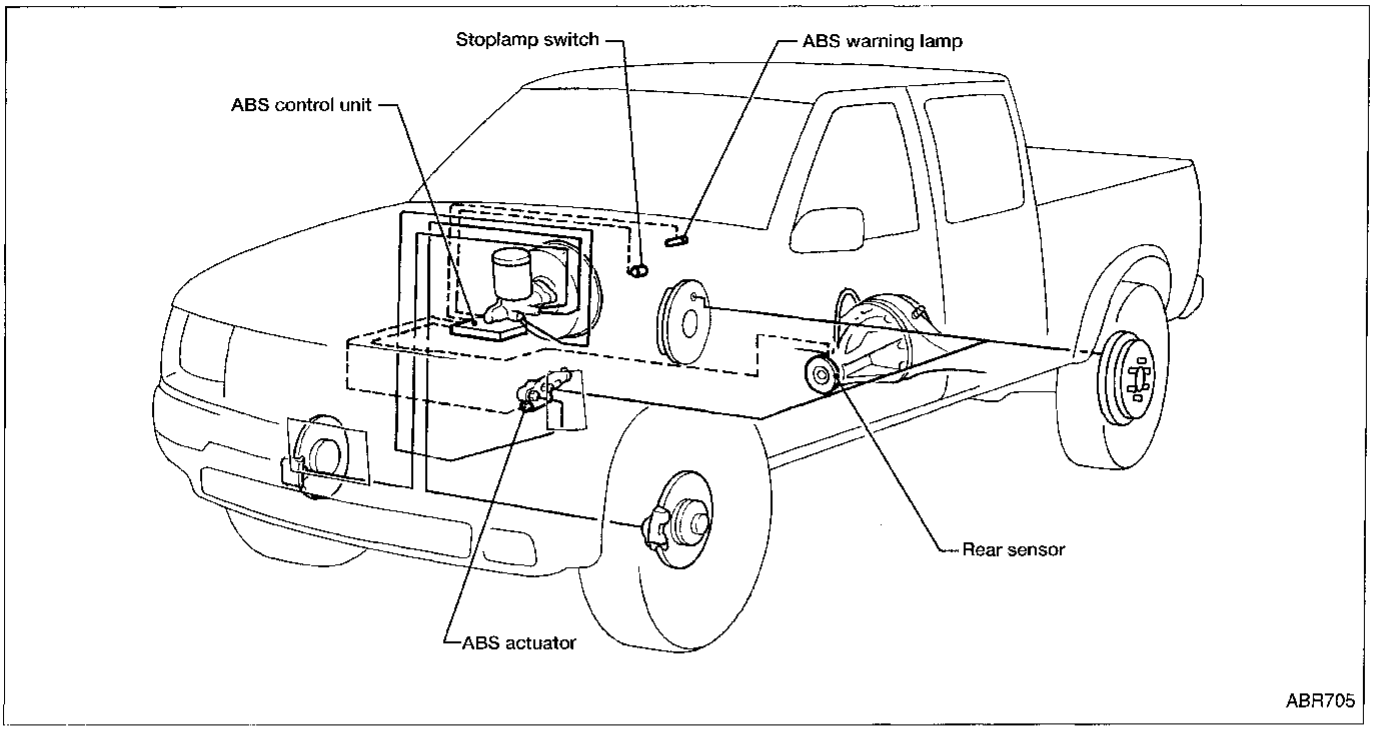
Purpose



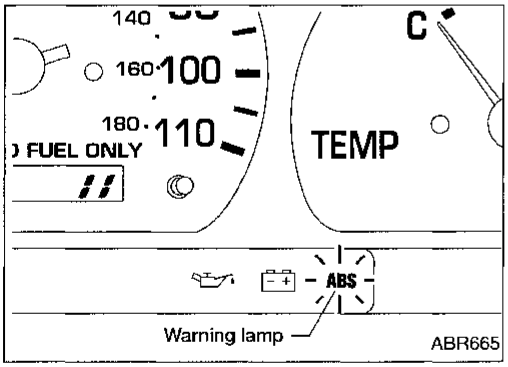
The Rear Wheel Anti-Lock Brake System (ABS) consists of electronic and hydraulic components. It controls rear braking force so locking of the rear wheels can be avoided.
The ABS:

1) Improves proper tracking performance during severe braking.
2) Eases obstacle avoidance during severe braking.
3) Improves vehicle stability.

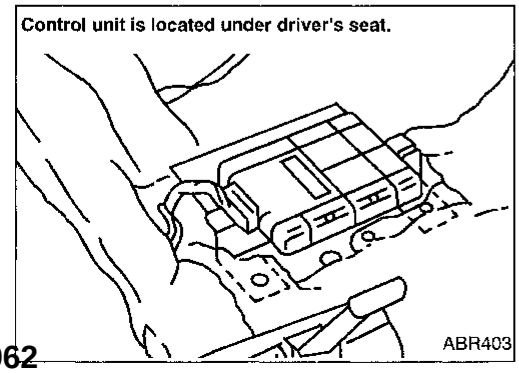
Operation



- When the vehicle speed is less than 10 km/h (6 MPH) this system does not work.
- The Rear Wheel Anti-Lock Brake System (ABS) has self-test capabilities. The system turns on the ABS warning lamp for a few seconds each time the ignition switch is turned ON. After the engine is started, the ABS warning lamp turns off. The system performs a circuit check when the ignition switch is first turned ON. If a malfunction is found during this check, the ABS warning lamp will stay on.
- While driving, a mechanical noise may be heard and slight pedal pulsation may be felt during ABS operation. This is a normal condition.



ABS Hydraulic Circuit



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

System Components

System Description

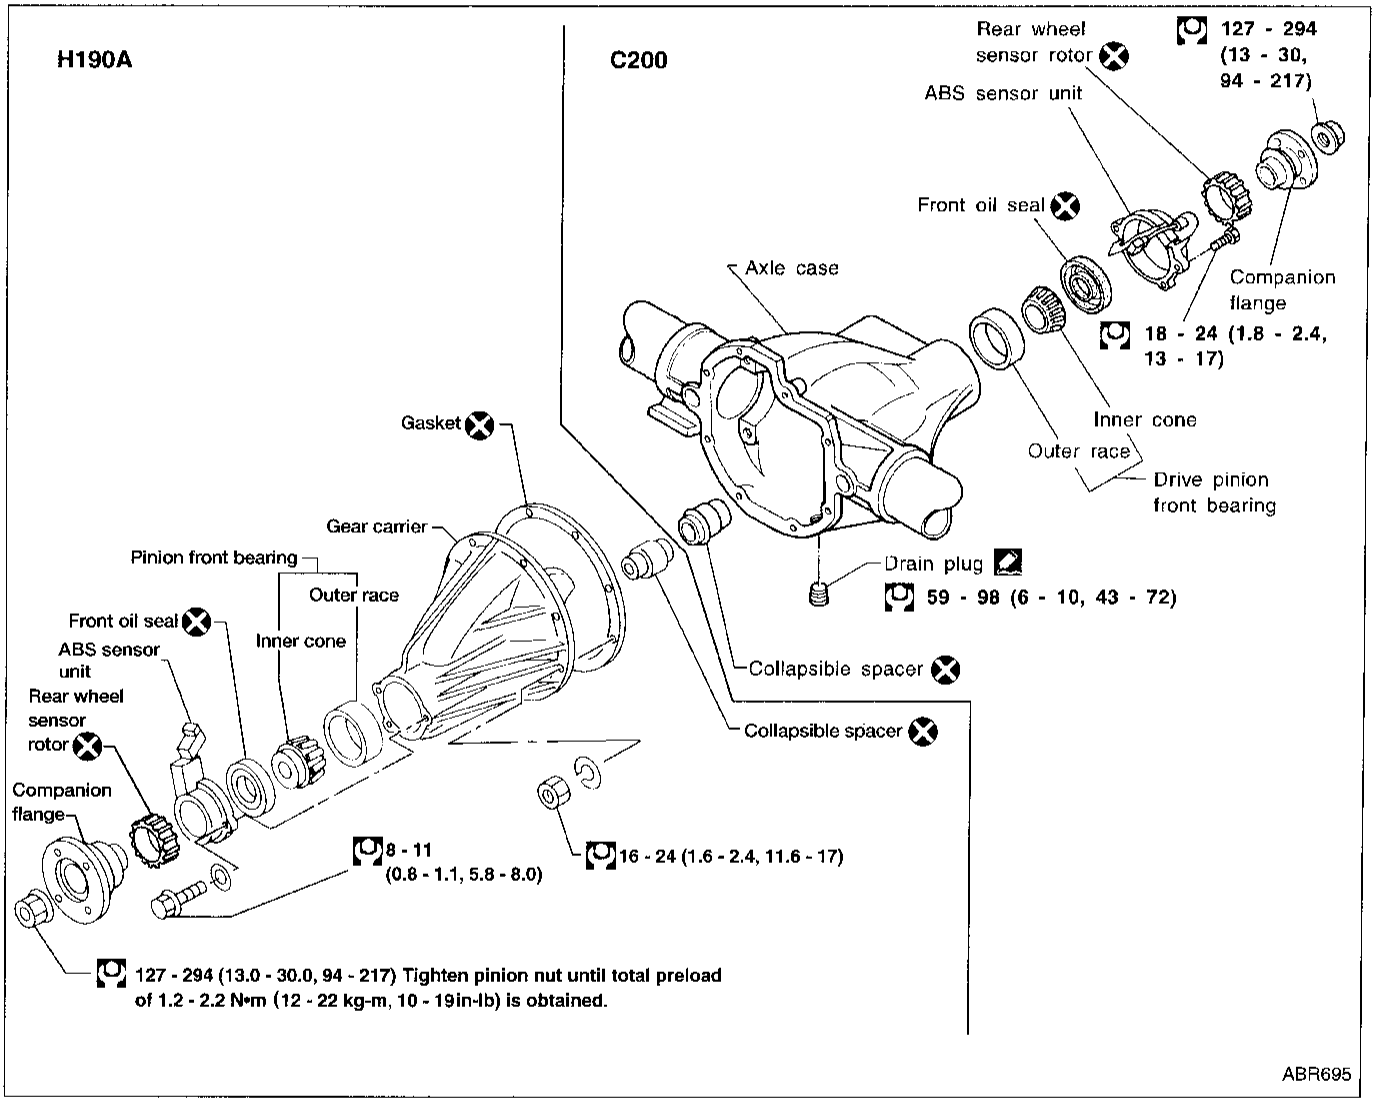
REAR SENSOR

The rear sensor unit consists of a gear-shaped sensor rotor and a sensor unit. The sensor unit consists of a bar magnet around which a coil is wound. The sensor rotor is installed on the companion flange and the sensor unit is installed on the rear axle housing. A sine-wave current is generated by the rear sensor unit as the rear axle pinion rotates. The frequency and voltage increase as the rotating speed increases.

ABS CONTROL UNIT

The ABS control unit computes the rear axle pinion rotating speed by reading the signal from the rear sensor unit. Then it supplies a DC current to the ABS actuator. If any electrical malfunction is detected in the system, the ABS control unit causes the ABS warning lamp to turn on. In this condition, the ABS system will be deactivated by the ABS control unit, and the vehicle's brake system reverts to normal operation.

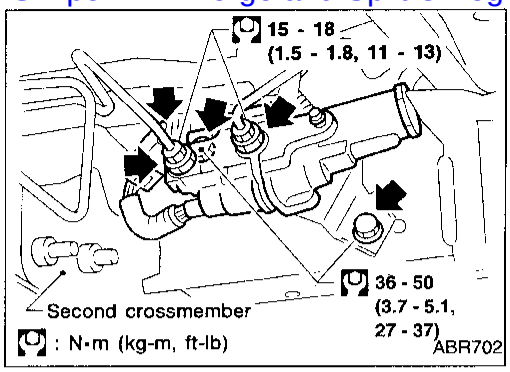
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Removal and Installation

CAUTION:

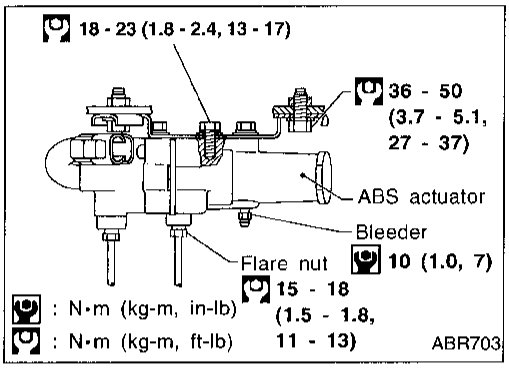
Be careful not to damage sensor edge and sensor rotor teeth. In case the final drive assembly needs to be removed, disconnect the ABS sensor from the assembly and move it away. Failure to do so may result in damage to the sensor wires making the sensor inoperative.



For final drive models using collapsible spacer (H190A, C200), bearing preload must be adjusted whenever companion flange is removed. Therefore, final drive overhaul is required.

REAR SENSOR AND CONTROL UNIT

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

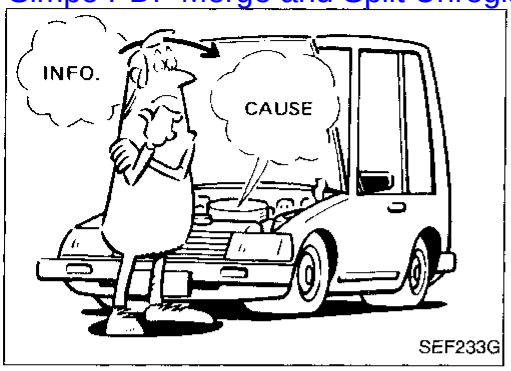


Removal and Installation (Cont'd)

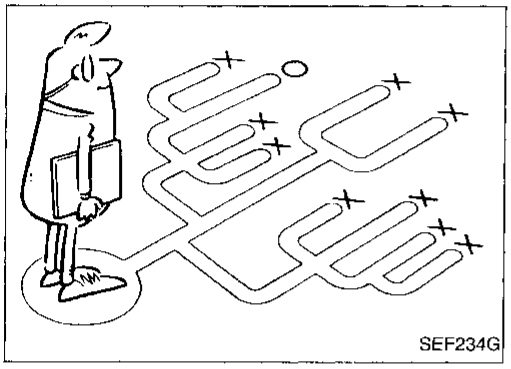
ACTUATOR

Removal

1. Disconnect battery cable.
2. Drain brake fluid.
   Refer to "Changing Brake Fluid", BR-5.
3. Disconnect connectors, brake pipes and remove fixing nuts.



Installation



CAUTION:
After installation, refill brake fluid. Then bleed air. Refer to "Bleeding Procedure", BR-6.

1. Connect brake pipes temporarily.
2. Secure fixing bolts.
3. Torque brake pipe flare nuts.
4. Connect connectors and battery cable.

SEF233G

SEF234G

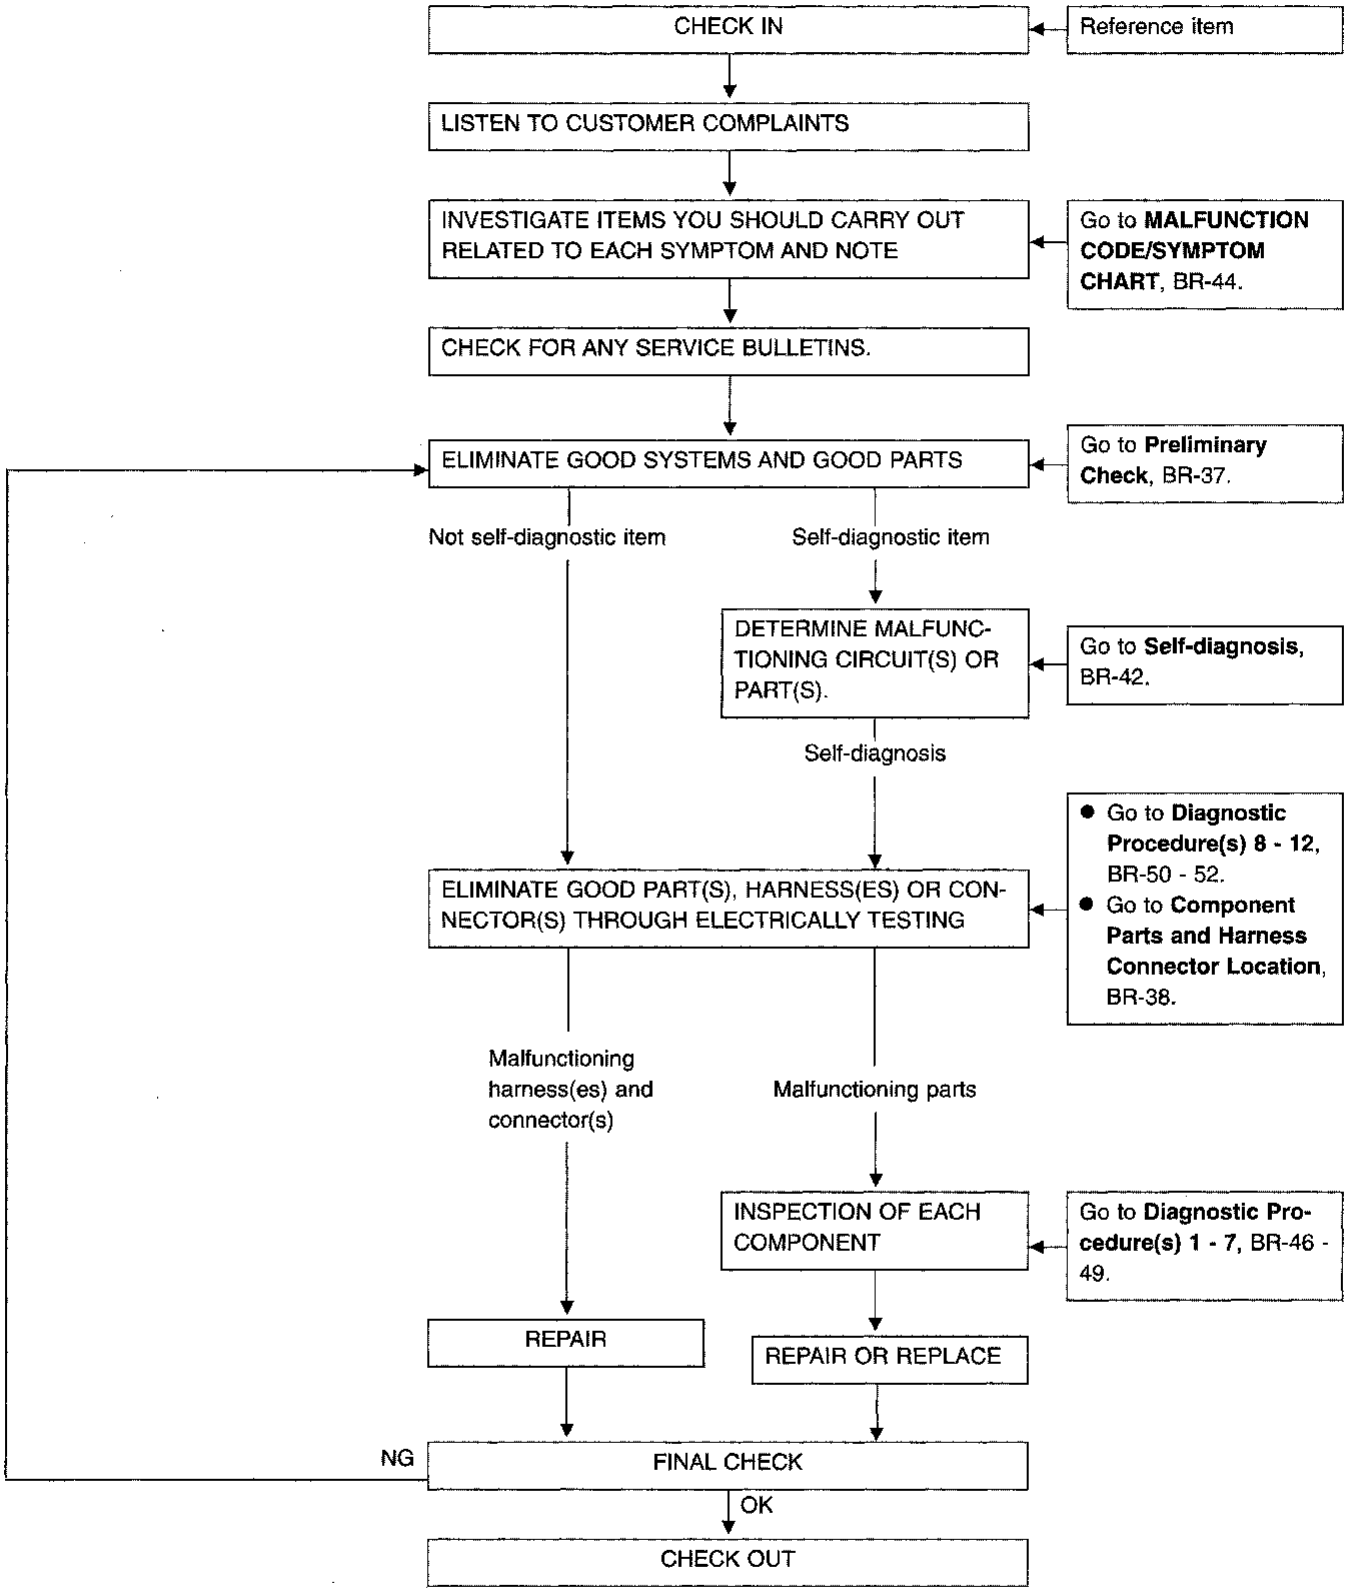
How to Perform Trouble Diagnoses for Quick and Accurate Repair

INTRODUCTION

The ABS system has an electronic control unit to control major functions. The control unit accepts input signals from sensors and instantly drives the actuators. It is essential that both kinds of signals are proper and stable. It is also important to check for conventional problems: such as air leaks in booster lines, lack of brake fluid, or other problems with the brake system.

It is much more difficult to diagnose a problem that occurs intermittently rather than continuously. Most intermittent problems are caused by poor electric connections or faulty wiring. In this case, careful checking of suspicious circuits may help prevent the replacement of good parts.

A visual check only, may not find the cause of the problems, so a road test should be performed.



Before undertaking actual checks, take a few minutes to talk with a customer who approaches with a ABS complaint. The customer is a very good source of information on such problems; especially intermittent ones. Through the talks with the customer, find out what symptoms are present and under what conditions they occur. Start your diagnosis by looking for "conventional" problems first. This is one of the best ways to troubleshoot brake problems on an ABS controlled vehicle.

Also check related service bulletins for information.

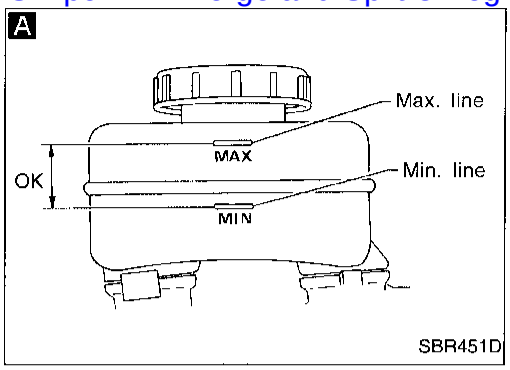
How to Perform Trouble Diagnoses for Quick and Accurate Repair (Cont'd)



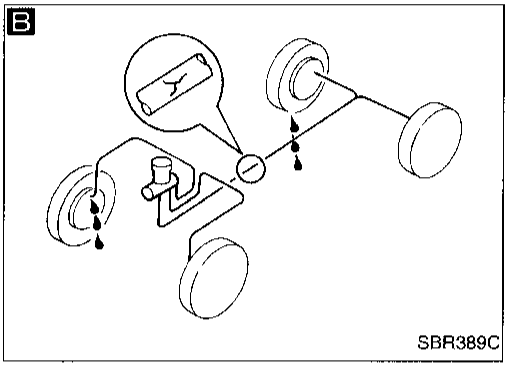
WORK FLOW

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Preliminary Check

A

SBR451D



A

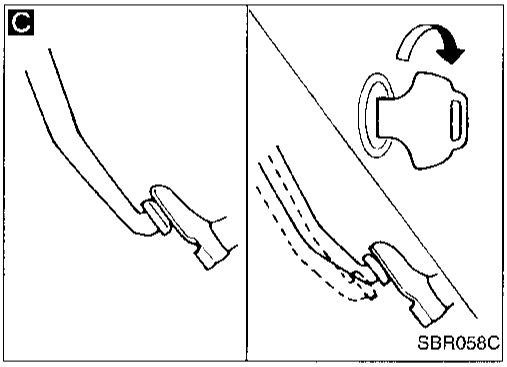
Check brake fluid level in reservoir tank.
Low fluid level may indicate brake pad wear or leakage from brake line.

B

Check brake line for leakage. — NG → Repair.
OK

B

SBR389C



C

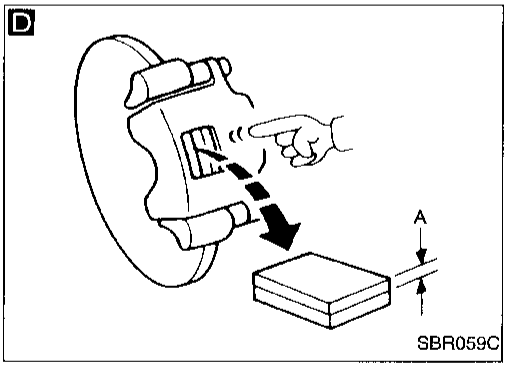
Check brake booster for operation and air tightness. Refer to BR-18. — NG → Replace.
OK

D

Check brake pads, rotors, linings and drums. Refer to BR-27. — NG → Replace.
OK

C

SBR058C



A

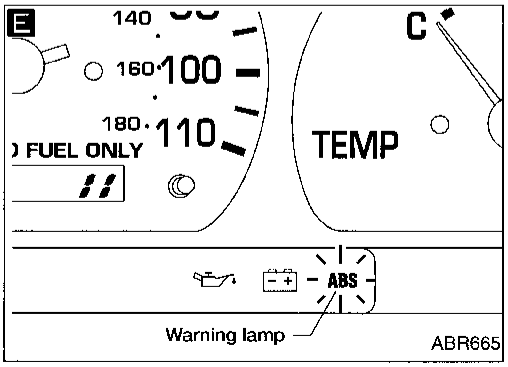
Check brake fluid level in reservoir tank again. — NG → Fill up brake fluid.
OK

E

Check warning lamp activation.
When ignition switch is turned ON, warning lamp turns on. — NG → Check fuse, warning lamp bulb and warning lamp circuit.
OK

D

SBR059C



Check warning lamp for deactivation after engine is started. — NG → Go to Self-diagnosis, BR-42.
OK

Drive vehicle at speeds over 40 km/h (25 MPH) for at least one minute.

Ensure warning lamp remains off while driving. — NG → Go to Self-diagnosis, BR-42.
OK

END

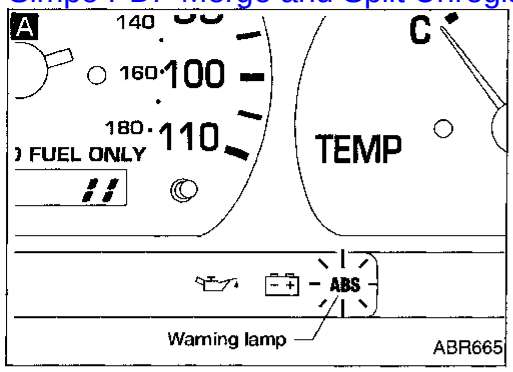
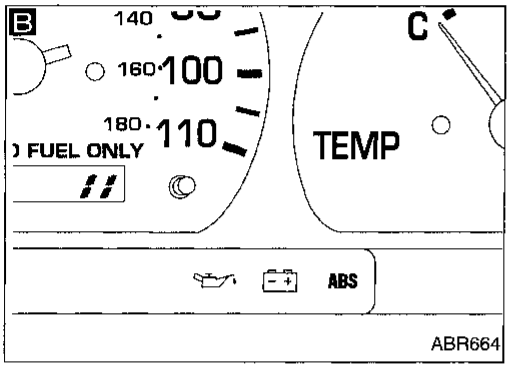
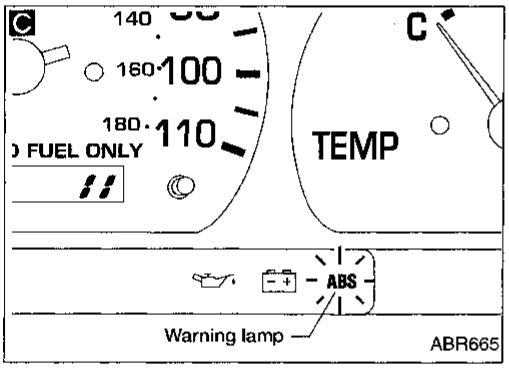
Self-diagnosis



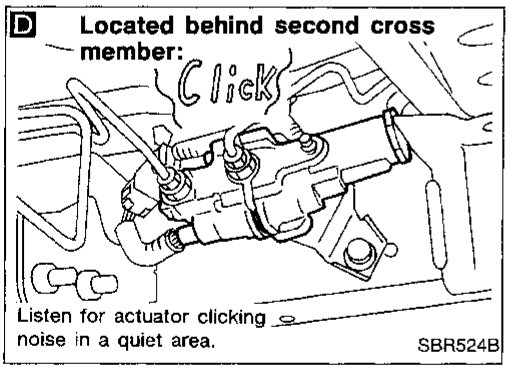
CHECKING THE NUMBER OF WARNING LAMP FLASHES



When a problem occurs in the ABS, the ABS warning lamp on the instrument panel turns on. As shown in the table, the control unit performs self-diagnosis.
To obtain satisfactory self-diagnosing results, the vehicle must be driven above 40 km/h (25 MPH) for at least one minute before the self-diagnosis is performed. After the vehicle has been stopped, the number of ABS warning lamp flashes is counted by grounding the check terminal, with the engine running, thereby identifying a malfunctioning part or unit by the number of flashes.
If more than two parts or units malfunction at the same time, the ABS warning lamp will flash to indicate one of the malfunctioning parts or units. After the part or unit has been repaired, the ABS warning lamp will then flash to indicate that the other part or unit is malfunctioning.



Self-diagnosis (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SELF-DIAGNOSIS PROCEDURE 1

A

1. Turn ignition switch ON.
2. Check warning lamp activation.
   When ignition switch is turned on, warning lamp should turn on.

NG → Go to **Main Power Supply and Ground Circuit Check**, BR-45.
If OK, replace ABS control unit.

OK ↓

B

Check warning lamp deactivates within a few seconds.

NG → Go to **Self-Diagnosis Procedure 2**, BR-44.

OK ↓

C

Check warning lamp reactivation.

NG → Go to **Self-Diagnosis Procedure 2**, BR-44.

OK ↓

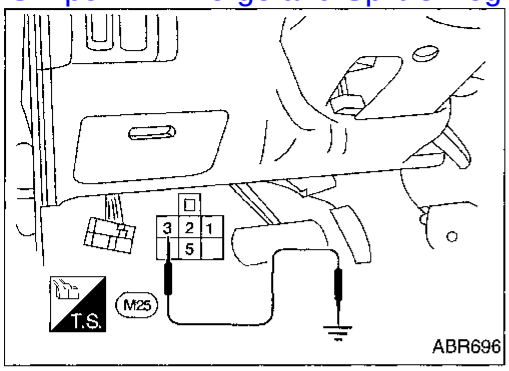
Drive vehicle for 1 minute or more at 40 km/h (25 MPH) or more.
Does warning lamp activate again?

Yes → Go to **Self-Diagnosis Procedure 2**, BR-44.

No ↓

D

1. Stop engine.
2. Turn ignition switch ON.
   Check actuator clicking noise, when warning lamp turns off.



OK → Self-operating function is OK.

NG ↓

Check actuator.
Go to Electrical Component Inspection, BR-53.

Self-diagnosis (Cont'd)

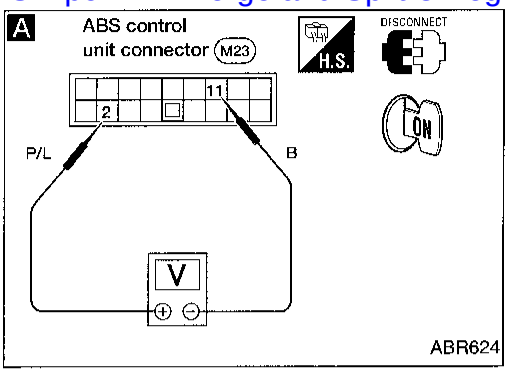
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SELF-DIAGNOSIS PROCEDURE 2

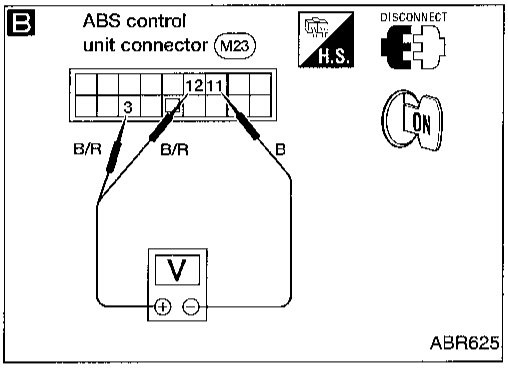
1. Start engine.
2. Ground the check terminal of check connector.
3. Check the warning lamp flashing.

No → Check brake fluid level. Go to **Main Power Supply and Ground Circuit Check**, BR-45.

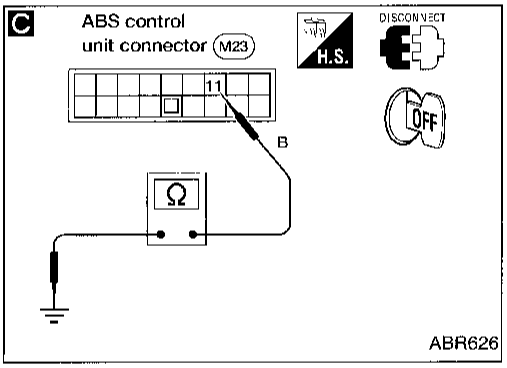
OK → Replace ABS control unit.



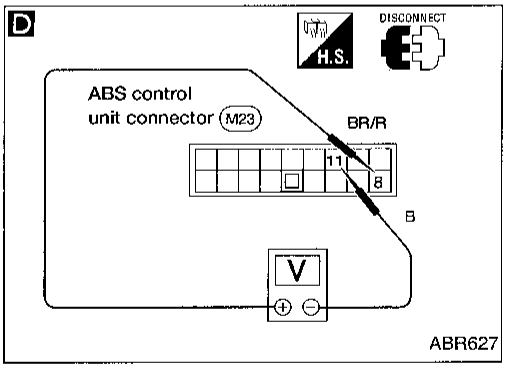
Yes → Count the number of flashes. Go to **MALFUNCTION CODE/SYMPTOM CHART** below.



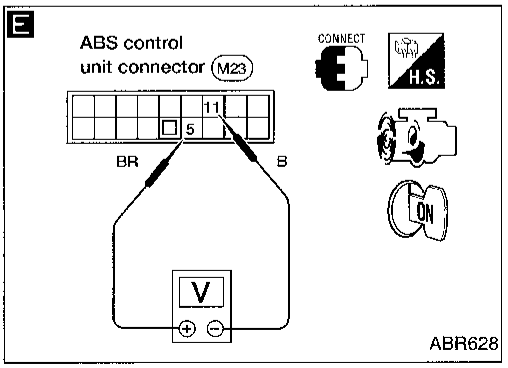
MALFUNCTION CODE/SYMPTOM CHART



Code No./Symptom (No. of warning lamp flashes)	Malfunctioning part	Diagnostic Procedure
2	Actuator ISO solenoid (open-circuit)	1
7	Actuator ISO solenoid (short-circuit)	1
4	Actuator ISO solenoid (blocked)	2
3	Actuator DUMP solenoid (open-circuit)	3
8	Actuator DUMP solenoid (short-circuit)	3
9	Rear sensor (open-circuit)	4
10	Rear sensor (short-circuit)	4
6	Rear sensor (erratic)	5
13	Control unit	6
14		
15		
5	Other	7
Pedal vibration or noise	—	12
Long stopping distance	—	10
Brake pedal stroke is large	—	9
ABS does not work	—	11
ABS works frequently	—	8



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Main Power Supply and Ground Circuit Check

A

CHECK WARNING LAMP POWER SUPPLY.
1. Connect battery cable and confirm battery voltage is 12V.
2. Disconnect ABS control unit connector.
3. Turn ignition switch ON.
4. Do approx. 12 volts exist between ABS control unit connector terminals (2) and (11)?

No → **C**

C

CHECK GROUND CIRCUIT.
Check harness continuity between ABS control unit terminal (11) and suitable body ground.
Continuity should exist.

OK → Check and replace fuse or warning lamp if necessary. Repair ignition harness, relay and warning lamp connectors.

NG → Repair harness or connectors.

Yes → **B**

B

CHECK POWER SUPPLY.
1. Turn ignition switch ON.
2. Do approx. 12 volts exist between ABS control unit connector terminals (12), (3) and (11)?

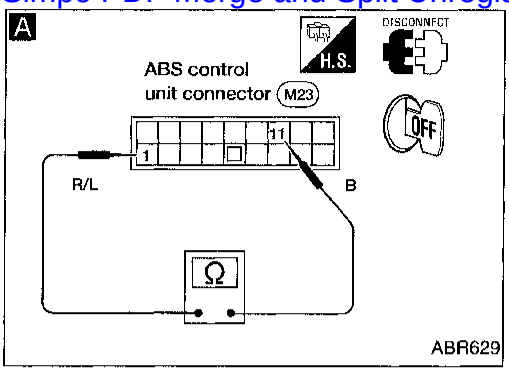
No → Check and replace fuse or repair harness and connectors.

Yes → **D**

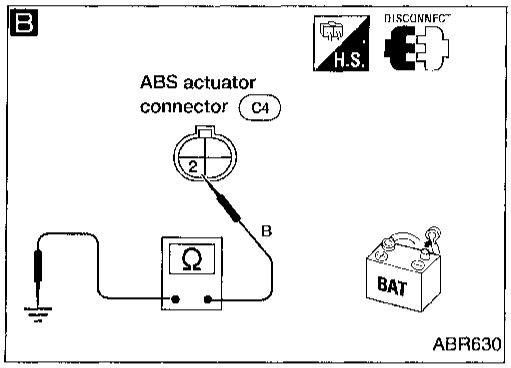
D

CHECK STOP LAMP SWITCH POWER SUPPLY.
1. Depress brake pedal.
2. Do approx. 12 volts exist between ABS control unit connector terminals (8) and (11)?

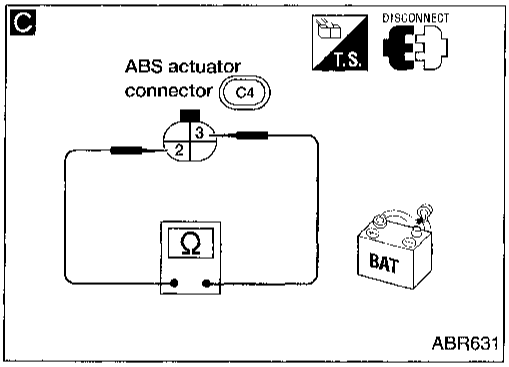
No → Adjust stop lamp switch if necessary. Replace stop lamp switch, if necessary, or repair harness or connectors.



Yes → **E**



E



CHECK PARKING BRAKE POWER SUPPLY.
1. Confirm that brake fluid level is adequate.
   If necessary, refill it.
2. Start engine.
3. Do approx. 12 volts exist between ABS control unit connector terminals (5) and (11) without parking brake applied?
   Do approx. 0 volts exist with parking brake applied?

No → Adjust parking brake switch, if necessary. Replace parking brake switch, if necessary, or repair harness or connectors.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostic Procedure 1

ABS ACTUATOR ISO SOLENOID SHORT CIRCUIT OR OPEN (Warning lamp flashing number 2 or 7)

Remove battery negative terminal connector.

↓

A

CHECK ISO SOLENOID.
Check resistance between ABS control unit connector terminals (1) and (11).
Resistance: Approximately 4Ω

OK → Replace ABS control unit.

↓ NG

CHECK ABS CONTROL UNIT GROUND CIRCUIT.
Go to **Main Power Supply and Ground Circuit Check**, BR-45.

NG → Repair harness or connectors.

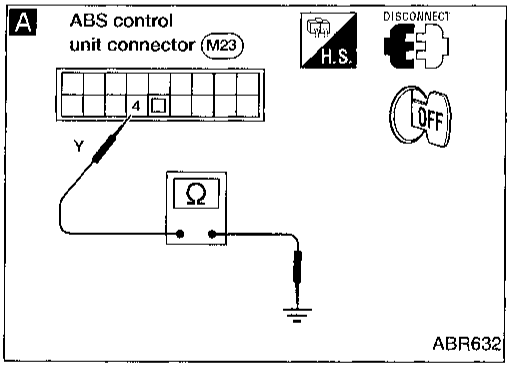
↓ OK

B

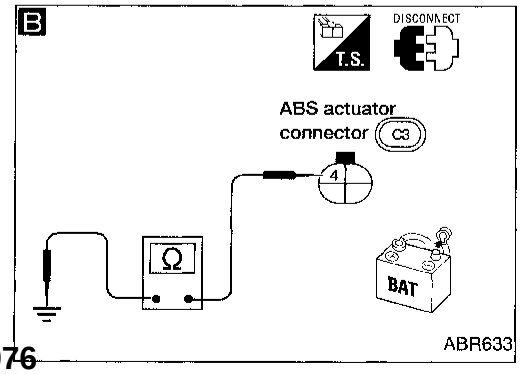
CHECK ABS ACTUATOR GROUND CIRCUIT.
Check harness continuity between ABS actuator terminal (2) and suitable body ground.

NG → Repair harness or connectors.

↓ OK



C



CHECK ISO SOLENOID.
Check resistance between ABS actuator connector terminals (2) and (3).
Resistance: Approximately 4Ω

OK → Repair harness and connectors between ISO solenoid and ABS control unit.

↓ NG

Replace ABS actuator.

Diagnostic Procedure 2

ABS ACTUATOR ISO SOLENOID BLOCKED (Warning lamp flashing number 4)

Remove battery negative terminal connector.

↓

A

CHECK ABS ACTUATOR SWITCH.
Does continuity exist between ABS control unit terminal (4) and suitable body ground?
Continuity should not exist.

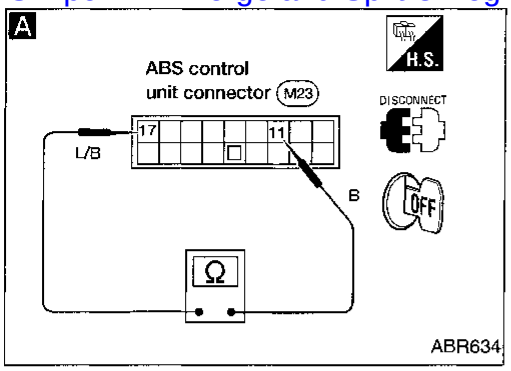
OK → Replace ABS control unit.

↓ NG

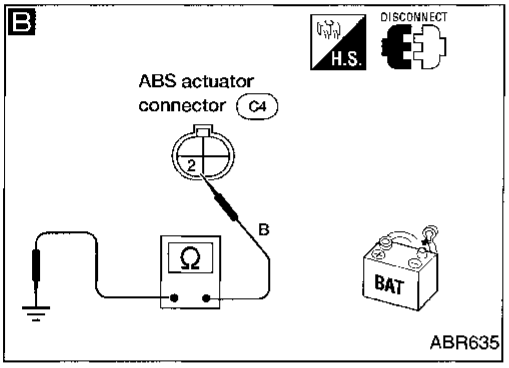
B

Does continuity exist between ABS actuator terminal (4) and suitable body ground?
Continuity should not exist.

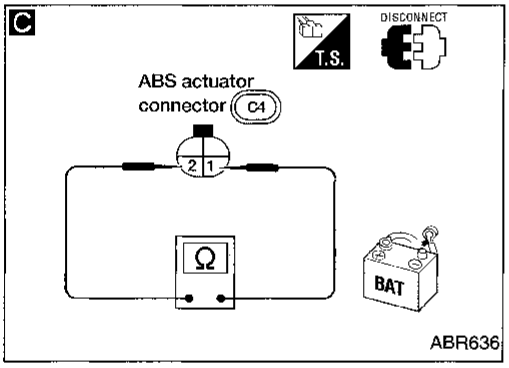
NG → Replace ABS actuator.



↓ OK



Repair harness and connectors between ABS actuator and ABS control unit.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostic Procedure 3

ABS ACTUATOR DUMP SOLENOID SHORT CIRCUIT OR OPEN (Warning lamp flashing number 3 or 8)

Remove battery negative terminal connector.

A

CHECK DUMP SOLENOID.
Check resistance between ABS control unit connector terminals ⑰ and ⑪.
Resistance:
Approximately 1.5Ω

OK → Replace ABS control unit.

NG

CHECK ABS CONTROL UNIT GROUND CIRCUIT.
Go to **Main Power Supply and Ground Check**, BR-45.

NG → Repair harness or connectors.

OK

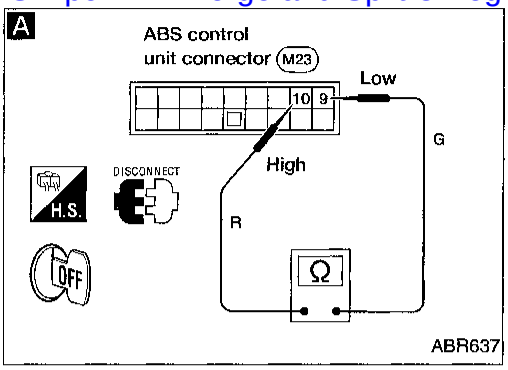
B

CHECK ABS ACTUATOR GROUND CIRCUIT.
Check harness continuity between ABS actuator terminal ② and suitable body ground.

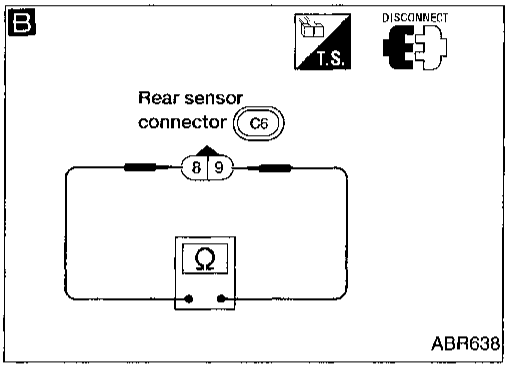
NG → Repair harness or connectors.

OK

C



CHECK DUMP SOLENOID.
Check resistance between ABS actuator connector terminals ① and ②.
Resistance:
Approximately 1.5Ω



OK → Repair harness or connectors between dump solenoid and ABS control unit.

NG

Replace ABS actuator.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostic Procedure 4

REAR SENSOR OPEN OR SHORT CIRCUIT (Warning lamp flashing number 9 or 10)

Remove battery negative terminal connector.

A

CHECK REAR SENSOR.
Check resistance between ABS control unit connector terminals (10) and (9).
Resistance:
1.22 - 1.48 kΩ

OK → Replace ABS control unit.

NG

B

Check resistance between rear sensor unit connector terminals (8) and (9).
Resistance:
1.22 - 1.48 kΩ

OK → Repair harness or connectors between ABS control unit and rear sensor.

NG

Replace rear sensor unit.

Diagnostic Procedure 5

SENSOR SIGNAL ERRATIC (Warning lamp flashing number 6)

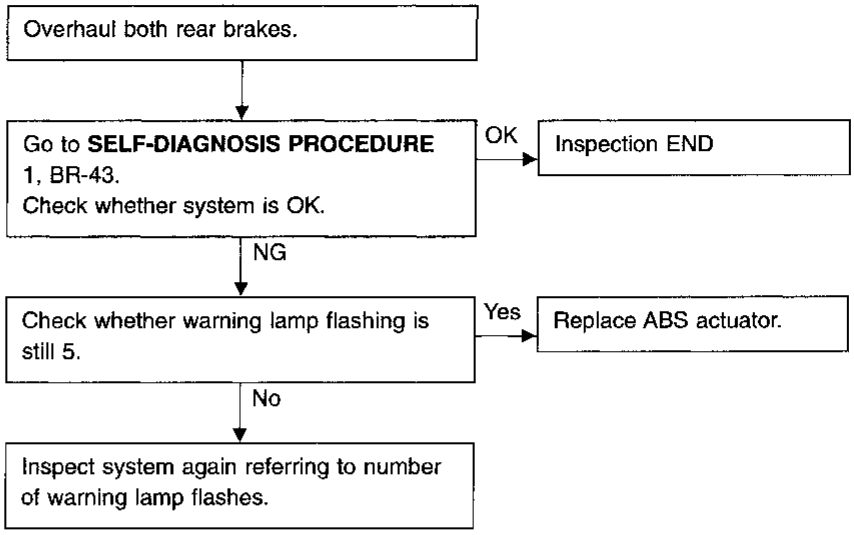
CHECK REAR SENSOR ROTOR TOOTH CONDITION.
1. Remove propeller shaft.
2. Remove companion flange, refer to "DISASSEMBLY" in PD section.
3. Check rotor on companion flange.

NG → Replace rear sensor rotor with companion flange.

OK

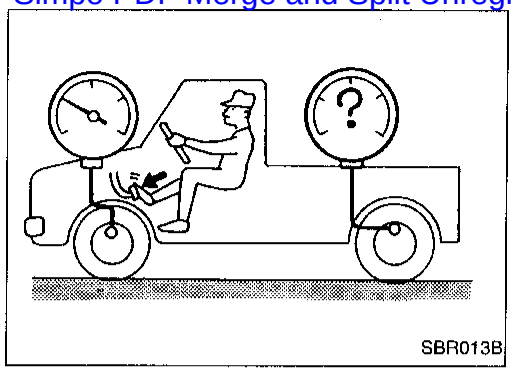
Replace ABS control unit.

Diagnostic Procedure 6



ABS CONTROL UNIT (Warning lamp flashing 13, 14 or 15)

ABS control unit malfunction.



Replace ABS control unit.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostic Procedure 7 (Warning lamp flashing 5)

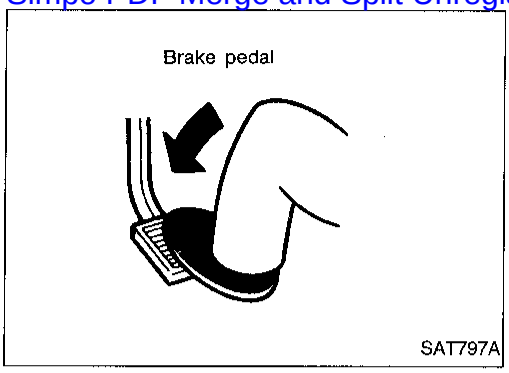
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostic Procedure 8 (ABS works frequently)

CHECK BRAKE FLUID PRESSURE.
Check whether brake fluid pressure distribution is normal.
Refer to BR-11.

NG → Replace master cylinder.

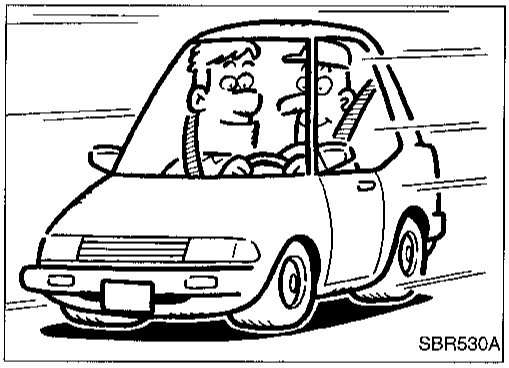
OK ↓



Perform usual brake inspection.

NG → Repair.

OK ↓



When wheel lock occurs frequently due to hard braking operation, the ABS operates at each occurrence of wheel lock. Accordingly, frequent ABS operation is normal under severe braking conditions where wheel lock would occur frequently due to braking.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostic Procedure 9 (Brake pedal stroke is large)

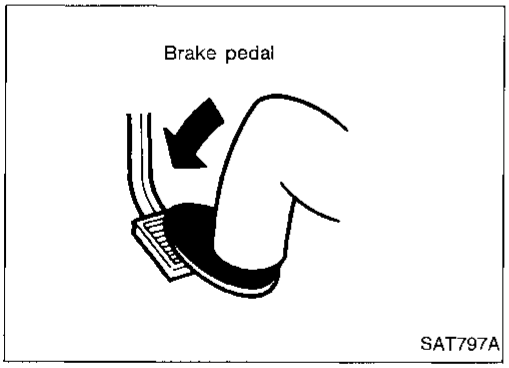
Check whether the symptom usually appears.
- No → Vehicles equipped with ABS may have a tendency to increase pedal stroke during operation.
- Yes → Check for accumulation of air by trying to bleed air.
  - No → Perform brake inspection. Refer to BR-20.

Diagnostic Procedure 10 (Long stopping distance)

Check if road condition is slippery with snow or gravel.
- Yes → Stopping distance may be longer than vehicles which are not equipped with ABS.
- No → Disconnect ABS actuator connector and check whether stopping distance is still long.
  - No → Connect ABS actuator connector. Go to **Self-Diagnosis Procedure 1**, BR-43.
  - Yes → Perform usual brake inspection and air bleeding.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostic Procedure 11 (ABS does not work.)



Check whether warning lamp activates.
Go to **Self-Diagnosis Procedure 1**, BR-43.
→ Yes → Go to **Self-Diagnosis Procedure 2**, BR-44.
↓ No

Check whether vehicle speed is under 10 km/h (6 MPH).
→ Yes → ABS does not work in this condition.
↓ No

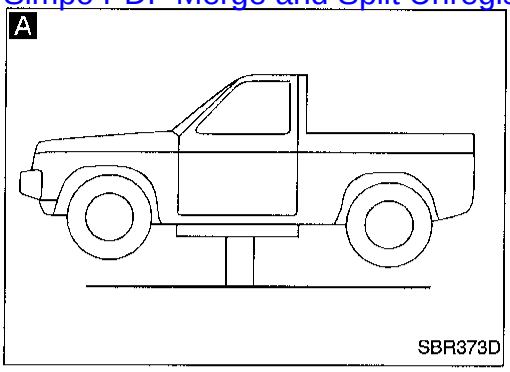
Check ABS actuator and rear sensor.
Go to **Electrical Component Inspection**, BR-53.
→ NG → Replace damaged parts.
↓ OK

Check main power supply and ground circuit.
Go to **Main Power Supply and Ground Circuit Check**, BR-45.
→ NG → Repair faulty part.
↓ OK

Check operation of ABS.
Refer to B in **Electrical Component Inspection**, BR-53.
→ NG → Replace ABS control unit.

Diagnostic Procedure 12 (Pedal vibration or noise)

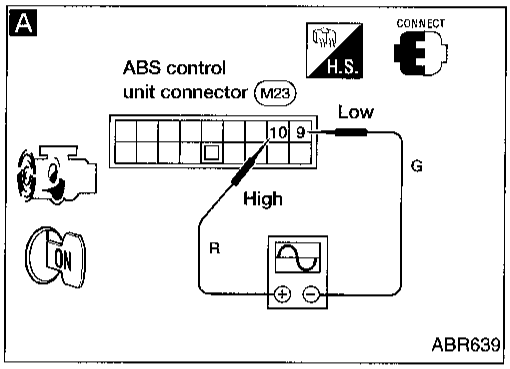
Check whether the symptom appears only when brake is applied suddenly.
→ Yes → When brake is suddenly applied, ABS works and produces pedal vibration or noise.
↓ No



Check whether the noise only appears and warning lamp only activates and deactivates when the ignition switch is turned on.
→ Yes → Self-operation of ABS functions properly.

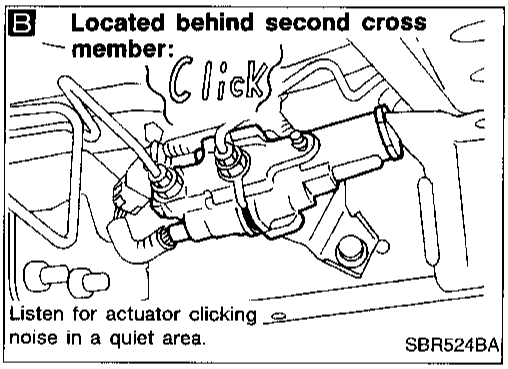
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Electrical Components Inspection



REAR SENSOR UNIT AND ACTUATOR

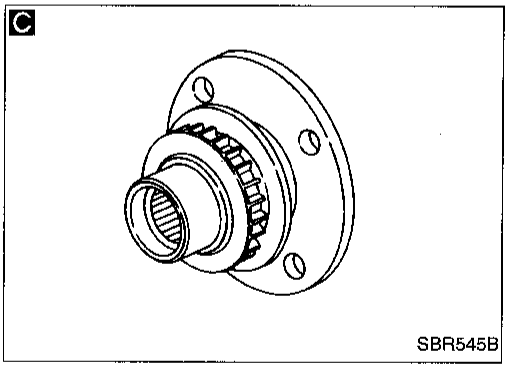
A



SBR373D

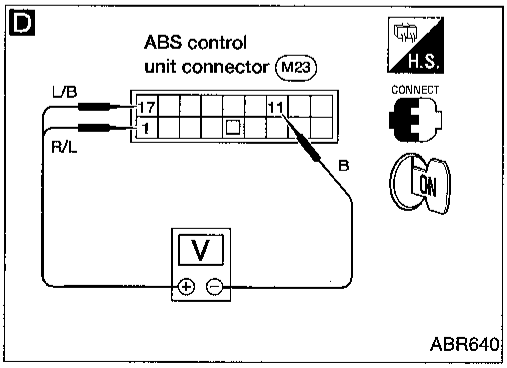
A

ABR639



B **Located behind second cross member:**

Listen for actuator clicking noise in a quiet area.



SBR524BA

C

SBR545B

D

ABR640

A

CHECK REAR SENSOR SIGNAL.

1. Raise vehicle. Confirm it is safe to rotate rear wheels.
2. Start engine and rotate rear wheels with transmission in D position or first gear position.
3. Check rear sensor signal voltage between control unit terminals (10) and (9) with AC voltmeter.

Voltage: 0.4V or more
M/T at 700 rpm
A/T at 850 rpm

NG → C

OK → B

C

CHECK REAR SENSOR ROTOR for following points:

- Tooth condition
- Installation on companion flange
- Deformation
- Wear
- Looseness

NG → Replace rear sensor rotor with companion flange.

OK → Replace rear sensor unit.

B

CHECK ABS ACTUATOR OPERATION.

Go to **Self-diagnosis Procedure 2**, BR-44. Clicking noise sounds from actuator, when the ignition switch is turned on with battery cable connected.

NG → D

OK →

CHECK ABS OPERATION as follows:

1. Perform ABS check in a safe place without obstacles in the vicinity.
2. Drive the vehicle for more than one minute at speeds over 40 km/h (25 MPH), then check that the warning lamp does not light on the instrument panel. After this, check for operation.
3. Check if ordinary braking effect occurs, and also check that the rear wheels do not lock when abrupt braking causes the front wheels to lock.

OK → ABS is in good condition.

NG → Replace ABS actuator.

D

CHECK PULSING VOLTAGE FROM ABS CONTROL UNIT.

Check pulsing voltage for ISO and DUMP solenoid between ABS control unit terminals (17) and (11), and terminals (1) and (11).

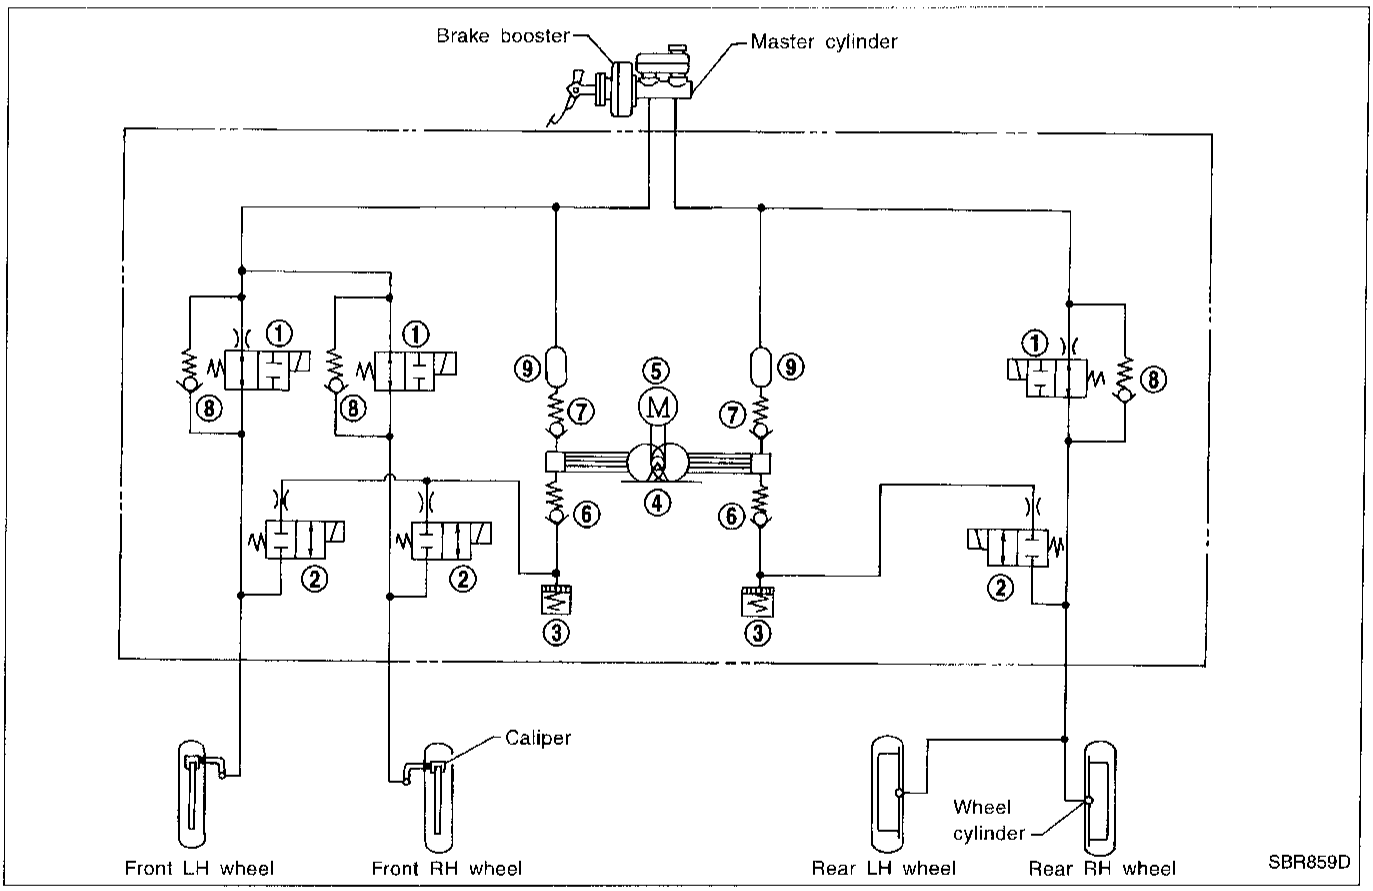
Voltage: 0.3 - 3.5V for approx. 13 msec.

Use suitable digital voltmeter. Pulsing voltage appears when ABS warning lamp goes off after ignition is turned on.

NG → Replace ABS control unit.

OK → Replace ABS actuator.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

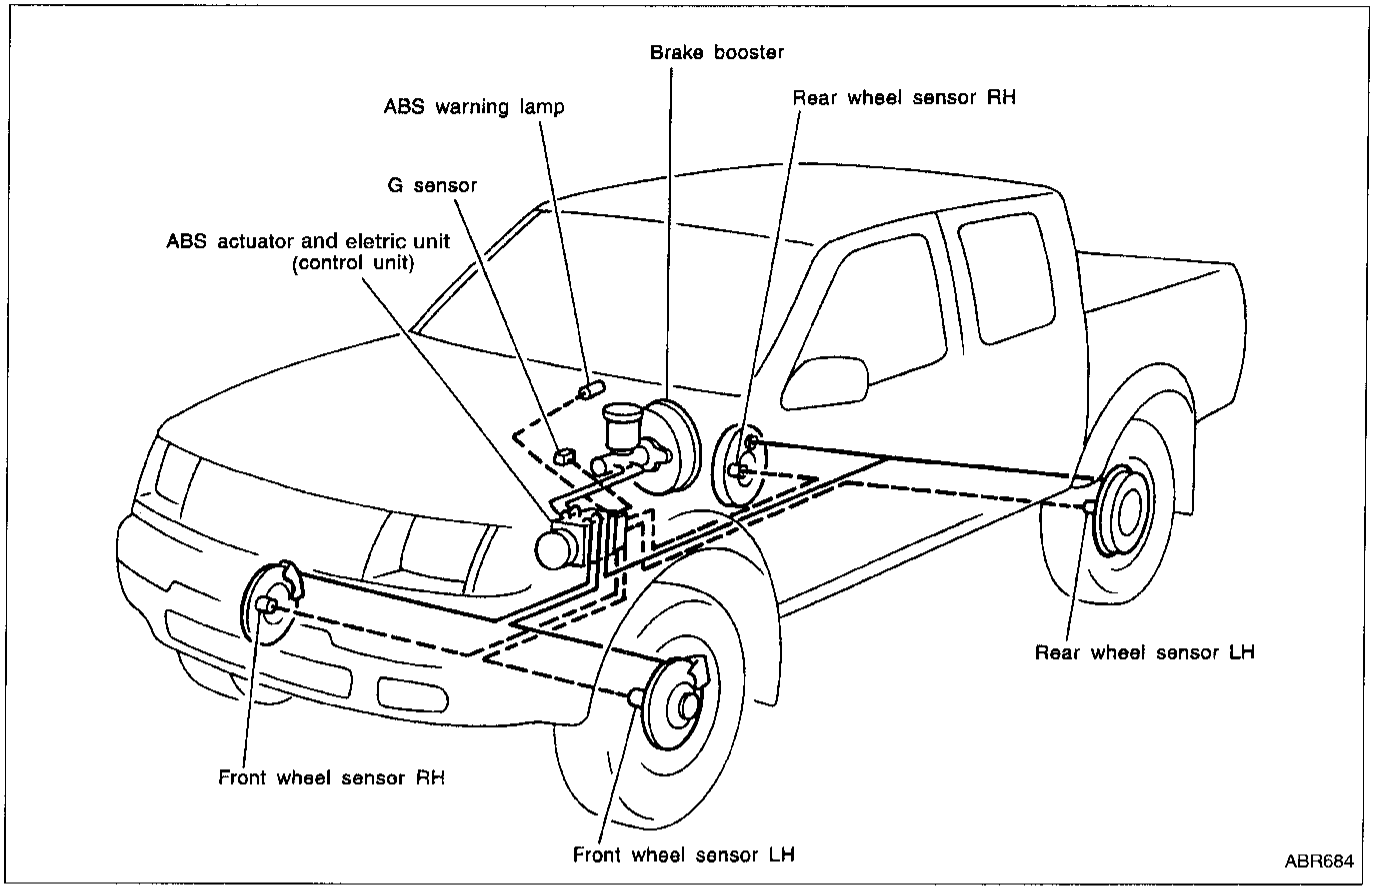


Purpose

The Anti-Lock Brake System (ABS) consists of electronic and hydraulic components. It allows for control of braking force so locking of the wheels can be avoided.
The ABS:
1) Improves proper tracking performance through steering wheel operation.
2) Eases obstacle avoidance through steering wheel operation.
3) Improves vehicle stability.

Operation

- When the vehicle speed is less than 10 km/h (6 MPH) this system does not work.
- The Anti-Lock Brake System (ABS) has a self-test function. The system turns on the ABS warning lamp for 1 second each time the ignition switch is turned "ON". After the engine is started, the ABS warning lamp turns off. The system performs a test the first time the vehicle reaches 6 km/h (4 MPH). A mechanical noise may be heard as the ABS performs this self-test. This is a normal part of the self-test feature. If a malfunction is found during this check, the ABS warning lamp will stay on.
- While driving, a mechanical noise may be heard during ABS operation. This is a normal condition.



ABS Hydraulic Circuit

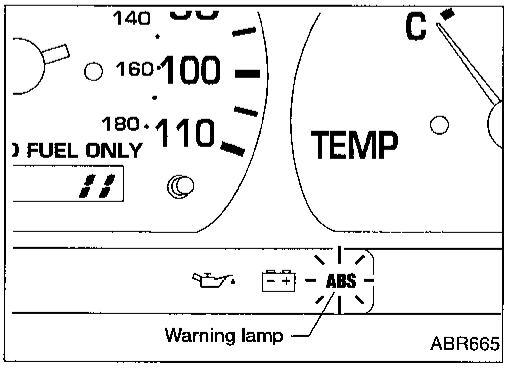
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



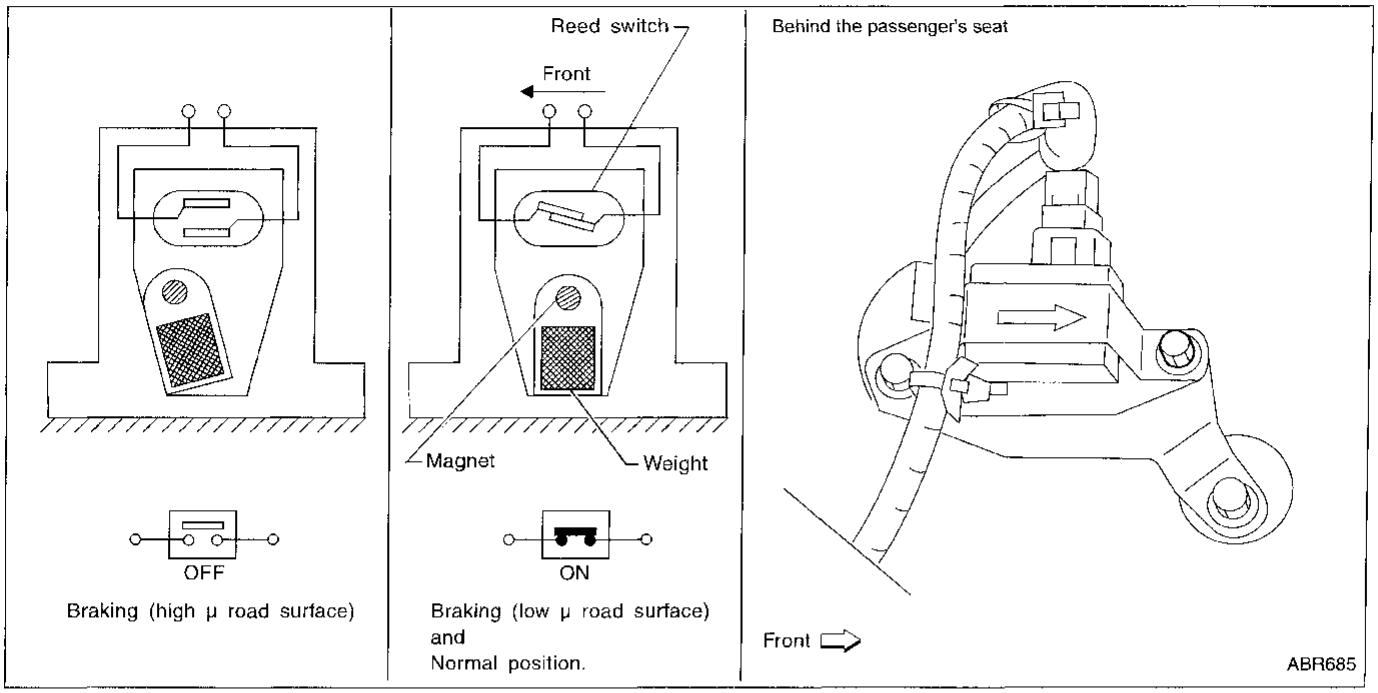
System Components

System Description

WHEEL SENSOR

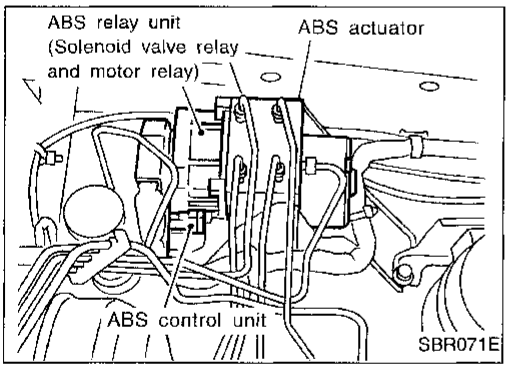
The sensor unit consists of a gear-shaped sensor rotor and a sensor element. The element contains a bar magnet around which a coil is wound. The sensor is installed on the back of the brake rotor and the back of the rear brake drum. As the wheel rotates, the sensor generates a sine-wave pattern. The frequency and voltage increase(s) as the rotating speed increases.

CONTROL UNIT (built-in ABS actuator and electric unit)



The control unit computes the wheel rotating speed by the signal current sent from the sensor. Then it supplies a DC current to the actuator solenoid valve. It also controls ON-OFF operation of the valve relay and motor relay. If any electrical malfunction should be detected in the system, the control unit causes the warning lamp to light up. In this condition, the ABS will be deactivated by the control unit, and the vehicle's brake system reverts to normal operation. (For control unit layout, refer to ABS ACTUATOR AND ELECTRIC UNIT, BR-56.)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



System Description (Cont'd)

G SENSOR

The G sensor senses deceleration during braking to determine whether the vehicle is being driven on a high μ road (asphalt road, etc.) or a low μ road (snow-covered road, etc.). It then sends a signal to the ABS control unit.

The reed switch turns on when it is affected by a magnetic field. During sudden deceleration (braking on a high μ road), the weight moves and the magnet in the weight moves away from the reed switch. The magnetic field then diminishes and the reed switch turns off.

ABS ACTUATOR AND ELECTRIC UNIT

The ABS actuator and electric unit contains:

- An electric motor and pump
- Two relays
- Six solenoid valves, each inlet and outlet for
  - — LH front
  - — RH front
  - — Rear
- ABS control unit

This component controls the hydraulic circuit and increases, holds or decreases hydraulic pressure to all or individual wheels. The ABS actuator and electric unit is serviced as an assembly.

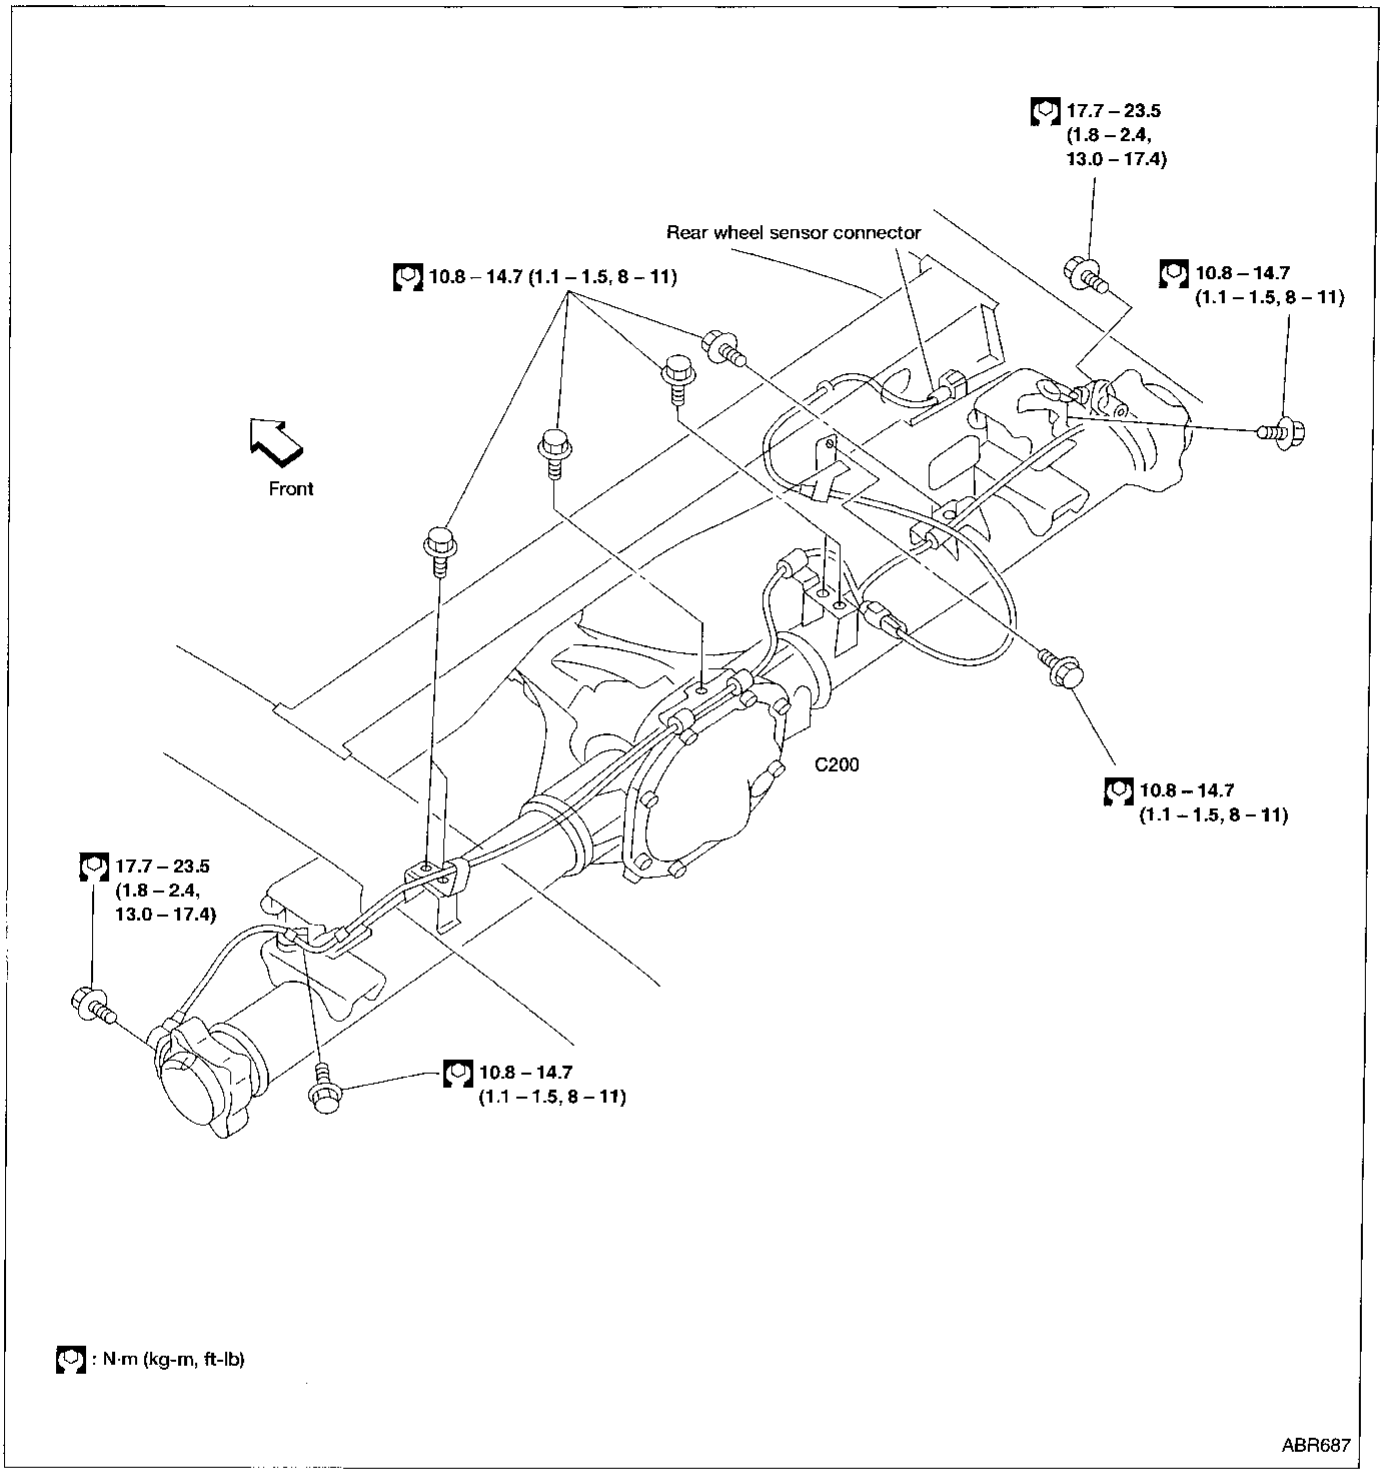
ABS actuator operation

		Inlet solenoid valve	Outlet solenoid valve	
Normal brake operation		OFF (Open)	OFF (Closed)	Master cylinder brake fluid pressure is directly transmitted to wheel cylinder via the inlet solenoid valve.
ABS operation	Pressure hold	ON (Closed)	OFF (Closed)	Hydraulic circuit is shut off to hold the wheel cylinder brake fluid pressure.
	Pressure decrease	ON (Closed)	ON (Open)	Wheel cylinder brake fluid is sent to reservoir via the outlet solenoid valve. Then it is pushed up to the master cylinder by pump.
	Pressure increase	OFF (Open)	OFF (Closed)	Master cylinder brake fluid pressure is transmitted to wheel cylinder.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

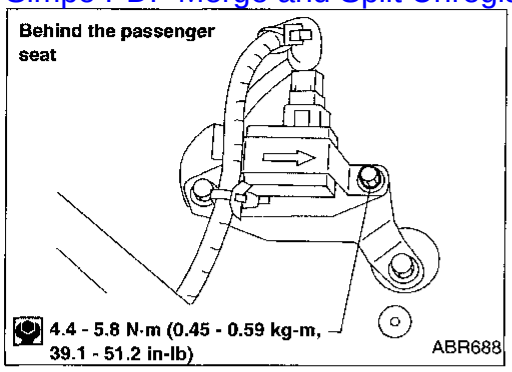
Removal and Installation

CAUTION:
Be careful not to damage sensor edge and sensor rotor teeth. When removing the front wheel hub or rear axle shaft assembly, disconnect the ABS wheel sensor from the assembly and move it away.



FRONT WHEEL SENSOR

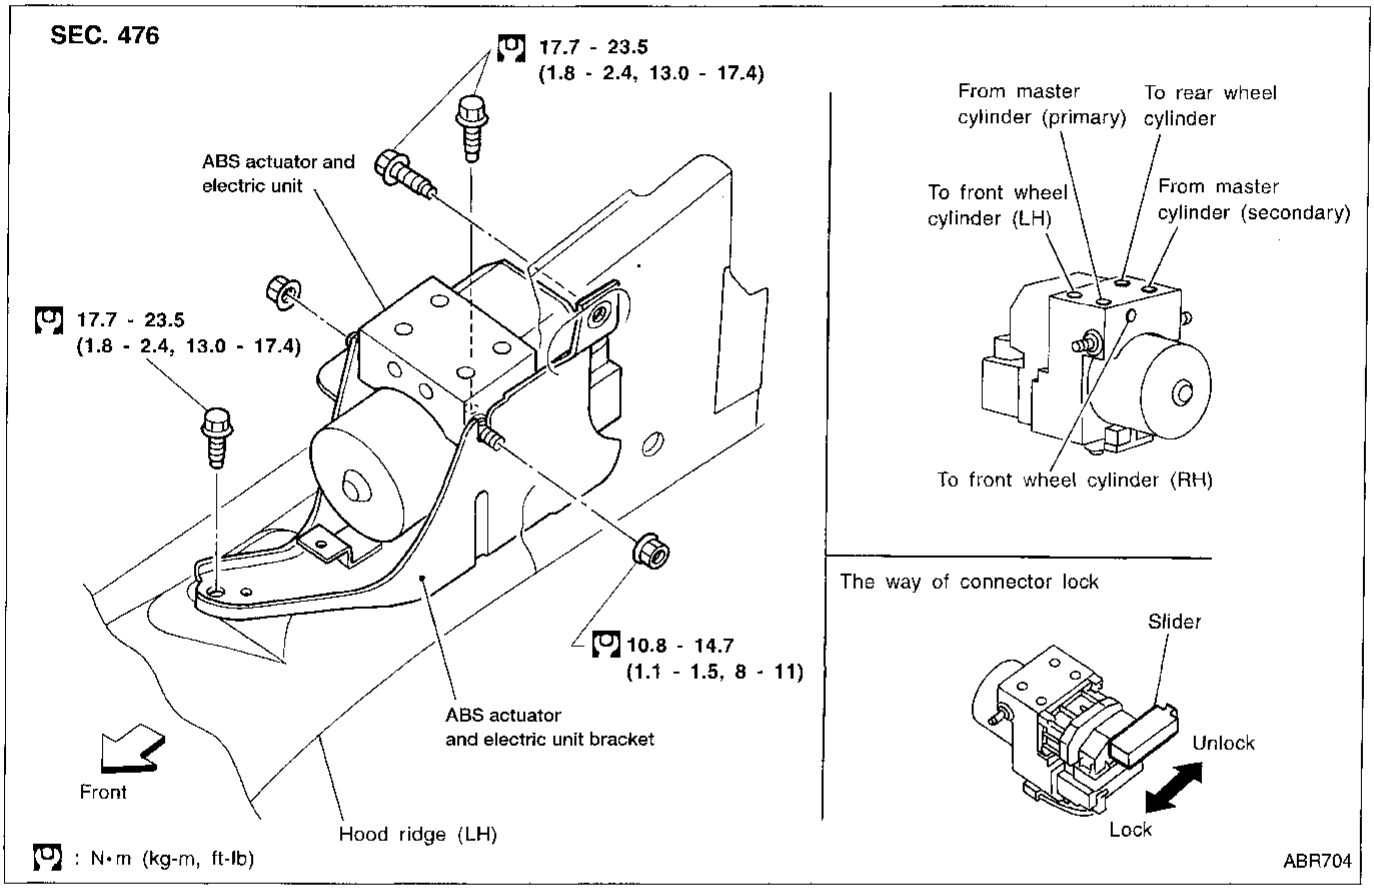
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Removal and Installation (Cont'd)

REAR WHEEL SENSOR

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



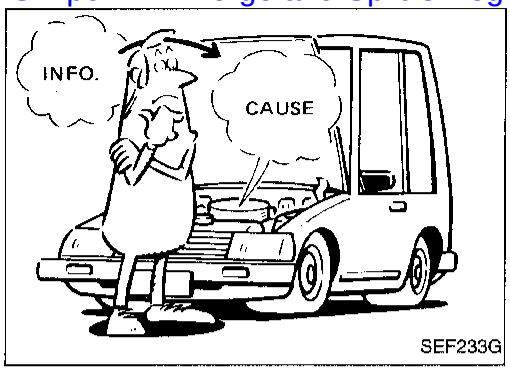
Removal and Installation (Cont'd)

G SENSOR

Always replace G sensor if bumped or dropped. Otherwise, performance characteristics of G sensor will be changed, which in turn changes ABS control performance characteristics.

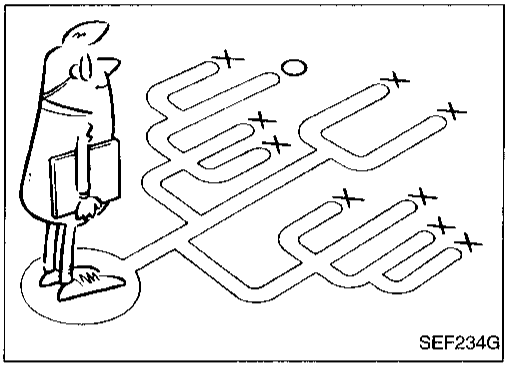
ABS ACTUATOR AND ELECTRIC UNIT

Removal



1. Disconnect battery cable.
2. Drain brake fluid. Refer to "Changing Brake Fluid", BR-5.
3. Remove mounting bracket fixing bolts and nuts.
4. Disconnect connector, brake pipes and remove fixing nuts.

Installation



CAUTION:
After installation, refill brake fluid. Then bleed air. Refer to "Bleeding Brake System", BR-6.

1. Connect brake pipes temporarily.
2. Tighten fixing bolts and nuts.
3. Tighten brake pipes.
4. Connect connector and battery cable.

SEF234G

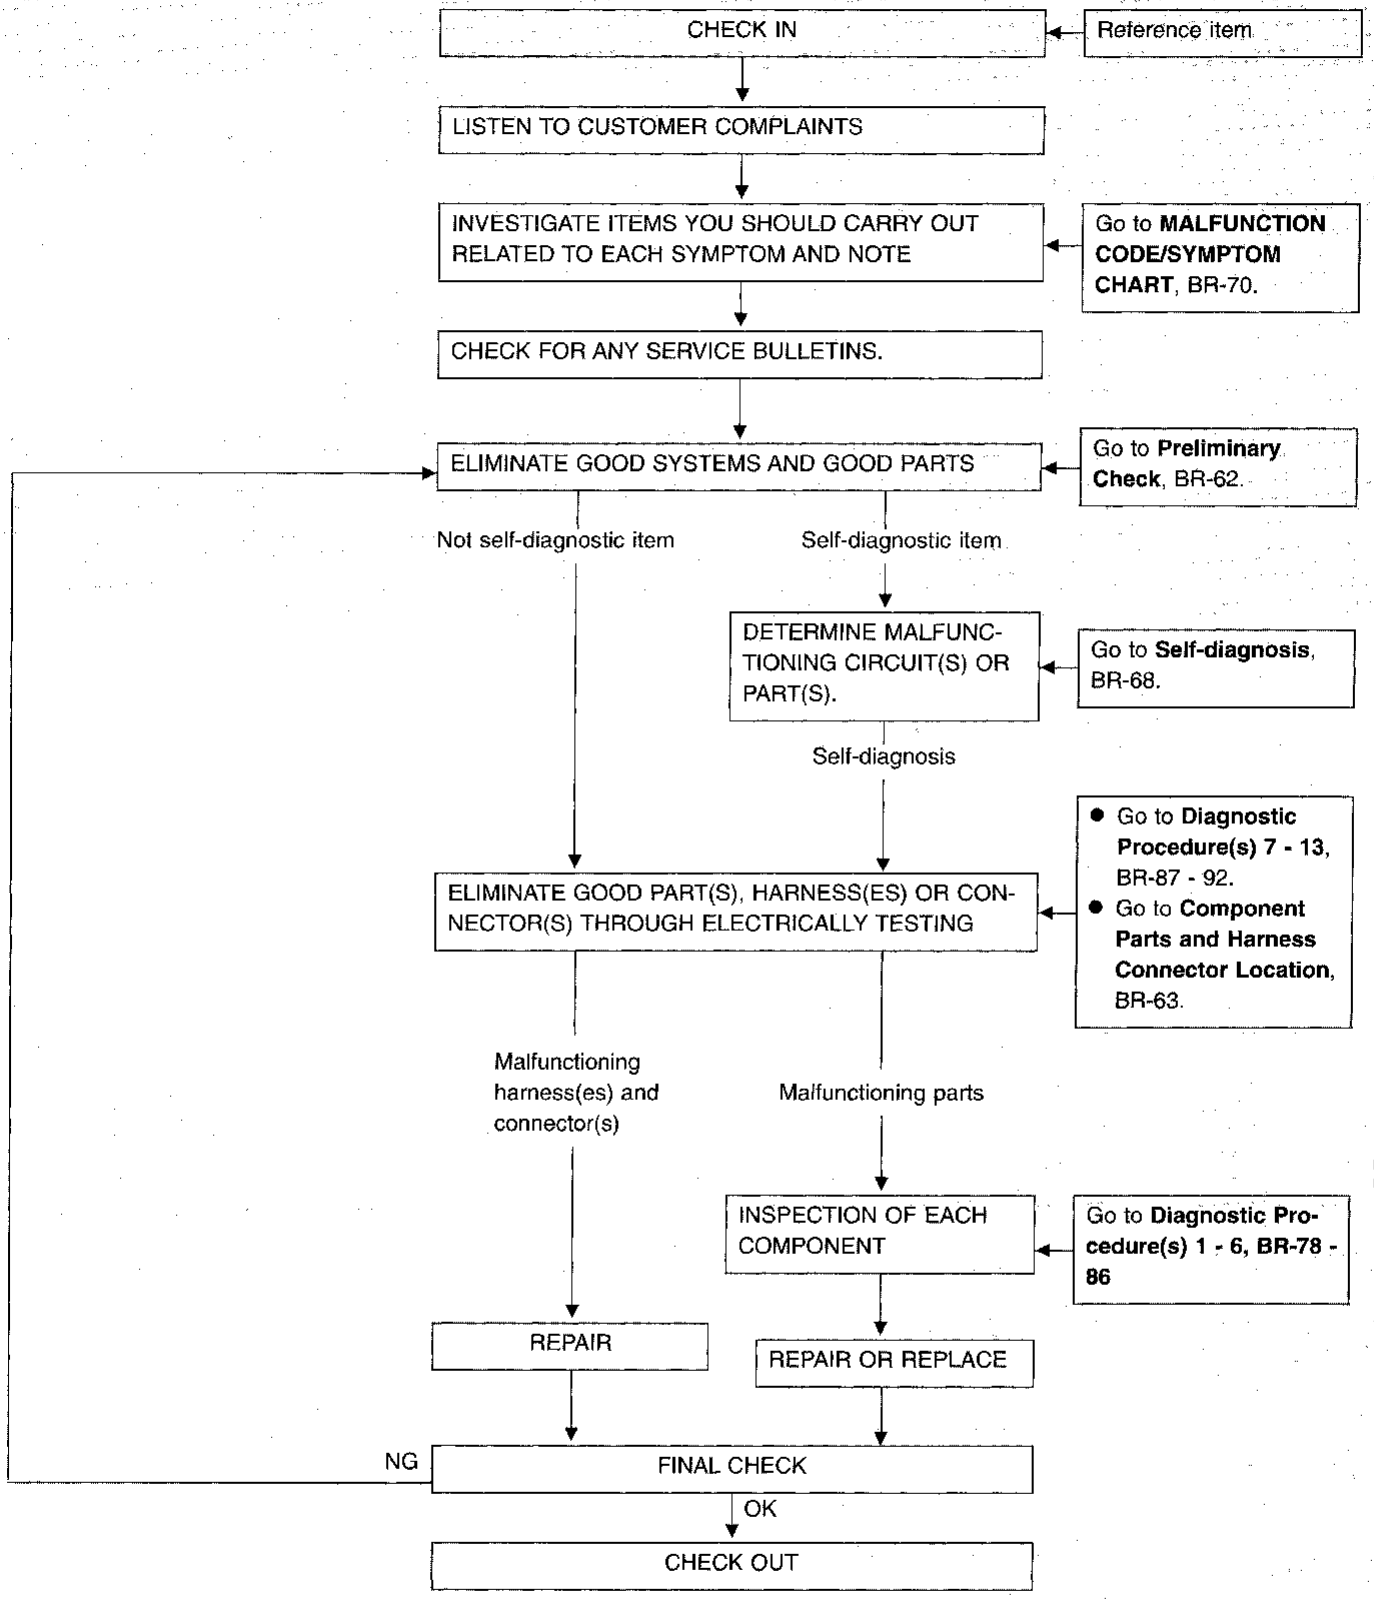
How to Perform Trouble Diagnoses for Quick and Accurate Repair

INTRODUCTION

The ABS system has an electronic control unit to control major functions. The control unit accepts input signals from sensors and instantly drives the actuators. It is essential that both kinds of signals are proper and stable. It is also important to check for conventional problems: such as air leaks in booster lines, lack of brake fluid, or other problems with the brake system.

It is much more difficult to diagnose a problem that occurs intermittently rather than continuously. Most intermittent problems are caused by poor electric connections or faulty wiring. In this case, careful checking of suspicious circuits may help prevent the replacement of good parts.

A visual check only, may not find the cause of the problems, so a road test should be performed.



Before undertaking actual checks, take a few minutes to talk with a customer who approaches with a ABS complaint. The customer is a very good source of information on such problems; especially intermittent ones. Through the talks with the customer, find out what symptoms are present and under what conditions they occur. Start your diagnosis by looking for "conventional" problems first. This is one of the best ways to troubleshoot brake problems on an ABS controlled vehicle.

Also check related service bulletins for information.

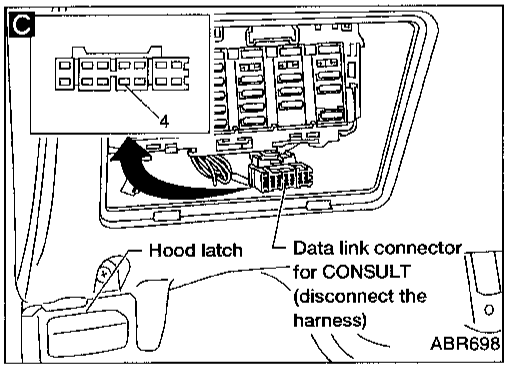
Self-diagnosis



FUNCTION

- When a problem occurs in the ABS, the warning lamp on the instrument panel comes on. To start the self-diagnostic results mode, ground the self-diagnostic (check) terminal located on "Data Link Connector for CONSULT". The location of the malfunction is indicated by the warning lamp flashing.

SELF-DIAGNOSIS PROCEDURE

Drive vehicle over 30 km/h (19 MPH) for at least one minute.

↓

Turn ignition switch "OFF".

↓

A

Ground terminal "4" of "Data link connector for CONSULT" with a suitable harness.

↓

Turn ignition switch "ON" while grounding terminal "4".
Do not depress brake pedal.

↓

B

After 3.0 seconds, the warning lamp starts flashing to indicate the malfunction code No. (See NOTE.)

↓

Verify the location of the malfunction with the malfunction code chart. Refer to BR-70. Then make the necessary repairs following the diagnostic procedures.

↓

After the malfunctions are repaired, erase the malfunction codes stored in the control unit. Refer to BR-69.

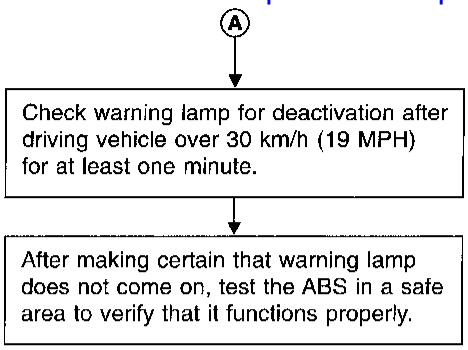
↓

Rerun the self-diagnostic results mode to verify that the malfunction codes have been erased.

↓

C

Disconnect the check terminal from the ground. The self-diagnostic results mode is now complete.

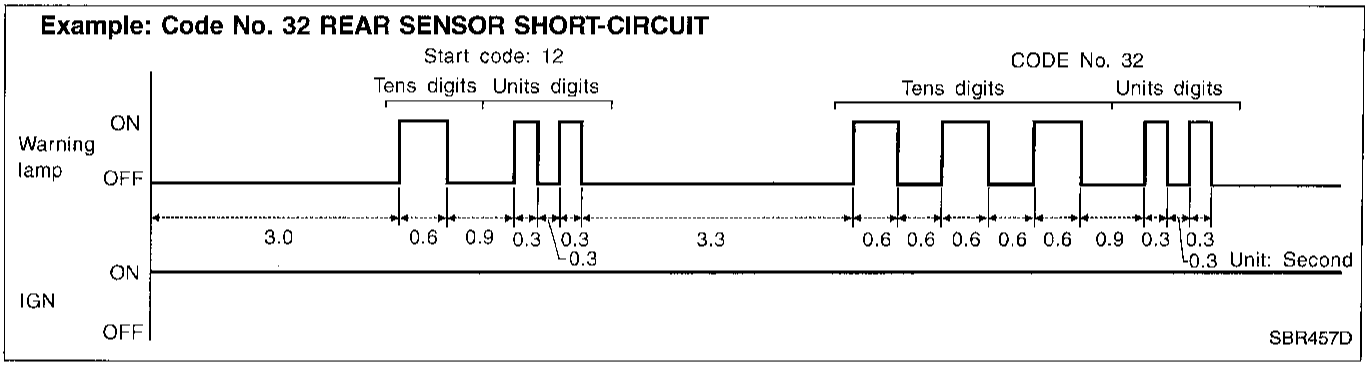


↓

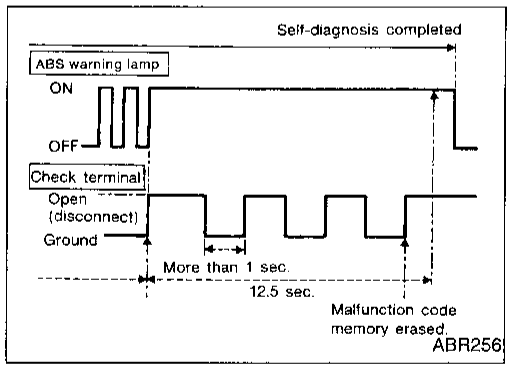
Ⓐ

(Go to next page.)

NOTE: The indication terminates after five minutes. However, when the ignition switch is turned from "OFF" to "ON", the indication starts flashing again.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



HOW TO READ SELF-DIAGNOSTIC RESULTS (Malfunction codes)

- Determine the code No. by counting the number of times the warning lamp flashes on and off.
- When several malfunctions occur at one time, up to three code numbers can be stored; the latest malfunction will be indicated first.
- The indication begins with the start code 12. After that a maximum of three code numbers appear in the order of the latest one first. The indication then returns to the start code 12 to repeat (the indication will stay on for five minutes at the most).
- The malfunction code chart is on the next page.

Example: Code No. 32 REAR SENSOR SHORT-CIRCUIT

HOW TO ERASE SELF-DIAGNOSTIC RESULTS (Malfunction codes)

1. Disconnect the check terminal from ground (ABS warning lamp will stay lit).
2. Within 12.5 seconds, ground the check terminal 3 times. Each terminal ground must last more than 1 second. The ABS warning lamp goes out after the erase operation has been completed.
3. Perform self-diagnosis again. Refer to BR-68. Only the start-code should appear, no malfunction codes.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Self-diagnosis (Cont'd)

MALFUNCTION CODE/SYMPTOM CHART

Code No./Symptom (No. of warning lamp flashes)	Malfunctioning part	Diagnostic procedure
45	Actuator front left outlet solenoid valve	2
46	Actuator front left inlet solenoid valve	2
41	Actuator front right outlet solenoid valve	2
42	Actuator front right inlet solenoid valve	2
55	Actuator rear outlet solenoid valve	2
56	Actuator rear inlet solenoid valve	2
25 ★1	Front left sensor (open-circuit)	1
26 ★1	Front left sensor (short-circuit)	1
21 ★1	Front right sensor (open-circuit)	1
22 ★1	Front right sensor (short-circuit)	1
31 ★1	Rear right sensor (open-circuit)	1
32 ★1	Rear right sensor (short-circuit)	1
35 ★1	Rear left sensor (open-circuit)	1
36 ★1	Rear left sensor (short-circuit)	1
18 ★1	Sensor rotor	1
17	G sensor and circuit	5
61 ★3	Actuator motor or motor relay	3
63	Solenoid valve relay	2
57 ★2	Power supply (Low voltage)	4
71	Control unit	6
Warning lamp stays on when ignition switch is turned ON	Control unit power supply circuit Warning lamp bulb circuit Control unit or control unit connector Solenoid valve relay stuck Power supply for solenoid valve relay coil	13
Warning lamp does not come on when ignition switch is turned ON	Fuse, warning lamp bulb or warning lamp circuit Control unit	12
Pedal vibration and noise	—	11
Long stopping distance	—	9
Unexpected pedal action	—	8
ABS does not work	—	10
ABS works frequently	—	7

★1: If one or more wheels spin on a rough or slippery road for 40 seconds or more, the ABS warning lamp will illuminate. This does not indicate a malfunction. Only in the case of the short-circuit (Code Nos. 26, 22, 32 and 36), after repair the ABS warning lamp also illuminates when the ignition switch is turned "ON". In this case, drive the vehicle at speeds greater than 30 km/h (19 MPH) for approximately 1 minute as specified in "SELF-DIAGNOSIS PROCEDURE", BR-68. Check to ensure that the ABS warning lamp goes out while the vehicle is being driven.

★2: The trouble code "57", which refers to a low power supply voltage, does not indicate that the ABS control unit is malfunctioning. Do not replace the ABS control unit with a new one.

★3: The trouble code "61" can sometimes appear when the ABS motor is not properly grounded. If it appears, be sure to check the condition of the ABS motor ground circuit connection.

CONSULT Inspection Procedure

SELF-DIAGNOSIS PROCEDURE

A

1) Turn ignition switch OFF.
2) Connect CONSULT to Data Link Connector for CONSULT.

1) Start engine.
2) Drive vehicle over 30 km/h (19 MPH) for at least one minute.

B 1) Stop vehicle with engine running and touch "START" on CONSULT screen.
C 2) Touch "ABS".
D 3) Touch "SELF-DIAG RESULTS".
- The screen shows the detected malfunction and how many times the ignition switch has been turned since the malfunction.

Make the necessary repairs following the diagnostic procedures.

E

After the malfunctions are repaired, erase the self-diagnostic results stored in the control unit by touching "ERASE".

Check warning lamp for deactivation after driving vehicle over 30 km/h (19 MPH) for at least one minute.

Test the ABS in a safe area to verify that it functions properly.

Note: "SELF-DIAG RESULTS" screen shows the detected malfunction and how many times the ignition switch has been turned since the malfunction.

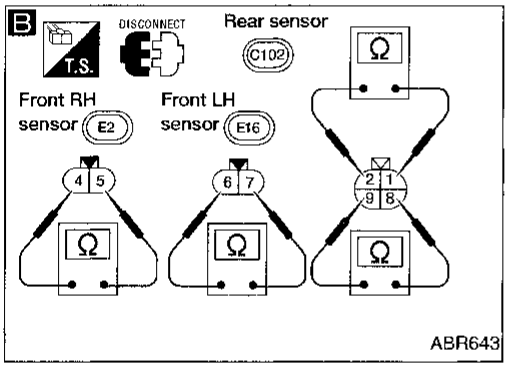
Ground Circuit Check



ABS ACTUATOR AND ELECTRIC UNIT GROUND

- Check resistance between ABS actuator and electric unit connector terminals and ground.
  Resistance: approximately 0Ω

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostic Procedure 1 (Wheel sensor or rotor)

Malfunction code No. 21, 22, 25, 26, 31, 32, 35, 36 or 18

INSPECTION START
1. Disconnect connectors from ABS actuator and electric unit and wheel sensor of malfunction code No. Check terminals for damage or loose connections. Then reconnect connectors.
2. Carry out self-diagnosis again.
Does warning lamp activate again?

No → Inspection end

Yes

A

CHECK WHEEL SENSOR ELECTRICAL.
1. Disconnect ABS actuator and electric unit connector.
2. Check resistance between ABS actuator and electric unit connector (E39) (body side) terminals.
Code No. 21 or 22 (Front RH wheel)
Terminals (4) and (5)
Code No. 25 or 26 (Front LH wheel)
Terminals (6) and (7)
Code No. 31 or 32 (Rear RH wheel)
Terminals (8) and (9)
Code No. 35 or 36 (Rear LH wheel)
Terminals (1) and (2)
Resistance: Front 1.44 - 1.76 kΩ
Rear 1.44 - 1.76 kΩ

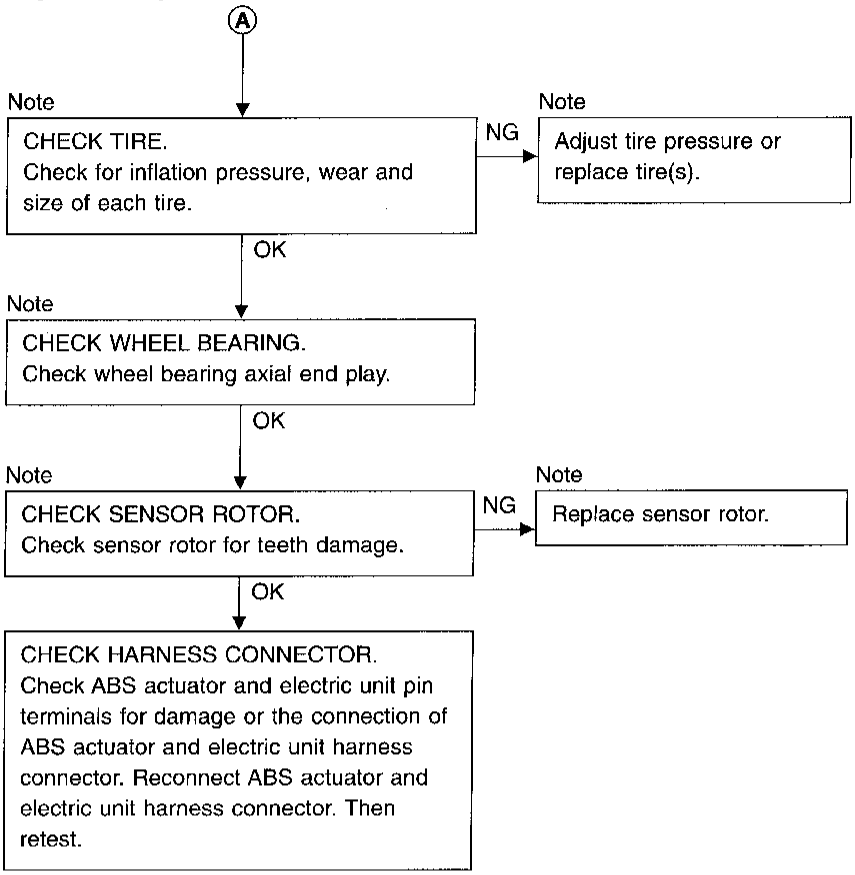
OK → (A) (Go to next page.)

NG

B

CHECK WHEEL SENSOR.
Check each sensor for resistance.
Resistance: Front 1.44 - 1.76 kΩ
Rear 1.44 - 1.76 kΩ

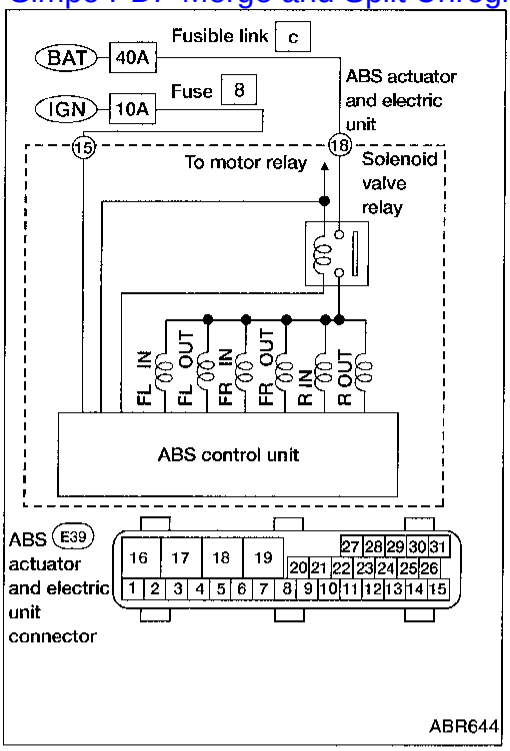
OK → Check the following.
- Harness connectors (E39), (E53), (C11), (C12), (C102)
- Harness for open or short between wheel sensor connectors and ABS actuator and electric unit



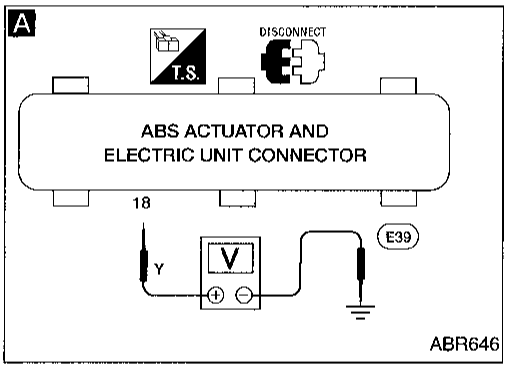
If NG, repair harness or connectors.

NG

REPLACE.
Replace wheel sensor.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Diagnostic Procedure 1 (Wheel sensor or rotor) (Cont'd)

Note: Wheel position should be distinguished by code numbers except code No. 18 (sensor rotor).

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostic Procedure 2 (ABS actuator solenoid valve and solenoid valve relay)

Malfunction code Nos. 41, 42, 45, 46, 55, 56, 63

CHECK FUSIBLE LINK.
Check 40A fusible link C. For fusible link layout, refer to POWER SUPPLY ROUTING in EL section.
NG → (A) (Go to next page.)
OK ↓

CHECK FUSE.
Check 10A fuse 8. For fuse layout, refer to POWER SUPPLY ROUTING in EL section.
NG → (B) (Go to next page.)
OK ↓

CHECK CONNECTOR.
1. Disconnect ABS actuator and electric unit connector. Check terminals for damage or loose connection. Then reconnect connector.
2. Carry out self-diagnosis again.
Does warning lamp activate again?

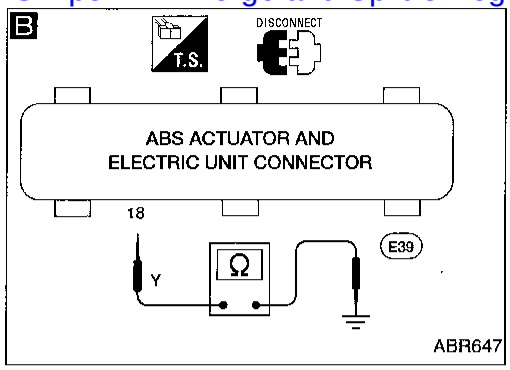
No → Inspection end
Yes ↓

CHECK ABS ACTUATOR AND ELECTRIC UNIT GROUND CIRCUIT.
Refer to ABS ACTUATOR AND ELECTRIC UNIT GROUND in Ground Circuit Check, BR-77.
NG → Repair harness and connector.
OK ↓

A

CHECK SOLENOID VALVE RELAY POWER SUPPLY CIRCUIT.
1. Disconnect ABS actuator and electric unit connector.
2. Check voltage between ABS actuator and electric unit connector E39 (body side) terminal 18 and ground.
Battery voltage should exist.

NG → Check the following.
- Harness connector E39
- Harness for open or short between ABS actuator and electric unit and fusible link



If NG, repair harness or connector.

OK ↓

REPLACE.
Replace ABS actuator and electric unit.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostic Procedure 2 (ABS actuator solenoid valve and solenoid valve relay) (Cont'd)

(A)

REPLACE.
Replace fusible link.
Does the fusible link blow out when ignition switch is turned ON?

No → Inspection end

Yes

B

CHECK SOLENOID VALVE RELAY POWER SUPPLY CIRCUIT.
1. Disconnect battery cable and ABS actuator and electric unit connector.
2. Check continuity between ABS actuator and electric unit connector (E39) (body side) terminal (18) and ground.
Continuity should not exit.

NG → Check the following.
- Harness connector (E39)
- Harness for open or short between ABS actuator and electric unit and fusible link

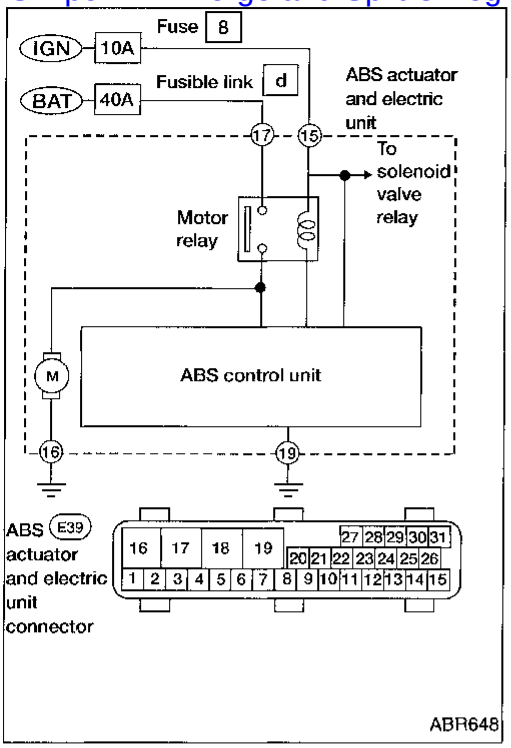
If NG, repair harness or connector.

OK

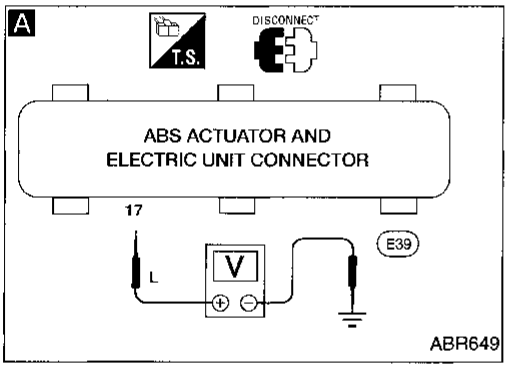
REPLACE.
Replace ABS actuator and electric unit.

(B)

REPLACE.
Replace fuse.
Does the fuse blow out when ignition switch is turned ON?



Yes → Check the following.
- Harness connector (E39)
- Harness for open or short between ABS actuator and electric unit and fuse



If NG, repair harness or connector.

No

END
Inspection end

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostic Procedure 3 (Motor relay or motor)

Malfunction code No. 61

CHECK FUSIBLE LINK.
Check 40A fusible link d. For fusible link layout, refer to POWER SUPPLY ROUTING in EL section.

NG → A (Go to next page.)

OK ↓

CHECK CONNECTOR.
1. Disconnect ABS actuator and electric unit connector. Check terminals for damage or loose connection. Then reconnect connector.
2. Carry out self-diagnosis again.
Does warning lamp activate again?

No → Inspection end

Yes ↓

A

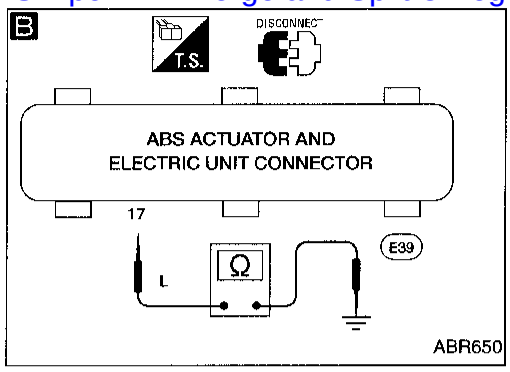
CHECK MOTOR RELAY POWER SUPPLY CIRCUIT.
1. Disconnect ABS actuator and electric unit connector.
2. Check voltage between ABS actuator and electric unit connector E39 (body side) terminal 17 and ground.
Battery voltage should exist.

NG → Check the following.
- Harness connector E39
- Harness for open or short between ABS actuator and electric unit and fusible link

If NG, repair harness or connector.

OK ↓

CHECK ABS ACTUATOR AND ELECTRIC UNIT GROUND.
Refer to ABS ACTUATOR AND ELECTRIC UNIT GROUND in Ground Circuit Check, BR-77.



NG → Repair harness and terminals.

OK ↓

REPLACE.
Replace ABS actuator and electric unit.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostic Procedure 3 (Motor relay or motor) (Cont'd)

(A)

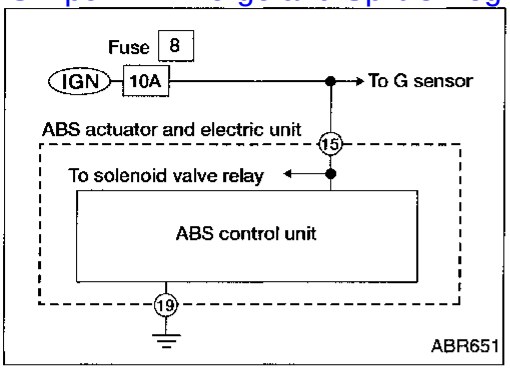
REPLACE.
Replace fusible link.
Does the fusible link blow out when ignition switch is turned ON?

No → Inspection end

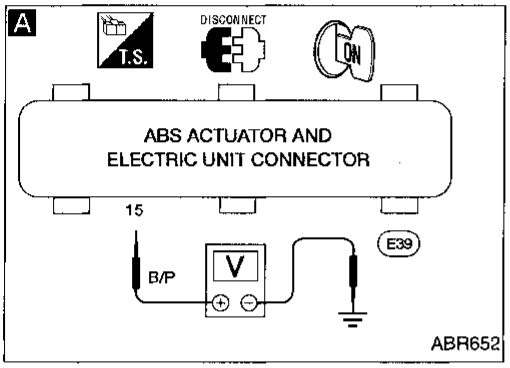
Yes

B

CHECK ABS ACTUATOR MOTOR POWER SUPPLY CIRCUIT.
1. Disconnect battery cable and ABS actuator and electric unit connector (E39).
2. Check continuity between ABS actuator and electric unit connector (E39) (body side) terminal (17) and ground.
Continuity should not exist.



NG → Check the following
- Harness connector (E39)
- Harness for open or short between ABS actuator and electric unit and fusible link



If NG, repair harness or connector.

OK

CHECK HARNESS CONNECTOR.
Check ABS actuator and electric unit pin terminals for damage or the connection of ABS actuator and electric unit harness connector.
Reconnect ABS actuator and electric unit harness connector. Then retest.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostic Procedure 4 (Low voltage)

Malfunction code No. 57

CHECK CONNECTOR.
1. Disconnect ABS actuator and electric unit connector. Check terminals for damage or loose connection. Then reconnect connector.
2. Carry out self-diagnosis again.
Does warning lamp activate again?

No → Inspection end

Yes ↓

A

CHECK ABS CONTROL UNIT POWER SUPPLY CIRCUIT.
1. Disconnect ABS actuator and electric unit connector.
2. Check voltage between ABS actuator and electric unit connector (E39) (body side) terminal (15) and ground.
Battery voltage should exist when ignition switch is turned ON.

NG → (A) (See below.)

OK ↓

CHECK ABS CONTROL UNIT GROUND.
Refer to ABS ACTUATOR AND ELECTRIC UNIT GROUND in Ground Circuit Check, BR-77.

NG → Repair harness and connector.

OK ↓

CHECK HARNESS CONNECTOR.
Check ABS actuator and electric unit pin terminals for damage or the connection of ABS actuator and electric unit harness connector. Reconnect ABS actuator and electric unit harness connector. Then retest.

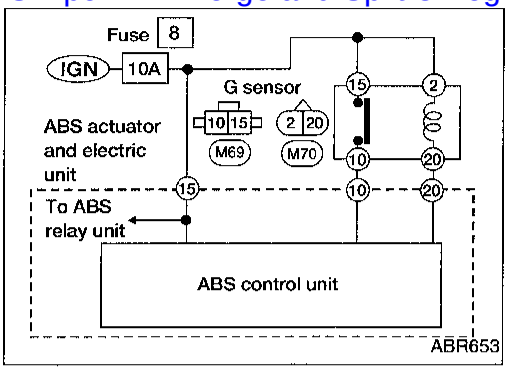
(A) ↓

CHECK FUSE.
Check 10A fuse [8]. For fuse layout, refer to POWER SUPPLY ROUTING in EL section.

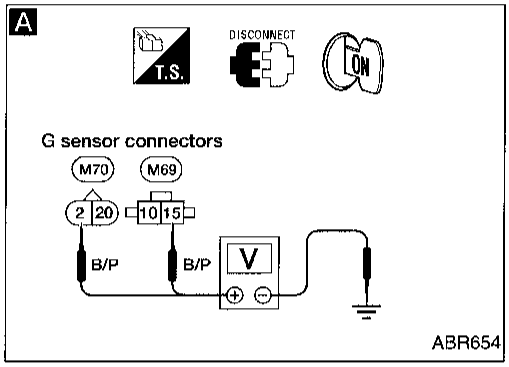
NG → Replace fuse.

OK ↓

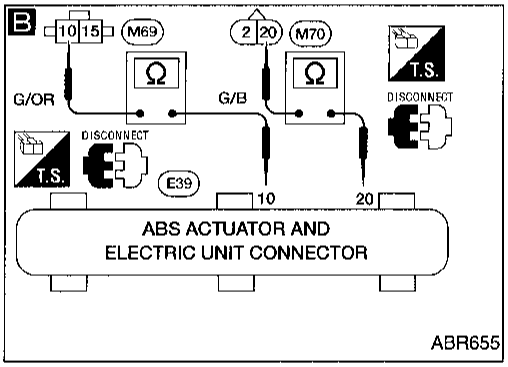
CHECK ABS CONTROL UNIT POWER SUPPLY CIRCUIT.
Check continuity between fuse and ABS actuator and electric unit connector (E39) (body side) terminal (15).



NG → Check the following.
- Harness connector (E39)
- Harness for open or short between ABS actuator and electric unit and fuse



If NG, repair harness or connector.



OK ↓

CHECK BATTERY.
Check battery. Refer to BATTERY in EL section.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostic Procedure 5 (G sensor)

Malfunction code No. 17

CHECK G SENSOR POWER SUPPLY CIRCUIT.
Check 10A fuse 8. For fuse layout, refer to POWER SUPPLY ROUTING in EL section.

NG → Replace fuse.

OK ↓

CHECK CONNECTOR.
1. Disconnect ABS actuator and electric unit connector. Check terminals for damage or loose connection. Then reconnect connector.
2. Carry out self-diagnosis again.
Does warning lamp activate again?

No → Inspection end

Yes ↓

CHECK G SENSOR.
Refer to G SENSOR in Electrical Components Inspection, BR-93.

NG → Replace G sensor.

OK ↓

A

CHECK G SENSOR POWER SUPPLY CIRCUIT.
1. Disconnect G sensor connectors.
2. Check voltage between G sensor connector M69, M70 (body side) terminal 2, 15 and ground.
Battery voltage should exist.

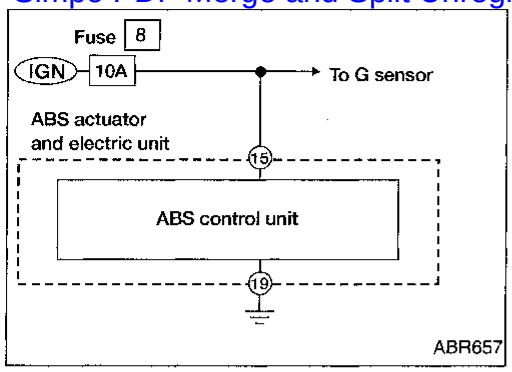
NG → Check the following.
- Harness connectors M69, M70, E39
- Harness for open or short between G sensor and ABS actuator and electric unit

If NG, repair harness or connectors.

OK ↓

B

CHECK G SENSOR GROUND.
1. Disconnect ABS actuator and electric unit connector and G sensor connectors.
2. Check continuity between ABS actuator and electric unit connector E39 (body side) terminals 10, 20 and G sensor connectors M69, M70 (body side) terminals 10, 20.
Continuity should exist.



NG → Check the following.
- Harness connectors M69, M70, E39, E53
- Harness for open or short between G sensor and ABS actuator and electric unit

If NG, repair harness or connectors.

OK ↓

CHECK HARNESS CONNECTOR.
Check ABS actuator and electric unit pin terminals for damage or the connection of ABS actuator and electric unit harness connector. Reconnect ABS actuator and electric unit harness connector. Then retest.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostic Procedure 6 (Control unit)

Malfunction code No. 71

CHECK CONNECTOR.
1. Disconnect ABS actuator and electric unit connector.
   Check terminals for damage or loose connections. Then reconnect connector.
2. Carry out self-diagnosis again.
   Does warning lamp activate again?

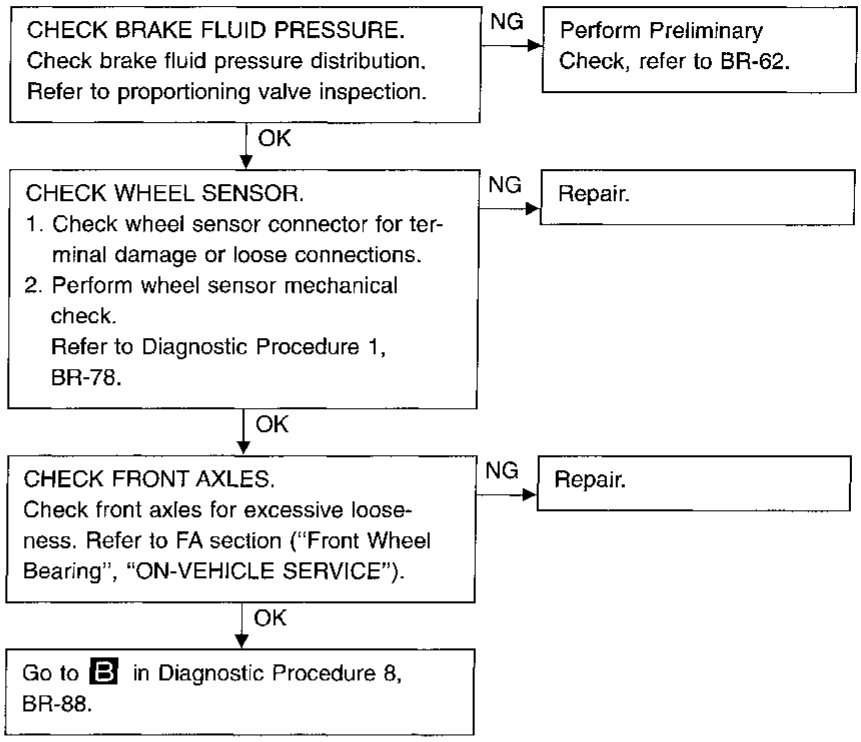
No → Inspection end

Yes ↓

ABS CONTROL UNIT POWER SUPPLY CHECK
Check voltage. Refer to A in Diagnostic Procedure 4, BR-84.

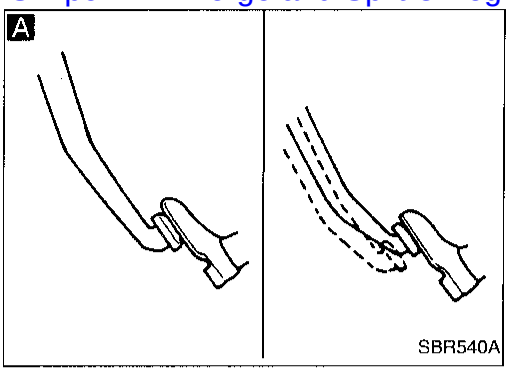
↓

CHECK SELF-DIAGNOSTIC RESULTS
Does warning lamp indicate code No. 71 again?

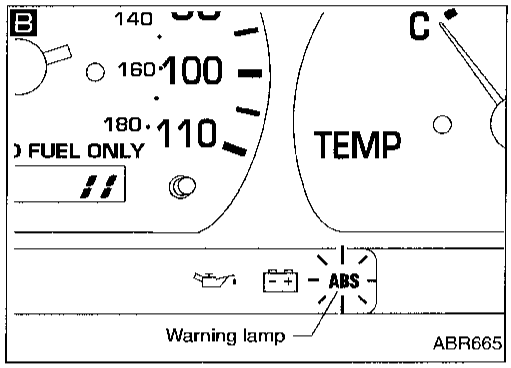


Yes → Replace ABS actuator and electric unit.

No ↓



INSPECTION
Inspect the system according to the code No.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostic Procedure 7 (ABS works frequently.)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostic Procedure 8 (Unexpected pedal action)

A

CHECK BRAKE PEDAL STROKE.
Check brake pedal stroke. Is stroke excessively large?
- Yes → Perform Preliminary Check, refer to BR-62.
- No ↓

CHECK BRAKE PERFORMANCE.
Disconnect ABS actuator and electric unit connector and check whether brake is effective.
- No → Perform Preliminary Check, refer to BR-62.
- Yes ↓

B

CHECK WARNING LAMP ACTIVATE.
Ensure warning lamp remains off while driving.
- NG → Carry out self-diagnosis. Refer to BR-68, 72.
- OK ↓

CHECK WHEEL SENSOR.
1. Check wheel sensor connector for terminal damage or loose connection.
2. Perform wheel sensor mechanical check.
   Refer to Diagnostic Procedure 1, BR-78.

- NG → Repair.
- OK ↓

CHECK HARNESS CONNECTOR.
Check ABS actuator and electric unit pin terminals for damage or the connection of ABS actuator and electric unit harness connector.
Reconnect ABS actuator and electric unit harness connector. Then retest.

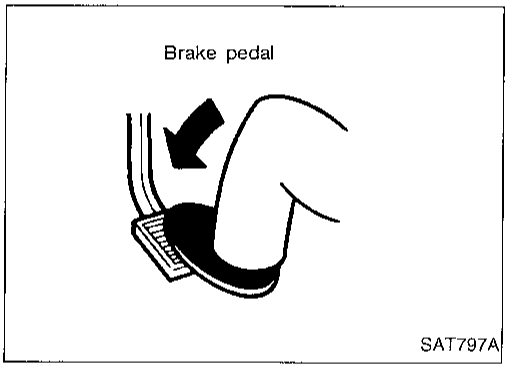
Diagnostic Procedure 9 (Long stopping distance)

CHECK ABS PERFORMANCE.
Disconnect ABS actuator and electric unit connector and check whether stopping distance is still long.
- No → Go to B in Diagnostic Procedure 8, BR-88.
- Yes ↓

Perform Preliminary Check and air bleeding.

Note: Stopping distance may be larger than vehicles without ABS when road condition is slippery.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Diagnostic Procedure 10 (ABS does not work.)

CHECK WARNING LAMP ACTIVATE.
Does the ABS warning lamp activate?

Yes → Carry out self-diagnosis. Refer to BR-68, 72.

No → Go to B in Diagnostic Procedure 8, BR-88.

Note: ABS does not work when vehicle speed is under 10 km/h (6 MPH).

Diagnostic Procedure 11 (Pedal vibration and noise)

INSPECTION START
1. Apply brake.
2. Start engine.
3. Does the symptom appear only when engine is started?

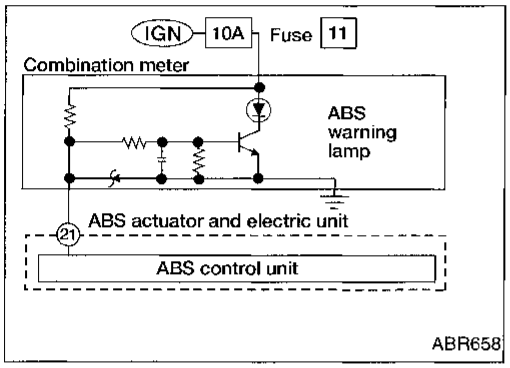
Yes → Carry out self-diagnosis. Refer to BR-68, 72.

No → CHECK IF SYMPTOM APPEARS.
Does the symptom appear when electrical equipment switches (such as headlamp) are operated?

No → Go to B in Diagnostic Procedure 8, BR-88.

Yes → CHECK WHEEL SENSOR.
Check wheel sensor shield ground. For location of shield ground, refer to wiring diagram and "HARNESS LAYOUT" in EL section.

NG → Repair wheel sensor.



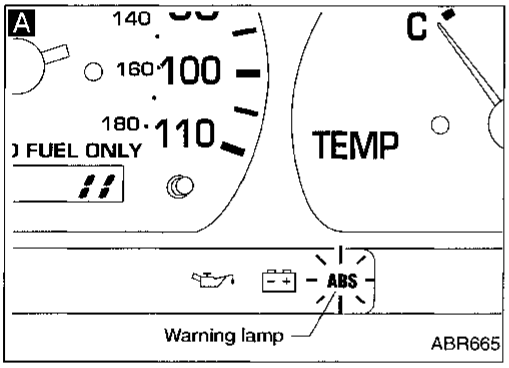
OK → CHECK HARNESS CONNECTOR.
Check ABS actuator and electric unit pin terminals for damage or the connection of ABS actuator and electric unit harness connector.
Reconnect ABS actuator and electric unit harness connector. Then retest.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostic Procedure 11 (Pedal vibration and noise) (Cont'd)

Note: ABS may operate and cause vibration under any of the following conditions.

- **Applying brake gradually when shifting or operating clutch.**
- **Low friction (slippery) road.**
- **High speed cornering.**
- **Driving over bumps and pot holes.**
- **Engine speed is over 5,000 rpm with vehicle stopped.**



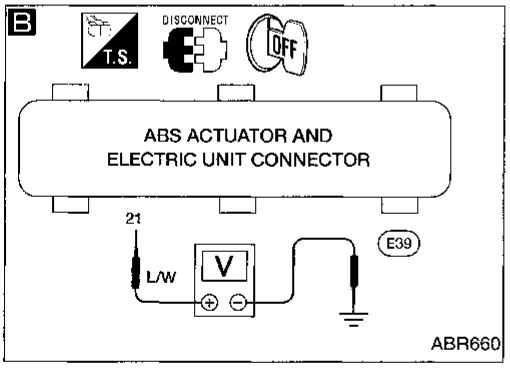
Diagnostic Procedure 12 (Warning lamp does not come on when ignition switch is turned ON.)

CHECK FUSE.
Check 10A fuse [11]. For fuse layout, refer to POWER SUPPLY ROUTING in EL section.

NG → Replace fuse.

OK ↓

A



CHECK WARNING LAMP ACTIVATE.
Disconnect ABS actuator and electric unit connector.
Does the warning lamp activate?

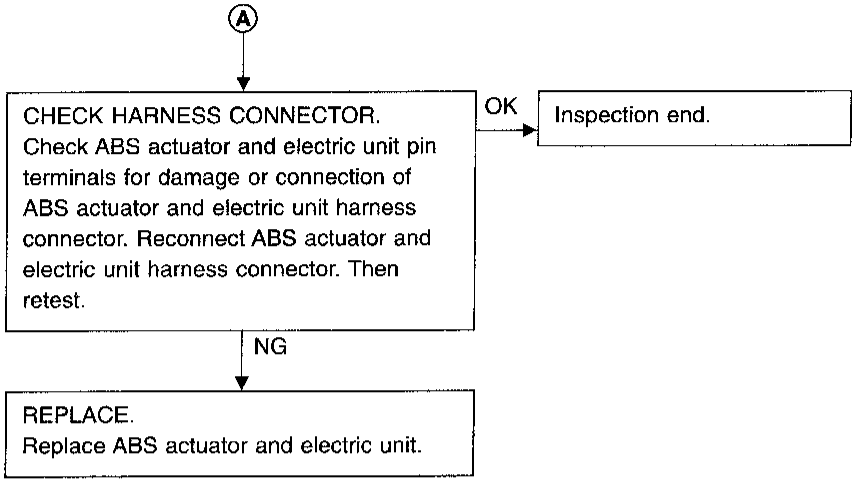
Yes → (A) (Go to next page.)

No ↓

B

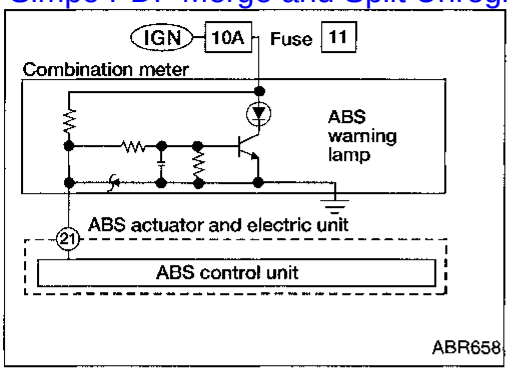
CHECK HARNESS FOR SHORT.
1. Disconnect ABS actuator and electric unit connector.
2. Check voltage between ABS actuator and electric unit connector (E39) (body side) terminal (21) and ground.

Battery voltage should not exist.

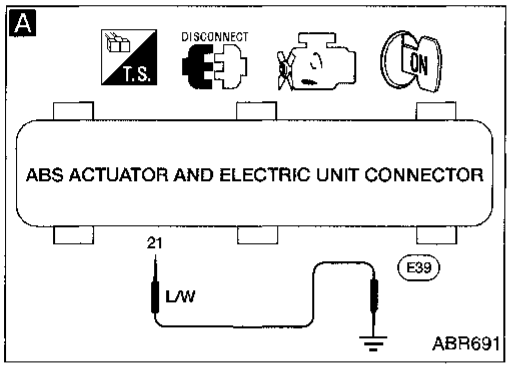


NG → Repair harness or connector.

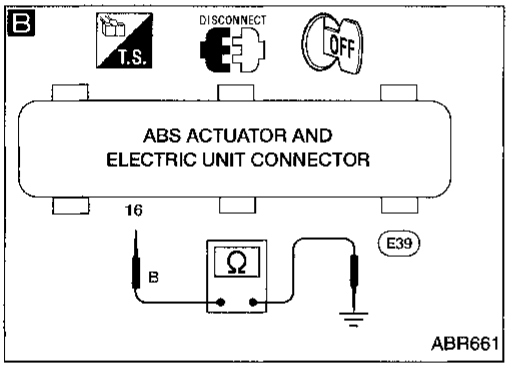
OK ↓



CHECK COMBINATION METER.
Check combination meter. Refer to WARNING LAMPS in EL section.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Diagnostic Procedure 12 (Warning lamp does not come on when ignition switch is turned ON.) (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostic Procedure 13 (Warning lamp stays on when ignition switch is turned ON.)

A

CHECK WARNING LAMP.
1. Disconnect ABS actuator and electric unit connector.
2. Connect suitable wire between ABS actuator and electric unit connector E39 (body side) terminal 21 and ground.

Warning lamp should not activate.

NG → Repair combination meter. Check the following.
- Harness connector E39
- Harness for open or short between ABS actuator and electric unit and fuse

If NG, repair harness or connector.

OK ↓

CHECK HARNESS CONNECTOR.
Check ABS actuator and electric unit pin terminals for damage or the connection of ABS actuator and electric unit harness connector. Reconnect ABS actuator and electric unit harness connector. Then retest.

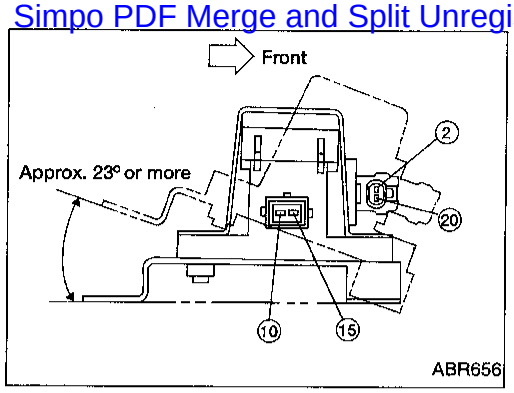
OK → Inspection end.

NG ↓

B

CHECK ABS MOTOR GROUND.
1. Turn ignition switch OFF.
2. Disconnect ABS actuator and electric unit connector.
3. Check continuity between ABS actuator and electric unit connector E39 (body side) terminal 16 and ground.

Continuity should exist.



NG → Check the following.
- Harness connector E39
- Harness for open or short between ABS actuator and electric unit and ground

If NG, repair harness or connector.

OK ↓

REPLACE.
Replace ABS actuator and electric unit.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Electrical Components Inspection

G sensor

CAUTION:
The G sensor is easily damaged if it sustains an impact. Be careful not to drop or bump it.

1. Measure resistance between terminals ⑩ and ⑮ of G sensor unit connector.

G sensor condition	Resistance between terminals ⑩ and ⑮	G sensor switch condition
Installed in vehicle	1.4 - 1.6 kΩ	"ON"
Tilted as shown in figure	4.7 - 5.5 kΩ	"OFF"

2. Measure resistance between terminals ② and ⑳ of the G sensor unit connector.

Resistance:	70 - 124 Ω

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

General Specifications

Applied model		2WD	4WD	
			Standard wheelbase	Long wheelbase
Front brake				
Brake model		CL28VD		
Cylinder bore diameter x number of pistons	mm (in)	42.8 (1.685) x 2		
Pad length x width x thickness	mm (in)	146.6 x 48.5 x 10 (5.77 x 1.909 x 0.39)		
Rotor outer diameter x thickness	mm (in)	250 x 22 (9.84 x 0.87)	277 x 26 (10.9 x 1.02)

Service Notice

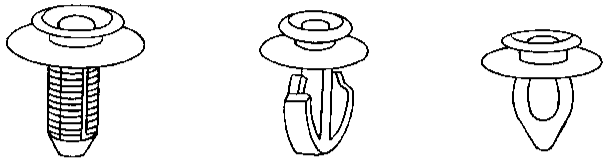
- When removing or installing various parts, place a cloth or padding onto the vehicle body to prevent scratches.
- Handle trim, molding, instruments, grille, etc. carefully during removing or installing. Be careful not to soil or damage them.
- Apply sealing compound where necessary when installing parts.
- When applying sealing compound, be careful that the sealing compound does not protrude from parts.
- When replacing any metal parts (for example body outer panel, members, etc.), be sure to take rust prevention measures.

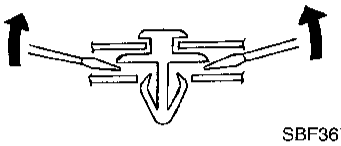
Supplemental Restraint System (SRS) "AIR BAG"

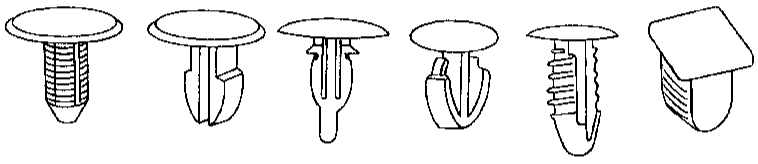
The Supplemental Restraint System "AIR BAG", used along with a seat belt, helps to reduce the risk or severity of injury to the driver and front passenger in a frontal collision. The Supplemental Restraint System consists of air bag modules (located in the center of the steering wheel and in the instrument panel on the passenger side), a diagnosis sensor unit, a crash zone sensor (4WD models), warning lamp, wiring harness and spiral cable.

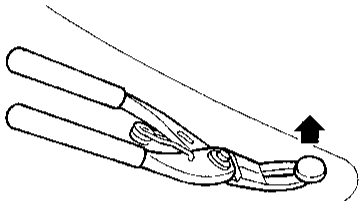
The vehicle is equipped with a passenger air bag deactivation switch. Because no rear seat exists where a rear-facing child restraint can be placed, the switch is designed to turn off the passenger air bag so that a rear-facing child restraint can be used in the front passenger seat. The switch is located in the center of the instrument panel, near the ashtray. When the switch is turned to the ON position, the passenger air bag is enabled and could inflate in a frontal collision. When the switch is turned to the OFF position, the passenger air bag is disabled and will not inflate in a frontal collision. A passenger air bag OFF indicator on the instrument panel lights up when the passenger air bag is switched OFF. The driver air bag always remains enabled and is not affected by the passenger air bag deactivation switch.

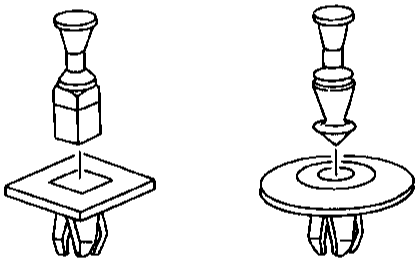
Information necessary to service the system safely is included in the **RS section** of this Service Manual.

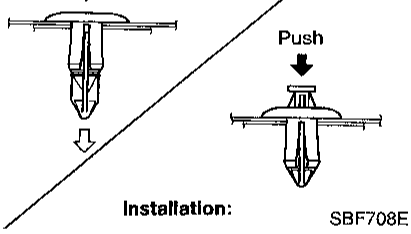


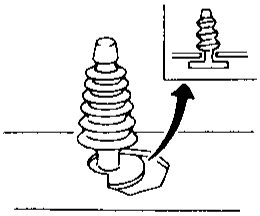


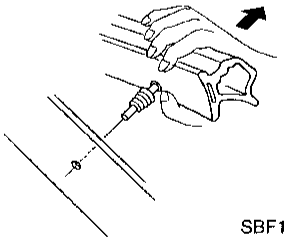












WARNING:

- **To avoid rendering the SRS inoperative, which could increase the risk of personal injury or death in the event of a collision which would result in air bag inflation, all maintenance should be performed by an authorized NISSAN dealer.**
- **Improper maintenance, including incorrect removal and installation of the SRS, can lead to personal injury caused by unintentional activation of the system.**
- **Do not use electrical test equipment on any circuit related to the SRS unless instructed to in this Service Manual. SRS wiring harnesses are covered with yellow insulation either just before the harness connectors or on the complete harness, for easy identification.**
- **The vehicle is equipped with a passenger air bag deactivation switch which can be operated by the customer. When the passenger air bag is switched OFF, the passenger air bag is disabled and will not inflate in a frontal collision. When the passenger air bag is switched ON, the passenger air bag is enabled and could inflate in a frontal collision. After SRS maintenance or repair, make sure the passenger air bag deactivation switch is in the same position (ON or OFF) as when the vehicle arrived for service.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

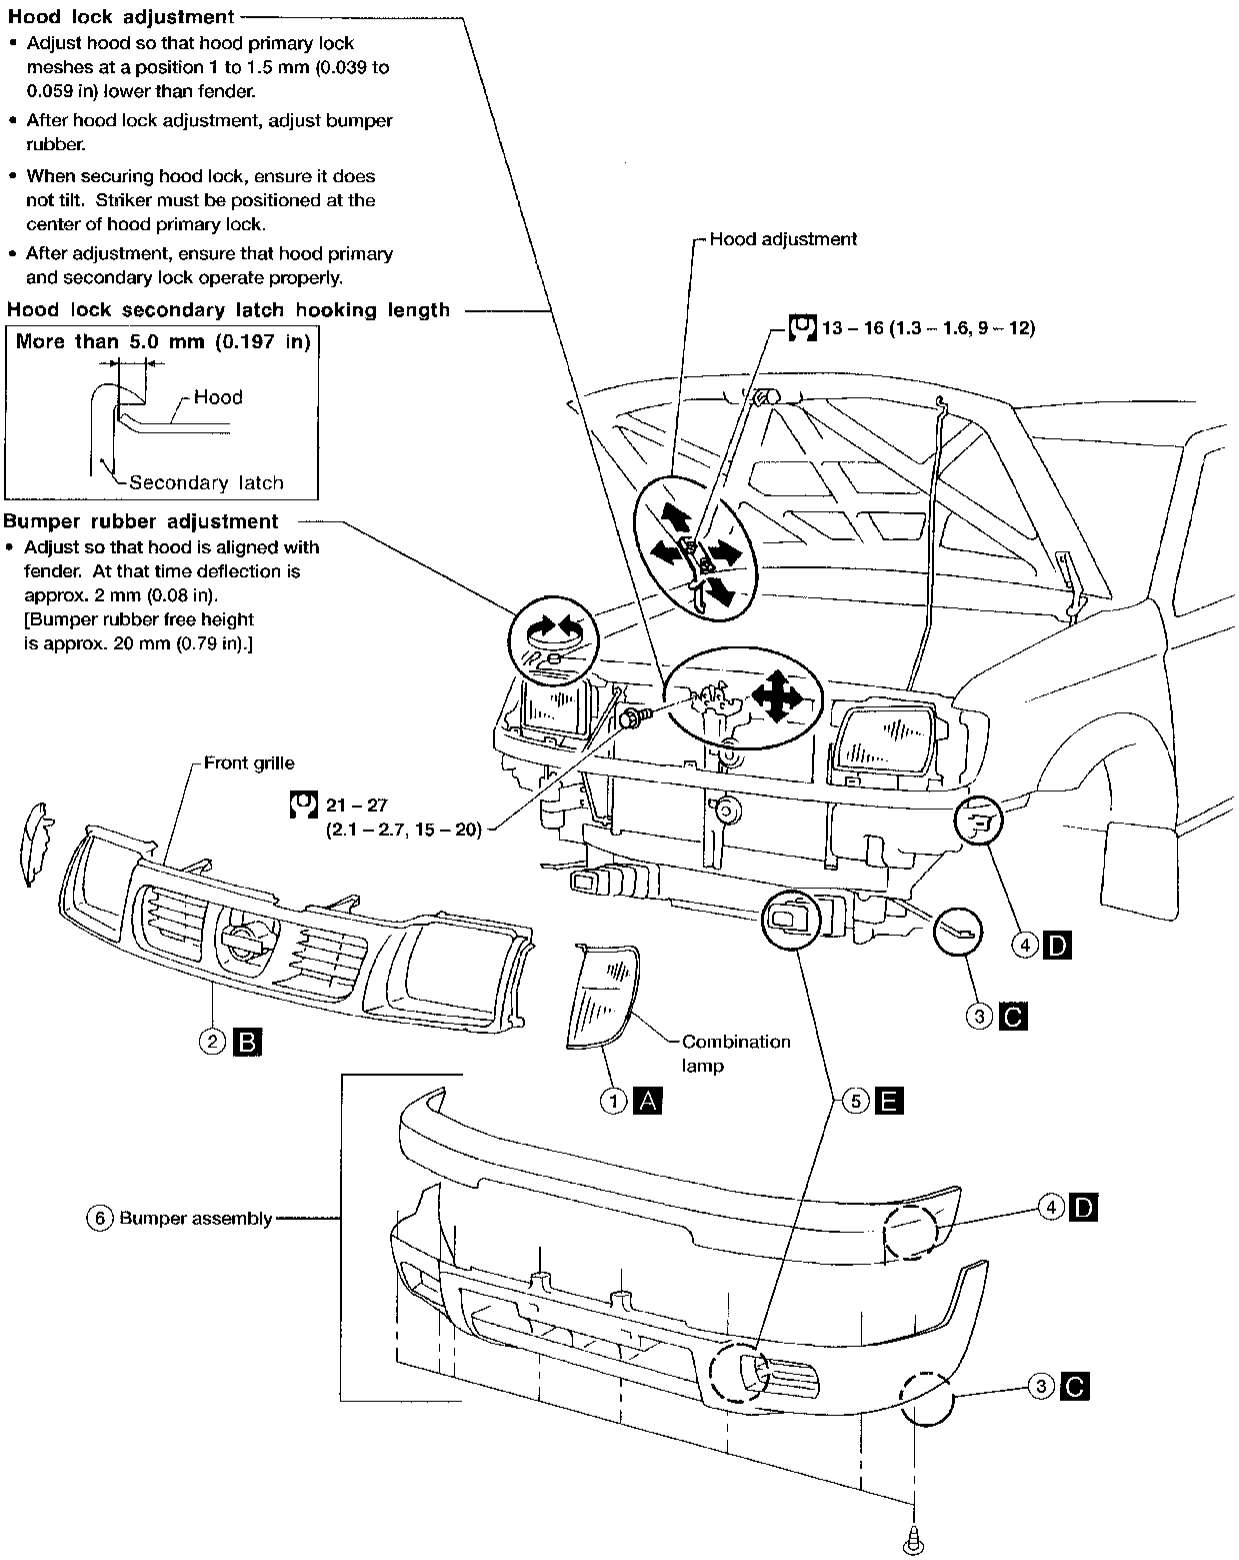
Body Front End

- When removing or installing hood, place a cloth or other padding on hood. This prevents vehicle body from being scratched.
- Bumper fascia is made of plastic. Do not use excessive force and be sure to keep oil away from it.
- Hood adjustment: Adjust at hinge portion.
- Hood lock adjustment: After adjusting, check hood lock control operation. Apply a coat of grease to hood locks engaging mechanism.
- Hood opener: Do not attempt to bend cable forcibly. Doing so increases effort required to unlock hood.



REMOVAL — Front bumper assembly

① Remove screws securing left and right combination lamps and remove the lamps. A
② Remove clips securing front grille and remove the front grille. B
③ Remove bolts securing left and right bumper stays. C
④ Remove bolts securing left and right bumper side brackets. D
⑤ Remove bolts securing left and right bumper side stays. E
⑥ Remove bumper assembly.
Separate bumper assembly.

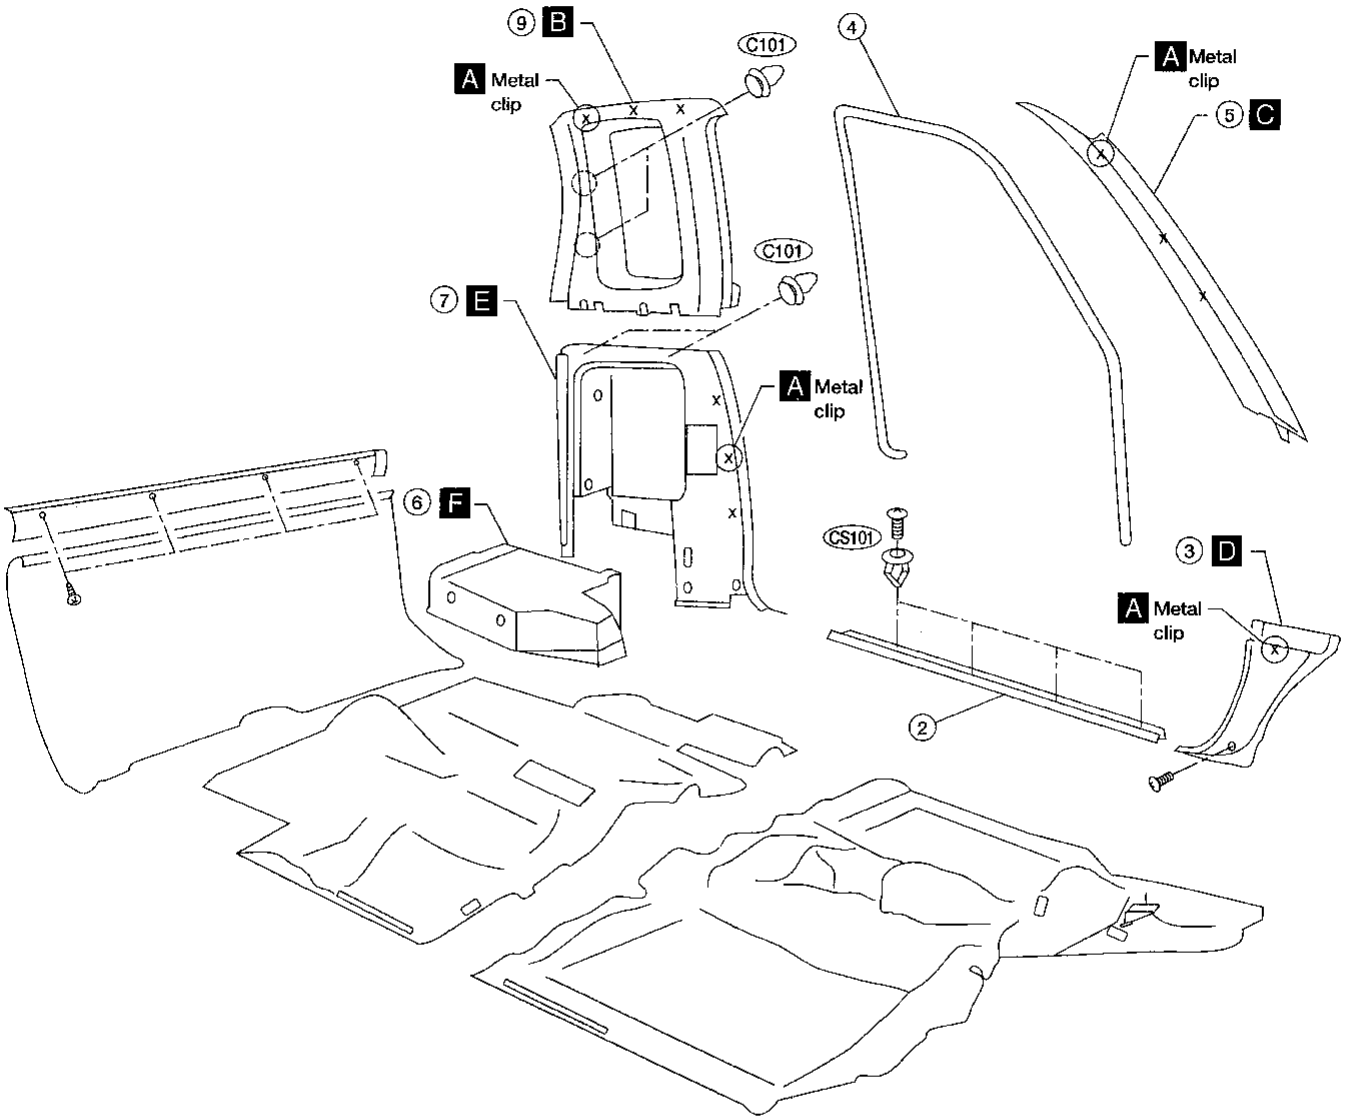
Side and Floor Trim

CAUTION:
Wrap the tip of flat-bladed screwdriver with a cloth when removing metal clips from garnishes.

REMOVAL — Body side trim

King cab model



① Remove front and jump seats. Refer to "SEAT" for details, BT-26, 29.
② Remove kicking plates.
③ Remove dash side lower finishers.
④ Remove body side welts.
⑤ Remove front pillar garnishes.
⑥ Remove jack cover.
⑦ Remove lower rear pillar garnishes.
⑧ Remove seat belt upper guide loop. Refer to "SEAT BELTS" in RS section.
⑨ Remove upper rear pillar garnishes.

Standard cab model

① Remove front seats. Refer to "SEAT" for details, BT-26.
② Remove kicking plates.
③ Remove dash side lower finishers.
④ Remove body side welts.
⑤ Remove front pillar garnishes.
⑥ Remove seat belt upper guide loop. Refer to "SEAT BELT" in RS section.
⑦ Remove upper rear garnishes.

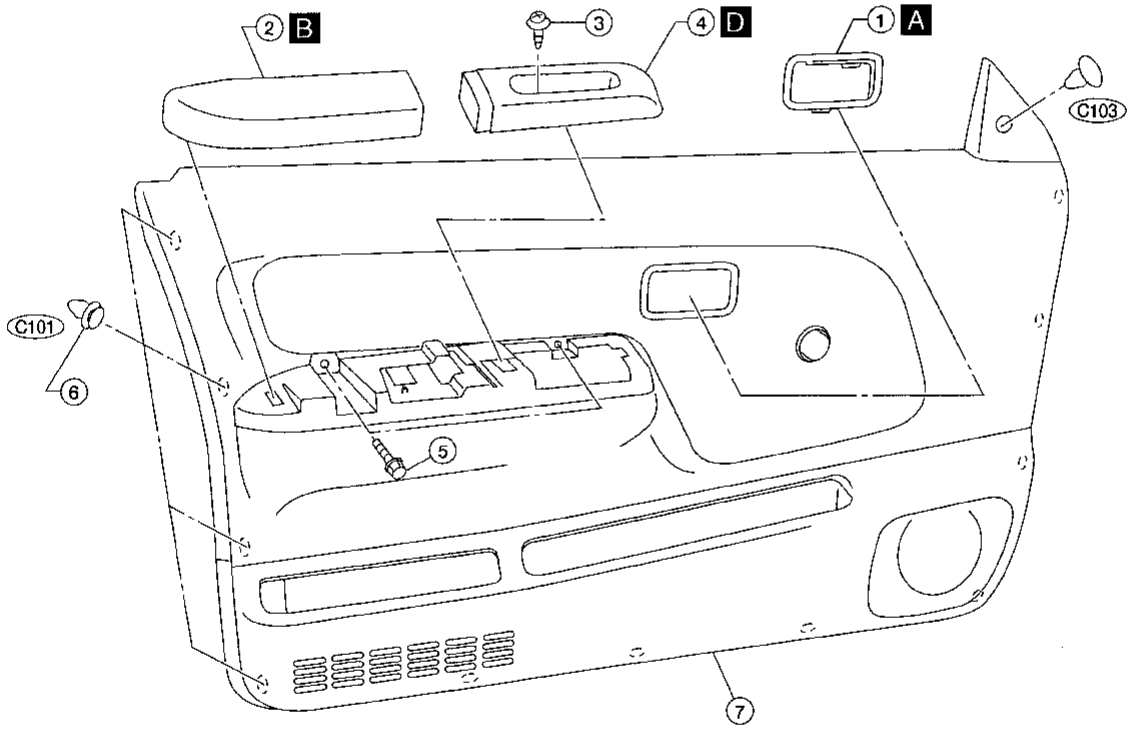
Door Trim

REMOVAL

Door trim (Formed type)

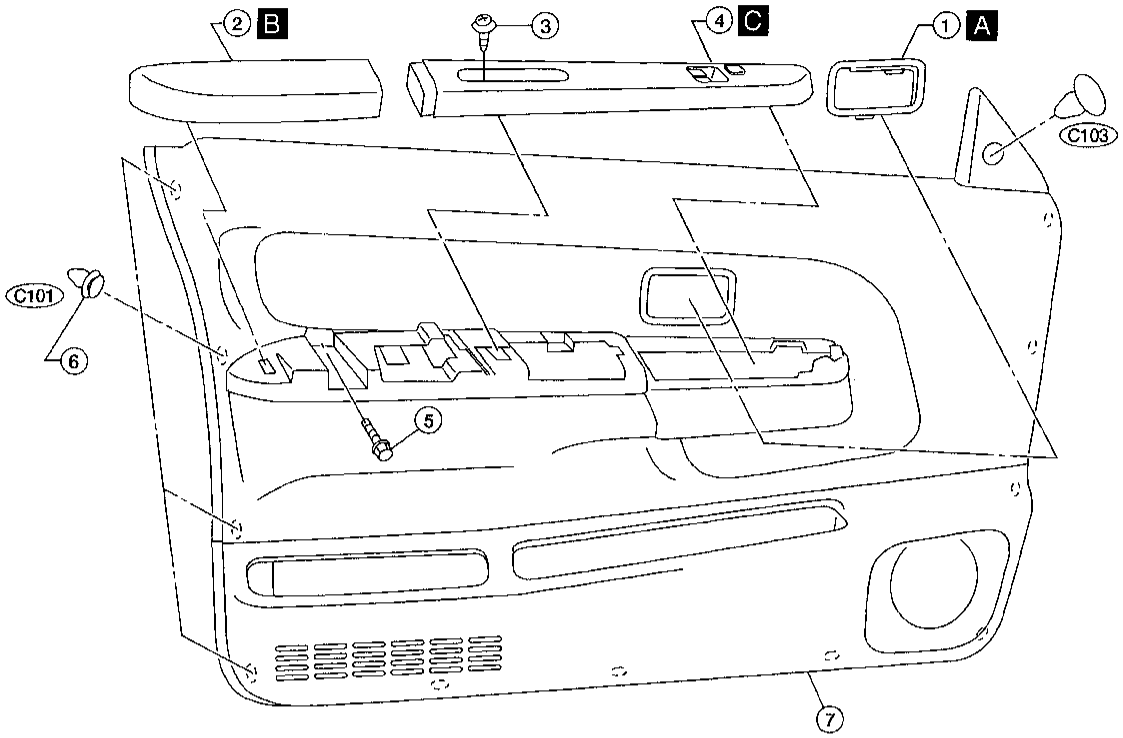


Remove manual window regulator handle, if equipped.

① Remove inside handle escutcheon. A
② Remove door armrest. B
③ Remove screw securing door pull handle.
④ Remove power window switch, then disconnect the connector. C D
⑤ Remove two screws.
⑥ Remove clips securing door finisher.
⑦ Lift out door finisher.

Door trim (Flat type)

① Remove inside handle escutcheon. A
② Remove window regulator handle.
③ Remove screws securing door armrest and remove armrest.
④ Lift out door finisher.



Formed type (without power windows)

REMOVAL

After removing moldings, remove glass using piano wire or power cutting tool and an inflatable pump bag.

WARNING:

When cutting the glass from the vehicle, always wear safety glasses and heavy gloves to help prevent glass splinters from entering your eyes or cutting your hands.

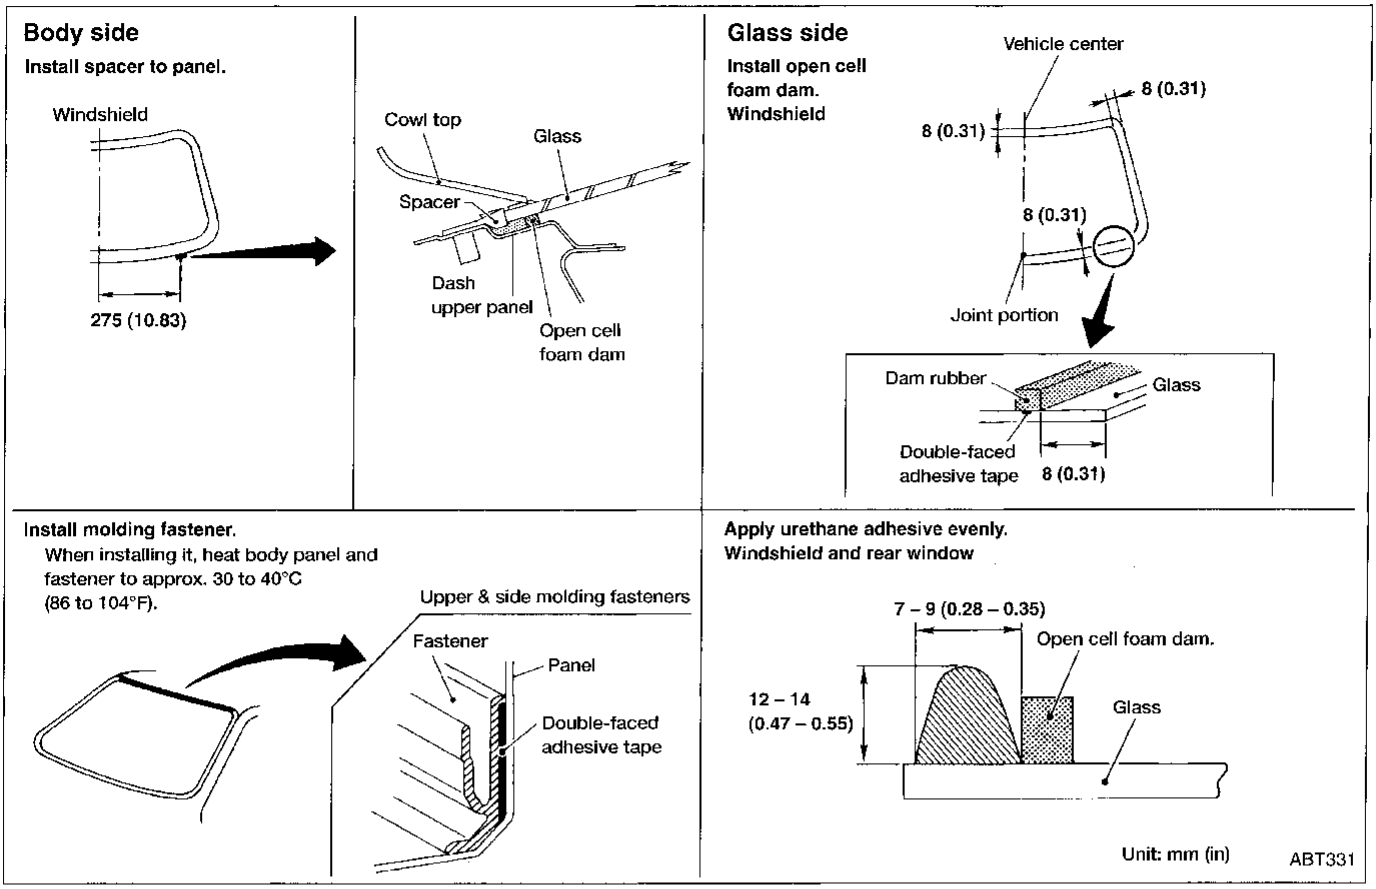
CAUTION:

- **Be careful not to scratch the glass when removing.**
- **Do not set or stand the glass on its edge. Small chips may develop into cracks.**

INSTALLATION

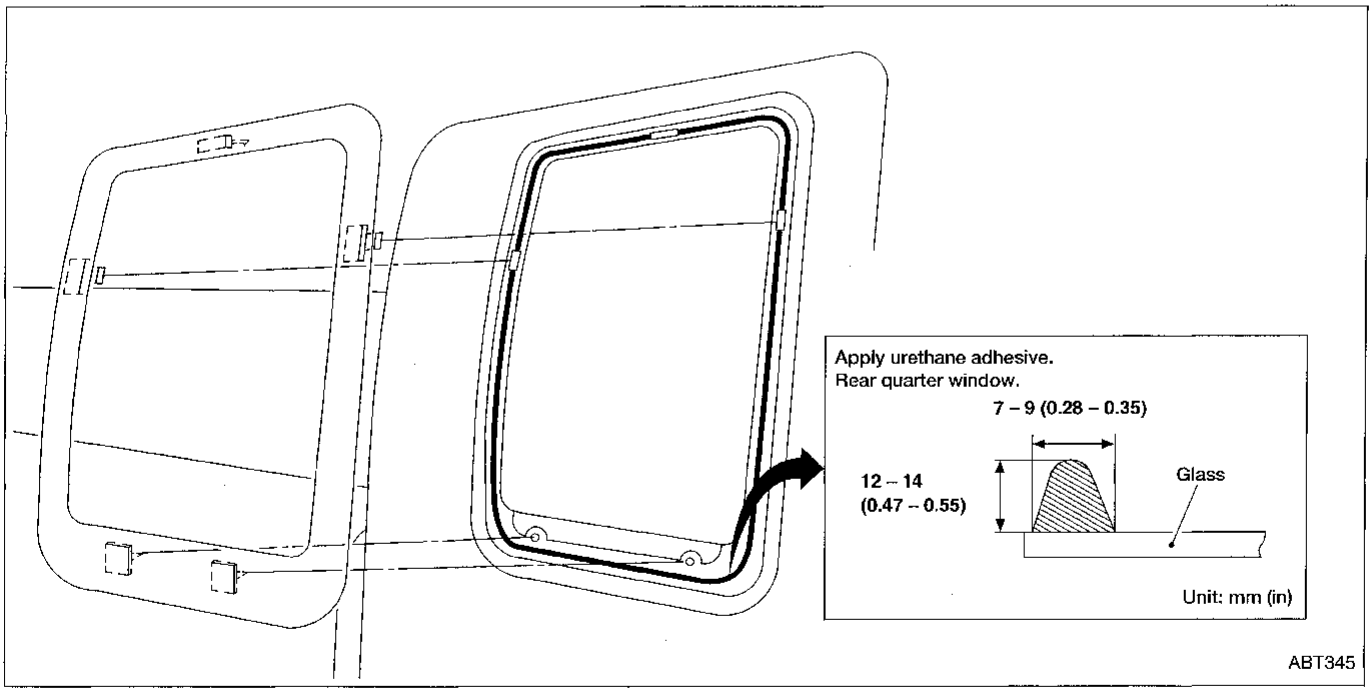
- **Use genuine Nissan Urethane Adhesive Kit or equivalent and follow the instructions furnished with it.**
- **While the urethane adhesive is curing, open a door window. This will prevent the glass from being forced out by passenger compartment air pressure when a door is closed.**
- **The molding must be installed securely so that it is in position and leaves no gap.**
- **Inform the customer that the vehicle should remain stationary until the urethane adhesive has completely cured (preferably 24 hours). Curing time varies with temperature and humidity.**

WARNING:



- **Keep heat and open flames away as primers and adhesive are flammable.**
- **The materials contained in the kit are harmful if swallowed, and may irritate skin and eyes. Avoid contact with the skin and eyes.**
- **Use in an open, well ventilated location. Avoid breathing the vapors. They can be harmful if inhaled. If affected by vapor inhalation, immediately move to an area with fresh air.**
- **Driving the vehicle before the urethane adhesive has completely cured may affect the performance of the windshield in case of an accident.**

CAUTION:

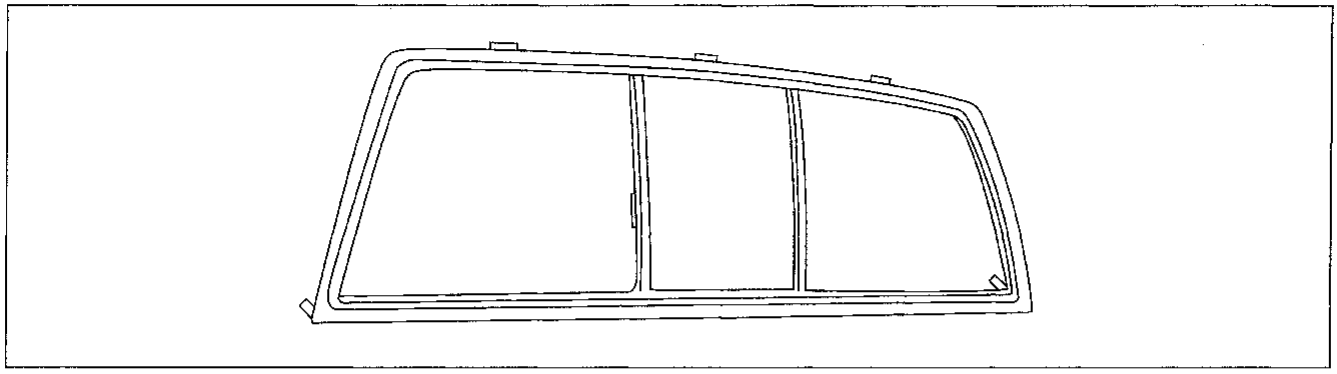


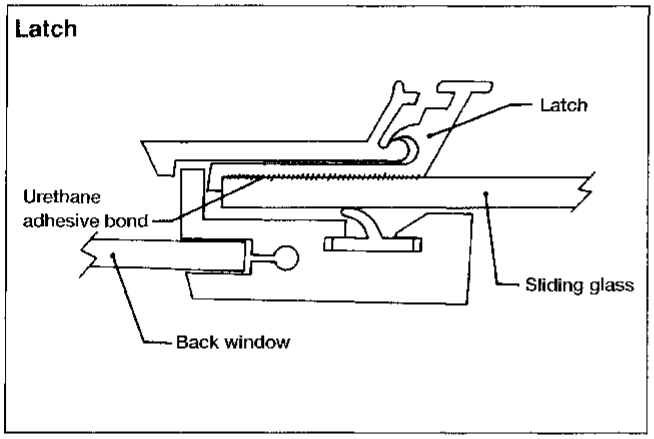
- **Do not use an adhesive which is past its usable term. Shelf life of this product is limited to six months after the date of manufacture. Carefully adhere to the expiration or manufacture date printed on the box.**
- **Keep primers and adhesive in a cool, dry place. Ideally, they should be stored in a refrigerator.**
- **Do not leave primers or adhesive cartridge unattended with their caps open or off.**
- **The vehicle should not be driven for at least 24 hours or until the urethane adhesive has completely cured. Curing time varies depending on temperature and humidities. The curing time will increase under higher temperatures and lower humidities.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

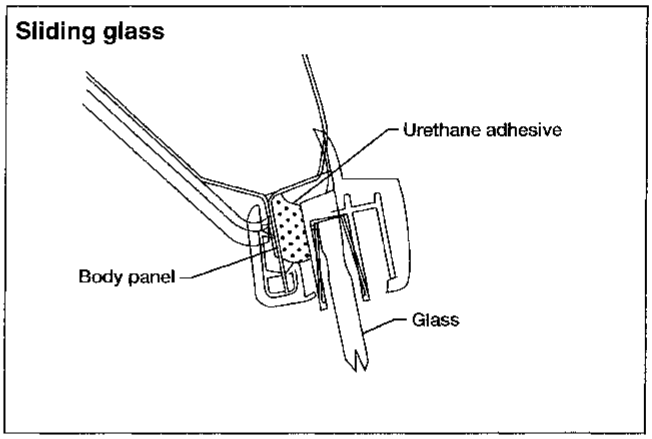
Windshield

Side Window

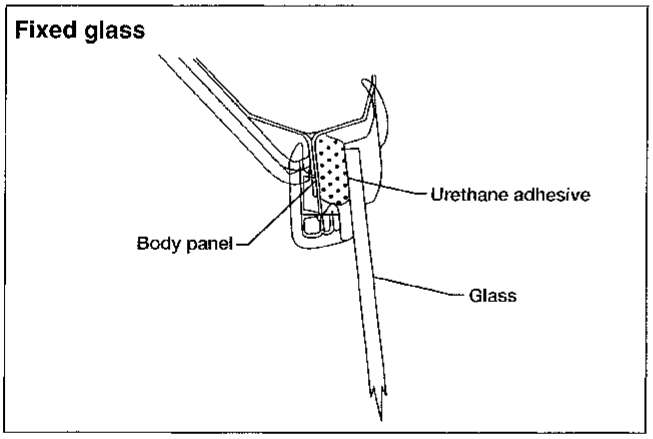




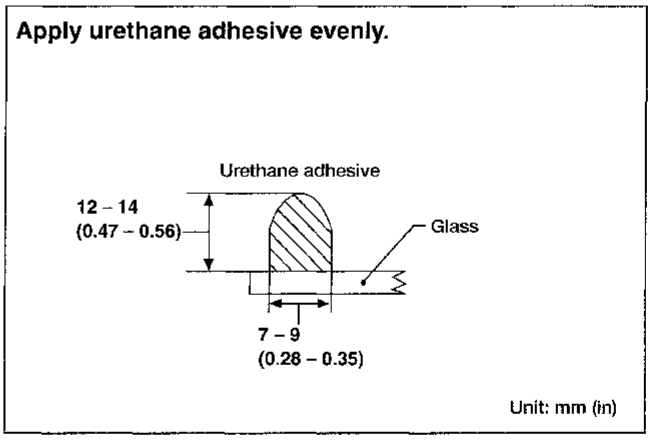
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Back Window



- Window glass is held in place by urethane adhesive.



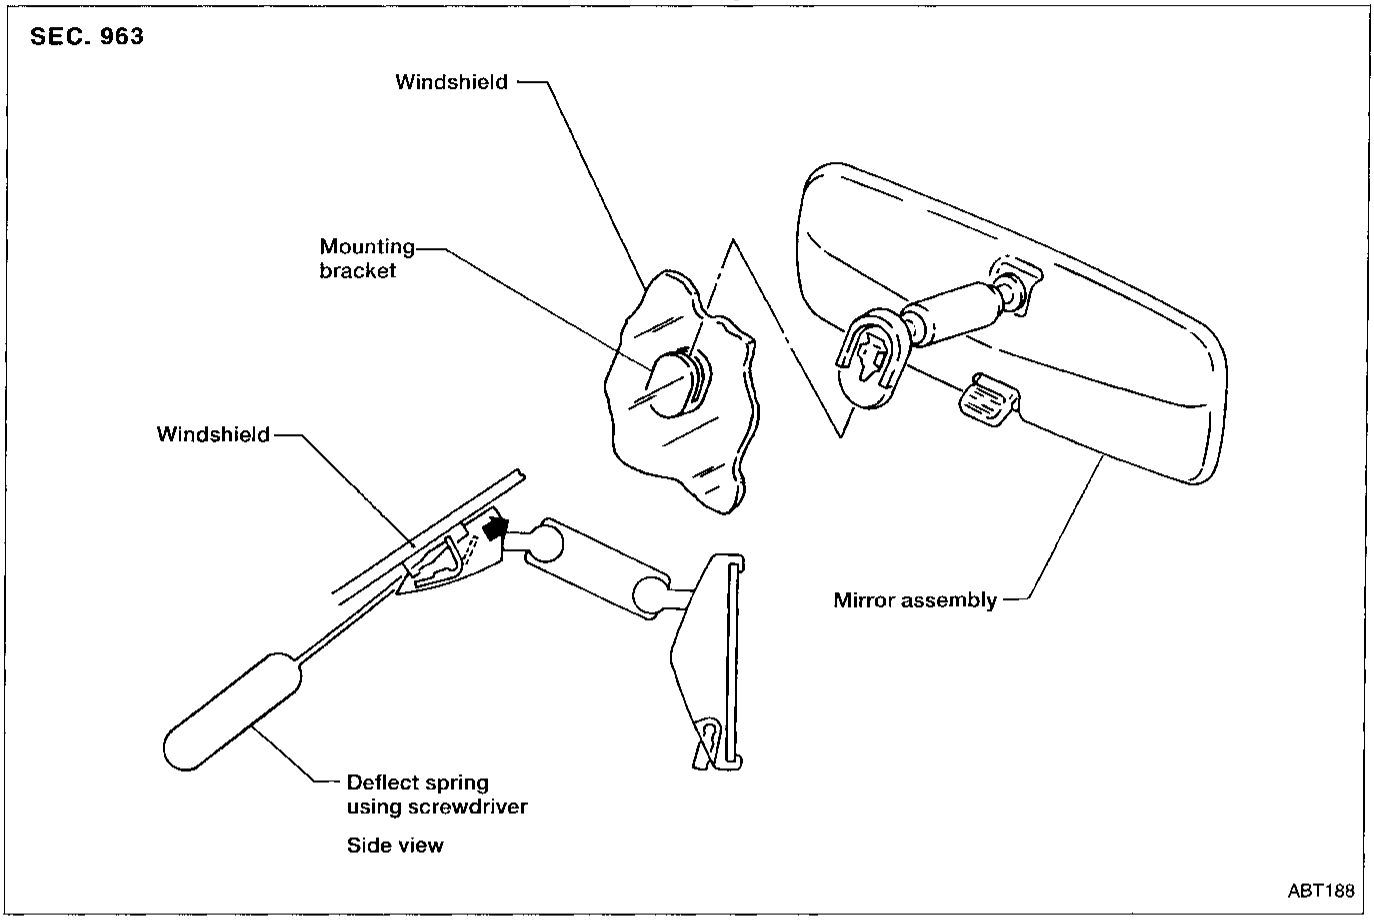
SEC. 797

ABT335

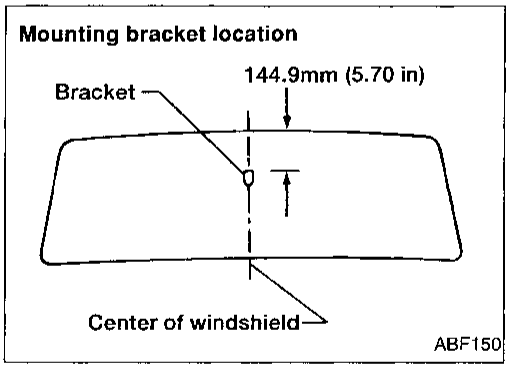
REPAIRING WATER LEAKS FOR WINDSHIELD, SIDE WINDOW AND BACK WINDOW

Leaks can be repaired without removing and reinstalling glass.

If water is leaking between urethane adhesive material and body or glass, determine the extent of leakage. This can be done by applying water to the windshield or side window area while pushing glass outward.



To stop the leak, apply primer (if necessary) and then urethane adhesive to the leak point.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Rearview Mirror

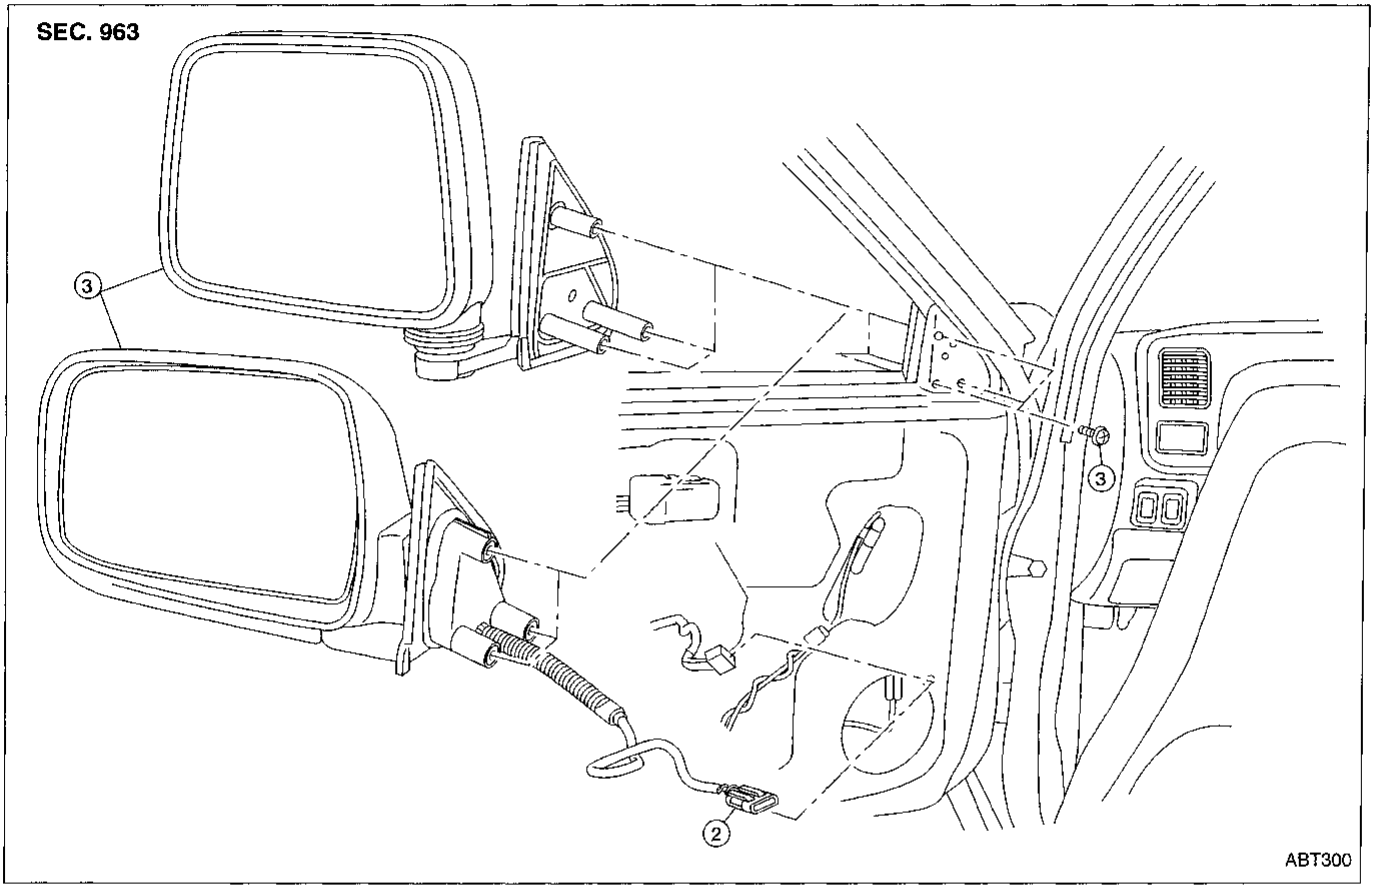
REMOVAL

Remove rearview mirror by deflecting spring with screwdriver as shown in the figure.

INSTALLATION

1. Install mounting bracket as follows:
   a. Determine mounting bracket position on windshield by measuring from top of windshield to top of mounting bracket as shown in the figure.
   b. Mark location on outside of windshield with wax pencil or equivalent.
   c. Clean attaching point on inside of windshield with an alcohol-saturated paper towel.
   d. Sand bonding surface of mounting bracket with sandpaper (No. 320 or No. 360).
   e. Clean bonding surface of mounting bracket with an alcohol-saturated paper towel.
   f. Apply Loctite Adhesive 11067-2 or equivalent to bonding surface of mounting bracket.
   g. Install mounting bracket at premarked position and press mounting bracket against glass for 30 to 60 seconds.
   h. After five minutes, wipe off excess adhesive with an alcohol-moistened paper towel.
2. Install rearview mirror.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



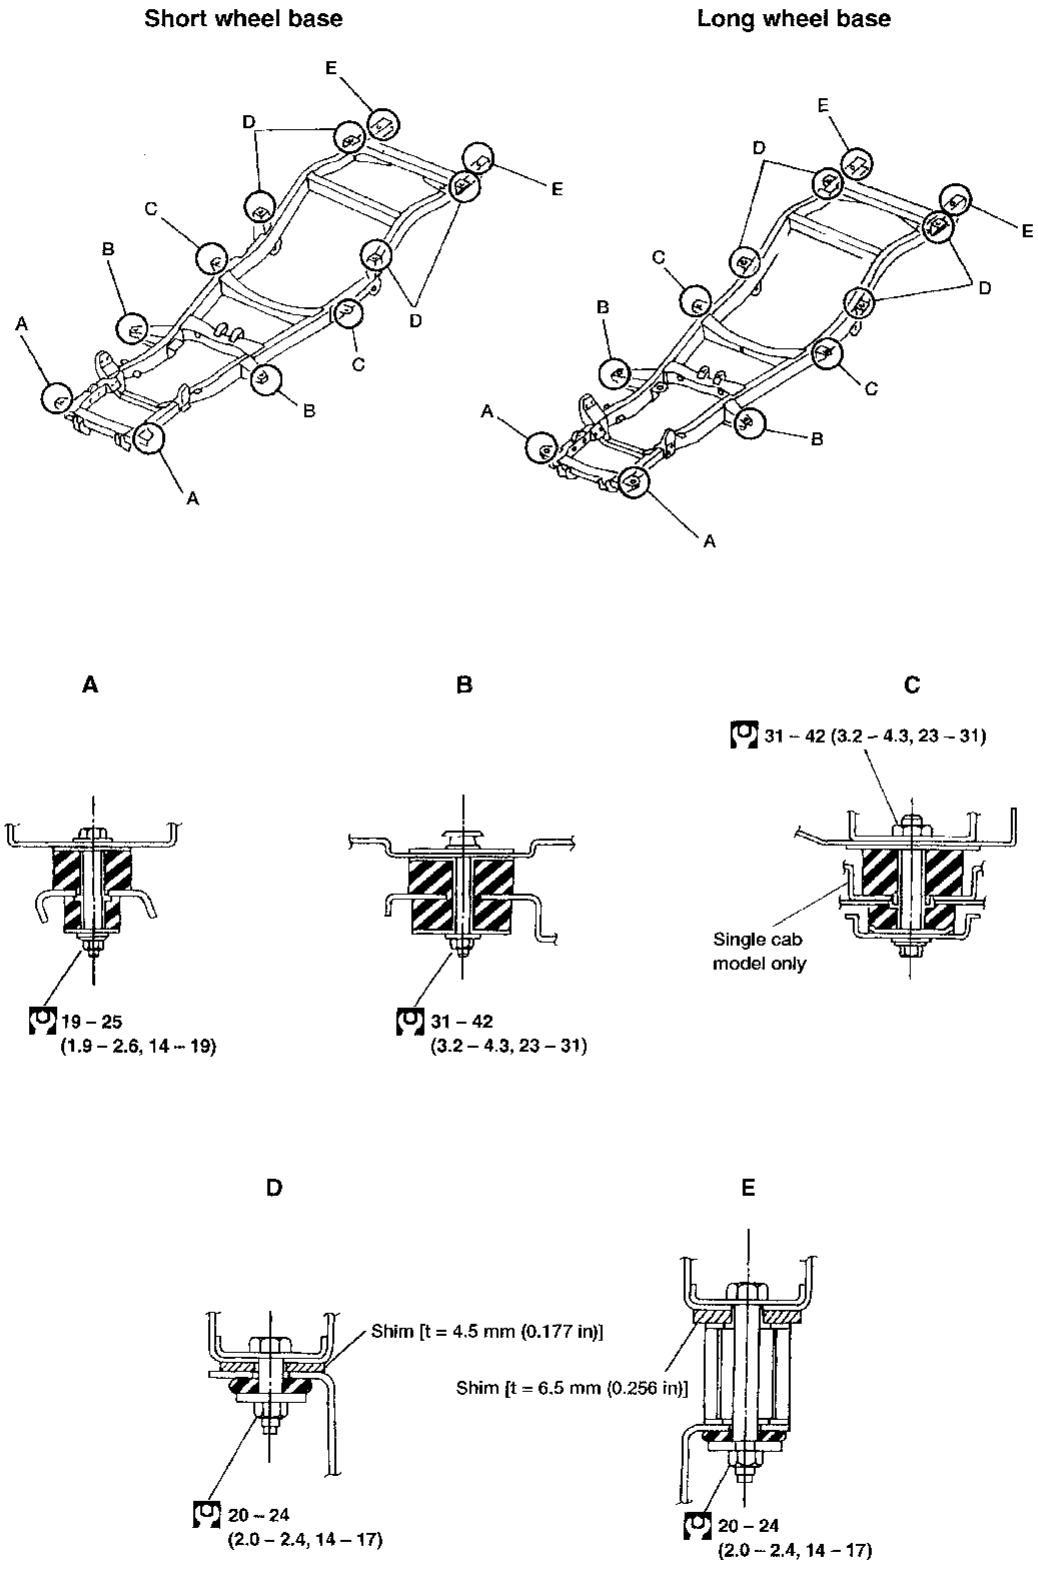
Door Mirror

CAUTION:
Be careful not to scratch door rearview mirror body.

★ **For Wiring Diagram, refer to "POWER DOOR MIRROR" in EL section.**

REMOVAL — Door mirror

① Remove door trim or inner cover from front corner of door. Refer to "Door Trim" for details, BT-17.
② Disconnect door mirror harness connector.
③ Remove bolts securing door mirror, then remove door mirror assembly.

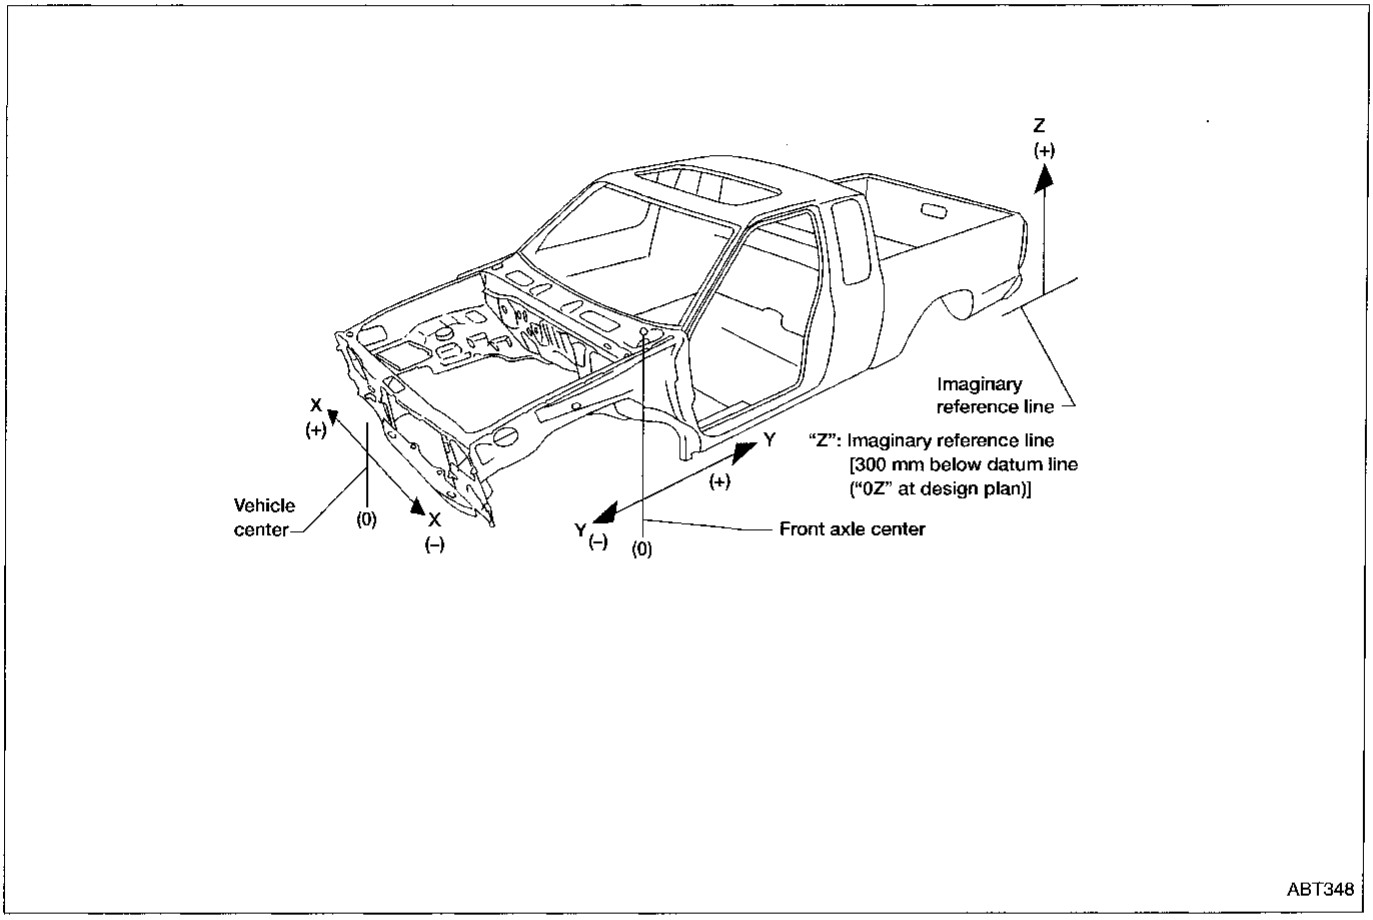


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Body Mounting

When removing, be sure to replace bolts and nuts (sealant applied bolts or self-lock nuts are used for all mounting).

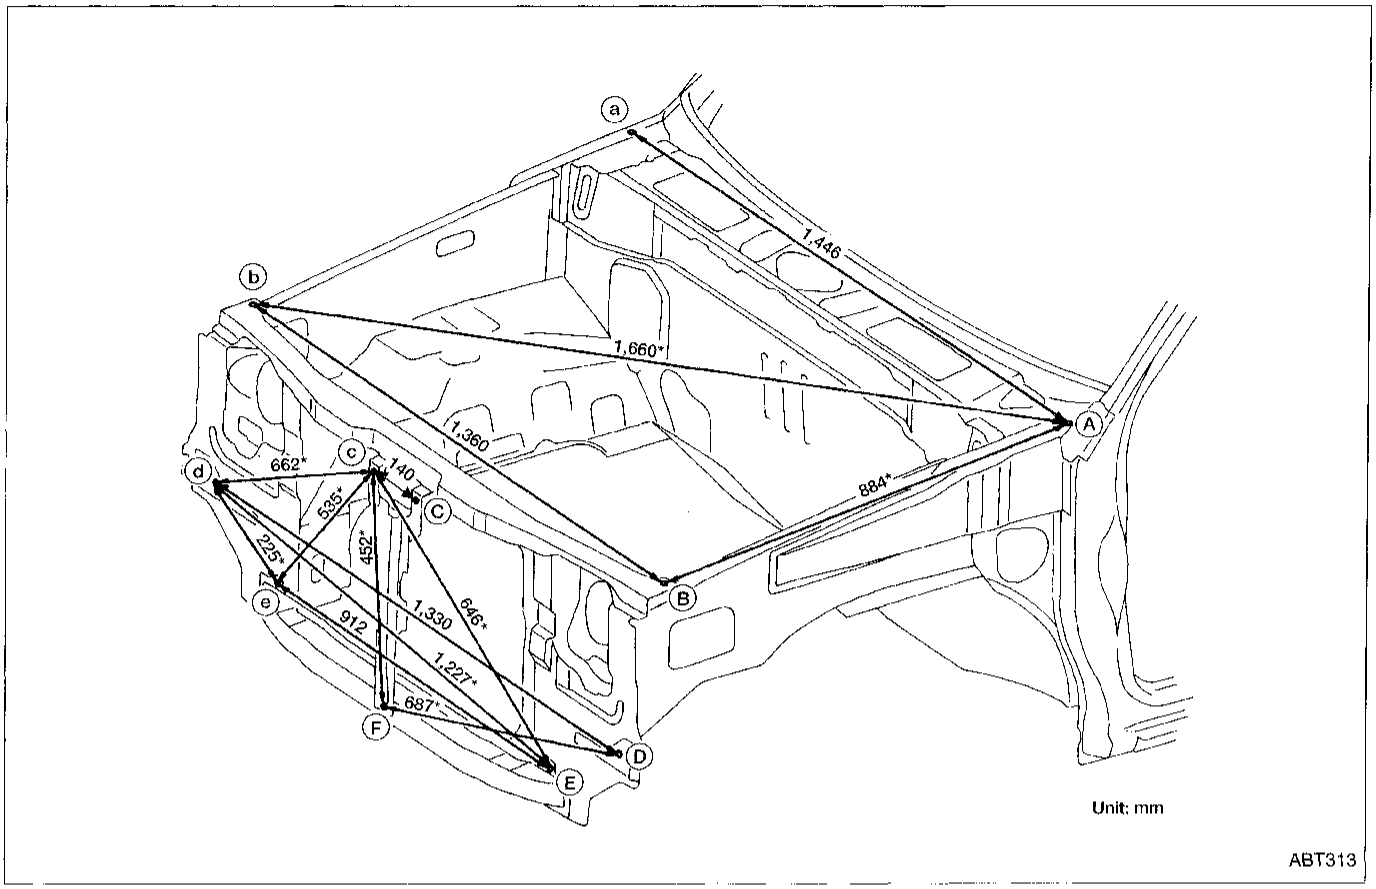
SEC. 930



: N·m (kg-m, ft-lb)

ABT312

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



- All dimensions indicated in the figures are actual.
- When using a tracking gauge, adjust both pointers to equal length, then check pointers and the gauge to make sure there is no free play.
- When a measuring tape is used, check to be sure there is no elongation, twisting or bending.
- Measurements should be taken at the center of the mounting holes.
- An asterisk (*) following the value at the measuring point indicates that the measuring point on the other side is symmetrically the same value.
- The coordinates of the measurement points are the distances measured from the standard line of "X", "Y" and "Z".

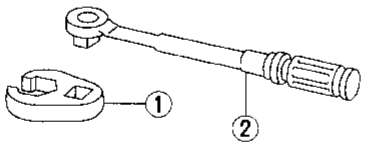
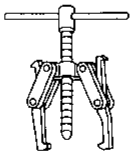
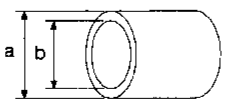
Precautions

- **Recommended fluid is brake fluid DOT 3.**
- **Never reuse drained brake fluid.**
- **Be careful not to splash brake fluid on painted areas.**
- **When removing and installing clutch piping, use a suitable tool.**
- **Use new brake fluid to clean or wash all parts of master cylinder, operating cylinder and clutch damper.**
- **Never use mineral oils such as gasoline or kerosene. They will ruin the rubber parts of the hydraulic system.**







WARNING:
After cleaning the clutch disc, wipe it with a dust collector. Do not use compressed air.

Special Service Tools

The actual shapes of Kent-Moore tools may differ from those of special service tools illustrated here.

Tool number (Kent-Moore No.) Tool name	Description

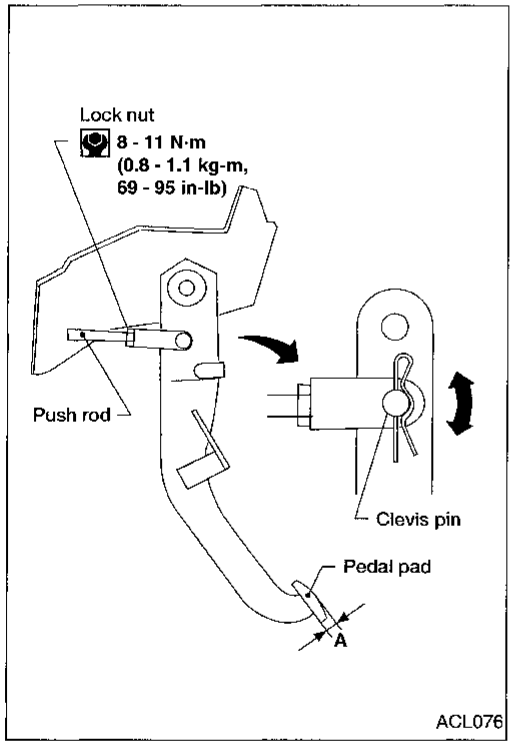
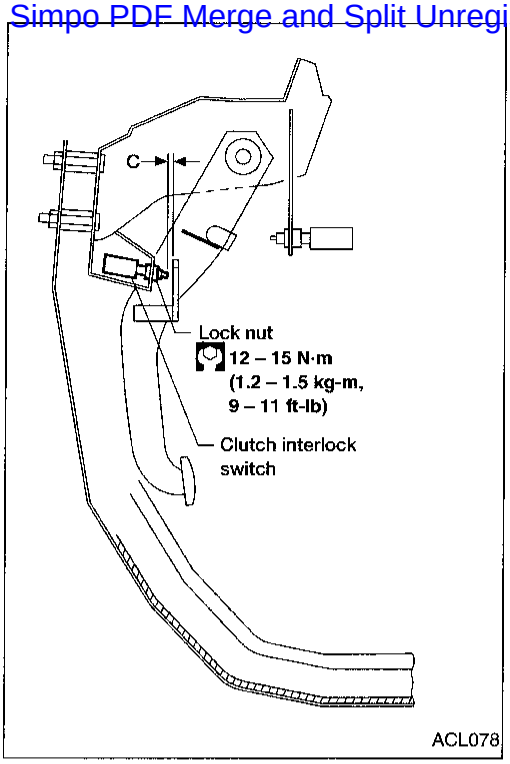
Clutch Pedal

SEC. 465

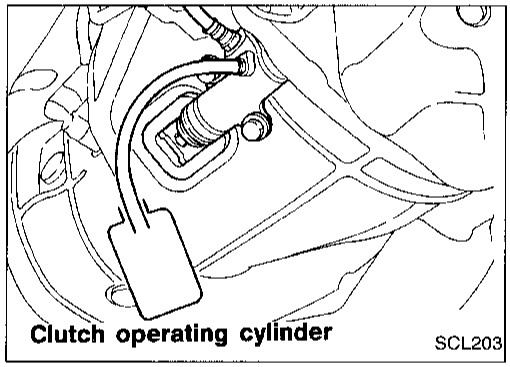


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Adjusting Clutch Pedal



1. Adjust pedal height with pedal stopper bolt or ASCD clutch switch.
   Pedal height "H":
   221 - 231 mm (8.70 - 9.09 in)

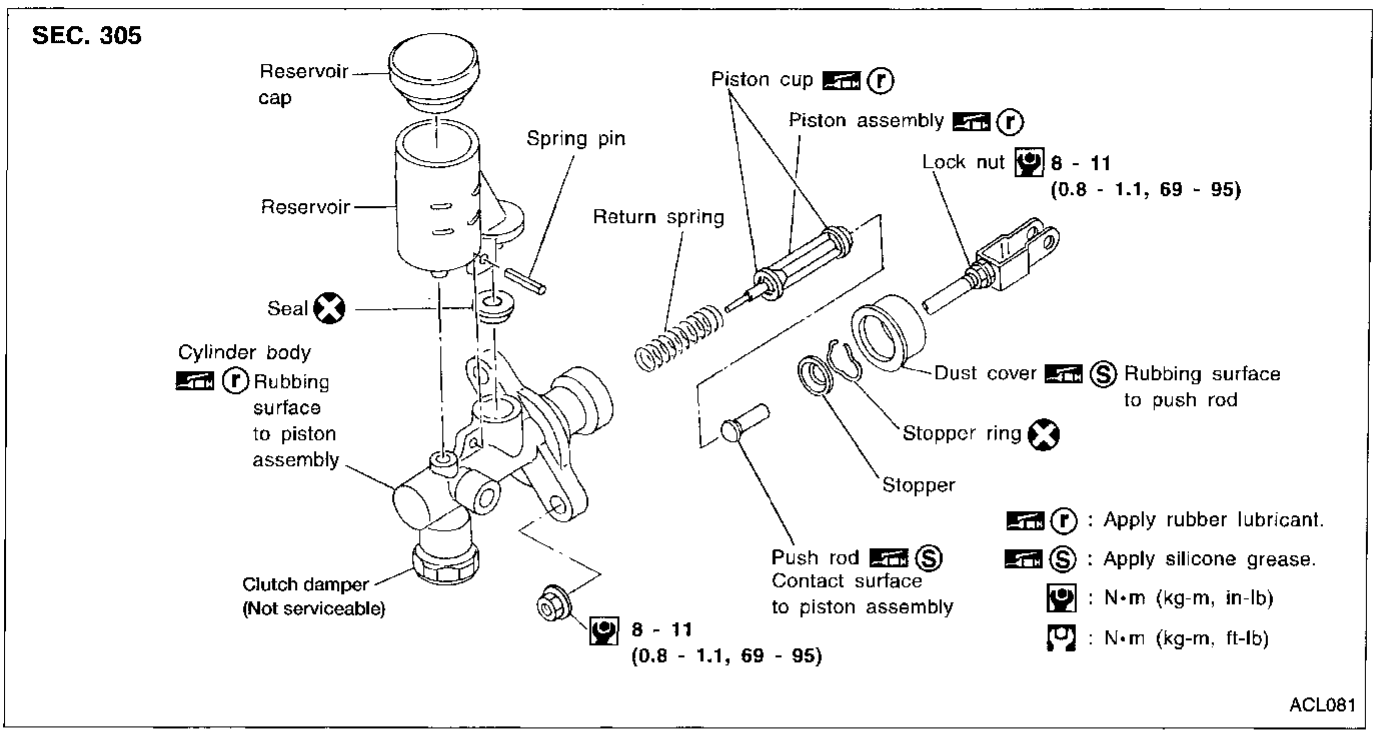


2. Adjust pedal free play by turning master cylinder push rod. Then tighten lock nut.
   Pedal free play "A":
   9 - 16 mm (0.35 - 0.63 in)
   Pedal free play, measured at pedal pad includes the following:
   - Free play due to clevis pin and clevis pin hole, push rod and master cylinder.
3. Make sure that clevis pin can rotate smoothly.
   If not, readjust pedal free play with master cylinder push rod.

Adjusting Clutch Pedal (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

4. Adjust clearance "C" shown in the figure while fully depressing clutch pedal.
   Clearance "C":
   0.1 - 1.0 mm (0.004 - 0.039 in)



Air Bleeding Procedure

Bleed air according to the following procedure.

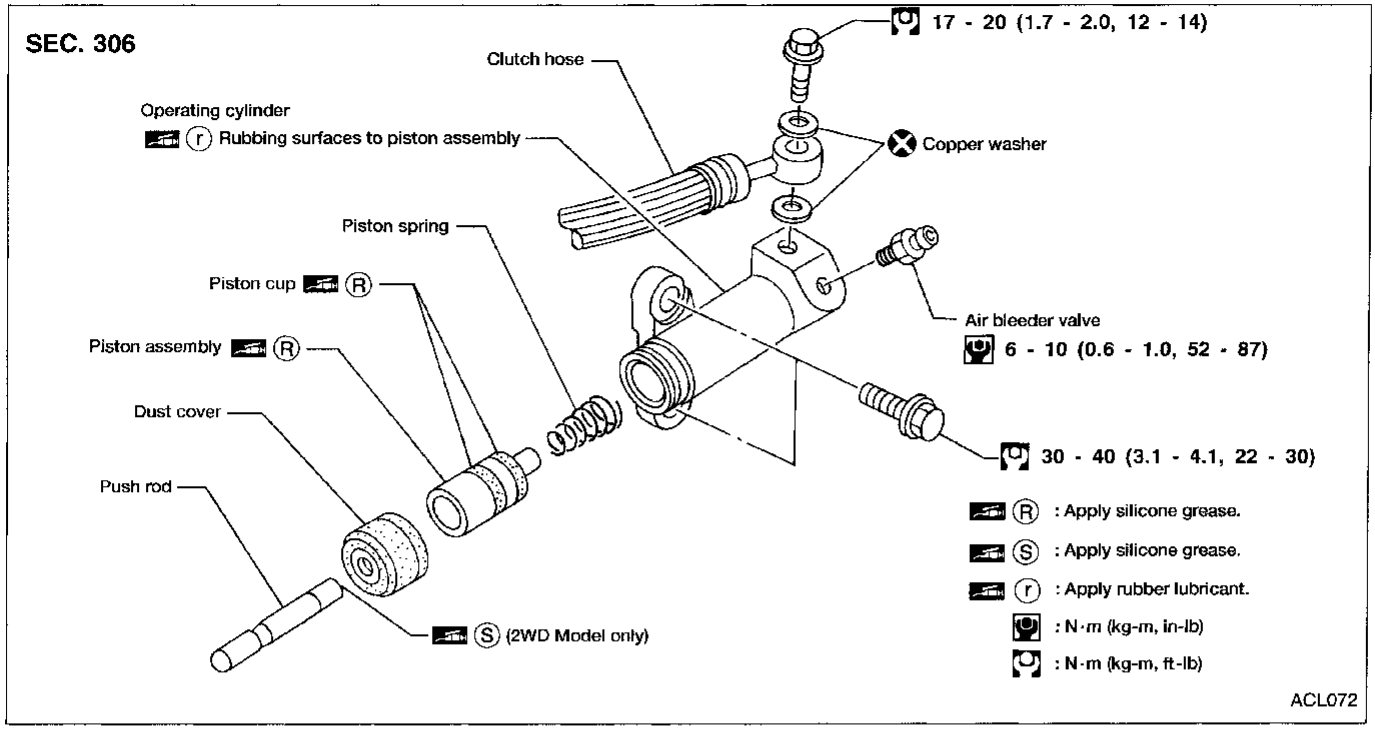
1. Fill the master cylinder reservoir tank with new brake fluid.
2. Connect a transparent vinyl hose to the air bleeder.
3. Slowly depress the clutch pedal to its full stroke length and release it completely. Repeat this operation several times at 2 to 3 second intervals.
4. Open the air bleeder with the clutch pedal fully depressed.
5. Close the air bleeder.
6. Release the clutch pedal and wait at least 5 seconds.
7. Repeat steps 3 through 6 above until air bubbles no longer appear in the brake fluid.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Clutch Master Cylinder (With clutch damper)

DISASSEMBLY AND ASSEMBLY

- Use a screwdriver to remove stopper ring while pushing push rod into cylinder.
- When installing stopper ring, tap in lightly while pushing push rod into cylinder.



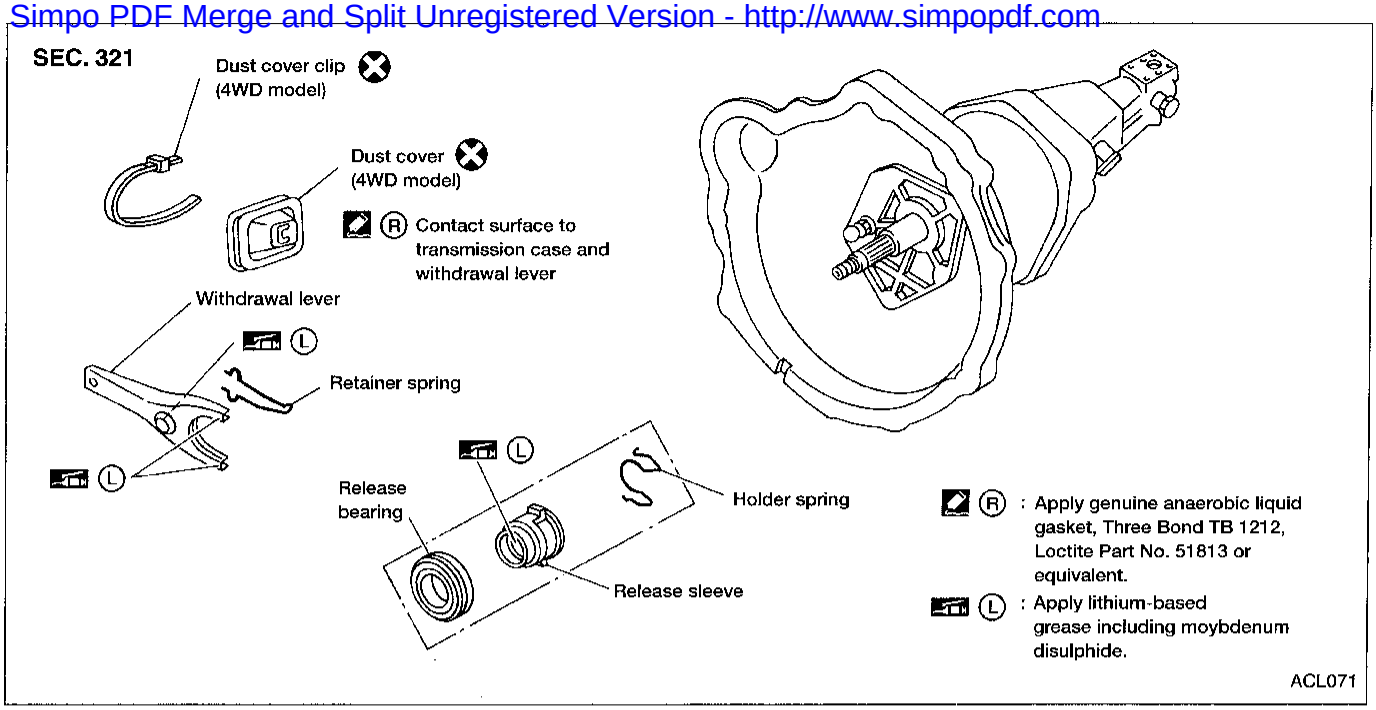
INSPECTION

Check the following items, and replace as necessary.

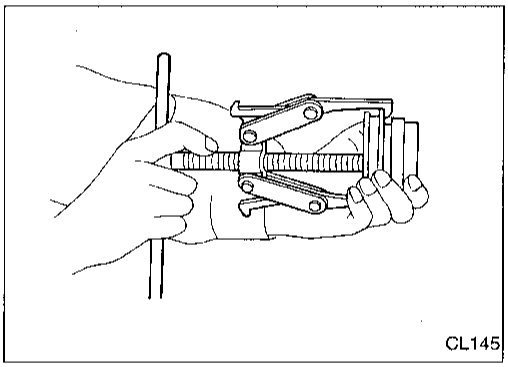
- Rubbing surface of cylinder and piston, for uneven wear, rust and damage
- Piston with piston cup, for wear and damage
- Return spring, for wear and damage
- Dust cover, for cracks, deformation and damage
- Reservoir, for deformation and damage

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Operating Cylinder

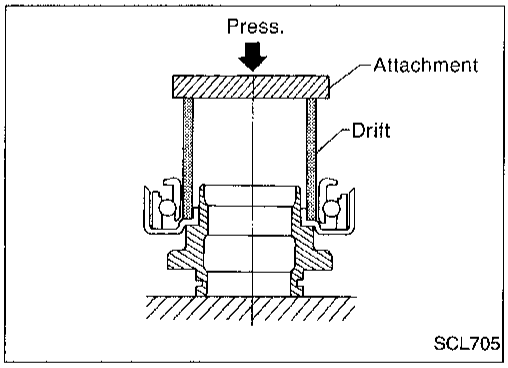


INSPECTION

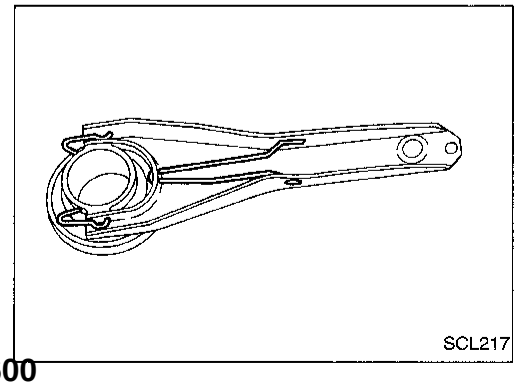


Check the following items, and replace as necessary.

- Rubbing surface of cylinder and piston, for uneven wear, rust and damage
- Piston with piston cup, for wear and damage
- Piston spring, for wear and damage
- Dust cover, for cracks, deformation and damage



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



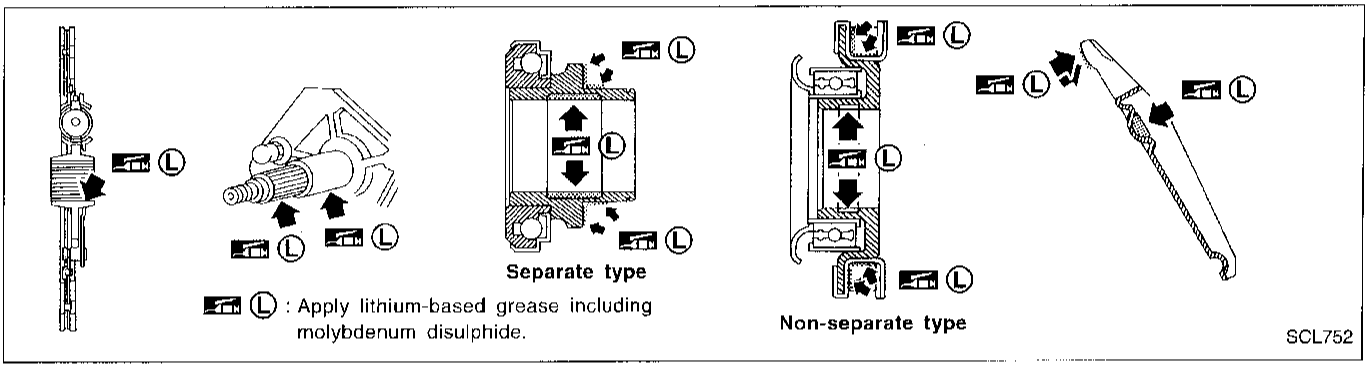
REMOVAL AND INSTALLATION

- Remove release bearing.

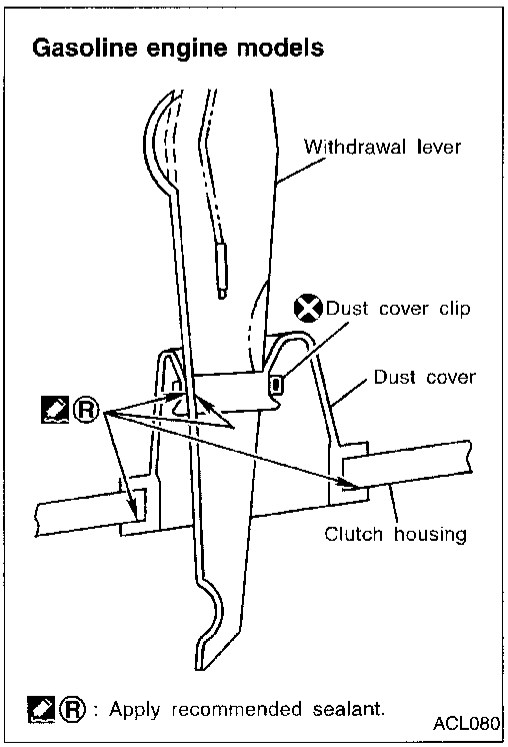
- Install release bearing with suitable drift.

- Install retainer spring and holder spring.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



INSPECTION

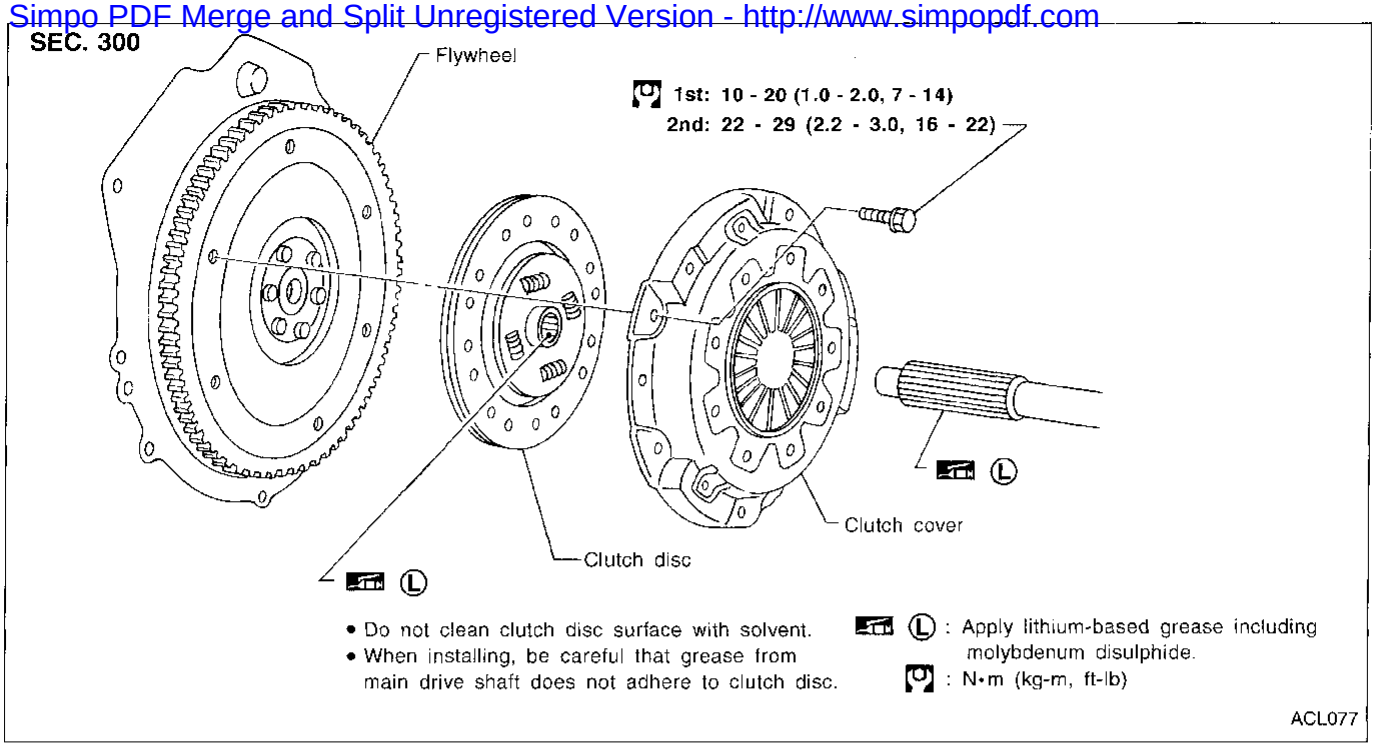


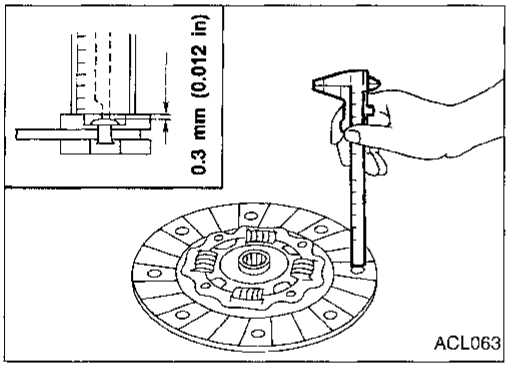
Check the following items, and replace as necessary.

- Release bearing, to see that it rolls freely and is free from noise, cracks, pitting and wear
- Release sleeve and withdrawal lever rubbing surface, for wear, rust and damage

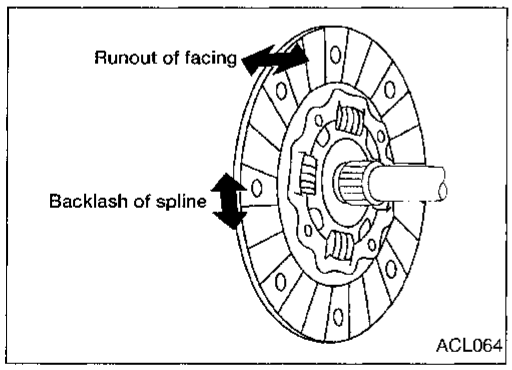
LUBRICATION

- Apply recommended grease to contact surface and rubbing surface.
- **Too much lubricant might damage clutch disc facing.**





WATERPROOF — for 4WD model



- Apply recommended sealant to contact surface of transmission case dust cover and withdrawal lever, then install dust cover clip.

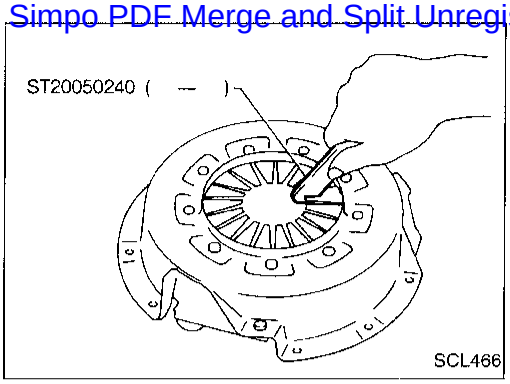
Recommended sealant: Nissan genuine part (KP115-00100) or equivalent.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Clutch Disc

INSPECTION

Check the following items, and replace as necessary.

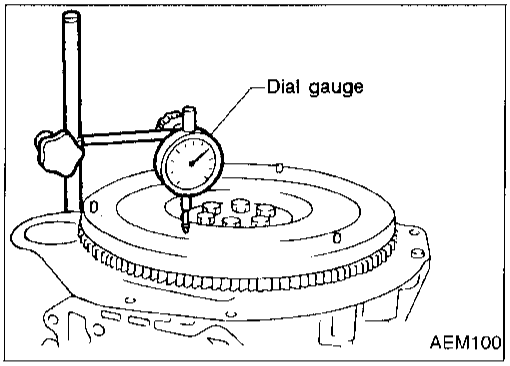


- Clutch disc, for burns, discoloration and oil or grease leakage
- Clutch disc, for wear of facing
  Wear limit of facing surface to rivet head:
  0.3 mm (0.012 in)

- Clutch disc, for backlash of spline and runout of facing
  Maximum backlash of spline (at outer edge of disc):
  1.0 mm (0.039 in)
  Runout limit:
  1.0 mm (0.039 in)
  Distance of runout check point (from hub center):
  115 mm (4.53 in)

INSTALLATION

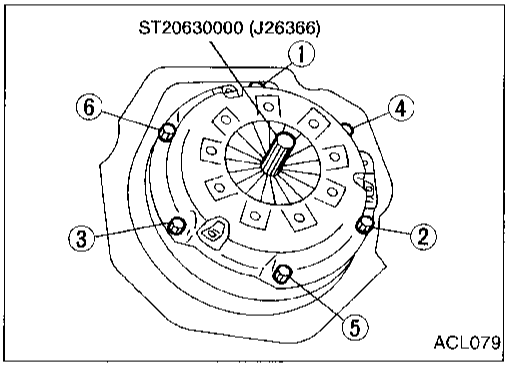
- Apply recommended grease to contact surface of splines.
- **Too much lubricant may damage clutch disc facing.**



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Clutch Cover and Flywheel

INSPECTION AND ADJUSTMENT



- Check clutch cover, installed on vehicle, for uneven diaphragm spring toe height.
  Uneven limit:
  0.7 mm (0.028 in)
- If out of limit, adjust the height using Tool.

FLYWHEEL INSPECTION

CAUTION:
Do not allow any magnetic materials to contact the ring gear teeth.

- Inspect contact surface of flywheel for slight burns or discoloration. Clean flywheel using emery paper.
- Check flywheel runout.
  Maximum allowable runout:
  Refer to EM section ("Inspection", "CYLINDER BLOCK").

INSTALLATION

- Insert Tool into clutch disc hub while installing clutch cover and disc.
- Be careful not to allow grease to contaminate clutch facing.
- Tighten bolts in numerical order, in two steps.
  First step:
  : 10 - 20 N·m (1.0 - 2.0 kg-m, 7 - 14 ft-lb)
  Final step:
  : 22 - 29 N·m (2.2 - 3.0 kg-m, 16 - 22 ft-lb)

Special Service Tools

The actual shapes of Kent-Moore tools may differ from those of special service tools illustrated here.

Tool number (Kent-Moore No.) Tool name	Description	
KV10117100 (J36471-A) Heated oxygen sensor wrench	 NT379	Loosening or tightening front heated oxygen sensor with 22 mm (0.87 in) hexagon nut
KV10114400 (J-38365) Heated oxygen sensor wrench	 NT636	Loosening or tightening rear heated oxygen sensor **a: 22 mm (0.87 in)**

Commercial Service Tools

Tool name	Description	
Fuel filler cap adapter	 NT653	Checking fuel tank vacuum relief valve opening pressure
Leak detector (J41416)	 NT703	Locating the EVAP leak
EVAP service port adapter (J41413-OBD)	 NT704	Applying positive pressure through EVAP service port
Hose clipper (—)	 Approx. 20 mm (0.79 in) NT720	Clamping the EVAP purge hose between the fuel tank and EVAP canister applied to DTC P1440 [EVAP control system (Small leak — Positive pressure)]

Supplemental Restraint System (SRS) "AIR BAG"

The Supplemental Restraint System "AIR BAG", used along with a seat belt, helps to reduce the risk or severity of injury to the driver and front passenger in a frontal collision. The Supplemental Restraint System consists of air bag modules (located in the center of the steering wheel and in the instrument panel on the passenger side), a diagnosis sensor unit, a crash zone sensor (4WD models), warning lamp, wiring harness and spiral cable.

The vehicle is equipped with a passenger air bag deactivation switch. Because no rear seat exists where a rear-facing child restraint can be placed, the switch is designed to turn off the passenger air bag so that a rear-facing child restraint can be used in the front passenger seat. The switch is located in the center of the instrument panel, near the ashtray. When the switch is turned to the ON position, the passenger air bag is enabled and could inflate in a frontal collision. When the switch is turned to the OFF position, the passenger air bag is disabled and will not inflate in a frontal collision. A passenger air bag OFF indicator on the instrument panel lights up when the passenger air bag is switched OFF. The driver air bag always remains enabled and is not affected by the passenger air bag deactivation switch.

Information necessary to service the system safely is included in the **RS section** of this Service Manual.

WARNING:

- **To avoid rendering the SRS inoperative, which could increase the risk of personal injury or death in the event of a collision which would result in air bag inflation, all maintenance should be performed by an authorized NISSAN dealer.**
- **Improper maintenance, including incorrect removal and installation of the SRS, can lead to personal injury caused by unintentional activation of the system.**
- **Do not use electrical test equipment on any circuit related to the SRS unless instructed to in this Service Manual. SRS wiring harnesses are covered with yellow insulation either just before the harness connectors or on the complete harness, for easy identification.**
- **The vehicle is equipped with a passenger air bag deactivation switch which can be operated by the customer. When the passenger air bag is switched OFF, the passenger air bag is disabled and will not inflate in a frontal collision. When the passenger air bag is switched ON, the passenger air bag is enabled and could inflate in a frontal collision. After SRS maintenance or repair, make sure the passenger air bag deactivation switch is in the same position (ON or OFF) as when the vehicle arrived for service.**

Precautions for On Board Diagnostic (OBD) System of Engine

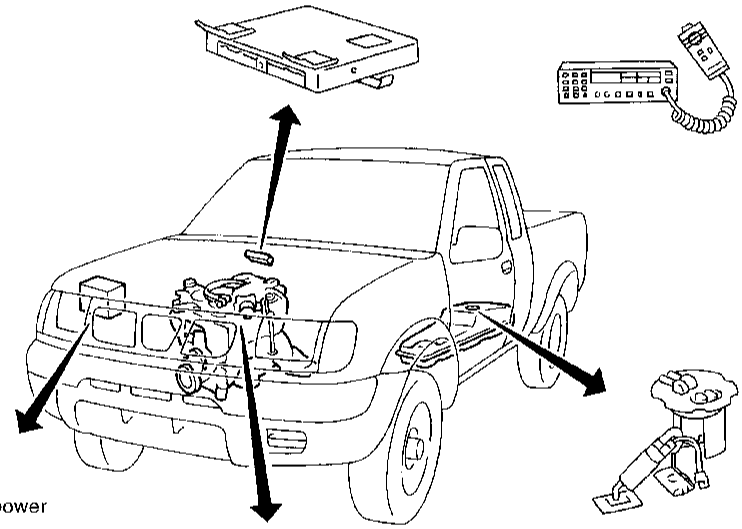
The ECM has an on board diagnostic system. It will light up the malfunction indicator lamp (MIL) to warn the driver of a malfunction causing emission deterioration.

CAUTION:

- **Be sure to turn the ignition switch "OFF" and disconnect the negative battery terminal before any repair or inspection work. The open/short circuit of related switches, sensors, solenoid valves, etc. will cause the MIL to light up.**
- **Be sure to connect and lock the connectors securely after work. A loose (unlocked) connector will cause the MIL to light up due to the open circuit. (Be sure the connector is free from water, grease, dirt, bent terminals, etc.)**
- **Be sure to route and secure the harnesses properly after work. The interference of the harness with a bracket, etc. may cause the MIL to light up due to the short circuit.**
- **Be sure to connect rubber tubes properly after work. A misconnected or disconnected rubber tube may cause the MIL to light up due to the malfunction of the EGR system or fuel injection system, etc.**
- **Be sure to erase the unnecessary malfunction information (repairs completed) from the ECM before returning the vehicle to the customer.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Engine Fuel & Emission Control System



ECM

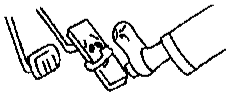
- Do not disassemble ECM.
- Do not turn on board diagnostic test mode selector forcibly.
- If a battery terminal is disconnected, the memory will return to the ECM value.
  The ECM will now start to self-control at its initial value. Engine operation can vary slightly when the terminal is disconnected. However, this is not an indication of a problem. Do not replace parts because of a slight variation.

WIRELESS EQUIPMENT

- When installing CB ham radio or a mobile phone, be sure to observe the following as it may adversely affect electronic control systems depending on its installation location.

1) Keep the antenna as far away as possible from the electronic control units.
2) Keep the antenna feeder line more than 20 cm (7.9 in) away from the harness of electronic controls.
   Do not let them run parallel for a long distance.
3) Adjust the antenna and feeder line so that the standing-wave ratio can be kept smaller.
4) Be sure to ground the radio to vehicle body.

BATTERY



- Always use a 12 volt battery as power source.
- Do not attempt to disconnect battery cables while engine is running.

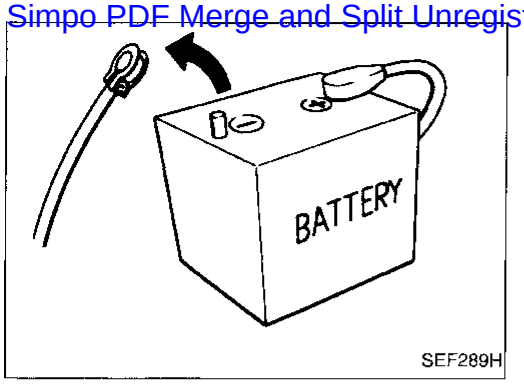
WHEN STARTING

- Do not depress accelerator pedal when starting.
- Immediately after starting, do not rev up engine unnecessarily.
- Do not rev up engine just prior to shutdown.

ECM PARTS HANDLING

- Handle mass air flow sensor carefully to avoid damage.
- Do not disassemble mass air flow sensor.
- Do not clean mass air flow sensor with any type of detergent.
- Do not disassemble IACV-AAC valve.
- Even a slight leak in the air intake system can cause serious problems.
- Do not shock or jar the camshaft position sensor or crankshaft position sensor (OBD).

FUEL PUMP

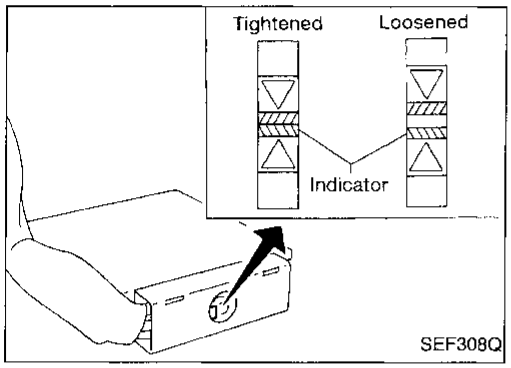


- Do not operate fuel pump when there is no fuel in lines.
- Tighten fuel hose clamps to the specified torque. (Refer to MA section.)

ECM HARNESS HANDLING

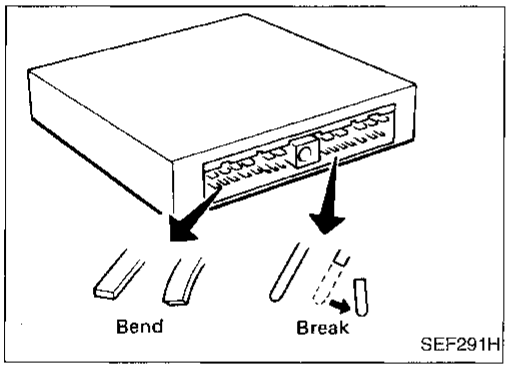
- Securely connect ECM harness connectors.
  A poor connection can cause an extremely high (surge) voltage to develop in coil and condenser, thus resulting in damage to ICs.
- Keep ECM harness at least 10 cm (3.9 in.) away from adjacent harnesses to prevent an ECM system malfunction due to receiving external noise, degraded operation of ICs, etc.
- Keep ECM parts and harnesses dry.
- Before removing parts, turn off ignition switch and then disconnect battery ground cable.

SEF236V



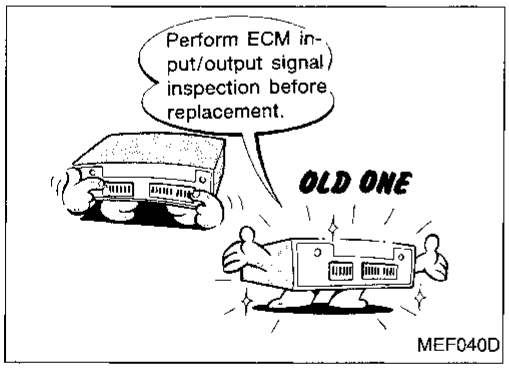
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SEF289H



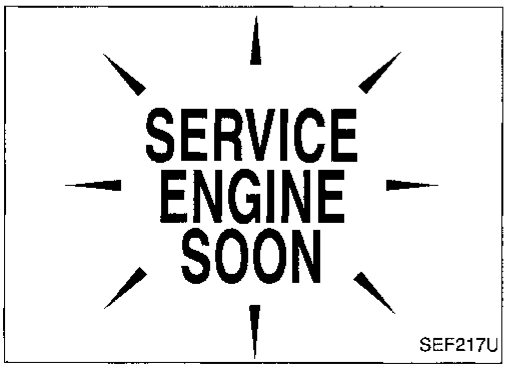
Precautions

- Before connecting or disconnecting the ECM harness connector, turn ignition switch OFF and disconnect negative battery terminal. Failure to do so may damage the ECM because battery voltage is applied to ECM even if ignition switch is turned off.



SEF308Q

- When connecting ECM harness connector, tighten securing bolt until the gap between orange indicators disappears.
  : 3.0 - 5.0 N·m (0.3 - 0.5 kg-m, 26 - 43 in-lb)

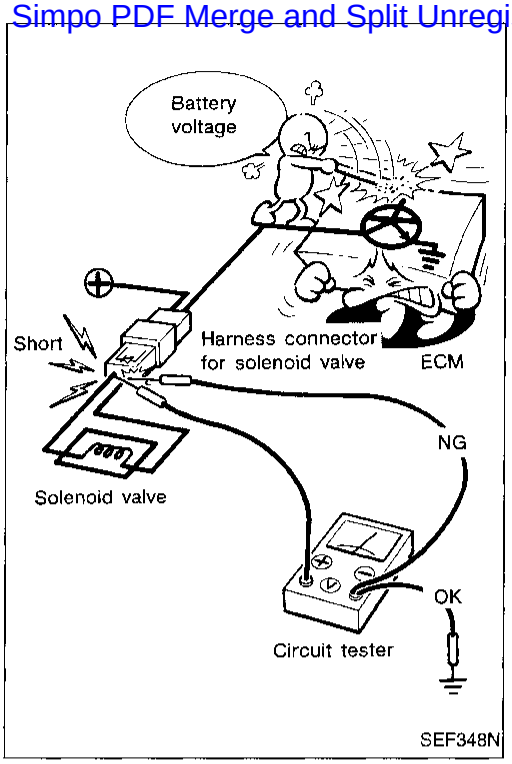


SEF291H

- When connecting or disconnecting pin connectors into or from ECM, take care not to damage pin terminals (bend or break).
  Make sure that there are not any bends or breaks on ECM pin terminal, when connecting pin connectors.

MEF040D

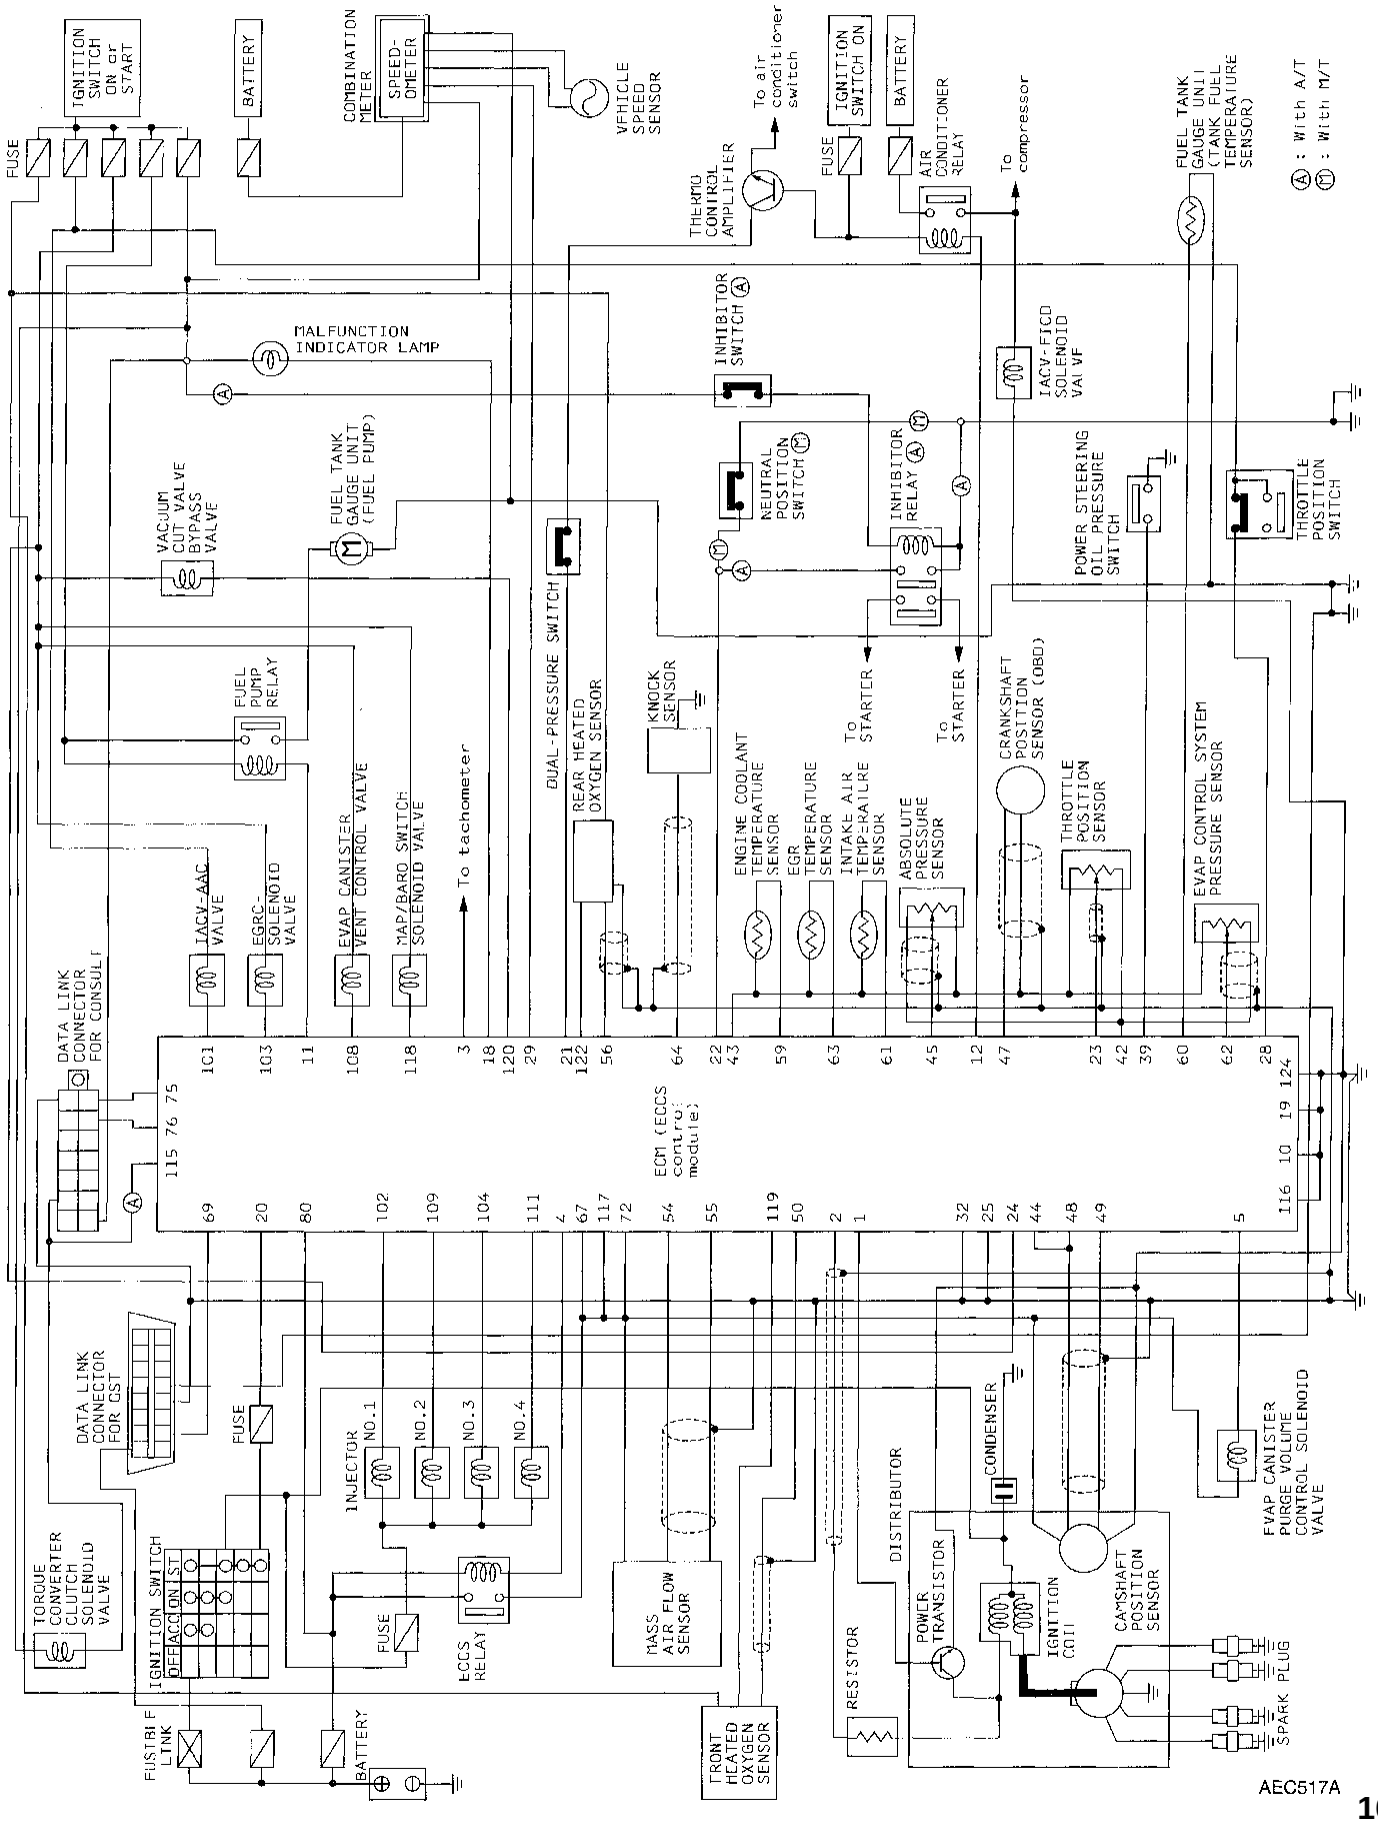
- Before replacing ECM, perform Terminals and Reference Value inspection and make sure ECM functions properly. Refer to EC-84.



SEF217U

- After performing each TROUBLE DIAGNOSIS, perform "OVERALL FUNCTION CHECK" or "DTC (Diagnostic Trouble Code) CONFIRMATION PROCEDURE".
  The DTC should not be displayed in the "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" if the repair is completed. The "OVERALL FUNCTION CHECK" should be a good result if the repair is completed.

Precautions (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

- **When measuring ECM signals with a circuit tester, never allow the two tester probes to contact.**
  Accidental contact of probes will cause a short circuit and damage the ECM power transistor.

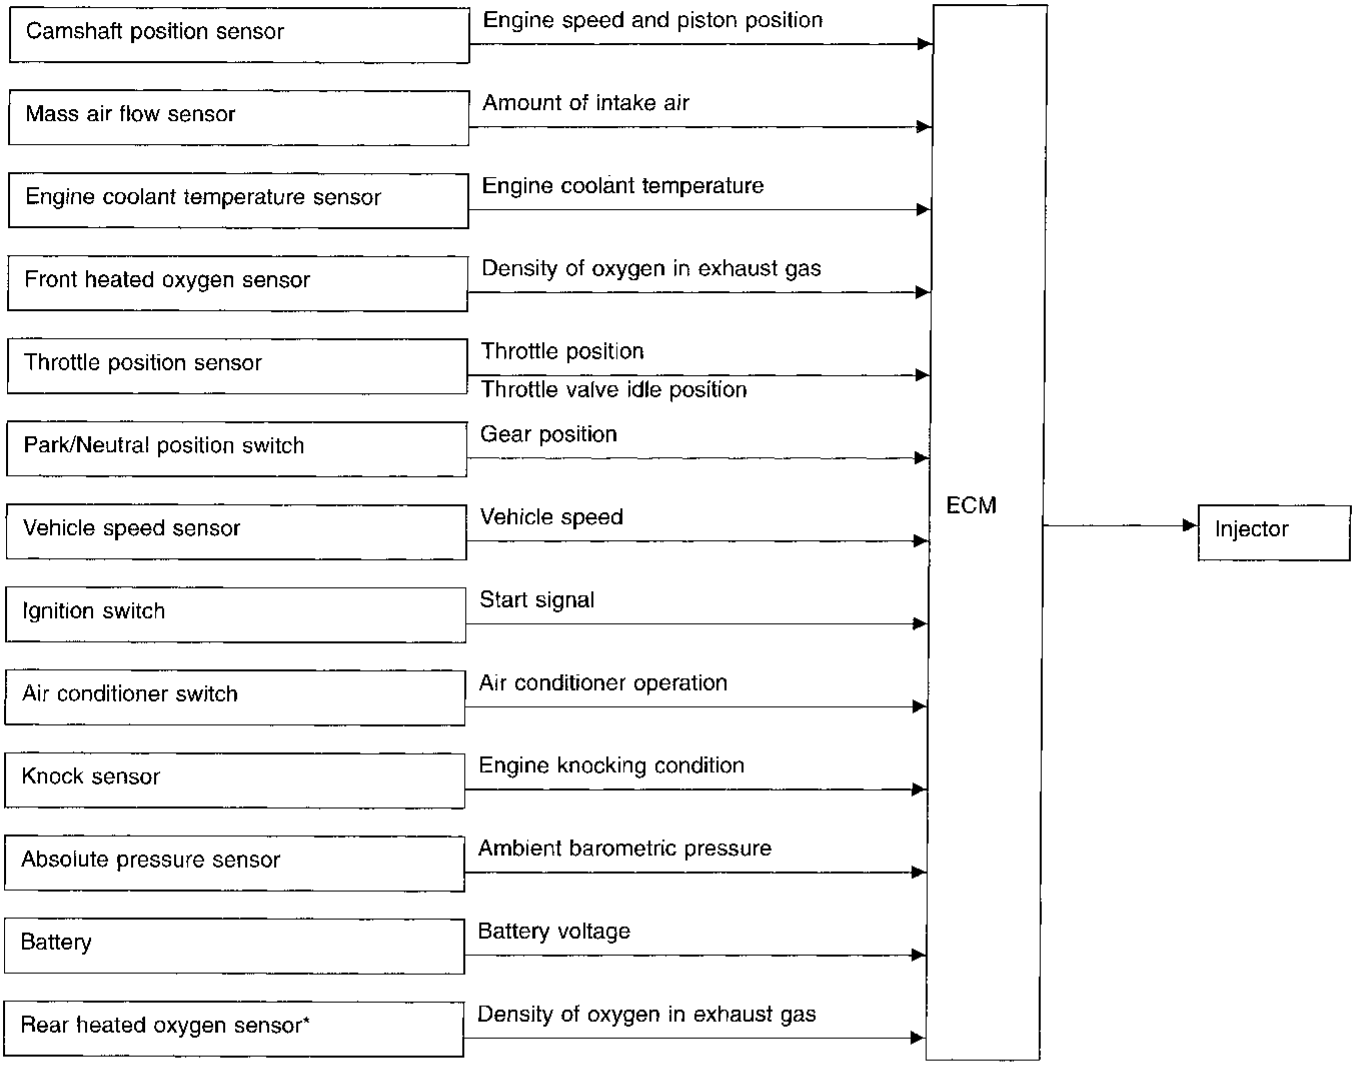
System Chart



*1: These sensors are not used to control the engine system. They are used only for the on board diagnosis.
*2: This sensor is not used to control the engine system under normal conditions.
*3: This switch will operate in place of the throttle position sensor to control EVAP parts if the sensor malfunctions.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

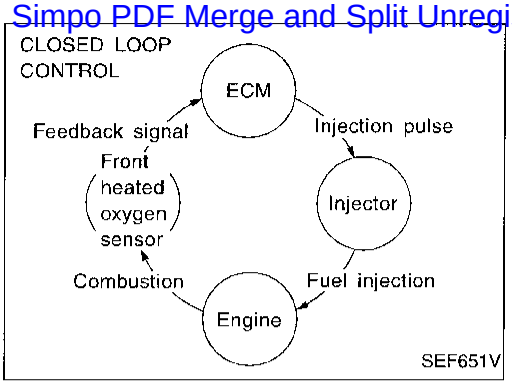
Multiport Fuel Injection (MFI) System

INPUT/OUTPUT SIGNAL LINE

* Under normal conditions, this sensor is not for engine control operation.

BASIC MULTIPORT FUEL INJECTION SYSTEM

The amount of fuel injected from the fuel injector is determined by the ECM. The ECM controls the length of time the valve remains open (injection pulse duration). The amount of fuel injected is a program value in the ECM memory. The program value is preset by engine operating conditions. These conditions are determined by input signals (for engine speed and intake air) from both the camshaft position sensor and the mass air flow sensor.



VARIOUS FUEL INJECTION INCREASE/DECREASE COMPENSATION

In addition, the amount of fuel injected is compensated to improve engine performance under various operating conditions as listed below.

<Fuel increase>
- During warm-up
- When starting the engine
- During acceleration
- Hot-engine operation
- High-load, high-speed operation

<Fuel decrease>
- During deceleration
- During high engine speed operation

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Multiport Fuel Injection (MFI) System (Cont'd)

MIXTURE RATIO FEEDBACK CONTROL (CLOSED LOOP CONTROL)

The mixture ratio feedback system provides the best air-fuel mixture ratio for driveability and emission control. The three way catalyst can then better reduce CO, HC and NOx emissions. This system uses a front heated oxygen sensor in the exhaust manifold to monitor if the engine operation is rich or lean. The ECM adjusts the injection pulse width according to the sensor voltage signal. For more information about the front heated oxygen sensor, refer to EC-144. This maintains the mixture ratio within the range of stoichiometric (ideal air-fuel mixture).

This stage is referred to as the closed loop control condition.

Rear heated oxygen sensor is located downstream of the three way catalyst. Even if the switching characteristics of the front heated oxygen sensor shift, the air-fuel ratio is controlled to stoichiometric by the signal from the rear heated oxygen sensor.

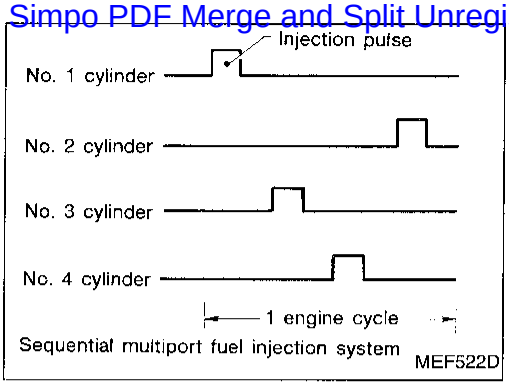
OPEN LOOP CONTROL

The open loop system condition refers to when the ECM detects any of the following conditions. Feedback control stops in order to maintain stabilized fuel combustion.

- Deceleration and acceleration
- High-load, high-speed operation
- Malfunction of front heated oxygen sensor or its circuit
- Insufficient activation of front heated oxygen sensor at low engine coolant temperature
- High engine coolant temperature
- During warm-up
- When starting the engine

MIXTURE RATIO SELF-LEARNING CONTROL

The mixture ratio feedback control system monitors the mixture ratio signal transmitted from the front heated oxygen sensor. This feedback signal is then sent to the ECM. The ECM controls the basic mixture ratio as close to the theoretical mixture ratio as possible. However, the basic mixture ratio is not necessarily controlled as originally designed. Both manufacturing differences (i.e., mass air flow sensor hot wire) and characteristic changes during operation (i.e., injector clogging) directly affect mixture ratio. Accordingly, the difference between the basic and theoretical mixture ratios is monitored in this system. This is then computed in terms of "injection pulse duration" to automatically compensate for the difference between the two ratios.



"Fuel trim" refers to the feedback compensation value compared against the basic injection duration. Fuel trim includes short term fuel trim and long term fuel trim.

"Short term fuel trim" is the short-term fuel compensation used to maintain the mixture ratio at its theoretical value. The signal from the front heated oxygen sensor indicates whether the mixture ratio is RICH or LEAN compared to the theoretical value. The signal then triggers a reduction in fuel volume if the mixture ratio is rich, and an increase in fuel volume if it is lean.

"Long term fuel trim" is overall fuel compensation carried out long-term to compensate for continual deviation of the short term fuel trim from the central value. Such deviation will occur due to individual engine differences, wear over time and changes in the usage environment.

Multiport Fuel Injection (MFI) System (Cont'd)

Sequential multiport fuel injection system

MEF522D

Simultaneous multiport fuel injection system

MEF523D

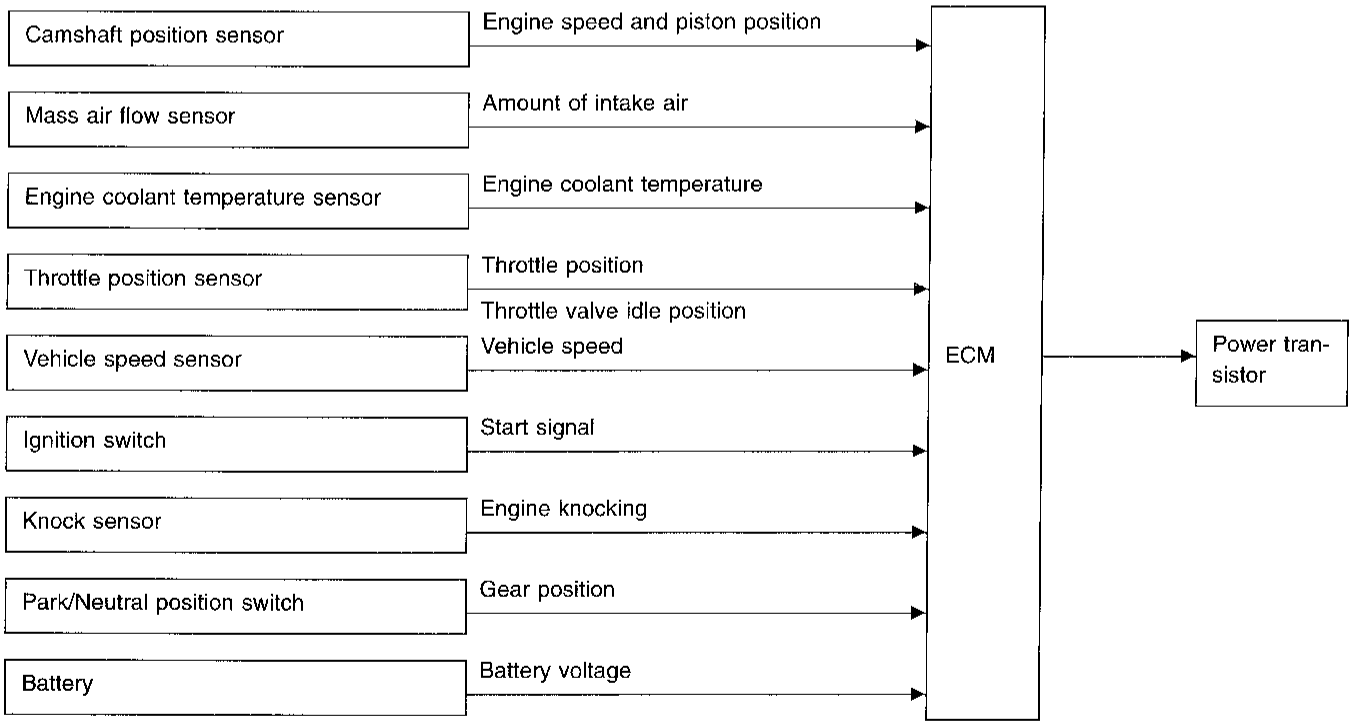
FUEL INJECTION TIMING

Two types of systems are used.

Sequential multiport fuel injection system

Fuel is injected into each cylinder during each engine cycle according to the firing order. This system is used when the engine is running.

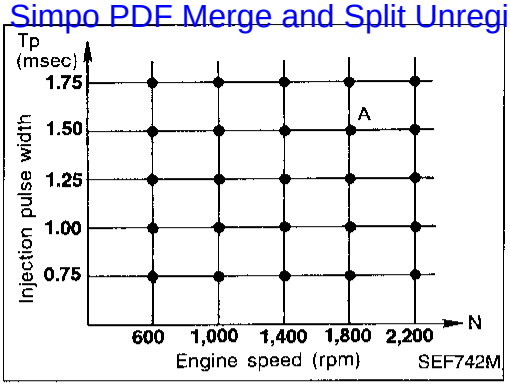
Simultaneous multiport fuel injection system



Fuel is injected simultaneously into all six cylinders twice each engine cycle. In other words, pulse signals of the same width are simultaneously transmitted from the ECM.
The six injectors will then receive the signals two times for each engine cycle.
This system is used when the engine is being started and/or if the fail-safe system (CPU) is operating.

FUEL SHUT-OFF

Fuel to each cylinder is cut off during deceleration or operation of the engine at excessively high speeds.



Distributor Ignition (DI) System

INPUT/OUTPUT SIGNAL LINE

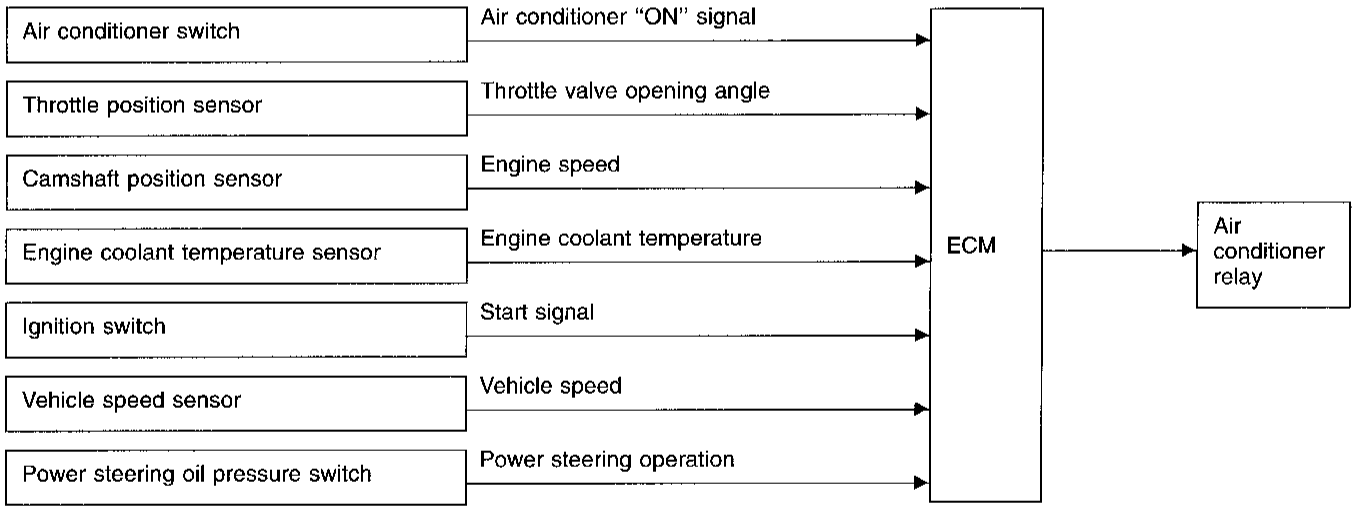
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Distributor Ignition (DI) System (Cont'd)

SYSTEM DESCRIPTION

The ignition timing is controlled by the ECM to maintain the best air-fuel ratio for every running condition of the engine.
The ignition timing data is stored in the ECM. This data forms the map shown.
The ECM receives information such as the injection pulse width and camshaft position sensor signal. Computing this information, ignition signals are transmitted to the power transistor.

e.g., N: 1,800 rpm, Tp: 1.50 msec
A°BTDC



During the following conditions, the ignition timing is revised by the ECM according to the other data stored in the ECM.

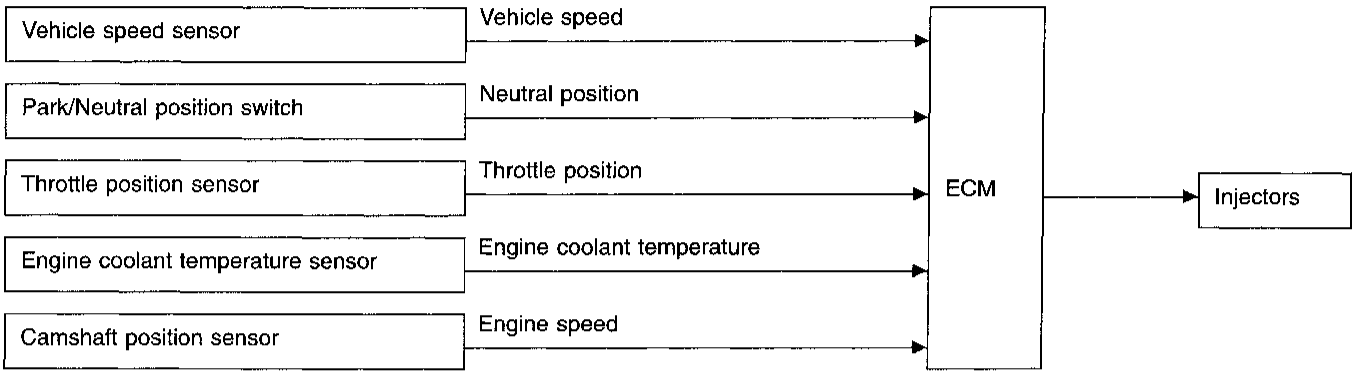
- At starting
- During warm-up
- At idle
- Hot engine operation
- During acceleration

The knock sensor retard system is designed only for emergencies. The basic ignition timing is programmed within the anti-knocking zone, if recommended fuel is used under dry conditions. The retard system does not operate under normal driving conditions.
If engine knocking occurs, the knock sensor monitors the condition. The signal is transmitted to the ECM. The ECM retards the ignition timing to eliminate the knocking condition.

Air Conditioning Cut Control

INPUT/OUTPUT SIGNAL LINE

SYSTEM DESCRIPTION



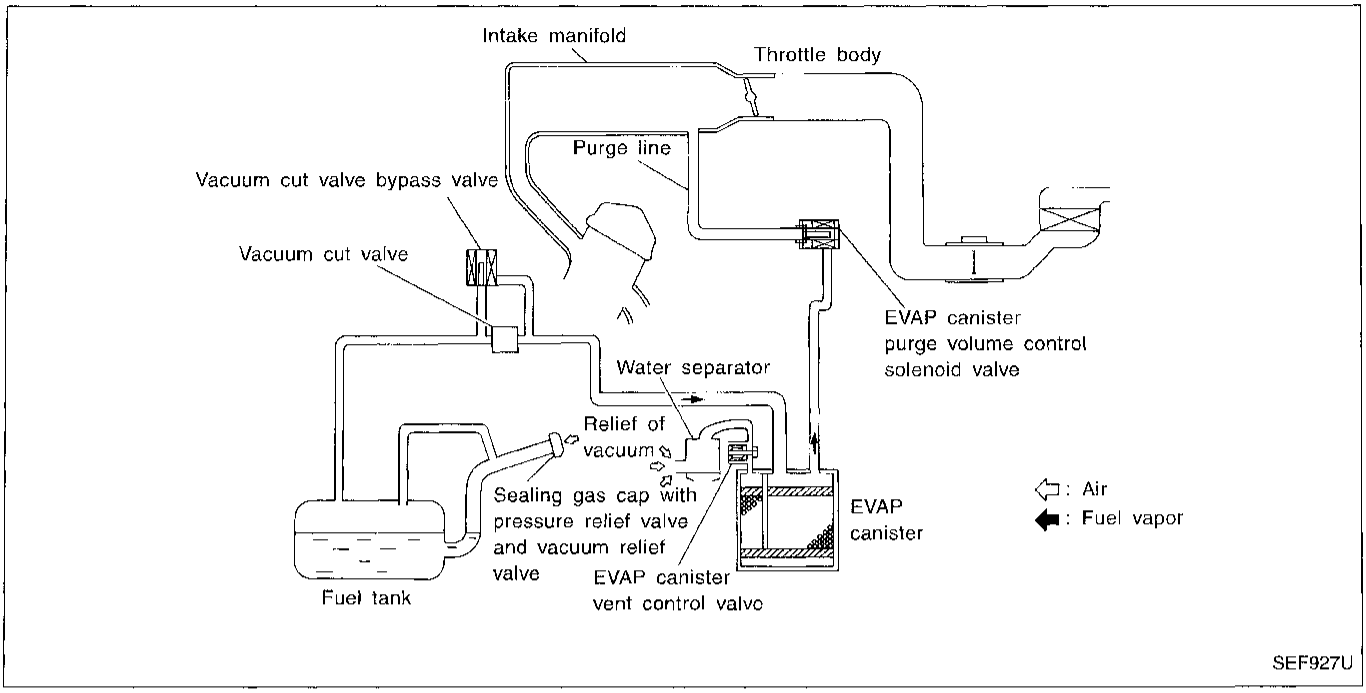
This system improves engine operation when the air conditioner is used.
Under the following conditions, the air conditioner is turned off.

- When the accelerator pedal is fully depressed.
- When cranking the engine.
- When the engine coolant temperature becomes excessively high.
- When operating power steering and air conditioner during low engine speed or when fully releasing accelerator pedal.
- When engine speed is excessively low.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Fuel Cut Control (at no load & high engine speed)

INPUT/OUTPUT SIGNAL LINE

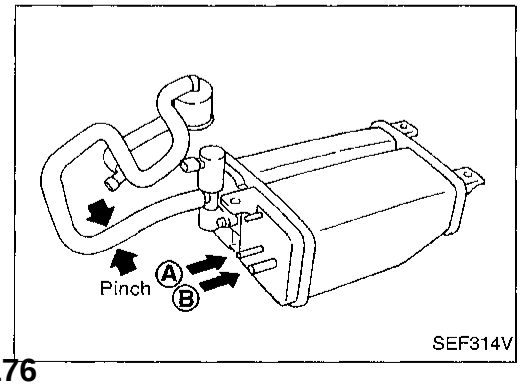


If the engine speed is above 3,000 rpm with no load, (for example, in neutral and engine speed over 3,000 rpm) fuel will be cut off after some time. The exact time when the fuel is cut off varies based on engine speed.
Fuel cut will operate until the engine speed reaches 1,500 rpm, then fuel cut is cancelled.

NOTE:
This function is different from deceleration control listed under "Multiport Fuel Injection (MFI) System", EC-15.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description



The evaporative emission system is used to reduce hydrocarbons emitted into the atmosphere from the fuel system. This reduction of hydrocarbons is accomplished by activated charcoals in the EVAP canister.

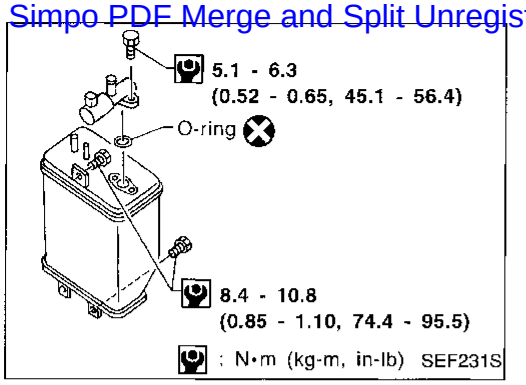
The fuel vapor in the sealed fuel tank is led into the EVAP canister which contains activated carbon and the vapor is stored there when the engine is not operating.

The vapor in the EVAP canister is purged by the air through the purge line to the intake manifold when the engine is operating.

EVAP canister purge volume control solenoid valve is controlled by ECM. When the engine operates, the flow rate of vapor controlled by EVAP canister purge volume control solenoid valve is proportionally regulated as the air flow increases.

EVAP canister purge volume control solenoid valve also shuts off the vapor purge line during decelerating and idling.

Inspection

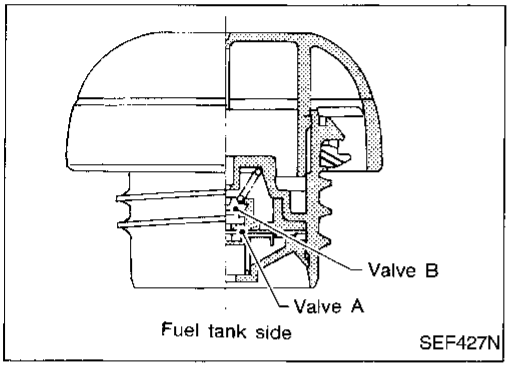


EVAP CANISTER

Check EVAP canister as follows:

1. Pinch the fresh air hose.
2. Blow air into port Ⓐ and check that air flows freely through port Ⓑ.

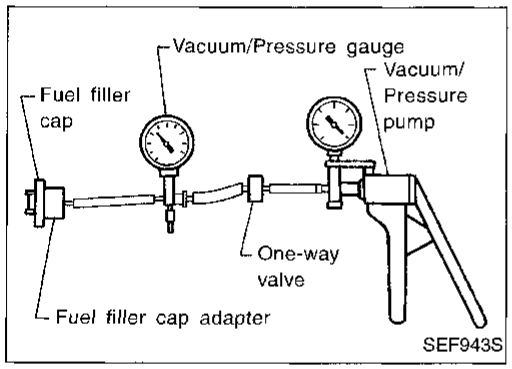
Inspection (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

TIGHTENING TORQUE

Tighten EVAP canister as shown in the figure.



Make sure new O-ring is installed properly between EVAP canister and EVAP vent control valve.

FUEL TANK VACUUM RELIEF VALVE (Built into fuel filler cap)

1. Wipe clean valve housing.
2. Check valve opening pressure and vacuum.
   Pressure:
   16.0 - 20.0 kPa (0.163 - 0.204 kg/cm^2, 2.32 - 2.90 psi)
   Vacuum:
   −6.0 to −3.5 kPa (−0.061 to −0.036 kg/cm^2, −0.87 to −0.51 psi)
3. If out of specification, replace fuel filler cap as an assembly.

CAUTION:
Use only a genuine NISSAN fuel filler cap as a replacement. If an incorrect fuel filler cap is used, the MIL may come on.

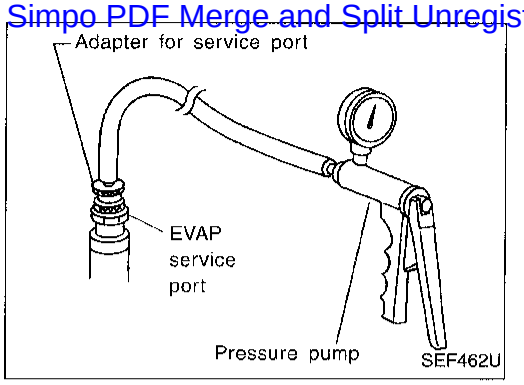
VACUUM CUT VALVE AND VACUUM CUT VALVE BYPASS VALVE

Refer to EC-383.

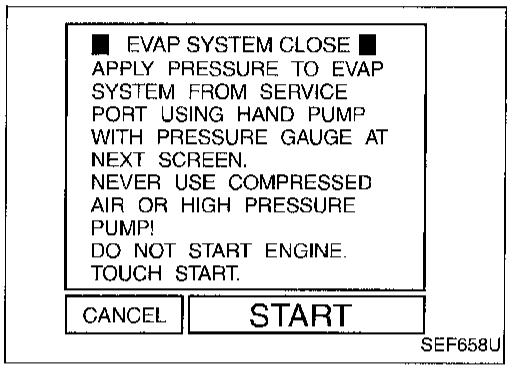
EVAPORATIVE EMISSION (EVAP) CANISTER PURGE VOLUME CONTROL SOLENOID VALVE

Refer to EC-355.

TANK FUEL TEMPERATURE SENSOR



Refer to EC-218.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (Cont'd)

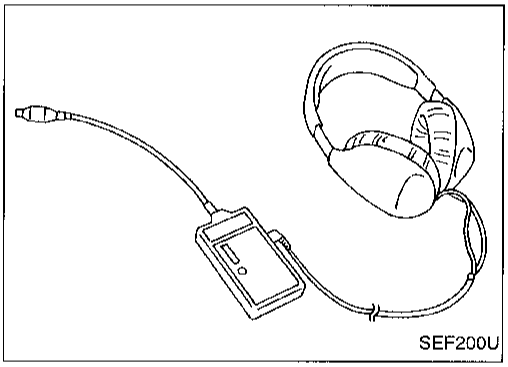
EVAP SERVICE PORT

Positive pressure is delivered to the EVAP system through the EVAP service port. If fuel vapor leakage in the EVAP system occurs, use a leak detector to locate the leak.

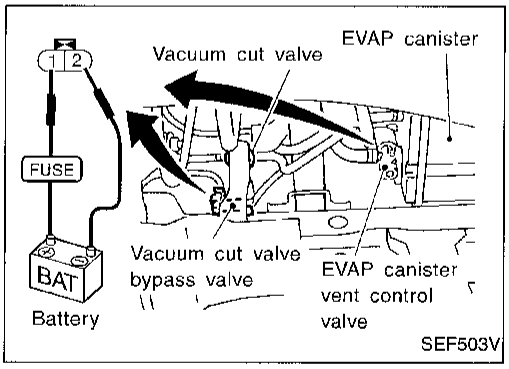
How to detect fuel vapor leakage

CAUTION:
Never use compressed air or a high pressure pump.

NOTE:
Improper installation of adapter to the service port may cause a leak.



