*3: Available in mainland U.S.A. through your Nissan dealer.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SAE Viscosity Number

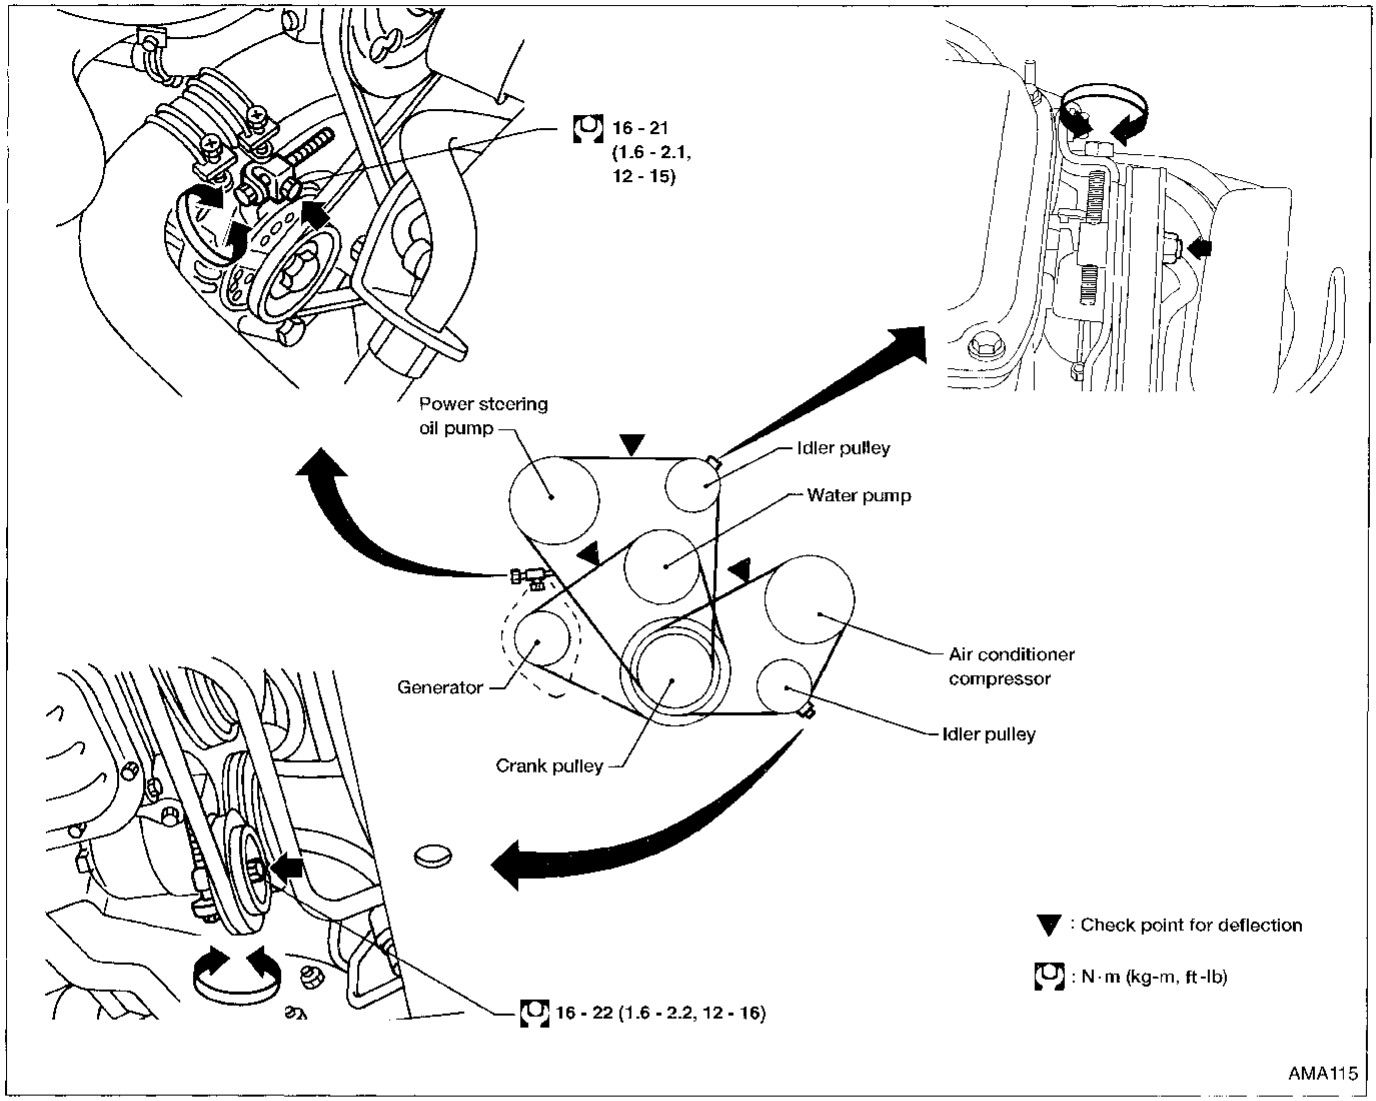
SAE 5W-30 viscosity oil is preferred for all temperatures. SAE 10W-30 viscosity oil may be used if the ambient temperature is above −18°C (0°F).

80W-90 for differential is preferable if the ambient temperature is below 40°C (104°F).

Antifreeze Coolant Mixture Ratio

The engine cooling system is filled at the factory with a high-quality, year-round, antifreeze coolant solution. The antifreeze solution contains rust and corrosion inhibitors. Additional cooling system additives are not necessary.

CAUTION:



When adding or replacing coolant, be sure to use only an ethylene glycol antifreeze with the proper mixture ratio of 50% antifreeze 50% soft water.

Outside temperature down to		Anti-freeze	Soft water
°C	°F		
−35	−30	50%	50%

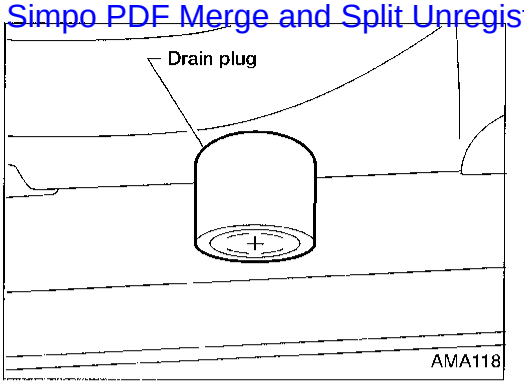
Other types of coolant solutions may damage the cooling system.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Checking Drive Belts

1. Inspect for cracks, fraying, wear and oil. If necessary, replace with a new one.
2. Inspect drive belt deflections by pushing midway between pulleys.

Inspect drive belt deflections when engine is cold.



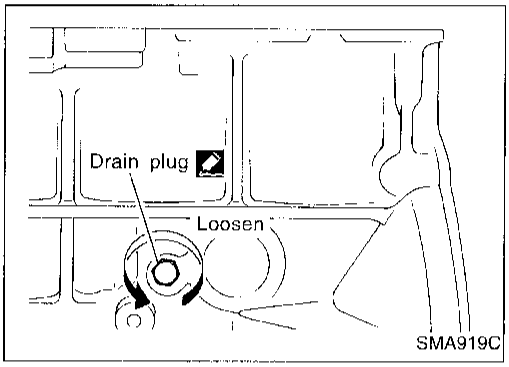
Adjust if belt deflections exceed the limit.

Belt deflection:

Unit: mm (in)

	Used belt deflection		Deflection of new belt
	Limit	Deflection after adjustment	
Generator	17 (0.67)	10 - 12 (0.39 - 0.47)	8 - 10 (0.31 - 0.39)
Air conditioner compressor	16 (0.63)	10 - 12 (0.39 - 0.47)	8 - 10 (0.31 - 0.39)
Power steering oil pump	17 (0.67)	10 - 13 (0.39 - 0.51)	8 - 10 (0.31 - 0.39)
Applied pushing force	80 - 100 N (8.2 - 10.2 kg, 18 - 22.5 lb)		

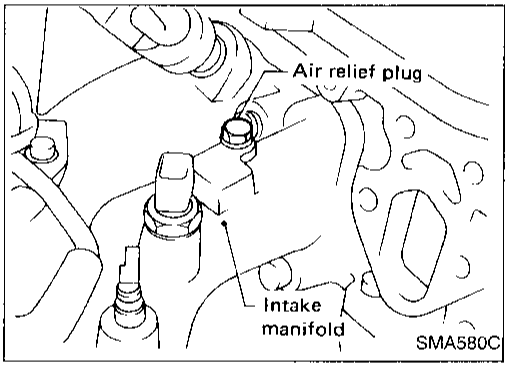
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



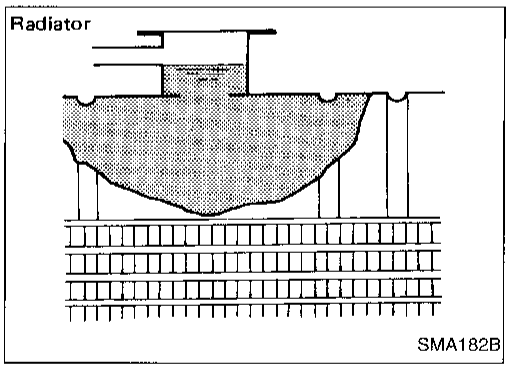
Changing Engine Coolant

WARNING:
To avoid being scalded, never change the coolant when the engine is hot.

1. Move heater temperature control lever all the way to "HOT" position or the highest temperature position.
2. Open drain plug at the bottom of radiator, and remove radiator cap.



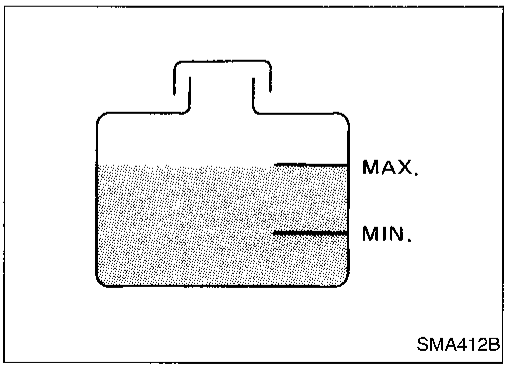
Be careful not to allow coolant to contact drive belts.



3. Remove cylinder block drain plug.
4. Close drain plug and tighten drain plug securely.

- **Apply sealant to the thread of drain plug.**
  : 34 - 44 N·m (3.5 - 4.5 kg-m, 25 - 33 ft-lb)

5. Open air relief plug.
6. Fill radiator with water and close air relief plug and radiator cap.
7. Run engine and warm it up sufficiently.
8. Rev engine 2 or 3 times under no-load.
9. Stop engine and wait until it cools down.
10. Repeat step 2 through step 9 until clear water begins to drain from radiator.
11. Drain water.

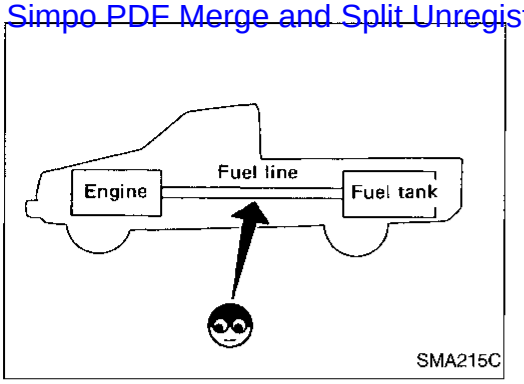


12. Open radiator cap and air relief plug.
13. Fill radiator with coolant up to specified level.

For coolant mixture ratio, refer to MA-9.

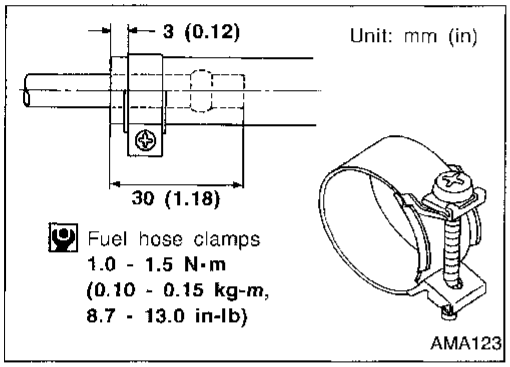
Unit: ℓ (US qt, Imp qt)

	Coolant capacity	
	2WD	4WD
Without reservoir tank	8.1 (8-5/8, 7-1/8)	9.0 (9-1/2, 7-7/8)
Reservoir tank	0.8 (7/8, 3/4)	



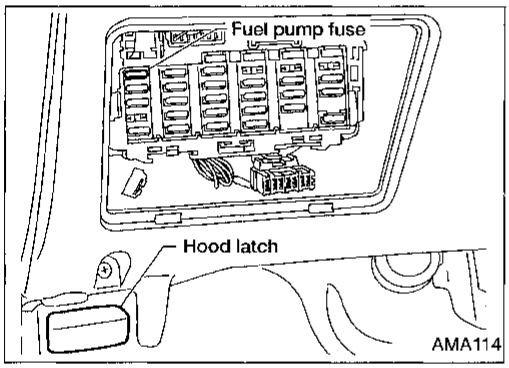
Pour coolant through coolant filler neck slowly to allow air in system to escape.

14. Close air relief plug.
15. Remove reservoir tank, drain coolant, then clean reservoir tank.
16. Install reservoir tank and fill it with coolant up to "MAX" level and then install radiator cap.
17. Run engine and warm it up sufficiently.
18. Rev engine 2 or 3 times under no-load.
19. Stop engine and cool it down, then add coolant as necessary.



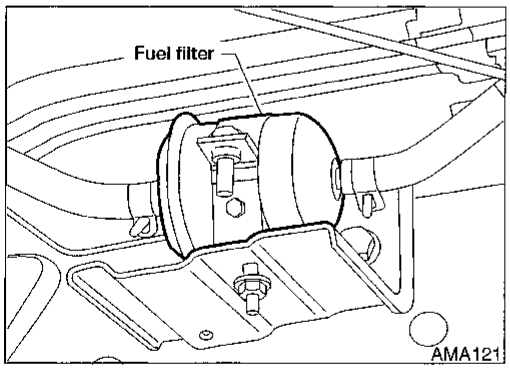
- **Clean excess coolant from engine.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



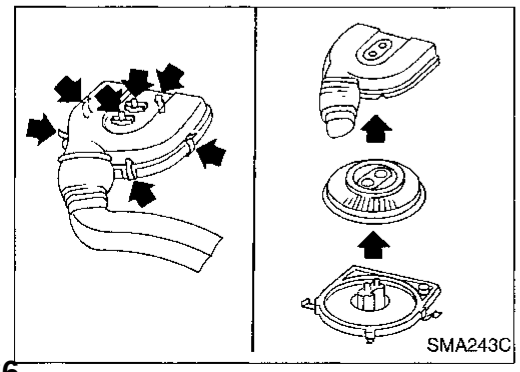
Checking Fuel Lines

Inspect fuel lines and tank for improper attachment, leaks, cracks, damage, chafing and deterioration.
If necessary, repair or replace.



Changing Fuel Filter

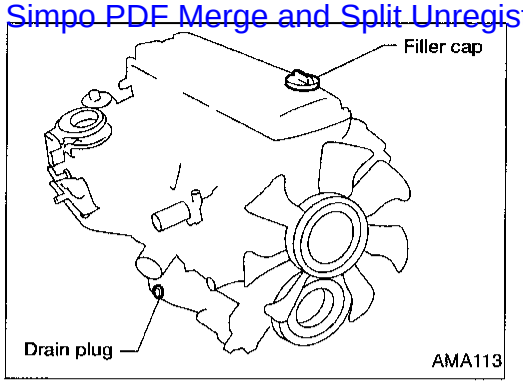
CAUTION:
Tighten high-pressure rubber hose clamp so that clamp end is 3 mm (0.12 in) from hose end.
Tightening torque specifications are the same for all rubber hose clamps.
Ensure that the screw does not contact adjacent parts.



WARNING:
Before removing fuel filter, release fuel pressure from fuel line.

1. Remove fuse for fuel pump.
2. Start engine.
3. After engine stalls, crank engine two or three times to make sure that fuel pressure is released.
4. Turn ignition switch OFF and install fuse for fuel pump.

5. Loosen fuel hose clamps.
6. Replace fuel filter.



- **Be careful not to spill fuel over engine compartment. Place a shop towel to absorb fuel.**
- **Use a high-pressure fuel filter. Do not use a synthetic resinous fuel filter.**

Changing Air Cleaner Filter

The viscous paper type filter does not need cleaning between renewals.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Changing Engine Oil

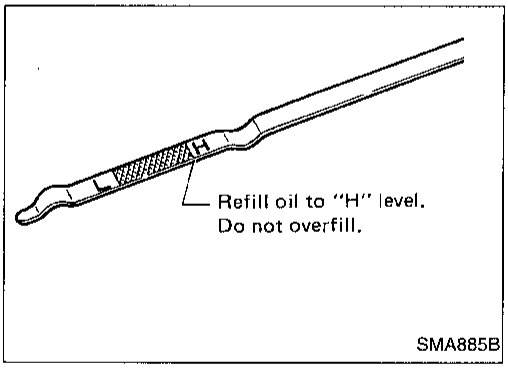
WARNING:

- **Be careful not to burn yourself, as the engine oil is hot.**
- **Prolonged and repeated contact with used engine oil may cause skin cancer; try to avoid direct skin contact with used oil. If skin contact is made, wash thoroughly with soap or hand cleaner as soon as possible.**

1. Warm up engine, and check for oil leakage from engine components.
2. Remove drain plug and oil filler cap.
3. Drain oil and refill with new engine oil.

Oil specification and viscosity:

- **API SG or SH and Energy Conserving II**
- **API Certification Mark**
- **Refer to "RECOMMENDED FLUIDS AND LUBRICANTS", MA-8.**



Refill oil capacity (Approximately):

Unit: ℓ (US qt, Imp qt)

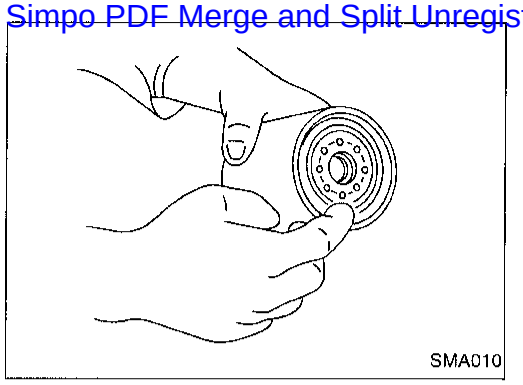
	2WD	4WD
With oil filter change	3.5 (3-3/4, 3-1/8)	3.9 (4-1/8, 3-3/8)
Without oil filter change	3.3 (3-1/2, 2-7/8)	3.7 (3-7/8, 3-1/4)

CAUTION:

- **Be sure to clean drain plug and install with new washer.**
  Drain plug:
  : 29 - 39 N·m (3.0 - 4.0 kg-m, 22 - 29 ft-lb)
- **The refill capacity depends on the oil temperature and drain time. Use these values as a reference and be certain to check the dipstick when changing the oil.**

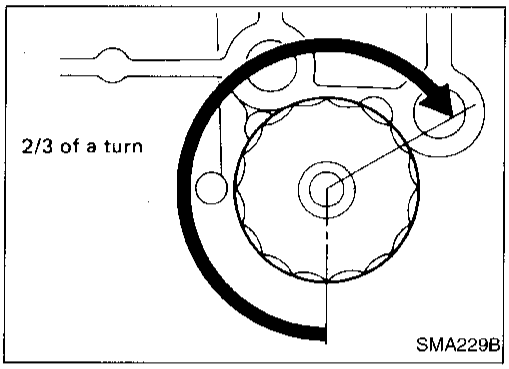
4. Check oil level.
5. Start engine and check area around drain plug and oil filter for oil leakage.
6. Run engine for a few minutes, then turn it off. After several minutes, check oil level.

Changing Oil Filter



1. Remove oil filter with Tool.

WARNING:

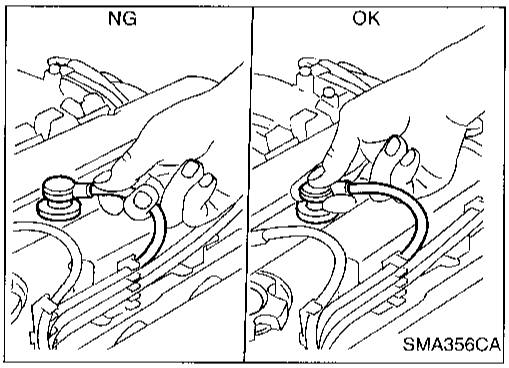


Be careful not to burn yourself. Engine and engine oil are hot.

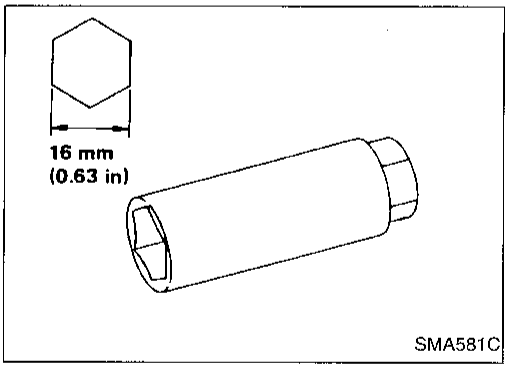
Changing Oil Filter (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

2. Clean oil filter mounting surface on cylinder block. Coat rubber seal of new oil filter with engine oil.



3. Screw in the oil filter until a slight resistance is felt, then tighten additionally more than 2/3 of a turn.
4. Add engine oil.



Refer to "Changing Engine Oil", MA-13.

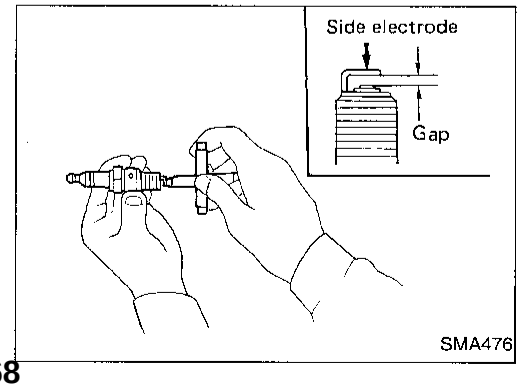
- **Clean excess oil from engine.**

Changing Spark Plugs

1. Disconnect ignition wires from spark plugs at boot. Do not pull on the wire.

2. Remove spark plugs with spark plug wrench.

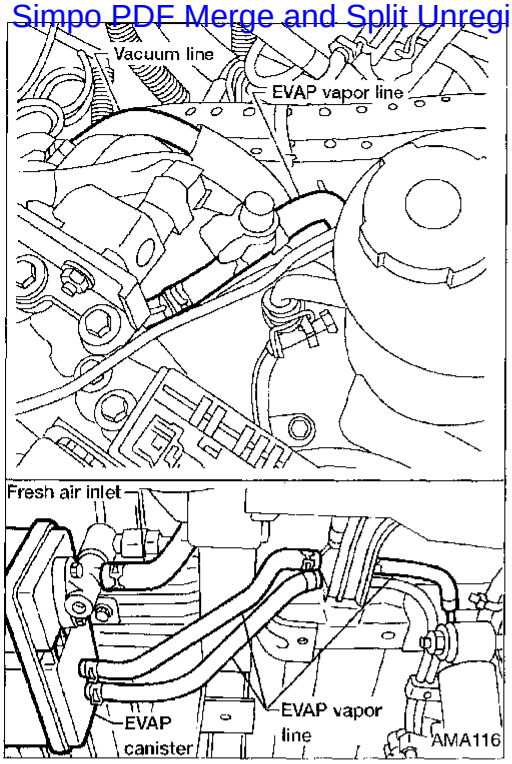
Spark plug:



Make	NGK
Standard type	BKR5E-11
Cold type	BKR6E-11 BKR7E-11

Use standard type spark plug under normal conditions. The hot type spark plug is suitable when fouling occurs with the standard spark plug under conditions such as:

- frequent engine starts
- low ambient temperature



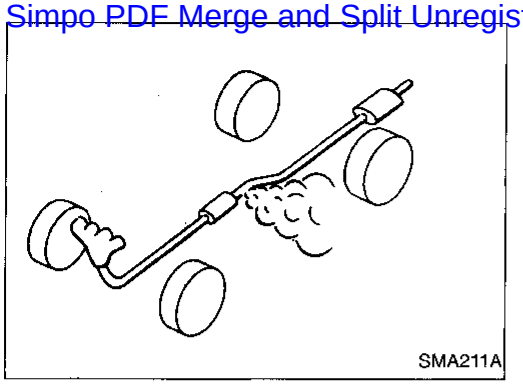
The cold type spark plug is suitable when spark knock occurs with the standard spark plug under conditions such as:

- extended highway driving
- frequent high engine revolution

3. Check plug gap of each new spark plug.
   Gap: 1.0 - 1.1 mm (0.039 - 0.043 in)
4. Install spark plugs. Reconnect ignition wires according to numbers indicated on them.
   Spark plug:
   : 20 - 29 N·m (2.0 - 3.0 kg-m, 14 - 22 ft-lb)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

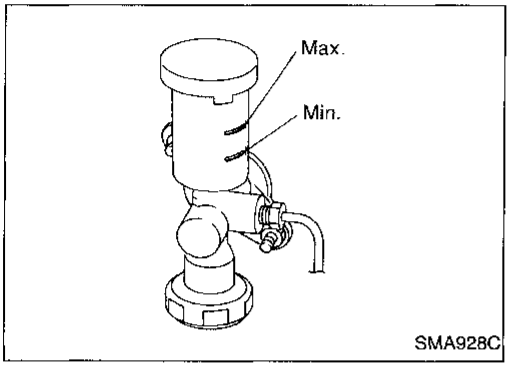
Checking EVAP Vapor Lines



1. Visually inspect EVAP vapor lines for improper attachment and for cracks, damage, loose connections, chafing and deterioration.
2. Inspect fuel tank filler cap vacuum relief valve for clogging, sticking, etc.

Refer to EC section ("EVAPORATIVE EMISSION SYSTEM").

Changing Positive Crankcase Ventilation (PCV) Filter

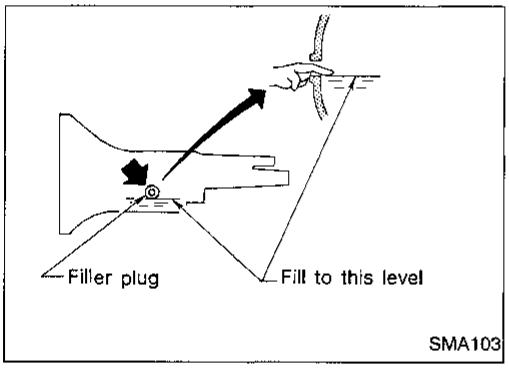


Remove air cleaner cover and take out PCV filter located inside air cleaner cover. Then install new PCV filter.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SMA211A

Checking Exhaust System



Check exhaust pipes, muffler and mounting for improper attachment, leaks, cracks, damage, loose connections, chafing and deterioration.

SMA928C

Checking Clutch Fluid Level and Leaks

If fluid level is extremely low, check clutch system for leaks.

SMA103

Checking M/T Oil

Check for oil leakage and oil level.

Never start engine while checking oil level.

Filler plug:

: 25 - 34 N·m (2.5 - 3.5 kg-m, 18 - 25 ft-lb)

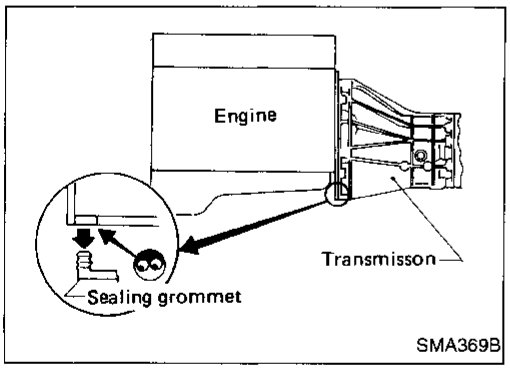
Changing M/T Oil

1. Drain oil from drain plug and refill with new gear oil.
2. Check oil level.

Oil grade and viscosity:

API GL-4. Refer to "RECOMMENDED FLUIDS AND LUBRICANTS", MA-8.

Oil capacity:

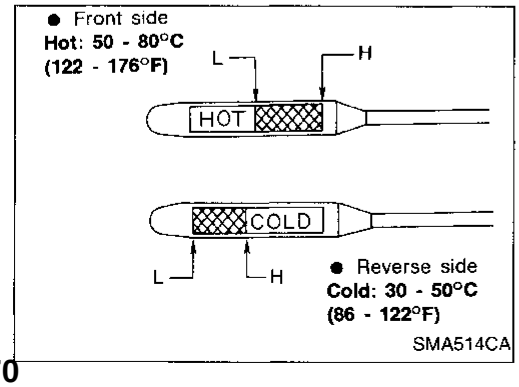


FS5W71C

2WD 2.0 ℓ (4-1/4 US pt, 3-1/2 Imp pt)

4WD 4.9 ℓ (10-3/8 US pt, 8 5/8 Imp pt)

Drain plug:



: 25 - 34 N·m (2.5 - 3.5 kg-m, 18 - 25 ft-lb)

SMA369B

Checking Water Entry — For 4WD models

Check water entry in the clutch housing by removing the sealing grommet after driving in deep water or mud.

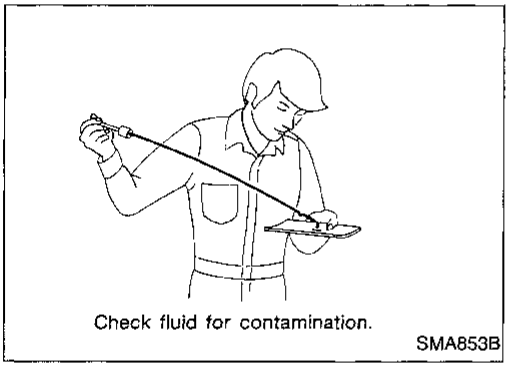
SMA514CA

Checking A/T Fluid

1. Warm up engine.
2. Check for fluid leakage.
3. Before driving, fluid level can be checked at fluid temperatures of 30 to 50°C (86 to 122°F) using "COLD" range on dipstick.

a. Park vehicle on level surface and set parking brake.
b. Start engine and move selector lever through each gear position. Leave selector lever in "P" position.
c. Check fluid level with engine idling.
d. Remove dipstick and note reading. If level is at low side of either range, add fluid to the charging pipe.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



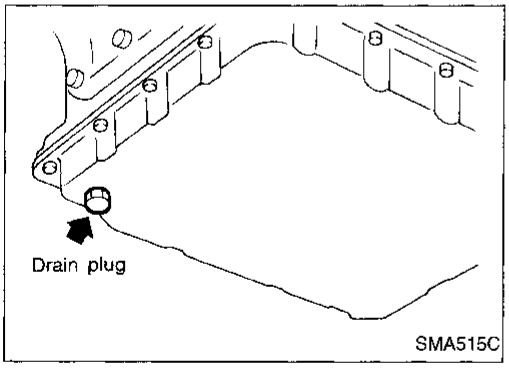
Checking A/T Fluid (Cont'd)

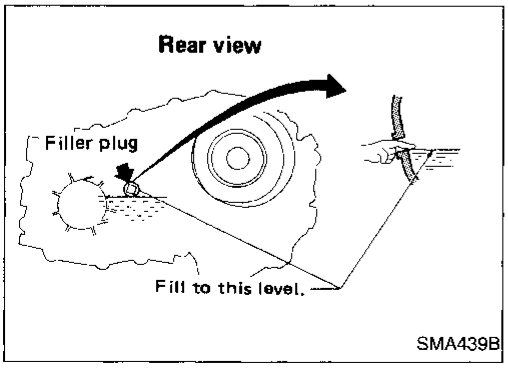
e. Reinsert dipstick into charging pipe as far as it will go.
f. Remove dipstick and note reading. If reading is at low side of range, add fluid to the charging pipe.

Do not overfill.

4. Drive vehicle for approximately 5 minutes in urban areas.
5. Recheck fluid level at fluid temperatures of 50° to 80°C (122° to 176°F) using "HOT" range on dipstick.
6. Check fluid condition.

- If fluid is very dark or smells burned, refer to AT section for checking operation of A/T. Flush cooling system after repair of A/T.
- If A/T fluid contains frictional material (clutches, bands, etc.), replace radiator and flush cooler line using cleaning solvent and compressed air after repair of A/T. Refer to LC section ("Radiator", "ENGINE COOLING SYSTEM").



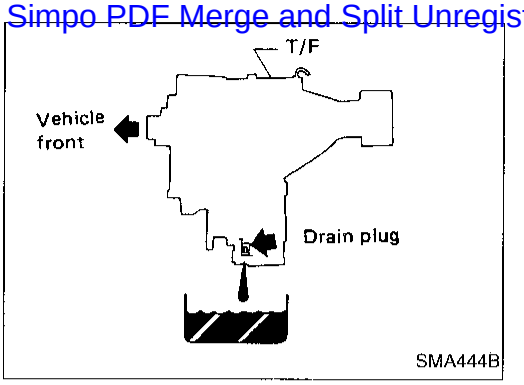


Changing A/T Fluid

1. Warm up A/T fluid.
2. Stop engine.
3. Drain A/T fluid from drain plug and refill with new A/T fluid. Measure amount of fluid drained and refill with equal amount of new fluid.

Fluid grade and viscosity:
Nissan Matic "D" (Continental U.S. and Alaska) or Genuine Nissan Automatic Transmission Fluid (Canada). Refer to "RECOMMENDED FLUIDS AND LUBRICANTS", MA-8.
Fluid capacity (With torque converter):
7.9 ℓ (8-3/8 US qt, 7 Imp qt)
Drain plug:
: 29 - 39 N·m (3.0 - 4.0 kg-m, 22 - 29 ft-lb)

4. Run engine at idle speed for five minutes.
5. Check fluid level and condition. Refer to "Checking A/T Fluid". If fluid is still dirty, repeat steps 2 through 5, MA-16.

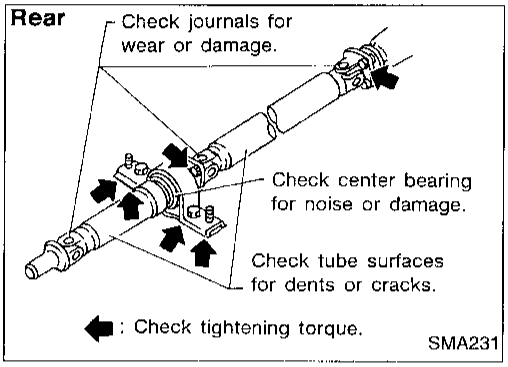


Checking Transfer Fluid

Check for fluid leakage and fluid level.

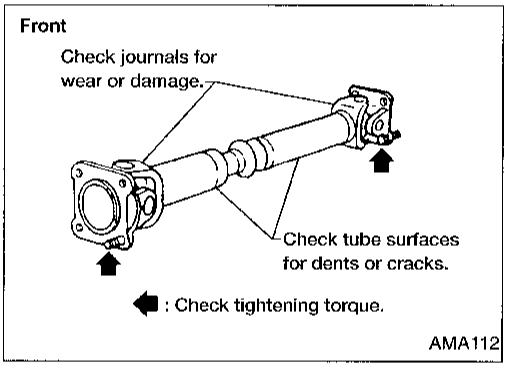
Automatic Transmission Fluid is used for the transfer in the factory.
Never start engine while checking fluid level.

Filler plug:
: 25 - 34 N·m (2.5 - 3.5 kg-m, 18 - 25 ft-lb)

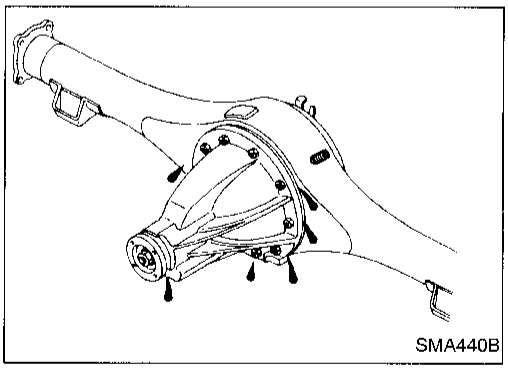


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Changing Transfer Fluid



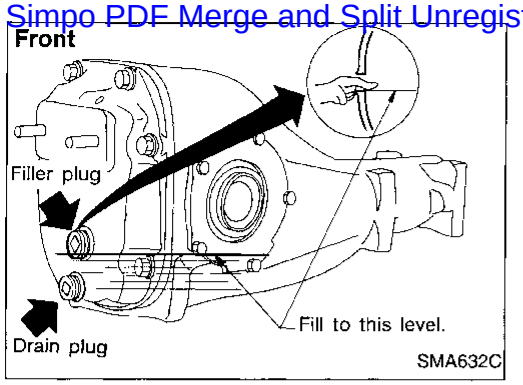
When changing transfer fluid completely, use the following fluid.

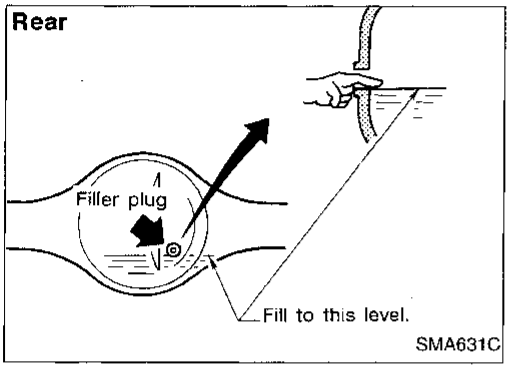


Fluid grade:
API GL-4. Refer to "RECOMMENDED FLUIDS AND LUBRICANTS", MA-8.
Fluid capacity:
2.2 ℓ (2-3/8 US qt, 2 Imp qt)
Drain plug:
: 25 - 34 N·m (2.5 - 3.5 kg-m, 18 - 25 ft-lb)

Checking Propeller Shaft

Check propeller shaft for damage, looseness and grease leakage.
Tightening torque: Refer to PD section.





Checking Differential Gear Oil

Check for oil leakage and oil level.

Filler plug:
Front
: 39 - 59 N·m (4 - 6 kg-m, 29 - 43 ft-lb)
Rear
H190A
: 59 - 98 N·m (6 - 10 kg-m, 43 - 72 ft-lb)
C200
: 39 - 59 N·m (4 - 6 kg-m, 29 - 43 ft-lb)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Changing Differential Gear Oil

1. Drain oil from drain plug and refill with new gear oil.
2. Check oil level.

Oil grade and viscosity:
See "RECOMMENDED FLUIDS AND LUBRICANTS", MA-8.

Oil capacity:

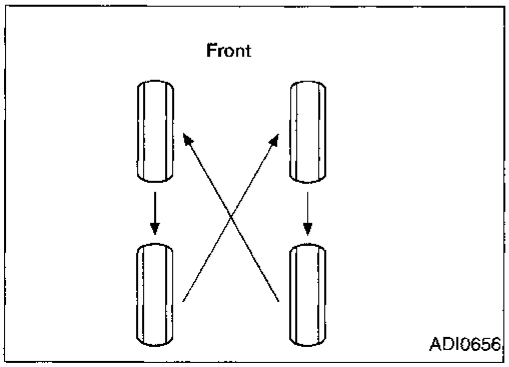
Front
1.3 ℓ (2-3/4 US pt, 2-1/4 Imp pt)

Rear

H190A
1.5 ℓ (3-1/8 US pt, 2-5/8 Imp pt)

C200
1.3 ℓ (2-3/4 US pt, 2-1/4 Imp pt)

Drain plug:



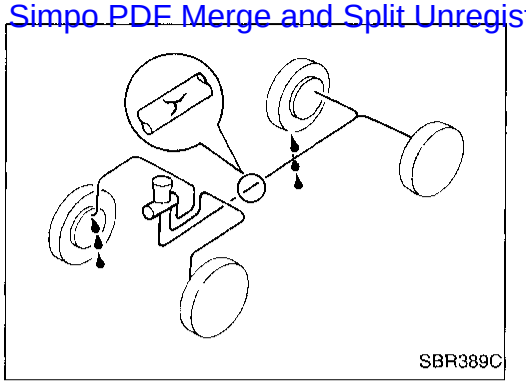
Front
: 39 - 59 N·m (4 - 6 kg-m, 29 - 43 ft-lb)

Rear
: 59 - 98 N·m (6 - 10 kg-m, 43 - 72 ft-lb)

Balancing Wheels

Adjust wheel balance using the road wheel center.

Wheel balance (Maximum allowable unbalance):
Refer to SDS, MA-24.

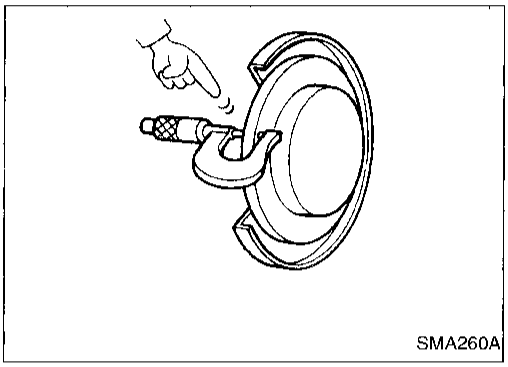


Tire Rotation

- After rotating the tires, adjust the tire pressure.
- Retighten the wheel nuts after the aluminum wheels have been run for the first 1,000 km (600 miles) or if a flat tire occurs.
- **Do not include the T-type spare tire when rotating the tires.**

Wheel nuts:
: 118 - 147 N·m (12 - 15 kg-m, 87 - 108 ft-lb)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



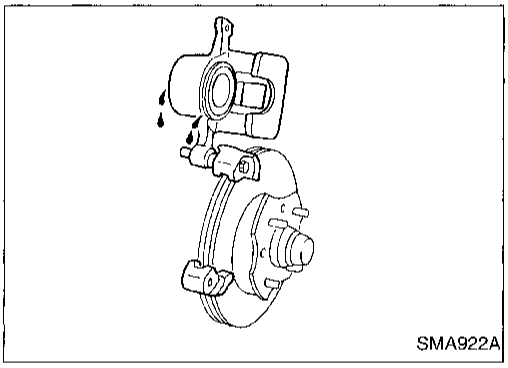
SBR389C

Checking Brake Fluid Level and Leaks

If fluid level is extremely low, check brake system for leaks.

Checking Brake System

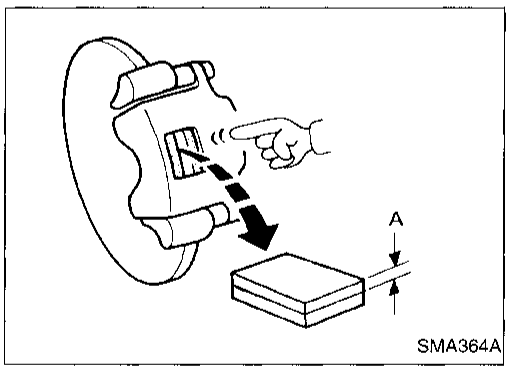
Check brake fluid lines and parking brake cables for improper attachment, leaks, chafing, abrasion and deterioration, etc.



SMA260A

Checking Disc Brake

ROTOR



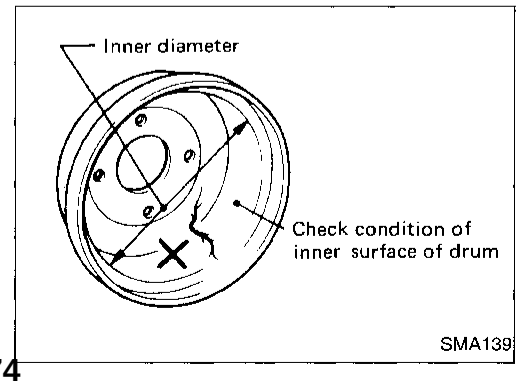
Check condition and thickness.

Minimum thickness: CL28VD 24 mm (0.94 in)

SMA922A

CALIPER

Check for leakage.



SMA364A

PAD

Measure wear and check for damage.

Minimum thickness: 2 mm (0.08 in)

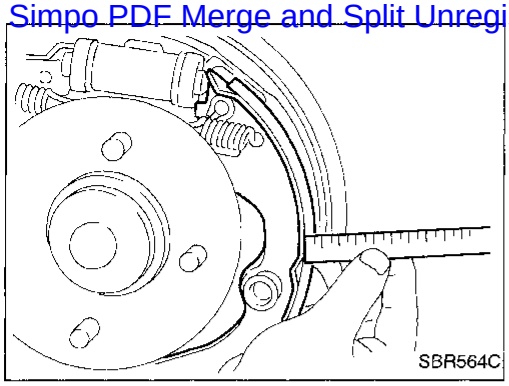
SMA139

Checking Drum Brake

WHEEL CYLINDER

Check operation and for leakage.

DRUM

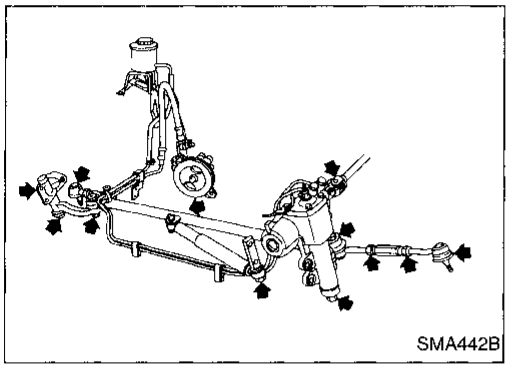


Check condition of inner surface.

Drum repair limit (Maximum inner diameter):

LT26B	**261.5 mm (10.30 in)**
LT30A	**296.5 mm (11.67 in)**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Checking Drum Brake (Cont'd)

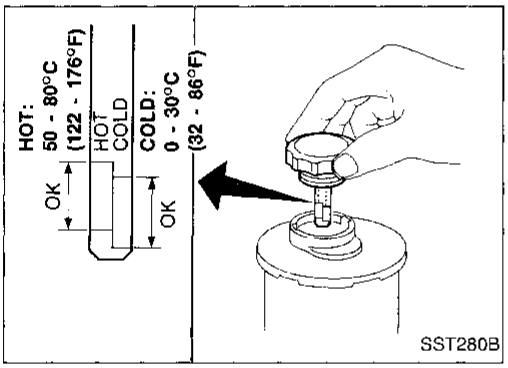
SBR564C

LINING

Measure wear and check for damage.

Lining wear limit (Minimum thickness):
1.5 mm (0.059 in)

SMA442B



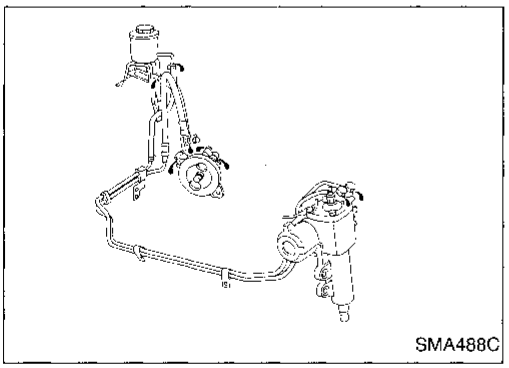
Checking Steering Gear and Linkage

STEERING GEAR

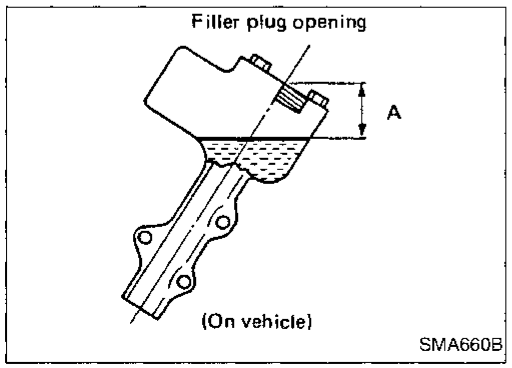
- Check gear housing and boots for looseness, damage and grease leakage.
- Check connection with steering column for looseness.

STEERING LINKAGE

- Check ball joint, dust cover and other component parts for looseness, wear, damage and grease leakage.



SST280B



Checking Power Steering Fluid and Lines

- Check fluid level with engine off.
- Check fluid level with dipstick on reservoir cap. Use "HOT" range at fluid temperatures of 50 to 80°C (122 to 176°F). Use "COLD" range at fluid temperatures of 0 to 30°C (32 to 86°F).

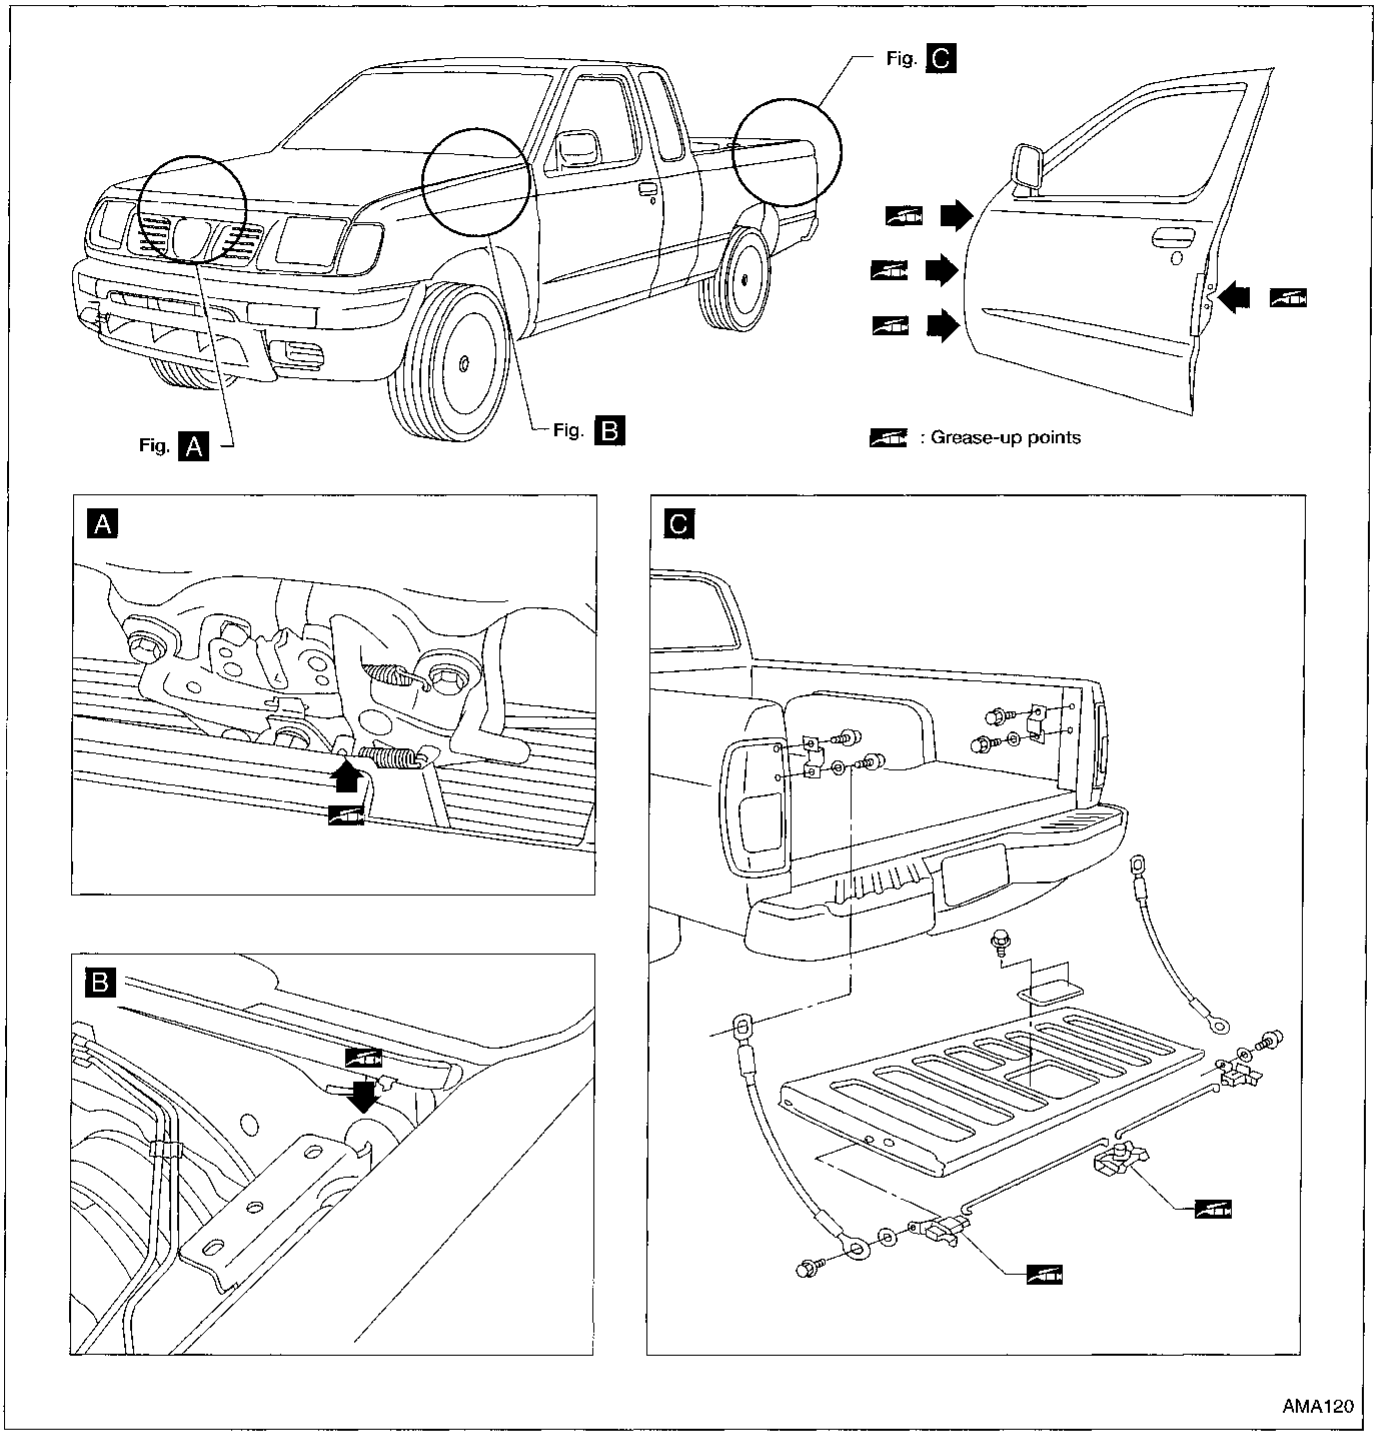
CAUTION:
- **Do not overfill.**
- **Recommended fluid is Automatic Transmission Fluid type DEXRON™ III or equivalent.**

SMA488C

- Check lines for improper attachment, leaks, cracks, damage, loose connections, chafing and deterioration.

SMA660B

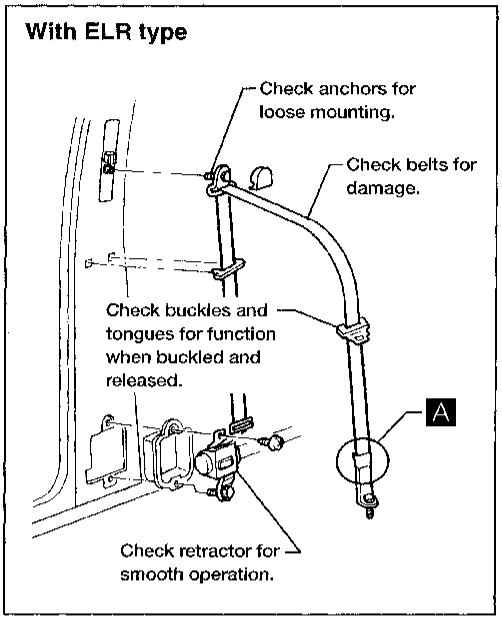
Checking Steering Gear Oil Level and Leaks



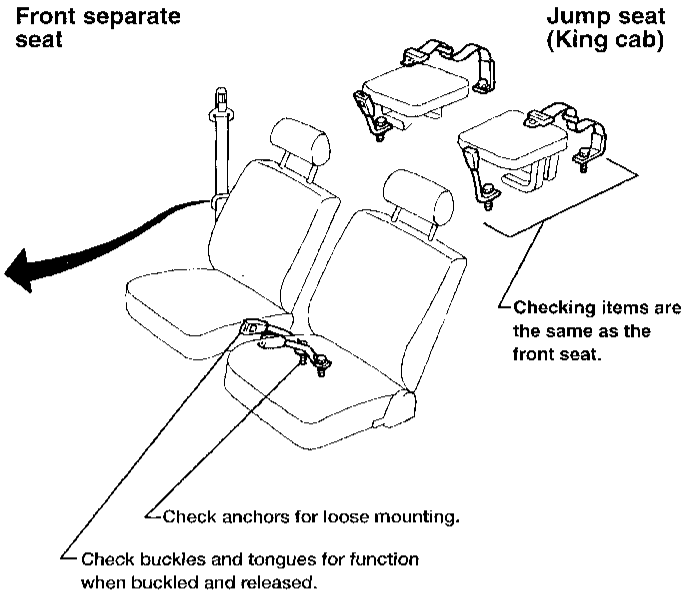
- Check steering gear for oil level and leakage.
- Check oil level.

Oil level:
Distance "A"
20 mm (0.79 in) or less

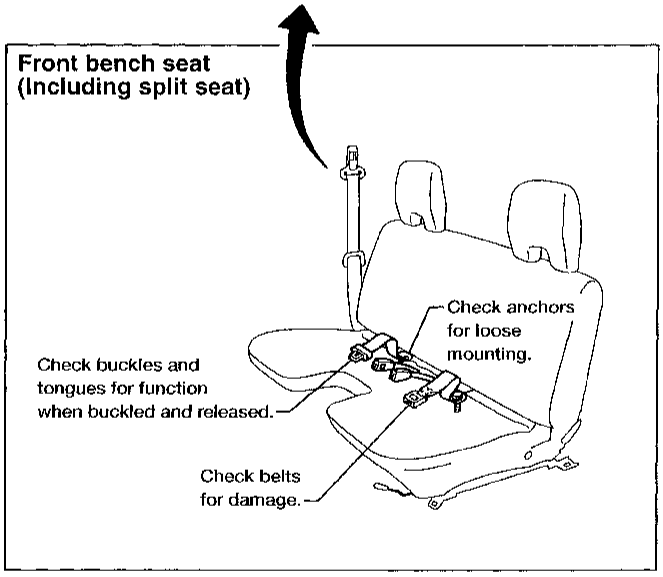
Be careful not to overflow gear oil when filling.

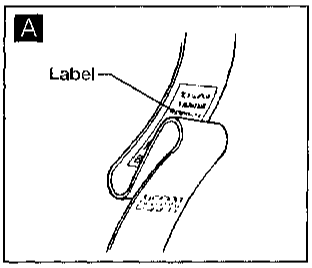


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Lubricating Hood Latches, Locks and Hinges





Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Checking Seat Belts, Buckles, Retractors, Anchors and Adjusters

For front seat belt, shock absorber type belt has been used. Replace the belt when loop has been pulled out and "REPLACE BELT" is visible because this seat belt has a loop of webbing under the sleeve.

CAUTION:

1. If the vehicle has collided or overturned, replace the entire belt assembly, regardless of nature of accident.
2. If the condition of any component of a seat belt is questionable, do not repair seat belt, but replace it as a belt assembly.
3. If webbing is cut, frayed, or damaged, replace belt assembly.
4. Do not spill drinks, oil, etc. on inner lap belt buckle. Never oil tongue and buckle.
5. Use a NISSAN genuine seat belt assembly.

Anchor bolt:
: 24 - 31 N•m (2.4 - 3.1 kg-m, 17 - 23 ft-lb)

For details, refer to "Seat Belt Inspection", "SEAT BELTS" in RS section.

AMA119

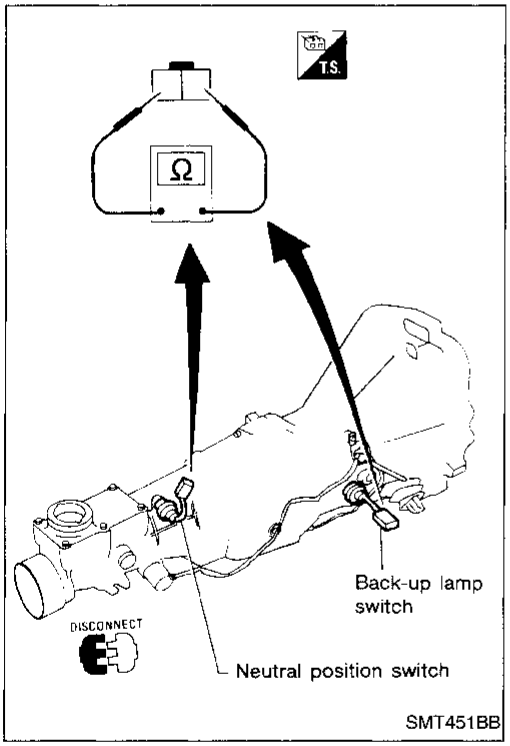
Replacing Rear Oil Seal — 2WD Model —

REMOVAL

1. Remove the propeller shaft. Refer to PD section ("Removal and Installation", "PROPELLER SHAFT").
2. Remove rear oil seal using Tool.

- **Always replace with a new seal once it has been removed.**

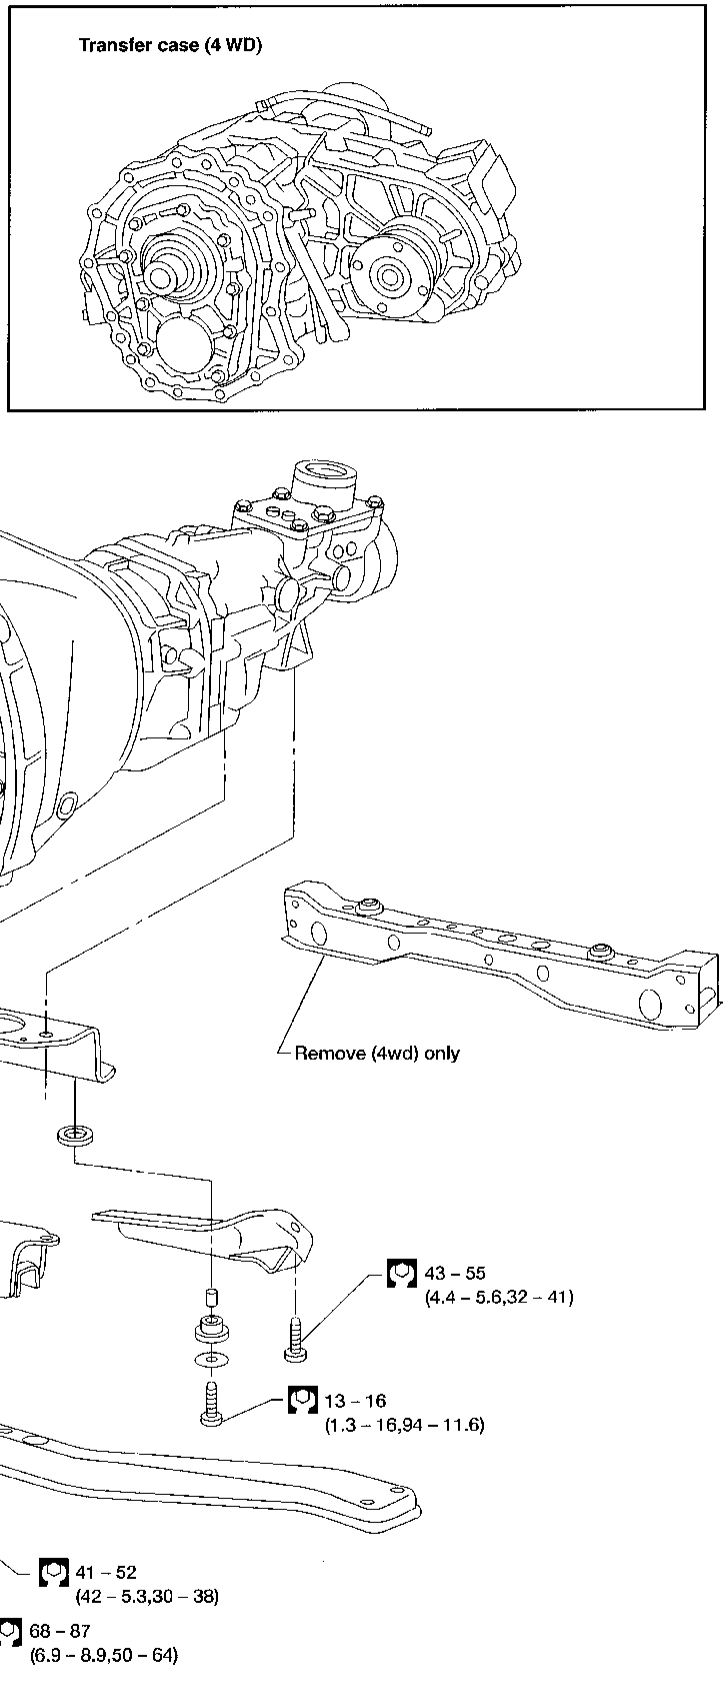


INSTALLATION

1. Install new oil seal until it stops.

- **Apply multi-purpose grease to seal lip of oil seal before installing.**

2. Install any part removed.



Position Switch Check

- Check continuity.

Switch	Gear position	Continuity
Back-up lamp switch	Reverse	Yes
	Except reverse	No
Neutral position switch	Neutral	Yes
	Except neutral	No

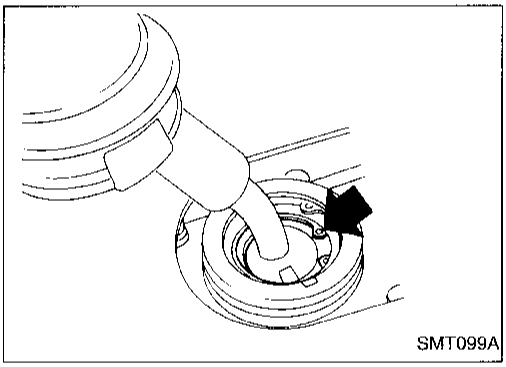
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Removal

AMT144

Removal (Cont'd)

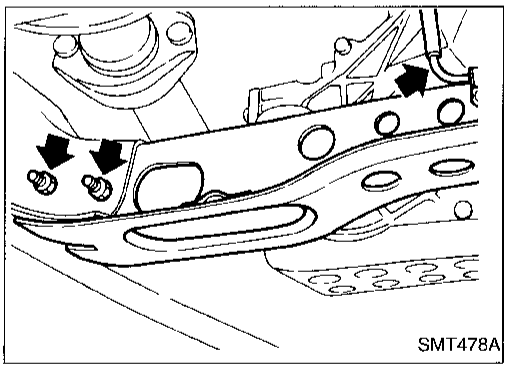
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



CAUTION:
Before separating the transmission from the engine, remove the crankshaft position sensor (OBD) from the transmission. Be careful not to damage sensor edge or ring gear teeth.

2WD MODEL

NOTE: To prevent oil spills, drain transmission oil before removing transmission or insert plug into rear oil seal after removing propeller shaft.



- **Be careful not to damage spline, sleeve yoke and rear oil seal when removing propeller shaft.**

1. Remove battery negative terminal.
2. Remove crankshaft position sensor (OBD) from transmission upper side.
3. Remove clutch operating cylinder from transmission.
4. Remove back-up switch and neutral position switch harness connectors.
5. Remove starter motor from transmission.
6. Remove propeller shaft. Refer to PD section ("Removal and Installation", "PROPELLER SHAFT").

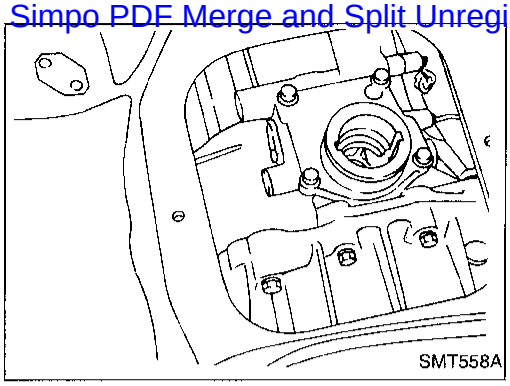
SMT099A

7. Remove shift lever.
8. Support engine by placing a jack under oil pan.
   - **Do not place jack under oil pan drain plug.**
9. Separate transmission from engine.

WARNING:
Support manual transmission while removing it.

SMT478A

4WD MODEL



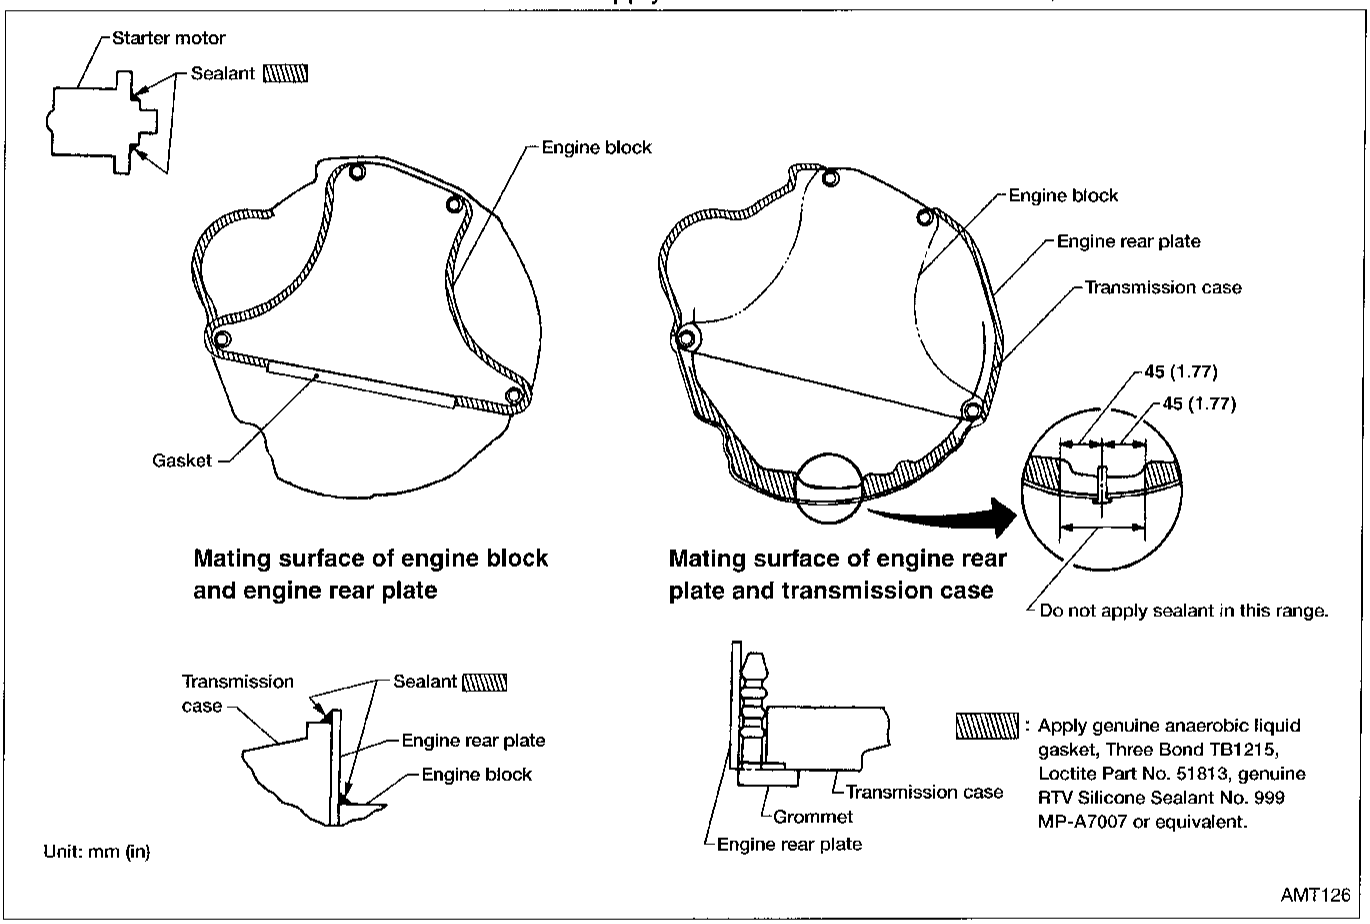
NOTE: To prevent oil spills, drain transmission and transfer oil before removing transmission or insert plug into rear oil seal of transfer after removing propeller shafts.

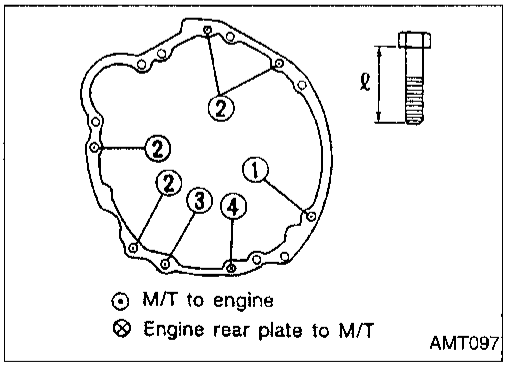
- **Always drain transmission and transfer oil whenever separating transmission and transfer.**

1. Remove battery negative terminal.
2. Remove crankshaft position sensor (OBD) from transmission upper side.
3. Remove clutch operating cylinder from transmission.
4. Remove back-up switch and neutral position switch harness connector.
5. Remove starter motor from transmission.
6. Remove front and rear propeller shafts. Refer to PD section ("Removal and Installation", "PROPELLER SHAFT").
   - **Be careful not to damage splines, sleeve yokes and front and rear oil seals of transfer when removing propeller shafts.**
7. Remove torsion bar springs. Refer to FA section ("Torsion Bar Spring", "FRONT SUSPENSION"). Then remove second crossmember.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Removal (Cont'd)





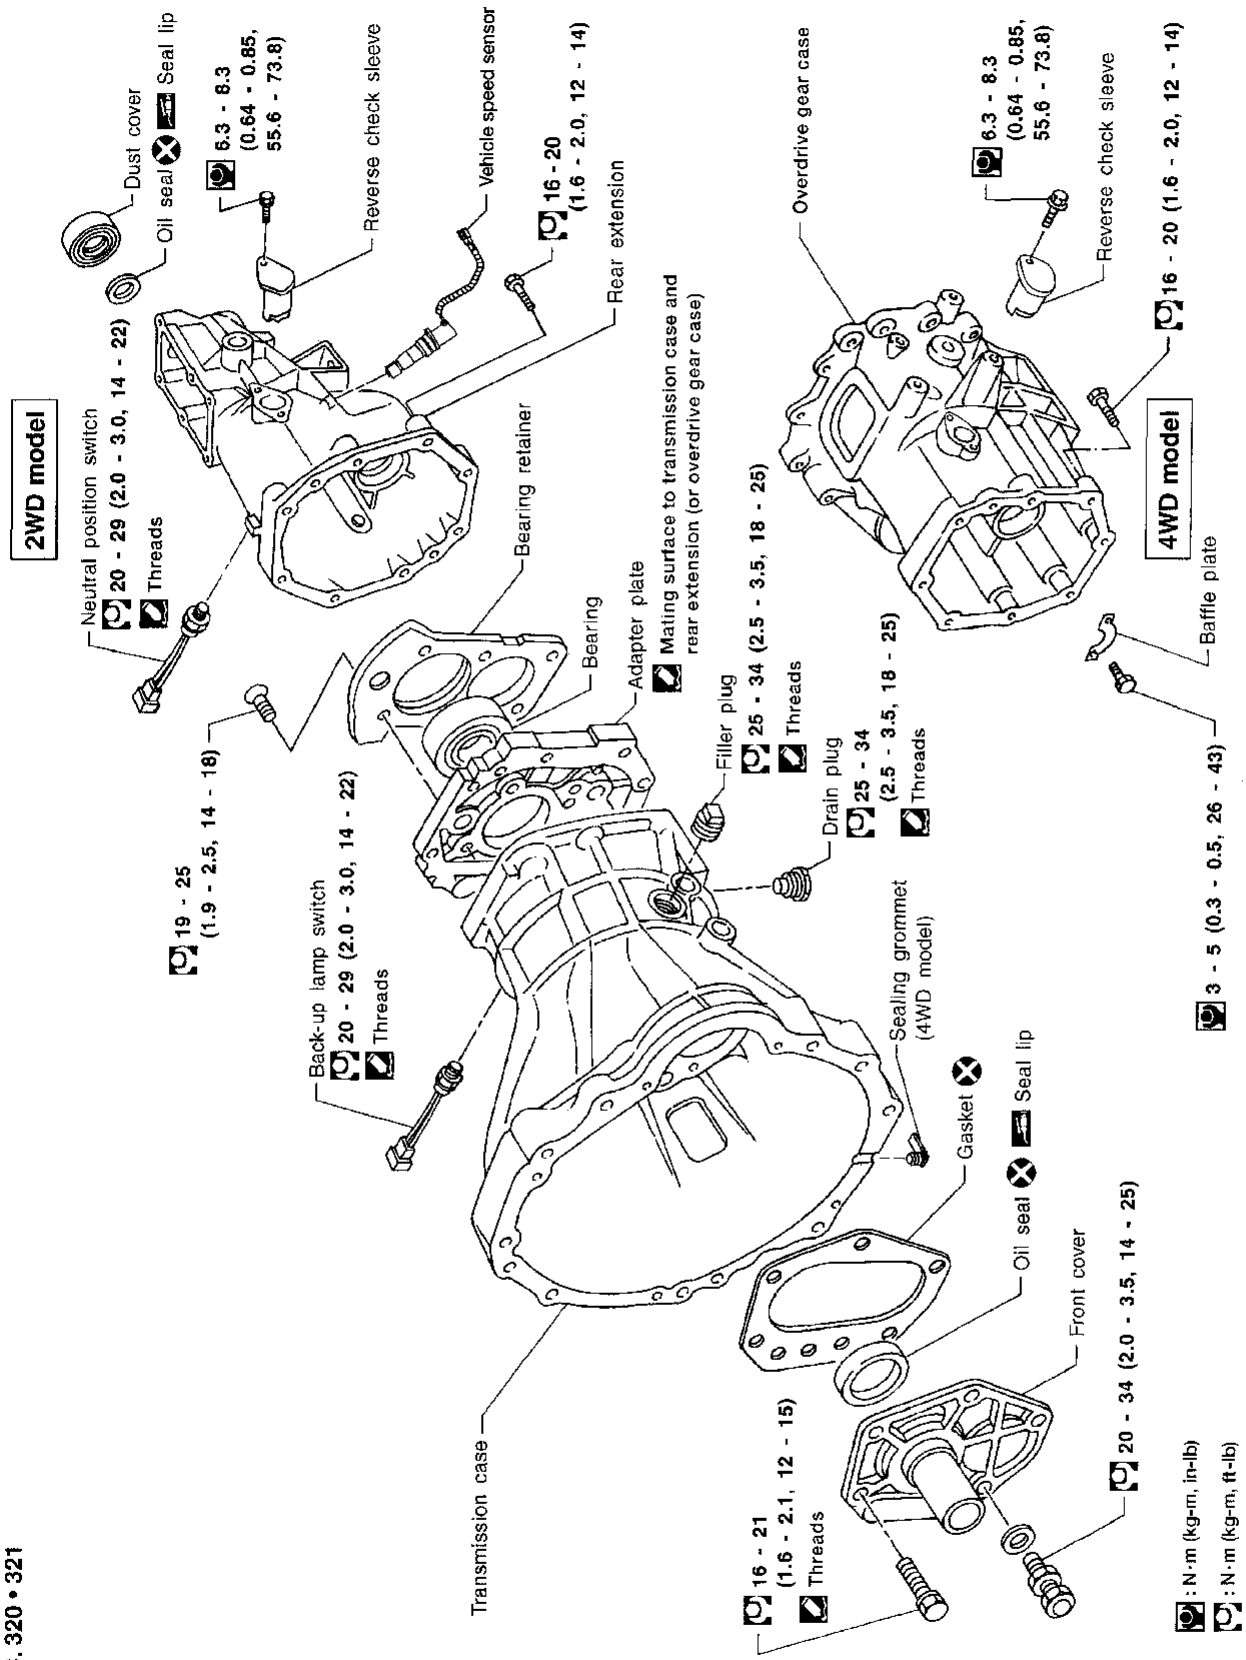
8. Remove transmission shift lever and transfer control lever.
9. Support engine by placing a jack under oil pan.
   - **Do not place jack under oil pan drain plug.**
10. Support transmission with a jack and remove engine rear member.
11. For clutch disc replacement, separate transmission with transfer from engine. For transmission overhaul, remove transfer from transmission, then separate transmission from engine.

WARNING:
Support manual transmission with transfer while removing it.

Installation

1. Apply sealant to areas shown below, — 4WD model.

2. Tighten bolts securing transmission.



Bolt No.	Tightening torque N·m (kg-m, ft-lb)	ℓ mm (in)
①	39 - 49 (4.0 - 5.0, 29 - 36)	65 (2.56)
②	39 - 49 (4.0 - 5.0, 29 - 36)	58 (2.28)
③*	16 - 22 (1.6 - 2.2, 12 - 16)	25 (0.98)
④	16 - 22 (1.6 - 2.2, 12 - 16)	16 (0.63)

*: With nut

3. Tighten clutch operating cylinder to the specified torque. Refer to CL section ("CLUTCH SYSTEM").
4. For transfer installation, refer to TF section ("Installation", "REMOVAL AND INSTALLATION").

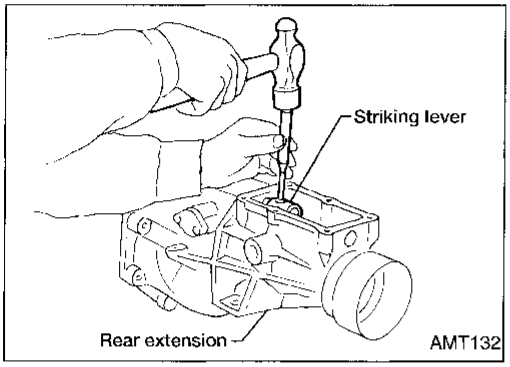
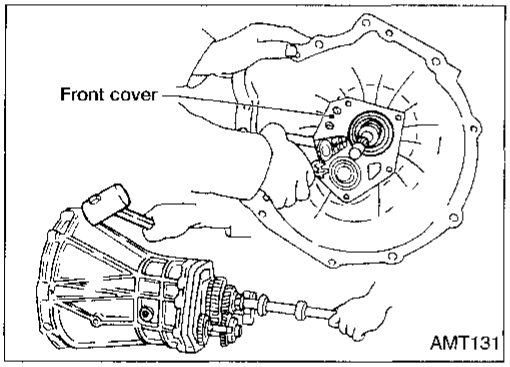
Shift Control Components

CAUTION:
To avoid damage when replacing shift knob, remove shift lever with knob, as assembled.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

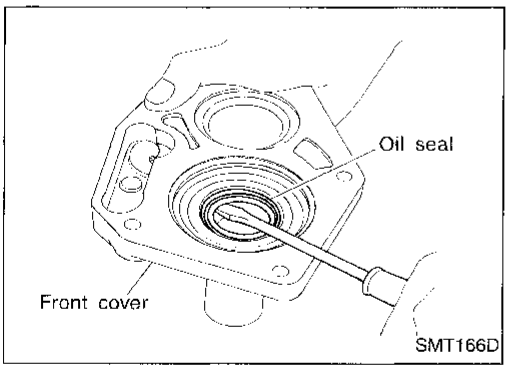


Case Components



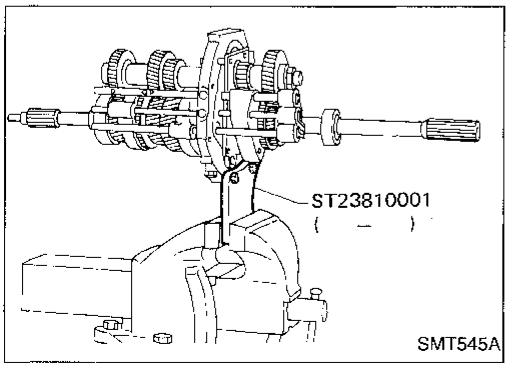
1. Remove rear extension.

a. Remove control housing, check ball, return spring plugs, select check plungers and return springs. Also remove reverse check plug, check spring and check ball.



- **Be careful not to lose check balls.**

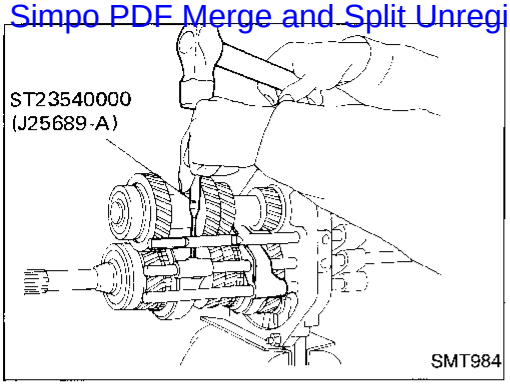
b. Drive out striking lever retaining pin.
c. Remove striking lever from striking rod.
d. Remove rear extension by lightly tapping on it.



2. Remove front cover, gasket, counter gear front bearing shim and main drive gear ball bearing snap ring.
3. Separate transmission case from adapter plate by lightly tapping on it.

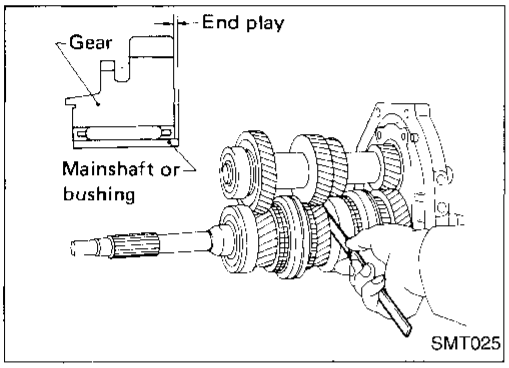
4. Remove oil seal from front cover.

- **Be careful not to damage mating surface of front cover.**



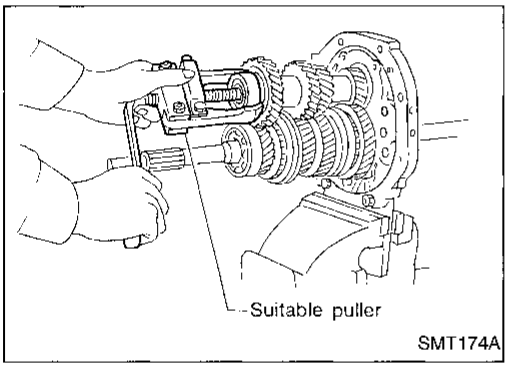
Shift Control Components

1. Set up Tool on adapter plate.
2. Remove striking rod from adapter plate.
3. Remove check ball plugs, check springs, and check balls.



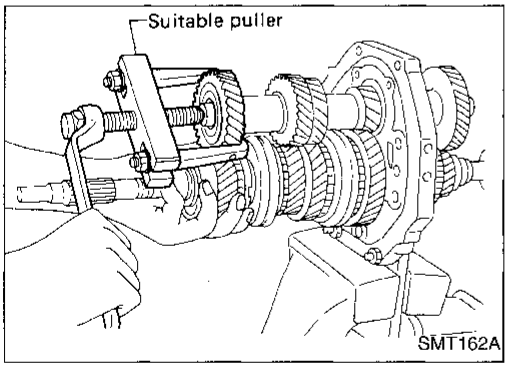
Shift Control Components (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



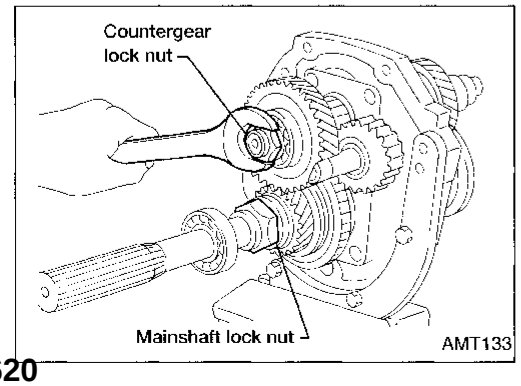
4. Drive out retaining pins. Then drive out fork rods and remove interlock balls.

Gear Components



1. Before disassembly, measure the end play of each gear.
- If end play is not within the specified limit, disassemble and inspect the parts.
- Replace any part which is worn or damaged.

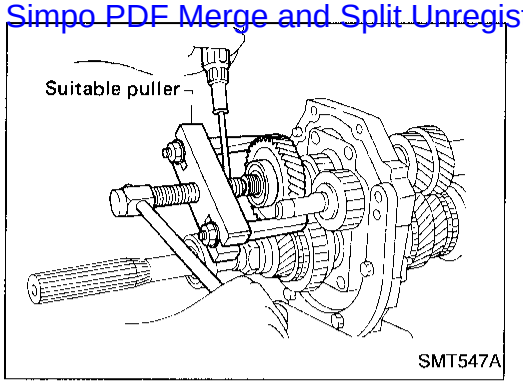
Gear end play:
Refer to SDS, MT-32.



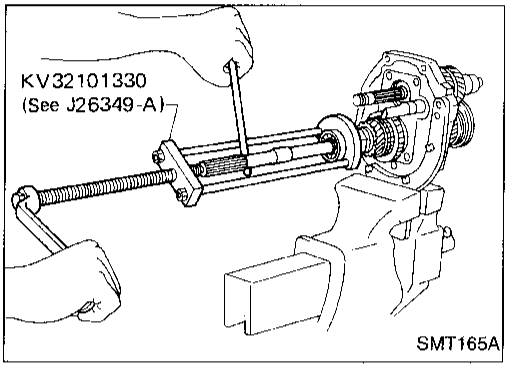
2. Mesh 2nd and reverse gear, then remove counter gear front bearing using a suitable puller.
3. Remove snap ring, then remove sub-gear bracket, sub-gear spring and sub-gear.

4. Remove counter drive gear together with main drive gear assembly using a suitable puller.
- **When removing main drive gear assembly, be careful not to drop pilot bearing or baulk ring.**

5. Remove snap ring, then remove 3rd & 4th synchronizer assembly and 3rd main gear.

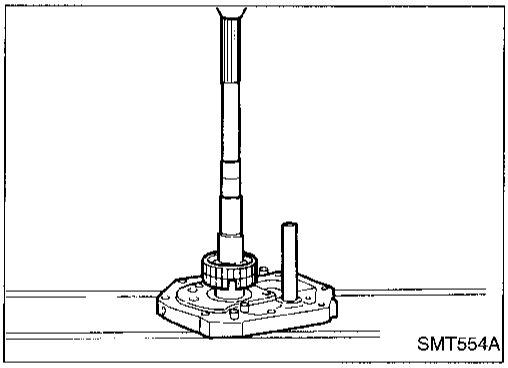


6. Disassemble parts at rear of adapter plate as follows:

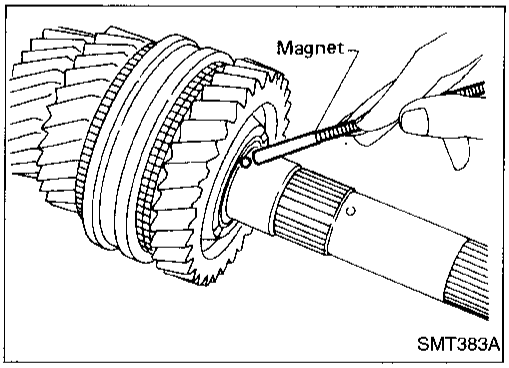


a. Release staking on both countergear and mainshaft lock nuts, then loosen both nuts.

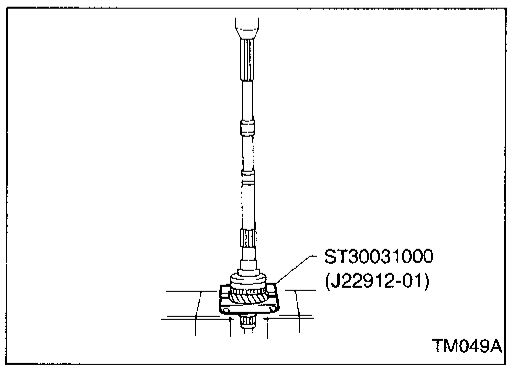
Mainshaft Lock nut: Left-hand thread



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

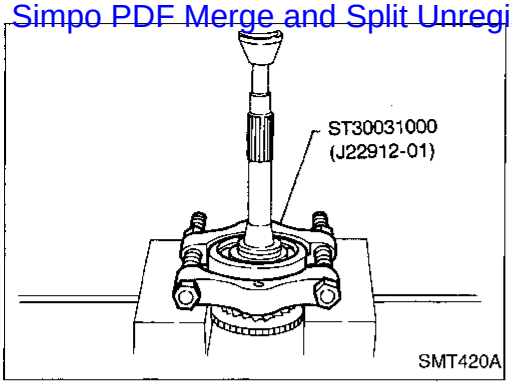


b. Remove overdrive counter gear together with counter gear rear end bearing using a suitable puller.
c. Remove reverse counter gear and spacer.
d. Remove snap rings from reverse idler shaft, then remove reverse idler gear, thrust washers and reverse idler gear bearing.



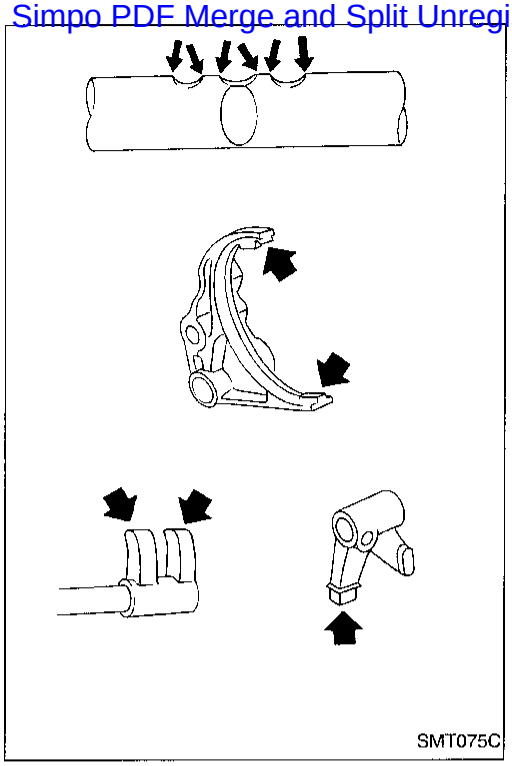
e. Remove snap ring and pull out overdrive mainshaft bearing, then remove snap ring. (2WD model)
f. Remove mainshaft lock nut.
g. Remove speedometer drive gear and steel ball. (2WD model)
h. Remove thrust washer, steel roller, roller bearing and washer.
i. Remove overdrive main gear, needle bearing and baulk ring (overdrive).
j. Remove counter gear by tapping on rear end of counter gear.
k. Press out overdrive gear bushing and overdrive & reverse synchronizer assembly.
l. Remove reverse main gear and needle bearing.

m. Press out reverse gear bushing.



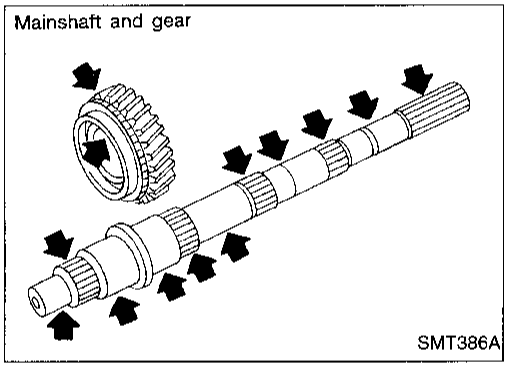
7. Remove thrust washer, steel ball, 1st main gear and needle bearing.
- **Be careful not to lose steel ball.**

8. Press out 1st gear bushing together with 2nd main gear using Tool.
Remove 2nd gear needle bearing.



Gear Components (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



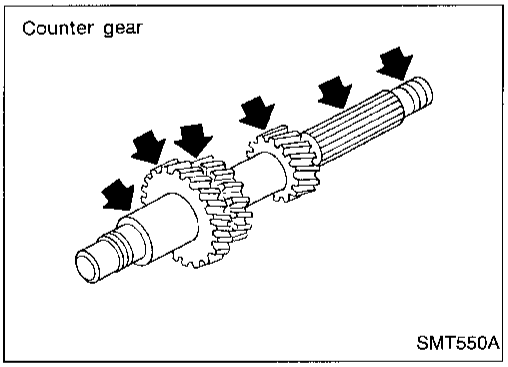
9. Remove main drive gear ball bearing.
a. Remove snap ring.
b. Remove main drive gear ball bearing.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

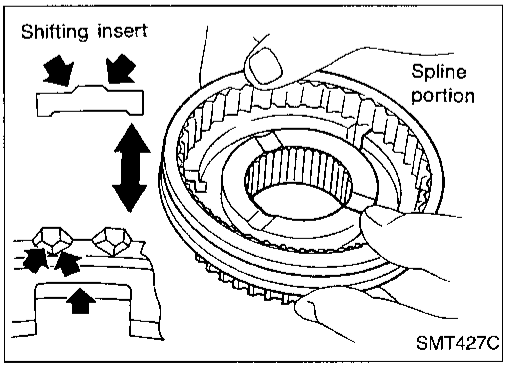
SMT075C

Shift Control Components

- Check contact and sliding surfaces of fork rods for wear, scratches, projections and other damage.



SMT386A

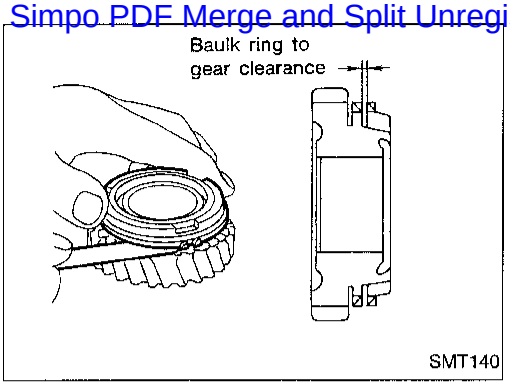


Gear Components

GEARS AND SHAFTS

- Check shafts for cracks, wear and bending.
- Check gears for excessive wear, chips and cracks.

SMT550A



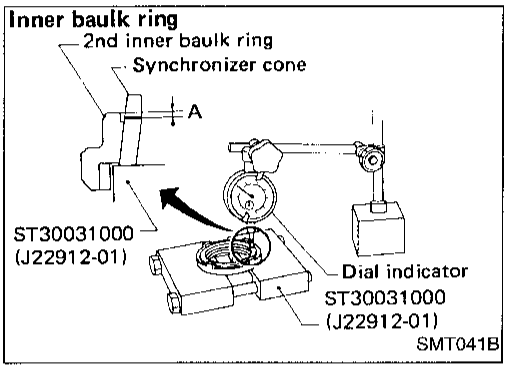
SMT427C

SYNCHRONIZERS

- Check spline portion of coupling sleeves, synchronizer hubs and gears for wear, chips and cracks.
- Check baulk rings for cracks and deformation.
- Check shifting inserts for wear and deformation.
- Check insert spread springs for deformation.

Gear Components (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

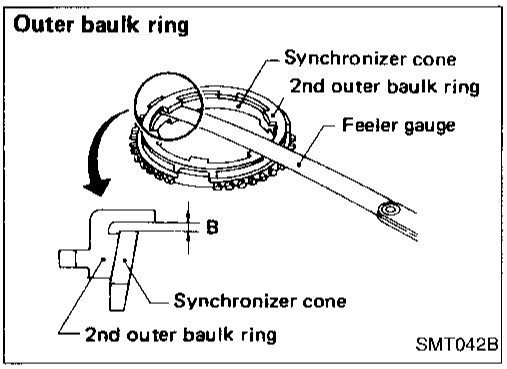


- Measure baulk ring wear.

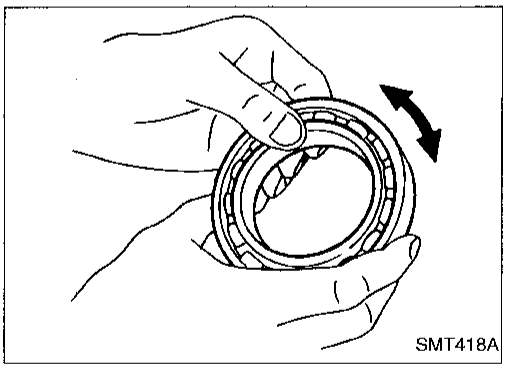
a. Measure clearance between baulk ring and gear.

Clearance between baulk ring and gear:
Refer to SDS, MT-32.

- If the clearance is less than the wear limit, replace baulk ring.



- Measure 2nd baulk ring wear—4WD model.

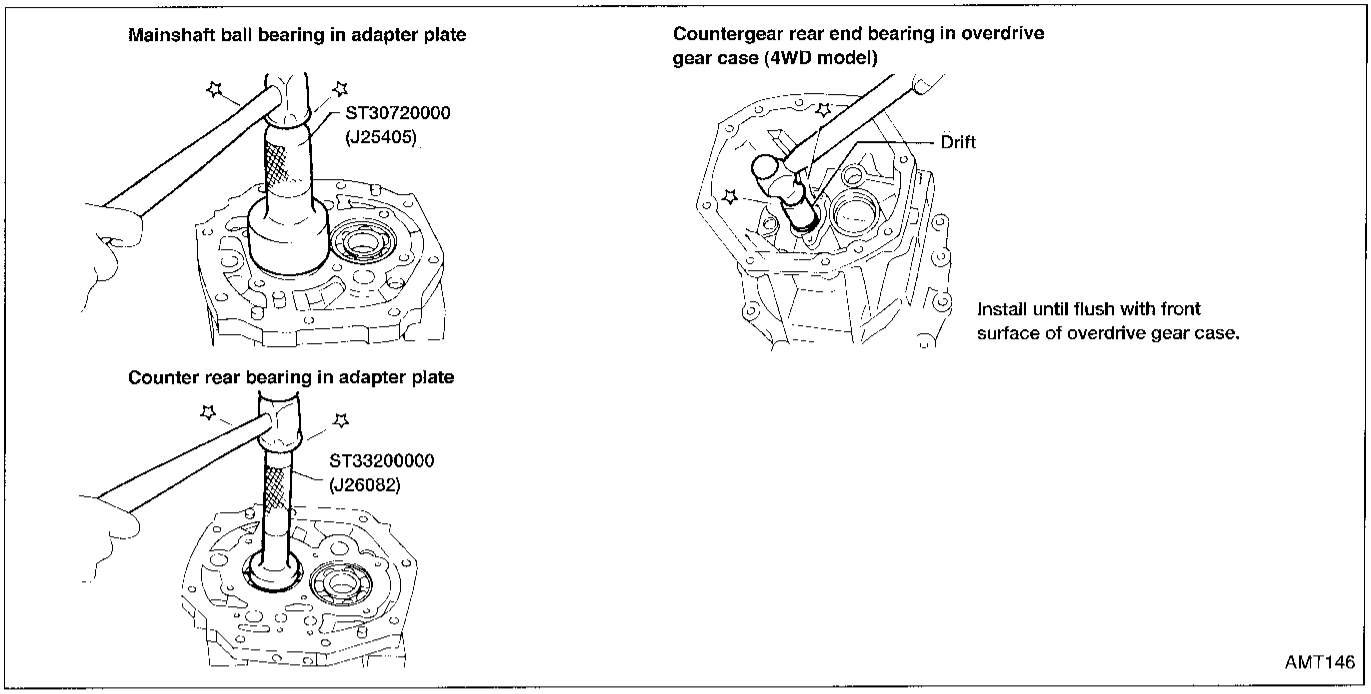


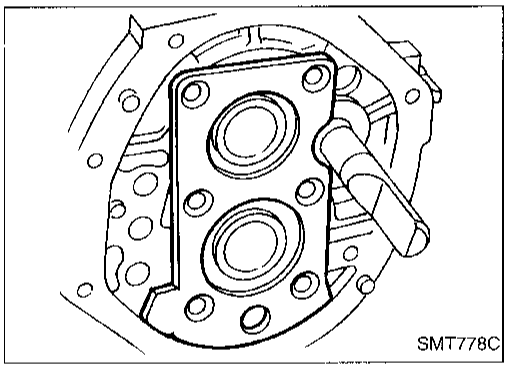
a. Place baulk rings in position on synchronizer cone.

b. While holding baulk rings against synchronizer cone as far as possible, measure dimensions "A" and "B".

Standard:
Inner "A": 0.7 - 0.9 mm (0.028 - 0.035 in)
Outer "B": 0.6 - 1.1 mm (0.024 - 0.043 in)
Wear limit:
0.2 mm (0.008 in)

- If dimension "A" or "B" is smaller than the wear limit, replace outer baulk ring, inner baulk ring and synchronizer cone as a set.



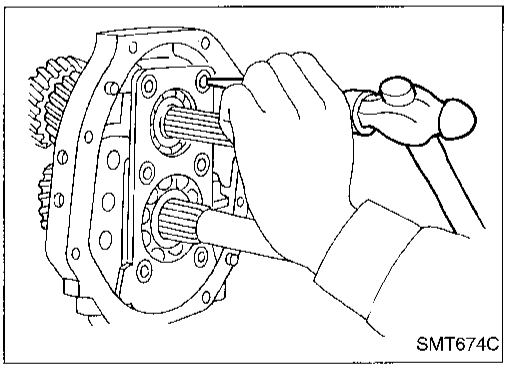


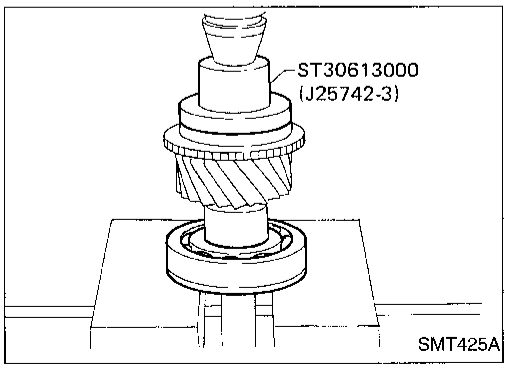
BEARINGS

- Make sure all bearings roll freely and are free from noise, cracks, pitting or wear.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Gear Components



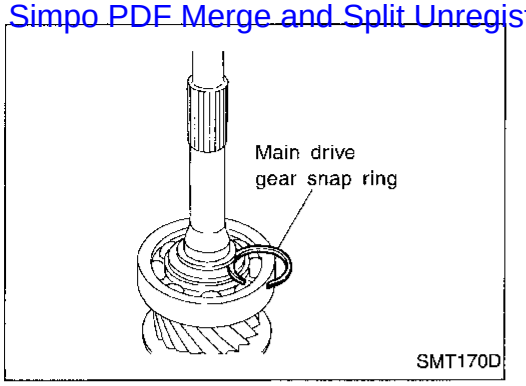


1. Install bearings into case components.
2. Assemble adapter plate parts.

- Install oil gutter on adapter plate and expand on rear side.
- Install bearing retainer.

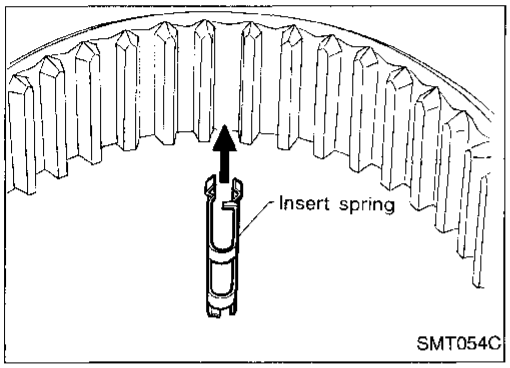
a. Insert reverse idler shaft, then install bearing retainer.

b. Tighten each screw, then stake each one at two points.



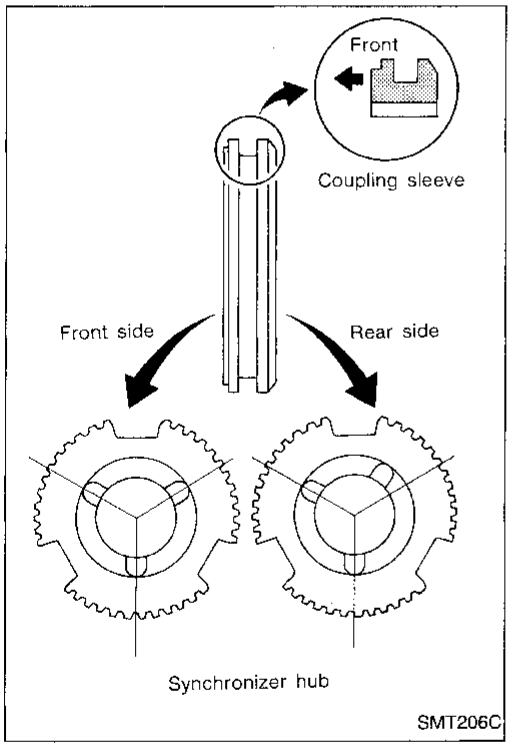
3. Install main drive gear ball bearing.

a. Press main drive gear ball bearing.



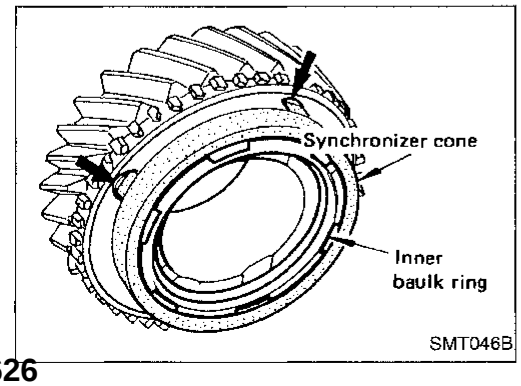
Gear Components (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



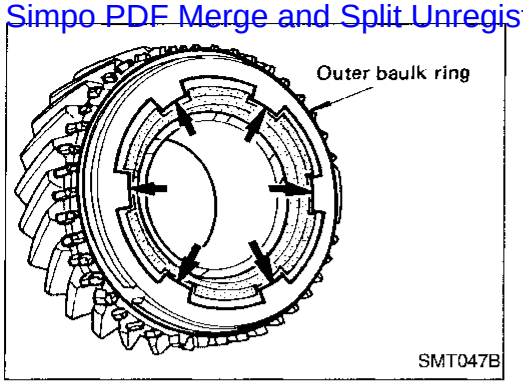
b. Select and install proper main drive gear snap ring to achieve proper clearance of groove.

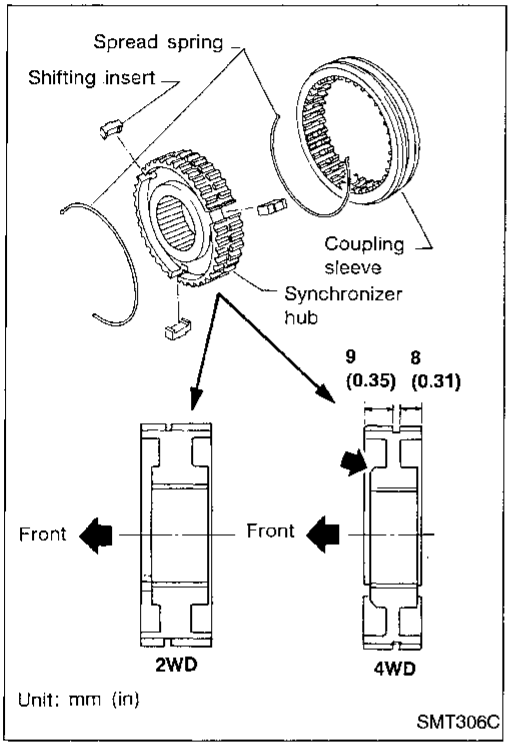
Allowable clearance of groove:
0 - 0.13 mm (0 - 0.0051 in)
Main drive gear snap ring:
Refer to SDS, MT-32.



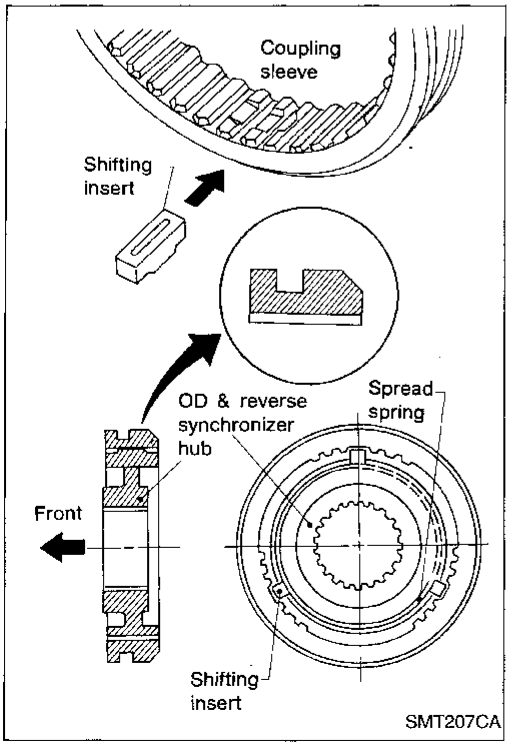
4. Assemble synchronizers.

- 1st and 2nd (2WD model) synchronizer





- **Check coupling sleeve and synchronizer hub orientation.**

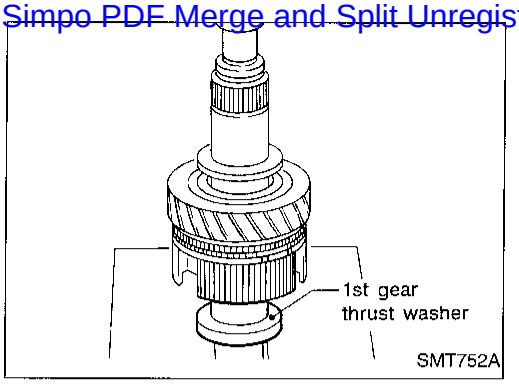


- 2nd double baulk ring type synchronizer (4WD model)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

- 3rd & 4th synchronizer
- **The three synchronizer gutters should be at the rear.**

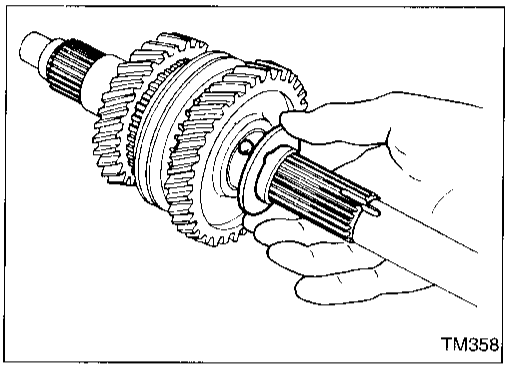
- Overdrive & reverse synchronizer



Gear Components (Cont'd)

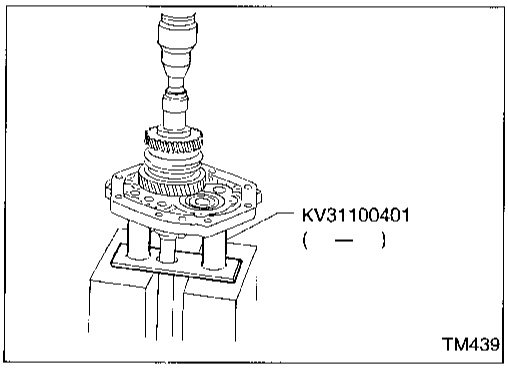
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

5. Assemble front side components to mainshaft.



a. Install 2nd main gear, needle bearing and 1st & 2nd synchronizer assembly; then press 1st gear bushing on mainshaft.

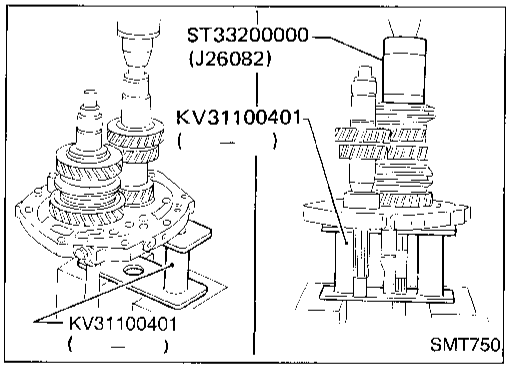
b. Install 1st main gear.



c. Install steel ball and 1st gear washer.

- **Before installation, apply multi-purpose grease to steel ball and to both sides of the 1st gear washer.**

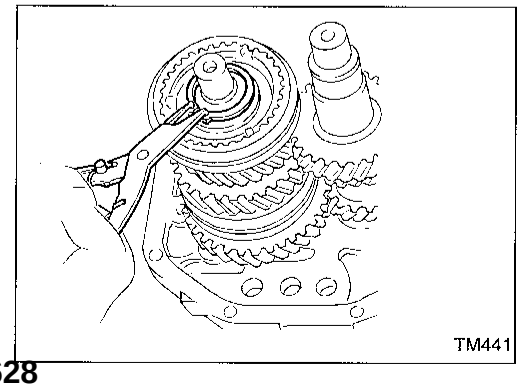
6. Install mainshaft and counter gear on adapter plate and main drive gear on mainshaft as follows:



a. Press mainshaft assembly into adapter plate using Tool.

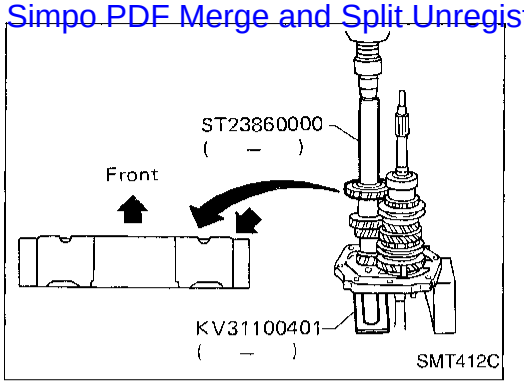
b. Press counter gear into adapter plate using Tool.

c. Install 3rd main gear and needle bearing, then press 3rd & 4th synchronizer assembly onto mainshaft.



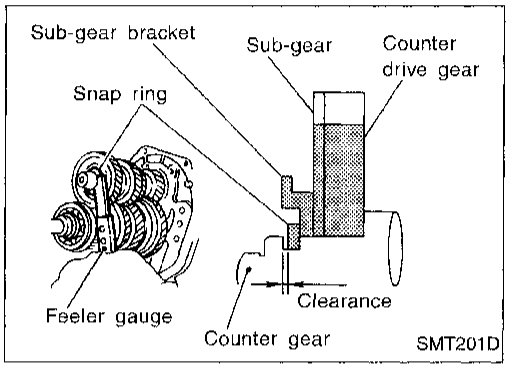
- **Pay attention to the direction of 3rd & 4th synchronizer.**

d. Install front mainshaft snap ring.
Select proper front mainshaft snap ring to achieve proper clearance of groove.



Allowable clearance of groove:
0 - 0.18 mm (0 - 0.0071 in)
Mainshaft front snap ring:
Refer to SDS, MT-32.

e. Apply gear oil to mainshaft pilot bearing and install it on mainshaft.

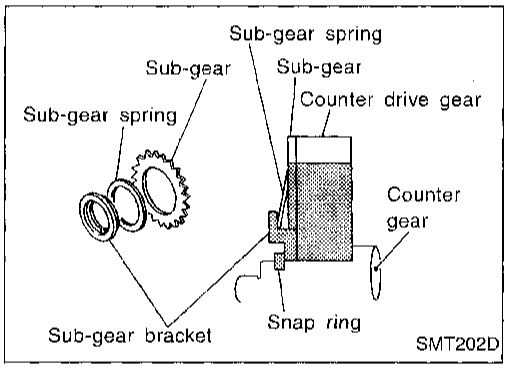


Gear Components (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

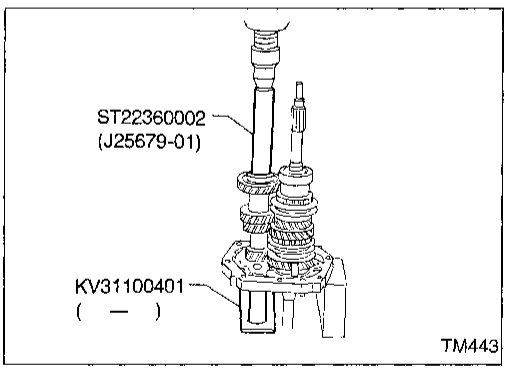
f. Press counter drive gear together with main drive gear using Tool.

- **Pay attention to the direction of counter drive gear.**



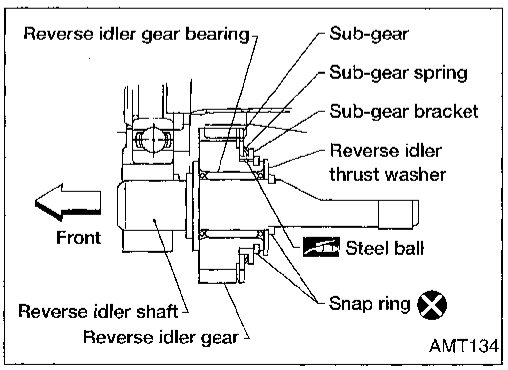
g. Install sub-gear components.

(1) Install sub-gear and sub-gear bracket on counter drive gear and then select proper snap ring that will minimize clearance of groove in counter gear.



- **Do not install sub-gear spring at this time.**

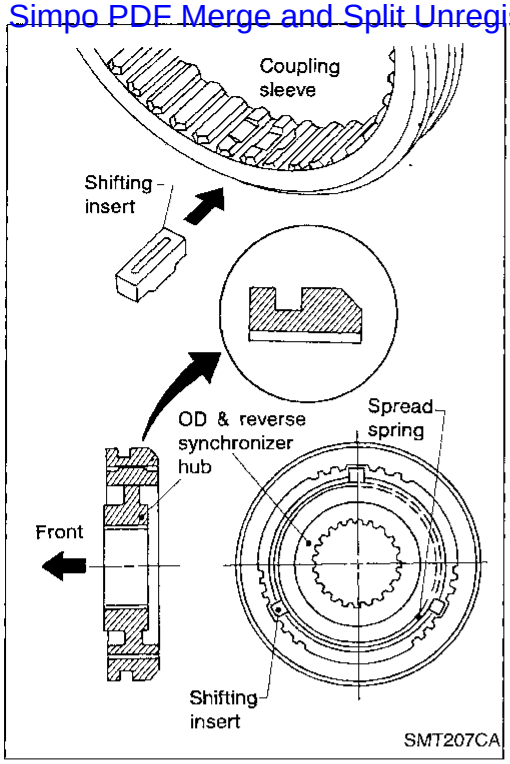
Allowable clearance of groove:
0 - 0.18 mm (0 - 0.0071 in)
Counter drive gear snap ring:
Refer to SDS, MT-32.



(2) Remove snap ring, sub-gear bracket and sub-gear from counter gear.

(3) Reinstall sub-gear, sub-gear spring, sub-gear bracket and snap ring.

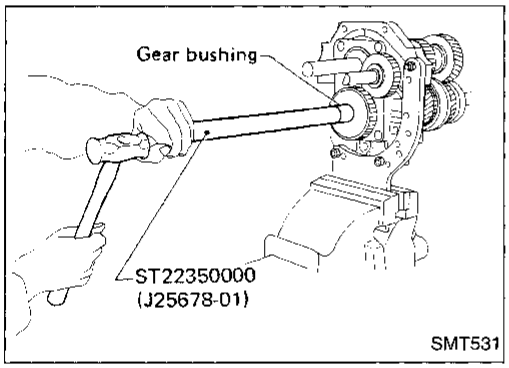
h. Press countergear front bearing onto counter gear using Tool.



7. Install rear side components on mainshaft and counter gear as follows:

a. Install sub-gear parts (sub-gear, sub-gear spring, sub-gear bracket, steel ball and snap ring) on the reverse idler gear.

b. Install reverse idler gear to reverse idler shaft along with reverse idler thrust washer, snap rings and reverse idler gear bearing.

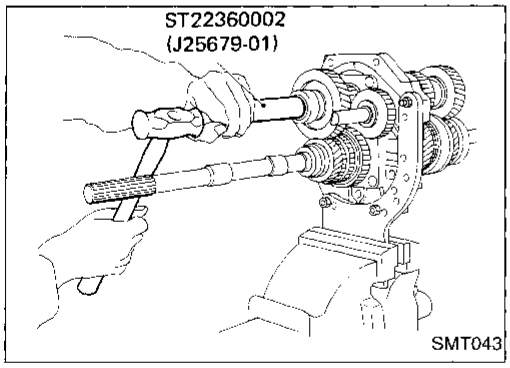


Gear Components (Cont'd)

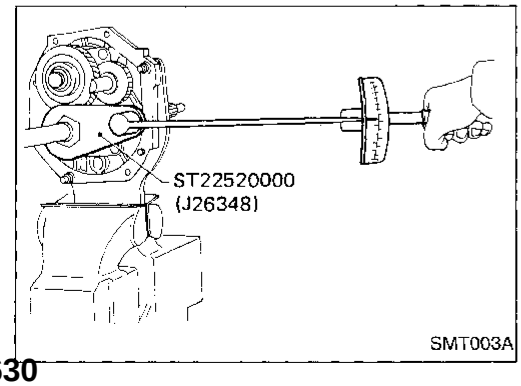
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

c. Install bushing, reverse main gear and overdrive & reverse synchronizer to mainshaft.

- **Pay attention to the direction of synchronizer hub.**



d. Install overdrive gear bushing to mainshaft using Tool.
e. Install overdrive main gear and needle bearing to mainshaft.
f. Install spacer, reverse counter gear and overdrive counter gear to countergear.



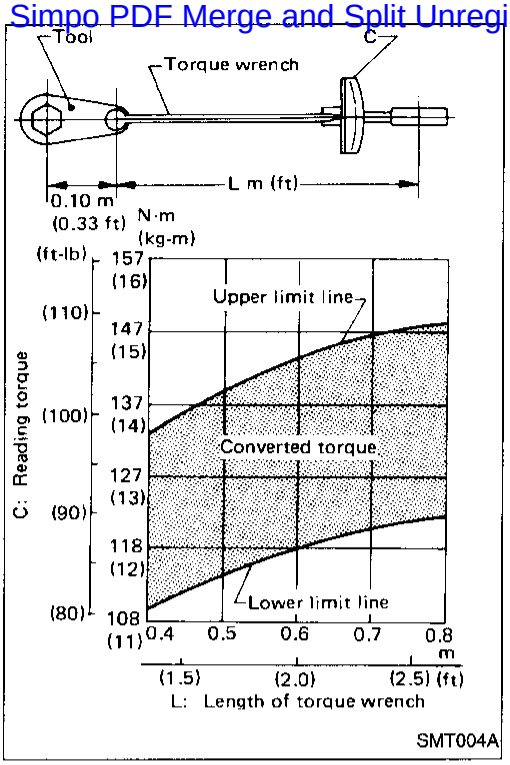
- **OD main gear and OD counter gear should be handled as a matched set.**

g. Install washer, roller bearing, steel roller and thrust washer.
h. Tighten mainshaft lock nut temporarily.

- **Always use new lock nut.**

i. Install countergear rear end bearing using Tool.

8. Mesh 2nd and reverse gears, then tighten mainshaft lock nut using Tool.



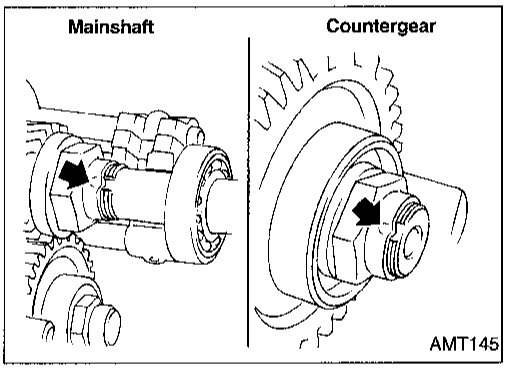
- **Always use new lock nut.**

  Mainshaft lock nut:

  : 137 - 167 N·m (14.0 - 17.0 kg-m, 101 - 123 ft-lb)

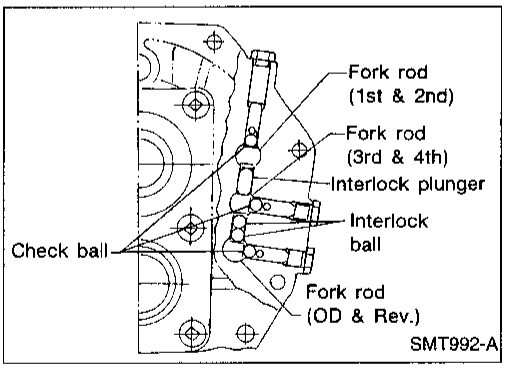
Gear Components (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



- Use the chart shown at left to determine the proper reading torque.
  (Length of torque wrench vs. setting or reading torque)
  Reference: Formula to convert torque wrench indication to the true torque value:

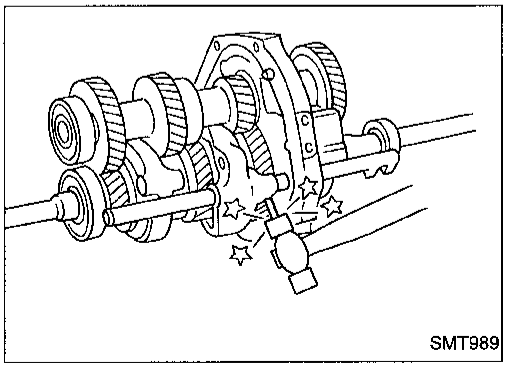
$$T = \frac{0.1\ \text{m}\ (0.33\ \text{ft}) + L}{L} \times C$$



If the specified torque is T kg-m (ft-lb), the torque wrench scale indication C is determined using the following formula.

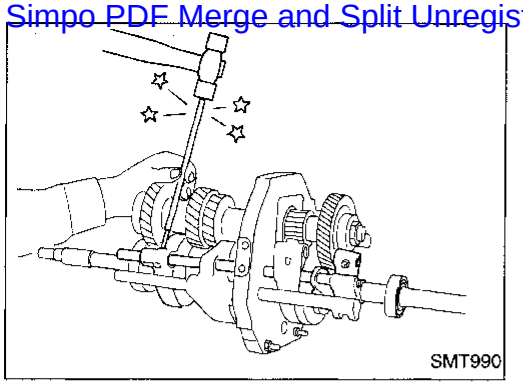
$$C = \frac{T \times L}{0.1\ \text{m}\ (0.33\ \text{ft}) + L}$$

9. Tighten counter gear lock nut.
- **Always use new lock nut.**
  Counter gear lock nut:
  : 98 - 127 N·m (10.0 - 13.0 kg-m, 72 - 94 ft-lb)

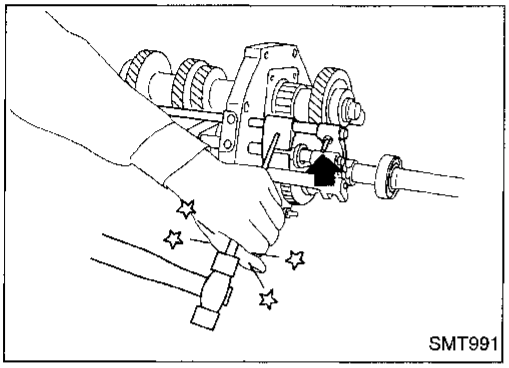


10. Stake mainshaft lock nut and counter gear lock nut using a punch.
11. Measure gear end play. Refer to "Gear Components", "DISASSEMBLY", MT-16.
12. Install snap ring and OD mainshaft bearing, then snap ring (2WD model only).
    Allowable clearance:
    0 - 0.14 mm (0 - 0.0055 in)
    OD mainshaft bearing snap ring:
    Refer to SDS, MT-32.

Shift Control Components



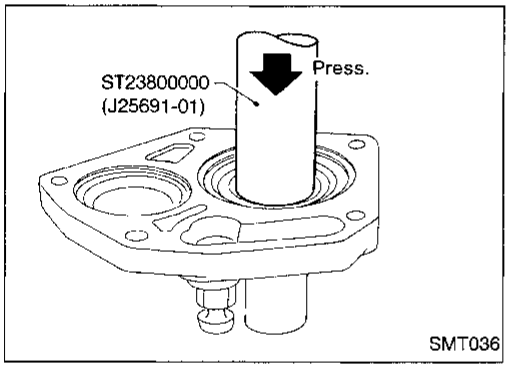
1. Install fork rods, interlock plunger, interlock balls and check balls.



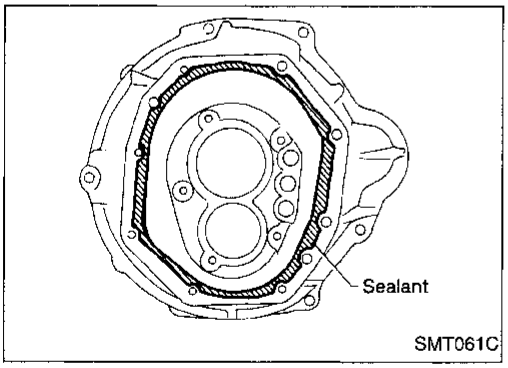
2. Install 1st & 2nd shift fork, then drive in retaining pin.

Shift Control Components (Cont'd)

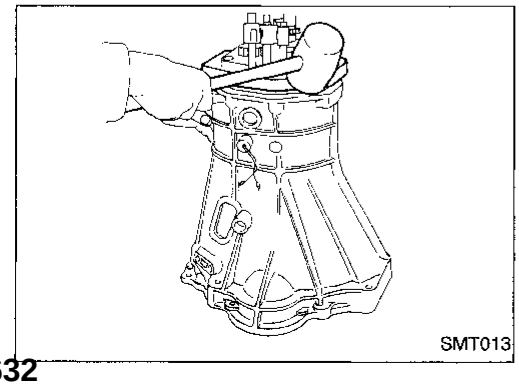
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



3. Install 3rd & 4th shift fork, then drive in retaining pin.

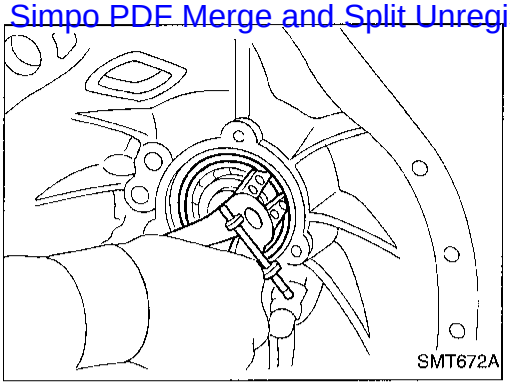


4. Install overdrive & reverse shift fork, then drive in retaining pin.

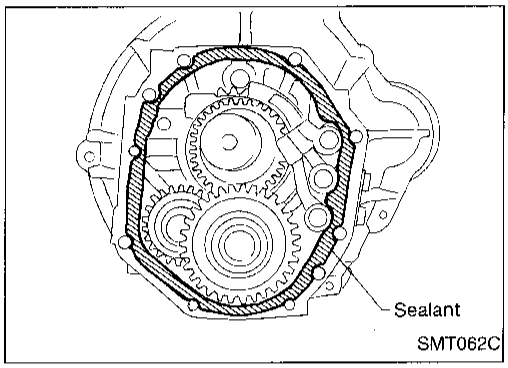


Case Components

1. Install front cover oil seal using Tool.
- **Apply multi-purpose grease to seal lip.**

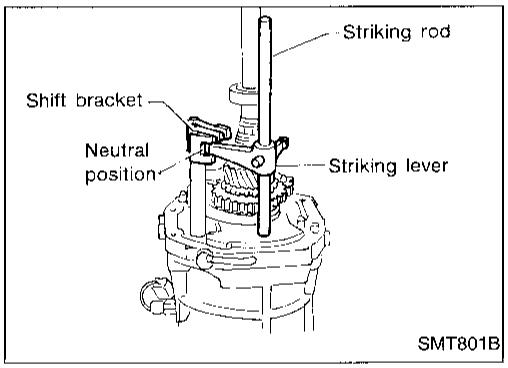


2. Apply sealant to mating surface of transmission case as shown at left.
- **Use genuine anaerobic liquid gasket, Three Bond TB1215, Loctite Part No. 51813 or equivalent.**

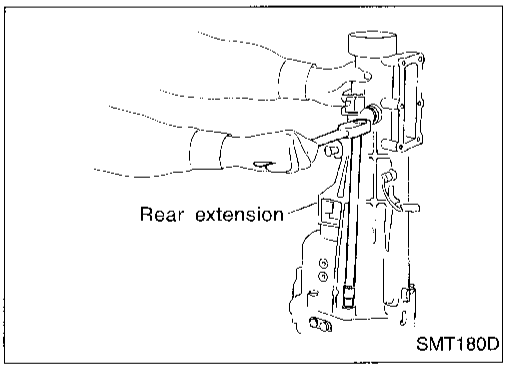


3. Slide gear assembly onto adapter plate by lightly tapping it using a soft hammer.

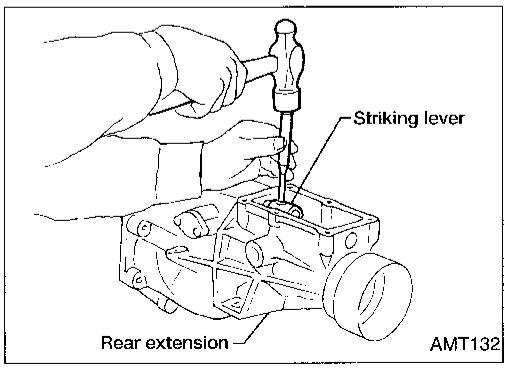
Case Components (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

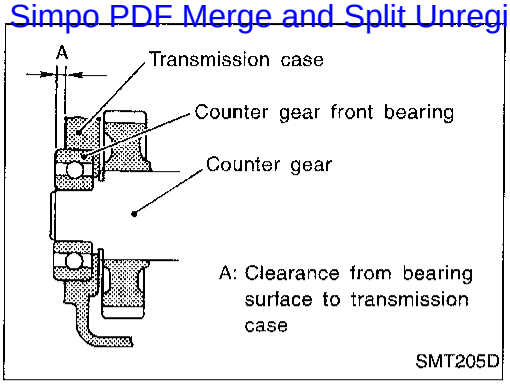


4. Install main drive gear ball bearing snap ring.

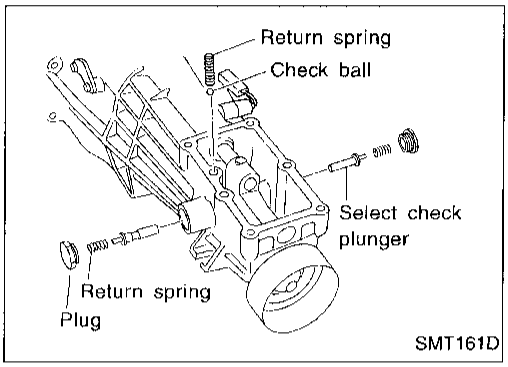


5. Apply sealant to mating surface of adapter plate as shown at left.
- **Use genuine anaerobic liquid gasket Three Bond TB1215, Loctite Part No. 51813 or equivalent.**

6. Place shift forks in neutral position.
7. Install striking lever and rod onto adapter plate and align striking lever with shift brackets.



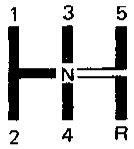
8. Install rear extension.
- Tighten mounting bolts equally in a criss-cross pattern.



9. Install striking lever retaining pin.

Case Components (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



10. Select counter gear front bearing shim.
    Allowable clearance (A) from bearing surface to transmission case:
    0 - 0.16 mm (0 - 0.0063 in)
    Countershaft front bearing shim:
    Refer to SDS, MT-33.
11. Install gasket and front cover.

12. Install return spring plugs, check ball, return springs and select check plungers.
13. Install control housing and gasket.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

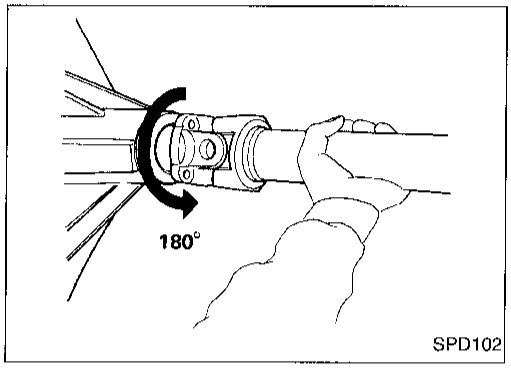
SPD728

On-vehicle Service

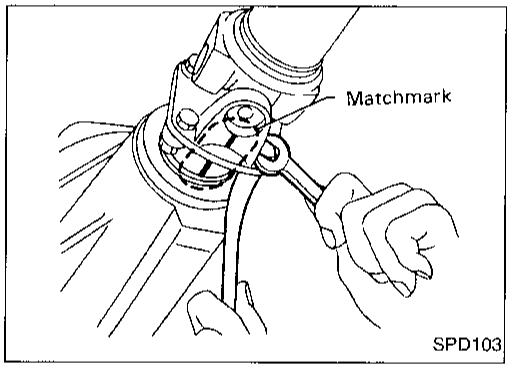


PROPELLER SHAFT VIBRATION

If vibration is present at high speed, inspect propeller shaft runout first.

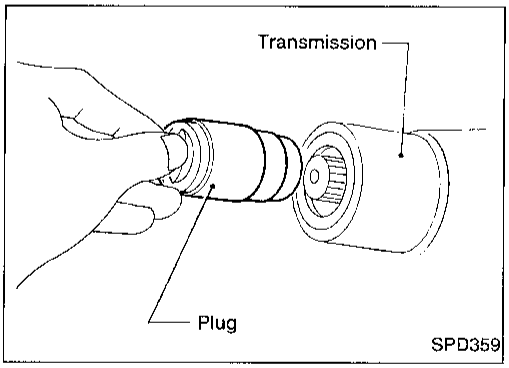
1. Raise rear end of vehicle until wheels are clear of the ground.
2. Measure propeller shaft runout at several points along propeller shaft by rotating final drive companion flange using hands.
3. If runout exceeds specifications, disconnect propeller shaft at final drive companion flange. Rotate companion flange 180 degrees, then reconnect propeller shaft.
   Runout limit: 0.6 mm (0.024 in)
4. Check runout again. If runout still exceeds the limit, replace propeller shaft assembly.
5. Perform road test.

APPEARANCE CHECKING



- Inspect propeller shaft tube surface for dents or cracks and replace as necessary.
- Check center bearing for noise or damage and replace as necessary.

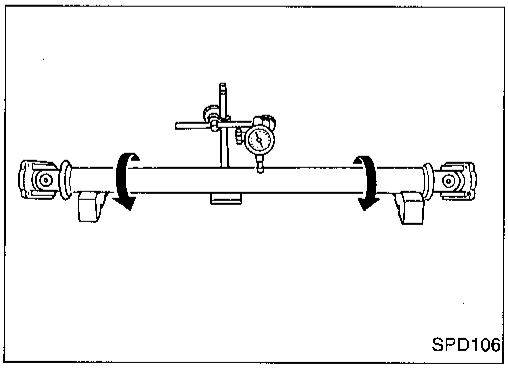
SPD102



Removal and Installation

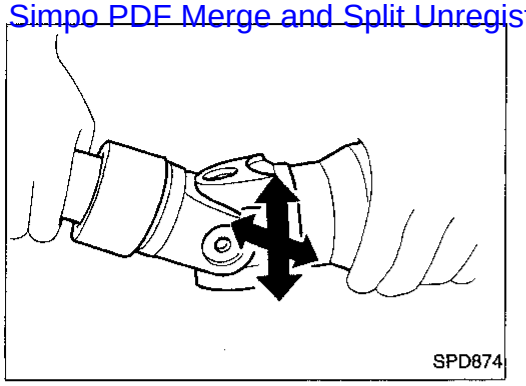
1. Place matching marks on flanges, then separate propeller shaft from final drive.

SPD103



2. Remove propeller shaft.
- **Insert plug into rear oil seal after removing rear propeller shaft.**

SPD359



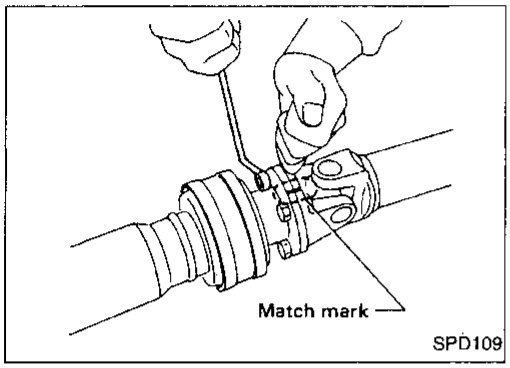
Inspection

- Inspect propeller shaft runout. If runout exceeds the limit, replace propeller shaft assembly.
  Runout limit: 0.6 mm (0.024 in)

SPD106

Inspection (Cont'd)

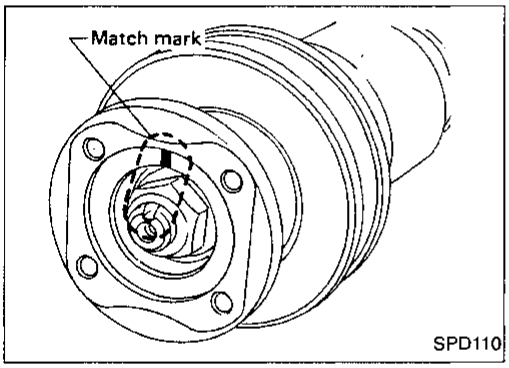
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



SPD874

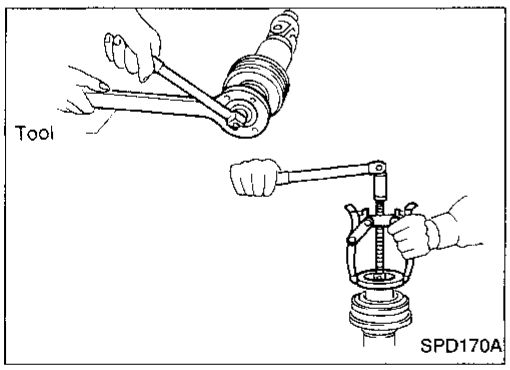
- Inspect journal axial play.
  If play exceeds the limit, replace propeller shaft assembly.
  Journal axial play:
  0.02 mm (0.0008 in) or less

Disassembly



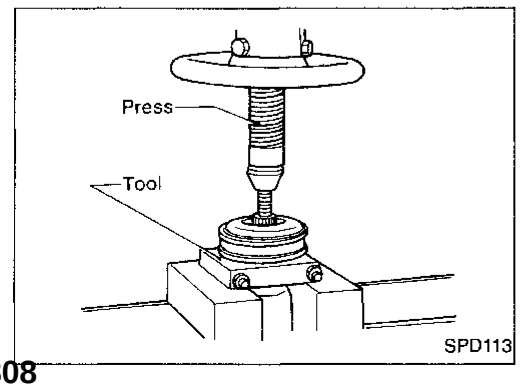
CENTER BEARING

1. Place matching marks on flanges, then separate 2nd tube from 1st tube.



SPD109

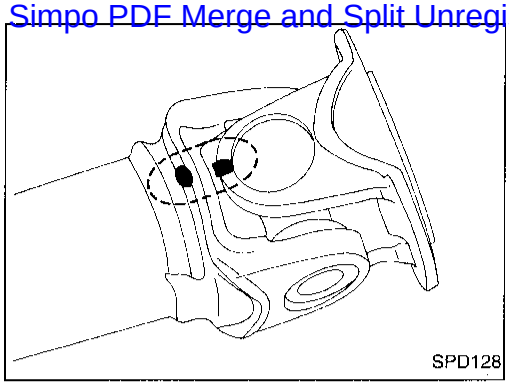
2. Place matching marks on the flange and shaft.



SPD110

3. Remove locking nut using Tool.
   Tool number:
   ST38060002 (J34311)
4. Remove companion flange using puller.

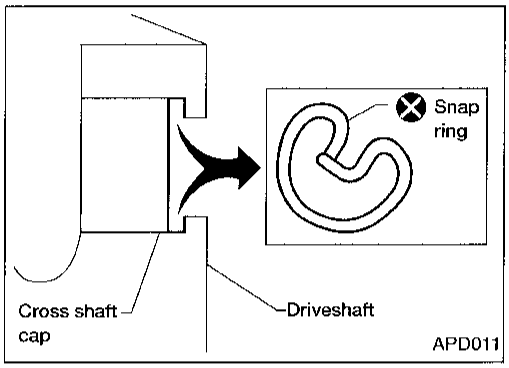
SPD170A



5. Remove center bearing using Tool and press.
   Tool number: ST30031000 (J22912-01)

SPD113

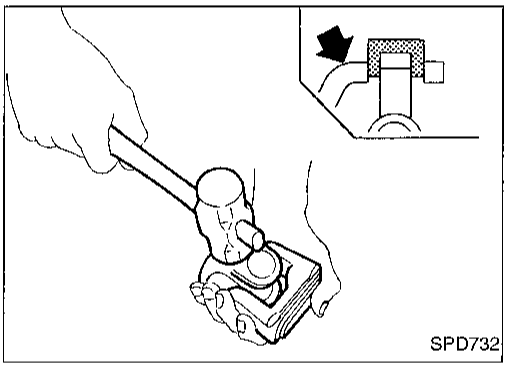
Disassembly (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

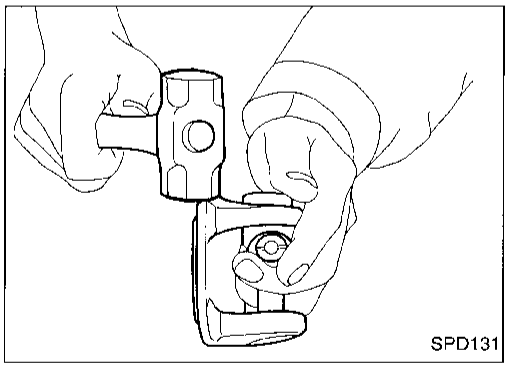
SPD128

JOURNAL



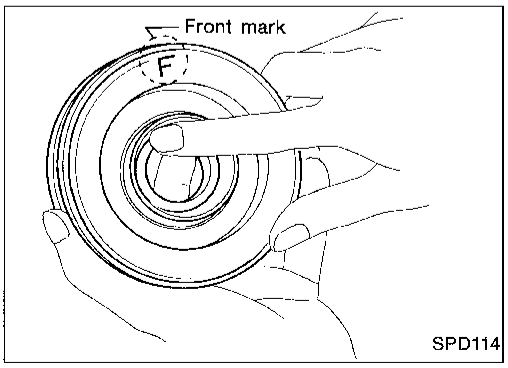
NOTE:

1. Place matching marks on propeller shaft and flange or yoke.



APD011

2. Remove snap ring.



SPD732

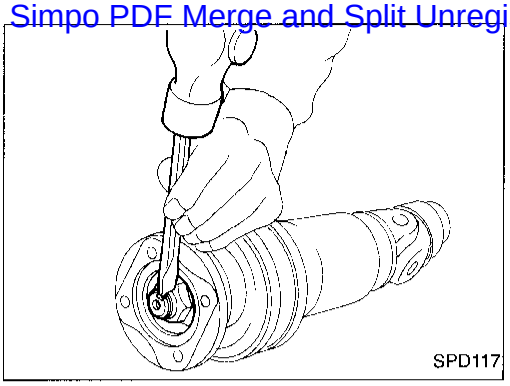
3. Remove pushed out journal bearing by lightly tapping yoke with a hammer, taking care not to damage journal and yoke hole.

SPD131

4. Remove bearing at opposite side in above operation.

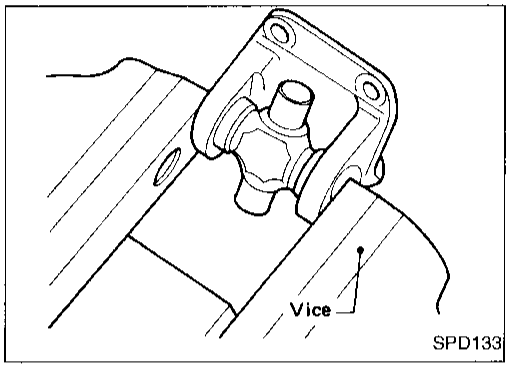
Put marks on disassembled parts so that they can be reinstalled in their original positions.

SPD114



Assembly

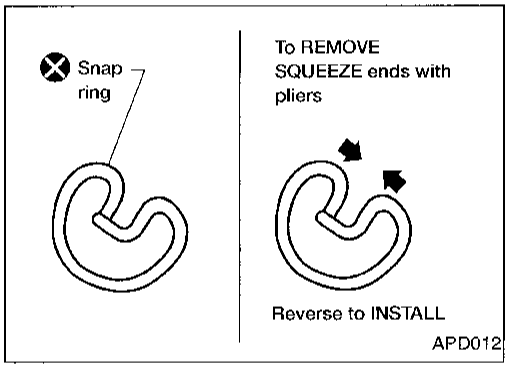
CENTER BEARING



- When installing center bearing, position the "F" mark on center bearing toward front of vehicle.
- **Apply a coat of multi-purpose lithium grease containing molybdenum disulfide to the end face of the center bearing and both sides of the washer.**

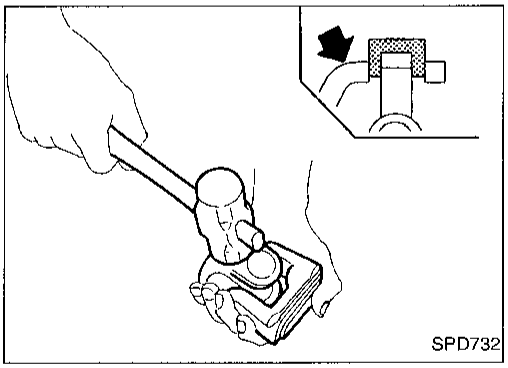
Assembly (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



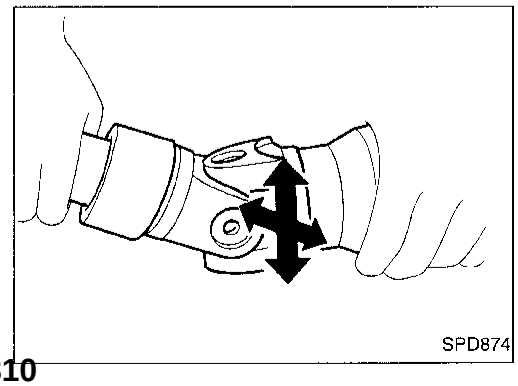
- Stake the nut. Always use new one.
- Align match marks when assembling tubes.

JOURNAL



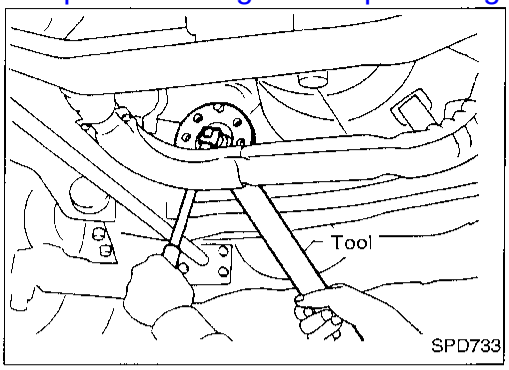
1. Assemble journal bearing. Apply recommended multi-purpose grease on bearing inner surface.

When assembling, be careful that needle bearing does not fall down.

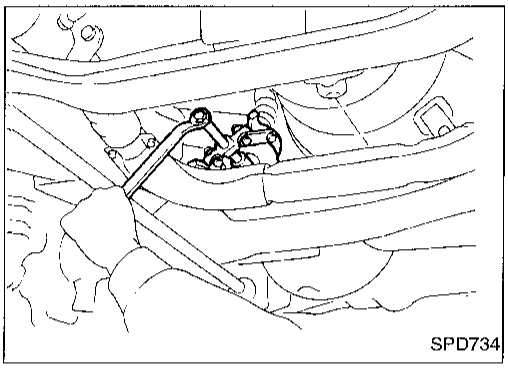


2. Select snap ring that will provide specified play in axial direction of journal, and install them.
   Refer to SDS, PD-69.

Select snap rings with a difference in thickness at both sides within 0.06 mm (0.0024 in).

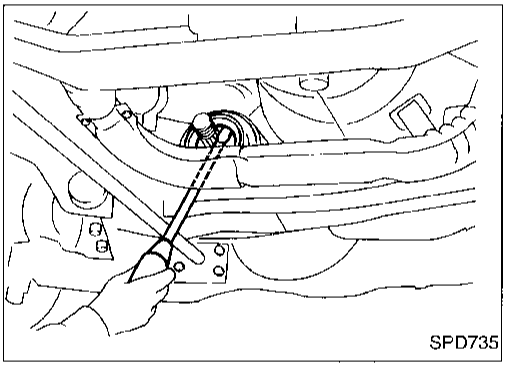


3. Adjust thrust clearance between bearing and snap ring to zero by tapping yoke.

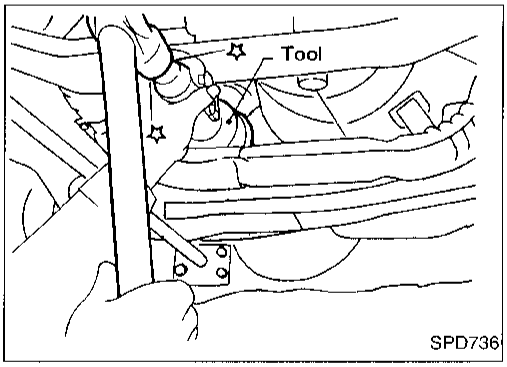


4. Check to see that journal moves smoothly and check for axial play.
   Axial play: 0.02 mm (0.0008 in) or less

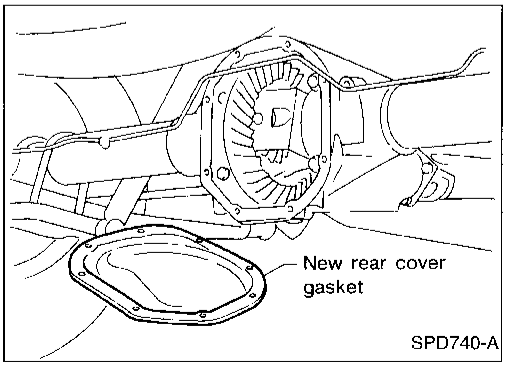
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Front Oil Seal Replacement (Front final drive: Model R180A)

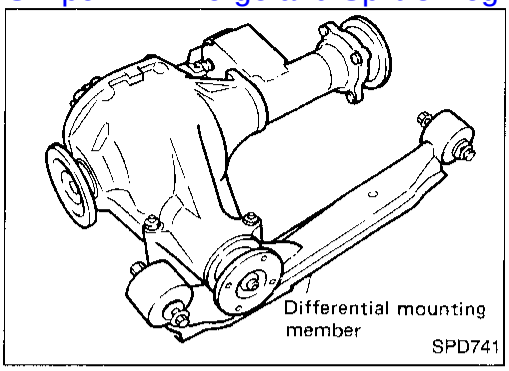


1. Remove front propeller shaft.
2. Loosen drive pinion nut.
   Tool number: ST38060002 (J34311)



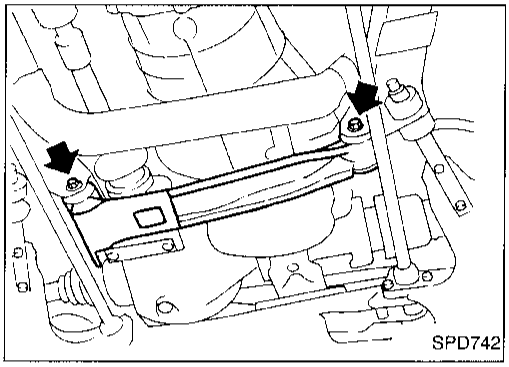
3. Remove companion flange using puller.

4. Remove front oil seal.



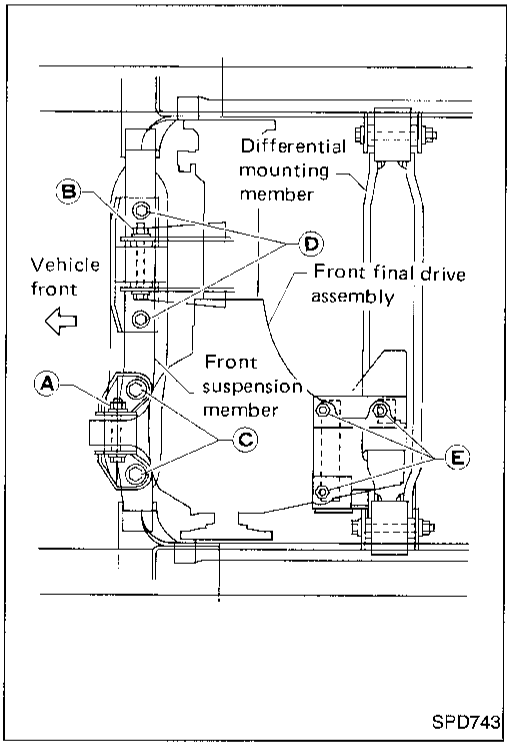
5. Apply multi-purpose grease to cavity at sealing lips of oil seal. Press front oil seal into carrier.
   Tool number:
   ST30720000 (J25405)
6. Install companion flange and drive pinion nut.
7. Install propeller shaft.

Rear Cover Gasket Replacement (Rear final drive: Model C200)



1. Drain gear oil.
2. Remove rear cover and rear cover gasket.
3. Install new rear cover gasket and rear cover.
4. Fill final drive with recommended gear oil.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Removal

1. Remove front propeller shaft.
2. Separate drive shaft from front final drive. Refer to FA section ["Drive Shaft", "FRONT AXLE (4WD)"].
3. Remove engine mounting bolts and raise up engine.
4. Remove front final drive together with differential mounting member.

Installation

1. Install front final drive assembly together with differential mounting member.

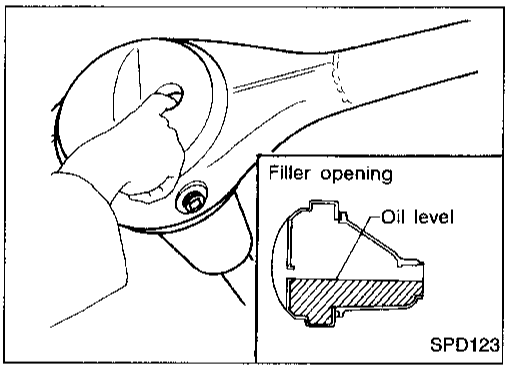
2. Tighten front final drive securing bolts and nuts by following the procedure to prevent drive train vibration.

a. Temporarily tighten nut Ⓐ.
b. Temporarily tighten nut Ⓑ.
c. Tighten bolt Ⓒ to the torque of 68 to 87 N·m (6.9 to 8.9 kg-m, 50 to 64 ft-lb).
d. Tighten bolt Ⓓ to the torque of 68 to 87 N·m (6.9 to 8.9 kg-m, 50 to 64 ft-lb).
e. Tighten nut Ⓐ to the torque of 68 to 87 N·m (6.9 to 8.9 kg-m, 50 to 64 ft-lb).
f. Tighten nut Ⓑ to the torque of 68 to 87 N·m (6.9 to 8.9 kg-m, 50 to 64 ft-lb).
g. Tighten nut Ⓔ to the torque of 68 to 87 N·m (6.9 to 8.9 kg-m, 50 to 64 ft-lb).

3. Install drive shaft. Refer to FA section ["Drive Shaft", "FRONT AXLE (4WD)"].
4. Install front propeller shaft.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Removal

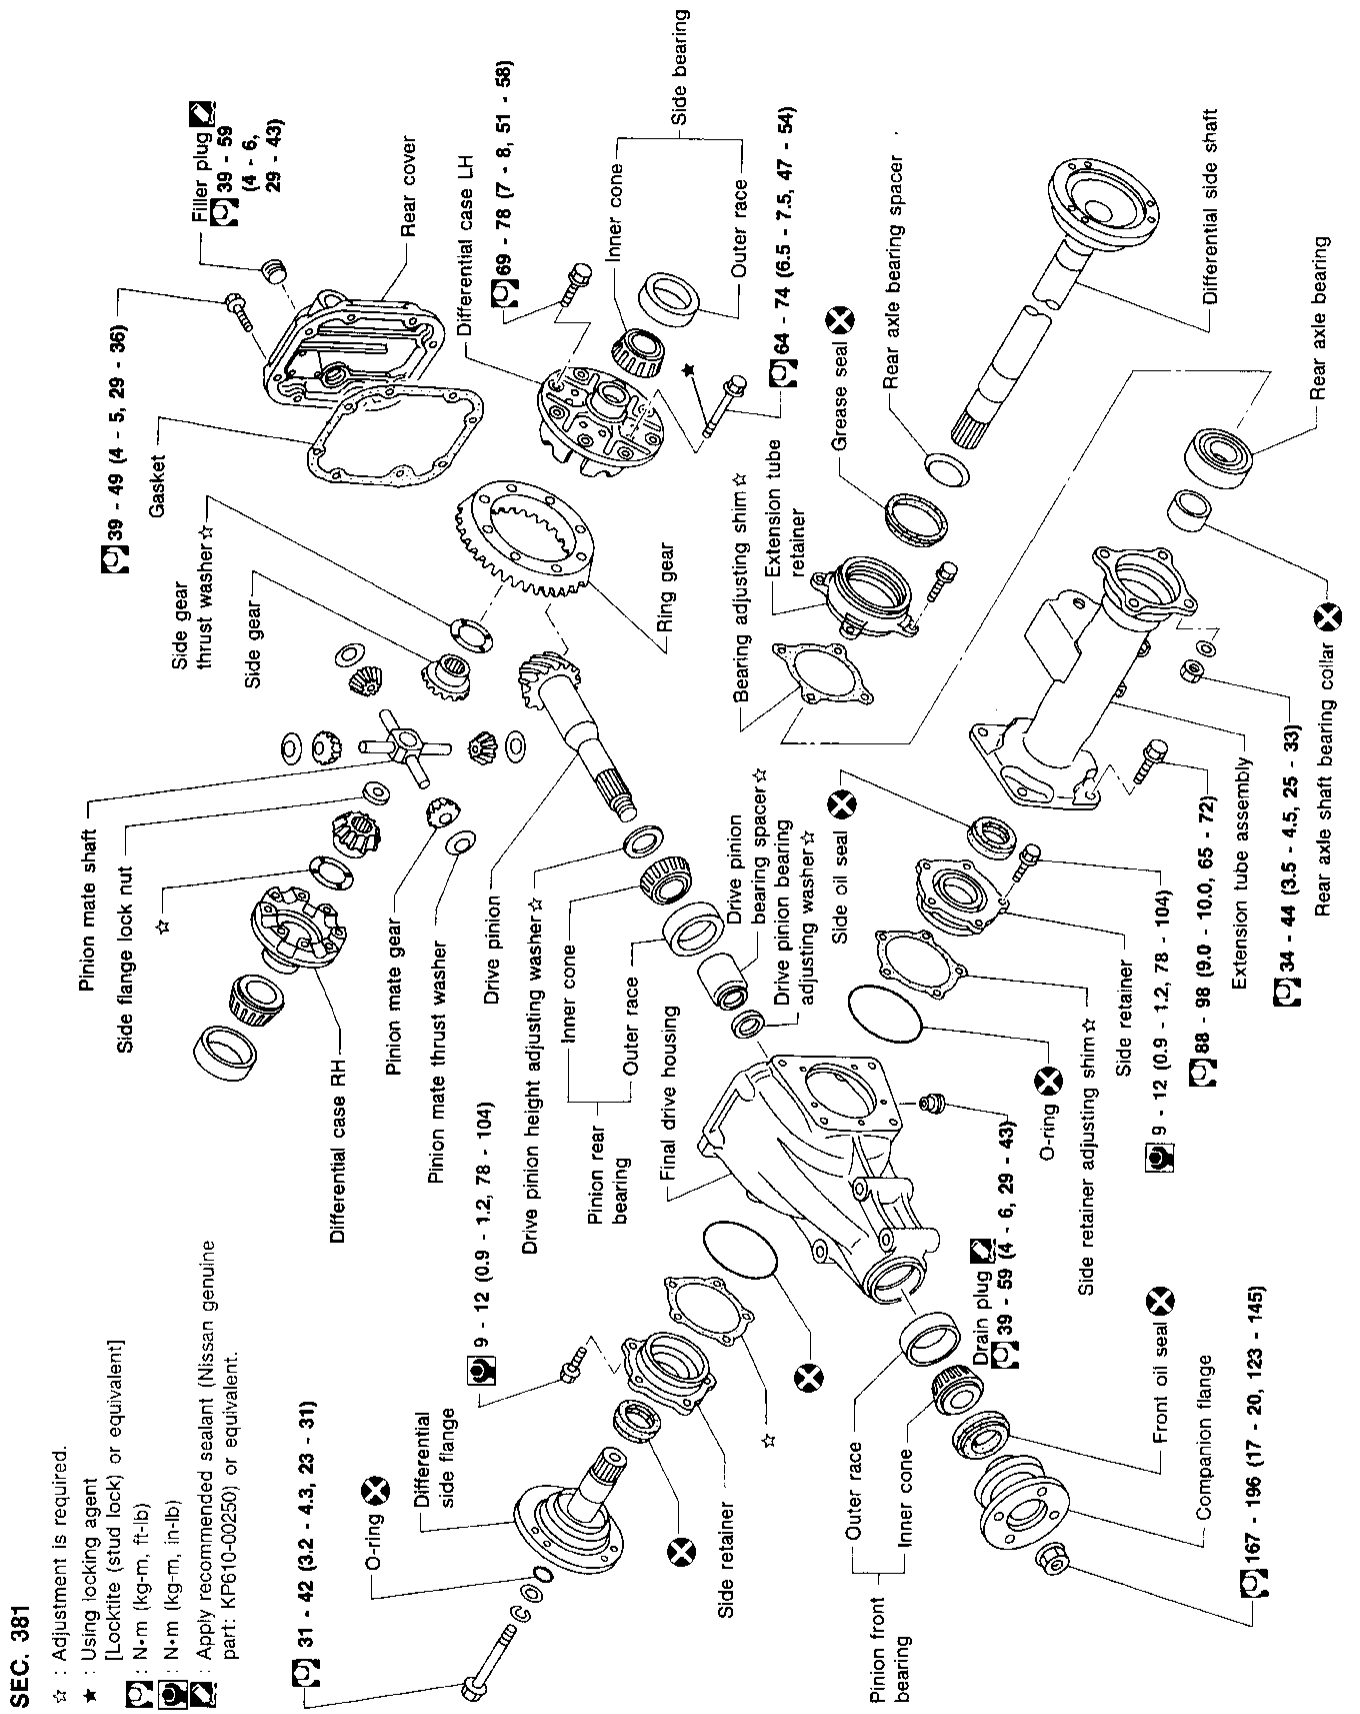


- Remove propeller shaft.

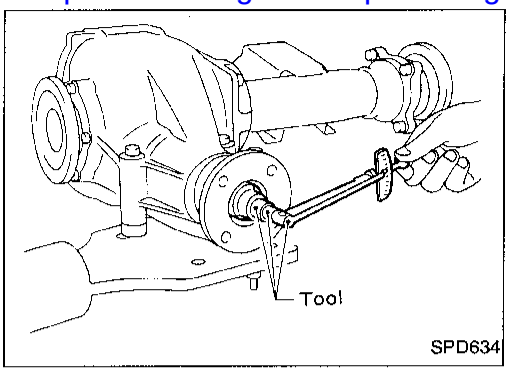
Plug front end of transfer.

- Remove axle shaft.
  Refer to RA section ("REAR AXLE").

CAUTION:



- **Be careful not to damage spline, sleeve yoke and front oil seal when removing propeller shaft.**
- **Before removing the final drive assembly or rear axle assembly, disconnect the ABS sensor harness connector from the assembly and move it away from the final drive/ rear axle assembly area. Failure to do so may result in the sensor wires being damaged and the sensor becoming inoperative.**



Installation

- Fill final drive with recommended gear oil.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

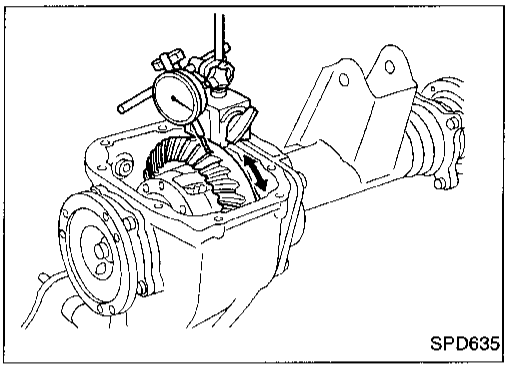
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Pre-inspection

Before disassembling final drive, perform the following inspection.

- Total preload

a. Turn drive pinion in both directions several times to set bearing rollers.



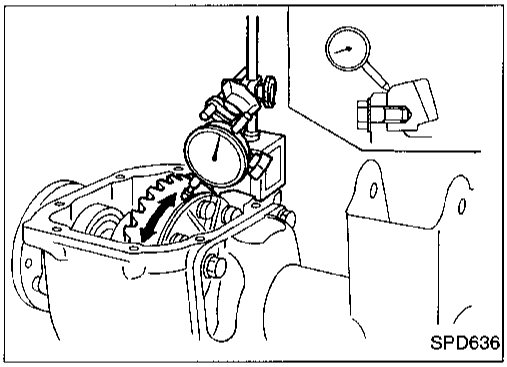
b. Check total preload with Tool.

Tool number: ST3127S000 (J25765-A)

Total preload:

1.2 - 2.3 N·m

(12 - 23 kg-cm, 10 - 20 in-lb)



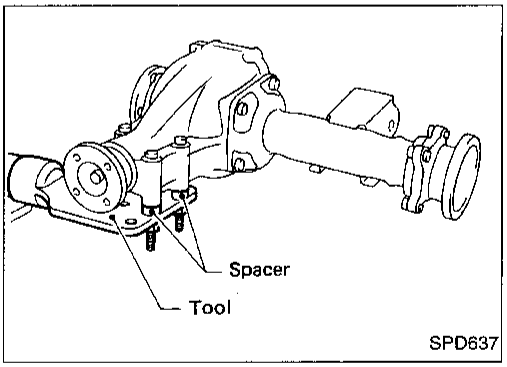
- Ring gear-to-drive pinion backlash

Check backlash of ring gear with a dial indicator at several points.

Ring gear-to-drive pinion backlash:

0.13 - 0.18 mm (0.0051 - 0.0071 in)

- Ring gear runout



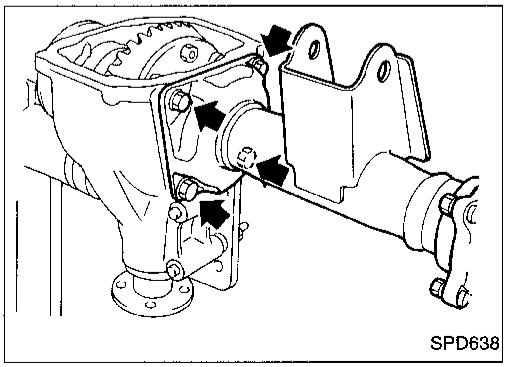
Check runout of ring gear with a dial indicator.