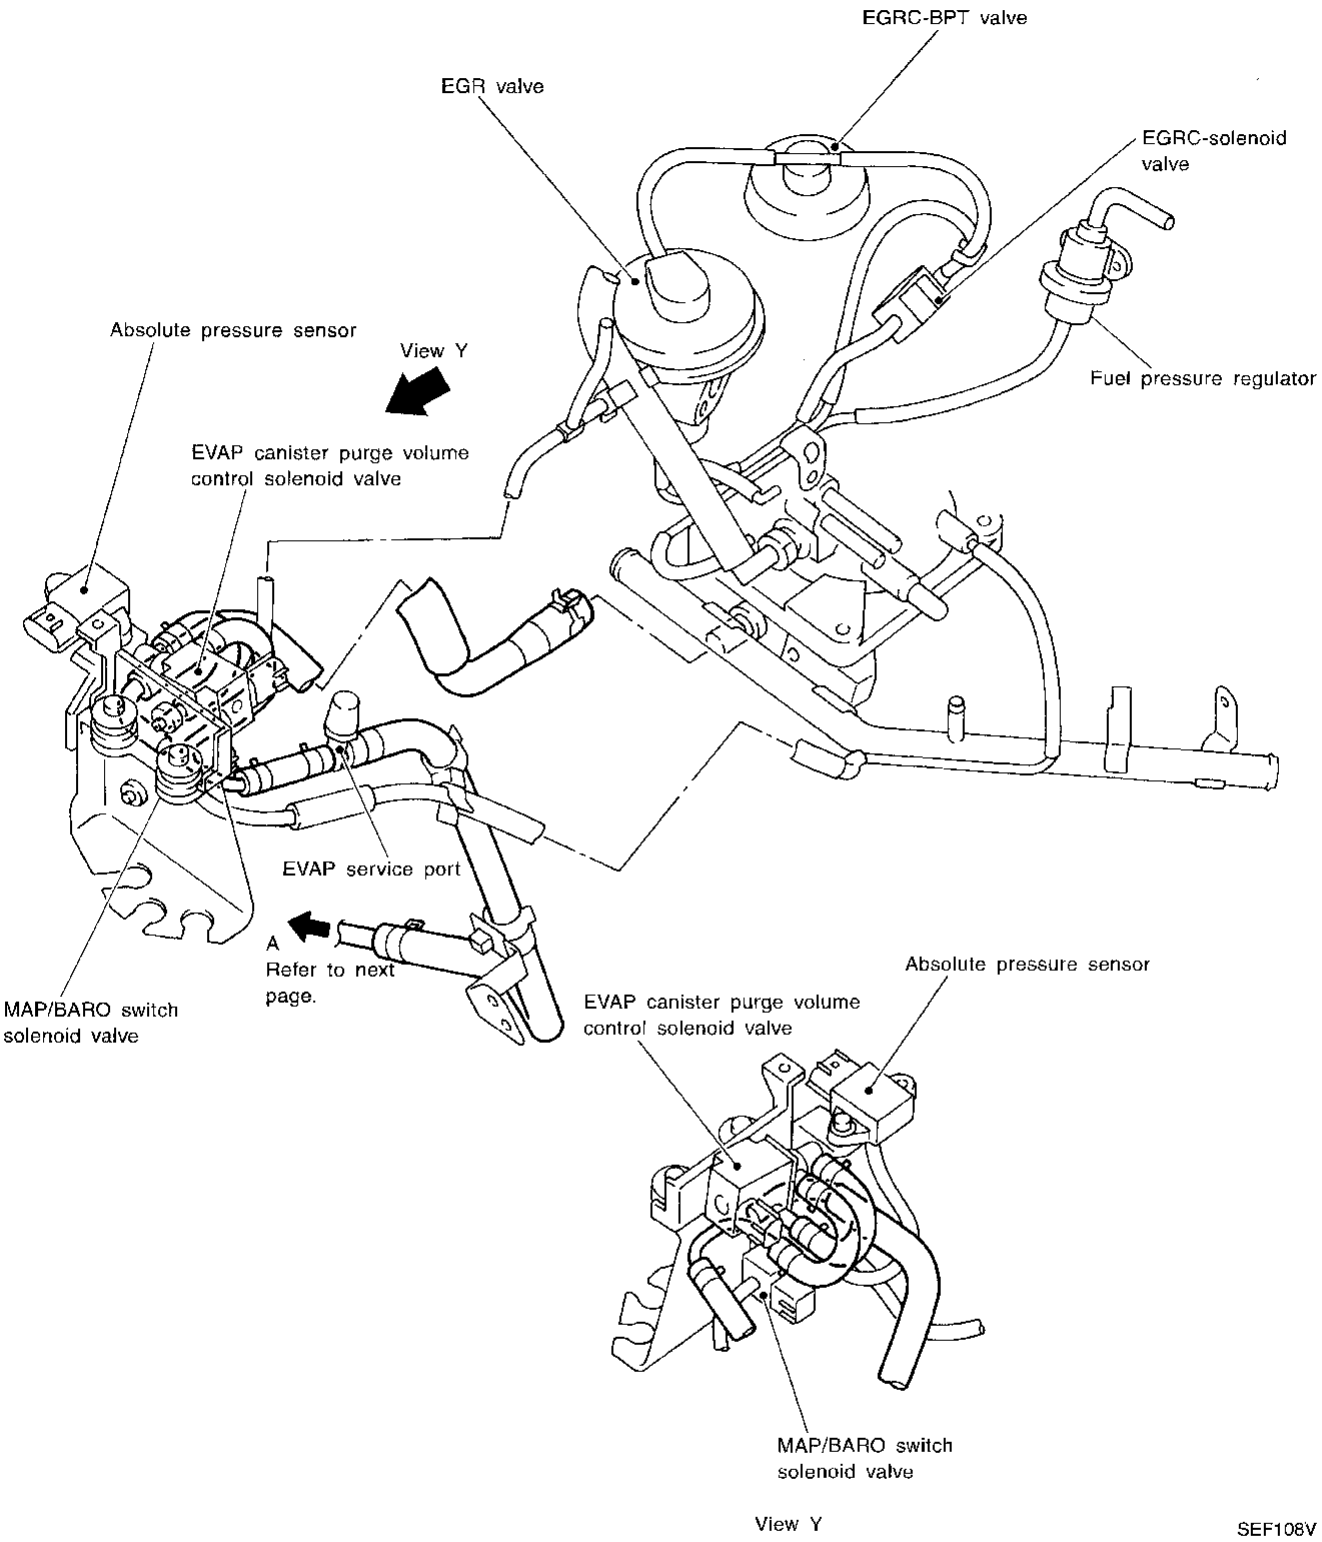
1. Attach the adapter securely to the EVAP SERVICE port.
2. Also attach the pressure pump and hose.
3. Turn ignition switch "ON".
4. Select the "EVAP SYSTEM CLOSE" of "WORK SUPPORT MODE" with CONSULT.
5. Touch "START". A bar graph (Pressure indicating display) will appear on the screen.
6. Apply positive pressure to the EVAP system until the pressure indicator reaches the middle of the bar graph.
7. Remove adapter and hose with pressure pump.
8. Locate the leak using a leak detector. Refer to "Evaporative Emission Line Drawing" on next page.



OR

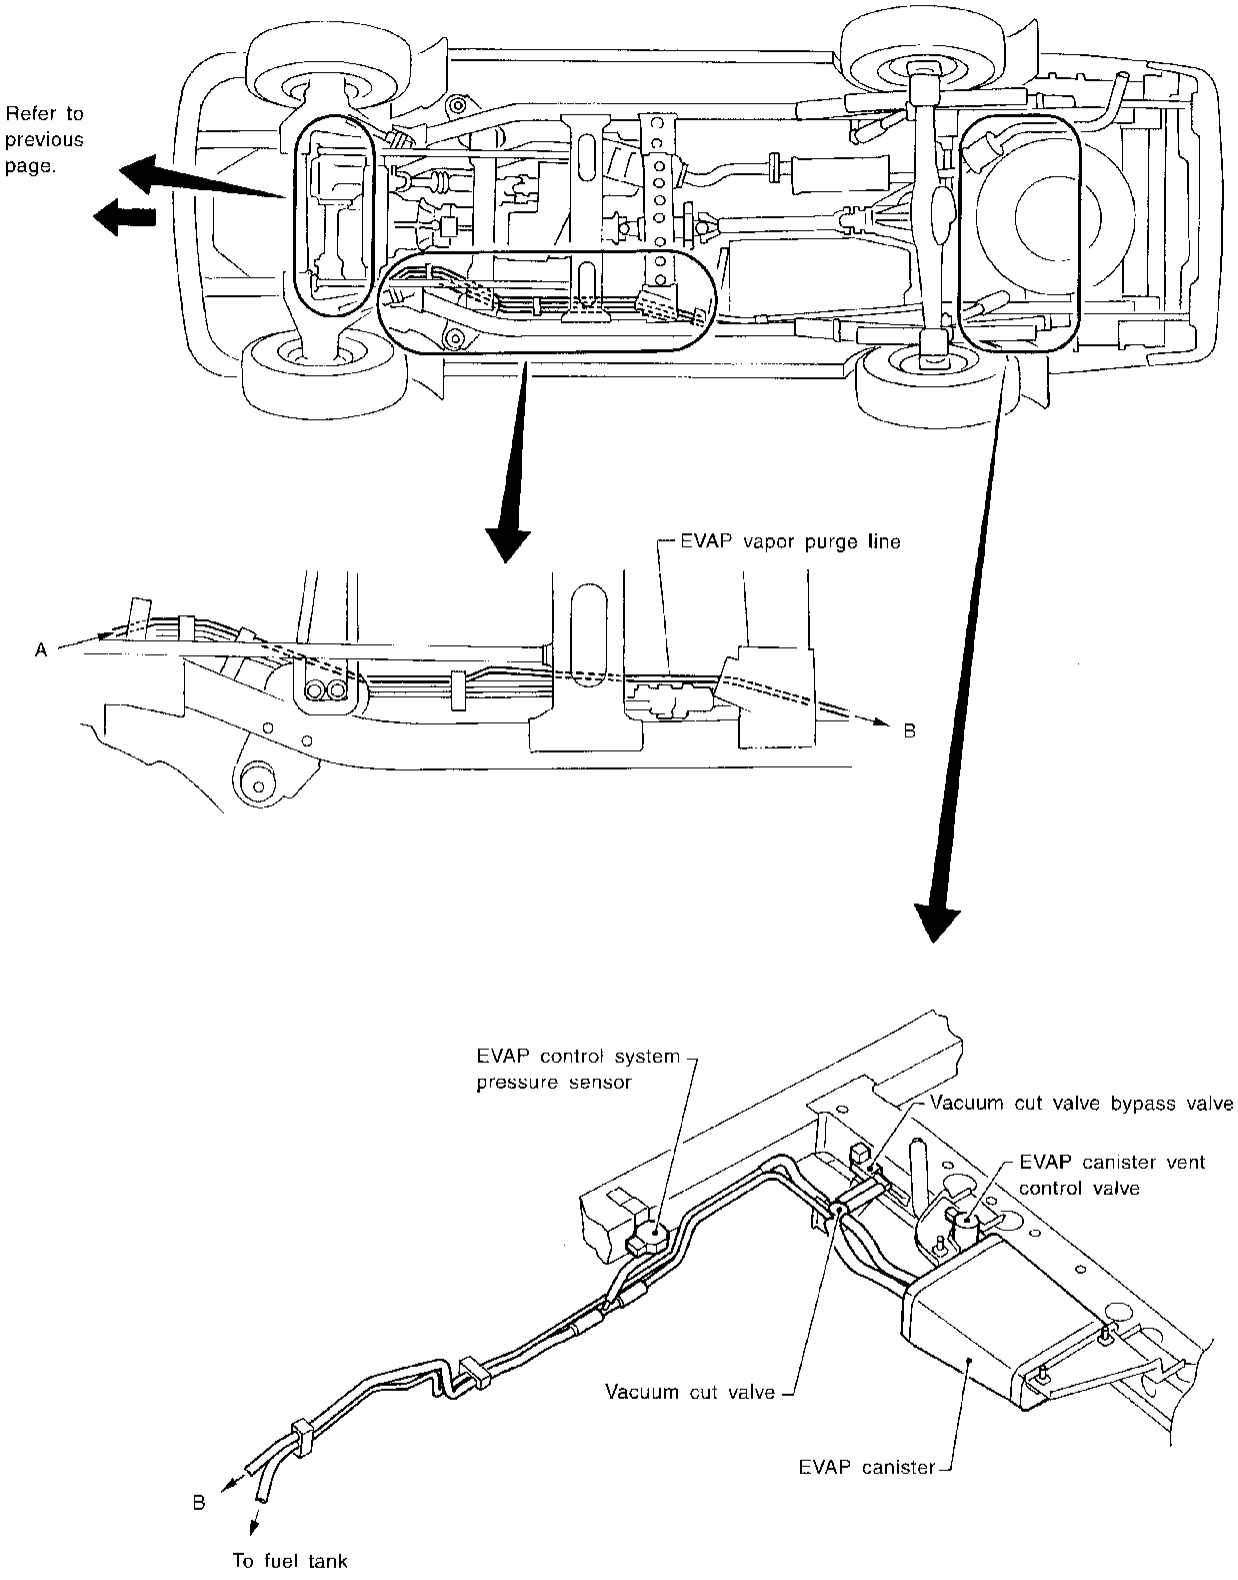
CAUTION:
Never use compressed air or a high pressure pump.

NOTE:
Improper installation of adapter to service port may cause a leak.



1. Attach the adapter securely to the EVAP service port and pressure pump with pressure gauge to the EVAP service port.
2. Apply battery voltage to between the terminals of both EVAP canister vent control valve and vacuum cut valve bypass valve to make a closed EVAP system.
3. To locate the leak, deliver positive pressure to the EVAP system until pressure gauge points reach 1.38 to 2.76 kPa (0.014 to 0.028 kg/cm^2, 0.2 to 0.4 psi).
4. Remove adapter and hose with pressure pump.
5. Locate the leak using a leak detector. Refer to "Evaporative Emission Line Drawing" on next page.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

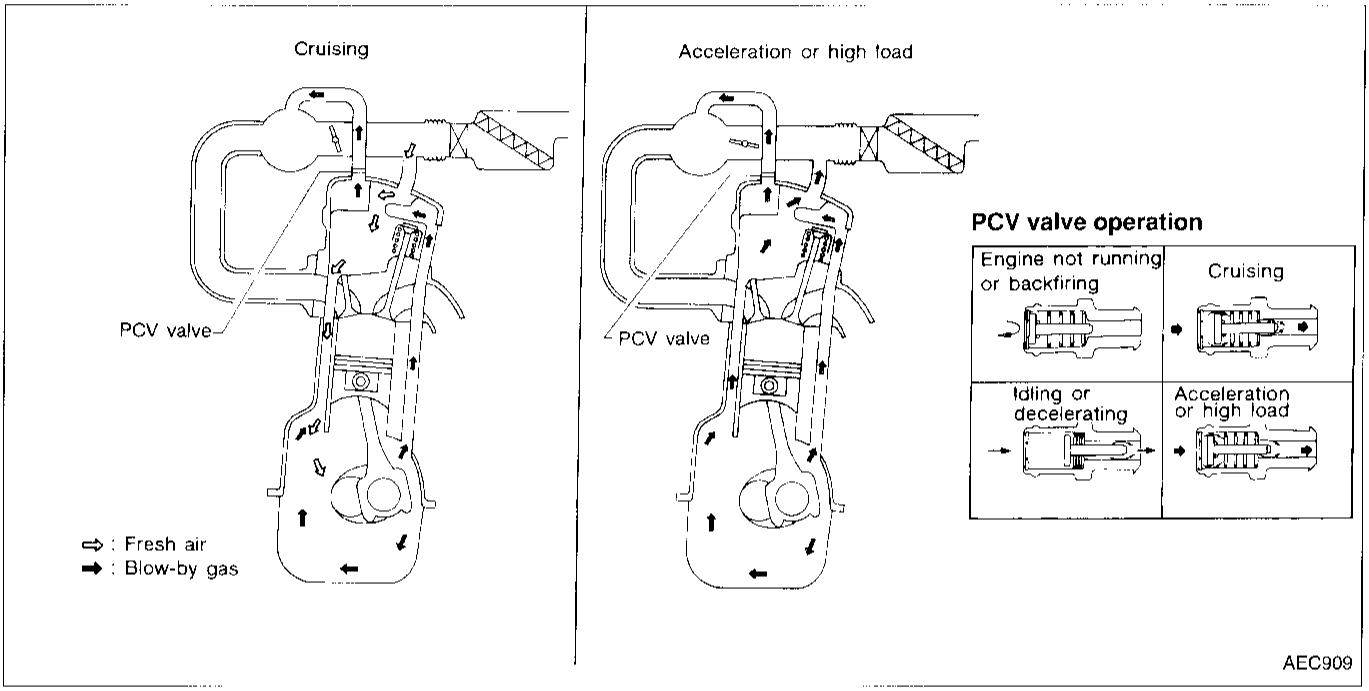


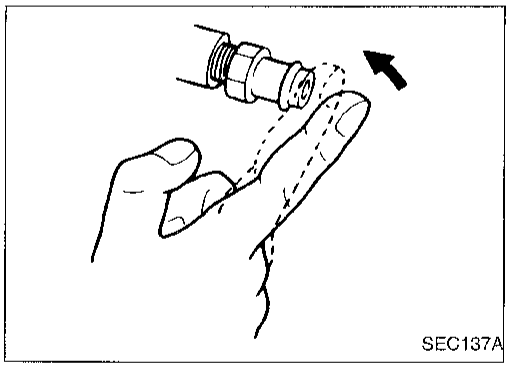
Evaporative Emission Line Drawing

Note: Do not use soapy water or any type of solvent while installing vacuum hoses or purge hoses.

Evaporative Emission Line Drawing (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



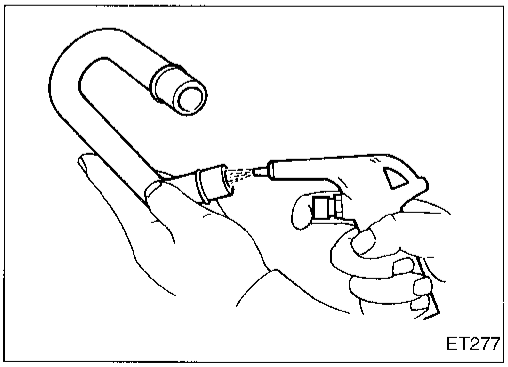


SEF315V

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

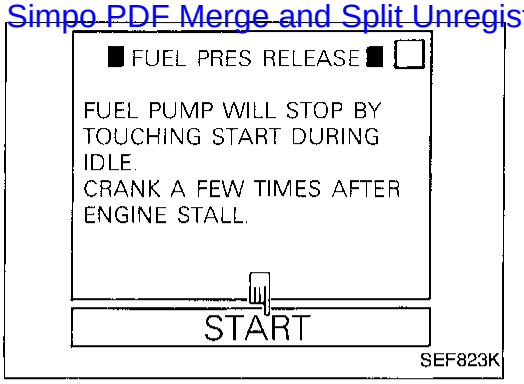
Description

This system returns blow-by gas to the intake collector.
The positive crankcase ventilation (PCV) valve is provided to conduct crankcase blow-by gas to the intake manifold.
During partial throttle operation of the engine, the intake manifold sucks the blow-by gas through the PCV valve.
Normally, the capacity of the valve is sufficient to handle any blow-by and a small amount of ventilating air.
The ventilating air is then drawn from the air duct into the crankcase. In this process the air passes through the hose connecting air inlet tubes to rocker cover.
Under full-throttle condition, the manifold vacuum is insufficient to draw the blow-by flow through the valve. The flow goes through the hose connection in the reverse direction.
On vehicles with an excessively high blow-by, the valve does not meet the requirement. This is because some of the flow will go through the hose connection to the intake collector under all conditions.



Inspection

PCV (Positive Crankcase Ventilation) VALVE

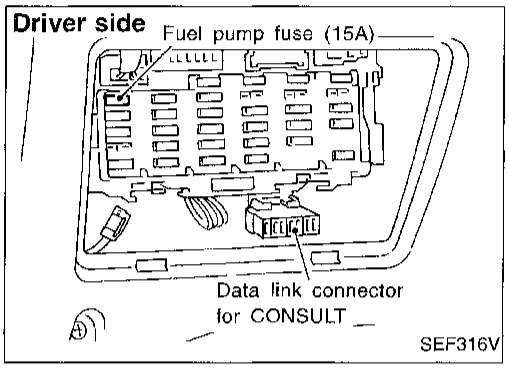


With engine running at idle, remove PCV valve from breather separator. A properly working valve makes a hissing noise as air passes through it. A strong vacuum should be felt immediately when a finger is placed over the valve inlet.

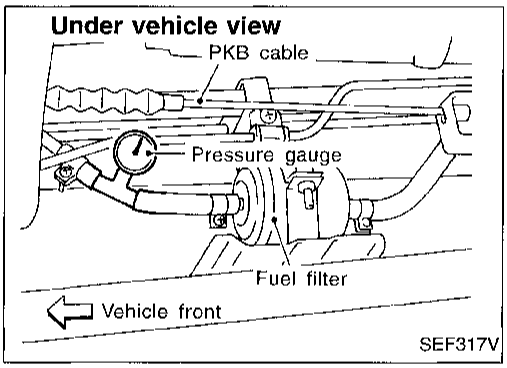
VENTILATION HOSE

1. Check hoses and hose connections for leaks.
2. Disconnect all hoses and clean with compressed air. If any hose cannot be freed of obstructions, replace.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Fuel Pressure Release



Before disconnecting fuel line, release fuel pressure from fuel line to eliminate danger.

1. Start engine.
2. Perform "FUEL PRESSURE RELEASE" in "WORK SUPPORT" mode with CONSULT.
3. After engine stalls, crank it two or three times to make sure that fuel pressure is released.
4. Turn ignition switch "OFF".

OR

1. Remove fuse for fuel pump.
2. Start engine.
3. After engine stalls, crank it two or three times to release all fuel pressure.
4. Turn ignition switch "OFF" and reconnect fuel pump fuse.

Fuel Pressure Check

- **When reconnecting fuel line, always use new clamps.**
- **Make sure that clamp screw does not contact adjacent parts.**
- **Use a torque driver to tighten clamps.**
- **Use Pressure Gauge to check fuel pressure.**
- **Do not perform fuel pressure check with system operating. Fuel pressure gauge may indicate false readings.**

1. Release fuel pressure to zero.
2. Disconnect fuel hose between fuel filter and fuel tube (engine side).
3. Install pressure gauge between fuel filter and fuel tube.
4. Start engine and check for fuel leakage.
5. Read the indication of fuel pressure gauge.

   At idling:

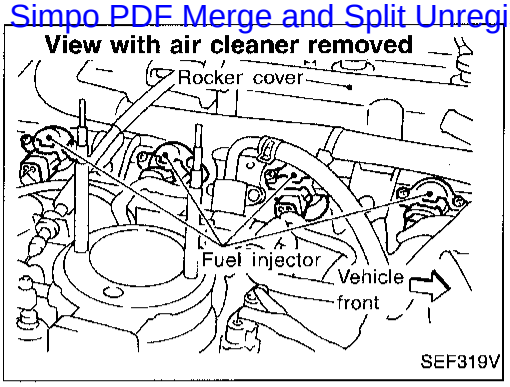
   With vacuum hose connected

   Approximately 235 kPa (2.4 kg/cm^2, 34 psi)

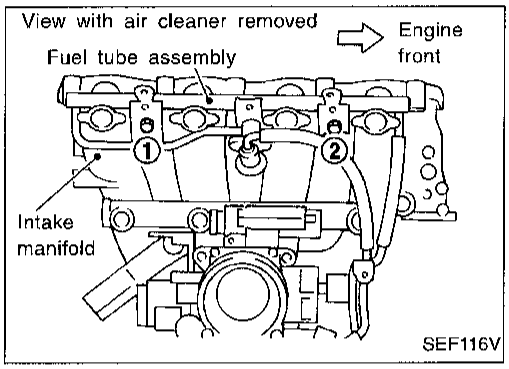
   With vacuum hose disconnected

   Approximately 294 kPa (3.0 kg/cm^2, 43 psi)

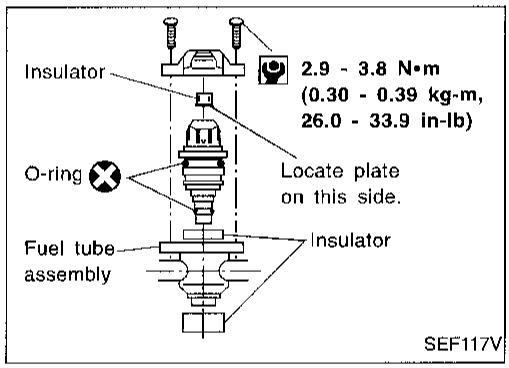
   If results are unsatisfactory, perform "Fuel Pressure Regulator Check".



Fuel Pressure Regulator Check



1. Stop engine and disconnect fuel pressure regulator vacuum hose from intake manifold.
2. Plug intake manifold with a rubber cap.
3. Connect variable vacuum source to fuel pressure regulator.
4. Start engine and read indication of fuel pressure gauge as vacuum is changed.



Fuel pressure should decrease as vacuum increases. If results are unsatisfactory, replace fuel pressure regulator.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

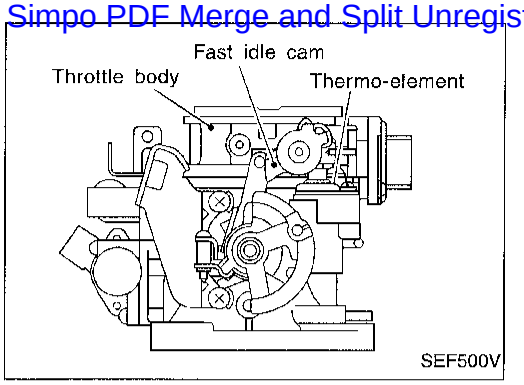
Injector Removal and Installation

1. Release fuel pressure to zero.
2. Remove injector tube assembly with injectors from intake manifold.
3. Remove injectors from injector tube assembly.
- Push injector tail piece.
- Do not pull on the connector.
4. Install injector to fuel tube assembly.

a. Clean exterior of injector tail piece.
b. Use new O-rings.

Always replace O-rings with new ones.
Lubricate O-rings with a smear of engine oil.

5. Install injectors with fuel tube assembly to intake manifold.

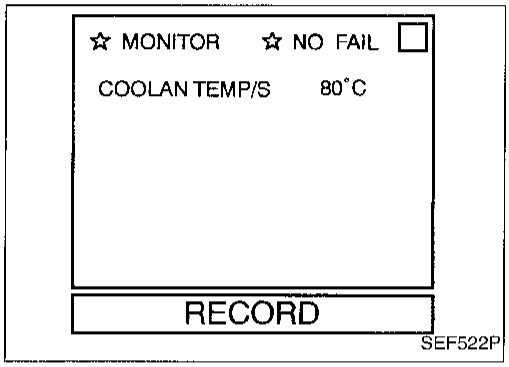


Tighten in numerical order shown in the figure.

a. First, tighten all bolts to 9.3 to 10.8 N·m (0.95 to 1.1 kg-m, 6.9 to 8.0 ft-lb).
b. Then, tighten all bolts to 21 to 26 N·m (2.1 to 2.7 kg-m, 15 to 20 ft-lb).

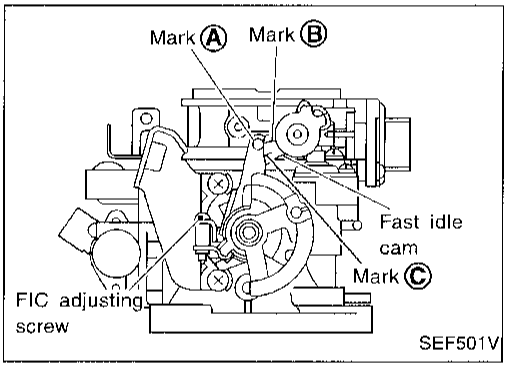
6. Install fuel hoses to fuel tube assembly.
7. Reinstall any parts removed in reverse order of removal.

CAUTION:
After properly connecting injectors to fuel tube assembly, check connections for fuel leakage.



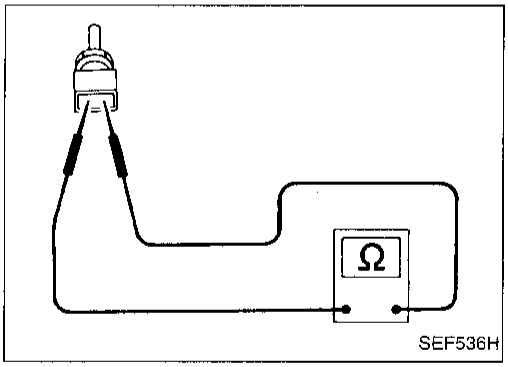
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Fast Idle Cam (FIC)



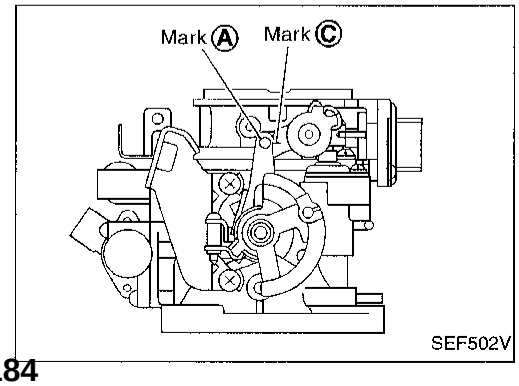
COMPONENT DESCRIPTION

The FIC is installed on the throttle body to maintain adequate engine speed while the engine is cold. It is operated by a volumetric change in wax located inside the thermo-element. The thermo-element is operated by engine coolant temperature.



COMPONENT INSPECTION AND ADJUSTMENT

1. Turn ignition switch "ON".
2. See "COOLAN TEMP/S" in "DATA MONITOR" mode with CONSULT.
3. Start engine and warm it up.
   When engine temperature is 80±5°C (176±9°F), make sure that the center of mark Ⓐ is aligned with mark Ⓑ as shown in the figure.



OR

1. Turn ignition switch "OFF".
2. Disconnect engine coolant temperature sensor harness connector and check resistance as shown in the figure.
3. Start engine and warm it up.
   When the resistance of engine coolant temperature sensor is 0.26 to 0.39 kΩ, make sure that the center of mark Ⓐ is aligned with mark Ⓑ as shown in the figure.

- If NG, adjust by turning adjusting screw.
  Adjusting screw tightening torque:
  0.98 - 1.96 N·m (10 - 20 kg-cm, 8.7 - 17.4 in-lb)

4. Stop engine.
5. Turn ignition switch "ON" and see "COOLAN TEMP/S" in "DATA MONITOR" mode with CONSULT.
6. When engine coolant temperature is 25±5°C (77±9°F), make sure that the center of mark Ⓐ is aligned with mark Ⓒ as shown in the figure.

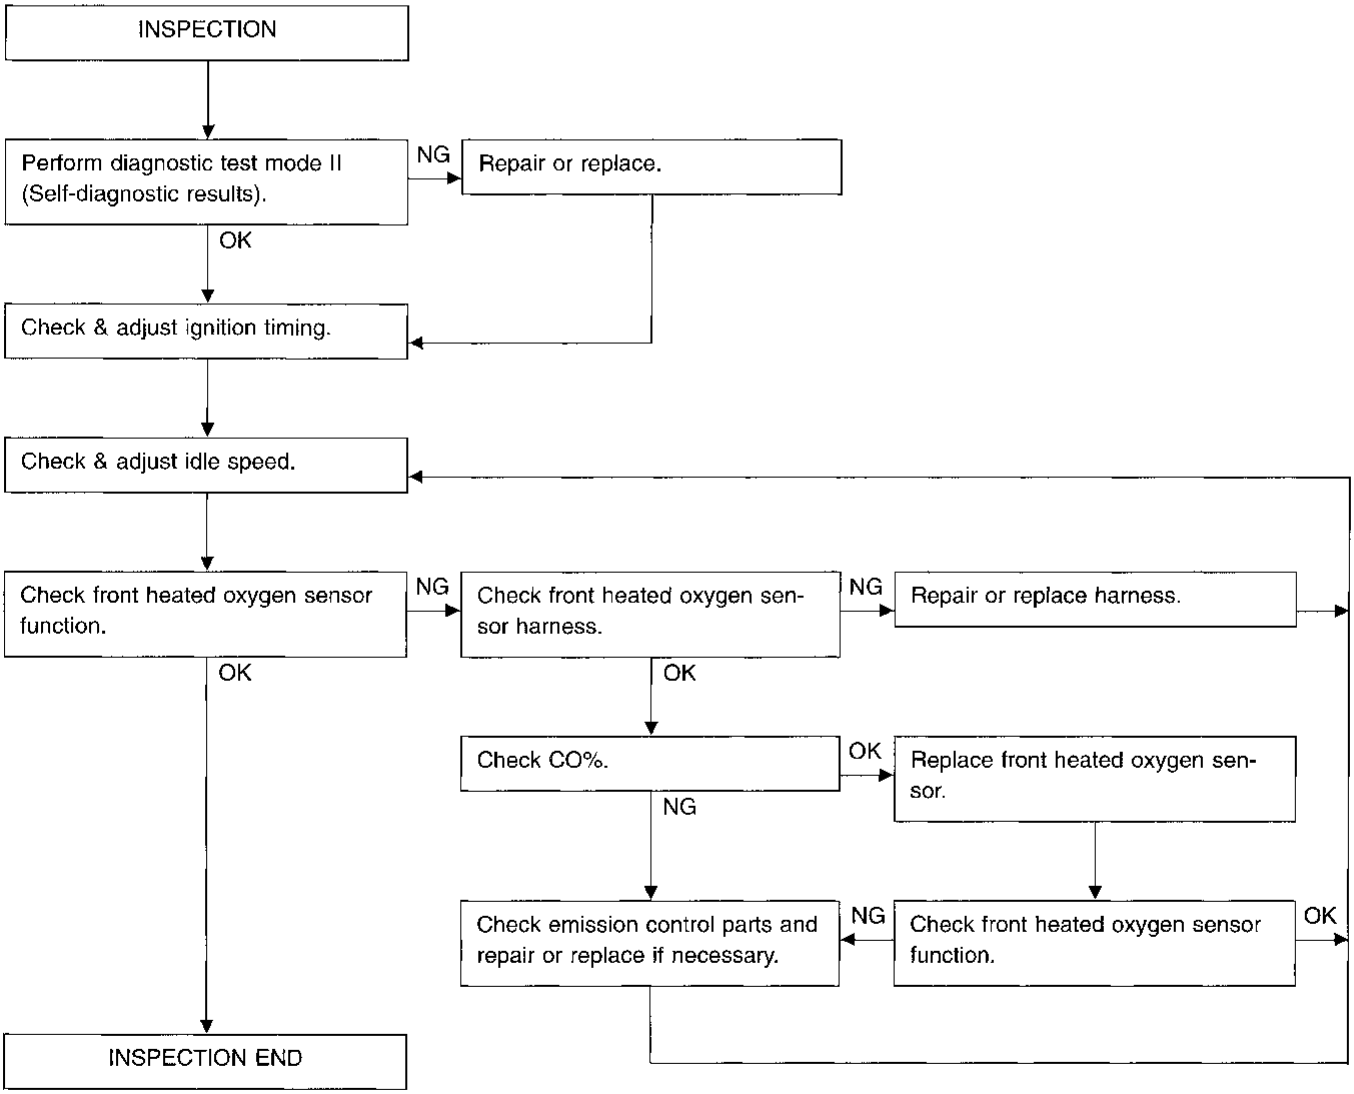
OR

5. When the resistance of engine coolant temperature sensor is 1.65 to 2.40 kΩ, make sure that the center of mark Ⓐ is aligned with mark Ⓒ as shown in the figure.

- If NG, replace thermo-element and perform the above inspection and adjustment again.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Idle Speed/Ignition Timing/Idle Mixture Ratio Adjustment



PREPARATION

- Make sure that the following parts are in good order.

(1) Battery
(2) Ignition system
(3) Engine oil and coolant levels
(4) Fuses
(5) ECM harness connector
(6) Vacuum hoses
(7) Air intake system
(Oil filler cap, oil level gauge, etc.)
(8) Fuel pressure
(9) Engine compression
(10) EGR valve operation
(11) Throttle valve
(12) EVAP system

- On models equipped with air conditioner, checks should be carried out while the air conditioner is "OFF".
- On models equipped with automatic transaxle, when checking idle speed, ignition timing and mixture ratio, checks should be carried out while shift lever is in "N" position.
- When measuring "CO" percentage, insert probe more than 40 cm (15.7 in) into tail pipe.
- Turn off headlamps, heater blower.
- Keep front wheels pointed straight ahead.

*: ECM may be the cause of a problem, but this is rarely the case.

- **If a vehicle contains a part which is operating outside of design specifications with no MIL illumination, the part shall not be replaced prior to emission testing unless it is determined that the part has been tampered with or abused in such a way that the diagnostic system cannot reasonably be expected to detect the resulting malfunction.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Introduction

The ECM has an on board diagnostic system, which detects malfunctions related to engine sensors or actuators. The ECM also records various emission-related diagnostic information including:

- Diagnostic Trouble Code (DTC) .....Mode 3 of SAE J1979
- Freeze Frame data .....Mode 2 of SAE J1979
- System Readiness Test (SRT) code .....Mode 1 of SAE J1979
- 1st Trip Diagnostic Trouble Code (1st Trip DTC) .....Mode 7 of SAE J1979
- 1st Trip Freeze Frame data
- Test values and Test limits .....Mode 6 of SAE J1979

The above information can be checked using procedures listed in the table below.

	DTC	1st trip DTC	Freeze Frame data	1st trip Freeze Frame data	SRT code	Test value
Diagnostic test mode II (Self-diagnostic results)	○	○*1				
CONSULT	○	○	○	○	○	
GST	○	○*2	○		○	○

*1: When DTC and 1st trip DTC simultaneously appear on the display, they cannot be clearly distinguished from each other.
*2: 1st trip DTCs for self-diagnoses concerning SRT items cannot be shown on the GST display.

The malfunction indicator lamp (MIL) on the instrument panel lights up when the same malfunction is detected in two consecutive trips (Two trip detection logic), or when the ECM enters fail-safe mode (Refer to EC-76.).

Two Trip Detection Logic

When a malfunction is detected for the first time, 1st trip DTC and 1st trip Freeze Frame data are stored in the ECM memory. The MIL will not light up at this stage. <1st trip>
If the same malfunction is detected again during the next drive, the DTC and Freeze Frame data are stored in the ECM memory, and the MIL lights up. The MIL lights up at the same time when the DTC is stored. <2nd trip> The "trip" in the "Two Trip Detection Logic" means a driving mode in which self-diagnosis is performed during vehicle operation. Specific on board diagnostic items will cause the ECM to light up or blink the MIL, and store DTC and Freeze Frame data, even in the 1st trip, as shown below.

Items	MIL			DTC		1st trip DTC	
	1st trip		2nd trip lighting up	1st trip displaying	2nd trip displaying	1st trip displaying	2nd trip displaying
	Blinking	Lighting up					
Misfire (Possible three way catalyst damage) — DTC: P0300 - P0304 (0701, 0605 - 0608) is being detected	X			X		X	
Misfire (Possible three way catalyst damage) — DTC: P0300 - P0304 (0701, 0605 - 0608) has been detected		X		X		X	
Closed loop control — DTC: P1148 (0307)		X		X		X	
Fail-safe items (Refer to EC-76.)		X		X*1		X*1	
Except above			X		X	X	X

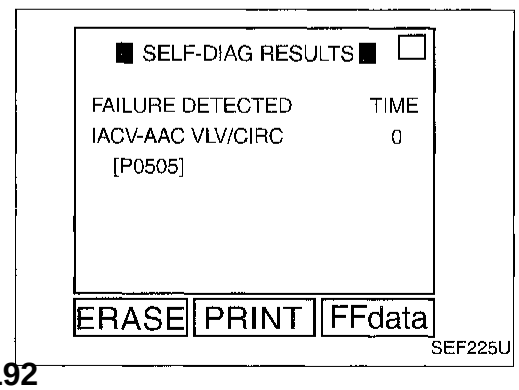
*1: Except "ECM".

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Emission-related Diagnostic Information

DTC AND 1ST TRIP DTC

The 1st trip DTC (whose number is the same as the DTC number) is displayed for the latest self-diagnostic result obtained. If the ECM memory was cleared previously, and the 1st trip DTC did not reoccur, the 1st trip DTC will not be displayed. If a malfunction is detected during the 1st trip, the 1st trip DTC is stored in the ECM memory. The MIL will not light up (two trip detection logic). If the same malfunction is not detected in the 2nd trip (meeting the required driving pattern), the 1st trip DTC is cleared from the ECM memory. If the same malfunction is detected in the 2nd trip, both the 1st trip DTC and DTC are stored in the ECM memory and the MIL lights up. In other words, the DTC is stored in the ECM memory and the MIL lights up when the same malfunction occurs in two consecutive trips. If a 1st trip DTC is stored and a non-diagnostic operation is performed between the 1st and 2nd trips, only the 1st trip DTC will continue to be stored. For malfunctions that blink or light up the MIL during the 1st trip, the DTC and 1st trip DTC are stored in the ECM memory.
Procedures for clearing the DTC and the 1st trip DTC from the ECM memory are described in "HOW TO ERASE EMISSION-RELATED DIAGNOSTIC INFORMATION". Refer to EC-45.
For malfunctions in which 1st trip DTCs are displayed, refer to EC-43. These items are required by legal regulations to continuously monitor the system/component. In addition, the items monitored non-continuously are also displayed on CONSULT.
1st trip DTC is specified in Mode 7 of SAE J1979. 1st trip DTC detection occurs without lighting up the MIL and therefore does not warn the driver of a problem. However, 1st trip DTC detection will not prevent the vehicle from being tested, for example during Inspection/Maintenance (I/M) tests.
When a 1st trip DTC is detected, check, print out or write down and erase (1st trip) DTC and Freeze Frame data as specified in "Work Flow" procedure Step II, refer to page EC-69. Then perform "Diagnostic trouble code confirmation procedure" or "Overall function check" to try to duplicate the problem. If the malfunction is duplicated, the item requires repair.

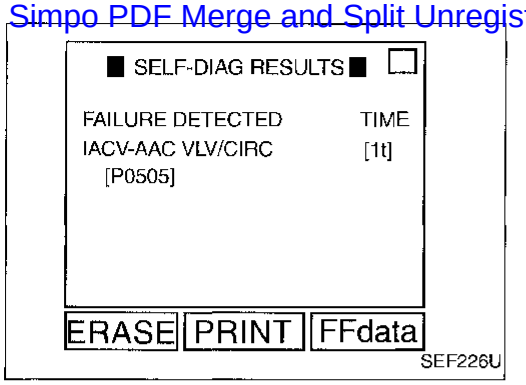


How to read DTC and 1st trip DTC

DTC and 1st trip DTC can be read by the following methods.

1. The number of blinks of the malfunction indicator lamp in the Diagnostic Test Mode II (Self-Diagnostic Results) Examples: 0101, 0201, 1003, 1104, etc.
   These DTCs are controlled by NISSAN.

2. CONSULT or GST (Generic Scan Tool) Examples: P0340, P1320, P0705, P0750, etc.
   These DTCs are prescribed by SAE J2012.
   (CONSULT also displays the malfunctioning component or system.)



- **1st trip DTC No. is the same as DTC No.**
- **Output of a DTC indicates a malfunction. However, Mode II and GST do not indicate whether the malfunction is still occurring or has occurred in the past and has returned to normal. CONSULT can identify malfunction status as shown below. Therefore, using CONSULT (if available) is recommended.**

A sample of CONSULT display for DTC is shown at left. DTC or 1st trip DTC of a malfunction is displayed in SELF-DIAGNOSTIC RESULTS mode of CONSULT. Time data indicates how many times the vehicle was driven after the last detection of a DTC.
If the DTC is being detected currently, the time data will be "0".

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Emission-related Diagnostic Information (Cont'd)

If a 1st trip DTC is stored in the ECM, the time data will be "[1t]".

FREEZE FRAME DATA AND 1ST TRIP FREEZE FRAME DATA

The ECM records the driving conditions such as fuel system status, calculated load value, engine coolant temperature, short term fuel trim, long term fuel trim, engine speed, vehicle speed and absolute pressure sensor at the moment a malfunction is detected.

Data which are stored in the ECM memory, along with the 1st trip DTC, are called 1st trip freeze frame data. The data, stored together with the DTC data, are called freeze frame data and displayed on CONSULT or GST. The 1st trip freeze frame data can only be displayed on the CONSULT screen, not on the GST. For details, see EC-57.

Only one set of freeze frame data (either 1st trip freeze frame data or freeze frame data) can be stored in the ECM. 1st trip freeze frame data is stored in the ECM memory along with the 1st trip DTC. There is no priority for 1st trip freeze frame data and it is updated each time a different 1st trip DTC is detected. However, once freeze frame data (2nd trip detection/MIL on) is stored in the ECM memory, 1st trip freeze frame data is no longer stored. Remember, only one set of freeze frame data can be stored in the ECM. The ECM has the following priorities to update the data.

Priority	Items	
1	Freeze frame data	Misfire — DTC: P0300 - P0304 (0701, 0605 - 0608) Fuel Injection System Function — DTC: P0171 (0115), P0172 (0114)
2		Except the above items
3	1st trip freeze frame data	

For example, the EGR malfunction (Priority: 2) was detected and the freeze frame data was stored in the 2nd trip. After that when the misfire (Priority: 1) is detected in another trip, the freeze frame data will be updated from the EGR malfunction to the misfire. The 1st trip freeze frame data is updated each time a different malfunction is detected. There is no priority for 1st trip freeze frame data. However, once freeze frame data is stored in the ECM memory, first trip freeze data is no longer stored (because only one freeze frame data or first trip freeze frame data can be stored in the ECM). If freeze frame data is stored in the ECM memory and freeze frame data with the same priority occurs later, the first (original) freeze frame data remains unchanged in the ECM memory.

Both 1st trip freeze frame data and freeze frame data (along with the DTCs) are cleared when the ECM memory is erased. Procedures for clearing the ECM memory are described in "HOW TO ERASE EMISSION-RELATED DIAGNOSTIC INFORMATION". Refer to EC-45.

SYSTEM READINESS TEST (SRT) CODE

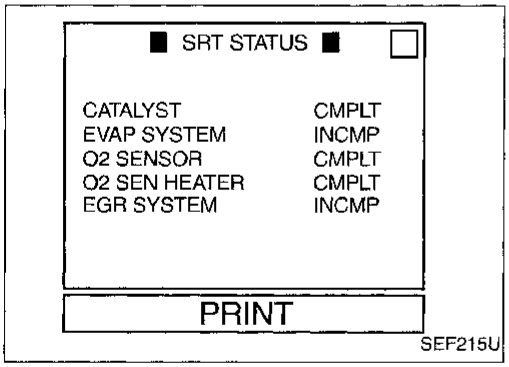
System Readiness Test (SRT) code is specified in Mode 1 of SAE J1979. It indicates whether the self-diagnostic tests for non-continuously monitored items have been completed or not.

Inspection/Maintenance (I/M) tests of the on board diagnostic (OBD) II system may become the legal requirements in some states/areas. All SRT codes must be set in this case. Unless all SRT codes are set, conducting the I/M test may not be allowed.

SRT codes are set after self-diagnosis has been performed one or more times. This occurs regardless of whether the diagnosis is in "OK" or "NG", and whether or not the diagnosis is performed in consecutive trips. The following table lists the five SRT items (18 test items) for the ECCS used in D22 models.

Emission-related Diagnostic Information (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



SRT items	Self-diagnostic test items
Catalyst monitoring	● Three way catalyst function P0420 (0702)
EVAP system monitoring	● EVAP control system (Small leak — Negative pressure) P0440 (0705) ● EVAP control system (Small leak — Positive pressure) P1440 (0213) ● EVAP control system purge flow monitoring P1447 (0111)
Oxygen sensor monitoring	● Front heated oxygen sensor (Response monitoring) P0133 (0409) ● Front heated oxygen sensor (Rich shift monitoring) P0132 (0410) ● Front heated oxygen sensor (Lean shift monitoring) P0131 (0411) ● Front heated oxygen sensor (Circuit) P0130 (0303) ● Front heated oxygen sensor (High voltage) P0134 (0412) ● Rear heated oxygen sensor (Response monitoring) P0139 (0707) ● Rear heated oxygen sensor (Max. voltage monitoring) P0138 (0510) ● Rear heated oxygen sensor (Min. voltage monitoring) P0137 (0511) ● Rear heated oxygen sensor (High voltage) P0140 (0512)
Oxygen sensor heater monitoring	● Front heated oxygen sensor heater P0135 (0901) ● Rear heated oxygen sensor heater P0141 (0902)
EGR system monitoring	● EGR function (Close) P0400 (0302) ● EGR function (Open) P1402 (0514) ● EGRC-BPT valve function P0402 (0306)

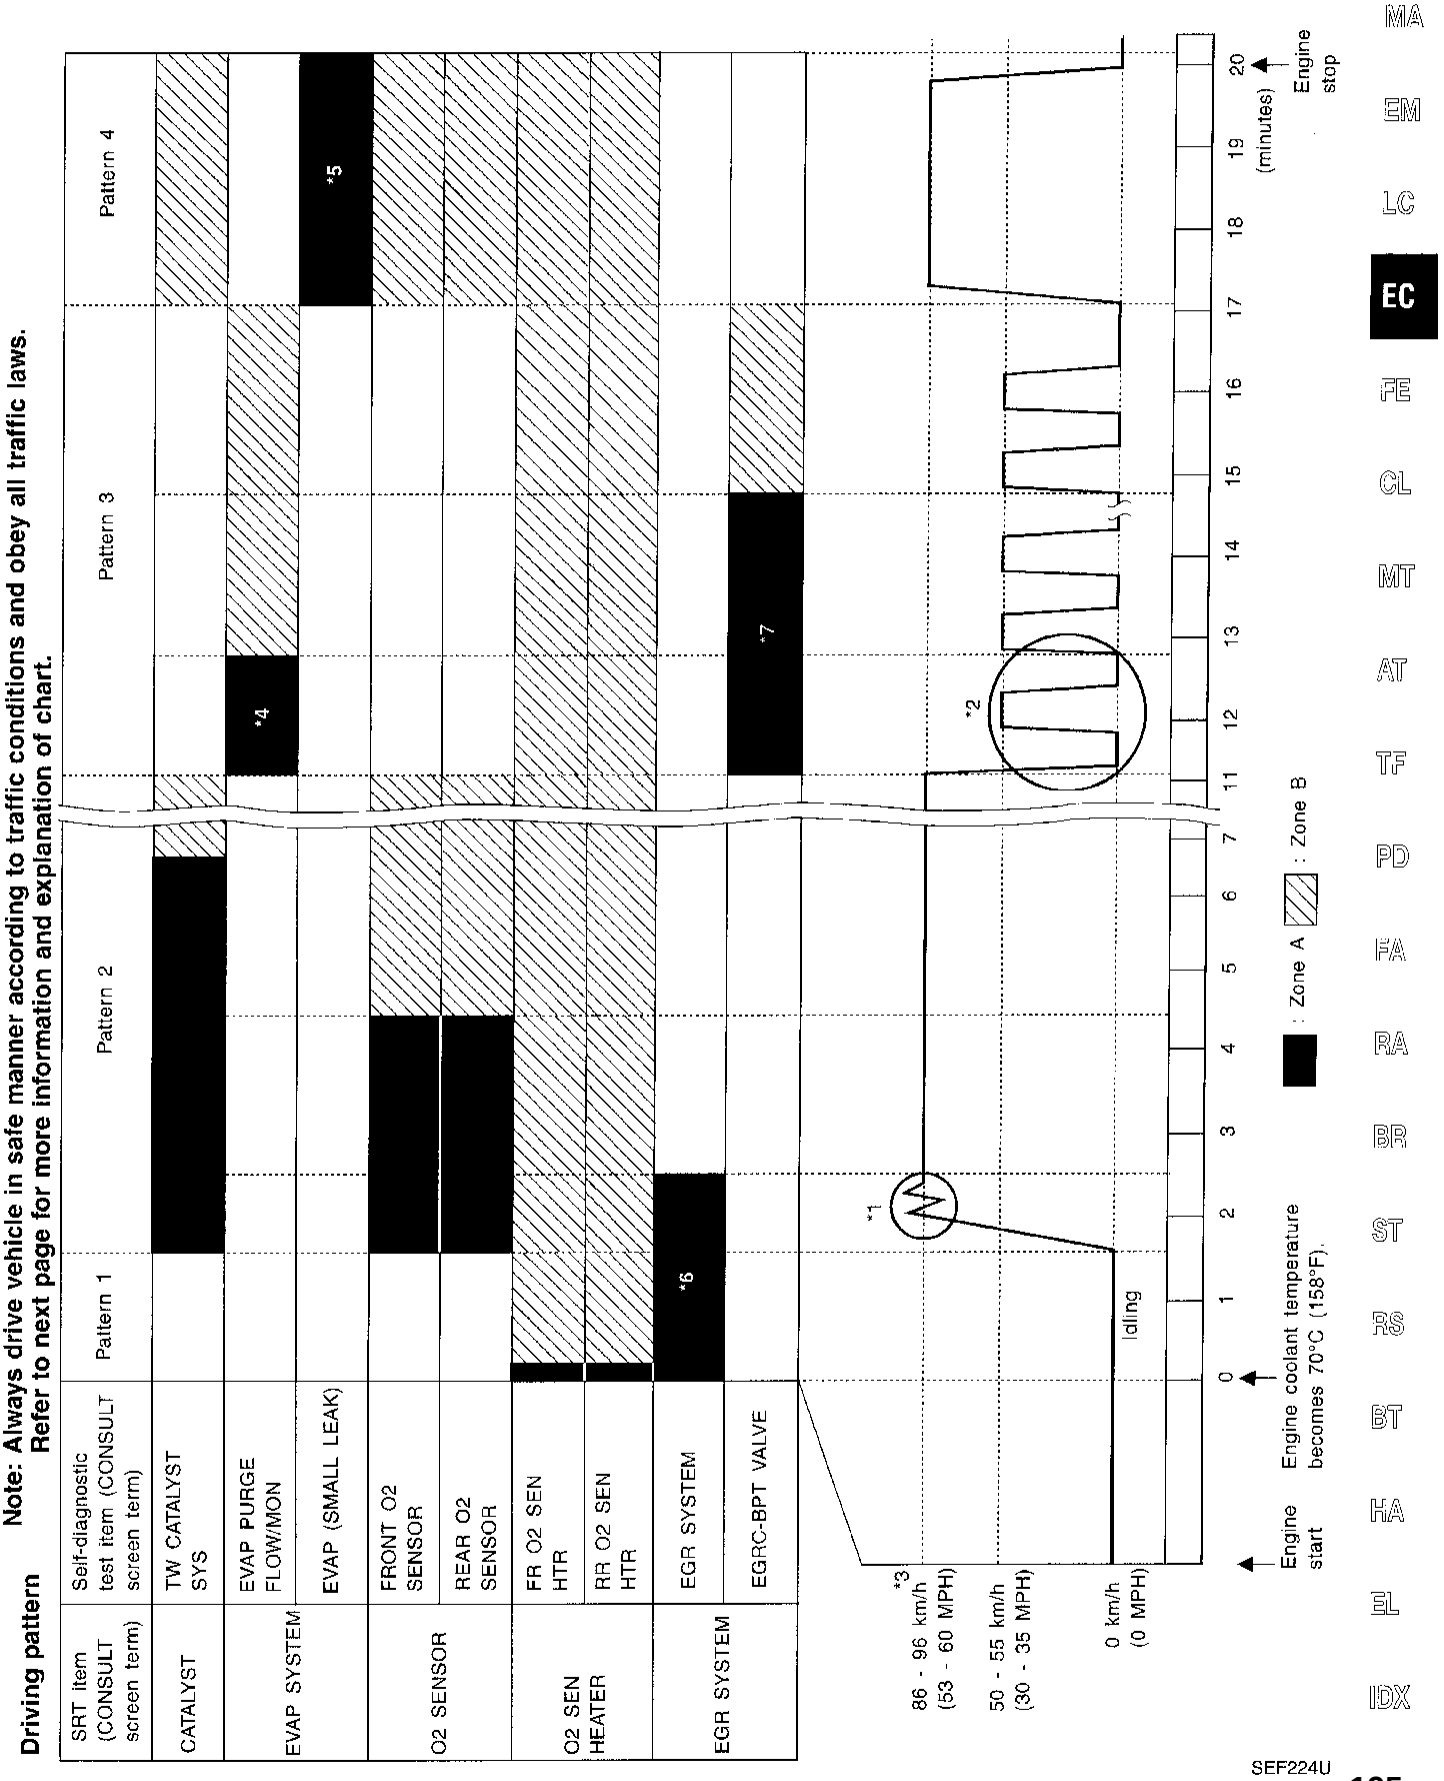
Together with the DTC, the SRT code is cleared from the ECM memory using the method described later (Refer to EC-45). In addition, after ECCS components/system are repaired or if the battery terminals remain disconnected for more than 24 hours, all SRT codes may be cleared from the ECM memory.

How to display SRT code

1. Selecting "SRT STATUS" in "DTC CONFIRMATION" mode with CONSULT.
   For items whose SRT codes are set, a "CMPLT" is displayed on the CONSULT screen; for items whose SRT codes are not set, "INCMP" is displayed.

2. Selecting Mode 1 with GST (Generic Scan Tool)

A sample of CONSULT display for SRT code is shown at left. "INCMP" means the self-diagnosis is incomplete and SRT is not set. "CMPLT" means the self-diagnosis is complete and SRT is set.



How to set SRT code

To set all SRT codes, self-diagnosis for the items indicated above must be performed one or more times. Each diagnosis may require a long period of actual driving under various conditions. The most efficient driving pattern in which SRT codes can be properly set is explained on the next page. The driving pattern should be performed one or more times to set all SRT codes.

Emission-related Diagnostic Information (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

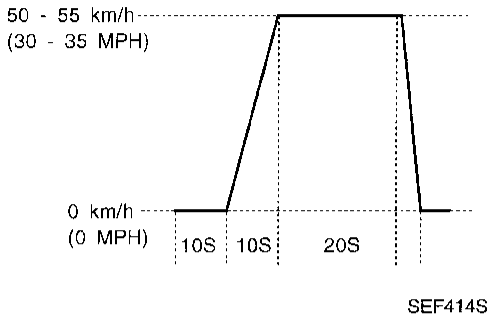
Driving pattern

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

- The time required for each diagnosis varies with road surface conditions, weather, altitude, individual driving habits, etc.
  Zone A refers to the range where the time required, for the diagnosis under normal conditions*, is the shortest. Zone B refers to the range where the diagnosis can still be performed if the diagnosis is not completed within zone A.

*: Normal conditions refer to the following:
— Sea level
— Flat road
— Ambient air temperature: 20 - 30°C (68 - 86°F)
— Diagnosis is performed as quickly as possible under normal conditions.
  Under different conditions [For example: ambient air temperature other than 20 - 30°C (68 - 86°F)], diagnosis may also be performed.

Pattern 1:
- **The engine is started at the engine coolant temperature of –10 to 35°C (14 to 95°F) (where the voltage between the ECM terminals ⑤⑨ and ④③ is 3.0 - 4.3V).**
- **The engine must be operated at idle speed until the engine coolant temperature is greater than 70°C (158°F) (where the voltage between the ECM terminals ⑤⑨ and ④③ is lower than 1.4V).**
- **The engine is started at the tank fuel temperature of warmer than 0°C (32°F) (where the voltage between the ECM terminals ⑥⓪ and ground is less than 4.1V).**



Pattern 2:
- When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.

Pattern 3:
- The driving pattern outlined in *2 must be repeated at least 3 times.
  On M/T models, shift gears following "suggested upshift speeds" schedule on next page.

Pattern 4:
- Tests are performed after the engine has been operated for at least 17 minutes.
- The accelerator pedal must be held very steady during steady-state driving.
- If the accelerator pedal is moved, the test must be conducted all over again.

*1: Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.

*2: Operate the vehicle in the following driving pattern.
1) Decelerate vehicle to 0 km/h and let engine idle.
2) Repeat driving pattern shown below at least 10 times.
   - **During acceleration, hold the accelerator pedal as steady as possible. (The THROTL POS SEN value of CONSULT should be between 0.8 to 1.2V.)**
3) Repeat steps 1 and 2 until the EGR system SRT is set.

SEF414S

*3: Checking the vehicle speed with CONSULT or GST is advised.

*4: The driving pattern may be omitted when "PURG FLOW P1447" is performed using the "DTC WORK SUPPORT" mode with CONSULT.

*5: The driving pattern may be omitted when "EVAP SML LEAK P0440" is performed using the "DTC WORK SUPPORT" mode with CONSULT.

*6: The driving pattern may be omitted when all the followings are performed using the "DTC WORK SUPPORT" mode with CONSULT.
- "EGR SYSTEM P0400"
- "EGR SYSTEM P1402"

*7: The driving pattern may be omitted when all the followings are performed using the "DTC WORK SUPPORT" mode with CONSULT.
- "PURGE FLOW P1447"
- "EGRC-BPT/VLV P0402"

Emission-related Diagnostic Information (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Suggested transmission gear position for A/T models

Set the selector lever in the "D" position with "OD" ON.

Suggested upshift speeds for M/T models

Shown below are suggested vehicle speeds for shifting into a higher gear. These suggestions relate to fuel economy and vehicle performance. Actual upshift speeds will vary according to road conditions, the weather and individual driving habits.

Gear change (2H and 4H position)	ACCEL shift point km/h (MPH)
1st to 2nd	24 (15)
2nd to 3rd	40 (25)
3rd to 4th	64 (40)
4th to 5th	72 (45)

Suggested maximum speed in each gear

Downshift to a lower gear if the engine is not running smoothly, or if you need to accelerate.
Do not exceed the maximum suggested speed (shown below) in any gear. For level road driving, use the highest gear suggested for that speed. Always observe posted speed limits and drive according to the road conditions to ensure safe operation. Do not over-rev the engine when shifting to a lower gear as it may cause engine damage or loss of vehicle control.

2-wheel drive models

Gear	km/h (MPH)
1st	48 (30)
2nd	88 (55)
3rd	129 (80)
4th & 5th	— (—)

4-wheel drive models
2H/4H position

Gear	km/h (MPH)
1st	40 (25)
2nd	69 (43)
3rd	109 (68)
4th & 5th	— (—)

Emission-related Diagnostic Information (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

TEST VALUE AND TEST LIMIT (GST only — not applicable to CONSULT)

The following is the information specified in Mode 6 of SAE J1979.
The test value is a parameter used to determine whether a system/circuit diagnostic test is "OK" or "NG" while being monitored by the ECM during self-diagnosis. The test limit is a reference value which is specified as the maximum or minimum value and is compared with the test value being monitored.
Items for which these data (test value and test limit) are displayed are the same as SRT code items (9 test items).
These data (test value and test limit) are specified by Test ID (TID) and Component ID (CID) and can be displayed on the GST screen.

X: Applicable
—: Not applicable

SRT item (CONSULT display)	Self-diagnostic test item	Test value		Test limit	Application
		TID	CID		
CATALYST	Three way catalyst function	01H	01H	Max.	X

Emission-related Diagnostic Information (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

HOW TO ERASE EMISSION-RELATED DIAGNOSTIC INFORMATION

How to erase DTC (With CONSULT)

1. If the ignition switch stays "ON" after repair work, be sure to turn ignition switch "OFF" once. Wait at least 5 seconds and then turn it "ON" (engine stopped) again.
2. Turn CONSULT "ON" and touch "ENGINE".
3. Touch "SELF-DIAG RESULTS".
4. Touch "ERASE". (The DTC in the ECM will be erased.)

How to erase DTC (With CONSULT)

1. If the ignition switch stays "ON" after repair work, be sure to turn ignition switch "OFF" once. Wait at least 5 seconds and then turn it "ON" again.

2. Turn CONSULT "ON" and touch "ENGINE".
3. Touch "SELF-DIAG RESULTS".
4. Touch "ERASE". (The DTC in the ECM will be erased.)

SEF847U

The emission-related diagnostic information in the ECM can be erased by selecting "ERASE" in the "SELF-DIAG RESULTS" mode with CONSULT.

How to erase DTC (With GST)

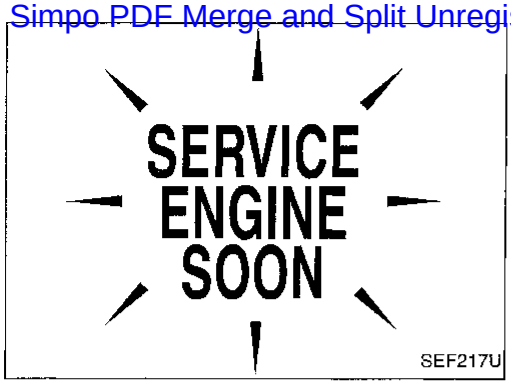
1. If the ignition switch stays "ON" after repair work, be sure to turn ignition switch "OFF" once. Wait at least 5 seconds and then turn it "ON" (engine stopped) again.
2. Select Mode 4 with GST (Generic Scan Tool).

The emission-related diagnostic information in the ECM can be erased by selecting Mode 4 with GST (Generic Scan Tool).

How to erase DTC (No Tools)

1. If the ignition switch stays "ON" after repair work, be sure to turn ignition switch "OFF" once. Wait at least 5 seconds and then turn it "ON" again.
2. Change the diagnostic test mode from Mode II to Mode I by turning the mode selector on the ECM. (See EC-47.)

The emission-related diagnostic information in the ECM can be erased by changing the diagnostic test mode from Diagnostic Test Mode II to Mode I by turning the mode selector on the ECM. (Refer to EC-47.)



Note:

- **If the battery is disconnected, the emission-related diagnostic information will be lost after approx. 24 hours.**
- **Erasing the emission-related diagnostic information using CONSULT or GST is easier and quicker than switching the mode selector on the ECM.**
- **The following data are cleared when the ECM memory is erased.**

1. Diagnostic trouble codes
2. 1st trip diagnostic trouble codes
3. Freeze frame data
4. 1st trip freeze frame data
5. System readiness test (SRT) codes
6. Test values
7. Others

Actual work procedures are explained using a DTC as an example. Be careful so that not only the DTC, but all of the data listed above, are cleared from the ECM memory during work procedures.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Malfunction Indicator Lamp (MIL)

1. The malfunction indicator lamp will light up when the ignition switch is turned ON without the engine running. This is a bulb check.
   - If the malfunction indicator lamp does not light up, refer to EL section ("WARNING LAMPS AND CHIME") or see EC-422.
2. When the engine is started, the malfunction indicator lamp should go off.
   If the lamp remains on, the on board diagnostic system has detected an engine system malfunction.

ON BOARD DIAGNOSTIC SYSTEM FUNCTION

The on board diagnostic system has the following four functions.

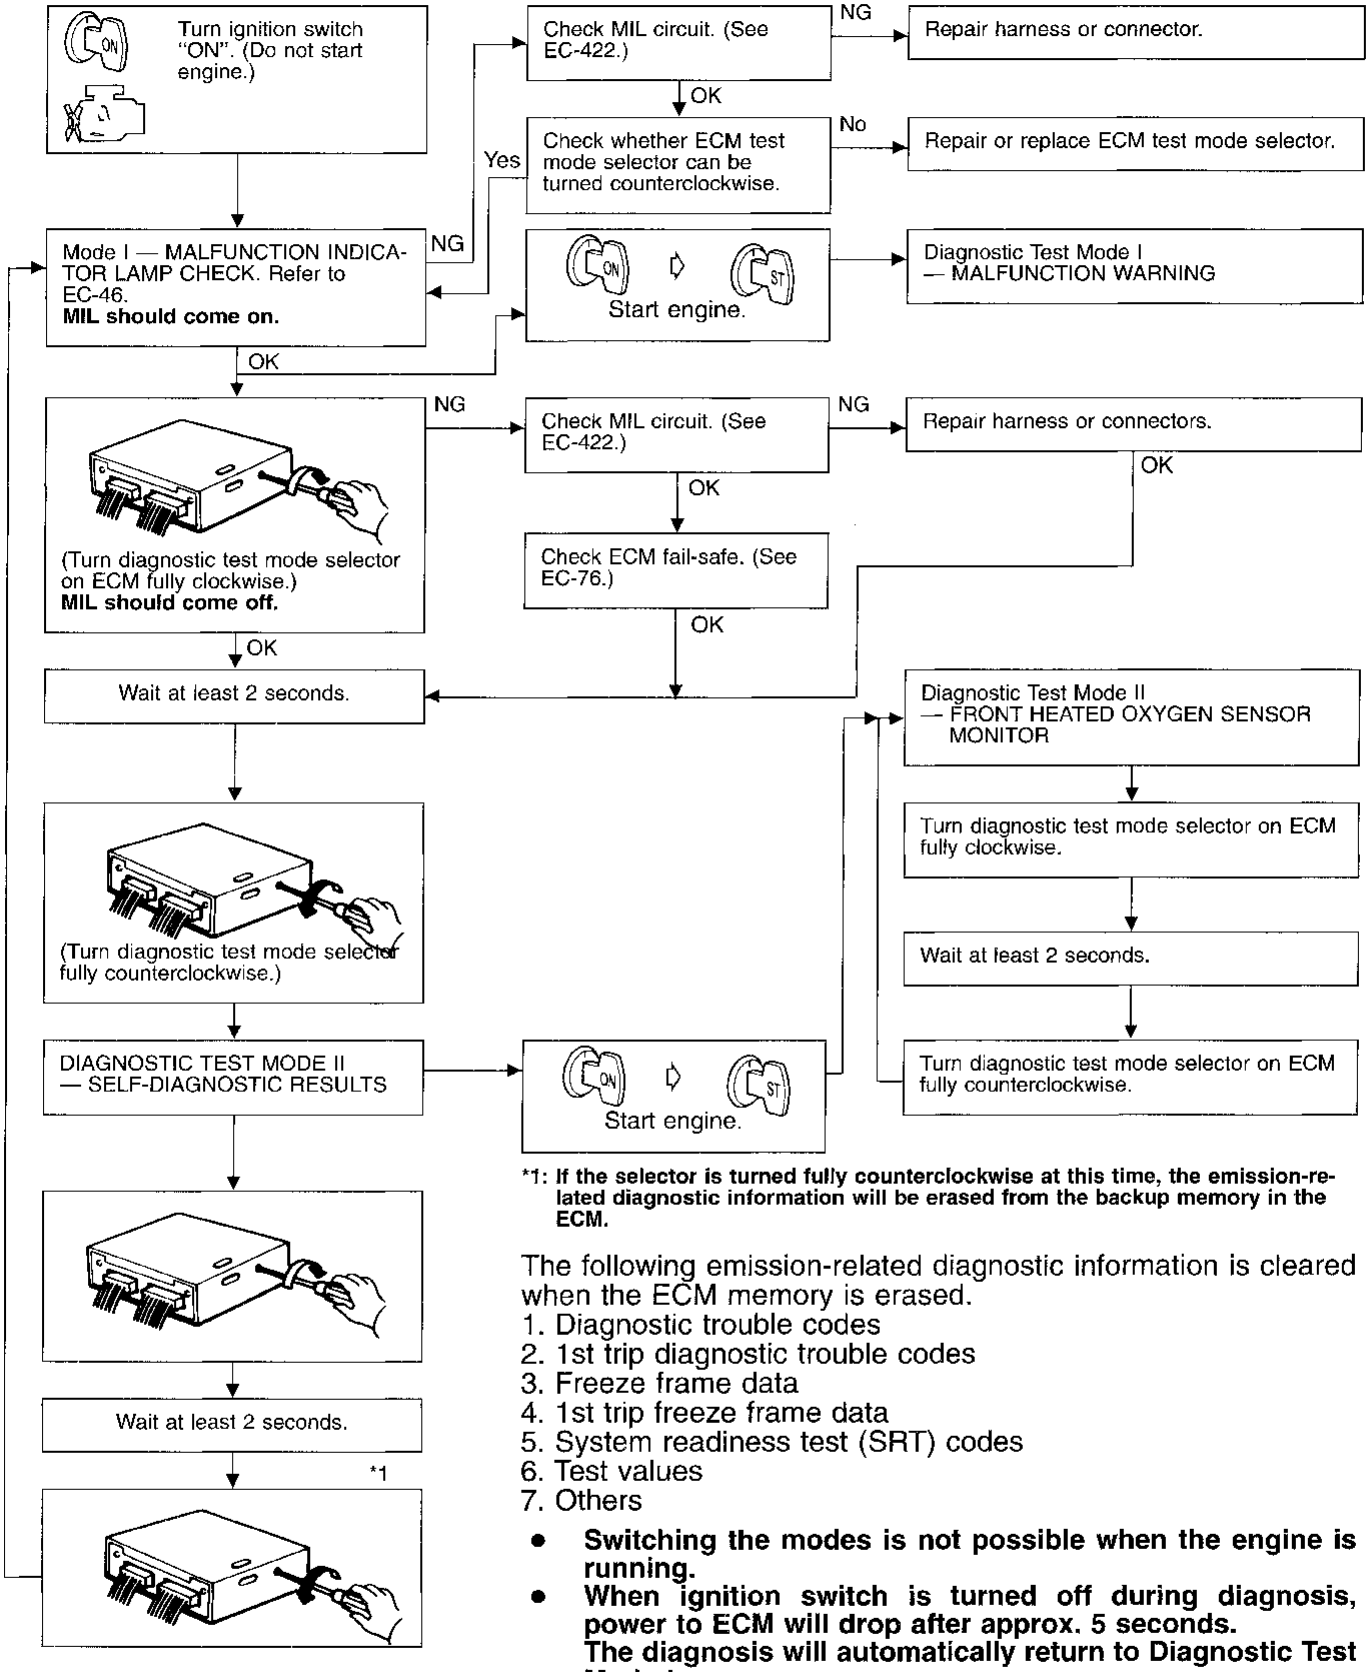
Diagnostic Test Mode I

1. BULB CHECK : This function checks the MIL bulb for damage (blown, open circuit, etc.).
   If the MIL does not come on, check MIL circuit and ECM test mode selector. (See next page.)
2. MALFUNCTION WARNING : This is a usual driving condition. When a malfunction is detected twice in two consecutive driving cycles (two trip detection logic), the MIL will light up to inform the driver that a malfunction has been detected.
   The following malfunctions will light up or blink the MIL in the 1st trip.
   - "Misfire (Possible three way catalyst damage)"
   - "Closed loop control"
   - Fail-safe mode

Diagnostic Test Mode II

3. SELF-DIAGNOSTIC RESULTS : This function allows DTCs and 1st trip DTCs to be read.
4. FRONT HEATED OXYGEN SENSOR MONITOR : This function allows the fuel mixture condition (lean or rich), monitored by front heated oxygen sensor, to be read.

MIL flashing without DTC



If the ECM is in Diagnostic Test Mode II, MIL may flash when engine is running. In this case, check ECM test mode selector following "HOW TO SWITCH DIAGNOSTIC TEST MODES" on next page.
How to switch the diagnostic test (function) modes, and details of the above functions are described later. (Refer to EC-47.)

Condition		Diagnostic Test Mode I	Diagnostic Test Mode II
Ignition switch in "ON" position	Engine stopped	BULB CHECK	SELF-DIAGNOSTIC RESULTS
	Engine running	MALFUNCTION WARNING	FRONT HEATED OXYGEN SENSOR MONITOR

Malfunction Indicator Lamp (MIL) (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

HOW TO SWITCH DIAGNOSTIC TEST MODES

***1: If the selector is turned fully counterclockwise at this time, the emission-related diagnostic information will be erased from the backup memory in the ECM.**

The following emission-related diagnostic information is cleared when the ECM memory is erased.

1. Diagnostic trouble codes
2. 1st trip diagnostic trouble codes
3. Freeze frame data
4. 1st trip freeze frame data
5. System readiness test (SRT) codes
6. Test values
7. Others

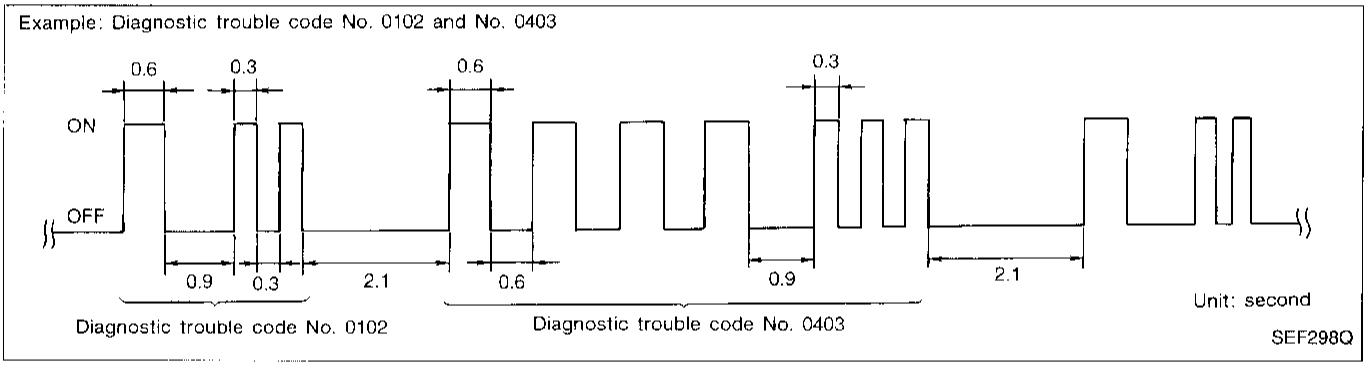
- **Switching the modes is not possible when the engine is running.**
- **When ignition switch is turned off during diagnosis, power to ECM will drop after approx. 5 seconds. The diagnosis will automatically return to Diagnostic Test Mode I.**
- **Turn back diagnostic test mode selector to the fully counterclockwise position whenever vehicle is in use.**

Malfunction Indicator Lamp (MIL) (Cont'd)

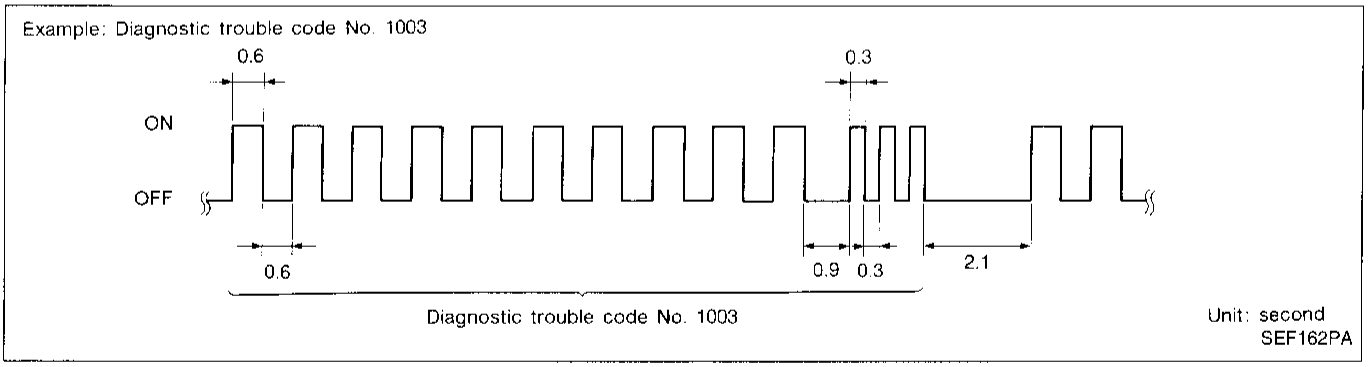
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

DIAGNOSTIC TEST MODE I — BULB CHECK

In this mode, the MALFUNCTION INDICATOR LAMP on the instrument panel should stay ON. If it remains OFF, check the bulb. Refer to EL section ("WARNING LAMPS AND CHIME") or see EC-422.



DIAGNOSTIC TEST MODE I — MALFUNCTION WARNING



MALFUNCTION INDICATOR LAMP	Condition
ON	When the malfunction is detected or the ECM's CPU is malfunctioning.
OFF	No malfunction.

- These Diagnostic Trouble Code Numbers are clarified in Diagnostic Test Mode II (SELF-DIAGNOSTIC RESULTS).

DIAGNOSTIC TEST MODE II — SELF-DIAGNOSTIC RESULTS

In this mode, the DTC and 1st trip DTC are indicated by the number of blinks of the MALFUNCTION INDICATOR LAMP.
The DTC and 1st trip DTC are displayed at the same time. If the MIL does not illuminate in diagnostic test mode 1 (Malfunction warning), all displayed items are 1st trip DTC's. If only one code is displayed when the MIL illuminates in diagnostic test mode II (SELF-DIAGNOSTIC RESULTS), it is a DTC; if two or more codes are displayed, they may be either DTC's or 1st trip DTC's. DTC No. is same as that of 1st trip DTC. These unidentified codes can be identified by using the consult or GST. A DTC will be used as an example for how to read a code.

Long (0.6 second) blinking indicates the two LH digits of number and short (0.3 second) blinking indicates the two RH digits of number. For example, the malfunction indicator lamp blinks 10 times for 6 seconds (0.6 sec x 10 times) and then it blinks three times for about 1 second (0.3 sec x 3 times). This indicates the DTC "1003" and refers to the malfunction of the neutral position switch.
In this way, all the detected malfunctions are classified by their diagnostic trouble code numbers. The DTC "0505" refers to no malfunction. (See DIAGNOSTIC TROUBLE CODE (DTC) INDEX, EC-2.)

Malfunction Indicator Lamp (MIL) (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

How to erase diagnostic test mode II (Self-diagnostic results)

The diagnostic trouble code can be erased from the backup memory in the ECM when the diagnostic test mode is changed from Diagnostic Test Mode II to Diagnostic Test Mode I. (Refer to "HOW TO SWITCH DIAGNOSTIC TEST MODES".)

- **If the battery is disconnected, the diagnostic trouble code will be lost from the backup memory after approx. 24 hours.**
- **Be careful not to erase the stored memory before starting trouble diagnoses.**

DIAGNOSTIC TEST MODE II — FRONT HEATED OXYGEN SENSOR MONITOR

In this mode, the MALFUNCTION INDICATOR LAMP displays the condition of the fuel mixture (lean or rich) which is monitored by the front heated oxygen sensor.

MALFUNCTION INDICATOR LAMP	Fuel mixture condition in the exhaust gas	Air fuel ratio feedback control condition
ON	Lean	Closed loop system
OFF	Rich	
*Remains ON or OFF	Any condition	Open loop system

*: Maintains conditions just before switching to open loop.

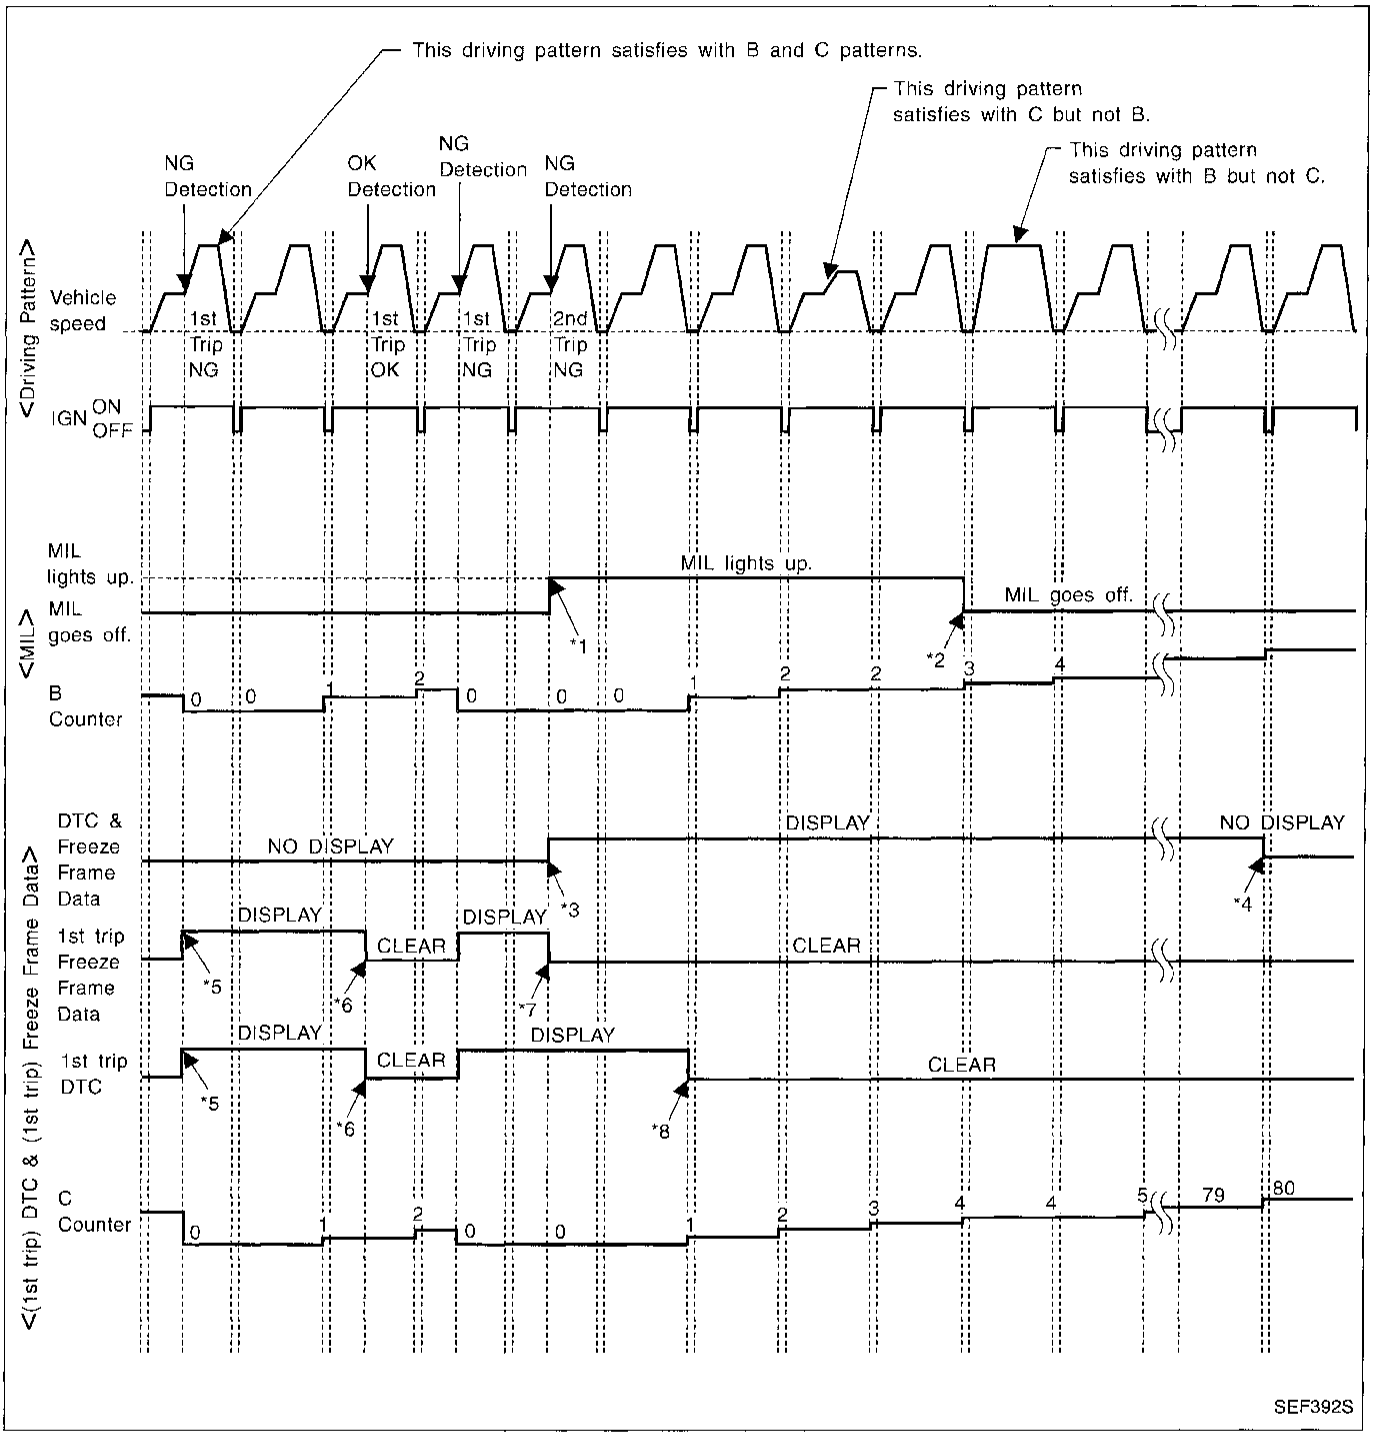
To check the front heated oxygen sensor function, start engine in the Diagnostic Test Mode II and warm it up until engine coolant temperature indicator points to the middle of the gauge.
Next run engine at about 2,000 rpm for about 2 minutes under no-load conditions. Then make sure that the MALFUNCTION INDICATOR LAMP comes ON more than 5 times within 10 seconds with engine running at 2,000 rpm under no-load.

OBD System Operation Chart

RELATIONSHIP BETWEEN MIL, 1ST TRIP DTC, DTC, AND DETECTABLE ITEMS

- When a malfunction is detected for the first time, the 1st trip DTC and the 1st trip freeze frame data are stored in the ECM memory.
- When the same malfunction is detected in two consecutive trips, the DTC and the freeze frame data are stored in the ECM memory, and the MIL will come on. For details, refer to "Two Trip Detection Logic" on EC-35.
- The MIL will go off after the vehicle is driven 3 times with no malfunction. The drive is counted only when the recorded driving pattern is met (as stored in the ECM). If another malfunction occurs while counting, the counter will reset.
- The DTC and the freeze frame data will be stored until the vehicle is driven 40 times (driving pattern A) without the same malfunction recurring (except for Misfire and Fuel Injection System). For Misfire and Fuel Injection System, the DTC and freeze frame data will be stored until the vehicle is driven 80 times (driving pattern C) without the same malfunction recurring. The "TIME" in "SELF-DIAGNOSTIC RESULTS" mode of CONSULT will count the number of times the vehicle is driven.
- The 1st trip DTC is not displayed when the self-diagnosis results in "OK" for the 2nd trip.

SUMMARY CHART



Items	Fuel Injection System	Misfire	Other
MIL (goes off)	3 (pattern B)	3 (pattern B)	3 (pattern B)
DTC, Freeze Frame Data (no display)	80 (pattern C)	80 (pattern C)	40 (pattern A)
1st Trip DTC (clear)	1 (pattern C), *1	1 (pattern C), *1	1 (pattern B)
1st Trip Freeze Frame Data (clear)	*1, *2	*1, *2	1 (pattern B)

For details about patterns "B" and "C" under "Fuel Injection System" and "Misfire", see EC-51.
For details about patterns "A" and "B" under "Other", see EC-53.
*1: Clear timing is at the moment OK is detected.
*2: Clear timing is when the same malfunction is detected in the 2nd trip.

OBD System Operation Chart (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

RELATIONSHIP BETWEEN MIL, DTC, 1ST TRIP DTC AND DRIVING PATTERNS FOR "MISFIRE" <EXHAUST QUALITY DETERIORATION>, "FUEL INJECTION SYSTEM"

*1: When the same malfunction is detected in two consecutive trips, MIL will light up.

*2: MIL will go off after vehicle is driven 3 times (pattern B) without any malfunctions.

*3: When the same malfunction is detected in two consecutive trips, the DTC and the freeze frame data will be stored in ECM.

*4: The DTC and the freeze frame data will not be displayed any longer after vehicle is driven 80 times (pattern C) without the same malfunction.
(The DTC and the freeze frame data still remain in ECM.)

*5: When a malfunction is detected for the first time, the 1st trip DTC and the 1st trip freeze frame data will be stored in ECM.

*6: The 1st trip DTC and the 1st trip freeze frame data will be cleared at the moment OK is detected.

*7: When the same malfunction is detected in the 2nd trip, the 1st trip freeze frame data will be cleared.

*8: 1st trip DTC will be cleared when vehicle is driven once (pattern C) without the same malfunction after DTC is stored in ECM.

OBD System Operation Chart (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

EXPLANATION FOR DRIVING PATTERNS FOR "MISFIRE <EXHAUST QUALITY DETERIORATION>", "FUEL INJECTION SYSTEM"

<Driving pattern B>

Driving pattern B means the vehicle operation as follows:

All components and systems should be monitored at least once by the OBD system.

- The B counter will be cleared when the malfunction is detected once regardless of the driving pattern.
- The B counter will be counted up when driving pattern B is satisfied without any malfunction.
- The MIL will go off when the B counter reaches 3. (*2 in "OBD SYSTEM OPERATION CHART")

<Driving pattern C>

Driving pattern C means the vehicle operation as follows:

(1) The following conditions should be satisfied at the same time:
Engine speed: (Engine speed in the freeze frame data) ±375 rpm
Calculated load value: (Calculated load value in the freeze frame data) x (1±0.1) [%]
Engine coolant temperature (T) condition:

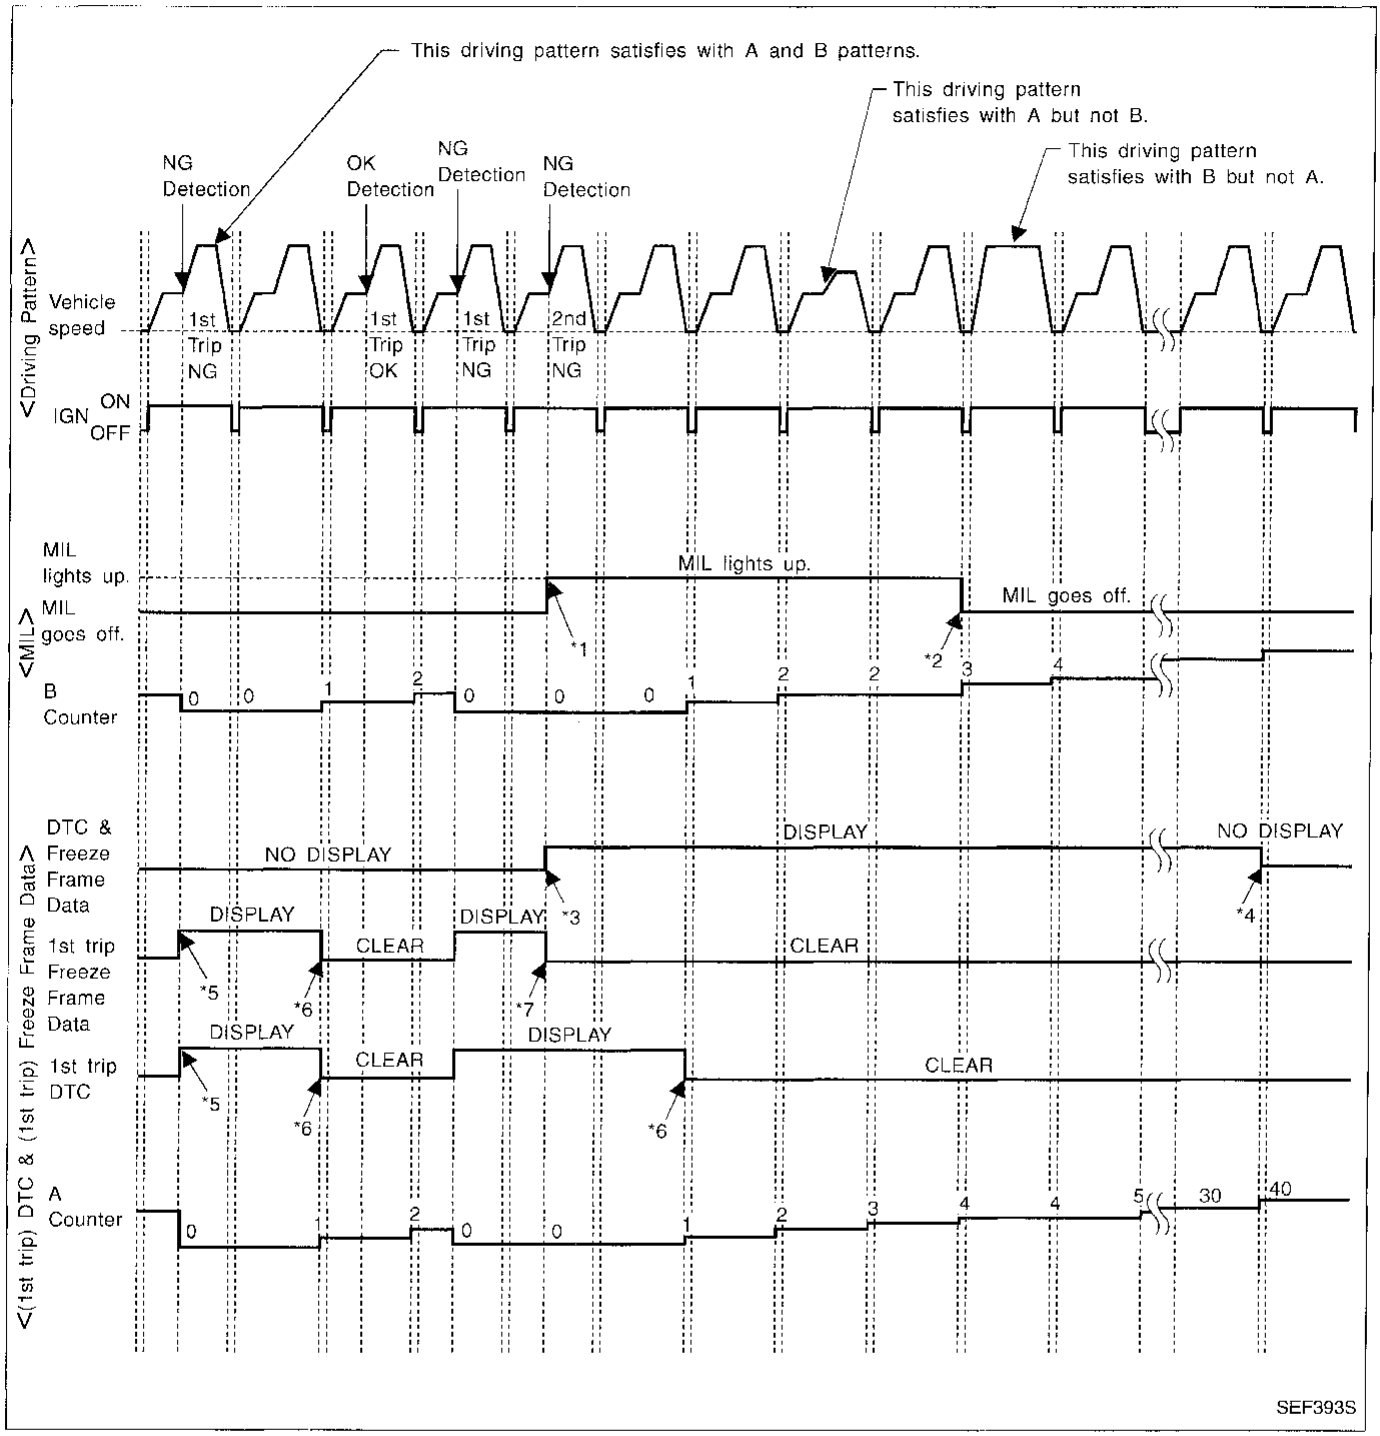
- When the freeze frame data shows lower than 70°C (158°F), "T" should be lower than 70°C (158°F).
- When the freeze frame data shows higher than or equal to 70°C (158°F), "T" should be higher than or equal to 70°C (158°F).

Example:

If the stored freeze frame data is as follows:

Engine speed: 850 rpm, Calculated load value: 30%, Engine coolant temperature: 80°C (176°F)

To be satisfied with driving pattern C, the vehicle should run under the following conditions:



Engine speed: 475 - 1,225 rpm, Calculated load value: 27 - 33%, Engine coolant temperature: more than 70°C (158°F)

- The C counter will be cleared when the malfunction is detected regardless of (1).
- The C counter will be counted up when (1) is satisfied without the same malfunction.
- The DTC will not be displayed after C counter reaches 80.
- The 1st trip DTC will be cleared when C counter is counted once without the same malfunction after DTC is stored in ECM.

OBD System Operation Chart (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

RELATIONSHIP BETWEEN MIL, DTC, 1ST TRIP DTC AND DRIVING PATTERNS EXCEPT FOR "MISFIRE <EXHAUST QUALITY DETERIORATION>", "FUEL INJECTION SYSTEM"

*1: When the same malfunction is detected in two consecutive trips, MIL will light up.

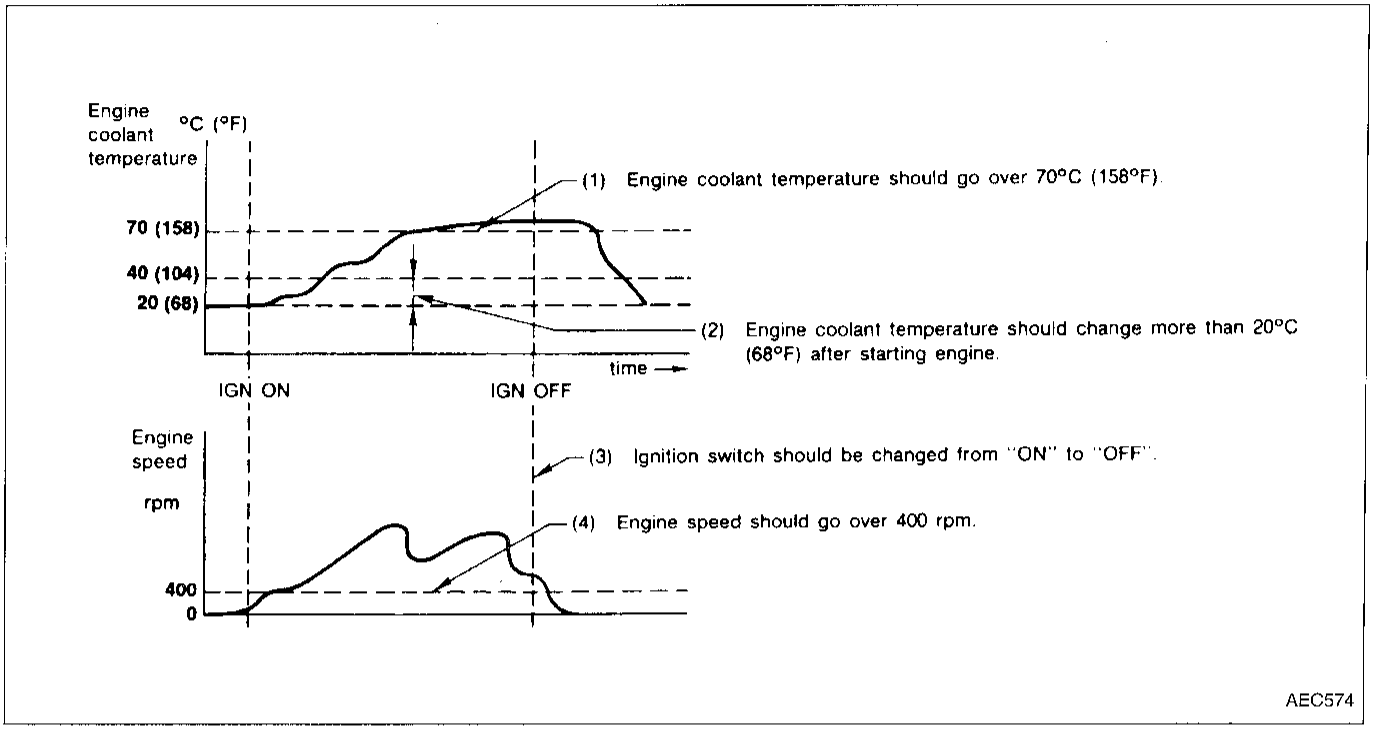
*2: MIL will go off after vehicle is driven 3 times (pattern B) without any malfunctions.

*3: When the same malfunction is detected in two consecutive trips, the DTC and the freeze frame data will be stored in ECM.

*4: The DTC and the freeze frame data will not be displayed any longer after vehicle is driven 40 times (pattern A) without the same malfunction.
(The DTC and the freeze frame data still remain in ECM.)

*5: When a malfunction is detected for the first time, the 1st trip DTC and the 1st trip freeze frame data will be stored in ECM.

*6: 1st trip DTC will be cleared after vehicle is driven once (pattern B) without the same malfunction.



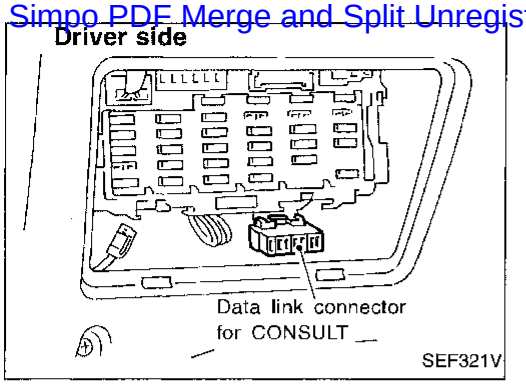
*7: When the same malfunction is detected in the 2nd trip, the 1st trip freeze frame data will be cleared.

OBD System Operation Chart (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

EXPLANATION FOR DRIVING PATTERNS EXCEPT FOR "MISFIRE <EXHAUST QUALITY DETERIORATION>", "FUEL INJECTION SYSTEM"

<Driving pattern A>



- The A counter will be cleared when the malfunction is detected regardless of (1) - (4).
- The A counter will be counted up when (1) - (4) are satisfied without the same malfunction.
- The DTC will not be displayed after the A counter reaches 40.

<Driving pattern B>

Driving pattern B means the vehicle operation as follows:
All components and systems should be monitored at least once by the OBD system.

- The B counter will be cleared when the malfunction is detected once regardless of the driving pattern.
- The B counter will be counted up when driving pattern B is satisfied without any malfunctions.
- The MIL will go off when the B counter reaches 3 (*2 in "OBD SYSTEM OPERATION CHART").

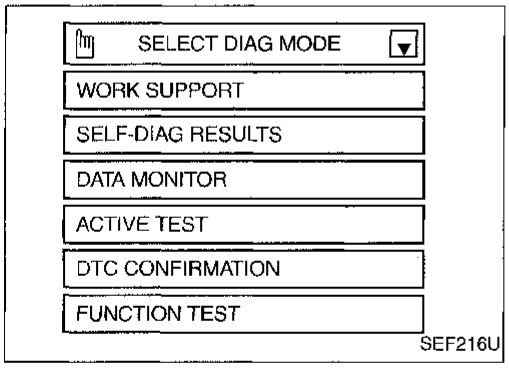
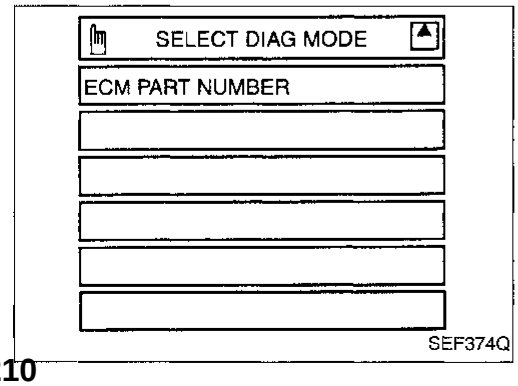
CONSULT

CONSULT INSPECTION PROCEDURE



1. Turn ignition switch "OFF".
2. Connect "CONSULT" to data link connector for CONSULT. (Data link connector for CONSULT is located behind the fuse box cover.)

3. Turn ignition switch "ON".
4. Touch "START".



5. Touch "ENGINE".

6. Perform each diagnostic test mode according to each service procedure.

For further information, see the CONSULT Operation Manual. This sample shows the display when using the UEOBD98 program card. Screen differs in accordance with the program card used.

CONSULT (Cont'd)

CONSULT (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

FUNCTION

Diagnostic test mode	Function
Work support	This mode enables a technician to adjust some devices faster and more accurately by following the indications on the CONSULT unit.
Self-diagnostic results	Self-diagnostic results such as 1st trip DTC, DTCs and 1st trip freeze frame data or freeze frame data can be read and erased quickly.*1
Data monitor	Input/Output data in the ECM can be read.
Active test	Diagnostic Test Mode in which CONSULT drives some actuators apart from the ECMs and also shifts some parameters in a specified range.
DTC confirmation	The status of system monitoring tests and the self-diagnosis status/result can be confirmed.
Function test	Conducted by CONSULT instead of a technician to determine whether each system is "OK" or "NG".
ECM part numbers	ECM part numbers can be read.

*1 The following emission-related diagnostic information is cleared when the ECM memory is erased.
1. Diagnostic trouble codes
2. 1st trip diagnostic trouble codes
3. Freeze frame data
4. 1st trip freeze frame data
5. System readiness test (SRT) codes
6. Test values
7. Others

WORK SUPPORT MODE

WORK ITEM	CONDITION	USAGE
THRTL POS SEN ADJ	CHECK THE THROTTLE POSITION SENSOR SIGNAL. ADJUST IT TO THE SPECIFIED VALUE BY ROTATING THE SENSOR BODY UNDER THE FOLLOWING CONDITIONS. ● IGN SW "ON" ● ENG NOT RUNNING ● ACC PEDAL NOT PRESSED	When adjusting throttle position sensor initial position
IGNITION TIMING ADJ	● IGNITION TIMING FEEDBACK CONTROL WILL BE HELD BY TOUCHING "START". AFTER DOING SO, ADJUST IGNITION TIMING WITH A TIMING LIGHT BY TURNING THE CRANKSHAFT POSITION SENSOR.	When adjusting initial ignition timing
IACV-AAC/V ADJ	SET ENGINE SPEED AT THE SPECIFIED VALUE UNDER THE FOLLOWING CONDITIONS. ● ENGINE WARMED UP ● NO-LOAD	When adjusting idle speed
FUEL PRESSURE RELEASE	● FUEL PUMP WILL STOP BY TOUCHING "START" DURING IDLING. CRANK A FEW TIMES AFTER ENGINE STALLS.	When releasing fuel pressure from fuel line
EVAP SYSTEM CLOSE	OPEN THE VACUUM CUT VALVE BYPASS VALVE AND CLOSE THE EVAP CANISTER VENT CONTROL VALVE IN ORDER TO MAKE EVAP SYSTEM CLOSE UNDER THE FOLLOWING CONDITIONS. ● BATTERY VOLTAGE IS SUFFICIENT. ● IGN SW "ON" ● ENGINE NOT RUNNING ● AMBIENT TEMPERATURE IS ABOVE 0°C (32°F). ● NO VACUUM AND NO HIGH PRESSURE IN EVAP SYSTEM ● TANK FUEL TEMP. IS MORE THAN 0°C (32°F). ● WITHIN 10 MINUTES AFTER STARTING "EVAP SYSTEM CLOSE" WHEN TRYING TO EXECUTE "EVAP SYSTEM CLOSE" UNDER THE CONDITION EXCEPT ABOVE, CONSULT WILL DISCONTINUE IT AND DISPLAY APPROPRIATE INSTRUCTION. **NOTE: WHEN STARTING ENGINE, CONSULT MAY DISPLAY "BATTERY VOLTAGE IS LOW. CHARGE BATTERY", EVEN IN USING CHARGED BATTERY.**	When detecting EVAP vapor leak point of EVAP system

CONSULT (Cont'd)

SELF-DIAGNOSTIC MODE

DTC and 1st trip DTC

Regarding items of "DTC and 1st trip DTC", refer to "DIAGNOSTIC TROUBLE CODE INDEX" (See EC-2.).

Freeze frame data and 1st trip freeze frame data

Freeze frame data item*	Description
DIAG TROUBLE CODE [PXXXX]	● ECCS component part/control system has a trouble code, it is displayed as "PXXXX". [Refer to "Alphabetical & P No. Index for DTC" (EC-2).]
FUEL SYS	● "Fuel injection system status" at the moment a malfunction is detected is displayed. ● One mode in the following is displayed. "MODE 2": Open loop due to detected system malfunction "MODE 3": Open loop due to driving conditions (power enrichment, deceleration enrichment) "MODE 4": Closed loop - using oxygen sensor(s) as feedback for fuel control "MODE 5": Open loop - has not yet satisfied condition to go to closed loop
CAL/LD VALUE [%]	● The calculated load value at the moment a malfunction is detected is displayed.
COOLANT TEMP [°C] or [°F]	● The engine coolant temperature at the moment a malfunction is detected is displayed.
S-FUEL TRIM [%]	● "Short-term fuel trim" at the moment a malfunction is detected is displayed. ● The short-term fuel trim indicates dynamic or instantaneous feedback compensation to the base fuel schedule.
L-FUEL TRIM [%]	● "Long-term fuel trim" at the moment a malfunction is detected is displayed. ● The long-term fuel trim indicates much more gradual feedback compensation to the base fuel schedule than short-term fuel trim.
ENGINE SPEED [rpm]	● The engine speed at the moment a malfunction is detected is displayed.
VHCL SPEED [km/h] or [mph]	● The vehicle speed at the moment a malfunction is detected is displayed.
ABSOL PRESS [kPa] or [kg/cm^2] or [psi]	● The absolute pressure at the moment a malfunction is detected is displayed.

*: The items are the same as those of 1st trip freeze frame data.

CONSULT (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

DATA MONITOR MODE

Monitored item [Unit]	ECM input signals	Main signals	Description	Remarks
CMPS·RPM (REF) [rpm]	○	○	● Indicates the engine speed computed from the REF signal (180° signal) of the camshaft position sensor.	
MAS AIR/FL SE [V]	○	○	● The signal voltage of the mass air flow sensor is displayed.	● When the engine is stopped, a certain value is indicated.
COOLAN TEMP/S [°C] or [°F]	○	○	● The engine coolant temperature (determined by the signal voltage of the engine coolant temperature sensor) is displayed.	● When the engine coolant temperature sensor is open or short-circuited, ECM enters fail-safe mode. The engine coolant temperature determined by the ECM is displayed.
FR O2 SENSOR [V]	○	○	● The signal voltage of the front heated oxygen sensor is displayed.	
RR O2 SENSOR [V]	○	○	● The signal voltage of the rear heated oxygen sensor is displayed.	
FR O2 MNTR [RICH/LEAN]	○	○	● Display of front heated oxygen sensor signal during air-fuel ratio feedback control: RICH ... means the mixture became "rich", and control is being affected toward a leaner mixture. LEAN ... means the mixture became "lean", and control is being affected toward a rich mixture.	● After turning ON the ignition switch, "RICH" is displayed until air-fuel mixture ratio feedback control begins. ● When the air-fuel ratio feedback is clamped, the value just before the clamping is displayed continuously.
RR O2 MNTR [RICH/LEAN]	○		● Display of rear heated oxygen sensor signal: RICH ... means the amount of oxygen after three way catalyst is relatively small. LEAN ... means the amount of oxygen after three way catalyst is relatively large.	● When the engine is stopped, a certain value is indicated.
VHCL SPEED SE [km/h] or [mph]	○	○	● The vehicle speed computed from the vehicle speed sensor signal is displayed.	
BATTERY VOLT [V]	○	○	● The power supply voltage of ECM is displayed.	
THRTL POS SEN [V]	○	○	● The throttle position sensor signal voltage is displayed.	
TANK F/TMP SE [°C] or [°F]	○		● The fuel temperature judged from the tank fuel temperature sensor signal voltage is displayed.	
EGR TEMP SEN [V]	○		● The signal voltage of the EGR temperature sensor is displayed.	
INT/A TEMP SE [°C] or [°F]	○		● The intake air temperature determined by the signal voltage of the intake air temperature sensor is indicated.	
START SIGNAL [ON/OFF]	○	○	● Indicates [ON/OFF] condition from the starter signal.	● After starting the engine, [OFF] is displayed regardless of the starter signal.
CLSD THL/P SW [ON/OFF]	○	○	● Indicates [ON/OFF] condition from the throttle position sensor signal.	
AIR COND SIG [ON/OFF]	○	○	● Indicates [ON/OFF] condition of the air conditioner switch as determined by the air conditioner signal.	
P/N POSI SW [ON/OFF]	○	○	● Indicates [ON/OFF] condition from the park/neutral position switch signal.	

NOTE:
Any monitored item that does not match the vehicle being diagnosed is deleted from the display automatically.

CONSULT (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Monitored item [Unit]	ECM input signals	Main signals	Description	Remarks
PW/ST SIGNAL [ON/OFF]	○	○	• [ON/OFF] condition of the power steering oil pressure switch determined by the power steering oil pressure signal is indicated.	
IGNITION SW [ON/OFF]	○		• Indicates [ON/OFF] condition from ignition switch.	
INJ PULSE [msec]		○	• Indicates the actual fuel injection pulse width compensated by ECM according to the input signals.	• When the engine is stopped, a certain computed value is indicated.
B/FUEL SCHDL [msec]		○	• "Base fuel schedule" indicates the fuel injection pulse width programmed into ECM, prior to any learned on board correction.	
IGN TIMING [BTDC]		○	• Indicates the ignition timing computed by ECM according to the input signals.	• When the engine is stopped, a certain value is indicated.
IACV-AAC/V [%]		○	• Indicates the IACV-AAC valve control value computed by ECM according to the input signals.	
PURG VOL C/V [%]		○	• Indicates the EVAP canister purge volume control solenoid valve computed by the ECM according to the input signals. • The opening becomes larger as the value increases.	
A/F ALPHA [%]			• The mean value of the air-fuel ratio feedback correction factor per cycle is indicated.	• When the engine is stopped, a certain value is indicated. • This data also includes the data for the air-fuel ratio learning control.
EVAP SYS PRES [V]		○	• The signal voltage of EVAP control system pressure sensor is displayed.	
AIR COND RLY [ON/OFF]			• The air conditioner relay control condition (determined by ECM according to the input signal) is indicated.	
FUEL PUMP RLY [ON/OFF]			• Indicates the fuel pump relay control condition determined by ECM according to the input signals.	
EGRC SOL/V [ON/OFF]			• The control condition of the EGRC-solenoid valve (determined by ECM according to the input signal) is indicated. • ON ... EGR operation is cut-off OFF ... EGR is operational	
TCC SOL/V			• The control condition of the torque converter clutch solenoid valve (determined by ECM according to the input signal) is indicated. ON ... Lock-up is cancelled OFF ... Lock-up is operational	
VENT CONT/V [ON/OFF]			• The control condition of the EVAP canister vent control valve (determined by ECM according to the input signal) is indicated. • ON ... Closed OFF ... Open	
FR O2 HEATER [ON/OFF]			• Indicates [ON/OFF] condition of front heated oxygen sensor heater determined by ECM according to the input signals.	
RR O2 HEATER [ON/OFF]			• Indicates [ON/OFF] condition of rear heated oxygen sensor heater determined by ECM according to the input signals.	
VC/V BYPASS/V [ON/OFF]			• The control condition of the vacuum cut valve bypass valve (determined by ECM according to the input signal) is indicated. • ON ... Open OFF ... Closed	

CONSULT (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Monitored item [Unit]	ECM input signals	Main signals	Description	Remarks
CAL/LD VALUE [%]			● "Calculated load value" indicates the value of the current airflow divided by peak airflow.	
ABSOL TH·P/S [%]			● "Absolute throttle position sensor" indicates the throttle opening computed by ECM according to the signal voltage of the throttle position sensor.	
MASS AIRFLOW [g·m/s]			● Indicates the mass airflow computed by ECM according to the signal voltage of the mass airflow sensor.	
MAP/BARO SW/V [MAP/BARO]			● The control condition of the MAP/BARO switch solenoid valve (determined by ECM according to the input signal) is indicated. MAP ... Intake manifold absolute pressure BARO ... Barometric pressure	
ABSOL PRES/SE [V]			● The signal voltage of the absolute pressure sensor is displayed.	
VOLTAGE [V]			● Voltage measured by the voltage probe.	
PULSE [msec] or [Hz] or [%]			● Pulse width, frequency or duty cycle measured by the pulse probe.	● Only "#" is displayed if item is unable to be measured. ● Figures with "#"s are temporary ones. They are the same figures as an actual piece of data which was just previously measured.

CONSULT (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

ACTIVE TEST MODE

TEST ITEM	CONDITION	JUDGEMENT	CHECK ITEM (REMEDY)
FUEL INJECTION	● Engine: Return to the original trouble condition ● Change the amount of fuel injection using CONSULT.	If trouble symptom disappears, see CHECK ITEM.	● Harness and connector ● Fuel injectors ● Front heated oxygen sensor
IACV-AAC/V OPENING	● Engine: After warming up, idle the engine. ● Change the IACV-AAC valve opening percent using CONSULT.	Engine speed changes according to the opening percent.	● Harness and connector ● IACV-AAC valve
ENG COOLANT TEMP	● Engine: Return to the original trouble condition ● Change the engine coolant temperature using CONSULT.	If trouble symptom disappears, see CHECK ITEM.	● Harness and connector ● Engine coolant temperature sensor ● Fuel injectors
IGNITION TIMING	● Engine: Return to the original trouble condition ● Timing light: Set ● Retard the ignition timing using CONSULT.	If trouble symptom disappears, see CHECK ITEM.	● Adjust initial ignition timing
POWER BALANCE	● Engine: After warming up, idle the engine. ● A/C switch "OFF" ● Shift lever "N" ● Cut off each injector signal one at a time using CONSULT.	Engine runs rough or dies.	● Harness and connector ● Compression ● Injectors ● Power transistor ● Spark plugs ● Ignition coils
FUEL PUMP RELAY	● Ignition switch: ON (Engine stopped) ● Turn the fuel pump relay "ON" and "OFF" using CONSULT and listen to operating sound.	Fuel pump relay makes the operating sound.	● Harness and connector ● Fuel pump relay
EGRC SOLENOID VALVE	● Ignition switch: ON ● Turn solenoid valve "ON" and "OFF" with the CONSULT and listen to operating sound.	Solenoid valve makes an operating sound.	● Harness and connector ● Solenoid valve
SELF-LEARNING CONT	● In this test, the coefficient of self-learning control mixture ratio returns to the original coefficient by touching "CLEAR" on the screen.		
PURG VOL CONT/V	● Engine: After warming up, idle the engine. ● Change the EVAP canister purge volume control solenoid valve opening percent using CONSULT.	Engine speed changes according to the opening percent.	● Harness and connector ● EVAP canister purge volume control solenoid valve
TANK F/TEMP SEN	● Change the tank fuel temperature using CONSULT.		
VENT CONTROL/V	● Ignition switch: ON (Engine stopped) ● Turn solenoid valve "ON" and "OFF" with the CONSULT and listen to operating sound.	Solenoid valve makes an operating sound.	● Harness and connector ● Solenoid valve
VC/V BYPASS/V	● Ignition switch: ON (Engine stopped) ● Turn solenoid valve "ON" and "OFF" with the CONSULT and listen to operating sound.	Solenoid valve makes an operating sound.	● Harness and connector ● Solenoid valve
MAP/BARO SW/V	● Ignition switch: ON (Engine stopped) ● Turn the MAP/BARO switch solenoid valve between "MAP" and "BARO" using CONSULT and listen for operating sound.	MAP/BARO switch solenoid valve makes an operating sound.	● Harness and connector ● MAP/BARO switch solenoid valve

FUNCTION TEST MODE

FUNCTION TEST ITEM	CONDITION	JUDGEMENT		CHECK ITEM (REMEDY)
SELF-DIAG RESULTS	● Ignition switch: ON (Engine stopped) ● Displays the results of on board diagnostic system.	—		Objective system
CLOSED THROTTLE POSI	● Ignition switch: ON (Engine stopped) ● Throttle position sensor circuit is tested when throttle is opened and closed fully. ("IDLE POSITION" is the test item name for the vehicles in which idle is selected by throttle position sensor.)	Throttle valve: opened	OFF	● Harness and connector ● Throttle position sensor (Closed throttle position) ● Throttle position sensor (Closed throttle position) adjustment ● Throttle linkage ● Verify operation in DATA MONITOR mode.
		Throttle valve: closed	ON	
THROTTLE POSI SEN CKT	● Ignition switch: ON (Engine stopped) ● Throttle position sensor circuit is tested when throttle is opened and closed fully.	Range (Throttle valve fully opened — Throttle valve fully closed)	More than 3.0V	● Harness and connector ● Throttle position sensor ● Throttle position sensor adjustment ● Throttle linkage ● Verify operation in DATA MONITOR mode.
PARK/NEUT POSI SW CKT	● Ignition switch: ON (Engine stopped) ● Inhibitor position switch circuit is tested when shift lever is manipulated.	Out of N/P positions	OFF	● Harness and connector ● Inhibitor switch ● Linkage or Inhibitor switch adjustment
		In N/P positions	ON	
FUEL PUMP CIRCUIT	● Ignition switch: ON (Engine stopped) ● Fuel pump circuit is tested by checking the pulsation in fuel pressure when fuel tube is pinched.	There is pressure pulsation on the fuel feed hose.		● Harness and connector ● Fuel pump ● Fuel pump relay ● Fuel filter clogging ● Fuel level
EGRC SOL/V CIRCUIT	● Ignition switch: ON (Engine stopped) ● EGRC-solenoid valve circuit is tested by checking solenoid valve operating noise.	The solenoid valve makes an operating sound every 3 seconds.		● Harness and connector ● EGRC-solenoid valve

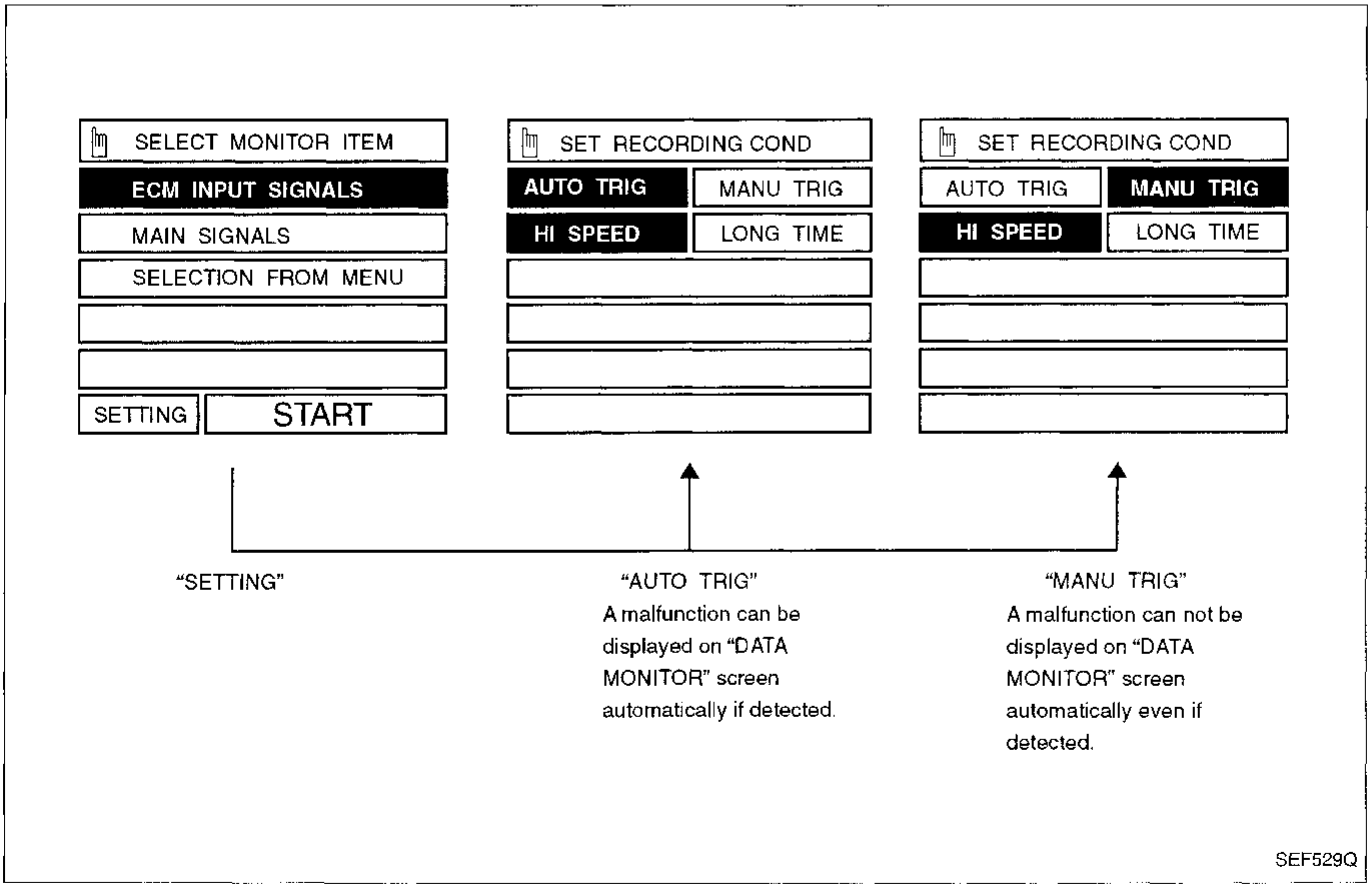
CONSULT (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

FUNCTION TEST ITEM	CONDITION	JUDGEMENT		CHECK ITEM (REMEDY)
START SIGNAL CIRCUIT	● Ignition switch: ON → START ● Start signal circuit is tested when engine is started by operating the starter. Battery voltage and engine coolant temperature before cranking, and average battery voltage, mass air flow sensor output voltage and cranking speed during cranking are displayed.	Start signal: OFF → ON		● Harness and connector ● Ignition switch
PW/ST SIGNAL CIRCUIT	● Ignition switch: ON (Engine running) ● Power steering circuit is tested when steering wheel is rotated fully and then set to a straight line running position.	Locked position	ON	● Harness and connector ● Power steering oil pressure switch ● Power steering oil pump
		Neutral position	OFF	
VEHICLE SPEED SEN CKT	● Vehicle speed sensor circuit is tested when vehicle is running at a speed of 10 km/h (6 MPH) or higher.	Vehicle speed sensor input signal is greater than 4 km/h (2 MPH).		● Harness and connector ● Vehicle speed sensor ● Speedometer
IGN TIMING ADJ	● After warming up, idle the engine. ● Ignition timing is checked by reading ignition timing with a timing light and checking whether it agrees with specifications.	The timing light indicates the same value on the screen.		● Adjust ignition timing (by moving camshaft position sensor or distributor) ● Camshaft position sensor drive mechanism
MIXTURE RATIO TEST	● Air-fuel ratio feedback circuit (injection system, ignition system, vacuum system, etc.) is tested by examining the front heated oxygen sensor output at 2,000 rpm under non-loaded state.	Front heated oxygen sensor COUNT: More than 5 times during 10 seconds		● INJECTION SYS (Injector, fuel pressure regulator, harness or connector) ● IGNITION SYS (Spark plug, power transistor, ignition coil, harness or connector) ● VACUUM SYS (Intake air leaks) ● Front heated oxygen sensor circuit ● Front heated oxygen sensor operation ● Fuel pressure high or low ● Mass air flow sensor
POWER BALANCE	● After warming up, idle the engine. ● Injector operation of each cylinder is stopped one after another, and resultant change in engine rotation is examined to evaluate combustion of each cylinder. (This is only displayed for models where a sequential multiport fuel injection system is used.)	Difference in engine speed is greater than 25 rpm before and after cutting off the injector of each cylinder.		● Injector circuit (Injector, harness or connector) ● Ignition circuit (Spark plug, ignition coil with power transistor harness or connector) ● Compression ● Valve timing
IACV-AAC/V SYSTEM	● After warming up, idle the engine. ● IACV-AAC valve system is tested by detecting change in engine speed when IACV-AAC valve opening is changed to 0%, 20% and 80%.	Difference in engine speed is greater than 150 rpm between when valve opening is at 80% and 20%.		● Harness and connector ● IACV-AAC valve ● Air passage restriction between air inlet and IACV-AAC valve ● IAS (Idle adjusting screw) adjustment

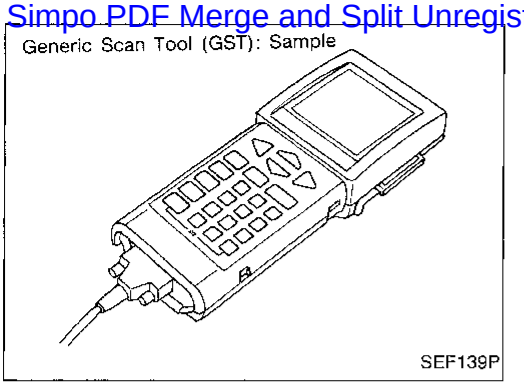
CONSULT (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



REAL TIME DIAGNOSIS IN DATA MONITOR MODE (Recording vehicle data)

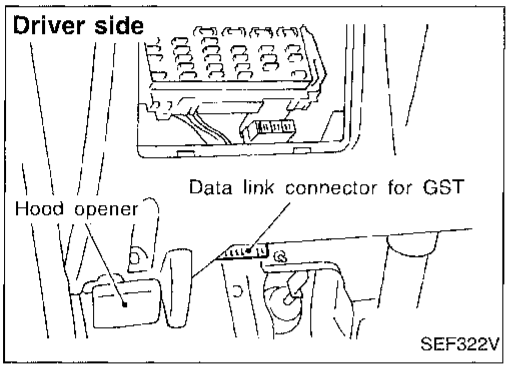
CONSULT has two kinds of triggers and they can be selected by touching "SETTING" in "DATA MONITOR" mode.



1. "AUTO TRIG" (Automatic trigger):
   - The malfunction will be identified on the CONSULT screen in real time.
     In other words, DTC/1st trip DTC and malfunction item will be displayed at the moment the malfunction is detected by ECM.
     DATA MONITOR can be performed continuously until a malfunction is detected. However, DATA MONITOR cannot continue any longer after the malfunction detection.
2. "MANU TRIG" (Manual trigger):
   - DTC/1st trip DTC and malfunction item will not be displayed automatically on CONSULT screen even though a malfunction is detected by ECM.
     DATA MONITOR can be performed continuously even though a malfunction is detected.

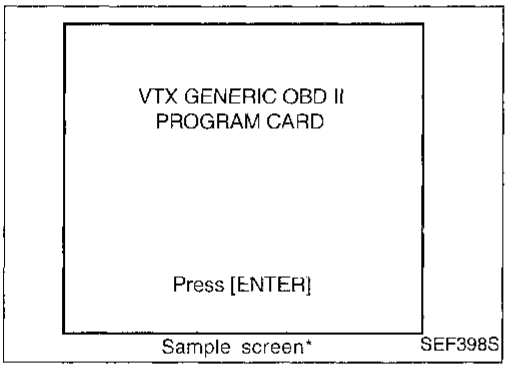
Use these triggers as follows:

1. "AUTO TRIG"
   - While trying to detect the DTC/1st trip DTC by performing the "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE", be sure to select to "DATA MONITOR (AUTO TRIG)" mode. You can confirm the malfunction at the moment it is detected.
   - While narrowing down the possible causes, CONSULT should be set in "DATA MONITOR (AUTO TRIG)" mode, especially in case the incident is intermittent.
     When you are inspecting the circuit by gently shaking (or twisting) the suspicious connectors, components and harness in the "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE", the moment a malfunction is found the DTC/1st trip DTC will be displayed. (Refer to GI section, "Incident Simulation Tests" in "HOW TO PERFORM EFFICIENT DIAGNOSIS FOR AN ELECTRICAL INCIDENT".)
2. "MANU TRIG"
   - If the malfunction is displayed as soon as "DATA MONITOR" is selected, reset CONSULT to "MANU TRIG". By selecting "MANU TRIG" you can monitor and store the data. The data can be utilized for further diagnosis, such as a comparison with the value for the normal operating condition.



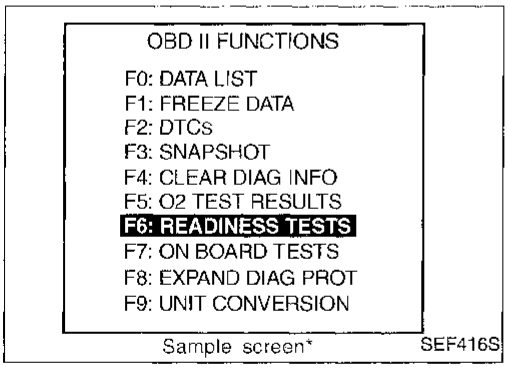
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Generic Scan Tool (GST)



DESCRIPTION

Generic Scan Tool (OBDII scan tool) complying with SAE J1978 has 7 different functions explained on the next page.
ISO9141 is used as the protocol.
The name "GST" or "Generic Scan Tool" is used in this service manual.



GST INSPECTION PROCEDURE

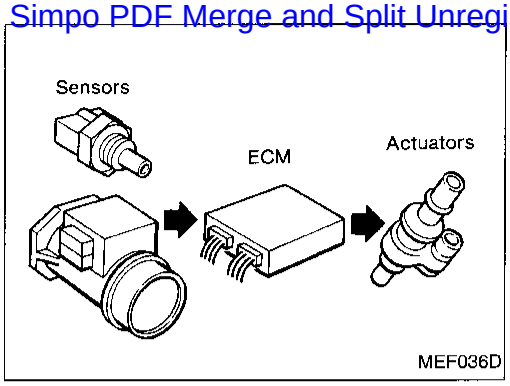
1. Turn ignition switch "OFF".
2. Connect "GST" to data link connector for GST. (Data link connector for GST is located under LH dash panel near the fuse box cover.)

3. Turn ignition switch "ON".
4. Enter the program according to instruction on the screen or in the operation manual.

(*: Regarding GST screens in this section, sample screens are shown.)

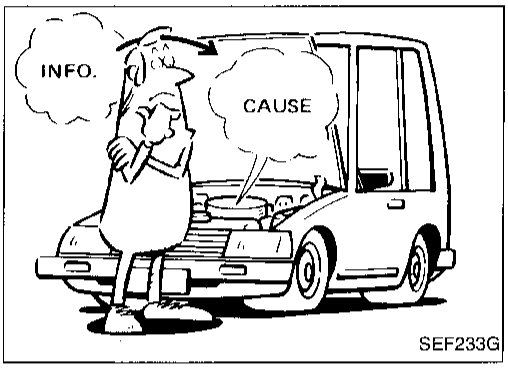
5. Perform each diagnostic mode according to each service procedure.

For further information, see the GST Operation Manual of the tool maker.



Generic Scan Tool (GST) (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



FUNCTION

Diagnostic test mode		Function
MODE 1	READINESS TESTS	This mode gains access to current emission-related data values, including analog inputs and outputs, digital inputs and outputs, and system status information.
MODE 2	(FREEZE DATA)	This mode gains access to emission-related data value which were stored by ECM during the freeze frame. [For details, refer to "Freeze Frame Data" (EC-57).]
MODE 3	DTCs	This mode gains access to emission-related power train trouble codes which were stored by ECM.
MODE 4	CLEAR DIAG INFO	This mode can clear all emission-related diagnostic information. This includes: ● Clear number of diagnostic trouble codes (MODE 1) ● Clear diagnostic trouble codes (MODE 3) ● Clear trouble code for freeze frame data (MODE 1) ● Clear freeze frame data (MODE 2) ● Reset status of system monitoring test (MODE 1) ● Clear on board monitoring test results (MODE 6 and 7)
MODE 6	(ON BOARD TESTS)	This mode accesses the results of on board diagnostic monitoring tests of specific components/systems that are not continuously monitored.
MODE 7	(ON BOARD TESTS)	This mode enables the off board test drive to obtain test results for emission-related powertrain components/systems that are continuously monitored during normal driving conditions.
MODE 8	—	This mode can close EVAP system in ignition switch "ON" position (Engine stopped). When this mode is performed, following parts can be opened or closed. ● EVAP canister vent control valve open ● Vacuum cut valve bypass valve closed In the following conditions, this mode cannot function. ● Low ambient temperature ● Low battery voltage ● Engine running ● Ignition switch "OFF" ● Low fuel temperature ● Too much pressure is applied to EVAP system

SEF907L

Introduction

The engine has an ECM to control major systems such as fuel control, ignition control, idle air control system, etc. The ECM accepts input signals from sensors and instantly drives actuators. It is essential that both input and output signals are proper and stable. At the same time, it is important that there are no problems such as vacuum leaks, fouled spark plugs, or other problems with the engine.

It is much more difficult to diagnose a problem that occurs intermittently rather than continuously. Most intermittent problems are caused by poor electric connections or improper wiring. In this case, careful checking of suspected circuits may help prevent the replacement of good parts.

A visual check only may not find the cause of the problems. A road test with CONSULT (or GST) or a circuit tester connected should be performed. Follow the "Work Flow" on EC-69.

Before undertaking actual checks, take a few minutes to talk with a customer who approaches with a driveability complaint. The customer can supply good information about such problems, especially intermittent ones. Find out what symptoms are present and under what conditions they occur. A "Diagnostic Worksheet" like the example on next page should be used.

Start your diagnosis by looking for "conventional" problems first. This will help troubleshoot driveability problems on an electronically controlled engine vehicle.

Diagnostic Worksheet

There are many operating conditions that lead to the malfunction of engine components. A good grasp of such conditions can make trouble-shooting faster and more accurate.

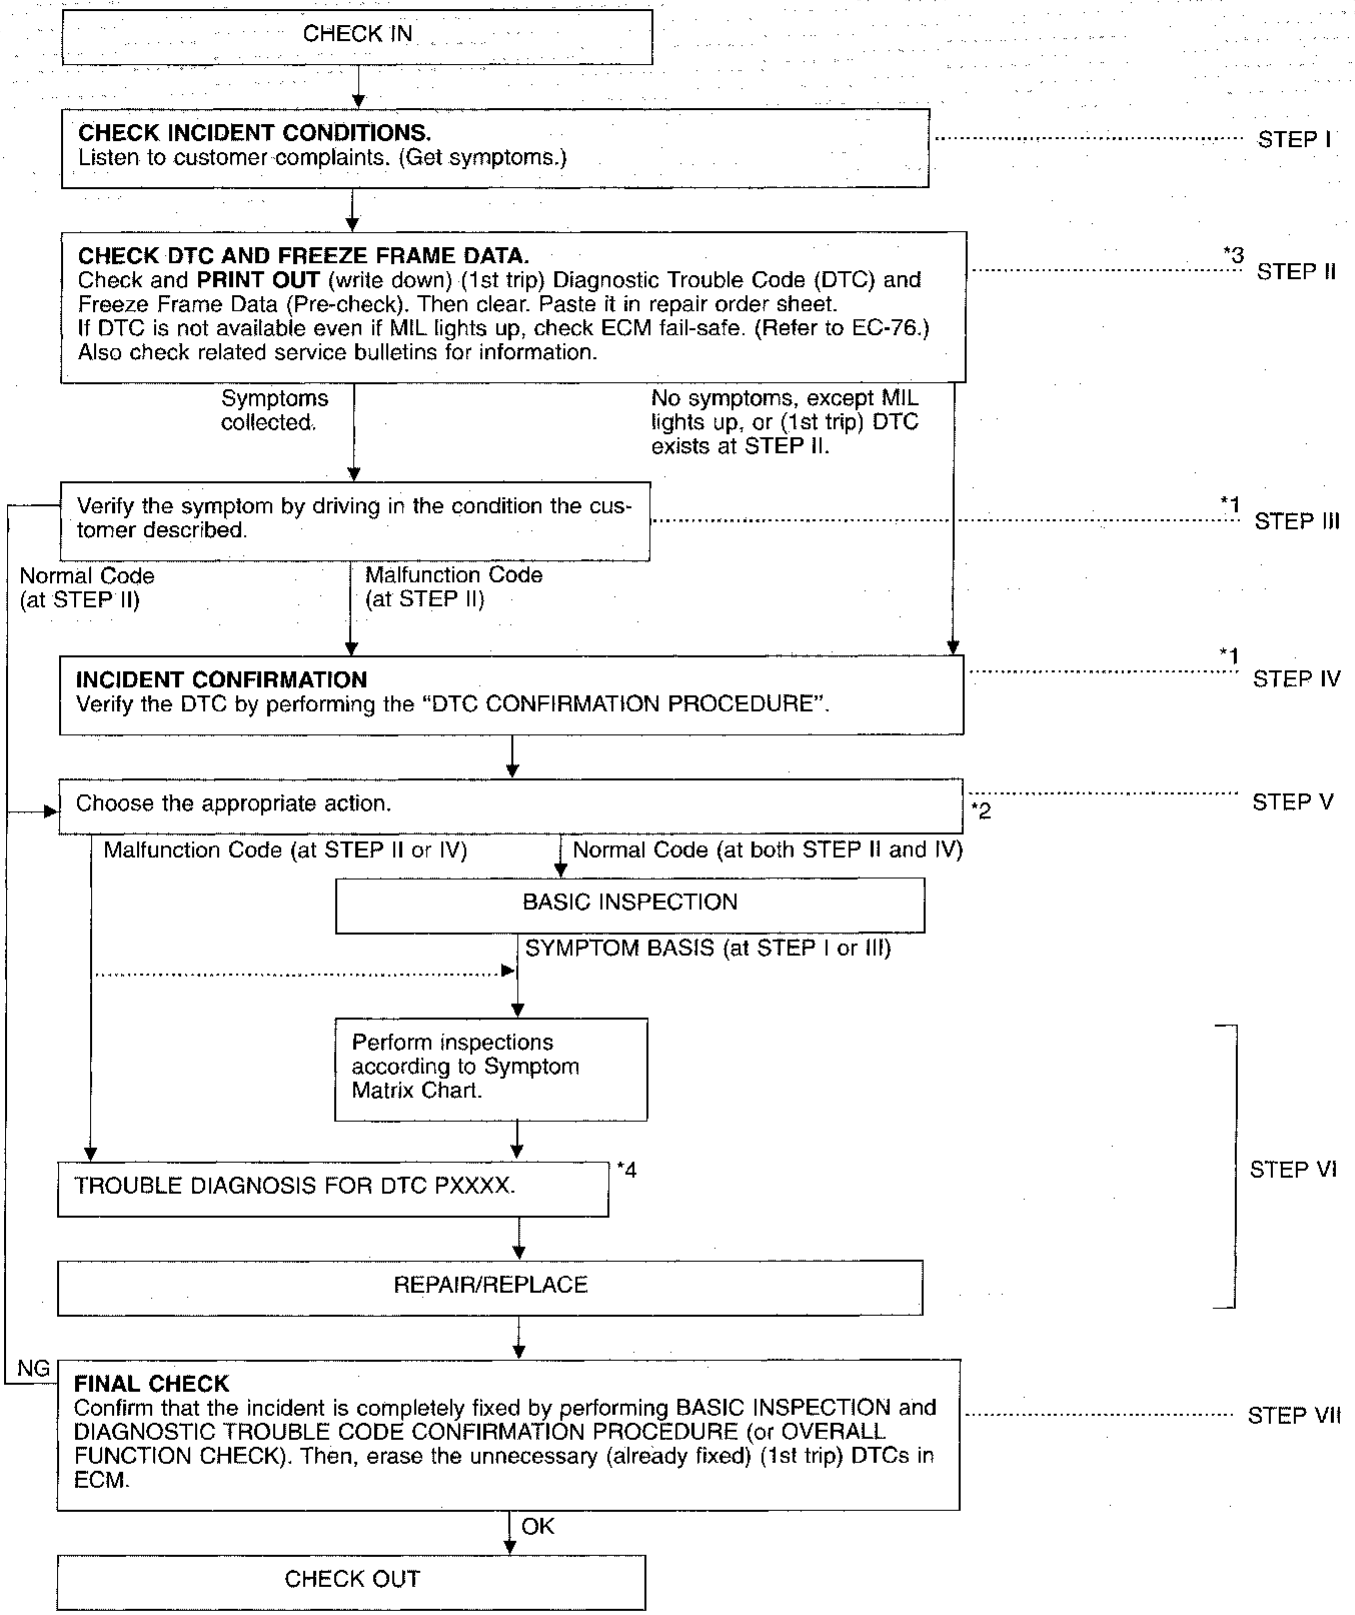
In general, each customer feels differently about a problem. It is important to fully understand the symptoms or conditions for a customer complaint.

Utilize a diagnostic worksheet like the one on the next page in order to organize all the information for troubleshooting.

Some conditions may cause the malfunction indicator lamp to come on steady or blink and DTC to be detected. Examples:

- Vehicle ran out of fuel, which caused the engine to misfire.
- Fuel filler cap was left off or incorrectly screwed on, allowing fuel to evaporate into the atmosphere [for the models with EVAP (SMALL LEAK) diagnosis].

Diagnostic Worksheet (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

WORKSHEET SAMPLE

Customer name MR/MS		Model & Year	VIN
Engine #		Trans.	Mileage
Incident Date		Manuf. Date	In Service Date
Fuel and fuel filler cap		☐ Vehicle ran out of fuel causing misfire ☐ Fuel filler cap was left off or incorrectly screwed on.	
Symptoms	☐ Startability	☐ Impossible to start ☐ No combustion ☐ Partial combustion ☐ Partial combustion affected by throttle position ☐ Partial combustion NOT affected by throttle position ☐ Possible but hard to start ☐ Others [ ]	
	☐ Idling	☐ No fast idle ☐ Unstable ☐ High idle ☐ Low idle ☐ Others [ ]	
	☐ Driveability	☐ Stumble ☐ Surge ☐ Knock ☐ Lack of power ☐ Intake backfire ☐ Exhaust backfire ☐ Others [ ]	
	☐ Engine stall	☐ At the time of start ☐ While idling ☐ While accelerating ☐ While decelerating ☐ Just after stopping ☐ While loading	
Incident occurrence		☐ Just after delivery ☐ Recently ☐ In the morning ☐ At night ☐ In the daytime	
Frequency		☐ All the time ☐ Under certain conditions ☐ Sometimes	
Weather conditions		☐ Not affected	
	Weather	☐ Fine ☐ Raining ☐ Snowing ☐ Others [ ]	
	Temperature	☐ Hot ☐ Warm ☐ Cool ☐ Cold ☐ Humid °F	
Engine conditions		☐ Cold ☐ During warm-up ☐ After warm-up Engine speed 0 2,000 4,000 6,000 8,000 rpm	
Road conditions		☐ In town ☐ In suburbs ☐ Highway ☐ Off road (up/down)	
Driving conditions		☐ Not affected ☐ At starting ☐ While idling ☐ At racing ☐ While accelerating ☐ While cruising ☐ While decelerating ☐ While turning (RH/LH) Vehicle speed 0 10 20 30 40 50 60 MPH	
Malfunction indicator lamp		☐ Turned on ☐ Not turned on

Description for Work Flow

STEP	DESCRIPTION
STEP I	Get detailed information about the conditions and the environment when the incident/symptom occurred using the "DIAGNOSTIC WORK SHEET", EC-68.
STEP II	Before confirming the concern, check and write down (print out using CONSULT or Generic Scan Tool) the (1st trip) Diagnostic Trouble Code (DTC) and the (1st trip) freeze frame data, then erase the code and the data. (Refer to EC-45.) The (1st trip) DTC and the (1st trip) freeze frame data can be used when duplicating the incident at STEP III & IV. Study the relationship between the cause, specified by (1st trip) DTC, and the symptom described by the customer. (The "Symptom Matrix Chart" will be useful. See EC-77.) Also check related service bulletins for information.
STEP III	Try to confirm the symptom and under what conditions the incident occurs. The "DIAGNOSTIC WORK SHEET" and the freeze frame data are useful to verify the incident. Connect CONSULT to the vehicle in DATA MONITOR (AUTO TRIG) mode and check real time diagnosis results. If the incident cannot be verified, perform INCIDENT SIMULATION TESTS. (Refer to GI section.) If the malfunction code is detected, skip STEP IV and perform STEP V.
STEP IV	Try to detect the (1st trip) Diagnostic Trouble Code by driving in (or performing) the "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE". Check and read the (1st trip) DTC and (1st trip) freeze frame data by using CONSULT or Generic Scan Tool. During the (1st trip) DTC verification, be sure to connect CONSULT to the vehicle in DATA MONITOR (AUTO TRIG) mode and check real time diagnosis results. If the incident cannot be verified, perform INCIDENT SIMULATION TESTS. (Refer to GI section.) In case the "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" is not available, perform the "OVERALL FUNCTION CHECK" instead. The (1st trip) DTC cannot be displayed by this check, however, this simplified "check" is an effective alternative. The "NG" result of the "OVERALL FUNCTION CHECK" is the same as the (1st trip) DTC detection.
STEP V	Take the appropriate action based on the results of STEP I through IV. If the malfunction code is indicated, proceed to TROUBLE DIAGNOSIS FOR DTC PXXXX. If the normal code is indicated, proceed to the BASIC INSPECTION. (Refer to EC-71.) Then perform inspections according to the Symptom Matrix Chart. (Refer to EC-77.)
STEP VI	Identify where to begin diagnosis based on the relationship study between symptom and possible causes. Inspect the system for mechanical binding, loose connectors or wiring damage using (tracing) "Harness Layouts". Gently shake the related connectors, components or wiring harness with CONSULT set in "DATA MONITOR (AUTO TRIG)" mode. Check the voltage of the related ECM terminals or monitor the output data from the related sensors with CONSULT. Refer to EC-80. The "DIAGNOSTIC PROCEDURE" in EC section contains a description based on open circuit inspection. A short circuit inspection is also required for the circuit check in the DIAGNOSTIC PROCEDURE. For details, refer to GI section ("HOW TO PERFORM EFFICIENT DIAGNOSIS FOR AN ELECTRICAL INCIDENT", "Circuit Inspection"). Repair or replace the malfunction parts.
STEP VII	Once you have repaired the circuit or replaced a component, you need to run the engine in the same conditions and circumstances which resulted in the customer's initial complaint. Perform the "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" and confirm the normal code [Diagnostic trouble code No. P0000 or 0505] is detected. If the incident is still detected in the final check, perform STEP VI by using a different method from the previous one. Before returning the vehicle to the customer, be sure to erase the unnecessary (already fixed) (1st trip) DTC in ECM. (Refer to EC-43.)

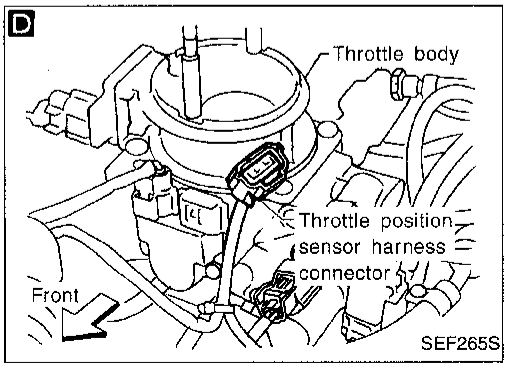
SEF321V

C



SEF501V

D

SEF320V

D

SEF265S

Basic Inspection

Precaution:

Perform Basic Inspection without electrical or mechanical loads applied;

- **Headlamp switch is OFF,**
- **Air conditioner switch is OFF,**
- **Steering wheel is in the straight-ahead position, etc.**

A

BEFORE STARTING

1. Check service records for repairs of related problems, or the current need for scheduled maintenance.
2. Open engine hood and check the following:
- Harness connectors for proper connections
- Vacuum hoses for splits, kinks, and proper connections
- Wiring for proper connections, pinches, or cuts

B

CONNECT CONSULT TO THE VEHICLE.

Connect "CONSULT" to the data link connector for CONSULT and select "ENGINE" from the menu. (Refer to page EC-54.)

C

Warm engine up to normal operating temperature and make sure that the center of mark Ⓐ is aligned with mark Ⓑ as shown in the figure.

NG → Check FI cam. Refer to EC-28.

OK

D

CHECK IGNITION TIMING.

NG → Adjust ignition timing by turning distributor.

1. Warm engine up to normal operating temperature.
2. Select "IGN TIMING ADJ" in "WORK SUPPORT" mode.
3. Touch "START".
4. Check ignition timing at idle using timing light.
   Ignition timing:
   20°±2° BTDC

OR

1. Warm engine up to normal operating temperature.
2. Stop engine and disconnect throttle position sensor harness connector.
3. Start engine.
4. Rev engine (2,000 to 3,000 rpm) 2 or 3 times under no-load and then run engine at idle speed.
5. Check ignition timing at idle using timing light.
   Ignition timing:
   20°±2° BTDC

OK

Ⓐ
(Go to next page.)

Basic Inspection (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Ⓐ

E

CHECK BASE IDLE SPEED.
Warm engine up to normal operating temperature.

1. Select "IGN TIMING ADJ" in "WORK SUPPORT" mode.
2. When touching "START", does engine speed fall to **750±50 rpm (in "P" or "N" position)?**

OR

Does engine run at **750±50 rpm (in "P" or "N" position)?**

NG → Adjust base idle speed by turning idle speed adjusting screw.
Refer to "Idle Speed/ Ignition Timing/Idle Mixture Ratio Adjustment", EC-29.

OK ↓

E

IGN TIMING ADJ

IGNITION TIMING FEEDBACK CONTROL WILL BE HELD BY TOUCHING START.
AFTER DOING SO, ADJUST IGNITION TIMING WITH A TIMING LIGHT BY TURNING THE CAMSHAFT POSITION SENSOR.

START

SEF555N

F

CHECK CLOSED THROTTLE POSITION SWITCH IDLE POSITION.

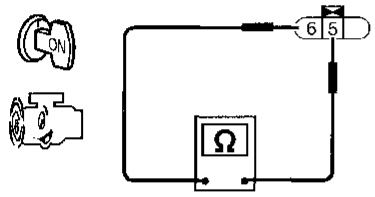
- **Warm engine up to normal operating temperature.**
- **Check FI cam. Refer to procedure C .**
- **Always check ignition timing and base idle speed before performing followings.**

1. Disconnect throttle position sensor harness connector and closed throttle position switch harness connector.
2. Rev engine (2,000 to 3,000 rpm) 2 or 3 times under no-load and then run engine at idle speed.
3. Check harness continuity between closed throttle position switch terminals ⑤ and ⑥ under the following condition.

- Raise engine speed to 2,000 rpm.
- Lower engine speed as gradually as possible.
  Engine speed at the point closed throttle position switch switches from OFF → ON (No continuity to continuity exists): 950±150 rpm

NG → **G**

ADJUSTMENT
Adjust closed throttle position switch idle position by rotating throttle position sensor body as follows.



1. Start engine and warm it up to normal operating temperature.
2. Stop engine and disconnect throttle position sensor harness connector and closed throttle position switch harness connector.
3. Set the circuit tester leads to the closed throttle position switch terminals ⑤ and ⑥.
4. Loosen throttle position sensor body fixing bolts and move the sensor.
5. Start engine and adjust the sensor body while engine speed at the point closed throttle position switch switches **from OFF → ON (No continuity to continuity exists): 950±150 rpm.**
6. Temporarily tighten the sensor body fixing bolts.
7. Raise engine speed to 2,000 rpm and lower the engine speed as gradually as possible, confirm that above adjustment is performed correctly.
8. Tighten throttle position sensor body.
9. Reconfirm that the closed throttle position idle position is switched from "OFF" to "ON" at 950±50 rpm while reducing engine speed from 2,000 rpm.

If NG, repeat from the step 4.

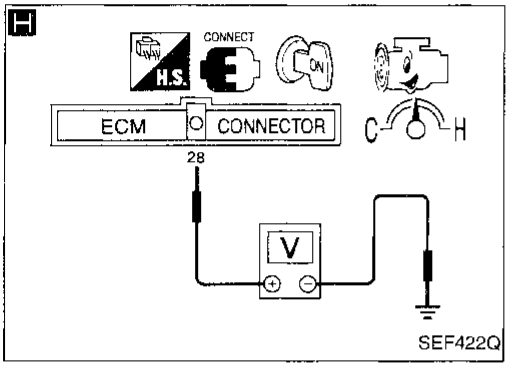
H

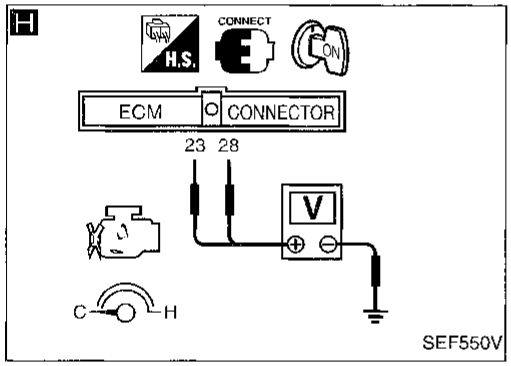
■ THRTL POS SEN ADJ ■ □



CHECK THE THROTTLE POSITION SENSOR SIGNAL. ADJUST IT TO THE SPECIFIED VALUE BY ROTATING THE SENSOR BODY UNDER THE FOLLOWING CONDITION

- IGN SW "ON"
- ENG NOT RUNNING
- ACC PEDAL KEPT OFF

START



SEF549V

H

SEF422Q

H

SEF550V

Ⓑ

- Reconnect throttle position sensor harness connector and throttle position switch harness connector.
- Rev engine (2,000 to 3,000 rpm) 2 or 3 times under no-load and then run engine at idle speed.

OK

Ⓒ

RESET THROTTLE POSITION SENSOR IDLE POSITION MEMORY.

1. Warm engine up to normal operating temperature and stop engine.
2. Select "CLSD THL/P SW" in "DATA MONITOR" mode (Manual trigger) with CONSULT before stopping engine.
3. Reconnect throttle position sensor harness connector and closed throttle position switch harness connector.
4. Turn ignition switch "ON".
5. Turn ignition switch "OFF" and wait at least 5 seconds.
6. Repeat steps 3 and 4 until "CLSD THL/P SW" in "DATA MONITOR" mode with CONSULT changes to "ON".
7. Repeat steps 3 and 4 20 times.

OK

H

CHECK THROTTLE POSITION SENSOR IDLE POSITION.

1. Stop engine.
2. Perform "THRTL POS SEN ADJ" in "WORK SUPPORT" mode.
3. Check that output voltage of throttle position sensor is approx. 0.3 to 0.7V. At the same time, measure voltage between ECM terminal 28 (Closed throttle position switch) and ground with CONSULT on tester.

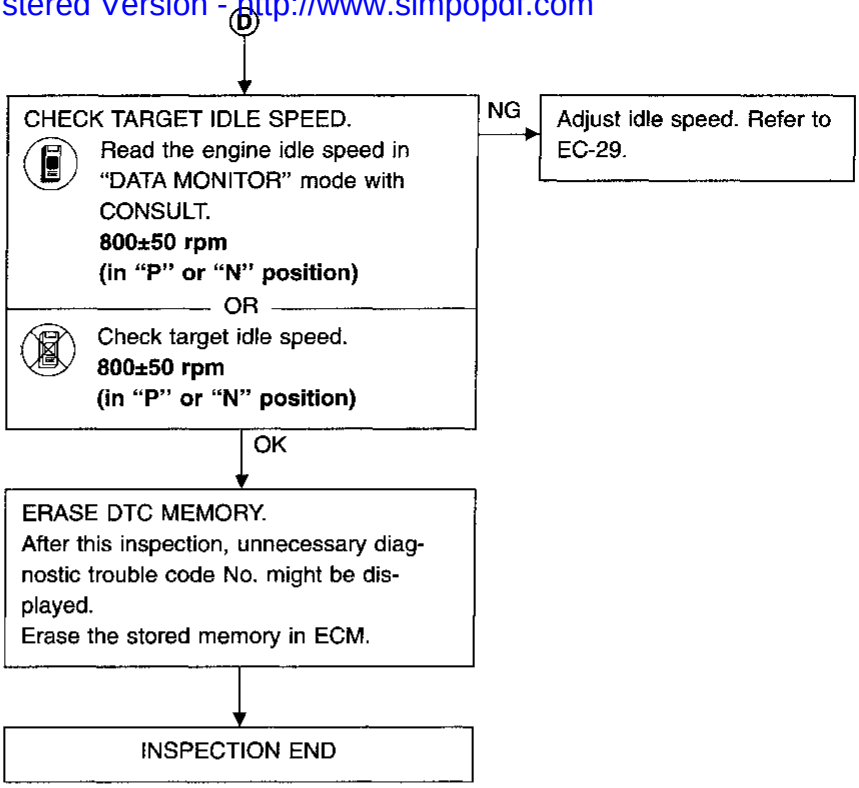
The voltage is between 11 to 14V (Battery voltage).

OR

1. Stop engine.
2. Measure voltage between ECM terminal 23 (Throttle position sensor) and ground. The voltage is approx. 0.3 to 0.7V. At the same time, measure voltage between ECM terminal 28 (Closed throttle position switch) and ground with CONSULT on tester.

The voltage is between 11 to 14V (Battery voltage).

NG → Readjust the closed throttle position switch idle position. Go to G .



OK

Ⓓ

(Go to next page.)

Diagnostic Trouble Code (DTC) Inspection Priority Chart

If some DTCs are displayed at the same time, perform inspections one by one based on the following priority chart.

Priority	Detected items (DTC)		
1	● ECM (P0605, 0301)	● Camshaft position sensor (P0340, 0101)	● Engine coolant temperature sensor (P0115, 0103) (P0125, 0908)
	● Mass air flow sensor (P0100, 0102)	● Vehicle speed sensor (P0500, 0104)	● Ignition signal (P1320, 0201)
	● Throttle position sensor (P0120, 0403)	● Intake air temperature sensor (P0110, 0401)	● Park/Neutral position switch (P1706, 1003)
	● EGRC-solenoid valve (P1400, 1005)	● Knock sensor (P0325, 0304)	
		● Tank fuel temperature sensor (P0180, 0402)	
2	● EGR temperature sensor (P1401, 0305)	● Front heated oxygen sensor heater (P0135, 0901)	● Front heated oxygen sensor (P0130 - P0134, 0303 - 0412)
		● Crankshaft position sensor (OBD) (P0335, 0802) (P1336, 0905)	● Rear heated oxygen sensor (P0137 - P0140, 0510 - 0707)
		● Torque converter clutch solenoid valve (P1775, 0904) (P1776, 0513)	
	● Absolute pressure sensor (P0105, 0803)		● Rear heated oxygen sensor heater (P0141, 0902)
	● MAP/BARO switch solenoid valve (P1105, 1302)	● Vacuum cut valve bypass valve (P1491, 0311) (P1490, 0801)	● EVAP control system pressure sensor (P0450, 0704)
	● Closed throttle position switch (P0510, 0203)		● EVAP canister vent control valve (P1448, 0309) (P0446, 0903) (P1446, 0215)
			● EVAP canister purge volume control solenoid valve (P1444, 0214) (P0443, 1008)
			● EVAP control system purge flow monitoring (P1447, 0111)
3	● EGR function (P0400, 0302) (P1402, 0514)	● Misfire (P0304 - P0300, 0605 - 0701)	● Fuel injection system function (P0172, 0114), (P0171, 0115)
	● EVAP control system (SMALL LEAK) (P0440, 0705) (P1440, 0213)	● Closed loop control (P1148, 0307)	● Three way catalyst function (P0420, 0702)
	● EGRC-BPT valve function (P0402, 0306)		
	● IACV-AAC valve (P0505, 0205)

CONSULT Reference Value in Data Monitor Mode

Remarks:

- Specification data are reference values.
- Specification data are output/input values which are detected or supplied by the ECM at the connector.
  * Specification data may not be directly related to their components signals/values/operations.
  i.e. Adjust ignition timing with a timing light before monitoring IGN TIMING, because the monitor may show the specification data in spite of the ignition timing not being adjusted to the specification data. This IGN TIMING monitors the data calculated by the ECM according to the signals input from the camshaft position sensor and other ignition timing related sensors.
- If the real-time diagnosis results are NG and the on board diagnostic system results are OK when diagnosing the mass air flow sensor, first check to see if the fuel pump control circuit is normal.

MONITOR ITEM	CONDITION		SPECIFICATION
CMPS·RPM (REF)	● Tachometer: Connect ● Run engine and compare tachometer indication with the CONSULT value.		Almost the same speed as the CONSULT value.
MAS AIR/FL SE	● Engine: After warming up ● Air conditioner switch: "OFF" ● Shift lever: "N" ● No-load	Idle	0.9 - 1.8V
		2,500 rpm	1.9 - 2.3V
COOLAN TEMP/S	● Engine: After warming up		More than 70°C (158°F)
FR O2 SENSOR	● Engine: After warming up	Maintaining engine speed at 2,000 rpm	0 - 0.3V ↔ Approx. 0.6 - 1.0V
FR O2 MNTR			LEAN ↔ RICH Changes more than 5 times during 10 seconds.
RR O2 SENSOR	● Engine: After warming up	Revving engine from idle to 3,000 rpm quickly	0 - 0.3V ↔ Approx. 0.6 - 1.0V
RR O2 MNTR			LEAN ↔ RICH
VHCL SPEED SE	● Turn drive wheels and compare speedometer indication with the CONSULT value		Almost the same speed as the CONSULT value
BATTERY VOLT	● Ignition switch: ON (Engine stopped)		11 - 14V
THRTL POS SEN	● Ignition switch: ON (Engine stopped) ● Engine: After warming up	Throttle valve: fully closed	0.3 - 0.7V
		Throttle valve: fully opened	Approx. 4.0V
EGR TEMP SEN	● Engine: After warming up		Less than 4.5V
START SIGNAL	● Ignition switch: ON → START → ON		OFF → ON → OFF
CLSD THL/P SW	● Engine: After warming up ● Ignition switch: ON (Engine stopped)	Throttle valve: Idle position	ON
		Throttle valve: Slightly open	OFF
AIR COND SIG	● Engine: After warming up, idle the engine	Air conditioner switch: "OFF"	OFF
		Air conditioner switch: "ON" (Compressor operates.)	ON
P/N POSI SW	● Ignition switch: ON	Shift lever: "P" or "N"	ON
		Except above	OFF
PW/ST SIGNAL	● Engine: After warming up, idle the engine	Steering wheel in neutral position (forward direction)	OFF
		The steering wheel is fully turned	ON

CONSULT Reference Value in Data Monitor Mode (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

MONITOR ITEM	CONDITION		SPECIFICATION
IGNITION SW	● Ignition switch: ON → OFF → ON		ON → OFF → ON
INJ PULSE	● Engine: After warming up ● Air conditioner switch: "OFF" ● Shift lever: "N" ● No-load	Idle	2.5 - 3.3 msec
		2,000 rpm	2.4 - 3.2 msec
B/FUEL SCHDL	● Engine: After warming up ● Air conditioner switch: "OFF" ● Shift lever: "N" ● No-load	Idle	0.8 - 1.2 msec
		2,000 rpm	0.8 - 1.2 msec
IGN TIMING	● Engine: After warming up ● Air conditioner switch: "OFF" ● Shift lever: "N" ● No-load	Idle	Approx. 20° BTDC
		2,000 rpm	More than 25° BTDC
IACV-AAC/V	● Engine: After warming up ● Air conditioner switch: "OFF" ● Shift lever: "N" ● No-load	Idle	Approx. 30%
		2,000 rpm	—
PURG VOL C/V	● Engine: After warming up ● Air conditioner switch "OFF" ● No-load	Idle	0%
		2,000 rpm (More than 200 seconds after starting engine)	—
A/F ALPHA	● Engine: After warming up	Maintaining engine speed at 2,000 rpm	50 - 159%
EVAP SYS PRES	● Ignition switch: ON		Approx. 3.4V
AIR COND RLY	● Air conditioner switch: OFF → ON		OFF → ON
FUEL PUMP RLY	● Ignition switch is turned to ON (Operates for 5 seconds) ● Engine running and cranking		ON
	Except as shown above		OFF
EGRC SOL/V	● Engine: After warming up ● Air conditioner switch: "OFF" ● Shift lever: "N" ● No-load	Idle	ON
		Engine speed: Revving engine from idle to 3,000 rpm quickly	OFF
TCC SOL/V	● Engine: After warming up	Idle	ON
		2,000 rpm	OFF
VENT CONT/V	● Ignition switch: ON		OFF
FR O2 HEATER	● Engine speed: Below 3,000 rpm (All models) For 6 seconds after engine speed exceeds 3,000 rpm (4WD models only)		ON
	● Engine speed: Above 3,000 rpm (2WD models) More than 6 seconds after engine speed exceeds 3,000 rpm (4WD models)		OFF
RR O2 HEATER	● Engine running		ON
	● Ignition switch: ON		OFF
VC/V BYPASS/V	● Ignition switch: ON		OFF
CAL/LD VALUE	● Engine: After warming up ● Air conditioner switch: "OFF" ● Shift lever: "N" ● No-load	Idle	9.5 - 34.0%
		2,500 rpm	13.9 - 24.9%
ABSOL TH·P/S	● Engine: After warming up, engine stopped ● Ignition switch: ON	Throttle valve: fully closed	0.0%
		Throttle valve: fully opened	Approx. 80%
MASS AIRFLOW	● Engine: After warming up ● Air conditioner switch: "OFF" ● Shift lever: "N" ● No-load	Idle	0.9 - 5.8 g·m/s
		2,500 rpm	7.5 - 13.2 g·m/s
MAP/BARO SW/V	● Engine: For 5 seconds after starting engine		BARO
	● Ignition switch: More than 5 seconds after turning ignition switch "ON" ● Engine: More than 5 seconds after starting engine		MAP
ABSOL PRES/SE	● Ignition switch: ON ● Engine: For 5 seconds after starting engine		Approx. 4.4V
	● Engine: More than 5 seconds after starting engine (After warming up)		Approx. 1.2V

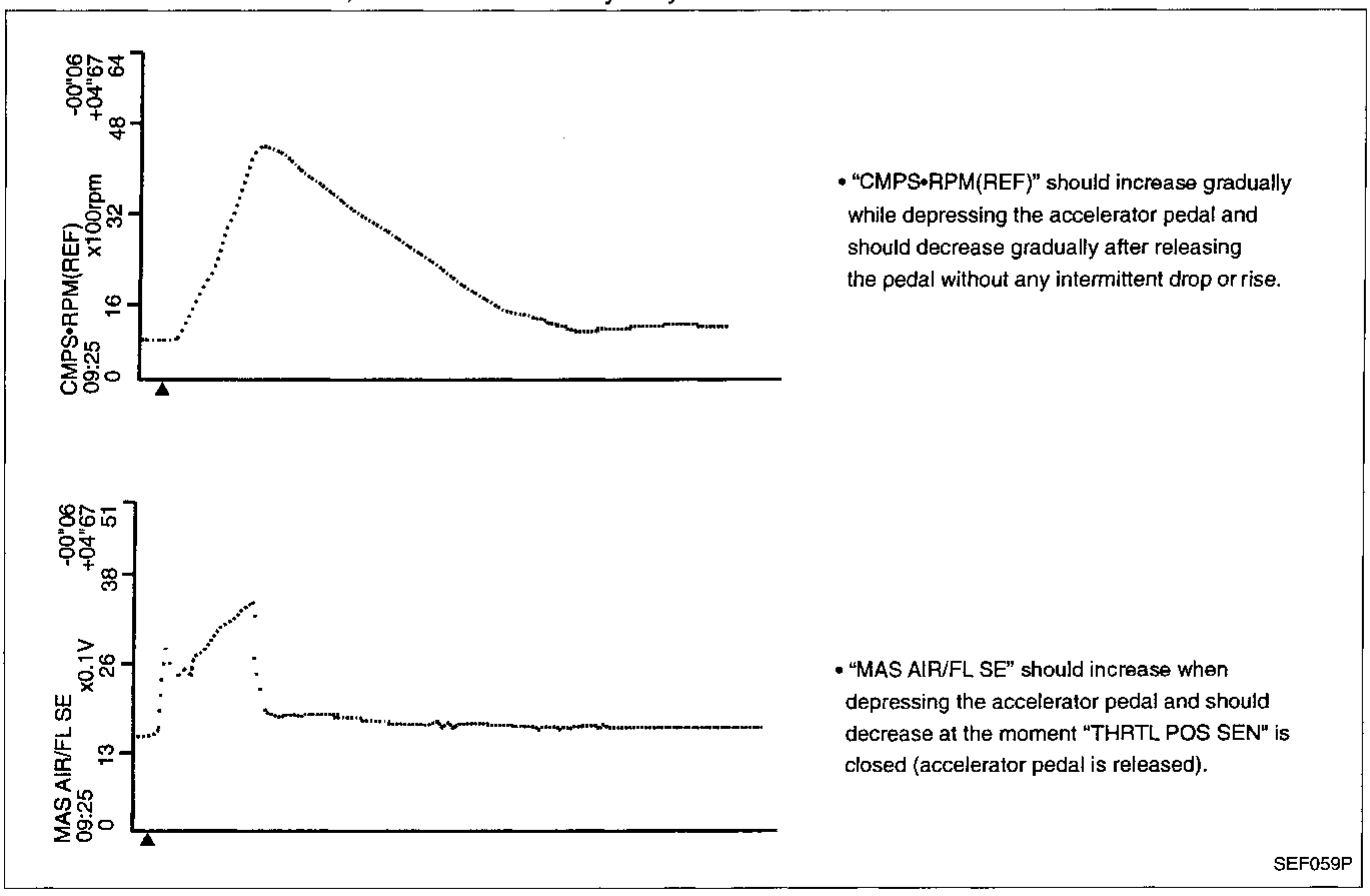
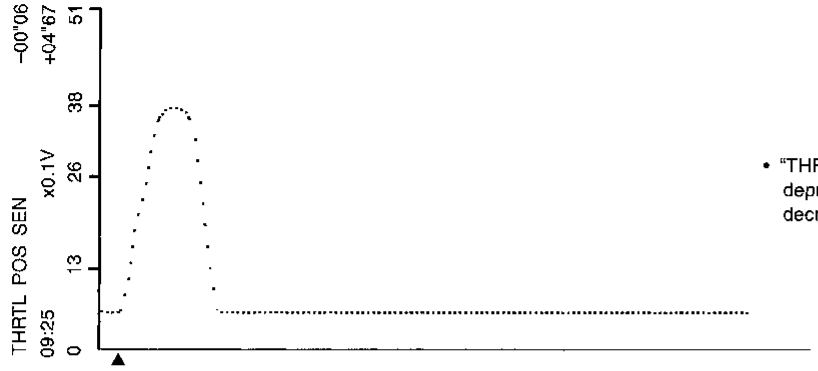
Major Sensor Reference Graph in Data Monitor Mode

The following are the major sensor reference graphs in "DATA MONITOR" mode.
(Select "HI SPEED" in "DATA MONITOR" with CONSULT.)



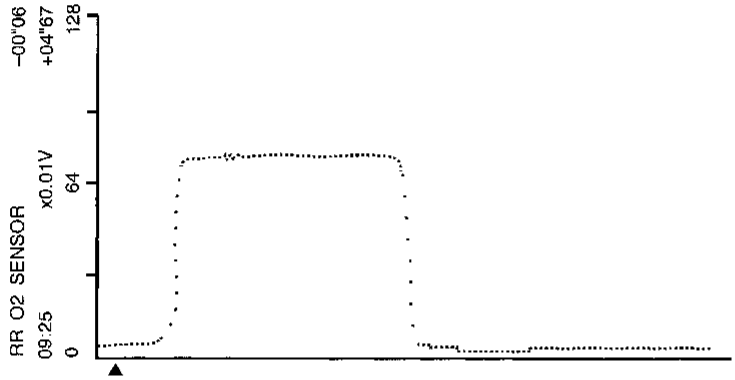
THRTL POS SEN, ABSOL TH·P/S, CLSD THL/P SW

Below is the data for "THRTL POS SEN", "ABSOL TH·P/S" and "CLSD THL/P SW" when depressing the accelerator pedal with the ignition switch "ON".
The signal of "THRTL POS SEN" and "ABSOL TH·P/S" should rise gradually without any intermittent drop or rise after "CLSD THL/P SW" is changed from "ON" to "OFF".

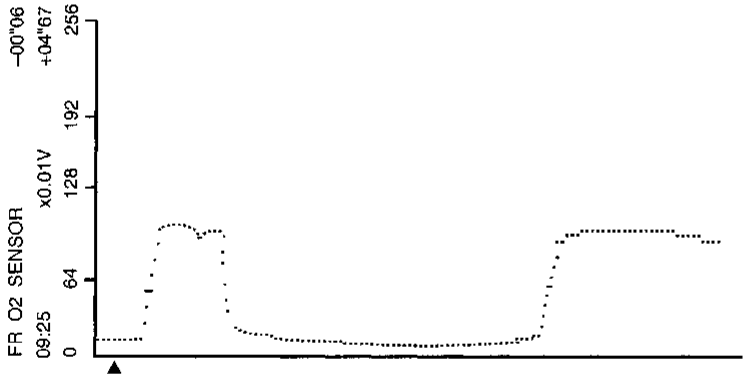


CMPS·RPM (REF), MAS AIR/FL SE, THRTL POS SEN, RR O2 SEN, FR O2 SEN, INJ PULSE

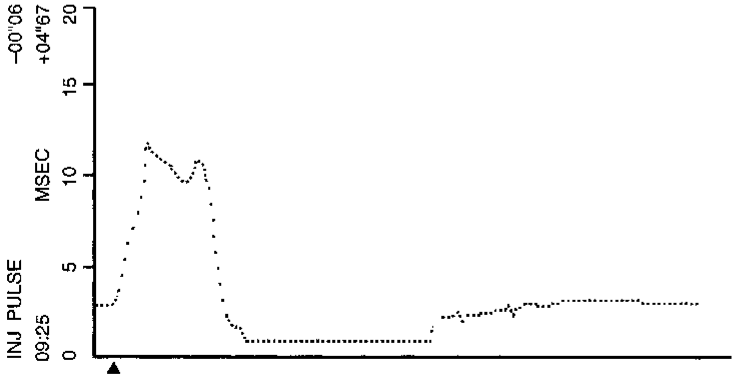
Below is the data for "CMPS·RPM (REF)", "MAS AIR/FL SE", "THRTL POS SEN", "RR O2 SEN", "FR O2 SEN" and "INJ PULSE" when revving engine quickly up to 4,800 rpm under no load after warming up engine to normal operating temperature.
Each value is for reference, the exact value may vary.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

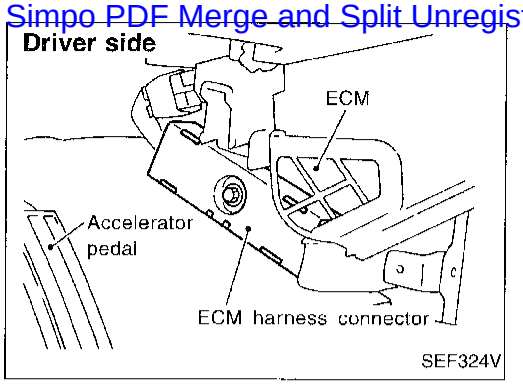


Major Sensor Reference Graph in Data Monitor Mode (Cont'd)



- "THRTL POS SEN" should increase while depressing the accelerator pedal and should decrease while releasing it.

- "RR O2 SENSOR" may increase immediately after depressing the accelerator pedal and may decrease after releasing the pedal.



- "FR O2 SENSOR" may increase immediately after depressing the accelerator pedal and may decrease after releasing the pedal.

- "INJ PULSE" should increase when depressing the accelerator pedal and should decrease when the pedal is released.

SEF417R

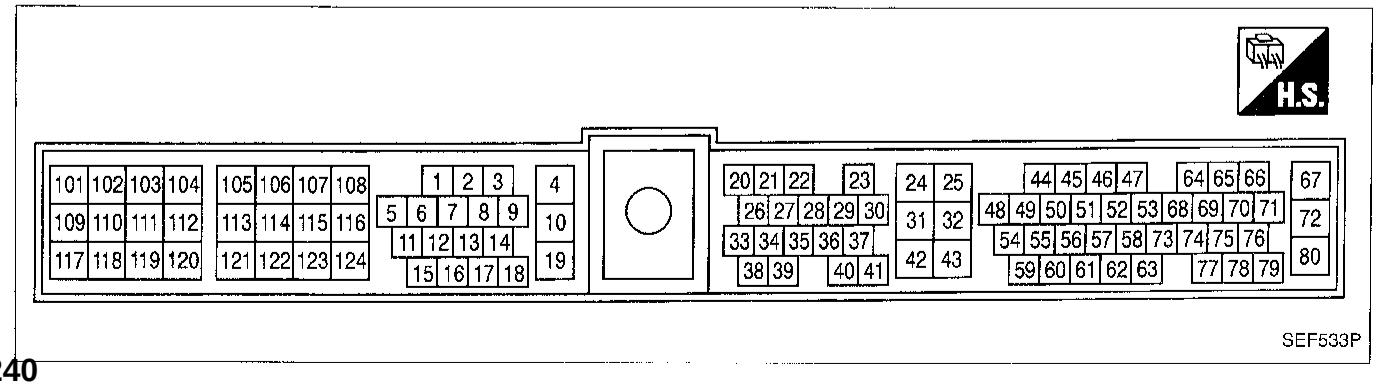
ECM Terminals and Reference Value

PREPARATION

1. ECM is located behind the instrument lower cover. For this inspection:
   - Remove instrument lower cover.



2. Remove ECM harness protector.

3. Perform all voltage measurements with the connector connected. Extend tester probe as shown to perform tests easily.
   - Open harness securing clip to make testing easier.
   - Use extreme care not to touch 2 pins at one time.
   - Data is for comparison and may not be exact.

ECM HARNESS CONNECTOR TERMINAL LAYOUT

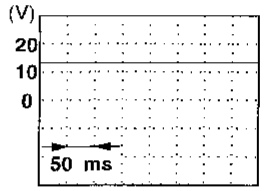
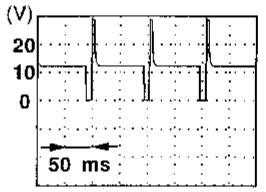
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



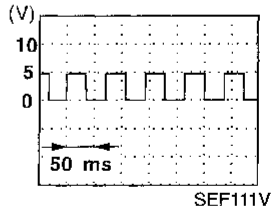


ECM INSPECTION TABLE

Specification data are reference values and are measured between each terminal and ㉜ (ECM ground).

TERMINAL NO.	WIRE COLOR	ITEM	CONDITION	DATA (DC Voltage)
1	PU/W	Ignition signal	Engine is running. (Warm-up condition) └ Idle speed	0 - 0.5V  SEF186T
			Engine is running. └ Engine speed is 2,000 rpm.	0.2 - 1.0V  SEF187T
2	B	Ignition check	Engine is running. (Warm-up condition) └ Idle speed	12 - 14V  SEF188T
			Engine is running. └ Engine speed is 2,000 rpm.	12 - 13V  SEF189T
3	P/L	Tachometer	Engine is running. (Warm-up condition) └ Idle speed	0 - 1V  SEF190T
			Engine is running. └ Engine speed is 2,000 rpm.	0.5 - 2V  SEF191T

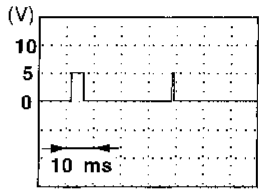
ECM Terminals and Reference Value (Cont'd)

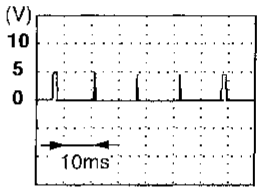


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

TERMINAL NO.	WIRE COLOR	ITEM	CONDITION	DATA (DC Voltage)
4	LG/R	ECCS relay (Self-shutoff)	Engine is running. Ignition switch "OFF" For a few seconds after turning ignition switch "OFF"	0 - 1V
			Ignition switch "OFF" A few seconds passed after turning ignition switch "OFF"	BATTERY VOLTAGE (11 - 14V)
5	R/Y	EVAP canister purge volume control solenoid valve	Engine is running. Idle speed	BATTERY VOLTAGE (11 - 14V)  SEF109V
			Engine is running. Engine speed is 2,000 rpm. (More than 200 seconds after starting engine)	12 - 13V  SEF110V
10	B/R	ECM ground	Engine is running. Idle speed	Engine ground
11	W/R	Fuel pump relay	Ignition switch "ON" For 5 seconds after turning ignition switch "ON" Engine is running.	0 - 1V
			Ignition switch "ON" More than 5 seconds after turning ignition switch "ON"	BATTERY VOLTAGE (11 - 14V)
12	P	Air conditioner relay	Engine is running. Both A/C switch and blower switch are "ON"*	Approximately 0V
			Engine is running. A/C switch is "OFF".	BATTERY VOLTAGE (11 - 14V)
18	R/W	Malfunction indicator lamp	Ignition switch "ON"	0 - 1V
			Engine is running. Idle speed	BATTERY VOLTAGE (11 - 14V)
19	B/R	ECM ground	Engine is running. Idle speed	Engine ground

*: Any mode except "OFF", ambient air temperature above 10°C (50°F).





ECM Terminals and Reference Value (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

TERMINAL NO.	WIRE COLOR	ITEM	CONDITION	DATA (DC Voltage)
20	L/OR	Start signal	Ignition switch "ON"	Approximately 0V
			Ignition switch "START"	BATTERY VOLTAGE (11 - 14V)
21	G/R	Air conditioner dual-pressure switch	Engine is running. └ Both air conditioner switch and blower switch are "ON" (Compressor operates)	Approximately 0V
			Engine is running. └ Air conditioner switch is "OFF".	BATTERY VOLTAGE (11 - 14V)
22	L/B	Neutral position switch (M/T models) Inhibitor switch (A/T models)	Ignition switch "ON" └ Gear position is "N" or "P".	Approximately 0V
			Ignition switch "ON" └ Except the above gear position	Approximately 5V
23	L	Throttle position sensor	Ignition switch "ON" (Warm-up condition) └ Accelerator pedal fully released	0.3 - 0.7V
			Ignition switch "ON" └ Accelerator pedal fully depressed	Approximately 4V
24	W/G	Ignition switch	Ignition switch "OFF"	0V
			Ignition switch "ON"	BATTERY VOLTAGE (11 - 14V)
25	B/Y	ECM ground	Engine is running. └ Idle speed	Engine ground
28	BR/W	Throttle position switch (Closed position)	Ignition switch "ON" (Warm-up condition) └ Accelerator pedal fully released	BATTERY VOLTAGE (11 - 14V)
			Ignition switch "ON" └ Accelerator pedal depressed	Approximately 0V
29	G/B	Vehicle speed sensor	Engine is running. ├ Lift up the vehicle. ├ In 2nd gear position └ 40 km/h (25 MPH)	1 - 4V  SEF111V
32	B/Y	ECM ground	Engine is running. └ Idle speed	Engine ground (Probe this terminal with ⊖ tester probe when measuring.)
39	GY/R	Power steering oil pressure switch	Engine is running. └ Steering wheel is fully turned.	Approximately 0V
			Engine is running. └ Steering wheel is not turned.	Approximately 5V

124	B/R	ECM ground	Engine is running. — Idle speed	Engine ground

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description

Intermittent incidents (I/I) may occur. In many cases, the problem resolves itself (the part or circuit function returns to normal without intervention). It is important to realize that the symptoms described in the customer's complaint often do not recur on DTC (1st trip) visits. Realize also that the most frequent cause of I/I occurrences is poor electrical connections. Because of this, the conditions under which the incident occurred may not be clear. Therefore, circuit checks made as part of the standard diagnostic procedure may not indicate the specific problem area.

Common I/I Report Situations

STEP in Work Flow	Situation
II	The CONSULT is used. The SELF-DIAG RESULTS screen shows time data other than "0" or "1t".
III	The symptom described by the customer does not recur.
IV	(1st trip) DTC data does not appear during the DTC CONFIRMATION PROCEDURE.
VI	The TROUBLE DIAGNOSIS for PXXXX does not indicate the problem area.

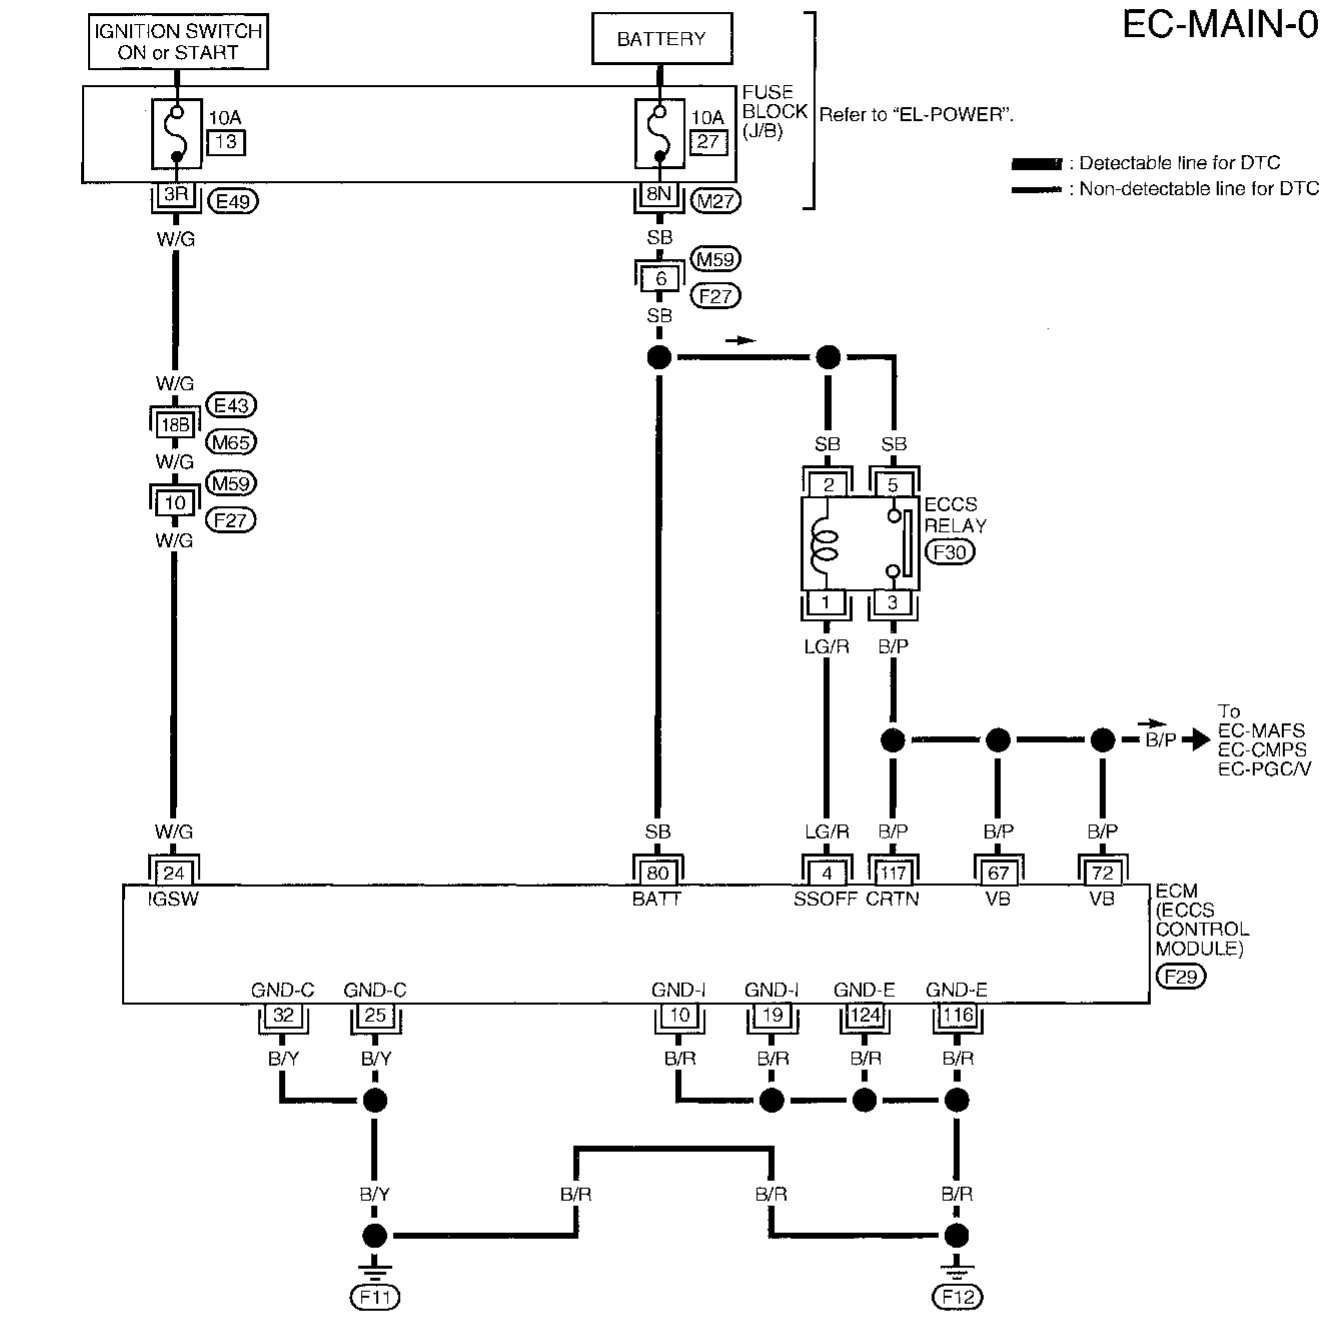
Diagnostic Procedure

Erase (1st trip) DTCs. Refer to "HOW TO ERASE EMISSION-RELATED INFORMATION" (EC-45).

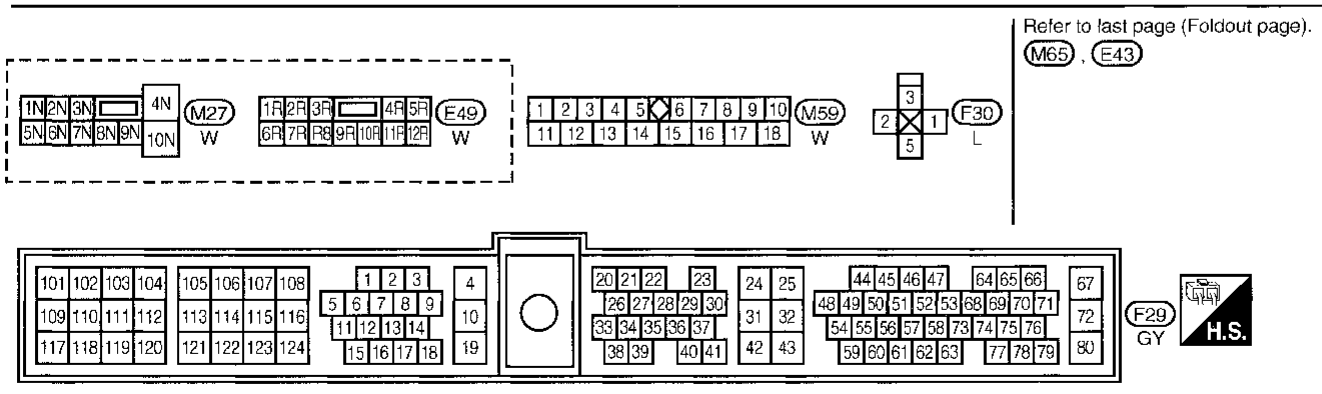
↓

Check ground terminals. Refer to "Circuit Inspection", "GROUND INSPECTION" (GI section).

↓



Perform "Incident Simulation Tests" (GI section).



↓

Check connector terminals. Refer to "How to Check Enlarged Contact Spring of Terminal" (GI section).

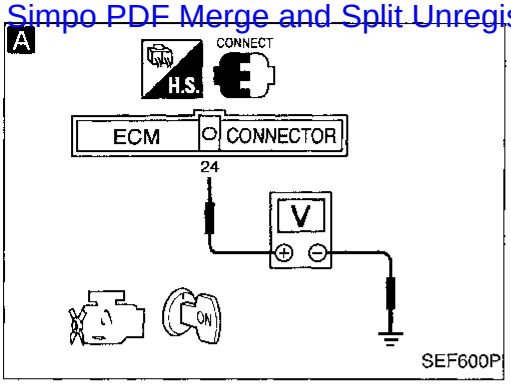
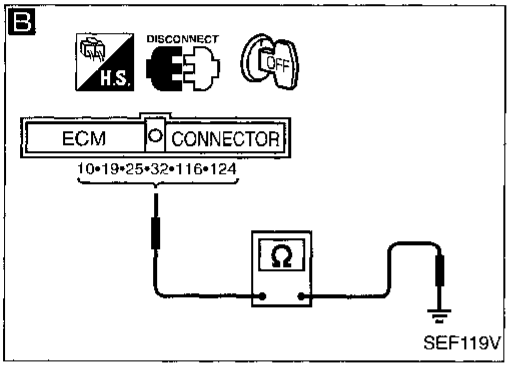
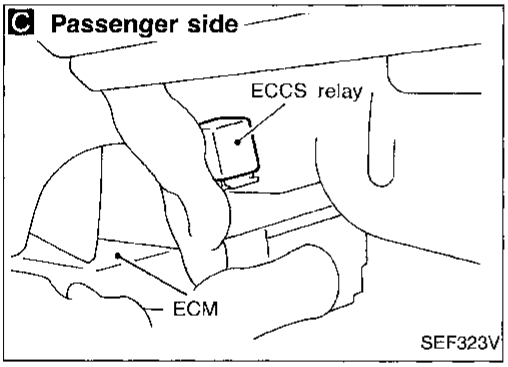
ECM TERMINALS AND REFERENCE VALUE



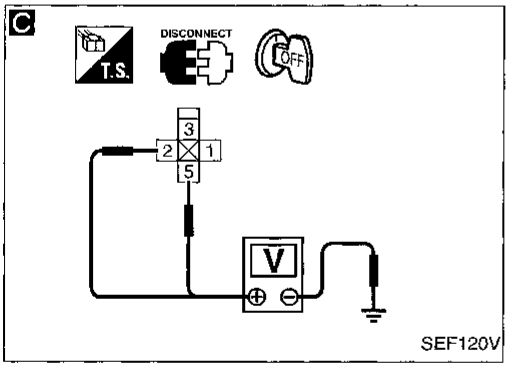
Specification data are reference values and are measured between each terminal and ㉜ (ECM ground).



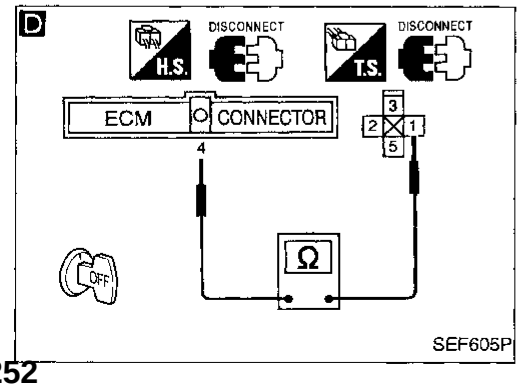
TER-MINAL NO.	WIRE COLOR	ITEM	CONDITION	DATA (DC Voltage)
4	LG/R	ECCS relay (Self-shutoff)	Engine is running. Ignition switch "OFF" └ For a few seconds after turning ignition switch "OFF"	0 - 1V
			Ignition switch "OFF" └ A few seconds passed after turning ignition switch "OFF"	BATTERY VOLTAGE (11 - 14V)
10	B/R	ECM ground	Engine is running. └ Idle speed	Engine ground
19	B/R	ECM ground	Engine is running. └ Idle speed	Engine ground
24	W/G	Ignition switch	Ignition switch "OFF"	0V
			Ignition switch "ON"	BATTERY VOLTAGE (11 - 14V)
25	B/Y	ECM ground	Engine is running. └ Idle speed	Engine ground
32	B/Y	ECM ground	Engine is running. └ Idle speed	Engine ground (Probe this terminal with ⊖ tester probe when measuring.)
67	B/P	Power supply for ECM	Ignition switch "ON"	BATTERY VOLTAGE (11 - 14V)
72	B/P			
80	SB	Power supply (Back-up)	Ignition switch "OFF"	BATTERY VOLTAGE (11 - 14V)
116	B/R	ECM ground	Engine is running. └ Idle speed	Engine ground
117	B/P	Current return	Engine is running. └ Idle speed	BATTERY VOLTAGE (11 - 14V)
124	B/R	ECM ground	Engine is running. └ Idle speed	Engine ground



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Main Power Supply and Ground Circuit (Cont'd)



DIAGNOSTIC PROCEDURE

INSPECTION START

Start engine.
Is engine running?

Yes → Go to E "**CHECK POWER SUPPLY-III**" on next page.

No

A

CHECK POWER SUPPLY-I.
1. Turn ignition switch "ON".
2. Check voltage between ECM terminal (24) and ground with CONSULT or tester.
   Voltage: Battery voltage

NG → Check the following.
- Harness connectors (M65), (E43)
- Harness connectors (M59), (F27)
- 10A fuse
- Harness for open or short between ECM and ignition switch

If NG, repair harness or connectors.

OK

B

CHECK GROUND CIRCUIT-I.
1. Turn ignition switch "OFF".
2. Disconnect ECM harness connector.
3. Check harness continuity between ECM terminals (10), (19), (25), (32), (116), (124) and engine ground.
   Continuity should exist.
   If OK, check harness for short to ground and short to power.

NG → Repair open circuit, short to ground or short to power in harness or connectors.

OK

C

CHECK POWER SUPPLY-II.
1. Disconnect ECCS relay.
2. Turn ignition switch "OFF".
3. Check voltage between terminals (2), (5) and ground with CONSULT or tester.
   Voltage: Battery voltage

NG → Check the following.
- 10A fuse
- Harness connectors (M59), (F27)
- Harness for open or short between ECCS relay and battery

If NG, repair harness or connectors.

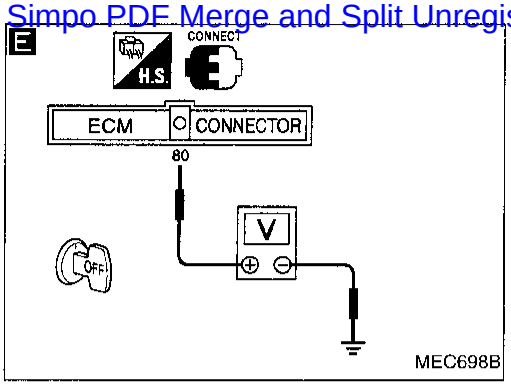
OK

D

CHECK OUTPUT SIGNAL CIRCUIT.
1. Turn ignition switch "OFF".
2. Check harness continuity between ECM terminal (4) and terminal (1).
   Continuity should exist.
   If OK, check harness for short to ground and short to power.

NG → Repair open circuit, short to ground or short to power in harness or connectors.

OK



Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.

INSPECTION END

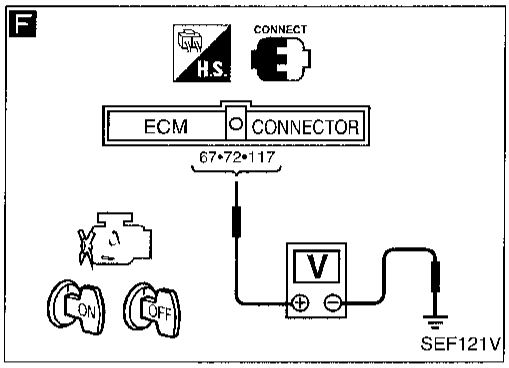
Main Power Supply and Ground Circuit (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

E

MEC698B

E



CHECK POWER SUPPLY-III.
Check voltage between ECM terminals (80) and ground with CONSULT or tester.
Voltage: Battery voltage

NG → Check the following.
- Harness connectors (F27), (M59)
- 10A fuse
- Harness for open or short between ECM and battery

If NG, repair harness or connectors.

OK ↓

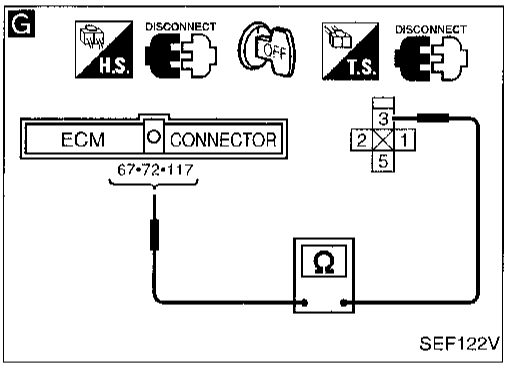
F

SEF121V

F

CHECK POWER SUPPLY-IV.
1. Turn ignition switch "ON" and then "OFF".
2. Check voltage between ECM terminals (67), (72), (117) and ground with CONSULT or tester.
   Voltage:
   After turning ignition switch "OFF", battery voltage will exist for a few seconds, then drop to approximately 0V.

OK → Go to K "CHECK GROUND CIRCUIT-II" on next page.



Case-1: Battery voltage does not exist.
Case-2: Battery voltage exists for more than a few seconds.

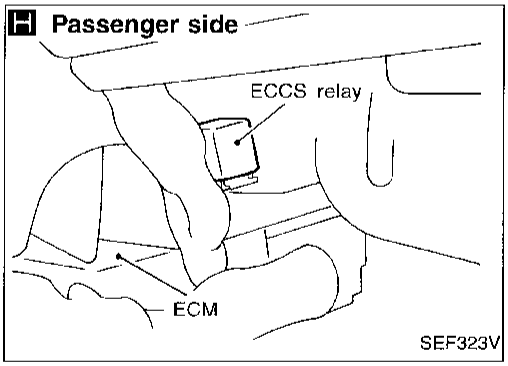
NG ↓

Case-1 ↓

Case-2 → Go to J "CHECK ECCS RELAY" on next page.

G

SEF122V



G

CHECK HARNESS CONTINUITY BETWEEN ECCS RELAY AND ECM.
1. Disconnect ECM harness connector.
2. Disconnect ECCS relay.
3. Check harness continuity between ECM terminals (67), (72), (117) and relay terminal (3).
   Continuity should exist.
   If OK, check harness for short to ground and short to power.

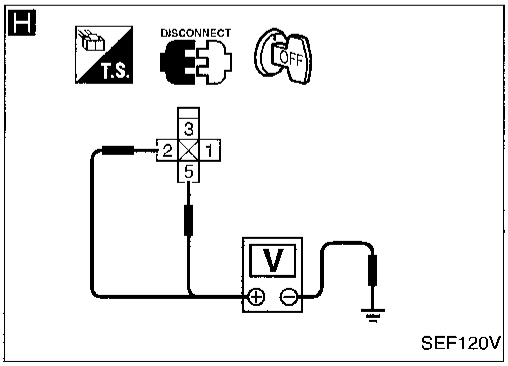
NG → If NG, repair open circuit or short to ground or short to power in harness or connectors.

OK ↓

H **Passenger side**

SEF323V

H



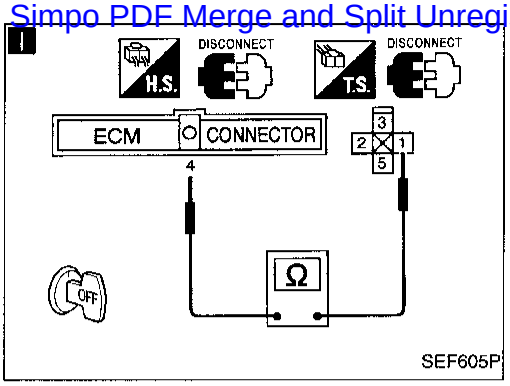
CHECK VOLTAGE BETWEEN ECCS RELAY AND GROUND.
Check voltage between relay terminals (2), (5) and ground with CONSULT or tester.
Voltage: Battery voltage

NG → Check the following.
- Harness connectors (F27), (M59)
- 10A fuse
- Harness for open or short between ECCS relay and battery

If NG, repair harness or connectors.

OK ↓

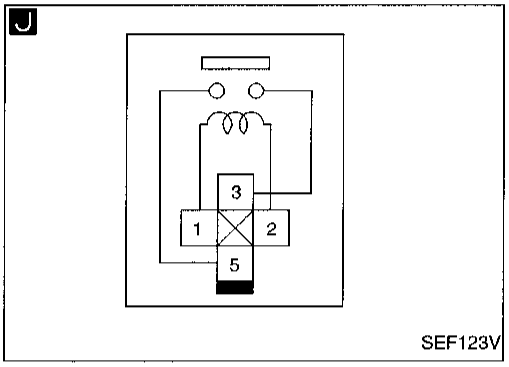
H



SEF120V

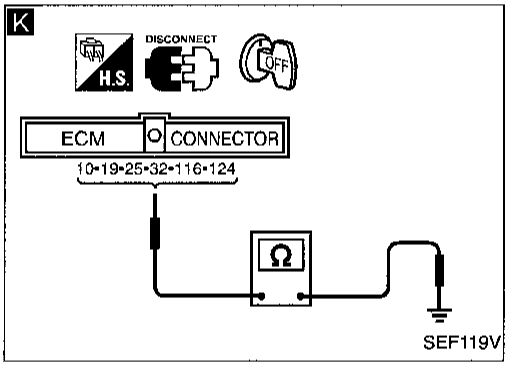
(B)
(Go to next page.)

Main Power Supply and Ground Circuit (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

I



SEF605P

J

SEF123V

K

SEF119V

Ⓑ

I

CHECK OUTPUT SIGNAL CIRCUIT.
Check harness continuity between ECM terminal ④ and relay terminal ①.
Continuity should exist.
If OK, check harness for short to ground and short to power.

NG → Repair open circuit, short to ground or short to power in harness or connectors.

OK ↓

J

CHECK ECCS RELAY.
1. Apply 12V direct current between relay terminals ① and ②.
2. Check continuity between relay terminals ③ and ⑤.
   12V (① - ②) applied:
   Continuity exists.
   No voltage applied:
   No continuity

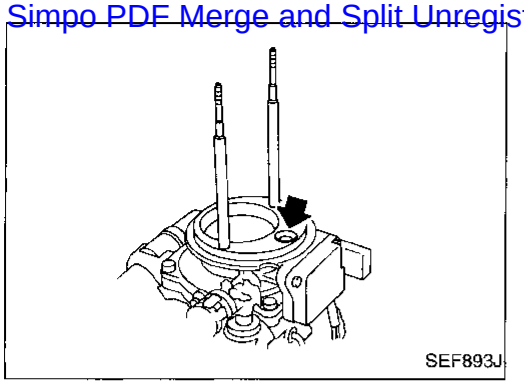
NG → Replace ECCS relay.

OK ↓

K

CHECK GROUND CIRCUIT-II.
Check harness continuity between ECM terminals ⑩, ⑲, ㉕, ㉜, ⑯, ㉔ and engine ground.
Continuity should exist.
If OK, check harness for short to power.

NG → Repair open circuit, short to ground or short to power in harness or connectors.



OK ↓

Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.

Mass Air Flow Sensor (MAFS)

COMPONENT DESCRIPTION

The mass air flow sensor is placed in the stream of intake air. It measures the intake flow rate by measuring a part of the entire intake flow. It consists of a hot wire that is supplied with electric current from the ECM. The temperature of the hot wire is controlled by the ECM a certain amount. The heat generated by the hot wire is reduced as the intake air flows around it. The more air, the greater the heat loss.
Therefore, the ECM must supply more electric current to maintain the temperature of the hot wire as air flow increases. The ECM detects the air flow by means of this current change.

CONSULT REFERENCE VALUE IN DATA MONITOR MODE

Specification data are reference values.

MONITOR ITEM	CONDITION		SPECIFICATION
MAS AIR/FL SE	● Engine: After warming up ● Air conditioner switch: "OFF" ● Shift lever: "N" ● No-load	Idle	0.9 - 1.8V
		2,500 rpm	1.9 - 2.3V
CAL/LD VALUE	● Engine: After warming up ● Air conditioner switch: "OFF" ● Shift lever: "N" ● No-load	Idle	9.5 - 34.0%
		2,500 rpm	13.9 - 24.9%
MASS AIRFLOW	● Engine: After warming up ● Air conditioner switch: "OFF" ● Shift lever: "N" ● No-load	Idle	0.9 - 5.8 g·m/s
		2,500 rpm	7.5 - 13.2 g·m/s

ECM TERMINALS AND REFERENCE VALUE

Specification data are reference values and are measured between each terminal and ㉜ (ECM ground).

TER-MINAL NO.	WIRE COLOR	ITEM	CONDITION	DATA (DC Voltage)
54	R	Mass air flow sensor	Engine is running. (Warm-up condition) └ Idle speed	0.9 - 1.8V
			Engine is running. (Warm-up condition) └ Engine speed is 2,500 rpm.	1.9 - 2.3V
55	G	Mass air flow sensor ground	Engine is running. (Warm-up condition) └ Idle speed	Approximately 0V

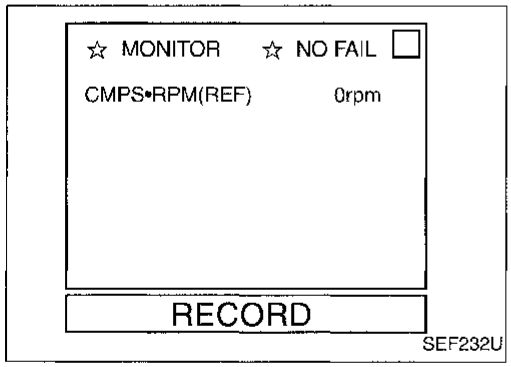
Mass Air Flow Sensor (MAFS) (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

ON BOARD DIAGNOSIS LOGIC

Diagnostic Trouble Code No.	Malfunction is detected when ...	Check Items (Possible Cause)
P0100 0102	A) An excessively high voltage from the sensor is sent to ECM when engine is not running. C) A high voltage from the sensor is sent to ECM under light load driving condition.	● Harness or connectors (The sensor circuit is open or shorted.) ● Mass air flow sensor
	B) An excessively low voltage from the sensor is sent to ECM* when engine is running. D) A low voltage from the sensor is sent to ECM under heavy load driving condition.	● Harness or connectors (The sensor circuit is open or shorted.) ● Intake air leaks ● Mass air flow sensor

*: When this malfunction is detected, the ECM enters fail-safe mode and the MIL lights up.



Detected items	Engine operating condition in fail-safe mode
Mass air flow sensor circuit	Engine speed will not rise more than 2,400 rpm due to the fuel cut.

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

Perform "Procedure for malfunction A" first. If the 1st trip DTC cannot be confirmed, perform "Procedure for malfunction B". If there is no problem on "Procedure for malfunction B", perform "Procedure for malfunction C". If there is no problem on "Procedure for malfunction C", perform "Procedure for malfunction D".

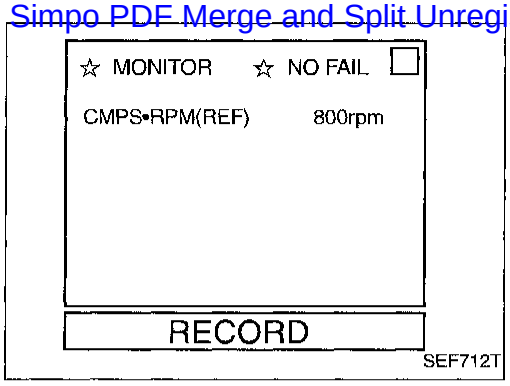
CAUTION:
Always drive vehicle at a safe speed.

NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

Procedure for malfunction A

1) Turn ignition switch "ON".
2) Select "DATA MONITOR" mode with CONSULT.
3) Wait at least 6 seconds.

OR



1) Turn ignition switch "ON", and wait at least 6 seconds.
2) Select "MODE 7" with GST.

OR

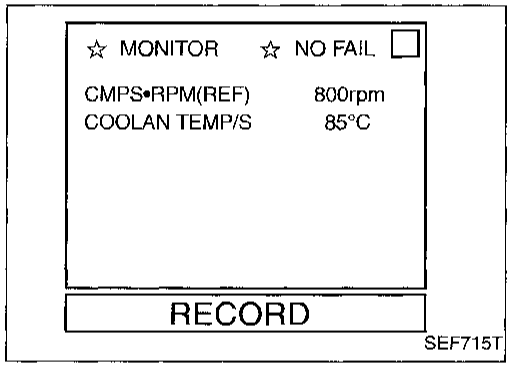
1) Turn ignition switch "ON", and wait at least 6 seconds.
2) Turn ignition switch "OFF", wait at least 5 seconds and then turn "ON".
3) Perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.

Mass Air Flow Sensor (MAFS) (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procedure for malfunction B

1) Turn ignition switch "ON".
2) Select "DATA MONITOR" mode with CONSULT.
3) Start engine and wait 5 seconds at most.



OR

1) Turn ignition switch "ON".
2) Start engine and wait 5 seconds at most.
3) Select "MODE 7" with GST.

OR

1) Turn ignition switch "ON".
2) Start engine and wait 5 seconds at most.
3) Turn ignition switch "OFF", wait at least 5 seconds and then turn "ON".
4) Perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.

NOTE:
If 1st trip DTC is confirmed after more than 5 seconds, there may be malfunction C.

Procedure for malfunction C

1) Turn ignition switch "ON".
2) Select "DATA MONITOR" mode with CONSULT.

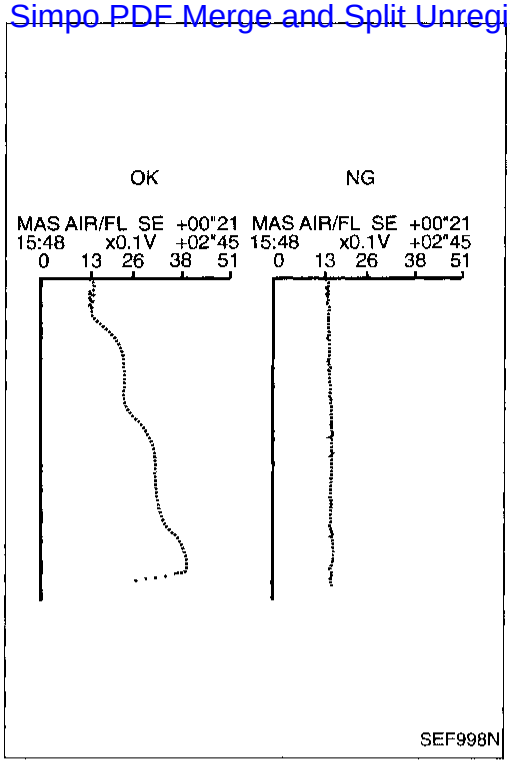
NOTE:
If engine will not start or stops soon after starting at next step, wait at least 10 seconds with engine stopped. (Ignition switch "ON")

3) Start engine and warm it up to normal operating temperature.
4) Run engine for at least 10 seconds at idle speed.

OR

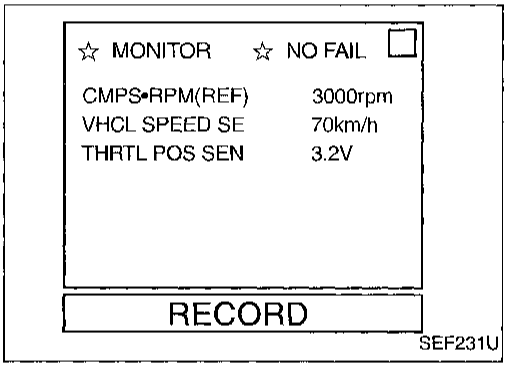
NOTE:
If engine will not start or stops soon after starting at next step, wait at least 10 seconds with engine stopped. (Ignition switch "ON")

1) Start engine and warm it up to normal operating temperature.
2) Run engine for at least 10 seconds at idle speed.
3) Select "MODE 7" with GST.



OR

NOTE:
If engine will not start or stops soon after starting at next step, wait at least 10 seconds with engine stopped. (Ignition switch "ON")



1) Start engine and warm it up to normal operating temperature.
2) Run engine for at least 10 seconds at idle speed.
3) Turn ignition switch "OFF", wait at least 5 seconds and then turn "ON".
4) Perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.

SEF998N

SEF231U

SEF534P

SEF535P

Procedure for malfunction D

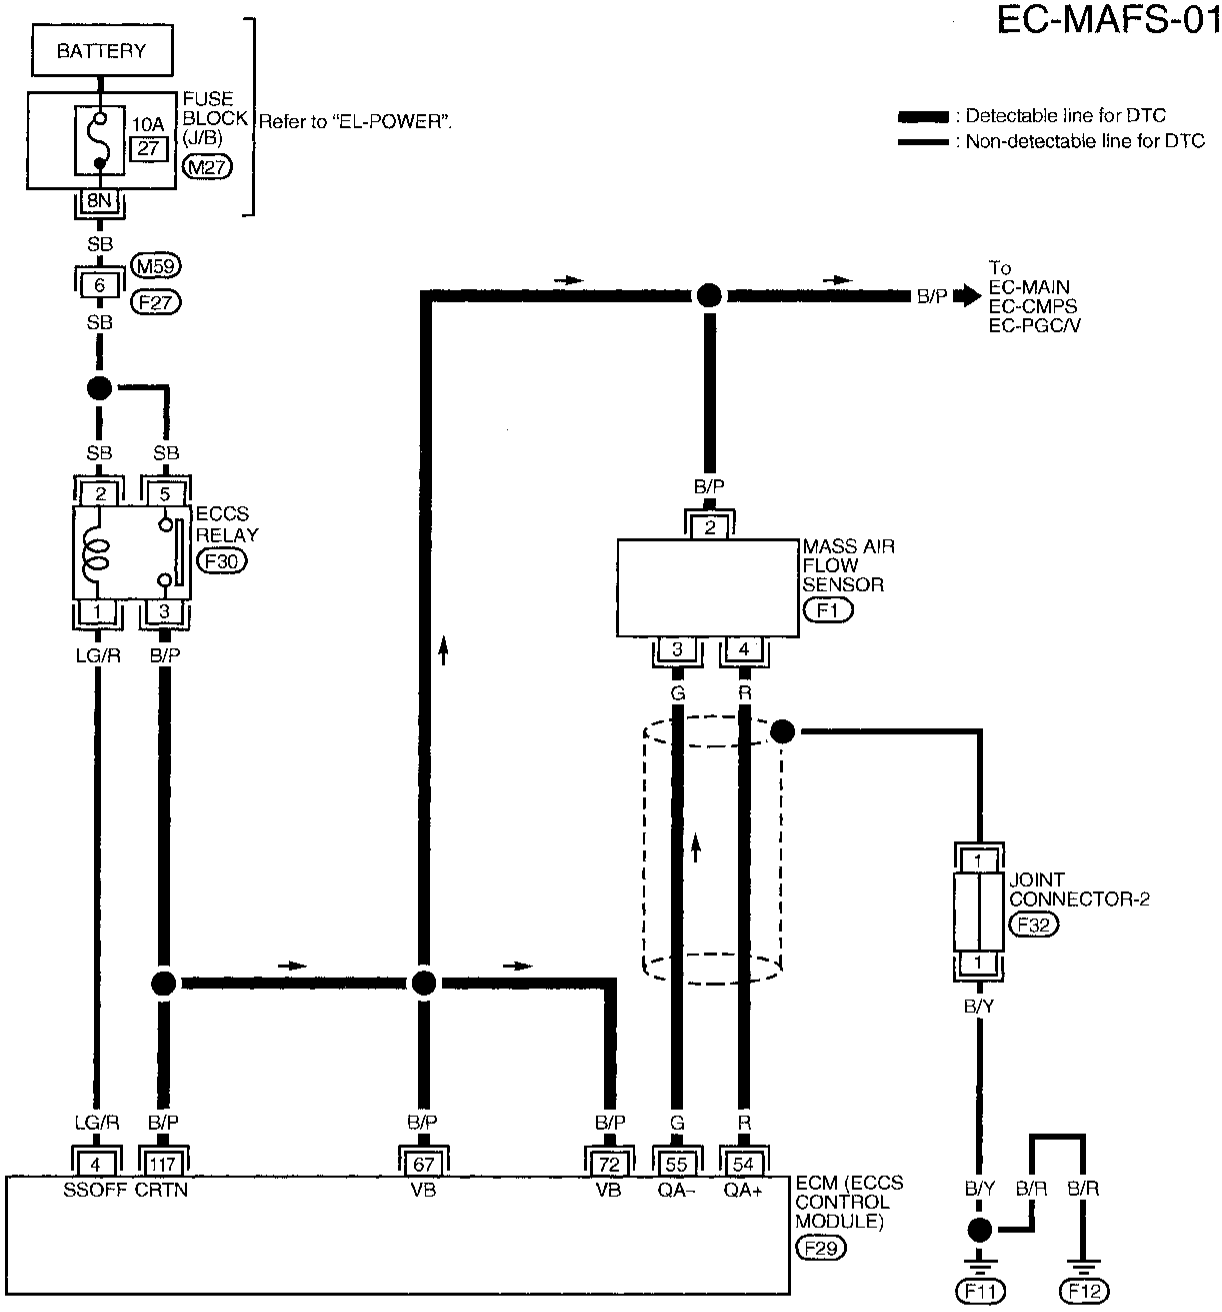
1) Turn ignition switch "ON".
2) Start engine and warm it up to normal operating temperature.
   If engine cannot be started, go to "DIAGNOSTIC PROCEDURE", EC-104.
3) Select "DATA MONITOR" mode with CONSULT.
4) Start engine.
5) Check the voltage of MAS AIR/FL SE with "DATA MONITOR".
6) Increases engine speed to about 4,000 rpm.
7) Monitor the linear voltage rise in response to engine speed increases.
   If NG, go to "DIAGNOSTIC PROCEDURE", EC-104.
   If OK, go to following step.
8) Maintain the following conditions for at least 10 consecutive seconds.
   CMPS·RPM (REF): More than 2,000 rpm
   THRTL POS SEN: More than 3V
   Selector lever: Suitable position
   Driving location: Driving vehicle uphill (Increased engine load) will help maintain the driving conditions required for this test.

OR

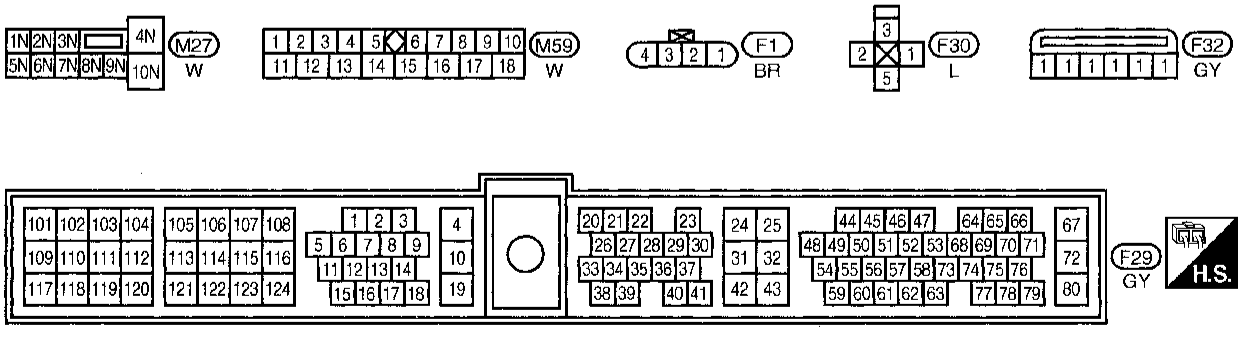
OVERALL FUNCTION CHECK

Use this procedure to check the overall function of the mass air flow sensor circuit. During this check, a 1st trip DTC might not be confirmed.

Procedure for malfunction D



1) Turn ignition switch "ON".
2) Start engine and warm it up to normal operating temperature.
3) Select "MODE 1" with GST.
4) Check the mass air flow with "MODE 1".
5) Check for linear mass air flow rise in response to increases to about 4,000 rpm in engine speed.



OR

1) Turn ignition switch "ON".
2) Start engine and warm it up to normal operating temperature.
3) Check the voltage between ECM terminal ⑤④ and ground.
4) Check for linear voltage rise in response to increases to about 4,000 rpm in engine speed.

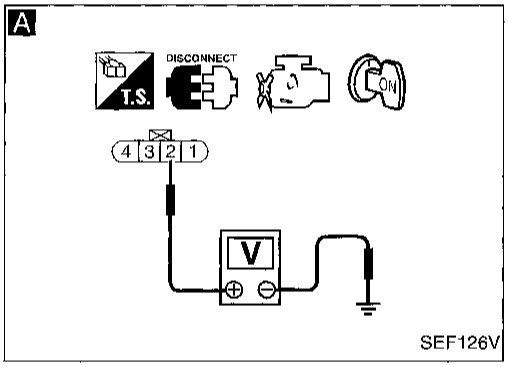
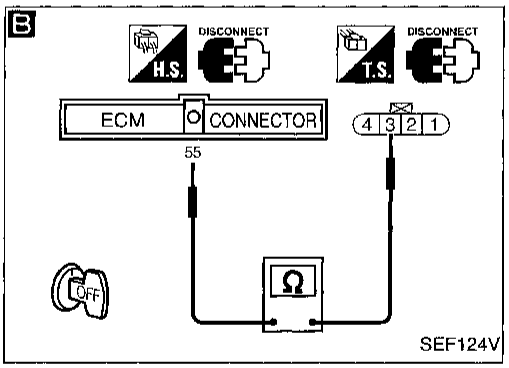
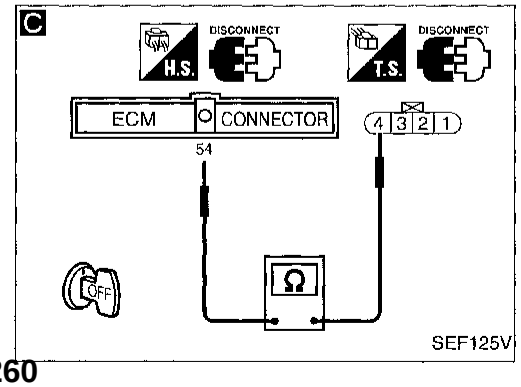
Mass Air Flow Sensor (MAFS) (Cont'd)



DIAGNOSTIC PROCEDURE



If the trouble is duplicated after "Procedure for malfunction A or C", perform "Procedure A" below. If the trouble is duplicated after "Procedure for malfunction B or D", perform "Procedure B" on next page.



Procedure A

INSPECTION START

1. Turn ignition switch "OFF".
2. Loosen and retighten engine ground screws.

A

CHECK POWER SUPPLY.
1. Disconnect mass air flow sensor harness connector.
2. Turn ignition switch "ON".
3. Check voltage between terminal ② and ground with CONSULT or tester.
Voltage: Battery voltage

NG → Check the following.
- Harness for open or short between ECCS relay and mass air flow sensor
- Harness for open or short between mass air flow sensor and ECM

If NG, repair harness or connectors.

OK ↓

B

CHECK GROUND CIRCUIT.
1. Turn ignition switch "OFF".
2. Disconnect ECM harness connector.
3. Check harness continuity between terminal ③ and ECM terminal ⑤⑤.
Continuity should exist.
If OK, check harness for short to ground and short to power.

NG → Repair open circuit, short to ground or short to power in harness or connectors.

OK ↓

C

CHECK INPUT SIGNAL CIRCUIT.
Check harness continuity between terminal ④ and ECM terminal ⑤④.
Continuity should exist.
If OK, check harness for short.

NG → Repair open circuit, short to ground or short to power in harness or connectors.

OK ↓

CHECK COMPONENT
(Mass air flow sensor).
Refer to "COMPONENT INSPECTION", EC-107.

NG → Replace mass air flow sensor.

OK ↓

Ⓐ

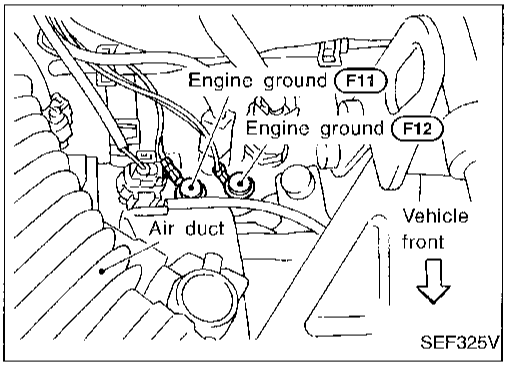
(Go to next page.)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Ⓐ

CHECK SHIELD CIRCUIT.
1. Turn ignition switch "OFF".
2. Remove joint connector-2.
3. Check the following.
   - Continuity between joint connector-2 terminal ① and ground
   - Joint connector-2
     (Refer to "HARNESS LAYOUT" in EL section.)

Continuity should exist.
If OK, check harness for short to power.



NG → Repair open circuit, short to ground or short to power in harness or connectors.

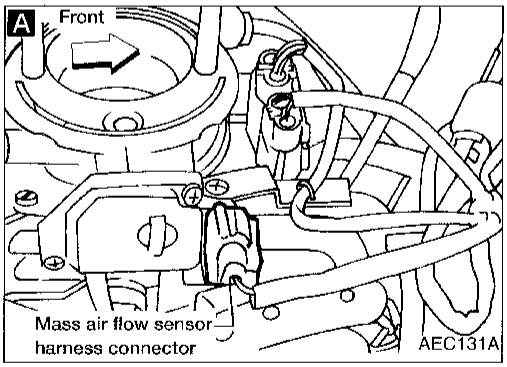
OK ↓

Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93. ↓

INSPECTION END

Procedure B

INSPECTION START ↓



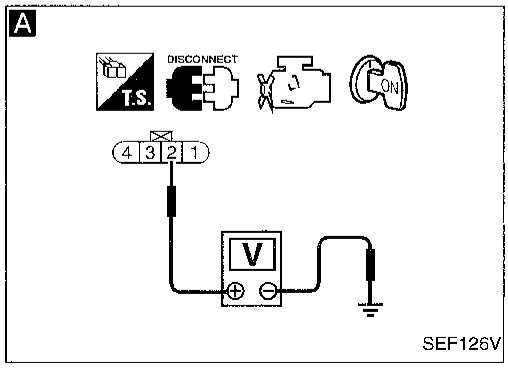
CHECK INTAKE SYSTEM.
Check the followings for connection.
- Air duct
- Air cleaner
- Vacuum hoses
- Intake air passage between air duct to collector

If disconnected, reconnect the parts.

NG → Reconnect the parts.

OK ↓

1. Turn ignition switch "OFF".
2. Loosen and retighten engine ground screws. ↓



A

CHECK POWER SUPPLY.
1. Disconnect mass air flow sensor harness connector.
2. Turn ignition switch "ON".
3. Check voltage between terminal ② and ground with CONSULT or tester.

Voltage: Battery voltage

NG → Check the following.
- Harness for open or short between ECCS relay and mass air flow sensor
- Harness for open or short between mass air flow sensor and ECM

If NG, repair harness or connectors.

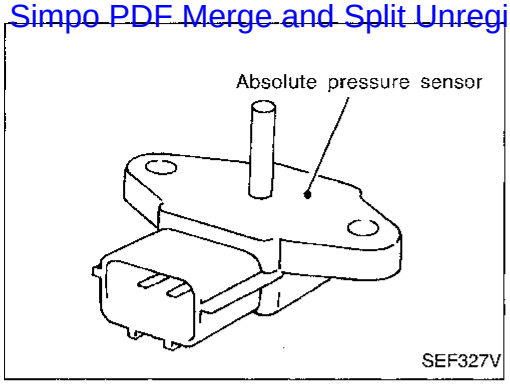
Mass Air Flow Sensor (MAFS) (Cont'd)

COMPONENT INSPECTION

Mass air flow sensor



1. Turn ignition switch "ON".
2. Start engine and warm it up to normal operating temperature.
3. Check voltage between terminal ⑤④ and ground.

Conditions	Voltage V
Ignition switch "ON" (Engine stopped.)	Less than 1.0
Idle (Engine is warmed-up to normal operating temperature.)	1.3 - 1.7
2,500 rpm (Engine is warmed-up to normal operating temperature.)	1.9 - 2.3
Idle to about 4,000 rpm*	1.3 - 1.7 to Approx. 3

*: Check for linear voltage rise in response to increases to about 4,000 rpm in engine speed.

4. If the voltage is out of specification, disconnect mass air flow sensor harness connector and connect it again. Repeat above check.
5. If NG, remove mass air flow sensor from air duct. Check hot wire for damage or dust.

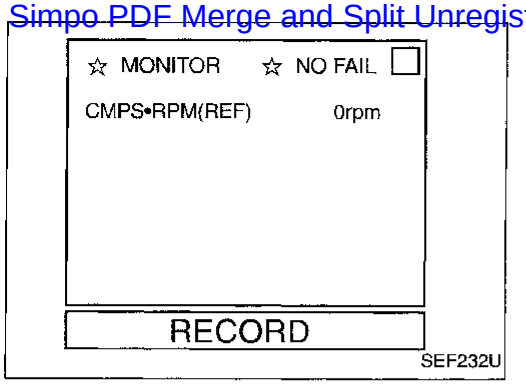
Absolute Pressure Sensor

COMPONENT DESCRIPTION

The absolute pressure sensor is connected to the MAP/BARO switch solenoid valve by a hose. The sensor detects ambient barometric pressure and intake manifold pressure and sends the voltage signal to the ECM. As the pressure increases, the voltage rises.

ON BOARD DIAGNOSIS LOGIC



Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P0105 0803	A) An excessively low or high voltage from the sensor is sent to ECM.	● Harness or connectors (Absolute pressure sensor circuit is open or shorted.) ● Absolute pressure sensor
	B) A high voltage from the sensor is sent to ECM under light load driving conditions.	● Hoses (Hoses between the intake manifold and absolute pressure sensor are disconnected or clogged.) ● Intake air leaks ● MAP/BARO switch solenoid valve ● Absolute pressure sensor
	C) A low voltage from the sensor is sent to ECM under heavy load driving conditions.	● Absolute pressure sensor

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

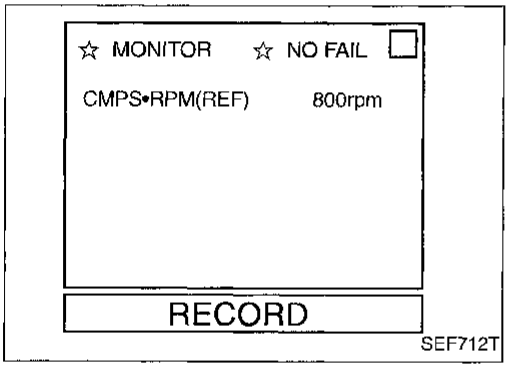
Perform "Procedure for malfunction A" first. If the 1st trip DTC cannot be confirmed, perform "Procedure for malfunction B". If the 1st trip DTC is not confirmed on "Procedure for malfunction B", perform "Procedure for malfunction C".

Absolute Pressure Sensor (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procedure for malfunction A

NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.



1) Turn ignition switch "ON".
2) Select "DATA MONITOR" mode with CONSULT.
3) Wait at least 6 seconds.

OR

1) Turn ignition switch "ON" and wait at least 6 seconds.
2) Select "MODE 7" with GST.

OR

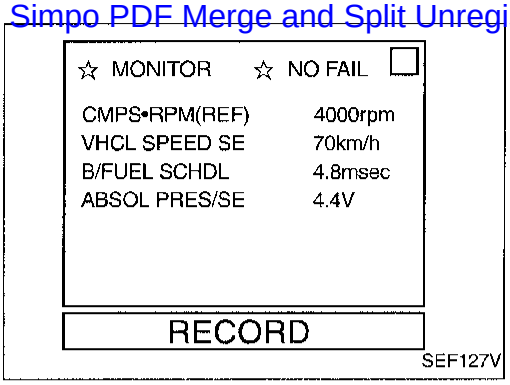
1) Turn ignition switch "ON" and wait at least 6 seconds.
2) Turn ignition switch "OFF", wait at least 5 seconds and then turn "ON".
3) Perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.

Procedure for malfunction B

NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

1) Start engine and warm it up to normal operating temperature.
2) Turn ignition switch "OFF" and wait at least 5 seconds.
3) Turn ignition switch "ON" and select "DATA MONITOR" mode with CONSULT.
4) Start engine and let it idle.
5) Wait at least 10 seconds.

OR



1) Start engine and warm it up to normal operating temperature.
2) Turn ignition switch "OFF" and wait at least 5 seconds.
3) Start engine.
4) Let engine idle and wait at least 10 seconds.
5) Select "MODE 7" with GST.

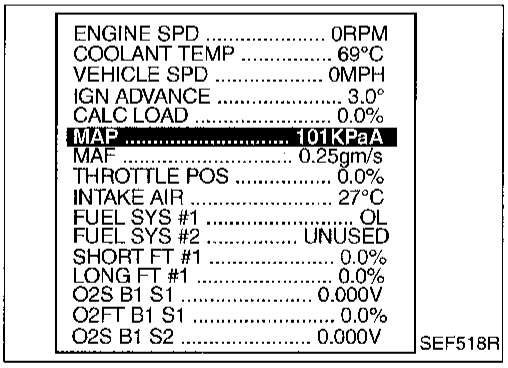
OR

1) Start engine and warm it up to normal operating temperature.
2) Turn ignition switch "OFF" and wait at least 5 seconds.
3) Start engine.
4) Let engine idle and wait at least 10 seconds.
5) Turn ignition switch "OFF", wait at least 5 seconds and then turn "ON".
6) Perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.

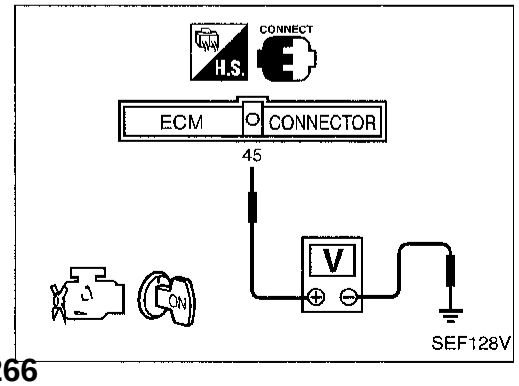
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Absolute Pressure Sensor (Cont'd)

Procedure for malfunction C



CAUTION:
Always drive vehicle at a safe speed.



NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

1) Turn ignition switch "ON".
2) Select "DATA MONITOR" mode with CONSULT.

The voltage of "ABSOL PRES/SE" should be more than 1.74 [V].
If the check result is NG, go to "DIAGNOSTIC PROCEDURE", EC-112.
If the check result is OK, go to following step.

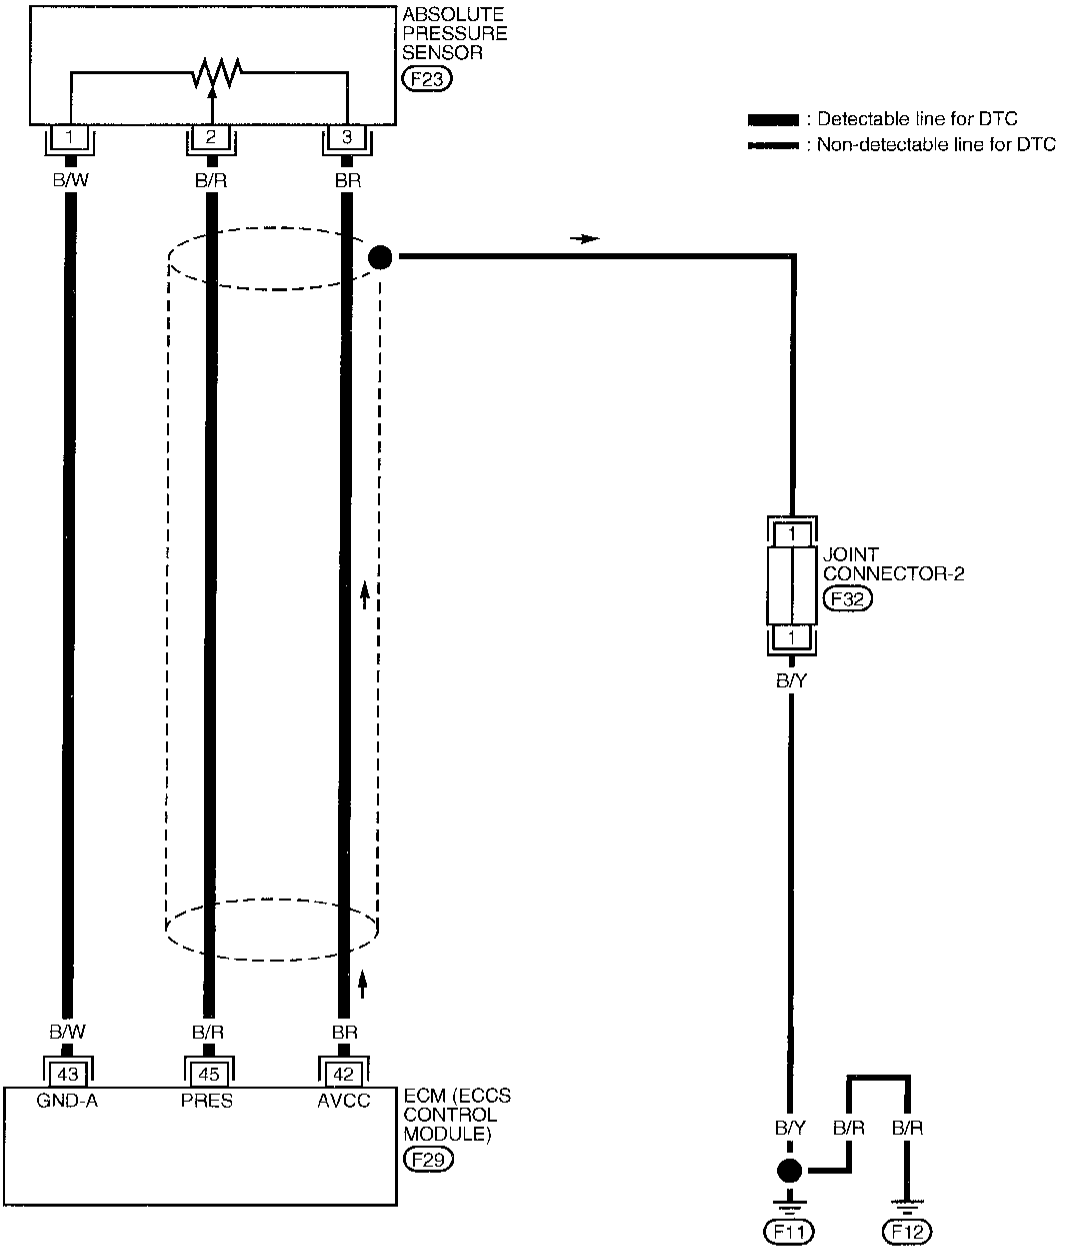
3) Start engine and warm it up to normal operating temperature.
4) Turn ignition switch "OFF" and wait at least 5 seconds.
5) Start engine and let it idle for at least 10 seconds.
6) Select "DATA MONITOR" mode with CONSULT.
7) Drive the vehicle at least 3 consecutive seconds under the following conditions,
   B/FUEL SCHDL: More than 4 ms
   CMPS·RPM (REF): 3,000 - 4,800 rpm
   Selector lever: Suitable position
   Driving pattern: Driving vehicle uphill (Increased engine load) will help maintain the driving conditions required for this test.

OR

OVERALL FUNCTION CHECK

Use this procedure to check the overall function of the front heated oxygen sensor circuit. During this check, a 1st trip DTC might not be confirmed.

Procedure for malfunction C



1) Turn ignition switch "ON".
2) Select "MAP" in "MODE 1" with GST.
3) Make sure that the pressure of "MAP" is more than 46 kPa (0.47 kg/cm^2, 6.7 psi).

OR

1) Turn ignition switch "ON".
2) Make sure that the voltage between ECM terminal ㊺ and ground is more than 1.74 [V].

Absolute Pressure Sensor (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procedure B

INSPECTION START

A

CHECK VACUUM SOURCE TO ABSOLUTE PRESSURE SENSOR.

1. Start engine and warm it up to normal operating temperature.
2. Turn ignition switch "OFF".
3. Connect MAP/BARO switch solenoid valve and absolute pressure sensor with a rubber tube that has vacuum gauge.
4. Turn ignition switch "ON".
5. Select "MAP/BARO SW/V" in "ACTIVE TEST" mode with CONSULT.
6. Start engine and let it idle.
7. Touch "MAP" and "BARO" alternately and check for vacuum.

MAP/BARO SW/V	Vacuum
BARO	Should not exist
MAP	Should exist

OR

4. Turn ignition switch "ON".
5. Start engine and check for vacuum.
   For 5 seconds after starting engine:
   Vacuum should not exist.
6. More than 5 seconds after starting engine.
   Vacuum should exist.

NG → CHECK VACUUM HOSE.
Check vacuum hose for clogging, cracks, disconnection or improper connection.
If NG, repair or replace the hose.

OK → Check vacuum port for clogging.
If NG, clean it.

OK → CHECK COMPONENT (MAP/BARO switch solenoid valve).
Refer to "COMPONENT INSPECTION" of "TROUBLE DIAGNOSIS FOR DTC P1105", EC-312.

OK → CHECK INTAKE SYSTEM.
Check intake system for air leaks.

NG → Replace MAP/BARO switch solenoid valve.

OK

B

CHECK HOSE BETWEEN ABSOLUTE PRESSURE SENSOR AND MAP/BARO SWITCH SOLENOID VALVE.

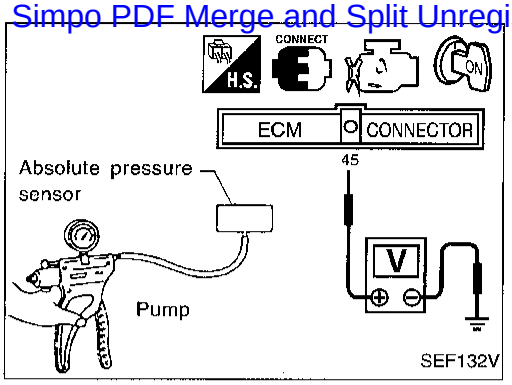
1. Turn ignition switch "OFF".
2. Check hose for clogging, cracks, disconnection or improper connection.

NG → Repair or reconnect hose.

OK

CHECK COMPONENT (Absolute pressure sensor).
Refer to "COMPONENT INSPECTION" on next page.

NG → Replace absolute pressure sensor.



OK

Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.

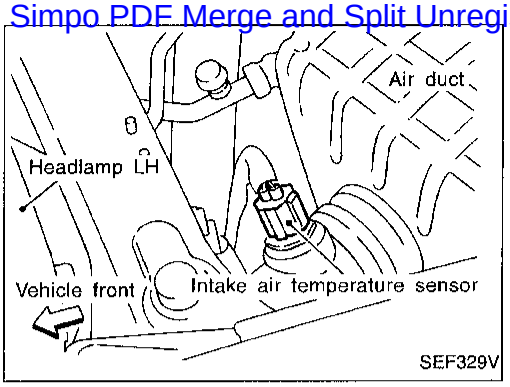
INSPECTION END

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Absolute Pressure Sensor (Cont'd)

COMPONENT INSPECTION

Absolute pressure sensor



1. Remove absolute pressure sensor with its harness connector connected.
2. Remove hose from absolute pressure sensor.
3. Turn ignition switch "ON" and check output voltage between ECM terminal ㊺ and engine ground.
   The voltage should be 3.2 to 4.8 V.
4. Use pump to apply vacuum of −26.7 kPa (−200 mmHg, −7.87 inHg) to absolute pressure sensor as shown in figure and check the output voltage.
   The voltage should be 1.0 to 1.4 V lower than the value measured in step 3.

CAUTION:

- **Always calibrate the vacuum pump gauge when using it.**
- **Do not apply vacuum below −93.3 kPa (−700 mmHg, −27.56 inHg) or pressure over 101.3 kPa (760 mmHg, 29.92 inHg).**

5. If NG, replace absolute pressure sensor.

Intake Air Temperature Sensor

COMPONENT DESCRIPTION

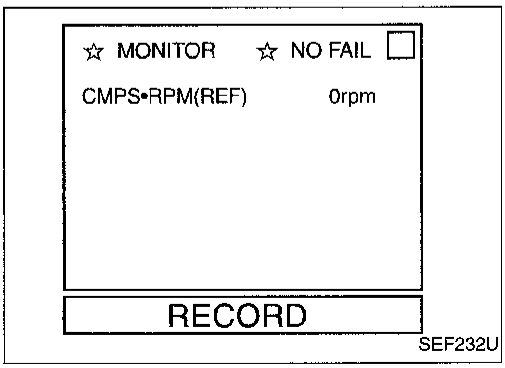
The intake air temperature sensor is mounted to the air duct housing. The sensor detects intake air temperature and transmits a signal to the ECM.

The temperature sensing unit uses a thermistor which is sensitive to the change in temperature. Electrical resistance of the thermistor decreases in response to the temperature rise.

<Reference data>

Intake air temperature °C (°F)	Voltage* V	Resistance kΩ
20 (68)	3.5	2.1 - 2.9
80 (176)	1.23	0.27 - 0.38

*: These data are reference values and are measured between ECM terminal (61) (Intake air temperature sensor) and ECM terminal (32) (ECM ground).



ON BOARD DIAGNOSIS LOGIC

Diagnostic Trouble Code No.	Malfunction is detected when ...	Check Items (Possible Cause)
P0110 0401	A) An excessively low or high voltage from the sensor is sent to ECM. ..... B) Rationally incorrect voltage from the sensor is sent to ECM, compared with the voltage signal from engine coolant temperature sensor.	● Harness or connectors (The sensor circuit is open or shorted.) ● Intake air temperature sensor

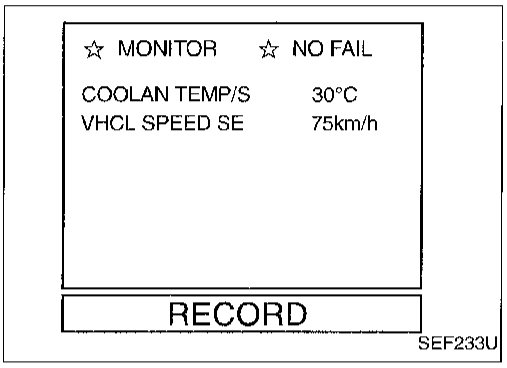
DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

Perform "Procedure for malfunction A" first. If DTC cannot be confirmed, perform "Procedure for malfunction B".

NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

Procedure for malfunction A

1) Turn ignition switch "ON".
2) Select "DATA MONITOR" mode with CONSULT.
3) Wait at least 5 seconds.



OR

1) Turn ignition switch "ON" and wait at least 5 seconds.
2) Select MODE 7 with GST.

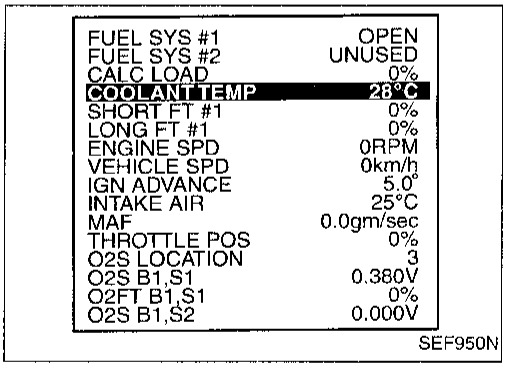
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

OR

1) Turn ignition switch "ON" and wait at least 5 seconds.
2) Turn ignition switch "OFF", wait at least 5 seconds and then turn "ON".
3) Perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.

Procedure for malfunction B

CAUTION:
Always drive vehicle at a safe speed.



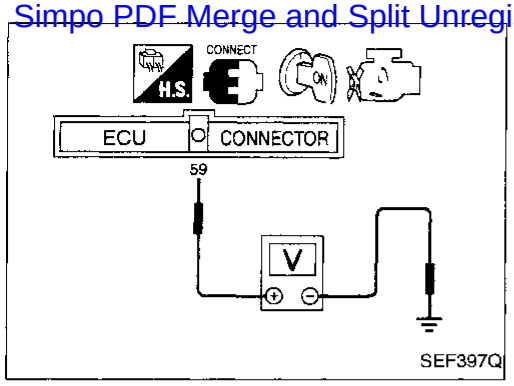
TESTING CONDITION:
This test may be conducted with the drive wheels lifted in the shop or by driving the vehicle. If a road test is expected to be easier, it is unnecessary to lift the vehicle.

1) Wait until engine coolant temperature is less than 90°C (194°F).
   (a) Turn ignition switch "ON".
   (b) Select "DATA MONITOR" mode with CONSULT.
   (c) Check the engine coolant temperature.
   (d) If the engine coolant temperature is above 90°C (194°F), turn ignition switch "OFF" and cool down engine.

- Perform the following steps before engine coolant temperature is above 90°C (194°F).

2) Turn ignition switch "ON".
3) Select "DATA MONITOR" mode with CONSULT.
4) Start engine.
5) Hold vehicle speed more than 70 km/h (43 MPH) for 100 consecutive seconds.

OR



1) Wait until engine coolant temperature is less than 90°C (194°F).
   (a) Turn ignition switch "ON".
   (b) Select MODE 1 with GST.
   (c) Check the engine coolant temperature.
   (d) If the engine coolant temperature is above 90°C (194°F), turn ignition switch "OFF" and cool down engine.

- Perform the following steps before engine coolant temperature is above 90°C (194°F).

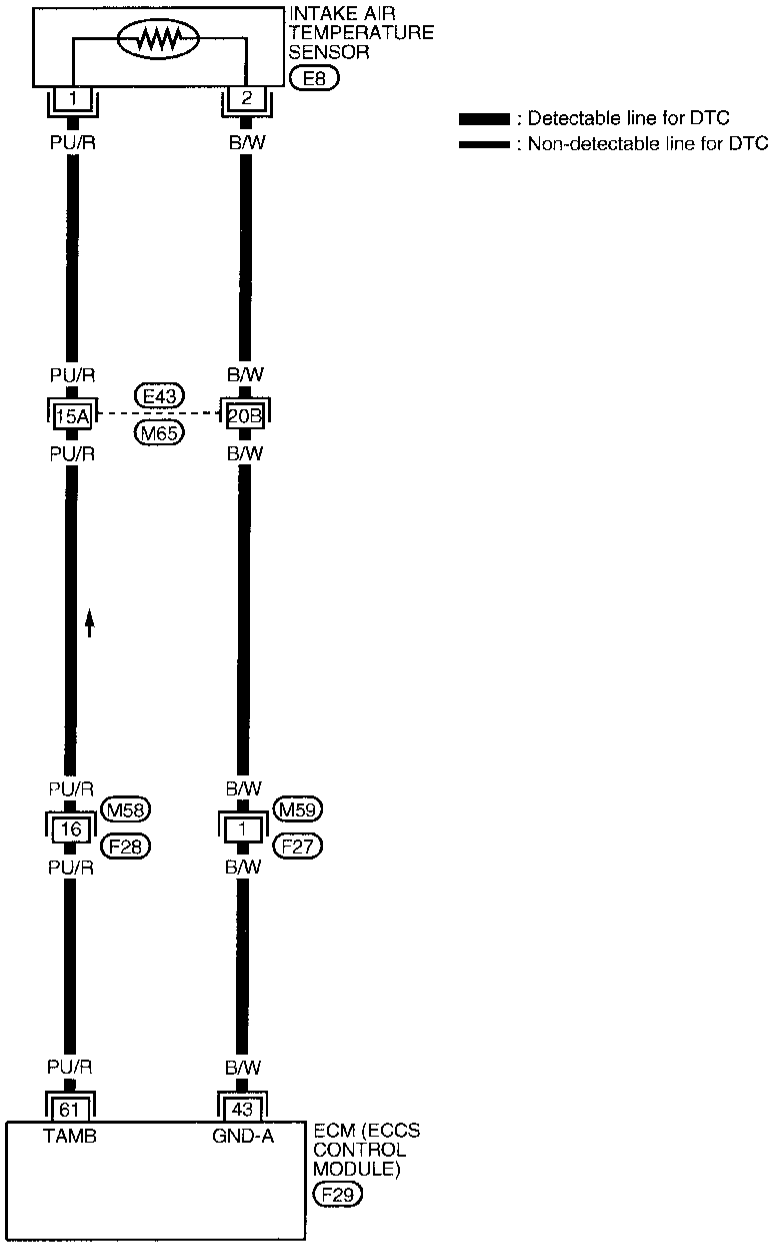
2) Start engine.
3) Hold vehicle speed more than 70 km/h (43 MPH) for 100 consecutive seconds.
4) Select MODE 7 with GST.

Intake Air Temperature Sensor (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

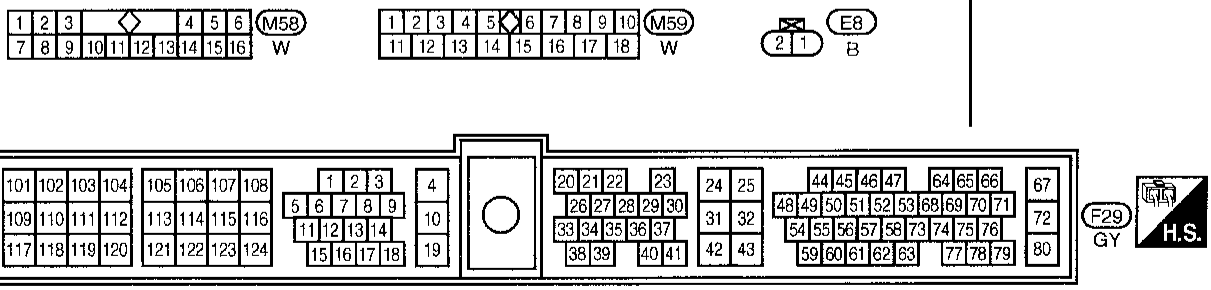
OR

NO TOOLS



1) Wait until engine coolant temperature is less than 90°C (194°F).
   (a) Turn ignition switch "ON".
   (b) Check voltage between ECM terminal (59) and ground.
   Voltage: More than 1.0 (V)
   (c) If the voltage is below 1.0 (V), turn ignition switch "OFF" and cool down engine.

- Perform the following steps before the voltage is below 1.0V.



2) Start engine.
3) Hold vehicle speed more than 70 km/h (43 MPH) for 100 consecutive seconds.
4) Turn ignition switch "OFF", wait at least 5 seconds and then turn "ON".
5) Perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.

Engine Coolant Temperature Sensor (ECTS) (Circuit)

COMPONENT DESCRIPTION

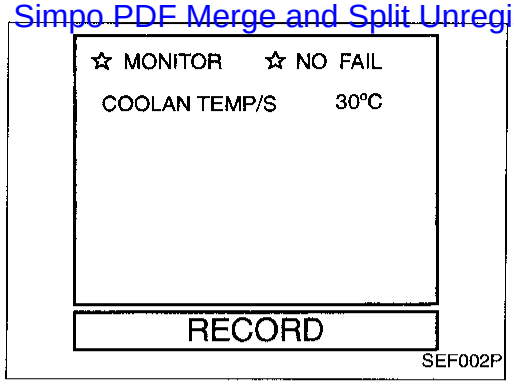
The engine coolant temperature sensor is used to detect the engine coolant temperature. The sensor modifies a voltage signal from the ECM. The modified signal returns to the ECM as the engine coolant temperature input. The sensor uses a thermistor which is sensitive to the change in temperature. The electrical resistance of the thermistor decreases as temperature increases.

<Reference data>

Engine coolant temperature °C (°F)	Voltage* V	Resistance kΩ
−10 (14)	4.4	7.0 - 11.4
20 (68)	3.5	2.1 - 2.9
50 (122)	2.2	0.68 - 1.00
90 (194)	0.9	0.236 - 0.260

*: These data are reference values and are measured between ECM terminal (59) (Engine coolant temperature sensor) and ECM terminal (32) (ECM ground).

ON BOARD DIAGNOSIS LOGIC



Diagnostic Trouble Code No.	Malfunction is detected when ...	Check Items (Possible Cause)
P0115 0103	● An excessively high or low voltage from the sensor is sent to ECM.*	● Harness or connectors (The sensor circuit is open or shorted.) ● Engine coolant temperature sensor

*: When this malfunction is detected, the ECM enters fail-safe mode and the MIL lights up.

Detected items	Engine operating condition in fail-safe mode
Engine coolant temperature sensor circuit	Engine coolant temperature will be determined by ECM based on the time after turning ignition switch "ON" or "START". CONSULT displays the engine coolant temperature decided by ECM.

Condition	Engine coolant temperature decided (CONSULT display)
Just as ignition switch is turned ON or Start	40°C (104°F)
More than approx. 4 minutes after ignition ON or Start	80°C (176°F)
Except as shown above	40 - 80°C (104 - 176°F) (Depends on the time)

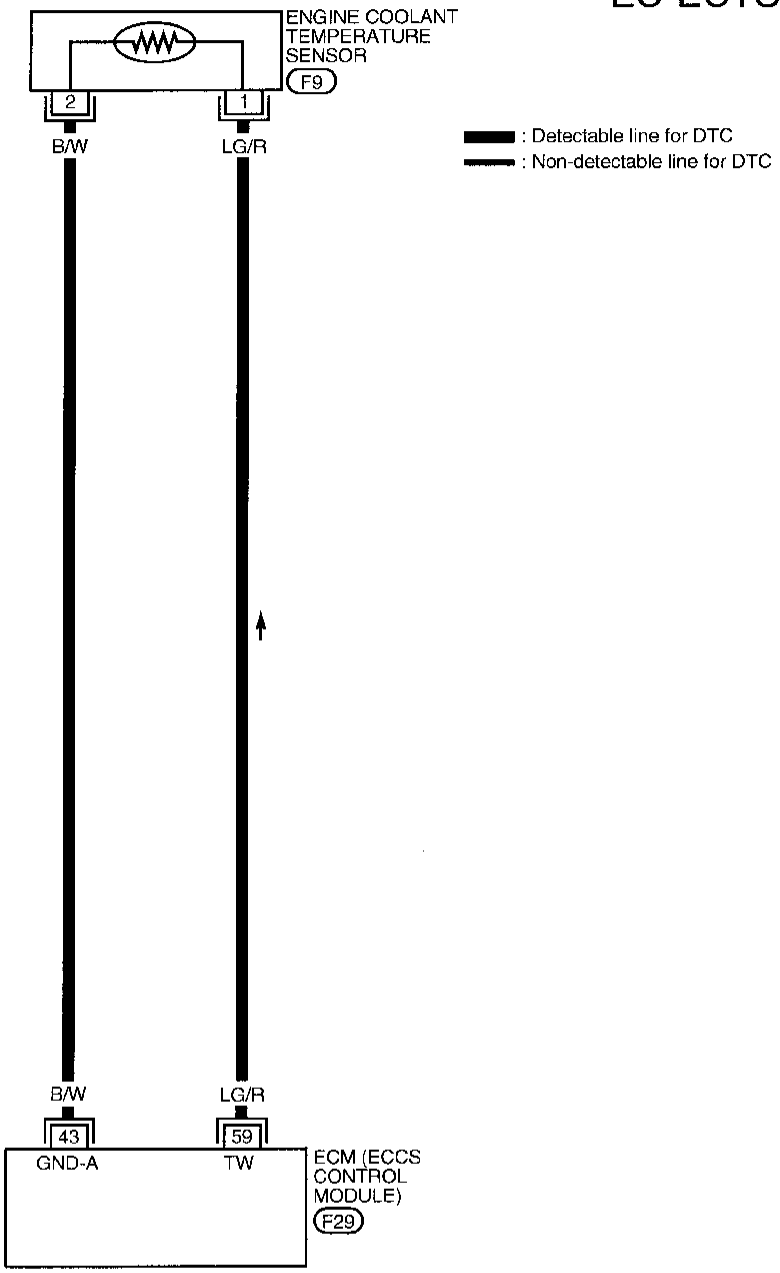
DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

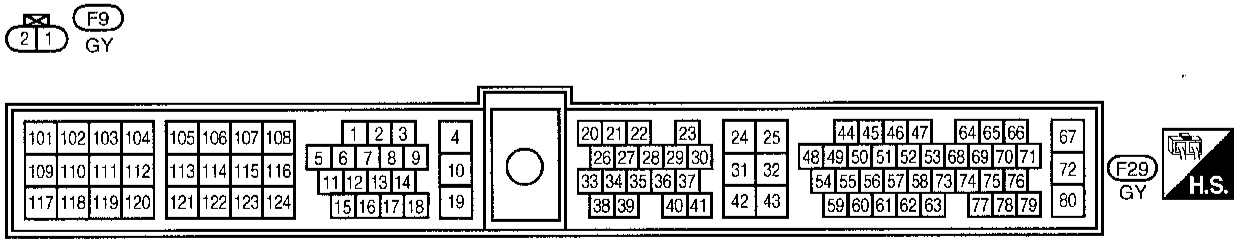
1) Turn ignition switch "ON".
2) Select "DATA MONITOR" mode with CONSULT.
3) Wait at least 5 seconds.

OR

1) Turn ignition switch "ON" and wait at least 5 seconds.
2) Select "MODE 7" with GST.



OR



1) Turn ignition switch "ON" and wait at least 5 seconds.
2) Turn ignition switch "OFF", wait at least 5 seconds and then turn "ON".
3) Perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.

DIAGNOSTIC PROCEDURE

INSPECTION START

A

CHECK POWER SUPPLY.
1. Turn ignition switch "OFF".
2. Disconnect engine coolant temperature sensor harness connector.
3. Turn ignition switch "ON".
4. Check voltage between terminal ① and ground with CONSULT or tester.

Voltage:
Approximately 5V

NG → Repair harness or connectors.

OK

B

CHECK GROUND CIRCUIT.
1. Turn ignition switch "OFF".
2. Check harness continuity between terminal ② and engine ground.

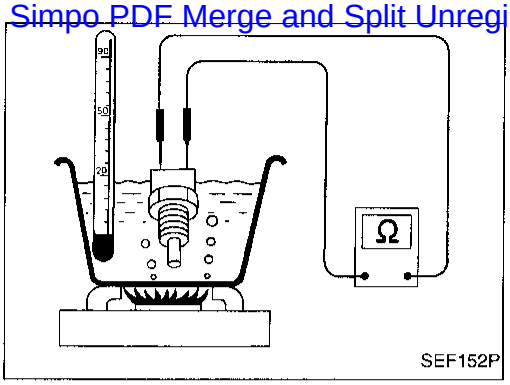
Continuity should exist.
If OK, check harness for short to ground and short to power.

NG → Repair open circuit, short to ground or short to power in harness or connectors.

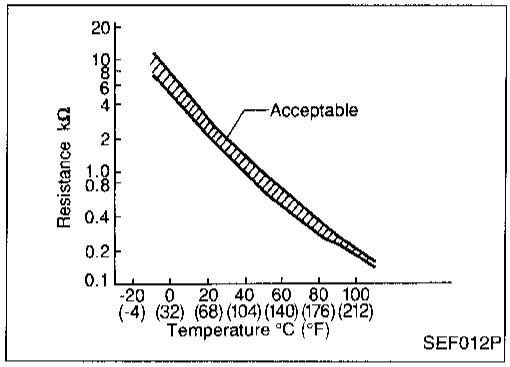
OK

CHECK COMPONENT
(Engine coolant temperature sensor).
Refer to "COMPONENT INSPECTION" on next page.

NG → Replace engine coolant temperature sensor.



OK



Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.

INSPECTION END

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Engine Coolant Temperature Sensor (ECTS) (Circuit) (Cont'd)

COMPONENT INSPECTION

Engine coolant temperature sensor

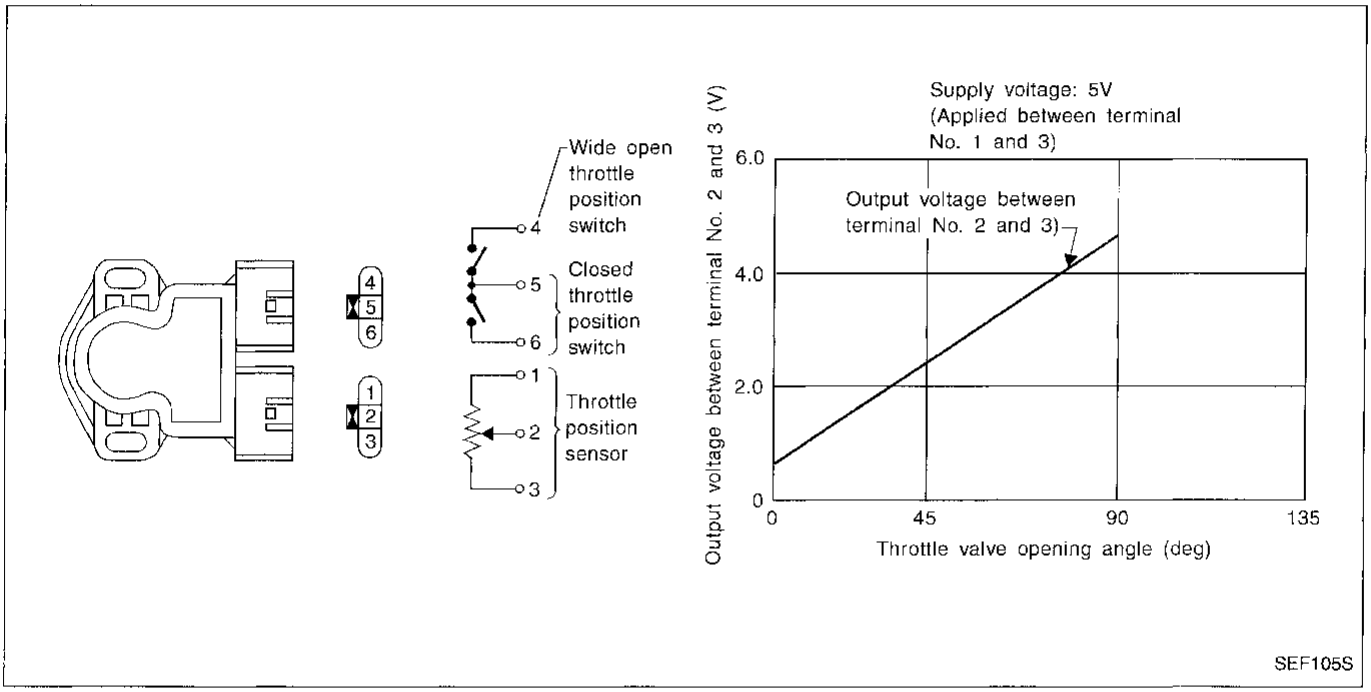
Check resistance as shown in the figure.

<Reference data>

Temperature °C (°F)	Resistance kΩ
20 (68)	2.1 - 2.9
50 (122)	0.68 - 1.00
90 (194)	0.236 - 0.260

If NG, replace engine coolant temperature sensor.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Throttle Position Sensor

Note: If both DTC P0120 (0403) and DTC P0510 (0203) are displayed, perform TROUBLE DIAGNOSIS FOR DTC P0510 first. (See EC-297.)

COMPONENT DESCRIPTION

The throttle position sensor responds to the accelerator pedal movement. This sensor is a kind of potentiometer which transforms the throttle position into output voltage, and emits the voltage signal to the ECM. In addition, the sensor detects the opening and closing speed of the throttle valve and feeds the voltage signal to the ECM.

Idle position of the throttle valve is determined by the ECM receiving the signal from the throttle position sensor. This sensor controls engine operation such as fuel cut. On the other hand, the "Wide open and closed throttle position switch", which is built into the throttle position sensor unit, is not used for engine control.

CONSULT REFERENCE VALUE IN DATA MONITOR MODE

Specification data are reference values.

MONITOR ITEM	CONDITION		SPECIFICATION
THRTL POS SEN	● Ignition switch: ON (Engine stopped) ● Engine: After warming up	Throttle valve: fully closed	0.3 - 0.7V
		Throttle valve: fully opened	Approx. 4.0V
ABSOL TH·P/S	● Ignition switch: ON (Engine stopped) ● Engine: After warming up	Throttle valve: fully closed	0.0%
		Throttle valve: fully opened	Approx. 80%

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

ECM TERMINALS AND REFERENCE VALUE

Specification data are reference values and are measured between each terminal and ㉜ (ECM ground).

TERMINAL NO.	WIRE COLOR	ITEM	CONDITION	DATA (DC Voltage)
23	L	Throttle position sensor	Ignition switch "ON" (Warm-up condition) └ Accelerator pedal fully released	0.3 - 0.7V
			Ignition switch "ON" └ Accelerator pedal fully depressed	Approximately 4V
42	BR	Sensors' power supply	Ignition switch "ON"	Approximately 5V
43	B/W	Sensors' ground	Engine is running. └ Idle speed	Approximately 0V

ON BOARD DIAGNOSIS LOGIC

Diagnostic Trouble Code No.	Malfunction is detected when ...	Check Items (Possible Cause)
P0120 0403	A) An excessively low or high voltage from the sensor is sent to ECM.*	● Harness or connectors (The throttle position sensor circuit is open or shorted.) ● Throttle position sensor
	B) A high voltage from the sensor is sent to ECM under light load driving condition.	● Harness or connectors (The throttle position sensor circuit is open or shorted.) ● Throttle position sensor ● Fuel injector ● Camshaft position sensor ● Mass air flow sensor
	C) A low voltage from the sensor is sent to ECM under heavy load driving condition.	● Harness or connectors (The throttle position sensor circuit is open or shorted.) ● Intake air leaks ● Throttle position sensor

*: When this malfunction is detected, the ECM enters fail-safe mode and the MIL lights up.

Detected items	Engine operating condition in fail-safe mode
Throttle position sensor circuit	Throttle position will be determined based on the injected fuel amount and the engine speed. Therefore, acceleration will be poor.

Condition	Driving condition
When engine is idling	Normal
When accelerating	Poor acceleration

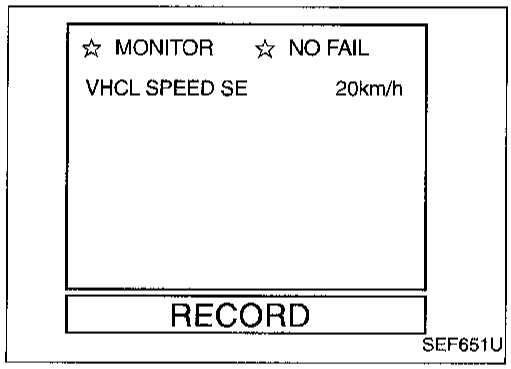
Throttle Position Sensor (Cont'd)

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

Perform "Procedure for malfunction A" first. If the DTC cannot be confirmed, perform "Procedure for malfunction B". If there is no problem on "Procedure for malfunction B", perform "Procedure for malfunction C".



Procedure for malfunction A

NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

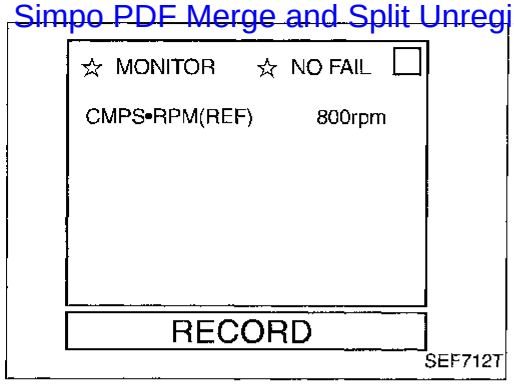
CAUTION:
Always drive vehicle at a safe speed.

TESTING CONDITION:

- **Before performing the following procedure, confirm that battery voltage is more than 10V at idle.**
- **This test may be conducted with the drive wheels lifted in the shop or by driving the vehicle. If a road test is expected to be easier, it is unnecessary to lift the vehicle.**

1) Turn ignition switch "ON" and select "DATA MONITOR" mode with CONSULT.
2) Start engine and maintain the following conditions for at least 5 consecutive seconds.
   VHCL SPEED SE: More than 4 km/h (2 MPH)
   Selector lever: Suitable position except "P" or "N" position

OR



1) Start engine and maintain the following conditions for at least 5 consecutive seconds.
   Vehicle speed: More than 4 km/h (2 MPH)
   Selector lever: Suitable position except "P" or "N" position
2) Select "MODE 7" with GST.

OR

1) Start engine and maintain the following conditions for at least 5 consecutive seconds.
   Vehicle speed: More than 4 km/h (2 MPH)
   Selector lever: Suitable position except "P" or "N" position
2) Turn ignition switch "OFF" and wait at least 5 seconds.
3) Turn ignition switch "ON" and perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.

Throttle Position Sensor (Cont'd)

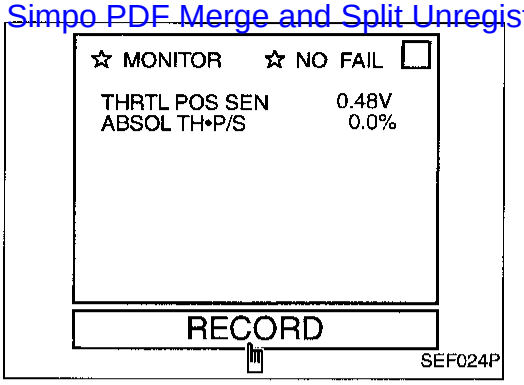
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procedure for malfunction B

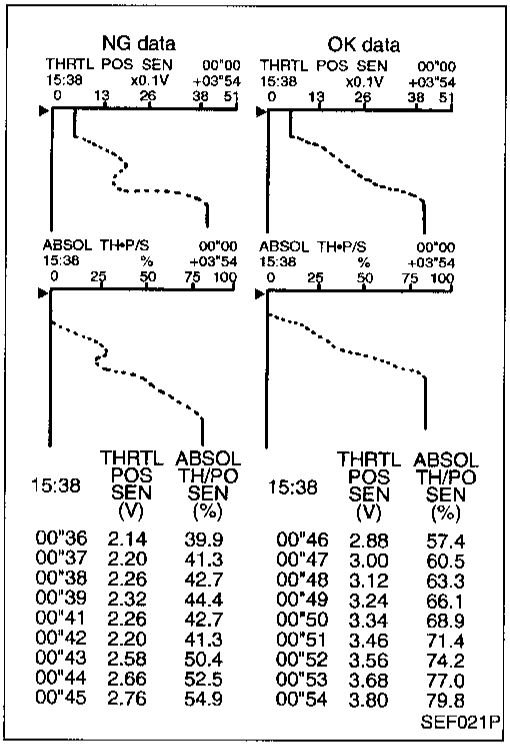
NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

1) Turn ignition switch "ON".
2) Select "DATA MONITOR" mode with CONSULT.
3) Start engine and let it idle for at least 10 seconds.
   If idle speed is over 1,100 rpm, maintain the following conditions for at least 10 seconds to keep engine speed below 1,100 rpm.
   A/T model
   Selector lever: Suitable position except "P" or "N"
   Brake pedal: Depressed
   Vehicle speed: 0 km/h (0 MPH)
   M/T model
   Selector lever: Suitable position except "N" (Higher gear position such as 3rd or 4th position is better to keep engine rpm low.)
   Accelerator pedal: Released
   Vehicle speed: As slow as possible

OR



1) Start engine and let it idle for at least 10 seconds.
   If idle speed is over 1,100 rpm, maintain the following conditions for at least 10 seconds to keep engine speed below 1,100 rpm.
   A/T model
   Selector lever: Suitable position except "P" or "N"
   Brake pedal: Depressed
   Vehicle speed: 0 km/h (0 MPH)
   M/T model
   Selector lever: Suitable position except "N" (Higher gear position such as 3rd or 4th position is better to keep engine rpm low.)
   Accelerator pedal: Released
   Vehicle speed: As slow as possible
2) Select "MODE 7" with GST.



OR

1) Start engine and let it idle for at least 10 seconds.
   If idle speed is over 1,100 rpm, maintain the following conditions for at least 10 seconds to keep engine speed below 1,100 rpm.
   A/T model
   Selector lever: Suitable position except "P" or "N"
   Brake pedal: Depressed
   Vehicle speed: 0 km/h (0 MPH)
   M/T model
   Selector lever: Suitable position except "N" (Higher gear position such as 3rd or 4th position is better to keep engine rpm low.)
   Accelerator pedal: Released
   Vehicle speed: As slow as possible
2) Turn ignition switch "OFF" and wait at least 5 seconds.
3) Turn ignition switch "ON" and perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.

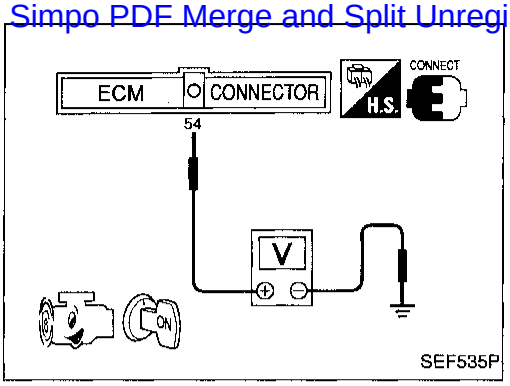
Procedure for malfunction C

CAUTION:

Always drive vehicle at a safe speed.

NOTE:

If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.



1) Start engine and warm it up to normal operating temperature.
2) Turn ignition switch "OFF" and wait at least 5 seconds.
3) Turn ignition switch "ON".
4) Select "MANU TRIG" and "HI SPEED" in "DATA MONITOR" mode with CONSULT.
5) Select "THRTL POS SEN" and "ABSOL TH•P/S" in "DATA MONITOR" mode with CONSULT.
6) Press RECORD on CONSULT SCREEN at the same time accelerator pedal is depressed.
7) Print out the recorded graph and check the following:
   - The voltage rise is linear in response to accelerator pedal depression.
   - The voltage when accelerator pedal is fully depressed is approximately 4V.

   If NG, go to "DIAGNOSTIC PROCEDURE", EC-133.
   If OK, go to following step.
8) Select "AUTO TRIG" in "DATA MONITOR" mode with CONSULT.
9) Maintain the following conditions for at least 10 consecutive seconds.

   CMPS•RPM (REF): More than 2,000 rpm
   MAS AIR/FL SE: More than 3V
   COOLAN TEMP/S: More than 70°C (158°F)
   Selector lever: Suitable position
   Driving location: Driving vehicle uphill (Increased engine load) will help maintain the driving conditions required for this test.

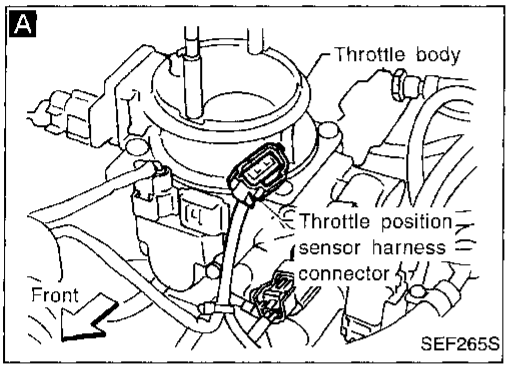
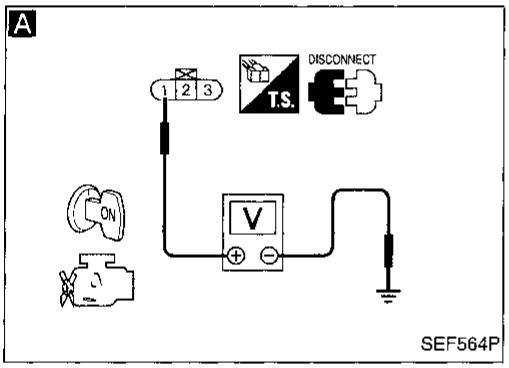
DIAGNOSTIC PROCEDURE

If the trouble is duplicated after "Procedure for malfunction A", perform "Procedure A" below. If the trouble is duplicated after "Procedure for malfunction B", perform "Procedure B" on EC-135. If the trouble is duplicated after "Procedure for malfunction C", perform "Procedure C" on EC-137.



Procedure A

INSPECTION START

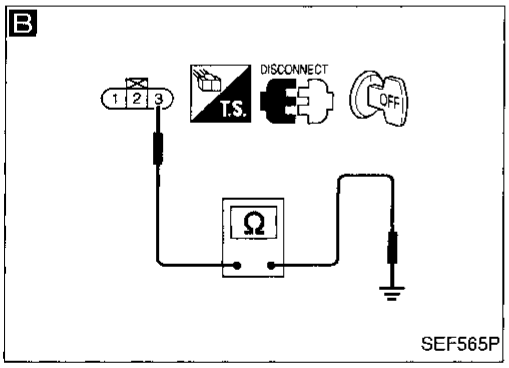


1. Turn ignition switch "OFF".
2. Loosen and retighten engine ground screws.

A

CHECK POWER SUPPLY.
1. Disconnect throttle position sensor harness connector.
2. Turn ignition switch "ON".
3. Check voltage between terminal ① and ground with CONSULT or tester.
Voltage: Approximately 5V

NG → Repair harness or connectors.

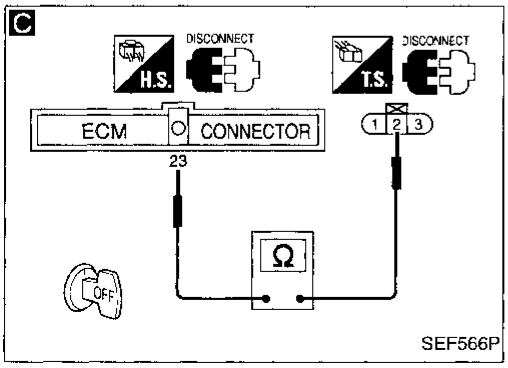


OK

B

CHECK GROUND CIRCUIT.
1. Turn ignition switch "OFF".
2. Check harness continuity between terminal ③ and engine ground.
Continuity should exist.
If OK, check harness for short to ground and short to power.

NG → Repair open circuit, short to ground or short to power in harness or connectors.

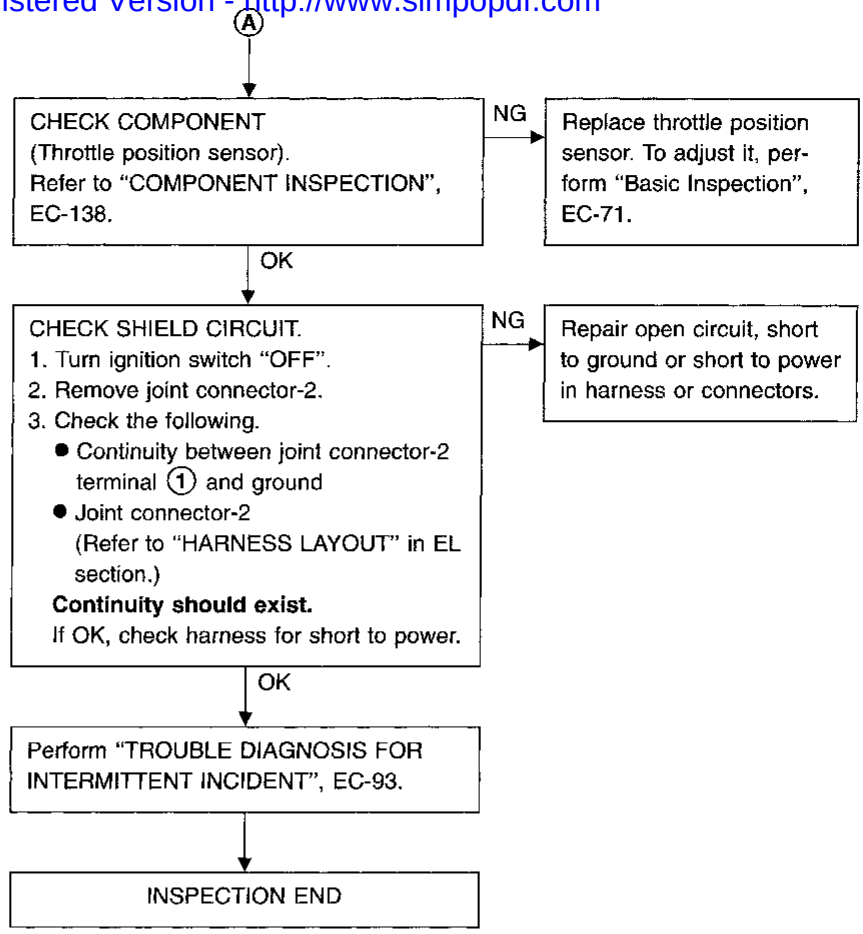


OK

C

CHECK INPUT SIGNAL CIRCUIT.
1. Disconnect ECM harness connector.
2. Check harness continuity between ECM terminal ㉓ and terminal ②.
Continuity should exist.
If OK, check harness for short to ground and short to power.

NG → Repair open circuit, short to ground or short to power in harness or connectors.



OK

Ⓐ

C

CHECK INPUT SIGNAL CIRCUIT.
1. Disconnect ECM harness connector.
2. Check harness continuity between ECM terminal (23) and terminal (2).
   Continuity should exist.
   If OK, check harness for short to ground and short to power.

NG → Repair open circuit, short to ground or short to power in harness or connectors.

OK ↓

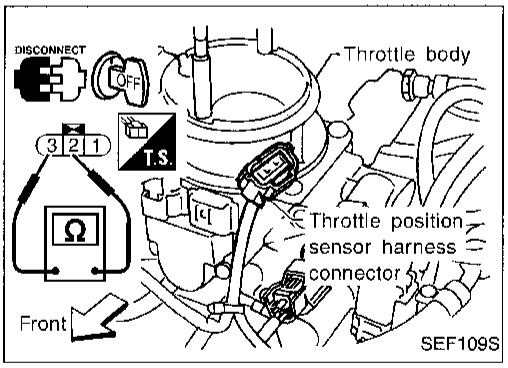
CHECK COMPONENT
(Throttle position sensor).
Refer to "COMPONENT INSPECTION" below.

NG → Replace throttle position sensor. To adjust it, perform "Basic Inspection", EC-71.

OK ↓

CHECK SHIELD CIRCUIT.
1. Turn ignition switch "OFF".
2. Remove joint connector-2.
3. Check the following.
   - Continuity between joint connector-2 terminal (1) and ground
   - Joint connector-2
     (Refer to "HARNESS LAYOUT" in EL section.)

   Continuity should exist.
   If OK, check harness for short to power.



NG → Repair open circuit, short to ground or short to power in harness or connectors.

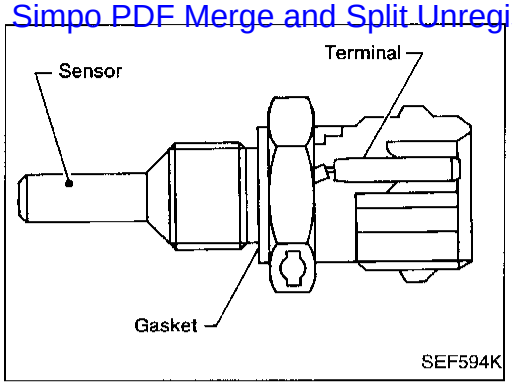
OK ↓

Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.

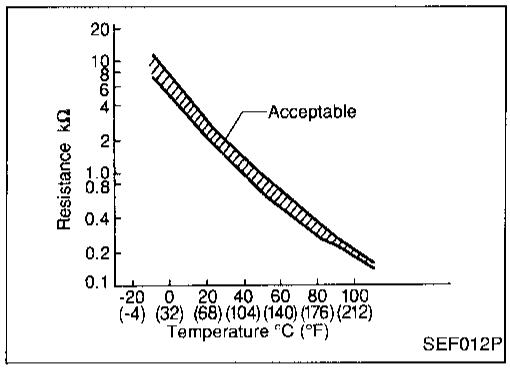
↓

INSPECTION END

COMPONENT INSPECTION



Throttle position sensor



1. Disconnect throttle position sensor harness connector.
2. Make sure that resistance between terminals (2) and (3) changes when opening throttle valve manually.

Throttle valve conditions	Resistance [at 25°C (77°F)]
Completely closed	Approximately 0.5 kΩ
Partially open	0.5 - 4 kΩ
Completely open	Approximately 4 kΩ

If NG, replace throttle position sensor.
To adjust it, perform "Basic Inspection", EC-71.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

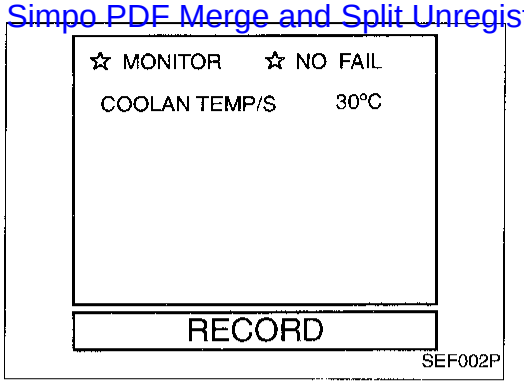
Engine Coolant Temperature (ECT) Sensor

COMPONENT DESCRIPTION

The engine coolant temperature sensor is used to detect the engine coolant temperature. The sensor modifies a voltage signal from the ECM. The modified signal returns to the ECM as the engine coolant temperature input. The sensor uses a thermistor which is sensitive to the change in temperature. The electrical resistance of the thermistor decreases as temperature increases.

<Reference data>

Engine coolant temperature °C (°F)	Voltage* V	Resistance kΩ
−10 (14)	4.4	7.0 - 11.4
20 (68)	3.5	2.1 - 2.9
50 (122)	2.2	0.68 - 1.00
90 (194)	0.9	0.236 - 0.260



*: These data are reference values and are measured between ECM terminal (59) (Engine coolant temperature sensor) and ECM terminal (32) (ECM ground).

ON BOARD DIAGNOSIS LOGIC

Diagnostic Trouble Code No.	Malfunction is detected when ...	Check Items (Possible Cause)
P0125 0908	● Voltage sent to ECM from the sensor is not practical, even when some time has passed after starting the engine. ● Engine coolant temperature is insufficient for closed loop fuel control.	● Harness or connectors (High resistance in the circuit) ● Engine coolant temperature sensor ● Thermostat

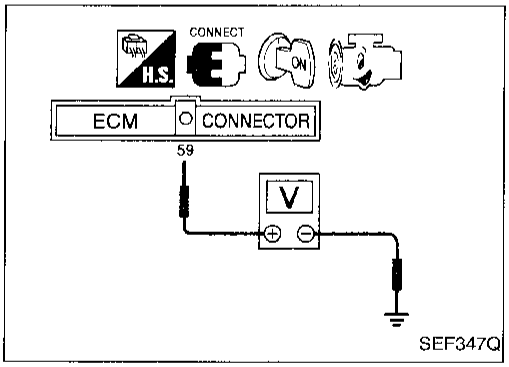
Engine Coolant Temperature (ECT) Sensor (Cont'd)

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

CAUTION:
Be careful not to overheat engine.

NOTE:

- **If both DTC P0115 (0103) and P0125 (0908) are displayed, first perform "TROUBLE DIAGNOSIS FOR DTC P0115". Refer to EC-121.**
- **If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.**



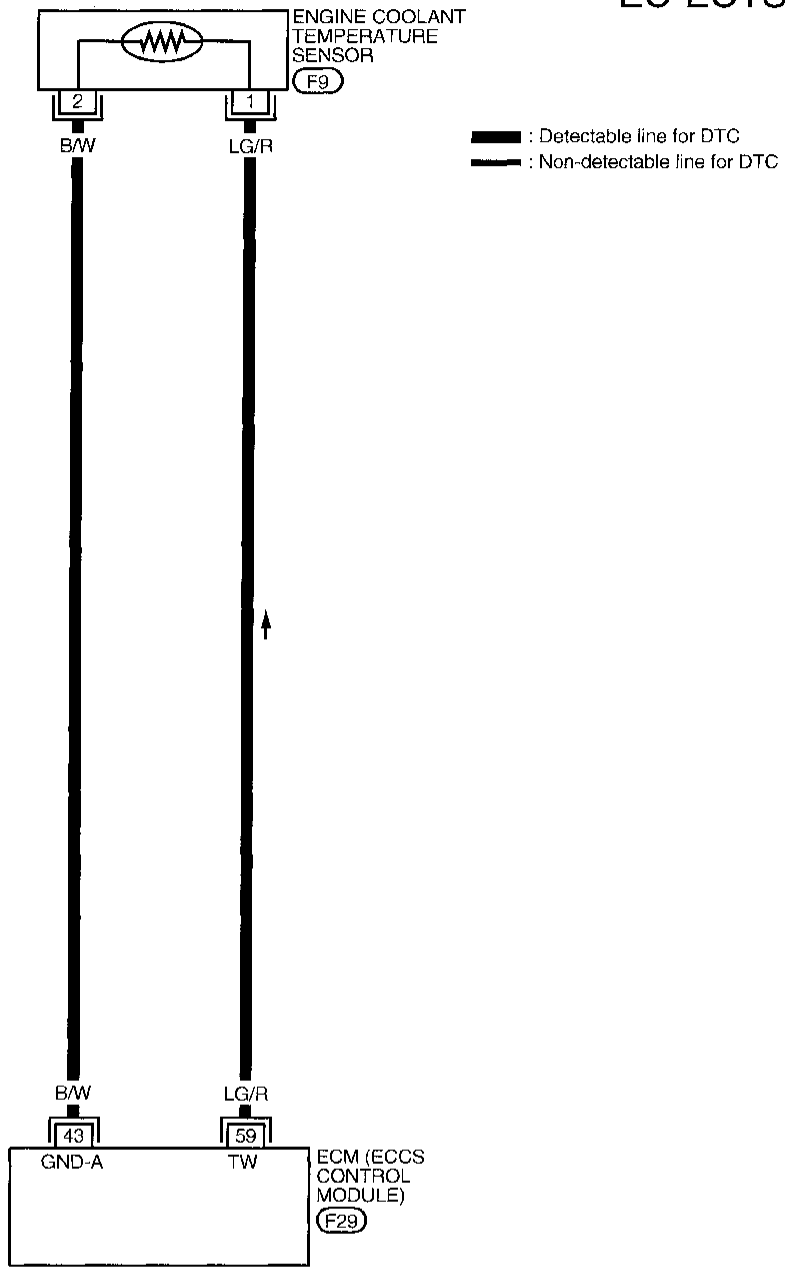
1) Turn ignition switch "ON".
2) Select "DATA MONITOR" mode with CONSULT.
3) Start engine and run it for 65 minutes at idle speed.

If "COOLAN TEMP/S" increases to more than 10°C (50°F) within 65 minutes, stop engine because the test result will be OK.

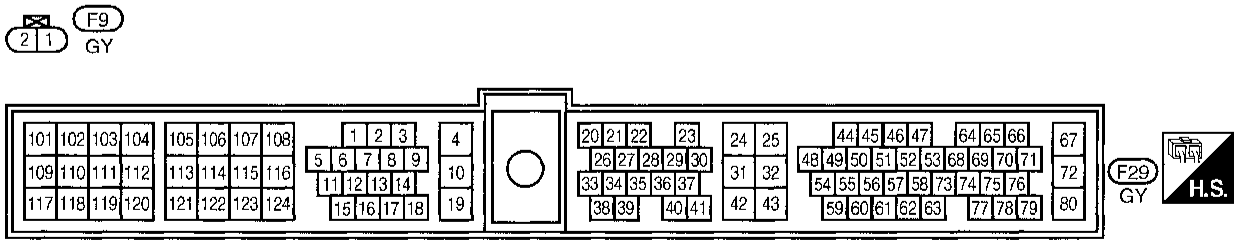
OR

1) Start engine and run it for 65 minutes at idle speed.
2) Select "MODE 7" with GST.

If engine coolant temperature increases to more than 10°C (50°F) within 65 minutes, stop engine because the test result will be OK.



OR



1) Start engine and run it for 65 minutes at idle speed.
2) Turn ignition switch "OFF", wait at least 5 seconds and then turn "ON".
3) Perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.

If voltage between ECM terminals (59) and ground decreases to less than 3.8V within 65 minutes, stop engine because the test result will be OK.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

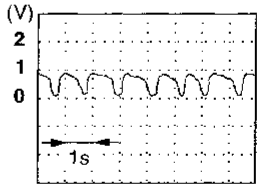
Front Heated Oxygen Sensor (Circuit) (Front HO2S)

COMPONENT DESCRIPTION

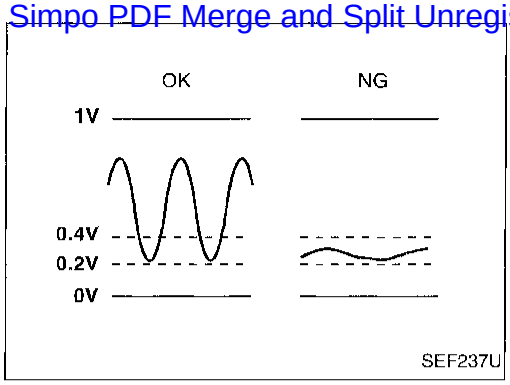
The front heated oxygen sensor is placed into the exhaust manifold. It detects the amount of oxygen in the exhaust gas compared to the outside air. The front heated oxygen sensor has a closed-end tube made of ceramic zirconia. The zirconia generates voltage from approximately 1V in richer conditions to 0V in leaner conditions. The front heated oxygen sensor signal is sent to the ECM. The ECM adjusts the injection pulse duration to achieve the ideal air-fuel ratio. The ideal air-fuel ratio occurs near the radical change from 1V to 0V.



CONSULT REFERENCE VALUE IN DATA MONITOR MODE

Specification data are reference values.

MONITOR ITEM	CONDITION		SPECIFICATION
FR O2 SENSOR	● Engine: After warming up	Maintaining engine speed at 2,000 rpm	0 - 0.3V ↔ Approx. 0.6 - 1.0V
FR O2 MNTR			LEAN ↔ RICH Changes more than 5 times during 10 seconds.

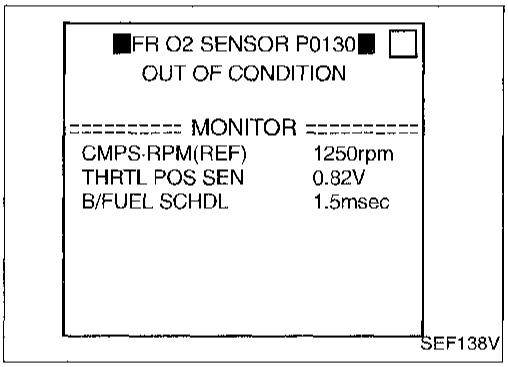


ECM TERMINALS AND REFERENCE VALUE

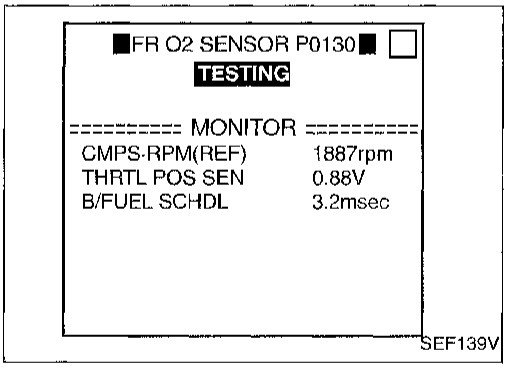
Specification data are reference values and are measured between each terminal and ㉜ (ECM ground).

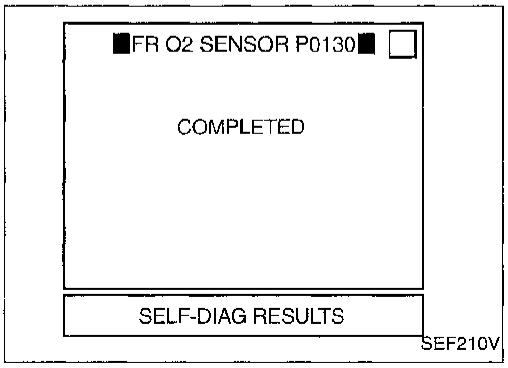
TERMINAL NO.	WIRE COLOR	ITEM	CONDITION	DATA (DC Voltage)
50	B	Front heated oxygen sensor	Engine is running. └ After warming up to normal operating temperature and engine speed is 2,000 rpm.	0 - Approximately 1.0V  SEF201T

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Front Heated Oxygen Sensor (Circuit) (Front HO2S) (Cont'd)





ON BOARD DIAGNOSIS LOGIC

Under the condition in which the front heated oxygen sensor signal is not input, the ECM circuits will read a continuous approximately 0.3V. Therefore, for this diagnosis, the time that output voltage is within 200 to 400 mV range is monitored, and the diagnosis checks that this time is not inordinately long.

Diagnostic Trouble Code No.	Malfunction is detected when ...	Check Items (Possible Cause)
P0130 0303	● The voltage from the sensor is constantly approx. 0.3V.	● Harness or connectors (The sensor circuit is open or shorted.) ● Front heated oxygen sensor

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

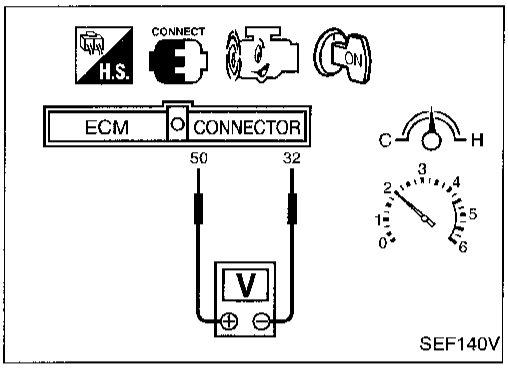
CAUTION:
Always drive vehicle at a safe speed.

NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

TESTING CONDITION:

- **Before performing the following procedure, confirm that battery voltage is in between 11V and 16V at idle.**
- **Never raise engine speed above 3,000 rpm during the "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE". If the engine speed limit is exceeded, retry the procedure from step 4).**

1) Start engine and warm it up to normal operating temperature.
2) Select "FR O2 SENSOR P0130" of "FRONT O2 SENSOR" in "DTC WORK SUPPORT" mode with CONSULT.
3) Touch "START".
4) Let it idle for at least 3 minutes.
5) When the following conditions are met, "TESTING" will be displayed on the CONSULT screen. Maintain the conditions continuously until "TESTING" changes to "COMPLETED". (It will take approximately 10 to 50 seconds.)
   CMPS-RPM (REF): 1,700 - 2,700 rpm (A/T)
   1,700 - 3,000 rpm (M/T)
   Vehicle speed: 80 - 100 km/h (50 - 62 MPH)
   B/FUEL SCHDL: 1.1 - 4.8 ms (A/T)
   1.1 - 5.2 ms (M/T)
   Selector lever: Suitable position



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Front Heated Oxygen Sensor (Circuit) (Front HO2S) (Cont'd)

If "TESTING" is not displayed after 5 minutes, retry from step 2).

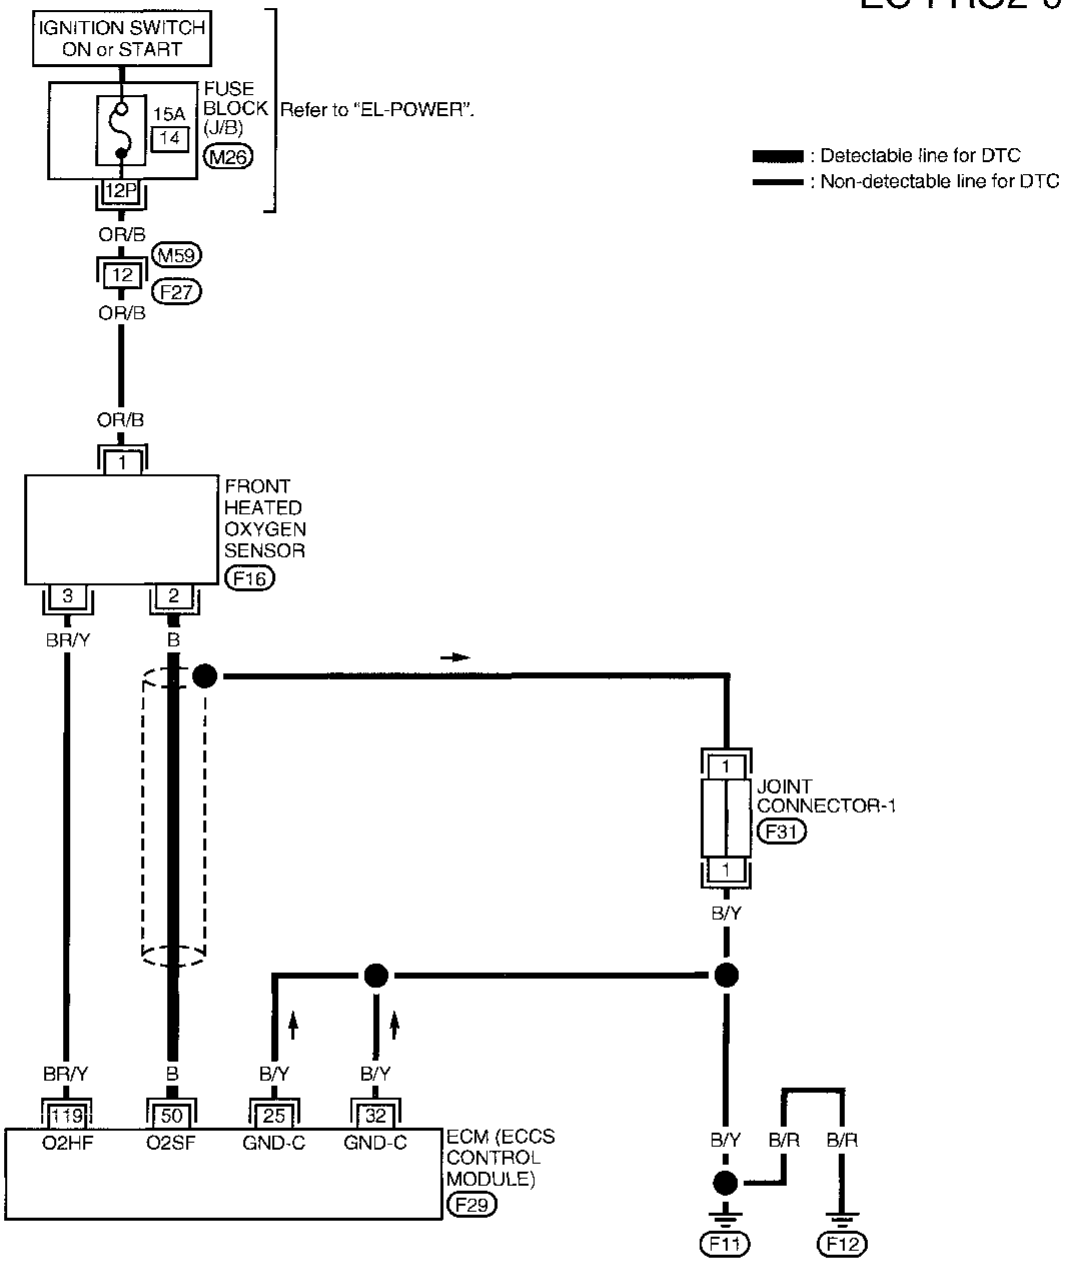
6) Make sure that "OK" is displayed after touching "SELF-DIAG RESULTS". If "NG" is displayed, refer to "DIAGNOSTIC PROCEDURE", EC-148.

During this test, P1148 may be displayed on CONSULT screen.

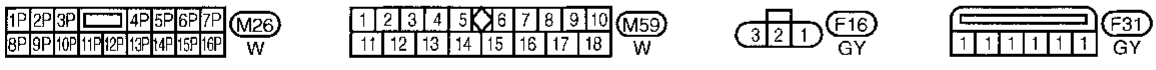
OR

OVERALL FUNCTION CHECK

Use this procedure to check the overall function of the front heated oxygen sensor circuit. During this check, a 1st trip DTC might not be confirmed.



1) Start engine and warm it up to normal operating temperature.
2) Set voltmeter probes between ECM terminals ⑤⓪ (sensor signal) and ③② (ECM ground).
3) Check the following with engine speed held at 2,000 rpm constant under no load.



- The voltage does not remain in the range of 0.2 - 0.4V.

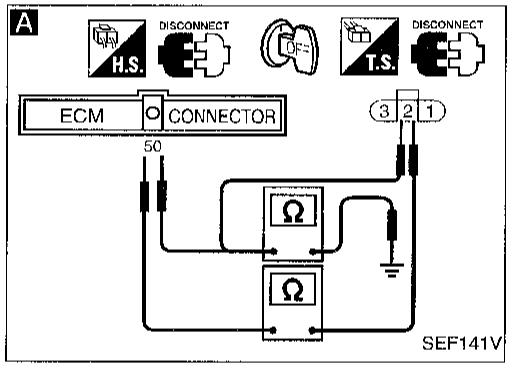
AEC524A



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Front Heated Oxygen Sensor (Circuit) (Front HO2S) (Cont'd)

DIAGNOSTIC PROCEDURE

INSPECTION START

1. Turn ignition switch "OFF".
2. Loosen and retighten engine ground screws.

A

CHECK INPUT SIGNAL CIRCUIT.
1. Disconnect front heated oxygen sensor harness connector and ECM harness connector.
2. Check harness continuity between ECM terminal (50) and terminal (2).
   Continuity should exist.
3. Check harness continuity between ECM terminal (50) (or terminal (2)) and ground.
   Continuity should not exist.

If OK, check harness for short to ground and short to power.

NG → Repair open circuit, short to ground or short to power in harness or connectors.

OK ↓

CHECK COMPONENT
(Front heated oxygen sensor).
Refer to "COMPONENT INSPECTION" on next page.

NG → Replace front heated oxygen sensor.

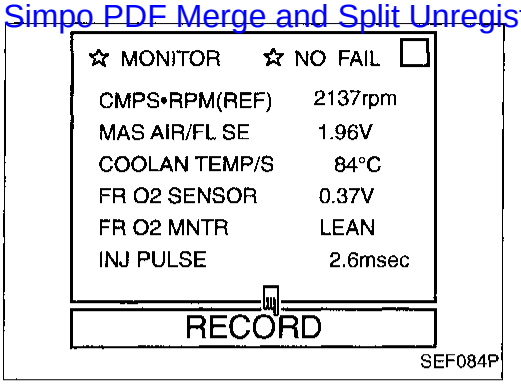
OK ↓

CHECK SHIELD CIRCUIT.
1. Turn ignition switch "OFF".
2. Remove joint connector-1.
3. Check the following.
   - Continuity between joint connector-1 terminal (1) and ground
   - Joint connector-1
     (Refer to "HARNESS LAYOUT" in EL section.)

   Continuity should exist.

If OK, check harness for short to power.

NG → Repair open circuit, short to ground or short to power in harness or connectors.



OK ↓

Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.

INSPECTION END

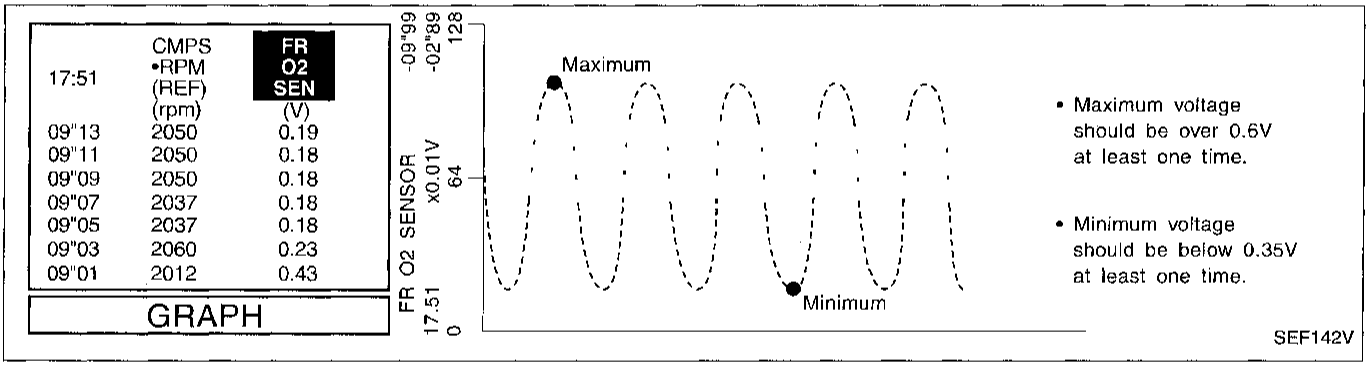
Front Heated Oxygen Sensor (Circuit) (Front HO2S) (Cont'd)

COMPONENT INSPECTION



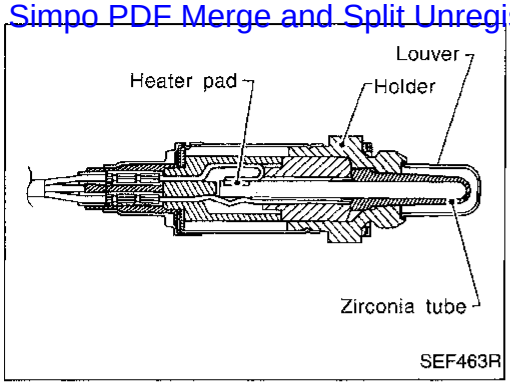
Front heated oxygen sensor

1) Start engine and warm it up to normal operating temperature.
2) Select "MANU TRIG" and "HI SPEED" in "DATA MONITOR" mode with CONSULT, and select "FR O2 SENSOR" and "FR O2 MNTR".
3) Hold engine speed at 2,000 rpm under no load during the following steps.
4) Touch "RECORD" on CONSULT screen.
5) Check the following.

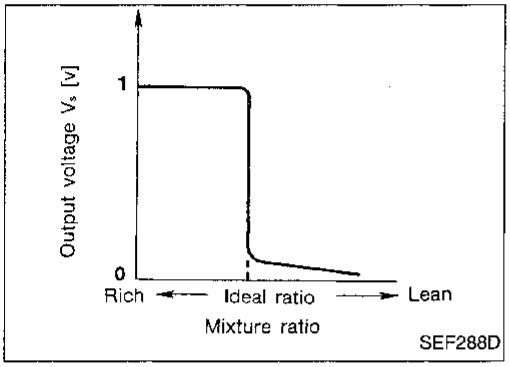
- "FR O2 MNTR" in "DATA MONITOR" mode changes from "RICH" to "LEAN" to "RICH" 5 times in 10 seconds.
  5 times (cycles) are counted as shown below:

cycle	1	2	3	4	5
FR O2 MNTR	R-L-R-L-R-L-R-L-R-L				

  R = "FR O2 MNTR", "RICH"
  L = "FR O2 MNTR", "LEAN"
- "FR O2 SENSOR" voltage goes above 0.6V at least once.
- "FR O2 SENSOR" voltage goes below 0.35V at least once.
- "FR O2 SENSOR" voltage never exceeds 1.0V.



OR



1) Start engine and warm it up to normal operating temperature.
2) Set voltmeter probes between ECM terminals ⑤⓪ (sensor signal) and ③② (ECM ground).
3) Check the following with engine speed held at 2,000 rpm constant under no load.

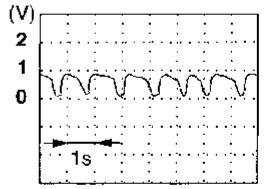
- Malfunction indicator lamp goes on more than 5 times within 10 seconds in Diagnostic Test Mode II (FRONT HEATED OXYGEN SENSOR MONITOR).
- The maximum voltage is over 0.6V at least one time.
- The minimum voltage is below 0.35V at least one time.
- The voltage never exceeds 1.0V.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Front Heated Oxygen Sensor (Lean Shift Monitoring) (Front HO2S)

COMPONENT DESCRIPTION

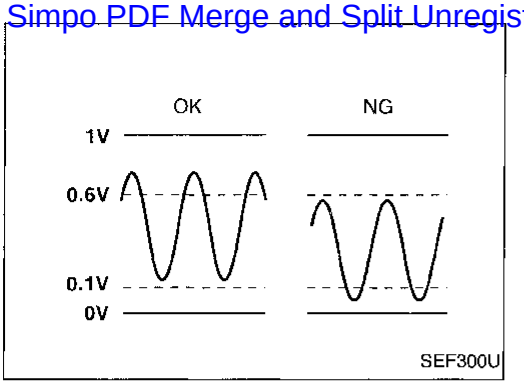
The front heated oxygen sensor is placed into the exhaust manifold. It detects the amount of oxygen in the exhaust gas compared to the outside air. The front heated oxygen sensor has a closed-end tube made of ceramic zirconia. The zirconia generates voltage from approximately 1V in richer conditions to 0V in leaner conditions. The front heated oxygen sensor signal is sent to the ECM. The ECM adjusts the injection pulse duration to achieve the ideal air-fuel ratio. The ideal air-fuel ratio occurs near the radical change from 1V to 0V.



CONSULT REFERENCE VALUE IN DATA MONITOR MODE

Specification data are reference values.

MONITOR ITEM	CONDITION		SPECIFICATION
FR O2 SENSOR ..... FR O2 MNTR	● Engine: After warming up	Maintaining engine speed at 2,000 rpm	0 - 0.3V ↔ Approx. 0.6 - 1.0V LEAN ↔ RICH Changes more than 5 times during 10 seconds.

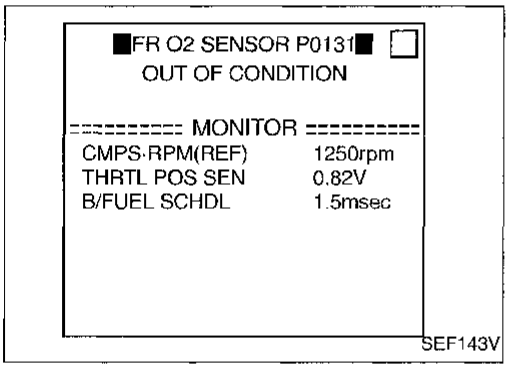


ECM TERMINALS AND REFERENCE VALUE

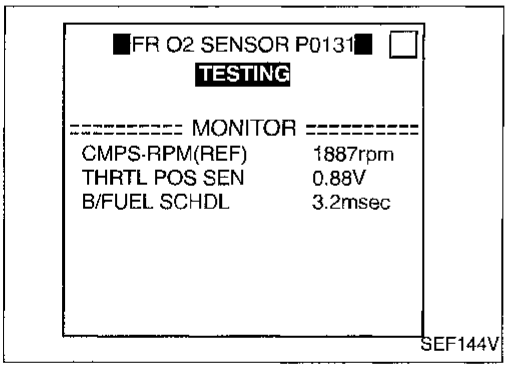
Specification data are reference values and are measured between each terminal and ㉜ (ECM ground).

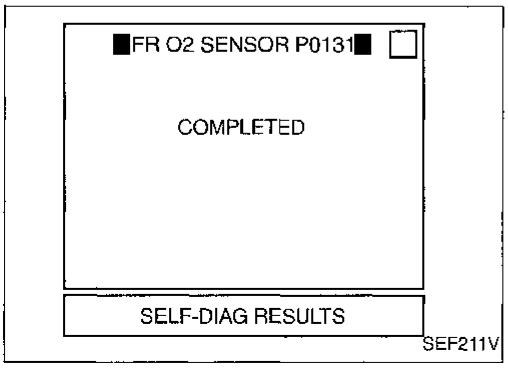
TERMINAL NO.	WIRE COLOR	ITEM	CONDITION	DATA (DC Voltage)
50	B	Front heated oxygen sensor	Engine is running. └ After warming up to normal operating temperature and engine speed is 2,000 rpm.	0 - Approximately 1.0V  SEF201T

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Front Heated Oxygen Sensor (Lean Shift Monitoring) (Front HO2S) (Cont'd)





ON BOARD DIAGNOSIS LOGIC

To judge the malfunction, the output from the front heated oxygen sensor is monitored to determine whether the "rich" output is sufficiently high and whether the "lean" output is sufficiently low. When both the outputs are shifting to the lean side, the malfunction will be detected.

Diagnostic Trouble Code No.	Malfunction is detected when ...	Check Items (Possible Cause)
P0131 0411	● The maximum and minimum voltages from the sensor are not reached to the specified voltages.	● Front heated oxygen sensor ● Front heated oxygen sensor heater ● Fuel pressure ● Injectors ● Intake air leaks

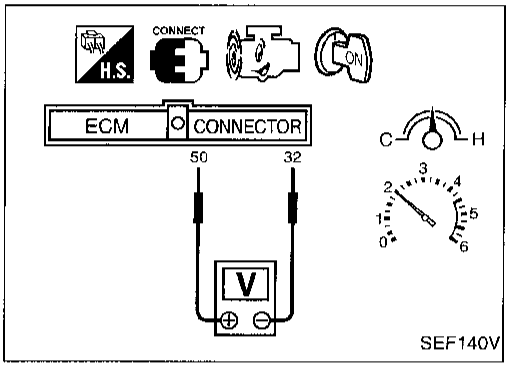
DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

CAUTION:
Always drive vehicle at a safe speed.

NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

TESTING CONDITION:

- **Always perform at a temperature above −10°C (14°F).**
- **Before performing the following procedure, confirm that battery voltage is in between 11V and 16V at idle.**
- **Never raise engine speed above 3,000 rpm during the "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE". If the engine speed limit is exceeded, retry the procedure from step 5).**



1) Start engine and warm it up to normal operating temperature.
2) Stop engine and wait at least 5 seconds.
3) Turn ignition switch "ON" and select "FR O2 SENSOR P0131" of "FRONT O2 SENSOR" in "DTC WORK SUPPORT" mode with CONSULT.
4) Touch "START".
5) Start engine and let it idle for at least 3 minutes.
6) When the following conditions are met, "TESTING" will be displayed on the CONSULT screen. Maintain the conditions continuously until "TESTING" changes to "COMPLETED". (It will take approximately 50 seconds or more.)
   CMPS·RPM (REF): 1,700 - 3,000 rpm
   Vehicle speed: 80 - 120 km/h (50 - 75 MPH)
   B/FUEL SCHDL: 1.1 - 4.8 ms
   Selector lever: Suitable position

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Front Heated Oxygen Sensor (Lean Shift Monitoring) (Front HO2S) (Cont'd)

If "TESTING" is not displayed after 5 minutes, retry from step 2).

7) Make sure that "OK" is displayed after touching "SELF-DIAG RESULTS". If "NG" is displayed, refer to "DIAGNOSTIC PROCEDURE", EC-153.

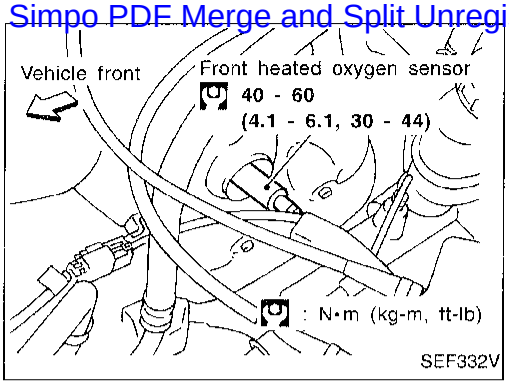
OR

OVERALL FUNCTION CHECK

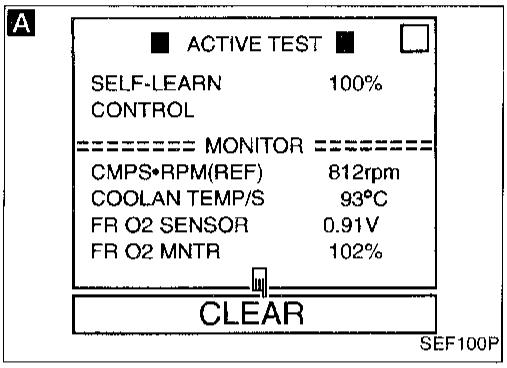
Use this procedure to check the overall function of the front heated oxygen sensor circuit. During this check, a 1st trip DTC might not be confirmed.

1) Start engine and warm it up to normal operating temperature.
2) Set voltmeter probes between ECM terminals ⑤⓪ (sensor signal) and ③② (ECM ground).
3) Check the following with engine speed held at 2,000 rpm constant under no load.

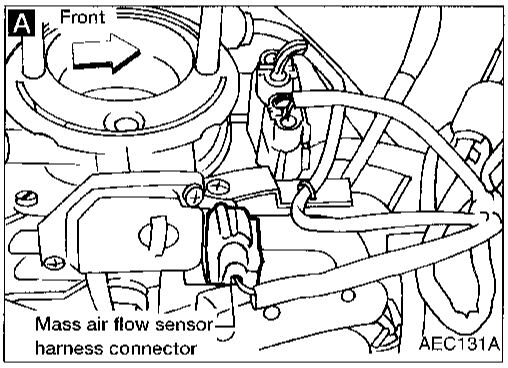
- The maximum voltage is over 0.6V at least one time.



OR



- The minimum voltage is over 0.1V at least one time.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Front Heated Oxygen Sensor (Lean Shift Monitoring) (Front HO2S) (Cont'd)

DIAGNOSTIC PROCEDURE

INSPECTION START

1. Turn ignition switch "OFF".
2. Loosen and retighten front heated oxygen sensor.
   Tightening torque:
   40 - 60 N·m
   (4.1 - 6.1 kg-m, 30 - 44 ft-lb)

A

CLEAR THE SELF-LEARNING DATA.

1. Start engine and warm it up to normal operating temperature.
2. Select "SELF-LEARNING CONT" in "ACTIVE TEST" mode with CONSULT.
3. Clear the self-learning control coefficient by touching "CLEAR".
4. Run engine for at least 10 minutes at idle speed.
   Is the 1st trip DTC P0171 detected? Is it difficult to start engine?

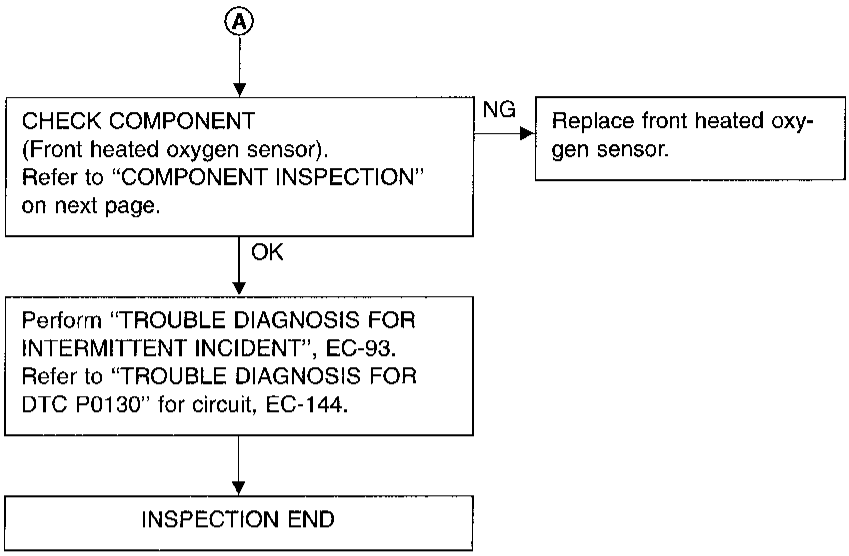
Yes → Go to "TROUBLE DIAGNOSIS FOR DTC P0171", EC-208.

OR

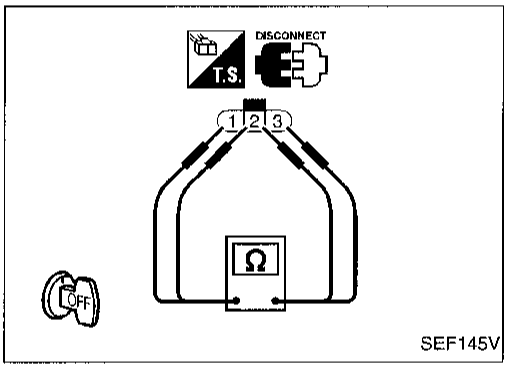
2. Turn ignition switch "OFF".
3. Disconnect mass air flow sensor harness connector, and restart and run engine for at least 3 seconds at idle speed.
4. Stop engine and reconnect mass air flow sensor harness connector.
5. Make sure diagnostic trouble code No. 0102 is displayed in Diagnostic Test Mode II.
6. Erase the diagnostic test mode II (Self-diagnostic results) memory. Make sure diagnostic trouble code No. 0505 is displayed in Diagnostic Test Mode II.
7. Run engine for at least 10 minutes at idle speed.
   Is the 1st trip DTC 0115 detected? Is it difficult to start engine?

No

CHECK COMPONENT
(Front heated oxygen sensor heater).
Refer to "COMPONENT INSPECTION" on next page.



NG → Replace front heated oxygen sensor.



OK

Ⓐ

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

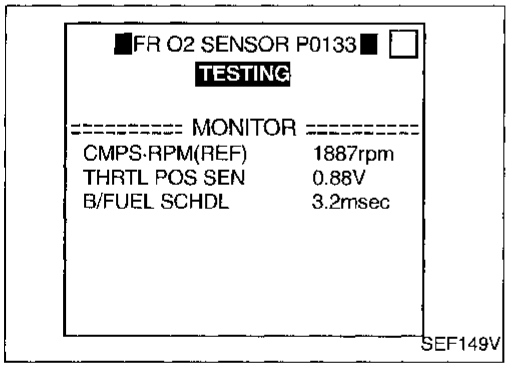
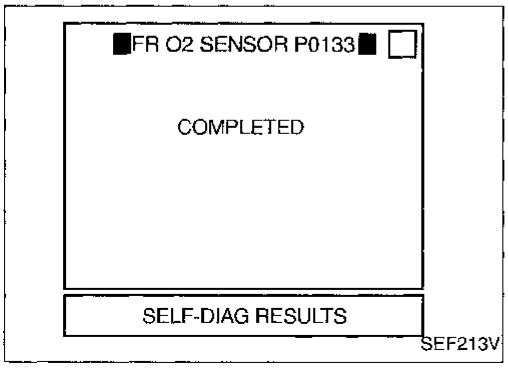
Front Heated Oxygen Sensor (Response Monitoring) (Front HO2S) (Cont'd)





ON BOARD DIAGNOSIS LOGIC

To judge the malfunction of front heated oxygen sensor, this diagnosis measures front heated oxygen sensor cycling time. The time is compensated by engine operating (speed and load), fuel feedback control constant, and front heated oxygen sensor temperature index. Judgment is based on whether the compensated time (front heated oxygen sensor cycling time index) is inordinately long or not.

Diagnostic Trouble Code No.	Malfunction is detected when ...	Check Items (Possible Cause)
P0133 0409	● The cycle of the voltage signal from the sensor is more than the specified time.	● Harness or connectors (The sensor circuit is open or shorted.) ● Front heated oxygen sensor ● Front heated oxygen sensor heater ● Fuel pressure ● Injectors ● Intake air leaks ● Exhaust gas leaks ● PCV ● Mass air flow sensor

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

CAUTION:
Always drive vehicle at a safe speed.

NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

TESTING CONDITION:

- **Always perform at a temperature above −10°C (14°F).**

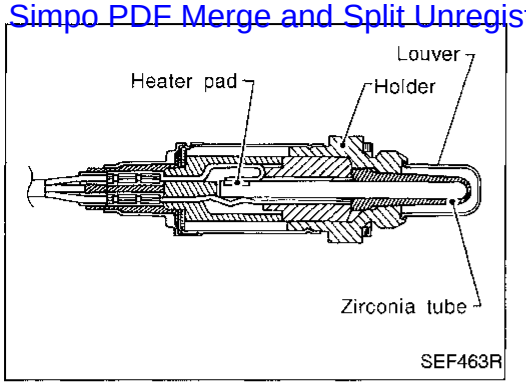
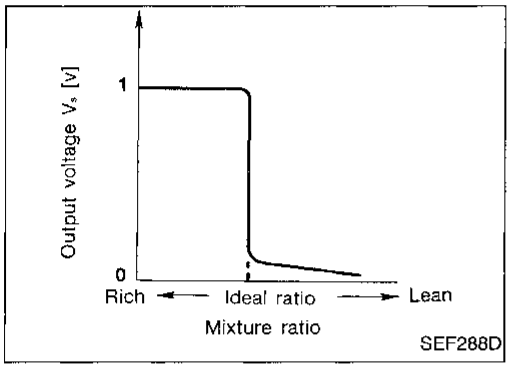
- "FR O2 SENSOR" voltage never exceeds 1.0V.

Front Heated Oxygen Sensor (Response Monitoring) (Front HO2S) (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com





OR

1) Start engine and warm it up to normal operating temperature.
2) Set voltmeter probes between ECM terminals ⑤⓪ (sensor signal) and ③② (ECM ground).
3) Check the following with engine speed held at 2,000 rpm constant under no load.

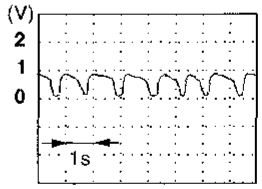
- Malfunction indicator lamp goes on more than 5 times within 10 seconds in Diagnostic Test Mode II (FRONT HEATED OXYGEN SENSOR MONITOR).
- The maximum voltage is over 0.6V at least one time.
- The minimum voltage is below 0.35V at least one time.
- The voltage never exceeds 1.0V.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Front Heated Oxygen Sensor (High Voltage) (Front HO2S)

COMPONENT DESCRIPTION

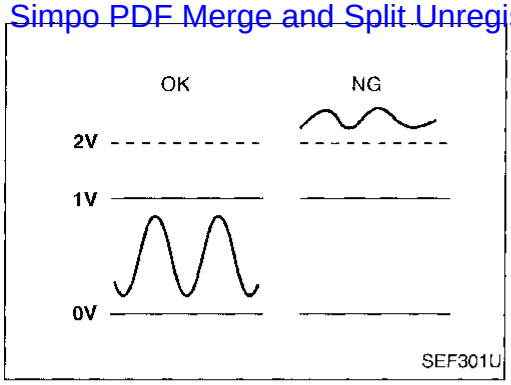
The front heated oxygen sensor is placed into the exhaust manifold. It detects the amount of oxygen in the exhaust gas compared to the outside air. The front heated oxygen sensor has a closed-end tube made of ceramic zirconia. The zirconia generates voltage from approximately 1V in richer conditions to 0V in leaner conditions. The front heated oxygen sensor signal is sent to the ECM. The ECM adjusts the injection pulse duration to achieve the ideal air-fuel ratio. The ideal air-fuel ratio occurs near the radical change from 1V to 0V.



CONSULT REFERENCE VALUE IN DATA MONITOR MODE

Specification data are reference values.

MONITOR ITEM	CONDITION		SPECIFICATION
FR O2 SENSOR ..... FR O2 MNTR	● Engine: After warming up	Maintaining engine speed at 2,000 rpm	0 - 0.3V ↔ Approx. 0.6 - 1.0V LEAN ↔ RICH Changes more than 5 times during 10 seconds.

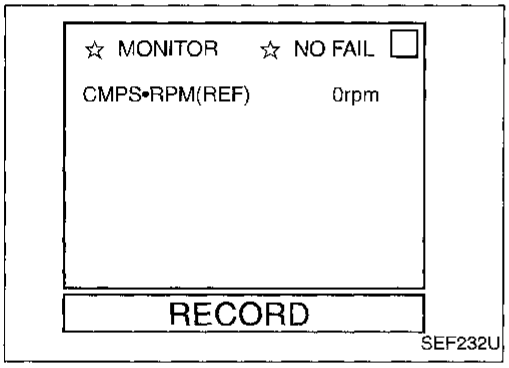


ECM TERMINALS AND REFERENCE VALUE

Specification data are reference values and are measured between each terminal and ㉜ (ECM ground).

TERMINAL NO.	WIRE COLOR	ITEM	CONDITION	DATA (DC Voltage)
50	B	Front heated oxygen sensor	Engine is running. └ After warming up to normal operating temperature and engine speed is 2,000 rpm.	0 - Approximately 1.0V  SEF201T

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Front Heated Oxygen Sensor (High Voltage) (Front HO2S) (Cont'd)

ON BOARD DIAGNOSIS LOGIC

To judge the malfunction, the diagnosis checks that the front heated oxygen sensor output is not inordinately high.

Diagnostic Trouble Code No.	Malfunction is detected when ...	Check Items (Possible Cause)
P0134 0412	● An excessively high voltage from the sensor is sent to ECM.	● Harness or connectors (The sensor circuit is open or shorted.) ● Front heated oxygen sensor

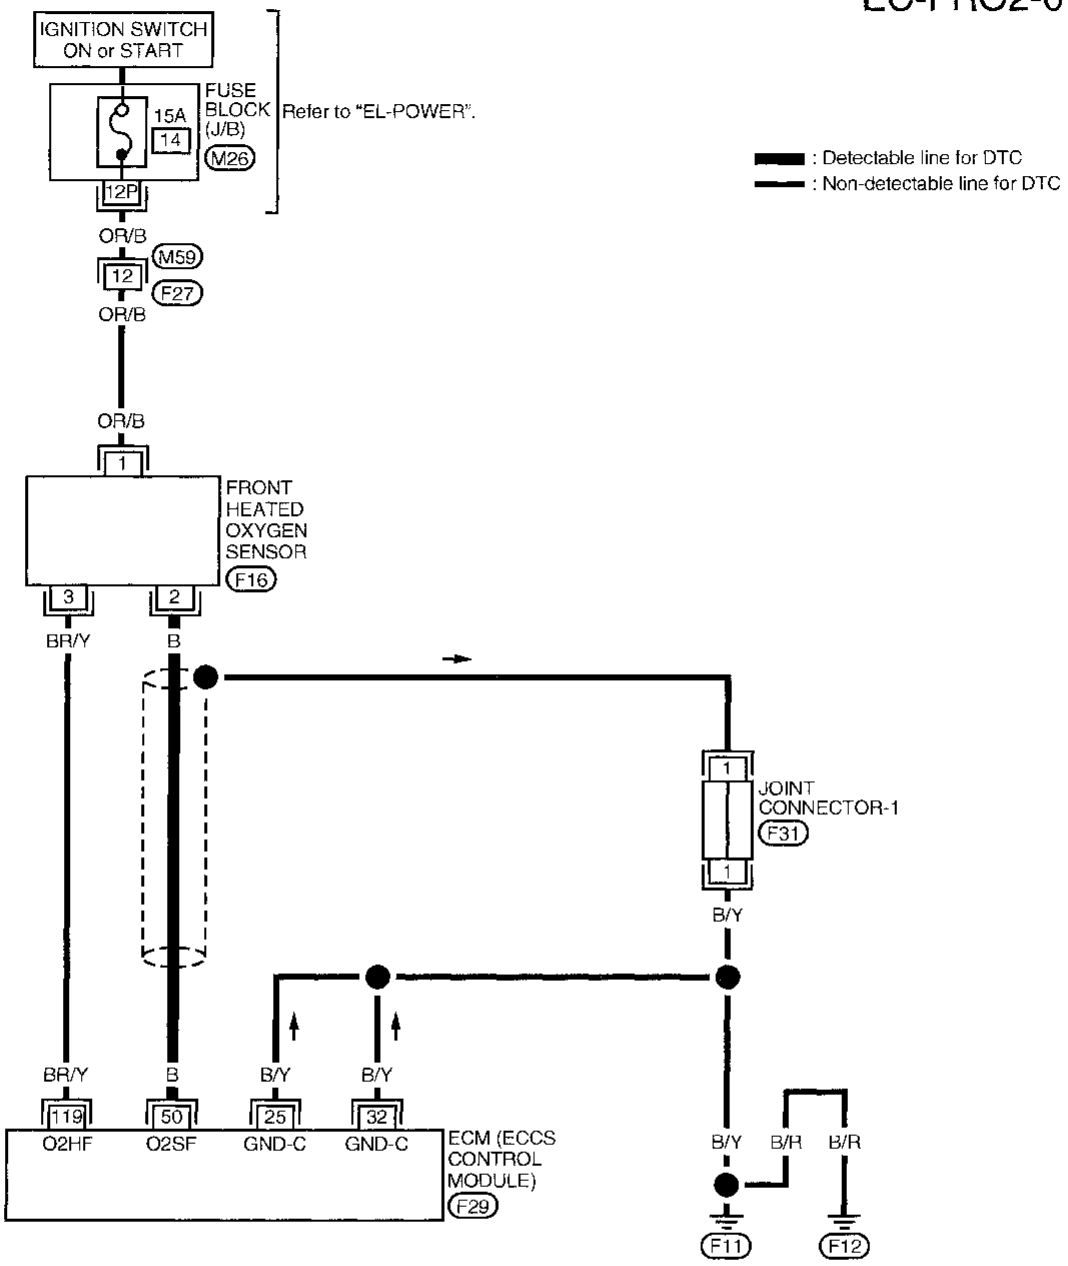
DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

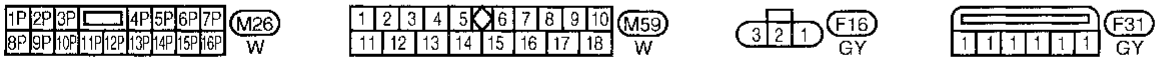
1) Turn ignition switch "ON".
2) Select "DATA MONITOR" mode with CONSULT and wait at least 5 seconds.

OR

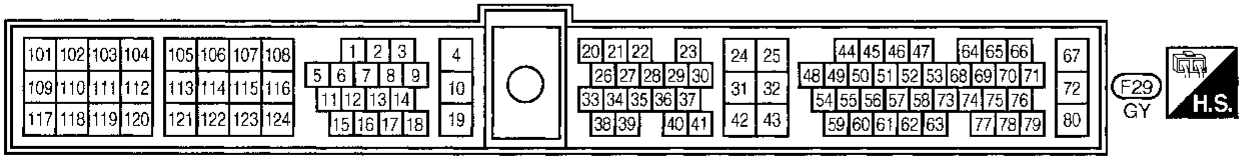
1) Turn ignition switch "ON" and wait at least 5 seconds.
2) Select "MODE 3" with GST.



OR



1) Turn ignition switch "ON" and wait at least 5 seconds.
2) Turn ignition switch "OFF", wait at least 5 seconds and then turn "ON".
3) Perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.



Front Heated Oxygen Sensor (High Voltage) (Front HO2S) (Cont'd)

DIAGNOSTIC PROCEDURE

INSPECTION START

1. Turn ignition switch "OFF".
2. Loosen and retighten front heated oxygen sensor.
   Tightening torque:
   40 - 60 N·m
   (4.1 - 6.1 kg-m, 30 - 44 ft-lb)

A

CHECK INPUT SIGNAL CIRCUIT.
1. Disconnect front heated oxygen sensor harness connector and ECM harness connector.
2. Check harness continuity between ECM terminal (50) and terminal (2).
   Continuity should exist.
3. Check harness continuity between ECM terminal (50) (or terminal (2)) and ground.
   Continuity should not exist.

If OK, check harness for short to ground and short to power.

NG → Repair open circuit, short to ground or short to power in harness or connectors.

OK

CHECK COMPONENT
(Front heated oxygen sensor).
1. Turn ignition switch "OFF".
2. Disconnect sensor harness connector and check for water.
   Water should not exist.
   If OK, go to step 3.
3. Check front heated oxygen sensor.

Refer to "COMPONENT INSPECTION" on next page.

NG → Repair or replace harness and/or connectors or replace front heated oxygen sensor.

OK

CHECK SHIELD CIRCUIT.
1. Turn ignition switch "OFF".
2. Remove joint connector-1.
3. Check the following.
   - Continuity between joint connector-1 terminal (1) and ground
   - Joint connector-1
     (Refer to "HARNESS LAYOUT" in EL section.)

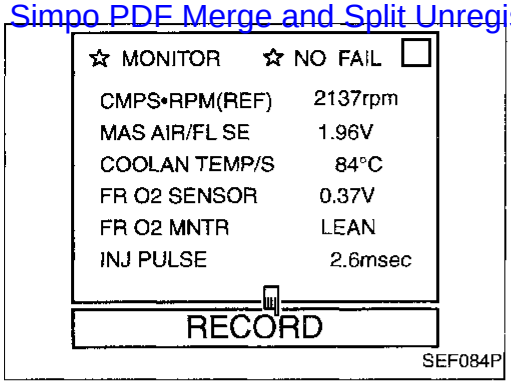
   Continuity should exist.

If OK, check harness for short to power.

NG → Repair open circuit, short to ground or short to power in harness or connectors.

OK

Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.



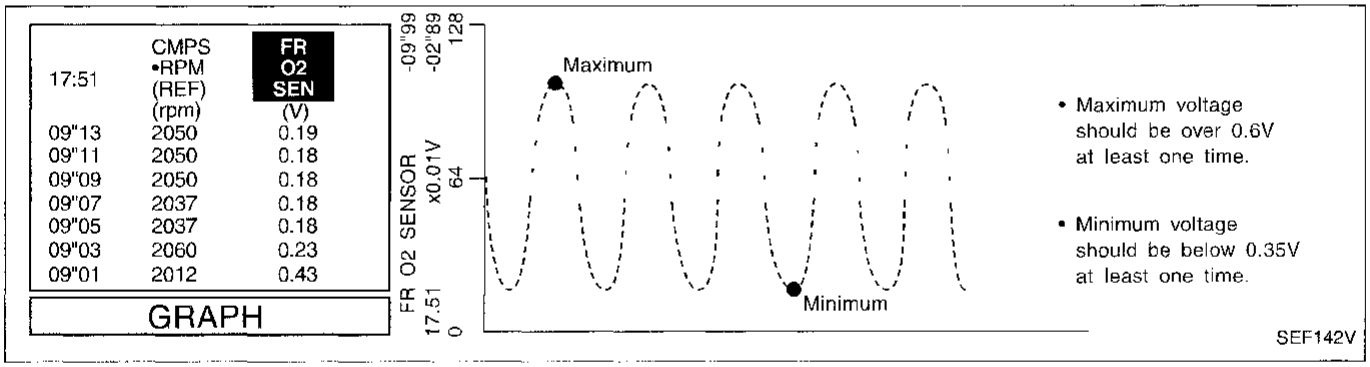
INSPECTION END

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

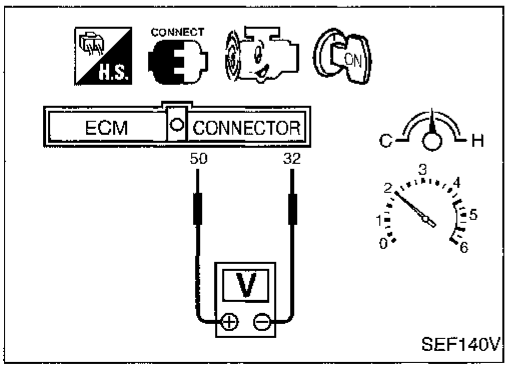
Front Heated Oxygen Sensor (High Voltage) (Front HO2S) (Cont'd)

COMPONENT INSPECTION

Front heated oxygen sensor



1) Start engine and warm it up to normal operating temperature.
2) Select "MANU TRIG" and "HI SPEED" in "DATA MONITOR" mode with CONSULT, and select "FR O2 SENSOR" and "FR O2 MNTR".
3) Hold engine speed at 2,000 rpm under no load during the following steps.
4) Touch "RECORD" on CONSULT screen.
5) Check the following.

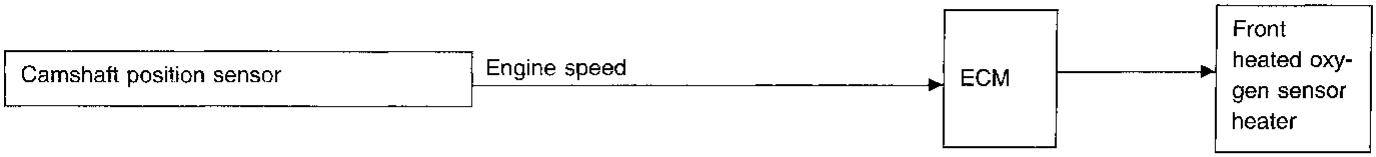


- "FR O2 MNTR" in "DATA MONITOR" mode changes from "RICH" to "LEAN" to "RICH" 5 times in 10 seconds.
  5 times (cycles) are counted as shown below:

cycle	1	2	3	4	5
FR O2 MNTR	R-L-R-L-R-L-R-L-R-L				

  R = "FR O2 MNTR", "RICH"
  L = "FR O2 MNTR", "LEAN"
- "FR O2 SENSOR" voltage goes above 0.6V at least once.
- "FR O2 SENSOR" voltage goes below 0.35V at least once.
- "FR O2 SENSOR" voltage never exceeds 1.0V.

OR



1) Start engine and warm it up to normal operating temperature.
2) Set voltmeter probes between ECM terminals ⑤⓪ (sensor signal) and ③② (ECM ground).
3) Check the following with engine speed held at 2,000 rpm constant under no load.

- Malfunction indicator lamp goes on more than 5 times within 10 seconds in Diagnostic Test Mode II (FRONT HEATED OXYGEN SENSOR MONITOR).
- The maximum voltage is over 0.6V at least one time.
- The minimum voltage is below 0.35V at least one time.
- The voltage never exceeds 1.0V.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Front Heated Oxygen Sensor Heater

SYSTEM DESCRIPTION

The ECM performs ON/OFF control of the front heated oxygen sensor heater corresponding to the engine speed.

OPERATION

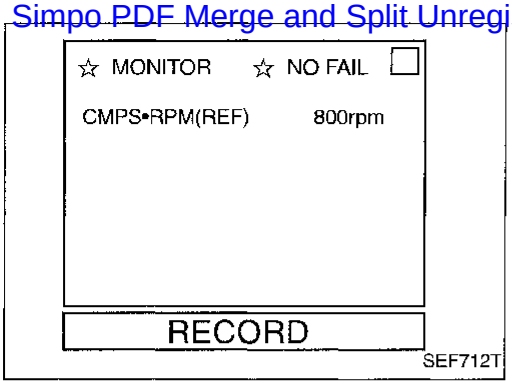
Engine speed rpm	Front heated oxygen sensor heater
Above 3,000 rpm (2WD models) More than 6 seconds after engine speed exceeds 3,000 rpm (4WD models)	OFF
Below 3,000 rpm (All models) For 6 seconds after engine speed exceeds 3,000 rpm (4WD models only)	ON

CONSULT REFERENCE VALUE IN DATA MONITOR MODE

Specification data are reference values.

MONITOR ITEM	CONDITION	SPECIFICATION
FR O2 HEATER	● Engine speed: Below 3,000 rpm (All models) For 6 seconds after engine speed exceeds 3,000 rpm (4WD models only)	ON
	● Engine speed: Above 3,000 rpm (2WD models) More than 6 seconds after engine speed exceeds 3,000 rpm (4WD models)	OFF

ECM TERMINALS AND REFERENCE VALUE



Specification data are reference values and are measured between each terminal and ㉜ (ECM ground).

TERMINAL NO.	WIRE COLOR	ITEM	CONDITION	DATA (DC Voltage)
119	BR/Y	Front heated oxygen sensor heater	Engine is running. — Engine speed is below 3,000 rpm. (All models) └ For 6 seconds after engine speed exceeds 3,000 rpm (4WD models only)	Approximately 0.4V
			Engine is running. — Engine speed is above 3,000 rpm. (2WD models) └ More than 6 seconds after engine speed exceeds 3,000 rpm (4WD models)	BATTERY VOLTAGE (11 - 14V)

ON BOARD DIAGNOSIS LOGIC

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P0135 0901	● The current amperage in the front heated oxygen sensor heater circuit is out of the normal range. (An improper voltage drop signal is sent to ECM through the front heated oxygen sensor heater.)	● Harness or connectors (The front heated oxygen sensor heater circuit is open or shorted.) ● Front heated oxygen sensor heater

Front Heated Oxygen Sensor Heater (Cont'd)

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

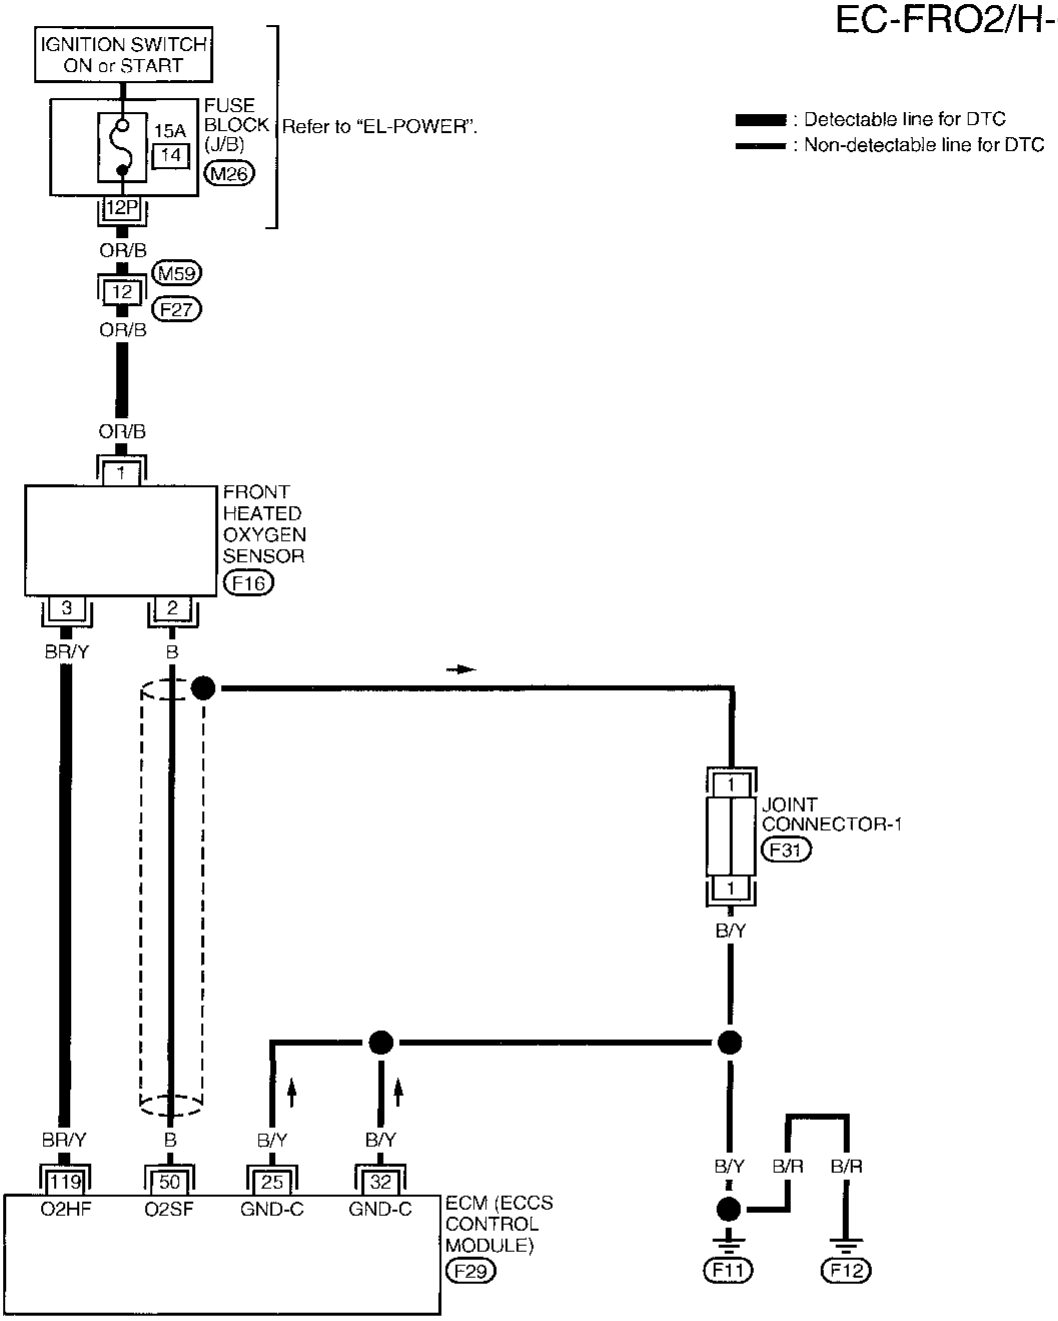
NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is in between 10.5V and 16V at idle.

1) Turn ignition switch "ON" and select "DATA MONITOR" mode with CONSULT.
2) Start engine and run it for at least 6 seconds at idle speed.

OR

1) Start engine and run it for at least 6 seconds at idle speed.
2) Turn ignition switch "OFF" and wait at least 5 seconds.
3) Start engine and run it for at least 5 seconds at idle speed.
4) Select "MODE 3" with GST.



OR

1) Start engine and run it for at least 5 seconds at idle speed.
2) Turn ignition switch "OFF", wait at least 5 seconds and then turn "ON".
3) Perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.

- **When using GST, "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" should be performed twice as much as when using CONSULT or ECM (Diagnostic Test Mode II) because GST cannot display MODE 7 (1st trip DTC) concerning this diagnosis. Therefore, using CONSULT or ECM (Diagnostic Test Mode II) is recommended.**

DIAGNOSTIC PROCEDURE

INSPECTION START

A

CHECK POWER SUPPLY.
1. Turn ignition switch "OFF".
2. Disconnect front heated oxygen sensor harness connector.
3. Turn ignition switch "ON".
4. Check voltage between terminal ① and ground with CONSULT or tester.
   Voltage: Battery voltage

NG → Check the following.
- 15A fuse
- Harness connectors (M59), (F27)
- Harness for open or short between front heated oxygen sensor and 15A fuse

If NG, repair harness or connectors.

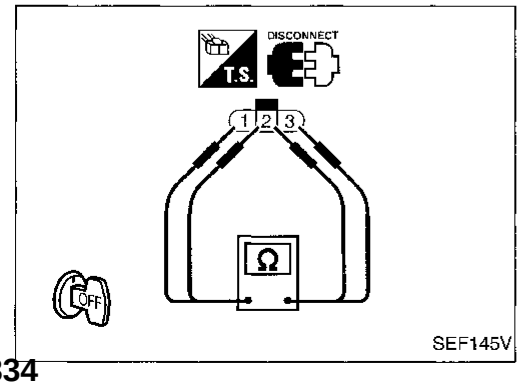
OK

B

CHECK GROUND CIRCUIT.
1. Turn ignition switch "OFF".
2. Disconnect ECM harness connector.
3. Check harness continuity between terminal ③ and ECM terminal (119).
   Continuity should exist.
   If OK, check harness for short to ground and short to power.

NG → Repair open circuit, short to ground or short to power in harness or connectors.

OK



CHECK COMPONENT
(Front heated oxygen sensor heater).
Refer to "COMPONENT INSPECTION" below.

NG → Replace front heated oxygen sensor.

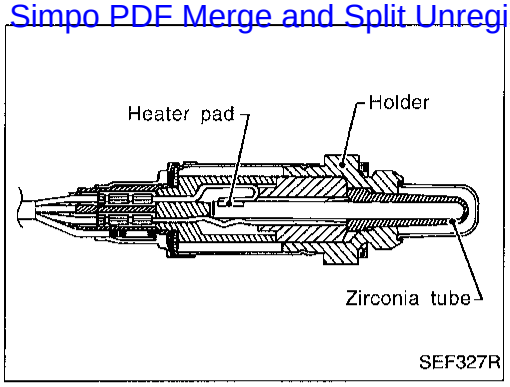
OK

Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.

INSPECTION END

COMPONENT INSPECTION

Front heated oxygen sensor heater



Check resistance between terminals ③ and ①.
Resistance: 2.3 - 4.3Ω at 25°C (77°F)

Check continuity between terminals ② and ①, ③ and ②.
Continuity should not exist.

If NG, replace the front heated oxygen sensor.

CAUTION:
Discard any heated oxygen sensor which has been dropped from a height of more than 0.5 m (19.7 in) onto a hard surface such as a concrete floor; use a new one.

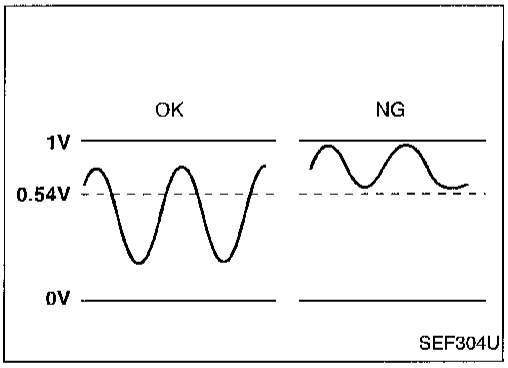
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Rear Heated Oxygen Sensor (Min. Voltage Monitoring) (Rear HO2S)

COMPONENT DESCRIPTION

The rear heated oxygen sensor (Rear HO2S), after three way catalyst, monitors the oxygen level in the exhaust gas.
Even if switching characteristics of the front heated oxygen sensor are shifted, the air fuel ratio is controlled to stoichiometric, by the signal from the rear heated oxygen sensor.
This sensor is made of ceramic zirconia. The zirconia generates voltage from approximately 1V in richer conditions to 0V in leaner conditions.
Under normal conditions the rear heated oxygen sensor is not used for engine control operation.

CONSULT REFERENCE VALUE IN DATA MONITOR MODE



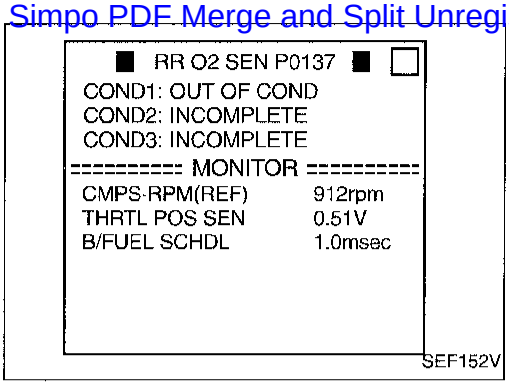
Specification data are reference values.

MONITOR ITEM	CONDITION		SPECIFICATION
RR O2 SENSOR ..... RR O2 MNTR	● Engine: After warming up	Revving engine from idle to 3,000 rpm quickly	0 - 0.3V ↔ Approx. 0.6 - 1.0V LEAN ↔ RICH

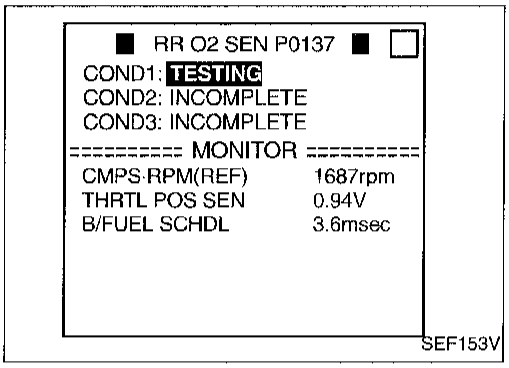
ECM TERMINALS AND REFERENCE VALUE

Specification data are reference values and are measured between each terminal and ㉜ (ECM ground).

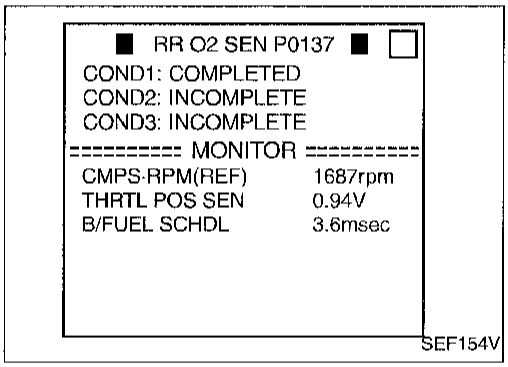
TER-MINAL NO.	WIRE COLOR	ITEM	CONDITION	DATA (DC Voltage)
56	OR	Rear heated oxygen sensor	Engine is running. └ After warming up to normal operating temperature and revving engine from idle to 3,000 rpm quickly	0 - Approximately 1.0V



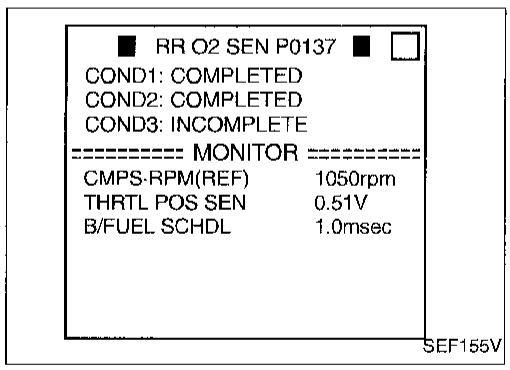
ON BOARD DIAGNOSIS LOGIC



The rear heated oxygen sensor has a much longer switching time between rich and lean than the front heated oxygen sensor. The oxygen storage capacity before the three way catalyst causes the longer switching time. To judge malfunctions of the rear heated oxygen sensor, ECM monitors whether the minimum voltage of the sensor is sufficiently low during various driving conditions such as fuel-cut.



Diagnostic Trouble Code No.	Malfunction is detected when ...	Check Items (Possible Cause)
P0137 0511	● The minimum voltage from the sensor has not reached the specified voltage.	● Harness or connectors (The sensor circuit is open or shorted.) ● Rear heated oxygen sensor ● Fuel pressure ● Injectors



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Rear Heated Oxygen Sensor (Min. Voltage Monitoring) (Rear HO2S) (Cont'd)

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

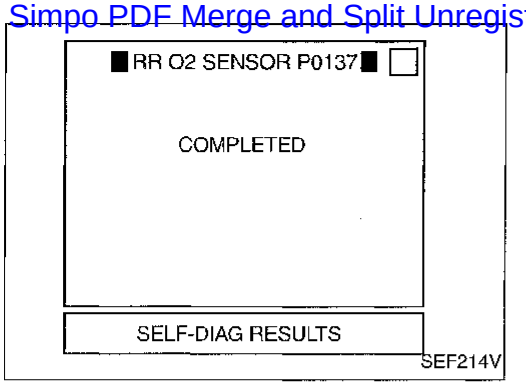
CAUTION:
Always drive vehicle at a safe speed.

NOTE:
- **"COMPLETED" will appear on CONSULT screen when all tests "COND1", "COND2" and "COND3" are completed.**
- **If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.**

TESTING CONDITION:
- **Never stop engine during this test. If the engine is stopped, reperform this test from step 2).**
- **Always perform at a temperature above −10°C (14°F).**

Procedure for COND1

1) Start engine and warm it up to normal operating temperature.
2) Turn ignition switch "OFF" and wait at least 5 seconds.
3) Turn ignition switch "ON" and select "RR O2 SENSOR P0137" of "REAR O2 SENSOR" in "DTC WORK SUPPORT" mode with CONSULT.
4) Touch "START".
5) Start engine and let it idle for at least 10 seconds.
6) Rev engine up to 2,000 rpm 2 or 3 times quickly under no load.
   If "COMPLETED" appears on CONSULT screen, go to step 10).
   If "COMPLETED" does not appear on CONSULT screen, go to the following step.
7) When the following conditions are met, "TESTING" will be displayed at "COND1" on the CONSULT screen. Maintain the conditions continuously until "TESTING" changes to "COMPLETED". (It will take approximately 50 seconds.)
   CMPS-RPM (REF): 1,400 - 3,000 rpm
   Vehicle speed: 64 - 120 km/h (40 - 75 MPH)
   B/FUEL SCHDL: 1 - 4.8 ms
   Selector lever: Suitable position



NOTE:
- **If "TESTING" is not displayed after 5 minutes, retry from step 2).**
- **If "COMPLETED" already appears at "COND2" on CONSULT screen before "Procedure for COND2" is conducted, it is unnecessary to conduct step 8).**

Procedure for COND2

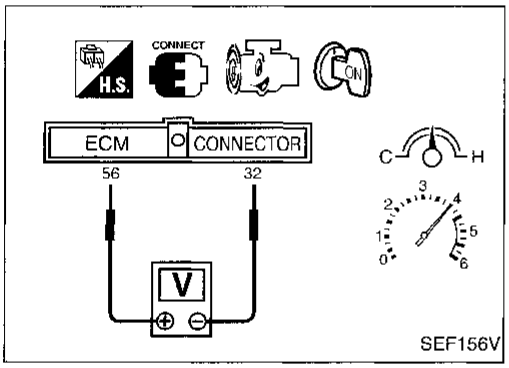
8) While driving, release accelerator pedal completely [with "OD" OFF (A/T models only)] from the above condition [step 7] until "INCOMPLETE" at "COND2" on CONSULT screen has turned to "COMPLETED". [It will take approximately 1 second (A/T), 4 seconds (M/T).]

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Rear Heated Oxygen Sensor (Min. Voltage Monitoring) (Rear HO2S) (Cont'd)

NOTE:

- **If "TESTING" is not displayed after 5 minutes, retry from step 2).**
- **If "COMPLETED" already appears at "COND3" on CONSULT screen before "Procedure for COND3" is conducted, it is unnecessary to conduct step 9).**



Procedure for COND3

9) Stop vehicle and let it idle until "INCOMPLETE" of "COND3" on CONSULT screen has turned to "COMPLETED". (It will take a maximum of approximately 6 minutes.)

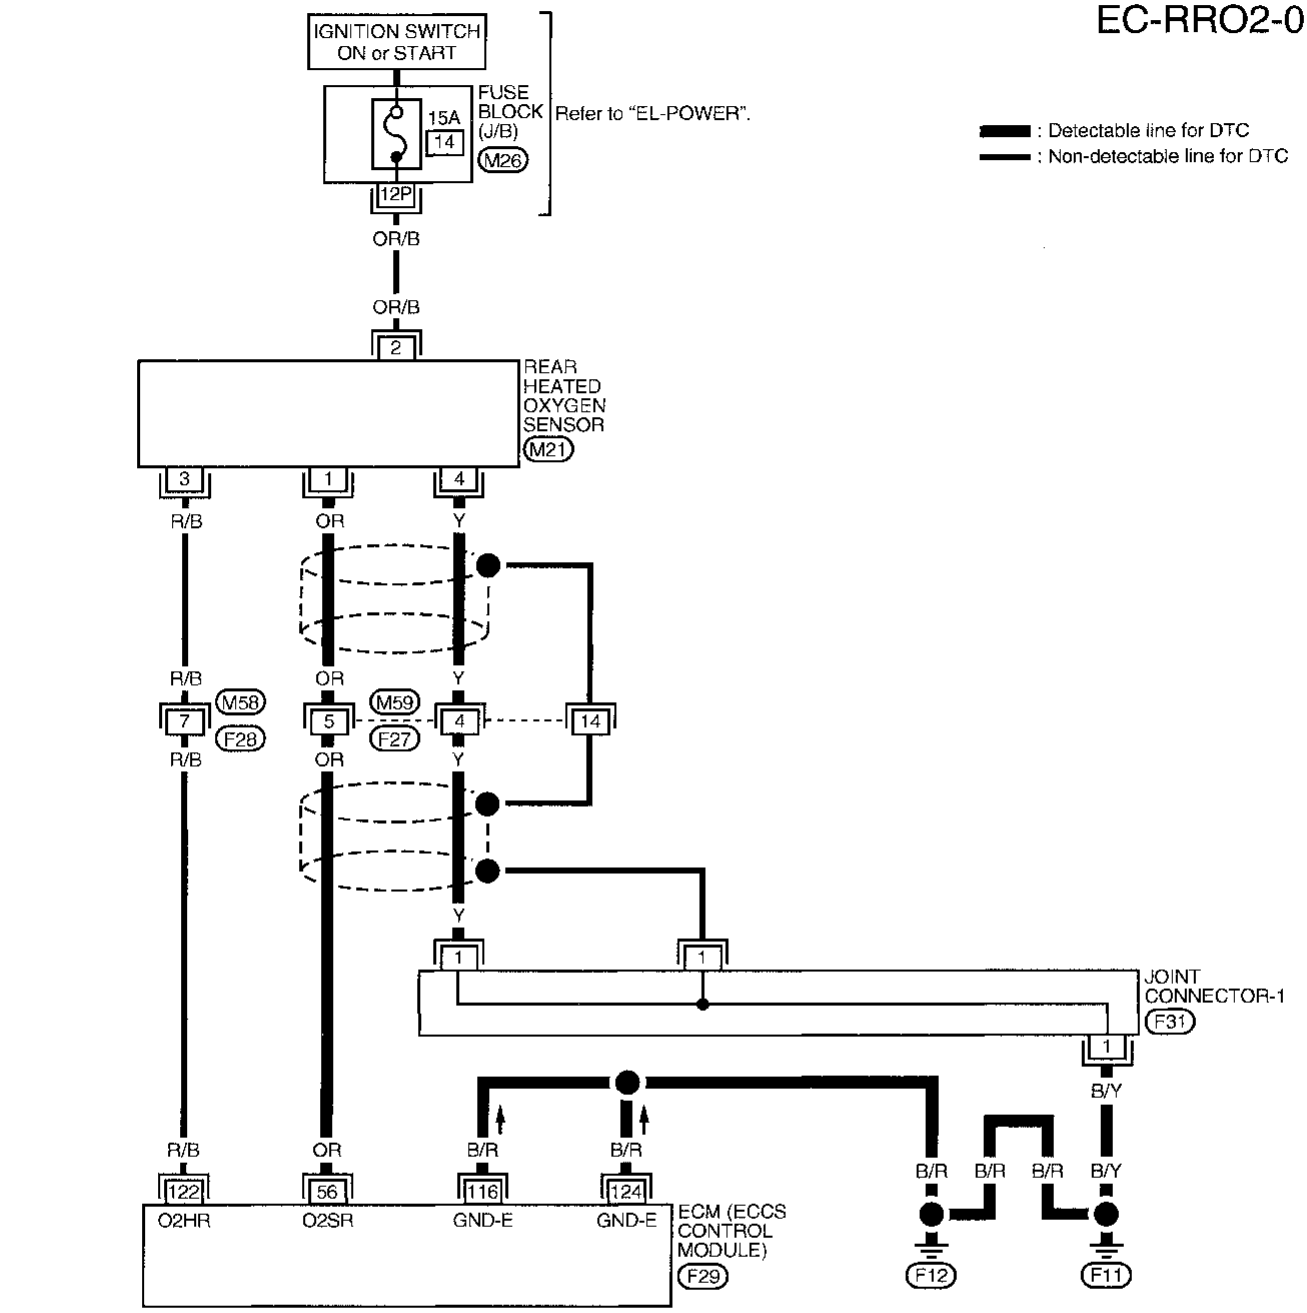
NOTE:

If "TESTING" is not displayed after 5 minutes, retry from step 2).

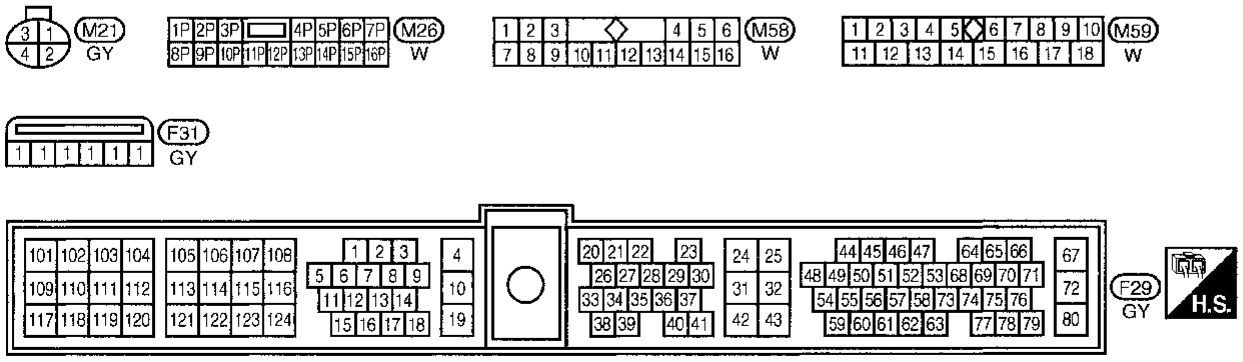
10) Make sure that "OK" is displayed after touching "SELF-DIAG RESULTS". If "NG" is displayed, refer to "DIAGNOSTIC PROCEDURE", EC-183.

OR

OVERALL FUNCTION CHECK



Use this procedure to check the overall function of the rear heated oxygen sensor circuit. During this check, a 1st trip DTC might not be confirmed.



1) Start engine and warm it up to normal operating temperature.
2) Set voltmeter probes between ECM terminals ⑤⑥ (sensor signal) and ③② (ECM ground).
3) Check the voltage when revving engine up to 4,000 rpm under no load at least 10 times.
   (Depress and release accelerator pedal as soon as possible.)
   The voltage should be below 0.54V at least once during this procedure.
   If the voltage can be confirmed in step 3, step 4 is not necessary.
4) Keep vehicle at idling for 10 minutes, then check the voltage. Or check the voltage when coasting from 80 km/h (50 MPH) in 3rd gear position (M/T), D position with "OD" OFF (A/T).
   The voltage should be below 0.54V at least once during this procedure.

Rear Heated Oxygen Sensor (Max. Voltage Monitoring) (Rear HO2S) (Cont'd)

DIAGNOSTIC PROCEDURE

INSPECTION START

1. Turn ignition switch "OFF".
2. Loosen and retighten engine ground screws.

A

CLEAR THE SELF-LEARNING DATA

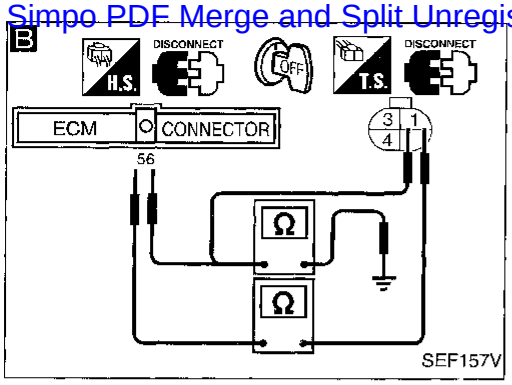
1. Start engine and warm it up to normal operating temperature.
2. Select "SELF-LEARNING CONT" in "ACTIVE TEST" mode with CONSULT.
3. Clear the self-learning control coefficient by touching "CLEAR".
4. Run engine for at least 10 minutes at idle speed.

Is the 1st trip DTC P0171 detected? Is it difficult to start engine?

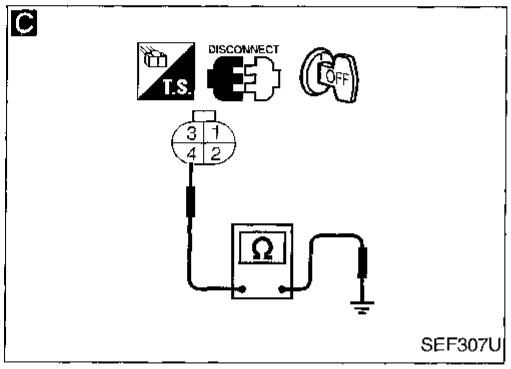
Yes → Go to "TROUBLE DIAGNOSIS FOR DTC P0171", EC-208.

OR

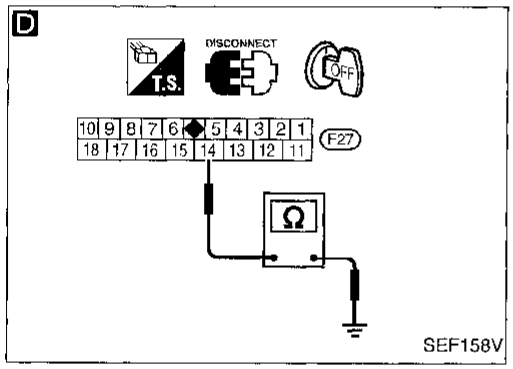
2. Turn ignition switch "OFF".
3. Disconnect mass air flow sensor harness connector, and restart and run engine for at least 3 seconds at idle speed.
4. Stop engine and reconnect mass air flow sensor harness connector.
5. Make sure diagnostic trouble code No. 0102 is displayed in Diagnostic Test Mode II.
6. Erase the diagnostic test mode II (Self-diagnostic results) memory. Make sure diagnostic trouble code No. 0505 is displayed in Diagnostic Test Mode II.
7. Run engine for at least 10 minutes at idle speed.



Is the 1st trip DTC 0115 detected? Is it difficult to start engine?



No → Ⓐ



(Go to next page.)

Rear Heated Oxygen Sensor (Max. Voltage Monitoring) (Rear HO2S) (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Ⓐ

B

CHECK INPUT SIGNAL CIRCUIT.
1. Disconnect rear heated oxygen sensor harness connector and ECM harness connector.
2. Check harness continuity between ECM terminal (56) and terminal (1).
   Continuity should exist.
3. Check harness continuity between ECM terminal (56) (or terminal (1)) and ground.
   Continuity should not exist.
   If OK, check harness for short to ground and short to power.

NG → Check the following.
- Harness connectors (M59), (F27)
- Harness for open or short between rear heated oxygen sensor and ECM

If NG, repair open circuit, short to ground or short to power in harness or connectors.

OK ↓

C

CHECK GROUND CIRCUIT.
Check harness continuity between terminal (4) and engine ground.
Continuity should exist.
If OK, check harness for short to ground and short to power.

NG → Check the following.
- Harness connectors (M59), (F27)
- Joint connector-1
- Harness for open or short between rear heated oxygen sensor and ground

If NG, repair open circuit, short to ground or short to power in harness or connectors.

OK ↓

CHECK COMPONENT
(Rear heated oxygen sensor).
Refer to "COMPONENT INSPECTION" on next page.

NG → Replace rear heated oxygen sensor.

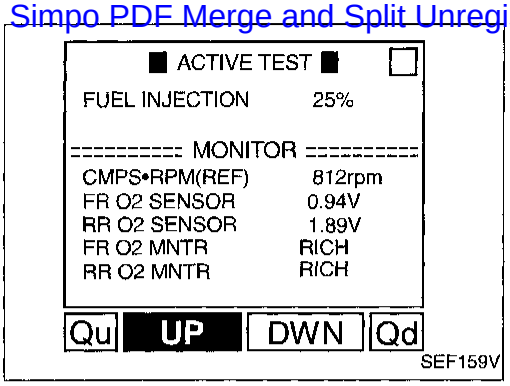
OK ↓

D

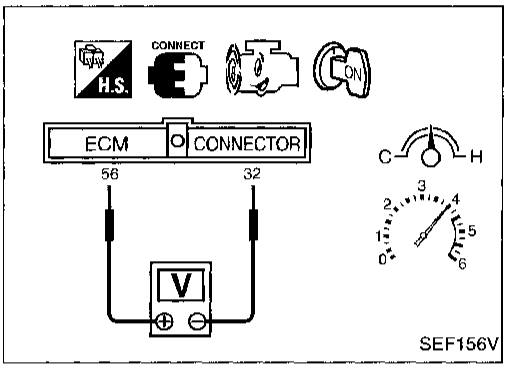
CHECK SHIELD CIRCUIT.
1. Turn ignition switch "OFF".
2. Disconnect harness connector (F27).
3. Check harness continuity between harness connector (F27) terminal (14) and ground.
   Continuity should exist.
   If OK, check harness for short to power.

NG → Check the following.
- Joint connector-1
- Harness for open or short between harness connector (F27) and ground

If NG, repair open circuit or short to power in harness or connectors.



OK ↓



Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.

INSPECTION END

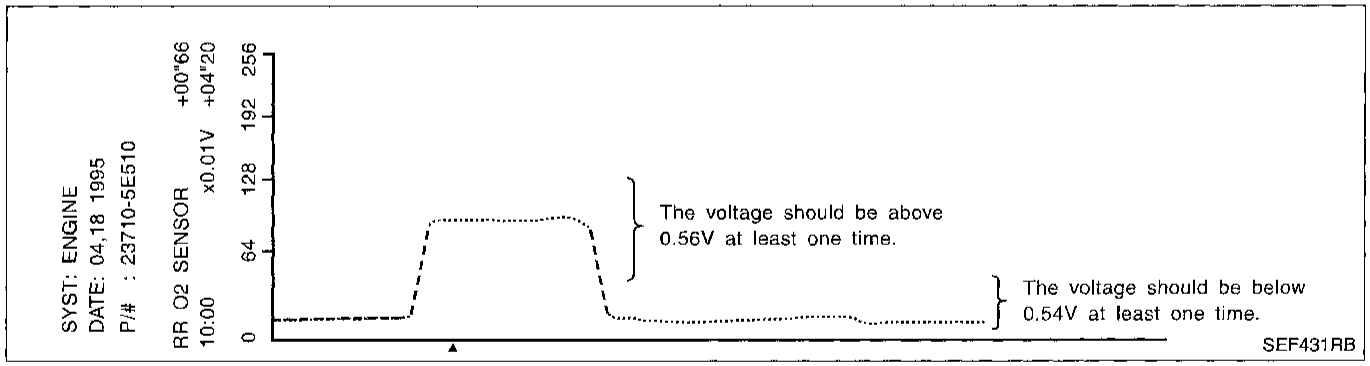
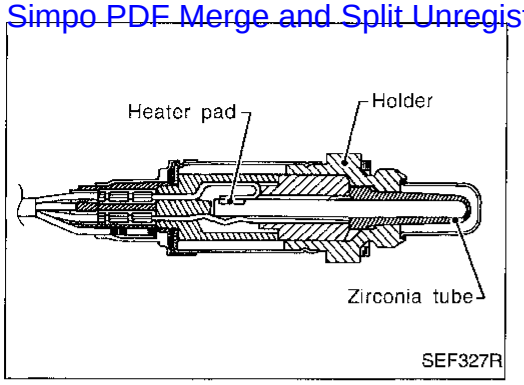
Rear Heated Oxygen Sensor (Max. Voltage Monitoring) (Rear HO2S) (Cont'd)



COMPONENT INSPECTION

Rear heated oxygen sensor



1) Start engine and warm it up to normal operating temperature.
2) Select "FUEL INJECTION" in "ACTIVE TEST" mode, and select "RR O2 SENSOR" as the monitor item with CONSULT.
3) Check "RR O2 SENSOR" at idle speed when adjusting "FUEL INJECTION" to ±25%.
   "RR O2 SENSOR" should be above 0.56V at least once when the "FUEL INJECTION" is +25%.
   "RR O2 SENSOR" should be below 0.54V at least once when the "FUEL INJECTION" is –25%.

OR

1) Start engine and warm it up to normal operating temperature.
2) Set voltmeter probes between ECM terminals ⑯ (sensor signal) and ㉜ (ECM ground).
3) Check the voltage when racing up to 4,000 rpm under no load at least 10 times.
   (Depress and release accelerator pedal as soon as possible.)
   The voltage should be above 0.56V at least once.
   If the voltage is above 0.56V at step 3, step 4 is not necessary.
4) Check the voltage when racing up to 5,000 rpm under no load. Or keep vehicle at idling for 10 minutes, then check the voltage. Or check the voltage when coasting from 80 km/h (50 MPH) in 3rd gear position (M/T), D position with "OD" OFF (A/T).
   The voltage should be below 0.54V at least once.

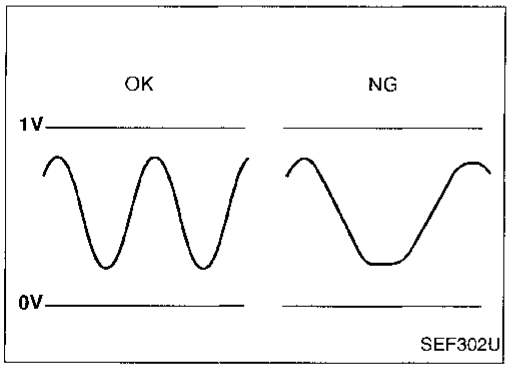
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Rear Heated Oxygen Sensor (Response Monitoring) (Rear HO2S)

COMPONENT DESCRIPTION

The rear heated oxygen sensor (rear HO2S), after three way catalyst, monitors the oxygen level in the exhaust gas.
Even if switching characteristics of the front heated oxygen sensor are shifted, the air fuel ratio is controlled to stoichiometric by the signal from the rear heated oxygen sensor.
This sensor is made of ceramic zirconia. The zirconia generates voltage from approximately 1V in richer conditions to 0V in leaner conditions.
Under normal conditions the rear heated oxygen sensor is not used for engine control operation.

CONSULT REFERENCE VALUE IN DATA MONITOR MODE



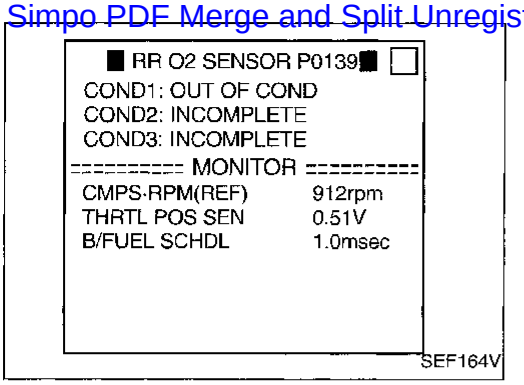
Specification data are reference values.

MONITOR ITEM	CONDITION		SPECIFICATION
RR O2 SENSOR ..... RR O2 MNTR	● Engine: After warming up	Revving engine from idle to 3,000 rpm quickly	0 - 0.3V ↔ Approx. 0.6 - 1.0V LEAN ↔ RICH

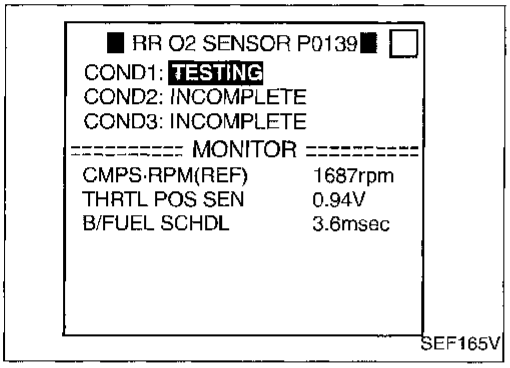
ECM TERMINALS AND REFERENCE VALUE

Specification data are reference values and are measured between each terminal and ㉜ (ECM ground).

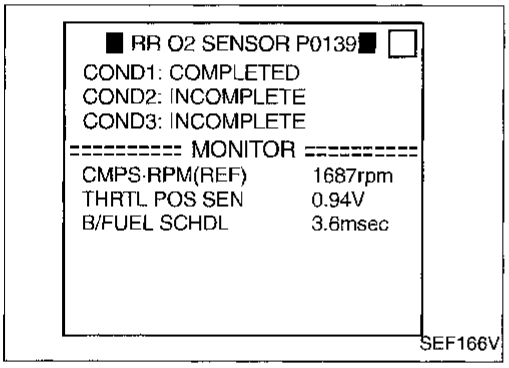
TER-MINAL NO.	WIRE COLOR	ITEM	CONDITION	DATA (DC Voltage)
56	OR	Rear heated oxygen sensor	Engine is running. └ After warming up to normal operating temperature and revving engine from idle to 3,000 rpm quickly	0 - Approximately 1.0V



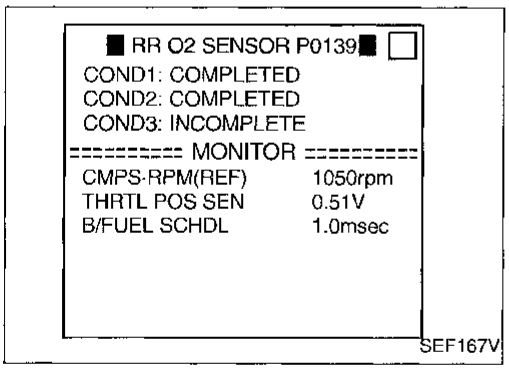
ON BOARD DIAGNOSIS LOGIC



The rear heated oxygen sensor has a much longer switching time between rich and lean than the front heated oxygen sensor. The oxygen storage capacity before the three way catalyst causes the longer switching time. To judge malfunctions of the rear heated oxygen sensor, ECM monitors whether the switching response of the sensor's voltage is faster than specified during various driving conditions such as fuel-cut.



Diagnostic Trouble Code No.	Malfunction is detected when ...	Check Items (Possible Cause)
P0139 0707	● It takes more time for the sensor to respond between rich and lean than the specified time.	● Harness or connectors (The sensor circuit is open or shorted.) ● Rear heated oxygen sensor ● Fuel pressure ● Injectors ● Intake air leaks



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Rear Heated Oxygen Sensor (Response Monitoring) (Rear HO2S) (Cont'd)

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

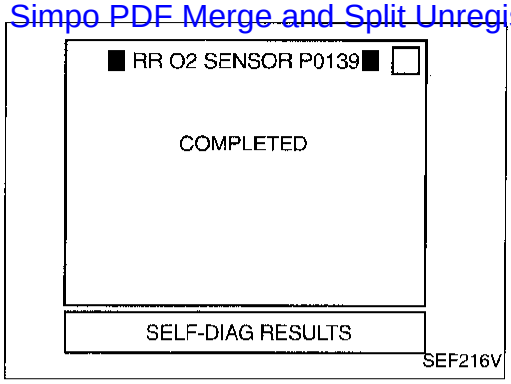
CAUTION:
Always drive vehicle at a safe speed.

NOTE:
- **"COMPLETED" will appear on CONSULT screen when all tests "COND1", "COND2" and "COND3" are completed.**
- **If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.**

TESTING CONDITION:
- **Never stop engine during this test. If the engine is stopped, reperform this test from step 2).**
- **Always perform at a temperature above −10°C (14°F).**

Procedure for COND1

1) Start engine and warm it up to normal operating temperature.
2) Turn ignition switch "OFF" and wait at least 5 seconds.
3) Turn ignition switch "ON" and select "RR O2 SENSOR P0139" of "REAR O2 SENSOR" in "DTC WORK SUPPORT" mode with CONSULT.
4) Touch "START".
5) Start engine and let it idle for at least 10 seconds.
6) Rev engine up to 2,000 rpm 2 or 3 times quickly under no load.
   If "COMPLETED" appears on CONSULT screen, go to step 10).
   If "COMPLETED" does not appear on CONSULT screen, go to the following step.
7) When the following conditions are met, "TESTING" will be displayed at "COND1" on the CONSULT screen. Maintain the conditions continuously until "TESTING" changes to "COMPLETED". (It will take approximately 50 seconds.)
   CMPS·RPM (REF): 1,400 - 3,000 rpm
   Vehicle speed: 64 - 120 km/h (40 - 75 MPH)
   B/FUEL SCHDL: 1 - 4.8 ms
   Selector lever: Suitable position



NOTE:
- **If "TESTING" is not displayed after 5 minutes, retry from step 2).**
- **If "COMPLETED" already appears at "COND2" on CONSULT screen before "Procedure for COND2" is conducted, it is unnecessary to conduct step 8).**

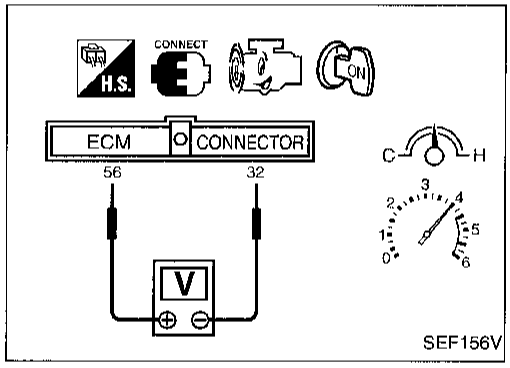
Procedure for COND2

8) While driving, release accelerator pedal completely [with "OD" OFF (A/T models only)] from the above condition [step 7] until "INCOMPLETE" at "COND2" on CONSULT screen has turned to "COMPLETED". [It will take approximately 1 second (A/T), 4 seconds (M/T).]

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Rear Heated Oxygen Sensor (Response Monitoring) (Rear HO2S) (Cont'd)

NOTE:



- **If "TESTING" is not displayed after 5 minutes, retry from step 2).**
- **If "COMPLETED" already appears at "COND3" on CONSULT screen before "Procedure for COND3" is conducted, it is unnecessary to conduct step 9).**

Procedure for COND3

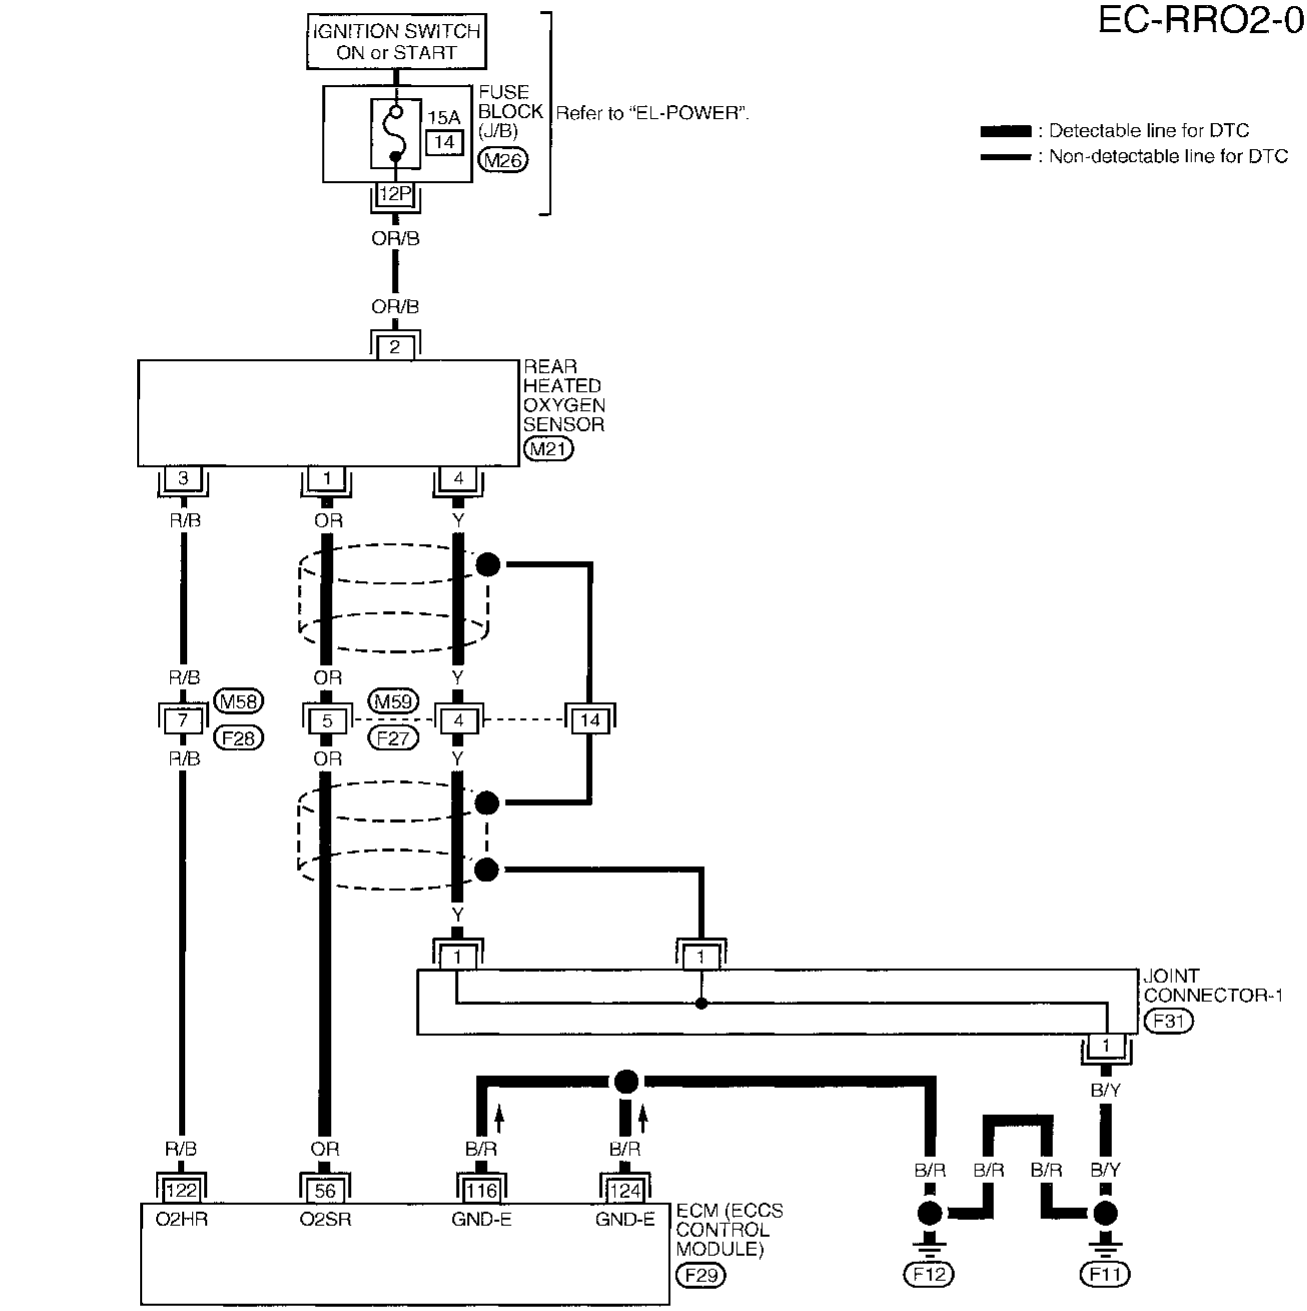
9) Stop vehicle and let it idle until "INCOMPLETE" of "COND3" on CONSULT screen has turned to "COMPLETED". (It will take a maximum of approximately 6 minutes.)

NOTE:
If "TESTING" is not displayed after 5 minutes, retry from step 2).

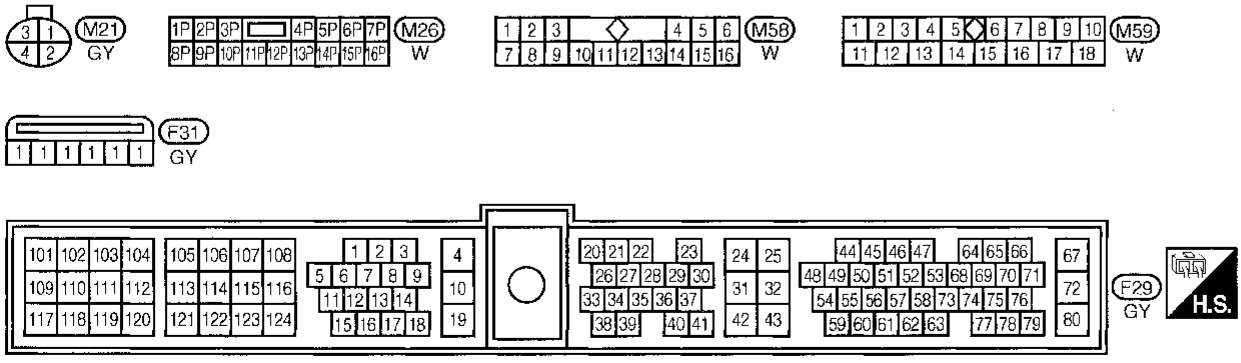
10) Make sure that "OK" is displayed after touching "SELF-DIAG RESULTS".
If "NG" is displayed, refer to "DIAGNOSTIC PROCEDURE", EC-197.

OR

OVERALL FUNCTION CHECK



Use this procedure to check the overall function of the rear heated oxygen sensor circuit. During this check, a 1st trip DTC might not be confirmed.



1) Start engine and warm it up to normal operating temperature.
2) Set voltmeter probes between ECM terminals ⑤⑥(sensor signal) and ③②(ECM ground).
3) Check the voltage when racing up to 4,000 rpm under no load at least 10 times.
(Depress and release accelerator pedal as soon as possible.)
The voltage should change at more than 0.06V for 1 second during this procedure.
If the voltage can be confirmed in step 3, step 4 is not necessary.
4) Keep vehicle at idling for 10 minutes, then check the voltage. Or check the voltage when coasting from 80 km/h (50 MPH) in 3rd gear position (M/T), D position with "OD" OFF (A/T).
The voltage should change at more than 0.06V for 1 second during this procedure.

Rear Heated Oxygen Sensor Heater (Cont'd)

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

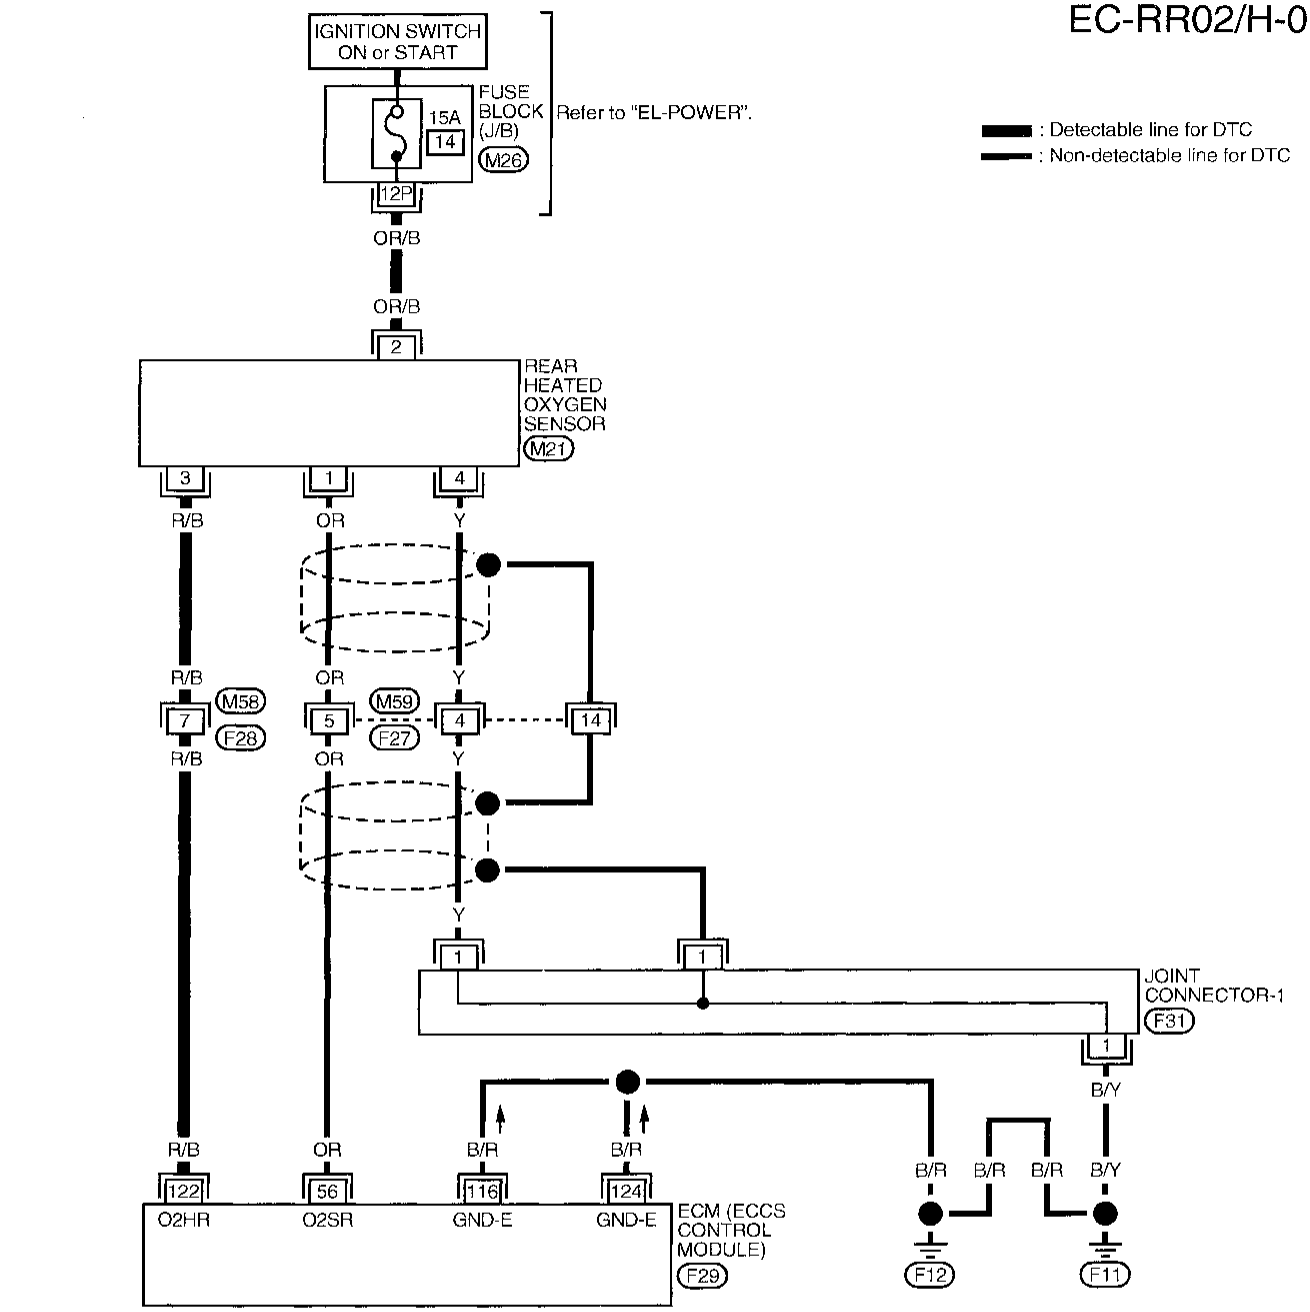
TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is between 10.5V and 16V at idle.

1) Turn ignition switch "ON" and select "DATA MONITOR" mode with CONSULT.
2) Start engine and run it for at least 6 seconds at idle speed.

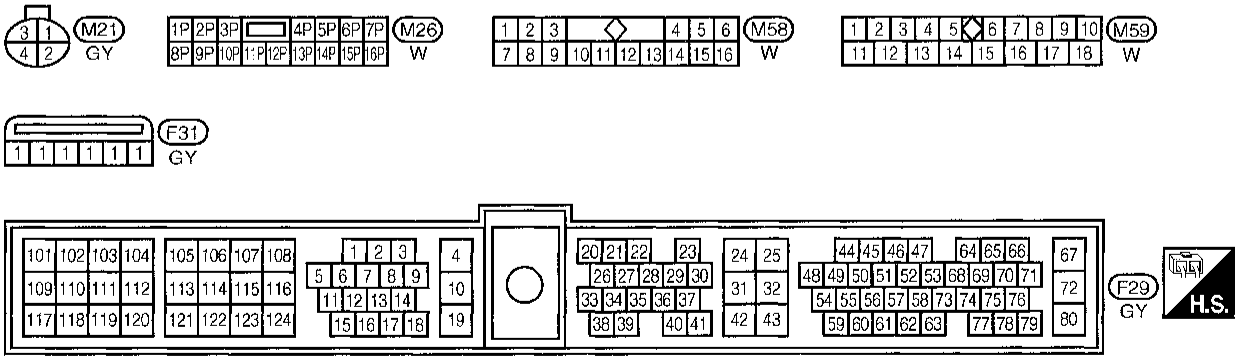
OR

1) Start engine and run it for at least 6 seconds at idle speed.
2) Turn ignition switch "OFF" and wait at least 5 seconds.
3) Start engine and run it for at least 5 seconds at idle speed.
4) Select "MODE 3" with GST.

OR



1) Start engine and run it for at least 5 seconds at idle speed.
2) Turn ignition switch "OFF", wait at least 5 seconds and then turn "ON".
3) Perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.



- **When using GST, "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" should be performed twice as much as when using CONSULT or ECM (Diagnostic Test Mode II) because GST cannot display MODE 7 (1st trip DTC) concerning this diagnosis. Therefore, using CONSULT or ECM (Diagnostic Test Mode II) is recommended.**

DIAGNOSTIC PROCEDURE

INSPECTION START

A

CHECK POWER SUPPLY.
1. Turn ignition switch "OFF".
2. Disconnect rear heated oxygen sensor harness connector.
3. Turn ignition switch "ON".
4. Check voltage between terminal ② and ground.
Voltage: Battery voltage

NG → Check the following.
- 15A fuse
- Harness for open or short between rear heated oxygen sensor and 15A fuse

If NG, repair harness or connectors.

OK ↓

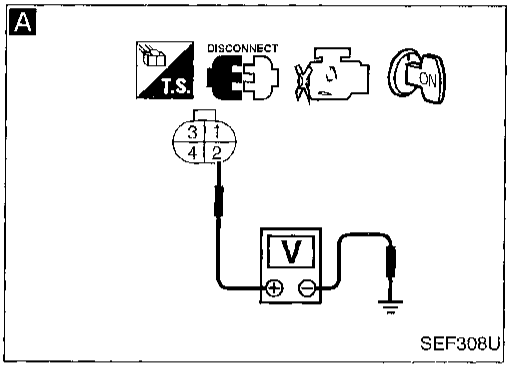
B

CHECK GROUND CIRCUIT.
1. Turn ignition switch "OFF".
2. Disconnect ECM harness connector.
3. Check harness continuity between terminal ③ and ECM terminal (122).
Continuity should exist.
If OK, check harness for short to ground and short to power.

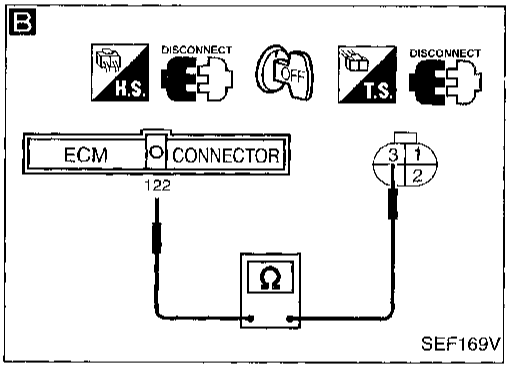
NG → Check the following.
- Harness connectors (M58), (F28)
- Harness for open or short between rear heated oxygen sensor and ECM

If NG, repair open circuit, short to ground or short to power in harness or connectors.

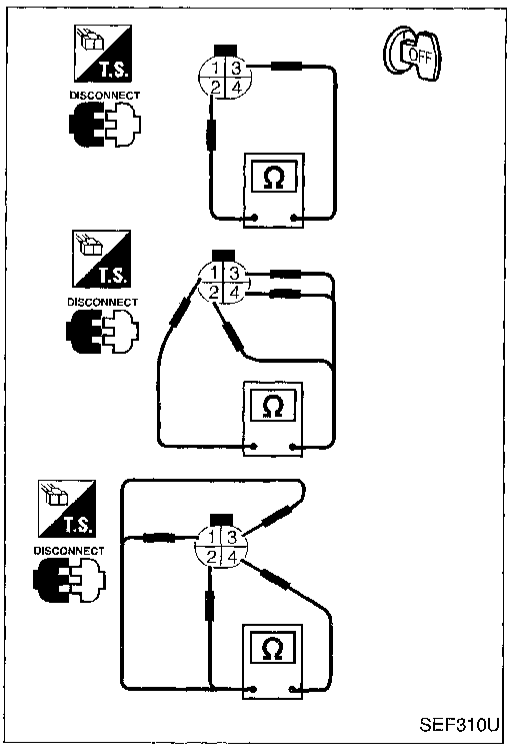
OK ↓



CHECK COMPONENT
(Rear heated oxygen sensor heater).
Refer to "COMPONENT INSPECTION" below.



NG → Replace rear heated oxygen sensor.



OK ↓

Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.

INSPECTION END

COMPONENT INSPECTION

Rear heated oxygen sensor heater

Check the following.

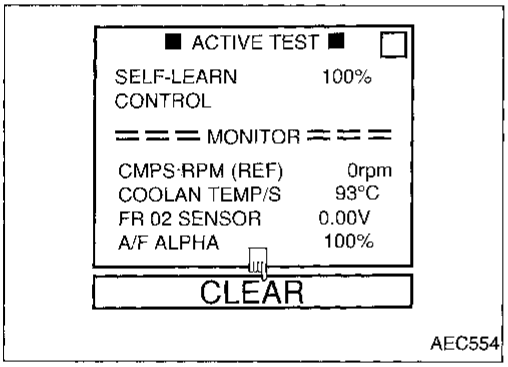
1. Check resistance between terminals ② and ③.
Resistance: 2.3 - 4.3Ω at 25°C (77°F)
2. Check continuity.

Terminal No.	Continuity
① and ②, ③, ④	No
④ and ①, ②, ③	

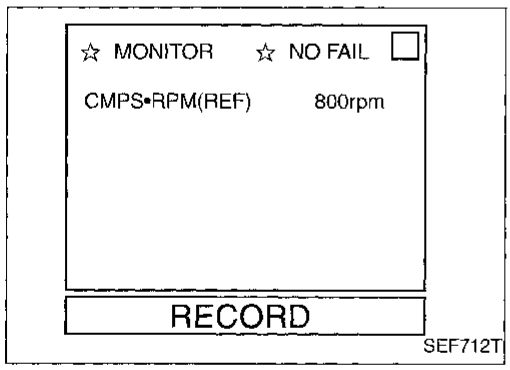
If NG, replace the rear heated oxygen sensor.

CAUTION:
Discard any heated oxygen sensor which has been dropped from a height of more than 0.5 m (19.7 in) onto a hard surface such as a concrete floor; use a new one.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Fuel Injection System Function (Lean side)



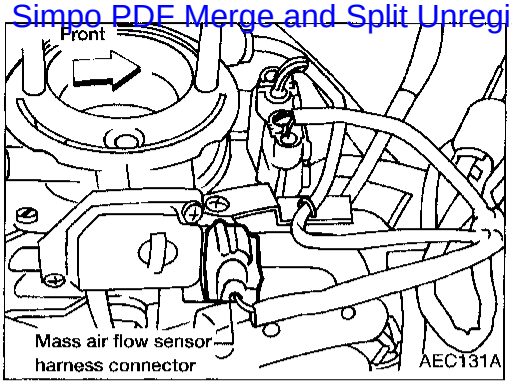
ON BOARD DIAGNOSIS LOGIC

With the Air/Fuel Mixture Ratio Self-Learning Control, the actual mixture ratio can be brought closely to the theoretical mixture ratio based on the mixture ratio feedback signal from the front heated oxygen sensor. The ECM calculates the necessary compensation to correct the offset between the actual and the theoretical ratios. In case the amount of the compensation value is extremely large (The actual mixture ratio is too lean.), the ECM judges the condition as the fuel injection system malfunction and light up the MIL (2 trip detection logic).

Front heated oxygen sensor → Density of oxygen in exhaust gas (Mixture ratio feedback signal) → ECM → Injectors

Diagnostic Trouble Code No.	Malfunction is detected when ...	Check Items (Possible Cause)
P0171 0115	● Fuel injection system does not operate properly. ● The amount of mixture ratio compensation is too large. (The mixture ratio is too lean.)	● Intake air leaks ● Front heated oxygen sensor ● Injectors ● Exhaust gas leaks ● Incorrect fuel pressure ● Lack of fuel ● Mass air flow sensor

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE



NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

1) Start engine and warm it up to normal operating temperature.
2) Turn ignition switch "OFF" and wait at least 5 seconds.
3) Turn ignition switch "ON" and select "SELF-LEARN CONTROL" in "ACTIVE TEST" mode with CONSULT.
4) Clear the self-learning control coefficient by touching "CLEAR".
5) Select "DATA MONITOR" mode with CONSULT.
6) Start engine again and let it idle for at least 10 minutes. The 1st trip DTC P0171 should be detected at this stage, if a malfunction exists.
7) If it is difficult to start engine at step 6, the fuel injection system has a malfunction.
8) Crank engine while depressing accelerator pedal. If engine starts, go to "DIAGNOSTIC PROCEDURE", EC-211. If engine does not start, visually check for exhaust and intake air leak.

OR

3) Disconnect mass air flow sensor harness connector. Then restart and run engine for at least 3 seconds at idle speed.
4) Stop engine and reconnect mass air flow sensor harness connector.
5) Turn ignition switch "ON".
6) Perform Diagnostic Test Mode II (Self-diagnostic results) with ECM. Make sure 1st trip DTC 0102 is detected.
7) Erase the 1st trip DTC 0102 by changing from Diagnostic Test Mode II to Diagnostic Test Mode I.
8) Perform Diagnostic Test Mode II (Self-diagnostic results) with ECM. Make sure DTC 0505 is detected.
9) Start engine again and run it for at least 10 minutes at idle speed.
   The 1st trip DTC 0115 should be detected at this stage, if a malfunction exists.
10) If it is difficult to start engine at step 9, the fuel injection system also has a malfunction.
11) Crank engine while depressing accelerator pedal. If engine starts, go to "DIAGNOSTIC PROCEDURE", EC-211. If engine does not start, visually check for exhaust and intake air leak.

DIAGNOSTIC PROCEDURE

INSPECTION START

A

CHECK EXHAUST AIR LEAK.
Start engine and run it at idle. Listen for an exhaust air leak before three way catalyst.
- NG → Repair or replace.
- OK ↓

CHECK FOR INTAKE AIR LEAK.
Start engine and run it at idle. Listen for an intake air leak between the mass air flow sensor and the intake manifold.
- NG → Repair or replace.
- OK ↓

B

CHECK FRONT HEATED OXYGEN SENSOR.
1. Turn ignition switch "OFF".
2. Disconnect front heated oxygen sensor harness connector and ECM harness connector.
3. Check harness continuity between ECM terminal (50) and terminal (2).
   Continuity should exist.
4. Check harness continuity between ECM terminal (50) (or terminal (2)) and ground.
   Continuity should not exist.
   If OK, check harness for short to ground and short to power.

- NG → Repair open circuit, short to ground or short to power in harness or connectors.
- OK ↓

CHECK FUEL PRESSURE.
1. Release fuel pressure to zero.
   Refer to EC-26.
2. Install fuel pressure gauge and check fuel pressure.
   At idling:
   When fuel pressure regulator valve vacuum hose is connected.
   235 kPa
   (2.4 kg/cm², 34 psi)
   When fuel pressure regulator valve vacuum hose is disconnected.
   294 kPa
   (3.0 kg/cm², 43 psi)

- NG → Check the following.
  - Fuel pump and circuit Refer to EC-410.
  - Fuel pressure regulator Refer to EC-26.
  - Fuel lines Refer to "ENGINE MAINTENANCE" in MA section.
  - Fuel filter for clogging

  If NG, repair or replace.
- OK ↓

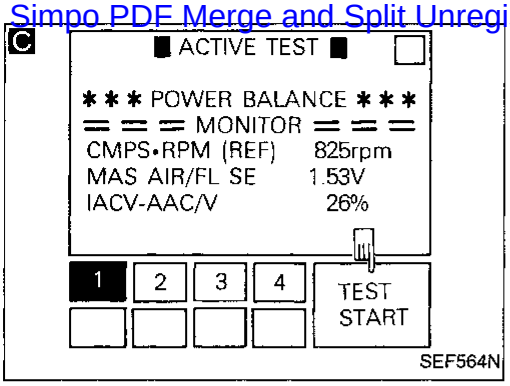
CHECK MASS AIR FLOW SENSOR.
1. Start engine and warm it up to normal operating temperature.
2. Check "MASS AIR FLOW" in "DATA MONITOR" mode with CONSULT.
   0.9 - 5.8 g·m/sec: at idling
   7.5 - 13.2 g·m/sec: at 2,500 rpm

OR

2. Check "MASS AIR FLOW" in MODE 1 with GST.
   0.9 - 5.8 g·m/sec: at idling
   7.5 - 13.2 g·m/sec: at 2,500 rpm

OR

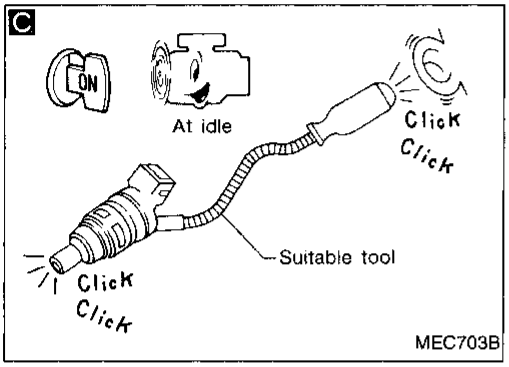
2. Check voltage between ECM terminal (47) and ground.
   0.9 - 1.8V: at idling
   1.9 - 2.3V: at 2,500 rpm



- NG → Check connectors for rusted terminals or loose connections in the mass air flow sensor circuit or engine grounds. Refer to EC-99.
- OK ↓

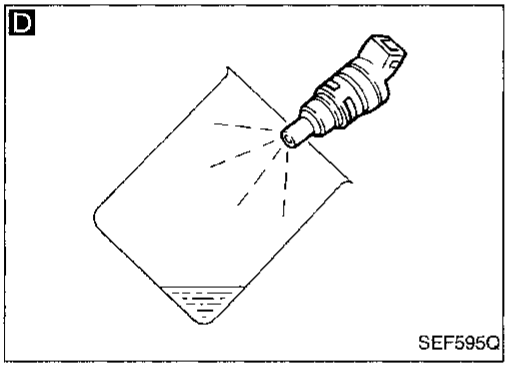
(A)
(Go to next page.)

Fuel Injection System Function (Lean side) (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

C



SEF564N

C

MEC703B

D

SEF595Q

Ⓐ

C

CHECK FUNCTION OF INJECTORS.
1. Install all parts removed.
2. Start engine.
3. Perform "POWER BALANCE" in "ACTIVE TEST" mode with CONSULT.
4. Make sure that each circuit produces a momentary engine speed drop.

OR

3. Listen to each injector operating sound.
Clicking noise should be heard.

NG → Perform TROUBLE DIAGNOSIS FOR NON-DETECTABLE ITEMS, "Injectors", EC-404. Repair harness or connectors.

OK ↓

Confirm that the engine is cooled down and there are no fire hazards near the vehicle.

1. Turn ignition switch "OFF".
2. Remove injector with fuel tube assembly.
Refer to EC-27.
Keep fuel hose and all injectors connected to injector gallery.
The injector harness connectors should remain connected.

D

1. Disconnect all ignition coil harness connectors.
2. Place pans or saucers under each cylinder.
3. Crank engine for about 3 seconds.
Make sure that fuel sprays out from injectors.
Fuel should be sprayed evenly for each cylinder.

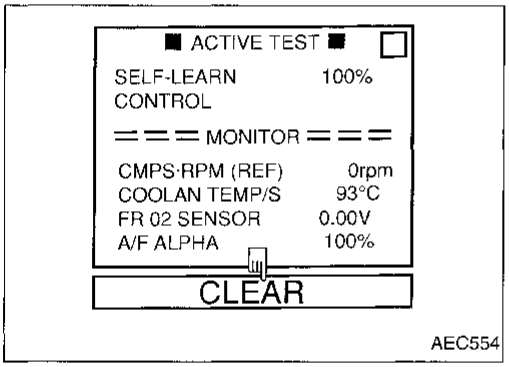
NG → Replace injectors from which fuel does not spray out. Refer to EC-27. Always replace O-ring with new one.

OK ↓

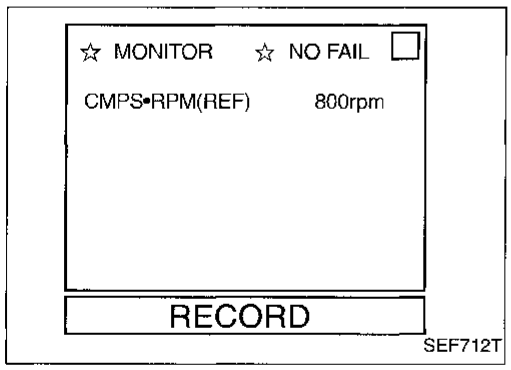
Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.

INSPECTION END

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Fuel Injection System Function (Rich side)



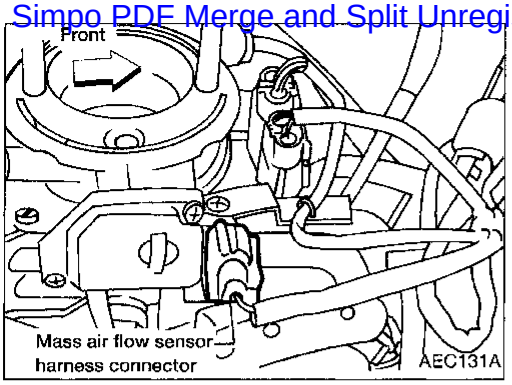
ON BOARD DIAGNOSIS LOGIC

With the Air/Fuel Mixture Ratio Self-Learning Control, the actual mixture ratio can be brought closely to the theoretical mixture ratio based on the mixture ratio feedback signal from the front heated oxygen sensor. The ECM calculates the necessary compensation to correct the offset between the actual and the theoretical ratios. In case the amount of the compensation value is extremely large (the actual mixture ratio is too rich.), the ECM judges the condition as the fuel injection system malfunction and lights up the MIL (2 trip detection logic).

Front heated oxygen sensor → Density of oxygen in exhaust gas (Mixture ratio feedback signal) → ECM → Injectors

Diagnostic Trouble Code No.	Malfunction is detected when ...	Check Items (Possible Cause)
P0172 0114	● Fuel injection system does not operate properly. ● The amount of mixture ratio compensation is too large. (The mixture ratio is too rich.)	● Front heated oxygen sensor ● Injectors ● Exhaust gas leaks ● Incorrect fuel pressure ● Mass air flow sensor

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE



NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

1) Start engine and warm it up to normal operating temperature.
2) Turn ignition switch "OFF" and wait at least 5 seconds.
3) Turn ignition switch "ON" and select "SELF-LEARN CONTROL" in "ACTIVE TEST" mode with CONSULT.
4) Clear the self-learning control coefficient by touching "CLEAR".
5) Select "DATA MONITOR" mode with CONSULT.
6) Start engine again and let it idle for at least 10 minutes. The 1st trip DTC P0172 should be detected at this stage, if a malfunction exists.
7) If it is difficult to start engine at step 6, the fuel injection system has a malfunction.
8) Crank engine while depressing accelerator pedal. If engine starts, go to "DIAGNOSTIC PROCEDURE", EC-216. If engine does not start, remove ignition plugs and check for fouling, etc.

OR

DIAGNOSTIC PROCEDURE

INSPECTION START

A

CHECK FOR EXHAUST AIR LEAK.
Start engine and run it at idle. Listen for an exhaust air leak before the warm-up three way catalyst (California model), the three way catalyst (Non-California model).

NG → Repair or replace.

OK ↓

B

CHECK FRONT HEATED OXYGEN SENSOR.
1. Turn ignition switch "OFF".
2. Disconnect front heated oxygen sensor RH harness connector and ECM harness connector.
3. Check harness continuity between ECM terminal (50) and terminal (2).
   Continuity should exist.
4. Check harness continuity between ECM terminal (50) (or terminal (2)) and ground.
   Continuity should not exist.
   If OK, check harness for short to ground and short to power.

NG → Repair harness or connectors.

OK ↓

CHECK FUEL PRESSURE.
1. Release fuel pressure to zero.
   Refer to EC-26.
2. Install fuel pressure gauge and check fuel pressure.
   At idling:
   When fuel pressure regulator valve vacuum hose is connected.
   Approximately 235 kPa (2.4 kg/cm², 34 psi)
   When fuel pressure regulator valve vacuum hose is disconnected.
   Approximately 294 kPa (3.0 kg/cm², 43 psi)

NG → Check the following.
- Fuel pump and circuit
  Refer to EC-410.
- Fuel pressure regulator
  Refer to EC-26.

If NG, repair or replace.

OK ↓

CHECK MASS AIR FLOW SENSOR.
1. Start engine and warm it up to normal operating temperature.

2. Check "MASS AIR FLOW" in "DATA MONITOR" mode with CONSULT.
   0.9 - 5.8 g·m/sec: at idling
   7.5 - 13.2 g·m/sec: at 2,500 rpm

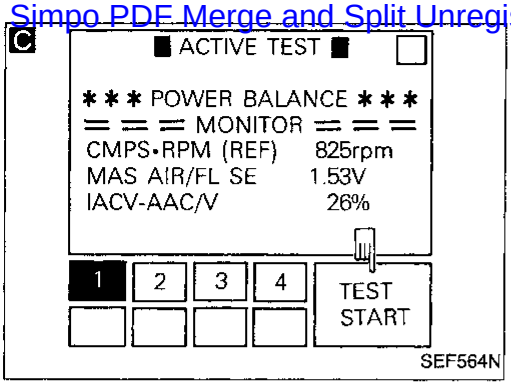
OR

2. Check "MASS AIR FLOW" in MODE 1 with GST.
   0.9 - 5.8 g·m/sec: at idling
   7.5 - 13.2 g·m/sec: at 2,500 rpm

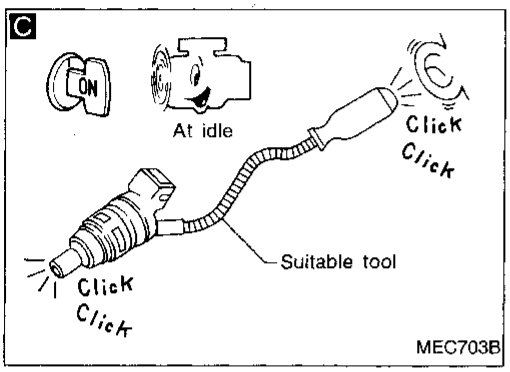
OR

2. Check voltage between ECM terminal (47) and ground.
   0.9 - 1.8V: at idling
   1.9 - 2.3V: at 2,500 rpm

NG → Check connectors for rusted terminals or loose connections in the mass air flow sensor circuit or engine grounds.
Refer to EC-99.



OK ↓



(A)

(Go to next page.)

Fuel Injection System Function (Rich side) (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Ⓐ

C

CHECK FUNCTION OF INJECTORS.
1. Install all parts removed.
2. Start engine.
3. Perform "POWER BALANCE" in "ACTIVE TEST" mode with CONSULT.
4. Make sure that each circuit produces a momentary engine speed drop.

OR

3. Listen to each injector operating sound.
Clicking noise should be heard.

NG → Perform TROUBLE DIAGNOSIS FOR NON-DETECTABLE ITEMS, "Injectors", EC-404. Repair harness or connectors.

OK ↓

Remove injector assembly.
Refer to EC-27.
Keep fuel hose and all injectors connected to injector gallery.

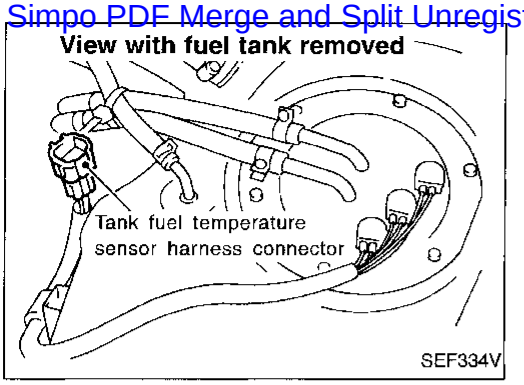
↓

Confirm that the engine is cooled down and there are no fire hazards near the vehicle.

↓

1. Disconnect all injector harness connectors.
2. Disconnect all ignition coil harness connectors.
3. Crank engine for about 3 seconds. Make sure fuel does not drip from injector.

Drips → Replace any injectors from which fuel is dripping.

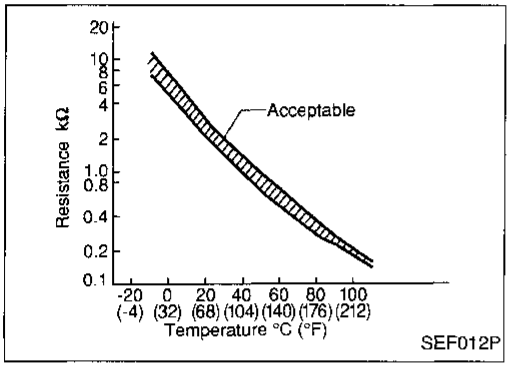


Does not drip. ↓

Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.

↓

INSPECTION END

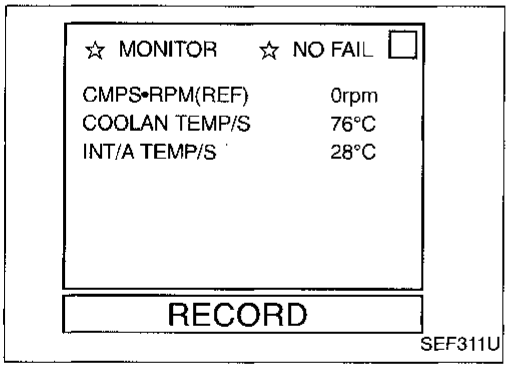


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Tank Fuel Temperature Sensor

COMPONENT DESCRIPTION

The tank fuel temperature sensor is used to detect the fuel temperature inside the fuel tank. The sensor modifies a voltage signal from the ECM. The modified signal returns to the ECM as the fuel temperature input. The sensor uses a thermistor which is sensitive to the change in temperature. The electrical resistance of the thermistor decreases as temperature increases.



<Reference data>

Fluid temperature °C (°F)	Voltage* V	Resistance kΩ
20 (68)	3.5	2.3 - 2.7
50 (122)	2.2	0.79 - 0.90

*: These data are reference values and are measured between ECM terminal (60) (Tank fuel temperature sensor) and ECM terminal (32) (ECM ground).

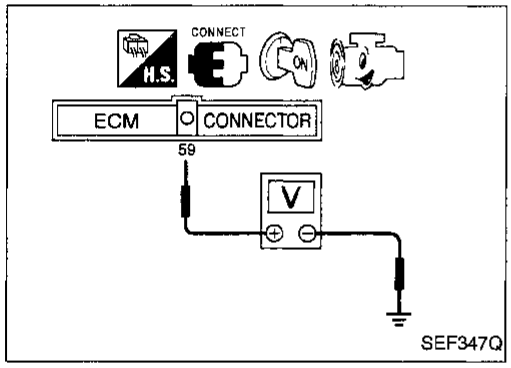
ON BOARD DIAGNOSIS LOGIC

Diagnostic Trouble Code No.	Malfunction is detected when ...	Check Items (Possible Causes)
P0180 0402	● An excessively high or low voltage is sent to ECM. ● Rationally incorrect voltage is sent to ECM, compared with the voltage signals from engine coolant temperature sensor and intake air temperature sensor.	● Harness or connectors (The sensor circuit is open or shorted.) ● Tank fuel temperature sensor

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

1) Turn ignition switch "ON".
2) Select "DATA MONITOR" mode with CONSULT.
3) Wait at least 10 seconds.
   If the result is NG, go to "DIAGNOSTIC PROCEDURE", EC-221.
   If the result is OK, go to following step.



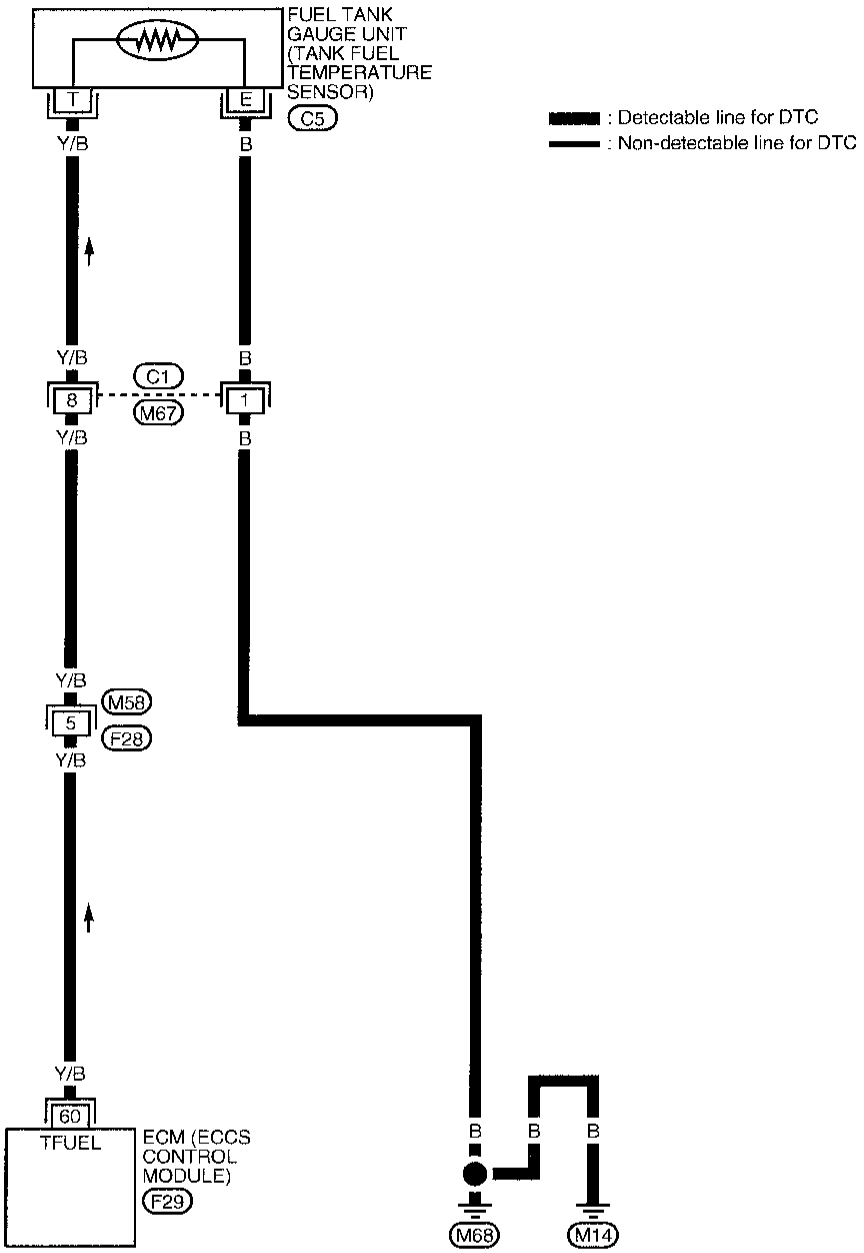
NOTE: If "COOLAN TEMP/S" is already less than 90°C (194°F) before step 4), the result will be OK. If "COOLAN TEMP/S" is above 90°C (194°F), go to the following step.

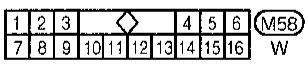
4) Cool engine down until "COOLAN TEMP/S" is less than 90°C (194°F).
5) Wait at least 10 seconds.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

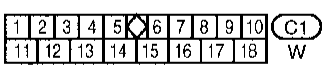
OR

1) Turn ignition switch "ON" and wait at least 10 seconds.
2) Select "MODE 7" with GST.
   If the result is NG, go to "DIAGNOSTIC PROCEDURE", EC-221.
   If the result is OK, go to following step.
3) Select "MODE 1" with GST and check for the engine coolant temperature.
4) Cool engine down until the engine coolant temperature is less than 90°C (194°F). If the temperature is already less than 90°C (194°F) before step 4), the result will be OK.
5) Wait at least 10 seconds.
6) Select "MODE 7" with GST.





OR



1) Turn ignition switch "ON" and wait at least 10 seconds.
2) Turn ignition switch "OFF", wait at least 5 seconds and then turn "ON".
3) Perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.
   If the result is NG, go to "DIAGNOSTIC PROCEDURE", EC-221.
   If the result is OK, go to following step.
4) Cool engine down until the voltage between ECM terminal ⑤⑨ (Engine coolant temperature sensor) and ground becomes more than 1.0V.
   If the voltage is already more than 1.0V before step 4), the result will be OK.
5) Wait at least 10 seconds.
6) Turn ignition switch "OFF", wait at least 5 seconds and then turn "ON".
7) Perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.

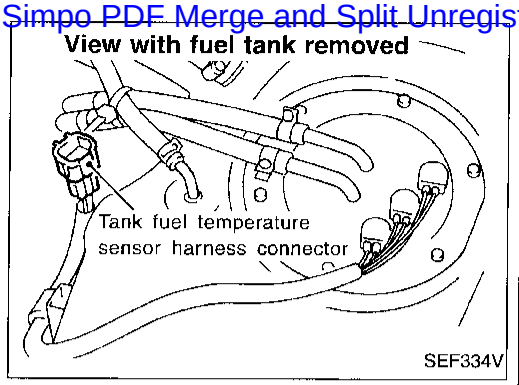
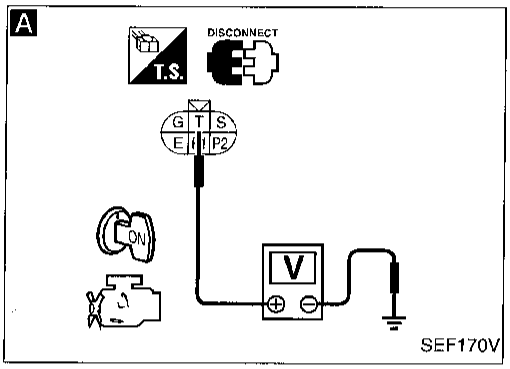
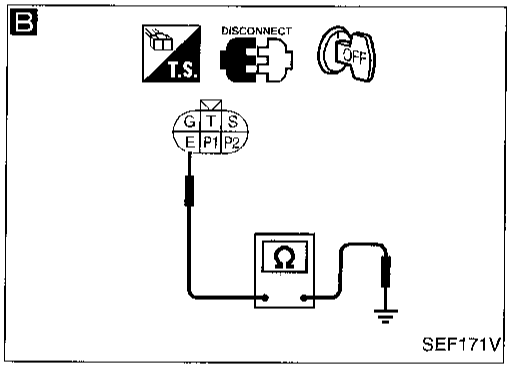
EC-TFTS-01





AEC530A



Tank Fuel Temperature Sensor (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

DIAGNOSTIC PROCEDURE

INSPECTION START

A

CHECK POWER SUPPLY.
1. Turn ignition switch "OFF".
2. Disconnect tank fuel temperature sensor harness connector.
3. Turn ignition switch "ON".
4. Check voltage between terminal (T) and ground with CONSULT or tester.
Voltage: Approximately 5V

NG → Check the following.
- Harness connectors (C1), (M67)
- Harness connectors (M58), (F28)
- Harness for open or short between ECM and tank fuel temperature sensor

If NG, repair harness or connector.

OK ↓

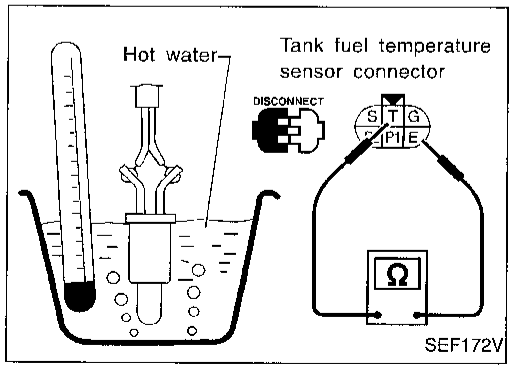
B

CHECK GROUND CIRCUIT.
1. Turn ignition switch "OFF".
2. Check harness continuity between terminal (E) and body ground.
Continuity should exist.
If OK, check harness for short to ground and short to power.

NG → Check the following.
- Harness connectors (C1), (M67)
- Harness for open or short between ECM and body ground

If NG, repair open circuit or short to ground or short to power in harness or connectors.

OK ↓



CHECK COMPONENT
(Tank fuel temperature sensor).
Refer to "COMPONENT INSPECTION" below.

NG → Replace tank fuel temperature sensor.

OK ↓

Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.

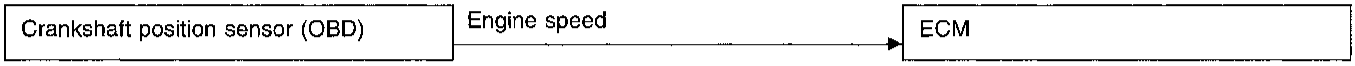
INSPECTION END

COMPONENT INSPECTION

Tank fuel temperature sensor

Check resistance by heating with hot water as shown in the figure or a heat gun.

Temperature °C (°F)	Resistance kΩ
20 (68)	2.3 - 2.7
50 (122)	0.79 - 0.90

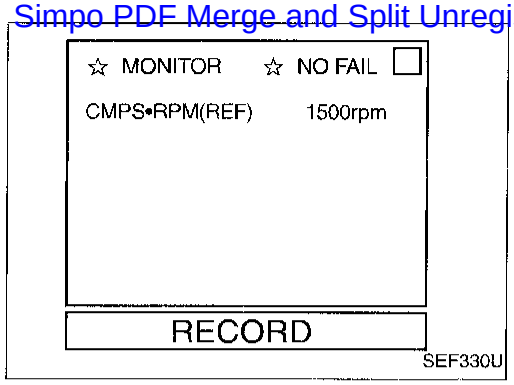


If NG, replace tank fuel temperature sensor.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

No. 4 - 1 Cylinder Misfire, Multiple Cylinder Misfire

ON BOARD DIAGNOSIS LOGIC



If a misfire occurs, the engine speed will fluctuate. If the fluctuation is detected by the crankshaft position sensor (OBD), the misfire is diagnosed.
The misfire detection logic consists of the following two conditions.

1. One Trip Detection Logic (Three Way Catalyst Damage)
   When a misfire is detected which will overheat and damage the three way catalyst, the malfunction indicator lamp (MIL) will start blinking; even during the first trip. In this condition, ECM monitors the misfire every 200 revolutions.
   If the misfire frequency decreases to a level that will not damage the three way catalyst, the MIL will change from blinking to lighting up.
   (After the first trip detection, the MIL will light up from engine starting. If a misfire is detected that will cause three way catalyst damage, the MIL will start blinking.)
2. Two Trip Detection Logic (Exhaust quality deterioration)
   When a misfire that will not damage the three way catalyst (but will affect exhaust emission) occurs, the malfunction indicator lamp will light up based on two trip detection logic. In this condition, ECM monitors the misfire for every 1,000 revolutions of the engine.

Diagnostic Trouble Code No.	Malfunction is detected when ...	Check Items (Possible Cause)
P0300 (0701)	● Multiple cylinders misfire.	● Improper spark plug ● Insufficient compression ● Incorrect fuel pressure ● EGR valve ● The injector circuit is open or shorted ● Injectors ● Intake air leak ● The ignition secondary circuit is open or shorted ● Lack of fuel ● Drive plate/Flywheel ● Front heated oxygen sensor
P0301 (0608)	● No. 1 cylinder misfires.	
P0302 (0607)	● No. 2 cylinder misfires.	
P0303 (0606)	● No. 3 cylinder misfires.	
P0304 (0605)	● No. 4 cylinder misfires.	

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

No. 4 - 1 Cylinder Misfire, Multiple Cylinder Misfire (Cont'd)

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE (Overall)

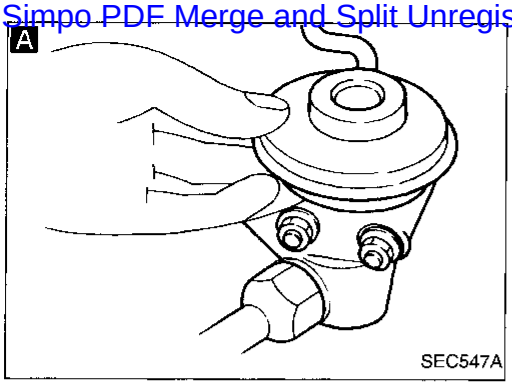
CAUTION:
Always drive vehicle at a safe speed.

NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

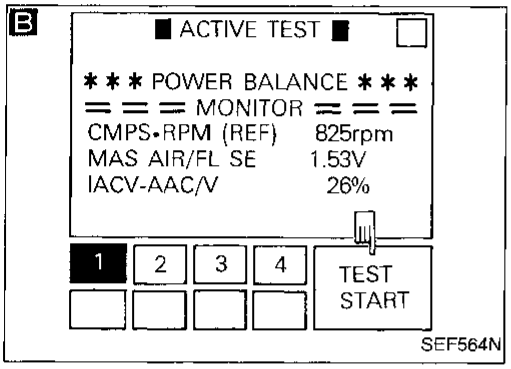
1) Turn ignition switch "ON", and select "DATA MONITOR" mode with CONSULT.
2) Start engine and warm it up to normal operating temperature.
3) Turn ignition switch "OFF" and wait at least 5 seconds.
4) Start engine again and drive at 1,500 - 3,000 rpm for at least 3 minutes.
   Hold the accelerator pedal as steady as possible.
   Note: Refer to the freeze frame data for the test driving conditions.

OR

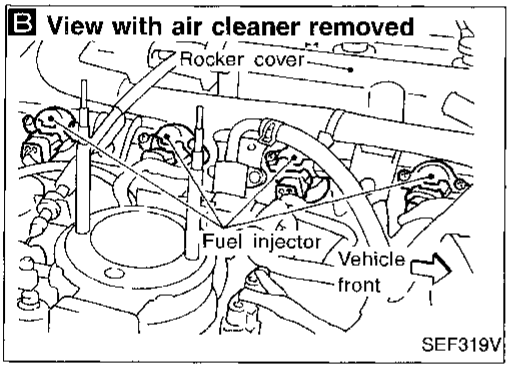
1) Start engine and warm it up to normal operating temperature.
2) Turn ignition switch "OFF" and wait at least 5 seconds.
3) Start engine again and drive at 1,500 - 3,000 rpm for at least 3 minutes.
   Hold the accelerator pedal as steady as possible.
   Note: Refer to the freeze frame data for the test driving conditions.
4) Select "MODE 7" with GST.



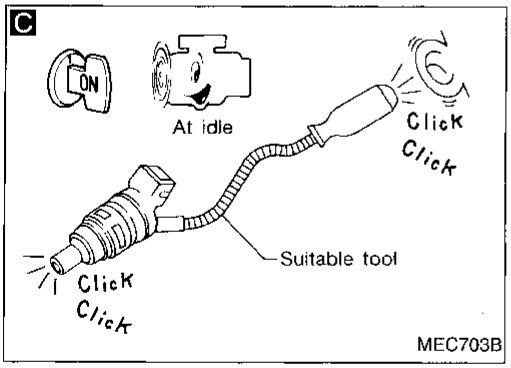
OR



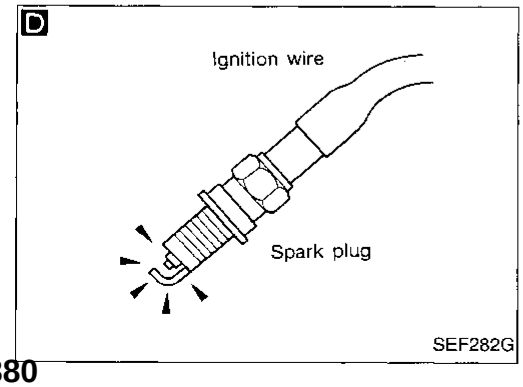
1) Start engine and warm it up to normal operating temperature.
2) Turn ignition switch "OFF" and wait at least 5 seconds.
3) Start engine again and drive at 1,500 - 3,000 rpm for at least 3 minutes.
   Hold the accelerator pedal as steady as possible.
4) Turn ignition switch "OFF", wait at least 5 seconds, and then turn "ON".
5) Perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



No. 4 - 1 Cylinder Misfire, Multiple Cylinder Misfire (Cont'd)



DIAGNOSTIC PROCEDURE

INSPECTION START

CHECK FOR INTAKE AIR LEAK.
Start engine and run it at idle speed. Listen for the sound of the intake air leak.
NG → Discover air leak location and repair.
OK

CHECK FOR EXHAUST SYSTEM CLOGGING.
Stop engine and visually check exhaust tube, three way catalyst and muffler for dents.
NG → Repair or replace it.
OK

A

CHECK EGR FUNCTION.
Perform DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE for EGR Function.
Refer to EC-338.
NG → Repair EGR system.
OK

B

PERFORM POWER BALANCE TEST.
1. Perform "POWER BALANCE" in "ACTIVE TEST" mode.
2. Is there any cylinder which does not produce a momentary engine speed drop?

OR

When disconnecting each injector harness connector one at a time, is there any cylinder which does not produce a momentary engine speed drop?

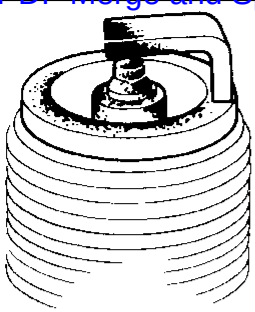
No → Go to E on next page.
Yes

C

CHECK INJECTOR.
Does each injector make an operating sound at idle?
No → Check injector(s) and circuit(s). Refer to EC-404.
Yes

D

CHECK IGNITION SPARK.
1. Disconnect ignition wire from spark plug.
2. Connect a known good spark plug to the ignition wire.
3. Place end of spark plug against a suitable ground and crank engine.
4. Check for spark.



NG → CHECK COMPONENT (Ignition wires).
Refer to "COMPONENT INSPECTION", EC-226.
OK → Check ignition coil, power transistor and their circuits. Refer to EC-315.
NG → Replace.
OK

Ⓐ
(Go to next page.)

Ⓐ

E

CHECK SPARK PLUGS.
Remove the spark plugs and check for fouling, etc.

NG → Repair or replace spark plug(s) with standard type one(s).
For spark plug type, refer to "ENGINE MAINTENANCE" in MA section.

OK ↓

CHECK COMPRESSION PRESSURE.
Refer to EM section.
- Check compression pressure.
  Standard:
  kPa (kg/cm², psi)/300 rpm
  1,226 (12.5, 178)
  Minimum:
  kPa (kg/cm², psi)/300 rpm
  1,030 (10.5, 149)
  Difference between each cylinder:
  kPa (kg/cm², psi)/300 rpm
  98 (1.0, 14)

NG → Check pistons, piston rings, valves, valve seats and cylinder head gaskets.

OK ↓

F

CHECK FUEL PRESSURE.
1. Release fuel pressure to zero. Refer to EC-26.
2. Install fuel pressure gauge and check fuel pressure.
   At idle:
   Approx. 235 kPa
   (2.4 kg/cm², 34 psi)

NG → Check the following.
- Fuel pump and circuit
  Refer to EC-410.
- Fuel pressure regulator
  Refer to EC-26.
- Fuel lines
  Refer to "ENGINE MAINTENANCE" in MA section.
- Fuel filter for clogging

If NG, repair or replace.

OK ↓

CHECK IGNITION TIMING.
Perform "Basic Inspection", EC-71.

NG → Adjust ignition timing.

OK ↓

CHECK COMPONENT
(Front heated oxygen sensor).
Refer to "COMPONENT INSPECTION", EC-155.

NG → Replace front heated oxygen sensor.

OK ↓

CHECK MASS AIR FLOW SENSOR.

Check "MASS AIR FLOW" in "DATA MONITOR" mode with CONSULT.
0.9 - 5.8 g·m/sec: at idling
7.5 - 13.2 g·m/sec: at 2,500 rpm

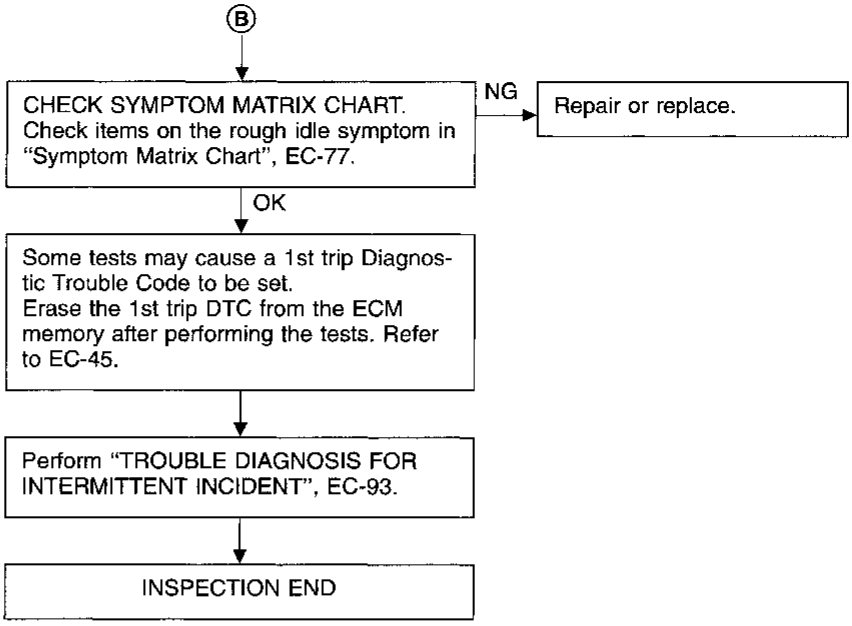
OR

Check "MASS AIR FLOW" in MODE 1 with GST.
0.9 - 5.8 g·m/sec: at idling
7.5 - 13.2 g·m/sec: at 2,500 rpm

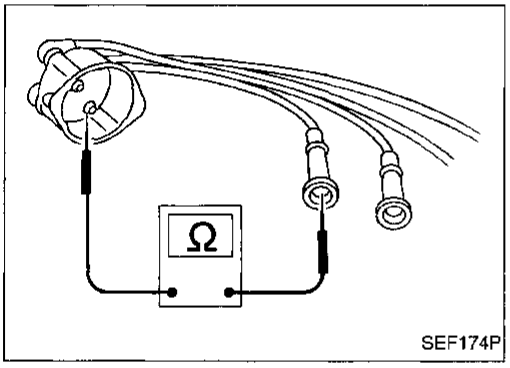
OR

Check voltage between ECM terminal (47) and ground.
0.9 - 1.8V: at idling
1.9 - 2.3V: at 2,500 rpm

NG → Check connectors for rusted terminals or loose connections in the mass air flow sensor circuit or engine grounds.
Refer to EC-99.
If NG, repair or replace it.



OK ↓



Ⓑ

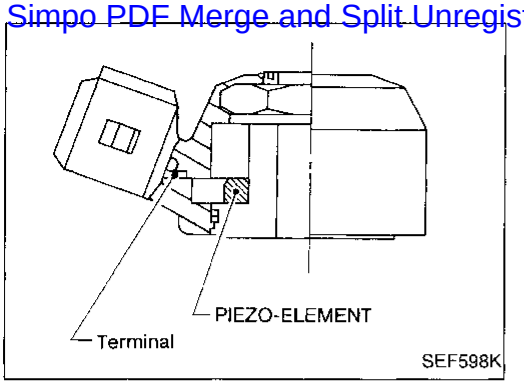
(Go to next page.)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

No. 4 - 1 Cylinder Misfire, Multiple Cylinder Misfire (Cont'd)

COMPONENT INSPECTION

Ignition wires



1. Inspect wires for cracks, damage, burned terminals and for improper fit.
2. Measure the resistance of wires to their distributor cap terminal. Move each wire while testing to check for intermittent breaks.

   Resistance:

   13.6 - 18.4 kΩ/m (4.15 - 5.61 kΩ/ft) at 25°C (77°F)

   If the resistance exceeds the above specification, inspect ignition wire to distributor cap connection. Clean connection or replace the ignition wire with a new one.

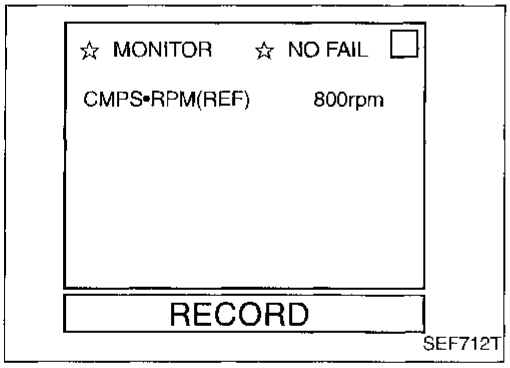
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Knock Sensor (KS)

COMPONENT DESCRIPTION

The knock sensor is attached to the cylinder block. It senses engine knocking using a piezoelectric element. A knocking vibration from the cylinder block is sensed as vibrational pressure. This pressure is converted into a voltage signal and sent to the ECM.

*** Freeze frame data will not be stored in the ECM for the knock sensor. The MIL will not light for knock sensor malfunction. The knock sensor has one trip detection logic.**



ECM TERMINALS AND REFERENCE VALUE

Specification data are reference values and are measured between each terminal and ㉜ (ECM ground).

TER-MINAL NO.	WIRE COLOR	ITEM	CONDITION	DATA (DC Voltage)
64	W	Knock sensor	Engine is running. └ Idle speed	Approximately 2.4V

ON BOARD DIAGNOSIS LOGIC

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P0325 0304	● An excessively low or high voltage from the knock sensor is sent to ECM.	● Harness or connectors (The knock sensor circuit is open or shorted.) ● Knock sensor

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

CAUTION:
Always drive vehicle at a safe speed.

NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

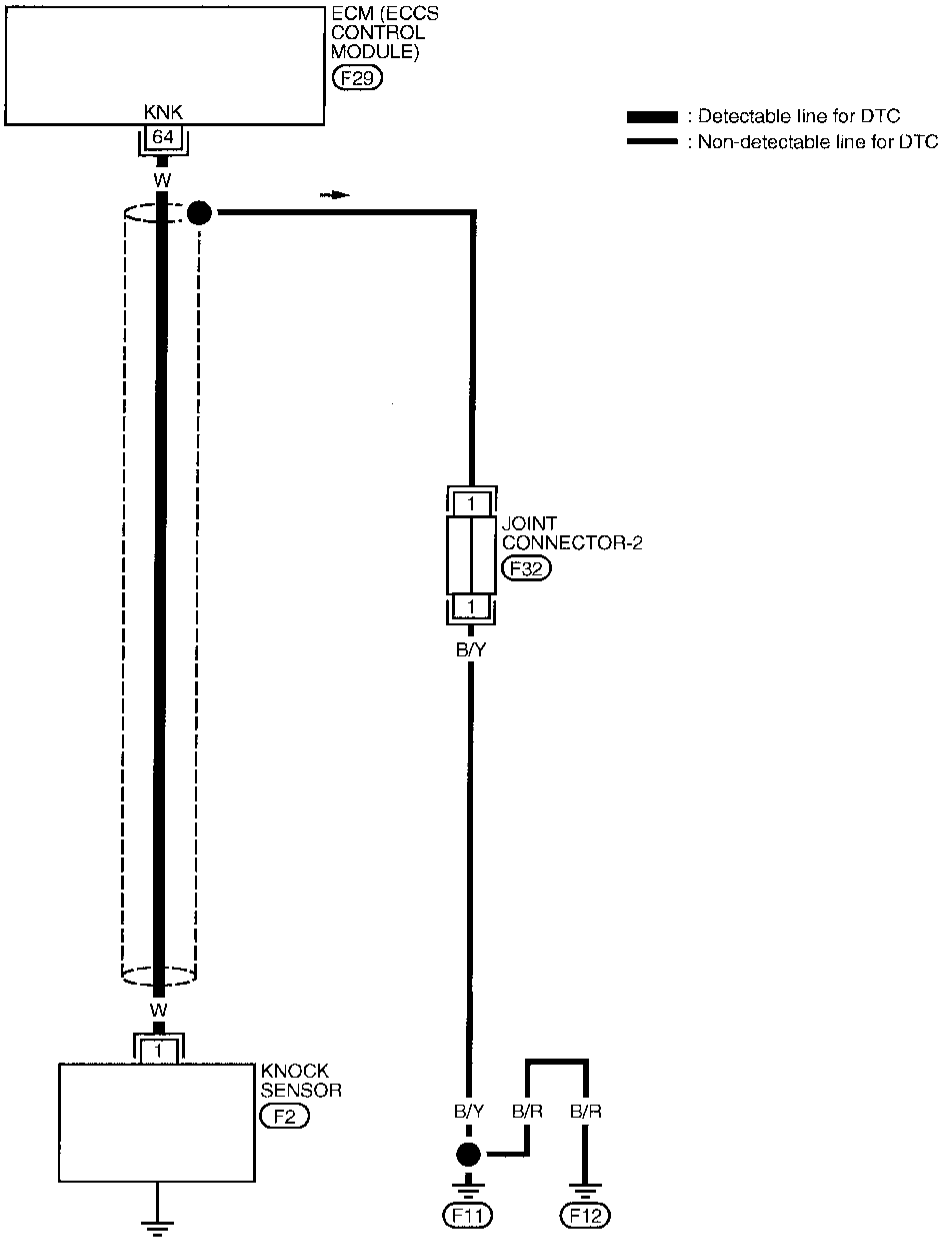
TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is more than 10V at idle.

1) Turn ignition switch "ON" and select "DATA MONITOR" mode with CONSULT.
2) Start engine and run it for at least 5 seconds at idle speed.

OR

1) Start engine and run it for at least 5 seconds at idle speed.
2) Select "MODE 3" with GST.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



OR

NO TOOLS

1) Start engine and run it for at least 5 seconds at idle speed.
2) Turn ignition switch "OFF", wait at least 5 seconds and then turn "ON".
3) Perform "Diagnostic Test Mode II" (Self-diagnostic results) with ECM.

INSPECTION START

A

CHECK INPUT SIGNAL CIRCUIT.
1. Turn ignition switch "OFF".
2. Disconnect ECM harness connector.
3. Check harness continuity between ECM terminal (64) and ground.
   Resistance:
   Approximately 500 - 620 kΩ [at 25°C (77°F)]

If OK, check harness for short to ground and short to power.
It is necessary to use an ohmmeter which can measure more than 10 MΩ.

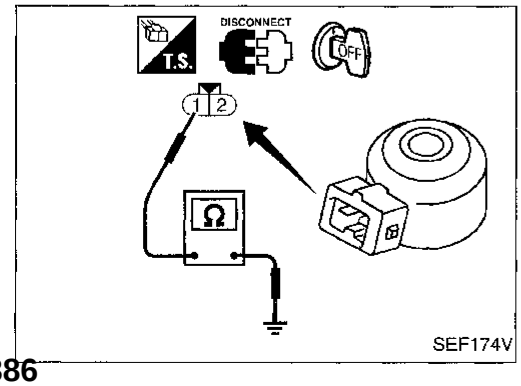
NG → Check the following.
- Harness for open or short between knock sensor and ECM

If NG, repair open circuit or short to ground or short to power in harness or connectors.
- Knock sensor (Refer to "COMPONENT INSPECTION" below.)

If NG, replace knock sensor.

OK ↓

CHECK SHIELD CIRCUIT.
1. Turn ignition switch "OFF".
2. Remove joint connector-2.
3. Check the following.
   - Continuity between joint connector-2 terminal (1) and ground
   - Joint connector-2
     (Refer to "HARNESS LAYOUT" in EL section.)



Continuity should exist.
If OK, check harness for short to power.

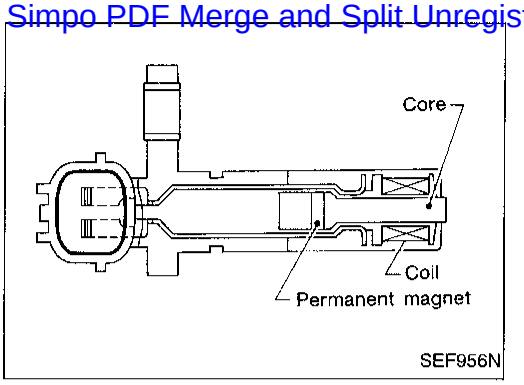
NG → Repair open circuit, short to ground or short to power in harness or connectors.

OK ↓

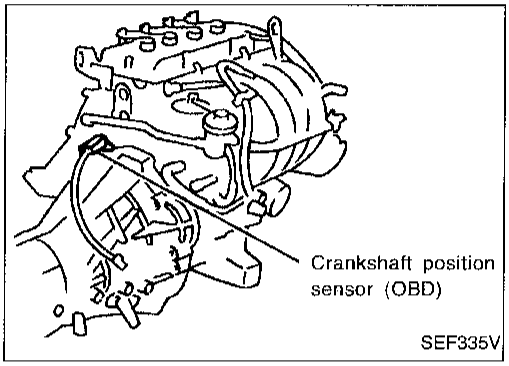
Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.

INSPECTION END

COMPONENT INSPECTION



Knock sensor

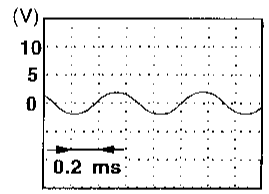


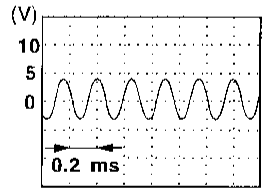
- Use an ohmmeter which can measure more than 10 MΩ.

1. Disconnect knock sensor harness connector.
2. Check resistance between terminal (1) and ground.
   Resistance: 500 - 620 kΩ [at 25°C (77°F)]

CAUTION:
Do not use any knock sensors that have been dropped or physically damaged. Use only new ones.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



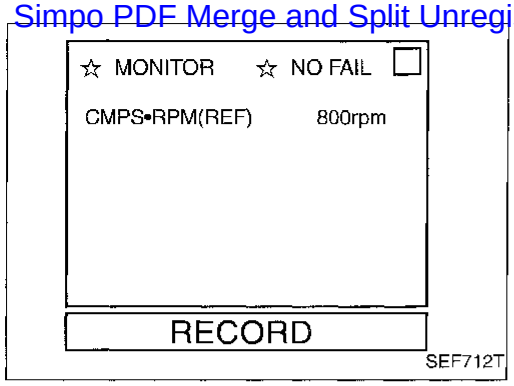


Crankshaft Position Sensor (CKPS) (OBD)

COMPONENT DESCRIPTION

The crankshaft position sensor (OBD) is located on the transaxle housing facing the gear teeth (cogs) of the flywheel or drive plate. It detects the fluctuation of the engine revolution.
The sensor consists of a permanent magnet, core and coil.
When the engine is running, the high and low parts of the teeth cause the gap with the sensor to change.
The changing gap causes the magnetic field near the sensor to change.
Due to the changing magnetic field, the voltage from the sensor changes.
The ECM receives the voltage signal and detects the fluctuation of the engine revolution.
This sensor is not directly used to control the engine system. It is used only for the on board diagnosis of misfire.

ECM TERMINALS AND REFERENCE VALUE



Specification data are reference values and are measured between each terminal and ㉜ (ECM ground).

TER-MINAL NO.	WIRE COLOR	ITEM	CONDITION	DATA (AC Voltage)
47	L	Crankshaft position sensor (OBD)	Engine is running. (Warm-up condition) Idle speed	Approximately 0V  SEF112V
			Engine is running. Engine speed is 2,000 rpm.	Approximately 0V  SEF113V

ON BOARD DIAGNOSIS LOGIC

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P0335 0802	● The proper pulse signal from the crankshaft position sensor (OBD) is not sent to ECM while the engine is running at the specified engine speed.	● Harness or connectors (The crankshaft position sensor (OBD) circuit is open.) ● Crankshaft position sensor (OBD)

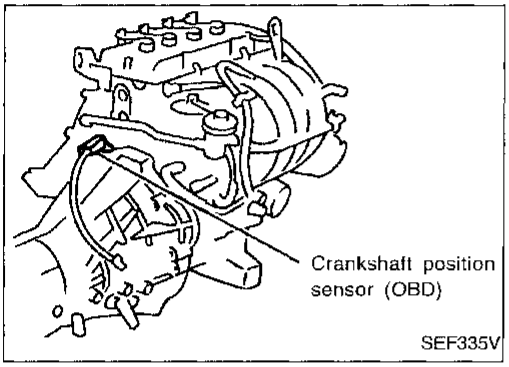
DIAGNOSTIC PROCEDURE

SEF325V

INSPECTION START

1. Turn ignition switch "OFF".
2. Loosen and retighten engine ground screws.



A

CHECK INPUT SIGNAL CIRCUIT.
1. Disconnect crankshaft position sensor (OBD) and ECM harness connectors.
2. Check continuity between ECM terminal (47) and terminal (2).
   Continuity should exist.
   If OK, check harness for short to ground and short to power.

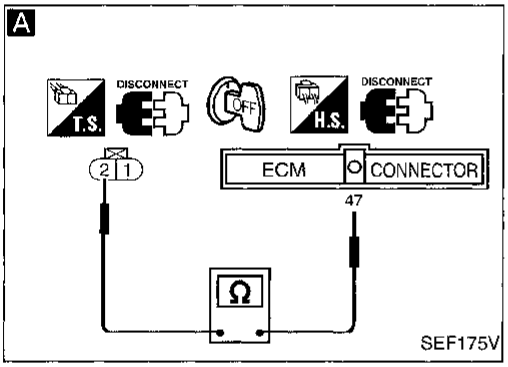
NG → Check the following.
- Harness connectors (E202), (E32)
- Harness connectors (E41), (F25)
- Harness for open or short between ECM and crankshaft position sensor (OBD)

If NG, repair open circuit or short to ground or short to power in harness or connectors.

OK

SEF335V

B



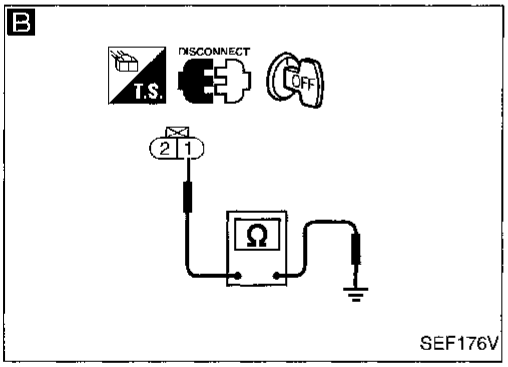
CHECK GROUND CIRCUIT.
1. Reconnect ECM harness connector.
2. Check harness continuity between terminal (1) and engine ground.
   Continuity should exist.
   If OK, check harness for short to ground and short to power.

NG → Check the following.
- Harness connectors (E202), (E32)
- Harness connectors (E41), (F25)
- Harness for open or short between crankshaft position sensor (OBD) and ECM

If NG, repair open circuit or short to ground or short to power in harness or connectors.

OK

A



SEF175V

CHECK COMPONENT
[Crankshaft position sensor (OBD)].

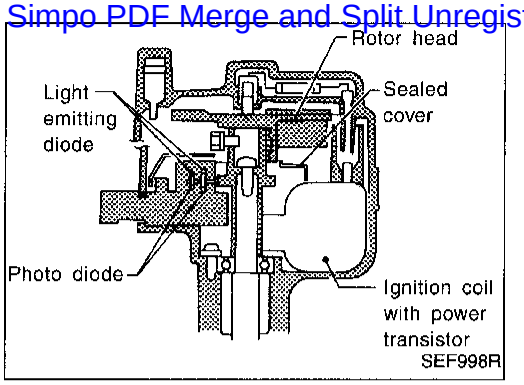
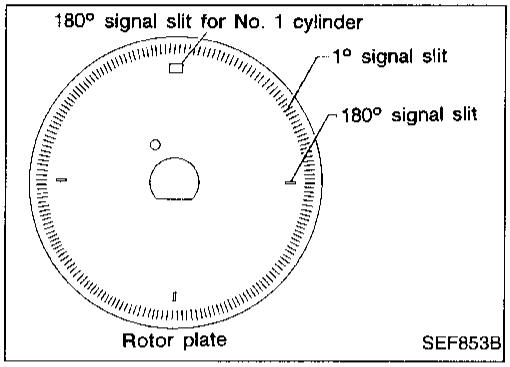
COMPONENT INSPECTION

Crankshaft position sensor (OBD)



1. Disconnect crankshaft position sensor (OBD) harness connector.
2. Loosen the fixing bolt of the sensor.
3. Remove the sensor.
4. Visually check the sensor for chipping.



SEF504V

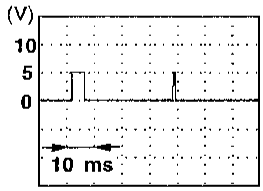
5. Check resistance as shown in the figure.
   Resistance: Approximately 166.5 - 203.5Ω [at 20°C (68°F)]
   If NG, replace crankshaft position sensor (OBD).

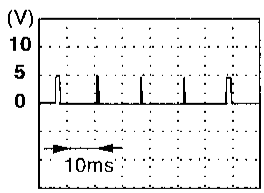
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Camshaft Position Sensor (CMPS)

COMPONENT DESCRIPTION

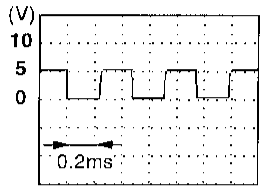
The camshaft position sensor is a basic component of the ECCS. It monitors engine speed and piston position. These input signals to the ECM are used to control fuel injection, ignition timing and other functions.

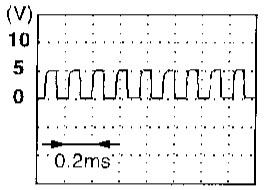




The camshaft position sensor has a rotor plate and a wave-forming circuit. The rotor plate has 360 slits for a 1° (POS) signal and 4 slits for a 180° (REF) signal. The wave-forming circuit consists of Light Emitting Diodes (LED) and photo diodes.

The rotor plate is positioned between the LED and the photo diode. The LED transmits light to the photo diode. As the rotor plate turns, the slits cut the light to generate rough-shaped pulses. These pulses are converted into on-off signals by the wave-forming circuit and sent to the ECM.





The distributor is not repairable and must be replaced as an assembly except distributor cap.

ECM TERMINALS AND REFERENCE VALUE

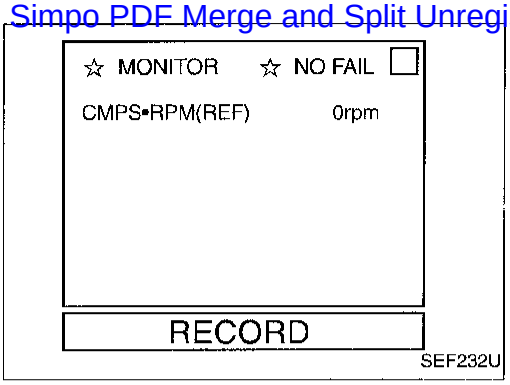
Specification data are reference values and are measured between each terminal and ㉜ (ECM ground).

TERMINAL NO.	WIRE COLOR	ITEM	CONDITION	DATA (DC Voltage)
4	LG/R	ECCS relay (Self-shutoff)	Engine is running. Ignition switch "OFF" └ For a few seconds after turning ignition switch "OFF"	0 - 1V
			Ignition switch "OFF" └ A few seconds passed after turning ignition switch "OFF"	BATTERY VOLTAGE (11 - 14V)
44	PU	Camshaft position sensor (Reference signal)	Engine is running. (Warm-up condition) └ Idle speed	0.2 - 0.5V  SEF114V
48	PU		Engine is running. └ Engine speed is 2,000 rpm.	0 - 0.5V  SEF200T

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

TER-MINAL NO.	WIRE COLOR	ITEM	CONDITION	DATA (DC Voltage)
49	LG	Camshaft position sensor (Position signal)	Engine is running. (Warm-up condition) └ Idle speed	Approximately 2.6V  SEF195T
			Engine is running. └ Engine speed is 2,000 rpm.	Approximately 2.5 - 2.6V  SEF196T
67	B/P	Power supply for ECM	Ignition switch "ON"	BATTERY VOLTAGE (11 - 14V)
72	B/P			
117	B/P	Current return	Engine is running. └ Idle speed	BATTERY VOLTAGE (11 - 14V)

ON BOARD DIAGNOSIS LOGIC



Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P0340 0101	A) Either 1° or 180° signal is not sent to ECM for the first few seconds during engine cranking. B) Either 1° or 180° signal is not sent to ECM often enough while the engine speed is higher than the specified engine speed. C) The relation between 1° and 180° signal is not in the normal range during the specified engine speed.	● Harness or connectors (The camshaft position sensor circuit is open or shorted.) ● Camshaft position sensor ● Starter motor (Refer to EL section.) ● Starting system circuit (Refer to EL section.) ● Dead (Weak) battery

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

Perform "Procedure for malfunction A" first. If DTC cannot be confirmed, perform "Procedure for malfunction B and C".

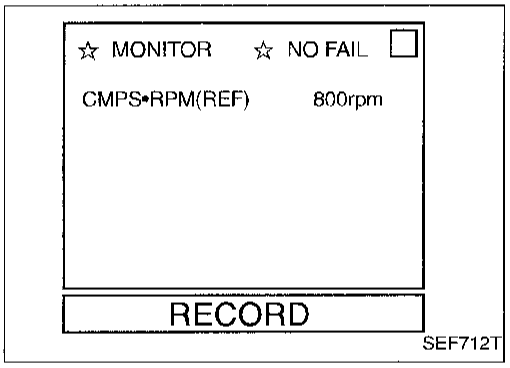
Camshaft Position Sensor (CMPS) (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procedure for malfunction A

NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is more than 10.5V at idle.



1) Turn ignition switch "ON".
2) Select "DATA MONITOR" mode with CONSULT.
3) Crank engine for at least 2 seconds.

OR

1) Crank engine for at least 2 seconds.
2) Select "MODE 7" with GST.

OR

1) Crank engine for at least 2 seconds.
2) Turn ignition switch "OFF", wait at least 5 seconds and then turn "ON".
3) Perform "Diagnostic Test Mode II" (Self-diagnostic results) with ECM.

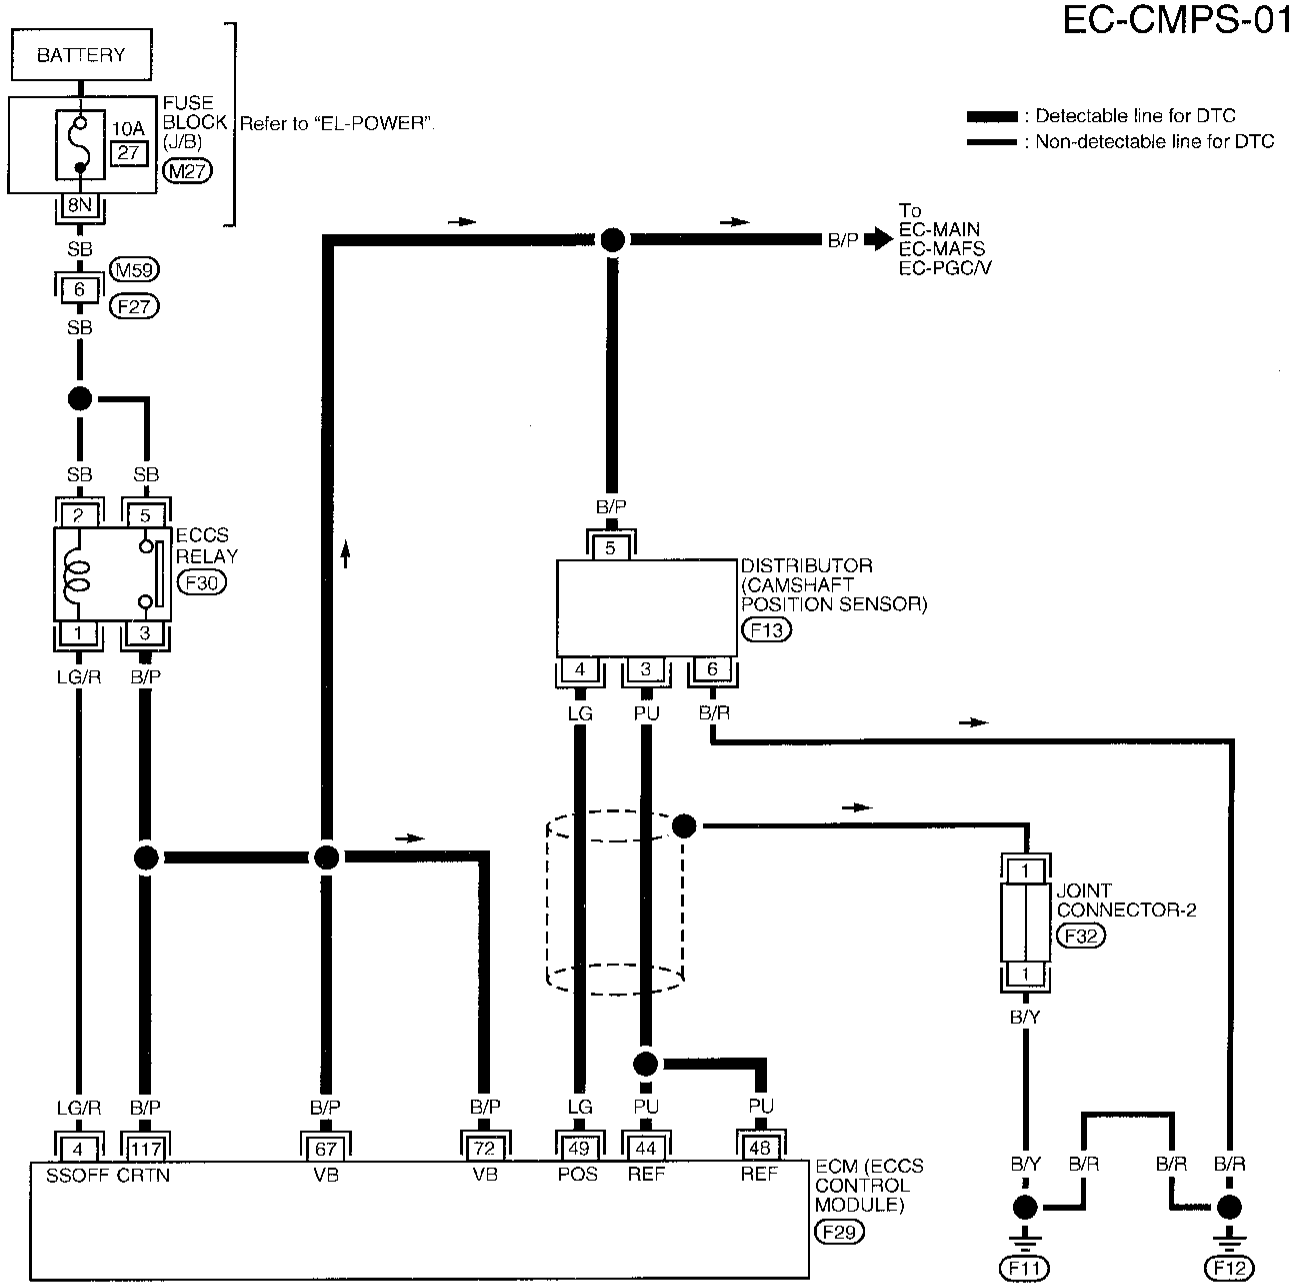
Procedure for malfunction B and C

NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is more than 10.5V at idle.

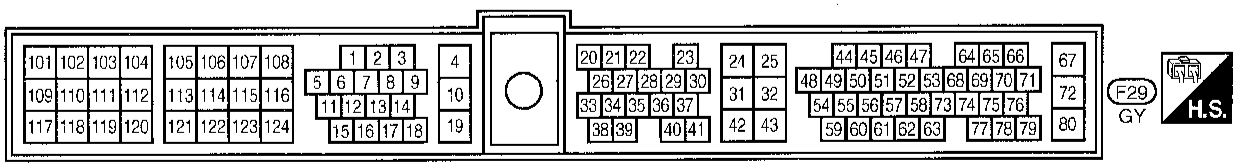
1) Turn ignition switch "ON".
2) Select "DATA MONITOR" mode with CONSULT.
3) Start engine and run it for at least 2 seconds at idle speed.

OR



1) Start engine and run it for at least 2 seconds at idle speed.
2) Select "MODE 7" with GST.

OR



1) Start engine and run it for at least 2 seconds at idle speed.
2) Turn ignition switch "OFF", wait at least 5 seconds and then turn "ON".
3) Perform "Diagnostic Test Mode II" (Self-diagnostic results) with ECM.

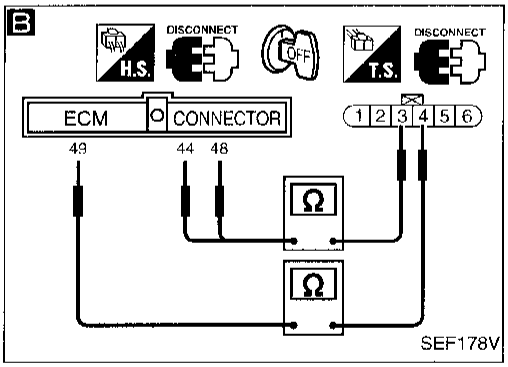
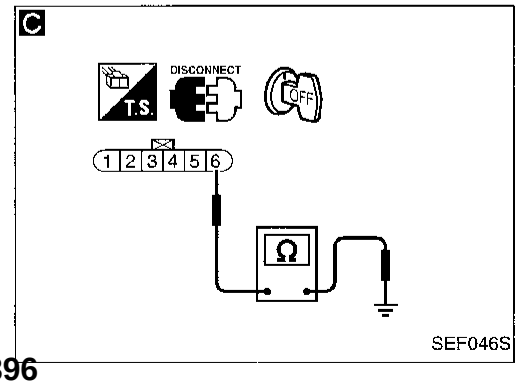
DIAGNOSTIC PROCEDURE (DETECTABLE CIRCUIT)





A

B

C

INSPECTION START

1. Turn ignition switch "OFF".
2. Loosen and retighten engine ground screws.

A

CHECK POWER SUPPLY.
1. Disconnect camshaft position sensor harness connector.
2. Turn ignition switch "ON".
3. Check voltage between terminal (5) and ground with CONSULT or tester.
Voltage: Battery voltage

NG → Check the following.
- Harness for open or short between camshaft position sensor and ECM
- Harness for open or short between camshaft position sensor and ECCS relay

If NG, repair harness or connectors.

OK ↓

B

CHECK INPUT SIGNAL CIRCUIT.
1. Turn ignition switch "OFF".
2. Disconnect ECM harness connector.
3. Check harness continuity between sensor terminal (4) and ECM terminals (49), sensor terminal (3) and ECM terminals (44), (48).
Continuity should exist.
If OK, check harness for short to ground and short to power.

NG → Repair open circuit, short to ground or short to power in harness or connectors.

OK ↓

C

CHECK GROUND CIRCUIT.
1. Turn ignition switch "OFF".
2. Disconnect camshaft position sensor harness connector.
3. Check harness continuity between sensor terminal (6) and engine ground.
Continuity should exist.
If OK, check harness for short to ground and short to power.

NG → Repair open circuit, short to ground or short to power in harness or connectors.

OK ↓

CHECK COMPONENT
(Camshaft position sensor).
Refer to "COMPONENT INSPECTION" on next page.

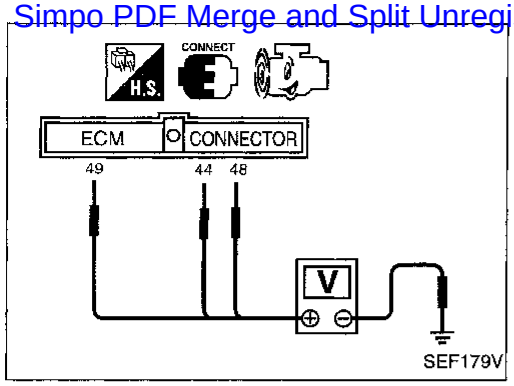
NG → Replace camshaft position sensor.

OK ↓

CHECK SHIELD CIRCUIT.
1. Turn ignition switch "OFF".
2. Remove joint connector-2.
3. Check the following.
- Continuity between joint connector-2 terminal (1) and ground
- Joint connector-2
(Refer to "HARNESS LAYOUT" in EL section.)

Continuity should exist.
If OK, check harness for short to power.

NG → Repair open circuit, short to ground or short to power in harness or connectors.



OK ↓

Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.

INSPECTION END

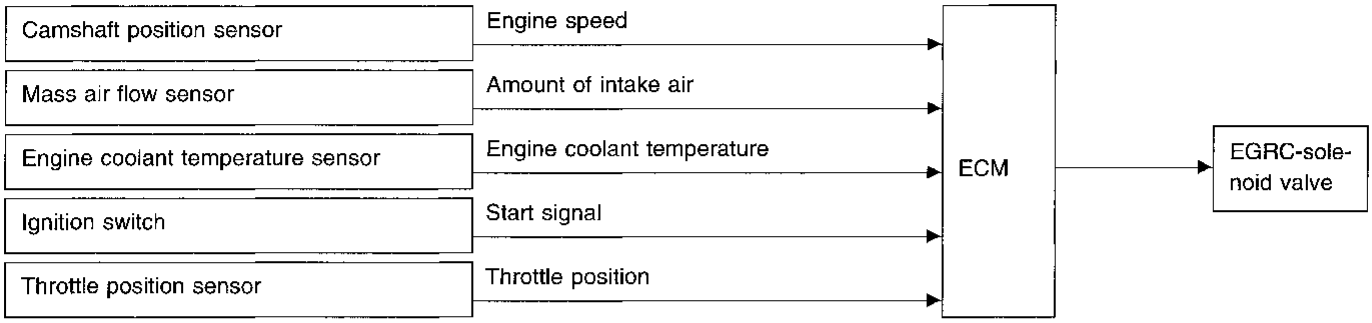
Camshaft Position Sensor (CMPS) (Cont'd)

COMPONENT INSPECTION

Camshaft position sensor

1. Start engine and warm it up to the normal operating temperature.
2. Check voltage between ECM terminal ㊾ and ground, ECM terminal ㊹ or ㊽ and ground.

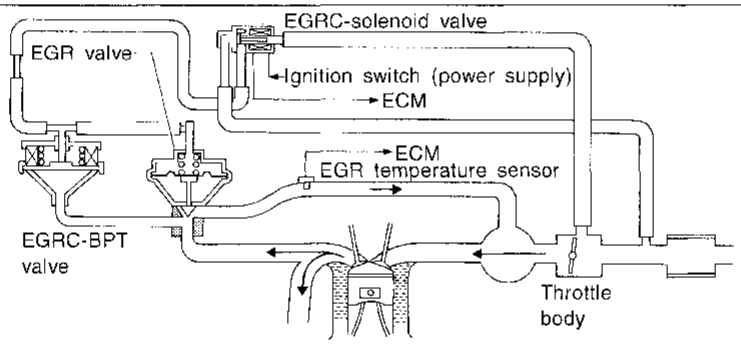


Condition	Terminal	Voltage
Engine running at idle	㊾ and ground	Approximately 2.6V  SEF195T
	㊹ or ㊽ and ground	0.2 - 0.5V  SEF114V
Engine speed is 2,000 rpm	㊾ and ground	Approximately 2.5 - 2.6V  SEF196T
	㊹ or ㊽ and ground	0 - 0.5V  SEF200T

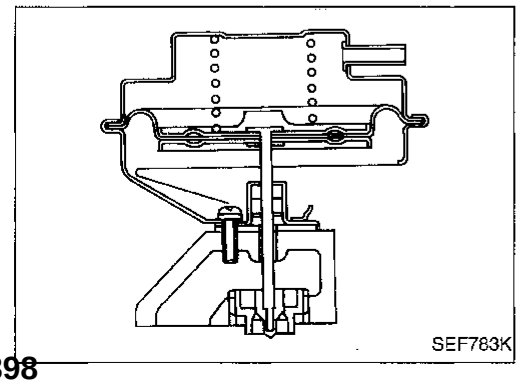
If NG, replace distributor assembly with camshaft position sensor.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

EGR Function (Close)



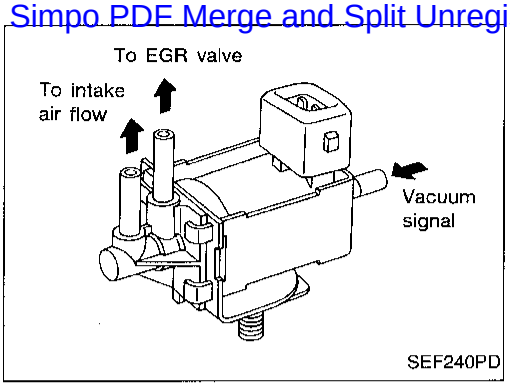
SYSTEM DESCRIPTION



This system cuts and controls vacuum applied to the EGR valve to suit engine operating conditions. This cut-and-control operation is accomplished through the ECM and the EGRC-solenoid valve. When the ECM detects any of the following conditions, current flows through the solenoid valve. This causes the port vacuum to be discharged into the atmosphere. The EGR valve remains closed.

- Low engine coolant temperature
- Engine starting
- High-speed engine operation
- Engine idling
- Excessively high engine coolant temperature
- Mass air flow sensor malfunction

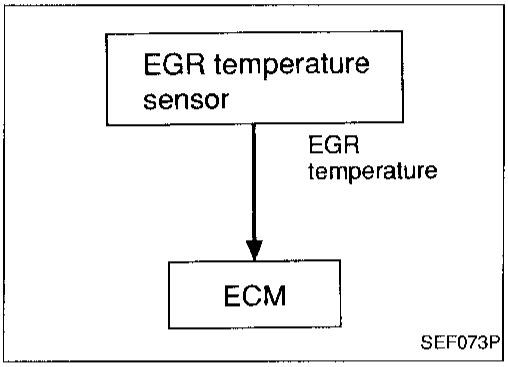
EGR and vacuum



COMPONENT DESCRIPTION

Exhaust gas recirculation (EGR) valve

The EGR valve controls the amount of exhaust gas routed to the intake manifold. Vacuum is applied to the EGR valve in response to throttle valve opening. The vacuum controls the movement of a taper valve connected to the vacuum diaphragm in the EGR valve.

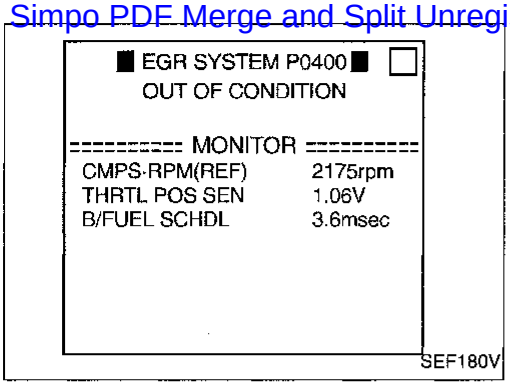


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

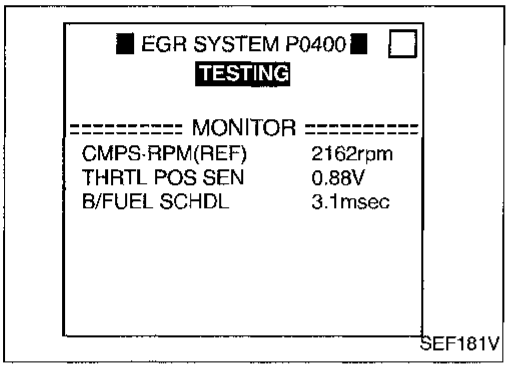
EGR Function (Close) (Cont'd)

EGRC-solenoid valve

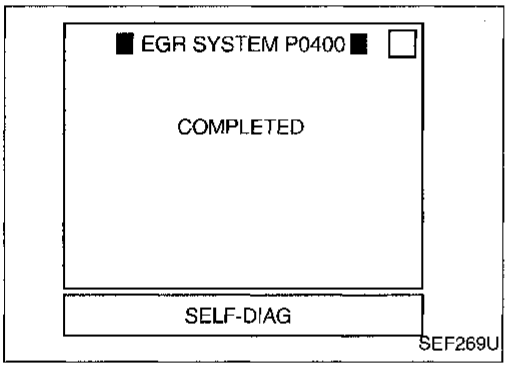
The EGRC-solenoid valve responds to signals from the ECM. When the ECM sends an ON (ground) signal, the coil in the solenoid valve is energized. The vacuum signal passes through the solenoid valve. The signal then reaches the EGR valve.
When the ECM sends an OFF signal, a plunger will then move to cut the vacuum signal from the throttle body to the EGR valve.



ON BOARD DIAGNOSIS LOGIC



If the absence of EGR flow is detected by EGR temperature sensor under the condition that calls for EGR, a low-flow malfunction is diagnosed.



Diagnostic Trouble Code No.	Malfunction is detected when ...	Check Items (Possible Cause)
P0400 0302	● The exhaust gas recirculation (EGR) flow is excessively low during the specified driving condition.	● EGR valve stuck closed ● EGRC-BPT valve ● Vacuum hose ● EGRC-solenoid valve ● EGR passage ● EGR temperature sensor ● Exhaust gas leaks

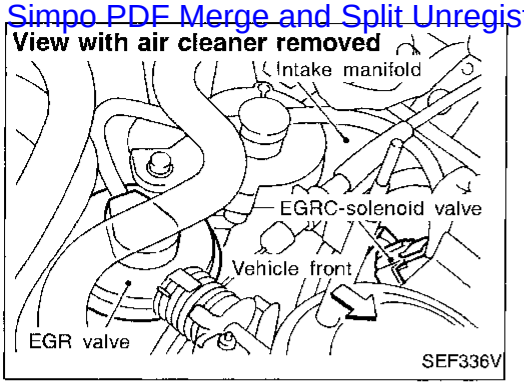
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

EGR Function (Close) (Cont'd)

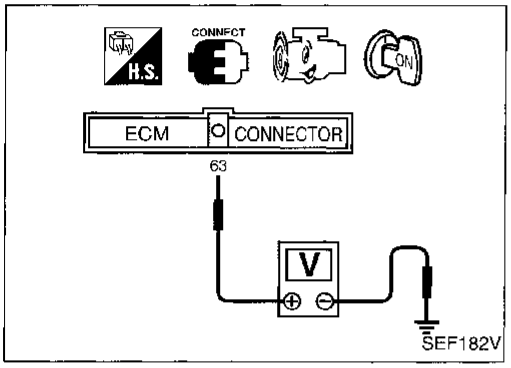
DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

CAUTION:
Always drive vehicle at a safe speed.

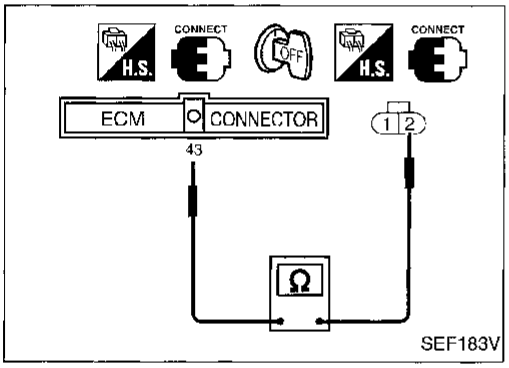
NOTE:



- **If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.**
- **P0400 will not be displayed at "SELF-DIAG RESULTS" mode with CONSULT even though DTC work support test result is "NG".**



TESTING CONDITION:
Always perform the test at a temperature of 5°C (41°F) or higher.



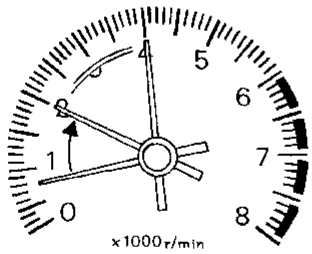
1) Turn ignition switch "ON"
2) Check "COOLAN TEMP/S" in "DATA MONITOR" mode witch CONSULT.
   Confirm COOLAN TEMP/S value is within the range listed below.
   COOLAN TEMP/S: Less than 40°C (104°F)
   If the value is out of range, park the vehicle in a cool place and allow the engine temperature to stabilize. Do not attempt to lower the coolant temperature with a fan or means other than ambient air. Doing so may produce an inaccurate diagnostic result.
3) Start engine and let it idle monitoring the value of "COOLAN TEMP/S". When the engine coolant temperature reaches 70°C (158°F), immediately go to the next step.
4) Select "EGR SYSTEM P0400" of "EGR SYSTEM" in "DTC WORK SUPPORT" mode with CONSULT.
5) Touch "START".
6) Accelerate vehicle to a speed of 40 km/h (25 MPH) once and then stop vehicle with engine running.
   If "COMPLETED" with "OK" appears on CONSULT screen, go to step 9).
   If "COMPLETED" does not appear on CONSULT screen, go to the following step.
7) Check the output voltage of "THRTL POS SEN" (at closed throttle position) and note it.
8) When the following conditions are met, "TESTING" will be displayed on the CONSULT screen. Maintain the conditions until "TESTING" changes to "COMPLETED". (It will take approximately 50 seconds or more.)
   CMPS·RPM (REF): 2,000 - 2,600 rpm
   Vehicle speed: Suitable speed
   B/FUEL SCHDL: 2.5 - 3.5 ms
   THRTL POS SEN: (X + 0.10) – (X + 0.52) V
   X = Voltage value measured at step 7)
   Selector lever: Suitable position
   If "TESTING" is not displayed after 5 minutes, retry from step 2).
9) Make sure that "OK" is displayed after touching "SELF-DIAG RESULTS". If "NG" is displayed, refer to "DIAGNOSTIC PROCEDURE", EC-247.

EGR Function (Close) (Cont'd)

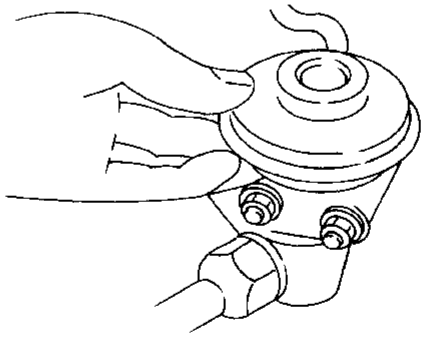
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

OR

OVERALL FUNCTION CHECK



Use this procedure to check the overall EGR function. During this check, a 1st trip DTC might not be confirmed.

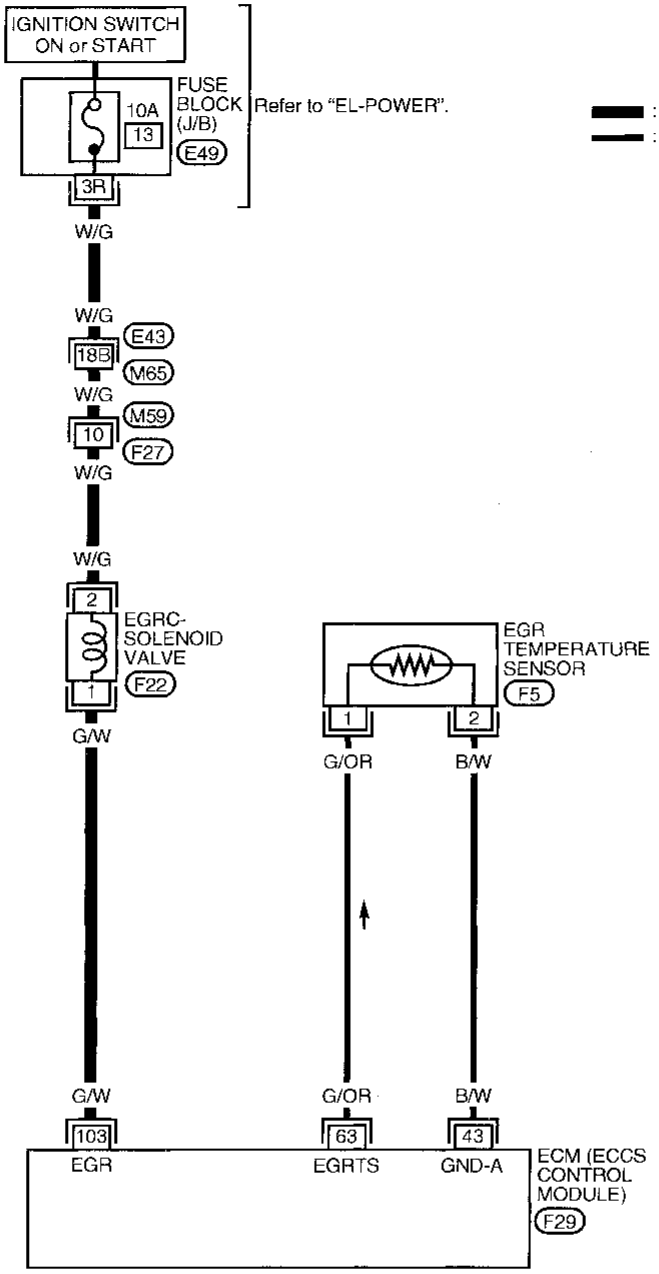


1) Start engine and warm it up to normal operating temperature.
2) Check the EGR valve lifting when revving engine from 2,000 rpm up to 4,000 rpm quickly under no load using the following methods.
   - Disconnect EGRC-solenoid valve harness connector. (The DTC for EGRC-solenoid valve will be displayed, however, ignore it.)

   EGR valve should lift up and down without sticking.

   If NG, go to **A** in DIAGNOSTIC PROCEDURE on EC-247.
3) Check voltage between ECM terminal ⑥③ (EGR temperature sensor) and ground at idle speed.
   Less than 4.5V should exist.
4) Turn ignition switch "OFF".
5) Check harness continuity between EGR temperature sensor harness connector terminal ② and ECM terminal ④③ (ECM ground).
   Continuity should exist.
6) Perform "COMPONENT INSPECTION", "EGR temperature sensor". Refer to EC-249.

Overall function check



Check the EGR valve lifting when revving engine from 2,000 rpm up to 4,000 rpm.

INSPECTION START

A

CHECK EXHAUST SYSTEM.
Check exhaust pipes and muffler for leaks.

NG → Repair or replace exhaust system.

OK ↓

B

CHECK VACUUM SOURCE TO EGR VALVE.
1. Start engine and warm it up to normal operating temperature.
2. Disconnect vacuum hose to EGR valve.
3. Check for vacuum existence.
4. Check for vacuum existence when revving engine from 2,000 rpm up to 4,000 rpm with the following methods.

Vacuum should not exist at idle.

- Select "EGRC SOLENOID VALVE" in "ACTIVE TEST" mode with CONSULT and turn the solenoid valve "OFF".
  Vacuum should exist when revving engine.

OR

- Disconnect EGRC-solenoid valve harness connector. (The 1st trip DTC for EGRC-solenoid valve will be displayed, but ignore it.)
  Vacuum should exist when revving engine.

OK → CHECK COMPONENT (EGR valve). Refer to "COMPONENT INSPECTION", EC-343.

NG → Replace EGR valve.

NG ↓

C

CHECK VACUUM HOSE.
Check vacuum hose for clogging, cracks or improper connection.
Refer to "Vacuum Hose Drawing", EC-13.

NG → Repair or replace vacuum hose.

OK ↓

D

CHECK EGRC-SOLENOID VALVE CIRCUIT.
1. Turn ignition switch "ON".
2. Perform "EGRC SOL/V CIRCUIT" in "FUNCTION TEST" mode with CONSULT.

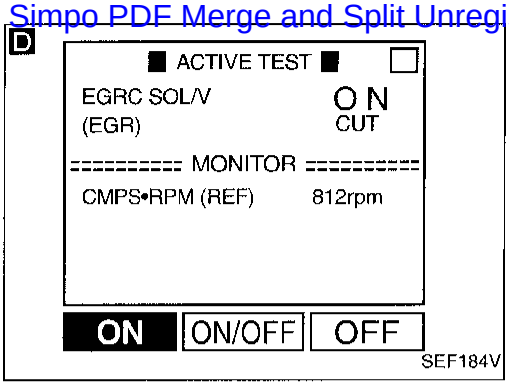
OR

1. Turn ignition switch "ON".
2. Turn EGRC-solenoid valve "ON" and "OFF" in "ACTIVE TEST" mode with CONSULT and check operating sound.

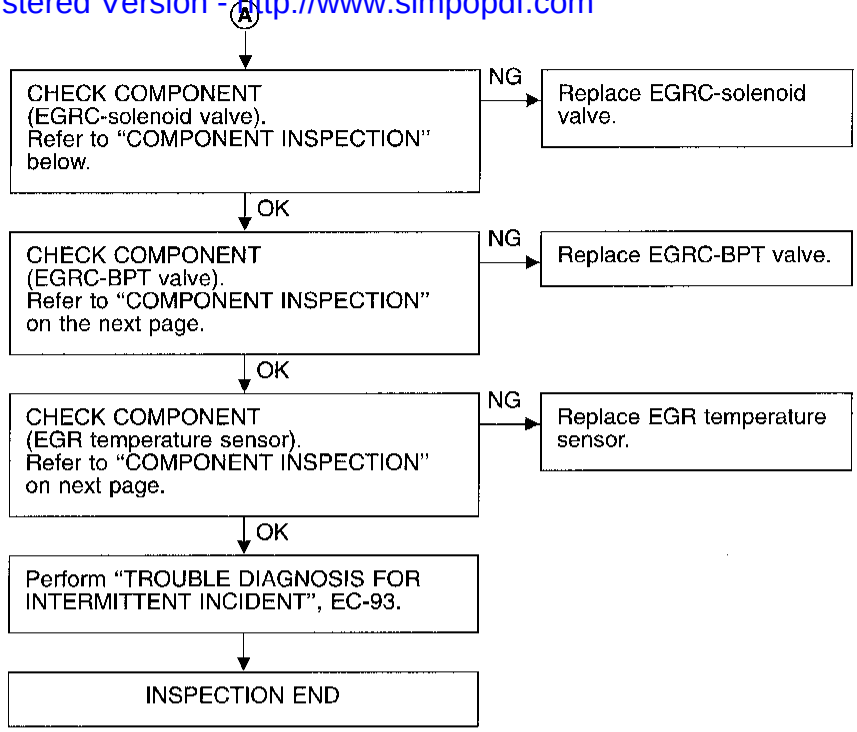
OR

1. Turn ignition switch "ON".
2. Check operating sound of the solenoid valve when disconnecting and reconnecting EGRC-solenoid valve harness connector. (The DTC or the 1st trip DTC for the EGRC-solenoid valve will be displayed, however, ignore it.)

NG → Check the following.
- Harness connectors (E43), (M65)
- Harness connectors (M59), (F27)
- 10A fuse
- Harness for open or short between fuse block and EGRC-solenoid valve
- Harness for open or short between ECM and EGRC-solenoid valve



If NG, repair open circuit or short to power in harness or connectors.



OK ↓

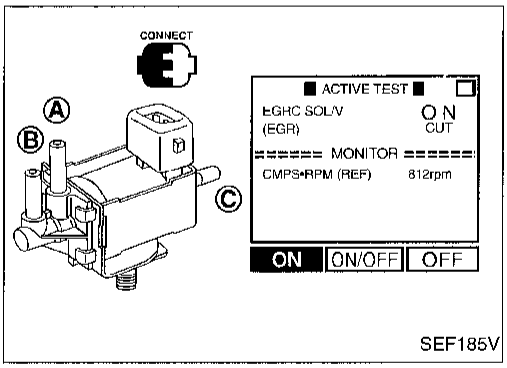
EGR Function (Close) (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

COMPONENT INSPECTION



EGR valve

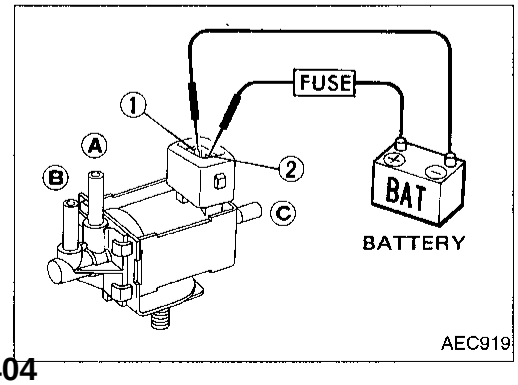
- Apply vacuum to EGR vacuum port with a hand vacuum pump.

EGR valve spring should lift.

- Check for sticking.

If NG, repair or replace EGR valve.

EGRC-solenoid valve

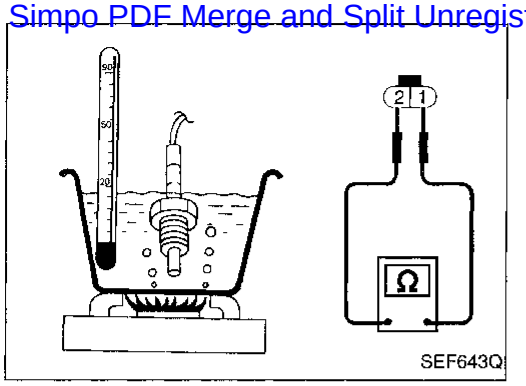


Check air passage continuity.

Perform "EGRC SOLENOID VALVE" in "ACTIVE TEST" mode.

Condition EGRC SOLENOID VALVE	Air passage continuity between Ⓐ and Ⓑ	Air passage continuity between Ⓐ and Ⓒ
ON	Yes	No
OFF	No	Yes

OR

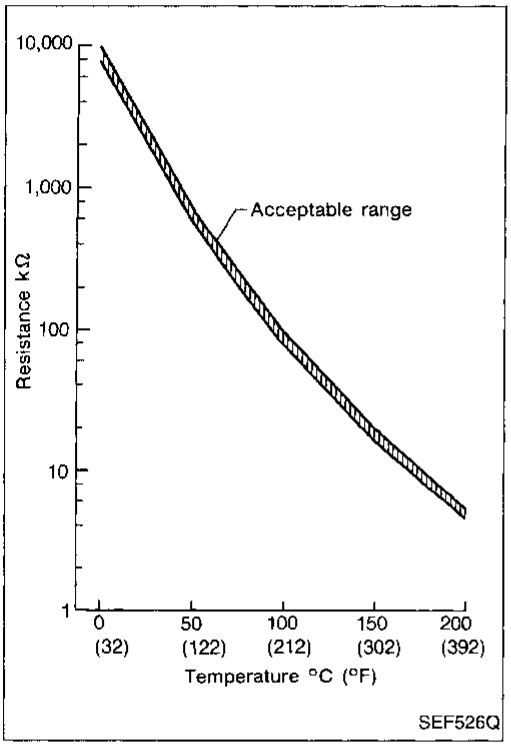


Condition	Air passage continuity between Ⓐ and Ⓑ	Air passage continuity between Ⓐ and Ⓒ
12V direct current supply between terminals ① and ②	Yes	No
No supply	No	Yes

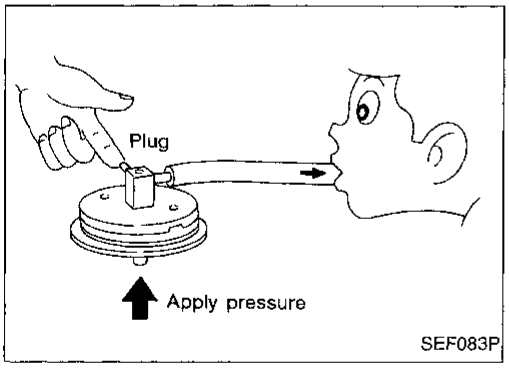
If NG or operation takes more than 1 second, replace EGRC-solenoid valve.

EGR Function (Close) (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



EGR temperature sensor

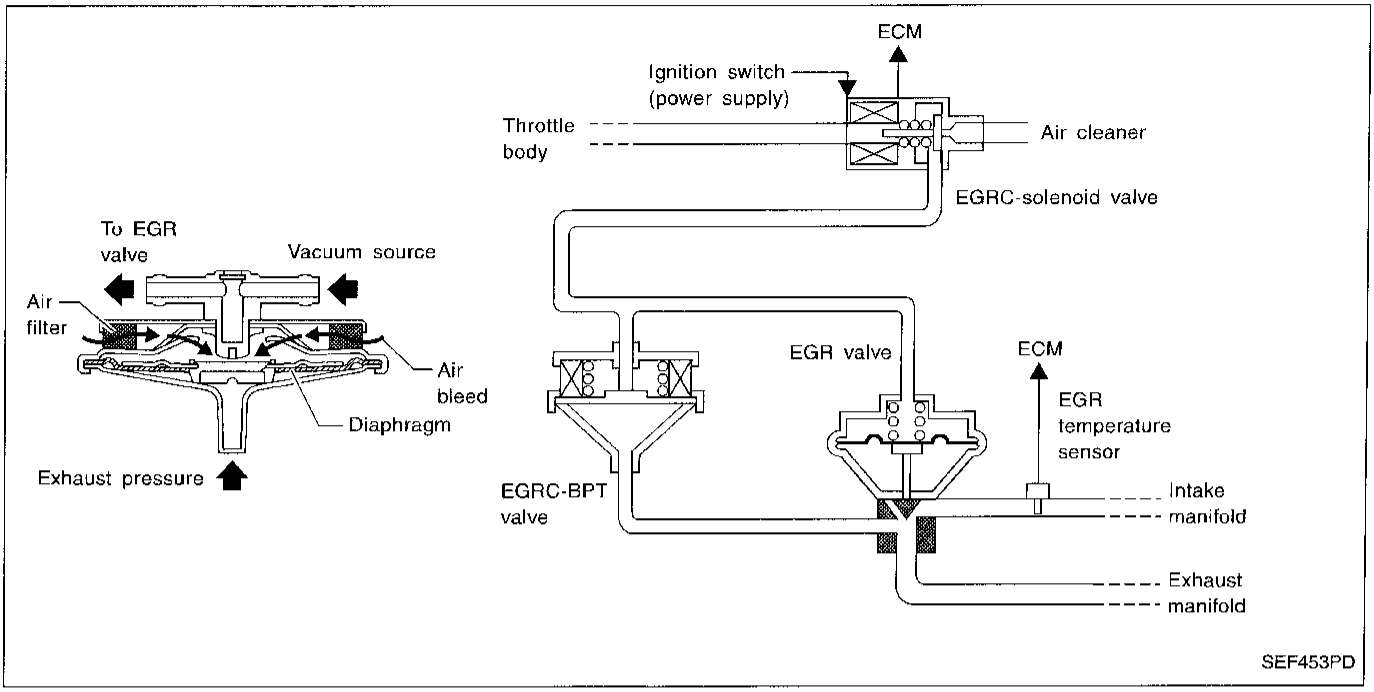


Check resistance change and resistance value.

<Reference data>

EGR temperature °C (°F)	Voltage V	Resistance MΩ
0 (32)	4.81	7.9 - 9.7
50 (122)	2.82	0.57 - 0.70
100 (212)	0.8	0.08 - 0.10

If NG, replace EGR temperature sensor.



EGRC-BPT valve

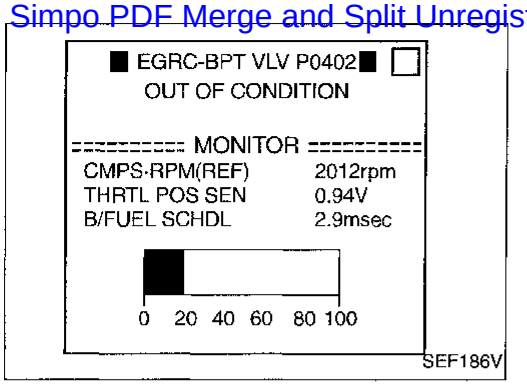
1. Plug one of two ports of EGRC-BPT valve.
2. Vacuum from the other port and check for leakage while applying a pressure above 0.981 kPa (100 mmH_2O, 3.94 inH_2O) from under EGRC-BPT valve.
3. If a leakage is noted, replace the valve.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

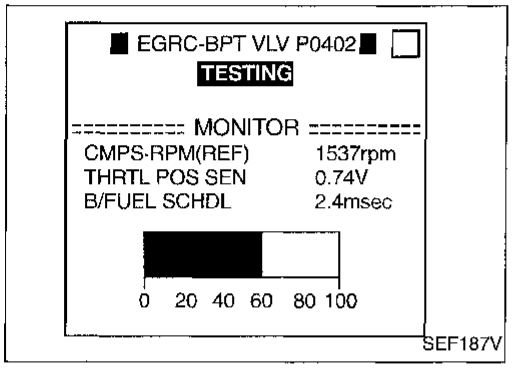
EGRC-BPT Valve Function

SYSTEM DESCRIPTION

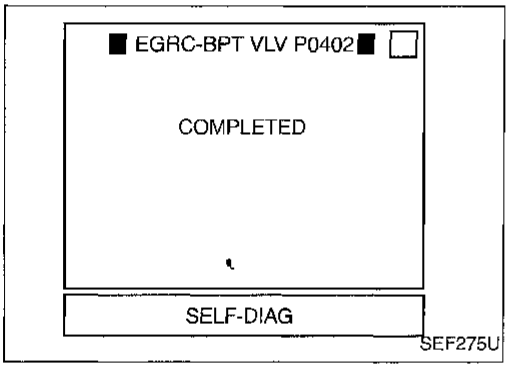
The EGRC-BPT valve monitors exhaust pressure to activate the diaphragm, controlling throttle body vacuum applied to the EGR valve. In other words, recirculated exhaust gas is controlled in response to positioning of the EGR valve or to engine operation.



ON BOARD DIAGNOSIS LOGIC



If too much EGR flow exists due to an EGRC-BPT valve malfunction, off idle engine roughness will increase. If the roughness is large, then the vacuum to the EGR valve is interrupted through the EGRC-solenoid valve. If the engine roughness is reduced at that time, the EGRC-BPT valve malfunction is indicated.



Diagnostic Trouble Code No.	Malfunction is detected when ...	Check Items (Possible Cause)
P0402 0306	● The EGRC-BPT valve does not operate properly.	● EGRC-BPT valve ● EGR valve ● Misconnected rubber tube ● Blocked rubber tube ● Camshaft position sensor ● Blocked exhaust system ● Orifice ● Mass air flow sensor ● EGRC-solenoid valve

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

CAUTION:
Always perform the test at a temperature of 5°C (41°F) or higher.

NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

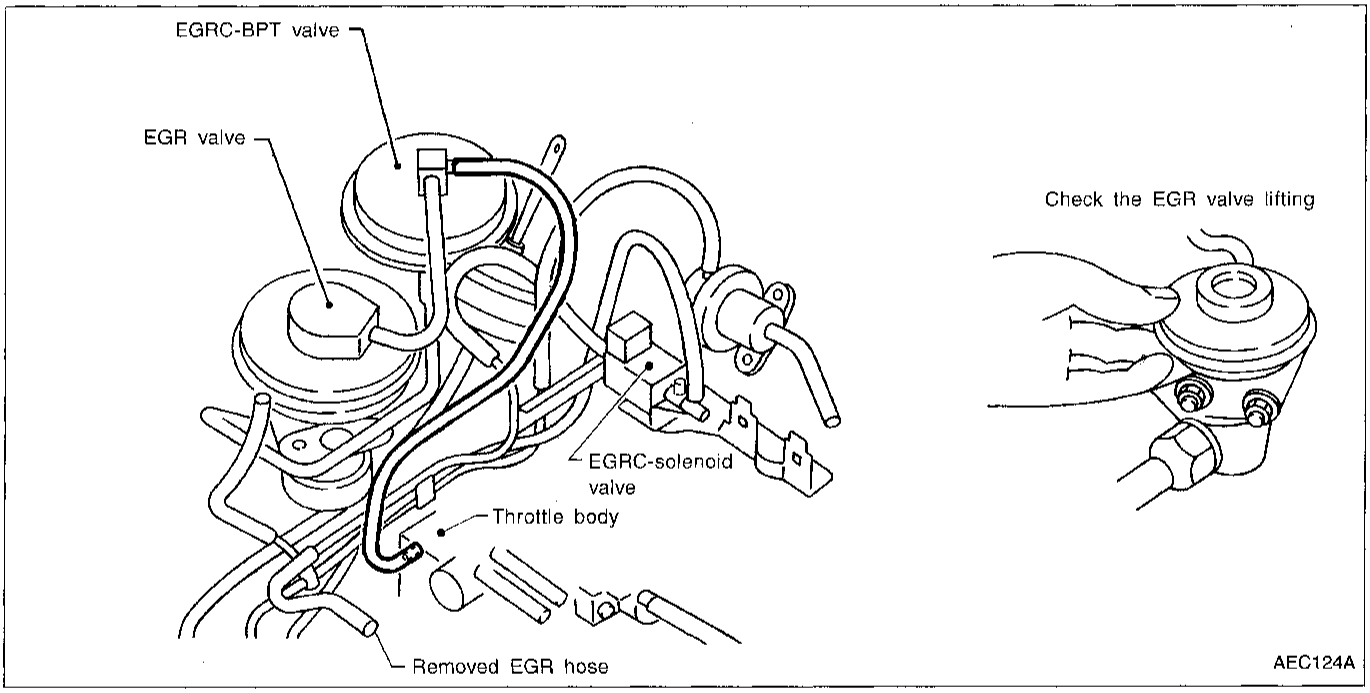
TESTING CONDITION:
Always drive vehicle at a safe speed.

1) Start engine and warm it up to normal operating temperature.
2) Stop engine and wait at least 5 seconds.
3) Turn ignition switch "ON" and select "EGRC-BPT/V P0402" of "EGR SYSTEM" in "DTC WORK SUPPORT" mode with CONSULT.
4) Start engine and let it idle.
5) Touch "START".
6) Check the output voltage of "THRTL POS SEN" (at closed throttle position) and note it.
7) When the following conditions are met, "TESTING" will be displayed on the CONSULT screen and the bar chart may increase. Maintain the conditions many times until "COMPLETED" appears.
   Selector lever: Suitable position
   CMPS·RPM (REF): 1,400 - 1,600 rpm (A/T)
   1,600 - 1,800 rpm (M/T)
   Vehicle speed: 30 - 54 km/h (19 - 34 MPH) (A/T)
   30 - 100 km/h (19 - 62 MPH) (M/T)
   B/FUEL SCHDL: 2.3 - 2.5 ms
   THRTL POS SEN: (X + 0.16) – (X + 0.26) V (A/T)
   (X + 0.19) – (X + 0.30) V (M/T)
   X = Voltage value measured at step 6)

- **The bar chart on CONSULT screen indicates the status of this test. However, the test may be finished before the bar chart becomes full scale.**
- **If the bar chart indication does not continue to progress, completely release accelerator pedal once and try to meet the conditions again.**
- **If "TESTING" does not appear on CONSULT screen, retry from step 2).**

8) If "OK" is displayed, carry out "OVERALL FUNCTION CHECK" on next page. If "NG" is displayed, refer to "DIAGNOSTIC PROCEDURE", EC-253.

OR

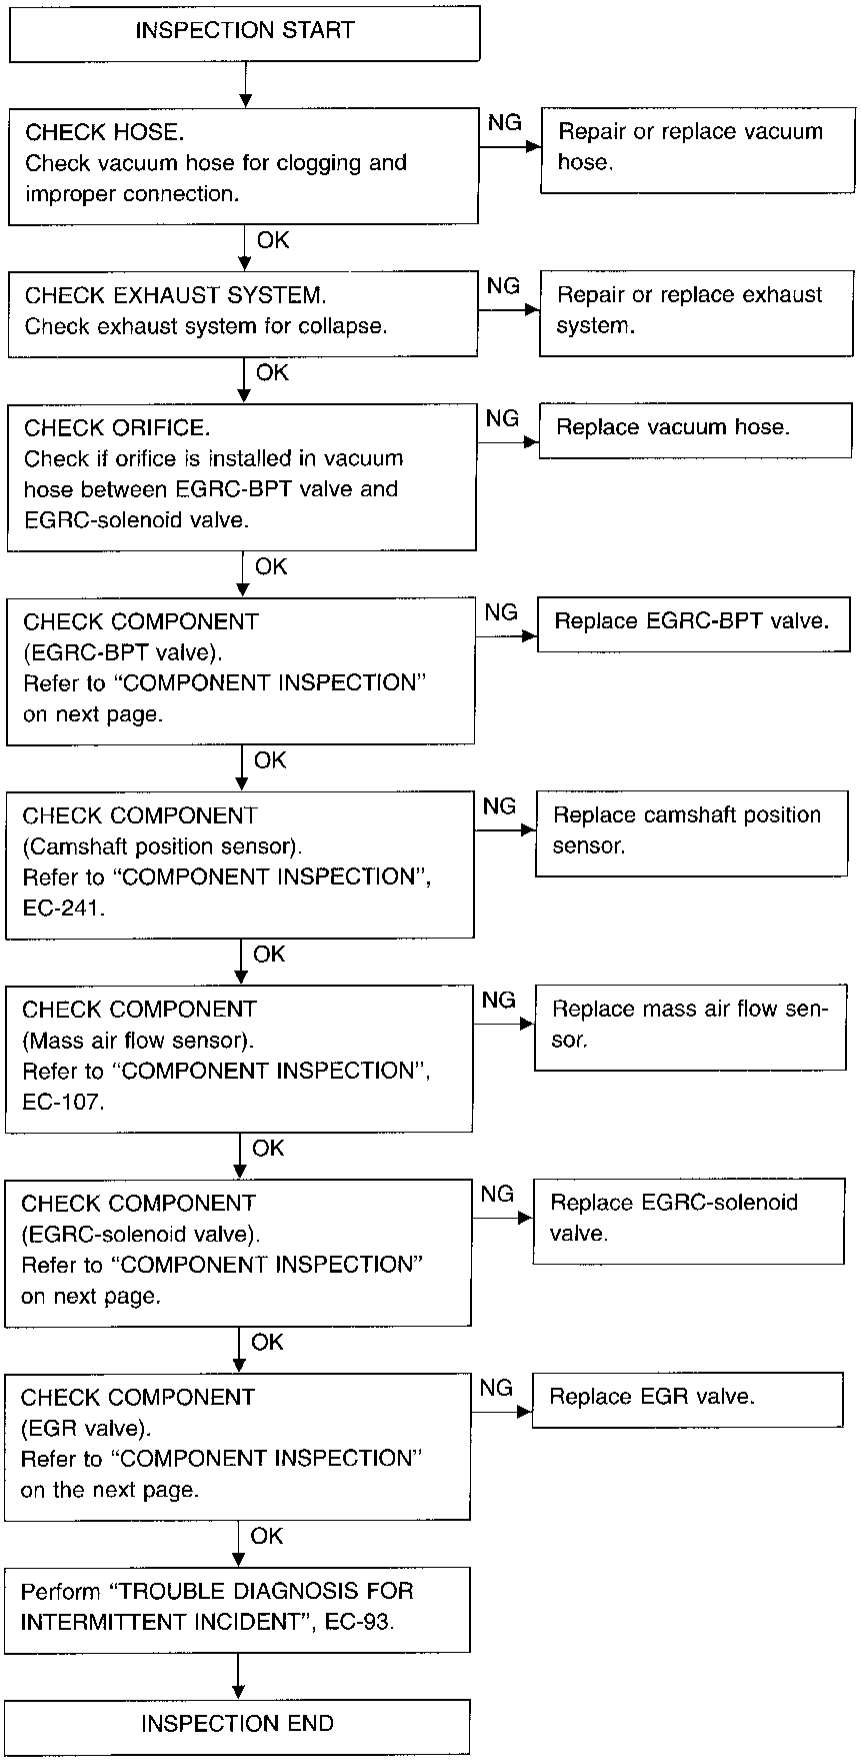


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

EGRC-BPT Valve Function (Cont'd)

OVERALL FUNCTION CHECK

Use this procedure to check the overall function of the EGRC-BPT valve. During this check, a 1st trip DTC might not be confirmed.



1) Disconnect the rubber tube to the fuel pressure regulator from the throttle body at the throttle body.
2) Disconnect the rubber tube to the EGRC-solenoid valve at the EGRC-BPT valve.
   Connect the throttle body and the EGRC-BPT valve directly with a rubber tube that has 0.5 mm (0.020 in) dia. orifice. (The intake manifold vacuum will be directly applied to the EGRC-BPT valve.)
3) Start engine.
4) Check for the EGR valve lifting with engine at idle speed.
   EGR valve should remain closed.
5) Check the EGR valve lifting when revving engine from 2,000 rpm up to 4,000 rpm quickly under no load.
   EGR valve should lift up, and go down without sticking when the engine is returned to idle.
6) Check rubber tube between EGRC-solenoid valve and throttle body for misconnection, cracks or blockages.

EGRC-BPT Valve Function (Cont'd)

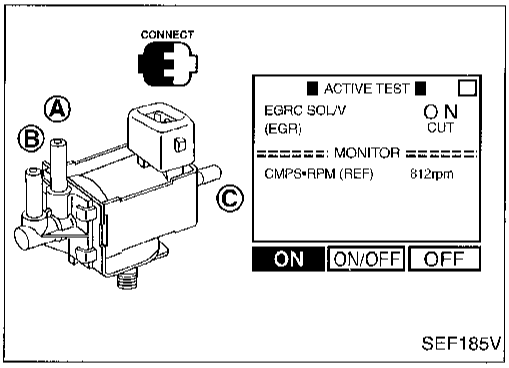
COMPONENT INSPECTION

EGRC-BPT valve

1. Plug one of two ports of EGRC-BPT valve.
2. Vacuum from the other port and check leakage without applying any pressure from under EGR-BPT valve.
   Leakage should exist.



EGR valve

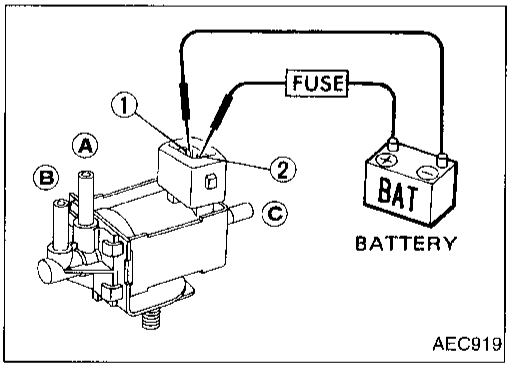
- Apply vacuum to EGR vacuum port with a hand vacuum pump.

EGR valve spring should lift.

- Check for sticking.

If NG, repair or replace EGR valve.

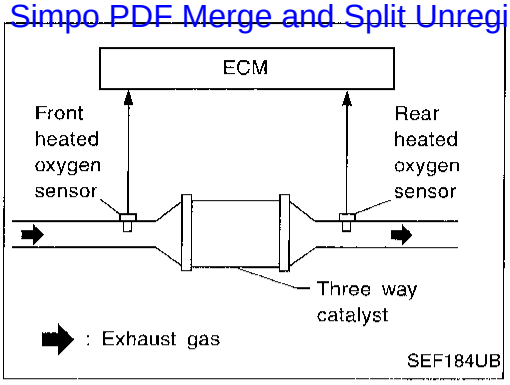
EGRC-solenoid valve



Check air passage continuity.

Perform "EGRC SOLENOID VALVE" in "ACTIVE TEST" mode.

Condition EGRC SOLENOID VALVE	Air passage continuity between Ⓐ and Ⓑ	Air passage continuity between Ⓐ and Ⓒ
ON	Yes	No
OFF	No	Yes



OR

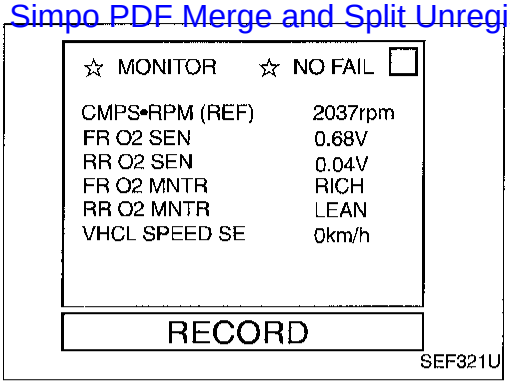
Condition	Air passage continuity between Ⓐ and Ⓑ	Air passage continuity between Ⓐ and Ⓒ
12V direct current supply between terminals ① and ②	Yes	No
No supply	No	Yes

If NG or operation takes more than 1 second, replace EGRC-solenoid valve.

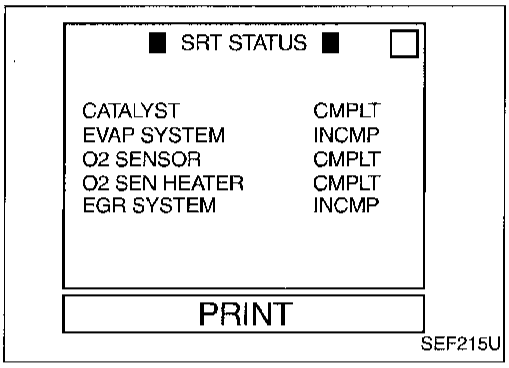
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Three-Way Catalyst Function

ON BOARD DIAGNOSIS LOGIC



The ECM monitors the switching frequency ratio of front and rear heated oxygen sensors.
Three-way catalyst* with high oxygen storage capacity will indicate a low switching frequency of rear heated oxygen sensor. As oxygen storage capacity decreases, the rear heated oxygen sensor switching frequency will increase.
When the frequency ratio of front and rear heated oxygen sensors approaches a specified limit value, the three-way catalyst* malfunction is diagnosed.
*: Warm-up three-way catalyst (For California)



Diagnostic Trouble Code No.	Malfunction is detected when ...	Check Items (Possible Cause)
P0420 0702	● Three-way catalyst* does not operate properly. ● Three-way catalyst* does not have enough oxygen storage capacity.	● Three-way catalyst* ● Exhaust tube ● Intake air leaks ● Injectors ● Injector leaks ● Spark plug ● Improper ignition timing

*: Warm-up three-way catalyst (For California)

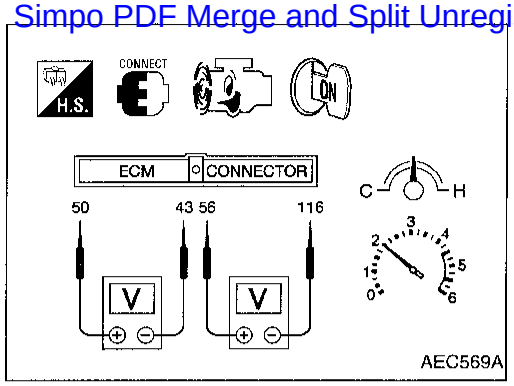
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Three-Way Catalyst Function (Cont'd)

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

CAUTION:
Always drive vehicle at a safe speed.

NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.



1) Start engine and warm it up to normal operating temperature.
2) Set "MANU TRIG" and "HI SPEED", then select "FR O2 SENSOR", "RR O2 SENSOR", "FR O2 MNTR", "RR O2 MNTR" in "DATA MONITOR" mode with CONSULT.
3) Touch "RECORD" on CONSULT screen with engine speed held at 2,000 rpm constantly under no load.
4) Make sure that the switching frequency between "RICH" and "LEAN" of "RR O2 MNTR" is much less than that of "FR O2 MNTR" as shown below.
   Switching frequency ratio =

   $$\frac{\text{Rear heated oxygen sensor switching frequency}}{\text{Front heated oxygen sensor switching frequency}}$$

   This ratio should be less than 0.75.
   If the ratio is greater than above, the warm-up three-way catalyst (Models for California), the three-way catalyst (Models except for California) is not operating properly.
   If the "FR O2 MNTR" does not indicate "RICH" and "LEAN" periodically more than 5 times within 10 seconds at step 3), perform "TROUBLE DIAGNOSES FOR DTC P0133" first. (See EC-162.)
   If the result is NG, go to "DIAGNOSTIC PROCEDURE", EC-258.
   If the result is OK, go to following step.
5) Select "AUTO TRIG" in "DATA MONITOR" mode with CONSULT.
6) Drive vehicle at a speed of approximately 84 to 96 km/h (52 to 60 MPH) with the following for at least 10 consecutive minutes.
   (Drive the vehicle in an area where vehicle speed and accelerator pressure can be held steady and constant.)
   M/T: 5th position
   A/T: D position ("OD" ON)
   If the result is NG, go to "DIAGNOSTIC PROCEDURE", EC-258.
7) Select "SRT STATUS" in "DTC CONFIRMATION" mode with CONSULT.
8) Verify that "CATALYST" is "CMPLT".
   If not "CMPLT", repeat the test from step 5).

Three-Way Catalyst Function (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

OR

OVERALL FUNCTION CHECK

Use this procedure to check the overall function of the three-way catalyst.

During this check, a 1st trip DTC might not be confirmed.

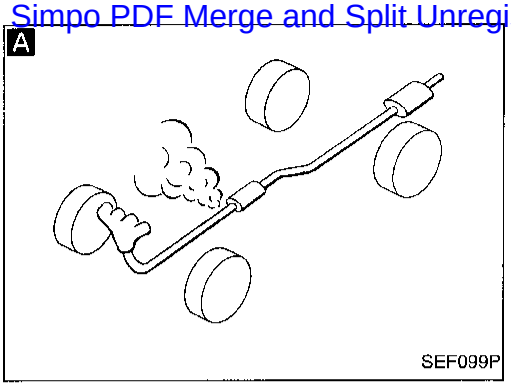
1) Start engine and warm it up to normal operating temperature.
2) Set voltmeters probes between ECM terminals 50 (front heated oxygen sensor signal) and 43 (ECM ground), and ECM terminals 56 (rear heated oxygen sensor signal) and 116 (ECM ground).
3) Keep engine speed at 2,000 rpm constant under no load.
4) Make sure that the voltage switching frequency (high & low) between ECM terminals 56 and 116 is much less than that of ECM terminals 50 and 43.

Switching frequency ratio =

$$\frac{\text{Rear heated oxygen sensor voltage switching frequency}}{\text{Front heated oxygen sensor voltage switching frequency}}$$

This ratio should be less than 0.75.

If the ratio is greater than above, it means three-way catalyst does not operate properly.



Note: If the voltage at terminal 50 does not switch periodically more than 5 times within 10 seconds at step 3, perform TROUBLE DIAGNOSIS FOR DTC P0133 first. (See EC-144.)

Three-Way Catalyst Function (Cont'd)

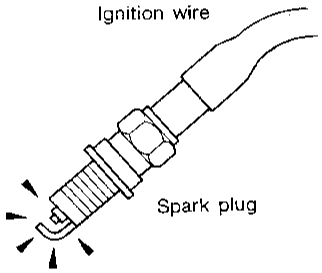
DIAGNOSTIC PROCEDURE

A



SEF099P

B

SEF189V

C

SEF282G

INSPECTION START

CHECK EXHAUST SYSTEM.
Visually check exhaust tubes and muffler for dent.

NG → Repair or replace it.

OK

A

CHECK EXHAUST AIR LEAK.
Start engine and run it at idle. Listen for an exhaust air leak before the warm-up three-way catalyst (California model), the three-way catalyst (Non-California model).

NG → Repair or replace.

OK

CHECK INTAKE AIR LEAK.
Start engine and run it at idle. Listen for an intake air leak after the mass air flow sensor.

NG → Repair or replace.

OK

B

CHECK INJECTORS.
1. Refer to WIRING DIAGRAM for Injectors, EC-404.
2. Stop engine and then turn ignition switch "ON".
3. Check voltage between ECM terminals (102), (104), (109) and (111) and ground with CONSULT or tester.
   Battery voltage should exist.

NG → Perform TROUBLE DIAGNOSIS FOR NON-DETECTABLE ITEMS, "Injector", EC-404. Repair harness or connectors.

OK

C

CHECK IGNITION SPARK.
1. Disconnect ignition wire from spark plug.
2. Connect a known good spark plug to the ignition wire.
3. Place end of spark plug against a suitable ground and crank engine.
4. Check for spark.

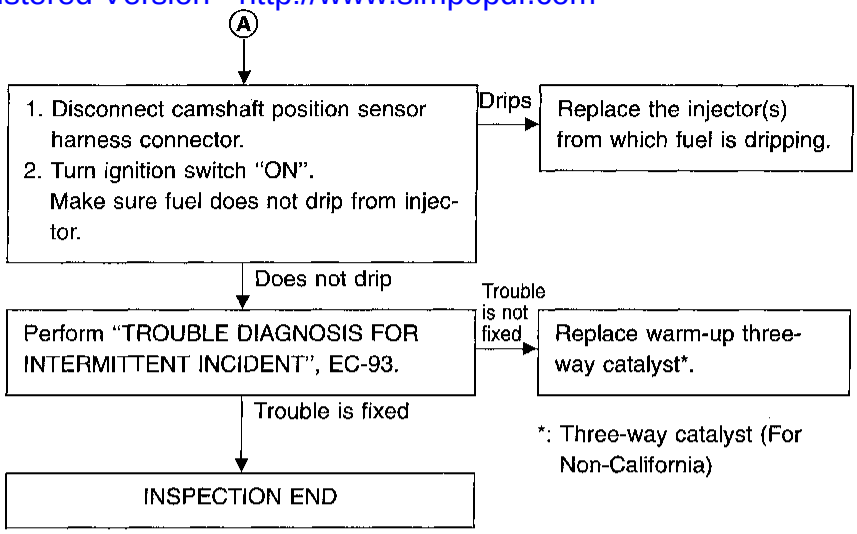
NG → CHECK COMPONENT (Ignition wires). Refer to "COMPONENT INSPECTION", EC-226.

OK → Check ignition coil, power transistor and their circuits. Refer to EC-315.

NG → Replace.

OK

Check for ignition timing.
Refer to "Basic Inspection", EC-71.



NG → Adjust ignition timing.

OK

1. Turn ignition switch "OFF".
2. Remove injector assembly.
   Refer to EC-27.
   Keep fuel hose and all injectors connected to injector gallery.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Evaporative Emission (EVAP) Control System (Small Leak) (Negative Pressure)

Note: If both DTC P0440 and P1448 are displayed, perform TROUBLE DIAGNOSIS FOR DTC P1448 first. (See EC-362.)

ON BOARD DIAGNOSIS LOGIC

This diagnosis detects leaks in the EVAP purge line using engine intake manifold vacuum.
If pressure does not increase, the ECM will check for leaks in the line between the fuel tank and EVAP canister purge volume control solenoid valve under the following "Vacuum test" conditions.
The vacuum cut valve bypass valve is opened to clear the line between the fuel tank and the EVAP canister purge volume control solenoid valve. The EVAP canister vent control valve will then be closed to shut the EVAP purge line off. The EVAP canister purge volume control solenoid valve is opened to depressurize the EVAP purge line using intake manifold vacuum. After this occurs, the EVAP canister purge volume control solenoid valve will be closed.

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P0440 0705	● EVAP control system has a leak. ● EVAP control system does not operate properly.	● Incorrect fuel tank vacuum relief valve ● Incorrect fuel filler cap used ● Fuel filler cap remains open or fails to close. ● Foreign matter caught in fuel filler cap. ● Leak is in line between intake manifold and EVAP canister purge volume control solenoid valve. ● Foreign matter caught in EVAP canister vent control valve. ● EVAP canister or fuel tank leaks ● EVAP purge line (pipe and rubber tube) leaks ● EVAP purge line rubber tube bent. ● Blocked or bent rubber tube to EVAP control system pressure sensor ● Loose or disconnected rubber tube ● EVAP canister vent control valve and the circuit ● EVAP canister purge volume control solenoid valve and the circuit ● Absolute pressure sensor ● Tank fuel temperature sensor ● MAP/BARO switch solenoid valve and the circuit ● Blocked or bent rubber tube to MAP/BARO switch solenoid valve ● O-ring of EVAP canister vent control valve is missing or damaged. ● Water separator ● EVAP canister is saturated with water. ● EVAP control system pressure sensor

CAUTION:

- **Use only a genuine NISSAN fuel filler cap as a replacement. If an incorrect fuel filler cap is used, the MIL may come on.**
- **If the fuel filler cap is not tightened properly, the MIL may come on.**
- **Use only a genuine rubber tube as a replacement.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Evaporative Emission (EVAP) Control System (Small Leak) (Negative Pressure) (Cont'd)

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

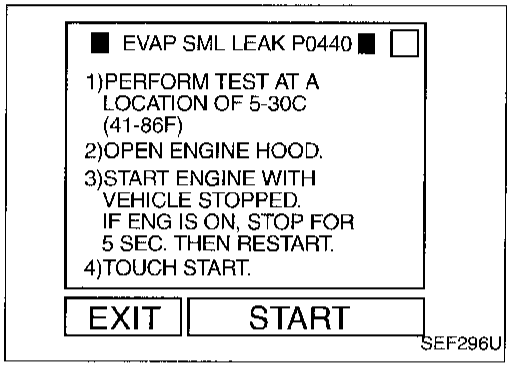
NOTE:

- **If both DTC P0440 and P1448 are displayed, perform TROUBLE DIAGNOSIS FOR DTC P1448 first. (See EC-373.)**
- **If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.**

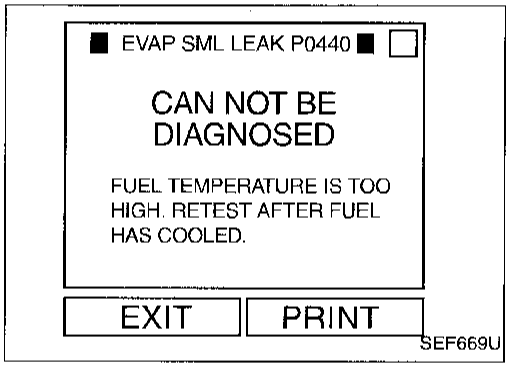
TESTING CONDITION:

- **Perform "DTC WORK SUPPORT" when the fuel level is less than 3/4 full and vehicle is placed on flat level surface.**
- **Always perform test at a temperature of 5 to 30°C (41 to 86°F).**
- **It is better that the fuel level is low.**

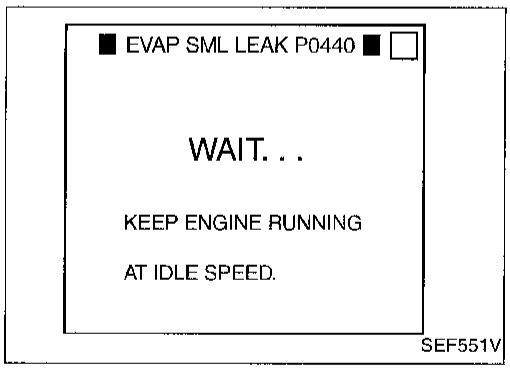
1) Turn ignition switch "ON".
2) Turn ignition switch "OFF" and wait at least 5 seconds.
3) Turn ignition switch "ON" and select "DATA MONITOR" mode with CONSULT.
4) Make sure that the following conditions are met.
   COOLAN TEMP/S: 0 - 70°C (32 - 158°F)
   INT/A TEMP SE: 5 - 60°C (41 - 140°F)
5) Select "EVAP SML LEAK P0440" of "EVAPORATIVE SYSTEM" in "DTC WORK SUPPORT" mode with CONSULT.
   Follow the instruction displayed.



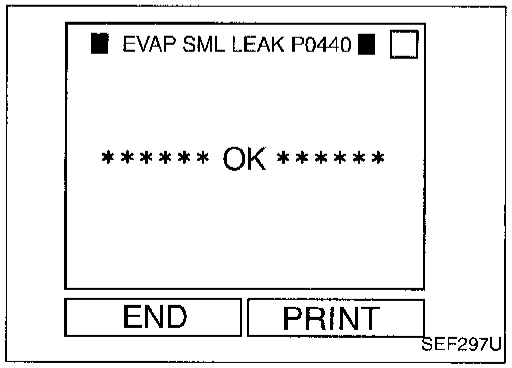
NOTE:



- **If the CONSULT screen shown at left is displayed, stop the engine and stabilize the vehicle temperature at 25°C (77°F) or cooler. After "TANK F/TMP SE" becomes less than 30°C (86°F), retest. (Use a fan to reduce the stabilization time.)**
- **If the engine speed cannot be maintained within the range displayed on CONSULT screen, go to "Basic Inspection", EC-71.**
- **The engine idle portion of this test (See illustration at left.) will take approximately 5 minutes.**



6) Make sure that "OK" is displayed.
   If "NG" is displayed, refer to "DIAGNOSTIC PROCEDURE", EC-263.



NOTE:

- **Make sure that EVAP hoses are connected to EVAP canister purge volume control solenoid valve properly.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Evaporative Emission (EVAP) Control System (Small Leak) (Negative Pressure) (Cont'd)

OR

NOTE:
Be sure to read the explanation of "Driving pattern" on EC-39 before driving vehicle.

1) Start engine.
2) Drive vehicle according to "Driving pattern", EC-39.
3) Stop vehicle.
4) Select "MODE 1" with GST.
- If SRT of EVAP system is not set yet, go to the following step.
- If SRT of EVAP system is set, the result will be OK.

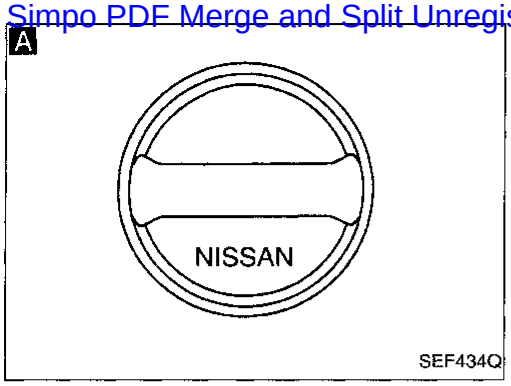
5) Turn ignition switch "OFF" and wait at least 5 seconds.
6) Start engine.

It is not necessary to cool engine down before driving.

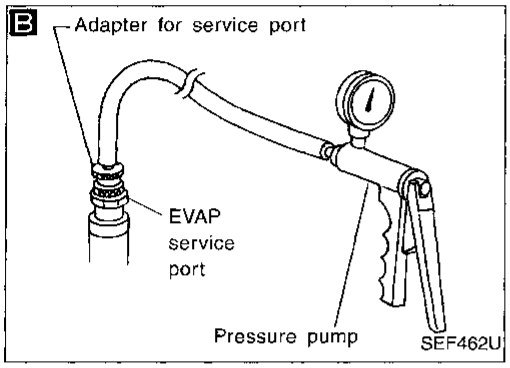
7) Drive vehicle again according to the "Driving pattern", EC-39.
8) Stop vehicle.
9) Select "MODE 3" with GST.
- If P1447 is displayed on the screen, go to "TROUBLE DIAGNOSIS FOR DTC P1447", EC-367.
- If P0440 is displayed on the screen, go to "DIAGNOSTIC PROCEDURE", EC-263.
- If P1440 is displayed on the screen, go to "DIAGNOSTIC PROCEDURE" in "TROUBLE DIAGNOSIS FOR DTC P1440", EC-348.
- If P0440, P1440 and P1447 are not displayed on the screen, go to the following step.

10) Select "MODE 1" with GST.
- If SRT of EVAP system is set, the result will be OK.
- If SRT of EVAP system is not set, go to step 6).

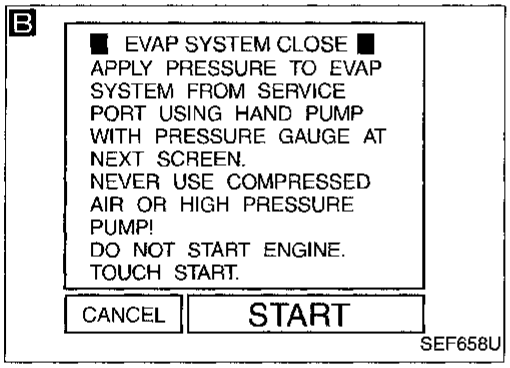
OR



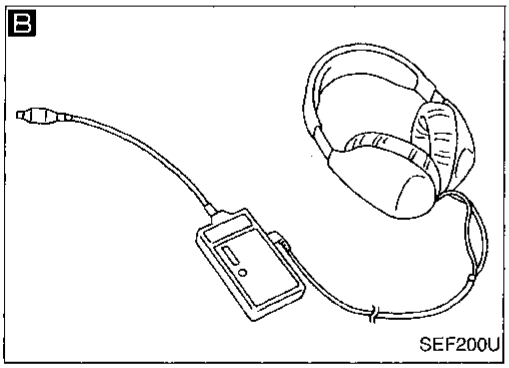
NOTE:
- **Be sure to read the explanation of "Driving pattern" on EC-39 before driving vehicle.**
- **It is better that the fuel level is low.**



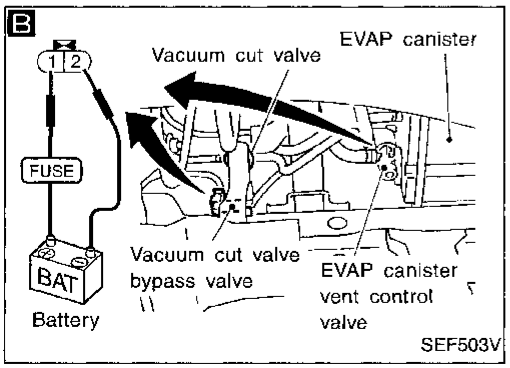
1) Start engine.
2) Drive vehicle according to "Driving pattern", EC-39.
3) Stop vehicle.
4) Turn ignition switch "OFF" and wait at least 5 seconds.
5) Perform the step 1) to 4) again.
6) Turn ignition switch "ON" and perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Evaporative Emission (EVAP) Control System (Small Leak) (Negative Pressure) (Cont'd)



DIAGNOSTIC PROCEDURE

INSPECTION START

A

CHECK FUEL FILLER CAP.
1. Check for genuine NISSAN fuel filler cap design.
2. Check for air releasing sound while opening the fuel filler cap.
   If the air releasing sound is heard, go to **B** .
   If the air releasing sound is not heard, check the following.
   Was the cap tightened properly?
   If Yes, check fuel filler cap vacuum relief valve.
   Refer to "EVAPORATIVE EMISSION SYSTEM", EC-20.
   If No, open fuel filler cap, then clean cap and filler neck thread using air blower. Retighten until ratcheting sound is heard.