Runout limit:

0.05 mm (0.0020 in)

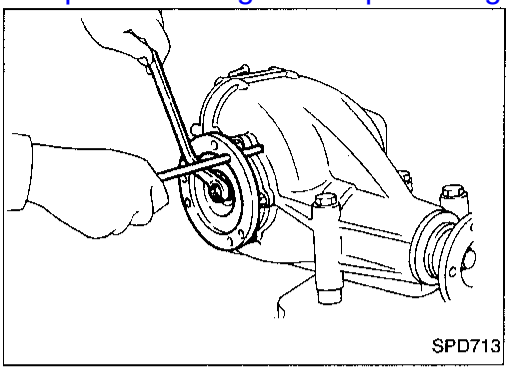
- Tooth contact

Check tooth contact. Refer to "ADJUSTMENT", PD-28.



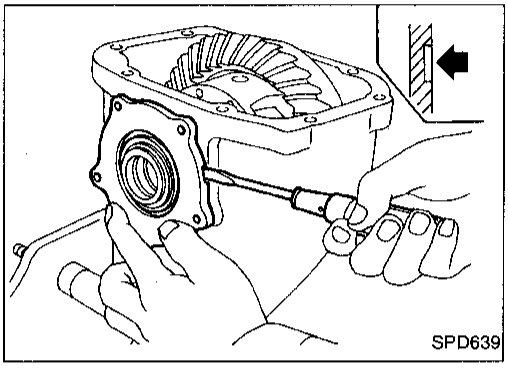
Final Drive Housing

1. Using three spacers [20 mm (0.79 in)], mount final drive assembly on Tool.



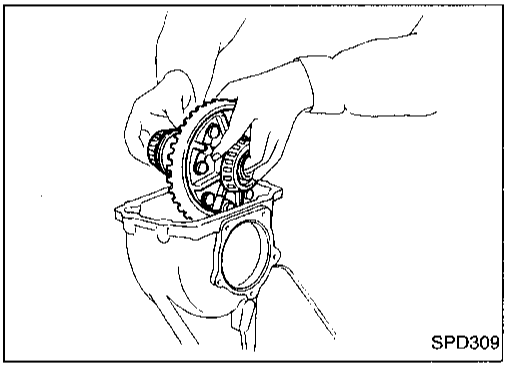
Tool number:

KV38100800 (J34310), (J25604-01)



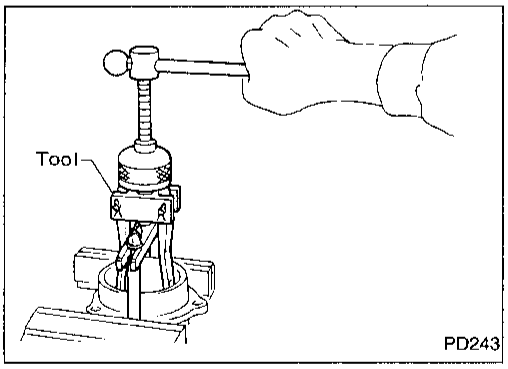
2. Remove extension tube and differential side shaft assembly.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



SPD713

3. Remove differential side flange.



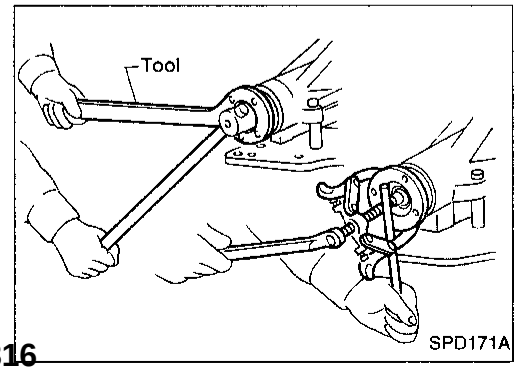
SPD639

4. Mark side retainers for identification. Remove side retainers.

Be careful not to confuse right and left side retainers and shims.

SPD309

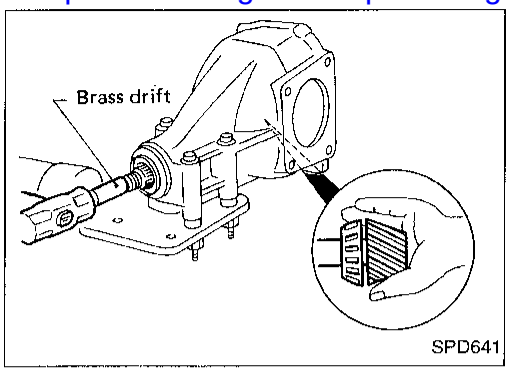
5. Extract differential case from final drive housing.



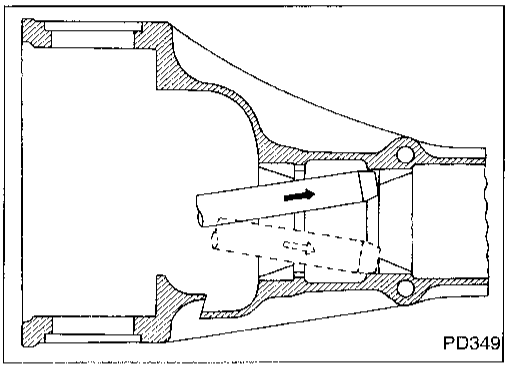
PD243

6. Remove side outer races.
   Tool number: ST33290001 (J25810-A)

Keep the side bearing outer races together with their respective inner cones — do not mix them up.

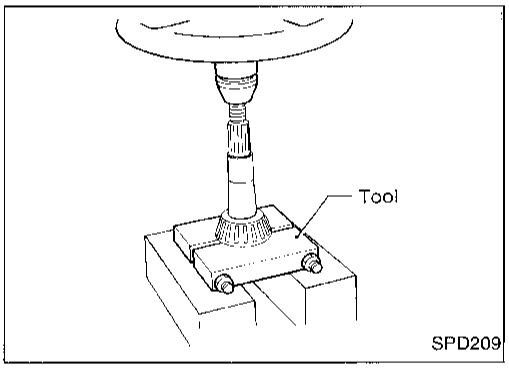


7. Remove side oil seal.



SPD171A

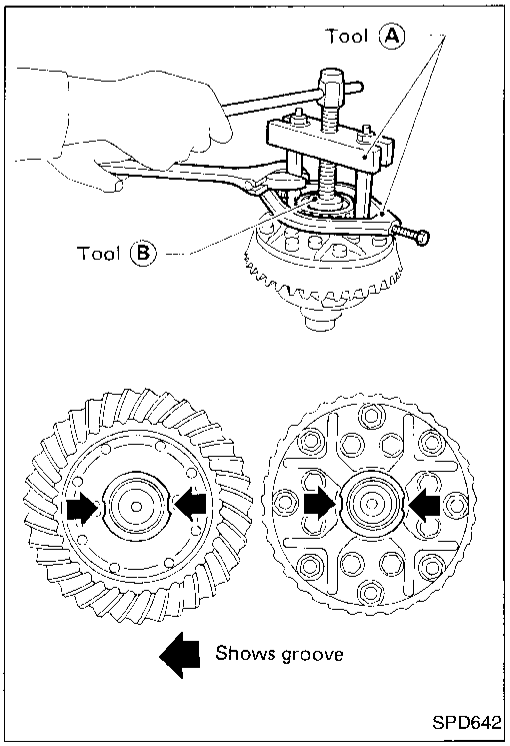
8. Loosen drive pinion nut.
   Tool number: ST38060002 (J34311)
9. Remove companion flange with puller.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

10. Take out drive pinion together with pinion rear bearing inner cone, drive pinion bearing spacer and pinion bearing adjusting washer.
11. Remove front oil seal and pinion front bearing inner cone.

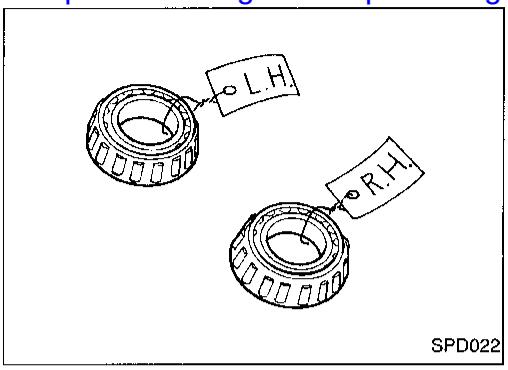
12. Remove pinion front and rear bearing outer races with brass drift.



13. Remove pinion rear bearing inner cone and drive pinion adjusting washer.
    Tool number: ST30031000 (J22912-01)

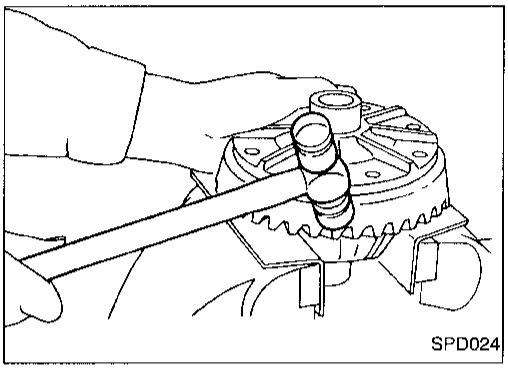
Differential Case

1. Remove side bearing inner cones.



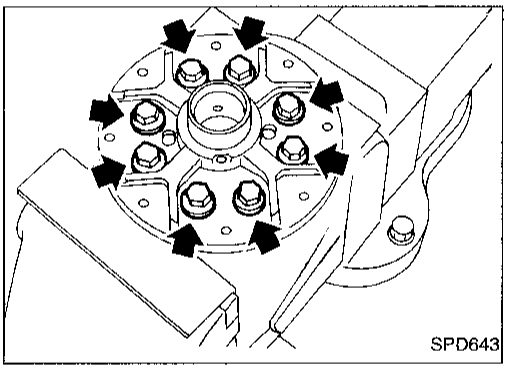
To prevent damage to bearing, engage puller jaws in grooves.

Tool numbers:
Ⓐ ST33051001 (J22888-20)
Ⓑ ST33061000 (J8107-2)



Differential Case (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

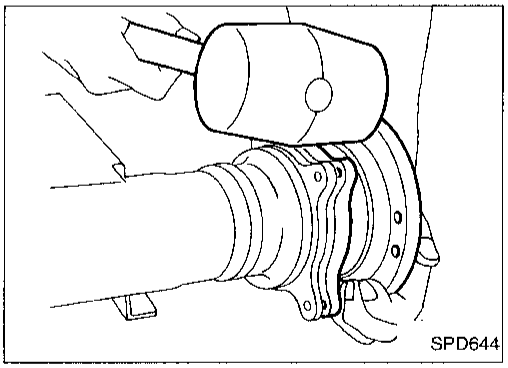


SPD022

Be careful not to confuse the right and left hand parts.

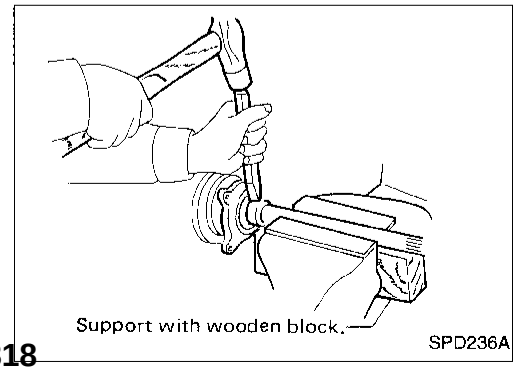
SPD024

2. Loosen ring gear bolts in a criss-cross fashion.
3. Tap ring gear off differential case with a soft hammer.



Tap evenly all around to keep ring gear from binding.

SPD643



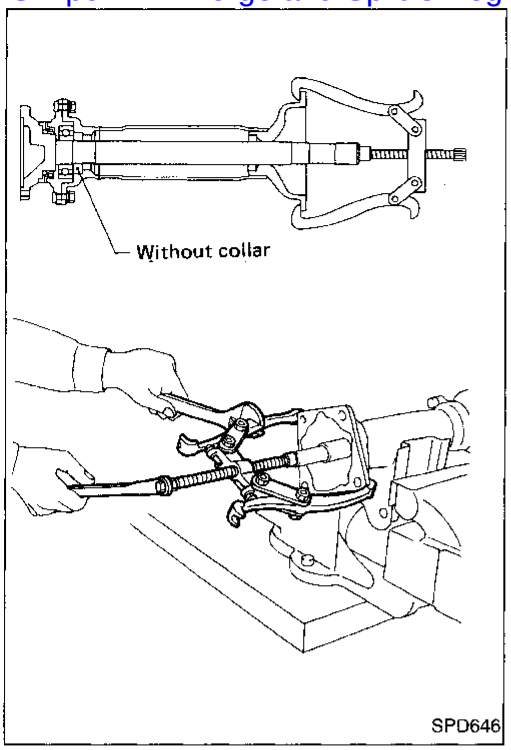
4. Separate differential case LH and RH.

Put match marks on both differential case LH and RH sides prior to separating them.

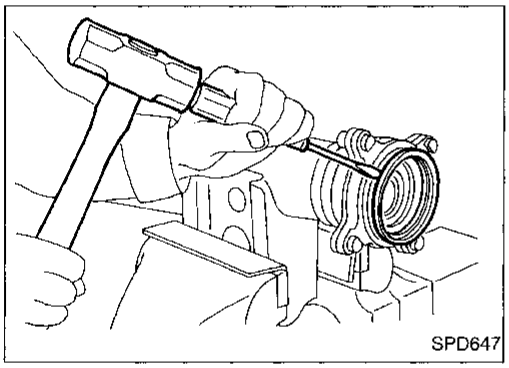
Extension Tube and Differential Side Shaft

SPD644

1. Remove differential side shaft assembly from extension tube.



SPD236A

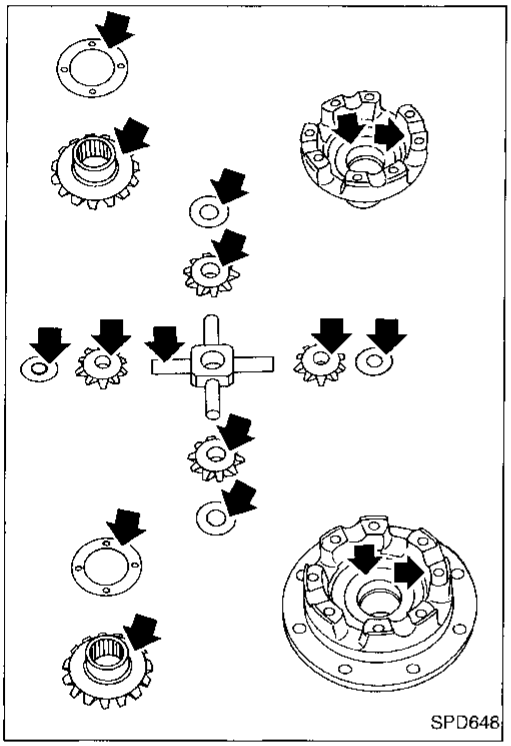


2. Cut rear axle bearing collar with cold chisel. Be careful not to damage differential side shaft.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

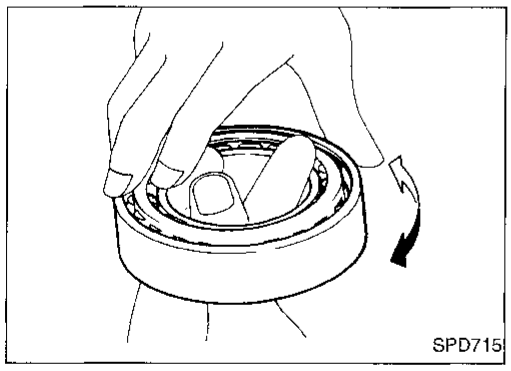
Extension Tube and Differential Side Shaft (Cont'd)

3. Reinstall differential side shaft into extension tube and secure with bolts. Remove rear axle bearing by drawing out differential side shaft from rear axle bearing with puller.



4. Remove grease seal.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Ring Gear and Drive Pinion

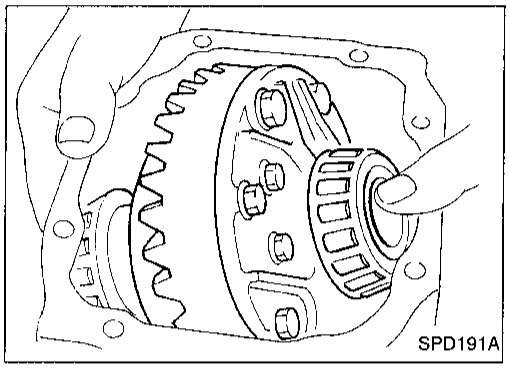
Check gear teeth for scoring, cracking or chipping.
If any damaged part is evident, replace ring gear and drive pinion as a set (hypoid gear set).

SPD648

Differential Case Assembly

Check mating surfaces of differential case, side gears, pinion mate gears, pinion mate shaft and thrust washers.

SPD715

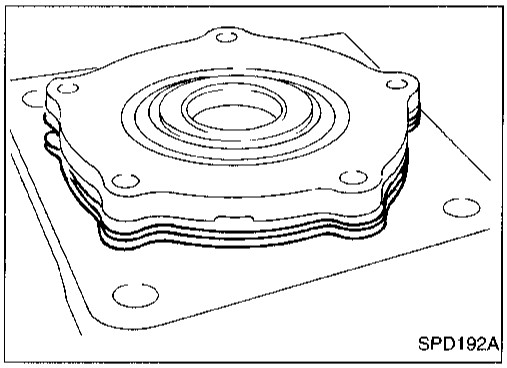


Bearing

1. Thoroughly clean bearing.
2. Check bearing for wear, scratches, pitting or flaking.
   Check tapered roller bearing for smooth rotation. If damaged, replace outer race and inner cone as a set.

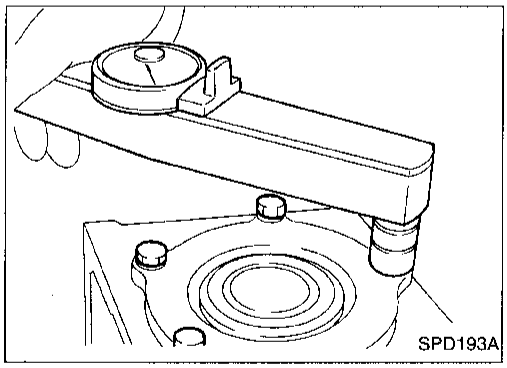
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

For quiet and reliable final drive operation, the following five adjustments must be made correctly:



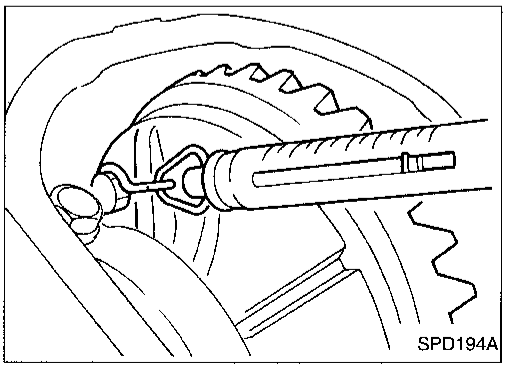
1. Side bearing preload
2. Pinion gear height
3. Pinion bearing preload
4. Ring gear-to-pinion backlash. Refer to "ASSEMBLY", PD-32.
5. Ring and pinion gear tooth contact pattern.

SPD191A



Side Bearing Preload

A selection of carrier side retainer adjusting shims is required for successful completion of this procedure.



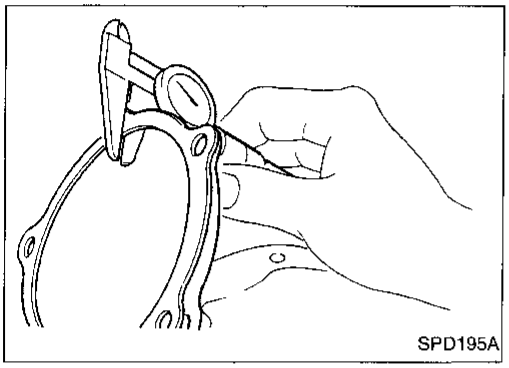
1. Make sure all parts are clean. Also make sure the bearings are well lubricated with light oil or type "DEXRON™" automatic transmission fluid.
2. Install differential carrier and side bearing assembly into the final drive housing.

SPD192A

3. Place all of the original side retainer adjusting shims onto the side bearing retainer that goes at the ring gear end of the carrier.

SPD193A

4. Install both bearing retainers onto the final drive housing and torque the retainer bolts.
   Bolt torque specification:
   : 9 - 12 N·m (0.9 - 1.2 kg-m, 78 - 104 in-lb)

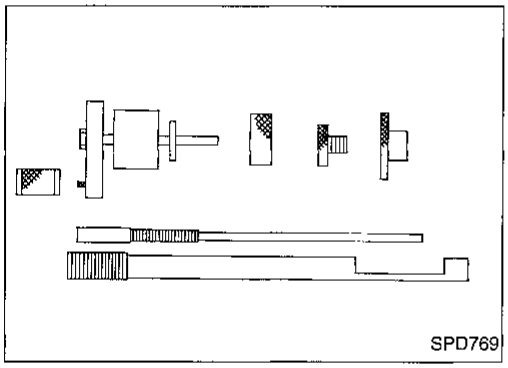


SPD194A

5. Turn the carrier several times to seat the bearings.
6. Measure the carrier turning torque with a spring gauge, J8129, at the ring gear retainer bolt.
   Turning torque specification:
   34.3 - 39.2 N (3.5 - 4.0 kg, 7.7 - 8.8 lb) of pulling force at the ring gear bolt

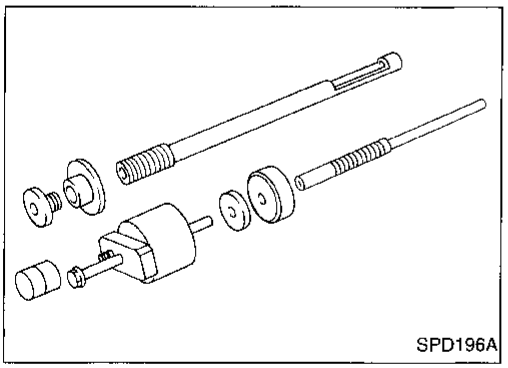
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Side Bearing Preload (Cont'd)



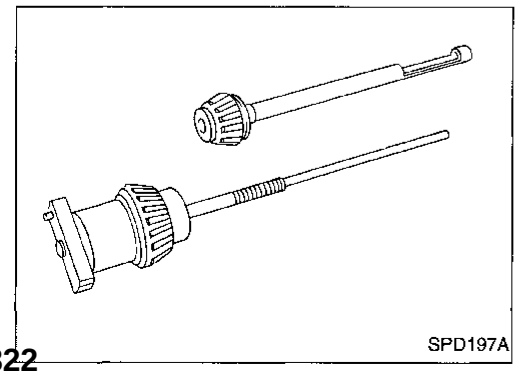
7. If the turning torque measured is incorrect, establish the correct bearing preload by adding to or subtracting from the total amount of shim thickness.
- Increase shim thickness to decrease turning torque on the carrier.
- Decrease shim thickness to increase turning torque on the carrier.

SPD195A



8. Record the correct, selected total thickness of the side retainer adjusting shims, and remove the carrier and bearings from the final drive housing. Save all shims for later re-use.

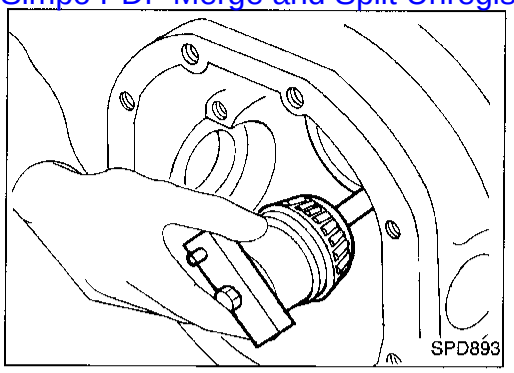
Pinion Gear Height and Pinion Bearing Preload



1. Make sure all parts are clean and that the bearings are well lubricated.
2. Assemble the pinion gear bearings into the pinion pre-load shim selector tool, J34309.

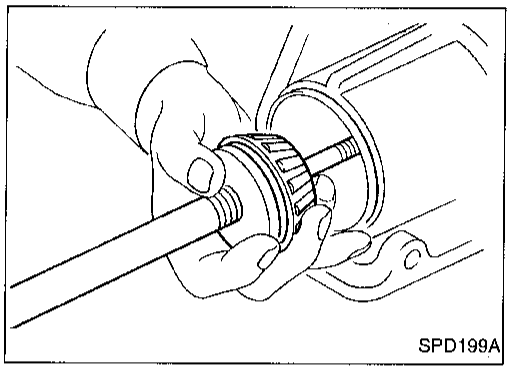
SPD769

- **Front Pinion Bearing** — make sure the J34309-3 front pinion bearing seat is secured tightly against the J34309-2 gauge anvil. Then turn the front pinion bearing pilot, J34309-7, to secure the bearing in its proper position.



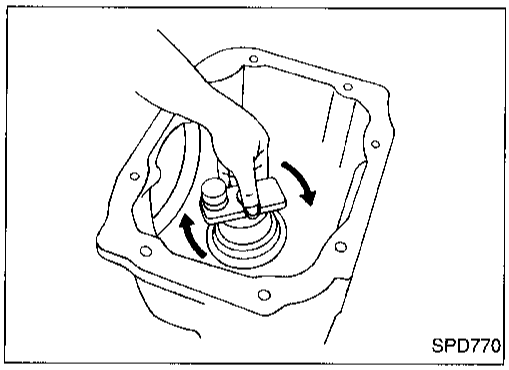
SPD196A

- **Rear Pinion Bearing** — the rear pinion bearing pilot, J34309-8, is used to center the rear pinion bearing only. The rear pinion bearing locking seat, J34309-4, is used to lock the bearing to the assembly.

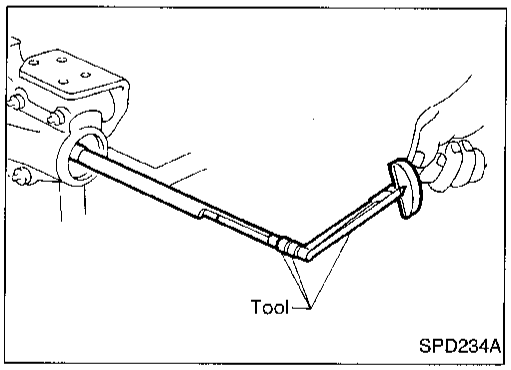


SPD197A

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

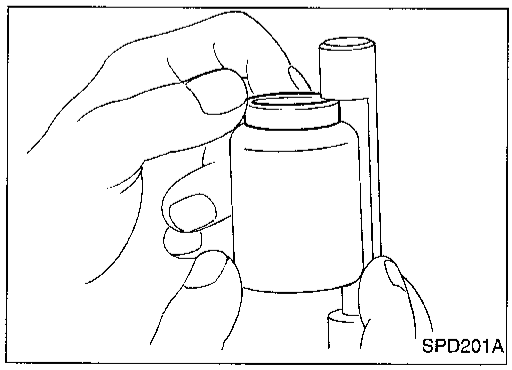


Pinion Gear Height and Pinion Bearing Preload (Cont'd)



3. Place the pinion preload shim selector tool gauge screw, J34309-1, with the pinion rear bearing inner cone installed, into the final drive housing.

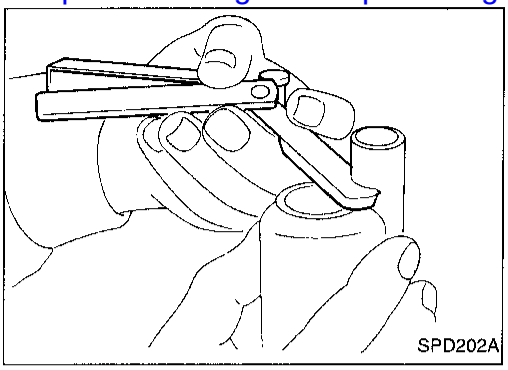
4. Install the J34309-2 gauge anvil with the front pinion bearing into the final drive housing and assemble it to the J34309-1 gauge screw. Make sure that the J34309-16 gauge plate will turn a full 360 degrees, and tighten the two sections by hand.



5. Turn the assembly several times to seat the bearings.

6. Measure the turning torque at the end of the J34309-2 shaft using Tool.
   Tool number: ST3127S000 (J25765-A)
   Turning torque specification:
   0.6 - 1.0 N·m (6 - 10 kg-cm, 5.2 - 8.7 in-lb)
7. Place the J34309-10 "R180A" pinion height adapter onto the gauge plate and tighten it by hand.

CAUTION:
Make sure all machined surfaces are clean.

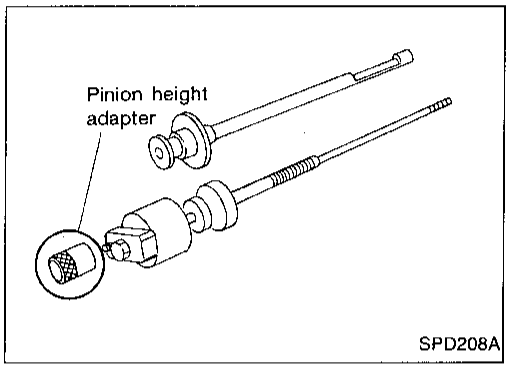


PINION BEARING PRELOAD WASHER SELECTION

8. Place the solid pinion bearing adjusting spacer squarely into the recessed portion of the J34309-2 gauge anvil.

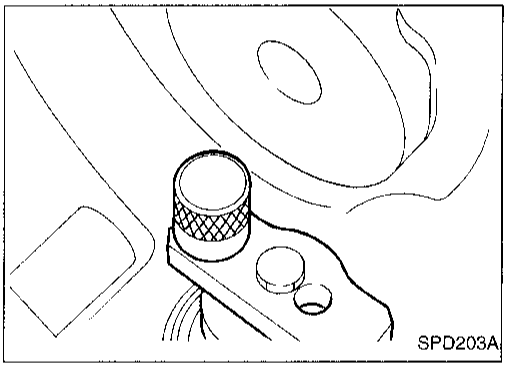
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Pinion Gear Height and Pinion Bearing Preload (Cont'd)



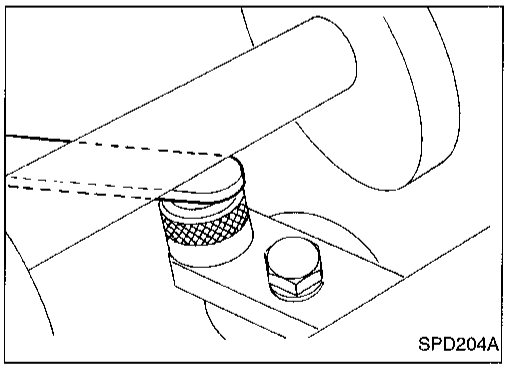
SPD202A

9. Select the correct thickness of pinion bearing preload adjusting washer using a standard gauge of 6 mm (0.24 in) and J34309-101 feeler gauge. The exact total measure you get with the gauges is the thickness of the adjusting washer required. Select the correct washer.
   Drive pinion bearing adjusting washer:
   Refer to SDS, PD-71.
10. Set the selected pinion bearing preload adjusting washer aside for use when assembling the pinion and bearings into the final drive housing.

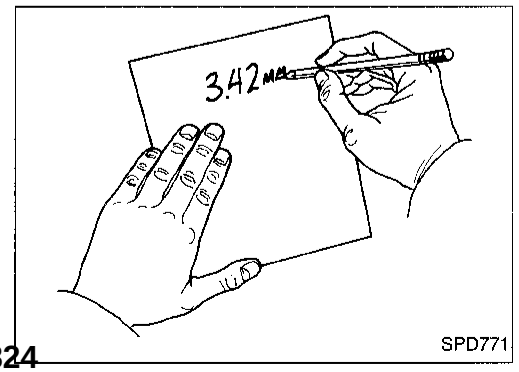


PINION HEIGHT ADJUSTING WASHER SELECTION

11. Place the J34309-10 pinion height adapter onto the gauge plate and tighten by hand.



CAUTION:
Make sure all machined surfaces are clean.



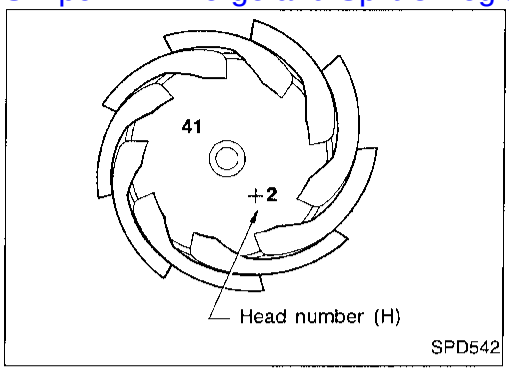
SPD208A

SPD203A

12. Position firmly the side bearing discs, J25269-4, and arbor into the side bearing bores.

SPD204A

13. Select the correct standard pinion height adjusting washer thickness using a standard gauge of 3 mm (0.12 in) and J34309-101 feeler gauge. Measure the distance between the J34309-10 "R180A" pinion height adapter and the arbor.

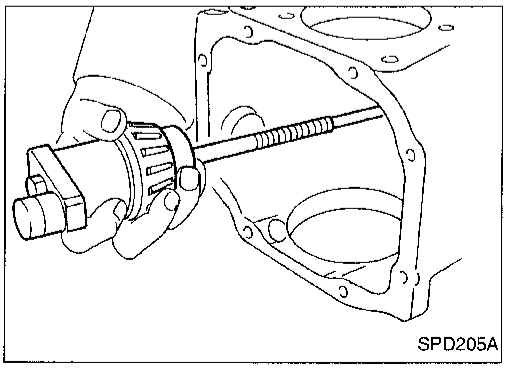


SPD771

14. Write down your exact total measurement.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Pinion Gear Height and Pinion Bearing Preload (Cont'd)

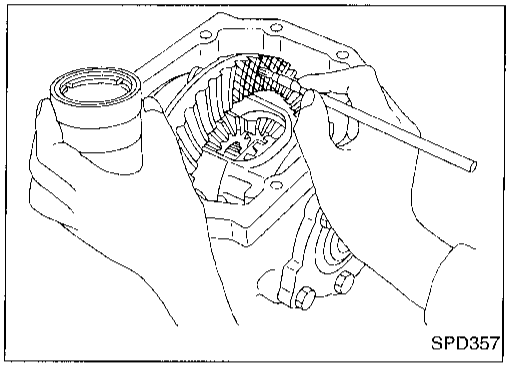


15. Correct the pinion height washer size by referring to the "pinion head number".

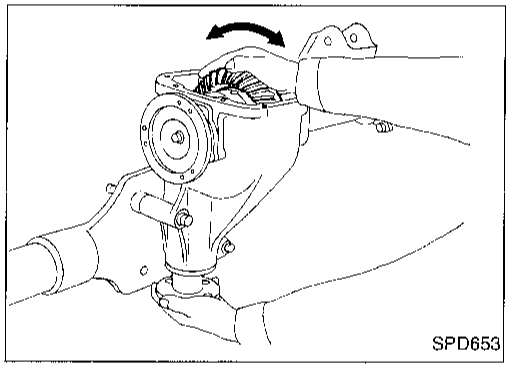
There are two numbers painted on the pinion gear. The first one refers to the pinion and ring gear as a matched set and should be the same as the number on the ring gear. The second number is the "pinion head height number", and it refers to the ideal pinion height from standard for quietest operation. Use the following chart to determine the correct pinion height washer.

Pinion Head Height Number	Add or Remove from the Standard Pinion Height Washer Thickness Measurement
−6	Add 0.06 mm (0.0024 in)
−5	Add 0.05 mm (0.0020 in)
−4	Add 0.04 mm (0.0016 in)
−3	Add 0.03 mm (0.0012 in)
−2	Add 0.02 mm (0.0008 in)
−1	Add 0.01 mm (0.0004 in)
0	Use the selected washer thickness
+1	Subtract 0.01 mm (0.0004 in)
+2	Subtract 0.02 mm (0.0008 in)
+3	Subtract 0.03 mm (0.0012 in)
+4	Subtract 0.04 mm (0.0016 in)
+5	Subtract 0.05 mm (0.0020 in)
+6	Subtract 0.06 mm (0.0024 in)

16. Select the correct pinion height washer.
    Drive pinion height adjusting washer:
    Refer to SDS, PD-71.



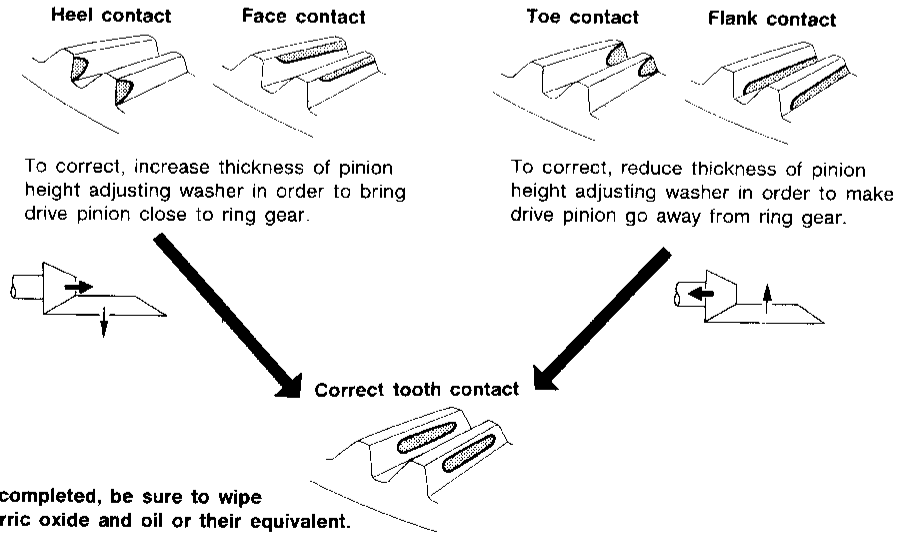
17. Remove the J34309 pinion preload shim selector tool from the final drive housing and disassemble to retrieve the pinion bearings.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Tooth Contact

Gear tooth contact pattern check is necessary to verify correct relationship between ring gear and drive pinion.
Hypoid gear sets which are not positioned properly may be noisy, or have short life, or both. With a pattern check, the most desirable contact for low noise level and long life can be assured.

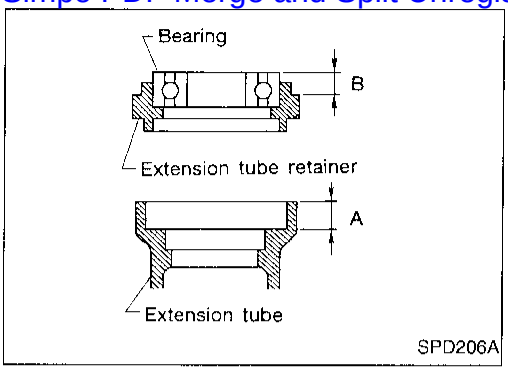


SPD357

1. Thoroughly clean ring gear and drive pinion teeth.
2. Sparingly apply a mixture of powdered ferric oxide and oil or equivalent to 3 or 4 teeth of ring gear drive side.

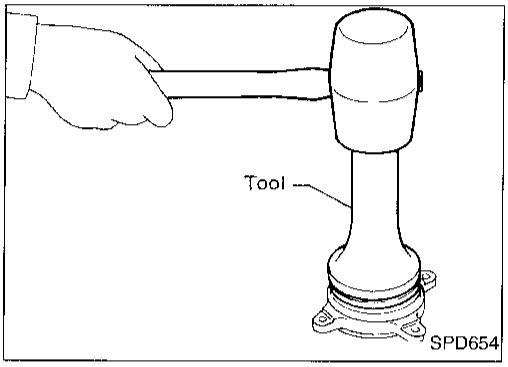
SPD653

3. Hold companion flange steady and rotate the ring gear in both directions.



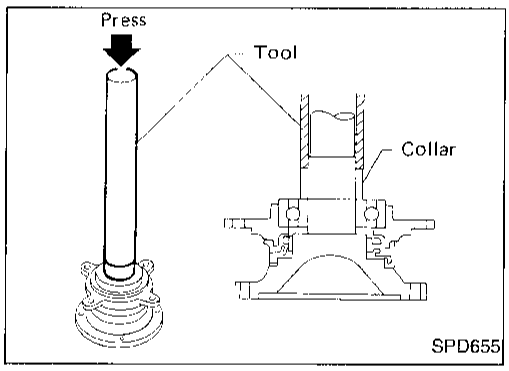
Usually the pattern will be correct if shims are correctly calculated and the backlash is correct.
However, in rare cases, trial and error processes may be employed to obtain a correct pattern.
The tooth pattern is the best indication of how well a differential has been set up.

When adjustment is completed, be sure to wipe off completely the ferric oxide and oil or their equivalent.

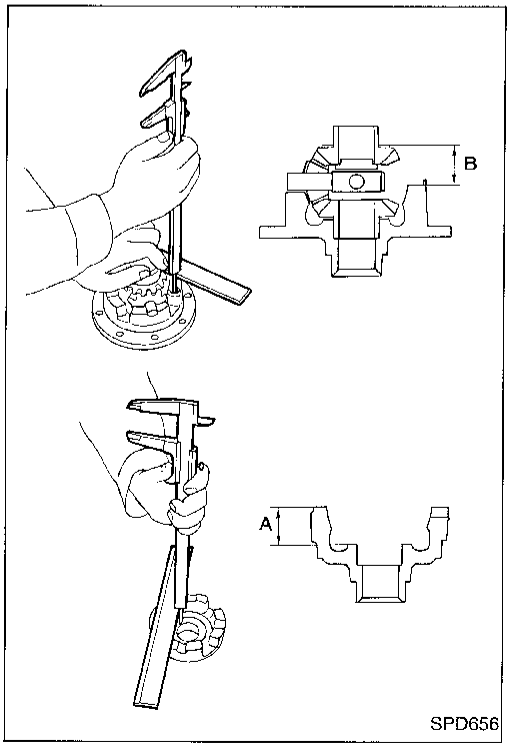


APD018

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



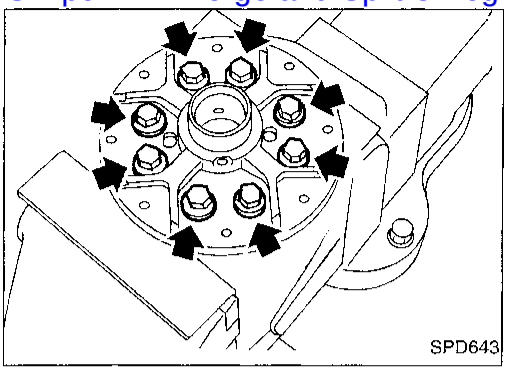
Extension Tube and Differential Side Shaft



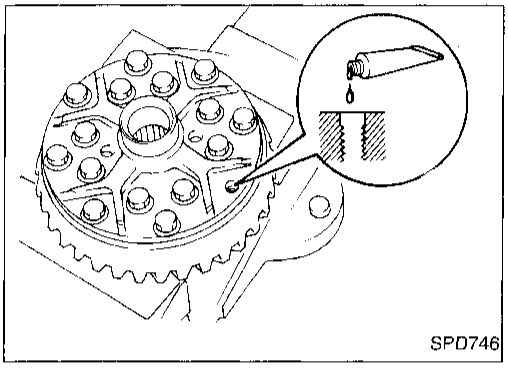
1. Measure rear axle bearing end play.
   Rear axle bearing end play (A - B):
   0.1 mm (0.0039 in) or less
   The end play can be adjusted with bearing adjusting shim.
   Available bearing adjusting shims:
   Refer to SDS, PD-71.

2. Install grease seal.
   Tool number: (J35764)

3. Install extension tube retainer, rear axle bearing and rear axle shaft bearing collar on differential side shaft.
4. Install differential side shaft assembly into extension tube.



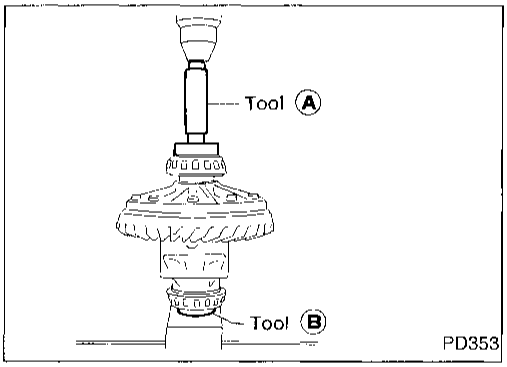
Differential Case



1. Measure clearance between side gear thrust washer and differential case.
   Clearance between side gear thrust washer and differential case (A - B):
   Less than 0.15 mm (0.0059 in)
   The clearance can be adjusted with side gear thrust washer.
   Available side gear thrust washers:
   Refer to SDS, PD-71.
2. Apply gear oil to gear tooth surfaces and thrust surfaces and check to see they turn properly.

Differential Case (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

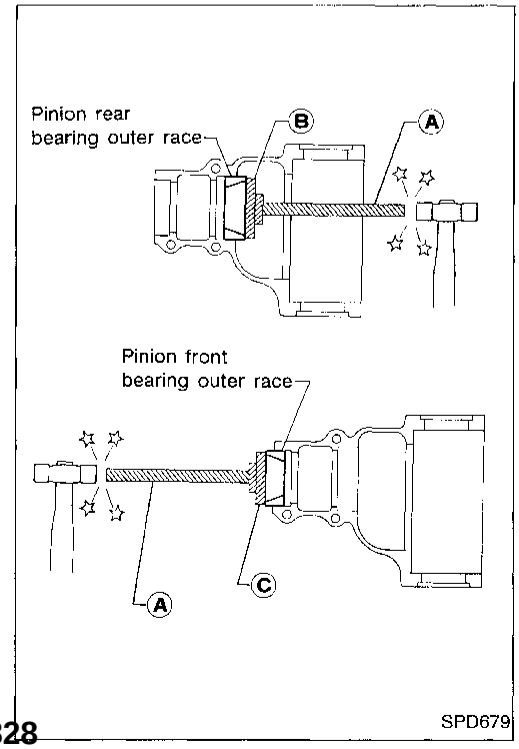


SPD643

3. Install differential case LH and RH.

SPD746

4. Place differential case on ring gear.
5. Apply locking agent [Locktite (stud lock) or equivalent] to ring gear bolts, and install them.



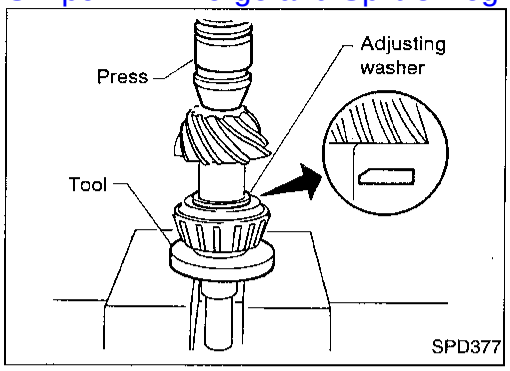
Tighten bolts in a criss-cross fashion, lightly tapping bolt head with a hammer.

PD353

6. Press-fit side bearing inner cones on differential case with Tools.

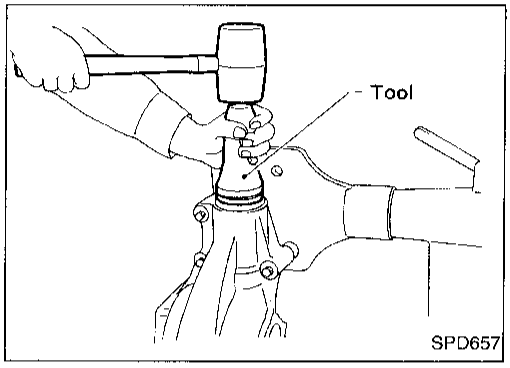
Tool numbers:
Ⓐ ST33230000 (J25805-01)
Ⓑ ST33061000 (J8107-2)

SPD679



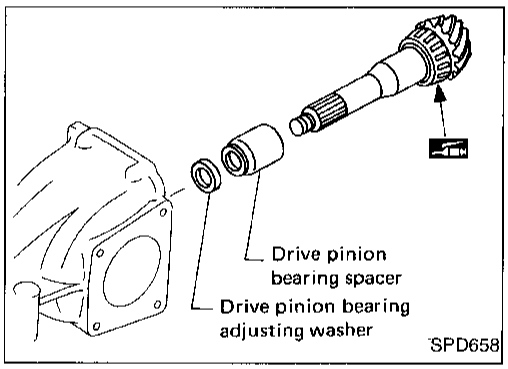
Final Drive Housing

1. Press-fit front and rear bearing outer races with Tools.

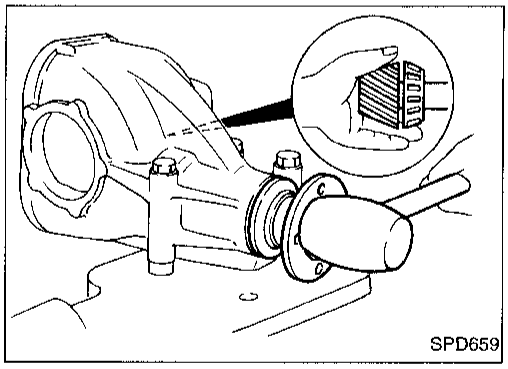


Tool numbers:
Ⓐ ST30611000 (J25742-1)
Ⓑ ST30621000 (J25742-5)
Ⓒ ST30701000 (J25742-2)

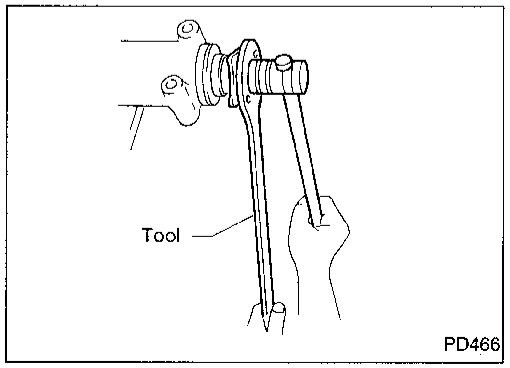
Final Drive Housing (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



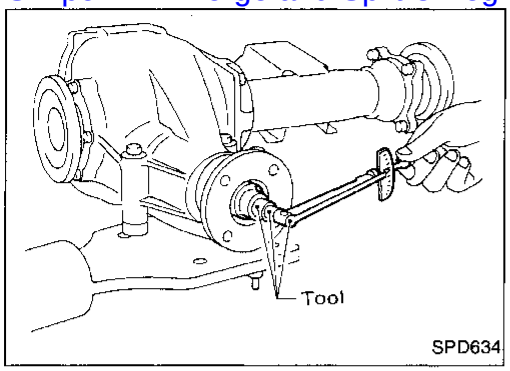
2. Select pinion bearing adjusting washer and drive pinion bearing spacer. Refer to "ADJUSTMENT", PD-24.
3. Install drive pinion height adjusting washer in drive pinion, and press-fit pinion rear bearing inner cone in it, using press and Tool.
   Tool number: ST30901000 (J26010-01)



4. Place pinion front bearing inner cone in final drive housing.
5. Apply multi-purpose grease to cavity at sealing lips of oil seal. Install front oil seal.
   Tool number: ST30720000 (J25405)

6. Place drive pinion bearing spacer, pinion bearing adjusting washer and drive pinion in final drive housing.

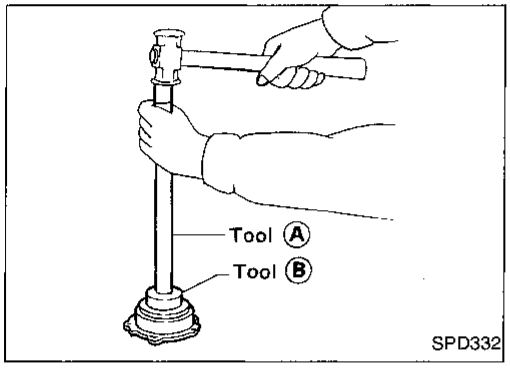
7. Insert companion flange into drive pinion by tapping the companion flange with a soft hammer.



8. Tighten pinion nut to the specified torque.

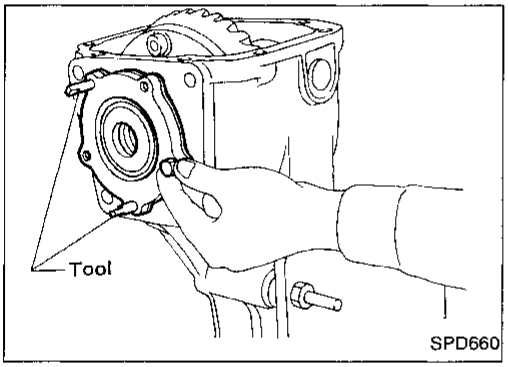
The threaded portion of drive pinion and pinion nut should be free from oil or grease.

Tool number: ST38060002 (J34311)

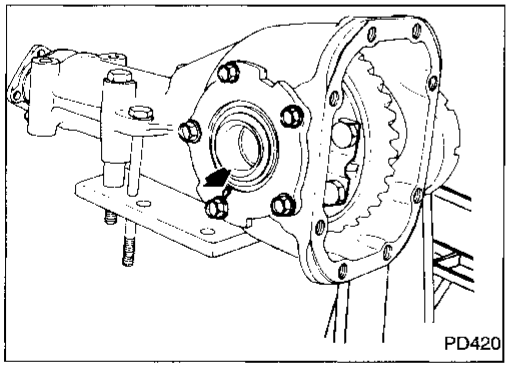


Final Drive Housing (Cont'd)

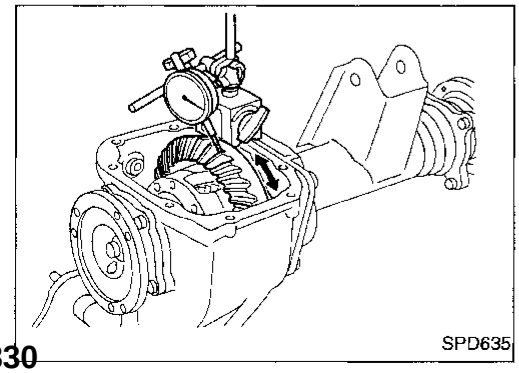
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



9. Turn drive pinion in both directions several revolutions and measure pinion bearing preload.
   Tool number: ST3127S000 (J25765-A)
   Pinion bearing preload:
   1.1 - 1.7 N·m (11 - 17 kg-cm, 9.5 - 14.8 in-lb)



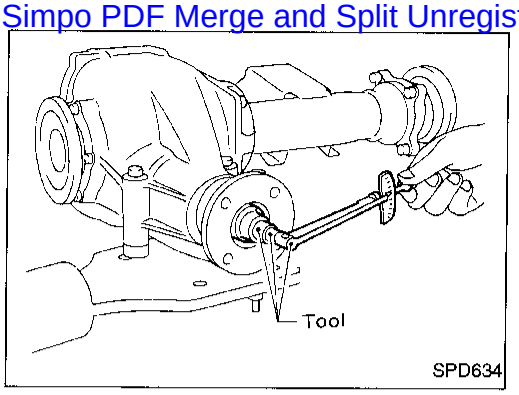
When pinion bearing preload is outside the specifications, replace pinion bearing adjusting washer and spacer with a different thickness.



10. Select side retainer adjusting shim.
    Refer to "ADJUSTMENT", PD-23.
11. Press-fit side bearing outer race into side retainer.
    Tool numbers:
    Ⓐ ST30611000 (J25742-1)
    Ⓑ ST30621000 (J25742-5)

12. Install side oil seal to side retainer.
    Tool number: ST33270000 (J25809)
13. Install differential case assembly.
14. Place side retainer adjusting shims (refer to "ADJUSTMENT", PD-23), and O-ring on side retainer, and install them in final drive housing.
    Tool number: ST33720000 (J25817)

- Align arrows stamped on side retainer and final drive housing.



15. Measure ring gear-to-drive pinion backlash with a dial indicator.
    Ring gear-to-drive pinion backlash:
    0.13 - 0.18 mm (0.0051 - 0.0071 in)

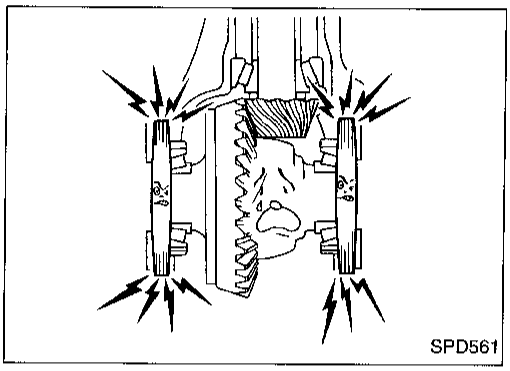
- If backlash is too small, decrease thickness of right shim and increase thickness of left shim by the same amount.
  If backlash is too great, reverse the above procedure.

Never change the total amount of shims as it will change the bearing preload.

Final Drive Housing (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

16. Check total preload with Tool.

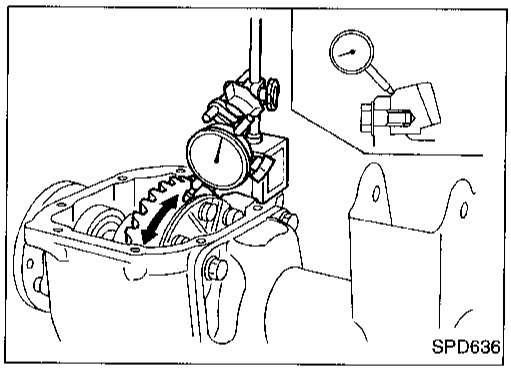


When checking preload, turn drive pinion in both directions several times to set bearing rollers.

Tool number: ST3127S000 (J25765-A)

Total preload:

1.2 - 2.3 N·m

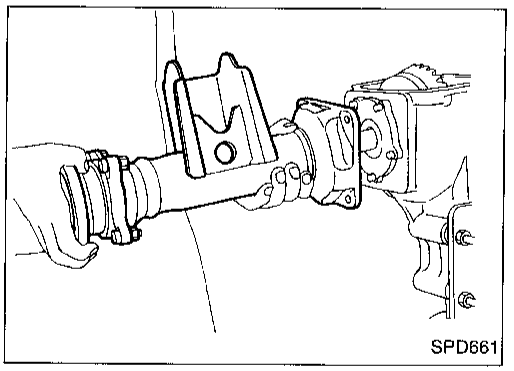


(12 - 23 kg-cm, 10 - 20 in-lb)

- If preload is too great, add the same amount of shim to each side.
- If preload is too small, remove the same amount of shim from each side.

Never add or remove a different number of shims for each side as it will change ring gear-to-drive pinion backlash.

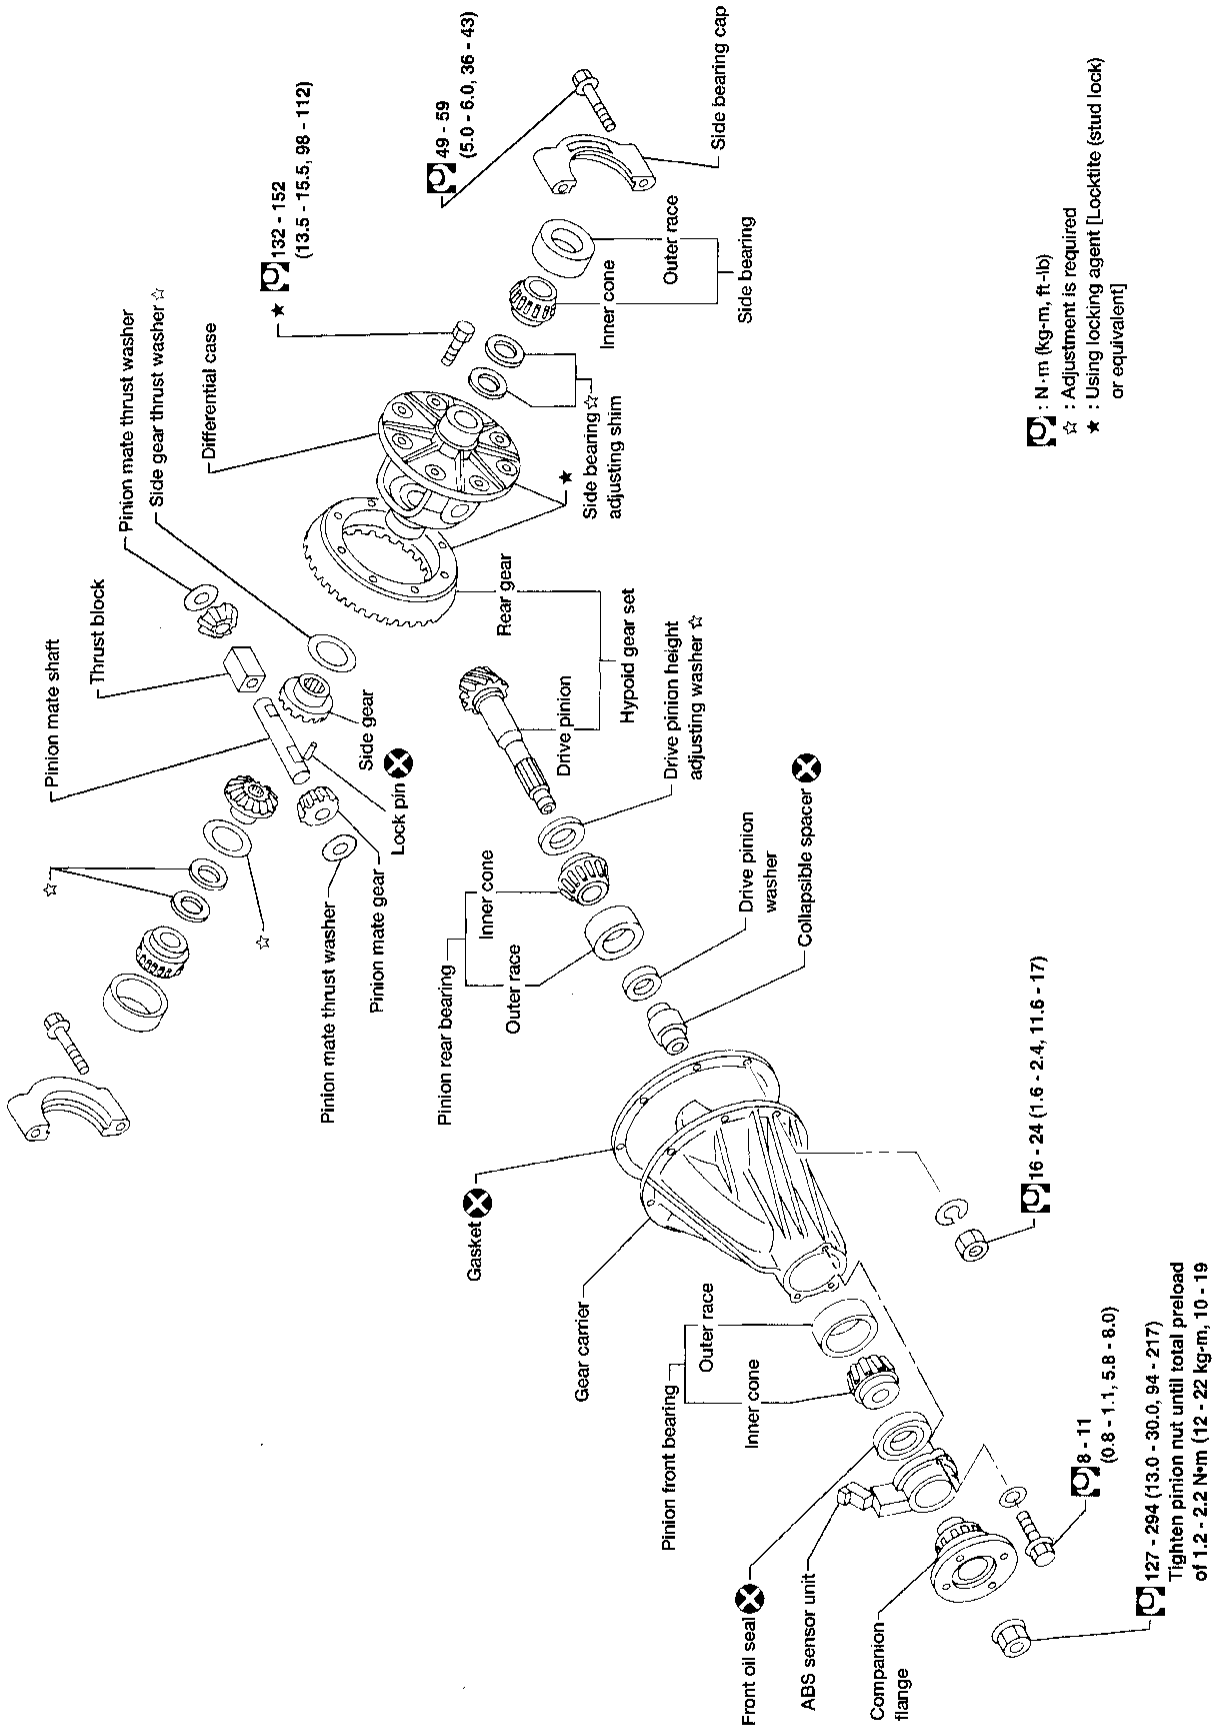
17. Recheck ring gear-to-drive pinion backlash because increase or decrease in thickness of shims will cause change of ring gear to pinion backlash.



18. Check runout of ring gear with a dial indicator.

Runout limit:

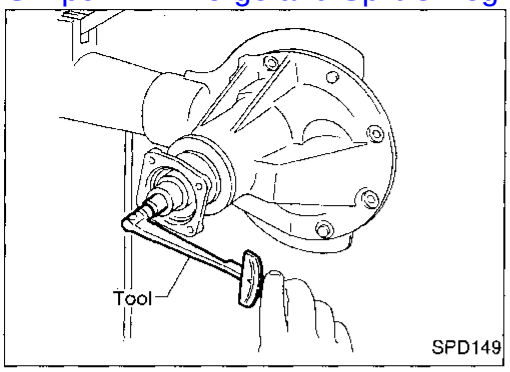
0.05 mm (0.0020 in)



- If backlash varies excessively in different places, the variance may have resulted from foreign matter caught between the ring gear and the differential case.
- If the backlash varies greatly when the runout of the ring gear is within a specified range, the hypoid gear set or differential case should be replaced.

19. Check tooth contact. Refer to "ADJUSTMENT", PD-28.
20. Install rear cover and gasket.

21. Install extension tube and differential side shaft assembly.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SEC.380

APD009

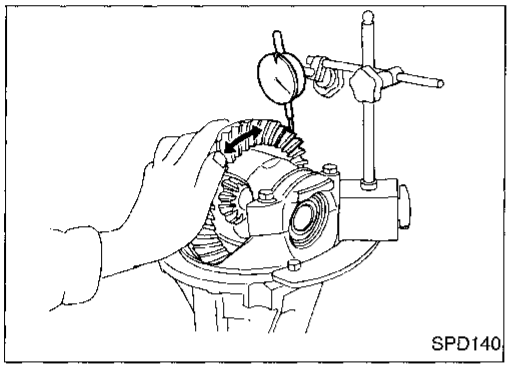
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Pre-inspection

Before disassembling final drive, perform the following inspection.

- Total preload

a. Turn drive pinion in both directions several revolutions to seat bearing rollers correctly.



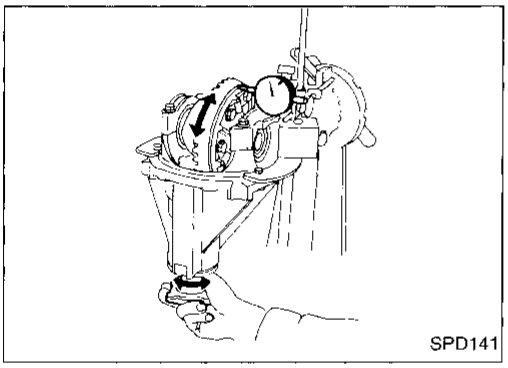
b. Check total preload with Tool.

Tool number: ST3127S000 (J25765-A)

Total preload:

1.2 - 2.2 N·m

(12 - 22 kg-cm, 10 - 19 in-lb)

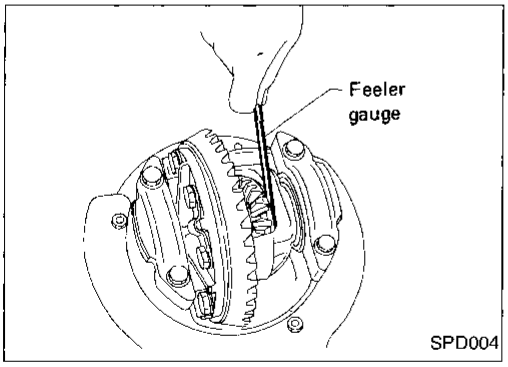


- Ring gear-to-drive pinion backlash

Check backlash of ring gear with a dial indicator at several points.

Ring gear-to-drive pinion backlash:

0.13 - 0.18 mm (0.0051 - 0.0071 in)



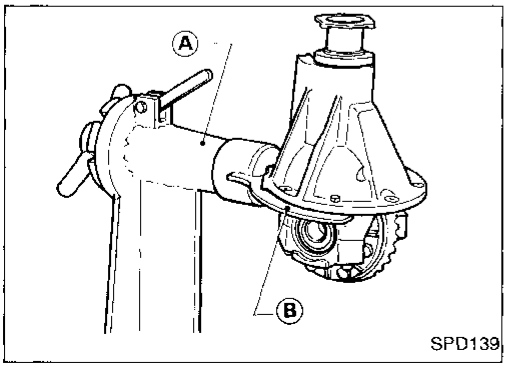
- Ring gear runout

Check runout of ring gear with a dial indicator.

Runout limit:

0.08 mm (0.0031 in)

- Tooth contact



Check tooth contact. Refer to "ADJUSTMENT", PD-45.

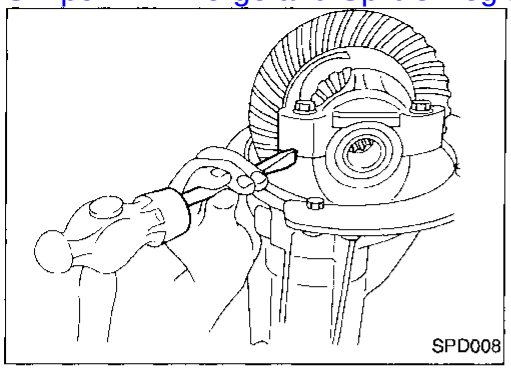
- Side gear-to-pinion mate gear backlash

Measure clearance between side gear thrust washer and differential case with a feeler gauge.

Clearance between side gear thrust washer and differential case:

Less than 0.15 mm (0.0059 in)

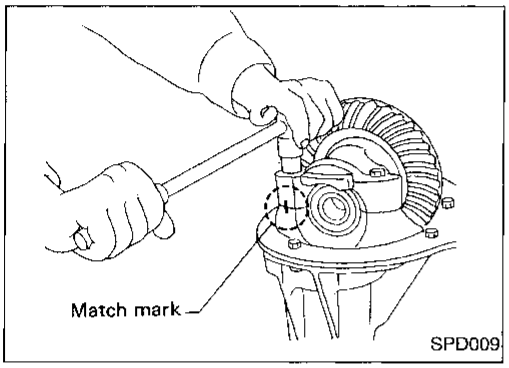
Differential Carrier



1. Mount differential carrier on Tools.

Tool numbers:

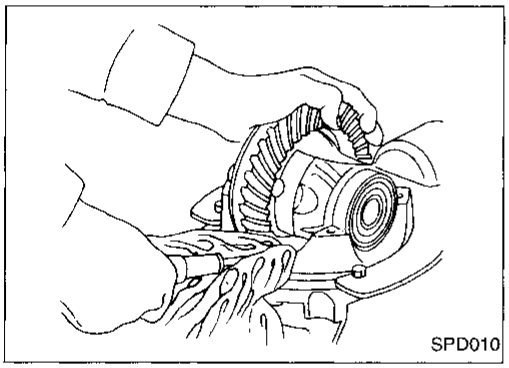
Ⓐ ST0501S000 (—)



Ⓑ ST06310000 (J25602-01)

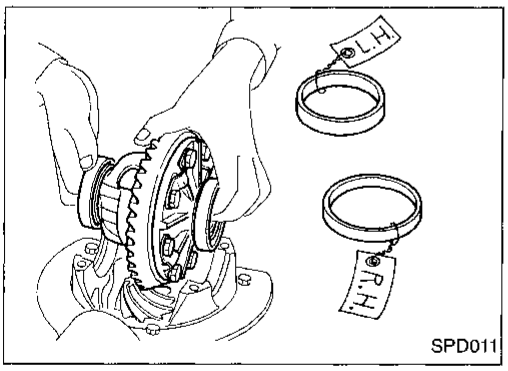
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SPD008



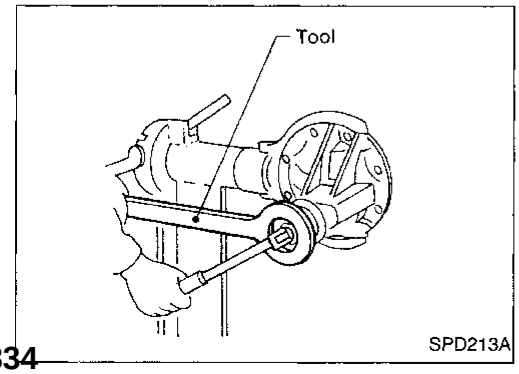
2. Put match marks on one side of side bearing cap with paint or punch to ensure that it is replaced in proper position during reassembly.

Bearing caps are line-bored during manufacture and should be put back in their original places.



SPD009

3. Remove side bearing caps.

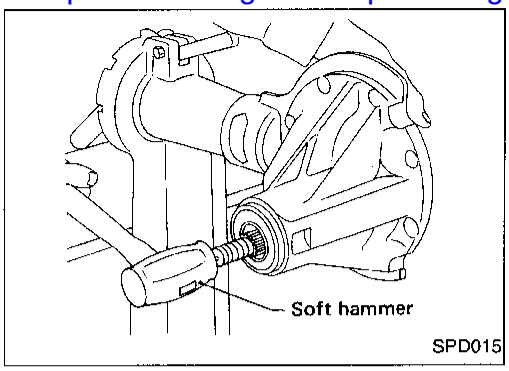


SPD010

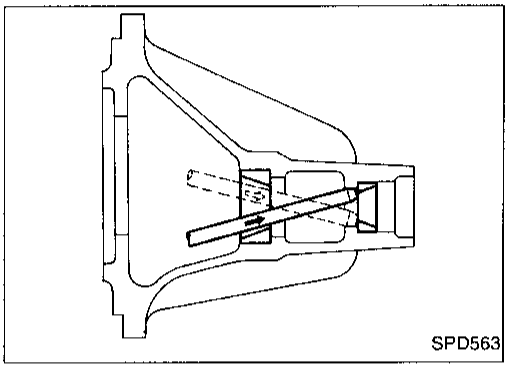
4. Remove differential case assembly with a pry bar.

SPD011

Keep the side bearing outer races together with their respective inner cones — do not mix them up.

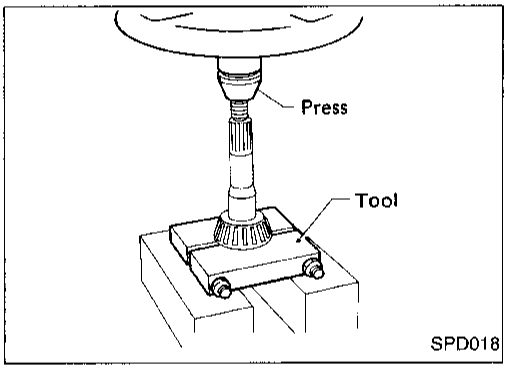


SPD213A



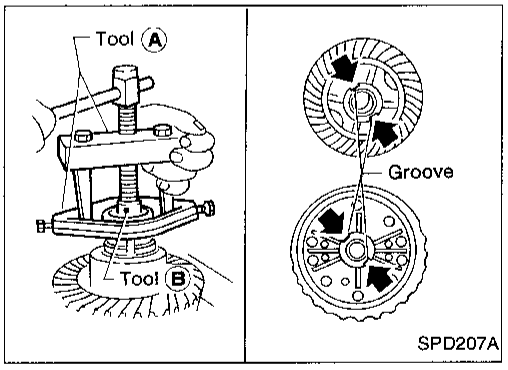
5. Remove drive pinion nut with Tool.
   Tool number: ST38060002 (J34311)
6. Remove companion flange with puller.

Differential Carrier (Cont'd)

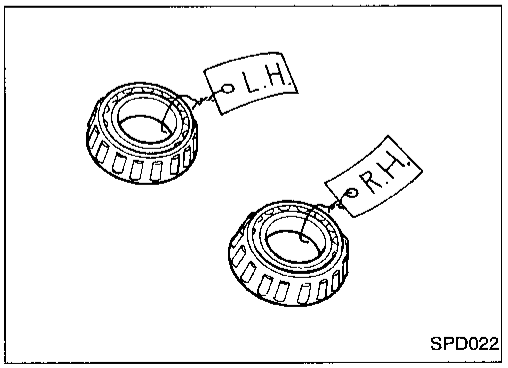


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

7. Remove drive pinion with soft hammer.
8. Remove oil seal.



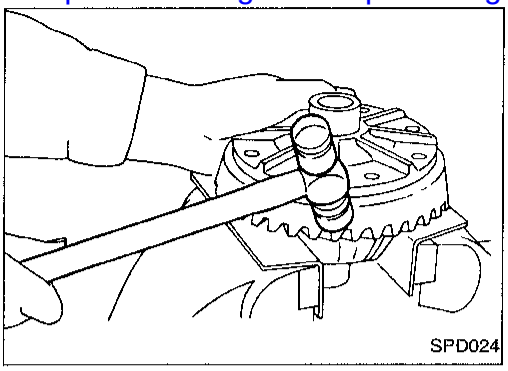
9. Remove pinion bearing outer races with a brass drift.



10. Pull out rear bearing inner cone with a press and Tool.
    Tool number: ST30031000 (J22912-01)

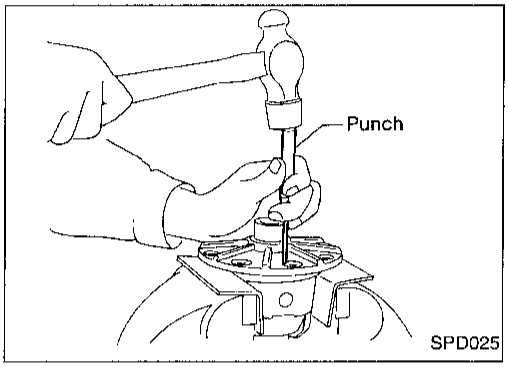
Differential Case

1. Remove side bearing inner cones.



To prevent damage to bearing, engage puller jaws in groove.
Tool numbers:
(A) ST33051001 (J22888-20)
(B) ST33061000 (J8107-2)

Be careful not to confuse the left and right hand parts.



Differential Case (Cont'd)

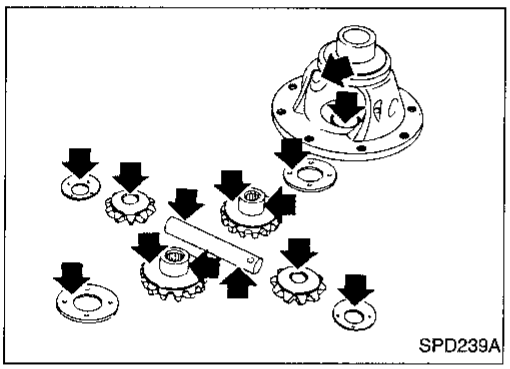
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SPD024

2. Spread out lock straps and loosen ring gear bolts in a criss-cross fashion.
3. Tap ring gear off differential case with a soft hammer.

Tap evenly all around to keep ring gear from binding.

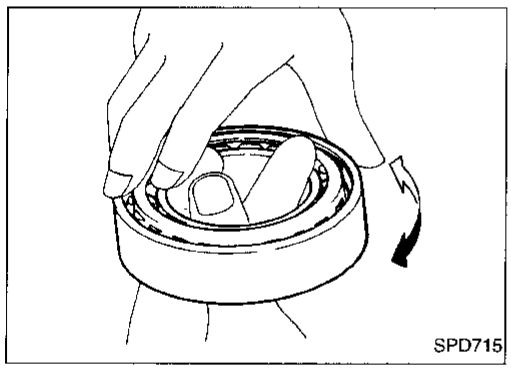
SPD025



4. Drive out pinion mate shaft lock pin, with Tool from ring gear side.

Lock pin is calked at pin hole mouth on differential case.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Ring Gear and Drive Pinion

Check gear teeth for scoring, cracking or chipping.
If any damaged part is evident, replace ring gear and drive pinion as a set (hypoid gear set).

SPD239A

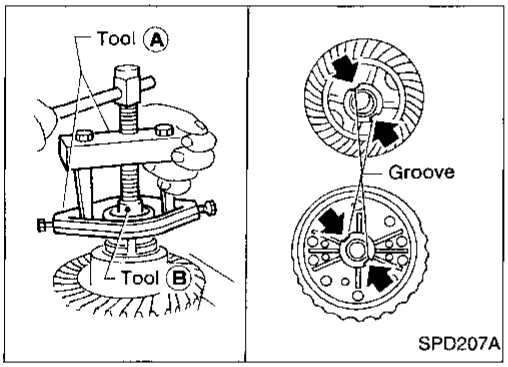
Differential Case Assembly

Check mating surfaces of differential case, side gears, pinion mate gears, pinion mate shaft, and thrust washers.

SPD715

Bearing

1. Thoroughly clean bearing.
2. Check bearings for wear, scratches, pitting or flaking.
   Check tapered roller bearing for smooth rotation. If damaged, replace outer race and inner cone as a set.



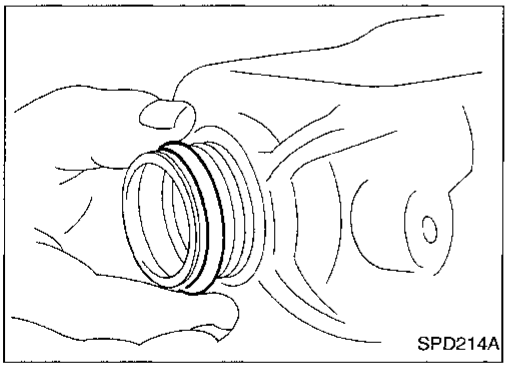
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

For quiet and reliable final drive operation, the following five adjustments must be made correctly:

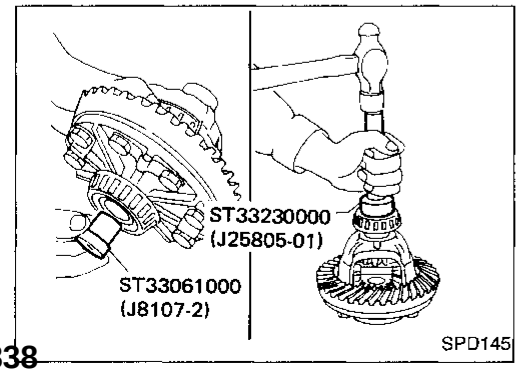
1. Side bearing preload
2. Pinion gear height
3. Pinion bearing preload. Refer to "ASSEMBLY", PD-49.
4. Ring gear-to-pinion backlash. Refer to "ASSEMBLY", PD-49.
5. Ring and pinion gear tooth contact pattern

Side Bearing Preload

A selection of carrier side bearing preload shims is required for successful completion of this procedure.



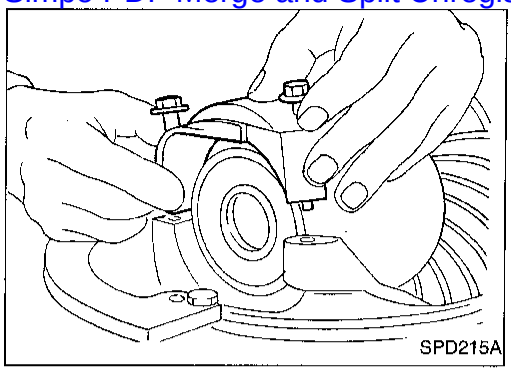
1. Make sure all parts are clean and that the bearings are well lubricated with light oil or type "DEXRON™" automatic transmission fluid.
2. Remove side bearing inner cones.



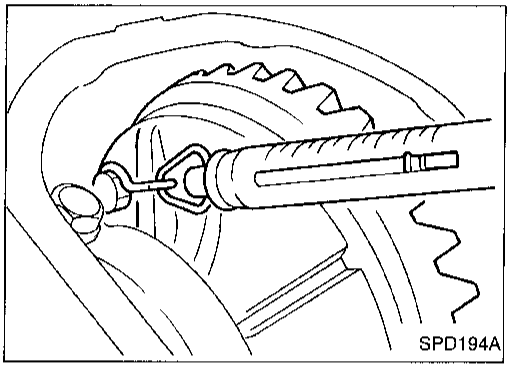
To prevent damage to bearing, engage puller jaws in grooves.

Tool numbers:

(A) ST33051001 (J22888-20)
(B) ST33061000 (J8107-2)

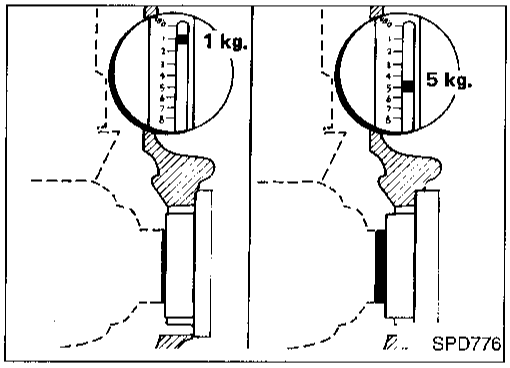


3. Reinstall all of the original side bearing adjusting shims on the carrier side, away from the ring gear.



4. Reinstall the carrier side bearing using Tools J25805-01 and J8107-2. Press on the bearings.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

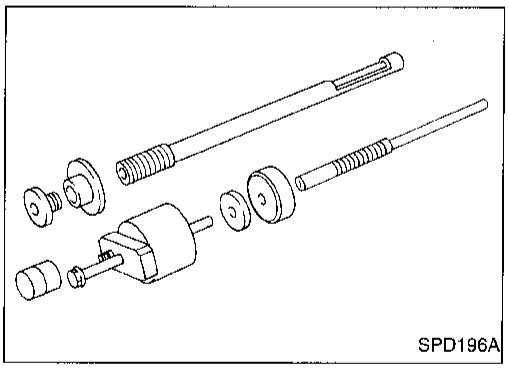


Side Bearing Preload (Cont'd)

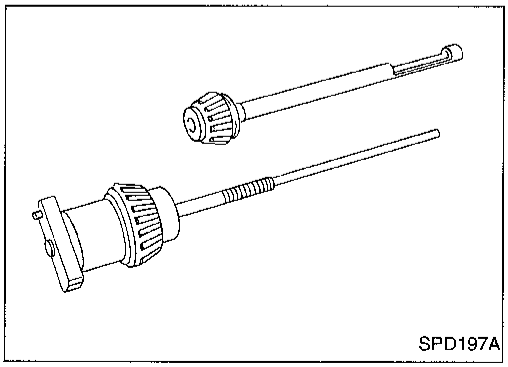
SPD215A

5. Install carrier and bearings into the final drive housing. Install side bearing caps. Torque the bolts and tap on the caps with a soft hammer to seat the bearings.
   Side bearing cap bolt torque specification:
   49 - 59 N·m (5 - 6 kg-m, 36 - 43 ft-lb)

SPD194A



6. After turning the carrier several times to seat the bearings, measure carrier turning force with spring gauge J8129.
   Turning force specification:
   34.3 - 39.2 N (3.5 - 4.0 kg, 7.7 - 8.8 lb)
   of pulling force at the ring gear bolt

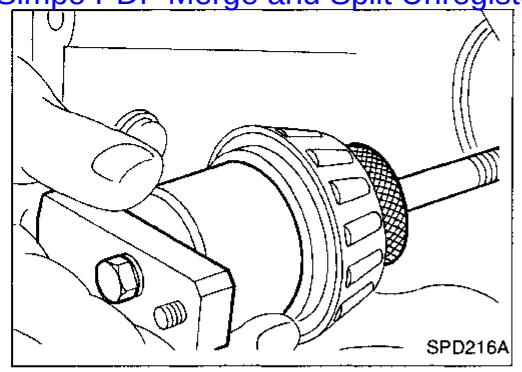


SPD776

7. If necessary, correct the carrier bearing preload by adding to or subtracting from the total amount of shim thickness.
   Add shim thickness to increase turning force on the carrier.
   Subtract shim thickness to decrease turning force on the carrier.

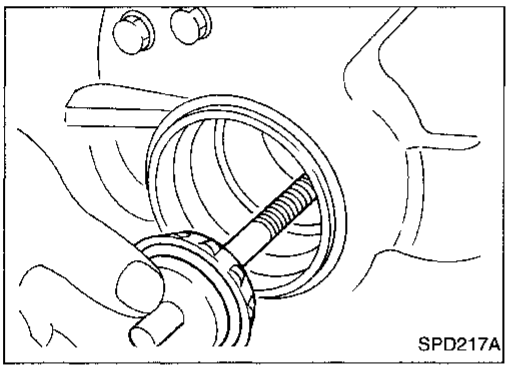
Pinion Gear Height

SPD196A



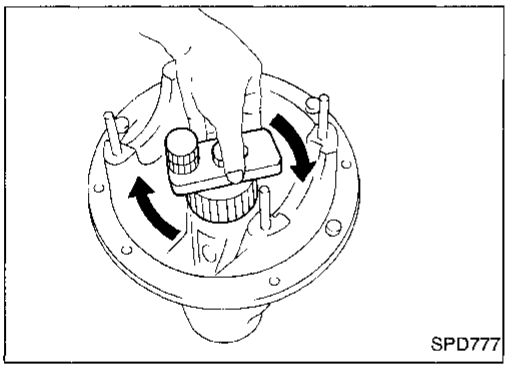
1. Make sure all parts are clean and that the bearings are well lubricated.
2. Assemble the pinion gear bearings into the pinion pre-load shim selector Tool, J34309.

SPD197A



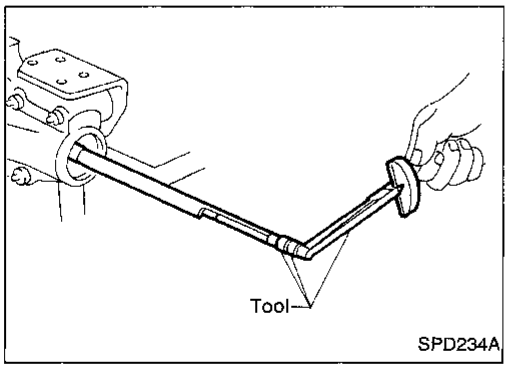
- **Front Pinion Bearing** — make sure the J34309-3 front pinion bearing is secured tightly against the J34309-2 gauge anvil. Then turn the front pinion bearing pilot J34309-5 to secure the bearing in its proper position.
- **Rear Pinion Bearing** — the rear pinion bearing pilot, J34309-15, is used to center the rear pinion bearing only. The rear pinion bearing locking seat, J34309-4 is used to lock the bearing to the assembly.

Pinion Gear Height (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

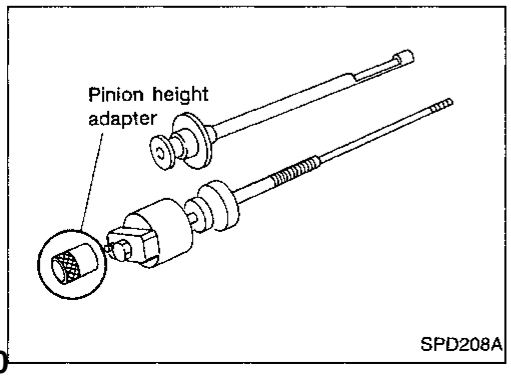
SPD216A



3. Place the pinion pre-load shim selector Tool J34309-1 gauge screw assembly with the pinion rear bearing inner cone installed into the final drive housing.

SPD217A

4. Assemble the front pinion bearing inner cone and the J34309-2 gauge anvil together with the J34309-1 gauge screw in the final drive housing. Make sure that the pinion height gauge plate, J34309-16, will turn a full 360 degrees, and tighten the two sections together by hand.



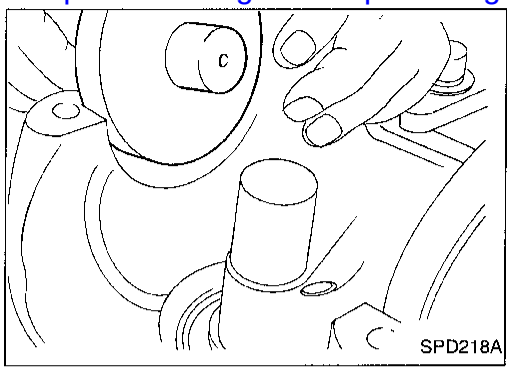
SPD777

5. Turn the assembly several times to seat the bearings.

SPD234A

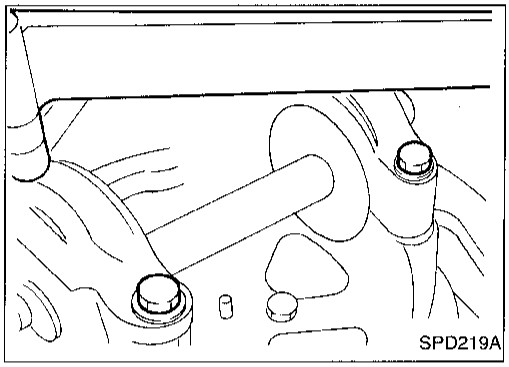
6. Measure the turning torque at the end of the J34309-2 gauge anvil using Tool.
   Tool number: ST3127S000 (J25765-A)
   Turning torque specification:
   1.0 - 1.3 N·m
   (10 - 13 kg-cm, 8.7 - 11.3 in-lb)

SPD208A



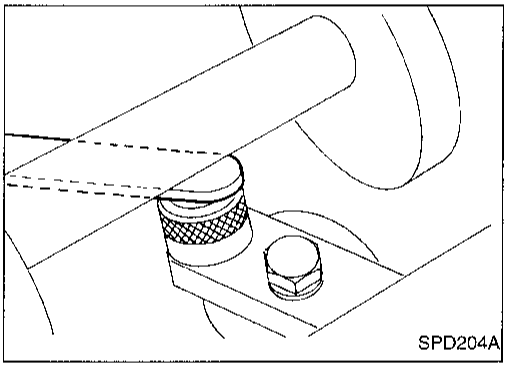
7. Place the J34309-14 pinion height adapter onto the gauge plate and tighten it by hand.

CAUTION:
Make sure all machined surfaces are clean.

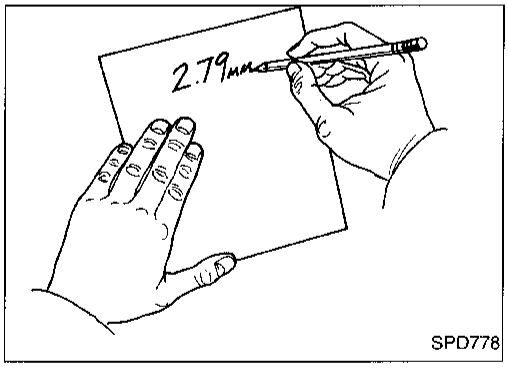


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

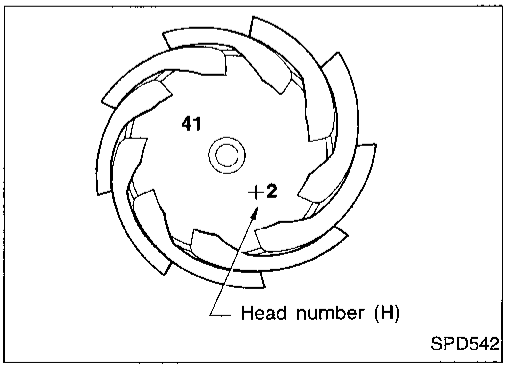
Pinion Gear Height (Cont'd)



PINION HEIGHT ADJUSTING WASHER SELECTION



8. Now, position the side bearing discs, J25269-18, and arbor firmly into the side bearing bores.



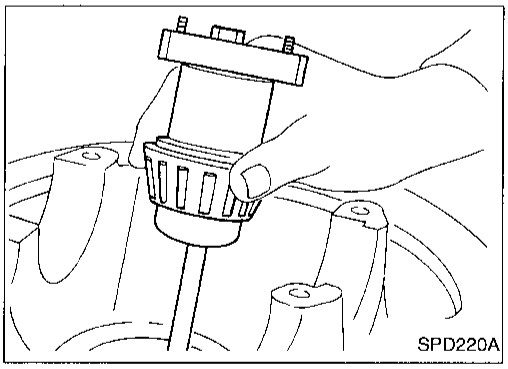
9. Install the side bearing caps and torque the cap bolts.
   Specification:
   49 - 59 N·m (5 - 6 kg-m, 36 - 43 ft-lb)

10. Select the correct standard pinion height adjusting washer thickness by using J34309-101 feeler gauge. Measure the gap between the J34309-14 pinion height adapter and the arbor.

11. Write down your exact total measurement.

12. Correct the pinion height washer size by referring to the "pinion head number".

There are two numbers painted on the pinion gear. The first one refers to the pinion and ring gear as a matched set and should be the same as the number on the ring gear. The second number is the "pinion head height number," and it refers to the ideal pinion height from standard for quietest operation.



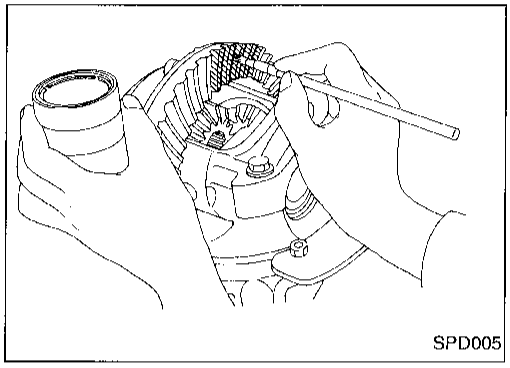
Pinion Gear Height (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

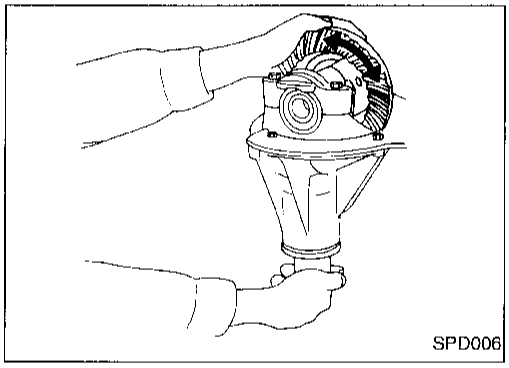
Use the following chart to determine the correct pinion height washer.

Pinion Head Height Number	Add or Remove from the Standard Pinion Height Washer Thickness Measurement
–6	Add 0.06 mm (0.0024 in)
–5	Add 0.05 mm (0.0020 in)
–4	Add 0.04 mm (0.0016 in)
–3	Add 0.03 mm (0.0012 in)
–2	Add 0.02 mm (0.0008 in)
–1	Add 0.01 mm (0.0004 in)
0	Use the selected washer thickness
+1	Subtract 0.01 mm (0.0004 in)
+2	Subtract 0.02 mm (0.0008 in)
+3	Subtract 0.03 mm (0.0012 in)
+4	Subtract 0.04 mm (0.0016 in)
+5	Subtract 0.05 mm (0.0020 in)
+6	Subtract 0.06 mm (0.0024 in)

13. Select the correct pinion height washer.
    Drive pinion height adjusting washer:
    Refer to SDS, PD-72.



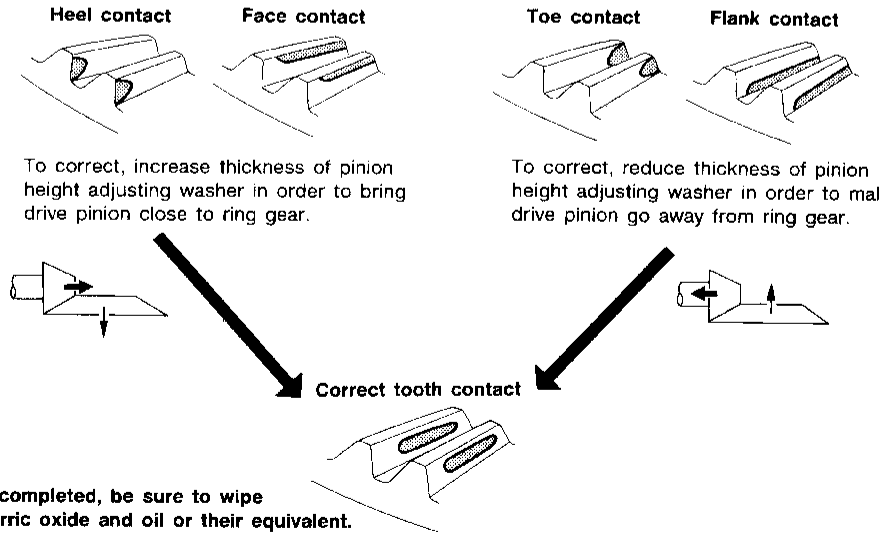
14. Remove the J34309 pinion preload shim selector Tool from the final drive housing and disassemble to retrieve the pinion bearings.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Tooth Contact

Checking of gear tooth contact pattern is necessary to verify correct relationship between ring gear and drive pinion.
Hypoid gear sets which are not positioned properly may be noisy, or have short life, or both. With a pattern check, the most desirable contact for low noise level and long life can be assured.



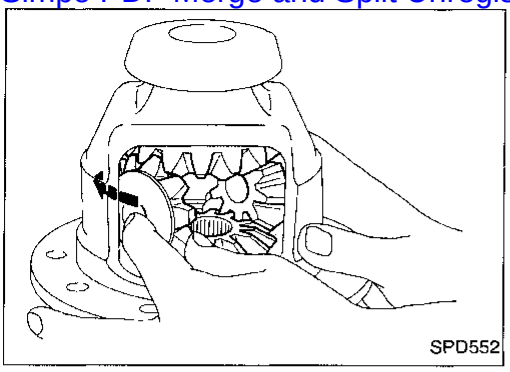
SPD005

1. Thoroughly clean ring gear and drive pinion teeth.
2. Sparingly apply a mixture of powdered ferric oxide and oil or equivalent to 3 or 4 teeth of ring gear drive side.

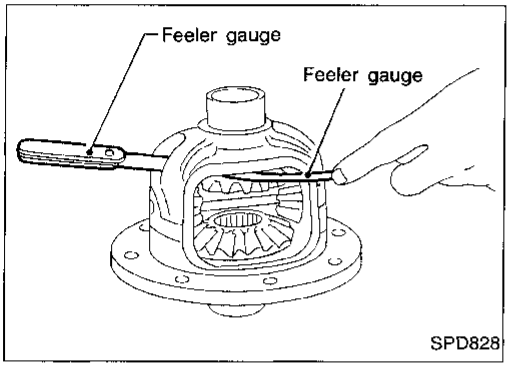
SPD006

3. Hold companion flange steady and rotate the ring gear in both directions.

Usually the pattern will be correct if shims are correctly calculated and the backlash is correct.
However, in rare cases, trial and error processes may be employed to obtain a correct pattern.
The tooth pattern is the best indication of how well a differential has been set up.



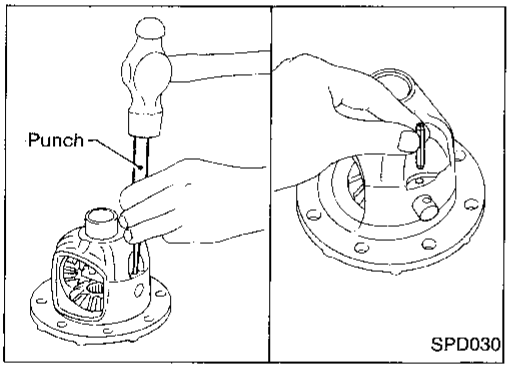
When adjustment is completed, be sure to wipe off completely the ferric oxide and oil or their equivalent.



APD018

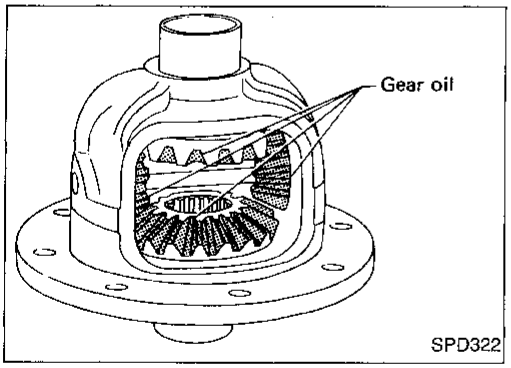
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Differential Case



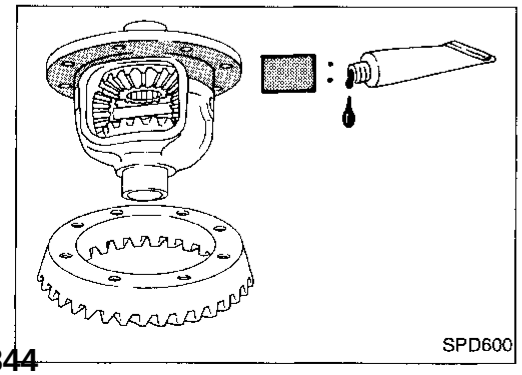
1. Install side gears, pinion mate gears and thrust washers into differential case.

2. Fit pinion mate shaft to differential case so that it meets lock pin holes.
3. Adjust backlash between side gear and pinion mate gear by selecting side gear thrust washer. Refer to SDS, PD-72.



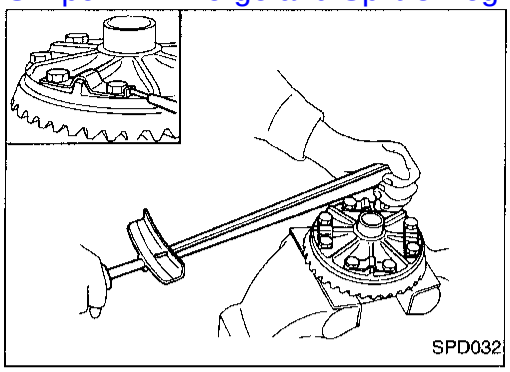
Backlash between side gear and pinion mate gear (Clearance between side gear thrust washer and differential case):

Less than 0.15 mm (0.0059 in)

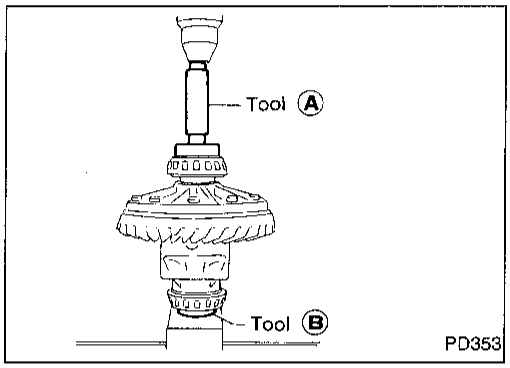


4. Install pinion mate shaft lock pin with a punch.

Make sure lock pin is flush with case.



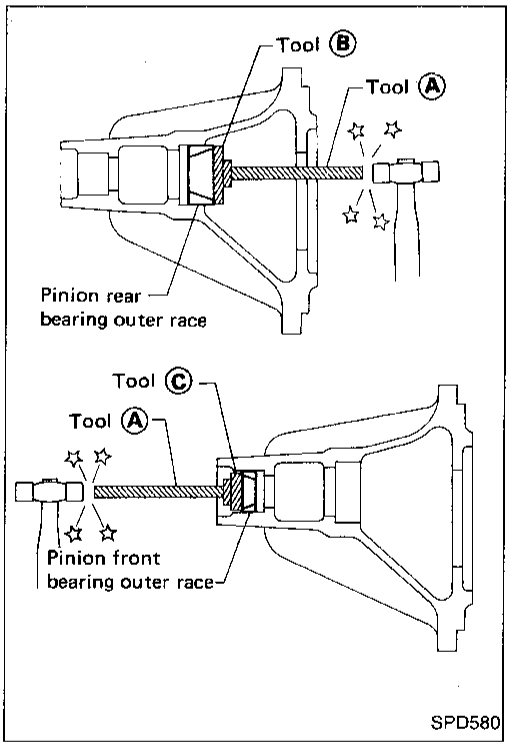
5. Apply gear oil to gear tooth surfaces and thrust surfaces and check to see they turn properly.



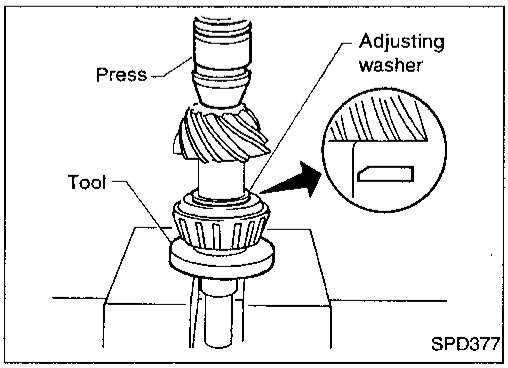
6. Apply locking agent [Locktite (stud lock) or equivalent] to contacting surfaces of ring gear and differential case, then place differential case on ring gear.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Differential Case (Cont'd)

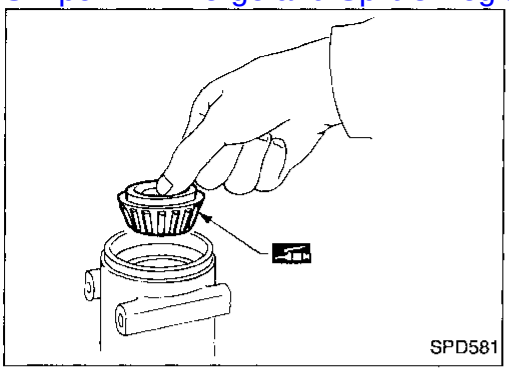


7. Apply a small amount of locking agent (described on previous page) to ring gear bolts.
8. Install new lock straps and ring gear bolts.
   - **Tighten bolts in a criss-cross fashion, lightly tapping bolt head with a hammer.**
   - **Then bend up lock straps to lock the bolts in place.**

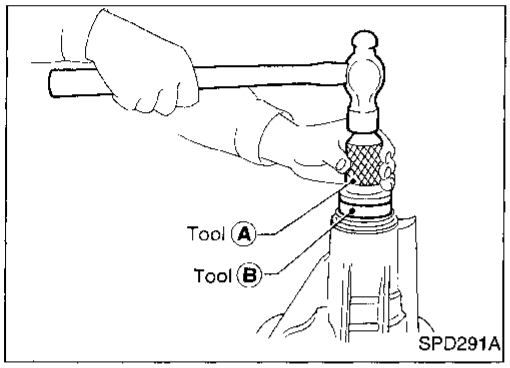


9. Select side bearing adjusting shims.
   Refer to "ADJUSTMENT", PD-40.
10. Install the shims behind each bearing and press on side bearing inner cones with Tools.
    Tool numbers:
    Ⓐ ST33230000 (J25805-01)
    Ⓑ ST33061000 (J8107-2)

Differential Carrier



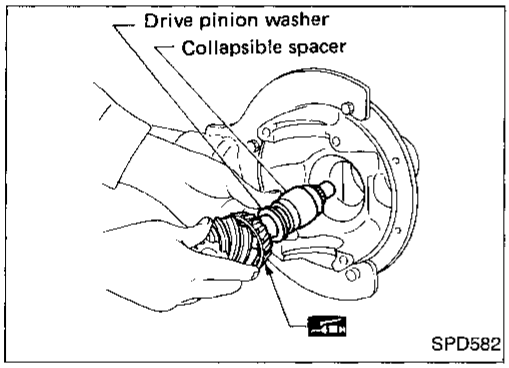
1. Press-fit front and rear bearing outer races with Tools.
   Tool numbers:
   Ⓐ ST30611000 (J25742-1)
   Ⓑ ST30621000 (J25742-5)
   Ⓒ ST30613000 (J25742-3)



2. Select pinion height adjusting washer. Refer to "ADJUSTMENT", PD-41.
3. Install pinion height adjusting washer in drive pinion, and press-fit rear bearing inner cone with press and Tool.
   Tool number: ST30901000 (J26010-01)

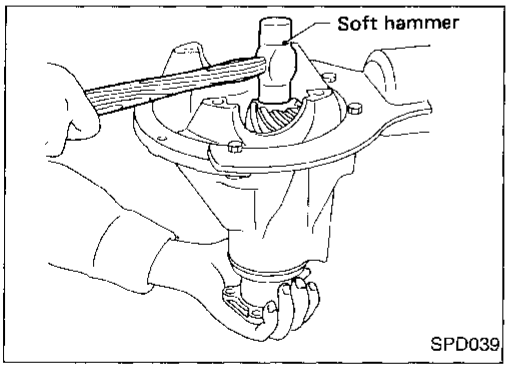
Differential Carrier (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



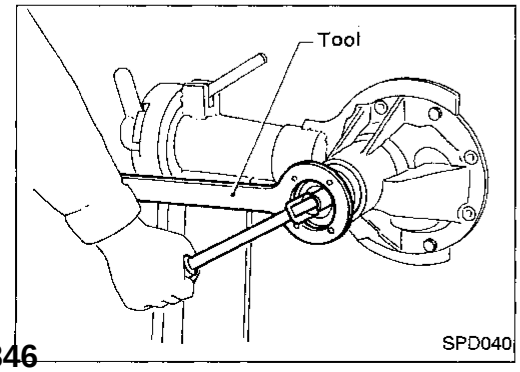
SPD581

4. Place pinion front bearing inner cone in gear carrier.



SPD291A

5. Apply multi-purpose grease to cavity at sealing lips of oil seal. Install front oil seal.
   Tool numbers:
   (A) ST30720000 (J25405)
   (B) KV38102510 (—)



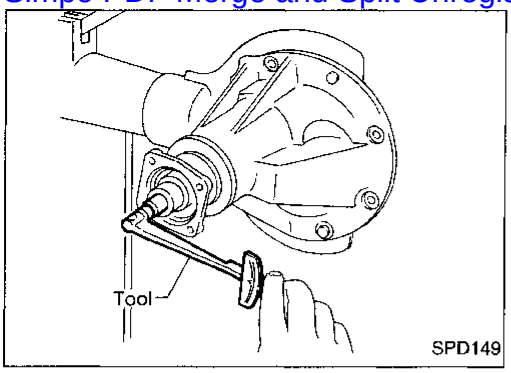
SPD582

6. Install drive pinion washer, collapsible spacer and drive pinion in gear carrier.

SPD039

7. Install companion flange and hold it firmly. Insert pinion into companion flange by tapping its head with a soft hammer.

SPD040



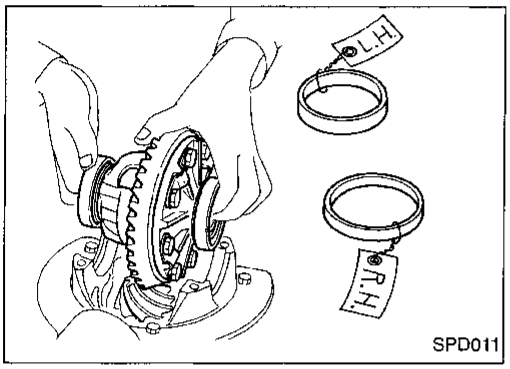
8. Temporarily tighten pinion nut until there is no axial play.

The threaded portion of drive pinion and pinion nut should be free from oil or grease.

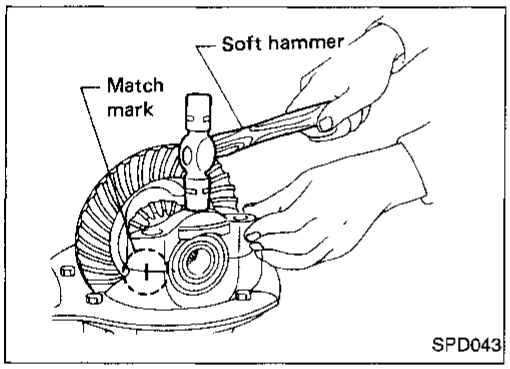
Tool number: ST38060002 (J34311)

Differential Carrier (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

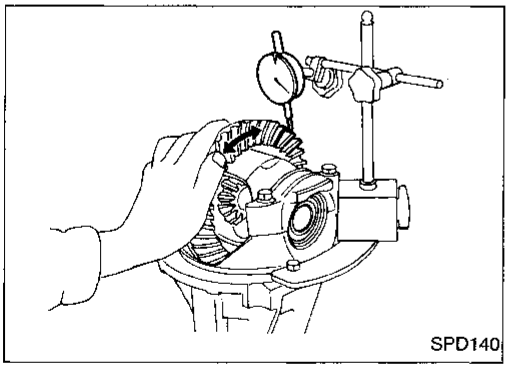


9. Tighten pinion nut by degrees to the specified preload while checking the preload with Tools.



When checking preload, turn drive pinion in both directions several times to seat bearing rollers correctly.

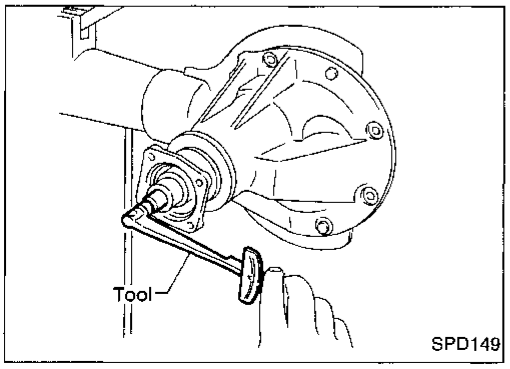
Pinion bearing preload:
1.1 - 1.6 N·m (11 - 16 kg-cm, 9.5 - 13.9 in-lb)
Tool number: ST3127S000 (J25765-A)



CAUTION:
The preload is achieved by the permanent setting of the collapsible spacer. So, if an overpreload results from turning of the pinion nut excessively, the spacer should be replaced by new one.

10. Install differential case assembly with side bearing outer races into gear carrier.

11. Align mark on bearing cap with that on gear carrier and install bearing cap on gear carrier.

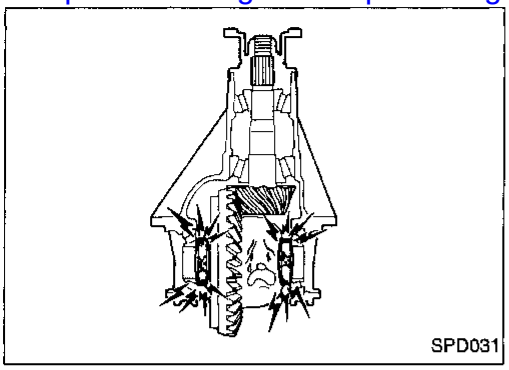


12. Measure ring gear-to-drive pinion backlash with a dial indicator.

Ring gear-to-drive pinion backlash:
0.13 - 0.18 mm (0.0051 - 0.0071 in)

- If backlash is too small, decrease thickness of left shim and increase thickness of right shim by the same amount.
- If backlash is too great, reverse the above procedure.

Never change the total amount of shims as it will change the bearing preload.

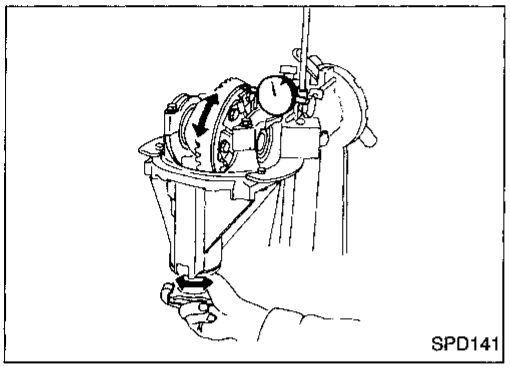


13. Check total preload with Tool.

When checking preload, turn drive pinion in both directions several times to set bearing rollers.

Tool number: ST3127S000 (J25765-A)
Total preload:
1.2 - 2.2 N·m (12 - 22 kg-cm, 10 - 19 in-lb)

Differential Carrier (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

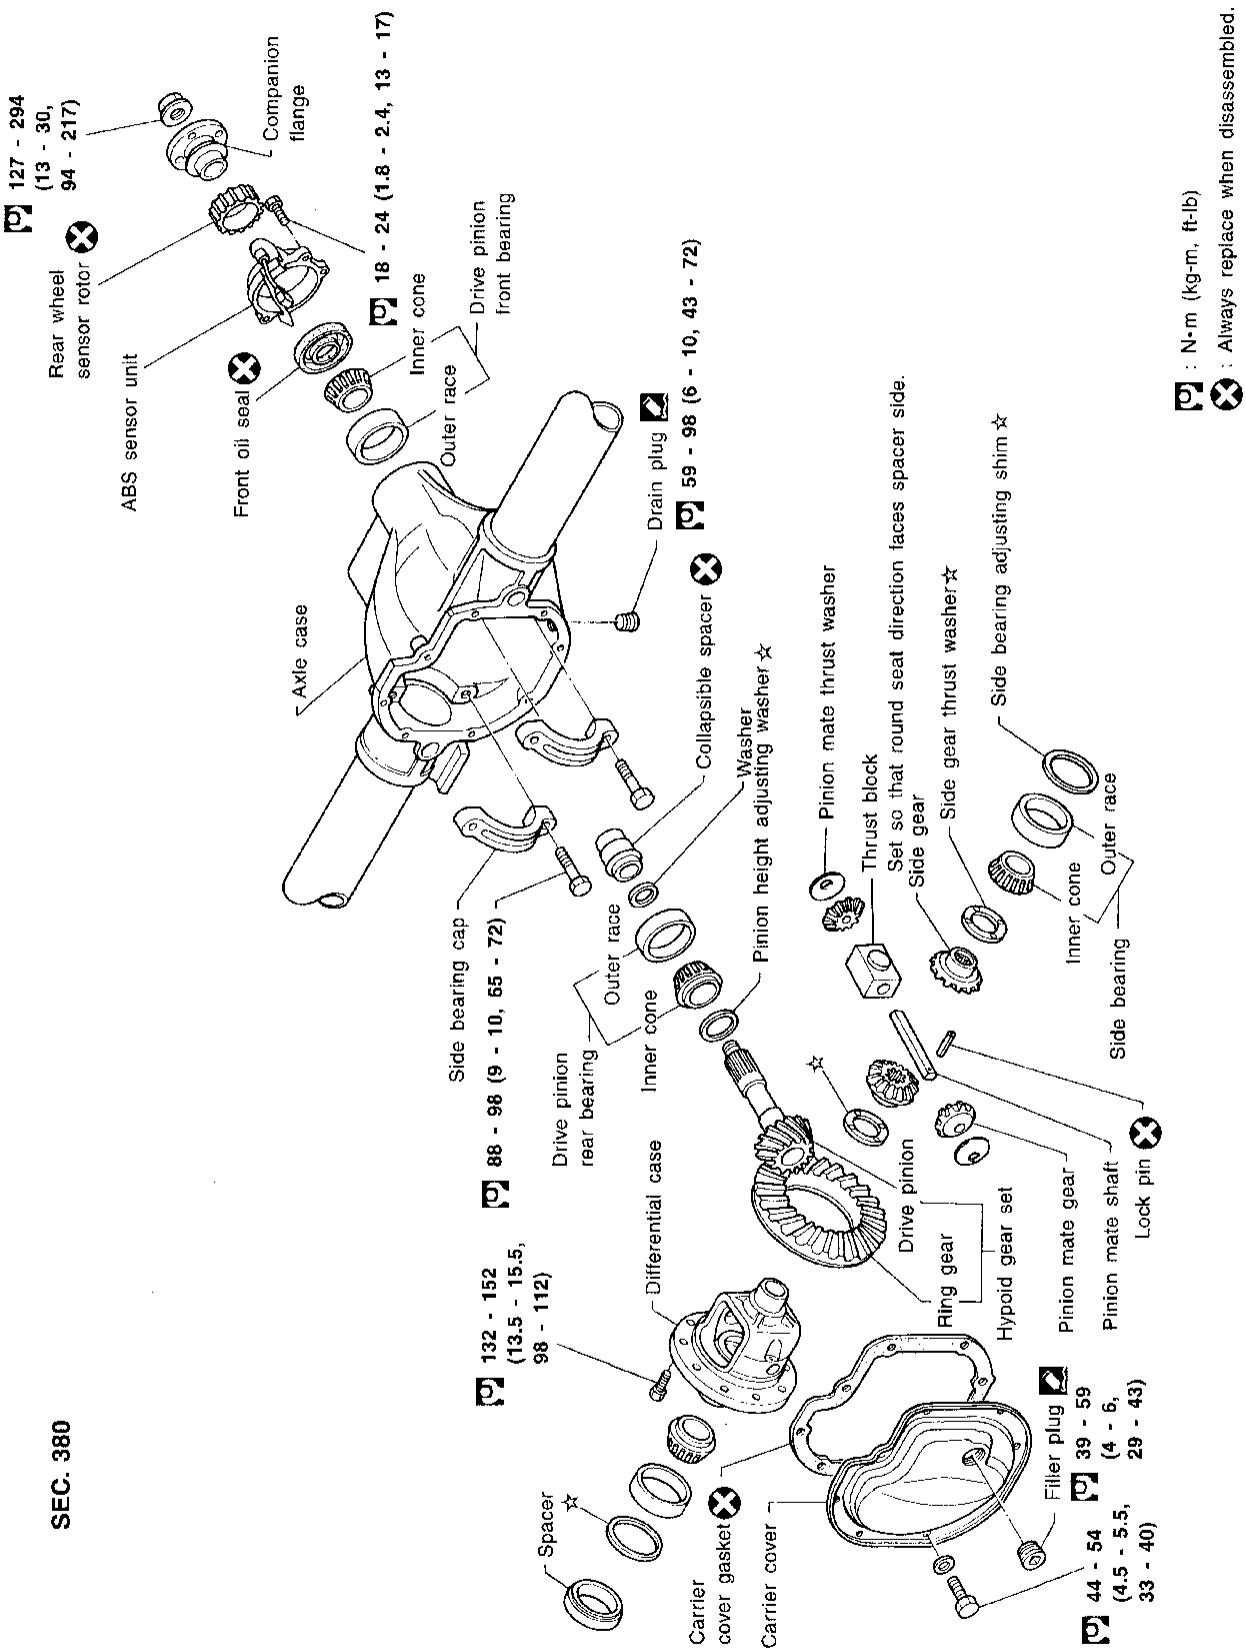
SPD031

- If preload is too great, remove the same amount of shims from each side.
- If preload is too small, add the same amount of shims to each side.

Never add or remove a different number of shims for each side as it will change ring gear-to-drive pinion backlash.

14. Recheck ring gear-to-drive pinion backlash because an increase or decrease in thickness of shims will cause change of ring gear-to-pinion backlash.

SPD141



15. Check runout of ring gear with a dial indicator.
    Runout limit: 0.08 mm (0.0031 in)

- If backlash varies excessively in different places, the variance may have resulted from foreign matter caught between the ring gear and the differential case.
- If the backlash varies greatly when the runout of the ring gear is within a specified range, the hypoid gear set or differential case should be replaced.

16. Check tooth contact.
    Refer to "ADJUSTMENT", PD-45.

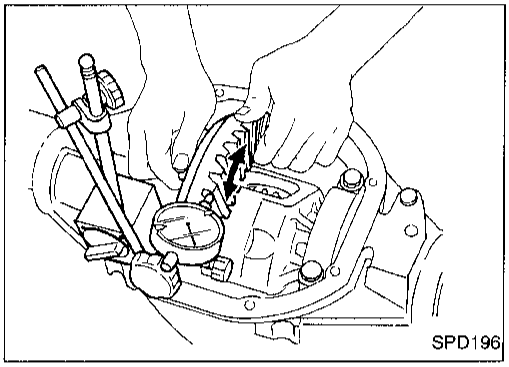
Pre-inspection

Before disassembling final drive, perform the following inspection.

- Total preload

a. Turn drive pinion in both directions several times to set bearing rollers.



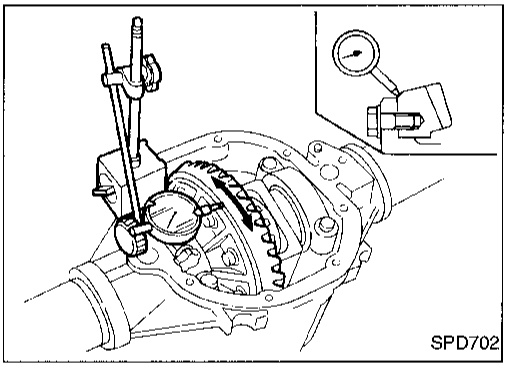
b. Check total preload with Tool.

Tool number: ST3127S000 (J25765-A)

Total preload:

1.2 - 2.3 N·m

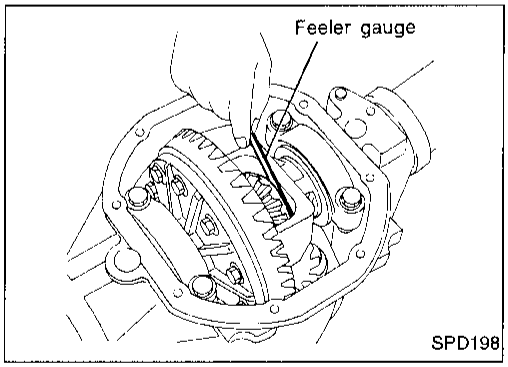
(12 - 23 kg-cm, 10 - 20 in-lb)



- Ring gear-to-drive pinion backlash.

Check backlash of ring gear with a dial indicator at several points.

Ring gear-to-drive pinion backlash:



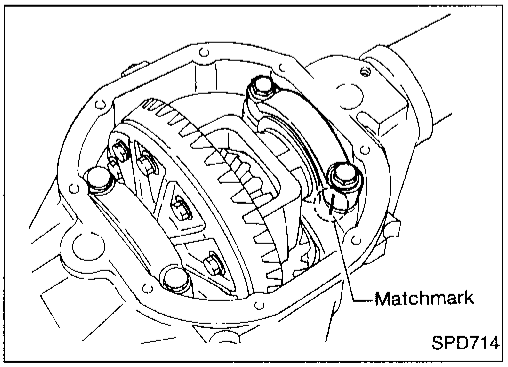
0.13 - 0.18 mm (0.0051 - 0.0071 in)

- Ring gear runout

Check runout of ring gear with a dial indicator.

Runout limit: 0.05 mm (0.0020 in)

- Tooth contact



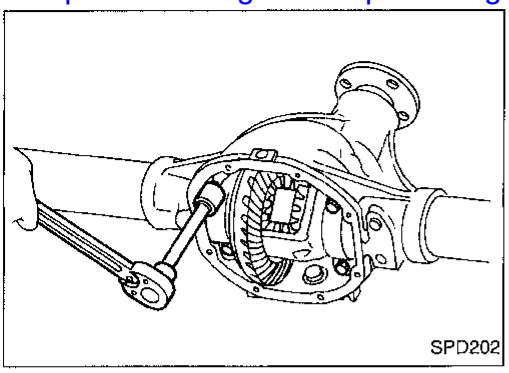
Check tooth contact. Refer to "ADJUSTMENT", PD-63.

- Side gear-to-pinion mate gear backlash

Measure clearance between side gear thrust washer and differential case with a feeler gauge.

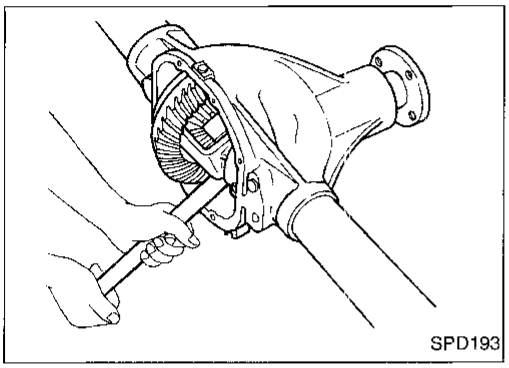
Clearance between side gear thrust washer and differential case:

Less than 0.15 mm (0.0059 in)



Differential Carrier

1. Remove rear cover and rear cover gasket.
2. Put match marks on one side of side bearing cap with paint or punch to ensure that it is replaced in proper position during reassembly.



Bearing caps are line-bored during manufacture and should be put back in their original places.

Differential Carrier (Cont'd)

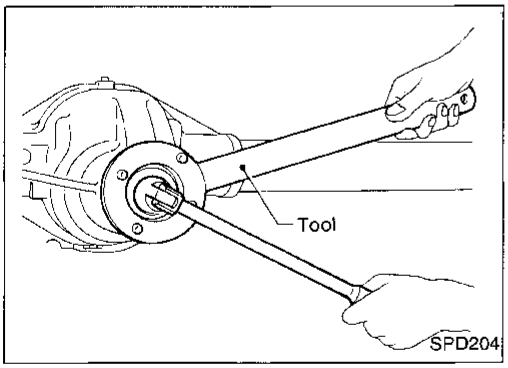
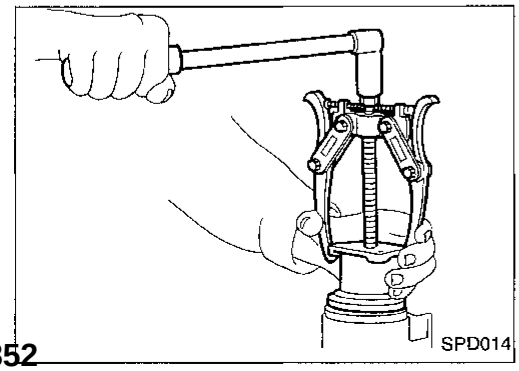
3. Remove side bearing caps.



SPD193

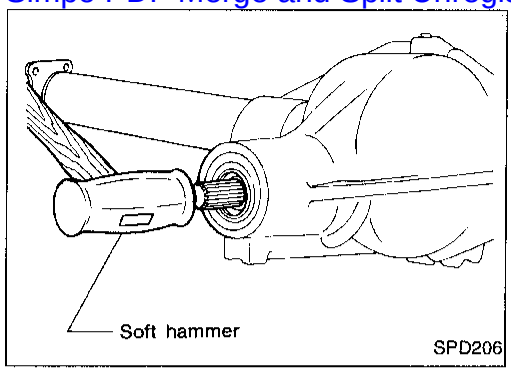
4. Remove differential case assembly with pry bar.



SPD745

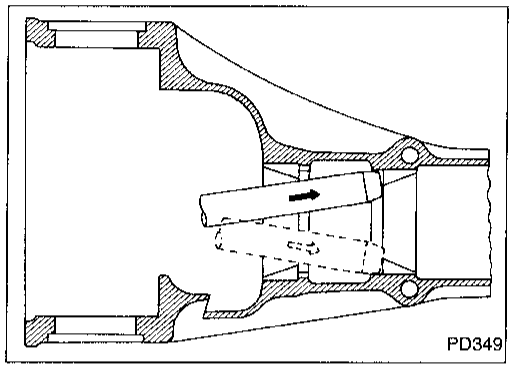
Keep the side bearing outer races together with their respective inner cones — do not mix them up.

SPD204



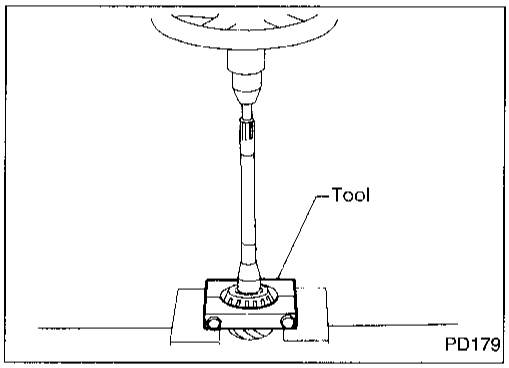
5. Remove pinion nut with Tool.
   Tool number: ST38060002 (J34311)

SPD014



6. Remove companion flange with puller.

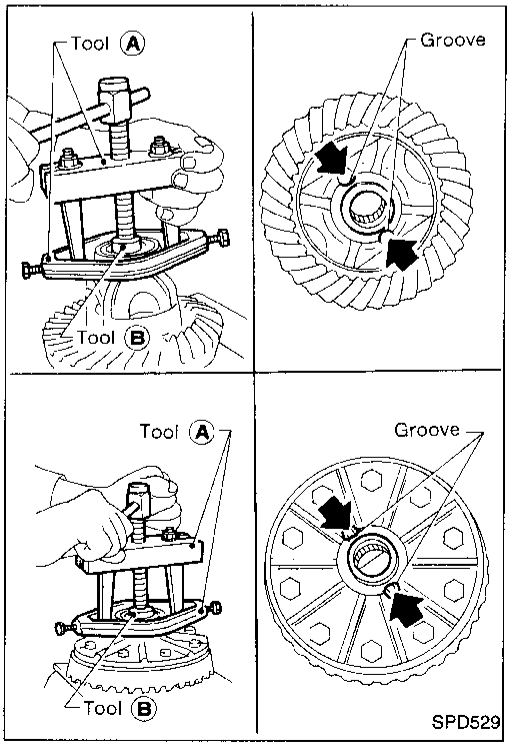
Differential Carrier (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

7. Remove drive pinion with soft hammer.
8. Remove front oil seal and pinion front bearing inner cone.

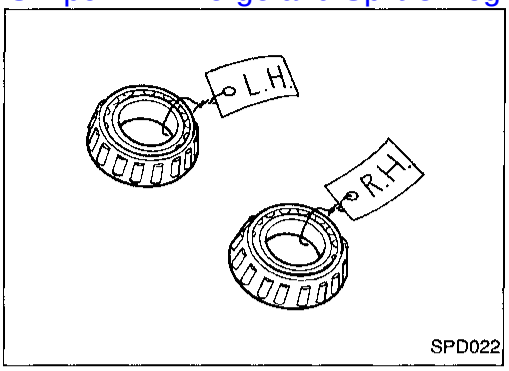
9. Remove pinion bearing outer races with a brass drift.



10. Remove pinion rear bearing inner cone and pinion height adjusting washer.
    Tool number: ST30031000 (J22912-01)

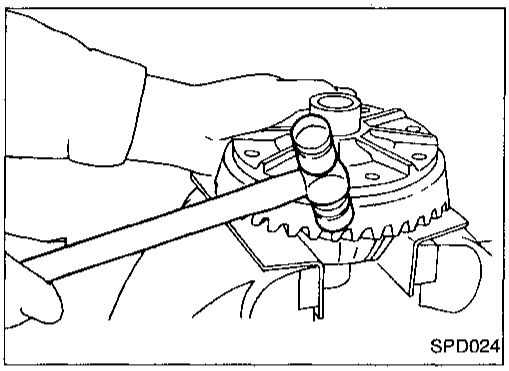
Differential Case

1. Remove side bearing inner cones.



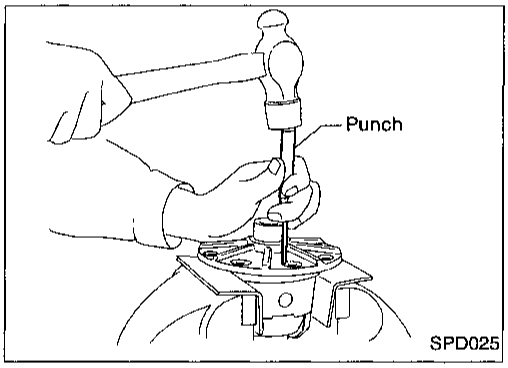
To prevent damage to bearing, engage puller jaws in grooves.

Tool numbers:
Ⓐ ST33051001 (J22888-20)
Ⓑ ST33061000 (J8107-2)



Differential Case (Cont'd)

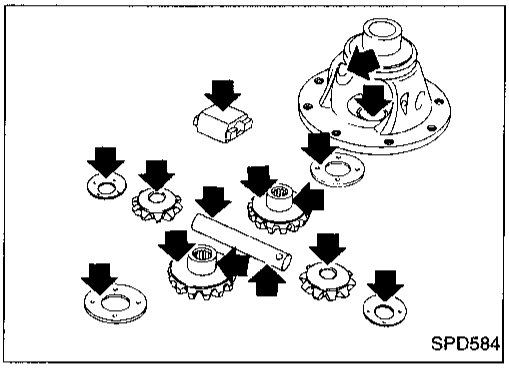
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Be careful not to confuse the right and left hand parts.

2. Loosen ring gear bolts in a criss-cross fashion.
3. Tap ring gear off the differential case with a soft hammer.

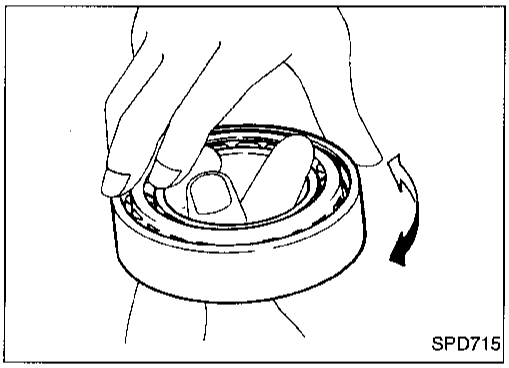
Tap evenly all around to keep ring gear from binding.



4. Punch off pinion mate shaft lock pin from ring gear side.

Lock pin is calked at pin hole mouth on differential case.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Ring Gear and Drive Pinion

Check gear teeth for scoring, cracking or chipping. If any damaged part is evident, replace ring gear and drive pinion as a set (hypoid gear set).

SPD584

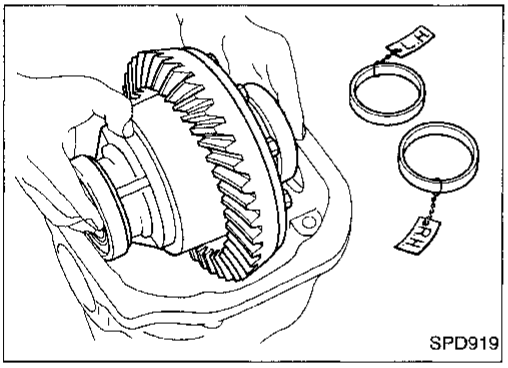
Differential Case Assembly

Check mating surfaces of differential case, side gears, pinion mate gears, pinion mate shaft, thrust block and thrust washers.

SPD715

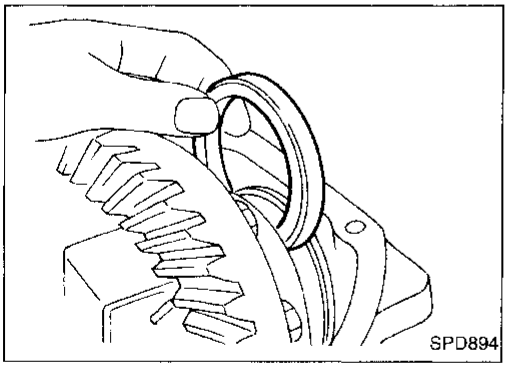
Bearing

1. Thoroughly clean bearing.
2. Check bearings for wear, scratches, pitting or flaking. Check tapered roller bearing for smooth rotation. If damaged, replace outer race and inner cone as a set.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

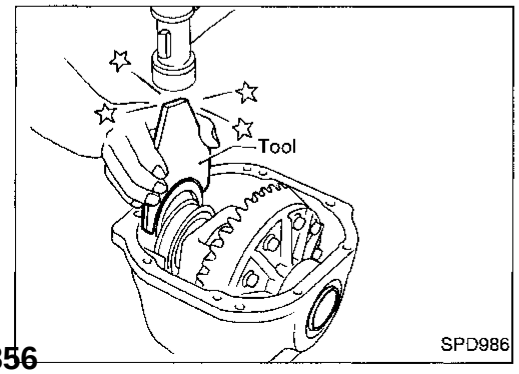
For quiet and reliable final drive operation, the following five adjustments must be made correctly.



1. Side bearing preload
2. Pinion gear height
3. Pinion bearing preload. Refer to "ASSEMBLY", PD-66.
4. Ring gear-to-pinion backlash. Refer to "ASSEMBLY", PD-67.
5. Ring and pinion gear tooth contact pattern

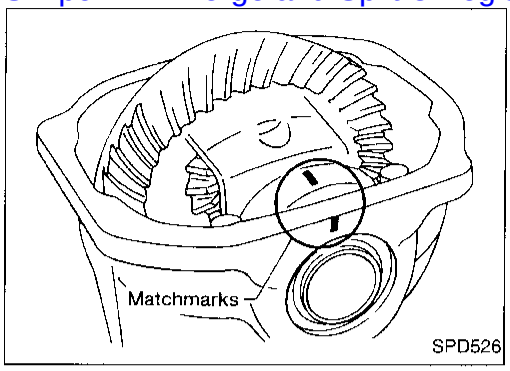
Side Bearing Preload

A selection of carrier side bearing preload shims is required for successful completion of this procedure.

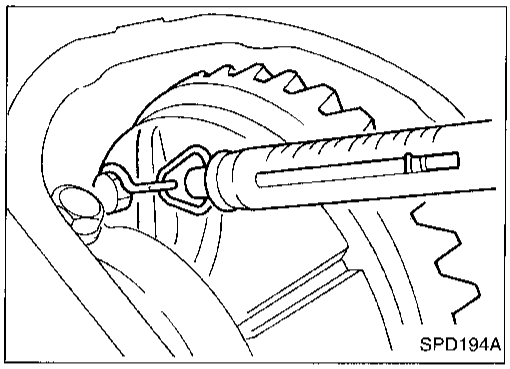


1. Make sure all parts are clean. Make sure, also, the bearings are well lubricated with light oil or type "DEXRON™" automatic transmission fluid.
2. Place the differential carrier, with side bearings and bearing races installed, into the final drive housing.

3. Put the side bearing spacer in place.

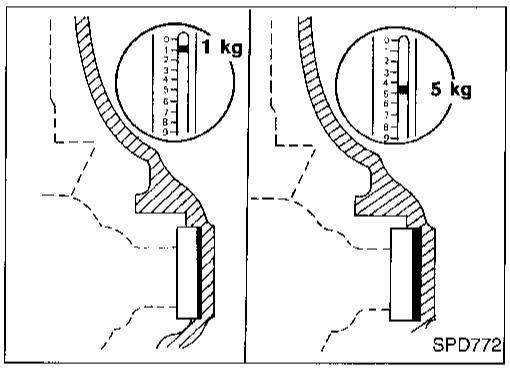


CAUTION:
Side bearing spacer is placed on either the right or left depending upon final drive gear ratio. Be sure to replace it on the correct side.

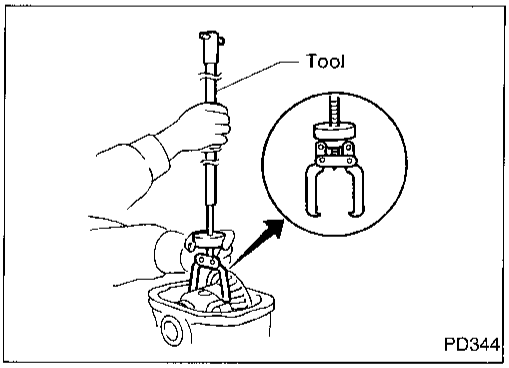


4. Use Tool to place original carrier side bearing preload shims on the carrier end, opposite the ring gear.
   Tool number: KV38100600 (J25267)

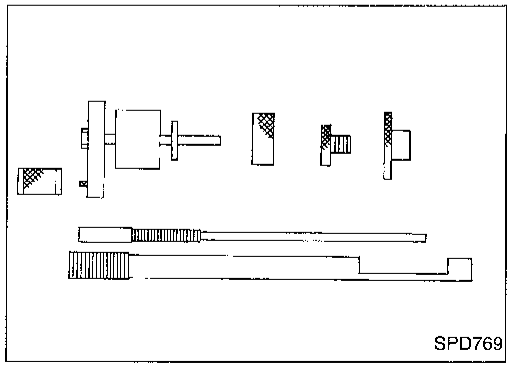
Side Bearing Preload (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



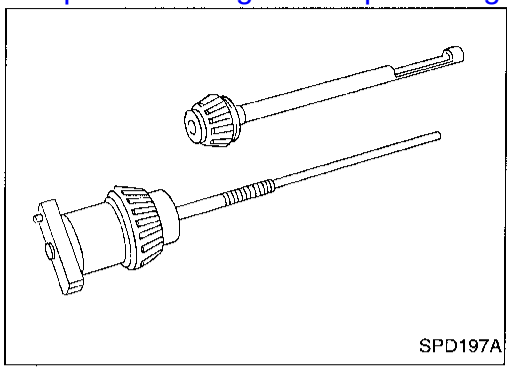
5. Install the side bearing caps in their correct locations and torque the bearing cap retaining bolts.
   Specification:
   88 - 98 N·m
   (9.0 - 10.0 kg-m, 65 - 72 ft-lb)
6. Turn the carrier several times to seat the bearings.



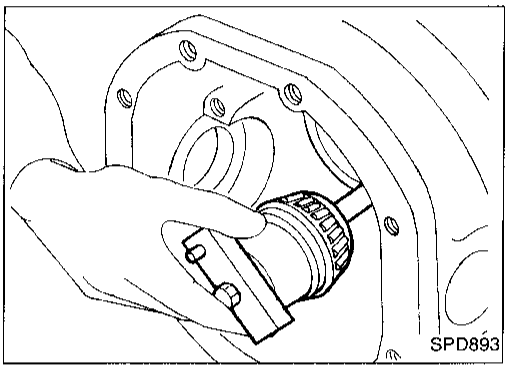
7. Measure the turning torque of the carrier at the ring gear retaining bolts with a spring gauge, J8129.
   Specification:
   34.3 - 39.2 N
   (3.5 - 4.0 kg, 7.7 - 8.8 lb)
   of pulling force at the ring gear bolt

8. If the turning torque is not within the specifications, correct the torque as follows:
   - If the turning torque is less than the specified range, install washers of greater thickness.
   - If the turning torque is greater than the specification, install thinner washers.
   - See the SDS section for washer dimensions and part numbers.
9. Record the total amount of washer thickness required for the correct carrier side bearing preload.

10. Remove the carrier from the final drive housing. Save the selected preload washers for later use during the assembly of the final drive unit.

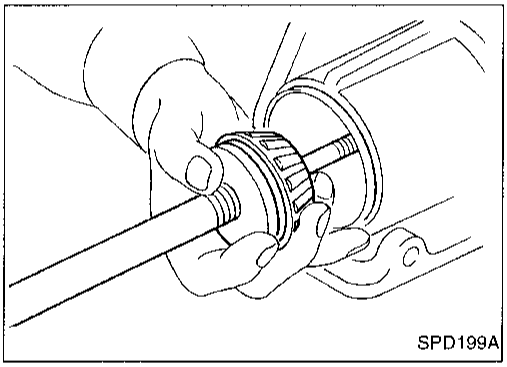


Pinion Gear Height



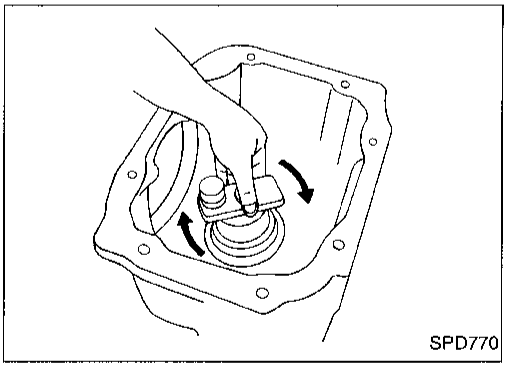
1. Make sure all parts are clean and that the bearings are well lubricated.
2. Assemble the pinion gear bearings into the pinion preload shim selector Tool, J34309.

Pinion Gear Height (Cont'd)



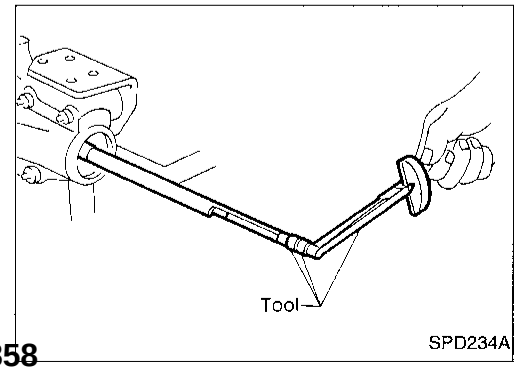
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SPD197A



- **Front pinion bearing** — make sure the J34309-3 front pinion bearing seat is secured tightly against the J34309-2 gauge anvil. Then turn the front pinion bearing pilot, J34309-5, to secure the bearing in its proper position.
- **Rear pinion bearing** — the rear pinion bearing pilot, J34309-8, is used to center the rear pinion bearing only. The rear pinion bearing locking seat, J34309-4, is used to lock the bearing to the assembly.

SPD893



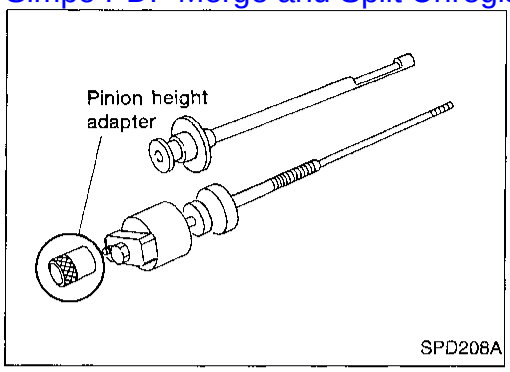
3. Install the pinion rear bearing inner cone into the final drive housing. Then place the pinion preload shim selector Tool, J34309-1, gauge screw assembly.

SPD199A

4. Assemble the front pinion bearing inner cone and the J34309-2 gauge anvil. Assemble them together with the J34309-1 gauge screw in the final drive housing. Make sure that the pinion height gauge plate, J34309-16, will turn a full 360 degrees. Tighten the two sections together by hand.

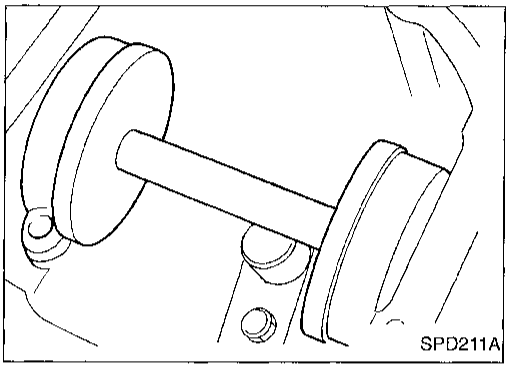
SPD770

5. Turn the assembly several times to seat the bearings.



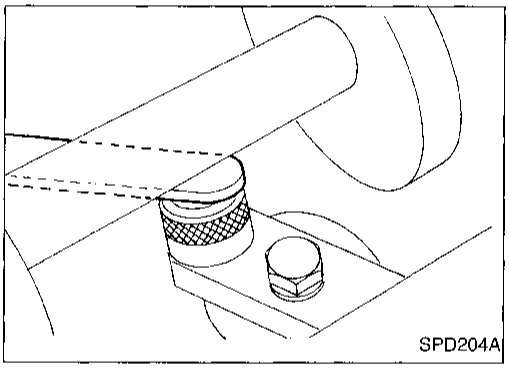
SPD234A

6. Measure the turning torque at the end of the J34309-2 gauge anvil using Tool.
   Tool number: ST3127S000 (J25765-A)
   Turning torque specification:
   1.0 - 1.3 N·m
   (10 - 13 kg-cm, 8.7 - 11.3 in-lb)



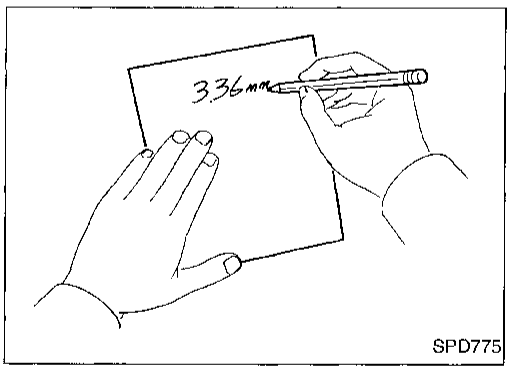
Pinion Gear Height (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



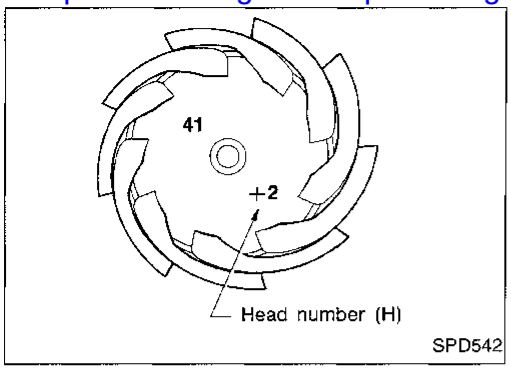
7. Place the J34309-11 pinion height adapter onto the gauge plate and tighten it by hand.

CAUTION:
Make sure all machined surfaces are clean.



PINION HEIGHT ADJUSTING WASHER SELECTION

8. Now, position the side bearing discs, J25269-4, and arbor firmly into the side bearing bores.
   Install the side bearing caps and tighten the cap bolts to proper torque.

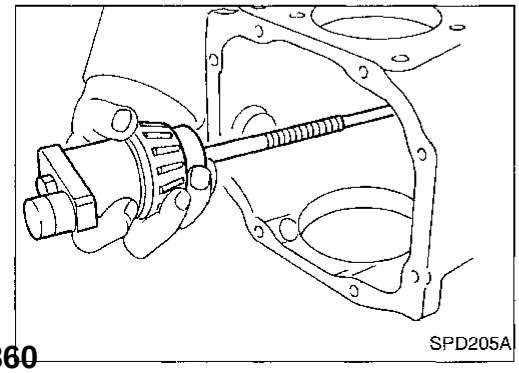


9. Select the correct standard pinion height adjusting washer thickness. Select by using a standard gauge of 3 mm (0.12 in) and J34309-101 feeler gauge. Measure the distance between the J34309-11 pinion height adapter including the standard gauge and the arbor.

10. Write down your exact measurement (the value of feeler gauge).

Pinion Gear Height (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



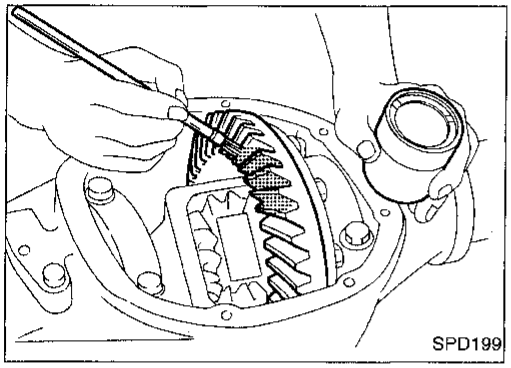
11. Correct the pinion height washer size by referring to the "pinion head number".

There are two numbers painted on the pinion gear. The first one refers to the pinion and ring gear as a matched set. This number should be the same as the number on the ring gear. The second number is the "pinion head height number". It refers to the ideal pinion height from standard for quietest operation. Use the following chart to determine the correct pinion height washer.

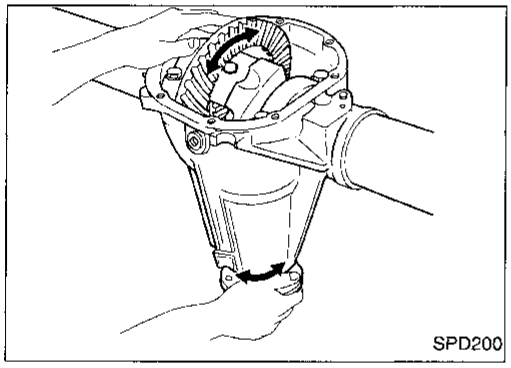
Use the following chart to determine the correct pinion height washer:

Pinion head height number	Add or remove from the standard pinion height washer thickness measurement
−6	Add 0.06 mm (0.0024 in)
−5	Add 0.05 mm (0.0020 in)
−4	Add 0.04 mm (0.0016 in)
−3	Add 0.03 mm (0.0012 in)
−2	Add 0.02 mm (0.0008 in)
−1	Add 0.01 mm (0.0004 in)
0	Use the selected washer thickness
+1	Subtract 0.01 mm (0.0004 in)
+2	Subtract 0.02 mm (0.0008 in)
+3	Subtract 0.03 mm (0.0012 in)
+4	Subtract 0.04 mm (0.0016 in)
+5	Subtract 0.05 mm (0.0020 in)
+6	Subtract 0.06 mm (0.0024 in)

12. Select the correct pinion height washer.
    Drive pinion height adjusting washer:
    Refer to SDS, PD-73.



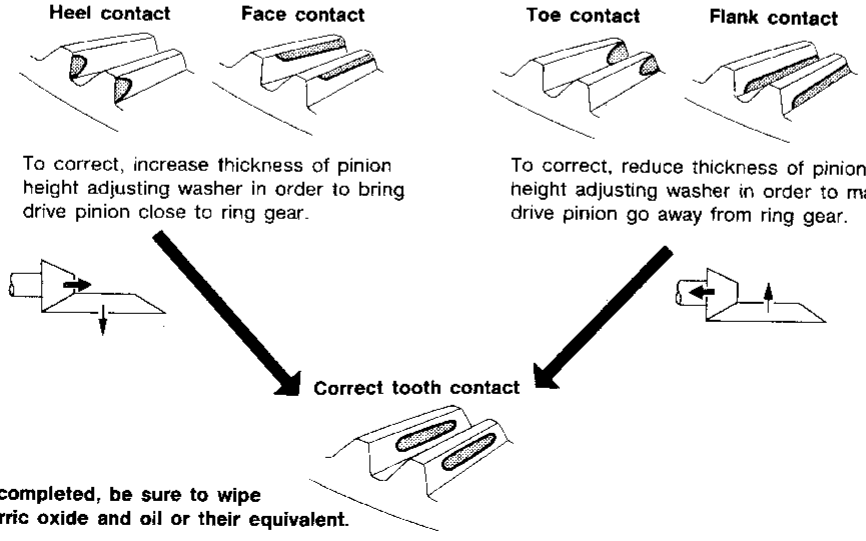
13. Remove the J34309 pinion preload shim selector Tool from the final drive housing. Then disassemble to retrieve the pinion bearings.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Tooth Contact

Checking gear tooth contact pattern is necessary to verify correct relationship between ring gear and drive pinion.
Hypoid gear set which is not positioned properly may be noisy, or have short life or both. With the checking or gear tooth contact pattern, the most desirable contact for low noise level and long life can be assured.



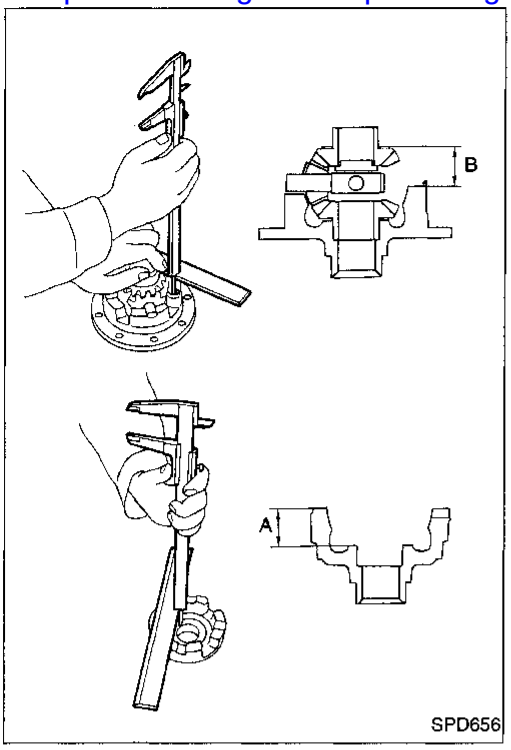
SPD199

1. Thoroughly clean ring gear and drive pinion teeth.
2. Sparingly apply a mixture of powdered ferric oxide and oil or equivalent to 3 or 4 teeth of ring gear drive side.

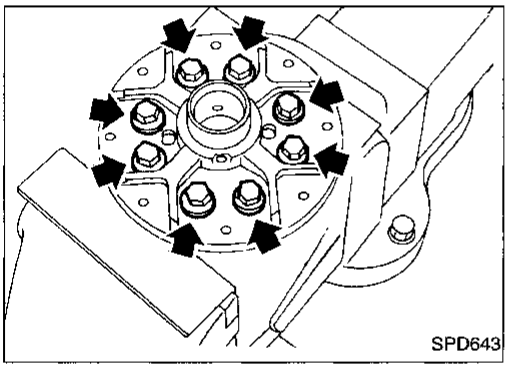
SPD200

3. Hold companion flange steady and rotate the ring gear in both directions.

Usually the pattern will be correct if shims are correctly calculated and the backlash is correct.
However, in rare cases, trial and error processes may be employed to obtain a correct pattern.
The tooth pattern is the best indication of how well a differential has been set up.

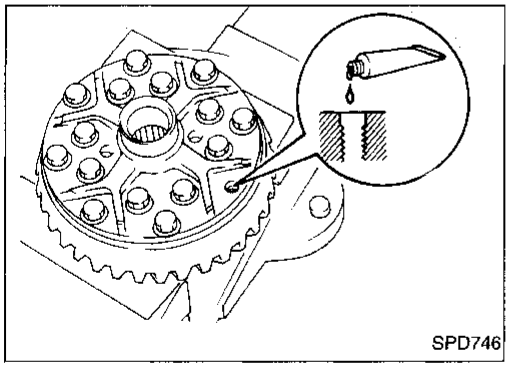


When adjustment is completed, be sure to wipe off completely the ferric oxide and oil or their equivalent.



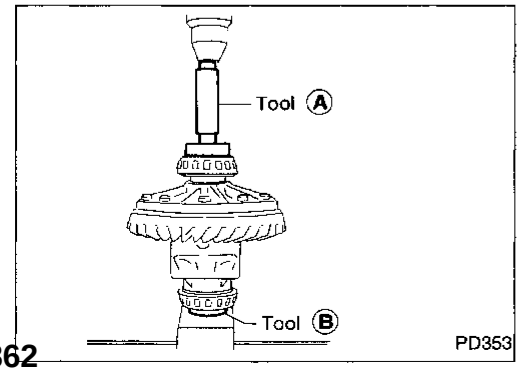
APD018

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



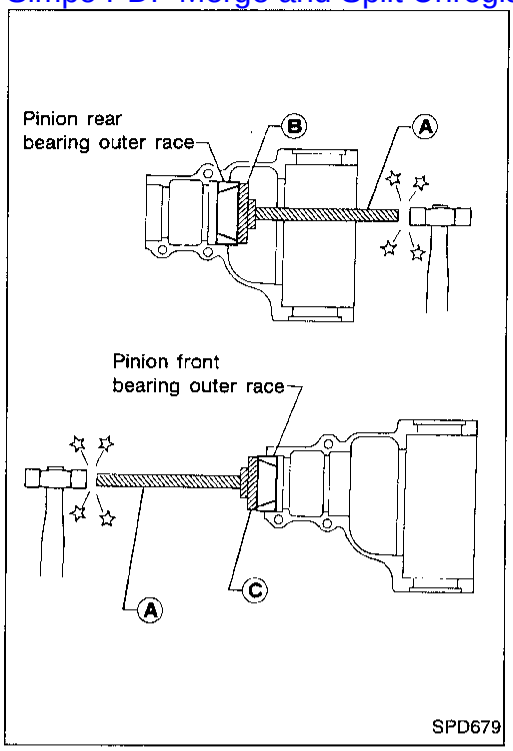
Differential Case

1. Measure clearance between side gear thrust washer and differential case.
   Clearance between side gear thrust washer and differential case (A – B):
   Less than 0.15 mm (0.0059 in)
   The clearance can be adjusted with side gear thrust washer. Refer to SDS, PD-73.
2. Apply gear oil to gear tooth surfaces and thrust surfaces and check to see they turn properly.

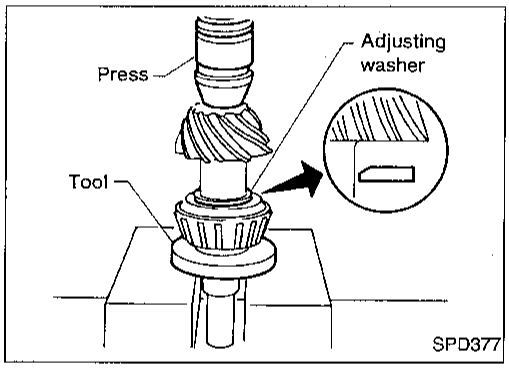


3. Install differential case LH and RH.

4. Place differential case on ring gear.
5. Apply locking agent [Locktite (stud lock) or equivalent] to ring gear bolts, and install them.

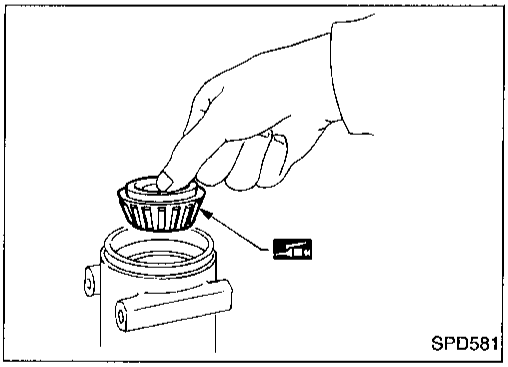


Tighten bolts in a criss-cross fashion, lightly tapping bolt head with a hammer.

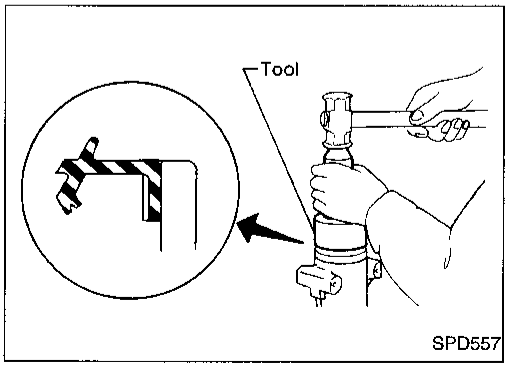


6. Press-fit side bearing inner cones on differential case with Tool.
   Tool numbers:
   Ⓐ ST33230000 (J25805-01)
   Ⓑ ST33061000 (J8107-2)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

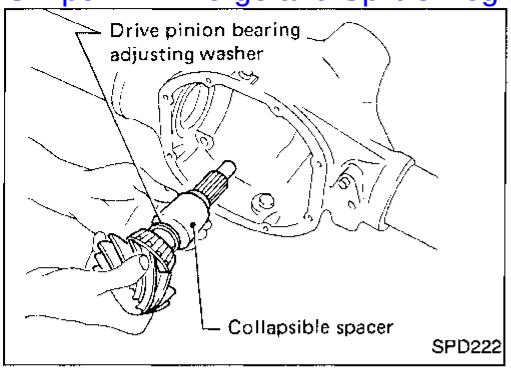


Differential Carrier

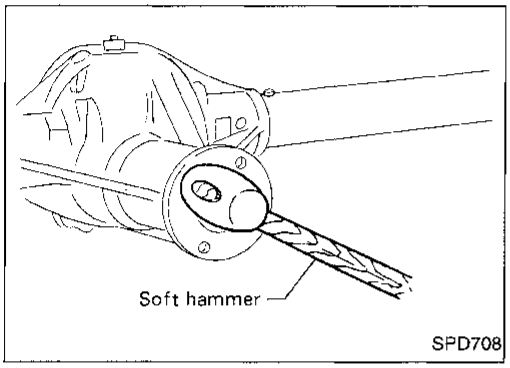


1. Press-fit front and rear bearing outer races with Tools.
   Tool numbers:
   - **Ⓐ ST30611000 (J25742-1)**
   - **Ⓑ ST30621000 (J25742-5)**
   - **Ⓒ ST30613000 (J25742-3)**

2. Select pinion height adjusting washer. Refer to "ADJUSTMENT", PD-59.
3. Install pinion height adjusting washer in drive pinion, and press-fit rear bearing inner cone in it, with press and Tool.
   Tool number: ST30901000 (J26010-01)

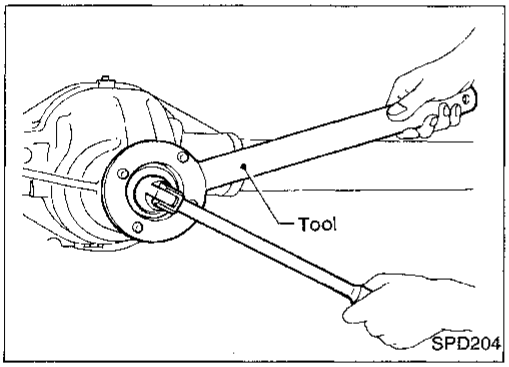


4. Place pinion front bearing inner cone in gear carrier.



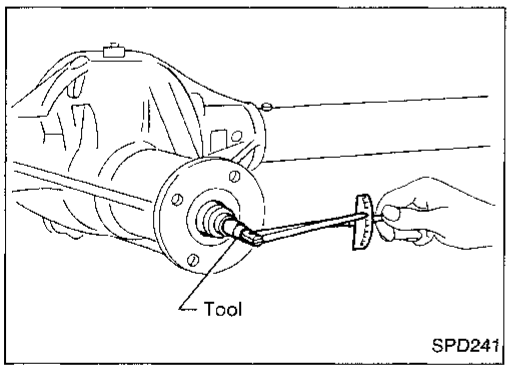
5. Apply multi-purpose grease to cavity at sealing lips of oil seal. Install front oil seal.
   Tool number: KV38100500 (J25273)

Differential Carrier (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

6. Place drive pinion bearing spacer, drive pinion bearing adjusting washer and drive pinion in gear carrier.



7. Insert companion flange into drive pinion by tapping the companion flange with a soft hammer.

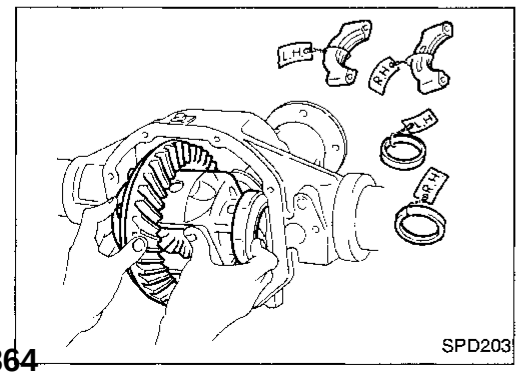
8. Tighten pinion nut to 127 N·m (13 kg-m, 94 ft-lb).

The threaded portion of drive pinion and pinion nut should be free from oil or grease.

Tool number: ST38060002 (J34311)

9. Tighten the pinion nut by very small degrees until the specified preload is achieved. When checking the preload, turn the drive pinion in both directions several times to set the bearing rollers.