NG → If genuine NISSAN filler cap is not used, replace with genuine NISSAN fuel filler cap.

OK ↓

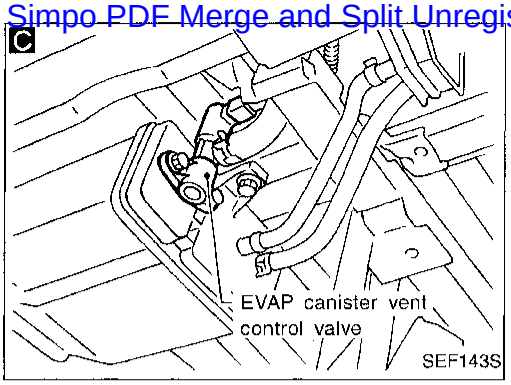
B

CHECK FOR EVAP LEAK.
- **Never use compressed air or high pressure pump.**
- **Improper installation of service port may cause leaking.**
- **Do not exceed 4.12 kPa (0.042 kg/cm², 0.6 psi) of pressure in the system.**

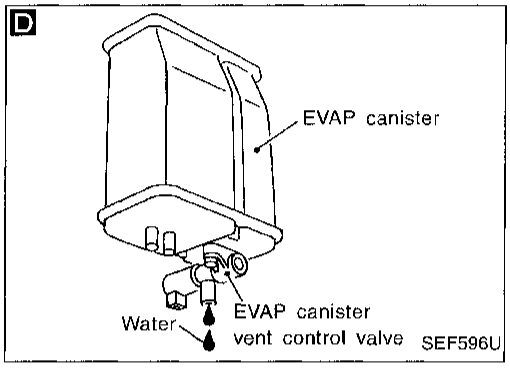
To locate EVAP leak portion, proceed with the following steps.
1. Install the EVAP service port adapter and the pressure pump securely.
2. Turn ignition switch "ON".
   Select "EVAP SYSTEM CLOSE" of "WORK SUPPORT" mode with CONSULT.
3. Touch "START" and apply vacuum into the EVAP line until the pressure indicator reaches the middle of bar graph.
4. Using EVAP leak detector, locate the leak portion. For the leak detector, refer to instruction manual for more details.
   Refer to "EVAPORATIVE EMISSION SYSTEM", EC-20.

NG → Repair or replace.

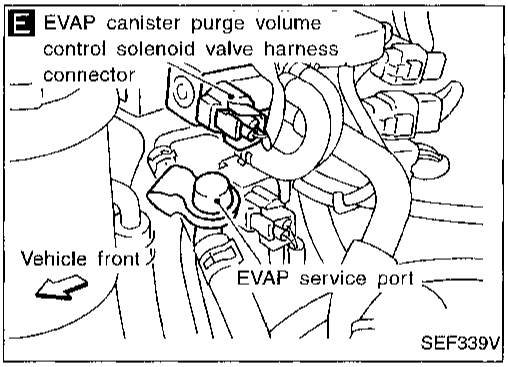
OR



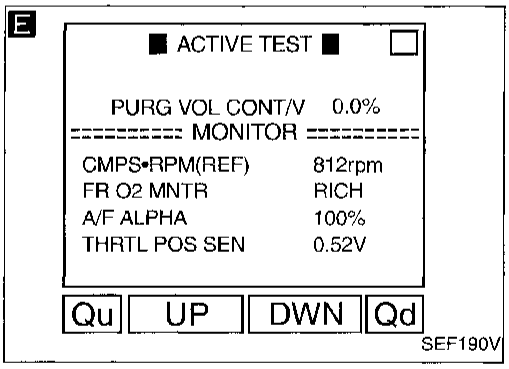
2. Turn ignition switch "OFF".
3. Apply 12 volts DC to EVAP canister vent control valve. The valve will close. (Continue to apply 12 volts until the end of test.)
4. Apply 12 volts DC to vacuum cut valve bypass valve. The valve will open. (Continue to apply 12 volts until the end of test.)
5. Pressurize the EVAP line using pressure pump with 1.3 to 2.7 kPa (10 to 20 mmHg, 0.39 to 0.79 inHg).
6. Locate the leak using a leak detector. Refer to the instruction manual for more details about the leak detector. Refer to "Evaporative Emission Line Drawing", EC-23.



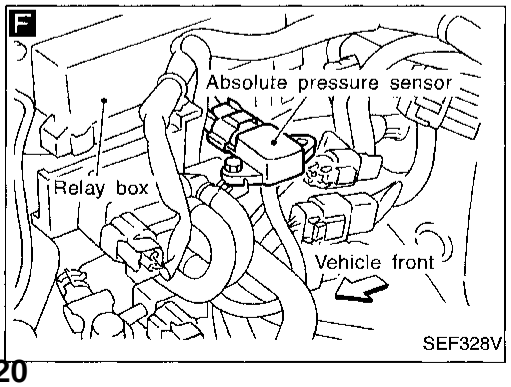
OK ↓



Ⓐ (Go to next page.)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Evaporative Emission (EVAP) Control System (Small Leak) (Negative Pressure) (Cont'd)

Ⓐ

C

CHECK COMPONENT AND CIRCUIT
(EVAP canister vent control valve, O-ring and water separator).
Refer to "TROUBLE DIAGNOSIS FOR DTC P0446" for circuit, EC-276 and "COMPONENT INSPECTION", EC-280.

NG → Repair or replace EVAP canister vent control valve and O-ring or harness/ connector.

OK ↓

D

CHECK IF EVAP CANISTER SATURATED WITH WATER.
1. Remove EVAP canister with EVAP canister vent control valve attached.
2. Check if water will drain from the EVAP canister. If it will, weigh the EVAP canister with the vent control valve attached.
   If the weight is:
   More than 1.8 kg (4.0 lb) → NG
   Less than 1.8 kg (4.0 lb) → OK

NG → Check the following.
1. Visually check the EVAP canister for damage.
2. Check hose connection between EVAP canister and water separator for clogging and poor connection.
3. Check water separator. Refer to "COMPONENT INSPECTION", EC-366.

If NG, repair hose or replace EVAP canister or water separator.

OK ↓

E

CHECK COMPONENT (EVAP canister purge volume control solenoid valve).

1. Disconnect EVAP hose to EVAP canister purge volume control solenoid valve at EVAP service port.
2. Start engine.
3. Perform "PURG VOL CONT/V" in "ACTIVE TEST" mode.
4. Touch "Qu" on CONSULT screen to increase "PURG VOL CONT/V" opening to 100.0%.
5. Check EVAP hose for vacuum.
   Vacuum should exist.

— OR —

1. Start engine and warm it up to normal operating temperature.
2. Stop engine.
3. Disconnect EVAP hose to EVAP canister purge volume control solenoid valve.
4. Start engine and let it idle for at least 60 seconds.
5. Check EVAP hose for vacuum.
   Vacuum should exist.

NG → Check the following.
- EVAP canister purge volume control solenoid valve
  Refer to "COMPONENT INSPECTION", EC-266.
- Vacuum hoses for clogging or disconnection
  Refer to "Vacuum Hose Drawing", EC-13.

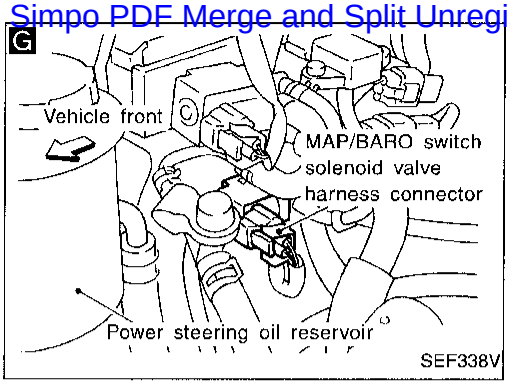
OK ↓

F

CHECK COMPONENT
(Absolute pressure sensor).
Refer to "COMPONENT INSPECTION", EC-353.

NG → Replace absolute pressure sensor.

OK ↓



Ⓑ

G

H

Ⓑ

G

CHECK COMPONENT AND CIRCUIT (MAP/BARO switch solenoid valve). Refer to "TROUBLE DIAGNOSIS FOR DTC P1105", EC-304.

NG → Repair or replace MAP/BARO switch solenoid valve or harness/connector.

OK ↓

H

CHECK COMPONENT (Tank fuel temperature sensor). Refer to "COMPONENT INSPECTION", EC-354.

NG → Replace tank fuel temperature sensor.

OK ↓

CHECK COMPONENT (EVAP control system pressure sensor). Refer to "COMPONENT INSPECTION", EC-365.

NG → Replace EVAP control system pressure sensor.

OK ↓

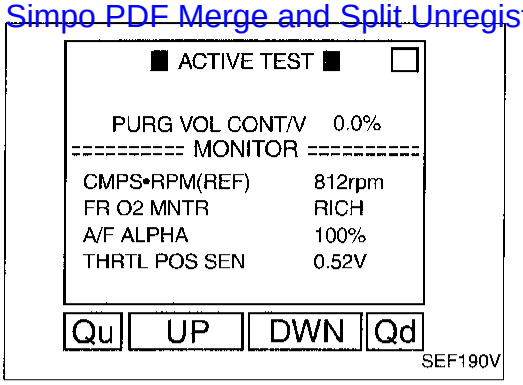
CHECK COMPONENT. Check EVAP purge line (pipe, rubber tube, fuel tank and EVAP canister) for cracks or improper connection. Refer to "EVAPORATIVE EMISSION SYSTEM", EC-23.

NG → Repair or reconnect the hose.

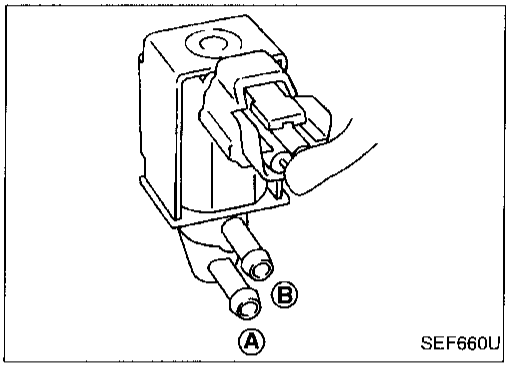
OK ↓

Clean EVAP purge line (pipe and rubber tube) using air blower.

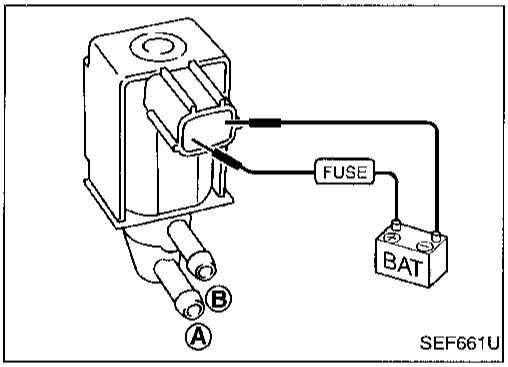
↓



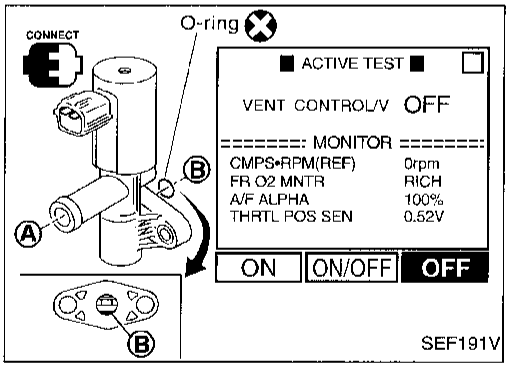
Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.



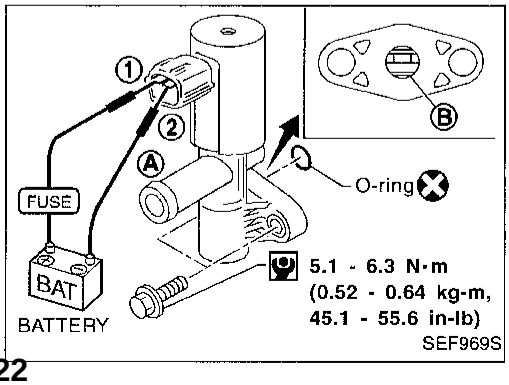
↓



INSPECTION END



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Evaporative Emission (EVAP) Control System (Small Leak) (Negative Pressure) (Cont'd)

COMPONENT INSPECTION

EVAP canister purge volume control solenoid valve

1. Start engine.
2. Perform "PURG VOL CONT/V" in "ACTIVE TEST" mode with CONSULT. Check that engine speed varies according to the valve opening.
   If OK, inspection end. If NG, go to following step.
3. Check air passage continuity.

Condition PURG VOL CONT/V value	Air passage continuity between (A) and (B)
100.0%	Yes
0.0%	No

If NG, replace the EVAP canister purge volume control solenoid valve.

OR

Check air passage continuity.

Condition	Air passage continuity between (A) and (B)
12V direct current supply between terminals	Yes
No supply	No

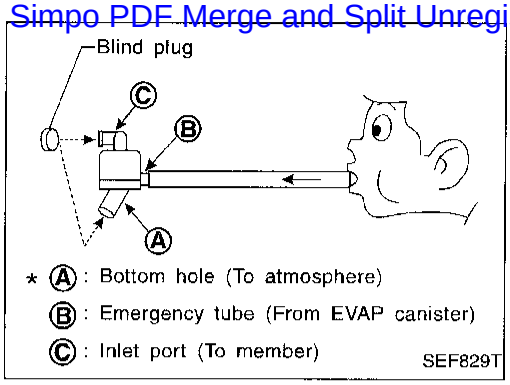
If NG or operation takes more than 1 second, replace solenoid valve.

EVAP canister vent control valve

Check air passage continuity.

Perform "VENT CONTROL/V" in "ACTIVE TEST" mode.

Condition VENT CONTROL/V	Air passage continuity between (A) and (B)
ON	No
OFF	Yes

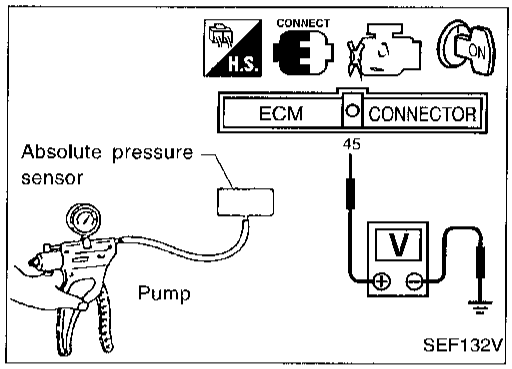


OR

Condition	Air passage continuity between (A) and (B)
12V direct current supply between terminals (1) and (2)	No
No supply	Yes

If NG or operation takes more than 1 second, clean valve using air blower or replace as necessary.
If portion (B) is rusted, replace control valve.
Make sure new O-ring is installed properly.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Evaporative Emission (EVAP) Control System (Small Leak) (Negative Pressure) (Cont'd)

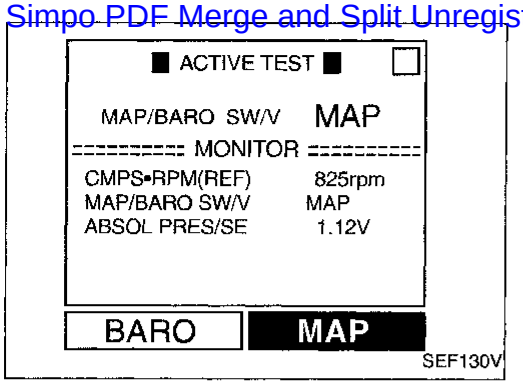
Water separator

1. Check visually for insect nests in the water separator air inlet.
2. Check visually for cracks or flaws in the appearance.
3. Check visually for cracks or flaws in the hose.
4. Check that Ⓐ and Ⓒ are not clogged by blowing air into Ⓑ with Ⓐ, and then Ⓒ plugged.
5. In case of NG in items 2 - 4, replace the parts.

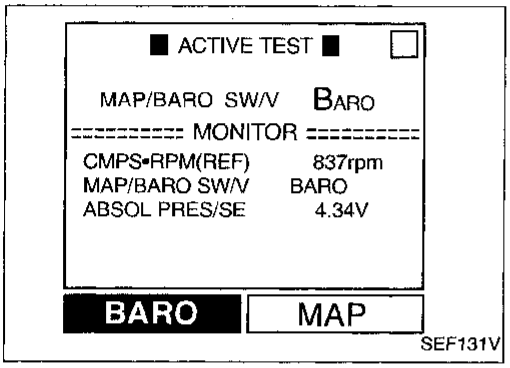
- **Do not disassemble water separator.**

Absolute pressure sensor

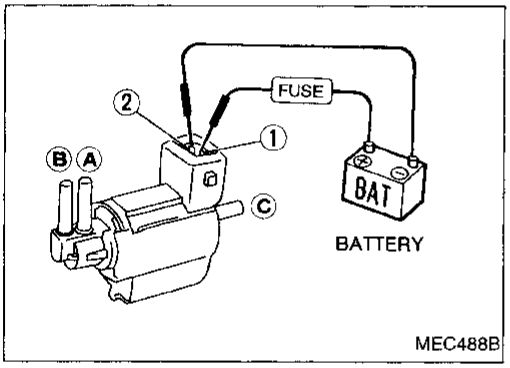
1. Remove absolute pressure sensor with its harness connector connected.
2. Remove hose from absolute pressure sensor.
3. Turn ignition switch "ON" and check output voltage between ECM terminal ㊺ and engine ground.
   The voltage should be 3.2 to 4.8V.
4. Use pump to apply vacuum of –26.7 kPa (–200 mmHg, –7.87 inHg) to absolute pressure sensor as shown in figure and check the output voltage.
   The voltage should be 1.0 to 1.4V lower than the value measured in step 3.



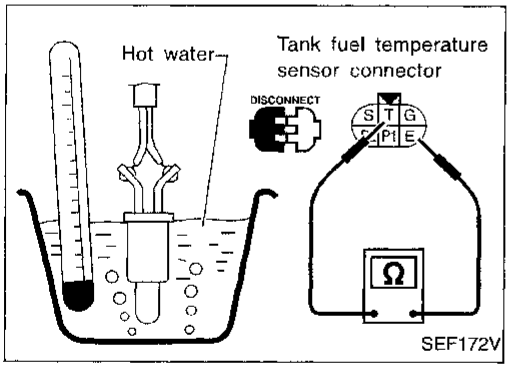
CAUTION:



- **Always calibrate the vacuum pump gauge when using it.**
- **Do not apply vacuum below –93.3 kPa (–700 mmHg, –27.56 inHg) or pressure over 101.3 kPa (760 mmHg, 29.92 inHg).**



5. If NG, replace absolute pressure sensor.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Evaporative Emission (EVAP) Control System (Small Leak) (Negative Pressure) (Cont'd)

MAP/BARO switch solenoid valve

1. Start engine and warm it up to normal operating temperature.
2. Perform "MAP/BARO SW/V" in "ACTIVE TEST" mode with CONSULT.
3. Check the following.
   - Condition: At idle under no-load
   - CONSULT display

MAP/BARO	ABSOL PRES/SE (Voltage)
BARO	More than 2.6V
MAP	Less than the voltage at BARO

- Time for voltage to change

MAP/BARO SW/V	Time to switch
BARO to MAP	Less than 1 second
MAP to BARO	

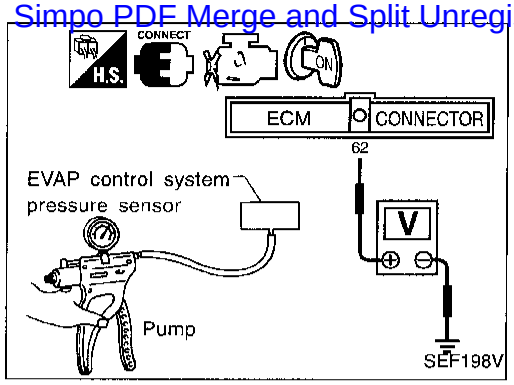
4. If NG, check solenoid valve as shown below.

OR

1. Remove MAP/BARO switch solenoid valve.
2. Check air passage continuity.

Condition	Air passage continuity between Ⓐ and Ⓑ	Air passage continuity between Ⓐ and Ⓒ
12V direct current supply between terminals ① and ②	Yes	No
No supply	No	Yes

3. If NG or operation takes more than 1 second, replace solenoid valve.



Tank fuel temperature sensor

Check resistance by heating with hot water or heat gun as shown in the figure.

Temperature °C (°F)	Resistance kΩ
20 (68)	2.3 - 2.7
50 (122)	0.79 - 0.90

If NG, replace tank fuel temperature sensor.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Evaporative Emission (EVAP) Control System (Small Leak) (Negative Pressure) (Cont'd)

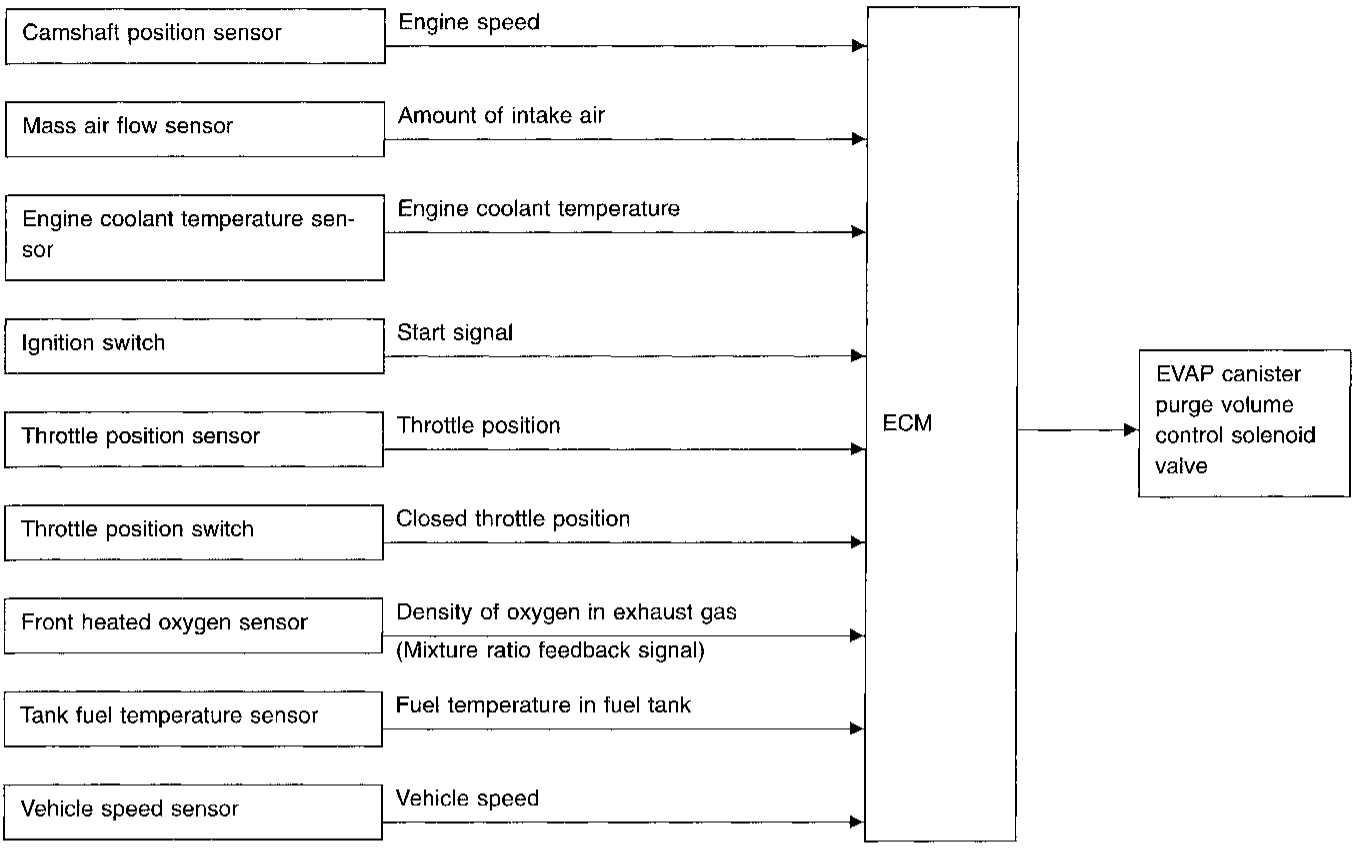
COMPONENT INSPECTION

EVAP control system pressure sensor

1. Remove EVAP control system pressure sensor with its harness connector connected.
2. Remove hose from EVAP control system pressure sensor.
3. Use pump to apply vacuum and pressure to EVAP control system pressure sensor as shown in figure.
4. Check output voltage between ECM terminal (62) and engine ground.

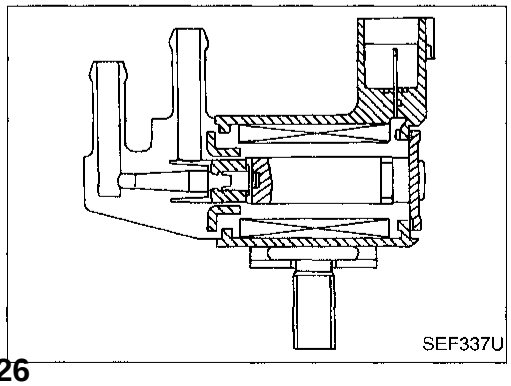
Pressure (Relative to atmospheric pressure)	Voltage (V)
0 kPa (0 mmHg, 0 inHg)	3.0 - 3.6
–9.3 kPa (–70 mmHg, –2.76 inHg)	0.4 - 0.6

CAUTION:



- **Always calibrate the vacuum pump gauge when using it.**
- **Do not apply vacuum below –20 kPa (–150 mmHg, –5.91 inHg) or pressure over 20.0 kPa (150 mmHg, 5.91 inHg).**

5. If NG, replace EVAP control system pressure sensor.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Evaporative Emission (EVAP) Canister Purge Volume Control Solenoid Valve (Circuit)

SYSTEM DESCRIPTION

This system controls flow rate of fuel vapor from the EVAP canister. The opening of the vapor by-pass passage in the EVAP canister purge volume control solenoid valve changes to control the flow rate. The EVAP canister purge volume control solenoid valve repeats ON/OFF operation according to the signal sent from the ECM. The opening of the valve varies for optimum engine control. The optimum value stored in the ECM is determined by considering various engine conditions. When the engine is operating, the flow rate of fuel vapor from the EVAP canister is regulated as the air flow changes.

COMPONENT DESCRIPTION

The EVAP canister purge volume control solenoid valve uses a ON/OFF duty to control the flow rate of fuel vapor from the EVAP canister. The EVAP canister purge volume control solenoid valve is moved by ON/OFF pulses from the ECM. The longer the ON pulse, the greater the amount of fuel vapor that will flow through the valve.

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

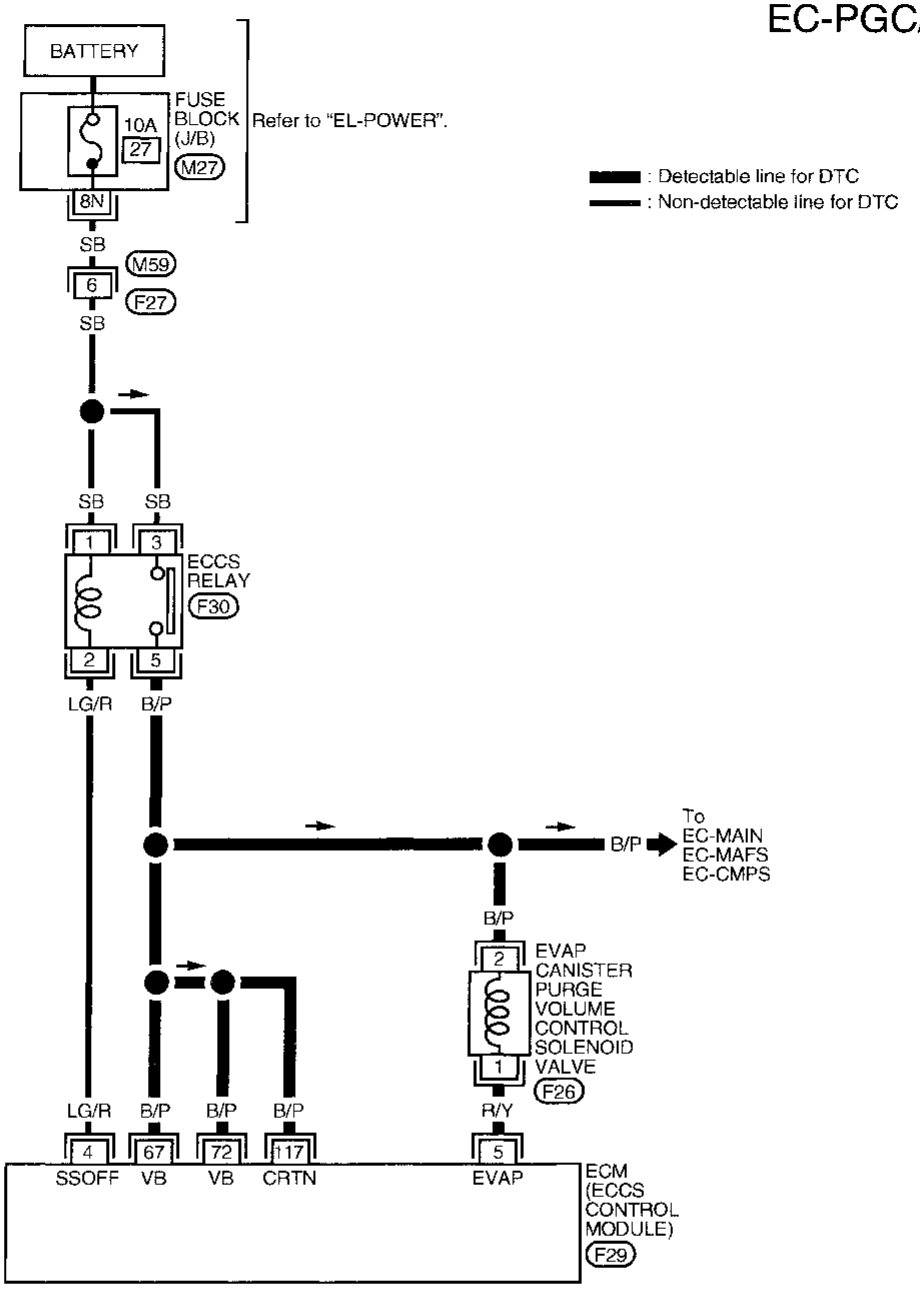
NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

TESTING CONDITION:
Before performing the following procedure, confirm battery voltage is between 11V and 16V at idle.

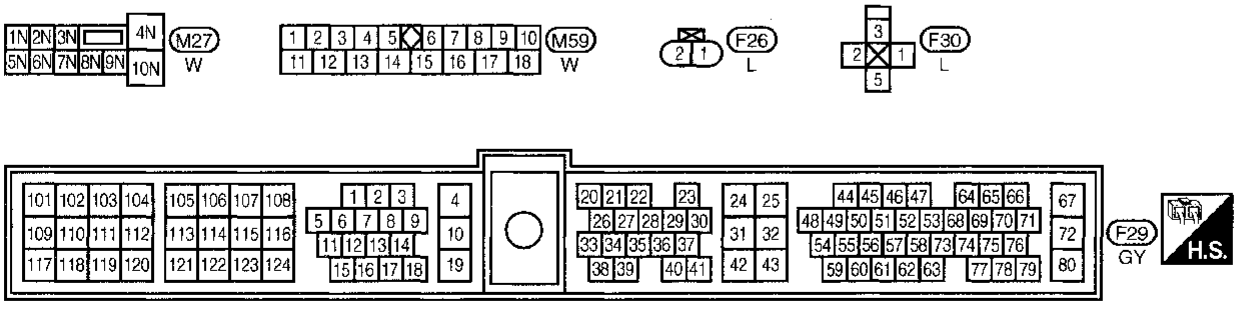
1) Turn ignition switch "ON".
2) Select "DATA MONITOR" mode with CONSULT.
3) Start engine and let it idle for at least 14 seconds.

OR

1) Start engine and let it idle for at least 14 seconds.
2) Select "MODE 7" with GST.



OR



1) Start engine and let it idle for at least 14 seconds.
2) Turn ignition switch "OFF" and wait at least 5 seconds.
3) Turn ignition switch "ON" and perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.

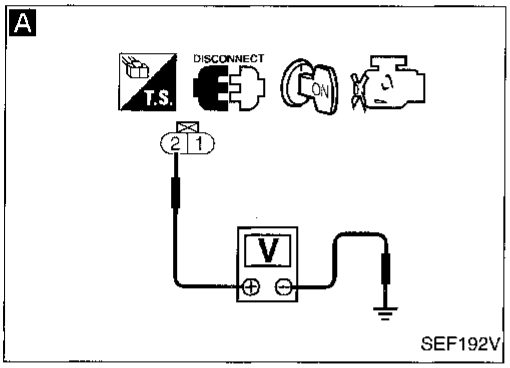
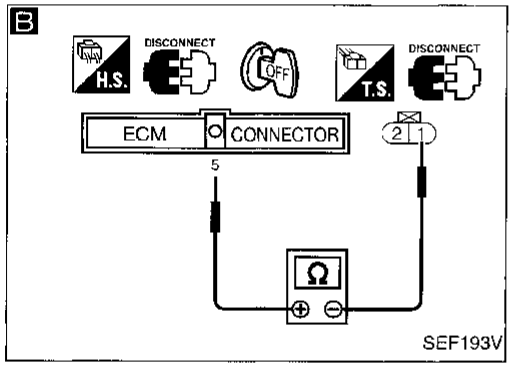
EC-PGC/V-01





Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Evaporative Emission (EVAP) Canister Purge Volume Control Solenoid Valve (Circuit) (Cont'd)

DIAGNOSTIC PROCEDURE

INSPECTION START

A

CHECK POWER SUPPLY.
1. Turn ignition switch "OFF".
2. Disconnect EVAP canister purge volume control solenoid valve harness connector.
3. Turn ignition switch "ON".
4. Check voltage between terminal ② and engine ground with CONSULT or tester.
   Voltage: Battery voltage

NG → Check the following.
- Harness for open or short between EVAP canister purge volume control solenoid valve and ECCS relay
- Harness for open or short between EVAP canister purge volume control solenoid valve and ECM

If NG, repair harness or connectors.

OK ↓

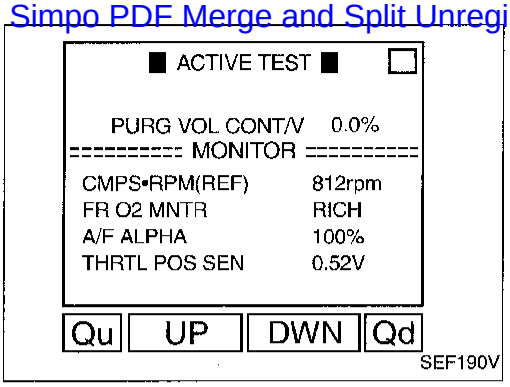
B

CHECK OUTPUT SIGNAL CIRCUIT.
1. Turn ignition switch "OFF".
2. Disconnect ECM harness connector.
3. Check harness continuity between ECM terminal ⑤ and terminal ①.
   Continuity should exist.
   If OK, check harness for short to ground and short to power.

NG → Repair open circuit, short to ground or short to power in harness or connectors.

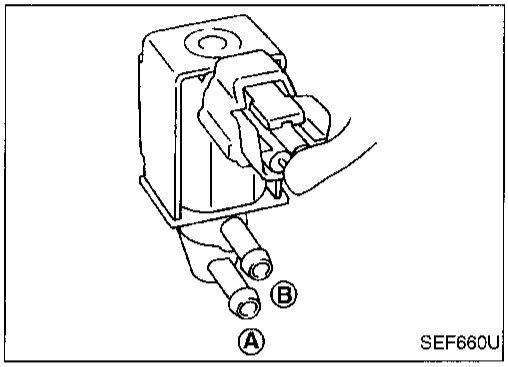
OK ↓

CHECK COMPONENT
(EVAP canister purge volume control solenoid valve).
Refer to "COMPONENT INSPECTION" on next page.



NG → Replace EVAP canister purge volume control solenoid valve.

OK ↓



Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.

INSPECTION END

Evaporative Emission (EVAP) Canister Purge Volume Control Solenoid Valve (Circuit) (Cont'd)

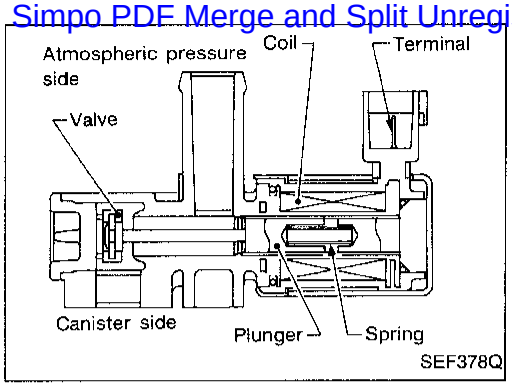
COMPONENT INSPECTION

EVAP canister purge volume control solenoid valve

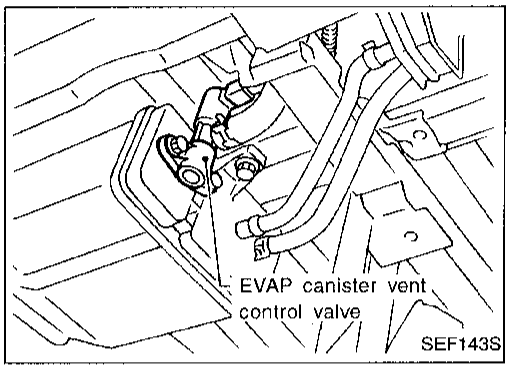
1. Start engine.
2. Perform "PURG VOL CONT/V" in "ACTIVE TEST" mode with CONSULT. Check that engine speed varies according to the valve opening.
   If OK, inspection end. If NG, go to following step.
3. Check air passage continuity.

Condition PURG VOL CONT/V value	Air passage continuity between (A) and (B)
100.0%	Yes
0.0%	No

If NG, replace the EVAP canister purge volume control solenoid valve.



OR



Check air passage continuity.

Condition	Air passage continuity between (A) and (B)
12V direct current supply between terminals	Yes
No supply	No

If NG or operation takes more than 1 second, replace solenoid valve.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Evaporative Emission (EVAP) Canister Vent Control Valve (Circuit)

COMPONENT DESCRIPTION

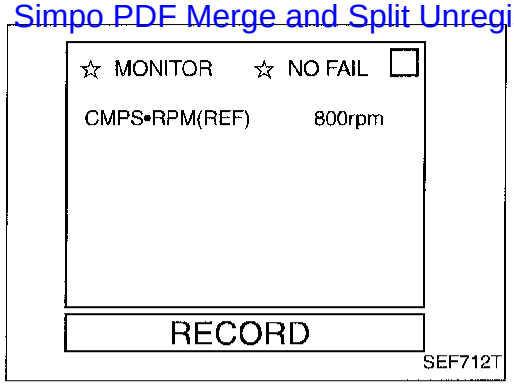
The EVAP canister vent control valve is located on the EVAP canister and is used to seal the canister vent.
This solenoid (the EVAP canister vent control valve) responds to signals from the ECM.
When the ECM sends an ON signal, the coil in the solenoid valve is energized.
A plunger will then move to seal the canister vent. The ability to seal the vent is necessary for the on board diagnosis of other evaporative emission control system components.
This solenoid valve is used only for diagnosis, and usually remains opened.
When the vent is closed, under normal purge conditions, the evaporative emission control system is depressurized and allows "EVAP Control System (Small Leak)" diagnosis.

CONSULT REFERENCE VALUE IN DATA MONITOR MODE

Specification data are reference values.

MONITOR ITEM	CONDITION	SPECIFICATION
VENT CONT/V	● Ignition switch: ON	OFF

ECM TERMINALS AND REFERENCE VALUE



Specification data are reference values and are measured between each terminal and ㉜ (ECM ground).

TERMINAL NO.	WIRE COLOR	ITEM	CONDITION	DATA (DC Voltage)
108	R/G	EVAP canister vent control valve	Ignition switch "ON"	BATTERY VOLTAGE (11 - 14V)

ON BOARD DIAGNOSIS LOGIC

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P0446 0903	● An improper voltage signal is sent to ECM through EVAP canister vent control valve.	● Harness or connectors (EVAP canister vent control valve circuit is open or shorted.) ● EVAP canister vent control valve

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

CAUTION:
Always drive vehicle at a safe speed.

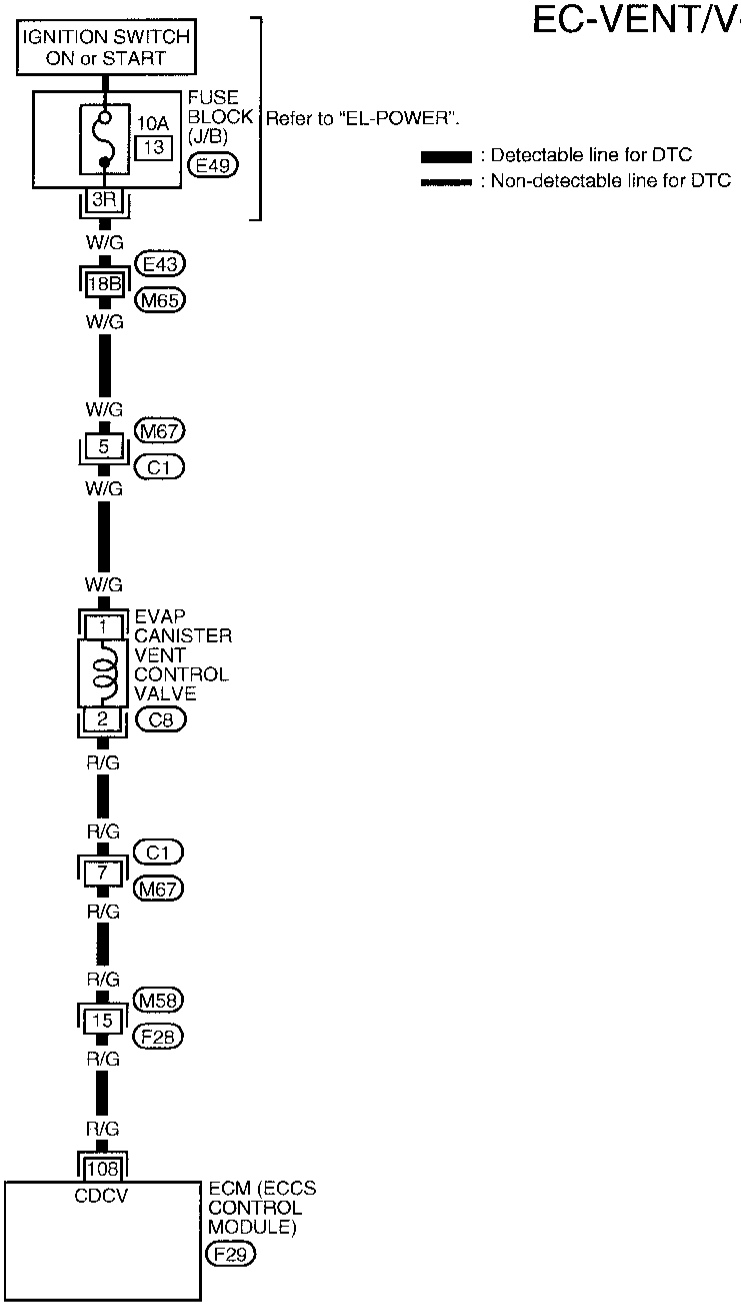
NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

TESTING CONDITION:
Before performing the following procedure, confirm battery voltage is more than 11V at idle.

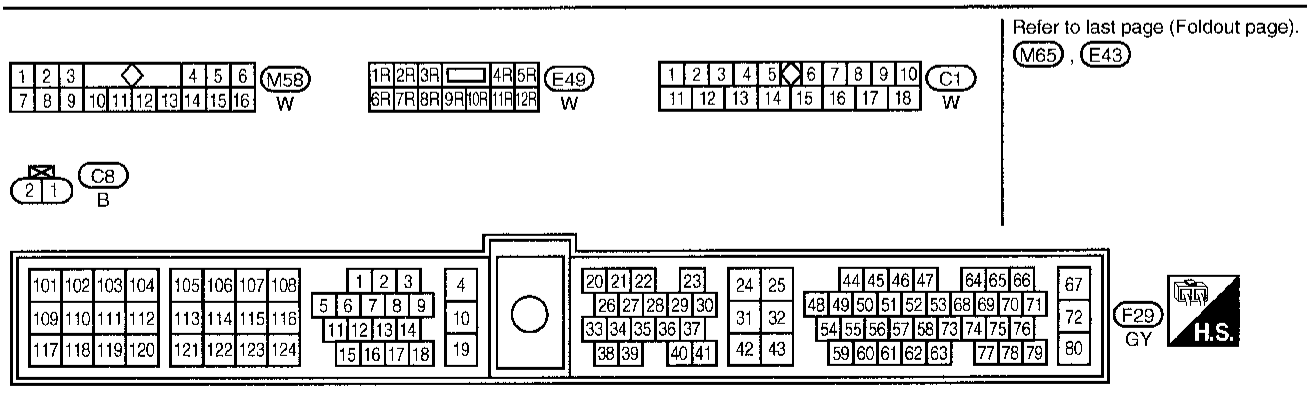
1) Turn ignition switch "ON".
2) Select "DATA MONITOR" mode with CONSULT.
3) Start engine and wait at least 5 seconds.

OR

1) Start engine and wait at least 5 seconds.
2) Select "MODE 7" with GST.



OR



1) Start engine and wait at least 5 seconds.
2) Turn ignition switch "OFF", wait at least 5 seconds and then turn "ON".
3) Perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.

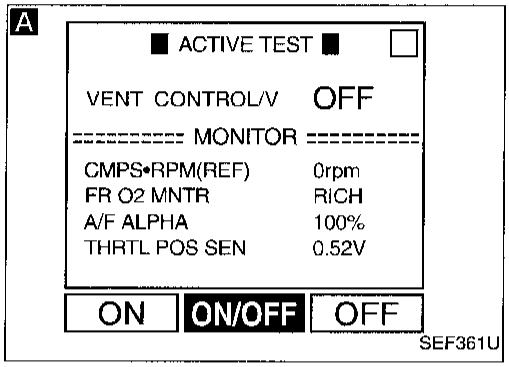
DIAGNOSTIC PROCEDURE

INSPECTION START

With CONSULT



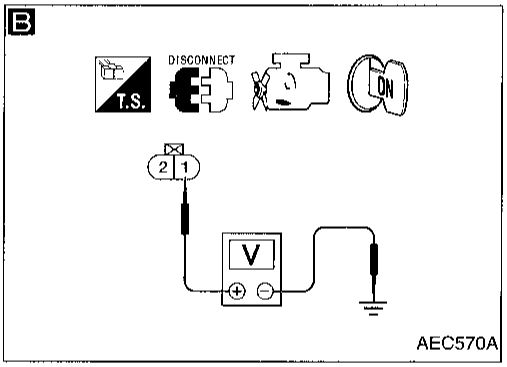
Without CONSULT
Go to CHECK POWER SUPPLY B.

A

CHECK CIRCUIT.
1. Turn ignition switch "ON".
2. Perform "VENT CONTROL/V" in "ACTIVE TEST" mode.
3. Make sure that ratcheting sound is heard from the vent control valve.

OK → Go to "CHECK COMPONENT" after procedure C.

NG



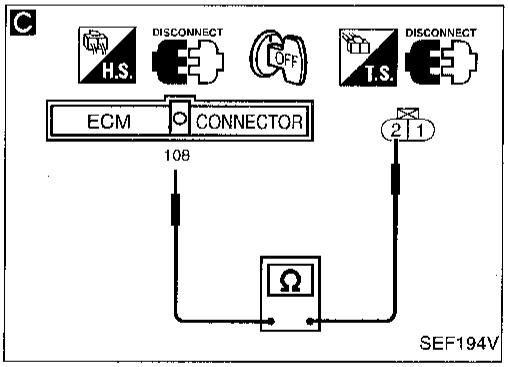
B

CHECK POWER SUPPLY.
1. Disconnect EVAP canister vent control valve harness connector.
2. Turn ignition switch "ON".
3. Check voltage between terminal ① and ground with CONSULT or tester.
Voltage: Battery voltage

NG → Check the following.
- Harness connectors E43, M65
- Harness connectors M67, C1
- 10A fuse
- Harness for open or short between EVAP canister vent control valve and 10A fuse

If NG, repair open circuit, short to ground or short to power in harness or connectors.

OK



C

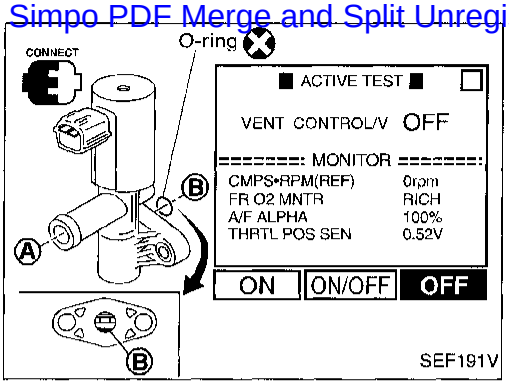
CHECK OUTPUT SIGNAL CIRCUIT.
1. Turn ignition switch "OFF".
2. Disconnect ECM harness connector.
3. Check harness continuity between ECM terminal 108 and terminal ②.
Continuity should exist.
If OK, check harness for short to ground and short to power.

NG → Check the following.
- Harness connectors C1, M67
- Harness connectors M58, F28
- Harness for open or short between EVAP canister vent control valve and ECM

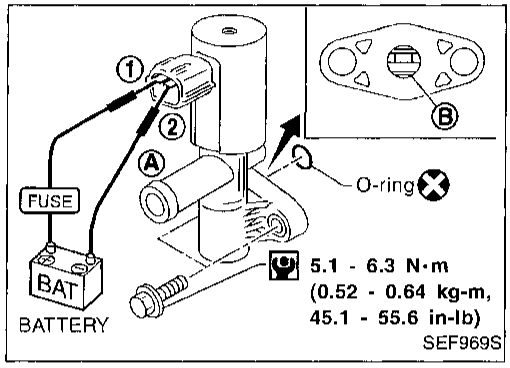
If NG, repair open circuit or short to ground or short to power in harness or connectors.

OK

CHECK COMPONENT
(EVAP canister vent control valve and O-ring).
Refer to "COMPONENT INSPECTION" on next page.



NG → Replace EVAP canister vent control valve and O-ring.



OK

Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.

INSPECTION END

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Evaporative Emission (EVAP) Canister Vent Control Valve (Circuit) (Cont'd)

COMPONENT INSPECTION

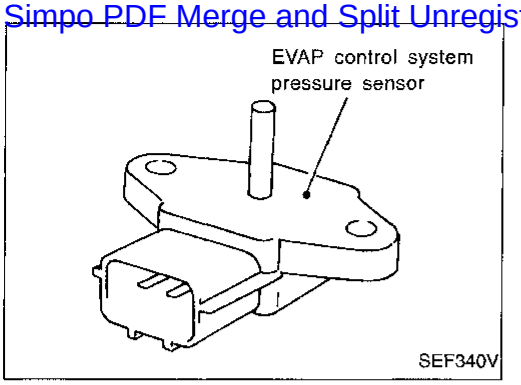
EVAP canister vent control valve

Check air passage continuity.

Perform "VENT CONTROL/V" in "ACTIVE TEST" mode.

Condition VENT CONTROL/V	Air passage continuity between (A) and (B)
ON	No
OFF	Yes

OR

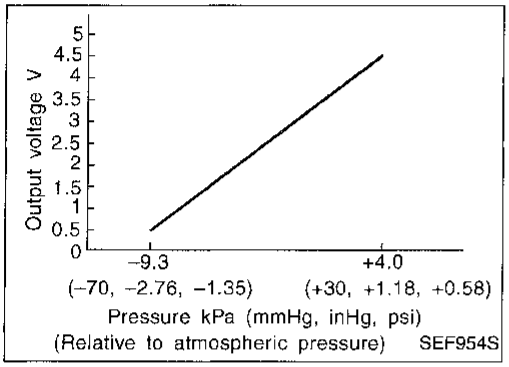


Condition	Air passage continuity between (A) and (B)
12V direct current supply between terminals (1) and (2)	No
No supply	Yes

If NG or operation takes more than 1 second, clean valve using air blower or replace as necessary.

If portion (B) is rusted, replace EVAP canister vent control valve.

Make sure new O-ring is installed properly.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Evaporative Emission (EVAP) Control System Pressure Sensor

COMPONENT DESCRIPTION

The EVAP control system pressure sensor detects pressure in the purge line. The sensor output voltage to the ECM increases as pressure increases. The EVAP control system pressure sensor is not used to control the engine system. It is used only for on board diagnosis.

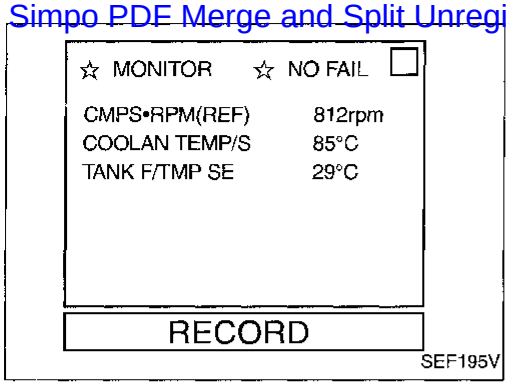
CONSULT REFERENCE VALUE IN DATA MONITOR MODE

Specification data are reference values.

MONITOR ITEM	CONDITION	SPECIFICATION
EVAP SYS PRES	● Ignition switch: ON	Approx. 3.4V

ECM TERMINALS AND REFERENCE VALUE

Specification data are reference values and are measured between each terminal and ㉜ (ECM ground).



TER-MINAL NO.	WIRE COLOR	ITEM	CONDITION	DATA (DC Voltage)
42	BR	Sensors' power supply	Ignition switch "ON"	Approximately 5V
43	B/W	Sensors' ground	Engine is running. (Warm-up condition) └ Idle speed	Approximately 0V
62	Y	EVAP control system pressure sensor	Ignition switch "ON"	Approximately 3.4V

ON BOARD DIAGNOSIS LOGIC

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P0450 0704	● An improper voltage signal from EVAP control system pressure sensor is sent to ECM.	● Harness or connectors (The EVAP control system pressure sensor circuit is open or shorted.) ● Rubber hose to EVAP control system pressure is clogged, vent, kinked, disconnected or improper connection. ● EVAP control system pressure sensor ● EVAP canister vent control valve ● EVAP canister purge volume control solenoid valve ● EVAP canister ● Rubber hose from EVAP canister vent control valve to water separator

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

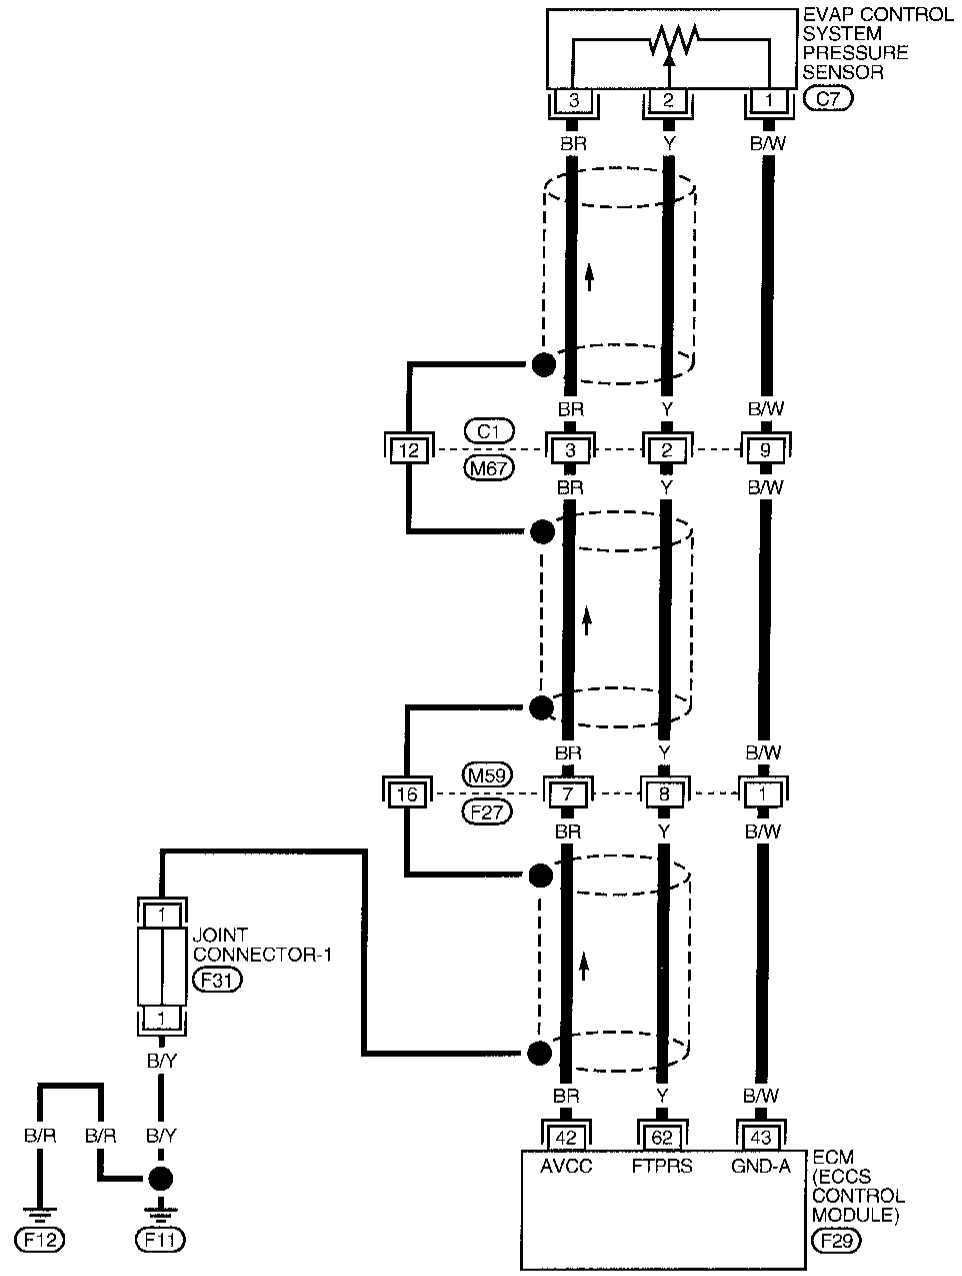
NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

TESTING CONDITION:
Always perform test at a temperature of 5°C (41°F) or more.

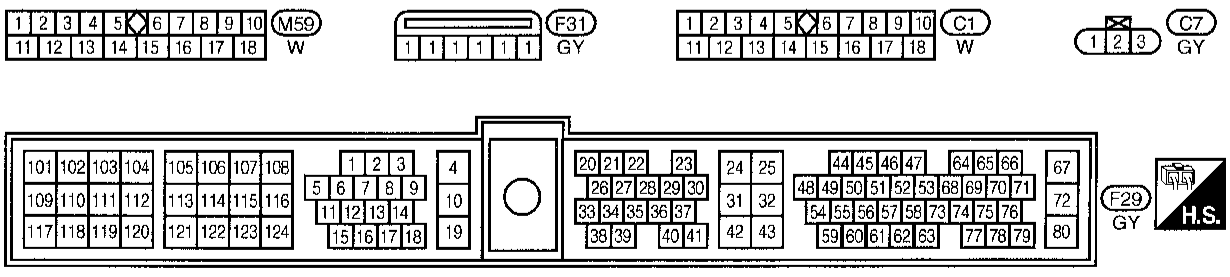
1) Start engine and warm it up to normal operating temperature.
2) Turn ignition switch "OFF" and wait at least 5 seconds.
3) Turn ignition switch "ON".
4) Select "DATA MONITOR" mode with CONSULT.
5) Make sure that "TANK F/TEMP SE" is more than 0°C (32°F).
6) Start engine and wait at least 20 seconds.

OR

1) Start engine and warm it up to normal operating temperature.
2) Check that voltage between ECM terminal ⑥⓪ and ground is less than 4.2V.
3) Turn ignition switch "OFF" and wait at least 5 seconds.
4) Start engine and wait at least 20 seconds.
5) Select "MODE 7" with GST.



OR



1) Start engine and warm it up to normal operating temperature.
2) Check that voltage between ECM terminal ⑥⓪ and ground is less than 4.2V.
3) Turn ignition switch "OFF" and wait at least 5 seconds.
4) Start engine and wait at least 20 seconds.
5) Turn ignition switch "OFF", wait at least 5 seconds and then turn "ON".
6) Perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.

Evaporative Emission (EVAP) Control System Pressure Sensor (Cont'd)

DIAGNOSTIC PROCEDURE

INSPECTION START

CHECK RUBBER TUBE CONNECTED TO THE SENSOR.
Check rubber tube connected to the sensor for clogging, vent, kink, disconnection or improper connection.

NG → Reconnect, repair or replace.

OK

1. Turn ignition switch "OFF".
2. Loosen and retighten engine ground screws.

A

CHECK POWER SUPPLY.
1. Disconnect EVAP control system pressure sensor harness connector.
2. Check sensor harness connector for water.
   Water should not exist.
   If OK, go to step 3. If NG, repair or replace harness connector.
3. Turn ignition switch "ON".
4. Check voltage between terminal ③ and engine ground with CONSULT or tester.
   Voltage: Approximately 5V

NG → Check the following.
- Harness connectors C1, M67
- Harness connectors M59, F27
- Harness for open or short between EVAP control system pressure sensor and ECM

If NG, repair harness or connectors.

OK

B

CHECK GROUND CIRCUIT.
1. Turn ignition switch "OFF".
2. Check harness continuity between terminal ① and engine ground.
   Continuity should exist.
   If OK, check harness for short to ground and short to power.

NG → Check the following.
- Harness connectors C1, M67
- Harness connectors M59, F27
- Harness for open or short between EVAP control system pressure sensor and ECM

If NG, repair open circuit or short to ground or short to power in harness or connectors.

OK

C

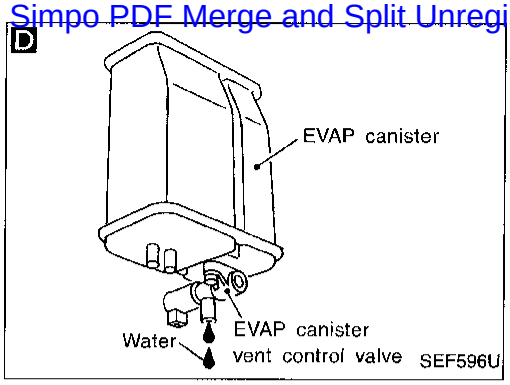
CHECK INPUT SIGNAL CIRCUIT.
1. Disconnect ECM harness connector.
2. Check harness continuity between ECM terminal 62 and terminal ②.
   Continuity should exist.
   If OK, check harness for short to ground and short to power.

NG → Check the following.
- Harness connectors C1, M67
- Harness connectors M59, F27
- Harness for open or short between EVAP control system pressure sensor and ECM

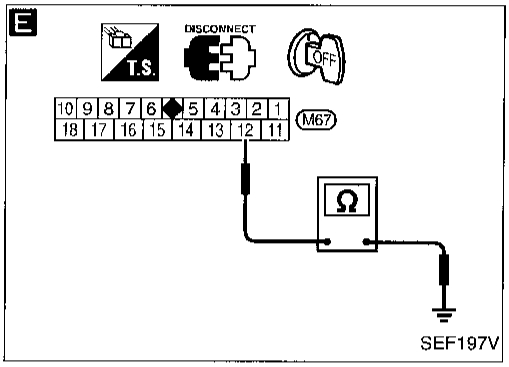
If NG, repair open circuit or short to ground or short to power in harness or connectors.

OK

CHECK COMPONENT
(EVAP canister purge volume control solenoid valve).
Refer to "COMPONENT INSPECTION" on EC-275.



NG → Replace EVAP canister purge volume control solenoid valve.



OK

Ⓐ
(Go to next page.)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Evaporative Emission (EVAP) Control System Pressure Sensor (Cont'd)

(A)

CHECK COMPONENT (EVAP canister vent control valve). Refer to "COMPONENT INSPECTION", EC-377.
- NG → Replace EVAP canister vent control valve.
- OK ↓

CHECK COMPONENT (EVAP control system pressure sensor). Refer to "COMPONENT INSPECTION", on next page.
- NG → Replace EVAP control system pressure sensor.
- OK ↓

CHECK RUBBER TUBE FOR CLOGGING.
Check obstructed water separator and rubber tube to EVAP canister vent control valve and clean the rubber tube using air blower.
For water separator, refer to EC-366.
- NG → Clean, repair or replace rubber tube and/or water separator.
- OK ↓

D

CHECK IF EVAP CANISTER SATURATED WITH WATER.
1. Remove EVAP canister with EVAP canister vent control valve attached.
2. Check if water will drain from the EVAP canister. If it will, weigh the EVAP canister with the vent control valve attached.

If the weight is:
More than 1.8 kg (4.0 lb) → NG
Less than 1.8 kg (4.0 lb) → OK

- NG → Check the following.
  1. Visually check the EVAP canister for damage.
  2. Check hose connection between EVAP canister and water separator for clogging and poor connection.
  3. Check water separator. Refer to "COMPONENT INSPECTION", EC-366.

  If NG, repair hose or replace EVAP canister or water separator.
- OK ↓

E

CHECK SHIELD CIRCUIT.
1. Turn ignition switch "OFF".
2. Disconnect connector (M67).
3. Check harness continuity between harness connector (M67) terminal (12) and ground.
   Continuity should exist.
   If OK, check harness for short to power.

- NG → Check the following.
  - Harness connectors (M59), (F27)
  - Joint connector-1
  - Harness for open or short between harness connector (M67) and ground

  If NG, repair open circuit or short to power in harness or connectors.
- OK ↓

Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.

INSPECTION END

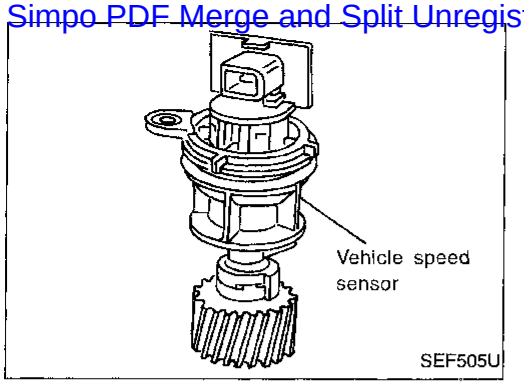
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Evaporative Emission (EVAP) Control System Pressure Sensor (Cont'd)

COMPONENT INSPECTION

EVAP control system pressure sensor

1. Remove EVAP control system pressure sensor with its harness connector connected.
2. Remove hose from EVAP control system pressure sensor.
3. Use pump to apply vacuum and pressure to EVAP control system pressure sensor as shown in figure.
4. Check output voltage between ECM terminal (62) and engine ground.



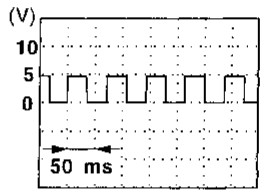
Pressure (Relative to atmospheric pressure)	Voltage (V)
0 kPa (0 mmHg, 0 inHg)	3.0 - 3.6
−9.3 kPa (−70 mmHg, −2.76 inHg)	0.4 - 0.6

CAUTION:

- **Always calibrate the vacuum pump gauge when using it.**
- **Do not apply vacuum below −20 kPa (−150 mmHg, −5.91 inHg) or pressure over 20.0 kPa (150 mmHg, 5.91 inHg).**

5. If NG, replace EVAP control system pressure sensor.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



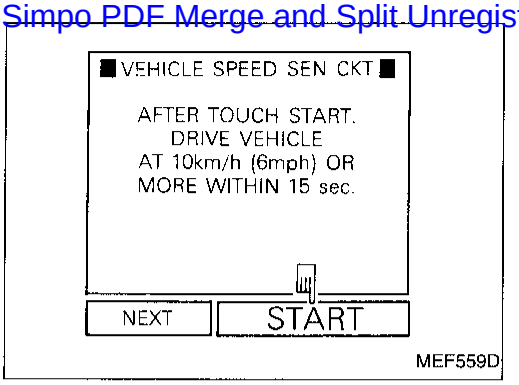
Vehicle Speed Sensor (VSS)

COMPONENT DESCRIPTION

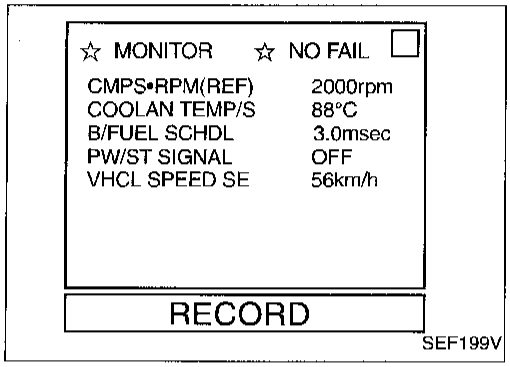
The vehicle speed sensor is installed in the transaxle. It contains a pulse generator which provides a vehicle speed signal to the speedometer. The speedometer then sends a signal to the ECM.

ECM TERMINALS AND REFERENCE VALUE

Specification data are reference values and are measured between each terminal and ㉜ (ECM ground).



TER-MINAL NO.	WIRE COLOR	ITEM	CONDITION	DATA (DC Voltage)
29	G/B	Vehicle speed sensor	Engine is running. — Lift up the vehicle. — In 2nd gear position — 40 km/h (25 MPH)	1 - 4V  SEF111V



ON BOARD DIAGNOSIS LOGIC

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P0500 0104	● The almost 0 km/h (0 MPH) signal from vehicle speed sensor is sent to ECM even when vehicle is being driven.	● Harness or connector (The vehicle speed sensor circuit is open or shorted.) ● Vehicle speed sensor

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Vehicle Speed Sensor (VSS) (Cont'd)

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

CAUTION:

- **Always drive vehicle at a safe speed.**
- **If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.**

TESTING CONDITION:

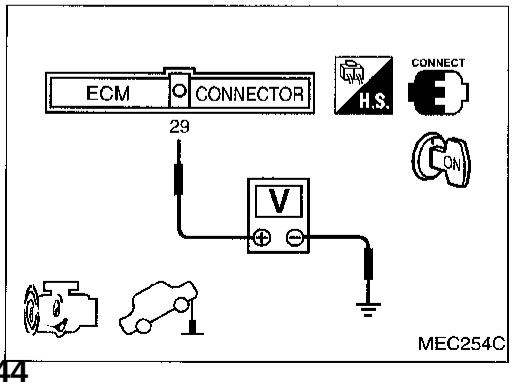
Steps 1 and 2 may be conducted with the drive wheels lifted in the shop or by driving the vehicle. If a road test is expected to be easier, it is unnecessary to lift the vehicle.

1) Start engine.
2) Perform "VEHICLE SPEED SEN CIRCUIT" in "FUNCTION TEST" mode with CONSULT.

OR

1) Start engine
2) Read vehicle speed sensor signal in "DATA MONITOR" mode with CONSULT. The vehicle speed on CONSULT should exceed 10 km/h (6 MPH) when rotating wheels with suitable gear position.
   If NG, go to "DIAGNOSTIC PROCEDURE", EC-290.
   If OK, go to following step.
3) Select "DATA MONITOR" mode with CONSULT.
4) Warm engine up to normal operating temperature.
5) Maintain the following conditions for at least 10 consecutive seconds.
   CMPS·RPM (REF): 1,800 - 2,500 rpm (A/T)
   1,500 - 2,500 rpm (M/T)
   COOLAN TEMP/S: More than 70°C (158°F)
   B/FUEL SCHDL: 2.2 - 3.1 ms (A/T)
   1.9 - 5.2 ms (M/T)
   Selector lever: Suitable position
   PW/ST SIGNAL: OFF

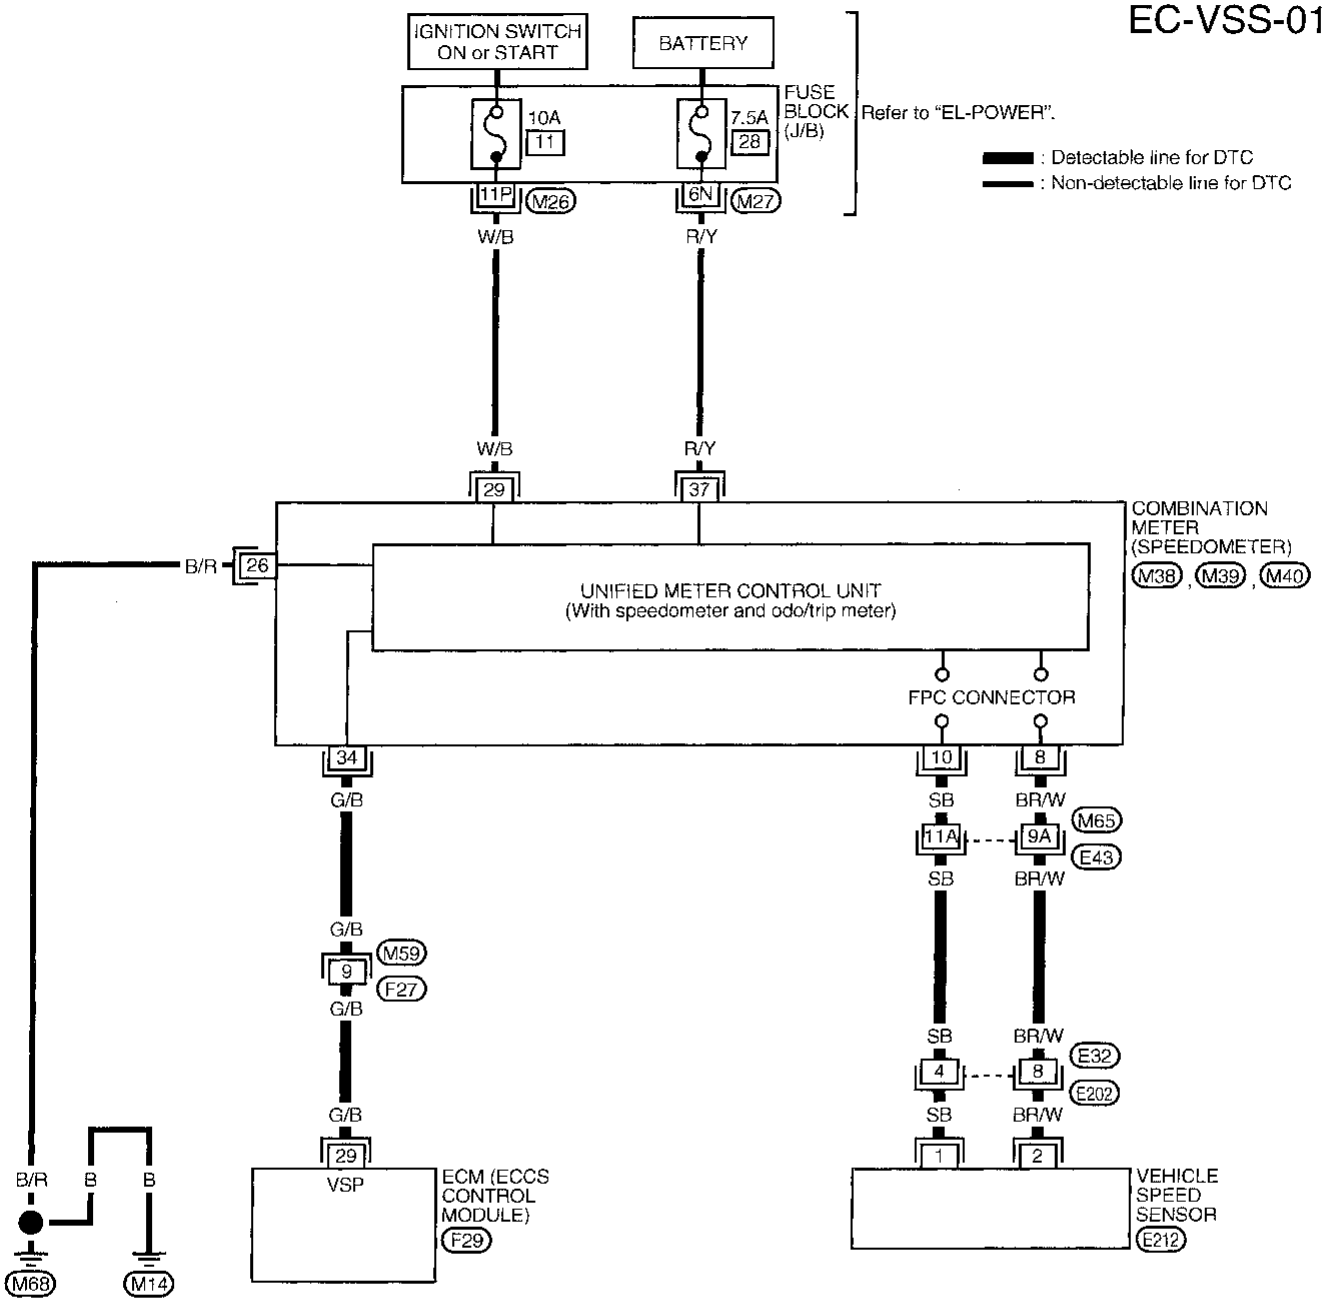
OR



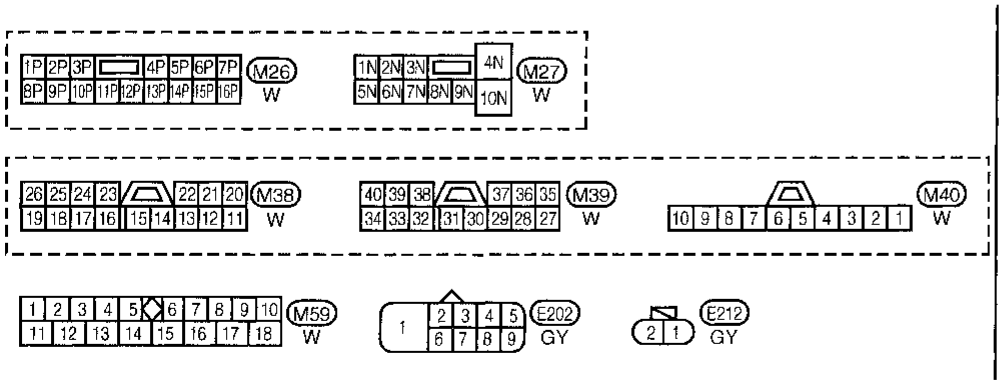
OVERALL FUNCTION CHECK

Use this procedure to check the overall function of the EVAP canister vent control valve circuit. During this check, a DTC might not be confirmed.

1) Lift up drive wheels.
2) Start engine.
3) Read vehicle speed sensor signal in "MODE 1" with GST.
   The vehicle speed sensor on GST should be able to exceed 10 km/h (6 MPH) when rotating wheels with suitable gear position.



OR



1) Lift up drive wheels.
2) Start engine.
3) Read the voltage signal between ECM terminal ㉙ (Vehicle speed sensor signal) and ground with oscilloscope.
4) Verify that the oscilloscope screen shows the signal wave as shown at "ECM TERMINALS AND REFERENCE VALUE" on the previous page.

DIAGNOSTIC PROCEDURE

INSPECTION START

A

CHECK INPUT SIGNAL CIRCUIT.
1. Turn ignition switch "OFF".
2. Disconnect ECM harness connector and combination meter harness connector (M39).
3. Check harness continuity between ECM terminal (29) and meter terminal (34).
   Continuity should exist.
   If OK, check harness for short to ground and short to power.

NG → Check the following.
- Harness connectors (M59), (F27)
- Harness for open or short between ECM and combination meter

If NG, repair open circuit or short to ground or short to power in harness or connectors.

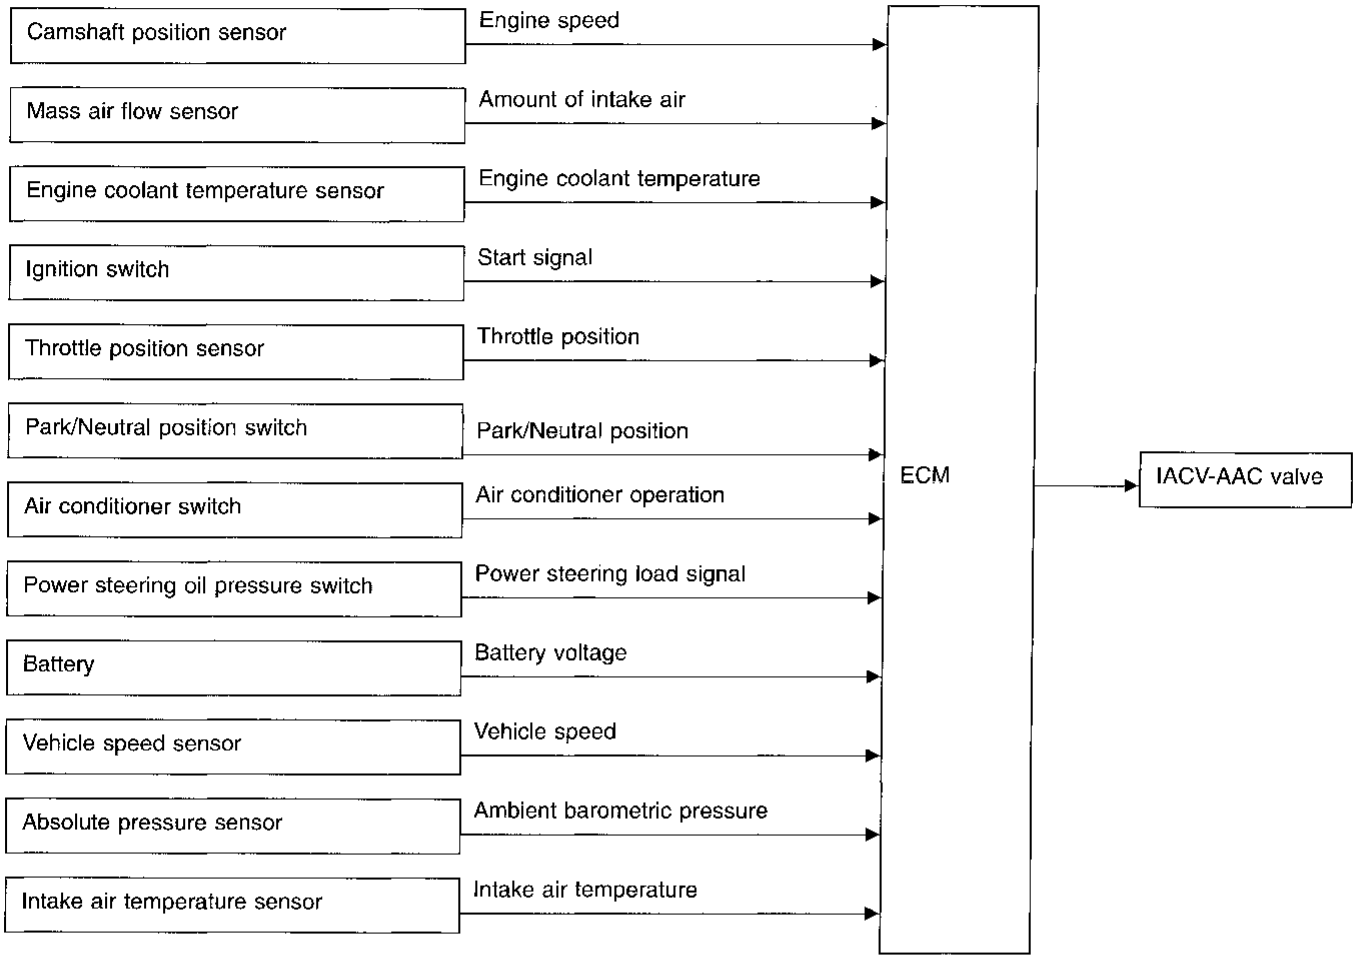
OK ↓

CHECK SPEEDOMETER FUNCTION.
Make sure that speedometer functions properly.

NG → Check the following.
- Harness connectors (E43), (E65)
- Harness connectors (E32), (E202)
- Harness for open or short between combination meter and vehicle speed sensor

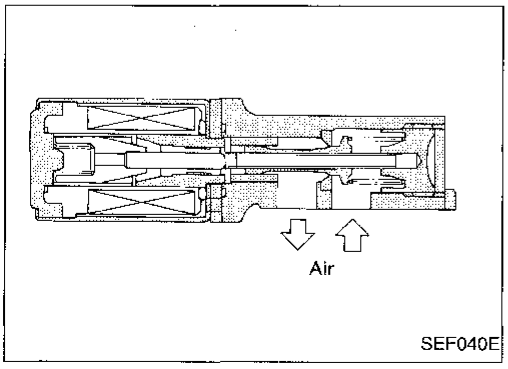
If NG, repair open circuit or short to ground or short to power in harness or connectors.
Check vehicle speed sensor and its circuit.
Refer to EL section.

OK ↓



Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.

INSPECTION END



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Idle Air Control Valve (IACV) — Auxiliary Air Control (AAC) Valve

SYSTEM DESCRIPTION

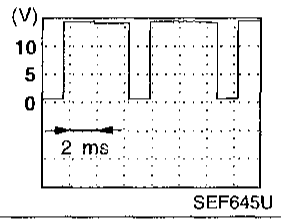
This system automatically controls engine idle speed to a specified level. Idle speed is controlled through fine adjustment of the amount of air which bypasses the throttle valve via IACV-AAC valve. The IACV-AAC valve repeats ON/OFF operation according to the signal sent from the ECM. The camshaft position sensor detects the actual engine speed and sends a signal to the ECM. The ECM then controls the ON/OFF time of the IACV-AAC valve so that engine speed coincides with the target value memorized in ECM. The target engine speed is the lowest speed at which the engine can operate steadily. The optimum value stored in the ECM is determined by taking into consideration various engine conditions, such as during warm up, deceleration, and engine load (air conditioner and power steering).

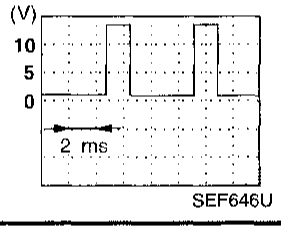
COMPONENT DESCRIPTION

IACV-AAC valve

The IACV-AAC valve is moved by ON/OFF pulses from the ECM. The longer the ON pulse, the greater the amount of air that will flow through the valve. The more air that flows through the valve, the higher the idle speed.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com





CONSULT REFERENCE VALUE IN DATA MONITOR MODE

Specification data are reference values.

MONITOR ITEM	CONDITION		SPECIFICATION
IACV-AAC/V	● Engine: After warming up ● Air conditioner switch: "OFF" ● Shift lever: "N" ● No-load	Idle	Approx. 30%
		2,000 rpm	—

ECM TERMINALS AND REFERENCE VALUE

Specification data are reference values and are measured between each terminal and ㉜ (ECM ground).

TERMINAL NO.	WIRE COLOR	ITEM	CONDITION	DATA (DC Voltage)
101	OR/L	IACV-AAC valve	Engine is running. (Warm-up condition) └ Idle speed	10.5 - 11.5V  SEF645U
			Engine is running. (Warm-up condition) └ Engine speed is 2,000 rpm.	1 - 13V  SEF646U

ON BOARD DIAGNOSIS LOGIC

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P0505 0205	A) The IACV-AAC valve does not operate properly.	● Harness or connectors (The IACV-AAC valve circuit is open.) ● IACV-AAC valve
	B) The IACV-AAC valve does not operate properly.	● Harness or connectors (The IACV-AAC valve circuit is shorted.) ● IACV-AAC valve

Idle Air Control Valve (IACV) — Auxiliary Air Control (AAC) Valve (Cont'd)

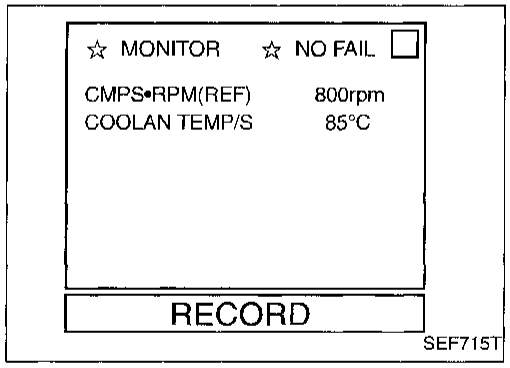
DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

Perform "Procedure for malfunction A" first. If DTC cannot be confirmed, perform "Procedure for malfunction B".

NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

Procedure for malfunction A

TESTING CONDITION:
Before performing the following procedure, confirm battery voltage is more than 10.5V at ignition switch "ON".



1) Turn ignition switch "ON".
2) Select "DATA MONITOR" mode with CONSULT.
3) Wait at least 2 seconds.

OR

1) Turn ignition switch "ON" and wait at least 2 seconds.
2) Select "MODE 7" with GST.

OR

1) Turn ignition switch "ON" and wait at least 2 seconds.
2) Turn ignition switch "OFF", wait at least 5 seconds and then turn "ON".
3) Perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.

Procedure for malfunction B

TESTING CONDITION:
Before performing the following procedure, confirm battery voltage is more than 11V at idle.

1) Start engine and warm it up to normal operating temperature.
2) Turn ignition switch "OFF" and wait at least 5 seconds.
3) Turn ignition switch "ON" again and select "DATA MONITOR" mode with CONSULT.
4) Start engine and run it for at least 1 minute at idle speed.

OR

1) Start engine and warm it up to normal operating temperature.
2) Turn ignition switch "OFF" and wait at least 5 seconds.
3) Start engine again and run it for at least 1 minute at idle speed.
4) Select "MODE 7" with GST.

Idle Air Control Valve (IACV) — Auxiliary Air Control (AAC) Valve (Cont'd)

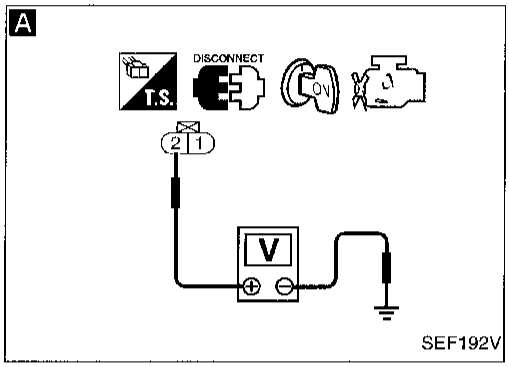
DIAGNOSTIC PROCEDURE

INSPECTION START



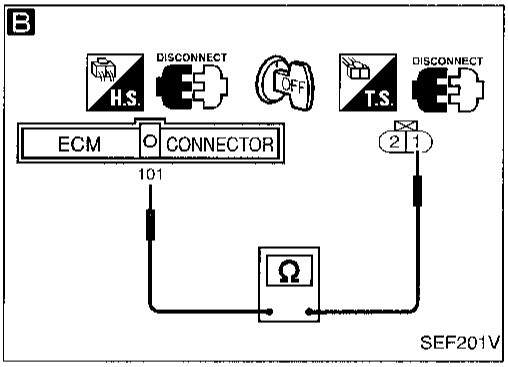
A

CHECK POWER SUPPLY.
1. Stop engine.
2. Disconnect IACV-AAC valve harness connector.
3. Turn ignition switch "ON".
4. Check voltage between terminal (2) and ground with CONSULT or tester.
   Voltage: Battery voltage

NG → Check the following.
- Harness connectors (M59), (F27)
- 10A fuse
- Harness for open or short between IACV-AAC valve harness connector and 10A fuse

If NG, repair harness or connectors.

OK ↓

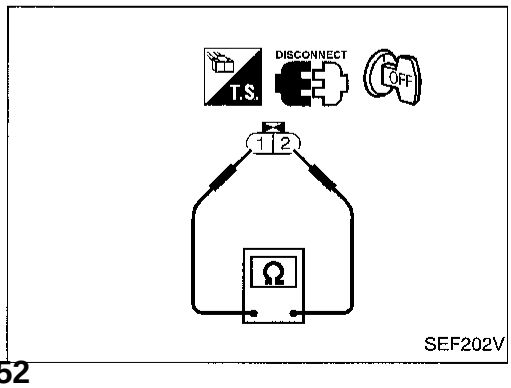


B

CHECK OUTPUT SIGNAL CIRCUIT.
1. Disconnect ECM harness connector.
2. Check harness continuity between ECM terminal (101) and terminal (1).
   Continuity should exist.
   If OK, check harness for short to ground and short to power.

NG → Repair open circuit, short to ground or short to power in harness or connectors.

OK ↓



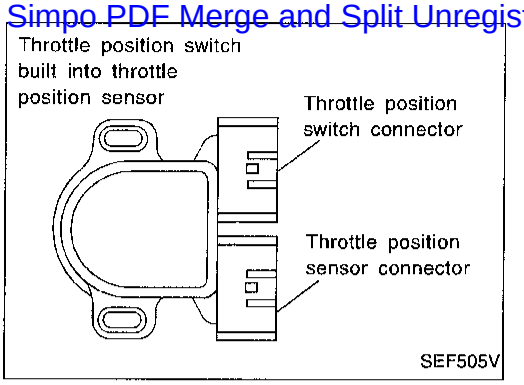
CHECK COMPONENT (IACV-AAC valve).
Refer to "COMPONENT INSPECTION" below.

NG → Replace IACV-AAC valve.

OK ↓

Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.

INSPECTION END



COMPONENT INSPECTION

IACV-AAC valve

Disconnect IACV-AAC valve harness connector.

- Check IACV-AAC valve resistance.
  Resistance:
  Approximately 10Ω [at 25°C (77°F)]
- Check plunger for seizing or sticking.
- Check for broken spring.

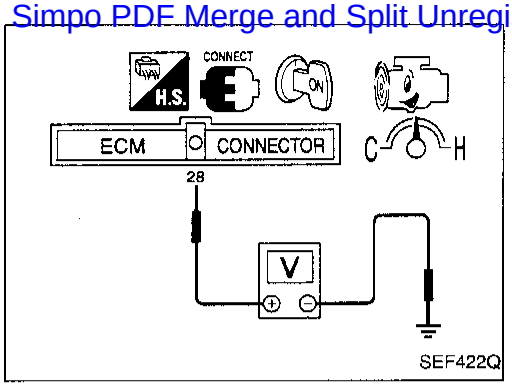
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Closed Throttle Position Switch

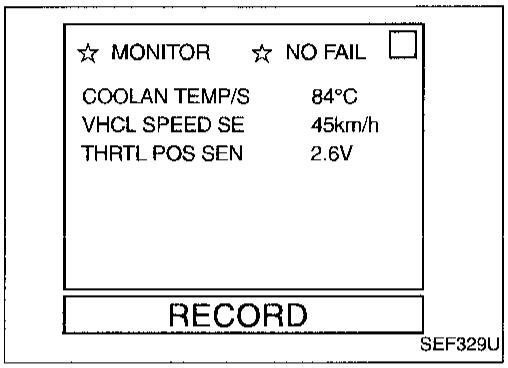
COMPONENT DESCRIPTION

A closed throttle position switch and wide open throttle position switch are built into the throttle position sensor unit.
When the throttle valve is in the closed position, the closed throttle position switch sends a voltage signal to the ECM. The ECM only uses this signal to open or close the EVAP canister purge volume control solenoid valve when the throttle position sensor is malfunctioning.

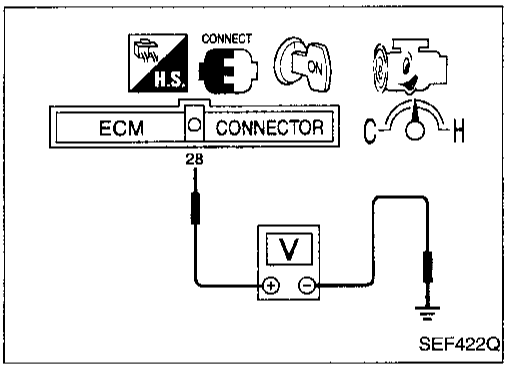
ECM TERMINALS AND REFERENCE VALUE



Specification data are reference values and are measured between each terminal and ㉜ (ECM ground).



TERMINAL NO.	WIRE COLOR	ITEM	CONDITION	DATA (DC Voltage)
28	BR/W	Throttle position switch (Closed position)	Ignition switch "ON" (Warm-up condition) └ Accelerator pedal fully released	BATTERY VOLTAGE (11 - 14V)
			Ignition switch "ON" └ Accelerator pedal depressed	Approximately 0V



ON BOARD DIAGNOSIS LOGIC

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P0510 0203	● Battery voltage from the closed throttle position switch is sent to ECM with the throttle valve opened.	● Harness or connectors (The closed throttle position switch circuit is shorted.) ● Closed throttle position switch ● Throttle position sensor

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Closed Throttle Position Switch (Cont'd)

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

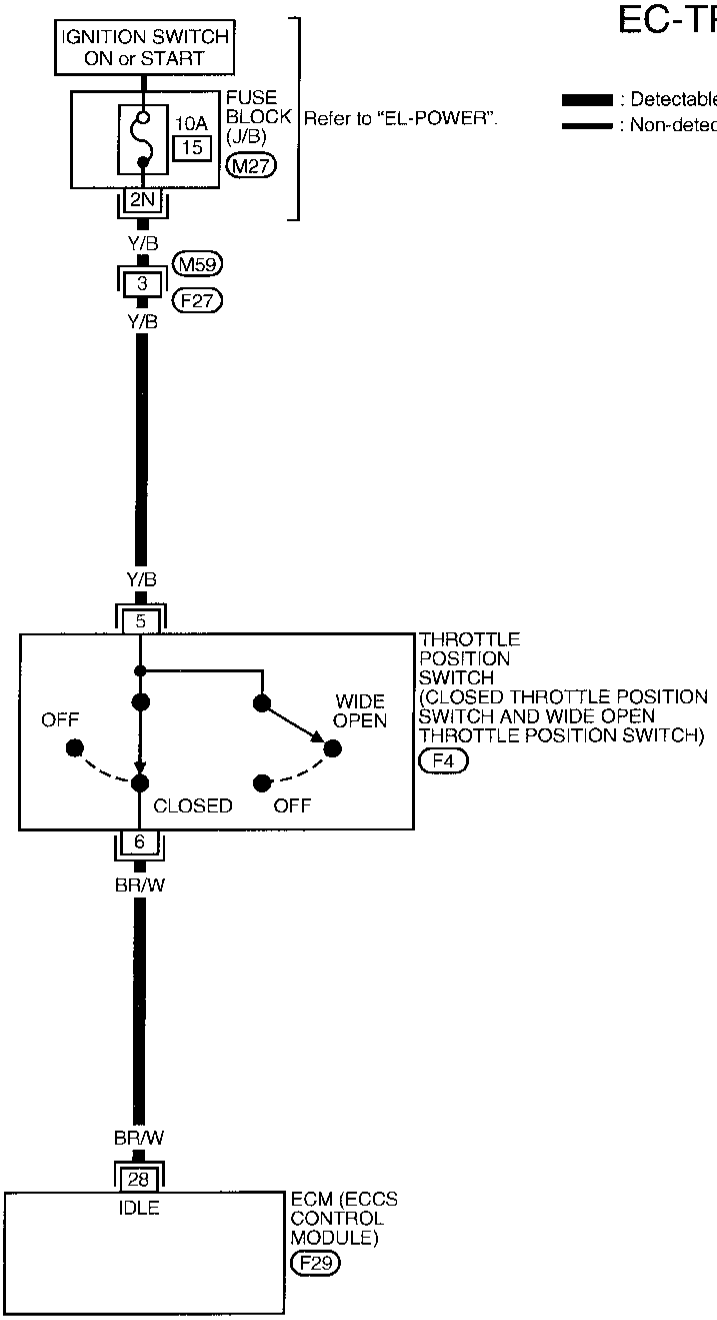
CAUTION:
Always drive vehicle at a safe speed.

NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

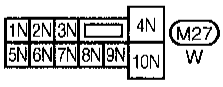
1) Start engine and warm it up to normal operating temperature.
2) Check voltage between ECM terminal ㉘ and ground under the following conditions.
   At idle: Battery voltage
   At 2,000 rpm: 0 - 1V
   If the check result is NG, go to "DIAGNOSTIC PROCEDURE", EC-300.
   If OK, go to following step.
3) Select "DATA MONITOR" mode with CONSULT.
4) Drive the vehicle for at least 5 consecutive seconds under the following condition.
   THRTL POS SEN: More than 2.5V
   VHCL SPEED SE: More than 4 km/h (2 MPH)
   Selector lever: Suitable position
   Driving pattern: Driving vehicle uphill (Increased engine load) will help maintain the driving conditions required for this test.

OR

OVERALL FUNCTION CHECK



Use this procedure to check the overall function of the closed throttle position switch circuit. During this check, a 1st trip DTC might not be confirmed.



1) Start engine and warm it up to normal operating temperature.
2) Check the voltage between ECM terminal ㉘ and ground under the following conditions.
   At idle: Battery voltage
   At 2,000 rpm: 0 - 1V

Closed Throttle Position Switch (Cont'd)

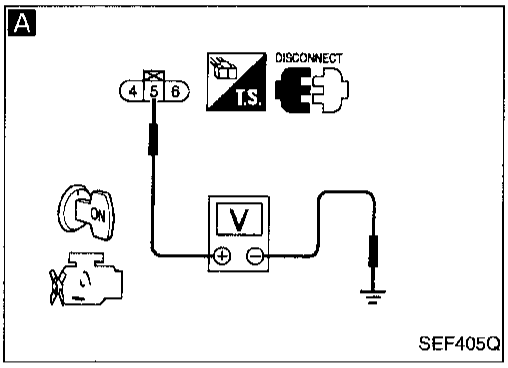
INSPECTION START

A



CHECK POWER SUPPLY.
1. Turn ignition switch "OFF".
2. Disconnect throttle position switch harness connector.
3. Turn ignition switch "ON".
4. Check voltage between terminal (5) and engine ground with CONSULT or tester.

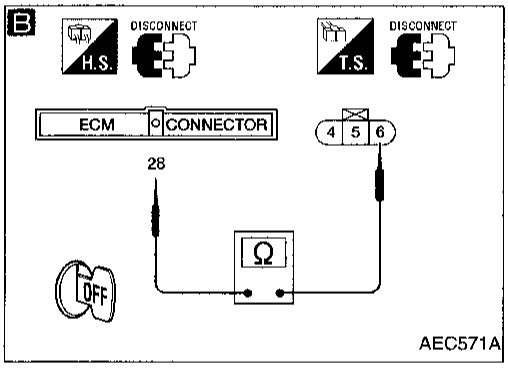
Voltage: Battery voltage

NG → Check the following.
- Harness connectors (M59), (F27)
- 10A fuse
- Harness for open or short between throttle position switch and 10A fuse

If NG, repair harness or connectors.

OK ↓

B



CHECK INPUT SIGNAL CIRCUIT.
1. Turn ignition switch "OFF".
2. Disconnect ECM harness connector.
3. Check harness continuity between ECM terminal (28) and terminal (6).

Continuity should exist.

If OK, check harness for short to ground and short to power.

NG → Repair open circuit, short to ground or short to power in harness or connectors.

OK ↓

ADJUST THROTTLE POSITION SWITCH IDLE POSITION.
Perform BASIC INSPECTION, EC-71.

OK ↓

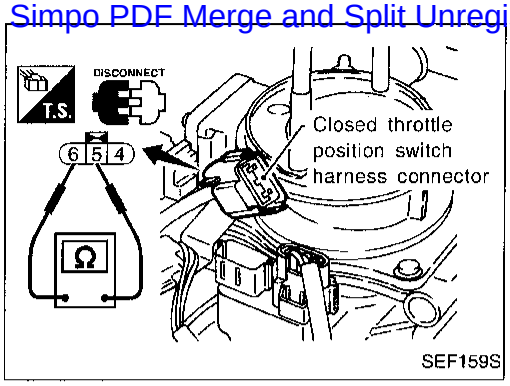
CHECK COMPONENT
(Closed throttle position switch).
Refer to "COMPONENT INSPECTION" on next page.

NG → Replace throttle position switch.

OK ↓

CHECK COMPONENT
(Throttle position sensor).
Refer to "COMPONENT INSPECTION" on next page.

NG → Replace throttle position sensor.



OK ↓

Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.

INSPECTION END

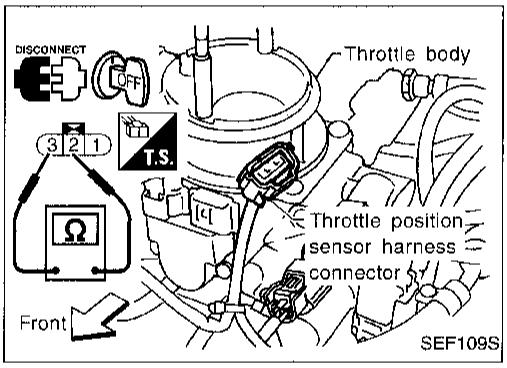
Closed Throttle Position Switch (Cont'd)



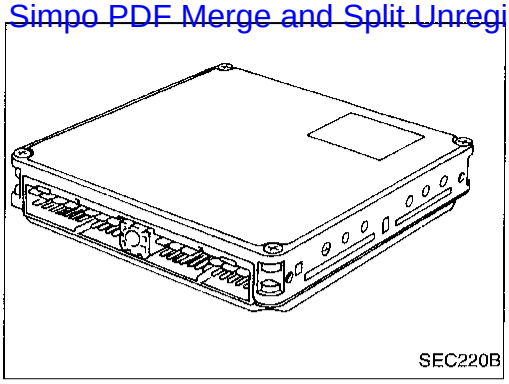
COMPONENT INSPECTION

Closed throttle position switch

1. Start engine and warm it up to normal operating temperature.
2. Turn ignition switch "OFF".
3. Disconnect throttle position switch harness connector.
4. Check continuity between terminals ⑤ and ⑥ while opening throttle valve manually.

Throttle valve conditions	Continuity
Completely closed	Yes
Partially open or completely open	No

If NG, replace throttle position switch.



Throttle position sensor

1. Disconnect throttle position sensor harness connector.
2. Make sure that resistance between terminals ② and ③ changes when opening throttle valve manually.

Throttle valve conditions	Resistance [at 25°C (77°F)]
Completely closed	Approximately 0.5 kΩ
Partially open	0.5 - 4 kΩ
Completely open	Approximately 4 kΩ

If NG, replace throttle position sensor.
To adjust it, perform "Basic Inspection", EC-71.

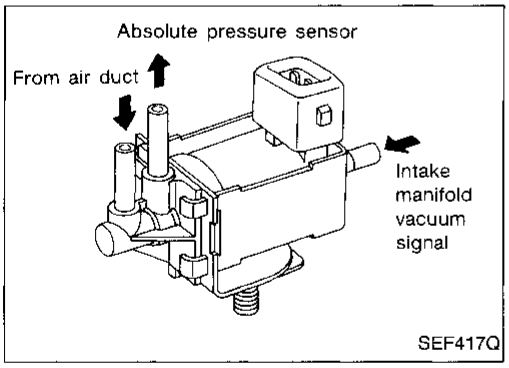
DIAGNOSTIC PROCEDURE

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Manifold Absolute Pressure (MAP)/ Barometric Pressure (BARO) Switch Solenoid Valve

SYSTEM DESCRIPTION

This system allows the absolute pressure sensor to monitor either ambient barometric pressure or intake manifold pressure. The MAP/BARO switch solenoid valve switches between two passages by ON-OFF pulse signals from the ECM. (One passage is from the intake air duct, the other is from the intake manifold.) Either ambient barometric pressure or intake manifold pressure is applied to the absolute pressure sensor.

Solenoid	Conditions
ON	● For 5 seconds after turning ignition switch ON (Engine is not running.) OR ● For 5 seconds after starting engine OR ● More than 5 minutes after the solenoid valve shuts OFF. and ● Throttle valve is shut or almost fully shut for more than 5 seconds and ● Vehicle speed is less than 100 km/h (62 MPH).

COMPONENT DESCRIPTION

The MAP/BARO switch solenoid valve switches its air flow passage according to the voltage signal sent from the ECM. When voltage is supplied from the ECM, the MAP/BARO switch solenoid turns "ON". Then, the absolute pressure sensor can monitor the ambient barometric pressure. When voltage is not supplied from the ECM, the MAP/BARO switch solenoid valve turns "OFF". Then, the sensor monitors intake manifold pressure.

CONSULT REFERENCE VALUE IN DATA MONITOR MODE

Specification data are reference values.

MONITOR ITEM	CONDITION	SPECIFICATION
MAP/BARO SW/V	● Engine: For 5 seconds after starting engine	BARO
	● Ignition switch: More than 5 seconds after turning ignition switch "ON" ● Engine: More than 5 seconds after starting engine	MAP

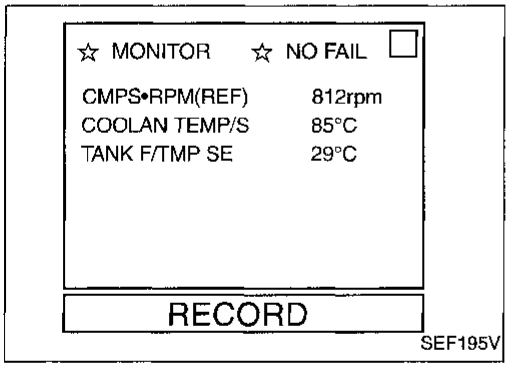
DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

Perform "Procedure for malfunction A" first. If the 1st trip DTC cannot be confirmed, perform "Procedure for malfunction B".

NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

Procedure for malfunction A

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is more than 11V at ignition switch "ON".



1) Turn ignition switch "ON".
2) Select "DATA MONITOR" mode with CONSULT.
3) Wait at least 10 seconds.

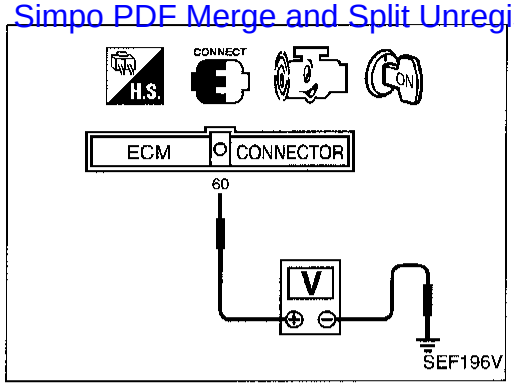
OR

1) Turn ignition switch "ON" and wait at least 10 seconds.
2) Select "Mode 7" with GST.

OR

1) Turn ignition switch "ON" and wait at least 10 seconds.
2) Turn ignition switch "OFF", wait at least 5 seconds and then turn "ON".
3) Perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.

Procedure for malfunction B



TESTING CONDITION:
Always perform the test at a temperature of 5°C (41°F) or higher.

1) Start engine and warm it up to normal operating temperature.
2) Turn ignition switch "OFF" and wait at least 5 seconds.
3) Turn ignition switch "ON" again and select "DATA MONITOR" mode with CONSULT.
4) Make sure that "TANK/F/TEMP SE" is more than 0°C (32°F).
5) Start engine and let it idle for at least 10 seconds.

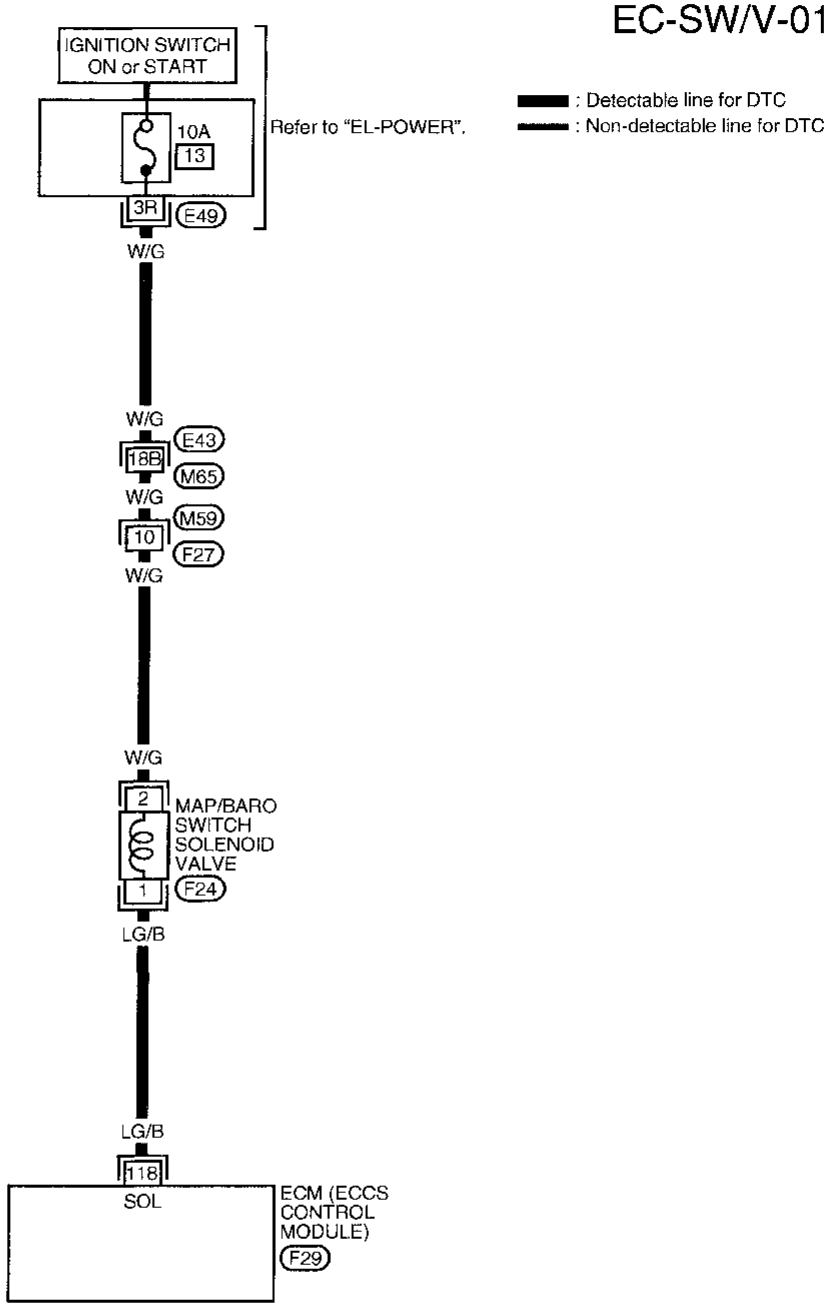
OR

1) Start engine and warm it up to normal operating temperature.
2) Turn ignition switch "OFF" and wait at least 5 seconds.
3) Turn ignition switch "ON".
4) Check that voltage between ECM terminal ⑥⓪ and ground is less than 4.2V.
5) Start engine and let it idle for at least 10 seconds.
6) Select "MODE 7" with GST.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Manifold Absolute Pressure (MAP)/ Barometric Pressure (BARO) Switch Solenoid Valve (Cont'd)

OR



NO TOOLS

1) Start engine and warm it up to normal operating temperature.
2) Turn ignition switch "OFF" and wait at least 5 seconds.
3) Turn ignition switch "ON".
4) Check that voltage between ECM terminal (60) and ground is less than 4.2V.
5) Start engine and let it idle for at least 10 seconds.
6) Turn ignition switch "OFF", wait at least 5 seconds and then turn "ON".
7) Perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.

Manifold Absolute Pressure (MAP)/ Barometric Pressure (BARO) Switch Solenoid Valve (Cont'd)

DIAGNOSTIC PROCEDURE

If the trouble is duplicated after "Procedure for malfunction A", perform "Procedure A" below. If the trouble is duplicated after "Procedure for malfunction B", perform "Procedure B" on next page.

Procedure A

INSPECTION START

A

CHECK POWER SUPPLY.
1. Turn ignition switch "OFF".
2. Disconnect MAP/BARO switch solenoid valve harness connector.
3. Turn ignition switch "ON".
4. Check voltage between terminal (2) and engine ground with CONSULT or tester.

Voltage: Battery voltage

NG → Check the following.
- Harness connectors (E43), (M65)
- Harness connectors (M59), (F27)
- 10A fuse
- Harness for open or short between MAP/BARO switch solenoid valve and 10A fuse

If NG, repair harness or connectors.

OK ↓

B

CHECK OUTPUT SIGNAL CIRCUIT.
1. Turn ignition switch "OFF".
2. Disconnect ECM harness connector.
3. Check harness continuity between ECM terminal (118) and terminal (1) with CONSULT or tester.

Continuity should exist.

If OK, check harness for short to ground and short to power.

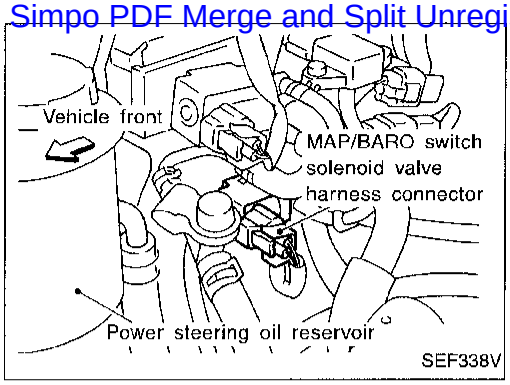
NG → Repair open circuit, short to ground or short to power in harness or connectors.

OK ↓

CHECK COMPONENT (MAP/BARO switch solenoid valve). Refer to "COMPONENT INSPECTION", EC-312.

NG → Replace MAP/BARO switch solenoid valve.

OK ↓



Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.

INSPECTION END

INSPECTION START

A

CHECK VACUUM SOURCE AND CIRCUIT TO MAP/BARO SWITCH SOLENOID VALVE.

1. Start engine and warm it up to normal operating temperature.
2. Turn ignition switch "OFF".
3. Connect MAP/BARO switch solenoid valve and absolute pressure sensor with a rubber tube that has vacuum gauge.
4. Turn ignition switch "ON".
5. Select "MAP/BARO SW/V" in "ACTIVE TEST" mode with CONSULT.
6. Start engine and let it idle.
7. Touch "MAP" and "BARO" alternately and check for vacuum.

MAP/BARO SW/V	Vacuum
BARO	Should not exist.
MAP	Should exist.

OR

4. Turn ignition switch "ON".
5. Start engine and check for vacuum.
   For 5 seconds after starting engine
   Vacuum should not exist.
   More than 5 seconds after starting engine
   Vacuum should exist.

OK → CHECK COMPONENT (Absolute pressure sensor).
1. Check for disconnection of vacuum hose connected to the sensor.
2. Check sensor harness connector for water.
   Water should not exist.

Refer to "COMPONENT INSPECTION" of "TROUBLE DIAGNOSIS FOR DTC P0105", EC-114.

OK → Go to "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.

NG → Replace absolute pressure sensor.

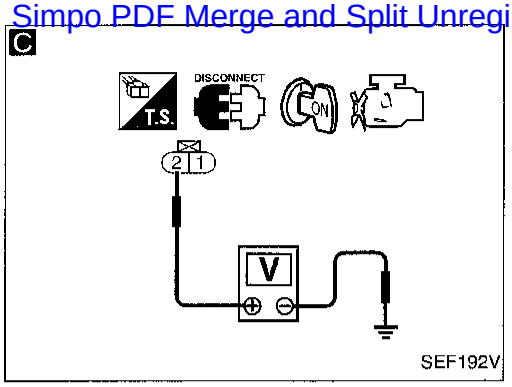
NG

B

CHECK HOSE.
1. Turn ignition switch "OFF".
2. Check hose for clogging, cracks, disconnection or improper connection.

NG → Clean, repair or reconnect the hose.
If NG, check vacuum port for clogging.

OK → CHECK INTAKE SYSTEM. Check the intake system for air leaks.



OK

Manifold Absolute Pressure (MAP)/ Barometric Pressure (BARO) Switch Solenoid Valve (Cont'd)

COMPONENT INSPECTION

MAP/BARO switch solenoid valve

1. Start engine and warm it up to normal operating temperature.
2. Perform "MAP/BARO SW/V" in "ACTIVE TEST" mode with CONSULT.
3. Check the following.
   - Condition: At idle under no-load
   - CONSULT display

MAP/BARO	ABSOL PRES/SE (Voltage)
BARO	More than 2.6V
MAP	Less than the voltage at BARO

- Time for voltage to change

MAP/BARO SW/V	Required time to switch
BARO to MAP	Less than 1 second
MAP to BARO	

4. If NG, check solenoid valve as shown below.

OR

1. Remove MAP/BARO switch solenoid valve.
2. Check air passage continuity.

Condition	Air passage continuity between (A) and (B)	Air passage continuity between (A) and (C)
12V direct current supply between terminals (1) and (2)	Yes	No
No supply	No	Yes

3. If NG or operation takes more than 1 second, replace solenoid valve.

Closed Loop Control

ON BOARD DIAGNOSIS LOGIC

★ The closed loop control has the one trip detection logic.

Diagnostic Trouble Code No.	Malfunction is detected when ...	Check Items (Possible Cause)
P1148 0307	● The closed loop control function does not operate even when vehicle is driving in the specified condition.	● The front heated oxygen sensor circuit is open or shorted. ● Front heated oxygen sensor ● Front heated oxygen sensor heater

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

CAUTION:
Always drive vehicle at a safe speed.

NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

TESTING CONDITION:

- **Never raise engine speed above 3,000 rpm during the "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE". If the engine speed limit is exceeded, retry the procedure from step 5).**
- **Before performing the following procedure, confirm that battery voltage is in between 11V and 16V at idle.**

1) Start engine and warm it up to normal operating temperature.
2) Select "DATA MONITOR" mode with CONSULT.
3) Hold engine speed at 2,000 rpm.
4) While holding engine speed at 2,000 rpm, check the following.
   - "FR O2 SENSOR" voltage should go above 0.61V at least once.

   OR

   - "FR O2 SENSOR" voltage should go below 0.23V at least once.

   If the check result is NG, perform "DIAGNOSIS PROCEDURE", EC-166.
   If the check result is OK, perform the following step.
5) Let engine idle at least 3 minutes.
6) Maintain the following condition at least 50 consecutive seconds.

Closed Loop Control (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

B/FUEL SCHDL: 1.5 ms or more (A/T)
1.3 ms or more (M/T)
CMPS·RPM (REF): 1,500 - 3,000 rpm (A/T)
1,700 - 3,000 rpm (M/T)
Selector lever: Suitable position
VHCL SPEED SE: More than 70 km/h (43 MPH)

During this test, P0130 may be displayed on CONSULT screen.

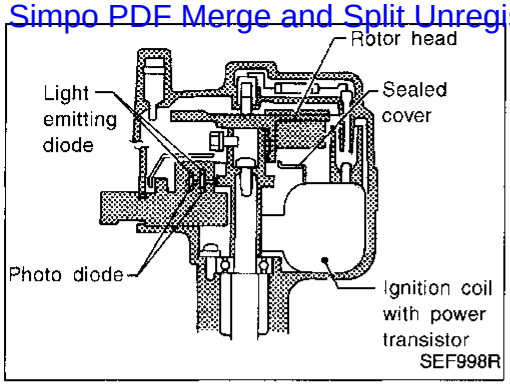
OR

OVERALL FUNCTION CHECK

Use this procedure to check the overall function of the closed loop control. During this check, a 1st trip DTC might not be confirmed.

1) Start engine and warm it up to normal operating temperature.
2) Set voltmeter probes between ECM terminal (50) (sensor signal) and (32) (ECM ground).
3) Check the following with engine speed held at 2,000 rpm constant under no load.

- The voltage should go above 0.7V at least once.



OR

- The voltage should go below 0.21V at least once.

DIAGNOSTIC PROCEDURE

Refer to TROUBLE DIAGNOSIS FOR DTC P0133, EC-166.

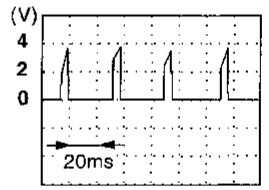
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

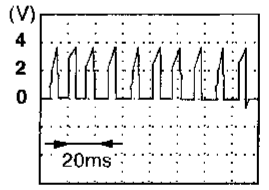
Ignition Signal

COMPONENT DESCRIPTION

Ignition coil & power transistor

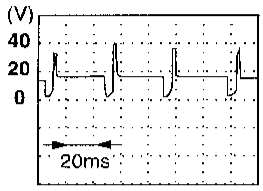
The ignition signal from the ECM is sent to the power transistor. The power transistor switches on and off the ignition coil primary circuit. As the primary circuit is turned on and off, the proper high voltage is induced in the coil secondary circuit.

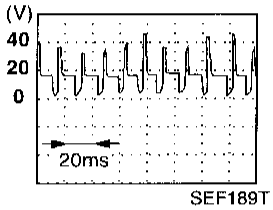




CONSULT REFERENCE VALUE IN DATA MONITOR MODE

Specification data are reference values.

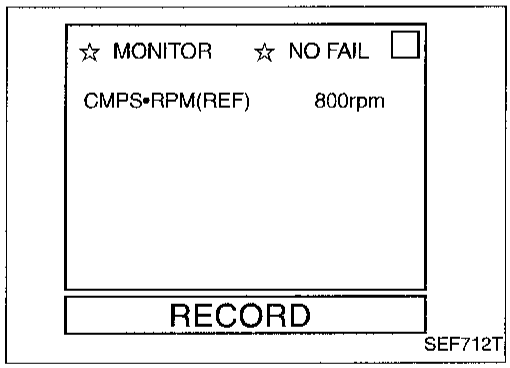




MONITOR ITEM	CONDITION		SPECIFICATION
IGNITION SW	● Ignition switch: ON → OFF → ON		ON → OFF → ON
IGN TIMING	● Engine: After warming up ● Air conditioner switch: "OFF" ● Shift lever: "N" ● No-load	Idle	Approx. 20° BTDC
		2,000 rpm	More than 25° BTDC

ECM TERMINALS AND REFERENCE VALUE

Specification data are reference values and are measured between each terminal and ㉜ (ECM ground).



TER-MINAL NO.	WIRE COLOR	ITEM	CONDITION	DATA (DC Voltage)
1	PU/W	Ignition signal	Engine is running. (Warm-up condition) └ Idle speed	0 - 0.5V  SEF186T

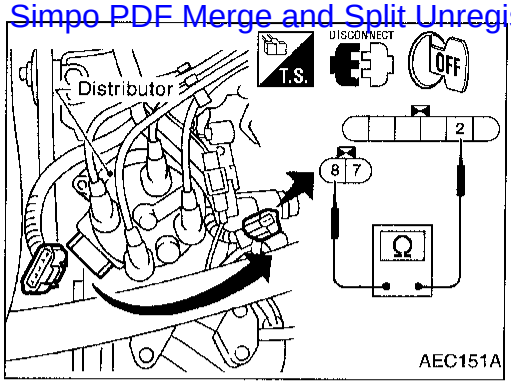
COMPONENT INSPECTION

Ignition coil



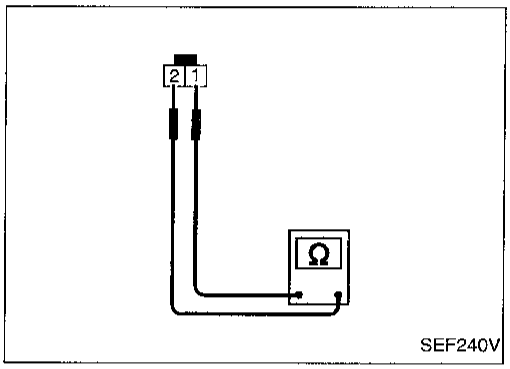
1. Disconnect ignition coil harness connector.
2. Remove distributor cap.
3. Check resistance as shown in the figure.

Terminal	Resistance [at 25°C (77°F)]
⑦ - ⑧	Less than 1Ω
⑦ - ⑨	7 - 13 kΩ

If NG, replace distributor assembly as a unit.

Ignition Signal (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

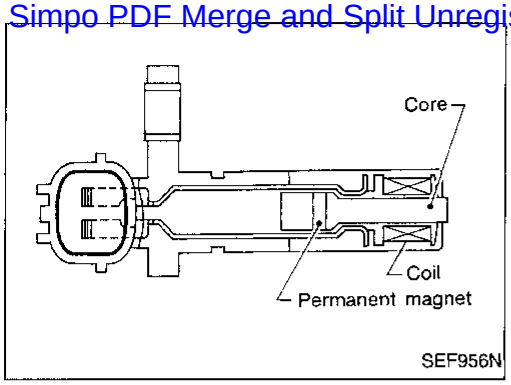


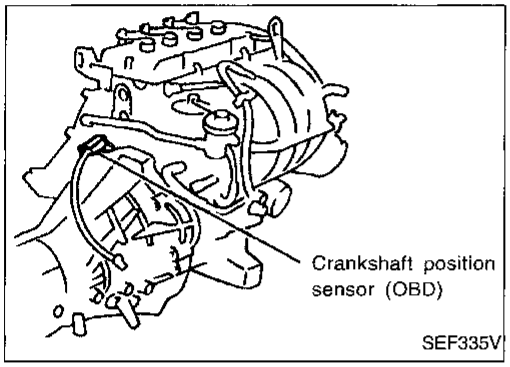
Power transistor

1. Disconnect camshaft position sensor & power transistor harness connector and ignition coil harness connector.
2. Check power transistor resistance between terminals ② and ⑧.

Terminals	Resistance	Result
② and ⑧	Except 0Ω	OK
	0Ω	NG

If NG, replace distributor assembly.



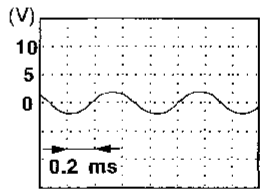


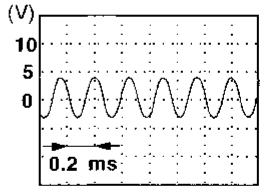
Resistor

1. Disconnect resistor harness connector.
2. Check resistance between terminals ① and ②.
   Resistance: Approximately 2.2 kΩ [at 25°C (77°F)]

If NG, replace resistor.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



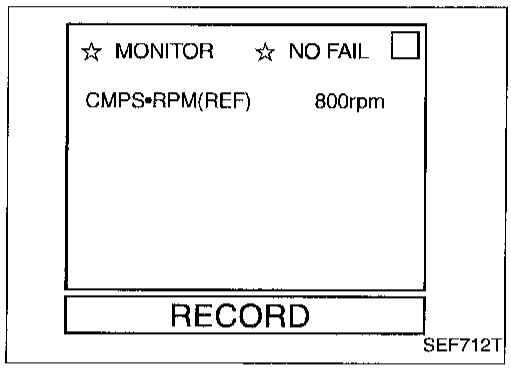


Crankshaft Position Sensor (CKPS) (OBD) (COG)

COMPONENT DESCRIPTION

The crankshaft position sensor (OBD) is located on the transmission housing facing the gear teeth (cogs) of the flywheel or drive plate. It detects the fluctuation of the engine revolution.
The sensor consists of a permanent magnet, core and coil.
When the engine is running, the high and low parts of the teeth cause the gap with the sensor to change.
The changing gap causes the magnetic field near the sensor to change.
Due to the changing magnetic field, the voltage from the sensor changes.
The ECM receives the voltage signal and detects the fluctuation of the engine revolution.
This sensor is not directly used to control the engine system.
It is used only for the on board diagnosis.

ECM TERMINALS AND REFERENCE VALUE



Specification data are reference values and are measured between each terminal and ㉜ (ECM ground).

TERMINAL NO.	WIRE COLOR	ITEM	CONDITION	DATA (DC Voltage)
43	B/W	Sensors' ground	Engine is running. └ Idle speed	Approximately 0V
47	L	Crankshaft position sensor (OBD)	Engine is running. (Warm-up condition) └ Idle speed	Approximately 0V  SEF112V
			Engine is running. └ Engine speed is 2,000 rpm.	Approximately 0V  SEF113V

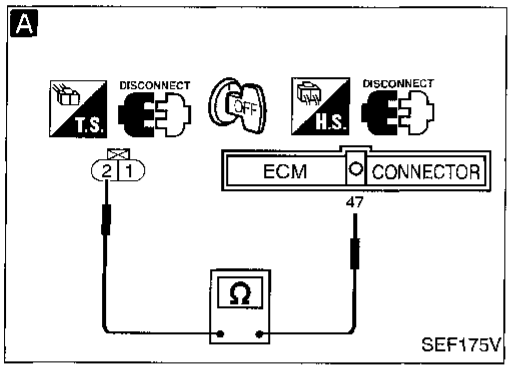
DIAGNOSTIC PROCEDURE

INSPECTION START

1. Turn ignition switch "OFF".
2. Loosen and retighten engine ground screws.



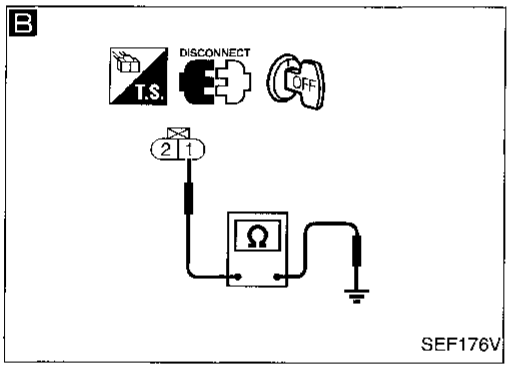
A

CHECK INPUT SIGNAL CIRCUIT.
1. Disconnect crankshaft position sensor (OBD) and ECM harness connectors.
2. Check continuity between ECM terminal (47) and terminal (2).
   Continuity should exist.
   If OK, check harness for short to ground and short to power.

NG → Check the following.
- Harness connectors (E202), (E32)
- Harness connectors (E41), (F25)
- Harness for open or short between ECM and crankshaft position sensor (OBD)

If NG, repair open circuit or short to ground or short to power in harness or connectors.

OK ↓



B

CHECK GROUND CIRCUIT.
1. Reconnect ECM harness connector.
2. Check harness continuity between terminal (1) and engine ground.
   Continuity should exist.
   If OK, check harness for short to ground and short to power.

NG → Check the following.
- Harness connectors (E202), (E32)
- Harness connectors (E41), (F25)
- Harness for open or short between crankshaft position sensor (OBD) and ECM

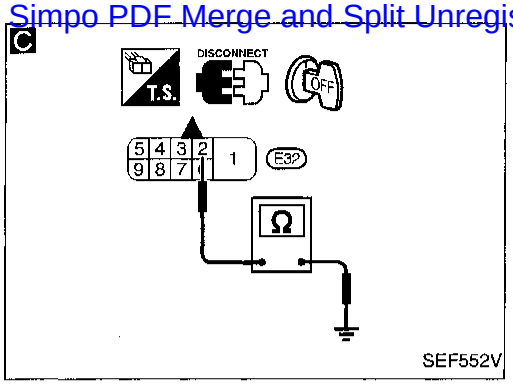
If NG, repair open circuit or short to ground or short to power in harness or connectors.

OK ↓

Loosen and retighten the fixing bolt of the crankshaft position sensor (OBD). Then retest.

Trouble is not fixed. ↓

CHECK COMPONENT
[Crankshaft position sensor (OBD)].
Refer to "COMPONENT INSPECTION" on next page.



NG → Replace crankshaft position sensor (OBD).

OK ↓

Ⓐ

C

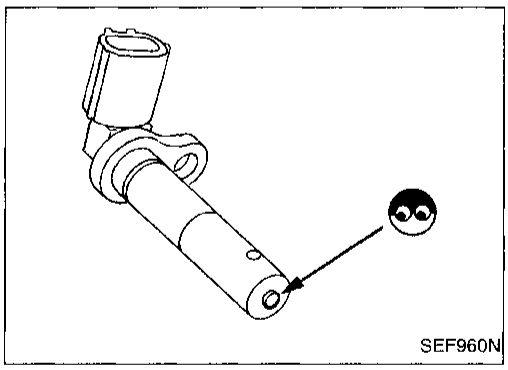
CHECK SHIELD CIRCUIT.
1. Turn ignition switch "OFF".
2. Disconnect connector (E32).
3. Check harness continuity between harness connector (E32) terminal (2) and ground.
   Continuity should exist.
   If OK, check harness for short to power.

NG → Check the following.
- Harness connectors (E41), (F25)
- Joint connector-1
- Harness for open or short between harness connector (E32) and ground

If NG, repair open circuit or short to power in harness or connectors.

OK ↓

Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.

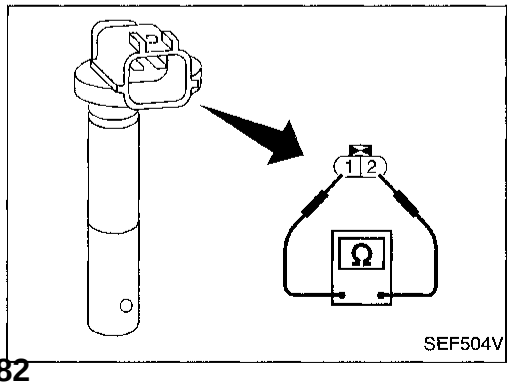


Trouble is not fixed. ↓

Visually check for chipping flywheel or drive plate gear tooth (cog).

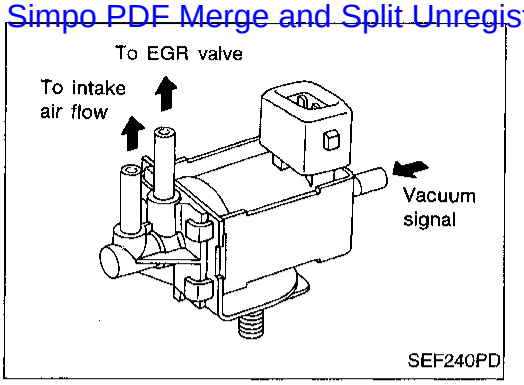
NG → Replace the flywheel or drive plate.

OK ↓



INSPECTION END

COMPONENT INSPECTION



Crankshaft position sensor (OBD)

1. Disconnect crankshaft position sensor (OBD) harness connector.
2. Loosen the fixing bolt of the sensor.
3. Remove the sensor.
4. Visually check the sensor for chipping.

5. Check resistance as shown in the figure.
   Resistance: Approximately 166.5 - 203.5Ω
   [at 20°C (68°F)]

EGRC-Solenoid Valve

COMPONENT DESCRIPTION

The EGRC-solenoid valve responds to signals from the ECM. When the ECM sends an ON (ground) signal, the coil in the solenoid valve is energized. The vacuum signal passes through the solenoid valve. The signal then reaches the EGR valve.
When the ECM sends an ON signal, a plunger will then move to cut the vacuum signal from the throttle body to the EGR valve.

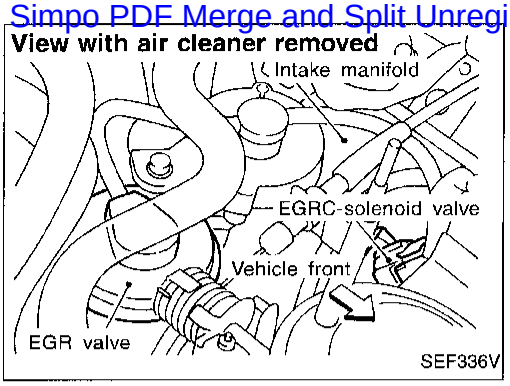
CONSULT REFERENCE VALUE IN DATA MONITOR MODE

Specification data are reference values.

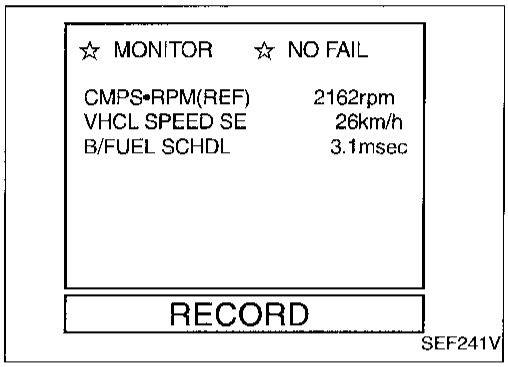
MONITOR ITEM	CONDITION		SPECIFICATION
EGRC SOL/V	● Engine: After warming up ● Air conditioner switch: "OFF" ● Shift lever: "N" ● No-load	Idle	ON
		Engine speed: Revving engine from idle to 3,000 rpm quickly	OFF

ECM TERMINALS AND REFERENCE VALUE

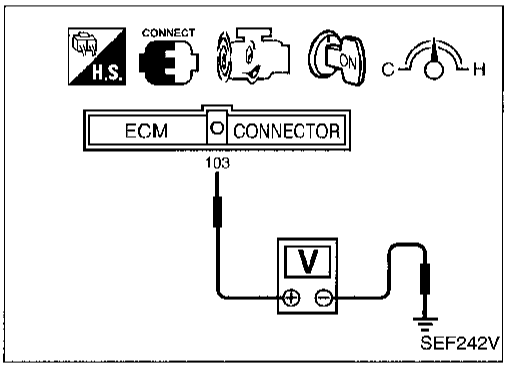
Specification data are reference values and are measured between each terminal and ㉜ (ECM ground).



TERMINAL NO.	WIRE COLOR	ITEM	CONDITION	DATA (DC Voltage)
103	G/W	EGRC-solenoid valve	Engine is running. (Warm-up condition) └ Idle speed	0 - 1V
			Engine is running. (Warm-up condition) └ Revving engine from idle to 3,000 rpm quickly	BATTERY VOLTAGE (11 - 14V)



ON BOARD DIAGNOSIS LOGIC



Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P1400 1005	● The improper voltage signal is sent to ECM through EGRC-solenoid valve.	● Harness or connectors (The EGRC-solenoid valve circuit is open or shorted.) ● EGRC-solenoid valve

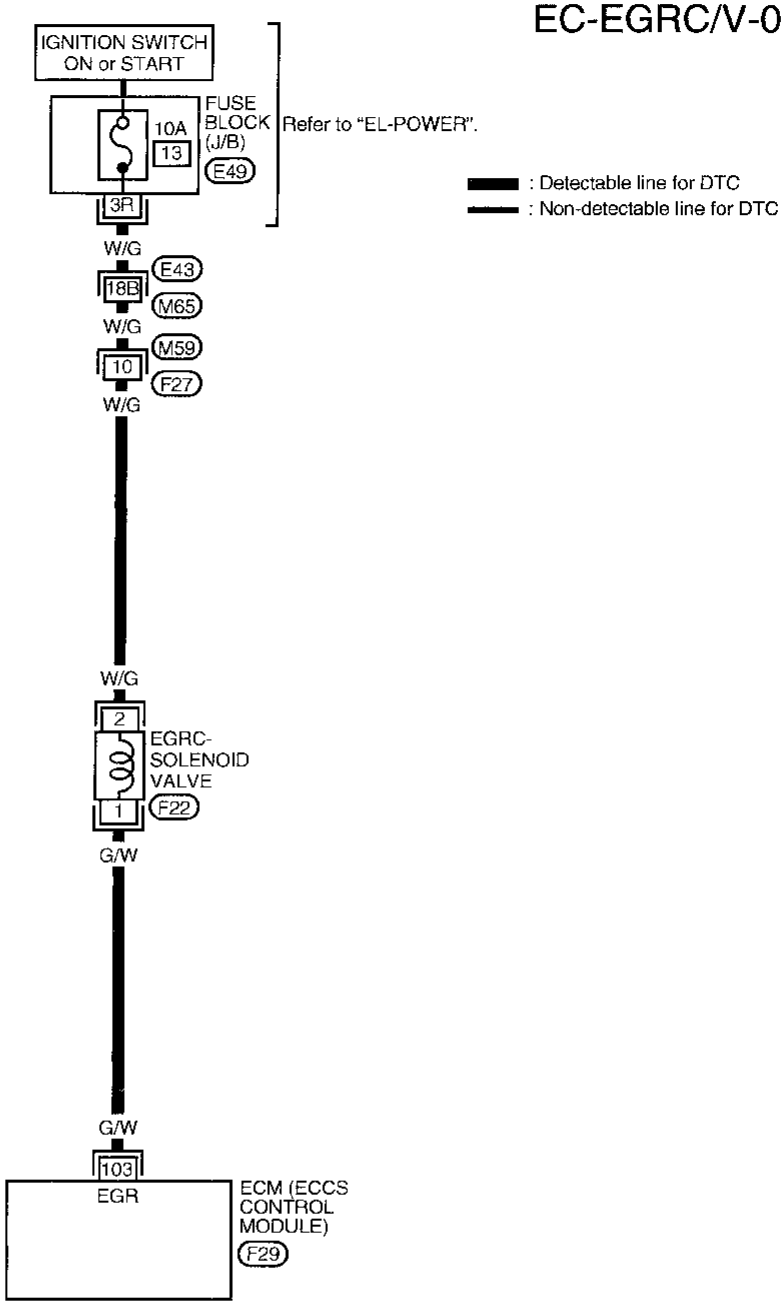
DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

CAUTION:
Always drive vehicle at a safe speed.

NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

1) Start engine and warm it up to normal operating temperature.
2) Select "DATA MONITOR" mode with CONSULT.
3) Maintain the following conditions for at least 5 consecutive seconds.
   CMPS·RPM (REF): 1,000 - 3,400 rpm
   B/FUEL SCHDL: 2 ms or more
   VHCL SPEED SE: Suitable speed

OR



OVERALL FUNCTION CHECK

Use this procedure to check the overall function of the EGR temperature sensor. During this check, a 1st trip DTC might not be confirmed.

1) Start engine and warm it up to normal operating temperature.
2) Check the voltage between ECM terminal (103) and ground at idle.
   Voltage: 0 - 1V
3) Check that the voltage changes to battery voltage and returns to 0 - 1V when revving the engine from idle to 3,000 rpm quickly.

DIAGNOSTIC PROCEDURE

INSPECTION START

A

CHECK POWER SUPPLY.
1. Turn ignition switch "OFF".
2. Disconnect EGRC-solenoid valve harness connector.
3. Turn ignition switch "ON".
4. Check voltage between terminal (2) and ground with CONSULT or tester.

Voltage: Battery voltage

NG → Check the following.
- Harness connectors (E43), (M65)
- Harness connectors (M59), (F27)
- 10A fuse
- Harness for open or short between EGRC-solenoid valve and 10A fuse

If NG, repair harness or connectors.

OK ↓

B

CHECK OUTPUT SIGNAL CIRCUIT.
1. Turn ignition switch "OFF".
2. Disconnect ECM harness connector.
3. Check harness continuity between ECM terminal (103) and terminal (1).

Continuity should exist.

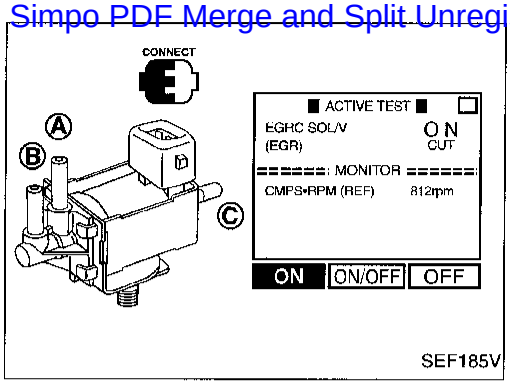
If OK, check harness for short to ground and short to power.

NG → Repair open circuit, short to ground or short to power in harness or connectors.

OK ↓

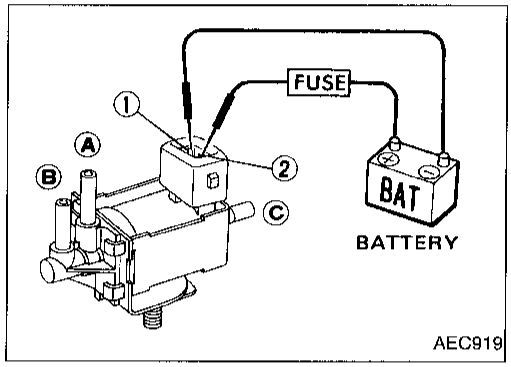
CHECK COMPONENT (EGRC-solenoid valve).
Refer to "COMPONENT INSPECTION" on next page.

NG → Replace EGRC-solenoid valve.



OK ↓

Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.



INSPECTION END

EGRC-Solenoid Valve (Cont'd)

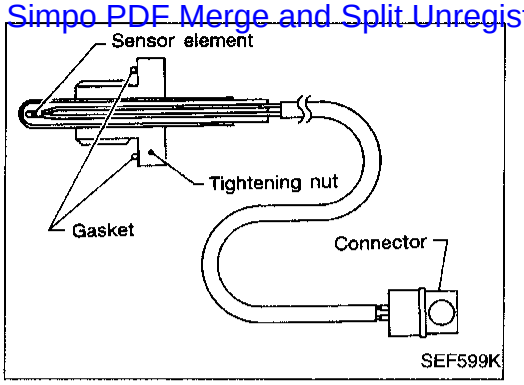
AEC919

COMPONENT INSPECTION

EGRC-solenoid valve

Check air passage continuity.

Perform "EGRC SOLENOID VALVE" in "ACTIVE TEST" mode.

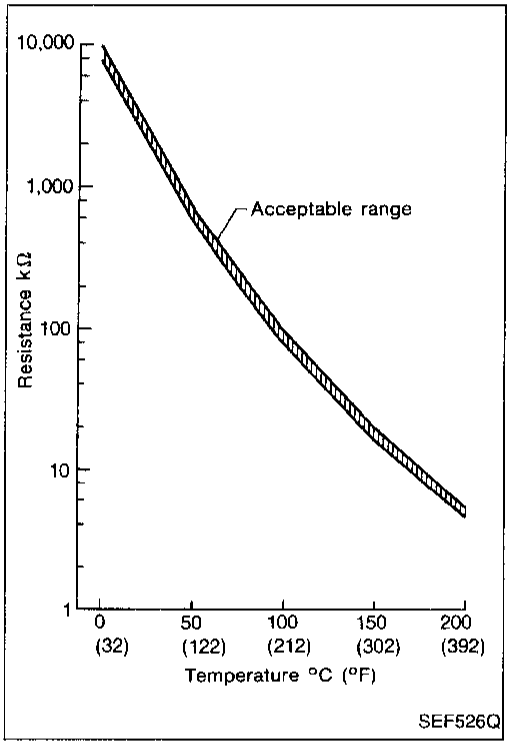


Condition EGRC SOLENOID VALVE	Air passage continuity between Ⓐ and Ⓑ	Air passage continuity between Ⓐ and Ⓒ
ON	Yes	No
OFF	No	Yes

OR

Condition	Air passage continuity between Ⓐ and Ⓑ	Air passage continuity between Ⓐ and Ⓒ
12V direct current supply between terminals ① and ②	Yes	No
No supply	No	Yes

If NG or operation takes more than 1 second, replace EGRC-solenoid valve.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

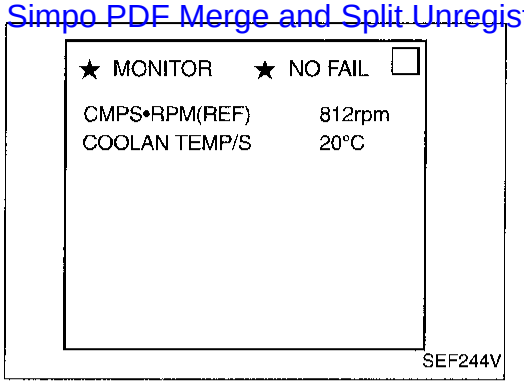
EGR Temperature Sensor

COMPONENT DESCRIPTION

The EGR temperature sensor detects temperature changes in the EGR passage way. When the EGR valve opens, hot exhaust gases flow, and the temperature in the passage way changes. The EGR temperature sensor is a thermistor that modifies a voltage signal sent from the ECM. This modified signal then returns to the ECM as an input signal. As the temperature increases, EGR temperature sensor resistance decreases. This sensor is not used to control the engine system.
It is used only for the on board diagnosis.

<Reference data>

EGR temperature °C (°F)	Voltage* V	Resistance MΩ
0 (32)	4.81	7.9 - 9.7
50 (122)	2.82	0.57 - 0.70
100 (212)	0.8	0.08 - 0.10



*: These data are reference values and are measured between ECM terminal ⑥③ (EGR temperature sensor) and ECM terminal ③② (ECM ground).
When EGR system is operating.
Voltage: 0 - 1.5V

ON BOARD DIAGNOSIS LOGIC

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P1401 0305	A) An excessively low voltage from the EGR temperature sensor is sent to ECM even when engine coolant temperature is low.	● Harness or connectors (The EGR temperature sensor circuit is shorted.) ● EGR temperature sensor ● Malfunction of EGR function, EGRC-BPT valve or EGRC-solenoid valve
	B) An excessively high voltage from the EGR temperature sensor is sent to ECM even when engine coolant temperature is high.	● Harness or connectors (The EGR temperature sensor circuit is open.) ● EGR temperature sensor ● Malfunction of EGR function, EGRC-BPT valve or EGRC-solenoid valve

EGR Temperature Sensor (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

Perform "Procedure for malfunction A" first. If DTC cannot be confirmed, perform "Procedure for malfunction B".

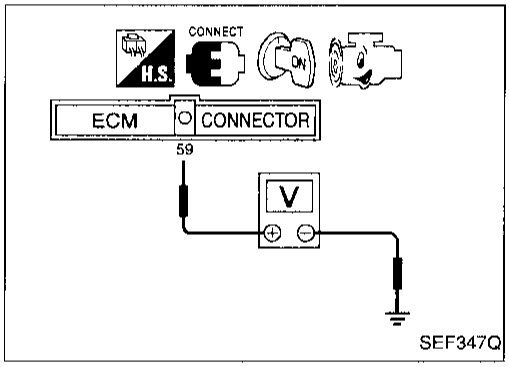
Procedure for malfunction A

NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

1) Turn ignition switch "ON".
2) Select "DATA MONITOR" mode with CONSULT.
3) Verify that engine coolant temperature is less than 40°C (104°F).

If the engine coolant temperature is above the range, cool the engine down.

4) Start engine and let it idle for at least 8 seconds.



OR

1) Turn ignition switch "ON".
2) Select "MODE 1" with GST.
3) Verify that engine coolant temperature is less than 40°C (104°F).

If the engine coolant temperature is above the range, cool the engine down.

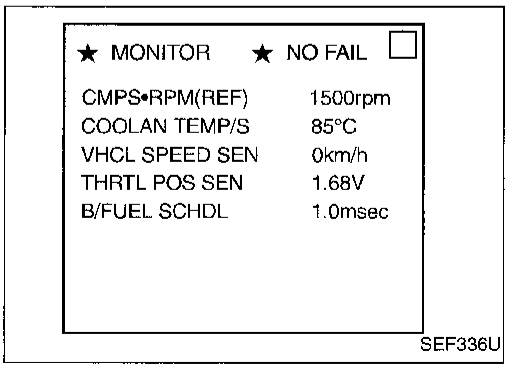
4) Start engine and let it idle for at least 8 seconds.
5) Select "MODE 7" with GST.

OR

1) Turn ignition switch "ON".
2) Verify that voltage between ECM terminal ⑤⑨ (engine coolant temperature) and ground is more 1.5V.

If the voltage is below the range, cool the engine down.

3) Start engine and let it idle for at least 8 seconds.
4) Turn ignition switch "OFF" and wait at least 5 seconds.
5) Turn ignition switch "ON" and perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.

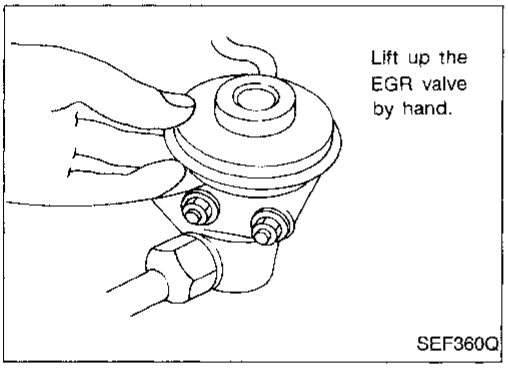


Procedure for malfunction B

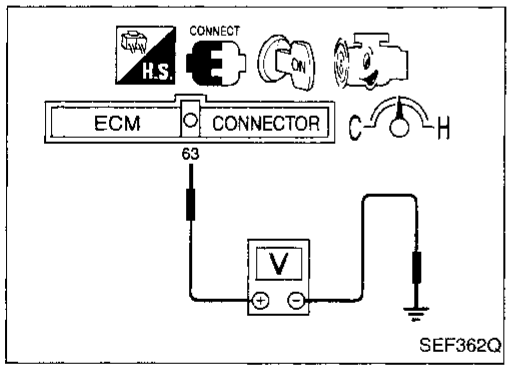
CAUTION:
Always drive vehicle at a safe speed.

NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

TESTING CONDITION:
Always perform the test at a temperature of 5°C (41°F) or higher.



1) Start engine and warm it up to normal operating temperature.
2) Run engine at idle for at least 2 minutes.
3) Confirm that EGR valve is not lifting.
   If the check result is NG, go to "TROUBLE DIAGNOSES FOR DTC P1402". (See page EC-338.)
4) Select "DATA MONITOR" mode with CONSULT.
5) Read "EGR TEMP SEN" at about 1,500 rpm while holding the EGR valve in full open position by hand.
   Voltage should decrease to less than 1.0V.



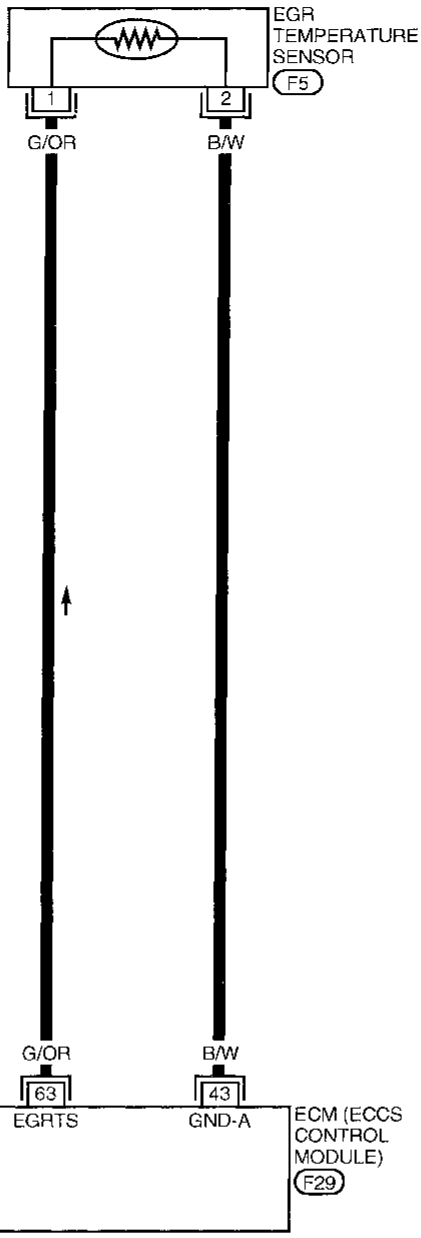
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

If the check result is NG, go to "DIAGNOSTIC PROCEDURE", EC-336.
If the check result is OK, go to following step.

6) Turn ignition switch "OFF" and wait at least 5 seconds.
7) Turn ignition switch "ON".
8) Check the output voltage of "THRTL POS SEN" (at closed throttle position) and note it.
9) Start engine.
10) Maintain the following conditions for at least 5 consecutive seconds.
CMPS·RPM (REF): 2,000 - 2,600 rpm
VHCL SPEED SE: Suitable speed
B/FUEL SCHDL: 2.5 - 3.5 ms
THRTL POS SEN: (X + 0.10) – (X + 0.52) V
X = Voltage value measured at step 8)
Selector lever: Suitable position

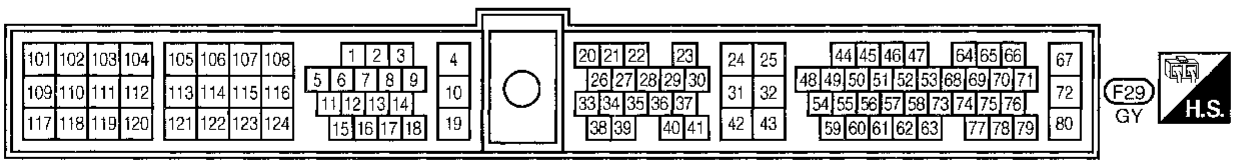
OR

OVERALL FUNCTION CHECK



Use this procedure to check the overall function of the EGR temperature sensor. During this check, a 1st trip DTC might not be confirmed.

Procedure for malfunction B



1) Start engine and warm it up to normal operating temperature.
2) Run engine at idle for at least 2 minutes.
3) Confirm that EGR valve is not lifting. If NG, go to TROUBLE DIAGNOSES FOR DTC P1402 (See page EC-338).
4) Check voltage between ECM terminal ⑥③ (EGR temperature sensor) and ground at about 1,500 rpm with EGR valve lifted up to the full position by hand.
Voltage should decrease to less than 1.0V.
5) If step 4 is OK, perform TROUBLE DIAGNOSES FOR DTC P0400 and P1400 (See pages EC-242 and 327).

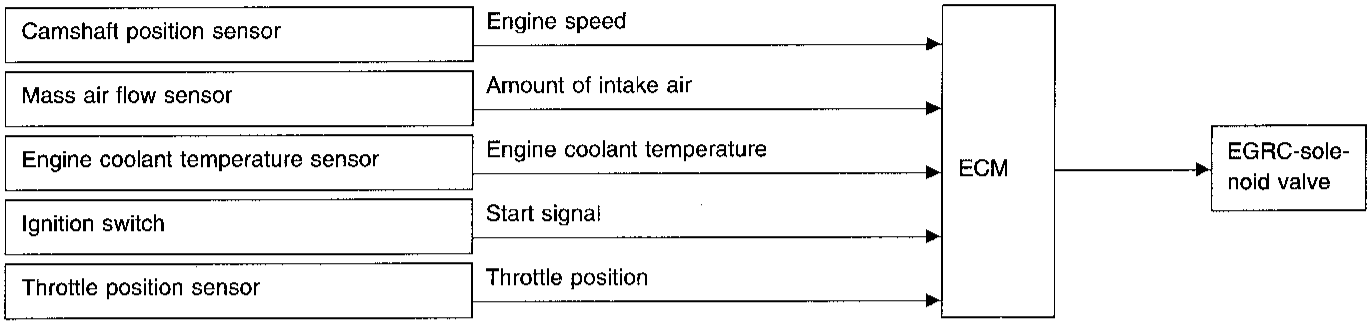
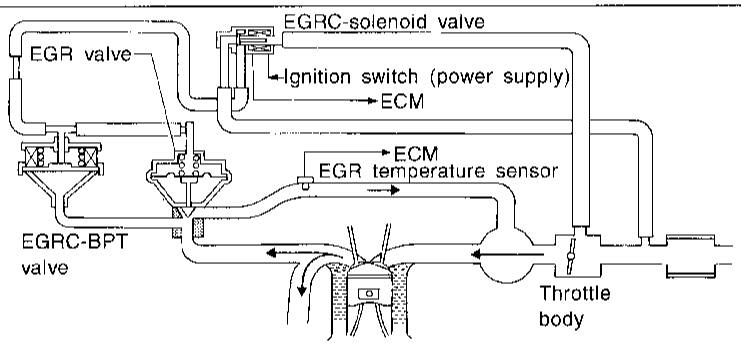
If NG, replace EGR temperature sensor.



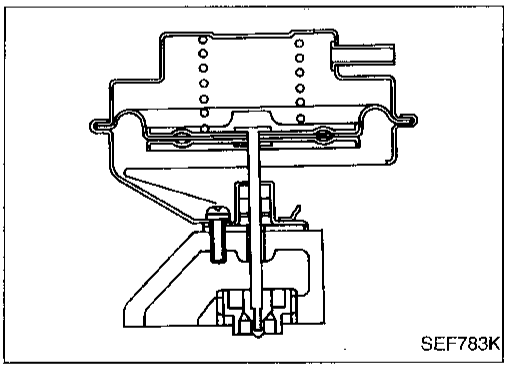
SEF526Q

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

EGR Function (Open)



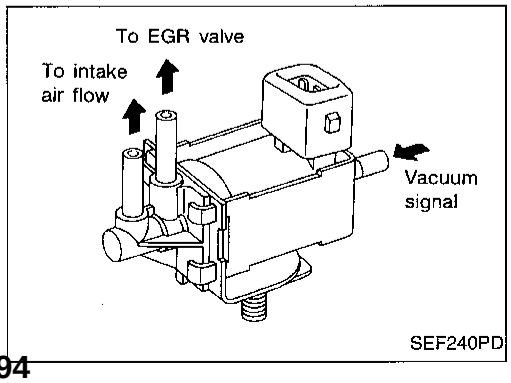
SYSTEM DESCRIPTION



This system cuts and controls vacuum applied to the EGR valve to suit engine operating conditions. This cut-and-control operation is accomplished through the ECM and the EGRC-solenoid valve. When the ECM detects any of the following conditions, current flows through the solenoid valve. This causes the port vacuum to be cut. The EGR valve remains closed.

- Low engine coolant temperature
- Engine starting
- High-speed engine operation
- Engine idling
- Excessively high engine coolant temperature
- Mass air flow sensor malfunction

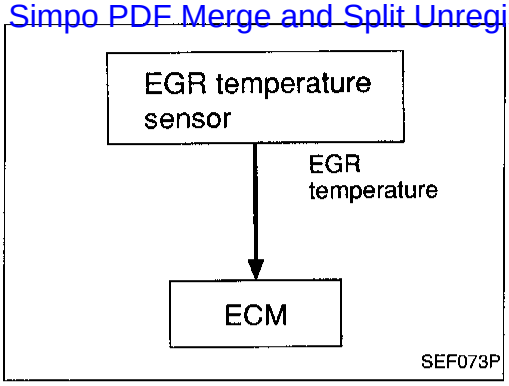
EGR and vacuum



COMPONENT DESCRIPTION

Exhaust gas recirculation (EGR) valve

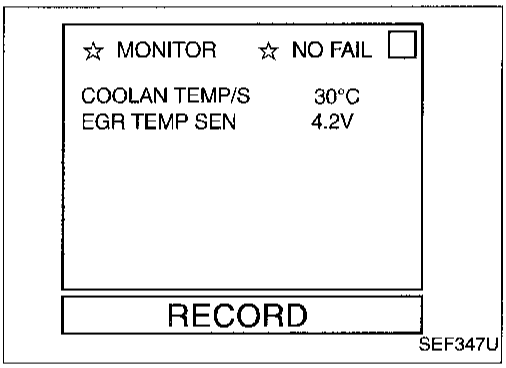
The EGR valve controls the amount of exhaust gas routed to the intake manifold. Vacuum is applied to the EGR valve in response to throttle valve opening. The vacuum controls the movement of a taper valve connected to the vacuum diaphragm in the EGR valve.



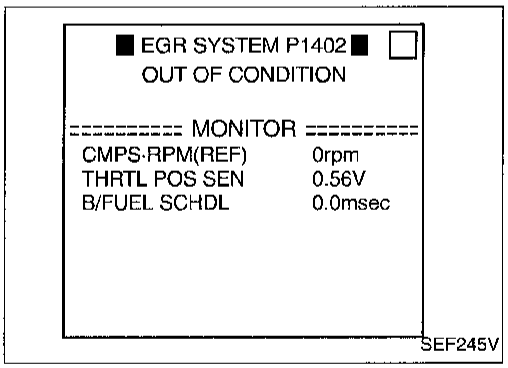
EGRC-solenoid valve

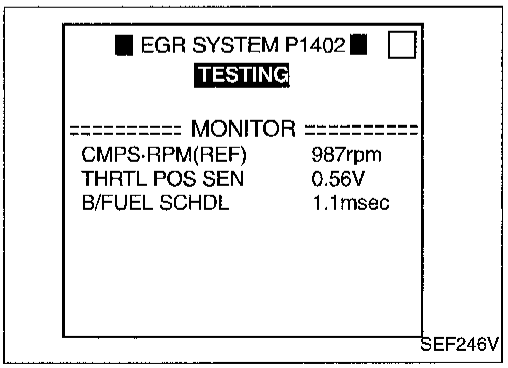
The EGRC-solenoid valve responds to signals from the ECM. When the ECM sends an ON (ground) signal, the coil in the solenoid valve is energized. The vacuum signal passes through the solenoid valve. A plunger will then move to cut the vacuum signal (from the throttle body to the EGR valve).
When the ECM sends an OFF signal, a plunger will then move to cut the vacuum signal from the throttle body to the EGR valve.

EGR Function (Open) (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com





ON BOARD DIAGNOSIS LOGIC

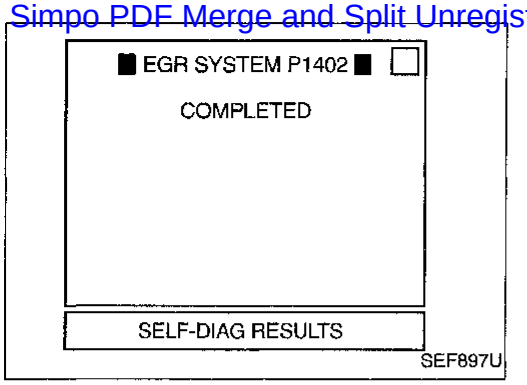
If EGR temperature sensor detects EGR flow under the condition that does not call for EGR, a high-flow malfunction is diagnosed.

Diagnostic Trouble Code No.	Malfunction is detected when ...	Check Items (Possible Cause)
P1402 0514	● The exhaust gas recirculation (EGR) flow is excessively high during the specified driving condition.	● EGRC-solenoid valve ● EGR valve leaking or stuck open ● EGR temperature sensor ● EGRC-BPT valve

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

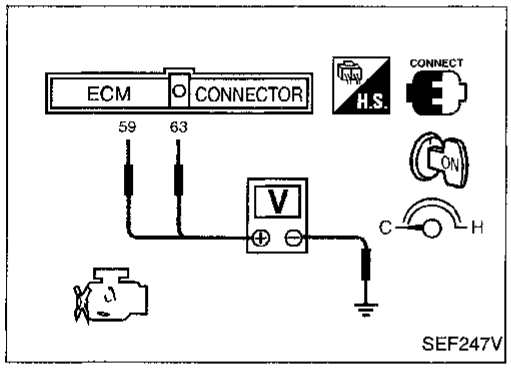
NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

TESTING CONDITION:



- **Always perform the test at a temperature of −10°C (14°F) or higher.**
- **Engine coolant temperature and EGR temperature must be verified in "DATA MONITOR" mode with CONSULT before starting DTC WORK SUPPORT test. If it is out of range below, the test cannot be conducted.**
  COOLAN TEMP/S: −10 to 40°C (14 to 104°F)
  EGR TEMP SEN: Less than 4.8V

  If the values are out of the ranges indicated above, park the vehicle in a cool place and allow the engine temperature to stabilize. Do not attempt to reduce the engine coolant temperature or EGR temperature with a fan or means other than ambient air. Doing so may produce an inaccurate diagnostic result.



1) Turn ignition switch "ON".
2) Select "EGR SYSTEM P1402" of "EGR SYSTEM" in "DTC WORK SUPPORT" mode with CONSULT.
3) Touch "START".
4) Start engine and let it idle until "TESTING" on CONSULT screen is turned to "COMPLETED". (It will take 60 seconds or more.)

EGR Function (Open) (Cont'd)

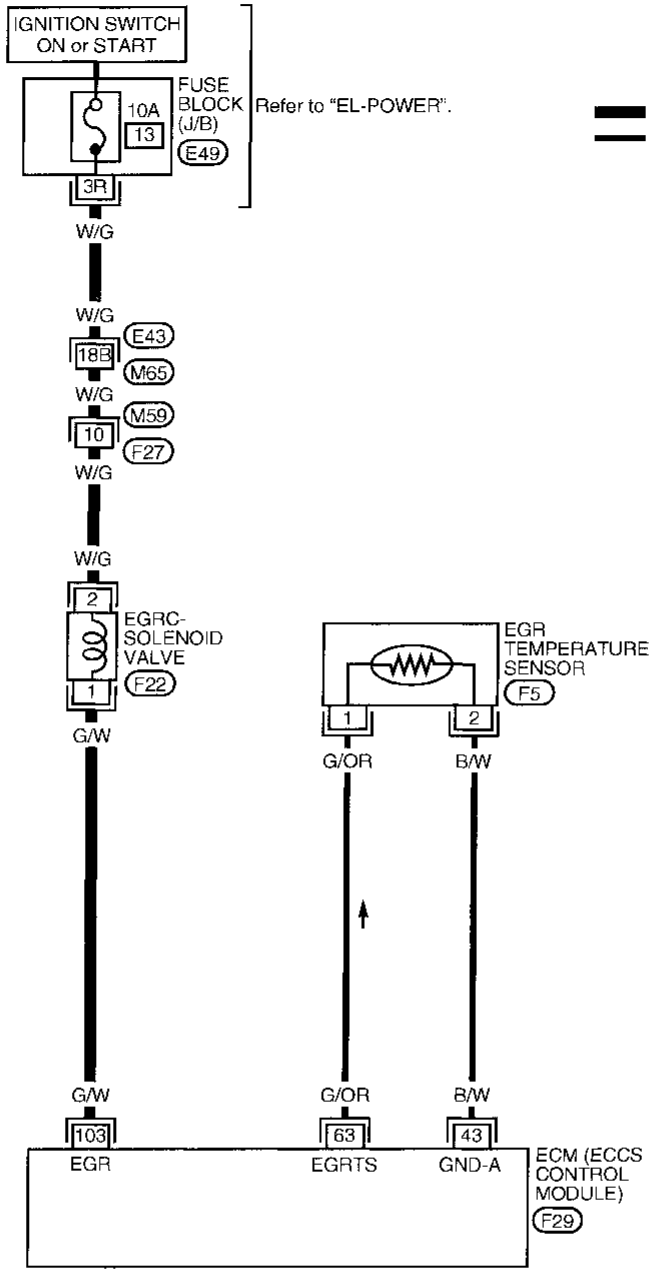
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

If "TESTING" is not displayed after 5 minutes, turn ignition "OFF" and cool the engine coolant temperature to the range of −10 to 40°C (14 to 104°F). Retry from step 1).

5) Make sure that "OK" is displayed after touching "SELF-DIAG RESULTS". If "NG" is displayed, refer to "DIAGNOSTIC PROCEDURE", EC-342.

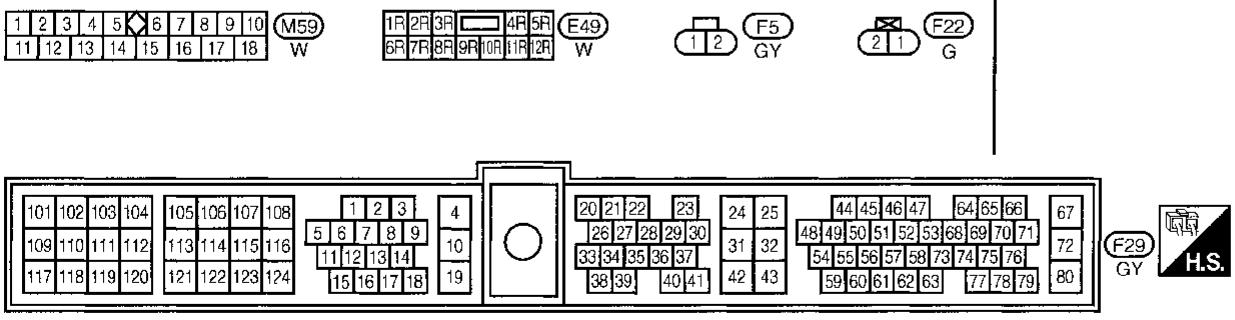
OR

1) Turn ignition switch "ON" and select "MODE 1" with GST.
2) Check that engine coolant temperature is within the range of −10 to 40°C (14 to 104°F).
3) Check that voltage between ECM terminal ⑥③ (EGR temperature) and ground is less than 4.8V.
4) Start engine and let it idle for at least 60 seconds.
5) Stop engine.
6) Perform from step 1) to 4).
7) Select "MODE 3" with GST.



OR

1) Turn ignition switch "ON".
2) Check the following voltages.
   ECM terminal ⑤⑨ (engine coolant temperature) and ground:
   1.5 - 4.4V
   ECM terminal ⑥③ (EGR temperature) and ground:
   Less than 4.8V
3) Start engine and let it idle for at least 60 seconds.
4) Turn ignition switch "OFF", wait at least 5 seconds and then turn "ON".
5) Perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.



- **When using GST, "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" should be performed twice as much as when using CONSULT or ECM (Diagnostic Test Mode II) because GST cannot display MODE 7 (1st trip DTC) concerning this diagnosis. Therefore, using CONSULT or ECM (Diagnostic Test Mode II) is recommended.**

DIAGNOSTIC PROCEDURE

INSPECTION START

A

CHECK VACUUM HOSE.
Check vacuum hose for clogging, cracks or improper connection.
Refer to "Vacuum Hose Drawing", EC-13.

NG → Repair or replace vacuum hose.

OK

B

CHECK EGRC-SOLENOID VALVE CIRCUIT.

1. Turn ignition switch "ON".
2. Perform "EGRC SOL/V CIRCUIT" in "FUNCTION TEST" mode with CONSULT.

OR

1. Turn ignition switch "ON".
2. Turn EGRC-solenoid valve "ON" and "OFF" in "ACTIVE TEST" mode with CONSULT and check operating sound.

OR

1. Turn ignition switch "ON".
2. Check operating sound of the solenoid valve when disconnecting and reconnecting EGRC-solenoid valve harness connector. (The DTC or the 1st trip DTC for the EGRC-solenoid valve will be displayed, however, ignore it.)

NG → Check the following.
- Harness connectors (E43), (M65)
- Harness connectors (M59), (F27)
- 10A fuse
- Harness for open or short between fuse block and EGRC-solenoid valve
- Harness for open or short between ECM and EGRC-solenoid valve

If NG, repair open circuit or short to power in harness or connector.

OK

OK

CHECK COMPONENT (EGRC-solenoid valve).
Refer to "COMPONENT INSPECTION" on next page.

NG → Replace EGRC-solenoid valve.

OK

CHECK COMPONENT (EGR valve).
Refer to "COMPONENT INSPECTION" on the next page.

NG → Replace EGR valve.

OK

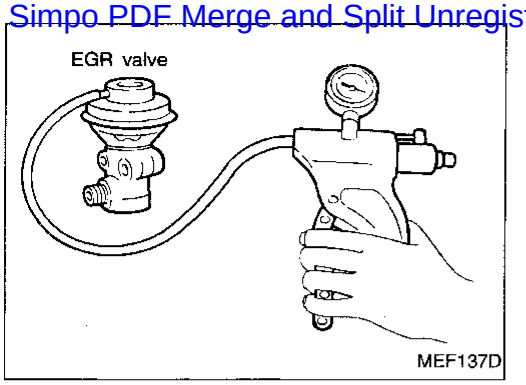
CHECK COMPONENT (EGRC-BPT valve).
Refer to "COMPONENT INSPECTION" on EC-344.

NG → Replace EGRC-BPT valve.

OK

CHECK COMPONENT (EGR temperature sensor).
Refer to "COMPONENT INSPECTION" on EC-344.

NG → Replace EGR temperature sensor.



OK

Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.

INSPECTION END

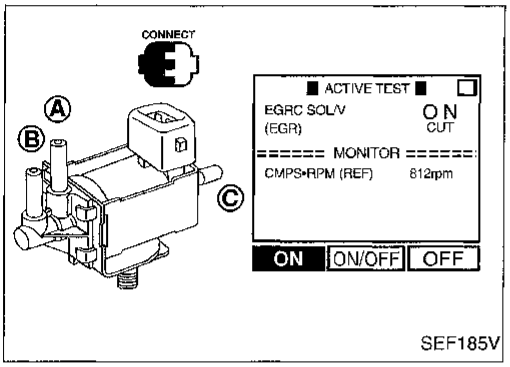
EGR Function (Open) (Cont'd)

COMPONENT INSPECTION



EGR valve

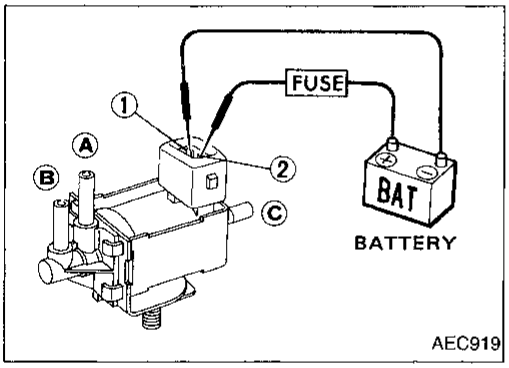
- Apply vacuum to EGR vacuum port with a hand vacuum pump.

EGR valve spring should lift.

- Check for sticking

If NG, repair or replace EGR valve.

EGRC-solenoid valve

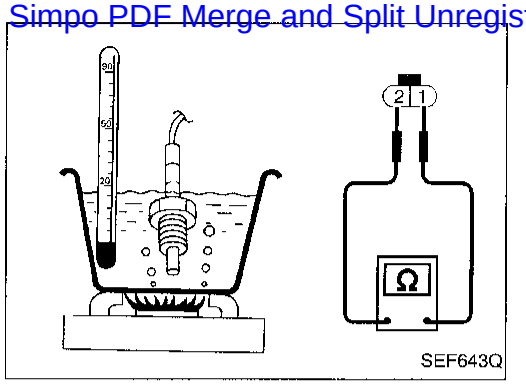


Check air passage continuity.

Perform "EGRC SOLENOID VALVE" in "ACTIVE TEST" mode.

Condition EGRC SOLENOID VALVE	Air passage continuity between Ⓐ and Ⓑ	Air passage continuity between Ⓐ and Ⓒ
ON	Yes	No
OFF	No	Yes

OR

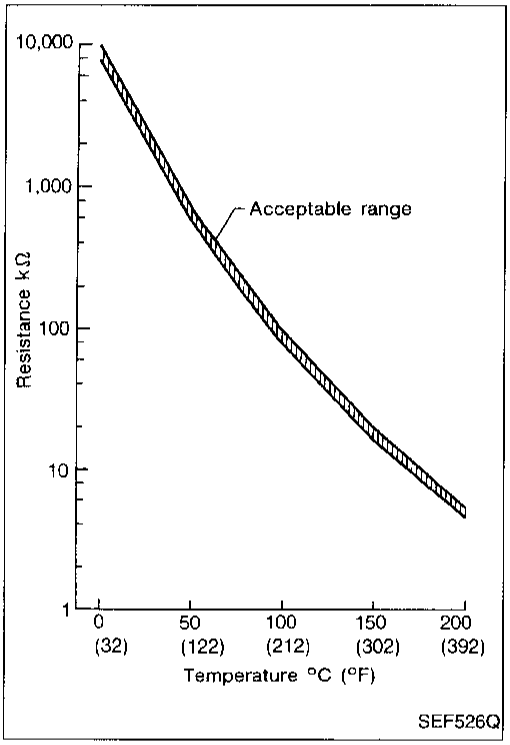


Condition	Air passage continuity between Ⓐ and Ⓑ	Air passage continuity between Ⓐ and Ⓒ
12V direct current supply between terminals ① and ②	Yes	No
No supply	No	Yes

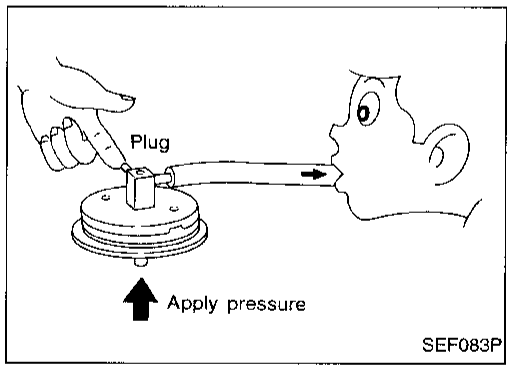
If NG or operation takes more than 1 second, replace EGRC-solenoid valve.

EGR Function (Open) (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



EGR temperature sensor



Check resistance change and resistance value.

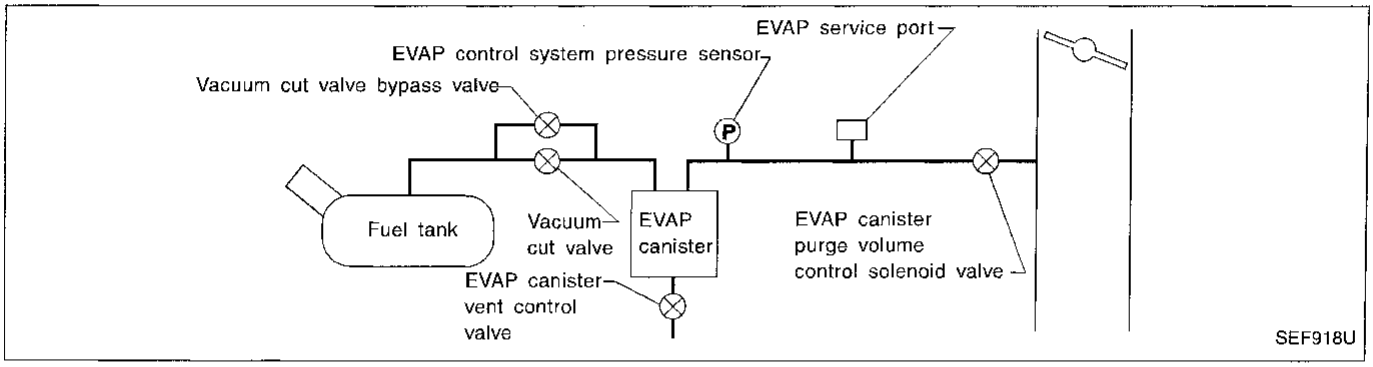
<Reference data>

EGR temperature °C (°F)	Voltage V	Resistance MΩ
0 (32)	4.81	7.9 - 9.7
50 (122)	2.82	0.57 - 0.70
100 (212)	0.8	0.08 - 0.10

If NG, replace EGR temperature sensor.

EGRC-BPT valve

1. Plug one of two ports of EGRC-BPT valve.
2. Vacuum from the other port and check for leakage while applying a pressure above 0.981 kPa (100 mmH_2O, 3.94 inH_2O) from under EGRC-BPT valve.
3. If a leakage is noted, replace the valve.



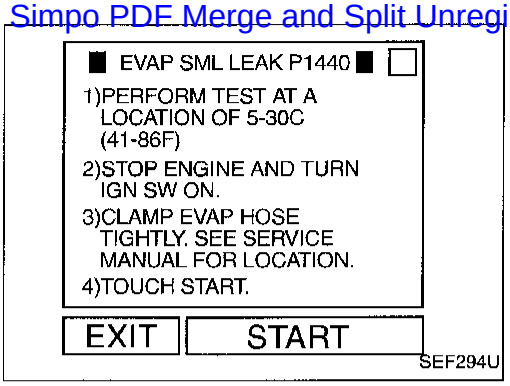
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Evaporative Emission (EVAP) Control System (Small Leak) (Positive Pressure)

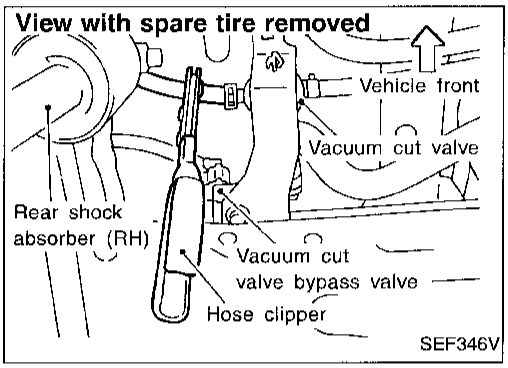
Note: If both DTC P1440 and P1448 are displayed, perform TROUBLE DIAGNOSIS FOR DTC P1448 first. (See EC-373.)

ON BOARD DIAGNOSIS LOGIC

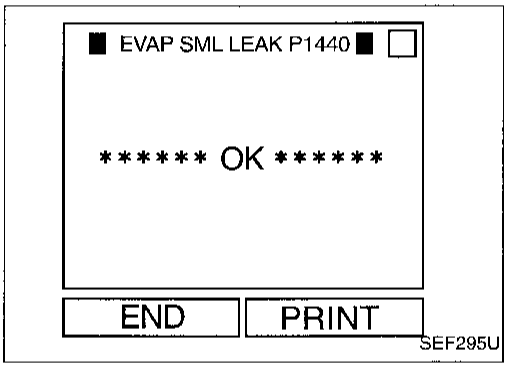
This diagnosis detects leaks in the EVAP purge line using vapor pressure in the fuel tank.
The EVAP canister vent control valve is closed to shut the EVAP purge line. The vacuum cut valve bypass valve will then be opened to clear the line between the fuel tank and the EVAP canister purge volume control solenoid valve. The EVAP control system pressure sensor can now monitor the pressure inside the fuel tank.
If pressure increases, the ECM will check for leaks in the line between the vacuum cut valve and EVAP canister purge volume control solenoid valve.



ON BOARD DIAGNOSIS LOGIC



Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P1440 0213	● EVAP control system has a leak. ● EVAP control system does not operate properly.	● Incorrect fuel tank vacuum relief valve ● Incorrect fuel filler cap used ● Fuel filler cap remains open or fails to close. ● Foreign matter caught in fuel filler cap. ● Leak is in line between intake manifold and EVAP canister purge volume control solenoid valve. ● Foreign matter caught in EVAP canister vent control valve. ● EVAP canister or fuel tank leaks ● EVAP purge line (pipe and rubber tube) leaks ● EVAP purge line rubber tube bent. ● Blocked or bent rubber tube to EVAP control system pressure sensor ● Loose or disconnected rubber tube ● EVAP canister vent control valve and the circuit ● EVAP canister purge volume control solenoid valve ● Absolute pressure sensor ● Tank fuel temperature sensor ● MAP/BARO switch solenoid valve ● Blocked or bent rubber tube to MAP/BARO switch solenoid valve ● O-ring of EVAP canister vent control valve is missing or damaged. ● Water separator ● EVAP canister is saturated with water.



CAUTION:

- **Use only a genuine NISSAN fuel filler cap as a replacement. If an incorrect fuel filler cap is used, the MIL may come on.**
- **If the fuel filler cap is not tightened properly, the MIL may come on.**
- **Use only a genuine rubber tube as a replacement.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Evaporative Emission (EVAP) Control System (Small Leak) (Positive Pressure) (Cont'd)

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

CAUTION:

- **Never use compressed air or high pressure pump. Otherwise, EVAP system may be damaged.**
- **Do not start engine.**
- **Do not exceed 4.12 kPa (0.042 kg/cm^2, 0.6 psi) of pressure in EVAP system.**

NOTE:

- **If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.**
- **Always remove service port adapter from service port when applying air up to 0.69 to 1.38 kPa (5.14 to 10.34 mmHg, 0.202 to 0.407 inHg).**
- **During the test, clamp the EVAP hose tightly as shown at left.**
- **If both DTC P1440 and P1448 are displayed, perform TROUBLE DIAGNOSIS FOR DTC P1448 first. (See EC-373.)**

1) Turn ignition switch "ON".
2) Select "EVAP SML LEAK P1440" of "EVAPORATIVE SYSTEM" in "DTC WORK SUPPORT" mode with CONSULT.
   Follow the instruction displayed.
3) Make sure that "OK" is displayed.
   If "NG" is displayed, refer to "DIAGNOSTIC PROCEDURE", EC-348.

OR

NOTE:
Be sure to read the explanation of "Driving pattern" on EC-39 before driving vehicle.

1) Start engine.
2) Drive vehicle according to "Driving pattern", EC-39.
3) Stop vehicle.
4) Select "MODE 1" with GST.
   - If SRT of EVAP system is not set yet, go to the following step.
   - If SRT of EVAP system is set, the result will be OK.
5) Turn ignition switch "OFF" and wait at least 5 seconds.
6) Start engine.
   It is not necessary to cool engine down before driving.
7) Drive vehicle again according to the "Driving pattern", EC-39.
8) Stop vehicle.
9) Select "MODE 3" with GST.
   - If P1447 is displayed on the screen, go to "TROUBLE DIAGNOSIS FOR DTC P1447", EC-367.
   - If P0440 is displayed on the screen, go to "DIAGNOSTIC PROCEDURE", EC-263.
   - If P1440 is displayed on the screen, go to "DIAGNOSTIC PROCEDURE" in "TROUBLE DIAGNOSIS FOR DTC P1440", EC-348.
   - If P0440, P1440 and P1447 are not displayed on the screen, go to the following step.
10) Select "MODE 1" with GST.
    - If SRT of EVAP system is set, the result will be OK.
    - If SRT of EVAP system is not set, go to step 5).

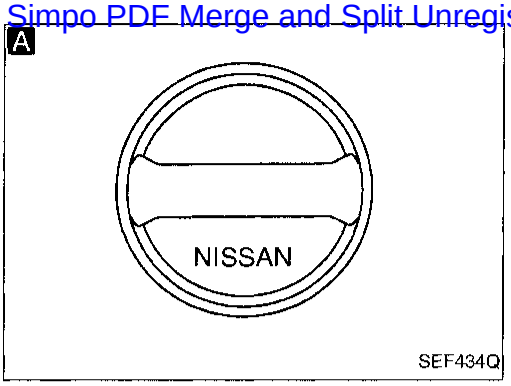
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Evaporative Emission (EVAP) Control System (Small Leak) (Positive Pressure) (Cont'd)

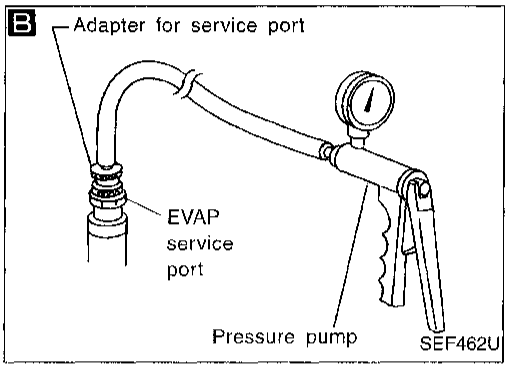
OR

NOTE:

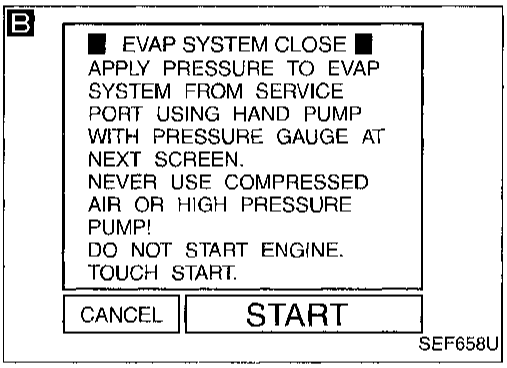
- **Be sure to read the explanation of "Driving pattern" on EC-39 before driving vehicle.**
- **It is better that the fuel level is low.**



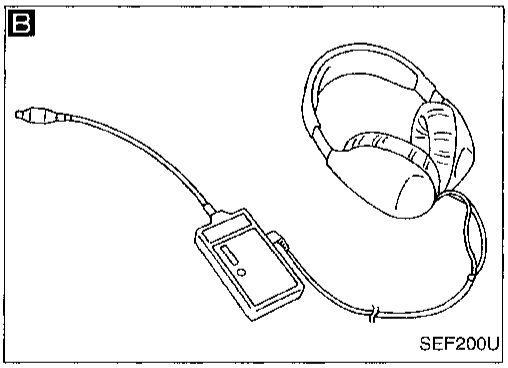
NO TOOLS



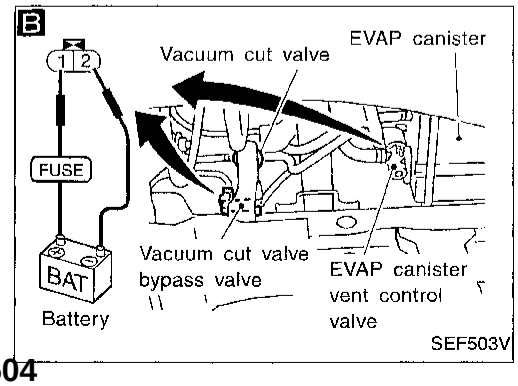
1) Start engine.
2) Drive vehicle according to "Driving pattern", EC-39.
3) Stop vehicle.
4) Turn ignition switch "OFF" and wait at least 5 seconds.
5) Perform the step 1) to 4) again.
6) Turn ignition switch "ON" and perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Evaporative Emission (EVAP) Control System (Small Leak) (Positive Pressure) (Cont'd)



DIAGNOSTIC PROCEDURE

INSPECTION START

A

CHECK FUEL FILLER CAP.
1. Check for genuine NISSAN fuel filler cap design.
2. Check for air releasing sound while opening the fuel filler cap.
   If the air releasing sound is heard, go to **B** .
   If the air releasing sound is not heard, check the following.
   Was the cap tightened properly?
   If Yes, check fuel filler cap vacuum relief valve.
   Refer to "EVAPORATIVE EMISSION SYSTEM", EC-21.
   If No, open fuel filler cap, then clean cap and filler neck thread using air blower. Retighten until ratcheting sound is heard.

NG → If genuine NISSAN filler cap is not used, replace with genuine NISSAN fuel filler cap.

OK ↓

B

CHECK FOR EVAP LEAK.
- **Never use compressed air or high pressure pump.**
- **Improper installation of service port may cause leaking.**
- **Do not exceed 4.12 kPa (0.042 kg/cm^2, 0.6 psi) of pressure in the system.**

To locate EVAP leak portion, proceed with the following steps.
1. Install the EVAP service port adapter and the pressure pump securely.
2. Turn ignition switch "ON".
   Select "EVAP SYSTEM CLOSE" of "WORK SUPPORT" mode with CONSULT.
3. Touch "START" and apply vacuum into the EVAP line until the pressure indicator reaches the middle of bar graph.
4. Using EVAP leak detector, locate the leak portion. For the leak detector, refer to instruction manual for more details.
   Refer to "EVAPORATIVE EMISSION SYSTEM", EC-23.

NG → Repair or replace.

OR

2. Turn ignition switch "OFF".
3. Apply 12 volts DC to EVAP canister vent control valve. The valve will close. (Continue to apply 12 volts until the end of test.)
4. Apply 12 volts DC to vacuum cut valve bypass valve. The valve will open. (Continue to apply 12 volts until the end of test.)
5. Pressurize the EVAP line using pressure pump with 1.3 to 2.7 kPa (10 to 20 mmHg, 0.39 to 0.79 inHg).
6. Locate the leak using a leak detector. Refer to the instruction manual for more details about the leak detector. Refer to "Evaporative Emission Line Drawing", EC-23.

OK ↓

Ⓐ

(Go to next page.)

Evaporative Emission (EVAP) Control System (Small Leak) (Positive Pressure) (Cont'd)

Ⓐ

C

CHECK COMPONENT AND CIRCUIT
(EVAP canister vent control valve, O-ring and water separator).
Refer to "TROUBLE DIAGNOSIS FOR DTC P0446", EC-276.

NG → Repair or replace EVAP canister vent control valve and O-ring or harness/ connector.

OK ↓

D

CHECK IF EVAP CANISTER IS SATURATED WITH WATER.
1. Remove EVAP canister with EVAP canister vent control valve attached.
2. Check if water will drain from the EVAP canister.
   If it will, weigh the EVAP canister with the vent control valve attached.

If the weight is:
More than 1.8 kg (4.0 lb) → NG
Less than 1.8 kg (4.0 lb) → OK

NG → Check the following.
1. Visually check the EVAP canister for damage.
2. Check hose connection between EVAP canister and water separator for clogging and poor connection.
3. Check water separator. Refer to "COMPONENT INSPECTION", EC-366.

If NG, repair hose or replace EVAP canister or water separator.

OK ↓

E

CHECK COMPONENT (EVAP canister purge volume control solenoid valve).

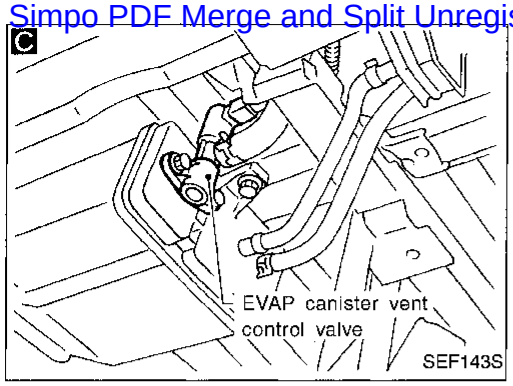
1. Disconnect vacuum hose to EVAP canister purge volume control solenoid valve at EVAP service port.
2. Start engine.
3. Perform "PURG VOL CONT/V" in "ACTIVE TEST" mode.
4. Touch "Qu" on CONSULT screen to increase "PURG VOL CONT/V" opening to 100.0%.
5. Check vacuum hose for vacuum when revving engine up to 2,000 rpm.
   Vacuum should exist.

OR

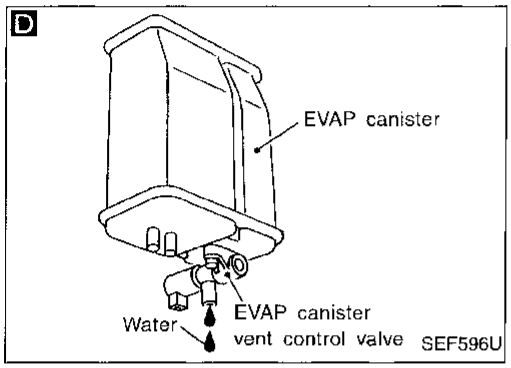
1. Start engine and warm it up to normal operating temperature.
2. Stop engine and let it idle for at least 60 seconds.
3. Disconnect vacuum hose to EVAP canister purge volume control solenoid valve at EVAP service port.
4. Start engine.
5. Check vacuum hose for vacuum when revving engine up to 2,000 rpm.
   Vacuum should exist.

NG → Check the following.
- EVAP canister purge volume control solenoid valve
  Refer to "COMPONENT INSPECTION", EC-351.
- Vacuum hoses for clogging or disconnection
  Refer to "Vacuum Hose Drawing", EC-13.

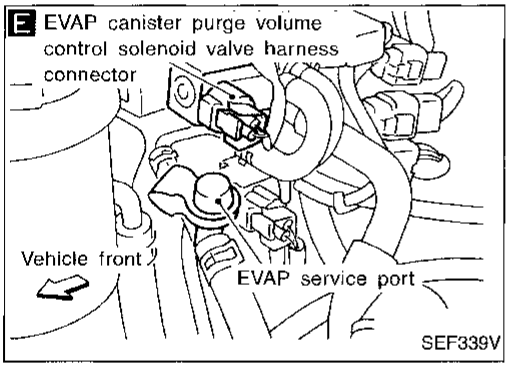
OK ↓



F



CHECK COMPONENT
(Absolute pressure sensor).
Refer to "COMPONENT INSPECTION", EC-353.



NG → Replace absolute pressure sensor.

INSPECTION END

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Evaporative Emission (EVAP) Control System (Small Leak) (Positive Pressure) (Cont'd)

COMPONENT INSPECTION

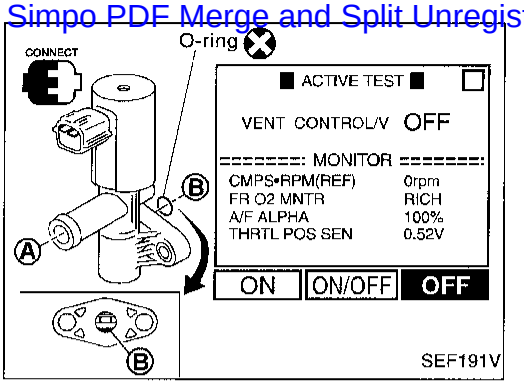
EVAP canister purge volume control solenoid valve

1. Start engine.
2. Perform "PURG VOL CONT/V" in "ACTIVE TEST" mode with CONSULT. Check that engine speed varies according to the valve opening.
   If OK, inspection end. If NG, go to following step.
3. Check air passage continuity.

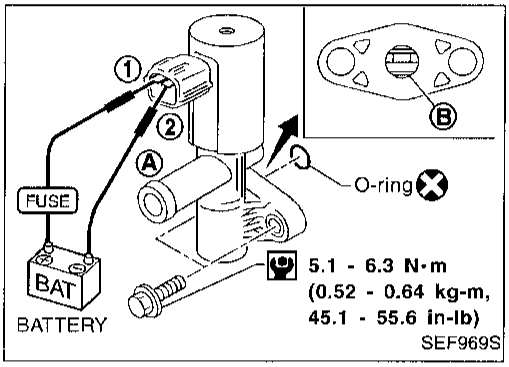
Condition PURG VOL CONT/V value	Air passage continuity between (A) and (B)
100.0%	Yes
0.0%	No

If NG, replace the EVAP canister purge volume control solenoid valve.

OR



Check air passage continuity.



Condition	Air passage continuity between (A) and (B)
12V direct current supply between terminals	Yes
No supply	No

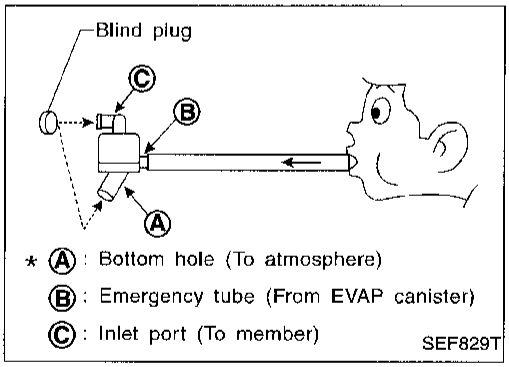
If NG or operation takes more than 1 second, replace solenoid valve.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Evaporative Emission (EVAP) Control System (Small Leak) (Positive Pressure) (Cont'd)

EVAP canister vent control valve

Check air passage continuity.



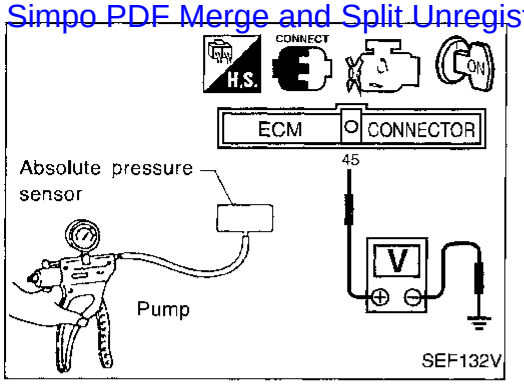
Perform "VENT CONTROL/V" in "ACTIVE TEST" mode.

Condition VENT CONTROL/V	Air passage continuity between Ⓐ and Ⓑ
ON	No
OFF	Yes

OR

Condition	Air passage continuity between Ⓐ and Ⓑ
12V direct current supply between terminals ① and ②	No
No supply	Yes

If NG or operation takes more than 1 second, clean valve using air blower or replace as necessary.
If the portion Ⓑ is rusted, replace EVAP canister vent control valve.
Make sure new O-ring is installed properly.



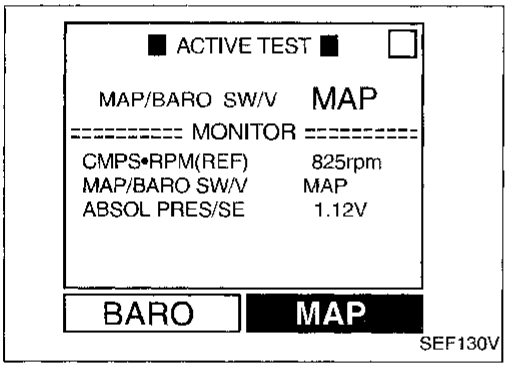
Water separator

1. Check visually for insect nests in the water separator air inlet.
2. Check visually for cracks or flaws in the appearance.
3. Check visually for cracks or flaws in the hose.
4. Check that Ⓐ and Ⓒ are not clogged by blowing air into Ⓑ with Ⓐ, and then Ⓒ plugged.
5. In case of NG in items 2 - 4, replace the parts.

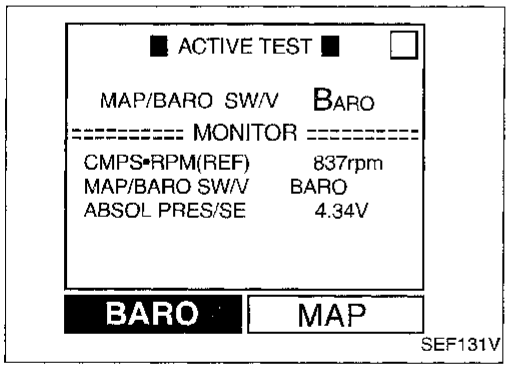
- **Do not disassemble water separator.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

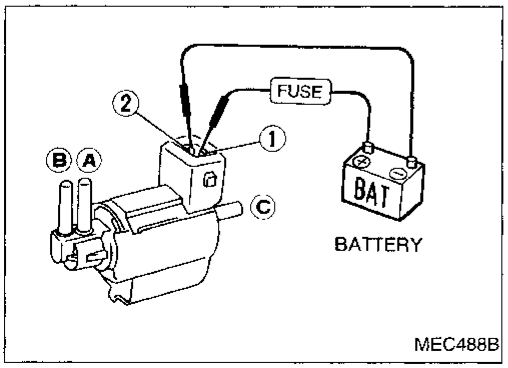
Evaporative Emission (EVAP) Control System (Small Leak) (Positive Pressure) (Cont'd)



Absolute pressure sensor



1. Remove absolute pressure sensor with its harness connector connected.
2. Remove hose from absolute pressure sensor.
3. Turn ignition switch "ON" and check output voltage between ECM terminal (45) and engine ground.
   The voltage should be 3.2 to 4.8 V.
4. Use pump to apply vacuum of –26.7 kPa (–200 mmHg, –7.87 inHg) to absolute pressure sensor as shown in figure and check the output voltage.
   The voltage should be 1.0 to 1.4 V lower than the value measured in step 3.



CAUTION:

- **Always calibrate the vacuum pump gauge when using it.**
- **Do not apply vacuum below –93.3 kPa (–700 mmHg, –27.56 inHg) or pressure over 101.3 kPa (760 mmHg, 29.92 inHg).**

5. If NG, replace absolute pressure sensor.

MAP/BARO switch solenoid valve

1. Start engine and warm it up to normal operating temperature.
2. Perform "MAP/BARO SW/V" in "ACTIVE TEST" mode with CONSULT.
3. Check the following.
   - Condition: At idle under no-load
   - CONSULT display

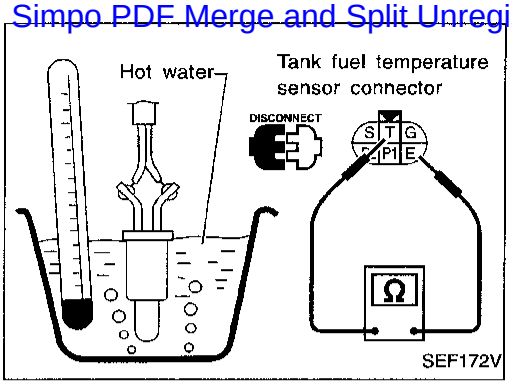
MAP/BARO	ABSOL PRES/SE (Voltage)
BARO	More than 2.6V
MAP	Less than the voltage at BARO

- Time for voltage to change

MAP/BARO SW/V	Required time to switch
BARO to MAP	Less than 1 second
MAP to BARO	

4. If NG, check solenoid valve as shown below.

OR



1. Remove MAP/BARO switch solenoid valve.
2. Check air passage continuity.

Condition	Air passage continuity between (A) and (B)	Air passage continuity between (A) and (C)
12V direct current supply between terminals (1) and (2)	Yes	No
No supply	No	Yes

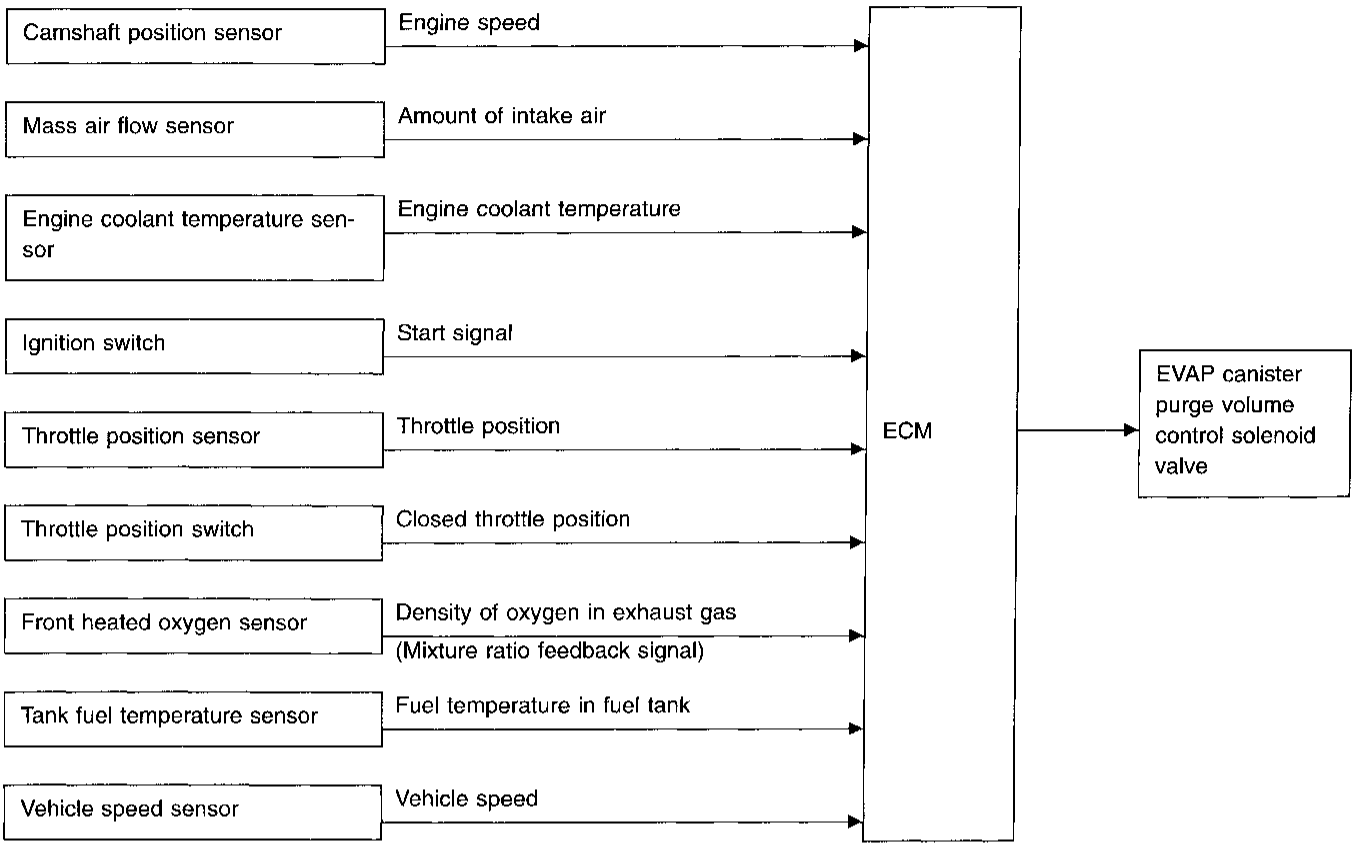
3. If NG or operation takes more than 1 second, replace solenoid valve.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Evaporative Emission (EVAP) Control System (Small Leak) (Positive Pressure) (Cont'd)

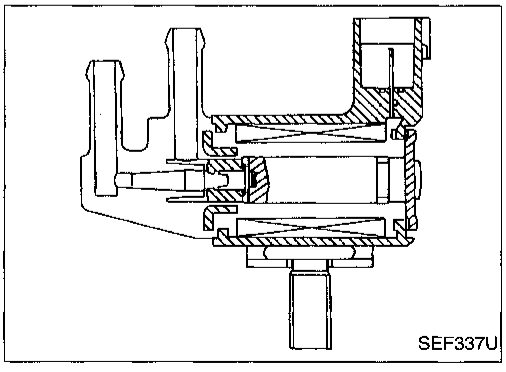
Tank fuel temperature sensor

Check resistance by heating with hot water as shown in the figure or heat gun.



Temperature °C (°F)	Resistance kΩ
20 (68)	2.3 - 2.7
50 (122)	0.79 - 0.90

If NG, replace tank fuel temperature sensor.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Evaporative Emission (EVAP) Canister Purge Volume Control Solenoid Valve

SYSTEM DESCRIPTION

This system controls flow rate of fuel vapor from the EVAP canister. The opening of the vapor by-pass passage in the EVAP canister purge volume control solenoid valve changes to control the flow rate. The EVAP canister purge volume control solenoid valve repeats ON/OFF operation according to the signal sent from the ECM. The opening of the valve varies for optimum engine control. The optimum value stored in the ECM is determined by considering various engine conditions. When the engine is operating, the flow rate of fuel vapor from the EVAP canister is regulated as the air flow changes.

COMPONENT DESCRIPTION

The EVAP canister purge volume control solenoid valve uses ON/OFF duty to control the flow rate of fuel vapor from the EVAP canister. The EVAP canister purge volume control solenoid valve is moved by ON/OFF pulses from the ECM. The longer the ON pulse, the greater the amount of fuel vapor that will flow through the valve.

ON BOARD DIAGNOSIS LOGIC

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P1444 0214	● The canister purge flow is detected during the specified driving conditions, even when EVAP canister purge volume control solenoid valve is completely closed.	● EVAP control system pressure sensor ● EVAP canister purge volume control solenoid valve (The valve is stuck open.) ● EVAP canister vent control valve ● EVAP canister ● Hoses (Hoses are connected incorrectly or clogged.)

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

TESTING CONDITION:
Always perform test at a temperature of 5°C (41°F) or more.

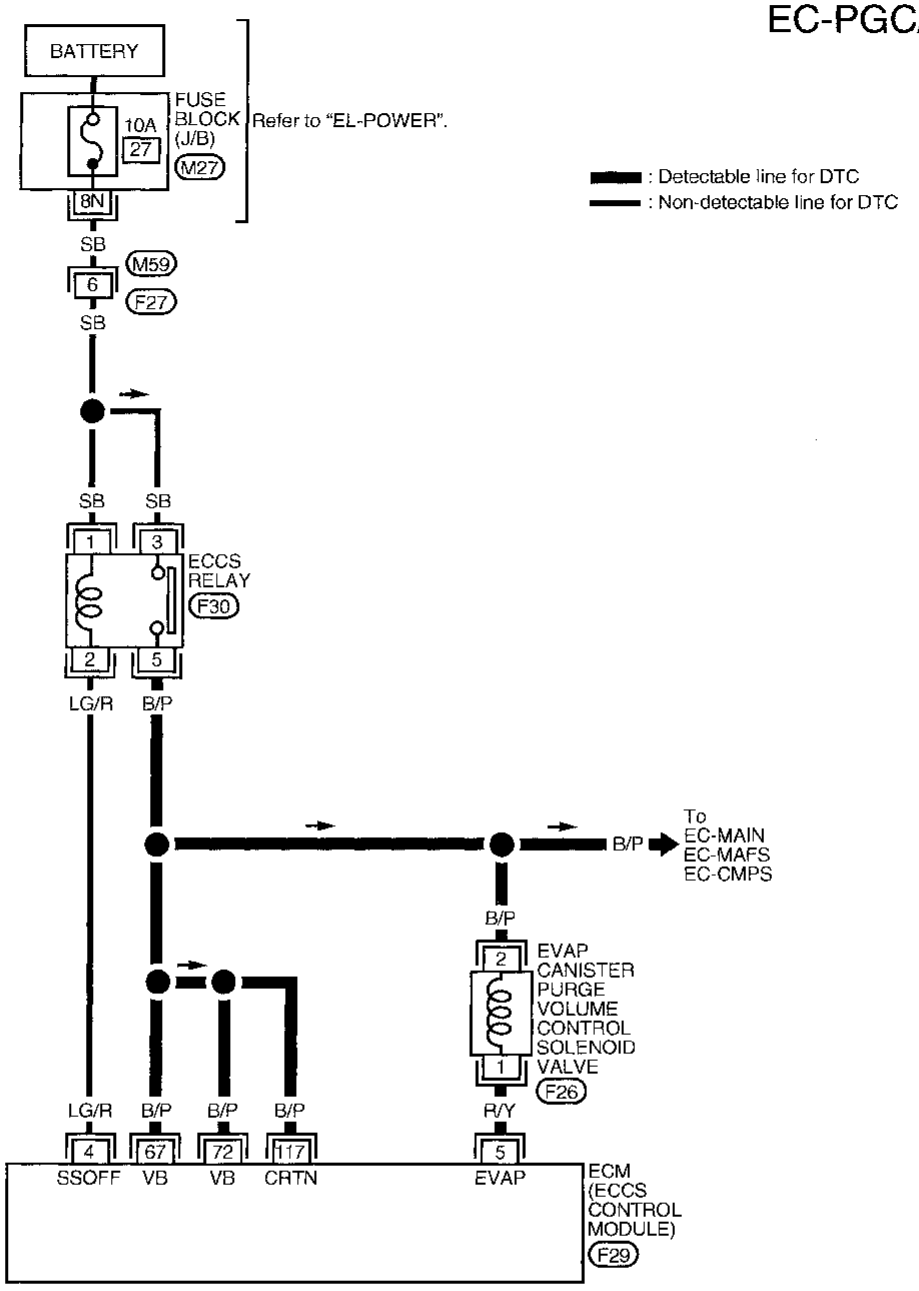
1) Start engine and warm it up to normal operating temperature.
2) Turn ignition switch "OFF" and wait at least 5 seconds.
3) Turn ignition switch "ON".
4) Select "PURG VOL CN/V P1444" of "EVAPORATIVE SYSTEM" in "DTC WORK SUPPORT" mode with CONSULT.
5) Touch "START".
6) Start engine and let it idle until "TESTING" on CONSULT changes to "COMPLETED". (It will take at least 10 seconds.)

If "TESTING" is not displayed after 5 minutes, retry from step 2).

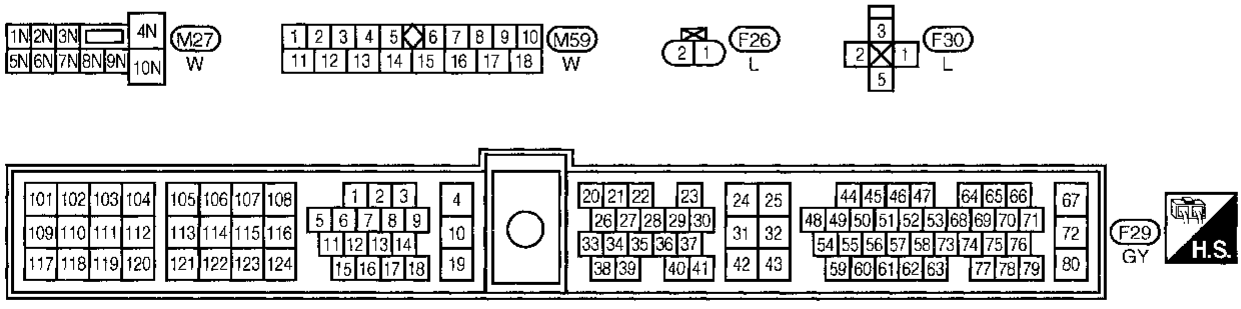
7) Make sure that "OK" is displayed after touching "SELF-DIAG RESULTS". (If "NG" is displayed, refer to "DIAGNOSTIC PROCEDURE".)

OR

1) Start engine and warm it up to normal operating temperature.
2) Turn ignition switch "OFF" and wait at least 5 seconds.
3) Start engine and let it idle for at least 20 seconds.
4) Select "MODE 7" with GST.



OR



1) Start engine and warm it up to normal operating temperature.
2) Turn ignition switch "OFF" and wait at least 5 seconds.
3) Start engine and let it idle for at least 20 seconds.
4) Turn ignition switch "OFF" and wait at least 5 seconds.
5) Turn ignition switch "ON" and perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.

DIAGNOSTIC PROCEDURE

SEF339V

SEF192V

SEF193V

INSPECTION START

A

CHECK POWER SUPPLY.
1. Turn ignition switch "OFF".
2. Disconnect EVAP canister purge volume control solenoid valve harness connector.
3. Turn ignition switch "ON".
4. Check voltage between terminal ② and engine ground with CONSULT or tester.

Voltage: Battery voltage

NG → Check the following.
- Harness for open or short between EVAP canister purge volume control solenoid valve and ECCS relay
- Harness for open or short between EVAP canister purge volume control solenoid valve and ECM

If NG, repair harness or connectors.

OK ↓

B

CHECK OUTPUT SIGNAL CIRCUIT.
1. Turn ignition switch "OFF".
2. Disconnect ECM harness connector.
3. Check harness continuity between ECM terminal ⑤ and terminal ①.

Continuity should exist.

If OK, check harness for short to ground and short to power.

NG → Repair open circuit, short to ground or short to power in harness or connectors.

OK ↓

CHECK COMPONENT
(EVAP control system pressure sensor).
Refer to "COMPONENT INSPECTION" in "TROUBLE DIAGNOSIS FOR DTC P0450", EC-281.

NG → Replace EVAP control system pressure sensor.

OK ↓

CHECK COMPONENT
(EVAP canister purge volume control solenoid valve).
Refer to "COMPONENT INSPECTION", EC-361.

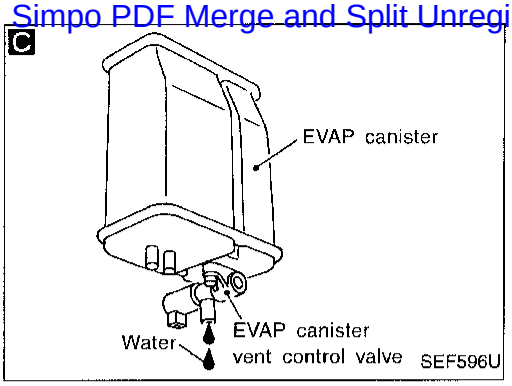
NG → Replace EVAP canister purge volume control solenoid valve.

OK ↓

CHECK COMPONENT
(EVAP canister vent control valve).
Refer to "COMPONENT INSPECTION", EC-280.

NG → Replace EVAP canister vent control valve.

OK ↓



Ⓐ

Evaporative Emission (EVAP) Canister Purge Volume Control Solenoid Valve (Cont'd)

C

(A)

CHECK RUBBER TUBE FOR CLOGGING.
Check obstructed water separator and rubber tube to EVAP canister vent control valve and clean the rubber tube using air blower.
For water separator, refer to EC-366.

NG → Clean, repair or replace rubber tube and/or water separator.

OK ↓

C

CHECK IF EVAP CANISTER IS SATURATED WITH WATER.

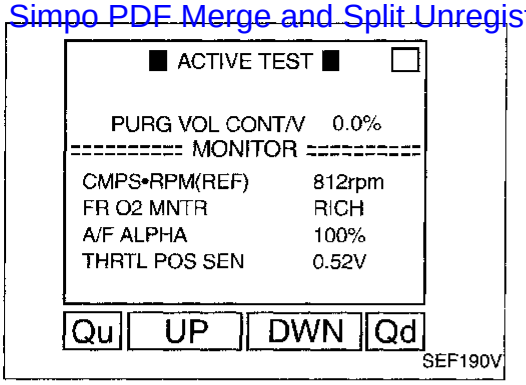
1. Remove EVAP canister with EVAP canister vent control valve attached.
2. Check if water will drain from the EVAP canister.
   If it will, weigh the EVAP canister with the vent control valve attached.

If the weight is:
More than 1.8 kg (4.0 lb) → NG
Less than 1.8 kg (4.0 lb) → OK

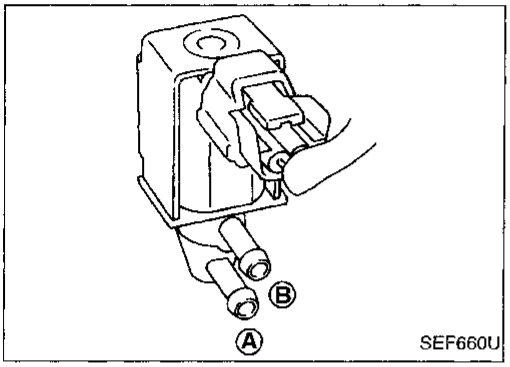
NG → Check the following.
1. Visually check the EVAP canister for damage.
2. Check hose connection between EVAP canister and water separator for clogging and poor connection.
3. Check water separator. Refer to "COMPONENT INSPECTION", EC-366.

If NG, repair hose or replace EVAP canister or water separator.

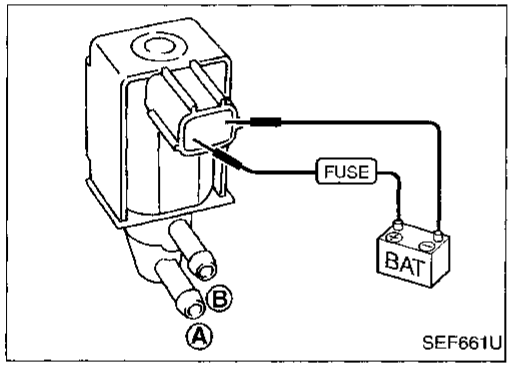
OK ↓



Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.



↓



INSPECTION END

Evaporative Emission (EVAP) Canister Purge Volume Control Solenoid Valve (Cont'd)

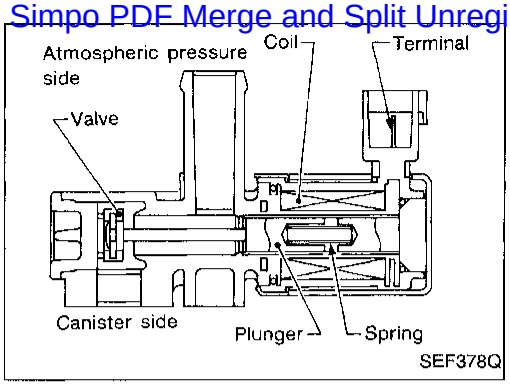
COMPONENT INSPECTION

EVAP canister purge volume control solenoid valve

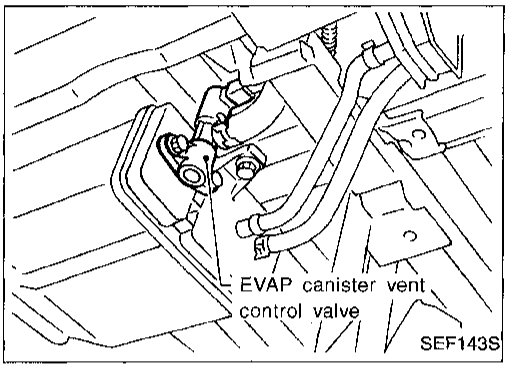
1. Start engine.
2. Perform "PURG VOL CONT/V" in "ACTIVE TEST" mode with CONSULT. Check that engine speed varies according to the valve opening.
   If OK, inspection end. If NG, go to following step.
3. Check air passage continuity.

Condition PURG VOL CONT/V value	Air passage continuity between Ⓐ and Ⓑ
100.0%	Yes
0.0%	No

If NG, replace the EVAP canister purge volume control solenoid valve.



OR



Check air passage continuity.

Condition	Air passage continuity between Ⓐ and Ⓑ
12V direct current supply between terminals	Yes
No supply	No

If NG or operation takes more than 1 second, replace solenoid valve.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Evaporative Emission (EVAP) Canister Vent Control Valve (Close)

COMPONENT DESCRIPTION

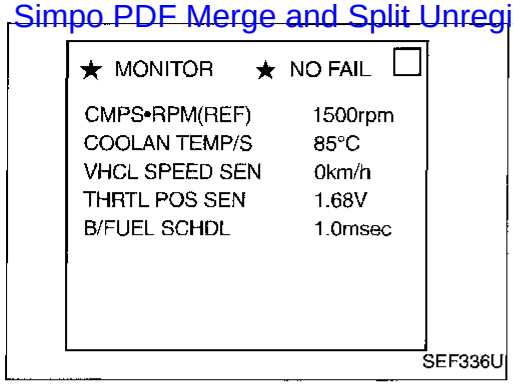
The EVAP canister vent control valve is located on the EVAP canister and is used to seal the canister vent.
This solenoid (the EVAP canister vent control valve) responds to signals from the ECM.
When the ECM sends an ON signal, the coil in the solenoid valve is energized.
A plunger will then move to seal the canister vent. The ability to seal the vent is necessary for the on board diagnosis of other evaporative emission control system components.
This solenoid valve is used only for diagnosis, and usually remains opened.
When the vent is closed, under normal purge conditions, the evaporative emission control system is depressurized and allows "EVAP Control System (Small Leak)" diagnosis.

CONSULT REFERENCE VALUE IN DATA MONITOR MODE

Specification data are reference values.

MONITOR ITEM	CONDITION	SPECIFICATION
VENT CONT/V	● Ignition switch: ON	OFF

ECM TERMINALS AND REFERENCE VALUE



Specification data are reference values and are measured between each terminal and ㉜ (ECM ground).

TERMINAL NO.	WIRE COLOR	ITEM	CONDITION	DATA (DC Voltage)

DIAGNOSTIC PROCEDURE

INSPECTION START

CHECK RUBBER TUBE FOR CLOGGING.
Check obstructed water separator and rubber tube to EVAP canister vent control valve and clean the rubber tube using air blower.
For water separator, refer to EC-366.

NG → Clean, repair or replace rubber tube and/or water separator.

OK

A

CHECK COMPONENT
(EVAP canister vent control valve and O-ring).
Refer to "COMPONENT INSPECTION" on next page.

NG → Replace EVAP canister vent control valve and O-ring.

OK

B

CHECK IF EVAP CANISTER IS SATURATED WITH WATER.
1. Remove EVAP canister with EVAP canister vent control valve attached.
2. Check if water will drain from the EVAP canister.
   If it will, weigh the EVAP canister with the vent control valve attached.

If the weight is:
More than 1.8 kg (4.0 lb) → NG
Less than 1.8 kg (4.0 lb) → OK

NG → Check the following.
1. Visually check the EVAP canister for damage.
2. Check hose connection between EVAP canister and water separator for clogging and poor connection.
3. Check water separator. Refer to "COMPONENT INSPECTION", EC-366.

If NG, repair hose or replace EVAP canister or water separator.

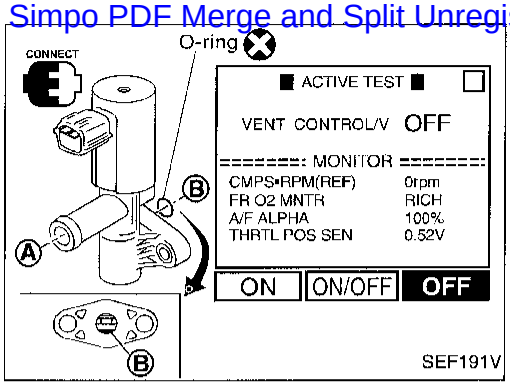
OK

C

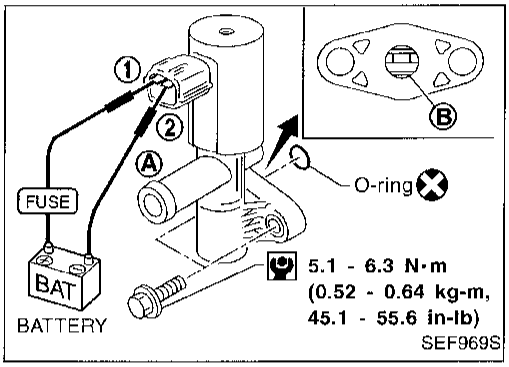
CHECK COMPONENT AND CIRCUIT
(EVAP control system pressure sensor).
1. Check for disconnection of hose connected to the sensor.
2. Check sensor harness connector for water.
   Water should not exist.
   If OK, go to step 3.
3. Check EVAP control system pressure sensor.

Refer to "P0450 EVAP control system pressure sensor", EC-281.

NG → Repair or replace harness and/or connectors or replace EVAP control system pressure sensor.



OK



Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.

INSPECTION END

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Evaporative Emission (EVAP) Canister Vent Control Valve (Close) (Cont'd)

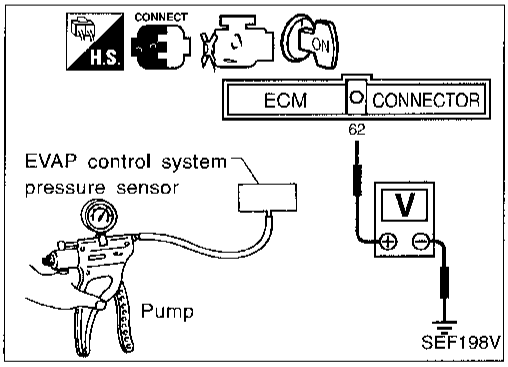
COMPONENT INSPECTION

EVAP canister vent control valve

Check air passage continuity.

Perform "VENT CONTROL/V" in "ACTIVE TEST" mode.

Condition VENT CONTROL/V	Air passage continuity between (A) and (B)
ON	No
OFF	Yes



OR

Condition	Air passage continuity between (A) and (B)
12V direct current supply between terminals (1) and (2)	No
No supply	Yes

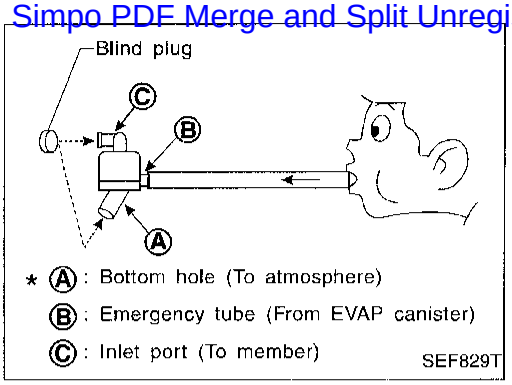
If NG or operation takes more than 1 second, clean valve using air blower or replace as necessary.

If the portion (B) is rusted, replace EVAP canister vent control valve.

Make sure new O-ring is installed properly.

EVAP control system pressure sensor

1. Remove EVAP control system pressure sensor with its harness connector connected.
2. Remove hose from EVAP control system pressure sensor.
3. Use pump to apply vacuum and pressure to EVAP control system pressure sensor as shown in figure.
4. Check output voltage between ECM terminals (62) and engine ground.



Pressure (Relative to atmospheric pressure)	Voltage (V)
0 kPa (0 mmHg, 0 inHg)	3.0 - 3.6
−9.3 kPa (−70 mmHg, −2.76 inHg)	0.4 - 0.6

CAUTION:

- **Always calibrate the vacuum pump gauge when using it.**
- **Do not apply vacuum below −20 kPa (−150 mmHg, −5.91 inHg) or pressure over 20.0 kPa (150 mmHg, 5.91 inHg).**

5. If NG, replace EVAP control system pressure sensor.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

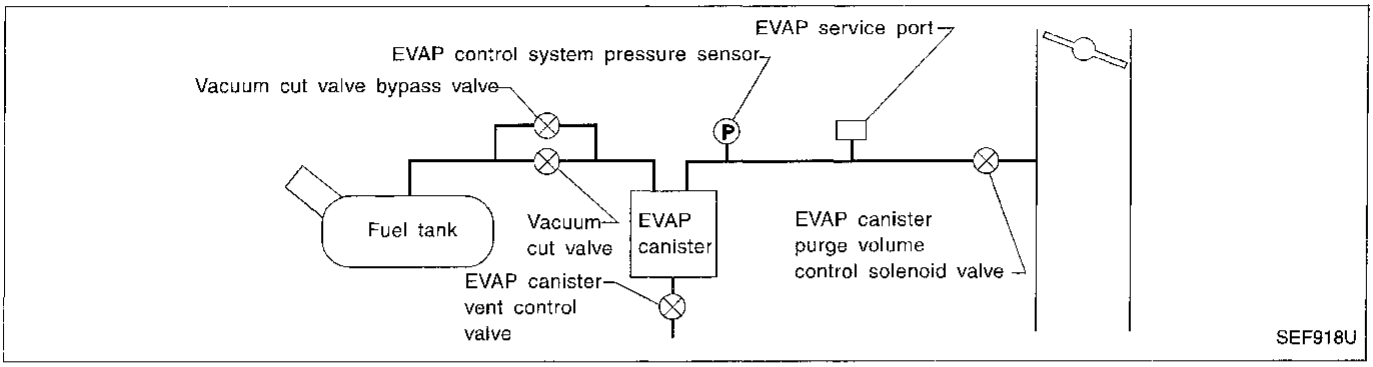
Water separator



1. Check visually for insect nests in the water separator air inlet.
2. Check visually for cracks or flaws in the appearance.
3. Check visually for cracks or flaws in the hose.
4. Check that Ⓐ and Ⓒ are not clogged by blowing air into Ⓑ with Ⓐ, and then Ⓒ plugged.
5. In case of NG in items 2 - 4, replace the parts.

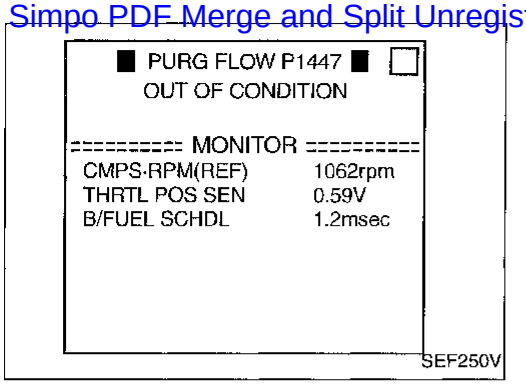
- **Do not disassemble water separator.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

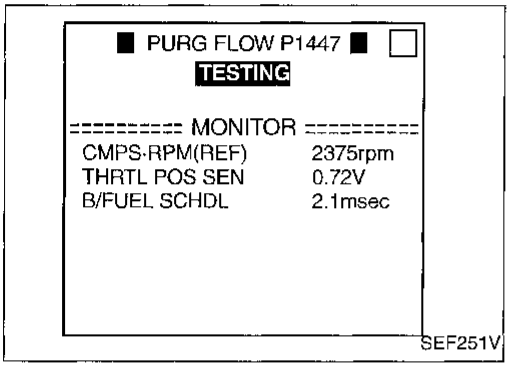
Evaporative Emission (EVAP) Control System Purge Flow Monitoring

Note: If both DTC P0510 and P1447 are displayed, perform TROUBLE DIAGNOSIS FOR DTC P0510 first. (See EC-297.)

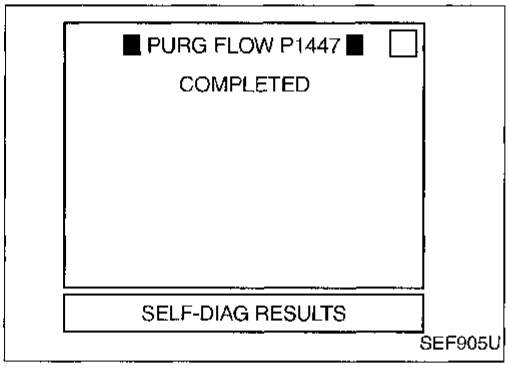
SYSTEM DESCRIPTION



In this evaporative emission (EVAP) control system, purge flow occurs during non-closed throttle conditions. Purge volume is related to air intake volume. Under normal purge conditions (non-closed throttle), the EVAP canister purge volume control solenoid valve is open. Purge flow exposes the EVAP control system pressure sensor to intake manifold vacuum.



ON BOARD DIAGNOSIS LOGIC



Under normal conditions (non-closed throttle), sensor output voltage indicates if pressure drop and purge flow are adequate. If not, a fault is determined.

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P1447 0111	● EVAP control system does not operate properly. ● EVAP control system has a leak between intake manifold and EVAP control system pressure sensor.	● EVAP canister purge volume control solenoid valve stuck closed ● EVAP control system pressure sensor and the circuit ● Loose, disconnected or improper connection of rubber tube ● Blocked rubber tube ● Blocked or bent rubber tube to MAP/BARO switch solenoid valve ● Cracked EVAP canister ● EVAP canister purge volume control solenoid valve circuit ● Closed throttle position switch ● Blocked purge port ● EVAP canister vent control valve

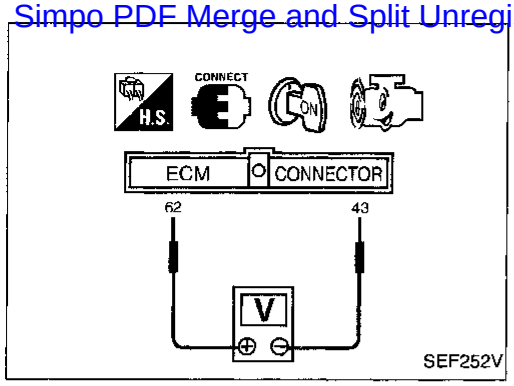
DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

CAUTION:
Always drive vehicle at a safe speed.



NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

TESTING CONDITION:
Always perform test at a temperature of 5°C (41°F) or more.

1) Start engine and warm it up to normal operating temperature.
2) Turn ignition switch "OFF" and wait at least 5 seconds.
3) Start engine and let it idle for at least 1 minute.
4) Select "PURG FLOW P1447" of "EVAPORATIVE SYSTEM" in "DTC CONFIRMATION" mode with CONSULT.
5) Touch "START".
6) When the following conditions are met, "TESTING" will be displayed on the CONSULT screen. Maintain the conditions continuously until "TESTING" changes to "COMPLETED". (It will take at least 30 seconds.)
   Selector lever: Suitable position
   Vehicle speed: 32 - 100 km/h (20 - 62 MPH)
   CMPS·RPM (REF): 500 - 3,100 rpm
   B/FUEL SCHDL: 1.6 - 3.5 ms
   Engine coolant temperature: 70 - 100°C (158 - 212°F)

   If "TESTING" is not changed for a long time, retry from step 2).
7) Make sure that "OK" is displayed after touching "SELF-DIAG RESULTS". If "NG" is displayed, refer to "DIAGNOSTIC PROCEDURE", EC-370.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

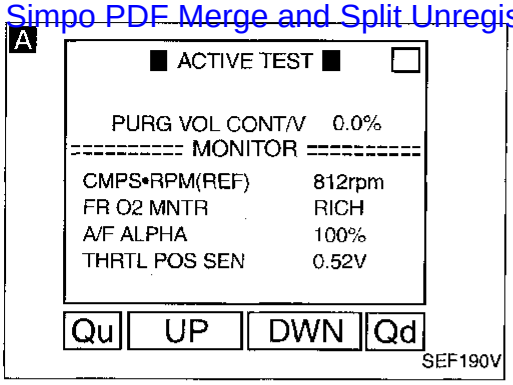
Evaporative Emission (EVAP) Control System Purge Flow Monitoring (Cont'd)

OR

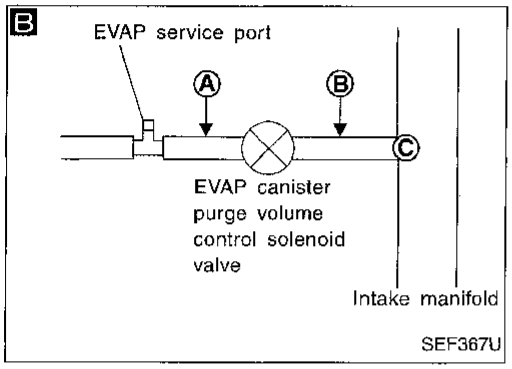
OVERALL FUNCTION CHECK

Use this procedure to check the overall monitoring function of the EVAP control system purge flow. During this check, a 1st trip DTC might not be confirmed.

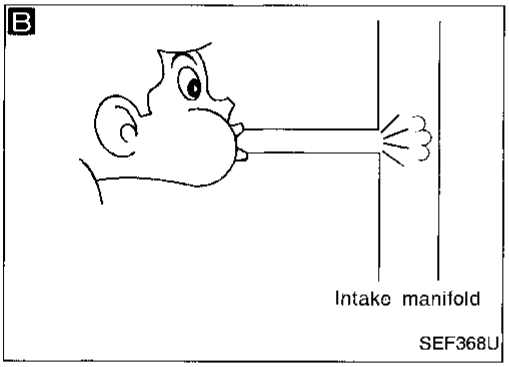
1) Lift up drive wheels.
2) Start engine and warm it up to normal operating temperature.
3) Turn ignition switch "OFF", wait at least 5 seconds.
4) Start engine and wait at least 60 seconds.
5) Set voltmeter probes to ECM terminals ⑥② (EVAP control system pressure sensor signal) and ④③ (ground).
6) Check EVAP control system pressure sensor value at idle speed.
7) Establish and maintain the following conditions for at least 1 minute.



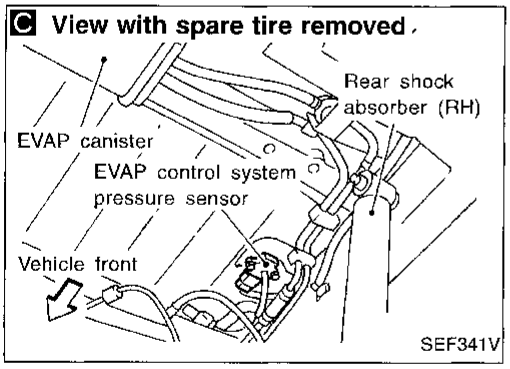
Air conditioner switch: ON
Steering wheel: Fully turned
Headlamp switch: ON
Engine speed: Approx. 3,000 rpm
Gear position:
M/T models
Any position other than "Neutral" or "Reverse"
A/T models
Any position other than "P", "N" or "R"



Verify that EVAP control system pressure sensor value stays 0.1V less than the value at idle speed for at least 1 second.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Evaporative Emission (EVAP) Control System Purge Flow Monitoring (Cont'd)

DIAGNOSTIC PROCEDURE

INSPECTION START

CHECK EVAP CANISTER.
Check EVAP canister for cracks.

NG → Replace EVAP canister.

OK

A

CHECK PURGE FLOW.

1. Disconnect EVAP hose to EVAP canister purge volume control solenoid valve at EVAP service port and install vacuum gauge.
2. Start engine and let it idle.
3. Perform "PURG VOL CONT/V" in "ACTIVE TEST" mode.
4. Touch "Qd" and "Qu" on CONSULT screen to adjust "PURG VOL CONT/V" opening.
   100.0%: Vacuum should exist.
   0.0%: Vacuum should not exist.

OR

1. Start engine and warm it up to normal operating temperature.
2. Stop engine.
3. Disconnect vacuum hose to EVAP canister purge volume control solenoid valve at EVAP service port and install vacuum gauge.
4. Start engine and let it idle for at least 60 seconds.
5. Check vacuum hose for vacuum when revving engine up to 2,000 rpm.
   While operating solenoid valve, vacuum should exist.
6. Release the accelerator pedal and let engine idle.
   Vacuum should not exist.

NG → B

CHECK EVAP PURGE LINE.
Check EVAP purge line for improper connection, disconnection and blocked purge port.

1. Turn ignition switch "OFF".
2. Disconnect purge hoses connected to EVAP canister purge volume control solenoid valve (Ⓑ) and EVAP service port (Ⓐ).
3. Blow air into each hose and check that air flows freely.
4. Check EVAP purge port Ⓒ.

If NG, repair or clean hoses and/or purge port.

OK

CHECK COMPONENT (EVAP canister purge volume control solenoid valve).
Refer to "COMPONENT INSPECTION", EC-372.

OK

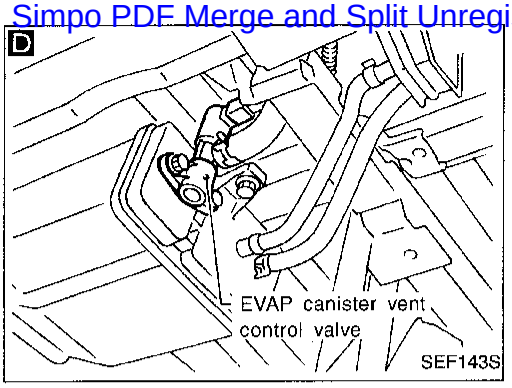
C

CHECK COMPONENT AND CIRCUIT
(EVAP control system pressure sensor).

1. Check disconnection of hose connected to the sensor.
2. Check sensor harness connector for water.
   Water should not exist.
   If OK, go to step 3.
3. Check EVAP control system pressure sensor.

Refer to "TROUBLE DIAGNOSIS FOR DTC P0450", EC-281.

NG → Replace EVAP control system pressure sensor and repair or replace harness and connector.



OK

CHECK COMPONENT
(Closed throttle position switch).
Refer to "COMPONENT INSPECTION", EC-301.

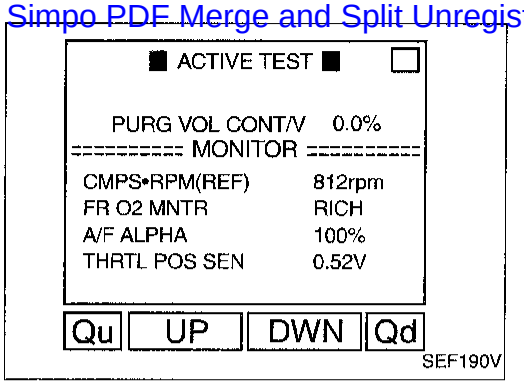
NG → Replace throttle position sensor with throttle position switch.

OK

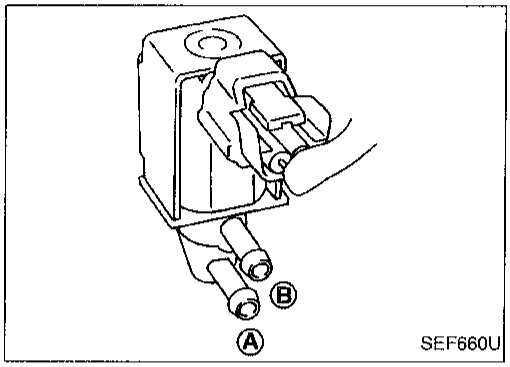
CHECK EVAP PURGE LINE.
Inspect EVAP purge line (pipe and rubber tube). Check for evidence of leaks.

NG → Replace it.

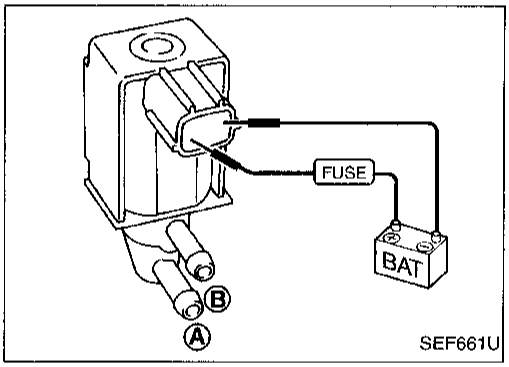
OK



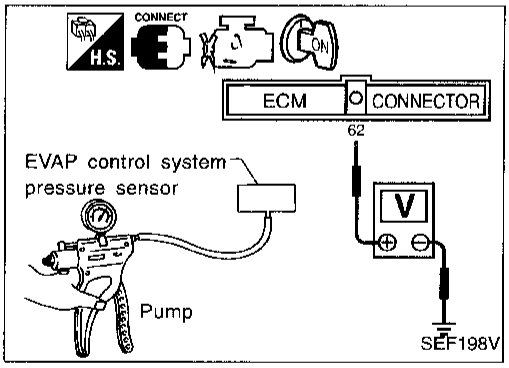
Clean EVAP purge line (pipe and rubber tube) using air blower.



Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.



INSPECTION END



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Evaporative Emission (EVAP) Control System Purge Flow Monitoring (Cont'd)

COMPONENT INSPECTION

EVAP canister purge volume control solenoid valve

1. Start engine.
2. Perform "PURG VOL CONT/V" in "ACTIVE TEST" mode with CONSULT. Check that engine speed varies according to the valve opening.
   If OK, inspection end. If NG, go to following step.
3. Check air passage continuity.

Condition PURG VOL CONT/V value	Air passage continuity between (A) and (B)
100.0%	Yes
0.0%	No

If NG, replace the EVAP canister purge volume control solenoid valve.

OR

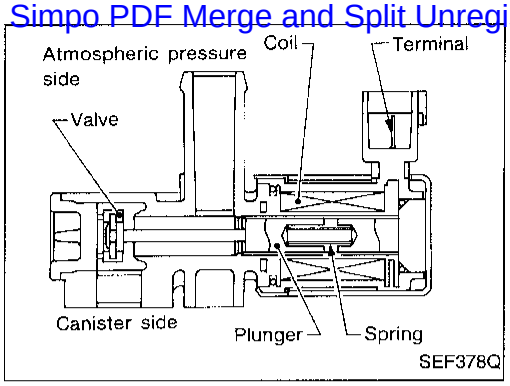
Check air passage continuity.

Condition	Air passage continuity between (A) and (B)
12V direct current supply between terminals	Yes
No supply	No

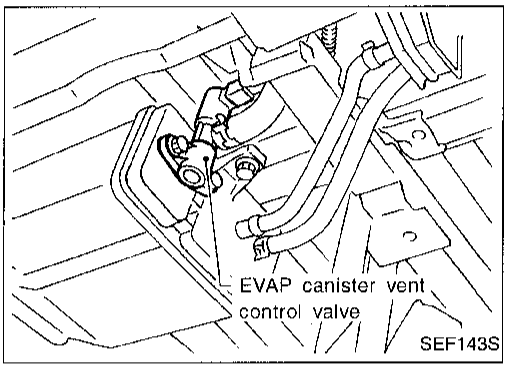
If NG or operation takes more than 1 second, replace solenoid valve.

EVAP control system pressure sensor

1. Remove EVAP control system pressure sensor with its harness connector connected.
2. Remove hose from EVAP control system pressure sensor.
3. Use pump to apply vacuum and pressure to EVAP control system pressure sensor as shown in figure.
4. Check output voltage between ECM terminal (62) and engine ground.



Pressure (Relative to atmospheric pressure)	Voltage (V)
0 kPa (0 mmHg, 0 inHg)	3.0 - 3.6
−9.3 kPa (−70 mmHg, −2.76 inHg)	0.4 - 0.6



CAUTION:

- **Always calibrate the vacuum pump gauge when using it.**
- **Do not apply vacuum below −20 kPa (−150 mmHg, −5.91 inHg) or pressure over 20.0 kPa (150 mmHg, 5.91 inHg).**

5. If NG, replace EVAP control system pressure sensor.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Evaporative Emission (EVAP) Canister Vent Control Valve (Open)

COMPONENT DESCRIPTION

NOTE:
If DTC P0440 or P1440 is displayed with P1448, perform TROUBLE DIAGNOSIS FOR DTC P1448 first.

The EVAP canister vent control valve is located on the EVAP canister and is used to seal the canister vent.
This solenoid (the EVAP canister vent control valve) responds to signals from the ECM.
When the ECM sends an ON signal, the coil in the solenoid valve is energized.
A plunger will then move to seal the canister vent. The ability to seal the vent is necessary for the on board diagnosis of other evaporative emission control system components.
This solenoid valve is used only for diagnosis, and usually remains opened.
When the vent is closed, under normal purge conditions, the evaporative emission control system is depressurized and allows "EVAP Control System (Small Leak)" diagnosis.

CONSULT REFERENCE VALUE IN DATA MONITOR MODE

Specification data are reference values.

MONITOR ITEM	CONDITION	SPECIFICATION
VENT CONT/V	● Ignition switch: ON	OFF

ECM TERMINALS AND REFERENCE VALUE

Specification data are reference values and are measured between each terminal and ㉜ (ECM ground).

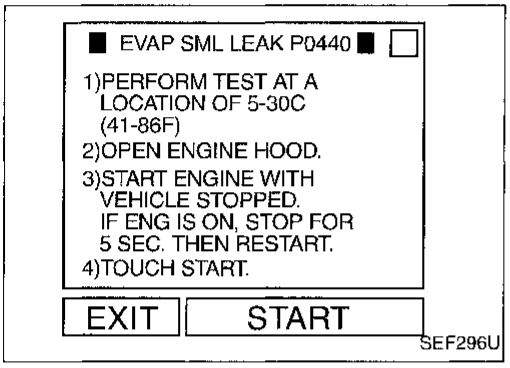
TERMINAL NO.	WIRE COLOR	ITEM	CONDITION	DATA (DC Voltage)
108	R/G	EVAP canister vent control valve	Ignition switch "ON"	BATTERY VOLTAGE (11 - 14V)

ON BOARD DIAGNOSIS LOGIC

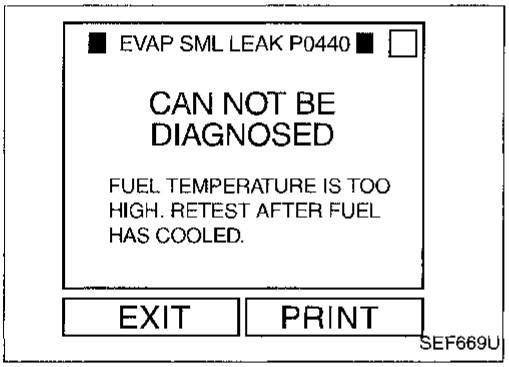
Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P1448 0309	● EVAP canister vent control valve remains opened under specified driving conditions.	● EVAP canister vent control valve ● EVAP control system pressure sensor ● Blocked rubber tube to EVAP canister vent control valve ● Water separator ● EVAP canister is saturated with water ● Vacuum cut valve

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

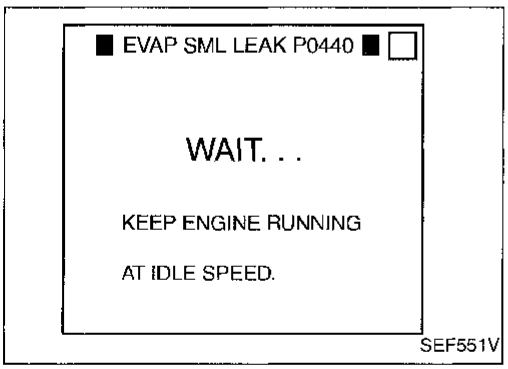
Evaporative Emission (EVAP) Canister Vent Control Valve (Open) (Cont'd)



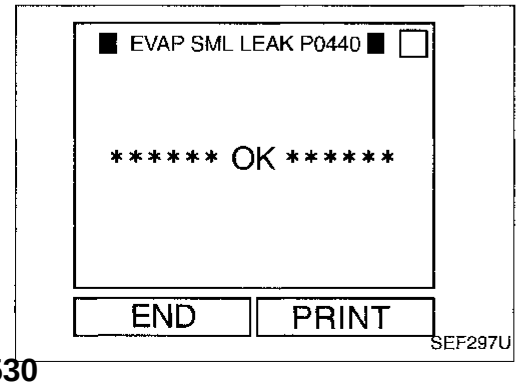
DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE



NOTE:



- **If DTC P0440 or P1440 is displayed with P1448, perform TROUBLE DIAGNOSIS FOR DTC P1448 first.**
- **If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.**



TESTING CONDITION:

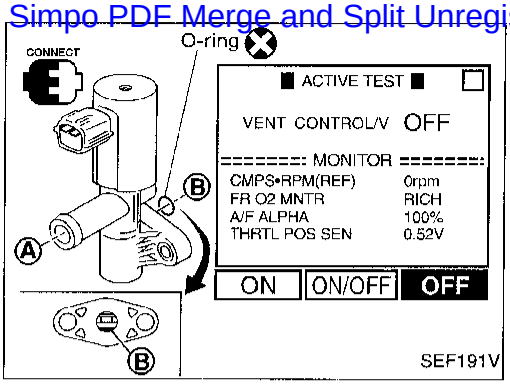
- **Perform "DTC WORK SUPPORT" when the fuel level is less than 3/4 full and vehicle is placed on flat level surface.**
- **Always perform test at a temperature of 5 to 30°C (41 to 86°F).**
- **It is better that the fuel level is low.**

1) Turn ignition switch "ON".
2) Turn ignition switch "OFF" and wait at least 5 seconds.
3) Turn ignition switch "ON" and select "DATA MONITOR" mode with CONSULT.
4) Make sure that the following conditions are met.
   COOLAN TEMP/S: 0 - 70°C (32 - 158°F)
   INT/A TEMP SE: 5 - 60°C (41 - 140°F)
5) Select "EVAP SML LEAK P0440" of "EVAPORATIVE SYSTEM" in "DTC WORK SUPPORT" mode with CONSULT.
   Follow the instruction displayed.

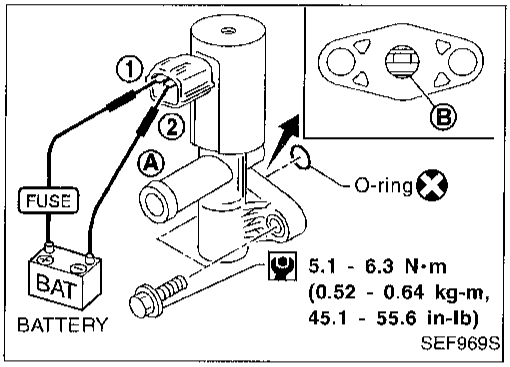
NOTE:

- **If the CONSULT screen shown at left is displayed, stop the engine and stabilize the vehicle temperature at 25°C (77°F) or cooler. After "TANK F/TMP SE" becomes less than 30°C (86°F), retest. (Use a fan to reduce the stabilization time.)**
- **The engine idle portion of this test (See illustration at left.) will take approximately 5 minutes.**

6) Make sure that "OK" is displayed.
   If "NG" is displayed, go to the following step.



NOTE:



Make sure that EVAP hoses are connected to EVAP canister purge volume control solenoid valve properly.

7) Stop engine and wait at least 5 seconds, then turn "ON".
8) Disconnect hose from water separator.
9) Select "VENT CONTROL/V" of "ACTIVE TEST" mode with CONSULT.
10) Touch "ON" and "OFF" alternately.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Evaporative Emission (EVAP) Canister Vent Control Valve (Open) (Cont'd)

11) Make sure of the following.

Condition VENT CONTROL/V	Air passage continuity between (A) and (B)
ON	No
OFF	Yes

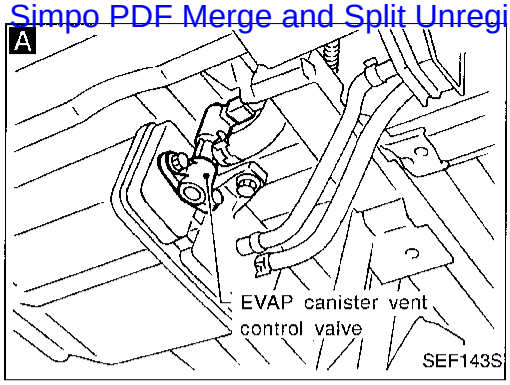
If the result is NG, go to "DIAGNOSTIC PROCEDURE", EC-376.
If the result is OK, go to "DIAGNOSTIC PROCEDURE" for "TROUBLE DIAGNOSIS FOR DTC P0440", EC-263.

OR

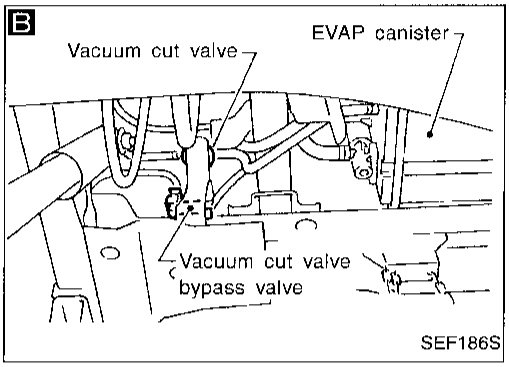
OVERALL FUNCTION CHECK

Use this procedure to check the overall function of the EVAP canister vent control valve circuit. During this check, a DTC might not be confirmed.

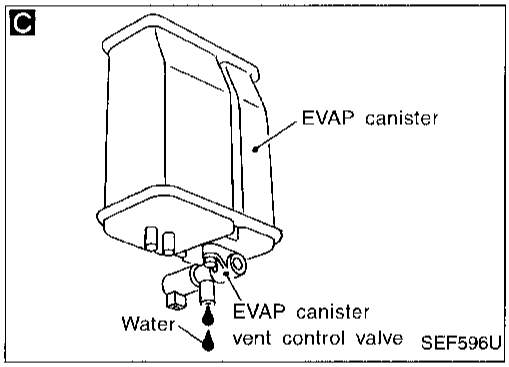
1) Disconnect hose from water separator.
2) Disconnect EVAP canister vent control valve harness connector.
3) Verify the following.



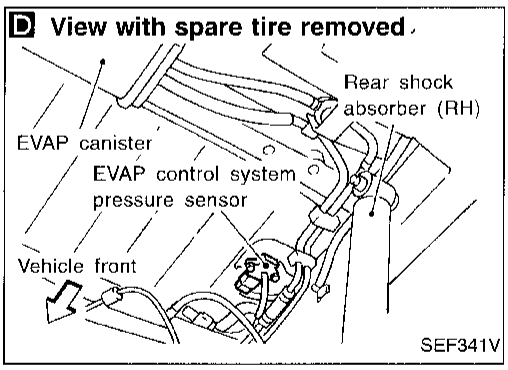
Condition	Air passage continuity
12V direct current supply between terminals (1) and (2)	No
No supply	Yes



If the result is NG, go to "DIAGNOSTIC PROCEDURE", EC-376.
If the result is OK, go to "TROUBLE DIAGNOSIS FOR DTC P0440", EC-260.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Evaporative Emission (EVAP) Canister Vent Control Valve (Open) (Cont'd)

DIAGNOSTIC PROCEDURE

INSPECTION START

CHECK RUBBER TUBE FOR DISCONNECTION.
Check disconnection of rubber tube to EVAP canister vent control valve and clean the rubber hose and/or vent control valve then install properly.

OK

A

CHECK COMPONENT
(EVAP canister vent control valve and O-ring).
Refer to "COMPONENT INSPECTION" on next page.

NG → Replace EVAP canister vent control valve and O-ring.

OK

B

CHECK COMPONENT
(Vacuum cut valve).
Refer to "COMPONENT INSPECTION", EC-387.

NG → Replace vacuum cut valve.

OK

C

CHECK IF EVAP CANISTER IS SATURATED WITH WATER.
1. Remove EVAP canister with EVAP canister vent control valve attached.
2. Check if water will drain from the EVAP canister.
   If it will, weigh the EVAP canister with the vent control valve attached.

If the weight is:
More than 1.8 kg (4.0 lb) → NG
Less than 1.8 kg (4.0 lb) → OK

NG → Check the following.
1. Visually check the EVAP canister for damage.
2. Check hose connection between EVAP canister and water separator for clogging and poor connection.
3. Check water separator. Refer to "COMPONENT INSPECTION", EC-366.

If NG, repair hose or replace EVAP canister or water separator.

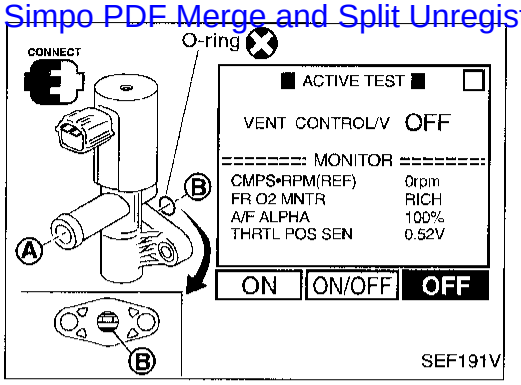
OK

D

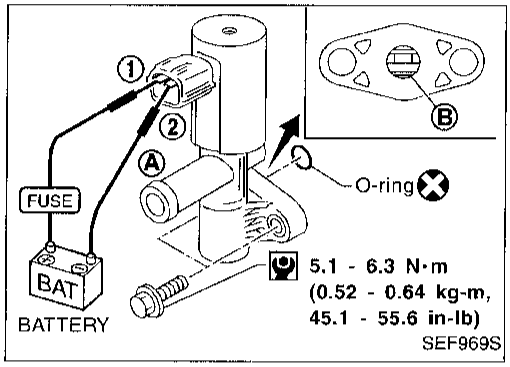
CHECK COMPONENT
(EVAP control system pressure sensor).
1. Check for disconnection of hose connected to the sensor.
2. Check harness connector for water in the sensor connectors.
   Water should not exist.
   If OK, go to step 3.
3. Check EVAP control system pressure sensor.

Refer to "COMPONENT INSPECTION" on next page.

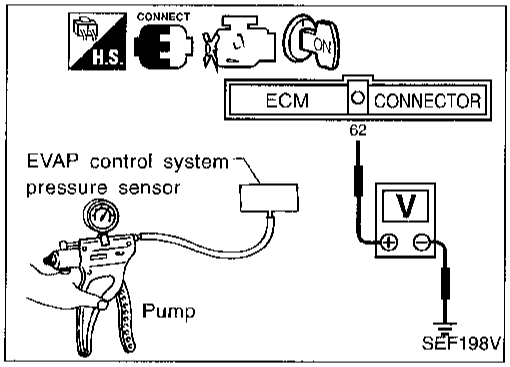
NG → Replace EVAP control system pressure sensor and repair or replace harness and connector.



OK



Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.



INSPECTION END

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Evaporative Emission (EVAP) Canister Vent Control Valve (Open) (Cont'd)

COMPONENT INSPECTION

EVAP canister vent control valve

Check air passage continuity.

Perform "VENT CONTROL/V" in "ACTIVE TEST" mode.

Condition VENT CONTROL/V	Air passage continuity between Ⓐ and Ⓑ
ON	No
OFF	Yes

OR

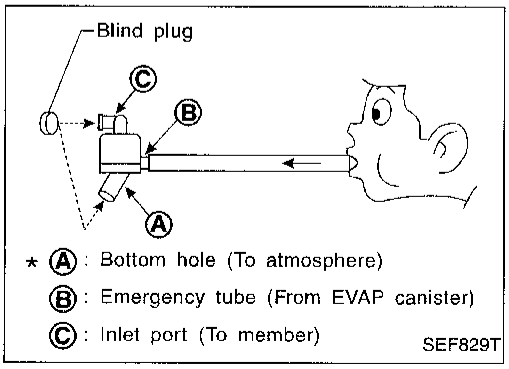
Condition	Air passage continuity between Ⓐ and Ⓑ
12V direct current supply between terminals ① and ②	No
No supply	Yes

If NG or operation takes more than 1 second, clean valve using air blower or replace as necessary.

If the portion Ⓑ is rusted, replace EVAP canister vent control valve.

Make sure new O-ring is installed properly.

EVAP control system pressure sensor



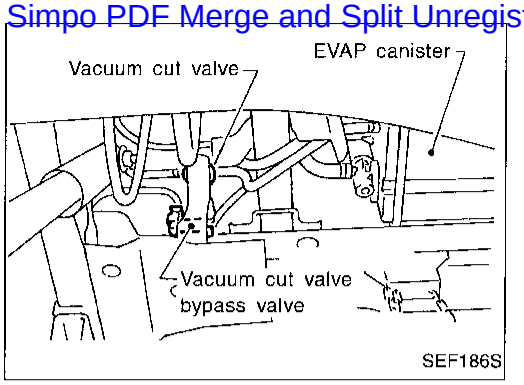
1. Remove EVAP control system pressure sensor with its harness connector connected.
2. Remove hose from EVAP control system pressure sensor.
3. Use pump to apply vacuum and pressure to EVAP control system pressure sensor as shown in figure.
4. Check output voltage between ECM terminal ⑫ and engine ground.

Pressure (Relative to atmospheric pressure)	Voltage (V)
0 kPa (0 mmHg, 0 inHg)	3.0 - 3.6
−9.3 kPa (−70 mmHg, −2.76 inHg)	0.4 - 0.6

CAUTION:

- **Always calibrate the vacuum pump gauge when using it.**
- **Do not apply vacuum below −20 kPa (−150 mmHg, −5.91 inHg) or pressure over 20.0 kPa (150 mmHg, 5.91 inHg).**

5. If NG, replace EVAP control system pressure sensor.



Water separator

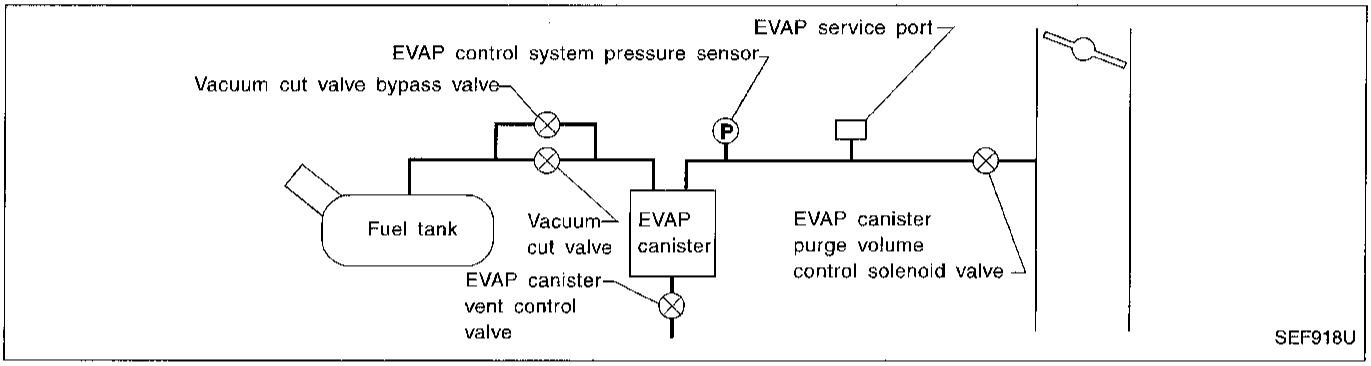
1. Check visually for insect nests in water separator air inlet.
2. Check visually for cracks or flaws in the appearance.
3. Check visually for cracks or flaws in the hose.
4. Check that Ⓐ and Ⓒ are not clogged by blowing air into Ⓑ with Ⓐ, and then Ⓒ plugged.
5. In case of NG in items 2 - 4, replace the parts.

- **Do not disassemble water separator.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Vacuum Cut Valve Bypass Valve (Circuit)

COMPONENT DESCRIPTION



The vacuum cut valve and vacuum cut valve bypass valve are installed in parallel on the EVAP purge line between the fuel tank and the EVAP canister.

The vacuum cut valve prevents the intake manifold vacuum from being applied to the fuel tank.

The vacuum cut valve bypass valve is a solenoid type valve and generally remains closed. It opens only for on board diagnosis.

The vacuum cut valve bypass valve responds to signals from the ECM. When the ECM sends an ON (ground) signal, the valve is opened. The vacuum cut valve is then bypassed to apply intake manifold vacuum to the fuel tank.

EVAPORATIVE EMISSION SYSTEM DIAGRAM

CONSULT REFERENCE VALUE IN DATA MONITOR MODE

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

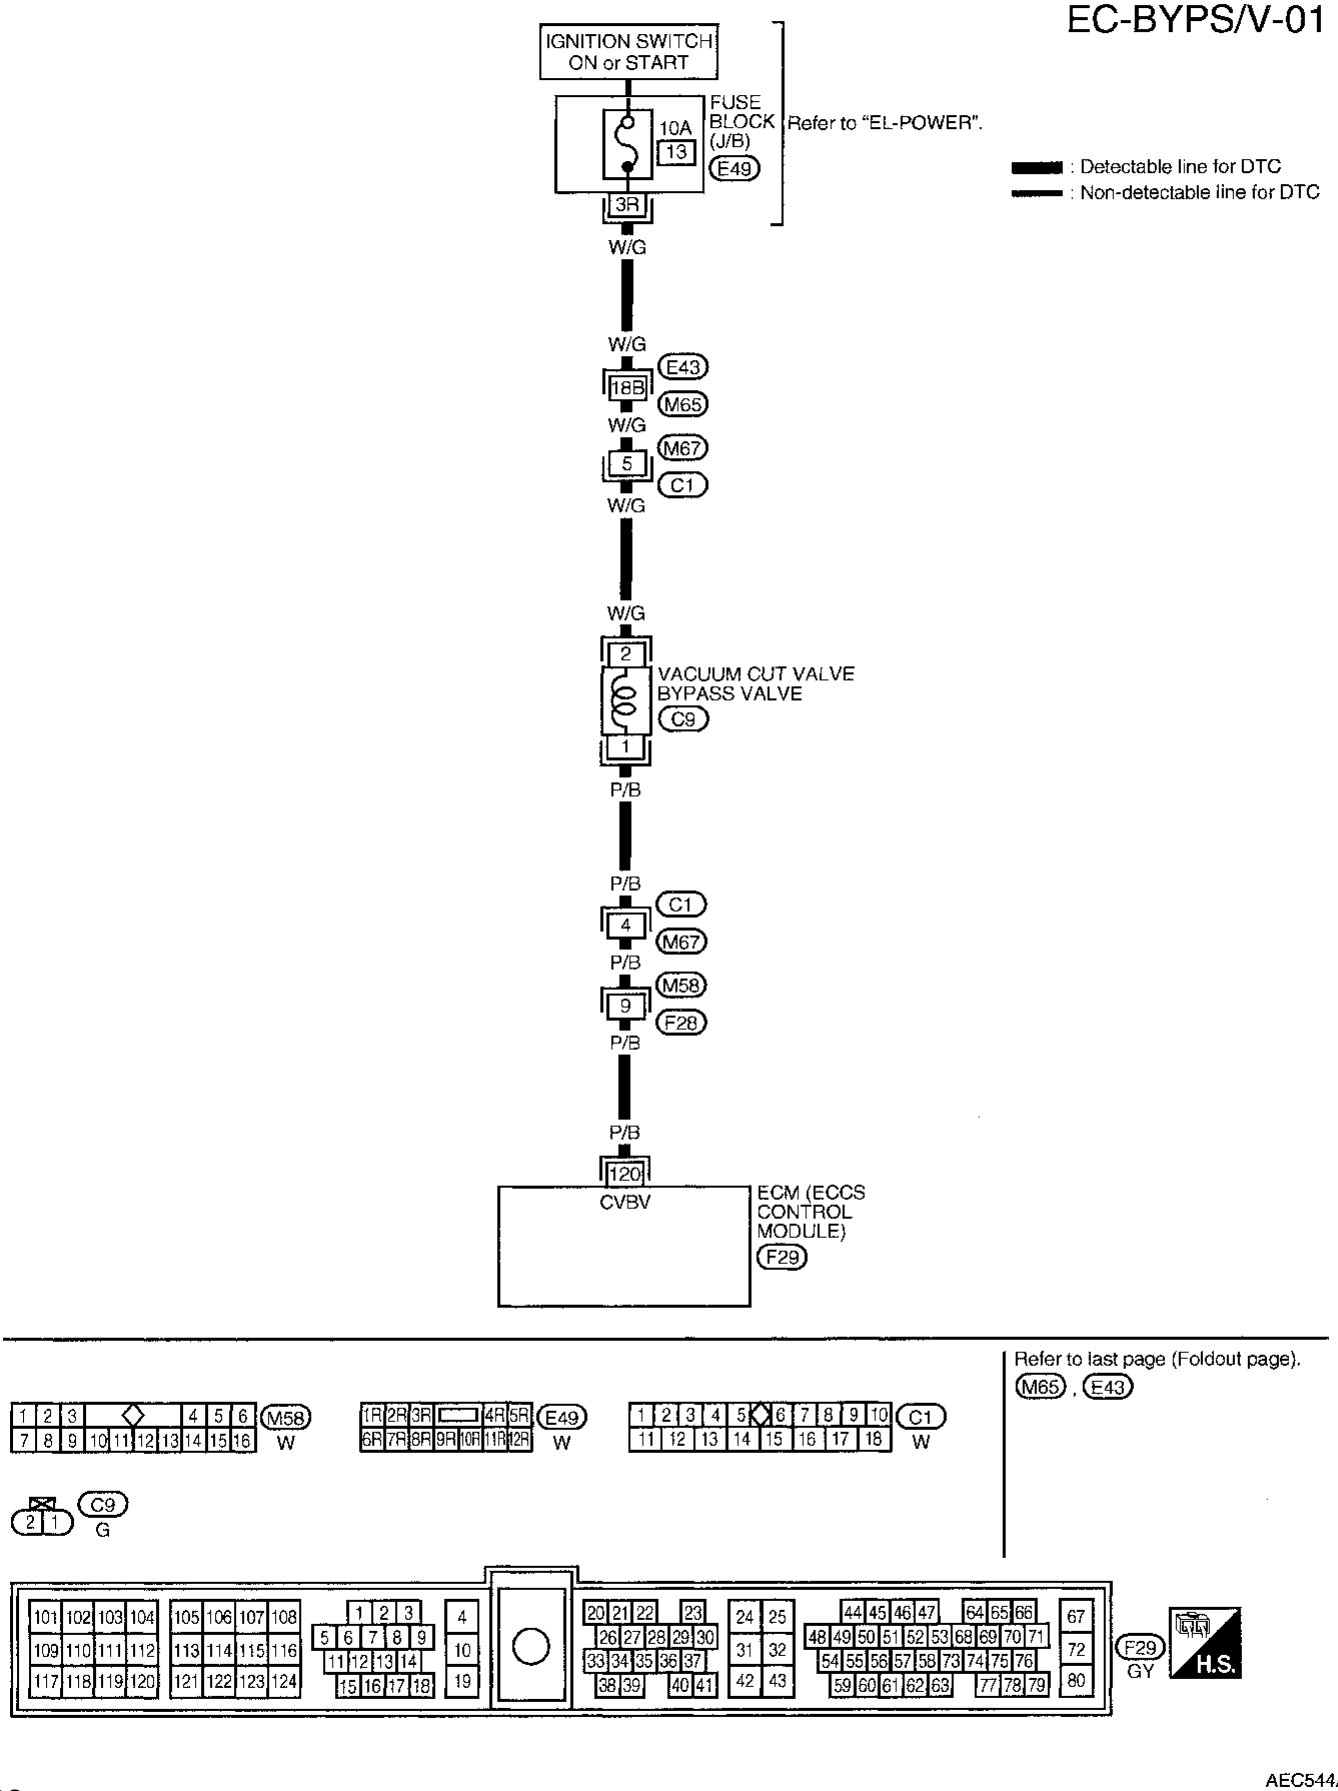
NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

TESTING CONDITION:
Before performing the following procedure, confirm battery voltage is more than 11V at idle.

1) Turn ignition switch "ON".
2) Select "DATA MONITOR" mode with CONSULT.
3) Start engine and wait at least 5 seconds.

OR

1) Start engine and wait at least 5 seconds.
2) Select "MODE 7" with GST.



OR

1) Start engine and wait at least 5 seconds.
2) Turn ignition switch "OFF", wait at least 5 seconds and then turn "ON".
3) Perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.

A

B

C

DIAGNOSTIC PROCEDURE

INSPECTION START

With CONSULT

Without CONSULT
Go to CHECK POWER SUPPLY B.

A

CHECK VACUUM CUT VALVE BYPASS VALVE CIRCUIT.
1. Turn ignition switch "ON".
2. Perform "VC/V BYPASS/V" in "ACTIVE TEST" mode.
3. Make sure that clicking sound is heard from the vacuum cut bypass valve.

OK → Go to "CHECK COMPONENT" after procedure C.

NG

B

CHECK POWER SUPPLY.
1. Turn ignition switch "OFF".
2. Disconnect vacuum cut valve bypass valve harness connector.
3. Turn ignition switch "ON".
4. Check voltage between terminal (2) and ground with CONSULT or tester.
Voltage: Battery voltage

NG → Check the following.
- Harness connectors (E43), (M65)
- Harness connectors (M67), (C1)
- 10A fuse
- Harness for open or short between vacuum cut valve bypass valve and 10A fuse

If NG, repair harness or connector.

OK

C

CHECK OUTPUT SIGNAL CIRCUIT.
1. Turn ignition switch "OFF".
2. Disconnect ECM harness connector.
3. Check harness continuity between ECM terminal (120) and terminal (1).
Continuity should exist.
If OK, check harness for short to ground and short to power.

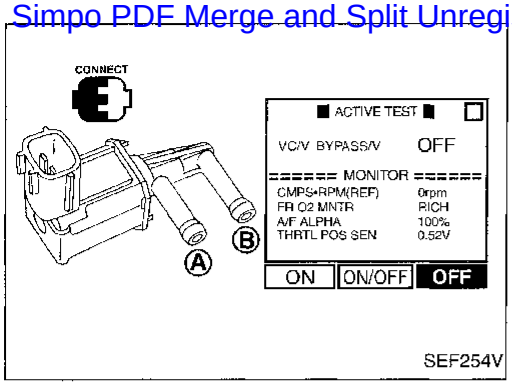
NG → Check the following.
- Harness connectors (M67), (C1)
- Harness connectors (M58), (F28)
- Harness for open or short between vacuum cut valve bypass valve and ECM

If NG, repair open circuit or short to ground or short to power in harness or connectors.

OK

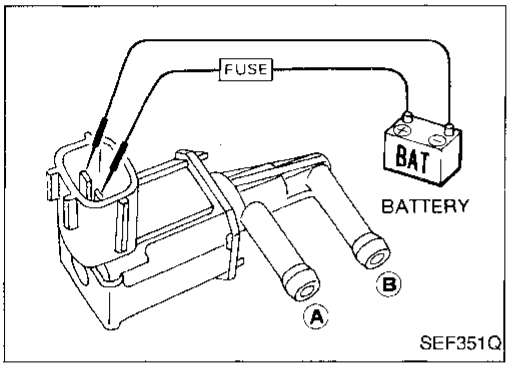
CHECK COMPONENT
(Vacuum cut valve bypass valve).
Refer to "COMPONENT INSPECTION" on next page.

NG → Replace vacuum cut valve bypass valve.



OK

Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.



INSPECTION END

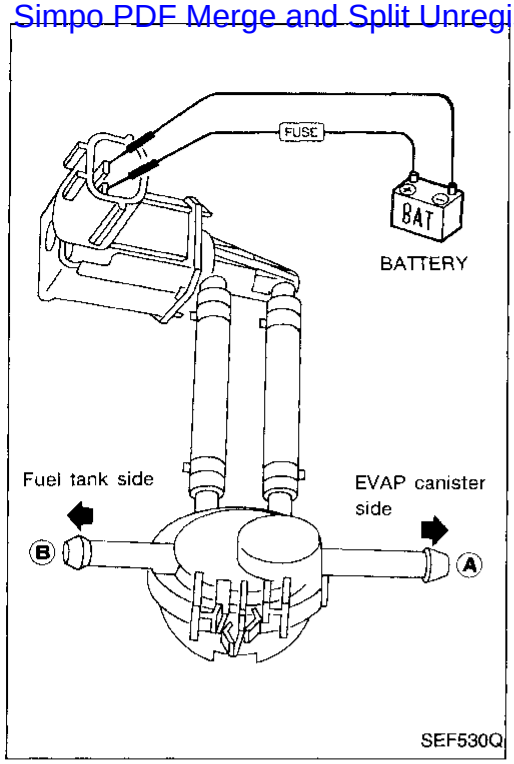
DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

CAUTION:
Always drive vehicle at a safe speed.

NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.



TESTING CONDITION:

- **Always perform test at a temperature of 5 to 30°C (41 to 86°F).**
- **This test may be conducted with the drive wheels lifted in the shop or by driving the vehicle. If a road test is expected to be easier, it is unnecessary to lift the vehicle.**

1) Turn ignition switch "ON".
2) Start engine and warm it up to normal operating temperature.
3) Turn ignition switch "OFF" and wait at least 5 seconds.
4) Start engine and let it idle for at least 1 minute.
5) Select "VC CUT/V BP/V P1491" of "EVAPORATIVE SYSTEM" in "DTC WORK SUPPORT" mode with CONSULT.
6) Touch "START".
7) When the following conditions are met, "TESTING" will be displayed on the CONSULT screen. Maintain the conditions continuously until "TESTING" changes to "COMPLETED". (It will take at least 30 seconds.)
   CMPS·RPM (REF): 1,000 - 2,700 rpm (A/T)
   1,000 - 3,200 rpm (M/T)
   Selector lever: Suitable position
   Vehicle speed: 36 - 100 km/h (22 - 62 MPH)
   B/FUEL SCHDL: 1.2 - 3.4 ms
   If "TESTING" is not displayed after 5 minutes, retry from step 3).
8) Make sure that "OK" is displayed after touching "SELF-DIAG RESULTS". If "NG" is displayed, refer to "DIAGNOSTIC PROCEDURE", EC-386.

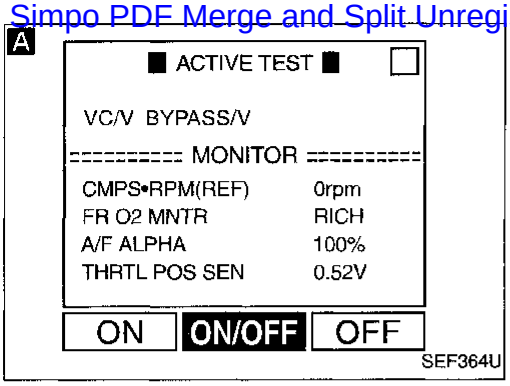
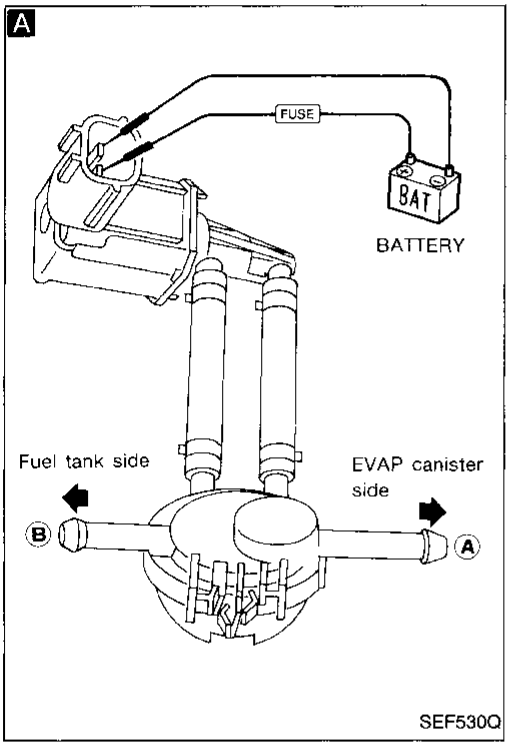
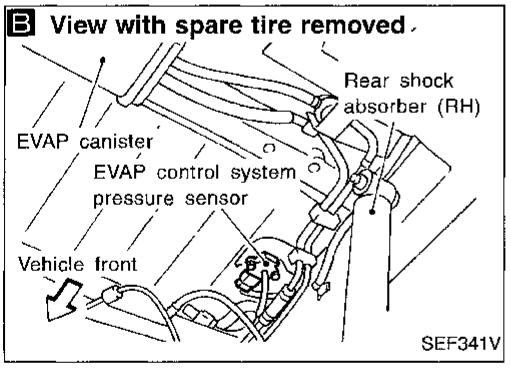
OR



OVERALL FUNCTION CHECK



1) Remove vacuum cut valve and vacuum cut valve bypass valve as an assembly.
2) Apply vacuum to port Ⓐ and check that there is no suction from port Ⓑ.
3) Apply vacuum to port Ⓑ and check that there is suction from port Ⓐ.
4) Blow air in port Ⓑ and check that there is a resistance to flow out of port Ⓐ.
5) Supply battery voltage to the terminal.
6) Blow air in port Ⓐ and check that air flows freely out of port Ⓑ.
7) Blow air in port Ⓑ and check that air flows freely out of port Ⓐ.



Vacuum Cut Valve Bypass Valve (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

DIAGNOSTIC PROCEDURE

INSPECTION START

A

CHECK COMPONENT.
1. Remove vacuum cut valve and vacuum cut valve bypass valve as an assembly.
2. Apply vacuum to port (A) and check that there is no suction from port (B).
3. Apply vacuum to port (B) and check that there is suction from port (A).
4. Blow air in port (B) and check that there is a resistance to flow out of port (A).
5. Turn ignition switch "ON" and select "VC/V BYPASS/V" in "ACTIVE TEST" mode with CONSULT, and touch "ON".

OR

5. Supply battery voltage to the terminal.
6. Blow air in port (A) and check that air flows freely out of port (B).
7. Blow air in port (B) and check that air flows freely out of port (A).

OK → Check the following.
- EVAP purge line between EVAP canister and fuel tank for clogging or disconnection
- EVAP canister, refer to EC-20.
- EVAP purge port of fuel tank for clogging

If NG, repair or replace.

OK → Go to B "CHECK COMPONENT (EVAP control system pressure sensor)" below.

NG

Check bypass hoses for clogging. NG → Repair or replace hoses.

OK

B

CHECK COMPONENT
(Vacuum cut valve, vacuum cut valve bypass valve).
Refer to "COMPONENT INSPECTION" on next page.

NG → Replace malfunctioning parts.

OK

B

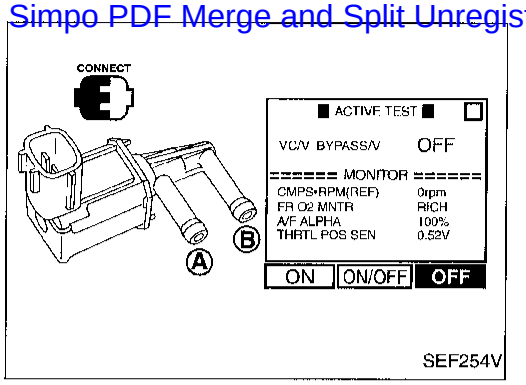
CHECK COMPONENT
(EVAP control system pressure sensor).
1. Check for disconnection of hose connected to the sensor.
2. Check sensor harness connector for water.
   Water should not exist.
   If OK, go to the following step.
3. Check EVAP control system pressure sensor.

Refer to "COMPONENT INSPECTION", EC-365.

NG → Repair or replace harness, connectors and/or replace EVAP control system pressure sensor.

OK

CHECK COMPONENT
(EVAP canister vent control valve).
Refer to "COMPONENT INSPECTION", EC-377.



NG → Repair or replace EVAP canister vent control valve.

OK

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

CAUTION:
Always drive vehicle at a safe speed.

NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

1) Turn ignition switch "ON".
2) Perform "PARK/NEUT POSI SW CKT" in "FUNCTION TEST" mode with CONSULT.
2) Select "P/N POSI SW" in "DATA MONITOR" mode with CONSULT. Then check the "P/N POSI SW" signal under the following conditions.

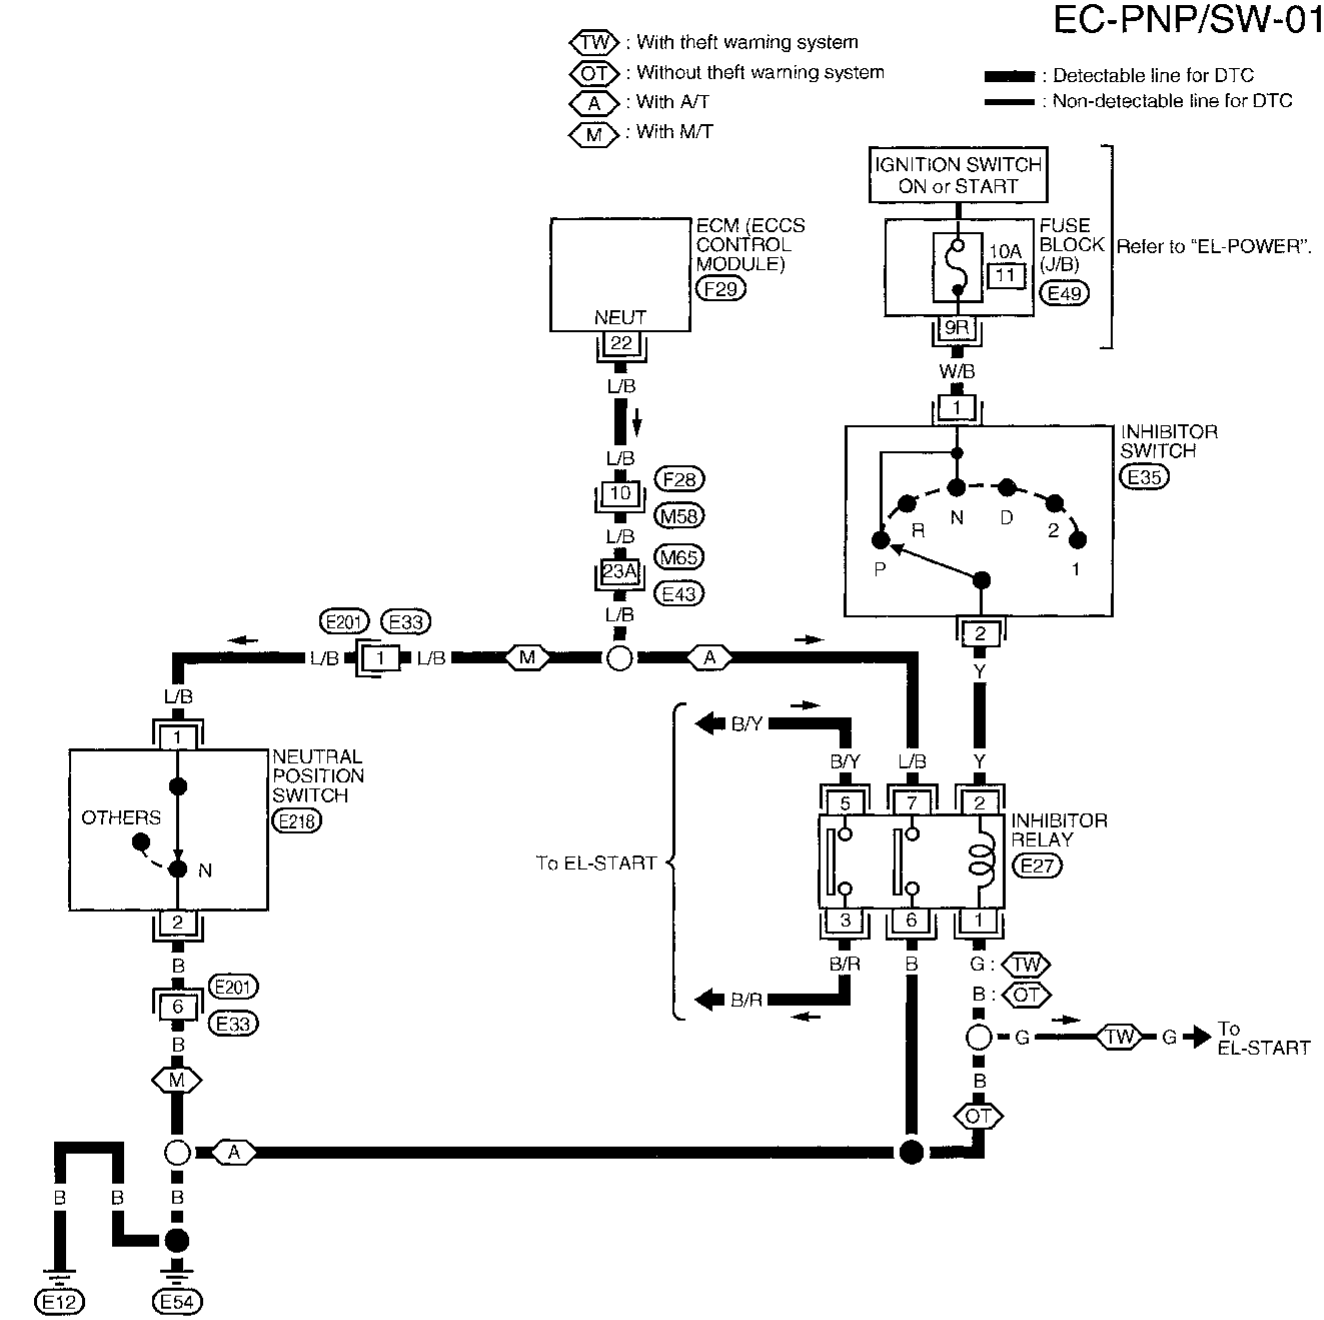
Position (Selector lever)	Known good signal
"N" and "P" (A/T only) position	ON
Except the above position	OFF

If NG, go to "DIAGNOSTIC PROCEDURE", EC-391.
If OK, go to following step.

3) Select "DATA MONITOR" mode with CONSULT.
4) Start engine and warm it up to normal operating temperature.
5) Maintain the following conditions for at least 60 consecutive seconds.
   CMPS·RPM (REF): 1,600 - 2,700 rpm (A/T)
   1,800 - 3,200 rpm (M/T)
   COOLAN TEMP/S: More than 70°C (158°F)
   B/FUEL SCHDL: 1 - 4.8 ms
   VHCL SPEED SE: 70 - 100 km/h (43 - 62 MPH)
   Selector lever: Suitable position

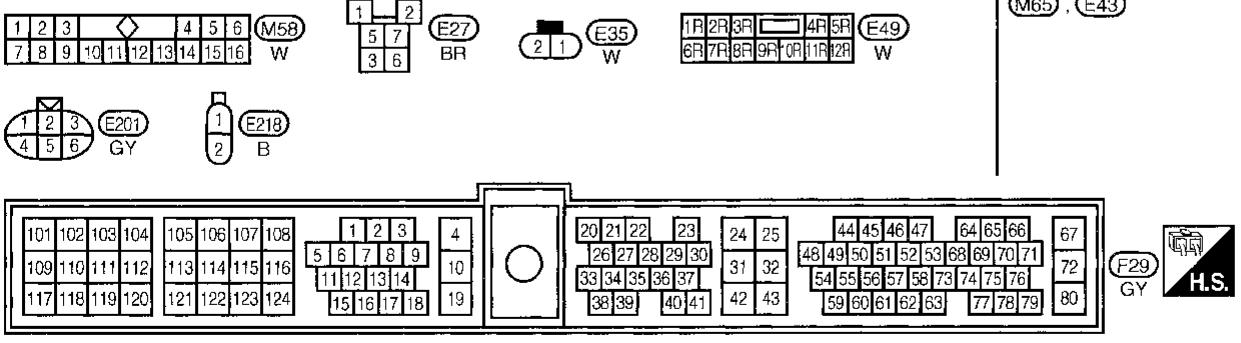
OR

OVERALL FUNCTION CHECK



Use this procedure to check the overall function of the park/neutral position switch circuit. During this check, a 1st trip DTC might not be confirmed.

1) Turn ignition switch "ON".
2) Check voltage between ECM terminal ㉒ and body ground under the following conditions.



Condition (Gear position)	Voltage (V) (Known good data)
"P" (A/T only) and "N" position	Approx. 0
Except the above position	Approx. 5

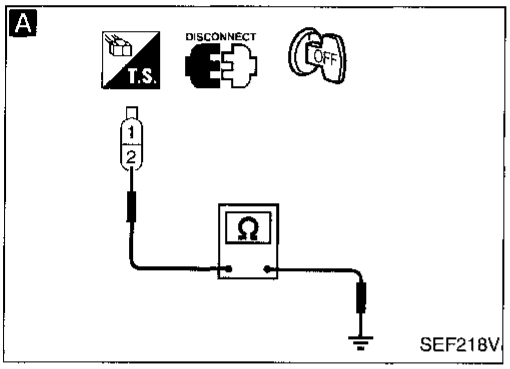
Park/Neutral Position Switch (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

DIAGNOSTIC PROCEDURE

Neutral position switch (M/T models)

INSPECTION START



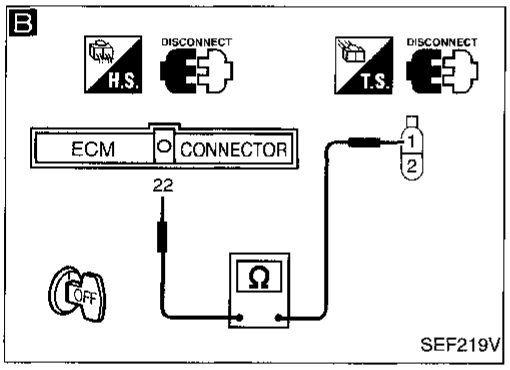
A

CHECK GROUND CIRCUIT.
1. Turn ignition switch "OFF".
2. Disconnect neutral position switch harness connector.
3. Check harness continuity between terminal (2) and body ground.
Continuity should exist.
If OK, check harness for short to power.

NG → Check the following.
- Harness connectors (E33), (E201)
- Harness for open or short between neutral position switch and body ground

If NG, repair open circuit or short to ground or short to power in harness or connectors.

OK



B

CHECK INPUT SIGNAL CIRCUIT.
1. Disconnect ECM harness connector.
2. Check harness continuity between ECM terminal (22) and terminal (1).
Continuity should exist.
If OK, check harness for short to ground and short to power.

NG → Check the following.
- Harness connectors (F28), (M58)
- Harness connectors (M65), (E43)
- Harness connectors (E33), (E201)
- Harness for open or short between ECM and neutral position switch

If NG, repair open circuit or short to ground or short to power in harness or connectors.

OK

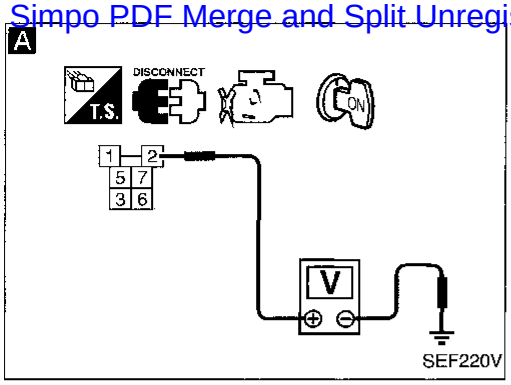
CHECK COMPONENT
(Neutral position switch).
Refer to MT section

NG → Replace neutral position switch.

OK

Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.

INSPECTION END



Park/Neutral Position Switch (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

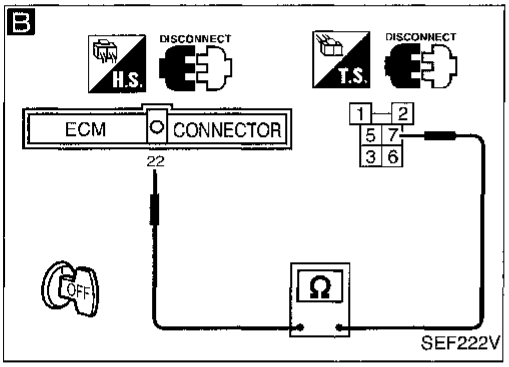
Inhibitor switch (A/T models)

INSPECTION START

A

CHECK POWER SUPPLY.
1. Turn ignition switch "OFF".
2. Disconnect inhibitor switch harness connector.
3. Turn ignition switch "ON".
4. Check voltage between terminal ② and ground with CONSULT or tester.

Voltage: Battery voltage



NG → Check the following.
- 10A fuse
- Harness for open or short between inhibitor switch and 10A fuse
- Harness for open or short between inhibitor relay and inhibitor switch

If NG, repair harness or connectors.

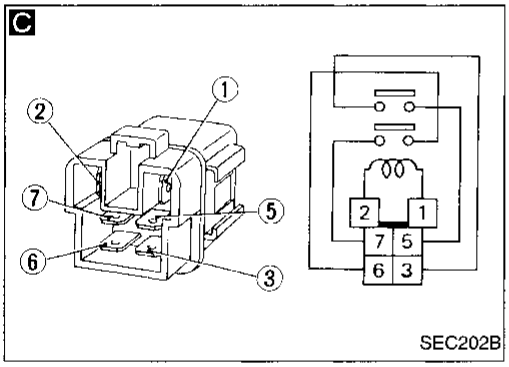
OK → CHECK COMPONENT (Inhibitor switch).
Refer to AT section.
If NG, replace inhibitor switch.

OK

B

CHECK INPUT SIGNAL CIRCUIT.
1. Disconnect ECM harness connector.
2. Check harness continuity between ECM terminal ㉒ and inhibitor relay terminal ⑦.

Continuity should exist.



If OK, check harness for short to ground and short to power.

NG → Check the following.
- Harness connectors (F28), (M58)
- Harness connectors (M65), (E43)
- Harness for open or short between ECM and inhibitor relay

If NG, repair open circuit or short to ground or short to power in harness or connectors.

OK

C

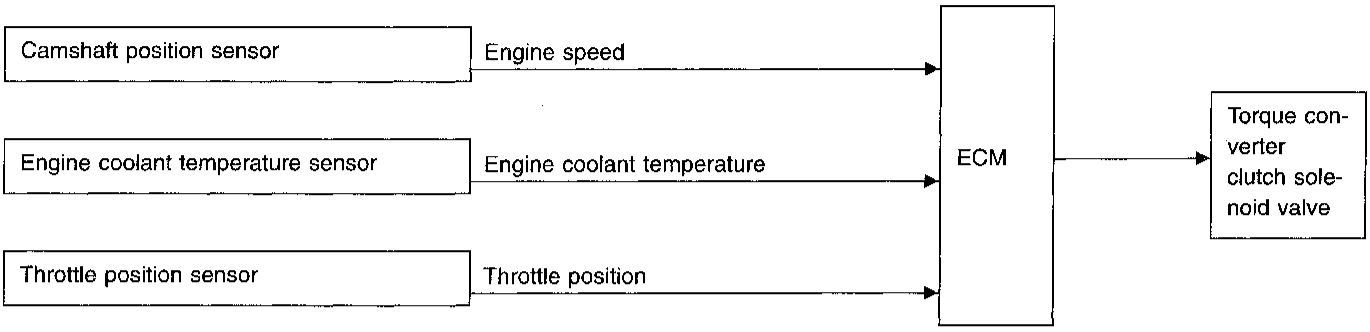
INHIBITOR RELAY
1. Apply 12V direct current between relay terminals ① and ②.
2. Check continuity between relay terminals ③ and ⑤, ⑥ and ⑦.

12V (① - ②) applied:
Continuity should exist.

No voltage applied:
Continuity should not exist.

NG → Replace inhibitor relay.

OK



Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.

INSPECTION END

Torque Converter Clutch Solenoid Valve

SYSTEM DESCRIPTION

The ECM controls torque converter clutch solenoid valve to cancel the lock-up condition of A/T. When the solenoid valve is **turned on**, lock-up is **cancelled**. When the solenoid valve is turned off, A/T lock-up is operational.

Conditions for lock-up cancel:

Torque converter clutch solenoid valve is turned "ON" when;

- Throttle valve is fully closed (during idling or deceleration)
- Engine coolant temperature is below 40°C (104°F)
- Engine is stopped

Conditions for lock-up operation:

- Under 55 to 63 km/h (34 to 39 MPH) (2/8 throttle on flat road), lock-up does not operate even when the torque converter clutch solenoid valve is "OFF".
- Over 58 to 66 km/h (36 to 41 MPH) (2/8 throttle on flat road), lock-up should operate because the torque converter clutch solenoid valve is "OFF".

To confirm vehicle lock-up, the torque converter clutch solenoid valve must be in operation ("ON" during idle and deceleration, and "OFF" during acceleration) and engine speed should drop.

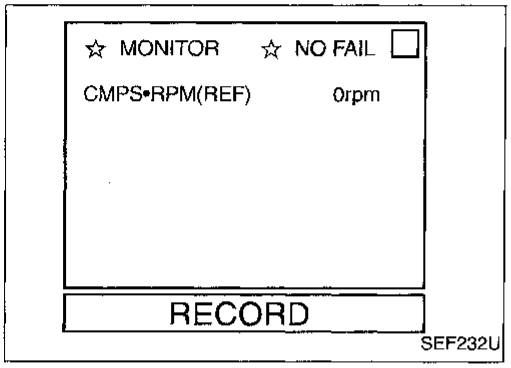
When the accelerator pedal is depressed (less than 2/8) in lock-up, the engine speed should not change abruptly. If there is a big jump in engine speed, there will be no lock-up.

CONSULT REFERENCE VALUE IN DATA MONITOR MODE

MONITOR ITEM	CONDITION		SPECIFICATION
TCC SOL/V	● Engine: After warming up	Idle	ON
		2,000 rpm	OFF

ECM TERMINALS AND REFERENCE VALUE

Specification data are reference values and are measured between each terminal and ㉜ (ECM ground).



TERMINAL NO.	WIRE COLOR	ITEM	CONDITION	DATA (DC voltage)
115	L/Y	Torque converter clutch solenoid valve (A/T models only)	Engine is running. └ Idle speed	Approximately 1V
			Engine is running. (Warm-up condition) └ Engine speed is 2,000 rpm.	BATTERY VOLTAGE (11 - 14V)

ON BOARD DIAGNOSIS LOGIC

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P1775 0904	● An excessively low voltage from the solenoid is sent to ECM.	● Harness or connectors (The circuit is open or shorted.) ● Torque converter clutch solenoid valve

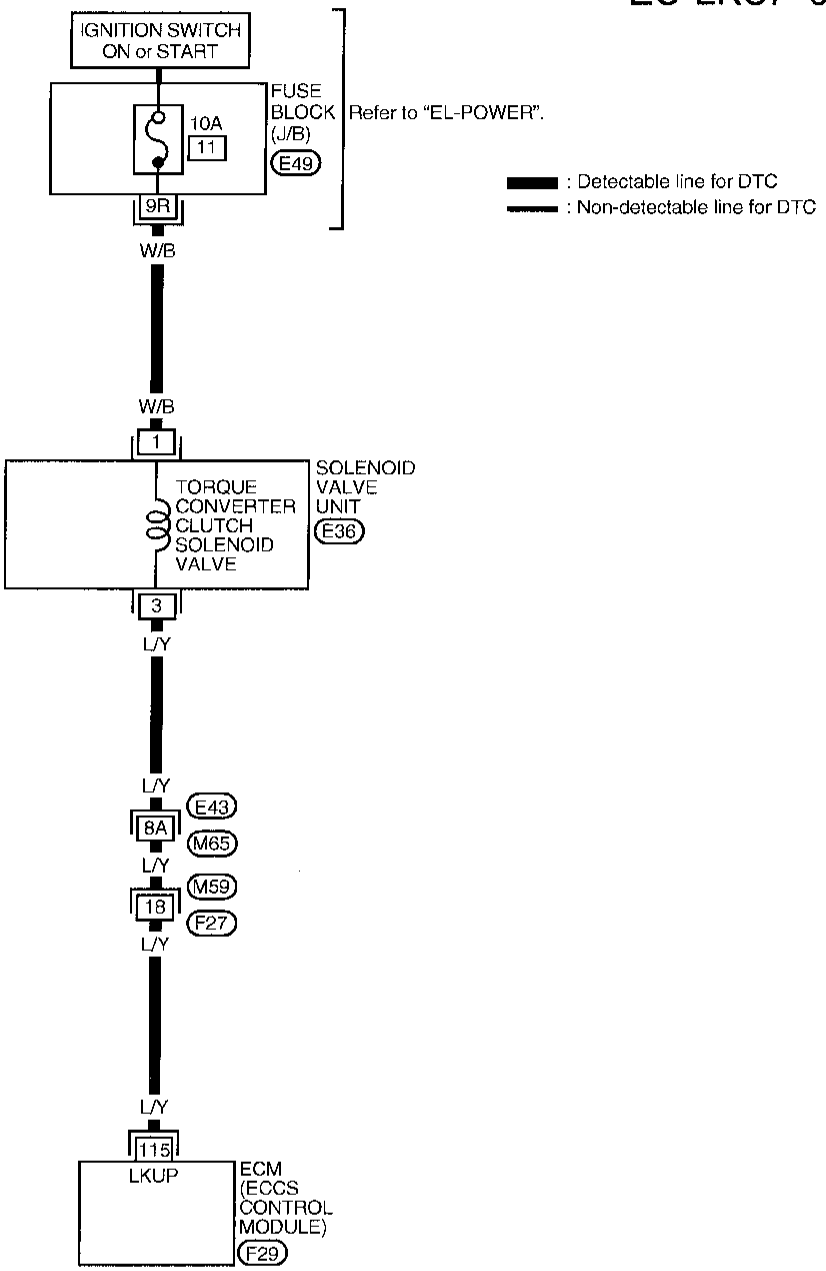
DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

1) Turn ignition switch "ON".
2) Select "DATA MONITOR" mode with CONSULT.
3) Wait at least 5 seconds.

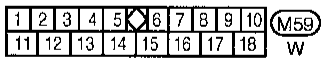
OR

1) Turn ignition switch "ON" and wait at least 5 seconds.
2) Select "MODE 7" with GST.



OR

1) Turn ignition switch "ON" and wait at least 5 seconds.
2) Turn ignition switch "OFF", wait at least 5 seconds and then turn "ON".
3) Perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.



Torque Converter Clutch Solenoid Valve (Cont'd)

DIAGNOSTIC PROCEDURE

INSPECTION START

A

CHECK POWER SUPPLY.
1. Disconnect torque converter clutch solenoid valve harness connector.
2. Turn ignition switch "ON".
3. Check voltage between terminal ① and ground with CONSULT or tester.
Voltage: Battery voltage

NG → Check the followings.
- 10A fuse
- Harness continuity between torque converter clutch solenoid valve and 10A fuse

If NG, repair harness or connectors.

OK

B

CHECK OUTPUT SIGNAL CIRCUIT.
2. Disconnect ECM harness connector.
3. Check harness continuity between ECM terminal (115) and terminal ③.
Continuity should exist.
If OK, check harness for short.

NG → Check the followings.
- Harness connectors (E43), (M65)
- Harness connectors (M59), (F27)
- Harness continuity between torque converter clutch solenoid valve and ECM

If NG, repair open circuit, short to ground or short to power in harness or connectors.

OK

CHECK COMPONENT
(Torque converter clutch solenoid valve).
Refer to "COMPONENT INSPECTION" on next page.

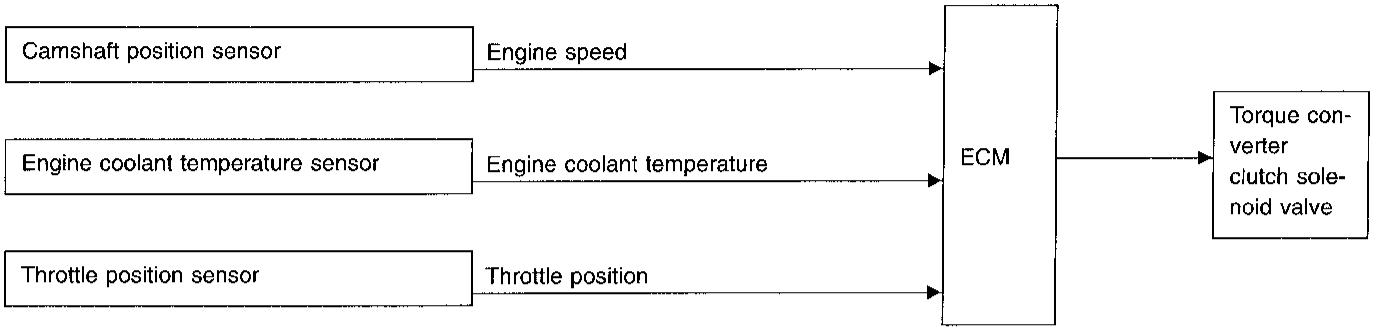
NG → Replace torque converter clutch solenoid valve.

OK

Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.

INSPECTION END

COMPONENT INSPECTION



Torque converter clutch solenoid valve

1. Check resistance between torque converter clutch solenoid valve terminals ① and ③.
Resistance: Approximately 25Ω [at 25°C (77°F)]
2. Remove torque converter clutch solenoid valve. Refer to "ON-VEHICLE SERVICE" in AT section.
3. Supply the solenoid valve terminals ① and ③ with battery voltage and check the solenoid valve operation.
Torque converter clutch solenoid valve should be operated.
4. If NG, replace torque converter clutch solenoid valve.

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

CAUTION:
Always drive vehicle at a safe speed.

NOTE:
If "DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

TESTING CONDITION:
Always perform the test at a temperature of –10°C (14°F) or higher.

1) Start engine and warm it up to normal operating temperature.
2) Turn ignition switch "OFF" and wait at least 5 seconds.
3) Start engine.
4) Select "TCC S/V FNCTN P1776" of "A/T (TCC S/V)" in "DTC WORK SUPPORT" mode with CONSULT.
5) Touch "START".
6) When the following conditions are met, "TESTING" will be displayed on the CONSULT screen. Maintain the conditions continuously until "TESTING" changes to "COMPLETED". (It will take approximately 20 seconds.)
   Selector lever: D (OD "ON")
   Vehicle speed: 76 - 100 km/h (47 - 62 MPH)
   CMPS·RPM (REF): Less than 2,150 rpm (Single cab model)
   Less than 2,300 rpm (King cab model)
   B/FUEL SCHDL: 2.5 - 5 ms
   THRTL POS SEN: Less than 1.3V
   If "TESTING" is not displayed after 5 minutes, retry from step 2).
7) Make sure that "OK" is displayed after touching "SELF-DIAG RESULTS".
   If "NG" is displayed, refer to "DIAGNOSTIC PROCEDURE", EC-400.

OR

1) Start engine and warm it up to normal operating temperature.
2) Perform test drive in "D" position (OD "ON") at least 20 consecutive seconds under the following conditions.

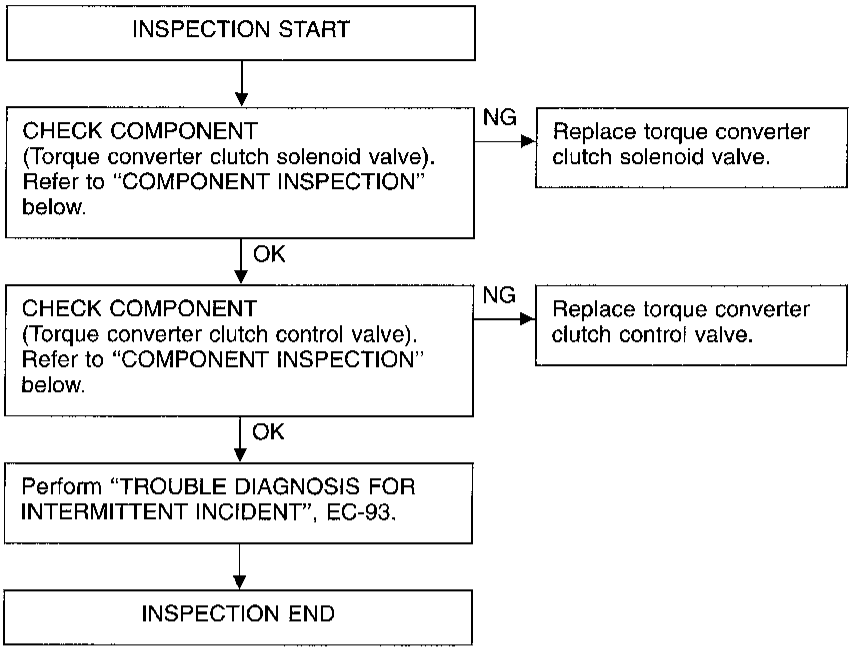
Torque Converter Clutch Solenoid Valve (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

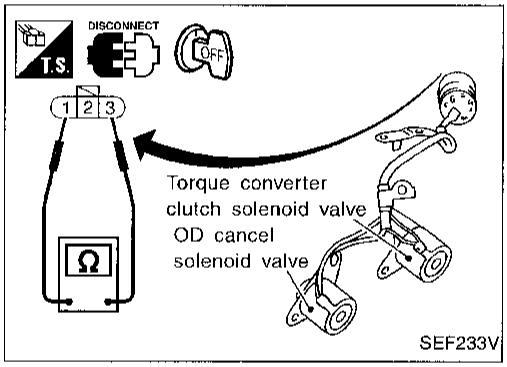
Engine speed: Less than 2,150 rpm (Single cab model)
Less than 2,300 rpm (King cab model)
Vehicle speed: 76 - 100 km/h (47 - 62 MPH)

3) Select MODE 7 with GST.

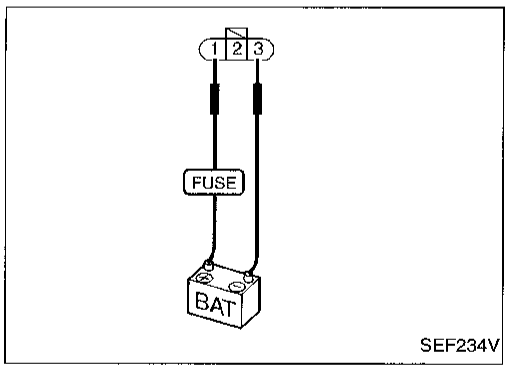
OR



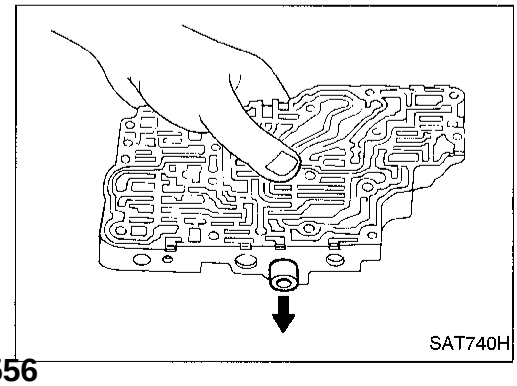
NO TOOLS



1) Start engine and warm it up to normal operating temperature.
2) Perform test drive in "D" position (OD "ON") at least 20 consecutive seconds under the following conditions.
   Engine speed: Less than 2,150 rpm (Single cab model)
   Less than 2,300 rpm (King cab model)
   Vehicle speed: 76 - 100 km/h (47 - 62 MPH)
3) Stop the vehicle, turn ignition switch "OFF", wait at least 5 seconds and then turn "ON".
4) Perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Torque Converter Clutch Solenoid Valve (Cont'd)

DIAGNOSTIC PROCEDURE

COMPONENT INSPECTION

Torque converter clutch solenoid valve

1. Check resistance between torque converter clutch solenoid valve terminals ① and ③.
   Resistance: Approximately 25Ω [at 25°C (77°F)]
2. Remove torque converter clutch solenoid valve. Refer to "ON-VEHICLE SERVICE" in AT section.
3. Supply the solenoid valve terminals ① and ③ with battery voltage and check the solenoid valve operation.
   Torque converter clutch solenoid valve should be operated.
4. If NG, replace torque converter clutch solenoid valve.

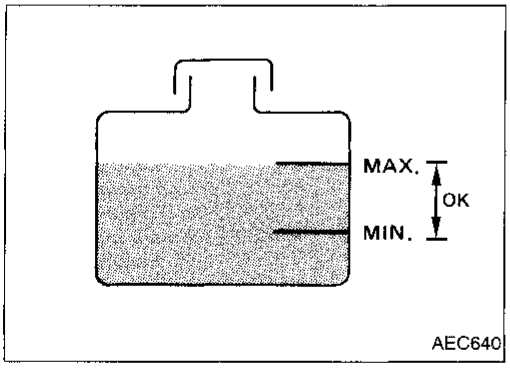
Torque converter clutch control valve

1. Disassemble torque converter clutch control valve assembly. Refer to "REPAIR FOR COMPONENT PARTS" on AT section.
2. Check torque converter clutch control valve.
   - Valve, and sleeve slide along valve bore under their own weight.
   - Valve, and sleeve are free from burrs, dents and scratches.
   - Control valve springs are free from damage, deformation and fatigue.
   - Hydraulic line is free from obstacles.
3. If NG, replace torque converter clutch control valve.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Overheat

ON BOARD DIAGNOSIS LOGIC



If the cooling fan or another component in the cooling system malfunctions, the engine coolant temperature will rise.
When the engine coolant temperature reaches an abnormally high temperature condition, a malfunction is indicated.

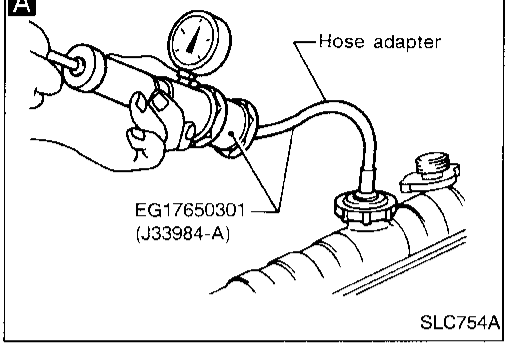
Diagnostic trouble code No.	Malfunction is detected when ...	Check Items (Possible Cause)
OVERHEAT 0208	● Engine coolant temperature reaches an abnormally high temperature.	● Harness or connectors (The cooling fan circuit is open or shorted.) ● Cooling fan ● Radiator hose ● Radiator ● Radiator cap ● Water pump ● Thermostat For more information, refer to "MAIN 12 CAUSES OF OVERHEATING", EC-403.

CAUTION:
When a malfunction is indicated, be sure to replace the coolant following the procedure in the MA section ("Changing Engine Coolant", "ENGINE MAINTENANCE"). Also, replace the engine oil.

a. Fill radiator with coolant up to specified level with a filling speed of 2 liters per minute like pouring coolant by kettle. Be sure to use coolant with the proper mixture ratio. Refer to MA section ("Anti-freeze Coolant Mixture Ratio", "RECOMMENDED FLUIDS AND LUBRICANTS").

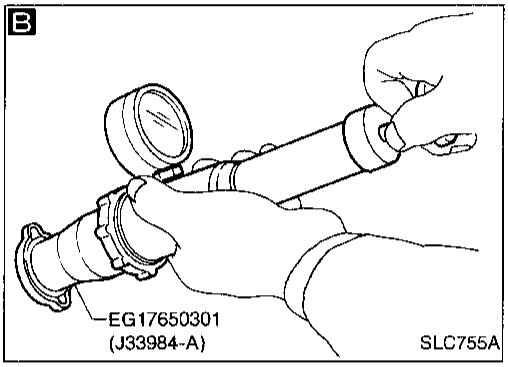
b. After refilling coolant, run engine to ensure that no water-flow noise is emitted.

OVERALL FUNCTION CHECK



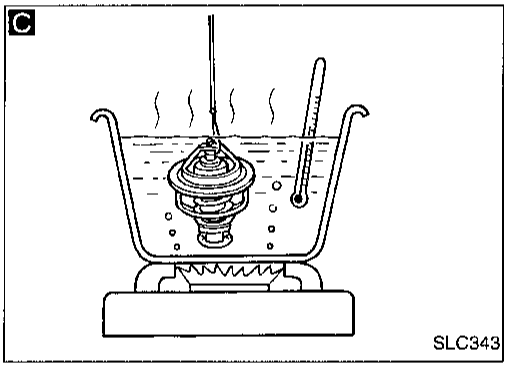
WARNING:
Never remove the radiator cap when the engine is hot. Serious burns could be caused by high pressure fluid escaping from the radiator.
Wrap a thick cloth around cap. Carefully remove the cap by turning it a quarter turn to allow built-up pressure to escape. Then turn the cap all the way off.

1) Check the coolant level in the reservoir tank and radiator.
Allow engine to cool before checking coolant level.
If the coolant level in the reservoir tank and/or radiator is below the proper range, skip the following steps and go to "DIAGNOSTIC PROCEDURE" on next page.
2) Confirm whether customer filled the coolant or not. If customer filled the coolant, skip the following steps and go to "DIAGNOSTIC PROCEDURE" on next page.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Overheat (Cont'd)



A

B

C

DIAGNOSTIC PROCEDURE

INSPECTION START

A

CHECK COOLING SYSTEM FOR LEAK.
Apply pressure to the cooling system with a tester, and check if the pressure drops.
Testing pressure:
157 kPa (1.6 kg/cm², 23 psi)
Pressure should not drop.
CAUTION:
Higher than the specified pressure may cause radiator damage.

NG → Check the following for leak.
- Hose
- Radiator
- Water pump

Refer to LC section ("Water Pump").

OK

B

CHECK RADIATOR CAP.
Apply pressure to cap with a tester.
Radiator cap relief pressure:
78 - 98 kPa (0.8 - 1.0 kg/cm², 11 - 14 psi)

NG → Replace radiator cap.

OK

C

CHECK THERMOSTAT.
1. Check valve seating condition at normal room temperatures.
   It should seat tightly.
2. Check valve opening temperature and valve lift.
   Valve opening temperature:
   76.5°C (170°F) [standard]
   Valve lift:
   More than 8 mm/90°C
   (0.31 in/194°F)
3. Check if valve is closed at 5°C (9°F) below valve opening temperature.

For details, refer to LC section ("Thermostat").

NG → Replace thermostat

OK

Check engine coolant temperature sensor. Refer to "COMPONENT INSPECTION", EC-125.

NG → Replace engine coolant temperature sensor.

If the cause can not be isolated, go to "MAIN 12 CAUSES OF OVERHEATING" on next page.

INSPECTION END

Perform FINAL CHECK by the following procedure after repair is completed.

1. Warm up engine. Run the vehicle for at least 20 minutes. Pay attention to engine coolant temperature gauge on the instrument panel. If the reading shows an abnormally high temperature, another part may be malfunctioning.
2. Stop vehicle and let engine idle. Check the intake and exhaust systems for leaks by listening for noise or visually inspecting the components.
3. Allow engine to cool and visually check for oil and coolant leaks. Then, perform "OVERALL FUNCTION CHECK".

Overheat (Cont'd)

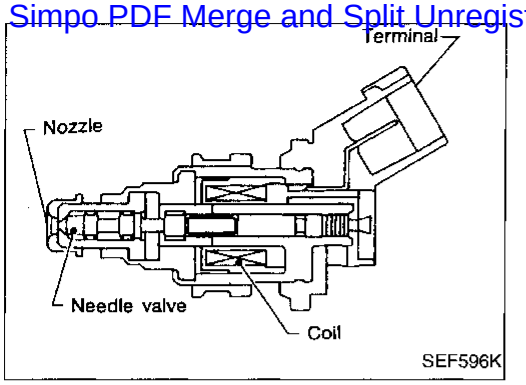
Injector

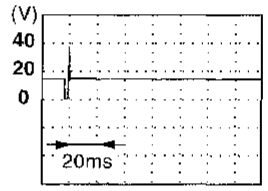
EC-INJECT-01

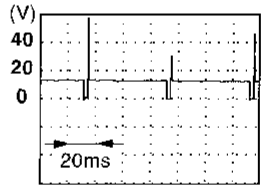


AEC547A

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Injector (Cont'd)

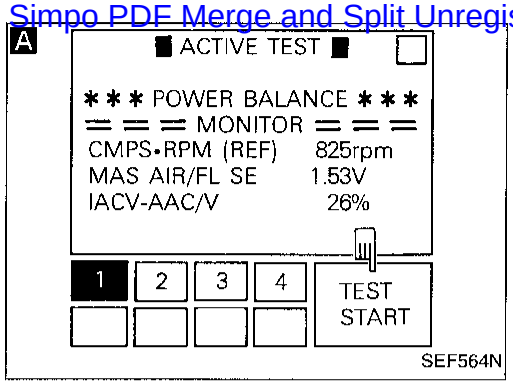




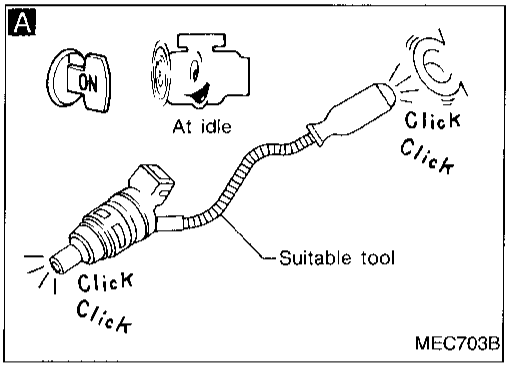
COMPONENT DESCRIPTION

The fuel injector is a small, precise solenoid valve. When the ECM supplies a ground to the injector circuit, the coil in the injector is energized. The energized coil pulls the needle valve back and allows fuel to flow through the injector into the intake manifold. The amount of fuel injected depends upon the injection pulse duration. Pulse duration is the length of time the injector remains open. The ECM controls the injection pulse duration based on engine fuel needs.

ECM TERMINALS AND REFERENCE VALUE



Specification data are reference values and are measured between each terminal and ㉜ (ECM ground).



TERMINAL NO.	WIRE COLOR	ITEM	CONDITION	DATA (DC Voltage)
102	W/B	Injector No. 1	Engine is running. (Warm-up condition) Idle speed	BATTERY VOLTAGE (11 - 14V)  SEF204T
104	W/R	Injector No. 3		
109	W/L	Injector No. 2	Engine is running. (Warm-up condition) Engine speed is 2,000 rpm.	BATTERY VOLTAGE (11 - 14V)  SEF205T

DIAGNOSTIC PROCEDURE

INSPECTION START

A

CHECK OVERALL FUNCTION.
1. Start engine.
2. Perform "POWER BALANCE" in "ACTIVE TEST" mode with CONSULT.
3. Make sure that each circuit produces a momentary engine speed drop.

OR

1. Start engine.
2. Listen to each injector operating sound.
Clicking noise should be heard.

OK → INSPECTION END

NG

B

CHECK POWER SUPPLY.
1. Stop engine.
2. Disconnect injector harness connector.
3. Turn ignition switch "ON".
4. Check voltage between terminal ① and ground with CONSULT or tester.
Voltage: Battery voltage

NG → Check the following.
- Harness connectors (F27), (M59)
- 10A fuse
- Harness for open or short between injector and fuse

If NG, repair harness or connectors.

OK

C

CHECK OUTPUT SIGNAL CIRCUIT.
1. Turn ignition switch "OFF".
2. Disconnect ECM harness connector.
3. Check harness continuity between injector harness connector terminal ① and ECM terminals (102), (104), (109), (111).
Continuity should exist.
If OK, check harness for short to ground and short to power.

NG → Repair open circuit, short to ground or short to power in harness or connectors.

OK

CHECK COMPONENT (Injector).
Refer to "COMPONENT INSPECTION" below.

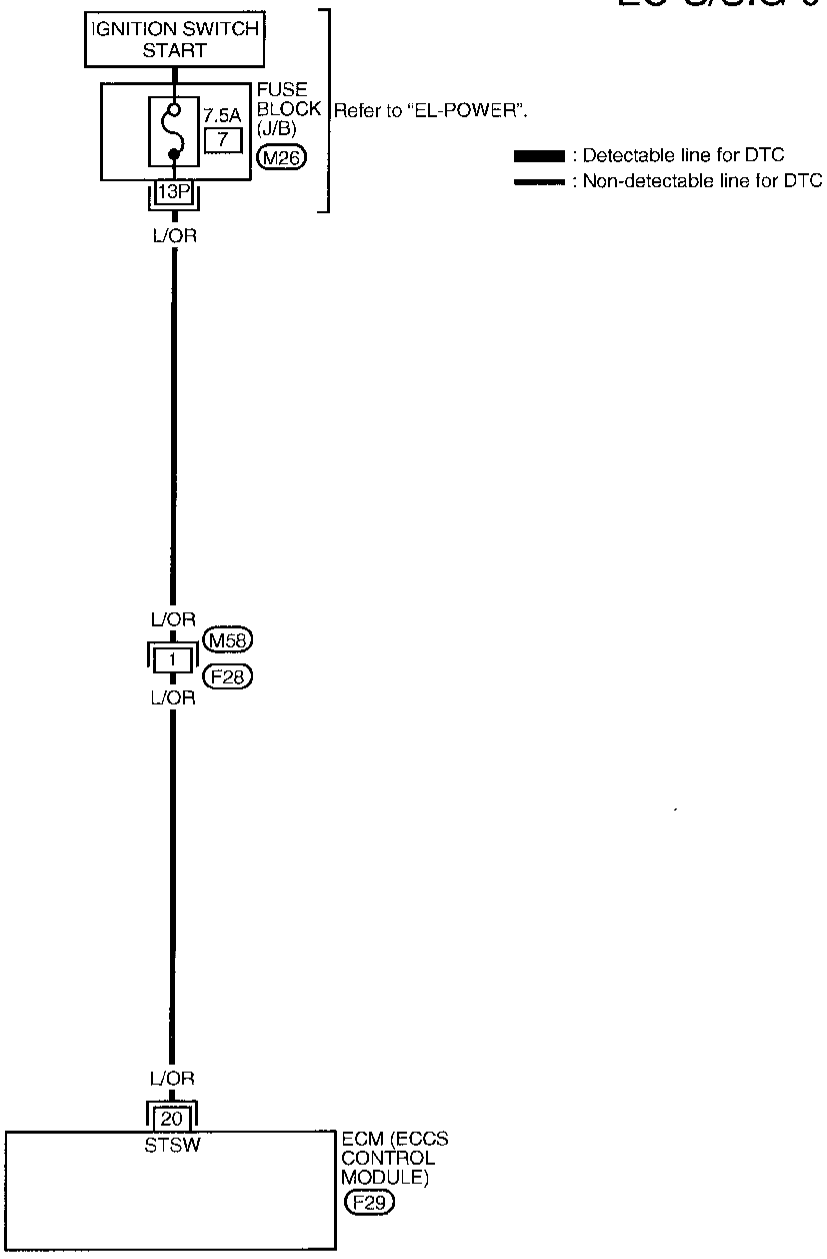
NG → Replace injector.

OK

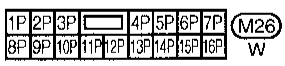
Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.

INSPECTION END

COMPONENT INSPECTION



Injector



1. Disconnect injector harness connector.
2. Check resistance between terminals as shown in the figure.
Resistance: 10 - 14Ω [at 25°C (77°F)]
If NG, replace injector.

Fuel Pump

SYSTEM DESCRIPTION

The ECM activates the fuel pump for several seconds after the ignition switch is turned on to improve engine startability. If the ECM receives a 180° signal from the camshaft position sensor, it knows that the engine is rotating, and causes the pump to perform. If the 180° signal is not received when the ignition switch is on, the engine stalls. The ECM stops pump operation and prevents battery discharging, thereby improving safety. The ECM does not directly drive the fuel pump. It controls the ON/OFF fuel pump relay, which in turn controls the fuel pump.

Condition	Fuel pump operation
Ignition switch is turned to ON.	Operates for 5 seconds
Engine running and cranking	Operates
Except as shown above	Stops

COMPONENT DESCRIPTION

The fuel pump with a fuel damper is an in-tank type (the pump and damper are located in the fuel tank).

CONSULT REFERENCE VALUE IN DATA MONITOR MODE

NG → Replace power steering oil pressure switch.

OK

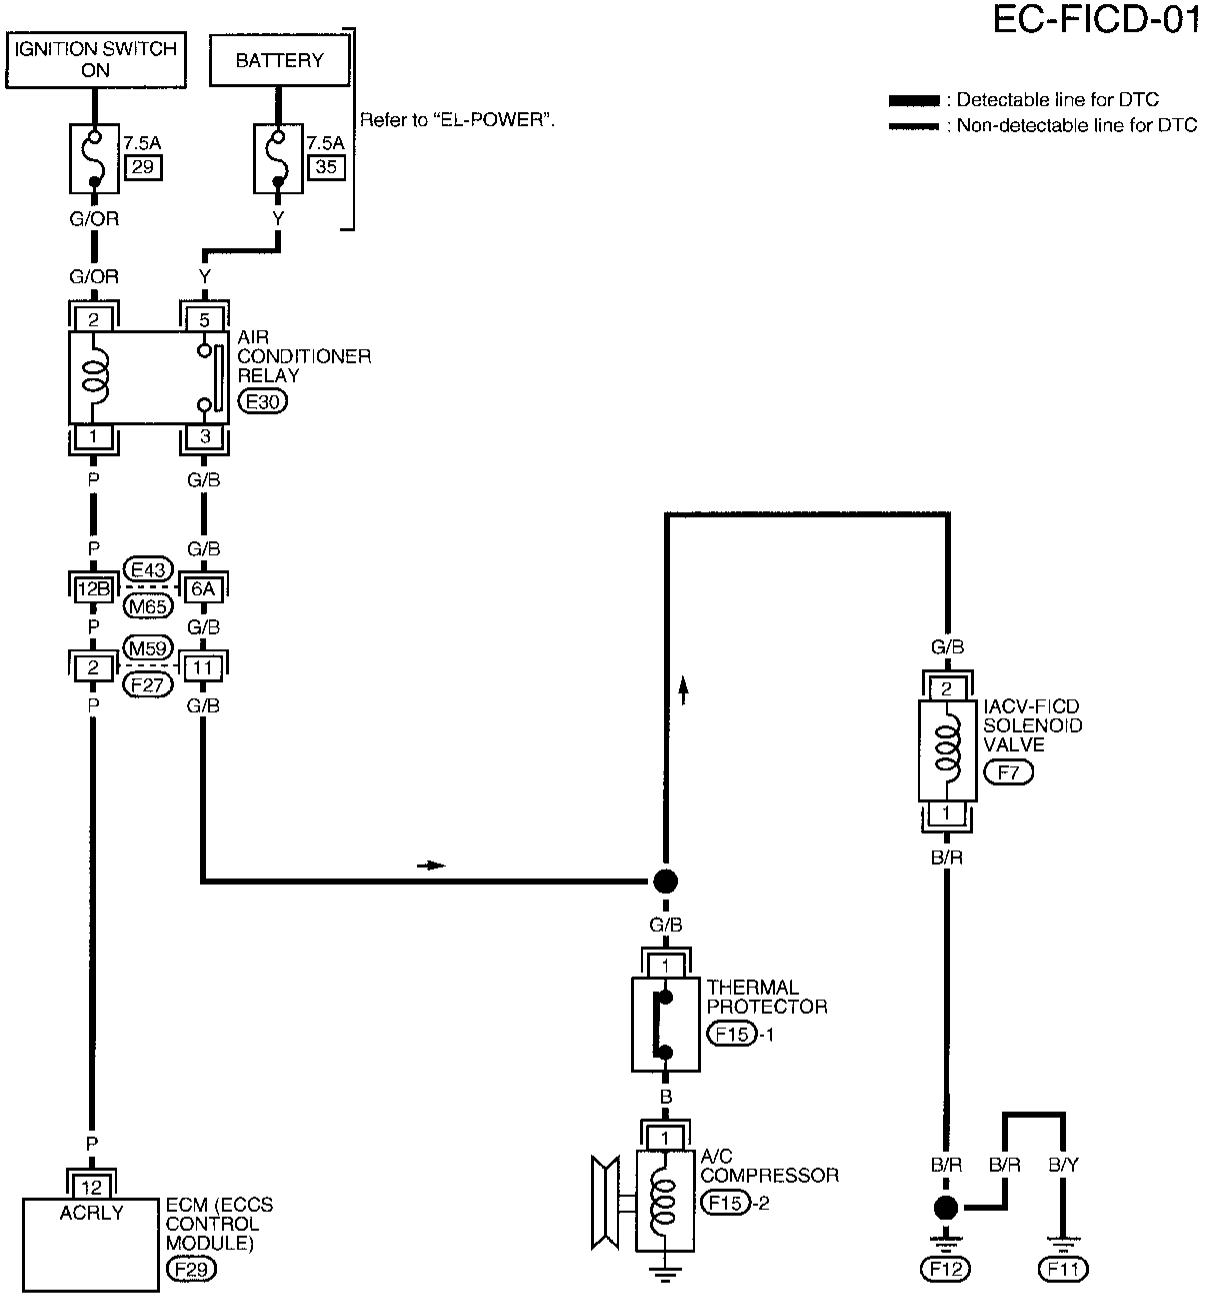
Perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-93.

INSPECTION END

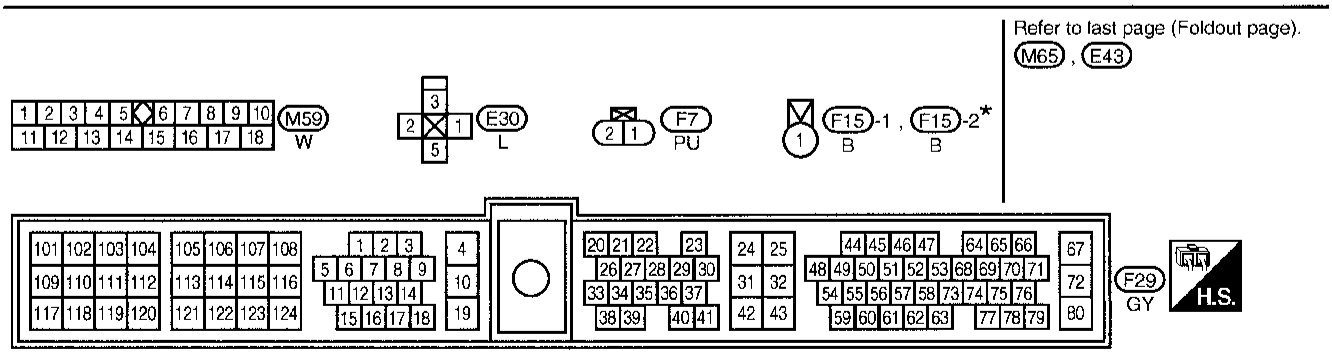
COMPONENT INSPECTION

Power steering oil pressure switch

1. Disconnect power steering oil pressure switch harness connector then start engine.
2. Check continuity between terminal (1) and ground.



Conditions	Continuity
Steering wheel is fully being turned	Yes
Steering wheel is not being turned	No



If NG, replace power steering oil pressure switch.

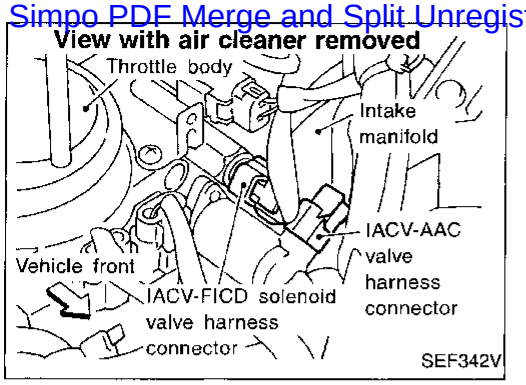
IACV-FICD Solenoid Valve

EC-FICD-01



* : This connector is not shown in "HARNESS LAYOUT" of EL section.

AEC551A

IACV-FICD Solenoid Valve (Cont'd)

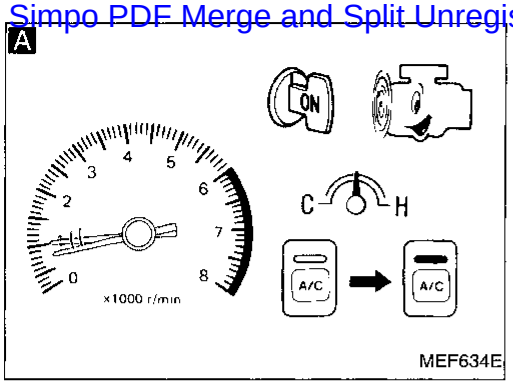
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

COMPONENT DESCRIPTION

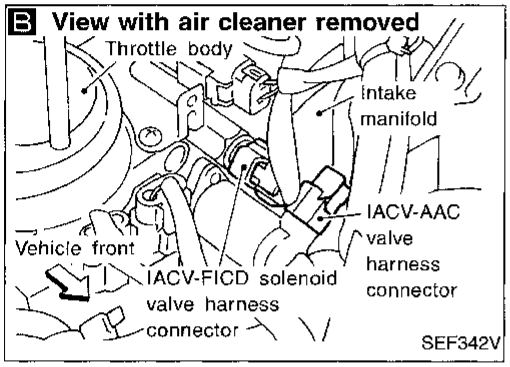
When the air conditioner is on, the IACV-FICD solenoid valve supplies additional air to adjust to the increased load.

ECM TERMINALS AND REFERENCE VALUE

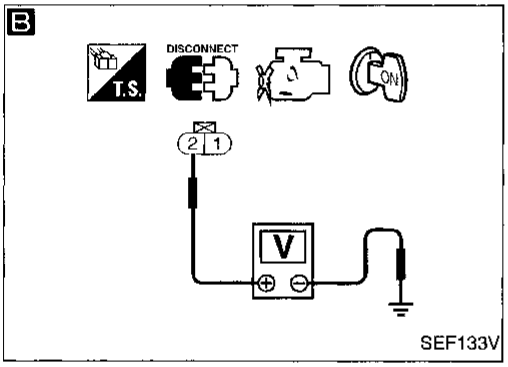
Specification data are reference values and are measured between each terminal and ㉜ (ECM ground).



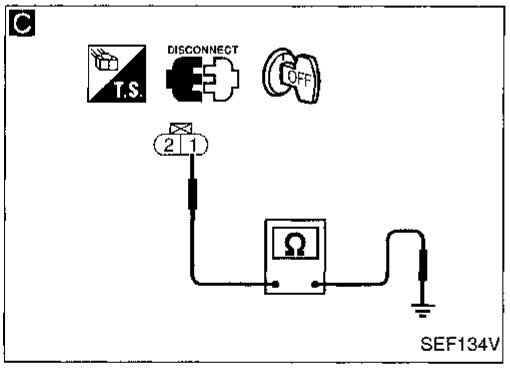
TERMINAL NO.	WIRE COLOR	ITEM	CONDITION	DATA (DC Voltage)
12	P	Air conditioner relay	Engine is running. └ Both A/C switch and blower switch are "ON"*.	Approximately 0V
			Engine is running. └ A/C switch is "OFF".	BATTERY VOLTAGE (11 - 14V)
21	G/R	Air conditioner dual-pressure switch	Engine is running. └ Both air conditioner switch and blower switch are "ON". (Compressor operates)	Approximately 0V
			Engine is running. └ Air conditioner switch is "OFF".	BATTERY VOLTAGE (11 - 14V)



*: Ambient air temperature above 10°C (50°F) and in any mode except "OFF".



IACV-FICD Solenoid Valve (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

DIAGNOSTIC PROCEDURE

INSPECTION START

A

CHECK OVERALL FUNCTION.
1. Start engine and warm it up to normal operating temperature.
2. Check idle speed.
   800±50 rpm (in "N" position)
   If NG, adjust idle speed.
3. Turn air conditioner switch and blower fan switch "ON".
4. Recheck idle speed.
   875 rpm or more (in "N" position)

OK → INSPECTION END

NG

Check if air conditioner compressor functions normally.

NG → Refer to HA section ("TROUBLE DIAGNOSES").

OK

B

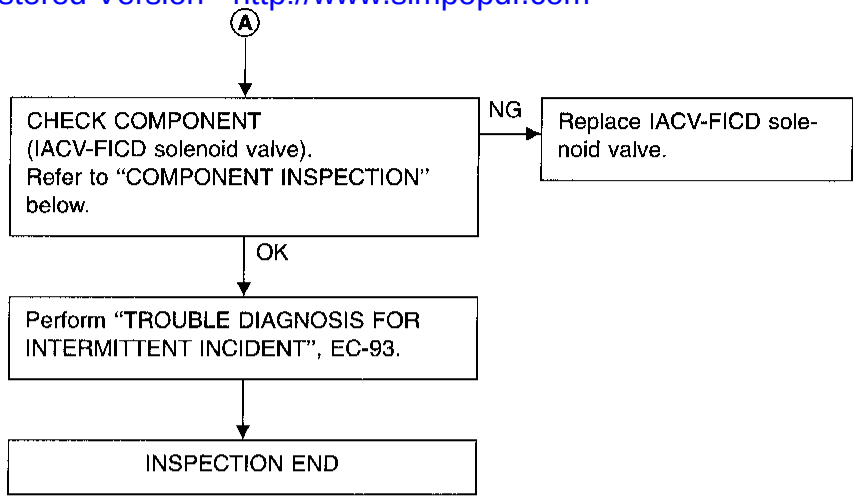
CHECK POWER SUPPLY.
1. Stop engine.
2. Disconnect IACV-FICD solenoid valve harness connector.
3. Start engine, then turn air conditioner switch and blower fan "ON".
4. Check voltage between terminal ② and ground with CONSULT or tester.
   Voltage: Battery voltage

NG → Check the following.
- Harness connectors (E43), (M65)
- Harness connectors (M59), (F27)
- Harness for open or short between IACV-FICD solenoid valve harness connector and air conditioner relay

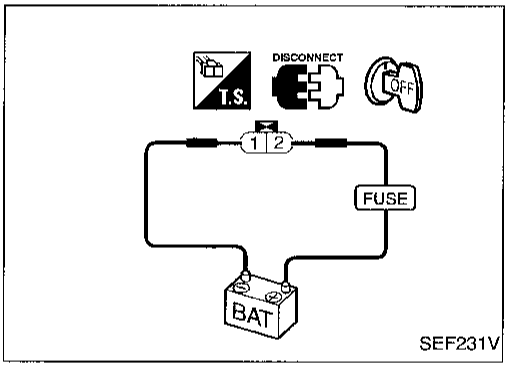
If NG, repair open circuit, short to ground or short to power in harness or connectors.

OK

C



CHECK GROUND CIRCUIT.
1. Start engine and warm it up to normal operating temperature.
2. Turn ignition switch "OFF".
3. Check harness continuity between terminal ① and body ground.
   Continuity should exist.
   If OK, check harness for short to ground and short to power.

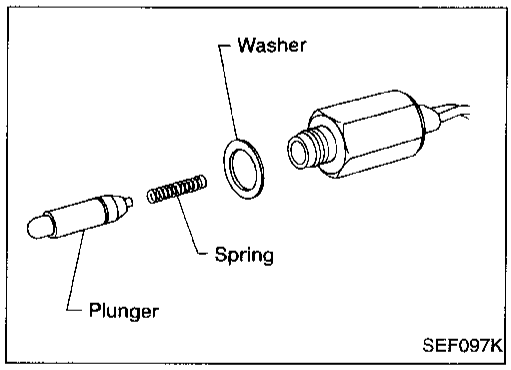


NG → Repair open circuit, short to ground or short to power in harness or connectors.

OK

Ⓐ
(Go to next page.)

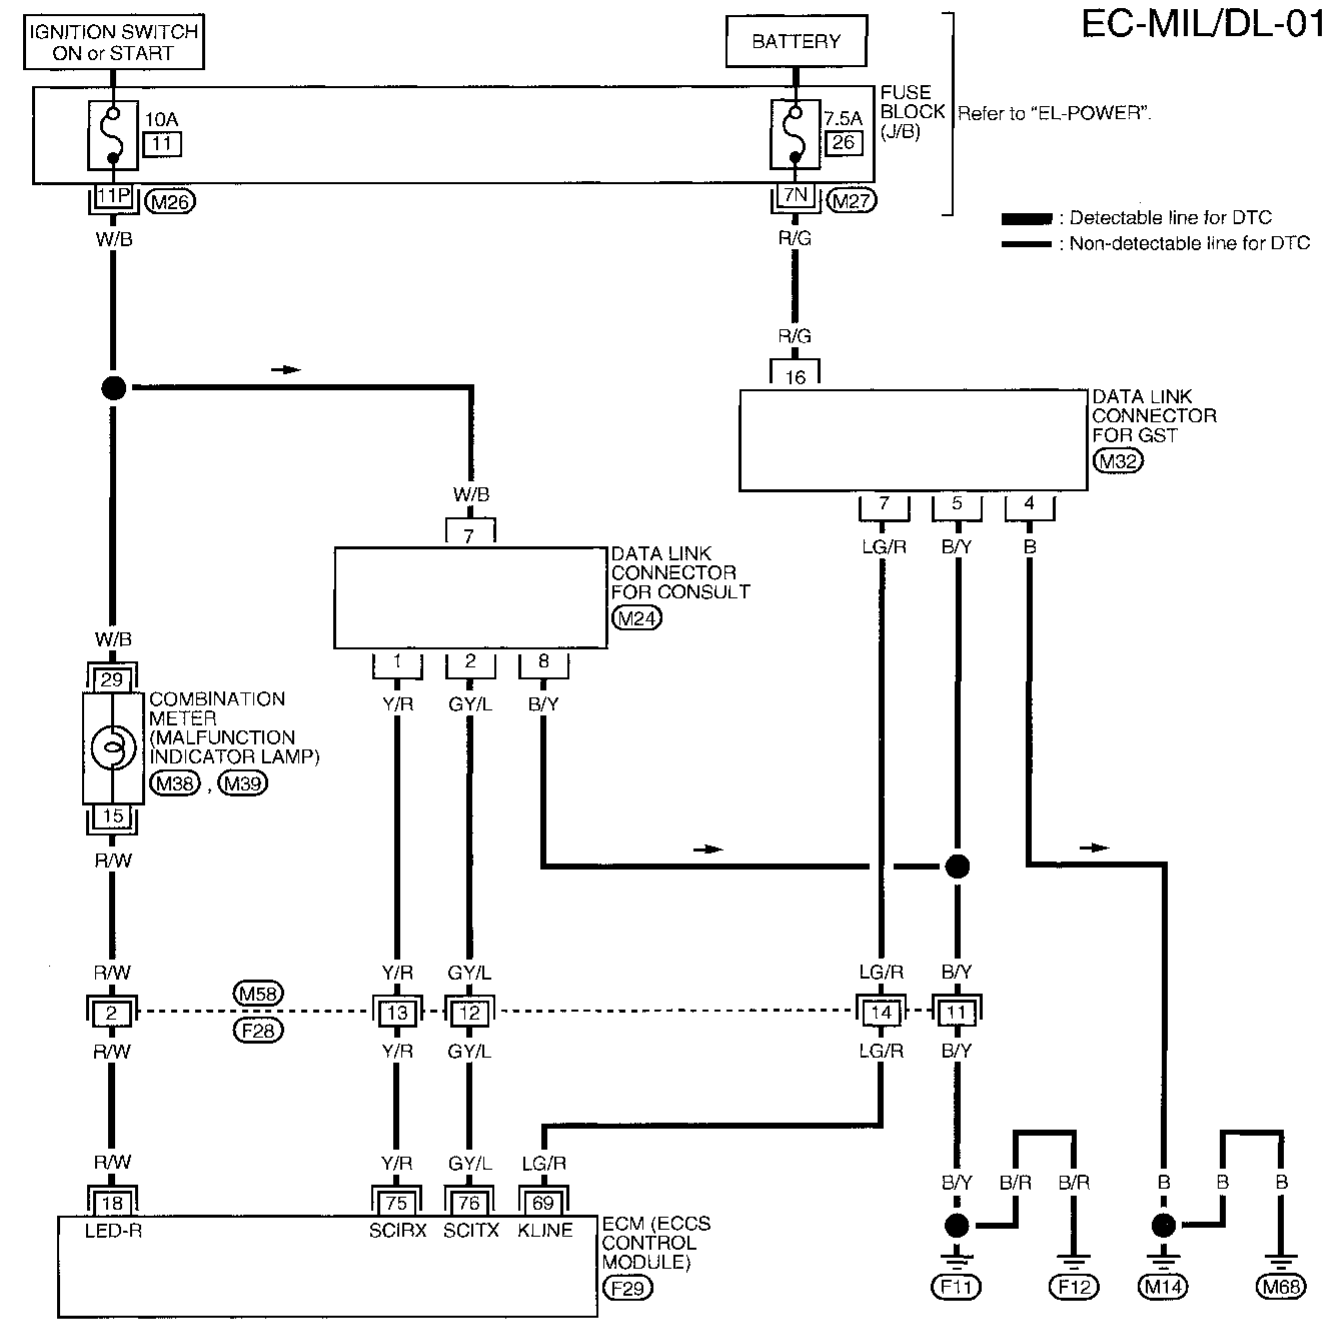
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



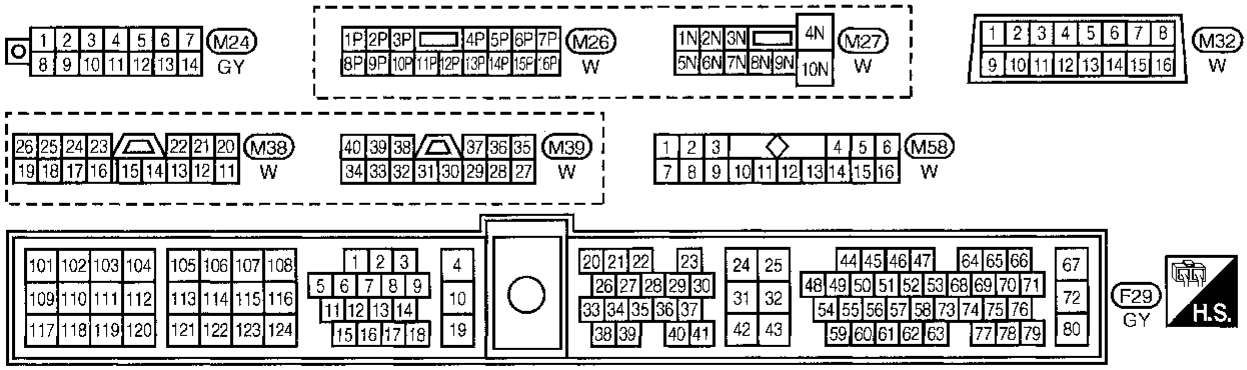
COMPONENT INSPECTION

IACV-FICD solenoid valve

Disconnect IACV-FICD solenoid valve harness connector.



- Check for clicking sound when applying 12V direct current to terminals.



- Check plunger for seizing or sticking.
- Check for broken spring.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

MIL & Data Link Connectors

AEC552A

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

General Specifications

FUEL PRESSURE REGULATOR

Fuel pressure at idling kPa (kg/cm^2, psi)	
Vacuum hose is connected	Approximately 235 (2.4, 34)
Vacuum hose is disconnected	Approximately 294 (3.0, 43)

Inspection and Adjustment

Idle speed*1 rpm	
No-load*2 (in "N" position)	800±50 (750±50*3)
Air conditioner: ON (in "N" position)	875 or more
Ignition timing	20°±2° BTDC*3
Closed throttle position switch touch speed ("OFF" to "ON") (in "N" position) rpm	950±150*3

*1: Feedback controlled and needs no adjustments
*2: Under the following conditions:
- Air conditioner switch: OFF
- Electric load: OFF (Lights & heater fan)
- Steering wheel: Kept in straight-ahead position

*3: Disconnect throttle position sensor

IGNITION COIL

Primary voltage	V	12
Primary resistance [at 20°C (68°F)]	Ω	Approximately 1.0
Secondary resistance [at 20°C (68°F)]	kΩ	Approximately 10

MASS AIR FLOW SENSOR

Supply voltage	V	Battery voltage (11 - 14)
Output voltage at idle	V	0.9 - 1.8*
Mass air flow (Using CONSULT or GST)	g·m/sec	0.9 - 5.8 at idle* 7.5 - 13.2 at 2,500 rpm*

*: Engine is warmed up to normal operating temperature and running under no-load.

ENGINE COOLANT TEMPERATURE SENSOR

Temperature °C (°F)	Resistance kΩ
20 (68)	2.1 - 2.9
50 (122)	0.68 - 1.00
90 (194)	0.236 - 0.260

EGR TEMPERATURE SENSOR

EGR temperature °C (°F)	Voltage V	Resistance MΩ
0 (32)	4.81	7.9 - 9.7
50 (122)	2.81	0.57 - 0.70
100 (212)	0.8	0.08 - 0.10

FRONT HEATED OXYGEN SENSOR HEATER

Resistance [at 25°C (77°F)]	Ω	2.3 - 4.3

FUEL PUMP

Resistance [at 25°C (77°F)]	Ω	0.2 - 5.0

IACV-AAC VALVE

Resistance [at 25°C (77°F)]	Ω	Approximately 10

INJECTOR

Resistance [at 25°C (77°F)]	Ω	10 - 14

RESISTOR

Resistance [at 25°C (77°F)]	kΩ	Approximately 2.2

THROTTLE POSITION SENSOR

Throttle valve conditions	Resistance kΩ [at 25°C (77°F)]
Completely closed	Approximately 0.5
Partially open	0.5 - 4.0
Completely open	Approximately 4.0

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

CALCULATED LOAD VALUE

	Calculated load value % (Using CONSULT or GST)
At idle	9.5 - 34.0%
At 2,500 rpm	13.9 - 24.9%

INTAKE AIR TEMPERATURE SENSOR

Temperature °C (°F)	Resistance kΩ
20 (68)	2.1 - 2.9
80 (176)	0.27 - 0.38

REAR HEATED OXYGEN SENSOR HEATER

Resistance [at 25°C (77°F)]	Ω	2.3 - 4.3

CRANKSHAFT POSITION SENSOR (OBD)

Resistance [at 20°C (68°F)]	Ω	166.5 - 203.5

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SECTION EL

When you read wiring diagrams:
- **Read GI section, "HOW TO READ WIRING DIAGRAMS".**

When you perform trouble diagnoses, read GI section, "HOW TO FOLLOW FLOW CHART IN TROUBLE DIAGNOSES" and "HOW TO PERFORM EFFICIENT DIAGNOSIS FOR AN ELECTRICAL INCIDENT".
- **Check for any service bulletins before servicing the vehicle.**

Supplemental Restraint System (SRS) "AIR BAG"

The Supplemental Restraint System "AIR BAG", used along with a seat belt, helps to reduce the risk or severity of injury to the driver and front passenger in a frontal collision. The Supplemental Restraint System consists of air bag modules (located in the center of the steering wheel and in the instrument panel on the passenger side), a diagnosis sensor unit, a crash zone sensor (4WD models), warning lamp, wiring harness and spiral cable.

The vehicle is equipped with a passenger air bag deactivation switch. Because no rear seat exists where a rear-facing child restraint can be placed, the switch is designed to turn off the passenger air bag so that a rear-facing child restraint can be used in the front passenger seat. The switch is located in the center of the instrument panel, near the ashtray. When the switch is turned to the ON position, the passenger air bag is enabled and could inflate in a frontal collision. When the switch is turned to the OFF position, the passenger air bag is disabled and will not inflate in a frontal collision. A passenger air bag OFF indicator on the instrument panel lights up when the passenger air bag is switched OFF. The driver air bag always remains enabled and is not affected by the passenger air bag deactivation switch.

Information necessary to service the system is included in the **RS section** of this Service Manual.

WARNING:

- **To avoid rendering the SRS inoperative, which could increase the risk of personal injury or death in the event of a collision which would result in air bag inflation, all maintenance should be performed by an authorized NISSAN dealer.**
- **Improper maintenance, including incorrect removal and installation of the SRS, can lead to personal injury caused by unintentional activation of the system.**
- **Do not use electrical test equipment on any circuit related to the SRS unless instructed to in this Service Manual. SRS wiring harnesses are covered with yellow insulation either just before the harness connectors or on the complete harness, for easy identification.**
- **The vehicle is equipped with a passenger air bag deactivation switch which can be operated by the customer. When the passenger air bag is switched OFF, the passenger air bag is disabled and will not inflate in a frontal collision. When the passenger air bag is switched ON, the passenger air bag is enabled and could inflate in a frontal collision. After SRS maintenance or repair, make sure the passenger air bag deactivation switch is in the same position (ON or OFF) as when the vehicle arrived for service.**

Description

HARNESS CONNECTOR

- All harness connectors have been modified to prevent accidental looseness or disconnection.
- The connector can be disconnected by pushing or lifting the locking section.

CAUTION:
Do not pull the harness when disconnecting the connector.

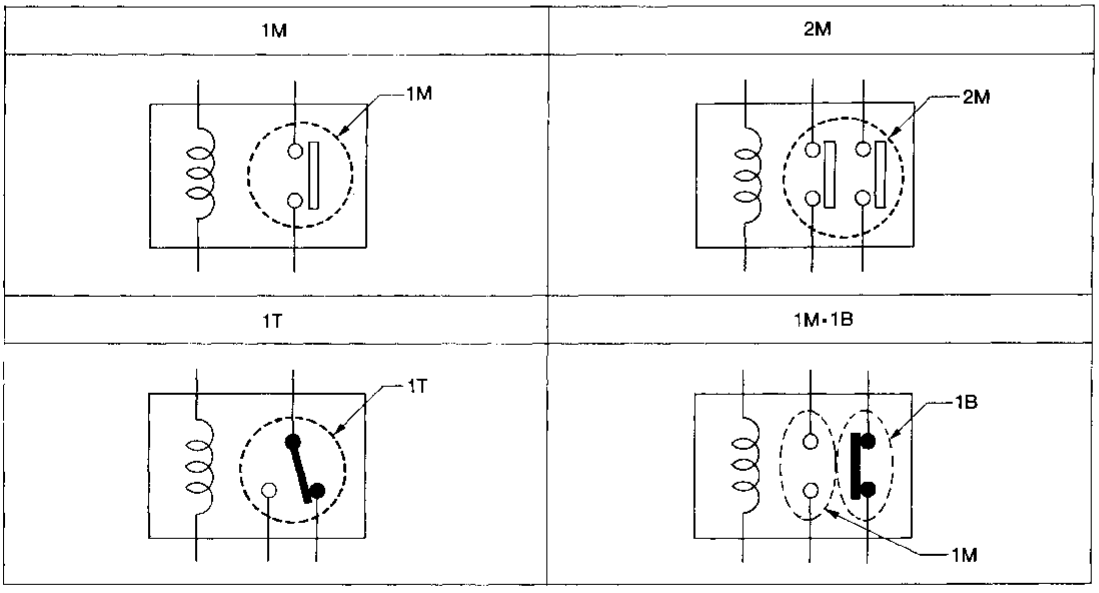
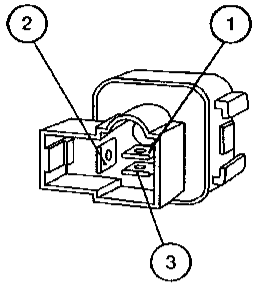
Description

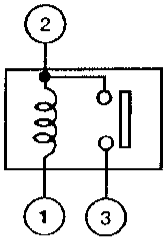
NORMAL OPEN, NORMAL CLOSED AND MIXED TYPE RELAYS

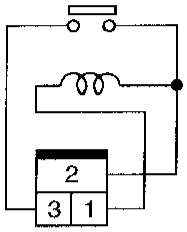


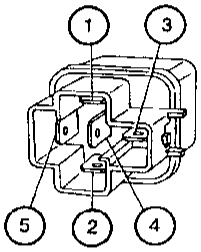
Relays can be divided into three main types: normal open, normal closed and mixed type relays.

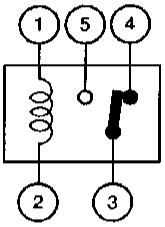
SEL881H

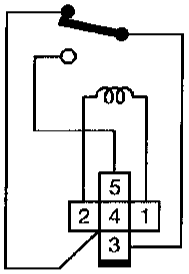


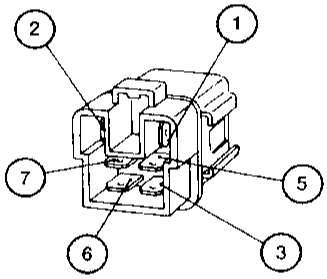


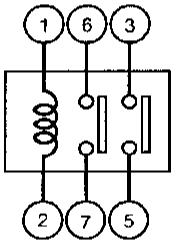


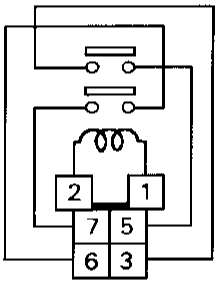


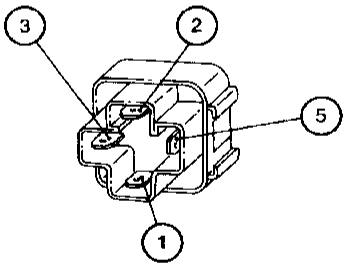


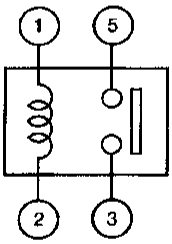


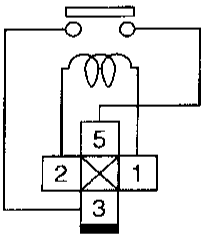










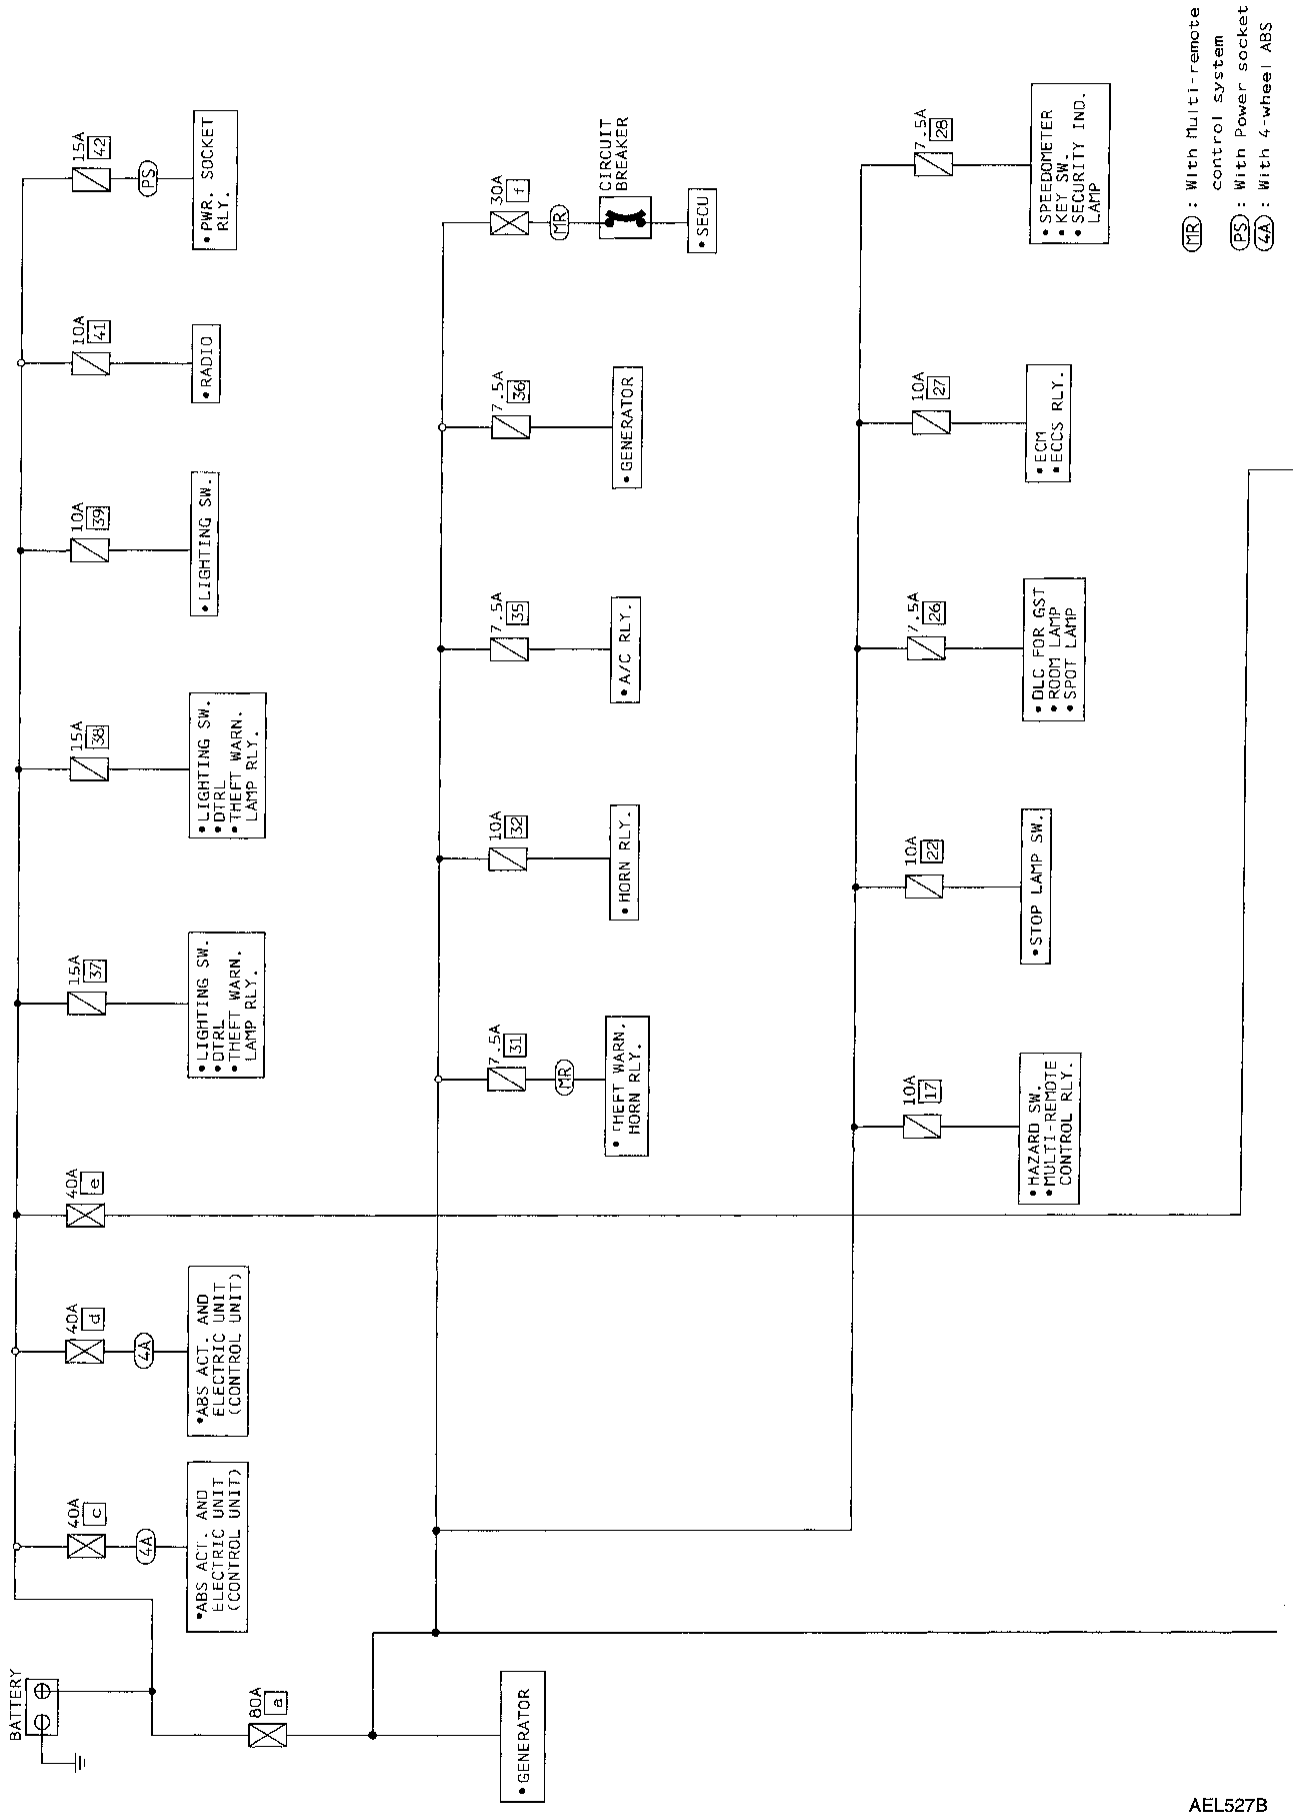


TYPES OF STANDARDIZED RELAYS

1M	1 Make	2M	2 Make
1T	1 Transfer	1M·1B	1 Make 1 Break

SEL882H

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Type	Outer view	Circuit	Connector symbol and connection	Case color
1M				BLACK
1T				BLACK
2M				BROWN
1M				BLUE

The arrangement of terminal numbers on the actual relays may differ from those shown above.

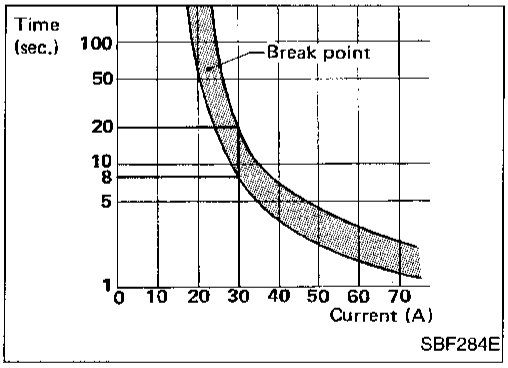
Fuse

a. **If fuse is blown, be sure to eliminate cause of problem before installing new fuse.**
b. **Use fuse of specified rating. Never use fuse of more than specified rating.**
c. **Do not partially install fuse; always insert it into fuse holder properly.**
d. **Remove fuse for "ELECTRICAL PARTS (BAT)" if vehicle is not used for a long period of time.**



Fusible Link

A melted fusible link can be detected either by visual inspection or by feeling with finger tip. If its condition is questionable, use circuit tester or test lamp.

CAUTION:

- **If fusible link should melt, it is possible that critical circuit (power supply or large current carrying circuit) is shorted. In such a case, carefully check and eliminate cause of problem.**
- **Never wrap outside of fusible link with vinyl tape. Important: Never let fusible link touch any other wiring harness, vinyl or rubber parts.**

Circuit Breaker Inspection

For example, when current is 30A, the circuit is broken within 8 to 20 seconds.

Circuit breakers are used in the following systems.

- Power window & power door lock
- Multi-remote control system
- Theft warning system
- Warning chime (with power door locks)
- Room lamp (with power door locks)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

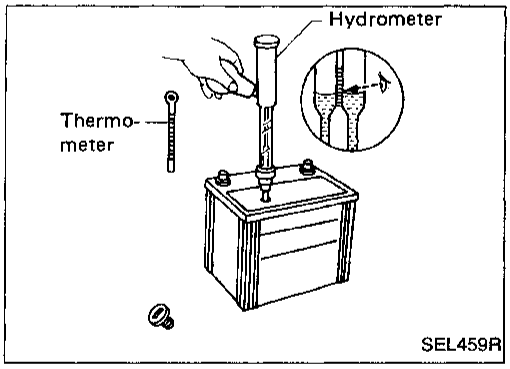
CAUTION:
If it becomes necessary to start the engine with a booster battery and jumper cables:
- **Use a 12-volt booster battery.**
- **After connecting battery cables, ensure that they are tightly clamped to battery terminals for good contact.**
- **Never add distilled water through the hole used to check specific gravity.**



How to Handle Battery

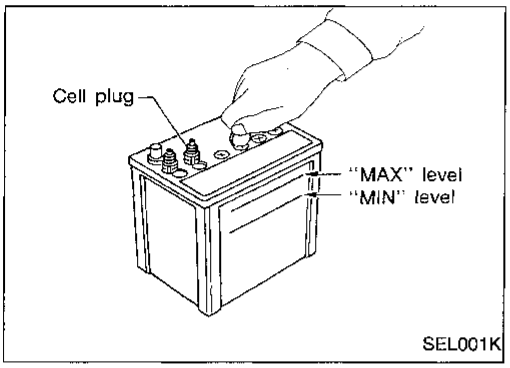
METHODS OF PREVENTING OVER-DISCHARGE

The following precautions must be taken to prevent over-discharging a battery.
- The battery surface (particularly its top) should always be kept clean and dry.
- The terminal connections should be clean and tight.
- At every routine maintenance, check the electrolyte level.

- When the vehicle is not going to be used over a long period of time, disconnect the negative battery terminal. (If the vehicle has an extended storage switch, turn it off.)

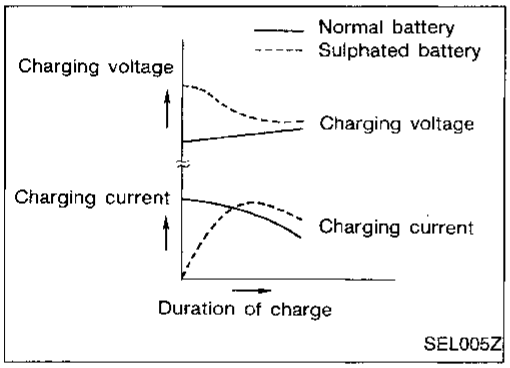
- Check the charge condition of the battery.
  Periodically check the specific gravity of the electrolyte. Keep a close check on charge condition to prevent overdischarge.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



How to Handle Battery (Cont'd)

CHECKING ELECTROLYTE LEVEL

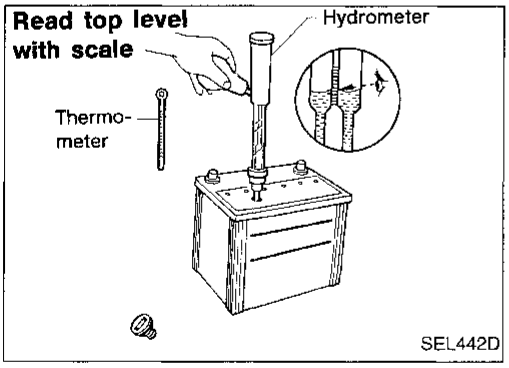


WARNING:

Do not allow battery fluid to come in contact with skin, eyes, fabrics, or painted surfaces. After touching a battery, do not touch or rub your eyes until you have thoroughly washed your hands. If the acid contacts the eyes, skin or clothing, immediately flush with water for 15 minutes and seek medical attention.

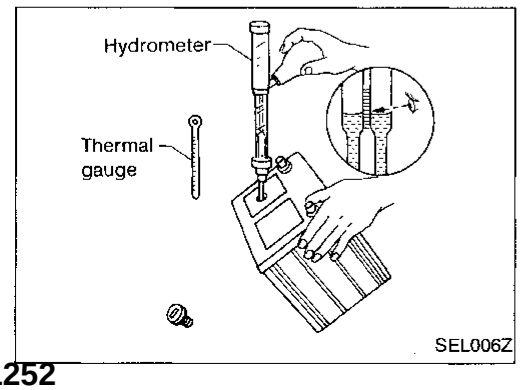
Normally the battery does not require additional water. However, when the battery is used under severe conditions, adding distilled water may be necessary during the battery life.

- Remove the cell plug using a suitable tool.
- Add distilled water up to the MAX level.



SULPHATION

A battery will be completely discharged if it is left unattended for a long time and the specific gravity becomes less than 1.100. This may result in sulphation on the cell plates.



To determine if a battery has been "sulphated", note its voltage and current when charging it. As shown in the figure, less current and higher voltage are observed in the initial stage of charging sulphated batteries.

A sulphated battery may sometimes be brought back into service by means of a long, slow charge, 12 hours or more, followed by a battery capacity test.

SPECIFIC GRAVITY CHECK

1. Read hydrometer and thermometer indications at eye level.

- When electrolyte level is too low, tilt battery case to raise it for easy measurement.

How to Handle Battery (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

2. Use the chart below to correct your hydrometer reading according to electrolyte temperature.

Hydrometer temperature correction

Battery electrolyte temperature °C (°F)	Add to specific gravity reading
71 (160)	0.032
66 (150)	0.028
60 (140)	0.024
54 (129)	0.020
49 (120)	0.016
43 (110)	0.012
38 (100)	0.008
32 (90)	0.004
27 (80)	0
21 (70)	−0.004
16 (60)	−0.008
10 (50)	−0.012
4 (39)	−0.016
−1 (30)	−0.020
−7 (20)	−0.024
−12 (10)	−0.028
−18 (0)	−0.032

Corrected specific gravity	Approximate charge condition
1.260 - 1.280	Fully charged
1.230 - 1.250	3/4 charged
1.200 - 1.220	1/2 charged
1.170 - 1.190	1/4 charged
1.140 - 1.160	Almost discharged
1.110 - 1.130	Completely discharged

How to Handle Battery (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

CHARGING THE BATTERY

CAUTION:

- **Do not "quick charge" a fully discharged battery.**
- **Keep the battery away from open flame while it is being charged.**
- **When connecting the charger, connect the leads first, then turn on the charger. Do not turn on the charger first, as this may cause a spark.**
- **If battery electrolyte temperature rises above 60°C (140°F), stop charging. Always charge battery at a temperature below 60°C (140°F).**

Charging rates

Amps	Time
50	1 hour
25	2 hours
10	5 hours
5	10 hours

Do not charge at more than 50 ampere rate.

Note: The ammeter reading on your battery charger will automatically decrease as the battery charges. This indicates that the voltage of the battery is increasing normally as the state of charge improves. The charging amps indicated above refer to initial charge rate.

- If, after charging, the specific gravity of any two cells varies more than .050, the battery should be replaced.
- After the battery is charged, always perform a capacity test to assure that the battery is serviceable.

Service Data and Specifications (SDS)

System Description

M/T MODELS

Power is supplied at all times:
- through 40A fusible link (letter [e], located in the fuse and fusible link box)
- to ignition switch terminal (B).

With the ignition switch in the START position, power is supplied:
- through terminal (ST) of the ignition switch
- to clutch interlock relay terminal (5).

For models with theft warning system

With the ignition switch in the ON or START position, power is supplied:
- through 7.5A fuse [No. [5], located in the fuse block (J/B)]
- to theft warning relay terminal (2).

With the ignition switch in the ON or START position, power is supplied:
- through 10A fuse [No. [11], located in the fuse block (J/B)]
- to clutch interlock relay terminal (2).

If the theft warning system is triggered, terminal (1) of the theft warning relay is grounded through terminal (32) of the smart entrance control unit and ground to the clutch interlock relay is interrupted.

When the theft warning system is not operating and clutch pedal is depressed, ground is supplied:
- from clutch interlock switch terminal (2)
- to theft warning relay terminal (3)
- through theft warning relay terminal (4)
- to clutch interlock relay terminal (1).

For models without theft warning system

With the ignition switch in the ON or START position, power is supplied:
- through 10A fuse [No. [11], located in the fuse block (J/B)]
- to clutch interlock relay terminal (2).

When the clutch pedal is depressed, ground is supplied:
- from clutch interlock switch terminal (2)
- to clutch interlock relay terminal (1).

Ground is supplied to clutch interlock switch terminal (1) through body grounds (M14) and (M68).

The clutch interlock relay is energized and power is supplied:
- from terminal (3) of the clutch interlock relay
- to terminal (2) of the starter motor windings.

The starter motor plunger closes and provides a closed circuit between the battery and the starter motor. The starter motor is grounded to the engine block. With power and ground supplied, cranking occurs and the engine starts.

System Description (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

A/T MODELS

Power is supplied at all times:
- through 40A fusible link (letter [e], located in the fuse and fusible link box)
- to ignition switch terminal (B).

With the ignition switch in the START position, power is supplied:
- through terminal (ST) of the ignition switch
- to inhibitor relay terminal (5).

For models with theft warning system

With the ignition switch in the ON or START position, power is supplied:
- through 7.5A fuse [No. [5], located in the fuse block (J/B)]
- to theft warning relay terminal (2).

With the ignition switch in the ON or START position, power is supplied:
- through 10A fuse [No. [11], located in the fuse block (J/B)]
- to inhibitor switch terminal (1).

With the selector lever in the "P" or "N" position, power is supplied:
- from inhibitor switch terminal (2)
- to inhibitor relay terminal (2).

If the theft warning system is triggered, terminal (1) of the theft warning relay is grounded through terminal (32) of the smart entrance control unit and ground to the inhibitor relay is interrupted.

When the theft warning system is not operating, ground is supplied:
- from theft warning relay terminal (3)
- through theft warning relay terminal (4)
- to inhibitor relay terminal (1).

For models without theft warning system

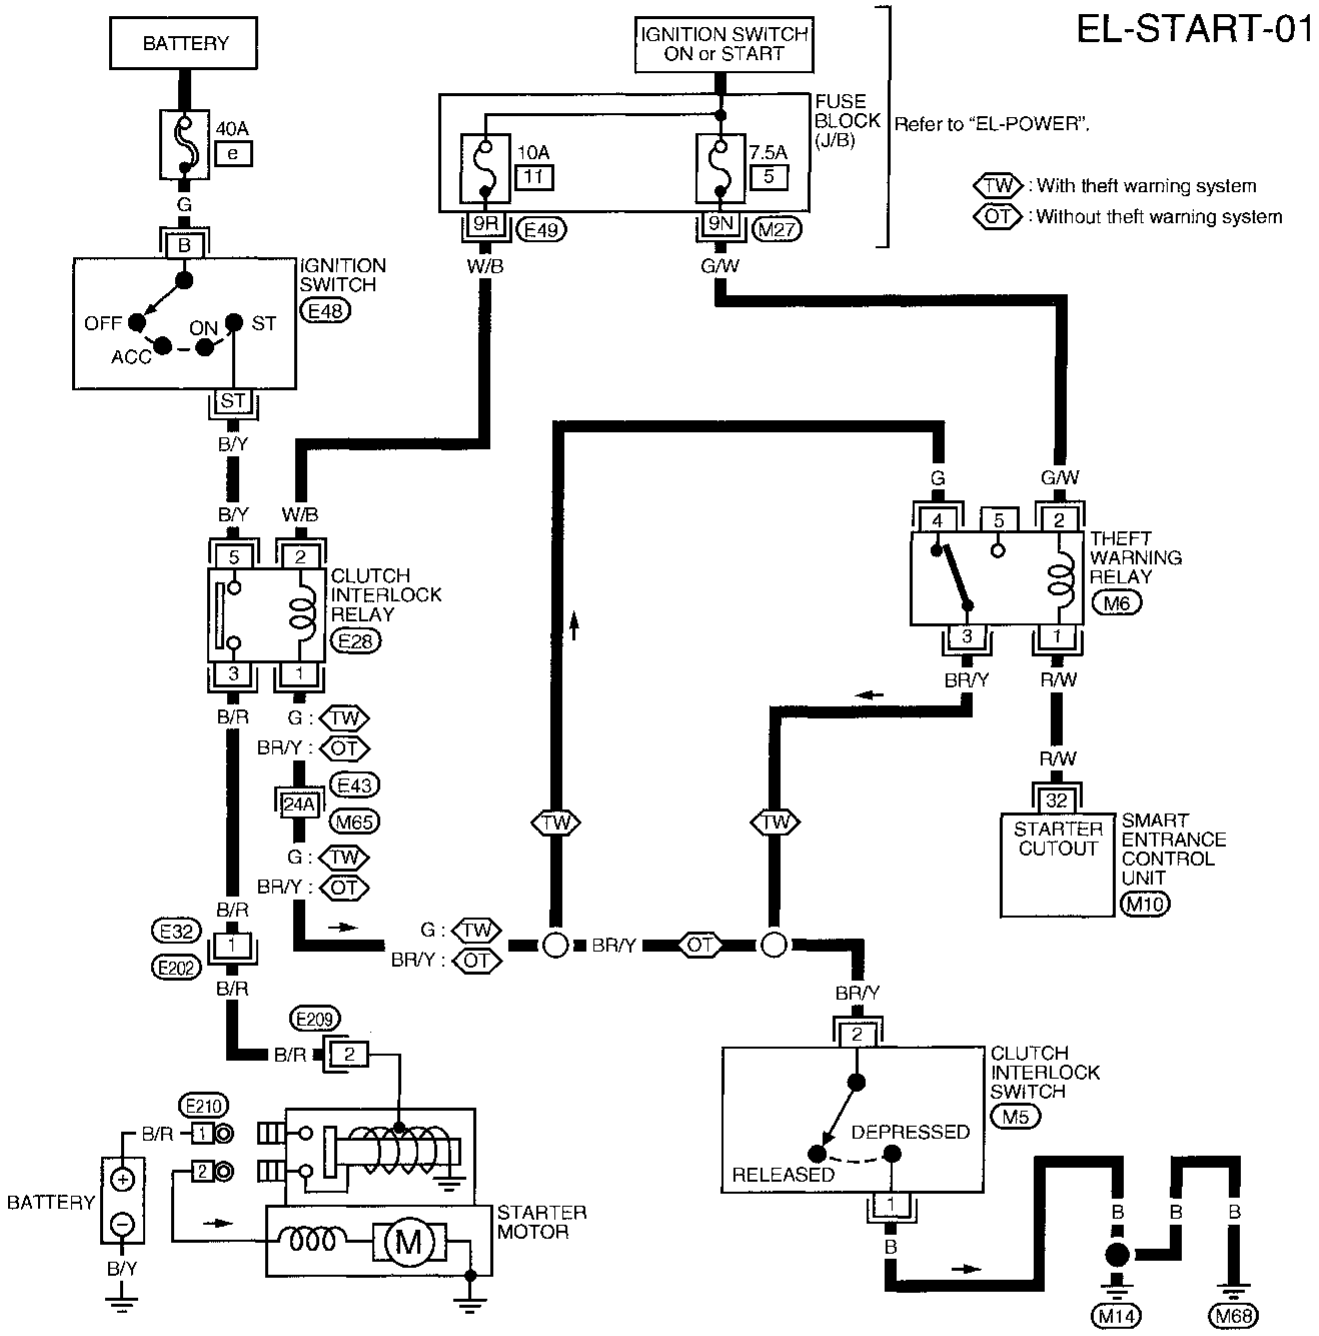
With the ignition switch in the ON or START position, power is supplied:
- through 10A fuse [No. [11], located in the fuse block (J/B)]
- to inhibitor switch terminal (1).

With the selector lever in the "P" or "N" position, power is supplied:
- from inhibitor switch terminal (2)
- to inhibitor relay terminal (2).

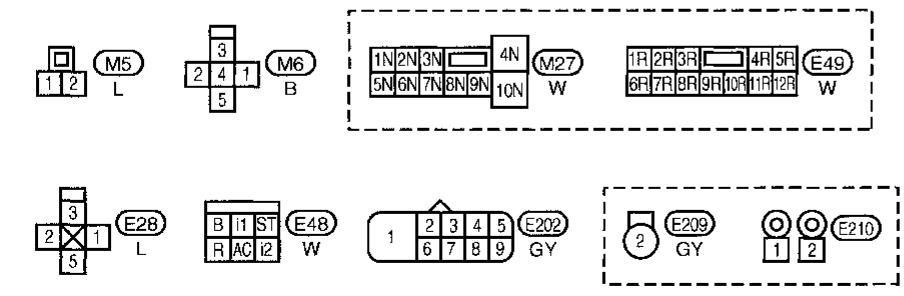
Ground is supplied to inhibitor relay terminal (1) through body grounds (E12) and (E54).

The inhibitor relay is energized and power is supplied:
- from terminal (3) of the inhibitor relay
- to terminal (2) of the starter motor windings.

The starter motor plunger closes and provides a closed circuit between the battery and the starter motor. The starter motor is grounded to the engine block. With power and ground supplied, cranking occurs and the engine starts.



THEFT WARNING SYSTEM



The theft warning system will interrupt ground to clutch interlock relay (M/T models) or inhibitor relay (A/T models) if the system is triggered. The starter motor will then not crank, and the engine will not start. Refer to "THEFT WARNING SYSTEM" (EL-177).

Removal and Installation

REMOVAL

1. Remove engine undercover.
2. Remove two bolts and starter.

INSTALLATION

To install, reverse the removal procedure.

Pinion/Clutch Check

1. Inspect pinion teeth.
- Replace pinion if teeth are worn or damaged. (Also check condition of ring gear teeth.)
2. Inspect reduction gear teeth.
- Replace reduction gear if teeth are worn or damaged. (Also check condition of armature shaft gear teeth.)
3. Check to see if pinion locks in one direction and rotates smoothly in the opposite direction.
- If it locks or rotates in both directions, or unusual resistance is evident, replace.

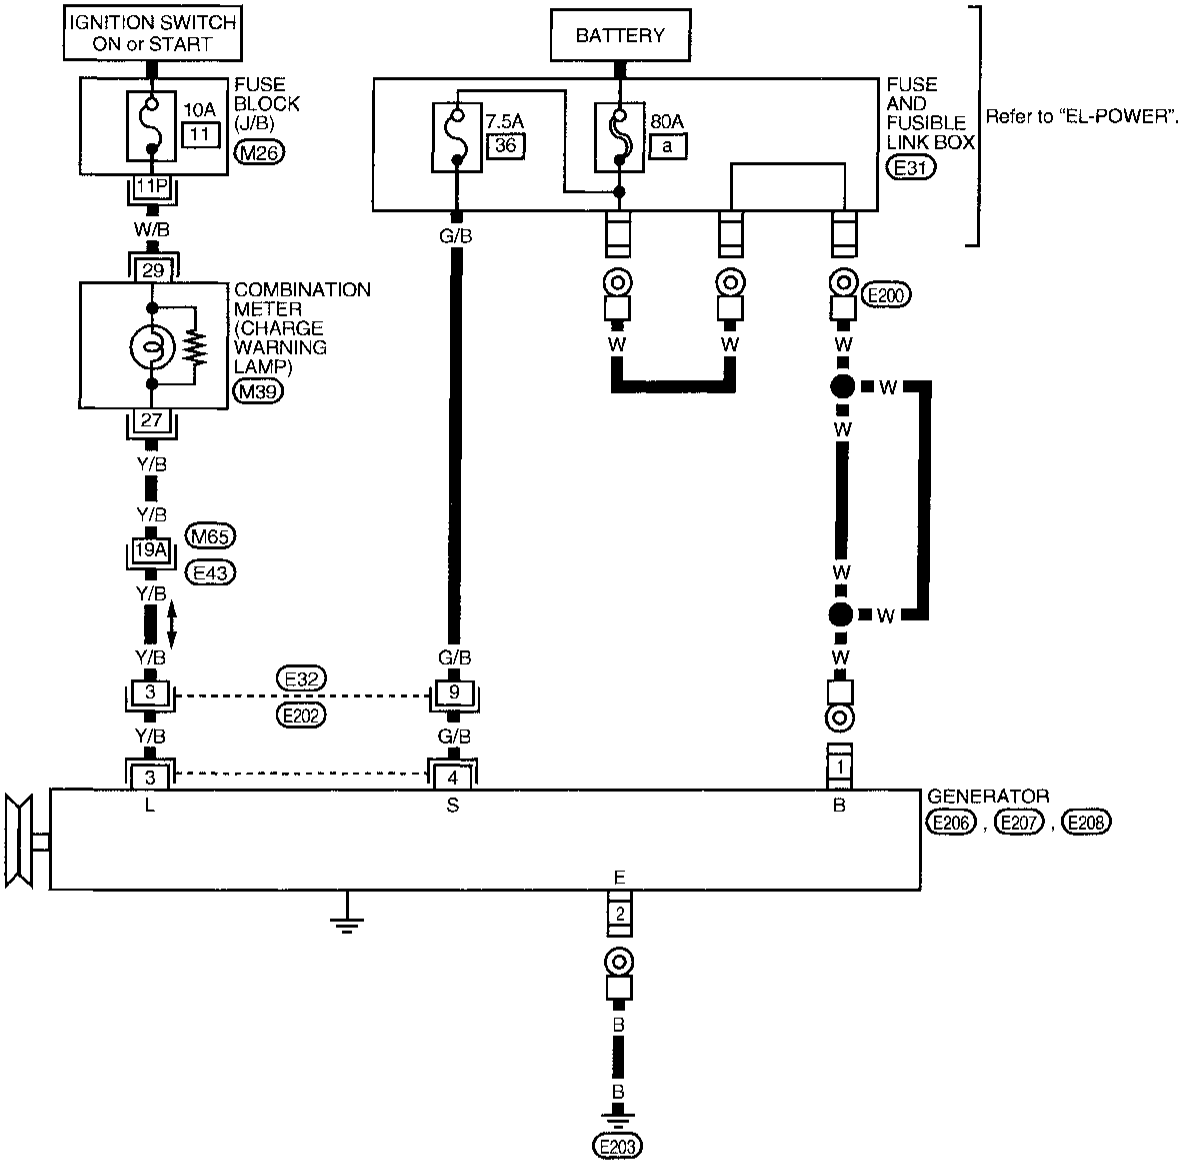
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

System Description

The generator provides DC voltage to operate the vehicle's electrical system and to keep the battery charged. The voltage output is controlled by the IC regulator.
Power is supplied at all times to generator terminal ④ through:

- 80A fusible link (letter [a], located in the fuse and fusible link box), and
- 7.5A fuse (No. [36], located in the fuse and fusible link box).

Terminal ① supplies power to charge the battery and operate the vehicle's electrical system. Output voltage is controlled by the IC regulator at terminal ④ detecting the input voltage. The charging circuit is protected by the 80A fusible link.
Terminal ② of the generator supplies ground through body ground (E203) .
With the ignition switch in the ON or START position, power is supplied:



- through 10A fuse [No. [11], located in the fuse block (J/B)]
- to combination meter terminal ㉙ for the charge warning lamp.

Ground is supplied to terminal ㉗ of the combination meter through terminal ③ of the generator. With power and ground supplied, the charge warning lamp will illuminate. When the generator is providing sufficient voltage with the engine running, the ground is opened and the charge warning lamp will not illuminate.
If the charge warning lamp illuminates with the engine running, a fault is indicated.

Trouble Diagnoses

Before conducting a generator test, make sure that the battery is fully charged. A 30-volt voltmeter and suitable test probes are necessary for the test. The generator can be checked easily by referring to the Inspection Table.

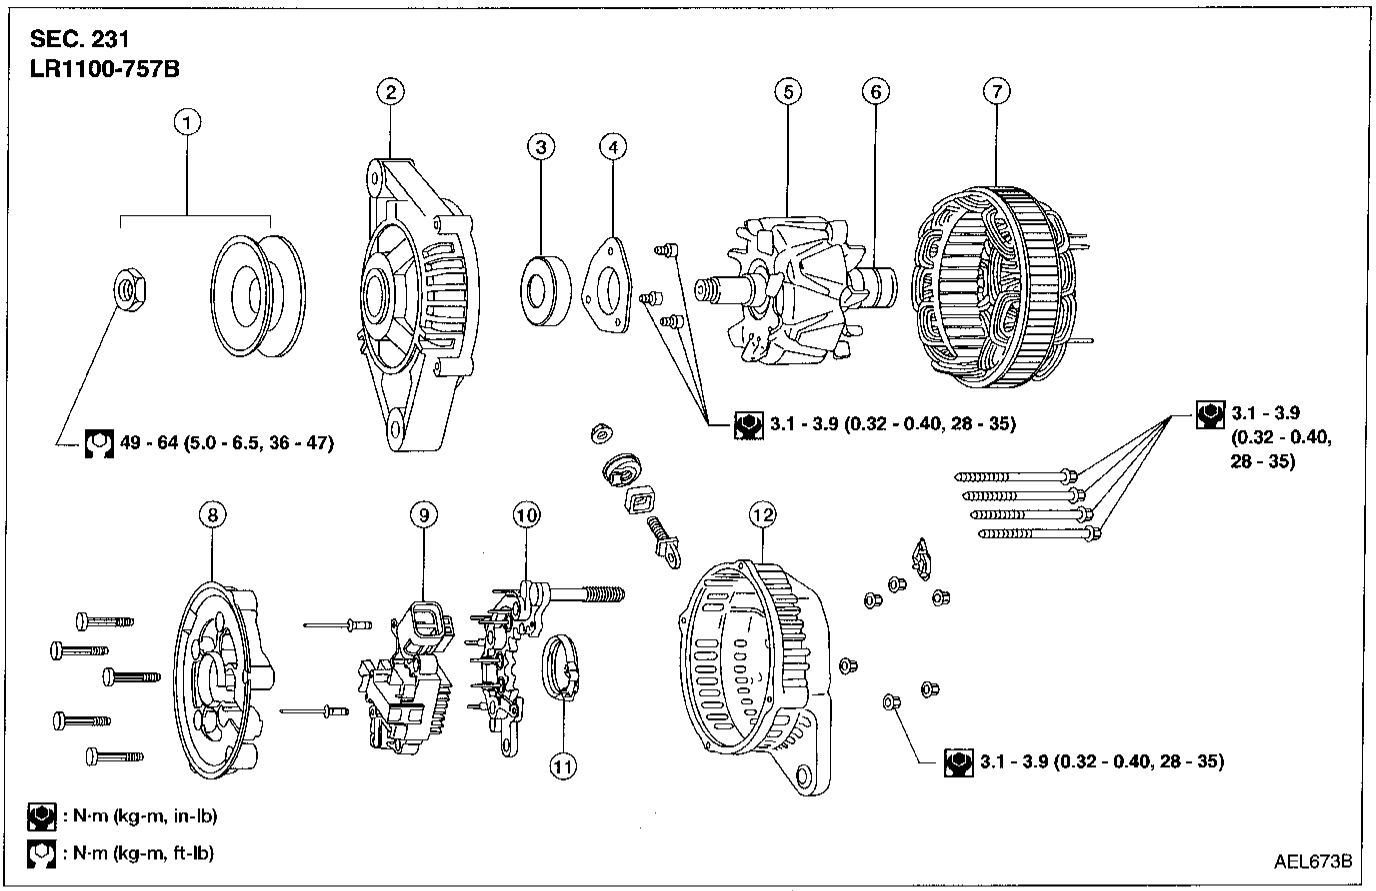
- **Before starting, inspect the fusible link.**
- **Use fully charged battery.**

WITH IC REGULATOR

Warning lamp: "CHARGE" warning lamp in combination meter

Note:

★: When field circuit is open, check condition of rotor coil, rotor slip ring and brush. If necessary, replace faulty parts with new ones.



MALFUNCTION INDICATOR

The IC regulator warning function activates to illuminate "CHARGE" warning lamp, if any of the following symptoms occur while generator is operating:

- Excessive voltage is produced.
- No voltage is produced.

Check

AEL603B

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

System Description (For USA)

The headlamps are controlled by the lighting switch which is built into the combination switch.
Power is supplied at all times:

- to lighting switch terminal ⑤
- through 15A fuse (No. 37, located in the fuse and fusible link box), and
- to lighting switch terminal ⑧
- through 15A fuse (No. 38, located in the fuse and fusible link box).

Low beam operation

When the lighting switch is turned to headlamp "ON" (2ND) position, "LOW BEAM" (B), power is supplied:

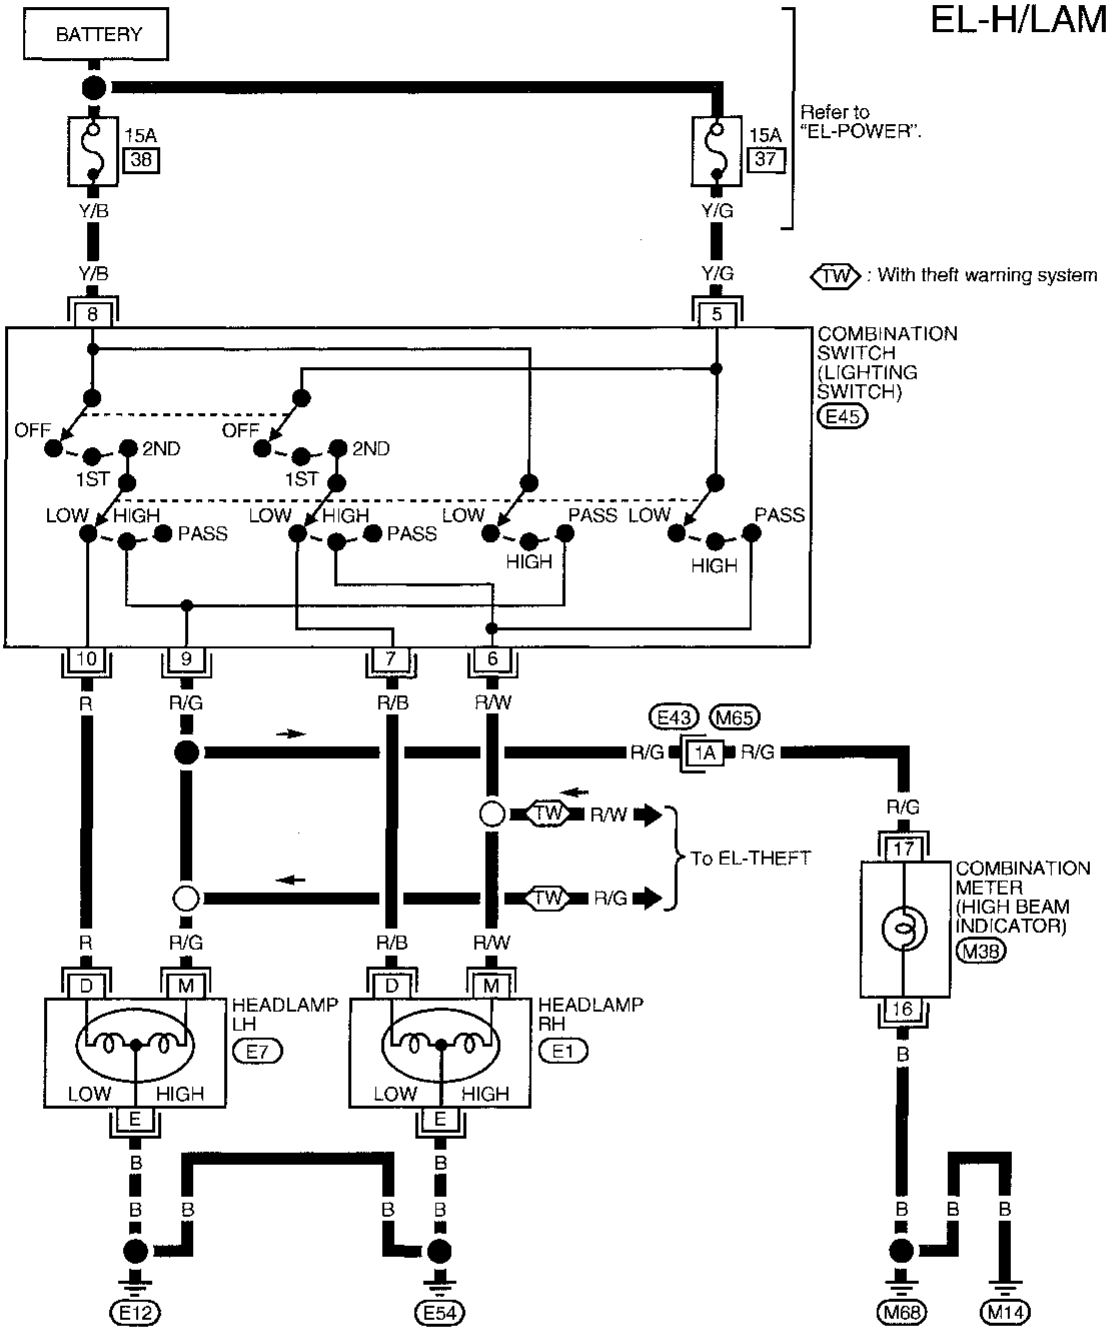
- from lighting switch terminal ⑩
- to terminal Ⓓ of the LH headlamp, and
- from lighting switch terminal ⑦
- to terminal Ⓓ of the RH headlamp.

Terminal Ⓔ of each headlamp supplies ground through body grounds E12 and E54.
With power and ground supplied, the headlamp(s) will illuminate.

High beam operation/flash-to-pass operation

When the lighting switch is turned to headlamp "ON" (2ND) position, "HIGH BEAM" (A) or "FLASH TO PASS" (C) position, power is supplied:

- from lighting switch terminal ⑥
- to terminal Ⓜ of RH headlamp, and
- from lighting switch terminal ⑨
- to terminal Ⓜ of LH headlamp, and
- to combination meter terminal ⑰ for the high beam indicator.



Ground is supplied to terminal ⑯ of the combination meter through body grounds M14 and M68.
Terminal Ⓔ of each headlamp supplies ground through body grounds E12 and E54.
With power and ground supplied, the high beams and the high beam indicator illuminate.

Theft warning system

The theft warning system will flash the high beams if the system is triggered. Refer to "THEFT WARNING SYSTEM" (EL-177).

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Bulb Replacement

The headlamp is a semi-sealed beam type which uses a replaceable halogen bulb. The bulb can be replaced from the engine compartment side without removing the headlamp body.

- **Grasp only the plastic base when handling the bulb. Never touch the glass envelope.**

1. Disconnect the battery cable.
2. Disconnect the harness connector from the back side of the bulb.
3. Unclip the bulb retaining clip, and then remove it.
4. Remove the headlamp bulb carefully. Do not shake or rotate the bulb when removing it.
5. Install in the reverse order of removal.

CAUTION:

- **Do not leave headlamp reflector without bulb for a long period of time. Dust, moisture, smoke, etc. entering headlamp body may affect the performance of the headlamp. Remove headlamp bulb from the headlamp reflector just before a replacement bulb is installed.**

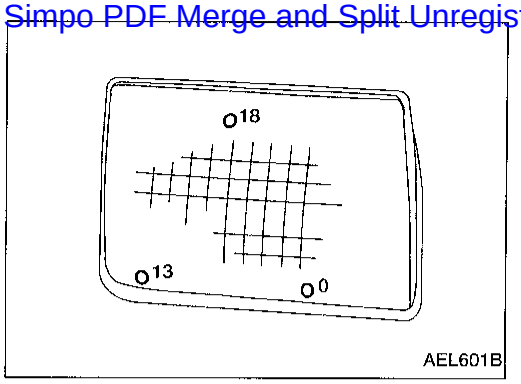
Aiming Adjustment

When performing headlamp aiming adjustment, use an aiming machine, aiming wall screen or headlamp tester. Aimers should be in good repair, calibrated and operated in accordance with respective operation manuals.
If any aimer is not available, aiming adjustment can be done as follows:

For details, refer to the regulations in your own country.

a. **Keep all tires inflated to correct pressures.**
b. **Place vehicle and tester on one and same flat surface.**
c. **See that there is no-load in vehicle (coolant, engine oil filled up to correct level and full fuel tank) other than the driver (or equivalent weight placed in driver's position).**

Aiming Adjustment (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

System Description (For Canada)

The headlamp system for Canada vehicles contains a daytime light control unit that activates the high beam headlamps at approximately half illumination whenever the engine is running. If the parking brake is applied before the engine is started the daytime lights will not be illuminated. The daytime lights will illuminate once the parking brake is released. Thereafter, the daytime lights will continue to operate when the parking brake is applied. If the daytime light control unit receives a ground signal from the generator, the daytime lights will not be illuminated. The daytime lights will illuminate once a battery positive voltage signal is sent to the daytime light control unit from the generator.

Power is supplied at all times:
- through 15A fuse (No. 38, located in the fuse and fusible link box)
- to daytime light control unit terminal ③ and
- to lighting switch terminal ⑧.

Power is also supplied at all times:
- through 15A fuse (No. 37, located in the fuse and fusible link box)
- to daytime light control unit terminal ② and
- to lighting switch terminal ⑤.

With the ignition switch in the ON or START position, power is supplied:
- through 7.5A fuse [No. 5, located in the fuse block (J/B)]
- to daytime light control unit terminal ⑫.

With the ignition switch in the START position, power is supplied:
- through 7.5A fuse [No. 7, located in the fuse block (J/B)]
- to daytime light control unit terminal ①.

Ground is supplied to daytime light control unit terminal ⑨ through body grounds E12 and E54.

HEADLAMP OPERATION

Low beam operation

When the lighting switch is turned to headlamp "ON" (2ND) position, "LOW BEAM" (B), power is supplied:
- from lighting switch terminal ⑦
- to RH headlamp terminal Ⓓ
- to daytime light control unit terminal ④.

Ground is supplied to RH headlamp terminal Ⓔ through body grounds E12 and E54.

Also, when the lighting switch is turned to headlamp "ON" (2ND) position, "LOW BEAM" (B), power is supplied:
- from lighting switch terminal ⑩
- to LH headlamp terminal Ⓓ.

Ground is supplied:
- to LH headlamp terminal Ⓔ
- from daytime light control unit terminal ⑦
- through daytime light control unit terminal ⑨
- through body grounds E12 and E54.

With power and ground supplied, the low beam headlamps illuminate.

High beam operation/flash-to-pass operation

When the lighting switch is turned to headlamp "ON" (2ND) position, "HIGH BEAM" (A) or "FLASH TO PASS" (C) position, power is supplied:
- from lighting switch terminal ⑥
- to terminal Ⓜ of RH headlamp.

When the lighting switch is turned to headlamp "ON" (2ND) position, "HIGH BEAM" (A) or "FLASH TO PASS" (C) position, power is supplied:
- from lighting switch terminal ⑨
- to daytime light control terminal ⑤
- to combination meter terminal ⑰ for the high beam indicator
- through daytime light control terminal ⑥
- to terminal Ⓜ of LH headlamp.

Ground is supplied in the same manner as low beam operation.

Ground is supplied to terminal ⑯ of the combination meter through body grounds M14 and M68.

With power and ground supplied, the high beam headlamps and HI BEAM indicator illuminate.

System Description (For Canada) (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

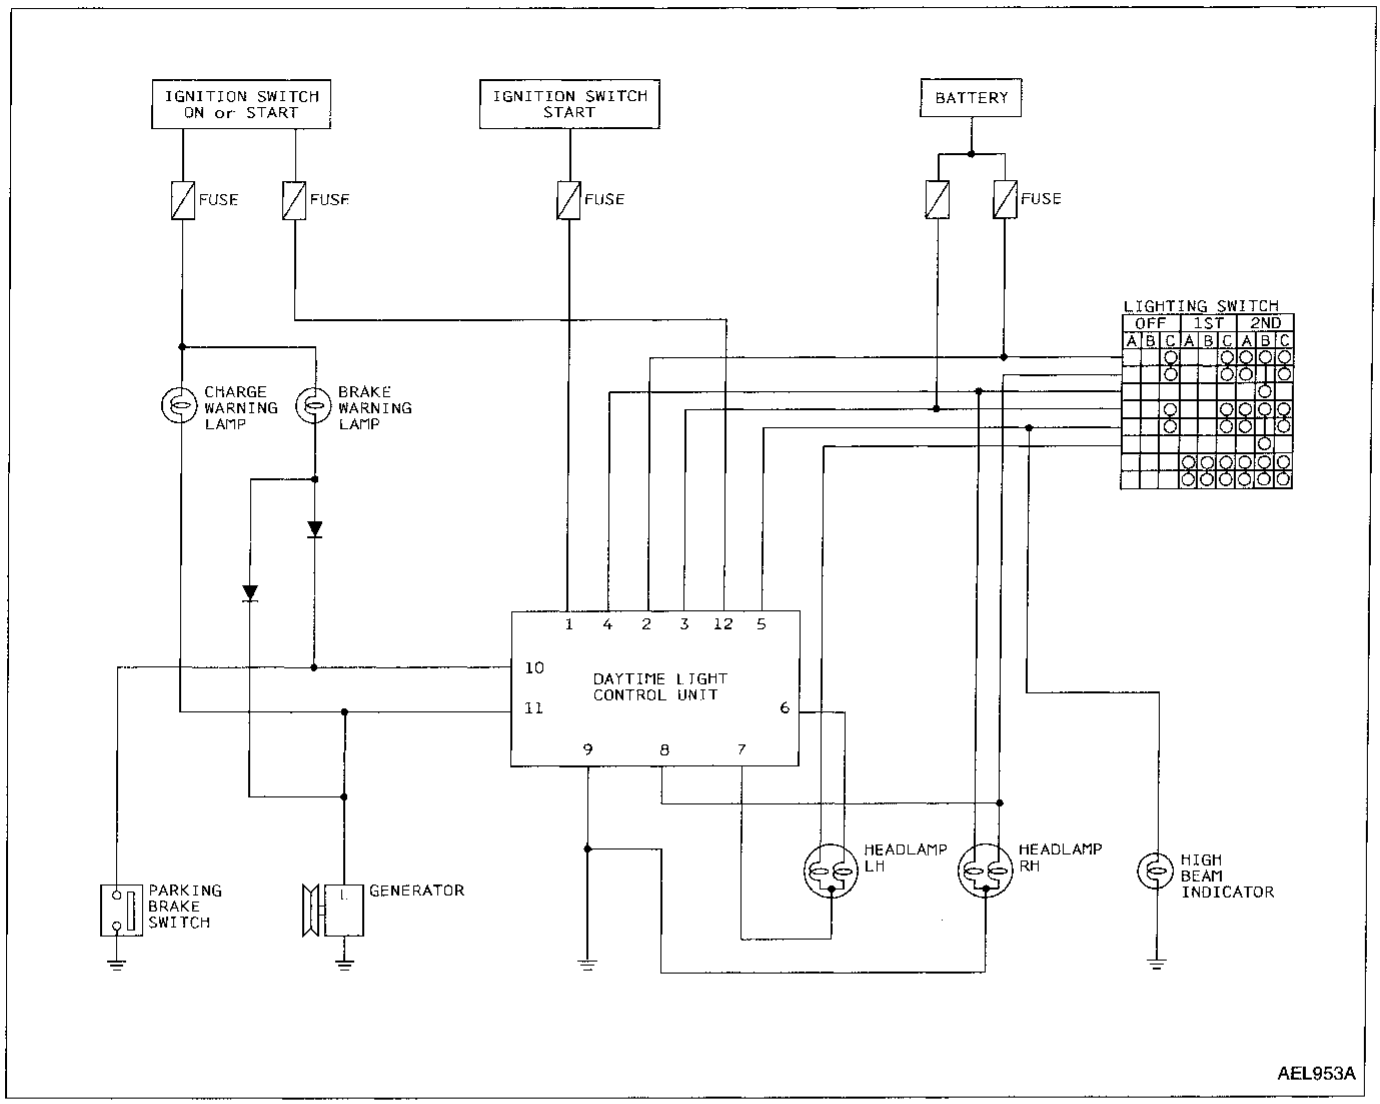
DAYTIME LIGHT OPERATION

With the engine running, the lighting switch in the "OFF" or parking lamp (1ST) position and parking brake released, power is supplied:

- to daytime light control unit terminal ③
- through daytime light control unit terminal ⑥
- to terminal Ⓜ of LH headlamp
- through terminal Ⓔ of LH headlamp
- to daytime light control unit terminal ⑦
- through daytime light control unit terminal ⑧
- to terminal Ⓜ of RH headlamp.

Ground is supplied to terminal Ⓔ of RH headlamp through body grounds (E12) and (E54).
Because the high beam headlamps are now wired in series, they operate at half illumination.

Operation (For Canada)



After starting the engine with the lighting switch in the "OFF" or parking lamp (1ST) position, the headlamp high beam automatically turns on. Lighting switch operations other than the above are the same as conventional light systems.

Engine		With engine stopped									With engine running								
Lighting switch		OFF			1ST			2ND			OFF			1ST			2ND		
		A	B	C	A	B	C	A	B	C	A	B	C	A	B	C	A	B	C
Headlamp	High beam	X	X	○	X	X	○	○	X	○	△*	△*	○	△*	△*	○	○	X	○
	Low beam	X	X	X	X	X	X	X	○	X	X	X	X	X	X	X	X	○	X
Parking and tail lamp		X	X	X	○	○	○	○	○	○	X	X	X	○	○	○	○	○	○
License and instrument illumination lamp		X	X	X	○	○	○	○	○	○	X	X	X	○	○	○	○	○	○

A : "HIGH BEAM" position
B : "LOW BEAM" position
C : "FLASH TO PASS" position
○ : Lamp "ON"
X : Lamp "OFF"
△ : Lamp dims.
□ : Added functions
*: When starting the engine with the parking brake released, the daytime light will come ON.
When starting the engine with the parking brake pulled, the daytime light won't come ON.

System Description

TURN SIGNAL OPERATION

With the hazard switch in the OFF position and the ignition switch in the ON or START position, power is supplied:

- through 7.5A fuse [No. 2, located in the fuse block (J/B)]
- to hazard switch terminal ②
- through terminal ① of the hazard switch
- to combination flasher unit terminal Ⓑ
- through terminal Ⓛ of the combination flasher unit
- to turn signal switch terminal ①.

Ground is supplied to combination flasher unit terminal Ⓔ through body grounds M14 and M68.

LH turn

When the turn signal switch is moved to the LH position, power is supplied from turn signal switch terminal ③ to:

- front combination lamp LH terminal ①
- combination meter terminal ㉔
- rear combination lamp LH terminal ②.

Ground is supplied to the front combination lamp LH terminal ② through body grounds E12 and E54.
Ground is supplied to the rear combination lamp LH terminal ① through body grounds M14 and M68.
Ground is supplied to combination meter terminal ㉝ through body grounds M14 and M68.
With power and ground supplied, the combination flasher unit controls the flashing of the LH combination lamps.

RH turn

When the turn signal switch is moved to the RH position, power is supplied from turn signal switch terminal ② to:

- front combination lamp RH terminal ①
- combination meter terminal ㊵
- rear combination lamp RH terminal ②.

Ground is supplied to the front combination lamp RH terminal ② through body grounds E12 and E54.
Ground is supplied to the rear combination lamp RH terminal ① through body grounds M14 and M68.
Ground is supplied to combination meter terminal ㉝ through body grounds M14 and M68.
With power and ground supplied, the combination flasher unit controls the flashing of the RH combination lamps.

HAZARD LAMP OPERATION

Power is supplied at all times to hazard switch terminal ③ through:

- 10A fuse [No. 17, located in the fuse block (J/B)].

With the hazard switch in the ON position, power is supplied:

- through terminal ① of the hazard switch
- to combination flasher unit terminal Ⓑ
- through terminal Ⓛ of the combination flasher unit
- to hazard switch terminal ④.

Ground is supplied to combination flasher unit terminal Ⓔ through body grounds M14 and M68.
Power is supplied through terminal ⑤ of the hazard switch to:

- front combination lamp LH terminal ①
- combination meter terminal ㉔
- rear combination lamp LH terminal ②.

Power is supplied through terminal ⑥ of the hazard switch to:

- front combination lamp RH terminal ①
- combination meter terminal ㊵
- rear combination lamp RH terminal ②.

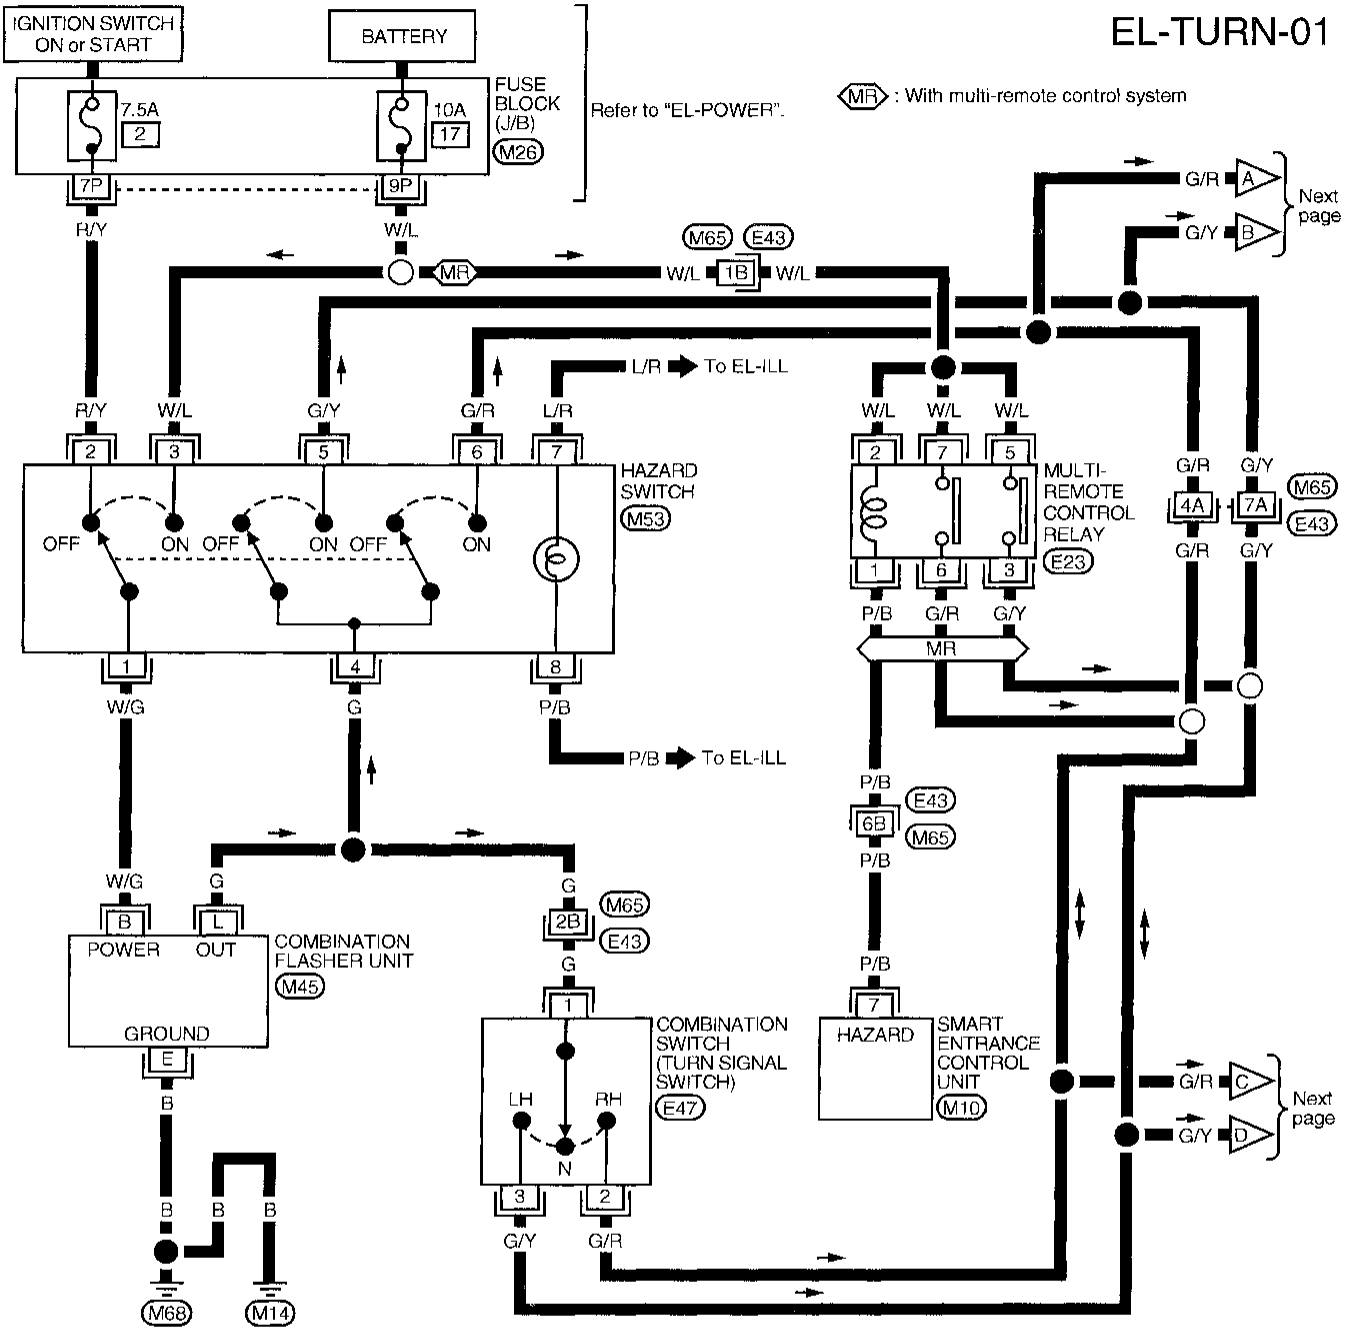
Ground is supplied to terminal ② of each front combination lamp through body grounds E12 and E54.
Ground is supplied to terminal ① of each rear combination lamp through body grounds M14 and M68.
Ground is supplied to combination meter terminal ㉝ through body grounds M14 and M68.
With power and ground supplied, the combination flasher unit controls the flashing of the hazard warning lamps.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

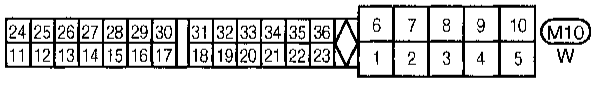
WITH MULTI-REMOTE CONTROL SYSTEM

Power is supplied at all times:
- through 10A fuse [No. 17, located in the fuse block (J/B)]
- to multi-remote control relay terminals ②, ⑤ and ⑦.

Ground is supplied to multi-remote control relay terminal ①, when the multi-remote control system is triggered through the smart entrance control unit.
Refer to "MULTI-REMOTE CONTROL SYSTEM" (EL-162).
When multi-remote control relay is energized.
Power is supplied through terminal ③ of the multi-remote control relay:
- to front combinaton lamp LH terminal ①
- to combination meter terminal ㉔
- to rear combination lamp LH terminal ②.



Power is supplied through terminal ⑥ of the multi-remote control relay:
- to front combination lamp RH terminal ①
- to combination meter terminal ㊵
- to rear combination lamp RH terminal ②.



Ground is supplied to terminal ② of each front combination lamp through body grounds E12 and E54.
Ground is supplied to terminal ① of each rear combination lamp through body grounds M14 and M68.
Ground is supplied to combination meter terminal ㉝ through body grounds M14 and M68.
With power and ground supplied, the smart entrance control unit controls the flashing of the hazard warning lamps.

Trouble Diagnoses

Symptom	Possible cause	Repair order
Turn signal and hazard warning lamps do not operate.	1. Hazard switch 2. Combination flasher unit 3. Open in combination flasher unit circuit	1. Check hazard switch. 2. Refer to combination flasher unit check. 3. Check wiring to combination flasher unit for open circuit.
Turn signal lamps do not operate but hazard warning lamps operate.	1. 7.5A fuse 2. Hazard switch 3. Turn signal switch 4. Open in turn signal switch circuit	1. Check 7.5A fuse [No. 2, located in fuse block (J/B)]. Turn ignition switch ON and verify battery positive voltage is present at terminal ② of hazard switch. 2. Check hazard switch. 3. Check turn signal switch. 4. Check G wire between combination flasher unit and turn signal switch for open circuit.
Hazard warning lamps do not operate but turn signal lamps operate.	1. 10A fuse 2. Hazard switch 3. Open in hazard switch circuit	1. Check 10A fuse [No. 17, located in fuse block (J/B)]. Verify battery positive voltage is present at terminal ③ of hazard switch. 2. Check hazard switch. 3. Check G wire between combination flasher unit and hazard switch for open circuit.
Front turn signal lamp LH or RH does not operate.	1. Bulb 2. Grounds E12 and E54	1. Check bulb. 2. Check grounds E12 and E54.
Rear turn signal lamp LH or RH does not operate.	1. Bulb 2. Grounds M14 and M68	1. Check bulb. 2. Check grounds M14 and M68.
LH and RH turn indicators do not operate.	1. Ground	1. Check grounds M14 and M68.
LH or RH turn indicator does not operate.	1. Bulb	1. Check bulb in combination meter.

Electrical Components Inspection

COMBINATION FLASHER UNIT CHECK

- Before checking, ensure that bulbs meet specifications.
- Connect a battery and test lamp to the combination flasher unit, as shown. Combination flasher unit is properly functioning if it blinks when power is supplied to the circuit.

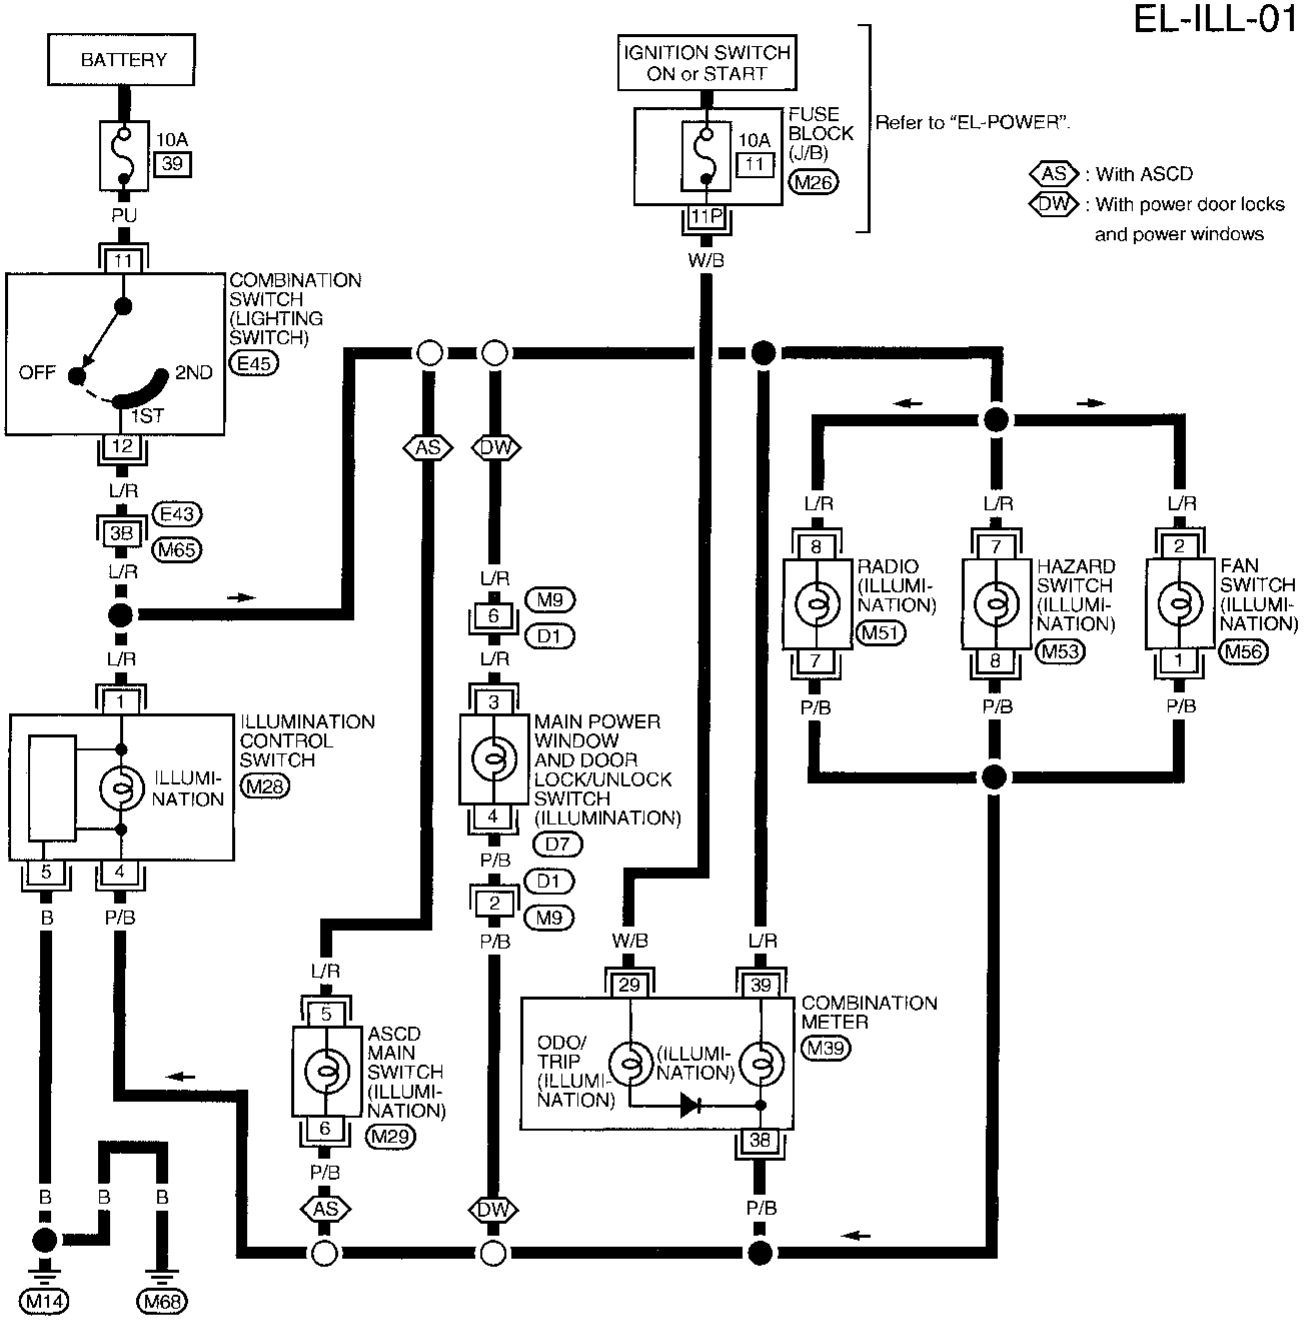
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

System Description

Power is supplied at all times:
- through 10A fuse (No. 39, located in the fuse and fusible link box)
- to lighting switch terminal ⑪.

With the ignition switch in the ON or START position, power is supplied:
- through 10A fuse [No. 11, located in the fuse block (J/B)]
- to combination meter terminal ㉙.

The lighting switch must be in parking lamp (1ST) or headlamp "ON" (2ND) position for illumination.
The illumination control switch controls the amount of current to the illumination system. As the amount of current increases, the illumination becomes brighter.
The following chart shows the power and ground connector terminals for the components included in the illumination system.



Component	Connector No.	Power terminal	Ground terminal
Illumination control switch	M28	①	⑤
ASCD main switch	M29	⑤	⑥
Main power window and door lock/unlock switch	D7	③	④
Combination meter	M39	㉙, ㊴	㊳
Radio	M51	⑧	⑦
Hazard switch	M53	⑦	⑧
Fan switch	M56	②	①

The ground for all of the components is controlled through terminal ④ of the illumination control switch and body grounds (M14) and (M68).

System Description

MODELS WITH POWER DOOR LOCKS

Power supply and ground

Power is supplied at all times:
- through 30A fusible link (Letter f, located in the fuse and fusible link box)
- to circuit breaker terminal ①
- through circuit breaker terminal ②
- to smart entrance control unit terminal ①.

Power is supplied at all times:
- through 7.5A fuse [No. 28, located in the fuse block (J/B)]
- to key switch terminal ①.

Power is supplied at all times:
- through 7.5A fuse [No. 26, located in the fuse block (J/B)]
- to room lamp terminal ⊕.

When the key is inserted into ignition key cylinder, power is supplied:
- from key switch terminal ②
- to smart entrance control unit terminal ㉔.

With the ignition switch in the ON or START position, power is supplied:
- through 7.5A fuse [No. 5, located in the fuse block (J/B)]
- to smart entrance control unit terminal ⑪.

Ground is supplied:
- through body grounds M14 and M68
- to smart entrance control unit terminal ⑩.

When the LH door is opened, ground is supplied:
- from door switch LH terminal ②
- to smart entrance control unit terminal ⑮.

When the RH door is opened, ground is supplied:
- from door switch RH terminal ①
- to smart entrance control unit terminal ㉟.

When the LH door is unlocked, the smart entrance control unit receives a ground signal:
- through body grounds M14 and M68
- to door unlock sensor terminal ④
- from door unlock sensor terminal ②
- to smart entrance control unit terminal ⑫.

When a signal, or combination of signals is received by the smart entrance control unit, ground is supplied:
- through smart entrance control unit terminal ⑨
- to room lamp terminal ㊞.

With power and ground supplied, the interior room lamp illuminates.

Switch operation

When the room lamp switch is ON, ground is supplied:
- through body grounds M14 and M68
- to room lamp terminal ⊖.

With power and ground supplied, the room lamp turns ON and remains ON until the room lamp switch is turned to OFF or turned to the "DOOR" postion and the doors are closed.

Interior room lamp timer operation

When the room lamp switch is in the "DOOR" position, the smart entrance control unit keeps the interior room lamp illuminated for about 30 seconds when:
- LH door is unlocked
- key is removed from ignition key cylinder while driver's door is closed
- driver's door is opened and then closed while ignition switch is not in the ON position.

The timer is canceled, and interior room lamp turns off when:
- driver's door is locked with remote controller, or
- ignition switch is turned ON.

The smart entrance control unit will shut off the room light if left on for 30 minutes.

System Description (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

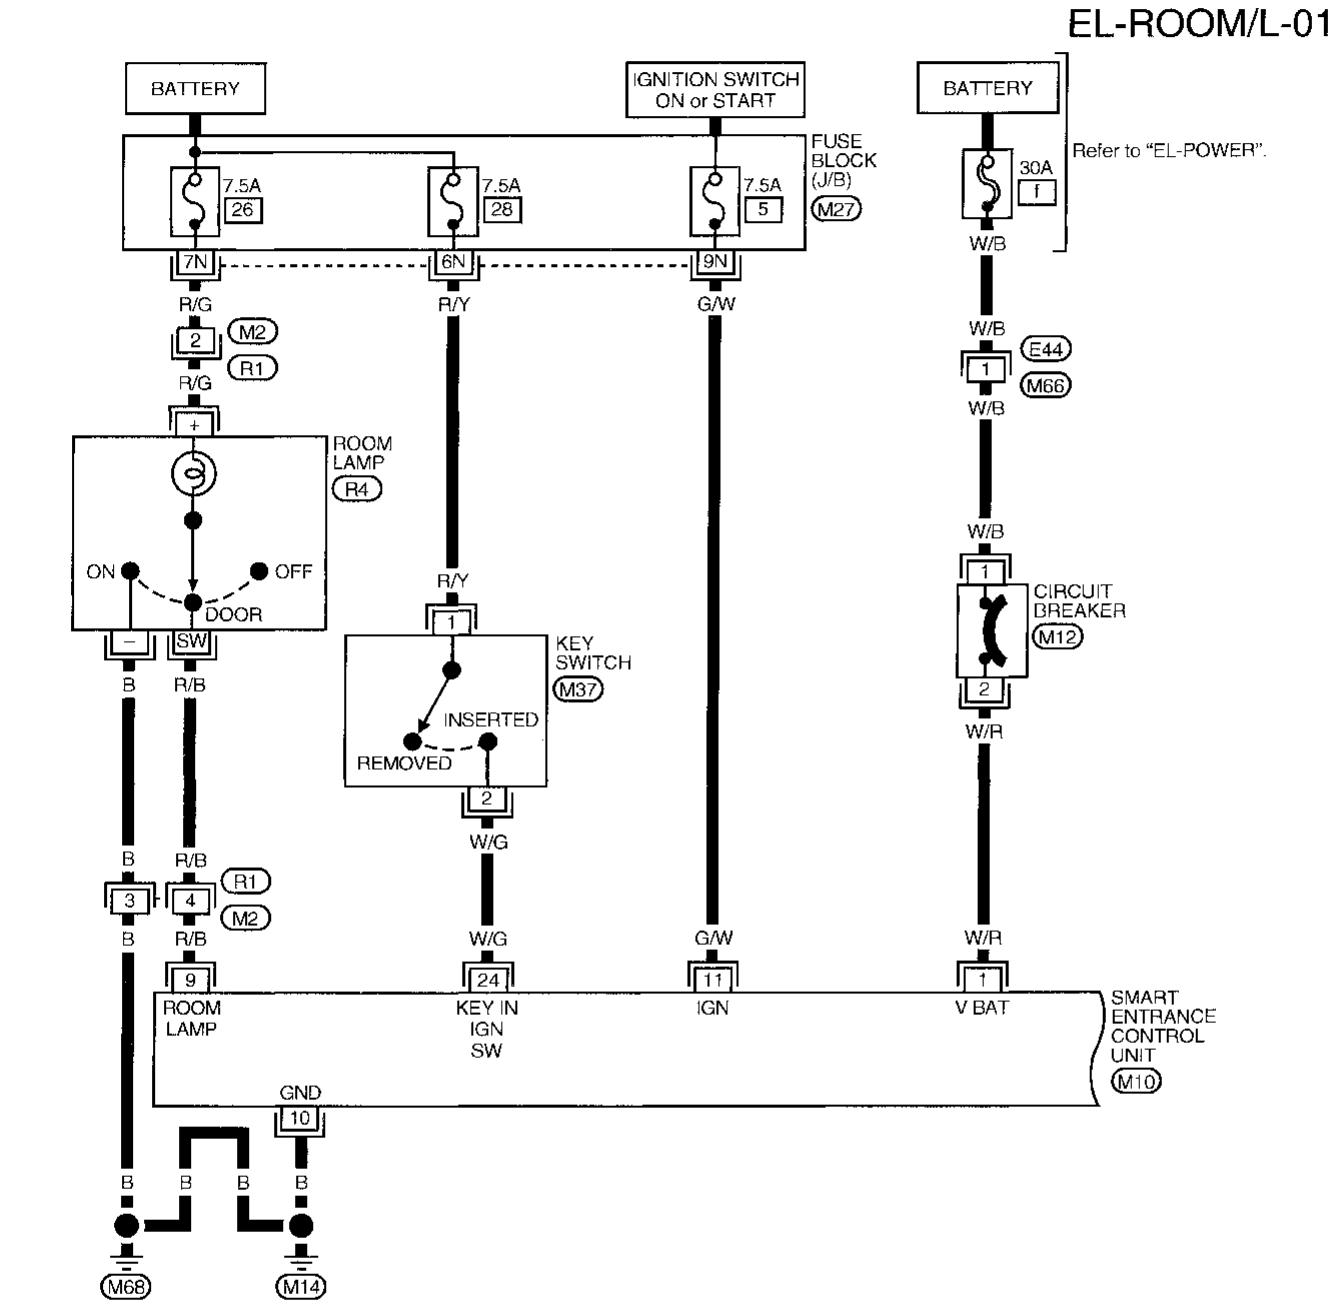
ON-OFF control

When the room lamp switch is in the "DOOR" position, when the driver side door or passenger door is opened the room lamp turns on.
When any door is opened and then closed while the ignition switch is not in the ON position, the room lamp timer operates.

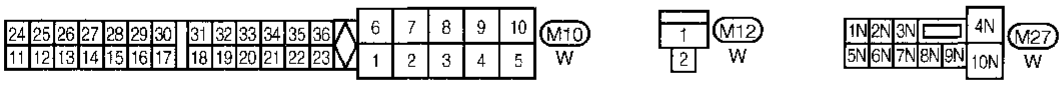
MODELS WITHOUT POWER DOOR LOCKS

Power is supplied at all times:
- through 7.5A fuse [No. 26, located in the fuse block (J/B)]
- to room lamp terminal ⊕.

With the room lamp switch ON, ground is supplied:
- through body grounds (M14) and (M68)
- to room lamp terminal ⊖.



When a door is opened with the room lamp switch in "DOOR" position, ground is supplied:
- through door switch LH or RH terminal ①
- to room lamp switch terminal (SW).



With power and ground supplied, the room lamp turns ON.

Trouble Diagnoses (For models with power door locks)

DIAGNOSTIC PROCEDURE

SYMPTOM: Room lamp does not turn on when any door is opened, or timer does not operate properly.

Does room lamp turn on when room lamp switch is in "ON" position?

No → Check the following.
- Bulb
- 7.5A fuse [No. 26, located in the fuse block (J/B)]
- Harness for open or short between fuse and room lamp
- Room lamp ground circuit

Yes ↓

Does key warning chime operate properly?

No → Check "WARNING CHIME" system. (Refer to EL-92.)

Yes ↓

Does power door lock operate using driver side knob lock switch?

No → Check "POWER DOOR LOCK" system. (Refer to EL-147.)

Yes ↓

A

CHECK ROOM LAMP OUTPUT SIGNAL.
1. Turn room lamp switch to "DOOR" position.
2. Disconnect control unit connector.
3. Check voltage between control unit terminal (9) and ground.

Battery voltage should exist.

NG → Check harness for open or short between room lamp and control unit.

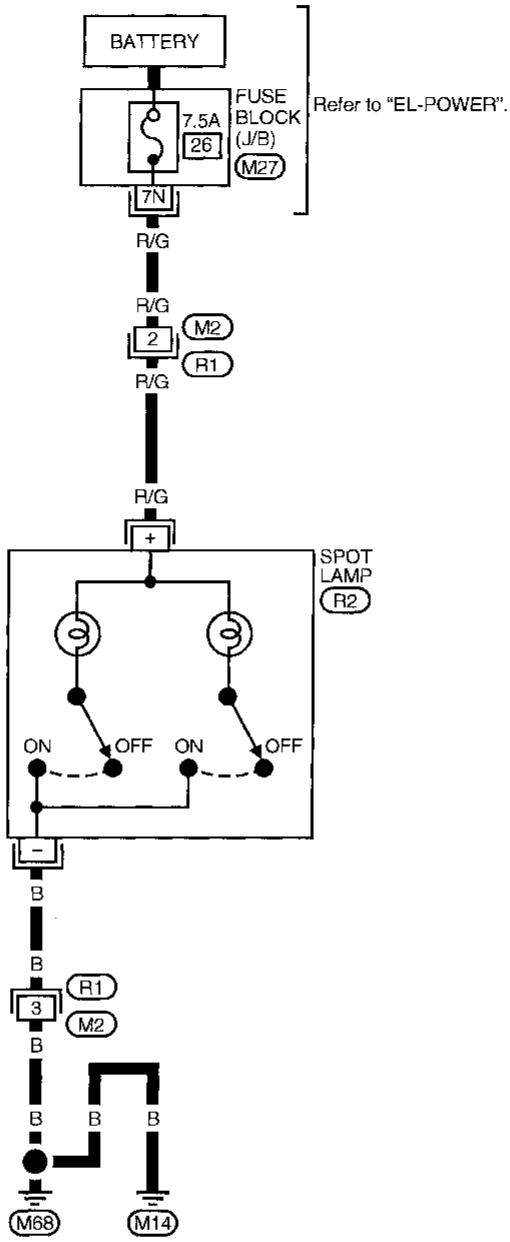
OK ↓

B

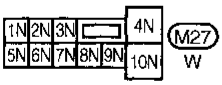
CHECK DOOR SWITCH INPUT SIGNAL.
1. Connect control unit connector.
2. Check voltage between control unit terminal (15), (35) and ground.

	Terminals ⊕	Terminals ⊖	Condition	Voltage [V]
Door switch LH	(15)	Ground	Open	0
			Closed	12
Door switch RH	(35)	Ground	Open	0
			Closed	12

NG → Check the following.
- Door switch
- Door switch ground circuit (LH) or door switch ground condition (RH)
- Harness for open or short between control unit and door switches



OK ↓



Replace control unit.

System Description

UNIFIED CONTROL METER

- Speedometer, odo/trip meter, tachometer, fuel gauge and water temperature gauge are controlled totally by control unit combined with speedometer.
- Digital meter is adopted for odo/trip meter.*
  *The record of the odo meter is kept even if the battery cable is disconnected. The record of the trip meter is erased when the battery cable is disconnected.
- Odo/trip meter segment can be checked in diagnosis mode.
- Meter/gauge can be checked in diagnosis mode.

HOW TO CHANGE THE DISPLAY FOR ODO/TRIP METER

Note: Turn ignition switch to the "ON" position to operate odo/trip meter.

POWER SUPPLY AND GROUND CIRCUIT

With the ignition switch in the ON or START position, power is supplied:

- through 10A fuse [No. 11, located in the fuse block (J/B)]
- to combination meter terminal (29).

Ground is supplied:

- to combination meter terminal (26)
- through body grounds (M14) and (M68).

FUEL GAUGE

The fuel gauge indicates the approximate fuel level in the fuel tank.
The fuel gauge is regulated by a variable ground signal supplied:

- to combination meter terminal (7) for the fuel gauge
- from terminal (G) of the fuel tank gauge unit
- through terminal (E) of the fuel tank gauge unit and
- through body grounds (M14) and (M68).

WATER TEMPERATURE GAUGE

The water temperature gauge indicates the engine coolant temperature. The reading on the gauge is based on the resistance of the thermal transmitter.
As the temperature of the coolant increases, the resistance of the thermal transmitter decreases. A variable ground is supplied to terminal (6) of the combination meter for the water temperature gauge. The needle on the gauge moves from "C" to "H".

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

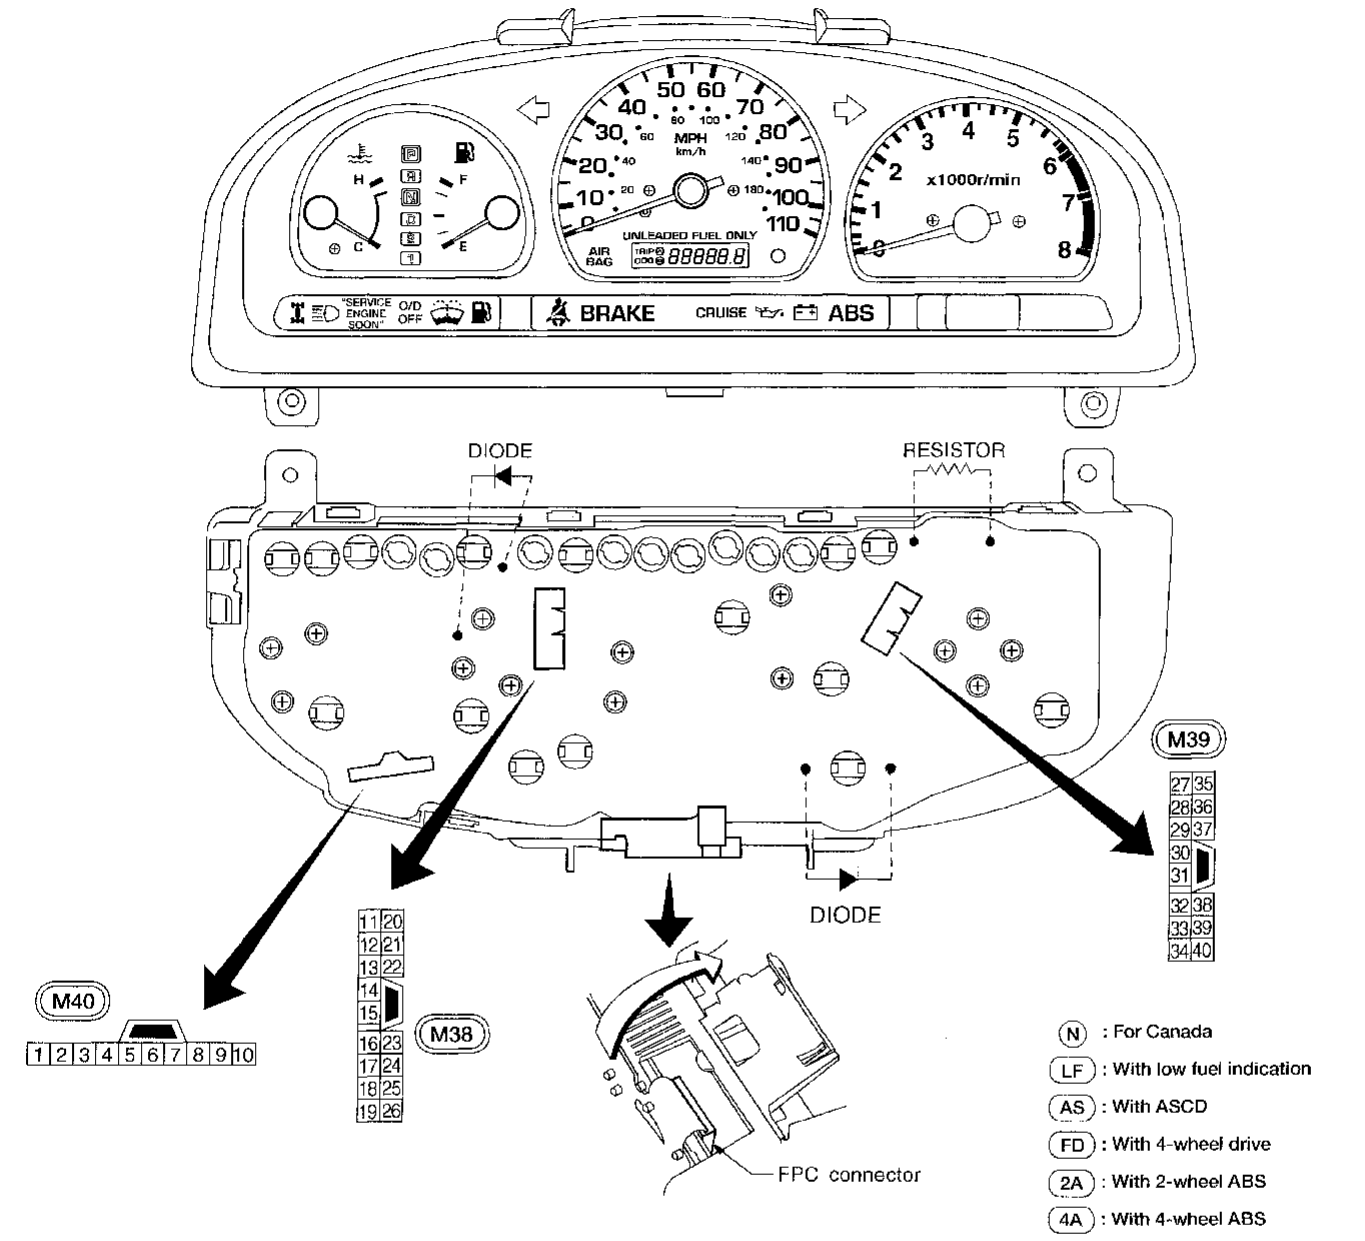
TACHOMETER

The tachometer indicates engine speed in revolutions per minute (rpm).
The tachometer is regulated by a signal:

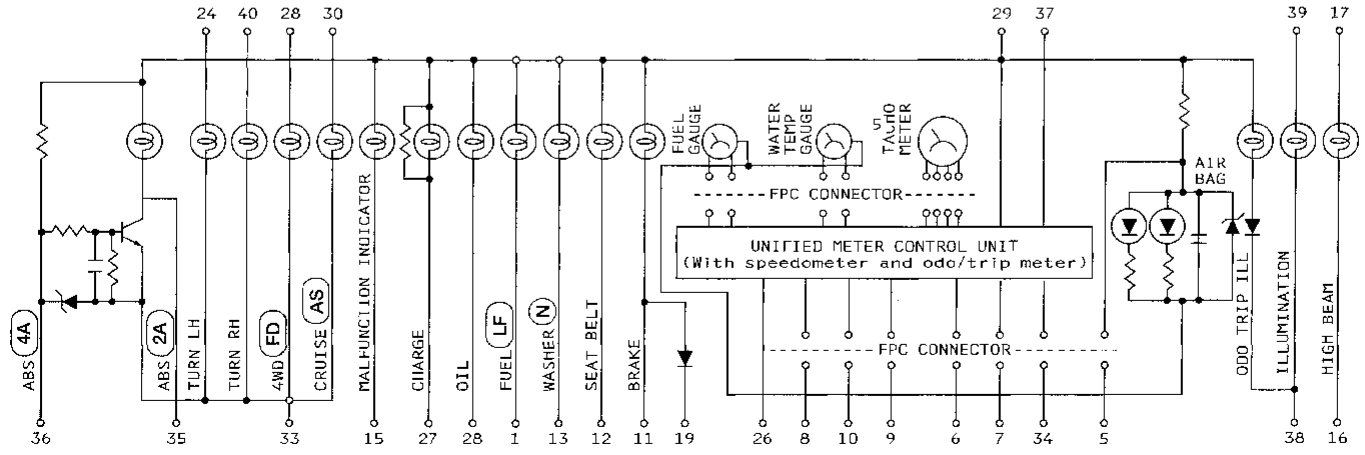
- from terminal ③ of the ECM
- to combination meter terminal ⑨ for the tachometer.

SPEEDOMETER

The vehicle speed sensor provides a voltage signal to the combination meter for the speedometer.
The voltage is supplied:



- to combination meter terminals ⑧ and ⑩ for the speedometer
- from terminals ② and ① of the vehicle speed sensor.



The speedometer converts the voltage into the vehicle speed displayed.

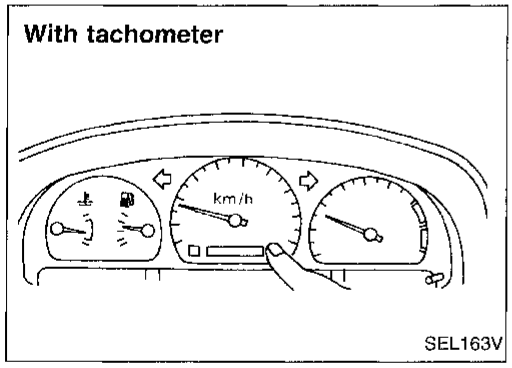
Meter/gauge Operation and Odo/Trip Meter Segment Check in Diagnosis Mode

DIAGNOSIS FUNCTION

- Odo/trip meter segment can be checked in diagnosis mode.
- Meters/gauges can be checked in diagnosis mode.

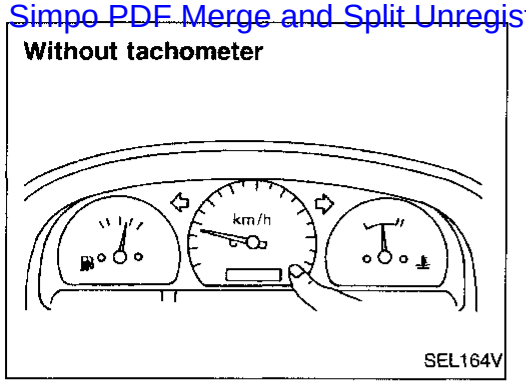


HOW TO ALTERNATE DIAGNOSIS MODE

1. Turn ignition switch to ON and change odo/trip meter to "TRIP A" or "TRIP B".
2. Turn ignition switch to OFF.
3. Turn ignition switch to ON when pushing odo/trip meter switch.
4. Confirm that trip meter indicates "000.0".
5. Push odo/trip meter switch more than three times within 5 seconds.
6. All odo/trip meter segments should be turned on.

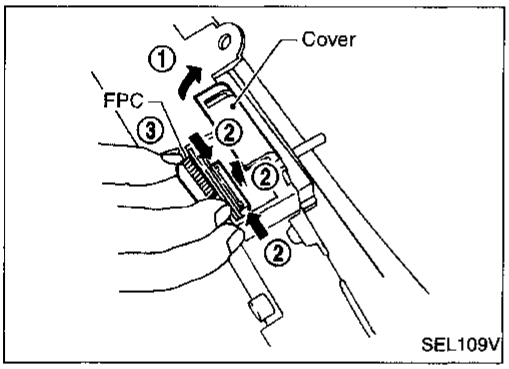
NOTE: If some segments are not turned on, speedometer (unified meter control unit) with odo/trip meter should be replaced.

At this point, the unified control meter is turned to diagnosis mode.



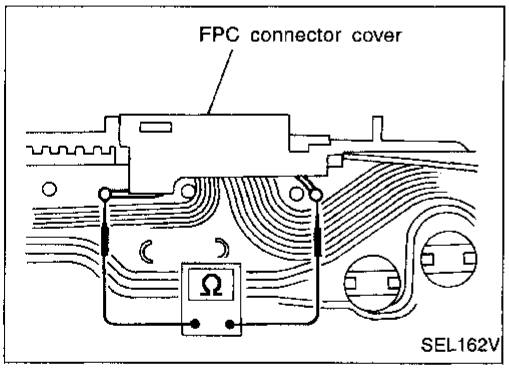
7. Push odo/trip meter switch. Indication of each meter/gauge should be as shown left during pushing odo/trip meter switch if it is not malfunctioning.

NOTE: It takes about 1 minute for indication of fuel gauge to become stable.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Meter/gauge Operation and Odo/Trip Meter Segment Check in Diagnosis Mode (Cont'd)

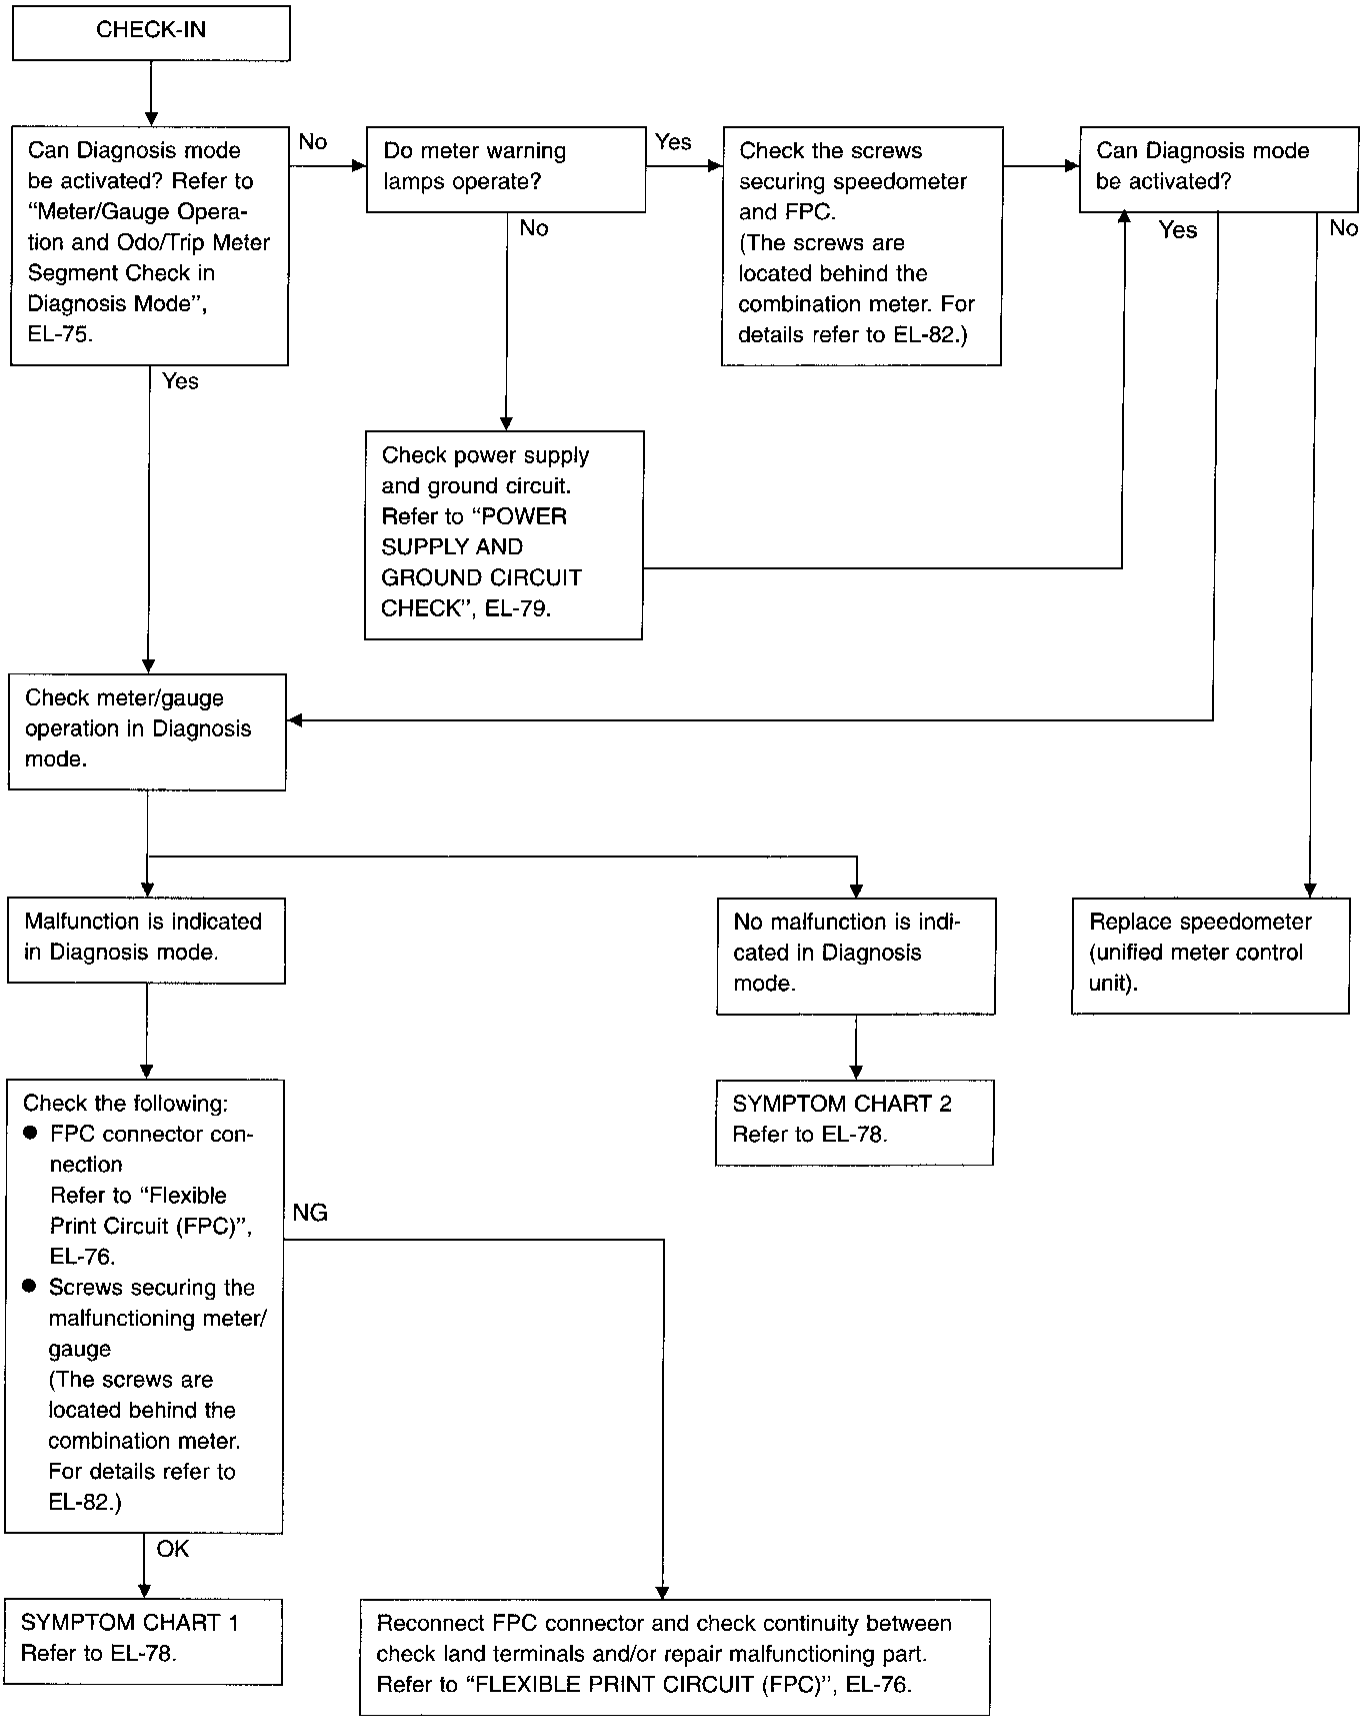


Flexible Print Circuit (FPC)

Tachometer, fuel gauge and water temperature gauge are connected with unified meter control unit (speedometer) by Flexible Print Circuit (FPC) connector. When replacing or removing and installing unified control unit (speedometer), disconnect and connect FPC connector according to the following steps.

DISCONNECT

1. Open connector cover.
2. Release connector lock by holding both ends of it and pulling it up.
3. Disconnect FPC by pulling it up.



CONNECT

1. Insert FPC into connector and lock connector pushing FPC downward.
2. Check secure connection of FPC.
3. Check continuity of check land terminals for secure connection of FPC.
   Resistance: 0Ω
4. Close connector cover.

Trouble Diagnoses

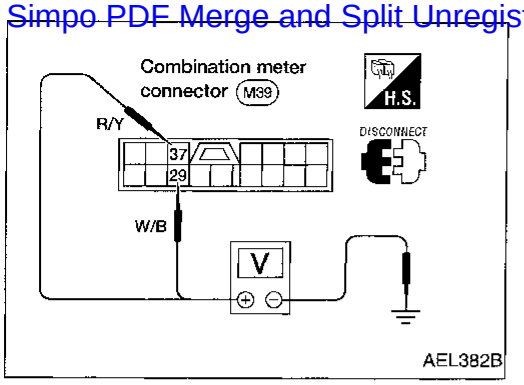
PRELIMINARY CHECK

Trouble Diagnoses (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SYMPTOM CHART 1 (Malfunction is indicated in diagnosis mode)

Symptom	Possible causes	Repair order
Speedometer and/or odo/trip meter indicate(s) malfunction in Diagnosis mode.	● Speedometer (Unified meter control unit)	● Replace speedometer (unified meter control unit).
Multiple meter/gauge indicate malfunction in Diagnosis mode.		
One of tachometer/fuel gauge/ water temp. gauge indicates malfunction in Diagnosis mode.	● Meter/Gauge ● Speedometer (Unified meter control unit)	1. Check resistance of meter/gauge indicating malfunction. If the resistance is NG, replace the meter/gauge. Refer to "METER/GAUGE RESISTANCE CHECK", EL-82. 2. If the resistance is OK, replace speedometer (unified meter control unit).



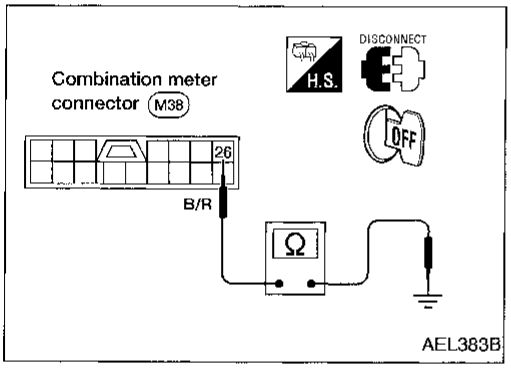
SYMPTOM CHART 2 (No malfunction is indicated in diagnosis mode)

Symptom	Possible causes	Repair order
Speedometer and odo/trip meter are malfunctioning.	1. Sensor - Speedometer, Odo/Trip meter 2. FPC connector 3. Speedometer (Unified meter control unit)	1. Check vehicle speed sensor. INSPECTION/VEHICLE SPEED SENSOR (Refer to EL-80.) 2. Check FPC connector. Refer to "FLEXIBLE PRINT CIRCUIT (FPC)", EL-76. 3. Replace speedometer (unified meter control unit).
Multiple meter/gauge are malfunctioning. (except speedometer, (odo/trip meter)	1. FPC connector 2. Speedometer (Unified meter control unit)	1. Check FPC connector. Refer to "FLEXIBLE PRINT CIRCUIT (FPC)", EL-76. 2. Replace speedometer (unified meter control unit).
One of tachometer/fuel gauge/ water temp. gauge is malfunctioning.	1. Sensor/Engine revolution signal - Tachometer - Fuel gauge - Water temp. gauge 2. FPC connector 3. Speedometer (Unified meter control unit)	1. Check the sensor for malfunctioning meter/gauge. INSPECTION/ENGINE REVOLUTION SIGNAL (Refer to EL-80.) INSPECTION/FUEL TANK GAUGE (Refer to EL-81.) INSPECTION/THERMAL TRANSMITTER (Refer to EL-81.) 2. Check FPC connector. Refer to "FLEXIBLE PRINT CIRCUIT (FPC)", EL-76. 3. Replace speedometer (unified meter control unit).

Before starting trouble diagnoses, perform PRELIMINARY CHECK, EL-77.

Trouble Diagnoses (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



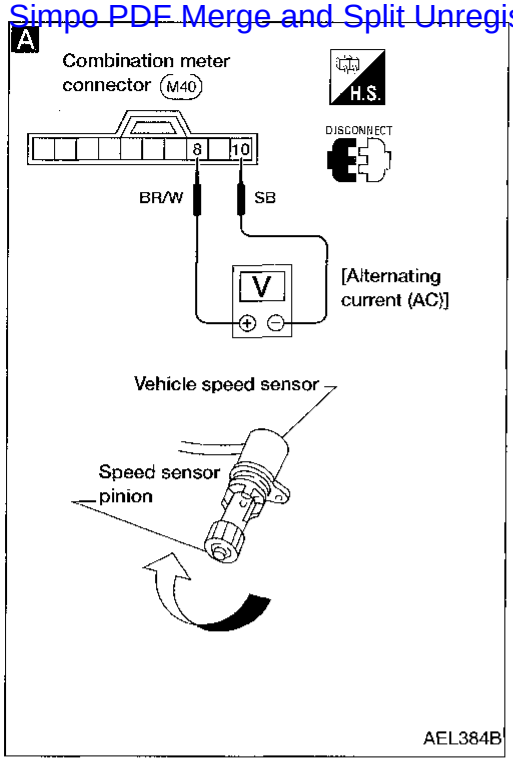
POWER SUPPLY AND GROUND CIRCUIT CHECK

Power supply circuit check

Terminals		Ignition switch position		
⊕	⊖	OFF	ACC	ON
37	Ground	Battery voltage	Battery voltage	Battery voltage
29	Ground	0V	0V	Battery voltage

If NG, check the following.

- 7.5A fuse [No. 28, located in fuse block (J/B)]
- 10A fuse [No. 11, located in fuse block (J/B)]
- Harness for open or short between fuse and combination meter



Ground circuit check

Terminals	Continuity
26 - Ground	Yes

Trouble Diagnoses (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

INSPECTION/VEHICLE SPEED SENSOR

A

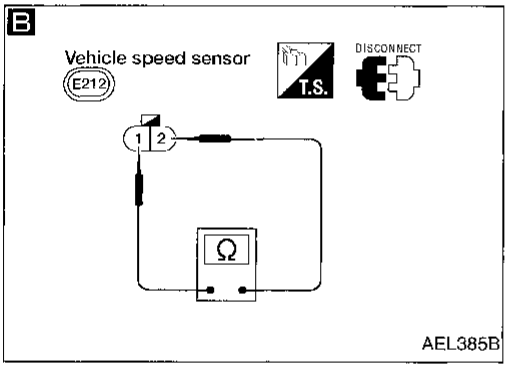
CHECK VEHICLE SPEED SENSOR OUTPUT.

1. Remove vehicle speed sensor from transmission and leave vehicle speed sensor connector connected.
2. Check voltage between combination meter terminals (8) and (10) while quickly turning speed sensor pinion.
   Voltage: Approx. 0.5V

OK → Vehicle speed sensor is OK.

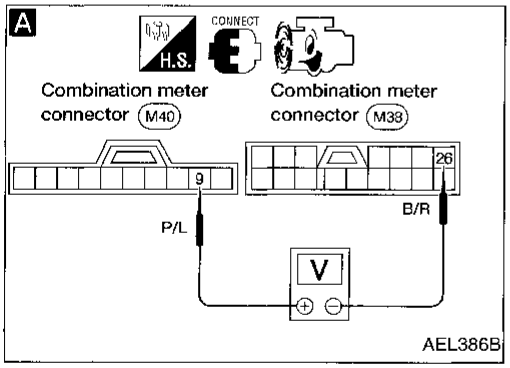
NG ↓

B



CHECK VEHICLE SPEED SENSOR.

Check resistance between vehicle speed sensor terminals (1) and (2).
Resistance: Approx. 250Ω



NG → Replace vehicle speed sensor.

OK ↓

Check harness or connector between speedometer and vehicle speed sensor.

INSPECTION/ENGINE REVOLUTION SIGNAL (Models with tachometer)

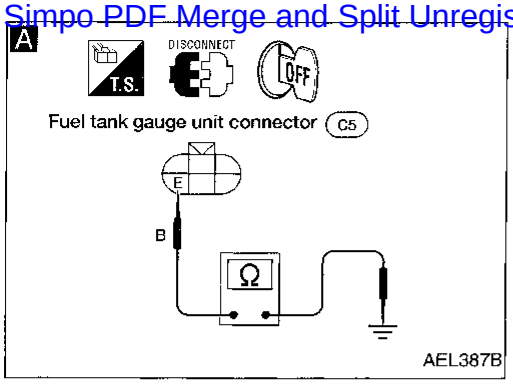
A

CHECK ECM OUTPUT.

1. Start engine.
2. Check voltage between combination meter terminals (9) and (26) at idle and 2,000 rpm.
   Higher rpm = Higher voltage
   Lower rpm - Lower voltage
   Voltage should change with rpm.

OK → Engine revolution signal is OK.

NG ↓



Check the following:

- Harness for open or short between ECM and combination meter.

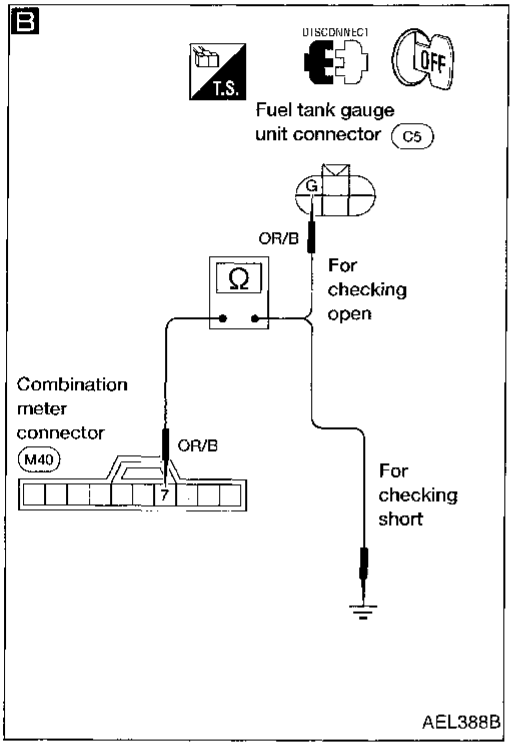
Trouble Diagnoses (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

INSPECTION/FUEL TANK GAUGE

A

CHECK GROUND CIRCUIT FOR FUEL TANK GAUGE UNIT.
Check harness continuity between fuel tank gauge unit terminal (E) and ground.
Continuity should exist.



NG → Repair harness or connector.

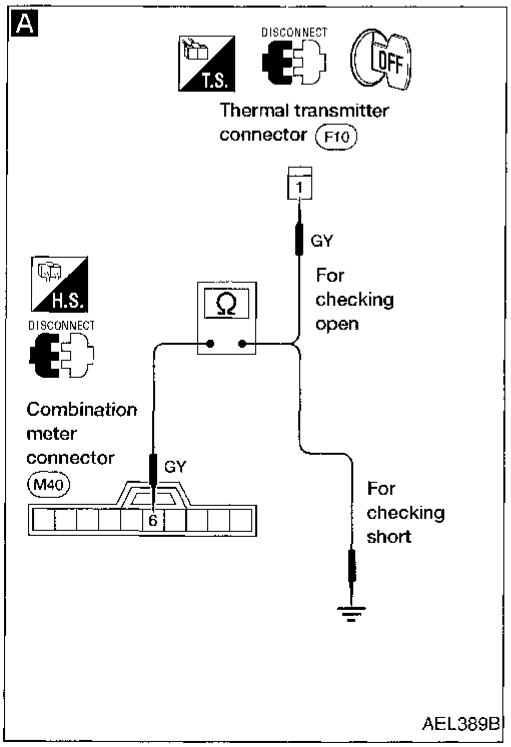
OK ↓

CHECK GAUGE UNITS.
Refer to "FUEL TANK GAUGE UNIT CHECK" (EL-82).

NG → Repair or replace. Refer to FE section.

OK ↓

B



CHECK HARNESS.
1. Disconnect combination meter connector (M40) and fuel tank gauge unit connector.
2. Check harness continuity between combination meter terminal (7) and fuel tank gauge unit terminal (G).
Continuity should exist.
3. Check continuity between combination meter terminal (7) and ground.
Continuity should not exist.

NG → Repair harness or connector.

OK ↓

Fuel tank gauge is OK.

INSPECTION/THERMAL TRANSMITTER

CHECK THERMAL TRANSMITTER.
Refer to "THERMAL TRANSMITTER CHECK" (EL-83).

NG → Repair or replace.

OK ↓

A

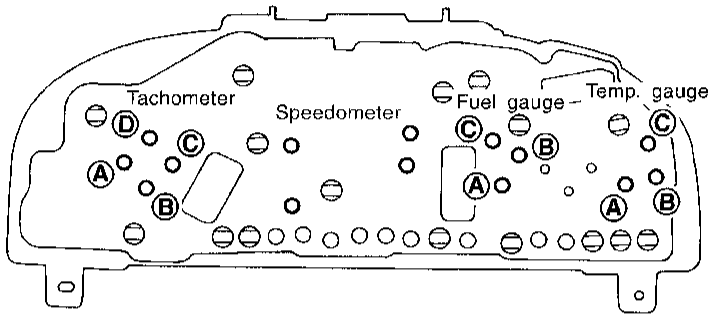
CHECK HARNESS.
1. Disconnect combination meter connector (M40) and thermal transmitter connector.
2. Check harness for open or short between combination meter terminal (6) and thermal transmitter terminal (1).
Continuity should exist.
3. Check continuity between combination meter terminal (6) and ground.
Continuity should not exist.

NG → Repair harness or connector.

OK ↓

Thermal transmitter is OK.

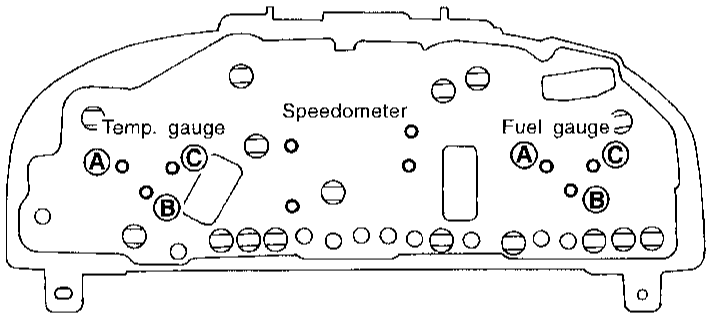
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Electrical Components Inspection

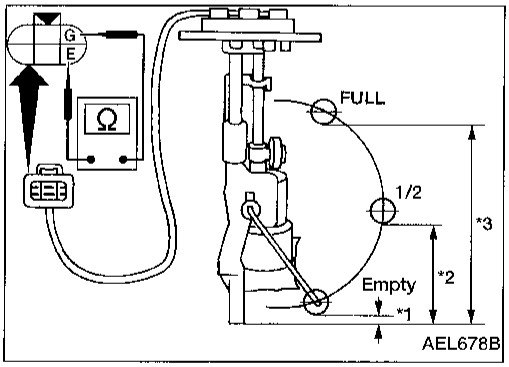
METER/GAUGE RESISTANCE CHECK

1. Disconnect FPC connector. Refer to EL-76.
2. Check resistance between installation screws of meter/gauge.



Screws		Resistance Ω
Tachometer	Fuel/Temp. gauge	
A - C	A - C	Approx. 70 - Approx. 140
B - D	B - C	Approx. 90 - Approx. 170

With tachometer



SEL172V

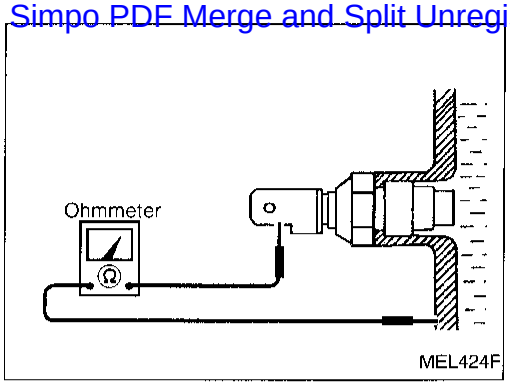
Without tachometer

SEL173V

AEL678B

FUEL TANK GAUGE UNIT CHECK

- For removal, refer to FE section.

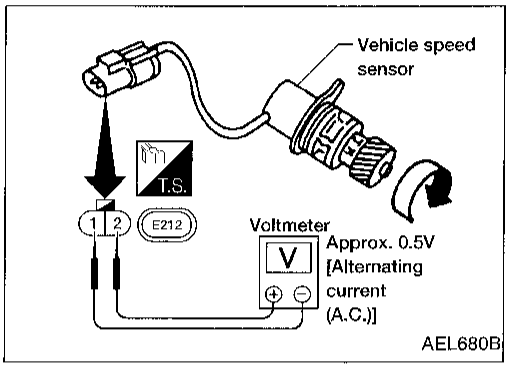


Check the resistance between terminals Ⓖ and Ⓔ.

Ohmmeter (+)	Ohmmeter (−)	Float position mm (in)			Resistance value (Ω)
Ⓖ	Ⓔ	*1	Empty	8 (0.31)	78 - 85
		*2	1/2	115 (4.53)	27 - 35
		*3	Full	241 (9.49)	Approx. 4 - 6

*1 and *3: When float rod is in contact with stopper.

Electrical Components Inspection (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

THERMAL TRANSMITTER CHECK

Check the resistance between the terminals of thermal transmitter and body ground.

Water temperature	Resistance
60°C (140°F)	Approx. 167 - 211Ω
100°C (212°F)	Approx. 47 - 53Ω

VEHICLE SPEED SENSOR SIGNAL CHECK

1. Remove vehicle speed sensor from transmission.
2. Turn vehicle speed sensor pinion quickly and measure voltage between terminals ① and ②.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

System Description

With the ignition switch in the ON or START position, power is supplied:
- through 10A fuse (No. 11, located in the fuse block [J/B])
- to combination meter terminal ㉙ and
- to 4WD switch terminal ①.

Ground is supplied:
- through body grounds M14 and M68
- to combination meter terminals ㉖ and ㉝.

Ground is supplied:
- through body grounds M14 and M68
- to fuel tank gauge unit terminal Ⓔ and
- seat belt buckle switch terminal ②.

Ground is supplied:
- through body grounds E12 and E54
- to brake fluid level switch terminal ② and
- to washer fluid level switch terminal ⊖.

AIR BAG WARNING LAMP

During prove out or when an air bag malfunction occurs, the ground path is interrupted:
- from the air bag diagnosis sensor unit terminal ⑮
- to combination meter terminal ⑤.

Ground is supplied:
- through combination meter terminal ㉖.

With power and ground supplied, the air bag warning lamp (LEDs) illuminate.
For further information, refer to RS section ("TROUBLE DIAGNOSES").

LOW FUEL LEVEL WARNING LAMP

The amount of fuel in the fuel tank is determined by the fuel level sensor in the fuel tank. A signal is sent from fuel tank gauge unit terminal Ⓢ to combination meter terminal ①. The fuel level sensor will illuminate the low fuel level warning lamp when the fuel level is low.
With power and ground supplied, the low fuel level warning lamp illuminates.

ABS WARNING LAMP

During prove out or when an ABS malfunction occurs, ground is supplied:
- from ABS control unit terminal ② (with 2-wheel ABS) or ABS actuator and electric unit (control unit) terminal ㉑ (with 4-wheel ABS)
- to combination meter terminals ㉟ or ㊱

With power and ground supplied, the ABS warning lamp illuminates.
For further information, refer to BR section ("Self-diagnosis", "TROUBLE DIAGNOSES").

4WD INDICATOR LAMP

When the 4WD switch is in the 4H or 4L position, power is supplied:
- from the 4WD switch terminal ①
- to combination meter terminal ⑱.

Ground is supplied:
- through combination meter terminal ㉝.

With power and ground supplied, the 4WD indicator lamp illuminates.

LOW OIL PRESSURE WARNING LAMP

Low oil pressure causes oil pressure switch terminal ① to provide ground to combination meter terminal ㉘.
With power and ground supplied, the low oil pressure warning lamp illuminates.

CHARGE WARNING LAMP

During prove out or when a generator malfunction occurs, ground is supplied:
- from generator terminal ③
- to combination meter terminals ㉗ and ⑲.

With power and ground supplied, the charge warning lamp and brake lamp illuminate.

System Description (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

BRAKE WARNING LAMP

When the parking brake is applied, or the brake fluid level is low, ground is supplied:
- from parking brake switch terminal ① or
- brake fluid level switch terminal ①
- to combination meter terminal ⑪.

With power and ground supplied, the brake warning lamp illuminates.

SEAT BELT WARNING LAMP

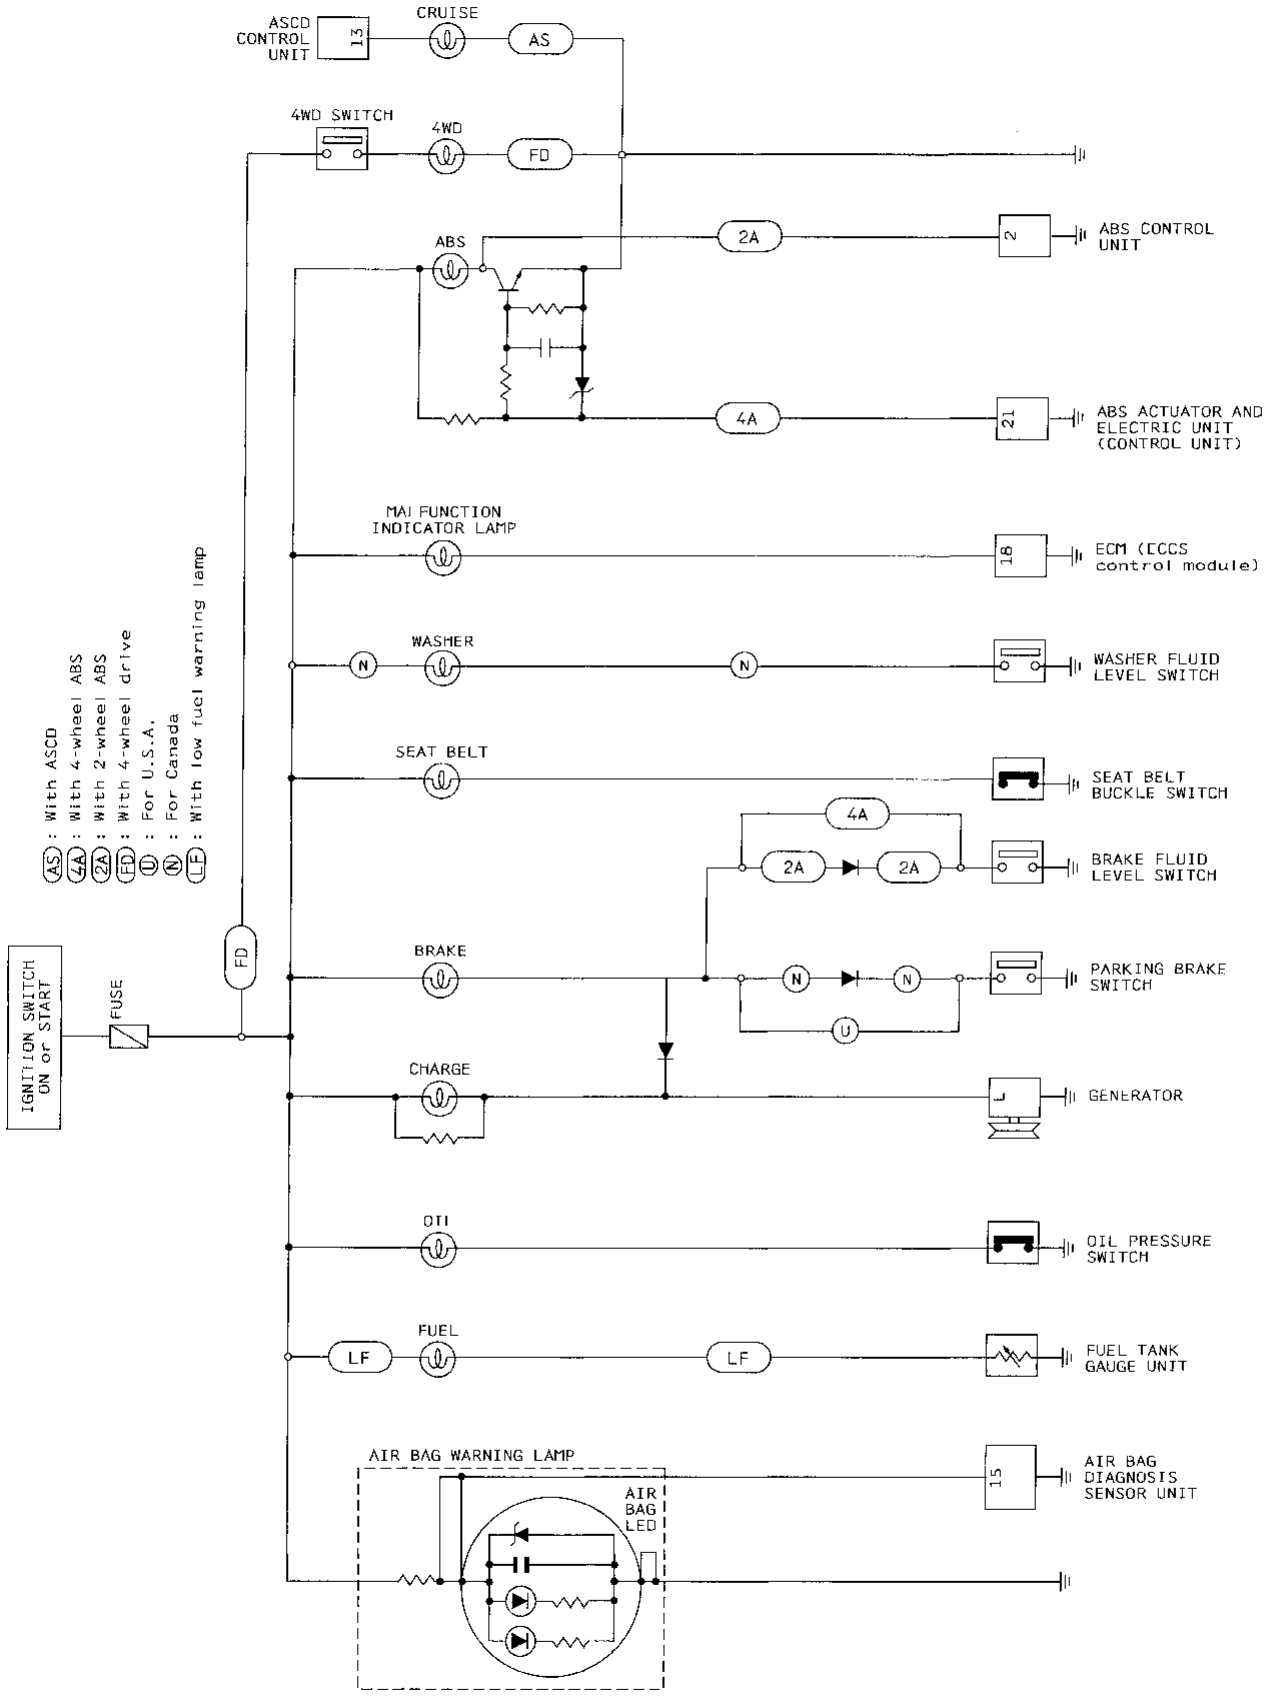
When the driver's seat belt is unfastened, ground is supplied:
- from seat belt buckle switch terminal ①
- to combination meter terminal ⑫.

With power and ground supplied, the seat belt warning lamp illuminates.

WASHER WARNING LAMP

When the washer fluid level is low, ground is supplied:
- from washer fluid level switch terminal ⊕
- to combination meter terminal ⑬.

With power and ground supplied, the washer warning lamp illuminates.



MALFUNCTION INDICATOR LAMP

During prove out or when an engine control malfunction occurs, ground is supplied:
- from ECM terminal ⑱
- to combination meter terminal ⑮.

With power and ground supplied, the malfunction indicator lamp illuminates.
For further information, refer to EC section ["Malfunction Indicator Lamp (MIL)", "ON BOARD DIAGNOSTIC SYSTEM DESCRIPTION"].

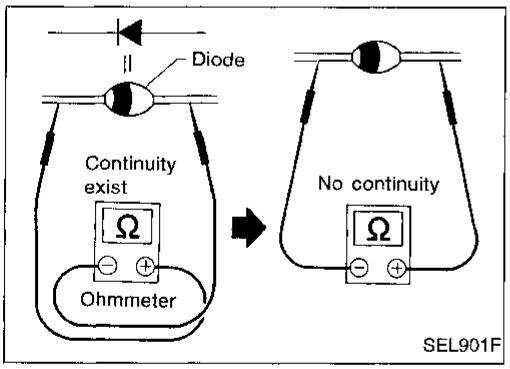
Electrical Components Inspection

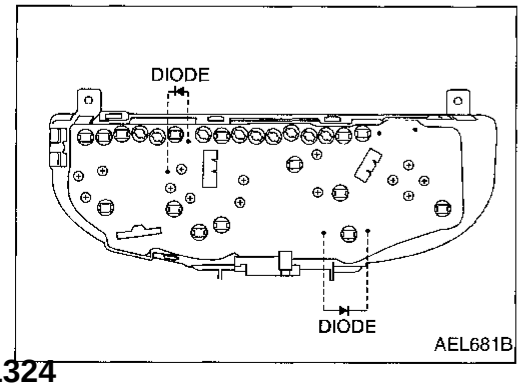
FUEL WARNING LAMP SENSOR CHECK



- It will take a short time for the bulb to light.

OIL PRESSURE SWITCH CHECK

	Oil pressure kPa (kg/cm^2, psi)	Continuity
Engine start	More than 10 - 20 (0.1 - 0.2, 1 - 3)	NO
Engine stop	Less than 10 - 20 (0.1 - 0.2, 1 - 3)	YES

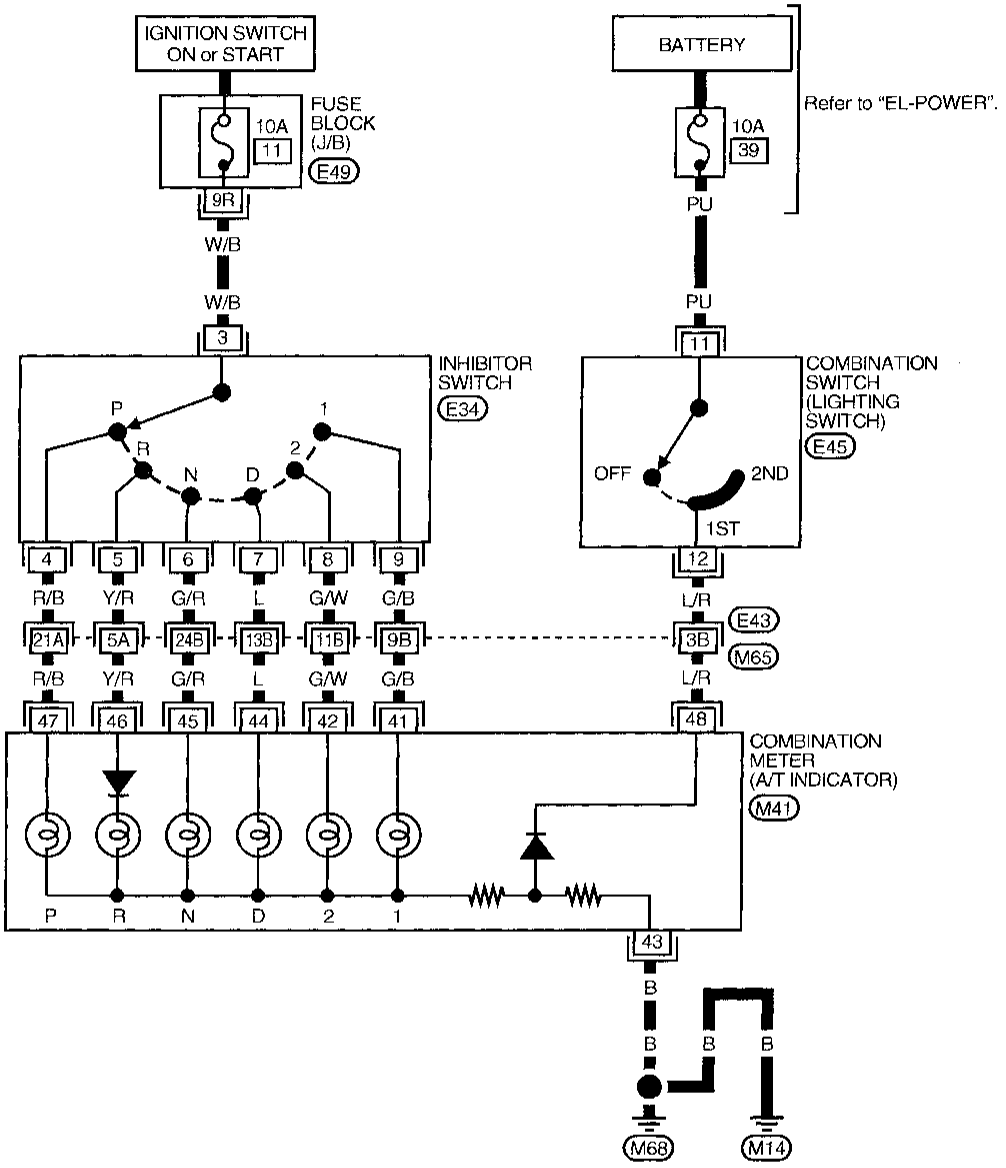


Check the continuity between the terminals of oil pressure switch and body ground.

DIODE CHECK

- Check continuity using an ohmmeter.
- Diode is functioning properly if test results are as shown in the figure at left.

NOTE: Specification may vary depending on the type of tester. Before performing this inspection, be sure to refer to the instruction manual for the tester to be used.



- Diodes for warning lamps are built into the combination meter printed circuit.

System Description

MODELS WITH POWER DOOR LOCKS

The warning chime is integral with the smart entrance control unit, which controls its operation.
Power is supplied at all times:
- through 7.5A fuse [No. 28, located in the fuse block (J/B)]
- to key switch terminal ①.

Power is supplied at all times:
- through 10A fuse (No. 39, located in the fuse and fusible link box)
- to lighting switch terminal ⑪.

Power is supplied at all times:
- through 30A fusible link (letter f, located in the fuse and fusible link box)
- to circuit breaker terminal ①
- through circuit breaker terminal ②
- to smart entrance control unit terminal ①.

With the ignition switch in the ON or START position, power is supplied:
- through 7.5A fuse [No. 5, located in the fuse block (J/B)]
- to smart entrance control unit terminal ⑪.

Ground is supplied to smart entrance control unit terminal ⑩ through body grounds (M14) and (M68).
When a signal, or combination of signals, is received by the smart entrance control unit, the warning chime will sound.

Ignition key warning chime

With the key in the ignition key cylinder, the ignition switch in the OFF or ACC position, and the driver's door open, the warning chime will sound. A battery positive voltage is supplied:
- from key switch terminal ②
- to smart entrance control unit terminal ㉔.

Ground is supplied:
- from door switch LH terminal ②
- to smart entrance control unit terminal ⑮.

Door switch LH terminal ③ is grounded through body grounds (M14) and (M68).

Light warning chime

With ignition switch in the OFF or ACC position, driver's door open, and lighting switch in 1ST or 2ND position, the warning chime will sound. A battery positive voltage is supplied:
- from lighting switch terminal ⑫
- to smart entrance control unit terminal ㉕.

Ground is supplied:
- from door switch LH terminal ②
- to smart entrance control unit terminal ⑮.

Door switch LH terminal ③ is grounded through body grounds (M14) and (M68).

Seat belt warning chime

The warning chime sounds for about 6 seconds when ignition switch is turned from OFF to ON and seat belt is unfastened.
Ground is supplied:
- from seat belt buckle switch terminal ①
- to smart entrance control unit terminal ㉑.

Seat belt buckle switch terminal ② is grounded through body grounds (M14) and (M68).

System Description (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

MODELS WITHOUT POWER DOOR LOCKS

The warning chime is integral with the warning chime unit, which controls its operation.
Power is supplied at all times:
- through 7.5A fuse [No. 28, located in the fuse block (J/B)]
- to key switch terminal ①.

Power is supplied at all times:
- through 10A fuse (No. 39, located in the fuse and fusible link box)
- to lighting switch terminal ⑪.

With the ignition switch in the ON or START position, power is supplied:
- through 7.5A fuse [No. 5, located in the fuse block (J/B)]
- to warning chime unit terminal ①.

Ground is supplied to warning chime unit terminal ⑧ through body grounds M14 and M68.
When a signal, or combination of signals, is received by the warning chime unit, the warning chime will sound.

Ignition key warning chime

With the key in the ignition key cylinder, the ignition switch in the OFF or ACC position, and the driver's door open, the warning chime will sound. A battery positive voltage is supplied:
- from key switch terminal ②
- to warning chime unit terminal ⑤.

Ground is supplied:
- to warning chime unit terminal ⑦
- from door switch LH terminal ②.

Door switch LH terminal ③ is grounded through body grounds M14 and M68.

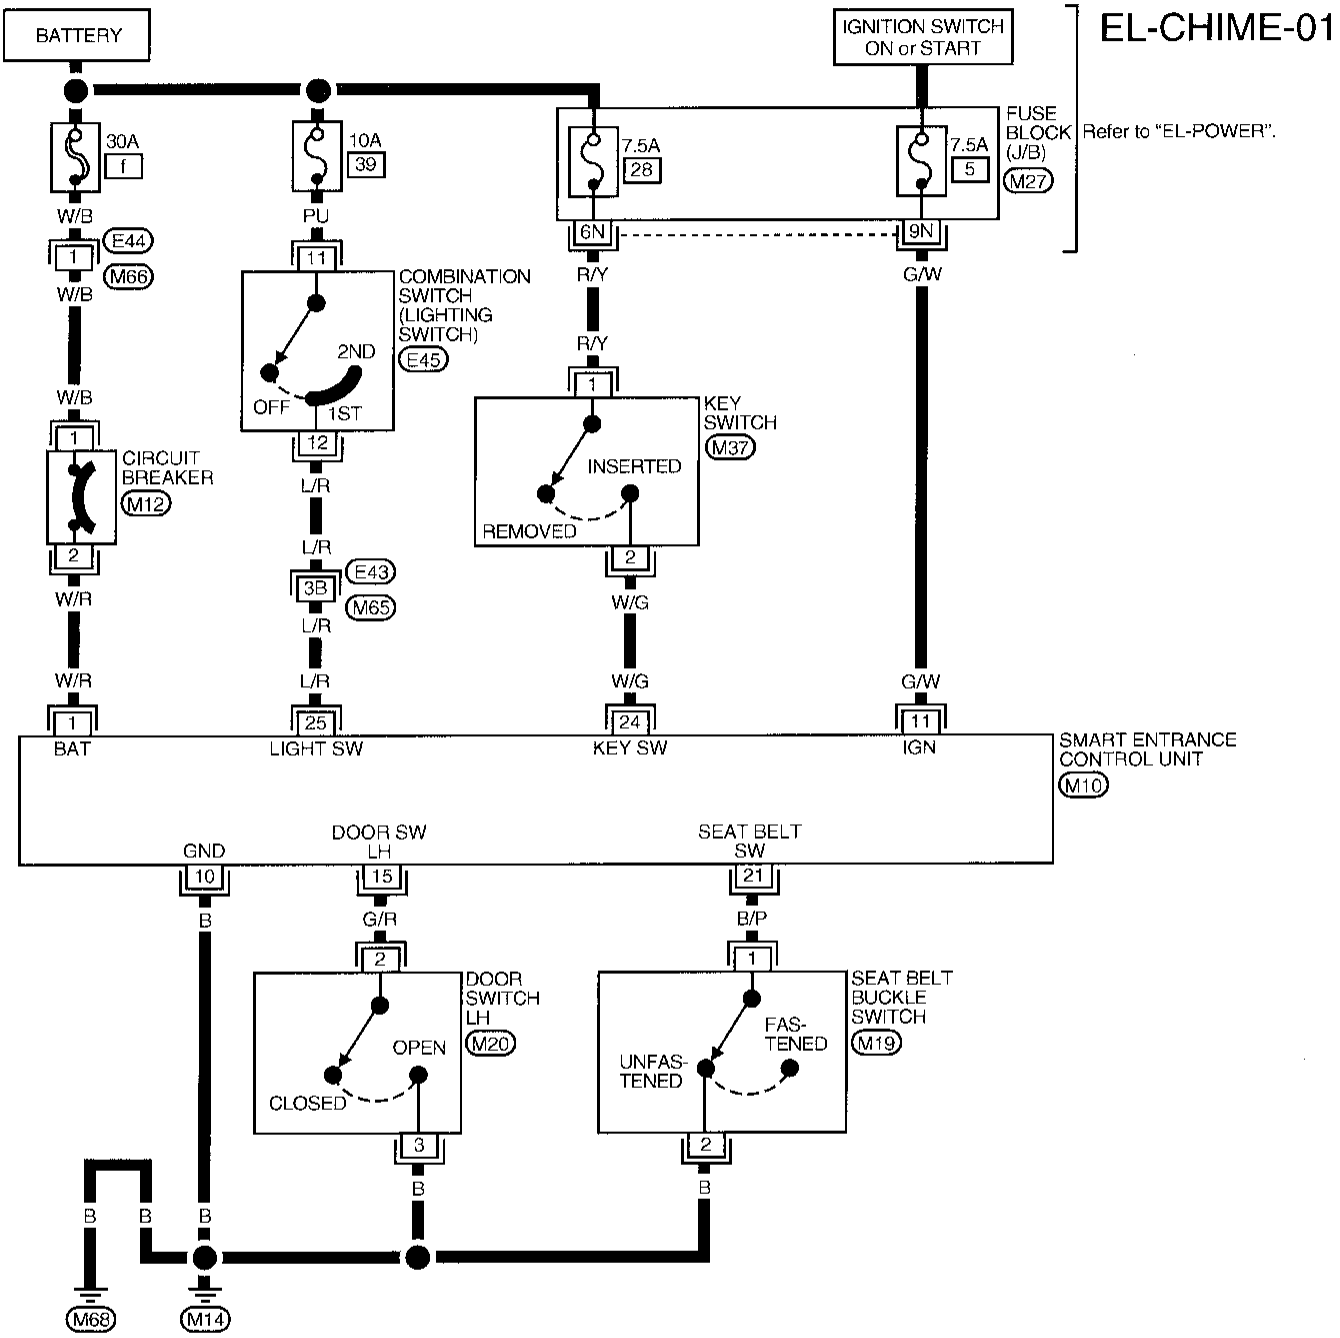
Light warning chime

With ignition switch OFF or ACC position, driver's door open, and lighting switch in 1ST or 2ND position, the warning chime will sound. A battery positive voltage is supplied:
- from lighting switch terminal ⑫
- to warning chime unit terminal ④.

Ground is supplied:
- to warning chime unit terminal ⑦
- from door switch LH terminal ②.

Door switch LH terminal ③ is grounded through body grounds M14 and M68.

Seat belt warning chime.



The warning chime will sound for approximately 6 seconds when ignition switch is turned from OFF to ON and seat belt is unfastened.
Ground is supplied:
- to warning chime unit terminal ②
- from seat belt buckle switch terminal ①.

Seat belt buckle switch terminal ② is grounded through body grounds M14 and M68.

Trouble Diagnoses (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

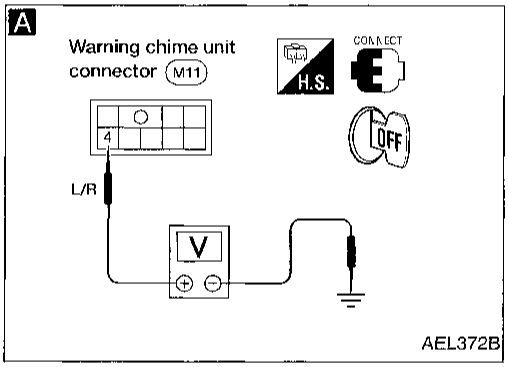
DIAGNOSTIC PROCEDURE 1

(Lighting switch input signal check)

Models with power door locks

A

CHECK LIGHTING SWITCH INPUT SIGNAL.



Check voltage between control unit terminal 25 and ground.

Condition of lighting switch	Voltage [V]
1ST or 2ND	Approx. 12
OFF	0

NG → Check the following.
- 10A fuse (No. 39, located in the fuse and fusible link box)
- Harness for open or short between control unit and lighting switch

OK → Go to Diagnostic Procedure 4, EL-102.

Models without power door locks

A

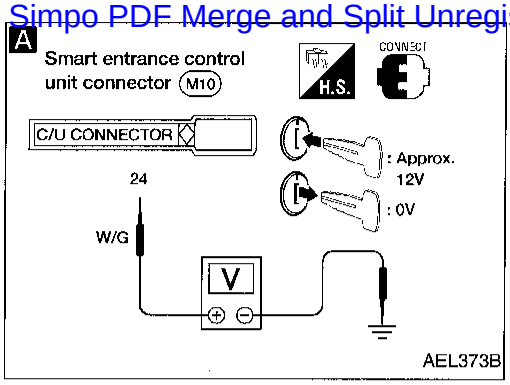
CHECK LIGHTING SWITCH INPUT SIGNAL.

Check voltage between warning chime unit terminal 4 and ground.

Condition of lighting switch	Voltage [V]
1ST or 2ND	Approx. 12
OFF	0

NG → Check the following.
- 10A fuse (No. 39, located in the fuse and fusible link box)
- Harness for open or short between warning chime unit and lighting switch

OK → Go to Diagnostic Procedure 4, EL-102.



Trouble Diagnoses (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

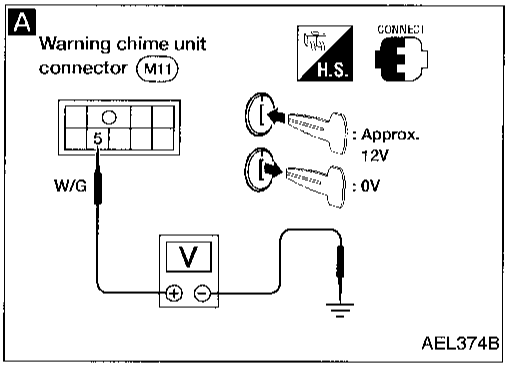
DIAGNOSTIC PROCEDURE 2

(Key switch input signal check)

Models with power door locks

A

CHECK KEY SWITCH INPUT SIGNAL.
Check voltage between control unit terminal 24 and ground.



Condition of key switch	Voltage [V]
Key is inserted.	Approx. 12
Key is removed.	0

NG → Check the following.
- Key switch
  Refer to "Electrical Components Inspection" (EL-103).
- 7.5A fuse [No. 28, located in fuse block (J/B)]
- Harness for open or short between key switch and fuse
- Harness for open or short between control unit and key switch

OK ↓

Go to Diagnostic Procedure 4, EL-102.

Models without power door locks

A

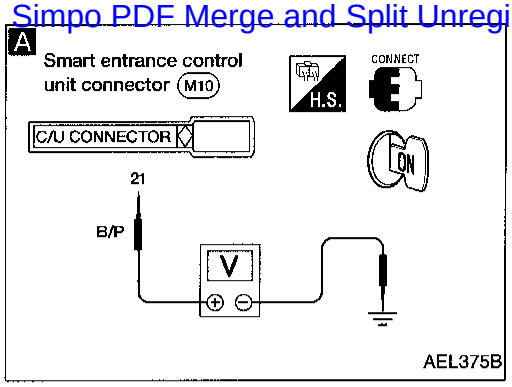
CHECK KEY SWITCH INPUT SIGNAL.
Check voltage between warning chime unit terminal 5 and ground.

Condition of key switch	Voltage [V]
Key is inserted.	Approx. 12
Key is removed.	0

NG → Check the following.
- Key switch
  Refer to "Electrical Components Inspection" (EL-103).
- 7.5A fuse [No. 28, located in fuse block (J/B)]
- Harness for open or short between key switch and fuse
- Harness for open or short between warning chime unit and key switch

OK ↓

Go to Diagnostic Procedure 4, EL-102.



Trouble Diagnoses (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

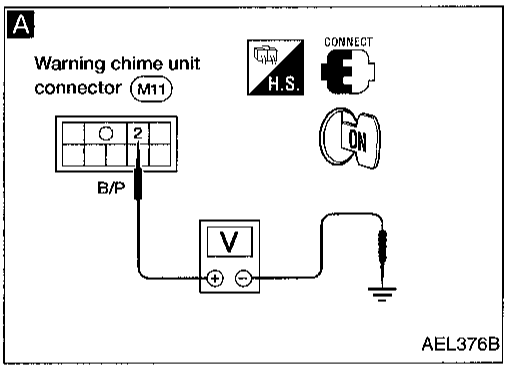
DIAGNOSTIC PROCEDURE 3

(Seat belt buckle switch input signal check)

Models with power door locks

A

CHECK SEAT BELT BUCKLE SWITCH INPUT SIGNAL.



1. Turn ignition switch ON.
2. Check voltage between control unit terminal (21) and ground.

Condition of seat belt buckle switch	Voltage [V]
Fastened	Approx. 12
Unfastened	0

NG → Check the following.
- Seat belt buckle switch Refer to "Electrical Components Inspection" (EL-103).
- Seat belt buckle switch ground circuit
- Harness for open or short between control unit and seat belt buckle switch

OK → Go to Diagnostic Procedure 4, EL-102.

Models without power door locks

A

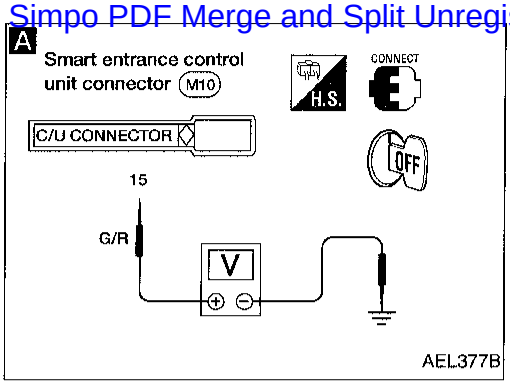
CHECK SEAT BELT BUCKLE SWITCH INPUT SIGNAL.

1. Turn ignition switch ON.
2. Check voltage between warning chime unit terminal (2) and ground.

Condition of seat belt buckle switch	Voltage [V]
Fastened	Approx. 12
Unfastened	0

NG → Check the following.
- Seat belt buckle switch Refer to "Electrical Components Inspection" (EL-103).
- Seat belt buckle switch ground circuit
- Harness for open or short between warning chime unit and seat belt buckle switch

OK → Go to Diagnostic Procedure 4, EL-102.



Trouble Diagnoses (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

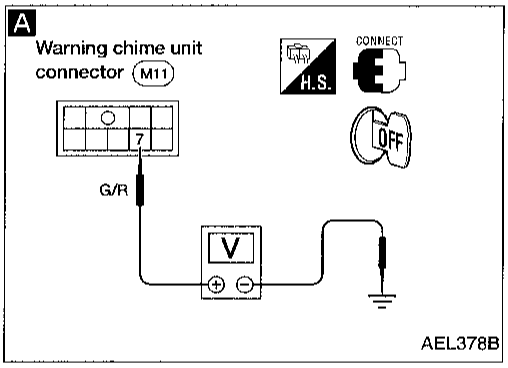
DIAGNOSTIC PROCEDURE 4

(Driver side door switch input signal check)

Models with power door locks

A

CHECK DOOR SWITCH INPUT SIGNAL.
Check voltage between control unit terminal (15) and ground.



Condition of driver's door	Voltage [V]
Driver side door is closed.	Approx. 12
Driver side door is open.	0

NG → Check the following.
- Driver side door switch Refer to "Electrical Components Inspection" (EL-103).
- Door switch ground condition
- Harness for open or short between control unit and door switch

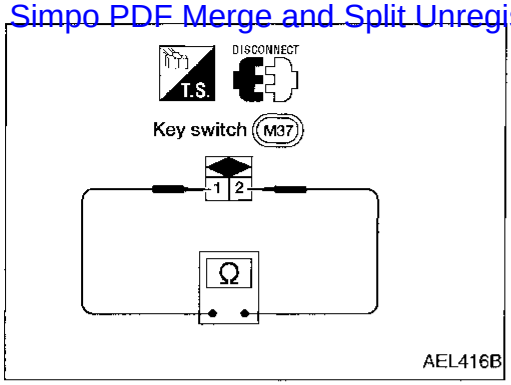
OK ↓

Replace smart entrance control unit.

Models without power door locks

A

CHECK DOOR SWITCH INPUT SIGNAL.
Check voltage between warning chime unit terminal (7) and ground.



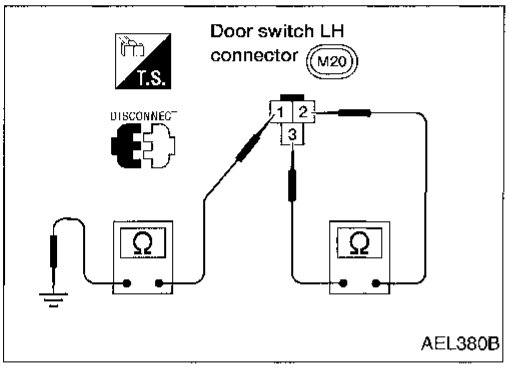
Condition of driver's door	Voltage [V]
Driver side door is closed.	Approx. 12
Driver side door is open.	0

NG → Check the following.
- Driver side door switch Refer to "Electrical Components Inspection" (EL-103).
- Door switch ground circuit
- Harness for open or short between warning chime unit and door switch

OK ↓

Replace warning chime unit.

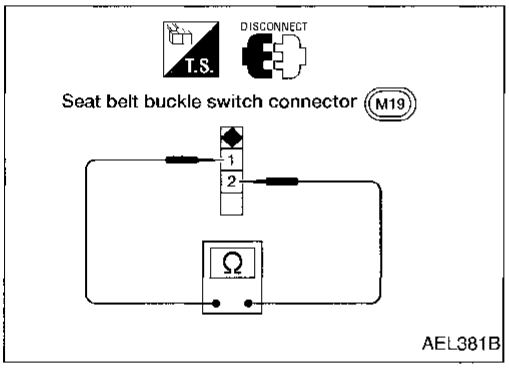
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Electrical Components Inspection

KEY SWITCH (insert)

Check continuity between terminals when key is inserted in ignition key cylinder and key is removed from ignition key cylinder.



Terminal No.	Condition	Continuity
① - ②	Key is inserted.	Yes
	Key is removed.	No

DRIVER SIDE DOOR SWITCH

Check continuity between terminals when door switch is pushed and released.

Terminal No.	Condition	Continuity
① - ground, ② - ③	Door switch is pushed.	No
	Door switch is released.	Yes

SEAT BELT BUCKLE SWITCH

Check continuity between terminals when seat belt is fastened and unfastened.

Terminal No.	Condition	Continuity
① - ②	Seat belt is fastened.	No
	Seat belt is unfastened.	Yes

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

System Description

WIPER OPERATION

The wiper switch is controlled by a lever built into the combination switch.
There are three wiper switch positions:

- LO speed
- HI speed
- INT (Intermittent) (If equipped).

With the ignition switch in the ON or START position, power is supplied:

- through 20A fuse [No. 6, located in the fuse block (J/B)]
- to wiper motor terminal Ⓑ and
- to wiper amplifier terminal ⑥ (with intermittent wipers).

Low and high speed wiper operation

Ground is supplied to wiper switch terminal ⑰ through body grounds E12 and E54.
When the wiper switch is placed in the LO position, ground is supplied:

- through terminal ⑭ of the wiper switch
- to wiper motor terminal Ⓛ.

With power and ground supplied, the wiper motor operates at low speed.
When the wiper switch is placed in the HI position, ground is supplied:

- through terminal ⑯ of the wiper switch
- to wiper motor terminal Ⓗ.

With power and ground supplied, the wiper motor operates at high speed.

Auto stop operation

With wiper switch turned OFF, wiper motor will continue to operate until wiper arms reach windshield base.
When wiper arms are not located at base of windshield with wiper switch OFF, ground is supplied:

- from terminal ⑭ of the wiper switch
- to wiper motor terminal Ⓛ, in order to continue wiper motor operation at low speed.

Ground is also supplied:

- through terminal ⑬ of the wiper switch
- to wiper amplifier terminal ④ (with intermittent wipers)
- through terminal ⑧ of the wiper amplifier (with intermittent wipers)
- to wiper motor terminal Ⓟ
- through terminal Ⓔ of the wiper motor, and
- through body grounds E12 and E54.

When wiper arms reach base of windshield, wiper motor terminals Ⓟ and Ⓑ are connected instead of terminals Ⓟ and Ⓔ. Wiper motor will then stop wiper arms at the PARK position.

Intermittent operation

The wiper motor operates the wiper arms one time at low speed at a set interval of approximately 3 to 13 seconds. This feature is controlled by the wiper amplifier.
When the wiper switch is placed in the INT position, ground is supplied:

- to wiper amplifier terminal ①
- from wiper switch terminal ⑮
- through body grounds E12 and E54
- to wiper motor terminal Ⓛ
- through the wiper switch terminal ⑭
- to wiper switch terminal ⑬
- through wiper amplifier terminal ④
- to wiper amplifier terminal ⑦
- through body grounds E12 and E54.

The desired interval time is input:

- to wiper amplifier terminal ②
- from wiper switch terminal ⑲
- to wiper switch terminal ⑳
- through body grounds E12 and E54.

The wiper motor operates at low speed at the desired time interval.

System Description (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

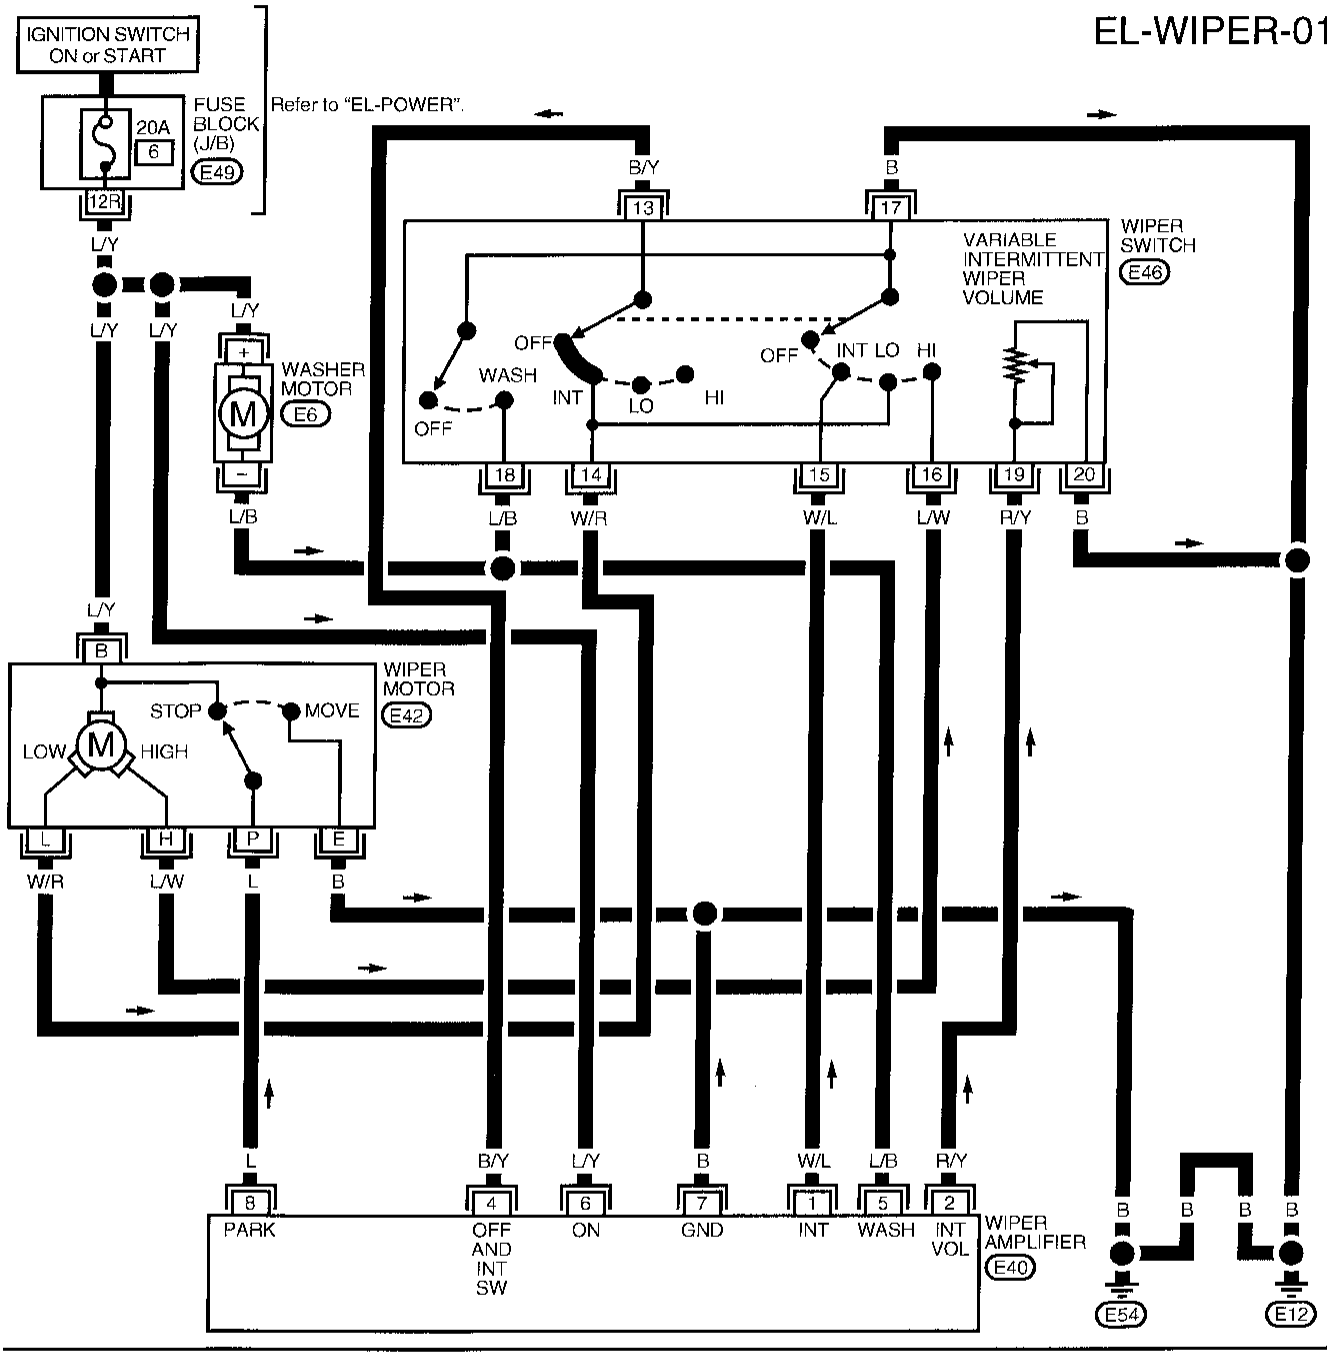
WASHER OPERATION

With the ignition switch in the ON or START position, power is supplied:

- through 20A fuse [No. 6], located in the fuse block (J/B)]
- to washer motor terminal ⊕.

When the lever is pulled to the WASH position, ground is supplied:

- to washer motor terminal ⊖, and
- to wiper amplifier terminal ⑤ (with intermittent wipers)
- from terminal ⑱ of the wiper switch
- through terminal ⑰ of the wiper switch, and
- through body grounds (E12) and (E54).



With power and ground supplied, the washer motor operates.

When the lever is pulled to the WASH position for one second or more, the wiper motor operates at low speed for approximately 3 seconds to clean windshield. This feature is controlled by the wiper amplifier in the same manner as the intermittent operation on vehicles equipped with intermittent wipers.

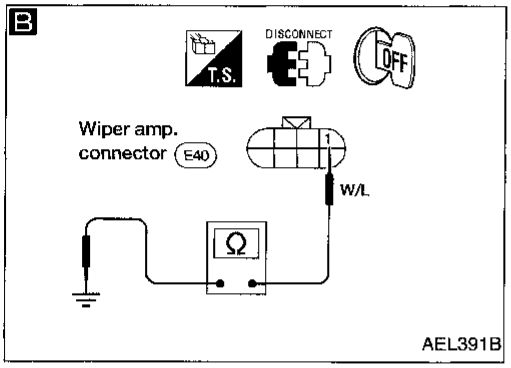
Trouble Diagnoses (With intermittent wipers)

DIAGNOSTIC PROCEDURE 1

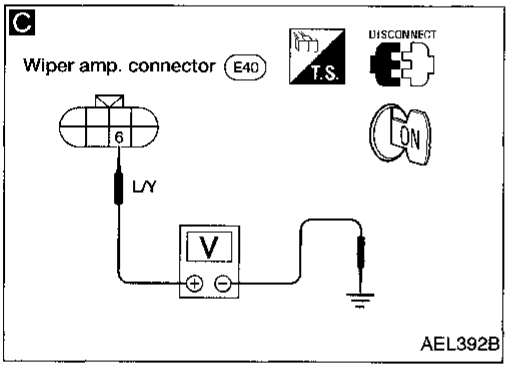


SYMPTOM: Intermittent wiper does not operate.

Check whether wiper operates with the wiper switch at LO position.

NG → Check the following.
- 20A fuse [No. 6, located in fuse block (J/B)]
- Wiper motor
- Wiper switch
- Harness for open or short

OK ↓



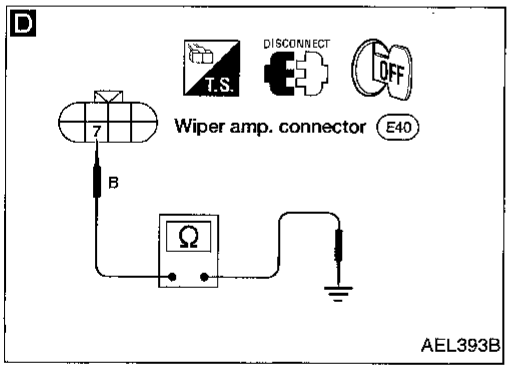
A

1. Turn front wiper switch to OFF.
2. Disconnect wiper amp. connector.
3. Check voltage between wiper amp. terminal ④ and ground.
   Battery voltage should exist.

NG → Check the following.
- Wiper switch
- Harness for open or short between wiper amp. terminal ④ and wiper switch terminal ⑬

OK ↓

B



CHECK INTERMITTENT SWITCH INPUT SIGNAL.

Check harness continuity between wiper amp. terminal ① and ground.

Condition of wiper switch	Continuity
OFF	No
INT	Yes

NG → Check the following.
- Wiper switch
- Harness for open or short between wiper amp. terminal ① and wiper switch terminal ⑮
- Ground circuit for front wiper switch terminal ⑰

OK ↓

C

CHECK WIPER AMP. POWER SUPPLY CIRCUIT.

Check voltage between wiper amp. terminal ⑥ and ground while ignition switch is in ON.
Battery voltage should exist.

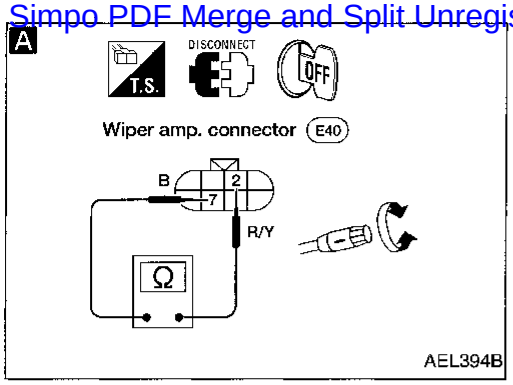
NG → Check the following.
- Harness for open or short between wiper amp. and fuse

OK ↓

D

CHECK WIPER AMP. GROUND CIRCUIT.

Check harness continuity between wiper amp. terminal ⑦ and body ground.
Continuity should exist.



NG → Repair harness or connector.

OK ↓

Replace wiper amp.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

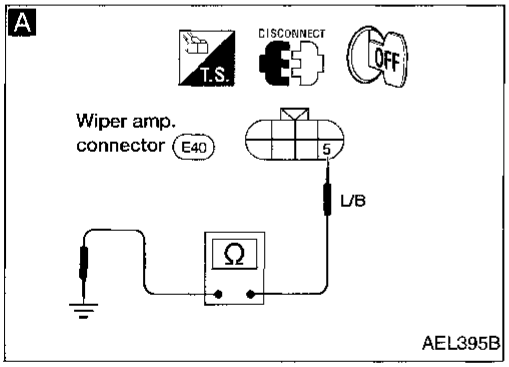
Trouble Diagnoses (With intermittent wipers) (Cont'd)

DIAGNOSTIC PROCEDURE 2

SYMPTOM: Intermittent time of wiper cannot be adjusted.

A

CHECK INTERMITTENT WIPER VOLUME INPUT SIGNAL.



1. Disconnect wiper amp. connector.
2. Measure resistance between wiper amp. terminals (2) and (7) while turning intermittent wiper volume.

Position of wiper knob	Resistance [Ω]
S	0
L	Approx. 1 k

OK → Replace wiper amp.

NG →

Check the following.
- Intermittent wiper volume
- Harness for open or short between wiper amp. terminal (2) and wiper switch terminal (19)
- Ground circuit for front wiper switch terminal (20)

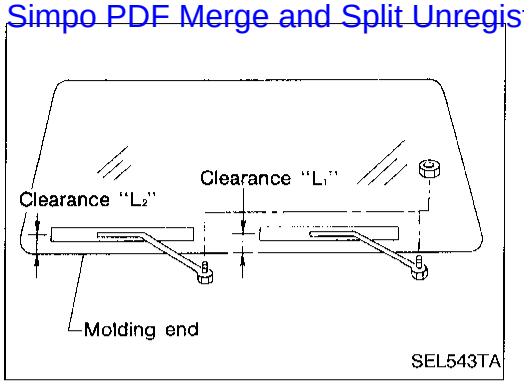
DIAGNOSTIC PROCEDURE 3

SYMPTOM: Wiper and washer activate individually but not in combination.

A

CHECK WASHER SWITCH INPUT SIGNAL.

1. Turn ignition switch and wiper switch OFF.
2. Disconnect wiper amp. connector.
3. Check harness continuity between wiper amp. terminal (5) and ground.



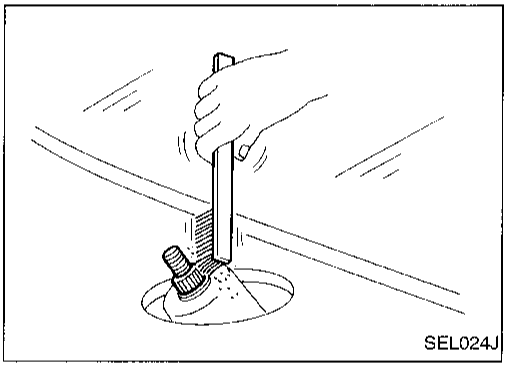
Condition of washer switch	Continuity
OFF	No
ON	Yes

NG → Check harness for open or short between wiper amp. terminal (5) and wiper switch terminal (18).

OK →

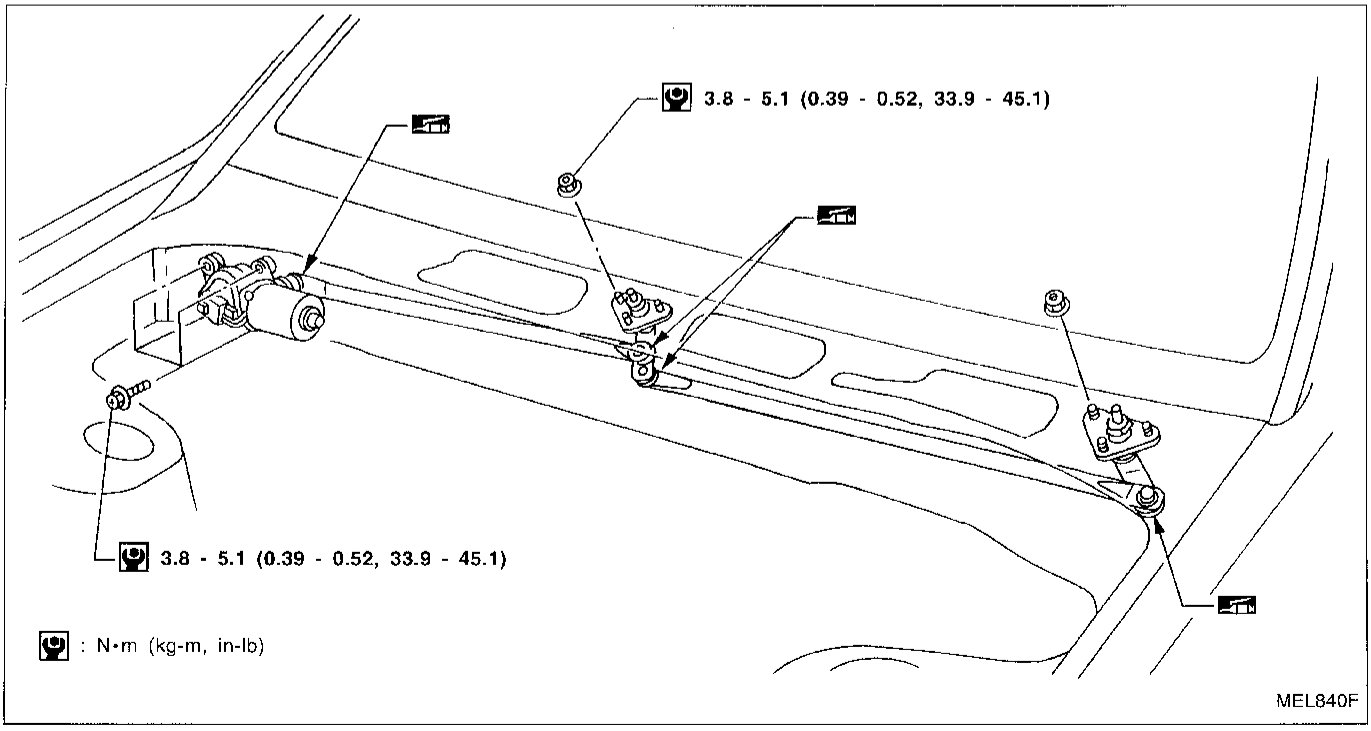
Go to DIAGNOSTIC PROCEDURE 1. NG → Replace wiper amp.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Removal and Installation

WIPER ARMS



1. Prior to wiper arm installation, turn on wiper switch to operate wiper motor and then turn it OFF (Auto Stop).
2. Lift the blade up and then set it down onto glass surface to set the blade center to clearance "L_1" & "L_2" immediately before tightening nut.
3. Eject washer fluid. Turn on wiper switch to operate wiper motor and then turn it OFF.
4. Ensure that wiper blades stop within clearance "L_1" & "L_2".
   Clearance "L_1": 25 mm (.98 in)
   Clearance "L_2": 25 mm (.98 in)

- Tighten wiper arm nuts to specified torque.
  Front wiper: 13 - 18 N·m (1.3 - 1.8 kg-m, 9 - 13 ft-lb)

- **Before reinstalling wiper arm, clean up the pivot area as illustrated. This will reduce possibility of wiper arm looseness.**

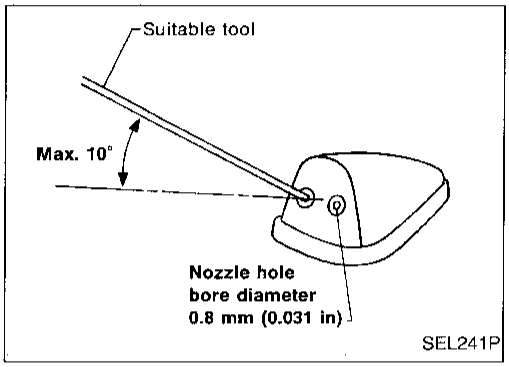
WIPER LINKAGE

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Removal and Installation (Cont'd)

Removal

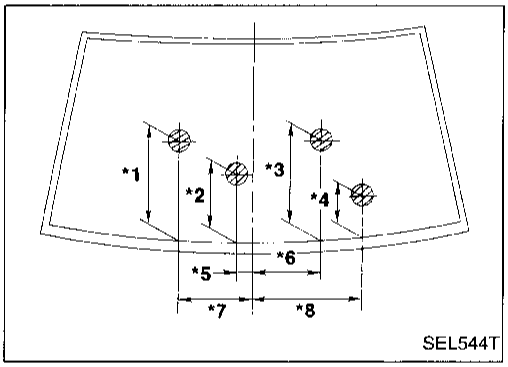
1. Remove 4 bolts that secure wiper motor.
2. Detach wiper motor from wiper linkage at ball joint.
3. Remove wiper linkage.



Be careful not to break ball joint rubber boot.

Installation

- Grease ball joint portion before installation.

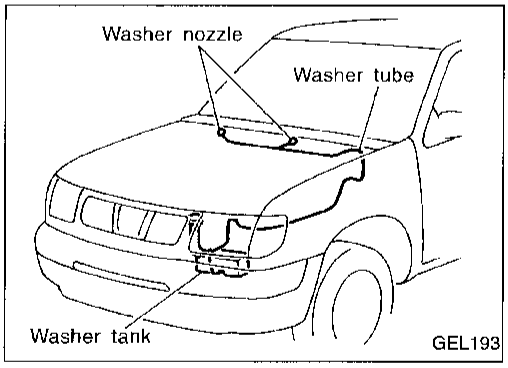


1. Installation is the reverse order of removal.

Washer Nozzle Adjustment

- Adjust washer nozzle with suitable tool as shown in the figure at left.

  Adjustable range: ±10°



Unit: mm (in)

*1	365 (14.37)	*5	60 (2.36)
*2	215 (8.46)	*6	225 (8.86)
*3	380 (14.96)	*7	210 (8.27)
*4	180 (7.09)	*8	460 (18.11)

*: The diameters of these circles are less than 80 mm (3.15 in).

System Description

Refer to Owner's Manual for audio system operating instructions.

BASE AUDIO SYSTEM

Power is supplied at all times:
- through 10A fuse (No. 41, located in the fuse and fusible link box)
- to radio terminal ⑥.

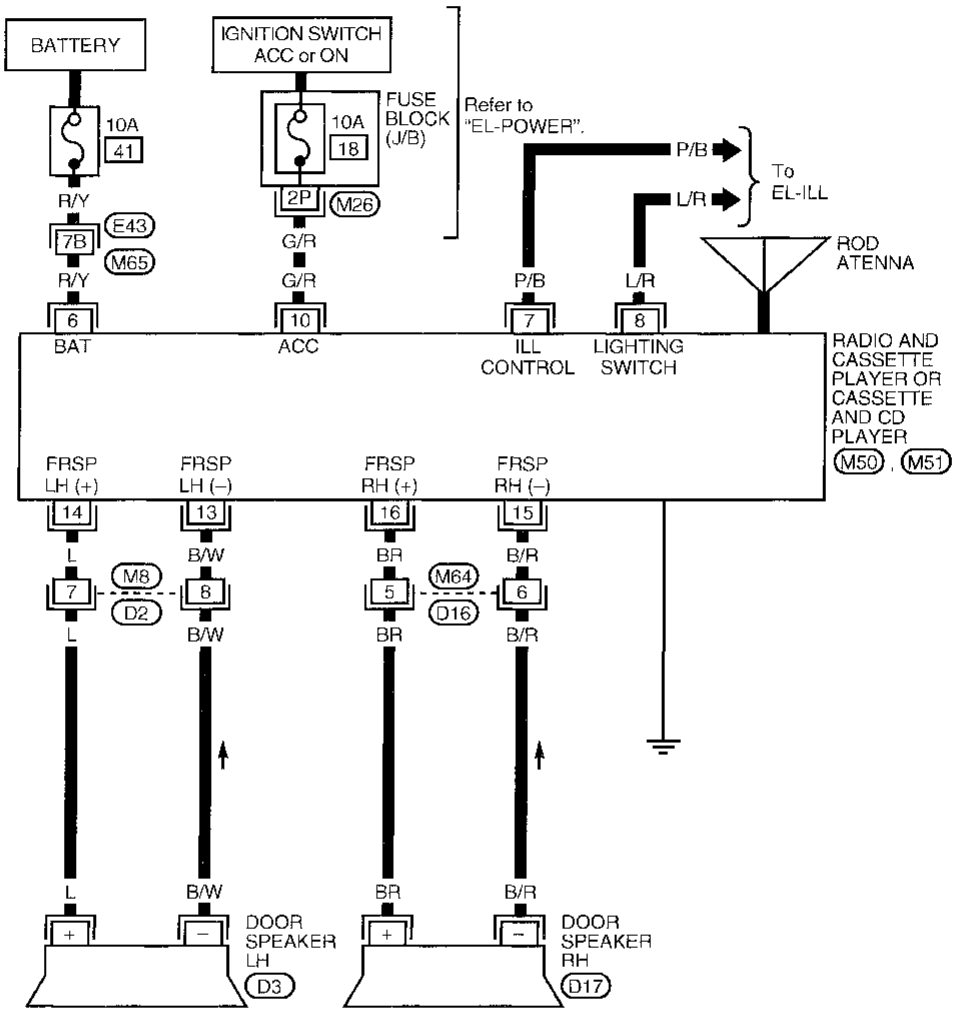
With the ignition switch in the ACC or ON position, power is supplied:
- through 10A fuse [No. 18, located in the fuse block (J/B)]
- to radio terminal ⑩.

Ground is supplied through the case of the radio.
When the radio power knob is pushed to the ON position, radio signals are supplied:
- through radio terminals ⑬, ⑭, ⑮, and ⑯
- to the door speakers.

PREMIUM AUDIO SYSTEM

Power is supplied at all times:
- through 10A fuse (No. 41, located in the fuse and fusible link box)
- to radio terminal ⑥.

With the ignition switch in the ACC or ON position, power is supplied:
- through 10A fuse [No. 18, located in the fuse block (J/B)]
- to radio terminal ⑩.



Ground is supplied through the case of the radio.
When the radio power knob is pushed to the ON position, radio signals are supplied:
- through radio terminals ①, ②, ③, ④, ⑬, ⑭, ⑮, and ⑯
- to the door speakers or tweeters.

Trouble Diagnoses

RADIO

Symptom	Possible causes	Repair order
Radio inoperative (no digital display and no sound from speakers).	1. 10A fuse 2. Poor radio case ground 3. Radio	1. Check 10A fuse [No. 18, located in fuse block (J/B)]. Turn ignition switch ON and verify that battery positive voltage is present at terminal ⑩ of radio. 2. Check radio case ground. 3. Remove radio for repair.
Radio controls are operational, but no sound is heard from any speaker.	1. Radio output 2. Radio	1. Check radio output voltages. 2. Remove radio for repair.
Radio presets are lost when ignition switch is turned OFF.	1. 10A fuse 2. Radio	1. Check 10A fuse (No. 41, located in fuse and fusible link box) and verify that battery positive voltage is present at terminal ⑥ of radio. 2. Remove radio for repair.
Individual speaker is noisy or inoperative.	1. Speaker 2. Radio output 3. Speaker circuit 4. Radio	1. Check speaker. 2. Check radio output voltages. 3. Check wires for open or short between radio and speaker. 4. Remove radio for repair.
Radio stations are weak or noisy	1. Antenna 2. Poor radio ground 3. Radio	1. Check antenna. 2. Check radio ground. 3. Remove radio for repair.
Radio generates noise in AM and FM modes with engine running.	1. Poor radio ground 2. Loose or missing ground bonding straps 3. Ignition condenser 4. Generator 5. Ignition coil or secondary wiring 6. Radio	1. Check radio ground. 2. Check ground bonding straps. 3. Replace ignition condenser. 4. Check generator. 5. Check ignition coil and secondary wiring. 6. Remove radio for repair.
Radio generates noise in AM and FM modes with accessories on (switch pops and motor noise).	1. Poor radio ground 2. Antenna 3. Accessory ground 4. Faulty accessory	1. Check radio ground. 2. Check antenna. 3. Check accessory ground. 4. Replace accessory.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection

SPEAKER

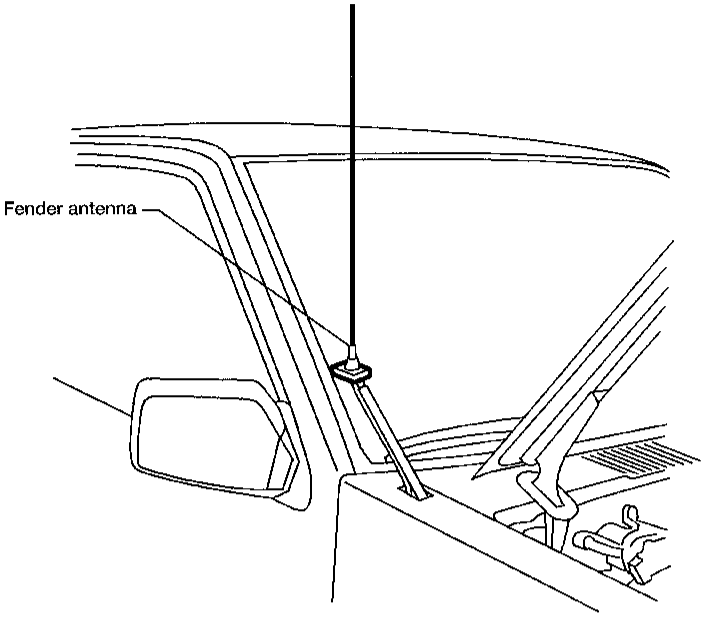
1. Disconnect speaker harness connector.
2. Measure the resistance between speaker terminals ⊕ and ⊖.
- The resistance should be 2 - 4Ω.
3. Using jumper wires, momentarily connect a 9V battery between speaker terminals ⊕ and ⊖.
- A momentary hum or pop should be heard.