Tool number: ST3127S000 (J25765-A)

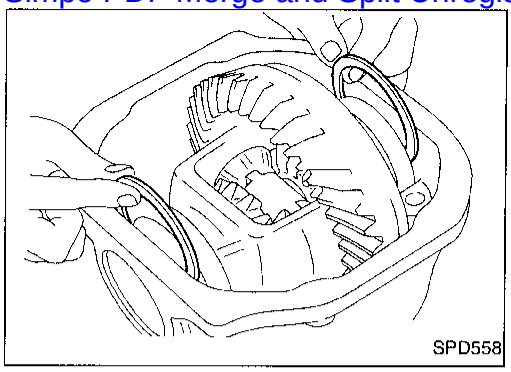


Pinion bearing preload:

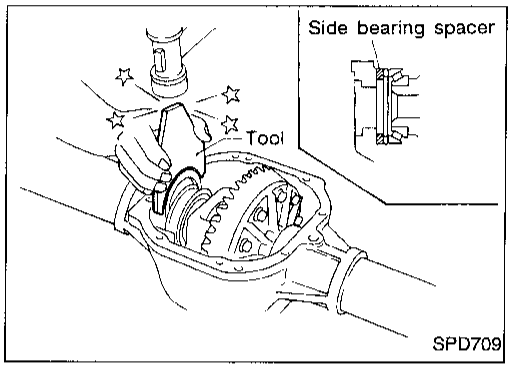
1.1 - 1.7 N·m

(11 - 17 kg-cm, 9.5 - 14.8 in-lb)

This procedure will have to be repeated if:

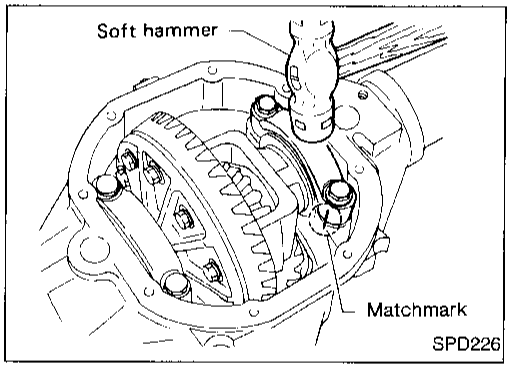


- **Maximum preload is achieved before the minimum pinion nut torque is reached.**
- **Minimum preload is not achieved before maximum pinion nut torque is reached.**

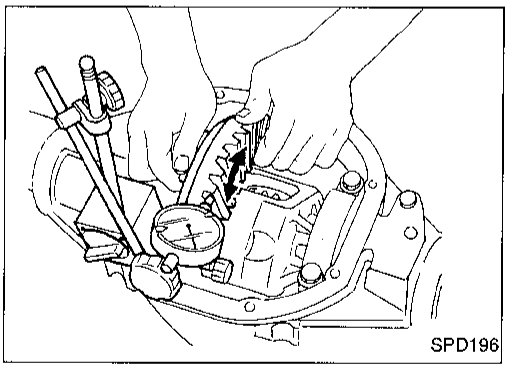


10. Select side bearing adjusting washer.
    Refer to Adjustment PD-58.
11. Install differential case assembly with side bearing outer races into gear carrier.

Differential Carrier (Cont'd)

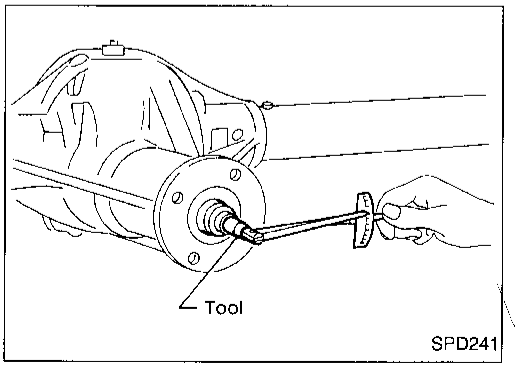


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



12. Insert left and right side bearing adjusting washers in place between side bearing and carrier.

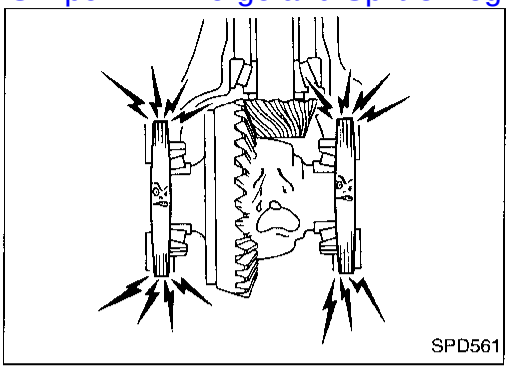
13. Drive in side bearing spacer with Tool.
Tool number: KV38100600 (J25267)



14. Align mark on bearing cap with that on gear carrier and install bearing cap on gear carrier.

15. Measure ring gear-to-drive pinion backlash with a dial indicator.
Ring gear-to-drive pinion backlash:
0.13 - 0.18 mm
(0.0051 - 0.0071 in)

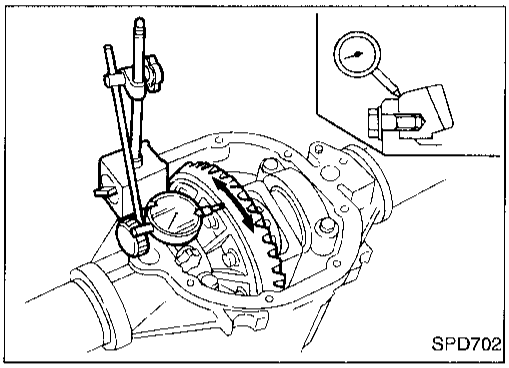
- If backlash is too small, decrease thickness of right shim and increase thickness of left shim by the same amount.
If backlash is too great, reverse the above procedure.



Never change the total amount of shims as it will change the bearing preload.

16. Check total preload with Tool.
When checking preload, turn drive pinion in both directions several times to seat bearing rollers correctly.
Total preload:
1.2 - 2.3 N·m
(12 - 23 kg-cm, 10 - 20 in-lb)
Tool number: ST3127S000 (J25765-A)

Differential Carrier (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SPD561

- If preload is too great, remove the same amount of shim from each side.
- If preload is too small, add the same amount of shim to each side.

Never add or remove a different number of shims for each side as it will change ring gear-to-drive pinion backlash.

17. Recheck ring gear-to-drive pinion backlash because increase or decrease in thickness of shims will cause change of ring gear-to-pinion backlash.

SPD702

18. Check runout of ring gear with a dial indicator.
    Runout limit:
    0.05 mm (0.0020 in)
- If backlash varies excessively in different places, the variance may have resulted from foreign matter caught between the ring gear and the differential case.
- If the backlash varies greatly when the runout of the ring gear is within a specified range, the hypoid gear set or differential case should be replaced.

19. Check tooth contact.
    Refer to "ADJUSTMENT", PD-63.
20. Install rear cover and gasket.

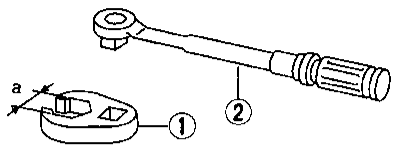
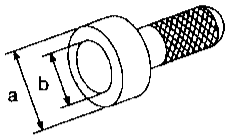
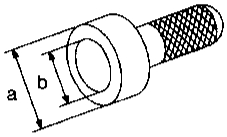
Precautions

- **When installing rubber parts, final tightening must be carried out under unladen condition* with tires on ground.**
  ***: Fuel, radiator coolant and engine oil full. Spare tire, jack, hand tools and mats in designated positions.**
- **Use flare nut wrench when removing and installing brake tubes.**
- **After installing removed suspension parts, check wheel alignment and adjust if necessary.**
- **Always torque brake lines when installing.**







Special Service Tools

The actual shapes of Kent-Moore tools may differ from those of special service tools illustrated here.

Tool number Kent-Moore No. Tool name	Description	
KV40101000 (J25604-01) Axle stand	 NT159	Removing rear axle shaft
ST36230000 (J25840-A) Sliding hammer	 NT126	Removing rear axle shaft
ST38020000 (—) Bearing lock nut wrench	 NT160	Removing wheel bearing lock nut
KV40106500 (J25852-B) Rear axle shaft bearing puller	 NT683	Removing wheel bearing and ABS sensor rotor
ST37840000 (—) Rear axle shaft guide	 NT162	Installing rear axle shaft

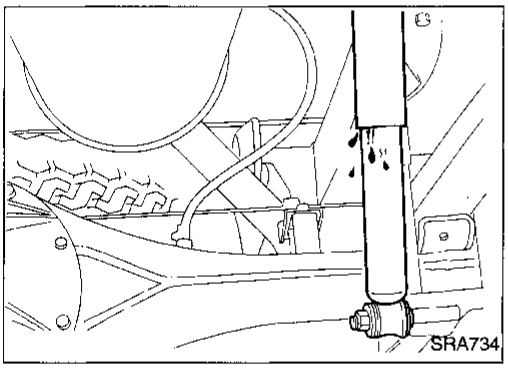
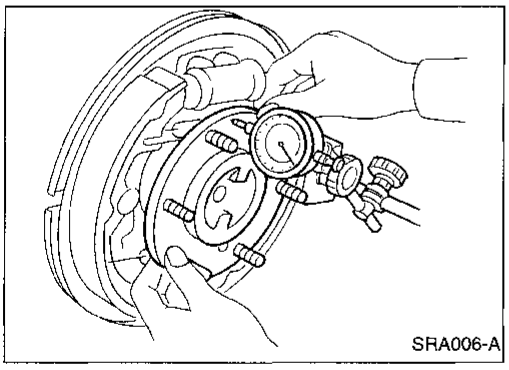
SMA525A



Rear Axle and Rear Suspension Parts

Check rear axle and rear suspension parts for excessive play, wear and damage.



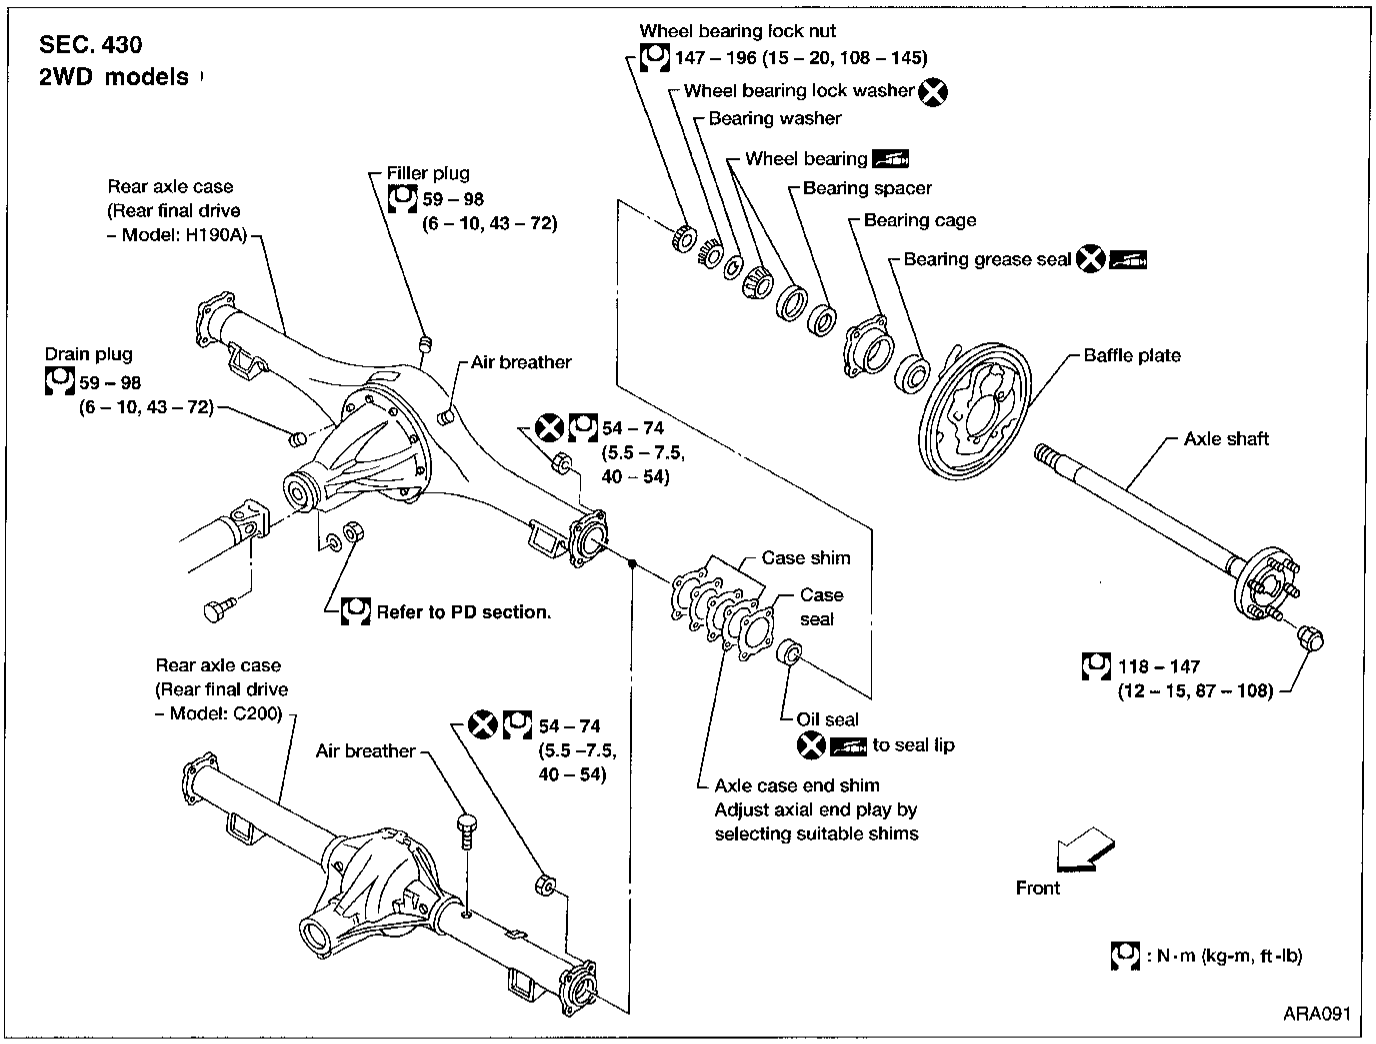
- Shake each rear wheel to check for excessive play.

SRA839

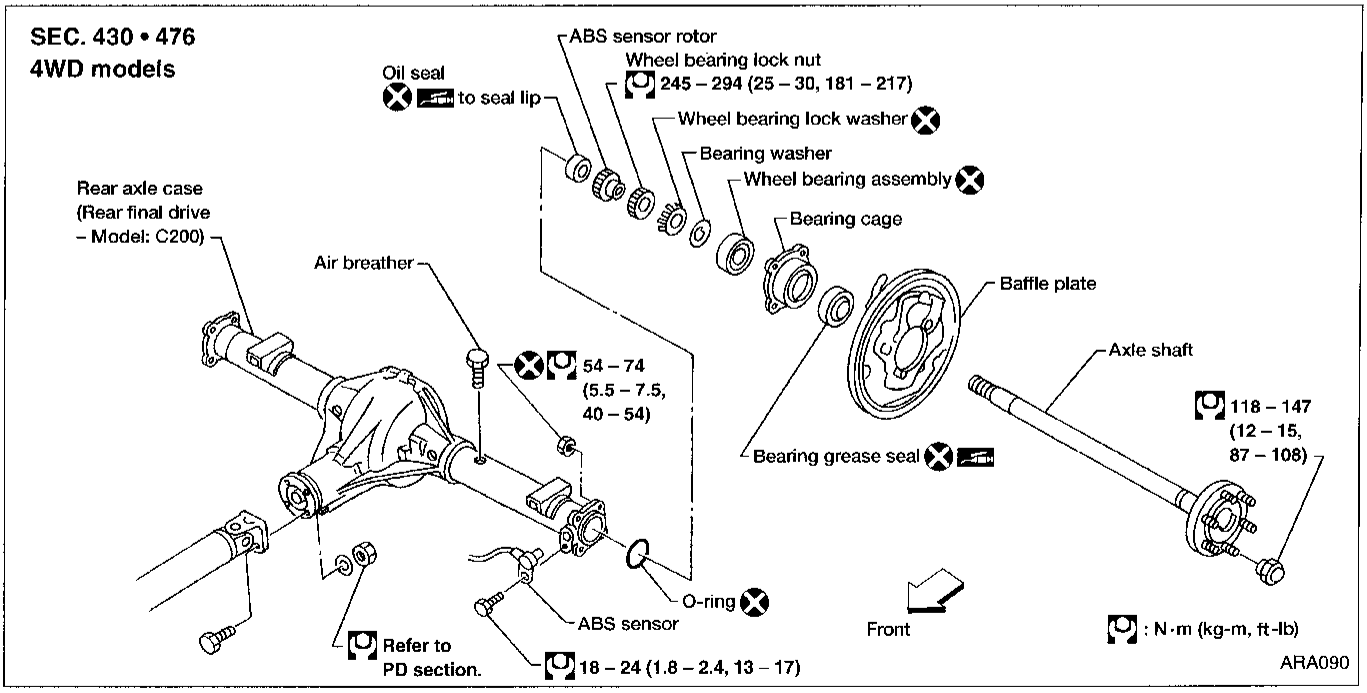
- Retighten all nuts and bolts to the specified torque.
  : Refer to REAR SUSPENSION, RA-14.

SRA734

- Check shock absorber for oil leakage and other damage.
- Check shock absorber bushing for excessive wear and other damage.



SRA006-A

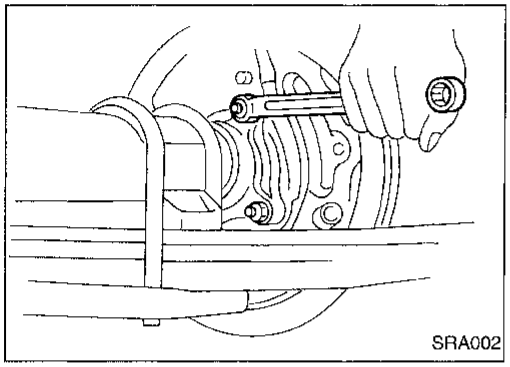


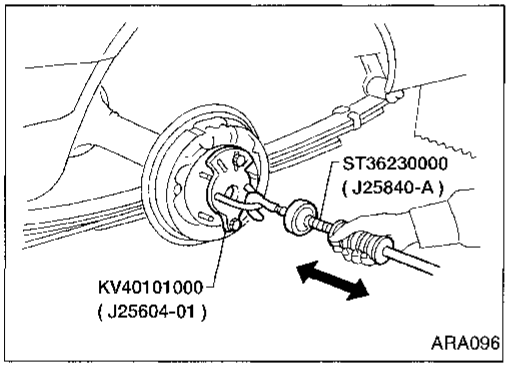
Rear Wheel Bearing

- Check that wheel bearings operate smoothly.
- Check axial end play.
  Axial end play:
  Refer to SDS, RA-17.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Components



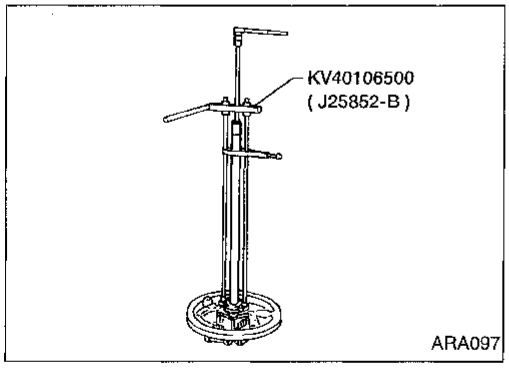


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

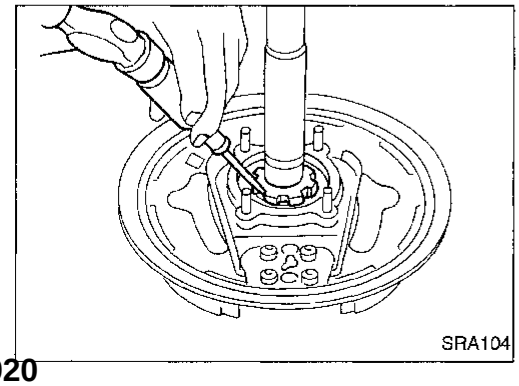
Removal

- **Before removing the rear axle, disconnect the ABS wheel sensor from the assembly. Then move it away from the axle. Failure to do so may result in damage to the sensor wires and the sensor becoming inoperative.**
- **Wheel bearing does not require maintenance. — 4WD models —**
- If growling noise is emitted from wheel bearing during operation, replace wheel bearing assembly.
- If the wheel bearing assembly is removed, it must be replaced. The old assembly must not be re-used.

1. Disconnect parking brake cable and brake tube.
2. Remove nuts securing wheel bearing cage with baffle plate.



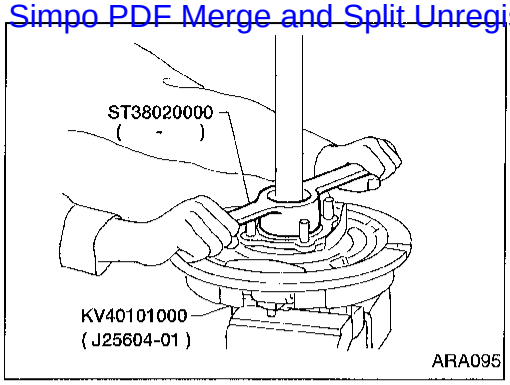
3. Draw out axle shaft with Tool.



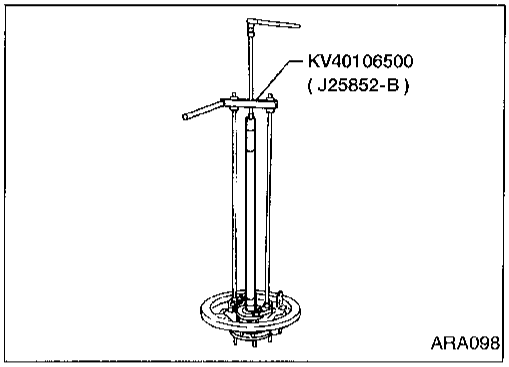
When drawing out axle shaft, be careful not to damage oil seal.

4. Remove case shim and case seal.
   — 2WD —
5. Remove O-ring. — 4WD models —
6. Remove oil seal.

Do not reuse oil seal once it is removed.
Always install new one.

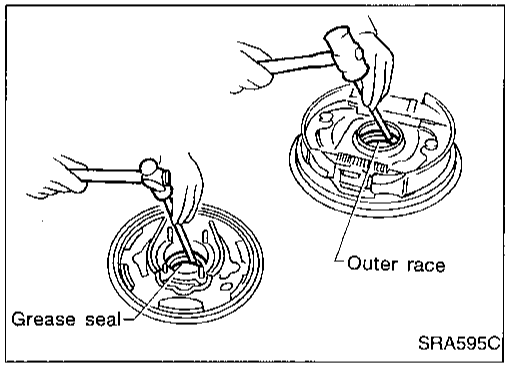


7. Remove ABS sensor rotor. — 4WD models —

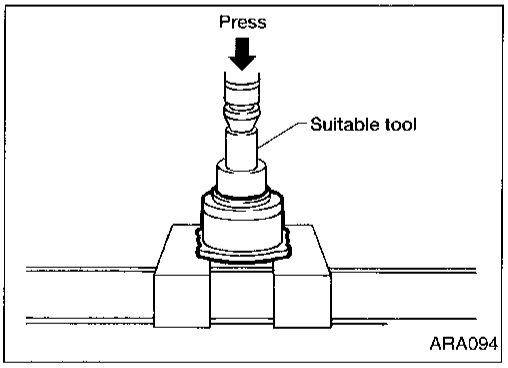


8. Unbend lock washer with a screwdriver.

Removal (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



9. Remove bearing lock nut with tool.

10. Remove wheel bearing together with bearing cage and baffle plate from axle shaft.

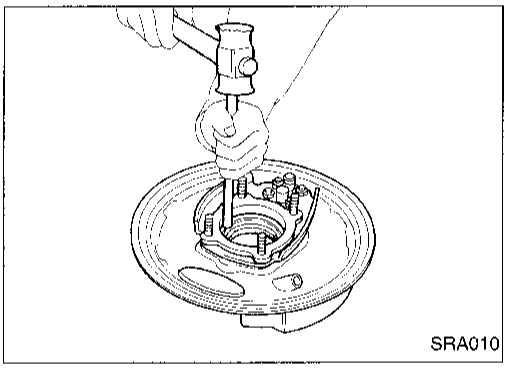
11. Remove grease seal in bearing cage with suitable bar.
12. Remove wheel bearing outer race with a brass drift.
— 2WD models —

13. Remove wheel bearing assembly. — 4WD models —

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection

AXLE SHAFT

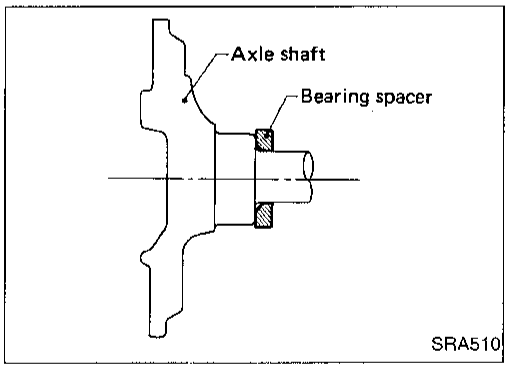


- Check axle shaft for straightness, cracks, damage, wear and distortion. Replace if necessary.

WHEEL BEARING

- Make sure wheel bearing rolls freely and is free from noise, cracks, pitting and wear.

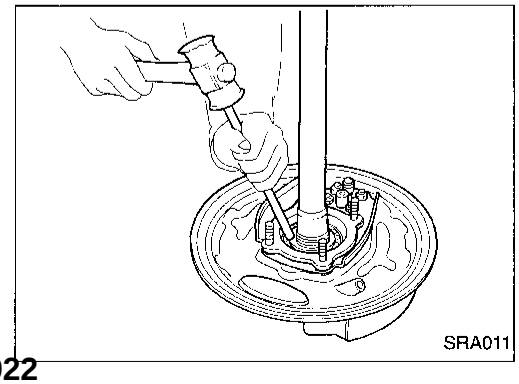
AXLE CASE



- Check axle case for yield, deformation and cracks. Replace if necessary.

SRA010

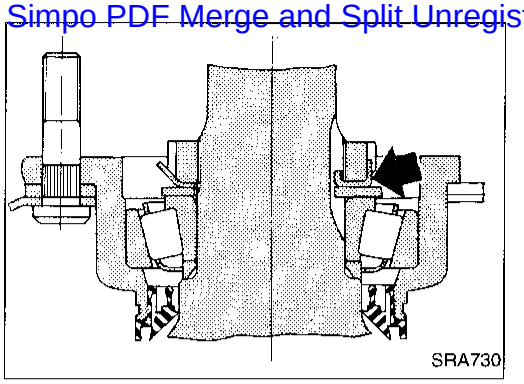
Installation — 2WD models —



1. Install wheel bearing outer race with a brass drift.
2. Install a new grease seal in bearing cage.

After installing new grease seal, coat sealing lip with multi-purpose grease.

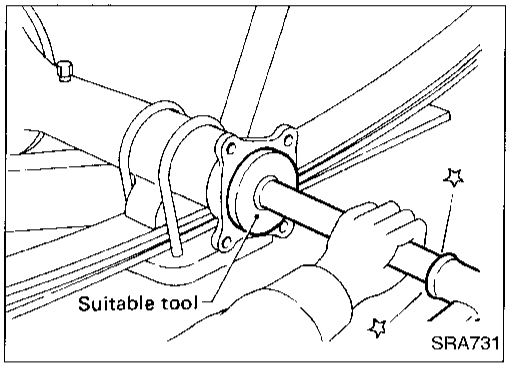
SRA510



3. Install bearing spacer with chamfer side facing axle shaft flange.

SRA011

4. Install wheel bearing inner race with a brass drift.
5. Coat each bearing cone with multi-purpose grease.
   Specified amount of grease:
   8 - 12 g (0.28 - 0.42 oz)

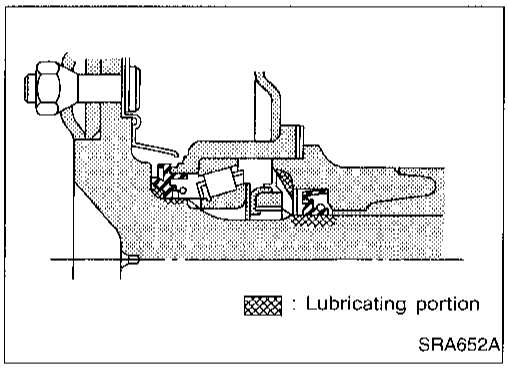


Installation — 2WD models — (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

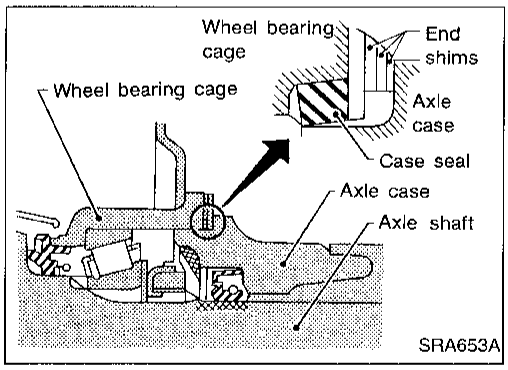
SRA730

6. Install plain washer and a new wheel bearing lock washer.
7. Tighten wheel bearing lock nut.



Fit wheel bearing lock washer lip in wheel bearing lock nut groove correctly by tightening lock nut. Be sure to bend it up.

SRA731

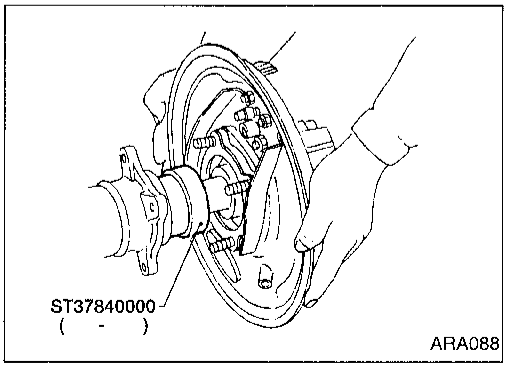


8. Install a new oil seal with suitable tool.

After installing new oil seal, coat sealing lip with multi-purpose grease.

SRA652A

9. Apply recess of axle case end with multi-purpose grease.
10. Apply gear oil to the spline of axle shaft. Coat seal surface of axle shaft with multi-purpose grease (as shown left).



SRA653A

11. Adjust axial end play.

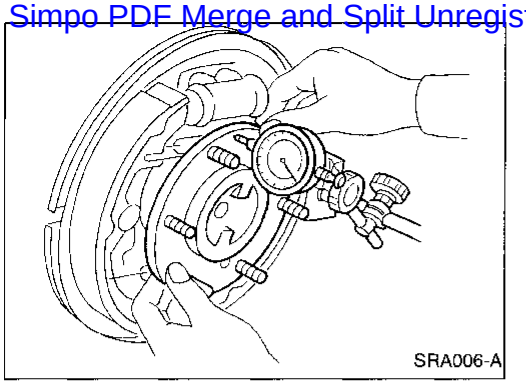
a. Select end shims.

Standard thickness including seal: 1.5 mm (0.059 in)
Axle case end shim: Refer to SDS, RA-17.

Do not insert end shims between case seal and bearing cage.

ARA088

b. Insert axle shaft with Tool as a guide.



When inserting axle shaft, be careful not to damage oil seal.

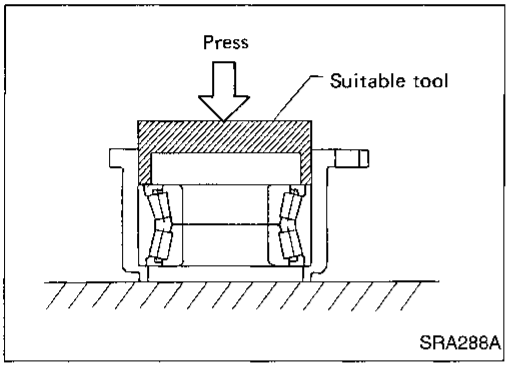
c. Measure end play of axle shaft.

Axial end play:
Servicing only one side of axle shaft
0.02 - 0.15 mm (0.0008 - 0.0059 in)
Servicing both side axle shafts
On first axle shaft (right or left) adjust axial end play
0.30 - 0.90 mm (0.0118 - 0.0354 in)
After servicing second axle shaft, total end play
0.02 - 0.15 mm (0.0008 - 0.0059 in)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Installation — 2WD models — (Cont'd)

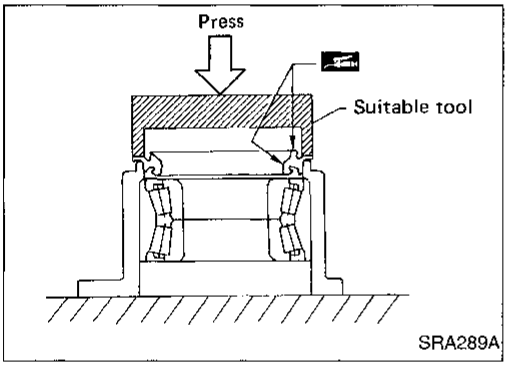
d. If axial end play is not within the specified limit, reselect axle case end shims.



While adjusting axial end play, be careful not to damage oil seal.

Installation — 4WD models —

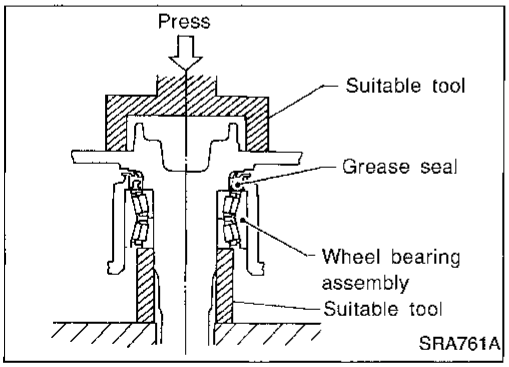
1. Press new wheel bearing until it bottoms end face of bearing cage.



Maximum load P:
78 kN (8 ton, 8.8 US ton, 7.9 Imp ton)

Always press outer race of wheel bearing during installation.

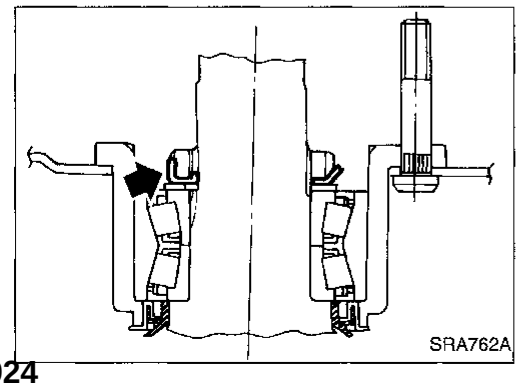
2. Press new grease seal until it bottoms end face of bearing cage.



After installing new grease seal, coat sealing lip with multi-purpose grease.

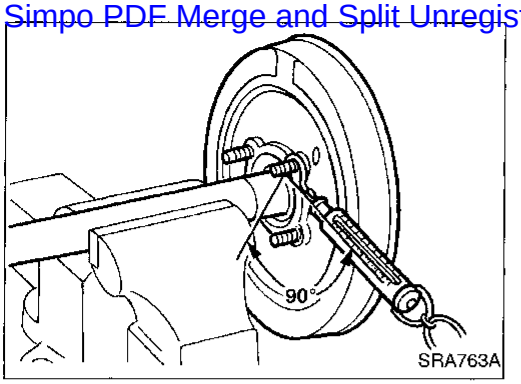
3. Press axle shaft into inner race of wheel bearing.

Maximum load P:
47.1 kN (4.8 ton, 5.3 US ton, 4.72 Imp ton)



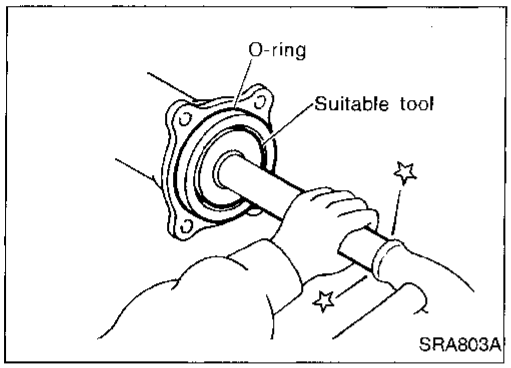
Be careful not to damage or deform grease seal.

4. Install plain washer and a new wheel bearing lock washer.
5. Tighten wheel bearing lock nut to specified torque.

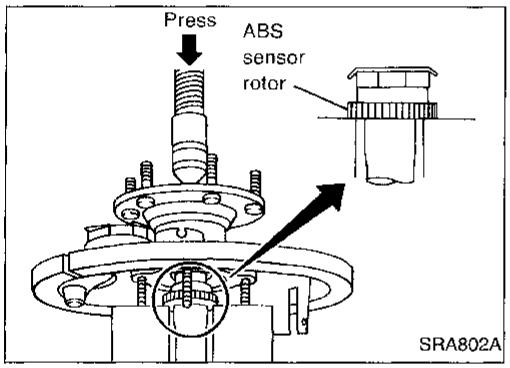


: 245 - 294 N·m (25 - 30 kg-m, 181 - 217 ft-lb)

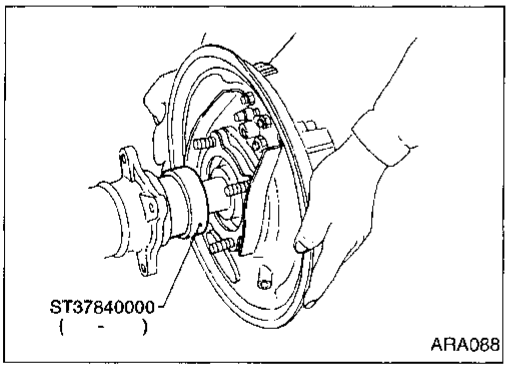
Fit wheel bearing lock washer lip in wheel bearing lock nut groove correctly by tightening lock nut. Be sure to bend it up.



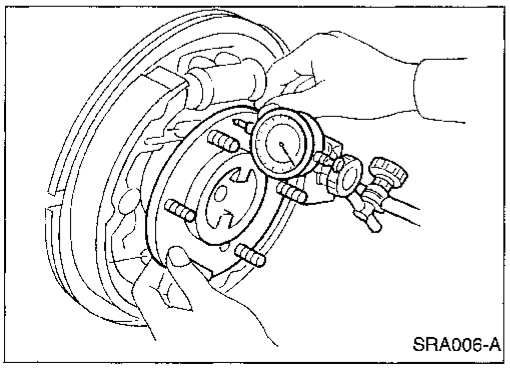
Installation — 4WD models — (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



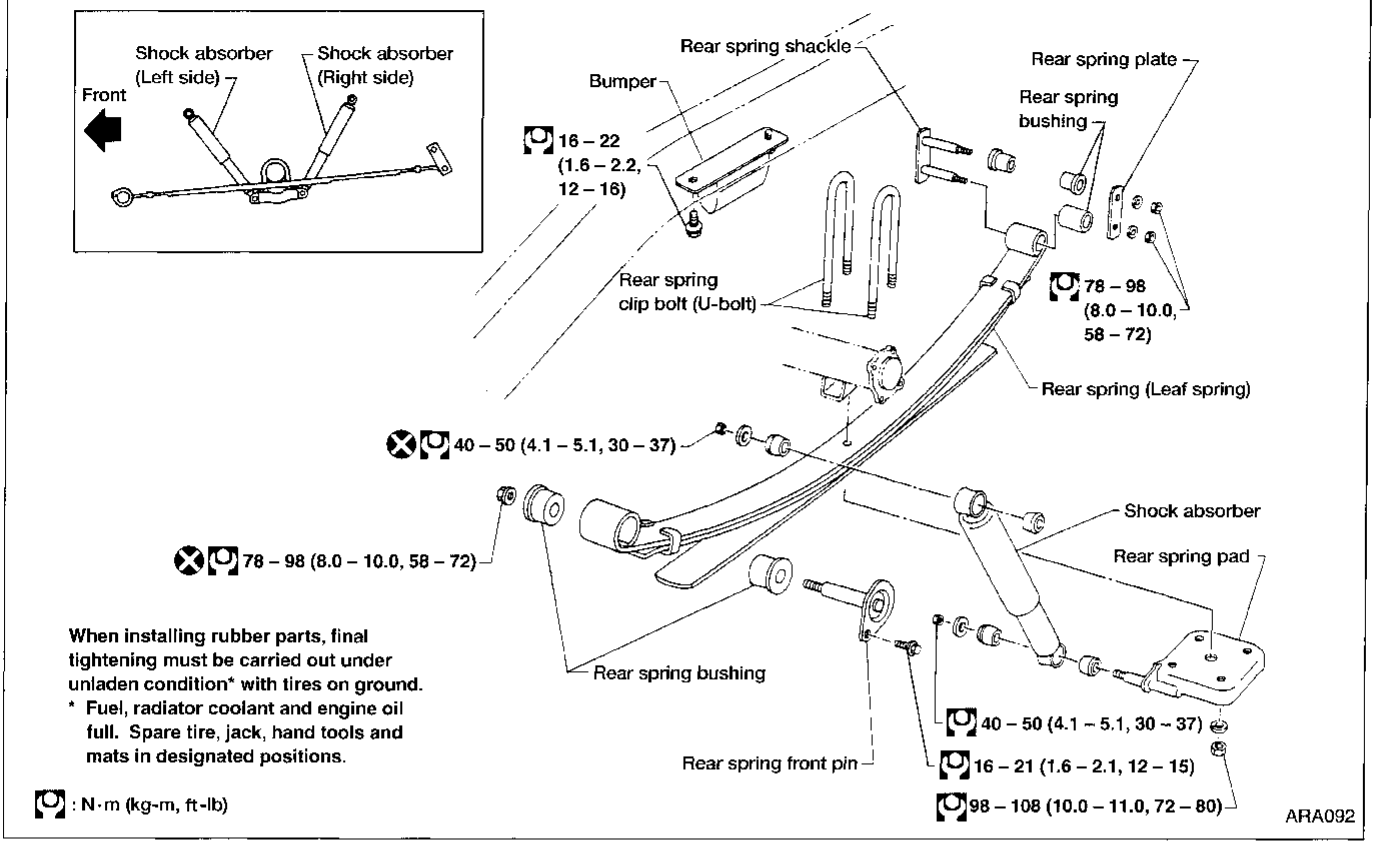
6. Check wheel bearing preload.
a. Turn bearing cage (with respect to axle shaft) two or three times. It must turn smoothly.
b. Attach spring gauge to bearing cage bolt (as shown at left) and pull it at a speed of 10 rpm to measure preload.
Spring gauge indication:
6.9 - 48.1 N (0.7 - 4.9 kg, 1.5 - 10.8 lb)



7. Install new oil seal to rear axle housing using a suitable tool.
After installing new oil seal, coat sealing lip with multi-purpose grease.
8. Install new O-ring to rear axle housing.

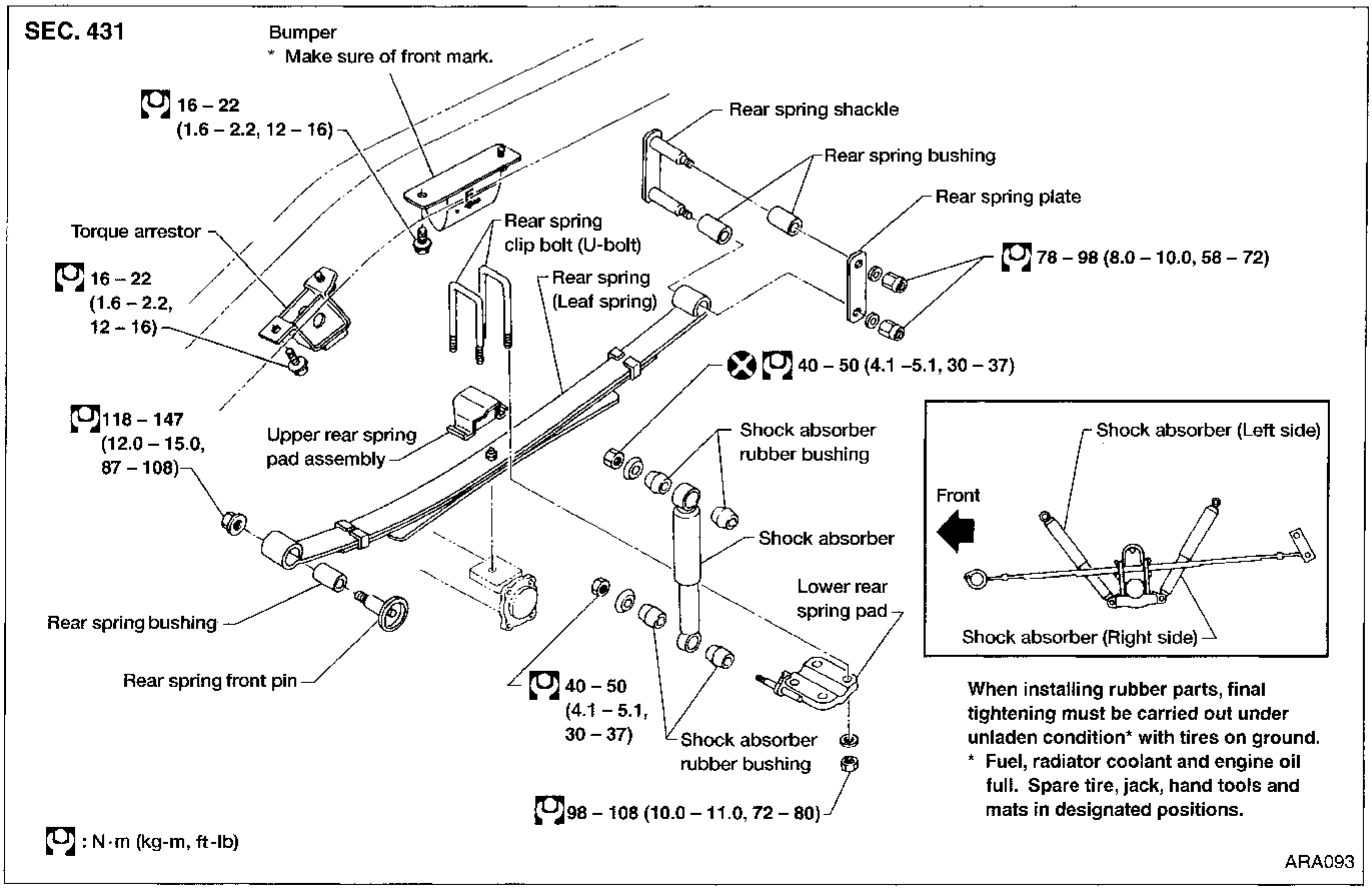
9. Press ABS sensor rotor onto axle shaft until it contacts wheel bearing lock nut.

10. Position axle shafts in rear axle housing with Tool as a guide.
Be careful not to damage oil seal.



11. Check axial end play.
a. Check that wheel bearings operate smoothly.
b. Check axial end play.
Axial end play:
0 mm (0 in)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



2WD models

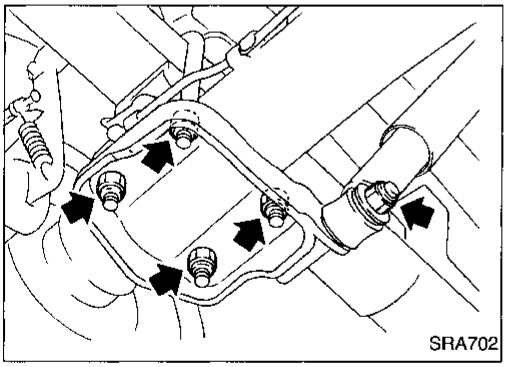
4WD models

SEC. 431

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

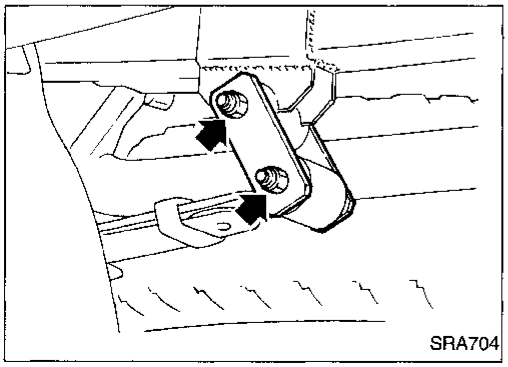


Shock Absorber

REMOVAL AND INSTALLATION

- Remove shock absorber by disconnecting upper and lower end.

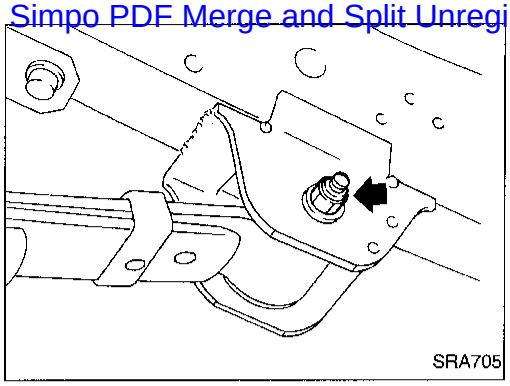
INSPECTION



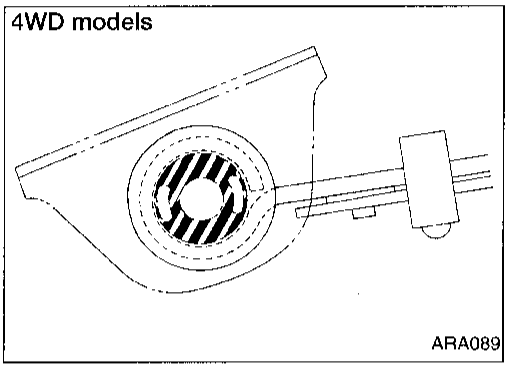
- If oil leakage, cracks and deformation occurs, replace shock absorber assembly.
- If rubber bushings are cracked and deformed, replace rubber bushings.

Leaf Spring

REMOVAL AND INSTALLATION



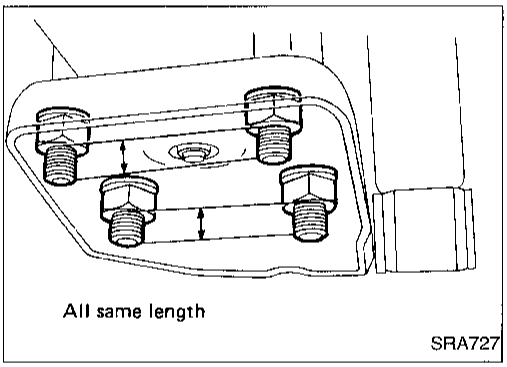
1. Disconnect shock absorber lower end, and remove U-bolts.



2. Disconnect spring shackle.

Leaf Spring (Cont'd)

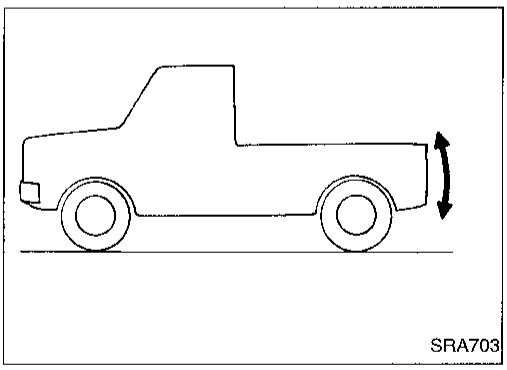
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



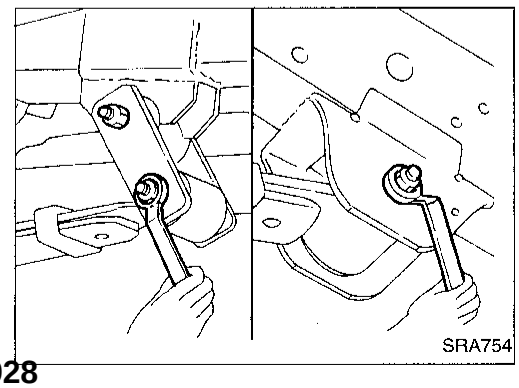
3. Disconnect front pin.

INSPECTION

- Check leaf spring for cracks. Replace if necessary.
- Check front bracket and pin, shackle, U-bolts and spring pad for wear, cracks, straightness and damaged threads. Replace if necessary.
- Check all bushings for deformation and cracks. Replace if necessary.
  (4WD models: Rear spring front bushing)
  Make sure that front bushing is properly installed.



INSTALLATION



1. Apply soapsuds to rubber bushing.
2. Install spring shackle and front pin, and finger tighten the nuts.
3. Install spring pad and nuts under leaf spring or axle case.
4. Tighten U-bolt mounting nuts diagonally.

Tighten U-bolts so that the lengths of all U-bolts under spring pad are the same.

5. Install shock absorber, and finger tighten the nuts.

6. Remove stands and bounce the vehicle to stabilize suspension. (Unladen)

7. Tighten spring shackle nuts, front pin nuts and shock absorber nuts.

When installing rubber parts, final tightening must be carried out under unladen condition* with tires on the ground.

*** Fuel, radiator coolant and engine oil full. Spare tire, jack, hand tools and mats in designated positions.**

When you read wiring diagrams:
- **Read GI section, "HOW TO READ WIRING DIAGRAMS".**
- **See EL section, "POWER SUPPLY ROUTING" for power distribution circuit.**

When you perform trouble diagnoses, read GI section, "HOW TO FOLLOW FLOW CHART IN TROUBLE DIAGNOSES" and "HOW TO PERFORM EFFICIENT DIAGNOSIS FOR AN ELECTRICAL INCIDENT".

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

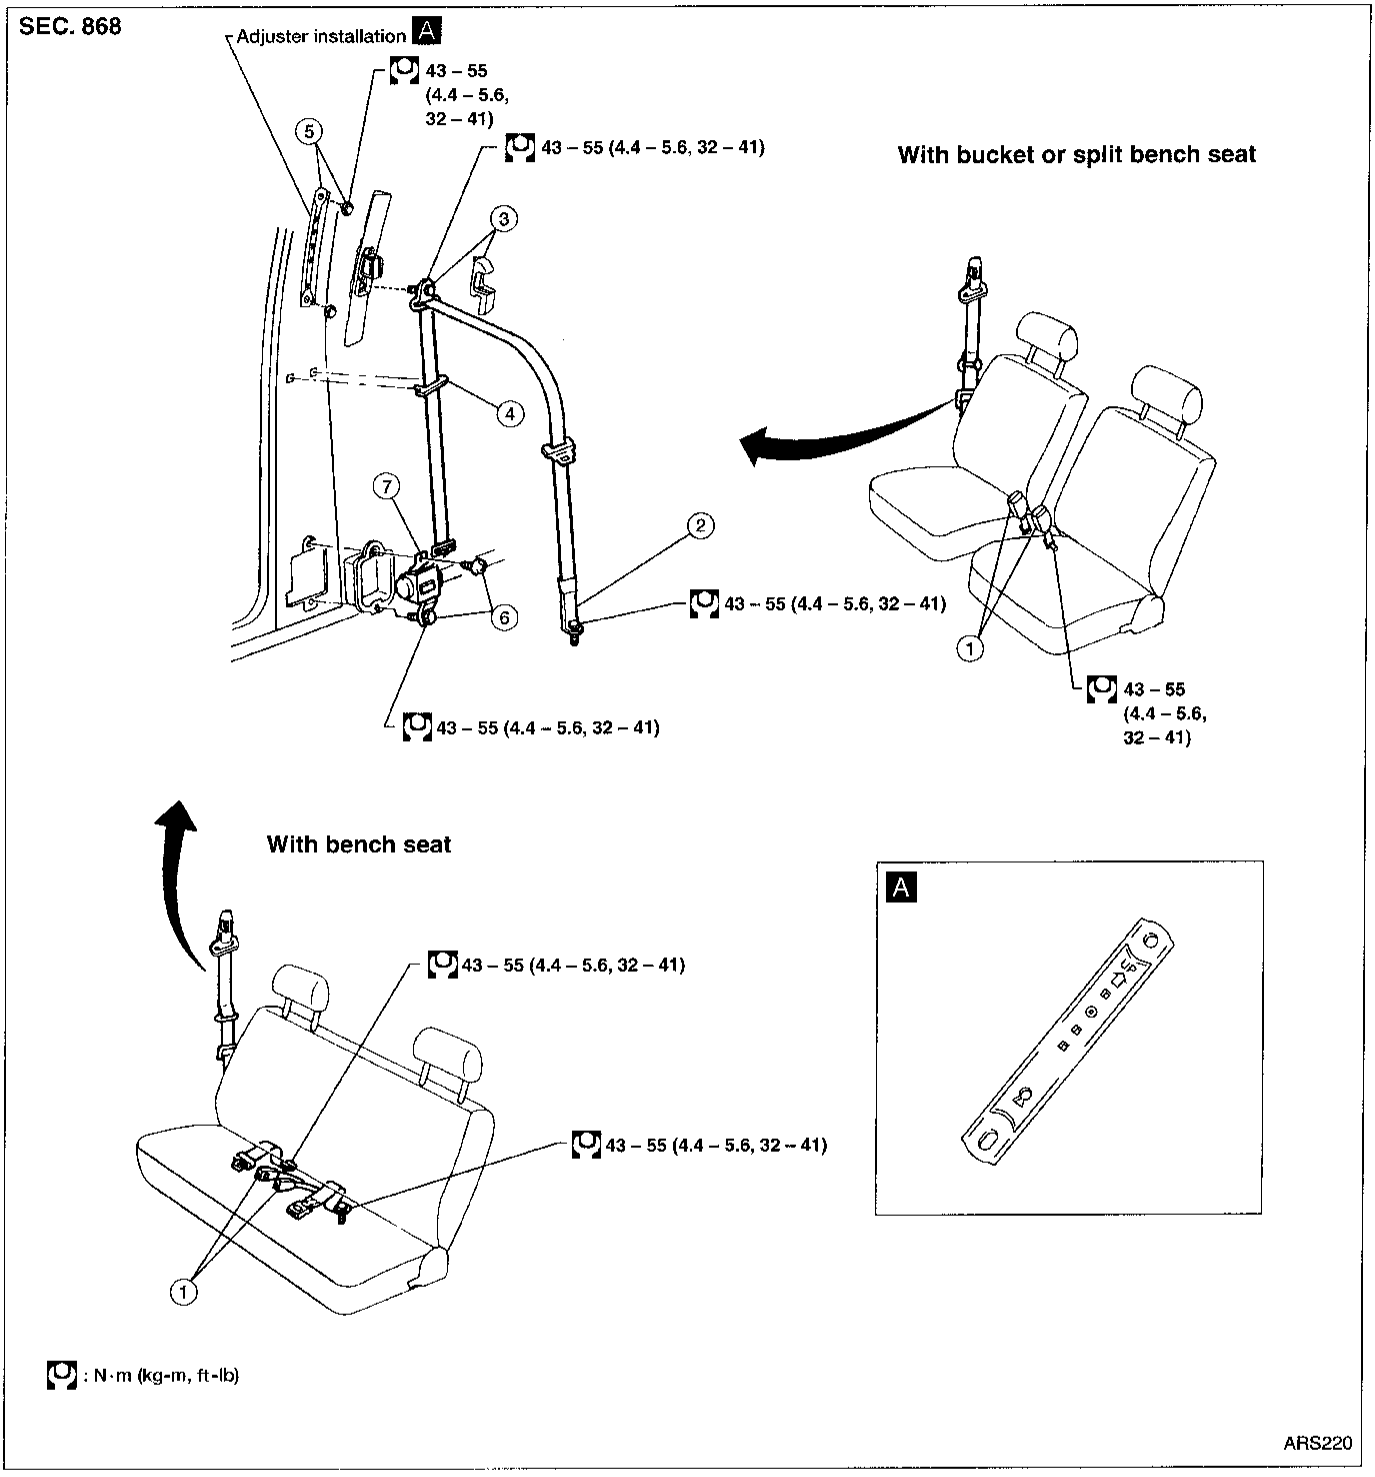
Supplemental Restraint System (SRS) "AIR BAG"

The Supplemental Restraint System "AIR BAG", used along with a seat belt, helps to reduce the risk or severity of injury to the driver and front passenger in a frontal collision. The Supplemental Restraint System consists of air bag modules (located in the center of the steering wheel and in the instrument panel on the passenger side), a diagnosis sensor unit, a crash zone sensor (4WD models), warning lamp, wiring harness and spiral cable.

The vehicle is equipped with a passenger air bag deactivation switch. Because no rear seat exists where a rear-facing child restraint can be placed, the switch is designed to turn off the passenger air bag so that a rear-facing child restraint can be used in the front passenger seat. The switch is located in the center of the instrument panel, near the ashtray. When the switch is turned to the ON position, the passenger air bag is enabled and could inflate in a frontal collision. When the switch is turned to the OFF position, the passenger air bag is disabled and will not inflate in a frontal collision. A passenger air bag OFF indicator on the instrument panel lights up when the passenger air bag is switched OFF. The driver air bag always remains enabled and is not affected by the passenger air bag deactivation switch.

WARNING:

- **To avoid rendering the SRS inoperative, which could increase the risk of personal injury or death in the event of a collision which would result in air bag inflation, all maintenance should be performed by an authorized NISSAN dealer.**
- **Improper maintenance, including incorrect removal and installation of the SRS, can lead to personal injury caused by unintentional activation of the system.**
- **Do not use electrical test equipment on any circuit related to the SRS unless instructed to in this Service Manual. SRS wiring harnesses are covered with yellow insulation either just before the harness connectors or on the complete harness, for easy identification.**
- **The vehicle is equipped with a passenger air bag deactivation switch which can be operated by the customer. When the passenger air bag is switched OFF, the passenger air bag is disabled and will not inflate in a frontal collision. When the passenger air bag is switched ON, the passenger air bag is enabled and could inflate in a frontal collision. After SRS maintenance or repair, make sure the passenger air bag deactivation switch is in the same position (ON or OFF) as when the vehicle arrived for service.**



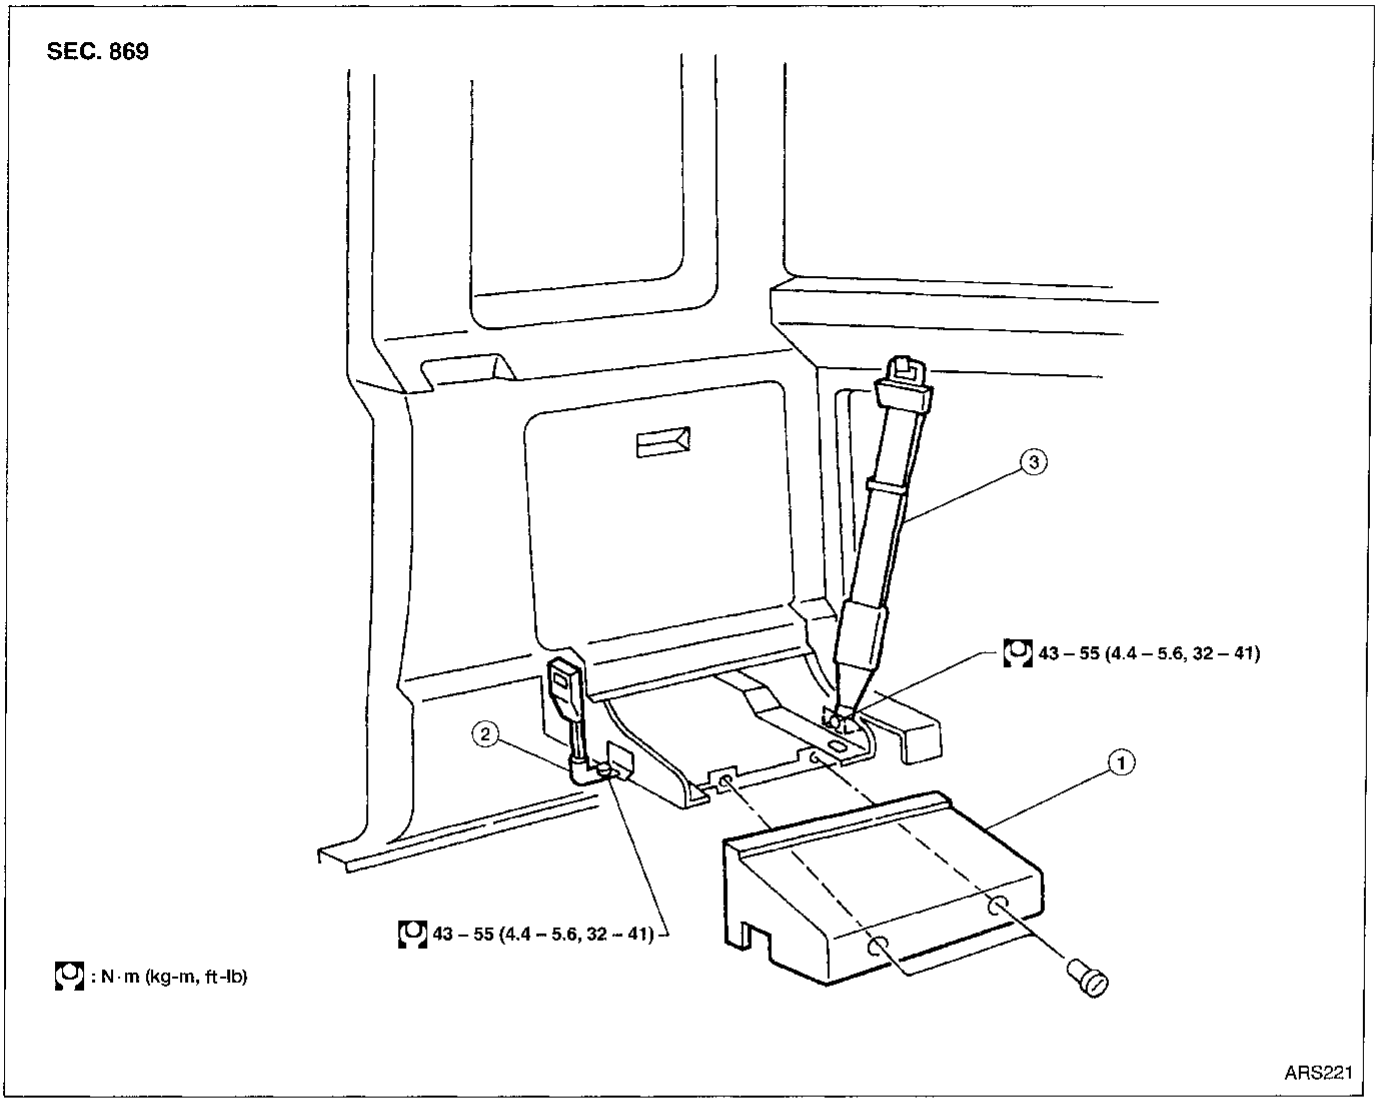
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

CAUTION:

- **Do not disassemble buckle or seat belt assembly.**
- **Replace anchor bolts if they are deformed or worn out.**
- **Never oil tongue and buckle.**
- **If any component of seat belt assembly is questionable, do not repair. Replace the seat belt assembly.**
- **If webbing is cut, frayed, or damaged, replace seat belt assembly.**
- **When replacing seat belt assembly, use a genuine NISSAN seat belt assembly.**
- **After any collision, inspect all seat belt assemblies, including retractors and other attached hardware.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Front Seat Belt



REMOVAL

Remove front seat. Refer to BT section (“Front Seat”, “SEAT”).

① Remove buckle.
② Remove floor anchor bolt.
③ Remove adjuster cover and upper guide loop anchor bolt.
For King Cab models, remove jump seat. Refer to BT section, (“Rear Seat”, “SEAT”).
Remove rear pillar lower and upper garnishes.
④ Remove guide plate.
⑤ Remove two adjuster bolts and adjuster assembly. A
⑥ Remove retractor bolt and screw.
⑦ Remove retractor.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Rear Seat Belt

REMOVAL

① Remove underseat storage.
② Remove buckle.
③ Remove seat belt anchor bolt.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Seat Belt Inspection

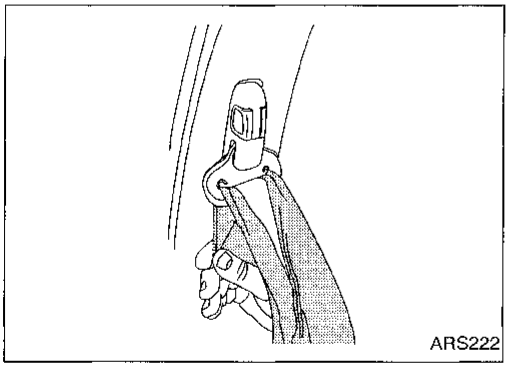
AFTER A COLLISION

WARNING:

Inspect all seat belt assemblies including retractors and attaching hardware after any collision. NISSAN recommends that all seat belt assemblies in use during a collision be replaced unless the collision was minor and the belts show no damage and continue to operate properly. Failure to do so could result in serious personal injury in an accident. Seat belt assemblies not in use during a collision should also be replaced if either damage or improper operation is noted.

Replace any seat belt assembly if:

- The seat belt was in use at the time of a collision (except for minor collisions when the belts, retractors and buckles show no damage and continue to operate properly).
- The seat belt was damaged in an accident (i.e. torn webbing, bent retractor or guide, etc.).
- The seat belt attaching point was damaged in an accident. Inspect the seat belt attaching area for damage or distortion and repair as necessary before installing a new seat belt assembly.



PRELIMINARY CHECKS

1. Check the seat belt warning lamp/chime for proper operation as follows:

a. Switch ignition ON. The seat belt warning lamp should illuminate. Also, the seat belt warning chime should sound for about 7 seconds.

b. Fasten driver's seat belt. The seat belt warning lamp should go out and the chime (if sounding) should stop.

2. Check that the seat belt retractor, seat belt anchor and buckle bolts are securely attached.
3. Check the shoulder seat belt guide and shoulder belt height adjuster for front seats. Ensure guide swivels freely and that belt lays flat and does not bind in guide. Ensure height adjuster operates properly and holds securely.

4. Check retractor operation including:

a. Fully extend the seat belt webbing and check for twists, tears or other damage.

b. Allow the seat belt to retract. Ensure that belt returns smoothly and completely into the retractor. If the seat belt does not return smoothly, wipe the inside of the loops with a clean paper cloth, etc. because dirt built up in the loops of the upper anchors can cause the seat belts to retract slowly.

c. Fasten the seat belt. Pull firmly on belt and buckle to ensure belt remains latched. Unfasten seat belt. Ensure belt releases freely and buckle button returns to original position.

5. For non-retractable seat belts, check that the seat belts are accessible. Check seat belt webbing for twists, tears or other damage. Fasten the seat belt. Pull firmly on belt and buckle to ensure belt remains latched. Unfasten seat belts. Ensure belt releases freely and buckle button returns to original position.
6. Repeat steps above as necessary to check the other seat belts.

Seat Belt Inspection (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SEAT BELT RETRACTOR ON-VEHICLE CHECK

Emergency locking retractors (ELR) and Automatic locking retractors (ALR)

NOTE:

All seat belt retractors are of the Emergency Locking (ELR) type. In an emergency (sudden stop) the retractor will lock and prevent the belt from extending any further. All outboard 3-point type seat belt retractors except the driver's seat belt also have an Automatic Locking (ALR) mode. The ALR mode (also called child restraint mode) is used when installing child seats in outboard seating positions. The ALR mode is activated when the seat belt is fully extended. When the belt is then retracted partially, the ALR mode automatically locks the seat belt in a specific position so the belt cannot be extended any further. To cancel the ALR mode, allow the seat belt to fully wind back into the retractor.

Check the seat belt retractors using the following test(s) to determine if a retractor assembly is operating properly.

ELR function stationary check

Grasp the shoulder belt and pull forward quickly. The retractor should lock and prevent the belt from extending further.

ALR function stationary check

1. Pull out entire length of seat belt from retractor until a click is heard.
2. Retract the belt partially; a clicking noise should be heard as the belt retracts indicating retractor is in the automatic locking (ALR) mode.
3. Grasp the seat belt and try to pull out of retractor. Belt must lock and not extend further. If NG, replace the retractor assembly.
4. Allow the entire length of belt to retract to cancel the automatic locking mode.

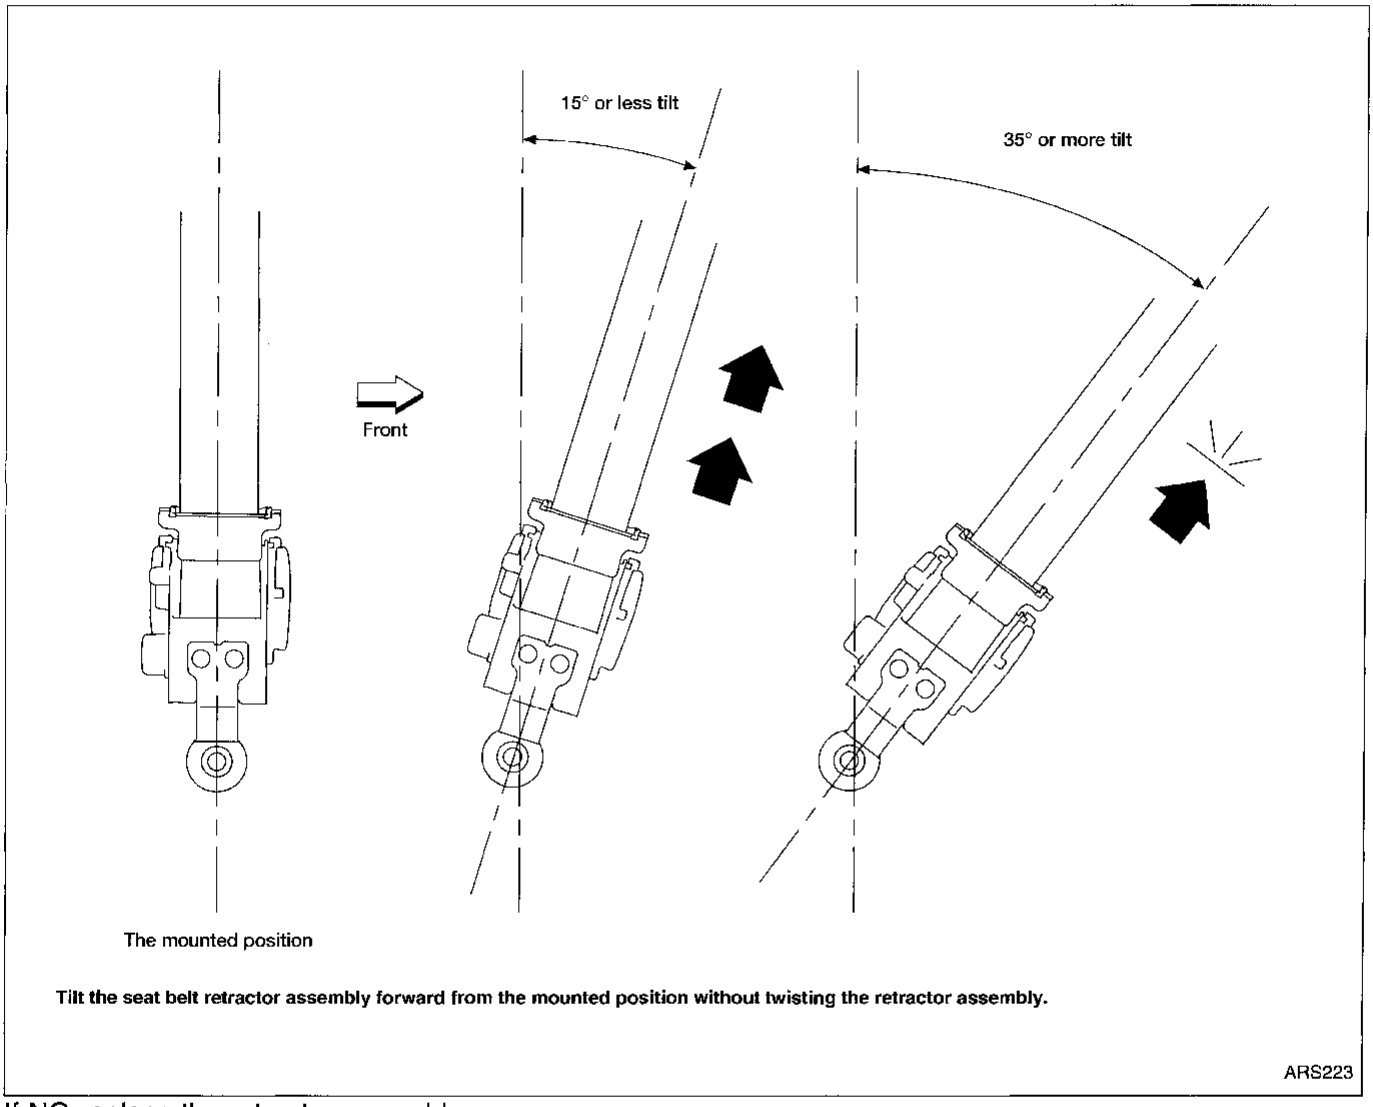
ELR function moving check (all outboard seating positions)

WARNING:

Perform the following test in a safe, open area clear of other vehicles and obstructions (for example, a large, empty parking lot). Road surface must be paved and dry. DO NOT perform the following test on wet or gravel roads or on public streets and highways. This could result in an accident and serious personal injury. The driver and passenger must be prepared to brace themselves in the event the retractor does not lock.

1. Fasten driver's seat belt. Buckle a passenger into the seat for the belt that is to be tested.
2. Proceed to the designated safe area.
3. Drive the vehicle at approximately 16 km/h (10 MPH). Notify any passengers of a pending sudden stop. The driver and passenger must be prepared to brace themselves in the event the retractor does not lock. Apply brakes firmly and make a very hard stop.

During stop, seat belts should lock and not extend. If the seat belt retractor assembly does not lock, perform the retractor off-vehicle check.



Seat Belt Inspection (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

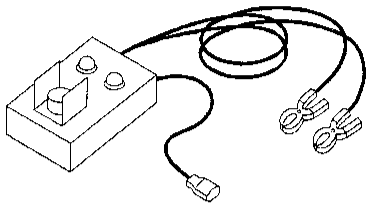
SEAT BELT RETRACTOR OFF-VEHICLE CHECK

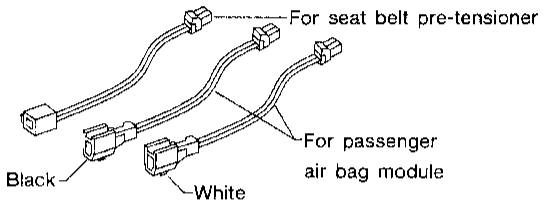
1. Remove the seat belt retractor assembly.
2. Slowly pull out belt while tilting the retractor assembly forward from the mounted position as shown in the illustration.

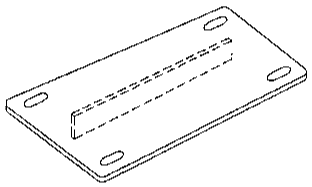
15 degrees or less tilt: Belt can be pulled out.
35 degrees or more tilt: Belt locks and cannot be pulled out.

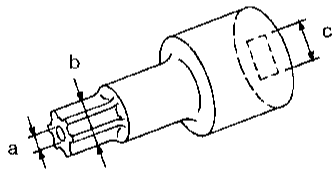
If NG replace the retractor assembly.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com









Precautions for SRS "AIR BAG" Service

- Do not use electrical test equipment on any circuit related to the SRS unless instructed to in this Service Manual. SRS wiring harnesses are covered with yellow insulation either just before the harness connectors or on the complete harness, for easy identification.
- Before servicing the SRS, turn ignition switch OFF, disconnect both battery cables and wait at least 3 minutes.
  For approximately 3 minutes after the cables are removed, it is still possible for the air bag to deploy. Therefore, do not work on any air bag system connectors or wires until at least 3 minutes have passed.
- Diagnosis sensor unit and crash zone sensor (4WD models) must always be installed with forward mark "⇦" pointing toward the front of the vehicle for proper operation. Also check diagnosis sensor unit for cracks, deformities and rust before installation and replace if necessary.
- The rotation of the spiral cable is limited. The spiral cable must be aligned in the neutral position. If the steering gear must be removed, set the front wheels in the straight-ahead direction. Do not rotate the steering column while the steering gear is removed to avoid damaging the spiral cable.
- Handle air bag modules carefully. Always place them with the pad side facing upward.
- Do not use old special bolts after removing any SRS parts; replace with new special bolts. Conduct self-diagnosis to check entire SRS for proper operation.
- If front of vehicle is damaged in a collision, always check the crash zone sensor (4WD models) and the wiring harness.
- After air bag inflates, the instrument panel assembly should be replaced if damaged.
- After SRS maintenance or repair, make sure the passenger air bag deactivation switch is in the same position (ON or OFF) as when the vehicle arrived for service.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Special Service Tools

The actual shapes of Kent-Moore tools may differ from those of special service tools illustrated here.

Tool number (Kent-Moore No.) Tool name	Description

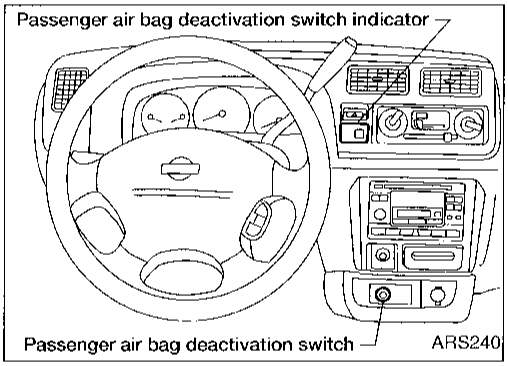
*: Special tool or commercial equivalent

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description



2WD models

The diagnosis sensor unit will deploy the air bags if the G-sensor activates simultaneously with the safing sensor while the ignition switch is ON. The passenger air bag does not deploy when the passenger air bag deactivation switch is turned to the OFF position.

4WD models

The diagnosis sensor unit will deploy the air bags if the G-sensor and/or the crash zone sensor activates simultaneously with the safing sensor while the ignition switch is ON. The passenger air bag does not deploy when the passenger air bag deactivation switch is turned to the OFF position.

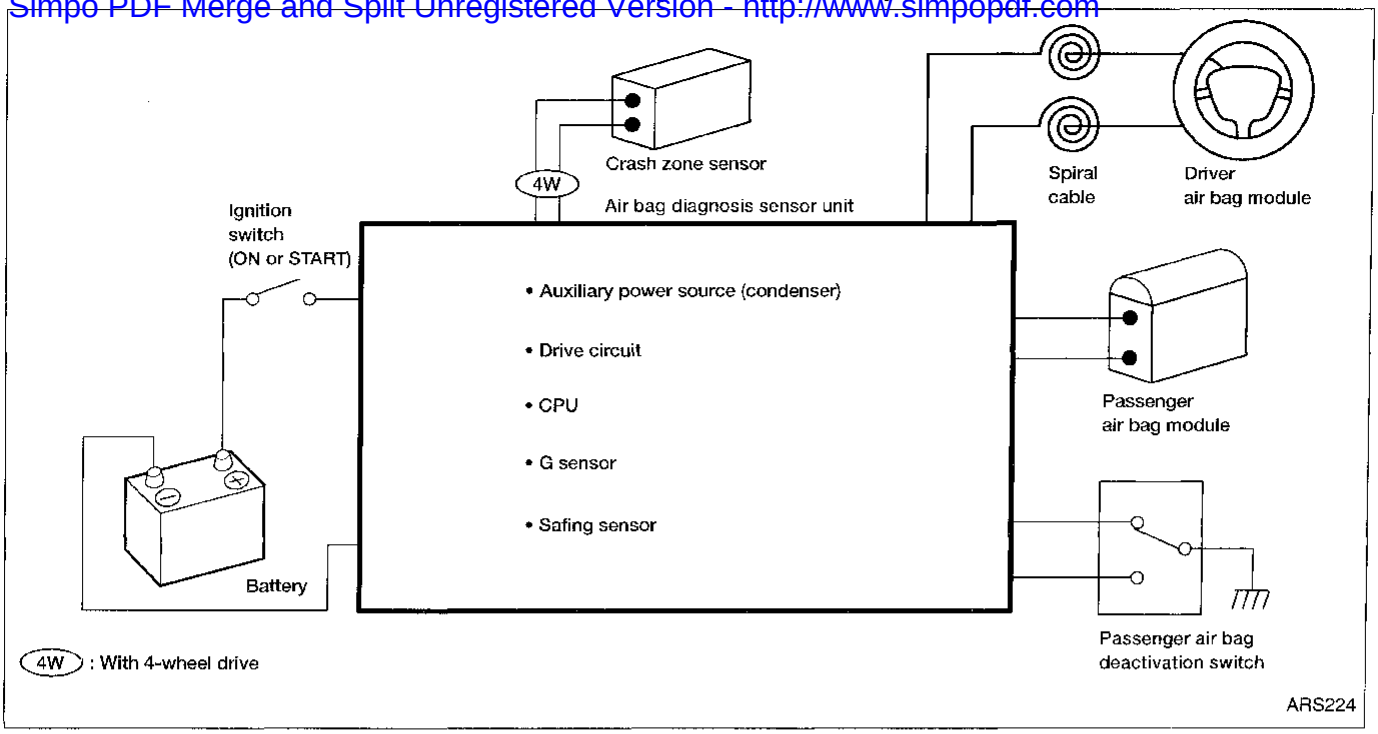
Ignition	Crash zone sensor (4WD models only)	Diagnosis sensor unit		Passenger air bag deactivation switch position	Driver air bag	Passenger air bag
		G-sensor	Safing sensor			
ON	—	ON	ON	ON	Deploy	Deploy
				OFF	Deploy	Not deploy
ON	ON	—	ON	ON	Deploy	Deploy
				OFF	Deploy	Not deploy
ON	ON	ON	ON	ON	Deploy	Deploy
				OFF	Deploy	Not deploy

Passenger air bag deactivation switch

The vehicle is equipped with a passenger air bag deactivation switch which can be operated by the customer. When the switch is turned to the ON position, the passenger air bag is enabled and could inflate in a frontal collision. When the switch is turned to the OFF position, the passenger air bag is disabled and will not inflate in a frontal collision.

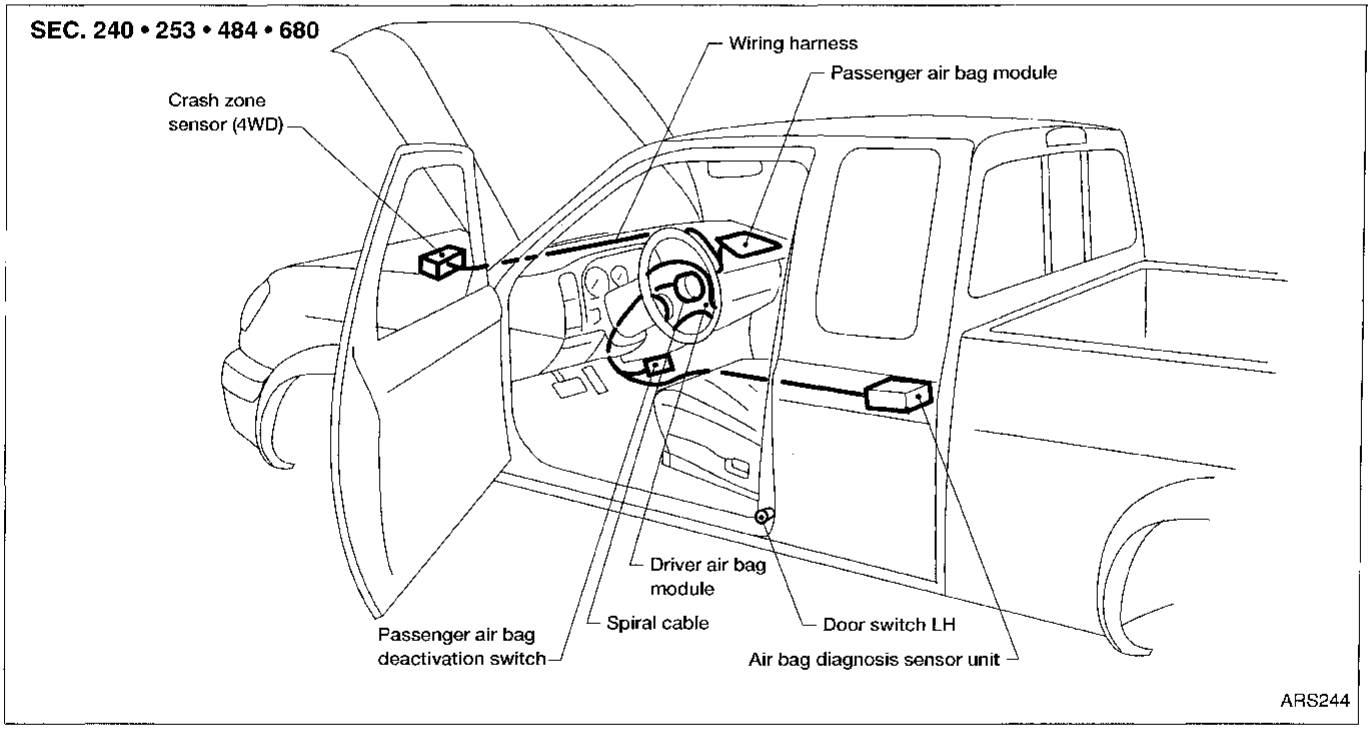
After turning the ignition switch ON, a passenger air bag deactivation switch indicator illuminates on the instrument panel for bulb check. The indicator will stay lit if the passenger air bag deactivation switch is in the OFF position. If the passenger air bag deactivation switch is in the ON position, the indicator will turn off after about 7 seconds.

After SRS maintenance or repair, make sure the passenger air bag deactivation switch is in the same position (ON or OFF) as when the vehicle arrived for service.



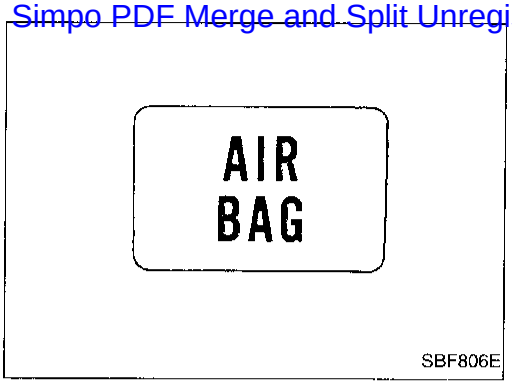
IGN OFF → ON

Passenger air bag deactivation switch position	Passenger air bag deactivation switch indicator	Passenger air bag deployment
ON	Turns off within 7 seconds	Enabled
OFF	Stays lit	Disabled



If the passenger air bag deactivation switch indicator operation does not correspond to ON/OFF operation of the passenger air bag deactivation switch, perform self-diagnoses for SRS and repair according to the self-diagnostic failure. Refer to "TROUBLE DIAGNOSES — Supplemental Restraint System (SRS)", "SRS Operation Check", RS-34.
If no self-diagnostic failure is detected, replace the passenger air bag deactivation switch including the key cylinder.

Description (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SRS Component Parts Location

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Maintenance Items

1. Check "AIR BAG" warning lamp operation
   After turning the ignition key ON, "AIR BAG" warning lamp illuminates. The "AIR BAG" warning lamp will turn off after about 7 seconds if no malfunction is detected.
   If any of the following "AIR BAG" warning lamp conditions occur, immediately check the air bag system. Refer to RS-34.
   - The warning lamp does not illuminate when the ignition switch is turned ON.
   - The warning lamp does not turn off about 7 seconds after the ignition switch is turned ON.
   - The warning lamp turns off about 7 seconds after the ignition switch is turned ON, but it turns on again or blinks.

2. Visually check SRS components

a. Crash zone sensor (4WD models)
- Check crash zone sensor to ensure the arrow marks face the front of the vehicle.
- Check body and sensor bracket for deformities and rust.
- Check sensor case for dents, cracks, deformities and rust.
- Check sensor harness for binding, connector for damage and terminals for deformities.

b. Air bag diagnosis sensor unit
- Check air bag diagnosis sensor unit and bracket for dents, cracks and deformities.
- Check connectors for damage and terminals for deformities.

c. Air bag modules, steering wheel and instrument panel
- Remove driver air bag module from steering wheel. Check harness cover and connectors for damage, terminals for deformities, and harness for binding.
- Install driver air bag module in steering wheel to check fit or alignment with the wheel.
- Check steering wheel for excessive free play.
- Remove passenger air bag module. Check harness cover and connectors for damage, terminals for deformities, and harness for binding. Check the bracket for deformities and rust.
- Install passenger air bag module in instrument panel to check fit or alignment with the instrument panel.

d. Spiral cable
- Check spiral cable for dents, cracks, and deformities.
- Check connectors and protective tape for damage.
- Check steering wheel for noise, binding and heavy operation.

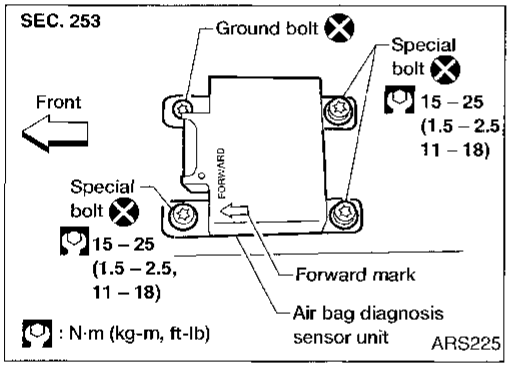
e. Passenger air bag deactivation switch
- Check passenger air bag deactivation switch for damage.
- Check harness for binding, connector for damage and terminals for deformities.

f. Main harness and air bag harness
- Check connectors for poor connections, damage, and terminals for deformities.
- Check harnesses for binding, chafing and cuts.

CAUTION:
Replace previously used special bolts with new ones.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnosis Sensor Unit and Crash Zone Sensor



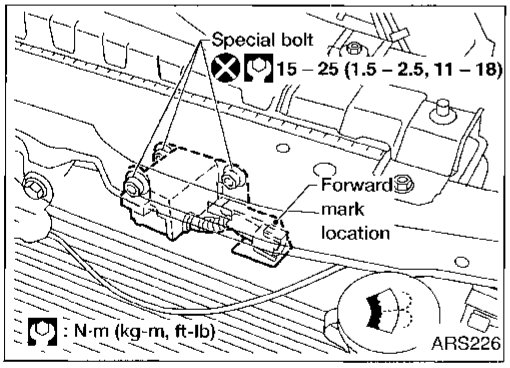
CAUTION:

- **Before servicing SRS, turn the ignition switch OFF, disconnect both battery cables and wait at least 3 minutes.**
- **The special bolts are coated with bonding agent while the other bolt is for ground. Do not use old bolts after removal; replace with new coated bolts.**
- **Check air bag diagnosis sensor unit for proper installation. Make sure that there are no deformities, dents, cracks or rust. If there are any visible signs of damage, replace with a new one.**
- **Check air bag diagnosis sensor unit brackets to ensure they are free of deformities and rust.**
- **Replace air bag diagnosis sensor unit if it has been dropped or sustained an impact.**
- **Check crash zone sensor (4WD models) for proper installation. Make sure that there are no deformities, dents, cracks or rust. If there are any visible signs of damage, replace the crash zone sensor.**
- **Check crash zone sensor bracket (4WD models) to ensure that it is free of deformities and rust.**

REMOVAL AND INSTALLATION

Diagnosis sensor unit

1. Disconnect driver and passenger air bag module connectors.
2. Remove console box. Refer to BT section ("INSTRUMENT PANEL").
3. Disconnect air bag diagnosis sensor unit connector.
4. Remove bolts from air bag diagnosis sensor unit. Use TAMPER RESISTANT TORX (Size T50) to remove special bolts.
5. Remove the air bag diagnosis sensor unit.



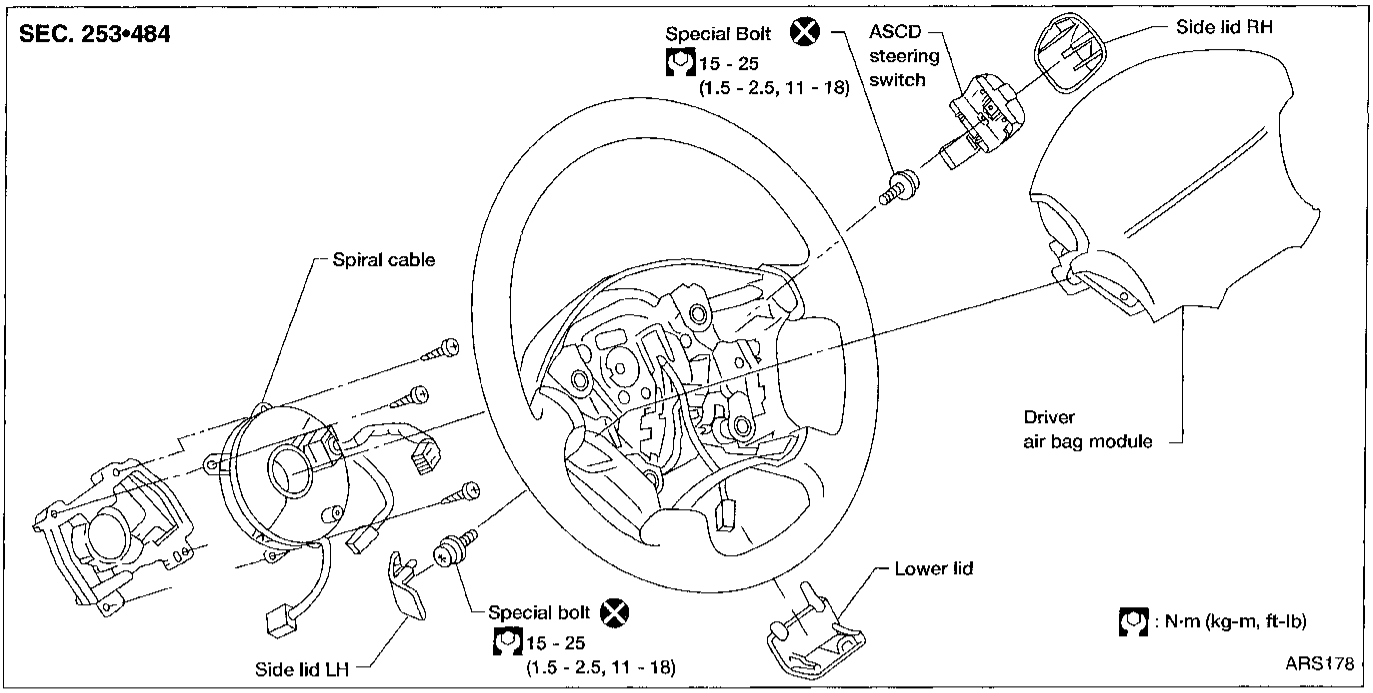
NOTE:

- **To install, reverse the removal procedure.**
- **After replacement, perform self-diagnosis for SRS. Refer to "TROUBLE DIAGNOSES — Supplemental Restraint System (SRS)", "SRS Operation Check", RS-34.**

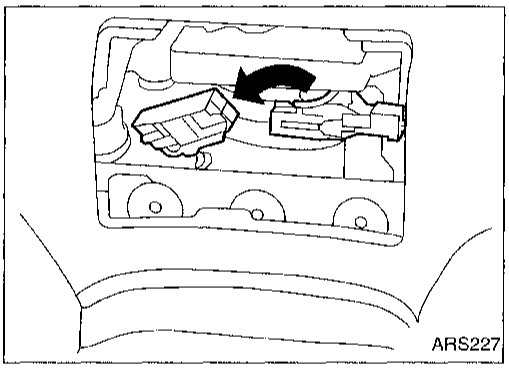
CAUTION:

Air bag diagnosis sensor unit must always be installed with forward mark "⇦" pointing towards the front of the vehicle for proper operation. Also check air bag diagnosis sensor unit for cracks, deformities and rust before installation and replace as required.

Crash zone sensor (4WD models)



1. Disconnect driver and passenger air bag module connectors.
2. Remove front grille. Refer to BT section ("BODY FRONT END").
3. Disconnect crash zone sensor connector.
4. Using the TAMPER RESISTANT TORX (Size T50), remove the three special bolts. The crash zone sensor can then be removed.

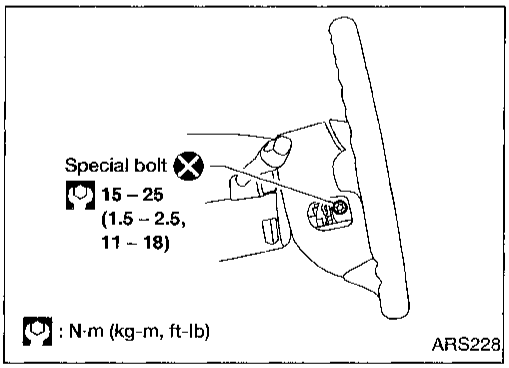


NOTE:

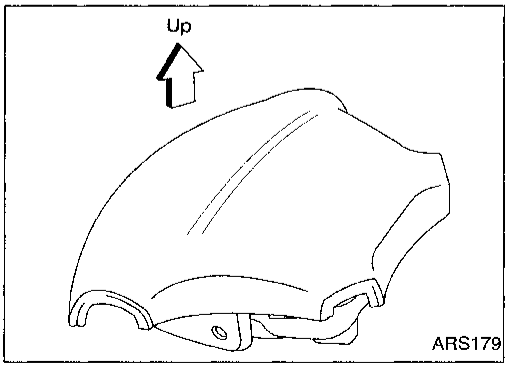
- **To install, reverse removal procedure.**
- **After replacement, perform Self-diagnosis for SRS. Refer to "TROUBLE DIAGNOSES — Supplemental Restraint System (SRS)", "SRS Operation Check", RS-34.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Driver Air Bag Module and Spiral Cable



REMOVAL



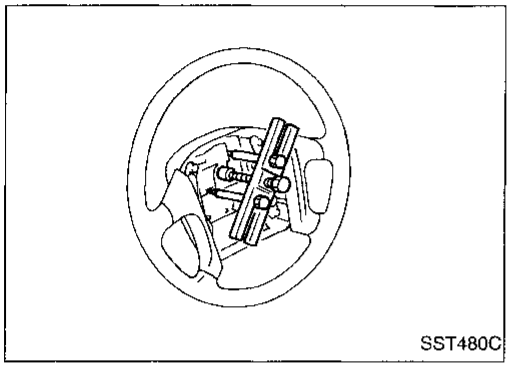
CAUTION:

- **Before servicing SRS, turn the ignition switch OFF, disconnect both battery cables and wait at least 3 minutes.**
- **Always work from the side of an air bag module.**

1. Remove lower lid from steering wheel, and disconnect driver air bag module connector.

2. Remove side lids. Using the TAMPER RESISTANT TORX (Size T50), remove left and right special bolts. Driver air bag module can then be removed.

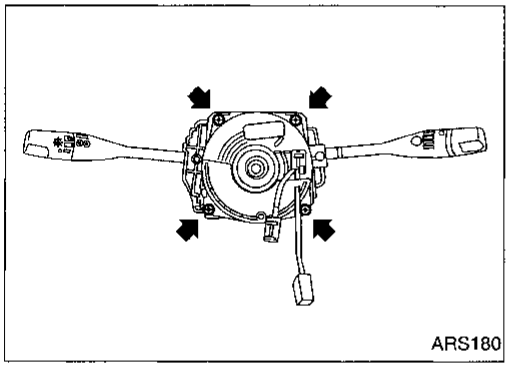
CAUTION:



- **Always place air bag module with pad side facing upward.**
- **Do not attempt to disassemble air bag module.**
- **The special bolts are coated with bonding agent. Do not use old bolts after removal; replace with new coated bolts.**

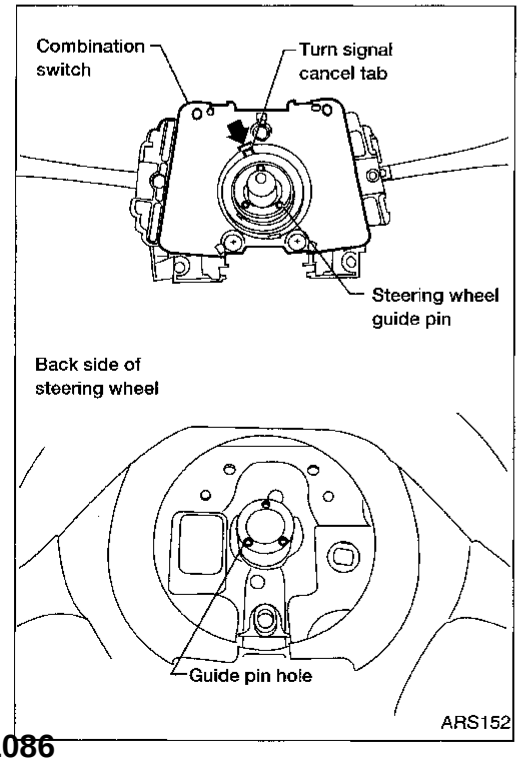
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Driver Air Bag Module and Spiral Cable (Cont'd)



- **Do not drop or impact air bag module. If any portion is deformed or cracked, replace the module.**
- **Do not expose the air bag module to temperatures exceeding 90°C (194°F).**
- **Do not allow oil, grease or water to come in contact with the air bag module.**

3. Set steering wheel in the neutral position.
4. Disconnect horn connector and remove steering wheel nut.
5. Using steering wheel puller, remove steering wheel. Be careful not to over-tighten puller bolt on steering wheel.

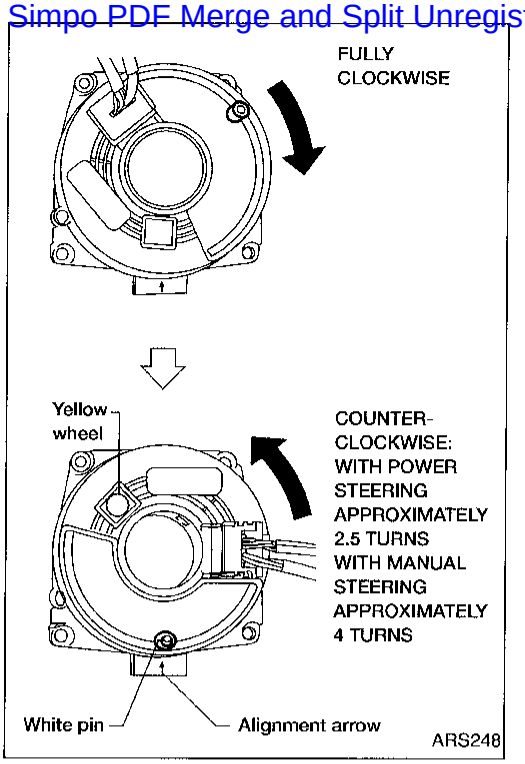


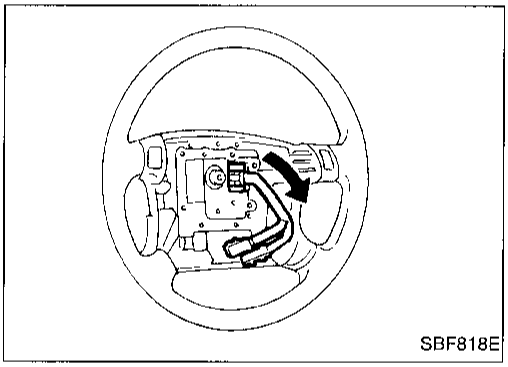
CAUTION:
Do not tap or bump the steering wheel.

6. Remove steering column covers.
7. Disconnect spiral cable from air bag harness.

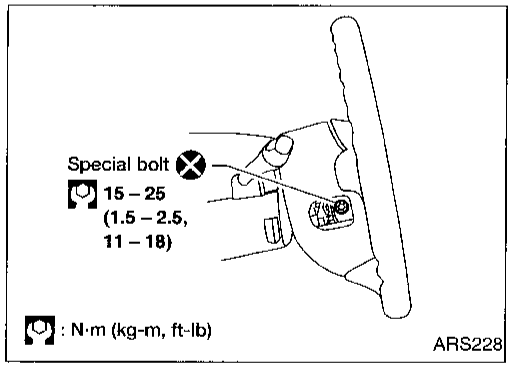
8. Remove the four spiral cable retaining screws. The spiral cable can then be removed.

CAUTION:
- **Do not attempt to disassemble spiral cable.**
- **Do not apply lubricant to the spiral cable.**





INSTALLATION



1. Set the front wheels in the straight-ahead position.
2. Align the turn signal cancel tab with the notch of the combination switch as shown.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Driver Air Bag Module and Spiral Cable (Cont'd)

3. Set the front wheels in the straight-ahead position.
4. Rotate the spiral cable fully clockwise until tight.
5. Rotate the spiral cable counterclockwise as specified below and align white pin with arrow on housing.

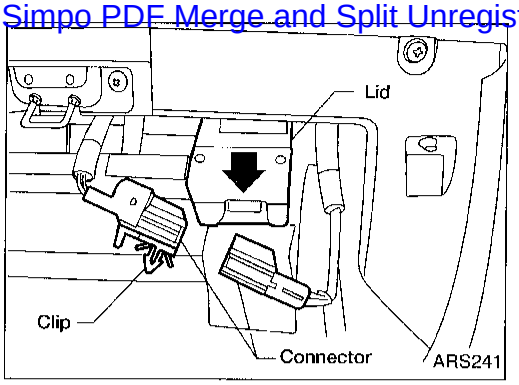
Specified turns for spiral cable:

Applied model	Specified turns from neutral position
With power steering	Approx. 2.5
Without power steering	Approx. 4

- **When spiral cable is centered, white pin is aligned with arrow on housing and yellow wheel shows in window.**

CAUTION:
The spiral cable may snap during steering operation if the spiral cable is installed improperly. Also, with the steering linkage disconnected, the spiral cable may snap by turning the steering wheel beyond the specified number of turns. Always perform SRS Self-diagnosis after installing the air bag module.

6. Connect spiral cable to air bag harness and tighten screws. Install steering column covers.
7. Install steering wheel, setting spiral cable pin guide, and pull spiral cable connectors through.
8. Connect horn connector and engage spiral cable with pawls in steering wheel.
9. Tighten steering wheel nut.
   : 29 - 39 N·m (3.0 - 4.0 kg-m, 22 - 29 ft-lb)
10. Position driver air bag module and tighten with new special bolts.
11. Connect driver air bag module connector.
12. Install all lids.
13. Connect both battery cables.
14. Conduct Self-diagnosis to ensure entire SRS operates properly (Use CONSULT or warning lamp check.). Turn the steering wheel fully to the right and left to check that the spiral cable is set in the neutral position.
15. If air bag warning lamp blinks (at the User mode), it shows the spiral cable may be snapped due to its improper position. Perform Self-diagnosis again. (Use CONSULT or warning lamp check.) If a malfunction is detected, replace the spiral cable with a new one.



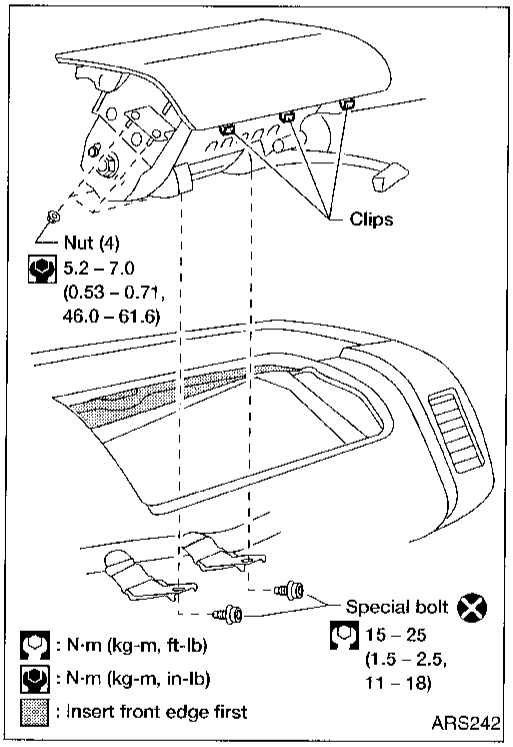
NOTE:

- **After replacement, perform Self-diagnosis for SRS. Refer to "TROUBLE DIAGNOSES — Supplemental Restraint System (SRS)", "SRS Operation Check", RS-34.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

NOTES

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



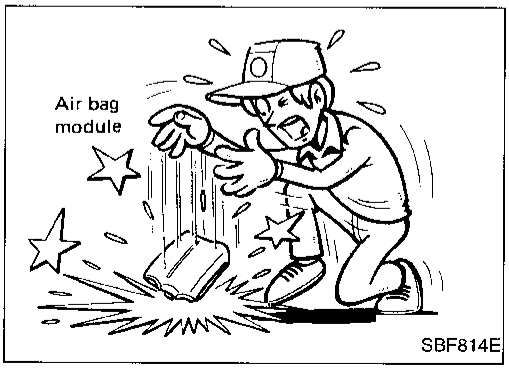
Passenger Air Bag Module

REMOVAL

CAUTION:

- **Before servicing SRS, turn the ignition switch OFF, disconnect both battery cables and wait for at least 3 minutes.**
- **Always work from the side of an air bag module.**

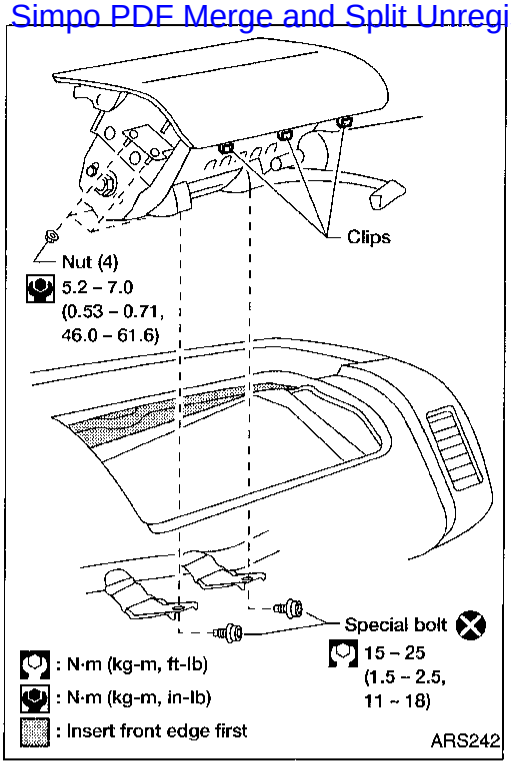
1. Open glove box assembly.
2. Open lid of instrument panel lower passenger side, inside glove box.
3. Remove passenger air bag module connector clip from lid.
4. Disconnect passenger air bag module connector.
5. Remove glove box and instrument panel lower passenger side. Refer to BT section ("INSTRUMENT PANEL").



6. Using TAMPER RESISTANT TORX (Size T50), remove the two special bolts.
7. Remove four mounting nuts.
8. Remove passenger air bag module by releasing the clips from the top of the instrument panel.

- **Air bag module is heavy and should be supported using both hands during removal.**

CAUTION:



- **Always place air bag module with pad side facing upward.**
- **Do not attempt to disassemble air bag module.**
- **The special bolts are coated with a bonding agent. Do not use old bolts after removal; replace with new coated bolts.**
- **Do not insert any foreign objects (screwdriver, etc.) into air bag module connector.**

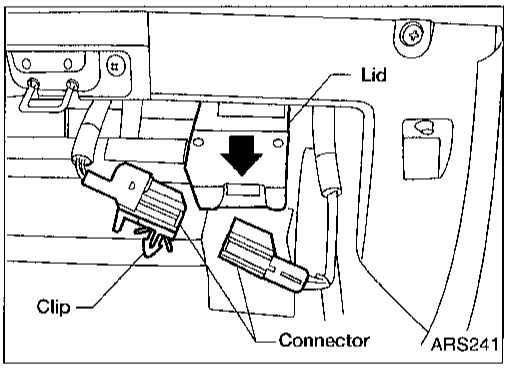
- **Do not drop or impact air bag module. If any portion is deformed or cracked, replace the module.**
- **Do not expose the air bag module to temperatures exceeding 90°C (194°F).**
- **Do not allow oil, grease or water to come in contact with the air bag module.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Passenger Air Bag Module (Cont'd)

INSTALLATION

1. Install passenger air bag module in instrument panel.



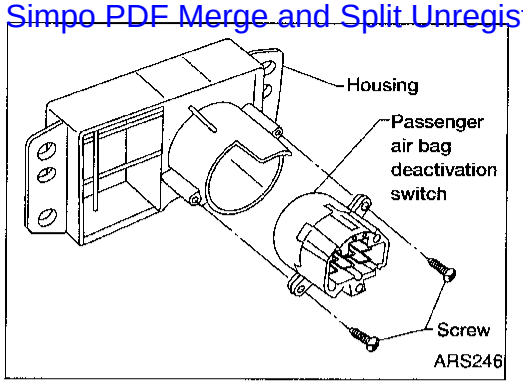
a) Insert front edge of passenger air bag module first to ease installation.

- Ensure harness is not caught between passenger air bag module and support bracket.

b) Install four mounting nuts.

c) Install two new special bolts using TAMPER RESISTANT TORX (Size T50).

2. Install instrument panel lower passenger side and glove box.



3. Connect passenger air bag module connector.
4. Attach passenger air bag module connector clip to lid.
5. Close lid and glove box.
6. Conduct Self-diagnosis to ensure SRS operates properly (Use CONSULT or warning lamp check.).

NOTE:

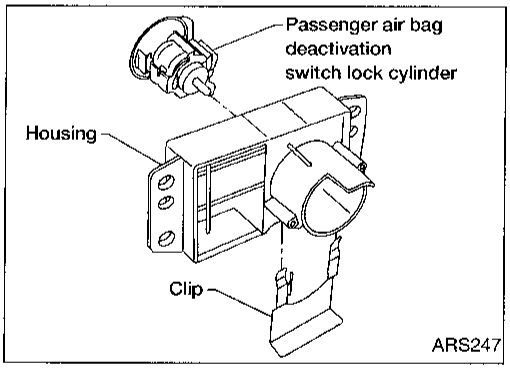
- **After replacement, perform Self-diagnosis for SRS. Refer to "TROUBLE DIAGNOSES — Supplemental Restraint System (SRS)", "SRS Operation Check", RS-34.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Passenger Air Bag Deactivation Switch

REMOVAL

- **Before servicing SRS, turn the ignition switch OFF, disconnect both battery cables and wait for at least 3 minutes.**



1. Detach instrument stay cover lower center from instrument panel. Refer to BT section ("INSTRUMENT PANEL").
2. Disconnect passenger air bag deactivation switch harness connector and cigarette lighter harness connector.
3. Remove instrument stay cover lower center.
4. Remove two screws and remove passenger air bag deactivation switch.

INSTALLATION

CAUTION:
Passenger air bag deactivation switch is keyed for proper installation. Improper positioning of the switch will result in damage to the switch.

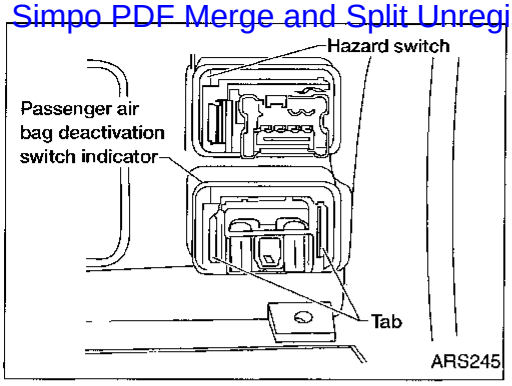
NOTE:

- **Be sure that passenger air bag deactivation switch and lock cylinder are in the same position as during removal for proper engagement.**
- **To install, reverse removal procedure.**
- **After replacement, perform Self-diagnosis for SRS. Refer to "TROUBLE DIAGNOSES — Supplemental Restraint System (SRS)", "SRS Operation Check", RS-34.**

Passenger Air Bag Deactivation Switch Lock Cylinder

REMOVAL

- **Before servicing SRS, turn the ignition switch OFF, disconnect both battery cables and wait for at least 3 minutes.**



1. Detach instrument stay cover lower center from instrument panel. Refer to BT section ("INSTRUMENT PANEL").
2. Disconnect passenger air bag deactivation switch harness connector and cigarette lighter harness connector.
3. Remove instrument stay cover lower center.
4. Remove four screws and housing from instrument stay cover lower center.
5. Remove clip from bottom of housing.
6. Remove passenger air bag deactivation switch lock cylinder from front of housing.

INSTALLATION

NOTE:

- **Be sure that passenger air bag deactivation switch and lock cylinder are in the same position as during removal for proper engagement.**
- **To install, reverse removal procedure.**
- **After replacement, perform Self-diagnosis for SRS. Refer to "TROUBLE DIAGNOSES — Supplemental Restraint System (SRS)", "SRS Operation Check", RS-34.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

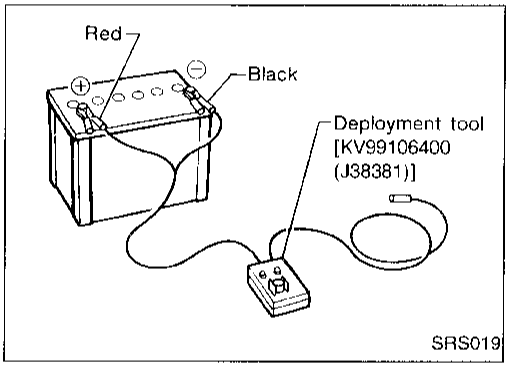
Passenger Air Bag Deactivation Switch Indicator

REMOVAL

- **Before servicing SRS, turn the ignition switch OFF, disconnect both battery cables and wait for at least 3 minutes.**

1. Remove meter cover. Refer to BT section ("INSTRUMENT PANEL").
2. Release passenger air bag deactivation switch indicator tabs from back side of meter cover.
3. Remove passenger air bag deactivation switch indicator from front side of meter cover.

INSTALLATION



NOTE:

- **To install, reverse removal procedure.**
- **After replacement, perform Self-diagnosis for SRS. Refer to "TROUBLE DIAGNOSES — Supplemental Restraint System (SRS)", "SRS Operation Check", RS-34.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Disposal of Air Bag Module

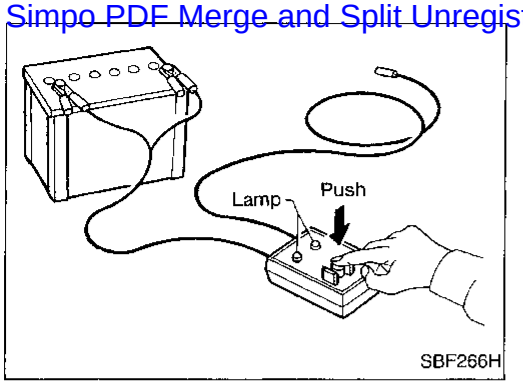
- Before disposing of air bag module, or vehicles equipped with such a system, deploy the system. If such a system has already been deployed due to an accident, dispose of as indicated in "DISPOSING OF AIR BAG MODULE" (RS-26).
- When deploying the air bag module, always use the Special Service Tool; Deployment tool KV99106400 (Kent-Moore No. J38381).
- When deploying the air bag module, stand at least 5 m (16 ft) away from the deployment component.
- When deploying air bag module, a fairly loud noise is made, followed by smoke being released. The smoke is not poisonous, however, be careful not to inhale smoke since it irritates the throat and can cause choking.
- Always activate one air bag module at a time.
- Due to heat, leave air bag module unattended for more than 30 minutes after deployment.
- Be sure to wear gloves when handling a deployed air bag module.
- Never apply water to a deployed air bag module.
- Wash your hands clean after finishing work.
- Place the vehicle outdoors with an open space of at least 6 m (20 ft) on all sides when deploying air bag module while mounted in vehicle.
- Use a voltmeter to make sure the vehicle battery is fully charged.
- Do not dispose of the air bag module un-deployed.

CHECKING DEPLOYMENT TOOL

Connecting to battery

- Place vehicle outdoors with at least 6 m (20 ft) of open space on all sides.
- Use a voltmeter to make sure the vehicle battery is fully charged.

CAUTION:
The battery must show voltage of 9.6V or more.



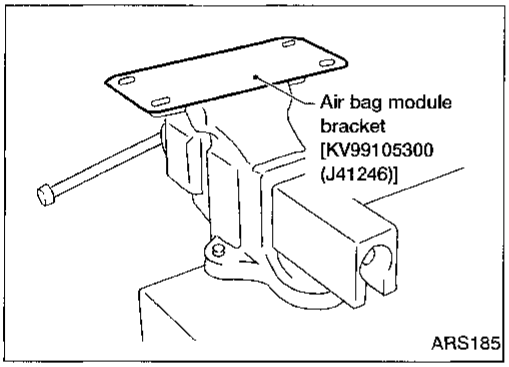
Remove the battery from the vehicle and place it on dry wood blocks approximately 5 m (16 ft) away from the vehicle.

- Wait 3 minutes after the vehicle battery is disconnected before proceeding.
- Connect red clip of deployment tool to battery positive terminal and black clip to negative terminal.

CAUTION:
Make sure the polarity is correct. The right side lamp in the tool, marked "deployment tool power", should glow with a green light. If the right side lamp glows red, reverse the connections to the battery.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Disposal of Air Bag Module (Cont'd)

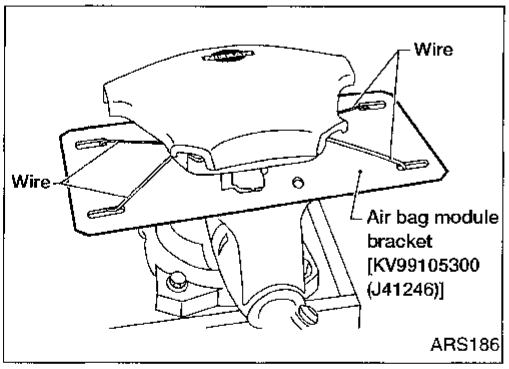


Deployment tool check

Press the deployment tool switch to the ON position. The left side lamp in the tool, marked "air bag connector voltage" should illuminate. If it does not illuminate, replace the tool.

Air bag deployment tool lamp illumination chart (Battery connected)

Switch operation	Left side lamp, green* "AIR BAG CONNECTOR VOLTAGE"	Right side lamp, green* "DEPLOYMENT TOOL POWER"
OFF	OFF	ON
ON	ON	ON

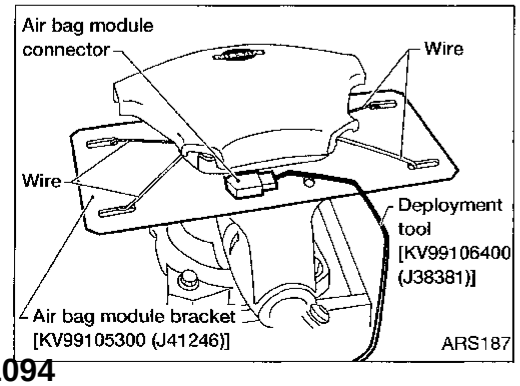


*: If this lamp glows red, the tool is connected to the battery incorrectly. Reverse the connections and make sure the lamp glows green.

DEPLOYMENT PROCEDURES FOR AIR BAG MODULE (OUTSIDE OF VEHICLE)

Unless the vehicle is being scrapped, deploying the air bag in the vehicle is not recommended. This may cause damage to the vehicle interior.

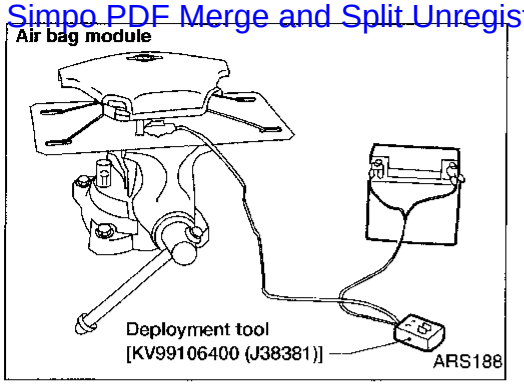
Anchor air bag module bracket [KV99105300 (J41246)] in a vise secured to a firm foundation during deployment.



Deployment of driver air bag module (outside of vehicle)

1. Using wire, firmly secure driver air bag module to air bag module bracket [SST: KV99105300 (J41246)] at two places.

CAUTION:
Use wire of at least 1 mm (0.04 in) diameter.

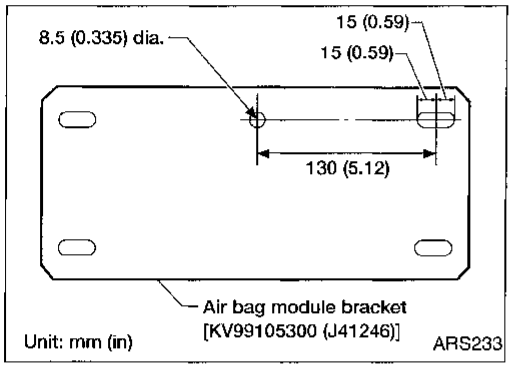


2. Firmly secure air bag module bracket [SST: KV99105300 (J41246)] with driver air bag module attached, in a vise.

3. Connect deployment tool [SST: KV99106400 (J38381)] to driver air bag module connector.

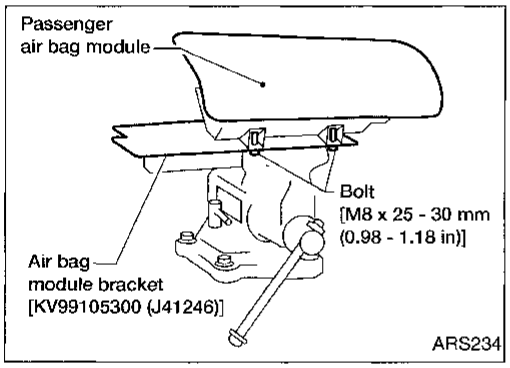
Disposal of Air Bag Module (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



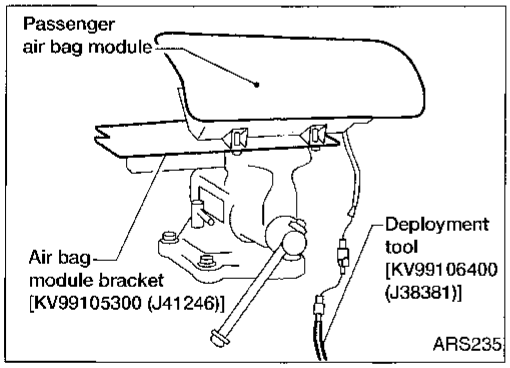
4. Connect red clip of deployment tool to battery positive terminal and black clip to negative terminal.
5. The lamp on the right side of the tool, marked "deployment tool power", should glow green, not red.
6. Press the button on the deployment tool. The left side lamp on the tool, marked "air bag connector voltage", will illuminate and the air bag module will deploy.

CAUTION:
When deploying the air bag module, stand at least 5 m (16 ft) away from the air bag module.



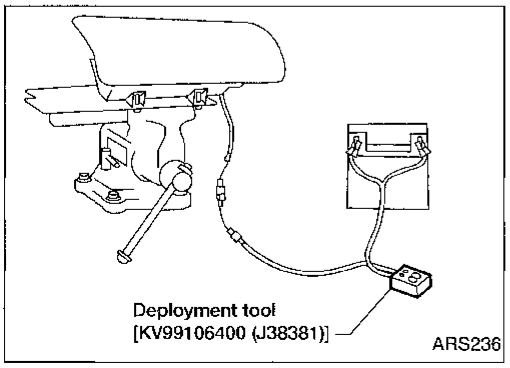
Deployment of passenger air bag module (outside of vehicle)

1. Make an 8.5 mm (0.335 in) diameter hole in air bag module bracket [SST: KV99105300 (J41246)] at the position shown in figure at left.

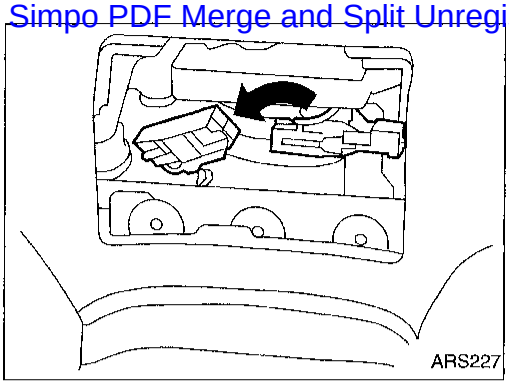


2. Firmly secure air bag module bracket [SST: KV99105300 (J41246)] in a vise.
3. Match the two holes in air bag module bracket (held in vise) and passenger air bag module and fix them with two bolts [M8 x 25 - 30 mm (0.98 - 1.18 in)].

CAUTION:
If a gap exists between passenger air bag module and air bag module bracket, use a piece of wood inserted in the gap to stabilize the air bag module.



4. Connect deployment tool adapter [SST: KV991065S0 (J38381-30)] to deployment tool [SST: KV99106400 (J38381)] connector and air bag module connector.

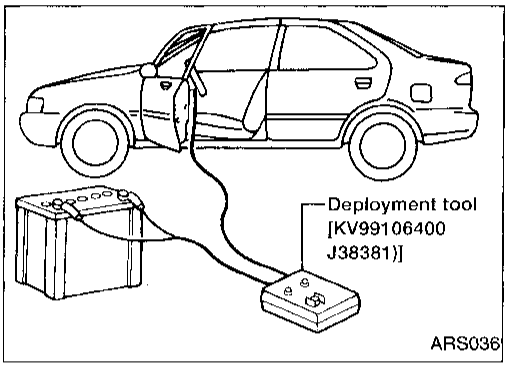


5. Connect red clip of deployment tool to battery positive terminal and black clip to negative terminal.
6. The lamp on the right side of the tool, marked "deployment tool power", should glow green, not red.
7. Press the button on the deployment tool. The left side lamp on the tool, marked "air bag connector voltage", will illuminate and the air bag module will deploy.

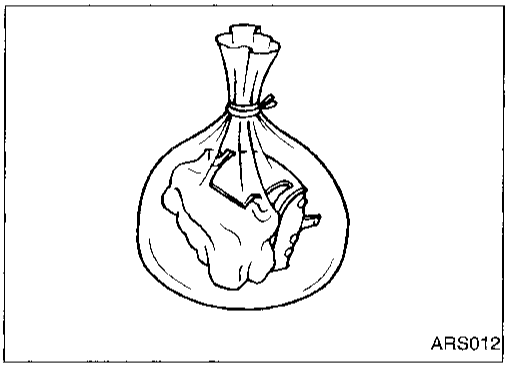
CAUTION:
When deploying the air bag module, stand at least 5 m (16 ft) away from the air bag module.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Disposal of Air Bag Module (Cont'd)



DEPLOYMENT OF AIR BAG MODULE WHILE MOUNTED IN VEHICLE



When disposing of vehicles, deploy air bag module while it is mounted in vehicle.

CAUTION:

When deploying air bag module, ensure vehicle is empty.

1. Turn ignition switch OFF, disconnect both battery cables and wait at least 3 minutes.
2. Disconnect air bag module connector.
3. Connect deployment tool [SST:KV99106400 (J38381)] connector to air bag module.
   For passenger air bag module, use adapter [SST:KV99106400 (J38381-30)] to attach module to deployment tool connector.
4. Connect red clip of deployment tool to battery positive terminal and black clip to negative terminal.
5. The lamp on the right side of the tool, marked "deployment tool power", should glow green, not red.
6. Press the button on the deployment tool. The left side lamp on the tool, marked "air bag connector voltage", will illuminate. Then the air bag module will deploy.

DISPOSING OF AIR BAG MODULE

Deployed air bag module is very hot. Before disposing of air bag module, wait at least 30 minutes. Seal them in a plastic bag before disposal.

CAUTION:

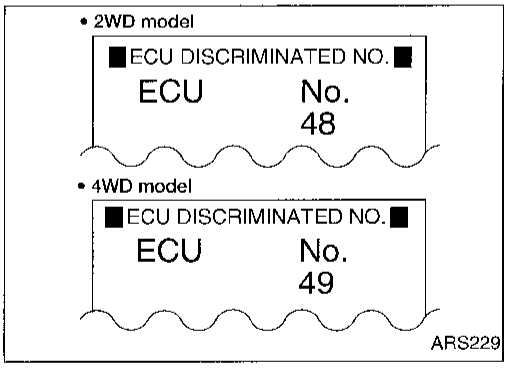
- **Never apply water to a deployed air bag module.**
- **Be sure to wear gloves when handling a deployed air bag module.**
- **No poisonous gas is produced upon air bag module deployment. However, be careful not to inhale gas since it irritates throat and can cause choking.**
- **Do not attempt to disassemble air bag module.**
- **Air bag module cannot be reused.**
- **Wash your hands clean after finishing work.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Trouble Diagnosis Introduction

CAUTION:

- **Do not use electrical test equipment on any circuit related to the SRS unless instructed to in this Service Manual. SRS wiring harnesses are covered with yellow insulation either just before the harness connectors or on the complete harness, for easy identification.**
- **Do not attempt to repair, splice or modify the SRS wiring harness. If the harness is damaged, replace it with a new one.**
- **Keep ground portion clean.**



DIAGNOSIS FUNCTION

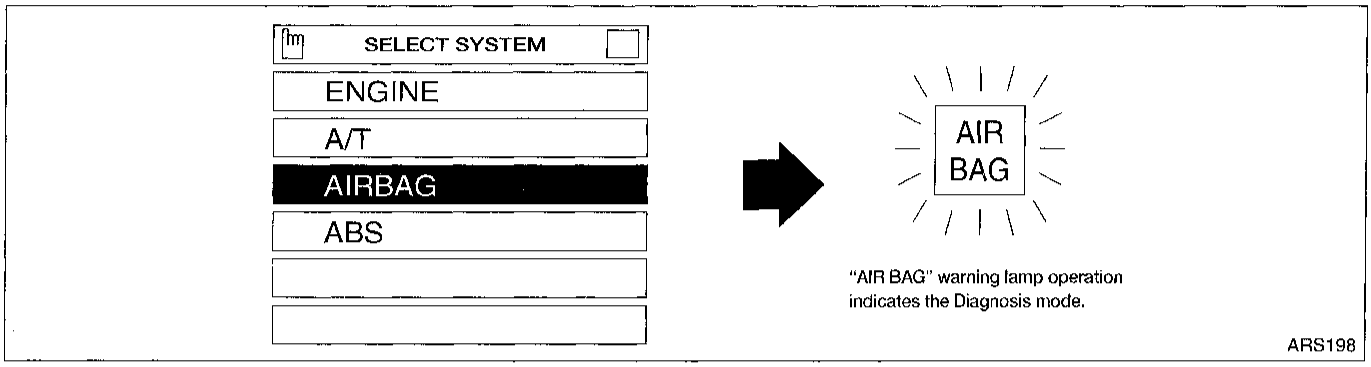
The SRS Self-diagnosis results can be read by using the "AIR BAG" warning lamp and/or CONSULT. The reading of these results is accomplished using one of two modes — "User mode" and "Diagnosis mode".
The User mode is exclusively prepared for the customer (driver). This mode warns the driver of a system malfunction through the operation of the "AIR BAG" warning lamp.
The Diagnosis mode allows the technician to locate and inspect the malfunctioning part.
The mode applications for the "AIR BAG" warning lamp and CONSULT are as follows:

	User mode	Diagnosis mode	Display type
"AIR BAG" warning lamp	X	X	ON-OFF operation
CONSULT	—	X	Monitoring

DIAGNOSIS MODE FOR CONSULT

- "SELF-DIAG [CURRENT]"
  A current Self-diagnosis result (also indicated by the number of warning lamp flashes in the Diagnosis mode) is displayed on the CONSULT screen in real time. This refers to a malfunctioning part requiring repairs.
- "SELF-DIAG [PAST]"
  Diagnosis results previously stored in the memory are displayed on the CONSULT screen. The stored results are not cleared until memory erasing is executed.
- "TROUBLE DIAG RECORD"
  With "TROUBLE DIAG RECORD", diagnosis results previously erased by a reset operation can be displayed on the CONSULT screen.

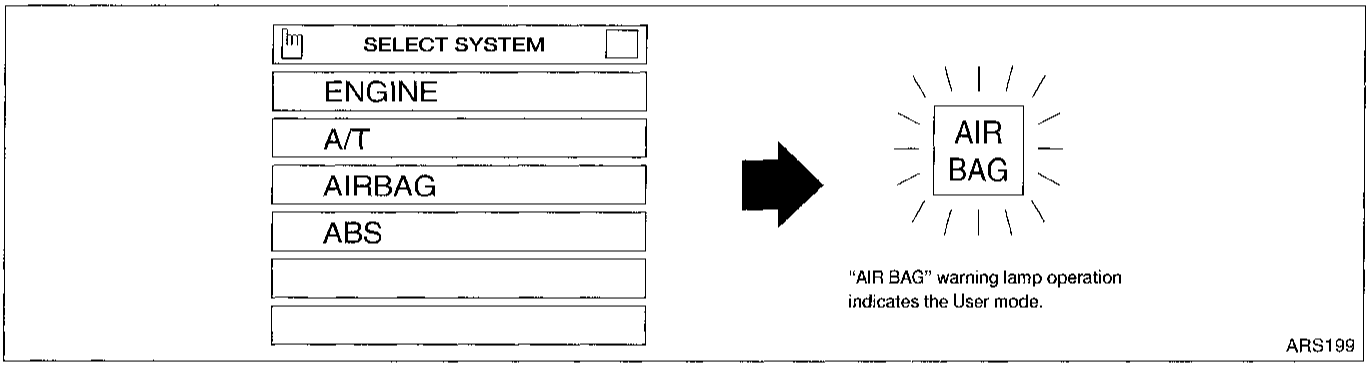
- ECU DISCRIMINATED NO.
  The air bag diagnosis sensor unit for each vehicle model is assigned with its own, individual classification number. This number will be displayed on the CONSULT screen, as shown at left. When replacing the diagnosis sensor unit, refer to the part number for the compatibility. After installation, replacement with a correct unit can be checked by confirming this classification number on the CONSULT screen.
  For NISSAN model D22, the air bag diagnosis sensor unit classification numbers assigned are 48 (for 2WD models) and 49 (for 4WD models).



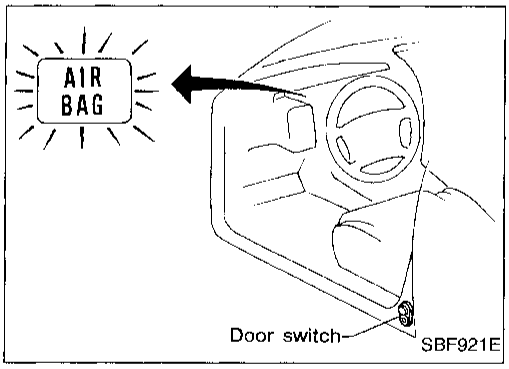
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

HOW TO CHANGE SELF DIAGNOSIS MODE

With CONSULT



From User mode to Diagnosis mode



Touch "AIRBAG" on the "SELECT SYSTEM" screen. User mode automatically changes to Diagnosis mode.

From Diagnosis mode to User mode

Touch "BACK" key of CONSULT until "SELECT SYSTEM" appears, Diagnosis mode automatically changes to User mode.

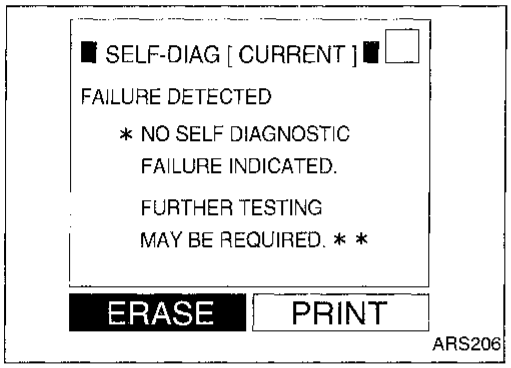
Without CONSULT

From User mode to Diagnosis mode

Diagnosis mode can be activated only when a malfunction is detected, by pressing the door switch LH at least 5 times within 7 seconds after turning the ignition switch ON. SRS will not enter Diagnosis mode if no malfunction is detected.

From Diagnosis mode to User mode

- To return to User mode while a malfunction is being detected, turn ignition switch OFF, then back ON and press the door switch LH at least 5 times within 7 seconds.
- After a malfunction is repaired, turn ignition switch OFF for at least one second, then back ON. Diagnosis mode returns to User mode.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

HOW TO ERASE SELF DIAGNOSIS RESULTS

With CONSULT

SELF-DIAG [CURRENT]

A current Self-diagnosis result is displayed on the CONSULT screen in real time. After the malfunction is repaired completely, no malfunction is detected on "SELF-DIAG [CURRENT]".

SELF-DIAG [PAST]

Return to the "SELF-DIAG [CURRENT]" CONSULT screen by pushing "BACK" key of CONSULT and select "SELF-DIAG [CURRENT]" in "SELECT DIAG MODE". Touch "ERASE" in "SELF-DIAG [CURRENT]" mode.

NOTE:
If the memory of the malfunction in "SELF-DIAG [PAST]" is not erased, the User mode shows the system malfunction by the operation of the warning lamp even if the malfunction is repaired completely.

TROUBLE DIAG RECORD

The memory of "TROUBLE DIAG RECORD" cannot be erased.

Without CONSULT

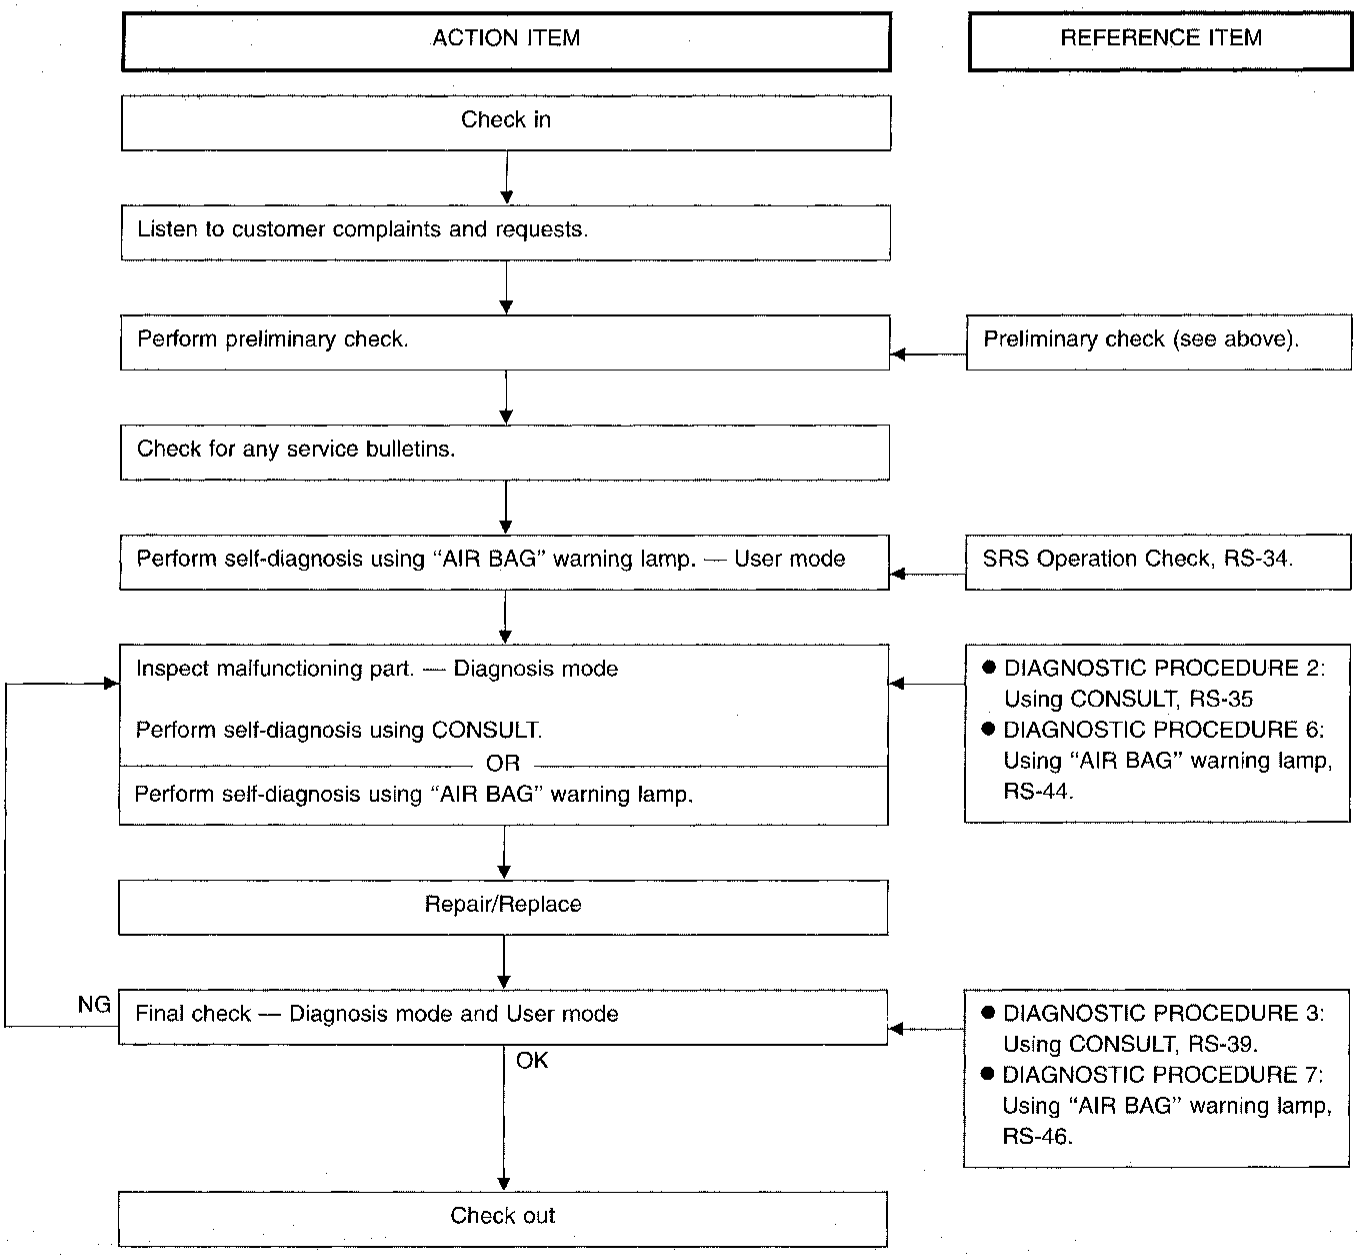
After a malfunction is repaired, turn ignition switch OFF for at least one second, then back ON. Diagnosis mode returns to User mode. At that time, the problem code is cleared.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

How to Perform Trouble Diagnoses for Quick and Accurate Repair

A good understanding of the malfunction conditions can make troubleshooting faster and more accurate. In general, each customer feels differently about a problem. It is important to fully understand the symptoms or conditions of a customer complaint.

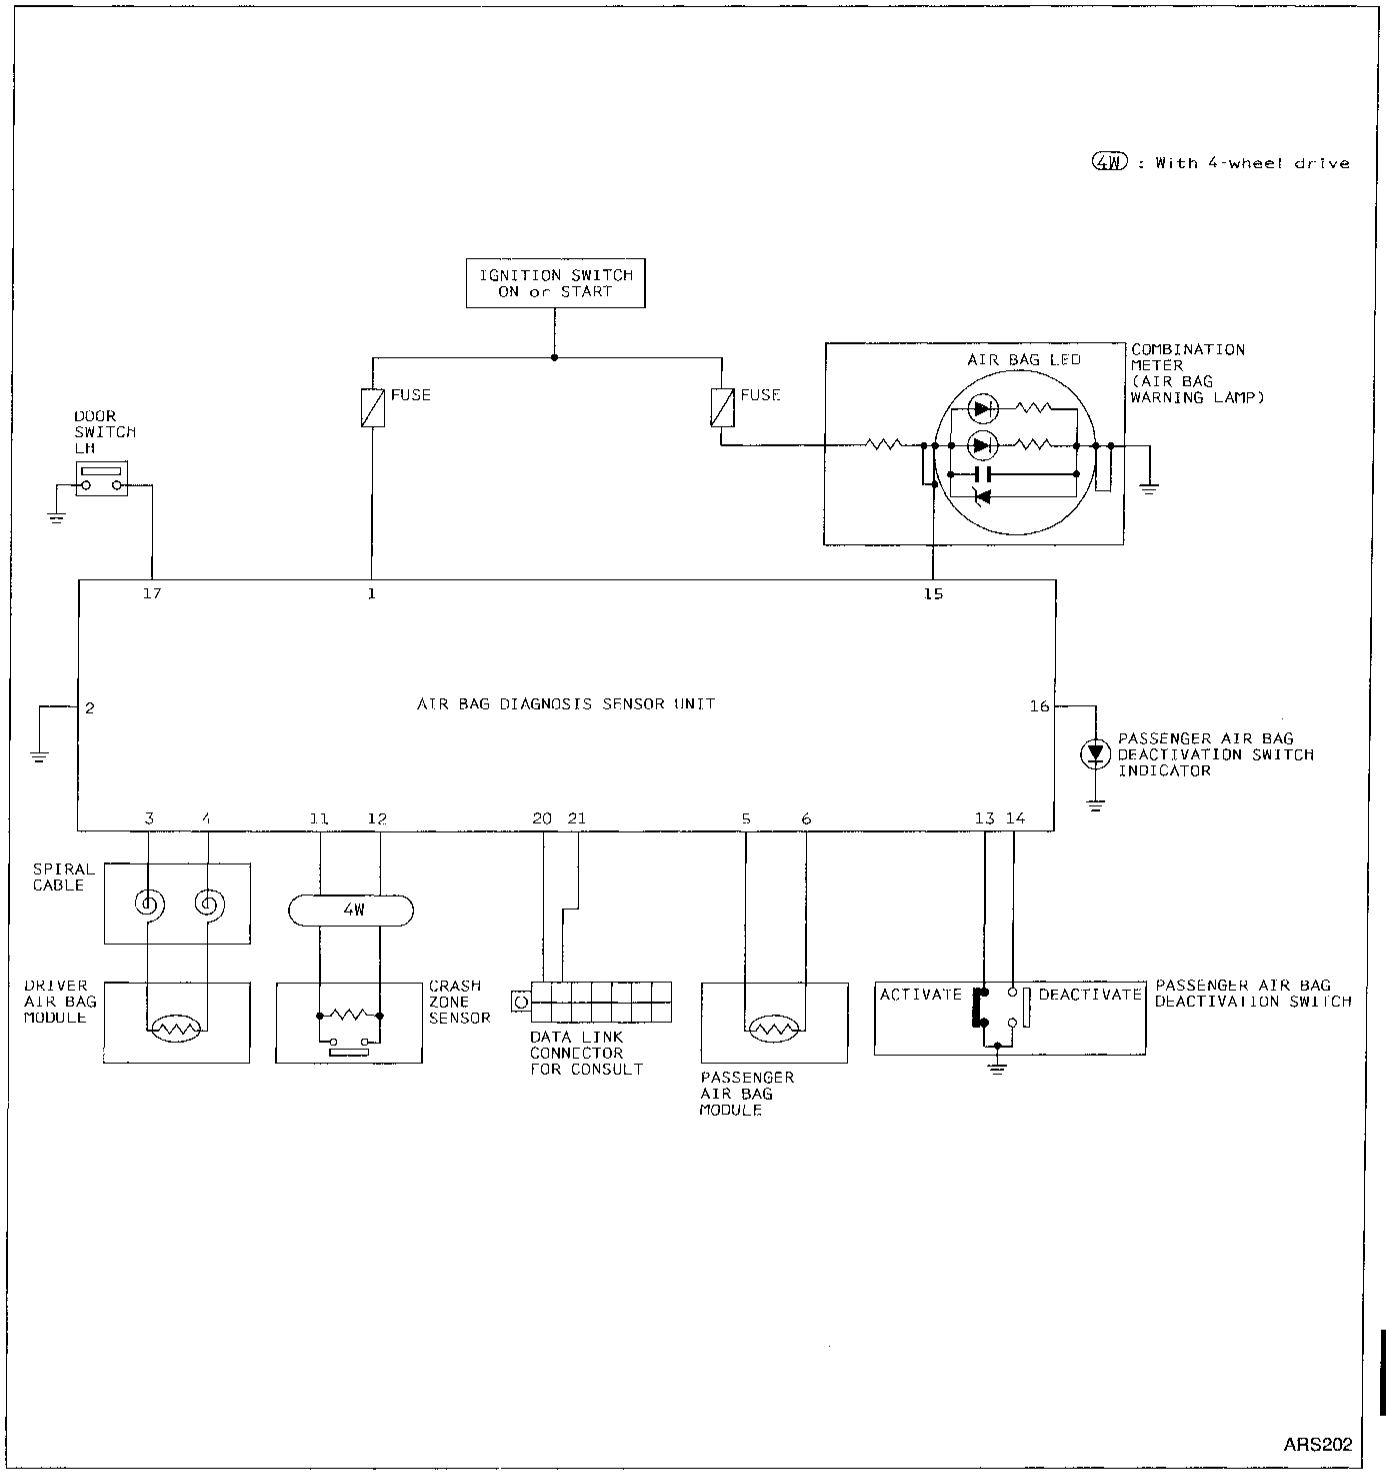
INFORMATION FROM CUSTOMER



WHAT ..... Vehicle model
WHEN ..... Date, Frequencies
WHERE ..... Road conditions
HOW ..... Operating conditions, Symptoms

PRELIMINARY CHECK

Check that the following parts are in good order.



- Battery [Refer to EL section ("BATTERY").]
- Fuse [Refer to EL section ("Fuse", "POWER SUPPLY ROUTING").]
- System component-to-harness connections

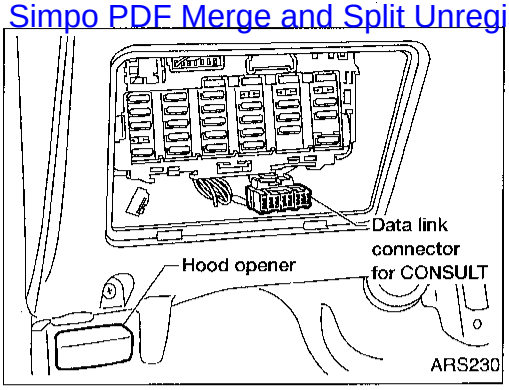
SRS Operation Check

DIAGNOSTIC PROCEDURE 1



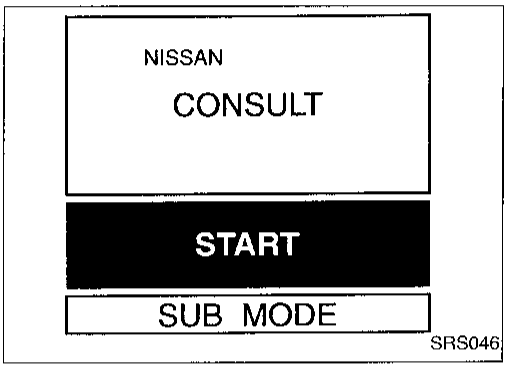
Checking SRS operation by using "AIR BAG" warning lamp — User mode

1. After turning ignition switch from OFF to ON, "AIR BAG" warning lamp operates.
2. Compare "AIR BAG" warning lamp operation to the chart below.

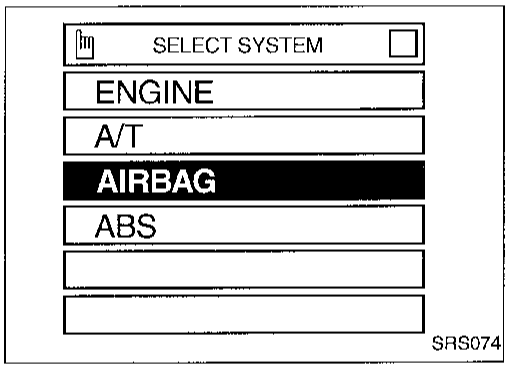
"AIR BAG" warning lamp operation — User mode —	SRS condition	Reference item
 MRS095A	No malfunction is detected. No further action is necessary.	—
 MRS096A	The system has problem and needs to be repaired as indicated.	Go to DIAGNOSTIC PROCEDURE 2, or 6, RS-35 or 44.
 MRS097A	Air bag is deployed.	Go to COLLISION DIAGNOSIS, RS-51.
	Air bag fuse for air bag diagnosis sensor unit or circuit is malfunctioning and needs to be repaired.	Go to DIAGNOSTIC PROCEDURE 9, RS-48.
 MRS098A	One of the following has occured and needs to be repaired. ● Meter fuse is open. ● "AIR BAG" warning lamp circuit is shorted or open. ● Air bag diagnosis sensor unit is malfunctioning.	Go to DIAGNOSTIC PROCEDURE 10, RS-49.

NOTE:
If "AIR BAG" warning lamp operates differently from the operations shown above, refer to "AIR BAG" warning lamp operation — Diagnosis mode —, DIAGNOSTIC PROCEDURE 6, step 4, RS-44. Then repair as necessary.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

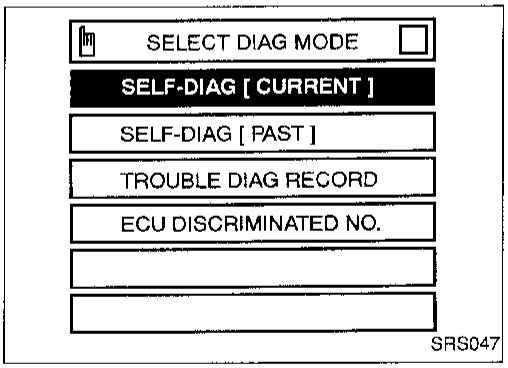


Trouble Diagnoses with CONSULT

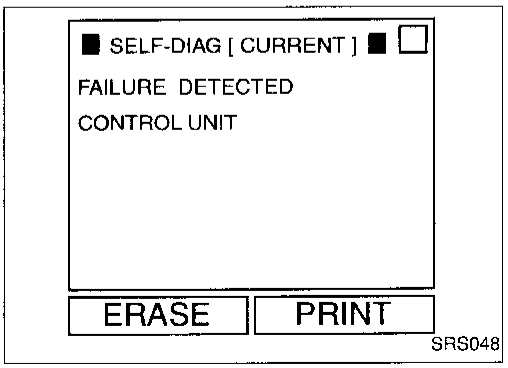


DIAGNOSTIC PROCEDURE 2

Inspecting SRS malfunctioning parts by using CONSULT — Diagnosis mode

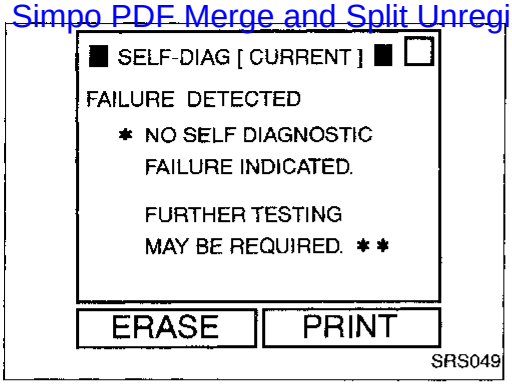


1. Turn ignition switch OFF.
2. Connect CONSULT to Data link connector.



3. Turn ignition switch ON.
4. Touch “START”.

5. Touch “AIRBAG”.



6. Touch “SELF-DIAG [CURRENT]”.

7. Diagnostic codes are displayed on “SELF-DIAG [CURRENT]”.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Trouble Diagnoses with CONSULT (Cont'd)

- **If no self-diagnostic failure is detected on "SELF-DIAG [CURRENT]" but malfunction is indicated by the "AIR BAG" warning lamp in User mode, go to DIAGNOSTIC PROCEDURE 4, RS-40 for diagnosing the following cases:**
- **Self-diagnostic failure (previously stored in the memory) might not be erased after repair.**
- **The SRS system is malfunctioning intermittently.**

8. Touch "PRINT".
9. Compare diagnostic codes to the CONSULT DIAGNOSTIC CODE CHART, RS-37.
10. Touch "BACK" key of CONSULT until "SELECT SYSTEM" appears in order to return to User mode from Diagnosis mode, then turn off CONSULT.
11. Turn ignition switch OFF, then disconnect CONSULT and both battery cables.
12. Repair the system as outlined by the Repair order in CONSULT DIAGNOSTIC CODE CHART, that corresponds to the problem code. For replacement procedure of component parts, refer to RS-14.
13. After repairing the system, connect battery cables and go to DIAGNOSTIC PROCEDURE 3, RS-39 for final checking.

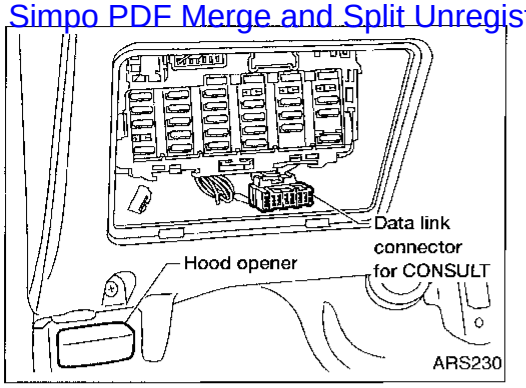
Trouble Diagnoses with CONSULT (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

CONSULT DIAGNOSTIC CODE CHART ("SELF-DIAG [CURRENT]")

Diagnostic item	Explanation/Possible causes		Repair order ***Recheck SRS using CONSULT at each replacement**
NO SELF DIAGNOSTIC FAILURE INDICATED	When malfunction is indicated by the "AIR BAG" warning lamp in User mode.	● Self-diagnostic failure "SELF-DIAG [PAST]" (previously stored in the memory) might not be erased after repair. ● Intermittent problem has been detected in the past.	● Go to DIAGNOSTIC PROCEDURE 4, RS-40.
	● No malfunction is detected.		● Go to DIAGNOSTIC PROCEDURE 3, RS-39.
AIRBAG MODULE [OPEN]	● Air bag module circuit is open (including the spiral cable).		1. Visually check wiring harness connections. 2. Replace air bag harness if it has visible damage. 3. Replace spiral cable. 4. Replace air bag module. (Before disposing of it, it must be deployed.) 5. Replace air bag diagnosis sensor unit. 6. Replace air bag harness.
AIRBAG MODULE [VB-SHORT]	● Air bag module circuit is shorted to some power supply circuit (including the spiral cable).		
AIRBAG MODULE [GND-SHORT]	● Air bag module circuit is shorted to ground (including the spiral cable).		
AIRBAG MODULE [SHORT]	● Air bag module circuits are shorted to each other.		
ASSIST A/B MODULE [VB-SHORT]	● Passenger air bag module circuit is shorted to some power supply circuit.		1. Visually check wiring harness connection. 2. Replace air bag harness if it has visible damage. 3. Replace passenger air bag module. (Before disposal of it, it must be deployed.) 4. Replace air bag diagnosis sensor unit. 5. Replace air bag harness.
ASSIST A/B MODULE [OPEN]	● Passenger air bag module circuit is open.		
ASSIST A/B MODULE [GND-SHORT]	● Passenger air bag module circuit is shorted to ground.		
ASSIST A/B MODULE [SHORT]	● Passenger air bag module circuits are shorted to each other.		
CRASH ZONE SEN-CTR [OPEN/UPR-VB-SHORT] (4WD models)	● Crash zone sensor circuit is open, or ● Crash zone sensor circuit is shorted to some power supply circuit.		1. Visually check wiring harness connections. 2. Replace air bag harness if it has visible damage. 3. Replace crash zone sensor. 4. Replace air bag diagnosis sensor unit. 5. Replace air bag harness for crash zone sensor.
CRASH ZONE SEN-CTR [SHORT/UPR-GND-SHORT] (4WD models)	● Both crash zone sensor circuits are shorted, or ● Crash zone sensor circuit is shorted to ground.		
CONTROL UNIT	● Low battery voltage (Less than 9V).		● Go to DIAGNOSTIC PROCEDURE 3 (RS-39) after charging battery.
	● Air bag diagnosis sensor unit is malfunctioning.		1. Visually check wiring harness connections. 2. Replace air bag harness if it has visible damage. 3. Replace air bag diagnosis sensor unit. 4. Replace air bag harness.

Trouble Diagnoses with CONSULT (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostic item	Explanation/Possible causes	Repair order ***Recheck SRS using CONSULT at each replacement**
PASS A/B DEACT SW	● Activate terminal is open. ● Activate terminal is shorted to ground. ● Deactivate terminal is open. ● Deactivate terminal is shorted to ground. ● Activate terminal and deactivate terminal are shorted to each other.	1. Visually check wiring harness connections. 2. Replace air bag harness if it has visible damage. 3. Replace passenger air bag deactivation switch. (The key cylinder of passenger air bag deactivation switch does not have to be replaced.) 4. Replace air bag diagnosis sensor unit. 5. Replace air bag harness.
PASS A/B DEACT SW INDICATOR	● Passenger air bag deactivation switch indicator circuit is open. ● Passenger air bag deactivation switch indicator circuit is shorted to some power supply circuit. ● Passenger air bag deactivation switch indicator circuit is shorted to ground.	1. Visually check wiring harness connections. 2. Replace air bag harness if it has visible damage. 3. Replace passenger air bag deactivation switch indicator. 4. Replace air bag diagnosis sensor unit. 5. Replace air bag harness.
INDEFINITE FAILURES [AIR BAGS]	● Passenger air bag deactivation switch status is not identified.	1. Visually check wiring harness connections. 2. Replace air bag harness if it has visible damage. 3. Replace passenger air bag deactivation switch. 4. Replace air bag diagnosis sensor unit. 5. Replace air bag harness.

*Follow the procedures in numerical order when repairing malfunctioning parts. Confirm whether malfunction is eliminated using the "AIR BAG" warning lamp (in User mode) or CONSULT each time repair is finished. If malfunction is still observed, proceed to the next step. When malfunction is eliminated, further repair work is not required.

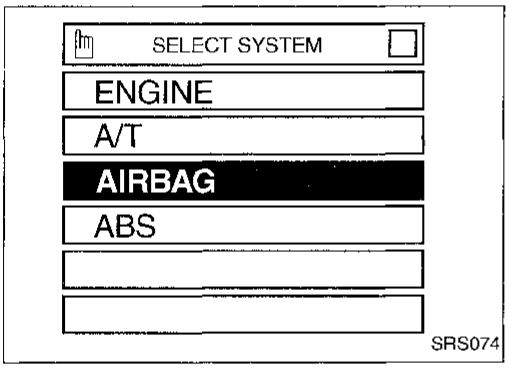
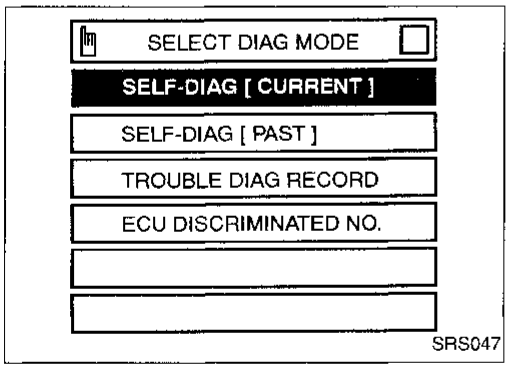
Trouble Diagnoses with CONSULT (Cont'd)

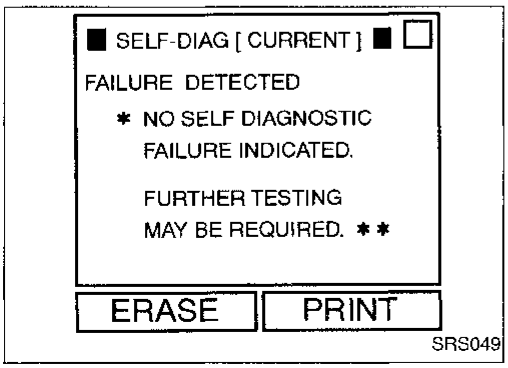


DIAGNOSTIC PROCEDURE 3

Final checking after repairing SRS by using CONSULT — Diagnosis mode



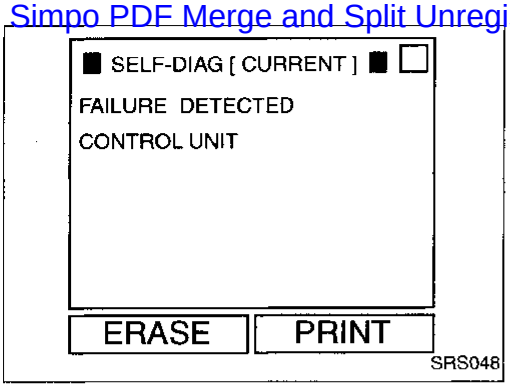
1. Check that both battery cables are connected.
2. Connect CONSULT to Data link connector.
3. Turn ignition switch from OFF to ON.



4. Touch "START".

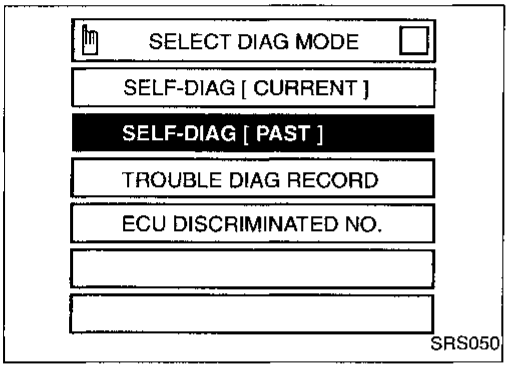
5. Touch "AIRBAG".

6. Touch "SELF-DIAG [CURRENT]".



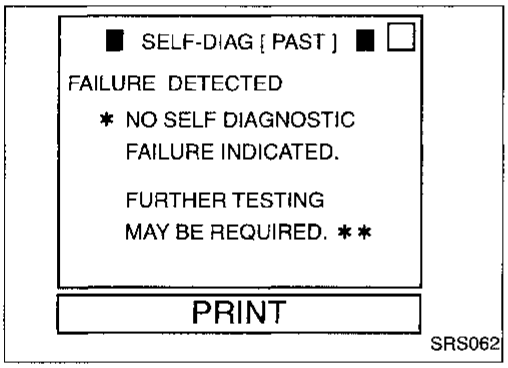
7. If no malfunction is detected on "SELF-DIAG [CURRENT]", repair of SRS is completed.

- If any problem code was displayed on "SELF-DIAG [CURRENT]", the malfunctioning part is not repaired completely or another malfunctioning part is detected. Go to DIAGNOSTIC PROCEDURE 2, RS-35 and repair malfunctioning part completely.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

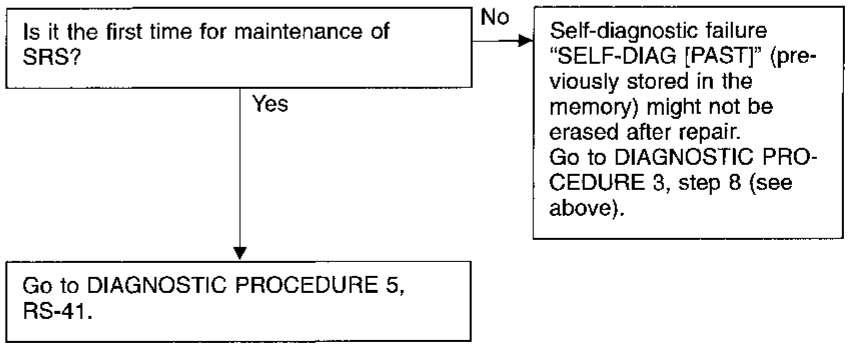
Trouble Diagnoses with CONSULT (Cont'd)



8. Touch "ERASE".
   NOTE:
   Touch "ERASE" to clear the memory of the malfunction ("SELF-DIAG [PAST]").

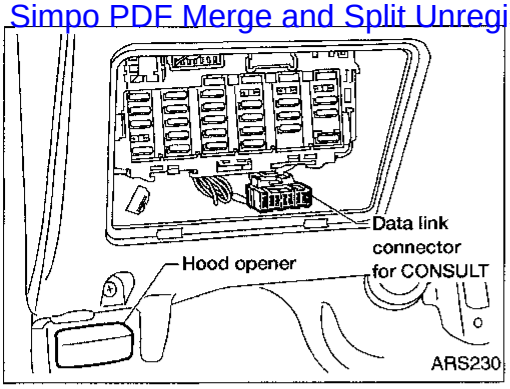
If the memory of the malfunction in "SELF-DIAG [PAST]" is not erased, the User mode shows the system malfunction by the operation of the warning lamp even if the malfunction is repaired completely.