ANTENNA

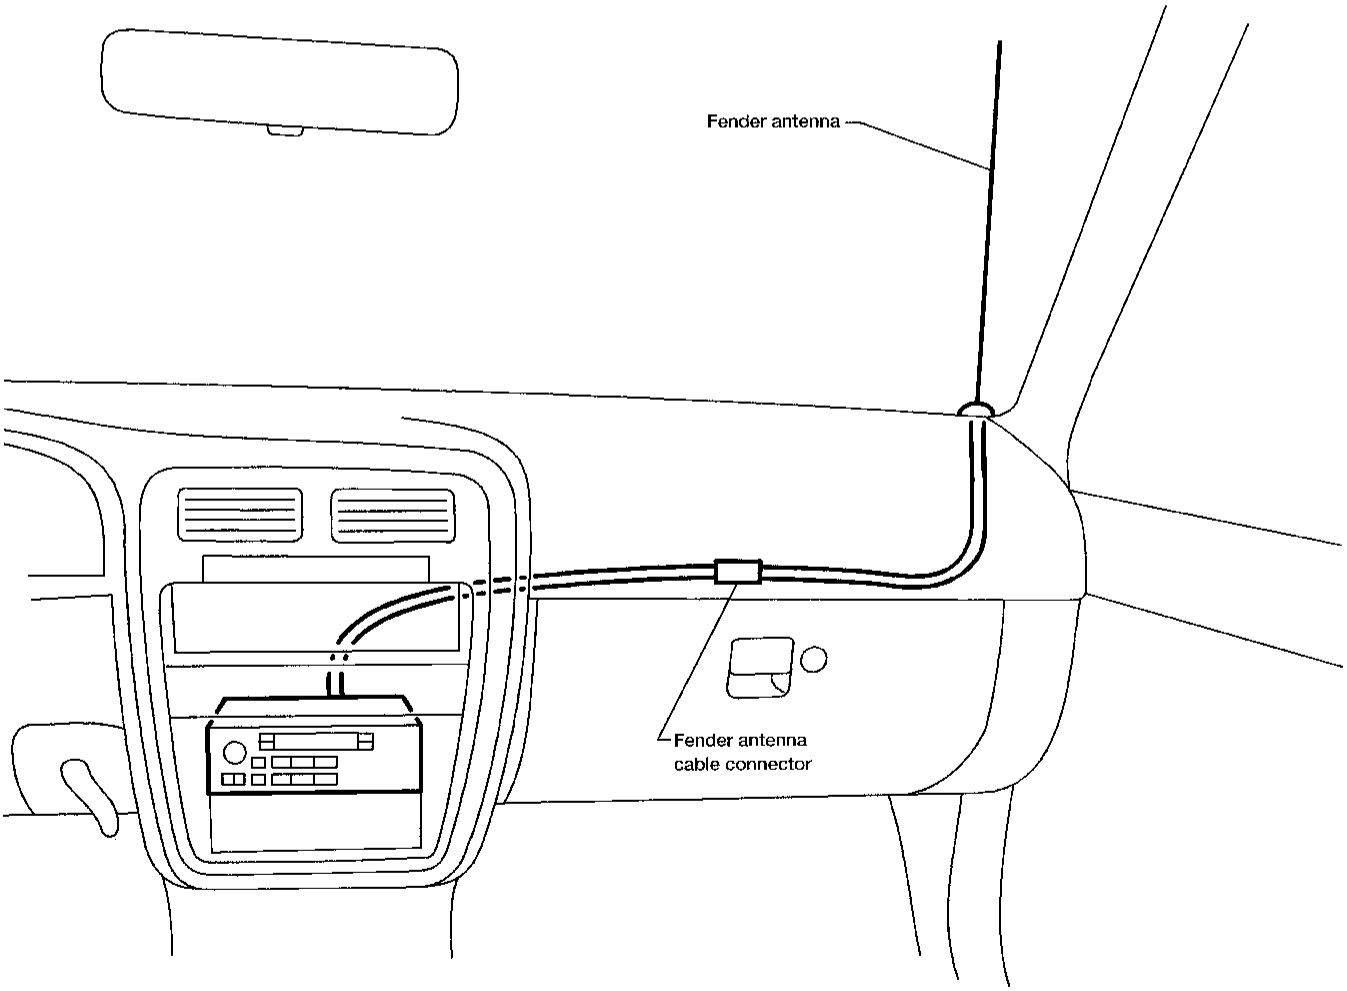
Using a jumper wire, clip an auxiliary ground between antenna and body.
- If reception improves, check antenna ground (at body surface).
- If reception does not improve, check main feeder cable for short circuit or open circuit.

RADIO

All voltage inspections are made with:
- Ignition switch ON or ACC
- Radio ON
- Radio connected (If removed for inspection, supply a ground to the case using a jumper wire).



RADIO VOLTAGES



Terminal	Voltage (V)	
	Base Audio System	Premium Audio System
1	—	5 - 7.5
2	—	5 - 7.5
3	—	5 - 7.5

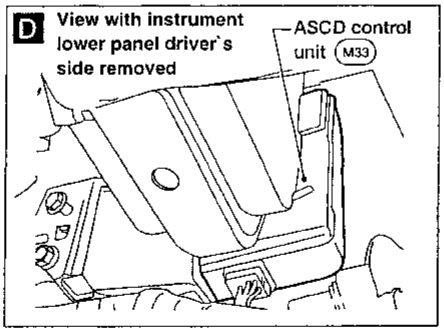
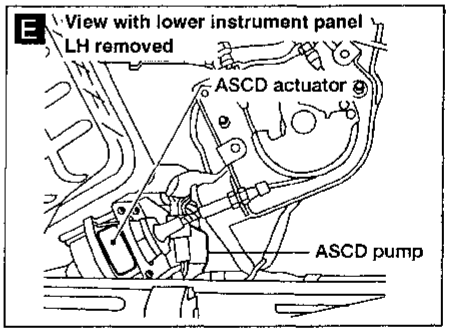
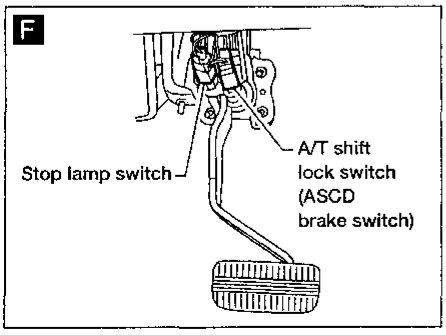
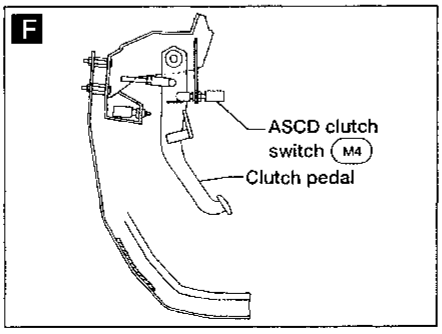
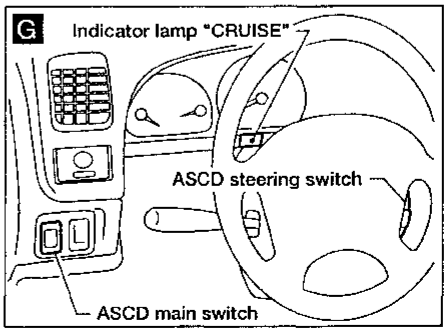
Component Parts and Harness Connector Location











AEL688B

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

System Description

Refer to Owner's Manual for ASCD operating instructions.
When the ignition switch is in the ON or START position, power is supplied:
- through 7.5A fuse [No. 5, located in the fuse block (J/B)]
- to ASCD main switch terminal ①
- to ASCD hold relay terminal ⑤
- to ASCD brake switch terminal ①
- through ASCD brake switch terminal ②
- to ASCD hold relay terminal ⑦.

When ASCD main switch is in the ON position, power is supplied:
- from ASCD main switch terminal ③
- to ASCD hold relay terminal ②.

Ground is supplied:
- to ASCD hold relay terminal ①
- through body grounds M14 and M68 .

With power and ground supplied, ASCD hold relay is energized, and then power is supplied:
- from ASCD hold relay terminal ③
- to ASCD control unit terminal ④ and
- to ASCD main switch terminal ②.

After the ASCD main switch is released, power remains supplied:
- to the coil circuit of ASCD hold relay
- through ASCD main switch terminal ③.

This power supply is kept until one of following conditions exists.
- Ignition switch is returned to the ACC or OFF position.
- ASCD main switch is pushed to OFF position.

When ASCD hold relay is energized, power is also supplied to ASCD control unit terminal ⑤
- through ASCD brake switch and
- ASCD clutch switch (with M/T) or
- Park/neutral position relay (with A/T).

Ground is supplied:
- to ASCD control unit terminal ③
- through body grounds M14 and M68 .

INPUTS

At this point, the system is ready to activate or deactivate, based on inputs from the following:
- speedometer in the combination meter
- stop lamp switch
- ASCD steering switch
- ASCD clutch switch (with M/T) or
- park/neutral position relay (with A/T)
- ASCD brake switch.

A vehicle speed input is supplied:
- to ASCD control unit terminal ⑦
- from terminal ㉞ of the combination meter.

Power is supplied at all times:
- to stop lamp switch terminal ①
- through 10A fuse [No. 22, located in the fuse block (J/B)].

When the brake pedal is depressed, power is supplied:
- from terminal ② of the stop lamp switch
- to ASCD control unit terminal ⑪.

Power is supplied at all times:
- through 10A fuse [No. 32, located in the fuse and fusible link box]
- to horn relay terminal ②
- through terminal ① of the horn relay
- to ASCD steering switch terminal ③.

When the SET/COAST switch is depressed, power is supplied:
- from terminal ② of the ASCD steering switch
- to ASCD control unit terminal ②.

System Description (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

When the RESUME/ACCEL switch is depressed, power is supplied:
- from terminal ① of the ASCD steering switch
- to ASCD control unit terminal ①.

When the ASCD CANCEL switch is depressed, power is supplied:
- to ASCD control unit terminals ① and ②.

When the system is activated, power is supplied:
- from ASCD clutch switch terminal ② (with M/T) or
- from park/neutral position relay terminal ④ (with A/T)
- to ASCD control unit terminal ⑤.

Power is interrupted when:
- the ASCD main switch is turned to OFF
- the ASCD clutch switch is depressed (with M/T),
- the A/T selector lever is placed in P or N (with A/T) or
- the ASCD brake switch is depressed.

OUTPUTS

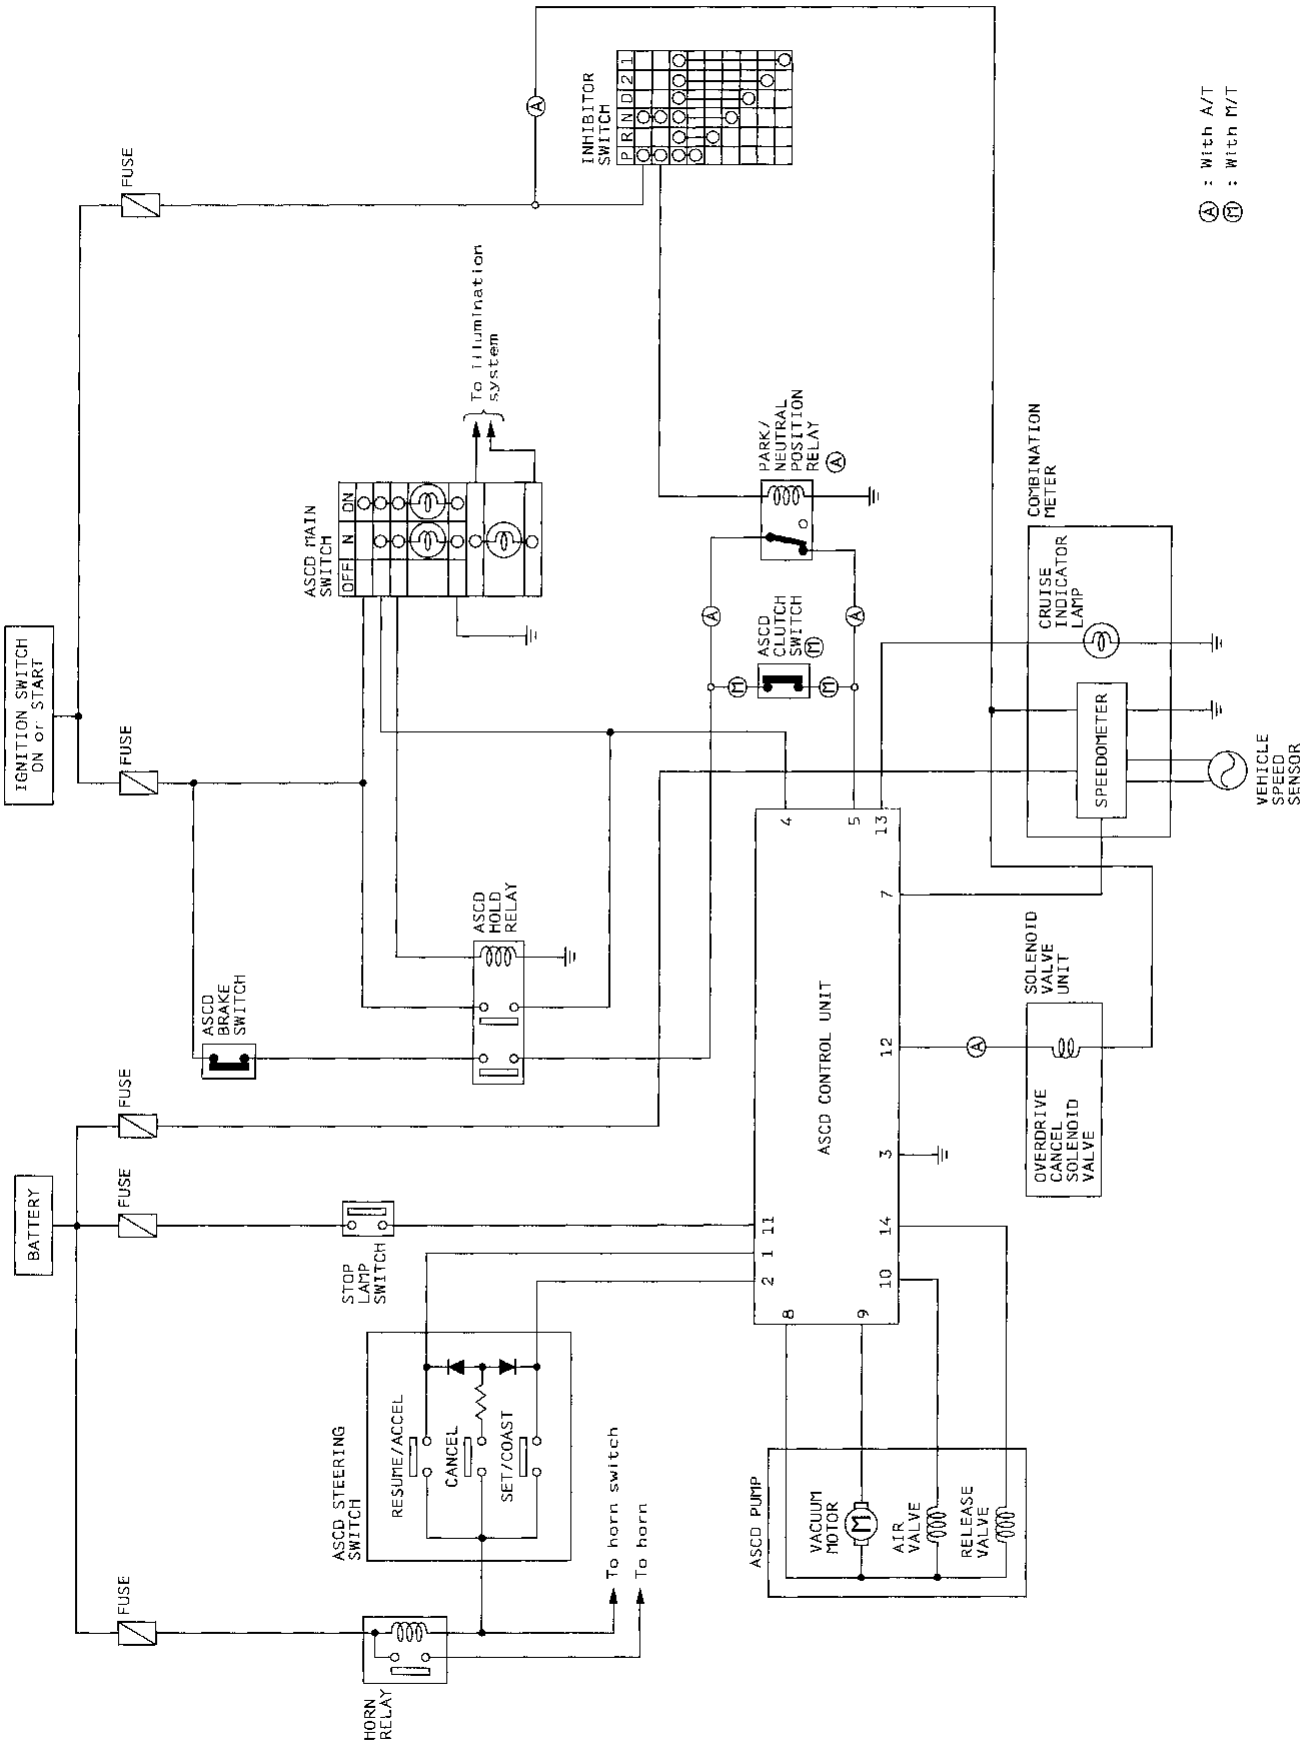
The ASCD actuator controls the throttle drum via the ASCD wire based on inputs from the ASCD control unit.
The ASCD pump consists of a vacuum motor, an air valve, and a release valve.
Power is supplied:
- from terminal ⑧ of the ASCD control unit
- to ASCD pump terminal ①.

Ground is supplied to the vacuum motor:
- from terminal ⑨ of the ASCD control unit
- to ASCD pump terminal ②.

Ground is supplied to the air valve:
- from terminal ⑩ of the ASCD control unit
- to ASCD pump terminal ③.

Ground is supplied to the release valve:
- from terminal ⑭ of the ASCD control unit
- to ASCD pump terminal ④.

When the system is activated, power is supplied:
- from terminal ⑬ of the ASCD control unit
- to combination meter terminal ㉚.



Ground is supplied:
- to combination meter terminal ㉝
- through body grounds (M14) and (M68).

With power and ground supplied, the CRUISE indicator illuminates.
When vehicle speed is approximately 8 km/h (5 MPH) below set speed on A/T models, ground is supplied:
- to terminal ② of the solenoid valve unit
- from ASCD control unit terminal ⑫.

When this occurs, the overdrive is canceled.
When vehicle speed reaches approximately 3 km/h (2 MPH) above set speed, overdrive is reactivated.

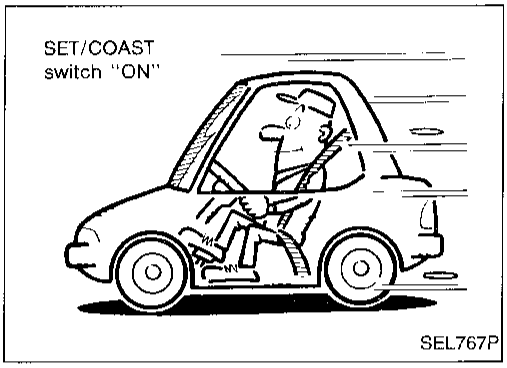
Fail-Safe System Description

When the fail-safe system senses a malfunction, it deactivates ASCD operation. The CRUISE indicator in the combination meter will then flash.

MALFUNCTION DETECTION CONDITIONS

Detection conditions	ASCD operation during malfunction detection
● ASCD steering (RESUME/ACCEL, CANCEL, SET/COAST) switch is stuck. ● Vacuum motor ground circuit or power circuit is open or shorted. ● Air valve ground circuit or power circuit is open or shorted. ● Release valve ground circuit or power circuit is open or shorted. ● Vehicle speed sensor is faulty. ● ASCD control unit internal circuit is malfunctioning.	● ASCD is deactivated. ● Vehicle speed memory is canceled.
● ASCD brake switch or stop lamp switch is faulty.	● ASCD is deactivated. ● Vehicle speed memory is not canceled.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



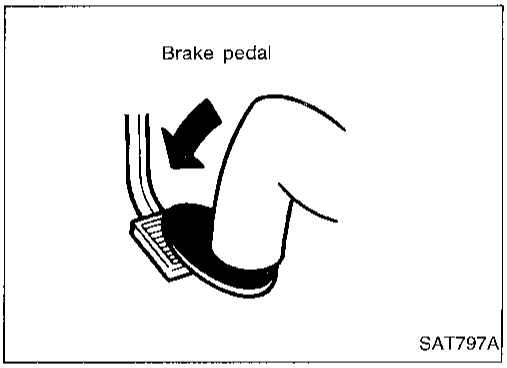
SEL174V

Fail-Safe System Check

1. Turn ignition switch ON.
2. Turn ASCD main switch to ON position and check if the "cruise indicator" blinks.

If the indicator lamp blinks, check the following.

- ASCD steering switch. Refer to "DIAGNOSTIC PROCEDURE 5" (EL-136).



SEL767P

3. Drive the vehicle at more than 48 km/h (30 MPH) and push SET/COAST switch.

If the indicator lamp blinks, check the following:

- Vehicle speed sensor. Refer to "DIAGNOSTIC PROCEDURE 6" (EL-137).
- ASCD pump circuit. Refer to "DIAGNOSTIC PROCEDURE 7" (EL-138).
- Replace control unit.

SAT797A

4. Depress brake pedal slowly (brake pedal should be depressed more than 5 seconds).

If the indicator lamp blinks, check the following:

- ASCD brake/stop lamp switch. Refer to "DIAGNOSTIC PROCEDURE 4" (EL-135).

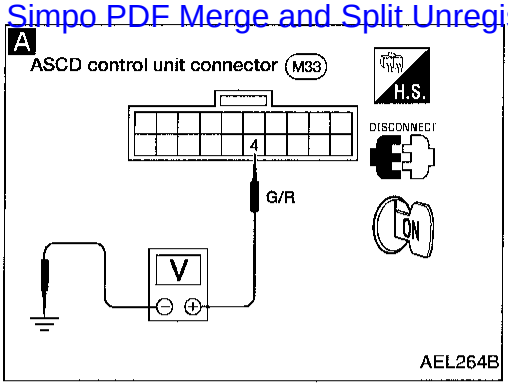
5. END. (System is OK.)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

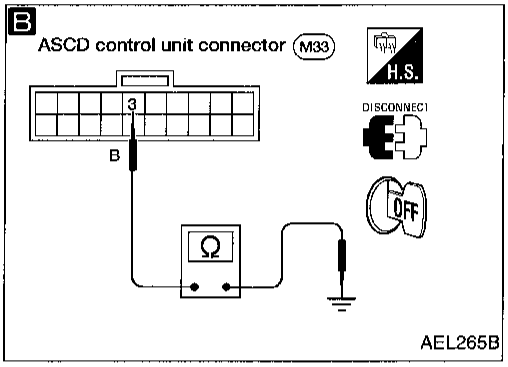
Trouble Diagnoses

SYMPTOM CHART

PROCEDURE	—	Diagnostic procedure							
REFERENCE PAGE	EL-131	EL-133	EL-133	EL-134	EL-135	EL-136	EL-137	EL-138	EL-139
SYMPTOM	Fail-safe system check	DIAGNOSTIC PROCEDURE 1 (POWER SUPPLY AND GROUND CIRCUIT CHECK)	DIAGNOSTIC PROCEDURE 2 (ASCD MAIN SWITCH CHECK)	DIAGNOSTIC PROCEDURE 3 (ASCD HOLD RELAY CHECK)	DIAGNOSTIC PROCEDURE 4 (ASCD BRAKE/STOP LAMP SWITCH CHECK)	DIAGNOSTIC PROCEDURE 5 (ASCD STEERING SWITCH CHECK)	DIAGNOSTIC PROCEDURE 6 (VEHICLE SPEED SENSOR CHECK)	DIAGNOSTIC PROCEDURE 7 (ASCD PUMP CIRCUIT CHECK)	DIAGNOSTIC PROCEDURE 8 (ASCD ACTUATOR/PUMP CHECK)
ASCD cannot be set. ("CRUISE" indicator lamp does not blink.)		X	X	X		X	X		
ASCD cannot be set. ("CRUISE" indicator lamp blinks.★1)	X				X	X	X	X	
Vehicle speed does not decrease after SET/COAST switch has been pressed.						X			X
Vehicle speed does not return to the set speed after RESUME/ACCEL switch has been pressed.★2						X			X
Vehicle speed does not increase after RESUME/ACCEL switch has been pressed.						X			X
System is not released after CANCEL switch (steering) has been pressed.						X			X
Large difference between set speed and actual vehicle speed.									X
Deceleration is greatest immediately after ASCD has been set.									X



X: Applicable



★1: It indicates that system is in fail-safe. After completing diagnostic procedures, perform "Fail-Safe System Check" (EL-131) to verify repairs.

★2: If vehicle speed is greater than 48 km/h (30 MPH) after system has been released, pressing RESUME/ACCEL switch returns vehicle speed to the set speed previously achieved. However, doing so when the ASCD main switch is turned to "OFF", vehicle speed will not return to the set speed since the memory is canceled.

Trouble Diagnoses (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

DIAGNOSTIC PROCEDURE 1

(POWER SUPPLY AND GROUND CIRCUIT CHECK)

1. Turn ignition switch ON.
2. Turn ASCD main switch "ON" to make sure indicators illuminate.

NG → Go to DIAGNOSTIC PROCEDURE 2 (ASCD MAIN SWITCH CHECK).

OK ↓

A

CHECK POWER SUPPLY CIRCUIT FOR ASCD CONTROL UNIT.

1. Disconnect ASCD control unit connector.
2. Turn ignition switch ON.
3. Turn ASCD main switch "ON".
4. Check voltage between control unit connector terminal ④ and ground.
   Battery voltage should exist.

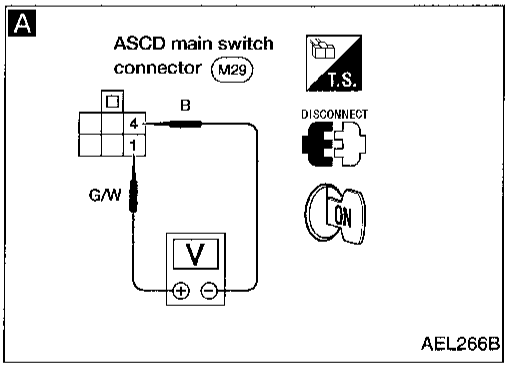
   Refer to wiring diagram in EL-126.

NG → Go to DIAGNOSTIC PROCEDURE 3 (ASCD HOLD RELAY CHECK). Refer to EL-134.

OK ↓

B

CHECK GROUND CIRCUIT FOR ASCD CONTROL UNIT.



Check continuity between ASCD control unit harness terminal ③ and body ground.

Refer to wiring diagram in EL-129.

NG → Repair harness.

OK ↓

Power supply and ground circuit is ok.

DIAGNOSTIC PROCEDURE 2

(ASCD MAIN SWITCH CHECK)

A

CHECK POWER SUPPLY FOR ASCD MAIN SWITCH.

1. Disconnect ASCD main switch connector.
2. Measure voltage between main switch terminals ① and ④.
   Battery voltage should exist.

   Refer to wiring diagram in EL-126.

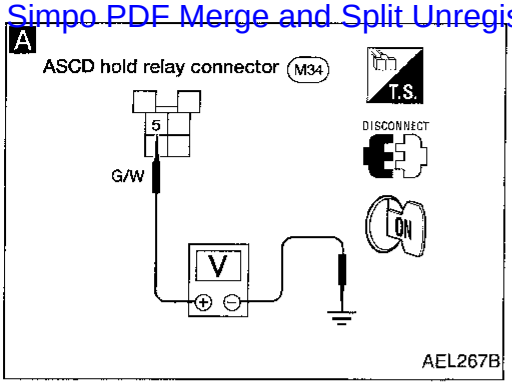
NG → Check the following.
- 7.5A fuse [No. 5], located in the fuse block (J/B)]
- Harness for open or short between fuse and ASCD main switch
- Ground circuit for ASCD main switch

OK ↓

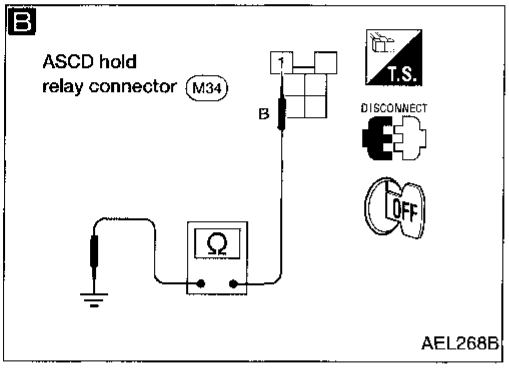
CHECK ASCD MAIN SWITCH.
Refer to "Electrical Components Inspection", EL-141.

NG → Replace ASCD main switch.

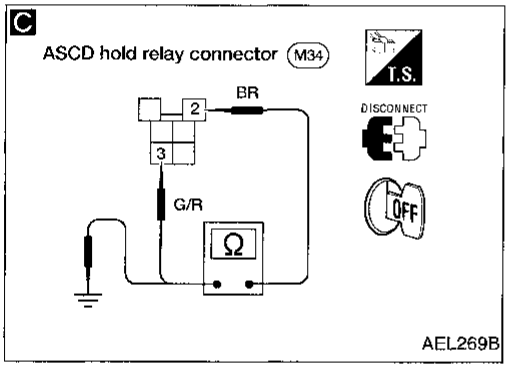
OK ↓



Go to DIAGNOSTIC PROCEDURE 3 (ASCD HOLD RELAY CHECK), Refer to EL-134.



Trouble Diagnoses (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

DIAGNOSTIC PROCEDURE 3

(ASCD HOLD RELAY CHECK)

A

CHECK POWER SUPPLY CIRCUIT FOR ASCD HOLD RELAY.
1. Disconnect ASCD hold relay.
2. Do approx. 12 volts exist between ASCD hold relay terminal (5) and ground?

Refer to wiring diagram in EL-126.

No → Check the following.
- 7.5A fuse [No. 5], located in the fuse block (J/B)]
- Harness for open or short between fuse and ASCD hold relay

Yes ↓

B

CHECK GROUND CIRCUIT FOR ASCD HOLD RELAY.
Does continuity exist between ASCD hold relay harness connector terminal (1) and ground?

No → Repair harness.

Yes ↓

CHECK ASCD MAIN SWITCH.
Refer to "Electrical Components Inspection", EL-141.

NG → Replace ASCD main switch.

OK ↓

C

CHECK ASCD HOLD RELAY CIRCUIT.
1. Check continuity between ASCD hold relay terminals (2) and (3).

Continuity should exist.

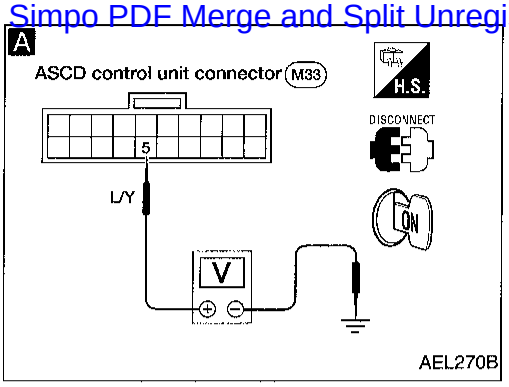
2. Check continuity between ASCD hold relay terminal (2) and ground.

Continuity should not exist.

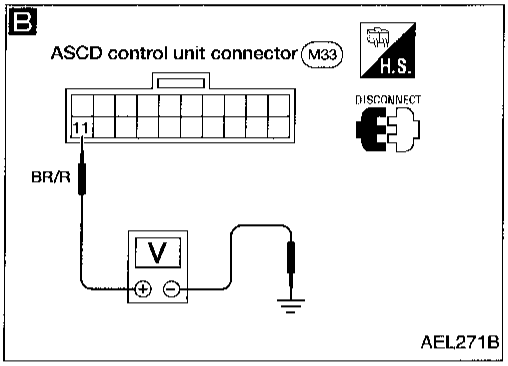
NG → Repair harness.

No ↓

CHECK ASCD HOLD RELAY.



NG → Replace ASCD hold relay.



OK ↓

ASCD hold relay circuit is OK.

Trouble Diagnoses (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

DIAGNOSTIC PROCEDURE 4

(ASCD BRAKE/STOP LAMP SWITCH CHECK)

A

CHECK ASCD BRAKE SWITCH CIRCUIT.

1. Disconnect control unit connector.
2. Turn ignition switch ON.
3. Turn ASCD main switch "ON".
4. Check voltage between control unit connector terminal (5) and ground.
   When brake pedal or clutch pedal (M/T) is depressed or A/T selector lever (A/T) is in "N" or "P" range:
   Approx. 0V
   When brake pedal and clutch pedal (M/T) are released or A/T selector lever (A/T) is not in "N" or "P" range:
   Battery voltage should exist.

   Refer to wiring diagram in EL-127.

NG → Check the following.
- ASCD brake switch
  Refer to "Electrical Components Inspection", EL-141.
- ASCD clutch switch (with M/T)
  Refer to "Electrical Components Inspection", EL-141.
- Inhibitor switch (with A/T)
  Refer to "Electrical Components Inspection", EL-141.
- ASCD hold relay
- Harness for open or short

OK ↓

B

CHECK STOP LAMP SWITCH CIRCUIT.

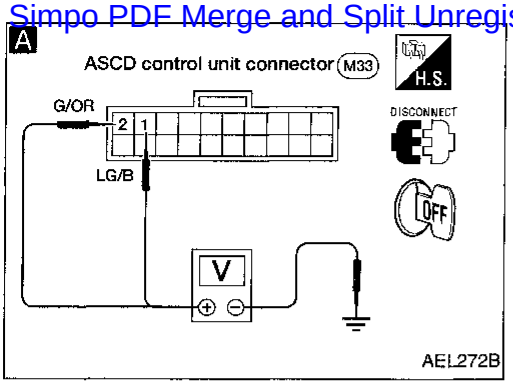
1. Disconnect control unit connector.
2. Check voltage between control unit terminal (11) and ground.

Condition		Voltage [V]
Stop lamp switch	Depressed	Approx. 12
	Released	0

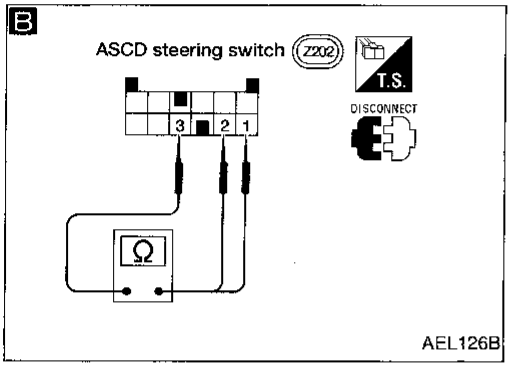
Refer to wiring diagram in EL-127.

NG → Check the following.
- 10A fuse [No. 22, located in the fuse block (J/B)]
- Harness for open or short between ASCD control unit and stop lamp switch
- Stop lamp switch
  Refer to "Electrical Components Inspection", EL-141.

OK ↓



ASCD brake/stop lamp switch circuit switch is OK.



Trouble Diagnoses (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

DIAGNOSTIC PROCEDURE 5

(ASCD STEERING SWITCH CHECK)

A

CHECK ASCD STEERING SWITCH CIRCUIT FOR ASCD CONTROL UNIT.

1. Disconnect control unit connector.
2. Check voltage between control unit harness terminals and ground.

	Terminal No.		Switch condition	
	⊕	⊖	Pressed	Released
SET/ COAST SW	②	Ground	12V	0V
RESUME/ ACC SW	①	Ground	12V	0V
CANCEL SW	②	Ground	12V	0V
	①	Ground	12V	0V

Refer to wiring diagram in EL-128.

OK → ASCD steering switch is OK.

NG ↓

CHECK POWER SUPPLY FOR ASCD STEERING SWITCH.
Does horn work?

NG → Check the following.
- 10A fuse (No. 32, located in the fuse and fusible link box)
- Horn relay
- Harness for open or short between horn and fuse

OK ↓

B

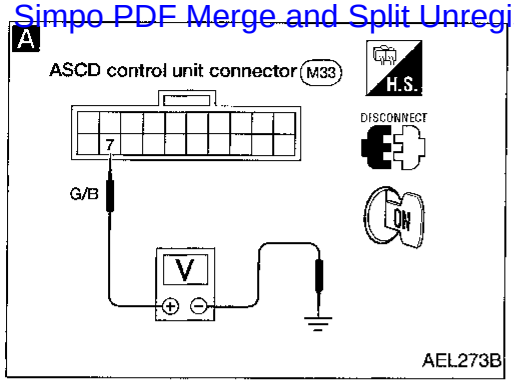
CHECK ASCD STEERING SWITCH.

1. Disconnect ASCD steering switch.
2. Check continuity between terminals by pushing each switch.

Switch	Terminal ③	②	①
RESUME/ ACCEL	○		○
SET/ COAST	○	○	
CANCEL	○	▶|○	
	○	▶	○

NG → Replace ASCD steering switch.

OK ↓



Check harness for open or short between ASCD steering switch and ASCD control unit.

Trouble Diagnoses (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

DIAGNOSTIC PROCEDURE 6

(VEHICLE SPEED SENSOR CHECK)

A

CHECK VEHICLE SPEED SENSOR CIRCUIT.

1. Apply wheel chocks and jack up drive wheel.
2. Disconnect control unit connector.
3. Connect voltmeter between control unit terminal ⑦ and ground.
4. Slowly turn drive wheel.
5. Check deflection of voltmeter pointer.

Refer to wiring diagram in EL-129.

OK → Vehicle speed sensor is OK.

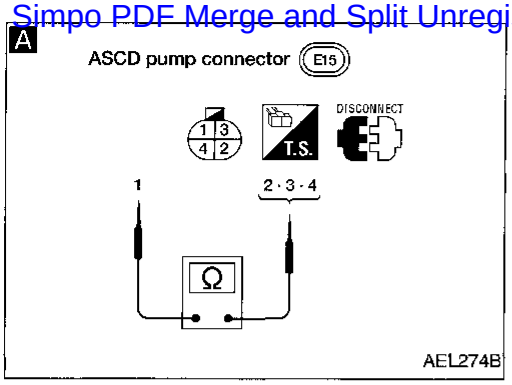
NG ↓

Does speedometer operate normally?

No → Check speedometer and vehicle speed sensor circuit. Refer to EL-75.

Yes ↓

Check harness for open or short between ASCD control unit terminal ⑦ and combination meter terminal ㉞.



Trouble Diagnoses (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

DIAGNOSTIC PROCEDURE 7

(ASCD PUMP CIRCUIT CHECK)

A

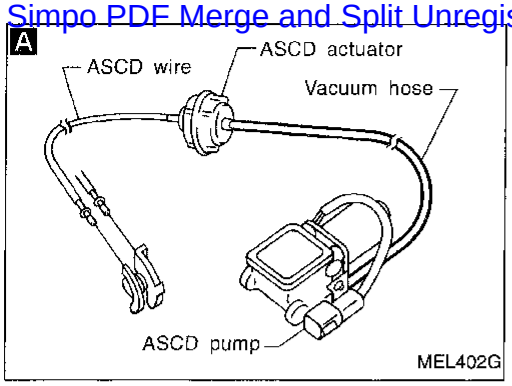
A

CHECK ASCD PUMP.

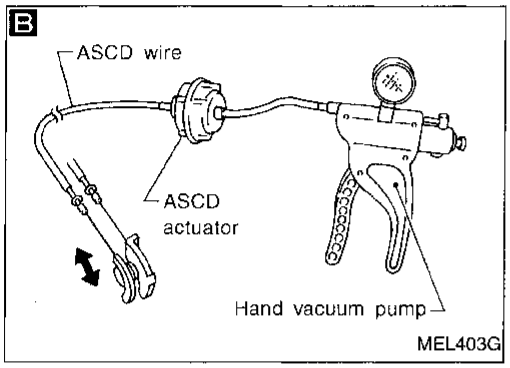
1. Disconnect ASCD pump connector.
2. Measure resistance between ASCD pump terminals ①and ②, ③, ④.

Terminals		Resistance [Ω]
①	②	Approx. 18.2
	③	Approx. 65.5
	④	Approx. 65.5

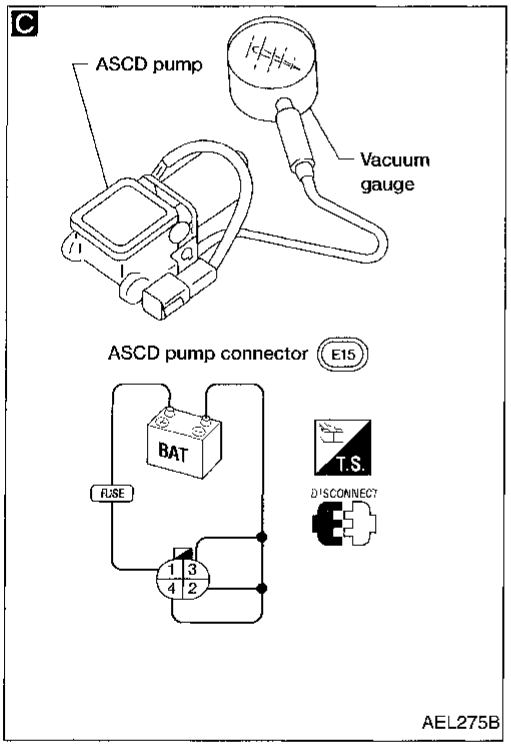
Refer to wiring diagram in EL-128.



NG → Replace ASCD pump.



OK ↓



Check harness for open or short between ASCD pump and ASCD control unit.

Trouble Diagnoses (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

DIAGNOSTIC PROCEDURE 8

(ASCD ACTUATOR/PUMP CHECK)

A

CHECK VACUUM HOSE.
Check vacuum hose (between ASCD actuator and ASCD pump) for breakage, cracks or fracture.

NG → Repair or replace hose.

OK ↓

CHECK ASCD WIRE.
Check wire for improper installation, rust formation or breaks.

NG → Repair or replace wire. Refer to "ASCD Wire Adjustment", EL-140.

OK ↓

B

CHECK ASCD ACTUATOR.
1. Disconnect vacuum hose from ASCD actuator.
2. Apply –40 kPa (–0.400 bar, –0.41 kg/cm^2, –5.8 psi) vacuum to ASCD actuator with hand vacuum pump.

ASCD wire should move to pull throttle drum.

3. Wait 10 seconds and check for decrease in vacuum pressure.

Vacuum pressure decrease:
Less than 2.7 kPa (0.0270 bar, 0.028 kg/cm^2, 0.39 psi)

NG → Replace ASCD actuator.

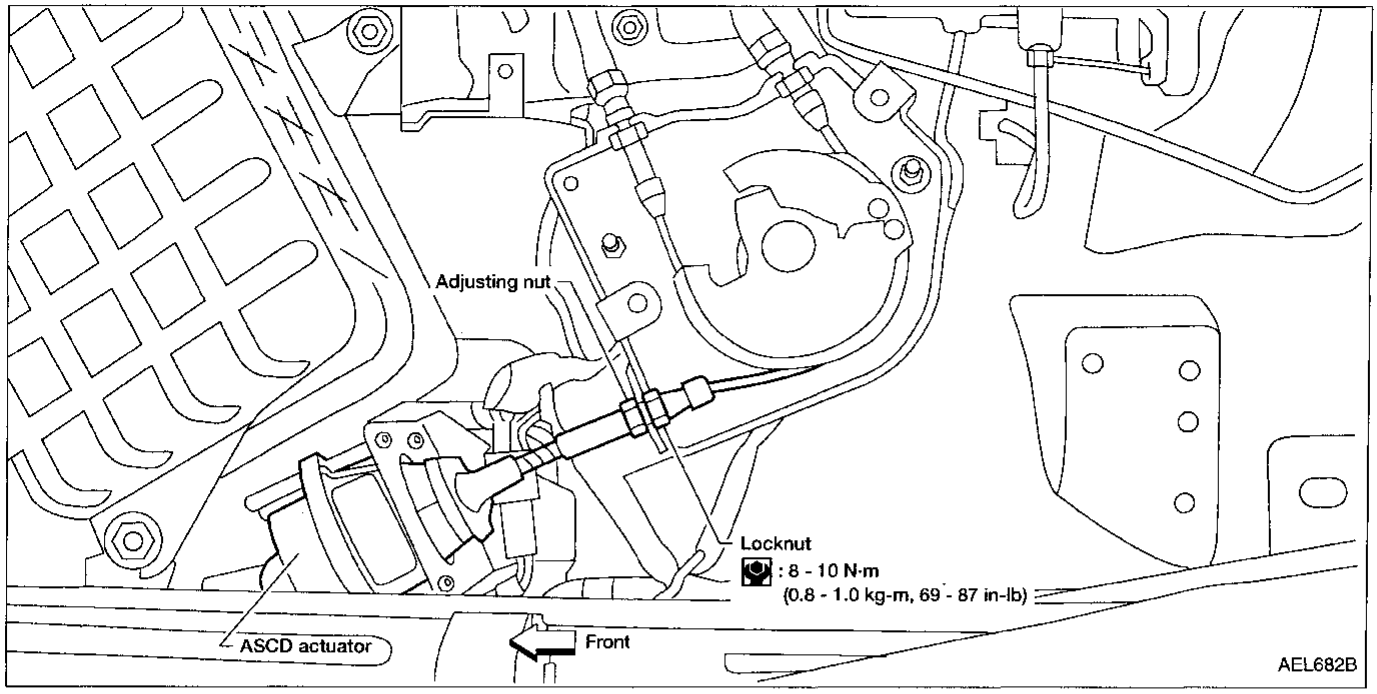
OK ↓

C

CHECK ASCD PUMP.
1. Disconnect vacuum hose from ASCD pump and ASCD pump connector.
2. If necessary remove ASCD pump.
3. Connect vacuum gauge to ASCD pump.
4. Apply 12V direct current to ASCD pump and check operation.

	12V direct current supply terminals		Operation
	⊕	⊖	
Vacuum motor	①	②	Operate
Release valve		③	Close
Air valve		④	Close

A vacuum pressure of at least –35 kPa (–0.350 bar, –0.36 kg/cm^2, –5.1 psi) should be generated.



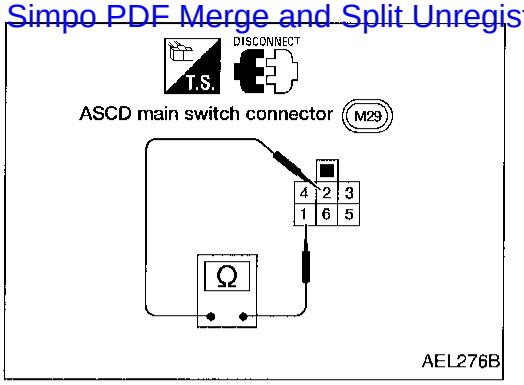
NG → Replace ASCD pump.

OK ↓

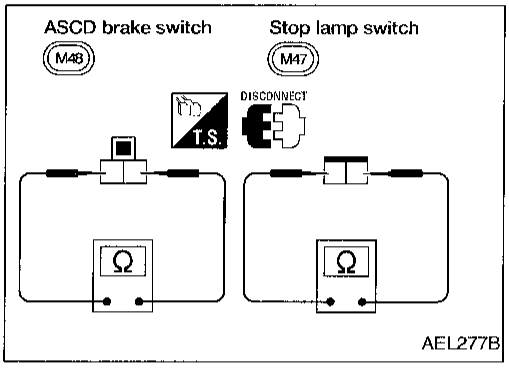
ASCD actuator/pump is OK.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

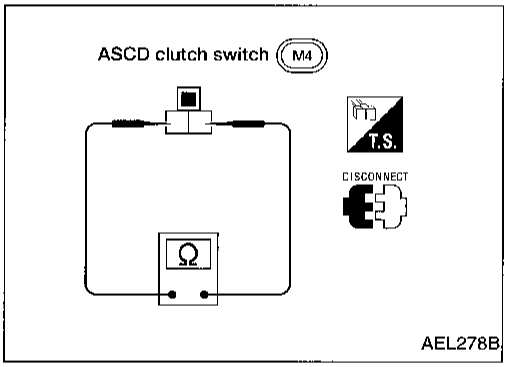
ASCD Wire Adjustment



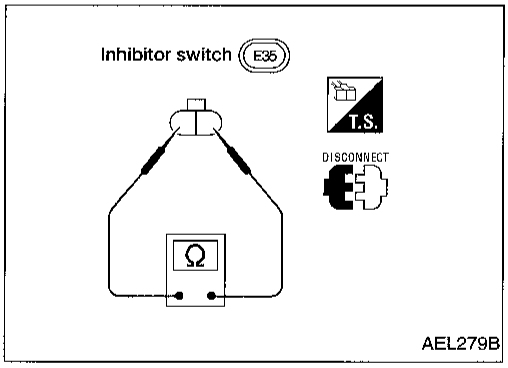
CAUTION:



- **Be careful not to twist ASCD wire when removing it.**
- **Do not tense ASCD wire excessively during adjustment.**



Adjust the tension of ASCD wire in the following manner.



(1) Loosen lock nut and adjusting nut.
(2) Make sure that accelerator wire is properly adjusted. Refer to FE section ("ACCELERATOR CONTROL SYSTEM").
(3) Tighten adjusting nut just until throttle drum starts to move.
(4) Loosen adjusting nut again 1/2 to 1 turn.
(5) Tighten lock nut.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Electrical Components Inspection

ASCD MAIN SWITCH

Check continuity between terminals by pushing switch to each position.

Switch position	Terminals					
	1	2	3	4	5	6
ON	○	○	○	(m)	○	ILL.
N		○	○	(n)	○	(n)
OFF						

ASCD BRAKE SWITCH AND STOP LAMP SWITCH

Condition	Continuity	
	ASCD brake switch	Stop lamp switch
When brake pedal is depressed	No	Yes
When brake pedal is released	Yes	No

Check each switch after adjusting brake pedal — refer to BR section.

ASCD CLUTCH SWITCH (For M/T models)

Condition	Continuity
When clutch pedal is depressed	No
When clutch pedal is released	Yes

INHIBITOR SWITCH (For A/T models)

A/T selector lever position	Continuity
	Between terminals
"P"	Yes
"N"	Yes
Except "P" and "N"	No

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

System Description

Power is supplied at all times:
- from 30A fusible link (Letter [f], located in the fuse and fusible link box)
- to circuit breaker terminal ①
- through circuit breaker terminal ②
- to power window relay terminal ⑤.

With ignition switch in ON or START position, power is supplied:
- through 7.5A fuse [No. [5] located in the fuse block (J/B)]
- to power window relay terminal ②.

Ground is supplied to power window relay terminal ①:
- through body grounds (M68) and (M14).

The power window relay is energized and power is supplied:
- through power window relay terminal ③
- to main power window and door lock/unlock switch terminal ①,
- to power window switch RH terminal ④.

MANUAL OPERATION

Door LH

Ground is supplied:
- through body grounds (M14) and (M68)
- to main power window and door lock/unlock switch terminal ⑤.

WINDOW UP
When the LH switch in the main power window and door lock/unlock switch is pressed in the up position, power is supplied:
- through main power window and door lock/unlock switch terminal ⑯
- to power window motor LH terminal (UP).

Ground is supplied:
- through main power window and door lock/unlock switch terminal ⑮
- to power window motor LH terminal (DN).

Then, the motor raises the window until the switch is released.

WINDOW DOWN
When the LH switch in the main power window and door lock/unlock switch is pressed in the down position, power is supplied:
- through main power window and door lock/unlock switch terminal ⑮
- to power window motor LH terminal (DN).

Ground is supplied:
- through main power window and door lock/unlock switch terminal ⑯
- to power window motor LH terminal (UP).

Then, the motor lowers the window until the switch is released.

Door RH

Ground is supplied:
- through body grounds (M14) and (M68)
- to main power window and door lock/unlock switch terminal ⑤.

NOTE:
Numbers in parentheses are terminal numbers, when power window switch is pressed in the UP and DOWN positions respectively.

MAIN SWITCH OPERATION
Power is supplied:
- through main power window and door lock/unlock switch terminal (⑭, ⑬)
- to power window switch RH terminal (⑤, ②).

The subsequent operation is the same as the power window switch operation.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

POWER WINDOW SWITCH OPERATION

Power is supplied:

- to power window switch RH terminal ④
- through power window switch RH terminal (⑥, ③)
- to power window motor RH terminal (UP, DN).

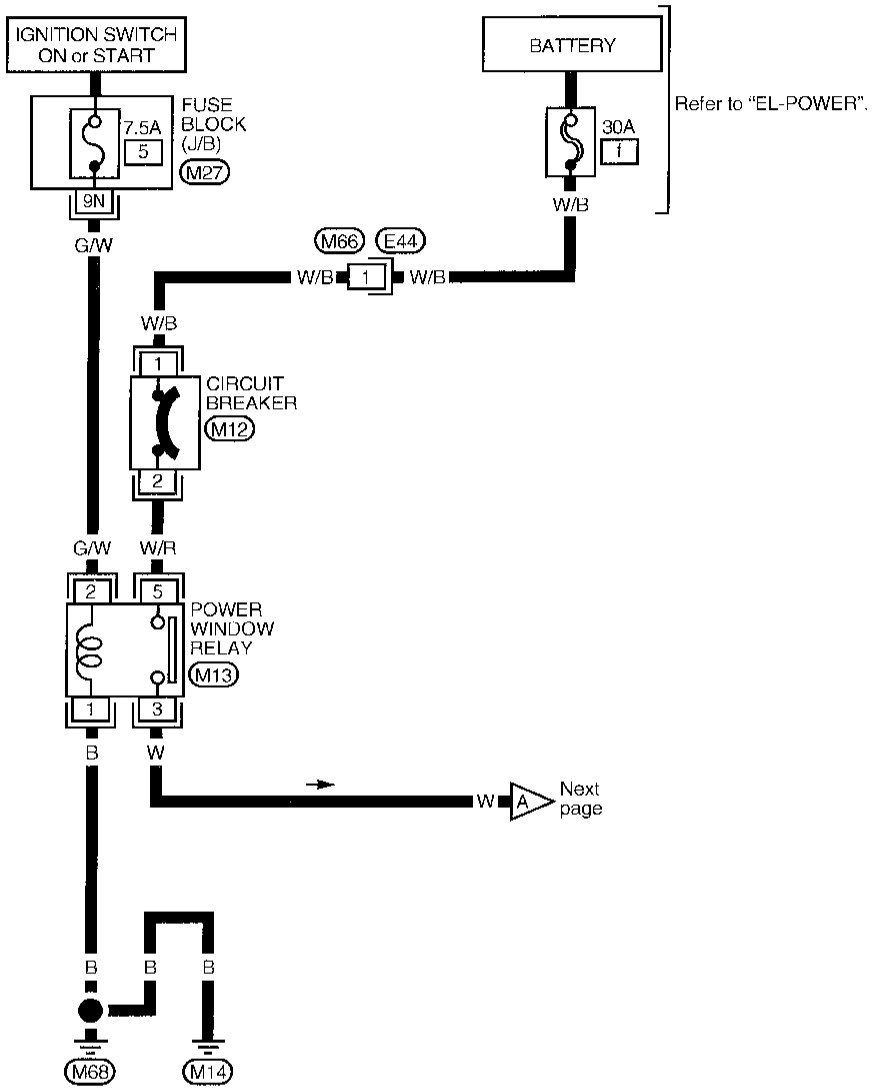
Ground is supplied:

- to power window motor RH terminal (DN, UP)
- to power window switch RH terminal (③, ⑥)
- through power window switch RH terminal (②, ⑤)
- through power window main switch terminal (⑬, ⑭).

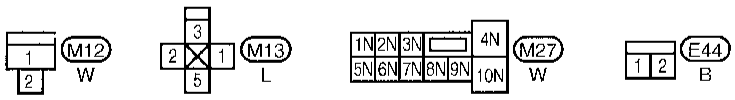
Then, the motor raises or lowers the window until the switch is released.

AUTO OPERATION

The power window AUTO feature enables the driver to lower the driver's window without holding the window switch in the down position.
The AUTO feature only operates on the driver's window downward movement.



POWER WINDOW LOCK



The power window lock is designed to lock operation of the RH door window.
When the lock switch is pressed to lock position, ground of the power window switch RH in the main power window and door lock/unlock switch is disconnected. This prevents the power window motor RH from operating.

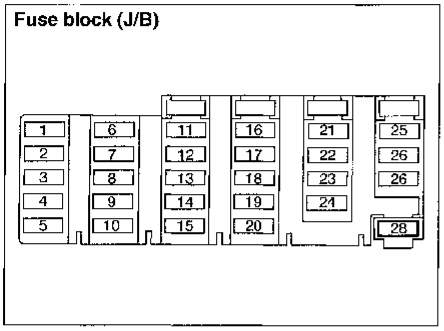
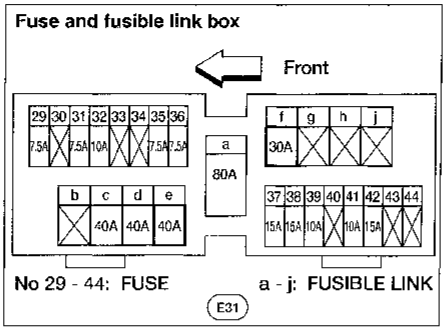
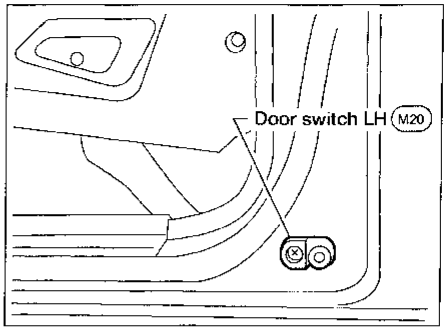
EL-WINDOW-02



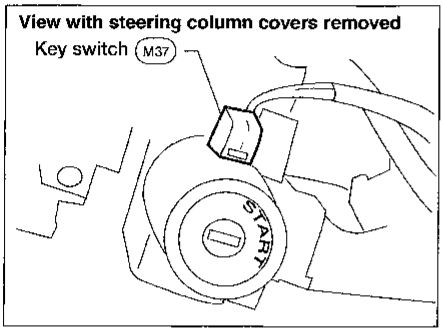
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



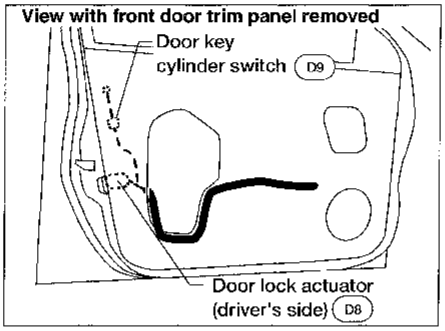
Trouble Diagnoses



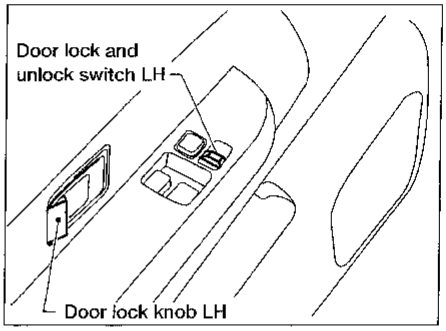
Symptom	Possible cause	Repair order
None of the power windows can be operated using any switch.	1. 7.5A fuse, 30A fusible link and (M12) circuit breaker	1. Check 7.5A fuse (No. 5, located in fuse block [J/B]), 30A fusible link (letter f, located in fuse and fusible link box) and (M12) circuit breaker. Turn ignition switch ON and verify battery positive voltage is present at terminal (1) of main power window switch and terminal (4) of passenger switch.
	2. Grounds (M14) and (M68)	2. Check grounds (M14) and (M68).
	3. Power window relay	3. Check power window relay.
	4. Open/short in main power window switch circuit	4. Check W wire between power window relay and main power window switch for open/short circuit.
Driver side power window cannot be operated but passenger window can be operated.	1. Driver side power window motor circuit	1. Check harness between main power window switch and power window motor LH for open or short circuit.
	2. Driver side power window motor	2. Check power window motor LH.
Passenger power window cannot be operated.	1. Passenger power window switch	1. Check passenger power window switch.
	2. Passenger power window motor	2. Check passenger power window motor.
	3. Main power window switch	3. Check main power window switch.
	4. Power window circuit	4-1. Check harnesses between main power window switch and passenger power window switch for open/short circuit.
		4-2. Check harnesses between passenger power window switch and passenger power window motor for open/short circuit.
Passenger power window cannot be operated using main power window switch but can be operated by passenger power window switch.	1. Main power window switch	1. Check main power window switch.
Driver side power window auto function cannot be operated using main power window switch.	1. Main power window switch	1. Check main power window switch.

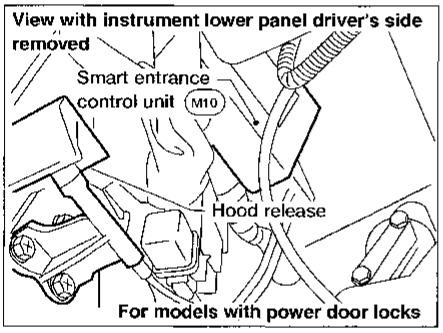


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Component Parts and Harness Connector Location





AEL689B

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

System Description

Power is supplied at all times:
- through 30A fusible link (Letter [f], located in the fuse and fusible link box)
- to circuit breaker terminal ①
- through circuit breaker terminal ②
- to smart entrance control unit terminal ①.

Power is supplied at all times:
- through 7.5A fuse [No. 28, located in the fuse block (J/B)]
- to key switch terminal ①.

Ground is supplied:
- through body grounds (M14) and (M68)
- to smart entrance control unit terminal ⑩.

INPUT

Power is supplied through key switch terminal ② to smart entrance control unit terminal ㉔ when the ignition key is inserted in the key switch.

Ground is supplied:
- through RH door switch terminal ① when RH door is open
- to smart entrance control unit terminal ㉟.

Ground is supplied:
- through body grounds (M14) and (M68)
- to LH door switch terminal ③
- through LH door switch terminal ② when LH door is open
- to smart entrance control unit terminal ⑮.

Ground is supplied:
- through body grounds (M14) and (M68)
- through LH or RH door key cylinder switch terminal ② when door key cylinder is BETWEEN FULL STROKE AND N (to unlock position)
- from LH door key cylinder switch terminal ③ or RH door key cylinder switch terminal ①
- to smart entrance control unit terminal ㉛.

Ground is supplied:
- through body grounds (M14) and (M68)
- through LH or RH door key cylinder switch terminal ② when door key cylinder is BETWEEN FULL STROKE AND N (to lock position)
- from LH door key cylinder switch terminal ① or RH door key cylinder switch terminal ③
- to smart entrance control unit terminal ㉚.

Ground is supplied:
- through body grounds (M14) and (M68)
- from door unlock sensor (in the LH or RH door lock actuator) terminal ④ when door lock is in UNLOCKED position
- through door unlock sensor (in the LH or RH door lock actuator) terminal ②
- to smart entrance control unit terminal ⑫ or ⑬.

Ground is supplied:
- through body grounds (M14) and (M68)
- through main power window and door lock/unlock switch terminal ⑤ (when switch is pressed in lock or unlock position)
- from main power window and door lock/unlock switch terminal ⑦ or ⑧
- to smart entrance control unit terminal ⑱ or ⑲.

Ground is also supplied from door lock/unlock switch RH in the same manner as main power window and door lock/unlock switch.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

OUTPUT

Unlock

Power is supplied:
- from smart entrance control unit terminal ③
- to LH door lock actuator terminal ①.

Power is supplied:
- from smart entrance control unit terminal ②
- to RH door lock actuator terminal ①.

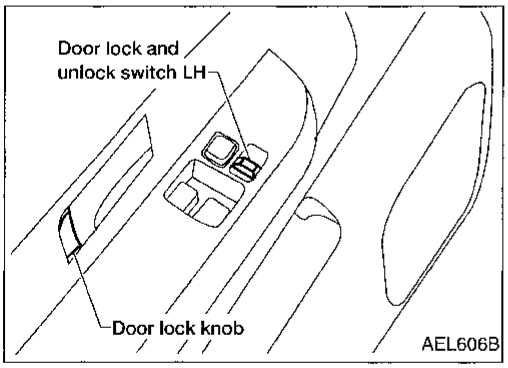
Ground is supplied:
- from smart entrance control unit terminal ④
- to LH and RH door lock actuator terminals ③.

With power and ground supplied, the door actuators move to the unlocked position.

Lock

Power is supplied:
- from smart entrance control unit terminal ④
- to LH and RH door lock actuator terminals ③.

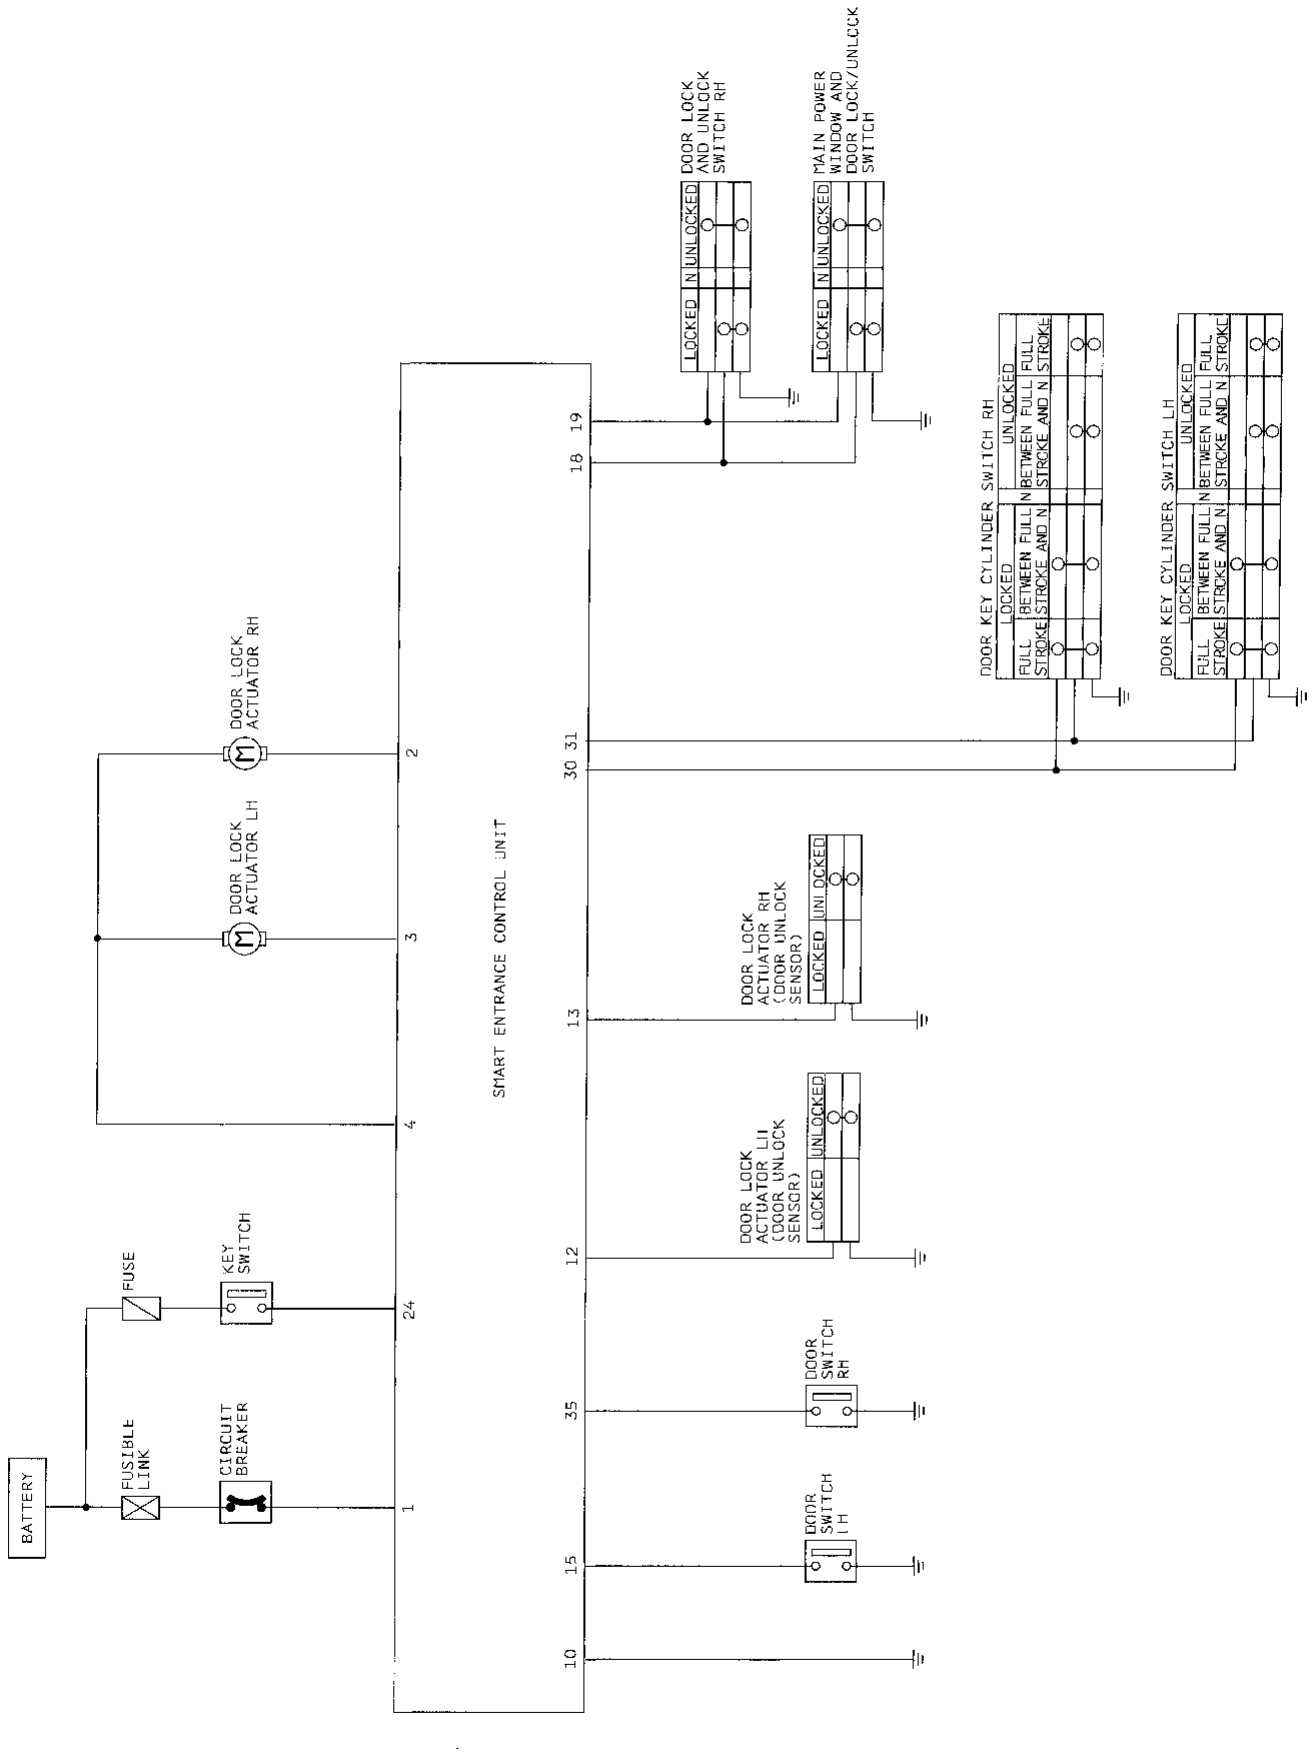
Ground is supplied:
- from smart entrance control unit terminal ③
- to LH door lock actuator terminal ①.



Ground is supplied:
- from smart entrance control unit terminal ②
- to RH door lock actuator terminal ①.

With power and ground supplied, the door actuators move to the locked position.

OPERATION



- The lock and unlock switch on driver's door trim can lock and unlock both doors.
- With the lock knob on LH or RH door set to LOCKED, all doors are locked (signal from door unlock sensor).
- With the door key inserted in the key cylinder on LH or RH door, turning it to LOCK will lock both doors; turning it to UNLOCK once unlocks the corresponding door; turning it to UNLOCK again within 5 seconds after the first unlock operation unlocks the other door (signal from door key cylinder switch).

However, if the ignition key is in the ignition key cylinder and one or more of the doors are open, setting the lock and unlock switch, lock knob, or the door key to LOCK locks the doors once but then immediately unlocks them (combination signals from key switch, LH or RH door switch and LH or RH door unlock sensor). — (KEY REMINDER DOOR SYSTEM)

Perform "Main Power Supply and Ground Circuit Check" before starting with power door lock diagnostic procedure.

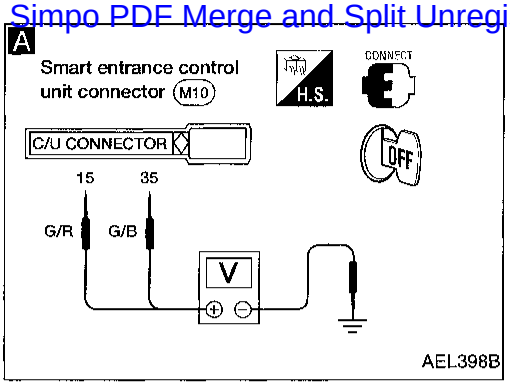
Trouble Diagnoses (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

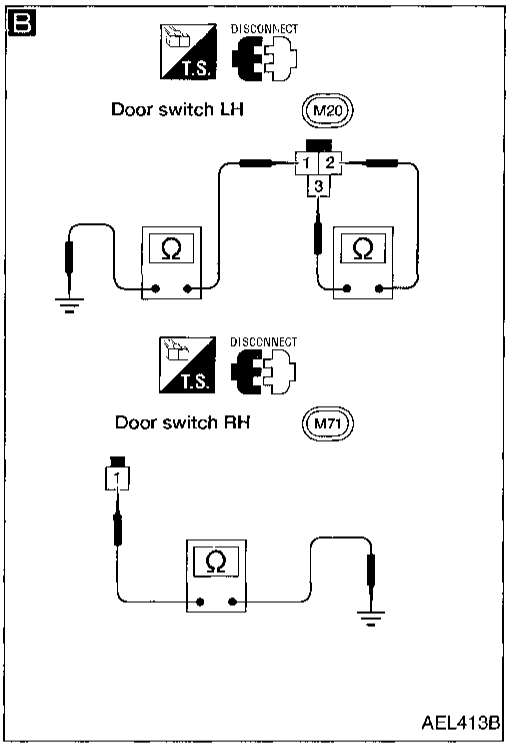
MAIN POWER SUPPLY AND GROUND CIRCUIT CHECK

Main power supply circuit check

Terminal		Ignition switch		
⊕	⊖	OFF	ACC	ON
①	Ground	Battery voltage	Battery voltage	Battery voltage



Ground circuit check



Terminals	Continuity
⑩ - Ground	Yes

Trouble Diagnoses (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

DIAGNOSTIC PROCEDURE 1
(Door switch check)

A

CHECK DOOR SWITCH INPUT SIGNAL.
Check voltage between control unit terminals 15 or 35 and ground.

	Terminals ⊕	Terminals ⊖	Condition	Voltage [V]
Door switch LH	15	Ground	Open	0
			Closed	Approx. 12
Door switch RH	35	Ground	Open	0
			Closed	Approx. 12

Refer to wiring diagram in EL-151.

OK → Door switch is OK.

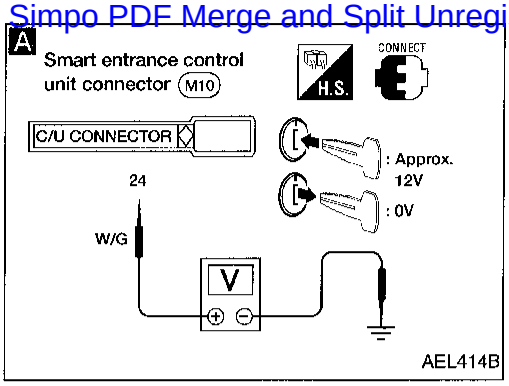
NG ↓

B

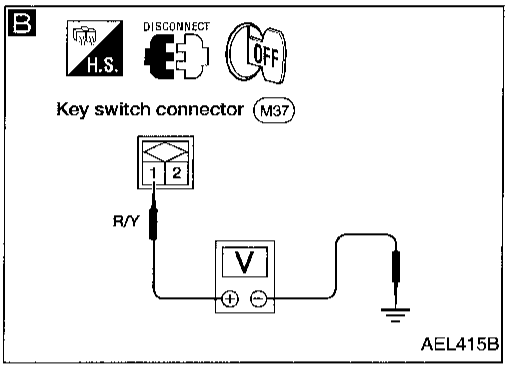
CHECK DOOR SWITCH.
1. Disconnect door switch connector.
2. Check continuity between door switch terminals.

	Terminals	Condition	Continuity
Door switch LH	1 - Ground, 2 - 3	Closed	No
		Open	Yes
Door switch RH	1 - Ground	Closed	No
		Open	Yes

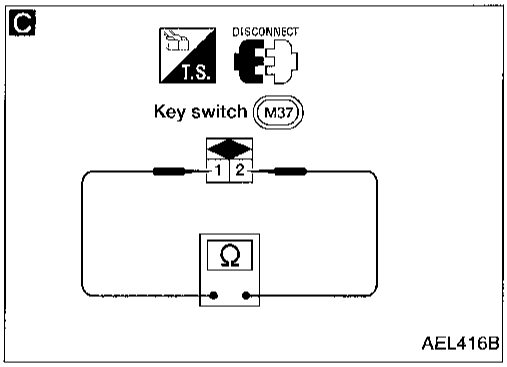
NG → Replace door switch.



OK ↓



Check the following.
- Door switch ground circuit (LH) or door switch ground condition
- Harness for open or short between control unit and door switch



Trouble Diagnoses (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

DIAGNOSTIC PROCEDURE 2
[Key switch (insert) check]

A

CHECK KEY SWITCH INPUT SIGNAL.
Check voltage between control unit terminal (24) and ground.

Condition of key switch	Voltage [V]
Key is inserted.	Approx. 12
Key is withdrawn.	0

Refer to wiring diagram in EL-151.

OK → Key switch (insert) is ok.

NG ↓

B

CHECK KEY SWITCH POWER SUPPLY.
1. Disconnect key switch connector.
2. Check voltage between key switch harness terminal (1) and ground.
Battery voltage should exist.

NG → Check the following.
- 7.5A fuse [No. 28, located in fuse block (J/B)]
- Harness for open or short between key switch and fuse

OK ↓

C

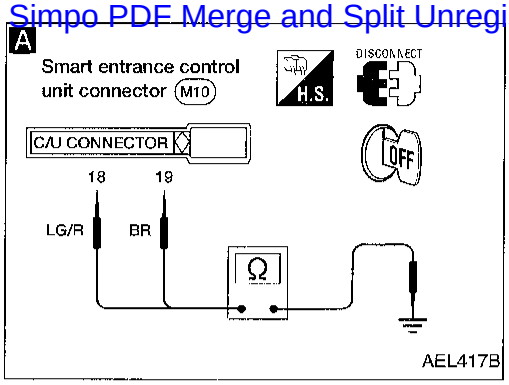
CHECK KEY SWITCH.
Check continuity between key switch terminals.

Terminals	Condition	Continuity
(1) - (2)	Key is inserted.	Yes
	Key is withdrawn.	No

NG → Replace key switch.

OK ↓

Check harness for open or short between control unit and key switch.



Trouble Diagnoses (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

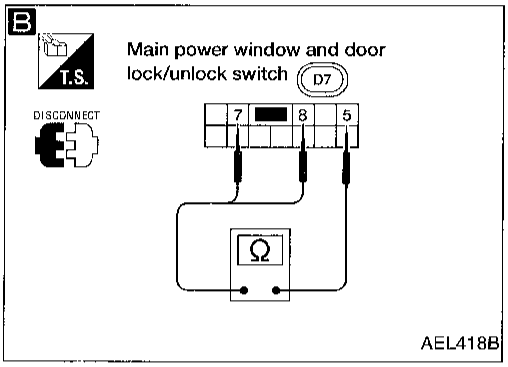
DIAGNOSTIC PROCEDURE 3

(Door lock/unlock switch check)

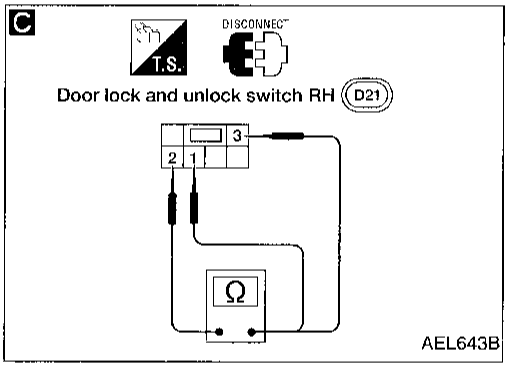
A

CHECK DOOR LOCK/UNLOCK SWITCH INPUT SIGNAL.

1. Disconnect control unit connector.
2. Check continuity between control unit terminal ⑱ or ⑲ and ground.



Terminals	Door lock/unlock switch (LH or RH) condition	Continuity
⑱ - Ground	Lock	Yes
	N and Unlock	No
⑲ - Ground	Unlock	Yes
	N and Lock	No



Refer to wiring diagram in EL-151.

OK → Door lock/unlock switch is OK.

NG ↓

B C

CHECK LH OR RH DOOR LOCK/UNLOCK SWITCH.

1. Disconnect main power window and door lock/unlock switch connector.
2. Check continuity between main power window and door lock/unlock switch terminals.

B Driver side

Condition	Terminals		
	5	7	8
Lock	○		○
N	No continuity		
Unlock	○	○	

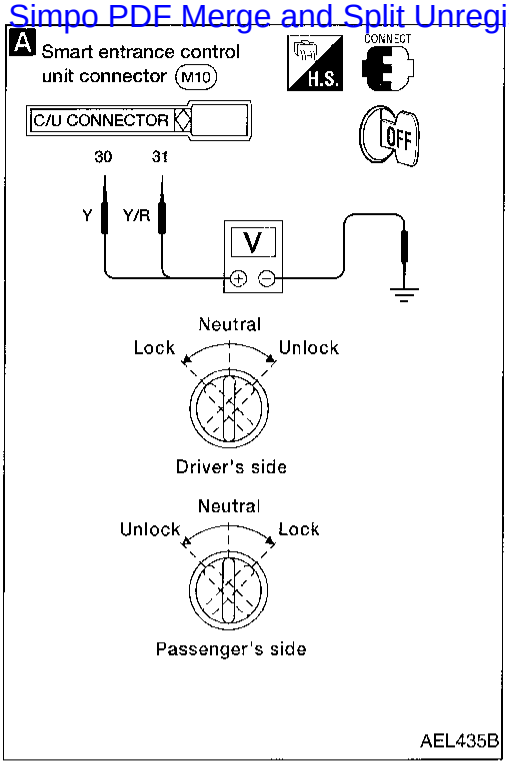
3. Disconnect door lock and unlock switch RH connector.
4. Check continuity between door lock and unlock switch RH terminals.

C Passenger side

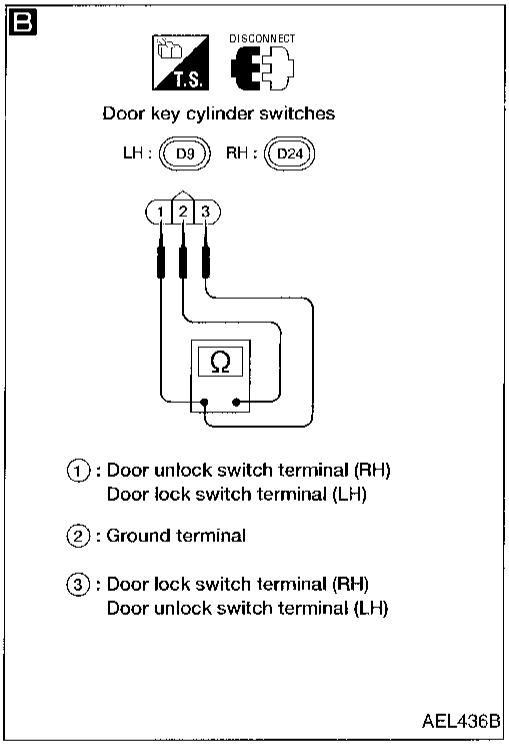
Condition	Terminals		
	1	2	3
Lock		○	○
N	No continuity		
Unlock	○	○	

NG → Replace main power window and door lock/unlock switch or door lock and unlock switch RH.

OK ↓



Check the following.



- Ground circuit for door lock/unlock switch
- Harness for open or short between door lock/unlock switch and control unit connector

Trouble Diagnoses (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

DIAGNOSTIC PROCEDURE 4
(Door key cylinder switch check)

A

CHECK DOOR KEY CYLINDER SWITCH INPUT SIGNAL (LOCK/UNLOCK SIGNAL).

Check voltage between control unit terminals ㉚ or ㉛ and ground.

Terminals ⊕	Terminals ⊖	Key position	Voltage [V]
㉚	Ground	Neutral	Approx. 12
		Lock	0
㉛	Ground	Neutral	Approx. 12
		Unlock	0

Refer to wiring diagram in EL-152.

OK → Door key cylinder switch is OK.

NG ↓

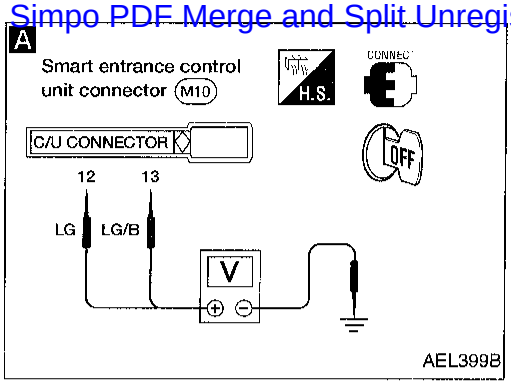
B

CHECK DOOR KEY CYLINDER SWITCH.

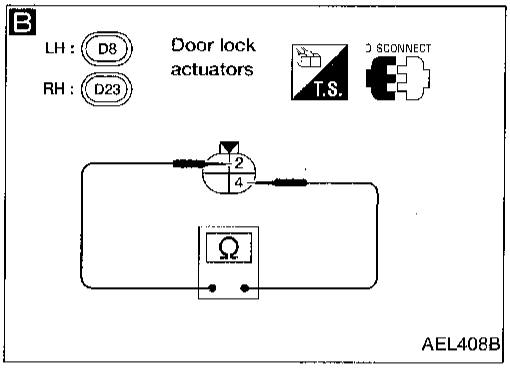
1. Disconnect door key cylinder switch connector.
2. Check continuity between door key cylinder switch terminals.

Terminals	Key position	Continuity
LH: ① - ②	Neutral	No
RH: ③ - ②	Lock	Yes
LH: ③ - ②	Neutral	No
RH: ① - ②	Unlock	Yes

NG → Replace door key cylinder switch.



OK ↓



Check the following.
- Door key cylinder switch ground circuit
- Harness for open or short between control unit and door key cylinder switch

Trouble Diagnoses (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

DIAGNOSTIC PROCEDURE 5
(Door unlock sensor check)

A

CHECK DOOR UNLOCK SENSOR INPUT SIGNAL.

Check voltage between control unit terminals ⑫, ⑬ and ground.

	Terminals ⊕	Terminals ⊖	Condition	Voltage [V]
LH door	⑫	Ground	Locked	Approx. 12
			Unlocked	0
RH door	⑬	Ground	Locked	Approx. 12
			Unlocked	0

Refer to wiring diagram in EL-153.

OK → Door unlock sensor is OK.

NG ↓

B

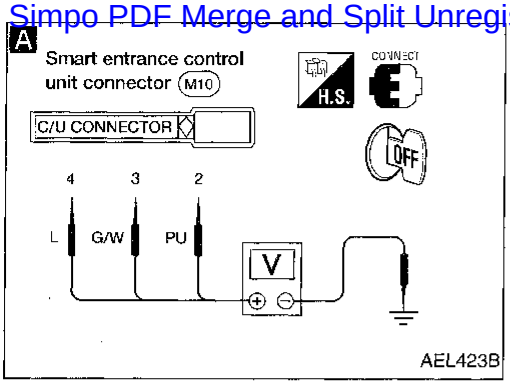
CHECK DOOR UNLOCK SENSOR.

1. Disconnect door unlock sensor connector.
2. Check continuity between door unlock sensor terminals.

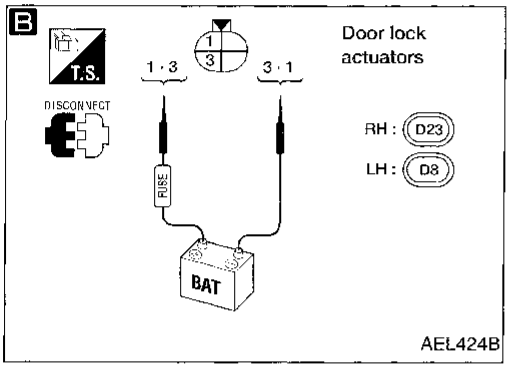
Terminals	Condition	Continuity
④ - ②	Locked	No
	Unlocked	Yes

NG → Replace door unlock sensor.

OK ↓



Check the following.
- Door unlock sensor ground circuit
- Harness for open or short between control unit and door unlock sensor



Trouble Diagnoses (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

DIAGNOSTIC PROCEDURE 6

(Door lock actuator check)

A

CHECK DOOR LOCK ACTUATOR OUTPUT.

Check voltage for door lock actuator.

Door lock/unlock switch condition	Terminals ⊕	Terminals ⊖	Voltage (V)
Lock	④	Ground	Battery voltage
Unlock	③, ②	Ground	

Refer to wiring diagram in EL-153.

NG → Replace smart entrance control unit. (Before replacing control unit, perform other procedures following SYMPTOM CHART.)

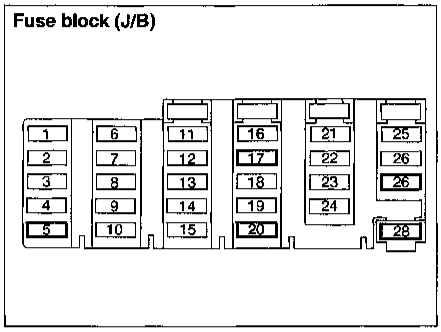
OK ↓

B

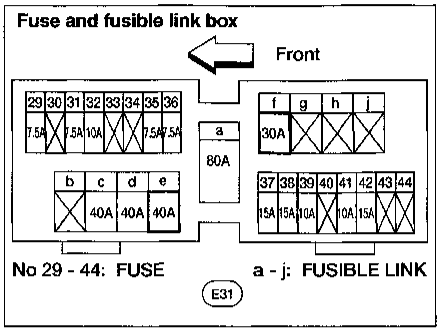
CHECK DOOR LOCK ACTUATOR.

1. Disconnect door lock actuator connector.
2. Apply 12V direct current to door lock actuator and check operation.

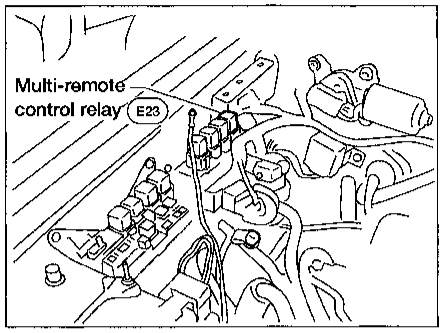
Door lock actuator operation	Terminals ⊕	Terminals ⊖
Unlocked → Locked	③	①
Locked → Unlocked	①	③



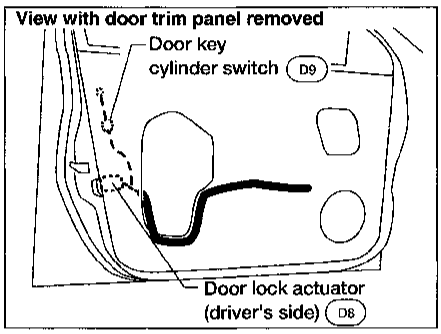
NG → Replace door lock actuator.



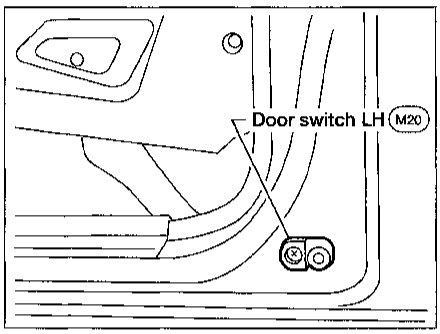
OK ↓



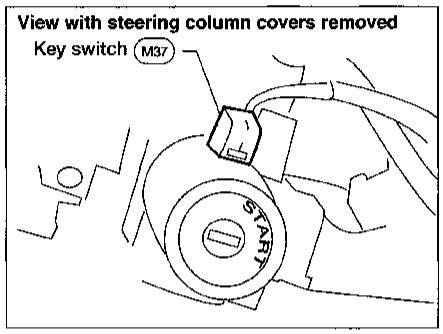
Check harness for open or short between control unit connector and door lock actuator.

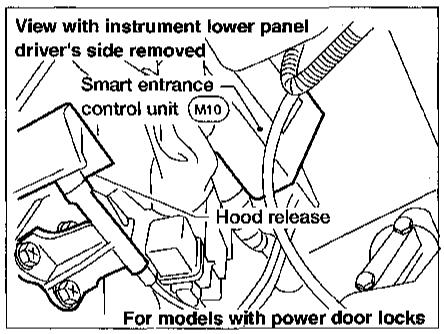


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Component Parts and Harness Connector Location





AEL690B

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

System Description

POWER SUPPLY AND GROUND

Power is supplied at all times:
- through 30A fusible link (letter f, located in the fuse and fusible link box)
- to circuit breaker terminal ①
- through circuit breaker terminal ②
- to smart entrance control unit terminal ①.

Power is supplied at all times:
- through 7.5A fuse [No. 26, located in the fuse block (J/B)]
- to interior lamp terminal ⊕

Power is supplied at all times:
- through 7.5A fuse [No. 28, located in the fuse block (J/B)]
- to key switch terminal ①.

Power is supplied at all times:
- through 10A fuse [No. 17, located in the fuse block (J/B)]
- to multi-remote control relay terminals ②, ⑤ and ⑦.

With the ignition switch in the ON or START position, power is supplied:
- through 7.5A fuse [No. 5, located in the fuse block (J/B)]
- to smart entrance control unit terminal ⑪.

With the ignition switch in the ACC or ON position, power is supplied:
- through 7.5A fuse [No. 20, located in the fuse block (J/B)]
- to smart entrance control unit terminal ⑰.

Ground is supplied:
- to smart entrance control unit terminal ⑩
- through body grounds (M14) and (M68).

INPUTS

When the key switch is ON (ignition key is inserted in key cylinder), power is supplied:
- through key switch terminal ②
- to smart entrance control unit terminal ㉔.

When the door switch LH is OPEN, ground is supplied:
- to smart entrance control unit terminal ⑮
- through door switch LH terminal ②
- from door switch LH terminal ③
- through body grounds (M14) and (M68).

When the door switch RH is OPEN, ground is supplied:
- to smart entrance control unit terminal ㉟
- through door switch RH terminal ①
- through door switch body ground.

When the door lock actuator LH (door unlock sensor) is UNLOCKED, ground is supplied:
- to smart entrance control unit terminal ⑫
- through door lock actuator LH (door unlock sensor) terminal ②
- to door lock actuator LH (door unlock sensor) terminal ④
- through body grounds (M14) and (M68).

When the door lock actuator RH (door unlock sensor) is UNLOCKED, ground is supplied to smart entrance control unit terminal ⑬ in the same manner as door lock actuator LH.

Remote controller signal input:
- through internal antenna.

The multi-remote control system controls operation of the
- power door lock
- interior lamp
- panic alarm
- hazard reminder.

OPERATION PROCEDURE

Power door lock operation

When the following input signals are both supplied:
- key switch REMOVED (when ignition key is not inserted in key cylinder);
- door switch CLOSED (when all the doors are closed).

System Description (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

The above two signals are already input into the smart entrance control unit. At this point, smart entrance control unit receives a LOCK signal from the remote controller. The smart entrance control unit locks all doors with input of the LOCK signal from the remote controller.
And then ground is supplied:

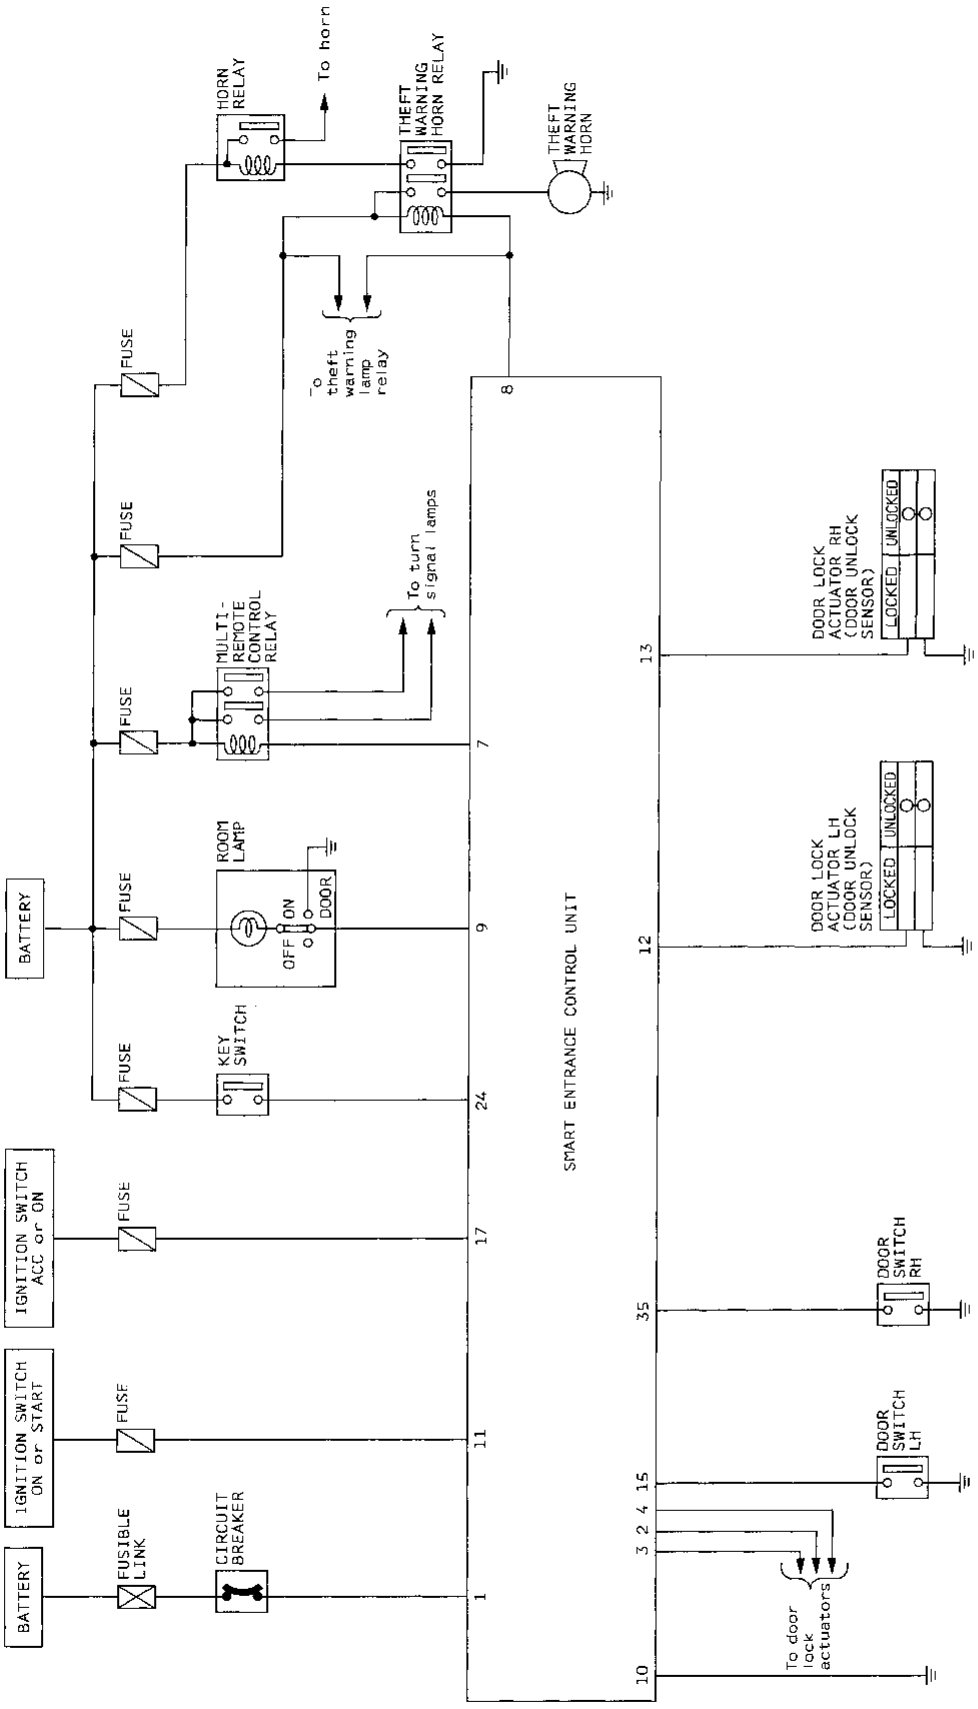
- to multi-remote control relay terminal ①
- through smart entrance control unit terminal ⑦.

Multi-remote control relay is now energized, and the hazard warning lamps flash twice as a reminder—**HAZARD REMINDER**. For detailed description, refer to "TURN SIGNAL AND HAZARD WARNING LAMPS", EL-54.
When an UNLOCK signal is sent from the remote controller once, the driver's door will be unlocked.
Then, if an UNLOCK signal is sent from the remote controller again within 5 seconds, the passenger door will be unlocked.
To deactivate the horn chirp when using the remote controller, press both unlock and lock buttons for two seconds. With the horn deactivated, the exterior lights do not flash when the unlock button is pressed. To activate the horn chirp, press both unlock and lock buttons for two seconds.

Interior lamp operation

When the following input signals are both supplied:

- key switch REMOVED (when ignition key is not inserted in key cylinder);
- door switch CLOSED (when all the doors are closed);



multi-remote control system turns on interior lamp (for 30 seconds) with input of UNLOCK signal from remote controller.
For detailed description, refer to "INTERIOR ROOM LAMP", EL-62.

Panic alarm operation

When key switch is OFF (when ignition key is not inserted in key cylinder), multi-remote control system turns on and off horn and headlamps intermittently with input of PANIC ALARM signal from remote controller.
For detailed description, refer to "THEFT WARNING SYSTEM", EL-179.

Trouble Diagnoses

TROUBLE SYMPTOM

- All functions of remote control system do not operate.

CHECK REMOTE CONTROLLER BATTERY.
Refer to DIAGNOSTIC PROCEDURE 1, EL-170.
→ NG → Replace battery.
↓ OK

Enter the Identity (ID) code of different or new remote controller. Refer to EL-176.
↓ OK

Can the new ID code be entered?
→ No → Go to DIAGNOSTIC PROCEDURE 2, EL-171.
↓ Yes

Replace with the originally used multi-remote controller.

- Some functions of multi-remote controller do not operate.

① DOOR LOCK OR UNLOCK DOES NOT FUNCTION.
(Pressing lock or unlock button of remote controller normally locks or unlocks all doors.)
● Check if power door lock system functions with door lock & unlock switch.
→ No → Check "POWER DOOR LOCK" system and door switch input signal. (Refer to DIAGNOSTIC PROCEDURE 2, EL-171.)

OR

② INTERIOR LAMP DOES NOT TURN ON FOR 30 SECONDS WHEN PRESSING UNLOCK BUTTON OF REMOTE CONTROLLER.
● Check if the interior lamp switch is in the "door" position, the lamp illuminates when a door is open.
If check is OK, Go to DIAGNOSTIC PROCEDURE 3, EL-173.
→ No → Check "Interior lamp" circuit.

OR

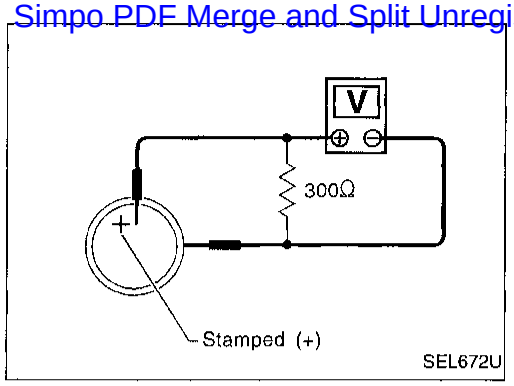
③ HAZARD INDICATOR DOES NOT FLASH TWICE WHEN PRESSING LOCK BUTTON OF REMOTE CONTROLLER.
● Check if hazard indicator flashes with hazard switch.
If check is OK, Go to DIAGNOSTIC PROCEDURE 4, EL-174.
→ No → Check "Hazard indicator lamp" circuit.

OR

④ PANIC ALARM (HORN AND HEADLAMP) DOES NOT ACTIVATE WHEN PANIC ALARM BUTTON IS CONTINUOUSLY PRESSED FOR MORE THAN 1.5 SECONDS.
● Check if horn and headlamps activate when test is conducted as follows:
1. Open the driver's window.
2. Close all doors and hood.
3. Lock doors with the key.
4. Wait for about 30 seconds to make sure that the lighted "SECURITY" warning lamp begins to blink.
5. Open the hood with hood lock opener, then panic alarm should activate. (The alarm will stop when door is unlocked with the key.)

→ No → Check "THEFT WARNING" system.

↓ Yes



Enter the identity (ID) code of different or new remote controller and recheck operation to see if the same trouble as indicated above occurs.
→ Yes → Check multi-remote controller operation again.
If necessary, replace Smart Entrance Control Unit.
↓ No

Replace the multi-remote controller.

Note: ● The unlock and panic alarm operation of the multi-remote control system does not activate with the ignition key inserted in the ignition key cylinder.
● The lock operation of the multi-remote control system does not activate with the key inserted in the ignition key cylinder or if one of the doors is opened.

Trouble Diagnoses (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

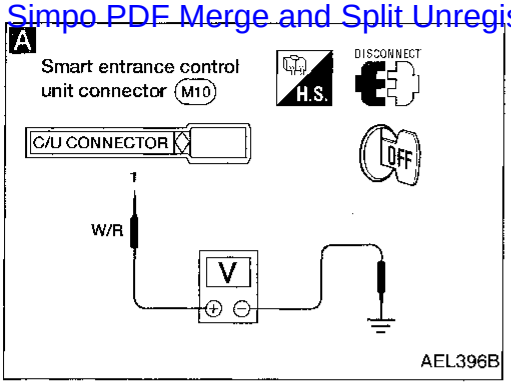
DIAGNOSTIC PROCEDURE 1

Check remote controller battery.

CHECK REMOTE CONTROLLER BATTERY.

Remove battery and measure voltage across battery positive and negative terminals, ⊕ and ⊖.

Measuring terminal		Standard value
⊕	⊖	
Battery positive terminal ⊕	Battery negative terminal ⊖	2.5 - 3.0V



Note:
Remote controller does not function if battery is not set correctly.

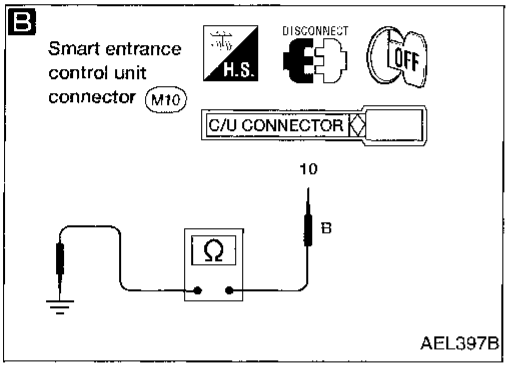
Trouble Diagnoses (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

DIAGNOSTIC PROCEDURE 2

All remote controls do not function even if remote controller is operated properly.

A



CHECK MAIN POWER SUPPLY CIRCUIT FOR CONTROL UNIT.

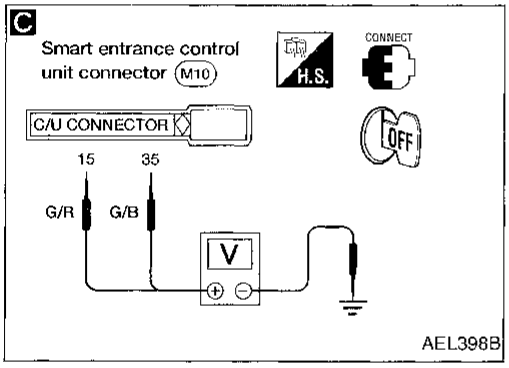
1. Disconnect connector from control unit.
2. Check voltage between control unit terminal (1) and ground.
   Battery voltage should exist.

Refer to wiring diagram in EL-166.

NG → Check the following:
- 30A fusible link (Letter f, located in fuse and fusible link box)
- M12 circuit breaker
- Harness for open or short between control unit and fusible link

OK ↓

B



CHECK GROUND CIRCUIT FOR CONTROL UNIT.

Check continuity between terminal (10) and ground.
Continuity should exist.

Refer to wiring diagram in EL-166.

NG → Check ground harness.

OK ↓

C

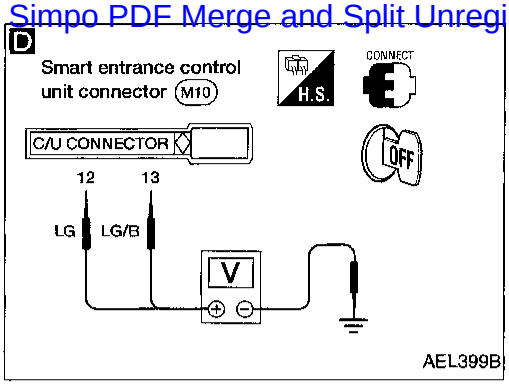
CHECK DOOR SWITCH CIRCUIT.

1. Connect control unit connector.
2. Check voltage between control unit terminal (15) and GND and (35) and GND.

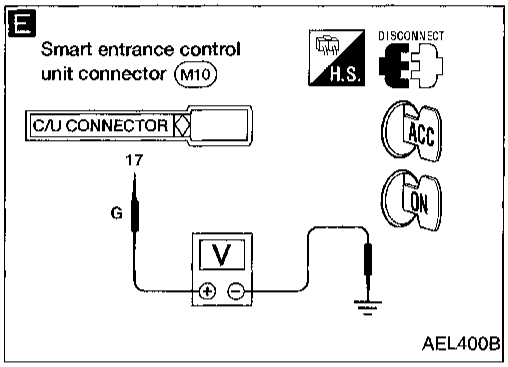
	Terminals ⊕	Terminals ⊖	Condition	Voltage [V]
Driver side door switch	(15)	Ground	Open	0
			Close	Approx. 12
Passenger door switch	(35)	Ground	Open	0
			Close	Approx. 12

Refer to wiring diagram in EL-167.

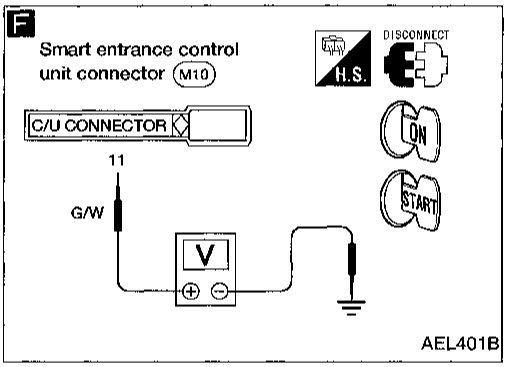
NG → Check the following.
- Door switch
  Refer to "Electrical Components Inspection" (EL-175).
- Door switch ground condition
- Harness for open or short between control unit and door switch



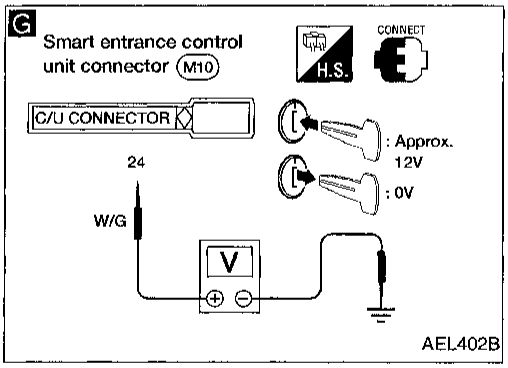
OK ↓



(A)



(Go to next page.)



Trouble Diagnoses (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

(A)

D

CHECK UNLOCK SENSOR CIRCUIT.

Check voltage between control unit terminal (12) and ground and (13) and ground.

	Terminals ⊕	Terminals ⊖	Condition	Voltage [V]
LH door	(12)	Ground	Unlock	0
			Lock	Approx. 12
RH door	(13)	Ground	Unlock	0
			Lock	Approx. 12

Refer to wiring diagram in EL-166.

NG → Check the following:
- Door unlock sensor
  Refer to "Electrical Components Inspection", EL-175.
- Door unlock sensor ground circuit
- Harness for open or short between control unit and unlock sensor

OK ↓

E

CHECK IGNITION SWITCH "ACC" OR "ON" CIRCUIT.

1. Disconnect control unit connector.
2. Check voltage between control unit terminal (17) and ground while ignition switch is in ACC or ON position.
   Battery voltage should exist.

Refer to wiring diagram in EL-166.

NG → Check the following:
- 7.5A fuse [No. 20, located in fuse block (J/B)]
- Harness for open or short between control unit and fuse

OK ↓

F

CHECK IGNITION SWITCH "ON" OR "START" CIRCUIT.

Check voltage between control unit terminal (11) and ground while ignition switch is in ON or START position.
Battery voltage should exist.

Refer to wiring diagram in EL-166.

NG → Check the following:
- 7.5A fuse [No. 5, located in fuse block (J/B)]
- Harness for open or short between control unit and fuse

OK ↓

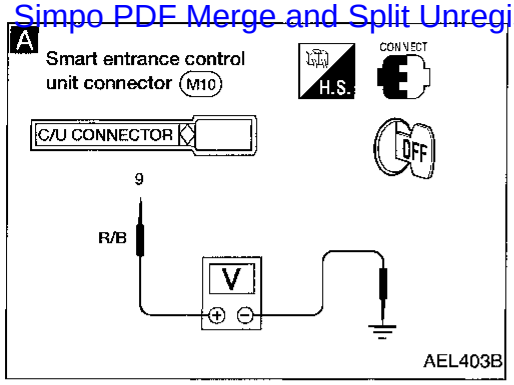
G

CHECK KEY SWITCH INPUT SIGNAL.

1. Connect control unit connector.
2. Check voltage between control unit terminal (24) and ground.

Condition	Voltage [V]
Key is inserted.	Approx. 12
Key is withdrawn.	0

Refer to wiring diagram in EL-166.



NG → Check the following:
- 7.5A fuse [No. 28, located in fuse block (J/B)]
- Key switch
  Refer to "Electrical Components Inspection", EL-175.
- Harness for open or short between key switch and fuse
- Harness for open or short between control unit and key switch

OK ↓

Check operation parts in multi-remote control system for function.

Trouble Diagnoses (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

DIAGNOSTIC PROCEDURE 3

Interior lamp does not turn on for 30 seconds when pressing unlock button of remote controller. Everything else functions.

A

CHECK INTERIOR LAMP CIRCUIT.
When interior lamp switch is in "DOOR" position, check voltage between control unit terminal (9) and ground.
Does battery voltage exist?

Refer to wiring diagram in EL-168.

No → Repair harness between control unit and interior lamp.

Yes ↓

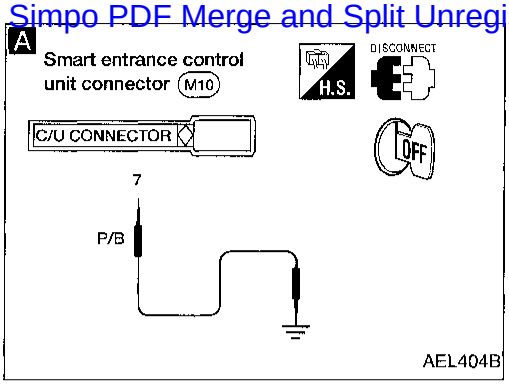
A

Push unlock button of remote controller and check voltage between control unit terminal (9) and ground.

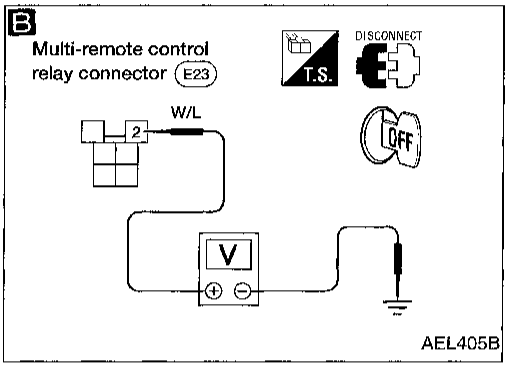
Multi-remote controller button condition	Voltage (V)
Unlock button is pushed.	0
Unlock button is not pushed.	Battery voltage

No → Check harness for open or short between interior lamp and control unit.

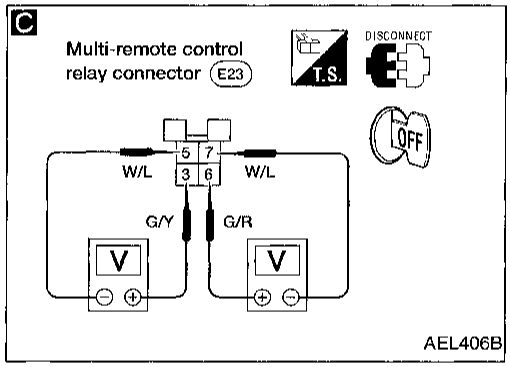
Yes ↓



Check system again.



Trouble Diagnoses (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

DIAGNOSTIC PROCEDURE 4

Hazard indicator does not flash twice when pressing lock button of remote controller. Everything else functions.

A

CHECK HAZARD INDICATOR OPERATION.
1. Disconnect control unit connector.
2. Apply ground to control unit terminal (7).

Does hazard indicator illuminate?

Refer to wiring diagram in EL-168.

Yes → Check harness connector, if OK, replace smart entrance control unit.

No ↓

Check multi-remote control relay. → NG → Replace.

OK ↓

B

CHECK POWER SUPPLY FOR MULTI-REMOTE CONTROL RELAY.
1. Disconnect multi-remote control relay connector.
2. Check voltage between terminal (2) and ground.

Battery voltage should exist.

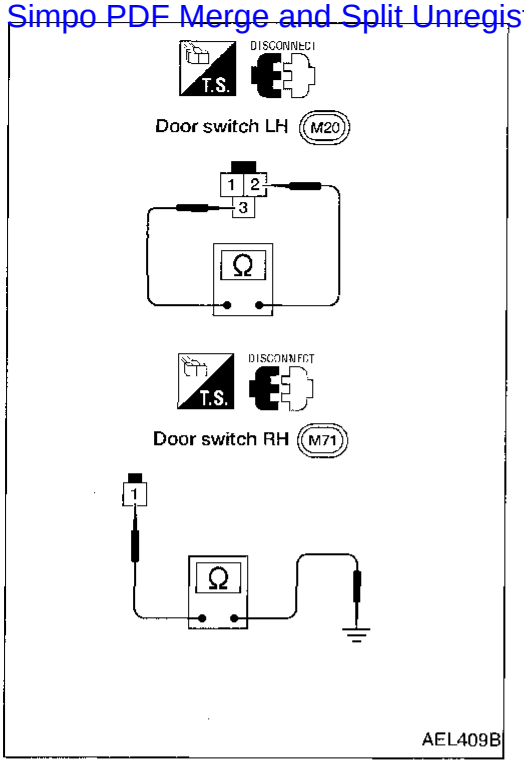
NG → Check the following.
- 10A fuse [No. 17, located in fuse block (J/B)]
- Harness for open or short between multi-remote control relay and fuse

OK ↓

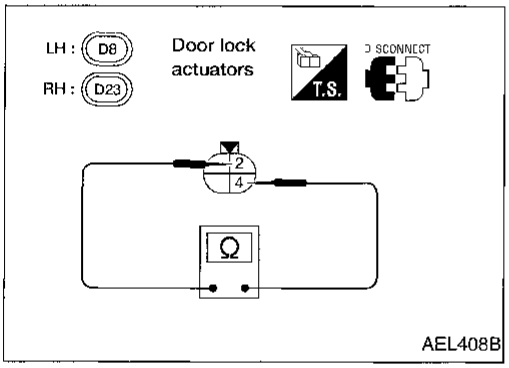
C

CHECK MULTI-REMOTE CONTROL RELAY CIRCUIT.
1. Check voltage between terminals (3) and (5).

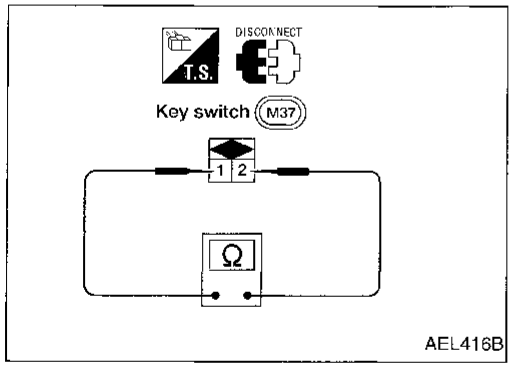
Battery voltage should exist.
2. Check voltage between terminals (6) and (7).



Battery voltage should exist.



NG → Check harness for open or short.



OK ↓

Check harness for open or short between control unit and multi-remote control relay.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Electrical Components Inspection

DOOR SWITCHES

Check continuity between terminals when door switch is pushed and released.

	Terminal No.	Condition	Continuity
Door switch LH	② - ③	Door switch is pushed.	No
		Door switch is released.	Yes
Door switch RH	① - Ground	Door switch is pushed.	No
		Door switch is released.	Yes

DOOR LOCK ACTUATOR (Door unlock sensor)

Check continuity between terminals when door is locked and unlocked.

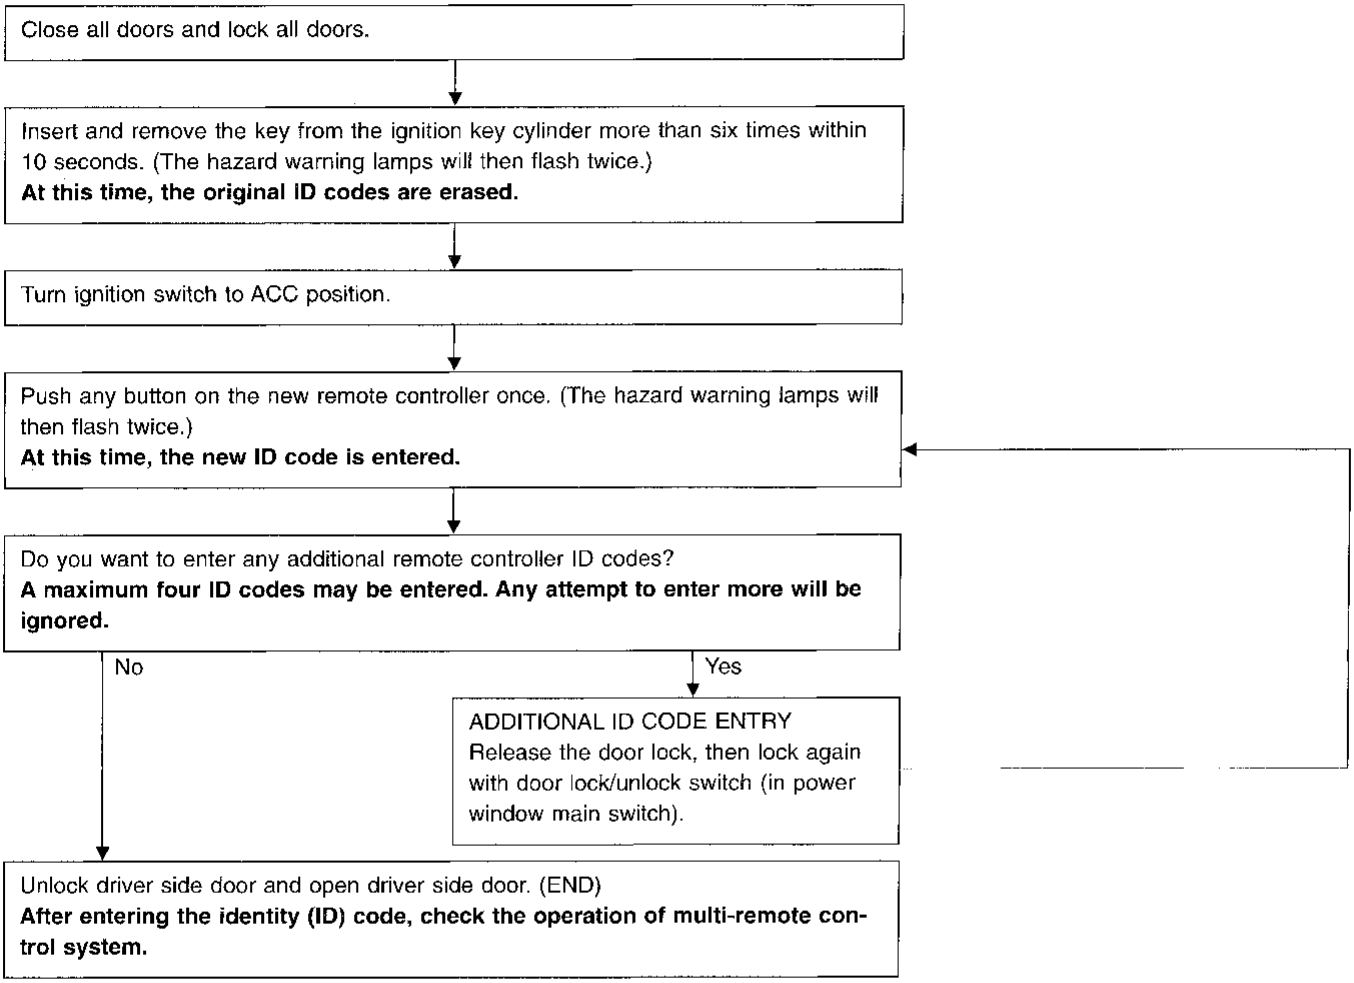
Terminal No.	Condition	Continuity
④ - ②	Door is locked.	No
	Door is unlocked.	Yes

KEY SWITCH (insert)

Check continuity between terminals when key is inserted in ignition key cylinder and key is removed from ignition key cylinder.

Terminal No.	Condition	Continuity
① - ②	Key is inserted.	Yes
	Key is removed.	No

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



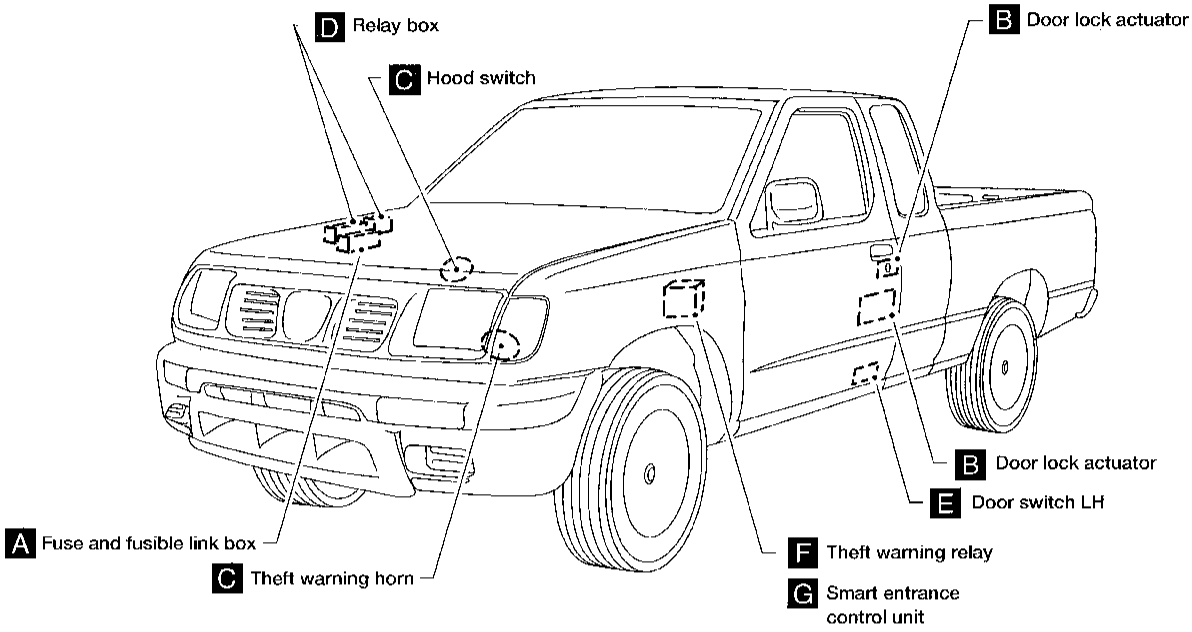
ID Code Entry Procedure

Enter the identity (ID) code manually when:

- **remote controller or control unit is replaced.**
- **an additional remote controller is activated.**

To enter the ID code, follow the procedures below.

PROCEDURE



NOTE:

- **If you need to activate more than two additional new remote controllers, repeat the procedure "Additional ID code entry" for each new remote controller.**
- **If the same ID code that exists in the memory is input, the entry will be ignored.**
- **Entry of four ID codes maximum is allowed and any attempt to enter more will be ignored.**
- **Any ID codes entered after termination of the "setting mode" will not be accepted. Additional remote control signals will be inhibited if not entered during the "setting" mode.**

System Description

OPERATION FLOW

SETTING THE THEFT WARNING SYSTEM

Initial condition

(1) Close all doors.
(2) Close hood.

Disarmed phase

The theft warning system is in the disarmed phase when any door(s) or hood is opened. The security indicator lamp blinks every second.

Pre-armed phase and armed phase

The theft warning system turns into the "pre-armed" phase when hood and all doors are closed and locked by key or multi-remote controller. (The security indicator lamp illuminates.)
After about 30 seconds, the system automatically shifts into the "armed" phase (the system is set). (The security indicator lamp blinks every 2.6 seconds.)

CANCELING THE SET THEFT WARNING SYSTEM

When the following operation is performed, the armed phase is canceled.
Unlock the doors with the key or multi-remote controller.

ACTIVATING THE ALARM OPERATION OF THE THEFT WARNING SYSTEM

Make sure the system is in the armed phase. (The security indicator lamp blinks every 2.6 seconds.)
When the following operation (a) or (b) is performed, the system sounds the horns and flashes the headlamps for about 2.5 minutes. (At the same time, the system disconnects the starting system circuit.)
(a) Engine hood or any door is opened before unlocking door with key or multi remote controller.
(b) Door is unlocked without using key or multi-remote controller.

System Description (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

POWER SUPPLY AND GROUND CIRCUIT

Power is supplied at all times:
- through 7.5A fuse [No. 28, located in the fuse block (J/B)]
- to security indicator lamp terminal ① and
- to key switch terminal ①.

When the key switch is INSERTED (ignition key is inserted in key cylinder), power is supplied:
- through key switch terminal ②
- to smart entrance control unit terminal ㉔.

Power is supplied at all times:
- through 30A fusible link (letter f, located in the fuse and fusible link box)
- to circuit breaker terminal ①
- through circuit breaker terminal ②
- to smart entrance control unit terminal ①.

With the ignition switch in the ACC or ON position, power is supplied:
- through 7.5A fuse [No. 20, located in the fuse block (J/B)]
- to smart entrance control unit terminal ⑰.

With the ignition switch in the ON or START position, power is supplied:
- through 7.5A fuse [No. 15, located in the fuse block (J/B)]
- to smart entrance control unit terminal ⑪.

Ground is supplied:
- through body grounds (M14) and (M68)
- to smart entrance control unit terminal ⑩.

INITIAL CONDITION TO ACTIVATE THE SYSTEM

The operation of the theft warning system is controlled by the doors and hood.
To activate the theft warning system, the smart entrance control unit must receive signals indicating the doors and hood are closed and the doors are locked.
When a door is open, smart entrance control unit terminals ⑮ or ㉟ receives a ground signal from each door switch.
When a door is unlocked, smart entrance control unit terminals ⑫ or ⑬ receives a ground signal:
- from terminal ② of each door unlock sensor
- through terminal ④ of each door unlock sensor
- through body grounds (M14) and (M68) for the door unlock sensors LH or RH.

When the hood is open, smart entrance control unit terminal ㉙ receives a ground signal:
- from terminal ⊕ of the hood switch
- through terminal ⊖ of the hood switch
- through body grounds (E12) and (E54).

When the doors are locked using the key or multi-remote controller and none of the described conditions exist, the theft warning system will automatically shift to the armed phase.

THEFT WARNING SYSTEM ACTIVATION (With key or remote controller used to lock doors)

If the key is used to lock doors, smart entrance control unit terminal ㉚ receives a ground signal:
- from terminal ① of the door key cylinder switch LH
- from terminal ③ of the door key cylinder switch RH
- through terminal ② of the front door key cylinder switch LH or RH
- through body grounds (M14) and (M68).

If this signal or lock signal from remote controller is received by the smart entrance control unit, the theft warning system will activate automatically.
Once the theft warning system has been activated, smart entrance control unit terminal ㉝ supplies ground to terminal ② of the security indicator lamp.
The security lamp will illuminate for approximately 30 seconds and then blink every 2.6 seconds.
Now the theft warning system is in armed phase.

THEFT WARNING SYSTEM ALARM OPERATION

The theft warning system is triggered by:
- opening a door
- opening the hood
- unlocking door without using the key or multi-remote controller.

Once the theft warning system is in armed phase, if the smart entrance control unit receives a ground signal

System Description (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

at terminal ⑫, ⑬ (door unlock sensor), ⑮, ⑯ (door switch) or ㉙ (hood switch), the theft warning system will be triggered. The headlamps flash and the horns sound intermittently, and the starting system is interrupted.

With the ignition switch in the ON or START position, power is supplied:

- through 7.5A fuse [No. 15, located in the fuse block (J/B)].
- to theft warning relay terminal ②.

If the theft warning system is triggered, ground is supplied:

- from terminal ㉜ of the smart entrance control unit
- to theft warning relay terminal ①.

With power and ground supplied, ground to the clutch interlock relay (M/T models) or inhibitor relay (A/T models) is interrupted. The starter motor will not crank and the engine will not start, refer to EL-START (EL-20).

Power is supplied at all times:

- through 25A fuse (No. 31, located in fuse and fusible link box)
- to theft warning lamp relay terminal ② and
- to theft warning horn relay terminals ② and ⑦.

When the theft warning system is triggered, ground is supplied intermittently:

- from terminal ⑧ of the smart entrance control unit
- to theft warning lamp relay terminal ① and
- to theft warning horn relay terminal ①.

The headlamps flash and the horns sound intermittently.

The alarm automatically turns off after 2 or 3 minutes but will reactivate if the vehicle is tampered with again.

THEFT WARNING SYSTEM DEACTIVATION

To deactivate the theft warning system a door must be unlocked with the key or remote controller.

When the key is used to unlock a door, smart entrance control unit terminal ㉛ receives a ground signal:

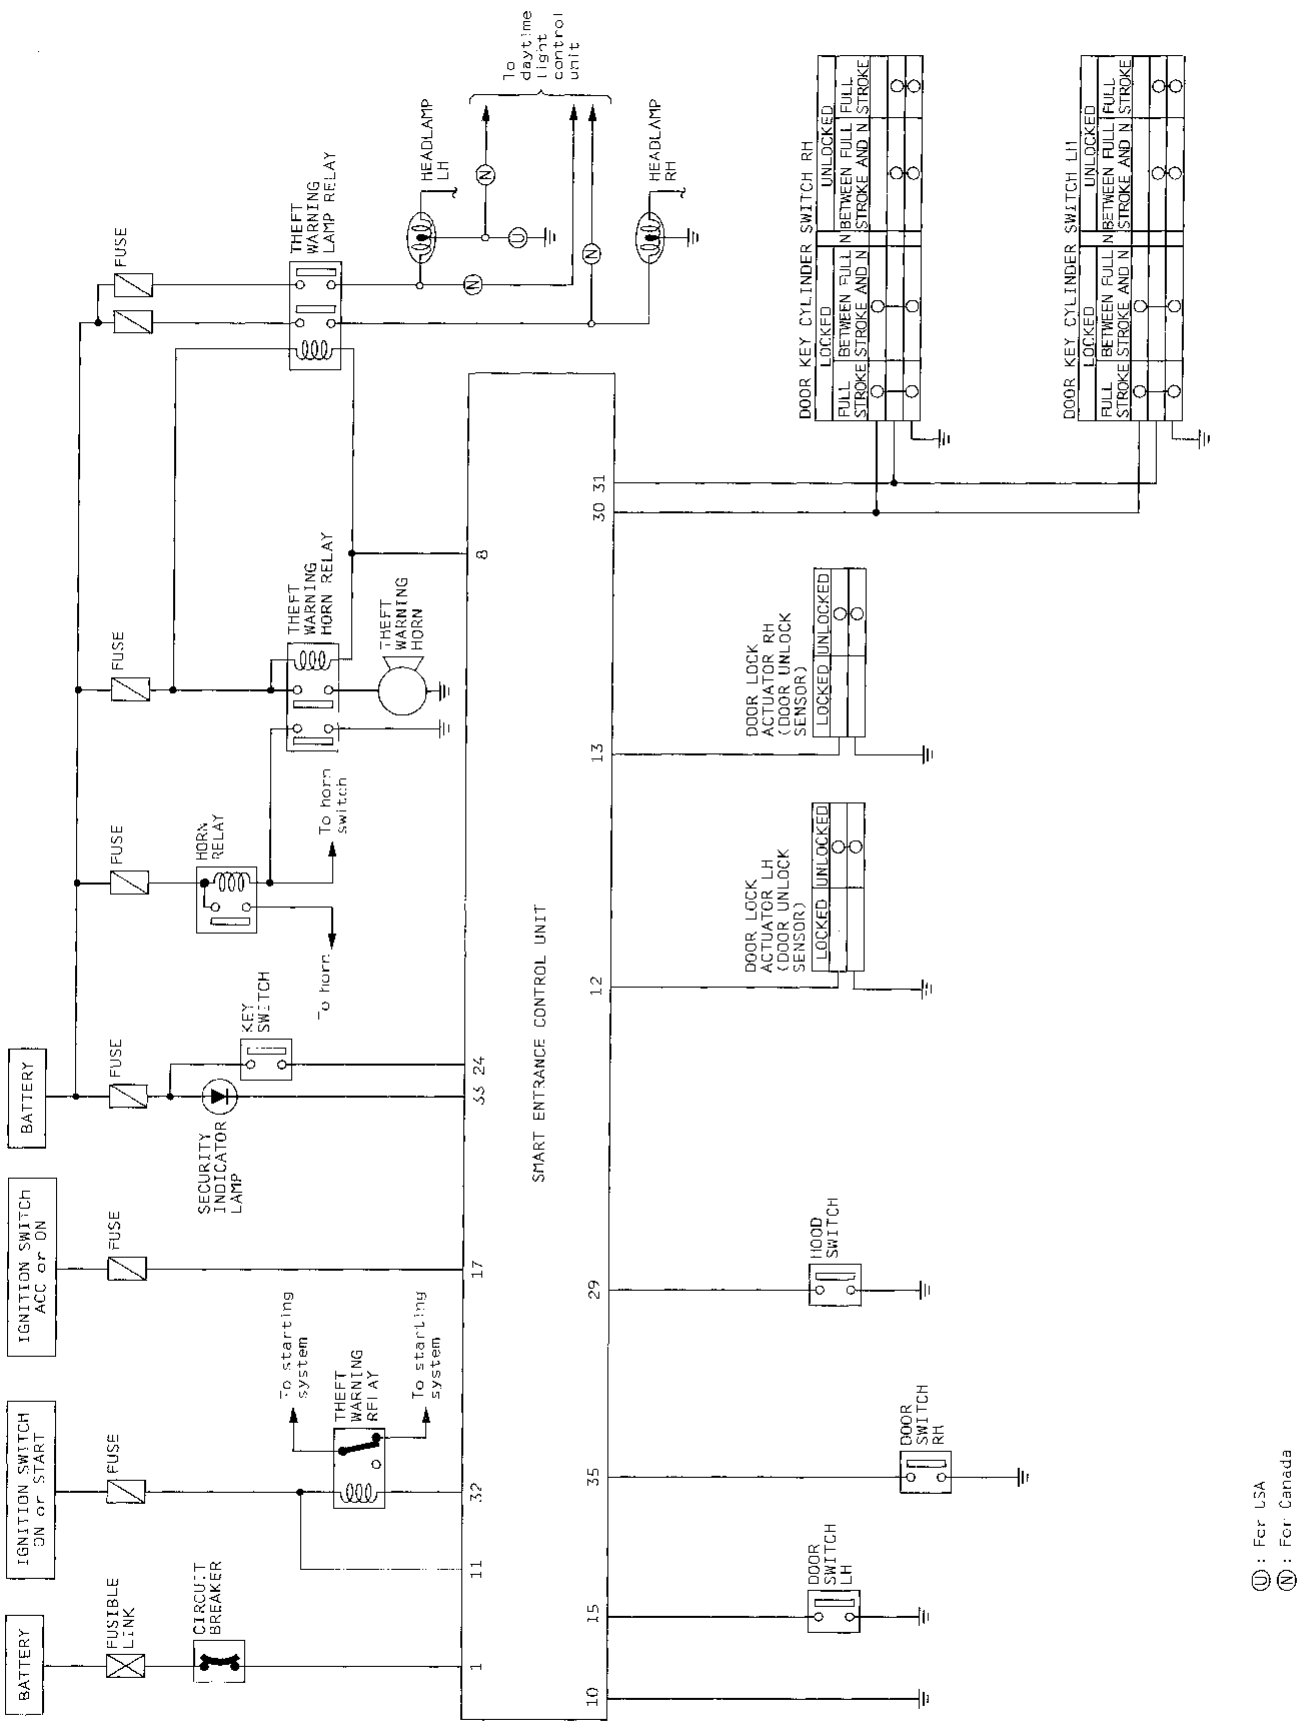
- from terminal ③ of the door key cylinder switch LH
- from terminal ① of the door key cylinder switch RH
- through terminal ② of the front door key cylinder switch LH or RH
- through body grounds (M14) and (M68).

When the smart entrance control unit receives this signal or unlock signal from remote controller, the theft warning system is deactivated. (Disarmed phase)

PANIC ALARM OPERATION

Multi-remote control system may or may not operate theft warning system (horn and headlamps) as required.

When the multi-remote control system is triggered, ground is supplied intermittently:



- from smart entrance control unit terminal ⑧
- to theft warning lamp relay terminal ① and
- to theft warning horn relay terminal ①.

The headlamps flash and the horns sound intermittently.

The alarm automatically turns off after 30 seconds or when smart entrance control unit receives any signal from multi-remote controller.

Trouble Diagnoses

PRELIMINARY CHECK

The system operation is canceled by turning ignition switch to ACC at any step between START and ARMED in the following flow chart.

After performing preliminary check, go to symptom chart on next page.

Trouble Diagnoses (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Before starting trouble diagnoses below, perform preliminary check, EL-186.

Symptom numbers in the symptom chart correspond with those of preliminary check.

SYMPTOM CHART

PROCEDURE			—	Power supply and ground circuit check		Diagnostic procedure							—
REFERENCE PAGE			EL-186	EL-188	EL-188	EL-189	EL-191	EL-192	EL-193	EL-194	EL-195	EL-196	EL-169
SYMPTOM			Preliminary check	Power supply circuit check	Ground circuit check	Diagnostic Procedure 1 (Door and hood switch check)	Diagnostic Procedure 2 (Security indicator lamp check)	Diagnostic Procedure 3 (Door unlock sensor check)	Diagnostic Procedure 4 (Door key cylinder switch check)	Diagnostic Procedure 5 (Theft warning horn alarm check)	Diagnostic Procedure 6 (Theft warning headlamp alarm check)	Diagnostic Procedure 7 (Starter interrupt system check)	Check "MULTI-REMOTE CONTROL" system.
1	Theft warning indicator does not turn "ON" or blinking.		X	X	X		X

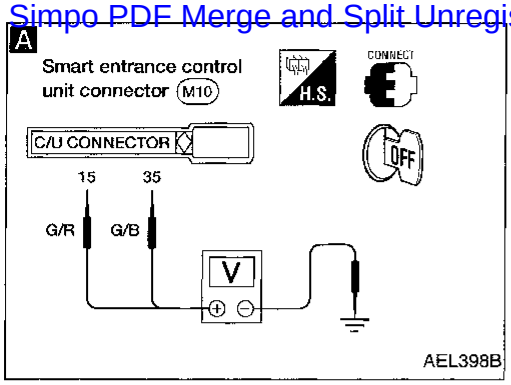
POWER SUPPLY AND GROUND CIRCUIT CHECK

Power supply circuit check

Terminals		Ignition switch position		
⊕	⊖	OFF	ACC	ON
①	Ground	Battery voltage	Battery voltage	Battery voltage
⑪	Ground	0V	0V	Battery voltage
⑰	Ground	0V	Battery voltage	Battery voltage

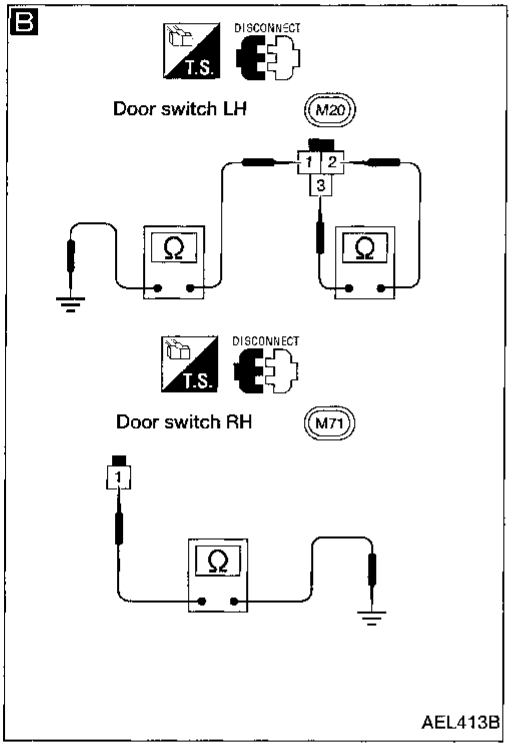
Ground circuit check



Terminal	Continuity
⑩ - Ground	Yes

Trouble Diagnoses (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



DIAGNOSTIC PROCEDURE 1-(1)
(Door switch check)

1. Turn ignition switch OFF and remove key from key cylinder.
2. Close all doors and hood.
   "SECURITY" indicator lamp should turn off.
3. Open any door.
   "SECURITY" indicator lamp should blink every second.

OK → Door switch is OK.

NG ↓

A

CHECK DOOR SWITCH INPUT SIGNAL.
Check voltage between control unit terminals (15) or (35) and ground.

OK → Door switch is OK.

	Terminals ⊕	Terminals ⊖	Condition	Voltage [V]
Door switch LH	(15)	Ground	Open	0
			Closed	Approx. 12
Door switch RH	(35)	Ground	Open	0
			Closed	Approx. 12

Refer to wiring diagram in EL-183.

NG ↓

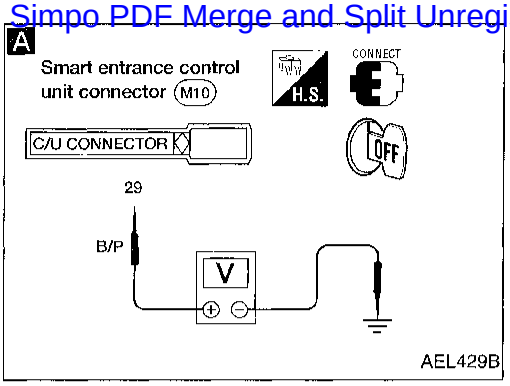
B

CHECK DOOR SWITCH.
1. Disconnect door switch connector.
2. Check continuity between door switch terminals.

NG → Replace door switch.

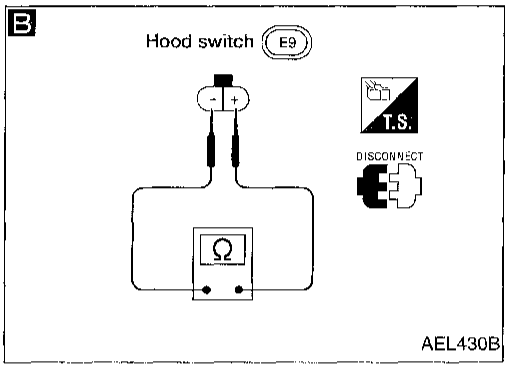
	Terminals	Condition	Continuity
Door switch LH	(1) - Ground, (2) - (3)	Closed	No
		Open	Yes
Door switch RH	(1) - Ground	Closed	No
		Open	Yes

OK ↓



Check the following.
- Door switch ground circuit (LH) or door switch ground condition
- Harness for open or short between control unit and door switch

Trouble Diagnoses (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

DIAGNOSTIC PROCEDURE 1-(2)
(Hood switch check)

A

B

1. Turn ignition switch OFF and remove key from key cylinder.
2. Close all doors and hood.
   "SECURITY" indicator lamp should turn off.
3. Open hood.
   "SECURITY" indicator lamp should blink every second.

OK → Hood switch is OK.

NG

Check hood switch and hood fitting condition.

NG → Adjust installation of hood switch or hood.

OK

A

CHECK HOOD SWITCH INPUT SIGNAL.
Check voltage between control unit terminal (29) and ground.

Condition	Voltage [V]
Hood is open.	0
Hood is closed.	Approx. 12

Refer to wiring diagram in EL-184.

OK → Hood switch is OK.

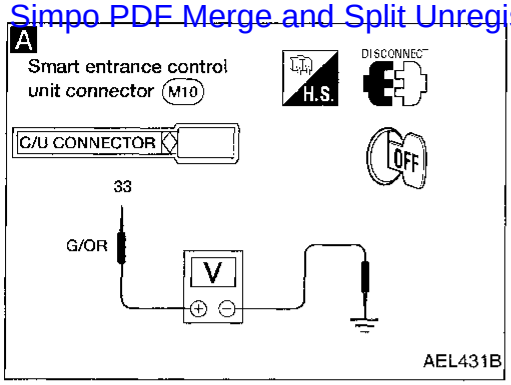
NG

B

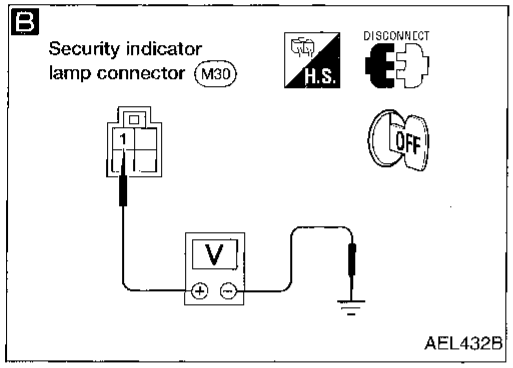
CHECK HOOD SWITCH.
1. Disconnect hood switch connector.
2. Check continuity between hood switch terminals.

Terminals	Condition	Continuity
⊖ - ⊕	Pushed	No
	Released	Yes

NG → Replace hood switch.



OK



Check the following.
- Hood switch ground circuit
- Harness for open or short between control unit and hood switch

Trouble Diagnoses (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

DIAGNOSTIC PROCEDURE 2
(Security indicator lamp check)

A

CHECK INDICATOR LAMP OUTPUT SIGNAL.
1. Disconnect control unit connector.
2. Check voltage between control unit terminal (33) and ground.
   Battery voltage should exist.

   Refer to wiring diagram in EL-183.

OK → Security indicator lamp is OK.

NG ↓

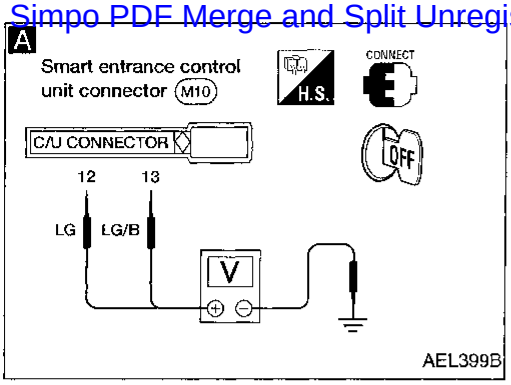
CHECK INDICATOR LAMP. NG → Replace indicator lamp.

OK ↓

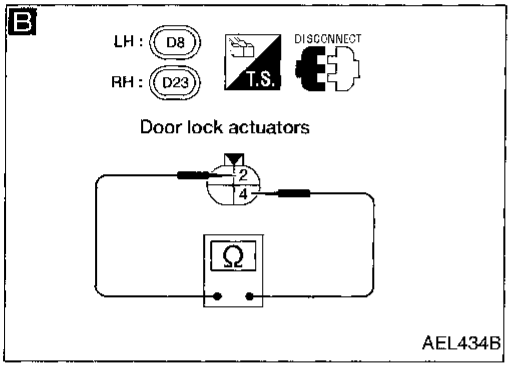
B

CHECK POWER SUPPLY CIRCUIT FOR INDICATOR LAMP.
1. Disconnect security lamp connector.
2. Check voltage between indicator lamp terminal (1) and ground.
   Battery voltage should exist.

NG → Check the following:
- 7.5A fuse [No. 28, located in fuse block (J/B)]
- Harness for open or short between security indicator lamp and fuse



OK ↓



Check harness for open or short between security indicator lamp and control unit.

Trouble Diagnoses (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

DIAGNOSTIC PROCEDURE 3 (Door unlock sensor check)

A

CHECK DOOR UNLOCK SENSOR INPUT SIGNAL.

Check voltage between control unit terminals ⑫ or ⑬ and ground.

	Terminals ⊕	Terminals ⊖	Condition	Voltage [V]
Door LH	⑫	Ground	Locked	Approx. 12
			Unlocked	0
Door RH	⑬	Ground	Locked	Approx. 12
			Unlocked	0

Refer to wiring diagram in EL-183.

OK → Door unlock sensor is OK.

NG ↓

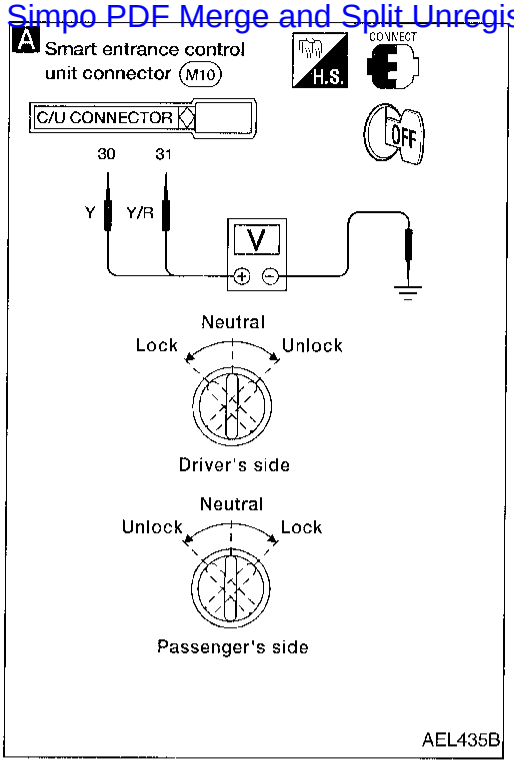
B

CHECK DOOR UNLOCK SENSOR.

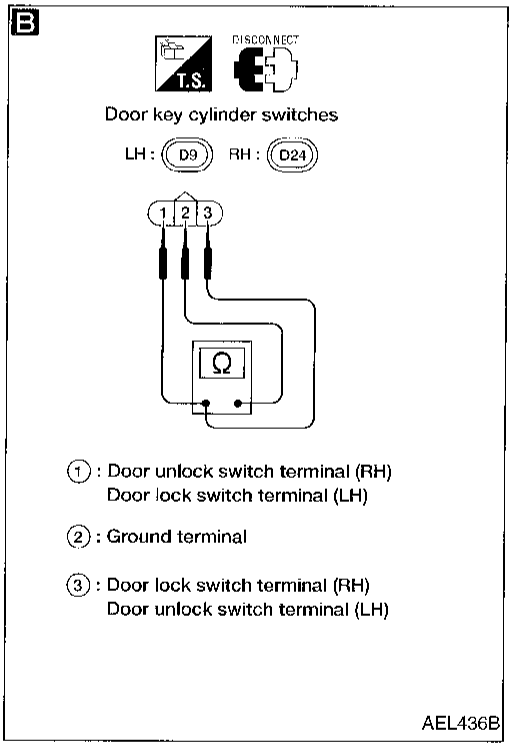
1. Disconnect door unlock sensor connector.
2. Check continuity between door unlock sensor terminals.

Terminals	Condition	Continuity
④ - ②	Locked	No
	Unlocked	Yes

NG → Replace door unlock sensor.



OK ↓



Check the following.
- Door unlock sensor ground circuit
- Harness for open or short between control unit and door unlock sensor

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Trouble Diagnoses (Cont'd)

DIAGNOSTIC PROCEDURE 4
(Door key cylinder switch check)

A

CHECK DOOR KEY CYLINDER SWITCH INPUT SIGNAL (LOCK/UNLOCK SIGNAL).

Check voltage between control unit terminals ㉚ or ㉛ and ground.

Terminals ⊕	Terminals ⊖	Key position	Voltage [V]
㉚	Ground	Neutral	Approx. 12
		Lock	0
㉛	Ground	Neutral	Approx. 12
		Unlock	0

Refer to wiring diagram in EL-184.

OK → Door key cylinder switch is OK.

NG ↓

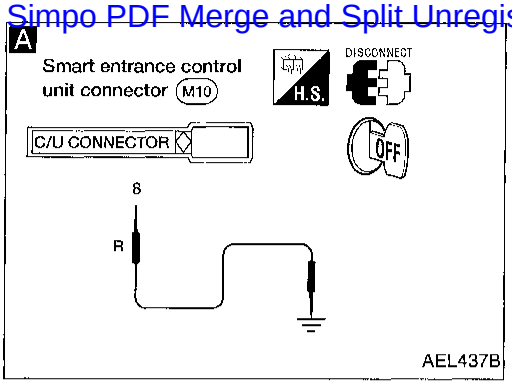
B

CHECK DOOR KEY CYLINDER SWITCH.

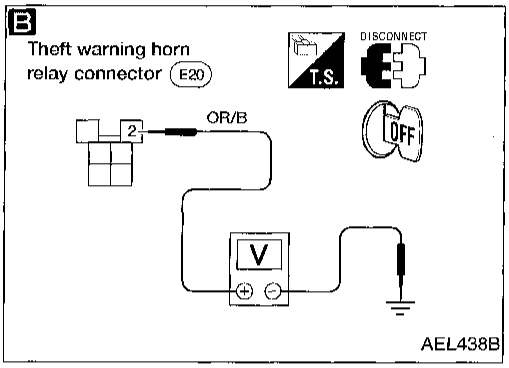
1. Disconnect door key cylinder switch connector.
2. Check continuity between door key cylinder switch terminals.

Terminals	Key position	Continuity
LH: ① - ②	Neutral	No
RH: ③ - ②	Lock	Yes
LH: ③ - ②	Neutral	No
RH: ① - ②	Unlock	Yes

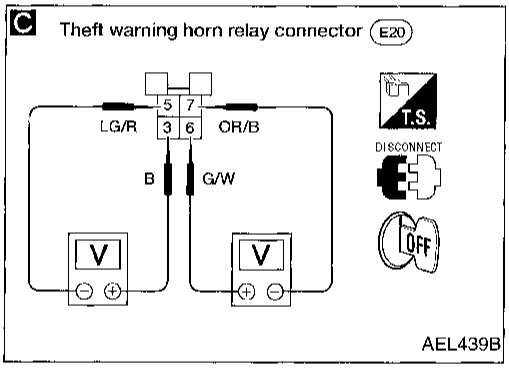
NG → Replace door key cylinder switch.



OK ↓



Check the following:
- Door key cylinder switch ground circuit
- Harness for open or short between control unit and door key cylinder switch



Trouble Diagnoses (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

DIAGNOSTIC PROCEDURE 5
(Theft warning horn alarm check)

A

CHECK THEFT WARNING HORN ALARM OPERATION.
1. Disconnect control unit connector.
2. Apply ground to control unit terminal (8).

Does horn alarm activate?

Refer to wiring diagram in EL-185.

Yes → Horn alarm is OK.

No ↓

Check theft warning horn relay. — NG → Replace.

OK ↓

B

CHECK POWER SUPPLY FOR THEFT WARNING HORN RELAY.
1. Disconnect theft warning horn relay connector.
2. Check voltage between terminal (2) and ground.

Battery voltage should exist.

NG → Check the following:
- 25A fuse (No. 31, located in the fuse and fusible link box)
- Harness for open or short between theft warning horn relay and fuse

OK ↓

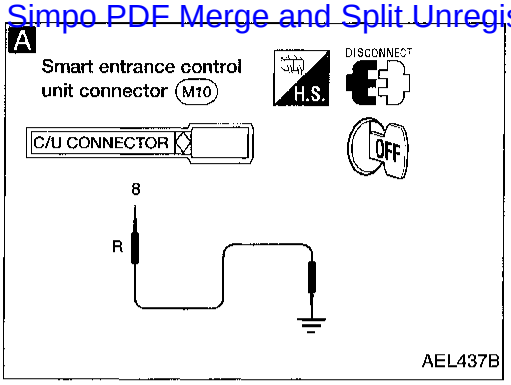
C

CHECK THEFT WARNING HORN RELAY CIRCUIT.
1. Disconnect theft warning horn relay connector.
2. Check voltage between terminals (3) and (5).

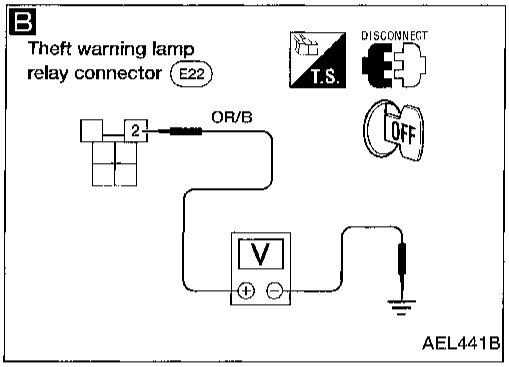
Battery voltage should exist.
3. Check voltage between terminals (6) and (7).

Battery voltage should exist.

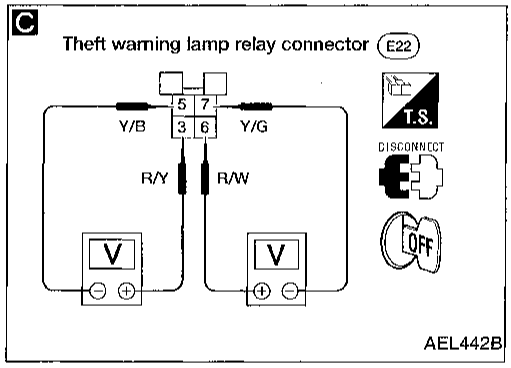
NG → Check harness for open or short.



OK ↓



Check harness for open or short between theft warning horn relay and control unit.



Trouble Diagnoses (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

DIAGNOSTIC PROCEDURE 6
(Theft warning headlamp alarm check)

A

CHECK THEFT WARNING HEADLAMP ALARM OPERATION.
1. Disconnect control unit connector.
2. Apply ground to control unit terminal (8).

Does headlamp alarm activate?

Refer to wiring diagram in EL-185.

Yes → Headlamp alarm is OK.

No →

Does headlamp come on when turning lighting switch ON?

No → Check headlamp system. Refer to "HEADLAMP" (EL-36).

Yes →

Check theft warning lamp relay.

NG → Replace.

OK →

B

CHECK POWER SUPPLY FOR THEFT WARNING LAMP RELAY.
1. Disconnect theft warning lamp relay connector.
2. Check voltage between terminal (2) and ground.

Battery voltage should exist.

Refer to wiring diagram in EL-185.

NG → Check the following:
- 25A fuse (No. 31, located in the fuse and fusible link box)
- Harness for open or short between theft warning lamp relay and fuse

OK →

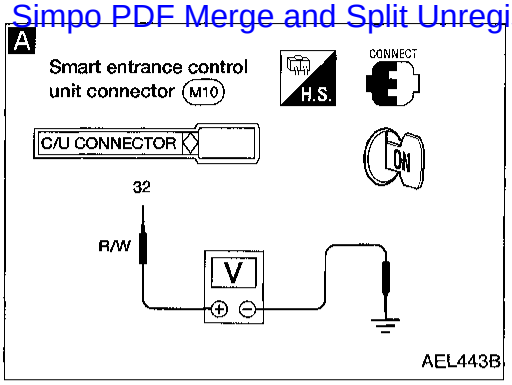
C

CHECK THEFT WARNING LAMP RELAY CIRCUIT.
1. Disconnect theft warning lamp relay connector.
2. Check voltage between terminals (3) and (5).

Battery voltage should exist.
3. Check voltage between terminals (6) and (7).

Battery voltage should exist.

NG → Check harness for open or short.



OK →

Check harness for open or short between theft warning lamp relay and ground.

Trouble Diagnoses (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

DIAGNOSTIC PROCEDURE 7
(Starter interrupt system check)

A

CHECK STARTER MOTOR INTERRUPT SIGNAL.

1. Turn ignition switch ON.
2. Check voltage between control unit terminal (32) and ground.

Condition	Voltage [V]
Except starter interrupted phase	Approx. 12
Starter interrupted phase	0

Refer to wiring diagram in EL-184.

NG → Check the following:
- 7.5A fuse [No. 15, located in fuse block (J/B)]
- Harness for open or short between theft warning relay and fuse
- Harness for open or short between control unit and theft warning relay

OK ↓

Check theft warning relay. → NG → Replace relay.

OK ↓

Check starting system. Refer to "STARTING SYSTEM" (EL-21).

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description

The following systems are controlled by the smart entrance control unit.

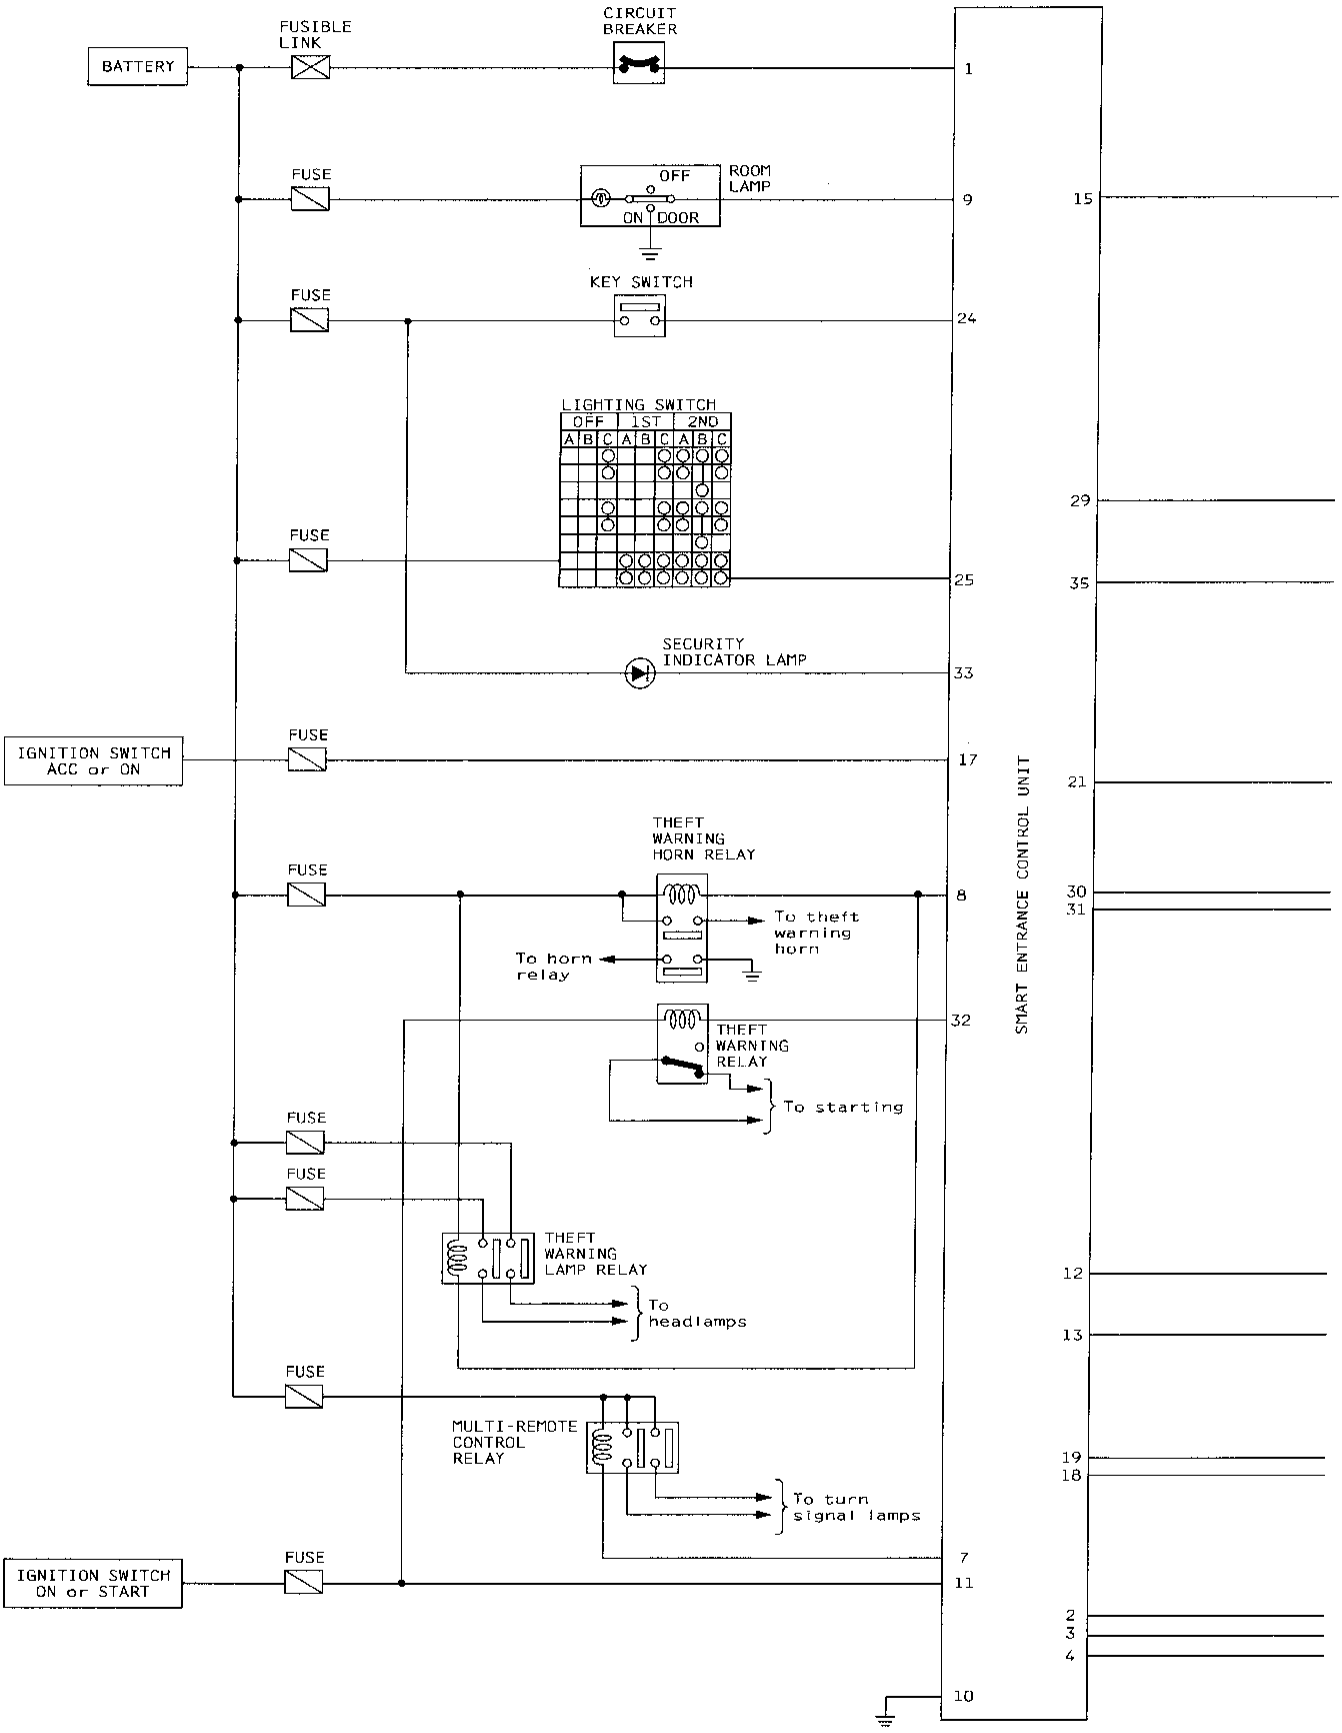
- Warning chime
- Power door lock
- Multi-remote control system
- Theft warning system.

For detailed description and wiring diagrams, refer to the relevant pages for the each system.
The control unit receives data from the switches and sensors to control their corresponding system relays and actuators.

System	Input	Output
Warning chime	Key switch (Insert) Ignition switch (ON) Lighting switch (1st) Seat belt buckle switch Door switch LH	Warning chime
Power door lock	Door lock and unlock switches Key switch (Insert) Door switches Door unlock sensors Door key cylinder switches (lock/unlock)	Door lock actuators
Multi-remote control	Key switch (Insert) Ignition switch (ACC) Door switches Door unlock sensors Antenna (remote controller signal)	Theft warning horn relay Theft warning lamp relay Interior lamp Multi-remote control relay Door lock actuators
Theft warning	Ignition switch (ACC, ON) Door switches Hood switch Door key cylinder switches (lock/unlock) Door unlock sensors	Theft warning horn relay Theft warning lamp relay Theft warning relay (Starter interrupt) Security indicator

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Input/Output Operation Signal



Terminal No.	Connections	Operated condition		Voltage (V) (Approximate values)
1	Power source (C/B)	—		12V
2	Passenger door lock actuator	Door lock & unlock switch	Unlocked	12V
3	Driver door lock actuator		Free	0V
4	Driver and passenger door lock actuators	Door lock & unlock switch	Locked	12V
			Free	0V
7	Multi-remote control relay	When doors are locked using remote controller		12V → 0V
8	Theft warning horn relay Theft warning lamp relay	When panic alarm is operated using remote controller		12V → 0V
9	Room lamp	When interior lamp is operated using remote controller. (Lamp switch in "DOOR" position)		12V → 0V
10	Ground	—		—
11	Ignition switch (ON)	Ignition key is in "ON" position		12V
12	Driver door unlock sensor	Driver door: Locked → Unlocked		12V → 0V
13	Passenger door unlock sensor	Passenger door: Locked → Unlocked		12V → 0V
15	Driver door switch	OFF (Closed) → ON (Open)		12V → 0V
17	Ignition switch (ACC)	"ACC" position		12V
18	Door lock/unlock switches (lock)	Neutral → Locks		12V → 0V
19	Door lock/unlock switches (unlock)	Neutral → Unlocks		12V → 0V
21	Seat belt buckle switch	Unfasten → Fasten (Ignition key is in "ON" position)		0V → 12V
24	Ignition key switch (Insert)	IGN key inserted → IGN key removed from IGN key cylinder		12V → 0V
25	Lighting switch (1ST)	1ST, 2ND positions: ON → OFF		12V → 0V
29	Hood switch	ON (Open) → OFF (Closed)		0V → 12V
30	Door key cylinder lock switch	OFF (Neutral) → ON (Locked)		12V → 0V
31	Door key cylinder unlock switch	OFF (Neutral) → ON (Unlocked)		12V → 0V
32	Theft warning relay (Starter cut)	OFF → ON (Ignition key is in "ON" position)		12V → 0V
33	Theft warning indicator	Goes off → Illuminates		12V → 0V
35	Passenger door switch	OFF (Closed) → ON (Open)		12V → 0V

Outline

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

How to Read Harness Layout

Example:

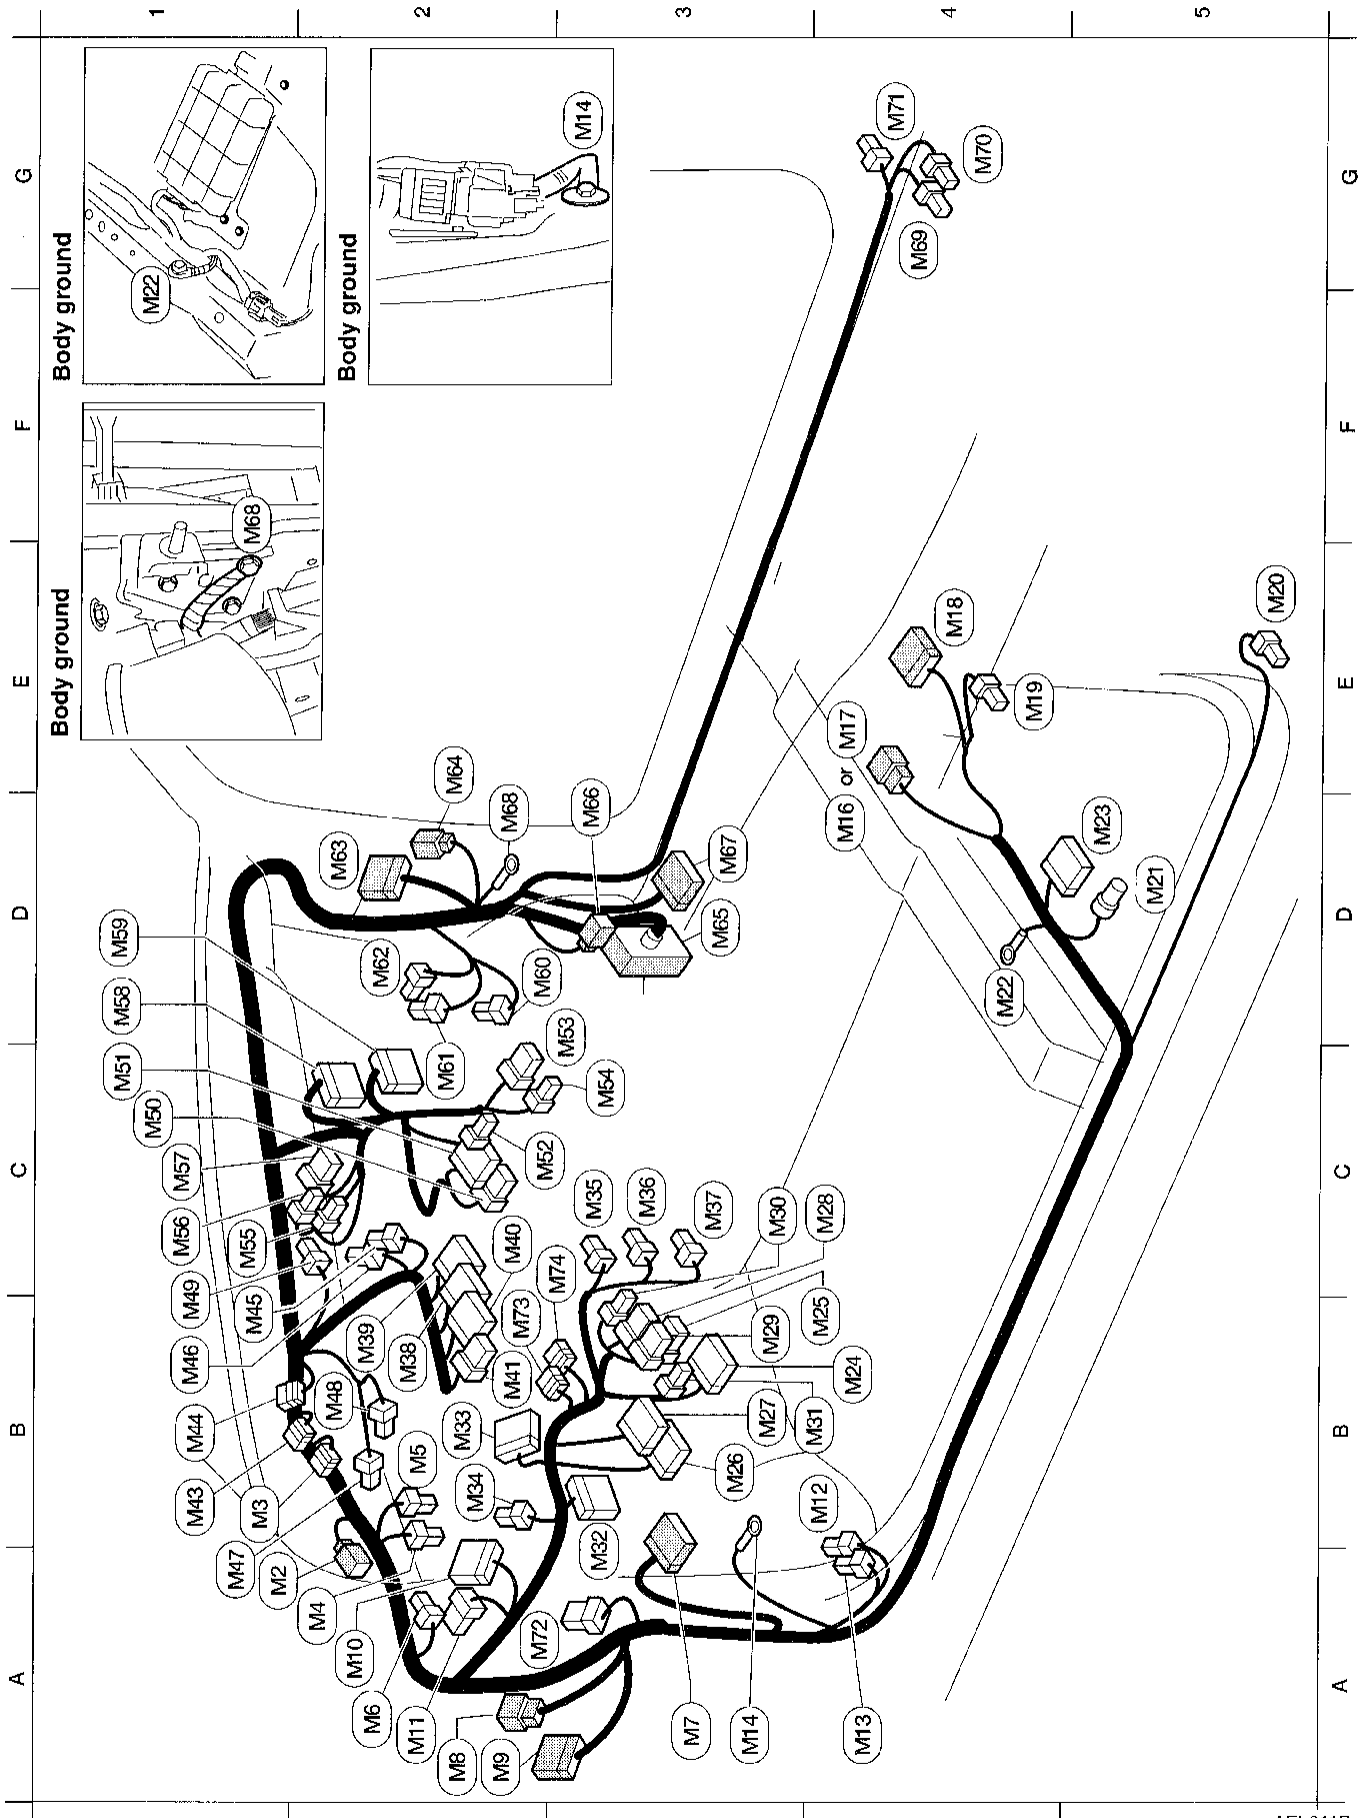
The following Harness Layouts use a map style grid to help locate connectors on the drawings:
- Main Harness
- Engine Room Harness (Engine Compartment)
- Engine Control Harness

To use the grid reference

1) Find the desired connector number on the connector list.
2) Find the grid reference.
3) On the drawing, find the crossing of the grid reference letter column and number row.
4) Find the connector number in the crossing zone.
5) Follow the line (if used) to the connector.

CONNECTOR SYMBOL

Main symbols of connector (in Harness Layout) are indicated in the below.



Connector type	Water proof type		Standard type	
	Male	Female	Male	Female
● Cavity: Less than 4 ● Relay connector				
● Cavity: From 5 to 8				
● Cavity: More than 9				
● Ground terminal etc.	—

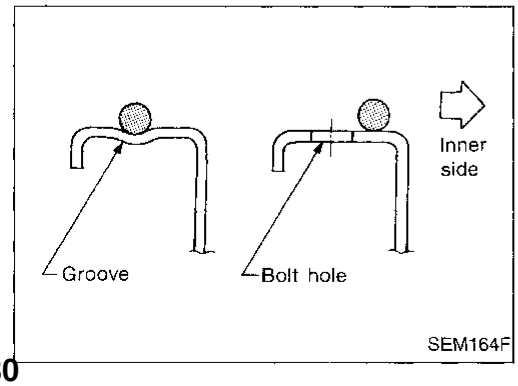
Supplemental Restraint System (SRS) "AIR BAG"



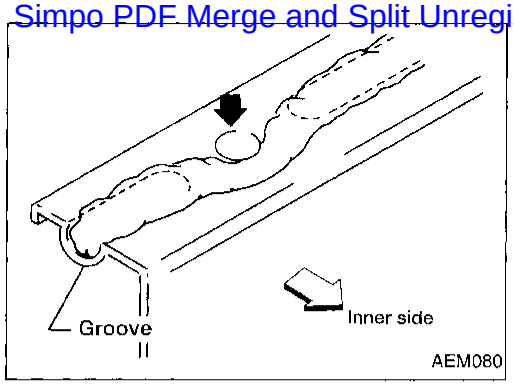
The Supplemental Restraint System "AIR BAG", used along with a seat belt, helps to reduce the risk or severity of injury to the driver and front passenger in a frontal collision. The Supplemental Restraint System consists of air bag modules (located in the center of the steering wheel and in the instrument panel on the passenger side), a diagnosis sensor unit, a crash zone sensor (4WD models), warning lamp, wiring harness and spiral cable.
The vehicle is equipped with a passenger air bag deactivation switch. Because no rear seat exists where a rear-facing child restraint can be placed, the switch is designed to turn off the passenger air bag so that a rear-facing child restraint can be used in the front passenger seat. The switch is located in the center of the instrument panel, near the ashtray. When the switch is turned to the ON position, the passenger air bag is enabled and could inflate in a frontal collision. When the switch is turned to the OFF position, the passenger air bag is disabled and will not inflate in a frontal collision. A passenger air bag OFF indicator on the instrument panel lights up when the passenger air bag is switched OFF. The driver air bag always remains enabled and is not affected by the passenger air bag deactivation switch.
Information necessary to service the system safely is included in the **RS section** of this Service Manual.

WARNING:

- **To avoid rendering the SRS inoperative, which could increase the risk of personal injury or death in the event of a collision which would result in air bag inflation, all maintenance should be performed by an authorized NISSAN dealer.**
- **Improper maintenance, including incorrect removal and installation of the SRS, can lead to personal injury caused by unintentional activation of the system.**
- **Do not use electrical test equipment on any circuit related to the SRS unless instructed to in this Service Manual. SRS wiring harnesses are covered with yellow insulation either just before the harness connectors or on the complete harness, for easy identification.**
- **The vehicle is equipped with a passenger air bag deactivation switch which can be operated by the customer. When the passenger air bag is switched OFF, the passenger air bag is disabled and will not inflate in a frontal collision. When the passenger air bag is switched ON, the passenger air bag is enabled and could inflate in a frontal collision. After SRS maintenance or repair, make sure the passenger air bag deactivation switch is in the same position (ON or OFF) as when the vehicle arrived for service.**

Parts Requiring Angular Tightening

- Use an angle wrench for the final tightening of the following engine parts:
  (1) Cylinder head bolts
  (2) Connecting rod cap nuts
- Do not use a torque value for final tightening.
- The torque values for these parts are for a preliminary step.
- Ensure thread and seat surfaces are clean and coated with engine oil.

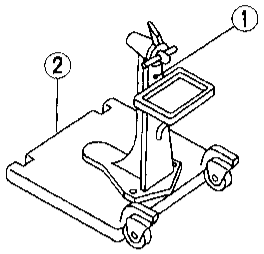


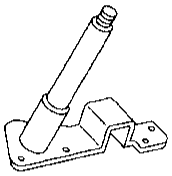
Liquid Gasket Application Procedure

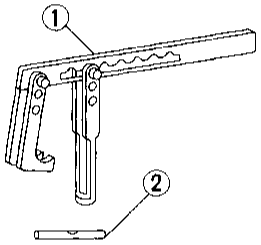
a. **Use a scraper to remove all traces of old liquid gasket from mating surfaces and grooves. Also, completely clean any oil from these areas.**
b. **Apply a continuous bead of liquid gasket to mating surfaces. (Use Genuine RTV Silicone Sealant, Part No. 999 MP-A7007, Three Bond TB1207D or equivalent.)**
   - **For oil pan, be sure liquid gasket diameter is 3.5 to 4.5 mm (0.138 to 0.177 in).**
   - **For areas except oil pan, be sure liquid gasket diameter is 2.0 to 3.0 mm (0.079 to 0.118 in).**

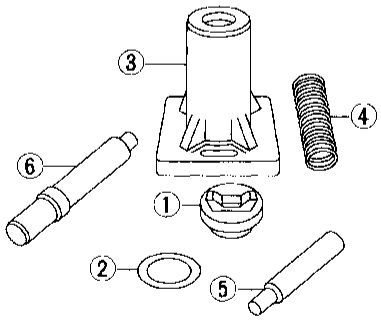
Liquid Gasket Application Procedure (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



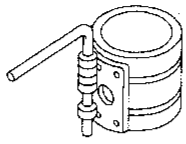


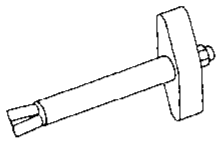


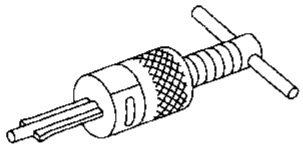


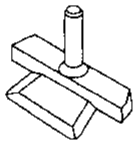
c. Apply liquid gasket around the inner side of bolt holes (unless otherwise specified).
d. Assembly should be done within 5 minutes after coating.
e. Wait at least 30 minutes before refilling engine oil and engine coolant.

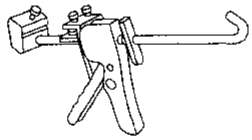
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

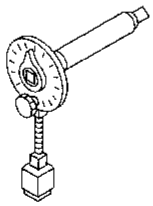


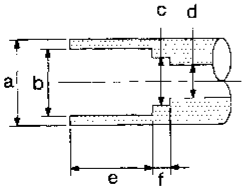


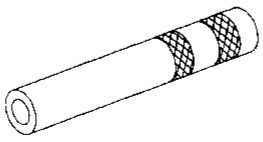












Special Service Tools

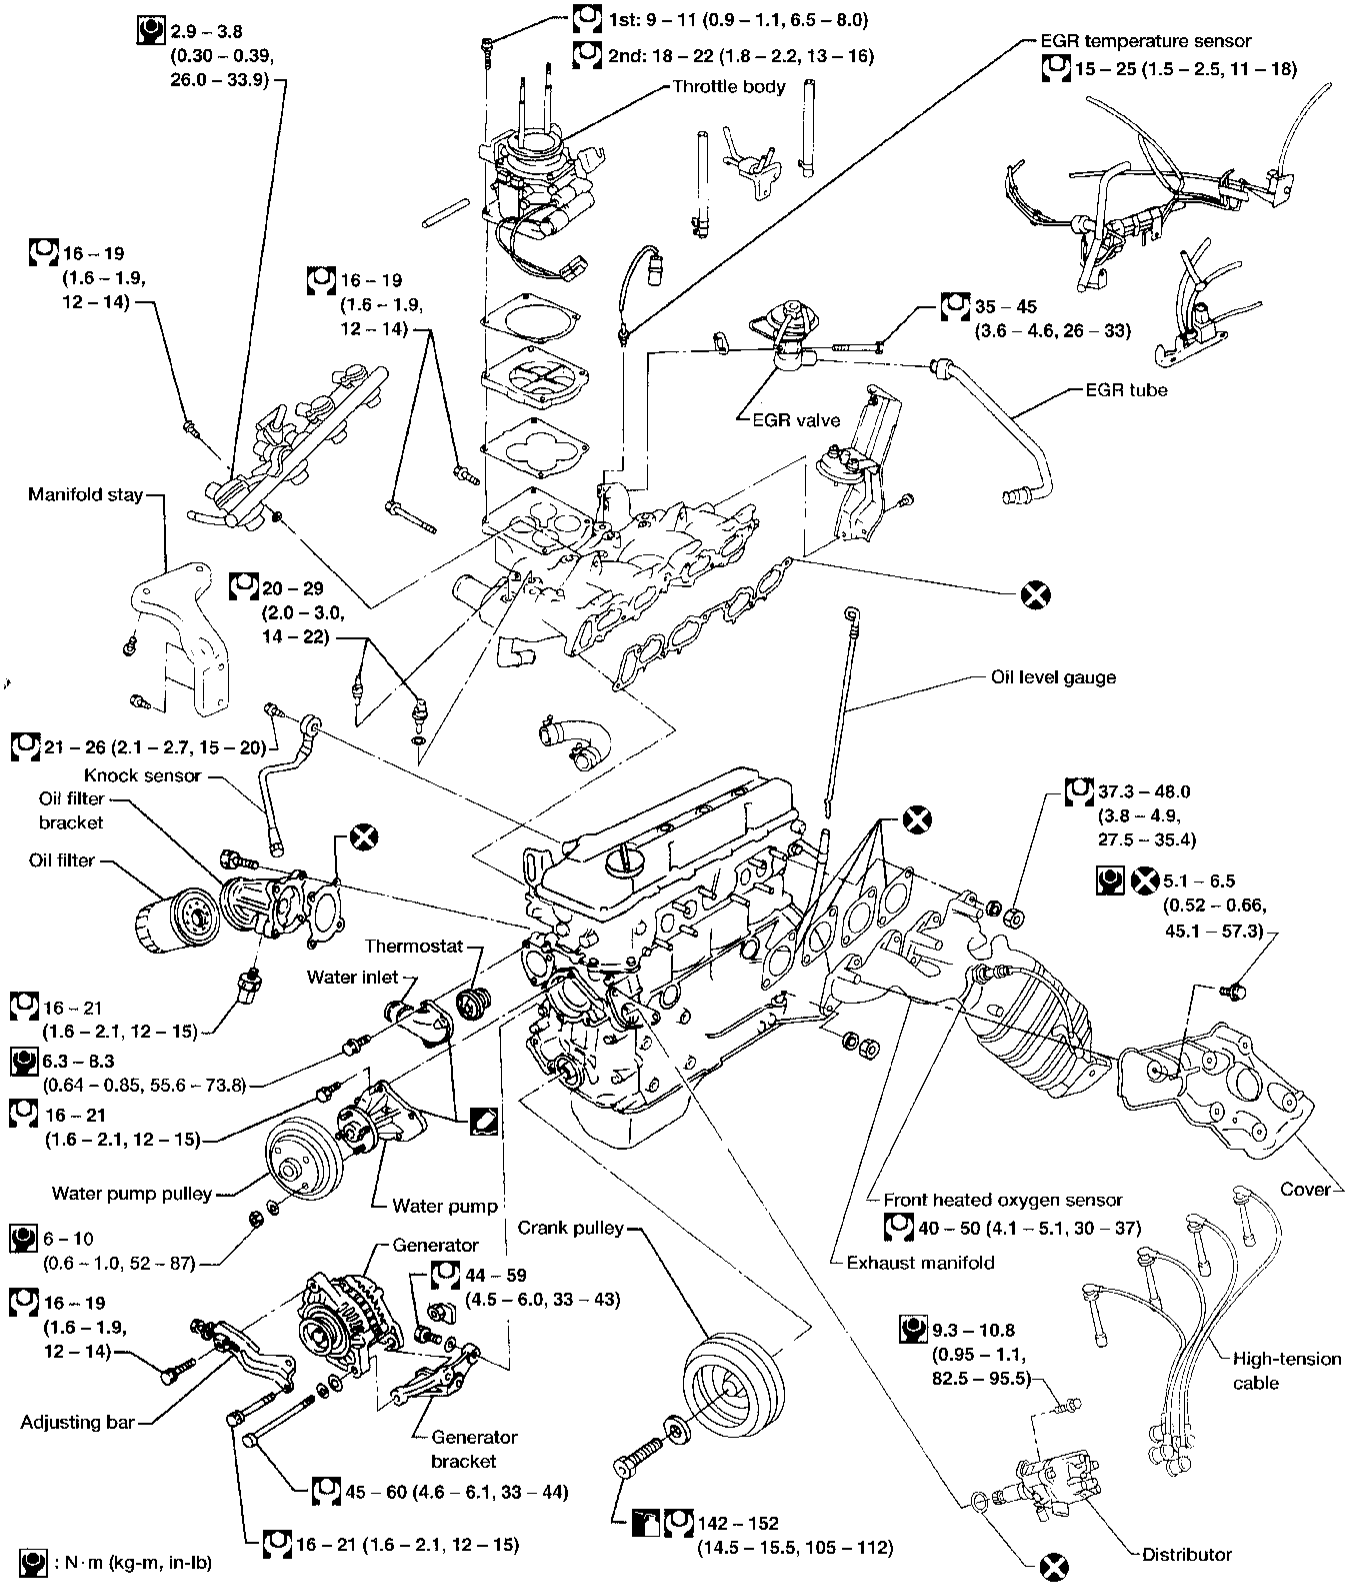
NVH Troubleshooting Chart—Engine Noise

Use the chart below to help you find the cause of the symptom.
1. Locate the area where noise occurs.
2. Confirm the type of noise.
3. Specify the operating condition of the engine.
4. Check the specified noise source.



If necessary, repair or replace these parts.

Location of noise	Type of noise	Operating condition of engine						Source of noise	Check item	Reference page
		Before warm-up	After warm-up	When starting	When idling	When revving	While driving			
Top of engine Rocker cover Cylinder head	Ticking or clicking	C	A	—	A	B	—	Tappet noise	Valve clearance	EM-35
	Rattle	C	A	—	A	B	C	Camshaft bearing noise	Camshaft journal clearance Camshaft runout	EM-30
Crankshaft pulley Cylinder block (upper side of engine) Oil pan	Slap or knock	—	A	—	B	B	—	Piston pin noise	Pistion and piston pin clearance Connecting rod bushing clearance	EM-42, 48
	Slap or rap	A	—	—	B	B	A	Piston slap noise	Piston ring side clearance Piston ring end gap Connecting rod bend and torsion Piston-to-bore clearance	EM-43, 44
	Knock	A	B	C	B	B	B	Connecting rod-bearing noise	Connecting rod bearing clearance (Big end) Connecting rod bushing clearance (Small end)	EM-47, 48
	Knock	A	B	—	A	B	C	Main bearing noise	Crankshaft runout Main bearing oil clearance	EM-45
Front of engine Timing chain cover	Tapping or ticking	A	A	—	B	B	B	Timing chain and chain tensioner noise	Timing chain cracks and wear	EM-21
Front of engine	Squeaking or fizzing	A	B	—	B	—	C	Other drive belts (Sticking or slipping)	Drive belt deflection	MA Section ("Checking Drive Belts", "ENGINE MAINTENANCE")
	Creaking	A	B	A	B	A	B	Other drive belts (Slipping)	Idler pulley bearing operation	
	Squall creak	A	B	—	B	A	B	Water pump noise	Water pump operation	LC Section ("Water Pump Inspection", "ENGINE COOLING SYSTEM")

A: Closely related B: Related C: Sometimes related —: Not related

AEM368

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Measurement of Compression Pressure

1. Warm up engine.
2. Turn ignition switch off.
3. Release fuel pressure.
   Refer to EC section ("Fuel Pressure Release", "BASIC SERVICE PROCEDURE").
4. Remove all spark plugs.
5. Disconnect distributor center cable.

6. Attach a compression tester to No. 1 cylinder.
7. Depress accelerator pedal fully to keep throttle valve wide open.
8. Crank engine and record highest gauge indication.
9. Repeat the measurement on each cylinder as shown above.

- **Always use a fully-charged battery to obtain specified engine speed.**

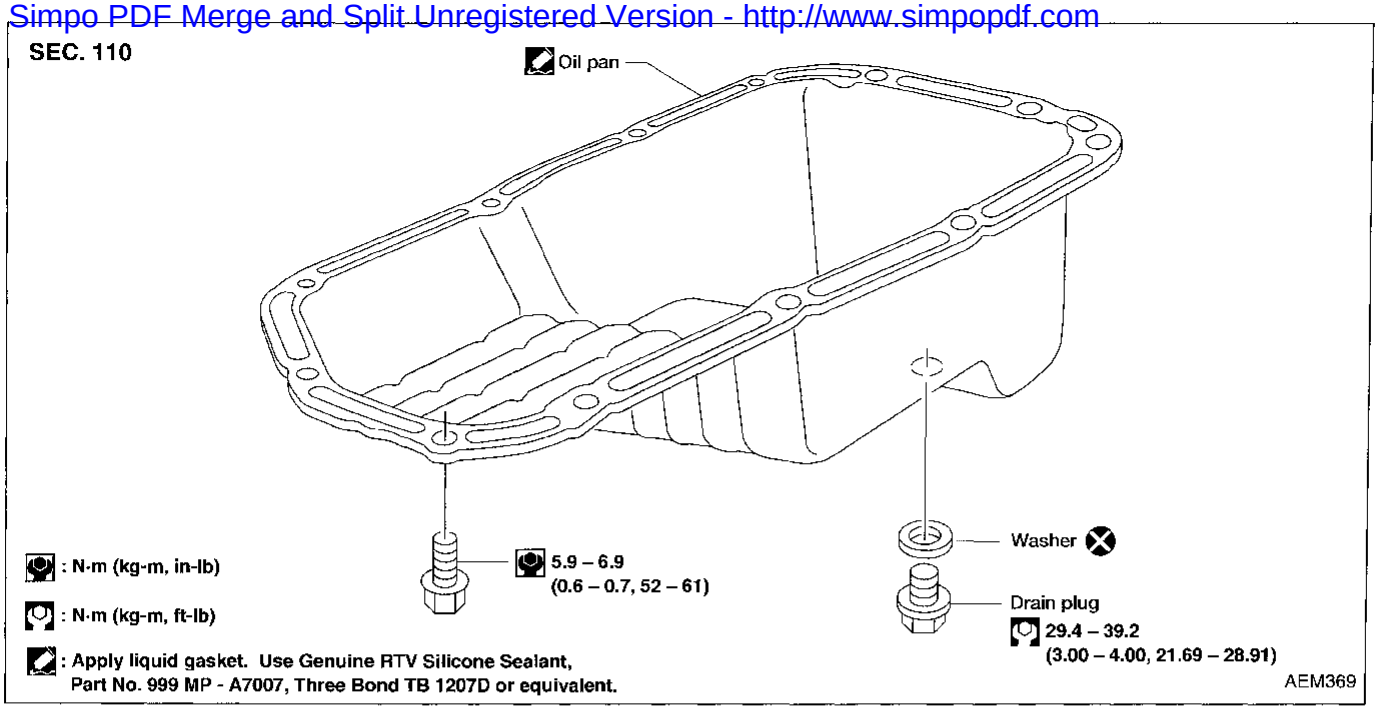
Compression pressure: kPa (kg/cm^2, psi)/rpm

Standard

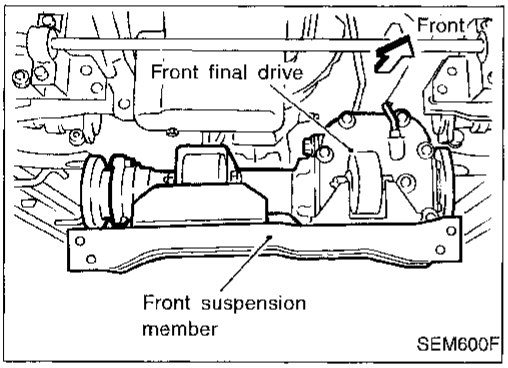
1,226 (12.5, 178)/300

Minimum

1,030 (10.5, 149)/300



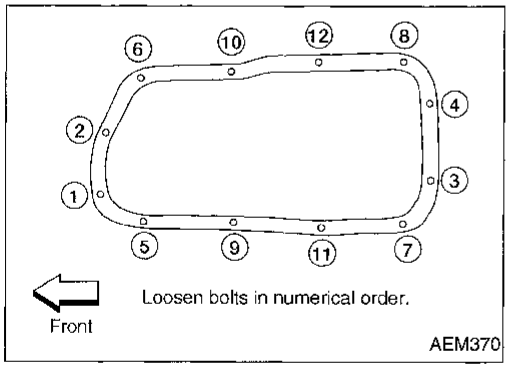
Difference limit between cylinders



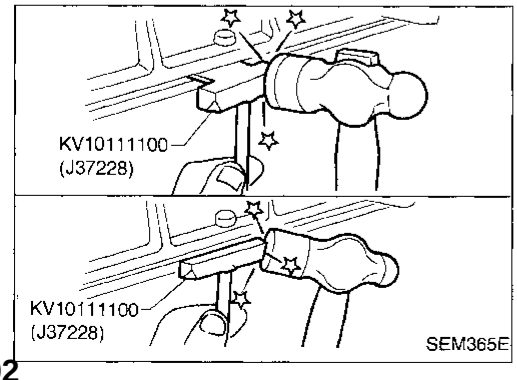
98 (1.0, 14)/300

10. If compression in one or more cylinders is low:
    a. Pour a small amount of engine oil into cylinders through spark plug holes.
    b. Retest compression.

- **If adding oil improves cylinder compression, piston rings may be worn or damaged. If so, replace piston rings after checking piston.**
- **If pressure stays low, a valve may be sticking or seating improperly. Inspect and repair valve and valve seat. (Refer to SDS, EM-52 and EM-54.) If valve or valve seat is damaged excessively, replace it.**
- **If compression stays low in two cylinders that are next to each other:**
  a. The cylinder head gasket may be leaking, or
  b. Both cylinders may have valve component damage. Inspect and repair as necessary.

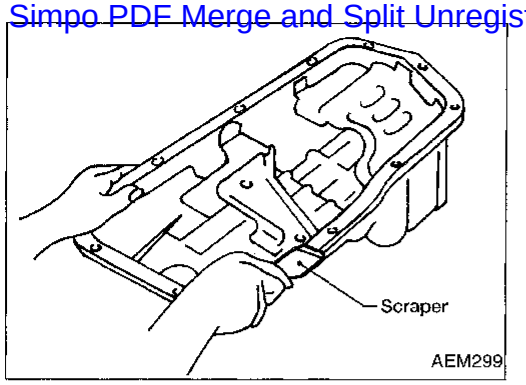


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



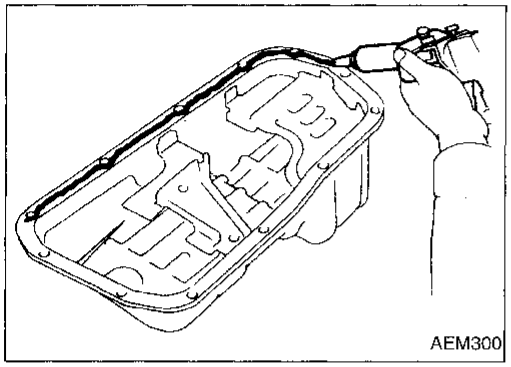
Removal

1. Raise vehicle and support it with safety stands.
2. Remove engine under cover.
3. Drain engine oil.
4. Remove front final drive together with differential mounting member. Refer to PD section ("Removal and Installation", "Front final drive") — 4WD models only.
5. Remove front suspension member.



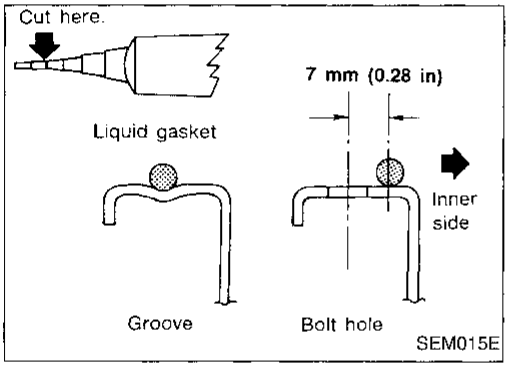
6. Remove oil pan bolts.

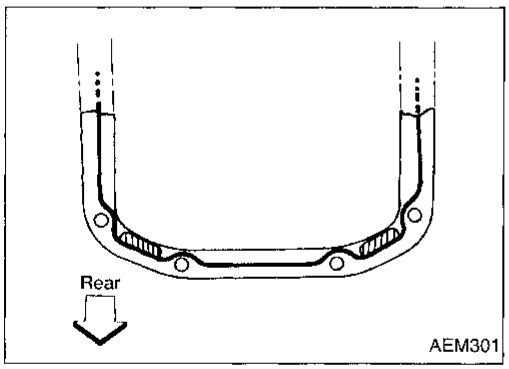
7. Remove oil pan.
a. Insert Tool between cylinder block and oil pan.
- **Be careful not to damage aluminum mating surface.**
- **Do not insert screwdriver, or oil pan flange will be damaged.**



b. Slide Tool by tapping on the side of the Tool with a hammer.
8. Pull out oil pan from front side.

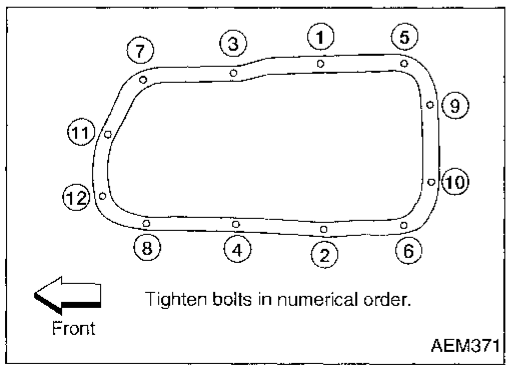
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



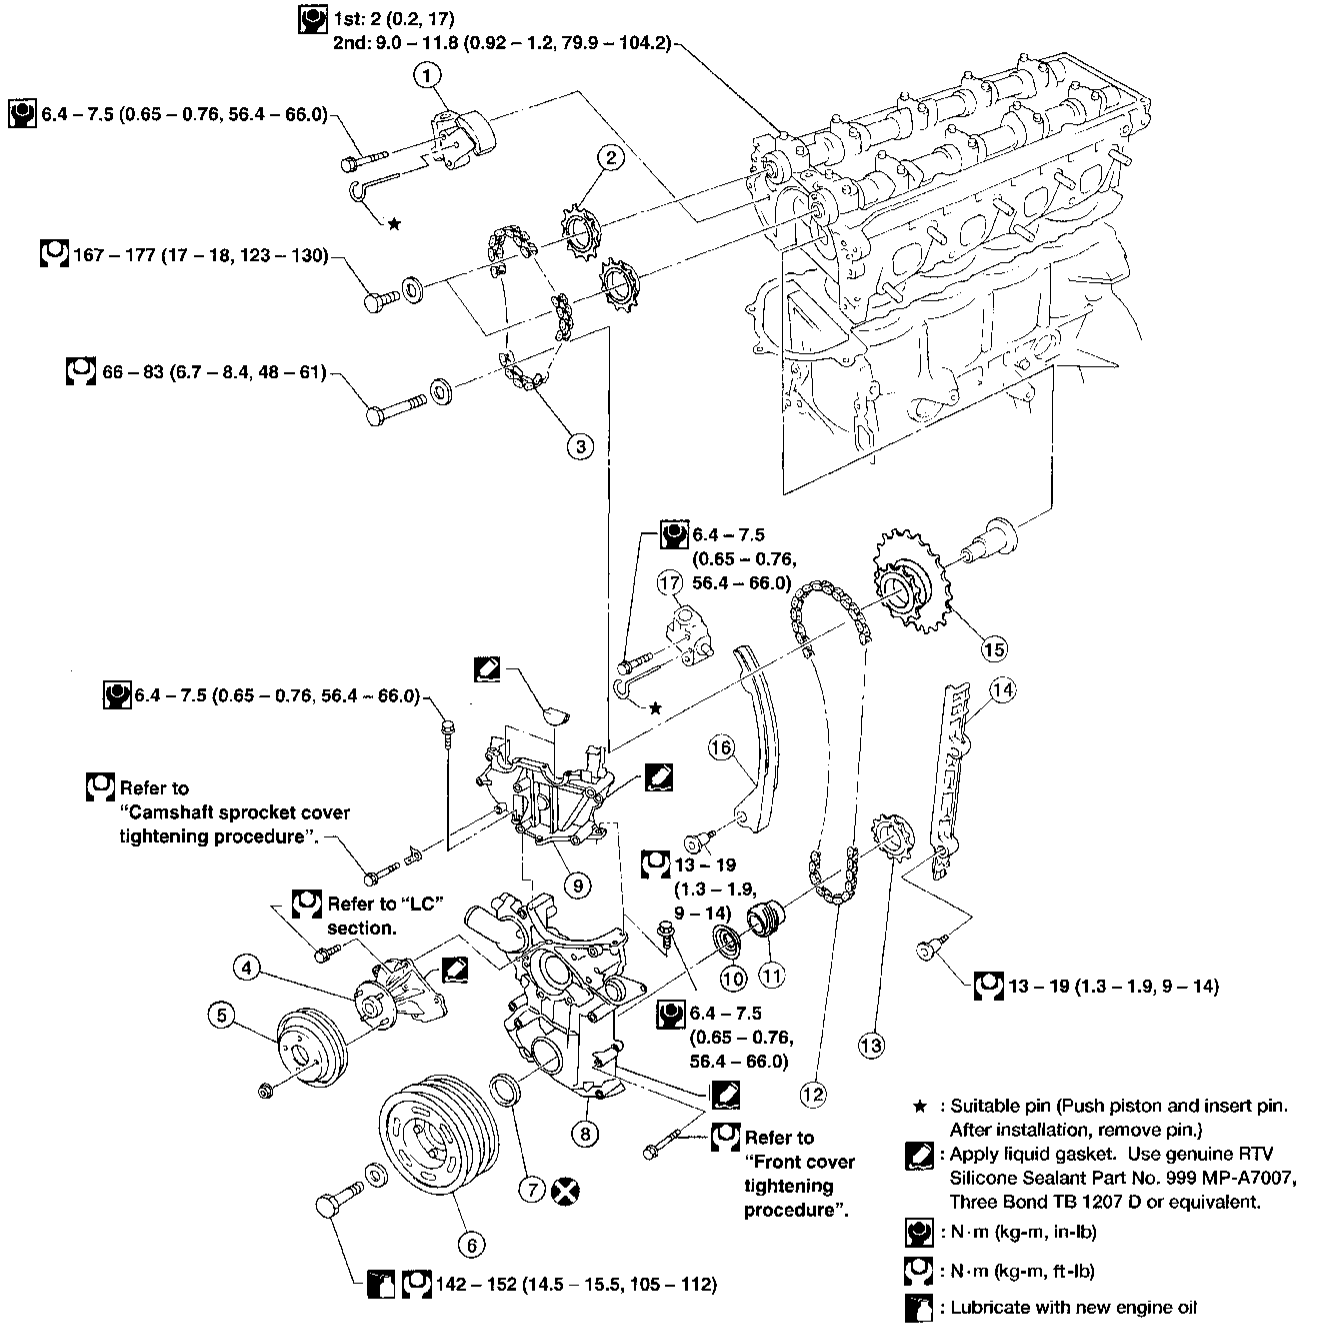


Installation

1. Use a scraper to remove old liquid gasket from mating surface of oil pan.
- **Also remove traces of liquid gasket from mating surface of cylinder block.**

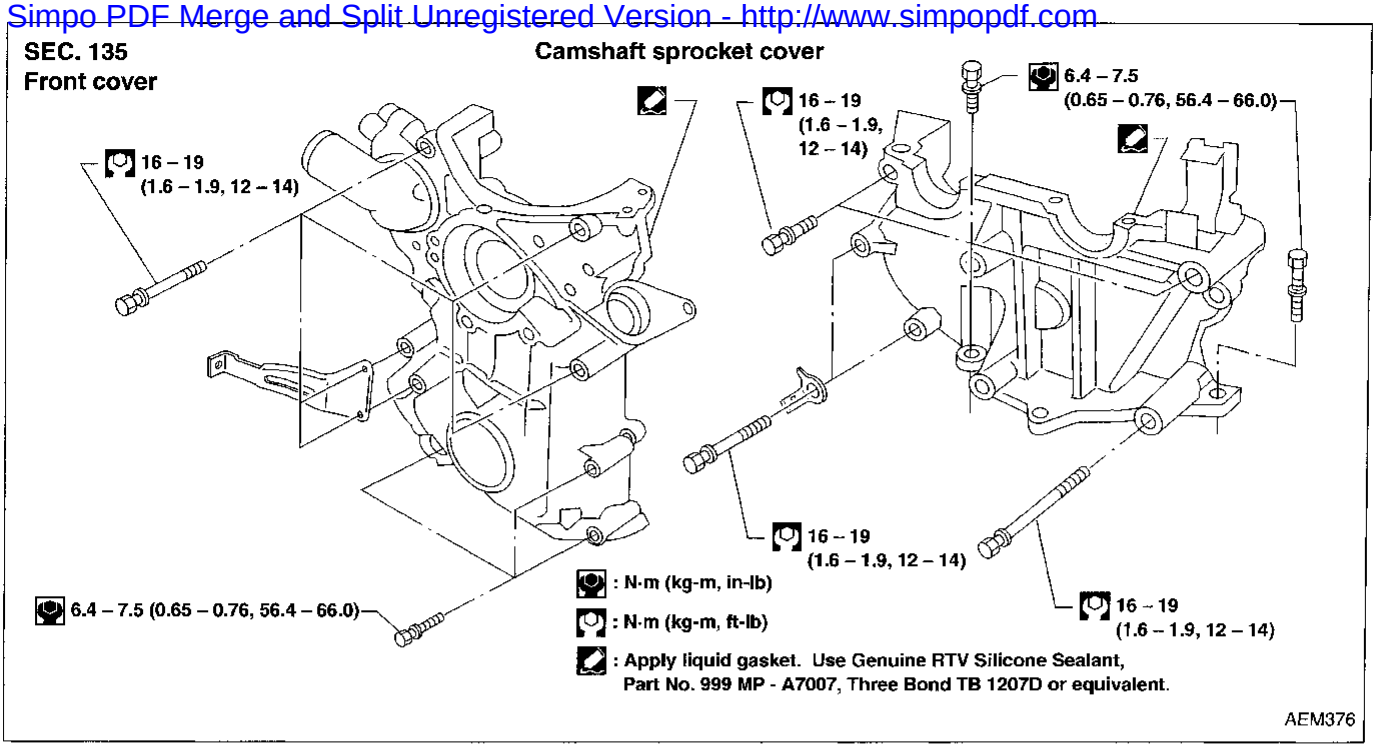


2. Apply a continuous bead of liquid gasket to mating surface of oil pan.
- **Use Genuine RTV Silicone Sealant, Part No. 999 MP-A7007, Three Bond TB1207D or equivalent.**
- **Apply to groove on mating surface.**
- **Allow 7 mm (0.28 in) clearance around bolt hole.**



- **Be sure liquid gasket diameter is 3.5 to 4.5 mm (0.138 to 0.177 in).**
- **Attaching should be done within 5 minutes after coating.**

3. Install oil pan.
- **Tighten oil pan bolts in numerical order.**
  : 5.9 - 6.9 N·m (0.6 - 0.7 kg-m, 52 - 61 in-lb)
- **Wait at least 30 minutes before refilling engine oil.**
4. Install parts in reverse order of removal.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

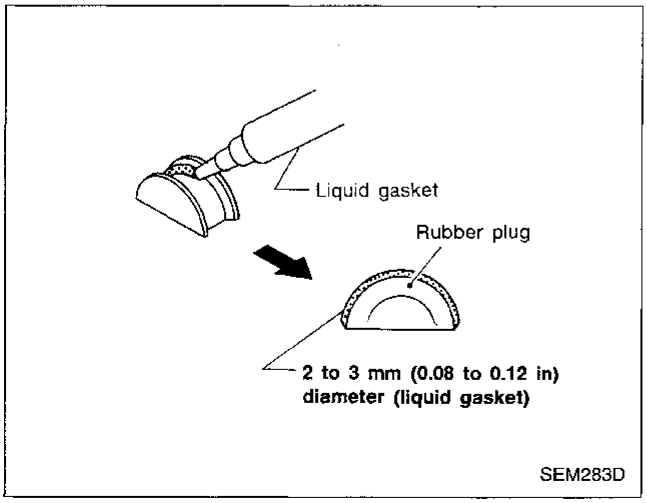
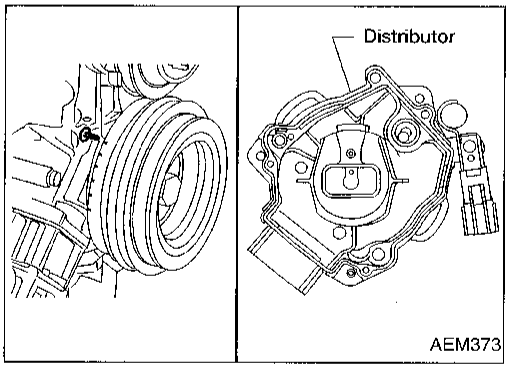
⑰ Lower timing chain tensioner



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

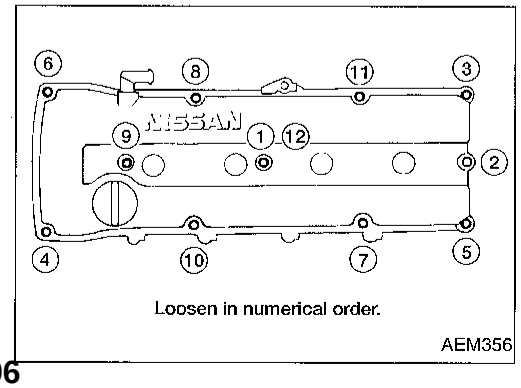
Liquid gasket application places

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



CAUTION:

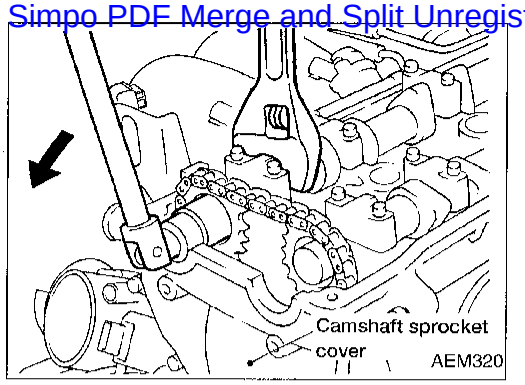
- **After removing timing chain, do not turn crankshaft and camshaft separately, or valves will strike piston heads.**
- **When installing camshafts, chain tensioners, oil seals, or other sliding parts, lubricate contacting surfaces with new engine oil.**
- **Apply new engine oil to bolt threads and seat surfaces when installing cylinder head, camshaft sprockets, crankshaft pulley, and camshaft brackets.**
- **Before disconnecting fuel hose, release fuel pressure. Refer to EC section ("Fuel Pressure Release", "BASIC SERVICE PROCEDURE").**
- **Do not spill engine coolant on drive belts.**



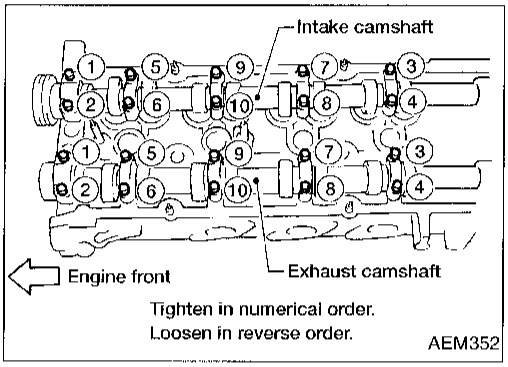
Removal

UPPER TIMING CHAIN

1. Drain coolant from both cylinder block drain plug and radiator drain cock. Refer to MA section.
2. Remove vacuum hoses, fuel tubes, wires, harness and connectors and so on.
3. Remove exhaust manifold cover and front exhaust tube.
4. Remove exhaust manifold.
5. Remove the following parts.
   - Air duct
   - Cooling fan with coupling
   - Radiator shroud
6. Disconnect injector harness connector and remove injector tube assembly with injectors.
7. Remove all spark plugs and high-tension wires.

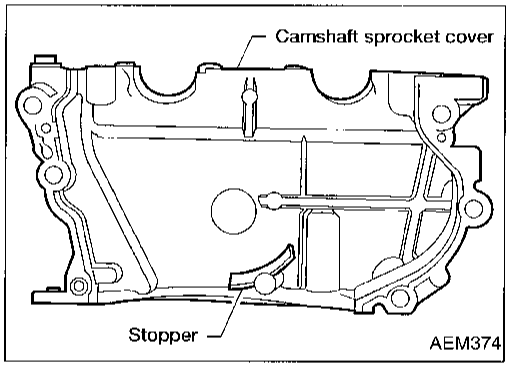


8. Set No. 1 piston at TDC on its compression stroke.
9. Remove distributor.
   - **Mark the position of the distributor and rotor before removing it.**



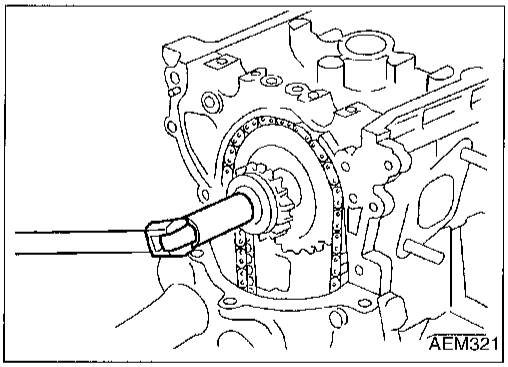
10. Remove rocker cover.
    - **Remove in numerical order, as shown.**

Removal (Cont'd)

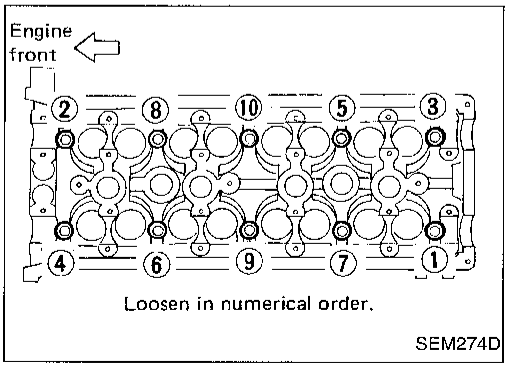


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

11. Remove intake cam sprocket.
- **For retiming in cylinder head removal, apply paint marks to timing chain matched with mating marks of both cam sprockets.**



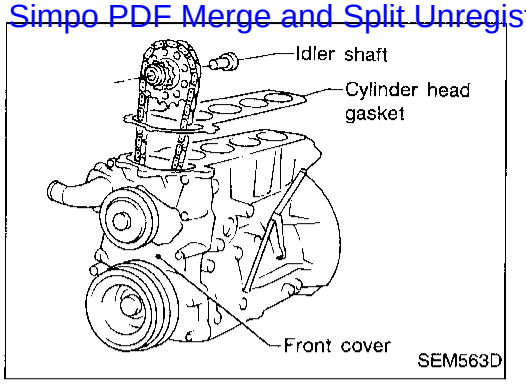
12. Remove cam brackets and camshafts.
- **Mark these parts' original positions for reassembly.**



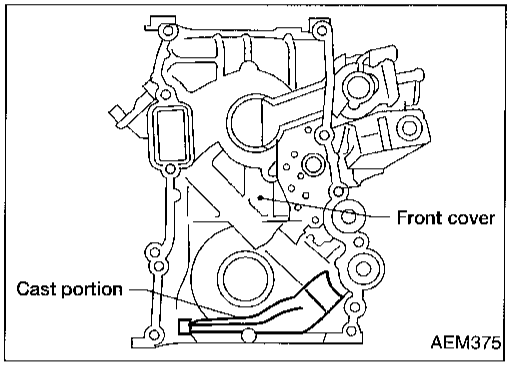
13. Remove camshaft sprocket cover.
- Upper timing chain will not be disengaged from idler sprocket. For this reason, a stopper need not be used.

Cast portion of camshaft sprocket cover is located on lower side of idler sprocket so upper timing chain need not be disengaged from idler sprocket.

14. Remove upper chain tensioner.
(Push piston and insert a suitable pin into pin hole.)



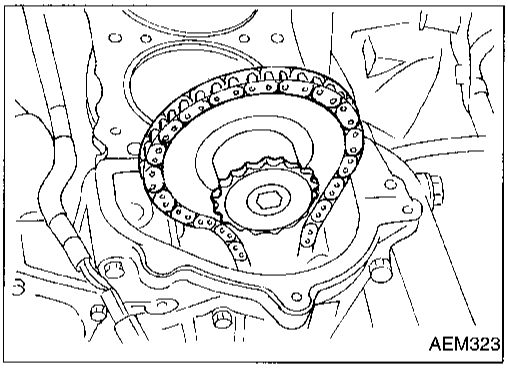
15. Remove upper timing chain.
16. Remove idler sprocket bolt.
- **For retiming in cylinder head removal, apply paint marks to timing chain matched with mating mark of idler sprocket.**



17. Loosen cylinder head bolts in numerical order.
- **A warped or cracked cylinder head could result from removing in incorrect order.**
- **Cylinder head bolts should be loosened in two or three steps.**

Removal (Cont'd)

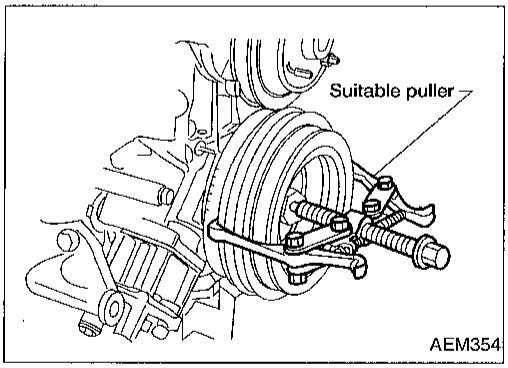
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



18. Remove cylinder head.
19. Remove cylinder head gasket.

- Lower timing chain will not be disengaged from crankshaft sprocket. For this reason, a stopper need not be used.

Cast portion of front cover is located on lower side of crankshaft sprocket so lower timing chain need not be disengaged from idler sprocket.



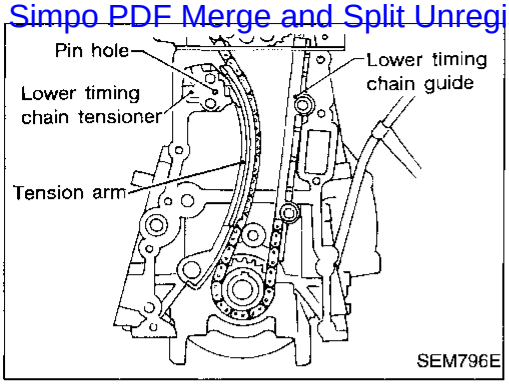
LOWER TIMING CHAIN

1. Remove upper timing chain.

Refer to "UPPER TIMING CHAIN" in "Removal" (EM-18).

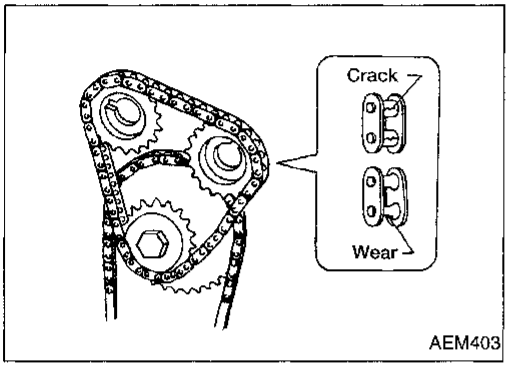
2. Drain engine oil from drain plug of oil pan.

3. Remove oil pan.



Refer to "Removal" in "OIL PAN" (EM-14).

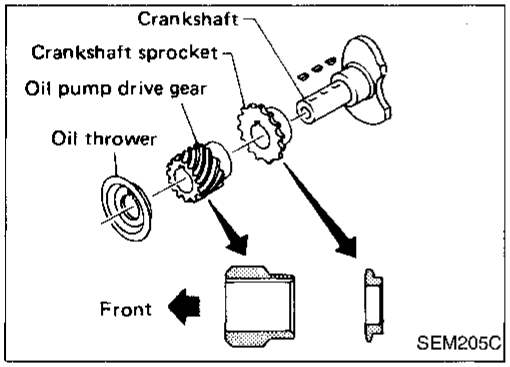
4. Remove oil strainer.
5. Remove the following parts.
- Power steering drive belt
- Alternator drive belt
- A/C compressor drive belt
- A/C compressor idler pulley



6. Remove crankshaft pulley.
7. Remove oil pump.
8. Remove front cover.
- Inspect for oil leakage at front oil seal. Replace seal if oil leak is present.

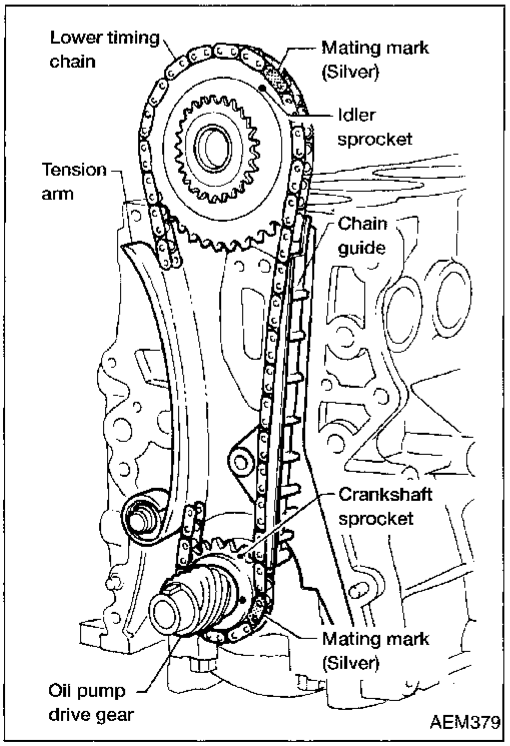
Removal (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



9. Remove the following parts.
   - Lower timing chain tensioner (Push piston and insert a suitable pin into pin hole.)
   - Chain tension arm
   - Lower timing chain guide
10. Remove lower timing chain and idler sprocket.

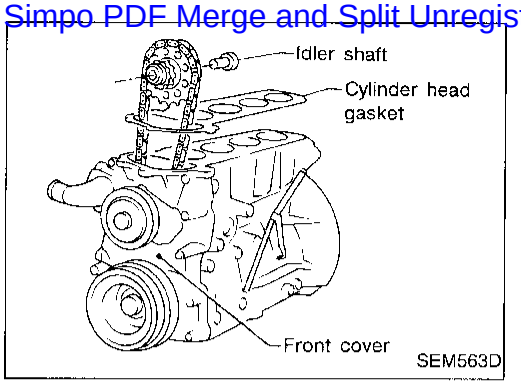
Inspection



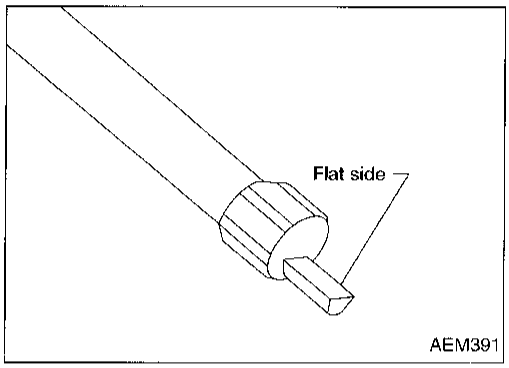
Check for cracks and excessive wear at roller links. Replace chain if necessary.

Installation

LOWER TIMING CHAIN



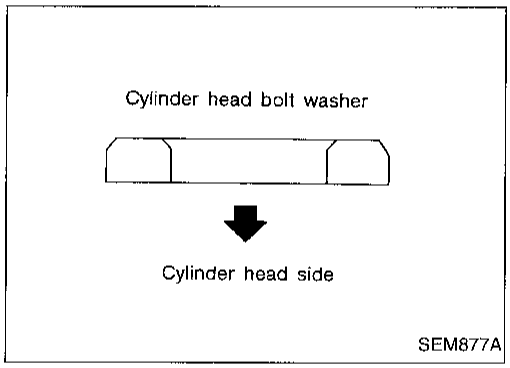
1. Install crankshaft sprocket, oil pump drive gear and oil thrower.
   - **Make sure that mating marks of crankshaft sprocket face front of engine.**
2. Position crankshaft so that No. 1 piston is set at TDC.



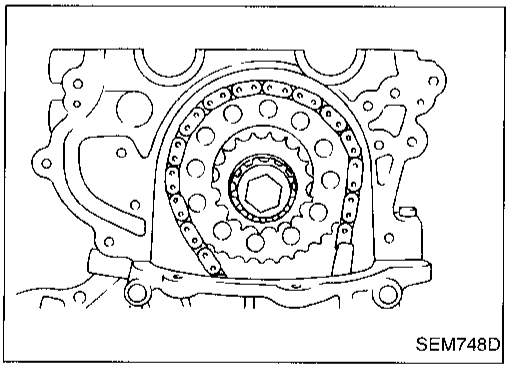
3. Install idler sprocket and lower timing chain.
   - **Set lower timing chain on the sprockets, aligning mating marks.**
   - **Be careful not to damage cylinder head gasket when installing lower timing chain.**
4. Install chain tension arm and chain guide.
5. Install lower timing chain tensioner.
   - **When installing, insert a suitable pin into pin hole to stop piston.**
   - **After installation remove the pin to release piston.**

Installation (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

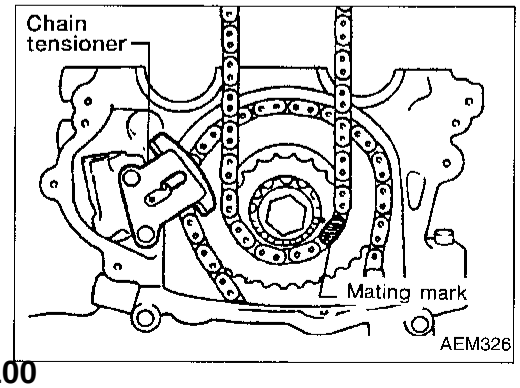


6. Install front cover.
- Use a scraper to remove all traces of liquid gasket from mating surface.
- Also remove traces of liquid gasket from mating surface of cylinder block.
- **Apply a continuous bead of liquid gasket to front cover (Refer to EM-17).**
- **Use Genuine RTV Silicone Sealant, Part No. 999 MP-A7007, Three Bond TB1207D or equivalent.**
- **Be careful not to damage cylinder head gasket.**
- **Be sure to install new front oil seal. Refer to EM-25.**



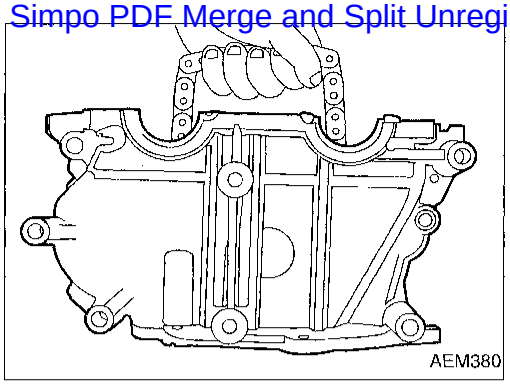
7. Install the following parts:
- Crankshaft pulley
- Oil strainer and oil pan
- Component parts below the engine
- A/C compressor idler pulley
- New cylinder head gasket
- Idler shaft

8. Install the oil pump.
- **Make sure the flat side of the distributor drive shaft is facing the engine.**

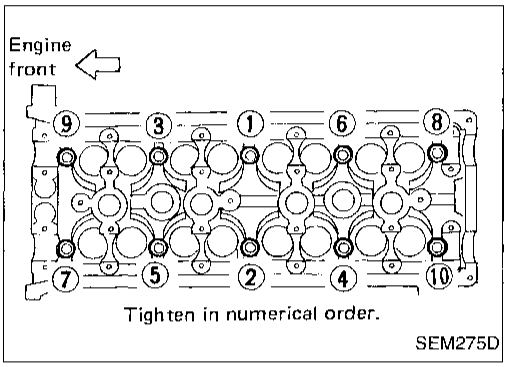


9. Install cylinder head and temporarily tighten cylinder head bolts when installing front cover.
- **Apply new engine oil to bolt threads and seat surfaces.**
- **Temporarily tighten cylinder head bolts. This is necessary to avoid damaging cylinder head gasket.**
- **Be sure to install washers between bolts and cylinder head.**

UPPER TIMING CHAIN



1. Install lower timing chain.
Refer to "LOWER TIMING CHAIN" in "Installation" (EM-21).

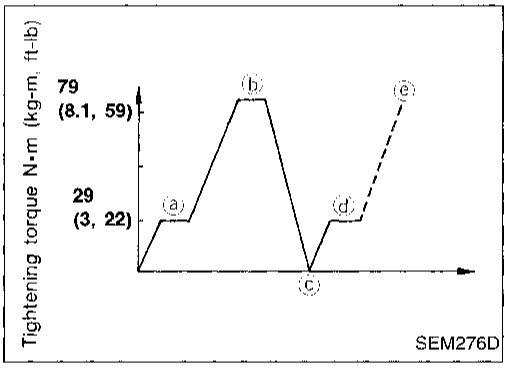


2. Install upper timing chain, chain tensioner.
- **Set upper timing chain on the idler sprockets, aligning mating marks.**
- **When installing chain tensioner, insert a suitable pin into pin hole to stop piston.**
- **After installation remove the pin to release piston.**

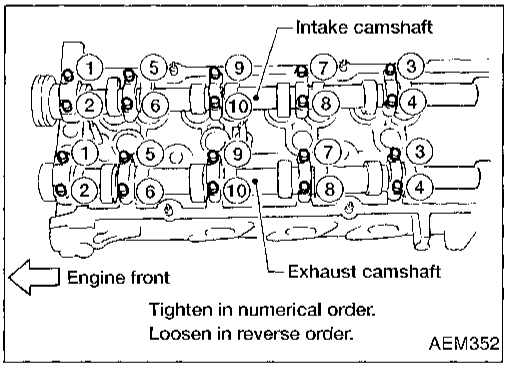
Installation (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

AEM380



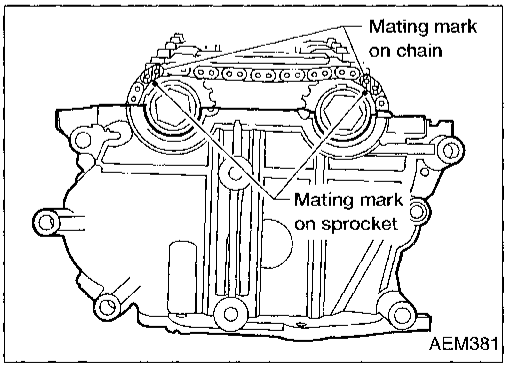
3. Install camshaft sprocket cover.
- Use a scraper to remove all traces of liquid gasket from mating surface.
- Also remove traces of liquid gasket from mating surface of cylinder block.
- **Apply a continuous bead of liquid gasket to camshaft sprocket cover (Refer to EM-17).**
- **Use Nissan Genuine RTV Silicone Sealant, Part No. 999 MP-A7007, Three Bond TB1207D or equivalent.**
- **Be careful not to damage cylinder head gasket.**
- **Be careful upper timing chain does not slip or jump when installing camshaft sprocket cover.**



SEM275D

4. Tighten cylinder head bolts in numerical order.
- **Tightening procedure**

a. **Tighten all bolts to 29 N·m (3.0 kg-m, 22 ft-lb).**
b. **Tighten all bolts to 79 N·m (8.1 kg-m, 59 ft-lb).**
c. **Loosen all bolts completely**
d. **Tighten all bolts to 25 to 34 N·m (2.5 to 3.5 kg-m, 18 to 25 ft-lb).**
e. **Turn all bolts 86^{+5}_{-0} degrees clockwise, or if an angle wrench is not available, tighten bolts to 75 to 84 N·m (7.6 to 8.6 kg-m, 55 to 62 ft-lb).**

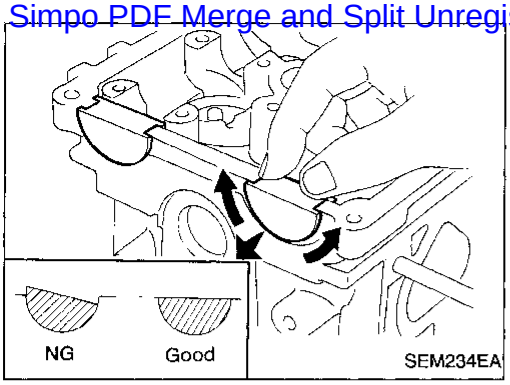


SEM276D

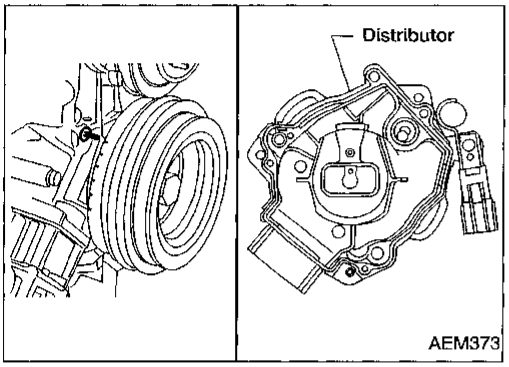
AEM352

5. Install camshafts and camshaft brackets.
- **Tightening procedure**

a. **Tighten all bolts to 2 N·m (0.2 kg-m, 17 in-lb).**
b. **Tighten all bolts to 9.0 to 11.8 N·m (0.92 to 1.2 kg-m, 79.9 - 104.2 in-lb).**
- **Apply new engine oil to bolt threads and seat surfaces.**

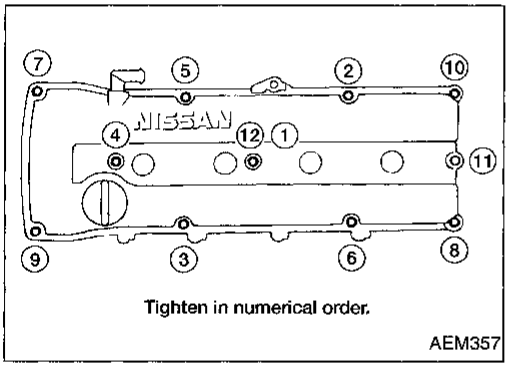


AEM381



6. Install camshaft sprockets.

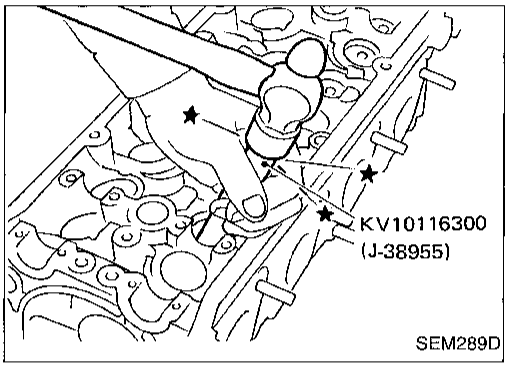
Installation (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

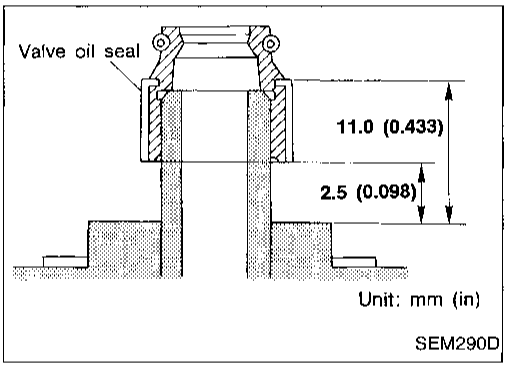
7. Install rubber plugs as follows.
(1) Apply liquid gasket to rubber plugs.
(2) Install rubber plugs, then move them by hand to uniformly spread the gasket on cam sprocket cover surface.
- Rubber plugs should be installed flush with the cylinder head surface.

8. Install distributor.
- Make sure that No. 1 piston is set at TDC and that distributor rotor is set at No. 1 cylinder spark position. Refer to marks made at removal.



9. Install rocker cover.
: 8 - 11 N·m (0.8 - 1.1 kg-m, 69 - 95 in-lb).
10. Install all spark plugs with high-tension cords.
11. Connect injector harness connector and replace injector tube assembly with injectors.
12. Install the following parts.
- Radiator shroud
- Cooling fan with coupling
- Air duct
13. Install vacuum hoses, fuel tubes, wires, harness and connectors and so on.

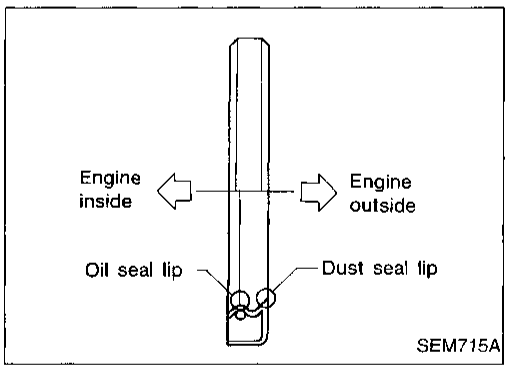
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



VALVE OIL SEAL

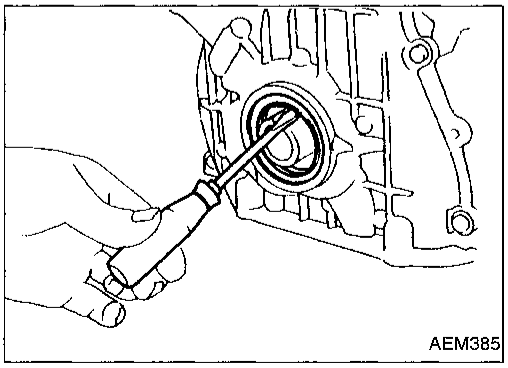
1. Remove rocker cover.
2. Remove camshaft. Refer to "TIMING CHAIN" (EM-16).
3. Remove valve spring and valve oil seal with Tool or a suitable tool.

Piston concerned should be set at TDC to prevent valve from falling.

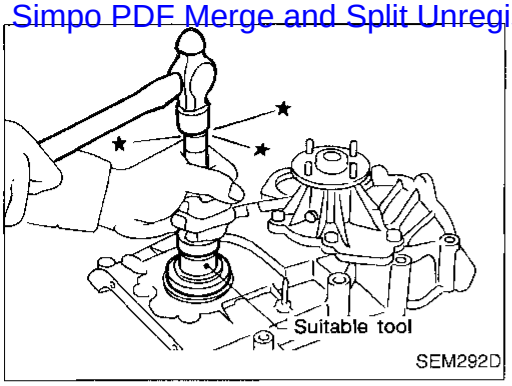


4. Apply engine oil to new valve oil seal and install it with Tool.

OIL SEAL INSTALLING DIRECTION

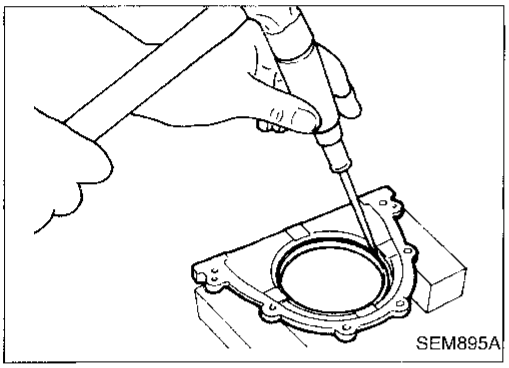


- Install new oil seal in the direction shown.



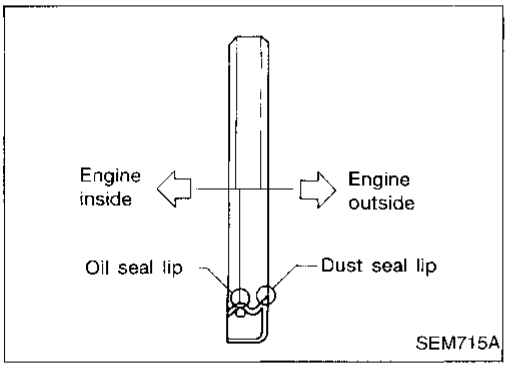
FRONT OIL SEAL

1. Remove radiator shroud and crankshaft pulley.
2. Remove front oil seal



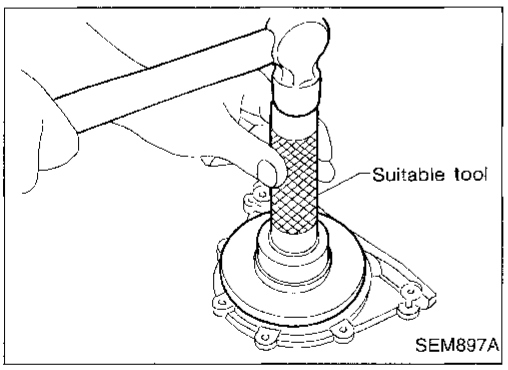
- **Be careful not to scratch front cover.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

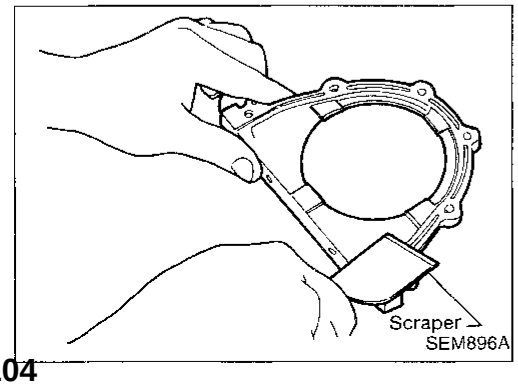


3. Apply engine oil to new oil seal and install it using a suitable tool.

REAR OIL SEAL



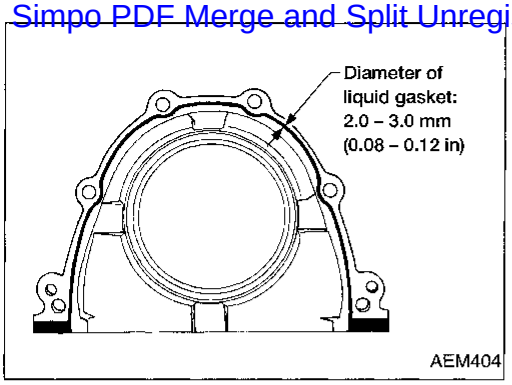
1. Remove flywheel or drive plate.
2. Remove rear oil seal retainer.
3. Remove rear oil seal from retainer.



- **Be careful not to scratch rear oil seal retainer.**

4. Apply engine oil to new oil seal and install it using suitable tool.

- **Install new oil seal in the direction shown.**

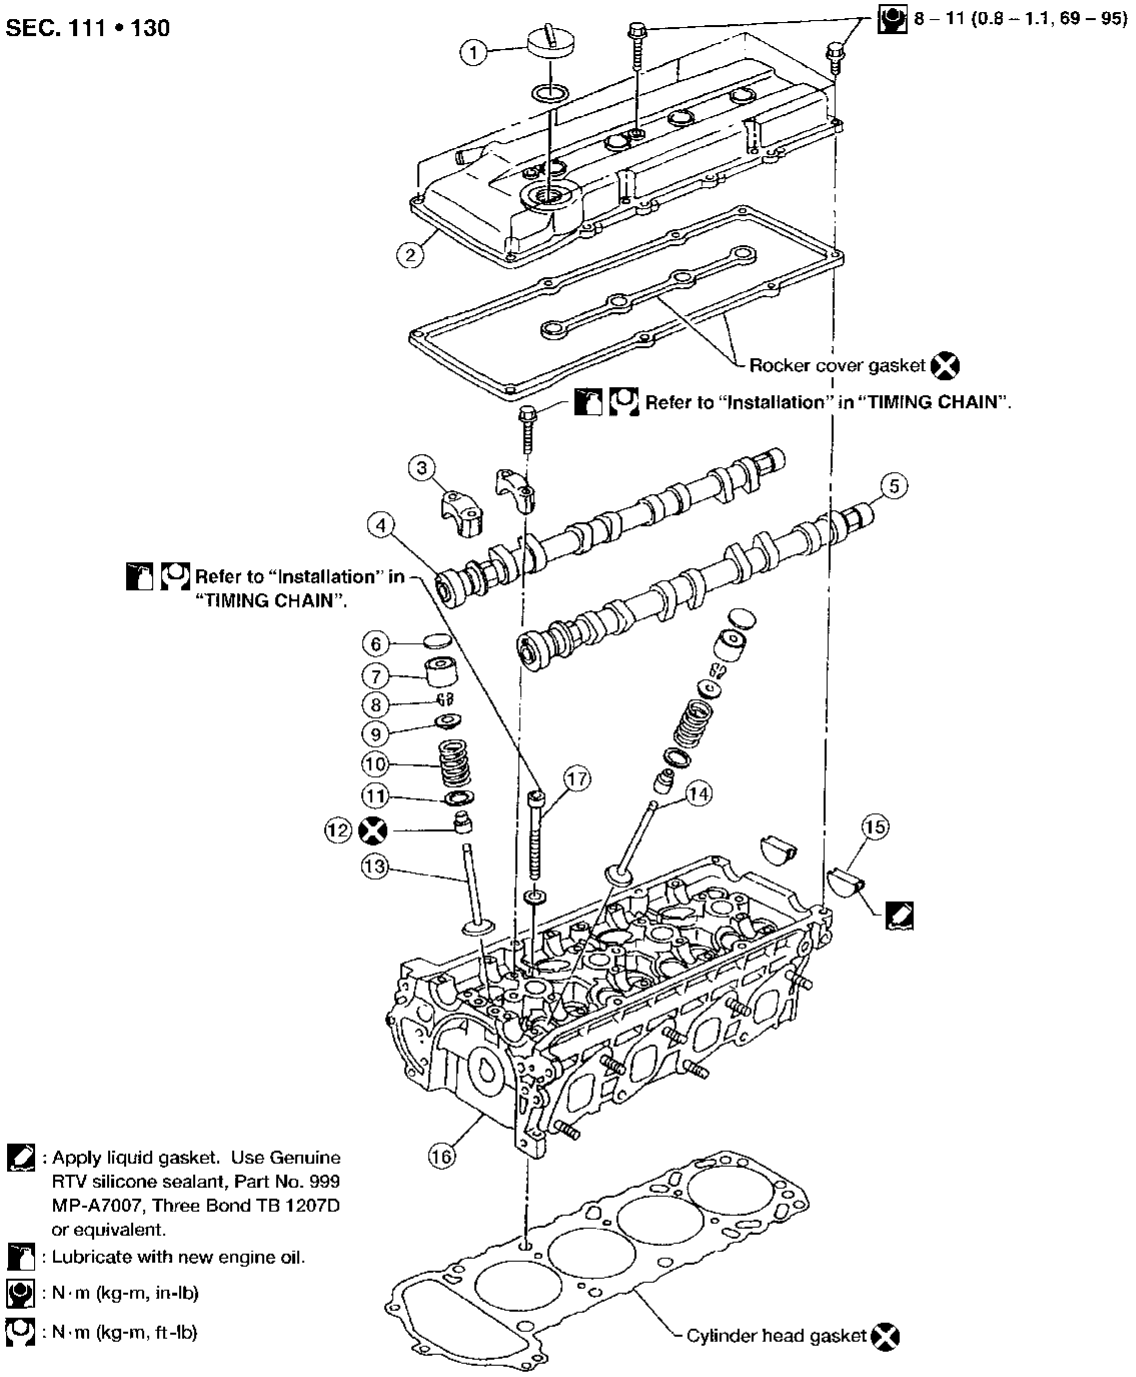


5. Install rear oil seal retainer.

a. Before installing rear oil seal retainer, remove all traces of liquid gasket from mating surface using a scraper.

- **Also remove traces of liquid gasket from mating surface of cylinder block.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



b. Apply a continuous bead of liquid gasket to mating surface of rear oil seal retainer.

- **Use Genuine RTV Silicone Sealant, Part No. 999 MP-A7007, Three Bond TB1207D or equivalent.**
- **Apply around inner side of bolt holes.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

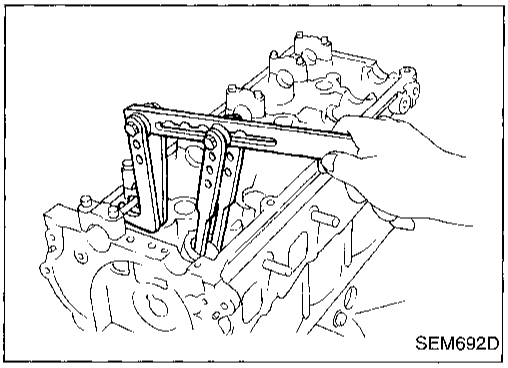
⑰ Cylinder head bolt

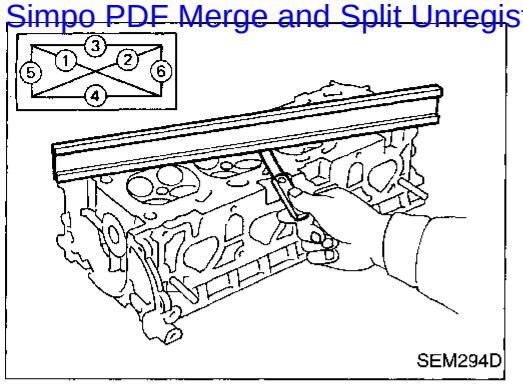


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

CAUTION:

- **When installing camshafts, chain tensioners, oil seals, or other sliding parts, lubricate contacting surfaces with new engine oil.**
- **Apply new engine oil to threads and seat surfaces when installing cylinder head, camshaft sprocket, crankshaft pulley, and camshaft bracket.**
- **Attach tags to valve lifters so as not to mix them up.**

Removal and Installation



- **Removal and installation procedures are the same as those for timing chain. Refer to "Removal" and "Installation" in "TIMING CHAIN" (EM-18, EM-22).**
- **Before removing camshaft and idler sprockets, apply paint marks to them for retiming.**

SEM692D

Disassembly

1. Remove intake manifold and exhaust manifold. Refer to "OUTER COMPONENT PARTS" (EM-10).
2. Remove valve components.
3. Remove valve oil seal with a suitable tool.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

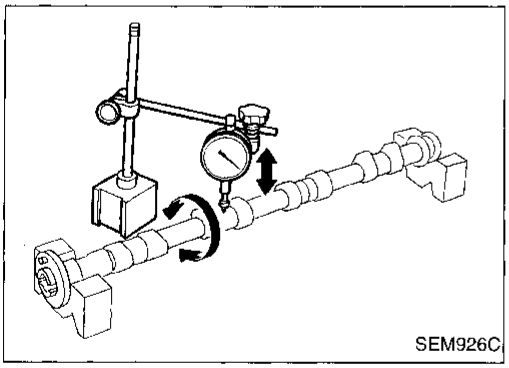
Inspection

CYLINDER HEAD DISTORTION

Clean surface of cylinder head.
Use a reliable straightedge and feeler gauge to check the flatness of cylinder head surface.
Check along six positions shown in the figure.

Head surface flatness:
Standard Less than 0.03 mm (0.0012 in)
Limit 0.1 mm (0.004 in)

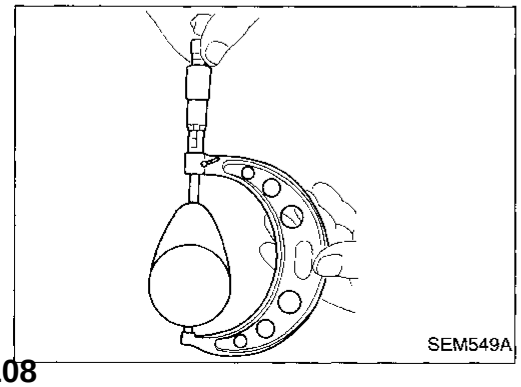
If beyond the specified limit, replace it or resurface it.



Resurfacing limit:
The limit of cylinder head resurfacing is determined by the cylinder block resurfacing.
Amount of cylinder head resurfacing is "A".
Amount of cylinder block resurfacing is "B".
The maximum limit:
A + B = 0.2 mm (0.008 in)

After resurfacing cylinder head, check that camshaft rotates freely by hand. If resistance is felt, cylinder head must be replaced.

Nominal cylinder head height:
126.3 - 126.5 mm (4.972 - 4.980 in)

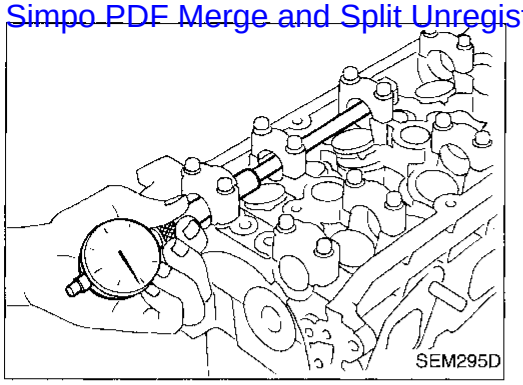


CAMSHAFT VISUAL CHECK

Check camshaft for scratches, seizure and wear.

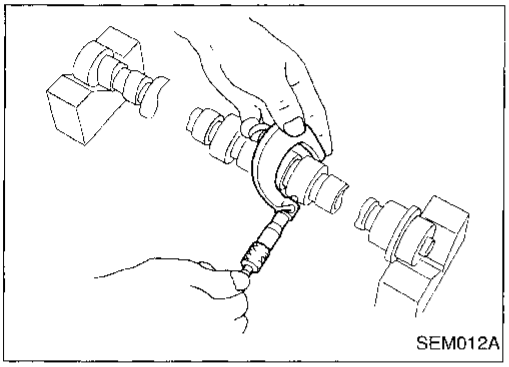
CAMSHAFT RUNOUT

1. Measure camshaft runout at the center journal.
   Runout (Total indicator reading):
   Standard:
   Less than 0.02 mm (0.0008 in)
   Limit:
   0.04 mm (0.0016 in)
2. If it exceeds the limit, replace camshaft.



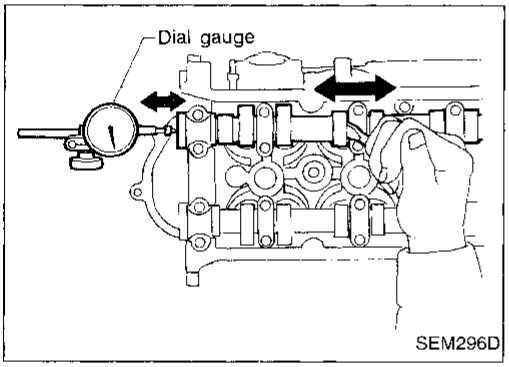
CAMSHAFT CAM HEIGHT

1. Measure camshaft cam height.
   Standard cam height:
   Intake 42.505 - 42.695 mm (1.673 - 1.681 in)
   Exhaust 40.905 - 41.095 mm (1.610 - 1.618 in)
   Cam height wear limit:
   Intake & Exhaust
   0.2 mm (0.008 in)
2. If wear is beyond the limit, replace camshaft.



Inspection (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

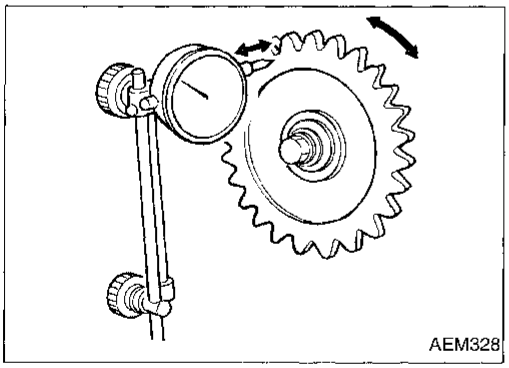


SEM295D

CAMSHAFT JOURNAL CLEARANCE

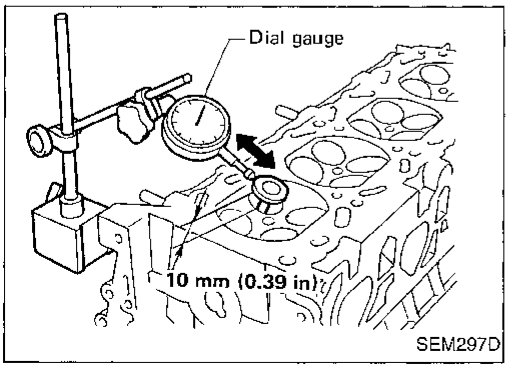
1. Install camshaft bracket and tighten bolts to the specified torque.
2. Measure inner diameter of camshaft bearing.
   Standard inner diameter:
   #1 to #5 journals
   28.000 - 28.025 mm (1.1024 - 1.1033 in)

SEM012A



3. Measure outer diameter of camshaft journal.
   Standard outer diameter:
   #1 to #5 journals
   27.935 - 27.955 mm (1.0998 - 1.1006 in)
4. If clearance exceeds the limit, replace camshaft and/or cylinder head.
   Camshaft journal clearance:
   Standard 0.045 - 0.090 mm (0.0018 - 0.0035 in)
   Limit 0.12 mm (0.0047 in)

SEM296D



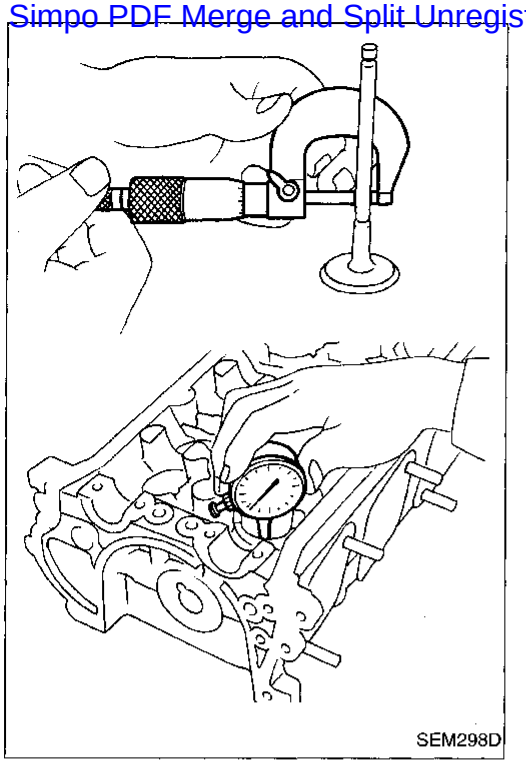
CAMSHAFT END PLAY

1. Install camshaft in cylinder head.
2. Measure camshaft end play.
   Camshaft end play:
   Standard
   0.070 - 0.148 mm (0.0028 - 0.0058 in)
   Limit
   0.2 mm (0.008 in)
3. If end play exceeds the limit, replace camshaft and remeasure camshaft end play.
4. If end play still exceeds the limit after replacing camshaft, replace cylinder head.

AEM328

CAMSHAFT SPROCKET RUNOUT

1. Install sprocket on camshaft.
2. Measure camshaft sprocket runout.
   Runout (Total indicator reading):
   Limit 0.15 mm (0.0059 in)
3. If it exceeds the limit, replace camshaft sprocket.



SEM297D

VALVE GUIDE CLEARANCE

1. Measure valve deflection as shown in figure. (Valve and valve guide mostly wear in this direction.)
   Valve deflection limit (Dial gauge reading):
   Intake & Exhaust
   0.2 mm (0.008 in)

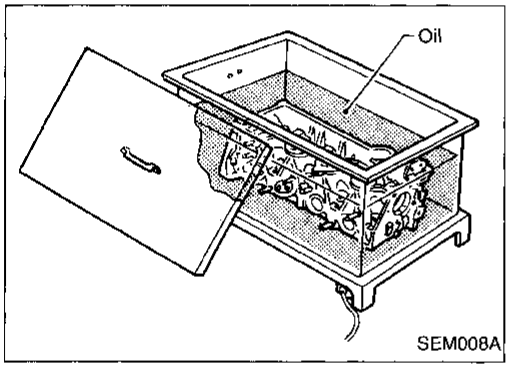
Inspection (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SEM298D

2. If it exceeds the limit, check valve to valve guide clearance.
a. Measure valve stem diameter and valve guide inner diameter.
b. Check that clearance is within specification.

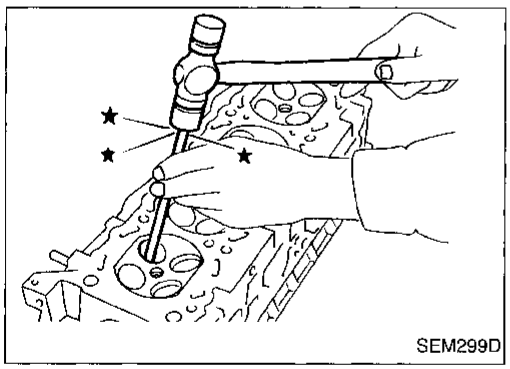
Valve to valve guide clearance = Valve guide inner diameter - Valve stem diameter:



Unit: mm (in)

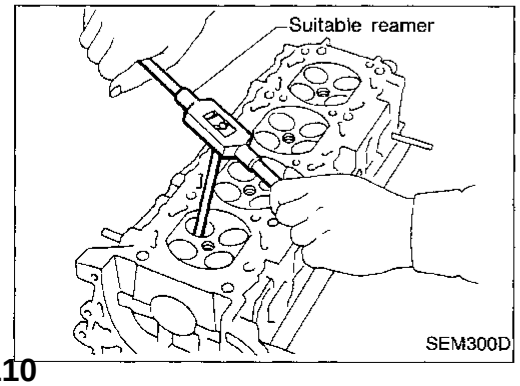
	Standard	Limit
Intake	0.020 - 0.053 (0.0008 - 0.0021)	0.08 (0.0031)
Exhaust	0.040 - 0.073 (0.0016 - 0.0029)	0.1 (0.004)

c. If it exceeds the limit, replace valve and remeasure clearance.
- If clearance still exceeds the limit after replacing valve, replace the valve guide.



VALVE GUIDE REPLACEMENT

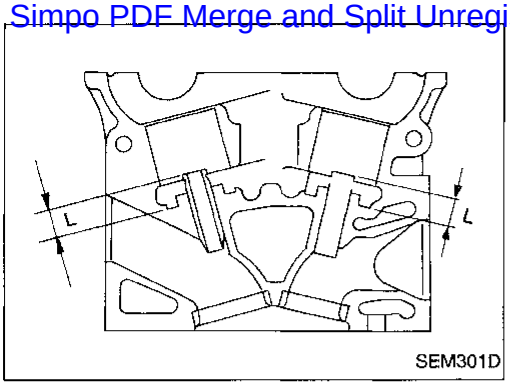
1. To remove valve guide, heat cylinder head to 120 to 140°C (248 to 284°F) by soaking in heated oil.



SEM008A

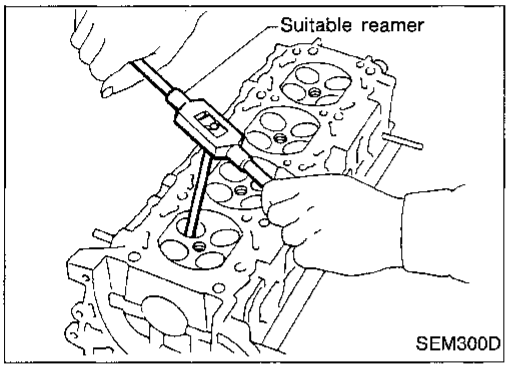
2. Drive out valve guide with a press [under a 20 kN (2 ton, 2.2 US ton, 2.0 Imp ton) pressure] or hammer and suitable tool.

SEM299D



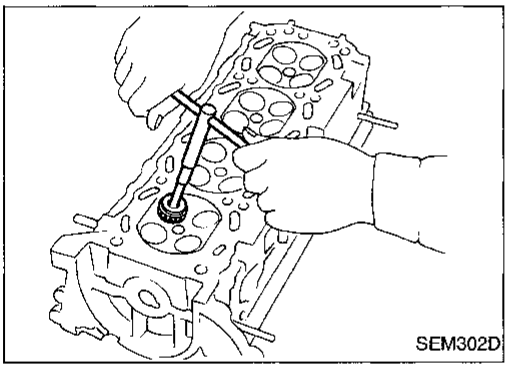
3. Ream cylinder head valve guide hole.
   Valve guide hole diameter
   (for service parts):
   Intake & Exhaust
   11.175 - 11.196 mm (0.4400 - 0.4408 in)

SEM300D



Inspection (Cont'd)

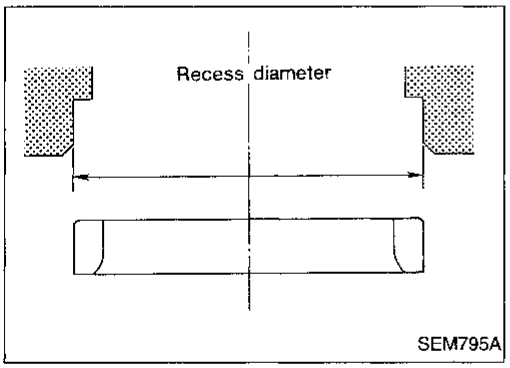
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



SEM301D

4. Heat cylinder head to 120 to 140°C (248 to 284°F) and press service valve guide onto cylinder head.
   Projection "L":
   13.3 - 13.9 mm (0.524 - 0.547 in)

SEM300D



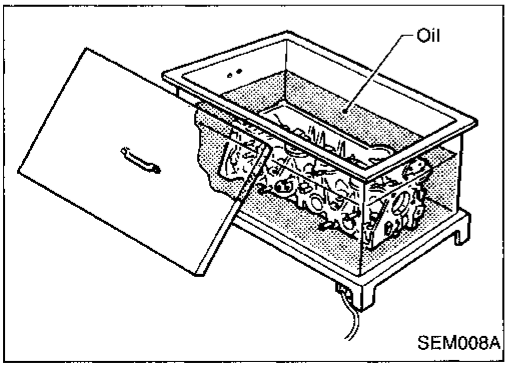
5. Ream valve guide.
   Finished size:
   Intake & Exhaust
   7.000 - 7.018 mm (0.2756 - 0.2763 in)

SEM302D

VALVE SEATS

Check valve seats for pitting at contact surface. Resurface or replace if excessively worn.

- **Before repairing valve seats, check valve and valve guide for wear. If they have worn, replace them. Then correct valve seat.**
- **Use both hands to cut uniformly.**

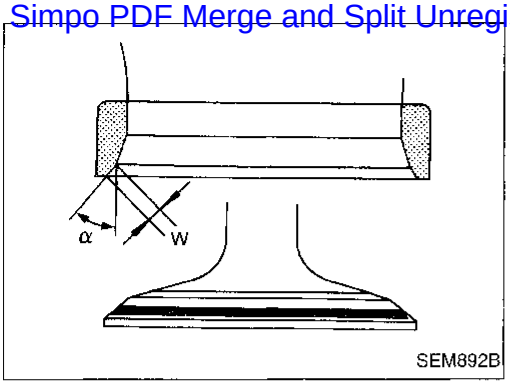


SEM795A

REPLACING VALVE SEAT FOR SERVICE PARTS

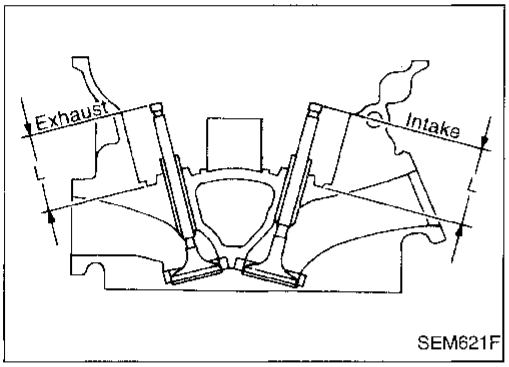
1. Bore out old seat until it collapses. Boring should not continue beyond the bottom face of the seat recess in cylinder head. Set the machine depth stop to ensure this.
2. Ream cylinder head recess.
   Reaming bore for service valve seat
   Oversize [0.5 mm (0.020 in)]:
   Intake 38.000 - 38.016 mm (1.4961 - 1.4967 in)
   Exhaust 32.700 - 32.716 mm (1.2874 - 1.2880 in)

Use the valve guide center for reaming to ensure valve seat will have the correct fit.



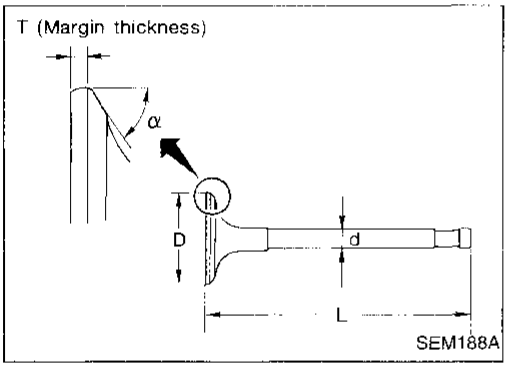
SEM008A

3. Heat cylinder head to 120 to 140°C (248 to 284°F).
4. Press fit valve seat until it seats on the bottom.



Inspection (Cont'd)

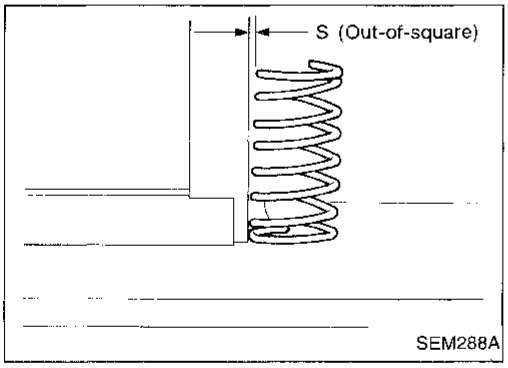
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



SEM892B

5. Cut or grind valve seat using suitable tool to the specified dimensions as shown in SDS.
6. After cutting, lap valve seat with abrasive compound.
7. Check valve seating condition.
   Seat face angle "α":
   44°53′ - 45°07′ deg.
   Contacting width "W":
   Intake
   1.48 - 1.63 mm (0.0583 - 0.0642 in)
   Exhaust
   1.8 - 2.0 mm (0.071 - 0.079 in)

SEM621F

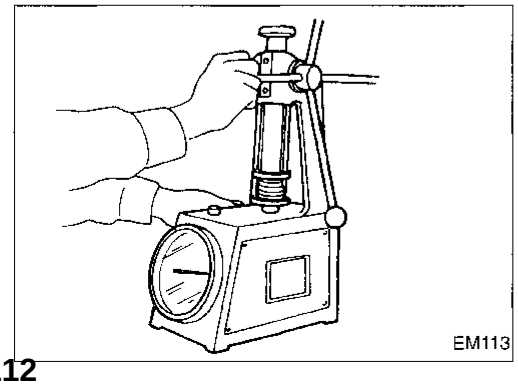


8. Use a depth gauge to measure the distance between the mounting surface of the cylinder head spring seat and the valve stem end. If the distance is shorter than specified, repeat step 5 above to adjust it. If it is longer, replace the valve seat with a new one.
   Valve seat resurface limit "L":
   Intake 42.02 - 42.52 mm (1.6543 - 1.6740 in)
   Exhaust 42.03 - 42.53 mm (1.6547 - 1.6744 in)

SEM188A

VALVE DIMENSIONS

Check dimensions of each valve. For dimensions, refer to SDS (EM-52).
When valve head has been worn down to 0.5 mm (0.020 in) in margin thickness, replace valve.
Grinding allowance for valve stem tip is 0.2 mm (0.008 in) or less.



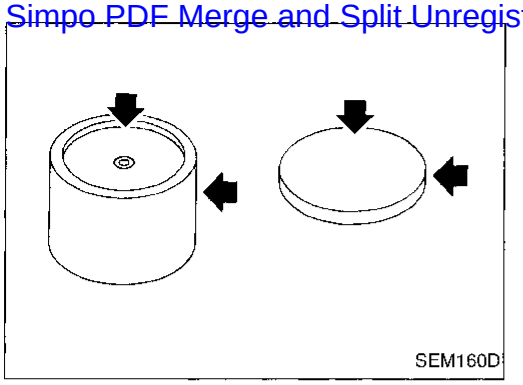
SEM288A

VALVE SPRING

Squareness

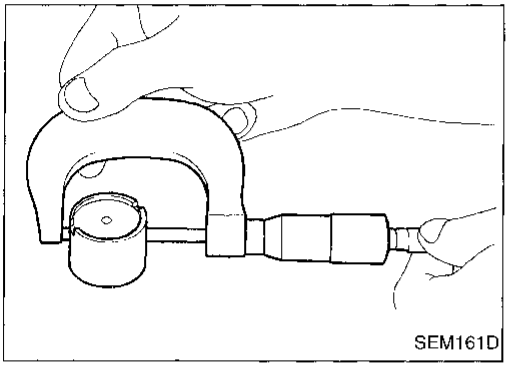
1. Measure dimension "S".
   Out-of-square "S":
   Less than 2.2 mm (0.087 in)
2. If it exceeds the limit, replace spring.

EM113



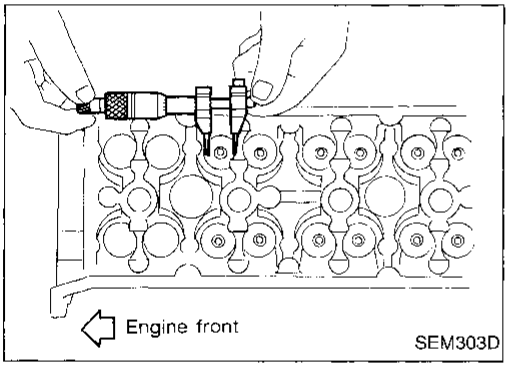
Pressure

Check valve spring pressure at specified spring height.
Pressure: N (kg, lb) at height mm (in)
Standard
418.0 (42.6, 93.9) at 29.17 (1.1484)
Limit
393.0 (40.1, 88.4) at 29.17 (1.1484)
If it exceeds the limit, replace spring.



Inspection (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

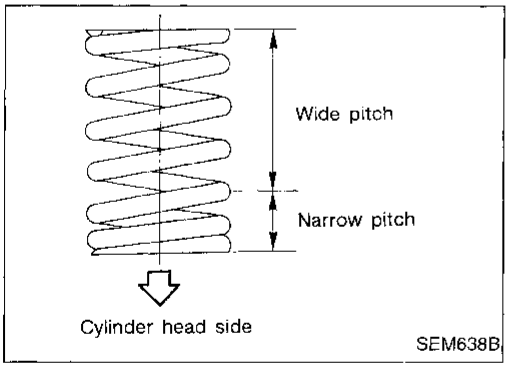


VALVE LIFTER AND VALVE SHIM

SEM160D

1. Visually check contact and sliding surfaces for wear and scratches.

SEM161D

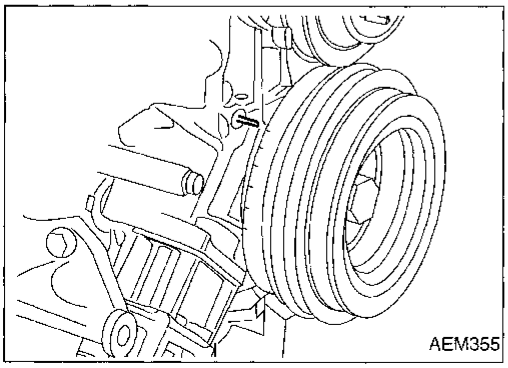


2. Check diameter of valve lifter and valve lifter guide bore.
   Valve lifter diameter:
   33.960 - 33.975 mm (1.3370 - 1.3376 in)

SEM303D

Lifter guide bore diameter:
34.000 - 34.021 mm (1.3386 - 1.3394 in)
Valve lifter to valve lifter guide clearance:
0.025 - 0.061 mm (0.0010 - 0.0024 in)
If it exceeds the standard diameter or clearance, replace valve lifter or cylinder head.

Assembly



SEM638B

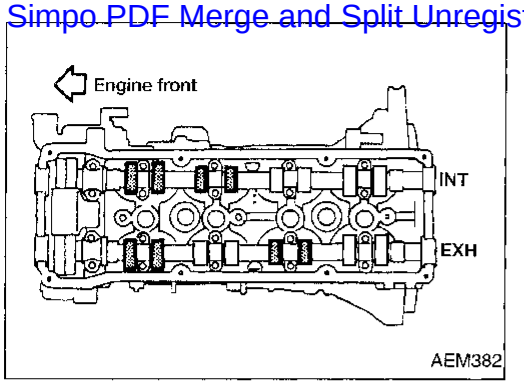
1. Install valve component parts.

- **Always use new valve oil seal. Refer to "OIL SEAL REPLACEMENT" (EM-25).**
- **Before installing valve oil seal, install valve spring seat.**
- **Install outer valve spring (uneven pitch type) with its narrow pitch side toward cylinder head side.**
- **After installing valve component parts, tap valve stem tip with plastic hammer to assure a proper fit.**

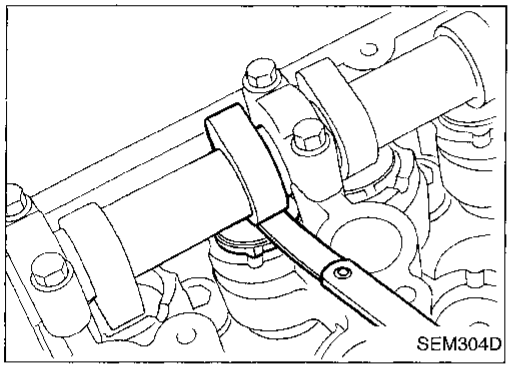
Valve Clearance

CHECKING

AEM355



Check valve clearance while engine is warm but not running.



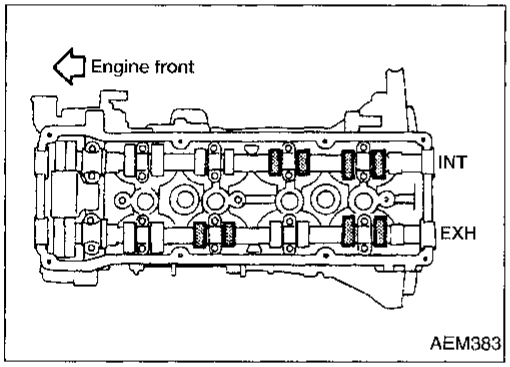
1. Remove rocker cover and all spark plugs.
2. Set No. 1 cylinder at TDC on its compression stroke.
- Align pointer with TDC mark on crankshaft pulley.
- Check that valve lifters on No. 1 cylinder are loose and valve lifters on No. 4 are tight.
  If not, turn crankshaft one revolution (360°) and align as above.

Valve Clearance (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

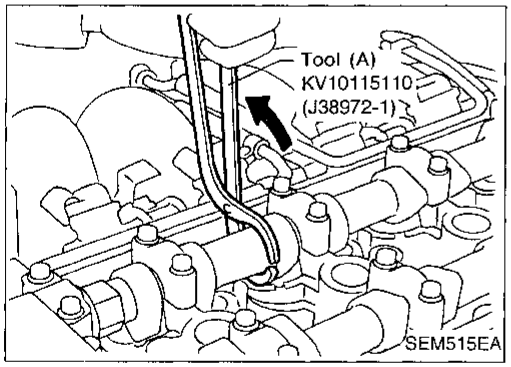
3. Check only those valves shown in the figure.

4. Using a feeler gauge, measure clearance between valve lifter and camshaft.
- Record any valve clearance measurements which are out of specification. They will be used later to determine the required replacement adjusting shim.



Valve clearance (Hot):

Intake



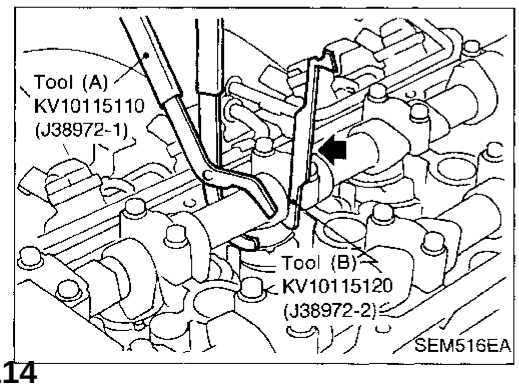
0.31 - 0.39 mm (0.012 - 0.015 in)

Exhaust

0.33 - 0.41 mm (0.013 - 0.016 in)

5. Turn crankshaft one revolution (360°) and align mark on crankshaft pulley with pointer.
6. Check those valves shown in the figure.
- Use the same procedure as mentioned in step 4.
7. If all valve clearances are within specification, install the following parts.
- Rocker cover
- All spark plugs

ADJUSTING



Adjust valve clearance while engine is cold.

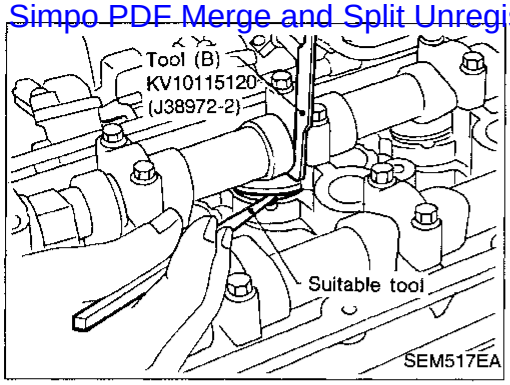
1. Turn crankshaft to position cam lobe on camshaft of valve that must be adjusted upward.
2. Place Tool (A) around camshaft as shown in figure.
3. Rotate Tool (A) so that lifter is pushed down.

Before placing Tool (A), rotate notch toward center of cylinder head (See figure.), to simplify shim removal later.

CAUTION:

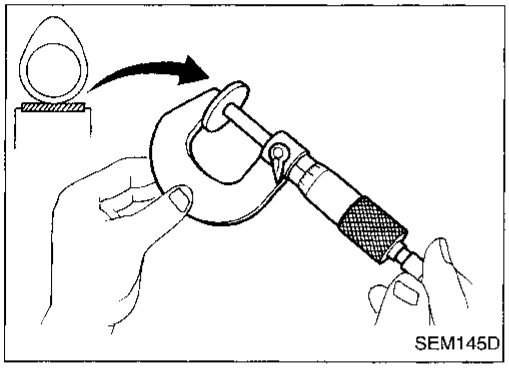
Be careful not to damage cam surface with Tool (A).

4. Place Tool (B) between camshaft and the edge of the valve lifter to retain valve lifter.



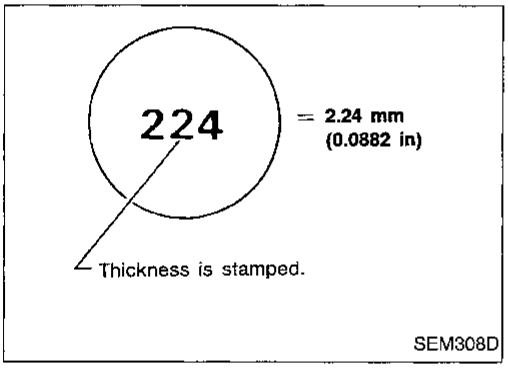
CAUTION:

- **Tool (B) must be placed as close to camshaft bracket as possible.**
- **Be careful not to damage cam surface with Tool (B).**

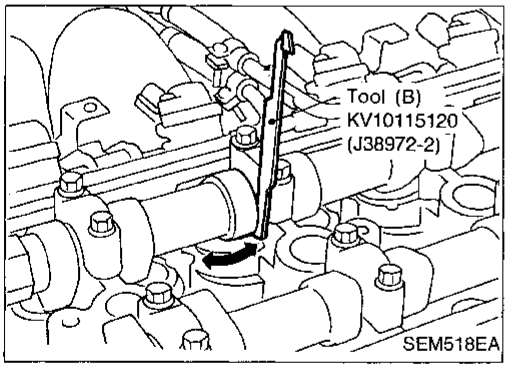


5. Remove Tool (A).

Valve Clearance (Cont'd)



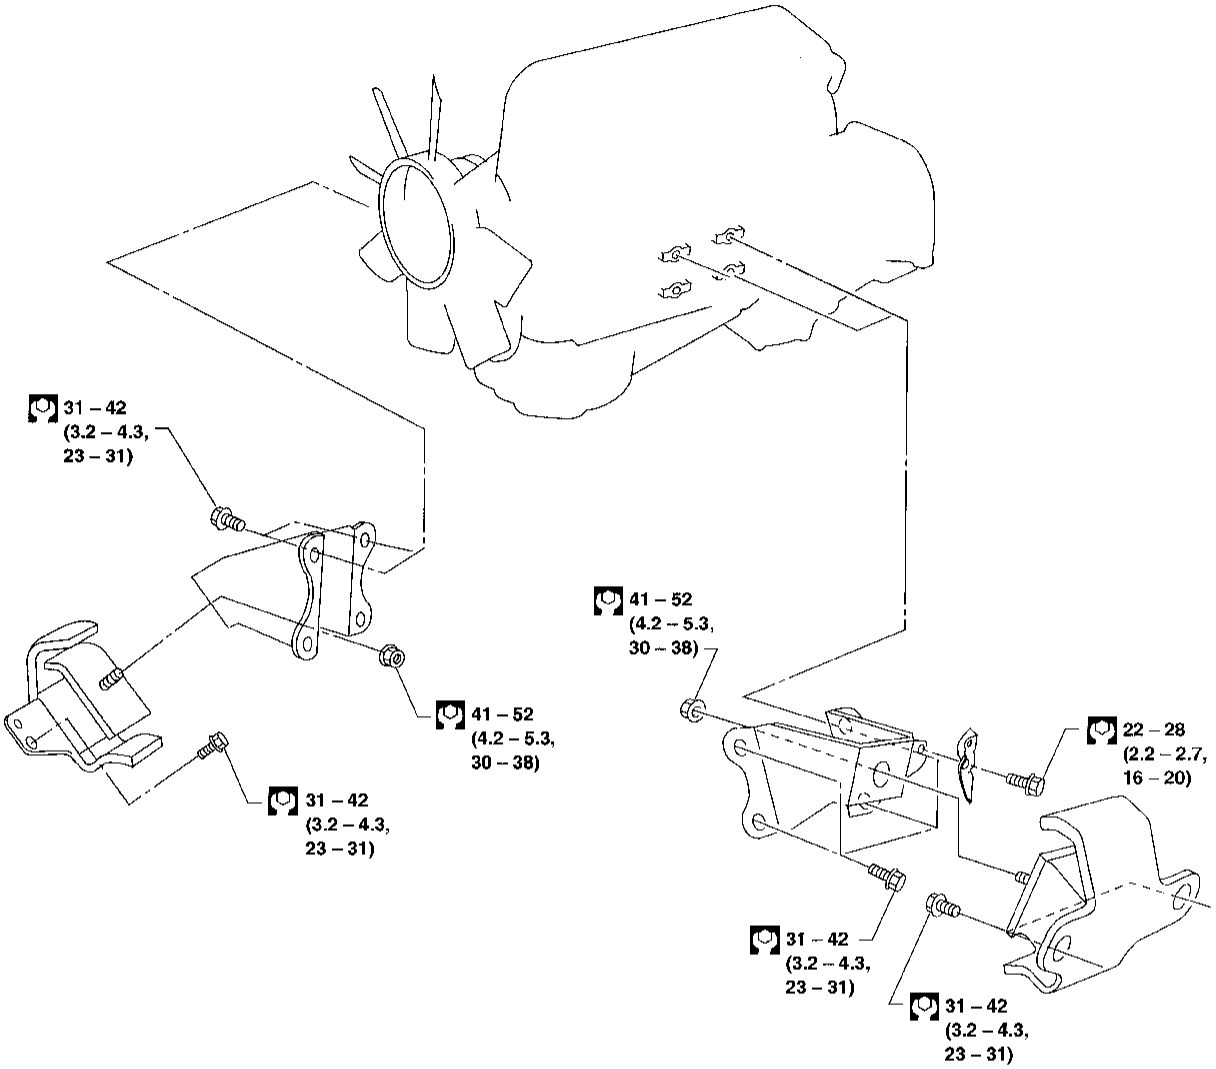
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



6. Remove adjusting shim using a small screwdriver and a magnetic finger.

7. Determine replacement adjusting shim size as follows.
a. Using a micrometer determine thickness of removed shim.
b. Calculate thickness of new adjusting shim so valve clearance comes within specified values.
   R = Thickness of removed shim
   N = Thickness of new shim
   M = Measured valve clearance
   Intake & Exhaust:
   N = R + [M – 0.37 mm (0.0146 in)]

Shims are available in thicknesses from 1.96 mm (0.0772 in) to 2.68 mm (0.1055 in), in steps of 0.02 mm (0.0008 in).
c. Select new shim with thickness as close as possible to calculated value.
   Refer to SDS, EM-53.



8. Install new shim using a suitable tool.
- **Install with the surface on which the thickness is stamped facing down.**

9. Place Tool (A) as mentioned in steps 2 and 3.
10. Remove Tool (B).
11. Remove Tool (A).
12. Recheck valve clearance.
    Refer to "CHECKING" (EM-35).

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SEC. 112

: N·m (kg-m, ft-lb)

AEM398

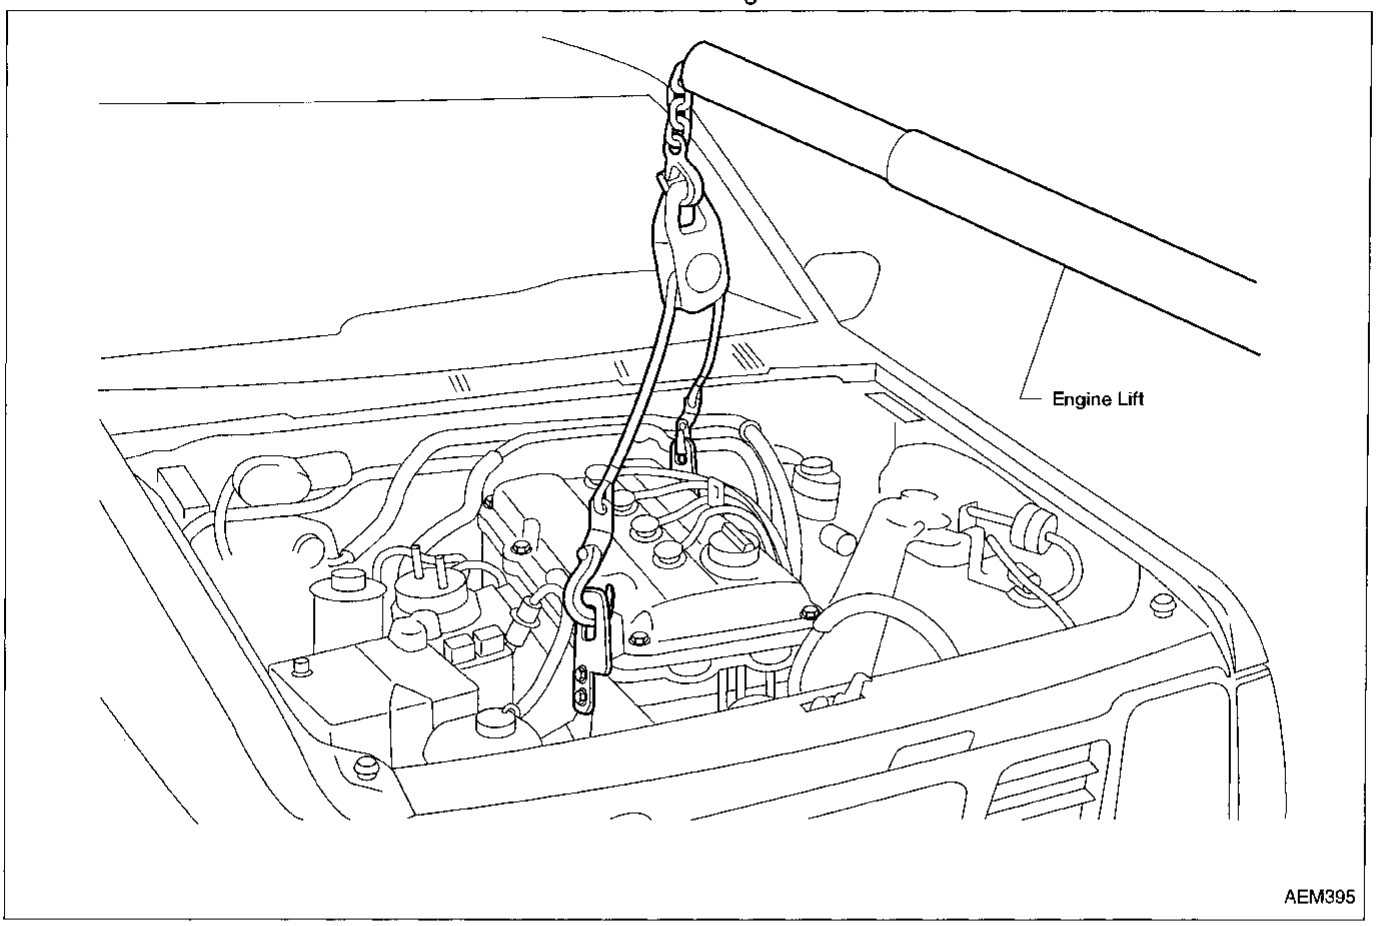
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

WARNING:

- **Position vehicle on a flat and solid surface.**
- **Place chocks at front and back of rear wheels.**
- **Do not remove engine until exhaust system has completely cooled off.**
  Otherwise, you may burn yourself and/or fire may break out in fuel line.
- **Before disconnecting fuel hose, release fuel pressure. Refer to EC section ("Fuel Pressure Release", "BASIC SERVICE PROCEDURE").**
- **Be sure to hoist engine and transmission in a safe manner.**
- **For engines not equipped with engine slingers, attach proper slingers and bolts described in PARTS CATALOG.**

CAUTION:

- **When lifting engine, be sure to clear surrounding parts. Take special care near accelerator wire casing, brake lines and brake master cylinder.**
- **In hoisting the engine, always use engine slingers in a safe manner.**
- **Before separating engine and transmission, remove the crankshaft position sensor (OBD) from the assembly.**
- **Always take extra care not to damage edge of crankshaft position sensor (OBD) or ring gear teeth.**



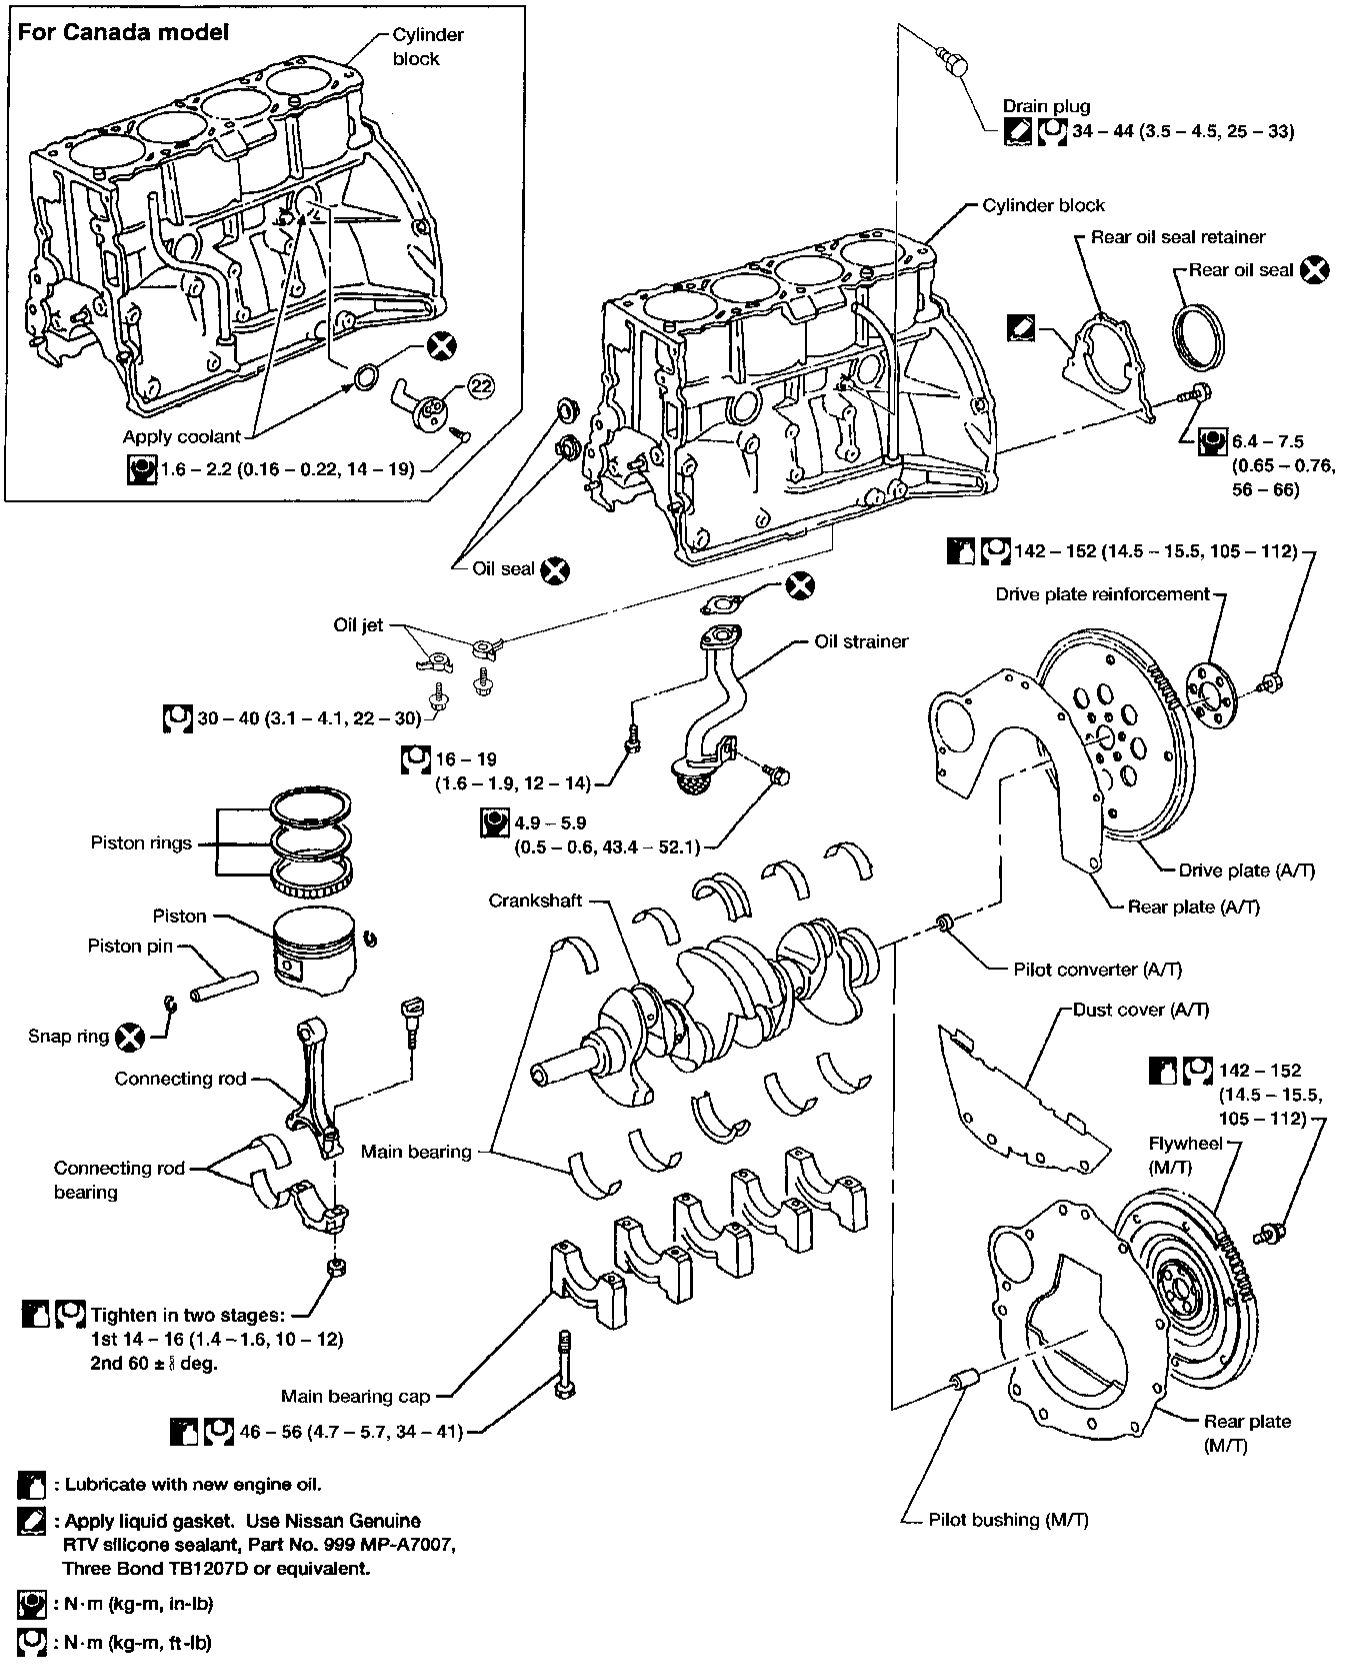
Removal

1. Drain coolant from engine block and radiator. Refer to MA section ("Changing Engine Coolant", "ENGINE MAINTENANCE").
2. Release fuel pressure. Refer to EC section ("Fuel Pressure Release", "BASIC SERVICE PROCEDURE").
3. Remove negative battery cable.
4. Remove hood. Refer to BT section.
5. Remove air cleaner.
6. Remove power steering drive belt, generator drive belt and A/C compressor drive belt.
7. Remove radiator. Refer to LC section ("Radiator", "ENGINE COOLING SYSTEM").
8. Remove exhaust manifold heat shield.
9. Disconnect exhaust system from #1 catalytic converter.
10. Remove A/C compressor from bracket. Refer to HA section ("Compressor Mounting", "SERVICE PROCEDURES").
11. Disconnect accelerator wire, vacuum hoses, electrical connectors, heater hoses and vacuum booster hose.

Removal (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

12. Remove four power steering pump bolts.
13. Remove transmission Refer to MT or AT section ("Removal", "REMOVAL AND INSTALLATION").
14. Remove LH and RH engine mounts.
15. Remove engine.

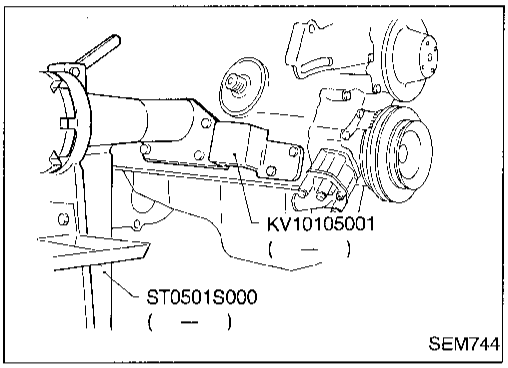


Installation

- Install in reverse order of removal.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

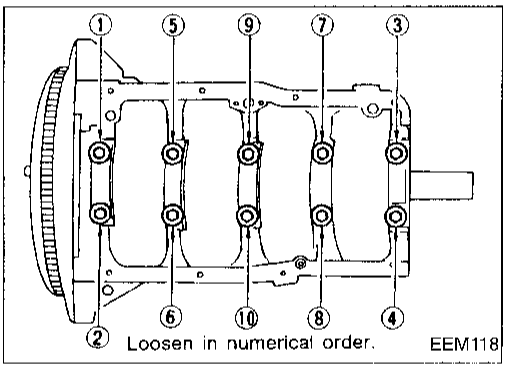
SEC. 110 • 120 • 135 • 150 • 210



AEM358

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

CAUTION:

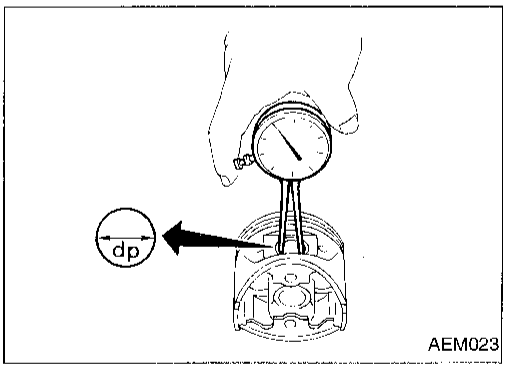


- **When installing sliding parts (bearings, pistons, etc.), lubricate contacting surfaces with new engine oil.**
- **Place removed parts such as bearings and bearing caps in their proper order and direction.**
- **When installing connecting rod nuts and main bearing cap bolts, apply new engine oil to threads and seating surfaces.**
- **Do not allow any magnetic materials to contact the ring gear teeth of flywheel or drive plate.**

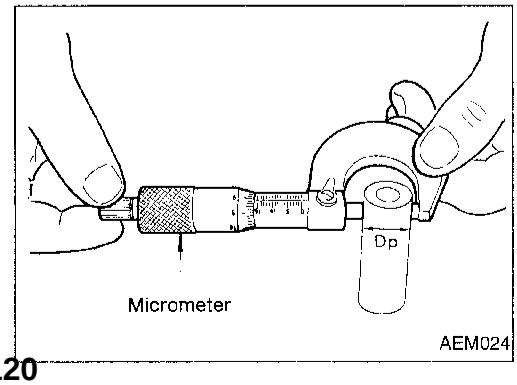
Disassembly

PISTON AND CRANKSHAFT

1. Place engine on a work stand.
2. Drain coolant and oil.
3. Remove oil pan.
4. Remove timing chain. Refer to "Removal" in "TIMING CHAIN" (EM-18).
5. Remove water pump.
6. Remove cylinder head.
7. Remove pistons with connecting rods.



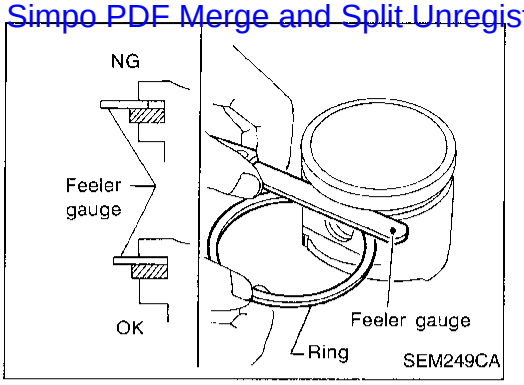
8. Remove bearing caps and crankshaft.



- **Before removing bearing caps, measure crankshaft end play. Refer to EM-49.**
- **Bolts should be loosened in two or three steps.**

Inspection

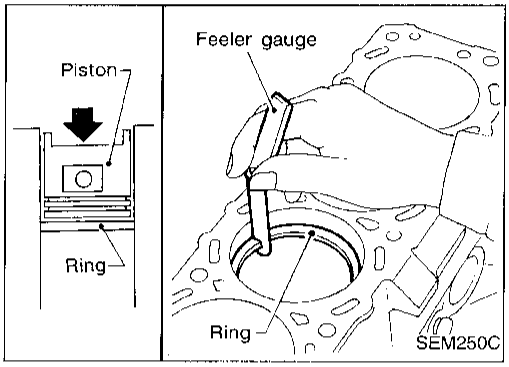
PISTON AND PISTON PIN CLEARANCE



1. Measure inner diameter of piston pin hole "dp".
   Standard diameter "dp":
   20.993 - 21.005 mm (0.8265 - 0.8270 in)

2. Measure outer diameter of piston pin "Dp".
   Standard diameter "Dp":
   20.989 - 21.001 mm (0.8263 - 0.8268 in)
3. Calculate piston pin clearance.
   dp – Dp = –0.002 - 0.01 mm (–0.0001 - 0.0004 in)
   If it exceeds the above value, replace piston assembly with pin.

Inspection (Cont'd)

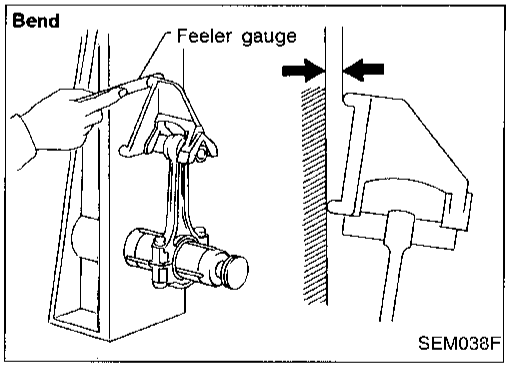


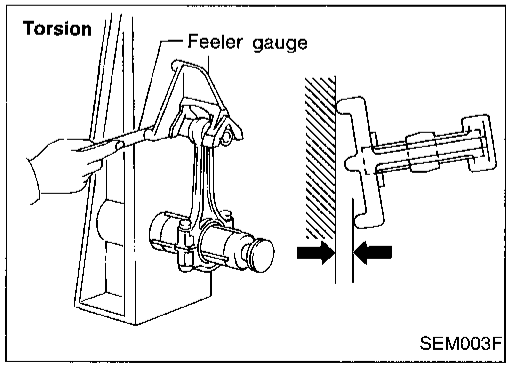
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

PISTON RING SIDE CLEARANCE

Side clearance:
Top ring 0.04 - 0.08 mm (0.0016 - 0.0031 in)
2nd ring 0.03 - 0.07 mm (0.0012 - 0.0028 in)
Max. limit of side clearance:
0.1 mm (0.004 in)

If out of specification, replace piston ring.
If clearance exceeds maximum limit with new ring, replace piston.





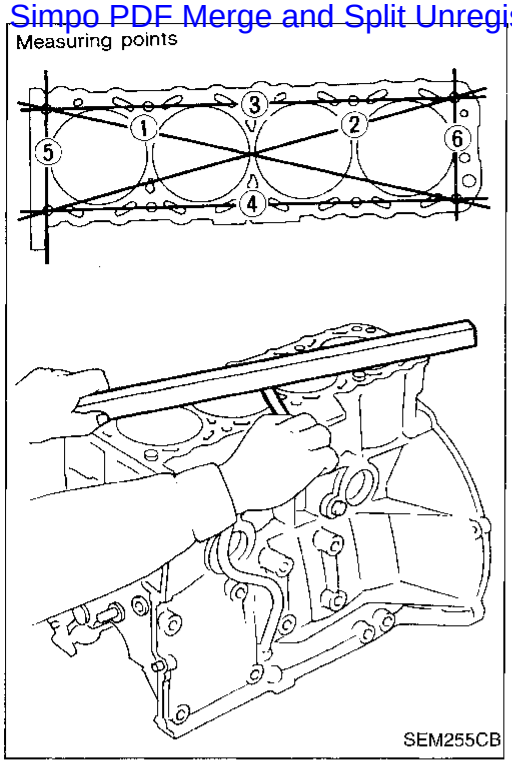
PISTON RING END GAP

End gap:
Top ring
0.28 - 0.52 mm (0.0110 - 0.0205 in)
2nd ring
0.45 - 0.69 mm (0.0177 - 0.0272 in)
(R or T is punched on the ring.)
0.55 - 0.70 mm (0.0217 - 0.0276 in)
(N is punched on the ring.)
Oil ring
0.20 - 0.69 mm (0.0079 - 0.0272 in)
Max. limit of ring gap:
Refer to SDS, EM-57.

If out of specification, replace piston ring. If gap exceeds maximum limit with a new ring, rebore cylinder and use oversized piston and piston rings. Refer to SDS, EM-57.

- When replacing the piston, check cylinder block surface for scratches or seizure. If scratches or seizure are found, hone or replace the cylinder block.

CONNECTING ROD BEND AND TORSION



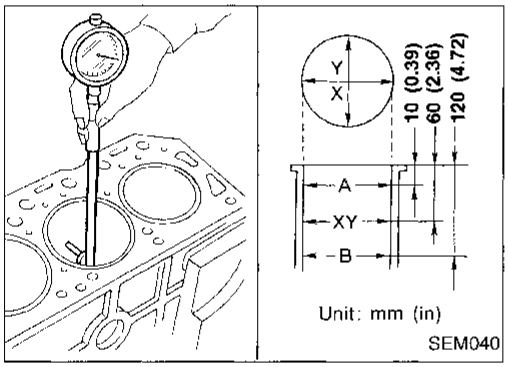
Bend:
Limit 0.15 mm (0.0059 in)
per 100 mm (3.94 in) length
Torsion:
Limit 0.30 mm (0.0118 in)
per 100 mm (3.94 in) length

If it exceeds the limit, replace connecting rod assembly.

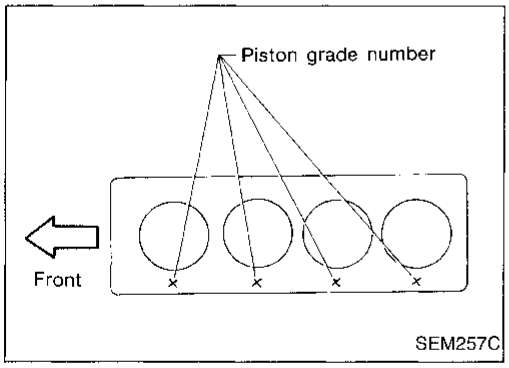
Inspection (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

CYLINDER BLOCK DISTORTION AND WEAR

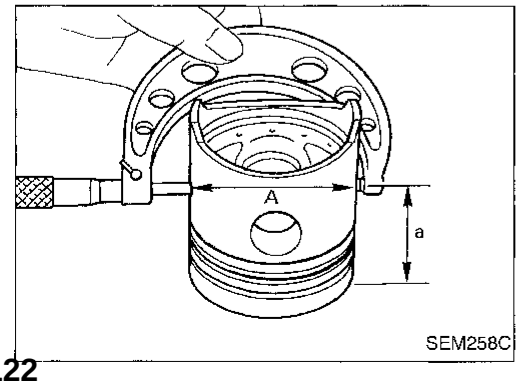


1. Clean upper face of cylinder block.
   Use a reliable straightedge and feeler gauge to check the flatness of cylinder block surface. Check along six positions shown in figure.
   Limit:
   0.1 mm (0.004 in)
2. If out of specification, resurface it.
   The limit for cylinder block resurfacing is determined by cylinder head resurfacing.



Amount of cylinder head resurfacing is "A"
Amount of cylinder block resurfacing is "B"
The maximum limit is as follows:
A + B = 0.2 mm (0.008 in)
Nominal cylinder block height from crankshaft center:
246.95 - 247.05 mm (9.7224 - 9.7264 in)

3. If necessary, replace cylinder block.



PISTON-TO-BORE CLEARANCE

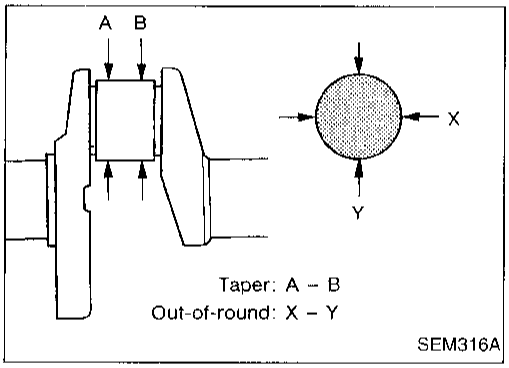
1. Using a bore gauge, measure cylinder bore for wear, out-of-round and taper.
   Standard inner diameter:
   Refer to SDS, EM-55.
   Wear limit: 0.2 mm (0.008 in)
   Out-of-round (X – Y) standard: 0.015 mm (0.0006 in)
   Taper (A – B) standard: 0.010 mm (0.0004 in)
   If it exceeds the limit, rebore all cylinders. Replace cylinder block if necessary.
2. Check for scratches and seizure. If seizure is found, hone it.

- **If cylinder block and piston are replaced, match piston grade with grade number on cylinder block upper surface.**

3. Measure piston skirt diameter.
   Piston diameter "A":
   Refer to SDS, EM-57.
   Measuring point "a" (Distance from the top):
   Approximately 48 mm (1.89 in)
4. Check that piston-to-bore clearance is within specification.
   Piston-to-bore clearance "B":
   0.020 - 0.040 mm (0.0008 - 0.0016 in)
5. Determine piston oversize according to amount of cylinder wear.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

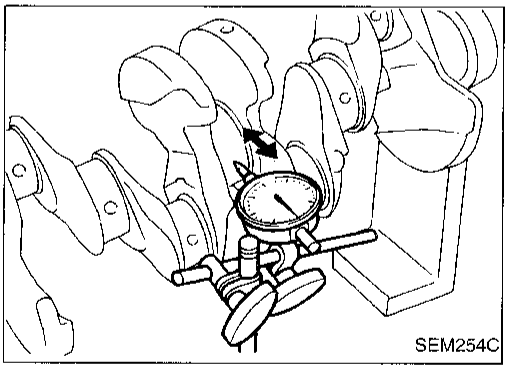
Inspection (Cont'd)



Oversize pistons are available for service. Refer to SDS, EM-57.

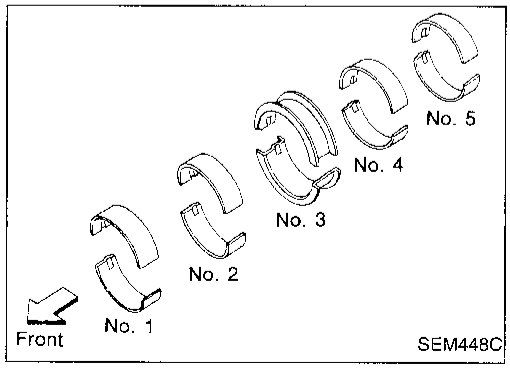
6. Cylinder bore size is determined by adding piston-to-bore clearance to piston diameter "A".
   Rebored size calculation:
   D = A + B – C
   where,
   D: Bored diameter
   A: Piston diameter as measured
   B: Piston-to-bore clearance
   C: Honing allowance 0.02 mm (0.0008 in)
7. Install main bearing caps and tighten bolts to the specified torque. This will prevent distortion of cylinder bores.
8. Cut cylinder bores.

- **When any cylinder needs boring, all other cylinders must also be bored.**
- **Do not cut too much out of cylinder bore at a time. Cut only 0.05 mm (0.0020 in) or so at a time.**



9. Hone cylinders to obtain specified piston-to-bore clearance.
10. Measure finished cylinder bore for out-of-round and taper.

- **Measurement should be done after cylinder bore cools down.**



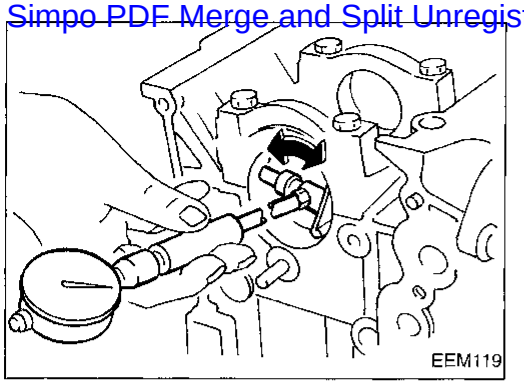
CRANKSHAFT

1. Check crankshaft main and pin journals for score, wear or cracks.
2. With a micrometer, measure journals for taper and out-of-round.
   Out-of-round (X – Y):
   Main journal Less than 0.01 mm (0.0004 in)
   Crank pin Less than 0.005 mm (0.0002 in)
   Taper (A – B):
   Main journal Less than 0.01 mm (0.0004 in)
   Crank pin Less than 0.005 mm (0.0002 in)

3. Measure crankshaft runout.
   Runout (Total indicator reading):
   Less than 0.10 mm (0.0039 in)

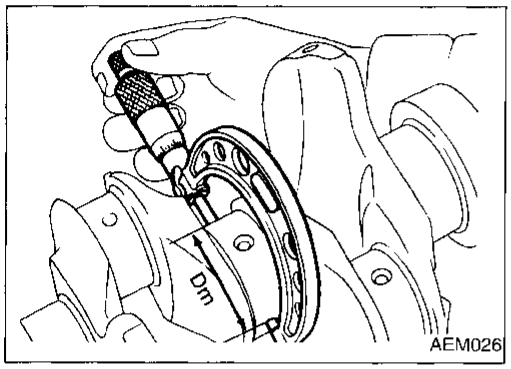
BEARING CLEARANCE

- Use Method A or Method B. Method A is preferred because it is more accurate.



Method A (Using bore gauge and micrometer)

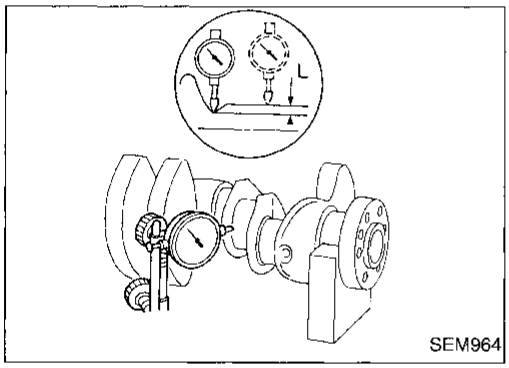
Main bearing



1. Set main bearings in their proper positions on cylinder block and main bearing cap.

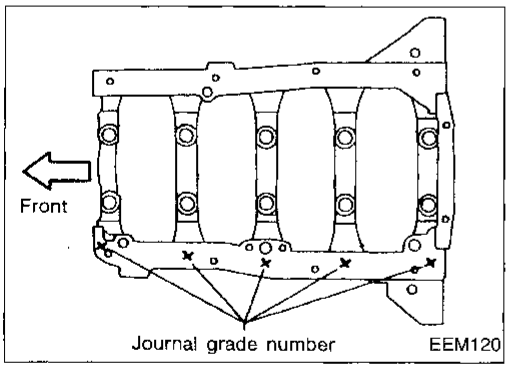
Inspection (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



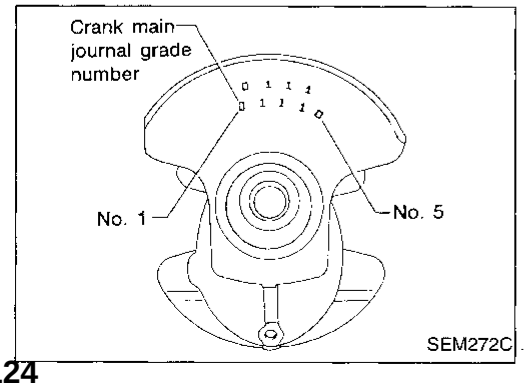
EEM119

2. Install main bearing cap to cylinder block.
- **Tighten all bolts in correct order in two or three stages. Refer to EM-41 and EM-49.**
3. Measure inner diameter "A" of each main bearing.



AEM026

4. Measure outer diameter "Dm" of each crankshaft main journal.
5. Calculate main bearing clearance.
   Main bearing clearance = A – Dm
   Standard:
   0.020 - 0.047 mm (0.0008 - 0.0019 in)
   Limit:
   0.1 mm (0.004 in)
6. If it exceeds the limit, replace bearing.
7. If clearance cannot be adjusted within the standard of any bearing, grind crankshaft journal and use undersized bearing.



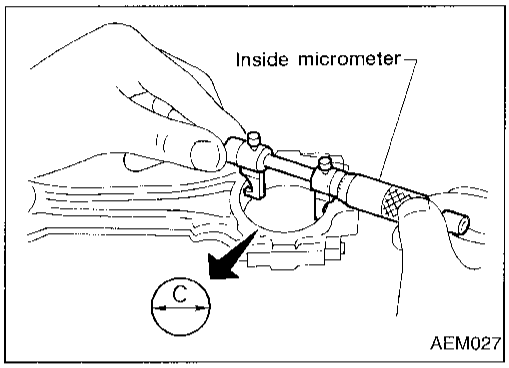
SEM964

a. When grinding crankshaft journal, confirm that "L" dimension in fillet roll is more than the specified limit.
"L": 0.1 mm (0.004 in)
b. Refer to SDS EM-58 & EM-59 for grinding crankshaft and available service parts.

EEM120

8. If crankshaft is reused, measure main bearing clearance and select thickness of main bearing.
   If crankshaft or cylinder block is replaced, select thickness of main bearings as follows:
a. Grade number of each cylinder block main journal is punched on the respective cylinder block. These numbers are punched in either Arabic or Roman numerals.

SEM272C



b. Grade number of each crankshaft main journal is punched on crankshaft. These numbers are punched in either Arabic or Roman numerals.
c. Select main bearing with suitable thickness according to the following example or table.
   For example:
   Main journal grade number: 1
   Crankshaft journal grade number: 2
   Main bearing grade number = 1 + 2
   = 3 (Yellow)

Inspection (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Main bearing grade number and identification color:

		Main journal grade number		
		0	1	2
Crankshaft journal grade number	0	0 (Black)	1 (Brown)	2 (Green)
	1 or I	1 (Brown)	2 (Green)	3 (Yellow)
	2 or II	2 (Green)	3 (Yellow)	4 (Blue)

AEM027

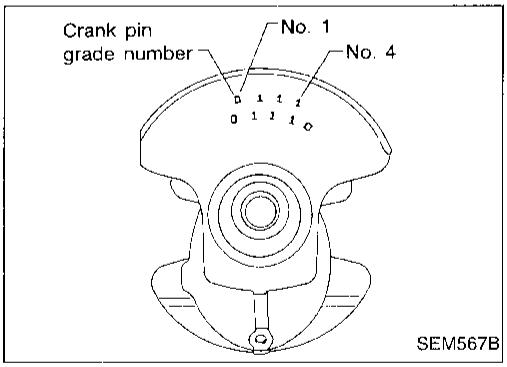
Connecting rod bearing (Big end)

1. Install connecting rod bearing to connecting rod and cap.
2. Install connecting rod cap to connecting rod.
- **Tighten bolts to the specified torque.**
3. Measure inner diameter "C" of each bearing.

AEM028

4. Measure outer diameter "Dp" of each crankshaft pin journal.
5. Calculate connecting rod bearing clearance.

Connecting rod bearing clearance = C – Dp:



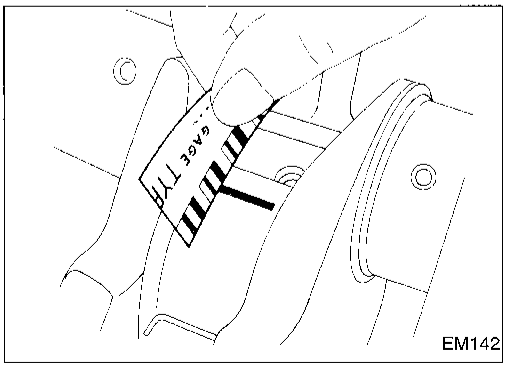
Standard

0.010 - 0.035 mm (0.0004 - 0.0014 in)

Limit

0.09 mm (0.0035 in)

6. If it exceeds the limit, replace bearing.
7. If clearance cannot be adjusted within the standard of any bearing, grind crankshaft journal and use undersized bearing. Refer to step 5 of "BEARING CLEARANCE" EM-45.



SEM567B

8. If crankshaft is replaced, select connecting rod bearing according to the following table.

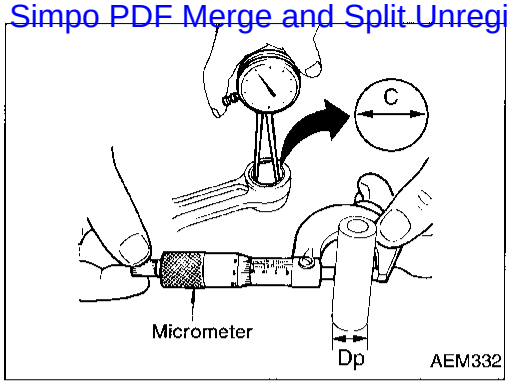
Connecting rod bearing grade number:

These numbers are punched in either Arabic or Roman numerals.

Crank pin grade number	Connecting rod bearing grade number
0	0
1 or I	1
2 or II	2

EM142

Method B (Using plastigage)



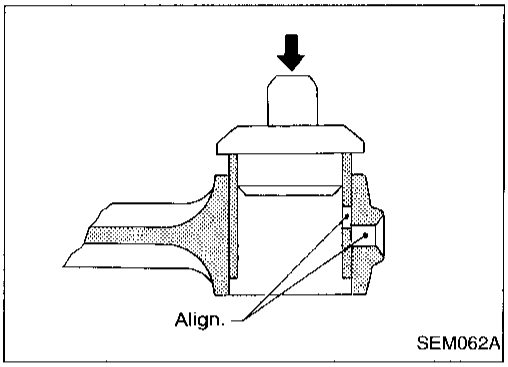
CAUTION:

- **Do not turn crankshaft or connecting rod while plastigage is being inserted.**
- **When bearing clearance exceeds the specified limit, ensure that the proper bearing has been installed. Then if excessive bearing clearance exists, use a thicker main bearing or undersized bearing so that the specified bearing clearance is obtained.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (Cont'd)

CONNECTING ROD BUSHING CLEARANCE (Small end)

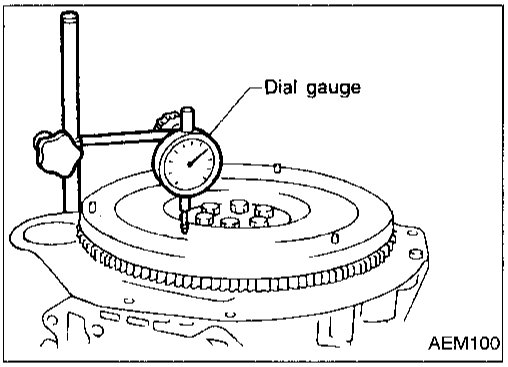


1. Measure inner diameter "C" of bushing.
2. Measure outer diameter "Dp" of piston pin.
3. Calculate connecting rod bushing clearance.

C – Dp =
0.001 to 0.013 mm (0 to 0.0005 in) (Standard)
0.023 mm (0.0009 in) (Limit)

If out of specification, replace connecting rod assembly and/or piston set with pin.

REPLACEMENT OF CONNECTING ROD BUSHING (Small end)



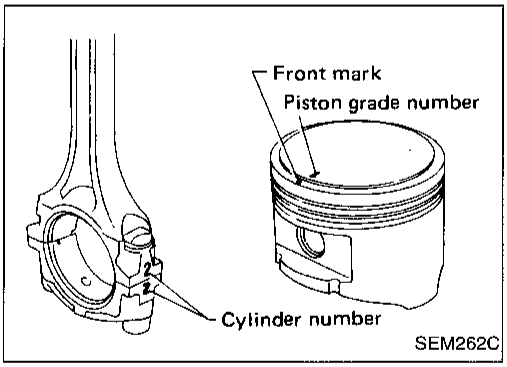
1. Drive in small end bushing until it is flush with end surface of rod.

Be sure to align the oil holes.

2. Ream the bushing until clearance with piston pin is within specification.

Clearance between connecting rod bushing and piston pin:
0.001 - 0.013 mm (0 - 0.0005 in)

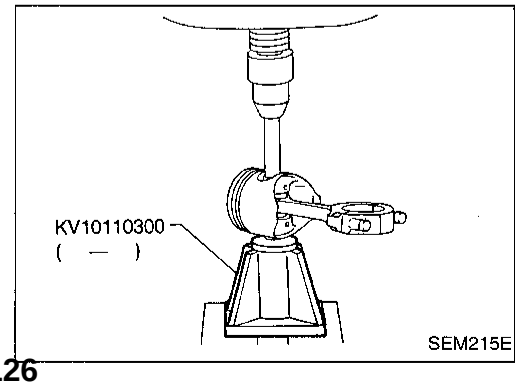
FLYWHEEL/DRIVE PLATE RUNOUT



Runout (Total indicator reading):
Flywheel (M/T model)
Less than 0.15 mm (0.006 in)
Drive plate (A/T model)
Less than 0.15 mm (0.006 in)

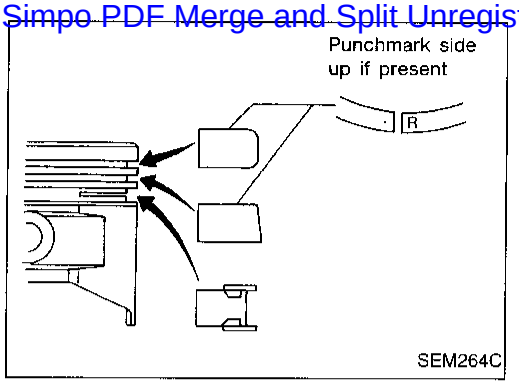
CAUTION:

- **Be careful not to damage the ring gear teeth.**
- **Check the drive plate for deformation and cracks.**
- **Do not allow any magnetic materials to contact the ring gear teeth.**
- **Do not resurface the flywheel. Replace as necessary.**



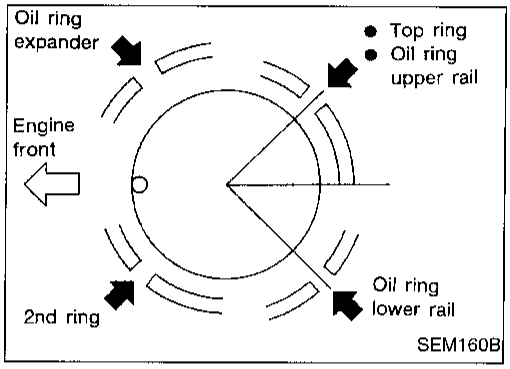
Assembly

PISTON



1. Heat piston to 60 to 70°C (140 to 158°F) and assemble piston, piston pin and connecting rod.

- **Align the direction of piston and connecting rod.**
- **Numbers stamped on connecting rod and cap correspond to each cylinder.**
- **After assembly, make sure connecting rod swings smoothly.**

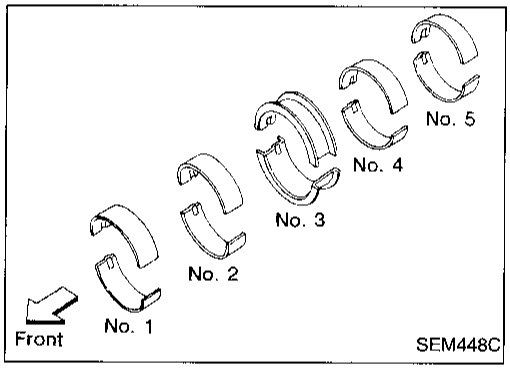


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

2. Set piston rings as shown.

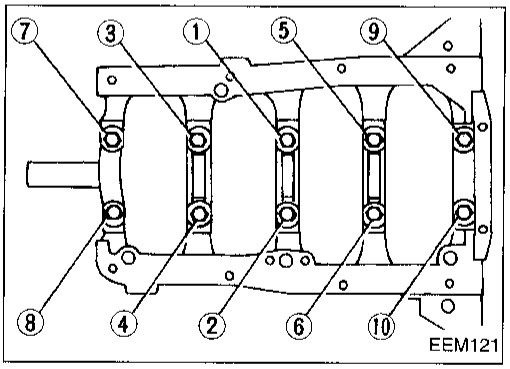
CAUTION:

- **When piston rings are not replaced, make sure that piston rings are mounted in their original positions.**
- **When piston rings are being replaced and no punchmark is present, piston rings can be mounted with either side up.**



3. Align piston rings so that end gaps are positioned as shown.

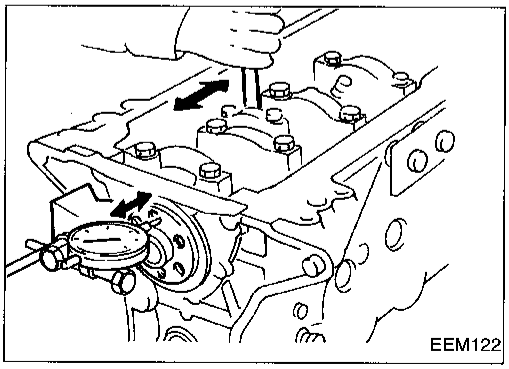
CRANKSHAFT



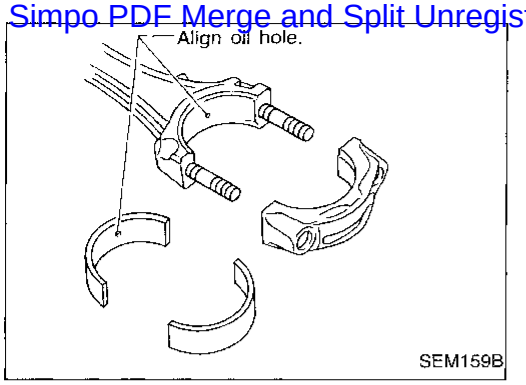
1. Set main bearings in their proper positions on cylinder block and main bearing caps.

- **Confirm that correct main bearings are used. Refer to EM-45.**
- **Apply new engine oil to bearing surfaces.**

2. Install crankshaft and main bearing caps and tighten bolts to the specified torque. Refer to EM-41.

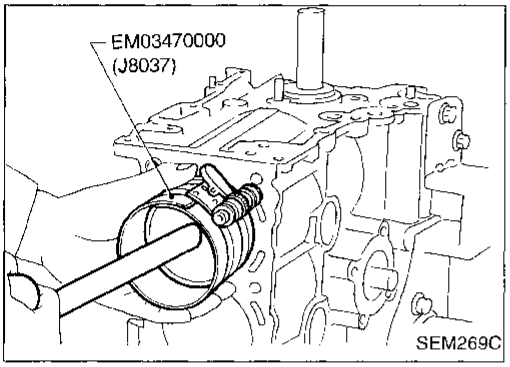


- **Apply new engine oil to the bolt threads and seat surface.**
- **Prior to tightening bearing cap bolts, place bearing cap in its proper position by shifting crankshaft in the axial direction.**
- **Tighten bearing cap bolts gradually in two or three stages. Start with center bearing and move outward as shown in figure.**
- **After securing bearing cap bolts, make sure crankshaft turns smoothly by hand.**



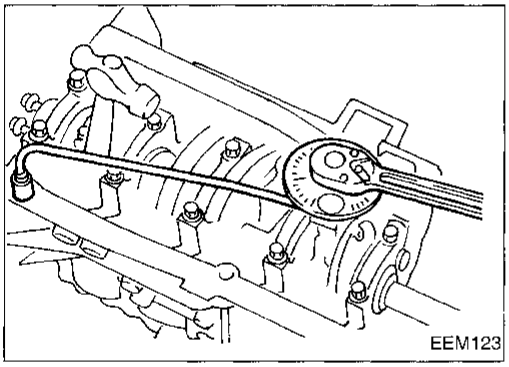
3. Measure crankshaft end play.

Crankshaft end play:
Standard
0.05 - 0.18 mm (0.0020 - 0.0071 in)
Limit
0.3 mm (0.012 in)



If beyond the limit, replace No. 3 bearing with a new one.

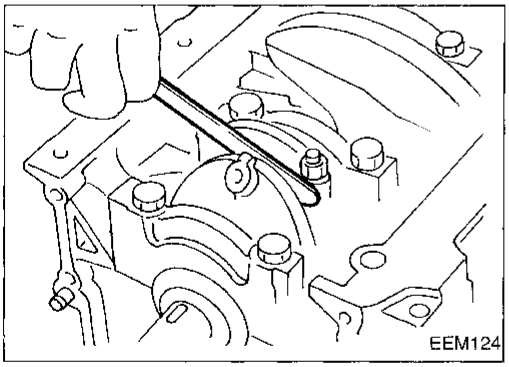
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



4. Install connecting rod bearings in connecting rods and connecting rod caps.
- **Confirm that correct bearings are used. Refer to EM-47.**
- **Install bearings so that oil hole in connecting rod aligns with oil hole of bearing.**
- **Apply new engine oil to bearing surfaces, bolt threads and seating surfaces.**

5. Install pistons with connecting rods.

a. Install them into corresponding cylinders with Tool.
- **Arrange so that front mark on piston head faces toward front of engine.**
- **Make sure connecting rod does not scratch cylinder wall.**
- **Make sure connecting rod bolts do not scratch crankshaft journals.**
- **Apply new engine oil to piston rings and sliding surface of piston.**

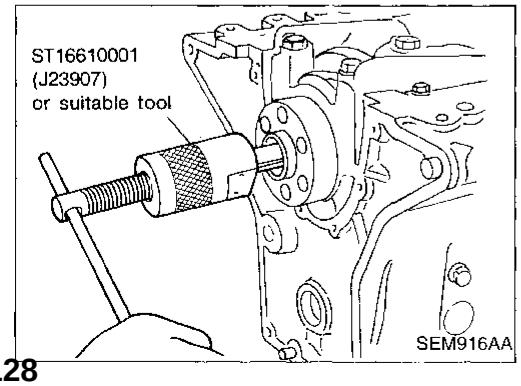


b. Install connecting rod bearing caps.
Tighten connecting rod bearing cap nuts using the following procedure.

Connecting rod bearing nut:

(1) Tighten to 14 to 16 N·m (1.4 to 1.6 kg-m, 10 to 12 ft-lb).

(2) Tighten bolts 60^{+5}_{-0} degrees clockwise with an angle wrench.
If an angle wrench is not available, tighten them to 38 to 44 N·m (3.9 to 4.5 kg-m, 28 to 33 ft-lb).



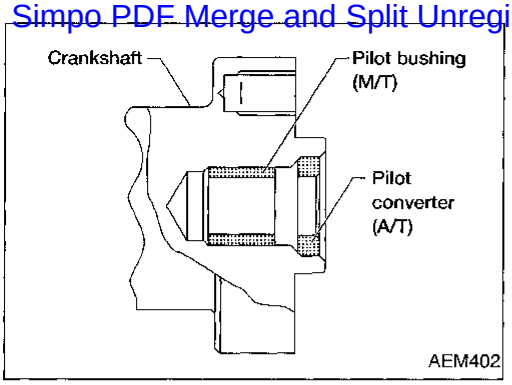
6. Measure connecting rod side clearance.

Connecting rod side clearance:

Standard
0.2 - 0.4 mm (0.008 - 0.016 in)

Limit
0.6 mm (0.024 in)

If beyond the limit, replace connecting rod and/or crankshaft.



REPLACING PILOT BUSHING

1. Remove pilot bushing (M/T) or pilot convertor (A/T).

Assembly (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

2. Install pilot bushing (M/T) or pilot convertor (A/T).

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

General Specifications

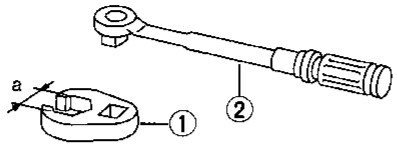
Precautions

- **When installing rubber parts, final tightening must be carried out under unladen condition* with tires on ground.**
  *** Fuel, radiator coolant and engine oil full. Spare tire, jack, hand tools and mats in designated positions.**
- **Use flare nut wrench when removing and installing brake tubes.**
- **After installing removed suspension parts, check wheel alignment and adjust if necessary.**
- **Always torque brake lines when installing.**



Special Service Tools

The actual shapes of Kent-Moore tools may differ from those of special service tools illustrated here.

Tool number (Kent-Moore No.) Tool name	Description		Unit application	
			2WD	4WD
ST29020001 (J24319-01) Gear arm puller	 NT694	Removing ball joint for knuckle spindle **a: 34 mm (1.34 in)** **b: 6.5 mm (0.256 in)** **c: 61.5 mm (2.421 in)**	X	X
HT72520000 (J25730-B) Ball joint remover	 NT546	Removing tie-rod outer end **a: 33 mm (1.30 in)** **b: 50 mm (1.97 in)** **r: R11.5 mm (0.453 in)**	X	X

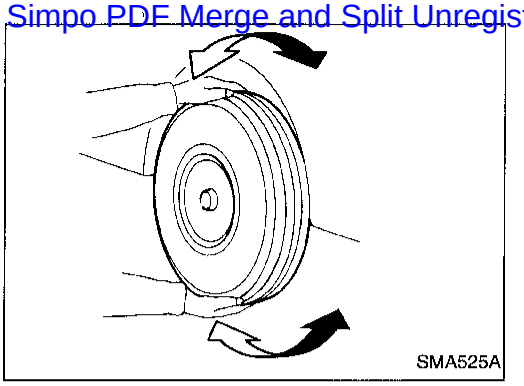
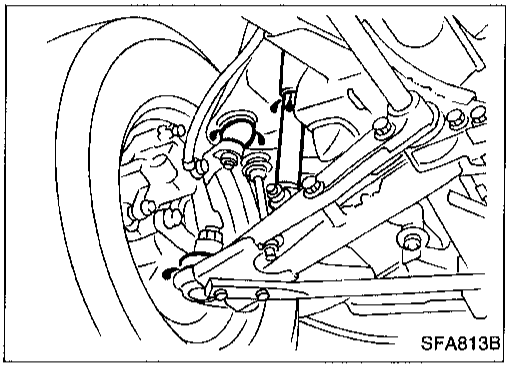
SEC. 391•400•401



When installing rubber parts, final tightening must be carried out under unladen condition* with tires on ground.

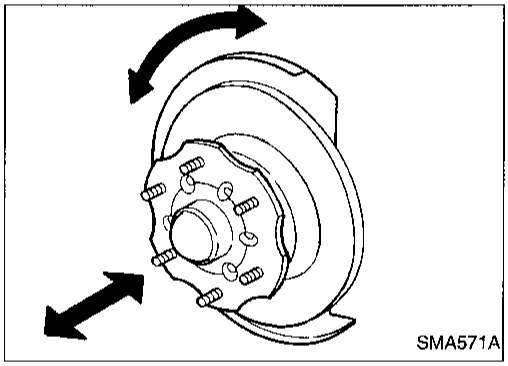
* Fuel, radiator coolant and engine oil full. Spare tire, jack, hand tools and mats in designated positions.

SFA812B



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

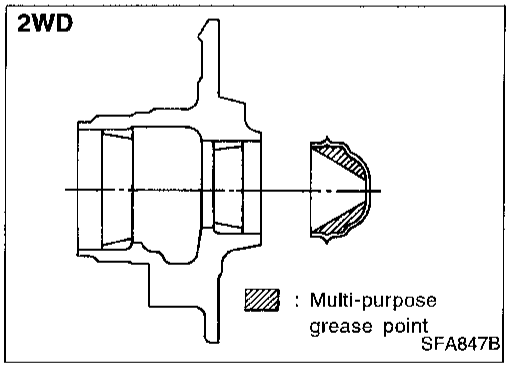
SMA525A



Front Axle and Front Suspension Parts

Check front axle and front suspension parts for excessive play, cracks, wear and other damage.

- Shake each front wheel to check for excessive play.
  If looseness is noted, adjust wheel bearing end play, then check ball joint end play.
- Make sure that the cotter pin is inserted.
- Retighten all nuts and bolts to the specified torque.
  : Refer to "FRONT SUSPENSION", FA-27.
- Check front axle and front suspension parts for wear, cracks and other damage.



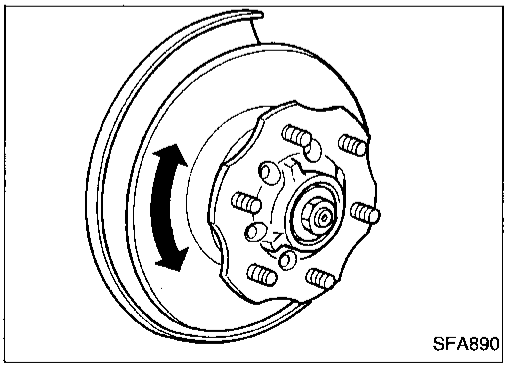
SFA813B

- Check shock absorber for oil leakage and other damage.
- Check suspension ball joint for grease leakage and ball joint dust cover for cracks and other damage.

SMA571A

Front Wheel Bearing

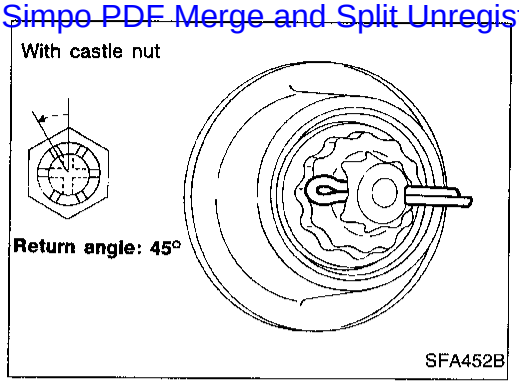
- Check that wheel bearings operate smoothly.
- Check axial end play.
  Axial end play: 0 mm (0 in)
- Adjust wheel bearing preload if there is any axial end play or wheel bearing does not turn smoothly.



SFA847B

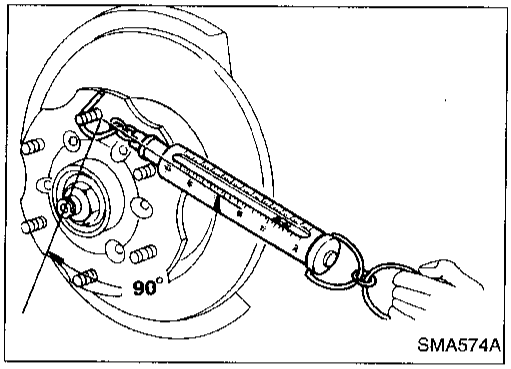
PRELOAD ADJUSTMENT (2WD)

Adjust wheel bearing preload after wheel bearing has been replaced or front axle has been reassembled.



1. Before adjustment, thoroughly clean all parts to prevent dirt entry.
2. Apply multi-purpose grease sparingly to the following parts:
- Threaded area of spindle
- Contact surface between lock washer and outer wheel bearing
- Hub cap (as shown at left) **18 - 22 g (0.63 - 0.78 oz)**
- Grease seal lip

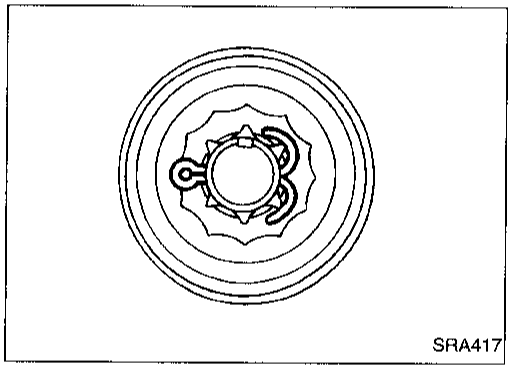
SFA890



3. Tighten wheel bearing lock nut to the specified torque.
   : 34 - 39 N·m (3.5 - 4.0 kg-m, 25 - 29 ft-lb)
4. Turn wheel hub several times in both directions to seat wheel bearing correctly.
5. Again tighten wheel bearing lock nut to the specified torque.
   : 34 - 39 N·m (3.5 - 4.0 kg-m, 25 - 29 ft-lb)

Front Wheel Bearing (Cont'd)

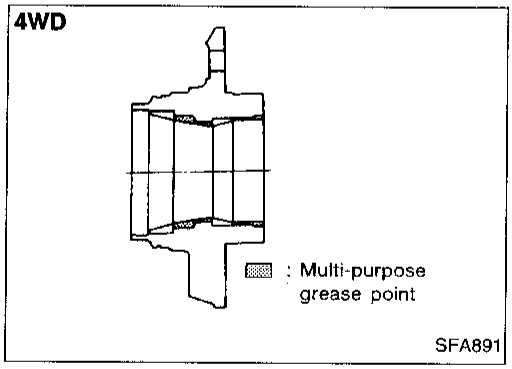
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



6. Turn wheel bearing lock nut back 45 degrees.
7. Fit adjusting cap and new cotter pin. Align cotter pin slot by loosening nut 15 degrees or less.

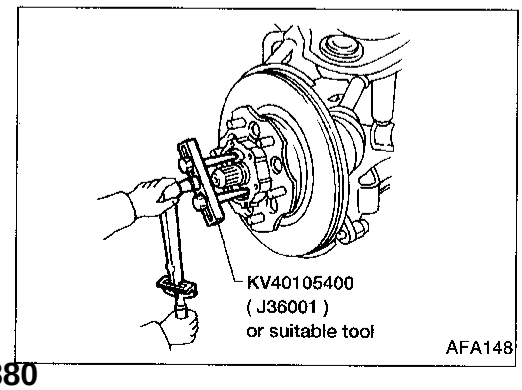
8. Measure wheel bearing preload and axial end play.
   Axial end play: 0 mm (0 in)
   Wheel bearing preload
   (As measured at wheel hub bolt):
   New grease seal
   9.8 - 28.4 N (1.0 - 2.9 kg, 2.2 - 6.4 lb)
   Used grease seal
   9.8 - 23.5 N (1.0 - 2.4 kg, 2.2 - 5.3 lb)

Repeat above procedures until correct bearing preload is obtained.



9. Spread cotter pin.
10. Install hub cap.

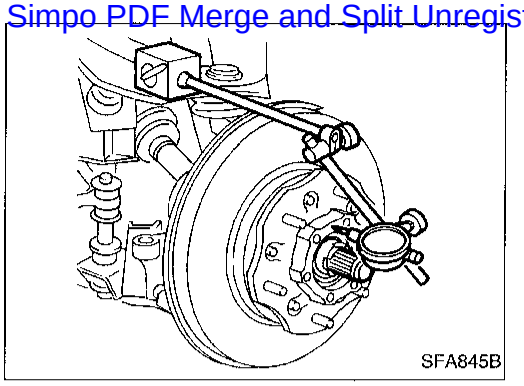
PRELOAD ADJUSTMENT (4WD)



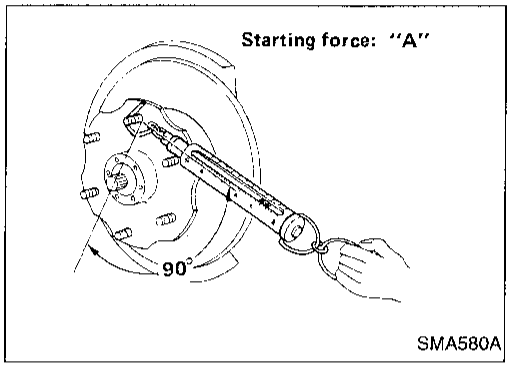
Adjust wheel bearing preload after wheel bearing has been replaced or front axle has been reassembled.

Adjust wheel bearing preload as follows:

1. Before adjustment, thoroughly clean all parts to prevent dirt entry.



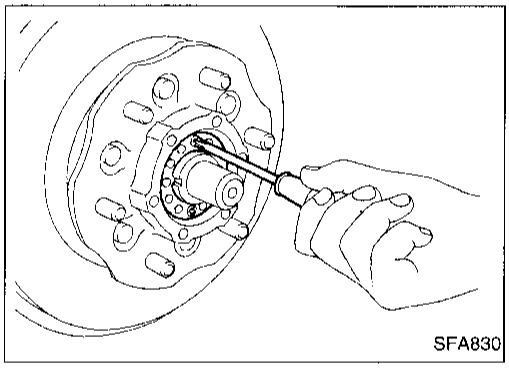
2. Apply multi-purpose grease sparingly to the following parts:
- Threaded portion of spindle
- Contact surface between wheel bearing washer and outer wheel bearing
- Grease seal lip
- Wheel hub (as shown at left) **18 - 23 g (0.63 - 0.81 oz)**



3. Tighten wheel bearing lock nut with Tool.
   : 78 - 98 N·m (8 - 10 kg-m, 58 - 72 ft-lb)
4. Turn wheel hub several times in both directions.
5. Loosen wheel bearing lock nut so that torque becomes 0 N·m (0 kg-m, 0 ft-lb).
6. Retighten wheel bearing lock nut with Tool.
   : 0.5 - 1.5 N·m (0.05 - 0.15 kg-m, 4.3 - 13.0 in-lb)

Front Wheel Bearing (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



SFA845B

7. Turn wheel hub several times in both directions.
8. Retighten wheel bearing lock nut with Tool.
   : 0.5 - 1.5 N·m (0.05 - 0.15 kg-m, 4.3 - 13.0 in-lb)
9. Measure wheel bearing axial end play.
   Axial end play: 0 mm (0 in)

SMA580A

10. Measure starting force "A" at wheel hub bolt.

SFA830

11. Install lock washer by tightening the lock nut within 15 to 30 degrees.
12. Turn wheel hub several times in both directions to seat wheel bearing correctly.
13. Measure starting force "B" at wheel hub bolt. Refer to step 10.
14. Wheel bearing preload "C" can be calculated as shown below.

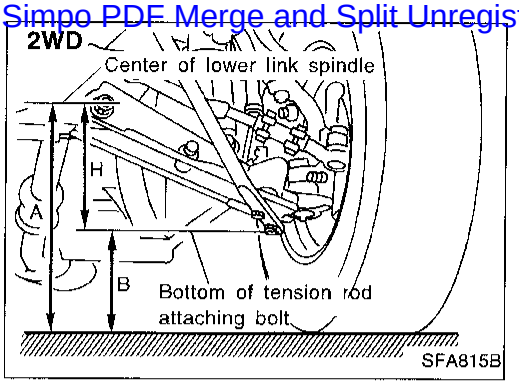
    C = B – A

    Wheel bearing preload "C":
    7.06 - 20.99 N (0.72 - 2.14 kg, 1.59 - 4.72 lb)
15. Repeat steps 3 through 14 until correct axial end play and wheel bearing preload are obtained.
16. Tighten screws.
    : 1.2 - 1.8 N·m (0.12 - 0.18 kg-m, 10.4 - 15.6 in-lb)
17. Install free-running hub.

Front Wheel Alignment

Before checking front wheel alignment, make a preliminary inspection (Unladen*).

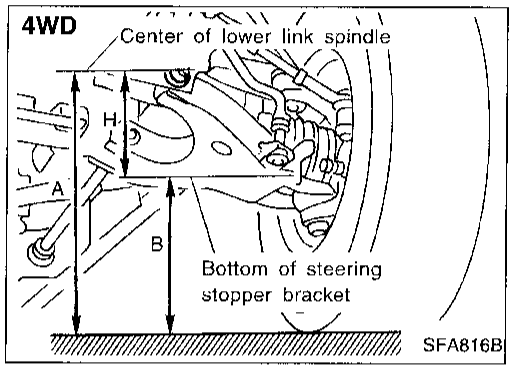
*: Fuel, radiator coolant and engine oil full. Spare tire, jack, hand tools and mats in designated positions.



SFA356B

PRELIMINARY INSPECTION

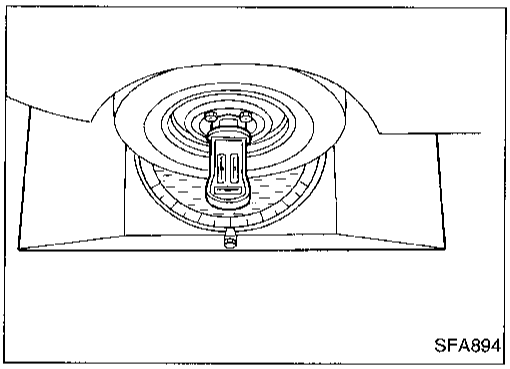
1. Check tires for wear and proper inflation.
2. Check outside and inside wheel runout.
   Wheel runout average
   [(Outside runout value + Inside runout value) x 0.5]:
   Refer to SDS, FA-36.
3. Check front wheel bearings for looseness.
4. Check front suspension for looseness.
5. Check steering linkage for looseness.
6. Check that front shock absorbers work properly by using the standard bounce test.



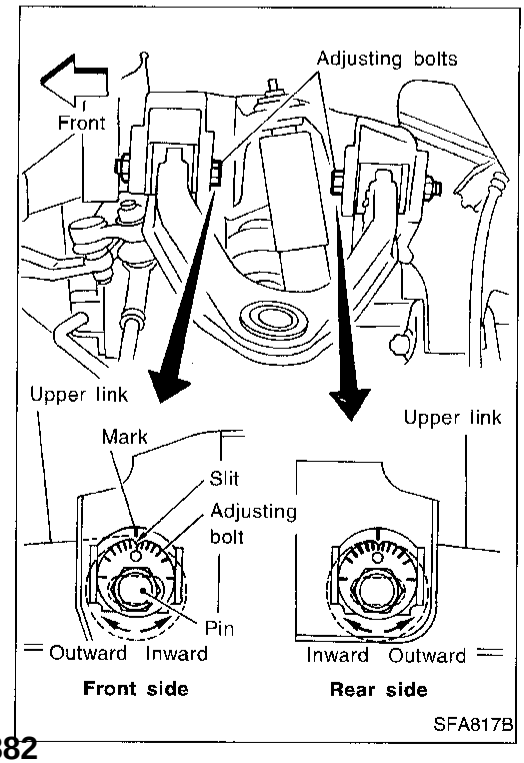
Front Wheel Alignment (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

7. Measure vehicle height (Unladen): H = A – B mm (in)
   Refer to SDS, FA-37.



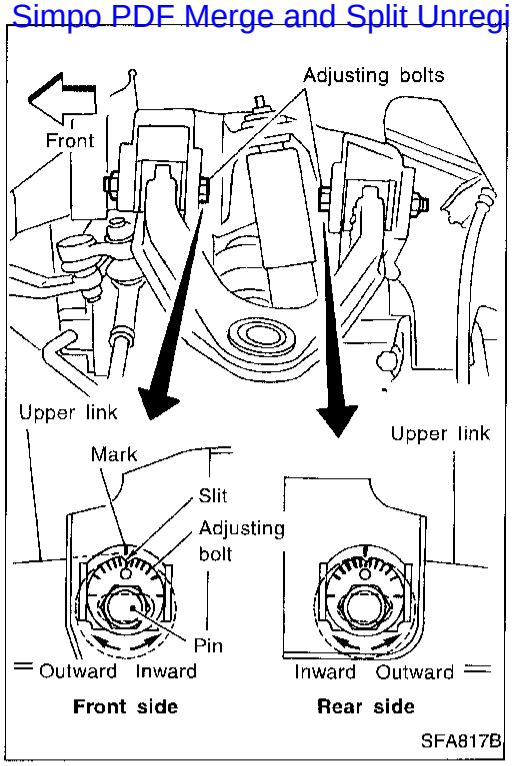
a. Exercise the front suspension by bouncing the front of the vehicle 4 or 5 times to ensure that the vehicle is in a neutral height attitude.
b. Measure wheel alignment.
   Refer to SDS, FA-37.
c. If wheel alignment is not as specified, adjust vehicle posture.
   Refer to SDS, FA-37.
d. Adjust wheel alignment.
   Refer to SDS, FA-37.



CAMBER, CASTER AND KINGPIN INCLINATION

Before checking camber, caster or kingpin inclination, move vehicle up and down on turning radius gauge to minimize friction. Ensure that the vehicle is in correct posture.

- Measure camber, caster and kingpin inclination of both right and left wheels with a suitable alignment gauge and adjust in accordance with the following procedures.
  Camber, Caster and Kingpin inclination:
  Refer to SDS, FA-37.



- In the following two cases, temporarily tighten the adjusting bolts while aligning the matching marks with the slits as shown in the figure at the left and measure the camber, caster and kingpin inclination:
  (1) When replacing the upper link or other suspension parts with new ones
  (2) When matching marks were not painted on adjusting bolts before suspension disassembly procedures
- If matching marks were already painted during suspension disassembly, align the matching marks with the slits, then temporarily tighten the adjusting bolts. Measure the camber, caster and kingpin inclination.

Front Wheel Alignment (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

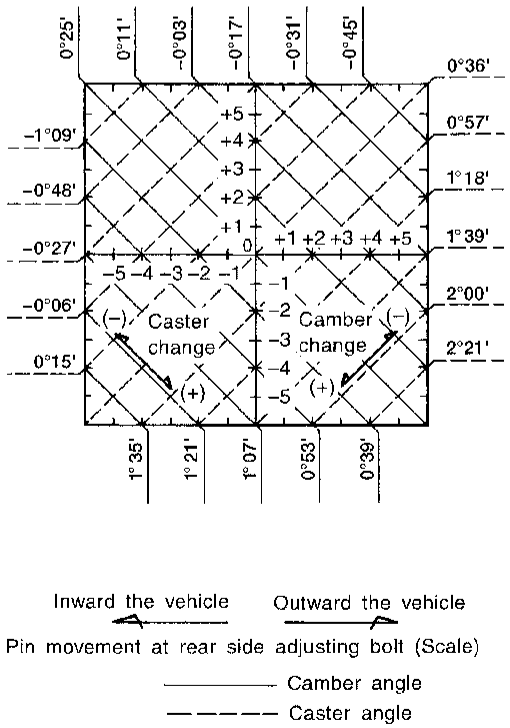
ADJUSTMENT

1. Both camber and caster angles are adjusted by adjusting bolts.
- If the kingpin inclination is outside specifications, check the front suspension parts for wear or damage. Replace faulty parts with new ones.
2. From the measured value, read the coordinate (or: graduation) at the intersecting point in the graph.

a. If the coordinate (or: graduation) at the intersecting point is positive, move the pin outward by turning the corresponding adjusting bolt by the indicated graduation.

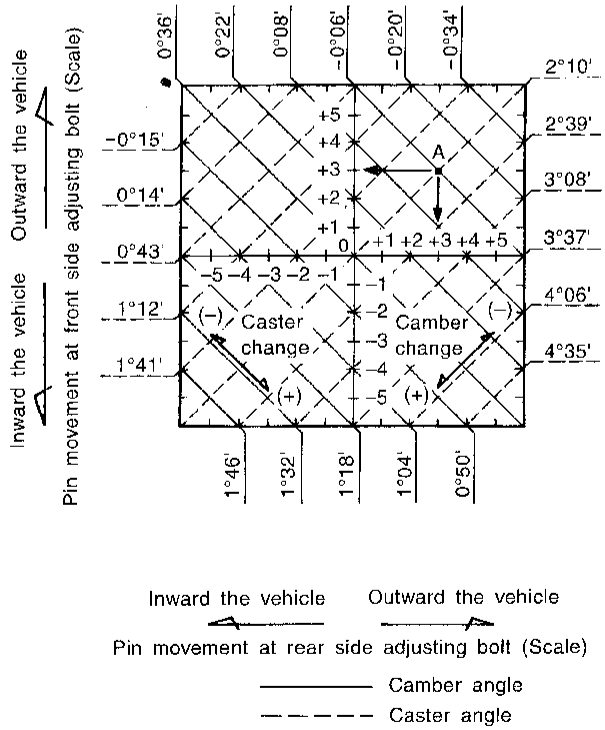
b. If the coordinate (or: graduation) at the intersecting point is negative, move the pin inward by turning the corresponding adjusting bolt by the indicated graduation.
After properly moving the pin(s), tighten the front and rear adjusting bolts to specifications.

3. Re-measure to ensure that the camber and caster are within specified tolerances.



[Example]

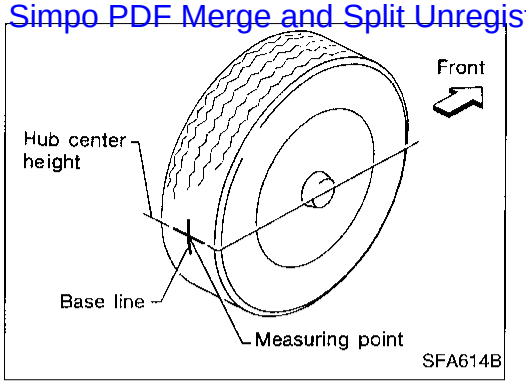
a. Measured values corresponding with the two values indicated below: (See chart for 4WD model.)
Camber angle: –0°06′ (–0.10°)
Caster angle: 2°10′ (2.17°)



b. Apply the above two values to the graph and determine point "A".

c. The coordinate (or: graduation) indicates that both the front and rear adjusting bolts must be turned outward by 3 graduations.
Turn the adjusting bolts by the amount corresponding with the 3 graduations.

2WD



4WD

AFA147

Front Wheel Alignment (Cont'd)

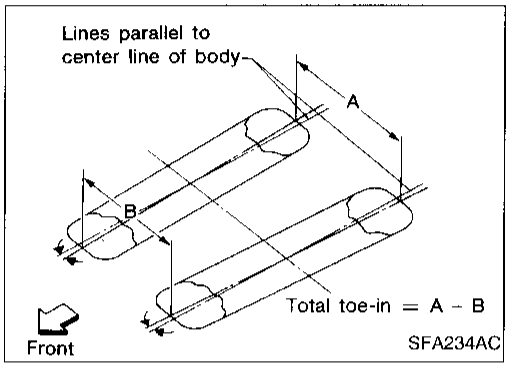
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

TOE-IN

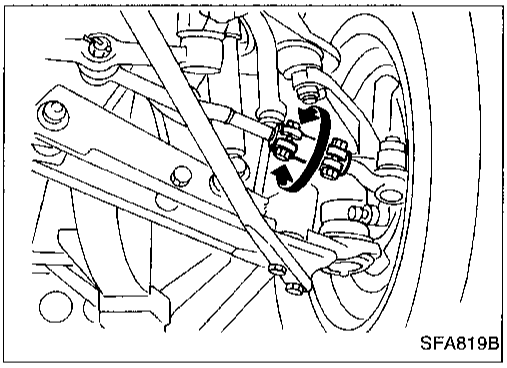
Measure toe-in using the following procedure.

WARNING:

- **Always perform the following procedure on a flat surface.**
- **Make sure that no one is in front of the vehicle before pushing it.**



1. Bounce front of vehicle up and down to stabilize the posture.
2. Push the vehicle straight ahead about 5 m (16 ft).
3. Put a mark on base line of the tread (rear side) of both tires at the same height of hub center. This mark is a measuring point.
4. Measure distance "A" (rear side).
5. Push the vehicle slowly ahead to rotate the wheels 180 degrees (1/2 turn).

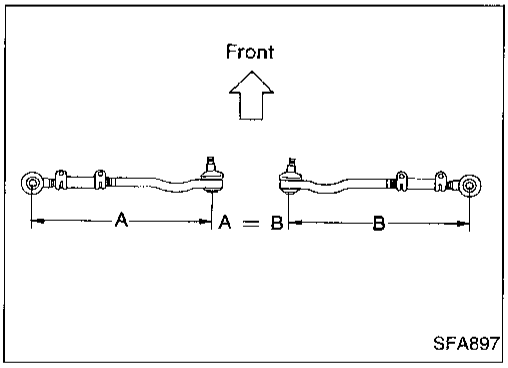


- **If the wheels have rotated more than 180 degrees (1/2 turn), try the above procedure again from the beginning. Never push vehicle backward.**

6. Measure distance "B" (front side).

Total toe-in:

Refer to SDS, FA-37.



7. Adjust toe-in by varying the length of both steering tie-rods.

a. Loosen clamp bolts or lock nuts.

b. Adjust toe-in by turning both the left and right tie-rod tubes equal amounts.

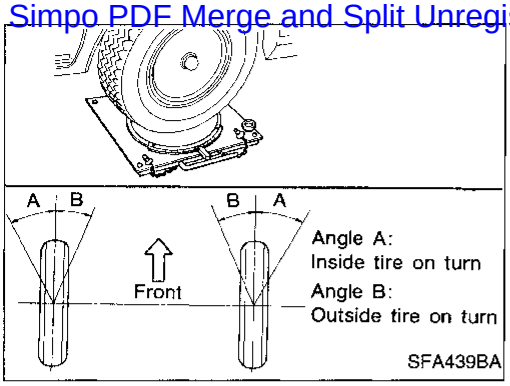
Make sure that the tie-rod bars are screwed into the tie-rod tube more than 35 mm (1.38 in).

Make sure that the tie-rods are the same length.

Standard length (A = B):

2WD

343.9 mm (13.54 in)



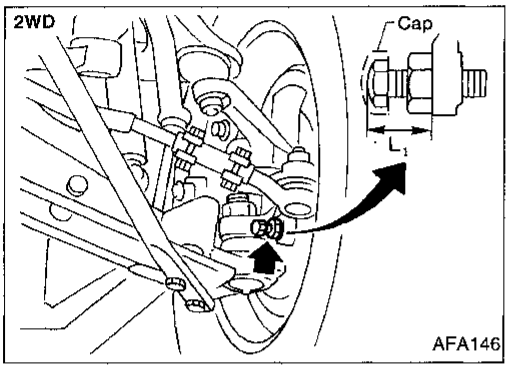
4WD

297.6 mm (11.72 in)

c. Tighten clamp bolts or lock nuts, then torque them.

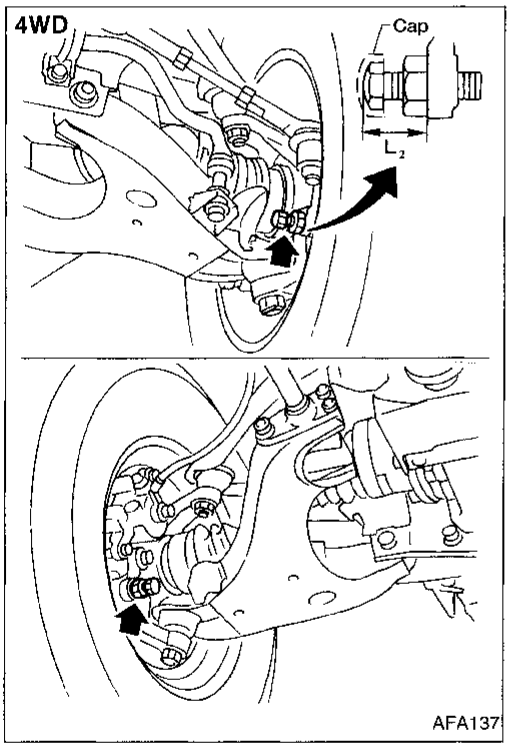
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Front Wheel Alignment (Cont'd)



FRONT WHEEL TURNING ANGLE

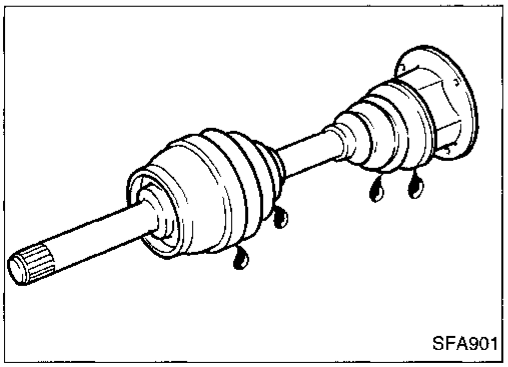
1. Set wheels in straight-ahead position. Then move vehicle forward until front wheels rest properly on turning radius gauge.
2. Rotate steering wheel all the way right and left; measure turning angle.



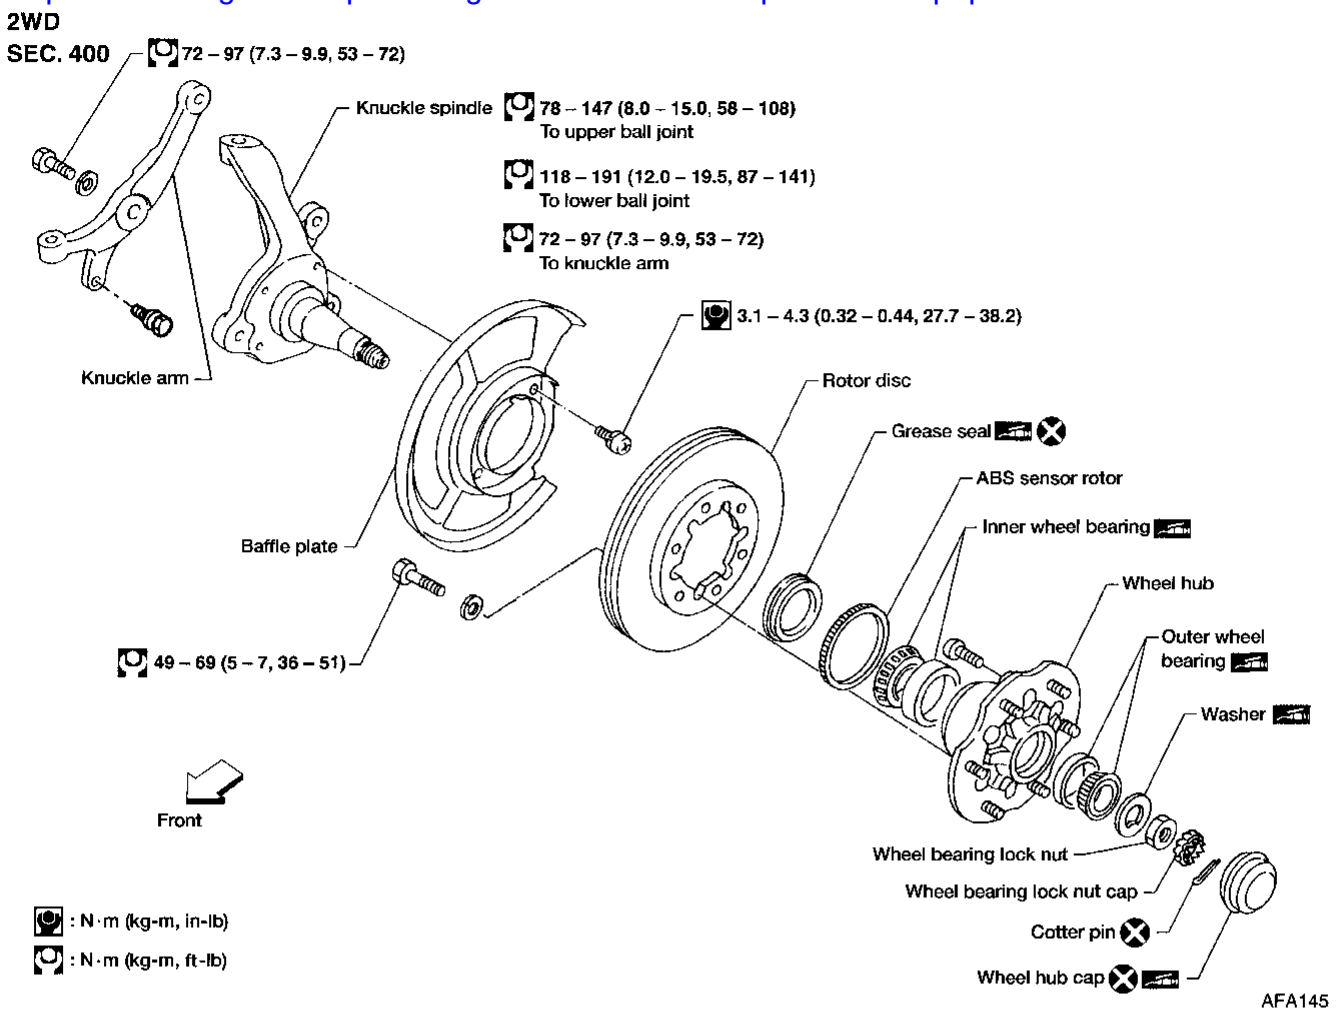
- On power steering models, turn steering wheel to full lock and apply force (at circumference of steering wheel) of 98 to 147 N (10 to 15 kg, 22 to 33 lb) with engine at idle.
- **Do not hold the steering wheel at full lock for more than 15 seconds.**

Wheel turning angle (Full turn):
Refer to SDS, FA-37.

3. Adjust stopper bolt if necessary.

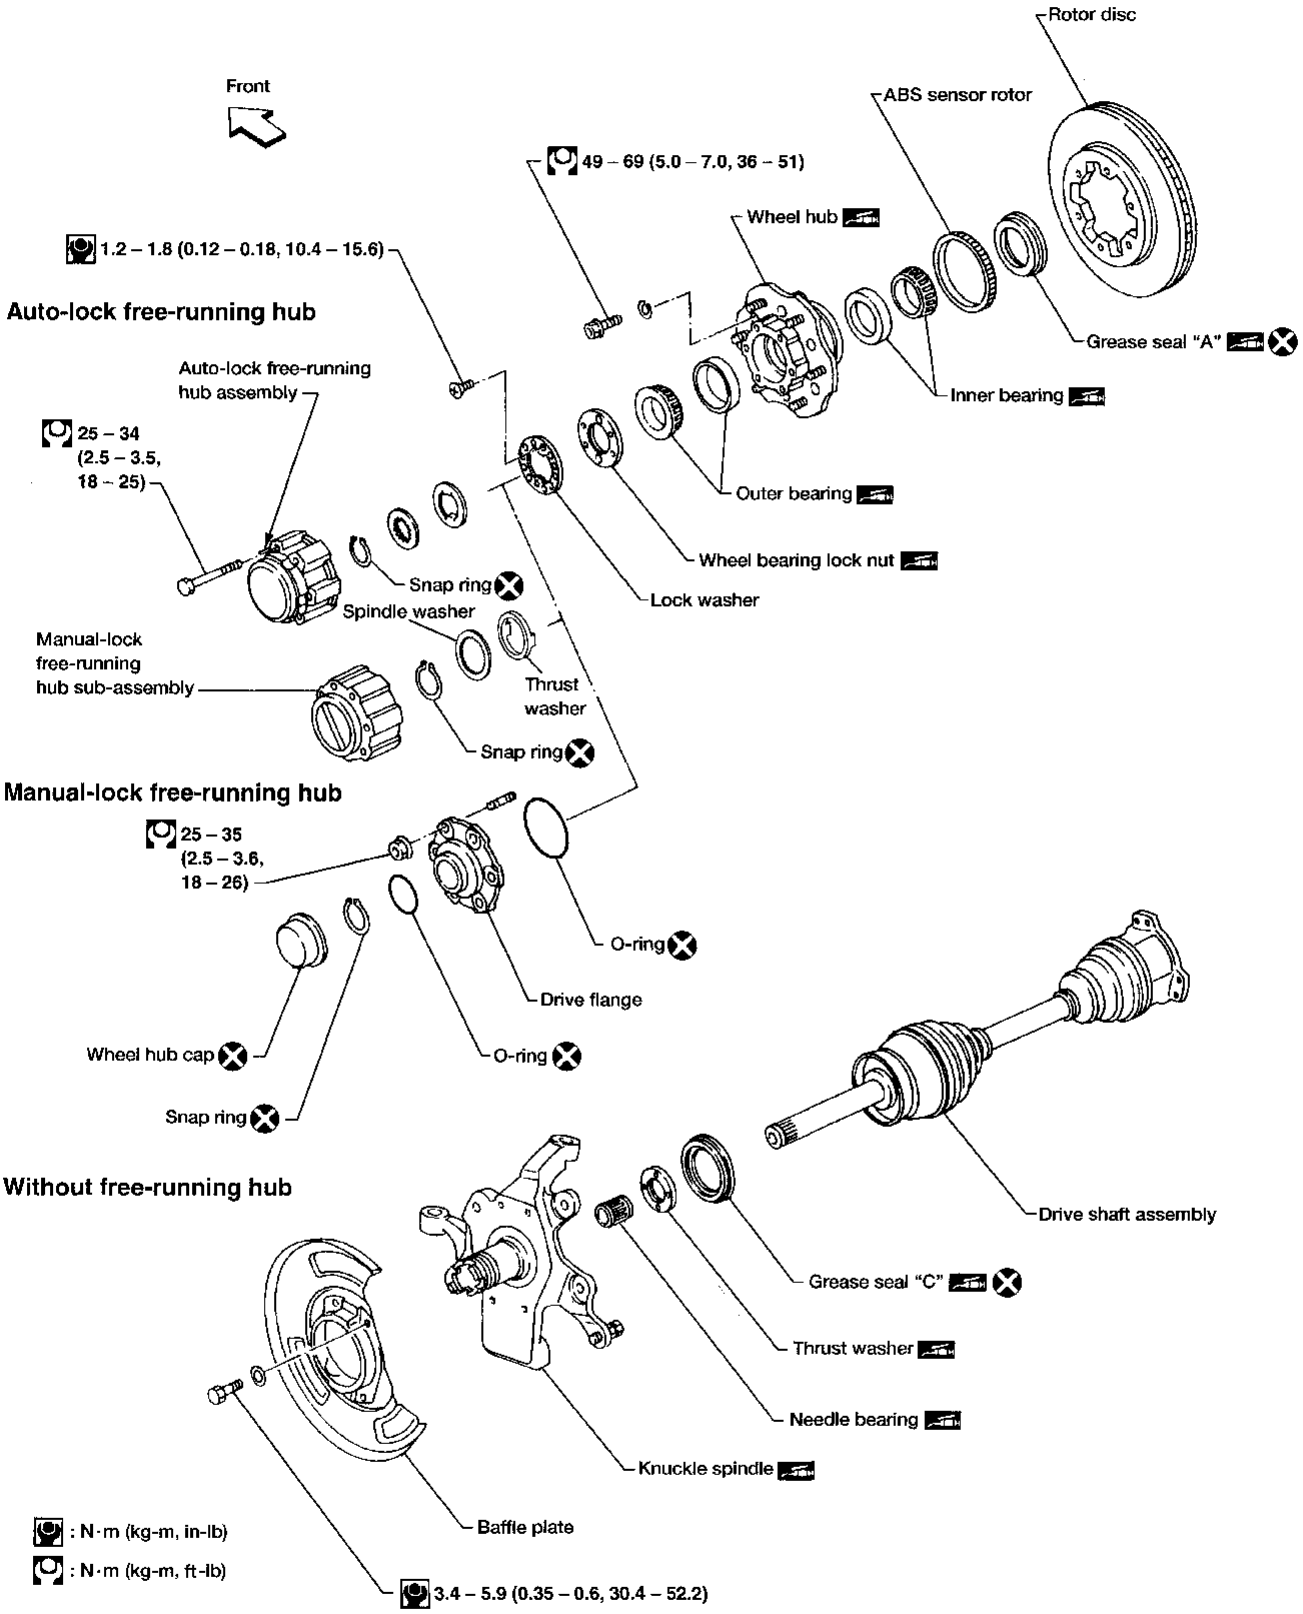


Standard length "L_1" (2WD):
20 mm (0.79 in)
(Length before cap is mounted)



Standard length "L_2" (4WD):
26.5 mm (1.043 in)
(Length before cap is mounted)

Drive Shaft



- Check for grease leakage and damage.

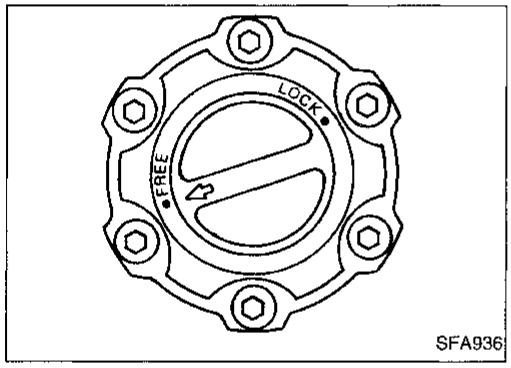
SEC. 391 • 400



AFA144

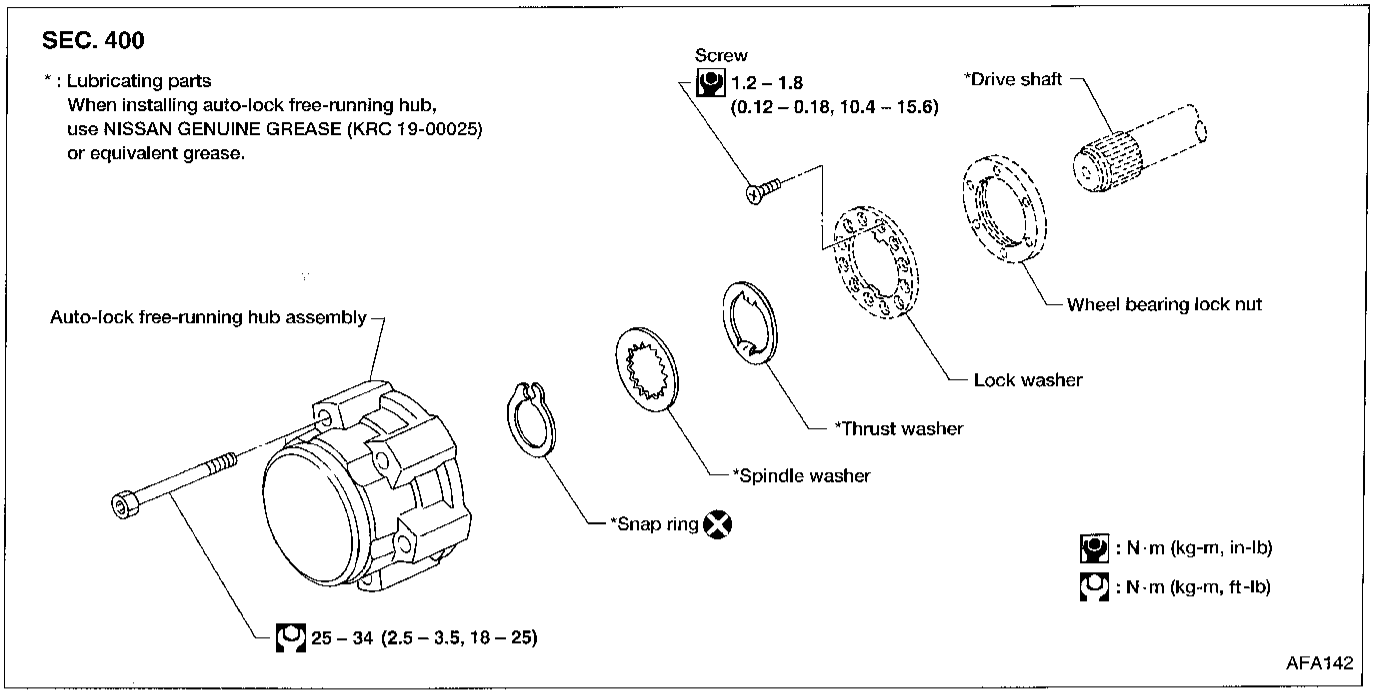
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Manual-lock Free-running Hub — 4WD —

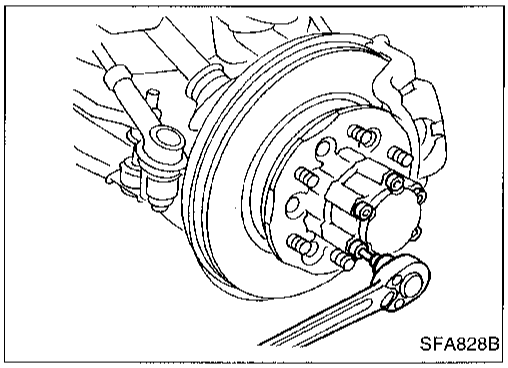
REMOVAL AND INSTALLATION

1. Set knob of manual-lock free-running hub in the FREE position.
2. Remove manual-lock free-running hub.
3. When installing manual-lock free-running hub, make sure the hub is in the FREE position.

Apply multi-purpose grease to the parts shown in the above illustration.



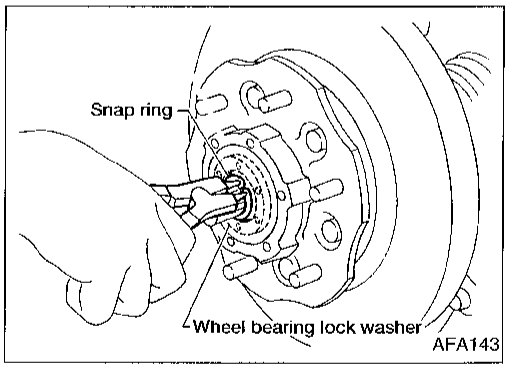
4. Check operation of manual-lock free-running hub after installation.



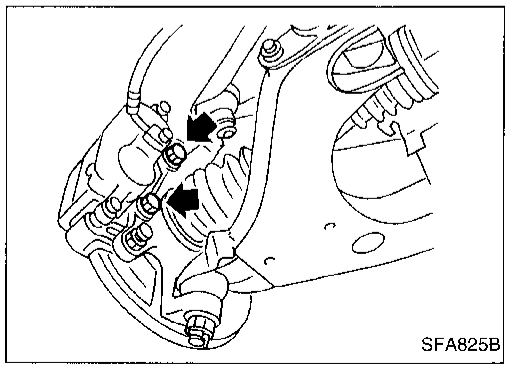
INSPECTION

- Check that the knob moves smoothly and freely.
- Check that the clutch moves smoothly in the body.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Auto-lock Free-running Hub — 4WD —



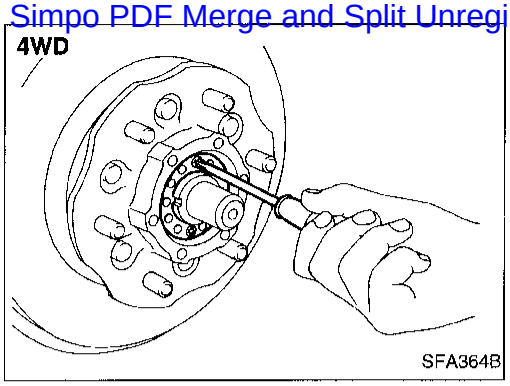
REMOVAL AND INSTALLATION

1. Set auto-lock free-running hub in the FREE position.
2. Remove auto-lock free-running hub.

3. Remove snap ring.
4. Remove spindle washer and thrust washer.
5. After installing auto-lock free-running hub, check operation.

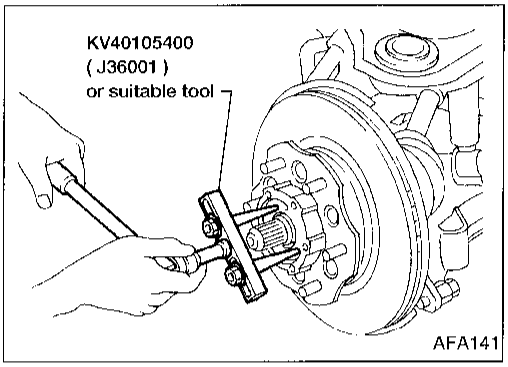
When installing it, apply recommended grease to the parts shown in the above illustration.

Wheel Hub and Rotor Disc



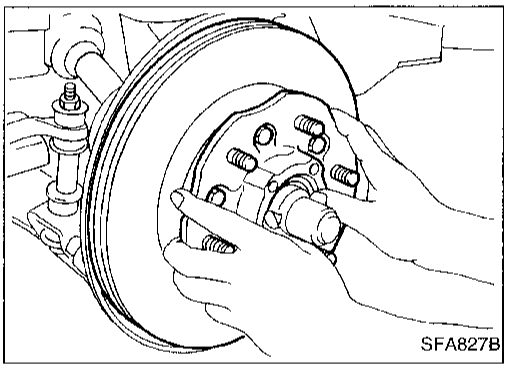
REMOVAL AND INSTALLATION

1. Remove free-running hub assembly. — 4WD — Refer to "Auto-lock Free-running Hub — 4WD —", FA-17, or "Manual-lock Free-running Hub — 4WD —", FA-16.
2. Remove brake caliper assembly without disconnecting hydraulic line.



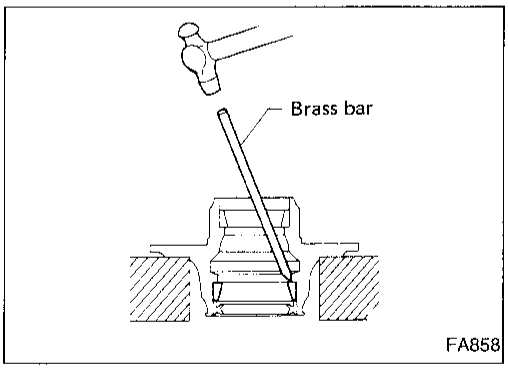
Be careful not to depress brake pedal, or piston will pop out. Make sure brake hose is not twisted.

Wheel Hub and Rotor Disc (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

3. Remove lock washer. — 4WD —



4. Remove wheel bearing lock nut.
   2WD: With suitable tool
   4WD: With Tool

5. Remove wheel hub and wheel bearing.

Be careful not to drop outer bearing.

6. After installing wheel hub and wheel bearing, adjust wheel bearing preload.
   Refer to "PRELOAD ADJUSTMENT", "Front Wheel Bearing", "ON-VEHICLE SERVICE", FA-7.

DISASSEMBLY

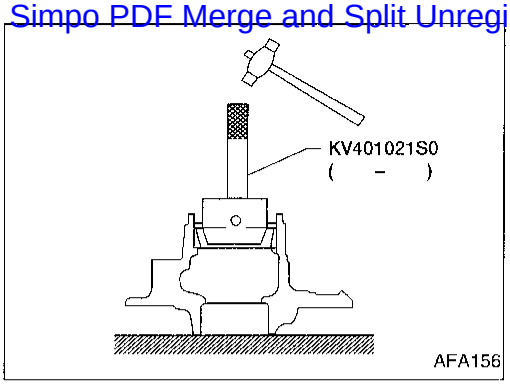
- Remove bearing outer races with suitable brass bar.

INSPECTION

Thoroughly clean wheel bearings and wheel hub.

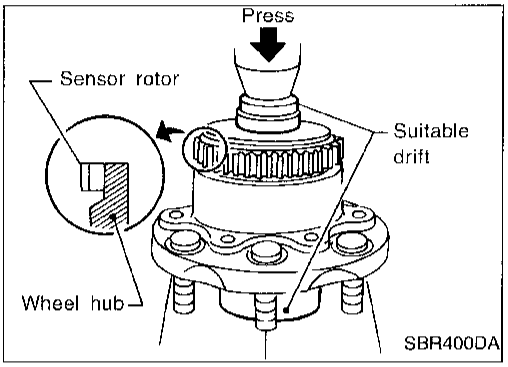
Wheel bearings

- Make sure wheel bearings roll freely and are free from noise, cracks, pitting and wear.



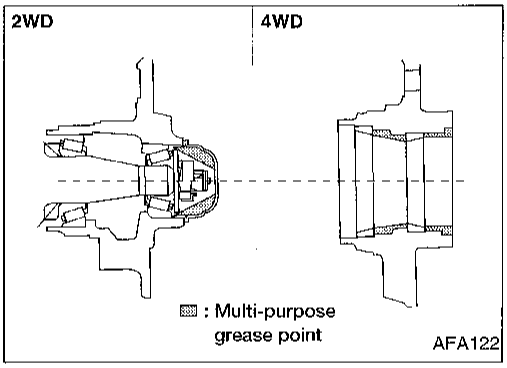
Wheel hub

- Check wheel hub for cracks by using a magnetic exploration or dyeing test.

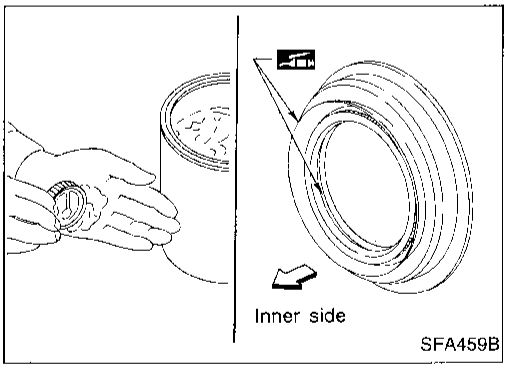


Wheel Hub and Rotor Disc (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

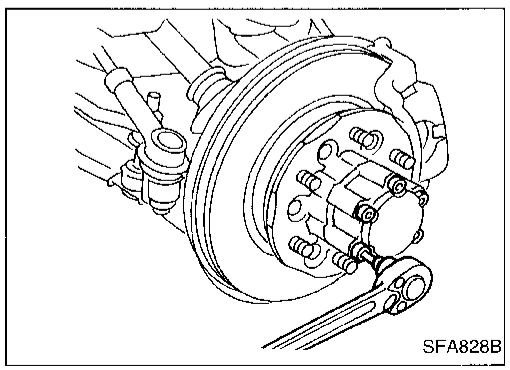


ASSEMBLY



1. Install bearing outer race with Tool until it seats in hub.

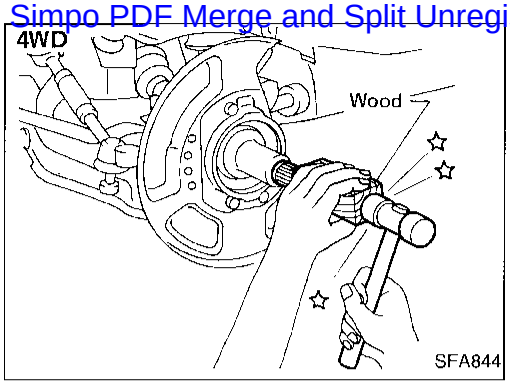
2. Install the sensor rotor using suitable drift and press. (Models with ABS)
   Always replace sensor rotor with new one.
   Pay attention to the direction of front sensor rotor as shown in figure.



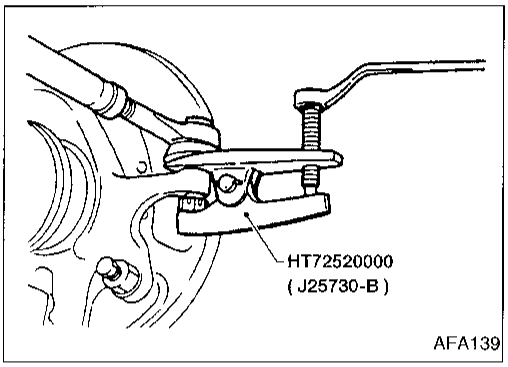
3. Pack multi-purpose grease in wheel hub and hub cap.

4. Apply multi-purpose grease to each bearing cone.
5. Pack grease seal lip with multi-purpose grease, then install it into wheel hub with suitable drift.

Knuckle Spindle



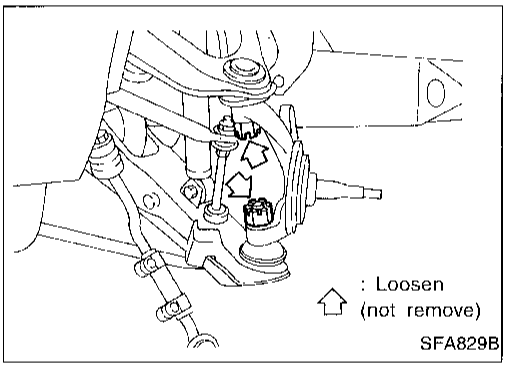
REMOVAL



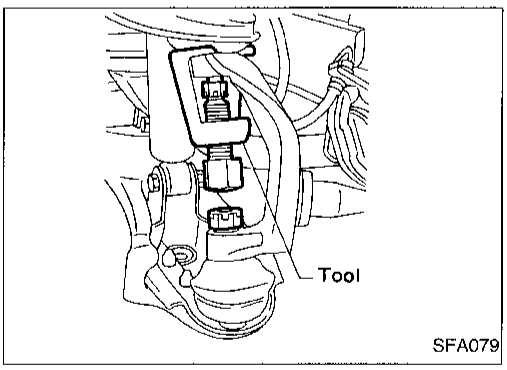
1. Remove free-running hub assembly. — 4WD —
   Refer to "Auto-lock Free-running Hub — 4WD —", FA-17, or "Manual-lock Free-running Hub — 4WD —", FA-16.
2. Remove wheel hub and rotor disc.
   Refer to "Wheel Hub and Rotor Disc", FA-17.

Knuckle Spindle (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

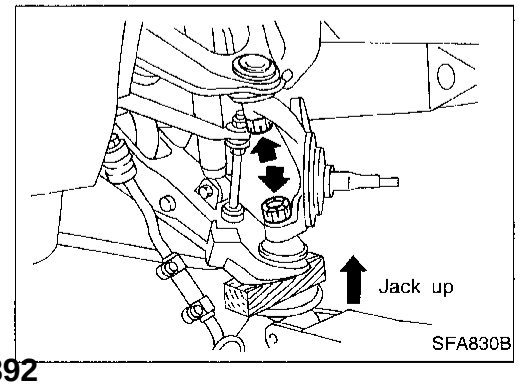


3. Separate drive shaft from knuckle spindle by slightly tapping drive shaft end. — 4WD —



4. Separate tie-rod from knuckle spindle with Tool.

Install stud nut conversely on stud bolt so as not to damage stud bolt.



5. Separate knuckle spindle from ball joints.
a. Loosen (do not remove) upper and lower ball joint tightening nuts.

b. Separate knuckle spindle from upper and lower ball joint studs with Tool.

During above operation, never remove ball joint nuts which are loosened in step (a) above.

Tool:
2WD
ST29020001 (J24319-01)
4WD
HT72520000 (J25730-B)

c. Remove ball joint tightening nuts.

Support lower link with jack.

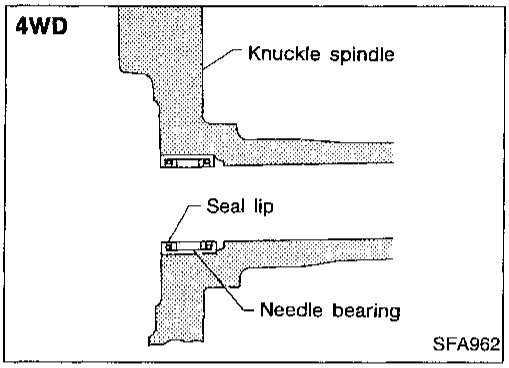
d. Remove knuckle spindle from upper and lower links.

INSPECTION

Knuckle spindle

- Check knuckle spindle for deformation, cracks and other damage by using a magnetic exploration or dyeing test.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

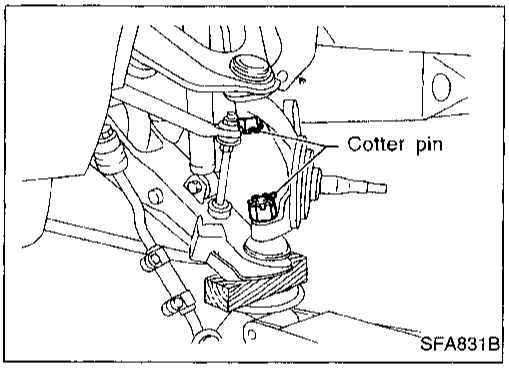


Knuckle Spindle (Cont'd)

Bearing spacer — 2WD —

- Check bearing spacer for damage.

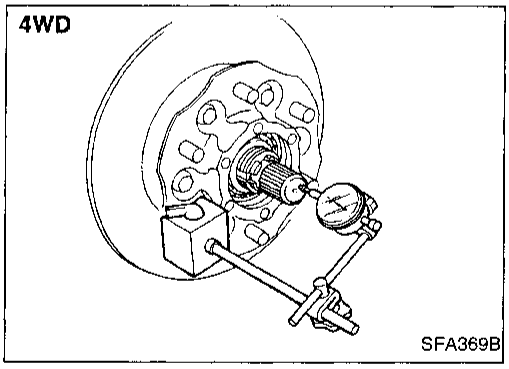
Needle bearing — 4WD —



- Check needle bearing for wear, scratches, pitting, flaking and burn marks.

INSTALLATION

1. Install needle bearing into knuckle spindle. — 4WD —

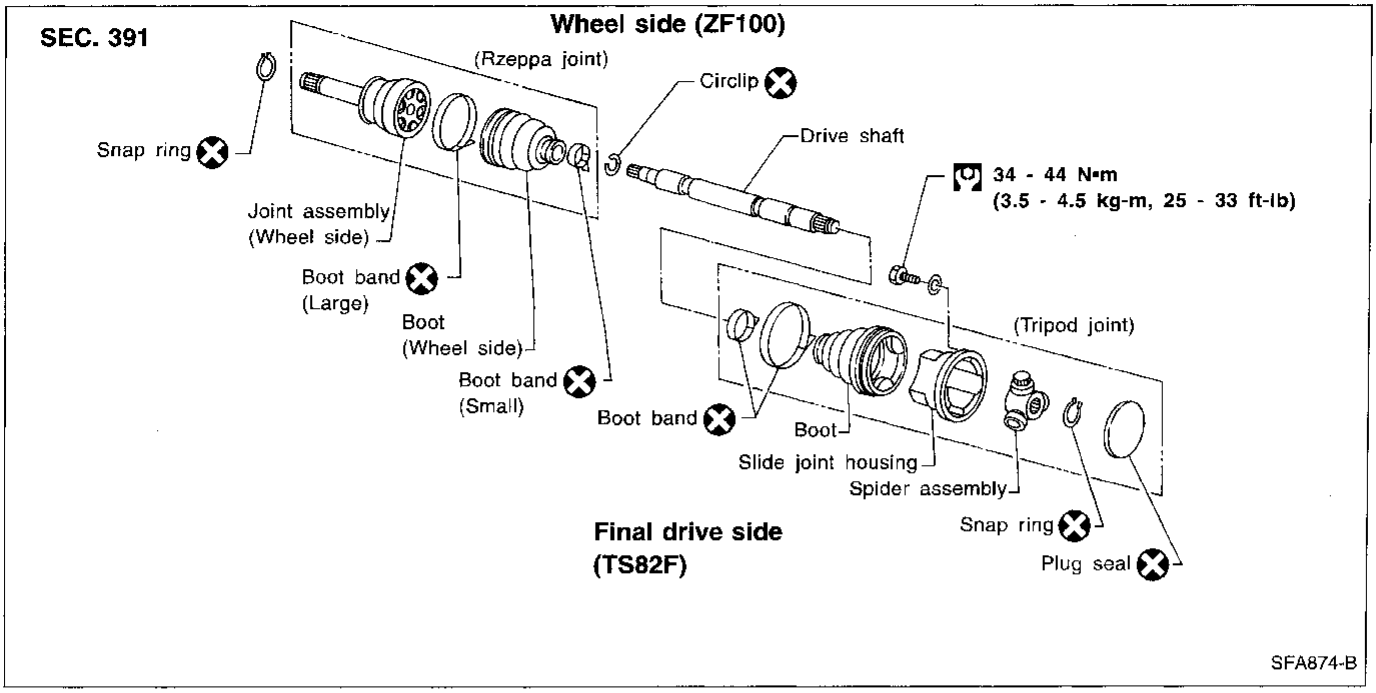


Make sure that needle bearing is facing in the proper direction.
Apply multi-purpose grease.

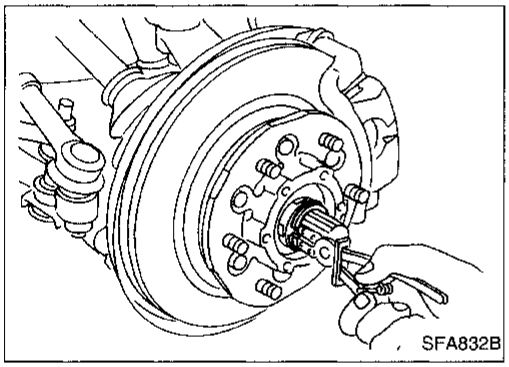
2. Install knuckle spindle to upper and lower ball joints with lower link jacked up.

CAUTION:
Make sure that oil and grease do not come into contact with tapered areas of ball joint, knuckle spindle and threads of ball joint.

3. Connect tie-rod to knuckle spindle.



4. After installing knuckle spindle, adjust wheel bearing preload. Refer to "PRELOAD ADJUSTMENT", "Front Wheel Bearing", "ON-VEHICLE SERVICE", FA-7.
5. After installing drive shaft, check drive shaft axial end play.

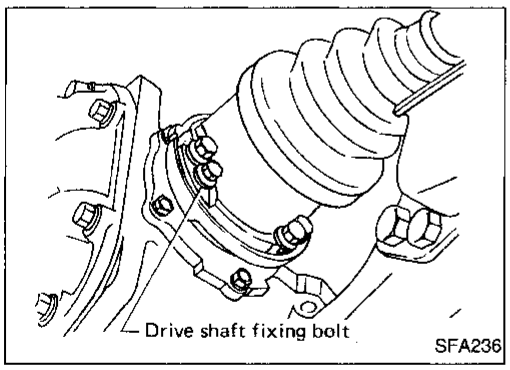


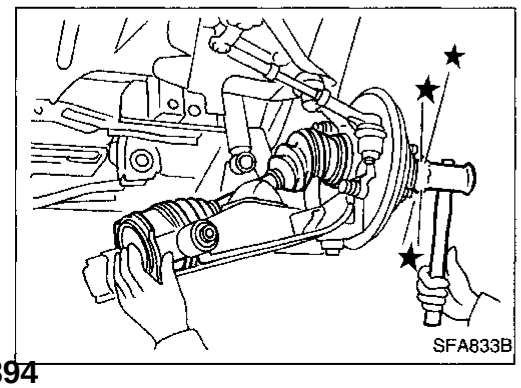
Do not reuse snap ring once it has been removed.

Refer to "Drive Shaft — 4WD —", FA-22.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Drive Shaft — 4WD —

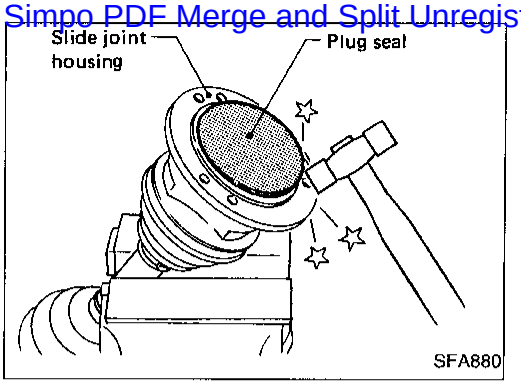




REMOVAL

1. Remove free-running hub or drive flange and snap ring. Refer to "Auto-lock Free-running Hub — 4WD —", FA-17, or "Manual-lock Free-running Hub — 4WD —", FA-16.
2. Remove torsion bar spring. Refer to "Torsion Bar Spring", "FRONT SUSPENSION", FA-29.
3. Remove shock absorber lower fixing bolt.
4. Remove lower link, fixing bolts.

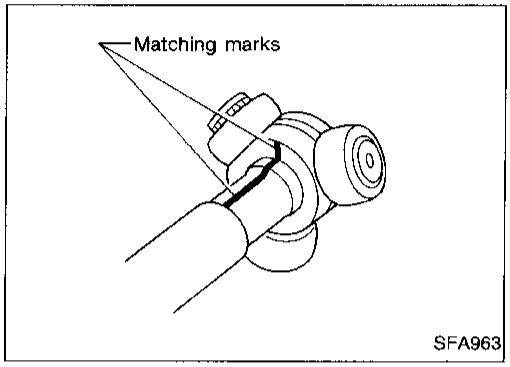
Support lower link with jack.



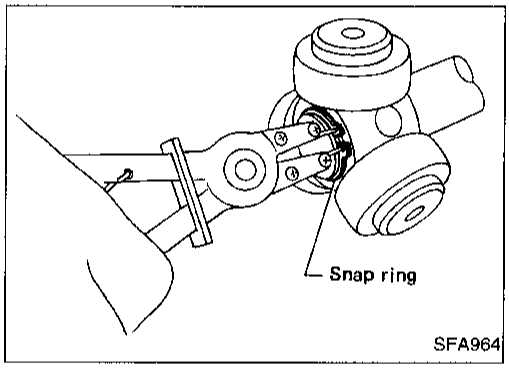
5. Remove bolts fixing drive shaft to final drive.

6. Separate drive shaft from knuckle spindle by slightly tapping end of drive shaft.

Drive Shaft — 4WD — (Cont'd)

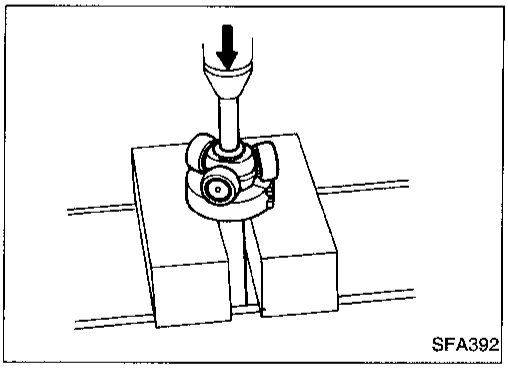


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

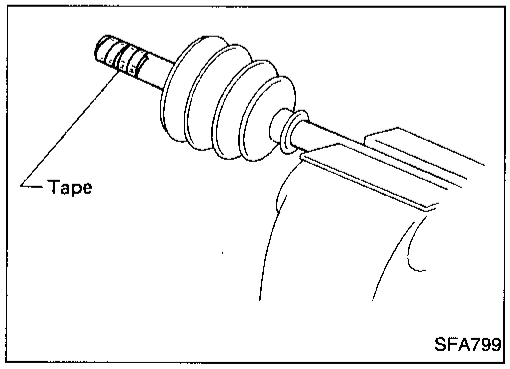


DISASSEMBLY

Final drive side (TS82F)



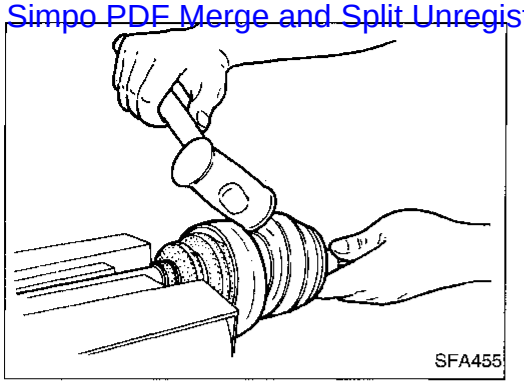
1. Remove plug seal from slide joint housing by lightly tapping around slide joint housing.
2. Remove boot bands.



3. Move boot and slide joint housing toward wheel side, and put matching marks.

4. Remove snap ring.

5. Detach spider assembly with press.



6. Draw out boot.

Cover drive shaft serration with tape to prevent damaging the boot.

Drive Shaft — 4WD — (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Wheel side (ZF100)

CAUTION:

The joint on the wheel side cannot be disassembled.

- Before separating joint assembly, put matching marks on drive shaft and joint assembly.
- Separate joint assembly with suitable tool.

Be careful not to damage threads on drive shaft.

- Remove boot bands.

INSPECTION

Thoroughly clean all parts in cleaning solvent, and dry with compressed air. Check parts for evidence of deformation and other damage.

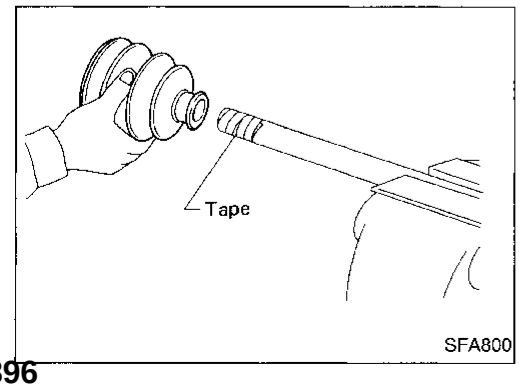
Drive shaft

Replace drive shaft if it is twisted or cracked.

Boot

Check boot for fatigue, cracks and wear. Replace boot with new boot bands.

Joint assembly (Final drive side)



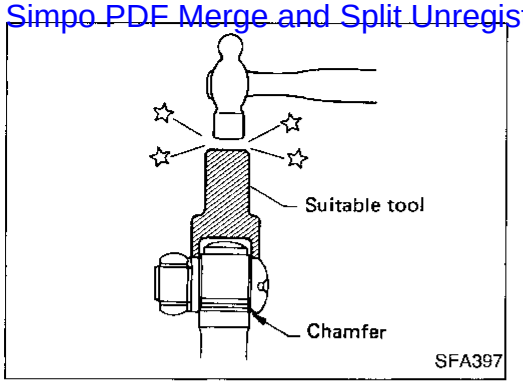
- Replace any parts of double offset joint which show signs of scorching, rust, wear or excessive play.
- Check serration for deformation. Replace if necessary.
- Check slide joint housing for any damage. Replace if necessary.

Joint assembly (Wheel side)

Replace joint assembly if it is deformed or damaged.

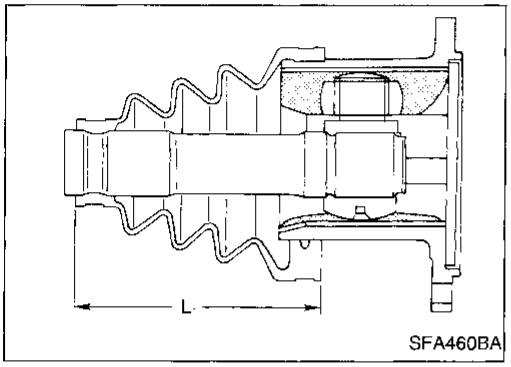
ASSEMBLY

- **After drive shaft has been assembled, ensure that it moves smoothly over its entire range without binding.**
- **Use NISSAN GENUINE GREASE or equivalent after every overhaul.**



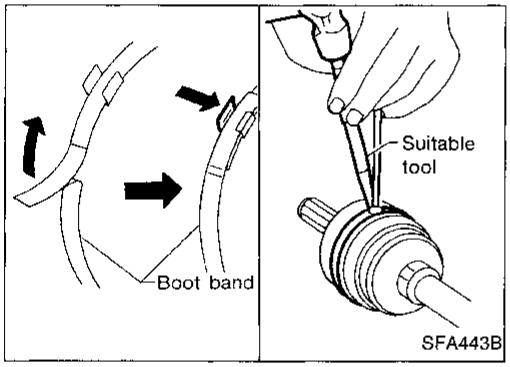
Final drive side (TS82F)

1. Install new small boot band, boot and side joint housing to drive shaft.



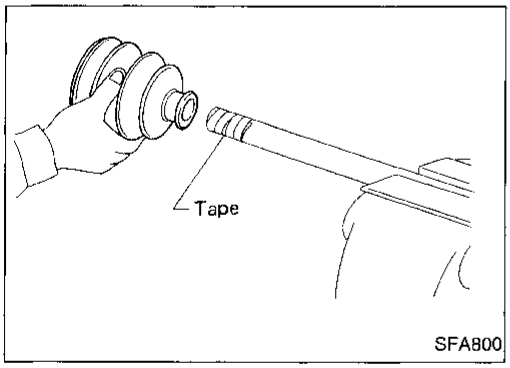
Cover drive shaft serration with tape to prevent damaging boot during installation.

Drive Shaft — 4WD — (Cont'd)



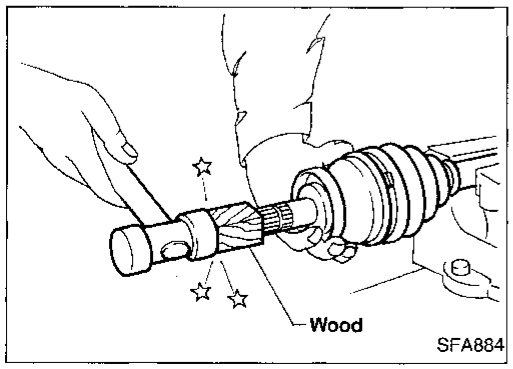
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

2. Install spider assembly securely, making sure marks are properly aligned.
   - **Press-fit with spider assembly serration chamfer facing shaft.**
3. Install new snap ring.



4. Pack with grease.
   Specified amount of grease:
   95 - 105 g (3.35 - 3.70 oz)
5. Make sure that the boot is properly installed on the drive shaft groove. Set the boot so that it does not swell or deform when its length is "L_1".
   Length "L_1": 95 - 97 mm (3.74 - 3.82 in)

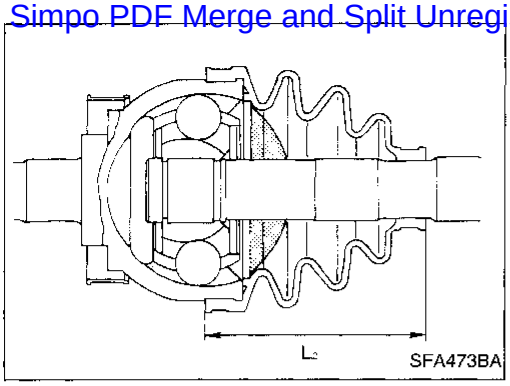
6. Lock new large boot band securely with a suitable tool, then lock new small boot band.
7. Install new plug seal to slide joint housing by lightly tapping it.



Apply sealant to mating surface of plug seal.

Wheel side (ZF100)

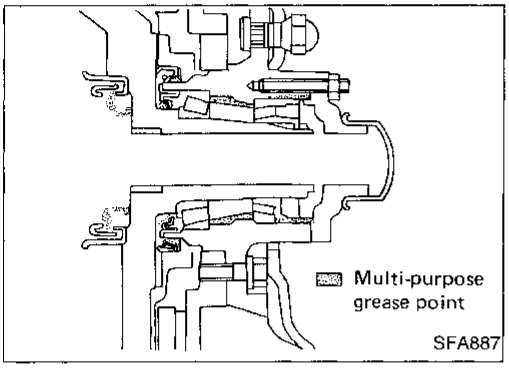
1. Install new small boot band and boot on drive shaft.



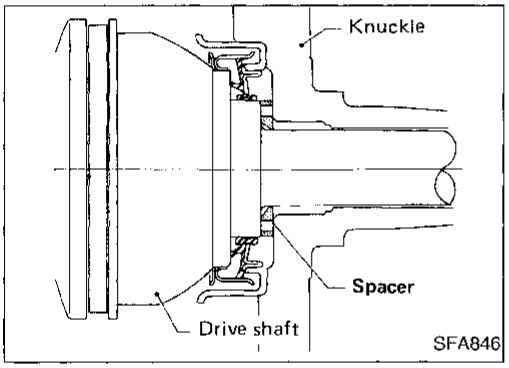
Cover drive shaft serration with tape to prevent damaging boot during installation.

2. Set joint assembly onto drive shaft by lightly tapping it. Install joint assembly securely, ensuring that marks which were made during disassembly are properly aligned.

Drive Shaft — 4WD — (Cont'd)



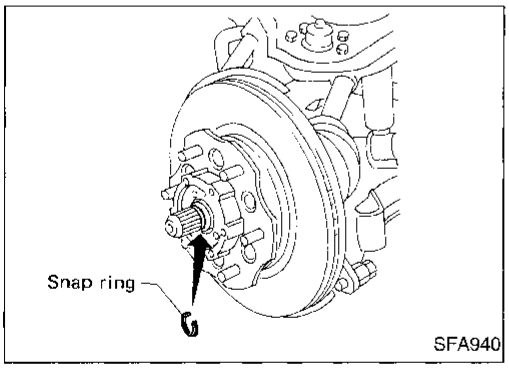
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



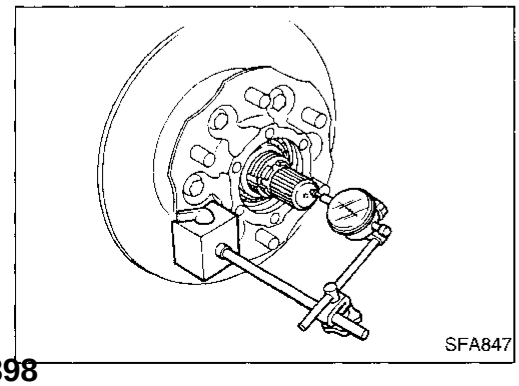
3. Pack drive shaft with specified amount of grease.
   Specified amount of grease:
   135 - 145 g (4.76 - 5.11 oz)
4. Make sure that the boot is properly installed on the drive shaft groove. Set the boot so that it does not swell or deform when its length is "L_2".
   Length "L_2": 96 - 98 mm (3.78 - 3.86 in)
5. Lock new large boot band securely with a suitable tool.
6. Lock new small boot band.

INSTALLATION

1. Apply multi-purpose grease.



2. Install bearing spacer onto drive shaft.

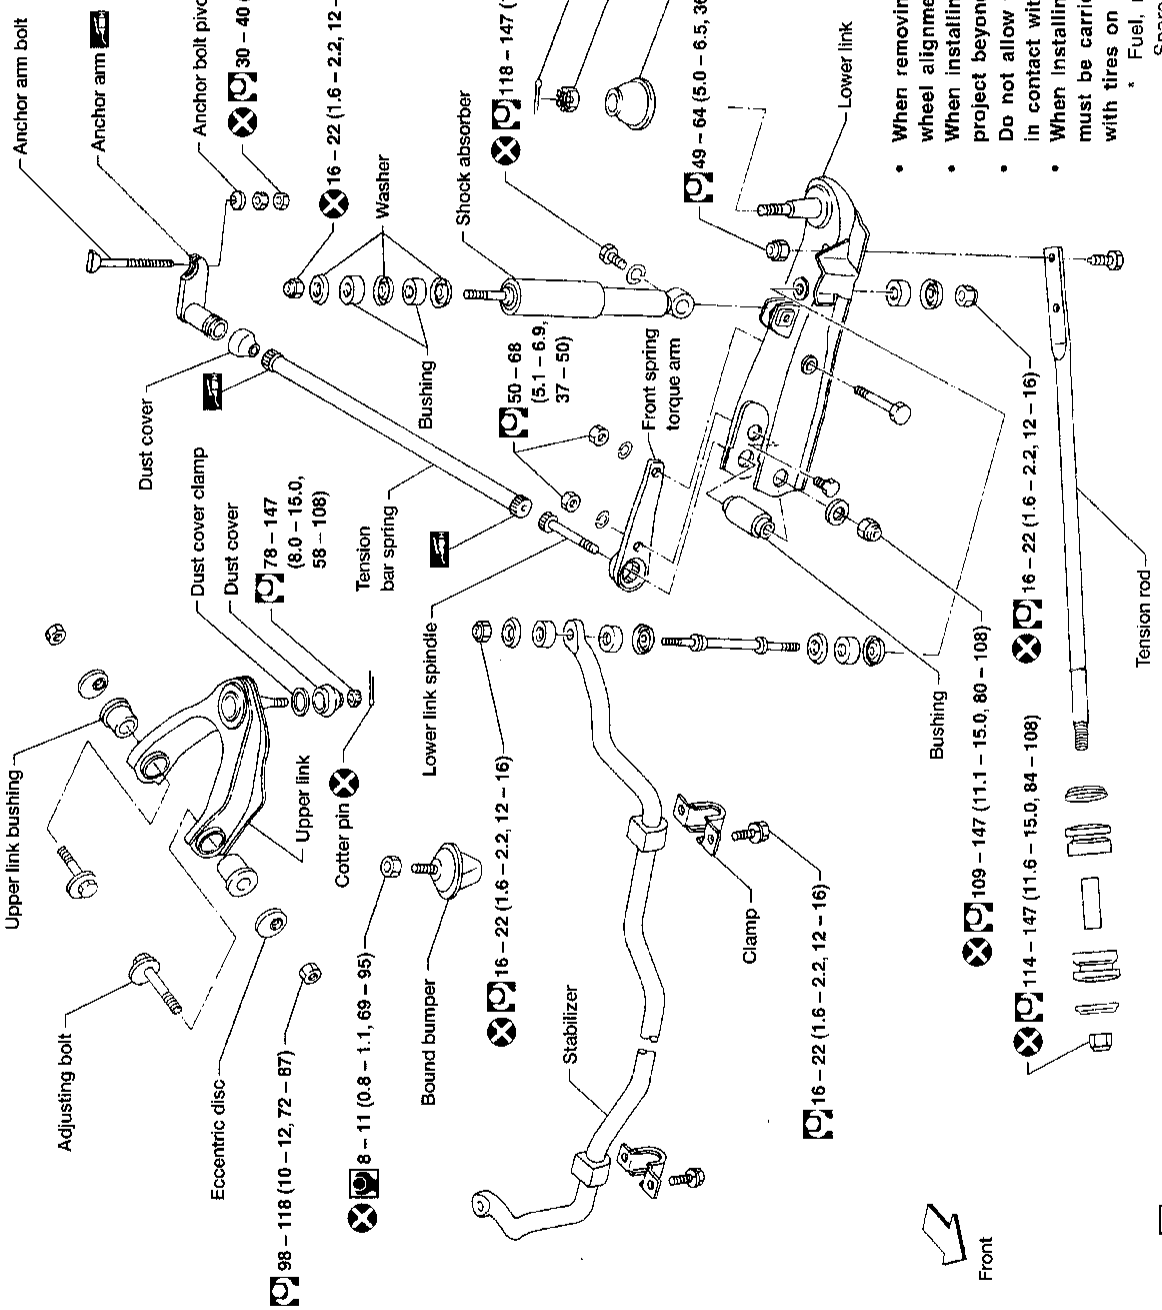


Make sure that the bearing spacer is facing in the proper direction.

3. After installing wheel hub and wheel bearing, adjust wheel bearing preload. Refer to "PRELOAD ADJUSTMENT", "Front Wheel Bearing", "ON-VEHICLE SERVICE", FA-7.

4. When installing drive shaft, adjust drive shaft axial end play by selecting a suitable snap ring.

a. Temporarily install new snap ring on drive shaft in the same thickness as it was installed before removal.



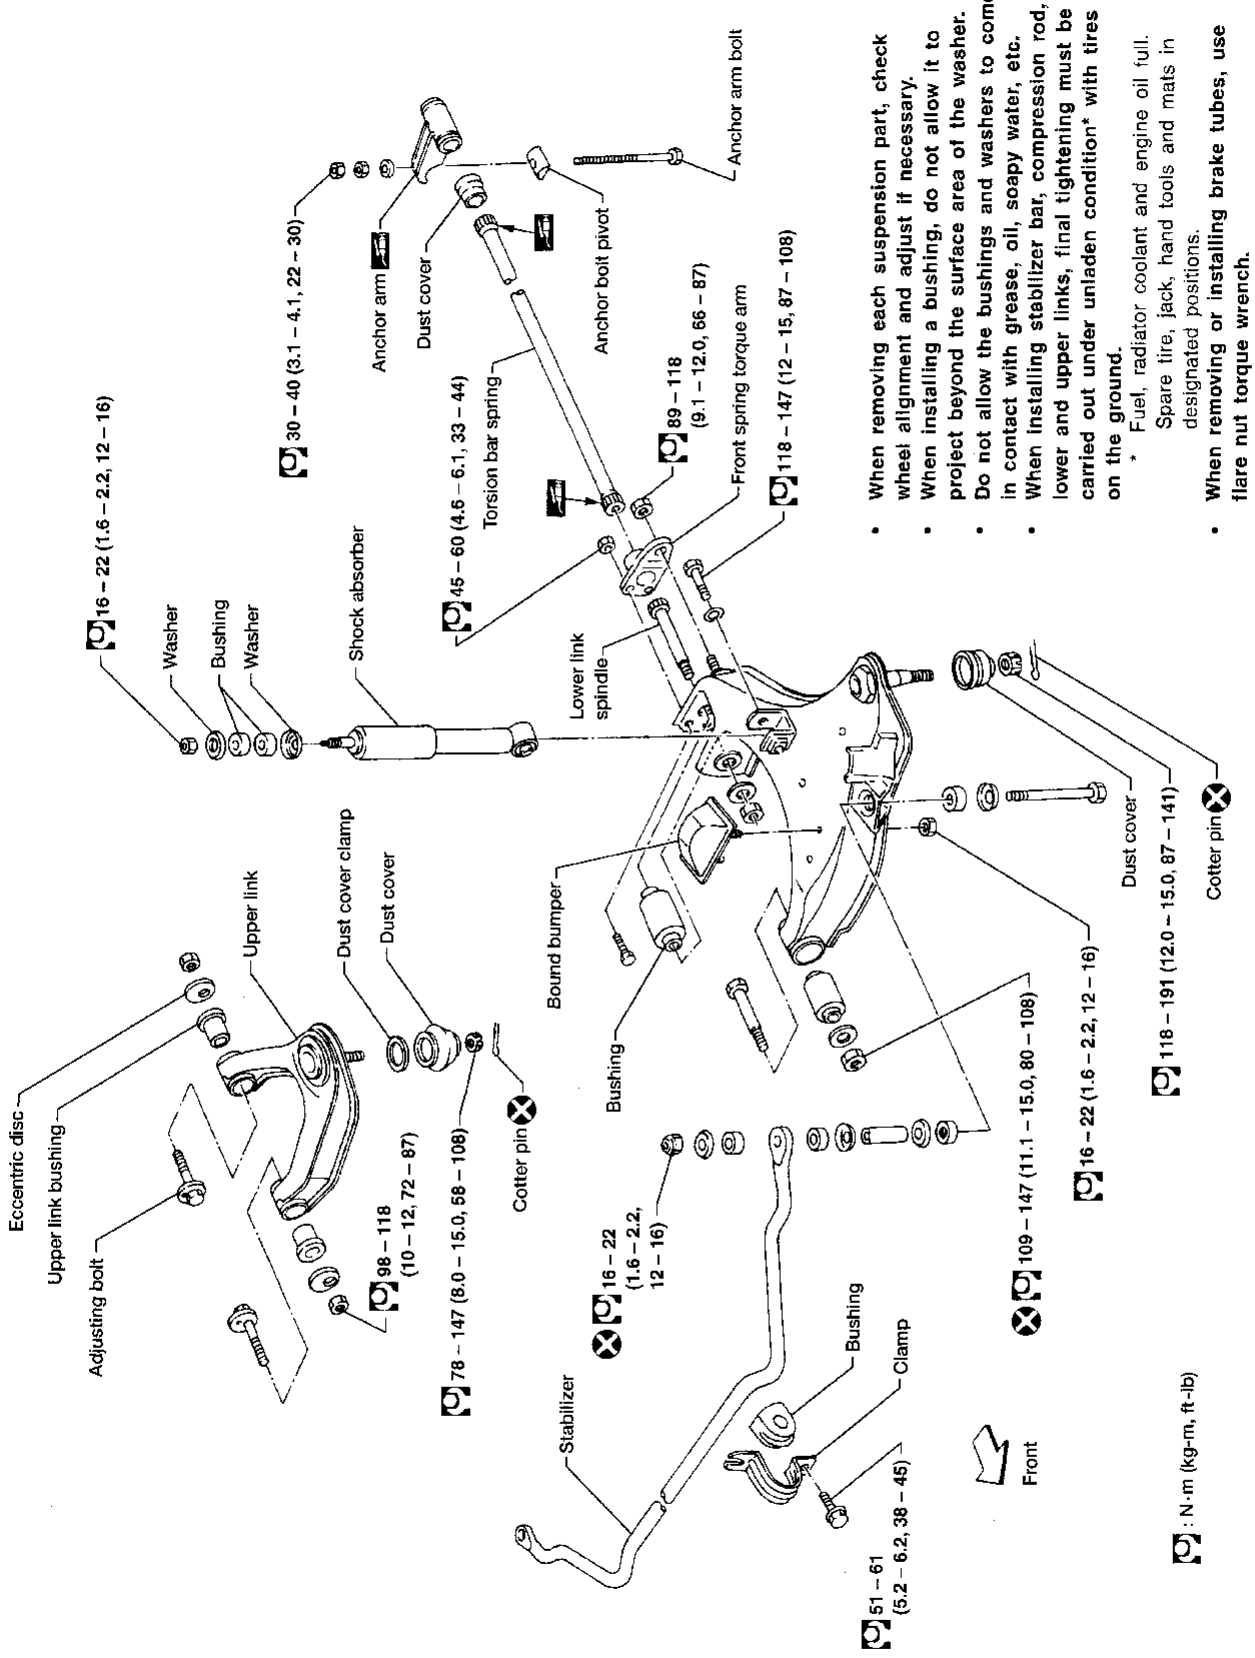
b. Set dial gauge on drive shaft end.
c. Measure axial end play of drive shaft.
   Axial end play:
   0.45 mm (0.0177 in) or less
d. If axial end play is not within the specified limit, select another snap ring.

1.1 mm (0.043 in)	**1.3 mm (0.051 in)**
1.5 mm (0.059 in)	**1.7 mm (0.067 in)**
1.9 mm (0.075 in)	**2.1 mm (0.083 in)**
2.3 mm (0.091 in)	

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

2WD

- When removing each suspension part, check wheel alignment and adjust if necessary.
- When installing a bushing, do not allow it to project beyond the surface area of the washer.
- Do not allow the bushings and washers to come in contact with grease, oil, soapy water, etc.
- When installing rubber parts, final tightening must be carried out under unladen condition* with tires on the ground.
  * Fuel, radiator coolant and engine oil full. Spare tire, jack, hand tools and mats in designated positions.
- When removing or installing brake tubes, use flare nut torque wrench.



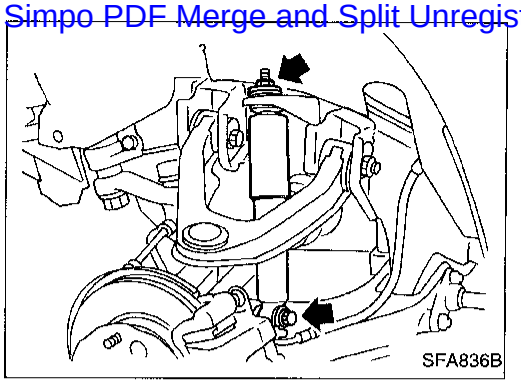
SEC. 400

AFA150

899

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

4WD



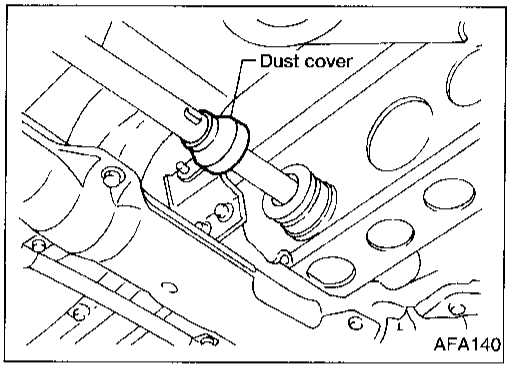
- When removing each suspension part, check wheel alignment and adjust if necessary.
- When installing a bushing, do not allow it to project beyond the surface area of the washer.
- Do not allow the bushings and washers to come in contact with grease, oil, soapy water, etc.
- When installing stabilizer bar, compression rod, lower and upper links, final tightening must be carried out under unladen condition* with tires on the ground.
  * Fuel, radiator coolant and engine oil full. Spare tire, jack, hand tools and mats in designated positions.
- When removing or installing brake tubes, use flare nut torque wrench.

SEC. 401

AFA149

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Shock Absorber



REMOVAL AND INSTALLATION

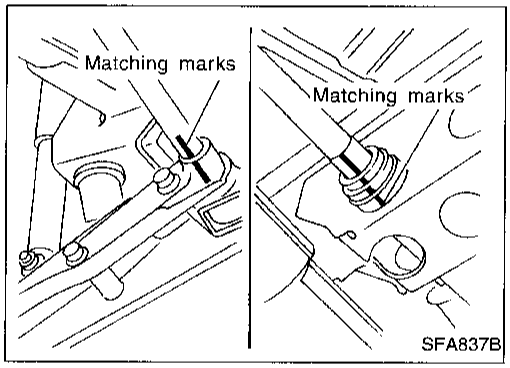
1. Support lower link with jack.
2. Remove bolt and nut that hold shock absorber.

INSPECTION

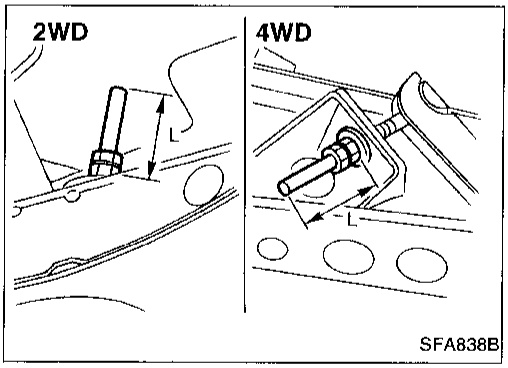
Except for nonmetallic parts, clean all parts with suitable solvent and dry with compressed air.
Use compressed air to blow dirt and dust off of nonmetallic parts.

- Check for oil leakage and cracks. Replace if necessary.
- Check piston rod for cracks, deformation and other damage. Replace if necessary.
- Check rubber parts for wear, cracks, damage and deformation. Replace if necessary.

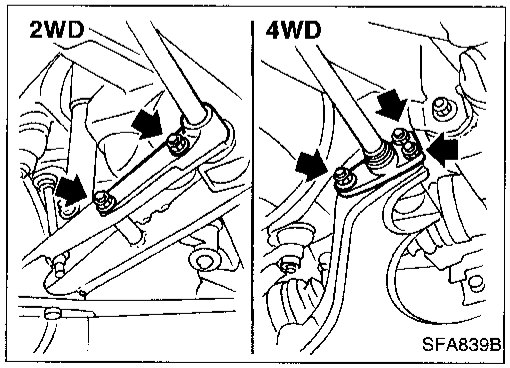
Torsion Bar Spring



REMOVAL



1. Move dust cover.
2. Paint matching marks on the torsion bar spring and the corresponding arm.

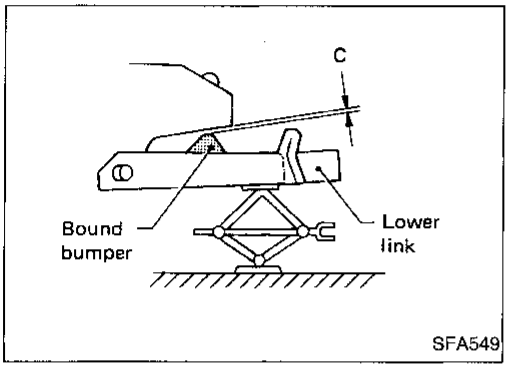


Always use paint to place the matching mark; do not scribe the affected parts.

3. Measure anchor bolt protrusion "L" and remove the lock nut and adjusting nut.

Before removing the nuts, ensure that twisting force is eliminated from the torsion bar springs.

4. Remove torsion bar spring.

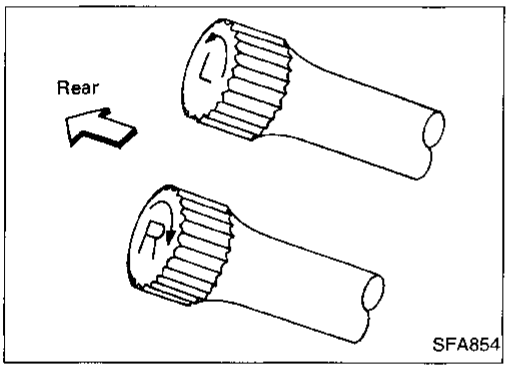


- Pull out anchor arm rearward, then withdraw torsion bar spring rearward. — 2WD —
- Remove torque arm. — 2WD —
- Remove torque arm fixing nuts, then withdraw torsion bar spring forward with torque arm. — 4WD —

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

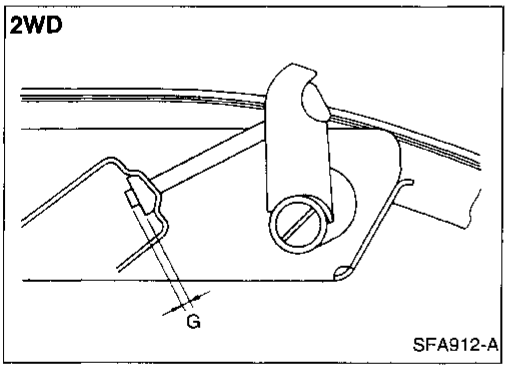
Torsion Bar Spring (Cont'd)

INSPECTION



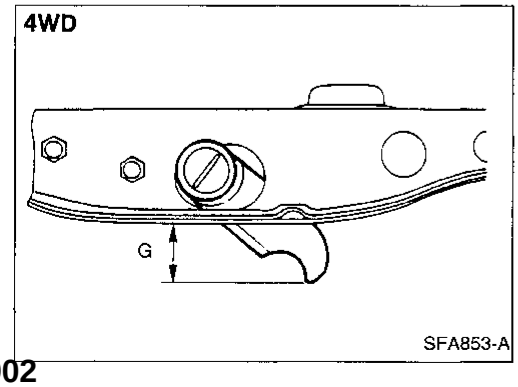
- Check torsion bar spring for wear, twist, bend and other damage.
- Check serrations of each part for cracks, wear, twist and other damage.
- Check dust cover for cracks.

INSTALLATION AND ADJUSTMENT



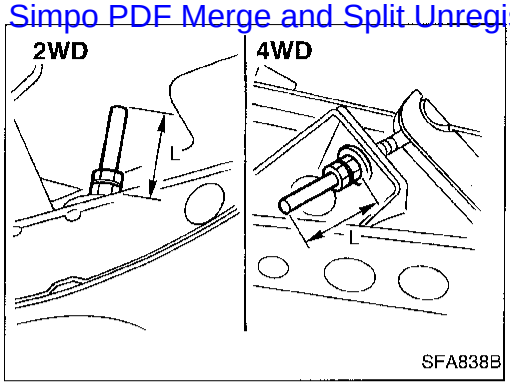
Adjustment of anchor arm adjusting nut is in tightening direction only.
Do not adjust by loosening anchor arm adjusting nut.

1. Install torque arm to lower link. — 2WD —
2. Coat multi-purpose grease on the serration of torsion bar spring.
3. Place lower link in the position where bound bumper clearance "C" is 0.
   Clearance "C": 0 mm (0 in)

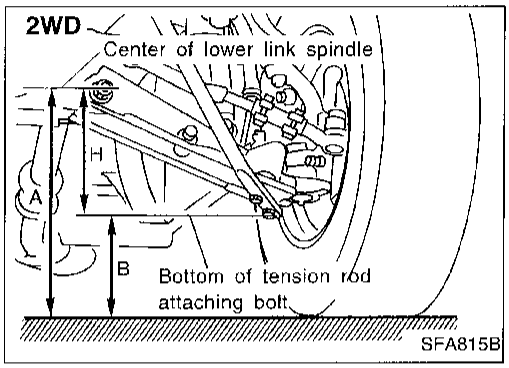


4. Install torsion bar spring. — 2WD —
   Install torsion bar spring with torque arm. — 4WD —

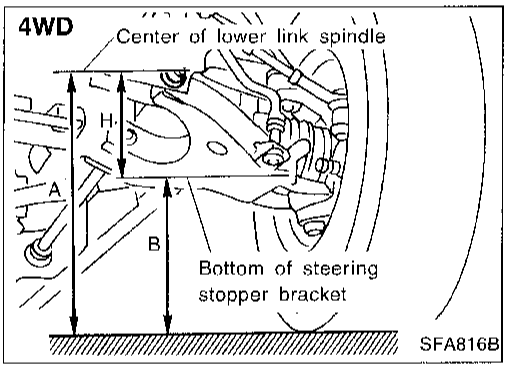
Be sure to install right and left torsion bar springs correctly.



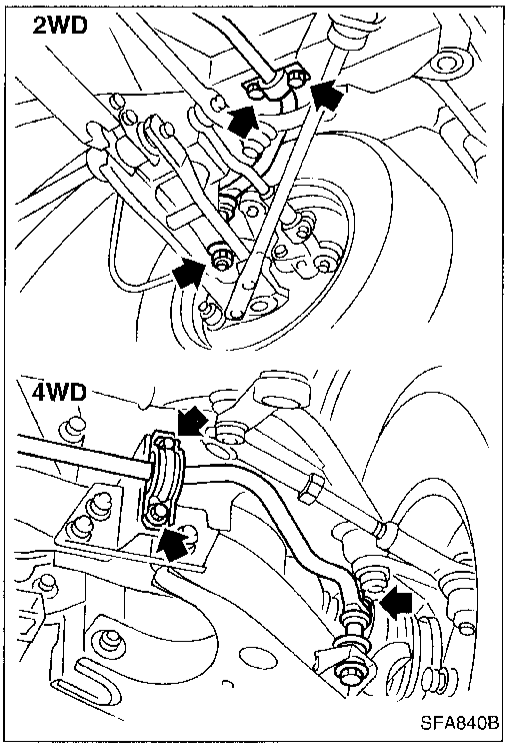
5. While aligning the anchor arm with the matching mark, install the anchor arm to the torsion bar spring.
   If a new torsion bar spring or anchor arm is installed, adjust anchor arm length to the dimension indicated in the figure at the left.
   Standard length "G":
   2WD
   6 - 18 mm (0.24 - 0.71 in)
   4WD
   25 - 39 mm (0.98 - 1.54 in)



Torsion Bar Spring (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



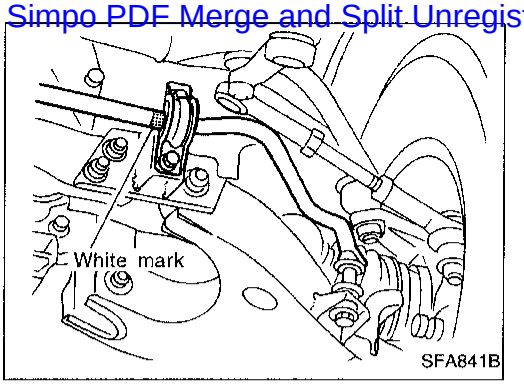
6. Tighten the adjusting nut so the torsion bar length corresponds with dimension "L" previously measured during torsion bar removal. Tighten the lock nut to specifications.
   If a new torsion bar spring or anchor arm is installed, tighten the adjusting nut to the dimension indicated in the figure at the left, then tighten the lock nut to specifications.
   Standard length "L":
   2WD
   54 mm (2.13 in)
   4WD
   70 mm (2.76 in)

7. Bounce vehicle with tires on ground (Unladen) to eliminate friction of suspension.
8. Measure vehicle posture "H".
a. Exercise the front suspension by bouncing the front of the vehicle 4 or 5 times to ensure that the vehicle is in a neutral height attitude.
b. Measure vehicle posture ... Dimension "H".
   H = A – B mm (in) "Unladen"
   Refer to "WHEEL ALIGNMENT (Unladen)", "SDS", FA-37.

9. If height of the vehicle is not within allowable limit, adjust vehicle posture.
   Refer to "WHEEL ALIGNMENT (Unladen)", "SDS", FA-37.
10. Check wheel alignment if necessary.
    Refer to "WHEEL ALIGNMENT (Unladen)", "SDS", FA-37.

Stabilizer Bar

REMOVAL



- Remove stabilizer bar connecting bolts and clamp bolts.

INSPECTION

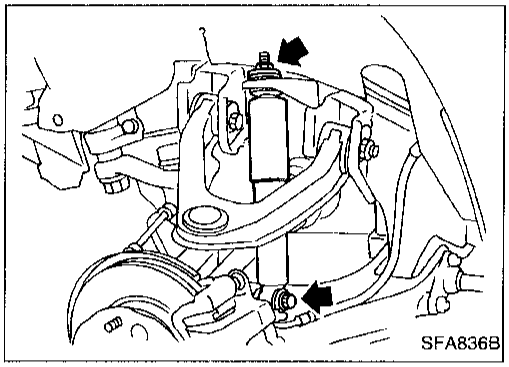
- Check stabilizer bar for twist and deformation.
  Replace if necessary.
- Check rubber bushing for cracks, wear and deterioration.
  Replace if necessary.

Stabilizer Bar (Cont'd)

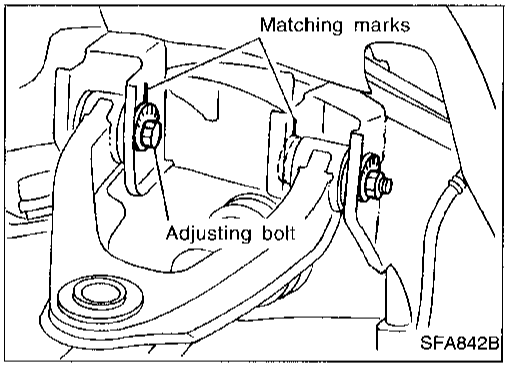
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

INSTALLATION

- Install bushing outside of white mark painted on stabilizer.

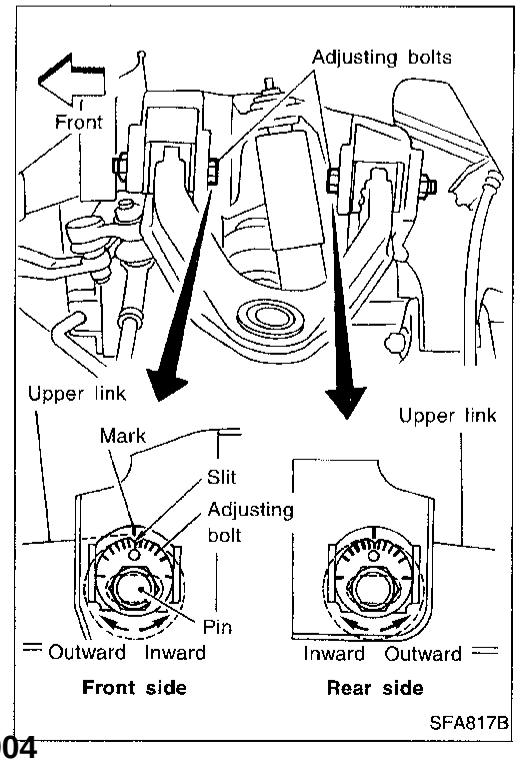


Upper Link



REMOVAL

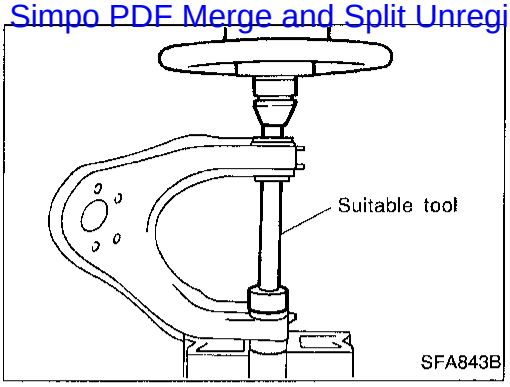
1. Remove shock absorber. Refer to "Shock Absorber", FA-29.
2. Separate upper ball joint stud from knuckle spindle.



Support lower link with jack.

Refer to "Knuckle Spindle", "FRONT AXLE", FA-19.

3. Put matching marks on adjusting bolts and remove adjusting bolts.

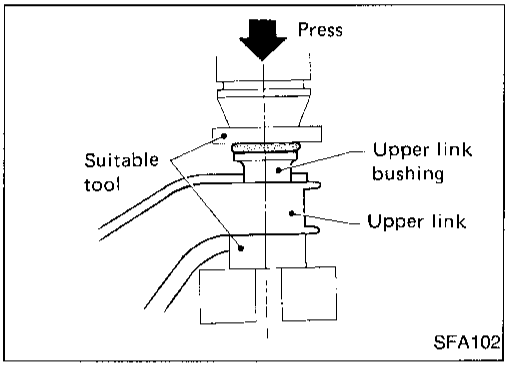


INSTALLATION

1. While aligning the adjusting bolts with the matching marks, install the upper link.
   If a new upper link or any other suspension part is installed, align the matching mark with the slit as indicated in the figure at the left, then install the upper link.
   Refer to "Front Wheel Alignment", "ON-VEHICLE SERVICE", FA-9.
2. Install shock absorber.
3. Tighten adjusting bolts under unladen condition with tires on ground.
4. After installing, check wheel alignment. Adjust if necessary. Refer to FA-9.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Upper Link (Cont'd)



DISASSEMBLY

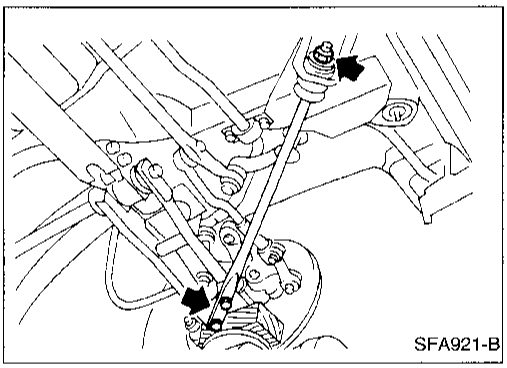
- Press out upper link bushings.

INSPECTION

- Check adjusting bolts and rubber bushings for damage. Replace if necessary.
- Check upper link for deformation and cracks. Replace if necessary.

ASSEMBLY

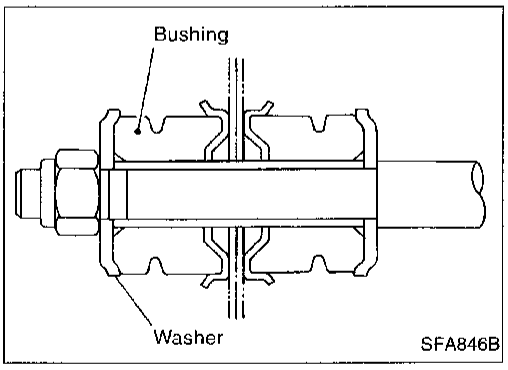
1. Apply soapsuds to rubber bushing.
2. Press upper link bushing.



Press bushing so that the flange of bushing securely contacts the end surface of the upper link collar.

Tension Rod

REMOVAL AND INSTALLATION



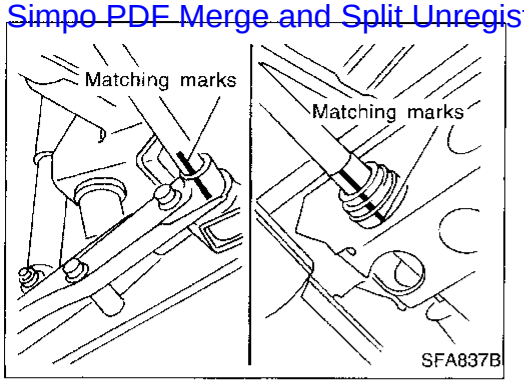
1. Remove fixing nuts on lower link and frame.

Support lower link with jack.

2. Install tension rod.

Make sure that the bushings and washers are installed properly.

INSPECTION

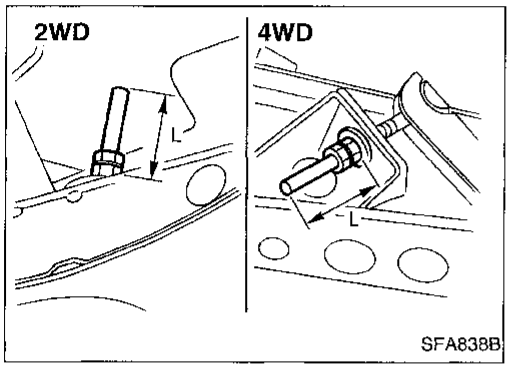


- Check tension rod for deformation and cracks. Replace if necessary.
- Check rubber bushings for damage. Replace if necessary.

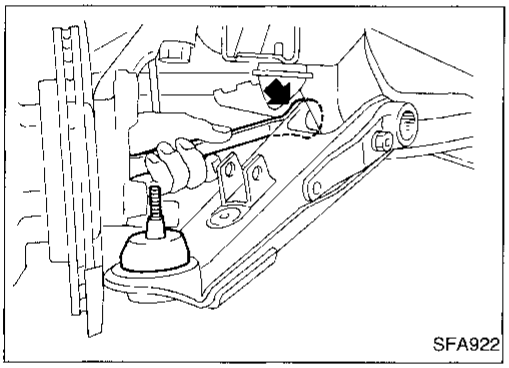
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Tension Rod (Cont'd)

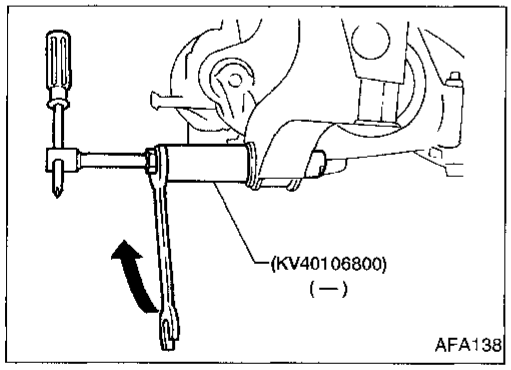
Lower Link



REMOVAL AND INSTALLATION



1. Remove torsion bar spring. Refer to "REMOVAL", "Torsion Bar Spring", FA-29.



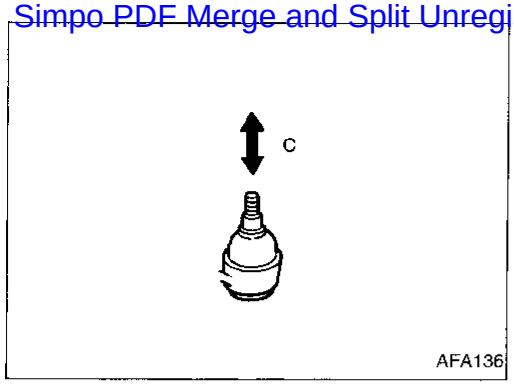
Make matching marks and measure dimension "L" when loosening adjusting nut until there is no tension on torsion bar spring.

2. Remove shock absorber lower fixing bolt.
3. Remove stabilizer bar connecting bolt.
4. Separate drive shaft from front final drive. — 4WD — Refer to "Drive Shaft —4WD —", "FRONT AXLE", FA-22.
5. Separate lower link ball joint from knuckle spindle. Refer to "Knuckle Spindle", "FRONT AXLE", FA-19.

6. Remove front lower link fixing nut.

7. Remove bushing of lower link spindle from frame with Tool.
8. After installing lower link, adjust wheel alignment and vehicle height. Refer to "Front Wheel Alignment", "ON-VEHICLE SERVICE", FA-9.

INSPECTION



Lower link and lower link spindle

- Check for deformation and cracks. Replace if necessary.

Lower link bushing

- Check for distortion and damage. Replace if necessary.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Upper Ball Joint and Lower Ball Joint

REMOVAL AND INSTALLATION

- Separate knuckle spindle from upper and lower links.
  Refer to "Knuckle Spindle", "FRONT AXLE", FA-19.

INSPECTION

- Check joints for play. If ball is worn and play in axial direction is excessive or joint is hard to swing, replace as a upper link or lower link.

  Axial end play "C":
  Upper link
  0 mm (0 in)
  Lower link
  2WD 1.3 mm (0.051 in) or less
  4WD 0.2 mm (0.008 in) or less

- Check dust cover for damage.
  Replace dust cover and dust cover clamp if necessary.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

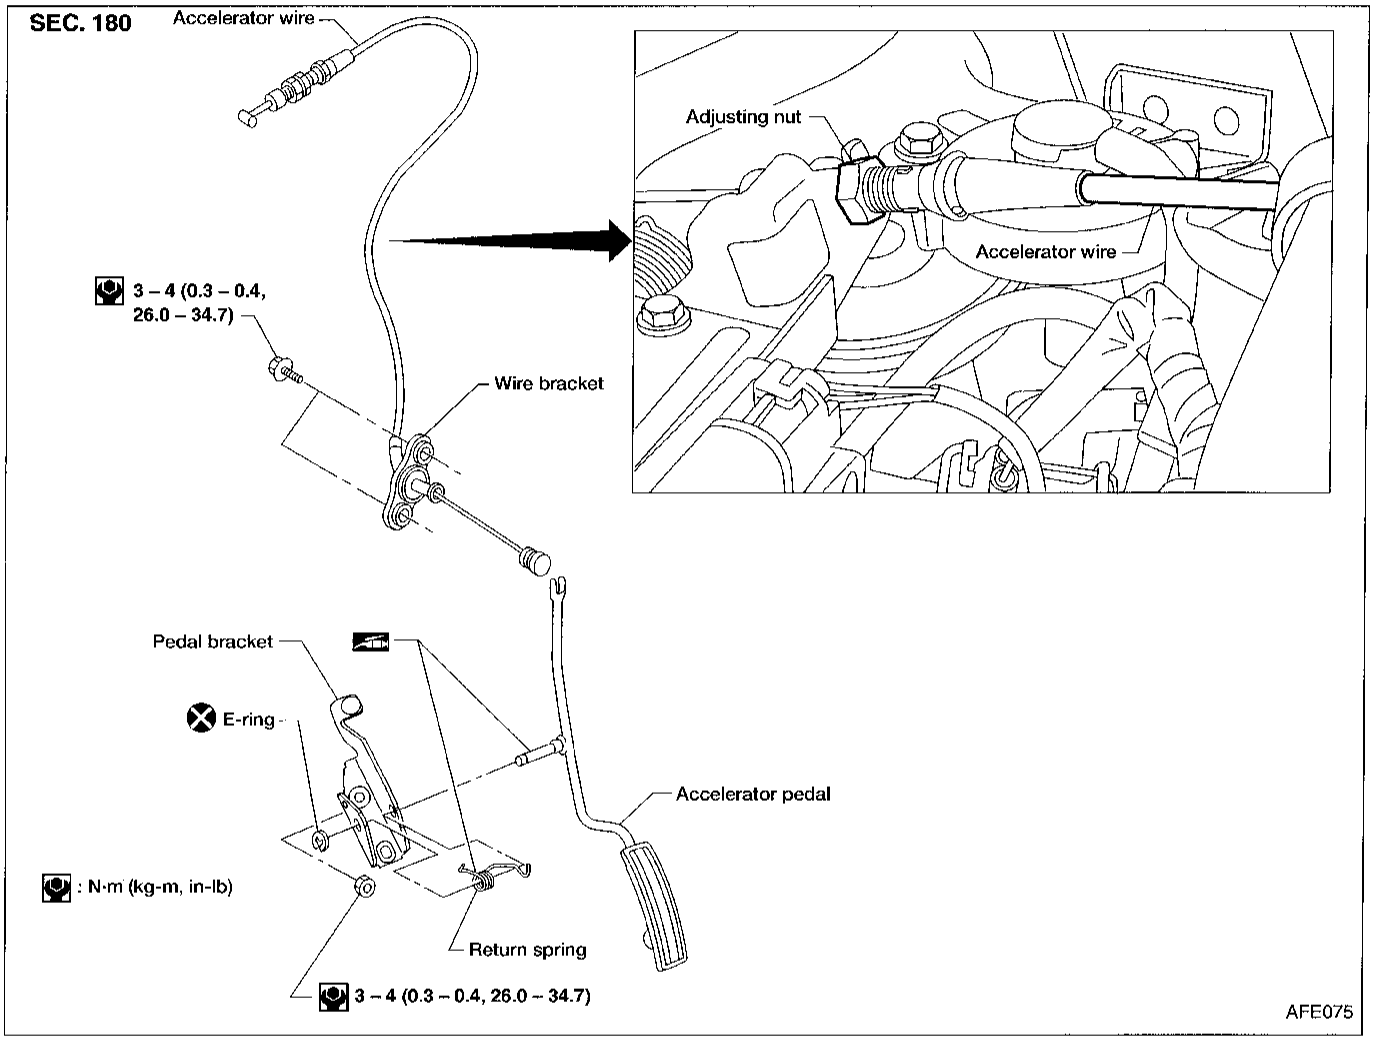
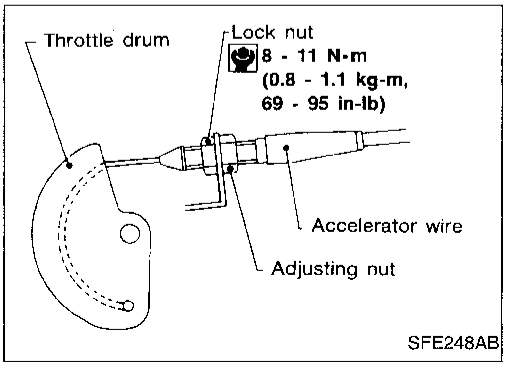
Special Service Tool



The actual shapes of Kent-Moore tools may differ from those of special service tools illustrated here.



Tool number (Kent-Moore No.) Tool name	Description	
KV10114400 (J-38365) Heated oxygen sensor wrench	 NT636	Loosening or tightening front and rear heated oxygen sensors **a = 22 mm (0.87 in)**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

CAUTION:

- **When removing accelerator wire, mark initial position of lock nut.**
- **Check that throttle valve opens fully when accelerator pedal is fully depressed. Check that throttle valve returns to idle position when accelerator pedal is released.**
- **Check accelerator control parts for improper contact with any adjacent parts.**
- **When connecting accelerator wire, do not twist or scratch the inner wire.**
- **For adjustment of A/T throttle wire, refer to AT section ("Throttle Wire Adjustment", "ON-VEHICLE SERVICE").**

Adjusting Accelerator Wire

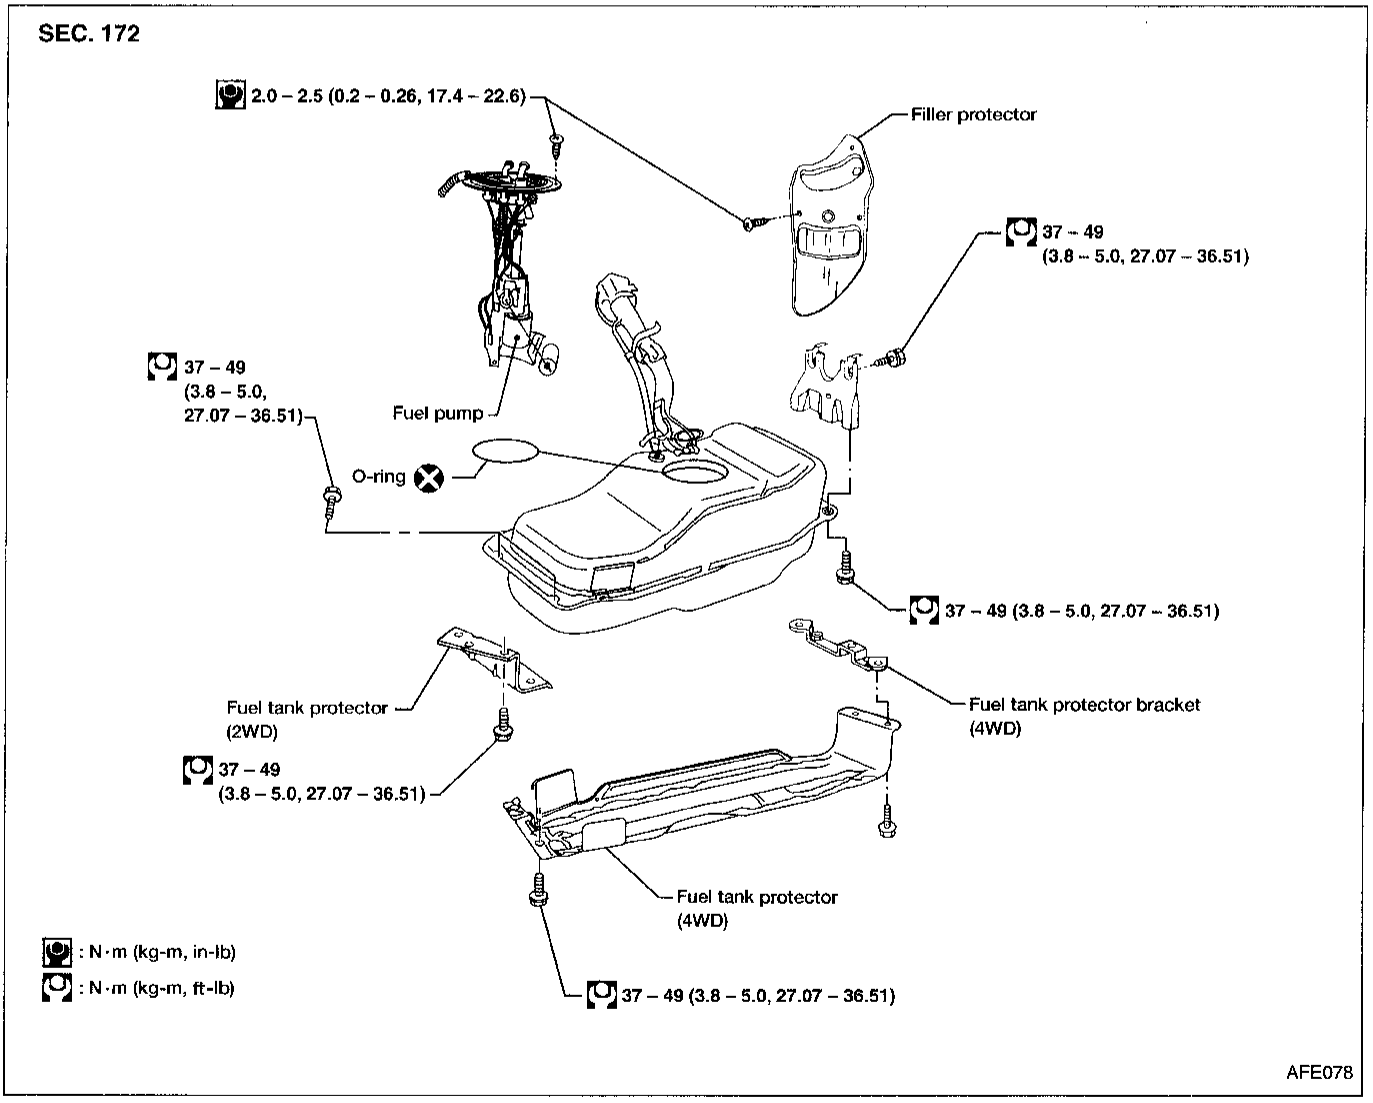
CAUTION:

- **Make sure the ASCD wire is not pulling the throttle drum.**
- **For ASCD wire adjustment, refer to EL section ["AUTOMATIC SPEED CONTROL DEVICE (ASCD)"].**

1. Loosen lock nut, and tighten adjusting nut until throttle drum starts to move.
2. Loosen adjusting nut 1.5 to 2 turns and tighten lock nut.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Fuel Tank



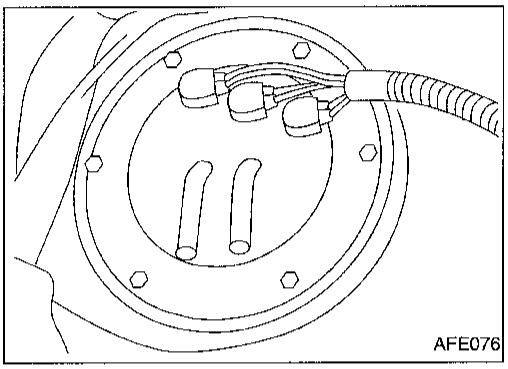
WARNING:
When replacing fuel line parts, be sure to observe the following:
- **Put a "CAUTION: FLAMMABLE" sign in workshop.**
- **Do not smoke while servicing fuel system. Keep open flames and sparks away from work area.**
- **Furnish workshop with a CO_2 fire extinguisher.**

CAUTION:
- **Before removing fuel line parts, carry out the following procedures:**

a. **Put drained fuel in an explosion-proof container and put the lid on securely.**
b. **Release fuel pressure from fuel line. Refer to EC section ("Fuel Pressure Release", "BASIC SERVICE PROCEDURE").**
c. **Disconnect battery ground cable.**

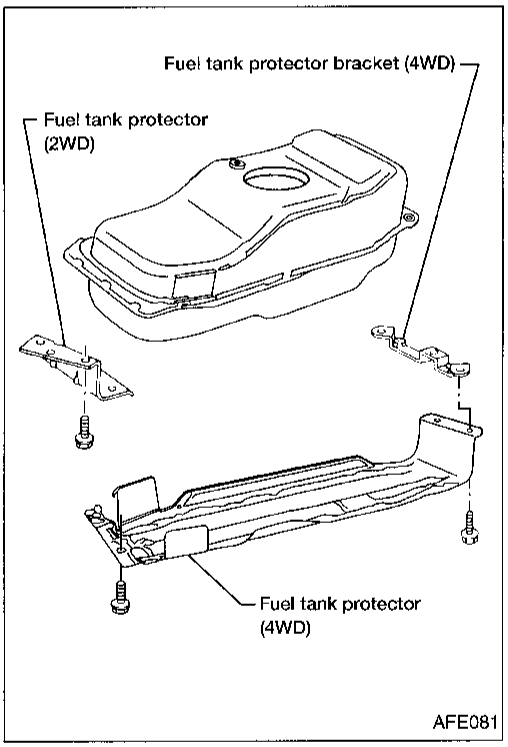
- **When installing fuel check valve, install it in the correct direction. Refer to EC section ("EVAPORATIVE EMISSION SYSTEM").**
- **Always replace O-ring with a new one.**
- **Do not kink or twist tubes and hoses during installation.**
- **To avoid damaging hoses, do not tighten hose clamps excessively.**
- **After installing tubes, run engine and check for fuel leaks at connections.**
- **Use only a genuine fuel filler cap as a replacement. If an incorrect fuel filler cap is used, the MIL may turn on.**

SEC. 172



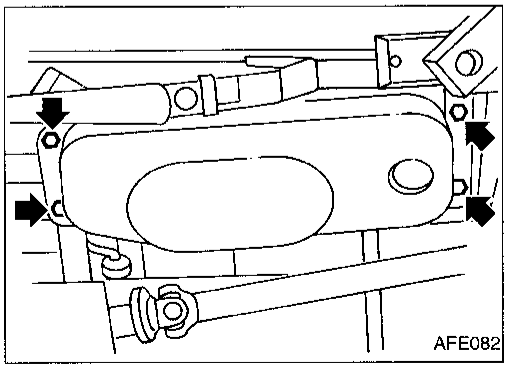
Fuel Tank (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



REMOVAL

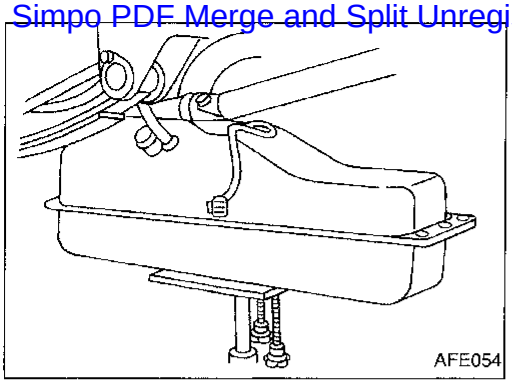
CAUTION:



- **Do not disconnect any fuel line unless absolutely necessary.**
- **Plug hose and pipe openings to prevent entry of dust and dirt.**

1. Release fuel pressure. Refer to EC section ("Fuel Pressure Release", "BASIC SERVICE PROCEDURE").
2. Disconnect battery ground cable.
3. Drain fuel from fuel tank.
4. Disconnect electrical connector.
5. Remove filler protector.
6. Disconnect filler tubes, EVAP hose, fuel supply tube and fuel return tube.

7. Remove fuel tank protector.

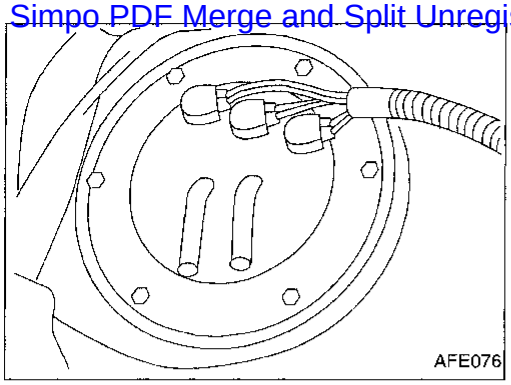


8. Remove four fuel tank mounting bolts while supporting fuel tank.

Fuel Tank (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

9. Remove fuel tank.

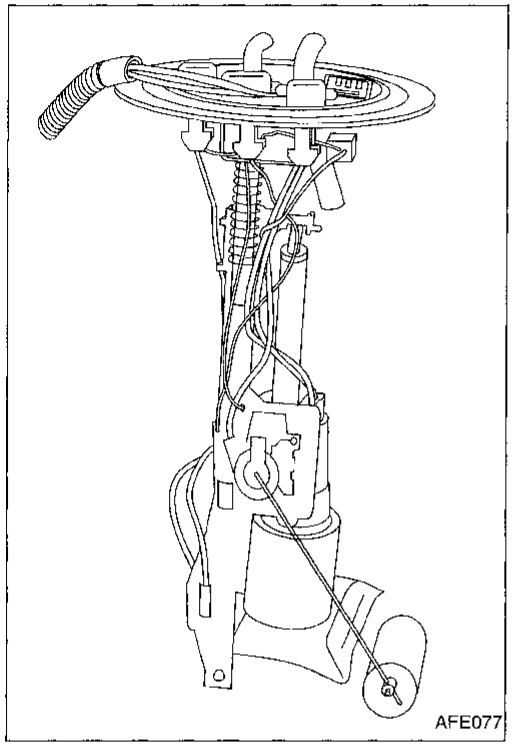


INSTALLATION

To install, reverse the removal procedure.

CAUTION:

- **Do not kink or twist hoses and tubes during installation.**
- **To avoid damaging hoses, do not tighten hose clamps excessively.**
- **Tighten bolts to specified torque.**
- **After installation, run engine and check for leaks at connections.**



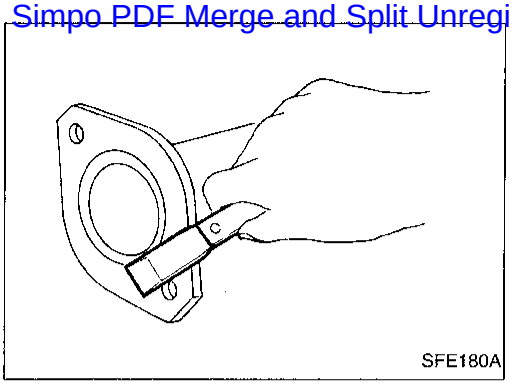
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Fuel Pump and Gauge

REMOVAL

1. Remove fuel tank. Refer to FE-5.
2. Disconnect fuel supply tube, fuel return tube and electrical connector.
3. Remove the six screws.

4. Remove fuel pump and gauge.



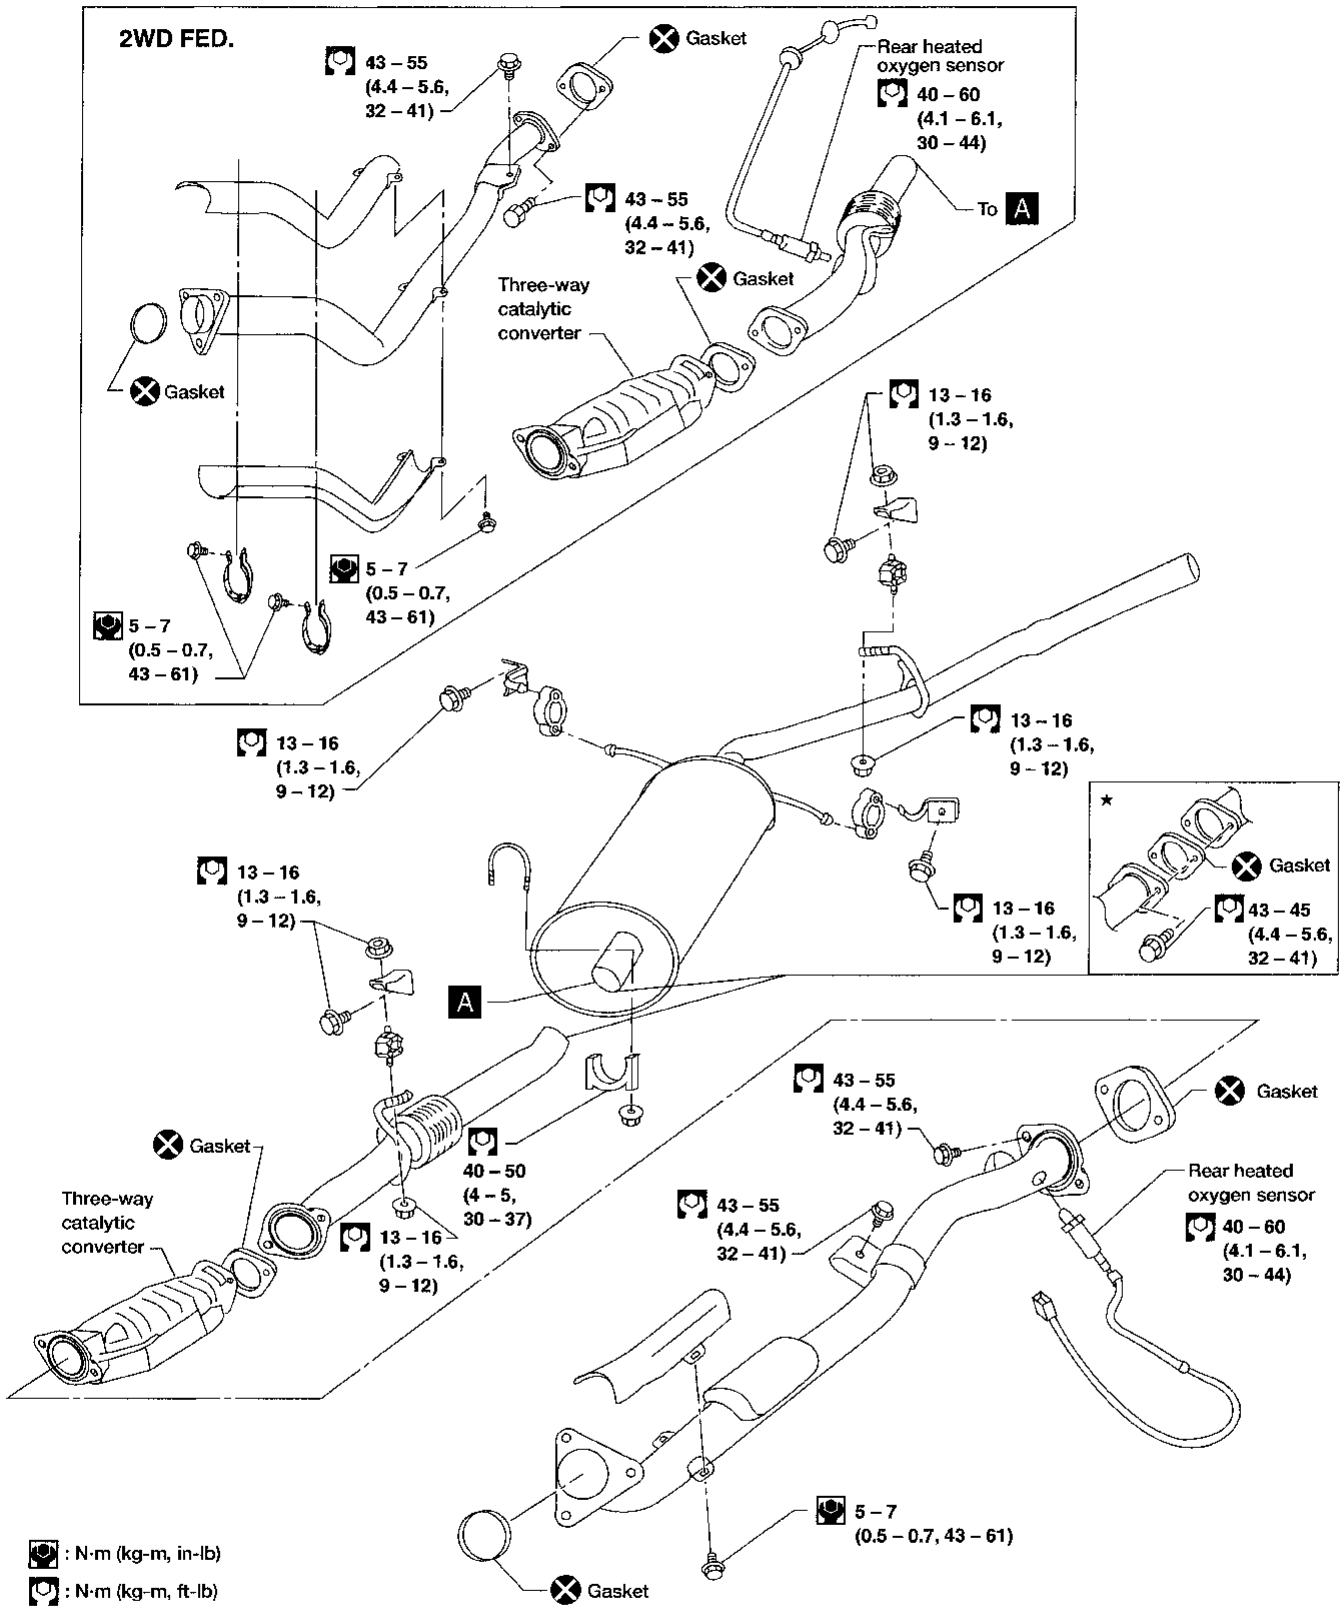
INSTALLATION

To install, reverse the removal procedure.

CAUTION:

- **Tighten bolts to specified torque.**
  : 2.0 - 2.5 N·m (0.20 - 0.26 kg-m, 17.4 - 22.6 in-lb)
- **Always replace O-ring with a new one.**
- **After installation, run engine and check for leaks at connections.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



CAUTION:

- **Replace exhaust gaskets with new ones when reassembling.**
  If gasket remains on flange surface, scrape off completely as shown at left.
- **With engine running, check all tube connections for exhaust gas leaks, and entire system for unusual noises.**
- **Check to ensure that mounting brackets and mounting insulators are installed properly and are free from undue stress. Improper installation could result in excessive noise or vibration.**
- **Discard any heated oxygen sensor dropped from a height of more than 0.5 m (19.7 in) onto a hard surface such as a concrete floor; use a new one.**

FOREWORD

This manual contains maintenance and repair procedures for the 1998 Nissan FRONTIER.

In order to assure your safety and the efficient functioning of the vehicle, this manual should be read thoroughly. It is especially important that the PRECAUTIONS in the GI section be completely understood before starting any repair task.

All information in this manual is based on the latest product information at the time of publication. The right is reserved to make changes in specifications and methods at any time without notice.

IMPORTANT SAFETY NOTICE

The proper performance of service is essential for both the safety of the technician and the efficient functioning of the vehicle.
The service methods in this Service Manual are described in such a manner that the service may be performed safely and accurately.
Service varies with the procedures used, the skills of the technician and the tools and parts available. Accordingly, anyone using service procedures, tools or parts which are not specifically recommended by NISSAN must first be completely satisfied that neither personal safety nor the vehicle's safety will be jeopardized by the service method selected.

TEST VALUE AND TEST LIMIT (GST ONLY — NOT APPLICABLE TO CONSULT-II)

The following is the information specified in Mode 6 of SAE J1979.
The test value is a parameter used to determine whether a system/circuit diagnostic test is “OK” or “NG” while being monitored by the ECM during self-diagnosis. The test limit is a reference value which is specified as the maximum or minimum value and is compared with the test value being monitored.
Items for which these data (test value and test limit) are displayed are the same as SRT code items.
These data (test value and test limit) are specified by Test ID (TID) and Component ID (CID) and can be displayed on the GST screen.

: Applicable ·: Not applicable

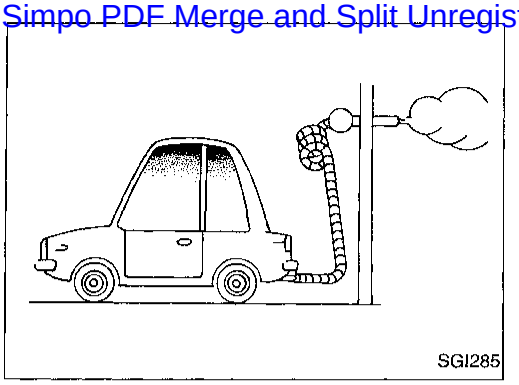
Observe the following precautions to ensure safe and proper servicing. These precautions are not described in each individual section.

Supplemental Restraint System (SRS) "AIR BAG"

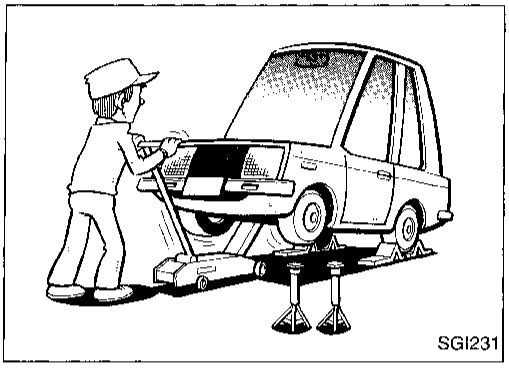
The Supplemental Restraint System "AIR BAG", used along with a seat belt, helps to reduce the risk or severity of injury to the driver and front passenger in a frontal collision. The Supplemental Restraint System consists of air bag modules (located in the center of the steering wheel and in the instrument panel on the passenger side), a diagnosis sensor unit, a crash zone sensor (4WD models), warning lamp, wiring harness and spiral cable.

The vehicle is equipped with a passenger air bag deactivation switch. Because no rear seat exists where a rear-facing child restraint can be placed, the switch is designed to turn off the passenger air bag so that a rear-facing child restraint can be used in the front passenger seat. The switch is located in the center of the instrument panel, near the ashtray. When the switch is turned to the ON position, the passenger air bag is enabled and could inflate in a frontal collision. When the switch is turned to the OFF position, the passenger air bag is disabled and will not inflate in a frontal collision. A passenger air bag OFF indicator on the instrument panel lights up when the passenger air bag is switched OFF. The driver air bag always remains enabled and is not affected by the passenger air bag deactivation switch.



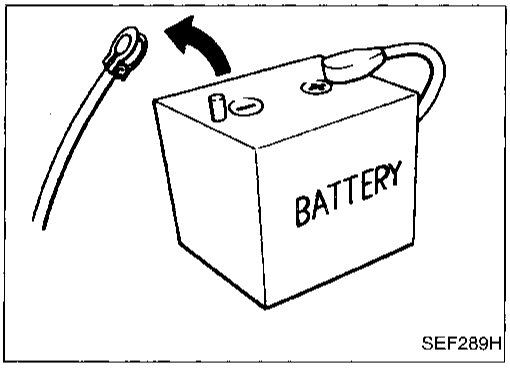
Information necessary to service the system safely is included in the **RS section** of this Service Manual.

WARNING:



- **To avoid rendering the SRS inoperative, which could increase the risk of personal injury or death in the event of a collision which would result in air bag inflation, all maintenance should be performed by an authorized NISSAN dealer.**
- **Improper maintenance, including incorrect removal and installation of the SRS, can lead to personal injury caused by unintentional activation of the system.**
- **Do not use electrical test equipment on any circuit related to the SRS unless instructed to in this Service Manual. SRS wiring harnesses are covered with yellow insulation either just before the harness connectors or on the complete harness, for easy identification.**
- **The vehicle is equipped with a passenger air bag deactivation switch which can be operated by the customer. When the passenger air bag is switched OFF, the passenger air bag is disabled and will not inflate in a frontal collision. When the passenger air bag is switched ON, the passenger air bag is enabled and could inflate in a frontal collision. After SRS maintenance or repair, make sure the passenger air bag deactivation switch is in the same position (ON or OFF) as when the vehicle arrived for service.**

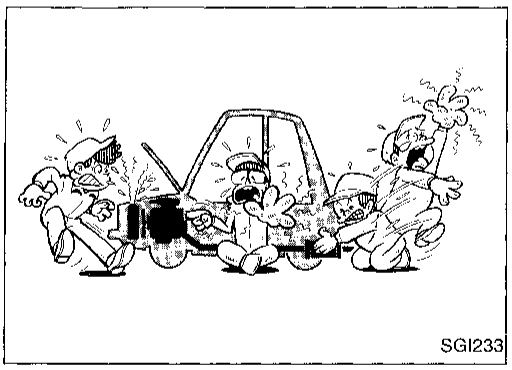
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



General Precautions

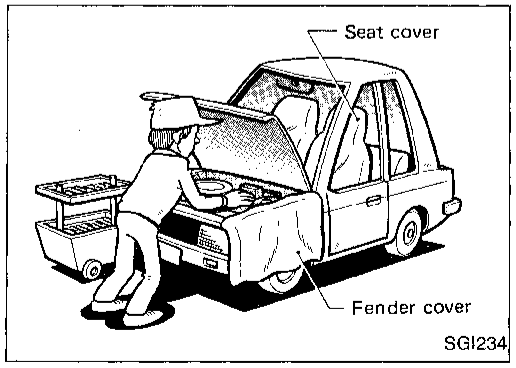
SGI285

- Do not operate the engine for an extended period of time without proper exhaust ventilation.
  Keep the work area well ventilated and free of any inflammable materials. Special care should be taken when handling any inflammable or poisonous materials, such as gasoline, refrigerant gas, etc. When working in a pit or other enclosed area, be sure to properly ventilate the area before working with hazardous materials.
  Do not smoke while working on the vehicle.



SGI231

- Before jacking up the vehicle, apply wheel chocks or tire blocks to the wheels to prevent the vehicle from moving. After jacking up the vehicle, support the vehicle weight with safety stands at the points designated for proper lifting before working on the vehicle.
  These operations should be done on a level surface.
- When removing a heavy component such as the engine or transaxle, be careful not to lose your balance and drop it. Also, do not allow it to strike adjacent parts, especially the brake tubes and master cylinder.



SEF289H

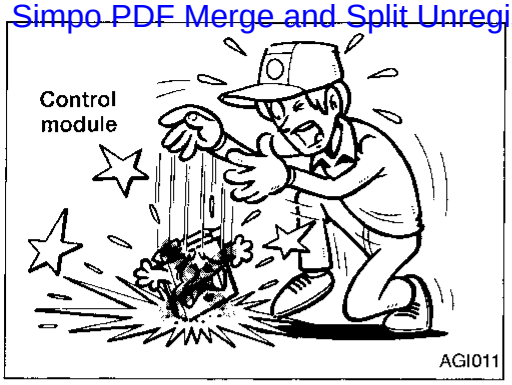
- Before starting repairs which do not require battery power:
  Turn off ignition switch.
  Disconnect the negative battery terminal.

SGI233

- To prevent serious burns:
  Avoid contact with hot metal parts.
  Do not remove the radiator cap when the engine is hot.

SGI234

- Before servicing the vehicle:
  Protect fenders, upholstery and carpeting with appropriate covers.
  Take caution that keys, buckles or buttons do not scratch paint.



General Precautions (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

- Clean all disassembled parts in the designated liquid or solvent prior to inspection or assembly.
- Replace oil seals, gaskets, packings, O-rings, locking washers, cotter pins and self-locking nuts with new ones.
- Replace inner and outer races of tapered roller bearings and needle bearings as a set.
- Arrange the disassembled parts in sequence with their assembled locations.
- Do not touch the terminals of electrical components which use microcomputers (such as electronic control unit).
  Static electricity may damage internal electronic components.
- After disconnecting vacuum or air hoses, attach a tag to indicate the proper connection.
- Use only the fluids and lubricants specified in this manual.
- Use approved bonding agent, sealants or their equivalents when required.
- Use tools and recommended special tools where specified for safe and efficient service repairs.
- When repairing the fuel, oil, water, vacuum or exhaust systems, check all affected lines for leaks.
- Dispose of drained oil or the solvent used for cleaning parts in an appropriate manner.

WARNING:
To prevent ECM from storing the diagnostic trouble codes, do not carelessly disconnect the harness connectors which are related to the ECCS system. The connectors should be disconnected only when working according to the WORK FLOW of TROUBLE DIAGNOSES in EC section.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Precautions for Multiport Fuel Injection System or ECCS Engine

- Before connecting or disconnecting any harness connector for the multiport fuel injection system or ECM:
  Turn ignition switch to OFF position.
  Disconnect negative battery terminal; otherwise, there may be damage to ECM.
- Before disconnecting pressurized fuel line from fuel pump to injectors, be sure to release fuel pressure.
- Be careful not to jar components such as ECM and mass air flow sensor.

Precautions for Three Way Catalyst

If a large amount of unburned fuel flows into the catalyst, the catalyst temperature will be excessively high. To prevent this, follow the instructions below:

- Use unleaded gasoline only. Leaded gasoline will seriously damage the three way catalyst.
- When checking for ignition spark or measuring engine compression, make tests quickly and only when necessary.
- Do not run engine when the fuel tank level is low; otherwise, the engine may misfire causing damage to the catalyst.

Do not place the vehicle on inflammable material. Keep inflammable material off the exhaust system.

Precautions for Engine Oils

Prolonged and repeated contact with used engine oil may cause skin cancer. Try to avoid direct skin contact with used oil.
If skin contact is made, wash thoroughly with soap or hand cleaner as soon as possible.

HEALTH PROTECTION PRECAUTIONS

- Avoid prolonged and repeated contact with oils, particularly used engine oils.
- Wear protective clothing, including oil resistant gloves when practicable.
- Do not put oily rags in pockets.
- Avoid contaminating clothes, particularly underclothing, with oil.
- Heavily soiled clothing and oil-impregnated footwear should not be worn. Overalls must be cleaned regularly.
- First aid treatment should be obtained immediately for open cuts and wounds.
- Use barrier creams, applying them before each work period, to help the removal of oil from the skin.
- Wash with soap and water to ensure all oil is removed (skin cleansers and nail brushes will help). Preparations containing lanolin replace the natural skin oils which have been removed.
- Do not use gasoline, kerosene, diesel fuel, gas oil, thinners or solvents for cleaning skin.
- If skin disorders develop, obtain medical advice without delay.
- Where practicable, degrease components prior to handling.
- Where there is a risk of eye contact, eye protection should be worn, for example, chemical goggles or face shields. In addition, an eye wash facility should be provided.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Precautions for Engine Oils (Cont'd)

ENVIRONMENTAL PROTECTION PRECAUTIONS

Burning used engine oil in small space heaters or boilers can be recommended only for units of approved design. The heating system must meet the requirements of HM Inspectorate of Pollution for small burners of less than 0.4 MW. If in doubt, check with the appropriate local authority and/or manufacturer of the approved appliance.

Dispose of used oil and used oil filters through authorized waste disposal contractors to licensed waste disposal sites, or to the waste oil reclamation trade. If in doubt, contact the local authority for advice on disposal facilities.

It is illegal to pour used oil on the ground, down sewers, drains, or into water sources.

The regulations concerning the pollution of the environment will vary between regions.

Precautions for Fuel

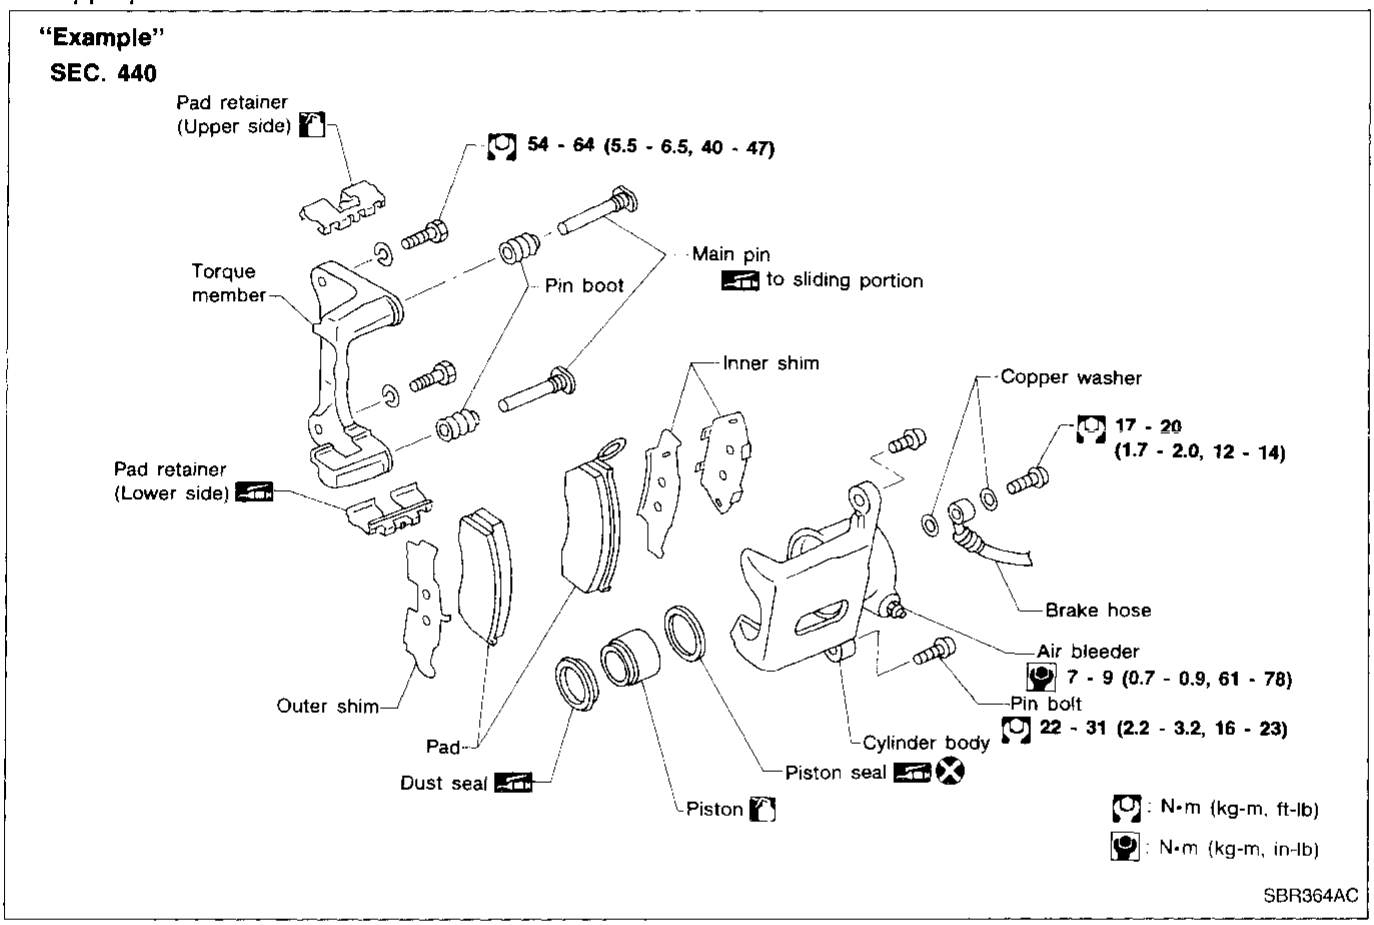
Use unleaded gasoline with an octane rating of at least 87 AKI (Anti-Knock Index) number (research octane number 91).

CAUTION:

Using a fuel other than that specified could adversely affect the emission control devices and systems, and could also affect the warranty coverage.

Under no circumstances should a leaded gasoline be used, since this will damage the three way catalyst.

Precautions for Air Conditioning



Use an approved refrigerant recovery unit anytime the air conditioner system must be discharged. Refer to HA section ("R-134a Service Procedure", "SERVICE PROCEDURES") for specific instructions.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

- **AN ALPHABETICAL INDEX** is provided at the end of this manual so that you can rapidly find the item and page you are searching for.
- **A QUICK REFERENCE INDEX,** a black tab (e.g., BR) is provided on the first page. You can quickly find each section by matching it to the section's black tabs.
- **THE CONTENTS** are listed on the first page of each section.
- **THE TITLE** is indicated on the upper portion of each page and shows the part or system.
- **THE PAGE NUMBER** of each section consists of two letters designating the particular section combined with a number (e.g., "BR-5").
- **THE LARGE ILLUSTRATIONS** are exploded views (see example below). These contain tightening torques, lubrication points, section number of the **PARTS CATALOG** (e.g., SEC. 440) and other information necessary to perform repairs.
  The illustrations should be used in reference to service matters only. When ordering parts, refer to the appropriate **PARTS CATALOG.**

"Example"

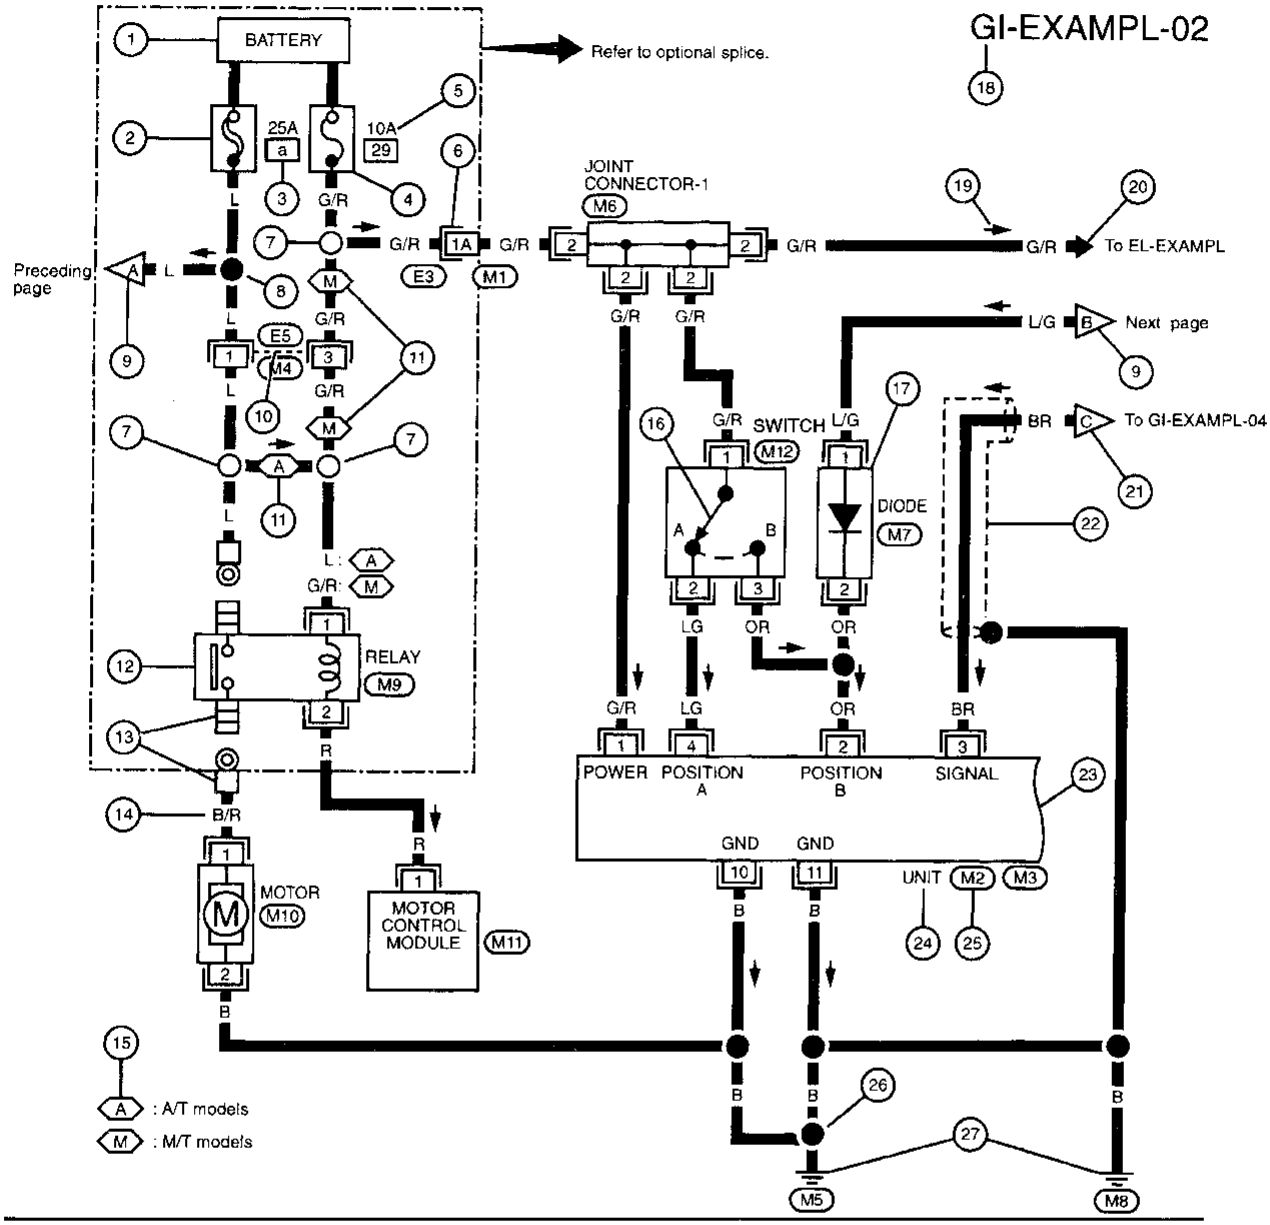
SEC. 440

- **THE SMALL ILLUSTRATIONS** show items not shown in the previous large illustrations. These include important steps such as inspection points, use of special tools, hidden fasteners and special or unique procedures.
  A step-by-step format for assembly, inspection and adjustment is presented for complicated units such as the automatic transaxle.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

- The following **SYMBOLS AND ABBREVIATIONS** are used.

,	:	Tightening torque
	:	Should be lubricated with grease. Unless otherwise indicated, use recommended multi-purpose grease.
	:	Should be lubricated with oil.
	:	Sealing point
	:	Checking point
	:	Always replace after every disassembly.
Ⓟ	:	Apply petroleum jelly.
ATF	:	Apply ATF.
SDS	:	Service Data and Specifications
LH, RH	:	Left-Hand, Right-Hand
FR, RR	:	Front, Rear
M/T	:	Manual Transaxle/Transmission
A/T	:	Automatic Transaxle/Transmission



4x4 ,		
4WD	:	4-Wheel Drive
2WD	:	2-Wheel Drive
A/C	:	Air Conditioner
P/S	:	Power Steering
Tool	:	Special Service Tools
SAE	:	Society of Automotive Engineers, Inc.
ATF	:	Automatic Transmission Fluid
D_1	:	Drive range 1st gear
D_2	:	Drive range 2nd gear
D_3	:	Drive range 3rd gear
D_4	:	Drive range 4th gear

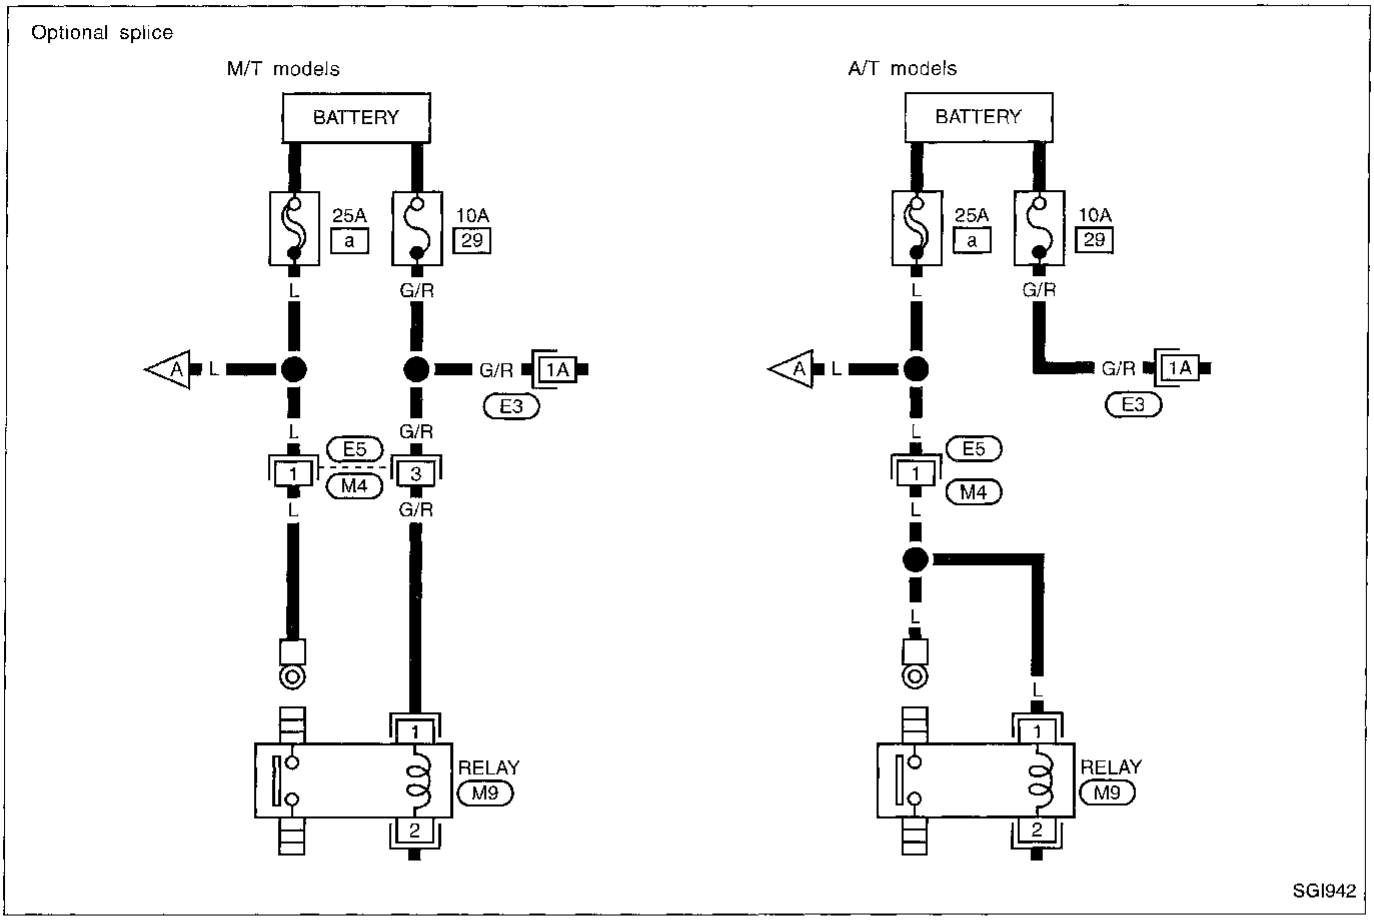
Sample/Wiring Diagram – EXAMPL –

- For Description, refer to GI-11.



AGI071

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

OPTIONAL SPLICE

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description

Number	Item	Description
①	Power condition	● This shows the condition when the system receives battery positive voltage (can be operated).
②	Fusible link	● The double line shows that this is a fusible link. ● The open circle shows current flow in, and the shaded circle shows current flow out.
③	Fusible link/fuse location	● This shows the location of the fusible link or fuse in the fusible link or fuse box. For arrangement, refer to EL section ("POWER SUPPLY ROUTING").
④	Fuse	● The single line shows that this is a fuse. ● The open circle shows current flow in, and the shaded circle shows current flow out.
⑤	Current rating	● This shows the current rating of the fusible link or fuse.
⑥	Connectors	● This shows that connector (E3) is female and connector (M1) is male. ● The G/R wire is located in the 1A terminal of both connectors. ● Terminal number with an alphabet (1A, 5B, etc.) indicates that the connector is SMJ connector. Refer to GI-16.
⑦	Optional splice	● The open circle shows that the splice is optional depending on vehicle application.
⑧	Splice	● The shaded circle shows that the splice is always on the vehicle.
⑨	Page crossing	● This arrow shows that the circuit continues to an adjacent page. ● The A will match with the A on the preceding or next page.
⑩	Common connector	● The dotted lines between terminals show that these terminals are part of the same connector.
⑪	Option abbreviation	● This shows that the circuit is optional depending on vehicle application.
⑫	Relay	● This shows an internal representation of the relay. For details, refer to EL section ("STANDARDIZED RELAY").
⑬	Connectors	● This shows that the connector is connected to the body or a terminal with bolt or nut.
⑭	Wire color	● This shows a code for the color of the wire. B = Black, BR = Brown W = White, OR = Orange R = Red, P = Pink G = Green, PU = Purple L = Blue, GY = Gray Y = Yellow, SB = Sky Blue LG = Light Green, CH = Dark Brown DG = Dark Green When the wire color is striped, the base color is given first, followed by the stripe color as shown below: Example: L/W = Blue with White Stripe
⑮	Option description	● This shows a description of the option abbreviation used on the page.
⑯	Switch	● This shows that continuity exists between terminals ① and ② when the switch is in the A position. Continuity exists between terminals ① and ③ when the switch is in the B position.
⑰	Assembly parts	● Connector terminal in component shows that it is a harness incorporated assembly.
⑱	Cell code	● This identifies each page of the wiring diagram by section, system and wiring diagram page number.
⑲	Current flow arrow	● Arrow indicates electric current flow, especially where the direction of standard flow (vertically downward or horizontally from left to right) is difficult to follow. ● A double arrow "◄►" shows that current can flow in either direction depending on circuit operation.

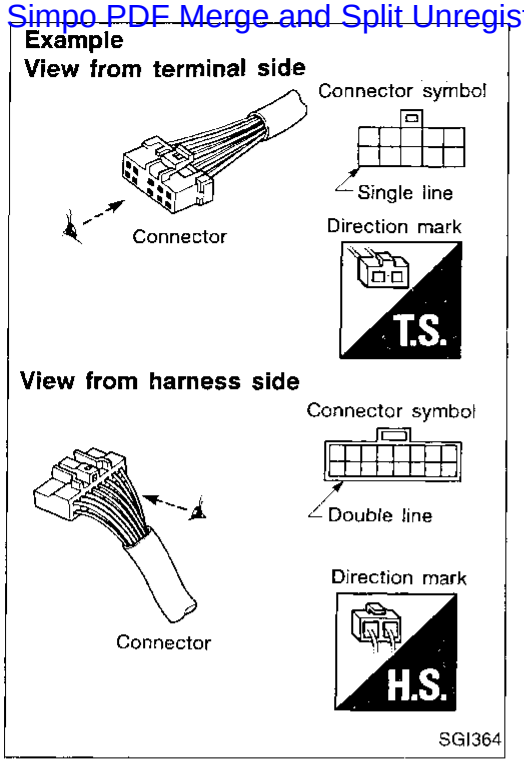
Description (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

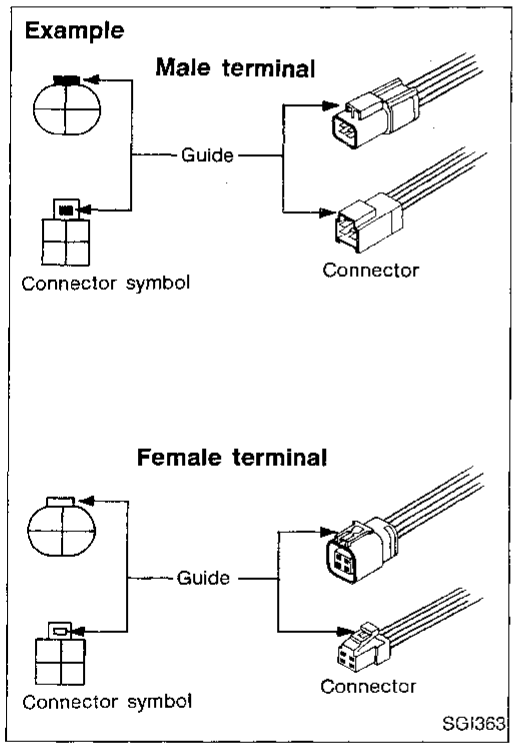
Number	Item	Description
⑳	System branch	● This shows that the system branches to another system identified by cell code (section and system).
㉑	Page crossing	● This arrow shows that the circuit continues to another page identified by cell code. ● The C will match with the C on another page within the system other than the next or preceding pages.
㉒	Shielded line	● The line enclosed by broken line circle shows shield wire.
㉓	Component box in wave line	● This shows that another part of the component is also shown on another page (indicated by wave line) within the system.
㉔	Component name	● This shows the name of a component.
㉕	Connector number	● This shows the connector number. ● The letter shows which harness the connector is located in. Example: **M**: main harness. For detail and to locate the connector, refer to EL section ("Main Harness", "HARNESS LAYOUT"). A coordinate grid is included for complex harnesses to aid in locating connectors.
㉖	Ground	● The line spliced and grounded under wire color shows that ground line is spliced at the grounded connector.
㉗	Ground	● This shows the ground connection.
㉘	Connector views	● This area shows the connector faces of the components in the wiring diagram on the page.
㉙	Common component	● Connectors enclosed in broken line show that these connectors belong to the same component.
㉚	Connector color	● This shows a code for the color of the connector. For code meaning, refer to wire color codes, number ⑭ of this chart.
㉛	Fuse and fusible link box	● This shows the arrangement of fusible link(s) and fuse(s), used for connector views of "POWER SUPPLY ROUTING" in EL section. The open square shows current flow in, and the shaded square shows current flow out.
㉜	Reference area	● This shows that more information on the Super Multiple Junction (SMJ) and Joint Connectors (J/C) exists on the foldout page. Refer to GI-16 for details.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description (Cont'd)



CONNECTOR SYMBOLS

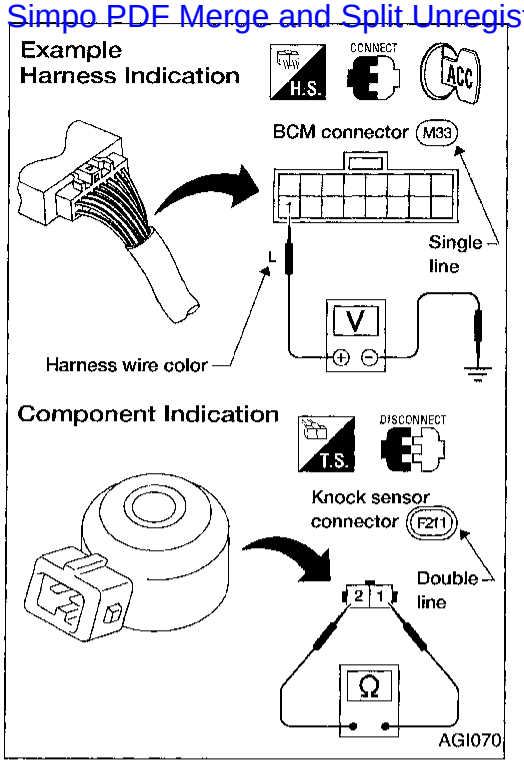


Most connector symbols in wiring diagrams are shown from the terminal side.

- Connector symbols shown from the terminal side are enclosed by a single line and followed by the direction mark 

.
- Connector symbols shown from the harness side are enclosed by a double line and followed by the direction mark 

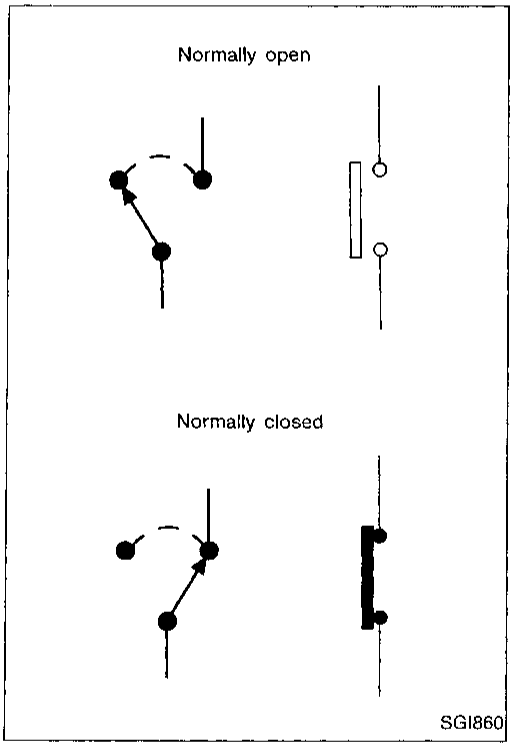
.



- Connector guides for male terminals are shown in black.
- Connector guides for female terminals are shown in white.

Description (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



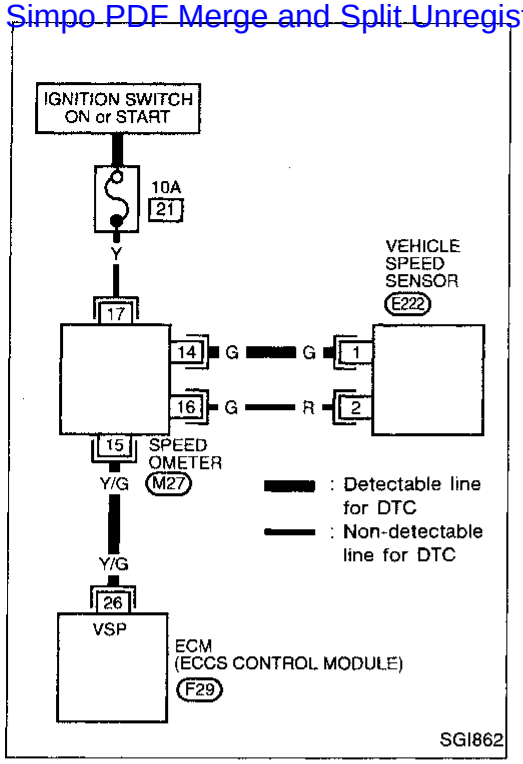
Harness indication

- Connector numbers in a signal oval (M33) indicate harness connectors.
- Letter designations next to test meter probes indicate harness (connector) wire colors.

Component indication

- Connector numbers in a double oval (F211) indicate component connectors.

SWITCH POSITIONS



Switches are shown in wiring diagrams as if the vehicle is in the "normal" condition.

A vehicle is in the "normal" condition when:

- ignition switch is OFF,
- doors, hood and trunk lid/back door are closed,
- pedals are not depressed, and
- parking brake is released.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description (Cont'd)

DETECTABLE LINES AND NON-DETECTABLE LINES

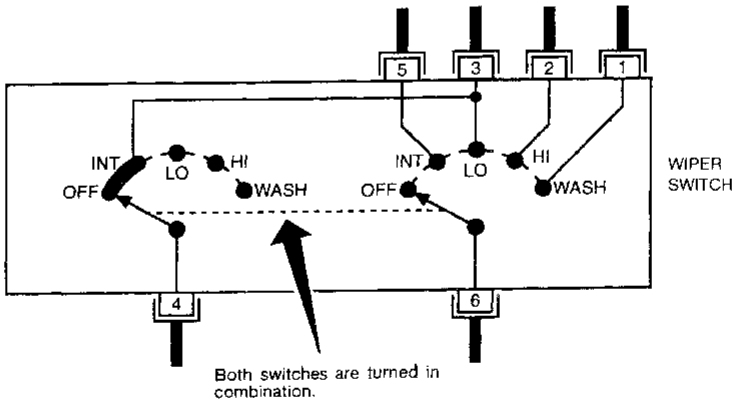
In some wiring diagrams, two kinds of lines with different thicknesses are used to represent wires.

- A line with regular thickness (wider line) represents a "detectable line for DTC (Diagnostic Trouble Code)". A "detectable line for DTC" is a circuit in which ECM can detect malfunctions with the on board diagnostic system.
- A line with less thickness (thinner line) represents a "non-detectable line for DTC". A "non-detectable line for DTC" is a circuit in which ECM cannot detect malfunctions with the on board diagnostic system.

MULTIPLE SWITCH

The continuity of multiple switch is described in two ways as shown below.

- The switch chart is used in schematic diagrams.
- The switch diagram is used in wiring diagrams.



Example

(SWITCH CHART)

WIPER SWITCH

	OFF	INT	LO	HI	WASH
1					○
2				○	○
3	○	○	○	○	
4	○	○			
5		○	○	○	○
6		○	○	○	○

(SWITCH DIAGRAM)

Continuity circuit of wiper switch

SWITCH POSITION	CONTINUITY CIRCUIT
OFF	3 - 4
INT	3 - 4, 5 - 6
LO	3 - 6
HI	2 - 6
WASH	1 - 6

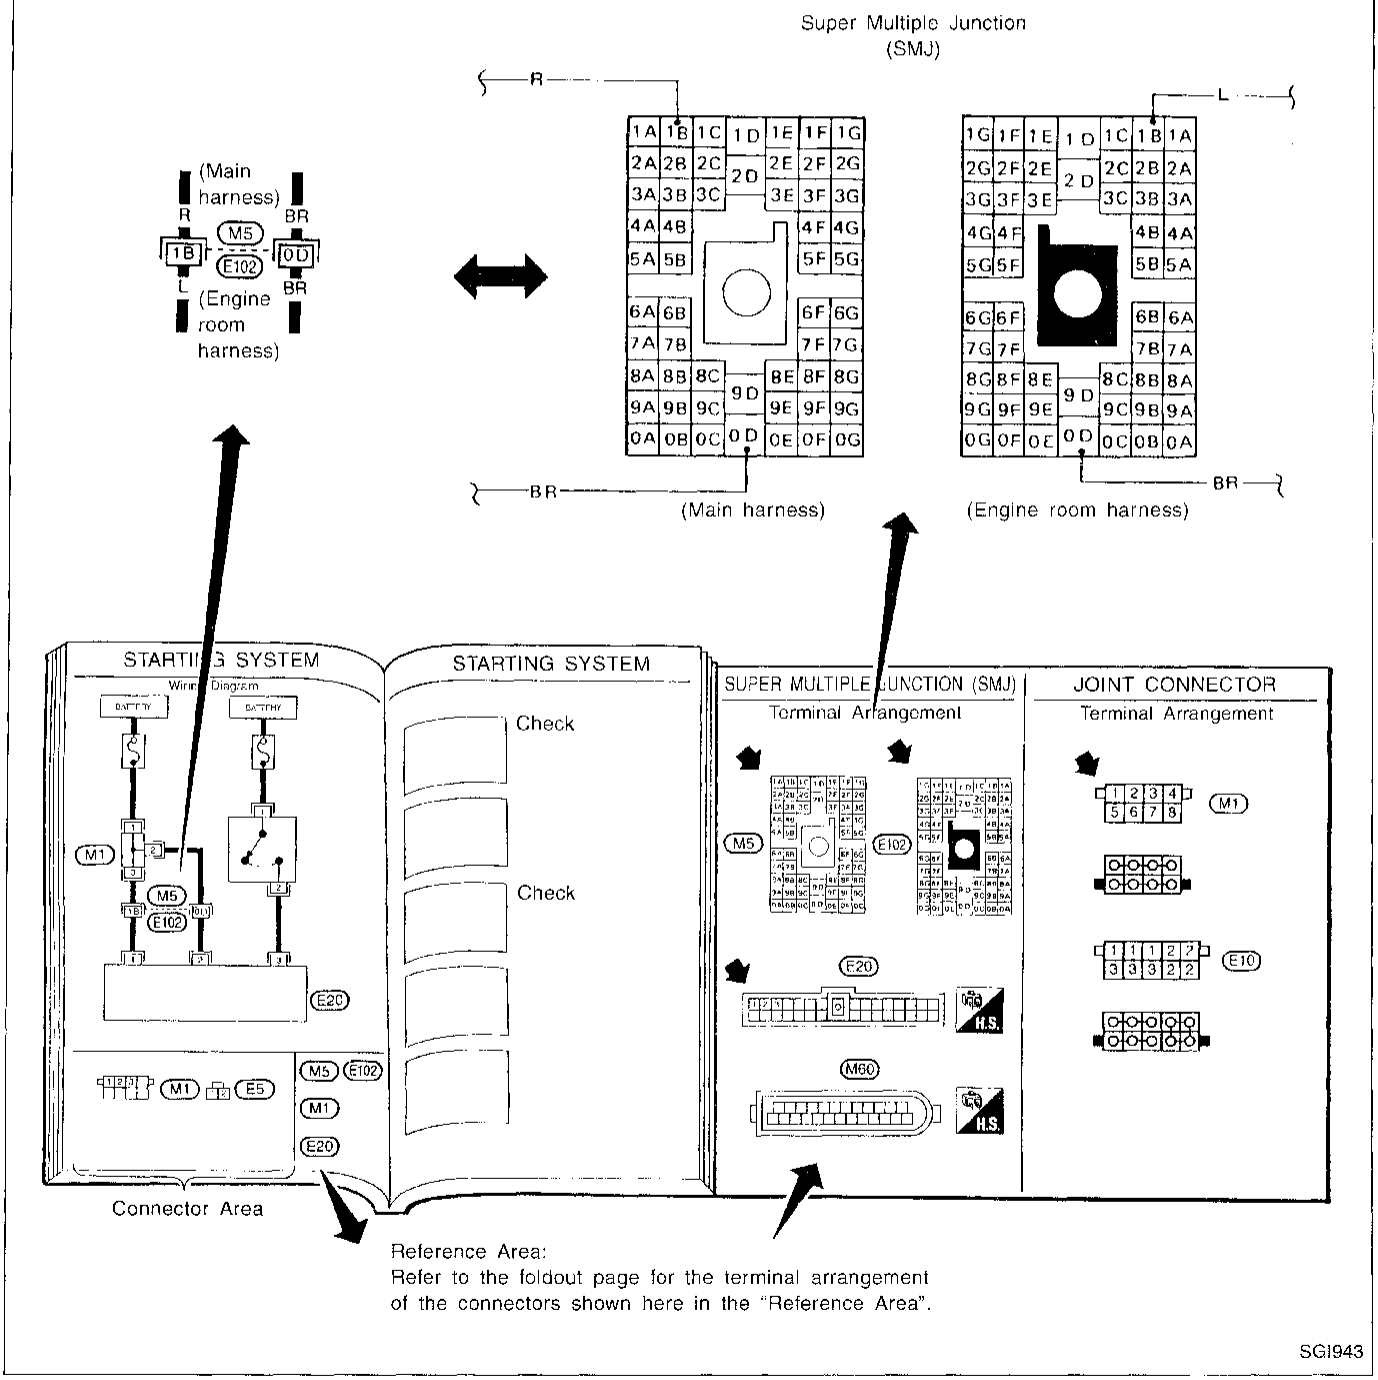
AGI033

Description (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

FOLDOUT PAGE

The foldout page should be opened when reading a wiring diagram.

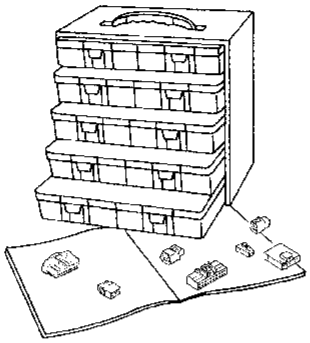


Super multiple junction (SMJ)

In a wiring diagram, SMJ connectors include a letter of the alphabet in the terminal number. SMJ connector numbers are shown in the Reference Area. Terminal arrangement can be found on the foldout page.
If connector numbers are shown in Reference Area, these connector symbols are not shown in Connector Area. For terminal arrangement of these connectors, refer to the foldout page at the end of this manual.

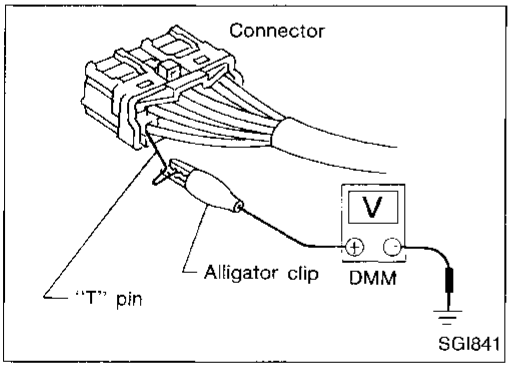
Joint connector

Joint connector symbols are shown in Connector Area of the wiring diagram. Inside wiring layout and joint connector terminal arrangement can be found on the foldout page.



Example

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



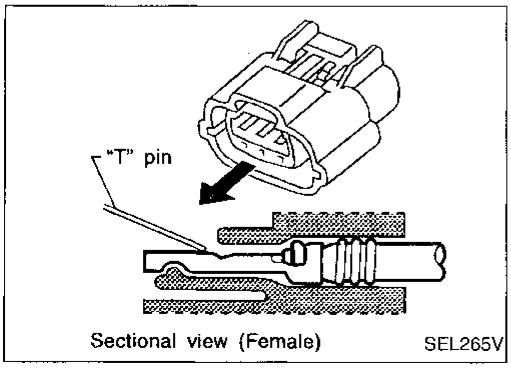
Connector and Terminal Pin Kit

Use the connector and terminal pin kit listed below when replacing connectors or terminals.
The connector and terminal pin kit contains some of the most commonly used NISSAN connectors and terminals.

Tool number (Kent-Moore No.) Tool name	Description
— (J38751-95NI) Connector and terminal pin kit	 AGI063

How to Probe Connectors

Connector damage and an intermittent connection can result from improperly probing of the connector during circuit checks.
The probe of a digital multimeter (DMM) may not correctly fit the connector cavity. To correctly probe the connector, follow the procedures below using a "T" pin. For the best contact grasp the "T" pin using an alligator clip.



SGI841

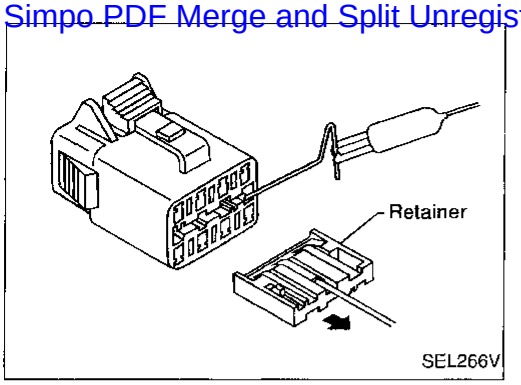
PROBING FROM HARNESS SIDE

Standard type (not waterproof type) connector should be probed from harness side with "T" pin.

- **If the connector has a rear cover such as a ECM connector, remove the rear cover before probing the terminal.**
- **Do not probe waterproof connector from harness side. Damage to the seal between wire and connector may result.**

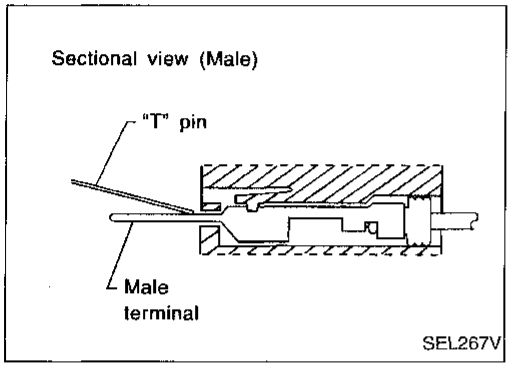
Sectional view (Female) SEL265V

PROBING FROM TERMINAL SIDE



Female terminal

There is a small notch above each female terminal. Probe each terminal with the "T" pin through the notch.

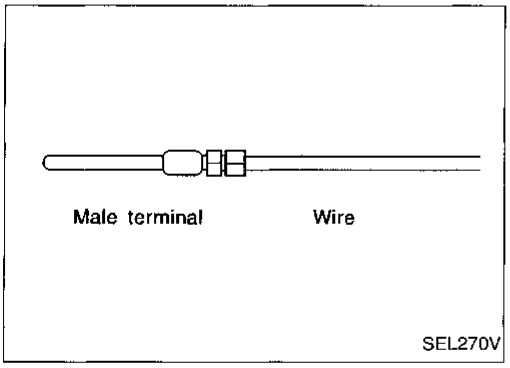


- **Do not insert any object other than the same type male terminal into female terminal.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

How to Probe Connectors (Cont'd)

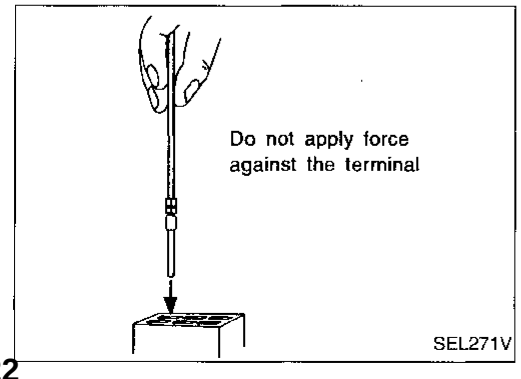
- Some connectors do not have a notch above each terminal. To probe each terminal, remove the connector retainer to make contact space for probing.



Male terminal

Carefully probe the contact surface of each terminal using a "T" pin
Do not bend terminal.

How to Check Enlarged Contact Spring of Terminal

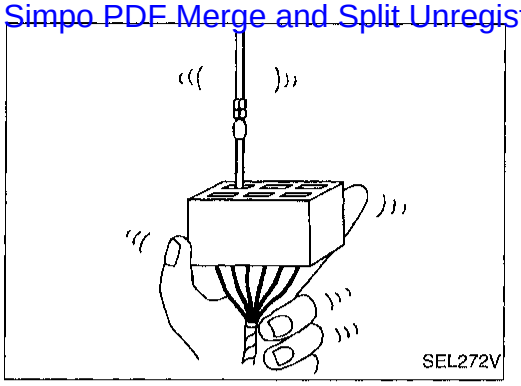


An enlarged contact spring of a terminal may create intermittent signals in the circuit.
If the intermittent open circuit occurs, follow the procedure below to inspect for open wires and enlarged contact spring of female terminal.

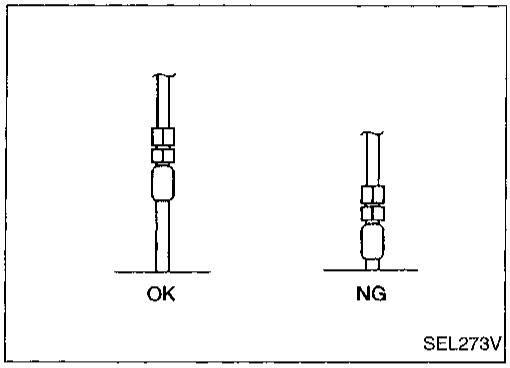
1. Assemble a male terminal and approx. 10 cm (3.9 in) of wire.

Use a male terminal which matches the female terminal.

2. Disconnect the suspected faulty connector and hold it terminal side up.

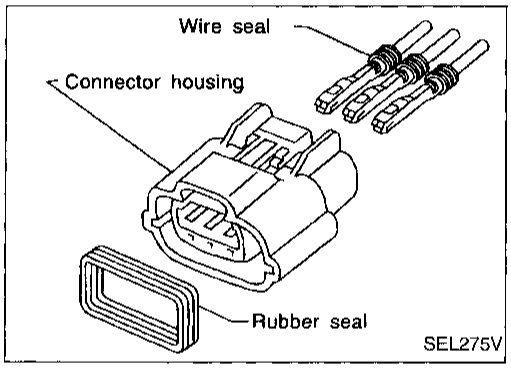


3. While holding the wire of the male terminal, try to insert the male terminal into the female terminal.



Do not force the male terminal into the female terminal with your hands.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

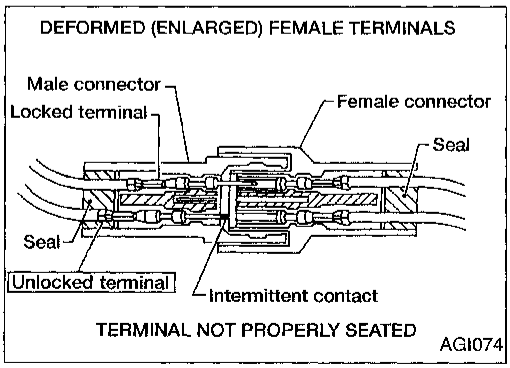


How to Check Enlarged Contact Spring of Terminal (Cont'd)

4. While moving the connector, check whether the male terminal can be easily inserted or not.

- If the male terminal can be easily inserted into the female terminal, replace the female terminal.

Waterproof Connector Inspection



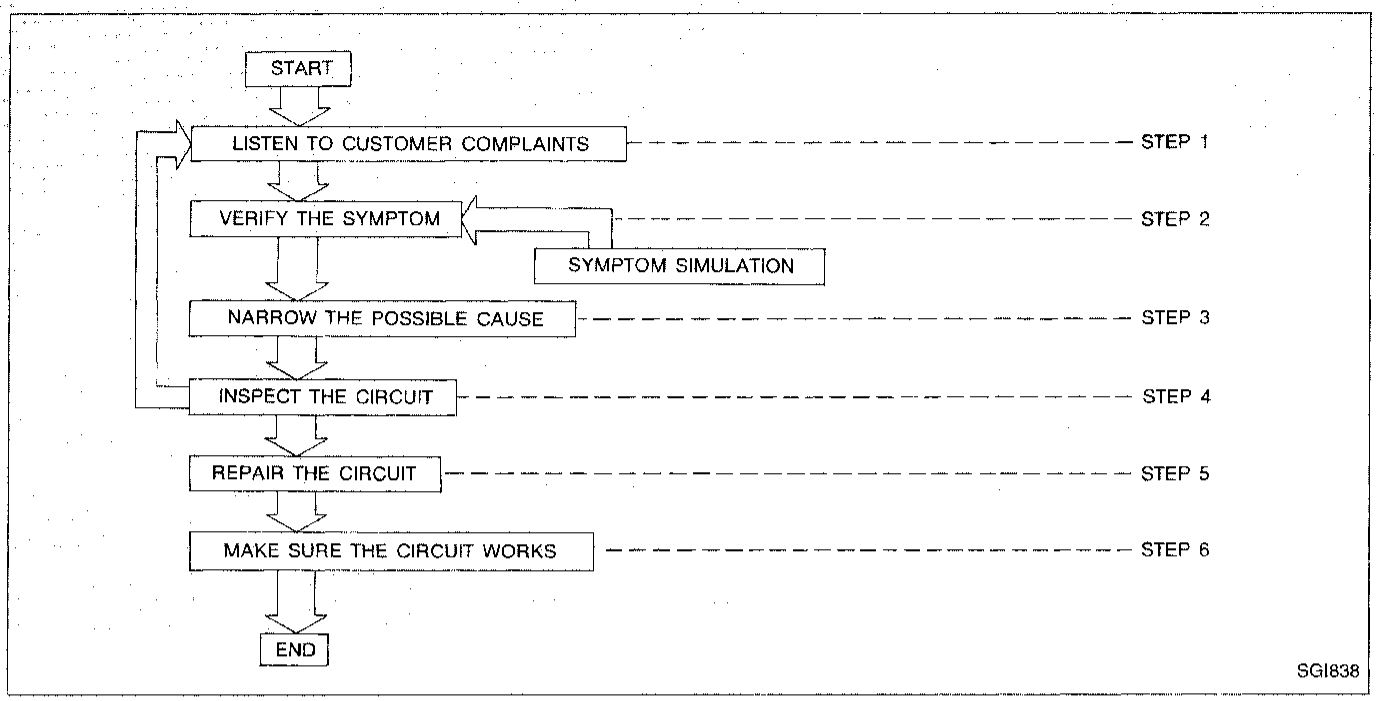
If water enters the connector, it can short interior circuits. This may lead to intermittent problems.
Check the following items to maintain the original waterproof characteristics.

RUBBER SEAL INSPECTION

Most waterproof connectors are provided with a rubber seal between the male and female connectors. If the seal is missing, the waterproof performance may not meet specifications.
The rubber seal may come off when connectors are disconnected. Whenever connectors are reconnected, make sure the rubber seal is properly installed on either side of male or female connector.

WIRE SEAL INSPECTION

The wire seal must be installed on the wire insertion area of a waterproof connector. Be sure that the seal is installed properly.



Terminal Lock Inspection

Check for unlocked terminals by pulling wire at the end of connector.
Unlocked terminal may create intermittent signals in the circuit.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Work Flow

STEP	DESCRIPTION
STEP 1	Get detailed information about the conditions and the environment when the incident occurred. The following are key pieces of information required to make a good analysis: **WHAT** Vehicle Model, Engine, Transmission and the System (i.e., Radio). **WHEN** Date, Time of Day, Weather Conditions, Frequency. **WHERE** Road Conditions, Altitude and Traffic Situation. **HOW** System Symptoms, Operating Conditions (Other Components Interaction). Service History and if any After Market Accessories have been installed.
STEP 2	Operate the system; road test if necessary. Verify the parameter of the incident. If the problem cannot be duplicated, refer to "Incident Simulation Tests" next page.
STEP 3	Get the proper diagnosis materials together including: POWER SUPPLY ROUTING System Operation Descriptions Applicable Service Manual Sections Check For Any Service Bulletins Identify where to begin diagnosis based upon your knowledge of the system operation and the customer comments.
STEP 4	Inspect the system for mechanical binding, loose connectors or wiring damage. Determine which circuits and components are involved and diagnose using the Power Supply Routing and Harness Layouts.
STEP 5	Repair or replace the incident circuit or component.
STEP 6	Operate and verify the system works properly under all conditions. Make sure you have not unintentionally created a new incident during your diagnosis or repair steps.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Incident Simulation Tests

INTRODUCTION

Sometimes the symptom is not present when the vehicle is brought in for service. If possible, recreate the conditions present at the time of the incident. Doing so may help avoid a No Trouble Found Diagnosis. The following section illustrates ways to simulate the conditions/environment under which the owner experiences an electrical incident.

The section is broken into the six following topics:

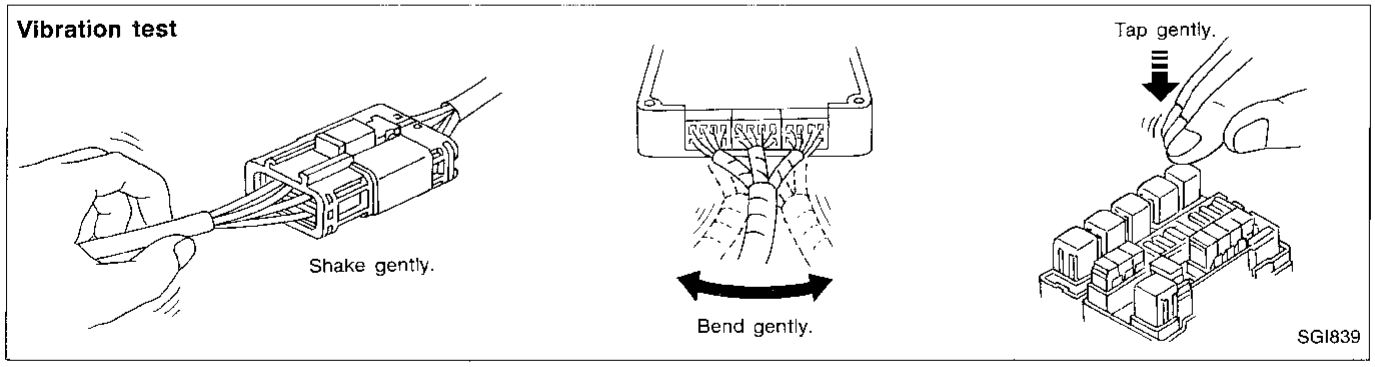
- Vehicle vibration
- Heat sensitive
- Freezing
- Water intrusion
- Electrical load
- Cold or hot start up

Get a thorough description of the incident from the customer. It is important for simulating the conditions of the problem.

VEHICLE VIBRATION

The problem may occur or become worse while driving on a rough road or when the engine is vibrating (idle with A/C on). In such a case, you will want to check for a vibration-related condition. Refer to the illustration below.

Connectors & harness



Determine which connectors and wiring harness would affect the electrical system you are inspecting. **Gently** shake each connector and harness while monitoring the system for the incident you are trying to duplicate. This test may indicate a loose or poor electrical connection.

Hint

Connectors can be exposed to moisture. It is possible to get a thin film of corrosion on the connector terminals. A visual inspection may not reveal this without disconnecting the connector. If the problem occurs intermittently, perhaps the problem is caused by corrosion. It is a good idea to disconnect, inspect and clean the terminals on related connectors in the system.

Sensors & relays

Gently apply a slight vibration to sensors and relays in the system you are inspecting.
This test may indicate a loose or poorly mounted sensor or relay.

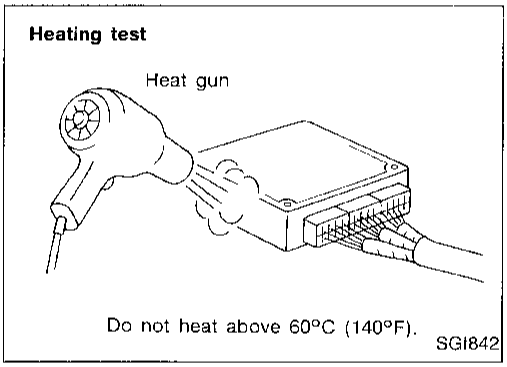
Incident Simulation Tests (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Engine compartment

There are several reasons a vehicle or engine vibration could cause an electrical complaint. Some of the things to check for are:

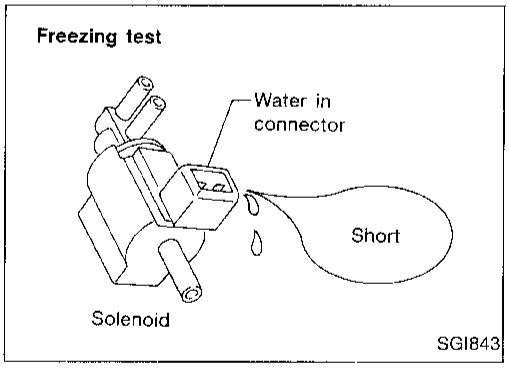
- Connectors not fully seated.
- Wiring harness not long enough and is being stressed due to engine vibrations or rocking.
- Wires laying across brackets or moving components.
- Loose, dirty or corroded ground wires.
- Wires routed too close to hot components.



To inspect components under the hood, start by verifying the integrity of ground connections. Refer to GI-26. First check that the system is properly grounded. Then, check for loose connection by **gently shaking** the wiring or components as previously explained. Using the wiring diagrams, inspect the wiring for continuity.

Behind the instrument panel

An improperly routed or improperly clamped harness can become pinched during accessory installation. Vehicle vibration can aggravate a harness which is routed along a bracket or near a screw.

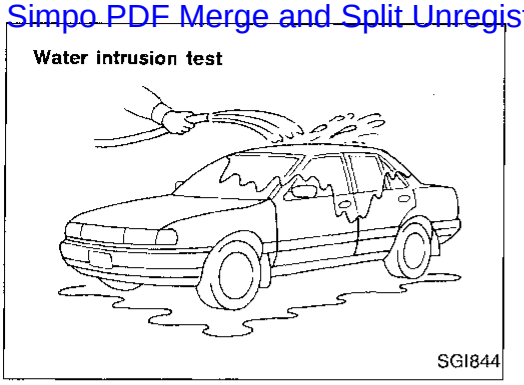


Under seating areas

An unclamped or loose harness can cause wiring to be pinched by seat components (such as slide guides) during vehicle vibration. If the wiring runs under seating areas, inspect wire routing for possible damage or pinching.

HEAT SENSITIVE

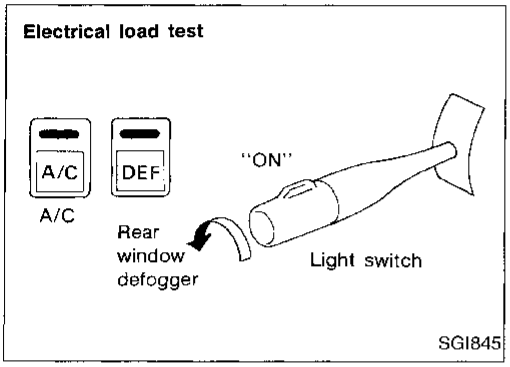
The owner's problem may occur during hot weather or after car has sat for a short time. In such cases, you will want to check for a heat sensitive condition.
To determine if an electrical component is heat sensitive, heat the component with a heat gun or equivalent.
Do not heat components above 60°C (140°F). If incident occurs while heating the unit, either replace or properly insulate the component.