9. Touch "BACK" key of CONSULT to "SELECT DIAG MODE" screen.
   Touch "SELF-DIAG [PAST]".



10. Check that no self-diagnostic failure is detected on "SELF-DIAG [PAST]".

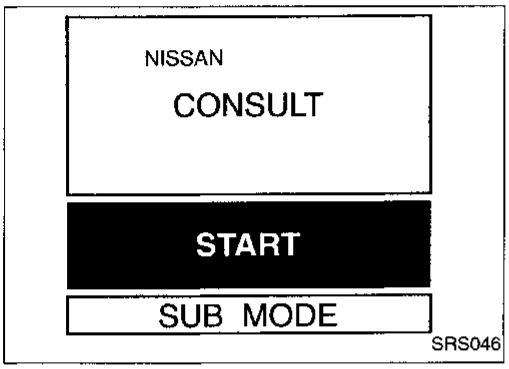
11. Touch "BACK" key of CONSULT until "SELECT SYSTEM" appears in order to return to User mode from Diagnosis mode, turn off CONSULT, then disconnect CONSULT.
12. Turn ignition switch OFF.
13. Go to SRS Operation Check, RS-34 to check SRS operation by using "AIR BAG" warning lamp with User mode.



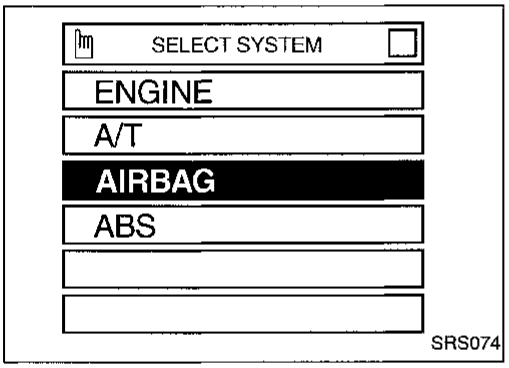
DIAGNOSTIC PROCEDURE 4 (Continued from DIAGNOSTIC PROCEDURE 2)

Inspecting SRS malfunctioning record

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

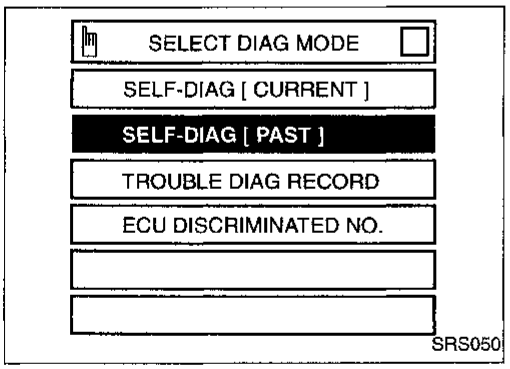


Trouble Diagnoses with CONSULT (Cont'd)

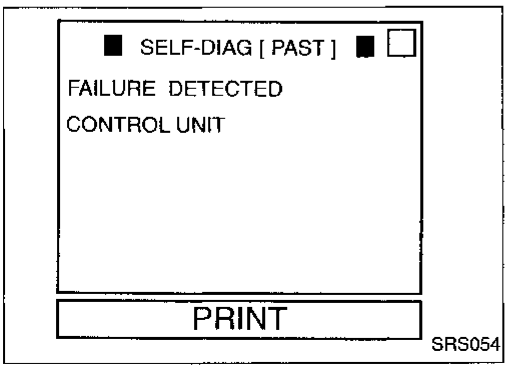


DIAGNOSTIC PROCEDURE 5

Inspecting SRS intermittent problem by using CONSULT — Diagnosis mode

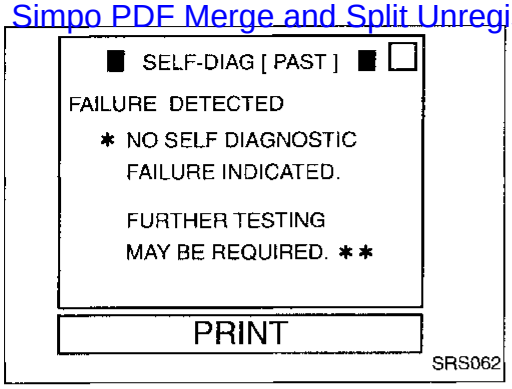


1. Turn ignition switch OFF.
2. Connect CONSULT to Data link connector.

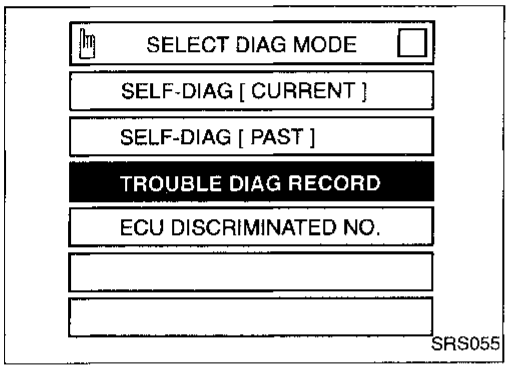


3. Turn ignition switch ON.
4. Touch "START".

5. Touch "AIRBAG".

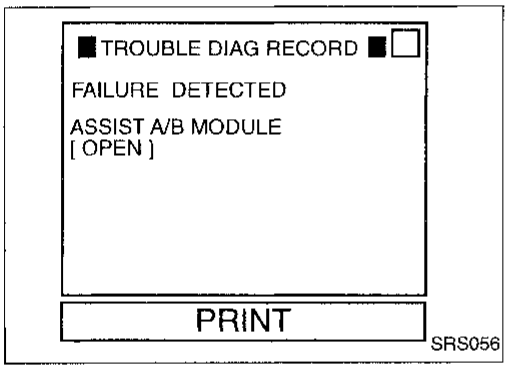


6. Touch "SELF-DIAG [PAST]".



7. If diagnostic codes are displayed on "SELF-DIAG [PAST]", go to step 10.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



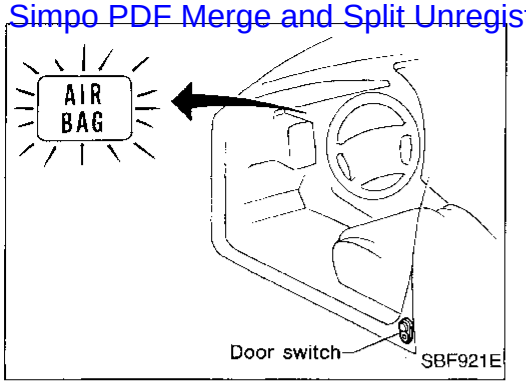
Trouble Diagnoses with CONSULT (Cont'd)

If no self-diagnostic failure is detected on "SELF-DIAG [PAST]", touch "BACK" and go back to "SELECT DIAG MODE".

8. Touch "TROUBLE DIAG RECORD".
   NOTE:
   With "TROUBLE DIAG RECORD", diagnosis results previously erased by a reset operation can be displayed.

9. Diagnostic code is displayed on "TROUBLE DIAG RECORD".
10. Touch "PRINT".
11. Compare diagnostic codes to the INTERMITTENT PROBLEM DIAGNOSTIC CODE CHART, RS-43.
12. Touch "BACK" key of CONSULT until "SELECT SYSTEM" appears, then turn off CONSULT.
13. Turn ignition switch OFF, then disconnect CONSULT and both battery cables.
14. Repair the system as outlined by the Repair order that corresponds to the problem code in INTERMITTENT PROBLEM DIAGNOSTIC CODE CHART, RS-43. For replacement procedure of component parts, refer to RS-14.
15. Go to DIAGNOSTIC PROCEDURE 3, RS-39.

Trouble Diagnoses with CONSULT (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

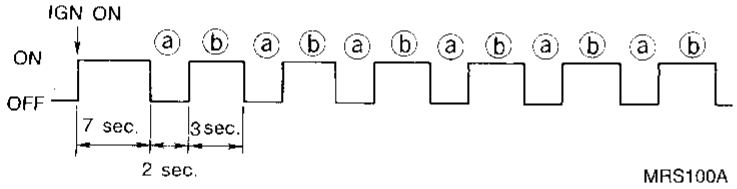
INTERMITTENT PROBLEM DIAGNOSTIC CODE CHART ("SELF-DIAG [PAST]" or "TROUBLE DIAG RECORD")

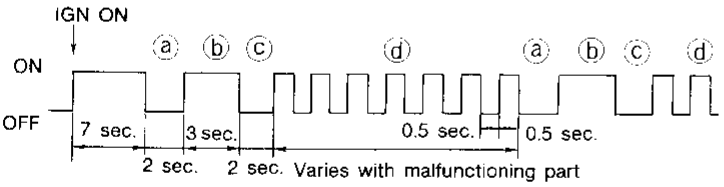
Diagnostic item	Explanation	Repair order
NO SELF DIAGNOSTIC FAILURE INDICATED.	● No malfunction is detected.	● Go to DIAGNOSTIC PROCEDURE 3, RS-39.
AIRBAG MODULE [OPEN]	● Driver air bag module circuit is open (including the spiral cable).	1. Visually check wiring harness connections. 2. Replace air bag harness if it has visible damage. 3. If the harness check result is OK, replace driver air bag module (Before disposal of it, it must be deployed.), air bag diagnosis sensor unit and spiral cable.
AIRBAG MODULE [VB-SHORT]	● Driver air bag module circuit is shorted to some power supply circuit (including the spiral cable).	
AIRBAG MODULE [GND-SHORT]	● Driver air bag module circuit is shorted to ground (including the spiral cable).	
AIRBAG MODULE [SHORT]	● Driver air bag module circuits are shorted to each other.	
ASSIST A/B MODULE [VB-SHORT]	● Passenger air bag module circuit is shorted to some power supply circuit.	1. Visually check wiring harness connections. 2. Replace air bag harness if it has visible damage. 3. If the harness check result is OK, replace air bag diagnosis sensor unit and air bag harness.
ASSIST A/B MODULE [OPEN]	● Passenger air bag module circuit is open.	1. Visually check wiring harness connections. 2. Replace air bag harness if it has visible damage. 3. If the harness check result is OK, replace passenger air bag module (Before disposal of it, it must be deployed.) and air bag diagnosis sensor unit.
ASSIST A/B MODULE [GND-SHORT]	● Passenger air bag module circuit is shorted to ground.	
ASSIST A/B MODULE [SHORT]	● Passenger air bag module circuits are shorted to each other.	
CRASH ZONE SEN-CTR [OPEN/UPR-VB-SHORT] (4WD models)	● Crash zone sensor circuit is open, or ● Crash zone sensor circuit is shorted to some power supply circuit.	1. Visually check wiring harness connections. 2. Replace air bag harness if it has visible damage.
CRASH ZONE SEN-CTR [SHORT/UPR-GND-SHORT] (4WD models)	● Both crash zone sensor circuits are shorted, or ● Crash zone sensor circuit is shorted to ground.	1. Visually check wiring harness connections. 2. Replace harness if it has visible damage. 3. If the harness check result is OK, replace crash zone sensor.
CONTROL UNIT	● Low battery voltage (Less than 9V).	● Go to DIAGNOSTIC PROCEDURE 3 (RS-39).
	● Air bag diagnosis sensor unit is malfunctioning.	● Replace air bag diagnosis sensor unit.
PASS A/B DEACT SW	● Activate terminal is open.	1. Visually check wiring harness connections. 2. Replace harness if it has visible damage. 3. If the harness check result is OK, replace passenger air bag deactivation switch (The key cylinder of passenger air bag deactivation switch does not have to be replaced.).
	● Activate terminal is shorted to ground.	
	● Deactivate terminal is open.	
	● Deactivate terminal is shorted to ground.	
	● Activate terminal and deactivate terminal are shorted to each other.	
PASS A/B DEACT SW INDICATOR	● Passenger air bag deactivation switch indicator circuit is open.	1. Visually check wiring harness connections. 2. Replace harness if it has visible damage. 3. If the harness check result is OK, replace passenger air bag deactivation switch indicator.
	● Passenger air bag deactivation switch indicator circuit is shorted to some power supply circuit.	
	● Passenger air bag deactivation switch indicator circuit is shorted to ground.	
INDEFINITE FAILURES [AIR BAGS]	● Passenger air bag deactivation switch status is not identified.	1. Visually check wiring harness connections. 2. Replace harness if it has visible damage. 3. If the harness check result is OK, replace passenger air bag deactivation switch and air bag diagnosis sensor unit.

*Follow the procedures in numerical order when repairing malfunctioning parts. Confirm whether malfunction is eliminated using the "AIR BAG" warning lamp (in User mode) or CONSULT each time repair is finished. If malfunction is still observed, proceed to the next step. When malfunction is eliminated, further repair work is not required.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Trouble Diagnoses without CONSULT





DIAGNOSTIC PROCEDURE 6

Inspecting SRS malfunctioning parts by using "AIR BAG" warning lamp — Diagnosis mode

NOTE:
SRS will not enter Diagnosis mode if no malfunction is detected in User mode.

1. Open driver's door.
2. Turn ignition switch from OFF to ON.
3. Press door switch LH at least 5 times within 7 seconds after turning ignition switch ON.
   SRS is now in Diagnosis mode.
4. "AIR BAG" warning lamp operates in Diagnosis mode as follows:

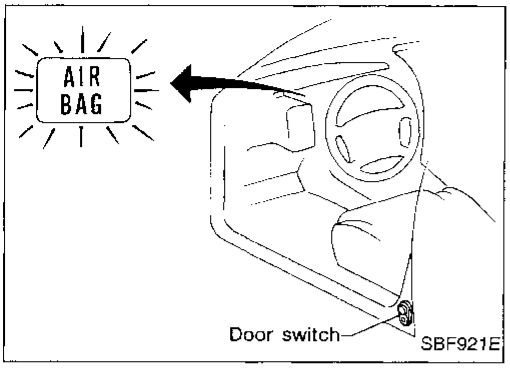
NOTE:
If SRS does not enter Diagnosis mode even though malfunction is detected in User mode, go to DIAGNOSTIC PROCEDURE 11, RS-50.

No.	"AIR BAG" warning lamp operation — Diagnosis mode —	SRS condition
1	 ⓐ through ⓑ are repeated.	● Self-diagnostic failure (previously stored in the memory) might not be erased after repair. ● Intermittent problem has been detected in the past. Go to DIAGNOSTIC PROCEDURE 8, RS-48.
2	 ⓐ through ⓓ are repeated. NOTE: ⓐ — Interval I ⓑ — Start signal (Start signal identifies display modes) ⓒ — Interval II ⓓ — Indicates malfunctioning part (0.5 sec. ON and 0.5 sec. OFF is counted as one flash.)	The system has a problem and needs to be repaired.

5. Malfunctioning part is indicated by the number of flashes (part ⓓ). Compare the number of flashes to WARNING LAMP FLASH CODE CHART and locate malfunctioning part.
6. Turn ignition switch OFF, and disconnect both battery cables.
7. Repair the system as outlined by the Repair order in WARNING LAMP FLASH CODE CHART that corresponds to the flash code. For replacement procedure of component parts, refer to RS-14.
8. After repairing the system, go to DIAGNOSTIC PROCEDURE 7, RS-46.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Trouble Diagnoses without CONSULT (Cont'd)

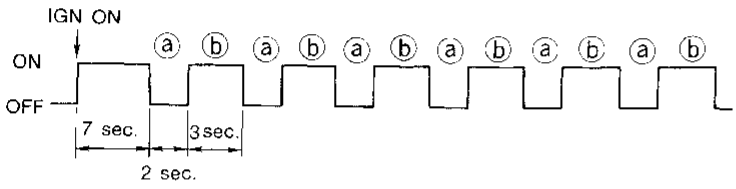


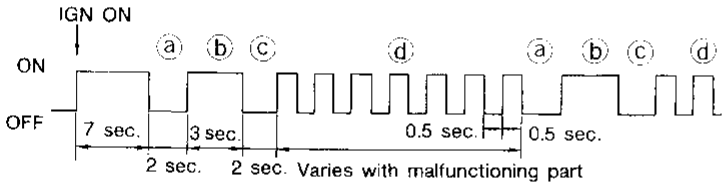
WARNING LAMP FLASH CODE CHART

Warning lamp	Flash code ⓓ (# of flashes)	Explanation	Repair order *Recheck SRS at each replacement
"AIR BAG" warning lamp	0	● Self-diagnostic failure might not be erased after repair. ● Intermittent problem has been detected in the past.	● Go to DIAGNOSTIC PROCEDURE 8 (RS-48).
	2	● Driver air bag module circuit is malfunctioning.	1. Visually check wiring harness connections. 2. Replace air bag harness if it has visible damage. 3. Replace spiral cable. 4. Replace driver air bag module. (Before disposing of it, it must be deployed.) 5. Replace air bag diagnosis sensor unit. 6. Replace air bag harness.
	6	● Crash zone sensor (4WD models) is malfunctioning.	1. Visually check wiring harness connections. 2. Replace air bag harness if it has visible damage. 3. Replace crash zone sensor. 4. Replace air bag diagnosis sensor unit. 5. Replace air bag harness for crash zone sensor.
	7	● Low battery voltage (Less than 9V).	● Go to DIAGNOSTIC PROCEDURE 7 (RS-46).
		● Air bag diagnosis sensor unit is malfunctioning.	1. Visually check wiring harness connections. 2. Replace air bag diagnosis sensor unit. 3. Replace air bag harness.
	8	● Passenger air bag module circuit is malfunctioning.	1. Visually check wiring harness connections. 2. Replace air bag harness if it has visible damage. 3. Replace passenger air bag module. (Before disposal of it, it must be deployed.) 4. Replace air bag diagnosis sensor unit. 5. Replace air bag harness.
	9	● Passenger air bag deactivation switch status is not identified.	1. Visually check wiring harness connections. 2. Replace air bag harness if it has visible damage. 3. Replace passenger air bag deactivation switch. (The key cylinder of passenger air bag deactivation switch does not have to be replaced.) 4. Replace air bag diagnosis sensor unit. 5. Replace air bag harness.
	10	● Passenger air bag deactivation switch is malfunctioning.	1. Visually check wiring harness connections. 2. Replace air bag harness if it has visible damage. 3. Replace passenger air bag deactivation switch. (The key cylinder of passenger air bag deactivation switch does not have to be replaced.) 4. Replace air bag diagnosis sensor unit. 5. Replace air bag harness.
	11	● Passenger air bag deactivation switch indicator is malfunctioning.	1. Visually check wiring harness connections. 2. Replace air bag harness if it has visible damage. 3. Replace passenger air bag deactivation switch indicator. 4. Replace air bag diagnosis sensor unit. 5. Replace air bag harness.

*Follow the procedures in numerical order when repairing malfunctioning parts. Confirm whether malfunction is eliminated using the "AIR BAG" warning lamp (in User mode) or CONSULT each time repair is finished. If malfunction is still observed, proceed to the next step. When malfunction is eliminated, further repair work is not required.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com





Trouble Diagnoses without CONSULT (Cont'd)

DIAGNOSTIC PROCEDURE 7

Final checking after repairing SRS by using "AIR BAG" warning lamp — Diagnosis mode and User mode

1. After repairing SRS, connect both battery cables.
2. Open driver's door.
3. Turn ignition switch from OFF to ON.
4. "AIR BAG" warning lamp operates in Diagnosis mode as follows:

No.	"AIR BAG" warning lamp operation — Diagnosis mode —	SRS condition
1	 MRS100A ⓐ through ⓑ are repeated.	No malfunction is detected or repair is completed. No further action is necessary.
2	 MRS099A ⓐ through ⓓ are repeated. NOTE: ⓐ — Interval I ⓑ — Start signal (Start signal identifies display modes) ⓒ — Interval II ⓓ — Indicates malfunctioning part (0.5 sec. ON and 0.5 sec. OFF is counted as one flash.)	The system has a problem and needs to be repaired.

NOTE:
When diagnosis sensor unit is replaced with a new one; the "AIR BAG" warning lamp will operate in User mode. Checking the "AIR BAG" warning lamp operation in Diagnosis mode is not required. Go to step 6.

5. If "AIR BAG" warning lamp operates as shown in No. 1 in the chart above, turn ignition switch OFF to reset from Diagnosis mode to User mode and to erase the memory of the malfunction.

   If "AIR BAG" warning lamp operates as in No. 2 in the chart above, the malfunctioning part is not repaired completely, or another malfunctioning part is detected. Go to DIAGNOSTIC PROCEDURE 6, RS-44 and repair malfunctioning part completely.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Trouble Diagnoses without CONSULT (Cont'd)

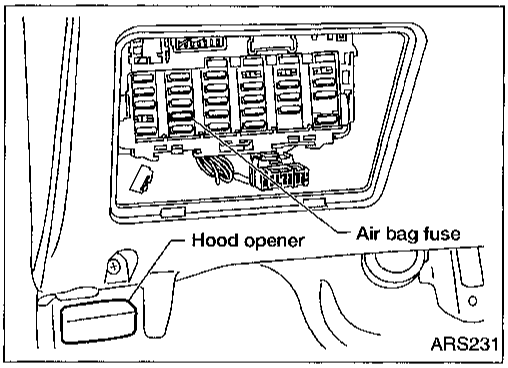
6. Turn ignition switch ON. "AIR BAG" warning lamp operates in User mode. Compare "AIR BAG" warning lamp operation to the chart below.

NOTE:
If switching Diagnosis mode to User mode is required while malfunction is being detected, turn ignition switch from OFF to ON. Then press door switch LH at least 5 times within 7 seconds after turning ignition switch ON.
SRS is now in User mode.

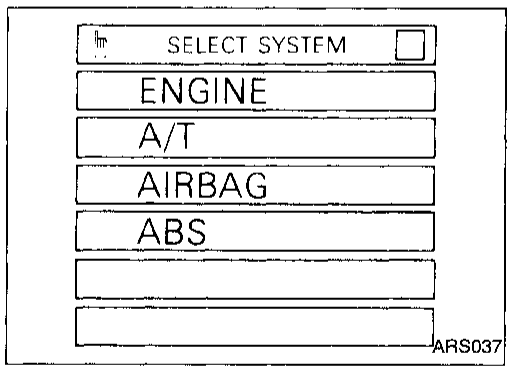
"AIR BAG" warning lamp operation — User mode —	SRS condition	Reference item
 MRS095A	No malfunction is detected. No further action is necessary.	—
 MRS096A	The system has problem and needs to be repaired as indicated.	Go to DIAGNOSTIC PROCEDURE 2 or 6, RS-34 or 44.
 MRS097A	Air bag is deployed.	Go to COLLISION DIAGNOSIS, RS-51.
	Air bag fuse for air bag diagnosis sensor unit or circuit is malfunctioning and needs to be repaired.	Go to DIAGNOSTIC PROCEDURE 9, RS-48.
 MRS098A	One of the following has occured and needs to be repaired. ● Meter fuse is open. ● "AIR BAG" warning lamp circuit is shorted or open. ● Air bag diagnosis sensor unit is malfunctioning.	Go to DIAGNOSTIC PROCEDURE 10, RS-49.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Trouble Diagnoses without CONSULT (Cont'd)



DIAGNOSTIC PROCEDURE 8 (Continued from DIAGNOSTIC PROCEDURE 6)



Inspection SRS malfunctioning record

Is it the first time for maintenance of SRS? — No → Diagnosis result (previously stored in the memory) might not be erased after repair. Go to DIAGNOSTIC PROCEDURE 7, step 5 (RS-46).

Yes ↓

Go to DIAGNOSTIC PROCEDURE 5, RS-41. Further inspection cannot be performed without CONSULT.

Trouble Diagnoses: "AIR BAG" Warning Lamp Does Not Turn Off

DIAGNOSTIC PROCEDURE 9

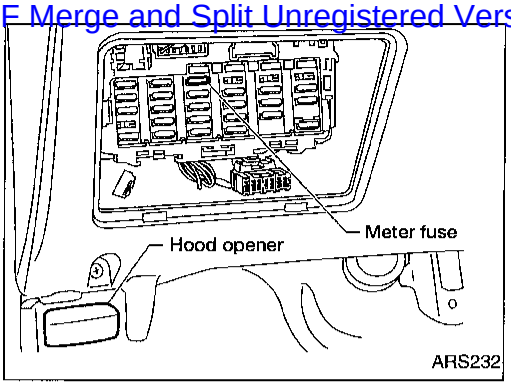
Is air bag module deployed? — Yes → Refer to COLLISION DIAGNOSIS, RS-51.

No ↓

Is SRS Air Bag fuse OK? — No → Replace fuse.

Yes ↓

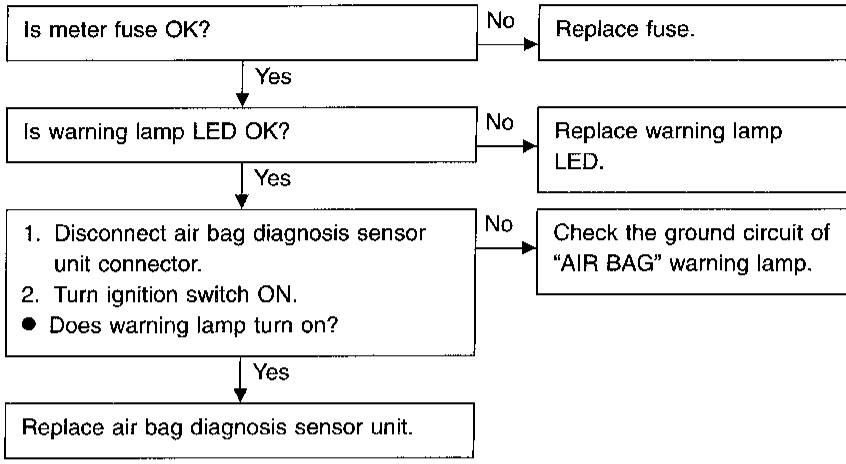
Connect CONSULT and touch "START".
- Is AIRBAG displayed on CONSULT? — No → Visually check the wiring harness connection of air bag diagnosis sensor unit. If the harness connection check is OK, replace air bag diagnosis sensor unit.



Yes ↓

Is harness connection between warning lamp and air bag diagnosis sensor unit OK? — No → Connect warning lamp and air bag diagnosis sensor unit properly. If warning lamp still does not go off, replace harness.

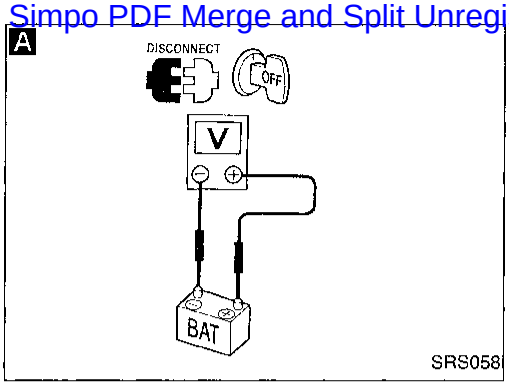
Yes ↓



Replace air bag diagnosis sensor unit.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Trouble Diagnoses: "AIR BAG" Warning Lamp Does Not Turn On

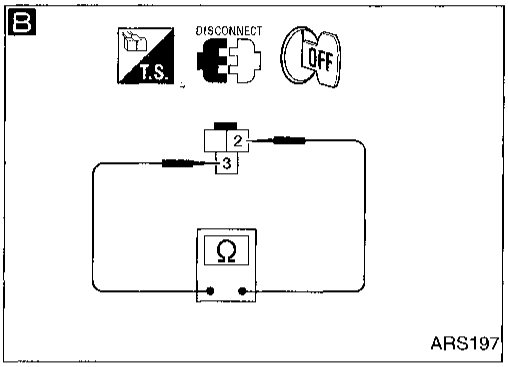


DIAGNOSTIC PROCEDURE 10

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Trouble Diagnoses: SRS Does Not Enter Diagnosis Mode Using Door Switch

DIAGNOSTIC PROCEDURE 11

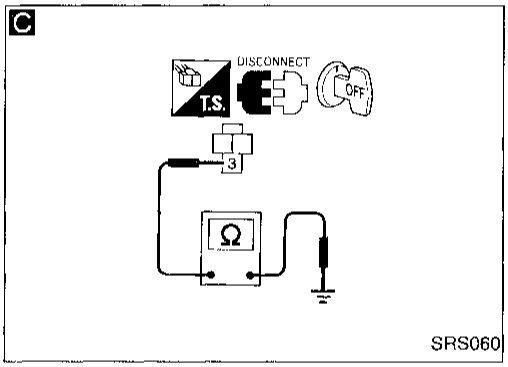


A

Disconnect both battery cables and check battery voltage using circuit tester.
- Is battery voltage more than 9V?

No → Charge battery.

Yes ↓



B

Remove door switch LH and check continuity between door switch LH connector terminals ② and ③ under the following conditions.

Condition	Continuity
Door switch is depressed (Door is closed).	NO
Door switch is released (Door is open).	YES

NG → Replace door switch LH.

OK ↓

C

Check harness continuity between door switch LH harness connector terminal ③ and body ground.
- Does continuity exist?

No → Replace or repair harness.

Yes ↓

Replace air bag diagnosis sensor unit.

↓

Go to SRS Operation Check, RS-34.

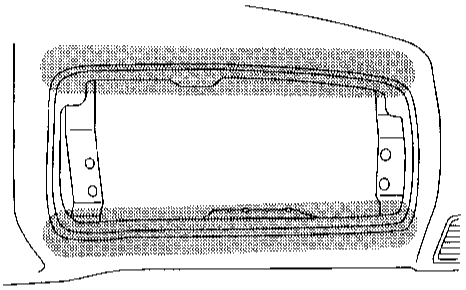
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

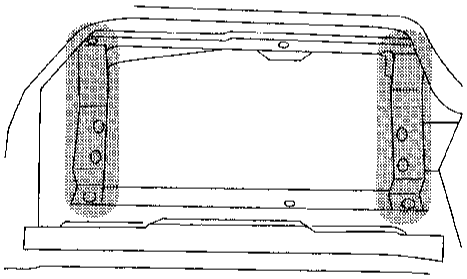
To repair the SRS, perform the following steps.

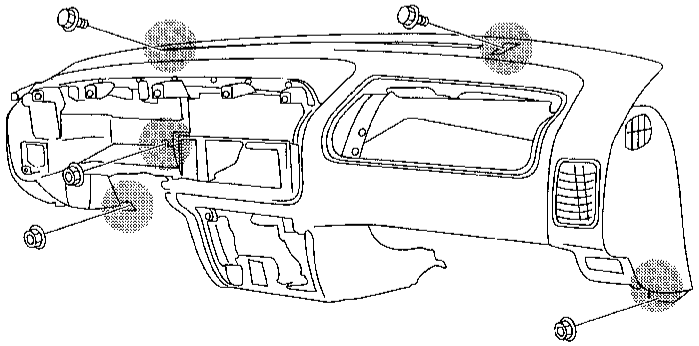
When SRS is activated in a collision:

① Replace the air bag diagnosis sensor unit.
② Remove the air bag modules.
③ Check the SRS components using the table shown on the next page.
- Replace any SRS components showing visible signs of damage (dents, cracks and deformation).

④ Install new air bag modules.
⑤ Conduct Self-diagnosis. Refer to "SRS Operation Check", RS-34. Ensure the remainder of the SRS operates properly.







When SRS is not activated in a collision:

① Check the SRS components using the table shown on the next page.
- Replace any SRS components showing visible signs of damage (dents, cracks and deformation).

② Conduct Self-diagnosis using CONSULT and "AIR BAG" warning lamp. Refer to "SRS Operation Check", RS-34. Ensure entire SRS operates properly.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SRS inspection

Part	SRS is activated	SRS is NOT activated
Air bag module (driver and passenger side)	REPLACE Install with new bolts.	1. Remove air bag module. Check harness cover and connectors for damage, terminals for deformities, and harness for binding. 2-1. Install driver air bag module into the steering wheel to check fit and alignment with the wheel. 2-2. Install passenger air bag module into the instrument panel to check fit with the instrument panel. 3. No damage found, reinstall with new bolts. 4. If damaged—REPLACE. Air bag must be deployed before discarding.
Crash zone sensor (4WD models)	1. Check body and sensor bracket for deformities and rust. 2. Check sensor case for dents, cracks, scratches, deformities and rust. 3. Check sensor harness, connector, and terminals for binding, damage, and deformities. 4. If no damage is found, reinstall with new bolts. 5. If damaged—REPLACE.	
Instrument panel	1. When passenger air bag inflates, check the following points for bending, deformities and cracks: ● Opening portion for passenger air bag  : Check points ● Passenger air bag module brackets  : Check points ● The portions securing the instrument panel  : Check points 2. If no damage is found, reinstall the instrument panel. 3. If damaged - REPLACE the instrument panel with new bolts.	

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Part	SRS is activated	SRS is NOT activated
Air bag diagnosis sensor unit	REPLACE Install with new bolts.	1. Check case and bracket for dents, cracks or deformities. 2. Check connectors for damage, and terminals for deformities. 3. If no damage is found, reinstall with new bolts. 4. If damaged—REPLACE.
Steering wheel	1. Visually check steering wheel for deformities. 2. Check harness (built into steering wheel) and connectors for damage, and terminals for deformities. 3. Install air bag module to check fit or alignment with steering wheel. 4. Check steering wheel for excessive free play. 5. If no damage is found, reinstall the steering wheel. 6. If damaged—REPLACE.	
Spiral cable	1. Visually check spiral cable and combination switch for damage. 2. Check connectors, flat cable and protective tape for damage. 3. Check steering wheel for noise, binding or heavy operation. 4. If no damage is found, reinstall the spiral cable. 5. If damaged—REPLACE.	
Passenger air bag deactivation switch and indicator	1. Visually check passenger air bag deactivation switch and indicator for dents, cracks and deformities. 2. Check the harness and connectors for damage, and terminals for deformities. 3. If damaged—REPLACE. **WARNING:** **After SRS maintenance or repair, make sure the passenger air bag deactivation switch is in the same position (ON or OFF) as when the vehicle arrived for service.**	
Harness and Connectors	1. Check connectors for poor connection, damage, and terminals for deformities. 2. Check harness for binding, chafing, cuts and deformities. 3. If no damage is found, reinstall. 4. Damaged—REPLACE damaged section of harness. Do not attempt to repair, splice or modify any SRS harness.

Supplemental Restraint System (SRS) "AIR BAG"

The Supplemental Restraint System "AIR BAG", used along with a seat belt, helps to reduce the risk or severity of injury to the driver and front passenger in a frontal collision. The Supplemental Restraint System consists of air bag modules (located in the center of the steering wheel and on the instrument panel on the passenger side), a diagnosis sensor unit, a crash zone sensor (4WD models), warning lamp, wiring harness and spiral cable.

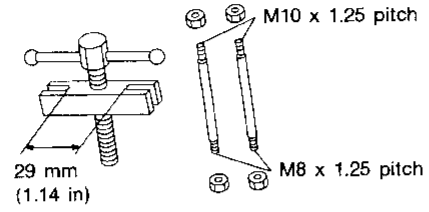
The vehicle is equipped with an passenger air bag deactivation switch. Because no rear seat exists where a rear-facing child restraint can be placed, the switch is designed to turn off the passenger air bag so that a rear-facing child restraint can be used in the front passenger seat. The switch is located in the center of the instrument panel, near the ashtray. When the switch is turned to the ON position, the passenger air bag is enabled and could inflate in a frontal collision. When the switch is turned to the OFF position, the passenger air bag is disabled and will not inflate in a frontal collision. A passenger air bag OFF indicator on the instrument panel lights up when the passenger air bag is switched OFF. The driver air bag always remains enabled and is not affected by the passenger air bag deactivation switch.

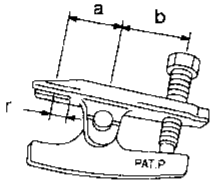
Information necessary to service the system safely is included in the **RS section** of this Service Manual.

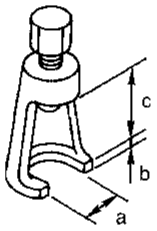
WARNING:

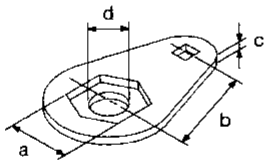
- **To avoid rendering the SRS inoperative, which could increase the risk of personal injury or death in the event of a collision which would result in air bag inflation, all maintenance should be performed by an authorized NISSAN dealer.**
- **Improper maintenance, including incorrect removal and installation of the SRS, can lead to personal injury caused by unintentional activation of the system.**
- **Do not use electrical test equipment on any circuit related to the SRS unless instructed to in this Service Manual. SRS wiring harnesses are covered with yellow insulation either just before the harness connectors or on the complete harness, for easy identification.**
- **The vehicle is equipped with a passenger air bag deactivation switch which can be operated by the customer. When the front passenger air bag is switched OFF, the front passenger air bag is disabled and will not inflate in a frontal collision. When the front passenger air bag is switched ON, the front passenger air bag is enabled and could inflate in a frontal collision. After SRS maintenance or repair, make sure the front passenger air bag switch is in the same position (ON or OFF) as when the vehicle arrived for service.**

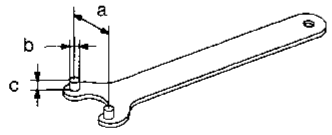
Precautions for Steering System

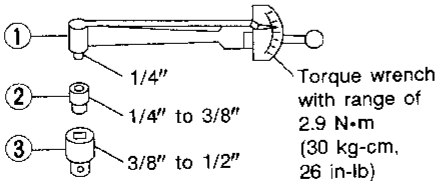












- **Before disassembly, thoroughly clean the outside of the unit.**
- **Disassembly should be done in a clean work area. It is important to prevent the internal parts from becoming contaminated by dirt or other foreign matter.**
- **For easier and proper assembly, place disassembled parts in order on a parts rack.**
- **Use nylon cloths or paper towels to clean the parts; common shop rags can leave lint that might interfere with their operation.**
- **Before inspection or reassembly, carefully clean all parts with a general purpose, non-flammable solvent.**
- **Before assembly, apply a coat of recommended ATF* to hydraulic parts. Petroleum jelly may be applied to O-rings and seals. Do not use any grease.**
- **Replace all gaskets, seals and O-rings. Avoid damaging O-rings, seals and gaskets during installation. Perform functional tests whenever designated.**

***: Automatic Transmission Fluid type DEXRON™ III or equivalent.**

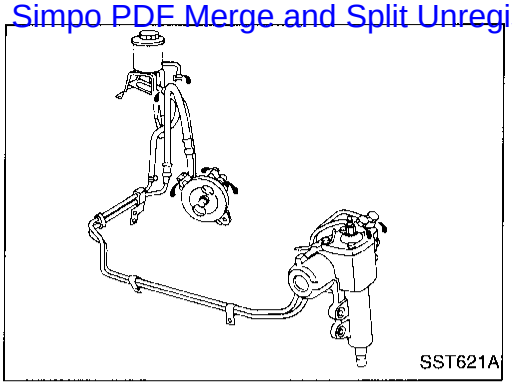
Steering System

Checking and Adjusting Drive Belts (For power steering)

Refer to MA section ("Checking Drive Belts", "ENGINE MAINTENANCE").



Checking Fluid Level (For power steering)

Check fluid level with engine off.
Check fluid level with dipstick on reservoir cap.
Use "HOT" range for fluid temperatures of 50 to 80°C (122 to 176°F). Use "COLD" range for fluid temperatures of 0 to 30°C (32 to 86°F).

CAUTION:

- **Do not overfill.**
- **Recommended fluid is Automatic Transmission Fluid type DEXRON™ III or equivalent.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Checking Fluid Leakage (For power steering)

Check lines for improper attachment, leaks, cracks, damage, chafing and deterioration.

1. Run engine between idle speed and 1,000 rpm.
- **Make sure temperature of fluid in reservoir tank rises to 60 to 80°C (140 to 176°F).**
2. Turn steering wheel right-to-left several times.
3. Hold steering wheel at each "lock" position for 5 seconds and carefully check for fluid leakage.

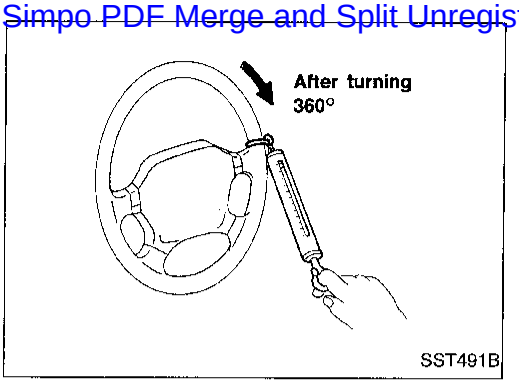
CAUTION:
Do not hold steering wheel at lock position for more than 15 seconds.

4. If fluid leakage from any line is noticed, loosen flare nut and then retighten.

Do not overtighten connector as this can damage O-ring, washer and connector.

5. If fluid leakage from power steering pump is noticed, check power steering pump. Refer to ST-36.
6. If fluid leakage from power steering gear is noticed, check power steering gear. Refer to ST-21 (PB48S), or ST-29 (PB59K).

Bleeding Hydraulic System (For power steering)



1. Raise front end of vehicle until wheels are clear of the ground.
2. Add fluid to reservoir tank to specified level. Then quickly turn steering wheel fully to right and left and lightly touch steering stoppers.
   Repeat steering wheel operation until fluid level no longer decreases.
3. Start engine.
   Repeat step 2 above.

- Incomplete air bleeding will cause the following to occur:

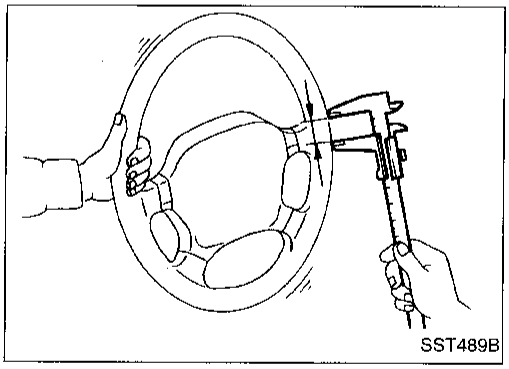
a. Air bubbles in reservoir tank
b. Clicking noise in power steering pump
c. Excessive buzzing in power steering pump
   When this happens, bleed air again.

Fluid noise may occur in the valve or power steering pump. This is common when the vehicle is stationary or while turning the steering wheel slowly. This does not affect the performance or durability of the system.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Checking Steering Wheel Turning Force (For power steering)

1. Park vehicle on a level, dry surface and set parking brake.
2. Start engine and run at idle speed or 1,000 rpm.
3. Bring power steering fluid up to adequate operating temperature. [Make sure temperature of fluid is approximately 60 to 80°C (140 to 176°F).]



Tires need to be inflated to normal pressure.

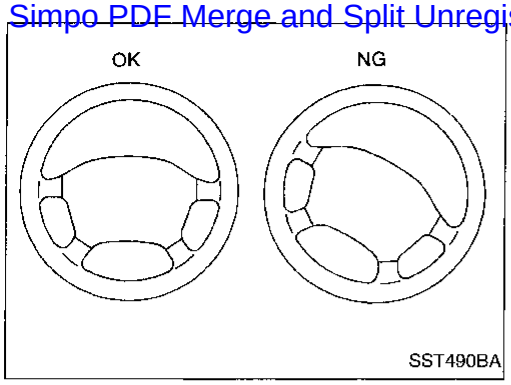
4. Check steering wheel turning force when steering wheel has been turned 360° from neutral position.

Steering wheel turning force:
PB48S-type
24.5 - 29.4 N (2.5 - 3.0 kg, 5.5 - 6.6 lb)
PB59K-type
39 N (4 kg, 9 lb) or less

5. If steering wheel turning force is out of specification, check the following:

a. Hydraulic system. Refer to "Checking Hydraulic System", ST-10.
b. Steering Column. Refer to ST-12.
c. Front suspension and axle. Refer to FA section ("Front Axle and Front Suspension Parts", "ON-VEHICLE SERVICE").
d. Steering gear turning torque. Refer to "TURNING TORQUE MEASUREMENT", ST-23 (PB48S), or ST-31 (PB59K).

Checking Steering Wheel Play



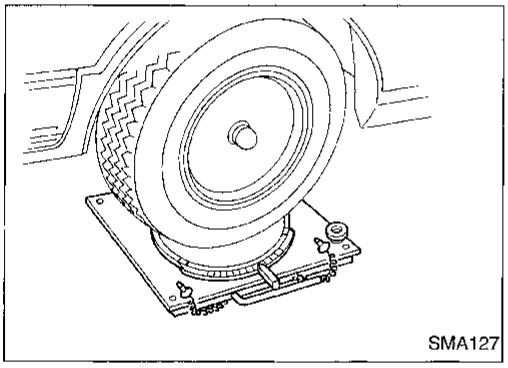
- Place wheels in straight ahead position and check steering wheel play.

Steering wheel play:
35 mm (1.38 in) or less

- If it is not within specification, check the following for loose or worn components.

a. Steering column. Refer to ST-12.
b. Front suspension and axle. Refer to FA section ("Front Axle and Front Suspension Parts", "ON-VEHICLE SERVICE").
c. Steering gear. [Refer to ST-15 (manual steering), ST-21 (power steering PB48S), or ST-29 (power steering PB59K).]

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

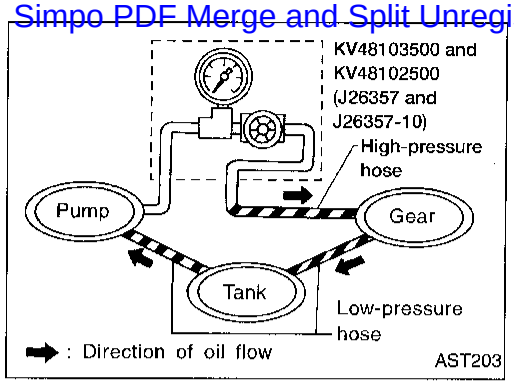


Checking Neutral Position on Steering Wheel

- Make sure that wheel alignment is correct.
  Wheel alignment:
  Refer to FA section ("Inspection and Adjustment", "SERVICE DATA AND SPECIFICATIONS").
- Verify that the steering gear is centered before removing the steering wheel.

Checking

1. Check that the steering wheel is in the neutral position when driving straight ahead.
2. If it is not in the neutral position, remove the steering wheel and reinstall it correctly.
3. If the neutral position is still not correct:



a. Loosen tie-rod lock nuts.
b. Move tie-rods, in opposite direction, the same amount on both left and right sides.
This will compensate for error in the neutral position.

Checking Front Wheel Turning Angle

1. Rotate steering wheel fully right, then left; measure turning angle.
   Turning angle of full turns:
   Refer to FA section ("Inspection and Adjustment", "SERVICE DATA AND SPECIFICATIONS".)
2. If it is not within specification, check stopper bolt adjustment. Refer to FA section ("FRONT WHEEL TURNING ANGLE", "Front Wheel Alignment").

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Checking Hydraulic System (For power steering)

Before starting, check belt tension, driving pulley and tire pressure.

1. Set Tool. Open shut-off valve. Then bleed air. Refer to "Bleeding Hydraulic System", ST-7.
2. Run engine at idle speed or 1,000 rpm.

- **Make sure fluid temperature in reservoir tank rises to 60 to 80°C (140 to 176°F).**

WARNING:

Warm up engine with shut-off valve fully opened. If engine is started with shut-off valve closed, fluid pressure in the power steering pump increases to maximum. This will raise fluid temperature abnormally.

3. Check pressure with steering wheel fully turned to left and right positions while idling at 1,000 rpm.

CAUTION:

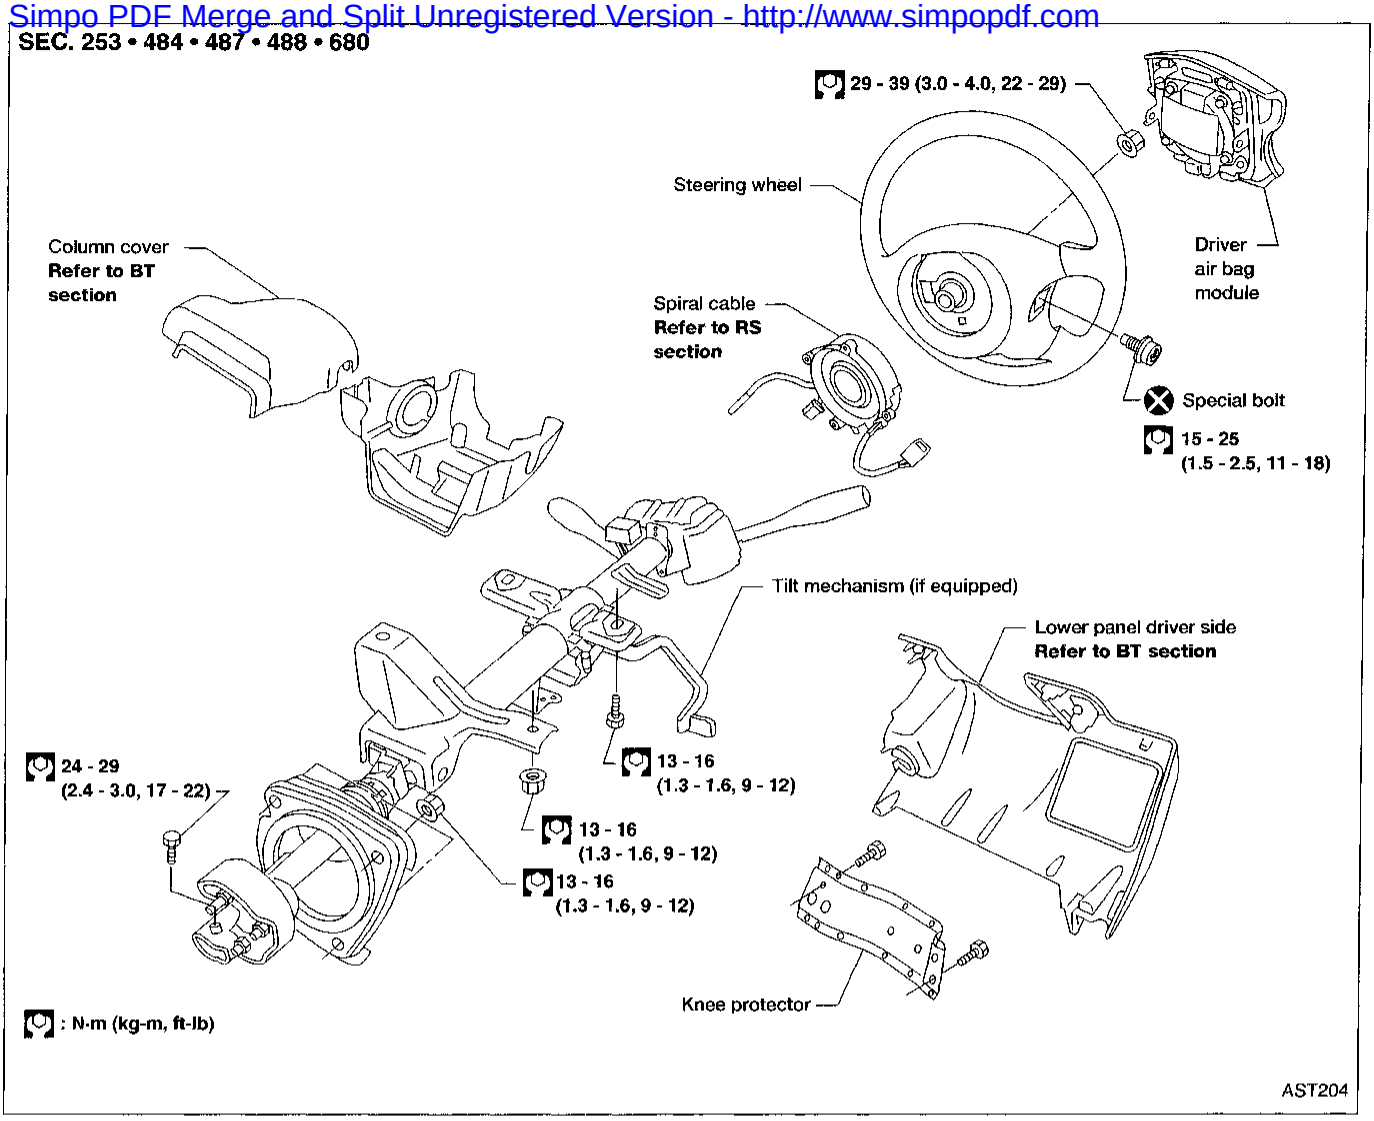
Do not hold the steering wheel at full lock position for more than 15 seconds.

Power steering pump maximum operating pressure:
7,649 - 8,238 kPa (76.5 - 82.4 bar, 78 - 84 kg/cm^2, 1,109 - 1,194 psi) at idling

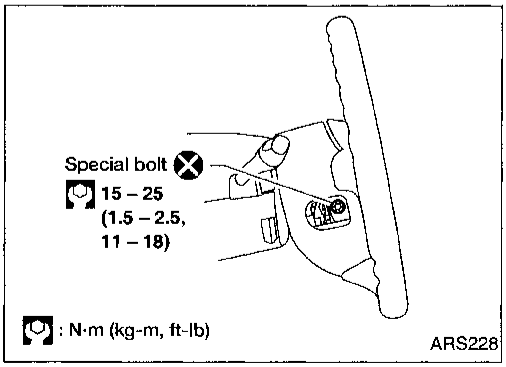
- If pressure reaches maximum operating pressure, system is OK.
- If pressure increases above maximum operating pressure, check power steering pump flow control valve. Refer to ST-36.

4. If power steering pressure is below the maximum operating pressure, slowly close shut-off valve and check pressure again.

CAUTION:



Do not close shut-off valve for more than 15 seconds.

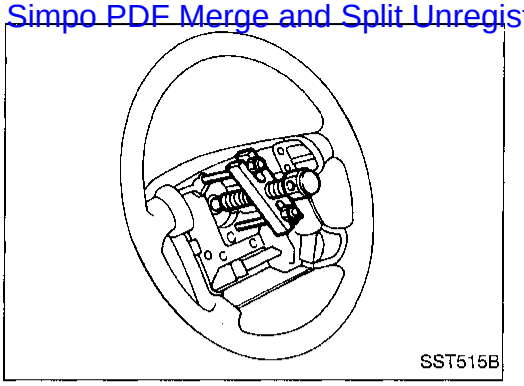


- If pressure increases to maximum operating pressure, gear is damaged. Refer to "Removal and Installation", ST-22, 30.
- If pressure remains below maximum operating pressure, pump is damaged. Refer to "Disassembly and Assembly", ST-36.

5. After checking hydraulic system, remove Tool and add fluid as necessary. Then completely bleed air out of system. Refer to ST-7.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SEC. 253 • 484 • 487 • 488 • 680



Steering Wheel

REMOVAL AND INSTALLATION

1. Remove air bag module and spiral cable. Refer to RS section ["Air Bag Module and Spiral Cable", "SUPPLEMENTAL RESTRAINT SYSTEM (SRS)"].
2. Disconnect horn connector and remove steering wheel nut.

Steering Wheel (Cont'd)

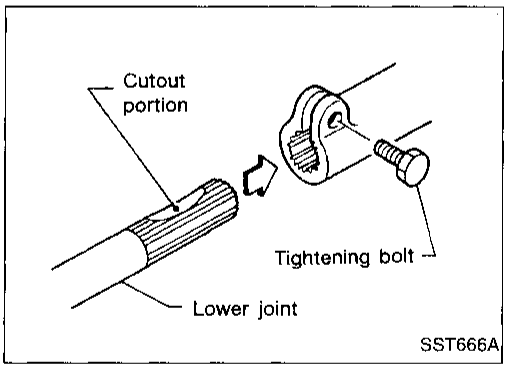
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SST515B

3. Remove steering wheel using tool.

- For installation, refer to RS section ["Air Bag Module and Spiral Cable", "SUPPLEMENTAL RESTRAINT SYSTEM (SRS)"].

Steering Column



REMOVAL

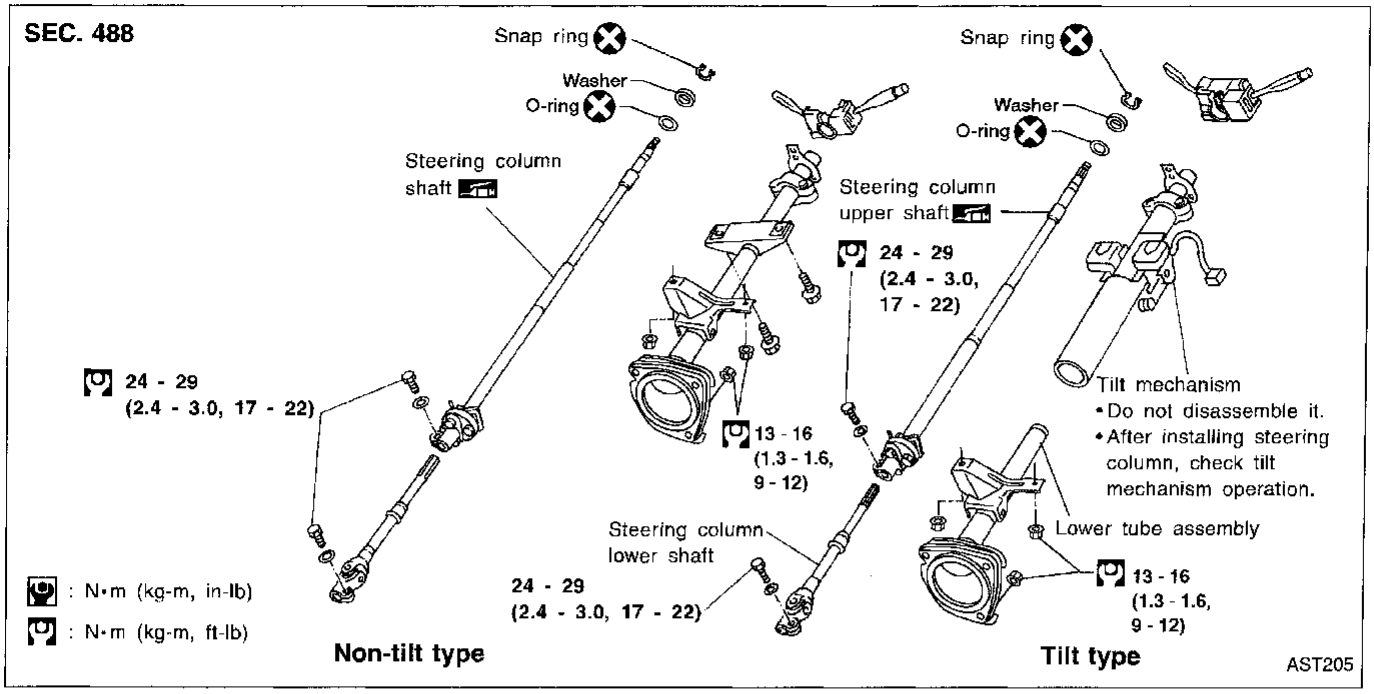
CAUTION:

- **The rotation of the spiral cable (SRS "Air bag" component part) is limited. If the steering gear must be removed, set the front wheels in the straight-ahead direction.**
  Do not rotate the steering column while the steering gear is removed.
- **Remove the steering wheel before removing the steering lower joint to avoid damaging the SRS spiral cable. Refer to ST-11.**

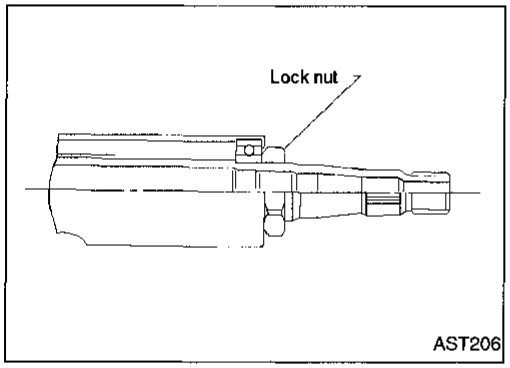
1. Remove steering wheel, refer to ST-11.
2. Remove steering column covers.
3. Remove instrument lower panel. Disconnect security lamp indicator.
4. Disconnect combination switch electrical connectors and air bag harness connector.
5. Remove knee protector.
6. Disconnect ignition switch and shift lock solenoid connectors.
7. Disconnect shift cable.
8. Remove bolt from lower joint.
9. Remove two steering column bolts and remove steering column.

INSTALLATION

SST666A

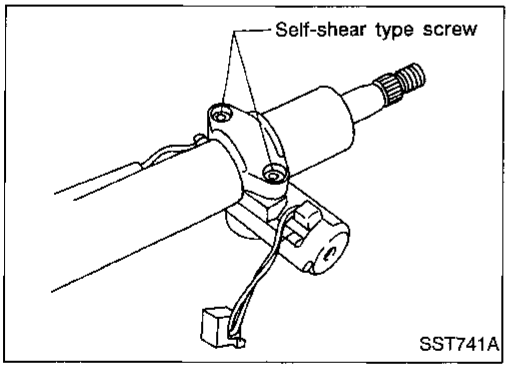


- When installing steering column, finger-tighten all lower bracket and clamp retaining bolts; then tighten them securely. Make sure that undue stress is not applied to steering column.
- When fitting steering lower joint, be sure tightening bolt faces cutout portion.
- Align spiral cable correctly when installing steering wheel. Refer to RS section ["Air Bag Module and Spiral Cable", "SUPPLEMENTAL RESTRAINT SYSTEM (SRS)"].



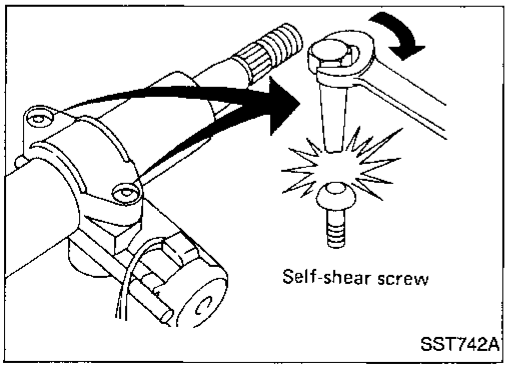
CAUTION:

After installation, turn steering wheel to make sure it moves smoothly. Ensure the number of turns from the straight forward position to left and right locks are the same. Be sure that the steering wheel is in a neutral position when driving straight ahead.



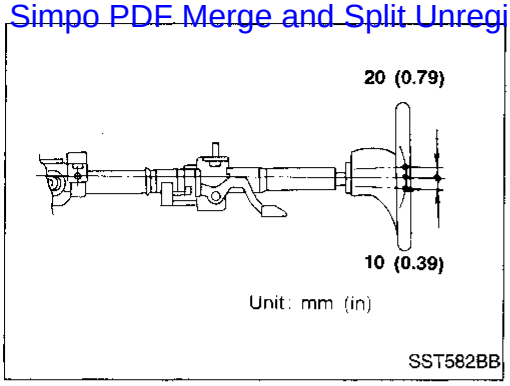
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Disassembly and Assembly



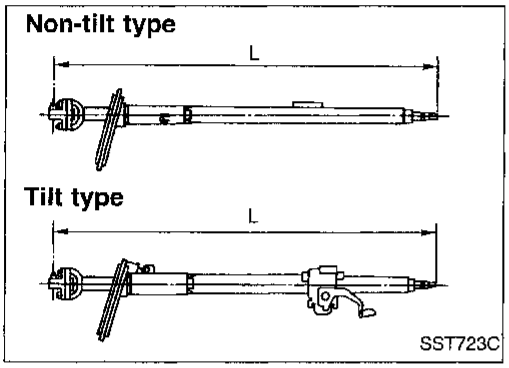
- When disassembling and assembling, unlock steering lock with key.
- Install lock nut on steering column shaft and tighten the nut to specification.
  : 25 - 34 N·m (2.5 - 3.5 kg-m, 18 - 25 ft. lb)

- Steering lock



a. Break self-shear type screws using a drill or other appropriate tool.

b. Install self-shear type screws, then tighten until heads break off.



Disassembly and Assembly (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Tilt mechanism

After installing steering column, check tilt mechanism operation.

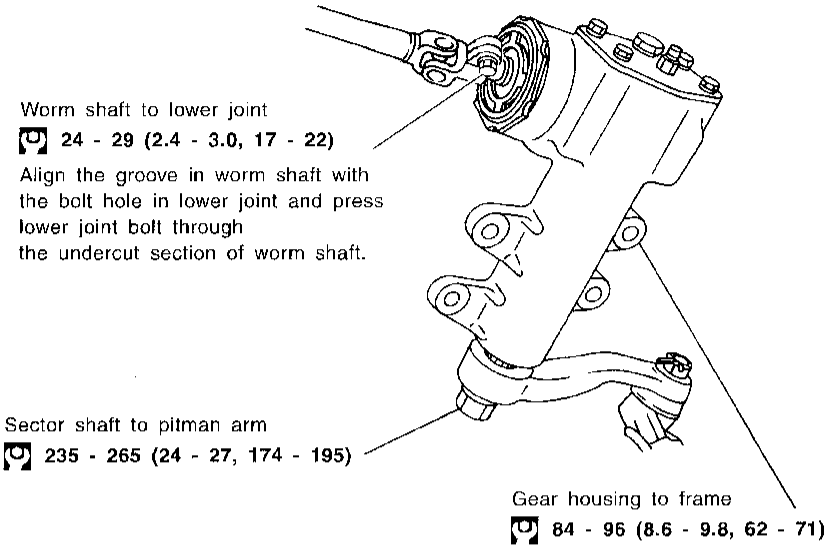
Inspection

- When steering wheel does not turn smoothly, check the steering column as follows and replace damaged parts.

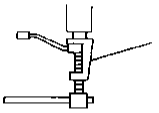
a. Check column bearings for damage and unevenness. Lubricate with recommended multi-purpose grease or replace steering column as an assembly, if necessary.

b. Check jacket tube for deformation and breakage. Replace if necessary.

- When the vehicle is involved in a light collision, check dimension "L". If it is not within specifications, replace steering column as an assembly.



Column length "L":

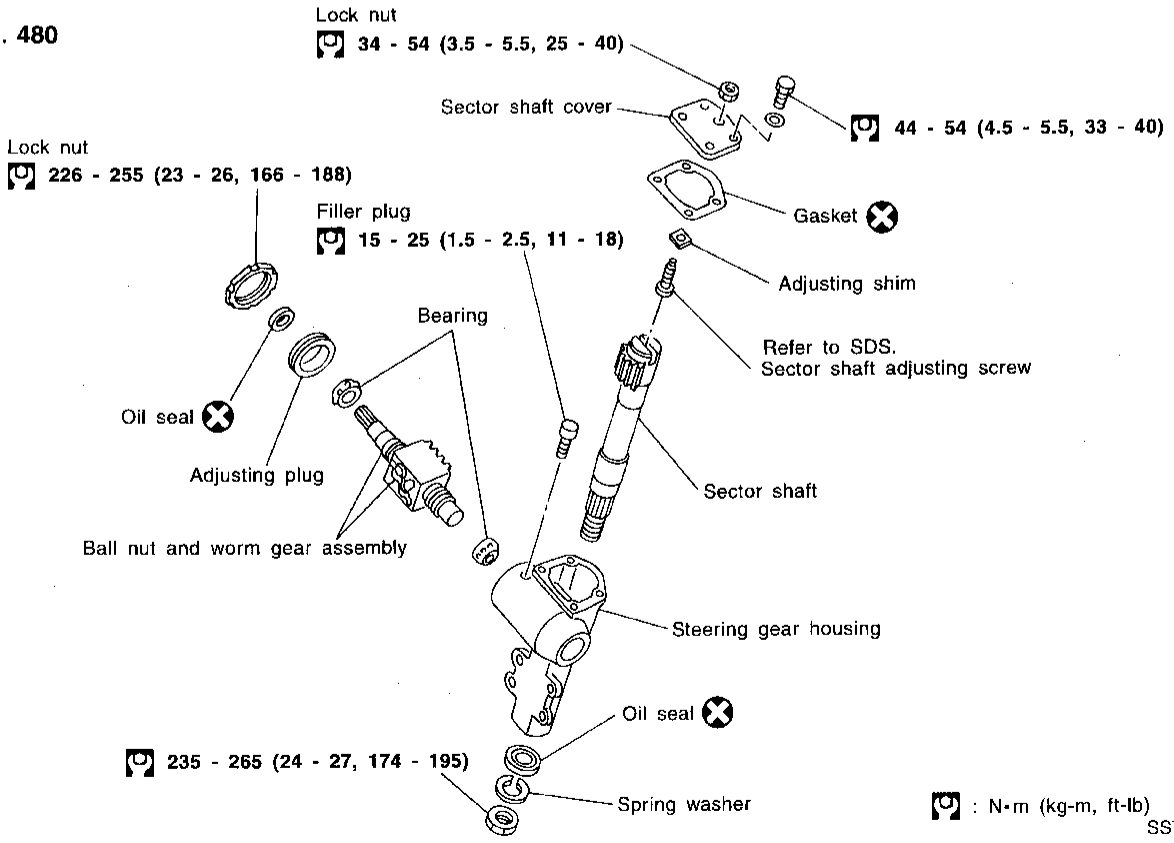


863.1 - 866.7 mm (33.98 - 34.12 in)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Removal and Installation

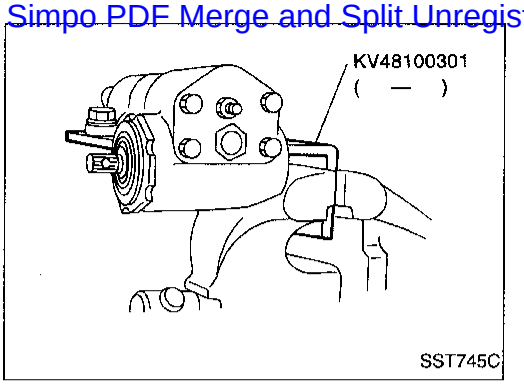
SEC. 480



• Install pitman arm.
Align four grooves of gear arm serrations with four projections of sector shaft serrations, and install and tighten lock washer and nut.

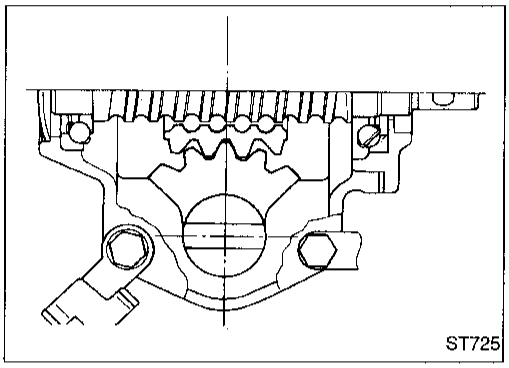
: N•m (kg-m, ft-lb)

SST724C



SEC. 480

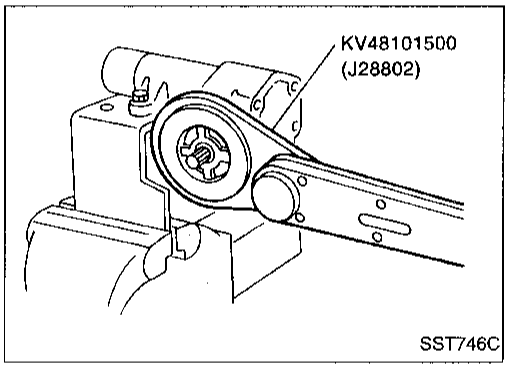
: N•m (kg-m, ft-lb)



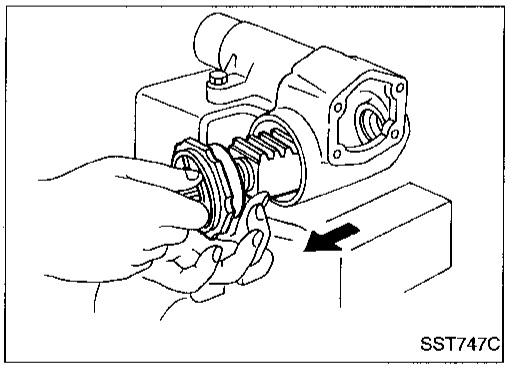
SST744C

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Disassembly



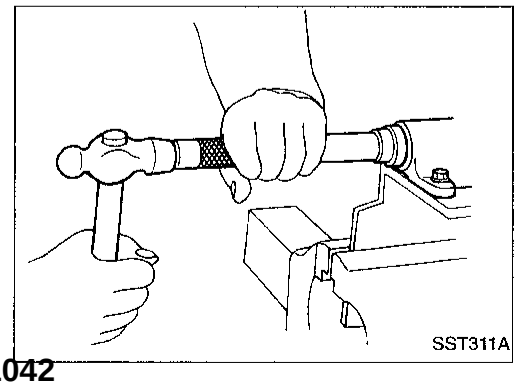
1. Place steering gear in a vise using Tool.



2. Set worm gear in straight-ahead position.
3. Remove sector shaft together with sector shaft cover.

CAUTION:

- **When pulling sector shaft out, be careful not to damage oil seal or associated parts.**
- **Do not remove sector shaft needle bearings from steering gear housing. If necessary, replace gear housing as an assembly.**



4. Loosen adjusting plug lock nut using Tool.

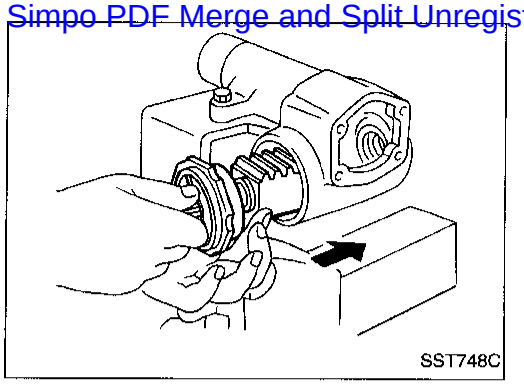
5. Remove worm gear together with worm bearing.

CAUTION:

- **Be careful not to rotate ball nut fully to either end of worm gear.**
  Ends of ball guides will be damaged if nut is rotated until it stops at end of worm gear.
- **Do not separate ball nut from worm gear assembly.**
  If necessary, replace entire unit as an assembly.
- **Do not remove sector shaft needle bearings from steering gear housing.**
  If necessary, replace entire gear housing as an assembly.

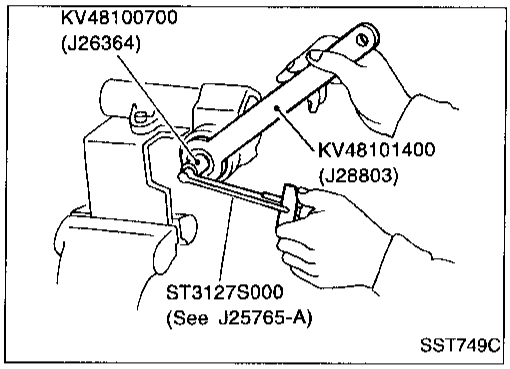
Assembly and Adjustment

Apply multi-purpose grease to sealing area of new oil seals for sector shaft and worm gear.



WORM GEAR BEARING PRELOAD

1. Drive oil seal into place.

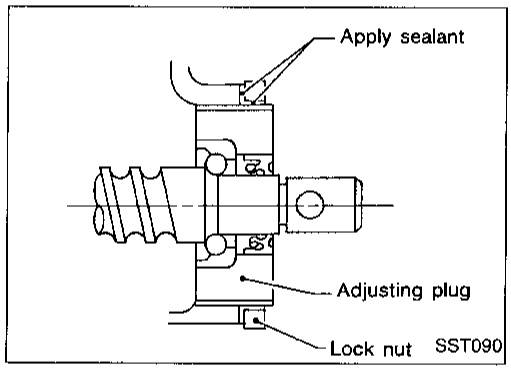


Before installing oil seal, coat oil seal contacting face with gear fluid.

Assembly and Adjustment (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

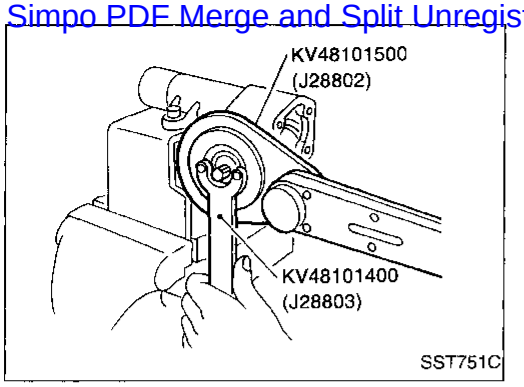
2. Place worm gear assembly together with worm gear bearing into gear housing.



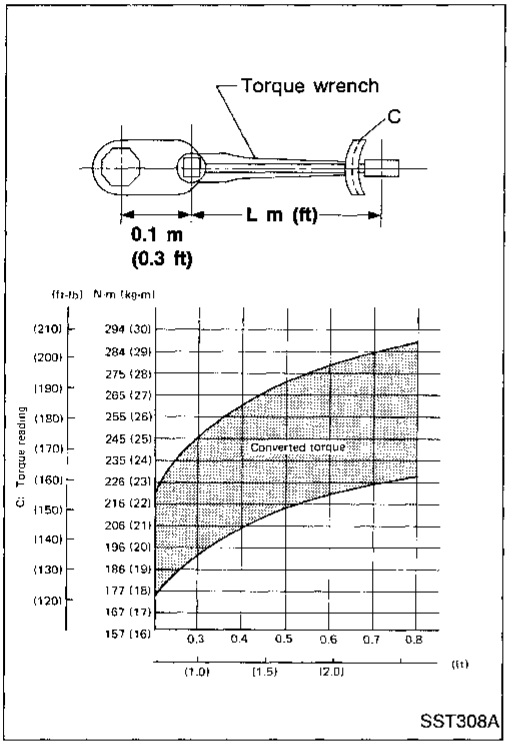
3. Adjust worm gear bearing preload using Tools.

CAUTION:

- **Always adjust worm gear bearing preload by turning adjusting plug in clockwise direction.**
- **Before measuring preload, rotate worm gear a few turns in both directions to seat worm gear bearing.**

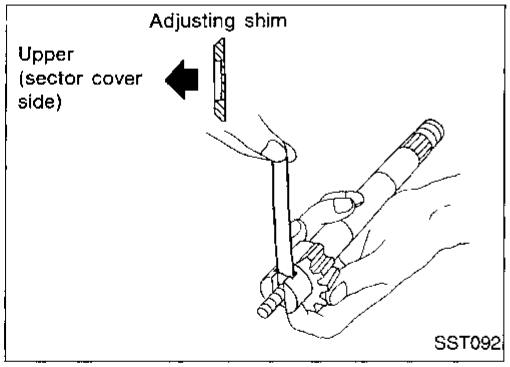


Worm gear bearing preload:
0.69 - 0.88 N·m (7.0 - 9.0 kg-cm, 6.1 - 7.8 in-lb)



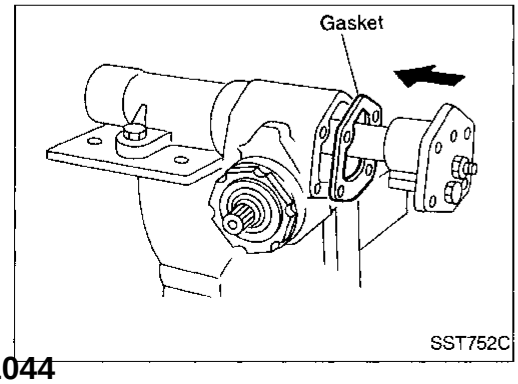
4. Apply suitable sealant to inner surface of lock nut.

Assembly and Adjustment (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

5. Tighten lock nut using Tools.
   Lock nut:
   [O]: 226 - 255 N·m (23 - 26 kg-m, 166 - 188 ft-lb)



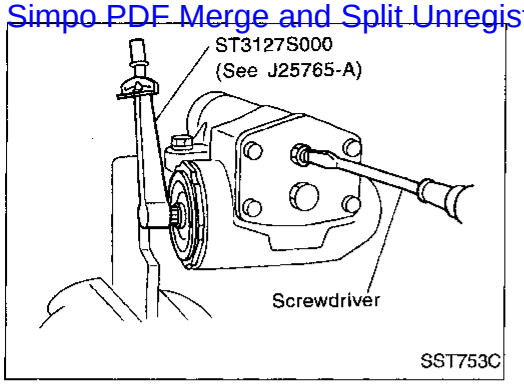
- When tightening lock nut, use the chart shown at left to determine the proper reading of torque.
  (Length of torque wrench vs. setting or reading of torque)
6. After tightening lock nut, check worm gear bearing preload to make sure it is within specification.

SECTOR SHAFT END PLAY

Select and install proper adjusting shim to achieve proper end play between sector shaft and adjusting screw.

Sector shaft end play:
0.1 mm (0.004 in) or less
Sector shaft adjusting screw shims:
Refer to SDS, ST-43.

STEERING GEAR PRELOAD AND BACKLASH



1. Set worm gear in straight-ahead position.

Carefully insert sector shaft in gear housing, being careful not to scratch oil seal.

2. Turn adjusting screw until sector shaft just contacts ball nut. Temporarily tighten lock nut.
3. Lubricate contacting portion of sector shaft and ball nut with gear oil or bearing grease.

Assembly and Adjustment (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

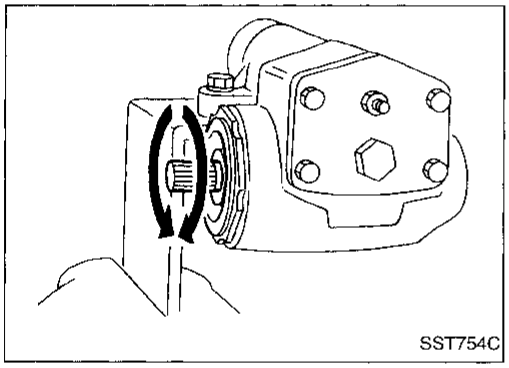
4. Adjust steering gear turning torque in a straight-ahead position using Tool, then lock with lock nut.

CAUTION:

- **Always adjust steering gear preload by turning adjusting screw in clockwise direction.**
- **Rotate worm gear a few turns in both directions to seat steering gear assembly.**

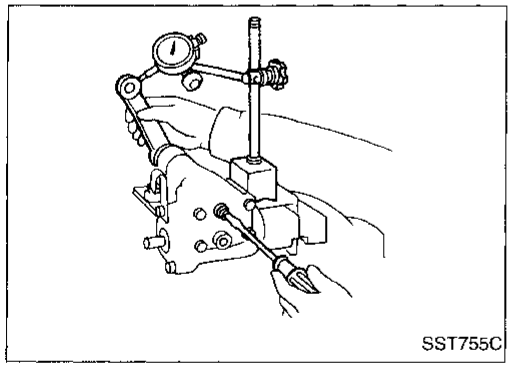
a. Measure turning torque at 360° position from straight-ahead position using Tools.

Turning torque at 360°:
0.69 - 0.88 N·m (7.0 - 9.0 kg-cm, 6.1 - 7.8 in-lb)



b. Measure turning torque at straight-ahead position.

Straight-ahead position is a position where stub shaft is turned 2.14 turns (two full turns and 50°) from lock position.



Turning torque at straight-ahead position:
0.20 - 0.39 N·m (2.0 - 4.0 kg-cm, 1.7 - 3.5 in-lb) higher than turning torque at 360°

Maximum turning torque:
1.08 N·m (11.0 kg-cm, 9.5 in-lb)

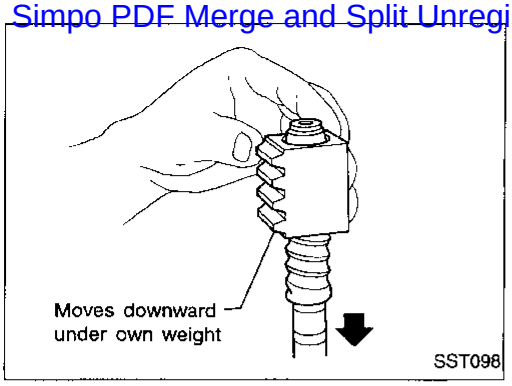
If turning torque is not within specifications, adjust by turning sector shaft adjusting screw.

5. Turn worm gear several times by hand to properly break in worm bearing.
6. Check steering gear preload. Readjust as necessary.

7. Measure total preload.
8. Check backlash.
   Measure backlash at top end of pitman arm in straight-ahead position.

Backlash (in straight-ahead position):
0.1 mm (0.004 in) or less

Inspection



Clean all the disassembled parts in solvent, then check condition.

SECTOR SHAFT

1. Check gear teeth surface for pitting, burrs, cracks and any other damage, and replace as necessary.
2. Check sector shaft serration for distortion and replace as necessary. Also check gear housing for deformation.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (Cont'd)

STEERING WORM ASSEMBLY

1. Inspect ball nut gear teeth surface. Replace if pitting, burrs, wear or any other damage is found.
2. Ball nut must rotate smoothly on worm gear. If found to be too tight, assembly should be replaced. Check rotation of ball nut as follows:

CAUTION:
Be careful not to allow ball nut to rotate fully to either end of worm gear.

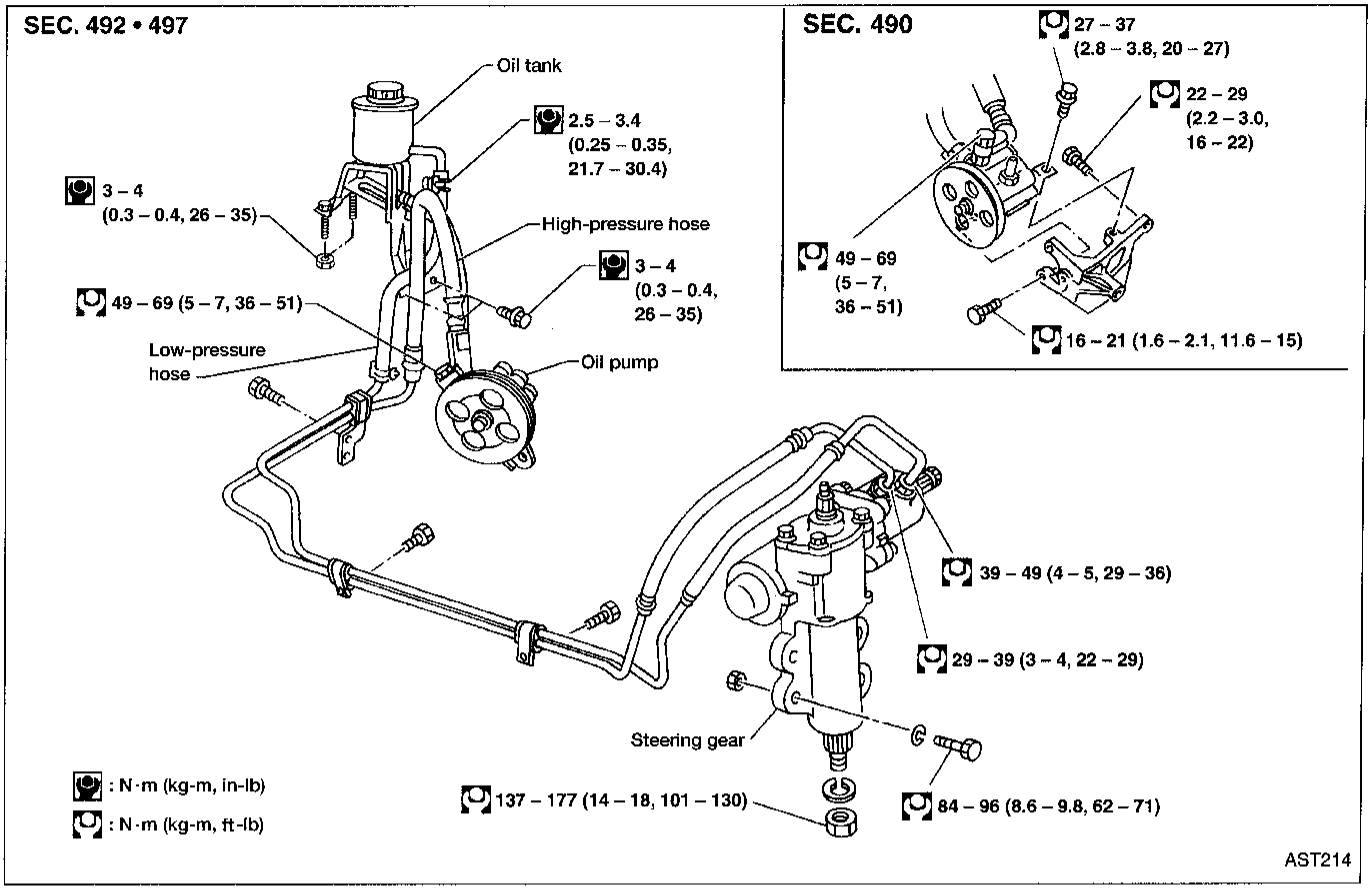
a. Move ball nut to either end of worm gear. Gradually stand worm shaft and ball nut assembly on end until ball nut moves downward on worm gear under its own weight.
b. If ball nut does not move freely over entire stroke, replace assembly.

Be careful not to damage ball nut guide tube while check is being made.

BEARING

1. Inspect worm gear bearing for wear, pitting and any other damage. Replace as necessary.

When replacing worm gear bearing, replace bearing and outer race as a set.



2. If sector shaft needle bearings are worn or damaged, replace gear housing as an assembly.

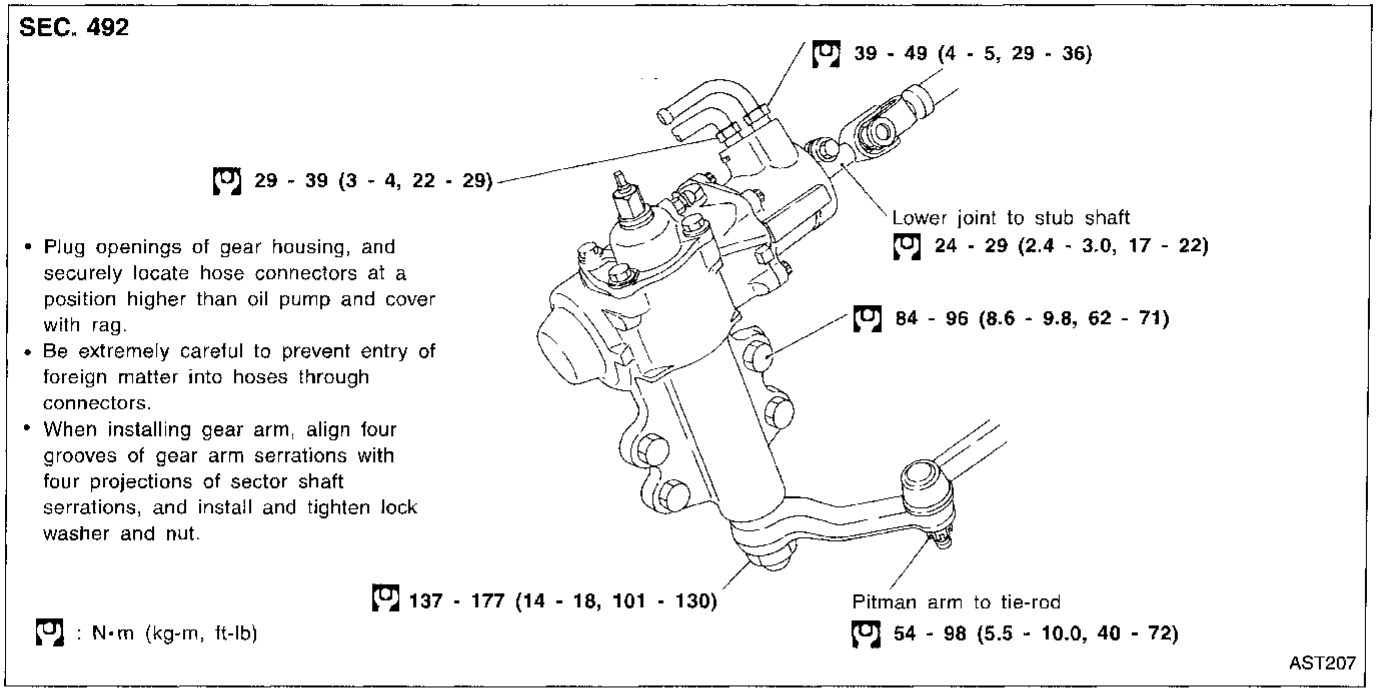
OIL SEALS

- Discard any oil seal which has been removed.
- Replace oil seal if sealing surface is deformed or cracked.
- Discard oil seal if spring is fatigued or dislocated.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

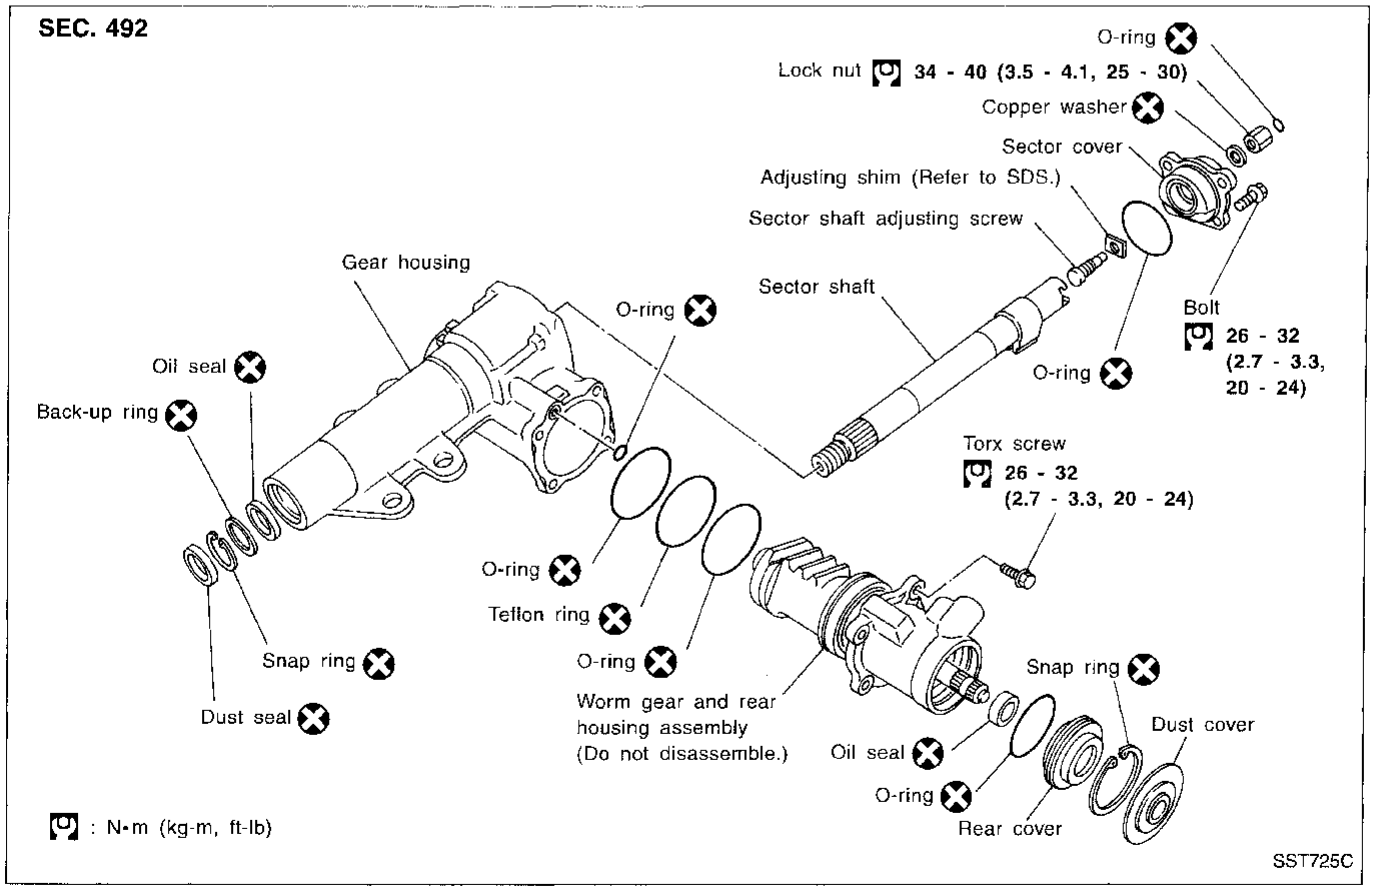
Description

CAUTION:



- **Parts which can be disassembled are strictly limited. Never disassemble parts other than those specified.**
- **Disassemble in as clean a place as possible.**
- **Clean your hands before disassembly.**
- **Do not use rags; use nylon cloths or paper towels.**
- **Follow the procedures and cautions indicated in the Service Manual.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



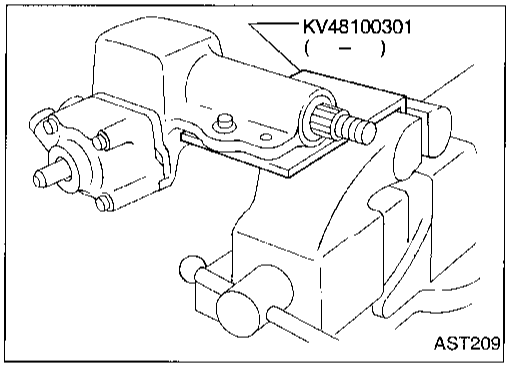
Removal and Installation

Before removal, clean gear housing and oil pump exteriors using a steam cleaner. Then dry with compressed air.

STEERING GEAR

Power Steering Gear Component

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

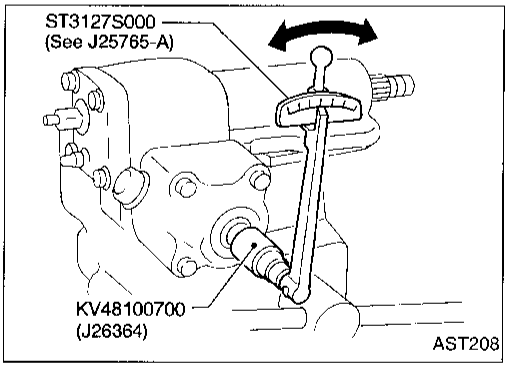


Pre-disassembly Inspection and Adjustment

Before disassembling power steering gear component parts, make sure there is no oil leakage around sealing portion and check steering turning torque as follows:

Check sealing portion.

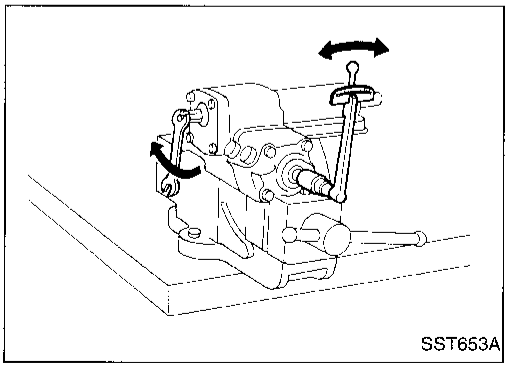
- Adjusting screw nut O-ring
- Sector shaft cover O-ring
- Sector shaft oil seal
- Rear cover oil seal and O-ring
- Rear housing O-ring
- Gear housing O-ring



Discard any oil seal and O-ring which have been removed. Replace oil seal and O-ring if sealing surface is deformed or cracked.

TURNING TORQUE MEASUREMENT

1. Measure turning torque at 360° position.



a. Install steering gear on Tool.

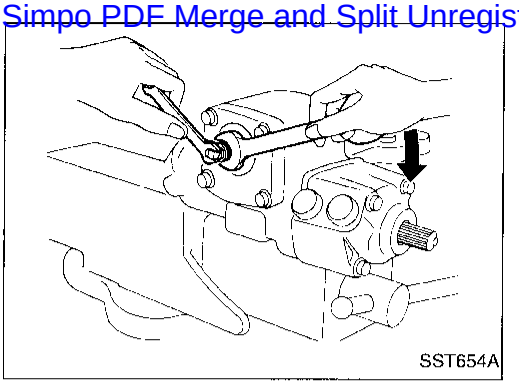
b. Turn stub shaft all the way to right and left several times.

c. Measure turning torque at 360° position from straight-ahead position with Tools.

Turning torque at 360°:
0.7 - 1.2 N·m (7 - 12 kg-cm, 6.1 - 10.4 in-lb)

d. Measure turning torque at straight-ahead position.

Straight-ahead position is a position where stub shaft is turned 2.14 turns (two full turns and 50°) from lock position.



Turning torque at straight-ahead position:
0.1 - 0.4 N·m (1 - 4 kg-cm, 0.9 - 3.5 in-lb)
higher than turning torque at 360°

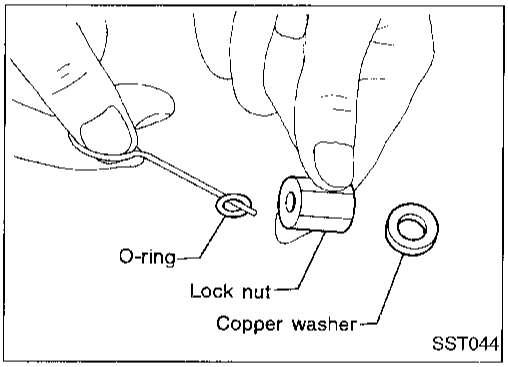
Maximum turning torque:
1.1 - 1.6 N·m (11 - 16 kg-cm, 9.5 - 13.9 in-lb)

If turning torque is not within specifications, adjust by turning sector shaft adjusting screw.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Pre-disassembly Inspection and Adjustment (Cont'd)

2. Tighten adjusting screw lock nut with tools.



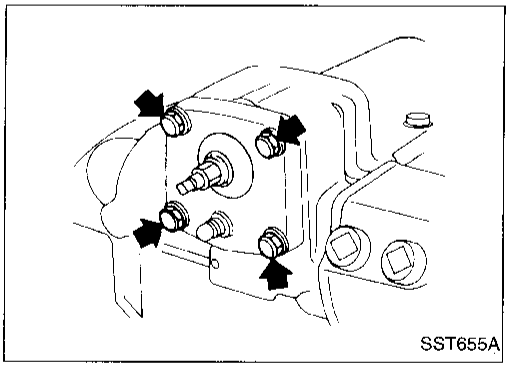
Disassembly

Before disassembly, measure turning torque.

If not within specifications, replace steering gear assembly.

CAUTION:

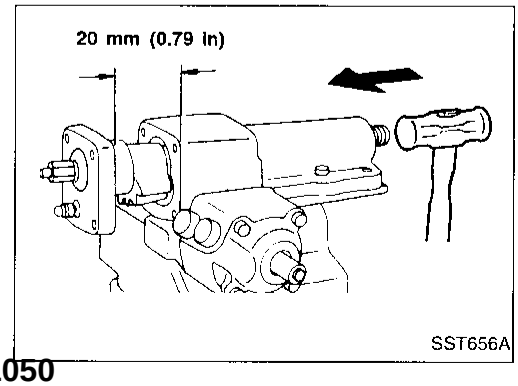
Oil sealing parts, copper washer and snap ring must not be used again after removal.



ADJUSTING SCREW LOCK NUT O-RING

Remove adjusting screw lock nut, and replace O-ring.

SECTOR SHAFT OIL SEAL

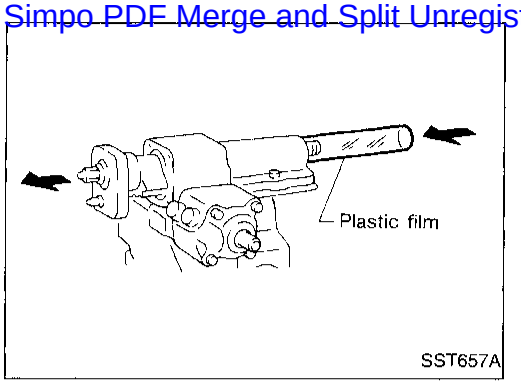


1. Set stub shaft in straight-ahead position.

Straight-ahead position is a position where stub shaft is turned 2.14 turns (two full turns and 50°) from lock position.

2. Disconnect sector shaft cover bolt.

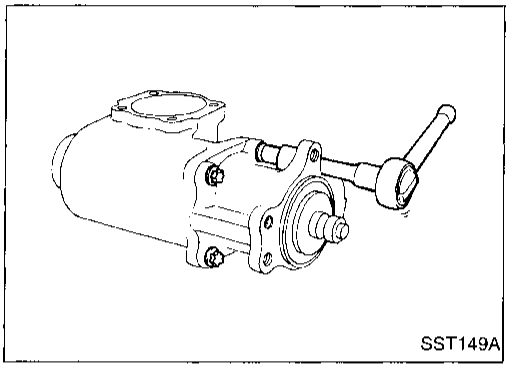
Do not turn lock nut unless necessary; otherwise it will damage O-ring, resulting in an oil leak.



3. Draw out sector shaft.

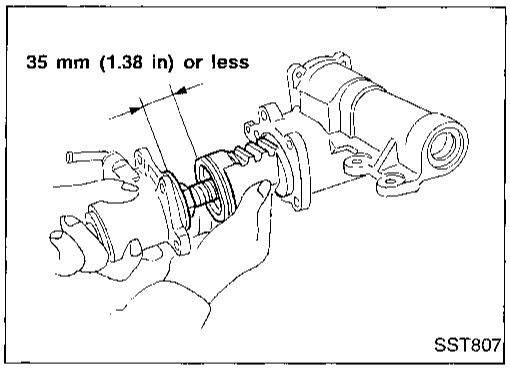
Knock out end of sector shaft approximately 20 mm (0.79 in).

Disassembly (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SST657A



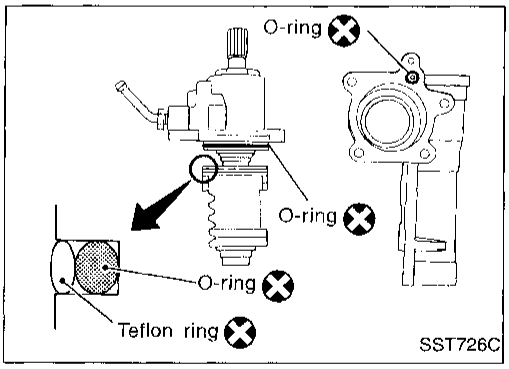
4. Connect a roll of plastic film to sector shaft.
   Plastic film:
   Thickness 0.1 mm (0.004 in)
   Length x width
   200 x 200 mm (7.87 x 7.87 in)
5. Pull out sector shaft by hand.

Attach plastic film to needle bearings located at two places inside gear housing while simultaneously pulling out sector shaft so that bearings will not drop into housing.

SST149A

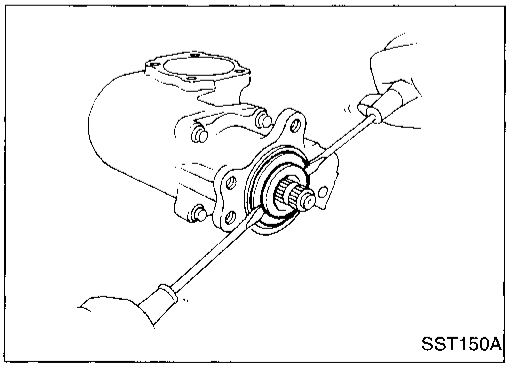
REAR HOUSING O-RING

1. Remove torx screw.



SST807

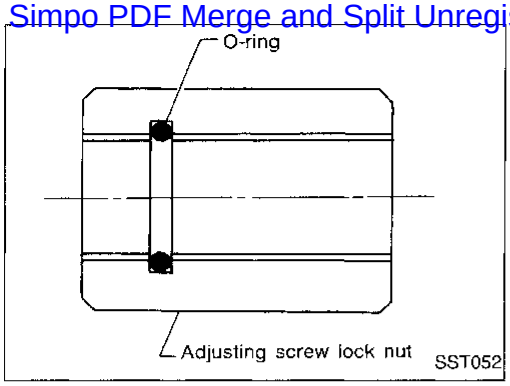
2. Remove rear housing together with worm gear assembly.



CAUTION:

- **When worm gear assembly is removed, piston may turn and come off under its own weight. Hold piston to prevent it from turning.**
- **If piston-to-rear housing clearance exceeds 35 mm (1.38 in) recirculating ball will be out of groove of worm gear; do not reinstall piston but replace the entire assembly.**
- **Be careful not to damage teflon ring at piston end when removing.**

SST726C



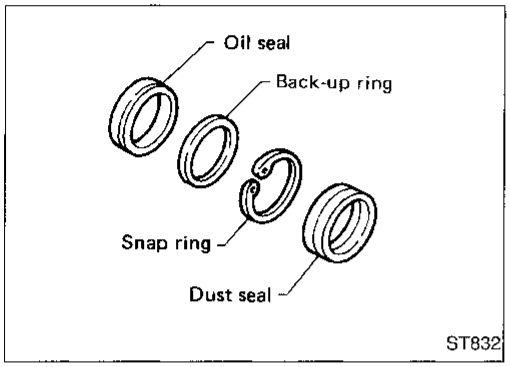
3. Remove O-rings and teflon ring.

SST150A

REAR COVER O-RING AND OIL SEAL

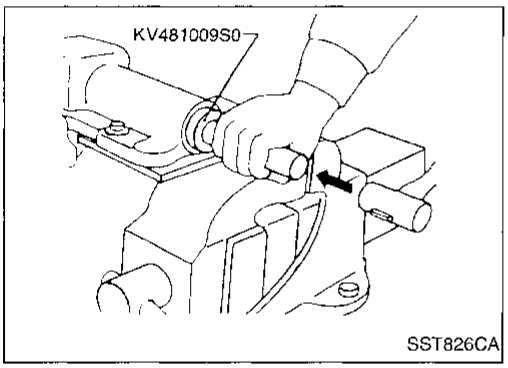
1. Remove snap ring, then rear cover.
2. Remove O-ring and oil seal.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



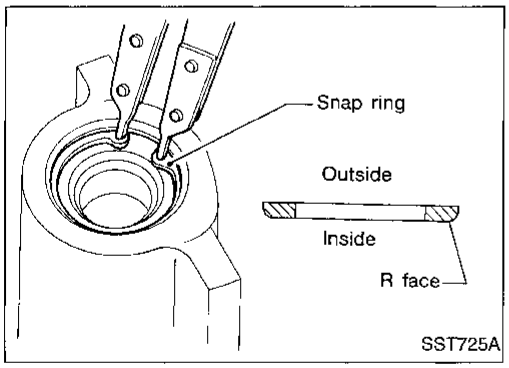
Assembly

ADJUSTING SCREW LOCK NUT O-RING



Insert new O-ring into adjusting screw lock nut.

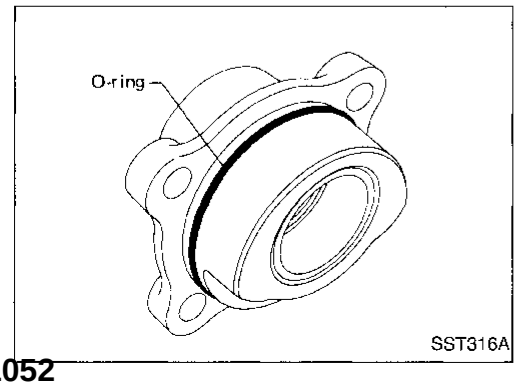
- **Before inserting, apply a thin coat of petroleum jelly to O-ring.**
- **Insert O-ring to make sure it fits into groove.**



SECTOR SHAFT OIL SEAL

- **When installing, be sure to use new oil seal, dust seal, back-up ring and snap ring.**
- **Before installing, apply a thin coat of petroleum jelly to new oil seal and dust seal.**

1. Press new oil seal and then install back-up ring with Tool.

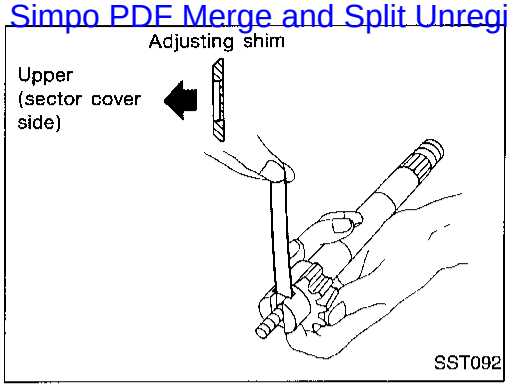


2. Install a new snap ring into gear housing.

CAUTION:

- **Turn snap ring to make sure it fits into groove.**
- **Always install snap ring with R face facing inward.**

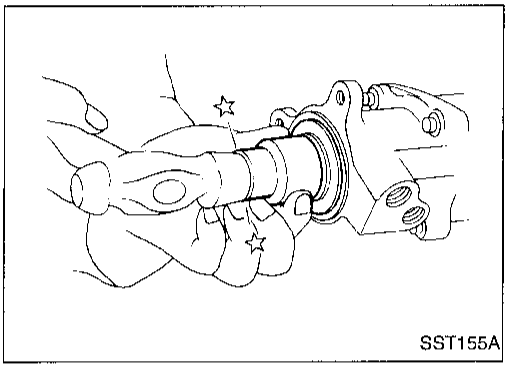
3. Press a new dust seal.



4. Fit new O-ring into sector shaft cover.

- **Before installing, apply a thin coat of petroleum jelly to O-ring.**
- **Make sure that O-ring is installed properly and is not damaged by sector shaft.**

Assembly (Cont'd)

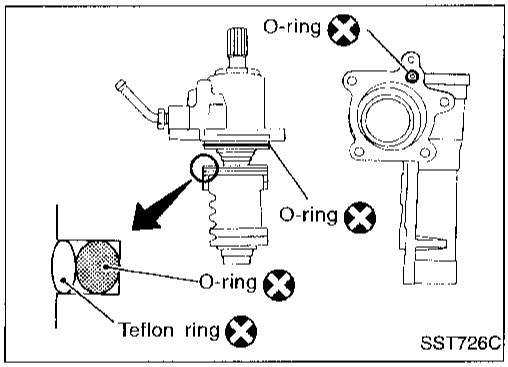


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SECTOR SHAFT END PLAY

Select suitable adjusting shim and adjust end play between sector shaft and adjusting screw.

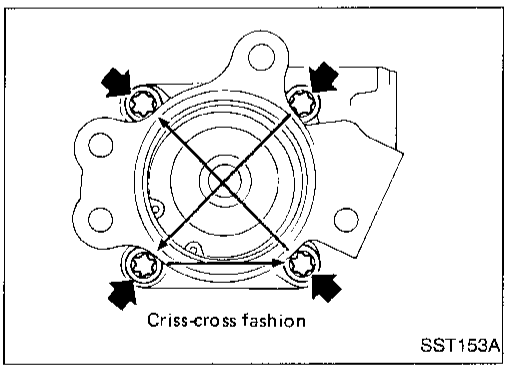
Sector shaft end play:
0.01 - 0.03 mm (0.0004 - 0.0012 in)
Sector shaft adjusting screw shims:
Refer to SDS, ST-43.



REAR COVER O-RING AND OIL SEAL

1. Install new O-ring and oil seal.
2. Install rear cover, then install new snap ring.

CAUTION:

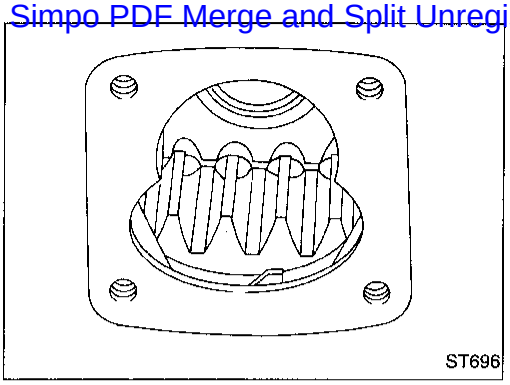


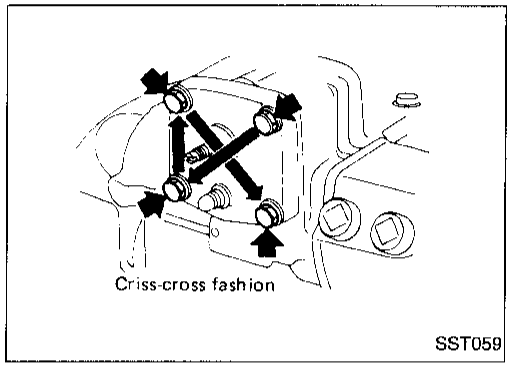
- **Turn snap ring to make sure it fits into grooves.**
- **Always install snap ring with its rounded edge facing rear cover.**

REAR HOUSING O-RING

1. Install new O-rings and teflon ring.

a. Before installing, apply a thin coat of petroleum jelly to rings.
b. Make sure rings are installed correctly and are not damaged by worm gear.





2. Gradually insert worm gear and rear housing assembly into gear housing, being careful not to damage oil seal and O-rings.
3. Install torx screws.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Assembly (Cont'd)

SECTOR SHAFT

1. Set piston rack at straight-ahead position.

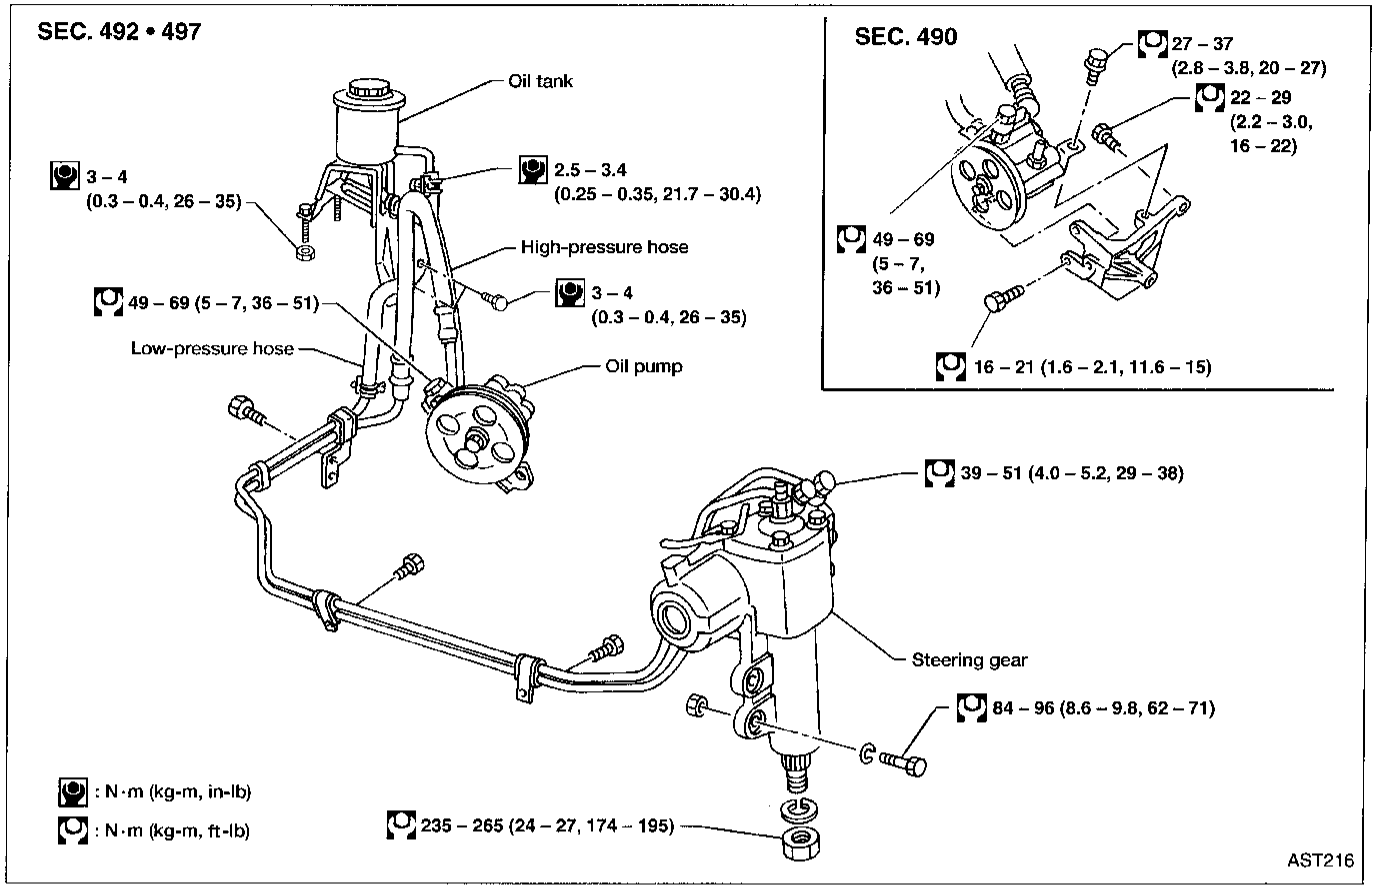
Turn piston rack about 10° to 15° toward yourself with your finger. This permits smooth insertion of sector gear.

2. Wrap vinyl tape around serration area of sector shaft.

Vinyl tape prevents oil seal lip from being damaged during insertion.

3. Gradually insert sector shaft into gear housing, being careful not to damage oil seal.

When inserting sector shaft into gear housing, remove plastic film. Be careful not to drop bearings into gear housing.



4. Tighten sector shaft cover bolts.
5. Check turning torque and steering gear preload.

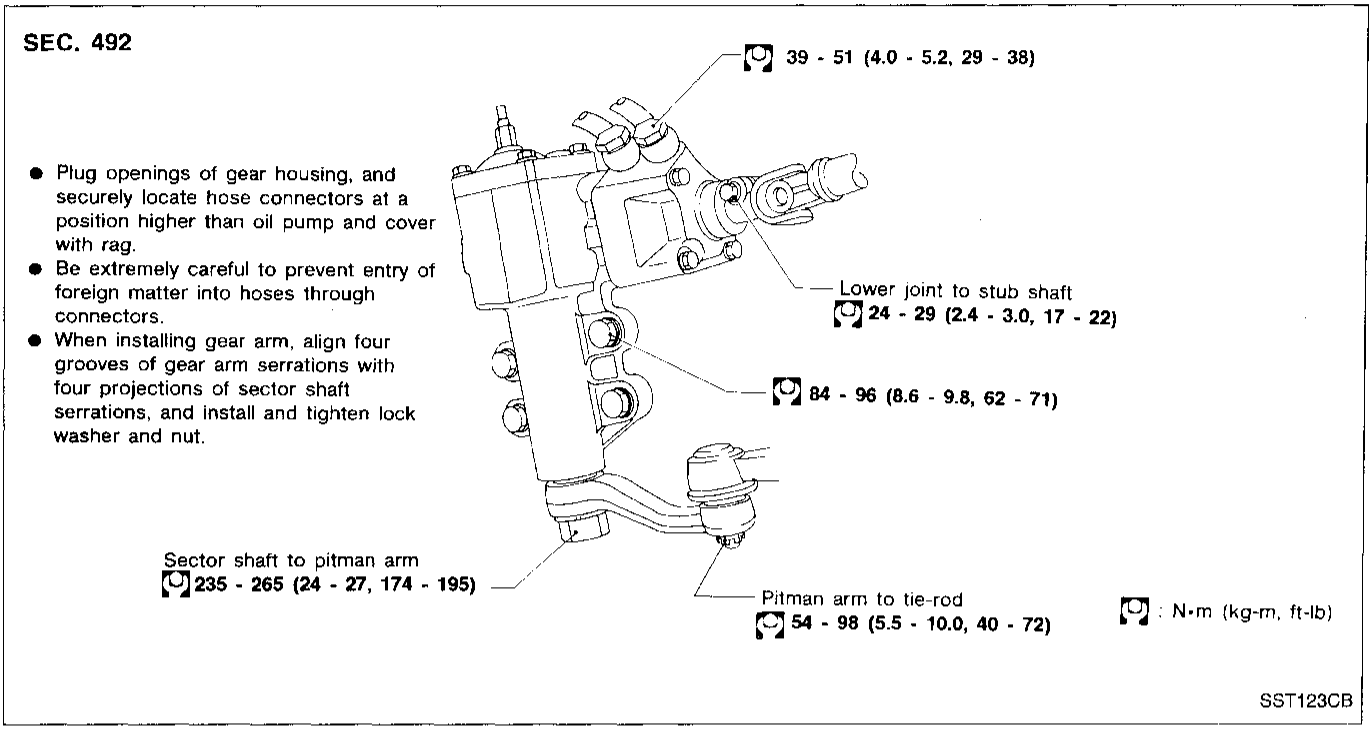
Refer to "TURNING TORQUE MEASUREMENT", "Pre-disassembly Inspection and Adjustment", ST-23.

- **If turning torque is considerably different from the value before disassembly, replace the entire assembly.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

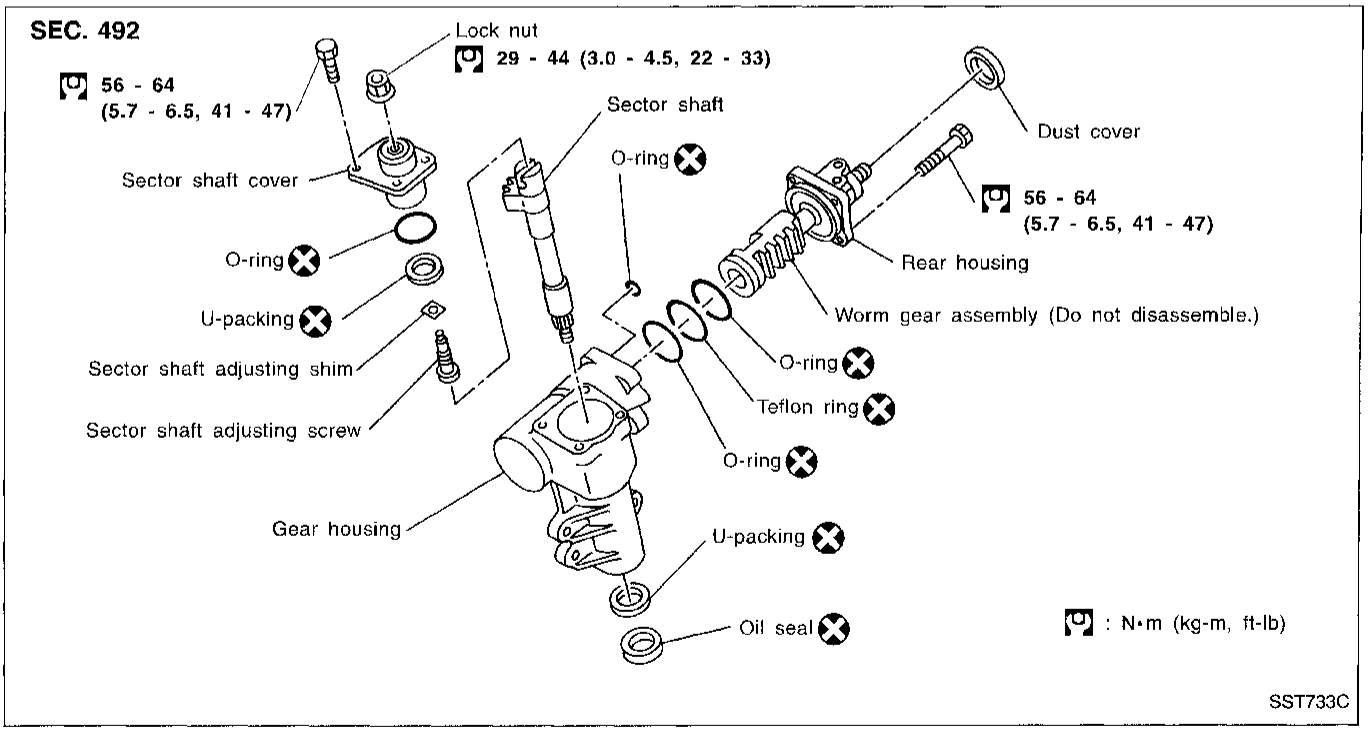
Description

CAUTION:



- **Parts which can be disassembled are strictly limited. Never disassemble parts other than those specified.**
- **Disassemble in as clean a place as possible.**
- **Clean your hands before disassembly.**
- **Do not use rags; use nylon cloths or paper towels.**
- **Follow the procedures and cautions indicated in the Service Manual.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Removal and Installation

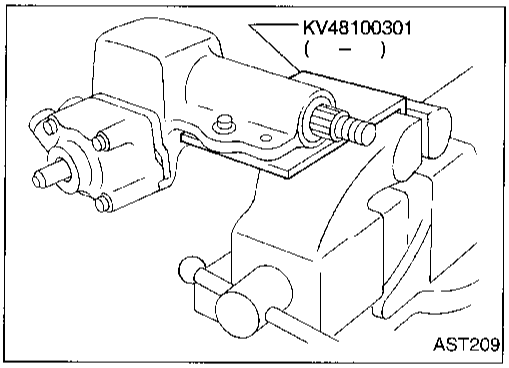
Before removal, clean gear housing and oil pump exteriors using a steam cleaner. Then dry with compressed air.

STEERING GEAR

Power Steering Gear Component

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Pre-disassembly Inspection and Adjustment

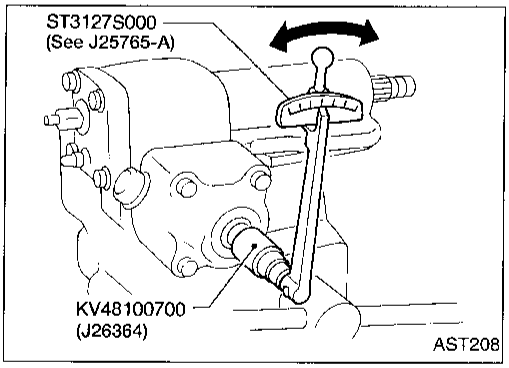


Before disassembling power steering gear component parts, make sure there is no oil leakage around sealing portion and check steering turning torque as follows:

Check sealing portion.

- Sector shaft cover O-ring
- Sector shaft U-packing
- Sector shaft oil seal
- Rear housing O-ring
- Gear housing O-ring

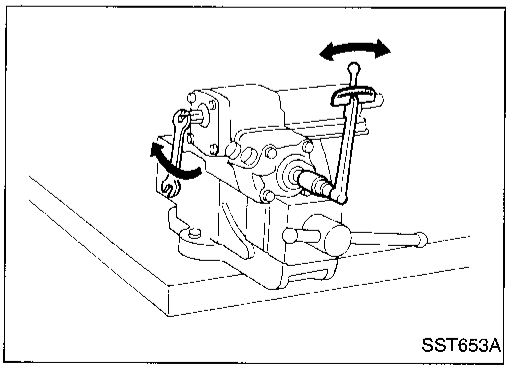
Discard any oil seal and O-ring which have been removed.



Replace oil seal and O-ring if sealing surface is deformed or cracked.

TURNING TORQUE MEASUREMENT

1. Measure turning torque at 360° position.



a. Install steering gear on Tool.

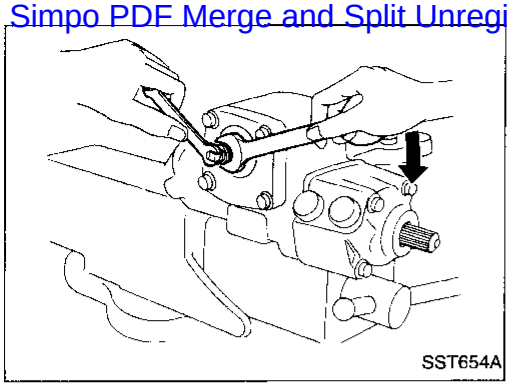
b. Turn stub shaft all the way to right and left several times.

c. Measure turning torque at 360° position from straight-ahead position with Tools.

Turning torque at 360°:
0.15 - 0.78 N·m (1.5 - 8.0 kg-cm, 1.3 - 6.9 in-lb)

d. Measure turning torque at straight-ahead position.

Straight-ahead position is a position where stub shaft is turned 2.14 turns (two full turns and 50°) from lock position.



Turning torque at straight-ahead position:
.25 - 1.32 N·m (2.5 - 13.5 kg-cm, 2.3 - 11.6 in-lb) higher than turning torque at 360°

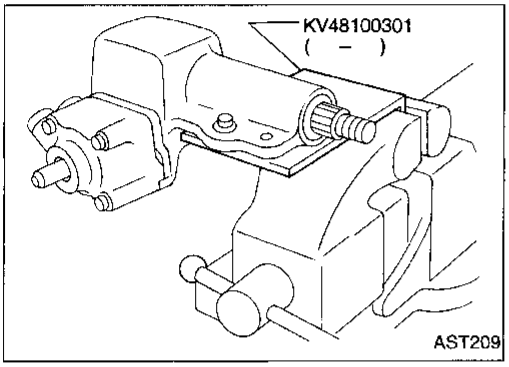
Maximum turning torque:
1.03 - 1.47 N·m (10.5 - 15 kg-cm, 9.2 - 13.0 in-lb)

If turning torque is not within specifications, adjust by turning sector shaft adjusting screw.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

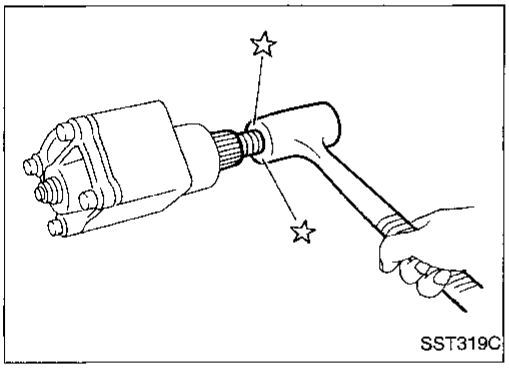
Pre-disassembly Inspection and Adjustment (Cont'd)

2. Tighten adjusting screw lock nut with tools.



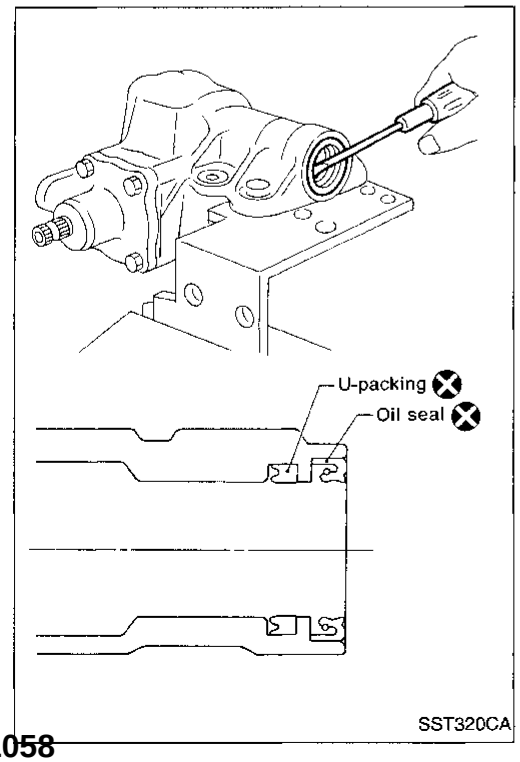
Disassembly

Before disassembly, measure turning torque.



If not within specifications, replace steering gear assembly.

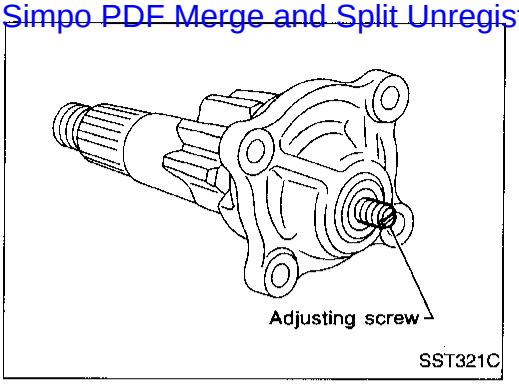
CAUTION:



Oil sealing parts and snap ring must not be used again after removal.

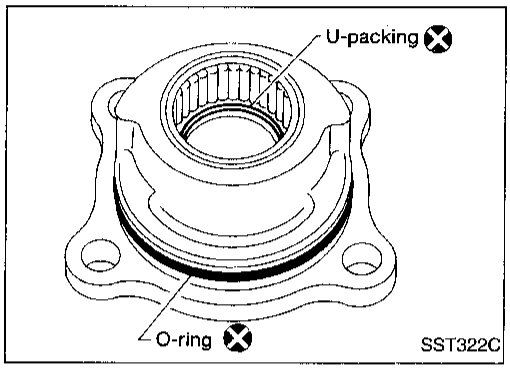
1. Place steering gear in a vise with Tool.
2. Set worm gear in straight-ahead position.

3. Loosen (do not remove) sector shaft cover bolt.
4. Knock out end of sector shaft with a plastic hammer.
5. Remove sector shaft by hand.



6. Remove oil seal.
7. Remove U-packing.

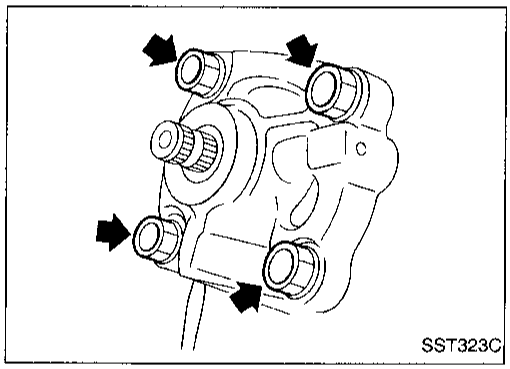
CAUTION:



When removing oil seal and U-packing, be careful not to scratch gear housing.

Disassembly (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

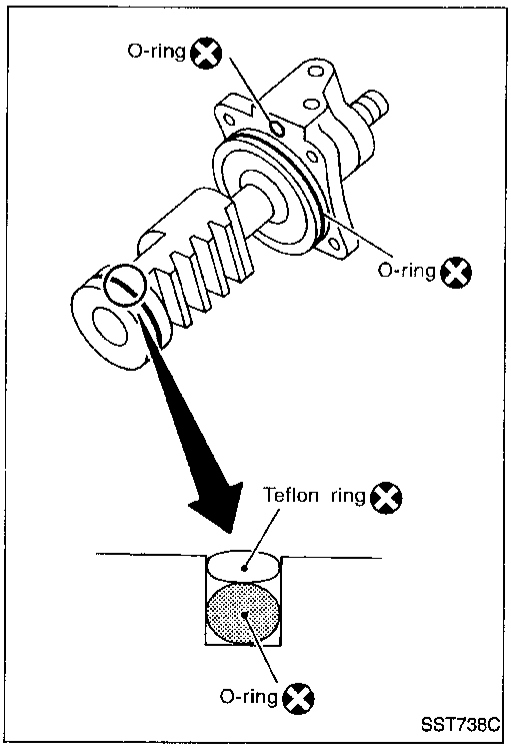


8. Remove lock nut, then loosen adjusting screw using a screwdriver. Separate sector cover and sector shaft.

9. Remove O-ring.
10. Remove U-packing.

CAUTION:

- **When removing U-packing, be careful not to scratch sector cover, needle bearing, etc.**
- **Needle bearing cannot be disassembled. If it is damaged, remove sector cover assembly.**

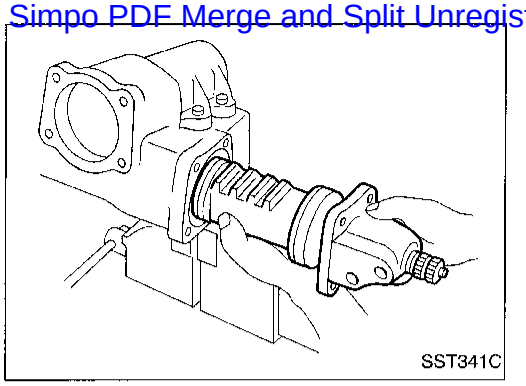


11. Remove dust seal.
12. Remove rear housing bolts.
13. Remove rear housing together with worm gear assembly.

CAUTION:

Worm gear assembly cannot be disassembled. When it is removed, be careful not to disengage worm gear from shaft or allow it to drop.

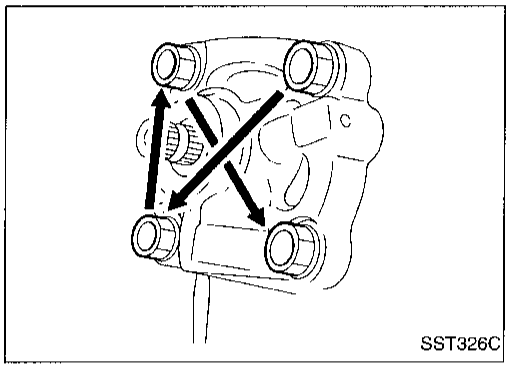
14. Remove teflon ring and O-ring of worm gear assembly.



Assembly

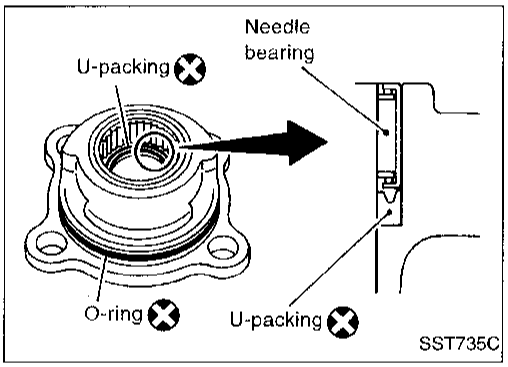
1. Install new O-ring on worm gear assembly.
- **Apply a thin coat of ATF to new O-ring.**
2. Install new teflon ring on worm gear assembly.
- **Make sure that teflon ring is seated in correct position.**
3. Install new O-rings into rear housing.

Assembly (Cont'd)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SST341C

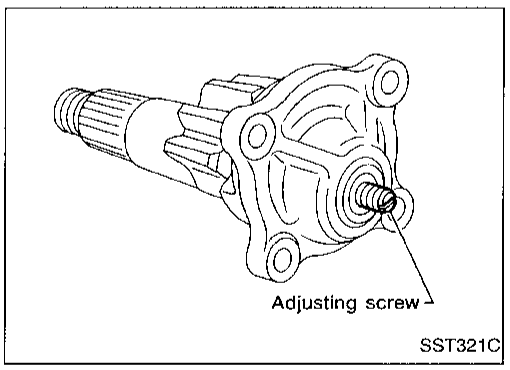


4. Install worm gear assembly with rear housing into the gear housing.

CAUTION:

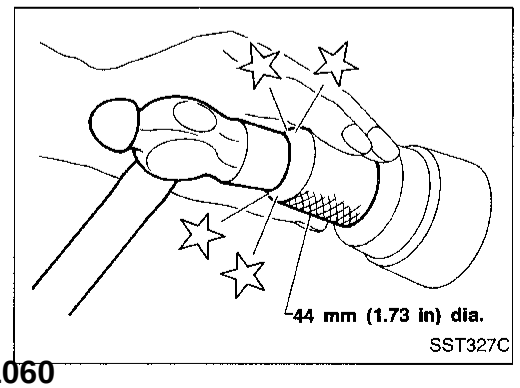
- **Apply a thin coat of ATF inside gear housing and piston before insertion.**
- **Be careful not to damage teflon ring at piston end when inserting worm gear assembly into gear housing.**

SST326C



5. Gradually tighten rear housing bolts in a criss-cross fashion.

SST735C

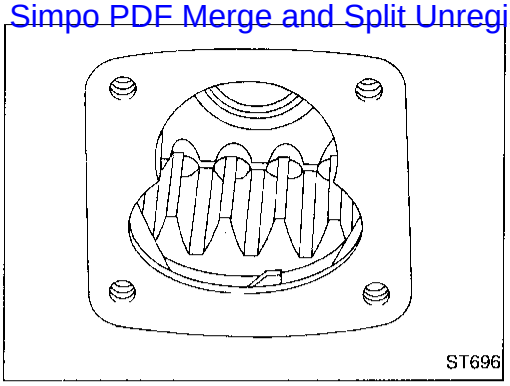


6. Install new O-ring into sector shaft cover.
- **Before installing, apply a thin coat of ATF to O-ring.**

7. Install new U-packing into sector shaft cover.
- **Before installing, apply a thin coat of ATF to U-packing.**
- **Direct grooved side of U-packing to needle bearing.**

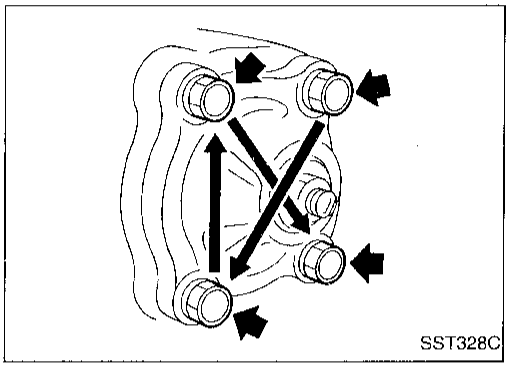
SST321C

8. Install sector shaft into sector shaft cover.
   Set adjusting screw to its outermost position.
- **Before installing sector shaft, apply multi-purpose grease to adjusting screw and adjusting screw shim.**



SST327C

9. Install new oil seal into gear housing with suitable tool.
- **Before installing oil seal, apply multi-purpose grease to oil seal lips.**



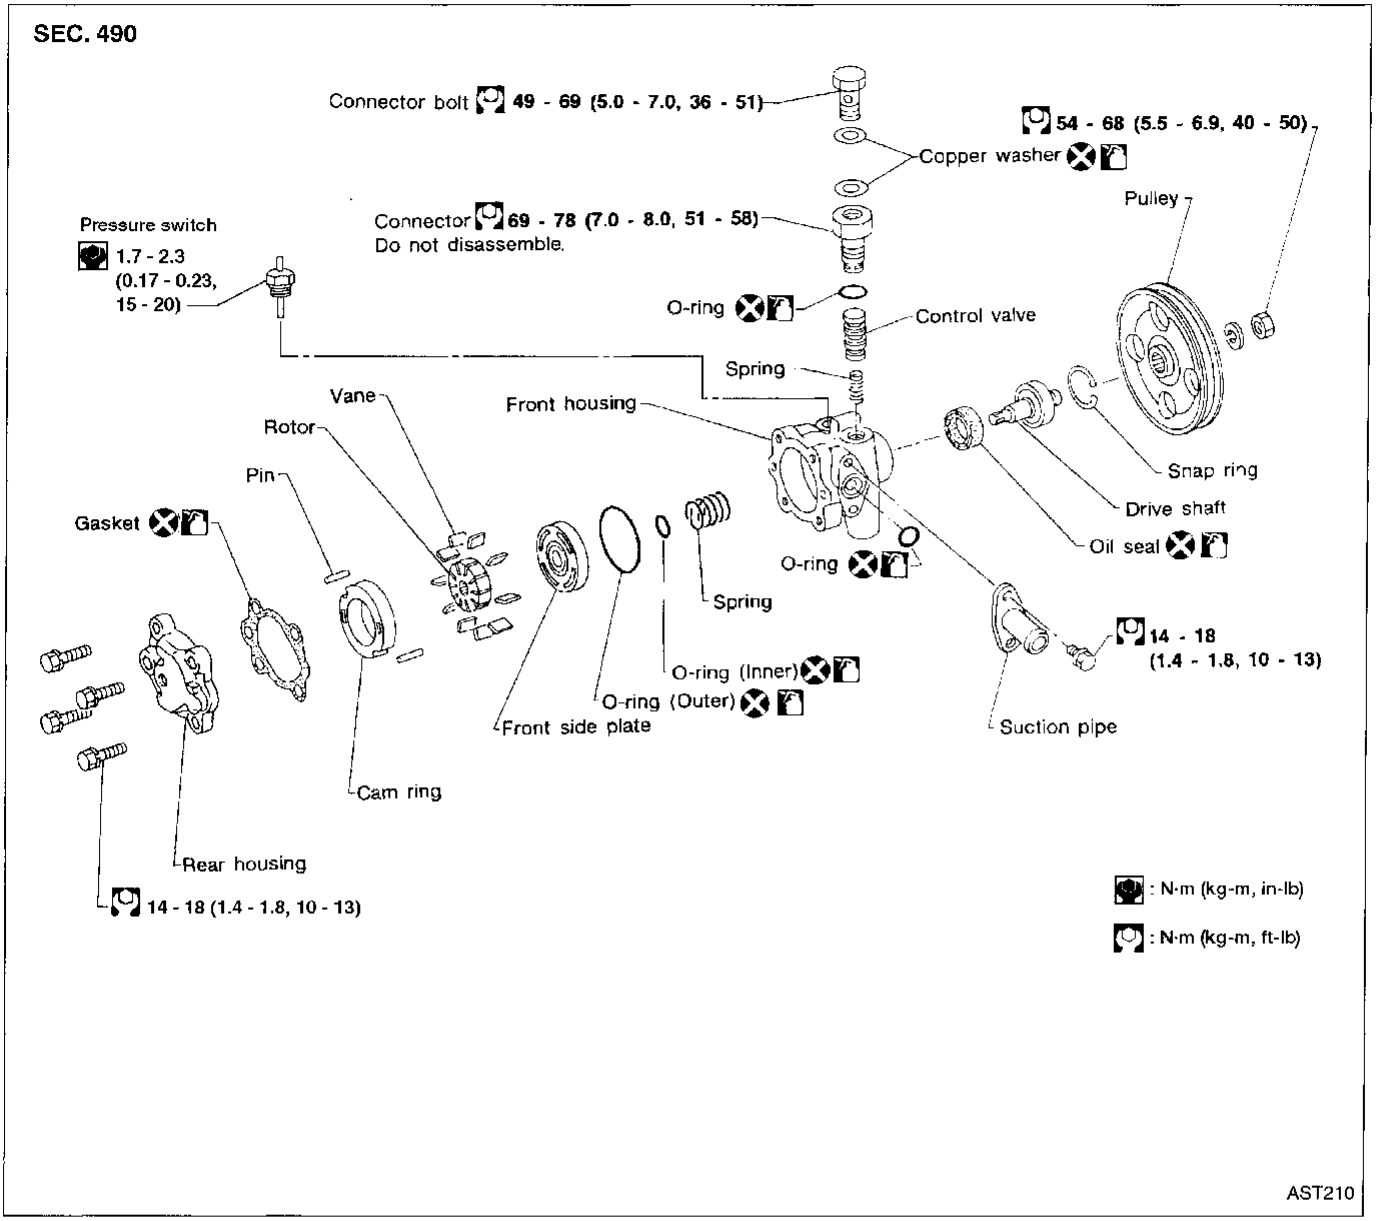
Assembly (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

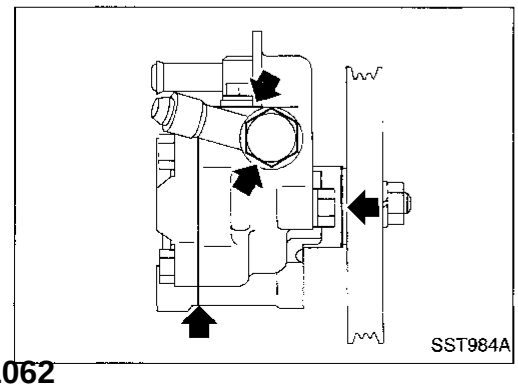
10. Set piston rack at straight-ahead position.

Turn piston rack about 10° to 15° toward yourself with your finger.
This enables smooth insertion of sector gear.

11. Gradually insert sector shaft into gear housing.
12. Tighten sector shaft cover bolts.
13. Set worm gear turning torque by turning sector shaft adjusting screw and locking with lock nut.



Refer to "TURNING TORQUE MEASUREMENT", "Pre-disassembly and Adjustment", ST-31.



- **If set and adjusting turning torque is considerably different from the value before disassembly, replace the entire assembly.**

14. Check sector shaft end play in neutral position.
    End play:
    Less than 0.1 mm (0.004 in)
    If not within specification, adjust it with adjusting screw.
15. Check worm gear preload. If not within specification, readjust it.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Disassembly and Assembly

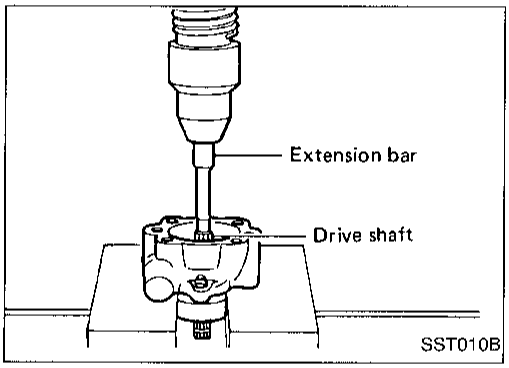
Pre-disassembly Inspection

Disassemble the power steering oil pump only if the following items are found.

- Oil leak from any point shown in the figure.
- Deformed or damaged pulley.
- Poor performance.

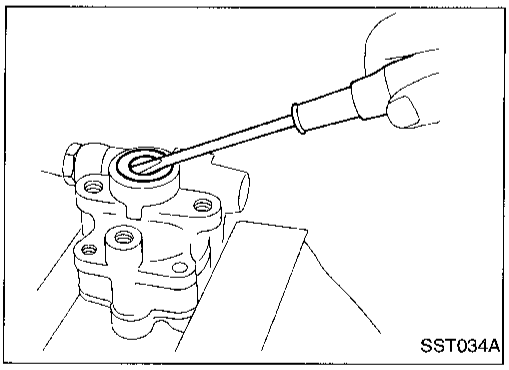
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection



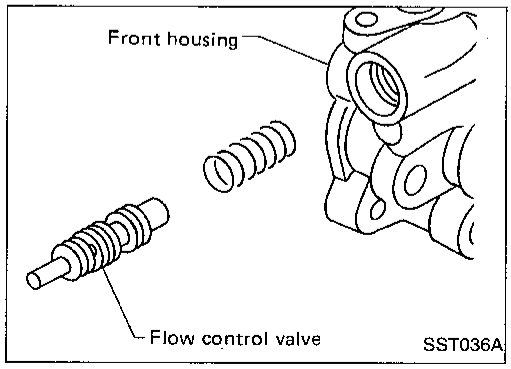
PULLEY AND PULLEY SHAFT

- If pulley is cracked or deformed, replace it.
- If fluid leak is found around the pulley shaft, replace the oil seal.



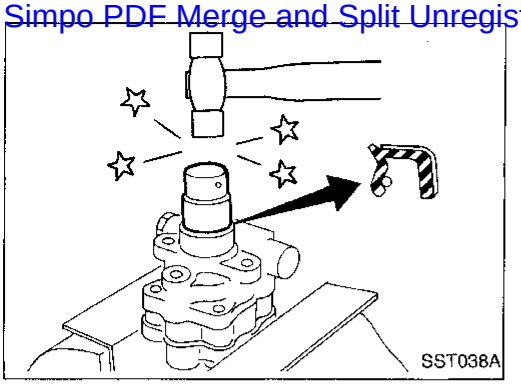
Disassembly

CAUTION:



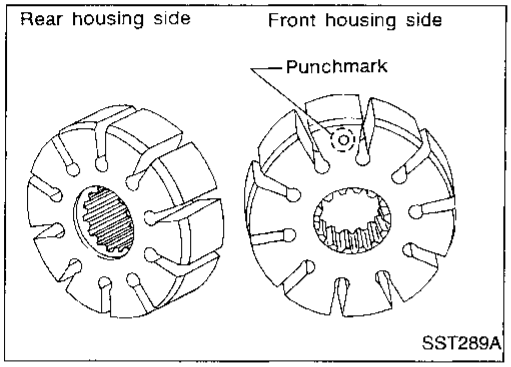
- **Parts which can be disassembled are strictly limited. Never disassemble parts other than those specified.**
- **Disassemble in as clean a place as possible.**
- **Clean your hands before disassembly.**
- **Do not use rags; use nylon cloths or paper towels.**
- **When disassembling and reassembling, do not let foreign matter enter or contact the parts.**

- Remove snap ring, then draw drive shaft out.
- **Be careful not to drop drive shaft.**

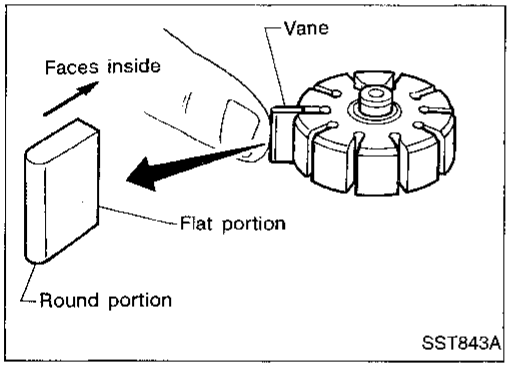


- Remove oil seal.
- **Be careful not to damage front housing.**

- Remove connector.
- **Be careful not to drop control valve.**

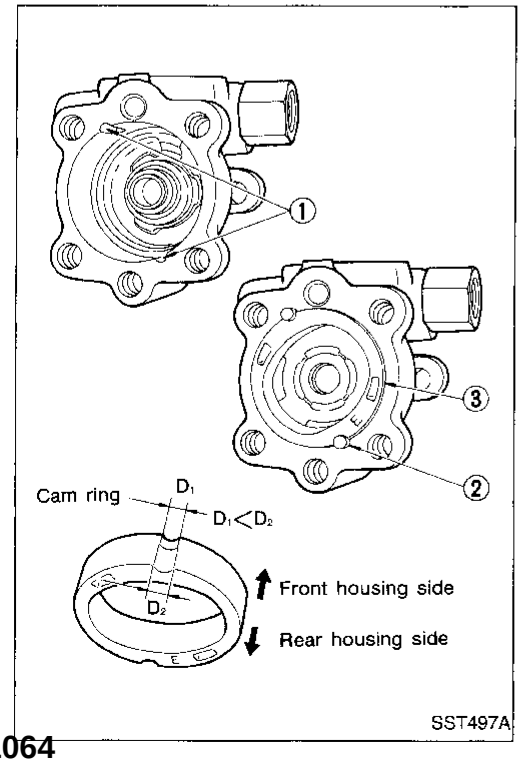


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Assembly

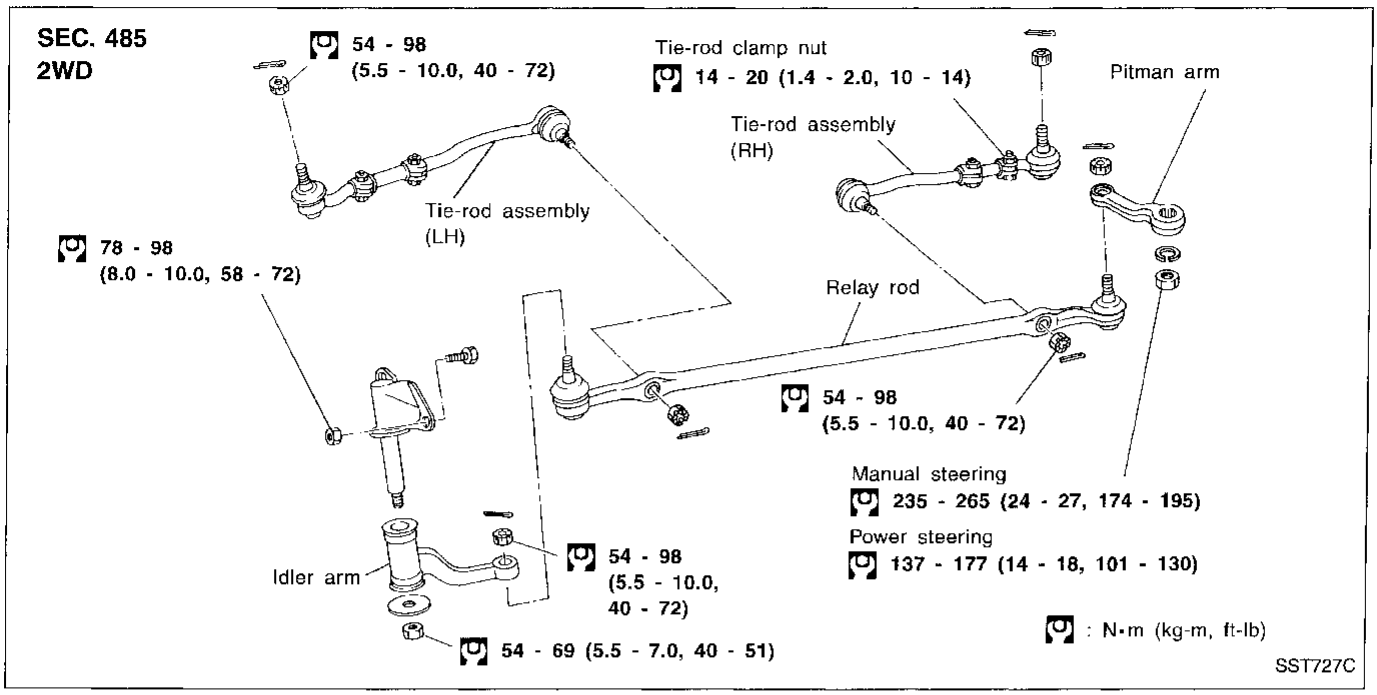
Assemble oil pump, noting the following instructions.



- Make sure O-rings and oil seal are properly installed.
- Always install new O-rings and oil seal.
- Be careful of oil seal direction.
- Cam ring, rotor and vanes must be replaced as a set if necessary.
- When assembling, coat each part with ATF.

- Pay attention to the direction of rotor.

- When assembling vanes to rotor, rounded surfaces of vanes must face cam ring side.



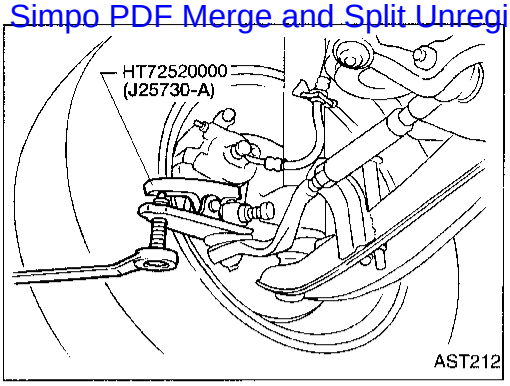
- Insert pin ② into pin groove ① of front housing and front side plate. Then install cam ring ③ as shown at left.

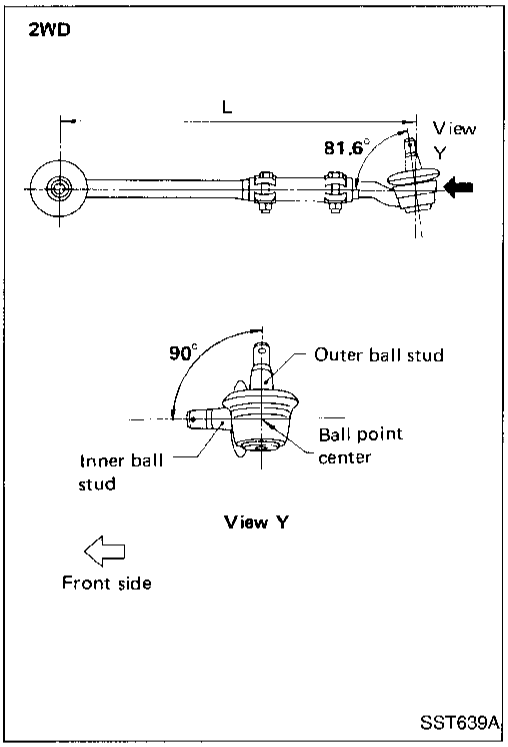
  Cam ring:

  D_1 is less than D_2

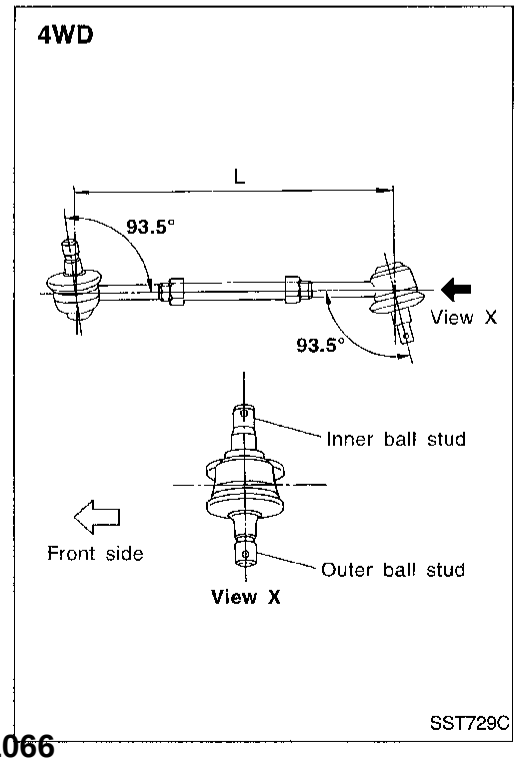
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Removal and Installation





Remove pitman arm with Tool.



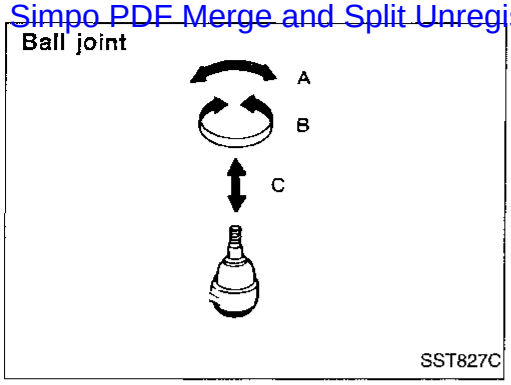
Removal and Installation (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

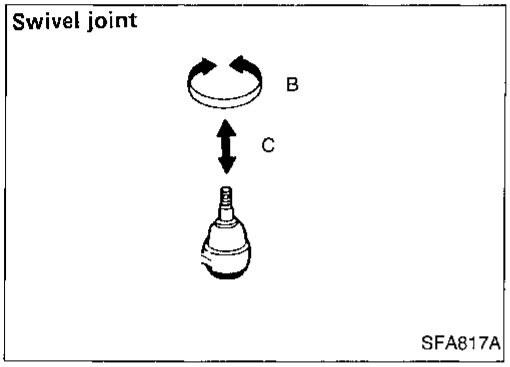
Remove tie-rod from knuckle arm with Tool.

Disassembly

IDLER ARM ASSEMBLY



- Apply coat of multi-purpose grease to bushing.
- Press bushing into idler body, and insert shaft of idler bracket carefully until bushing protrudes.



CROSS ROD AND TIE-ROD

1. When tie-rod ball joints and tie-rod bar are separated, adjust tie-rod length correctly.
   Adjustment should be done between ball stud centers.
2. Lock tie-rod clamp nut so that ball joint on outer ball stud is as follows with respect to that on inner ball stud.
   L: Standard
   343.9 mm (13.54 in) ... 2WD
   297.6 mm (11.72 in) ... 4WD

CAUTION:
Make sure that tie-rod bars are screwed into tie-rod tube more than 29 mm (1.14 in)...2WD, 22 mm (.87 in)...4WD.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection

BALL JOINT AND SWIVEL JOINT

1. Check joints for play. If ball or swivel stud is worn and play in axial direction is excessive or joint is hard to swing, replace as a complete unit.
   Swinging force (Measure point: Cotter pin hole) "A":
   Ball joint
   15.7 - 147.1 N (1.6 - 15.0 kg, 3.5 - 33.1 lb)
   Rotating torque "B":
   Ball joint
   0.5 - 4.9 N·m (5 - 50 kg-cm, 4.3 - 43.4 in-lb)
   Swivel joint
   1.0 - 5.9 N·m (10 - 60 kg-cm, 8.7 - 52.1 in-lb)
   Axial end play "C":
   Ball joint and swivel joint
   0 mm (0 in)
2. Check condition of dust cover. If it is cracked excessively, replace as a complete unit.

CAUTION:
Be careful not to apply grease or oil to taper of joint.

IDLER ARM ASSEMBLY

- Check rubber bushing of idler arm for breakage, wear or play, and if necessary replace.
- Lubricate idler arm assembly with multi-purpose grease, if necessary.

CROSS ROD AND TIE-ROD

Check tie-rod and cross rod for breakage, bends and cracks, and replace with a new one if necessary.

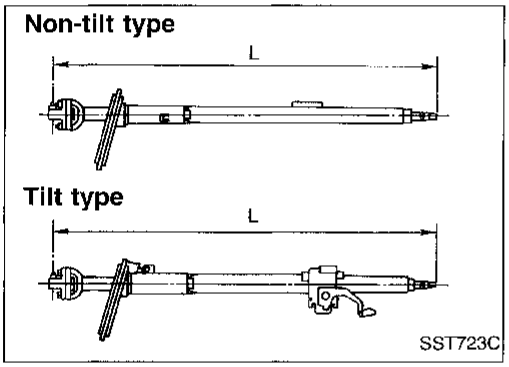
FIXING LOCATION

- Check fixing location (nuts and cotter pins) for looseness, play or breakage.
- When looseness or play is found, check for wear on tapered portion of joints, gear arm of idler arm.
- When reassembling each joint, use new cotter pins.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

General Specifications

Steering column type (Collapsible)	Manual steering	Power steering	
	2WD	2WD	4WD
Steering gear type	VB66K	PB48S	PB59K
Turns of steering wheel on the vehicle (Lock-to-lock)	5.8	3.6	3.4
Steering gear ratio	24.4 - 26.8	16.5	15



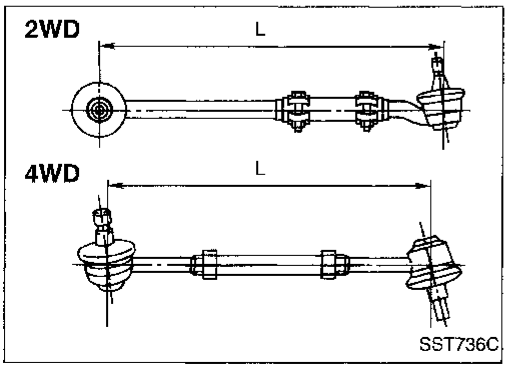
Steering wheel axial play mm (in)	0 (0)
Steering wheel play mm (in)	35 (1.38) or less

Inspection and Adjustment

STEERING COLUMN LENGTH

Unit: mm (in)

Dimension "L"	863.1 - 866.7 (33.98 - 34.12)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

MANUAL STEERING GEAR (Model: VB66K)

Worm bearing preload N·m (kg-cm, in-lb)	0.69 - 0.88 (7.0 - 9.0, 6.1 - 7.8)	
Steering gear turning torque N·m (kg-cm, in-lb)		
360° position from straight-ahead position	0.69 - 0.88 (7.0 - 9.0, 6.1 - 7.8)	
Straight-ahead position (As compared with steering wheel turned 360°)	0.20 - 0.39 (2.0 - 4.0, 1.7 - 3.5) higher	
Maximum turning torque	1.08 (11.0, 9.5)	
Backlash at pitman arm top end (in a straight-ahead position) mm (in)	0 - 0.1 (0 - 0.004)	
End play (Between sector shaft and adjusting screw) mm (in)	0.1 (0.004) or less	
Adjusting shim thickness	Thickness mm (in)	Part number
	1.95 (0.0768)	48129-84500
	2.00 (0.0787)	48130-84500
	2.05 (0.0807)	48131-84500

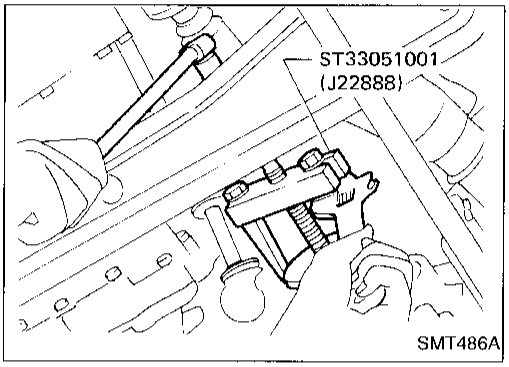
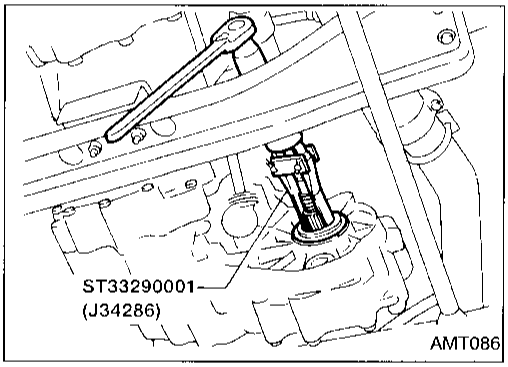
Cross-sectional View

SMT013D

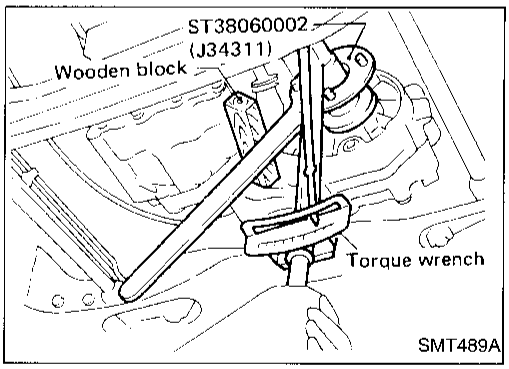


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



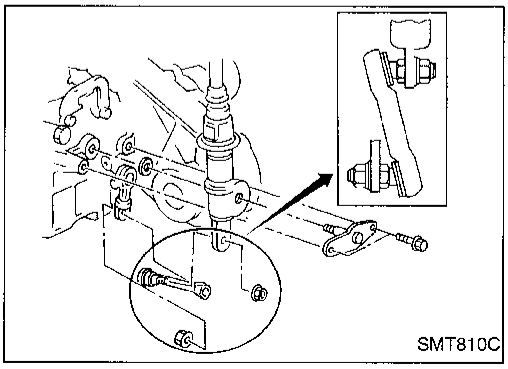
Replacing Oil Seal

CENTER CASE OIL SEAL



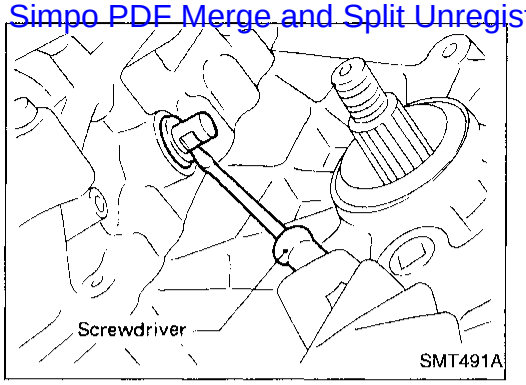
1. Remove front propeller shaft. Refer to PD section ("Removal and Installation", "PROPELLER SHAFT").
2. Remove companion flange nut.

3. Remove companion flange.



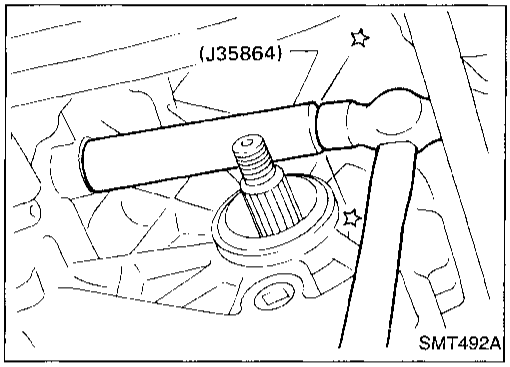
4. Remove center case oil seal.
5. Install center case oil seal.
- **Before installing, apply multi-purpose grease to seal lip.**
6. Install companion flange.

7. Tighten companion flange nut.
   : 226 - 324 N·m (23 - 33 kg-m, 166 - 239 ft-lb)
8. Install front propeller shaft. Refer to PD section ("Removal and Installation", "PROPELLER SHAFT").



SHIFT SHAFT OIL SEAL

1. Remove front propeller shaft. Refer to PD section ("Removal and Installation", "PROPELLER SHAFT").
2. Remove companion flange. Refer to "CENTER CASE OIL SEAL", above.
3. Remove transfer control lever from transfer outer shift lever. Then remove outer shift lever.

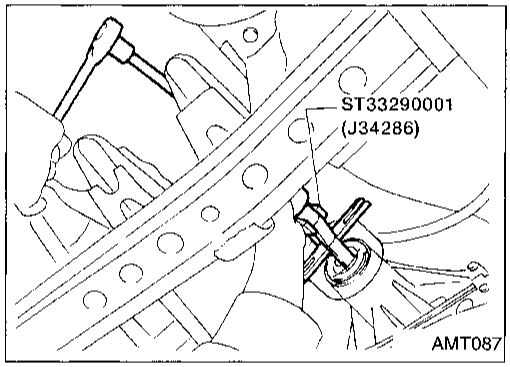


Replacing Oil Seal (Cont'd)

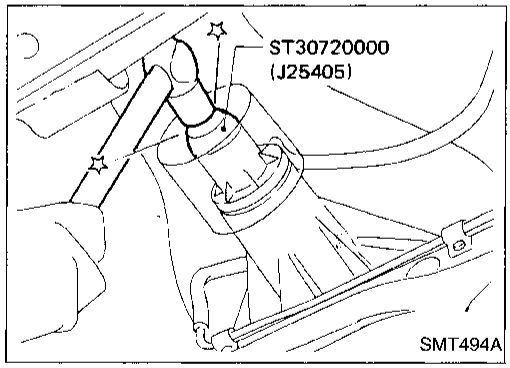
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

4. Remove shift shaft oil seal.

- **Be careful not to damage cross shaft.**



5. Install shift shaft oil seal.

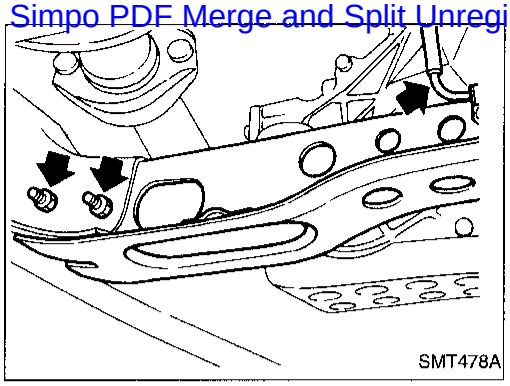


- **Before installing, apply multi-purpose grease to seal lip.**

6. Install transfer control linkage.
7. Install companion flange. Refer to "CENTER CASE OIL SEAL", TF-5.
8. Install front propeller shaft. Refer to PD section ("Removal and Installation", "PROPELLER SHAFT").

REAR OIL SEAL

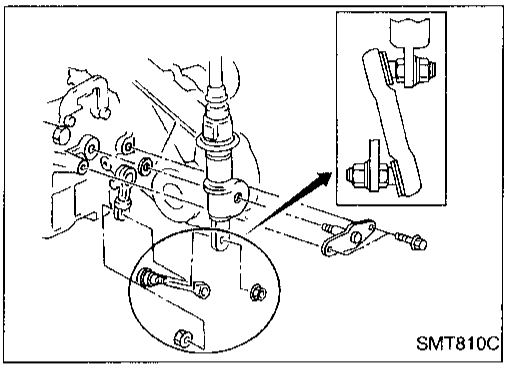
1. Remove rear propeller shaft. Refer to PD section ("Removal and Installation", "PROPELLER SHAFT").
2. Remove rear oil seal.



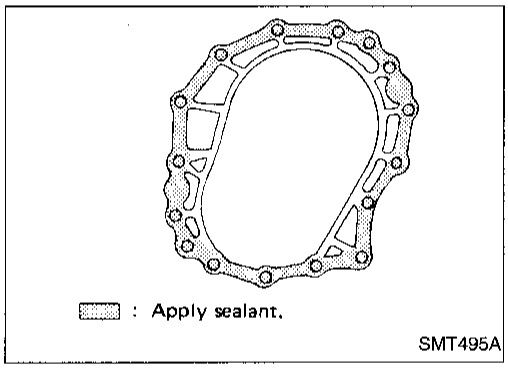
3. Install rear oil seal.

- **Before installing apply multi-purpose grease to seal lip.**

4. Install rear propeller shaft. Refer to PD section ("Removal and Installation", "PROPELLER SHAFT").



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

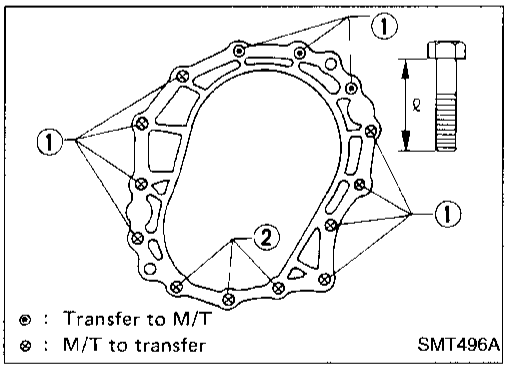


SMT478A

Removal

1. Drain oil from transfer and transmission.
2. Remove front and rear propeller shaft. Refer to PD section ("Removal and Installation", "PROPELLER SHAFT").
   Insert plug into rear oil seal after removing propeller shaft.
   - **Be careful not to damage spline, sleeve yoke and rear oil seal, when removing propeller shaft.**
3. Remove torsion bar spring. Refer to FA section ("Torsion Bar Spring", "FRONT SUSPENSION"). Then remove second crossmember.
4. Remove transfer control lever from transfer outer shift lever.
5. Separate transfer from transmission.

WARNING:
Support transfer while removing it.



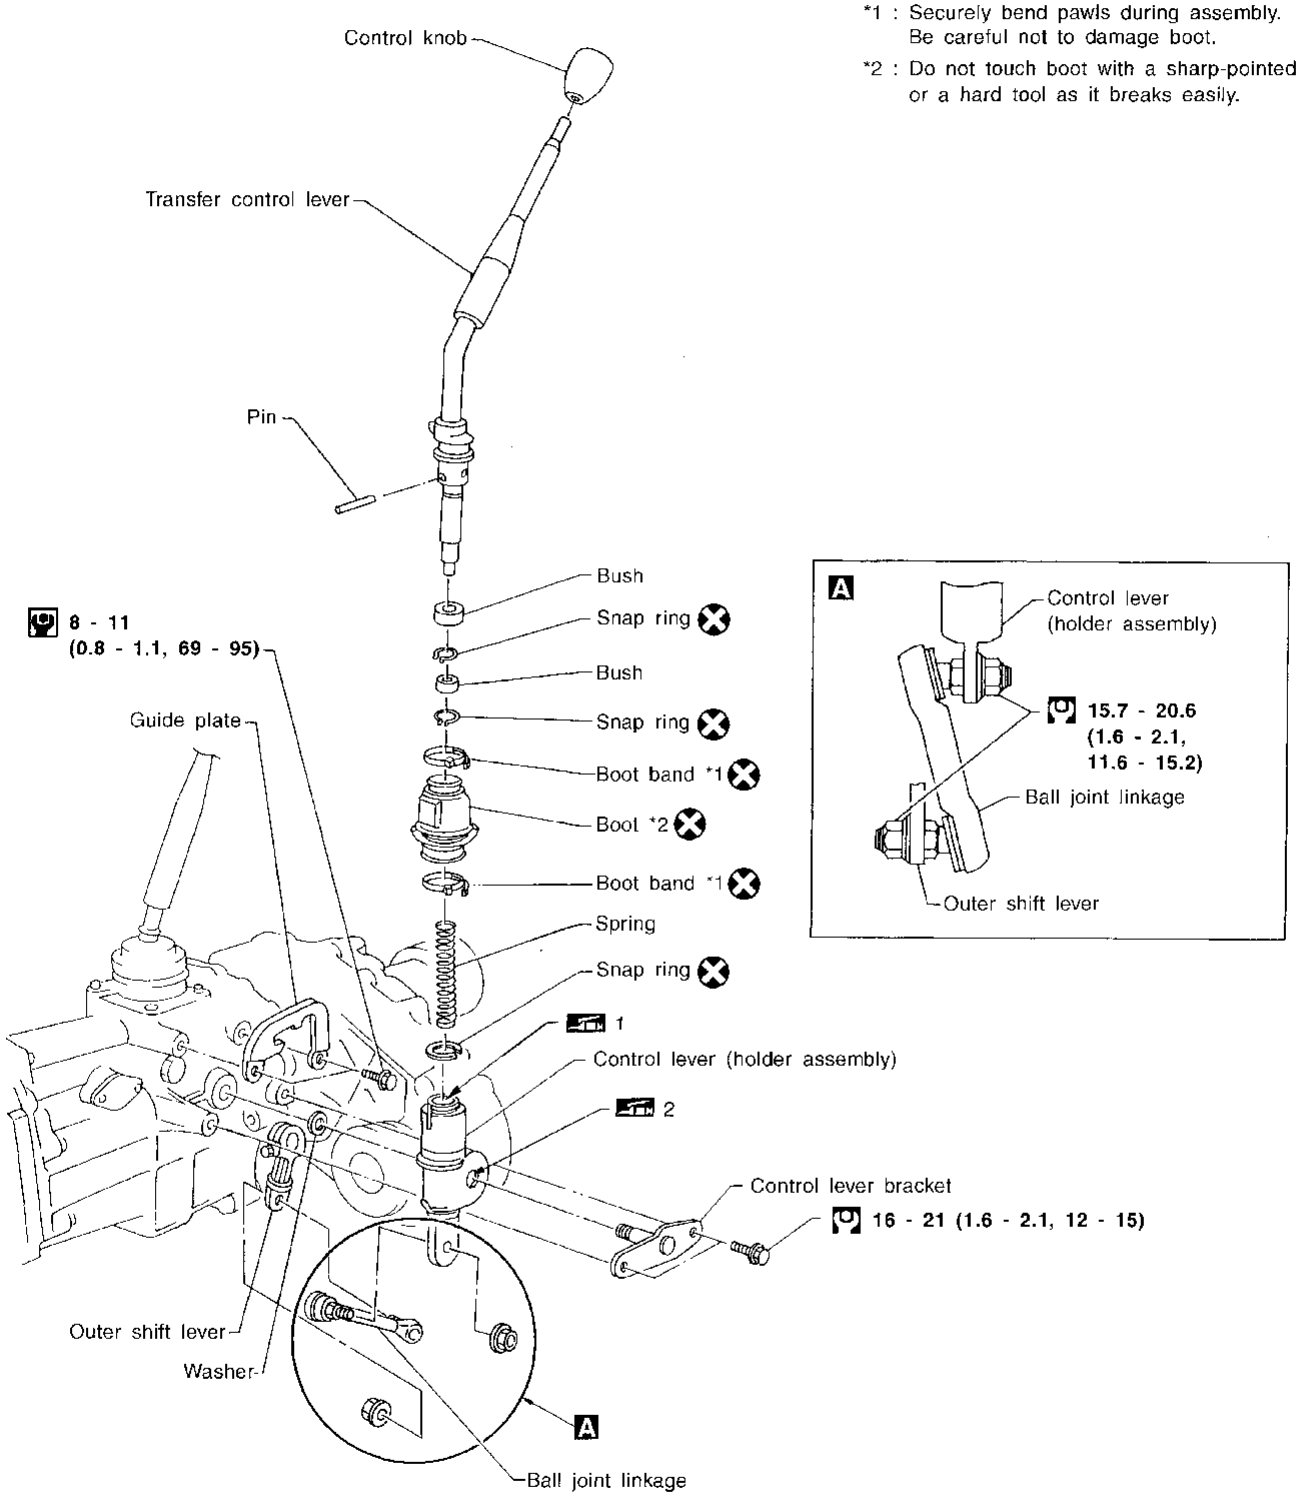
SMT810C

SMT495A

Installation

- Apply sealant to mating surface of transfer case to transmission.
- **Use genuine anaerobic liquid gasket, Three Bond TB1215, Loctite Part No. 51813 or equivalent.**

SMT496A

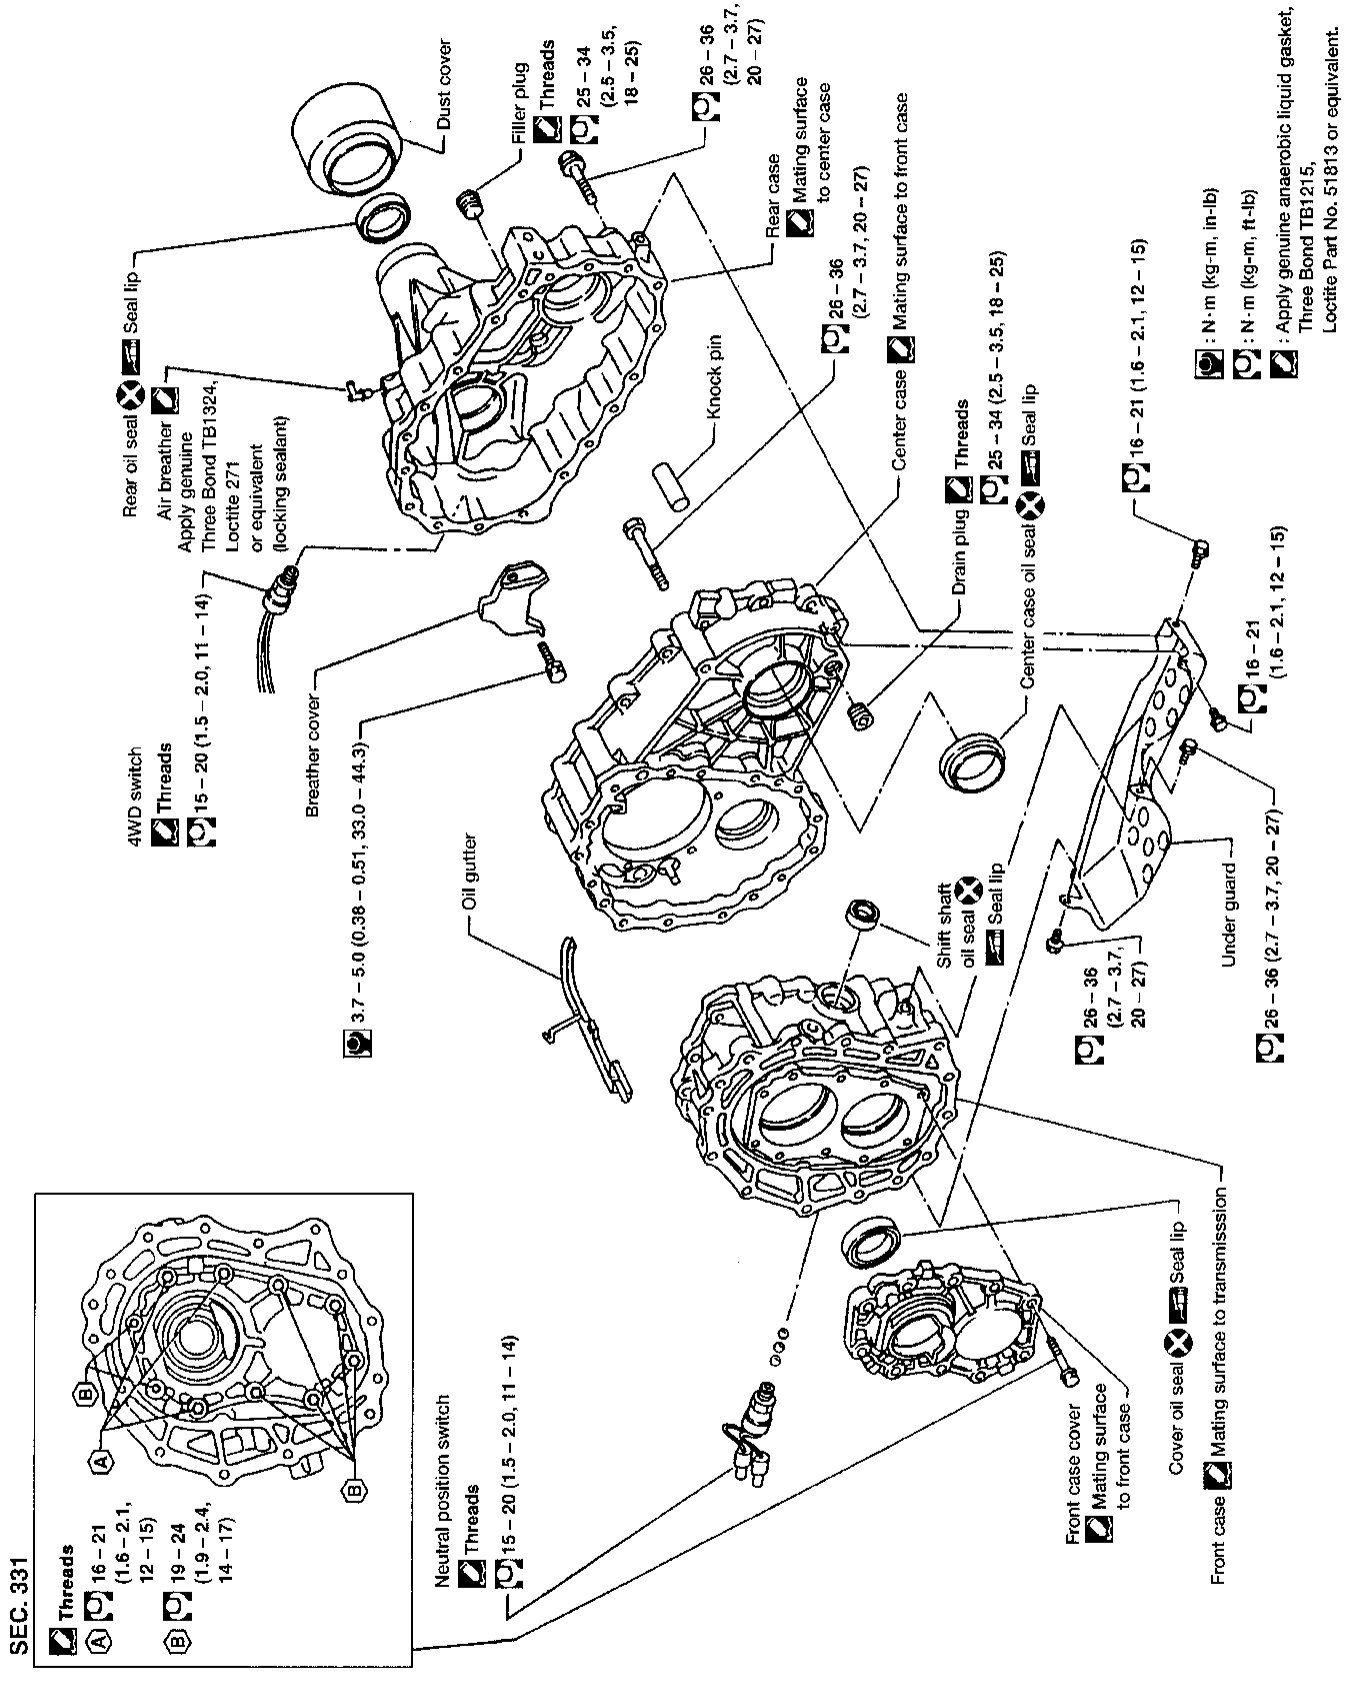


- Tighten bolts securing transfer.

Bolt No.	Tightening torque N·m (kg-m, ft-lb)	ℓ mm (in)
①	31 - 41 (3.2 - 4.2, 23 - 30)	45 (1.77)
②	31 - 41 (3.2 - 4.2, 23 - 30)	60 (2.36)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SEC. 333



: N•m (kg-m, in-lb)
: N•m (kg-m, ft-lb)
1 : Fill multi-purpose grease up.
2 : Apply multi-purpose grease.
*1 : Securely bend pawls during assembly. Be careful not to damage boot.
*2 : Do not touch boot with a sharp-pointed or a hard tool as it breaks easily.

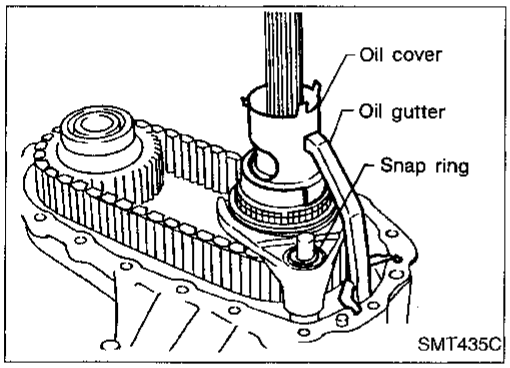
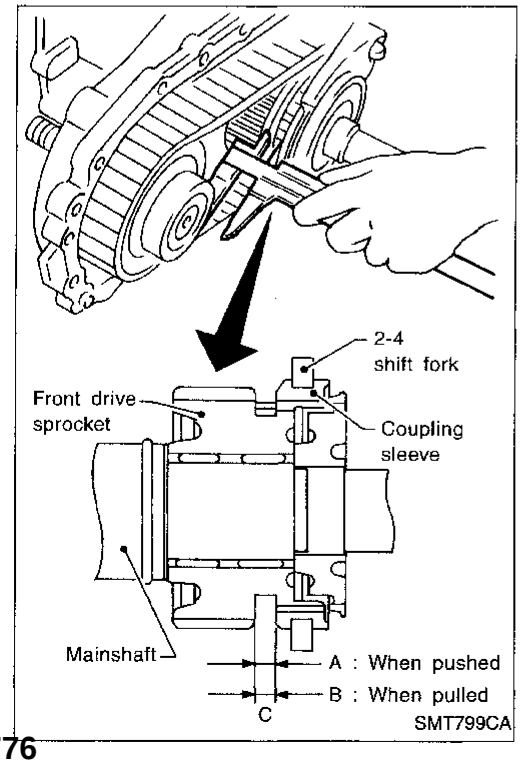
ATF003

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



1. Remove companion flange nut.
2. Remove companion flange.



3. Remove 4WD switch.
4. Remove rear case.

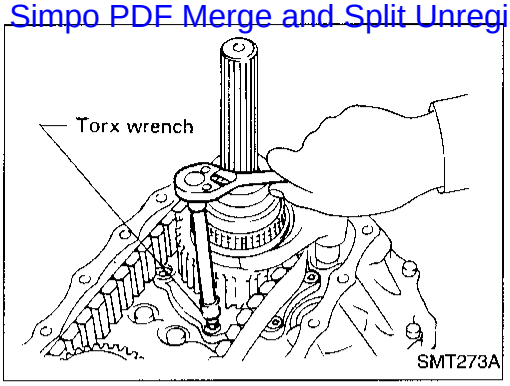
- **Be careful not to damage the mating surface.**

5. Remove oil cover and oil gutter.
6. Remove snap ring from 2-4 shift rod.

7. Using calipers, measure the difference between front drive sprocket and 2-4 coupling sleeve as outlined under Measuring method below. If it is outside specifications, check front drive sprocket, 2-4 coupling sleeve, clutch gear, 2-4 shift fork and 2-4 fork rod for abnormalities. Replace faulty part(s) as required.

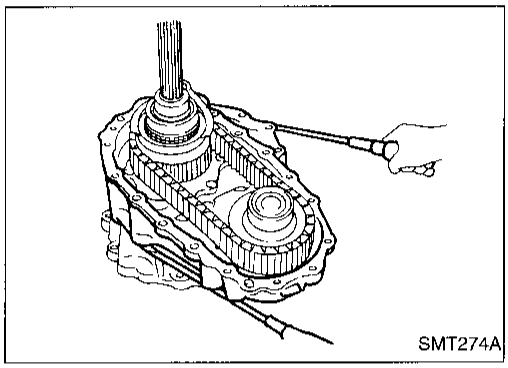
Measuring method

a. Move coupling sleeve until it is in contact with sprocket, then measure dimension A. Move coupling sleeve until it is in contact with clutch gear, then measure dimension B. Obtain dimensional difference C between two measurements A and B.



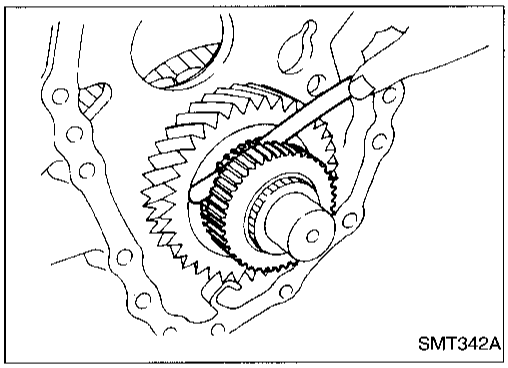
C = A – B

b. To determine dimension A, measure at 3 or 4 different points by rotating sprocket and obtain average value of 3 or 4 measurements.

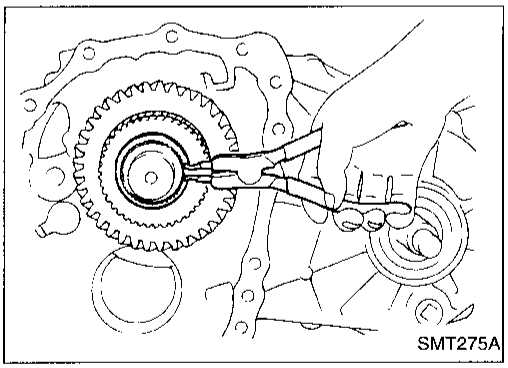


Specification C:

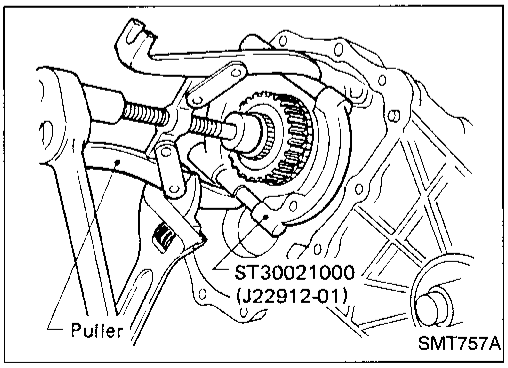
Refer to TF-32.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

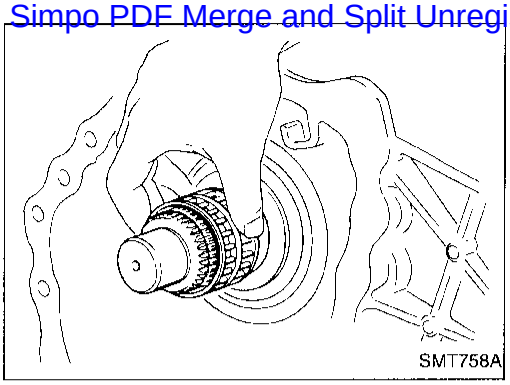


8. Remove bolts securing bearing retainer.
- **This step is necessary to remove mainshaft from center case.**

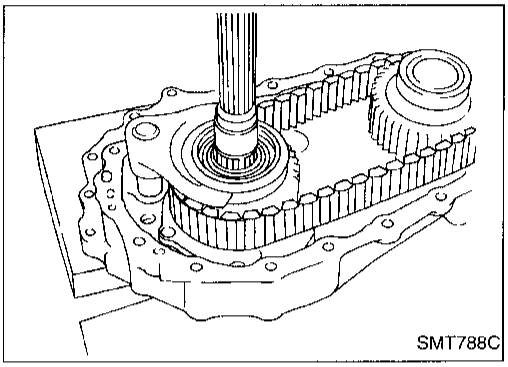


9. Remove bolts securing center case to front case, then separate center case from front case.

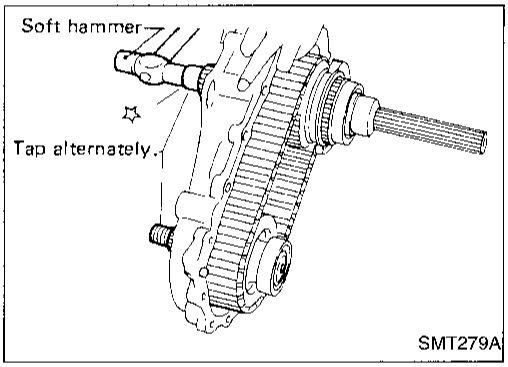
10. Measure low gear end play.
Standard:
0.2 - 0.35 mm (0.0079 - 0.0138 in)
- **If end play is not within specification, check low gear and L & H hub for wear.**



11. Disassemble center case assembly.
a. Remove snap ring from mainshaft.

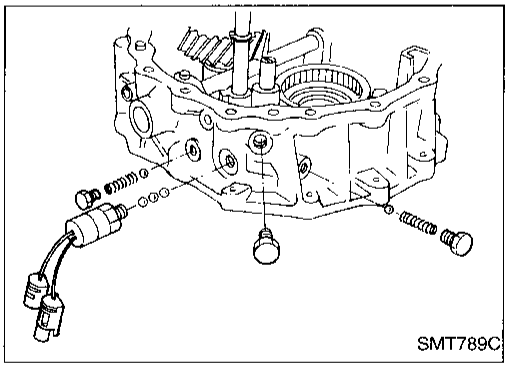


b. Remove low gear with L & H hub.

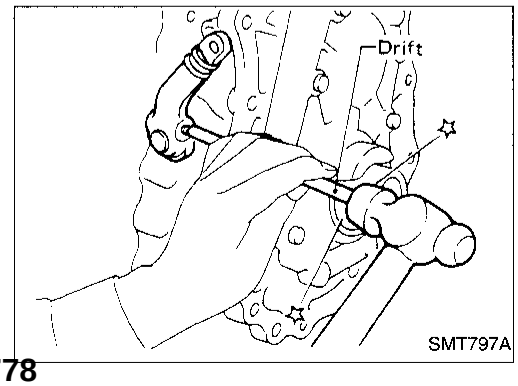


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

c. Remove needle bearing from main shaft.

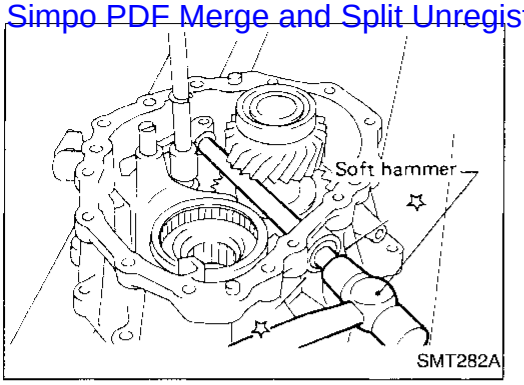


d. Make sure of the direction of the drive chain before removing it. (It must be reinstalled in the same direction.)



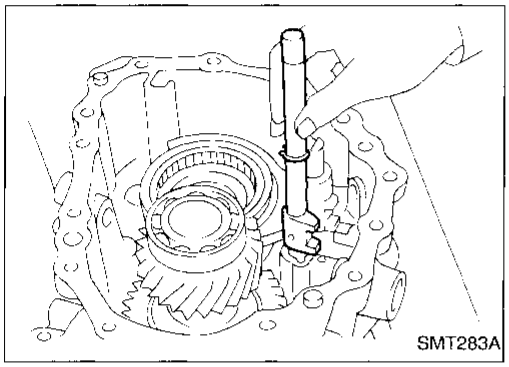
e. Remove mainshaft, front drive and drive chain as a set by tapping front end of mainshaft and front drive shaft alternately.

- **Be careful not to bend drive chain.**

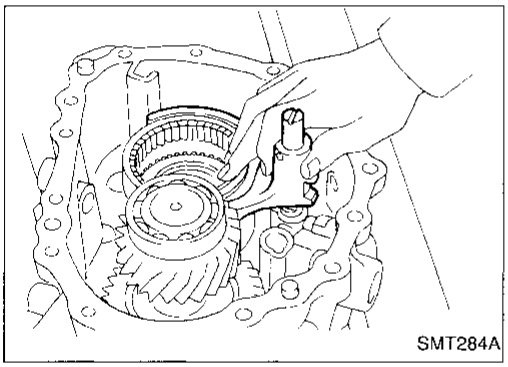


12. Disassemble front case assembly.

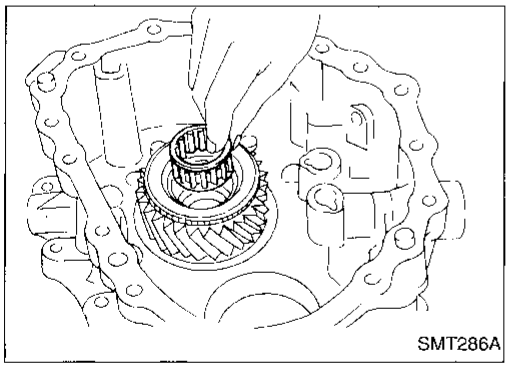
a. Remove switch, plugs, check springs and balls.



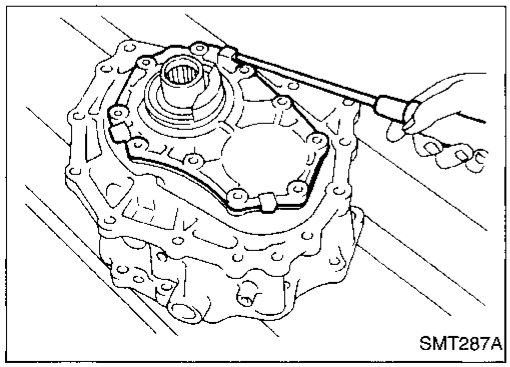
b. Remove lock pin from outer shift lever, then remove outer shift lever.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

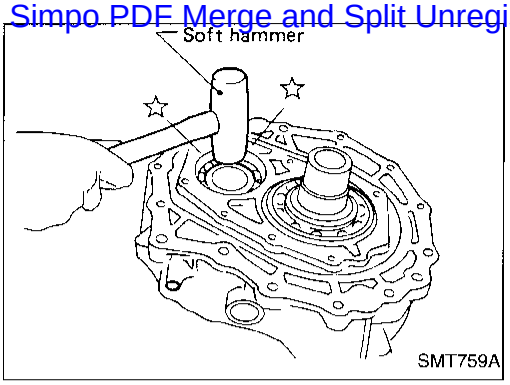


c. Remove lock pin from inner shift lever, then drive out cross shaft and plug together.

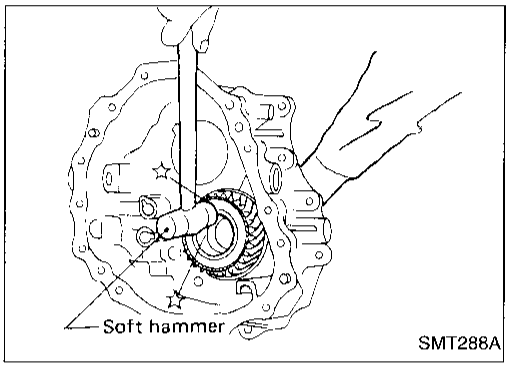


d. Remove 2-4 shift rod.

e. Remove L & H shift rod and fork assembly with coupling sleeve.

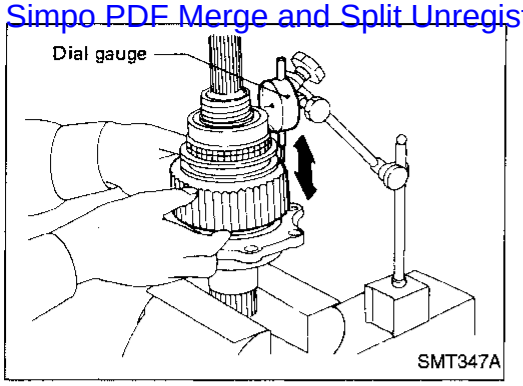


f. Remove needle bearing from main gear.



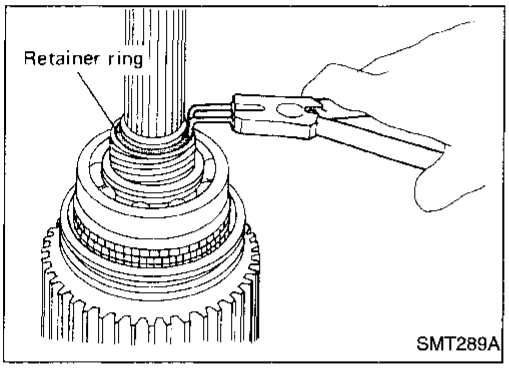
g. Remove bolts securing front case cover, then remove case cover.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

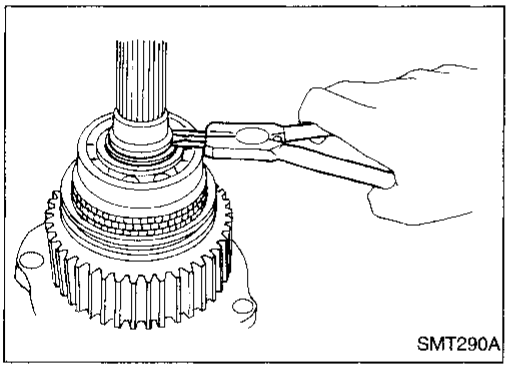


h. Remove counter gear by tapping lightly.

i. Remove main gear by tapping lightly.

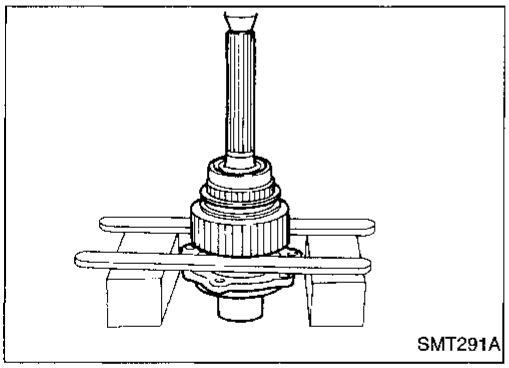


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

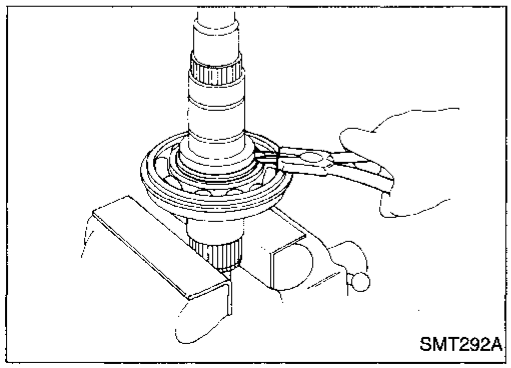


Mainshaft

DISASSEMBLY



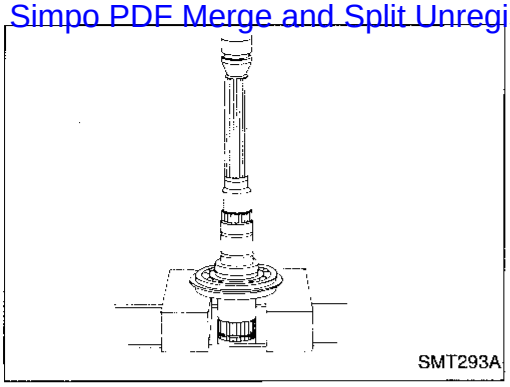
1. Check front drive sprocket end play.
   Standard:
   0.2 - 0.35 mm (0.0079 - 0.0138 in)
- **If end play is not within specification, check front drive sprocket and clutch gear for wear.**

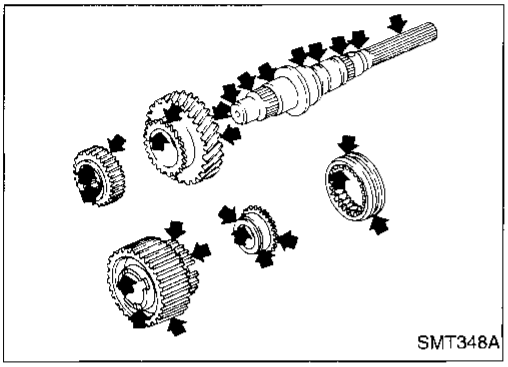


2. Remove retainer ring, speedometer drive gear and steel ball.
- **Be careful not to lose the steel ball.**

3. Remove snap ring and spacer.

4. Use a press to remove front drive sprocket with mainshaft rear bearing and clutch gear together.
5. Remove needle bearing.



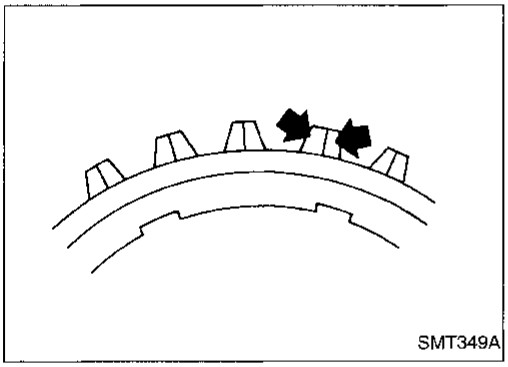


6. Remove bearing retainer, then remove snap ring and spacer.

Mainshaft (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

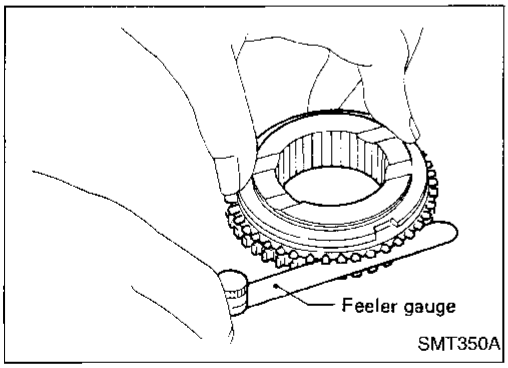
7. Use a press to remove mainshaft front bearing from mainshaft.



SMT293A

SMT348A

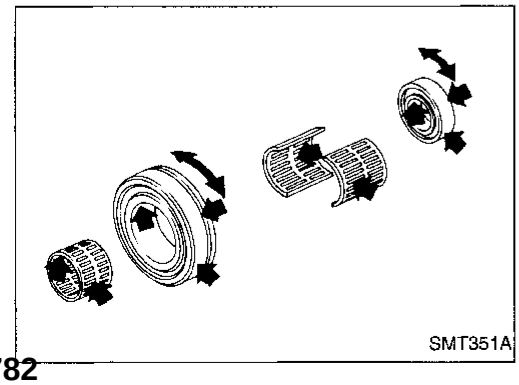
INSPECTION



Gear and shaft

- Check gears for excessive wear, chips or cracks.
- Check shaft for cracks, wear or bending.
- Check coupling sleeve for wear or damage.

SMT349A

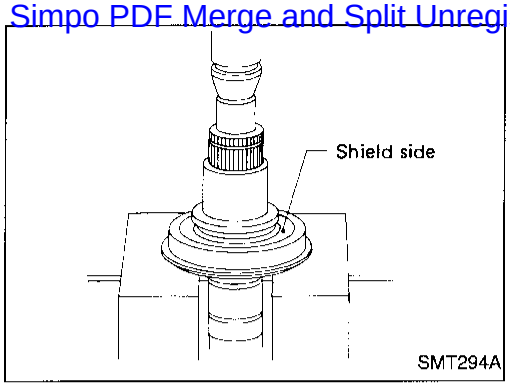


Baulk ring

- Check baulk ring for cracks or deformation.

SMT350A

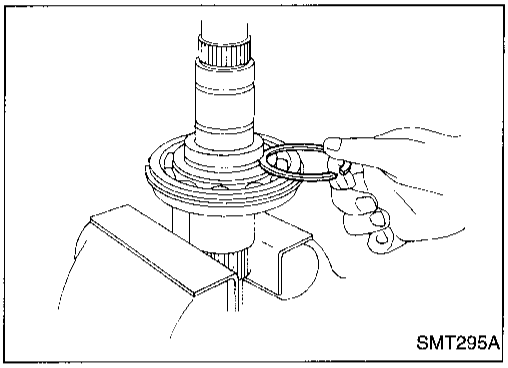
- Measure clearance between baulk ring and clutch gear.
  Baulk ring to clutch gear clearance:
  Refer to SDS, TF-32.



SMT351A

Bearing

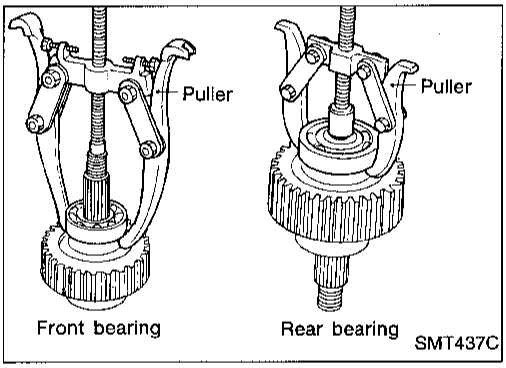
- Make sure bearings roll freely and are free from noise, cracks, pitting or wear.



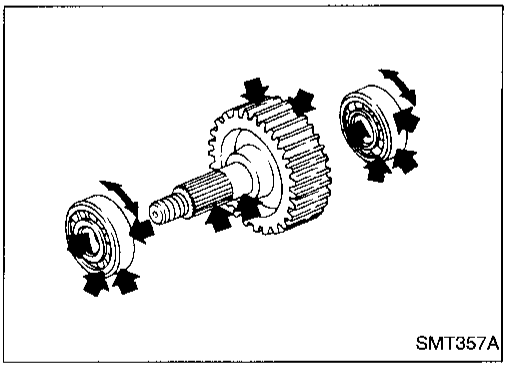
Mainshaft (Cont'd)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

ASSEMBLY



1. Press mainshaft front bearing onto mainshaft.
   - **Pay attention to its direction.**

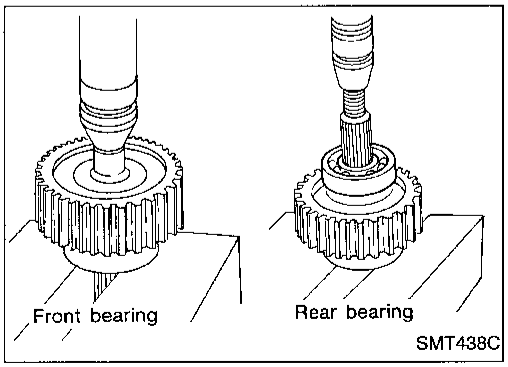


2. Install spacer.
3. Select and install snap ring with proper thickness.
   Allowable clearance between snap ring and groove:
   0 - 0.15 mm (0 - 0.0059 in)
   Available snap ring for mainshaft front bearing:
   Refer to SDS, TF-32.
4. For further procedures, refer to "ASSEMBLY", TF-25.

Front Drive Shaft

DISASSEMBLY

- Using a gear puller, remove front drive shaft front and rear bearings.

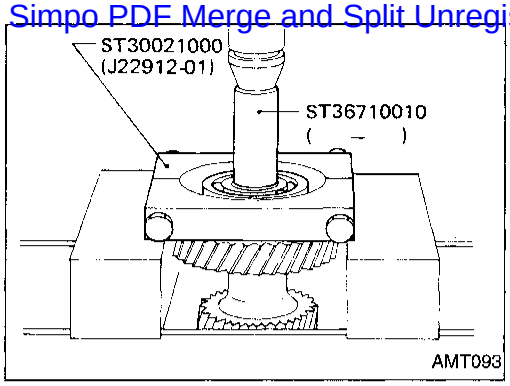


INSPECTION

Sprocket and shaft

- Check sprocket for excessive wear, chips or cracks.
- Check shaft for cracks or wear.

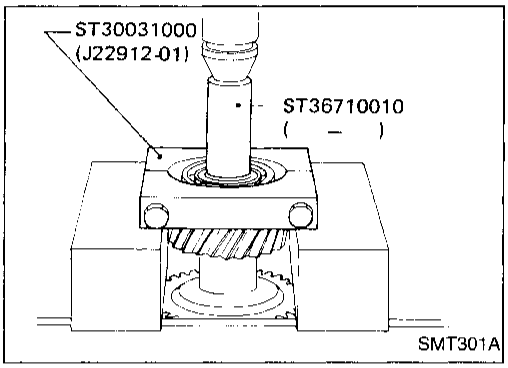
Bearing



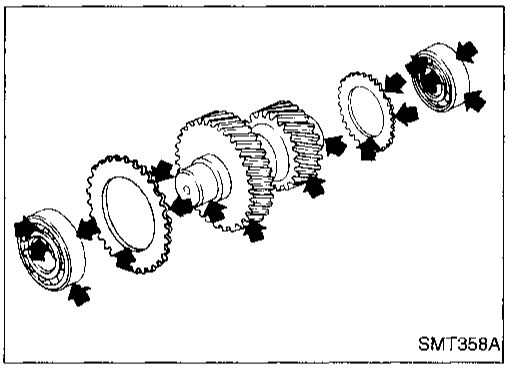
- Make sure bearings roll freely and are free from noise, cracks, pitting or wear.

ASSEMBLY

- Press front drive shaft front and rear bearings onto front drive shaft.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

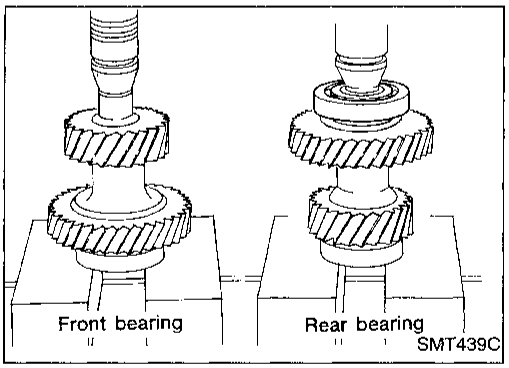


Counter Gear

DISASSEMBLY

1. Press out counter gear front bearing.
- Remove front sub-gear, spacer and dish plate.

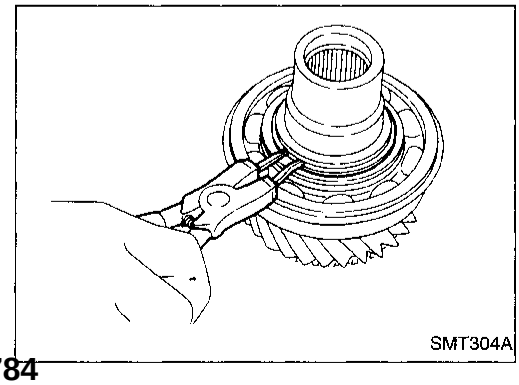
2. Press out counter gear rear bearing and then remove rear sub-gear, spacer and dish plate.



INSPECTION

Gear and shaft

- Check gears for excessive wear, chips or cracks.
- Check shaft for cracks or wear.



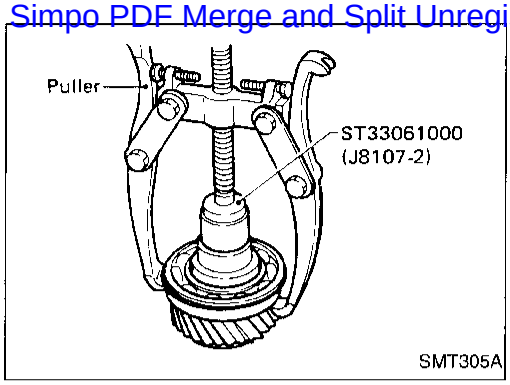
Bearing

- Make sure bearings roll freely and are free from noise, cracks, pitting or wear.

ASSEMBLY

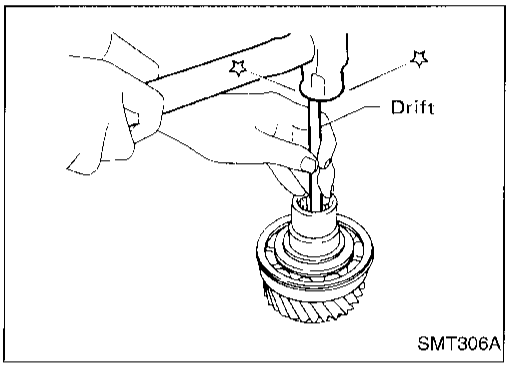
1. Install front sub-gear, dish plate and spacer, then press on counter gear front bearing.
2. Install rear sub-gear, dish plate and spacer, then press on counter gear rear bearing.

Main Gear



DISASSEMBLY

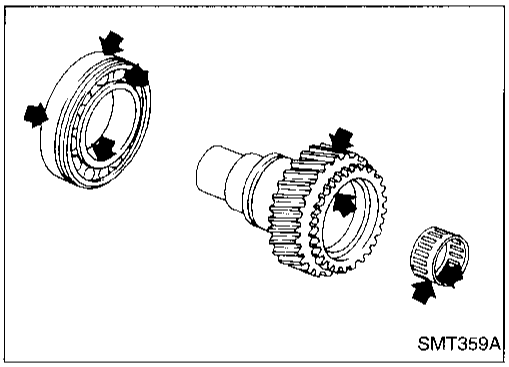
Main gear bearing



1. Remove snap ring.

Main Gear (Cont'd)

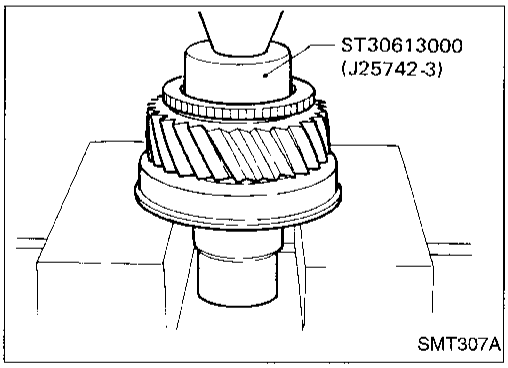
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



2. Pull out main gear bearing.

Plug

- **Always replace with a new one whenever it has been removed.**

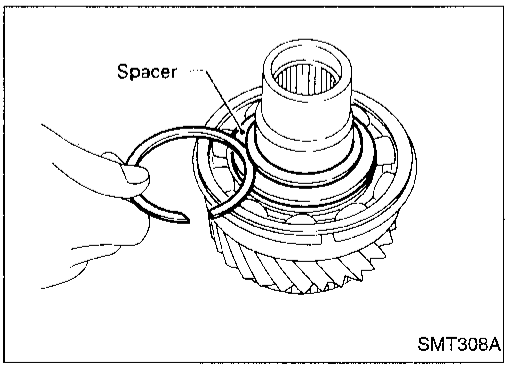


INSPECTION

Gear and shaft

- Check gears for excessive wear, chips or cracks.
- Check shaft for cracks or wear.

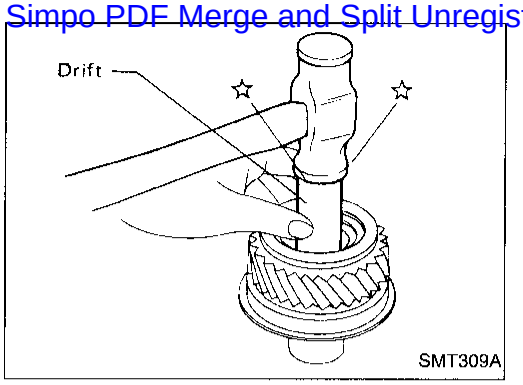
Bearing



- Make sure bearings roll freely and are free from noise, cracks, pitting or wear.

ASSEMBLY

Main gear bearing



1. Press on main gear bearing.

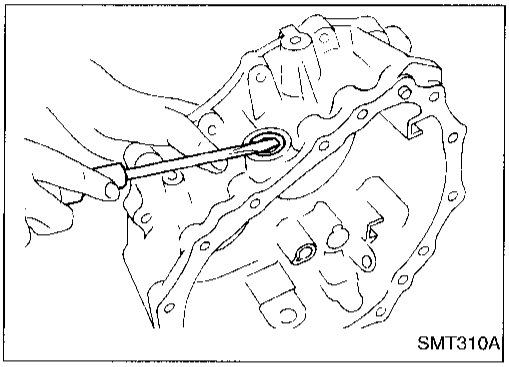
2. Select and install snap ring with proper thickness.
   Allowable clearance between snap ring and groove:
   0 - 0.15 mm (0 - 0.0059 in)
   Available snap ring for main gear bearing:
   Refer to SDS, TF-32.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Main Gear (Cont'd)

Plug

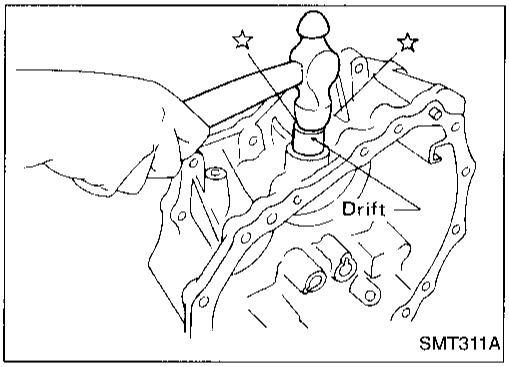
Apply sealant to plug, then install.



- **Use genuine anaerobic liquid gasket, Three Bond TB1215, Loctite Part No. 51813 or equivalent.**

Front Case

SHIFT SHAFT OIL SEAL

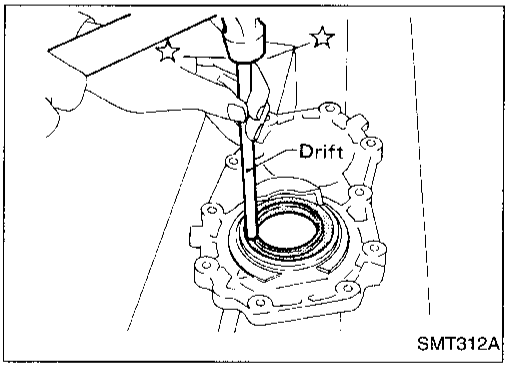


Removal

- Use a screwdriver to pry out old seal.
- Be careful not to damage case.
- Always replace with a new one whenever it has been removed.

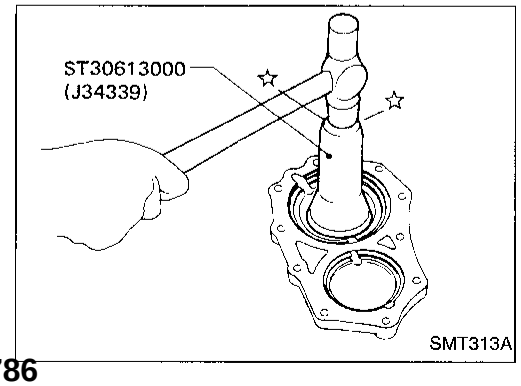
Installation

- Install new shift shaft oil seal until flush with case.
- Before installing, apply multi-purpose grease to seal lip.



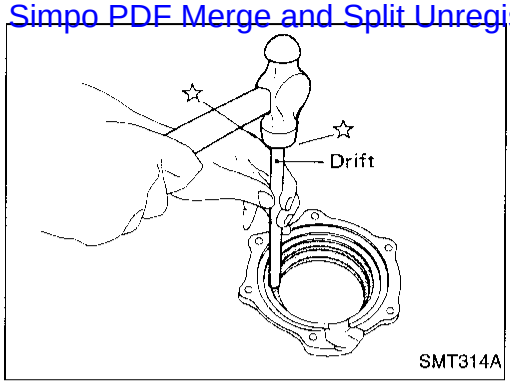
Front Case Cover

COVER OIL SEAL



Removal

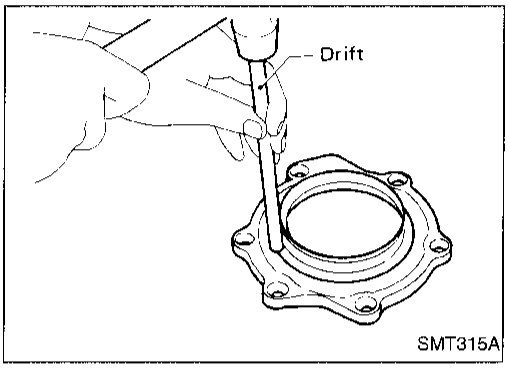
- Drive out old seal from inside of front case cover.
- Be careful not to damage front case cover.



Installation

- Install new front case cover oil seal until it stops.
- Before installing, apply multi-purpose grease to seal lip.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



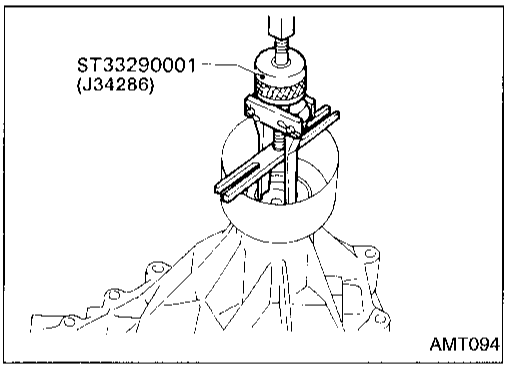
Bearing Retainer

OIL CATCHER

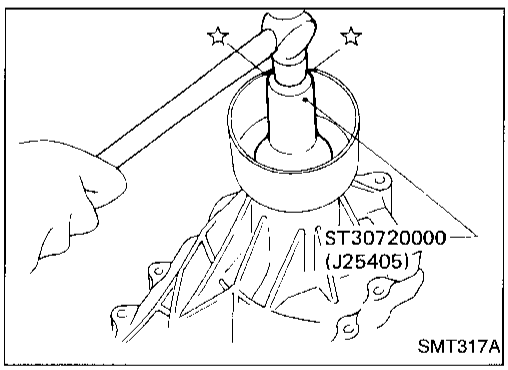
Removal

- Drive out oil catcher from inside of bearing retainer.
- Be careful not to damage bearing retainer.

Installation



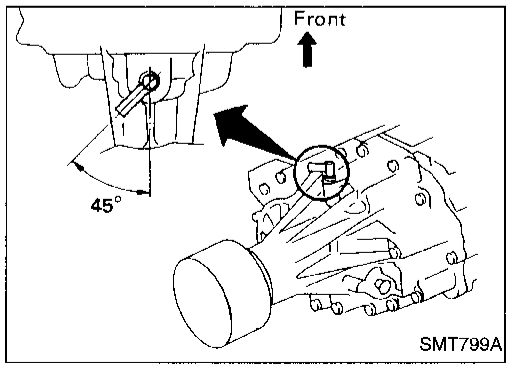
- Install oil catcher until it stops.
- Be careful not to damage or distort oil catcher or bearing retainer.
- Before installing, apply multi-purpose grease to seal lip.



Rear Case

REAR OIL SEAL

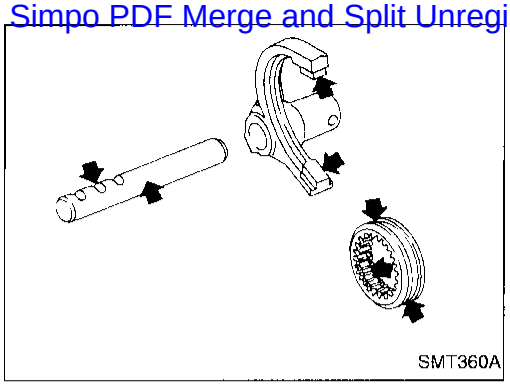
Removal



- Pull out rear oil seal.

Installation

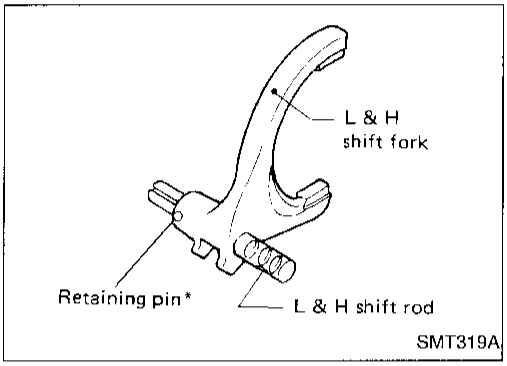
- Install new rear oil seal until it stops.
- Before installing, apply multi-purpose grease to seal lip.



AIR BREATHER

Install as shown in illustration.

- **Use genuine thread locker, Three Bond TB1324, Loctite 271 or equivalent.**



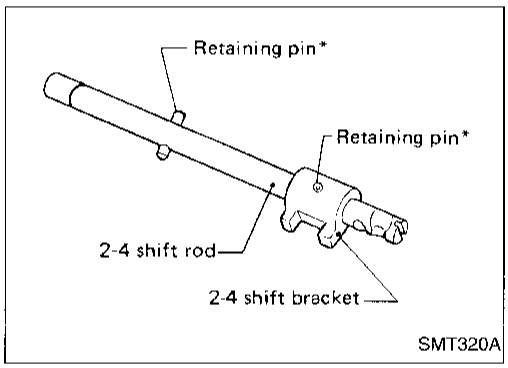
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SMT360A

Shift Control Components

INSPECTION

- Check contact surface and sliding surface for wear, scratches, projections or other faulty conditions.

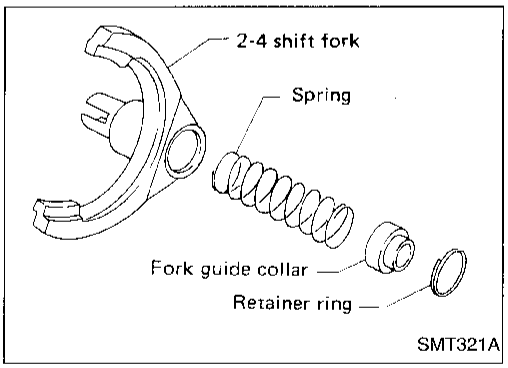


SMT319A

L & H SHIFT ROD & FORK

- Assemble as shown in illustration.

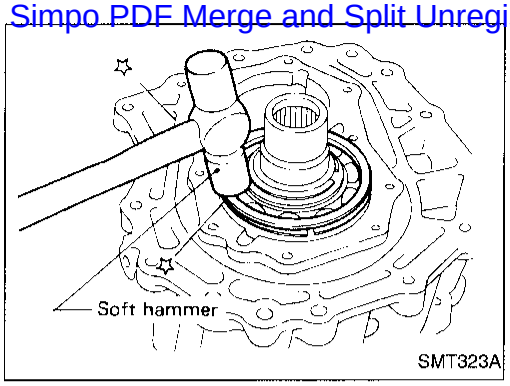
* Retaining pin is the same size as the one for 2-4 shift rod.



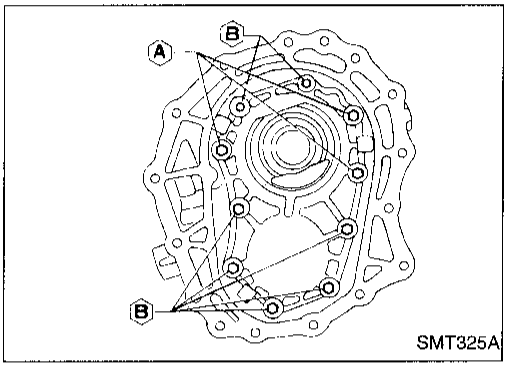
SMT320A

2-4 SHIFT ROD & FORK

- Assemble as shown in illustration.



* Retaining pins are the same size.



SMT321A

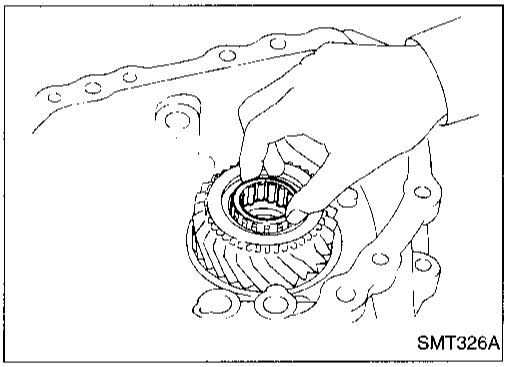
- **Pay special attention to the direction of fork guide collar.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

1. Assemble front case.
a. Install main gear assembly by tapping lightly.

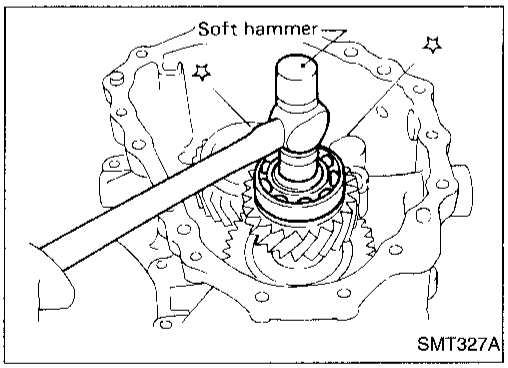
b. Apply sealant to the mating surface and bolts of front case cover, then attach it to the front case.

- **Use genuine anaerobic liquid gasket, Three Bond TB1215, Loctite Part No. 51813 or equivalent.**
- **These ten bolts should be coated with sealant.**



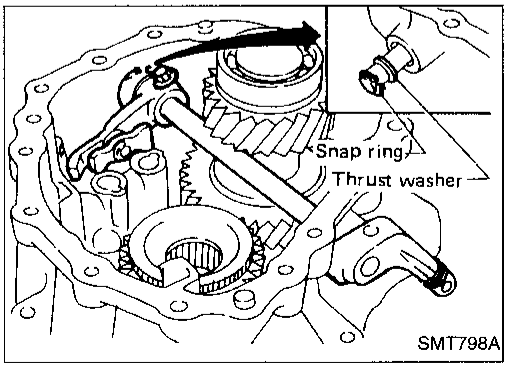
Bolts A:

: 16 - 21 N·m (1.6 - 2.1 kg-m, 12 - 15 ft-lb)



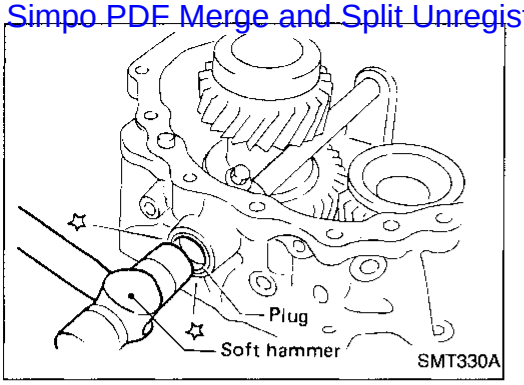
Bolts B:

: 19 - 24 N·m (1.9 - 2.4 kg-m, 14 - 17 ft-lb)

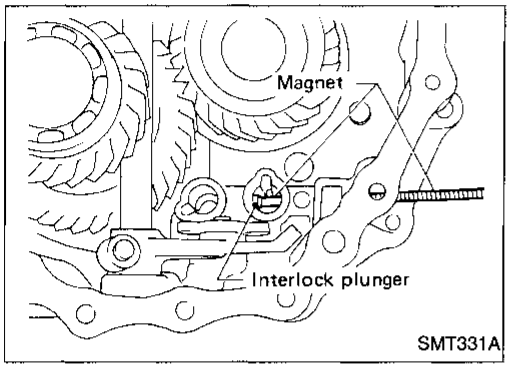


- **Use genuine thread locker, Three Bond TB1324, Loctite 271 or equivalent.**

c. Apply gear oil to needle bearing and install it into main gear.

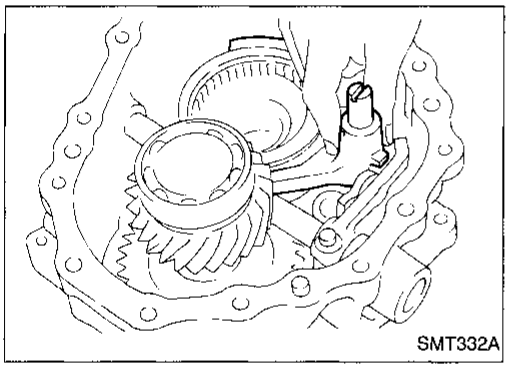


d. Install counter gear assembly by tapping lightly.

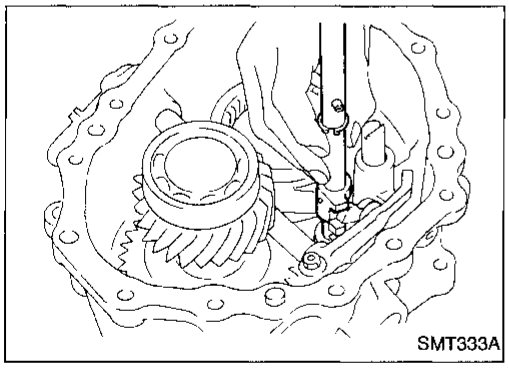


e. Install cross shaft and inner shift lever.

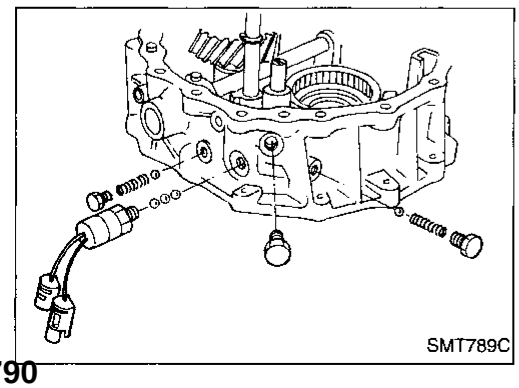
- **When replacing cross shaft, outer shift lever or outer shift lever lock pin, replace them as a set.**



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

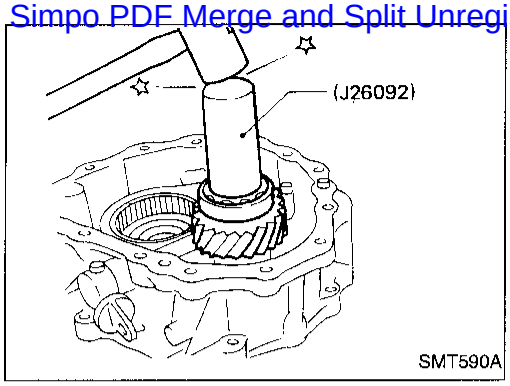


f. Apply sealant to plug, then install it into front case.
- **Use genuine anaerobic liquid gasket, Three Bond TB1215, Loctite Part No. 51813 or equivalent.**

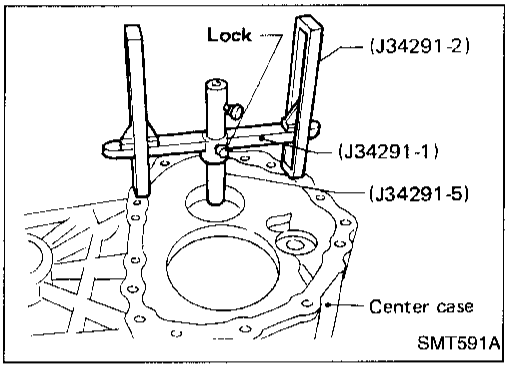


g. Insert interlock plunger into front case.

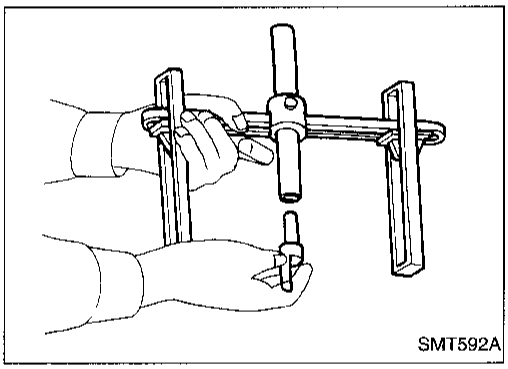
h. Install L & H shift rod and fork assembly with coupling sleeve.



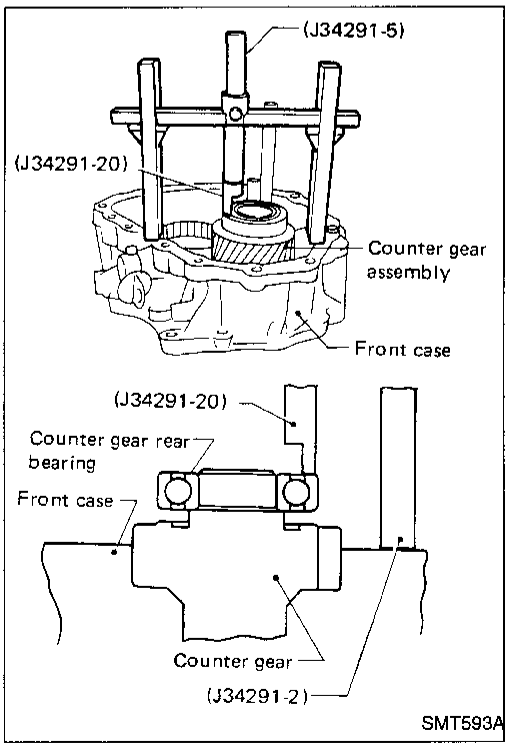
i. Install 2-4 shift rod.



j. Install switches, check balls, check springs and plugs.
- **Apply sealant to switches and plugs.**
- **Use genuine thread locker, Three Bond TB1324, Loctite 271 or equivalent.**

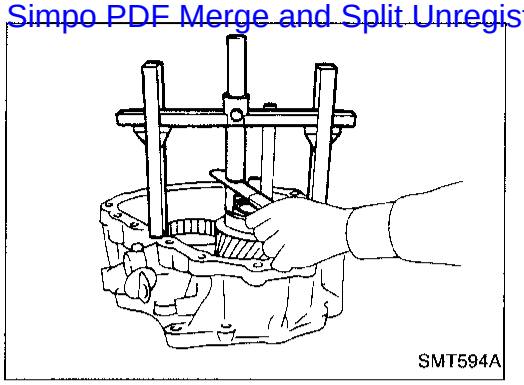


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

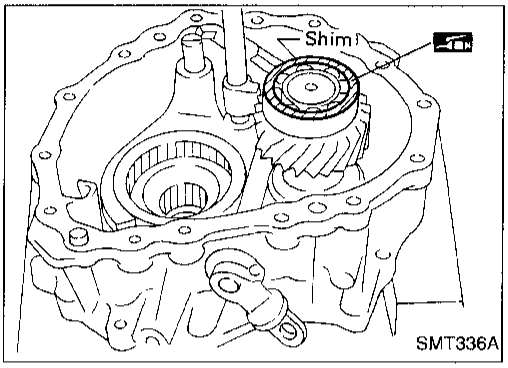


2. Select counter gear rear bearing shim.
a. Seat counter gear assembly.

b. Place J34291-1 (bridge), J34291-2 (legs) and J34291-5 (gauging cylinder) on machined surface of center case, allowing gauging cylinder to rest on top outer portion of counter gear rear bearing. Lock gauging cylinder in place.



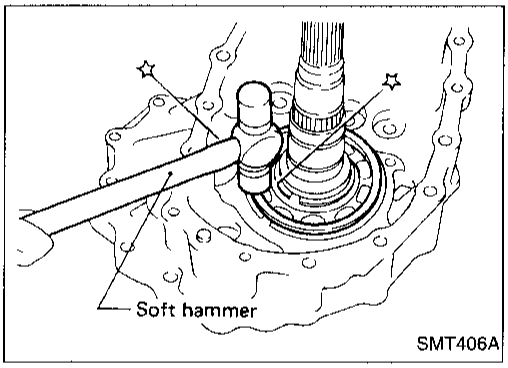
c. Insert J34291-20 (gauging plunger) into J34291-5 (gauging cylinder).



d. Place bridge, legs, gauging cylinder and gauging plunger onto machined surface of front case assembly, allowing gauging plunger to drop until it contacts counter gear rear bearing mating surface.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

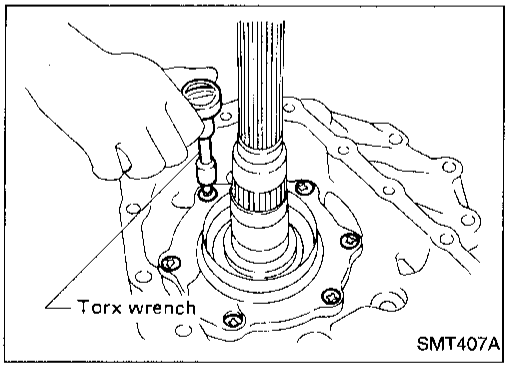
SMT594A



e. Lock gauging plunger in place and use feeler gauge to measure end play between gauging cylinder and gauging plunger.
f. Use measured distance to select correct counter gear rear bearing shim.

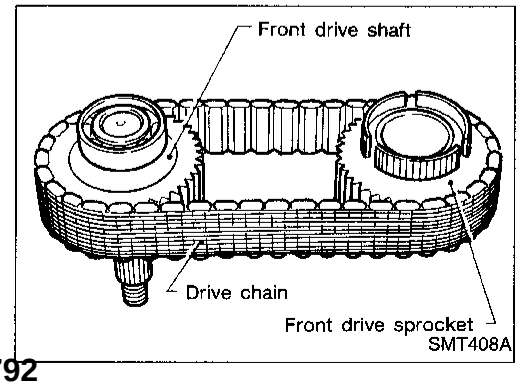
Allowable counter gear end play:
0 - 0.2 mm (0 - 0.008 in)
Available counter gear rear bearing shim:
Refer to SDS, TF-32.

SMT336A



3. Place suitable shim with grease on counter gear rear bearing.
4. Apply gear oil to each part in front case.

SMT406A

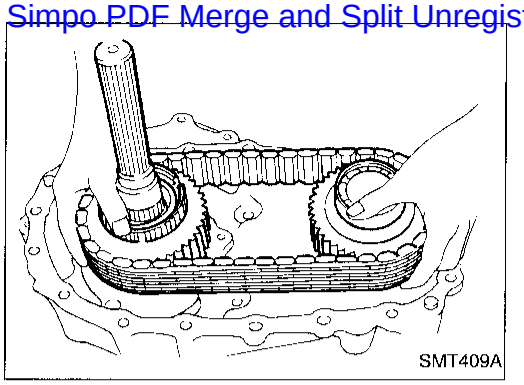


5. Assemble center case assembly.
a. Install mainshaft on center case by tapping lightly.

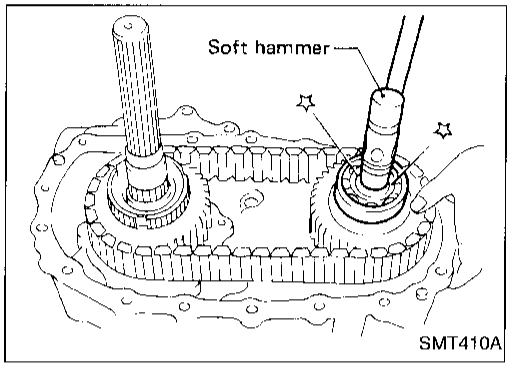
- **Apply gear oil to mainshaft front bearing.**

SMT407A

b. Install bearing retainer.
: 16 - 21 N·m (1.6 - 21 kg-m, 12 - 15 ft-lb)



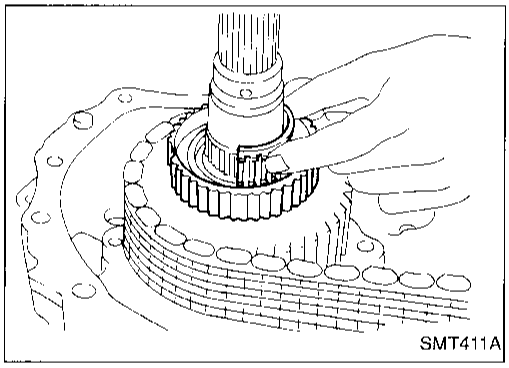
SMT408A



c. Put drive chain onto the front drive sprocket and front drive shaft, and then put them in center case.

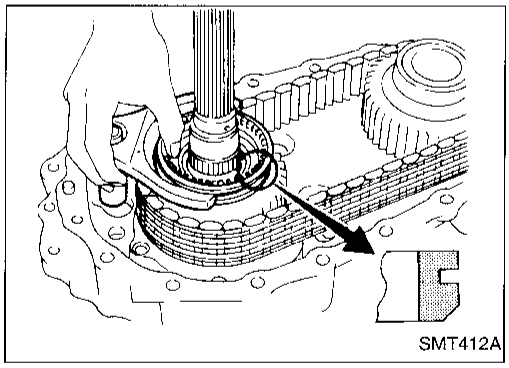
- **Be sure to install drive chain in same direction as removed.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

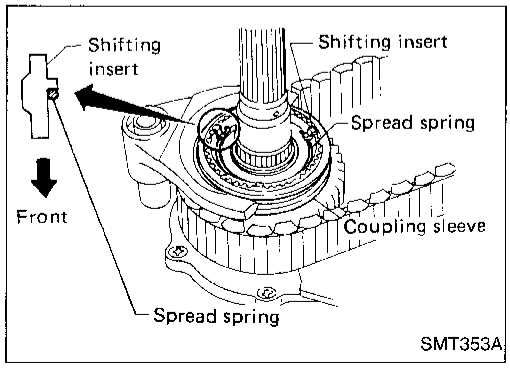


SMT409A

d. Install front drive shaft by tapping lightly.
- **Make sure shafts are aligned in the case.**



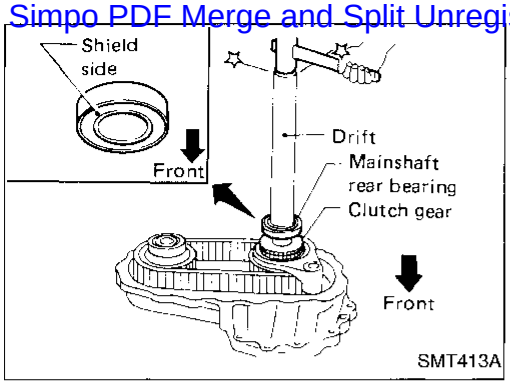
SMT410A



e. Apply gear oil to needle bearings and install them into front drive sprocket.
- **These needle bearings will be installed more easily if front drive sprocket is rotated while installing them.**

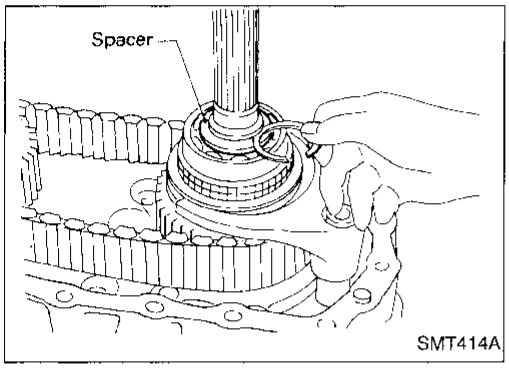
SMT411A

f. Install 2-4 coupling sleeve with 2-4 shift fork.
- **Pay attention to the direction of the coupling sleeve.**



SMT412A

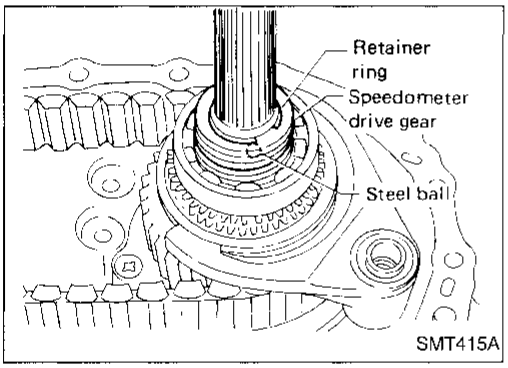
g. Install shifting inserts and spread spring.
- **Pay attention to the direction of shifting inserts.**



SMT353A

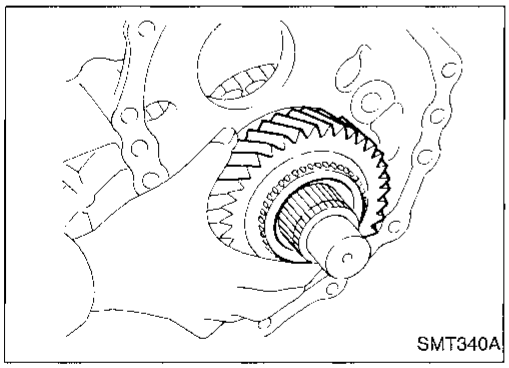
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

h. Install baulk ring, then install clutch gear and mainshaft rear bearing.



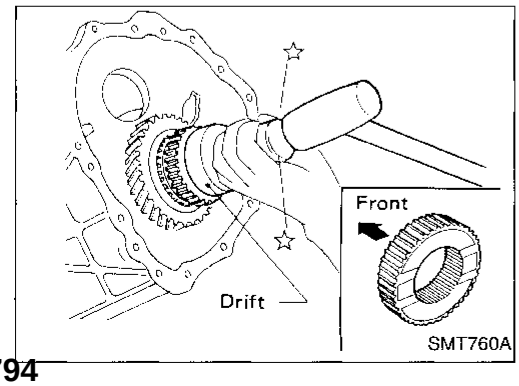
- **Place wooden block under mainshaft in order to protect mainshaft front bearing.**

i. Install spacer.



j. Select and install snap ring with proper thickness.

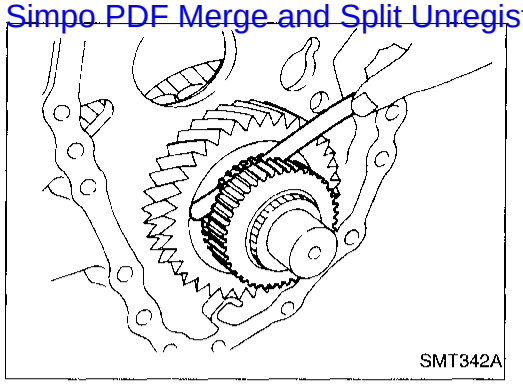
Allowable clearance between snap ring and groove:
0 - 0.15 mm (0 - 0.0059 in)
Available snap ring for mainshaft rear bearing:
Refer to SDS, TF-32.



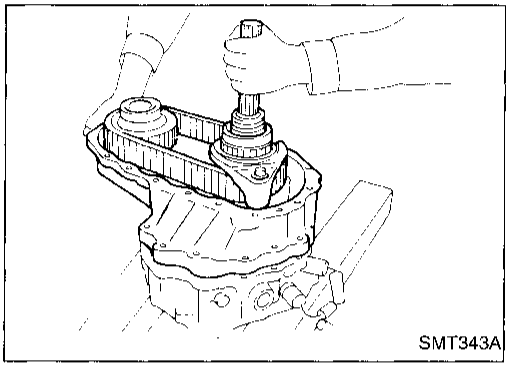
k. Install steel ball, speedometer drive gear and retainer ring.

- **Steel ball is the smallest check ball for this unit.**

l. Install low gear and bearing onto mainshaft.

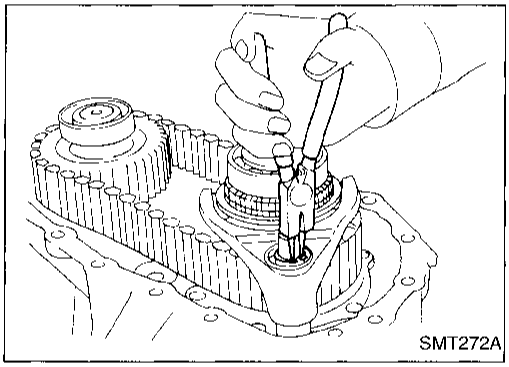


- **Apply gear oil to needle bearing.**



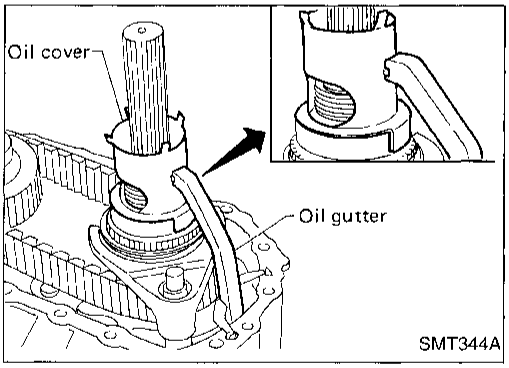
m. Install L & H hub and snap ring onto mainshaft.

- **Pay attention to the direction of L & H hub.**



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

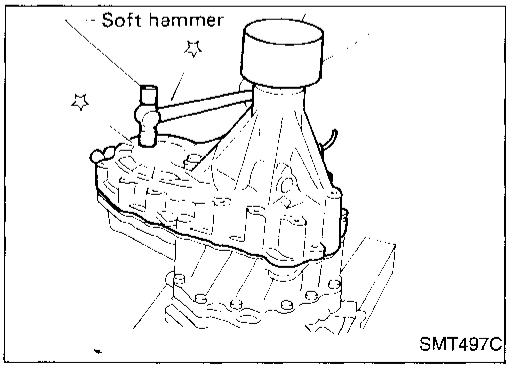
SMT342A



n. Measure low gear end play.
- **Standard: 0.2 - 0.35 mm (0.0079 - 0.0138 in)**

SMT343A

6. Apply sealant to mating surface of center case, then attach to front case and tighten bolts.
- **Use genuine anaerobic liquid gasket, Three Bond TB1215, Loctite Part No. 51813 or equivalent.**



SMT272A

7. Install snap ring to 2-4 shift rod.

SMT344A

8. Install oil gutter and oil cover.
9. Apply gear oil to each part in center case.

SMT497C

10. Apply sealant to mating surface of rear case, then attach it to center case and tighten bolts.
- **Use genuine anaerobic liquid gasket, Three Bond TB1215, Loctite Part No. 51813 or equivalent.**
11. Install 4WD switch.
- **Apply sealant to switch threads.**
- **Use genuine thread locker, Three Bond TB1324, Loctite 271 or equivalent.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

General Specifications

Transfer model			TX10A
Gear ratio	High		1.000
	Low		2.020
Number of teeth	Main gear		29
	Low gear		37
	Counter gear	High	38
		Low	24
	Front drive sprocket		41
	Front drive shaft		41
Fluid capacity		ℓ (US qt, Imp qt)	2.2 (2-3/8, 2)

Inspection and Adjustment

CLEARANCE BETWEEN FRONT DRIVE SPROCKET AND 2-4 COUPLING SLEEVE

Unit: mm (in)

Allowable clearance "C"	0.2 - 0.54 (0.008 - 0.0213)

GEAR END PLAY

Unit: mm (in)

Front drive sprocket	0.2 - 0.35 (0.0079 - 0.0138)
Low gear	0.2 - 0.35 (0.0079 - 0.0138)
Counter gear	0 - 0.2 (0 - 0.008)

CLEARANCE BETWEEN BAULK RING AND CLUTCH GEAR

Unit: mm (in)

Standard	Wear limit
1.0 - 1.5 (0.039 - 0.059)	0.5 (0.020)

AVAILABLE SHIM

Counter gear rear bearing

Unit: mm (in)

Allowable clearance	0 - 0.2 (0 - 0.008)

Lecture des schémas de câblage :
- **Lire la section GI, ''COMMENT LIRE LES SCHEMAS DE CABLAGE''.**
- **Voir la section EL, ''DISPOSITION DE L'ALIMENTATION ELECTRIQUE'' pour le circuit de distribution électrique.**

Pour effectuer les diagnostics des défauts, lire la section GI ''COMMENT LIRE LES ORGANIGRAMMES DANS LES DIAGNOSTICS DES DEFAUTS'' et ''COMMENT EFFECTUER UN DIAGNOSTIC EFFICACE EN CAS D'INCIDENT ELECTRIQUE''.

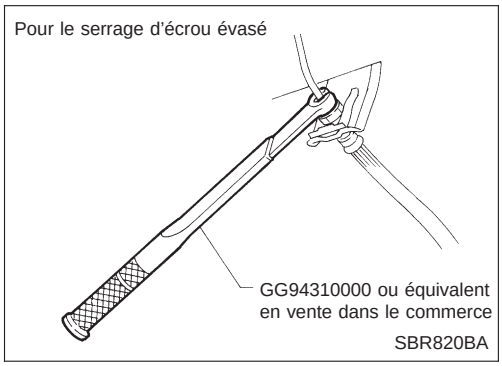
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Système de retenue supplémentaire (SRS) ‘‘COUSSIN GONFLABLE’’ (4 roues motrices)

Utilisé avec une ceinture de sécurité, le coussin gonflable du système de retenue supplémentaire contribue à réduire les risques et la gravité des blessures subies par le conducteur en cas de collision frontale. Le système de retenue supplémentaire se compose d’un module de coussin gonflable (air bag) (situé dans le moyeu du volant), d’un boîtier de capteurs de diagnostic, d’un témoin avertisseur, d’un faisceau de câblage et d’un câble spiralé. Les informations nécessaires à l’entretien sans danger du système se trouvent à la **section RS** de ce manuel de réparation.

AVERTISSEMENT :

- **Pour ne pas affecter le fonctionnement du SRS, ce qui augmenterait les risques de blessures graves ou mortelles en cas de collision entraînant le déploiement du coussin gonflable (air bag), toutes les opérations d’entretien doivent être effectuées par un concessionnaire NISSAN agréé.**
- **Un entretien incorrect, y compris une mauvaise dépose ou repose du SRS, pourra entraîner des risques de blessures dues au déploiement accidentel du système.**
- **Ne pas utiliser d’équipement d’essai électrique sur les circuits connexes du SRS sauf sur indication de ce manuel de réparation. Les faisceaux de câblage électrique du SRS sont équipés d’une gaine d’isolation jaune soit juste devant les connecteurs de faisceau, soit sur le faisceau tout entier pour une identification plus rapide.**



Système de retenue supplementaire (SRS) ‘‘COUSSIN GONFLABLE’’ (2 roues motrices)

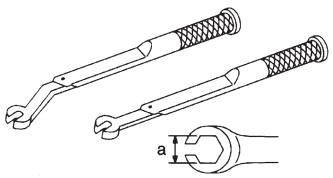
Utilisé avec une ceinture de sécurité, le coussin gonflable du système de retenue supplémentaire contribue à réduire les risques et la gravité des blessures subies par le conducteur en cas de collision frontale. Le système de retenue supplémentaire se compose d’un module de coussin gonflable (air bag) (situé dans le moyeu du volant), d’un boîtier de capteurs de diagnostic, d’un témoin avertisseur, d’un faisceau de câblage et d’un câble spiralé. Les informations nécessaires à l’entretien sans danger du système se trouvent à la **section RS** de ce manuel de réparation.

AVERTISSEMENT :

- **Pour ne pas affecter le fonctionnement du SRS, ce qui augmenterait les risques de blessures graves ou mortelles en cas de collision entraînant le déploiement du coussin gonflable (air bag), toutes les opérations d’entretien doivent être effectuées par un concessionnaire NISSAN agréé.**
- **Un entretien incorrect, y compris une mauvaise dépose ou repose du SRS, pourra entraîner des risques de blessures dues au déploiement accidentel du système.**
- **Ne pas utiliser d’équipement d’essai électrique sur les circuits connexes du SRS.**

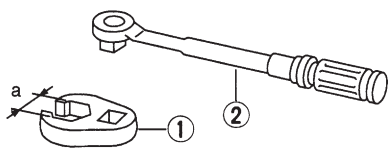
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

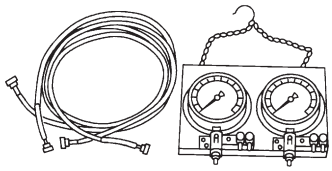
Précautions à prendre avec le système de freinage



- **Utiliser du liquide de frein DOT 3 ou DOT 4 *1.**
- **Ne jamais réutiliser du liquide de frein que l'on a vidangé.**
- **Veiller à ne pas éclabousser de liquide de frein les parties peintes ; cela pourrait endommager la peinture. Si du liquide de frein éclabousse des parties peintes, laver immédiatement avec de l'eau.**
- **Pour nettoyer les pièces du maître-cylindre, de l'étrier de frein à disque ou du cylindre de roue, toujours utiliser du liquide de frein propre.**
- **Ne jamais utiliser d'huiles minérales telles que l'essence ou le kérosène. Cela détruirait les pièces en caoutchouc du circuit hydraulique.**
- **Utiliser une clé à écrou évasé pour déposer et reposer les tuyaux de frein.**
- **Toujours serrer les conduites de frein au couple spécifié lors du remontage.**

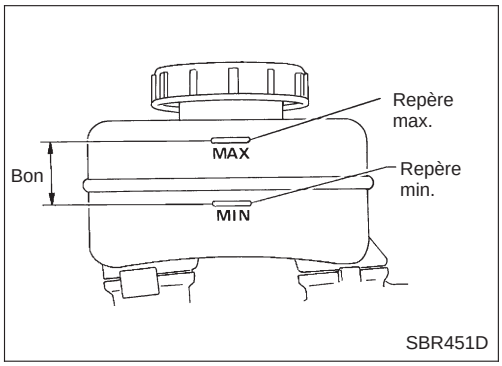
AVERTISSEMENT :





- **Nettoyer les freins avec un aspirateur à poussières pour réduire les risques de présence de poussières dans l'air.**

*1 Se reporter à la section MA ''Liquides et Lubrifiants'', ''LIQUIDES ET LUBRIFIANTS CONSEILLES''.

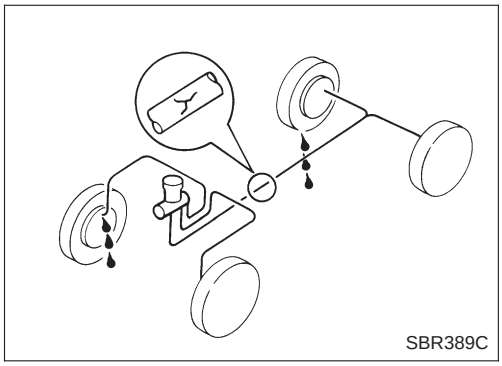


Outillage spécial

Numéro de l'outil Nom de l'outil	Description	
GG94310000 Clé dynamométrique pour écrou évasé	 NT406	Dépose et repose de chaque tuyau de frein **a : 10 mm** **: 16,2 N·m (1,65 kg-m)**

Outillage en vente dans le commerce

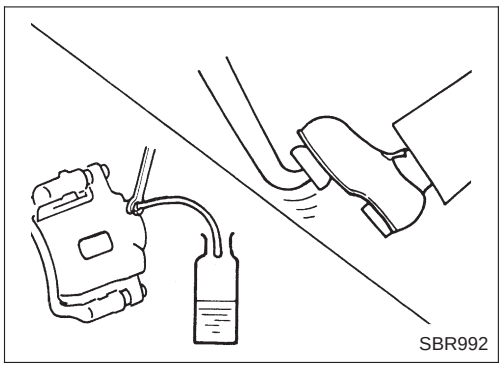
Nom de l'outil	Description	
① Adaptateur pour écrou évasé ② Clé dynamométrique	 NT360	Dépose et repose de chaque tuyau de frein **a : 10 mm**
Manomètre du liquide de frein	 NT151	Mesure de la pression du liquide de frein



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SBR451D

Contrôle du niveau de liquide de frein



- Contrôler le niveau du liquide dans le réservoir. Il faut qu'il se situe entre les repères maxi. et mini. sur le réservoir.
- Si le niveau du liquide est trop bas, vérifier l'étanchéité du circuit de freinage.
- Si la lampe témoin de frein s'allume, vérifier le contact de niveau de liquide de frein et le contact de frein de stationnement.

SBR389C

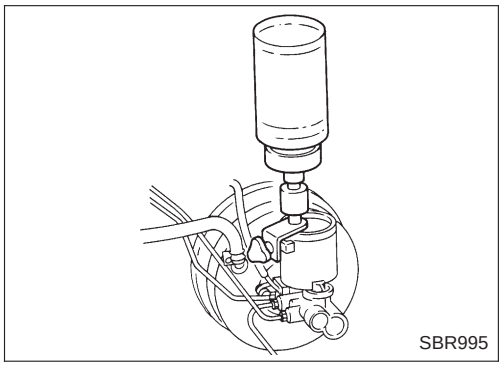
Contrôle des canalisations de frein

ATTENTION :
S'il y a une fuite aux raccords, les resserrer ou, en cas de besoin, remplacer les pièces endommagées.

1. Vérifier que les canalisations de frein (tuyaux et flexibles) ne sont pas fendues, détériorées ou endommagées de quelque façon que ce soit. Remplacer toutes les pièces endommagées.
2. Rechercher les fuites d'huile en enfonçant la pédale de frein à fond, moteur en marche.

SBR992

Vidange du liquide de frein



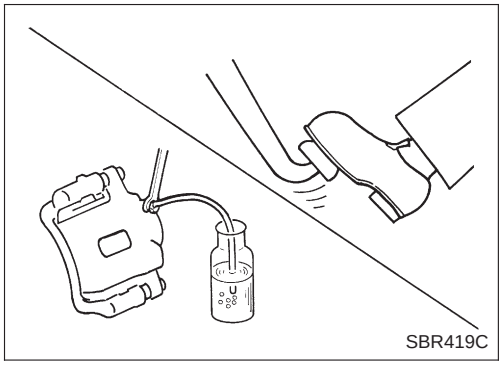
ATTENTION :

- **Faire le plein de liquide de frein neuf DOT 3 ou DOT 4*1.**
- **Toujours veiller à ce que le niveau du liquide de frein soit au-dessus de la ligne de repère minimum du réservoir.**
- **Ne jamais réutiliser du liquide de frein que l'on a vidangé.**
- **Veiller à ne pas éclabousser de liquide de frein les parties peintes ; cela pourrait endommager la peinture. Si du liquide de frein éclabousse des parties peintes, laver immédiatement avec de l'eau.**

1. Nettoyer l'intérieur du réservoir, et faire le plein de liquide de frein neuf.
2. Connecter un tuyau en vinyle à chaque vanne de purge d'air.
3. Vidanger le liquide de frein par chaque vanne de purge d'air en enfonçant à fond la pédale de frein.
4. Remplir jusqu'à ce que du liquide de frein s'échappe de chaque vanne de purge d'air.
   Pour remplir le circuit de liquide neuf, suivre la même procédure que celle employée pour la purge du circuit hydraulique.
   Se reporter à ''Purge du circuit de freinage'', à la page BR-4.

1* Se reporter à la section MA ''Liquides et Lubrifiants'', ''LIQUIDES ET LUBRIFIANTS CONSEILLES''.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

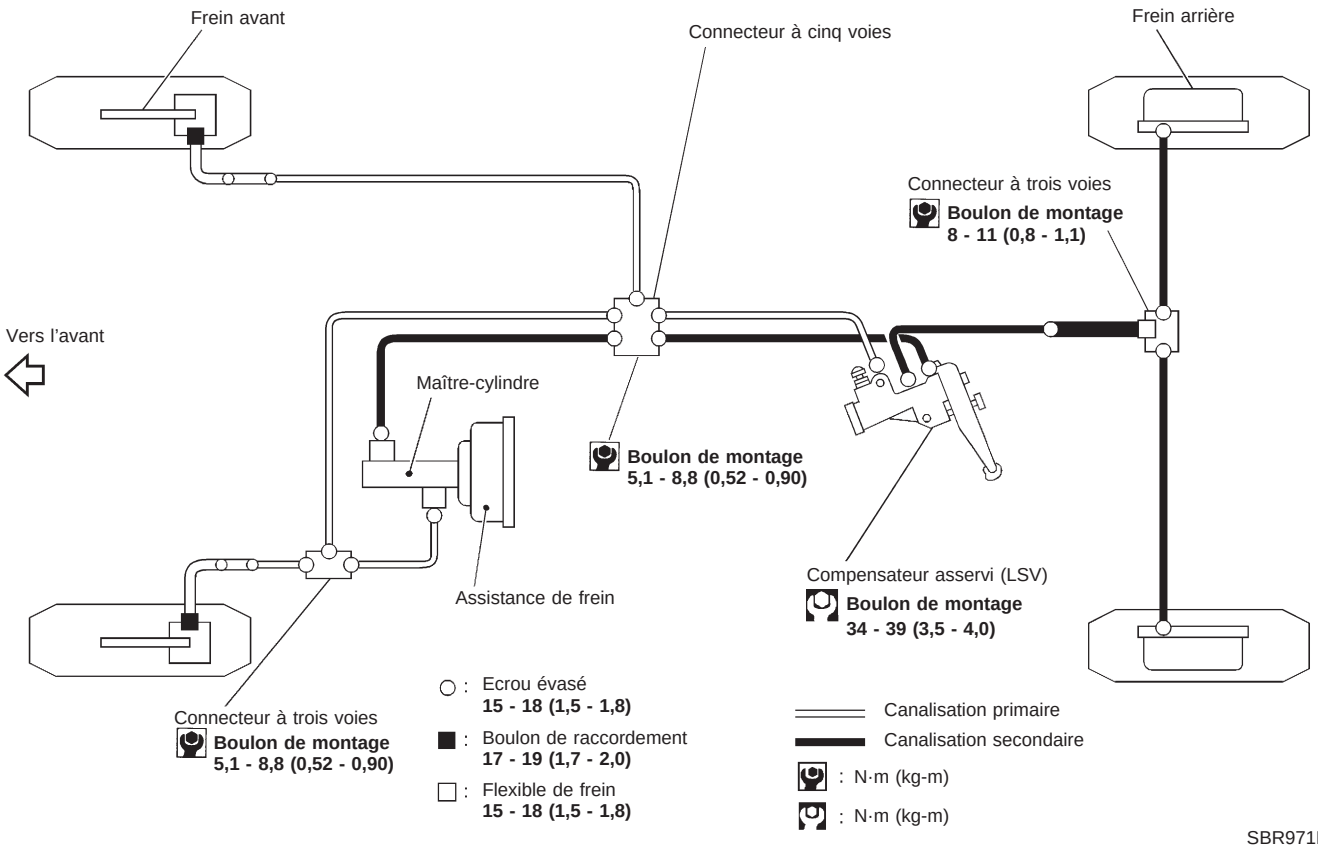


SBR995

Purge du circuit de freinage

ATTENTION :

- **Pendant la purge, surveiller avec soin le niveau du liquide de frein dans le maître-cylindre.**
- **Si l'on suspecte la présence d'air dans le maître-cylindre, commencer par purger l'air du maître-cylindre. Se reporter à ''Repose'' au chapitre ''MAITRE-CYLINDRE'', à la page BR-14.**
- **Remplir le réservoir de liquide de frein neuf DOT 3 ou DOT 4*1. S'assurer qu'il reste toujours plein pendant que l'on purge l'air du circuit.**
- **Placer un récipient sous le maître-cylindre pour éviter de répandre du liquide de frein.**
- **Pour les modèles avec ABS, couper le contact d'allumage et débrancher le connecteur de l'actionneur ABS ou le câble de batterie.**
- Purger l'air dans l'ordre suivant.
  a. Epurateur d'air de compensateur asservi
  b. Frein arrière gauche
  c. Frein arrière droit
  d. Frein avant gauche
  e. Frein avant droit



1* Se reporter à la section MA ''Liquides et Lubrifiants'', ''LIQUIDES ET LUBRIFIANTS CONSEILLES''.

SBR419C

1. Raccorder un tuyau transparent en vinyle à la vanne de purge d'air.
2. Appuyer à fond sur la pédale de frein plusieurs fois de suite.
3. Lorsque la pédale de frein est enfoncée, ouvrir la vanne de purge d'air pour relâcher l'air.
4. Fermer la vanne de purge d'air.
5. Relâcher lentement la pédale de frein.
6. Répéter les étapes 2 à 5 jusqu'a ce que du liquide de frein limpide s'échappe de la vanne de purge d'air.
7. Serrer la vanne de purge d'air au couple spécifié.
   : 7 - 9 N·m (0,7 - 0,9 kg-m)

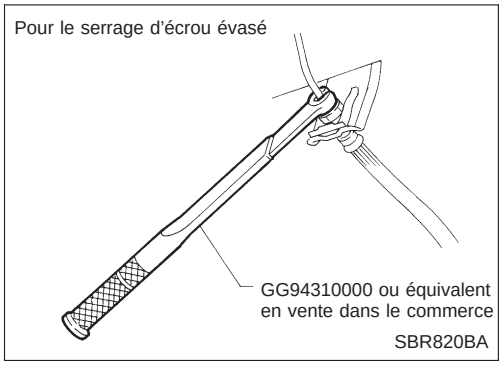
SBR992

DEPOSE



ATTENTION :

- **Veiller à ne pas éclabousser de liquide de frein les parties peintes ; cela pourrait endommager la peinture. Si du liquide de frein éclabousse des parties peintes, laver immédiatement avec de l'eau.**
- **Pour tous les flexibles, il ne doit pas y avoir de courbure excessive, de torsion ni de traction.**

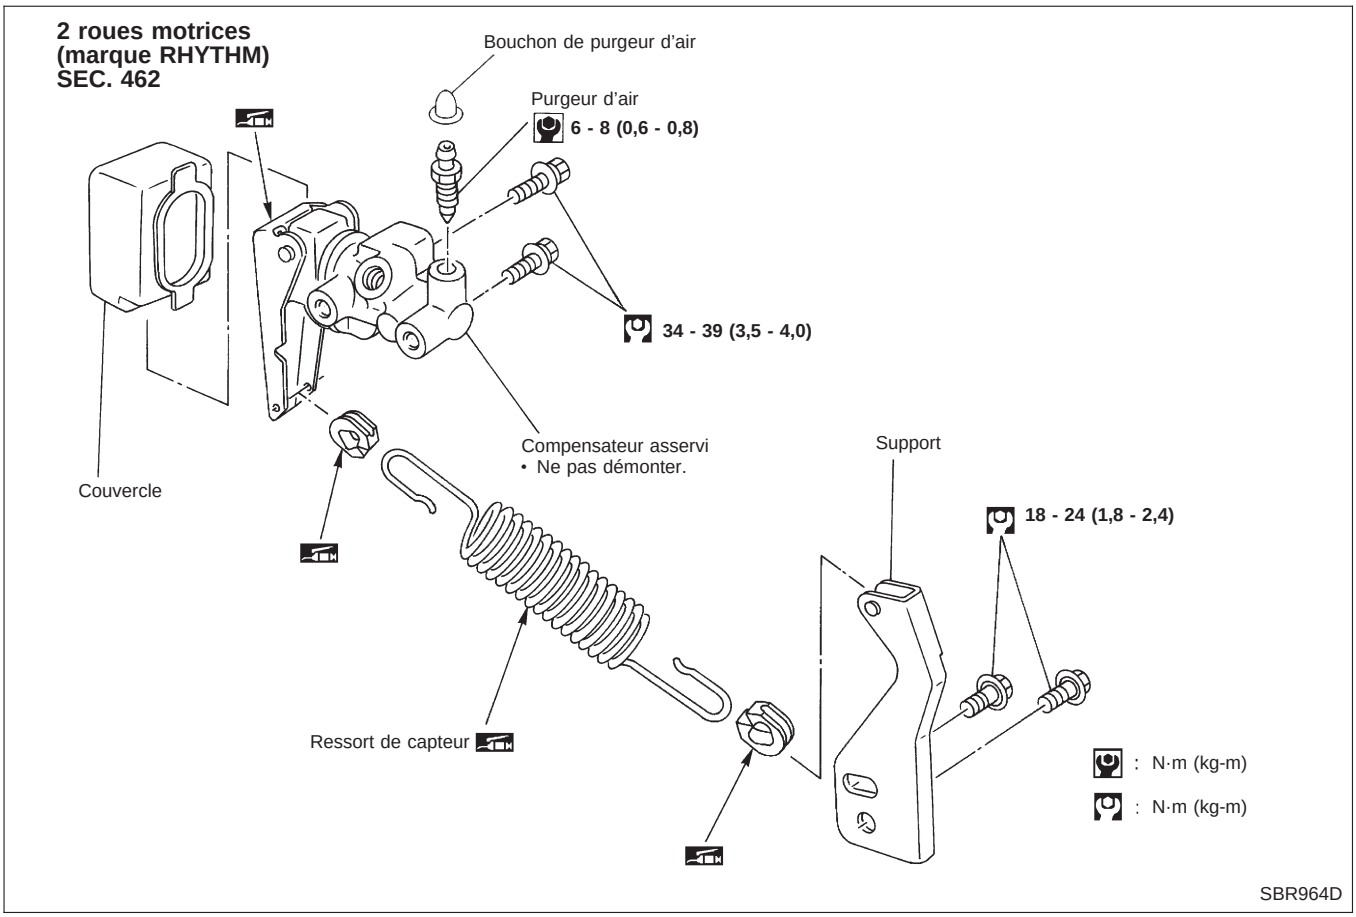
1. Raccorder un tuyau en vinyle à la vanne de purge d'air.
2. Vidanger le liquide de frein par chaque vanne de purge d'air en enfonçant à fond la pédale de frein.
3. Déposer l'écrou évasé connectant le tuyau de frein au flexible, puis retirer le ressort de blocage.
4. Chaque fois que l'on déconnecte une canalisation de frein, il faut recouvrir les ouvertures pour empêcher la pénétration de poussières.

INSPECTION

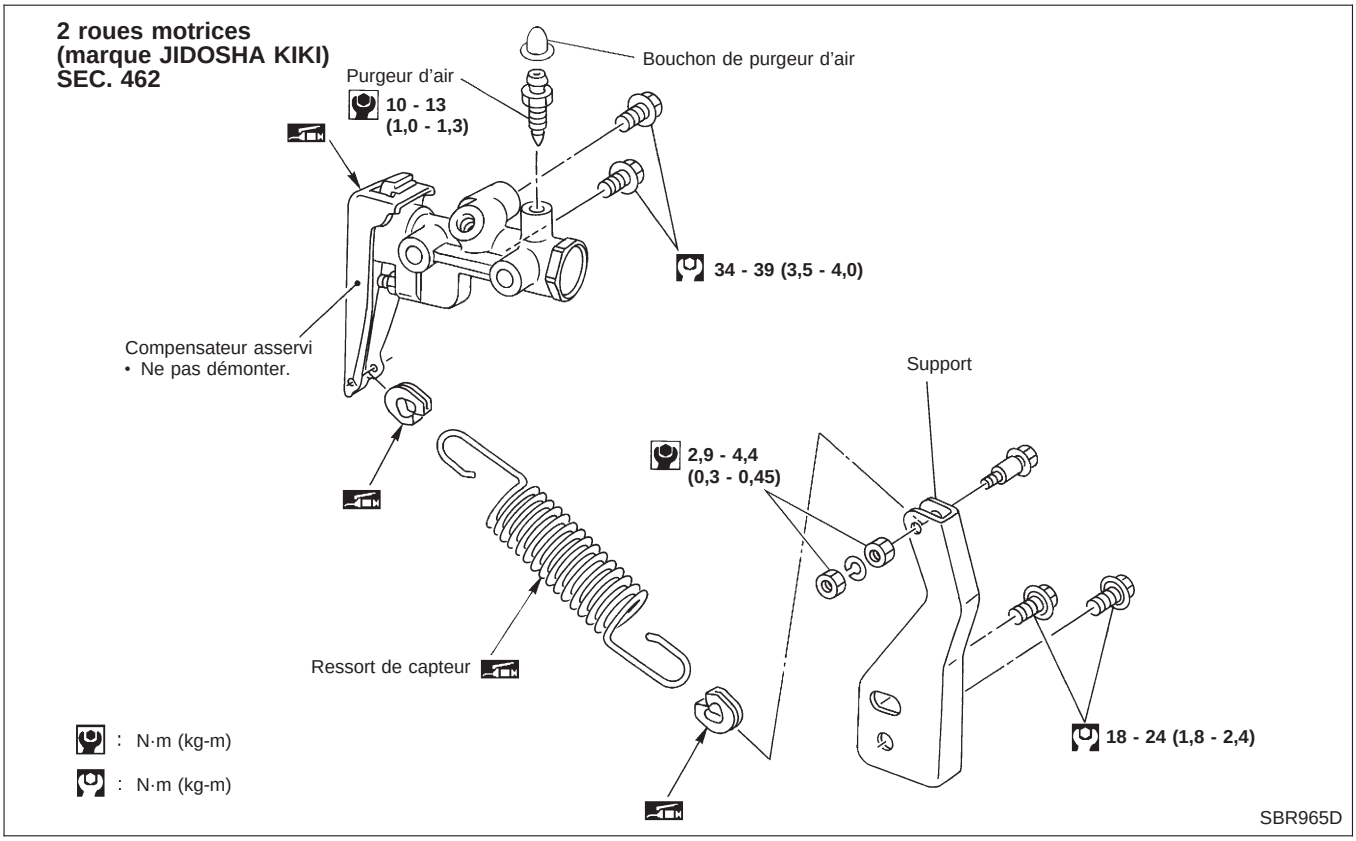
Vérifier que les canalisations de frein (tuyaux et flexibles) ne sont pas fendues, détériorées ou endommagées de quelque façon que ce soit. Remplacer toutes les pièces endommagées.

REPOSE

ATTENTION :



- **Faire le plein de liquide de frein neuf DOT 3 ou DOT 4*1.**
- **Ne jamais réutiliser du liquide de frein que l'on a vidangé.**



1. Serrer tous les écrous évasés et les boulons de raccord.
   Ecrou évasé :
   : 15 - 18 N·m (1,5 - 1,8 kg-m)
   Boulon de raccord :
   : 17 - 19 N·m (1,7 - 2,0 kg-m)
2. Remplir jusqu'à ce que du liquide de frein neuf s'échappe de chaque vanne de purge d'air.
3. Purger l'air. Se reporter à ''Purge du circuit de freinage'', à la page BR-4.

1* Se reporter à la section MA ''Liquides et Lubrifiants'', ''LIQUIDES ET LUBRIFIANTS CONSEILLES''.

Compensateur asservi

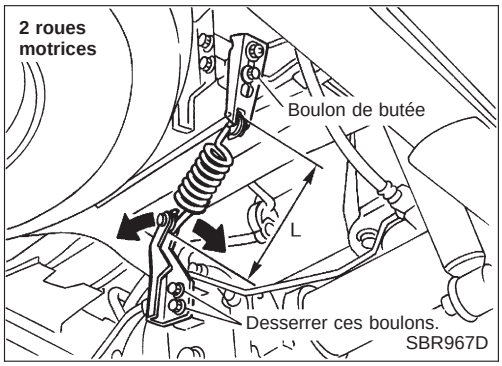
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Compensateur asservi (Suite)

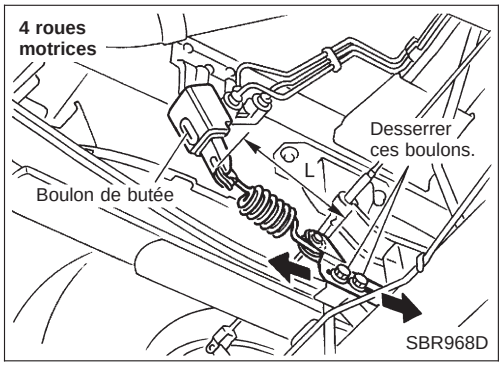
DEPOSE ET REPOSE

ATTENTION :

- **Faire le plein de liquide de frein neuf DOT 3 ou DOT 4*1.**
- **Veiller à ne pas éclabousser de liquide de frein les parties peintes ; cela pourrait endommager la peinture. Si du liquide de frein éclabousse des parties peintes, laver immédiatement avec de l'eau.**



1. Remplacer la timonerie endommagée du compensateur asservi comme un ensemble.
2. Lors du démontage, enduire la timonerie de graisse à usages multiples.
3. Serrer tous les écrous évasés et les boulons.
   : 15 - 18 N·m (1,5 - 1,8 kg-m)
4. Purger l'air. Se reporter à ''Purge du circuit de freinage'', à la page BR-4.

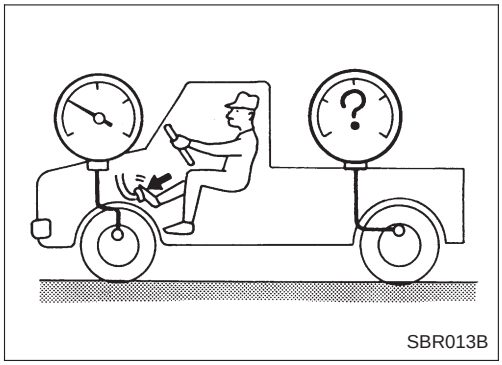


1* Se reporter à la section MA ''Liquides et Lubrifiants'', ''LIQUIDES ET LUBRIFIANTS CONSEILLES''.

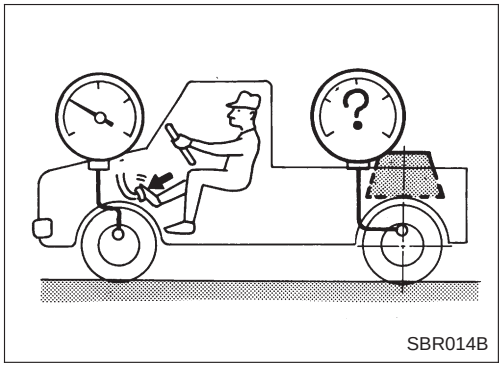
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Compensateur asservi (Suite)

INSPECTION



1. S'assurer que le véhicule est à vide*.
   * Avec pleins de carburant, de liquide de refroidissement et d'huile moteur. Mettre les pneus de secours, le cric, les outillages et les tapis à leur place.
2. Le conducteur doit être assis à sa place, et une personne doit être assise à l'arrière du véhicule. Puis demander à la personne assise à l'arrière de descendre lentement du véhicule. Ceci est nécessaire pour stabiliser la déflection de la suspension.
3. Régler la longueur ''L'' de la façon suivante :



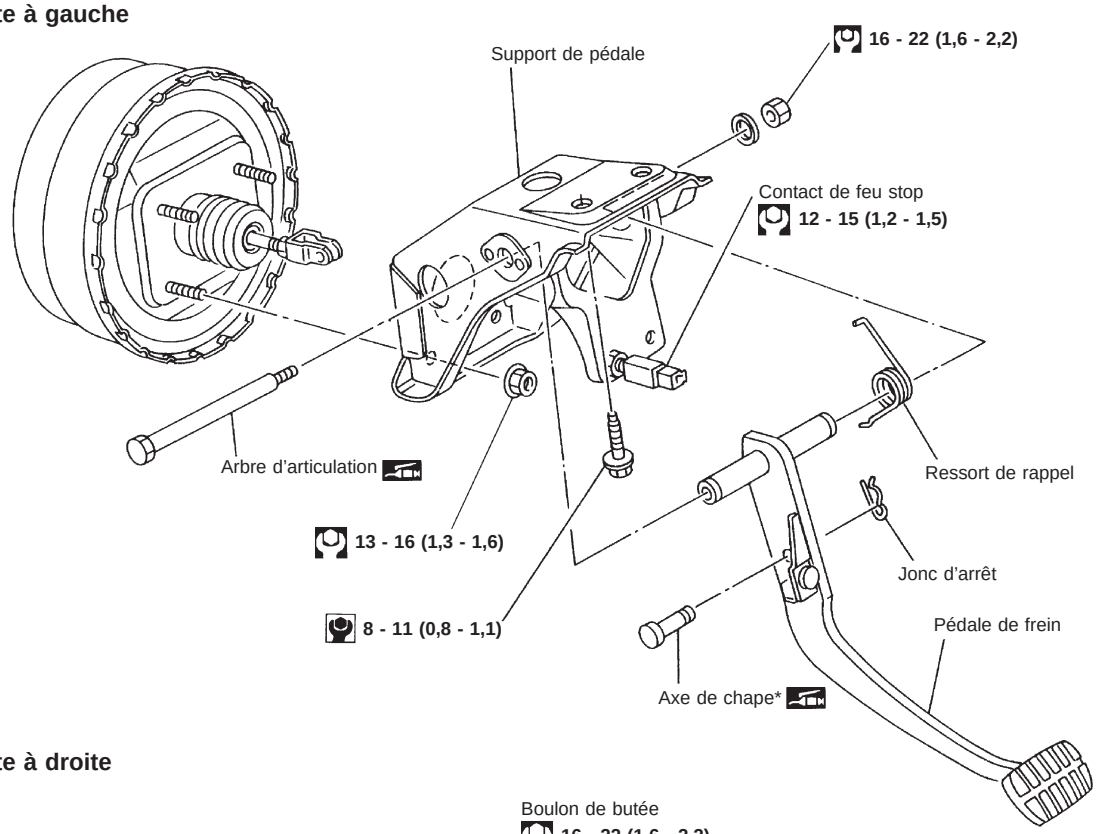
a. Desserrer le contre-écrou du boulon de butée (2 roues motrices, marque JIDOSHA KIKI).
b. Tirer le levier vers le boulon de butée et le régler en tournant le boulon de butée.
c. Serrer le contre-écrou du boulon de butée (2 roues motrices, marque JIDOSHA KIKI).

Longueur ''L'' :
Modèles à 2 roues motrices
Environ 187,3 mm
Modèles à 4 roues motrices
Environ 158,1 mm

4. Installer le manomètre à l'avant et à l'arrière du purgeur d'air de frein.
5. Purger de l'air de l'outil spécial.
6. Faire monter la pression sur le frein avant à 4 904 kPa (49,0 bar, 50 kg/cm^2) et 9 807 kPa (98,1 bar, 100 kg/cm^2), puis vérifier la pression sur le frein arrière.

Pression au frein arrière :
Se reporter au tableau ci-dessous.

7. Déplacer lentement un poids vers le centre de l'essieu arrière de manière à ce que la longueur du ressort de régulation soit la même que dans des conditions de charge (voir le tableau ci-dessous). Contrôler la pression aux freins arrière de la façon décrite à l'étape 6.



Unité : kPa (bar, kg/cm^2)

Pression au frein avant	Pression au frein arrière			
	2 roues motrices		4 roues motrices	
	A vide L = 187,3 mm	En charge L = 204,0 mm	A vide L = 158,1 mm	En charge L = 184,0 mm
4 904 (49,0, 50)	1 667 - 2 648 (16,7 - 26,5, 17 - 27)	3 334 - 4 315 (33,3 - 43,2, 34 - 44)	1 863 - 2 844 (18,6 - 28,4, 19 - 29)	3 334 - 4 315 (33,3 - 43,2, 34 - 44)
9 807 (98,1, 100)	2 844 - 3 825 (28,4 - 38,2, 29 - 39)	3 629 - 5 590 (36,3 - 55,9, 37 - 57)	2 059 - 4 021 (20,6 - 40,2, 21 - 41)	3 629 - 5 590 (36,3 - 55,9, 37 - 57)

: N·m (kg-m)

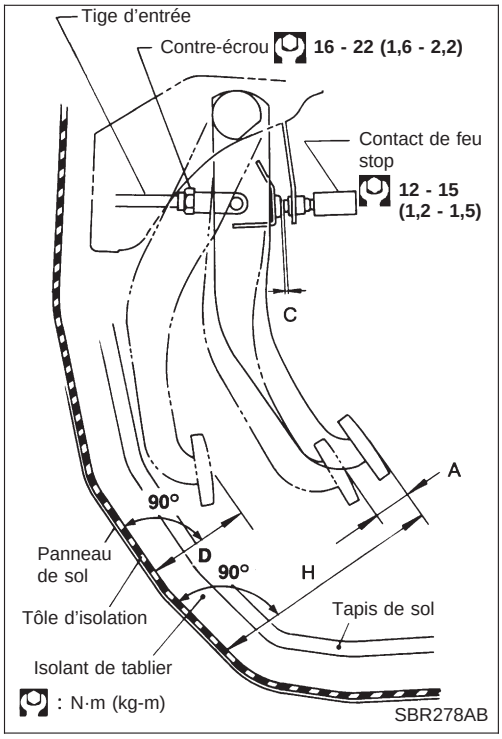
SBR969DA



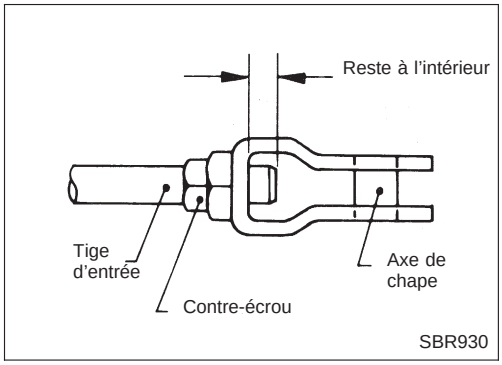
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection

Vérifier la pédale de frein par rapport aux éléments suivants :

- Coude de la pédale de frein
- Déformation de l'axe de chape
- Fissure sur toute partie soudée
- Fissure ou déformation de la butée d'axe de chape

Réglage



Vérifier la hauteur libre de la pédale de frein à partir du panneau de renfort de tablier.

H : Hauteur libre
Consulter les SDS, page BR-81.

D : Course complète
Consulter les SDS, page BR-81.
Sous une force de 490 N (50 kg), alors que le moteur tourne

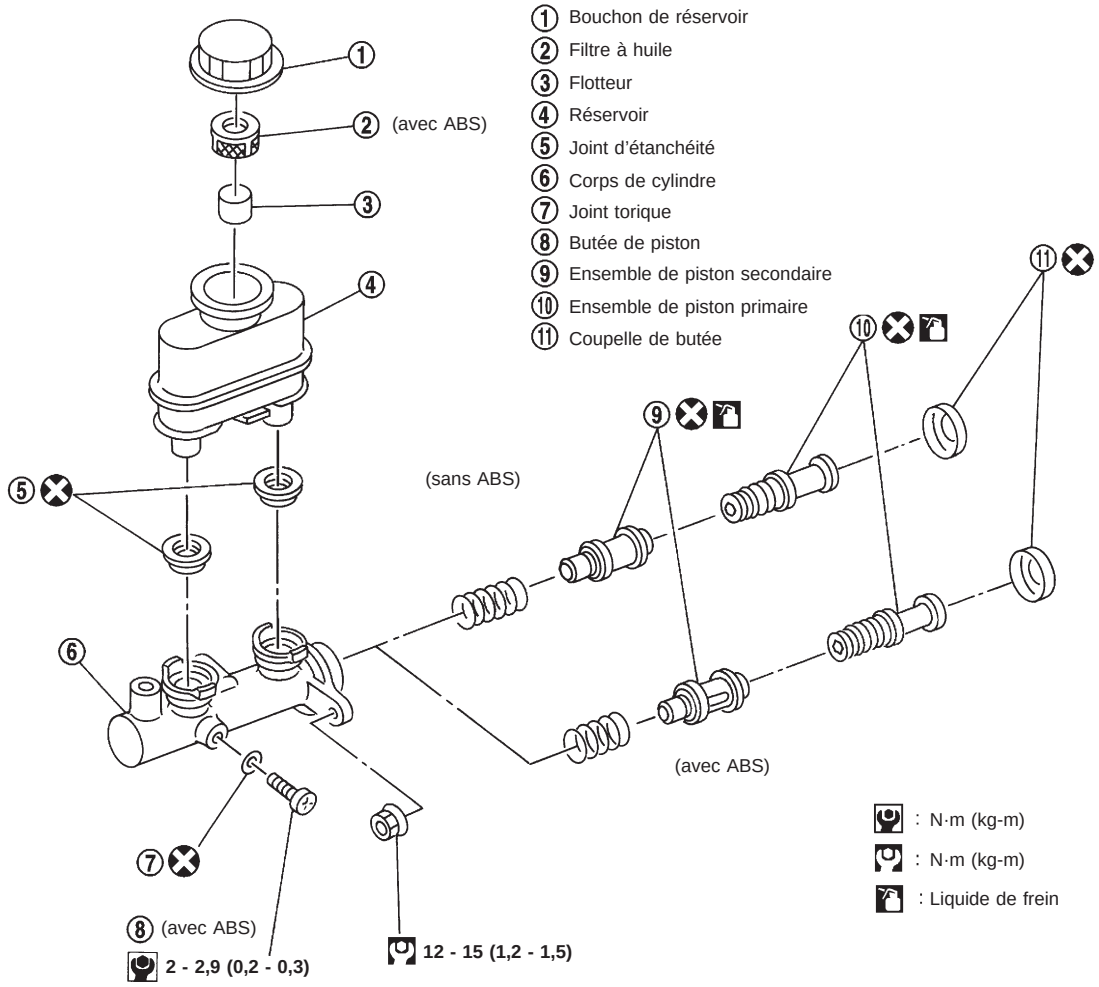
C : Jeu entre butée de pédale et extrémité filetée du contact de feu stop
0,3 - 1,0 mm

A : Jeu libre de pédale à la chape
1 - 3 mm

Si nécessaire, régler la hauteur libre de pédale de frein.

1. Desserrer le contre-écrou et régler la hauteur libre de la pédale en tournant la tige d'entrée d'assistance de freinage. Puis resserrer le contre-écrou.

- **S'assurer que la pointe de la tige d'entrée reste à l'intérieur.**



2. Desserrer le contre-écrou et régler le jeu ''C'' avec le contact de feu stop. Puis serrer les contre-écrous.
3. Vérifier le jeu libre de la pédale.

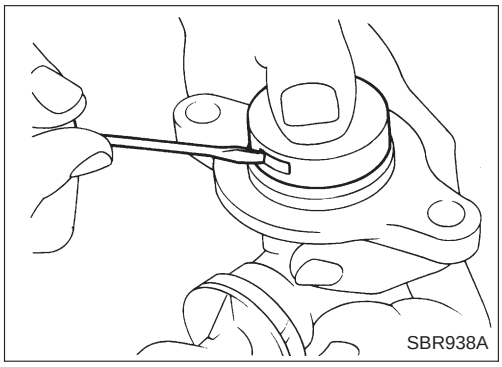
- **S'assurer que les feux de stop s'éteignent quand la pédale est relâchée.**

4. Vérifier la hauteur de la pédale de frein une fois enfoncée, moteur en marche. Si elle est inférieure aux limites spécifiées, vérifier que le circuit de freinage ne présente pas de fuites, d'accumulation d'air et que ses composants ne sont pas endommagés (maître-cylindre, cylindre de roue, etc.). Puis procéder aux réparations nécessaires.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SEC. 460

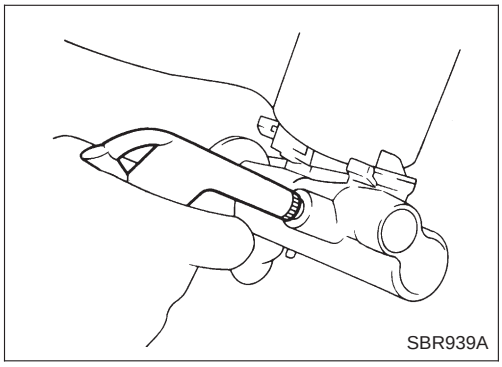
SBR970D



Dépose

ATTENTION :

- **Veiller à ne pas éclabousser de liquide de frein les parties peintes ; cela pourrait endommager la peinture. Si du liquide de frein éclabousse des parties peintes, laver immédiatement avec de l'eau.**
- **En cas de fuite de liquide de frein au niveau du maître-cylindre, démonter le cylindre. Puis vérifier si les coupelles de piston ne sont pas déformées ou rayées, et remplacer les parties endommagées.**

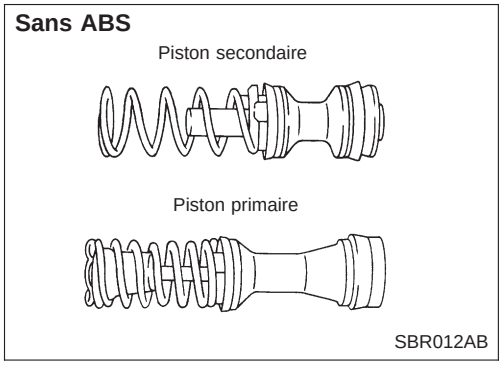


1. Raccorder un tuyau en vinyle à la vanne de purge d'air.
2. Vidanger le liquide de frein par chaque vanne de purge d'air en enfonçant à fond la pédale de frein pour vider le maître-cylindre.
3. Déposer les écrous évasés de tuyau de frein.
4. Déposer les écrous de fixation du maître-cylindre.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

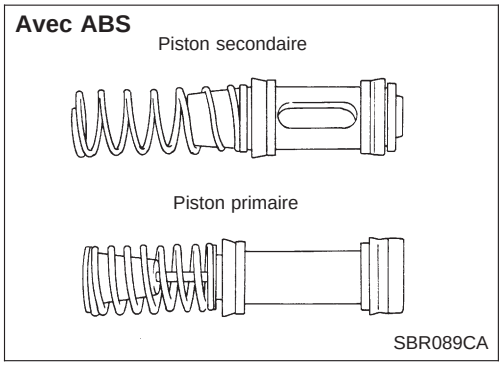
SBR938A

Démontage



1. Replier les griffes du chapeau de butée vers l'extérieur.

SBR939A

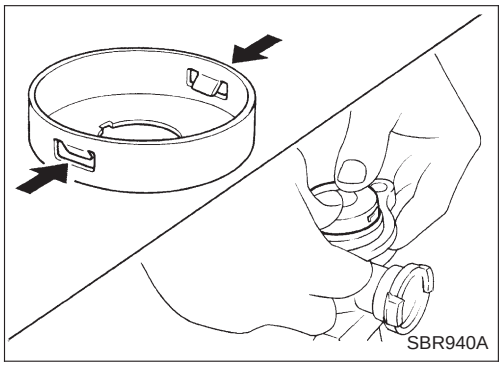


2. Déposer les ensembles de pistons.
- **S'il est difficile de déposer l'ensemble de piston secondaire, insuffler progressivement de l'air comprimé par la sortie de liquide de frein.**
3. Sortir le réservoir.

Inspection

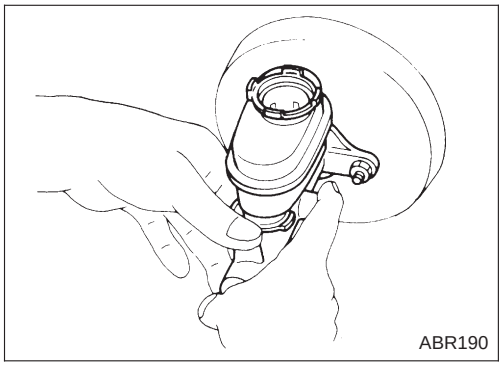
Vérifier sur la paroi interne du maître-cylindre si les goupilles sont percées ou éraflées. Les remplacer si elles sont endommagées.

SBR012AB



SBR089CA

Remontage



1. Introduire l'ensemble de piston secondaire. Introduire ensuite l'ensemble de piston primaire.
- **Faire attention au sens des coupelles de piston comme indiqué sur la figure de gauche. Introduire les pistons de façon égale pour éviter de rayer l'alésage du cylindre.**

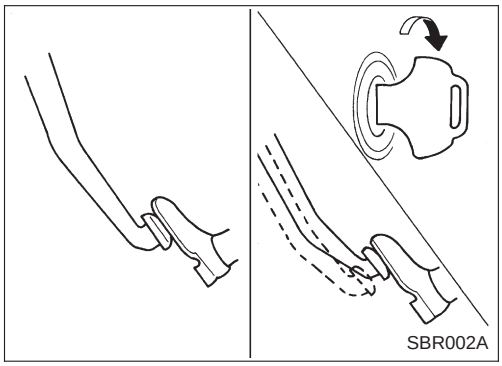
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Remontage (Suite)

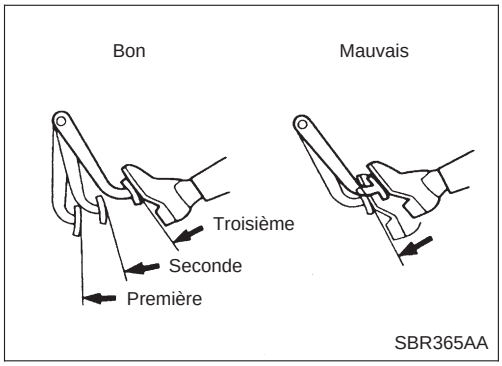
SBR940A

2. Reposer le chapeau de butée.
- **Avant de reposer le chapeau de butée, s'assurer que les griffes sont repliées vers l'intérieur.**
3. Pousser les joints de réservoir dans le corps de cylindre.
4. Pousser le réservoir dans le corps de cylindre.

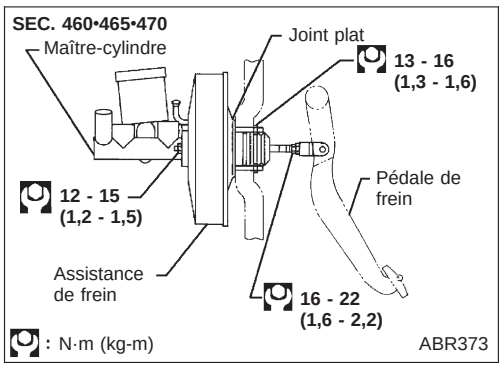
ABR190



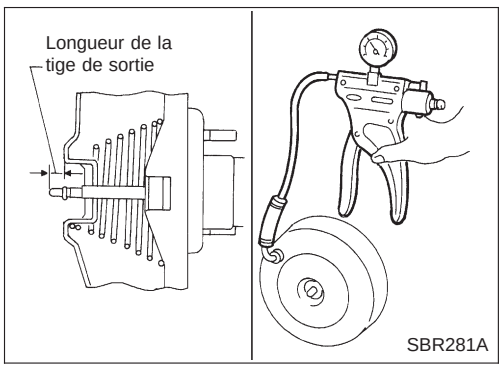
Repose



ATTENTION :
- **Faire le plein de liquide de frein neuf DOT 3 ou DOT 4*1.**
- **Ne jamais réutiliser du liquide de frein que l'on a vidangé.**



1. Placer le maître-cylindre sur l'assistance de frein et serrer légèrement les écrous de fixation.
2. Serrer les écrous de fixation.
   : 12 - 15 N·m (1,2 - 1,5 kg-m)
3. Remplir le réservoir de liquide de frein neuf.
4. Boucher tous les orifices du maître-cylindre avec les doigts pour empêcher l'aspiration d'air lorsqu'on relâche la pédale de frein.
5. Demander au conducteur d'enfoncer lentement et à plusieurs reprises la pédale de frein jusqu'à ce que l'air ne sorte plus du maître-cylindre.
6. Adapter les canalisations de frein sur le maître-cylindre.
7. Serrer les écrous évasés.
   : 15 - 18 N·m (1,5 - 1,8 kg-m)
8. Purger de l'air du circuit de freinage. Se reporter à ''Purge du circuit de freinage'', à la page BR-4.



1* Se reporter à la section MA ''Liquides et Lubrifiants'', ''LIQUIDES ET LUBRIFIANTS CONSEILLES''.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Entretien sur le véhicule

VERIFICATION DU FONCTIONNEMENT

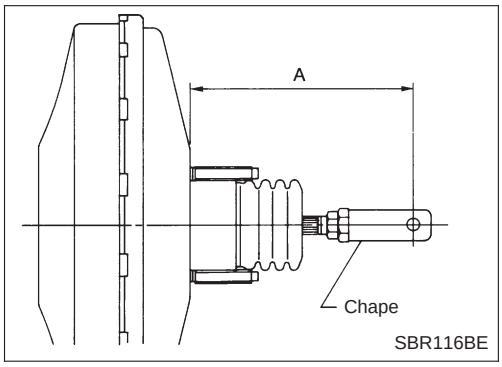
- Enfoncer la pédale de frein plusieurs fois alors que le moteur est arrêté. Après avoir évacué les gaz, vérifier que la course de la pédale ne change pas.
- Appuyer sur la pédale de frein, puis mettre le moteur en marche. Si la pédale s'enfonce légèrement, les freins fonctionnent bien.

VERIFICATION DE L'ETANCHEITE A L'AIR

- Mettre le moteur en marche, et l'arrêter au bout d'une ou deux minutes. Appuyer lentement plusieurs fois sur la pédale de frein. L'assistance de frein est étanche à l'air si la course de la pédale de frein diminue chaque fois.
- Appuyer sur la pédale de frein alors que le moteur tourne, puis arrêter le moteur alors que la pédale est enfoncée. La course de la pédale ne doit pas changer lorsqu'on enfonce la pédale pendant **30 secondes**.

Dépose

ATTENTION :



- **Veiller à ne pas éclabousser de liquide de frein les parties peintes ; cela pourrait endommager la peinture. Si du liquide de frein éclabousse des parties peintes, laver immédiatement avec de l'eau.**
- **Veiller à ne pas déformer ou plier les conduites de freins pendant la dépose de l'assistance de frein.**

Inspection

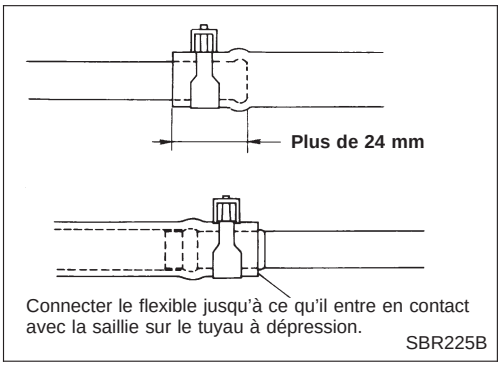
CONTROLE DE LA LONGUEUR DE LA TIGE DE SORTIE

1. Appliquer à l'assistance de frein une dépression de −66,7 kPa (−667 mbar, −500 mmHg) à l'aide d'une pompe à dépression à main.
2. Vérifier la longueur de la tige de sortie.
   Longueur spécifiée :
   10, 275 - 10, 525 mm

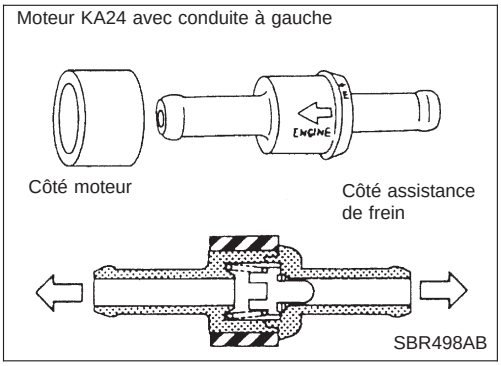
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Repose

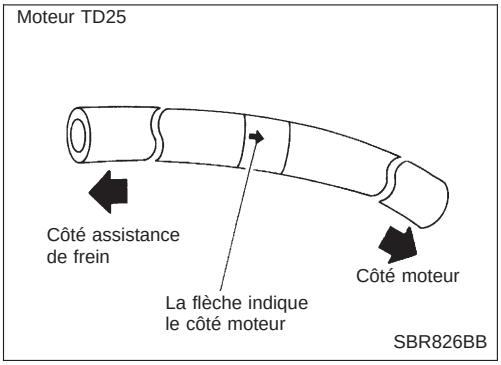
ATTENTION :



- **Veiller à ne pas déformer ou plier les conduites de freins pendant la repose de l'assistance de frein.**
- **Changer l'axe de chape s'il est abîmé.**
- **Faire le plein de liquide de frein neuf DOT 3 ou DOT 4*1.**
- **Ne jamais réutiliser du liquide de frein que l'on a vidangé.**
- **Veiller à ne pas endommager le filetage du boulon de fixation de l'assistance de frein pendant la repose. Les filets peuvent être endommagés par le tableau de bord du fait de l'angle étroit de montage.**



A : S230, M215T
C. à G. 165 mm
C. à D. 185 mm
M195T
C. à G. 160 mm
C. à D. 180 mm



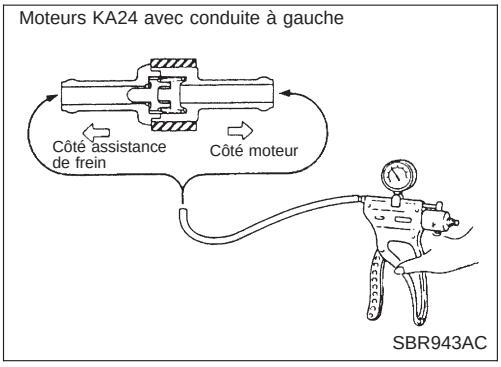
1. Avant de monter l'assistance de frein, régler temporairement la chape à la cote indiquée.
2. Monter l'assistance de frein, puis serrer légèrement les écrous de fixation (du support de pédale de frein sur l'assistance de frein).
3. Connecter la pédale de frein et la tige d'entrée de l'assistance de frein avec l'axe de chape.
4. Serrer les écrous de fixation.
   : 13 - 16 N·m (1,3 - 1,6 kg-m)
5. Monter le maître-cylindre. Se reporter à ''Repose'' au chapitre ''MAITRE-CYLINDRE'', à la page BR-14.
6. Régler la hauteur et le jeu libre de la pédale de frein. Consulter la page BR-11.
7. Fixer le contre-écrou de la chape.
   : 16 - 22 N·m (1,6 - 2,2 kg-m)
8. Purger l'air. Se reporter à ''Purge du circuit de freinage'', à la page BR-4.

1* Se reporter à la section MA ''Liquides et Lubrifiants'', ''LIQUIDES ET LUBRIFIANTS CONSEILLES''.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Dépose et repose

ATTENTION :



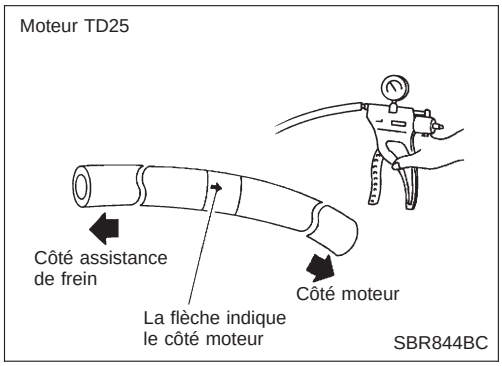
Faire attention aux points suivants lors de la repose des flexibles à dépression.

- **Ne pas appliquer d'huile ou de lubrifiant d'aucune sorte sur le flexible à dépression et sur le clapet sens unique.**
- **Introduire le tuyau à dépression dans le flexible à dépression comme indiqué ci-contre.**
- **Reposer le clapet sens unique, en s'assurant qu'il est monté dans le bon sens.**

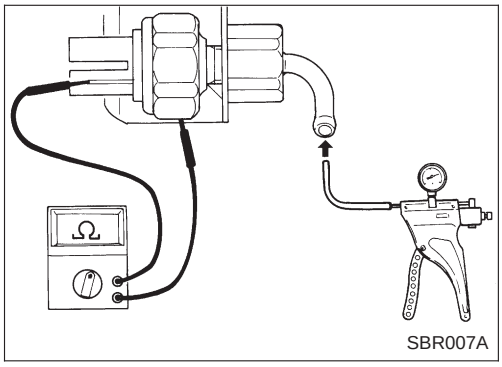
Inspection

FLEXIBLES ET RACCORDS

Contrôler l'étanchéité à l'air des conduites à dépression, des raccords et du clapet sens unique ainsi que leurs fixations, et rechercher toute trace d'usure et de détérioration.



CLAPET SENS UNIQUE



Vérifier la dépression à l'aide d'une pompe à dépression.

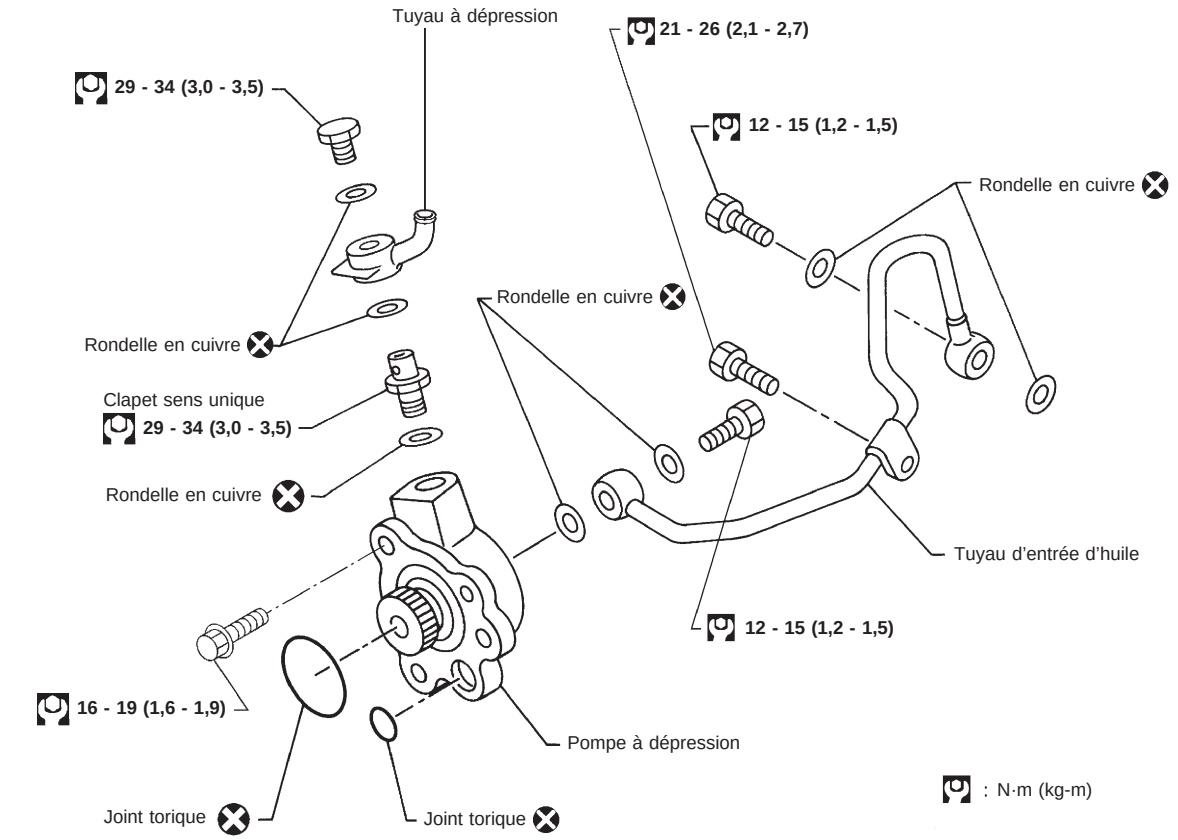
Brancher du côté de l'assistance de frein	Une dépression doit se faire sentir.
Brancher du côté moteur	Il doit y avoir absence de dépression.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (Suite)

CONTACT D'AVERTISSEUR DE DEPRESSION*

Vérifier la continuité à travers le contact d'avertisseur de dépression à l'aide d'un ohmmètre et d'une pompe à dépression.



Dépression	Moins de 26,7 kPa (267 mbar, 200 mmHg)	0Ω
	33,3 kPa (333 mbar, 250 mmHg) ou plus	∞ Ω

* Moteurs diesel

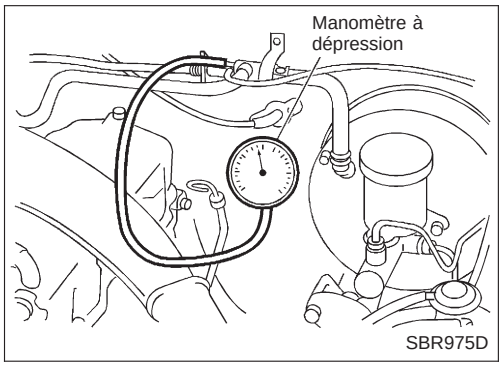
Recherche des fuites d'air du clapet

SBR195

Inspection

CLAPET SENS UNIQUE



1. Vérifier le fonctionnement du clapet. Vérifier que le clapet fonctionne régulièrement en le poussant légèrement. Le remplacer si nécessaire.

2. Rechercher les fuites d'air en appliquant une pression d'air comprise entre 98 et 490 kPa (1 à 4,9 bar, 1 à 5 kg/cm^2). Remplacer si nécessaire.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (Suite)

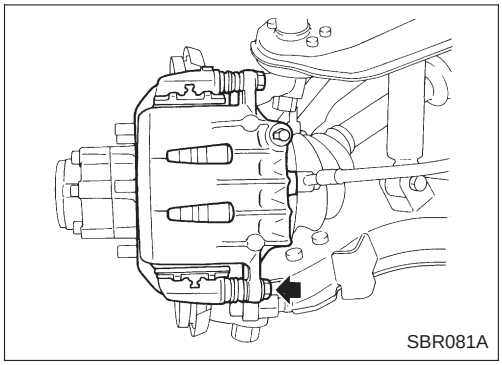
DEPRESSION

1. Monter un manomètre à dépression.
2. Faire tourner le moteur à 1 000 tr/mn ou plus.
3. Vérifier la dépression.

Dépression spécifiée :

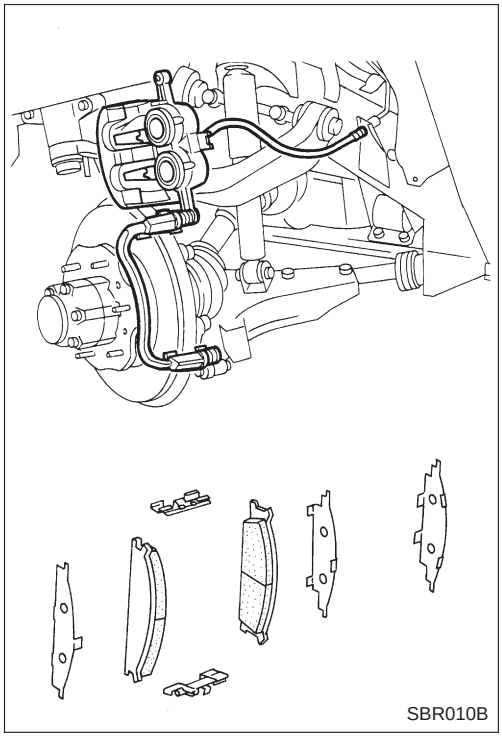
86,6 kPa (866 mbar, 650 mmHg) ou plus

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Remplacement des plaquettes

AVERTISSEMENT :



Nettoyer les plaquettes de freins avec un aspirateur de poussière pour réduire les risques de présence de poussières dans l'air.

ATTENTION :

- **Lorsque le corps de cylindre est ouvert, éviter d'enfoncer la pédale de frein sous peine d'éjecter le piston d'étrier.**
- **Veiller à ne pas abîmer les soufflets de piston et à ne pas mettre d'huile sur le disque. Toujours remplacer les cales d'épaisseur en même temps que les plaquettes.**
- **Si les cales d'épaisseur sont rouillées, ou si leur revêtement en caoutchouc semble se décoller, les remplacer par des cales neuves.**
- **Il n'est pas nécessaire de retirer les boulons de raccord, sauf si l'étrier doit être démonté ou remplacé. Dans ce cas, maintenir le corps du cylindre suspendu avec un fil pour éviter que le flexible de frein ne s'étire.**

SBR081A

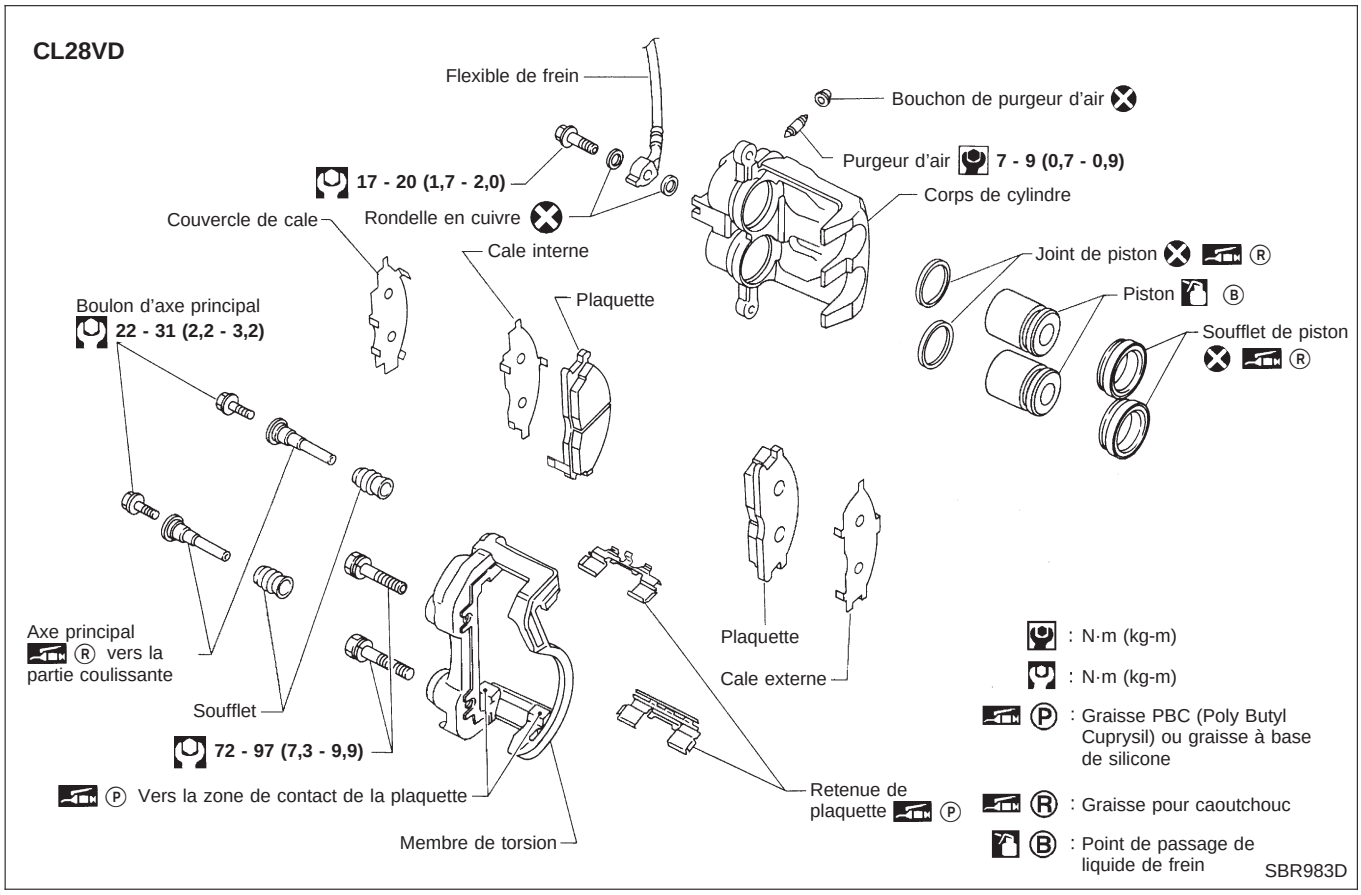
1. Déposer le bouchon de réservoir du maître-cylindre.
2. Déposer le boulon d'axe inférieur.

SBR010B

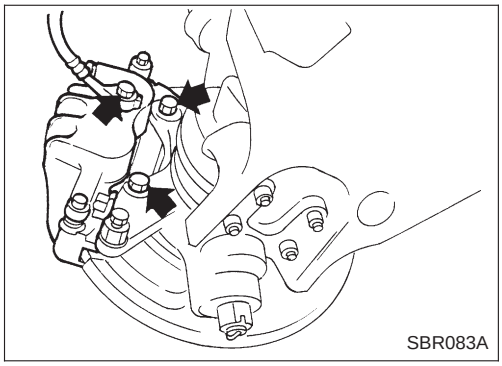
3. Ouvrir le corps du cylindre par le haut. Puis retirer les pièces de retenue des plaquettes, le ressort de rappel ainsi que les cales d'épaisseur interne et externe.

Epaisseur standard des plaquettes :

Modèle CL28VD



10 mm

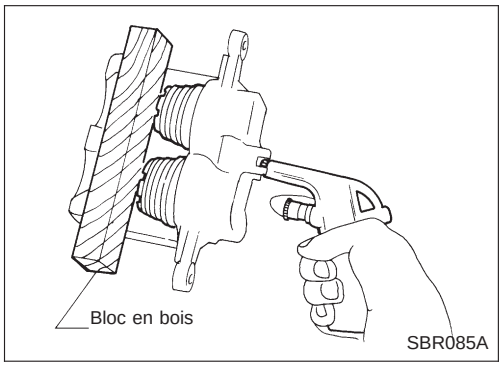


Limite d'usure des plaquettes :

2,0 mm

- **Surveiller avec soin le niveau du liquide de frein car il refluera vers le réservoir quand les pistons seront repoussés.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Dépose

AVERTISSEMENT :
Nettoyer les plaquettes de freins avec un aspirateur de poussière pour réduire les risques de présence de poussières dans l'air.
ATTENTION :
Suspendre l'ensemble de l'étrier avec un fil pour éviter d'étirer le flexible de frein.
Déposer les boulons de fixation du membre de torsion et le boulon de raccord.

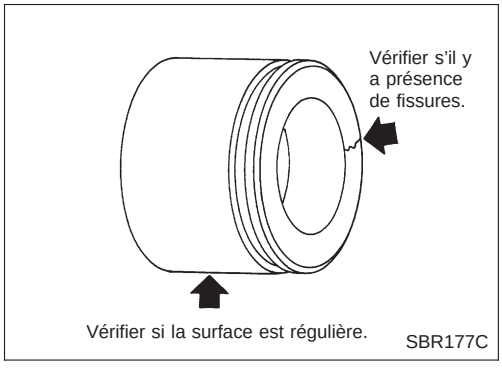
- **Il n'est pas nécessaire de retirer les boulons de raccord, sauf si l'ensemble de l'étrier doit être démonté ou remplacé. Dans ce cas, suspendre l'ensemble de l'étrier avec un fil pour éviter d'étirer le flexible de frein.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Démontage

AVERTISSEMENT :
Ne pas mettre ses doigts devant le piston.
ATTENTION :

- **Ne pas griffer ou rayer les parois du cylindre.**
- **Le frein avant à disque CL28VD contient des pistons en plastique, et doit être manipulé avec précaution.**



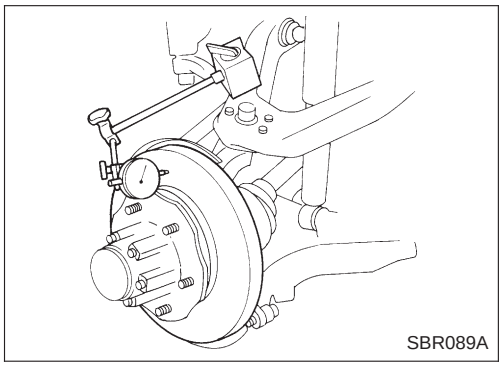
1. Chasser le piston et le cache-poussières à l'air comprimé. Pour le modèle CL28VD (type à 2 pistons), utiliser un bloc de bois pour que les deux pistons ressortent de façon égale.
2. Déposer le joint de piston à l'aide d'un outil adéquat.

Inspection – Etrier

CORPS DE CYLINDRE

- Rechercher sur la surface interne du cylindre toute trace de rayures, de rouille, d'usure, de dommages ou encore la présence de particules étrangères. Si l'on remarque l'une de ces conditions, changer le corps de cylindre.
- On peut éliminer les petites irrégularités causées par la rouille ou des corps étrangers en polissant la surface avec une toile émeri à grain fin. Changer le corps de cylindre si nécessaire.

ATTENTION :
Nettoyer les pièces avec du liquide de frein. Ne jamais utiliser d'huile minérale.



PISTON

– pour piston en plastique (CL28VD) –
Vérifier si les pistons ont une surface irrégulière, s'ils sont fissurés ou écaillés. Si l'on remarque une de ces conditions, changer le piston.

AXE, BOULON D'AXE ET SOUFFLET D'AXE

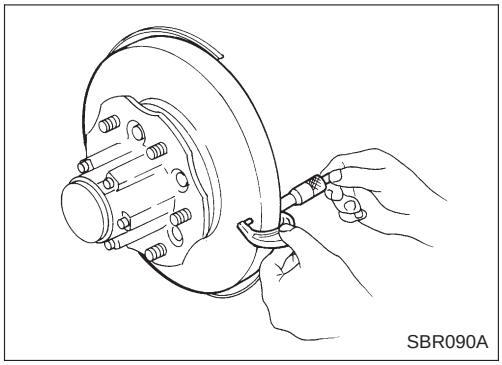
Vérifier si ces pièces ne sont pas usées, fissurées, ou endommagées de quelque façon que ce soit. Les remplacer si l'une de ces conditions se manifeste.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SBR089A

Inspection – Rotor

VOILE



1. Vérifier le voile avec un comparateur à cadran.

- **S'assurer que le jeu axial du roulement de roue est compris dans les limites spécifiées avant de prendre la mesure. Consulter la section FA (''Roulement des roues avant'', ''ENTRETIEN DU VEHICULE'').**

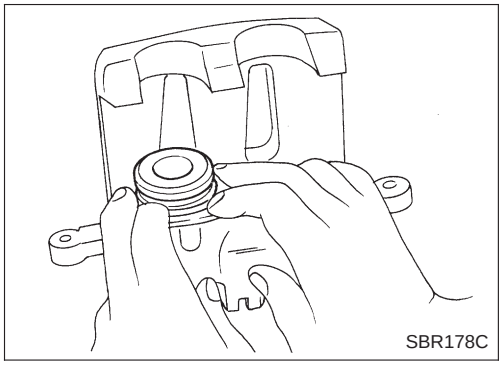
Voile maximum :

0,07 mm

2. Si le voile est toujours hors des limites spécifiées, rectifier le rotor avec un tour utilisable sur le véhicule (''MAD, DL-8700'', ''AMMCO 700 et 705'' ou équivalent).

SBR090A

EPAISSEUR



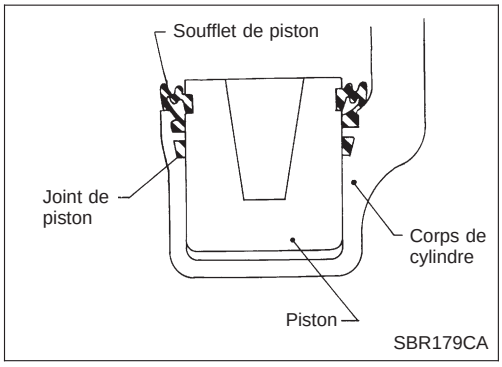
Variation d'épaisseur (mesurée en 8 positions, au moins) :

Maximum 0,02 mm

Si la variation d'épaisseur est supérieure aux spécifications, rectifier le rotor avec un tour utilisable sur le véhicule.

Limite de réparation du rotor :

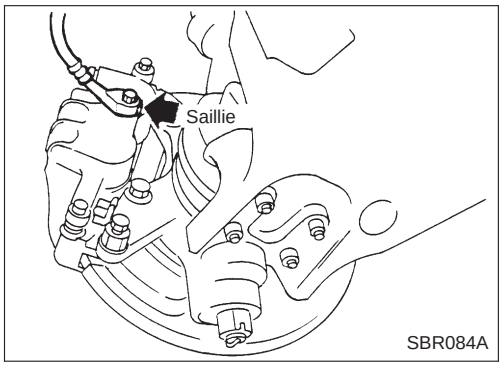
CL28VD 24,0 mm



SBR178C

Remontage

1. Insérer le joint de piston dans la rainure du corps de cylindre.
2. Le soufflet de piston étant monté sur le piston, introduire le soufflet dans la rainure du corps de cylindre puis monter le piston.
3. Bien fixer le soufflet de piston.