FREEZING

The customer may indicate the incident goes away after the car warms up (winter time). The cause could be related to water freezing somewhere in the wiring/electrical system.
There are two methods to check for this. The first is to arrange for the owner to leave the car overnight. Make sure it will get cold enough to demonstrate the complaint. Leave the car parked outside overnight. In the morning, do a quick and thorough diagnosis of those electrical components which could be affected.
The second method is to put the suspect component into a freezer long enough for any water to freeze. Reinstall the part into the car and check for the reoccurrence of the incident. If it occurs, repair or replace the component.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Incident Simulation Tests (Cont'd)

WATER INTRUSION

The incident may occur only during high humidity or in rainy/snowy weather. In such cases, the incident could be caused by water intrusion on an electrical part. This can be simulated by soaking the car or running it through a car wash.

Do not spray water directly on any electrical components.

ELECTRICAL LOAD

The incident may be electrical load sensitive. Perform diagnosis with all accessories (including A/C, radio, fog lamps) turned on.

COLD OR HOT START UP

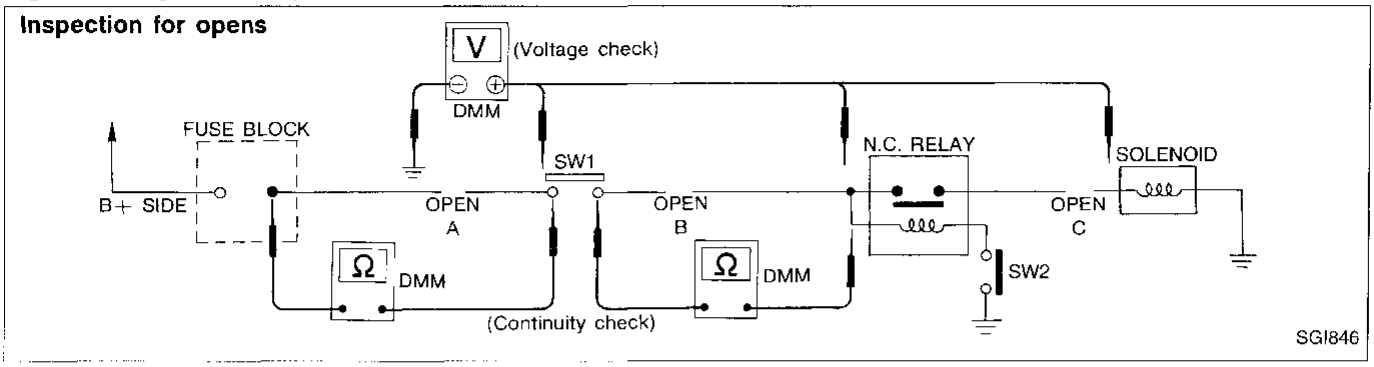
On some occasions, an electrical incident may occur only when the car is started cold. Or it may occur when the car is restarted hot shortly after being turned off. In these cases you may have to keep the car overnight to make a proper diagnosis.

Circuit Inspection

INTRODUCTION

In general, testing electrical circuits is an easy task if approached logically. Before beginning, it is important to have all available information on the system to be tested. Also, get a thorough understanding of system operation. Then you will be able to use the appropriate equipment and follow the correct test procedure.
You may have to simulate vehicle vibrations while testing electrical components. **Gently shake** the wiring harness or electrical component to do this.

OPEN	A circuit is open when there is no continuity through a section of the circuit.	
SHORT	There are two types of shorts.	
	• SHORT CIRCUIT	When a circuit contacts another circuit and causes the normal resistance to change.
	• SHORT TO GROUND	When a circuit contacts a ground source and grounds the circuit.



NOTE:
Refer to "HOW TO CHECK TERMINAL" in GI-17 to probe or check terminal.

Circuit Inspection (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

TESTING FOR "OPENS" IN THE CIRCUIT

Before you begin to diagnose and test the system, you should rough sketch a schematic of the system. This will help you to logically walk through the diagnosis process. Drawing the sketch will also reinforce your working knowledge of the system.

Continuity check method

The continuity check is used to find an open in the circuit. The Digital Multimeter (DMM) set on the resistance function will indicate an open circuit as over limit (OL, no beep tone or no ohms symbol). Make sure no power is supplied to the checked component. Always start with the DMM at the highest resistance level.
To help in understanding the diagnosis of open circuits, please refer to the schematic above.

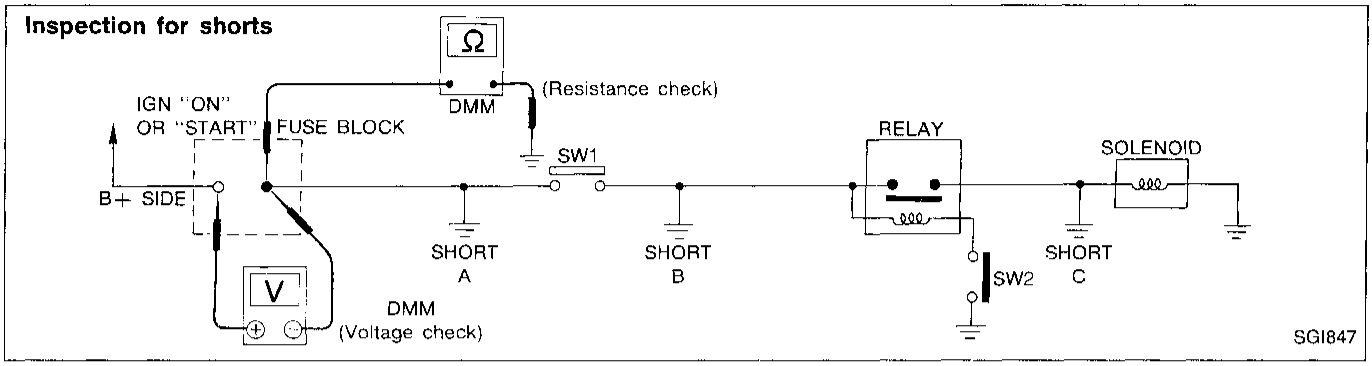
1. Disconnect the battery negative cable.
2. Start at one end of the circuit and work your way to the other end (At the fuse block in this example).
3. Connect one probe of the DMM to the fuse block terminal on the load side.
4. Connect the other probe to the fuse block (power) side of SW1. Little or no resistance will indicate that portion of the circuit has good continuity. If there was an open in the circuit, the DMM would indicate an over limit or infinite resistance condition (point A).
5. Connect the probes between SW1 and the relay. Little or no resistance will indicate that portion of the circuit has good continuity. If there was an open in the circuit, the DMM would indicate an over limit or infinite resistance condition (point B).
6. Connect the probes between the relay and the solenoid. Little or no resistance will indicate that portion of the circuit has good continuity. If there were an open in the circuit, the DMM would indicate an over limit or infinite resistance condition (point C).

Any circuit can be diagnosed using the approach in the above example.

Voltage check method

To help in understanding the diagnosis of open circuits, please refer to the previous schematic.
In any powered circuit, an open can be found by methodically checking the system for voltage. This is done by switching the DMM to the voltage function.

1. Connect one probe of the DMM to a known good ground.
2. Begin probing at one end of the circuit and work your way to the other end.
3. With SW1 open, probe at SW1 to check for voltage.
   - Voltage: open is further down the circuit than SW1.
   - No voltage: open is between fuse block and SW1 (point A).
4. Close SW1 and probe at relay.
   - Voltage: open is further down the circuit than the relay.
   - No voltage: open is between SW1 and relay (point B).
5. Close the relay and probe at the solenoid.
   - Voltage: open is further down the circuit than the solenoid.
   - No voltage: open is between relay and solenoid (point C).



Any powered circuit can be diagnosed using the approach in the above example.

Circuit Inspection (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

TESTING FOR "SHORTS" IN THE CIRCUIT

To simplify the discussion of shorts in the system, please refer to the schematic below.

Resistance check method

1. Disconnect the battery negative cable and remove the blown fuse.
2. Disconnect all loads (SW1 open, relay disconnected and solenoid disconnected) powered through the fuse.
3. Connect one probe of the ohmmeter to the load side of the fuse terminal. Connect the other probe to a known good ground.
4. With SW1 open, check for continuity.
   - Continuity: short is between fuse terminal and SW1 (point A).
   - No continuity: short is further down the circuit than SW1.
5. Close SW1 and disconnect the relay. Put probes at the load side of fuse terminal and a known good ground. Then, check for continuity.
   - Continuity: short is between SW1 and the relay (point B).
   - No continuity: short is further down the circuit than the relay.
6. Close SW1 and jump the relay contacts with jumper wire. Put probes at the load side of fuse terminal and a known good ground. Then, check for continuity.
   - Continuity: short is between relay and solenoid (point C).
   - No continuity: check solenoid, retrace steps.

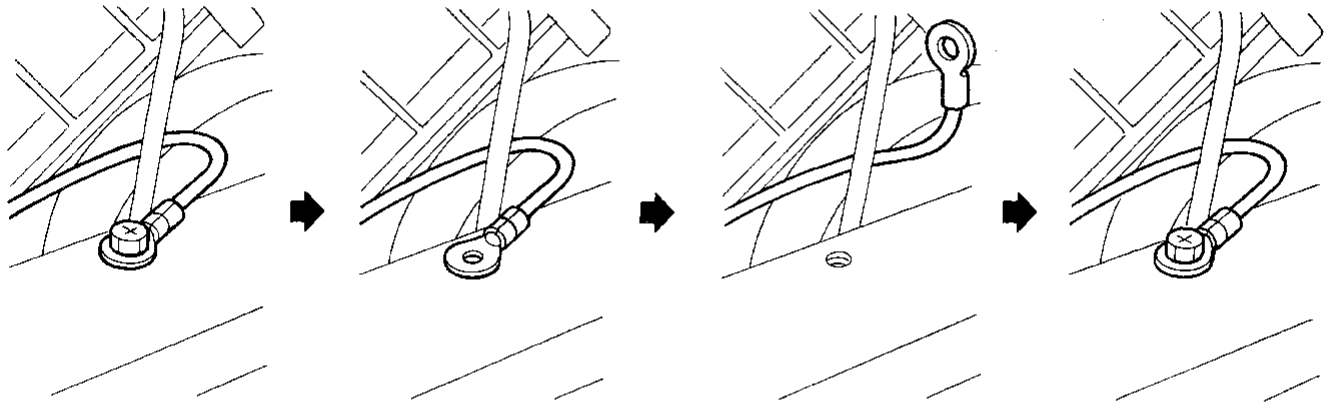
Voltage check method

1. Remove the blown fuse and disconnect all loads (i.e., SW1 open, relay disconnected and solenoid disconnected) powered through the fuse.
2. Turn the ignition key to the ON or START position. Verify battery voltage at the B + side of the fuse terminal (one lead on the B + terminal side of the fuse block and one lead on a known good ground).
3. With SW1 open and the DMM leads across both fuse terminals, check for voltage.
   - Voltage: short is between fuse block and SW1 (point A).
   - No voltage: short is further down the circuit than SW1.
4. With SW1 closed, relay and solenoid disconnected and the DMM leads across both fuse terminals, check for voltage.
   - Voltage: short is between SW1 and the relay (point B).
   - No voltage: short is further down the circuit than the relay.
5. With SW1 closed, relay contacts jumped with fused jumper wire check for voltage.
   - Voltage: short is down the circuit of the relay or between the relay and the disconnected solenoid (point C).
   - No voltage: retrace steps and check power to fuse block.

Circuit Inspection (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

GROUND INSPECTION



Ground connections are very important to the proper operation of electrical and electronic circuits. Ground connections are often exposed to moisture, dirt and other corrosive elements. The corrosion (rust) can become an unwanted resistance. This unwanted resistance can change the way a circuit works.

Electronically controlled circuits are very sensitive to proper grounding. A loose or corroded ground can drastically affect an electronically controlled circuit. A poor or corroded ground can easily affect the circuit. Even when the ground connection looks clean, there can be a thin film of rust on the surface.

When inspecting a ground connection follow these rules:

1. Remove the ground bolt screw or clip.
2. Inspect all mating surfaces for tarnish, dirt, rust, etc.
3. Clean as required to assure good contact.
4. Reinstall bolt or screw securely.
5. Inspect for "add-on" accessories which may be interfering with the ground circuit.
6. If several wires are crimped into one ground eyelet terminal, check for proper crimps. Make sure all of the wires are clean, securely fastened and providing a good ground path. If multiple wires are cased in one eyelet, make sure no ground wires have excess wire insulation.

Ground Inspection

SGI853

Circuit Inspection (Cont'd)

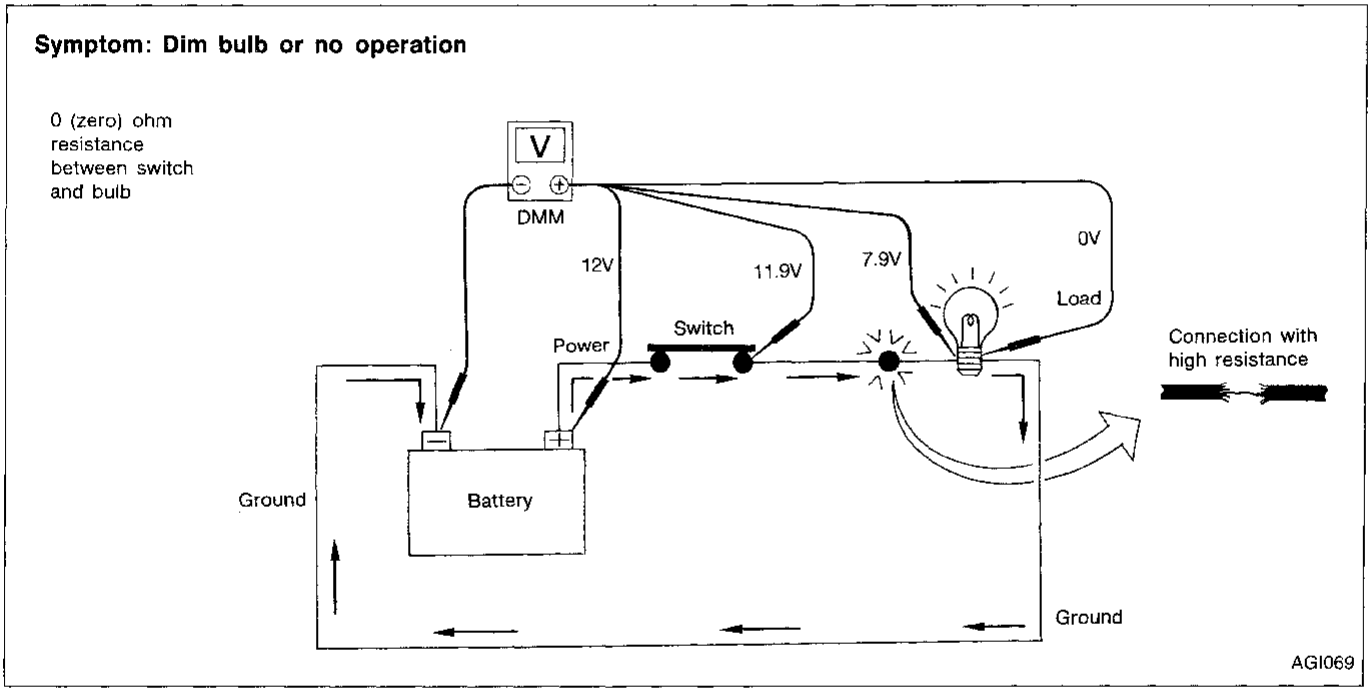
VOLTAGE DROP TESTS

Voltage drop tests are often used to find components or circuits which have excessive resistance. A voltage drop in a circuit is caused by a resistance **when the circuit is in operation**.

Check the wire in the illustration. When measuring resistance with ohmmeter, contact by a single strand of wire will give reading of 0 ohms. This would indicate a good circuit. When the circuit operates, this single strand of wire is not able to carry the current. The single strand will have a high resistance to the current. This will be picked up as a slight voltage drop.

Unwanted resistance can be caused by many situations:



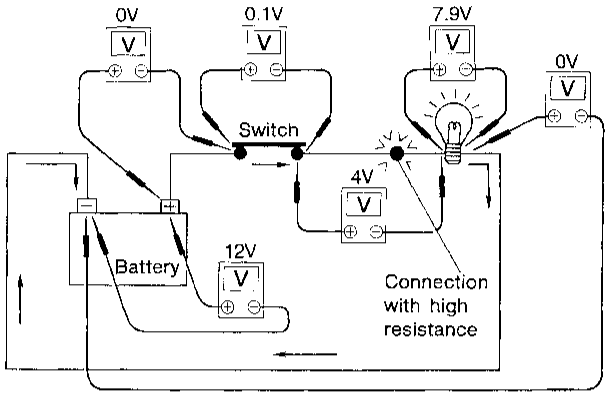
- Undersized wiring (single strand example)
- Corrosion on switch contacts
- Loose wire connections or splices.

If repairs are needed always use wire that is of the same or larger gauge.

Measuring voltage drop — Accumulated method

1. Connect the voltmeter across the connector or part of the circuit you want to check. The positive lead of the voltmeter should be closer to power and the negative lead closer to ground.
2. Operate the circuit.
3. The voltmeter will indicate how many volts are being used to "push" current through that part of the circuit.

Note in the illustration that there is an excessive 4.1 volt drop between the battery and the bulb.



Circuit Inspection (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Measuring voltage drop — Step by step

The step by step method is most useful for isolating excessive drops in low voltage systems (such as those in "Computer Controlled Systems").
Circuits in the computer controlled system operate on very low amperage.
Computer controlled operations can be adversely affected by any variation in resistance in the system. Such resistance variation may be caused by poor connection, improper installation, improper wire gauge or corrosion.
The step by step voltage drop test can identify a component or wire with too much resistance.

1. Connect the voltmeter as shown, starting at the battery and working your way around the circuit.
2. An unusually large voltage drop will indicate a component or wire that needs to be repaired. In the illustration, the poor connection causes a 4 volt drop.

The chart that follows illustrates some maximum allowable voltage drops. These values are given as a guideline, the exact value for each component may vary.

COMPONENT	VOLTAGE DROP
Wire	negligible <.001 volts
Ground Connections	Approx. 0.1 volts
Switch Contacts	Approx. 0.3 volts

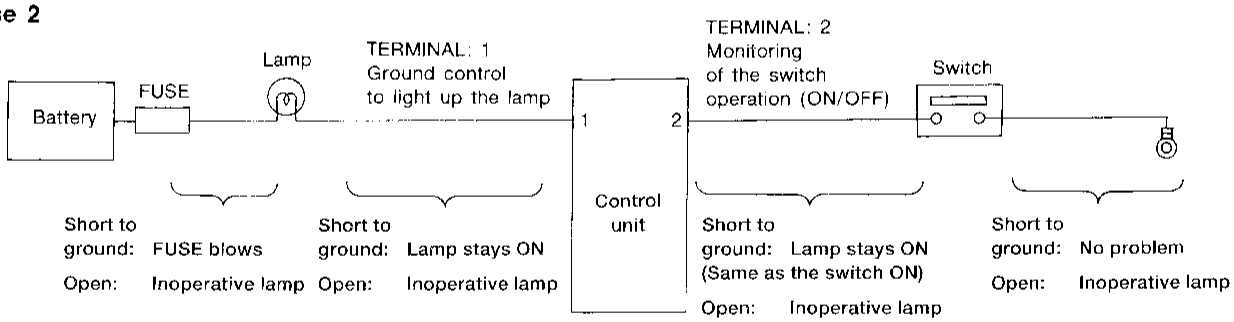
Circuit Inspection (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Relationship between open/short (high resistance) circuit and the ECM pin control

System Description: When the switch is ON, the ECM lights up the lamp.

Case 1



Input-output voltage chart

Pin No.	Item	Condition	Voltage value [V]	In case of high resistance such as single strand [V] *
1	Switch	Switch ON	Battery voltage	Lower than battery voltage Approx. 8 (Example)
		OFF	Approx. 0	Approx. 0
2	Lamp	Switch ON	Battery voltage	Approx. 0 (Inoperative lamp)
		OFF	Approx. 0	Approx. 0

The voltage value is based on the body ground.

*: If high resistance exists in the switch side circuit (caused by a single strand), terminal 1 does not detect battery voltage. Control unit does not detect the switch is ON even if the switch does turn ON. Therefore, the Control unit does not supply power to light up the lamp.

Case 2

Input-output voltage chart

Pin No.	Item	Condition	Voltage value [V]	In case of high resistance such as single strand [V] *
1	Lamp	Switch ON	Approx. 0	Battery voltage (Inoperative lamp)
		OFF	Battery voltage	Battery voltage
2	Switch	Switch ON	Approx. 0	Higher than 0 Approx. 4 (Example)
		OFF	Approx. 5	Approx. 5

The voltage value is based on the body ground.

*: If high resistance exists in the switch side circuit (caused by a single strand), terminal 2 does not detect approx. 0V. Control unit does not detect the switch is ON even if the switch does turn ON. Therefore, the Control unit does not control ground to light up the lamp.

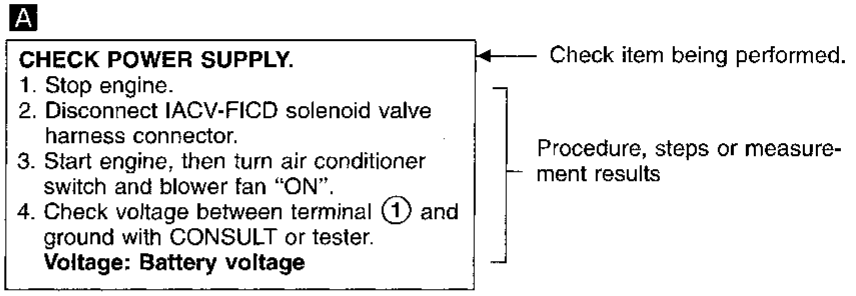
The flow chart indicates work procedures required to diagnose problems effectively. Observe the following instructions before diagnosing.

1) **Use the flow chart after locating probable causes of a problem following the "Preliminary Check", the "Symptom Chart" or the "Work Flow".**
2) **After repairs, re-check that the problem has been completely eliminated.**
3) **Refer to Component Parts and Harness Connector Location for the Systems described in each section for identification/location of components and harness connectors.**
4) **Refer to the Circuit Diagram for quick pinpoint check.**
   If you must check circuit continuity between harness connectors in more detail, such as when a sub-harness is used, refer to Wiring Diagram and Harness Layout in EL section for identification of harness connectors.
5) **When checking circuit continuity, ignition switch should be OFF.**
6) **Before checking voltage at connectors, check battery voltage.**
7) **After accomplishing the Diagnostic Procedures and Electrical Components Inspection, make sure that all harness connectors are reconnected properly.**

Example



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

How To Follow This Flow Chart

1 Work and diagnostic procedure

Start to diagnose a problem using procedures indicated in enclosed blocks, as shown in the following example.

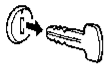
2 Measurement results

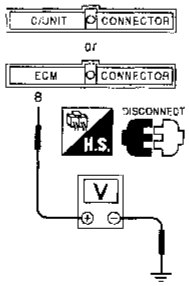
Required results are indicated in bold type in the corresponding block, as shown below.
These have the following meanings:

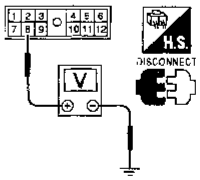
Battery voltage → 11 - 14V or approximately 12V
Voltage: Approximately 0V → Less than 1V
Resistance: Continuity should exist → Approximately 0Ω

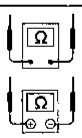
3 Cross reference of work symbols in the text and illustrations

Illustrations are provided as visual aids for work procedures. For example, symbol A indicated in the left upper portion of each illustration corresponds with the symbol in the flowchart for easy identification. More precisely, the procedure under the "CHECK POWER SUPPLY" outlined previously is indicated by an illustration A.









4 Symbols used in illustrations

Symbols included in illustrations refer to measurements or procedures. Before diagnosing a problem, familiarize yourself with each symbol.
For connector symbols, refer to "HOW TO READ WIRING DIAGRAMS" on GI-13.

DIRECTION MARK
Refer to "CONNECTOR SYMBOLS" on GI-13.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Key to symbols signifying measurements or procedures

Symbol	Symbol explanation	Symbol	Symbol explanation
	Check after disconnecting the connector to be measured.		Procedure with CONSULT.
	Check after connecting the connector to be measured.		Procedure without CONSULT.
	Insert key into ignition switch.		Procedure with Generic Scan Tool (GST, OBD-II scan tool).
	Remove key from ignition switch.		Procedure without CONSULT or GST.
	Turn ignition switch to "OFF" position.		A/C switch is "OFF".
	Turn ignition switch to "ON" position.		A/C switch is "ON".
	Turn ignition switch to "START" position.		Fan switch is "ON". (At any position except for "OFF" position)
	Turn ignition switch from "OFF" to "ACC" position.		Fan switch is "OFF".
	Turn ignition switch from "ACC" to "OFF" position.		Apply positive voltage from battery with fuse directly to components.
	Turn ignition switch from "OFF" to "ON" position.		Drive vehicle.
	Turn ignition switch from "ON" to "OFF" position.		Disconnect battery negative cable.
	Do not start engine, check with engine stopped.		Depress brake pedal.
	Start engine, check with engine running.		Release brake pedal.
	Apply parking brake.		Depress accelerator pedal.
	Release parking brake.		Release accelerator pedal.
	Check after engine is warmed up sufficiently.		Pin terminal check for SMJ type ECM connectors. **For details regarding the terminal arrangement, refer to the foldout page.** 
	Voltage should be measured with a voltmeter.		
	Circuit resistance should be measured with an ohmmeter.		
	Current should be measured with an ammeter.		

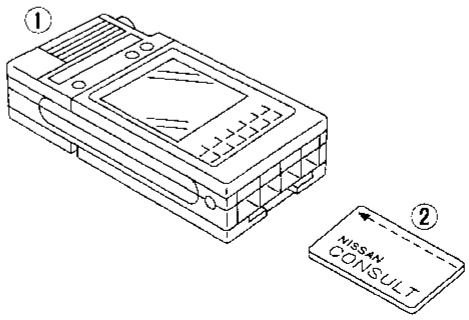
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Function and System Application

Diagnostic test mode	Function	ECCS	Air bag	ABS
Work support	This mode enables a technician to adjust some devices faster and more accurately by following the indications on CONSULT.	x	—	—
Self-diagnostic results	Self-diagnostic results can be read and erased quickly.	x	x	x
Trouble diagnostic record	Current self-diagnostic results and all trouble diagnostic records previously stored can be read.	—	x	—
ECU discriminated No.	Classification number of a replacement ECU can be read to prevent an incorrect ECU from being installed.	—	x	—
Data monitor	Input/Output data in the ECM can be read.	x	—	x
DTC work support	This mode enables a technician to set operating conditions to confirm self-diagnosis status/result.	—	—	—
Active test	Diagnostic Test Mode in which CONSULT drives some actuators apart from the ECMs and also shifts some parameters in a specified range.	x	—	x
DTC confirmation	The results of SRT (System Readiness Test) and the self-diagnosis status/result can be confirmed.	x	—	—
ECM part number	ECM part number can be read.	x	—	x
Function test	Conducted by CONSULT instead of a technician to determine whether each system is "OK" or "NG".	x	—	—

x: Applicable

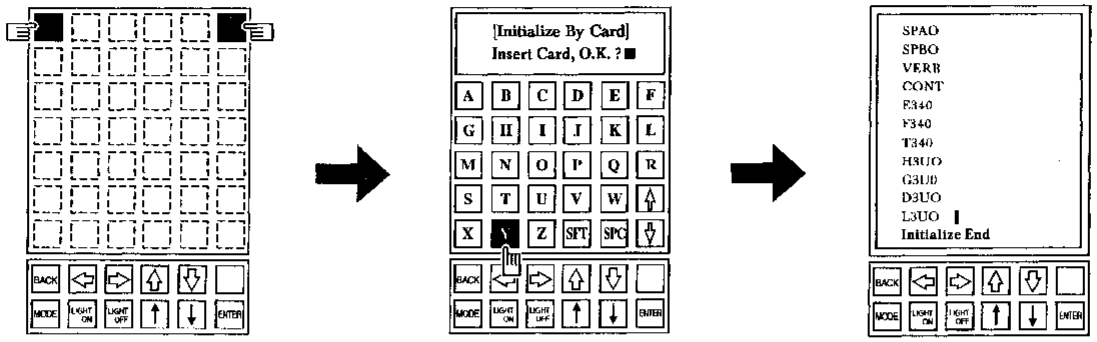
Lithium Battery Replacement



CONSULT contains a lithium battery. When replacing the battery, do the following:

WARNING:

Replace the lithium battery with SANYO Electric Co., Ltd., CR2032 only. Use of another battery may present a risk of fire or explosion. The battery may present a fire or chemical burn hazard if mistreated.
Do not recharge, disassemble or dispose of in fire.
Keep the battery out of reach of children and discard used battery conforming to the local regulations.

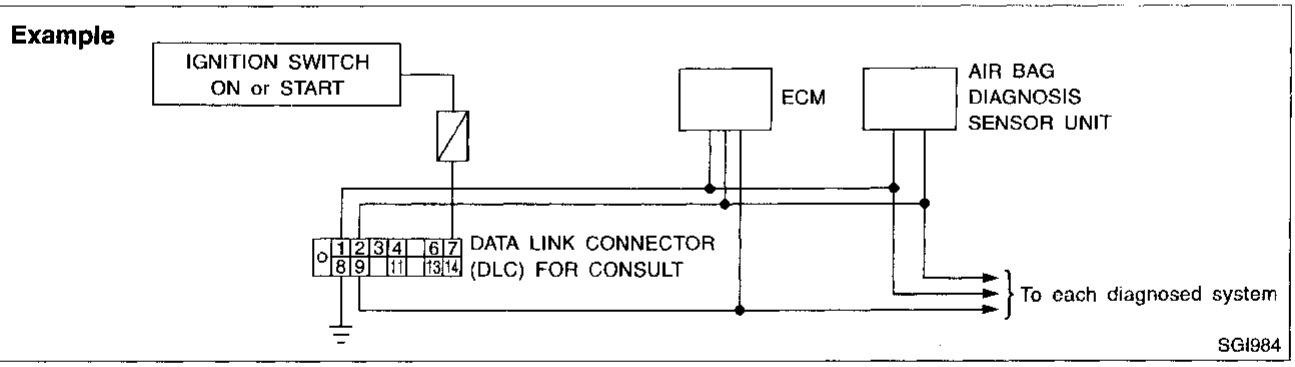


Checking Equipment

When ordering the below equipment, contact your NISSAN distributor.

Tool name	Description
NISSAN CONSULT ① CONSULT unit and accessories ② Program card UE950, UE951 and UEOBD98 (For Engine and A/T system)	 NT004

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Loading Procedure

1. While holding down the upper left and right corner keys of the CONSULT touch panel, simultaneously press the power "ON" switch. While pushing the power "ON" switch, hold down both corner keys until the next screen appears.
2. If the initialization was done correctly, the following message will appear at the top of the display: "[Initialize By Card] Insert Card, O.K.?"
3. Insert the program card into the CONSULT program card reader.
4. Press "Y" on the touch panel.
5. Now the program will start to load.
6. After the "Initialize End" message appears, touch the "OFF" switch.

SGI983

CONSULT Data Link Connector (DLC) Circuit

SGI984

INSPECTION PROCEDURE

If the CONSULT cannot diagnose the system properly, check the following items.

Symptom	Check item
CONSULT cannot access any system.	● CONSULT DLC power supply circuit (Terminal 7) and ground circuit (Terminal 8) (For detailed circuit, refer to "MIL & Data Link Connectors Wiring Diagram" in EC section.) ● CONSULT DDL cable
CONSULT cannot access individual system. (Other systems can be accessed.)	● CONSULT program card (Check the appropriate CONSULT program card for the system. Refer to GI-33.) ● Power supply and ground circuit for the control unit of the system (For detailed circuit, refer to wiring diagram for each system.) ● Open or short circuit between the system and CONSULT DLC (For detailed circuit, refer to wiring diagram for each system.)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

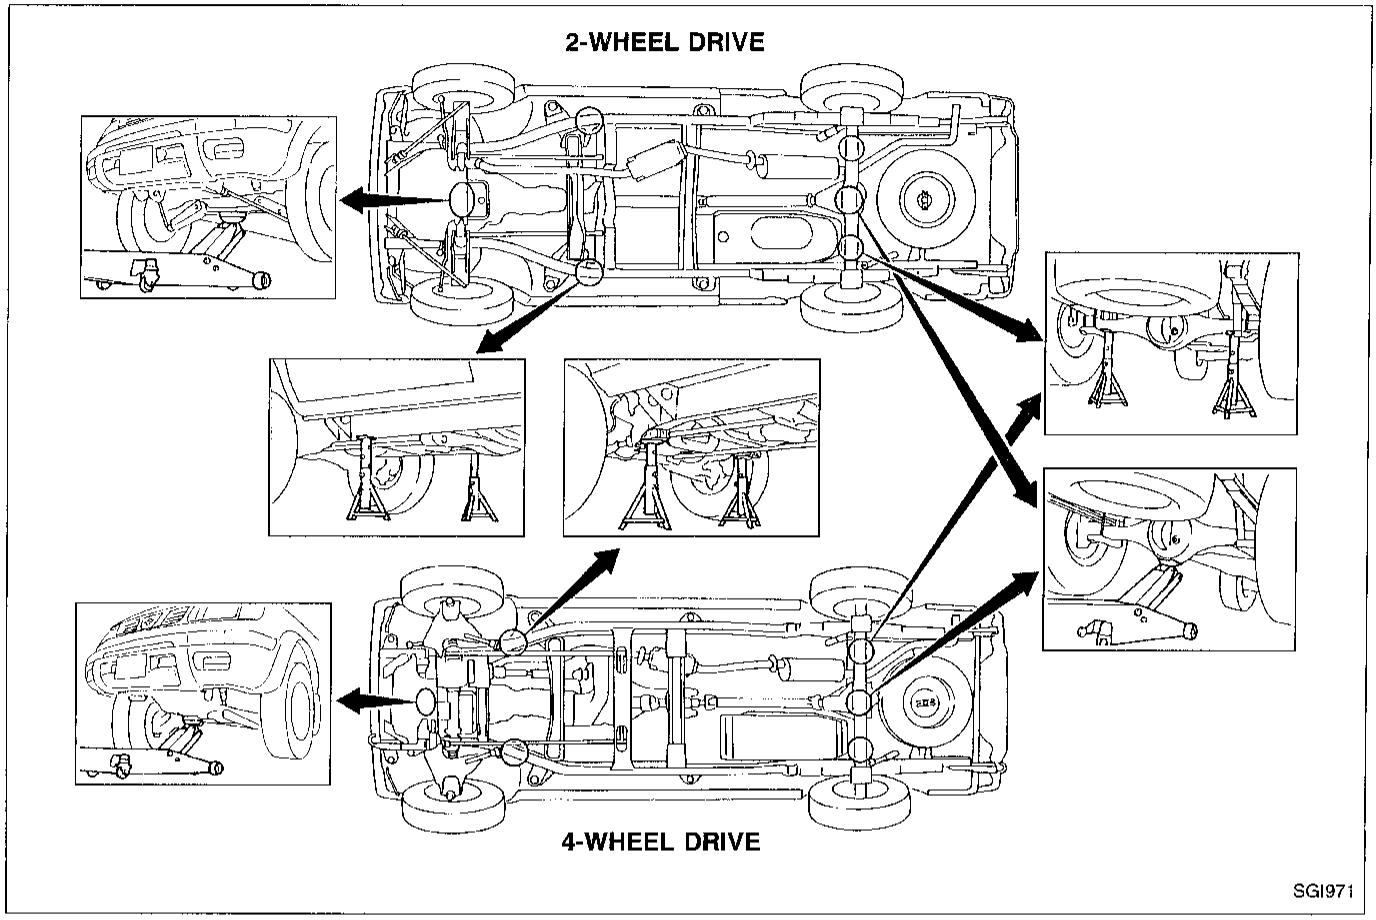
WARNING:

- **Never get under the vehicle while it is supported only by the jack. Always use safety stands to support the frame when you have to get under the vehicle.**
- **Place wheel chocks at both front and back of the wheels on the ground.**

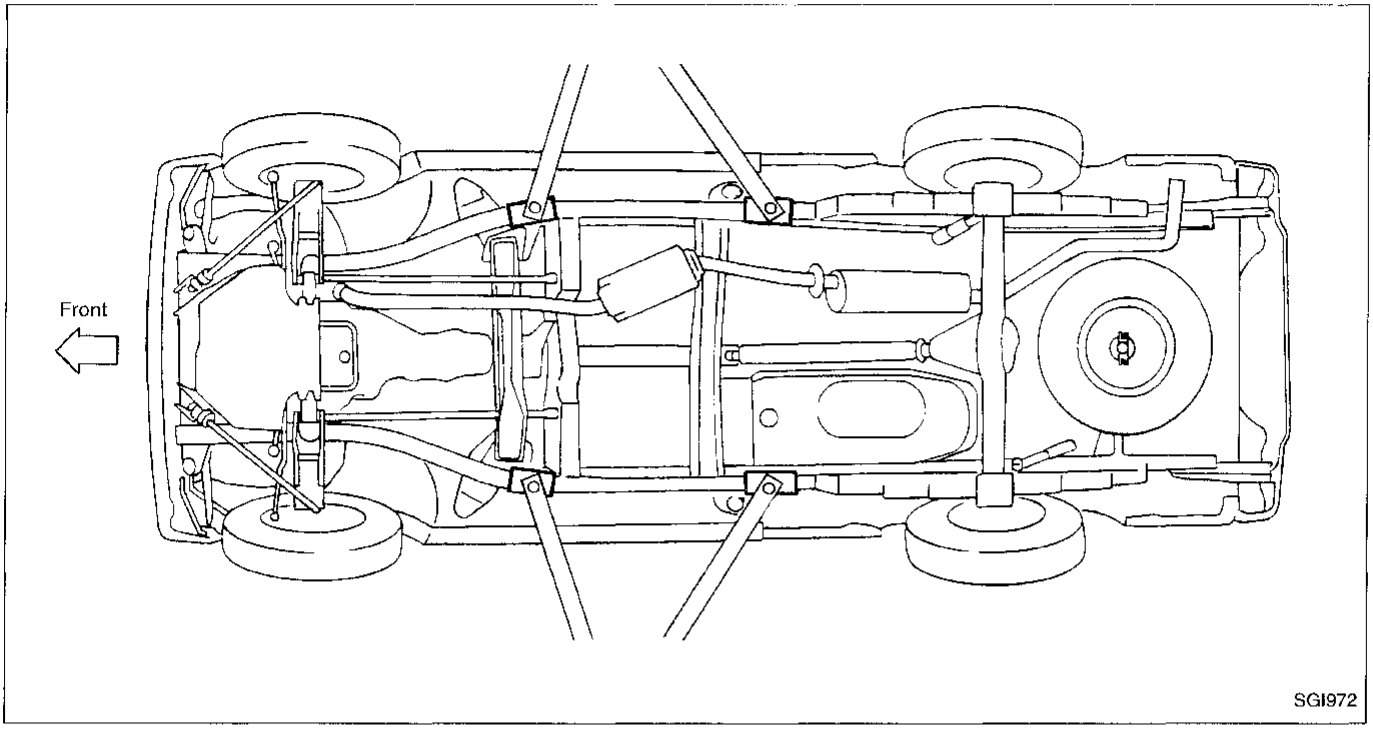


Pantograph Jack

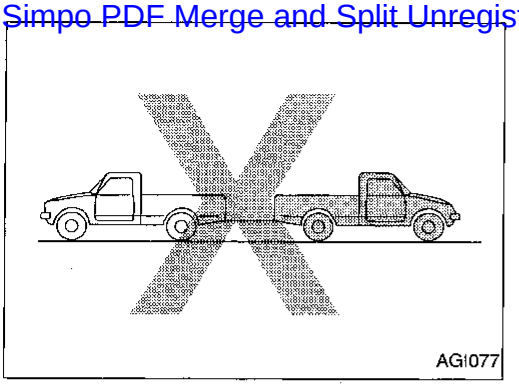
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Garage Jack and Safety Stand

CAUTION:
Place a wooden or rubber block between safety stand and vehicle body when the supporting body is flat.



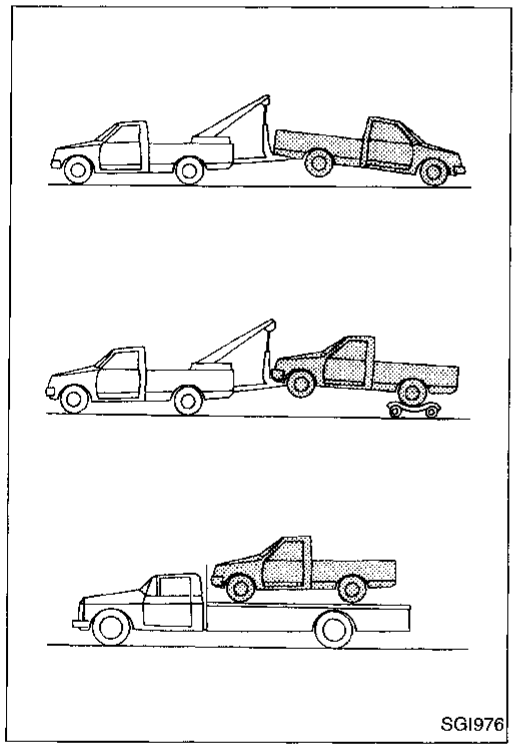
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



2-pole Lift

WARNING:

When lifting the vehicle, open the lift arms as wide as possible and ensure that the front and rear of the vehicle are well balanced.
When setting the lift arm, do not allow the arm to contact the brake tubes, brake cable or fuel lines.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

AGI077

Tow Truck Towing

CAUTION:

- **All applicable state or Provincial (in Canada) laws and local laws regarding the towing operation must be obeyed.**
- **It is necessary to use proper towing equipment to avoid possible damage to the vehicle during towing operation. Towing is in accordance with Towing Procedure Manual at dealer.**
- **Always attach safety chains before towing.**
- **When towing, make sure that the transmission, steering system and power train are in good order. If any unit is damaged, dollies must be used.**
- **Never tow an automatic transmission model from the rear (i.e., backward) with four wheels on the ground as this may cause serious and expensive damage to the transmission.**

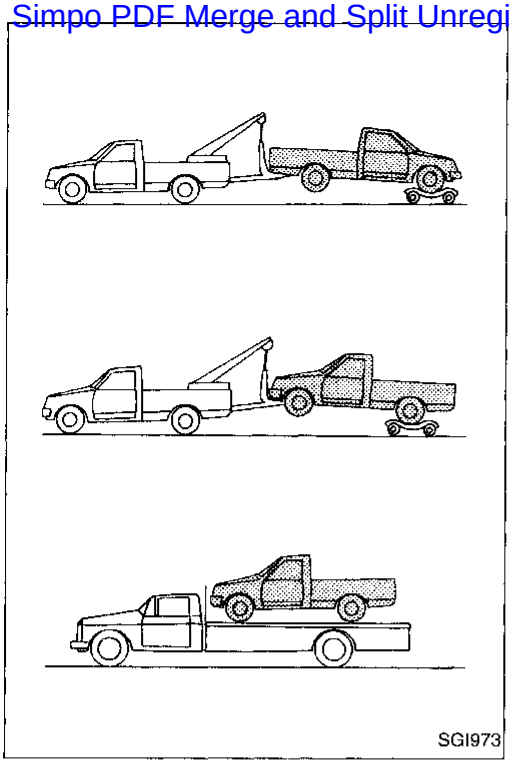
SGI976

2-WHEEL DRIVE MODELS

NISSAN recommends that vehicle be towed with the driving (rear) wheels off the ground as illustrated.

CAUTION:

- **When towing with the front wheels on the ground: Turn the ignition key to the "OFF" position and move the transmission shift lever to the neutral postion. On automatic transmission models, to move the selector lever to "N" (neutral) position, turn the ignition key to "ACC" position. After moving the selector lever to "N" (neutral) position, turn the ignition key to "OFF" position and secure the steering wheel in a straight ahead position with a rope or similar device. Never place the ignition key in the "LOCK" position. This will result in damage to the steering lock mechanism.**
- **When towing manual transmission models with the rear wheels on the ground (if you do not use a towing dollies): Always release the parking brake and move the transmission shift lever to the neutral position.**



Observe the following restricted towing speeds and distances.

Speed: Below 95 km/h (60 MPH)
Distance: Less than 800 km (500 miles)

If the speed or distance must necessarily be greater, remove the propeller shaft beforehand to prevent damage to the transmission.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Tow Truck Towing (Cont'd)

SGI973

4-WHEEL DRIVE MODELS

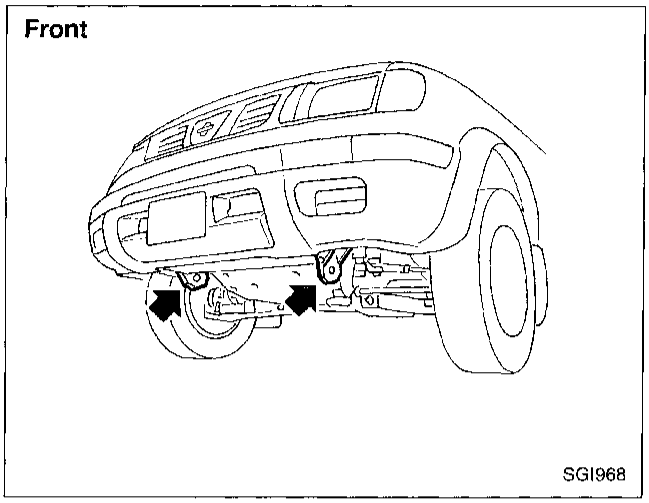
NISSAN recommends that a dolly be used as illustrated when towing 4-wheel drive models.

CAUTION:

- **When towing with the front wheels on the ground or rear wheels on the ground (If you do not use a towing dollies): Set the free-running hubs to the free position and move the transfer case shift lever into the "2H" position.**
- **When towing with the front wheels on the ground: Turn the ignition key to the "OFF" position and secure the steering wheel in a straight ahead position with a rope or similar device. Never place the ignition key in the "LOCK" position. This will result in damage to the steering lock mechanism.**
- **When towing manual transmission models with the rear wheels on the ground:**
  Always release the parking brake and move the transmission shift lever to the neutral position.

Observe the following restricted towing speeds and distances.

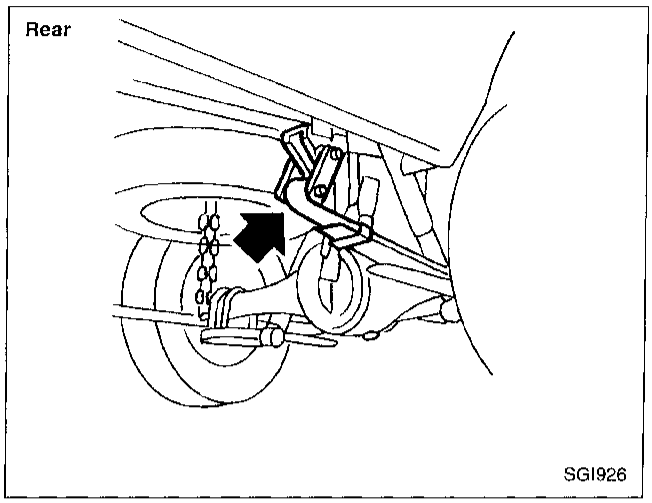
Speed: Below 95 km/h (60 MPH)
Distance: Less than 800 km (500 miles)



If the speed or distance must necessarily be greater, remove the front and rear propeller shafts beforehand to prevent damage to the transmission.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Towing Point



Never tow the vehicle using only the towing points. To avoid damaging the vehicle body, use proper towing equipment when towing.

Front

SGI968

Rear

SGI926

VEHICLE RECOVERY (Freeing a stuck vehicle)

- Pulling devices should be routed so they do not touch any part of the suspension, steering, brake or cooling systems.
- Always pull the cable straight out from the front or rear of the vehicle. Never pull the vehicle at a sideways angle.
- Pulling devices such as ropes or canvas straps are not recommended for use for vehicle towing or recovery.

SAE J1930 Terminology List

All emission related terms used in this publication in accordance with SAE J1930 are listed. Accordingly, new terms, new acronyms/abbreviations and old terms are listed in the following chart.

***: Not applicable

NEW TERM	NEW ACRONYM / ABBREVIATION	OLD TERM
Air cleaner	ACL	Air cleaner
Barometric pressure	BARO	***
Barometric pressure sensor-BCDD	BAROS-BCDD	BCDD
Camshaft position	CMP	***
Camshaft position sensor	CMPS	Crank angle sensor
Carburetor	CARB	Carburetor
Charge air cooler	CAC	Intercooler
Closed loop	CL	Closed loop
Closed throttle position switch	CTP switch	Idle switch
Clutch pedal position switch	CPP switch	Clutch switch
Continuous fuel injection system	CFI system	***
Continuous trap oxidizer system	CTOX system	***
Crankshaft position	CKP	***
Crankshaft position sensor	CKPS	***
Data link connector	DLC	***
Data link connector for CONSULT	DLC for CONSULT	Diagnostic connector for CONSULT
Diagnostic test mode	DTM	Diagnostic mode
Diagnostic test mode selector	DTM selector	Diagnostic mode selector
Diagnostic test mode I	DTM I	Mode I
Diagnostic test mode II	DTM II	Mode II
Diagnostic trouble code	DTC	Malfunction code
Direct fuel injection system	DFI system	***
Distributor ignition system	DI system	Ignition timing control
Early fuel evaporation-mixture heater	EFE-mixture heater	Mixture heater
Early fuel evaporation system	EFE system	Mixture heater control
Electrically erasable programmable read only memory	EEPROM	***
Electronic ignition system	EI system	Ignition timing control
Engine control	EC	***
Engine control module	ECM	ECCS control unit
Engine coolant temperature	ECT	Engine temperature
Engine coolant temperature sensor	ECTS	Engine temperature sensor
Engine modification	EM	***
Engine speed	RPM	Engine speed
Erasable programmable read only memory	EPROM	***
Evaporative emission canister	EVAP canister or Canister	Canister

When you read wiring diagrams:
- **Read GI section, "HOW TO READ WIRING DIAGRAMS".**
- **See EL section, "POWER SUPPLY ROUTING" for power distribution circuit.**

When you perform trouble diagnoses, read GI section, "HOW TO FOLLOW FLOW CHART IN TROUBLE DIAGNOSES" and "HOW TO PERFORM EFFICIENT DIAGNOSIS FOR AN ELECTRICAL INCIDENT".

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Supplemental Restraint System (SRS) "AIR BAG"

The Supplemental Restraint System "AIR BAG", used along with a seat belt, helps to reduce the risk or severity of injury to the driver and front passenger in a frontal collision. The Supplemental Restraint System consists of air bag modules (located in the center of the steering wheel and in the instrument panel on the passenger side), a diagnosis sensor unit, a crash zone sensor (4WD models), warning lamp, wiring harness and spiral cable.

The vehicle is equipped with a passenger air bag deactivation switch. Because no rear seat exists where a rear-facing child restraint can be placed, the switch is designed to turn off the passenger air bag so that a rear-facing child restraint can be used in the front passenger seat. The switch is located in the center of the instrument panel, near the ashtray. When the switch is turned to the ON position, the passenger air bag is enabled and could inflate in a frontal collision. When the switch is turned to the OFF position, the passenger air bag is disabled and will not inflate in a frontal collision. A passenger air bag OFF indicator on the instrument panel lights up when the passenger air bag is switched OFF. The driver air bag always remains enabled and is not affected by the passenger air bag deactivation switch.

Information necessary to service the system safely is included in the **RS section** of this Service Manual.

WARNING:

- **To avoid rendering the SRS inoperative, which could increase the risk of personal injury or death in the event of a collision which would result in air bag inflation, all maintenance should be performed by an authorized NISSAN dealer.**
- **Improper maintenance, including incorrect removal and installation of the SRS, can lead to personal injury caused by unintentional activation of the system.**
- **Do not use electrical test equipment on any circuit related to the SRS unless instructed to in this Service Manual. SRS wiring harnesses are covered with yellow insulation either just before the harness connectors or on the complete harness, for easy identification.**
- **The vehicle is equipped with a passenger air bag deactivation switch which can be operated by the customer. When the passenger air bag is switched OFF, the passenger air bag is disabled and will not inflate in a frontal collision. When the passenger air bag is switched ON, the passenger air bag is enabled and could inflate in a frontal collision. After SRS maintenance or repair, make sure the passenger air bag deactivation switch is in the same position (ON or OFF) as when the vehicle arrived for service.**

Precautions for Working with R-134a

WARNING:

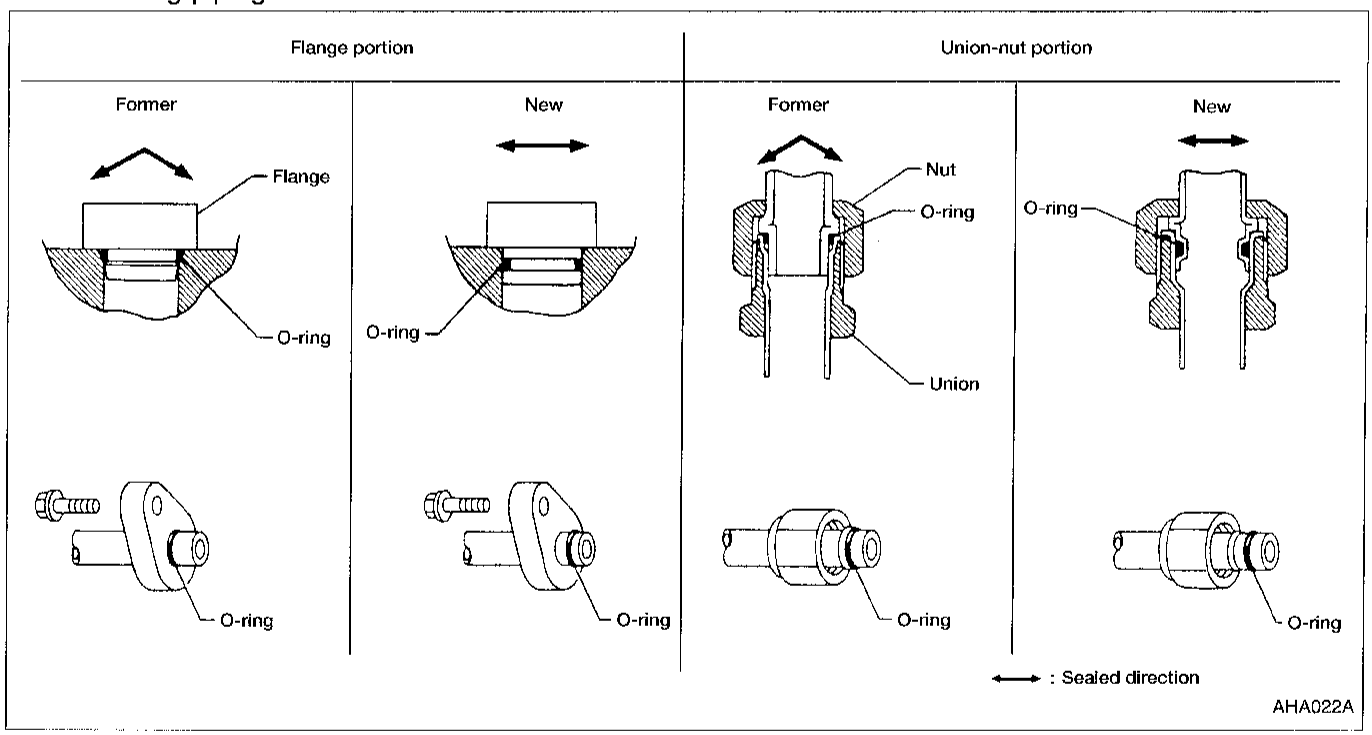
- **CFC-12 (R-12) refrigerant and R-134a refrigerant are not compatible. These refrigerants must never be mixed, even in the smallest amounts. If the refrigerants are mixed, compressor malfunction is likely.**
- **Use only specified lubricant for the R-134a A/C system and R-134a components. If lubricant other than that specified is used, compressor malfunction is likely.**
- **The specified R-134a lubricant rapidly absorbs moisture from the atmosphere. The following handling precautions must be observed:**
  - **a: When removing refrigerant components from a vehicle, immediately cap (seal) the component to minimize the entry of moisture from the atmosphere.**
  - **b: When installing refrigerant components to a vehicle, do not remove the caps (unseal) until just before connecting the components. Connect all refrigerant loop components as quickly as possible to minimize the entry of moisture into the system.**
  - **c: Only use the specified lubricant from a sealed container. Immediately reseal containers of lubricant. Without proper sealing, lubricant will become moisture saturated and should not be used.**
  - **d: Avoid breathing A/C refrigerant and lubricant vapor or mist. Exposure may irritate eyes, nose and throat. Remove R-134a from the A/C system using certified service equipment meeting requirements of SAE J2210 (R-134a recycling equipment) or J2209 (R-134a recovery equipment). If accidental system discharge occurs, ventilate work area before resuming service. Additional health and safety information may be obtained from refrigerant and lubricant manufacturers.**
  - **e: Do not allow lubricant to contact styrofoam parts. Damage may result.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

General Refrigerant Precautions

WARNING:

- **Do not release refrigerant into the air. Use approved recovery/recycling equipment to capture the refrigerant every time an air conditioner system is discharged. Always follow the manufacturers recommendations for use of the recovery/recycling equipment.**
- **Always wear eye and hand protection (goggles and gloves) when working with any refrigerant or air conditioner system.**
- **Do not store or heat refrigerant containers above 52°C (125°F).**
- **Do not heat a refrigerant container with an open flame; if container warming is required, place the bottom of the container in a pail of warm water.**
- **Do not intentionally drop, puncture, or incinerate refrigerant containers.**
- **Keep refrigerant away from open flames: poisonous gas will be produced if refrigerant burns.**
- **Refrigerant will displace oxygen, therefore be certain to work in well ventilated areas to prevent suffocation.**
- **Do not introduce compressed air to any refrigerant container or refrigerant component.**

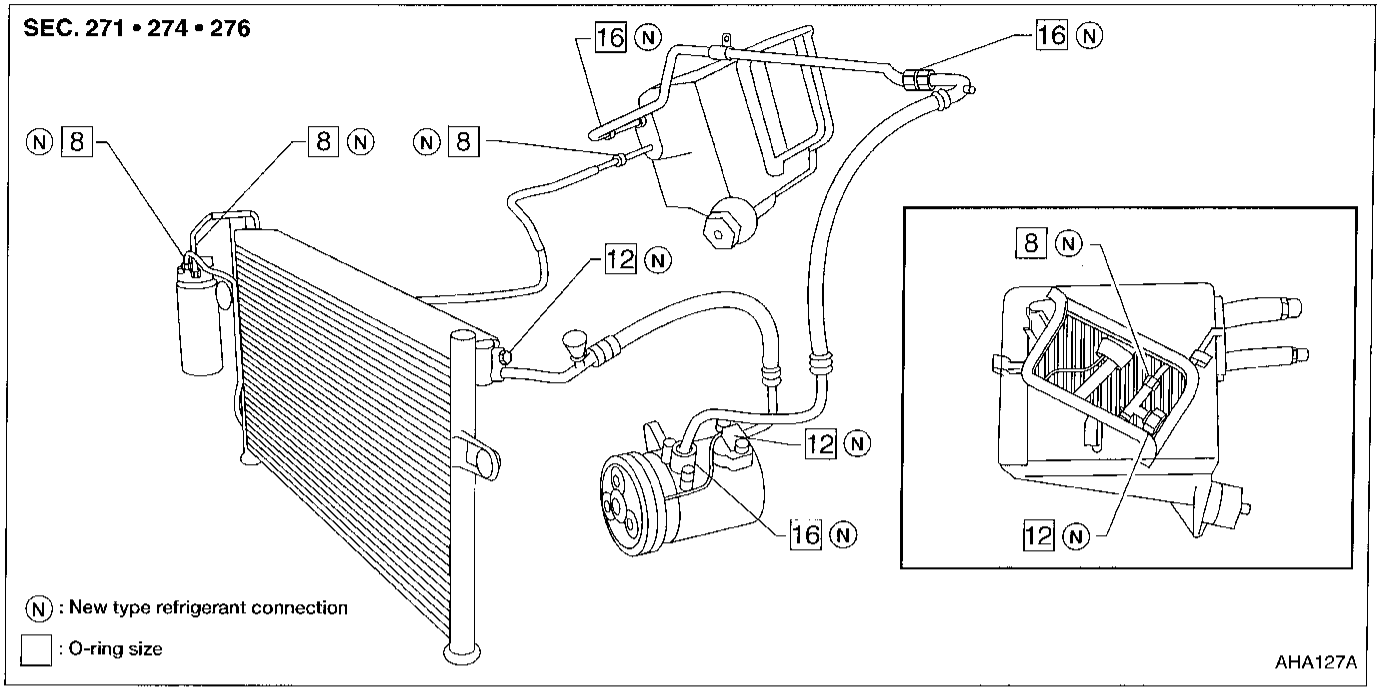


Precautions for Refrigerant Connection

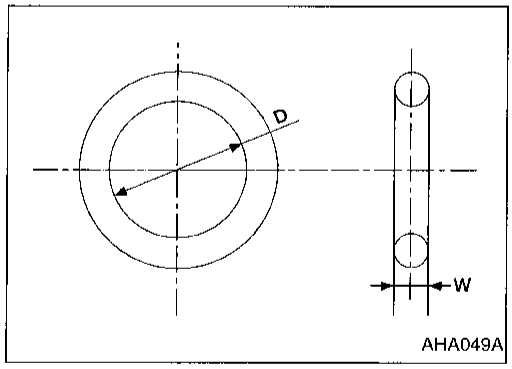
A new type refrigerant connection has been introduced to all refrigerant lines except the following location:

- Expansion valve to cooling unit.

FEATURES OF NEW TYPE REFRIGERANT CONNECTION



- The O-ring has been relocated. It has also been provided with a groove for proper installation. This eliminates the chance of the O-ring being caught in, or damaged by, the mating part. The sealing direction of the O-ring is now set vertically in relation to the contacting surface of the mating part to improve sealing characteristics.
- The reaction force of the O-ring will not occur in the direction that causes the joint to pull out, thereby facilitating piping connections.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

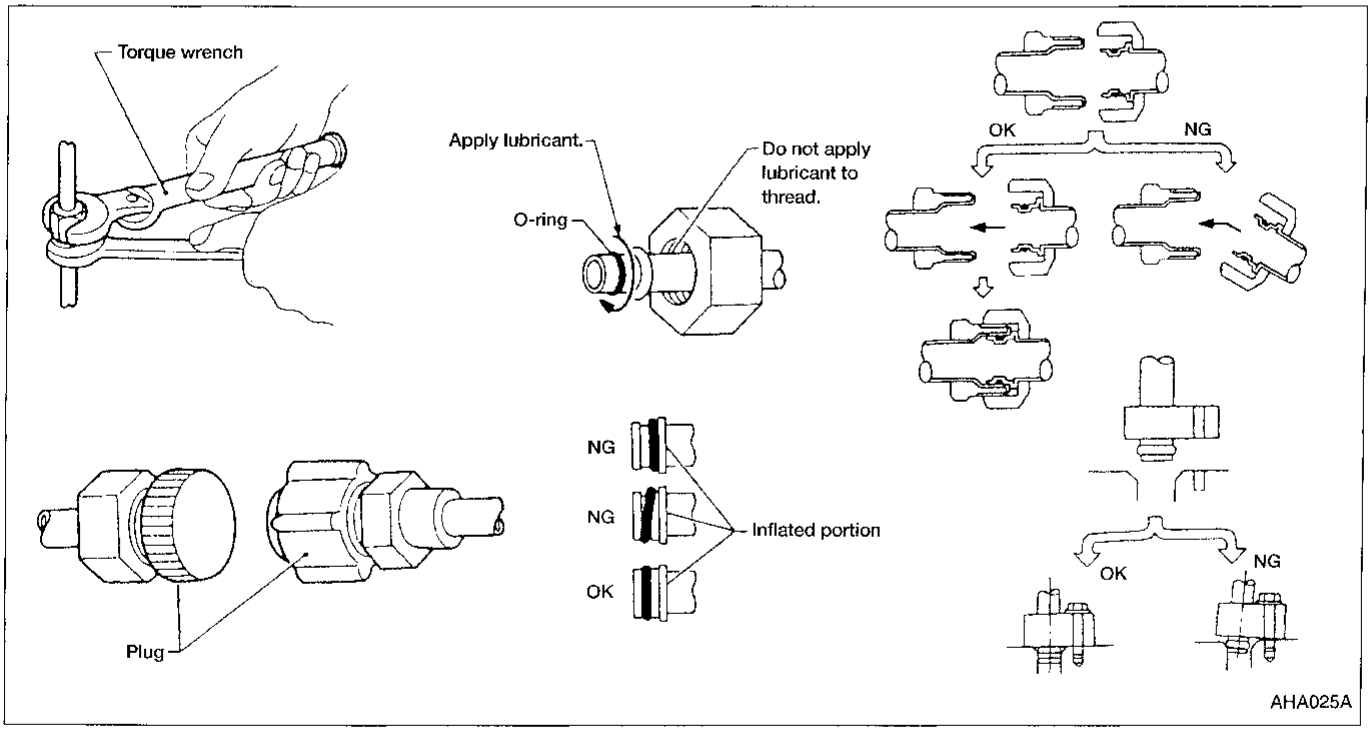
Precautions for Refrigerant Connection (Cont'd)

O-RING AND REFRIGERANT CONNECTION

CAUTION:
The new and former refrigerant connections use different O-ring configurations. Do not confuse O-rings since they are not interchangeable. If a wrong O-ring is installed, refrigerant will leak at, or around, the connection.

O-ring part numbers and specifications

Connection type	O-ring size	Part number	D mm (in)	W mm (in)
New	8	92471 N8210	6.8 (0.268)	1.85 (0.0728)
Former		92470 N8200	6.07 (0.2390)	1.78 (0.0701)
New	12	92472 N8210	10.9 (0.429)	2.43 (0.0957)
Former		92475 71L00	11.0 (0.433)	2.4 (0.094)
New	16	92473 N8210	13.6 (0.535)	2.43 (0.0957)
Former		92475 72L00	14.3 (0.563)	2.3 (0.0906)



Precautions for Refrigerant Connection (Cont'd)

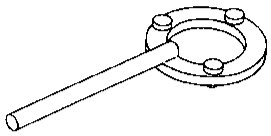
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

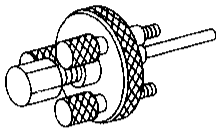
WARNING:
Make sure all refrigerant is discharged into the recycling equipment and the pressure in the system is less than atmospheric pressure. Then gradually loosen the discharge side hose fitting and remove it.

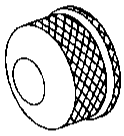
CAUTION:
When replacing or cleaning refrigerant cycle components, observe the following.

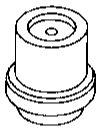
- **Do not leave compressor on its side or upside down for more than 10 minutes. Compressor lubricant will enter low pressure chamber.**
- **When connecting tubes, always use a torque wrench and a back-up wrench.**
- **After disconnecting tubes, plug all openings immediately to prevent entry of dirt and moisture.**
- **When installing an air conditioner unit in the vehicle, connect the pipes as the final stage of the operation. Do not remove seal caps from pipes and other components until just before connection.**
- **Allow components stored in cool areas to warm to working area temperature before removing seal caps. This prevents condensation from forming inside A/C components.**
- **Thoroughly remove moisture from the refrigeration system before charging the refrigerant.**
- **Always replace used O-rings.**
- **When connecting tube, apply lubricant to portions shown in illustration. Be careful not to apply lubricant to threaded portion.**
  Name: Nissan A/C System Lubricant Type R
  Part No.: KLH00-PAGR0
- **O-ring must be closely attached to inflated portion of tube.**
- **After inserting tube into union until O-ring is no longer visible, tighten nut to specified torque.**
- **After connecting line, conduct leak test and make sure that there is no leakage. When the gas leaking point is found, disconnect that line and replace the O-ring. Then tighten connections of seal seat to the specified torque.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com









Precautions for Servicing Compressor

- Plug all openings to prevent moisture and foreign matter from entering.
- Do not keep the compressor in the upside down position or laid on its side for more than 10 minutes.
- When replacing or repairing compressor, be sure to remove lubricant from the compressor and check the lubricant quantity extracted.
- When replacing or repairing compressor, follow lubricant checking and adjusting procedure exactly. Refer to "Compressor Lubricant Quantity", "SERVICE PROCEDURES", HA-53.
- Keep friction surfaces between clutch and pulley clean. If the surface is contaminated with oil, wipe it off by using a clean waste cloth moistened with thinner.
- After compressor service operation, turn the compressor shaft by hand more than five turns in both directions. This will equally distribute lubricant inside the compressor. After the compressor is installed, let the engine idle and operate the compressor for one hour.
- After replacing the compressor magnet clutch, apply voltage to the new one and check for normal operation.

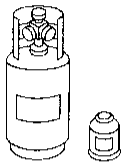
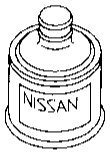
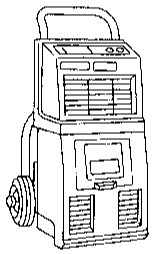
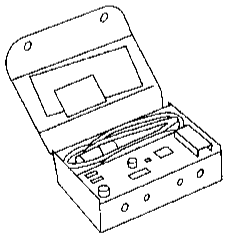
Special Service Tools





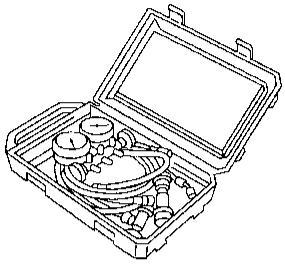


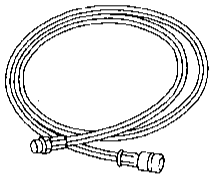


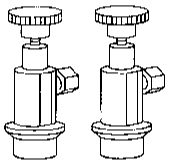
The actual shapes of Kent-Moore tools may differ from those of special service tools illustrated here.

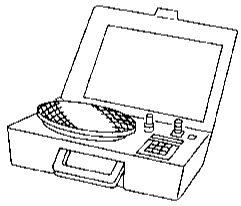
Tool number (Kent-Moore No.) Tool name	Description	
KV99231260 (J-38874) Clutch disc wrench	 NT204	Removing shaft nut and clutch disc
KV99232340 (J-38874) Clutch disc puller	 NT206	Removing clutch disc
KV99234330 (J-39024) Pulley installer	 NT207	Installing pulley
KV99233130 (J-39023) Pulley puller	 NT208	Removing pulley

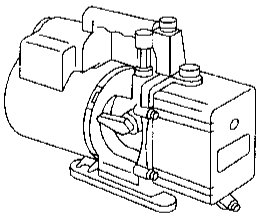
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com











R-134a Service Tools and Equipment

Never mix R-134a refrigerant and/or its specified lubricant with CFC-12 (R-12) refrigerant and/or its lubricant.
Separate and non-interchangeable service equipment must be used for each type of refrigerant/lubricant.
Refrigerant container fittings, service hose fittings, and service equipment fittings (equipment which handles refrigerant and/or lubricant) are different between CFC-12 (R-12) and R-134a. This is to avoid mixed use of the refrigerants/lubricants.
Adapters to convert from one size fitting to the other must never be used: refrigerant/lubricant contamination will occur and compressor failure will result.

Tool number (Kent-Moore No.) Tool name	Description	Note
R-134a refrigerant	 NT196	Container color: Light blue Container marking: R-134a Fitting size: Thread size ● large container 1/2″-16 ACME
KLH00-PAGR0 (—) Nissan A/C System Lubricant Type R	 NT197	Type: Polyalkylene glycol oil (PAG), type R Application: R-134a vane rotary compressors (Nissan only) Lubricity: 40 mℓ (1.4 US fl oz, 1.4 Imp fl oz)
(J-39500-NI) Recovery/Recycling equipment (ACR4)	 NT195	Function: Refrigerant Recovery and Recycling and Recharging
(J-39400) Electronic leak detector	 NT198	Power supply: ● DC 12 V (Cigarette lighter)

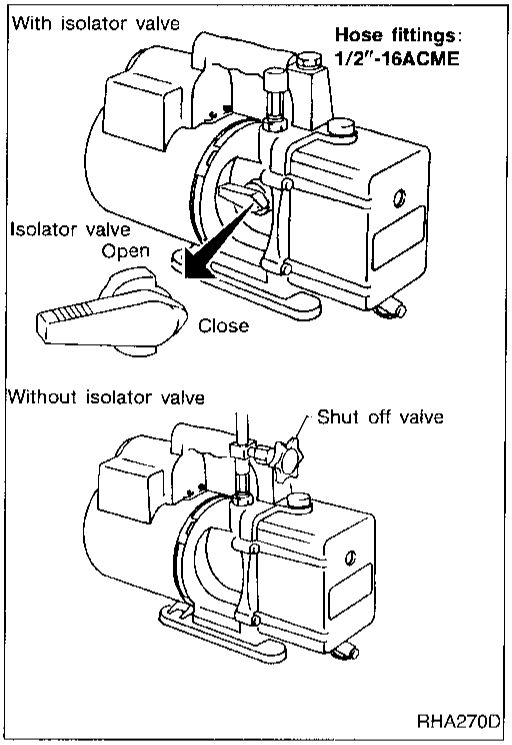
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Tool number (Kent-Moore No.) Tool name	Description	Note
(J-39183) Manifold gauge set (with hoses and couplers)	 NT199	Identification: ● The gauge face indicates R-134a. Fitting size: Thread size ● 1/2″-16 ACME
Service hoses ● High-side hose (J-39501-72) ● Low-side hose (J-39502-72) ● Utility hose (J-39476-72)	 NT201	Hose color: ● Low hose: Blue with black stripe ● High hose: Red with black stripe ● Utility hose: Yellow with black stripe or green with black stripe Hose fitting to gauge: ● 1/2″-16 ACME
Service couplers ● High-side coupler (J-39500-20) ● Low-side coupler (J-39500-24)	 NT202	Hose fitting to service hose: ● M14 x 1.5 fitting (optional) or permanently attached
(J-39650) Refrigerant weight scale	 NT200	For measuring of refrigerant Fitting size: Thread size ● 1/2″-16 ACME
(J-39649) Vacuum pump (Including the isolator valve)	 NT203	Capacity: ● Air displacement: 4 CFM ● Micron rating: 20 microns ● Oil capacity: 482 g (17 oz) Fitting size: Thread size ● 1/2″-16 ACME

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



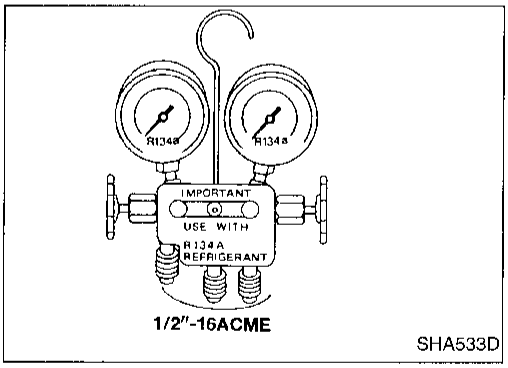
Precautions for Service Equipment

RECOVERY/RECYCLING EQUIPMENT

Follow the manufacturer's instructions for machine operation and machine maintenance. Never introduce any refrigerant other than that specified into the machine.

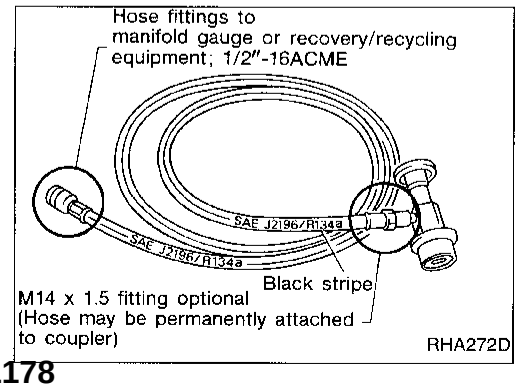
ELECTRONIC LEAK DETECTOR

Follow the manufacturer's instructions for tester operation and tester maintenance.



VACUUM PUMP

The lubricating oil contained inside the vacuum pump is not compatible with the specified lubricant for R-134a A/C systems. The vent side of the vacuum pump is exposed to atmospheric pressure. Therefore, if the pump is switched off after evacuation the lubricating oil may migrate into the hose. To prevent this, isolate the pump from the hose after evacuation (vacuuming).
This migration is avoided by placing a manual shut-off valve near the hose-to-pump connection, as follows:

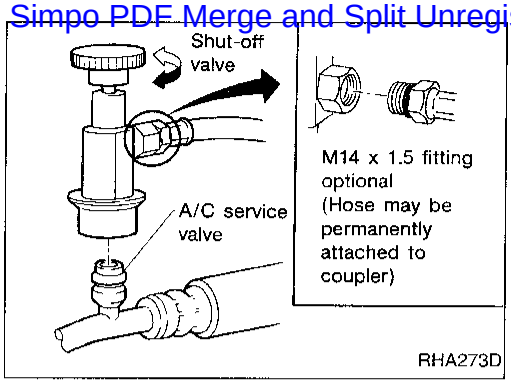


- Usually vacuum pumps have a manual isolator valve as part of the pump. Close this valve to isolate the service hose from the pump.
- For pumps without an isolator valve, use a hose equipped with a manual shut-off valve near the pump end. Close the valve to isolate the hose from the pump.
- If the hose has an automatic shut-off valve, disconnect the hose from the pump. As long as the hose is connected, the valve is open and lubricating oil may migrate.

Some one-way valves open when vacuum is applied and close under a no vacuum condition. Such valves may restrict the pump's ability to pull a deep vacuum and are not recommended.

MANIFOLD GAUGE SET

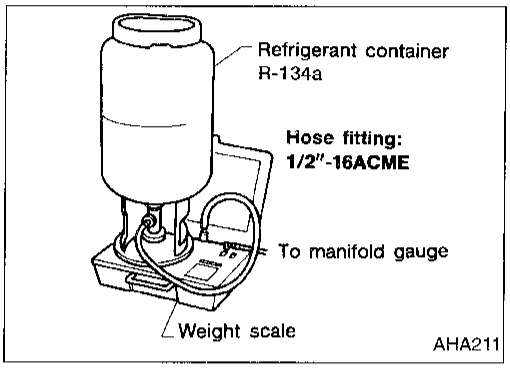
Be sure the gauge set has 1/2"-16 ACME threaded connections for service hoses. Confirm the set has been used only with refrigerant R-134a along with specified lubricants.



SERVICE HOSES

Be certain that the service hoses display the markings described (colored hose with black stripe). Be certain that all hoses include positive shut-off devices (either manual or automatic) near the end of the hoses opposite the manifold gauge.

Precautions for Service Equipment (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SERVICE COUPLERS

Never attempt to connect R-134a service couplers to a CFC-12 (R-12) A/C system. The R-134a couplers will not properly connect to the CFC-12 (R-12) system. However, if an improper connection is attempted, discharging and contamination can occur.

Shut-off valve rotation	A/C service valve
Clockwise	Open
Counterclockwise	Close

REFRIGERANT WEIGHT SCALE

When using a scale which controls refrigerant flow electronically, assure the following:

- Hose fitting size is 1/2"-16 ACME
- No refrigerant other than R-134a (along with specified lubricant) has been used with the scale.

CHARGING CYLINDER

Using a charging cylinder is not recommended. Refrigerant may be vented into the air through the cylinder's top valve when filling the cylinder.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

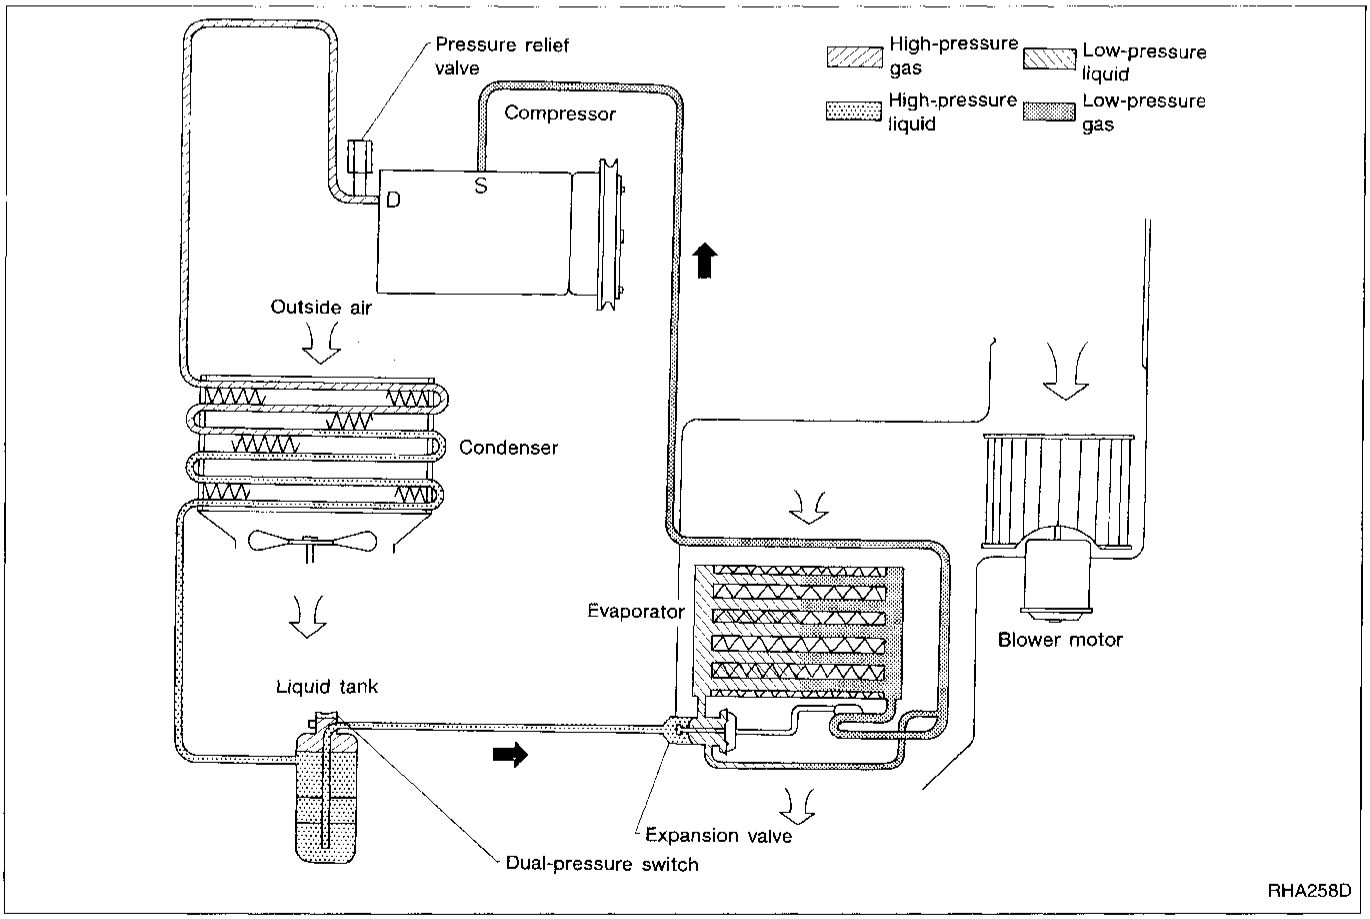
Refrigeration Cycle

REFRIGERANT FLOW

The refrigerant flow is in the standard pattern. Refrigerant flows through the compressor, condenser, liquid tank, evaporator, and back to the compressor.
The refrigerant evaporation through the evaporator coil is controlled by an externally equalized expansion valve, located inside the evaporator case.

FREEZE PROTECTION

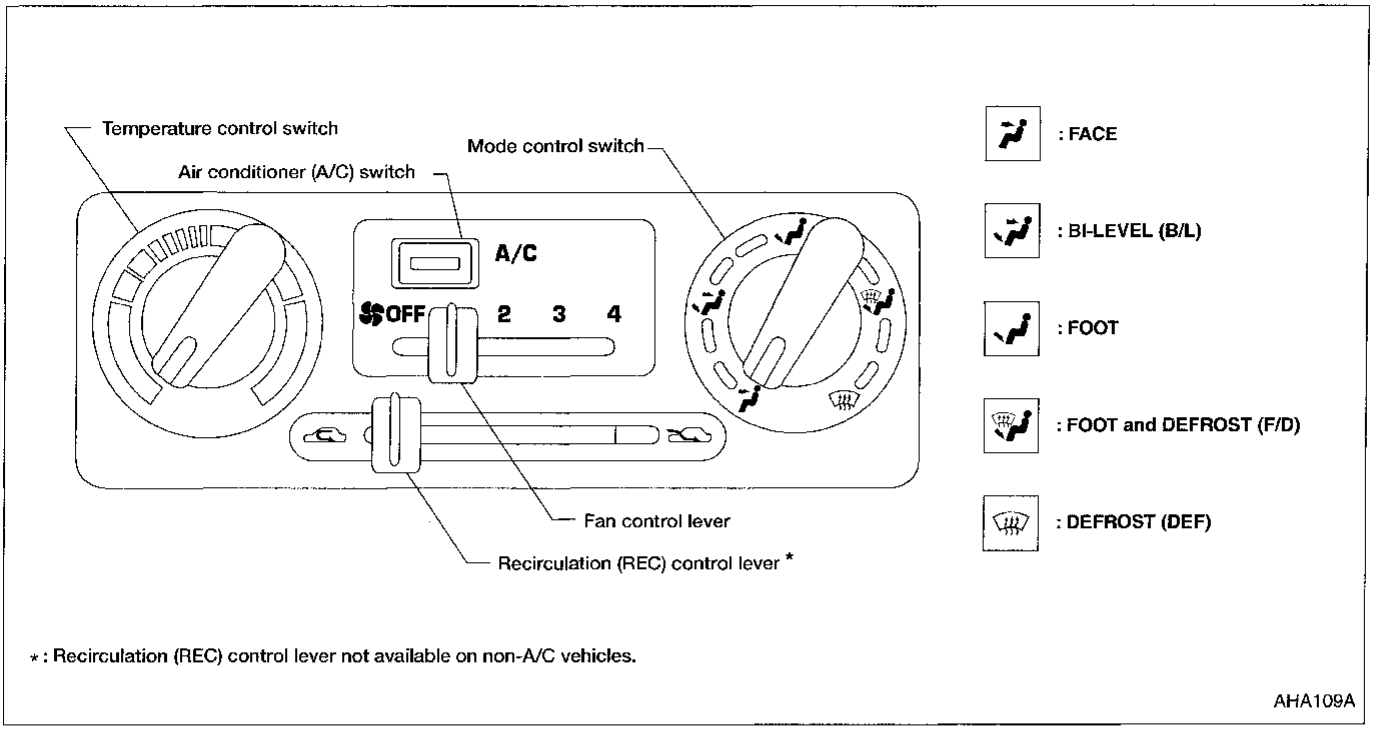
The compressor cycles on and off to maintain the evaporator temperature within a specified range. When the evaporator coil temperature falls below a specified point, the thermo control amplifier interrupts the compressor operation. When the evaporator coil temperature rises above the specification, the thermo control amplifier allows compressor operation.



REFRIGERANT SYSTEM PROTECTION

Dual-pressure switch

The refrigerant system is protected against excessively high or low pressure. The protection is effected by the dual-pressure switch located on the liquid tank. If the pressure rises or falls out of specifications, the switch opens to interrupt the compressor operation.



Pressure relief valve

The refrigerant system is protected by a pressure relief valve. The valve is located on the end of the flexible high pressure hose near the compressor. When refrigerant system pressure increases abnormally [over 3,727 kPa (38 kg/cm^2, 540 psi)], the relief valve's port opens. The valve then releases refrigerant into the atmosphere.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Control Operation

* : Recirculation (REC) control lever not available on non-A/C vehicles.

AHA109A

FAN CONTROL LEVER

This lever turns the fan ON and OFF, and controls fan speed.

MODE CONTROL SWITCH

This switch controls the outlet air flow.

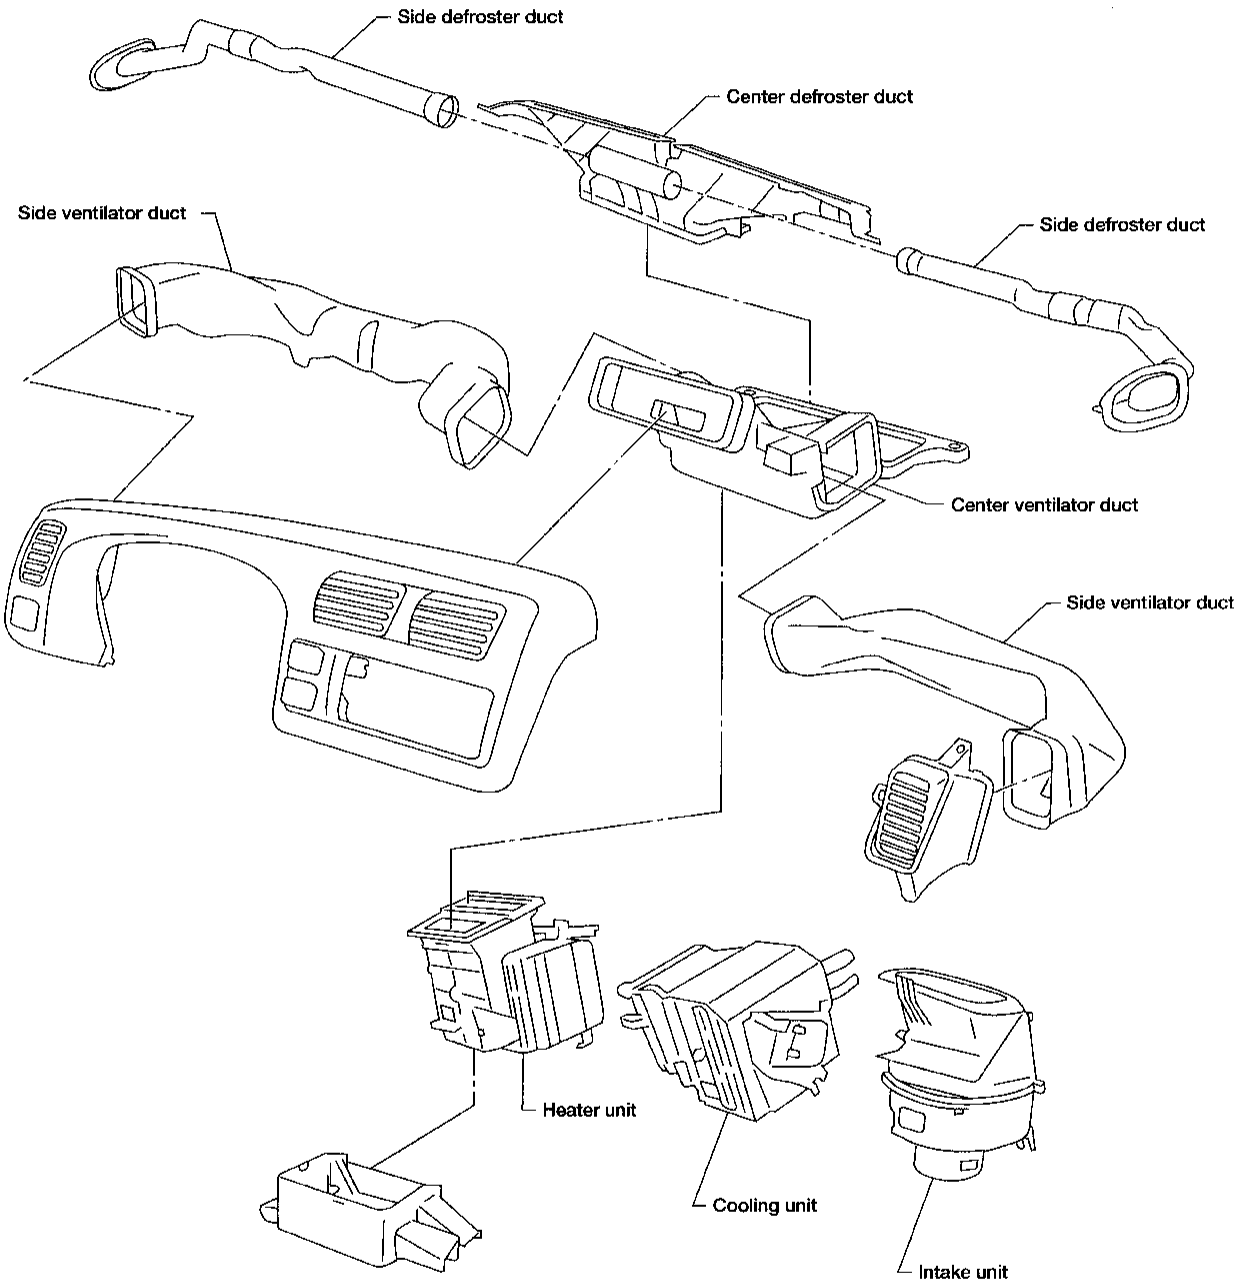
TEMPERATURE CONTROL SWITCH

This switch allows adjustment of the temperature of the outlet air.

RECIRCULATION (REC) CONTROL LEVER

FRESH position:
Outside air is drawn into the passenger compartment.
Recirculation REC position:
Interior air is recirculated inside the vehicle.

AIR CONDITIONER SWITCH



The air conditioner switch controls the A/C system. When the switch is depressed with the fan ON, the compressor will turn ON. The indicator lamp will also light.

The air conditioner cooling function operates only when the engine is running.

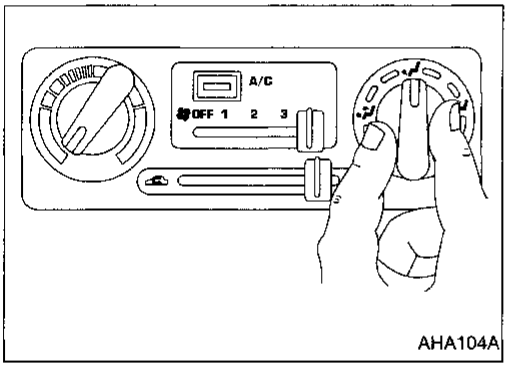
Operational Check

The purpose of the operational check is to confirm that the system operates properly.
After operational check is completed, go to SYMPTOM TABLE in How to Perform Trouble Diagnoses for Quick and Accurate Repair, HA-24.

CONDITIONS:

- **Engine running and at normal operating temperature.**



AHA103A

PROCEDURE:

1. Check blower

a. Slide fan control lever to 1-speed.
Blower should operate on 1-speed.
b. Then slide fan control lever to 2-speed, and continue checking blower speed until all speeds are checked.
c. Leave blower on 4-speed.

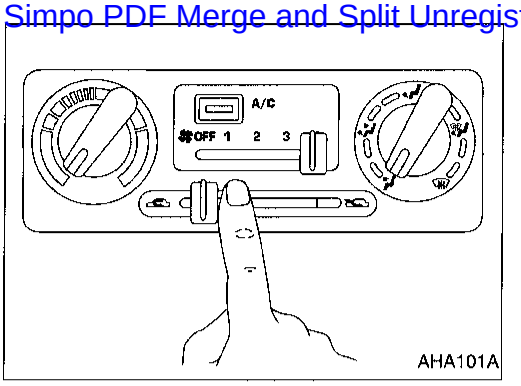
AHA104A

2. Check discharge air

a. Turn mode switch to each mode.
b. Confirm that air discharge comes out each mode.

Discharge air flow

Switch mode/ indicator	Air outlet/distribution		
	Face	Foot	Defrost
	100%	—	—
	60%	40%	—
	—	80%	20%
	—	60%	40%
	—	—	100%

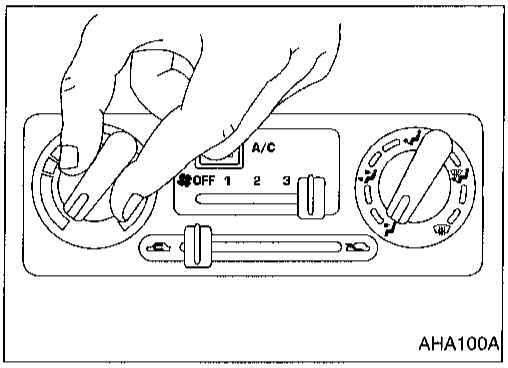


AHA983

NOTE:

Confirm that discharge air comes out according to the air distribution table at left.

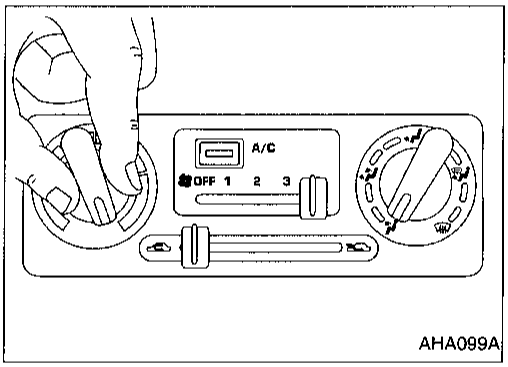
Operational Check (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

AHA101A

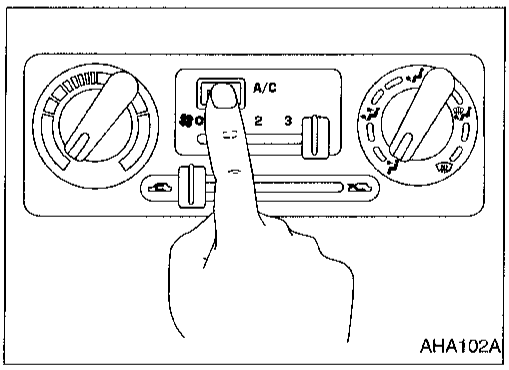
3. Check recirculation



a. Slide REC control lever to REC position.
b. Listen for intake door position to change (you should hear blower sound change slightly).

AHA100A

4. Check temperature decrease



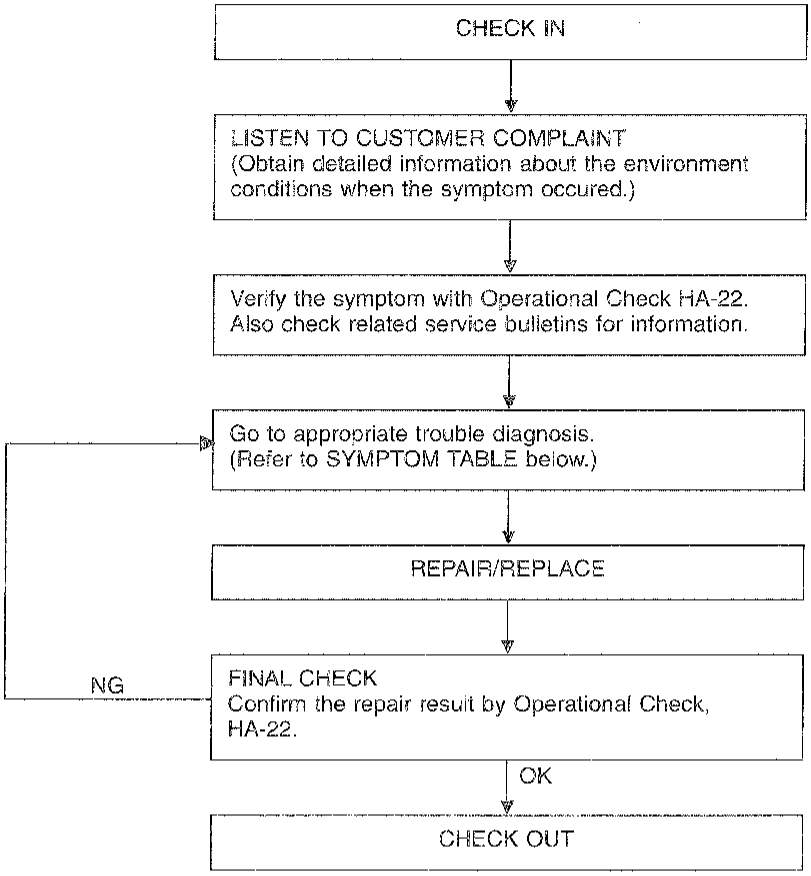
a. Turn temperature switch to full cold.
b. Check for cold air at discharge air outlets.

AHA099A

5. Check temperature increase

a. Turn temperature control switch to full hot.
b. Check for hot air at discharge air outlets.

AHA102A



6. Check air conditioner switch

Slide the fan control lever to the desired (1 to 4 speed) position and push the A/C switch to turn ON the air conditioner. The indicator lamp should come on when air conditioner is ON.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Blower Motor Circuit

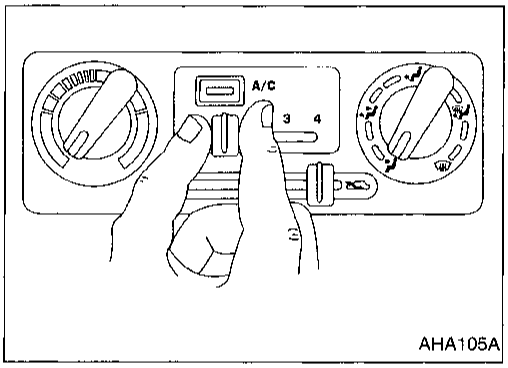
SYMPTOM: Blower motor does not rotate.

INSPECTION FLOW

1. Confirm symptom by performing BLOWER MOTOR OPERATION CHECK shown below.

↓

If OK (symptom cannot be duplicated), perform complete Operational Check, HA-22.
If NG (symptom is confirmed), continue with STEP-2 below.



↓

2. Check for any service bulletins.

↓ OK

3. Go to Diagnostic Procedure for Blower Motor Circuit, HA-26.

BLOWER MOTOR OPERATION CHECK

1. Start engine.
2. Check blower motor.
3. Slide fan control lever to 1-speed and blower motor should operate on 1-speed.
4. Slide fan control lever to 2-speed and continue checking blower speed until all speeds are checked.

Blower Motor Circuit (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

	INCIDENT	Flow chart
1	Fan fails to rotate.	1
2	Fan does not rotate at 1-speed.	2
3	Fan does not rotate at 2-speed.	3
4	Fan does not rotate at 3-speed.	4
5	Fan does not rotate at 4-speed.	5

DIAGNOSTIC PROCEDURE

Check if blower motor rotates properly at each fan speed.
Conduct check as per flow chart at left.

2 3 4 5 (Go to next page.) → (B)

1

A

CHECK POWER SUPPLY FOR BLOWER MOTOR.
Disconnect blower motor harness connector.
Does approx. 12 volts exist between blower motor harness terminal ① and body ground?

No → Check 15A fuses No. 19 and 24, located in fuse block (J/B).
Refer to EL section ("Wiring Diagram", "POWER SUPPLY ROUTING").

Yes

B

1. Slide fan control lever to 4-speed.
2. Check circuit continuity between blower motor harness terminal ② and body ground.
   Continuity should exist.

OK → Check blower motor.
Refer to HA-28.

NG → Replace blower motor.

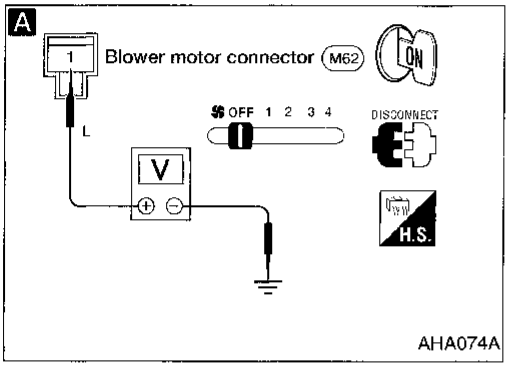
NG

Reconnect blower motor harness connector.

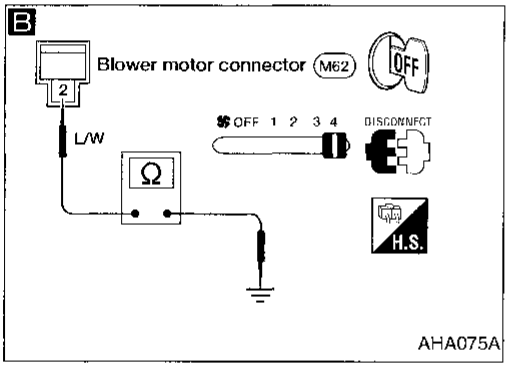
C

CHECK BLOWER MOTOR CIRCUIT BETWEEN BLOWER MOTOR AND RESISTOR.
Do approx. 12 volts exist between resistor harness terminal ① and body ground?

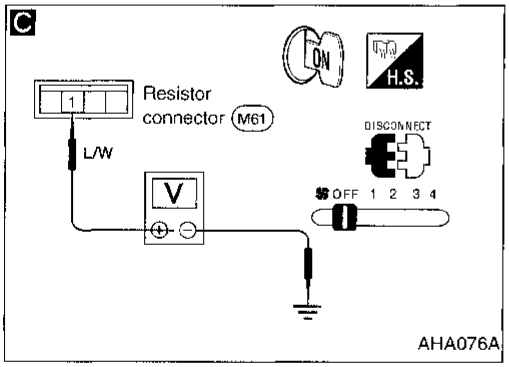
No → Disconnect blower motor and resistor harness connectors.



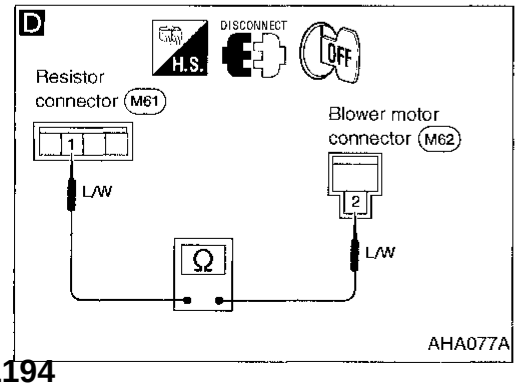
D



Note: Check circuit continuity between blower motor harness terminal ② and resistor harness terminal ①.
Continuity should exist.
If OK, check harness for short.

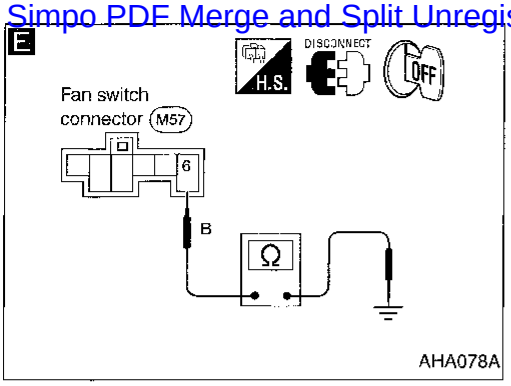


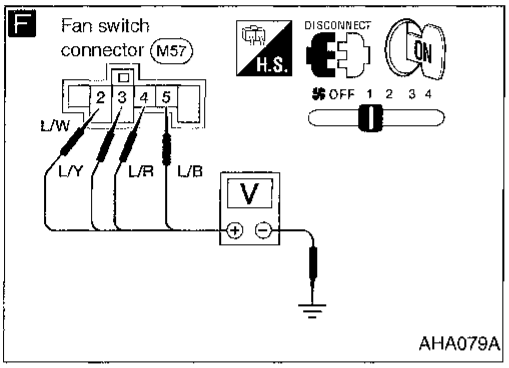
Yes

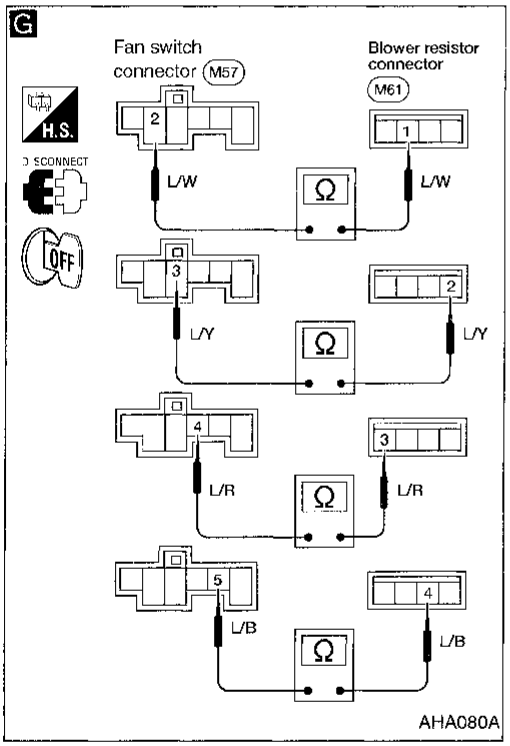


(A) (Go to next page.)

Note:
If the result is NG or No after checking circuit continuity, repair harness or connector.







Blower Motor Circuit (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

(A)

E

Note

CHECK GROUND CIRCUIT FOR FAN SWITCH.
Check circuit continuity between fan switch harness terminal No. (6) and body ground.

OK

CHECK BLOWER RESISTOR AFTER DISCONNECTING IT.
(Refer to Electrical Components Inspection.)
(HA-28).

OK

NG

Replace resistor.

Reconnect resistor harness connector.

1 2 3 4 5

F

CHECK FAN SWITCH CIRCUIT.
Do approx. 12 volts exist between each fan switch harness terminal and body ground?

Flow chart No.	Terminal No. ⊕	Terminal No. ⊖	Voltage
2	(5)	Body ground	Approx. 12V
3	(4)		
4	(3)		
5	(2)		

Yes

No

G

Note

Check circuit continuity between fan switch harness terminal and resistor harness terminal.

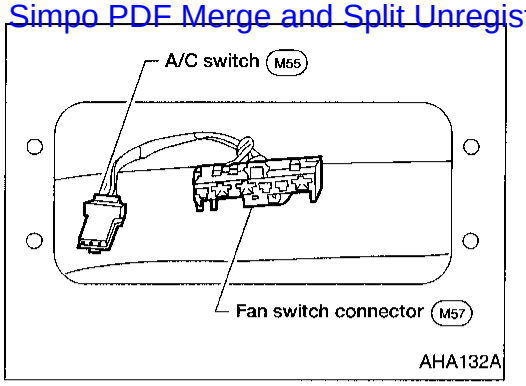
Terminal No. Fan switch	Terminal No. Resistor	Continuity
(2)	(1)	Yes
(3)	(2)	
(4)	(3)	
(5)	(4)	

If OK, check harness for short.

CHECK FAN SWITCH AFTER DISCONNECTING IT.
(Refer to COMPONENT INSPECTION.)
(HA-28)

NG

Replace fan switch.

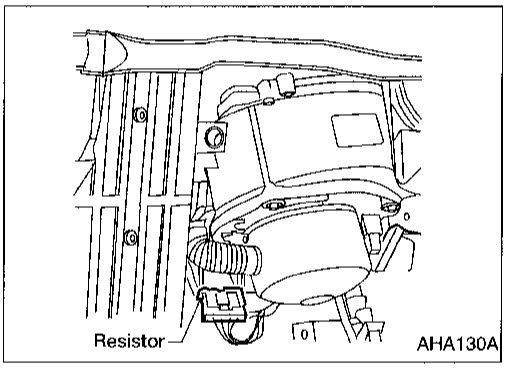


(B)

Note:
If the result is NG after checking circuit continuity, repair harness or connector.

Blower Motor Circuit (Cont'd)

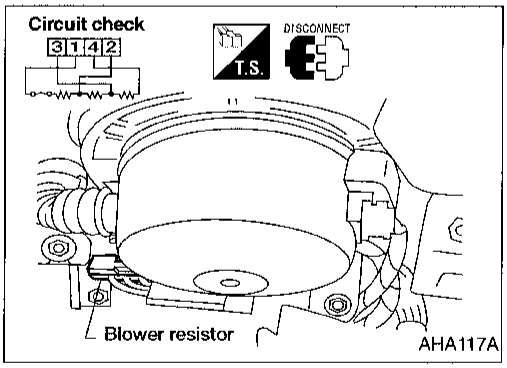
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



COMPONENT INSPECTION

Fan switch

Check continuity between terminals at each position.



TERMINAL	POSITION				
	OFF	1	2	3	4
1		○	○	○	○
2					○
3				○	
4			○		
5		○			
6		○	○	○	○

Blower motor

Confirm smooth rotation of the blower motor.

- Check that there are no foreign particles inside the intake unit.

Blower resistor

Check continuity between terminals.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

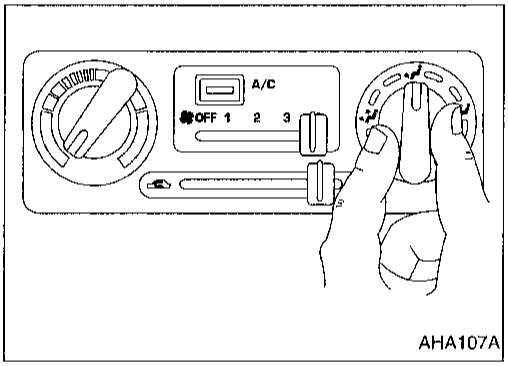
Air Outlet

SYMPTOM: Air outlet does not change.

INSPECTION FLOW

1. Confirm symptom by performing AIR OUTLET CONTROL DOORS OPERATION CHECK.

↓



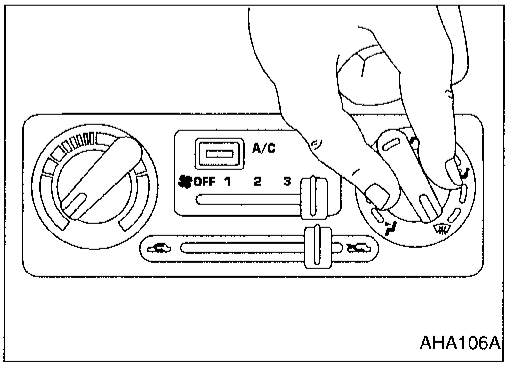
If OK (symptom cannot be duplicated), perform complete Operational Check, HA-22.
If NG (symptom is confirmed), continue with STEP-2 below.

↓

2. Check for any service bulletins.

↓

3. Repair/adjust control linkage, refer to CONTROL LINKAGE ADJUSTMENT, HA-30.

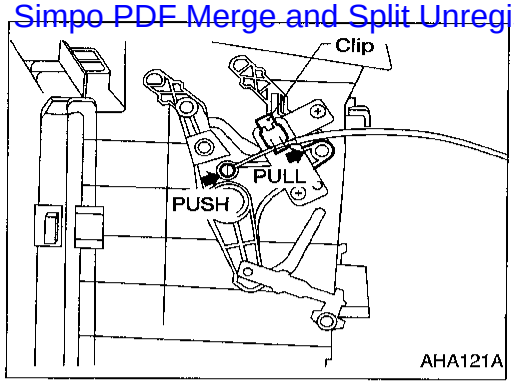


AHA107A

AIR OUTLET CONTROL DOORS OPERATION CHECK

1. Start engine.
2. Slide fan control lever to max speed.
3. Check discharge air.

a. Turn mode control switch to posiiton
b. Confirm that all discharge air comes out of face vents.
c. Turn mode control switch to position.
d. Confirm that discharge air comes out of face vents and foot vents.
e. Turn mode control switch to position.
f. Confirm that discharge air comes out of foot vents, with some air from defrost vents.
g. Turn mode control switch to position.
h. Confirm that discharge air comes out of foot vents with some air from defrost vents.



AHA106A

i. Turn mode control switch to position.
j. Confirm that all discharge air comes out of defrost vents.

Note:
Confirm that discharge air comes out according to the air distribution table, HA-22.

Air Outlet (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

CONTROL LINKAGE ADJUSTMENT

Mode control cable

- Turn mode control switch to position.
  Set side link in DEF mode.
  Pull on outer cable in direction of arrow and then clamp it.
- **After positioning mode control cable, check that it operates properly.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

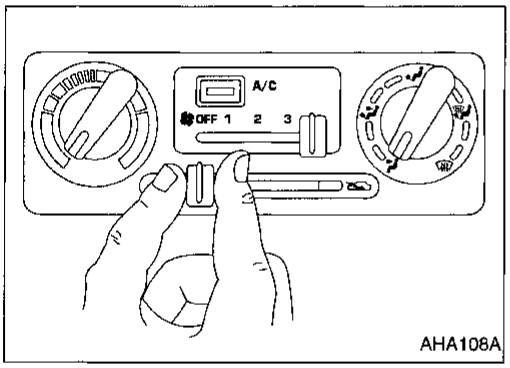
Intake Door

SYMPTOM: Intake door position does not change.

INSPECTION FLOW

1. Confirm symptom by performing INTAKE DOOR OPERATION CHECK, shown below.

↓

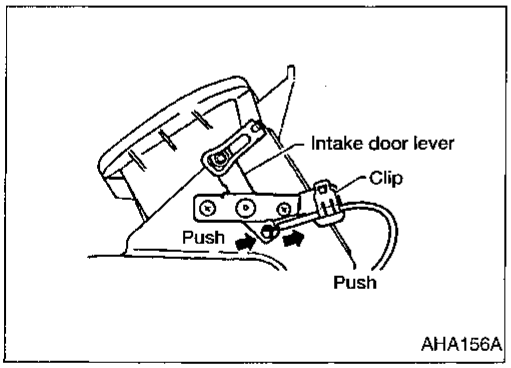


If OK (symptom cannot be duplicated), perform complete Operational Check, HA-22.
If NG (symptom is confirmed), continue with STEP-2 below.

↓

2. Check for any service bulletins.

↓



3. Repair/adjust control linkage, refer to CONTROL LINKAGE ADJUSTMENT, shown below.

AHA108A

INTAKE DOOR OPERATION CHECK

1. Start engine.
2. Slide fan control switch to max speed.
3. Check recirculation.
   a. Slide recirculation control lever to the REC posiiton.
   b. Listen for intake door position change (you should hear blower sound change slightly).

AHA156A

CONTROL LINKAGE ADJUSTMENT

Recirculation control cable

- Move recirculation lever to REC position.
  Set recirculation lever in REC mode.
  Pull on outer cable in direction of arrow and then clamp it.
- **After positioning recirculation control cable, check that it operates properly.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Magnet Clutch Circuit

SYMPTOM: Magnet clutch does not engage when A/C switch and fan switch are ON.

INSPECTION FLOW

1. Confirm symptom by performing MAGNET CLUTCH OPERATION CHECK, shown below.

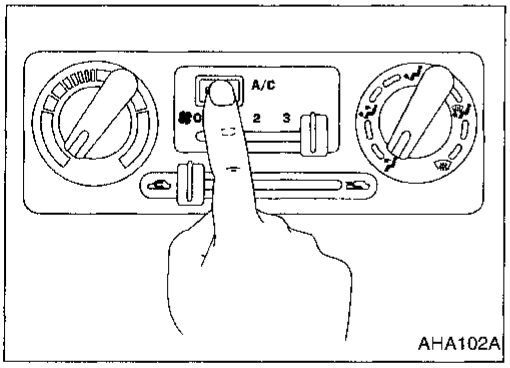
↓

If OK (magnet clutch can be engaged), go to Trouble Diagnosis Procedure for Insufficient Cooling, HA-37.
If NG (symptom is confirmed), continue with STEP-2 below.

↓

2. Check for any service bulletins.

↓



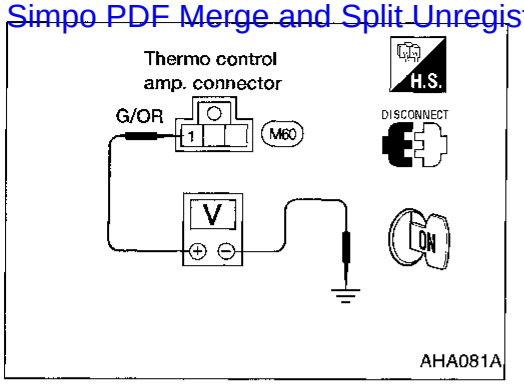
3. Check refrigeration cycle pressure with manifold gauge corrected.
   Refer to Trouble Diagnoses for Abnormal Pressure, HA-41.

↓

4. Go to THERMO CONTROL AMP. CHECK, HA-33.

↓

Go to DIAGNOSES PROCEDURE, HA-34.



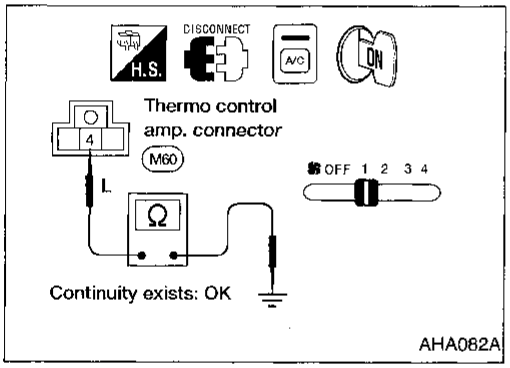
MAGNET CLUTCH OPERATION CHECK

1. Start engine.
2. Slide fan control lever to operate blower motor.
3. Push A/C switch to ON. Make sure that magnet clutch is engaged. (You can hear magnet clutch engage sound.)
4. Push A/C switch to OFF. Make sure that magnet clutch is disengaged.

Note: If magnet clutch sticks, check magnet clutch. Refer to HA-34.

Magnet Clutch Circuit (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



THERMO CONTROL AMP. CHECK

Power supply circuit check

Check power supply circuit for thermo control amp. with ignition switch ON.

1. Disconnect thermo control amp. harness connector.
2. Connect voltmeter from harness side.
3. Measure voltage across terminal ① and body ground.

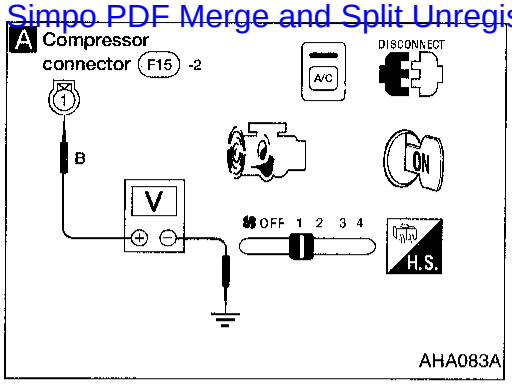
Voltmeter terminal		Voltage
⊕	⊖	
①	Body ground	Approx. 12V

Ground circuit check

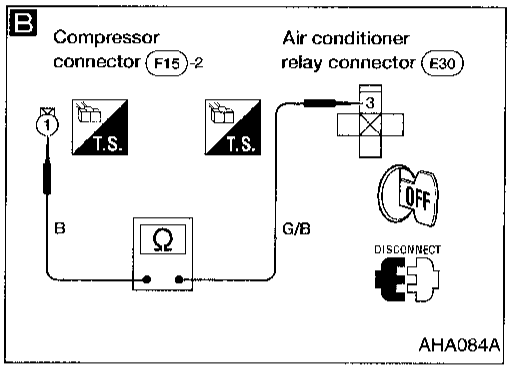
Check body ground circuit for thermo control amp. with ignition switch ON, air conditioner switch ON and fan switch ON.

1. Disconnect thermo control amp. harness connector.
2. Connect ohmmeter from harness side.
3. Check for continuity between terminal No. ② and body ground.

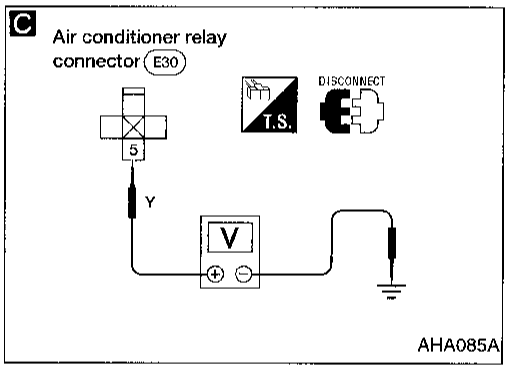
Ohmmeter terminal		Continuity
⊕	⊖	
④	Body ground	Yes



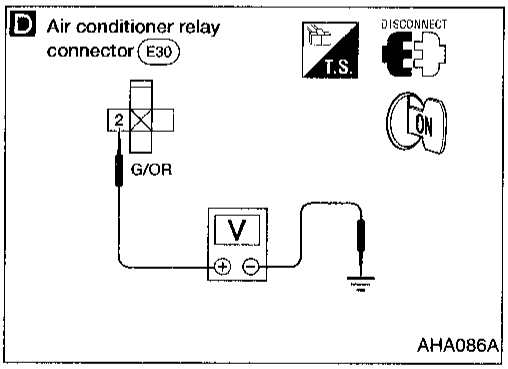
If the ground circuit is NG, check the following.



- A/C switch (Refer to HA-36.)
- Fan switch (Refer to HA-28.)
- Harness for open or short between thermo control amp. and A/C switch
- Harness for open or short between A/C switch and fan switch
- Fan switch ground circuit



Magnet Clutch Circuit (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

DIAGNOSTIC PROCEDURE

A

CHECK POWER SUPPLY FOR COMPRESSOR.
Disconnect compressor harness connector.
Do approx. 12 volts exist between compressor harness terminal No. ① and body ground?

Yes → Check the following.
- Magnet clutch coil
- Thermal protector

Refer to HA-36.

NG → Replace magnet clutch. Refer to HA-56.

No

B

Note

Check circuit continuity between A/C relay harness terminal No. ③ and compressor harness terminal No. ①. Continuity should exist.
If OK, check harness for short.

OK

C

CHECK POWER SUPPLY FOR A/C RELAY.
Do approx. 12 volts exist between A/C relay harness terminal No. ⑤ and body ground?

No → Check power supply circuit and 7.5A fuse (No. 35, located in the fuse block). (Refer to "POWER SUPPLY ROUTING" in EL section and Wiring Diagram.)

Yes

D

CHECK POWER SUPPLY FOR A/C RELAY.
Do approx. 12 volts exist between A/C relay harness terminal No. ② and body ground?

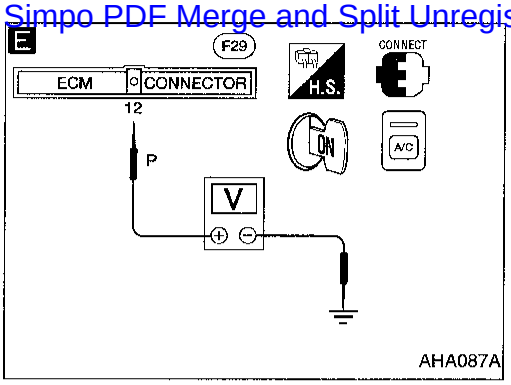
No → Check power supply circuit and 7.5A fuse (No. 29, located in the fuse block). (Refer to "POWER SUPPLY ROUTING" in EL section and Wiring Diagram.)

Yes

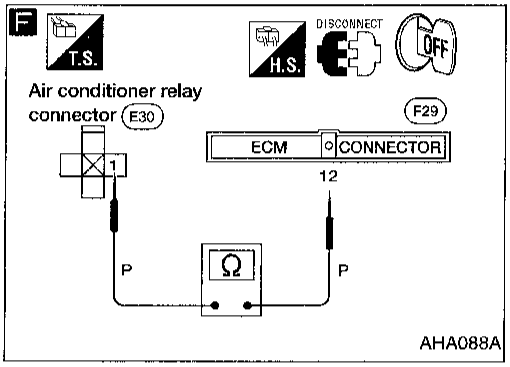
CHECK A/C RELAY AFTER DISCONNECTING IT.
Refer to HA-36.

NG → Replace A/C relay.

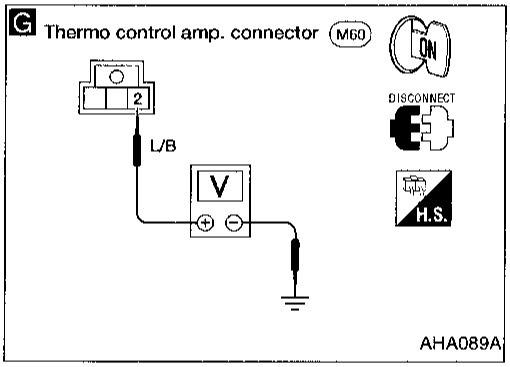
OK



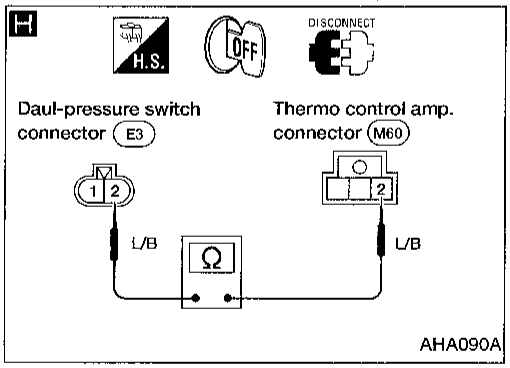
Reconnect A/C relay.



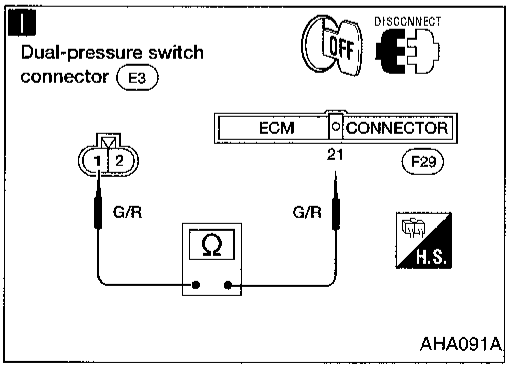
Ⓐ
(Go to next page.)



Note:
If the result is NG after checking circuit continuity, repair harness or connector.



Magnet Clutch Circuit (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

A

E **CHECK COIL SIDE CIRCUIT OF A/C RELAY.**
Do approx. 12 volts exist between ECM harness terminal No. (12) and body ground?

No → **F** Note: Check circuit continuity between A/C relay harness terminal No. (1) and ECM harness terminal No. (12). **Continuity should exist.** If OK, check harness for short.

Yes ↓

CHECK POWER SUPPLY AND GROUND CIRCUIT FOR THERMO CONTROL AMP.
Refer to HA-33.

OK ↓

G **CHECK VOLTAGE FOR THERMO CONTROL AMP.**
Do approx. 5 volts exist between thermo control amp. harness terminal No. (2) and body ground?

Yes → Replace thermo control amp.

No ↓

H **Check circuit continuity between thermo control amp. harness terminal No. (2) and dual-pressure switch harness terminal No. (2). Continuity should exist.**
If OK, check harness for short.

OK ↓

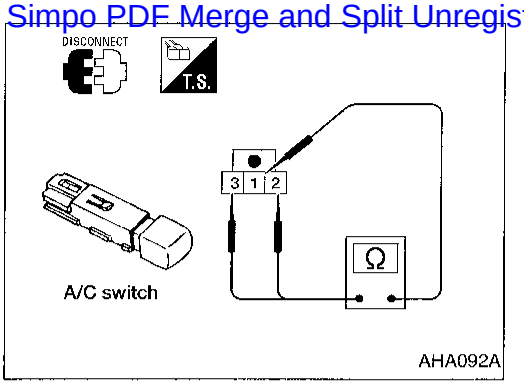
CHECK DUAL-PRESSURE SWITCH.
Refer to HA-36.

NG → Replace thermo control amp.

OK ↓

I Note: **Check circuit continuity between ECM harness terminal No. (21) and dual-pressure switch harness terminal No. (1).**

OK ↓

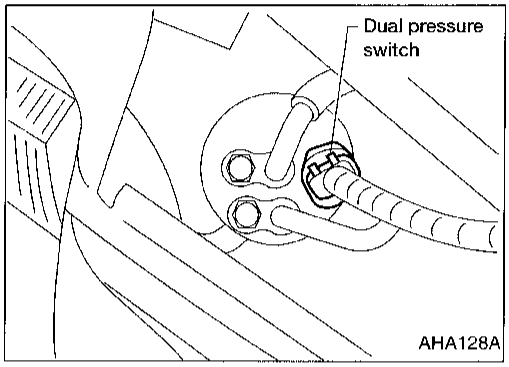


CHECK ECM.
Refer to EC section.

Note:
If the result is NG or No after checking circuit continuity, repair harness or connector.

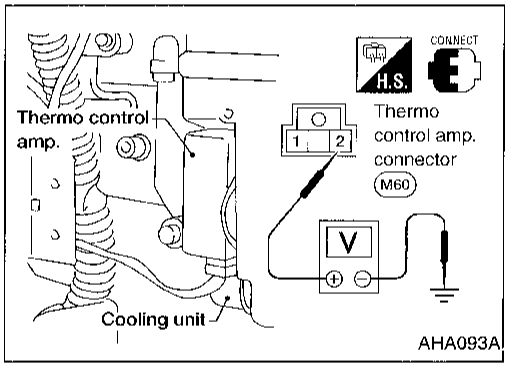
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Magnet Clutch Circuit (Cont'd)



ELECTRICAL COMPONENT INSPECTION

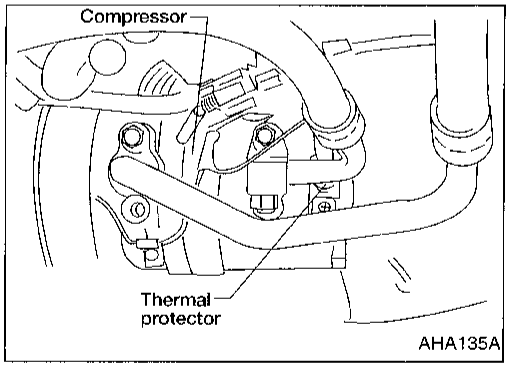
Air conditioner switch



Check continuity between terminals at each switch position

Switch condition	Terminal No.	Continuity
ON	① - ②, ① - ③	Yes
OFF		No

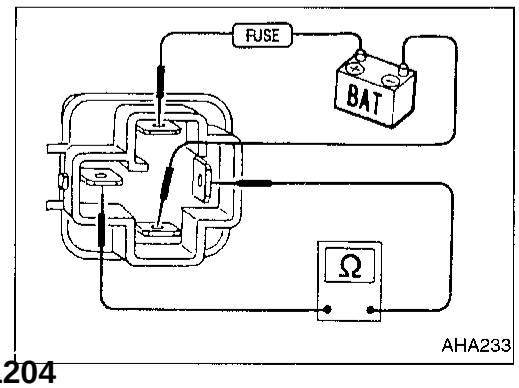
Dual pressure switch



High-pressure side line pressure kPa (kg/cm^2, psi)	Operation	Continuity
Decreasing to 157 - 216 (1.6 - 2.2, 23 - 31) Increasing to 2,648 - 2,844 (27 - 29, 384 - 412)	Turn OFF	Does not exist
Increasing to 157 - 235 (1.6 - 2.4, 23 - 34) Decreasing to 392 - 785 (4 - 8, 57 - 114)	Turn ON	Exists

Thermo control amp.

1. Run engine, and operate A/C system.
2. Connect the voltmeter from harness side.
3. Check thermo control amp. operation shown in the table.

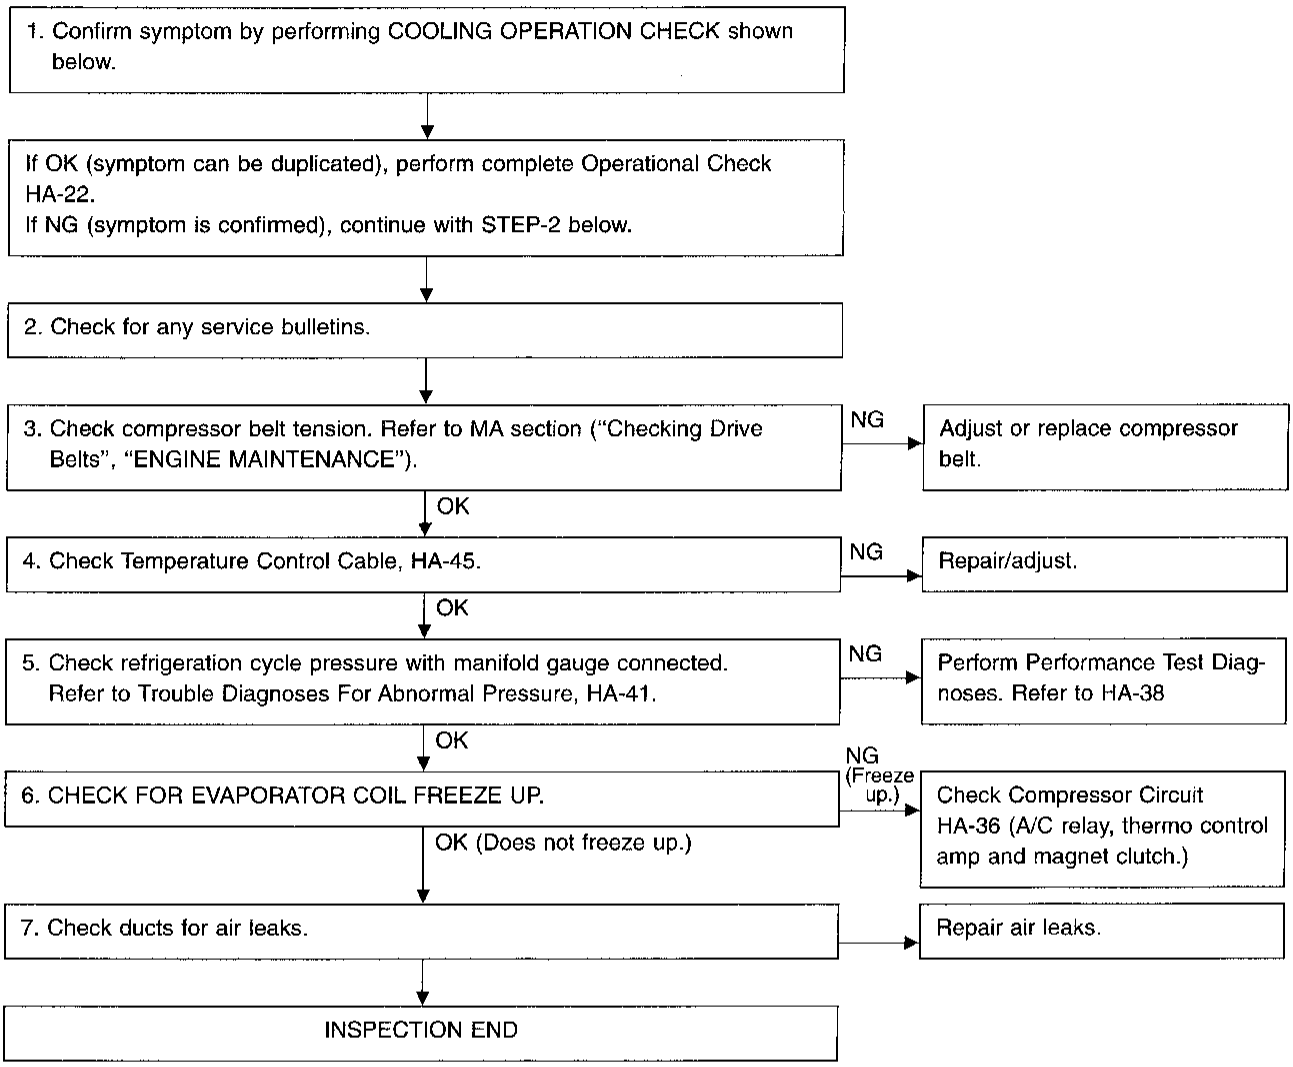


Evaporator outlet air temperature °C (°F)	Thermo amp. operation	Tester
Decreasing to 2.5 - 3.5 (37 - 38)	Turn OFF	Approx. 12V
Increasing to 4.0 - 5.0 (39 - 41)	Turn ON	Approx. 0V

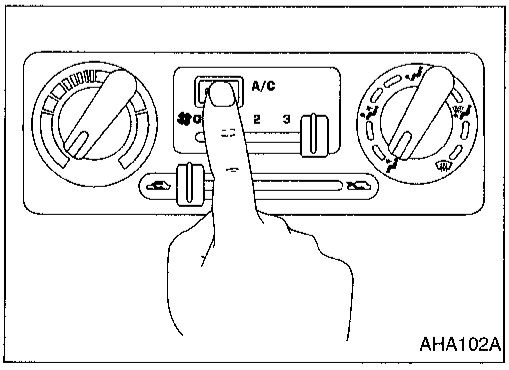
Thermal protector

Temperature of compressor °C (°F)	Operation
Increasing to approx. 145 - 155 (293 - 311)	Turn OFF
Decreasing to approx. 130 - 140 (266 - 284)	Turn ON

If NG, replace thermal protector.



Air conditioner relay

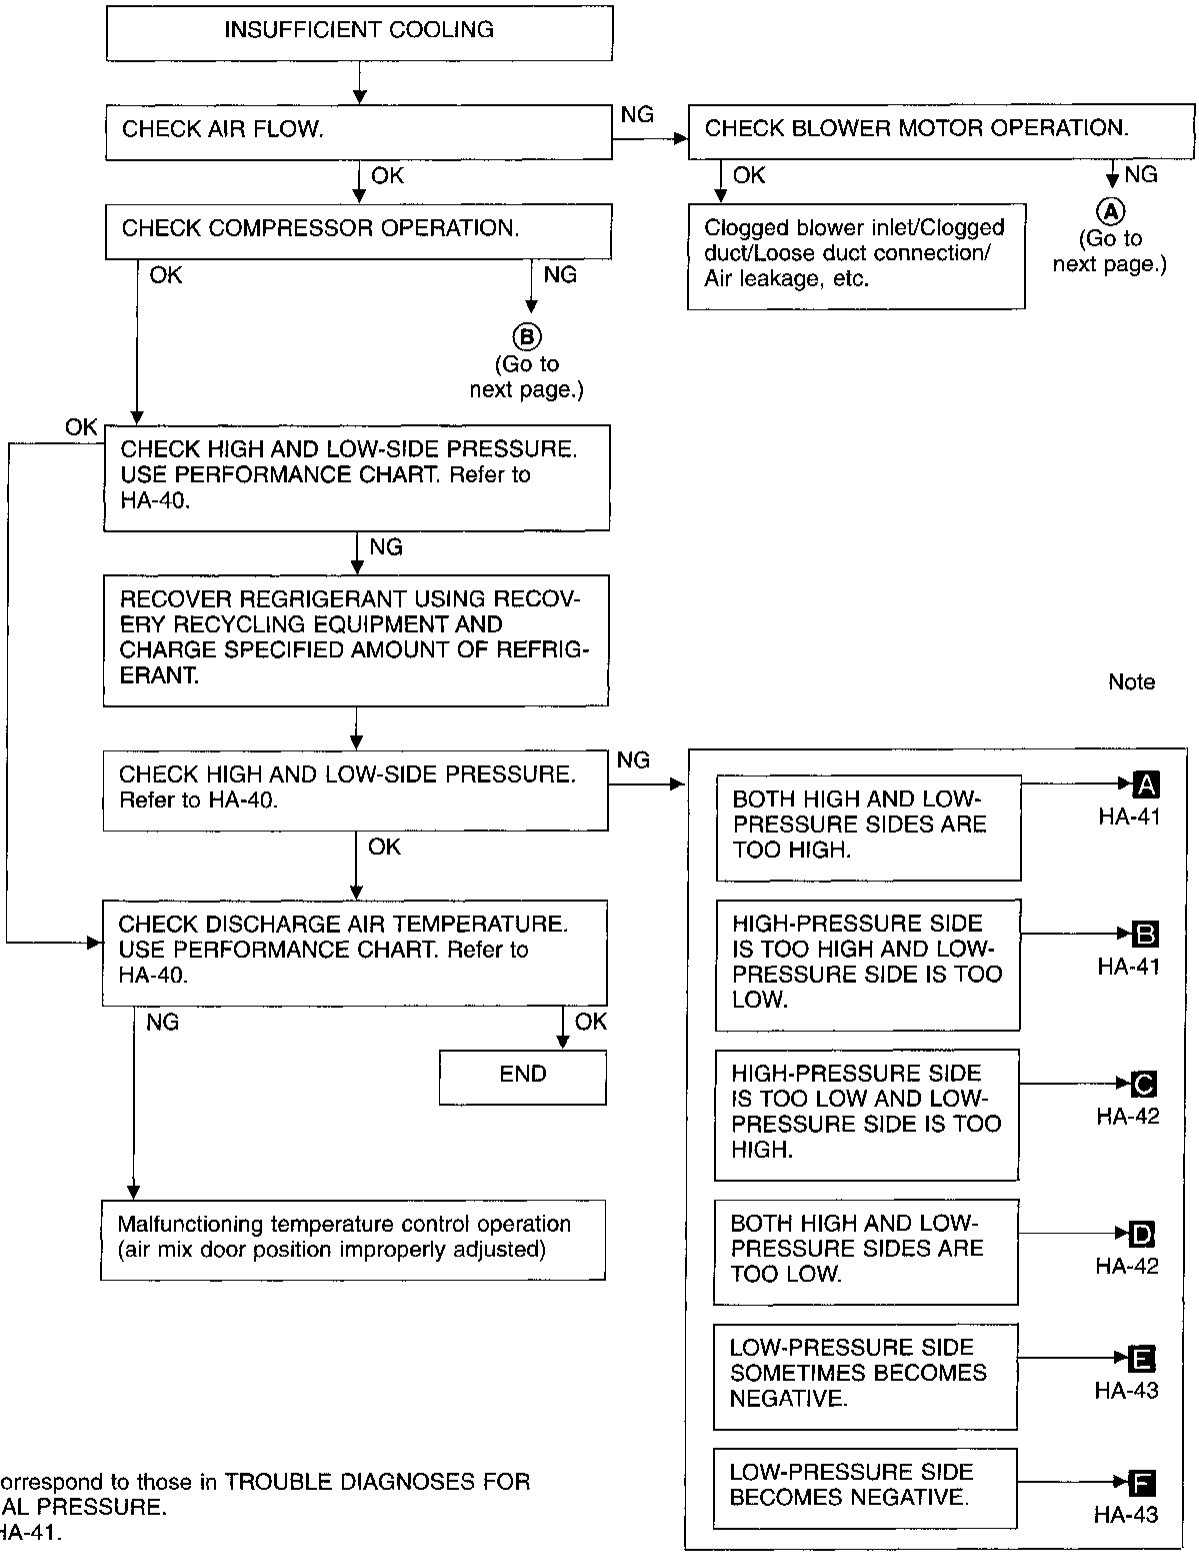


Check circuit continuity between terminals by supplying 12 volts to coil side terminals of air conditioner relay.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Trouble Diagnosis Procedure For Insufficient Cooling

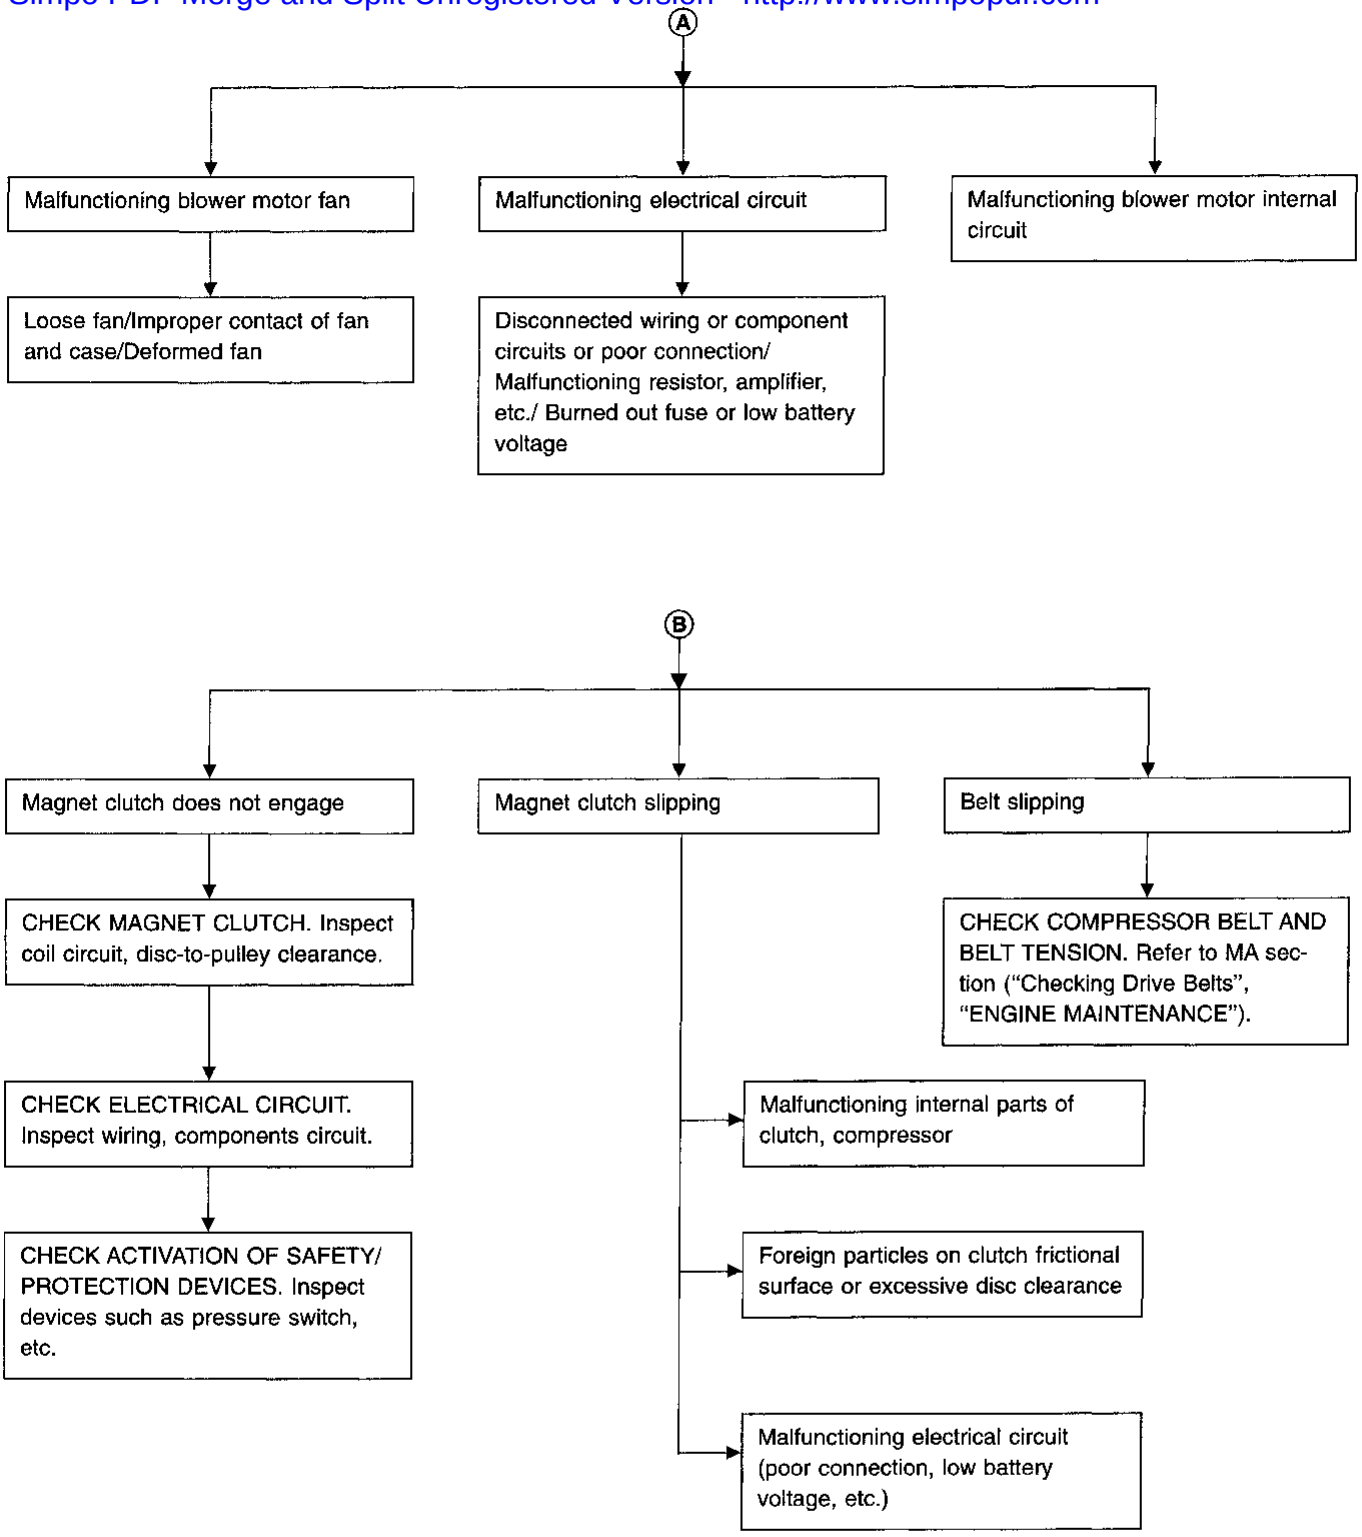
INSPECTION FLOW



COOLING OPERATION CHECK

1. Start engine.
2. Slide fan control lever to max speed.
3. Turn air conditioner switch ON.
4. Check temperature decrease.
   a. Turn temperature switch to full cold.
   b. Check for cold air at discharge air outlets.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Performance Test Diagnoses

INSUFFICIENT COOLING

Note: A-F correspond to those in TROUBLE DIAGNOSES FOR ABNORMAL PRESSURE.
Refer to HA-41.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Performance Chart

TEST CONDITION

Testing must be performed as follows:

Vehicle location: Indoors or in the shade (in a well-ventilated place)
Doors: Closed
Door window: Open
Hood: Open
TEMP. setting: Max. COLD
Discharge Air: FACE VENT
INTAKE lever position: (Recirculation)
FAN speed: 4-speed
Engine speed: 1,500 rpm

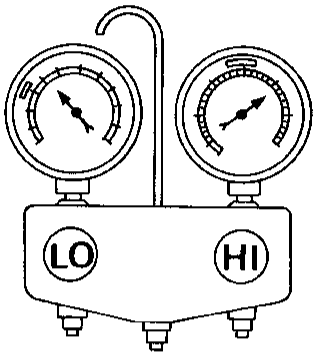
Operate the air conditioner system for 10 minutes before taking measurements.

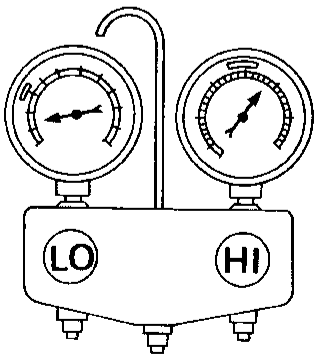
TEST READING

Recirculating-to-discharge air temperature table

Inside air (Recirculating air) at blower assembly inlet		Discharge air temperature at center ventilator °C (°F)
Relative humidity %	Air temperature °C (°F)	
50 - 60	20 (68)	6.6 - 8.3 (44 - 47)
	25 (77)	10.4 - 12.4 (51 - 54)
	30 (86)	14.2 - 16.7 (58 - 62)
	35 (95)	18.2 - 21.0 (65 - 70)
	40 (104)	22.0 - 25.2 (72 - 77)
60 - 70	20 (68)	8.3 - 9.8 (47 - 50)
	25 (77)	12.4 - 14.4 (54 - 58)
	30 (86)	16.7 - 18.9 (62 - 66)
	35 (95)	21.0 - 23.6 (70 - 74)
	40 (104)	25.2 - 28.1 (77 - 83)

Ambient air temperature-to-operating pressure table

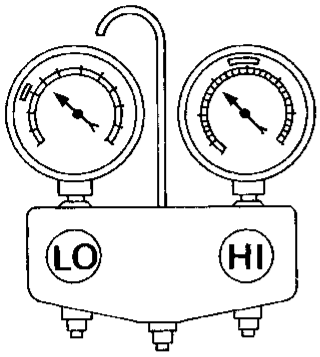


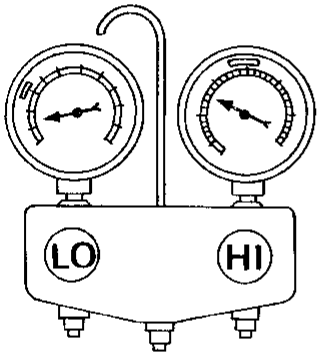


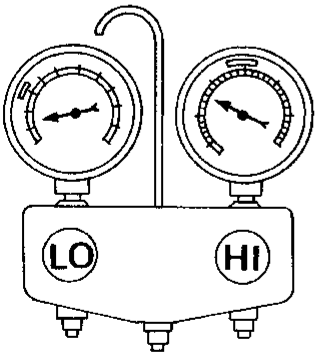
Ambient air		High-pressure (Discharge side) kPa (kg/cm^2, psi)	Low-pressure (Suction side) kPa (kg/cm^2, psi)
Relative humidity %	Air temperature °C (°F)		
50 - 70	20 (68)	961 - 1,187 (9.8 - 12.1, 139 - 172)	108 - 157 (1.1 - 1.6, 16 - 23)
	25 (77)	1,295 - 1,599 (13.2 - 16.3, 188 - 232)	161.8 - 215.8 (1.65 - 2.2, 23.5 - 31.3)
	30 (86)	1,285 - 1,569 (13.1 - 16, 186 - 228)	167 - 216 (1.7 - 2.2, 24 - 31)
	35 (95)	1,520 - 1,863 (15.5 - 19, 220 - 270)	235 - 284 (2.4 - 2.9, 34 - 41)
	40 (104)	1,765 - 2,158 (18 - 22, 256 - 313)	289.3 - 353.1 (2.95 - 3.6, 41.9 - 51.2)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Trouble Diagnoses for Abnormal Pressure



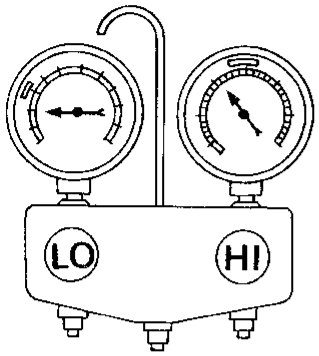


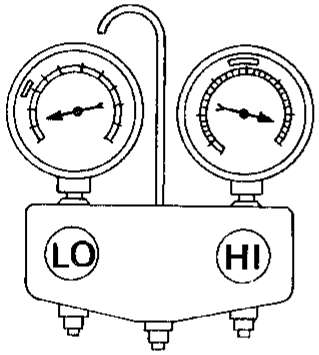


Whenever system's high or low-side pressure is abnormal, diagnose using a manifold gauge. The marker above the gauge scale in the following table indicates the standard (normal) pressure range. Since the standard normal pressure differs from vehicle to vehicle, refer to HA-40 ("Ambient air temperature-to-operating pressure table").

Pressure measurements are effective only when ambient temperature is in the range indicated under the Performance Chart.

Gauge indication	Refrigerant cycle	Probable cause	Corrective action
Both high and low-pressure sides are too high. A  AC359A	● Pressure is reduced soon after water is splashed on condenser.	Excessive refrigerant charge in refrigeration cycle.	Reduce refrigerant until specified pressure is obtained.
	● Air suction by radiator or cooling fan is insufficient.	Insufficient condenser cooling performance. ↓ ① Condenser fins are clogged. ② Improper rotation of cooling fan.	● Clean condenser. ● Check and repair radiator or cooling fan as necessary.
	● Low-pressure pipe is not cold. ● When compressor is stopped high-pressure value quickly drops by approximately 196 kPa (2 kg/cm^2, 28 psi). It then decreases gradually thereafter.	Poor heat exchange in condenser. (After compressor operation stops, high-pressure decreases too slowly.) ↓ Air in refrigeration cycle.	Evacuate repeatedly and recharge system.
	Engine tends to overheat.	Engine cooling systems malfunction.	Check and repair each engine cooling system.
	● An area of the low-pressure pipe is colder than near the evaporator outlet. ● Plates are sometimes covered with frost.	● Excessive liquid refrigerant on low-pressure side. ● Excessive refrigerant discharge flow. ● Expansion valve is open a little compared with the specification. ↓ ① Improper thermal valve installation. ② Improper expansion valve adjustment.	Replace expansion valve.
High-pressure side is too high and low-pressure side is too low. B  AC360A	Upper side of condenser and high-pressure side are hot, however, liquid tank is not as hot.	High-pressure tube or parts located between compressor and condenser are clogged or crushed.	● Check and repair or replace malfunctioning parts. ● Check lubricant for contamination.



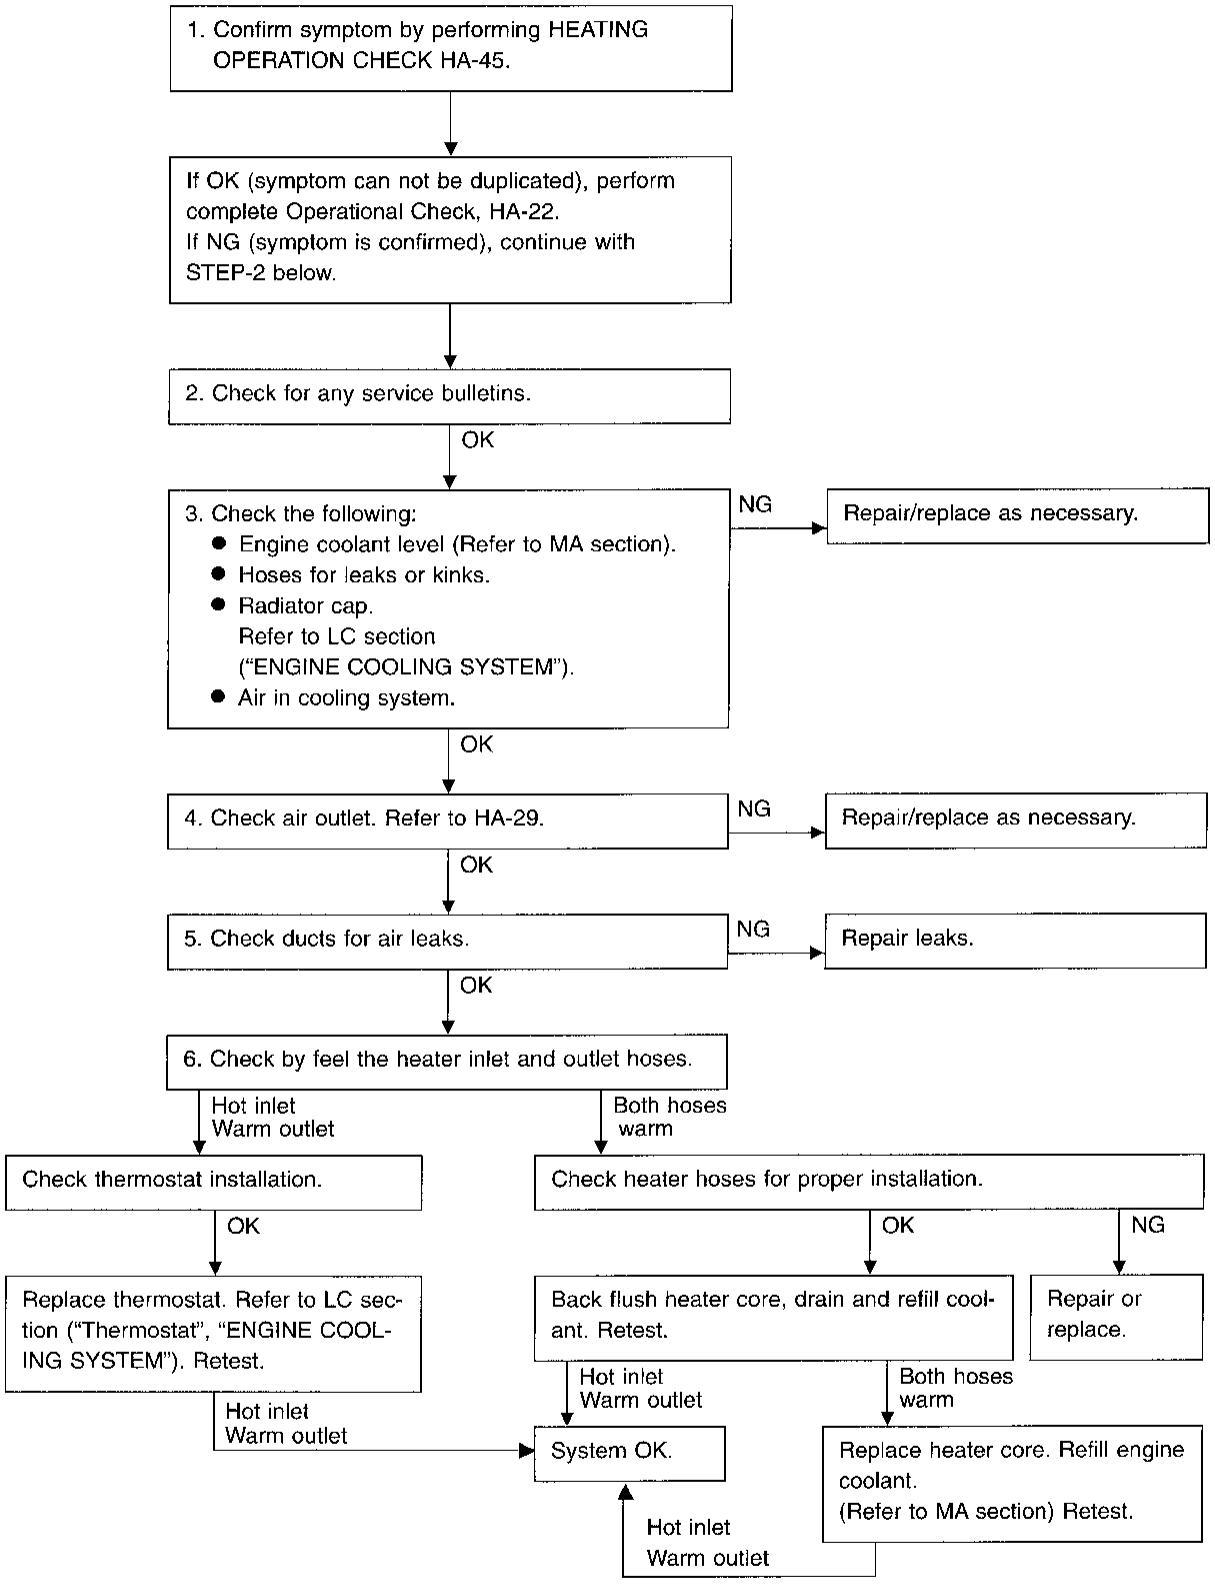


Trouble Diagnoses for Abnormal Pressure (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Gauge indication	Refrigerant cycle	Probable cause	Corrective action
High-pressure side is too low and low-pressure side is too high. C  AC356A	High and low-pressure sides become equal soon after compressor operation stops.	Compressor pressure operation is improper. ↓ Damaged inside compressor packings.	Replace compressor.
	No temperature difference between high and low-pressure sides.	Compressor discharge capacity does not change. (Compressor stroke is set at maximum.)	Replace compressor.
Both high and low-pressure sides are too low. D  AC353A	● There is a big temperature difference between liquid tank outlet and inlet. Outlet temperature is extremely low. ● Liquid tank inlet and expansion valve are frosted.	Liquid tank is partly clogged.	● Replace liquid tank. ● Check lubricant for contamination.
	● Temperature of expansion valve inlet is extremely low as compared with areas near liquid tank. ● Expansion valve inlet may be frosted. ● Temperature difference occurs somewhere in high-pressure side.	High-pressure pipe located between liquid tank and expansion valve is clogged.	● Check and repair malfunctioning parts. ● Check lubricant for contamination.
	● Expansion valve and liquid tank are warm or only cool to the touch.	Low refrigerant charge. ↓ Leaking fittings or components.	● Check for refrigerant leaks. Refer to "Checking Refrigerant Leaks", HA-48.
Both high and low-pressure sides are too low. D  AC353A	There is a big temperature difference between expansion valve inlet and outlet while the valve itself is frosted.	Expansion valve closes a little compared with the specification. ↓ ① Improper expansion valve adjustment. ② Malfunctioning thermal valve. ③ Outlet and inlet may be clogged.	● Remove foreign particles by using compressed air. ● Check lubricant for contamination.
	An area of low-pressure pipe is colder than areas near the evaporator outlet.	Low-pressure pipe is clogged or crushed.	● Check and repair malfunctioning parts. ● Check lubricant for contamination.
	Air flow volume is not enough or is too low.	Compressor pressure operation is improper.	Replace compressor.

Trouble Diagnoses for Abnormal Pressure (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Gauge indication	Refrigerant cycle	Probable cause	Corrective action
Low-pressure side sometimes becomes negative. E  AC354A	● Air conditioner system does not function and does not cyclically cool the compartment air. ● The system constantly functions for a certain period of time after compressor is stopped and restarted.	Refrigerant does not discharge cyclically. ↓ Moisture is frozen at expansion valve outlet and inlet. ↓ Water is mixed with refrigerant.	● Replace refrigerant. ● Replace liquid tank.
Low-pressure side becomes negative. F  AC362A	Liquid tank or front/rear side of expansion valve's pipe is frosted or dewed.	High-pressure side is closed and refrigerant does not flow. ↓ Expansion valve or liquid tank is frosted.	Leave the system at rest . Start it again to check whether or not the problem is caused by water or foreign particles. ● If water is the cause, initially cooling is okay. Then the water freezes, causing a blockage. Drain water from refrigerant or replace refrigerant. ● If due to foreign particles, remove expansion valve and remove the particles with dry and compressed air. ● If either of the above methods cannot correct the problem, replace expansion valve. ● Replace liquid tank. ● Check lubricant for contamination.

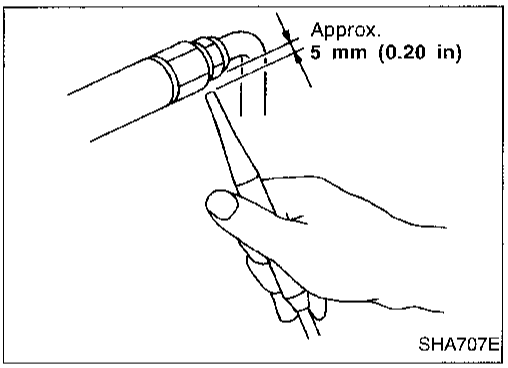
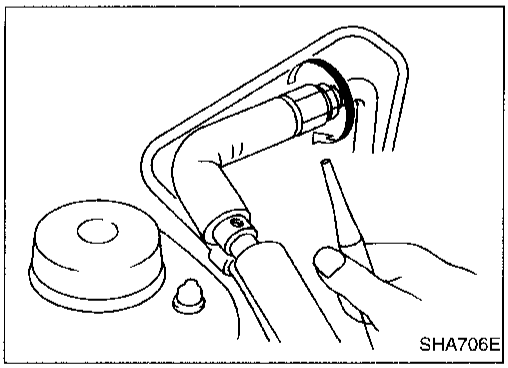
Checking Refrigerant Leaks

PRELIMINARY CHECK

Perform a visual inspection of all refrigeration parts, fittings, hoses, and components for signs of A/C lubricant leakage, damage and corrosion.

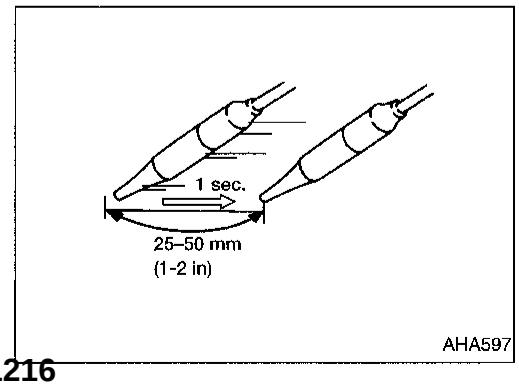


PRECAUTIONS FOR HANDLING LEAK DETECTOR



When performing a refrigerant leak check, use a J39400 A/C leak detector or equivalent. Ensure that the instrument is calibrated and set properly per the operating instructions.

The leak detector is a delicate device. In order to use the leak detector properly, read the operating instructions and perform any specified maintenance.



Other gases in the work area or substances on the A/C components, for example, anti-freeze, windshield washer fluid, solvents and cleaners, may falsely trigger the leak detector. Make sure the surfaces to be checked are clean. Do not allow the sensor tip of the detector to come into contact with any substance. This can also cause false readings and may damage the detector.

1. Position probe approximately 5 mm (0.20 in) away from point to be checked.

2. When testing, circle each fitting completely with probe.

3. Move probe along component approximately 25-50 mm/sec. (1-2 in.)/sec.

Checking Refrigerant Leaks (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

CHECKING PROCEDURE

To prevent inaccurate or false readings, make sure there is no refrigerant vapor or tobacco smoke in the vicinity of the vehicle. Perform the leak test in calm area (low air/wind movement) so that the leaking refrigerant is not dispersed.

1. Turn engine off.
2. Connect a suitable A/C manifold gauge set to the A/C service ports.
3. Check if the A/C refrigerant pressure is at least 345 kPa (50 psi) above 16°C (60°F). If less than specification, evacuate and recharge the system with the specified amount of refrigerant.
   NOTE: At temperatures below 16°C (60°F), leaks may not be detected since the system may not reach 345 kPa (50 psi).
4. Conduct the leak test from the high side to the low side at points ⓐ through ⓚ. Refer to HA-4.
   Perform a leak check for the following areas carefully. Clean the component to be checked and move the leak detector probe completely around the connection/component.
   - **Compressor**

   Check the fittings of high and low-pressure hoses, relief valve, and shaft seal.
   - **Liquid tank**

   Check the pressure switch, tube fitting, weld seams and the fusible plug mounts.
   - **Service valves**

   Check all around the service valves. Ensure service valve caps are secured on the service valves (to prevent leaks).
   NOTE: After removing A/C manifold gauge set from service valves, wipe any residue from valves to prevent any false readings by leak detector.
   - **Cooling unit (Evaporator)**

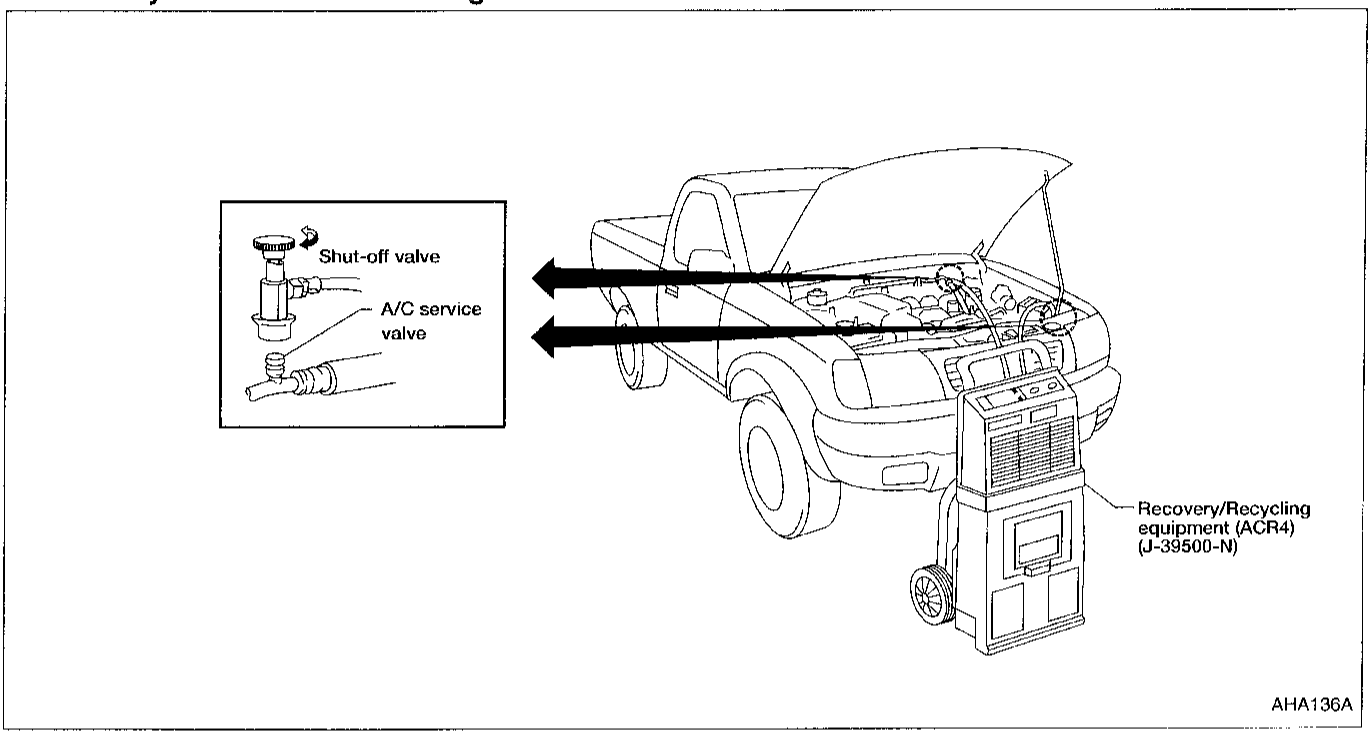
   Slide blower fan on "High" for at least 15 seconds to dissipate any refrigerant trace in the cooling unit. Insert the leak detector probe into the drain hose immediately after stopping engine. (Keep the probe inserted for at least ten seconds.)
5. If the leak detector detects a leak, verify at least once by blowing compressed air into area of suspected leak, then repeat check.
6. Do not stop when one leak is found. Continue to check for additional leaks at all system components.
7. Start engine.
8. Set the heater A/C control as follows:
   a. A/C switch ON
   b. Face mode
   c. Recirculation switch ON
   d. Max cold temperature
   e. Fan speed high
9. Run engine at 1500 rpm for at least 2 minutes.
10. Turn engine off and perform leak check again following steps 4 through 6 above.

Checking Refrigerant Leaks (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

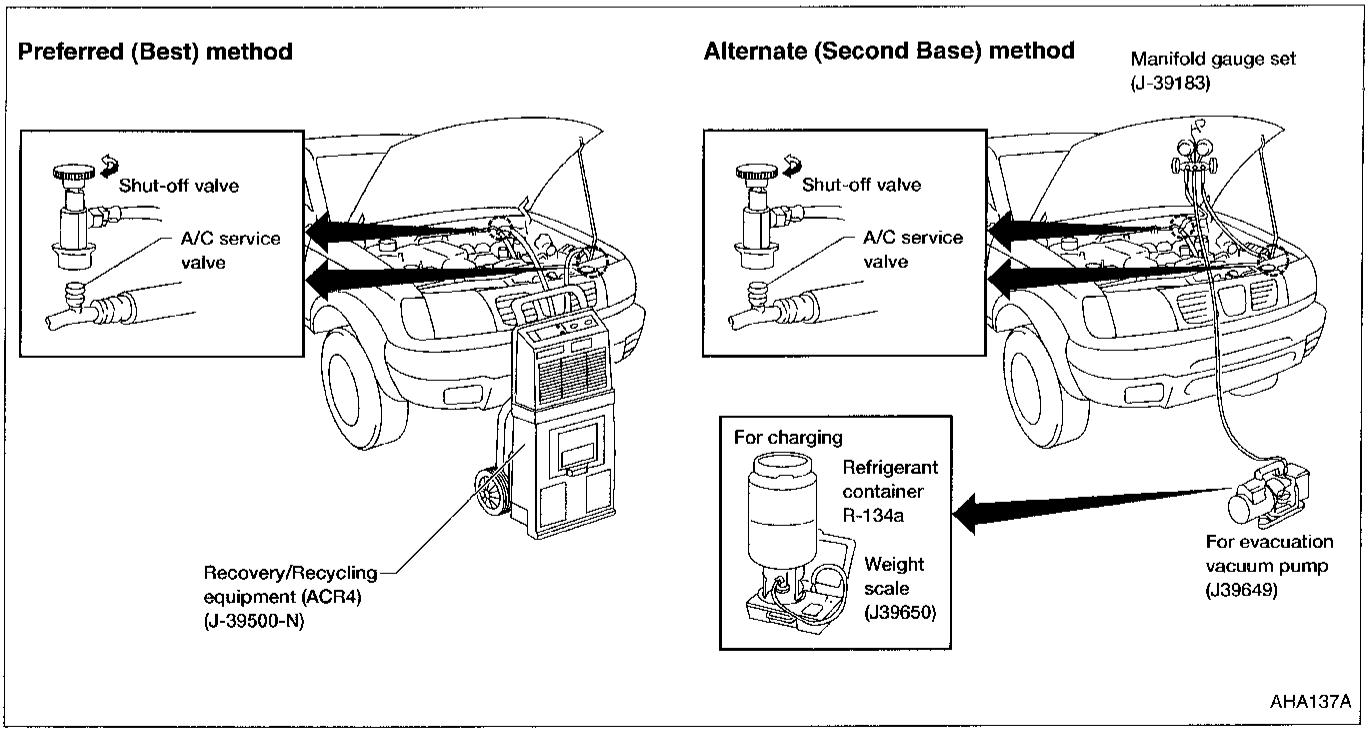
Refrigerant leaks should be checked immediately after stopping the engine. Begin with the leak detector on the high-pressure line. The pressure in the high pressure line will gradually drop after refrigerant circulation stops and pressure in the low pressure line will gradually rise, as shown in the graph. Leaks are more easily detected when pressure is high.

11. Discharge A/C system using approved refrigerant recovery equipment. Repair the leaking fitting or component as necessary.
12. Evacuate and recharge A/C system and perform the leak test to confirm no refrigerant leaks.
13. Conduct A/C performance test to ensure system works properly.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

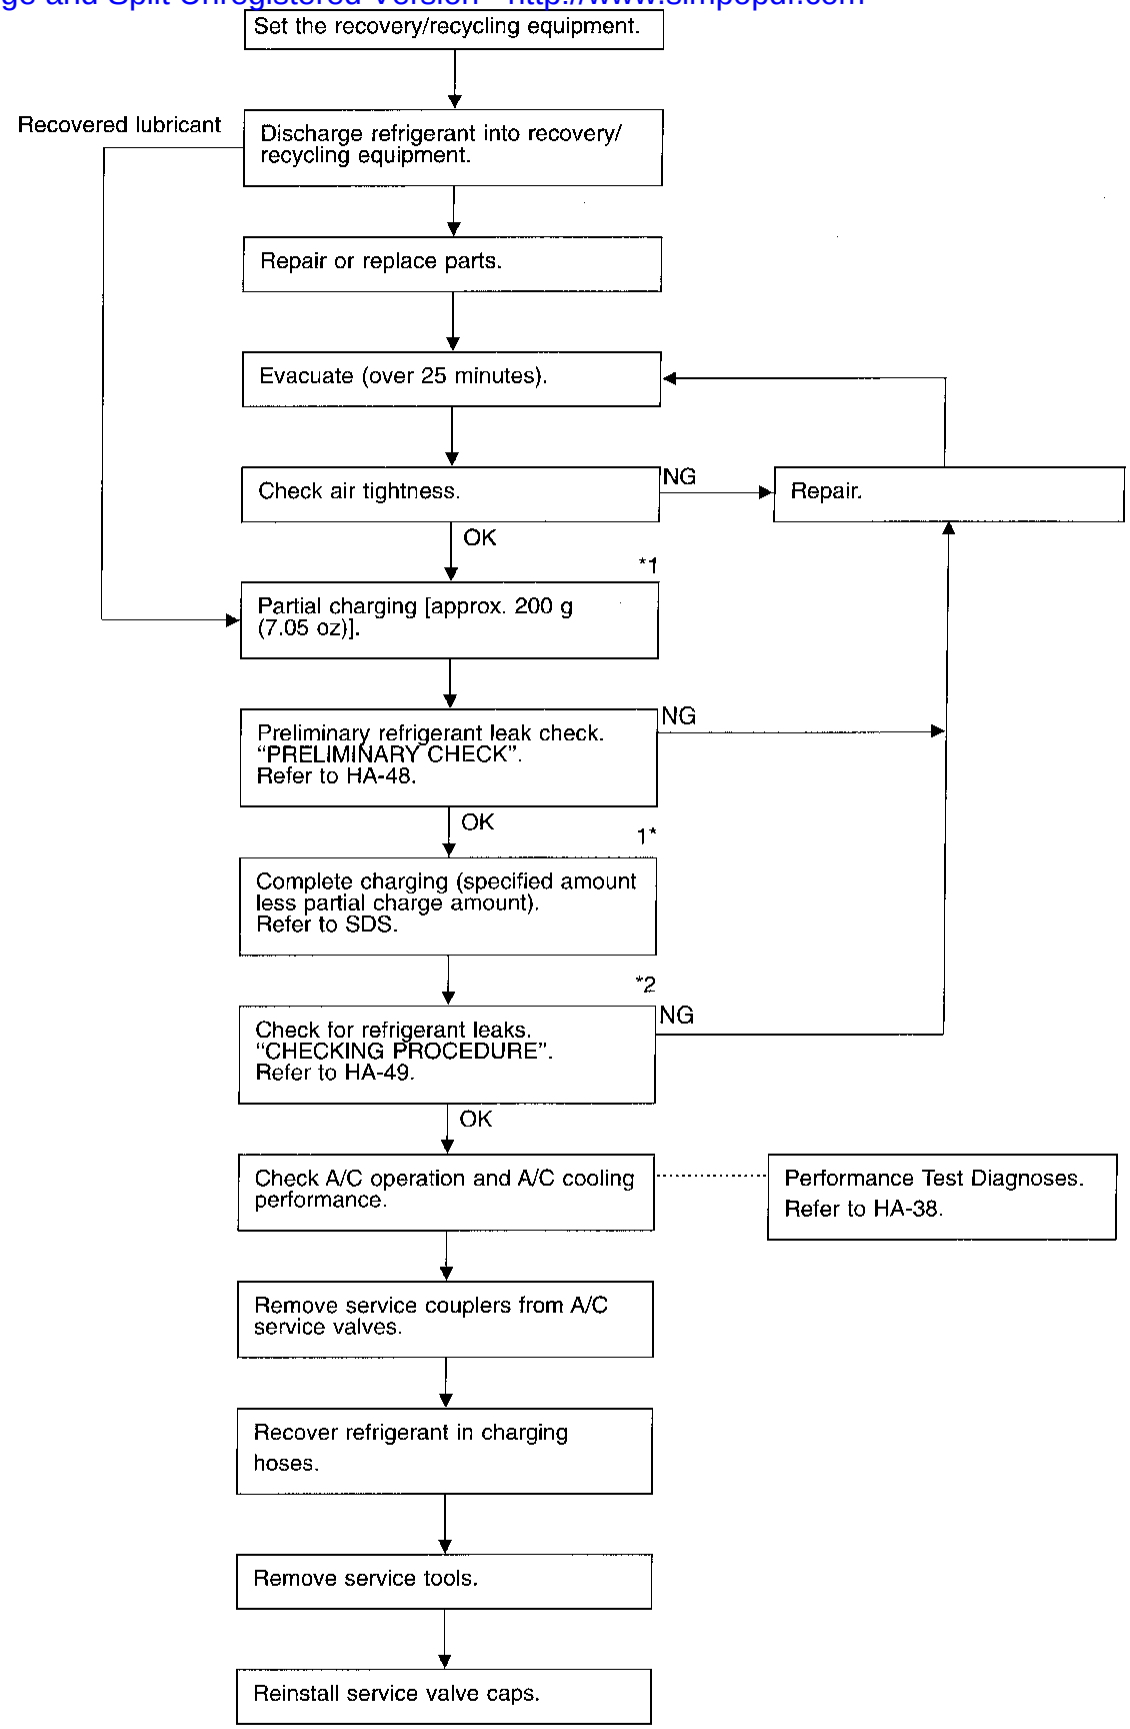
R-134a Service Procedure



DISCHARGING REFRIGERANT

WARNING:

Avoid breathing A/C refrigerant and lubricant vapor or mist. Exposure may irritate eyes, nose and throat. Remove R-134a from the A/C system using certified service equipment meeting requirements of SAE J2210 (R-134a recycling equipment) or J2209 (R-134a recovery equipment). If accidental system discharge occurs, ventilate work area before resuming service. Additional health and safety information may be obtained from refrigerant and lubricant manufacturers.



EVACUATING SYSTEM AND CHARGING REFRIGERANT

R-134a Service Procedure (Cont'd)

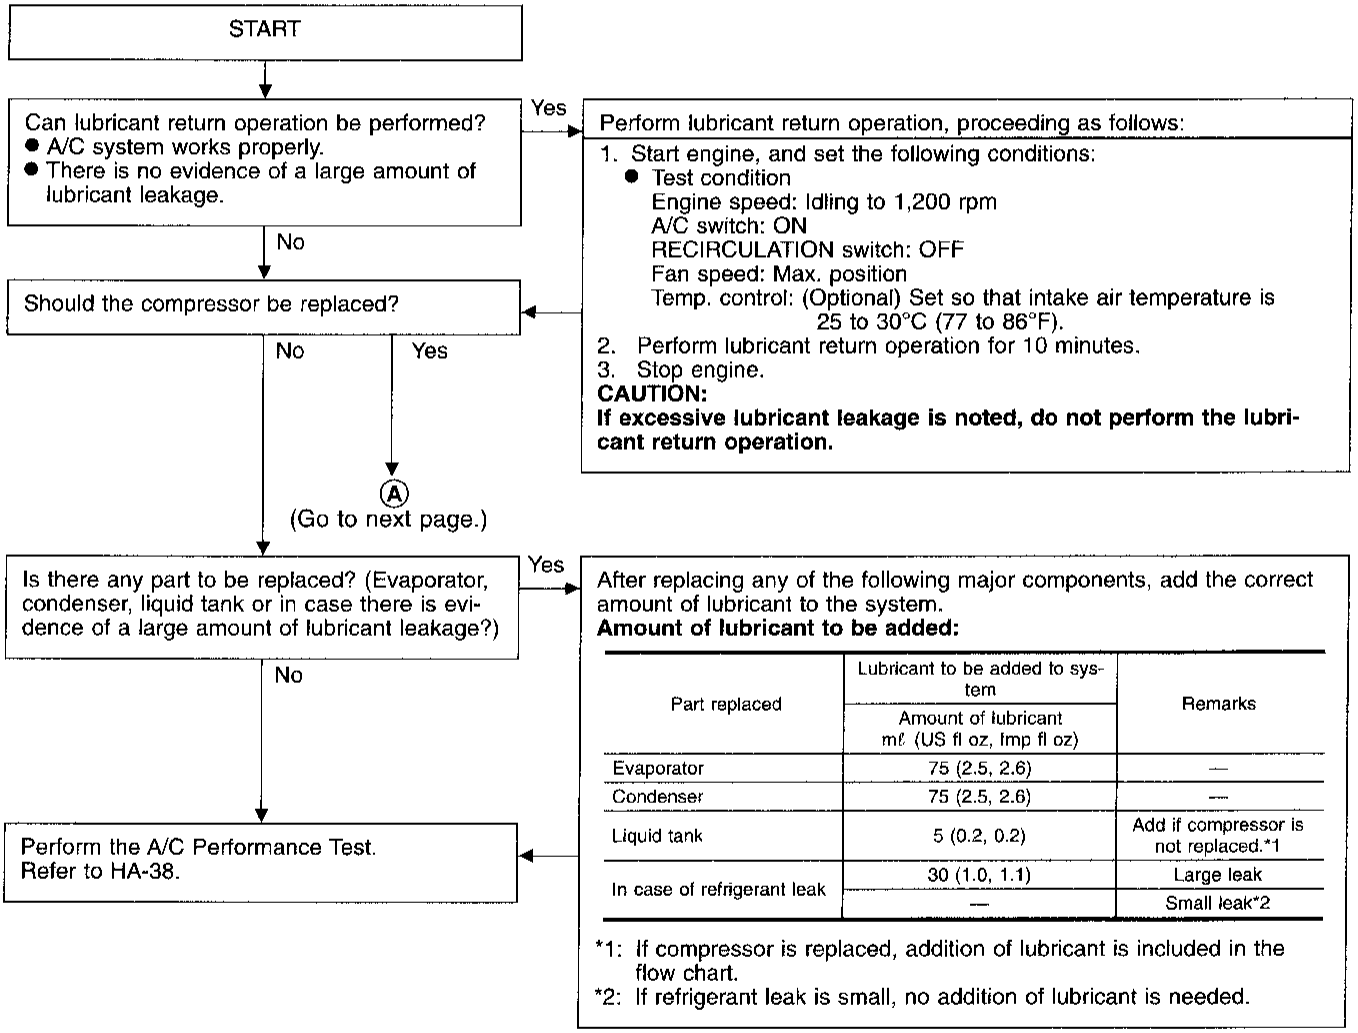
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Note: *1 Before charging refrigerant, ensure engine is OFF.
*2 Before checking for leaks, start engine to activate air conditioner system then turn engine OFF. Service valve caps must be installed to prevent leakage.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Compressor Lubricant Quantity

The lubricant used to lubricate the compressor circulates through the system with the refrigerant. Whenever any A/C component is replaced or gas leakage occurs, lubricant must be added.
If lubricant quantity is not maintained properly, the following malfunctions may result:



- Lack of lubricant: May lead to a seized compressor
- Excessive lubricant: Inadequate cooling (thermal exchange interference)

LUBRICANT

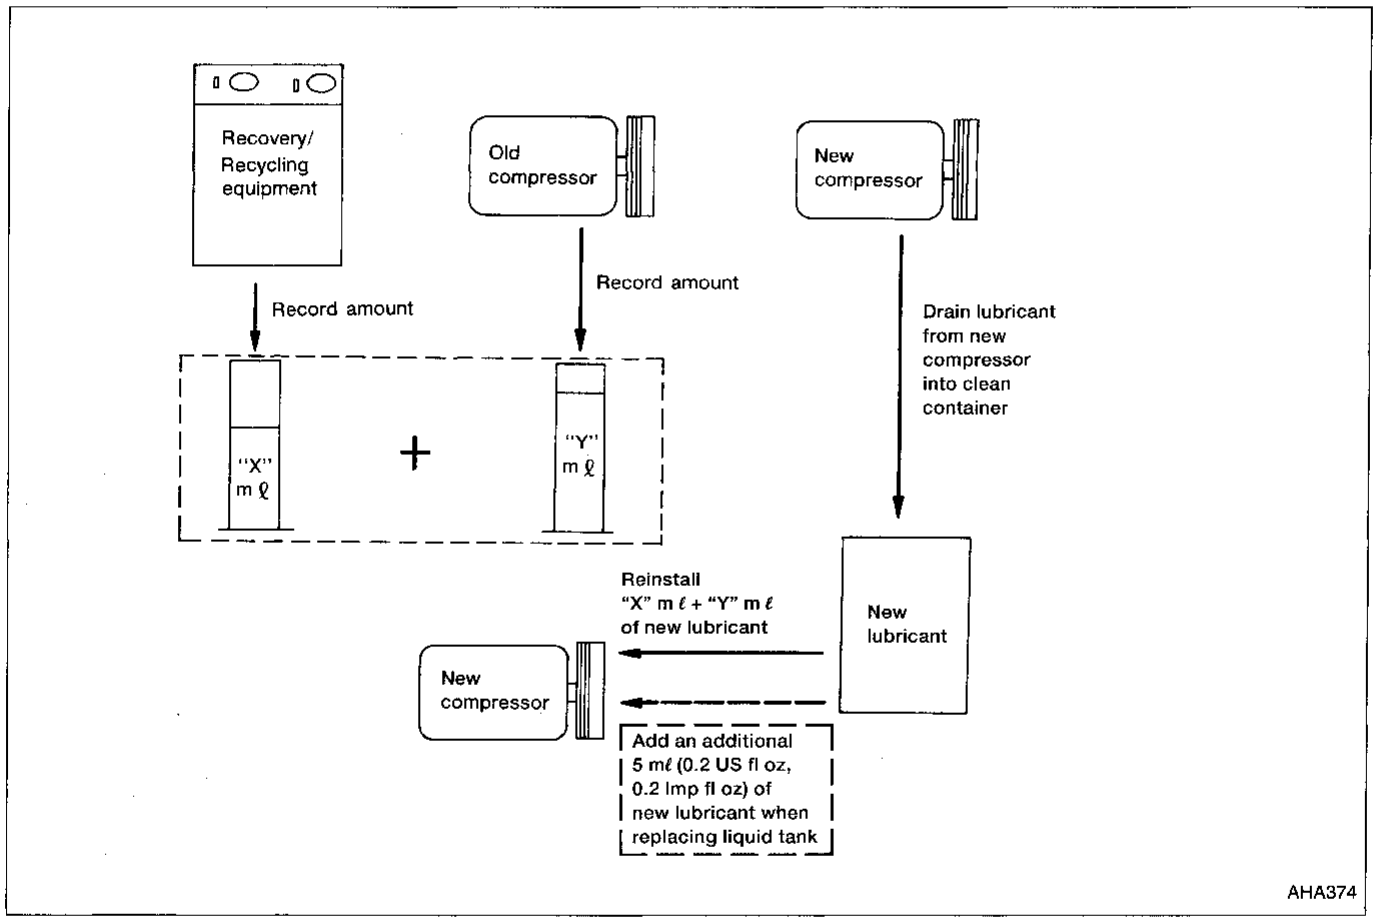
Name: Nissan A/C System Lubricant Type R
Part No.: KLH00-PAGR0

CHECKING AND ADJUSTING

Adjust the lubricant quantity according to the flowchart shown below.

Part replaced	Lubricant to be added to system Amount of lubricant mℓ (US fl oz, Imp fl oz)	Remarks
Evaporator	75 (2.5, 2.6)	—
Condenser	75 (2.5, 2.6)	—
Liquid tank	5 (0.2, 0.2)	Add if compressor is not replaced.*1
In case of refrigerant leak	30 (1.0, 1.1)	Large leak
	—	Small leak*2

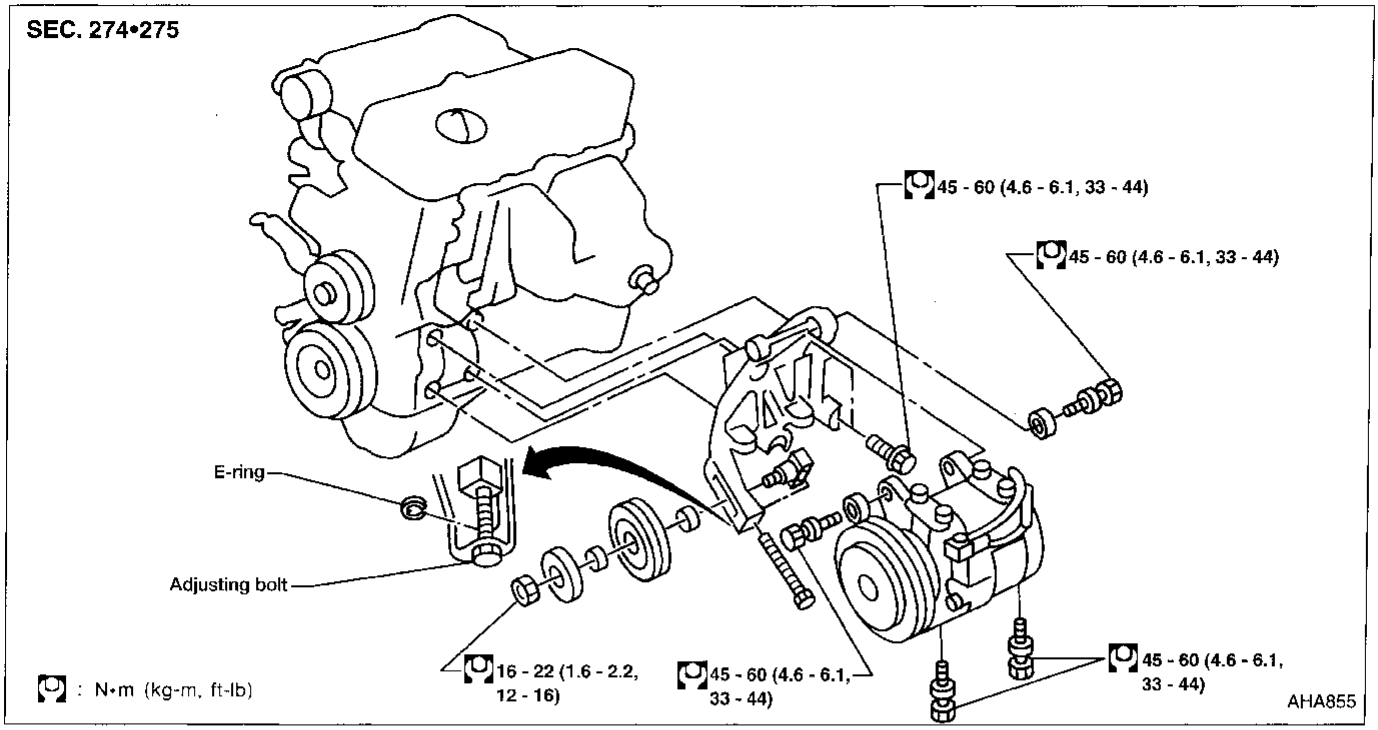
*1: If compressor is replaced, addition of lubricant is included in the flow chart.
*2: If refrigerant leak is small, no addition of lubricant is needed.



Compressor Lubricant Quantity (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Ⓐ

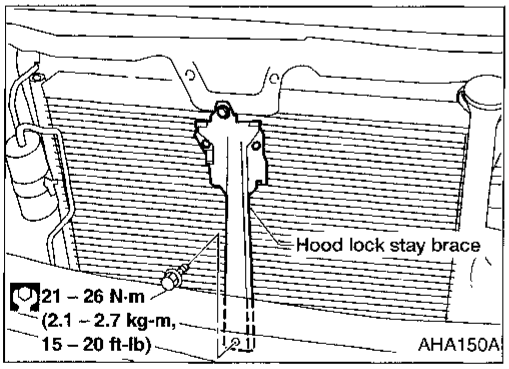


1. Discharge refrigerant into refrigerant recovery/recycling equipment. Measure lubricant discharged into the recovery/recycling equipment.
2. Drain the lubricant from the old (removed) compressor into a graduated container and record the amount of lubricant drained.
3. Drain the lubricant from the new compressor into a separate, clean container.
4. Measure an amount of new lubricant equal to amount drained from old compressor. Add this lubricant to new compressor through the suction port opening.
5. Measure an amount of new lubricant equal to the amount recovered during discharging. Add this lubricant to new compressor through the suction port opening.
6. If the liquid tank also needs to be replaced, add an additional 5 mℓ (0.2 US fl oz, 0.2 Imp fl oz) of lubricant at this time.
   Do not add this 5 mℓ (0.2 US fl oz, 0.2 Imp fl oz) of lubricant if only replacing the compressor.

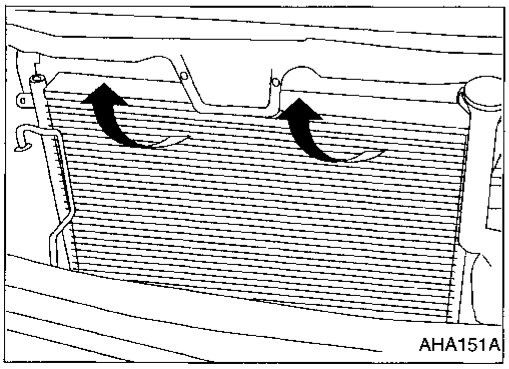
Lubricant adjusting procedure for compressor replacement

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Compressor Mounting



Belt Tension

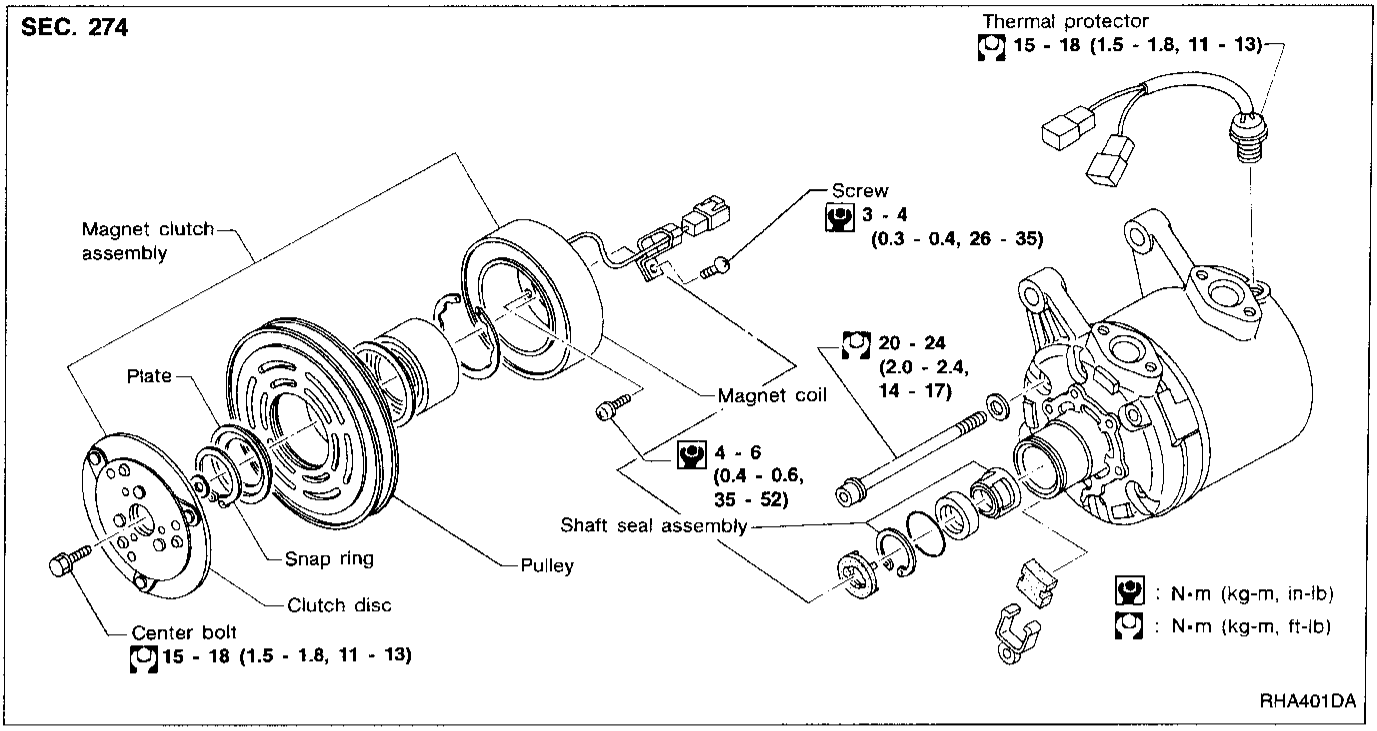


- **Refer to MA section ("Checking Drive Belts", "ENGINE MAINTENANCE").**

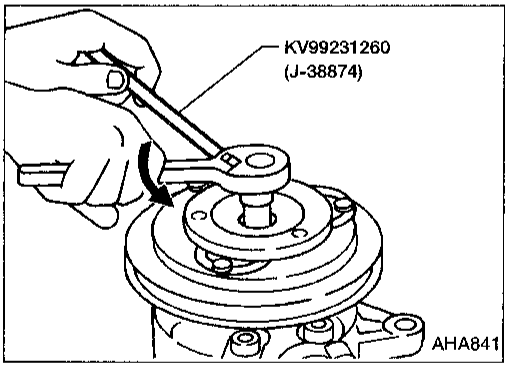
Fast Idle Control Device (FICD)

- **Refer to EC section ("IACV-FICD Solenoid Valve", "TROUBLE DIAGNOSIS FOR NON-DETECTABLE ITEMS").**

Condenser



REMOVAL

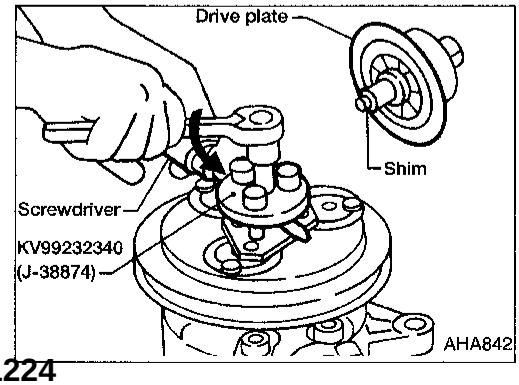


1. Discharge refrigerant using the recovery/recycling equipment (ACR4).
2. Remove side marker lamps.
3. Remove front grille (4 fasteners).
4. Remove harness clip from hood lock stay, if equipped (gently press out).
5. Remove grille apron (5 nuts).
6. Remove hood lock stay brace (4 bolts). Remove hood latch (3 bolts).
7. Remove hose (high-pressure) clamp bracket from radiator core support.
8. Disconnect high-pressure hose at condenser.
9. Disconnect dual-pressure switch harness connector.
10. Disconnect high-pressure tube (liquid tank to cooling unit) at liquid tank.
11. Remove liquid tank and bracket.
12. Remove lower core support seal (4 bolts).
13. Loosen windshield washer tank bolts.
14. Remove condenser mounting bolts (2 bolts).
15. Remove condenser assembly.

CAUTION:
Carefully lift condenser without damaging radiator (fin and tube).

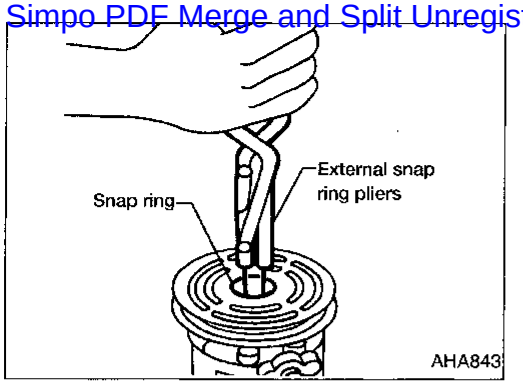
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Compressor

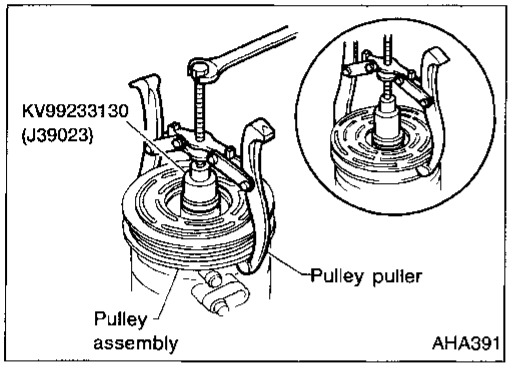


Compressor Clutch

REMOVAL

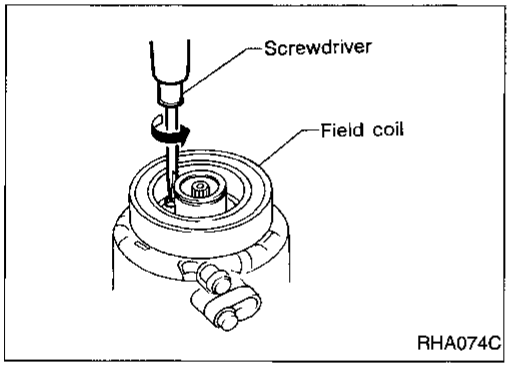


- When removing center bolt, hold clutch disc with clutch disc wrench.

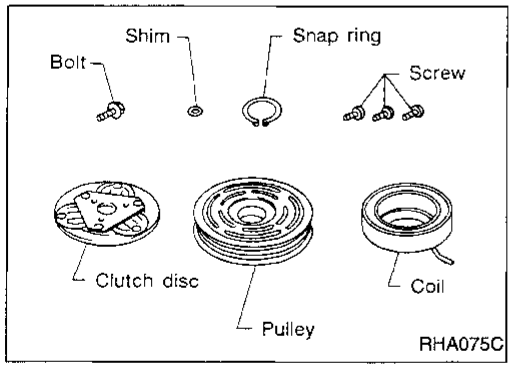


- Remove the drive plate using the clutch disc puller.
  Insert holder's three pins into the drive plate. Rotate the holder clockwise to hook it onto the plate. Then, tighten the center bolt to remove the drive plate.
  While tightening the center bolt, insert a round bar (screwdriver, etc.) between two of the pins (as shown in the figure) to prevent drive plate rotation. After removing the drive plate, remove the shims from either the drive shaft or the drive plate.

Compressor Clutch (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



- Remove the snap ring using external snap ring pliers.

- For pulley removal use pulley puller.
  Use a commercially available pully puller. Position the center of the puller on the end of the drive shaft. Remove the pully assembly with the puller.
  For Pressed Pulleys:
  To prevent deformation of the pulley groove, the puller claws should be hooked under (not into) the pulley groove.
- Remove the field coil harness clip using a screwdriver.

- Remove the three field coil fixing screws and remove the field coil.

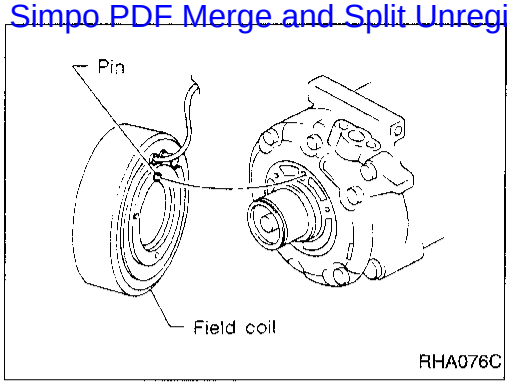
INSPECTION

Clutch disc

If the contact surface shows signs of damage due to excessive heat, replace clutch disc and pully.

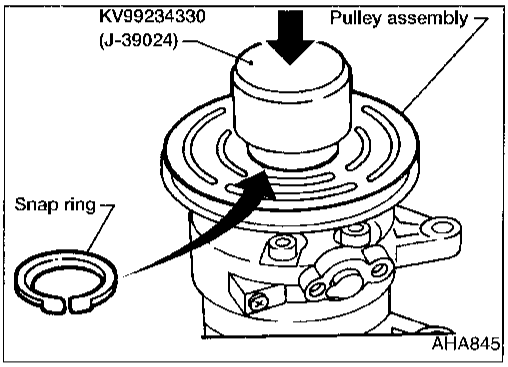
Pulley

Check the appearance of the pulley assembly. If contact surface of pulley shows signs of excessive grooving, replace clutch disc and pulley. The contact surfaces of the pulley assembly should be cleaned with a suitable solvent before reinstallation.



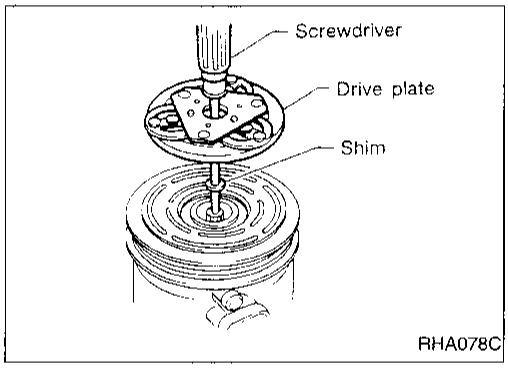
Coil

Check coil for loose connection or cracked insulation.

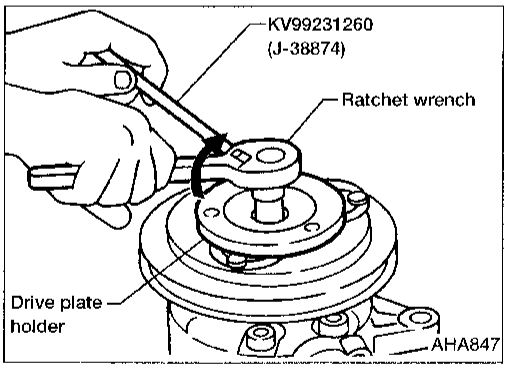


Compressor Clutch (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

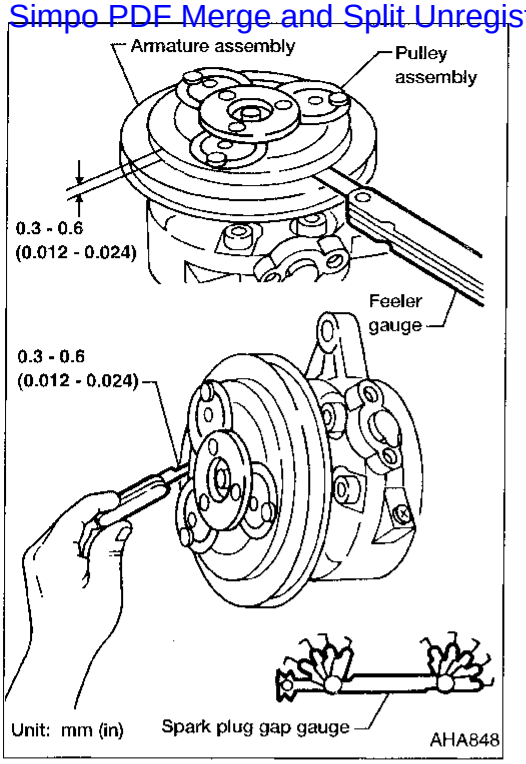


INSTALLATION



- Install the field coil.
- **Be sure to align the coil's pin with the hole in the compressor's front head.**
- Install the field coil harness clip using a screwdriver.

- Install the pulley assembly using the installer and a hand press, and then install the snap ring using snap ring pliers.



- Install the drive plate on the drive shaft, together with the original shim(s). Press the drive plate down by hand.

- Using the holder to prevent drive plate rotation, tighten the bolt to 12 to 15 N·m (1.2 to 1.5 kg-m, 9 to 11 ft-lb) torque.
- **After tightening the bolt, check that the pulley rotates smoothly.**

Compressor Clutch (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

- Check clearance all the way around the clutch disc.

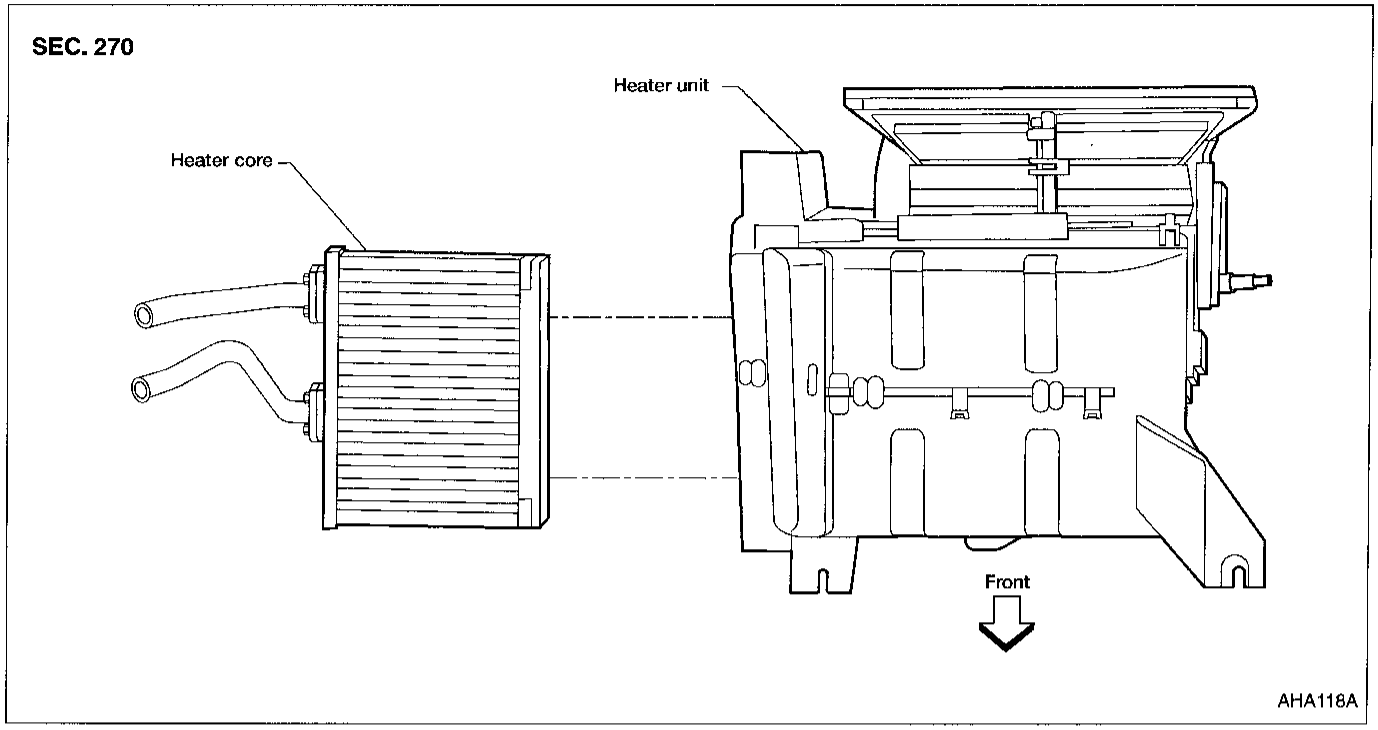
  Disc-to-pulley clearance:

  0.3 - 0.6 mm (0.012 - 0.024 in)

  If the specified clearance is not obtained, replace adjusting spacer and recheck.

BREAK-IN OPERATION

When replacing compressor clutch assembly, always conduct the break-in operation. This is done by engaging and disengaging the clutch about 30 times. Break-in operation raises the level of transmitted torque.



Thermal Protector

INSPECTION

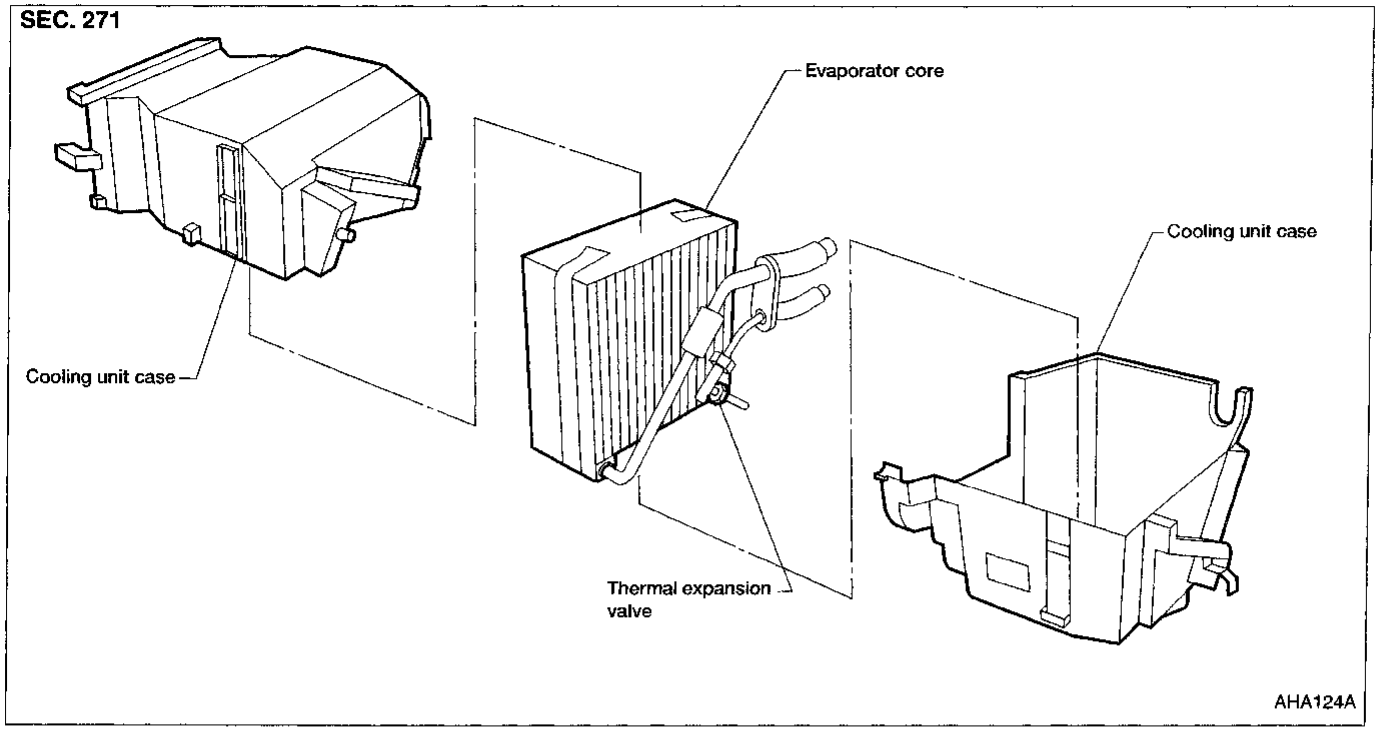
- When servicing, do not allow foreign matter to get into compressor.
- Check continuity between two terminals.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

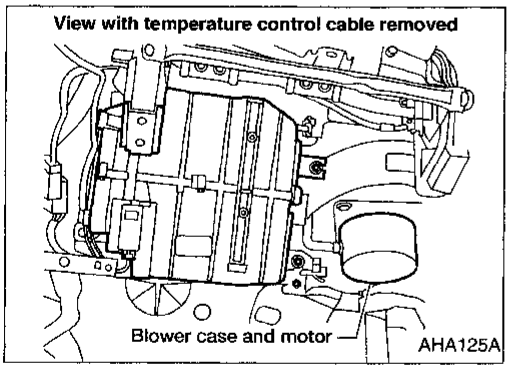
Heater Unit (Heater Core)

REMOVAL

1. Drain the cooling system. Refer to MA section, ("Changing Engine Coolant").
2. Disconnect the two heater hoses from inside the engine compartment.
3. Remove the cooling unit. Refer to HA-61.
4. Remove the steering member assembly. Refer to BT section ("Instrument Panel").
5. Remove the heater unit.
6. Remove the heater core.



INSTALLATION



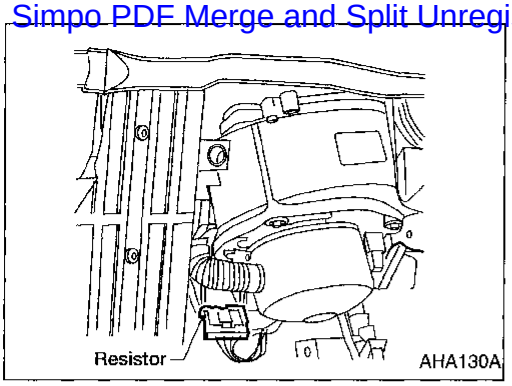
Installation is basically the reverse order of removal.

When filling radiator with coolant, refer to MA section ("Changing Engine Coolant").

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Cooling Unit (A/C Evaporator)

REMOVAL



1. Evacuate the A/C system. Refer to HA-51.
2. Disconnect the two refrigerant lines from the engine compartment.
   - Cap the A/C lines to prevent moisture from entering the system.
3. Remove the glove box and mating trim. Refer to BT section ("Instrument Panel").
4. Disconnect the thermal amp. connector.
5. Remove the cooling unit.
6. Separate the cooling unit case, and remove the evaporator.

INSTALLATION

Installation is basically the reverse order of removal.

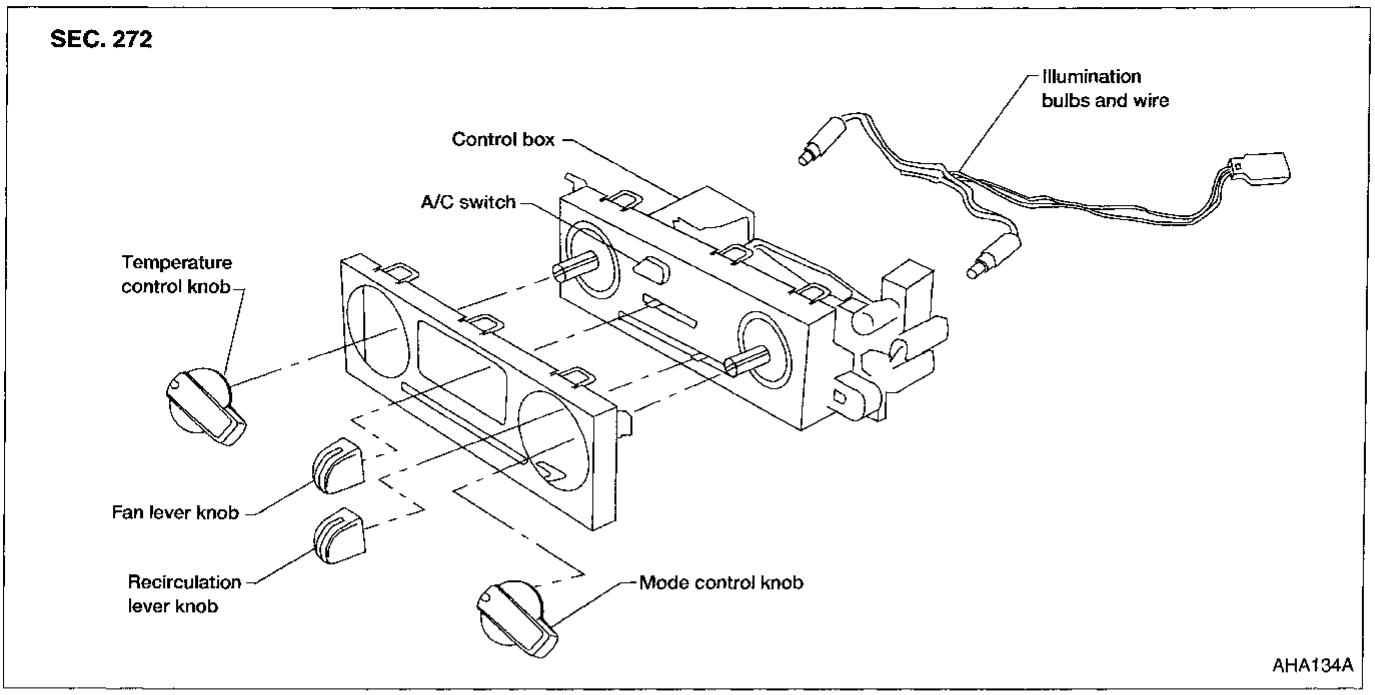
Recharge the A/C system. Refer to HA-51.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

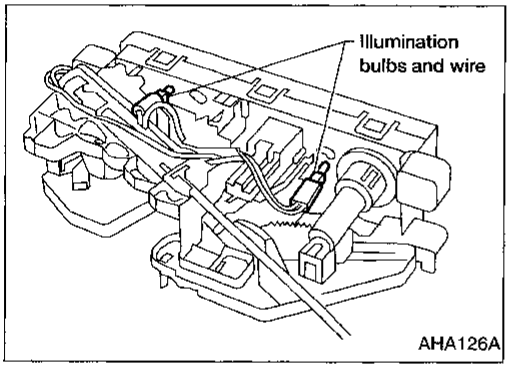
Blower Case and Motor

REMOVAL

1. Remove the glove box and mating trim. Refer to BT section ("Instrument Panel").
2. Remove the cooling unit. Refer to HA-61.
3. Disconnect the fan motor resistor.
4. Disconnect the fan motor.
5. Remove the blower case and motor.
6. Remove the three bolts and remove the motor from the blower case.



INSTALLATION



Installation is basically the reverse order of removal.

- **Recharge the A/C system. Refer to HA-51.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Fan Lever and Illumination Bulbs

REMOVAL

1. Remove A/C & Heat control. Refer to BT section ("Instrument Panel").
2. Loosen illumination bulbs and wire and pull out.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

General Specifications

COMPRESSOR

Model	DKV-14C
Type	Vane rotary
Displacement cm³ (cu in)/Rev	140 (8.54)
Direction of rotation	Clockwise (Viewed from drive end)
Drive belt	Poly V type

LUBRICANT

Model	ZEXEL make DKV-14C
Name	Nissan A/C System Lubricant Type R
Part No.	KLH00-PAGR0
Capacity mℓ (US fl oz, Imp fl oz)	
Total in system	200 (6.8, 7.0)
Compressor (Service part) charging amount	200 (6.8, 7.0)

REFRIGERANT

Type		R-134a
Capacity	kg (lb)	0.60 - 0.70 (1.32 - 1.54)
	g (oz)	600 - 700 (21.16 - 24.69)

Inspection and Adjustment

ENGINE IDLING SPEED
When A/C is ON

- **Refer to EC section (“Inspection and Adjustment”, “SERVICE DATA AND SPECIFICATIONS”).**

BELT TENSION

- **Refer to MA section (“Checking Drive Belts”, “ENGINE MAINTENANCE”).**

COMPRESSOR CLUTCH

Model		DKV-14C
Clutch disc-pulley clearance	mm (in)	0.3 - 0.6 (0.012 - 0.024)

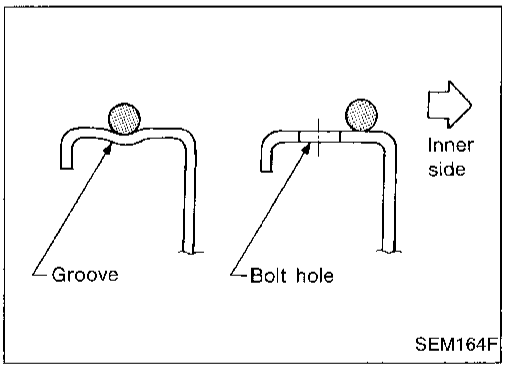
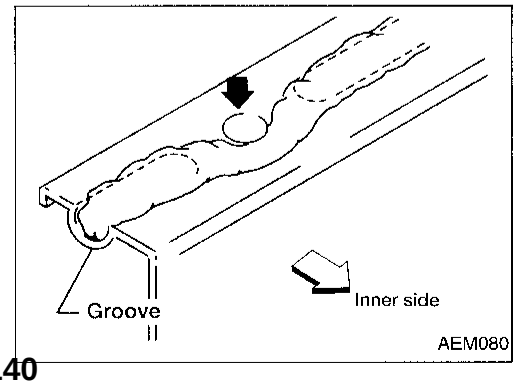
Supplemental Restraint System (SRS) "AIR BAG"



The Supplemental Restraint System "AIR BAG", used along with a seat belt, helps to reduce the risk or severity of injury to the driver and front passenger in a frontal collision. The Supplemental Restraint System consists of air bag modules (located in the center of the steering wheel and in the instrument panel on the passenger side), a diagnosis sensor unit, a crash zone sensor (4WD models), warning lamp, wiring harness and spiral cable.

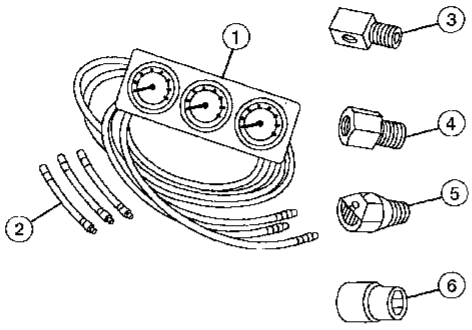


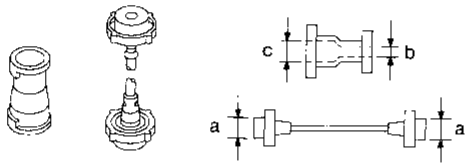
The vehicle is equipped with a passenger air bag deactivation switch. Because no rear seat exists where a rear-facing child restraint can be placed, the switch is designed to turn off the passenger air bag so that a rear-facing child restraint can be used in the front passenger seat. The switch is located in the center of the instrument panel, near the ashtray. When the switch is turned to the ON position, the passenger air bag is enabled and could inflate in a frontal collision. When the switch is turned to the OFF position, the passenger air bag is disabled and will not inflate in a frontal collision. A passenger air bag OFF indicator on the instrument panel lights up when the passenger air bag is switched OFF. The driver air bag always remains enabled and is not affected by the passenger air bag deactivation switch.

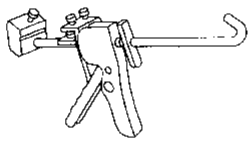
Information necessary to service the system safely is included in the **RS section** of this Service Manual.

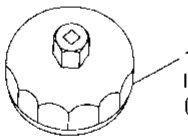
WARNING:

- **To avoid rendering the SRS inoperative, which could increase the risk of personal injury or death in the event of a collision which would result in air bag inflation, all maintenance should be performed by an authorized NISSAN dealer.**
- **Improper maintenance, including incorrect removal and installation of the SRS, can lead to personal injury caused by unintentional activation of the system.**
- **Do not use electrical test equipment on any circuit related to the SRS unless instructed to in this Service Manual. SRS wiring harnesses are covered with yellow insulation either just before the harness connectors or on the complete harness, for easy identification.**
- **The vehicle is equipped with a passenger air bag deactivation switch which can be operated by the customer. When the passenger air bag is switched OFF, the passenger air bag is disabled and will not inflate in a frontal collision. When the passenger air bag is switched ON, the passenger air bag is enabled and could inflate in a frontal collision. After SRS maintenance or repair, make sure the passenger air bag deactivation switch is in the same position (ON or OFF) as when the vehicle arrived for service.**









Liquid Gasket Application Procedure

a. Use a scraper to remove all traces of old liquid gasket from mating surfaces and grooves. Also, completely clean any oil from these areas.
b. Apply a continuous bead of liquid gasket to mating surfaces. (Use Genuine RTV Silicone Sealant Part No. 999 MP-A7007, Three Bond TB1207D or equivalent.)
   - For oil pan, be sure liquid gasket diameter is 3.5 to 4.5 mm (0.138 to 0.177 in).
   - For areas except oil pan, be sure liquid gasket diameter is 2.0 to 3.0 mm (0.079 to 0.118 in).
c. Apply liquid gasket around the inner side of bolt holes (unless otherwise specified).
d. Assembly should be done within 5 minutes after coating.
e. Wait at least 30 minutes before refilling engine oil and engine coolant.

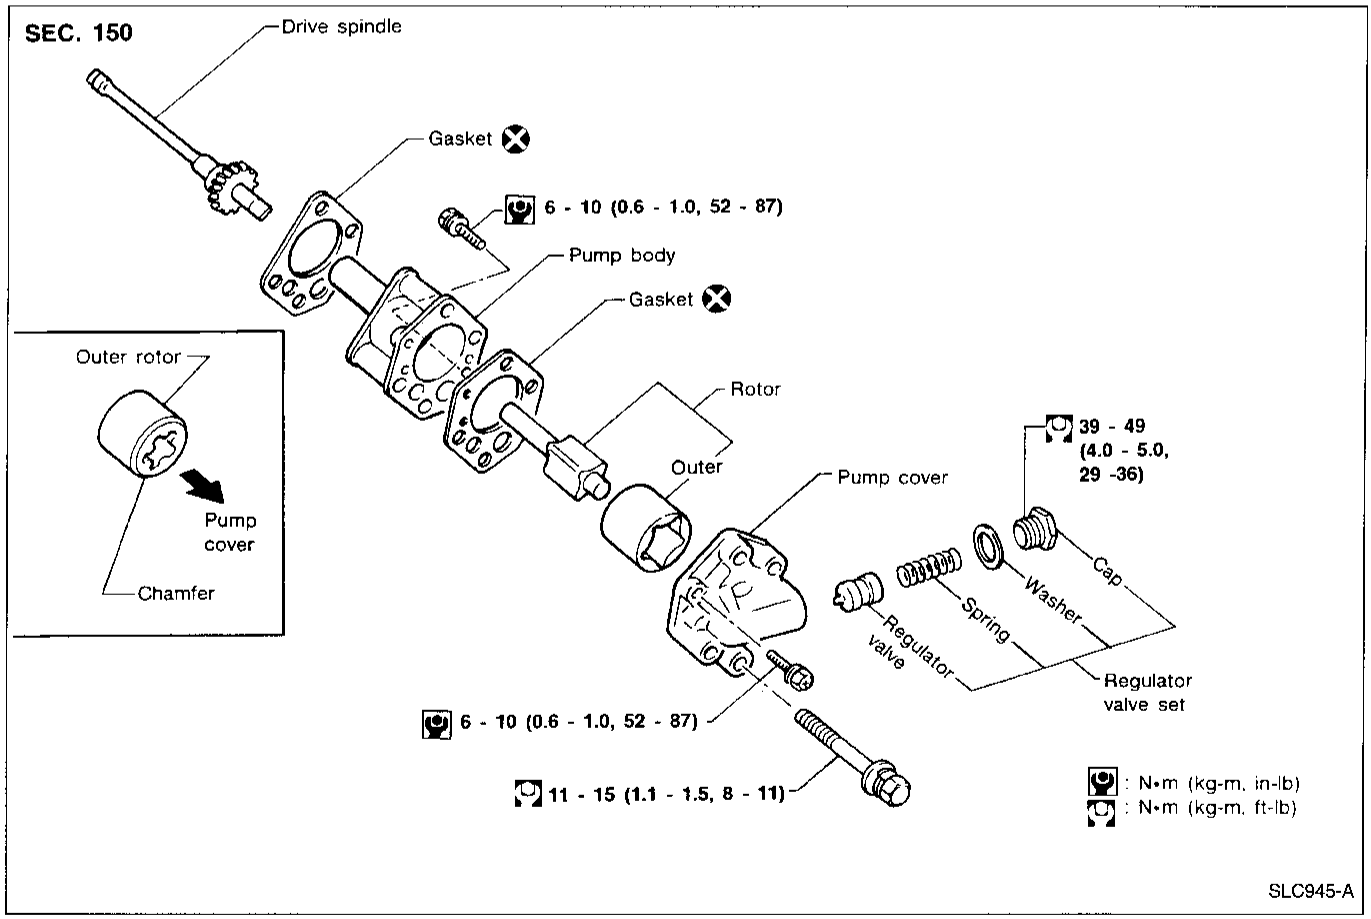
Oil Pressure Check

WARNING:

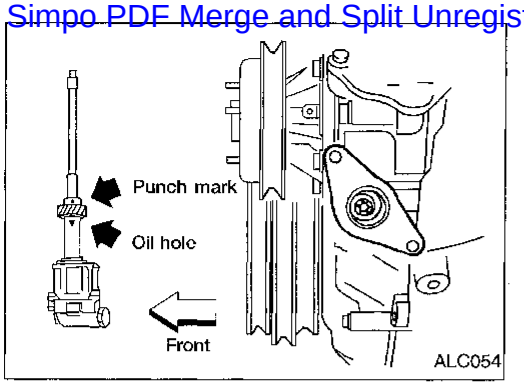
- **Be careful not to burn yourself, as the engine and oil may be hot.**
- **For M/T models, put gearshift lever in Neutral "N" position. For A/T models, put selector lever in Park "P" position.**



1. Check oil level.
2. Remove oil pressure switch.
3. Install pressure gauge.
4. Start engine and warm it up to normal operating temperature.
5. Check oil pressure with engine running under no-load.

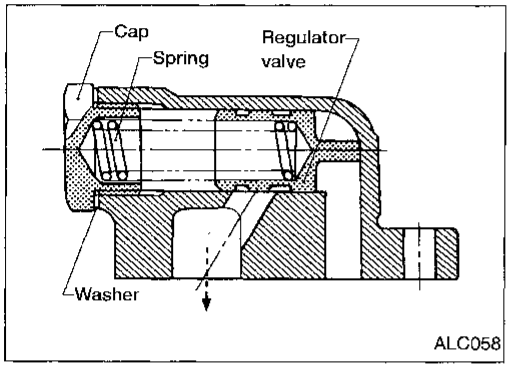
Engine speed rpm	Approximate discharge pressure kPa (kg/cm^2, psi)
Idle speed	More than 78 (0.8, 11)
3,000	412 - 481 (4.2 - 4.9, 60 - 70)

- **If difference is extreme, check oil passage and oil pump for oil leaks.**



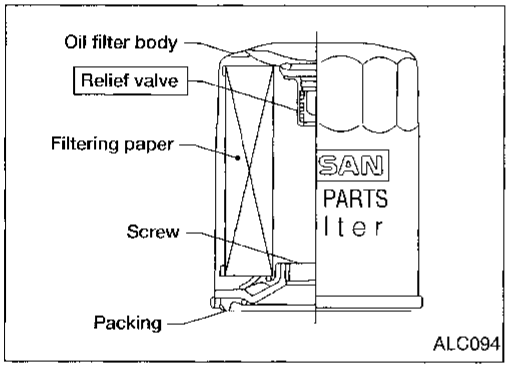
6. Install oil pressure switch with sealant.

Oil Pump



Oil Pump (Cont'd)

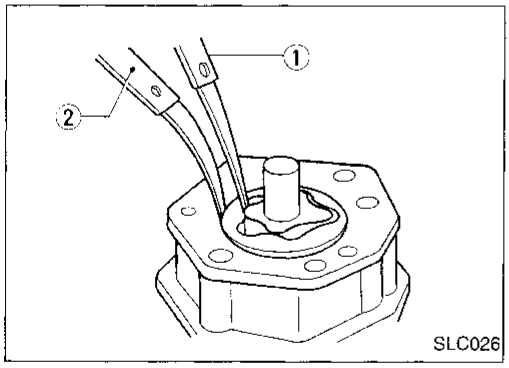
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



- **Always replace with new oil seal and gasket.**
- **When removing oil pump, turn crankshaft so that No. 1 piston is at TDC on its compression stroke.**
- **When installing oil pump, apply engine oil to gears, then align punchmark on drive spindle and oil hole on oil pump.**

REGULATOR VALVE INSPECTION

1. Visually inspect components for wear and damage.
2. Check oil pressure regulator valve sliding surface and valve spring.
3. Coat regulator valve with engine oil. Check that it falls smoothly into the valve hole by its own weight.

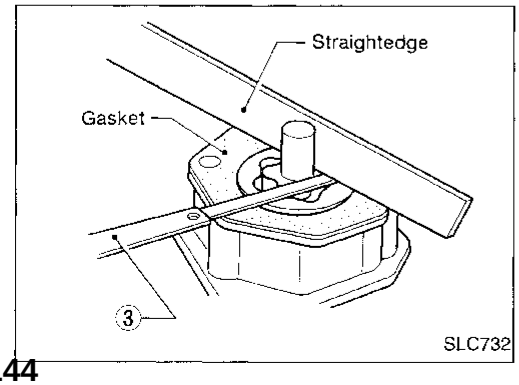


- **Replace regulator valve set or oil pump assembly, if damaged.**

OIL FILTER

The oil filter is a small, full-flow cartridge type and is provided with a relief valve.

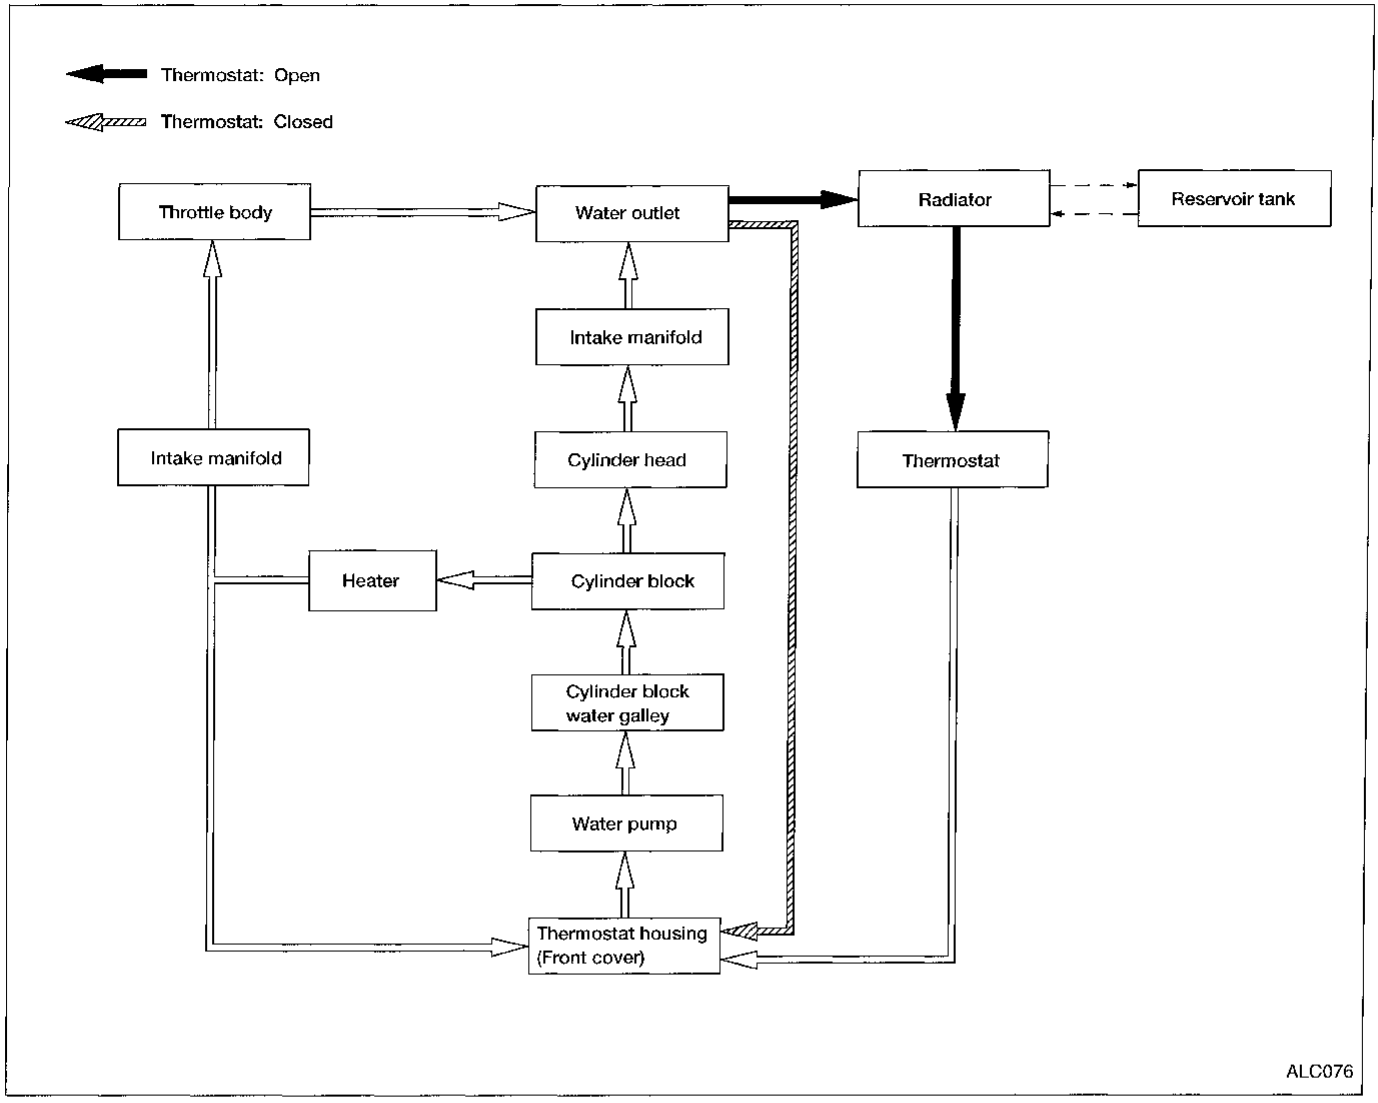
- **The new and previous oil filter designs differ from each other and are not interchangeable.**
- **Use Tool KV10115801 (J38956) for removing oil filter.**



OIL PUMP INSPECTION

Using a feeler gauge, check the following clearances.

Standard clearance: Unit: mm (in)



Rotor tip clearance ①	Less than 0.12 (0.0047)
Outer rotor to body clearance ②	0.15 - 0.21 (0.0059 - 0.0083
Side clearance (with gasket) ③	0.04 - 0.100 (0.0016 - 0.0039)

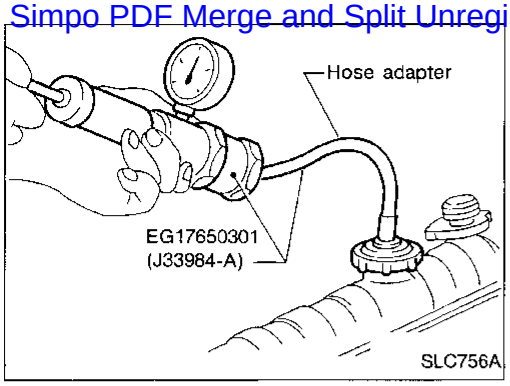
- **If the tip clearance (①) exceeds the limit, replace gear set.**
- **If body to gear clearances (②, ③) exceed the limit, replace oil pump assembly.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Cooling Circuit

System Check

WARNING:
Never remove the radiator cap when the engine is hot. Serious burns could occur from high pressure coolant escaping from the radiator.
Wrap a thick cloth around the radiator cap. Slowly turn it a quarter turn to allow built up pressure to escape. Carefully remove the radiator cap by turning it all the way.



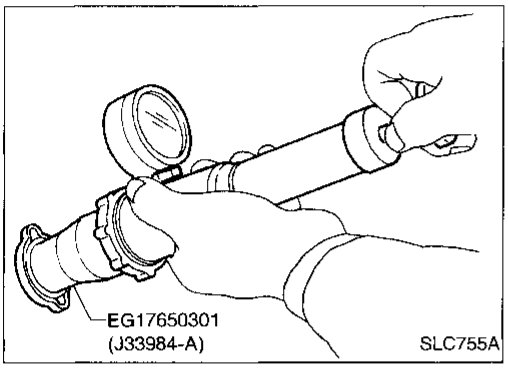
CHECKING COOLING SYSTEM HOSES

Check hoses for the following:

- Improper attachment
- Leaks
- Cracks
- Damage
- Chafing
- Deterioration

System Check (Cont'd)

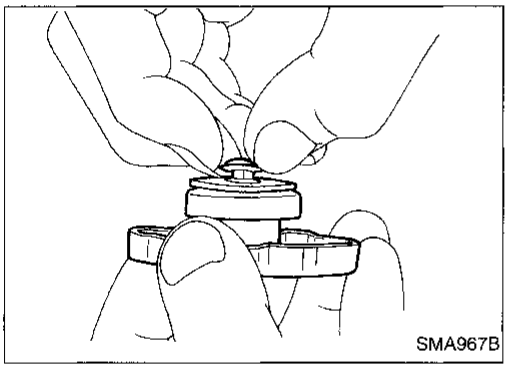
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



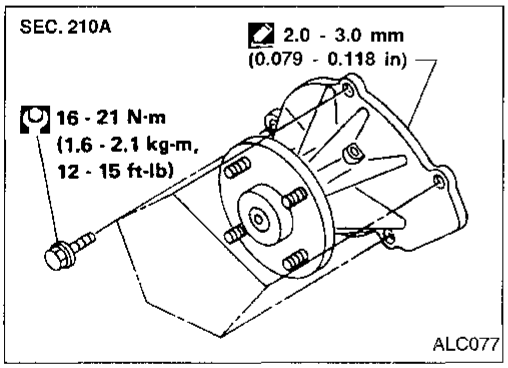
CHECKING COOLING SYSTEM FOR LEAKS

To check for leakage, apply pressure to the cooling system with a radiator cap tester.

Testing pressure:
157 kPa (1.6 kg/cm^2, 23 psi)



CAUTION:
Higher pressure than specified may cause radiator damage.



CHECKING RADIATOR CAP

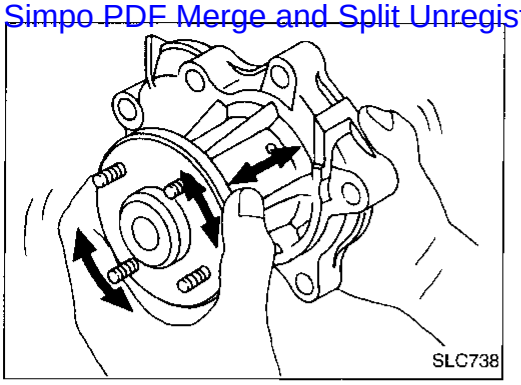
To check radiator cap, apply pressure to radiator cap with a radiator cap tester.

Radiator cap relief pressure:
Standard
78 - 98 kPa (0.8 - 1.0 kg/cm^2, 11 - 14 psi)
Limit
59 - 98 kPa (0.6 - 1.0 kg/cm^2, 9 - 14 psi)

Pull the negative pressure valve to open it.
Check that it closes completely when released.

Water Pump

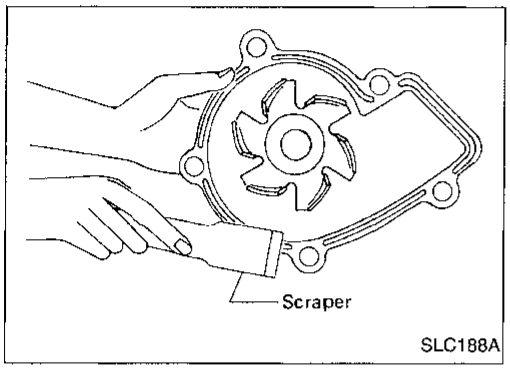
CAUTION:



- **When removing water pump assembly, be careful not to get coolant on drive belts.**
- **Water pump cannot be disassembled and should be replaced as a unit.**
- **After installing water pump, connect hose and clamp securely, then check for leaks using radiator cap tester.**

REMOVAL

1. Drain coolant from engine.
   Refer to MA section ("Changing Engine Coolant", "ENGINE MAINTENANCE").
2. Remove fan coupling with fan.
3. Remove power steering pump drive belt, generator drive belt and A/C compressor drive belt.
4. Remove water pump.

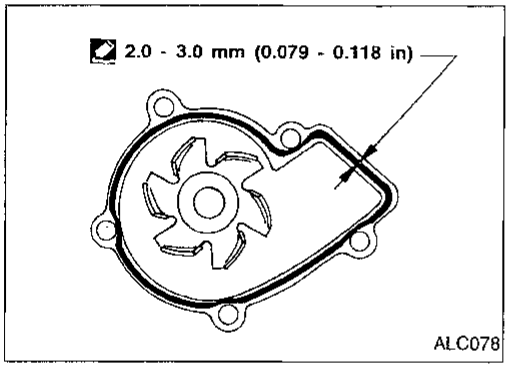


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Water Pump (Cont'd)

SLC738

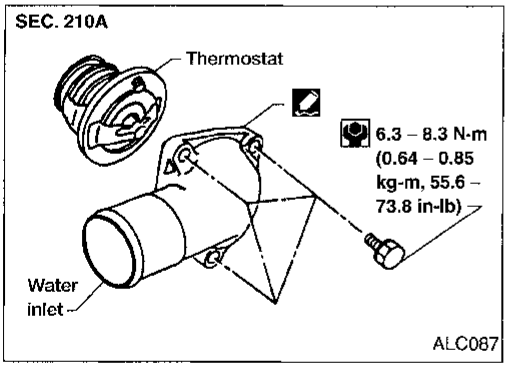
INSPECTION



- Check body assembly for rust or corrosion.
- Check for rough operation due to excessive end play.

SLC188A

INSTALLATION

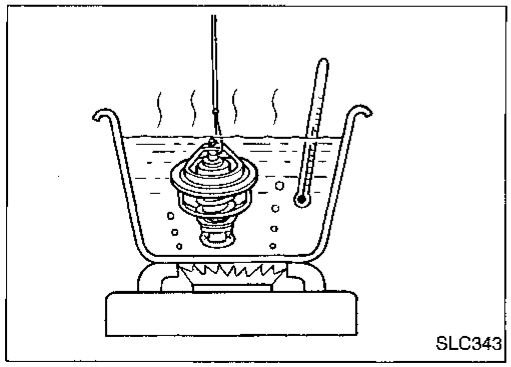


1. Use a scraper to remove liquid gasket from water pump.
- **Also remove traces of liquid gasket from mating surface of cylinder block.**

ALC078

2. Apply a continuous bead of liquid gasket to mating surface of water pump.
- **Use Genuine RTV Silicone Sealant Part No. 999 MP-A7007, Three Bond TB1207D or equivalent.**

When filling radiator with coolant, refer to MA section ("Changing Engine Coolant", "ENGINE MAINTENANCE").
When installing drive belts, refer to MA section ("Checking Drive Belts").



ALC087

Thermostat

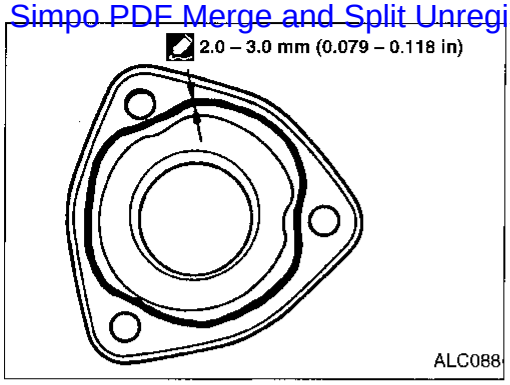
- **Be careful not to spill coolant over engine compartment. Use a rag to absorb coolant.**

REMOVAL

1. Drain coolant from engine. Refer to MA section ("Changing Engine Coolant", "ENGINE MAINTENANCE").
2. Remove air cleaner and air duct assembly.
3. Remove water hose from water inlet housing.
4. Remove water inlet housing, then take out thermostat.

SLC343

INSPECTION



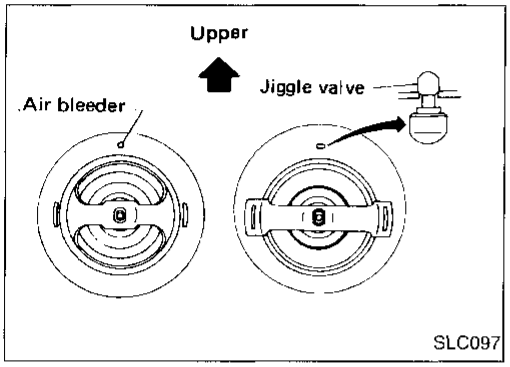
1. Check valve seating condition at normal room temperature. It should seat tightly.
2. Check valve opening temperature and valve lift.

Valve opening temperature	°C (°F)	76.5 (170)
Valve lift	mm/°C (in/°F)	More than 8/90 (0.31/194)

3. Then check if valve closes at 5°C (9°F) below valve opening temperature.

Thermostat (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



INSTALLATION

1. Use a scraper to remove old liquid gasket from water inlet.

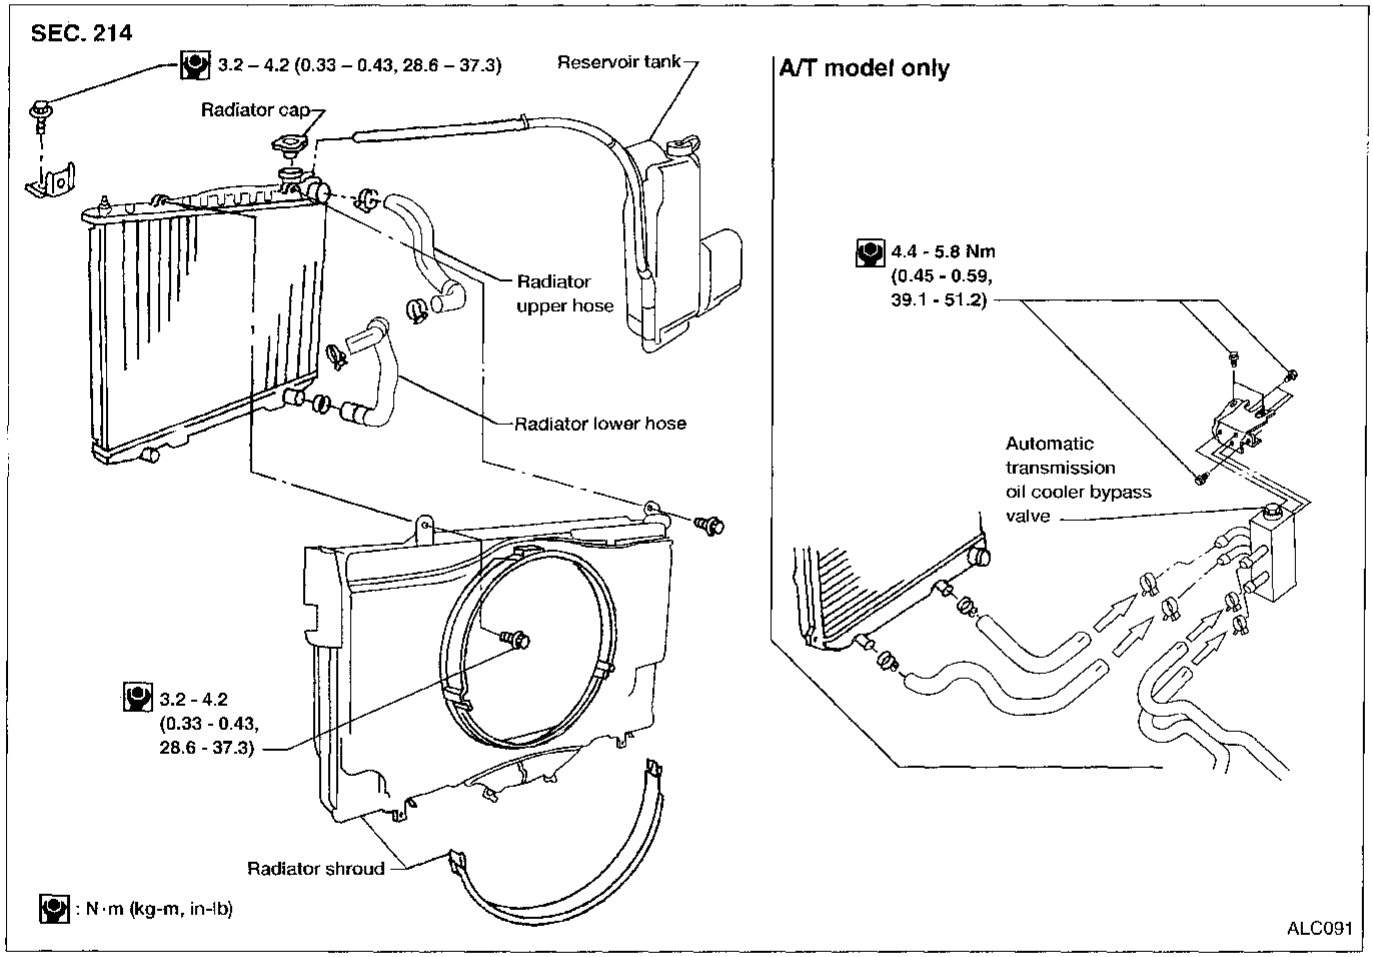
- **Also remove traces of liquid gasket from mating surface of front cover.**

2. Apply a continuous bead of liquid gasket to mating surface of water inlet.

- **Use Genuine RTV Silicone Sealant Part No. 999 MP-A7007, Three Bond TB1207D or equivalent.**

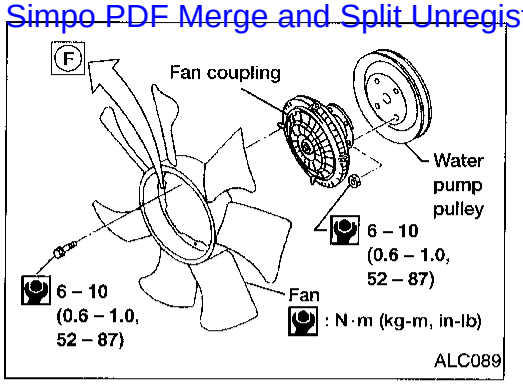
3. Install thermostat with jiggle valve or air bleeder at upper side.
4. Install water inlet housing.
5. Install water hose to water inlet housing.
6. Install air cleaner and air duct assembly.
7. Refill engine coolant. Refer to MA section ("Changing Engine Coolant", "ENGINE MAINTENANCE").

- **After installation, run engine for a few minutes, and check for leaks.**



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

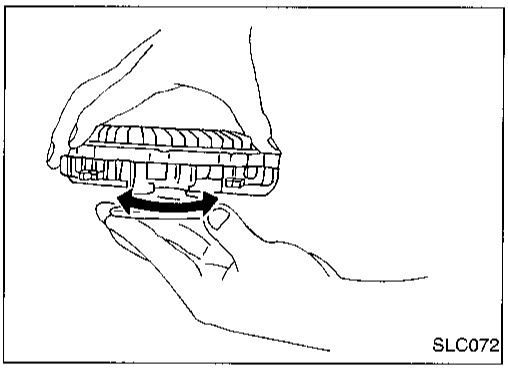
Radiator



REMOVAL AND INSTALLATION

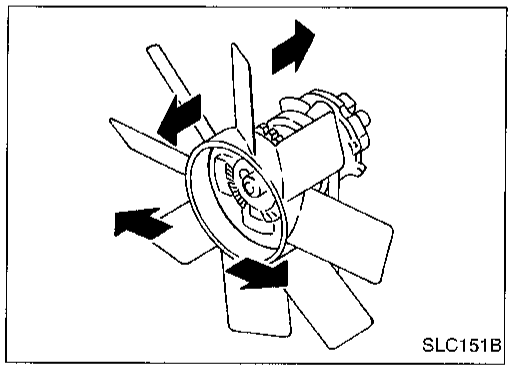
1. Remove under cover.
2. Drain coolant from radiator. Refer to MA section ("Changing Engine Coolant", "ENGINE MAINTENANCE").
3. Disconnect upper and lower radiator hoses.
4. Remove air cleaner and air duct assembly.
5. Remove lower radiator shroud.
6. Remove radiator shroud.
7. Remove A/T oil cooler hoses (A/T models only).
8. Disconnect coolant reservoir hose.
9. Remove radiator.
10. After replacing radiator, install all parts in reverse order of removal.
11. Refill engine coolant. Refer to MA section ("Changing Engine Coolant", "ENGINE MAINTENANCE").

- **After installation, run engine for a few minutes, and check for leaks.**



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Cooling Fan (Crankshaft driven)



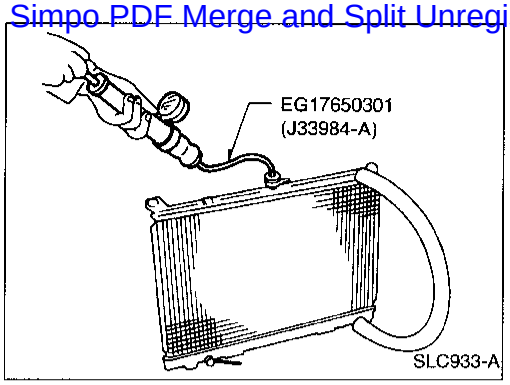
REMOVAL AND INSTALLATION

- Do not release the drive belt tension by removing the fan/water pump pulley.
- Fan coupling cannot be disassembled and should be replaced as a unit. If front mark Ⓕ is present, install fan so that side marked Ⓕ faces the front.
- Install the drive belt only after the fan and fan coupling to water pump flange bolts/nuts have been properly torqued.
- Proper alignment of these components is essential. Improper alignment will cause them to wobble and may eventually cause the fan to separate from the water pump causing extensive damage.

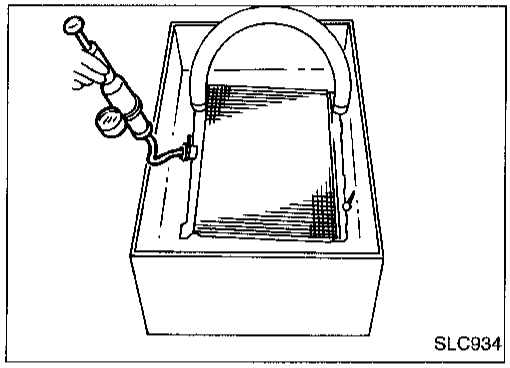
INSPECTION

Check fan coupling for rough operation, silicon oil leakage and bent bimetal.

After assembly, verify the fan does not wobble or flap while the engine is running.



WARNING:



- **When the engine is running, keep hands and clothing away from moving parts such as drive belts and fan.**

Refilling engine coolant

For details on refilling engine coolant, refer to MA section ("Changing Engine Coolant", "ENGINE MAINTENANCE").

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Radiator (Aluminum type)

INSPECTION

1. Apply pressure with Tool.
   Specified pressure value:
   157 kPa (1.6 kg/cm^2, 23 psi)

WARNING:
To prevent the risk of the hose coming undone while under pressure, securely fasten it down with a hose clamp.
Attach a hose to the oil cooler as well. (A/T model only)

2. Check for leakage.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Overheating Cause Analysis

	Symptom		Check items	
Cooling system parts malfunction	Poor heat transfer	Water pump malfunction	Worn or loose drive belt	—
		Thermostat stuck closed	—	
		Damaged fins	Dust contamination or paper clogging	
			Mechanical damage	
		Clogged radiator cooling tube	Excess foreign material (rust, dirt, sand, etc.)	
	Reduced air flow	Fan coupling does not operate	—	—
		High resistance to fan rotation		
		Damaged fan blades		
	Damaged radiator shroud	—	—	—
	Improper coolant mixture ratio	—	—	—
	Poor coolant quality	—	—	—
	Insufficient coolant	Coolant leaks	Cooling hose	Loose clamp
				Cracked hose
			Water pump	Poor sealing
			Radiator cap	Loose
				Poor sealing
			Radiator	O-ring for damage, deterioration or improper fitting
				Cracked radiator tank
				Cracked radiator core
			Reservoir tank	Cracked reservoir tank
		Overflowing reservoir tank	Exhaust gas leaks into cooling system	Cylinder head deterioration
				Cylinder head gasket deterioration
Except cooling system parts malfunction	—	Overload on engine	Abusive driving	High engine rpm under no load
				Driving in low gear for extended time
				Driving at extremely high speed
			Powertrain system malfunction	—
			Installed improper size wheels and tires	
			Dragging brakes	
			Improper ignition timing	
	Blocked or restricted air flow	Blocked bumper	—	—
		Blocked radiator grille	Installed truck brassiere	
			Mud contamination or paper clogging	
		Blocked radiator	—	
		Blocked condenser	—	
		Installed large fog lamp

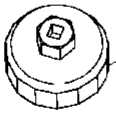
Supplemental Restraint System (SRS) "AIR BAG"

The Supplemental Restraint System "AIR BAG", used along with a seat belt, helps to reduce the risk or severity of injury to the driver and front passenger in a frontal collision. The Supplemental Restraint System consists of air bag modules (located in the center of the steering wheel and in the instrument panel on the passenger side), a diagnosis sensor unit, a crash zone sensor (4WD models), warning lamp, wiring harness and spiral cable.

The vehicle is equipped with a passenger air bag deactivation switch. Because no rear seat exists where a rear-facing child restraint can be placed, the switch is designed to turn off the passenger air bag so that a rear-facing child restraint can be used in the front passenger seat. The switch is located in the center of the instrument panel, near the ashtray. When the switch is turned to the ON position, the passenger air bag is enabled and could inflate in a frontal collision. When the switch is turned to the OFF position, the passenger air bag is disabled and will not inflate in a frontal collision. A passenger air bag OFF indicator on the instrument panel lights up when the passenger air bag is switched OFF. The driver air bag always remains enabled and is not affected by the passenger air bag deactivation switch.



Information necessary to service the system safely is included in the **RS section** of this Service Manual.

WARNING:

- **To avoid rendering the SRS inoperative, which could increase the risk of personal injury or death in the event of a collision which would result in air bag inflation, all maintenance should be performed by an authorized NISSAN dealer.**
- **Improper maintenance, including incorrect removal and installation of the SRS, can lead to personal injury caused by unintentional activation of the system.**
- **Do not use electrical test equipment on any circuit related to the SRS unless instructed to in this Service Manual. SRS wiring harnesses are covered with yellow insulation either just before the harness connectors or on the complete harness, for easy identification.**
- **The vehicle is equipped with a passenger air bag deactivation switch which can be operated by the customer. When the passenger air bag is switched OFF, the passenger air bag is disabled and will not inflate in a frontal collision. When the passenger air bag is switched ON, the passenger air bag is enabled and could inflate in a frontal collision. After SRS maintenance or repair, make sure the passenger air bag deactivation switch is in the same position (ON or OFF) as when the vehicle arrived for service.**

Special Service Tool

The actual shapes of Kent-Moore tools may differ from those of special service tools illustrated here.

Tool number (Kent-Moore No.) Tool name	Description
KV10105901 (J34274) Oil filter cap wrench	Removing oil filter  15 faces, inner span: 80 mm (3.15 in) (Face to opposite corner) NT689

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

General maintenance includes those items which should be checked during the normal day-to-day operation of the vehicle. They are essential if the vehicle is to continue operating properly. The owners can perform checks and inspections themselves or they can have their NISSAN dealers do them.

Item	Reference page
OUTSIDE THE VEHICLE The maintenance items listed here should be performed from time to time, unless otherwise specified.	
Tires Check the pressure, including the spare, with a gauge periodically when at a service station, and adjust to the specified pressure if necessary. Check carefully for damage, cuts and excessive wear.	—
Wheel nuts When checking the tires, make sure no nuts are missing, and check for any loose nuts. Tighten if necessary.	—
Tire rotation Tires should be rotated every 12,000 km (7,500 miles).	MA-19
Wheel alignment and balance If the vehicle pulls to either side while driving on a straight and level road, or if you detect uneven or abnormal tire wear, there may be a need for wheel alignment. If the steering wheel or seat vibrates at normal highway speeds, wheel balancing may be needed.	MA-19, FA-8
Windshield wiper blades Check for cracks and wear if they do not wipe properly.	—
Doors and engine hood Check that all doors, engine hood and tailgate operate smoothly. Also make sure that all latches lock securely; lubricate if necessary. Make sure that the secondary latch keeps the hood from opening when the primary latch is released. When driving in areas using road salt or other corrosive materials, check lubrication frequently.	MA-22
Lamps Make sure that the headlamps, stop lamps, tail lamps, turn signal lamps, and other lamps are all operating properly and installed securely. Also check headlamp aim.	—
INSIDE THE VEHICLE The maintenance items listed here should be checked on a regular basis, such as when performing periodic maintenance, cleaning the vehicle, etc.	
Warning lamps and buzzers/chimes Make sure that all warning lamps and buzzers/chimes are operating properly.	—
Windshield wiper and washer Check that the wipers and washer operate properly and that the wipers do not streak.	—
Windshield defroster Check that the air comes out of the defroster outlets properly and in sufficient quantity when operating the heater or air conditioner.	—
Steering wheel Check that it has the specified play. Be sure to check for changes in the steering condition, such as excessive play, hard steering or strange noises. **Free play: Less than 35 mm (1.38 in)**	ST-7
Seats Check seat position controls such as seat adjusters, seatback recliner, etc. to make sure they operate smoothly and that all latches lock securely in every position. Check that the head restraints move up and down smoothly and that the locks (if equipped) hold securely in all latched positions. Check jump seats for smooth operation.	—
Seat belts Check that all parts of the seat belt system (e.g., buckles, anchors, adjusters and retractors) operate properly and smoothly and are installed securely. Check the belt webbing for cuts, fraying, wear and damage.	MA-23 RS-6
Clutch pedal Make sure the pedal operates smoothly and check that it has the proper free play.	CL-5
Brakes Check that the brakes do not pull the vehicle to one side when applied.	—
Brake pedal and booster Check the pedal for smooth operation and make sure that it has the proper distance under it when depressed fully. Check the brake booster function. Be sure to keep floor mats away from the pedal.	BR-11, 16
Parking brake Check that the lever has the proper travel and make sure that the vehicle is held securely on a fairly steep hill when only the parking brake is applied.	BR-27

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Item	Reference page
Automatic transmission "Park" mechanism Check that the lock release button on the selector lever operates properly and smoothly. On a fairly steep hill check that the vehicle is held securely with the selector lever in the "P" position without applying any brakes.	—
UNDER THE HOOD AND VEHICLE The maintenance items listed here should be checked periodically (e.g., each time you check the engine oil or refuel).	
Windshield washer fluid Check that there is adequate fluid in the tank.	—
Engine coolant level Check the coolant level when the engine is cold.	MA-11
Radiator and hoses Check the front of the radiator and clean off any dirt, insects, leaves, etc., that may have accumulated. Make sure that the hoses have no cracks, deformation, deterioration or loose connections.	—
Brake and clutch fluid levels Make sure that the brake and clutch fluid levels are between the "MAX" and "MIN" lines on the reservoirs.	MA-16, 20
Battery Check the fluid level in each cell. It should be between the "MAX" and "MIN" lines.	—
Engine drive belts Make sure that no belt is frayed, worn, cracked or oily.	MA-10
Engine oil level Check the level on the dipstick after parking the vehicle on a level spot and turning off the engine.	MA-13
Power steering fluid level and lines Check the level on the dipstick with the engine off. Check the lines for improper attachment, leaks, cracks, etc.	MA-21
Automatic transmission fluid level Check the level on the dipstick after putting the selector lever in "P" with the engine idling.	MA-16
Exhaust system Make sure that there are no loose supports, cracks or holes. If the sound of the exhaust seems unusual or there is a smell of exhaust fumes, immediately locate the trouble and correct it.	MA-16
Underbody The underbody is frequently exposed to corrosive substances such as those used on icy roads or to control dust. It is very important to remove these substances, otherwise rust will form on the floor pan, frame, fuel lines and around the exhaust system. At the end of winter, the underbody should be thoroughly flushed with plain water, being careful to clean those areas where mud and dirt can easily accumulate.	—
Fluid leaks Check under the vehicle for fuel, oil, water and other fluid leaks after the vehicle has been parked for a while. Water dripping from the air conditioner after use is normal. If any leaks or gasoline fumes are evident, check for the cause and correct it immediately.	—

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Two different maintenance schedules are provided, and should be used, depending upon the conditions under which the vehicle is mainly operated. **After 60,000 miles (96,000 km) or 48 months, continue the periodic maintenance at the same mileage/time intervals.**

SCHEDULE 1

Follow Periodic Maintenance Schedule 1 if your driving habits frequently include one or more of the following driving conditions:

- Repeated short trips of less than 5 miles (8 km).
- Repeated short trips of less than 10 miles (16 km) with outside temperatures remaining below freezing.
- Operating in hot weather in stop-and-go "rush hour" traffic.
- Extensive idling and/or low speed driving for long distances, such as police, taxi or door-to-door delivery use.
- Driving in dusty conditions.
- Driving on rough, muddy, or salt spread roads.
- Towing a trailer, using a camper or a car-top carrier.

SCHEDULE 2

Follow Periodic Maintenance Schedule 2 if none of the driving conditions shown in Schedule 1 apply to your driving habits.

Maintenance for off-road driving (4X4 only)

Whenever you drive off-road through sand, mud or water, more frequent maintenance may be required of the following items:

- ▲ Brake pads and discs
- ▲ Brake lining and drums
- ▲ Brake lines and hoses
- ▲ Wheel bearing grease and free-running hub grease
- ▲ Differential gear oil, transmission and transfer fluid
- ▲ Steering linkage
- ▲ Propeller shaft and drive shafts
- ▲ Air cleaner filter
- ▲ Clutch housing (Check water entry. Refer to MA-16.)

Abbreviations: R = Replace I = Inspect. Correct or replace if necessary. [ ]: At the mileage intervals only

Exhaust system			I		I		I		I		I		I		I		I	MA-16
Air bag system	See NOTE (5)																	RS-12

NOTE: (1) If operating mainly in dusty conditions, more frequent maintenance may be required.
(2) If vehicle is operated under extremely adverse weather conditions or in areas where ambient temperatures are either extremely low or extremely high, the filters might become clogged. In such an event, replace them immediately.
(3) After 60,000 miles (96,000 km) or 48 months, replace every 30,000 miles (48,000 km) or 24 months.
(4) If operating frequently in water, replace grease every 3,750 miles (6,000 km) or 3 months.
(5) Inspect the air bag system 10 years after the date of manufacture noted on the FMVSS certification label.
★ Maintenance items and intervals with "*" are recommended by NISSAN for reliable vehicle operation. The owner need not perform such maintenance in order to maintain the emission warranty or manufacturer recall liability. Other maintenance items and intervals are required.

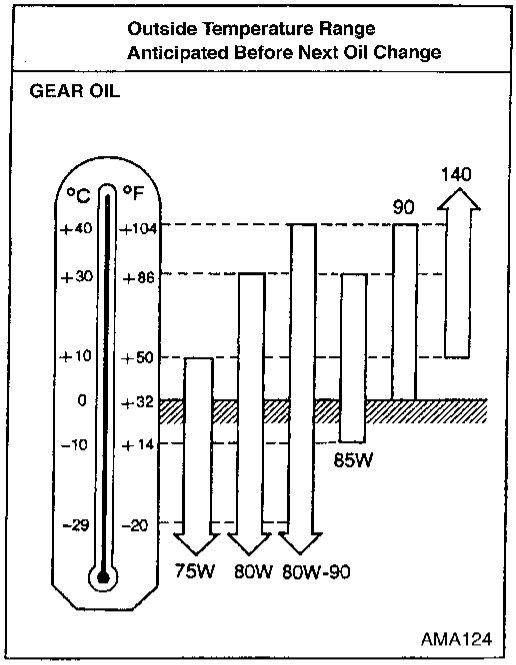
Fluids and Lubricants

			Capacity (Approximate)			Recommended Fluids and Lubricants
			US measure	Imp measure	Liter	
Engine oil (Refill)						
2WD	With oil filter		3-3/4 qt	3-1/8 qt	3.5	● API SG or SH and Energy Conserving II*1 ● API Certification Mark*1
	Without oil filter		3-1/2 qt	2-7/8 qt	3.3	
4WD	With oil filter		4-1/8 qt	3-3/8 qt	3.9	
	Without oil filter		3-7/8 qt	3-1/4 qt	3.7	
Cooling system (With reservoir)						
		2WD	8-5/8 qt	7-1/8 qt	8.1	50% antifreeze coolant (Ethylene glycol base) 50% soft water
		4WD	9-1/2 qt	7-7/8 qt	9.0	
Manual transmission gear oil	FS5W71C	2WD	4-1/4 pt	3-1/2 pt	2.0	API GL-4 Viscosity SAE 75W-90 only
		4WD	10-3/8 pt	8-5/8 pt	4.9	
Transfer fluid			2-3/8 qt	2 qt	2.2	Nissan Matic "D" or equivalent Automatic Transmission Fluid *2 or API GL-4*1
Manual steering fluid			1-3/8 pt	1-1/8 pt	0.62	API GL-4*1, SAE #80
Differential carrier gear oil						
Rear:	H190A		3-1/8 pt	2-5/8 pt	1.5	Standard differential gear: API GL-5*1
	C200		2-3/4 pt	2-1/4 pt	1.3	
Front (4WD):	R180A		2-3/4 pt	2-1/4 pt	1.3	
Automatic transmission fluid			8-3/8 qt	7 qt	7.9	Nissan Matic "D" (Continental U.S. and Alaska) or Genuine Nissan Automatic Transmission Fluid (Canada)*2
Power steering fluid	PB48S		30.4-33.8 fl oz	31.7-35.2 fl oz	0.9-1.0	Type DEXRON™ III or equivalent
	PB59K		33.8-37.2 fl oz	35.2-38.7 fl oz	1.0-1.1	
Brake and clutch fluid			—	—	—	Genuine Nissan Brake Fluid*3 or equivalent DOT 3 (US FMVSS No. 116)
Propeller shaft grease			—	—	—	NLGI No. 2 (Lithium soap base)
Multi-purpose grease			—	—	—	NLGI No. 2 (Lithium soap base)
Free-running hub grease (Auto-lock)			—	—	—	Genuine Nissan grease or equivalent



*1: For further details, see "SAE Viscosity Number".
*2: Dexron™ III/Mercon™ or equivalent may also be used. Outside the continental United States and Alaska contact a NISSAN dealership for more information regarding suitable fluids, including recommended brand(s) of Dexron™ III/Mercon™ Automatic Transmission Fluid.