ATTENTION :

- **Fixer correctement le joint cache-poussière.**
- **Lubrifier avec du liquide de frein neuf avant de monter les pistons en plastique (CL28VD) sur le corps de cylindre.**

SBR179CA

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Repose

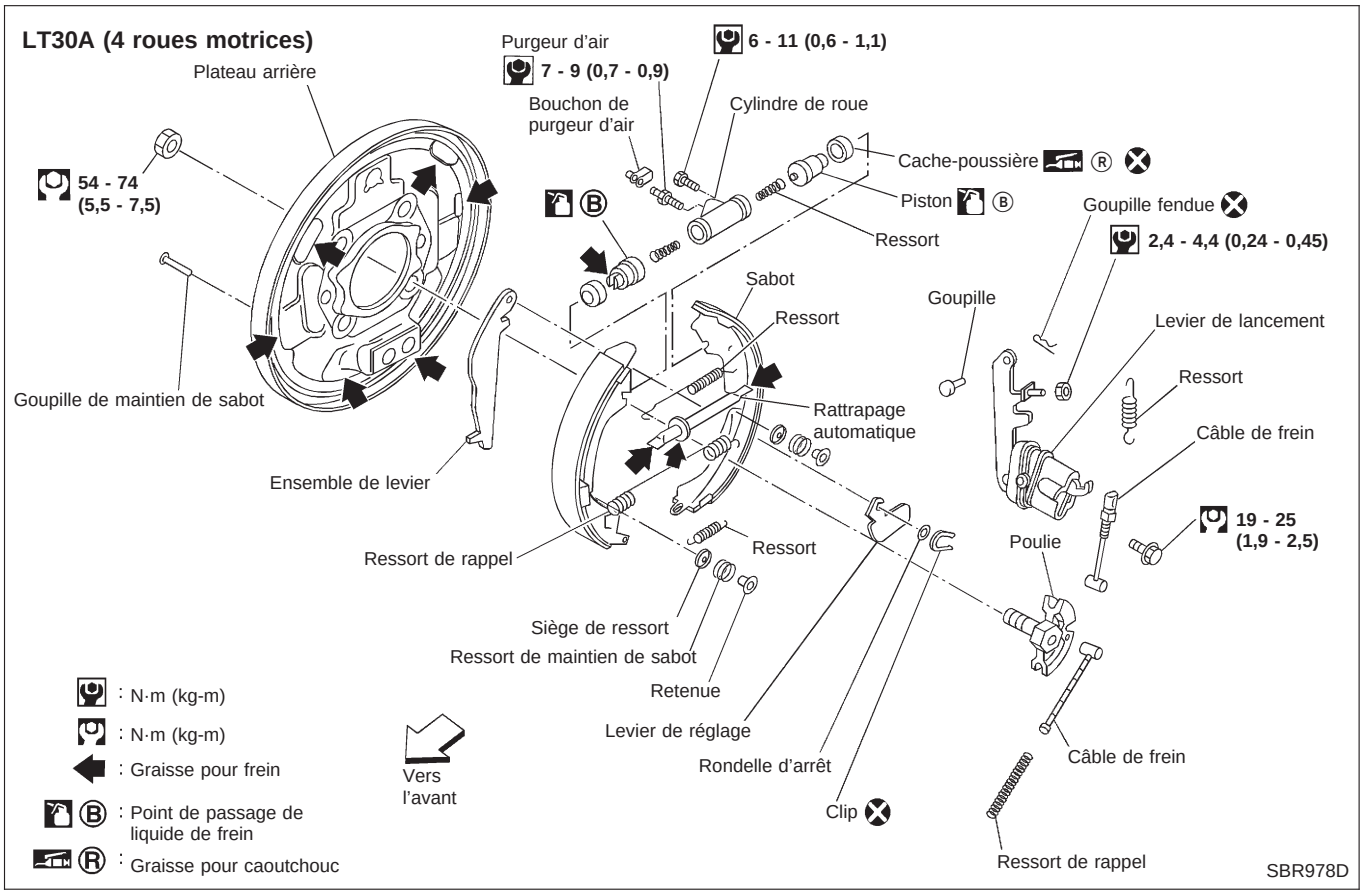
ATTENTION :

- **Faire le plein de liquide de frein neuf DOT 3 ou DOT 4.*1**
- **Ne jamais réutiliser du liquide de frein que l'on a vidangé.**

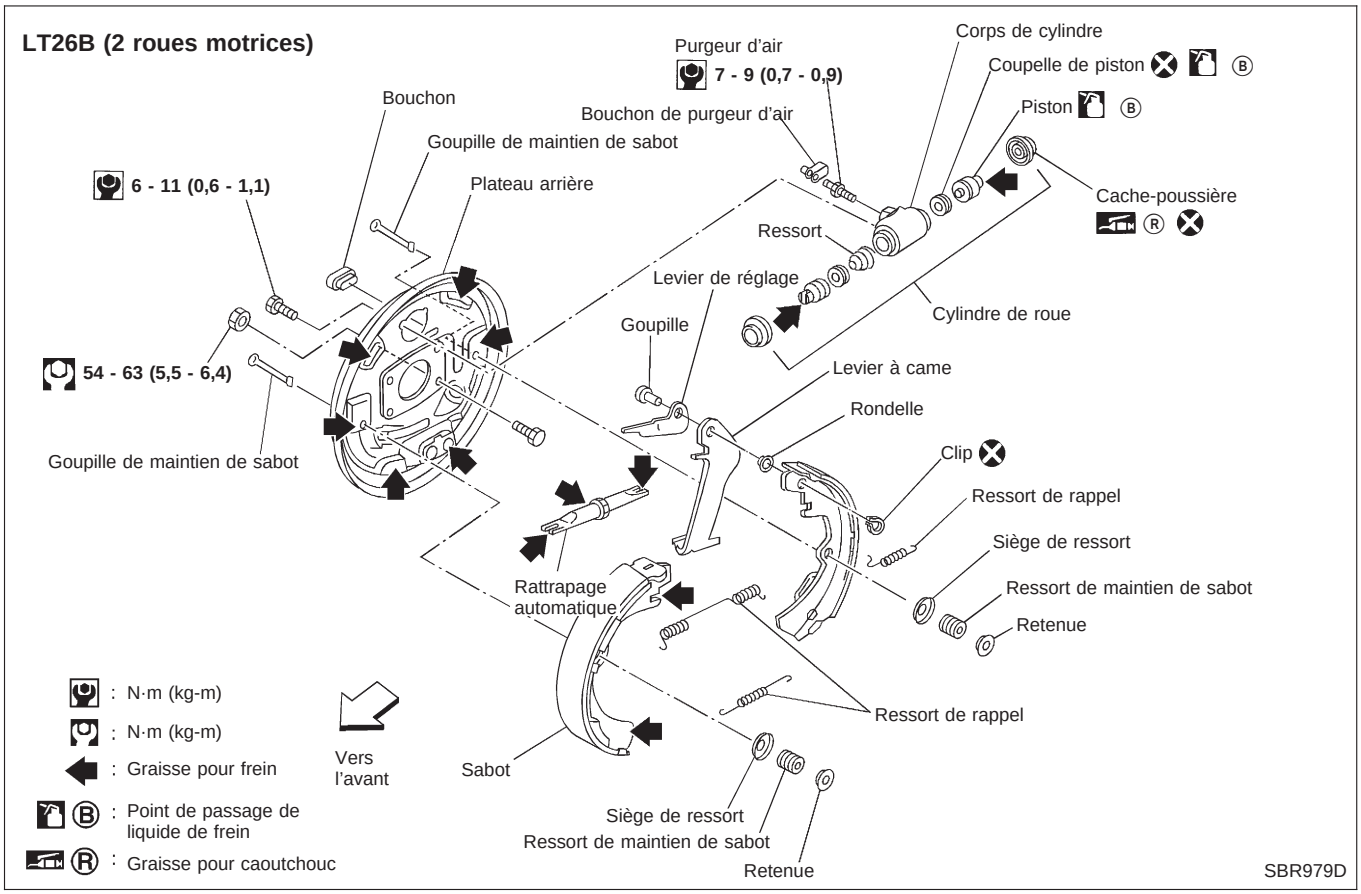
1. Reposer l'ensemble de l'étrier.
2. Monter correctement le flexible de frein sur l'étrier.
3. Monter toutes les pièces et serrer tous les boulons.
4. Purger l'air. Se reporter à ''Purge du circuit de freinage'', à la page BR-4.

1* Se reporter à la section MA ''Liquides et Lubrifiants'', ''LIQUIDES ET LUBRIFIANTS CONSEILLES''.

Procédure de rodage des freins



Lorsque la pédale de frein semble molle après un petit kilométrage, ou après le remplacement du disque, roder les surfaces de contact des plaquettes de freins selon la procédure suivante.

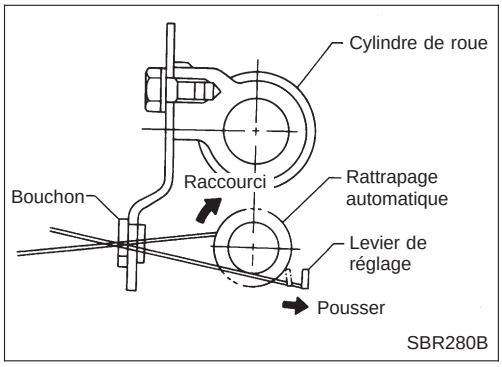


ATTENTION :

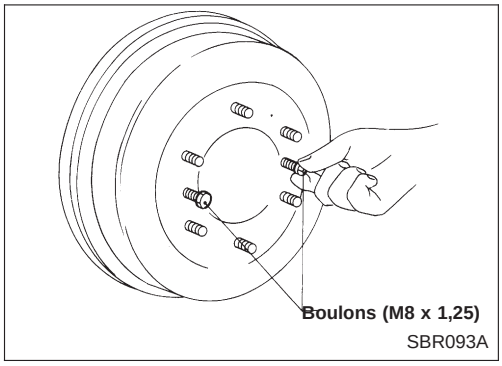
N'effectuer cette procédure qu'en cas de bon état de la route et de fluidité de la circulation. Redoubler de vigilance.

1. Rouler en ligne droite sur une surface plane à 50 km/h.
2. Freiner en appuyant à mi-course sur la pédale lorsque les 50 km/h sont atteints pour arrêter le véhicule. Ajuster la pression de freinage de telle sorte que le véhicule s'arrête dans un espace de 3 à 5 secondes.
3. Pour refroidir le système de freinage, rouler à 50 km/h pendant une minute sans s'arrêter.
4. Effectuer les étapes 1 à 3 dix fois ou plus pour terminer la procédure de rodage.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

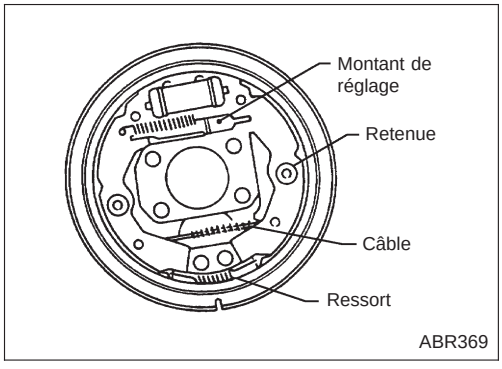


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



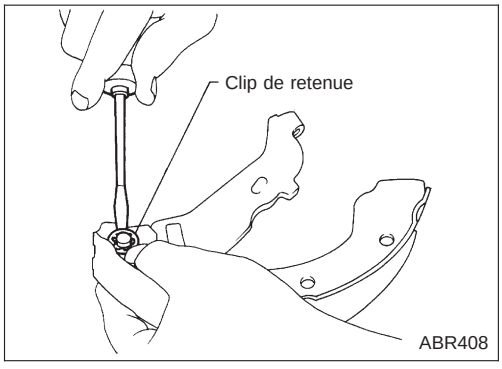
Dépose

AVERTISSEMENT :
Nettoyer les garnitures de freins avec un aspirateur de poussière pour réduire les risques de présence de poussières dans l'air.
ATTENTION :
S'assurer que le levier de frein de stationnement est complètement desserré.

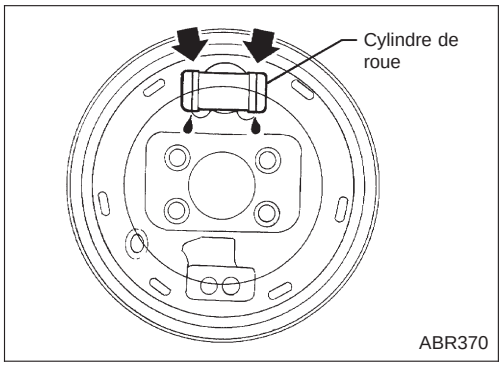


1. Desserrer complètement le levier de frein de stationnement, puis déposer le tambour.
- **S'il est difficile de déposer le tambour, il convient d'appliquer les procédures suivantes.**

a. Déposer le bouchon. Puis raccourcir le rattrapage automatique pour créer un jeu entre le sabot de frein et le tambour.



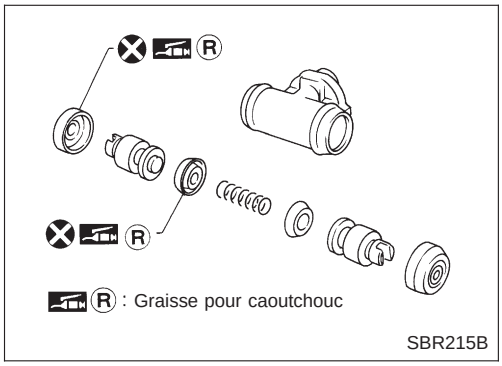
b. Monter deux boulons comme indiqué. Serrer progressivement les deux boulons.



2. Après avoir déposé la pièce de retenue, déposer le ressort en faisant tourner les sabots.
- **Faire attention à ne pas endommager les soufflets de piston du cylindre de roue.**
- **Faire attention à ne pas endommager le câble de frein de stationnement lors de la séparation.**

3. Déposer le rattrapage automatique.
4. Débrancher le câble de frein de stationnement du levier à came.

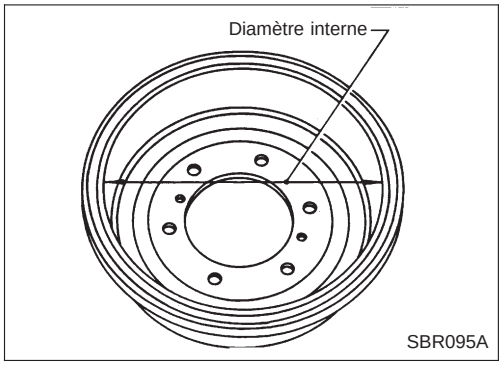
5. Déposer le clip de retenue à l'aide d'un outil adéquat. Puis séparer le levier à came du sabot de frein.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

ABR370

Inspection – Cylindre de roue

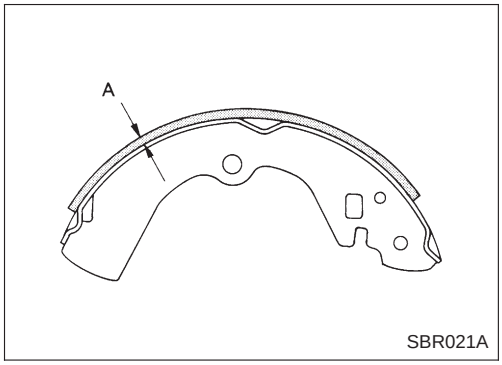


- Vérifier si le cylindre de roue ne fuit pas.
- Rechercher toute trace d'usure, de dommage ou de mauvais serrage.
  Remplacer le cylindre si l'une de ces conditions se manifeste.

SBR215B

Révision du cylindre de roue

- Vérifier si les pièces internes ne sont pas usées, rouillées ou endommagées. Les remplacer si nécessaire.
- Veiller à ne pas griffer les cylindres en reposant les pistons.

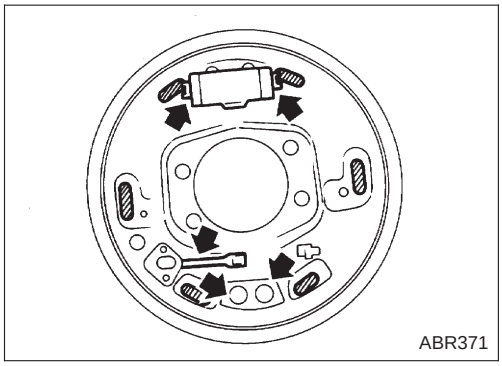


SBR095A

Inspection – Tambour

Diamètre interne maximum (limite de réparation) :
LT26B 261,5 mm
LT30A 296,5 mm

- La surface de contact doit finalement être polie avec du papier émeri n° 120 à 150.
- Avec un tour pour frein, rectifier le tambour s'il est marqué, usé partiellement ou inégalement.
- Après avoir remis en état ou remplacé le tambour de frein, vérifier que le tambour et les sabots sont bien en place l'un par rapport à l'autre.



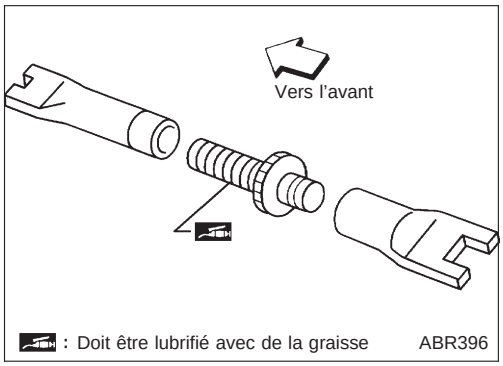
SBR021A

Inspection – Garniture

Vérifier l'épaisseur de la garniture.

Epaisseur de garniture standard :
LT26B 5,5 mm
LT30A 6,1 mm
Limite d'usure de la garniture (A) :
LT26B 1,5 mm
LT30A 1,5 mm

ABR371

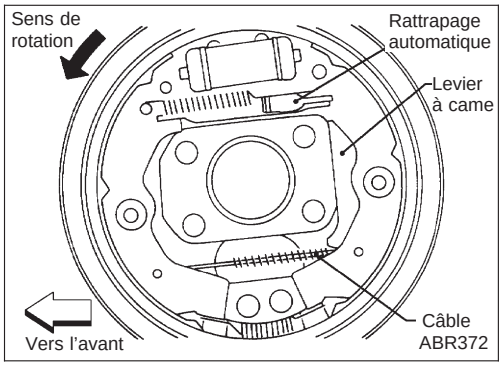


Repose

- **Toujours régler le jeu du sabot. Consulter la page BR-31.**

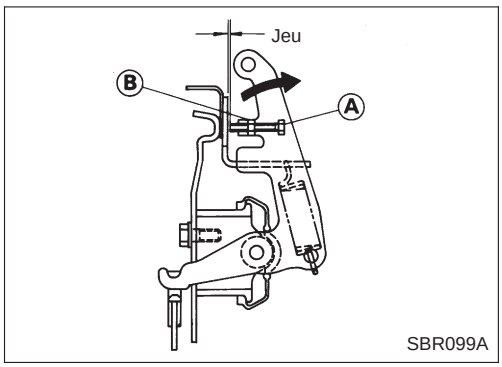
1. Monter le levier à came sur le sabot de frein avec un clip de retenue.
2. Enduire de graisse pour freins les surfaces de contact indiquées ci-à gauche.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

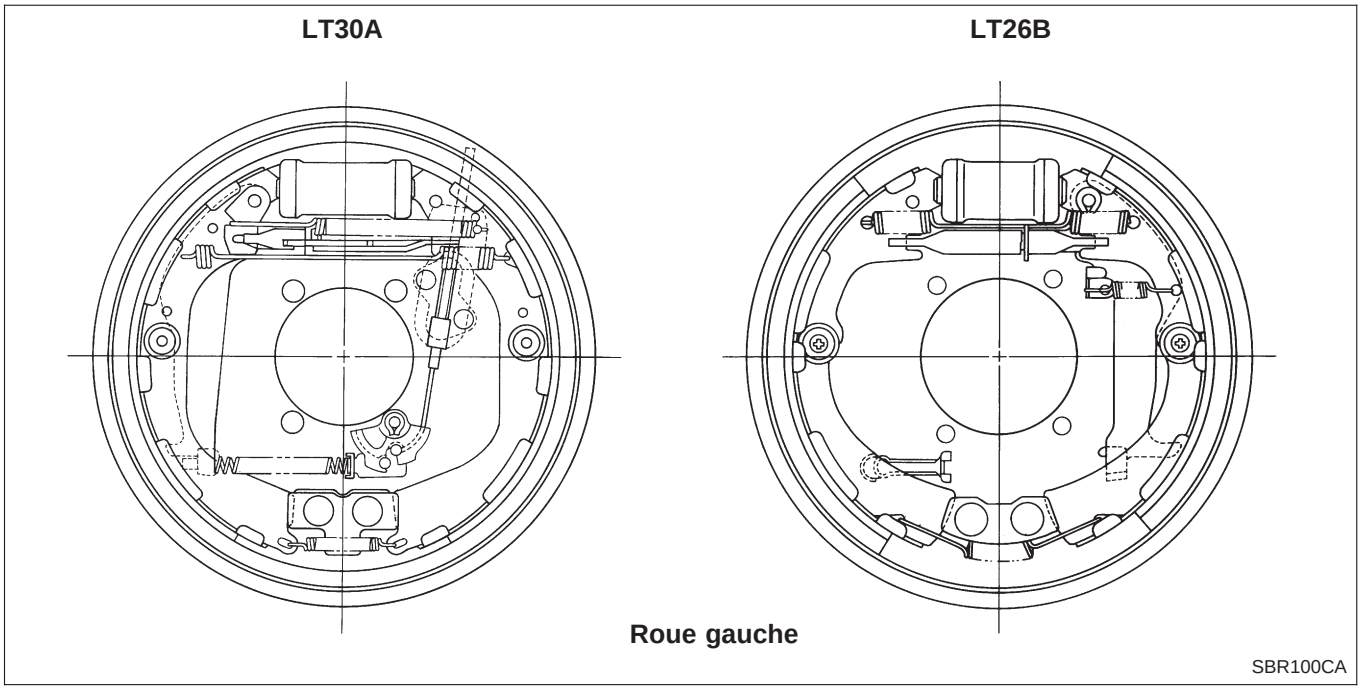


Repose (Suite)

3. Raccourcir le rattrapage automatique en le faisant tourner.
- **Faire attention au sens du rattrapage automatique.**

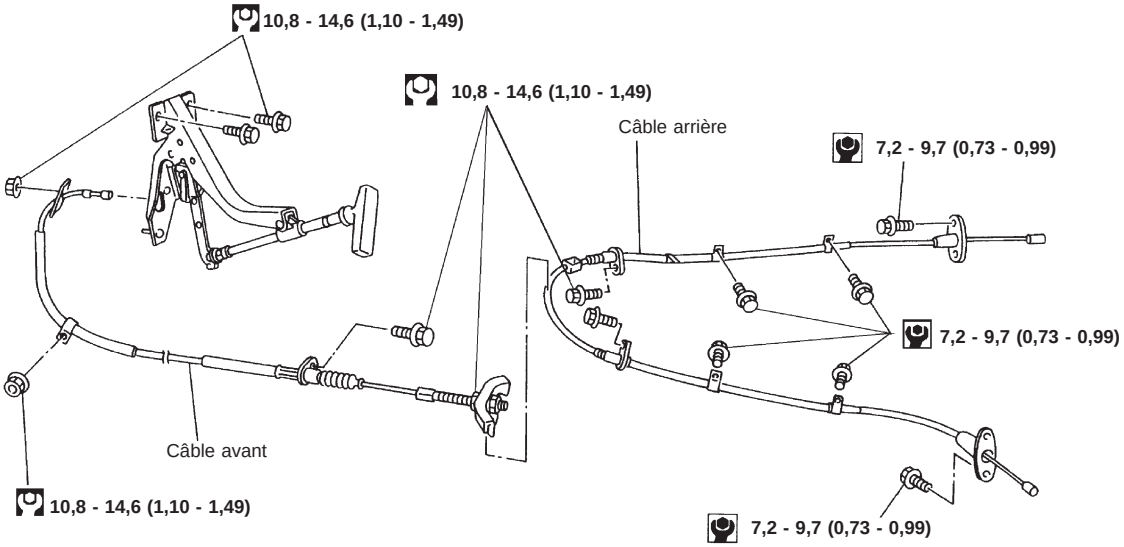


Roue	Vis
Gauche	Filetage gauche
Droite	Filetage droit



4. Brancher le câble de frein de stationnement sur le levier à came.
5. Reposer toutes les pièces.
- **Veiller à ne pas endommager les soufflets de piston du cylindre de roue.**
6. Vérifier si les pièces sont correctement reposées.
- **Une fois la repose achevée, régler le jeu entre le sabot et le tambour.**
7. Reposer le tambour de frein.
8. Si un nouveau cylindre de roue est monté ou si le cylindre de roue est révisé, purger l'air du circuit. Se reporter à ''Purge du circuit de freinage'', à la page BR-4.
9. Régler le frein de stationnement. Consulter la page BR-31.
- Reposer toutes les pièces conformément à la figure ci-dessous.

Modèle LT30A



- Après avoir reposé le levier coudé sur le plateau arrière, s'assurer qu'il n'y a pas de jeu entre ces pièces. S'il y a du jeu, ajuster le boulon Ⓐ et le contre-écrou Ⓑ.

Objet

Le système anti-enrayeur des freins (ABS) se compose de composants électriques et hydrauliques. Il permet de contrôler la force de freinage de manière à éviter le blocage des roues.
L'ABS :
1) Améliore le contrôle permanent du véhicule par la direction assistée.
2) Facilite l'appréhension d'obstacles par la manœuvre du volant de direction.
3) Améliore la stabilité du véhicule.

Fonctionnement

- Ce système n'est pas opérationnel lorsque la vitesse du véhicule est inférieure à 10 km/h.
- Le système anti-enrayeur des freins (ABS) comporte une fonction d'autodiagnostic. Le système allume le témoin ABS pendant une seconde chaque fois que le contact d'allumage est mis sur ''ON''. Après que le moteur est démarré, le témoin ABS s'éteint. Le système effectue un diagnostic lorsque le véhicule atteint 6 km/h pour la première fois. Un bruit mécanique peut être entendu lorsque l'ABS effectue un autodiagnostic. C'est une étape normale de la fonction d'autodiagnostic. Si un défaut est détecté pendant cette vérification, le témoin ABS s'allumera.
- Pendant la conduite, un bruit mécanique peut se manifester pendant le fonctionnement de l'ABS. C'est une condition normale.

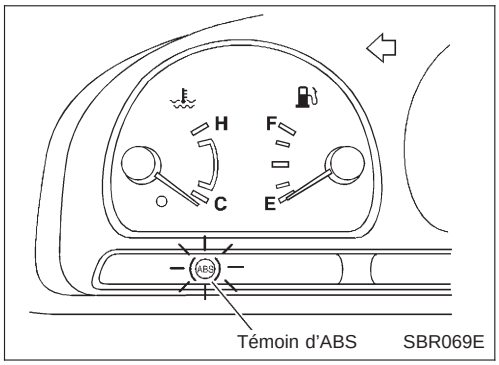
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



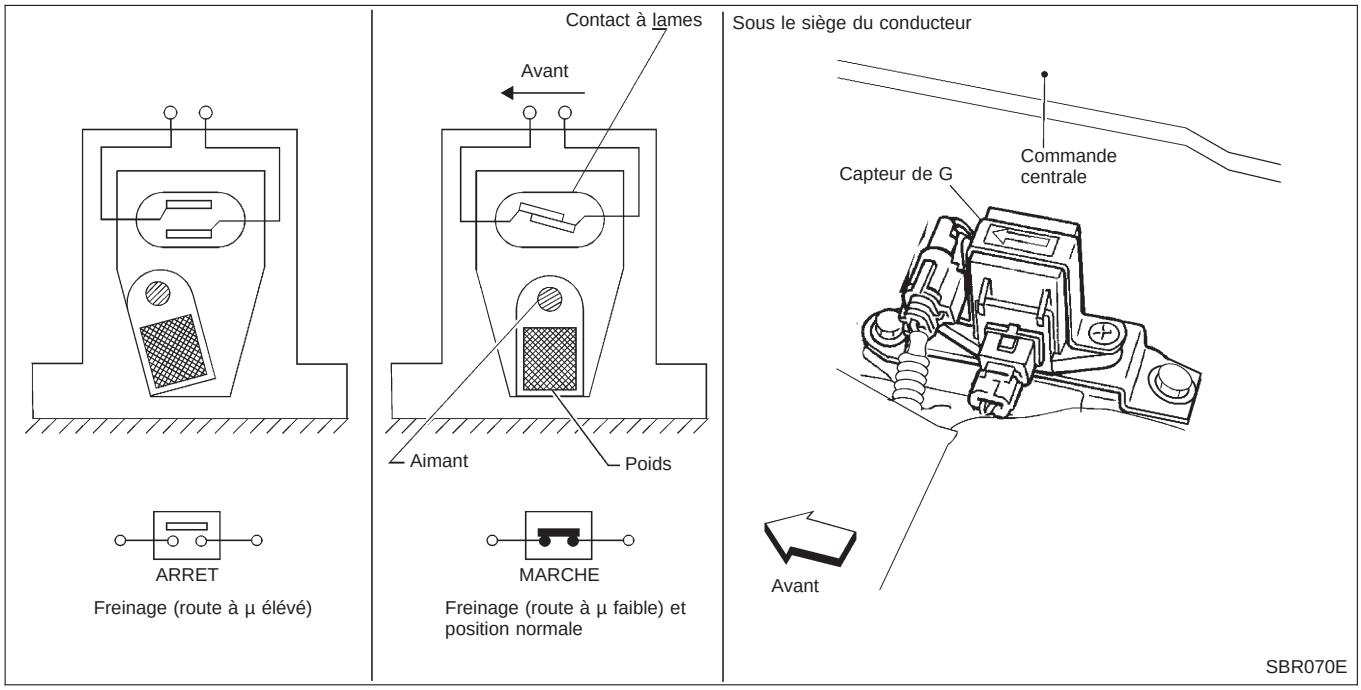
Composants du système

Description du système

CAPTEUR DE ROUE

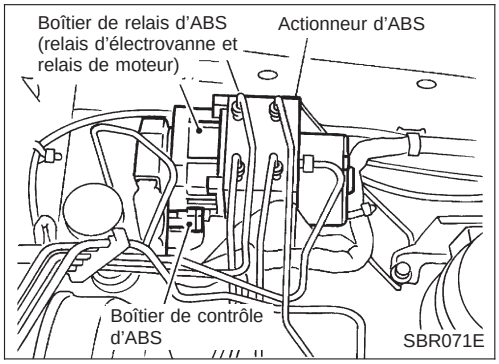
L'ensemble de capteur se compose d'un rotor de capteur denté et d'un élément du capteur. L'élément contient une barre magnétique entourée d'un enroulement électrique. Le capteur est placé à l'arrière du rotor de frein et à l'avant du différentiel (2 roues motrices), ou à l'arrière du tambour de frein arrière à disque (4 roues motrices). Quand la roue tourne, le capteur produit un courant à ondes sinusoïdales. La fréquence et la tension de ce courant augmentent proportionnellement à la vitesse de rotation de la roue.

BOITIER DE CONTROLLE (actionneur ABS et boîtier électrique intégrés)



Le boîtier de contrôle calcule la vitesse de rotation de la roue en analysant le courant émis par le capteur. Puis il applique un courant continu à l'électrovanne d'actionneur. Il commande également le fonctionnement MARCHE/ARRET du relais de soupape et du relais de moteur. Si un défaut détectable électriquement se produit dans le système, le boîtier de contrôle allume un témoin. En pareil cas, l'ABS sera mis hors fonction par le boîtier de contrôle et le système de freinage du véhicule reviendra au mode de fonctionnement normal (pour la disposition du boîtier de contrôle, se reporter à ACTIONNEUR D'ABS ET BOITIER ELECTRIQUE, BR-34.)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Description du système (Suite)

CAPTEUR DE G (4 roues motrices seulement)

Le capteur de G détecte la décélération durant le freinage pour déterminer si le véhicule roule sur une route à haut µ (route asphaltée, etc.) ou à bas µ (route enneigée, etc.). Il adresse alors un signal au boîtier de contrôle d'ABS.

Le contact à lames est activé quand il est affecté par un champ magnétique. Lors d'une décélération soudaine (freinage sur une route à haut µ), le poids se déplace et l'aimant dans le poids s'écarte du contact à lames. Le champ magnétique se réduit et le contact à lames est désactivé.

ACTIONNEUR D'ABS ET BOÎTIER ELECTRIQUE

L'actionneur d'ABS et le boîtier électrique comprennent :

- Un moteur électrique et une pompe
- Deux relais
- Six électrovannes avec chacune une entrée et une sortie pour
  - — avant gauche
  - — avant droite
  - — arrière
- Boîtier de contrôle d'ABS

Ce composant commande le circuit hydraulique et augmente, maintient ou réduit la pression hydraulique appliquée à toutes les roues ou à une roue individuelle. L'actionneur et le boîtier électrique ABS ne sont pas démontables.

Fonctionnement de l'actionneur d'ABS

		Electro-vanne d'entrée	Electro-vanne de sortie	
Fonctionnement normal des freins		ARRET (Ouverte)	ARRET (Fermée)	La pression du liquide de frein du maître-cylindre est transmise directement au cylindre de roue par l'électrovanne d'entrée.
Fonctionnement de l'ABS	Maintien de la pression	MARCHE (Fermée)	ARRET (Fermée)	Le circuit hydraulique est coupé pour maintenir la pression du liquide de frein dans le cylindre de roue.
	Baisse de la pression	MARCHE (Fermée)	MARCHE (Ouverte)	Du liquide de frein est envoyé du cylindre de roue au réservoir par l'intermédiaire de l'électrovanne de sortie. Il est ensuite renvoyé au maître-cylindre par la pompe.
	Augmentation de la pression	ARRET (Ouverte)	ARRET (Fermée)	La pression du liquide de frein du maître-cylindre est transmise au cylindre de roue.

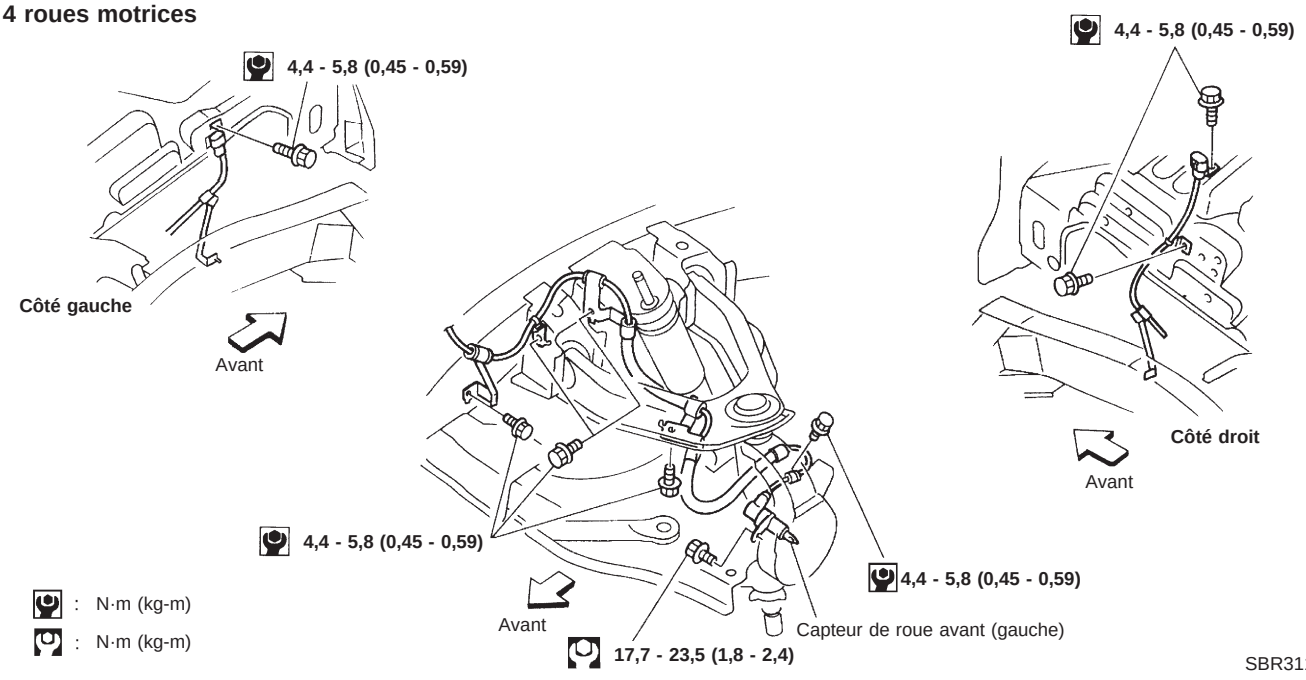
Dépose et repose



ATTENTION :
Faire attention de ne pas abîmer la bordure du capteur et les dents du rotor du capteur.
Lors de la dépose du moyeu de roue avant ou de l'ensemble d'arbre de l'axe arrière, débrancher le capteur de roue du système ABS de l'ensemble et le pousser à l'écart.

Dépose et repose (Suite)

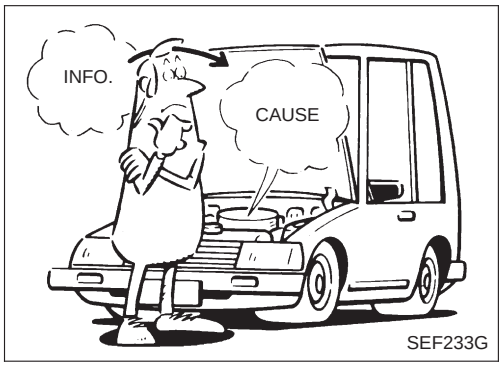
CAPTEUR DE G

Toujours remplacer le capteur G en cas de choc brutal ou de chute. Sinon, les caractéristiques de performance du capteur G changeront, ce qui, par conséquent, changera les caractéristiques de performances du boîtier de contrôle de l'ABS.

ACTIONNEUR ABS ET BOITIER ELECTRIQUE

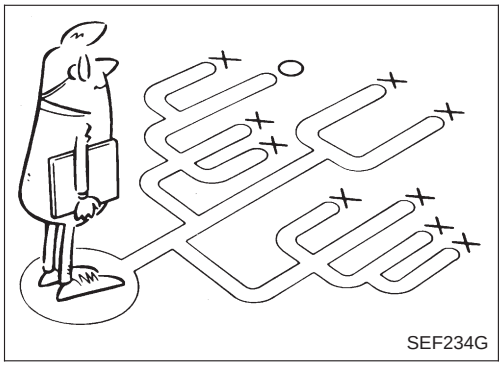
Dépose

1. Débrancher le câble de batterie.
2. Vidanger le liquide de frein. Se reporter à ''Vidange du liquide de frein'', BR-3.
3. Déposer les boulons et écrous de fixation du support de montage.
4. Débrancher le connecteur, les conduites de frein et déposer les écrous de fixation.



Repose

ATTENTION :



Après repose, refaire le plein de liquide de frein. Puis purger l'air. Se reporter à ''Purge du circuit de freinage'', BR-4.

1. Brancher les conduites de frein provisoirement.
2. Serrer les boulons et les écrous de fixation.
3. Serrer les conduites de frein.
4. Brancher le connecteur et le câble de batterie.

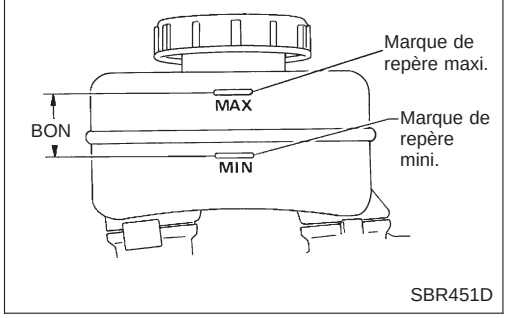
SEF234G

Comment effectuer les diagnostics des défauts permettant une réparation rapide et correcte

INTRODUCTION

Les principales commandes du système anti-enrayeur des freins (ABS) fonctionnent à partir d'un boîtier de contrôle éléctronique. Le boîtier de contrôle reçoit des signaux d'entrée envoyés par les capteurs, et envoie des signaux à son tour aux actionneurs. Il est essentiel que les deux catégories de signaux soient correctes et stables. Il est également important de rechercher des causes de problèmes plus conventionelles telles que des fuites d'air dans les canalisations de l'assistance de frein, un niveau de liquide de frein insuffisant ou autres problèmes pouvant affecter le circuit de freinage.

Il est beaucoup plus difficile de diagnostiquer un problème qui apparaît par intermittence qu'un problème qui apparaît d'une façon continue. La plupart des pannes intermittentes sont causées par des mauvais raccords électriques ou un mauvais câblage. Il faut donc vérifier correctement tous les circuits électriques qui pourraient être mal branchés, afin d'éviter le remplacement de pièces encore bonnes.



Il est assez difficile de trouver la cause des pannes avec simplement une vérification à l'œil nu, aussi nous vous conseillons d'effectuer des essais sur route.

Avant d'entreprendre les vérifications, prendre quelques minutes pour parler au client qui se plaint de l'ABS. Le client est une très bonne source de renseignements sur ces problèmes, particulièrement sur les pannes intermittentes. A partir de ce que le client vous dira, vous pourrez plus facilement localiser les symptômes et essayer d'en trouver la cause.

Lors du diagnostic, commencer par vérifier les pannes dites ''conventionelles''. Ceci est un des meilleurs moyens pour dépister les pannes de frein sur les véhicules avec ABS.

Vérification préliminaire

A

Vérifier le niveau du liquide de frein dans le réservoir.

Un niveau de liquide bas peut indiquer une usure des plaquettes de frein ou une fuite des canalisations de frein.

B

Vérifier s'il n'y a pas de fuite de liquide, dans les canalisations de frein.
- Mauvais → Réparer.
- Bon

C

Vérifier le fonctionnement de l'assistance de frein et l'étanchéité à l'air. Se reporter à BR-15.
- Mauvais → Remplacer.
- Bon

D

Vérifier les plaquettes, le rotor, les garnitures et le tambour de frein. Se reporter à BR-21,23, 28.
- Mauvais → Remplacer.
- Bon

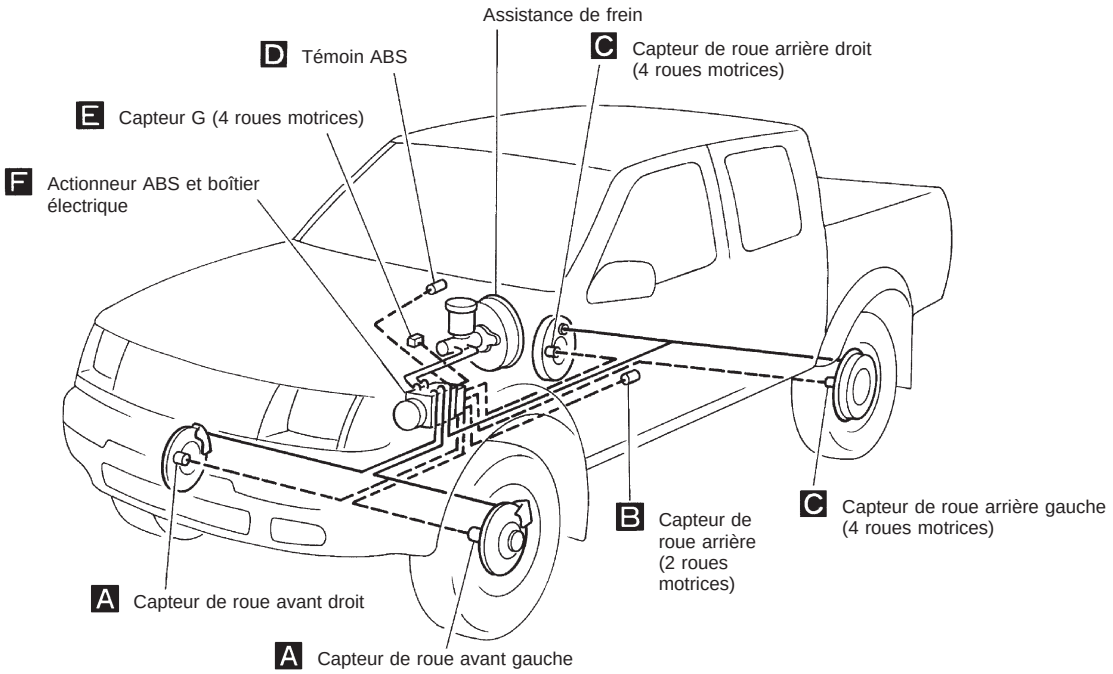
A

Vérifier de nouveau le niveau du liquide de frein dans le réservoir.
- Mauvais → Faire le plein du liquide de frein.
- Bon

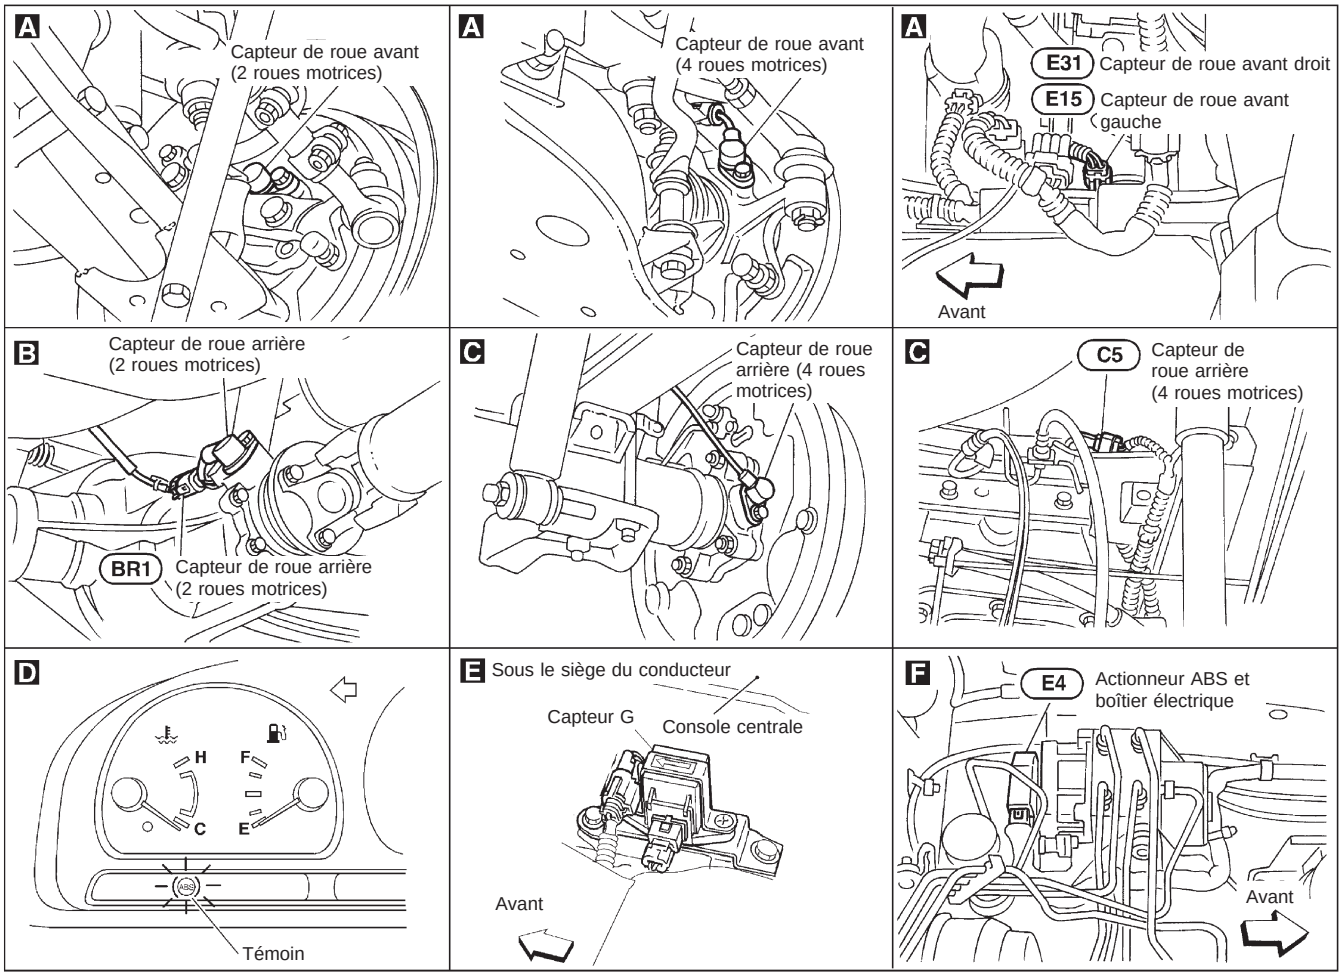
E

Vérifier le fonctionnement du témoin. Lorsque le contact d'allumage est mis sur ON, le témoin s'allume.
- Mauvais → Vérifier le fusible, l'ampoule du témoin et le circuit du témoin.
- Bon

Vérifier l'extinction du témoin après le démarrage du moteur.
- Mauvais → Se reporter à Auto diagnostic, BR-53, 57.
- Bon



Conduire le véhicule à plus de 30 km/h pendant au moins 1 minute.



S'assurer que le témoin reste allumé pendant la conduite.
- Mauvais → Se reporter à auto diagnostic, BR-53, 57.
- Bon

Autodiagnostic

Fonction

- Lorsqu'il y a un problème sur le systgeme d'ABS, le témoin du tableau de bord s'allume. Pour mettre en marche le mode de résultats d'autodiagnostic, mettre à la masse la borne de l'autodiagnostic (contrôle) située sur le ''Connecteur de liaison de données pour CONSULT''. L'emplacement du défaut est indiqué par le clignotement du témoin avertisseur.

PROCEDURE D'AUTODIAGNOSTIC

Conduire le véhicule à plus de 30 km/h pendant au moins une minute.

↓

Mettre le contact d'allumage sur ''OFF''.

↓

A

Mettre à la masse la borne ''4'' du ''Connecteur de liaison de données pour CONSULT'' avec un faisceau approprié.

↓

Mettre le contact d'allumage sur ''ON'' lorsque la borne ''4'' est mise à la masse.
Ne pas enfoncer la pédale de frein.

↓

B

Après 3,0 secondes, le témoin avertisseur commence à clignoter pour indiquer le numéro du code de défaut (voir NOTE).

↓

Déterminer l'emplacement des défauts à l'aide du tableau des codes de défaut. Se reporter à BR-55. Puis faire les réparations requises en observant les procédures de diagnostic.

↓

Une fois les défauts réparés, effacer les codes de défaut mémorisés dans le boîtier de contrôle. Se reporter à BR-54.

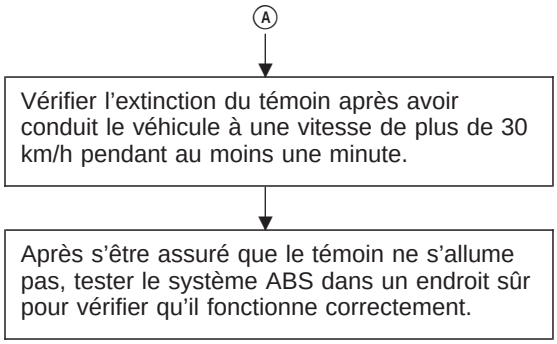
↓

Passer à nouveau en mode de résultats d'autodiagnostic pour vérifier si les codes de défaut ont été effacés.

↓

C

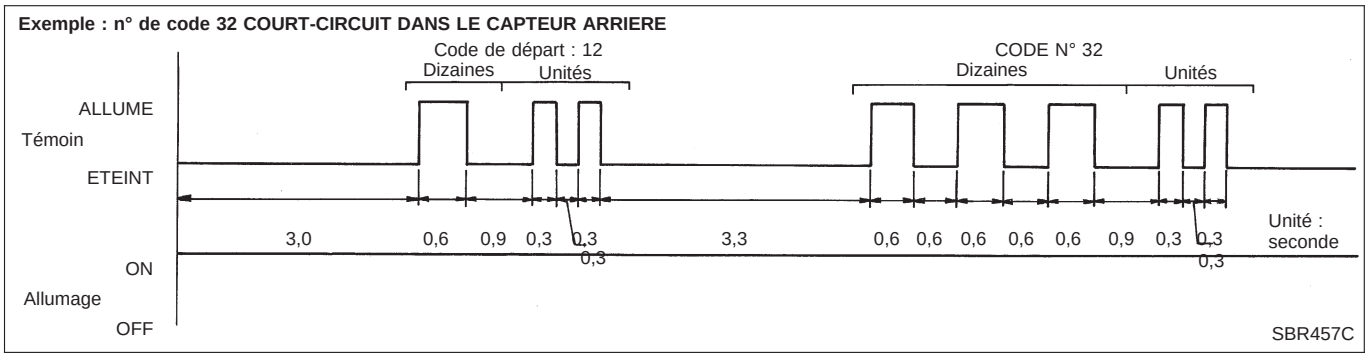
Débrancher la borne de contrôle de la masse. Le mode de résultats d'autodiagnostic est maintenant terminé.



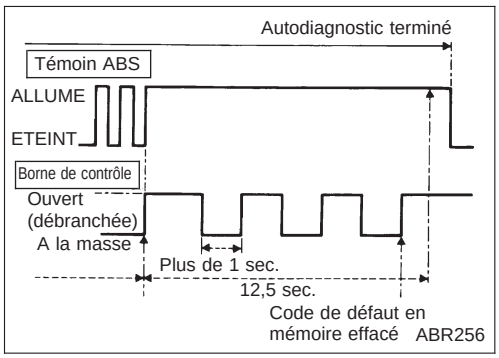
↓

Ⓐ

REMARQUE:
L'indication est terminée après cinq minutes. Le témoin se remet cependant à clignoter lorsqu'on passe le contact d'allumage de la position ''OFF'' à ''ON''.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Autodiagnostic (Suite)

COMMENT LIRE LES RESULTATS DE L'AUTODIAGNOSTIC (codes de défaut)

- Déterminer le n° de code en comptant le nombre de clignotements du témoin.
- Lorsque plusieurs défauts se produisent en même temps, le système pourra mémoriser jusqu'à trois codes. Le dernier défaut sera indiqué en premier.
- Le témoin commence avec le code 12. Par la suite, un maximum de trois numéros de code sera donné en commençant par le dernier. Le témoin revient ensuite au code de départ 12 pour répéter l'indication (l'indication sera donnée pendant un maximum de cinq minutes).
- Le tableau de code de défaut est mentionné à la page suivante.

COMMENT EFFACER LES RESULTATS DE L'AUTODIAGNOSTIC (codes de défaut)

1. Débrancher la borne de vérification de la masse (le témoin ABS reste allumé).
2. Dans les 12,5 secondes, mettre en mise à la masse la borne de vérification trois fois. Chaque mise à la masse de borne doit durer plus d'une seconde. Le témoin ABS s'éteint une fois l'effacement terminé.
3. Effectuer de nouveau l'autodiagnostic. Se reporter à BR-53. Seul le code de départ doit apparaître, aucun code de défaut de fonctionnement ne doit apparaître.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

★1 : Modèles à 2 roues motrices seulement

★2 : Modèles à 4 roues motrices seulement

★3 : Si une ou plusieurs roues patinent sur une route cahoteuse ou glissante pendant 40 secondes ou plus, le témoin ABS s'allume. Cela n'indique pas un défaut de fonctionnement. Uniquement en cas de court-circuit. (n° de code 26, 22, 32 et 36), après réparation, le témoin ABS s'allume également quand le contact d'allumage est mis sur ''ON''. En pareil cas, conduire le véhicule à plus de 30 km/h pendant environ 1 minute comme spécifié dans ''PROCEDURE D'AUTODIAGNOSTIC'', BR-53. Vérifier que le témoin ABS est bien éteint pendant la conduite du véhicule.

★4 : Le code de défaut ''57'', qui renvoie à une basse tension d'alimentation, n'indique pas un défaut de fonctionnement du boîtier de contrôle d'ABS. Ne pas remplacer le boîtier de contrôle d'ABS par un neuf.

★5 : Le code de défaut ''61'' peut parfois apparaître quand le moteur d'ABS est mal mis à la masse, S'il apparaît, prendre soin de vérifier l'état de la connexion du circuit de masse du moteur d'ABS.

Procédure d’inspection CONSULT

PROCEDURE D’AUTODIAGNOSTIC

A

1) Mettre le contact d’allumage sur ‘‘OFF’’.
2) Brancher CONSULT au connecteur de liaison de données pour CONSULT.

↓

1) Démarrer le moteur.
2) Conduire le véhicule à plus de 30 km/h pendant au moins une minute.

↓

B 1) Arrêter le véhicule avec le moteur en marche et toucher ‘‘DEPART’’ sur l’écran de CONSULT.
C 2) Appuyer sur ‘‘ABS’’.
D 3) Appuyer sur ‘‘RESULT AUTO-DIAG’’.
● L’écran montre le défaut de fonctionnement détecté et combien de fois le contact d’allumage a été tourné depuis le dernier défaut de fonctionnement.

↓

Faire les réparations nécessaires en suivant les procédures de diagnostic.

↓

E

Une fois les défauts réparés, effacer les résultats de l’autodiagnostic mémorisés dans le boîtier de contrôle en appuyant ‘‘EFFAC’’.

↓

Vérifier l’extinction du témoin après avoir conduit le véhicule à plus de 30 km/h pendant au moins une minute.

↓

Essayer le système d’ABS dans un endroit sûr pour vérifier s’il fonctionne correctement.

Remarque : l’écran ‘‘RESULT AUTO-DIAG’’ montre le défaut de fonctionnement détecté et combien de fois le contact d’allumage a été tourné depuis le défaut de fonctionnement.

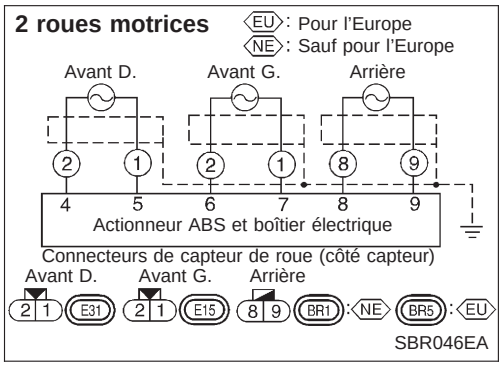
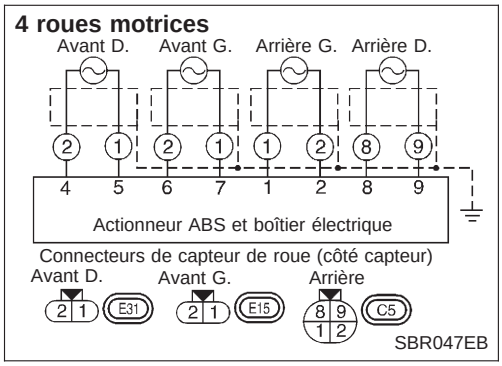
CONTACT G★	Le contact d'allumage est sur ON.	CONTACT G (CAPTEUR G), MARCHE : Régler le MONTEUR DE CONTACT G sur ''ON'' (le circuit du contact G est fermé). ARRET : Régler le moniteur du contact G sur ''OFF'' (le circuit du contact G est ouvert).

★ : Modèles à 4 roues motrices seulement

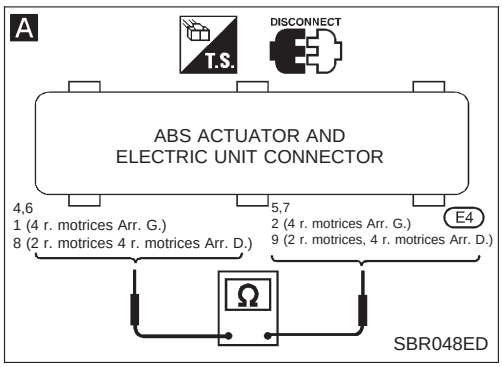
Remarque : le test actif s'arrêtera automatiquement 10 secondes après le début du test (la surveillance du ''SIGNAL LIMIT'' indique MAR).

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

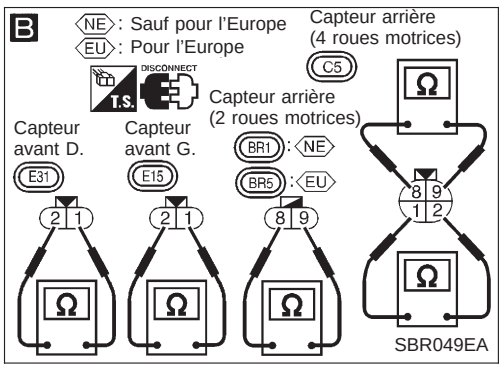




Vérification du circuit de mise à la masse



MASSE DE L'ACTIONNEUR D'ABS ET DU BOITIER ELECTRIQUE



- Vérifier la résistance entre les bornes du connecteur de l'actionneur d'ABS et du boîtier électrique et la masse.
  Résistance : environ 0Ω

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic 1 (Capteur de roue ou rotor)

Codes de défaut n° 21, 22, 25, 26, 31, 32, 35, 36 ou 18

DEBUT DE L'INSPECTION

1. Débrancher les connecteurs de l'actionneur de l'ABS, le boîtier électrique et le capteur de roue selon le numéro de code de défaut. Contrôler si les bornes ne sont pas endommagées ou les connexions débranchées. Puis rebrancher les connecteurs.
2. Effectuer de nouveau l'autodiagnostic.
   Est-ce que la lampe témoin fonctionne encore ?

Non → Fin de l'inspection

Oui ↓

A

VERIFICATION ELECTRIQUE DU CAPTEUR DE ROUE.

1. Débrancher l'actionneur de l'ABS et le connecteur du boîtier électrique.
2. Vérifier la résistance entre l'actionneur de l'ABS et les bornes du connecteur (côté carrosserie) (E4) du boîtier électrique.
   Code n° 21 ou 22 (roue avant droite)
   Bornes (4) et (5)
   Code n° 25 ou 26 (roue avant gauche)
   Bornes (6) et (7)
   Code n° 31 ou 32 (roue arrière droite 4 roues motrices)
   Bornes (8) et (9)
   Code n° 35 ou 36 (roues arrière pour les 2 roues motrices, roue arrière gauche pour les 4 roues motrices)
   Bornes (8) et (9) (roues arrière pour les 2 roues motrices)
   Bornes (1) et (2) (roue arrière gauche pour les 4 roues motrices)
   Résistance :
   Avant 1,44 - 1,76 kΩ
   Arrière (2 roues motrices) 1,22 - 1,48 kΩ
   Arrière (4 roues motrices) 1,44 - 1,76 kΩ

Bon → (A) (Aller à la page suivante).

Mauvais ↓

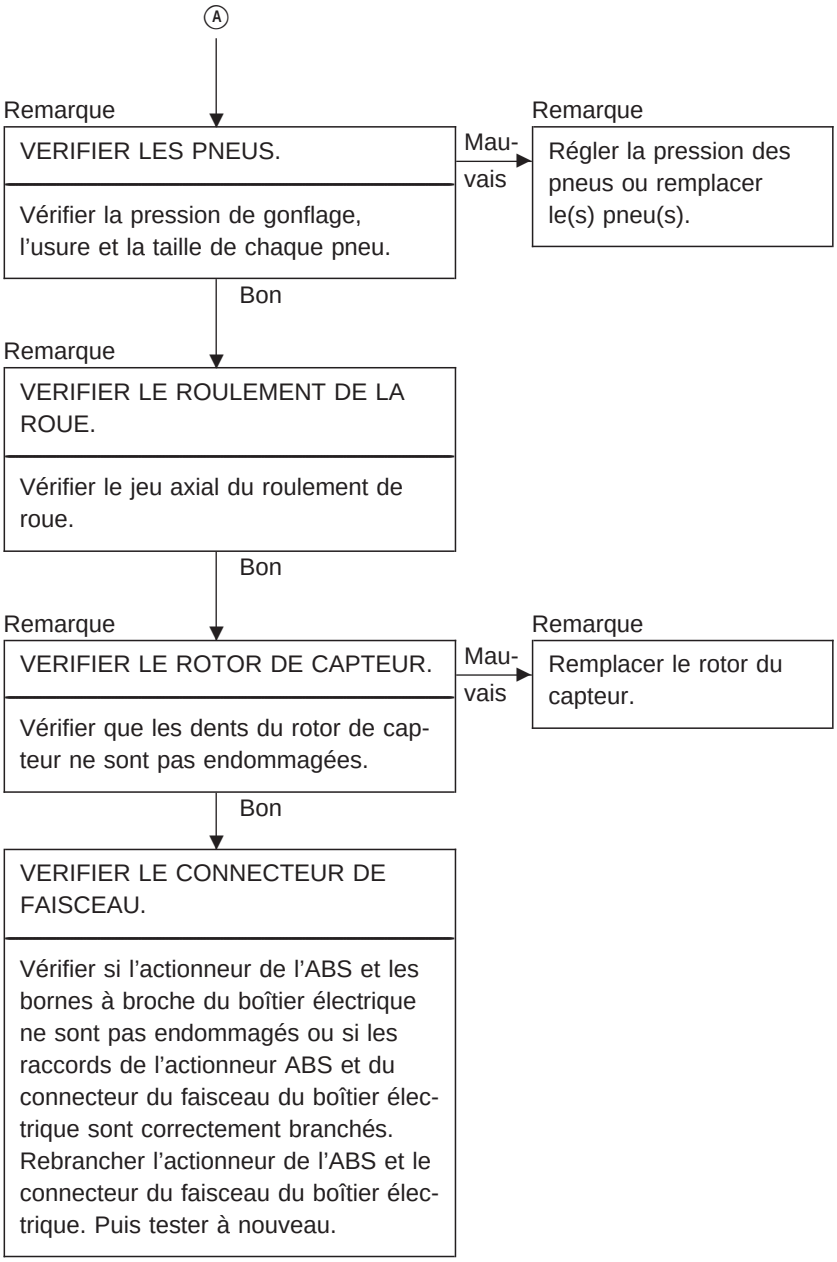
B

VERIFICATION DU CAPTEUR DE ROUE

Vérifier la résistance de chaque capteur.
Résistance : Avant 1,44 - 1,76 kΩ
Arrière (2 roues motrices) 1,22 - 1,48 kΩ
Arrière (4 roues motrices) 1,44 - 1,76 kΩ

Bon → Vérifier les points suivants.
- Connecteurs de faisceau (E4), (E31), (E15) (BR1) (BR5), (C5)
- Faisceau ouvert ou court-circuité entre les connecteurs de capteur de roue, l'actionneur de l'ABS et le boîtier électrique

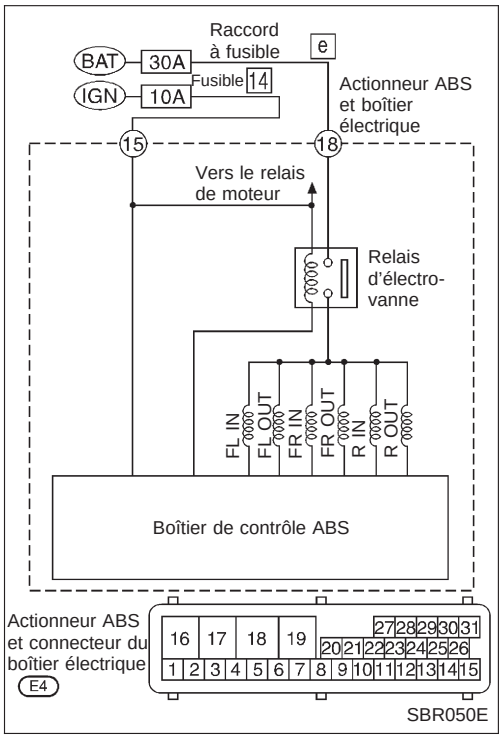
Si le résultat n'est pas satisfaisant, réparer le faisceau ou les connecteurs.



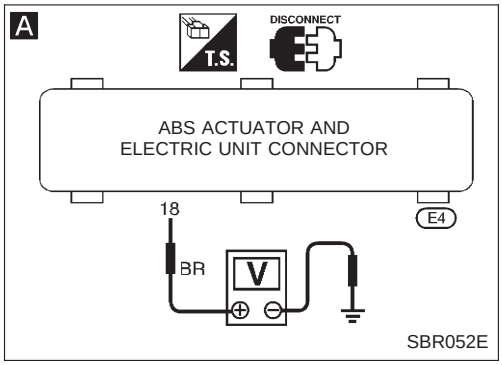
Mauvais ↓

REMPLACER.

Remplacer le capteur de roue.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Procédure de diagnostic 1 (Capteur de roue ou rotor) (Suite)

Remarque : la position de la roue doit être signalée par les numéros de code à l'exception du code n° 18 (rotor du capteur).

SimpoPDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic 2 (Electrovanne d'actionneur de l'ABS et relais d'électro-vanne)

Code de défaut n° 41, 45, 55, 42, 46, 56, 63

VERIFIER LE RACCORD A FUSIBLE.

Vérifier le raccord à fusible de 30 A [e]. Pour la disposition des raccords à fusibles, se reporter au chapitre ''DISPOSITION DE L'ALIMENTATION ELECTRIQUE'' dans la section EL.

Mauvais → Ⓐ (Aller à la page suivante).

Bon ↓

VERIFIER LE FUSIBLE.

Vérifier le fusible de 10A [14]. Pour la disposition du fusible, se reporter au chapitre ''DISPOSITION DE L'ALIMENTATION ELECTRIQUE'' dans la section EL.

Mauvais → Ⓑ (Aller à la page suivante).

Bon ↓

VERIFIER LE CONNECTEUR.

1. Débrancher l'actionneur de l'ABS et le connecteur du boîtier électrique. Vérifier les bornes pour voir s'il n'y a pas de dommages ou de connexions desserrées. Puis rebrancher le connecteur.
2. Effectuer de nouveau l'autodiagnostic.
   Est-ce que la lampe témoin fonctionne encore ?

Non → Fin de l'inspection

Oui ↓

VERIFIER LE CIRCUIT DE MISE A LA MASSE DE L'ACTIONNEUR ABS ET DU BOITIER ELECTRIQUE.

Se reporter à ''MASSE DE L'ACTIONNEUR ABS ET DU BOITIER ELECTRIQUE'' dans le chapitre ''Vérification du circuit de mise à la masse'', BR-62.

Mauvais → Réparer le faisceau et le connecteur.

Bon ↓

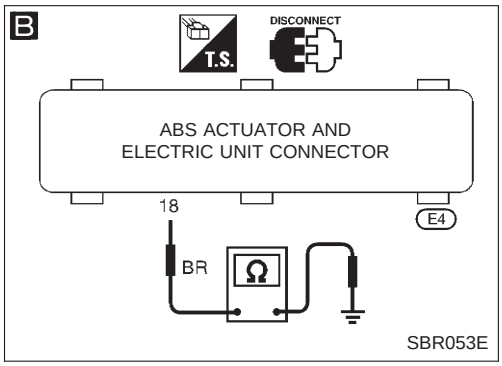
A

VERIFIER LE CIRCUIT DE L'ALIMENTATION ELECTRIQUE DU RELAIS DE L'ELECTROVANNE.

1. Débrancher l'actionneur de l'ABS et le connecteur du boîtier électrique.
2. Vérifier la tension entre l'actionneur de l'ABS et la borne ⑱ du connecteur (côté carrosserie) [E4] du boîtier électrique et la masse.
   Il doit y avoir tension de la batterie.

Mauvais → Vérifier les points suivants.
- Connecteur de faisceau [E4]
- Faisceau ouvert ou court-circuité entre l'actionneur de l'ABS, le boîtier électrique et le raccord à fusible

Si le résultat n'est pas satisfaisant, réparer le faisceau ou le connecteur.



Bon ↓

REMPLACER.

Remplacer l'actionneur de l'ABS et le boîtier électrique.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic 2 (Electrovanne d'actionneur de l'ABS et relais d'électrovanne) (Suite)

Ⓐ

REMPLACER.

Remplacer le raccord à fusible.
Le raccord à fusible saute-t-il lorsque le contact d'allumage est mis sur "ON" ?

Non → Fin de l'inspection

Oui

B

VERIFIER LE CIRCUIT DE L'ALIMENTATION ELECTRIQUE DU RELAIS DE L'ELECTROVANNE.

1. Débrancher l'actionneur de l'ABS et le connecteur du boîtier électrique.
2. Vérifier la continuité entre l'actionneur de l'ABS et la borne ⑱ du connecteur (côté carrosserie) E4 du boîtier électrique et la masse.
   Il doit y avoir continuité.

Mauvais → Vérifier les points suivants.
- Connecteur de faisceau E4
- Faisceau ouvert ou court-circuité entre l'actionneur de l'ABS, le boîtier électrique et le raccord à fusible

Si le résultat n'est pas satisfaisant, réparer le faisceau ou le connecteur.

Bon

REMPLACER.

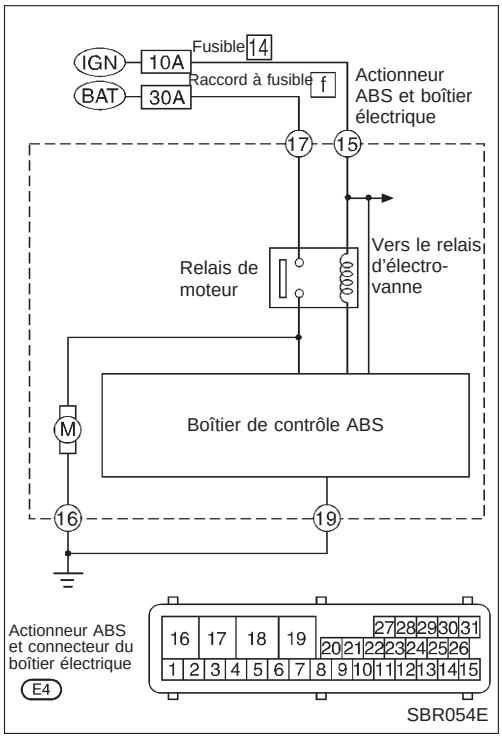
Remplacer l'actionneur de l'ABS et le boîtier électrique.

Ⓑ

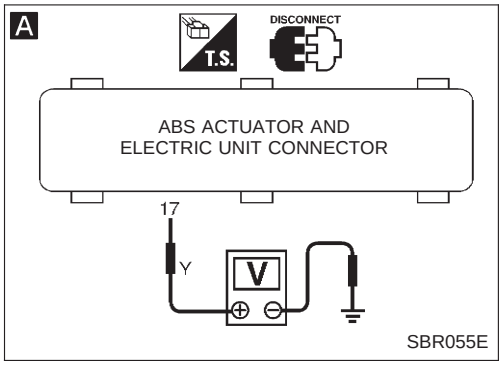
REMPLACER.

Remplacer le fusible.
Le fusible saute-t-il lorsque le contact d'allumage est mis sur "ON" ?

Oui → Vérifier les points suivants.
- Connecteur de faisceau E4
- Faisceau ouvert ou court-circuité entre l'actionneur de l'ABS, le boîtier électrique et le fusible



Si le résultat n'est pas satisfaisant, réparer le faisceau ou le connecteur.



Non

FIN

FIN DE L'INSPECTION

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic 3 (Relais de moteur ou moteur)

Code de défaut n° 61

VERIFIER LE RACCORD A FUSIBLE.

Vérifier le raccord à fusible de 30A f. Pour la disposition des raccords à fusibles, se reporter au chapitre "DISPOSITION DE L'ALIMENTATION ELECTRIQUE" dans la section EL.

Mauvais → Ⓐ (Aller à la page suivante).

Bon ↓

VERIFIER LE CONNECTEUR.

1. Débrancher l'actionneur de l'ABS et le connecteur du boîtier électrique. Vérifier les bornes pour voir s'il n'y a pas de dommages ou de connexions desserrées. Puis rebrancher le connecteur.
2. Effectuer de nouveau l'autodiagnostic.
   Est-ce que la lampe témoin fonctionne encore ?

Non → Fin de l'inspection

Oui ↓

A

VERIFIER LE CIRCUIT D'ALIMENTATION ELECTRIQUE DU RELAIS DE MOTEUR.

1. Débrancher l'actionneur de l'ABS et le connecteur du boîtier électrique.
2. Vérifier la résistance entre l'actionneur de l'ABS et la borne ⑰ du connecteur (côté carrosserie) E4 du boîtier électrique et la masse.
   Il doit y avoir tension de la batterie.

Mauvais → Vérifier les points suivants.
- Connecteur de faisceau E4
- Faisceau ouvert ou court-circuité entre l'actionneur de l'ABS, le boîtier électrique et le raccord à fusible

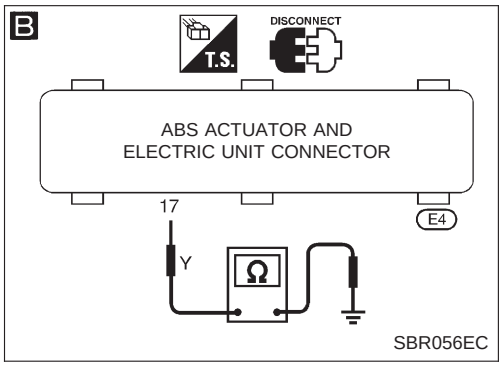
Si le résultat n'est pas satisfaisant, réparer le faisceau ou le connecteur.

Bon ↓

VERIFIER LA MISE A LA MASSE DE L'ACTIONNEUR DE L'ABS ET DU BOITIER ELECTRIQUE.

Se reporter à "MASSE DE L'ACTIONNEUR DE L'ABS ET DU BOITIER ELECTRIQUE" dans le chapitre "Vérification du circuit de mise à la masse", BR-62.

Mauvais → Réparer le faisceau et les bornes.



Bon ↓

REMPLACER.

Remplacer l'actionneur de l'ABS et le boîtier électrique.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic 3 (Relais de moteur ou moteur) (Suite)

Ⓐ

REMPLACER.

Remplacer le raccord à fusible.
Le raccord à fusible saute-t-il lorsque le contact d'allumage est mis sur "ON" ?

Non → Fin de l'inspection

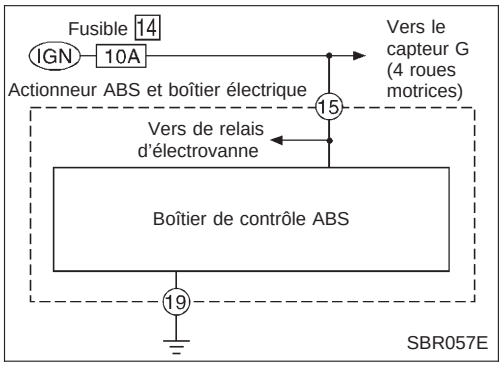
Oui

B

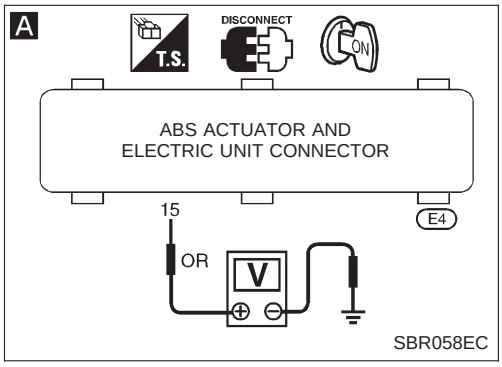
VERIFIER LE CIRCUIT DE L'ALIMENTATION ELECTRIQUE DU MOTEUR DE L'ACTIONNEUR ABS .

1. Débrancher le câble de la batterie, l'actionneur de l'ABS et le connecteur (E4) du boîtier électrique.
2. Vérifier la continuité entre l'actionneur de l'ABS et la borne (17) du connecteur (côté carrosserie) (E4) du boîtier électrique et la masse.
   Il ne doit pas y avoir de continuité.

Mauvais →
Vérifier les points suivants.
- Connecteur de faisceau (E4)
- Faisceau ouvert ou court-circuité entre l'actionneur de l'ABS, le boîtier électrique et le raccord à fusible



Si le résultat n'est pas satisfaisant, réparer le faisceau ou le connecteur.



Bon

VERIFIER LE CONNECTEUR DE FAISCEAU.

Vérifier si l'actionneur de l'ABS et les bornes à broche du boîtier électrique ne sont pas endommagés ou si les raccords de l'actionneur ABS et du connecteur du faisceau du boîtier électrique sont correctement branchés.
Rebrancher l'actionneur de l'ABS et le connecteur du faisceau du boîtier électrique. Puis tester à nouveau.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic 4 (Basse tension)

Code de défaut n° 57

VERIFIER LE CONNECTEUR.

1. Débrancher l'actionneur de l'ABS et le connecteur du boîtier électrique. Vérifier les bornes pour voir s'il n'y a pas de dommages ou de connexions desserrées. Puis rebrancher le connecteur.
2. Effectuer de nouveau l'autodiagnostic.
   Est-ce que la lampe témoin fonctionne encore ?

Non → Fin de l'inspection

Oui ↓

A

VERIFIER LE CIRCUIT DE L'ALIMENTATION ELECTRIQUE DU BOITIER DE CONTROLE ABS.

1. Débrancher l'actionneur de l'ABS et le connecteur du boîtier électrique.
2. Vérifier la résistance entre l'actionneur de l'ABS et la borne (15) du connecteur (côté carrosserie) (E4) du boîtier électrique et la masse.
   La tension de la batterie doit exister quand le contact d'allumage est mis sur ''ON''.

Mauvais → (A) (Voir ci-dessous).

Bon ↓

VERIFIER LA MISE A LA MASSE DU BOITIER DE CONTROLE ABS.

Se reporter à ''MASSE DE L'ACTIONNEUR DE L'ABS ET DU BOITIER ELECTRIQUE'' dans le chapitre ''Vérification du circuit de mise à la masse'', BR-62.

Mauvais → Réparer le faisceau et le connecteur.

Bon ↓

VERIFIER LE CONNECTEUR DE FAISCEAU.

Vérifier si l'actionneur de l'ABS et les bornes à broche du boîtier électrique ne sont pas endommagés ou si les raccords de l'actionneur ABS et du connecteur du faisceau du boîtier électrique sont correctement branchés. Rebrancher l'actionneur de l'ABS et le connecteur du faisceau du boîtier électrique. Puis tester à nouveau.

(A) ↓

VERIFIER LE FUSIBLE.

Vérifier le fusible de 10A 14. Pour la disposition du fusible, se reporter au chapitre ''DISPOSITION DE L'ALIMENTATION ELECTRIQUE'' dans la section EL.

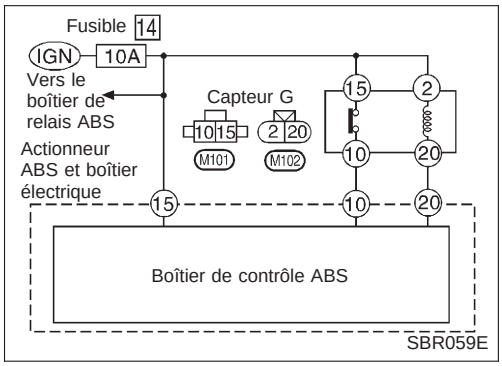
Mauvais → Remplacer le fusible.

Bon ↓

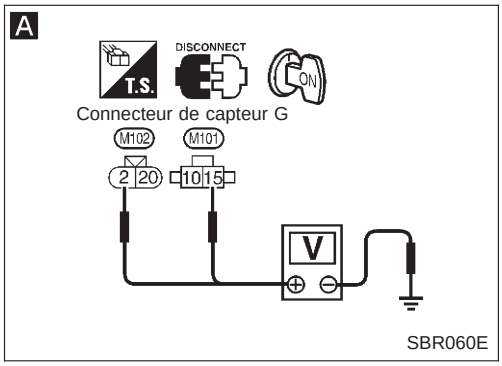
VERIFIER L'ALIMENTATION ELECTRIQUE DU BOITIER DE CONTROLE ABS.

Vérifier la continuité entre la batterie et l'actionneur de l'ABS et la borne (15) du connecteur (E4) (côté carrosserie).

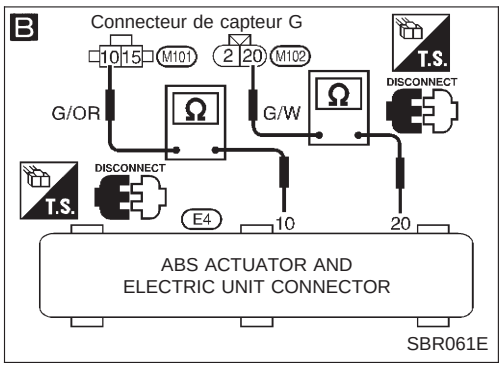
Mauvais → Vérifier les points suivants.
- Connecteur de faisceau (E4)
- Faisceau ouvert ou court-circuité entre l'actionneur de l'ABS, le boîtier électrique et le fusible



Si le résultat n'est pas satisfaisant, réparer le faisceau ou le connecteur.



Bon ↓



VERIFIER LA BATTERIE.

Vérifier la batterie. Se reporter à ''BATTERIE'' dans la section EL.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic 5 (Capteur G)

Code de défaut n° 17

VERIFIER LE CIRCUIT DE L'ALIMENTATION ELECTRIQUE DU CAPTEUR G.

Vérifier le fusible de 10A 14 . Pour la disposition du fusible, se reporter au chapitre "DISPOSITION DE L'ALIMENTATION ELECTRIQUE" dans la section EL.

Mauvais → Remplacer le fusible.

Bon ↓

VERIFIER LE CONNECTEUR.

1. Débrancher l'actionneur de l'ABS et le connecteur du boîtier électrique. Vérifier les bornes pour voir s'il n'y a pas de dommages ou de connexions desserrées. Puis rebrancher le connecteur.
2. Effectuer de nouveau l'autodiagnostic.
   Est-ce que la lampe témoin fonctionne encore ?

Non → Fin de l'inspection

Oui ↓

VERIFIER LE CAPTEUR G.

Se reporter à "CAPTEUR G" dans le chapitre "Inspection des composants électriques", BR-71.

Mauvais → Remplacer le capteur G.

Bon ↓

A

VERIFIER LE CIRCUIT DE L'ALIMENTATION ELECTRIQUE DU CAPTEUR G.

1. Débrancher le connecteur du capteur G.
2. Vérifier la tension entre les bornes 2 , 15 du connecteur (côté carrosserie) M101 , M102 de capteur G et la masse.
   Il doit y avoir tension de la batterie.

Mauvais → Vérifier les points suivants.
- Connecteurs de faisceau M101 , M102 et E4
- Faisceau ouvert ou court-circuité entre le capteur G, l'actionneur de l'ABS et le boîtier électrique

Si le résultat n'est pas satisfaisant, réparer le faisceau ou les connecteurs.

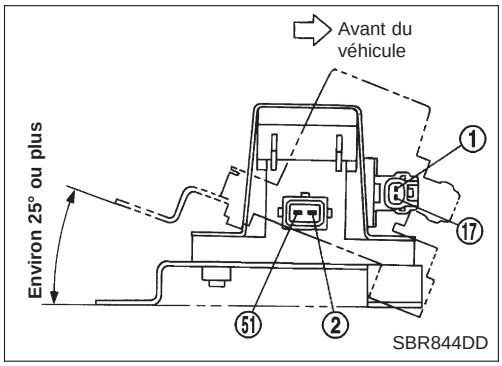
Bon ↓

B

VERIFIER LA MASSE DU CAPTEUR G.

1. Débrancher l'actionneur de l'ABS, le connecteur du boîtier électrique et les connecteurs du capteur G.
2. Vérifier la continuité entre l'actionneur de l'ABS et les bornes 10 , 20 du connecteur (côté carrosserie) E4 du boîtier electrique et les bornes 10 , 20 des connecteurs M101 , M102 (côté carrosserie) du capteur G.
   Il doit y avoir continuité

Mauvais → Vérifier les points suivants.
- Connecteurs de faisceau M101 , M102 et E4
- Faisceau ouvert ou court-circuité entre le capteur G, l'actionneur de l'ABS et le boîtier électrique



Si le résultat n'est pas satisfaisant, réparer le faisceau ou les connecteurs.

Bon ↓

VERIFIER LE CONNECTEUR DE FAISCEAU.

Vérifier si l'actionneur de l'ABS et les bornes à broche du boîtier électrique ne sont pas endommagés ou si les raccords de l'actionneur ABS et du connecteur du faisceau du boîtier électrique sont correctement branchés.
Rebrancher l'actionneur de l'ABS et le connecteur du faisceau du boîtier électrique. Puis tester à nouveau.

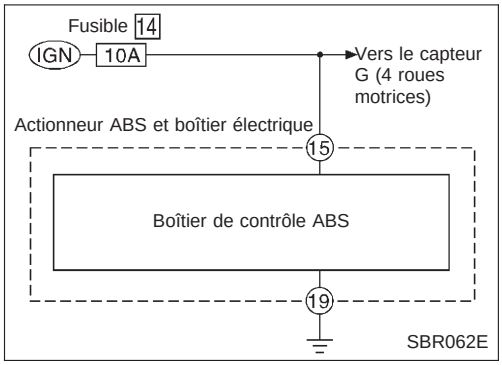
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic 5 (Capteur G) (Suite)

INSPECTION DES COMPOSANTS ELECTRIQUES

Capteur G

ATTENTION :



Le capteur G est facilement abîmé s'il subit un impact. Veiller à ne pas le faire tomber ou le cogner.

1. Calculer la résistance entre les bornes ⑩ et ⑮ du connecteur du boîtier de capteur G

Position du capteur G	Résistance entre les bornes ⑩ et ⑮	Position du contact de capteur G
Reposé dans le véhicule	1,4 - 1,6 kΩ	"MARCHE"
Incliné comme indiqué ci-contre	4,7 - 5,5 kΩ	"ARRET"

2. Calculer la résistance entre les bornes ② et ⑳ du connecteur du boîtier de capteur G.

Résistance :	70 - 124 Ω

Procédure de diagnostic 6 (Boîtier de contrôle)

Code de défaut n° 71

VERIFIER LE CONNECTEUR.

1. Débrancher l'actionneur de l'ABS et le connecteur du boîtier électrique. Contrôler si les bornes ne sont pas endommagées ou les connexions débranchées. Puis rebrancher le connecteur.
2. Effectuer de nouveau l'autodiagnostic. **Est-ce que la lampe témoin fonctionne encore ?**

Non → Fin de l'inspection

Oui ↓

CONTROLE DE L'ALIMENTATION ELECTRIQUE DU BOITIER DE CONTROLE ABS

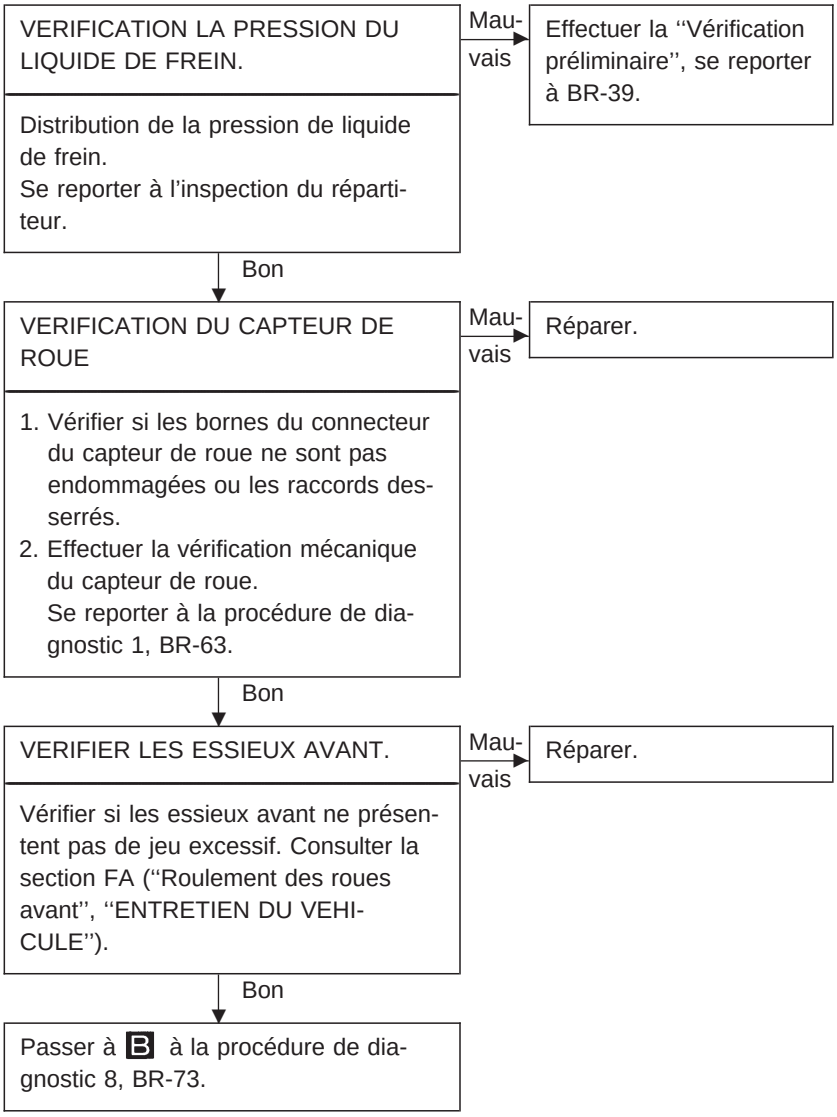
Vérifier la tension. Se reporter à A dans la procédure de diagnostic 4, BR-69.

↓

VERIFIER LES RESULTATS DE L'AUTODIAGNOSTIC

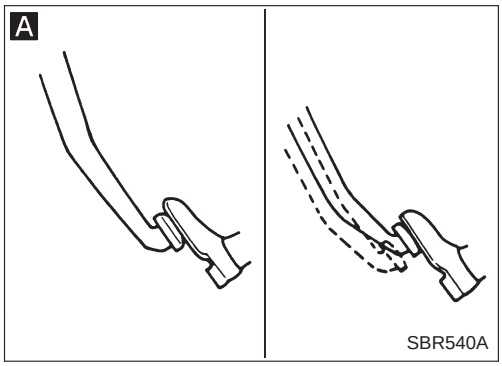
Est-ce que le témoin indique à nouveau le code n° 71 ?

Oui → Remplacer l'actionneur de l'ABS et le boîtier électrique.

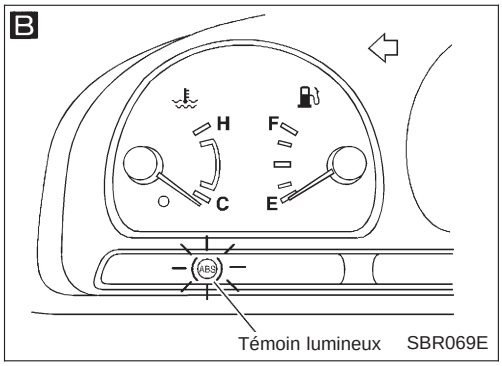


Non ↓

INSPECTION



Inspecter le système selon le n° de code.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic 7 (L'ABS fonctionne fréquemment).

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic 8 (Fonctionnement anormal de la pédale)

A

VERIFIER LA COURSE DE LA PEDALE DE FREIN.

Vérifier la course de la pédale de frein. La course de la pédale de frein est-elle anormalement importante ?

Oui → Effectuer la ‘‘Vérification préliminaire’’, se reporter à BR-39.

Non ↓

VERIFIER LE FONCTIONNEMENT DES FRIENS.

Débrancher l’actionneur de l’ABS, le connecteur du boîtier électrique et vérifier si le frein fonctionne.

Non → Effectuer la Vérification préliminaire, se reporter à BR-35.

Oui ↓

B

VERIFIER SI LE TEMOIN LUMINEUX FONCTIONNE.

S’assurer que la lampe témoin reste éteinte lors de la conduite.

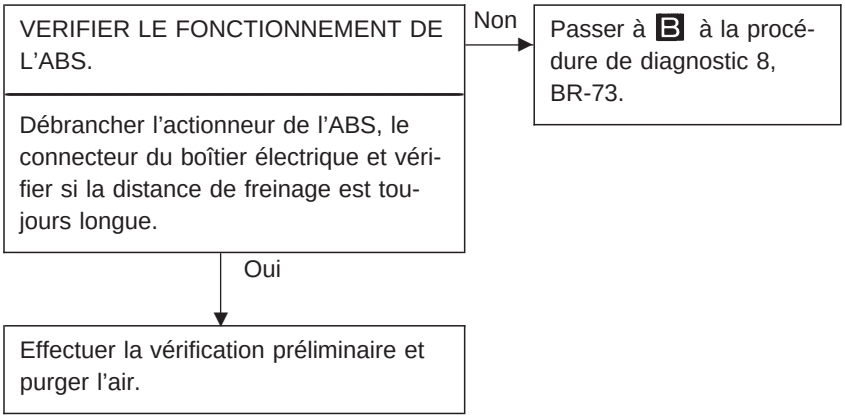
Mauvais → Effectuer ‘‘l’Autodiagnostic’’. Consulter BR-53, 57.

Bon ↓

VERIFICATION DU CAPTEUR DE ROUE

1. Vérifier le connecteur du capteur de roue pour voir s’il n’y a pas de borne endommagée ou de connexion desserrée.
2. Effectuer la vérification mécanique du capteur de roue.
   Se reporter à la procédure de diagnostic 1, BR-63.

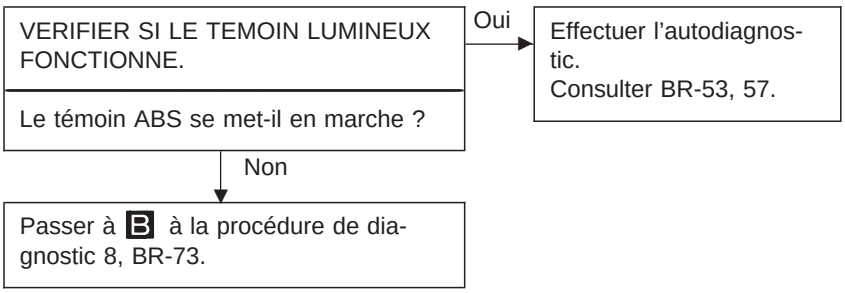
Mauvais → Réparer.



Bon ↓

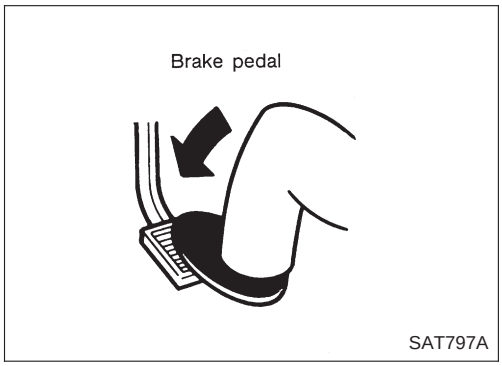
VERIFIER LE CONNECTEUR DE FAISCEAU.

Vérifier si l’actionneur de l’ABS et les bornes à broche du boîtier électrique ne sont pas endommagés ou si les raccords de l’actionneur ABS et du connecteur du faisceau du boîtier électrique sont correctement branchés. Rebrancher l’actionneur de l’ABS et le connecteur du faisceau du boîtier électrique. Puis tester à nouveau.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic 9 (Distance de freinage prolongée)



Remarque : lorsque la route est glissante, la distance de freinage peut être plus longue que pour les véhicules qui ne sont pas équipés d'ABS.

Procédure de diagnostic 10 (L'ABS ne fonctionne pas)

Remarque : l'ABS ne fonctionne pas lorsque le véhicule roule à moins de 10 km/h.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic 11 (Vibration et bruit de la pédale)

DEBUT DE L'INSPECTION

1. Serrer le frein.
2. Démarrer le moteur.
3. Le symptôme apparaît-il seulement lorsque le moteur est démarré ?

Oui → Effectuer l'autodiagnostic. Consulter BR-53, 57.

Non ↓

VERIFIER SI LE SYMPTOME APPARAIT.

Le symptôme apparaît-il lorsque les commandes de l'équipement électrique (tels que les phares) sont actionnées ?

Non → Passer à B à la procédure de diagnostic 8, BR-73.

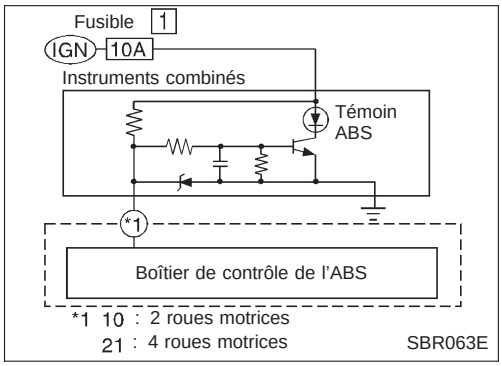
Oui ↓

VERIFICATION DU CAPTEUR DE ROUE

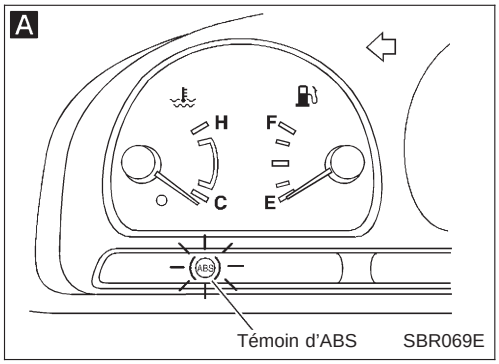
Vérifier la masse de protection du capteur de roue. Pour la disposition de la protection de la masse, se référer au schéma de câblage et ''DISPOSITION DES FAISCEAUX'' dans la section EL.

Mauvais → Réparer le capteur de roue.

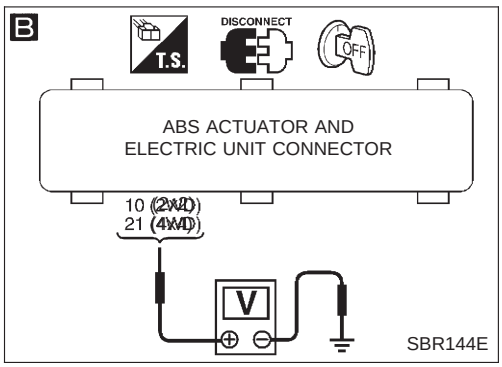
Bon ↓



VERIFIER LE CONNECTEUR DE FAISCEAU.



Vérifier si l'actionneur de l'ABS et les bornes à broche du boîtier électrique ne sont pas endommagés ou si les raccords de l'actionneur ABS et du connecteur du faisceau du boîtier électrique sont correctement branchés. Rebrancher l'actionneur de l'ABS et le connecteur du faisceau du boîtier électrique. Puis tester à nouveau.



Remarque : l'ABS peut fonctionner et provoquer des vibrations dans les circonstances suivantes.

- **Application graduelle de frein en même temps que le passage de vitesse ou le fonctionnement de l'embrayage.**
- **Faible friction de route (glissante).**
- **Virage à grande vitesse.**
- **Conduite sur une route accidentée ou défoncée.**
- **Le moteur tourne à plus de 5 000 tr/mn lorsque le véhicule est arrêté.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic 12 (Le témoin ne s'allume pas quand le contact d'allumage est mis sur ON) .

VERIFIER LE FUSIBLE.

Vérifier le fusible de 10A . Pour la disposition du fusible, se reporter au chapitre ''DISPOSITION DE L'ALIMENTATION ELECTRIQUE'' dans la section EL.

Mauvais → Remplacer le fusible.

Bon ↓

A

VERIFIER SI LE TEMOIN LUMINEUX FONCTIONNE.

Débrancher l'actionneur de l'ABS et le connecteur du boîtier électrique.
Le témoin fonctionne-t-il ?

Oui → Ⓐ (Aller à la page suivante).

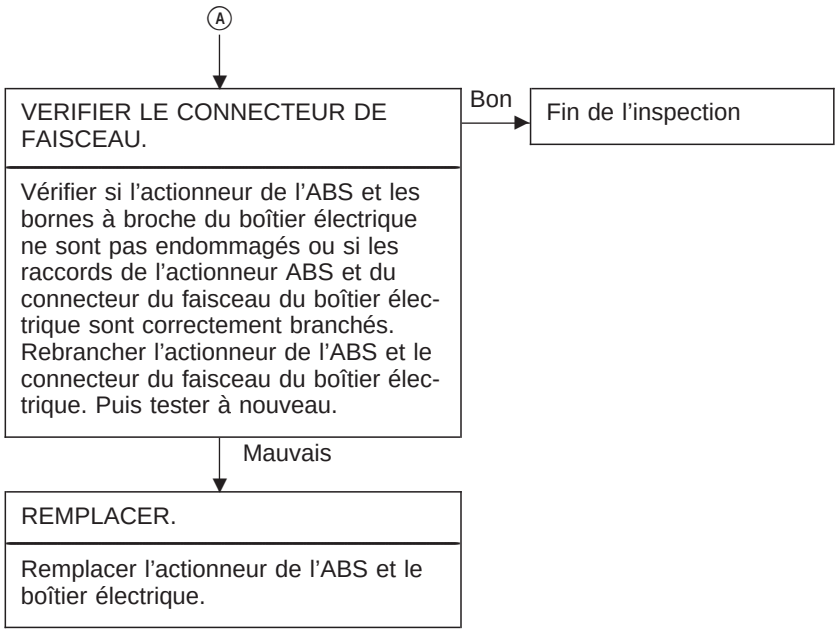
Non ↓

B

VERIFIER SI LE FAISCEAU N'EST PAS EN COURT-CIRCUIT.

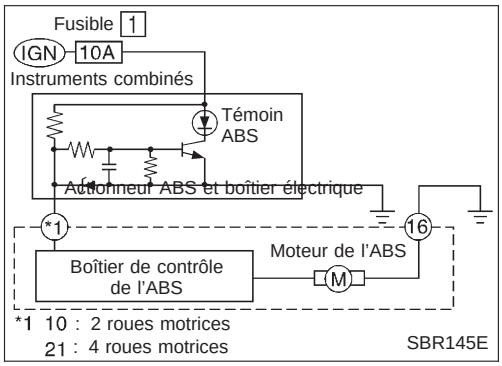
1. Débrancher l'actionneur de l'ABS et le connecteur du boîtier électrique.
2. Vérifier la tension entre l'actionneur de l'ABS et la borne ⑩ (2 roues motrices) ou ㉑ (4 roues motrices) du connecteur (côté carrosserie) E4 du boîtier électrique et la masse.
   Il ne doit pas y avoir tension de la batterie.

Mauvais → Réparer le faisceau ou le connecteur.

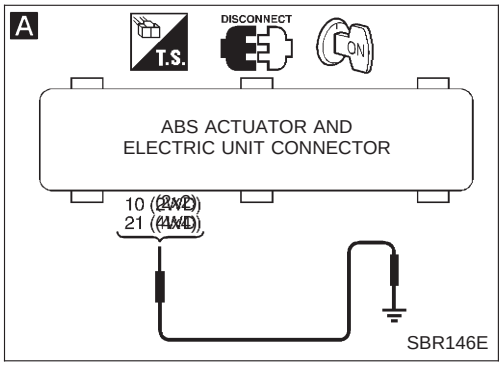


Bon ↓

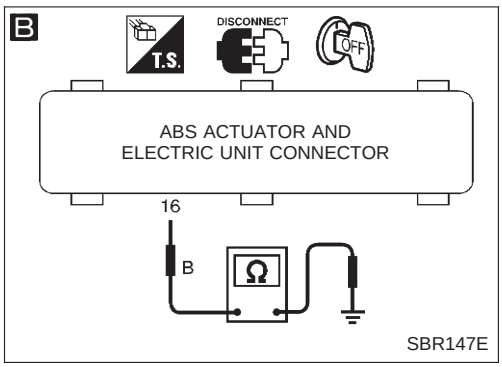
VERIFIER LES INSTRUMENTS COMBINES.



Vérifier les instruments combinés. Se reporter à ''TEMOINS LUMINEUX'' dans la section EL.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Procédure de diagnostic 12 (Le témoin ne s'allume pas quand le contact d'allumage est mis sur ON) . (Suite)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic 13 (Le témoin reste allumé quand le contact d'allumage est mis sur ON).

A

CONTROLER LE TEMOIN LUMINEUX.

1. Débrancher l'actionneur de l'ABS et le connecteur du boîtier électrique.
2. Brancher le câble adéquat entre l'actionneur de l'ABS et la borne (10) (2 roues motrices) ou (21) (4 roues motrices) du connecteur (E4) (côté carrosserie) du boîtier électrique et la masse.
   Le témoin lumineux ne devrait pas fonctionner.

Mauvais → Réparer les instruments combinés. Vérifier les points suivants.
- Connecteur de faisceau (E4)
- Faisceau ouvert ou court-circuité entre l'actionneur de l'ABS, le boîtier électrique et le fusible

Si le résultat n'est pas satisfaisant, réparer le faisceau ou le connecteur.

Bon ↓

VERIFIER LE CONNECTEUR DE FAISCEAU.

Vérifier si l'actionneur de l'ABS et les bornes à broche du boîtier électrique ne sont pas endommagés ou si les raccords de l'actionneur ABS et du connecteur du faisceau du boîtier électrique sont correctement branchés. Rebrancher l'actionneur de l'ABS et le connecteur du faisceau du boîtier électrique. Puis tester à nouveau.

Bon → Fin de l'inspection

Mauvais ↓

B

VERIFIER LA MISE A LA MASSE DE L'ABS.

1. Mettre le contact d'allumage sur "OFF".
2. Débrancher l'actionneur de l'ABS et le connecteur du boîtier électrique.
3. Vérifier la continuité entre l'actionneur de l'ABS et la borne (16) du connecteur (côté carrosserie) (E4) du boîtier électrique et la masse.
   Il doit y avoir continuité

Mauvais → Vérifier les points suivants.
- Connecteur de faisceau (E4)
- Faisceau ouvert ou court-circuité entre l'actionneur de l'ABS, le boîtier électrique et la masse

Si le résultat n'est pas satisfaisant, réparer le faisceau ou le connecteur.

Bon ↓

REMPLACER.

Remplacer l'actionneur de l'ABS et le boîtier électrique.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Notice d'entretien

- Lors de la dépose ou de la repose des diverses pièces, mettre un chiffon ou une protection sur la carrosserie du véhicule pour éviter les éraflures.
- Manipuler avec soin la garniture, les moulures, les instruments, la grille, etc. durant la dépose ou la repose. Faire attention de ne pas les tâcher ou les abîmer.
- Mettre du produit d'étanchéité lorsque c'est nécessaire, pour monter les pièces.
- Veiller à ce que le produit d'étanchéité ne déborde pas des espaces entre les pièces lors de son application.
- Lors du remplacement de pièces métalliques (par exemple, panneau extérieur de carrosserie, membres, etc.), veiller à prendre les mesures nécessaires de protection contre la rouille.

Système de retenue supplémentaire (SRS) ''COUSSIN GONFLABLE'' (modèles à 4 roues motrices)

Utilisé avec une ceinture de sécurité, le coussin gonflable du système de retenue supplémentaire contribue à réduire les risques et la gravité des blessures subies par le conducteur en cas de collision frontale. Le système de retenue supplémentaire se compose d'un module de coussin gonflable (situé dans le moyeu du volant), d'un boîtier de capteurs de diagnostic, d'un témoin avertisseur, d'un faisceau de câblage et d'un câble spiralé. Les informations nécessaires à l'entretien sans danger du système se trouvent à la **section RS** de ce manuel de réparation.

AVERTISSEMENT :

- **Pour ne pas affecter le fonctionnement du SRS, ce qui augmenterait les risques de blessures graves ou mortelles en cas de collision entraînant le déploiement du coussin gonflable (air bag), toutes les opérations d'entretien doivent être effectuées par un concessionnaire NISSAN agréé.**
- **Un entretien incorrect, y compris une mauvaise dépose ou repose du SRS, pourra entraîner des risques de blessures dues au déploiement accidentel du système.**
- **Ne pas utiliser d'équipement d'essai électrique sur les circuits connexes du SRS sauf sur indication de ce manuel de réparation. Les faisceaux de câblage électrique du SRS sont équipés d'une gaine d'isolation jaune soit juste devant les connecteurs de faisceau, soit sur le faisceau tout entier pour une identification plus rapide.**

Système de retenue supplémentaire (SRS) ''COUSSIN GONFLABLE'' (modèles à 2 roues motrices)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

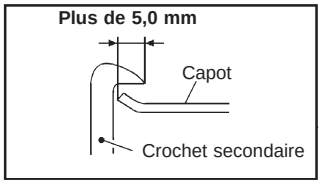
Extrémité avant

- Couvrir le capot avec un chiffon ou tout autre matériel de protection lors de sa dépose ou de sa repose. La carrosserie sera ainsi protégée contre les rayures.
- La garniture de pare-chocs est en plastique. Ne pas appliquer de force excessive et veiller à éviter tout contact avec de l'huile.
- Réglage du capot : régler à hauteur des charnières.
- Réglage du verrouillage de capot : après réglage, vérifier le fonctionnement de la commande de verrouillage de capot. Appliquer une couche de graisse sur le mécanisme d'enclenchement des verrous de capot.
- Commande d'ouverture de capot : ne pas tenter de plier le câble en le forçant. Cela augmenterait l'effort nécessaire pour ouvrir le capot.

DEPOSE – Ensemble de pare-chocs avant

① Déposer les vis qui fixent les feux combinés gauche et droit, et déposer les feux. A
② Déposer les clips qui fixent la grille avant, et la déposer. B
③ Déposer les boulons qui fixent les montants à gauche et à droite du pare-chocs. C
④ Déposer les boulons qui fixent les supports latéraux à gauche et à droite du pare-chocs. D
⑤ Déposer les boulons qui fixent les montants latéraux à gauche et à droite du pare-chocs. E
⑥ Déposer l'ensemble pare-chocs.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Extrémité avant (Suite)

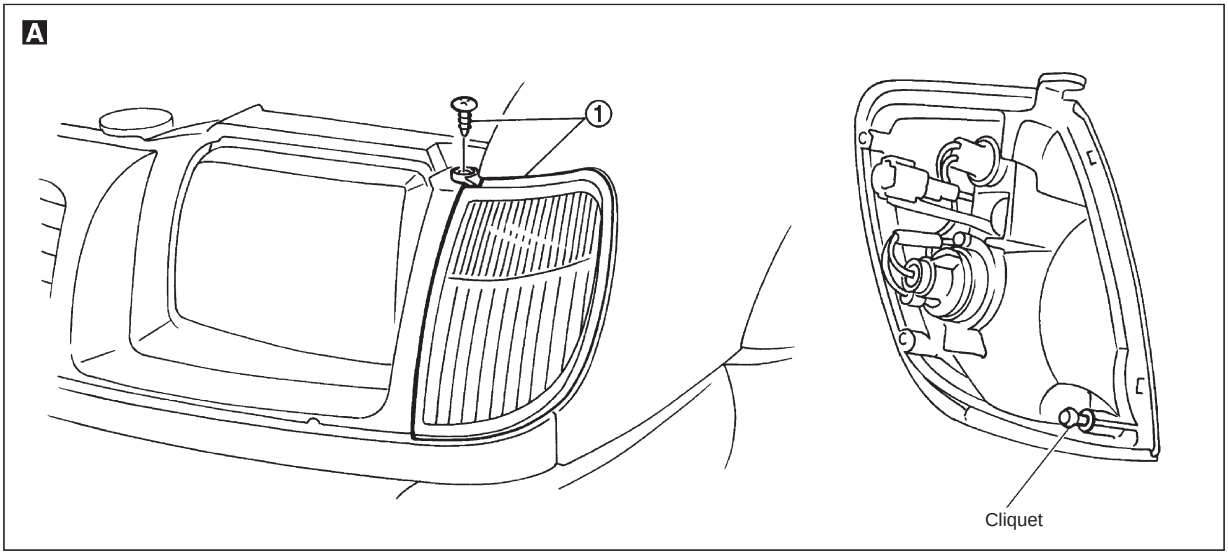
Réglage du verrou de capot

- Régler le capot de façon à ce que le verrou primaire s'enclenche 1 à 1,5 mm plus bas que l'aile.
- Après avoir réglé le verrou de capot, régler le caoutchouc de butée.
- Lors du montage du verrou de capot, veiller à ce qu'il ne soit pas penché. La gâche doit être positionnée au centre du verrou primaire de capot.
- Après le réglage, s'assurer que le verrou primaire et le verrou secondaire fonctionnent correctement.

Longueur d'accrochage du crochet secondaire de verrou de capot

Réglage du caoutchouc de butée

- Régler de façon à ce que le capot soit aligné sur l'aile. La déflexion est alors d'environ 2 mm.



(La hauteur libre du **caoutchouc de butée** est d'env. 13 mm)

Extrémité arrière

- Réglage : régler à hauteur des charnières pour un montage correct.
- Réglage du système de verrouillage : régler la gâche de façon à ce qu'elle soit au centre de la serrure. Vérifier le fonctionnement de la serrure du panneau de coffre après le réglage.
- Après la repose, s'assurer que la trappe arrière s'ouvre facilement.

Dépose – Ensemble pare-chocs arrière

① Déposer les connecteurs qui fixent les éclairages de plaque minéralogique.
② Déposer les écrous qui fixent le montant latéral de pare-chocs. A
③ Déposer l'ensemble pare-chocs.

DEPOSE

Après avoir enlevé les moulures, enlever la vitre à l'aide d'un câble métallique ou d'un outil à découper et d'un appareil à pompe gonflable.

AVERTISSEMENT :

Lors de la découpe des vitres du véhicule, toujours porter des lunettes de sécurité et des gants épais pour éviter de recevoir des éclats de verre dans les yeux et de se couper les mains.

ATTENTION :

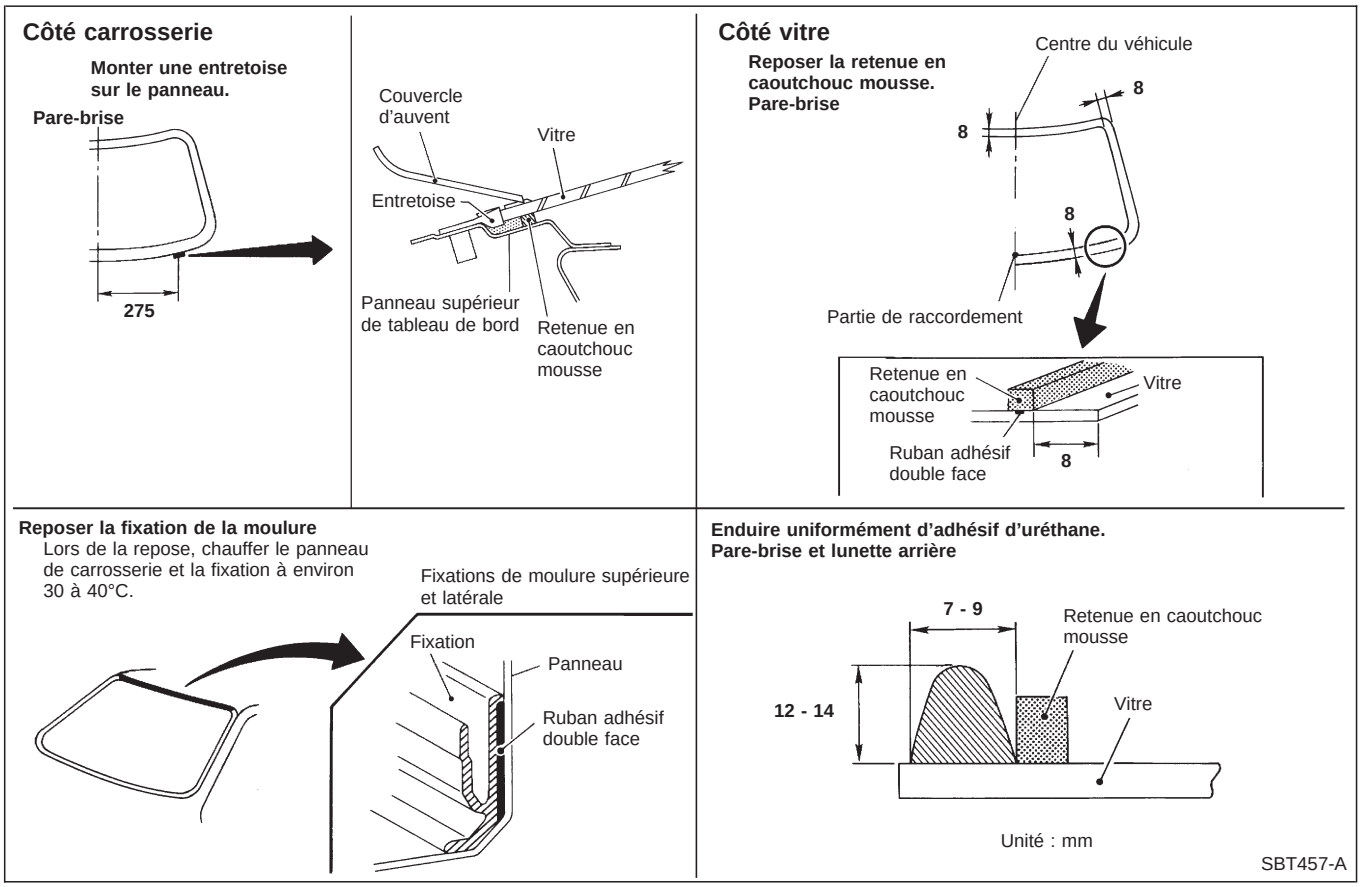
- **Veiller à ne pas rayer les vitres lors de la dépose.**
- **Ne pas laisser la vitre à plat sur le sol ou debout sur la tranche. De petits éclats pourraient devenir des fêlures.**

REPOSE

- **Utiliser un kit d'adhésif en uréthane d'origine Nissan ou un équivalent, et suivre les instructions fournies avec le kit.**
- **Pendant que l'adhésif en uréthane sèche, ouvrir une des fenêtres. De cette façon, la vitre ne sera pas par l'effet d'une pression dans le compartiment passager lorsque l'on ferme une porte.**
- **La moulure doit être montée correctement de manière à ce qu'elle soit parfaitement en position, sans laisser aucun espace.**
- **Avertir le conducteur que le véhicule doit rester immobile jusqu'à ce que l'adhésif en uréthane ait complètement durci (24 heures de préférence). Le temps de séchage varie en fonction de la température et du degré d'humidité.**

AVERTISSEMENT :

- **Les enduits primaires et les adhésifs étant inflammables, les maintenir à l'écart des sources de chaleur et des flammes nues.**
- **Les matériaux contenus dans le kit sont nocifs si on les avale, et peuvent irriter la peau et les yeux. Eviter donc tout contact avec la peau et les yeux.**
- **Les utiliser dans un endroit ouvert et ventilé. Eviter d'en respirer les vapeurs car elles peuvent être dangereuses en cas d'inhalation. Si cela se produit, sortir immédiatement à l'air frais.**
- **Il se peut que les performances du pare-brise soient affectées en cas d'accident de la route avant séchage complet de l'adhésif en uréthane.**



ATTENTION :

- **Ne pas utiliser un adhésif dont la date d'utilisation serait dépassée. Le produit doit être utilisé dans les six mois suivant sa date de fabrication. Se conformer strictement à la date d'expiration ou la date de fabrication indiquée sur la boîte.**
- **Conserver les enduits primaires dans un endroit sec et frais. La solution idéale consiste à les conserver dans un réfrigérateur.**
- **Ne pas laisser d'enduit primaire ou de cartouche d'adhésif avec le bouchon ouvert ou déposer sans surveillance.**
- **Le véhicule ne doit pas être conduit pendant 24 heures au moins ou jusqu'à ce que l'adhésif en uréthane ait complètement durci. Le temps de séchage varie en fonc-**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

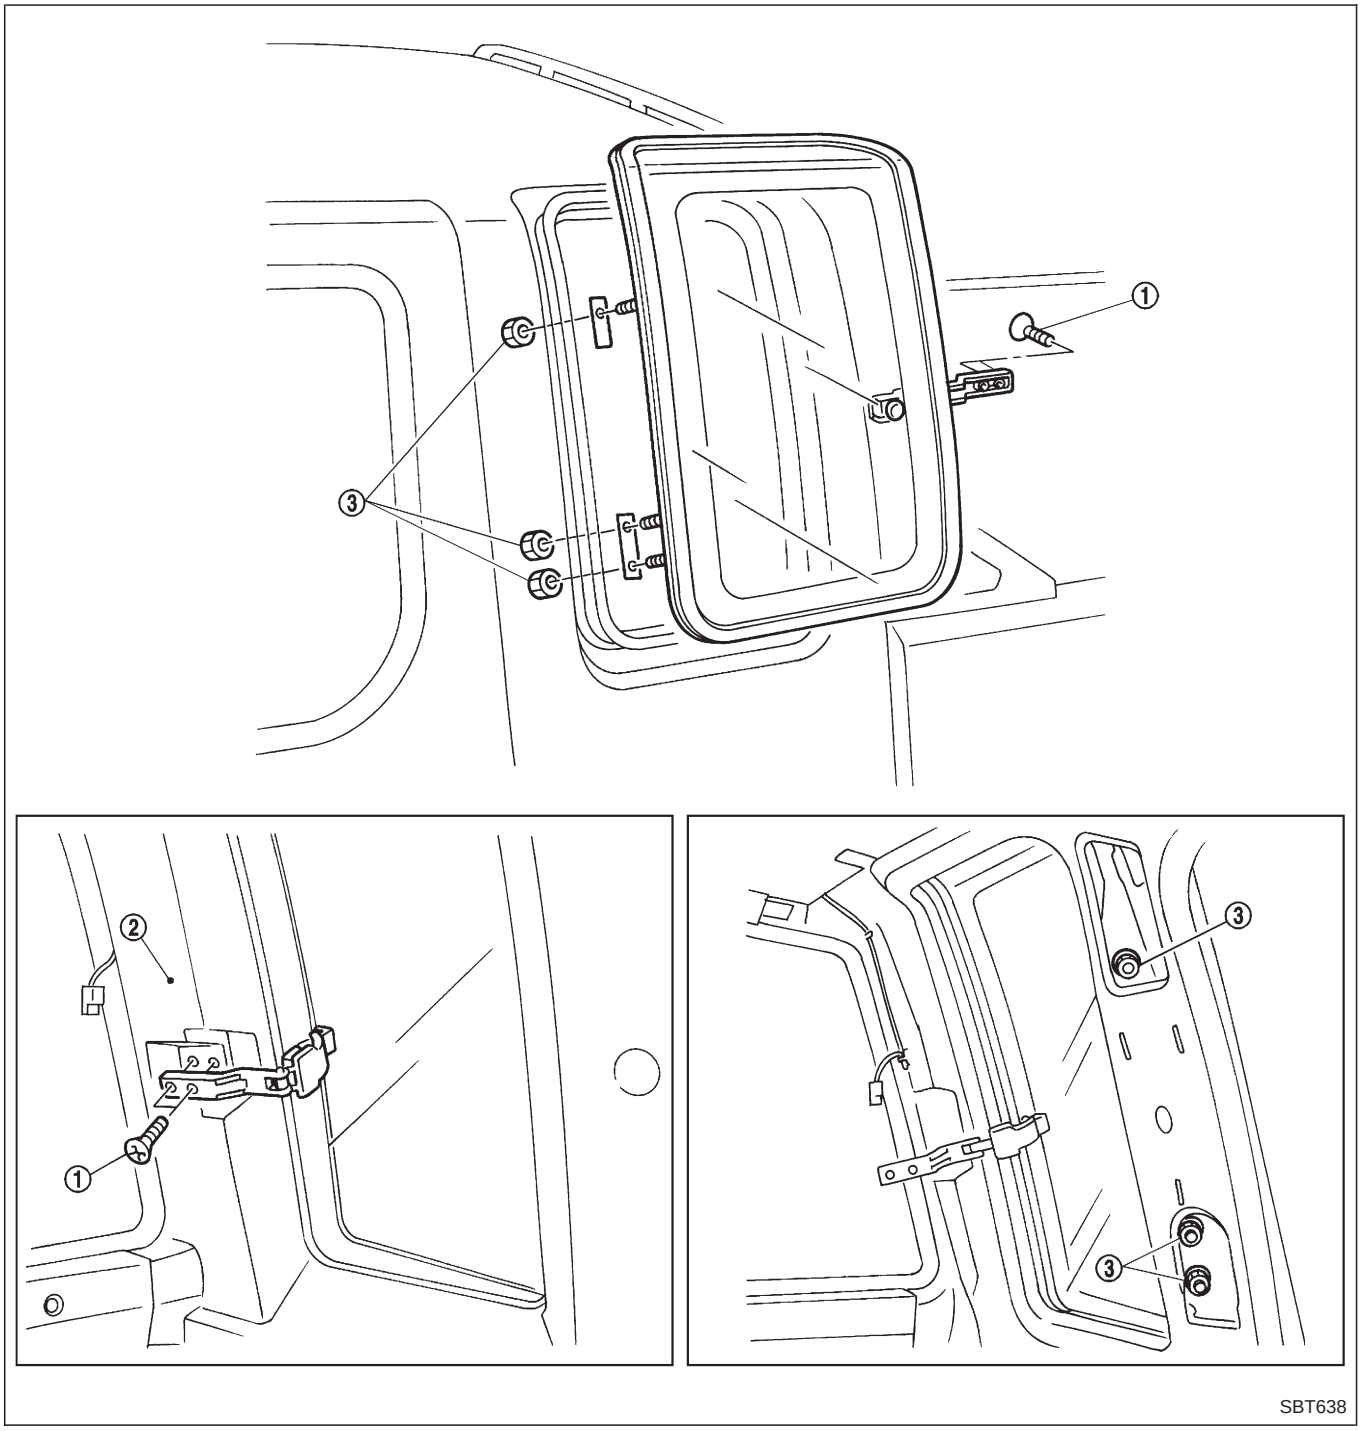
tion de la température et du degré d'humidité. Il augmentera dans des conditions de température haute ou d'humidité basse.

Pare-brise

REPARATION DES FUITES D'EAU DU PARE-BRISE

On peut réparer les fuites sans déposer et reposer la vitre.

S'il y a une fuite d'eau entre l'adhésif d'uréthane et la carrosserie ou la vitre, déterminer l'importance de la fuite. Pour ce faire, projeter de l'eau sur le pare-brise tout en repoussant la vitre vers l'extérieur.



Pour arrêter la fuite, enduire l'endroit de la fuite d'enduit primaire (si nécessaire), puis d'adhésif d'uréthane.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Vitre latérale

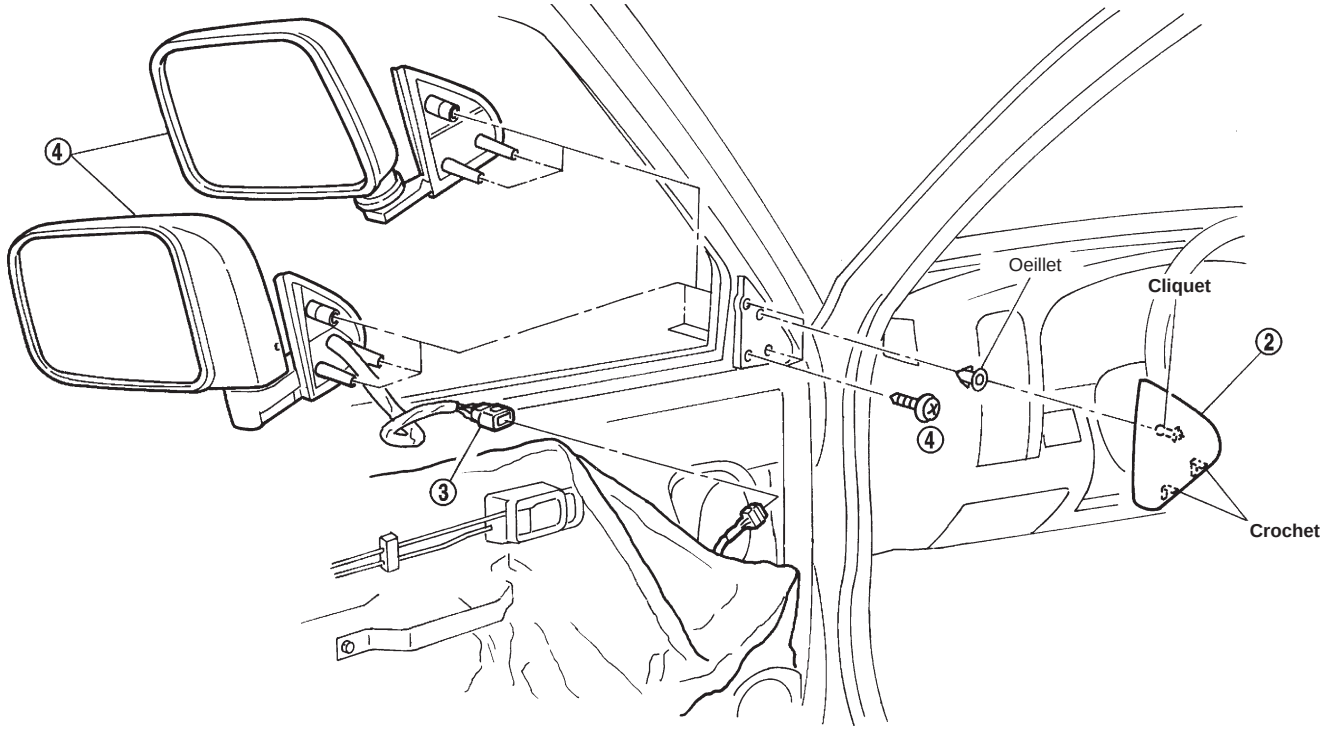
DEPOSE – Vitre latérale

① Déposer les vis.
② Déposer la garniture de montant arrière. Pour plus de détails, se reporter au chapitre ‘‘Garniture latérale et garniture de plancher’’ (modèle à grande cabine) à la section BT-15.
③ Déposer les écrous fixant la vitre latérale , puis déposer l’ensemble de vitre latérale.

SBT638

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

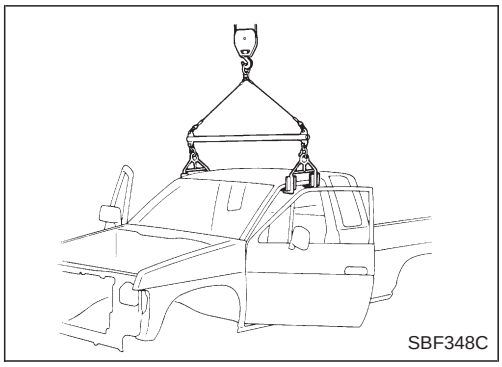
Rétroviseur de porte



ATTENTION :
Prendre soin de ne pas rayer le boîtier du rétroviseur extérieur.

★ **Pour le schéma de câblage, se reporter au chapitre ''RETROVISEUR EXTERIEUR ELECTRIQUE DE PORTE'' à la section EL.**

DEPOSE – Rétroviseur de porte



① Déposer la garniture de porte. Se reporter à ''Garniture de porte'' pour plus de détails, BT-17.
② Déposer le revêtement intérieur du coin avant de la porte.
③ Débrancher le connecteur de faisceau du rétroviseur de porte.
④ Déposer les boulons qui fixent le rétroviseur de porte, puis déposer l'ensemble de rétroviseur de porte.

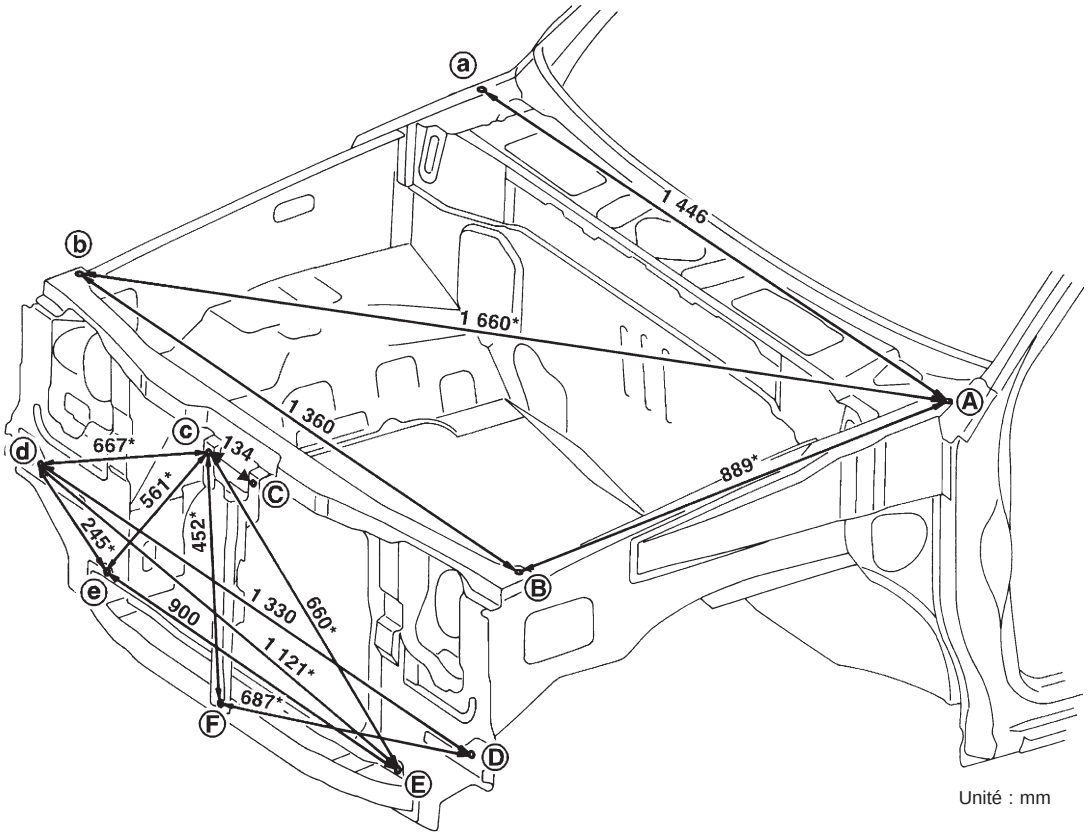
- Toutes les dimensions indiquées sur les figures sont des dimensions exactes.
- Si l'on utilise une jauge d'alignement, régler les deux aiguilles de compteur sur la même longueur. S'assurer qu'il n'y a pas de jeu.
- Si l'on utilise un mètre souple, s'assurer qu'il n'y a pas d'élongation, de torsion ni de coude.
- On doit prendre les mesures au centre des orifices de montage.
- Toutes les mesures et diamètres des orifices de montage sont en millimètres (mm).
- Un astérisque (*) suivant la valeur indiquée au point de mesure signifie que le point de mesure de l'autre côté a symétriquement la même valeur.
- Les coordonnées des points de mesure sont les distances mesurées à partir des lignes respectives dans les directions ''x'', ''y'' et ''z''.
  Lignes de dimensions : ligne ''x'' — ligne centrale du véhicule
  ligne ''y'' — ligne centrale de l'essieu avant (tout point de mesure à l'avant de la ligne de dimension fait référence à une valeur négative ''—'')
  ligne ''z'' — ligne de donnée (tout point de mesure sous la ligne de dimension fait référence à une valeur négative ''—'').

2W. SB : Empattement court (2 X 2)



2W. LB : Empattement long (2 X 2)

4W. LB : Empattement long (4 X 4)

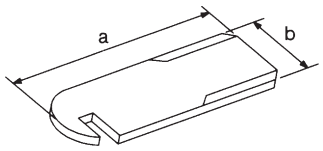
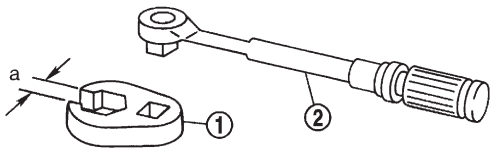
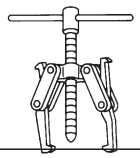
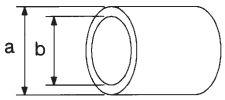
Précautions

- **Le liquide conseillé est le liquide de frein ‘‘DOT 3’’ ou ‘‘DOT 4’’. Se reporter à la section MA (‘‘Liquides et lubrifiants’’, ‘‘LIQUIDES ET LUBRIFIANTS CONSEILLES’’).**
- **Ne pas réutiliser du liquide de frein vidangé.**
- **Faire attention de ne pas éclabousser les surfaces peintes avec du liquide de frein.**
- **Pour déposer et reposer le tube d’embrayage, utiliser l’outil spécial.**
- **Utiliser du liquide de frein neuf pour nettoyer ou laver toutes les pièces du maître-cylindre, du cylindre récepteur et de l’amortisseur d’embrayage.**
- **Ne jamais utiliser d’huiles minérales telles qu’essence ou kérosène. Ceci endommagerait les pièces en caoutchouc du système hydraulique.**









AVERTISSEMENT :
Après avoir nettoyé le disque d’embrayage, l’essuyer avec un chiffon à poussière. Ne pas utiliser d’air comprimé.

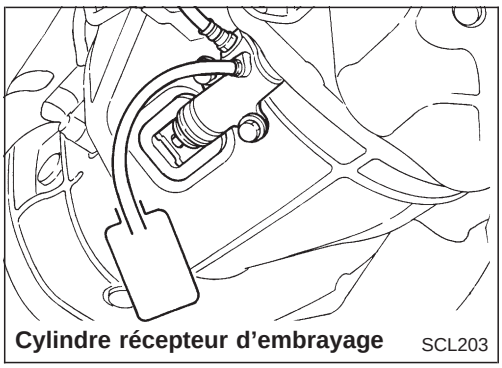
SCL741-A

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Réglage de la pédale d'embrayage

1. Régler la hauteur de pédale avec la butée de pédale.
2. Régler le jeu libre de la pédale avec la tige de poussoir.



Hauteur de pédale "H"
(mesurée de la surface de la tôle d'isolation au patin de pédale) :
Conduite à gauche
221 - 231 mm
Conduite à droite
195 - 205 mm
Jeu libre de la pédale "A" :
1 - 1,5 mm

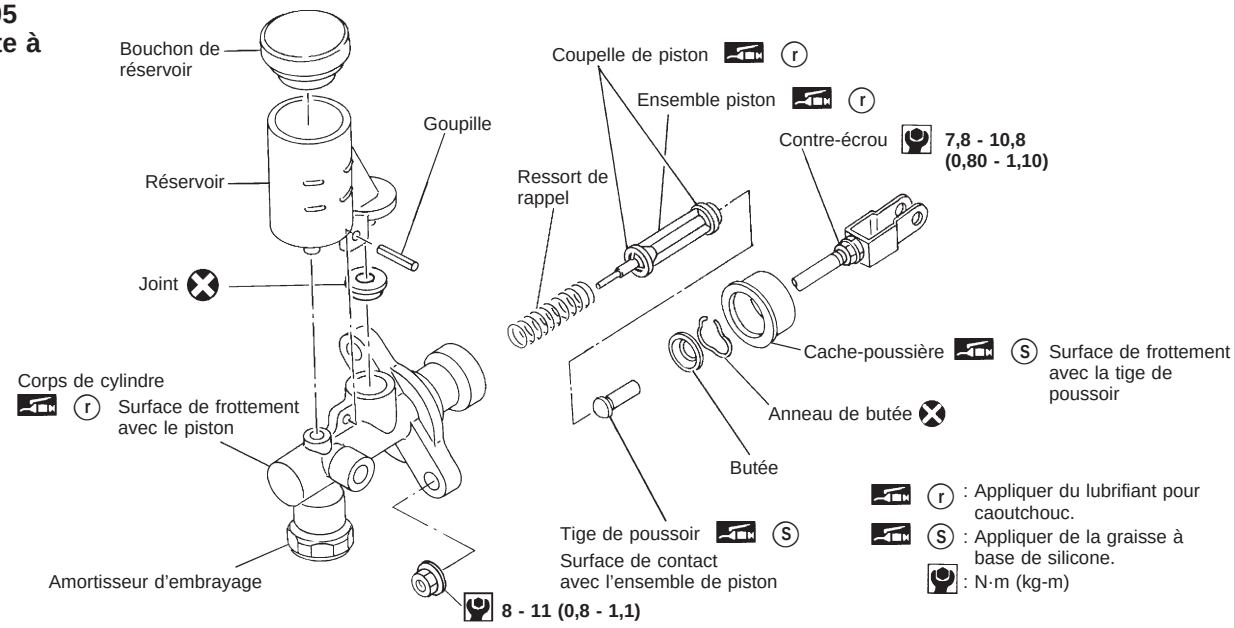
: N·m (kg-m)

: N·m (kg-m)

SCL742-A

Cylindre récepteur d'embrayage SCL203

Procédure de purge



Purger l'air en suivant la méthode suivante.
Purger l'air du maître-cylindre (modèles avec conduite à droite uniquement) puis du cylindre récepteur.

1. Remplir le réservoir du maître-cylindre avec du liquide de frein neuf.
2. Connecter un flexible transparent en vinyle au purgeur d'air.
3. Enfoncer lentement la pédale d'embrayage sur toute sa course puis la relâcher complètement. Répéter cette opération plusieurs fois à 2 ou 3 secondes d'intervalle.
4. Ouvrir le purgeur d'air en enfonçant la pédale d'embrayage à fond.
5. Fermer le purgeur d'air.
6. Relâcher la pédale d'embrayage et attendre au moins 5 secondes.
7. Répéter les étapes 3 à 6 ci-dessus jusqu'à ce que le liquide de frein apparaisse, sans bulles d'air.

SCL744

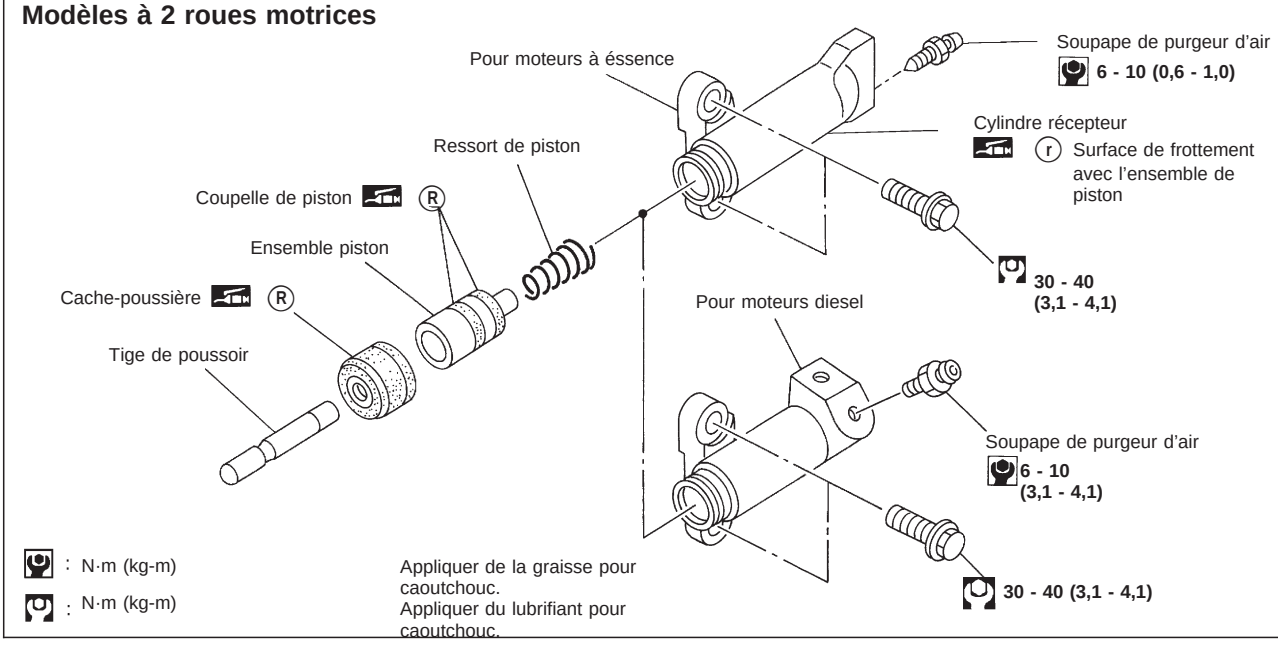
DEMONTAGE ET REMONTAGE

- Retirer la bague de butée à l'aide d'un tournevis tout en poussant la tige de poussoir dans le cylindre.
- Pour reposer la bague de butée, l'introduire doucement tout en poussant la tige de poussoir dans le cylindre.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Maître-cylindre d'embrayage (Suite)

INSPECTION



Vérifier les pièces suivantes, et les remplacer si nécessaire.

- La surface de frottement entre le cylindre et le piston pour voir s'il n'y a pas d'usure inégale, de rouille ou de détérioration.
- Le piston et les coupelles pour voir s'ils ne présentent pas de signes d'usure ou de détérioration.
- Le ressort de rappel pour voir s'il n'est pas usé ou endommagé.
- Le cache-poussière pour voir s'il n'est pas fêlé, déformé ou endommagé.
- Le réservoir pour voir s'il n'est pas déformé ou endommagé.

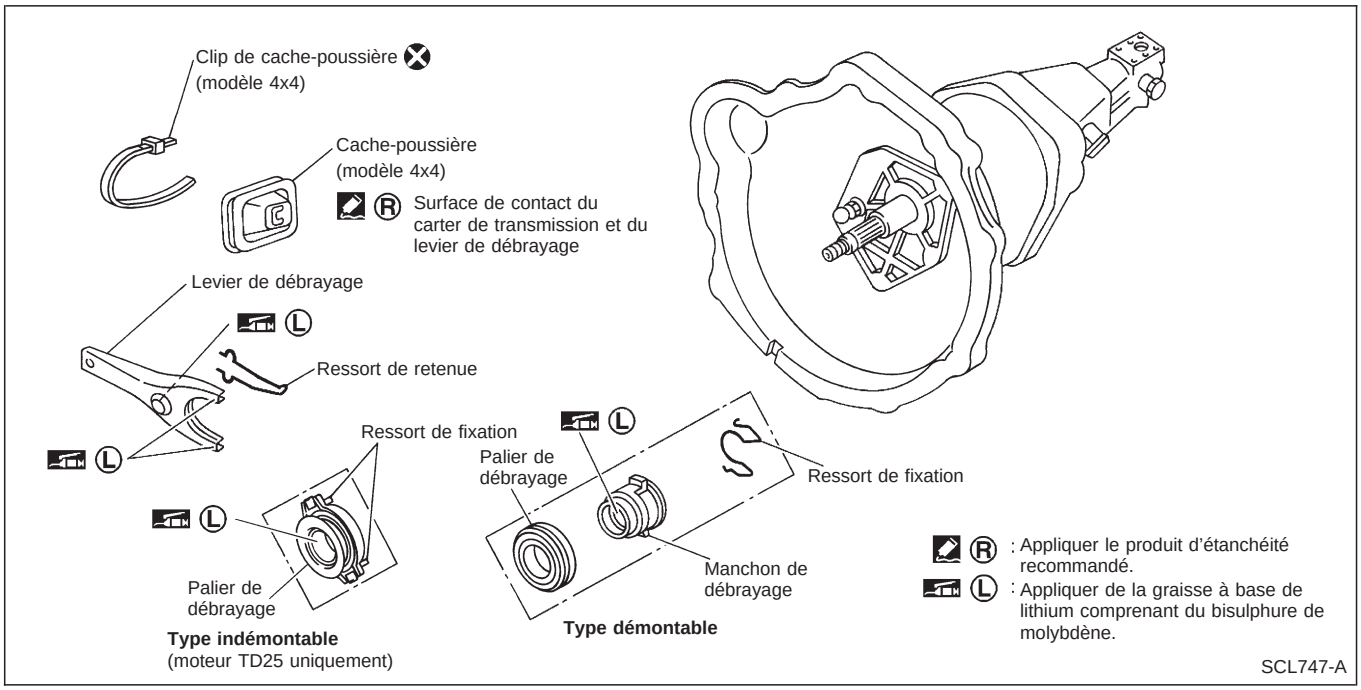
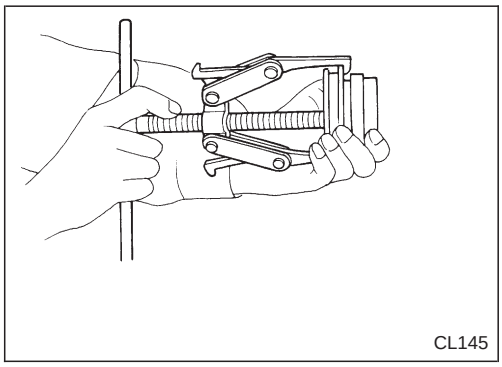
Modèles à 2 roues motrices

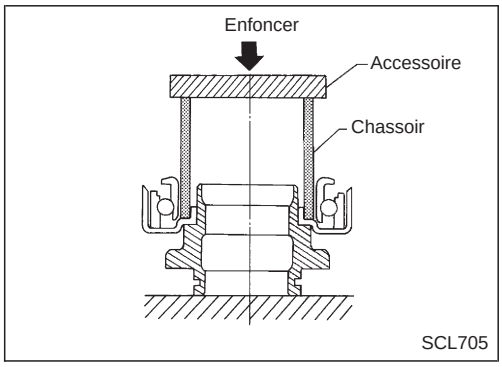
SCL796

SEC. 306
Modèles à 4 roues motrices

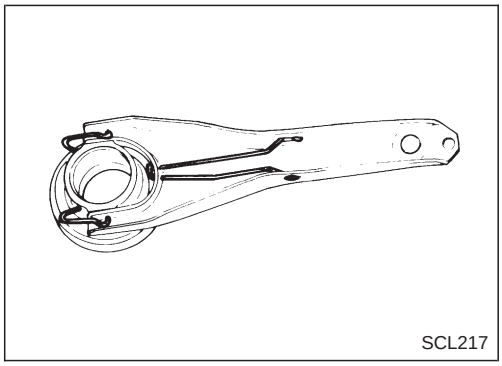




SCL746-A



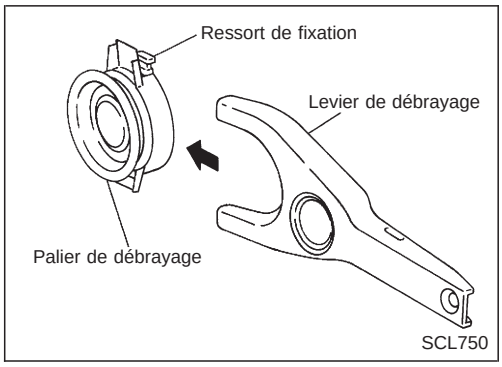
INSPECTION



- Vérifier si la surface de frottement du cylindre présente des traces d'usure, de rouille ou de détérioration. Remplacer si nécessaire.
- Vérifier si le piston et la coupelle présentent des signes d'usure ou de détérioration. Remplacer si nécessaire.
- Vérifier si le ressort de piston n'est pas endommagé ou usé. Remplacer si nécessaire.
- Vérifier si le cache-poussière n'est pas fissuré, déformé ou endommagé. Remplacer si nécessaire.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

CL145



SCL217

DEPOSE ET REPOSE

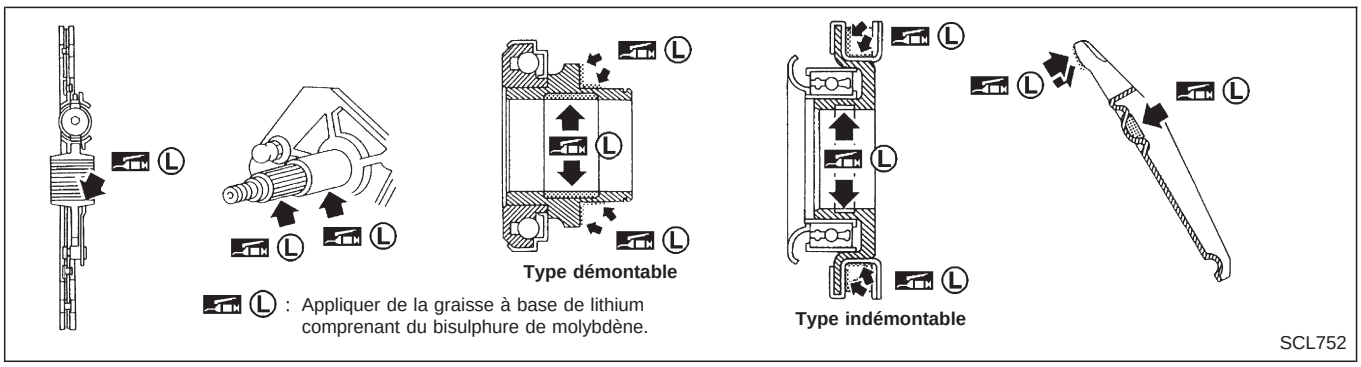
Type démontable

- Déposer le palier de débrayage.
- Reposer le palier de débrayage avec le chassoir approprié.
- Installer le ressort de retenue et le ressort de fixation.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Type indémontable

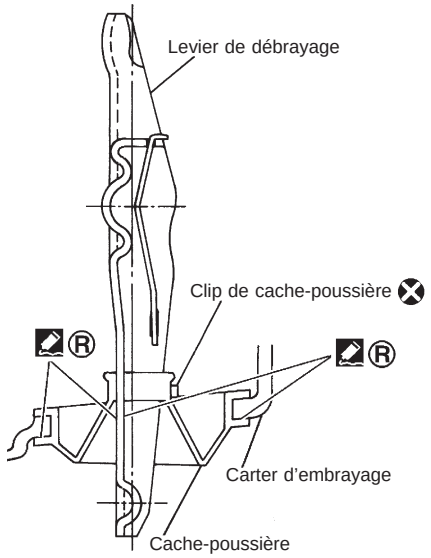
- Reposer le ressort de support sur le palier de débrayage comme indiqué sur la figure de gauche et insérer le levier de débrayage en respectant le sens indiqué par la flèche.



INSPECTION

Vérifier les pièces suivantes, et les remplacer si nécessaire.

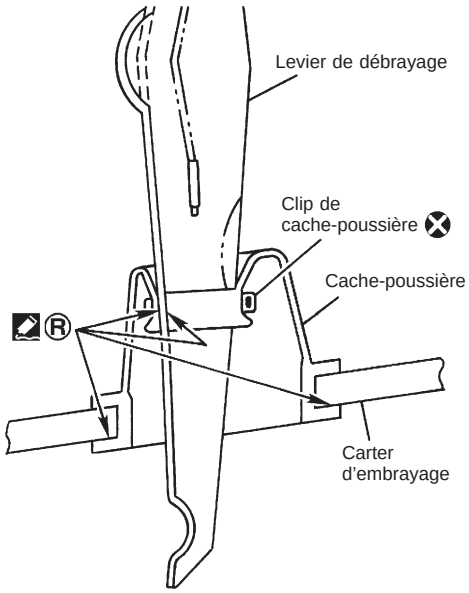
- Le palier de débrayage pour voir s'il tourne librement et s'il n'émet pas de bruits anormaux et ne présente pas de fêlures, de piqûres ou d'usure.
- Le manchon de débrayage et la surface de frottement du levier de débrayage pour voir si ces pièces ne présentent pas de traces d'usure, de rouille ou de détérioration.



LUBRIFICATION

- Enduire de graisse recommandée les surfaces de contact et les surfaces de frottement.
- **Il ne faut pas mettre trop de lubrifiant, car ceci risque d'endommager les garnitures du disque d'embrayage.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Moteurs diesel

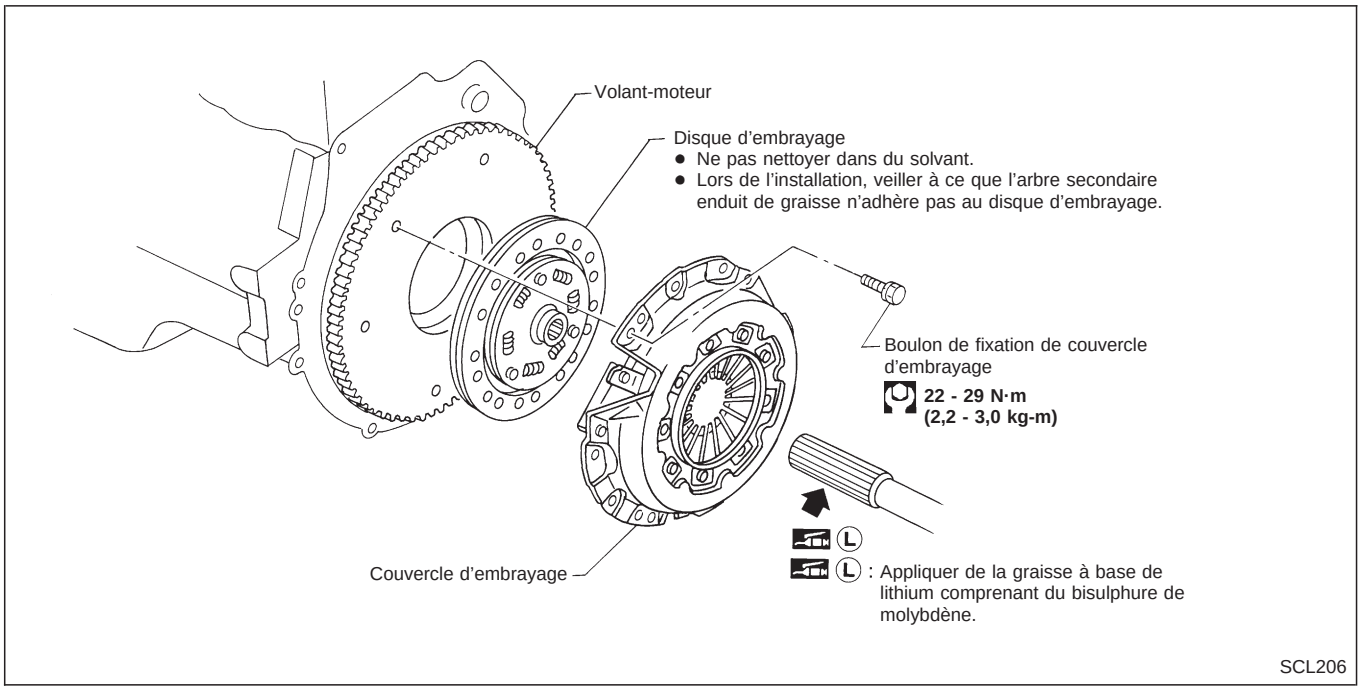
Ⓡ : Appliquer le produit d'étanchéité recommandé.

SCL760

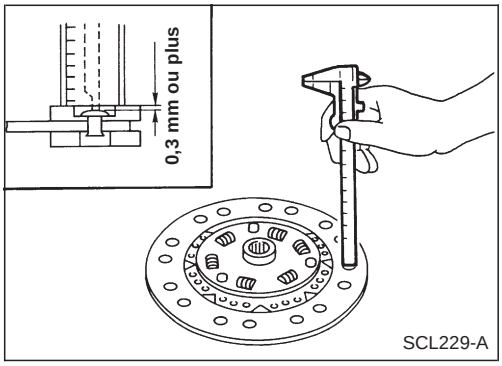
Moteurs à essence

Ⓡ : Appliquer le produit d'étanchéité recommandé.

SCL761



RESISTANT A L'EAU – pour modèle à 4 roues motrices

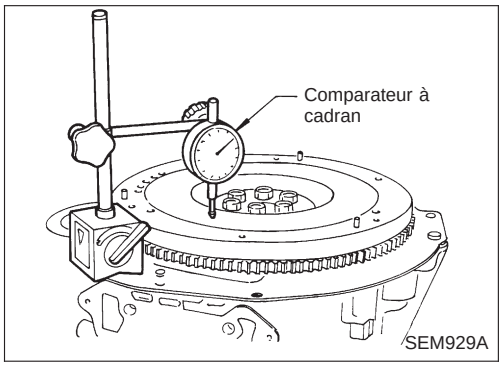


- Enduire la surface de contact du cache-poussière de carter de transmission et du levier de débrayage de produit d'étanchéité recommandé, puis monter le clip de cache-poussière.

  Produit d'étanchéité recommandé :

  Pièce d'origine Nissan (KP115-00100), Three Bond TB1212 ou équivalent.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Disque d'embrayage et volant-moteur

INSPECTION

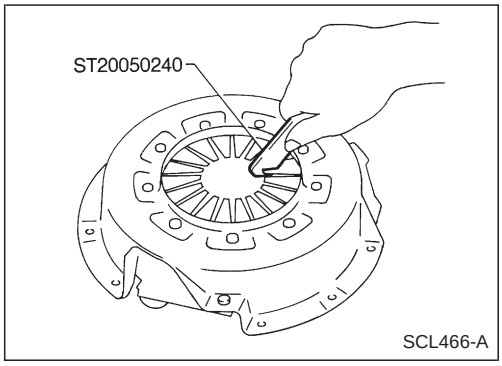
- Contrôler le disque d'embrayage pour voir s'il n'y a pas de trace de brûlures, de décolorations ou de fuites d'huile ou de graisse. Remplacer si nécessaire.
- Contrôler le disque d'embrayage pour voir si les garnitures ne sont pas usées.
  Limite d'usure de la surface de garniture jusqu'aux têtes des rivets :
  0,3 mm
- Vérifier le battement des cannelures et le voile des garnitures du disque d'embrayage.
  Battement maximum des cannelures (à la bordure extérieure du disque) :
  240 1,0 mm
  250 1,0 mm
  Limite de voile :
  0,7 mm moteur TD25
  1,0 mm sauf moteur TD25
  Distance du point de contrôle du voile (depuis le centre du moyeu) :
  240 115 mm
  250 120 mm

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Disque d'embrayage et volant-moteur (Suite)

- Contrôler la surface de contact du volant-moteur pour voir s'il n'y a pas de légères brûlures ou de décolorations. Rectifier le volant-moteur avec du papier émeri.
- Contrôler le voile du volant-moteur.

Voile acceptable maximum :



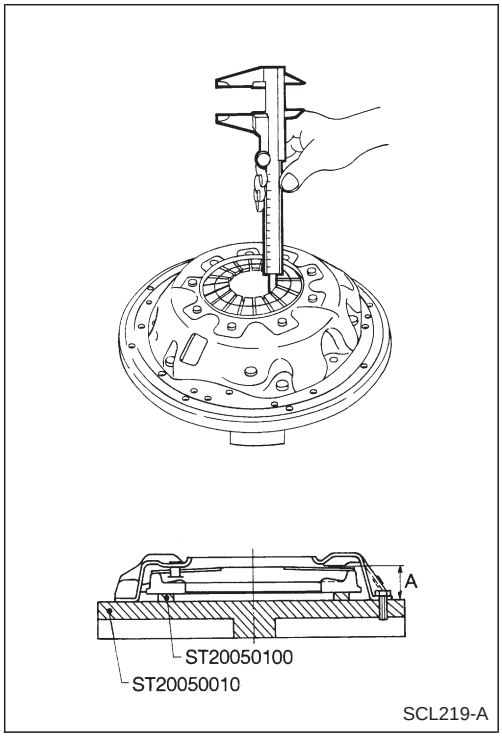
Se reporter à la section EM (''Inspection'', ''BLOC-CYLINDRES'').

REPOSE

- Enduire de graisse recommandée la surface de contact de la partie cannelée.

Il ne faut pas mettre trop de lubrifiant, car ceci risque d'endommager les garnitures du disque d'embrayage.

Couvercle d'embrayage



INSPECTION

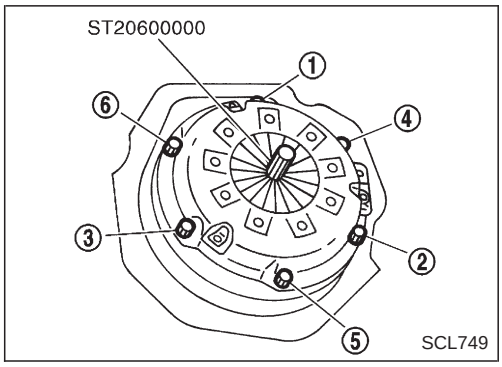
- Corriger la différence de hauteur des ressorts de diaphragme à l'aide de l'outil spécial.

Limite de différence de hauteur :

250 0,5 mm
240 0,5 mm sauf moteur TD25
0,7 mm moteur TD25

- Mettre l'outil spécial en place et contrôler la hauteur et la régularité des ressorts de diaphragme.

Placer des calibres d'épaisseur de 0,2 mm sur les entretoises (ST20050100) lors de la vérification des modèles 240 ou 250.



Hauteur du ressort de diaphragme ''A'' :

240 37,5 - 39,5 mm
250 37,0 - 39,0 mm

- Contrôler les bagues de butée pour voir si elles ne sont pas usées ou endommagées en secouant l'ensemble de couvercle de haut en bas pour voir si des pièces ne se sont pas déssolidarisées, ou en frappant légèrement sur les rivets et en écoutant le son émis. Remplacer l'ensemble de couvercle d'embrayage si nécessaire.
- Contrôler la surface de contact entre le plateau de pression et le disque d'embrayage pour voir s'il n'y a pas de légères brûlures ou de décolorations. Rectifier le plateau de pression avec du papier émeri.
- Contrôler la surface de contact entre le plateau de pression et le disque d'embrayage pour voir s'il n'y a pas de déformation ou autre dommage. Remplacer si nécessaire.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Couvercle d'embrayage (Suite)

REPOSE

- Introduire l'outil spécial dans le moyeu du disque d'embrayage pour la mise en place du couvercle et du disque d'embrayage.
- Veiller à ce qu'il n'y ait pas de graisse sur la garniture d'embrayage.
- Serrer les boulons en ordre numérique, en deux étapes.

  Première étape :

  : 10 - 20 N·m (1,0 - 2,0 kg-m)

  Etape finale :

  : 22 - 29 N·m (2,2 - 3,0 kg-m)

Système de retenue supplémentaire (SRS) ''COUSSIN GONFLABLE'' (modèles à 4 roues motrices)

Utilisé avec une ceinture de sécurité, le coussin gonflable du système de retenue supplémentaire contribue à réduire les risques et la gravité des blessures subies par le conducteur en cas de collision frontale. Le système de retenue supplémentaire se compose d'un module de coussin gonflable (situé dans le moyeu du volant), d'un boîtier de capteurs de diagnostic, d'un témoin lumineux, de faisceaux de câblage et d'un câble spiralé. Les informations nécessaires à un entretien du système sans danger se trouvent à la **section RS** de ce Manuel de Réparation.

AVERTISSEMENT :

- **Pour ne pas affecter le fonctionnement du SRS, ce qui augmenterait les risques de blessures graves ou mortelles en cas de collision entraînant le déploiement du coussin gonflable, toutes les opérations d'entretien doivent être effectuées par un concessionnaire NISSAN agréé.**
- **Un entretien inadapté, y compris la dépose et la repose incorrecte du SRS, peut être à l'origine de blessures causées par le déclenchement accidentel du système.**
- **Ne pas utiliser d'équipement d'essai électrique sur les circuits connexes au SRS, sauf instructions contraires données dans ce Manuel de Réparation. Les faisceaux de câblage électrique du SRS sont équipés d'une gaine d'isolation jaune soit juste devant les connecteurs de faisceau, soit sur le faisceau tout entier pour une identification plus rapide.**

Système de retenue supplémentaire (SRS) ''COUSSIN GONFLABLE'' (modèles à 2 roues motrices)

Circuit de carburation et système antipollution

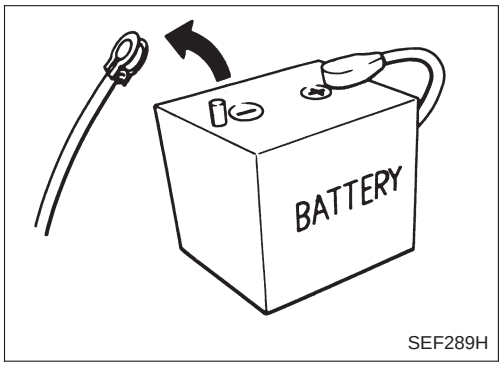
POMPE D'ALIMENTATION
- Ne pas actionner la pompe d'alimentation alors que les canalisations sont vides.
- Serrer les colliers de fixation des canalisations au couple spécifié (se reporter à la section MA).

BATTERIE
- Toujours utiliser une batterie de 12 volts comme source d'alimentation.
- Ne pas essayer de déconnecter les câbles de batterie lorsque le moteur tourne.

RADIO C.B. OU TELEPHONE
- Au montage d'un poste de CB ou d'un téléphone mobile, s'assurer d' observer les points suivants ; faute de quoi le système de commande électronique pourrait être endommagé, en fonction de l'emplacement.

1) Maintenir l'antenne aussi loin que possible des appareils de commande électronique.
2) Maintenir la ligne d'alimentation de l'antenne à plus de 20 cm du faisceau du système électronique.
   Veiller à ce que cette ligne ne soit jamais parallèle au faisceau sur une grande longueur.
3) Régler l'antenne et la ligne d'alimentation de manière à pouvoir maintenir au plus petit niveau le taux d'onde stationnaire.
4) Veiller à brancher la radio à la masse de carrosserie du véhicule.

ECM
- Ne pas démonter le module de contrôle de l'ECCS (ECM).
- Ne pas actionner de façon trop brutale le sélecteur de mode de diagnostic.
- Lorsque une borne de batterie est débranchée, la mémoire retourne à la valeur de l'ECM.
  Le boîtier de contrôle va maintenant s'autocontrôler à sa valeur initiale. Le fonctionnement du moteur peut varier légèrement lorsque la borne est déconnectée. Ceci ne signifie toutefois pas qu'il y ait un problème. Ne pas remplacer les pièces à cause de variations mineures.

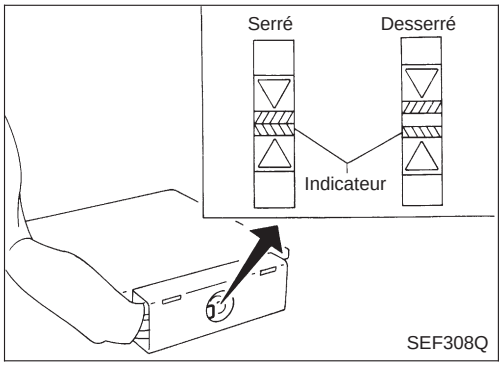


AU DEMARRAGE
- Ne pas enfoncer la pédale d'accélérateur lors du démarrage.
- Immédiatement après le démarrage, ne pas emballer le moteur de façon inutile.
- Ne pas emballer le moteur avant de couper le contact.

MANIPULATION DES PIECES DE L'ECCS
- Manipuler soigneusement le débitmètre d'air pour éviter tout dommage.
- Ne pas démonter le débitmètre d'air.
- Ne pas nettoyer le débitmètre d'air avec un détergent.
- Ne pas démonter layvanne IACV-AAC.
- Une fuite, même légère, dans le système d'admission d'air peut causer de sérieux problèmes.
- Ne pas heurter ou soumettre à des chocs le capteur d'angle d'arbre à cames.

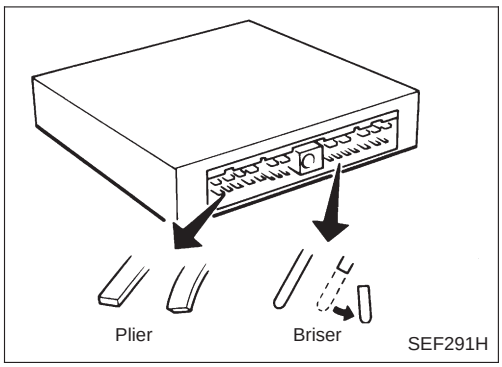
MANIPULATION DU FAISCEAU DE L'ECCS
- Brancher fermement les connecteurs du faisceau de l'ECCS.
  Une mauvaise connexion peut engendrer de très hautes tensions (afflux) sur la bobine et sur le condensateur, susceptibles par conséquent d'endommager les CI (circuits intégrés).
- Maintenir le faisceau de l'ECCS à 10 cm au moins des faisceaux voisins, afin d'éviter toute défaillance du système par suite de réception de bruits extérieurs.
- Maintenir les pièces et faisceaux de l'ECM parfaitement secs.
- Avant la dépose de toute pièce, couper le contact et déconnecter le câble de masse de la batterie.

SEF903MD



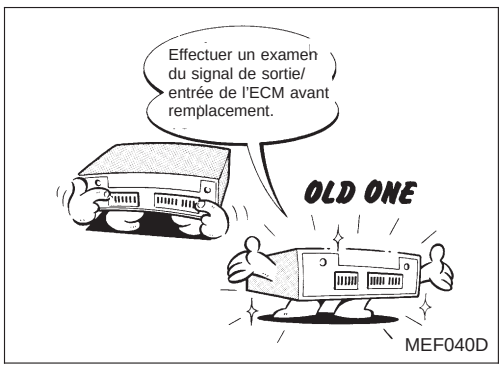
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SEF289H



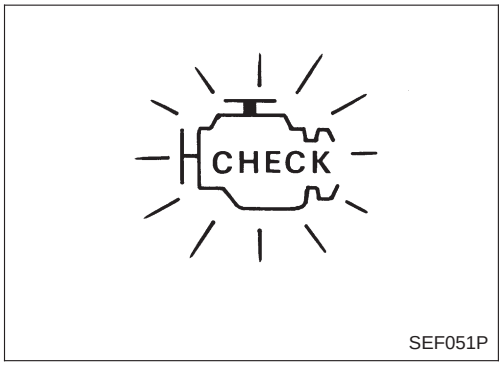
Précautions

- **Avant de brancher ou débrancher le connecteur du faisceau d'ECM, couper le contact et débrancher la borne négative de la batterie. Le non respect de cette instruction peut entraîner la détérioration de l'ECM. En effet, la tension de batterie est appliquée à l'ECM même lorsque le contact est coupé.**



SEF308Q

- **Lors du branchement du connecteur de faisceau de l'ECM, serrer le boulon de fixation jusqu'à ce que l'espace entre les indicateurs oranges disparaisse.**
  : 3,0 - 5,0 N·m (0,3 - 0,5 kg-m)

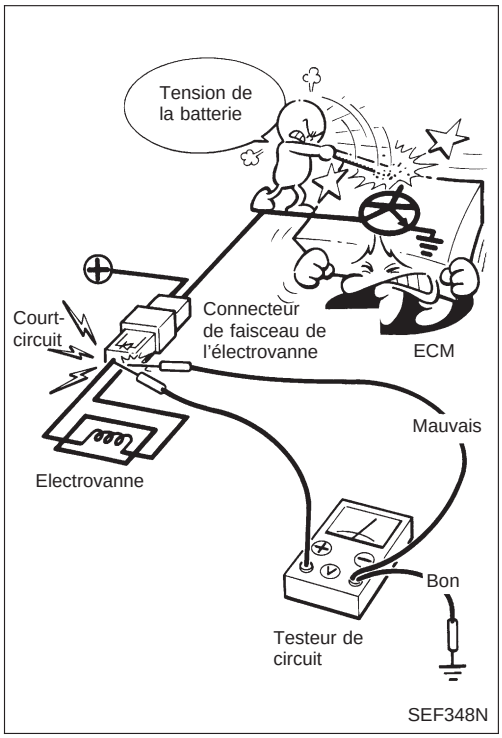


SEF291H

- **Lors du branchement ou du débranchement des connecteurs à broches de l'ECM, veiller à ne pas endommager (tordre ou casser) les bornes à broches.**
  Veiller à ce qu'aucune des bornes à broches de l'ECM ne soit pliée ou cassée au moment où l'on rebranche les connecteurs à broches.

MEF040D

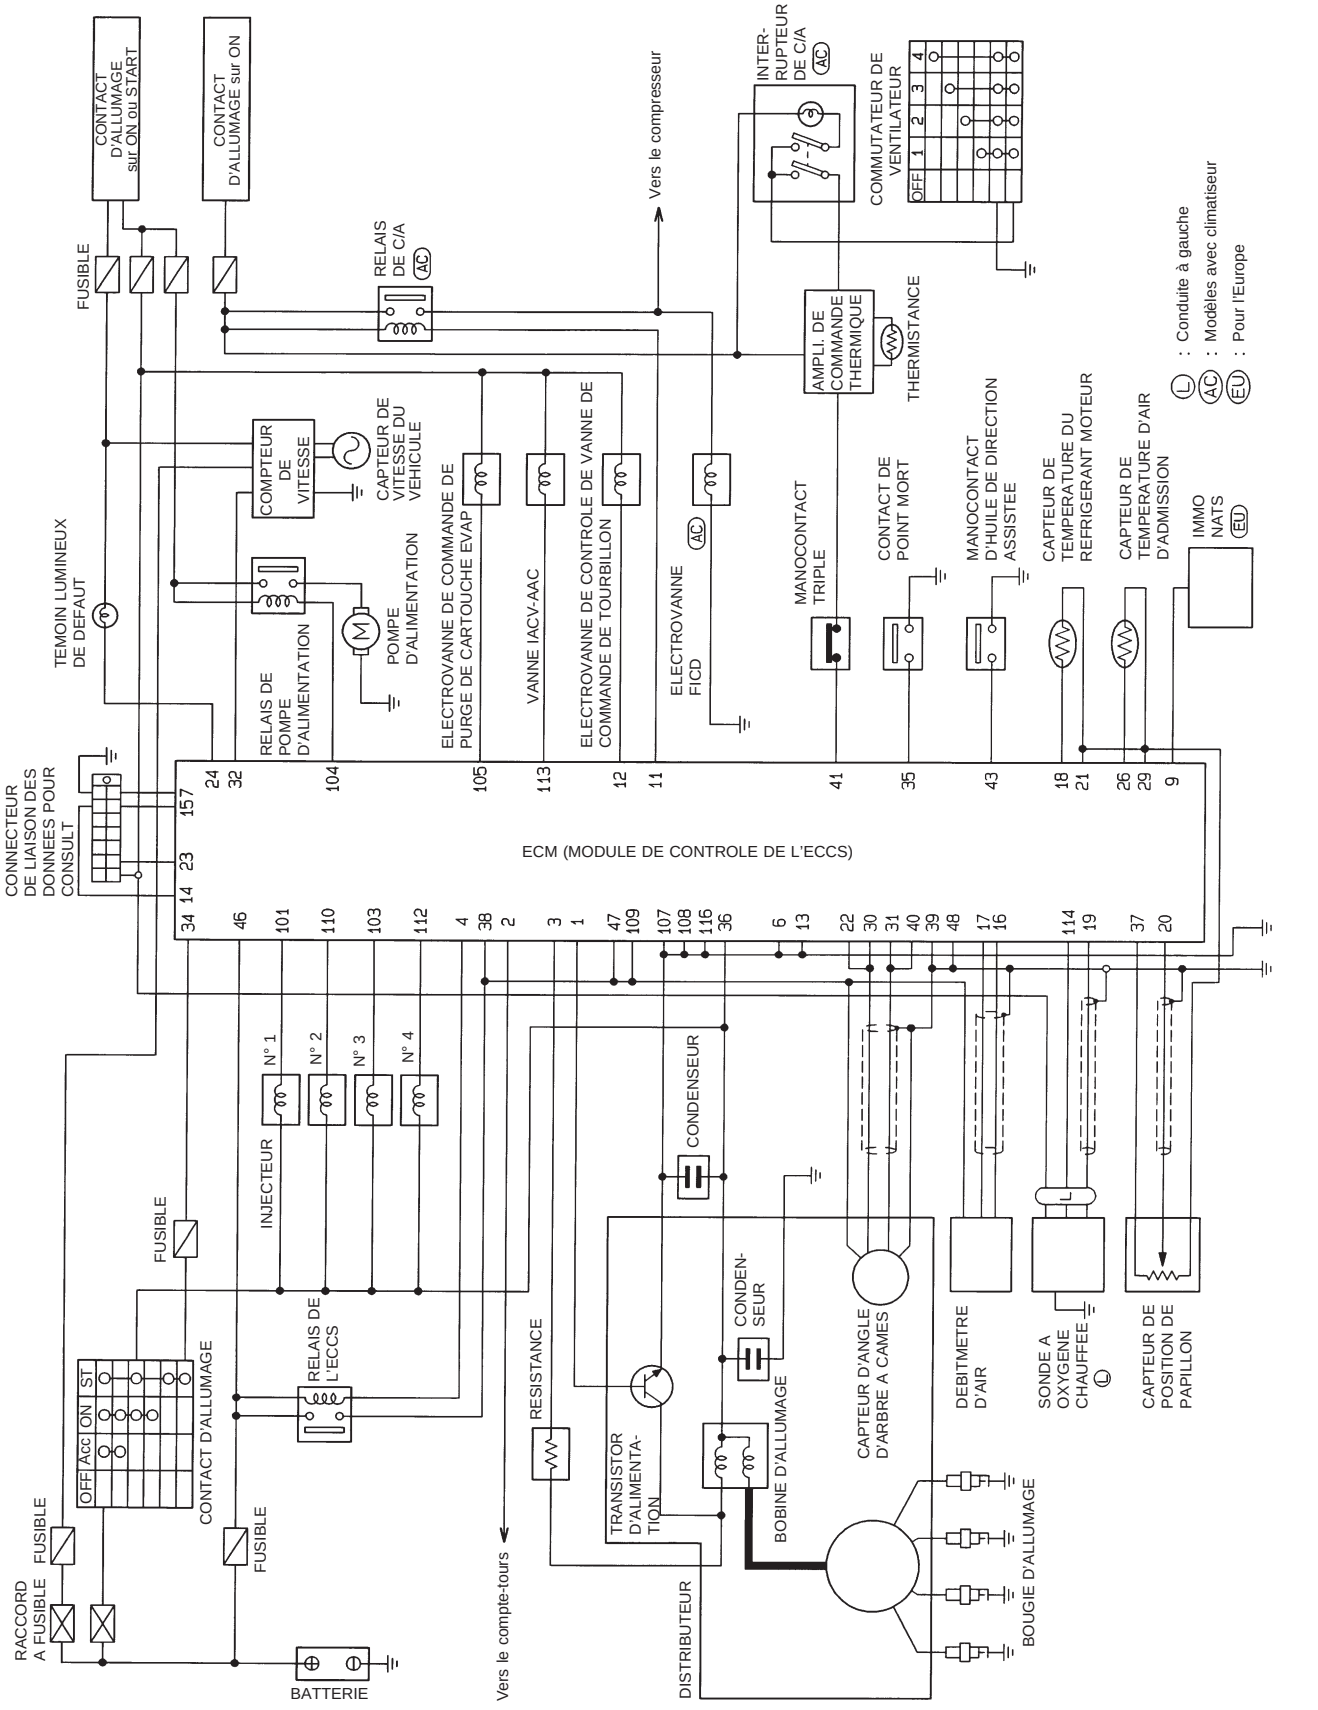
- **Avant de remplacer l'ECM, effectuer une inspection du signal d'entrée/sortie de l'ECM afin de déterminer en toute certitude s'il fonctionne correctement ou non (voir page EC-71).**



SEF051P

- **Après avoir effectué chaque DIAGNOSTIC DES DEFAUTS, effectuer une ''VERIFICATION DU FONCTIONNEMENT GENERAL'' ou ''PROCEDURE DE CONFIRMATION DTC (code de défaut de diagnostic)''.**
  Le DTC ne doit pas être affiché dans la ''PROCEDURE DE CONFIRMATION DTC'' si la réparation a été effectuée. La ''VERIFICATION DU FONCTIONNEMENT GENERAL'' devrait produire un bon résultat si la réparation a été effectuée.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Précautions (Suite)

- **Lors de la mesure des signaux d'ECM avec un testeur de circuit, ne jamais mettre en contact les deux sondes de l'appareil.**
  La mise en contact accidentelle des deux sondes entraînera un court-circuit et endommagera le transistor d'alimentation de l'ECM.

Système d'injection multipoint de carburant (MFI)

LIGNE DE SIGNAL D'ENTREE/SORTIE

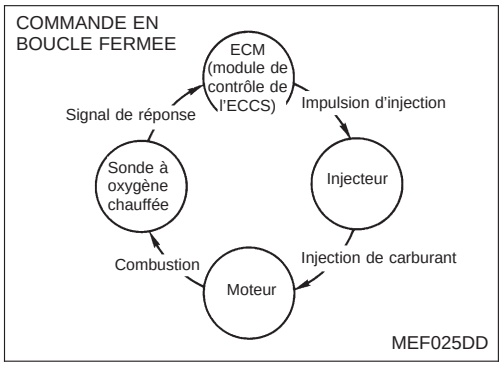
* : Conduite à gauche

PRINCIPE DE BASE DU SYSTEME D'INJECTION MULTIPOINT DE CARBURANT

La quantité de carburant injectée depuis l'injecteur de carburant est déterminée par l'ECM. L'ECM commande la durée d'ouverture du clapet (durée d'impulsion d'injection). La quantité de carburant injectée est une valeur de programme contenue dans la mémoire de l'ECM. La valeur de programme est prédéterminée par les conditions de marche du moteur. Ces conditions sont déterminées par des signaux d'entrée (régime du moteur et air d'admission) en provenance du capteur d'angle d'arbre à cames et du débitmètre d'air.

COMPENSATION DES VARIATIONS DES DIFFERENTES VALEURS D'INJECTION DE CARBURANT

La quantité de carburant injecté est compensée pour améliorer les performances du moteur. Cette compensation sera effective dans les diverses conditions de fonctionnement énumérées ci-après :



<Augmentation de la quantité de carburant>

- Pendant la période d'échauffement
- Au démarrage
- Pendant l'accélération
- Lorsque le moteur est chaud
- Fonctionnement à forte charge, à grande vitesse
- Lorsque la vanne de commande de tourbillon fonctionne

<Diminution de la quantité de carburant>

- Pendant la décélération
- Durant le fonctionnement à régime moteur élevé
- Température du réfrigérant moteur extrêmement élevée

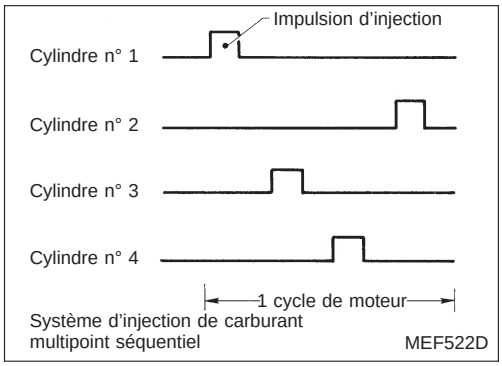
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Système d'injection multipoint de carburant (MFI) (Suite)

REGULATION AUTOMATIQUE DE LA RICHESSE DE MELANGE

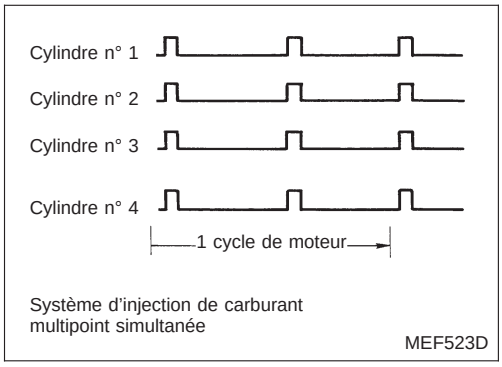
Le système de signal de réponse de richesse de mélange fournit le mélange optimal d'air et de carburant pour améliorer la conduite et le contrôle antipollution. Le catalyseur à trois voies peut mieux réduire les émissions de CO, HC et NOx. Ce système utilise une sonde à oxygène chauffée dans le collecteur d'échappement pour vérifier si le mélange du moteur est riche ou pauvre. L'ECM règle la largeur d'impulsion d'injection en fonction du signal de tension de la sonde. Pour plus d'informations sur la sonde à oxygène chauffée, consulter la page EC-129. Ceci maintient la richesse de mélange dans la gamme stoechiométrique (mélange idéal air/carburant).
Ce stade est désigné comme étant la condition de commande en boucle fermée.

COMMANDE EN BOUCLE OUVERTE



La condition de commande en boucle ouverte se rapporte à la détection de l'une des conditions suivantes par l'ECM. La commande de signal s'interrompt afin de maintenir une combustion de carburant stabilisée.

- Décélération et accélération
- Fonctionnement à forte charge, à grande vitesse
- Ralenti
- Défaut de la sonde à oxygène chauffée ou de son circuit
- Activation insuffisante de la sonde à oxygène chauffée à basse température du réfrigérant moteur
- Température de liquide de refroidissement élevée
- Pendant la période d'échauffement
- Au démarrage



COMMANDE D'AUTO-INSTRUCTION DE RICHESSE DU MELANGE

Le système de commande de régulation automatique de la richesse du mélange surveille le signal de la richesse du mélange transmis par la sonde à oxygène chauffée. Ce signal de réponse est ensuite envoyé à l'ECM. L'ECM contrôle la richesse du mélange de base le plus près possible de la richesse de mélange théorique. Toutefois, la richesse de base du mélange n'est pas nécessairement réglée comme cela est conçu à l'origine. Tant les tolérances de fabrication (à savoir le fil chaud du débitmètre d'air) que les modifications des caractéristiques pendant le fonctionnement (par exemple l'engorgement des injecteurs) affectent directement la richesse.
Par conséquent, la différence entre le mélange de base et le mélange théorique est contrôlée par ce système. Ceci est alors calculé en termes de ''durée d'impulsion d'injection'' pour compenser automatiquement la différence entre les deux richesses.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Système d'injection de carburant multipoint séquentiel
MEF522D

Système d'injection de carburant multipoint simultanée
MEF523D

Système d'injection multipoint de carburant (MFI) (Suite)

SYSTEME D'INJECTION DE CARBURANT

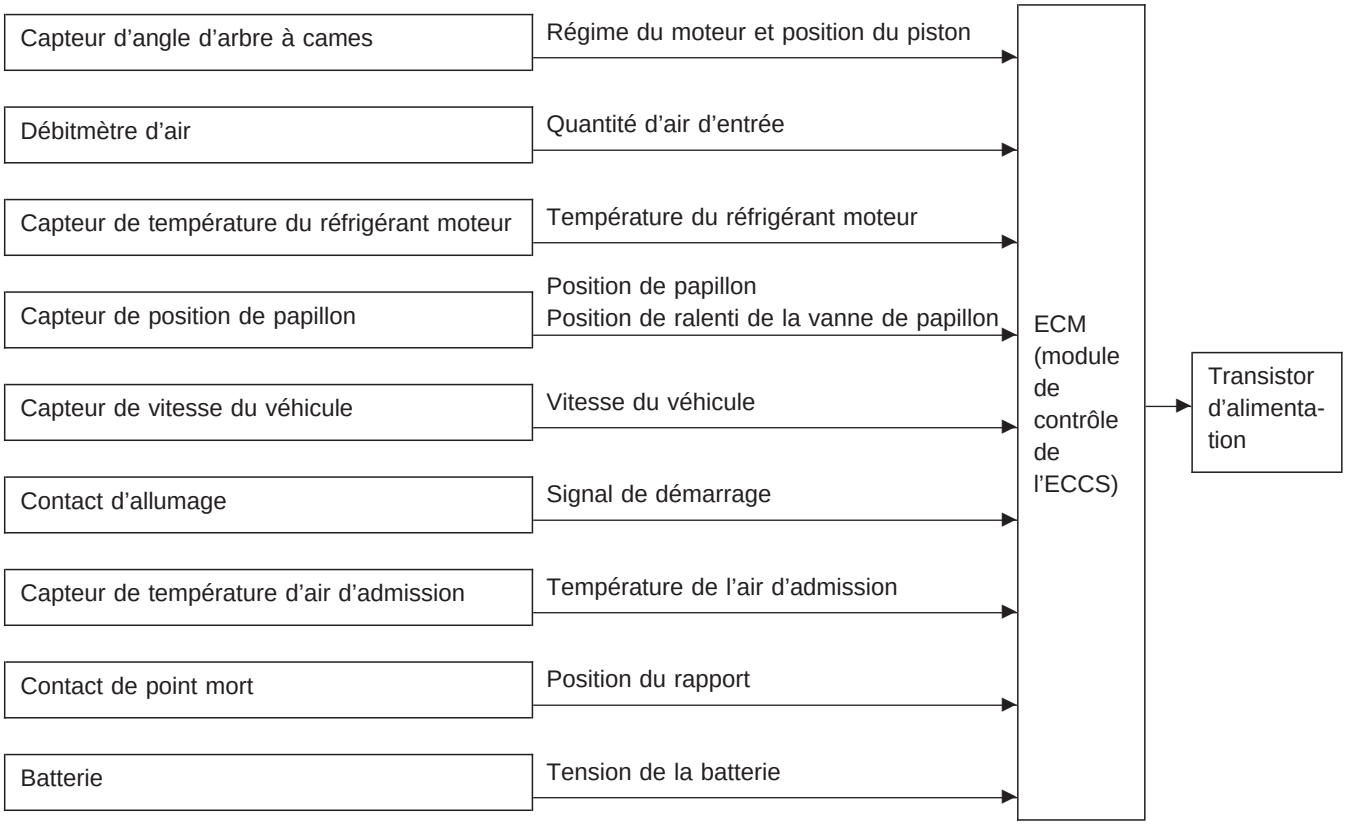
Deux types de systèmes sont utilisés.

Système d'injection multipoint séquentielle

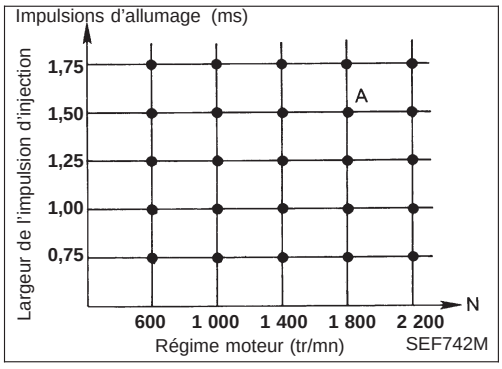
Le carburant est injecté dans chaque cylindre à chaque cycle moteur, en fonction de l'ordre d'allumage. Ce système est utilisé lorsque le moteur tourne.

Système d'injection multipoint simultanée

Le carburant est injecté simultanément dans les quatre cylindres deux fois par cycle moteur. En d'autres termes, des signaux d'impulsion de même amplitude sont transmis simultanément de l'ECM.
Les quatre injecteurs reçoivent ainsi des signaux deux fois par cycle moteur.
Ce système est utilisé au démarrage du moteur et/ou lorsque le système de sécurité (CPU) est actif.



COUPURE DE L'ALIMENTATION DE CARBURANT



L'alimentation de carburant à chaque cylindre est coupée lors de la décélération ou du surrégime.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Système d'allumage à distributeur (DI)

LIGNE DE SIGNAL D'ENTREE/SORTIE

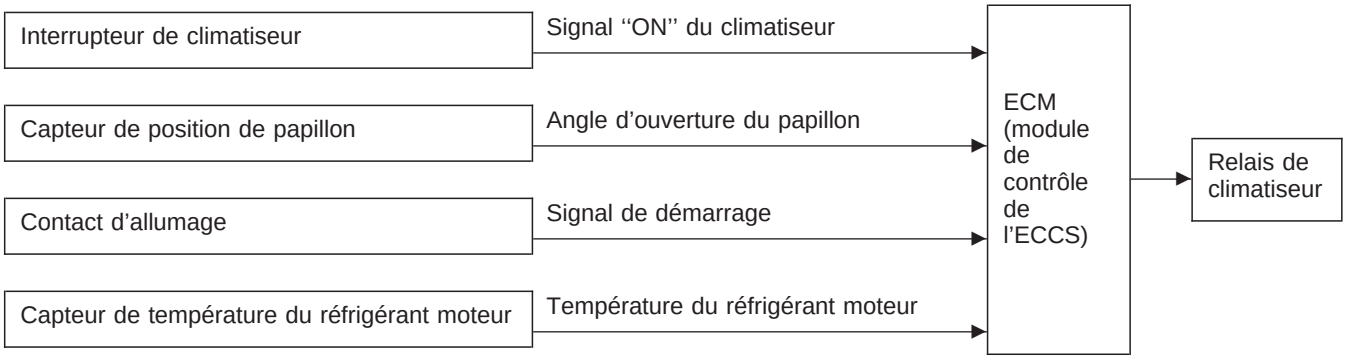
DESCRIPTION DU SYSTEME

Le calage d'allumage est contrôlé par l'ECM de manière à maintenir le meilleur mélange air/carburant dans toutes les conditions de marche du moteur.

Les données de calage d'allumage sont mémorisées dans l'ECM. Ces données sont représentées sur le diagramme ci-contre.

L'ECM détecte des informations telles que la largeur des impulsions d'injection et le signal du capteur d'angle d'arbre à cames. En réponse à cette information, des signaux d'allumage sont transmis au transistor d'alimentation.

Ex. N : 1 800 tr/mn, Impulsions d'allumage : 1,50 ms
A° avant P.M.H.



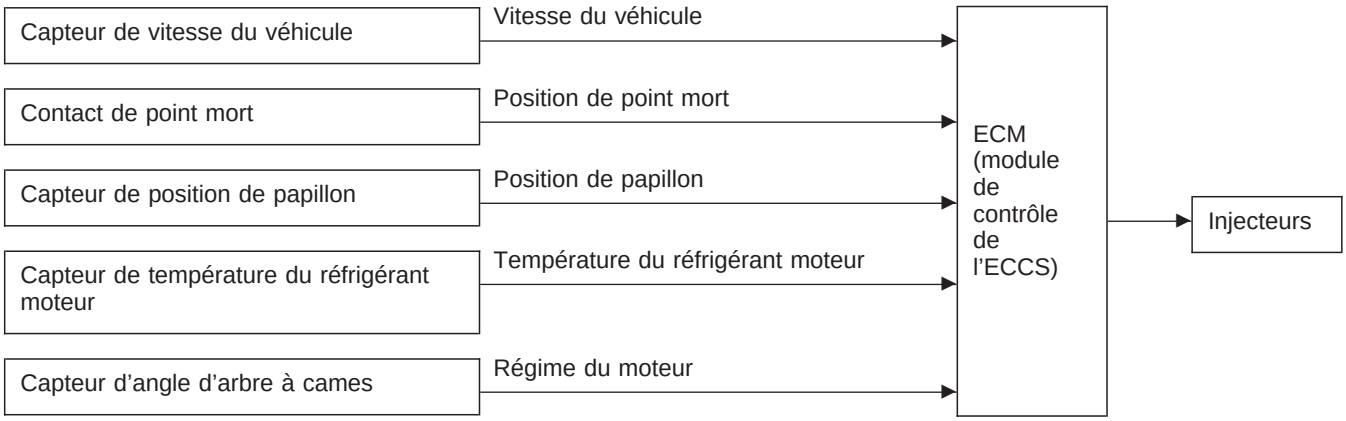
Dans les conditions suivantes, le calage de l'allumage est révisé par l'ECM en fonction des autres données mémorisées dans l'ECM.

1 Au démarrage
2 Pendant la période d'échauffement
3 Au ralenti
4 Lorsque la vanne de commande de tourbillon fonctionne
5 Lorsque le moteur est chaud
6 Pendant l'accélération

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Commande de coupure de climatisation

LIGNE DE SIGNAL D'ENTREE/SORTIE

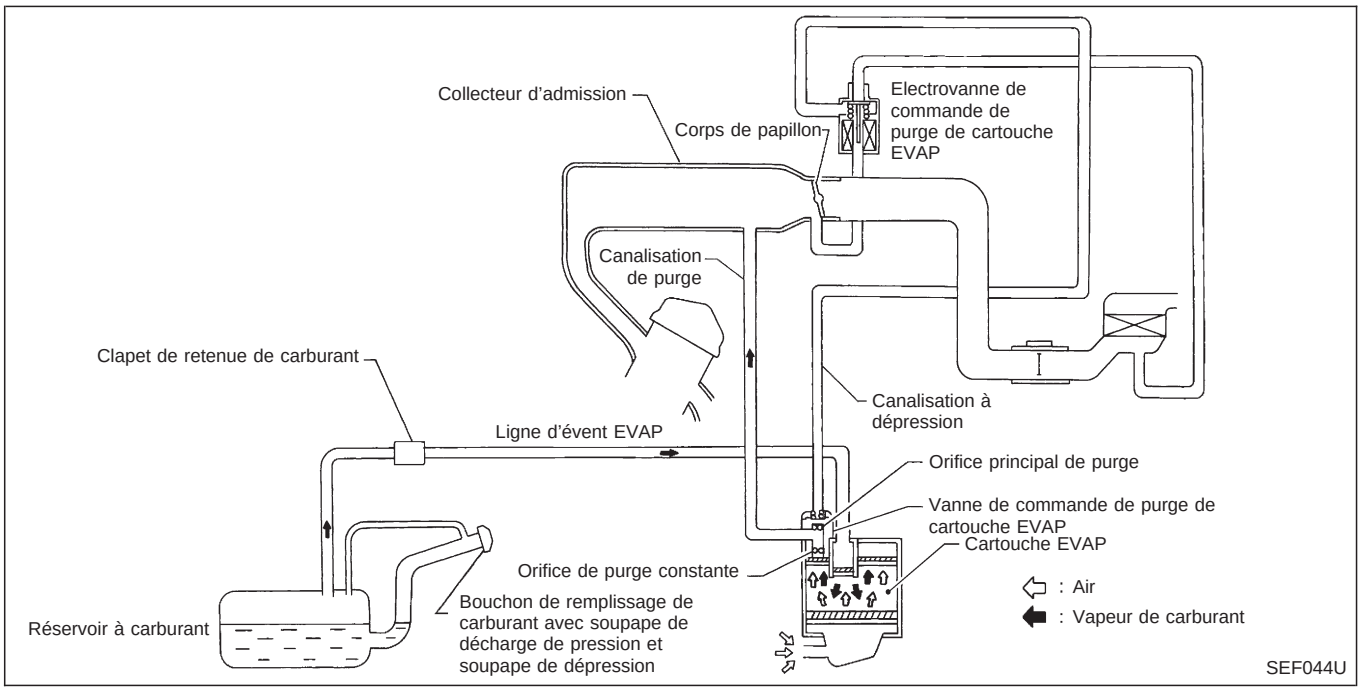


DESCRIPTION DU SYSTEME

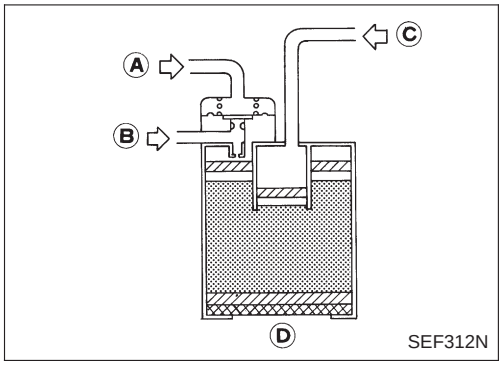
Ce système permet d'améliorer le fonctionnement du moteur pendant le fonctionnement du climatiseur.
Le climatiseur s'éteint dans les conditions suivantes.

- Lorsque la pédale d'accélérateur est enfoncée à fond
- Lors du lancement du moteur
- Lorsque la température du réfrigérant devient excessivement élevée

Commande de coupure d'alimentation (à vide et à régime du moteur élevé)



LIGNE DE SIGNAL D'ENTREE/SORTIE



Si le régime du moteur est supérieur à 3 500 tr/mn sans charge (par exemple au point mort et à un régime de moteur supérieur à 3 500 tr/mn), l'alimentation de carburant sera coupée au bout d'un certain temps. Le moment exact de la coupure d'alimentation varie selon le régime du moteur.
La coupure d'alimentation est maintenue jusqu'à ce que le régime du moteur atteigne 1 500 tr/mn, point auquel la coupure d'alimentation est annulée.
NOTE :
Cette fonction diffère de la commande de décélération décrite au chapitre "Système d'injection multipoint (MFI)" à la page EC-14.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description

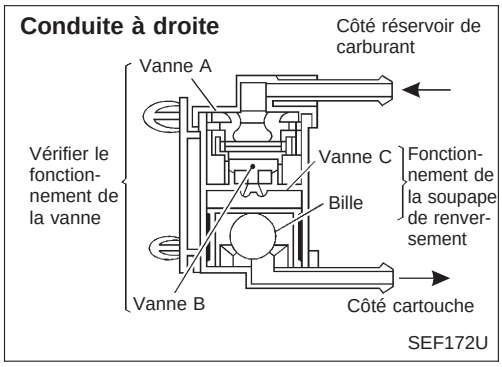
Le système de contrôle des émissions évaporatives est utilisé pour réduire les vapeurs d'hydrocarbure émises dans l'atmosphère par le système d'alimentation. Cette réduction des vapeurs d'hydrocarbures est accomplie par les charbons activés contenus dans la cartouche.
Les vapeurs de carburant provenant du réservoir hermétique sont orientées vers la cartouche EVAP quand le moteur est à l'arrêt. Ces vapeurs sont ensuite conservées dans la cartouche EVAP. Les vapeurs de carburant restent dans la cartouche EVAP jusqu'à ce que celle-ci soit purgée par l'air.
Lorsque le moteur est en marche, l'air est aspiré à travers le fond de la cartouche EVAP. Ainsi, les vapeurs de carburant sont amenées au collecteur d'admission.
Quand le moteur tourne au ralenti, la soupape de commande de purge de la cartouche EVAP est fermée. Seule une petite quantité de vapeur passe dans le collecteur d'admission par l'intermédiaire de l'orifice de purge permanente.
Quand le régime du moteur augmente et que la dépression au papillon s'accroît, la soupape de commande de purge de la cartouche EVAP s'ouvre. Les vapeurs sont alors aspirées à la fois par la purge principale et par les orifices de purge permanente.

Inspection

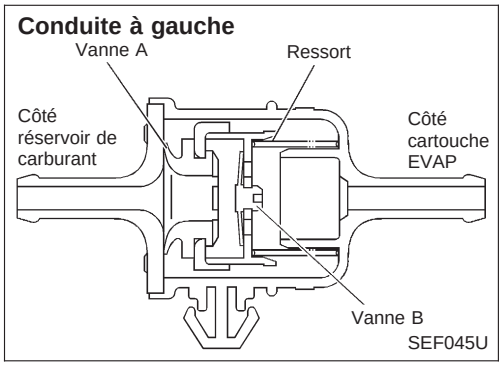
CARTOUCHE EVAP

Vérifier la cartouche EVAP comme suit :
1. Souffler de l'air par l'orifice Ⓐ et vérifier qu'il n'y a pas de fuite.
2. Appliquer une dépression à l'orifice Ⓐ. [Environ −13,3 à −20,0 kPa (−133 à −200 mbar, −100 à −150 mmHg)]
3. Couvrir l'orifice Ⓓ avec la main.
4. Souffler de l'air dans l'orifice Ⓒ et vérifier qu'il s'écoule librement par l'orifice Ⓑ.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Inspection (Suite)

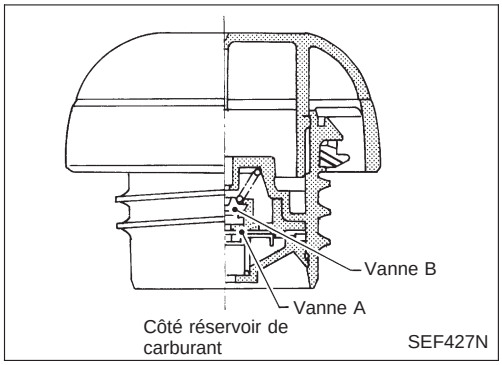


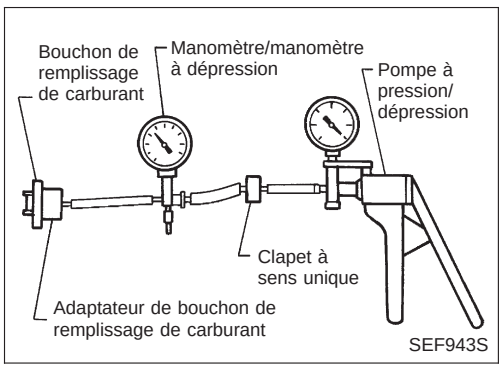
CLAPET ANTI-RETOUR DE CARBURANT

1. Souffler de l'air par le raccord, côté réservoir de carburant. Une résistance considérable doit être ressentie et une partie de l'air doit s'écouler en direction de la cartouche EVAP.
2. Souffler de l'air par le raccord sur le côté de la cartouche EVAP.
   L'air ainsi soufflé doit être dirigé sans résistance vers le réservoir de carburant.
3. Si le fonctionnement du clapet de retenue de carburant est suspect durant les étapes 1 et 2 ci-dessus, remplacer le clapet.

Fonctionnement de la soupape de renversement (modèles avec conduite à droite uniquement)

S'assurer qu'il n'y a pas continuité du passage d'air lorsqu'on incline la soupape de renversement de 90° ou 180°.

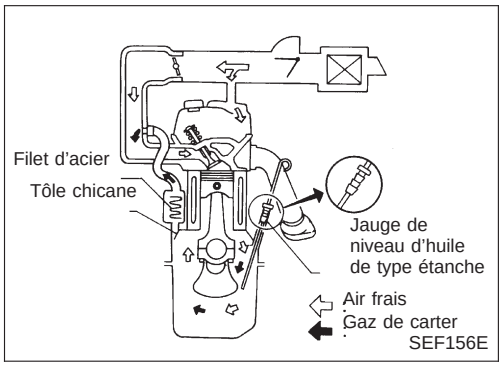


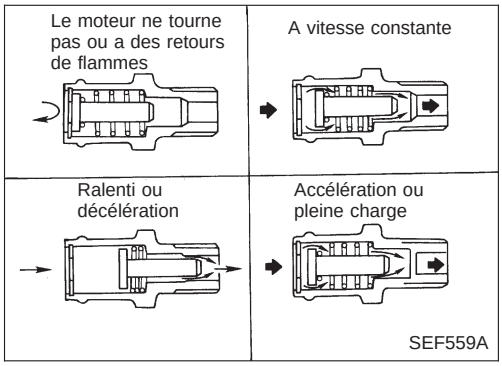


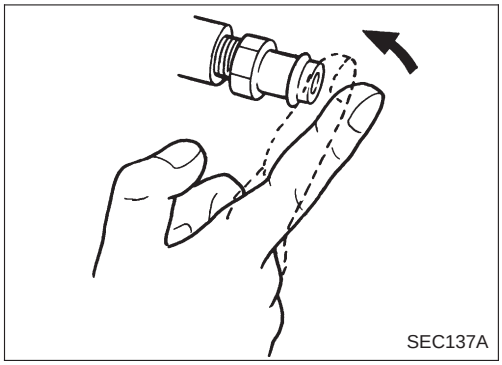
SOUPAPE DE DETENTE DE DEPRESSION DU RESERVOIR DE CARBURANT

1. Nettoyer soigneusement le logement de la soupape.
2. Vérifier la pression d'ouverture et la dépression de la soupape.
   Pression :
   15,3 - 20,0 kPa (0,1530 - 0,2001 bar, 0,156 - 0,204 kg/cm^2)
   Dépression :
   −6,0 à −3,3 kPa (−0,0598 à −0,0333 bar, −0,061 à −0,034 kg/cm^2)
3. Si hors spécification, remplacer le bouchon de remplissage de carburant comme un ensemble.

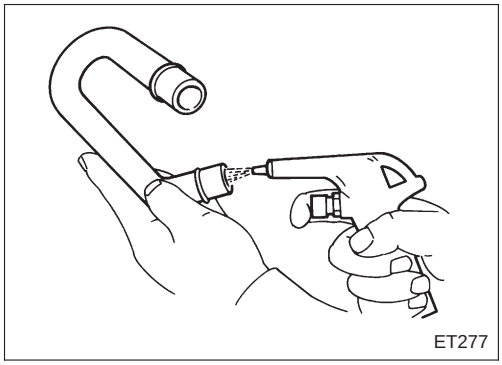
ATTENTION :
Utiliser uniquement un bouchon de réservoir d'origine comme pièce de rechange.







ELECTROVANNE DE COMMANDE DE PURGE DE CARTOUCHE EVAP



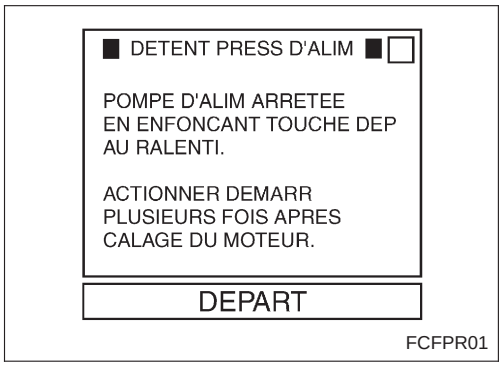
Consulter la page EC-146.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description

Ce système renvoie les gaz de carter au collecteur d'admission. La vanne de recyclage des gaz en carter (P.C. V.) est montée pour conduire les gaz de carter au collecteur d'admission.
Durant le fonctionnement du moteur, alors que le papillon est partiellement ouvert, le collecteur d'admission aspire les gaz de carter par la vanne de recyclage des gaz en carter.
En condition normale, la vanne a une capacité suffisante pour aspirer tous les gaz de carter et une petite quantité d'air de ventilation.
L'air de ventilation est alors aspiré de la canalisation d'air dans le carter. Durant cette opération, l'air passe à travers le flexible qui raccorde les conduites d'admission au cache-culbuteur.
Quand le papillon est grand ouvert, la dépression régnant dans le collecteur est insuffisante pour aspirer les gaz de carter par la vanne. Les gaz traversent donc le raccord de flexible dans le sens opposé.
Sur les véhicules présentant une quantité excessive de gaz de carter, la vanne ne suffit pas aux besoins. Cela est dû au fait qu'une partie des gaz traverse le raccord de flexible et va au collecteur d'admission dans toutes les conditions de fonctionnement.

Inspection



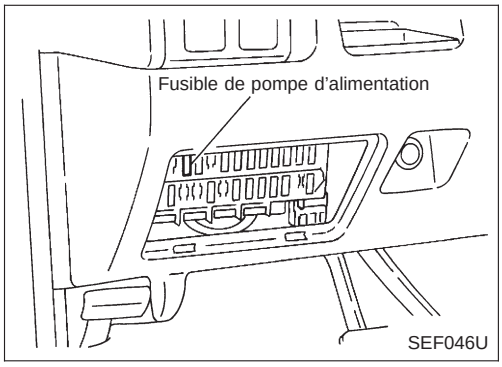
VANNE PCV (ventilation positive du carter)

Le moteur tournant au ralenti, déposer la vanne PCV du séparateur de reniflard. Une soupape en bon état émet un sifflement lors du passage de l'air. On doit sentir immédiatement une forte succion lorsqu'on place un doigt à l'entrée de la vanne.

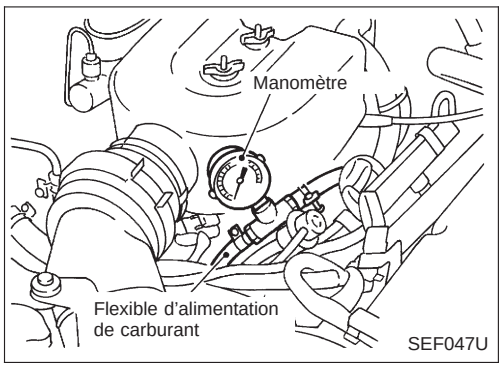
FLEXIBLE PCV

1. Vérifier les flexibles et les raccords de flexible pour déceler toute présence de fuite.
2. Débrancher tous les flexibles et les nettoyer à l'air comprimé. Remplacer tous les flexibles qui ne peuvent pas être débouchés de façon satisfaisante.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Détente de la pression d'alimentation

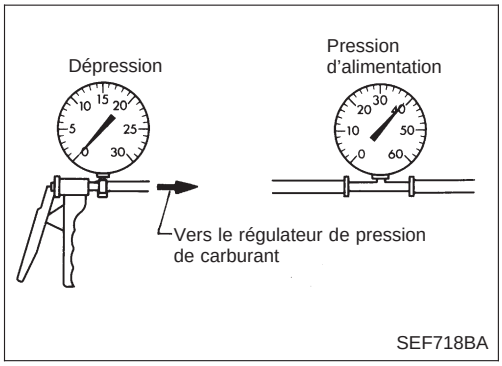


Avant de débrancher les canalisations d'alimentation, détendre la pression de carburant par mesure de sécurité.

1. Démarrer le moteur.
2. Effectuer une ''DETENT PRESS D'ALIM'' en mode ''SUPPORT TRAVAIL'' à l'aide du CONSULT.
   (Appuyer sur ''DEPART'' et, après le calage du moteur, lancer le moteur deux ou trois fois pour détendre complètement la pression d'alimentation).
3. Mettre le contact d'allumage sur ''ARRET''.

OU

1. Déposer le fusible de la pompe d'alimentation.
2. Démarrer le moteur.
3. Après que le moteur a calé, le relancer deux ou trois fois afin de dépressuriser le carburant.
4. Mettre le contact d'allumage sur ''OFF'' et brancher le fusible de pompe d'alimentation.



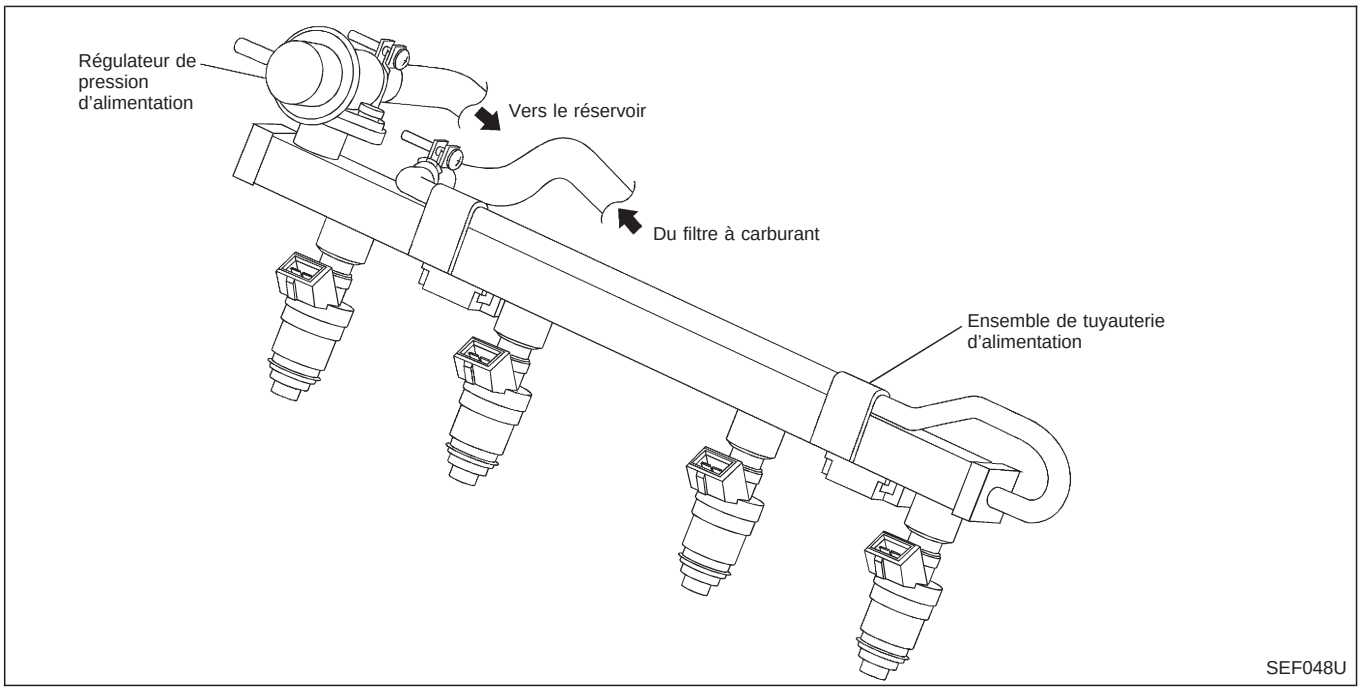
Vérification de la pression d'alimentation

- **Pour rebrancher une canalisation d'alimentation, toujours utiliser des colliers neufs.**
- **Veiller à ce que la vis de collier n'entre pas en contact avec une pièce voisine.**
- **Utiliser un tournevis dynamométrique pour serrer les colliers.**
- **Utiliser un manomètre pour vérifier la pression du carburant.**

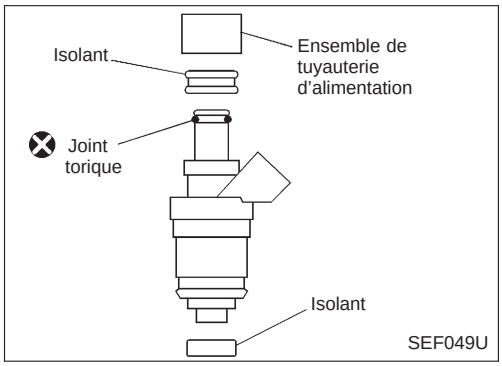
1. Détendre totalement la pression de carburant (zéro bar), conformément au chapitre ci-dessus.
2. Déconnecter le flexible d'alimentation entre le filtre et le tuyau d'alimentation (côté moteur).
3. Monter le manomètre entre le filtre et le tube d'alimentation.
4. Démarrer le moteur et rechercher la présence de fuites de carburant.

5. Lire la valeur indiquée par le manomètre d'alimentation.
   Au ralenti :
   Approximativement 235 kPa (2,35 bar, 2,4 kg/cm^2)
   Quelques secondes après que le contact d'allumage est passé de ''OFF'' à ''ON'' :
   Approximativement 294 kPa (2,94 bar, 3,0 kg/cm^2)
6. Arrêter le moteur et déconnecter le flexible à dépression du régulateur de pression d'alimentation du collecteur d'admission.
7. Boucher le collecteur d'admission avec un capuchon en caoutchouc.

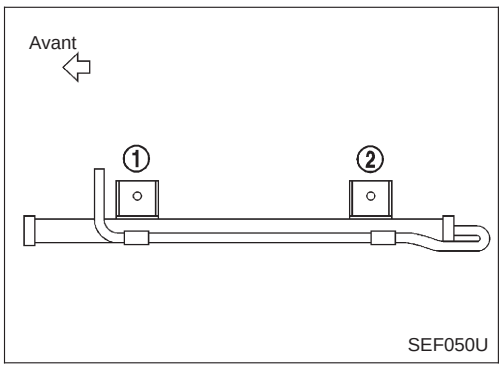
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Vérification de la pression d'alimentation (Suite)



8. Connecter une source de dépression variable au régulateur de pression d'alimentation.
9. Démarrer le moteur et observer le cadran du manomètre au moment où la dépression change.



La pression du carburant doit diminuer parallèlement à l'augmentation de la dépression. Si les résultats ne sont pas satisfaisants, remplacer le régulateur de pression d'alimentation.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Dépose et repose de l'injecteur

1. Détendre totalement la pression de carburant (zéro bar).
2. Déposer l'ensemble de tube à injection ainsi que les injecteurs du collecteur d'admission.
3. Déposer les injecteurs de l'ensemble de tube à injection

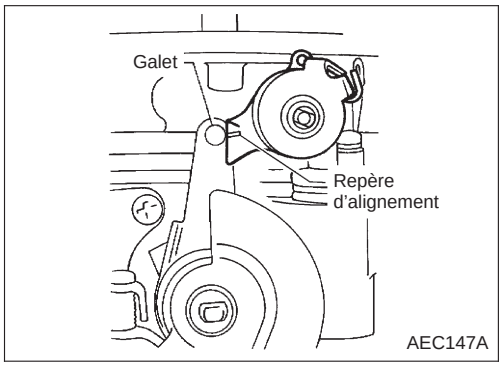
● Ne pas tirer sur le connecteur.

4. Monter l'injecteur sur l'ensemble du tuyau de carburant.

a. Nettoyer l'extérieur de la queue d'injecteur.
b. Utiliser des joints toriques neufs.

Toujours remplacer les joints toriques par des neufs.
Graisser les joints toriques avec une petite quantité d'huile moteur.

5. Reposer les injecteurs avec l'ensemble du tuyau de carburant sur le collecteur d'admission.

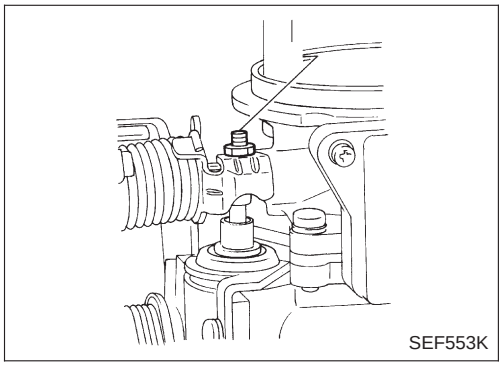


Serrer en ordre numérique comme indiqué sur la figure.

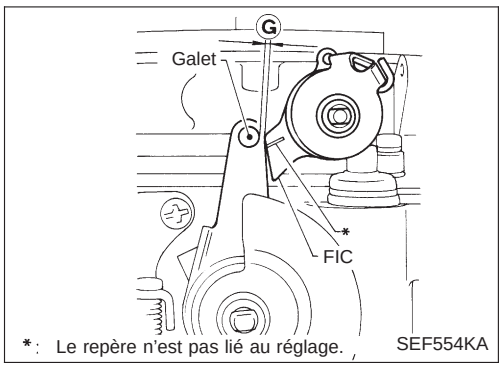
a. Premièrement, serrer tous les boulons de 7,8 à 10,8 N·m (0,8 à 1,1 kg-m).
b. Puis, serrer tous les boulons de 16 à 21 N·m (1,6 à 2,1 kg-m).

6. Monter les flexibles de carburant avec l'ensemble du tuyau de carburant.
7. Reposer toutes les pièces qui ont été déposées en procédant dans l'ordre inverse de la dépose.

ATTENTION :
Après avoir raccordé correctement les injecteurs à l'ensemble du tube d'alimentation, vérifier que les raccords ne fuient pas.



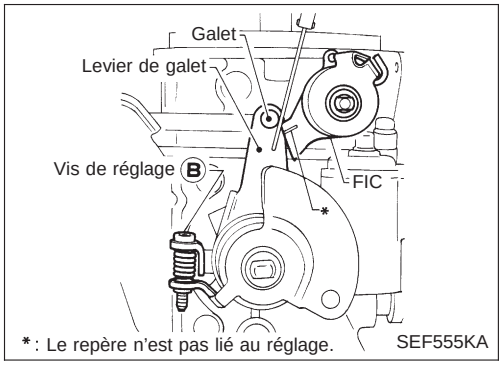
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Inspection et réglage de la came de ralenti accéléré (FIC)

1. Déposer l'ensemble du filtre à air.
2. S'assurer que la marque de repère FIC est alignée sur le galet de levier comme indiqué sur la figure.

- Un repère d'alignement est marqué sur la came de ralenti accéléré pour que le sommet de came puisse être orienté dans le bon sens.



- Si nécessaire, régler la vis FIC Ⓐ jusqu'à ce que le repère d'alignement soit centré sur le galet de levier.

3. Démarrer le moteur et le laisser chauffer jusqu'à sa température de fonctionnement.
4. Mesurer le jeu Ⓖ entre le galet de levier et le haut du FIC avec une jauge d'épaisseur comme indiqué sur la figure.

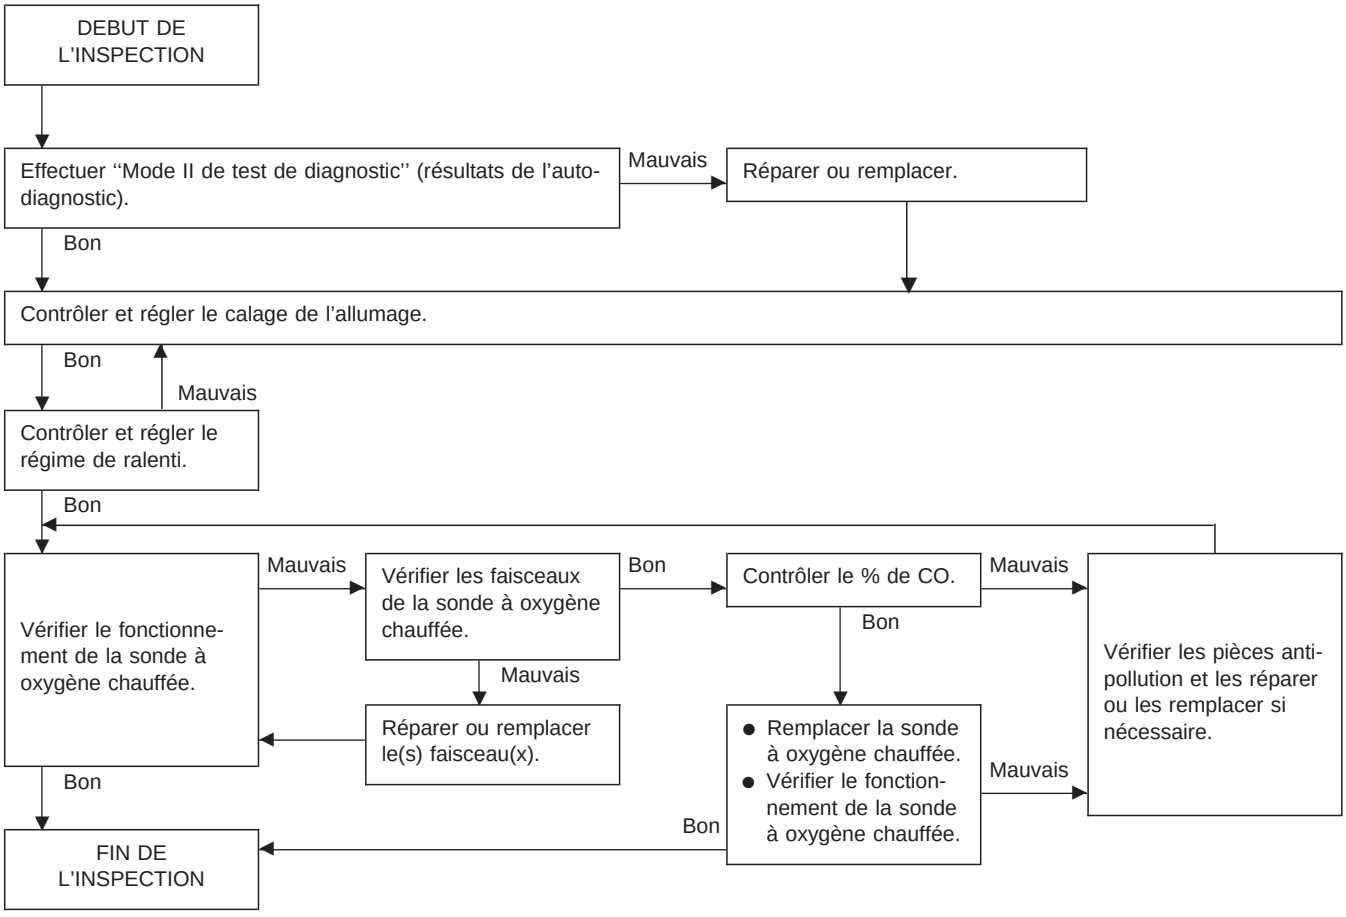
Jeu Ⓖ :
2,0 - 2,6 mm

- Si le jeu Ⓖ n'a pas la valeur spécifiée, agir sur la vis de réglage Ⓖ de 2,3 mm pour régler le jeu Ⓑ.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Réglage du régime de ralenti/calage d'allumage/richesse de mélange de ralenti

PREPARATION



- **S'assurer que les pièces suivantes sont en bon état.**

(1) Batterie
(2) Système d'allumage
(3) Niveaux d'huile moteur et de liquide de refroidissement
(4) Fusibles
(5) Connecteur du faisceau de l'ECM
(6) Flexibles à dépression
(7) Système d'admission d'air (Bouchon de remplissage d'huile, jauge de niveau d'huile, etc).
(8) Pression d'alimentation
(9) Taux de compression moteur
(10) Papillon d'accélérateur

- **Sur les modèles équipés d'un climatisateur, ces contrôles doivent être effectués lorsque le climatiseur est à l'arrêt.**
- **Lors de la mesure du pourcentage de ''CO'', introduire la sonde de plus de 40 cm dans le tuyau d'échappement.**
- **Eteindre les phares et arrêter la soufflerie de chauffage et le désembuage de lunette arrière.**
- **Aligner les roues avant en position de marche en ligne droite.**

FIN DE L'INSPECTION

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

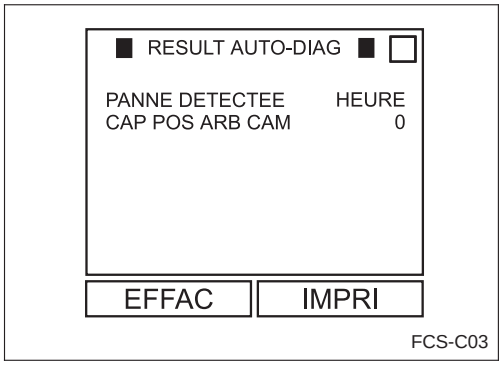
Introduction

L'ECM (module de contrôle de l'ECCS) comporte un système de diagnostic de bord qui détecte tout défaut relatif aux capteurs ou actionneurs du moteur. Les éléments d'autodiagnostic sont listés dans l'"INDEX DES CODES DE DEFAUT DE DIAGNOSTIC'', EC-1.

Le témoin de défaut (MIL) situé sur le tableau de bord s'allume quand un défaut est détecté, ou quand l'ECM passe en mode de sécurité (consulter EC-63).



Code de défaut de diagnostic (DTC)

COMMENT CONFIRMER LES ELEMENTS DE DEFAUT

Il est possible de confirmer Les éléments de défaut avec les méthodes suivantes.

1. Le DTC est indiqué par le nombre de clignotements du témoin de défaut en mode II d'essai de diagnostic (résultats d'autodiagnostic). Exemples : 11, 21 etc.
2. Le CONSULT affiche le composant défectueux ou le système en mode ''RESULT AUTO-DIAG''.

- **L'affichage d'un DTC indique un défaut. En mode II, cependant, il n'indique pas si le défaut de fonctionnement est toujours présent ou s'il s'est produit auparavant et que tout est redevenu normal.**
  Le CONSULT peut identifier la position de la panne comme indiqué ci-dessous. Il est donc recommandé d'utiliser le CONSULT (si disponible).

Un exemple d'affichage CONSULT est présenté à gauche. Le défaut s'affiche en mode ''RESULT AUTO-DIAG'' du CONSULT. Les indications relatives à l'"HEURE'' indiquent le nombre de fois où le véhicule a été conduit après la dernière détection d'un défaut.
Si le défaut vient d'être détecté, l'"HEURE'' indiquera ''0''.

COMMENT EFFACER LE DTC

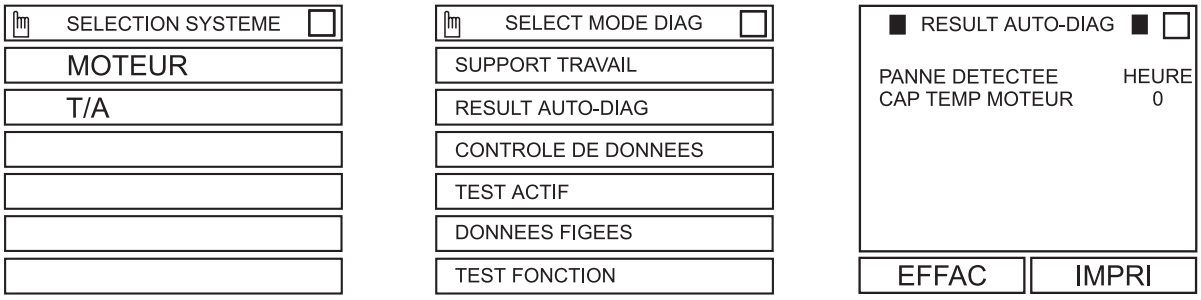
Le DTC peut être effacé de la mémoire de sauvegarde de l'ECM selon les méthodes suivantes.

Sélectionner ''EFFAC'' en mode ''RESULT AUTO-DIAG'' avec CONSULT.

Passer du mode II au mode I de test de diagnostic en tournant le sélecteur de mode de l'ECM (modèle avec conduite à droite uniquement) ou en branchant le connecteur de liaison des données des bornes CONSULT. (consulter les pages EC-40, 42).

- **Si la borne de la batterie est débranchée, le DTC disparaîtra après 24 heures.**
- **Lorsque l'on efface le DTC, il est plus facile et rapide d'utiliser CONSULT que d'actionner le sélecteur mode de l'ECM (modèle avec conduite à droite uniquement) ou de brancher le connecteur de liaison des données des bornes CONSULT.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



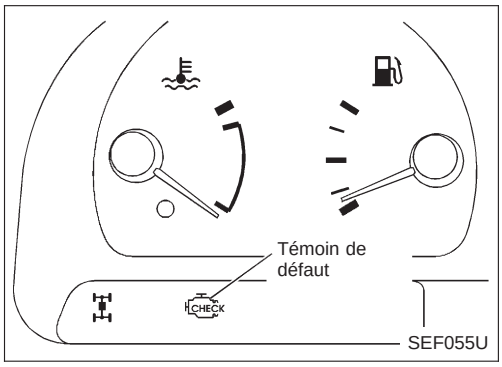
Code de défaut de diagnostic (DTC) (Suite)

Comment effacer le DTC (avec CONSULT)

1. Si le contact d'allumage reste sur ''ON'' après la réparation, veiller à tourner le contact d'allumage une fois sur ''OFF''. Attendre pendant au moins 5 secondes, puis le tourner à nouveau sur ''ON'' (moteur coupé).
2. Allumer le CONSULT et appuyer sur ''MOTEUR''.
3. Sélectionner ''RESULT AUTO-DIAG''.
4. Appuyer sur ''EFFAC'' (Le DTC sera effacé dans l'ECM).

Comment effacer le DTC (avec CONSULT)

1. Si le contact d'allumage reste sur ''ON'' après la réparation, veiller à tourner le contact d'allumage une fois sur ''OFF''. Attendre pendant au moins 5 secondes, puis le tourner à nouveau sur ''ON'' (moteur coupé).



2. Allumer le CONSULT et appuyer sur ''MOTEUR''.
3. Sélectionner ''RESULT AUTO-DIAG''.
4. Appuyer sur ''EFFAC'' (le DTC sera effacé dans l'ECM).

FCXSS02

Comment effacer le DTC (sans CONSULT)

1. Si le contact d'allumage reste sur ''ON'' après la réparation, veiller à tourner le contact d'allumage une fois sur ''OFF''. Attendre au moins 5 secondes et le tourner à nouveau sur ''ON''.
2. Passer du mode II au mode I de test de diagnostic en tournant le sélecteur de mode de l'ECM (modèle avec conduite à droite uniquement) ou en branchant le connecteur de liaison des données des bornes CONSULT (Voir EC-40, 42).

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Témoin de défaut (MIL)

Le témoin de défaut de fonctionnement est située sur le tableau de bord.

1. Le témoin s'allumera lorsque le contact d'allumage est mis sur ''ON'' avec le moteur arrêté. Ceci sert à vérifier si l'ampoule est grillée.
- Si le témoin de défaut MIL ne s'allume pas, se reporter à ''TEMOINS LUMINEUX ET TEMOINS SONORES'' à la section EL.
  (Ou voir EC-179, 180.)
2. Lorsque le moteur commence à tourner, le témoin doit s'éteindre.
   Si le témoin demeure allumé, le système de diagnostic de bord a détecté un défaut de fonctionnement dans le système motopropulseur.

FONCTION DU SYSTEME D'AUTODIAGNOSTIC

Le système de diagnostic de bord comprend les quatre fonctions suivantes.

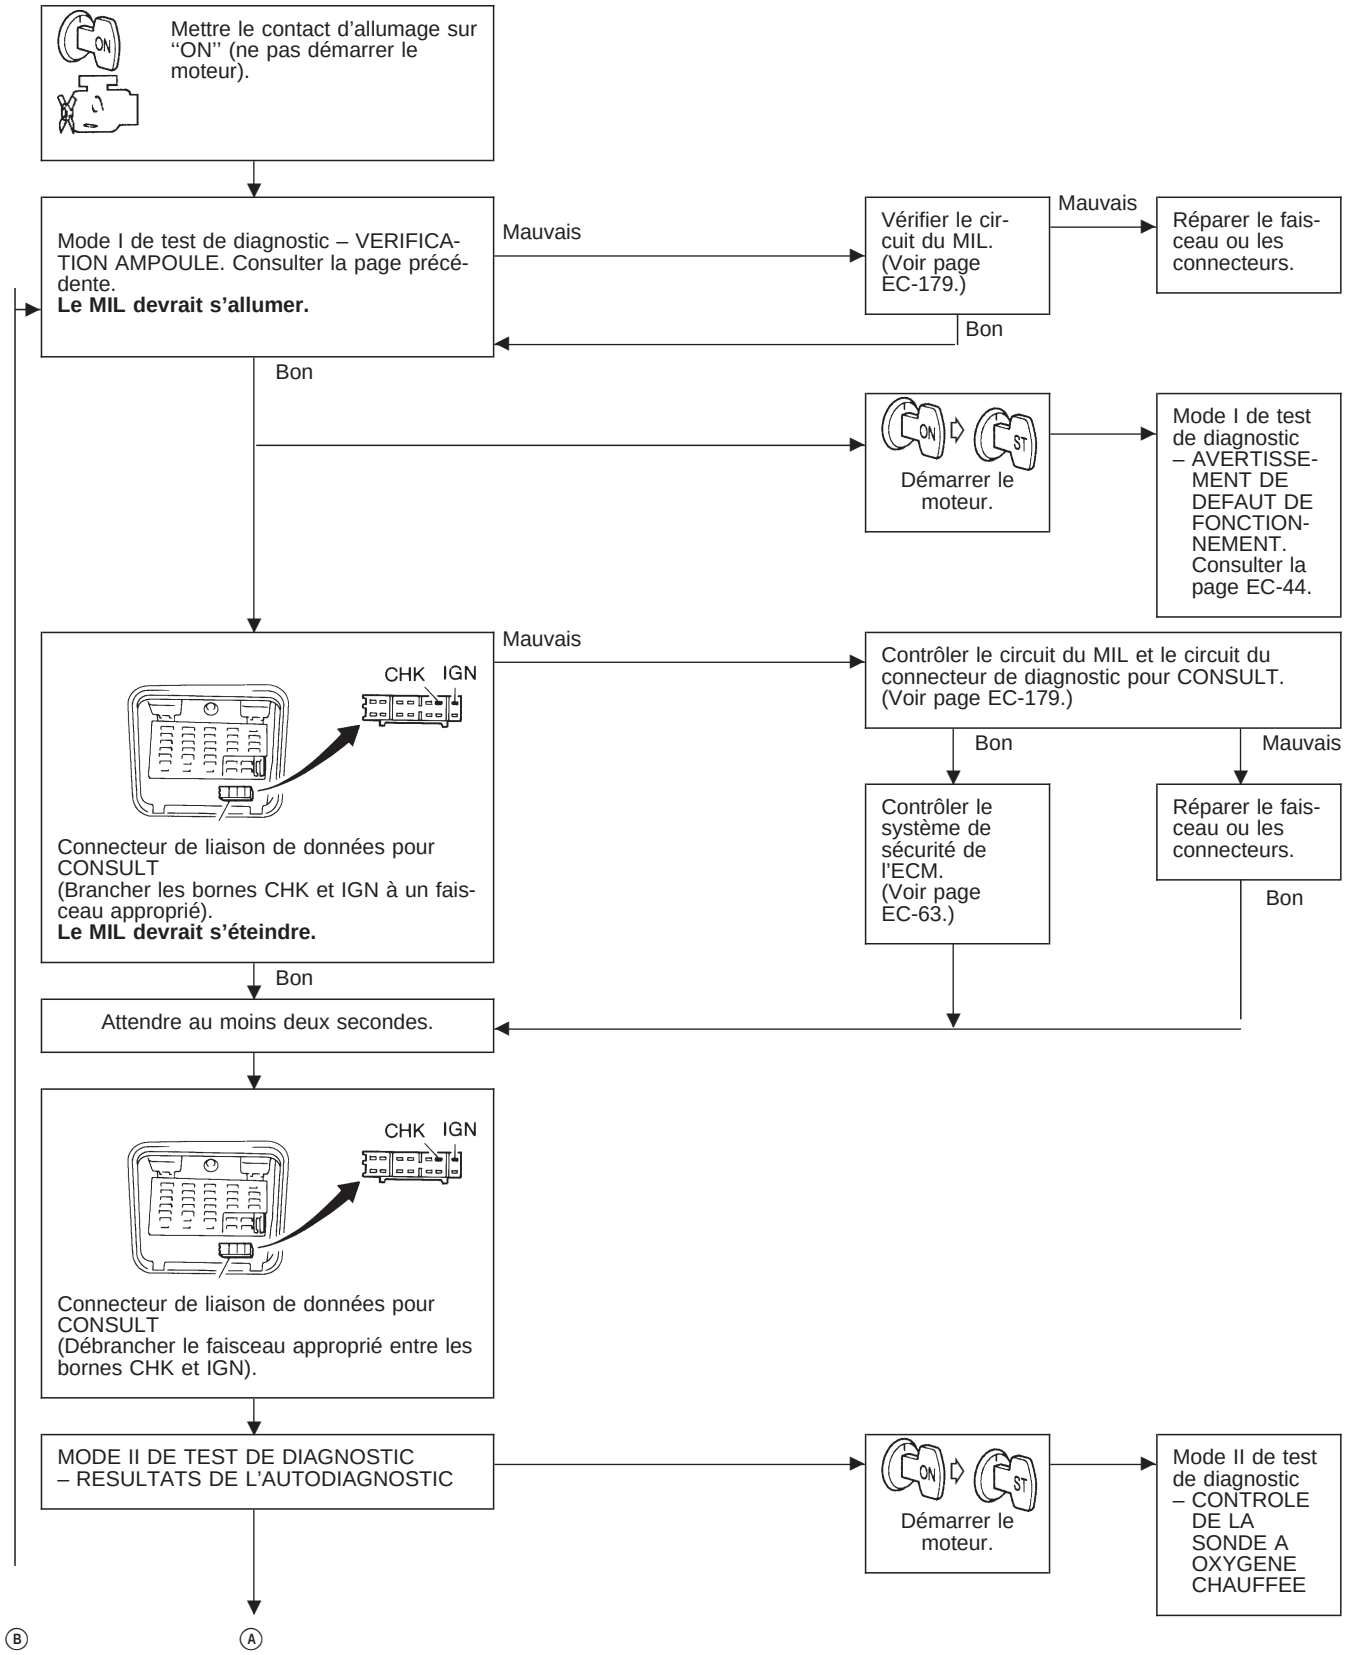
Mode I de test de diagnostic

1. VERIFICATION DE L'AMPOULE : Cette fonction vérifie si l'ampoule du témoin de défaut de fonctionnement est endommagée (grillée, circuit ouvert, etc.).
   Si le MIL ne s'allume pas, vérifier son circuit et le sélecteur de mode de test de l'ECM (voir page suivante).
2. AVERTISSEMENT DE DEFAUT DE FONCTIONNEMENT : Ceci est une condition de conduite habituelle. Lorsqu'un défaut est détecté, le MIL s'allume pour informer le conducteur de la présence du défaut.

Mode II de test de diagnostic

3. RESULTATS DE L'AUTODIAGNOSTIC : Cette fonction permet de lire les DTC.
4. CONTROLE DE LA SONDE A OXYGENE CHAUFFEE : Cette fonction permet de lire la richesse du mélange de carburant (pauvre ou riche), contrôlée par la sonde à oxygène chauffée.

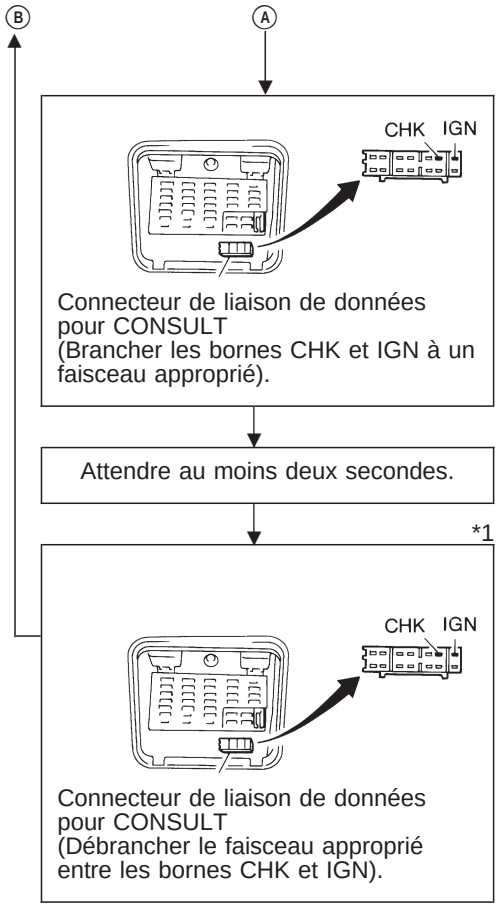
Le MIL clignote sans DTC



Si l'ECM est en mode de test de diagnostic II, il se peut que le MIL clignote quand le moteur tourne. Dans ce cas, se reporter à ''COMMENT CHANGER LE MODE DE DIAGNOSTIC'' à la page suivante.
La méthode d'activation du mode de test de diagnostic (fonction) et tous détails concernant les fonctions ci-dessus sont décrits plus loin.(Voir pages EC-40, 42).

Condition		Mode I de test de diagnostic	Mode II de test de diagnostic
Contact d'allumage sur ''ON'' 	Moteur arrêté 	VERIFICATION DE L'AMPOULE	RESULTATS DE L'AUTODIAGNOSTIC
	Moteur en marche 	AVERTISSEMENT DE DEFAUT DE FONCTIONNEMENT	CONTROLE DE LA SONDE A OXYGENE CHAUFFEE

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

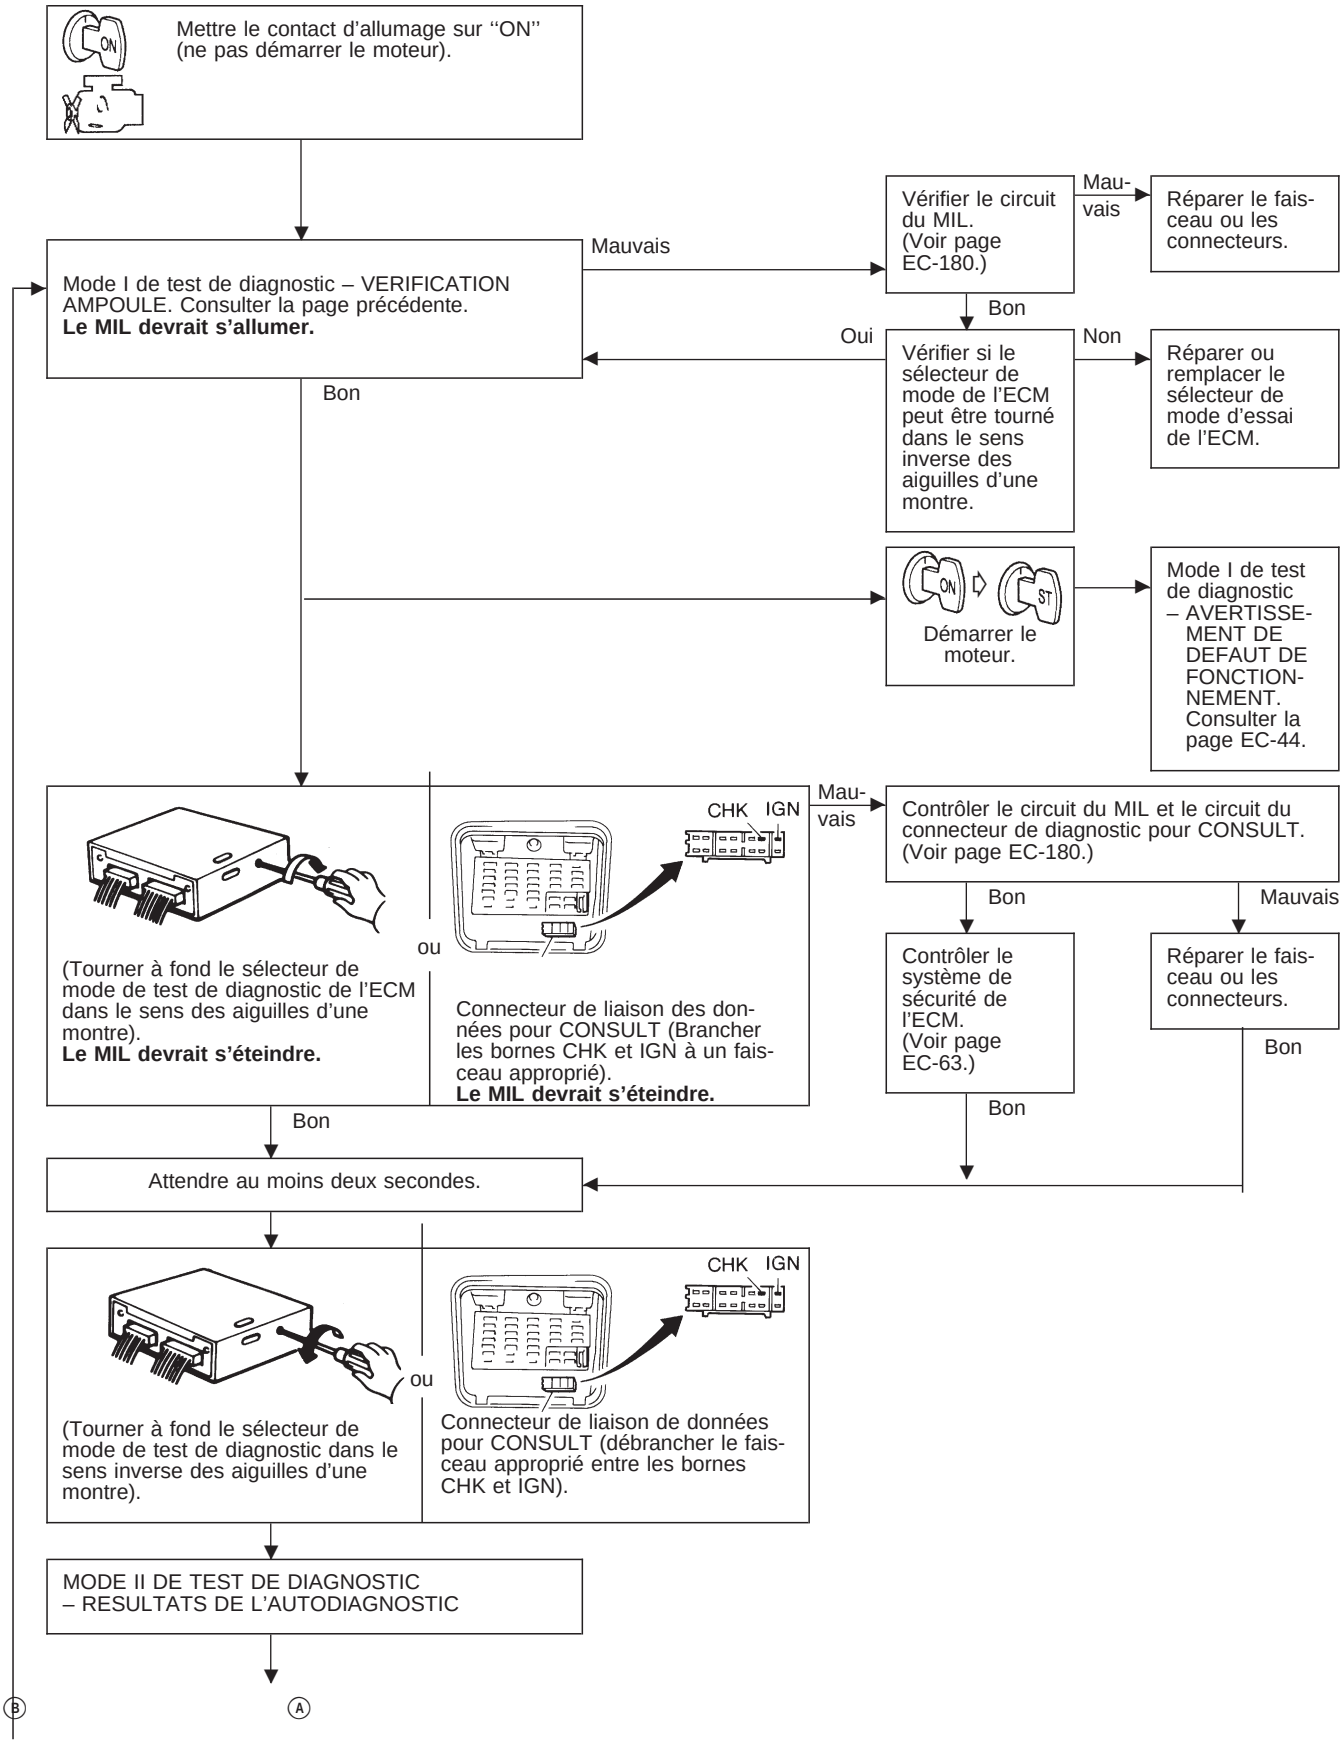


Témoin de défaut (MIL) (Suite)

COMMENT CHANGER DE MODE DE TEST DE DIAGNOSTIC (conduite à gauche)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

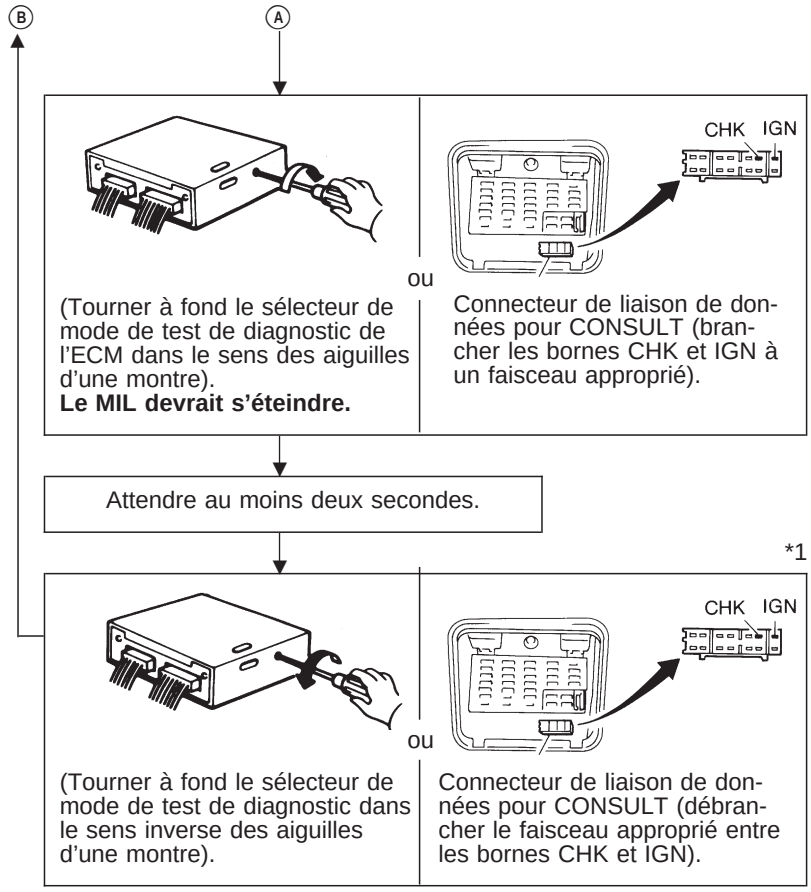
Témoin de défaut (MIL) (Suite)



- **Il n'est pas possible de changer de mode lorsque le moteur est en marche.**
- **Lorsque le contact d'allumage est placé sur la position ''OFF'' pendant le diagnostic, l'alimentation de l'ECM chutera après 5 secondes environ.**
  Le diagnostic reviendra automatiquement au Mode I de test de diagnostic.

***1 : Si un faisceau particulier est débranché au même moment, le code de défaut de diagnostic sera effacé de la mémoire de sauvegarde de l'ECM.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Témoin de défaut (MIL) (Suite)

COMMENT CHANGER DE MODE DE TEST DE DIAGNOSTIC (conduite à droite)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Témoin de défaut (MIL) (Suite)

- **Il n'est pas possible de changer de mode lorsque le moteur est en marche.**
- **Quand le contact d'allumage est sur la position OFF pendant le diagnostic, l'alimentation électrique adressée à l'ECM chutera après env. 5 secondes.**
  Le diagnostic reviendra automatiquement au Mode I de test de diagnostic.
- **Tourner à nouveau le sélecteur de mode de diagnostic à fond dans le sens inverse des aiguilles d'une montre lorsque le véhicule est en marche.**

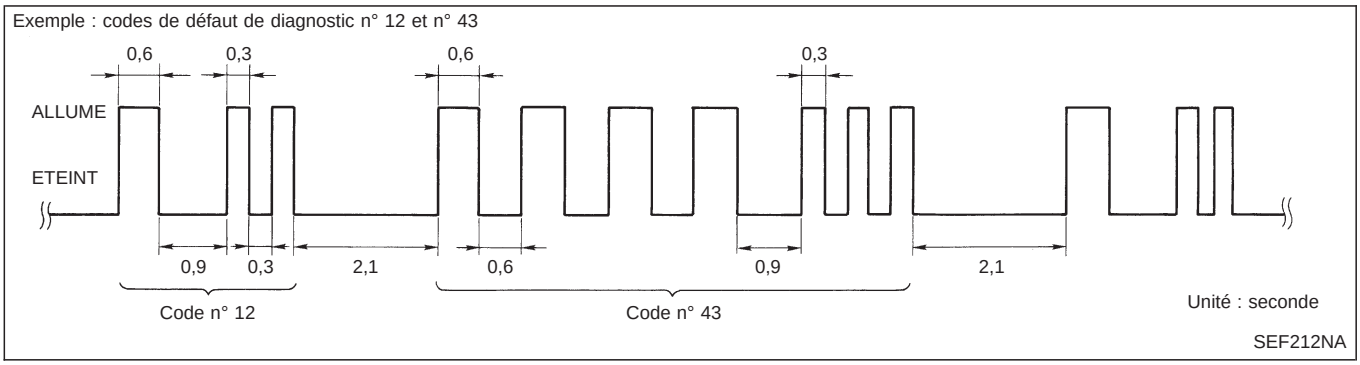
***1 : Si le sélecteur est tourné à fond dans le sens contraire des aiguilles d'une montre, ou si un faisceau particulier est débranché au même moment, le code de défaut de diagnostic sera effacé de la mémoire de l'ECM.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Témoin de défaut (MIL) (Suite)

MODE I DE TEST DE DIAGNOSTIC – VERIFICATION AMPOULE

Dans ce mode, le TEMOIN DE DEFAUT sur le tableau de bord doit demeurer allumé. S'il demeure éteint, vérifier l'ampoule (voir TEMOINS LUMINEUX ET TEMOINS SONORES à la section EL ou voir EC-179, 180).



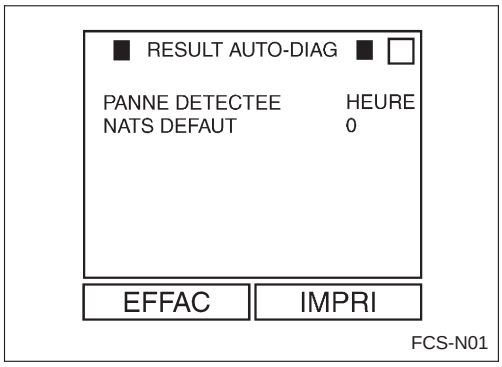
MODE I DE TEST DE DIAGNOSTIC – AVERTISSEMENT DE DEFAUT DE FONCTIONNEMENT

TEMOIN LUMINEUX DE DEFAUT	Condition
MARCHE	Lorsqu'un défaut est détecté (consulter EC-1) ou que l'unité centrale de l'ECM est défectueuse.
ARRET	Pas de défaut

- Les numéros de codes de diagnostic sont identifiés en mode II d'essai de diagnostic (RESULTATS D'AUTODIAGNOSTIC).

MODE II DE TEST DE DIAGNOSTIC – RESULTATS D'AUTODIAGNOSTIC

Dans ce mode, le code de défaut de diagnostic est indiqué par le nombre de clignotements du TEMOIN DE DEFAUT de la manière indiquée ci-dessous.



Un clignotement long (0,6 seconde) indique le chiffre des dizaines, et un clignotement court (0,3 seconde) celui des unités. Par exemple, le témoin de défaut clignote 4 fois en 5 secondes environ (0,6 sec x 8 fois) puis il clignote trois fois pendant environ 1 seconde (0,3 sec x 3 fois). Ce signal indique le code de défaut DTC ''43'' et donc un défaut du capteur de position de papillon.
De cette façon, tous les défauts détectés sont classés par leurs numéros de code de défaut de diagnostic. Le DTC ''55'' indique qu'il n'y a aucun défaut (voir l'INDEX DES CODES DE DEFAUT DE DIAGNOSTIC, à la page EC-1).

Comment effacer le mode II de test de diagnostic (résultats de l'autodiagnostic)

Le code de défaut peut être effacé de la mémoire de sauvegarde dans l'ECM lorsque le mode de diagnostic passe du ''Mode II d'essai de diagnostic'' au ''Mode I d'essai de diagnostic'' (se reporter à ''COMMENT CHANGER DE MODE DE TEST DE DIAGNOSTIC'').

- **Si la borne de la batterie est débranchée, le code de défaut de diagnostic sera effacé de la mémoire de sauvegarde au bout de 24 heures.**
- **Veiller à ne pas effacer la mémoire enregistrée avant de commencer les diagnostics de défaut.**

- **Si le MIL clignote ou que ''DEFAUT DU NATS'' s'affiche sur l'écran de ''RESULT AUTO-DIAG'', effectuer le mode de résultats d'autodiagnostic à l'aide du CONSULT avec une carte de programme NATS (NATS-E940). Consulter la section EL.**
- **Confirmer qu'aucun résultat d'autodiagnostic NATS n'est affiché avant d'appuyer sur ''EFFAC'' en mode ''RESULT AUTO-DIAG'' avec CONSULT.**
- **Lorsque l'on remplace l'ECM, il est nécessaire de procéder à l'initialisation du système NATS V.2.0 et à l'enregistrement de tous les codes d'identification des clés de contact NATS V.2.0 à l'aide du CONSULT et de la carte de programme NATS (NATS-F940).**
  S'assurer par conséquent que le client a bien remis tou-

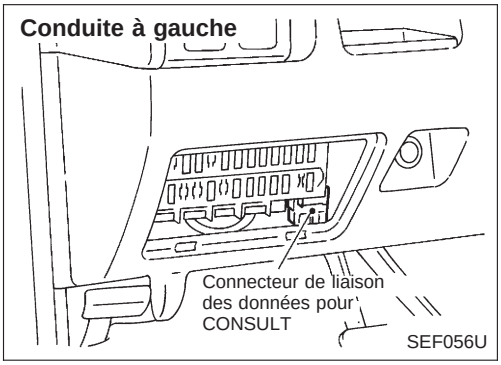
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Témoin de défaut (MIL) (Suite)

tes ses clés.
Pour les procédures d'initialisation du système NATS et d'enregistrement des clés de contact NATS, se reporter au manuel d'utilisation de CONSULT, NATS V.2.0.

MODE II DE TEST DE DIAGNOSTIC – CONTROLE DE LA SONDE A OXYGENE CHAUFFEE

Dans ce mode, le TEMOIN DE DEFAUT affiche l'état du mélange (pauvre ou riche), lequel est surveillé par la sonde à oxygène chauffée.



TEMOIN LUMINEUX DE DEFAUT	Richesse de mélange de carburant dans les gaz d'échappement	Condition de contrôle du signal de réponse du mélange air/carburant
MARCHE	Pauvre	Commande en boucle fermée
ARRET	Riche	
*Reste sur MARCHE ou ARRET.	Toute condition	Commande en boucle ouverte

* : Maintient les conditions juste avant de passer en boucle ouverte.

Pour vérifier le fonctionnement de la sonde à oxygène chauffée, démarrer le moteur en mode de diagnostic II et le laisser chauffer jusqu'à ce que l'indicateur de température du réfrigérant moteur pointe vers le milieu de la jauge.
Puis faire tourner le moteur à environ 2 000 tr/mn pendant environ 2 minutes à vide. Puis s'assurer que le témoin de défaut s'allume plus de 5 fois toutes les 10 secondes lorsque le moteur tourne à 2 000 tr/mn sans charge.

CPA•TR/MN (POS) [t/mn]	◯	◯	• Indique le régime moteur calculé à partir du signal POS (signal de 1°) du capteur d'angle d'arbre à cames.	
DEBITMET AIR [V]	◯	◯	• La tension de signal du débitmètre d'air est affichée.	• Une fois le moteur arrêté, une certaine valeur est indiquée.
CAP TEMP MOT [°C]	◯	◯	• La température du réfrigérant moteur (déterminée par la tension de signal du capteur de température du réfrigérant moteur) est affichée.	• Si le circuit du capteur de température du réfrigérant moteur est ouvert ou court-circuité, l'ECM passe en mode de sécurité. La température du réfrigérant moteur déterminée par l'ECM est affichée.
CAP GAS ECH [V]	◯	◯	• La tension du signal de la sonde à oxygène chauffée est affichée.	• Modèles avec conduite à gauche uniquement
CON F/C MEL [RICH/PAUV]	◯	◯	• Affichage du signal de la sonde à oxygène chauffée pendant le contrôle de signal réponse du mélange air/carburant : RICH ... signifie que le mélange est devenu ''riche'', et la commande est affectée vers un mélange plus pauvre. PAUV ... signifie que le mélange est devenu trop pauvre et la commande est affectée vers un mélange plus riche.	• Lorsque la clé de contact est en position ''ON'', ''RICH'' est affiché jusqu'à ce que le contrôle de signal réponse du mélange air/carburant commence. • Lorsque le signal réponse du mélange air/carburant est verrouillé, la valeur trouvée juste avant le verrouillage est affichée de façon continue. • Modèles avec conduite à gauche uniquement
CAP VIT VEHI [km/h]	◯	◯	• La vitesse du véhicule calculée à partir du signal de capteur de vitesse du véhicule est affichée.	
TENS BATTERIE [V]	◯	◯	• La tension d'alimentation électrique de l'ECM est affichée.	
CAP PAPILLON [V]	◯	◯	• La tension de signal du capteur de position de papillon est affichée.	
CAP TEMP ADMI [°C]	◯		• La température d'air d'admission (déterminée par la tension du signal du capteur de température d'air d'admission) est indiquée.	
SIGNAL DEMAR [MAR/ARR]	◯	◯	• Indique l'état [MARCHE/ARRET] du signal de démarreur.	• Après avoir démarré le moteur, l'état [ARRET] est affiché quel que soit le signal du démarreur.
POSIT RALENTI [MAR/ARR]	◯	◯	• Indique l'état [MAR/ARR] à partir du signal du capteur de position de papillon.	
SIGNAL CLIMAT [MAR/ARR]	◯	◯	• Indique l'état [MARCHE/ARRET] de l'interrupteur de climatiseur de la manière déterminée par le signal du climatiseur.	
CON NEUTRE [MAR/ARR]	◯	◯	• Indique l'état [MARCHE/ARRET] depuis le signal du contact de stationnement/point mort.	

NOTE :
Tout élément contrôlé qui ne correspond pas au véhicule diagnostiqué est automatiquement effacé de l'affichage.

CONSULT (Suite)

Elément contrôlé [Unité]	Signaux d'entrée de l'ECM	Signaux principaux	Description	Remarques
SIG DIR ASSIS [MAR/ARR]	◯	◯	● Indique l'état [MARCHE/ARRET] du manocontact d'huile de direction assistée déterminé par le signal de pression d'huile de direction assistée.	
IMPUL INJ [msec]		◯	● Indique l'amplitude réelle des impulsion d'injection de carburant compensées par l'ECM en fonction des signaux d'entrée.	● Une fois le moteur arrêté, une certaine valeur calculée est indiquée.
CALAGE ALLUM [APMH]		◯	● Indique le calage de l'allumage calculé par l'ECM en fonction des signaux d'entrée.	● Une fois le moteur arrêté, une certaine valeur est indiquée.
VANNE AAC [%]		◯	● Indique la valeur de commande de la vanne de commande d'air de ralenti (vanne IACV-AAC) calculée par l'ECM en fonction des signaux d'entrée.	
ALPHA A/CARB [%]		◯	● La valeur moyenne du facteur de correction du retour de mélange air/carburant par cycle est indiquée.	● Une fois le moteur arrêté, une certaine valeur est indiquée. ● Ces données comprennent également les données pour la commande d'auto-instruction du rapport air/carburant.
RELAIS CLIMAT [MAR/ARR]		◯	● La condition de commande du relais de climatiseur (déterminée par l'ECM en fonction du signal d'entrée) est indiquée.	
REL POMP ALI [MAR/ARR]		◯	● Indique la condition de la commande du relais de la pompe d'alimentation déterminée par l'ECM en fonction des signaux d'entrée.	
EV COM TOURBI [MAR/ARR]		◯	● Le contrôle de l'état de l'électrovanne de contrôle de vanne de commande de tourbillon (déterminé par l'ECM en fonction du signal d'entrée) est indiqué. MARCHE ... vanne de commande de tourbillon fermée ARRET ... la vanne de commande de tourbillon est ouverte	
EV COM EGR (Electrovanne de commande de purge de cartouche EVAP) [MAR/ARR]		◯	● Le contrôle de l'état de l'électrovanne de commande de purge de cartouche EVAP (déterminé par l'ECM en fonction du signal d'entrée) est indiqué. MARCHE ... La commande de purge de cartouche EVAP ne fonctionne pas ARRET... La commande de purge de cartouche EVAP est en état de marche.	
TENSION [V]			● Tension mesurée par la sonde de tension.	
IMPULSIONS [msec] ou [Hz] ou [%]			● Amplitude, fréquence ou cycle d'impulsions mesurés par la sonde d'impulsions.	● Seul "#" est affiché si l'élément ne peut pas être mesuré. ● Les valeurs accompagnées du signe "#" sont temporaires. Elles sont identiques aux données mesurées précédemment.

CONSULT (Suite)

MODE DE TEST ACTIF

ELEMENT DE TEST	CONDITION	JUGEMENT	ELEMENT A VERIFIER (REMISE EN ETAT)
INJECTION CARBURANT	● Moteur : retour à la condition de défaut original ● Modifier la quantité de carburant injecté au moyen du CONSULT.	Si les symptômes du défaut disparaissent, voir la colonne ELEMENT A VERIFIER.	● Faisceau et connecteur ● Injecteurs de carburant ● Sonde à oxygène chauffée
OUVERT VANNE AAC	● Moteur : après échauffement, faire tourner au ralenti. ● Changer le pourcentage d'ouverture de la vanne IACV-AAC à l'aide du CONSULT.	Le régime du moteur change avec le taux d'ouverture.	● Faisceau et connecteur ● Vanne IACV-AAC
TEMPERATURE MOTEUR	● Moteur : retour à la condition de défaut original ● Changer la température du réfrigérant moteur au moyen du CONSULT.	Si les symptômes du défaut disparaissent, voir la colonne ELEMENT A VERIFIER.	● Faisceau et connecteur ● Capteur de température du réfrigérant moteur ● Injecteurs de carburant
CALAGE ALLUMAGE	● Moteur : retour à la condition de défaut original ● Lampe stroboscopique installée ● Retarder le calage de l'allumage au moyen du CONSULT.	Si les symptômes du défaut disparaissent, voir la colonne ELEMENT A VERIFIER.	● Régler le calage de l'allumage (en déplaçant le capteur d'angle d'arbre à cames).
EQUILIBR PUISSANCE	● Moteur : après échauffement, faire tourner au ralenti. ● Interrupteur de climatiseur à l'arrêt ● Levier de vitesse en position ''N'' ● Couper chaque signal d'injecteur un par un, au moyen du CONSULT.	Le moteur tourne mal ou s'arrête.	● Faisceau et connecteur ● Compression ● Injecteurs ● Bobine d'allumage avec transistor d'alimentation ● Bougies d'allumage
RELAIS POMPE D'ALIM	● Contact d'allumage : ''ON'' (moteur à l'arrêt) ● Mettre le relais de la pompe d'alimentation en marche puis à l'arrêt au moyen du CONSULT et en écouter le bruit de fonctionnement.	Le relais de la pompe d'alimentation produit son bruit de fonctionnement.	● Faisceau et connecteur ● Relais de pompe d'alimentation
EV COM EGR (Electrovanne de commande de purge de cartouche EVAP)	● Contact d'allumage : ''ON'' ● Tourner l'électrovanne sur ''MAR'' et ''ARR'' avec le CONSULT et écouter son bruit de fonctionnement.	L'électrovanne émet un bruit de fonctionnement.	● Faisceau et connecteur ● Electrovanne de commande de purge de cartouche EVAP
EV COM TOURBIL	● Contact d'allumage : ''ON'' (moteur à l'arrêt) ● Tourner l'électrovanne sur ''MAR'' et ''ARR'' avec le CONSULT et écouter son bruit de fonctionnement.	L'électrovanne émet un bruit de fonctionnement.	● Faisceau et connecteur ● Electrovanne de contrôle de vanne de commande de tourbillon
COM AUTO INSTRUCT	● Dans ce test, le coefficient original de commande d'auto-instruction de richesse de mélange peut être rappelé en appuyant sur ''EFFAC'' sur l'écran.

CONSULT (Suite)

ELEMENT DE TEST DE FONCTION	CONDITION	JUGEMENT		ELEMENT A VERIFIER (REMISE EN ETAT)
CIRC SIGNAL DEMARR	● Contact d'allumage : ''ON'' → ''START'' ● Le circuit de signal de démarrage est testé lorsque le moteur est démarré en actionnant le démarreur. La tension de la batterie et la température d'eau avant démarrage, la tension moyenne de la batterie, la tension de sortie du débitmètre d'air et la vitesse de démarrage durant le démarrage sont affichées.	Signal de démarrage : DECLENCHE → ENCLENCHE		● Faisceau et connecteur ● Contact d'allumage
CIRC SIGNAL DIR AS	● Contact d'allumage : ''ON'' (Moteur en marche) ● Le circuit du manocontact d'huile de direction assistée est testé en tournant le volant à fond, puis en le plaçant en ligne droite.	Position verrouillée	MARCHE	● Faisceau et connecteur ● Manocontact d'huile de direction assistée ● Pompe à huile de direction assistée
		Position de point mort	ARRET	
CIRC EV COMM TOURB	● Contact d'allumage : ''ON'' (Moteur à l'arrêt) ● Le circuit de l'électrovanne de contrôle de vanne de commande de tourbillon est testé par le contrôle du bruit de fonctionnement de l'électrovanne.	L'électrovanne émet un bruit de fonctionnement toutes les 3 secondes.		● Faisceau et connecteur ● Electrovanne ● Vanne de commande de tourbillon ● Flexible à dépression
CIRC CAP VITES VEH	● Le circuit du capteur de vitesse du véhicule est testé en conduisant le véhicule à 10 km/h ou plus.	Le signal d'entrée du capteur de vitesse du véhicule est supérieur à 4 km/h.)		● Faisceau et connecteur ● Capteur de vitesse du véhicule ● Compteur de vitesses
REGL CALAGE ALLUMA	● Faire chauffer le moteur, puis le faire tourner au ralenti. ● Le calage d'allumage est contrôlé en observant le calage de l'allumage à l'aide d'une lampe stroboscopique et en contrôlant s'il est identique aux spécifications.	La lampe stroboscopique affiche la même valeur à l'écran.		● Régler le calage de l'allumage (en déplaçant le capteur d'angle d'arbre à cames ou le distributeur) ● Mécanisme d'entraînement du capteur d'angle d'arbre à cames

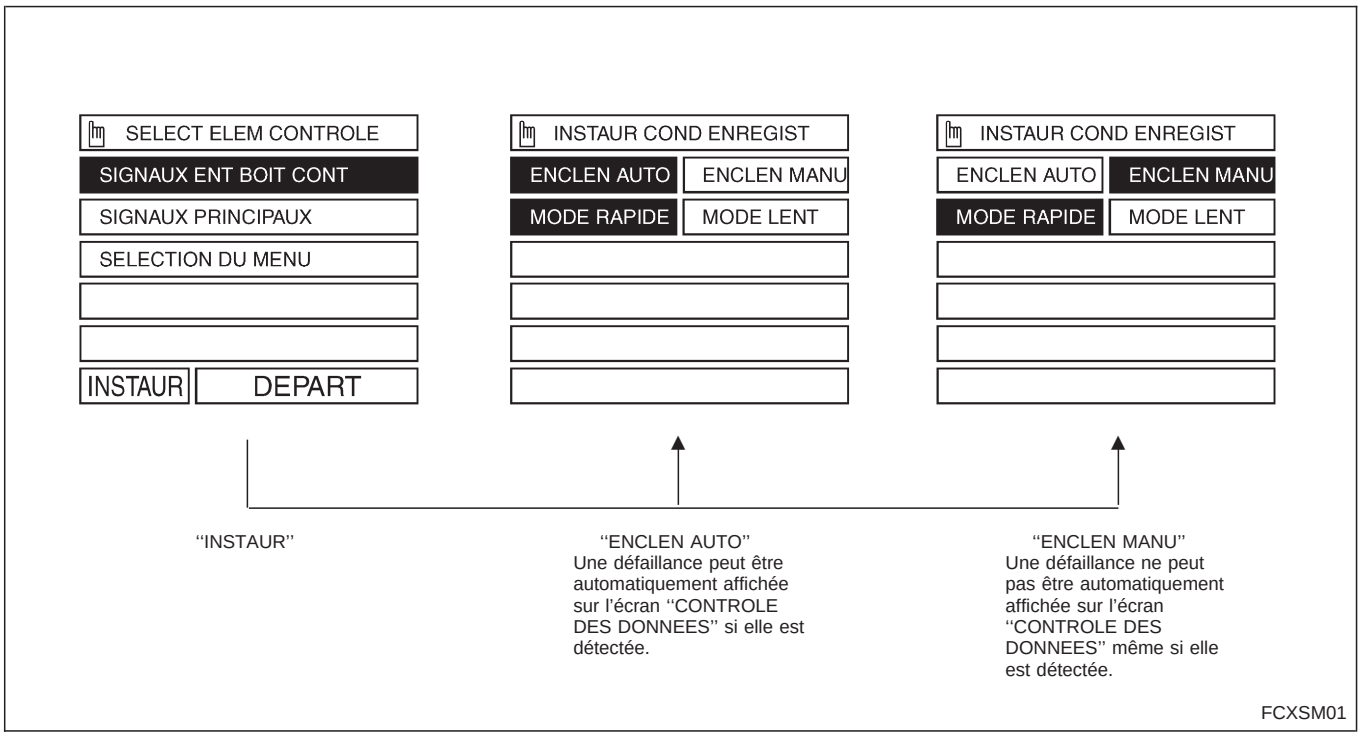
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

CONSULT (Suite)

ELEMENT DE TEST DE FONCTION	CONDITION	JUGEMENT	ELEMENT A VERIFIER (REMISE EN ETAT)
TEST RICHESS MELAN	● Le circuit de régulation du mélangle air/carburant (systèmes d'injection, d'allumage, de dépression, etc.) est testé par l'examen de la sortie de la sonde à oxygène chauffée lorsque le moteur tourne à 2 000 tr/mn à vide.	Sonde à oxygène chauffée - COMPTE : plus de 5 fois pendant 10 secondes	● SYSTEME D'INJECTION (injecteur, régulateur de pression d'alimentation, faisceau ou connecteur) ● SYSTEME D'ALLUMAGE (faisceau ou connecteur de bougie d'allumage, bobine d'allumage, transistor d'alimentation) ● SYSTEME DE DEPRESSION (fuites d'air d'admission) ● Circuit de la sonde à oxygène chauffée ● Fonctionnement de la sonde à oxygène chauffée ● Haute ou basse pression d'alimentation ● Débitmètre d'air
EQUILIBR PUISSANCE	● Faire chauffer le moteur, puis le faire tourner au ralenti. ● Les injecteurs de chaque cylindre s'arrêtent de fonctionner l'un après l'autre et le changement enregistré dans le régime du moteur est examiné pour évaluer la combustion de chaque cylindre (affichage seulement pour les modèles équipés d'un système d'injection multipoint séquentielle).	La différence de régime du moteur est supérieure à 25 tr/mn avant et après avoir coupé l'injecteur de chaque cylindre.	● Circuit d'injecteur (injecteur, faisceau ou connecteur) ● Circuit d'allumage (faisceau ou connecteur de bougie d'allumage, bobine d'allumage, transistor d'alimentation) ● Compression ● Synchronisation de soupapes
SYST VANNE AAC	● Faire chauffer le moteur, puis le faire tourner au ralenti. ● Le système de vanne IACV-AAC est testé en détectant le changement dans le régime du moteur lorsque l'ouverture de la vanne IACV-AAC passe de 0%, à 20% et 80%.	La différence de régime du moteur est supérieure à 150 tr/mn lorsque l'ouverture de la soupape est comprise entre 80% et 20%.	● Faisceau et connecteur ● Vanne IACV-AAC ● Restriction du passage d'air entre l'entrée d'air et la vanne IACV-AAC ● Réglage de la vis de réglage de ralenti

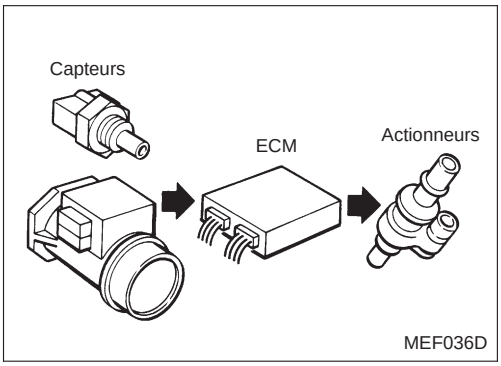
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

CONSULT (Suite)



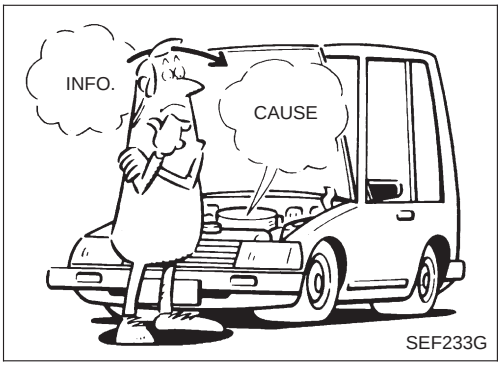
DIAGNOSTIC EN TEMPS REEL EN MODE DE CONTROLE DES DONNEES

Le CONSULT possède deux types d'enclencheurs et ils peuvent être sélectionnés en appuyant sur ''INSTAUR'' en mode de ''CONTROLE DE DONNEES''.



1. ''ENCLEN AUTO'' (enclencheur automatique) :
   - Le défaut sera identifié sur l'écran de CONSULT en temps réel.
     En d'autres termes, l'élément responsable du défaut s'affichera au moment où le défaut est détecté par l'ECM.
     Le CONTROLE DES DONNEES peut être effectué de façon continue jusqu'à ce que le défaut soit détecté. Toutefois, le CONTROLE DES DONNEES ne peut pas être poursuivi longtemps après la détection du défaut.
2. ''ENCLEN MANU'' (Enclencheur manuel) :
   - L'élément de défaut ne peut pas être affiché automatiquement sur l'écran CONSULT même si l'ECM a détecté un défaut.
     Le CONTROLE DES DONNEES peut être effectué continuellement même si un mauvais fonctionnement est détecté.

Utiliser ces enclencheurs comme suit :



1. ''ENCLEN AUTO''
   - Lorsque l'on essaye de détecter le DTC en réalisant une ''PROCEDURE DE CONFIRMATION DTC'', veiller à sélectionner le mode ''CONTROLE DE DONNEES (ENCLEN AUTO)''. Le défaut peut être confirmé au moment où il est détecté.
   - Pour procéder à l'élimination des causes possibles, le CONSULT doit être réglé en mode ''CONTROLE DES DONNEES (ENCLEN AUTO)'', particulièrement si le défaut se produit de façon intermittente.
     Lors du contrôle du circuit en secouant avec précaution (ou en tordant) les connecteurs, pièces ou faisceau suspects dans la ''PROCEDURE DE CONFIRMATION DTC'', dès qu'un défaut est dépisté, le DTC s'affichera (se reporter à la section GI, ''Essais de simulation des problèmes'' au chapitre ''COMMENT ACCOMPLIR UN DIAGNOSTIC EFFICACE EN CAS D'INCIDENT ELECTRIQUE'').
2. ''ENCLEN MANU''
   - Si le défaut s'affiche dès que le ''CONTROLE DE DONNEES'' est sélectionné, régler le CONSULT sur ''ENCLEN MANU''. Il est possible de contrôler et enregistrer les données en sélectionnant ''ENCLEN MANU''. Les données peuvent être utilisées pour d'autres diagnostics, telle que la comparaison de la valeur avec des conditions normales de fonctionnement.

SEF907L

Introduction

Le moteur dispose d'un ECM pour commander les principaux systèmes tels que l'injection, l'allumage, la régulation du ralenti, etc. L'ECM reçoit des signaux d'entrée que lui délivrent les capteurs, et en réponse, commande instantanément les actionneurs. Il est essentiel que les signaux d'entrée et de sortie soient corrects et stables. Parallèlement, il ne doit pas y avoir de problèmes tels que des fuites au niveau de la conduite de dépression, bougies d'allumage encrassées ou autre, affectant le moteur.

Il est beaucoup plus difficile de faire le diagnostic d'un problème qui se manifeste de manière intermittente que celui d'un problème constant. La plupart des problèmes intermittents sont causés par de mauvaises connexions électriques ou un câblage incorrect. En pareil cas, une vérification soigneuse des circuits suspects peut éventuellement éviter le remplacement de pièces qui n'étaient pas fautives.

Le contrôle visuel seul ne permet pas toujours de déterminer la cause des défauts. Il convient d'effectuer un essai sur route à l'aide du CONSULT ou d'un testeur de circuit branché. Suivre ''Procédure de travail'' à la page EC-58.

Avant d'entreprendre les vérifications, prendre quelques minutes pour parler à un client qui se plaint d'une mauvaise conduite. Le client peut fournir des renseignements utiles quant à ces problèmes, en particulier les problèmes se produisant de façon intermittente. Se renseigner sur les symptômes présents et sur les conditions dans lesquelles ils se présentent. Il convient d'utiliser une ''Fiche de contrôle de diagnostic'' comme celle présentée à la page suivante.

Commencer le diagnostic en recherchant d'abord les problèmes ''conventionnels''. Ceci aidera à dépister les problèmes de conduite sur un véhicule à moteur à commande électronique.

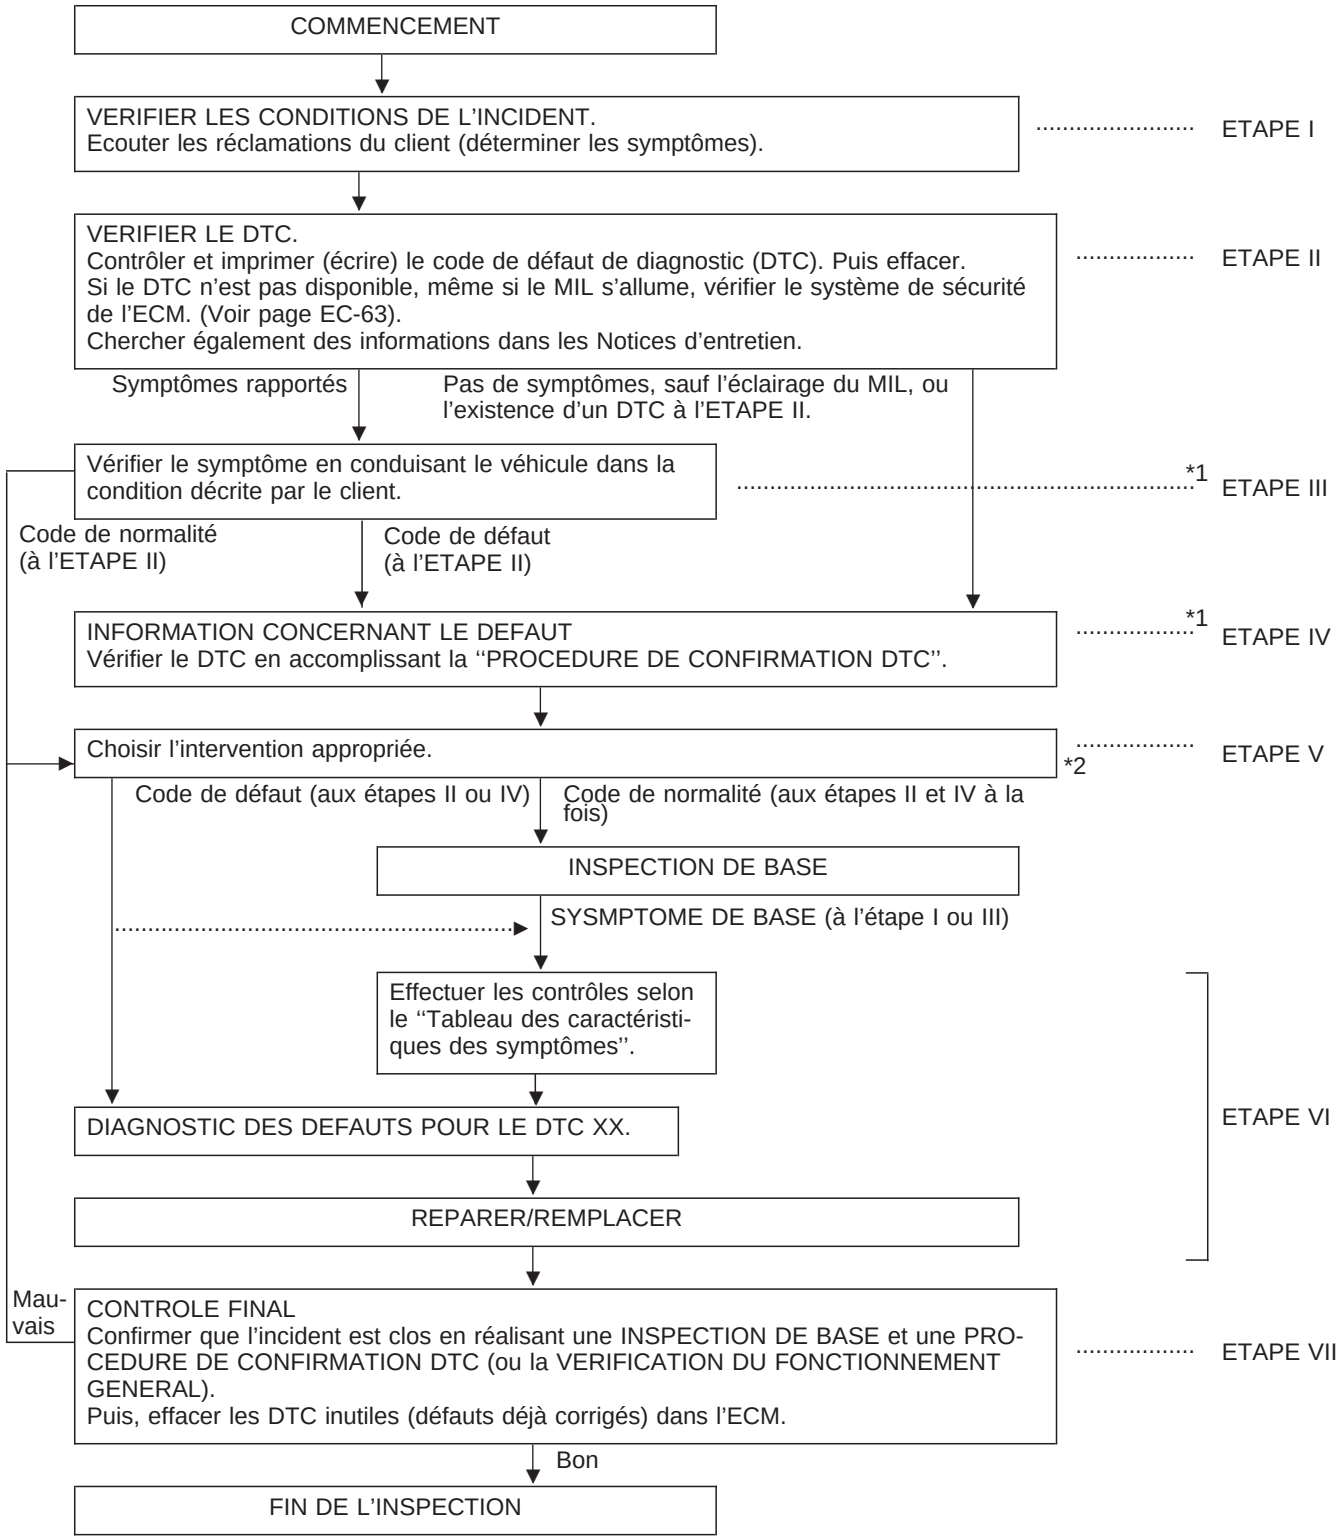
Fiche de contrôle de diagnostic

Il existe de nombreuses conditions de fonctionnement qui conduisent vers le défaut des composants du moteur. Une bonne connaissance de ces cas peut accélérer la procédure et en améliorer l'exactitude.

En règle générale, la capacité de cerner le problème dépend de chaque client. Il est important de bien comprendre les symptômes ou les conditions liées à la plainte du client.

Il convient donc d'utiliser une fiche de contrôle de diagnostic comme celle présentée à la page suivante pour récapituler les informations nécessaires à la recherche des pannes.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Fiche de contrôle de diagnostic (Suite)

EXEMPLE DE FICHE DE CONTROLE DE DIAGNOSTIC

Nom du client M./Mme/Mlle		Modèle et année	Immatriculation
N# de moteur		Transmission	Kilométrage
Date de l'incident		Date de fabrication	Date d'entrée en service
Carburant et bouchon de remplissage de carburant.		☐ Le véhicule peut manquer de carburant, ce qui provoque des ratées à l'allumage. ☐ Le bouchon de remplissage de carburant n'a pas été reposé ou n'est pas bien revissé.	
Symptômes	☐ Démarrage	☐ Démarrage impossible ☐ Pas de combustion ☐ Combustion partielle ☐ Combustion partielle affectée par la position du papillon ☐ Combustion partielle NON affectée par la position du papillon ☐ Démarrage possible mais récalcitrant ☐ Autres [ ]	
	☐ Ralenti	☐ Pas de ralenti accéléré ☐ Instable ☐ Ralenti accéléré ☐ Bas régime de ralenti ☐ Autres [ ]	
	☐ Conduite	☐ Hésitation ☐ Etranglement ☐ Détonation ☐ Manque de puissance ☐ Retour de flamme admission ☐ Retour de flamme échappement ☐ Autres [ ]	
	☐ Calage du moteur	☐ Au démarrage ☐ Au ralenti ☐ En accélération ☐ En décélération ☐ Peu après l'immobilisation ☐ Lors de l'application d'une charge	
Manifestation de l'incident		☐ Peu après la livraison ☐ Récemment ☐ Le matin ☐ La nuit ☐ Dans la journée	
Fréquence		☐ Constamment ☐ Dans certaines conditions ☐ Parfois	
Conditions climatiques		☐ Sans effet	
	Temps	☐ Beau ☐ Pluie ☐ Neige ☐ Autres [ ]	
	Température	☐ Chaud ☐ Tempéré ☐ Frais ☐ Froid ☐ Humide °C	
Conditions du moteur		☐ Froid ☐ Pendant la période d'échauffement ☐ Une fois le moteur chaud Régime du moteur **0 2 000 4 000 6 000 8 000 rpm**	
Conditions de la route		☐ Cycle urbain ☐ Cycle banlieue ☐ Autoroute ☐ Tous terrains (haut/bas)	
Conditions de conduite		☐ Sans effet ☐ Au démarrage ☐ Au ralenti ☐ En conduite sportive ☐ En accélération ☐ En vitesse de croisière ☐ En décélération ☐ En tournant (droite/gauche) Vitesse du véhicule **0 20 40 60 80 100 120** km/h	
Témoin de défaut		☐ Allumé ☐ Eteint

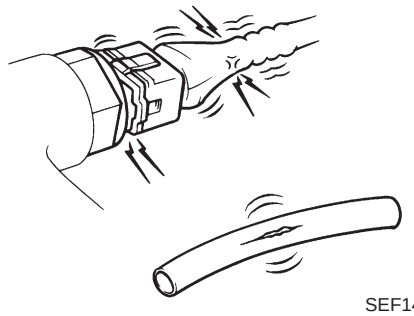
Procédure de travail

***1 : Si un défaut ne peut pas être reproduit, voir ''Essais de simulation de défaut'' au chapitre ''COMMENT EFFECTUER UN DIAGNOSTIC EFFICACE EN CAS D'INCIDENT ELECTRIQUE'' à la section GI.**

***2 : Si l'autodiagnostic ne peut être exécuté, contrôler les circuits d'alimentation principale et de masse (voir ''DIAGNOSTIC DES DEFAUTS POUR L'ALIMENTATION ELECTRIQUE'', page EC-78).**



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description de la procédure

ETAPE	DESCRIPTION
ETAPE I	Obtenir des renseignements détaillés sur les conditions et l'environnement dans lesquels le défaut/ symptôme s'est produit en utilisant la ''FICHE DE CONTROLE DE DIAGNOSTIC'', illustrée à la page EC-56.
ETAPE II	Avant de confirmer ce défaut, vérifier et noter le code de défaut de diagnostic (DTC) (l'imprimer à l'aide du CONSULT), puis effacer ce code (voir page EC-37). Le DTC peut être utilisé lors de la simulation de l'incident aux ETAPES III et IV. Etudier la relation entre la cause, spécifiée par le DTC, et le symptôme décrit par le client (le ''Tableau des caractéristiques des symptômes'' sera utile). Voir page EC-64. Chercher également des informations dans les Notices d'entretien.
ETAPE III	Essayer de confirmer le symptôme et les conditions dans lesquelles le défaut se produit. La ''FICHE DE CONTROLE DE DIAGNOSTIC'' est utile pour vérifier le défaut. Adapter le CONSULT sur le véhicule en mode ''CONTROLE DE DONNEES (ENCLEN AUTO) et vérifier les résultats d'autodiagnostic en temps réel. Si le défaut ne peut pas être reproduit, effectuer les ''ESSAIS DE SIMULATION DE DEFAUT'' (se reporter à la section GI). Si le code de défaut est détecté, sauter l'étape IV et effectuer l'étape V.
ETAPE IV	Essayer de détecter le code de défaut de diagnostic (DTC) en conduisant (ou effectuant) la ''PROCEDURE DE CONFIRMATION DTC''. Vérifier et lire le code de défaut à l'aide du CONSULT. Pendant la vérification DTC, s'assurer que le CONSULT est adapté sur le véhicule en mode ''CONTROLE DE DONNEES'' (ENCLEN AUTO) et vérifier les résultats de diagnostic en temps réel. Si le défaut ne peut pas être reproduit, effectuer les ''ESSAIS DE SIMULATION DE DEFAUT'' (se reporter à la section GI). Si la ''PROCEDURE DE CONFIRMATION DTC'' n'est pas disponible, effectuer la ''VERIFICATION DU FONCTIONNEMENT GENERAL'' à la place. Le DTC ne peut pas s'afficher grâce à ce contrôle, toutefois, ce contrôle simplifié est une alternative efficace. Le mauvais résultat de la ''VERIFICATION DU FONCTIONNEMENT GENERAL'' est le même que pour la détection DTC.
ETAPE V	Prendre les mesures apropriées sur la base des résultats des étapes I à IV. Si le code de défaut est indiqué, passer à ''DIAGNOSTIC DES DEFAUTS POUR LE DTC XX''. Si le code normal est indiqué, procéder à l'INSPECTION DE BASE à la page suivante. Puis effectuer les inspections conformément au tableau des caractéristiques des symptômes (voir page EC-64).
ETAPE VI	Déterminer où commencer le diagnostic en fonction de l'étude de la relation entre le symptôme et les causes possibles. Inspecter le système en cas de grippage mécanique, connecteurs desserrés ou câblage endommagé à l'aide de la ''Disposition des faisceaux''. Secouer avec précaution les connecteurs correspondants, composants ou faisceau de câblage avec CONSULT réglé en mode de ''CONTROLE DE DONNEES (ENCLEN AUTO)''. Contrôler la tension des bornes de l'ECM en question ou contrôler les données de sortie des capteurs avec le CONSULT. Consulter les pages EC-67, EC-71. La ''PROCEDURE DE DIAGNOSTIC'' à la section EC contient une description basée sur l'inspection du circuit ouvert. Une inspection des courts-circuits est également requise pour le contrôle du circuit dans la PROCEDURE DE DIAGNOSTIC. Pour plus de détails, se reporter à la section GI (''COMMENT EFFECTUER UN DIAGNOSTIC EFFICACE EN CAS D'INCIDENT ELECTRIQUE'' et ''Inspection du circuit''). Réparer ou remplacer les pièces défectueuses.
ETAPE VII	Après avoir réparé le circuit ou remplacé un composant, faire tourner le moteur dans les mêmes conditions et circonstances qui sont à l'origine du problème initialement décrit par le client. Effectuer la ''PROCEDURE DE CONFIRMATION DTC'' et confirmer que le code normal (code de défaut de diagnostic n° 55) est détecté. Si le défaut est toujours présent lors du contrôle final, effectuer l'ETAPE VI en utilisant une méthode différente de la précédente. Avant de rendre le véhicule au client, veiller à effacer le DTC inutile (déjà enregistré) dans l'ECM (voir page EC-37).

Inspection de base

Précaution :

Effectuer une inspection de base sans appliquer de charge électrique ou mécanique ;

- **La commande des phares n'est pas actionnée,**
- **L'interrupteur de climatiseur est à l'arrêt,**
- **L'interrupteur de désembuage de lunette arrière est à l'arrêt,**
- **Le volant est dans la position droite, etc.**

A

AVANT LE DEMARRAGE

1. Vérifier les documents d'entretien pour voir si des réparations récentes ont été effectuées qui pourraient indiquer un problème connexe, ou si un entretien est prévu sous peu.
2. Ouvrir le capot et vérifier :

- Que les connecteurs de faisceau ne sont pas mal branchés
- Que les flexibles à dépression ne sont pas fissurés, n'ont pas de défauts et sont bien raccordés
- Que les câbles ne sont pas desserrés, coincés ou coupés.

↓

B

BRANCHER CONSULT AU VEHICULE.

Brancher CONSULT sur le connecteur de liaison des données et sélectionner "MOTEUR" dans le menu. Consulter la page EC-46.

↓

C

VERIFIER LE CALAGE D'ALLUMAGE.

1. Faire chauffer le moteur suffisamment.
2. Sélectionner "REGL CALAGE ALLUMA" dans le mode "SUPPORT TRAVAIL".
3. Appuyer sur "DEPART".
4. Vérifier le calage de l'allumage au ralenti à l'aide d'une lampe stroboscopique.

Calage de l'allumage :
10°±2° avant P.M.H.

OU

1. Faire chauffer le moteur suffisamment.
2. Couper le moteur et débrancher le connecteur de faisceau auxiliaire du capteur de position de papillon.
3. Démarrer le moteur.
4. Vérifier le calage de l'allumage au ralenti à l'aide d'une lampe stroboscopique.

Calage de l'allumage :
10°±2° avant P.M.H.

Mauvais → Régler le calage de l'allumage en faisant tourner le capteur d'angle d'arbre à cames.

Bon ↓

Ⓐ

(Aller à la page suivante).

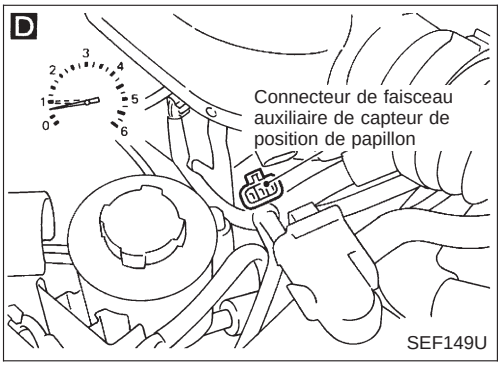
Inspection de base (Suite)

D



REG CALAGE ALLUMAGE

SIGNAL FEEDBACK CALAGE DE L'ALLUMAGE MAINTENU EN APPUYANT SUR DEPART PUIS, REGLER CALAGE DE L'ALLUMAGE AVEC UNE LAMPE EN TOURNANT LE CAPT D'ANGLE DE DEMARR.

DEPART

FCITA02

D

Ⓐ

D

VERIFIER LE REGL. DU REGIME DE RALENTI, REGLAGE INITIAL DE LA VIS (SUR LA BASE DU RALENTI).

1. Sélectionner ''REG CALAGE ALLUMA'' dans le mode ''SUPPORT TRAVAIL''.
2. En touchant ''DEPART'', le régime moteur tombe-t-il à 750±50 tr/mn ?

OU

Le moteur tourne-t-il à 750±25 tr/mn lorsqu'on débranche le connecteur du faisceau auxiliaire du capteur de position de papillon ?

Mauvais → Régler le régime de ralenti de base en tournant la vis de réglage du régime de ralenti.

Bon ↓

VERIFIER LA POSITION DE RALENTI DU CAPTEUR DE POSITION DE PAPILLON.

1. Effectuer ''REGL CAP PAPILLON'' en mode ''SUPPORT TRAVAIL''.
2. Vérifier la tension de sortie du capteur de position de papillon.
   Tension : 0,35 - 0,65V

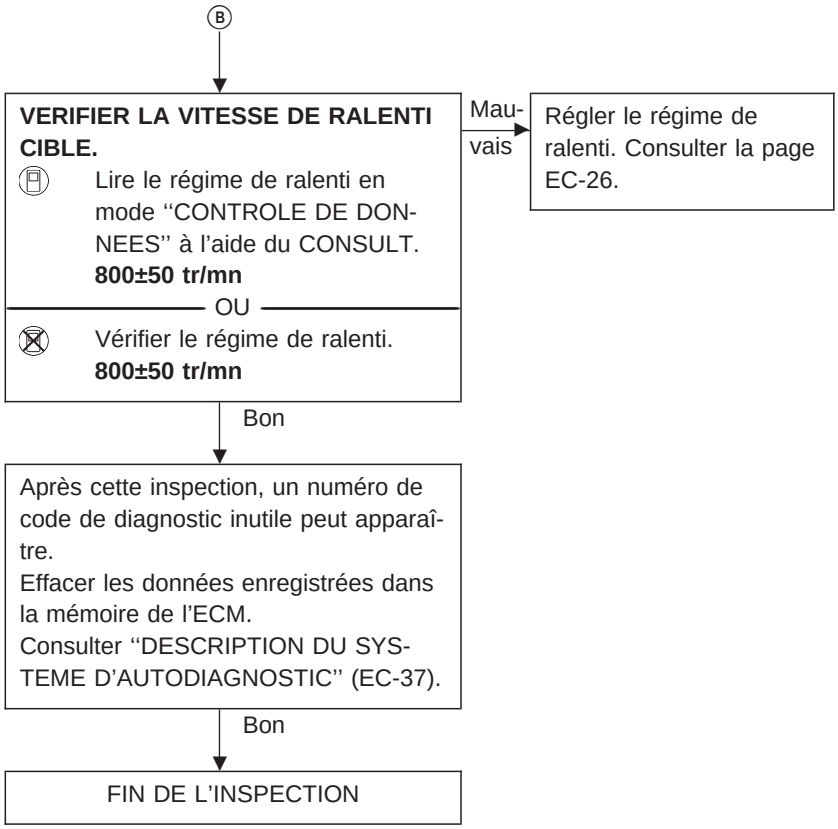
OU

1. Rebrancher le connecteur du faisceau auxiliaire du capteur de position de papillon.
2. Vérifier la tension de sortie entre la borne ② du capteur de position de papillon et la masse à l'aide d'un voltmètre.
   Tension : 0,35 - 0,65V

Mauvais → Régler la tension de sortie sur 0,5V en tournant le corps du capteur de position de papillon.

REMETTRE A ZERO LA MEMOIRE DE POSITION DE RALENTI.

1. Débrancher le connecteur de faisceau auxiliaire du capteur de position de papillon.
2. Faire chauffer le moteur suffisamment.
3. Sélectionner ''POSIT RALENTI'' en mode ''CONTROLE DE DONNEES'' (déclencheur manuel) à l'aide du CONSULT avant de couper le moteur.
4. Rebrancher le connecteur du faisceau auxiliaire du capteur de position de papillon.
5. Démarrer le moteur et attendre quelques secondes.
6. Mettre le contact d'allumage sur ''OFF'' et attendre 5 secondes au moins.
7. Répéter les étapes 5 et 6 jusqu'à ce que le ''POSIT RALENTI'' passe sur ''MAR'' en mode ''CONTROLE DE DONNEES'' avec CONSULT.
   Répéter 10 fois les étapes 5 et 6.



Bon ↓

Inspection de base (Suite)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Tableau de sécurité

L'ECM passe en mode de sécurité, lorsqu'un des défauts suivants est détecté en raison d'un circuit ouvert ou d'un court-circuit.
Quand l'ECM passe en mode de sécurité répertorié dans la dernière colonne ci-dessus, le MIL s'allume.

<table>
<tr><th>N° de DTC</th><th>Eléments détectés</th><th>Condition de fonctionnement du moteur en mode de sécurité</th></tr>
<tr><td>12</td><td>Circuit du débitmètre d'air</td><td>Le régime du moteur ne dépassera pas 2 400 tr/mn en raison de la coupure d'alimentation.</td></tr>
<tr><td>13</td><td>Circuit du capteur de température du réfrigé-rant moteur</td><td>La température du réfrigérant moteur sera déterminée sur la base du temps suivant la mise du contact d'allumage sur ''ON'' ou ''START''.
Le CONSULT affiche la température du réfrigérant moteur déterminée par l'ECM.
<table>
<tr><th>Condition</th><th>Température du réfrigérant moteur déterminée (Affichage CONSULT)</th></tr>
<tr><td>Au moment de la mise du contact d'allumage sur ''ON'' ou ''START''</td><td>20°C</td></tr>
<tr><td>Plus de 6 minutes après que l'allumage est mis sur ''START''</td><td>80°C</td></tr>
<tr><td>Sauf comme indiqué ci-dessus</td><td>20 - 80°C
(en fonction du temps écoulé)</td></tr>
</table></td></tr>
<tr><td>41</td><td>Circuit de la sonde de température d'air d'admission</td><td>L'ECM remplit sa mission de contrôle en partant de l'hypothèse que la température d'air d'admission est de 20°C.</td></tr>
<tr><td>43</td><td>Circuit du capteur de position de papillon</td><td>La position du papillon sera déterminée sur la base du débitmètre d'air et du régime moteur.
Par conséquent l'accélération sera mauvaise.
<table>
<tr><th></th><th>Condition de conduite</th></tr>
<tr><td>Moteur au ralenti</td><td>Normal</td></tr>
<tr><td>Lors de l'accélération</td><td>Mauvaise accélération</td></tr>
</table></td></tr>
<tr><td>Impossibilité d'accéder au mode II de test de diagnostic</td><td>ECM</td><td>Condition de déclenchement du système de sécurité de l'ECM
Le fonctionnement de la fonction de calcul du boîtier de contrôle de L'ECCS a été jugé défec-tueux.
Lorsque le système de sécurité est enclenché, c'est à dire si l'ECM détecte un défaut de fonc-tionnement dans son unité centrale, le TEMOIN ''CHECK ENGINE (Vérifier le moteur)'' s'éclaire sur le tableau de bord pour prévenir le conducteur.
Toutefois, il n'est pas possible d'accéder à l'ECCS et le DTC ne peut pas être confirmé.
Commande du moteur avec système de sécurité de l'ECM
Lorsque le système de sécurité intégré fonctionne, le fonctionnement de l'injection de carburant, du calage d'allumage, de la pompe d'alimentation et de la vanne IACV-AAC sont contrôlés dans certaines limites.
<table>
<tr><th></th><th>Fonctionnement du système de sécurité de l'ECM</th></tr>
<tr><td>Régime du moteur</td><td>Le régime du moteur ne dépassera pas 3 000 tr/mn.</td></tr>
<tr><td>Injection de carburant</td><td>Système d'injection multipoint simultanée</td></tr>
<tr><td>Calage de l'allumage</td><td>Le calage de l'allumage est fixé à la valeur préétablie.</td></tr>
<tr><td>Pompe d'alimentation</td><td>Le relais de pompe d'alimentation se met en marche lorsque le moteur tourne et se met hors circuit lorsque le moteur cale.</td></tr>
<tr><td>Vanne IACV-AAC</td><td>Complètement ouverte</td></tr>
</table>
Remplacer l'ECM, après confirmation que l'ECM se trouve en mode sécurité.</td></tr>
</table>

Valeur de référence de CONSULT en mode de contrôle de données

Remarques :

- Les données de spécification sont des valeurs de référence.
- Les données de spécification sont des valeurs de sortie/entrée détectées ou transmises au connecteur par l'ECM.
  * Les données de spécification peuvent ne pas être directement en rapport avec le fonctionnement, les signaux et les valeurs de leurs composants.

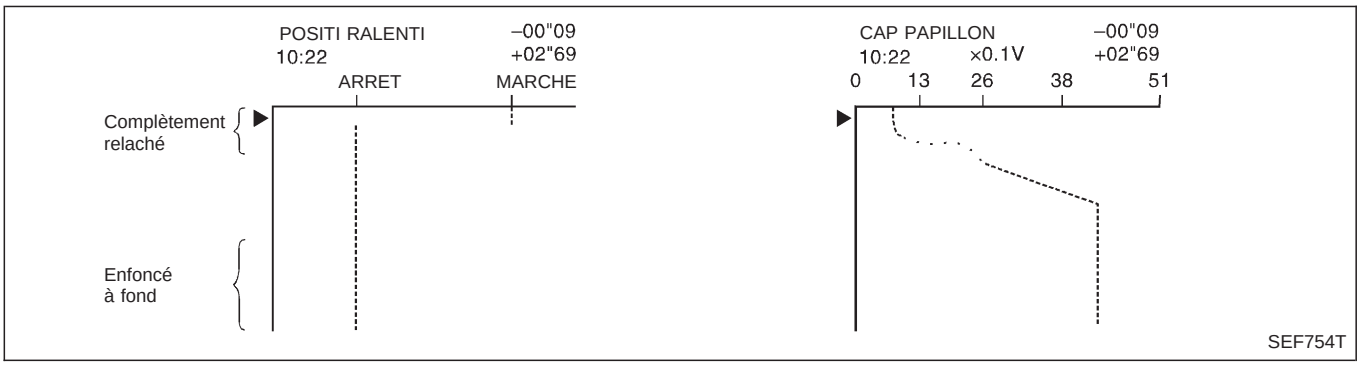
  i.e. Régler le calage de l'allumage avec une lampe stroboscopique avant de contrôler le ''CALAGE ALLUM'', car le contrôleur peut indiquer les données de spécification en dépit du fait que le calage de l'allumage n'est pas réglé selon ces données. Le ''CALAGE ALLUM'' contrôle les données calculées par l'ECM selon les signaux d'entrée provenant du capteur d'angle d'arbre à cames et des autres capteurs qui contrôlent le calage de l'allumage.
- Si les résultats de diagnostic en temps réel sont mauvais et que les résultats du système d'autodiagnostic sont bons lorsqu'on effectue le diagnostic du débitmètre d'air, vérifier tout d'abord que le circuit de commande de pompe d'alimentation fonctionne normalement.

ELEMENT DE CONTROLE	CONDITION		SPECIFICATION
CPA•TR/MN (POS)	● Compte-tours : brancher ● Faire tourner le moteur et comparer l'indication du compte-tours et la valeur de CONSULT.		Presque la même vitesse que la valeur donnée par CONSULT.
DEBITMET AIR	● Moteur : après échauffement ● Interrupteur de climatiseur : à l'arrêt ● Levier de passage : point mort ● A vide	Ralenti	1,3 - 1,7V
		2 500 tr/mn	1,7 - 2,1V
CAP TEMP MOT	● Moteur : après échauffement		Plus de 70°C
CAP GAZ ECH	● Moteur : après échauffement	Maintenir le régime moteur à 2 000 tr/mn	0 - 0,3V ↔ 0,6 - 1,0V
CON F/C MEL			PAUVRE ↔ RICHE Change plus de 5 fois en 10 secondes.
CAP VIT VEHI	● Faire tourner les roues motrices et comparer l'indication du compteur de vitesse et la valeur donnée par CONSULT.		Presque la même vitesse que la valeur donnée par CONSULT
TENS BATTERIE	● Contact d'allumage : ''ON'' (moteur à l'arrêt)		11 - 14V
CAP PAPILLON	● Contact d'allumage : ''ON'' (Moteur à l'arrêt)	Papillon : complètement fermé	0,35 - 0,65V
		Papillon : complètement ouvert	Env. 4,0V
SIGNAL DE DEMARRAGE	● Contact d'allumage : ''ON'' → ''START'' → ''ON''		ARRET → MARCHE → ARRET
POSIT RALENTI	● Contact d'allumage : ''ON'' (Moteur à l'arrêt)	Papillon : position de ralenti	MARCHE
		Vanne de papillon : légèrement ouverte	ARRET
SIGNAL CLIMAT	● Moteur : après échauffement, faire tourner au ralenti	Interrupteur de climatiseur : à l'arrêt	ARRET
		Interrupteur de climatiseur : en marche (Le compresseur fonctionne).	MARCHE
CON NEUTRE	● Contact d'allumage : ''ON''	Levier de passage : point mort	MARCHE
		Sauf ci-dessus	ARRET
SIG DIR ASSIS	● Moteur : après échauffement, faire tourner au ralenti	Position neutre du volant de direction (vers l'avant)	ARRET
		Le volant est tourné.	MARCHE

Simpo PDF Merge and Split Unregistered Version - http://www.simopdf.com

Valeur de référence de CONSULT en mode de contrôle de données (Suite)

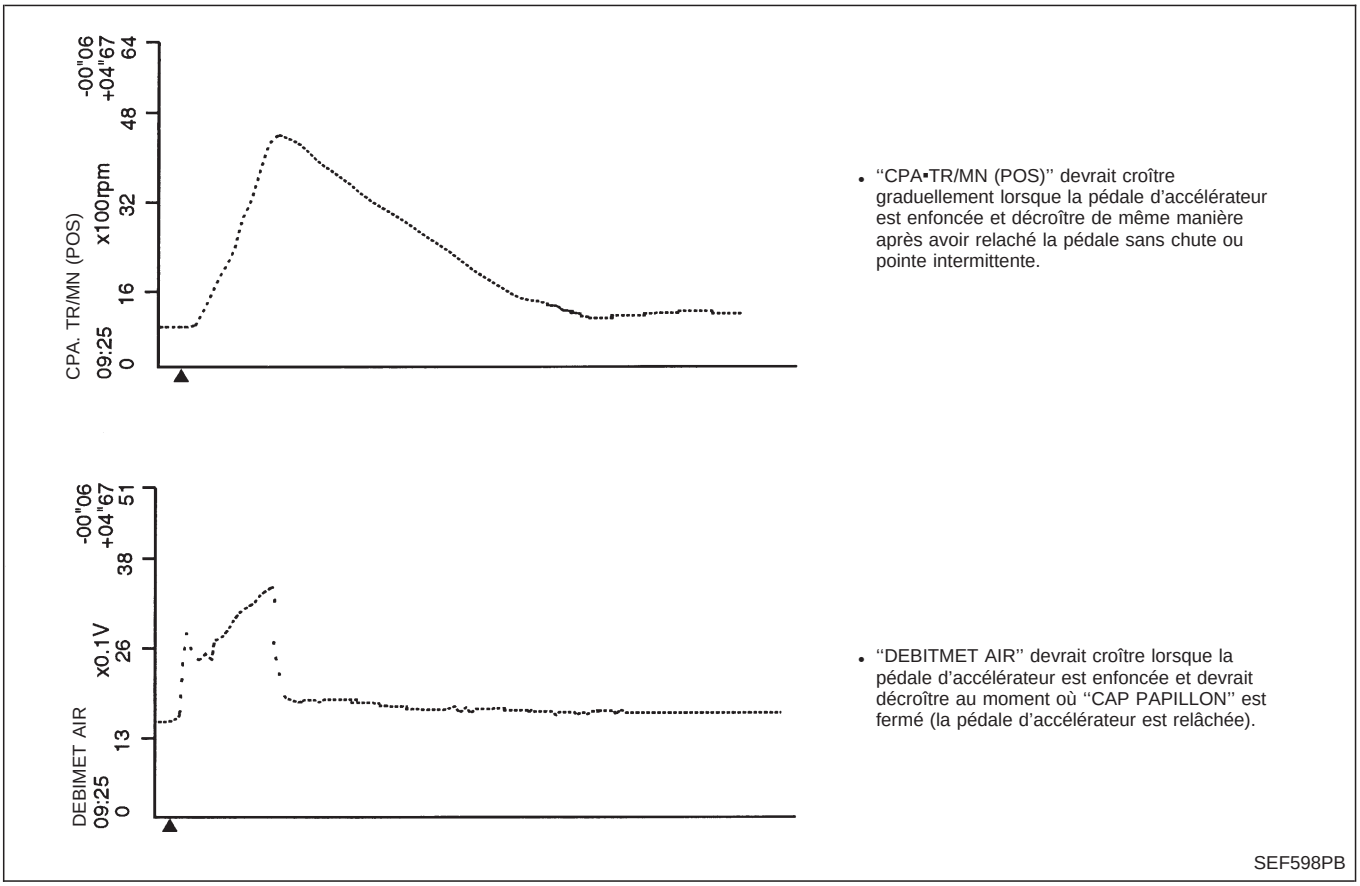
ELEMENT DE CONTROLE	CONDITION		SPECIFICATION
IMPUL INJ	● Moteur : après échauffement ● Interrupteur de climatiseur : à l'arrêt ● Levier de passage : point mort ● A vide	Ralenti	2,4 - 3,2 m/sec.
		2 000 tr/mn	1,9 - 3,2 m/sec.
CALAGE ALLUM	dito	Ralenti	10° avant P.M.H.
		2 000 tr/mn	Plus de 25° avant P.M.H.
VANNE AAC	dito	Ralenti	20 - 40%
		2 000 tr/mn	–
ALPHA A/CARB	● Moteur : après échauffement	Maintenir le régime moteur à 2 000 tr/mn	65 - 140%
RELAIS CLIMAT	● Interrupteur de climatiseur : ARRET → MARCHE		ARRET → MARCHE
REL POMP ALI	● Le contact d'allumage est mis sur "ON" (fonctionne pendant 5 secondes) ● Le moteur tourne et démarre ● Lorsque le moteur est arrêté (il s'arrête en 1 seconde)		MARCHE
	Sauf comme indiqué ci-dessus		ARRET
EV COM TOURBI	● Le moteur tourne à un régime inférieur à 3 600 tr/mn.		MARCHE
	● Sauf ci-dessus		ARRET
EV COM EGR	● Moteur : après échauffement ● Interrupteur de climatiseur : à l'arrêt ● Levier de passage : point mort ● A vide	Ralenti	ARRET
		Supérieur à 3 800 tr/mn	MARCHE



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Graphique de référence du capteur principal en mode de contrôle de données

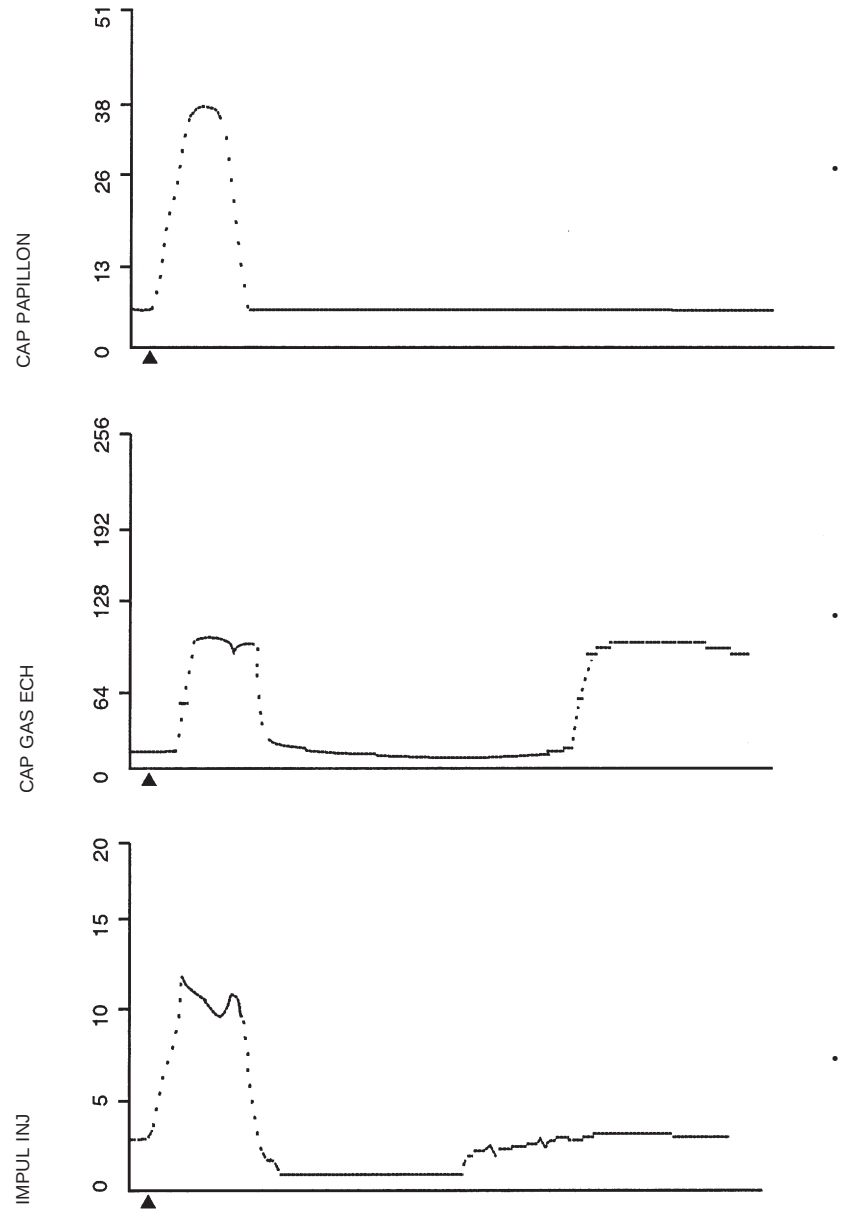
Les courbes suivantes sont les courbes de référence principales des capteurs en mode de ‘‘CONTROLE DE DONNEES’’.
(Sélectionner ‘‘MODE RAPIDE’’ en ‘‘CONTROLE DE DONNEES’’ avec CONSULT).



CAP PAPILLON, POSIT RALENTI

On trouvera ci-dessous les données des paramètres ‘‘CAP PAPILLON’’ et ‘‘POSIT RALENTI’’ lorsqu’on enfonce la pédale d’accélérateur alors que le contact d’allumage est sur ‘‘ON’’.
Le signal de ‘‘CAP PAPILLON’’ doit augmenter progressivement sans chute ou pointe intermittente après avoir changé le paramètre de ‘‘POSIT PAPILLON’’ de ‘‘MAR’’ à ‘‘ARR’’.

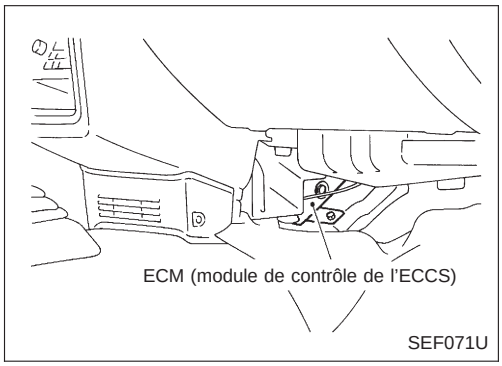
CPA•TR/MN (POS), DEBITMET AIR, CAP PAPILLON, CAP GAS ECH, IMPUL INJ



On trouvera ci-dessous les données des paramètres ‘‘CPA▪TR/MN (POS)’’, ‘‘DEBITMET AIR’’, ‘‘CAP PAPILLON’’, ‘‘CAP GAS ECH’’ et ‘‘IMPUL INJ’’ lorsque l’on emballe rapidement le moteur à 4 800 tr/mn à vide après avoir suffisamment chauffé le moteur.
Chaque valeur sert de référence, la valeur exacte peut varier.

- ‘‘CPA▪TR/MN (POS)’’ devrait croître graduellement lorsque la pédale d’accélérateur est enfoncée et décroître de même manière après avoir relaché la pédale sans chute ou pointe intermittente.
- ‘‘DEBITMET AIR’’ devrait croître lorsque la pédale d’accélérateur est enfoncée et devrait décroître au moment où ‘‘CAP PAPILLON’’ est fermé (la pédale d’accélérateur est relâchée).

Simpo PDF Merge and Split Unregistered Version - http://www.simopdf.com



Graphique de référence du capteur principal en mode de contrôle de données (Suite)

- "CAP PAPILLON" devrait croître lorsque la pédale d'accélérateur est enfoncée et décroître lorsqu'elle est relâchée.
- "CAP GAS ECH" peut croître immédiatement après avoir enfoncé la pédale d'accélérateur et peut décroître après avoir relaché la pédale.
- "IMPUL INJ" devrait croître lorsque la pédale d'accélérateur est enfoncée et devrait décroître lorsque la pédale est relâchée.

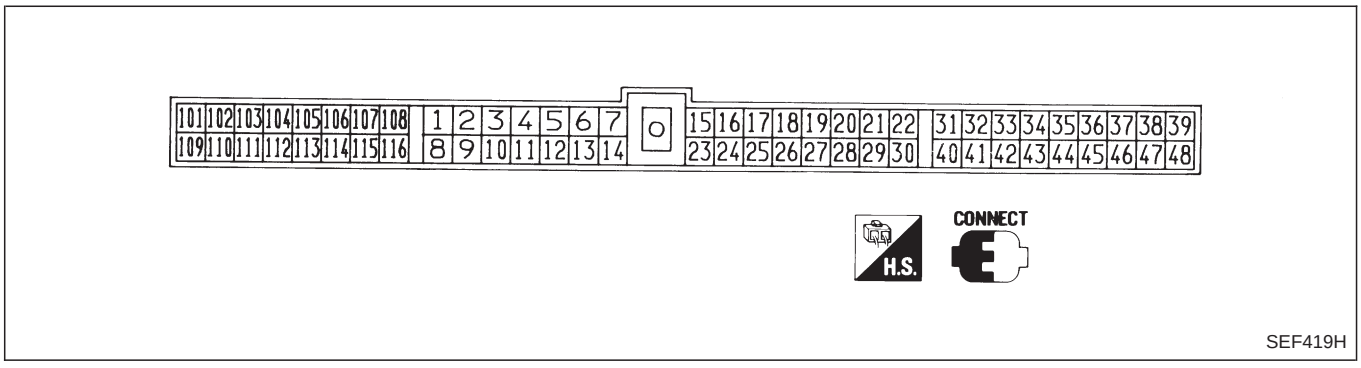
Bornes de l'ECM et valeurs de référence

PREPARATION

1. L'ECM se trouve derrière le tableau de bord inférieur.



2. Déposer le protecteur du faisceau du module de contrôle de l'ECCS.

3. Effectuer toutes les mesures de tension alors que les connecteurs sont branchés. Les sondes prolongées de la façon illustrée ci-contre permettent d'effectuer les tests plus facilement.

DISPOSITION DES BORNES DU CONNECTEUR DE FAISCEAU DE L'ECM

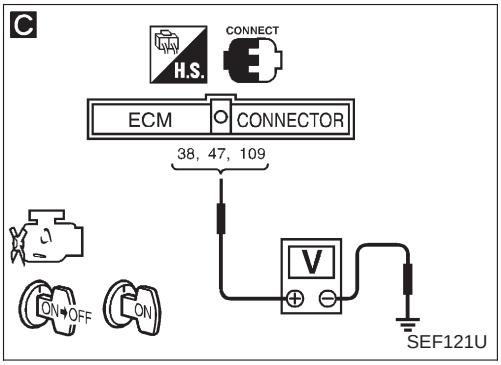
A



B

C

DEBUT DE L'INSPECTION

Démarrer le moteur.
Le moteur tourne-t-il ?

Non → A

Oui

A

VERIFIER L'ALIMENTATION ELECTRIQUE I.
1. Mettre le contact d'allumage sur "ON".
2. Vérifier la tension entre la borne (36) de l'ECM et la masse à l'aide du CONSULT ou d'un testeur.
   Tension : tension de la batterie

Si le résultat est mauvais, vérifier les points suivants.
- Connecteurs de faisceau (F55), (M47) (conduite à droite)
- Faisceau ouvert ou court-circuit entre l'ECM et le contact d'allumage

Si le résultat est mauvais, réparer le faisceau ou les connecteurs.

Bon → Voir "VERIFIER LE CIRCUIT DE MISE A LA MASSE" à la page suivante.

B

VERIFIER L'ALIMENTATION ELECTRIQUE II.
1. Arrêter le moteur.
2. Vérifier la tension entre la borne (46) de l'ECM et la masse à l'aide du CONSULT ou d'un testeur.
   Tension : tension de la batterie

Mauvais →
Vérifier les points suivants.
- Connecteurs de faisceau (F54), (M48) (conduite à droite)
- Connecteurs de faisceau (M5), (E101)
- Fusible de 10A
- Faisceau ouvert ou court-circuité entre l'ECM et la batterie

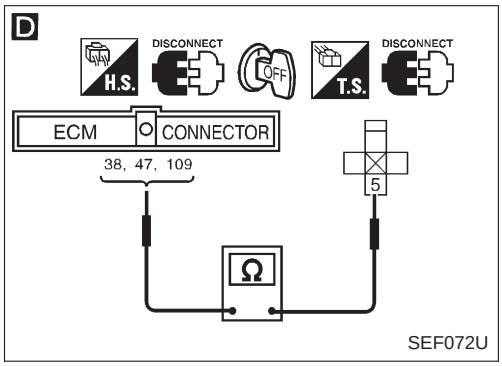
Si le résultat est mauvais, réparer le faisceau ou les connecteurs.

Bon

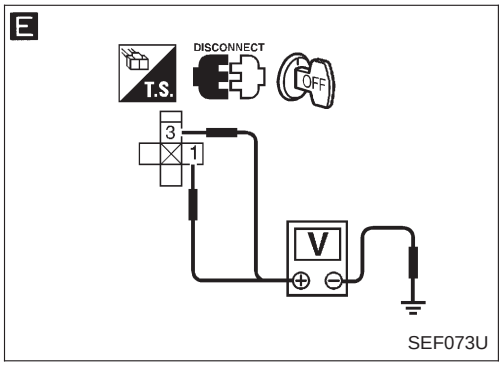
C

VERIFIER L'ALIMENTATION ELECTRIQUE III.
1. Tourner le contact d'allumage sur "ON" puis sur "OFF".
2. Vérifier la tension entre les bornes (38), (47), (109) de l'ECM et la masse à l'aide du CONSULT ou d'un testeur.
   Tension :
   Après avoir mis le contact d'allumage sur "OFF", il y aura tension de la batterie pendant quelques secondes avant que la tension ne retombe à 0V.

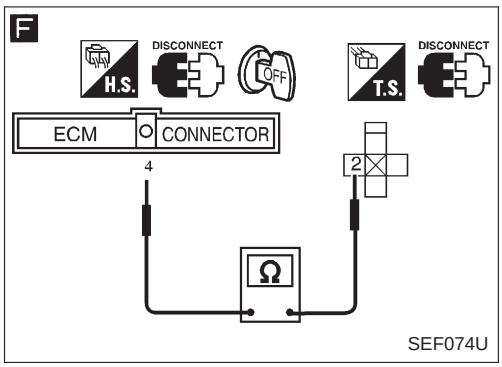
Bon → Voir "VERIFIER LE CIRCUIT DE MISE A LA MASSE" à la page 85.



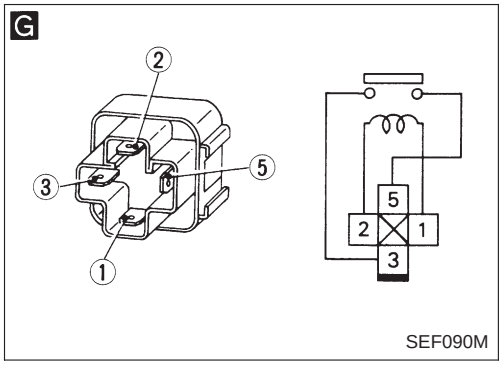
Cas 1 : il n'y a pas tension de la batterie.
Cas 2 : il y a tension de la batterie pendant plus de quelques secondes.



Mauvais
Cas-2
Cas 1 → Voir "VERIFIER LE RELAIS DE L'ECCS" à la page suivante.



Ⓐ



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Alimentation électrique principale et circuit de mise à la masse (Suite)

Ⓐ

D

VERIFIER LA CONTINUITE DU FAISCEAU ENTRE LE RELAIS DE L'ECCS ET L'ECM.

1. Débrancher le connecteur de faisceau de l'ECM.
2. Débrancher le relais de l'ECCS.
3. Vérifier la continuité du faisceau entre les bornes (38), (47), (109) de l'ECM et la borne (5).
   Il doit y avoir continuité.
   Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité à la masse ou à l'alimentation.

Mauvais → Vérifier les points suivants.
- Connecteurs de faisceau (F54), (M48) (conduite à droite)
- Connecteurs de faisceau (M5), (E101)
- Faisceau ouvert ou court-circuité entre l'ECM et le relais de l'ECCS

Si le résultat est mauvais, réparer le circuit ouvert, court-circuité à la masse ou court-circuité à l'alimentation du faisceau ou des connecteurs.

Bon ↓

E

VERIFIER LA TENSION ENTRE LE RELAIS DE L'ECCS ET LA MASSE.

Vérifier la tension entre les bornes (1), (3) et la masse avec le CONSULT ou un testeur.
Tension : tension de la batterie

Mauvais → Vérifier les points suivants.
- Faisceau ouvert ou court-circuité entre le relais de l'ECCS et le fusible

Si le résultat est mauvais, réparer le faisceau ou les connecteurs.

Bon ↓

F

VERIFIER LE CIRCUIT DE SIGNAL DE SORTIE.

Vérifier la continuité du faisceau entre la borne (4) de l'ECM et la borne (2) de relais.
Il doit y avoir continuité.
Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité à la masse ou à l'alimentation.

Mauvais → Vérifier les points suivants.
- Connecteurs de faisceau (F54), (M48) (conduite à droite)
- Connecteurs de faisceau (M5), (E101)
- Faisceau ouvert ou court-circuité entre l'ECM et le relais de l'ECCS

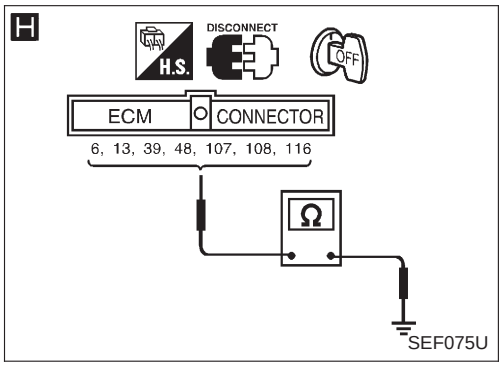
Si le résultat est mauvais, réparer le circuit ouvert, court-circuité à la masse ou court-circuité à l'alimentation du faisceau ou des connecteurs.

Bon ↓

G

VERIFIER LE RELAIS DE L'ECCS.

1. Appliquer un courant continu de 12V entre les bornes (1) et (2) du relais.
2. Vérifier la continuité entre les bornes (3) et (5) du relais.
   12V ((1) - (2)) sont appliqués :
   Il y a continuité.
   Pas de tension appliquée :
   Pas de continuité



Mauvais → Remplacer le relais de l'ECCS.

Bon ↓

Ⓑ

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Alimentation électrique principale et circuit de mise à la masse (Suite)

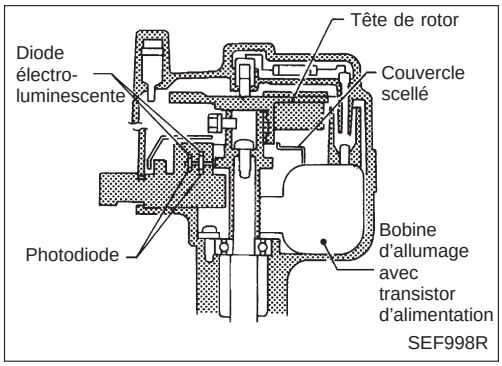
Ⓑ

H

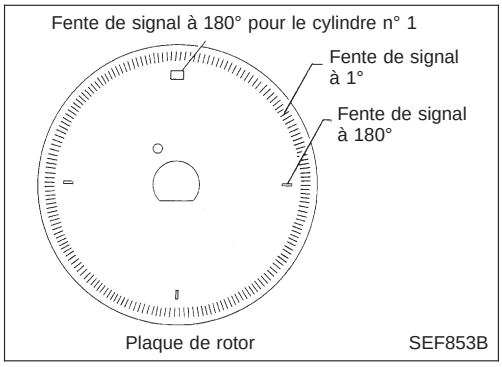
VERIFIER LE CIRCUIT DE MISE A LA MASSE.

1. Mettre le contact d'allumage sur ''OFF''.
2. Desserrer et resserrer les vis de masse du moteur.
3. Débrancher le connecteur de faisceau de l'ECM.
4. Vérifier la continuité du faisceau entre les bornes (6), (13), (39), (48), (107), (108), (116) de l'ECM et la masse de moteur.
   Il doit y avoir continuité.
   Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité à la masse ou à l'alimentation.

Mauvais → Réparer le circuit ouvert, court-circuité à la masse ou court-circuité à l'alimentation dans un faisceau ou des connecteurs.



Bon ↓



Vérifier si les bornes à broches de l'ECM sont endommagées et vérifier la connexion du connecteur de faisceau de l'ECM.

↓

FIN DE L'INSPECTION

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

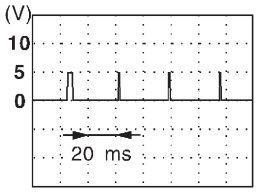
Capteur d'angle d'arbre à cames (CMPS)

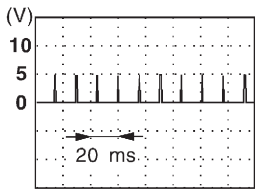
DESCRIPTION DES COMPOSANTS

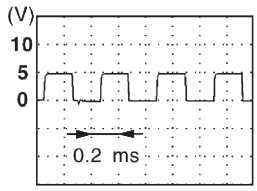
Le capteur d'angle d'arbre à cames forme un composant de base de l'ECCS. Il surveille le régime du moteur et la position du piston. Ces signaux d'entrée à l'ECM sont utilisés pour commander l'injection de carburant, le calage de l'allumage et d'autres fonctions.

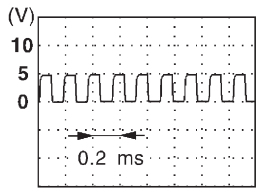
Le capteur d'angle d'arbre à cames comporte une plaque de rotor et un circuit de formation d'ondes. La plaque de rotor comporte 360 fentes pour le signal de 1° et 4 fentes pour le signal de 180°. Le circuit de formation d'ondes se compose de diodes électroluminescentes (DEL) et de photodiodes.

La plaque de rotor est située entre la DEL et la photodiode. La DEL transmet la lumière à la photodiode. Pendant la rotation de la plaque de rotor, les fentes coupent la lumière pour produire des impulsions brutales. Ces impulsions sont converties en signaux de marche-arrêt par le circuit de formation d'onde et ces signaux sont adressés à l'ECM.









Le distributeur n'est pas réparable et il doit être remplacé en tant qu'ensemble, à l'exception de son chapeau.

LOGIQUE DE DIAGNOSTIC DE BORD

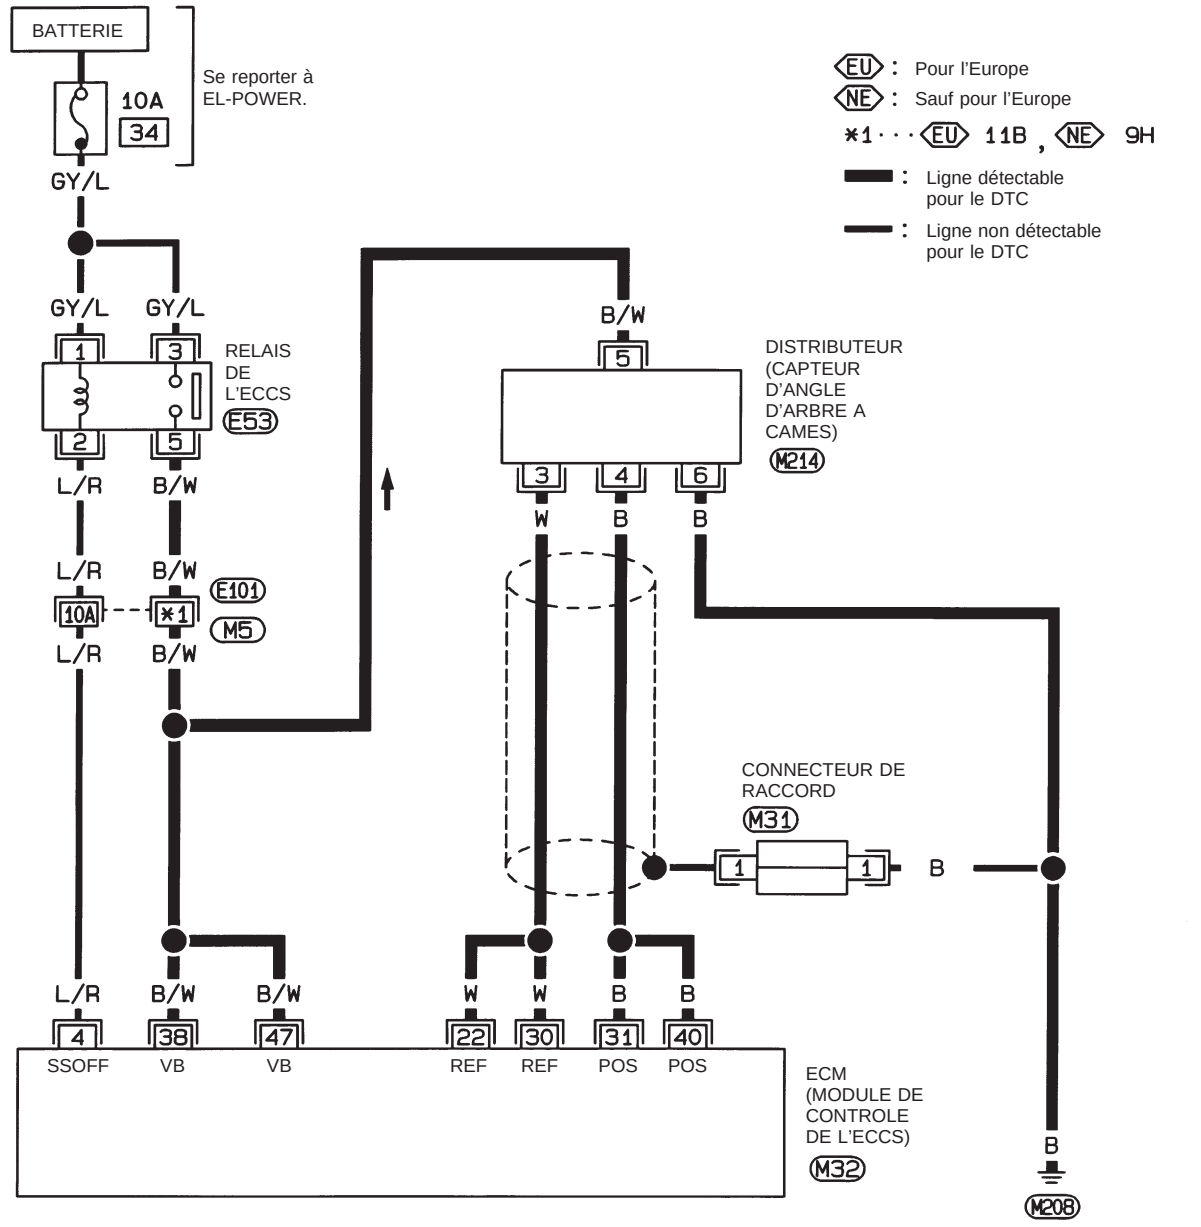
N° de code de défaut de diagnostic	Le défaut est détecté quand ...	Eléments à vérifier (Cause possible)
11	● Le signal à 1° ou 180° n'est pas adressé à l'ECM pendant les premières secondes de lancement du moteur. ● Ni le signal de 1°, ni celui de 180° n'est envoyé à l'ECM lorsque le moteur tourne. ● Un signal de 1° ou 180° n'est pas habituel lorsque le moteur tourne.	● Faisceau ou connecteurs (Le circuit du capteur d'angle d'arbre à cames est ouvert ou court-circuité). ● Capteur d'angle d'arbre à cames ● Démarreur (se reporter à la section EL). ● Circuit de démarrage (se reporter à la section EL). ● Batterie à plat (faible)

PROCEDURE DE CONFIRMATION DU CODE DE DEFAUT DE DIAGNOSTIC

Avant d'effectuer la procédure suivante, vérifier que la tension de la batterie est supérieure à 10V.

1) Mettre le contact d'allumage sur ''ON'' et sélectionner le mode ''CONTROLE DE DONNEES'' à l'aide du CONSULT.
2) Démarrer le moteur et le faire tourner pendant au moins 2 secondes au régime de ralenti.
   (Si le moteur ne tourne pas, mettre le contact d'allumage sur ''START'' pendant au moins 2 secondes).

OU



1) Démarrer le moteur et le faire tourner pendant au moins 2 secondes au régime de ralenti.
   (Si le moteur ne tourne pas, mettre le contact d'allumage sur ''START'' pendant au moins 2 secondes).
2) Tourner le contact d'allumage sur ''OFF'', attendre au moins 5 secondes puis le tourner sur ''ON''.
3) Effectuer ''Mode II de test de diagnostic'' (résultats d'autodiagnostic) à l'aide de l'ECM.

PROCEDURE DE DIAGNOSTIC

DEBUT DE L'INSPECTION

↓

VERIFIER LE SYSTEME DE DEMARRAGE.
Le moteur tourne-t-il au ralenti ?
(Est-ce que le démarreur fonctionne ?)

Non → Vérifier le système de démarrage.
(Se reporter à la section EL).

↓ Oui

VERIFIER LE CIRCUIT PROTECTEUR.
1. Mettre le contact d'allumage sur "OFF".
2. Desserrer et resserrer les vis de masse du moteur (M208 et F8).
3. Déposer le connecteur de raccord M31 ou F53.
4. Vérifier les points suivants.
   - Continuité entre la borne ① du connecteur de raccord et la masse
   - Connecteur de raccord
     (Consulter la "DISPOSITION DES FAISCEAUX" à la section EL).

   Il doit y avoir continuité.

   Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité à la masse ou à l'alimentation. Puis rebrancher le connecteur de raccord.

Mauvais → Réparer le circuit ouvert, court-circuité à la masse ou court-circuité à l'alimentation dans un faisceau ou des connecteurs.

↓ Bon

A

VERIFIER L'ALIMENTATION ELECTRIQUE.
1. Débrancher le connecteur de faisceau du capteur d'angle d'arbre à cames.
2. Mettre le contact d'allumage sur "ON".
3. Vérifier la tension entre la borne ⑤ et la masse avec le CONSULT ou un testeur.

   Tension : tension de la batterie

Mauvais → Vérifier les points suivants.
- Connecteurs de faisceau M5, E101
- Connecteurs de faisceau F54, M48 (conduite à droite)
- Faisceau ouvert ou court-circuité entre le capteur d'angle d'arbre à cames et l'ECM
- Faisceau ouvert ou court-circuité entre le capteur d'angle d'arbre à cames et le relais de l'ECCS

Si le résultat est mauvais, réparer le faisceau ou les connecteurs.

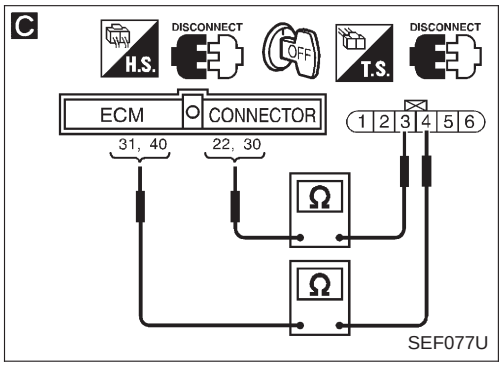
↓ Bon

B

VERIFIER LE CIRCUIT DE MISE A LA MASSE.
1. Débrancher le connecteur de faisceau du capteur d'angle d'arbre à cames.
2. Vérifier la continuité du faisceau entre la borne ⑥ et la masse de moteur.

   Il doit y avoir continuité.

   Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité.



Mauvais → Réparer le circuit ouvert, court-circuité à la masse ou court-circuité à l'alimentation dans le faisceau ou les connecteurs.

↓ Bon

Ⓐ

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Capteur d'angle d'arbre à cames (CMPS) (Suite)

C

(A)

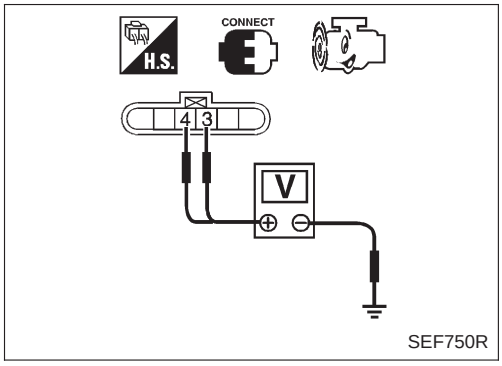
VERIFIER LE CIRCUIT DE SIGNAL D'ENTREE.
1. Mettre le contact d'allumage sur "OFF".
2. Débrancher le connecteur de faisceau de l'ECM.
3. Vérifier la continuité du faisceau entre la borne (4) et les bornes (31), (40) de l'ECM (signal 1°), la borne (3) et les bornes (22), (30) de l'ECM (signal 180°).
   Il doit y avoir continuité.
   Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité à la masse ou à l'alimentation.

Mauvais → Réparer le circuit ouvert, court-circuité à la masse ou court-circuité à l'alimentation dans faisceau ou les connecteurs.

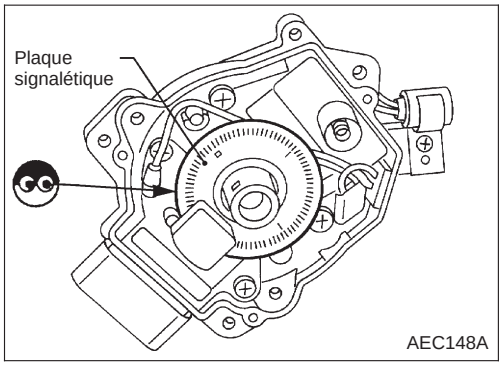
Bon ↓

VERIFIER LE COMPOSANT (Capteur d'angle d'arbre à cames). Consulter l'"INSPECTION DES COMPOSANTS" ci-dessous.

Mauvais → Remplacer le capteur d'angle d'arbre à cames.



Bon ↓



Débrancher et rebrancher sur les circuits les connecteurs de faisceau. Puis procéder à un nouvel essai.

Le problème n'est pas résolu. ↓

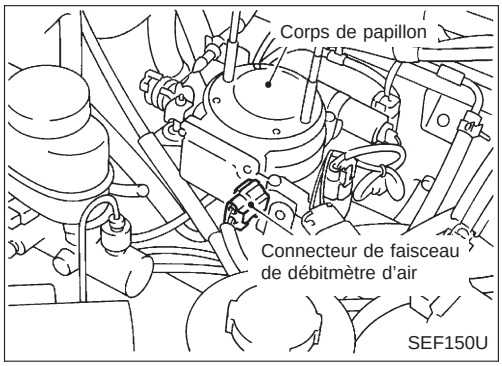
Vérifier si les bornes à broches de l'ECM sont endommagées et vérifier la connexion du connecteur de faisceau de l'ECM. Rebrancher le connecteur de faisceau de l'ECM et tester à nouveau.

FIN DE L'INSPECTION

INSPECTION DES COMPOSANTS

Capteur d'angle d'arbre à cames

1. Démarrer le moteur.
2. Vérifier la tension entre les bornes (3), (4) et la masse sur la plage C. C.



Condition	Bornes	Tension
Le moteur tourne au ralenti	(3) et la masse	Environ 0,4V*
	(4) et la masse	Environ 2,5V*

* : La tension moyenne du signal d'impulsion (le signal d'impulsion peut être confirmé à l'aide d'un oscilloscope).

Si le résultat est mauvais, remplacer l'ensemble du distributeur avec le capteur d'angle d'arbre à cames.

3. Vérifier visuellement la plaque de signal pour déceler toute présence de dommage ou de poussière.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Débitmètre d'air (MAFS)

DESCRIPTION DES COMPOSANTS

Le débitmètre d'air est situé dans le passage d'air d'admission. Il mesure le débit d'admission en mesurant une partie du débit total. Il consiste en un fil chaud qui est alimenté en courant électrique depuis l'ECM. La température du fil chaud est contrôlée en partie par l'ECM. La chaleur produite par le fil chaud est réduite au fur et à mesure que l'air d'admission circule autour de lui. Plus il y a d'air, plus la perte de chaleur est importante.
Par conséquent, l'ECM doit fournir une alimentation électrique plus importante au fil chaud alors que le débit de l'air augmente. Ceci maintient la température du fil chaud. Le module de contrôle de l'ECCS détecte le débit de l'air par le changement du courant électrique.

VALEUR DE REFERENCE DE CONSULT EN MODE DE CONTROLE DE DONNEES

Remarques : les données de spécification sont des valeurs de référence.

ELEMENT DE CONTROLE	CONDITION		SPECIFICATION
DEBITMET AIR	● Moteur : après échauffement ● Interrupteur de climatiseur : à l'arrêt ● Levier de passage : point mort ● A vide	Ralenti	1,3 - 1,7V
		2 500tr/mn	1,7 - 2,1V

BORNES DE L'ECM ET VALEURS DE REFERENCE

Remarques : les données de spécifications sont des valeurs de référence et sont mesurées entre chaque borne et ㊴ (masse de l'ECCS) à l'aide d'un voltmètre.

Débitmètre d'air (MAFS) (Suite)

PROCEDURE DE DIAGNOSTIC

DEBUT DE L'INSPECTION

VERIFIER LE CIRCUIT PROTECTEUR.
1. Mettre le contact d'allumage sur "OFF".
2. Desserrer et resserrer les vis de masse du moteur (M208 et F8).
3. Déposer le connecteur de raccord M31 ou F53.
4. Vérifier les points suivants.
   - Continuité entre la borne ① du connecteur de raccord et la masse
   - Connecteur de raccord (Consulter la "DISPOSITION DES FAISCEAUX" à la section EL).

Il doit y avoir continuité.
Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité à la masse ou à l'alimentation. Puis rebrancher le connecteur de raccord.

Mauvais → Réparer le circuit ouvert, court-circuité à la masse ou court-circuité à l'alimentation dans faisceau ou les connecteurs.

Bon

A

VERIFIER L'ALIMENTATION ELECTRIQUE.
1. Débrancher le connecteur de faisceau du débitmètre d'air.
2. Mettre le contact d'allumage sur "ON".
3. Vérifier la tension entre la borne ③ et la masse avec le CONSULT ou un testeur.

Tension : tension de la batterie

Mauvais → Vérifier les points suivants.
- Connecteurs de faisceau M5, E101
- Connecteurs de faisceau F54, M48 (conduite à droite)
- Faisceau ouvert ou court-circuité entre le débitmètre d'air et l'ECM
- Faisceau ouvert ou court-circuité entre le débitmètre d'air et le relais de l'ECCS

Si le résultat est mauvais, réparer le faisceau ou les connecteurs.

Bon

B

VERIFIER LE CIRCUIT DE MISE A LA MASSE.
1. Mettre le contact d'allumage sur "OFF".
2. Débrancher le connecteur de faisceau de l'ECM.
3. Vérifier la continuité du faisceau entre la borne ② et la borne ⑰ de l'ECM.

Il doit y avoir continuité.
Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité à la masse ou à l'alimentation.

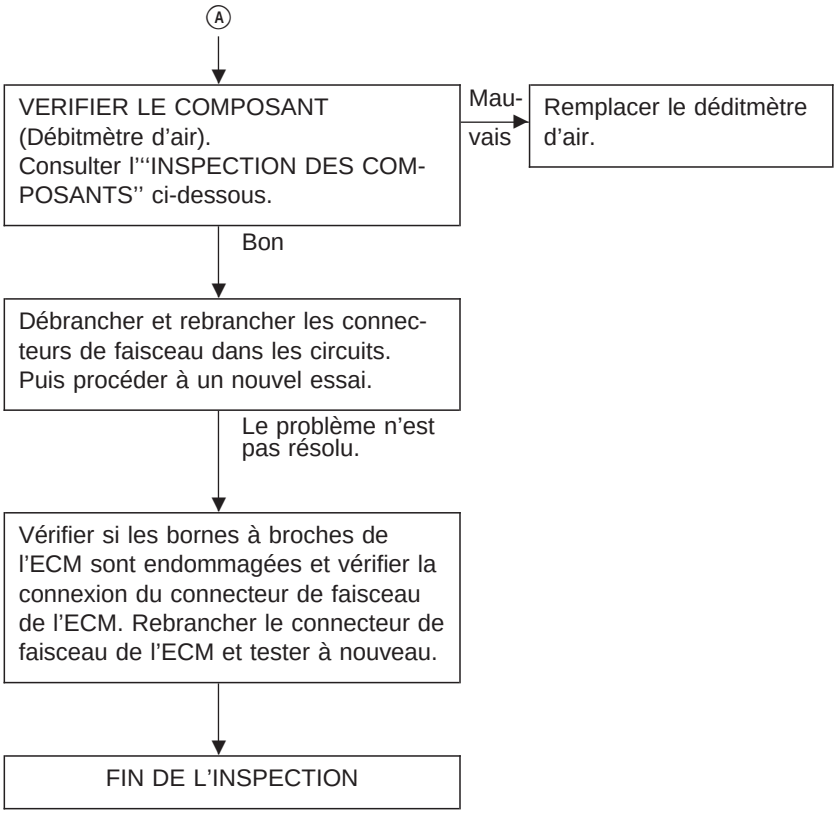
Mauvais → Réparer le circuit ouvert, court-circuité à la masse ou court-circuité à l'alimentation dans le faisceau ou les connecteurs.

Bon

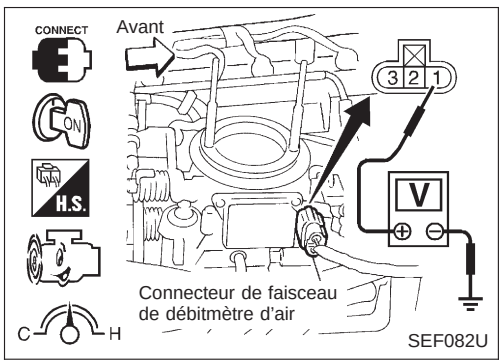
C

VERIFIER LE CIRCUIT DE SIGNAL D'ENTREE.
Vérifier la continuité du faisceau entre la borne ① et la borne ⑯ de l'ECM.

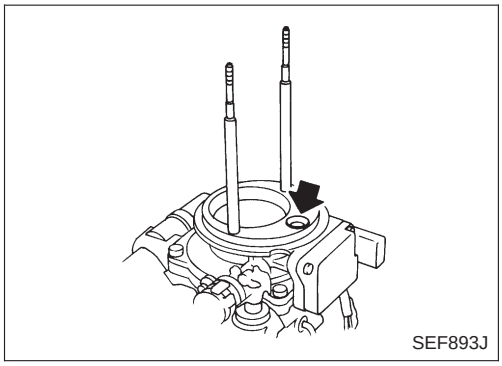
Il doit y avoir continuité.
Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité à la masse ou à l'alimentation.



Mauvais → Réparer le circuit ouvert, court-circuité à la masse ou court-circuité à l'alimentation dans le faisceau ou les connecteurs.



Bon



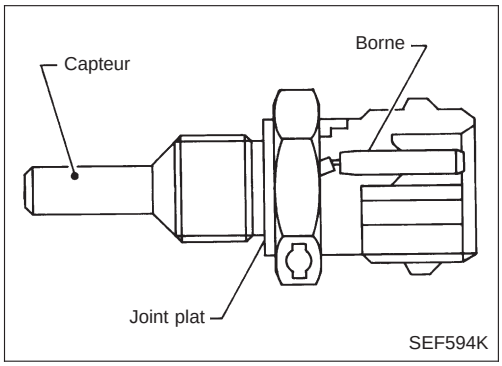
Ⓐ

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

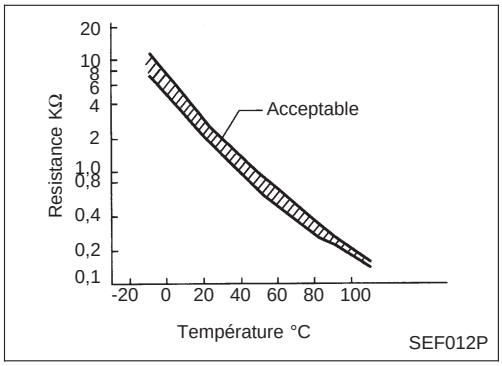
Débitmètre d’air (MAFS) (Suite)

INSPECTION DES COMPOSANTS

Débitmètre d’air



1. Mettre le contact d’allumage sur ‘‘ON’’.
2. Démarrer le moteur et le laisser s’échauffer suffisamment.
3. Vérifier la tension entre la borne ① et la masse.



Conditions	Tension V
Contact d’allumage sur ‘‘ON’’ (moteur arrêté)	Moins de 1,0
Ralenti (le moteur est suffisamment réchauffé).	1,3 - 1,7
2 500 tr/mn	1,7 - 2,1
Ralenti d’environ 4 000 tr/mn*	1,3 - 1,7 à environ 4,0

* : Vérifier la montée de la tension linéaire par rapport aux augmentations de régime du moteur jusqu’à environ 4 000 tr/mn.

4. Si le résultat est mauvais, déposer le débitmètre d’air du conduit d’air. Vérifier l’état et l’encrassement du filament chauffant.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

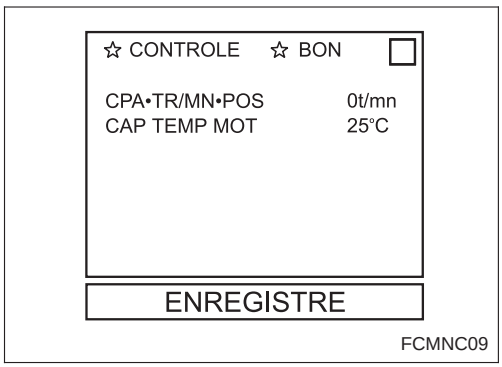
Capteur de température du réfrigérant moteur (ECTS)

DESCRIPTION DES COMPOSANTS

Le capteur de température du réfrigérant moteur est utilisé pour détecter la température du réfrigérant moteur. Le capteur modifie un signal de tension depuis l'ECM. Le signal modifié retourne à l'ECM en tant qu'entrée de température du réfrigérant moteur. Le capteur utilise une thermistance qui est sensible au changement de température. La résistance électrique de la thermistance diminue au fur et à mesure que la température monte.

<Données de référence>

Température du réfrigérant moteur °C	Tension* (V)	Résistance (kΩ)
−10	4,4	7,0 - 11,4
20	3,5	2,1 - 2,9
50	2,2	0,68 - 1,00
90	1,0	0,236 - 0,260



* : Ces données sont des valeurs de référence et sont mesurées entre la borne (18) de l'ECM (capteur de température du réfrigérant moteur) et la borne (39) de l'ECM (masse de l'ECCS).

LOGIQUE DE DIAGNOSTIC DE BORD

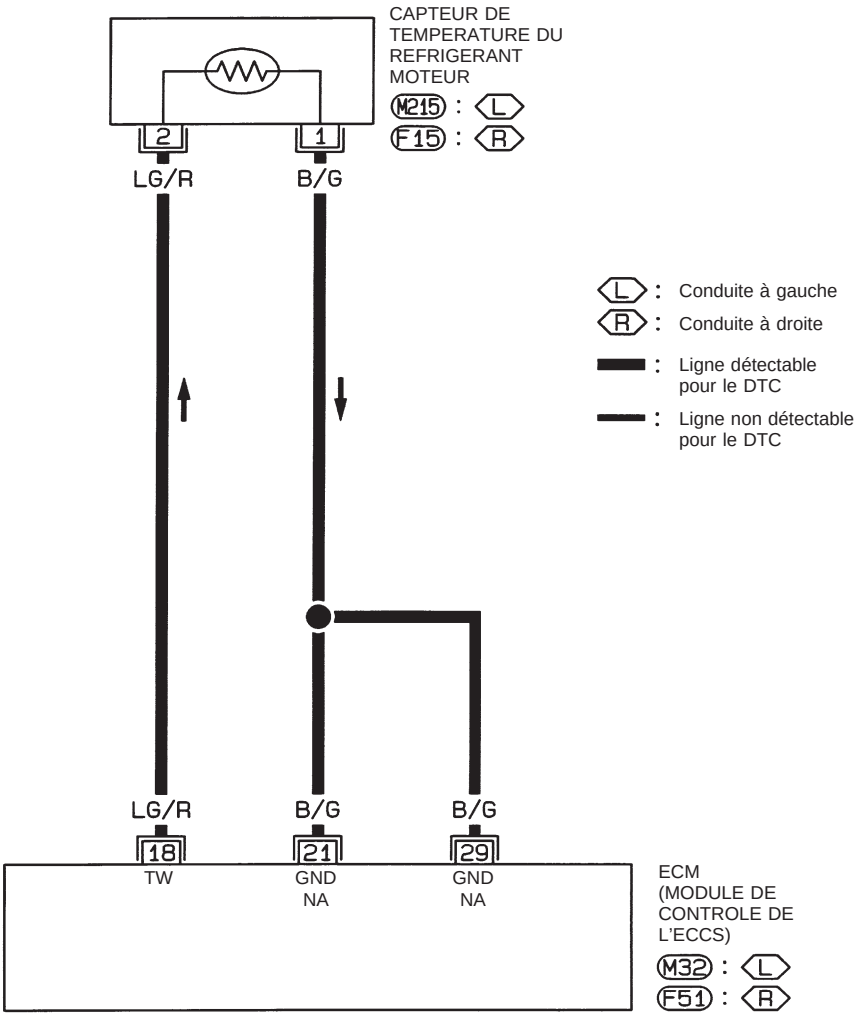
N° de code de défaut de diagnostic	Le défaut est détecté quand ...	Eléments à vérifier (Cause possible)
13	● Une tension excessivement haute ou basse provenant du capteur est adressée à l'ECM.*	● Faisceau ou connecteurs (Le circuit du capteur est ouvert ou court-circuité) ● Capteur de température du réfrigérant moteur

* : Lorsque ce défaut est détecté, l'ECM passe en mode de sécurité.

Condition de fonctionnement du moteur en mode de sécurité	Condition	Température du réfrigérant moteur déterminée (AFFICHAGE CONSULT)
La température du réfrigérant moteur sera déterminée sur la base du temps suivant la mise du contact d'allumage sur "ON" ou "START". Le CONSULT affiche la température du réfrigérant moteur déterminée par l'ECM.	Au moment de la mise du contact d'allumage sur "ON" ou "START"	20°C
	Plus de 6 minutes après que l'allumage est mis sur "START"	80°C
	Sauf comme indiqué ci-dessus	20 - 80°C (en fonction du temps écoulé)

PROCEDURE DE CONFIRMATION DU CODE DE DEFAUT DE DIAGNOSTIC

1) Mettre le contact d'allumage sur "ON".
2) Effectuer "CONTROLE DE DONNEES" avec le CONSULT.
3) Attendre au moins 5 secondes.



OU

1) Tourner le contact d'allumage sur "ON" et attendre au moins 5 secondes.
2) Tourner le contact d'allumage sur "OFF", attendre au moins 5 secondes puis le tourner sur "ON".
3) Effectuer "Mode II de test de diagnostic" (résultats d'autodiagnostic) à l'aide de l'ECM.

Capteur de température du réfrigérant moteur (ECTS) (Suite)

PROCEDURE DE DIAGNOSTIC

DEBUT DE L'INSPECTION

A

VERIFIER L'ALIMENTATION ELECTRIQUE.
1. Mettre le contact d'allumage sur "OFF".
2. Débrancher le connecteur de faisceau du capteur de température du réfrigérant moteur.
3. Mettre le contact d'allumage sur "ON".
4. Vérifier la tension entre la borne ② et la masse avec le CONSULT ou un testeur.
   Tension :
   Environ 5V

Mauvais → Réparer le faisceau ou les connecteurs.

Bon

B

VERIFIER LE CIRCUIT DE MISE A LA MASSE.
1. Mettre le contact d'allumage sur "OFF".
2. Vérifier la continuité du faisceau entre la borne ① et la masse de moteur.
   Il doit y avoir continuité.
   Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité à la masse ou à l'alimentation.

Mauvais → Vérifier les points suivants.
- Faisceau ouvert ou court-circuité entre l'ECM et le capteur de température du réfrigérant moteur

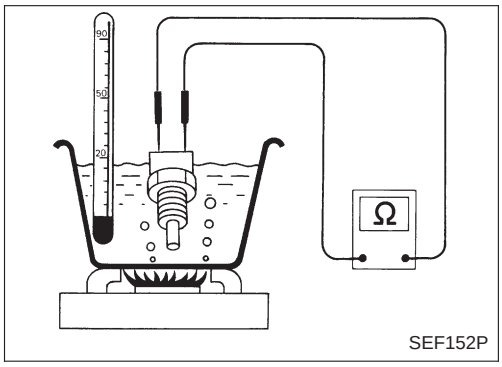
Si le résultat est mauvais, réparer le circuit ouvert, court-circuité à la masse ou court-circuité à l'alimentation du faisceau ou des connecteurs.

Bon

VERIFIER LE COMPOSANT
(Capteur de température du réfrigérant moteur).
Consulter l'"INSPECTION DES COMPOSANTS" à la page suivante.

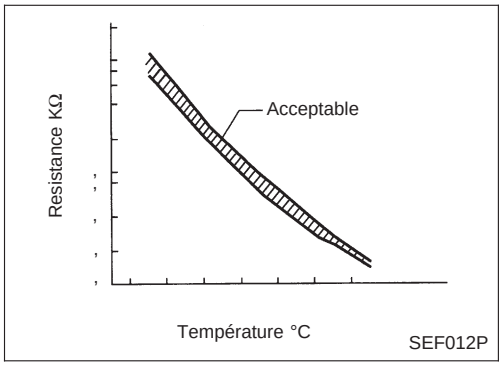
Mauvais → Remplacer le capteur de température du réfrigérant moteur.

Bon



Débrancher et rebrancher sur les circuits les connecteurs de faisceau. Puis procéder à un nouvel essai.

Le problème n'est pas résolu.



Vérifier si les bornes à broches de l'ECM sont endommagées et vérifier la connexion du connecteur de faisceau de l'ECM. Rebrancher le connecteur de faisceau de l'ECM et tester à nouveau.

FIN DE L'INSPECTION

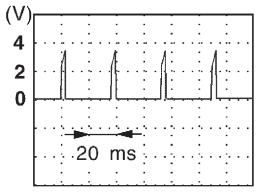
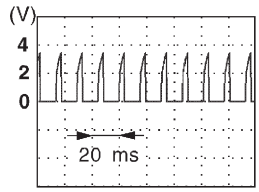
Signal d'allumage

DESCRIPTION DES COMPOSANTS

Bobine d'allumage et transistor d'alimentation (intégrés au distributeur)

Le signal d'allumage depuis l'ECM est délivré à et amplifié par le transistor d'alimentation. Le transistor d'alimentation excite et coupe le circuit primaire de la bobine d'allumage. Ce fonctionnement intermittent alimente la tension élevée correcte dans le circuit secondaire de la bobine.

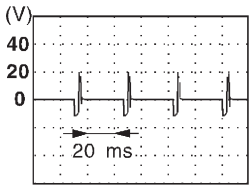


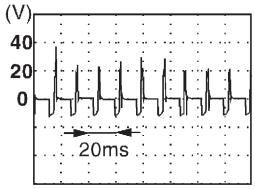


VALEUR DE REFERENCE DE CONSULT EN MODE DE CONTROLE DE DONNEES

Remarques : les données de spécification sont des valeurs de référence.

ELEMENT DE CONTROLE	CONDITION		SPECIFICATION
CALAGE ALLUM	● Moteur : après échauffement ● Interrupteur de climatiseur : à l'arrêt ● Levier de passage : point mort ● A vide	Ralenti	10° avant P.M.H.
		2 000 tr/mn	Plus de 25° avant P.M.H.





BORNES DE L'ECM ET VALEURS DE REFERENCE

Remarques : les données de spécifications sont des valeurs de référence et sont mesurées entre chaque borne et ㊴ (masse de l'ECCS) à l'aide d'un voltmètre.

Signal d'allumage (Suite)

PROCEDURE DE DIAGNOSTIC

DEBUT DE L'INSPECTION

Mettre le contact d'allumage sur "OFF", et redémarrer le moteur.
Le moteur tourne-t-il ?

Oui → Ⓐ (Aller à la page suivante).

Non

A

VERIFIER L'ALIMENTATION ELECTRIQUE.
1. Mettre le contact d'allumage sur "OFF".
2. Débrancher le connecteur de faisceau de la bobine d'allumage.
3. Mettre le contact d'allumage sur "ON".
4. Vérifier la tension entre la borne ⑦ et la masse avec le CONSULT ou un testeur.
   Tension : tension de la batterie

Mauvais → Vérifier les points suivants.
- Connecteurs de faisceau (F55), (M47) (conduite à droite)
- Faisceau ouvert ou court-circuité entre la bobine d'allumage et le contact d'allumage

Si le résultat est mauvais, réparer le faisceau ou les connecteurs.

Bon

B

VERIFIER LE CIRCUIT DE MISE A LA MASSE.
1. Mettre le contact d'allumage sur "OFF".
2. Débrancher le connecteur de faisceau du transistor d'alimentation.
3. Vérifier la continuité du faisceau entre la borne ② et la masse de moteur.
   Il doit y avoir continuité.
   Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité à la masse ou à l'alimentation.

Mauvais → Réparer le circuit ouvert, court-circuité à la masse ou court-circuité à l'alimentation dans le faisceau ou les connecteurs.

Bon

C

VERIFIER LE CIRCUIT DE SIGNAL DE SORTIE.
1. Débrancher le connecteur de faisceau de l'ECM.
2. Vérifier la continuité du faisceau entre la borne ① de l'ECM et la borne ① .
   Il doit y avoir continuité.
   Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité à la masse ou à l'alimentation.

Mauvais → Réparer le circuit ouvert, court-circuité à la masse ou court-circuité à l'alimentation dans le faisceau ou les connecteurs.

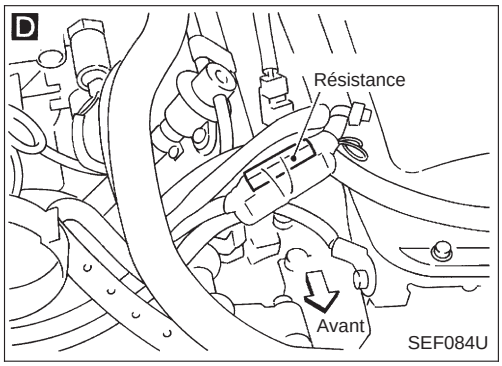
Bon

VERIFIER LES COMPOSANTS
(Bobine d'allumage, transistor d'alimentation).
Consulter l'"INSPECTION DES COMPOSANTS", EC-109.

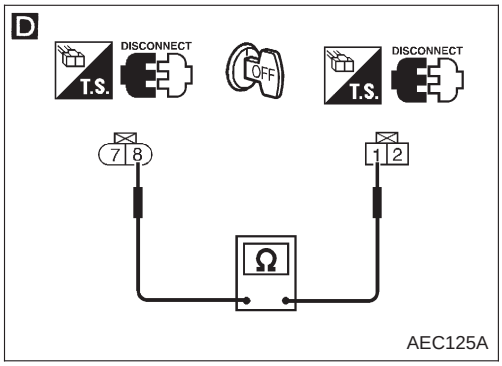
Mauvais → Remplacer le(s) composant(s) défectueux.

Bon

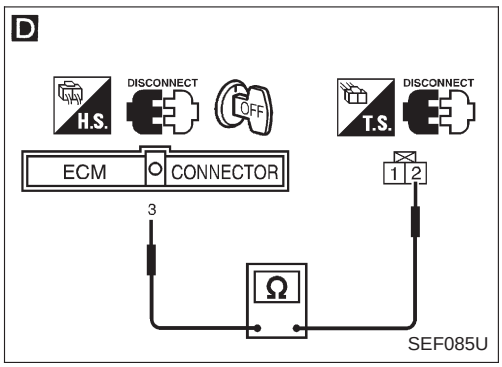
Débrancher et rebrancher sur les circuits les connecteurs de faisceau. Puis procéder à un nouvel essai.



Le problème n'est pas résolu.



Vérifier si les bornes à broches de l'ECM sont endommagées et vérifier la connexion du connecteur de faisceau de l'ECM. Rebrancher le connecteur de faisceau de l'ECM et tester à nouveau.



FIN DE L'INSPECTION

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Signal d’allumage (Suite)

Ⓐ

D

VERIFIER LE CIRCUIT DE SIGNAL D’ENTREE.
1. Arrêter le moteur.
2. Débrancher le connecteur de faisceau de la bobine d’allumage.
3. Retirer le ruban adhésif couvrant la résistance.
4. Débrancher le connecteur de faisceau de la résistance.
5. Débrancher le connecteur de faisceau de l’ECM.
6. Vérifier la continuité du faisceau entre la borne ⑧ et la borne ①, la borne ② et la borne ③ de l’ECM.
   Il doit y avoir continuité.
   Si le résultat est bon, vérifier si le faisceau n’est pas court-circuité à la masse ou à l’alimentation.

Mauvais → Réparer le circuit ouvert, court-circuité à la masse ou court-circuité à l’alimentation dans le faisceau ou les connecteurs.

Bon

VERIFIER LE COMPOSANT (Résistance).
Consulter l’“INSPECTION DES COMPOSANTS” à la page suivante.

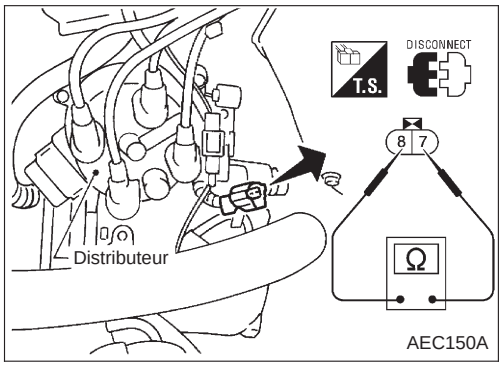
Mauvais → Remplacer la résistance.

Bon

Débrancher et rebrancher sur les circuits les connecteurs de faisceau. Puis procéder à un nouvel essai.

Le problème n’est pas résolu.

Vérifier si les bornes à broches de l’ECM sont endommagées et vérifier la connexion du connecteur de faisceau de l’ECM. Rebrancher le connecteur de faisceau de l’ECM et tester à nouveau.

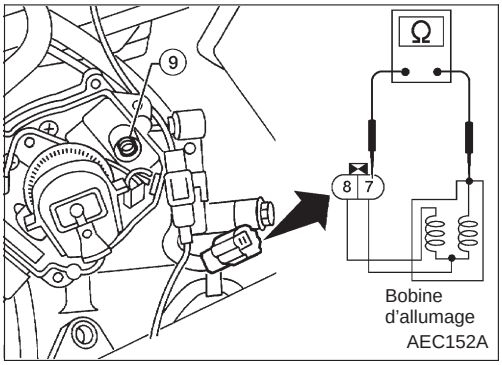


FIN DE L’INSPECTION

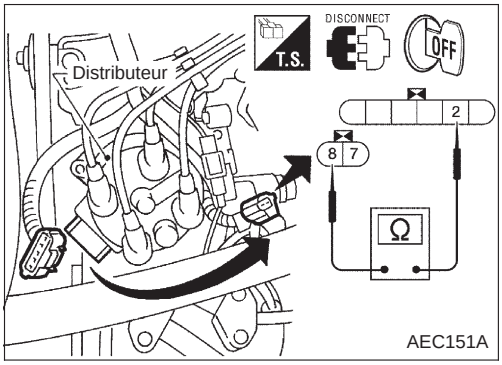
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Signal d’allumage (Suite)

INSPECTION DES COMPOSANTS



Bobine d’allumage

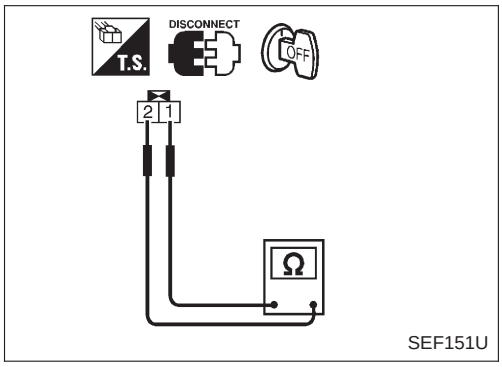


1. Débrancher le connecteur de faisceau de la bobine d’allumage.
2. Déposer le chapeau de distributeur.
3. Vérifier la résistance comme indiqué sur la figure ci-contre.

Borne	Résistance (à 25°C)
⑦ - ⑧	Moins de 1Ω
⑦ - ⑨	7 - 13 kΩ

Si le résultat est mauvais, remplacer l’ensemble de distributeur.

Transistor d’alimentation



1. Débrancher le connecteur de faisceau du capteur d’angle d’arbre à cames et du transistor d’alimentation et le connecteur du faisceau de la bobine d’allumage.
2. Vérifier la résistance du transistor d’alimentation entre les bornes ② et ⑧.

Bornes	Résistance	Résultat
② et ⑧	Sauf 0Ω	Bon
	0Ω	Mauvais

Si le résultat est mauvais, remplacer l’ensemble de distributeur.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

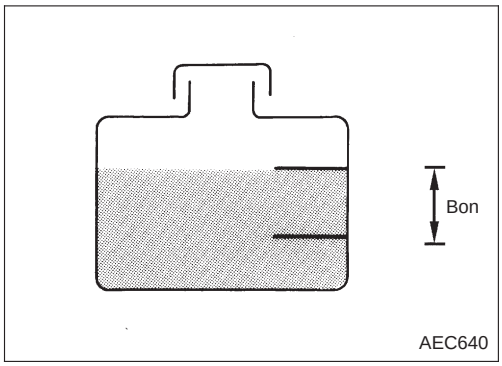
Signal d'allumage (Suite)

Résistance

1. Débrancher le connecteur de faisceau de la résistance.
2. Vérifier la résistance entre les bornes ① et ② .
   Résistance : environ 2,2 kΩ
   Si le résultat est mauvais, remplacer la résistance.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Surchauffe



LOGIQUE DE DIAGNOSTIC DE BORD

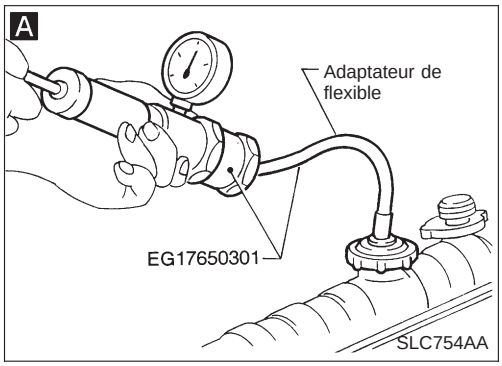
Si le ventilateur de refroidissement ou tout autre composant du système de refroidissement est défectueux, la température moteur augmentera.
Lorsque la température du réfrigérant moteur atteint un degré de température anormalement élevé, un défaut est indiqué.

N° de code de défaut de diagnostic	Le défaut est détecté quand ...	Eléments à vérifier (Cause possible)
28	● La température du réfrigérant moteur devient anormalement élevée.	● Ventilateur de refroidissement ● Flexible de radiateur ● Radiateur ● Bouchon du radiateur ● Pompe à eau ● Thermostat Pour plus d'information, consulter ''12 CAUSES PRINCIPALES DE SURCHAUFFE'', à la page EC-114.

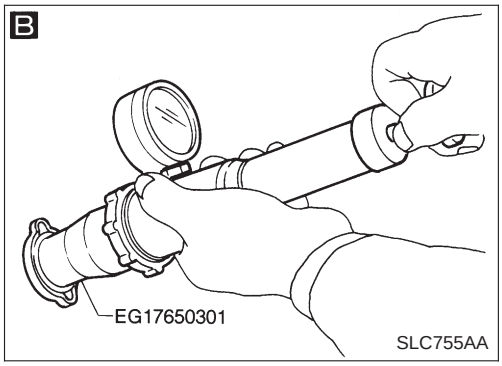
ATTENTION :
Lorsqu'un défaut est indiqué, veiller à remplacer le réfrigérant en suivant la procédure indiquée à la section MA (''Remplacement du réfrigérant moteur'', ''ENTRETIEN DU MOTEUR''). Remplacer également l'huile moteur.

- **Faire le plein du radiateur jusqu'au niveau spécifié en versant 2 litres de réfrigérant par minute. Veiller à utiliser un réfrigérant contenant une richesse de mélange appropriée. Consulter la section MA (''Richesse de mélange de réfrigérant antigel'', dans ''FLUIDES ET LUBRIFIANTS RECOMMANDES'').**
- **Après avoir fait le plein de réfrigérant, faire tourner le moteur pour s'assurer que l'on entend aucun bruit d'écoulement d'eau.**

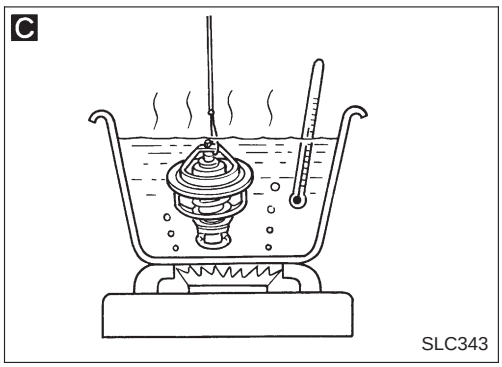
VERIFICATION DU FONCTIONNEMENT GENERAL



AVERTISSEMENT :
Ne jamais déposer le bouchon de radiateur lorsque le moteur est chaud. Le liquide haute pression s'échappant du radiateur peut occasionner de sérieuses brûlures.
Entourer le bouchon d'un chiffon épais. Retirer le bouchon avec précaution en le tournant d'un quart de tour pour permettre à la pression de s'échapper. Puis tourner le bouchon à fond.



1. Contrôler le niveau de réfrigérant dans le réservoir et dans le radiateur.
   Laisser le moteur refroidir avant de vérifier le niveau de réfrigérant.
   Si le niveau de réfrigérant dans le réservoir et/ou dans le radiateur est en dessous du niveau adéquat, sauter les étapes suivantes et passer à ''PROCEDURE DE DIAGNOSTIC'' à la page suivante.
2. S'assurer que le client a fait le plein de réfrigérant ou non.
   Si le client a fait le plein de réfrigérant, passer à la ''PROCEDURE DE DIAGNOSTIC'', à la page suivante.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Surchauffe (Suite)

PROCEDURE DE DIAGNOSTIC

DEBUT DE L'INSPECTION

↓

A

VERIFIER SI LE SYSTEME DE REFROIDISSEMENT NE FUIT PAS.
Augmenter la pression du système de refroidissement à l'aide d'un testeur, et vérifier si la pression chute.
Pression d'essai :
157 kPa (1,57 bar, 1,6 kg/cm^2)
La pression ne doit pas chuter.
ATTENTION :
Une pression supérieure à celle spécifiée pourrait endommager le radiateur.

Mauvais → Vérifier si les éléments suivants ne fuient pas.
- Flexible
- Radiateur
- Pompe à eau

Consulter la section LC ("Pompe à eau").

↓ Bon

B

VERIFIER LE BOUCHON DU RADIATEUR.
Mettre le couvercle sous pression à l'aide d'un testeur.
Pression de décharge du bouchon de radiateur :
78 - 98 kPa
(0,78 - 0,98 bar, 0,8 - 1,0 kg/cm^2)

Mauvais → Remplacer le bouchon de radiateur.

↓ Bon

C

VERIFIER LE THERMOSTAT.
1. Vérifier l'assise de la vanne à température ambiante normale.
   Elle doit être assise en contact étroit avec le siège.
2. Vérifier la température d'ouverture de soupape et la levée de soupape.
   Température d'ouverture de soupape
   76,5°C (standard)
   Levée de soupape :
   Plus de 10 mm/90°C
3. Vérifier si la soupape est fermée à 5°C au-dessous de la température d'ouverture de la soupape.

Pour plus de détails, consulter la section LC ("Thermostat").

Mauvais → Remplacer le thermostat

↓ Bon

Vérifier le capteur de température du réfrigérant moteur. Consulter l'"INSPECTION DES COMPOSANTS", EC-102.

Mauvais → Remplacer le capteur de température du réfrigérant moteur.

↓ Bon

Si la cause ne peut pas être identifiée, aller à "12 CAUSES PRINCIPALES DE SURCHAUFFE" à la page 114.

↓

FIN DE L'INSPECTION

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Surchauffe (Suite)

Effectuer un CONTROLE FINAL à l'aide de la procédure suivante une fois la réparation achevée.

1. Laisser chauffer le moteur. Faire tourner le moteur pendant au moins 20 minutes. Faire attention à la jauge de température du réfrigérant moteur située sur le tableau de bord. Si la lecture indique une température anormalement haute, il se peut qu'une autre pièce soit défectueuse.
2. Arrêter le véhicule et garder le régime de ralenti. Vérifier si les systèmes d'admission et d'échappement ne fuient pas en écoutant tous les bruits et en inspectant visuellement les composants.
3. Laisser le moteur refroidir puis vérifier toute présence de fuites d'huile ou de réfrigérant. Puis, effectuer la ''VERIFICATION DU FONCTIONNEMENT GENERAL''.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Capteur de position de papillon

DESCRIPTION DES COMPOSANTS

Le capteur de position de papillon répond aux mouvements de la pédale d'accélérateur. Ce capteur est une sorte de potentiomètre qui transforme la position du papillon en tension électrique qu'il transmet à l'ECM. De plus, le capteur détecte la vitesse d'ouverture et de fermeture du papillon et transmet un signal de tension à l'ECM.
La position de ralenti de la vanne de papillon est déterminée par l'ECM recevant le signal du capteur de position de papillon. Il contrôle les modes d'exploitation du moteur tel que la coupure d'alimentation.

VALEUR DE REFERENCE DE CONSULT EN MODE DE CONTROLE DE DONNEES

Remarques : les données de spécification sont des valeurs de référence.

ELEMENT DE CONTROLE	CONDITION		SPECIFICATION
CAP PAPILLON	● Contact d'allumage : "ON" (Moteur à l'arrêt)	Papillon : complètement fermé	0,35 - 0,65V
		Papillon : complètement ouvert	Env. 4,0V
POSIT RALENTI	● Contact d'allumage : "ON" (Moteur à l'arrêt)	Papillon : position de ralenti	MARCHE
		Vanne de papillon : légèrement ouverte	ARRET

BORNES DE L'ECM ET VALEURS DE REFERENCE

Remarques : les données de spécifications sont des valeurs de référence et sont mesurées entre chaque borne et ㊴ (masse de l'ECCS) à l'aide d'un voltmètre.

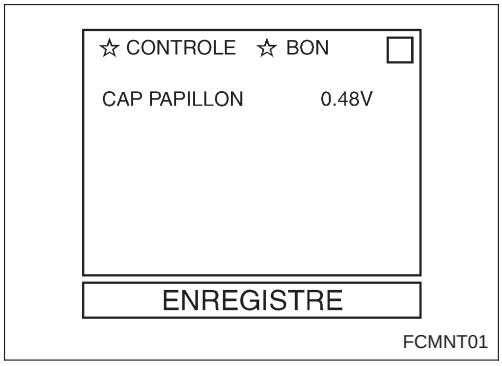
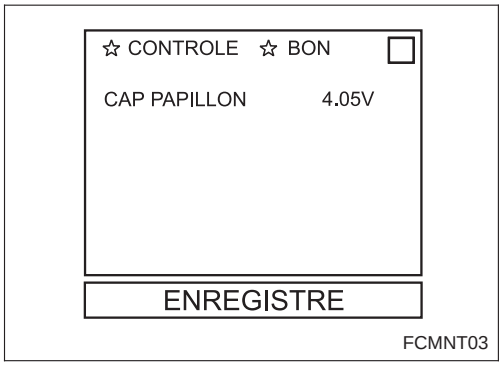
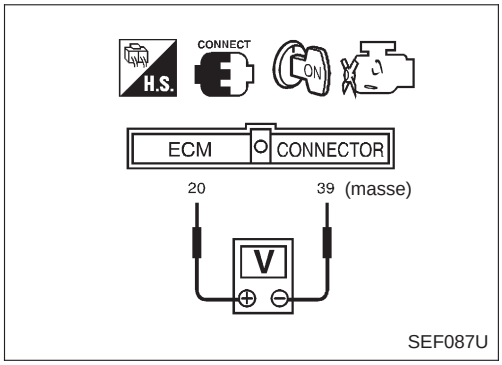
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Capteur de position de papillon (Suite)



LOGIQUE DE DIAGNOSTIC DE BORD



Diagnostic de défaut N° de code	Le défaut est détecté quand ...	Eléments à vérifier (Cause possible)
43	● Une tension anormalement basse ou élevée provenant du capteur est adressée à l'ECM.*	● Faisceau ou connecteurs (Le circuit du capteur est ouvert ou court-circuité) ● Capteur de position de papillon

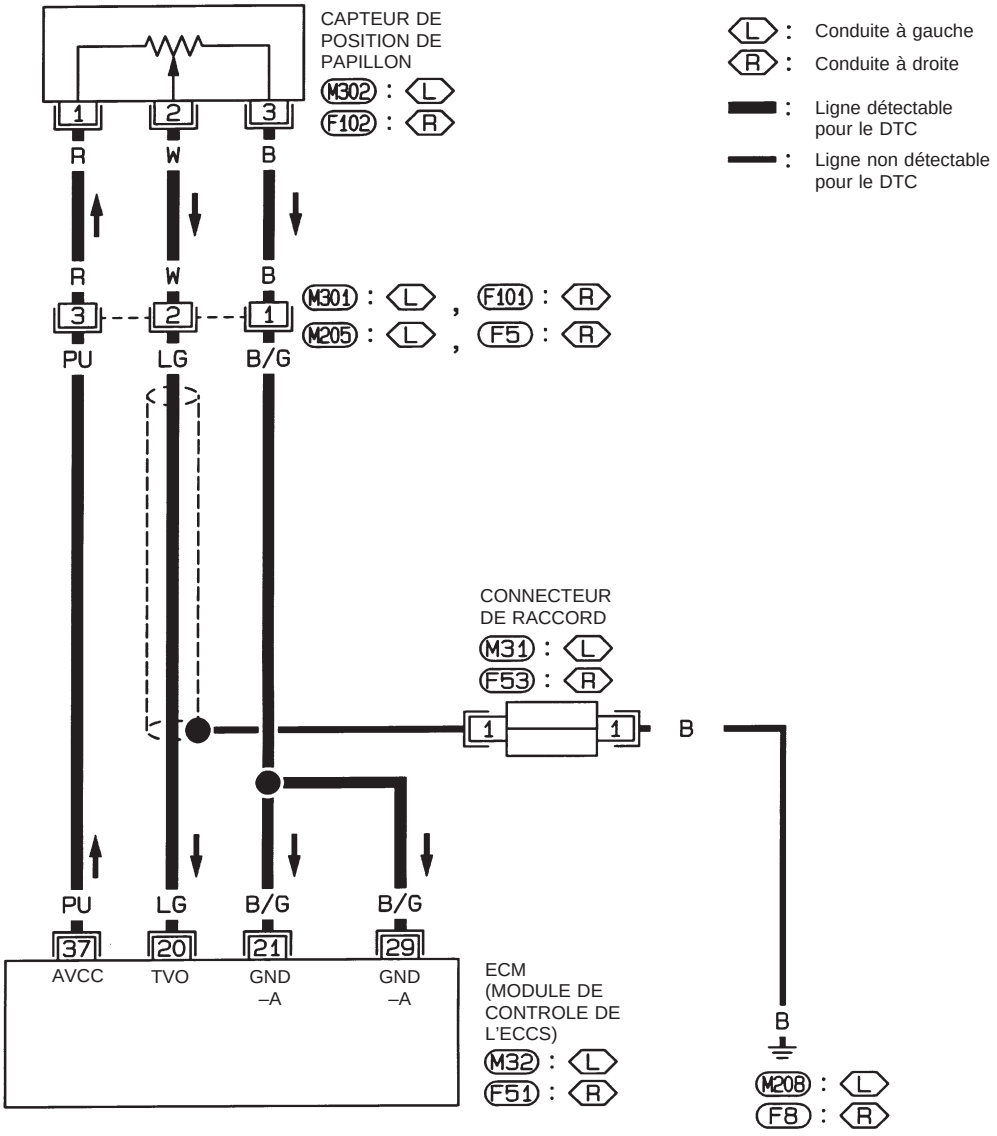
* : Lorsque ce défaut est détecté, l'ECM passe en mode de sécurité.

Condition de fonctionnement du moteur en mode de sécurité	Condition	Condition de conduite
La position du papillon sera déterminée sur la base du débitmètre d'air et du régime moteur. Par conséquent l'accélération sera mauvaise.	Moteur au ralenti	Normal
	Lors de l'accélération	Mauvaise accélération

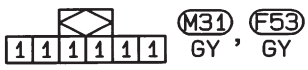
VERIFICATION DU FONCTIONNEMENT GENERAL

Utiliser cette procédure pour vérifier le fonctionnement général du circuit du capteur de position de papillon. Pendant ce contrôle, il se peut que le DTC ne soit pas confirmé.

1) Démarrer le moteur et le laisser chauffer suffisamment.
2) Mettre le contact d'allumage sur "OFF" et attendre 5 secondes au moins.
3) Mettre le contact d'allumage sur "ON".
4) Sélectionner "CAP PAPILLON" en mode "CONTROLE DE DONNEES" avec CONSULT.
5) Lire le signal "CAP PAPILLON" et vérifier les points suivants :
   - Quand la pédale d'accélérateur est en position repos, la tension est d'environ 0,35 - 0,65 V.
   - Quand la pédale d'accélérateur est enfoncée à fond, la tension est d'environ 4V.



OU



1) Démarrer le moteur et le laisser s'échauffer suffisamment.
2) Mettre le contact d'allumage sur "OFF" et attendre 5 secondes au moins.
3) Mettre le contact d'allumage sur "ON".
4) Vérifier la tension entre les bornes ⑳ et ㊴ (masse) de l'ECM et vérifier les points suivants :
   - Quand la pédale d'accélérateur est en position repos, la tension est d'environ 0,35 - 0,65 V.
   - Quand la pédale d'accélérateur est enfoncée à fond, la tension est d'environ 4V.

PROCEDURE DE DIAGNOSTIC

DEBUT DE L'INSPECTION

↓

REGLER LE CAPTEUR DE POSITION DE PAPILLON.
Effectuer une INSPECTION DE BASE, EC-60.

↓ Bon

VERIFIER LE CIRCUIT PROTECTEUR.
1. Mettre le contact d'allumage sur "OFF".
2. Desserrer et resserrer les vis de masse du moteur (M208 et F8).
3. Déposer le connecteur de raccord M31 ou F53.
4. Vérifier les points suivants.
   - Continuité entre la borne ① du connecteur de raccord et la masse
   - Connecteur de raccord (Consulter la "DISPOSITION DES FAISCEAUX" à la section EL).

   Il doit y avoir continuité.

   Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité à la masse ou à l'alimentation. Puis rebrancher le connecteur de raccord.

Mauvais → Réparer le circuit ouvert, court-circuité à la masse ou court-circuité à l'alimentation dans le faisceau ou les connecteurs.

↓ Bon

A

VERIFIER L'ALIMENTATION ELECTRIQUE.
1. Débrancher le connecteur de faisceau du capteur de position de papillon.
2. Mettre le contact d'allumage sur "ON".
3. Vérifier la tension entre la borne ① et la masse avec le CONSULT ou un testeur.

   Tension : environ 5V

Mauvais → Vérifier les points suivants.
- Connecteurs de faisceau M205, M301 (conduite à gauche) F5, F101 (conduite à droite)
- Faisceau ouvert ou court-circuité entre le capteur de position de papillon et l'ECM

Si le résultat est mauvais, réparer le faisceau ou les connecteurs.

↓ Bon

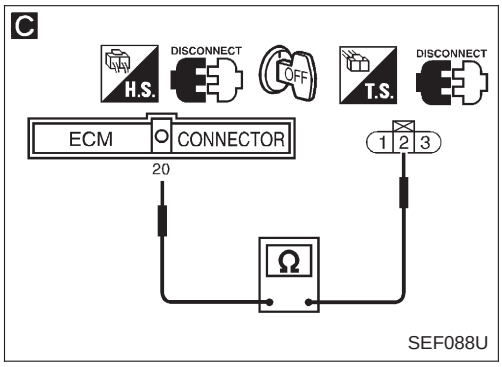
B

VERIFIER LE CIRCUIT DE MISE A LA MASSE.
1. Mettre le contact d'allumage sur "OFF".
2. Vérifier la continuité du faisceau entre la borne ③ et la masse de moteur.

   Il doit y avoir continuité.

   Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité à la masse ou à l'alimentation.

Mauvais → Vérifier les points suivants.
- Connecteurs de faisceau M205, M301 (conduite à gauche) F5, F101 (conduite à droite)
- Faisceau ouvert ou court-circuité entre le capteur de position de papillon et l'ECM



Si le résultat est mauvais, réparer le circuit ouvert, court-circuité à la masse ou court-circuité à l'alimentation du faisceau ou des connecteurs.

↓ Bon

Ⓐ

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Capteur de position de papillon (Suite)

Ⓐ

C

VERIFIER LE CIRCUIT DE SIGNAL D'ENTREE.
1. Débrancher le connecteur de faisceau de l'ECM.
2. Vérifier la continuité du faisceau entre la borne ⑳ de l'ECM et la borne ②.
   Il doit y avoir continuité.
   Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité à la masse ou à l'alimentation.

Mauvais → Vérifier les points suivants.
- Connecteurs de faisceau (M205), (M301) (conduite à gauche)
  (F5), (F101) (conduite à droite)
- Faisceau ouvert ou court-circuité entre le capteur de position de papillon et l'ECM

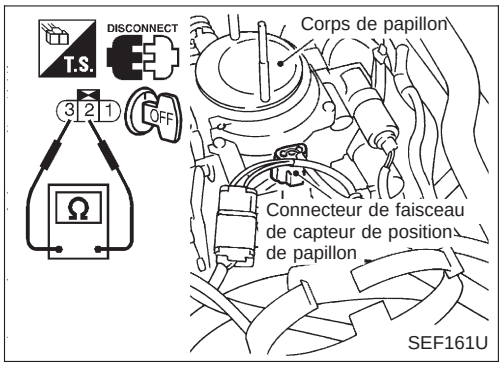
Si le résultat est mauvais, réparer le circuit ouvert, court-circuité à la masse ou court-circuité à l'alimentation du faisceau ou des connecteurs.

Bon ↓

VERIFIER LE COMPOSANT (Capteur de position de papillon). Consulter l'"INSPECTION DES COMPOSANTS" ci-dessous.

Mauvais → Remplacer le capteur de papillon. Pour le régler, effectuer une "INSPECTION DE BASE", EC-60.

Bon ↓



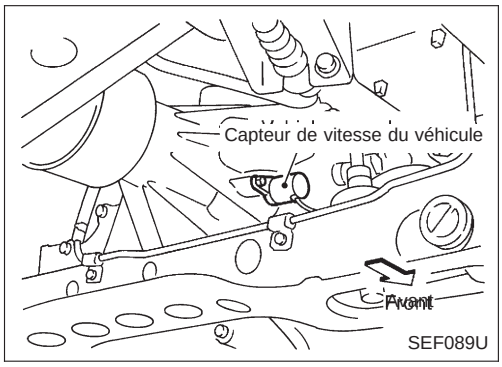
Débrancher et rebrancher sur les circuits les connecteurs de faisceau. Puis procéder à un nouvel essai.

Le problème n'est pas résolu. ↓

Vérifier si les bornes à broches de l'ECM sont endommagées et vérifier la connexion du connecteur de faisceau de l'ECM.
Rebrancher le connecteur de faisceau de l'ECM et tester à nouveau.

↓

FIN DE L'INSPECTION



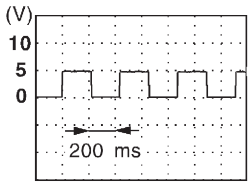
INSPECTION DES COMPOSANTS
Capteur de position de papillon

1. Démarrer le moteur et le laisser s'échauffer suffisamment.
2. Mettre le contact d'allumage sur "OFF".
3. Débrancher le connecteur de faisceau du capteur de position de papillon.
4. S'assurer que la résistance entre les bornes ② et ③ varie lorsque la vanne de papillon est ouverte manuellement.

Conditions de vanne de papillon	Résistance à 25°C
Complètement fermée	Environ 0,6 kΩ
Ouvert à demi	0,6 - 4,0 kΩ
Complètement ouverte	Environ 4 kΩ

Si le résultat est mauvais, remplacer le capteur de position de papillon.
Pour régler le capteur de position de papillon, effectuer une "INSPECTION DE BASE", EC-60.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



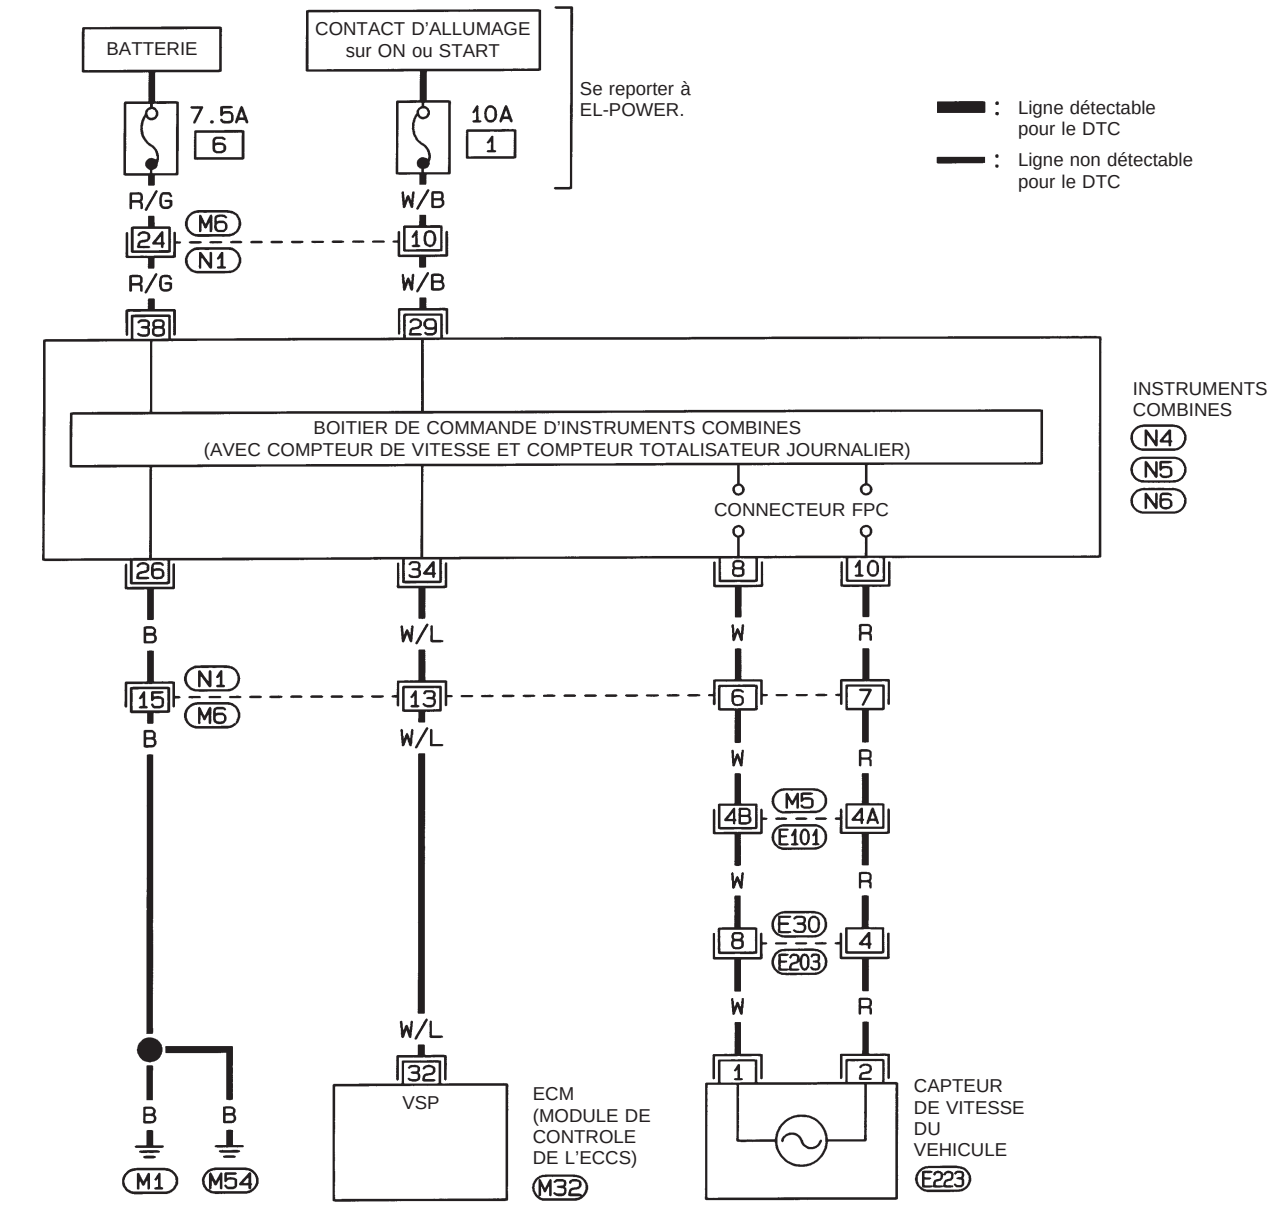
Capteur de vitesse du véhicule (VSS)

DESCRIPTION DES COMPOSANTS

Le capteur de vitesse du véhicule est monté dans la transmission. Il contient un générateur d'impulsions qui délivre le signal de vitesse du véhicule au compteur de vitesse. Le compteur de vitesse envoie alors un signal à l'ECM.

BORNES DE L'ECM ET VALEURS DE REFERENCE

Remarques : Les données de spécifications sont des valeurs de référence et sont mesurées entre chaque borne et ㊴ (masse de l'ECCS) à l'aide d'un voltmètre.



N° DE BORNE	COULEUR DE CABLE	ELEMENT	CONDITION	DONNEES (Tension du courant continu)
32	W/L	Capteur de vitesse du véhicule	Moteur en marche. └ Soulever toutes les roues à l'aide d'un cric et faire tourner le moteur au ralenti en 1ère position.	Varie de 0 à 5V  SEF068U

Capteur de vitesse du véhicule (VSS) (Suite)

PROCEDURE DE DIAGNOSTIC

DEBUT DE L'INSPECTION

A

VERIFIER LE FONCTIONNEMENT GENERAL.
1. Soulever le véhicule.
2. Démarrer le moteur.
3. Effectuer "CIRC CAP VITES VEH" en mode "TEST FONCTION" à l'aide du CONSULT.

Bon → FIN DE L'INSPECTION

OU

2. Démarrer le moteur.
3. Lire le signal "CAP VIT VEHI" en mode "CONTROLE DE DONNEES" à l'aide du CONSULT.
La vitesse du véhicule indiquée par CONSULT devrait pouvoir dépasser 10 km/h quand on fait tourner les roues avec un rapport approprié sélectionné.

OU

2. Mettre le contact d'allumage sur "ON".
3. Faire tourner la roue motrice à la main.
4. Vérifier la tension entre la borne (32) de l'ECM et la masse.
La tension devrait osciller entre environ 0 - 5V.

Mauvais

B

VERIFIER LE CIRCUIT DE SIGNAL D'ENTREE.
1. Mettre le contact d'allumage sur "OFF".
2. Débrancher le connecteur de faisceau de l'ECM et le connecteur de faisceau des instruments combinés.
3. Vérifier la continuité du faisceau entre la borne (32) de l'ECM et la borne (34).
Il doit y avoir continuité.
Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité à la masse ou à l'alimentation.

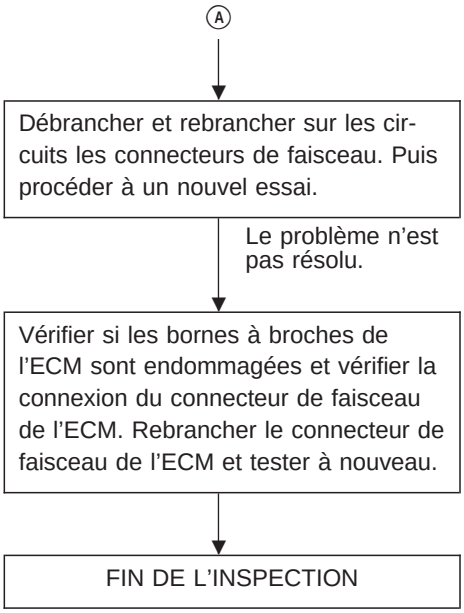
Mauvais → Vérifier les points suivants.
- Connecteurs de faisceau (F54), (M48) (conduite à droite)
- Connecteurs de faisceau (M6), (N1)
- Faisceau ouvert ou court-circuité entre l'ECM et les instruments combinés

Si le résultat est mauvais, réparer le circuit ouvert, court-circuité à la masse ou court-circuité à l'alimentation du faisceau ou des connecteurs.

Bon

VERIFIER LE FONCTIONNEMENT DU COMPTEUR DE VITESSE.
S'assurer que le compteur de vitesse fonctionne correctement.

Mauvais → Vérifier les points suivants.
- Faisceau ouvert ou court-circuité entre les instruments combinés et le capteur de vitesse du véhicule



Si le résultat est mauvais, réparer le faisceau ou les connecteurs.
- Capteur de vitesse du véhicule et son circuit (Se reporter à la section EL).

Sonde à oxygène chauffée (HO2S) – Conduite à gauche –

DESCRIPTION DES COMPOSANTS

La sonde à oxygène chauffée est placée dans le tuyau d'échappement avant. Elle détecte la quantité d'oxygène contenue dans les gaz d'échappement par comparaison avec l'air extérieur. La sonde à oxygène chauffée comporte un tube fermé fait de céramique de zirconium. Le zirconium produit une tension d'environ 1V dans des conditions de mélange plus riche à 0V dans des conditions de mélange plus pauvre. Le signal de la sonde à oxygène chauffée est adressé à l'ECM. L'ECM règle la durée d'impulsion d'injection pour obtenir le mélange idéal air/carburant. Le mélange idéal air/carburant a lieu près du changement radical de 1V à 0V.

VALEUR DE REFERENCE DE CONSULT EN MODE DE CONTROLE DE DONNEES

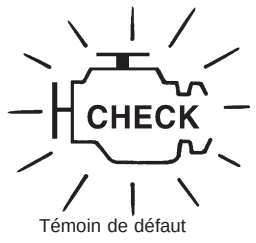
PROCEDURE DE DIAGNOSTIC



A

A

A

DEBUT DE L'INSPECTION

A

VERIFIER LE CIRCUIT DE LA SONDE A OXYGENE CHAUFFEE.

1. Démarrer le moteur et le laisser s'échauffer suffisamment.

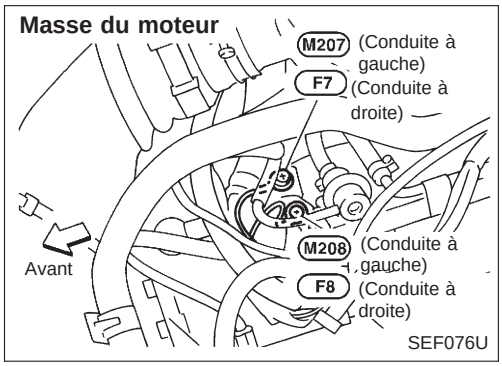
2. Effectuer ''TEST RICHESS MELAN'' en mode ''TEST FONCTION'' à l'aide du CONSULT.

OU

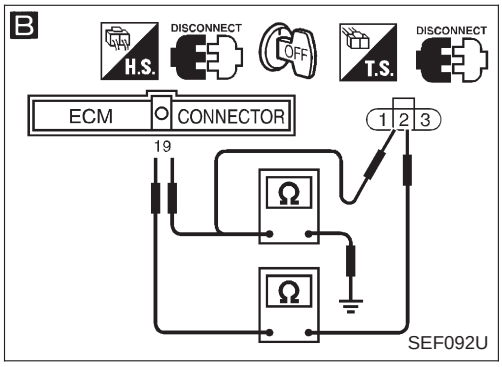
2. S'assurer que ''CON F/C MEL'' en mode ''CONTROLE DE DONNEES'' indique ''RICH'' et ''PAUV'' alternativement et plus de 5 fois en 10 secondes, à 2 000 tr/mn.

OU

2. Arrêter le moteur et régler le mode de diagnostic II de l'ECM (contrôle de la sonde à oxygène chauffée).
3. Redémarrer le moteur et le faire tourner à environ 2 000 tr/mn pendant environ 2 minutes à vide.
4. Maintenir le régime du moteur à 2 000 tr/mn et s'assurer que le témoin de défaut situé sur le tableau de bord clignote plus de 5 fois en 10 secondes.



Bon → FIN DE L'INSPECTION



Mauvais

Ⓐ

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Sonde à oxygène chauffée (HO2S) – Conduite à gauche – (Suite)

Ⓐ

VERIFIER LE CIRCUIT PROTECTEUR.
1. Mettre le contact d'allumage sur "OFF".
2. Desserrer et resserrer les vis de masse du moteur (M208 et F8).
3. Déposer le connecteur de raccord M31.
4. Vérifier les points suivants.
   - Continuité entre la borne ① du connecteur de raccord et la masse
   - Connecteur de raccord (Consulter la "DISPOSITION DES FAISCEAUX" à la section EL).

   Il doit y avoir continuité.

   Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité à la masse ou à l'alimentation. Puis rebrancher le connecteur de raccord.

Mauvais → Réparer le circuit ouvert, court-circuité à la masse ou court-circuité à l'alimentation dans un faisceau ou des connecteurs.

Bon ↓

B

VERIFIER LE CIRCUIT DE SIGNAL D'ENTREE.
1. Mettre le contact d'allumage sur "OFF".
2. Débrancher le connecteur de faisceau de la sonde à oxygène chauffée et le connecteur de faisceau de l'ECM.
3. Vérifier la continuité du faisceau entre la borne ⑲ de l'ECM et la borne ② .

   Il doit y avoir continuité.
4. Vérifier la continuité du faisceau entre la borne ⑲ de l'ECM (ou la borne ②) et la masse.

   Il ne doit pas y avoir continuité.

   Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité à la masse ou à l'alimentation.

Mauvais → Réparer le circuit ouvert, court-circuité à la masse ou court-circuité à l'alimentation dans le faisceau ou les connecteurs.

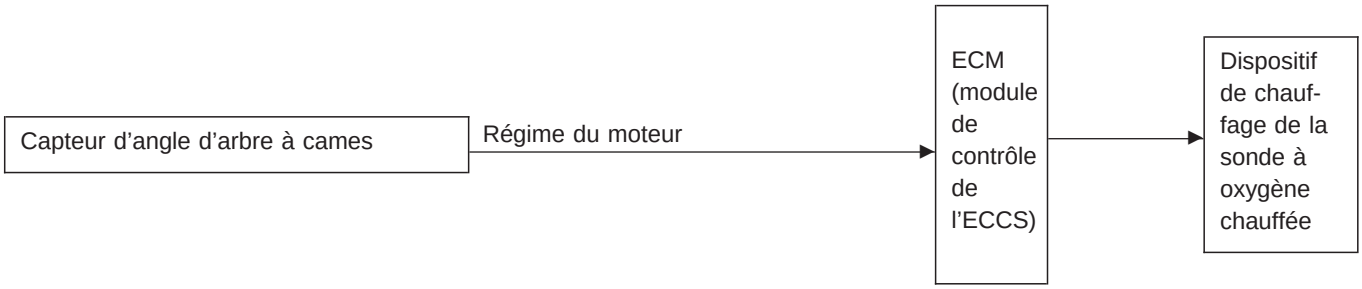
Bon ↓

Débrancher et rebrancher sur les circuits les connecteurs de faisceau. Puis procéder à un nouvel essai.

Le problème n'est pas résolu. ↓

Vérifier si les bornes à broches de l'ECM sont endommagées et vérifier la connexion du connecteur de faisceau de l'ECM. Rebrancher le connecteur de faisceau de l'ECM et tester à nouveau.

Mauvais → Remplacer la sonde à oxygène chauffée.



Bon ↓

INSPECTION DES COMPOSANTS

Dispositif de chauffage de la sonde à oxygène chauffée

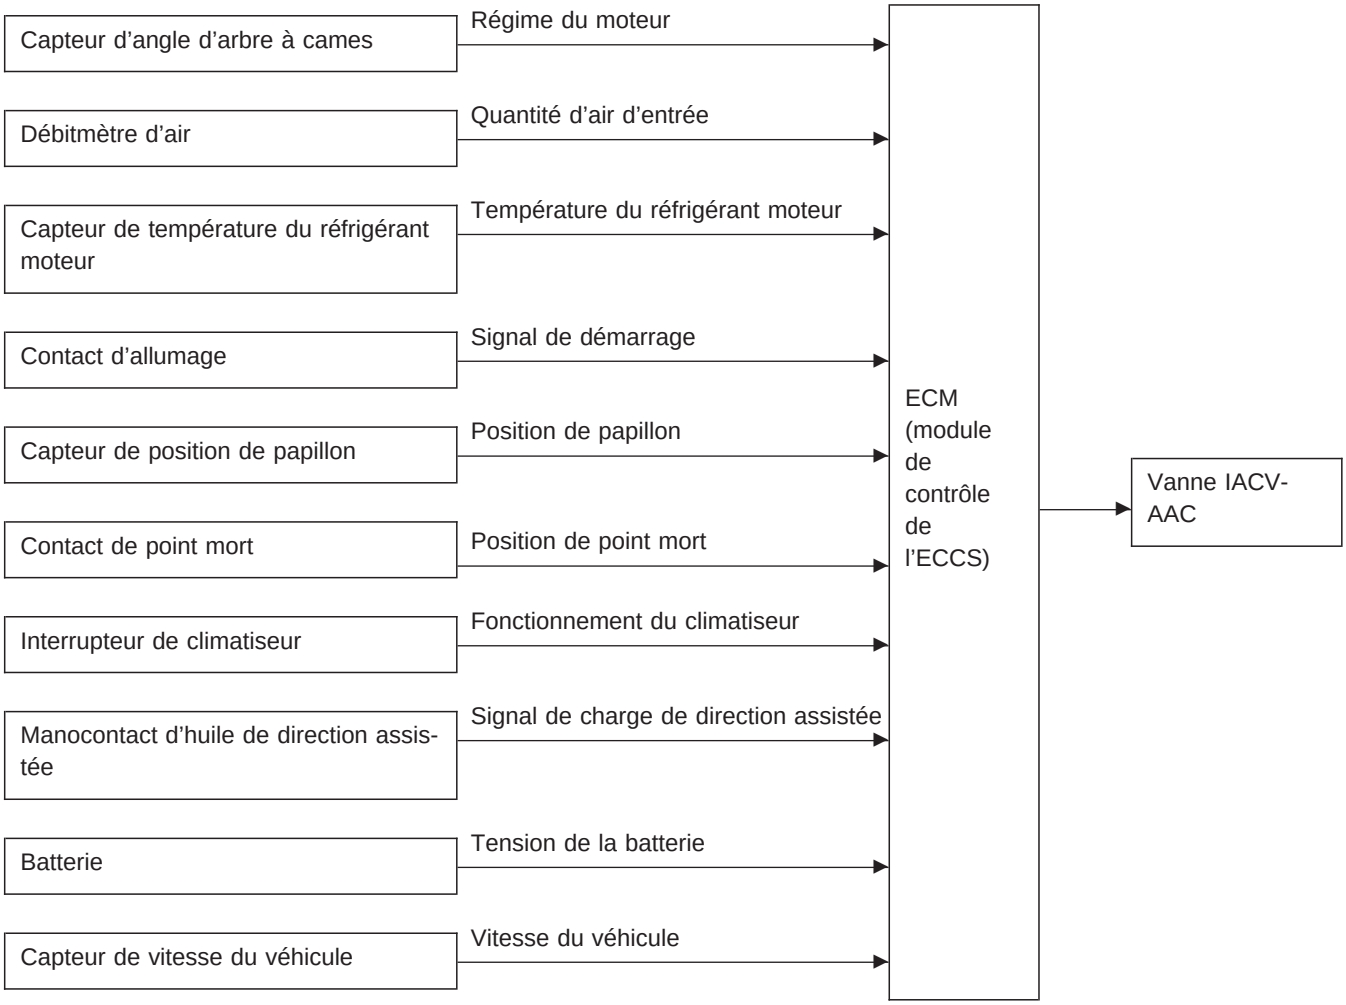
Vérifier la résistance entre les bornes ③ et ①.

Résistance : 2,3 - 4,3Ω à 25°C

Vérifier la continuité entre les bornes ② et ①, ③ et ②.

Il ne doit pas y avoir continuité.

Si le résultat est mauvais, remplacer la sonde à oxygène chauffée.

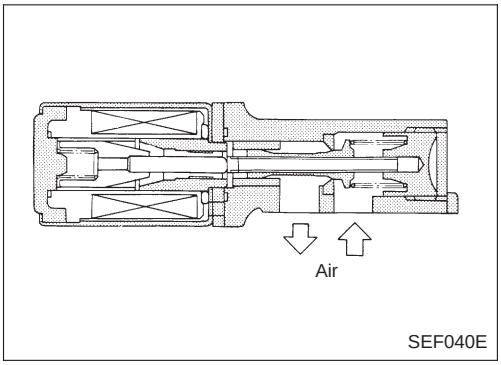


ATTENTION :

Jeter toute sonde à oxygène chauffée tombée d'une hauteur supérieure à 0,5 m sur une surface dure tel qu'un plancher en béton, et la remplacer par une sonde neuve.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Vanne de commande d'air de ralenti (IACV) – Vanne de commande d'air auxiliaire (AAC)



DESCRIPTION DU SYSTEME

Ce système assure la régulation automatique du ralenti moteur à un régime spécifié. Le régime de ralenti est contrôlé par un réglage précis de la quantité d'air qui est admise directement par la vanne IACV-AAC, sans passer par le papillon. La vanne IACV-AAC s'ouvre et se ferme successivement en fonction du signal transmis par l'ECM. Le capteur d'angle d'arbre à cames détecte la vitesse réelle du moteur et envoie un signal à l'ECM. L'ECM commande alors la durée de MARCHE/ARRET de la vanne IACV-AAC de manière à ce que le régime de moteur corresponde à la valeur cible mémorisée dans l'ECM. Le régime moteur cible est le régime le plus bas auquel le moteur peut tourner de façon stable. La valeur optimum conservée dans la mémoire de l'ECM est déterminée en prenant en considération les diverses conditions du moteur telles que : la durée de réchauffement du moteur, la décélération et la charge du moteur (fonctionnement du climatiseur ou de la direction assistée).

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Vanne de commande d'air de ralenti (IACV) – Vanne de commande d'air auxiliaire (AAC) (Suite)

DESCRIPTION DES COMPOSANTS

Vanne IACV-AAC

La vanne IACV-AAC se déplace en fonction des impulsions de MARCHE/ARRET adressées par l'ECM. Plus l'impulsion ''MARCHE'' est longue et plus la quantité d'air qui passe à travers la vanne sera grande. Plus la quantité d'air qui passe à travers la vanne est grande et plus le régime du moteur est élevé.

Contact de point mort (Suite)

PROCEDURE DE DIAGNOSTIC

DEBUT DE L'INSPECTION

A

VERIFIER LE FONCTIONNEMENT GENERAL.

1. Mettre le contact d'allumage sur "ON".
2. Effectuer "CIRC CON NEUTRE" en mode "TEST FONCTION" à l'aide du CONSULT.

OU

2. Sélectionner "CON NEUTRE" en mode "CONTROLE DE DONNEES" avec CONSULT.
3. Vérifier le signal "CON NEUTRE" dans les conditions suivantes.
   Point mort : MARCHE
   Position autre que ci-dessus : ARRET

OU

2. Vérifier la tension entre la borne (35) de l'ECM et la masse à l'aide du CONSULT ou d'un testeur dans les conditions suivantes.
   Tension :
   Position de point mort
   Environ 0V
   Position autre que ci-dessus
   Environ 5V

Bon → FIN DE L'INSPECTION

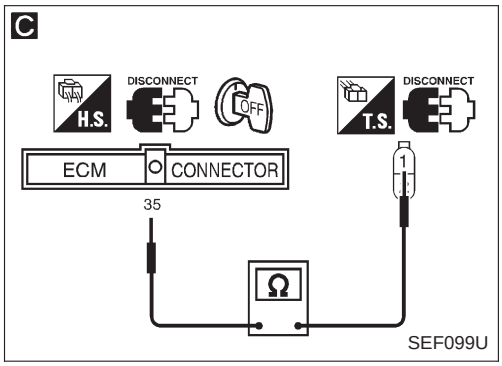
Mauvais

B

VERIFIER LE CIRCUIT DE MISE A LA MASSE.

1. Débrancher le connecteur de faisceau du contact de position de point mort.
2. Vérifier la continuité du faisceau entre la borne (2) et la masse de carrosserie.
   Il doit y avoir continuité.
   Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité à la masse ou à l'alimentation.

Mauvais → Vérifier les points suivants.
- Connecteurs de faisceau (E204), (E29)
- Faisceau ouvert ou court-circuité entre le capteur de position de point mort et la masse de carrosserie



Si le résultat est mauvais, réparer le circuit ouvert, court-circuité à la masse ou court-circuité à l'alimentation du faisceau ou des connecteurs.

Bon → (A)

Contact de point mort (Suite)

C

Ⓐ

C

VERIFIER LE CIRCUIT DE SIGNAL D'ENTREE.
1. Débrancher le connecteur de faisceau de l'ECM.
2. Vérifier la continuité du faisceau entre la borne (35) de l'ECM et la borne (1).
   Il doit y avoir continuité.
   Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité à la masse ou à l'alimentation.

Mauvais →
Vérifier les points suivants.
- Connecteurs de faisceau (E205), (E33)
- Connecteurs de faisceau (E101), (M5)
- Connecteurs de faisceau (M48), (F54) (conduite à droite)
- Faisceau ouvert ou court-circuité entre l'ECM et le contact de position de point mort

Si le résultat est mauvais, réparer le circuit ouvert, court-circuité à la masse ou court-circuité à l'alimentation du faisceau ou des connecteurs.

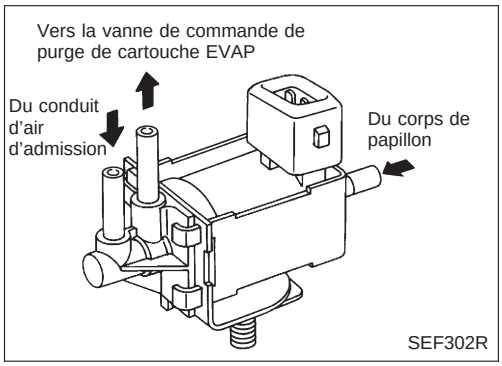
Bon ↓

VERIFIER LE COMPOSANT (Contact de point mort).
Se reporter à la section MT.

Mauvais → Remplacer le contact de position de point mort.

Bon ↓

Débrancher et rebrancher sur les circuits les connecteurs de faisceau. Puis procéder à un nouvel essai.



Le problème n'est pas résolu. ↓

Vérifier si les bornes à broches de l'ECM sont endommagées et vérifier la connexion du connecteur de faisceau de l'ECM. Rebrancher le connecteur de faisceau de l'ECM et tester à nouveau.

↓

FIN DE L'INSPECTION

Electrovanne de commande de purge de cartouche EVAP

DESCRIPTION DES COMPOSANTS

Electrovanne de commande de purge de cartouche EVAP

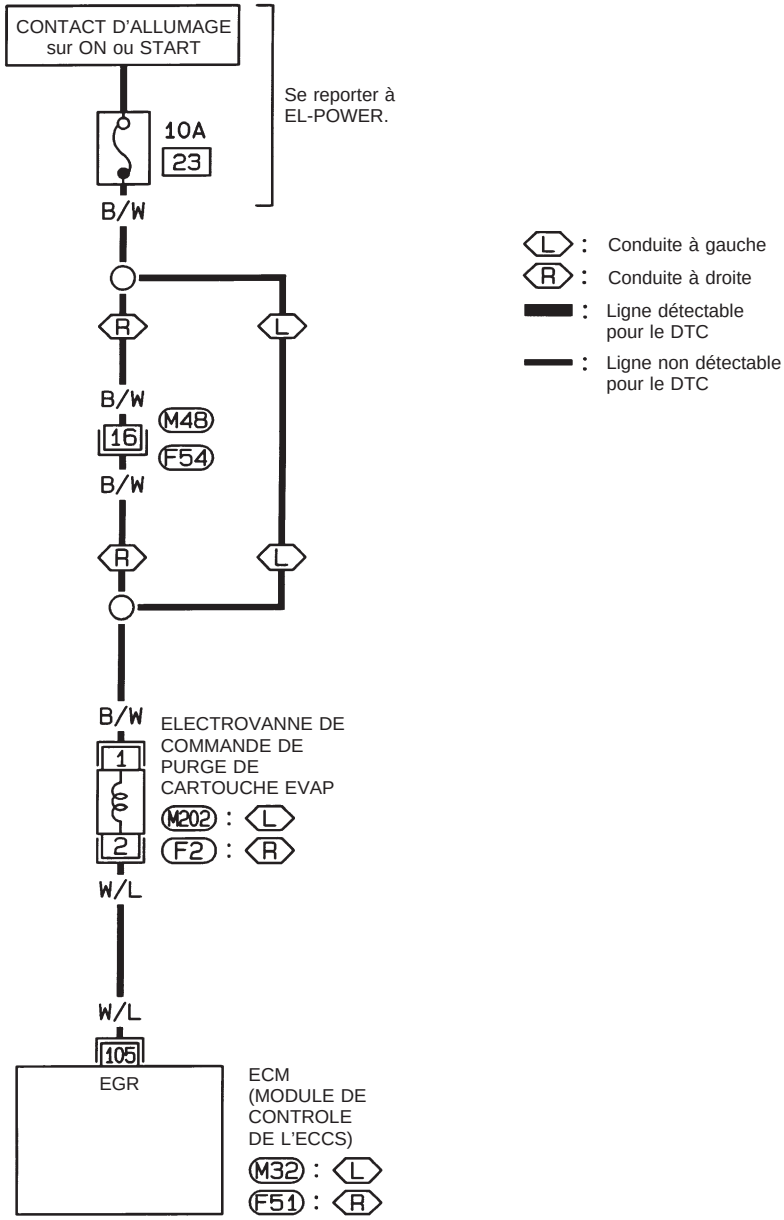
L'électrovanne de commande de purge de cartouche EVAP répond aux signaux de l'ECM. Lorsque l'ECM transmet un signal ARRET, le signal de dépression (du corps de papillon à la vanne de commande de purge de cartouche EVAP) passe par l'électrovanne de commande de purge de cartouche EVAP. Le signal atteint alors la vanne de commande de purge de cartouche EVAP.
Lorsque l'ECM transmet un signal MARCHE (masse), le signal de dépression est coupé.

VALEUR DE REFERENCE DE CONSULT EN MODE DE CONTROLE DE DONNEES

Remarques : les données de spécification sont des valeurs de référence.

ELEMENT DE CONTROLE	CONDITION		SPECIFICATION
EV COM EGR	● Moteur : après échauffement ● Interrupteur de climatiseur : à l'arrêt ● Levier de passage : point mort ● A vide	Ralenti	ARRET
		Supérieur à 3 800 tr/mn	MARCHE

BORNES DE L'ECM ET VALEURS DE REFERENCE



Remarques : Les données de spécifications sont des valeurs de référence et sont mesurées entre chaque borne et ㊴ (masse de l'ECCS) à l'aide d'un voltmètre.

N° DE BORNE	COULEUR DE CABLE	ELEMENT	CONDITION	DONNEES (Tension du courant continu)
105	W/L	Electrovanne de commande de purge de cartouche EVAP	Moteur en marche. (Condition d'échauffement) └ Régime de ralenti	TENSION DE LA BATTERIE (11 - 14V)
			Moteur en marche. (Condition d'échauffement) └ Régime moteur supérieur à 3 800 tr/mn.	Environ 1V

Electrovanne de commande de purge de cartouche EVAP (Suite)

PROCEDURE DE DIAGNOSTIC

DEBUT DE L'INSPECTION

VERIFIER LE FONCTIONNEMENT GENERAL.
1. Effectuer ''Mode II de test de diagnostic'' (résultats de l'autodiagnostic).
   S'assurer que le code de diagnostic n° 55 est affiché.
2. Démarrer le moteur et le laisser s'échauffer suffisamment.
3. Débrancher le flexible à dépression de la cartouche EVAP.
4. S'assurer qu'il y a une dépression dans les conditions suivantes :
   Emballer le moteur à moins de 3 800 tr/mn :
   Il doit y avoir une dépression.
   Au dessus de 3 800 tr/mn :
   Il ne doit pas y avoir de dépression.

Bon → VERIFIER LE COMPOSANT (cartouche EVAP). Consulter ''CARTOUCHE EVAP'', EC-19. Si le résultat est mauvais, remplacer la cartouche EVAP.

Bon → FIN DE L'INSPECTION

Mauvais

VERIFIER LE FONCTIONNEMENT DE L'ELECTROVANNE.
L'électrovanne de commande de purge de cartouche EVAP émet-elle un bruit de fonctionnement lors de la VERIFICATION DU FONCTIONNEMENT GENERAL ci-dessus ?

Oui → **VERIFIER LE FLEXIBLE A DEPRESSION.** Vérifier que le flexible à dépression n'est pas bouché, fissuré ou mal connecté. Consulter ''Schéma des flexibles à dépression'', EC-12.

Non

A

VERIFIER L'ALIMENTATION ELECTRIQUE.
1. Mettre le contact d'allumage sur ''OFF''.
2. Débrancher le connecteur de faisceau de l'électrovanne de commande de purge de cartouche EVAP.
3. Mettre le contact d'allumage sur ''ON''.
4. Vérifier la tension entre la borne ① et la masse de moteur avec le CONSULT ou un testeur.
   Tension : tension de la batterie

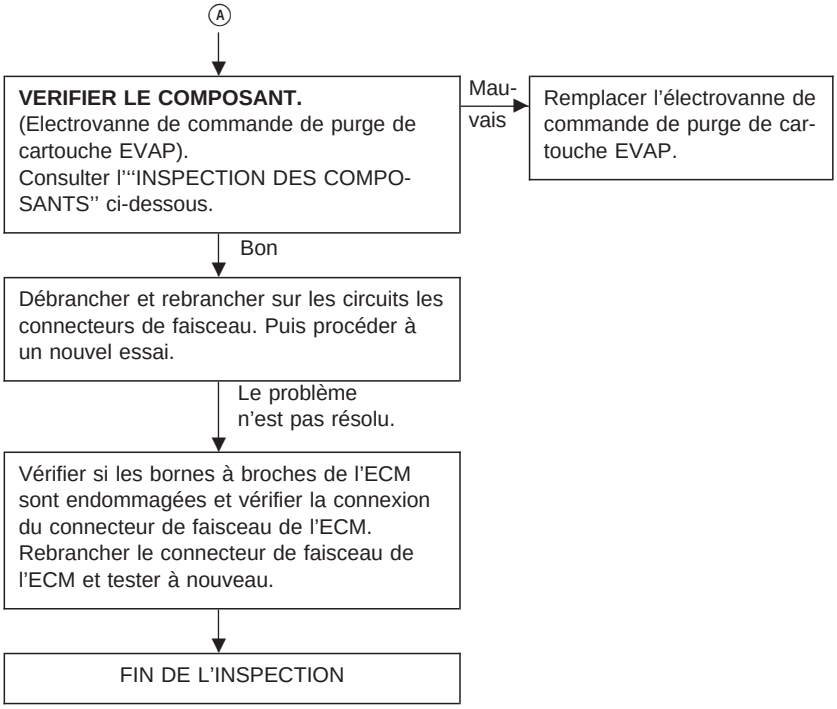
Mauvais → Vérifier les points suivants.
- Connecteurs de faisceau F54, M48 (conduite à droite)
- Fusible de 10A
- Faisceau ouvert ou court-circuité entre l'électrovanne de commande de purge de cartouche EVAP et le fusible

Si le résultat est mauvais, réparer le faisceau ou les connecteurs.

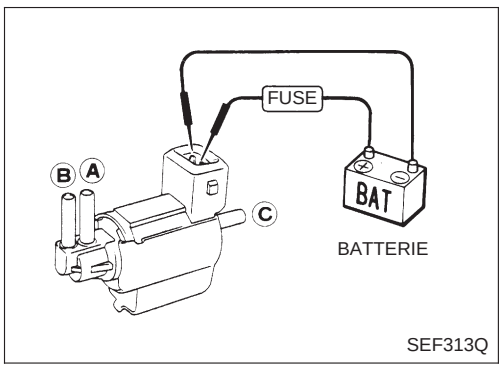
Bon

B

VERIFIER LE CIRCUIT DE SIGNAL DE SORTIE.
1. Mettre le contact d'allumage sur ''OFF''.
2. Débrancher le connecteur de faisceau de l'ECM.
3. Vérifier la continuité du faisceau entre la borne 105 de l'ECM et la borne ② .
   Il doit y avoir continuité.
   Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité à la masse ou à l'alimentation.



Mauvais → Réparer le circuit ouvert, court-circuité à la masse ou court-circuité à l'alimentation dans un faisceau ou des connecteurs.



Bon

Injecteur (Suite)

DESCRIPTION DES COMPOSANTS

L'injecteur de carburant est une électrovanne précise de petite dimension. Quand l'ECM fournit une masse au circuit d'injecteur, la bobine dans l'injecteur est alimentée en courant. La bobine alimentée tire la vanne à pointeau et permet au carburant de couler par l'injecteur dans le collecteur d'admission. La quantité de carburant injectée est déterminée par la durée de l'impulsion d'injection. La durée d'impulsion correspond au temps où l'injecteur reste ouvert. L'ECM commande la durée d'impulsion d'injection basée sur les besoins en carburant du moteur.

BORNES DE L'ECM ET VALEURS DE REFERENCE

Remarques : les données de spécifications sont des valeurs de référence et sont mesurées entre chaque borne et (39) (masse de l'ECCS) à l'aide d'un voltmètre.

SEF103U

B

SEF104U

C

SEF105U

DEBUT DE L'INSPECTION

A

VERIFIER LE FONCTIONNEMENT GENERAL.
1. Démarrer le moteur.
2. Effectuer un test de "EQUILIBR PUISSANCE" en mode "TEST ACTIF" à l'aide du CONSULT.
3. Vérifier que chaque circuit entraîne une baisse momentanée du régime du moteur.

OU

2. Vérifier le bruit du fonctionnement de chaque injecteur.
On doit entendre un cliquetis.

Bon → FIN DE L'INSPECTION

Mauvais

B

VERIFIER L'ALIMENTATION ELECTRIQUE.
1. Arrêter le moteur.
2. Débrancher le connecteur de faisceau de l'injecteur.
3. Mettre le contact d'allumage sur "ON".
4. Vérifier la tension entre la borne (2) et la masse avec le CONSULT ou un testeur.
Tension : tension de la batterie

Mauvais → Vérifier les points suivants.
- Connecteurs de faisceau (F55), (M47) (conduite à droite)
- Faisceau ouvert ou court-circuit entre l'injecteur et le contact d'allumage

Si le résultat est mauvais, réparer le faisceau ou les connecteurs.

Bon

C

VERIFIER LE CIRCUIT DE SIGNAL DE SORTIE.
1. Mettre le contact d'allumage sur "OFF".
2. Débrancher le connecteur de faisceau de l'ECM.
3. Vérifier la continuité du faisceau entre la borne (1) et les bornes (101), (103), (110), (112) de l'ECM.
Il doit y avoir continuité.
Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité à la masse ou à l'alimentation.

Mauvais → Réparer le circuit ouvert, court-circuité à la masse ou court-circuité à l'alimentation dans un faisceau ou des connecteurs.

Bon

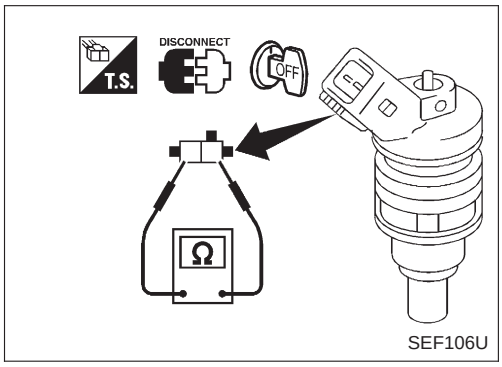
VERIFIER LE COMPOSANT (Injecteur).
Consulter l'"INSPECTION DES COMPOSANTS" à la page suivante.

Mauvais → Remplacer l'injecteur.

Bon

Débrancher et rebrancher sur les circuits les connecteurs de faisceau. Puis procéder à un nouvel essai.

Le problème n'est pas résolu.



Vérifier si les bornes à broches de l'ECM sont endommagées et vérifier la connexion du connecteur de faisceau de l'ECM. Rebrancher le connecteur de faisceau de l'ECM et tester à nouveau.

FIN DE L'INSPECTION

VERIFIER LE CIRCUIT DE SIGNAL D'ENTREE.

1. Mettre le contact d'allumage sur "OFF".
2. Débrancher le connecteur de faisceau de l'ECM et le fusible de 7,5A.
3. Vérifier la continuité du faisceau entre la borne (34) de l'ECM et le boîtier à fusibles.
   Il doit y avoir continuité.
   Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité à la masse ou à l'alimentation.

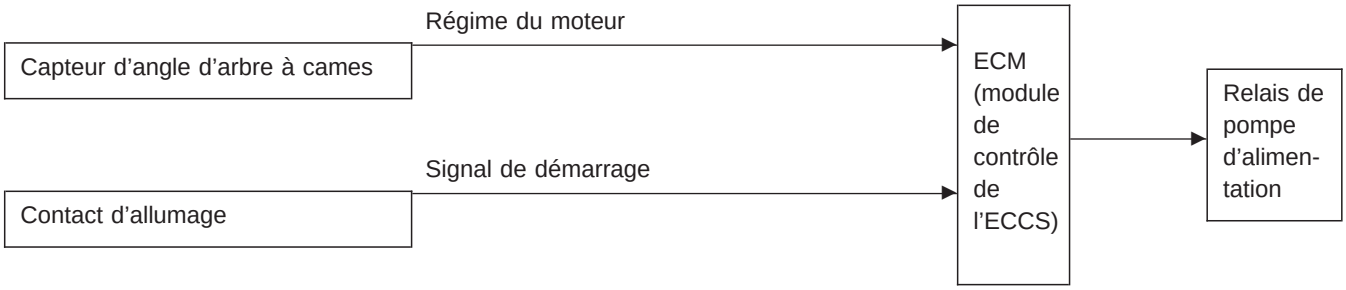
Mauvais → Vérifier les points suivants.
- Connecteurs de faisceau (F54), (M48) (conduite à droite)
- Faisceau ouvert ou court-circuité entre l'ECM et le boîtier à fusibles

Si le résultat est mauvais, réparer le circuit ouvert, court-circuité à la masse ou court-circuité à l'alimentation du faisceau ou des connecteurs.

Bon

Débrancher et rebrancher sur les circuits les connecteurs de faisceau. Puis procéder à un nouvel essai.

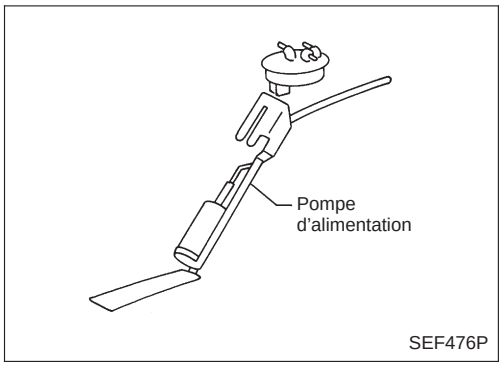
Le problème n'est pas résolu.



Vérifier si les bornes à broches de l'ECM sont endommagées et vérifier la connexion du connecteur de faisceau de l'ECM. Rebrancher le connecteur de faisceau de l'ECM et tester à nouveau.

FIN DE L'INSPECTION

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Pompe d'alimentation

DESCRIPTION DU SYSTEME

L'ECM actionne la pompe d'alimentation pendant plusieurs secondes après que le contact d'allumage a été établi afin d'améliorer l'aptitude au démarrage du moteur. Si l'ECM reçoit un signal 180° du capteur d'angle d'arbre à cames, il sait que le moteur tourne et commande la mise en marche de la pompe. Si le signal 180° n'est pas reçu lorsque le contact d'allumage est mis, le moteur cale. L'ECM arrête la pompe et empêche la batterie de se décharger, renforçant ainsi la sécurité. L'ECM n'entraîne pas directement la pompe d'alimentation. Il commande l'état de MARCHE/ARRET du relais de la pompe d'alimentation, qui à son tour commande la pompe d'alimentation.

Condition	Fonctionnement de la pompe d'alimentation
Le contact d'allumage est mis sur ''ON''	Fonctionne pendant 5 secondes.
Le moteur tourne et démarre	Fonctionne.
Le moteur est arrêté	S'arrête après 1 seconde.
Sauf comme indiqué ci-dessus.	S'arrête.

DESCRIPTION DES COMPOSANTS

La pompe d'alimentation à turbine est immergée (la pompe et la turbine sont situées dans le réservoir de carburant).

VALEUR DE REFERENCE DE CONSULT EN MODE DE CONTROLE DE DONNEES

Remarques : les données de spécification sont des valeurs de référence.

ELEMENT DE CONTROLE	CONDITION	SPECIFICATION

PROCEDURE DE DIAGNOSTIC

DEBUT DE L'INSPECTION

A

VERIFIER LE FONCTIONNEMENT GENERAL.
1. Mettre le contact d'allumage sur "ON".
2. Pincer avec les doigts le flexible d'alimentation.
   L'impulsion de la pression d'alimentation doit se faire sentir dans le flexible d'alimentation de carburant pendant 5 secondes après avoir mis le contact d'allumage sur "ON".

Bon → FIN DE L'INSPECTION

Mauvais ↓

B

VERIFIER L'ALIMENTATION ELECTRIQUE.
1. Mettre le contact d'allumage sur "OFF".
2. Débrancher le relais de pompe d'alimentation.
3. Mettre le contact d'allumage sur "ON".
4. Vérifier la tension entre les bornes ①, ③ et la masse avec le CONSULT ou un testeur.
   Tension : tension de la batterie

Mauvais → Vérifier les points suivants.
- Fusible de 15A
- Connecteurs de faisceau E101, M5
- Faisceau ouvert ou court-circuité entre le fusible et le relais de pompe d'alimentation

Si le résultat est mauvais, réparer le faisceau ou les connecteurs.

Bon ↓

C

VERIFIER LE CIRCUIT DE MISE A LA MASSE.
1. Mettre le contact d'allumage sur "OFF".
2. Débrancher le connecteur de faisceau de la pompe d'alimentation.
3. Vérifier la continuité du faisceau entre la borne ⑥ et la masse de carrosserie, la borne ⑤ de relais et la borne ⑤.
   Il doit y avoir continuité.
   Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité à la masse ou à l'alimentation.

Mauvais → Vérifier les points suivants.
- Connecteurs de faisceau C9, M121 (Conduite à gauche pour l'Europe)
- Connecteurs de faisceau E101, M5
- Faisceau ouvert ou court-circuité entre la pompe d'alimentation et la masse de carrosserie
- Faisceau ouvert ou court-circuité entre la pompe d'alimentation et le relais de pompe d'alimentation

Si le résultat est mauvais, réparer le circuit ouvert, court-circuité à la masse ou court-circuité à l'alimentation du faisceau ou des connecteurs.

Bon ↓

D

VERIFIER LE CIRCUIT DE SIGNAL DE SORTIE.
1. Débrancher le connecteur de faisceau de l'ECM.
2. Vérifier la continuité du faisceau entre la borne 104 de l'ECM et la borne ②.
   Il doit y avoir continuité.
   Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité à la masse ou à l'alimentation.

Mauvais → Vérifier les points suivants.
- Connecteurs de faisceau E101, M5
- Connecteurs de faisceau M48, F54 (conduite à droite)
- Faisceau ouvert ou court-circuit entre l'ECM et le relais de pompe d'alimentation

Si le résultat est mauvais, réparer le circuit ouvert, court-circuité à la masse ou court-circuité à l'alimentation du faisceau ou des connecteurs.

Débrancher et rebrancher sur les circuits les connecteurs de faisceau. Puis procéder à un nouvel essai.

Le problème n'est pas résolu. ↓

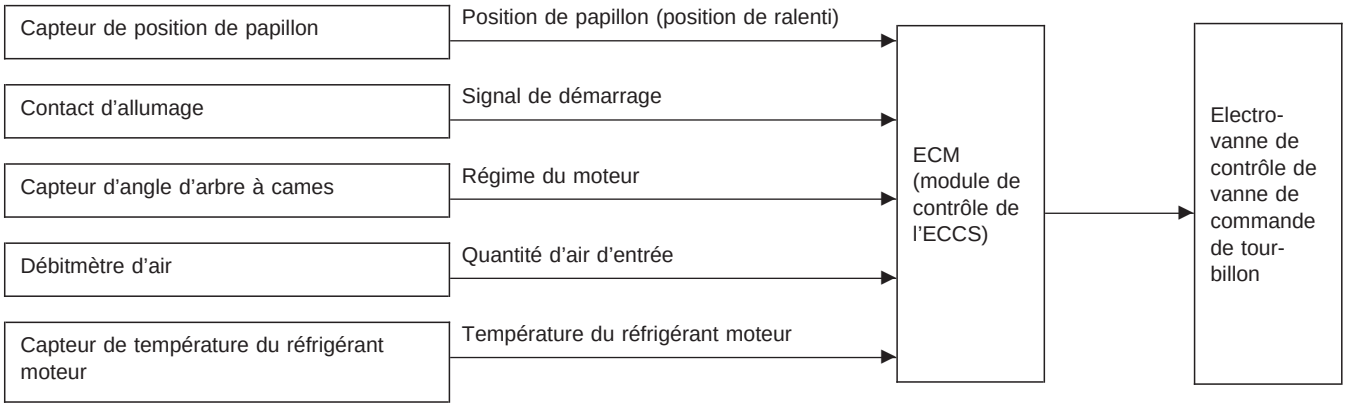
Vérifier si les bornes à broches de l'ECM sont endommagées et vérifier la connexion du connecteur de faisceau de l'ECM. Rebrancher le connecteur de faisceau de l'ECM et tester à nouveau.

FIN DE L'INSPECTION

INSPECTION DES COMPOSANTS

Manocontact d'huile de direction assistée

1. Débrancher le connecteur de faisceau du manocontact d'huile de direction assistée, puis démarrer le moteur.
2. Vérifier la continuité entre les bornes (1) et (2).



Conditions	Continuité
Le volant est braqué	Oui
Le volant n'est pas tourné	Non

Si le résultat est mauvais, remplacer le manocontact d'huile de direction assistée.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Electrovanne de contrôle de vanne de commande de tourbillon

DESCRIPTION DU SYSTEME

Ce système comporte une vanne de commande de tourbillon située dans le passage d'admission de chaque cylindre.
Au ralenti et à régime moteur bas, la vanne de commande de tourbillon se ferme. De ce fait, la vitesse de l'air dans le passage d'admission augmente, favorisant la vaporisation du carburant et produisant un tourbillon dans la chambre de combustion.
En raison de cette action, le système tend à augmenter la vitesse de combustion du mélange gazeux, à améliorer la consommation en carburant et à accroître la stabilité de la marche du moteur.
De même, dans des conditions autres que le ralenti et le régime moteur bas, ce système ouvre la vanne de commande de tourbillon. Dans ce cas, il tend à augmenter la puissance en améliorant l'efficacité de l'admission via la réduction de la résistance du flux d'admission, et du flux d'admission.
L'électrovanne contrôle l'ouverture et la fermeture de la vanne de commande de tourbillon. Cette électrovanne est actionnée par l'ECM.

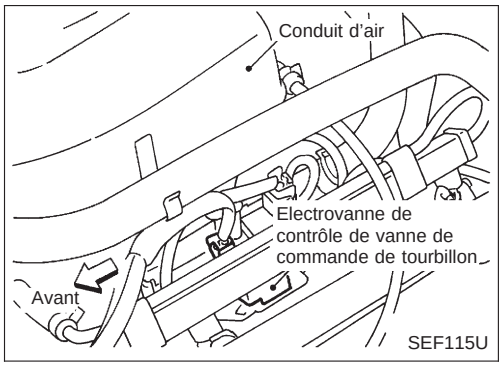
Contact de position de papillon	Régime du moteur	Electrovanne de contrôle de vanne de commande de tourbillon	Vanne de commande de tourbillon
Ralenti	Inférieur à 3 600 tr/mn	MARCHE	Fermée
Sauf au ralenti	Plus de 3 600 tr/mn	ARRET	Ouverte

Lorsque la température du réfrigérant moteur est inférieure à 0°C, la vanne de commande de tourbillon est maintenue ouverte.

VALEUR DE REFERENCE DE CONSULT EN MODE DE CONTROLE DE DONNEES

Observation : les données de spécification sont des valeurs de référence.

ELEMENT DE CONTROLE	CONDITION	SPECIFICATION
EV COM TOURBI	● Le moteur tourne à un régime inférieur à 3 600 tr/mn.	MARCHE
	● Sauf ci-dessus	ARRET



BORNES DE L'ECM ET VALEURS DE REFERENCE

Remarques : les données de spécifications sont des valeurs de référence et sont mesurées entre chaque borne et ㊴ (masse de l'ECCS) à l'aide d'un voltmètre.

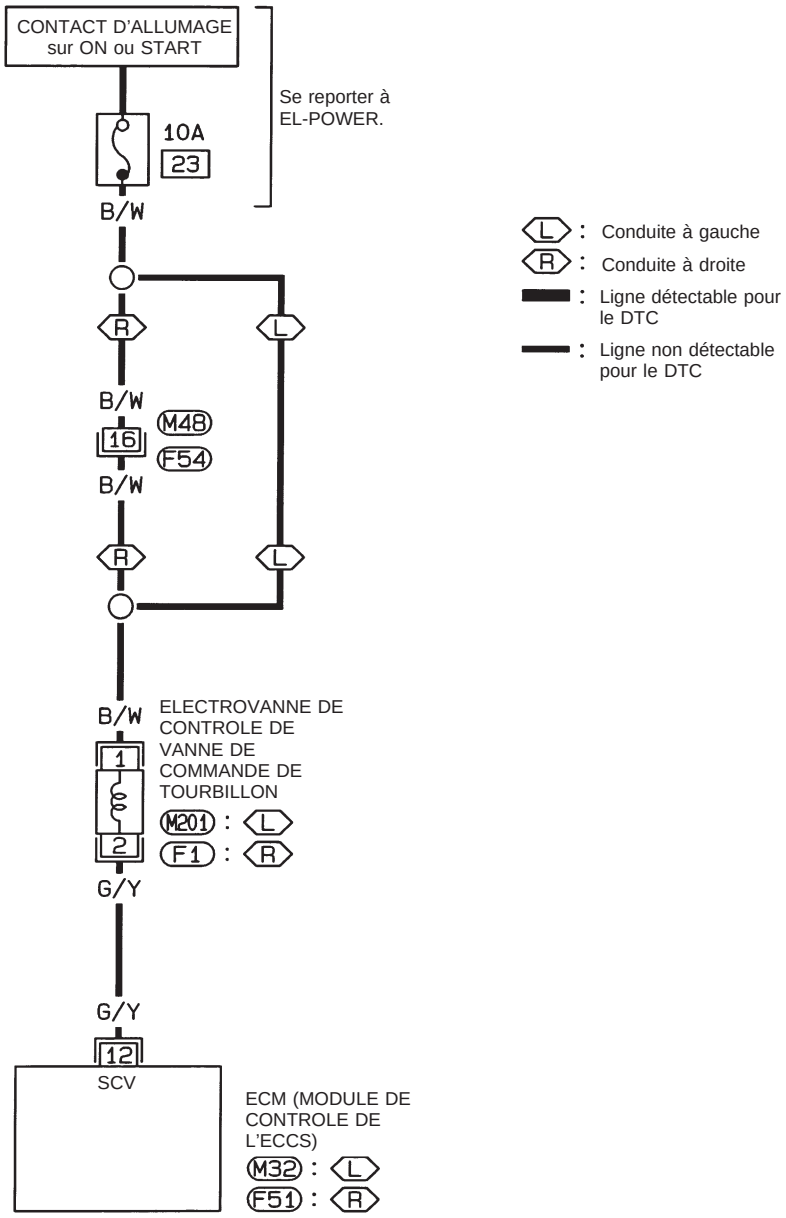
DESCRIPTION DES COMPOSANTS



Electrovanne de contrôle de vanne de commande de tourbillon

L'électrovanne de contrôle de vanne de commande de tourbillon répond au signal de l'ECM. Lorsque l'ECM transmet un signal MARCHE (masse), l'électrovanne est dérivée pour appliquer la dépression du collecteur d'admission à l'actionneur de vanne de commande de tourbillon. Ceci ferme la vanne de commande de tourbillon. Lorsque l'ECM transmet un signal ARRET, le signal de dépression est coupé et la vanne de commande de tourbillon s'ouvre.

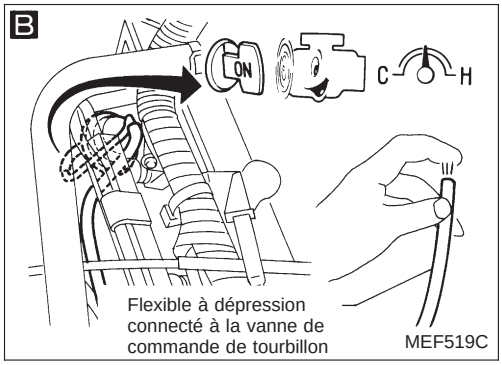
PROCEDURE DE DIAGNOSTIC



A

A

B

DEBUT DE L'INSPECTION

A

VERIFIER LE FONCTIONNEMENT GENERAL.

1. Démarrer le moteur et le laisser s'échauffer suffisamment.
2. Effectuer "EV COMM TOURBIL" en mode "TEST ACTIF" à l'aide du CONSULT.
3. Tourner l'électrovanne de contrôle de vanne de commande de tourbillon sur "MAR" et "ARR", et vérifier que l'actionneur de la vanne de commande de tourbillon fonctionne.

OU

1. Démarrer le moteur et le laisser s'échauffer suffisamment.
2. Emballer le moteur du ralenti à plus de 3 600 tr/mn, et vérifier que l'actionneur de vanne de commande de tourbillon fonctionne.

Bon → VERIFIER LE COMPOSANT (vanne de commande de tourbillon). Consulter l'"INSPECTION DES COMPOSANTS", EC-173. Si le résultat est mauvais, remplacer la vanne de commande de tourbillon.

Bon → FIN DE L'INSPECTION

Mauvais

B

VERIFIER LA PRESSION A LA VANNE DE COMMANDE DE TOURBILLON.

1. Arrêter le moteur.
2. Débrancher le flexible à dépression de la vanne de commande de tourbillon et redémarrer le moteur.
3. Vérifier s'il y a dépression dans les conditions suivantes.
   Le régime moteur est inférieur à 3 600 tr/mn :
   Il doit y avoir une dépression.
   Le régime moteur est supérieur à 3 600 tr/mn :
   Il ne doit pas y avoir de dépression.

Bon → **VERIFIER LE COMPOSANT (actionneur de vanne de commande de tourbillon).** Consulter l'"INSPECTION DES COMPOSANTS", EC-173. Si le résultat est mauvais, remplacer l'actionneur de vanne de commande de tourbillon.

Ⓐ

C

VERIFIER LE FONCTIONNEMENT DE L'ELECTROVANNE DE CONTROLE DE VANNE DE COMMANDE DE TOURBILLON.

1. Arrêter le moteur.
2. Mettre le contact d'allumage sur "ON".
3. Effectuer un test de "CIRC EV COMM TOURBIL" en mode "TEST FONCTION" à l'aide du CONSULT.

OU

2. Mettre le contact d'allumage sur "ON".
3. Effectuer "CIRC EV COMM TOURBIL" en mode "TEST ACTIF" à l'aide du CONSULT.
4. Tourner l'électrovanne de contrôle de vanne de commande de tourbillon sur "MAR" et "ARR", et vérifier son bruit de fonctionnement.

OU

2. Démarrer le moteur et le laisser s'échauffer suffisamment.
3. Vérifier la tension entre la borne ⑫ de l'ECM et la masse dans les conditions suivantes.
   Le régime moteur est inférieur à 3 600 tr/mn:
   Tension : 0 - 1V
   Le régime moteur est supérieur à 3 600 tr/mn :
   Tension : tension de la batterie

Bon → Vérifier les points suivants.
- Flexible à dépression mal raccordé
  Consulter "Schéma des flexibles à dépression", EC-12.
- Flexible à dépression bouché ou fissuré.
- Réservoir à dépression
  Consulter l'"INSPECTION DES COMPOSANTS", EC-173.
- Clapet sens unique
  Consulter l'"INSPECTION DES COMPOSANTS", EC-173.

Si le résultat est mauvais, réparer ou remplacer la(les) pièce(s) défectueuse(s).

Mauvais

D

VERIFIER L'ALIMENTATION ELECTRIQUE.

1. Mettre le contact d'allumage sur "OFF".
2. Débrancher le connecteur de faisceau de l'électrovanne de contrôle de la vanne de commande de tourbillon.
3. Mettre le contact d'allumage sur "ON".
4. Vérifier la tension entre la borne ① et la masse avec le CONSULT ou un testeur.
   Tension : tension de la batterie

Mauvais → Vérifier les points suivants.
- Connecteurs de faisceau F54, M48 (conduite à droite)
- Fusible de 10A
- Faisceau ouvert ou court-circuité entre l'électrovanne de contrôle de la vanne de commande de tourbillon et le fusible

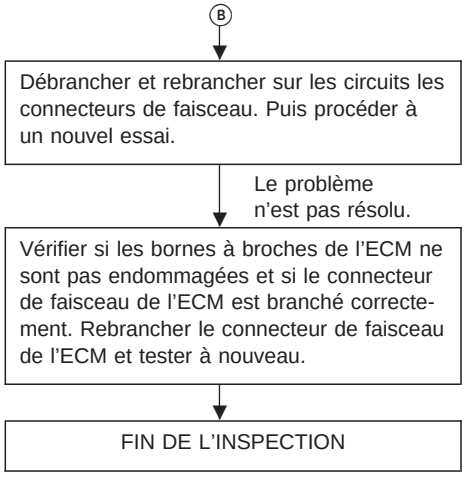
Si le résultat est mauvais, réparer le faisceau ou les connecteurs.

Bon

E

VERIFIER LE CIRCUIT DE SIGNAL D'ENTREE.

1. Mettre le contact d'allumage sur "OFF".
2. Débrancher le connecteur de faisceau de l'ECM.
3. Vérifier la continuité entre la borne ② et la borne ⑫ de l'ECM.
   Il doit y avoir continuité.
   Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité à la masse ou à l'alimentation.



Mauvais → Réparer le circuit ouvert, court-circuité à la masse ou court-circuité à l'alimentation dans un faisceau ou des connecteurs.

Bon

PROCEDURE DE DIAGNOSTIC

DEBUT DE L'INSPECTION

A

VERIFIER LE FONCTIONNEMENT GENERAL.
1. Démarrer le moteur et le laisser chauffer suffisamment.
2. Vérifier le régime de ralenti.
   800±50 tr/mn
   Si le résultat est mauvais, régler le régime de ralenti.
3. Mettre l'interrupteur de climatiseur et le commutateur de ventilateur de soufflerie sur "ON".
4. Vérifier de nouveau le régime de ralenti.
   900 tr/mn ou plus

Bon → FIN DE L'INSPECTION

Mauvais

Vérifier si le compresseur de climatiseur fonctionne normalement.

Mauvais → Se reporter à la section HA.

Bon

B

VERIFIER L'ALIMENTATION ELECTRIQUE.
1. Arrêter le moteur.
2. Débrancher le connecteur de faisceau de l'électrovanne FICD.
3. Démarrer à nouveau le moteur et tourner l'interrupteur de climatisation et le commutateur de ventilateur de soufflerie sur "ON" (MARCHE).
4. Vérifier la tension entre la borne ④ et la masse avec le CONSULT ou un testeur.
   Tension : tension de la batterie

Mauvais → Vérifier les points suivants.
- Connecteurs de faisceau (E101), (M5)
- Faisceau ouvert ou court-circuité entre l'électrovanne FICD et le relais de climatiseur

Si le résultat est mauvais, réparer le faisceau ou les connecteurs.

Bon

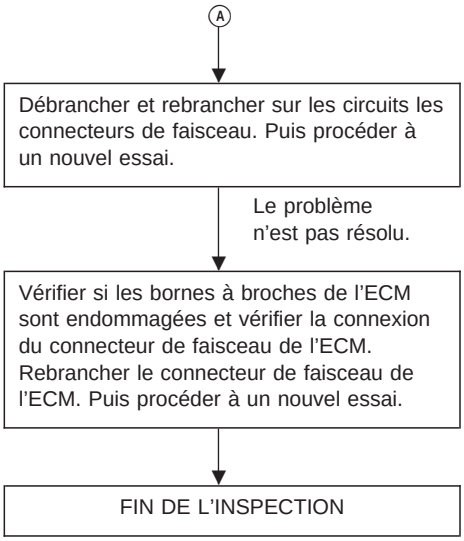
C

VERIFIER LE CIRCUIT DE MISE A LA MASSE.
1. Mettre le contact d'allumage sur "OFF".
2. Vérifier la continuité du faisceau entre la borne ② et la masse de carrosserie.
   Il doit y avoir continuité.
   Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité à la masse ou à l'alimentation.

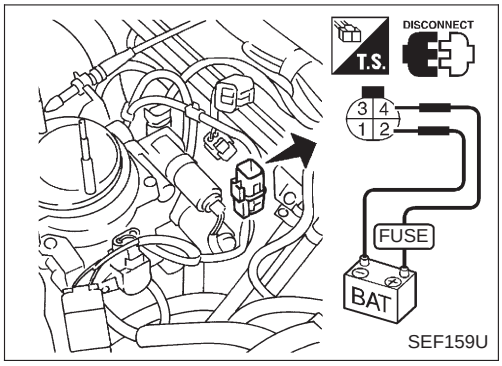
Mauvais → Réparer le circuit ouvert, court-circuité à la masse ou court-circuité à l'alimentation dans un faisceau ou des connecteurs.

Bon

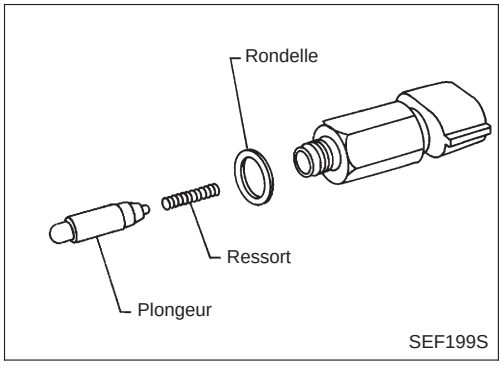
VERIFIER LE COMPOSANT (Electrovanne IACV-FICD).
Consulter l'"INSPECTION DES COMPOSANTS" à la page suivante.



Mauvais → Remplacer l'électrovanne FICD



Bon



Ⓐ

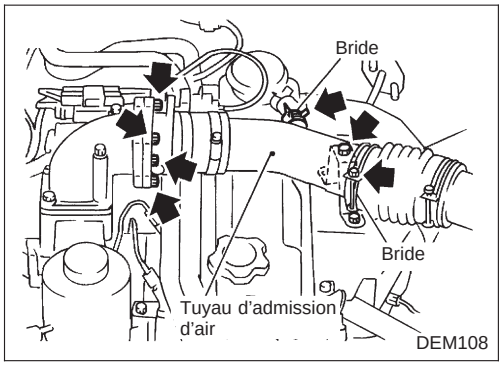
Inspection

INSPECTION DE LA LEVEE DU PLONGEUR

1. Déposer les tubes à injection.
2. Déposer le boulon de bouchon de la tête de distributeur et monter le comparateur à cadran.
3. Mesure de la levée du plongeur

(1) Tourner le vilebrequin dans le sens inverse des aiguilles d'une montre de 20 à 25° à partir de la position P.M.H. du piston n° 1.
(2) Trouver la position de repos de l'aiguille du comparateur à cadran en effectuant l'étape (1), puis ramener la jauge à ''0''.
(3) Tourner le vilebrequin dans le sens des aiguilles d'une montre, jusqu'à ce que le piston n° 1 se trouve au P.M.H.
(4) Prendre note de l'indication donnée par le comparateur à cadran.
0,71±0,05 mm
(5) S'il n'est pas compris dans la plage ci-dessus, le régler jusqu'à ce que la valeur adéquate soit obtenue.

Consulter la page EC-187.

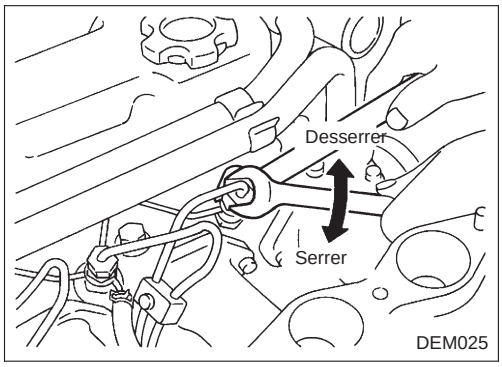


SEF852

4. Débrancher le comparateur à cadran et remonter le boulon de bouchon avec une rondelle neuve.
: 14 - 20 N·m (1,4 - 2,0 kg-m)
5. Raccorder les tuyaux d'injection.
Ecrou évasé :
: 20 - 25 N·m (2,0 - 2,5 kg-m)
6. Purger l'air du système d'alimentation.
Consulter la page EC-197.

CALIBRAGE DE POMPE A INJECTION

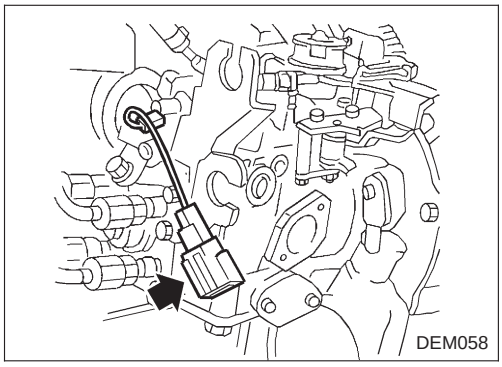
Etalonner la pompe à injection sur l'appareil d'essai.
Consulter ''Calibrage standard de la pompe à injection'' dans les SDS, EC-240.



DEM108

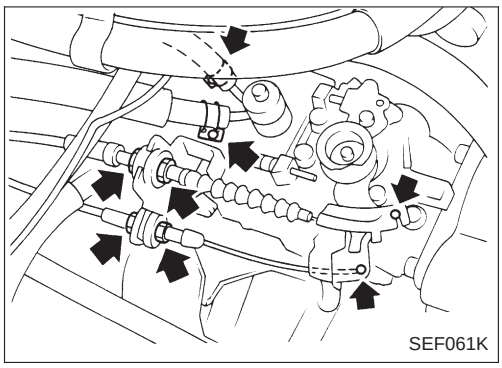
Dépose

1. Débrancher le conduit d'air et le boîtier d'admission d'air.

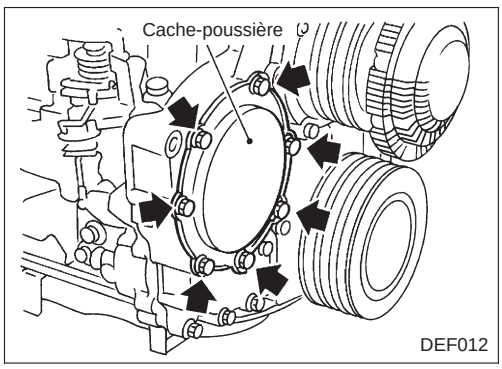


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

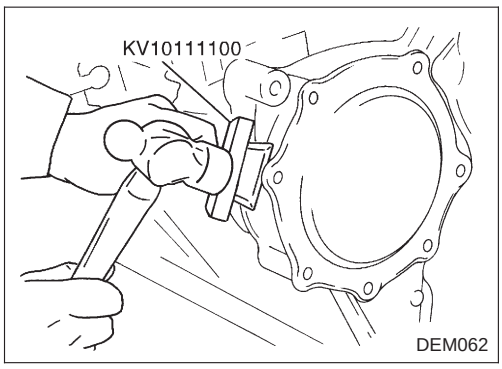
Dépose (Suite)



2. Déposer le tube à injection.



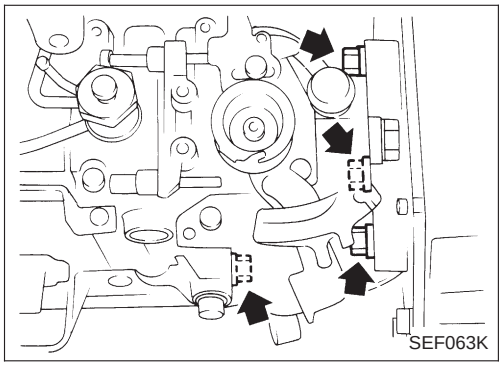
Couvrir l'ensemble d'injecteur avec un bouchon pour empêcher la poussière de pénétrer.



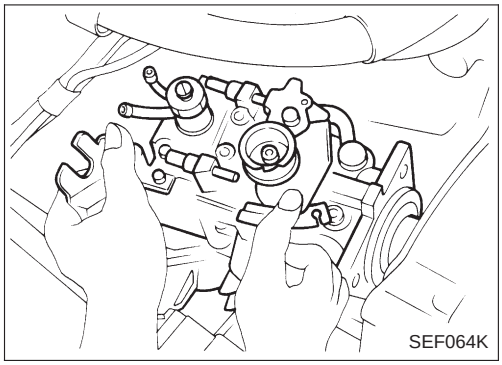
3. Mettre le contact d'allumage sur la position OFF et débrancher les connecteurs de faisceau de câble branchés sur la pompe à injection.

4. Déposer le câble d'accélérateur et débrancher le flexible de trop-plein, le flexible d'entrée de carburant et le flexible de retour de carburant.

5. Déposer le couvercle du pignon d'entraînement de la pompe à injection.



6. Desserrer l'écrou du pignon d'entraînement de la pompe à injection, puis déposer le pignon avec un extracteur.

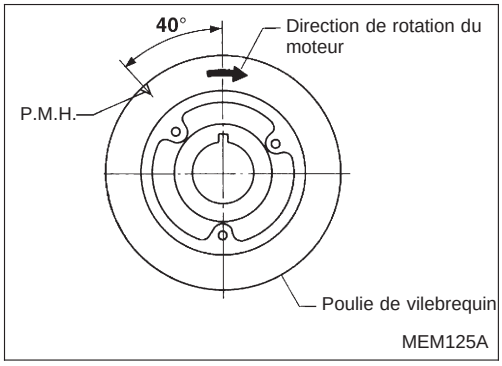


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Dépose (Suite)

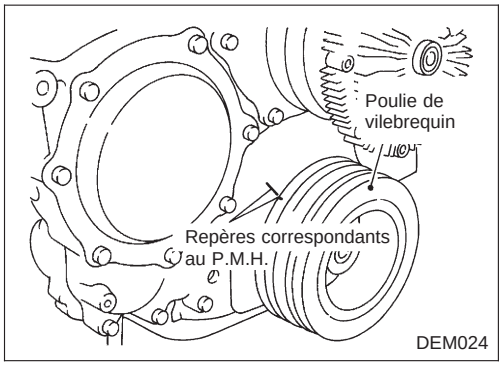
7. Déposer la pompe à dépression.
- Déposer le boulon à œil fixant le tuyau d'huile. Déposer la pompe à dépression. Veiller à ne pas plier le tuyau d'huile lors de la dépose de la pompe à dépression.

SEF063K



8. Déposer les écrous et boulons de fixation de la pompe à injection.

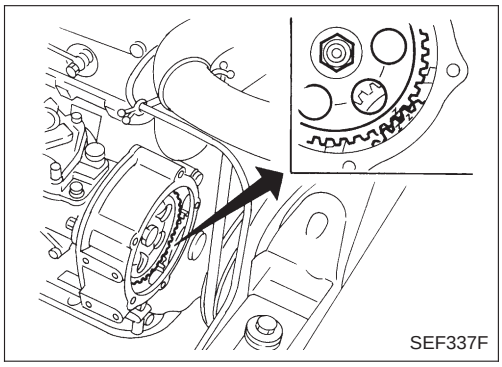
SEF064K



9. Déposer la pompe à injection avec les tubes à injection.
Débrancher le tube à injection de la pompe une fois qu'il est déposé.

Repose et réglage

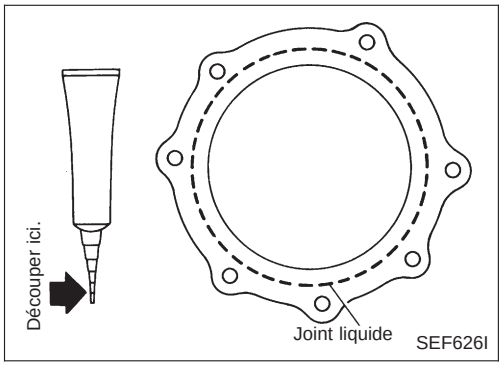
1. S'assurer que le piston n° 1 est au point mort haut (P.M.H.) dans sa course de compression.



MEM125A

DEM024

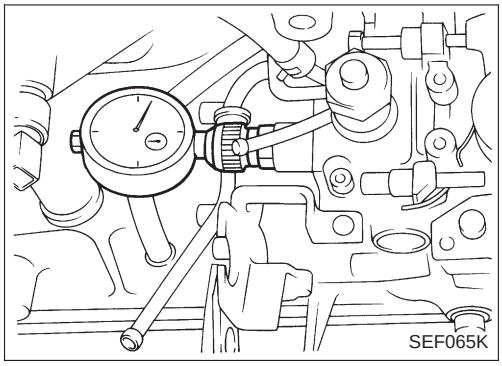
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Repose et réglage (Suite)

SEF337F

2. Monter la pompe à injection.
(1) Monter provisoirement la pompe à injection de manière à ce que le flasque de la pompe soit aligné avec la marque de repère du couvercle avant.
(2) Reposer le pignon d'entraînement d'injection sur la clavette.
: 59 - 69 N·m (6 - 7 kg-m)



Enduire la clavette de graisse pour l'empêcher de tomber dans le couvercle avant. Veiller à bien aligner les repères "Z".

(3) Reposer le couvercle du pignon d'entraînement en appliquant un cordon uniforme de joint liquide.

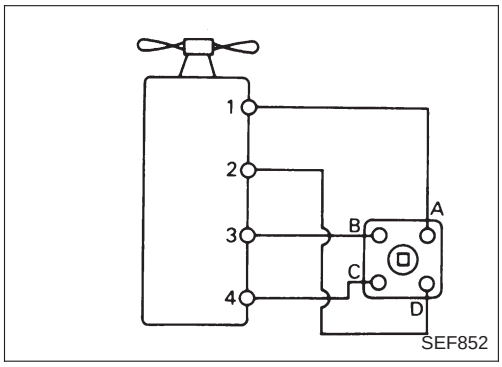
SEF626I

- **S'assurer que le joint liquide fait 2,5 à 3,5 mm de large.**
- **Fixer le couvercle du carter de distribution au carter dans les 5 minutes suivant le revêtement.**
- **Attendre pendant au moins 30 minutes avant de refaire le plein d'huile moteur.**
- **Utiliser du joint liquide d'origine ou un produit équivalent.**

SEF065K

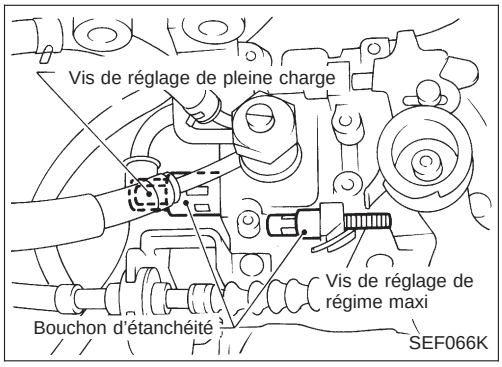
REGLAGE DE LA LEVEE DU PLONGEUR

1. Desserrer les écrous de fixation de pompe à injection et le boulon de support de montage.
2. Déposer le boulon de bouchon de la tête de distributeur et monter le comparateur.
3. Mesure et réglage de la levée du plongeur
(1) Tourner le vilebrequin dans le sens inverse des aiguilles d'une montre de 20 à 25° à partir de la position P.M.H. du piston n° 1.
(2) Trouver la position de repos de l'aiguille du comparateur en effectuant l'étape (1), puis ramener la jauge à "0".
(3) Tourner le vilebrequin dans le sens des aiguilles d'une montre, jusqu'à ce que le piston n° 1 se trouve au P.M.H.
(4) Prendre note de l'indication donnée par le comparateur.
0,71±0,02 mm
(5) Si l'indication donnée par le comparateur n'est pas dans la plage ci-dessus, tourner le corps de pompe jusqu'à ce que la valeur adéquate soit obtenue.



a. Si l'indication est inférieure à la valeur spécifiée, tourner le corps de pompe dans le sens inverse des aiguilles d'une montre.

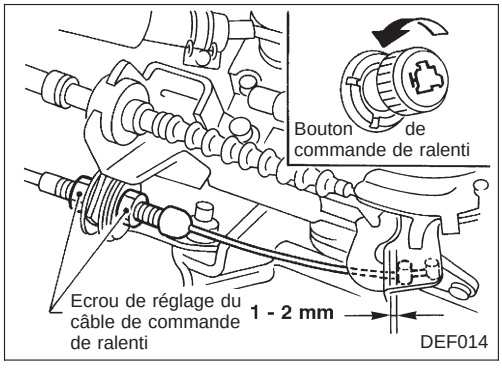
b. Si l'indication est supérieure à la valeur spécifiée, tourner le corps de pompe dans le sens des aiguilles d'une montre.



4. Serrer soigneusement la pompe à injection.
Boulon de fixation de pompe à injection :
: 20 - 25 N·m (2,0 - 2,5 kg-m)
Pompe à injection au support de fixation :
: 30 - 41 N·m (3,1 - 4,2 kg-m)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Repose et réglage (Suite)



5. Débrancher le comparateur et remonter le boulon de bouchon avec une rondelle neuve.
   : 14 - 20 N·m (1,4 - 2,0 kg-m)
6. Raccorder les tuyaux d'injection.
   Ecrou évasé :
   : 20 - 25 N·m (2,0 - 2,5 kg-m)
7. Purger l'air du système d'alimentation.
   Consulter la page EC-197.

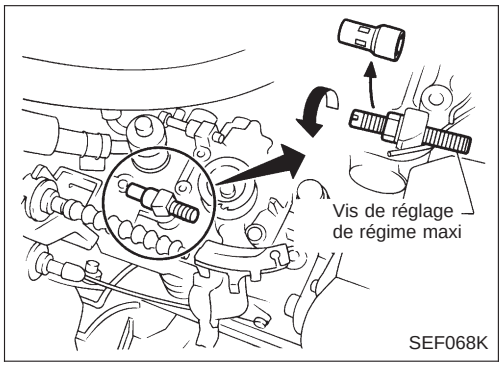
REGLAGE DU RALENTI ET DU REGIME MAXI

ATTENTION :

- **Ne pas déposer les câbles d'étanchéité, sauf nécessité absolue.**
- **Le fait de déranger la position de la vis de réglage pleine charge changera les caractéristiques du débit de carburant, ce qui entraînera un mauvais réglage du moteur. Il faut donc effectuer alors un réglage de la pompe à injection à l'aide de l'appareil d'essai de pompe à injection.**
- **Si on tourne la vis de réglage de régime maxi dans le sens qui augmente l'angle du levier de commande, le moteur risque d'être endommagé.**

Réglage du câble de commande d'accélérateur

1. Tourner le bouton de commande de ralenti à bout de course en sens inverse des aiguilles d'une montre.
2. S'assurer que le jeu entre l'axe du levier de commande de ralenti et le levier de commande de pompe à injection est conforme aux limites spécifiées.
   Jeu :
   1 - 2 mm
3. Si le jeu n'est pas dans les limites spécifiées, régler à l'aide de l'écrou de réglage de câble de commande de ralenti.
4. Après avoir réglé le jeu, serrer le contre-écrou.



Réglage du ralenti

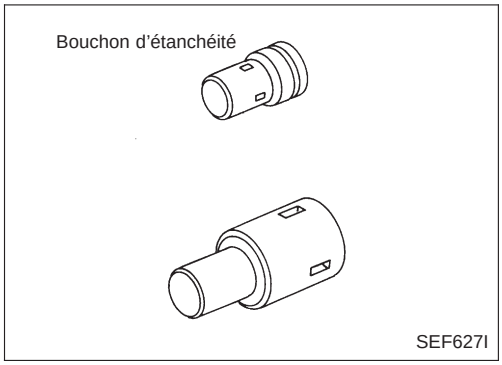
Consulter ''Contrôle du régime de ralenti'', ''ENTRETIEN DU MOTEUR'' à la section MA.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Repose et réglage (Suite)

Réglage du régime maxi

La vis de réglage de régime maxi est retenue par un câble d'étanchéité et ne doit pas être réglée en temps normal. Néanmoins, s'il est absolument nécessaire de l'ajuster, il faut procéder comme suit :

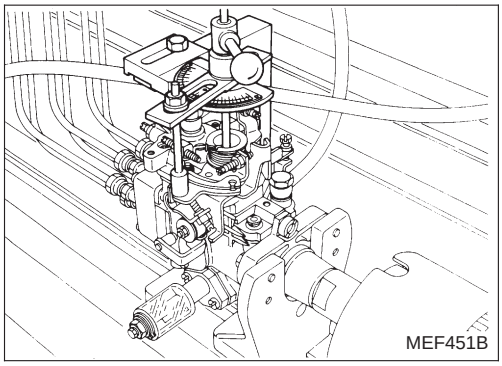


1. Mettre le moteur en marche et le réchauffer jusqu'à ce que l'aiguille de l'indicateur de température du liquide de refroidissement soit au milieu du cadran.
2. Raccorder la prise de compte-tours au tuyau d'injection n° 1.

Pour obtenir une lecture précise du régime moteur, enlever les brides fixant le tuyau d'injection n° 1.

3. Enfoncer à bout de course la pédale d'accélérateur à vide et, à ce point, prendre note de l'indication du compte-tours.

Régime maxi du moteur (à vide) :

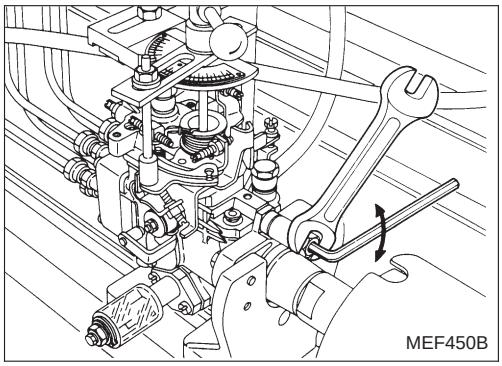


5 000 $^{+100}_{-200}$ tr/mn

4. Si l'indication est inférieure au régime maximum spécifié, tourner la vis de réglage de régime maxi dans le sens inverse des aiguilles d'une montre, d'un ou deux tours. Enfoncer alors la pédale d'accélérateur au plancher, à vide, et à ce point, lire l'indication donnée par le compte-tours.
5. Si le régime indiqué est encore inférieur à la valeur spécifiée, répéter l'étape 4 ci-dessus jusqu'à ce que le régime adéquat soit atteint.
6. Après réglage, serrer soigneusement le contre-écrou.
7. Sceller avec un câble d'étanchéité ou monter un bouchon d'étanchéité.

Démontage

Consulter ''POMPE A INJECTION VE'' à la section EF du Manuel de Réparation pour les moteurs diesel de série TD (1ère révision).



Réglage du minuteur de charge

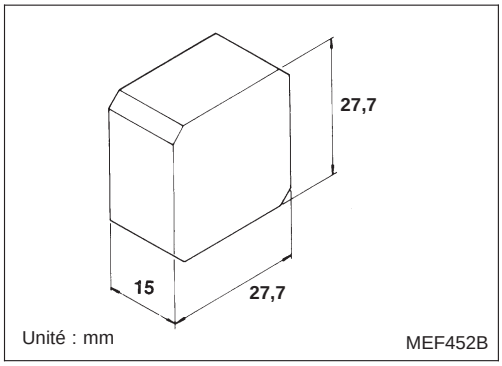
1. Après réglage de la course du minuteur, chercher la position du levier de commande permettant à la quantité d'injection d'être dans les limites spécifiées, puis fixer le levier à l'aide du dispositif de réglage (KV11282617).

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Réglage du minuteur de charge (Suite)

MEF450B

2. Faire tourner la pompe à injection à la vitesse spécifiée, puis régler la position de montage de l'arbre de régulateur de façon à ce que la course du minuteur soit comprise dans les valeurs spécifiées.
   Consulter ''Calibrage standard de la pompe à injection'' dans les SDS pour la course du minuteur.



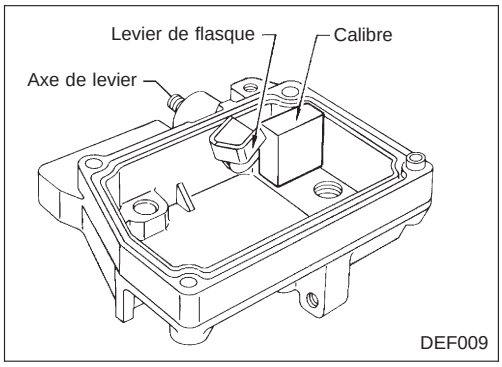
Levier de réglage de démarrage Q (Quantité)

DEMONTAGE

1. Attacher la pompe à injection au support à l'aide de deux boulons.
2. Déposer le levier de réglage de démarrage Q en enlevant l'écrou, sans omettre de marquer la position de l'installation au préalable.
3. Déposer l'écrou et la rondelle de l'extrémité du levier de commande, puis déposer le levier de réglage de démarrage Q, le ressort, la rondelle et le joint torique.
4. Déposer l'axe de levier et la rondelle à l'intérieur du couvercle de régulateur.

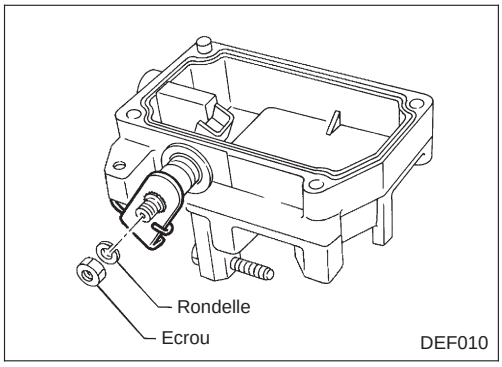
INSPECTION

1. S'assurer que la surface de glissement de l'axe de levier n'est pas usée, rayée ou excessivement endommagée, et que son rebord n'est pas tordu, usé ou endommagé excessivement.
   Remplacer l'axe de levier s'il est endommagé.
2. Inspecter les autres pièces avec attention. Les remplacer si elles sont endommagées, usées, rouillées ou tordues excessivement.



MEF452B

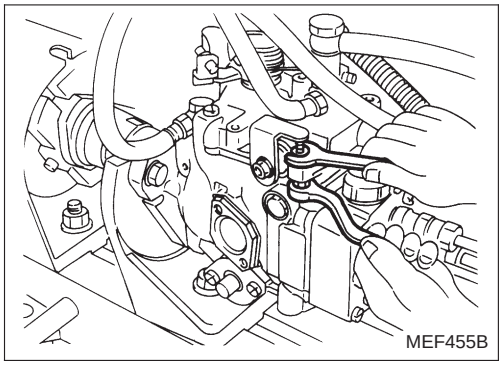
REMONTAGE



Lors du remontage de la pompe à injection de carburant avec le levier de réglage de démarrage Q, une cale d'épaisseur doit être utilisée pour déterminer la position de l'installation du levier.

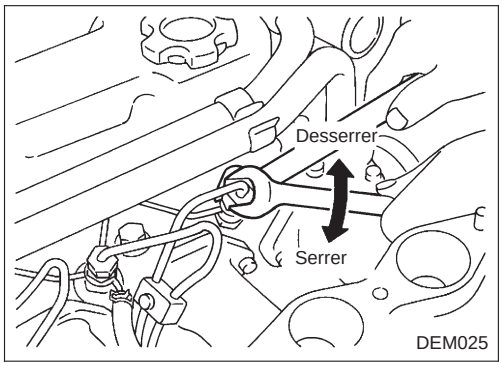
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Levier de réglage de démarrage Q (Quantité) (Suite)



1. En utilisant une cale d'épaisseur, s'assurer que la distance entre la face interne du couvercle et la pointe du rebord du levier de flasque est de 27,7 mm. Maintenir l'axe de levier dans cette position.

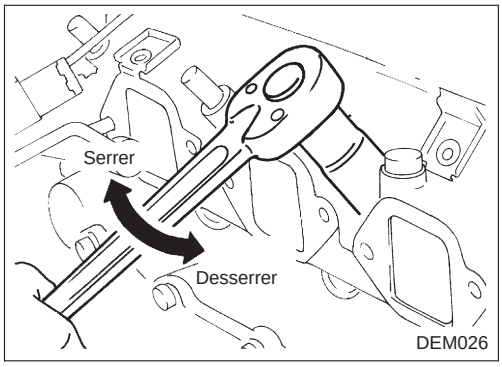
2. Installer le levier de réglage de démarrage Q sur l'axe de levier de sorte que le levier de réglage de démarrage Q entre en contact (ou quasiment en contact) avec le côté inférieur de la base du boulon de réglage.
   Puis fixer le levier de réglage de démarrage Q sur l'axe de levier en utilisant une rondelle et un écrou.



Si le levier de réglage de démarrage Q ne peut pas être installé comme décrit ci-dessus, utiliser un levier de réglage de démarrage Q possédant une dentelure à phases différentes.

REGLAGE

Ajuster le boulon de réglage du côté de fonctionnement normal de sorte que la quantité d'injection de départ soit comprise dans les spécifications.
Consulter ''Calibrage standard de la pompe à injection'' dans les SDS pour la quantité d'injection de départ.

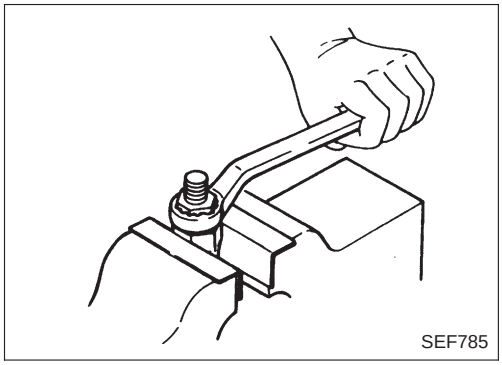


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Dépose et repose

1. Déposer l'ensemble de tube à injection.
2. Déposer l'ensemble du tube de trop-plein.

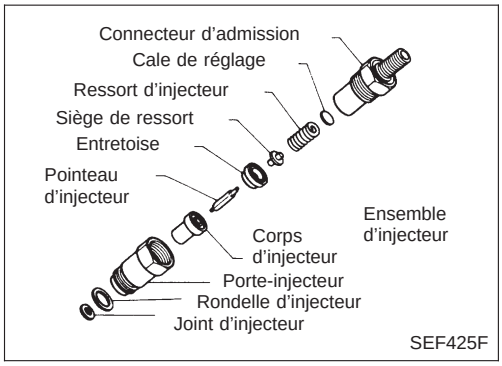
Pour éviter que le tube de trop-plein ne se casse, le déposer en serrant le porte-injecteur.



3. Déposer l'ensemble injecteur à l'aide d'une clé à douille longue.
4. Reposer l'injecteur dans l'ordre inverse de la dépose.

Injecteur à culasse :
: 54 - 64 N·m (5,5 - 6,5 kg-m)
Ecrou de tube de trop-plein :
: 29 - 39 N·m (3,0 - 4,0 kg-m)
Ecrou évasé de tube à injection :
: 20 - 25 N·m (2,0 - 2,5 kg-m)

a. Il faut toujours remplacer les joints d'injecteur par des pièces neuves.
b. Pour éviter que le tube de trop-plein ne se casse par la suite, il convient de serrer ses écrous progressivement en séquence.

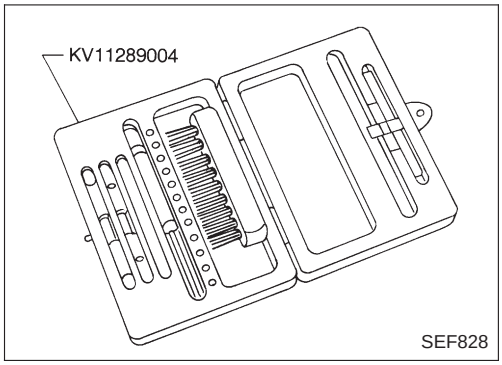


5. Purger l'air du système d'alimentation.

Consulter ''Système de purge de carburant'', page EC-197.

Démontage

1. Desserrer le connecteur d'admission tout en empêchant le sommet de l'injecteur de tourner.



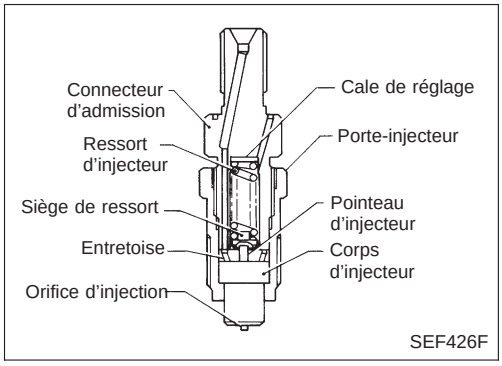
2. Disposer toutes les pièces démontées dans l'ordre indiqué ci-contre.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

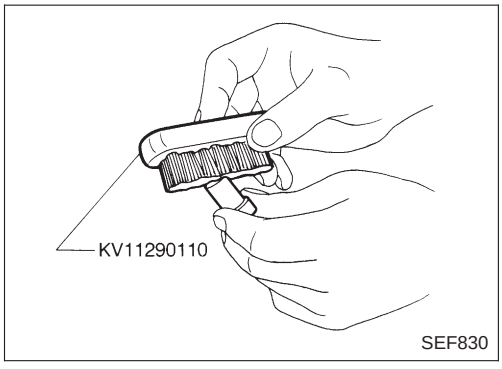
Inspection

Nettoyer soigneusement toutes les pièces démontées dans du kérosène ou du solvant frais.

- Si le pointeau est endommagé ou fendu, remplacer l'ensemble injecteur par un ensemble neuf.
- Si l'extrémité du pointeau est grippée ou excessivement décolorée, remplacer l'ensemble injecteur.
- Vérifier le corps injecteur et l'entretoise pour s'assurer que le contact est correct. Remplacer l'ensemble injecteur ou porte-injecteur s'ils sont excessivement usés ou endommagés.
- Vérifier le contact entre l'entretoise et le porte-injecteur. Remplacer l'entretoise ou le porte-injecteur s'ils sont excessivement usés ou endommagés.
- Vérifier si le ressort d'injecteur n'est pas excessivement usé ou endommagé. Le remplacer par un ressort neuf s'il est excessivement usé ou endommagé.



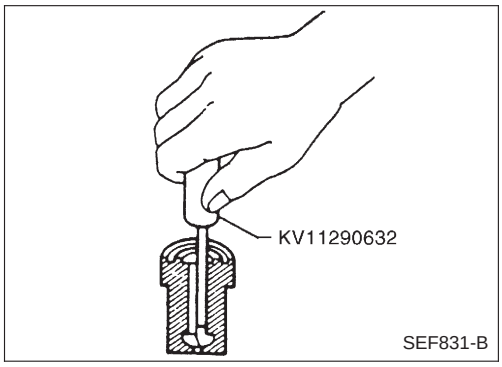
Nettoyage



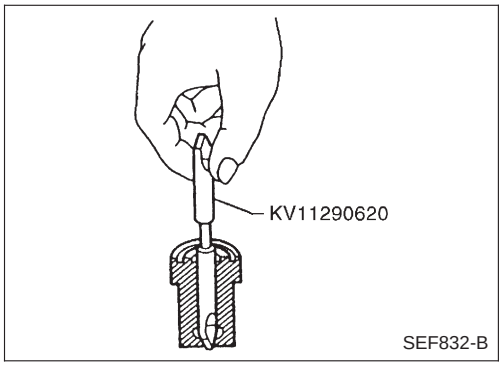
a. Ne pas toucher les surfaces de contact de l'injecteur avec ses doigts.

b. Pour nettoyer les injecteurs, utiliser une tige en bois et une brosse en laiton avec du gazole propre.

1. Nettoyer l'ensemble de l'injecteur en utilisant son kit de nettoyage.



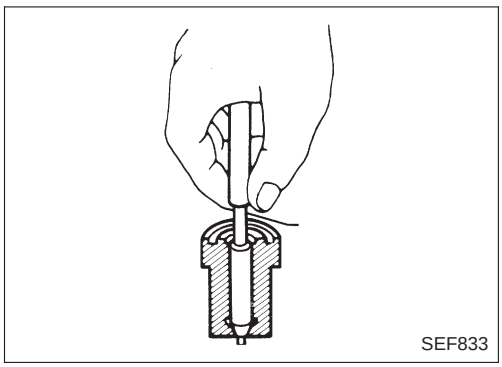
2. Les parties à nettoyer sont indiquées sur la figure de gauche.



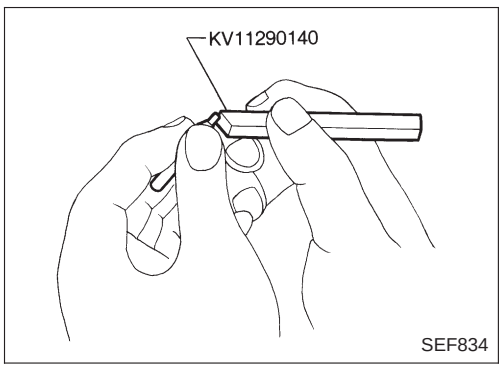
3. Enlever tous les dépôts de charbon de la surface extérieure du corps d'injecteur (sauf la partie enveloppante) à l'aide de l'outil spécial.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Nettoyage (Suite)

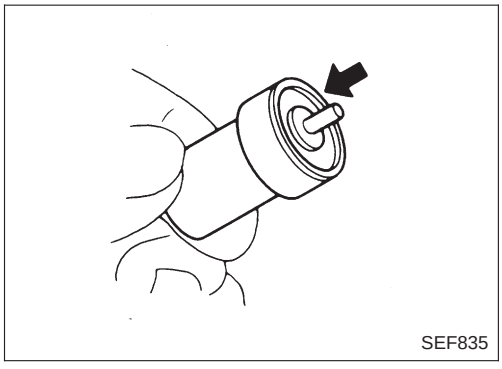


4. Nettoyer le carter à carburant de l'injecteur avec l'outil spécial.



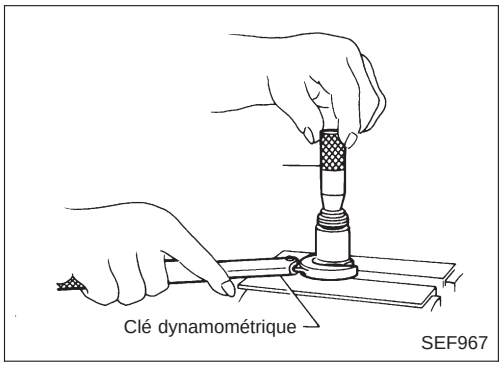
5. Nettoyer le siège de l'injecteur à l'aide de l'outil spécial.

Ce travail requiert un soin extrême car le fonctionnement efficace de l'injecteur dépend en grande partie de l'état du siège.



6. Nettoyer l'orifice d'injection à l'aide de l'outil spécial.

Procéder toujours en partant de l'intérieur vers l'extérieur pour éviter de chanfreiner l'orifice d'injection.

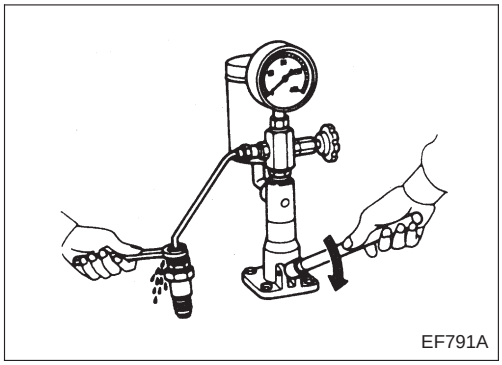


7. Décarboniser l'extrémité du pointeau de l'injecteur avec l'outil spécial.

8. Vérifier si le pointeau est en position correcte.
(1) Tirer le pointeau à environ mi-course de son siège et le relâcher.
(2) Le pointeau doit s'enfoncer très régulièrement dans le corps, sous son propre poids.
(3) Répéter cet essai et faire tourner le pointeau légèrement à chaque fois.

Si le pointeau ne retombe pas librement à partir d'une position quelconque, remplacer le pointeau et le corps comme un ensemble.

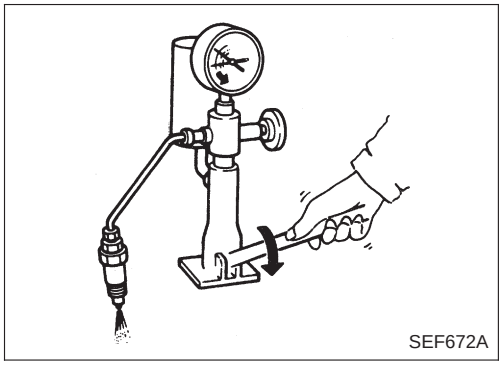
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Remontage

Remonter dans l'ordre inverse du démontage.

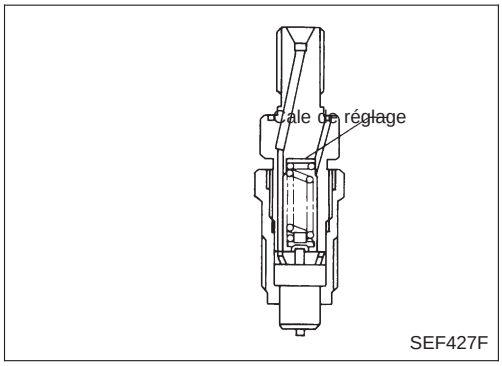
Connecteur d'admission à porte-injecteur :
: 29 - 49 N·m (3,0 - 5,0 kg-m)



Essai et réglage

AVERTISSEMENT :
Lorsqu'on utilise un appareil d'essai pour injecteur, il faut veiller à ne pas laisser le carburant diesel vaporisé par l'injecteur entrer en contact avec les mains ou avec le corps, et il faut s'assurer que les yeux sont correctement protégés par des lunettes de travail.

ESSAI DE PRESSION D'INJECTION

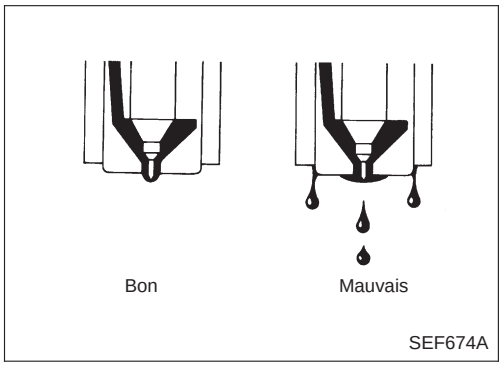


1. Monter l'injecteur sur l'appareil d'essai et purger l'air par l'écrou évasé.

2. Pomper lentement la poignée de l'appareil (une fois par seconde) et surveiller le manomètre.
3. Prendre note de la valeur indiquée par le manomètre, lorsque la pression d'injection commence juste à chuter.

Pression d'injection initiale :
Usagé 9 807 - 10 297 kPa
(98,1 - 103,0 bar, 100 - 105 kg/cm^2)
Neuf 10 297 - 11 278 kPa
(103,0 - 112,8 bar, 105 - 115 kg/cm^2)

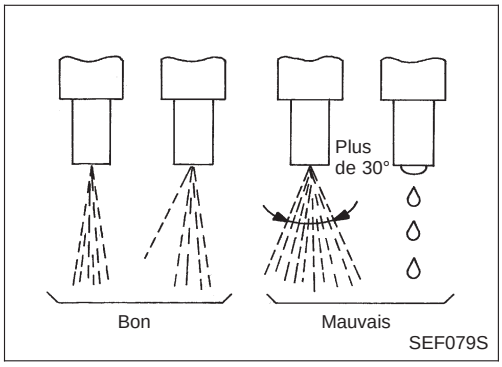
Vérifier systématiquement la pression d'injection initiale á l'aide d'un injecteur neuf.



4. Pour régler la pression d'injection, changer les cales de réglage.

a. Le fait d'augmenter l'épaisseur des cales augmente la pression d'injection initiale. Le fait de diminuer l'épaisseur réduit la pression initiale.
b. Une cale d'épaisseur de 0,04 mm correspond à une différence approximative de 471 kPa (4,71 bar, 4,8 kg/cm^2) de la pression d'injection initiale.

Consulter ''Injecteur'' dans les SDS pour les cales de réglage, EC-239.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Essai et réglage (Suite)

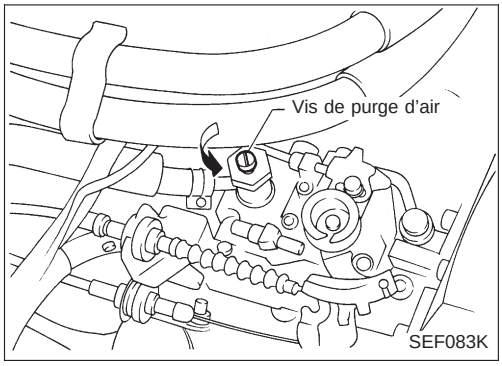
ESSAI D'ETANCHEITE

1. Maintenir la pression d'environ 981 à 1 961 kPa (9,8 à 19,6 bar, 10 à 20 kg/cm^2) sous la pression à injection initiale.
2. Vérifier que la pointe de l'injecteur et le contour du corps ne gouttent pas.
3. S'il y a des fuites, nettoyer, réparer ou remplacer l'injecteur.

ESSAI DU JET D'INJECTION

1. Contrôler le cône d'injection en pompant une fois par seconde la poignée du contrôleur d'injecteurs.

a. Si l'angle de jet principal est inférieur à 30 degrés (comme indiqué), l'injecteur est bon.

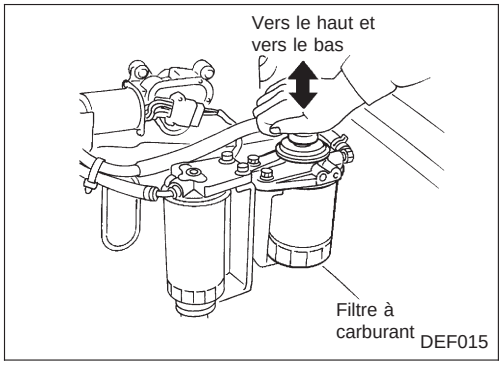


b. L'injecteur est normal même si un mince jet dévie du jet principal (forme B).

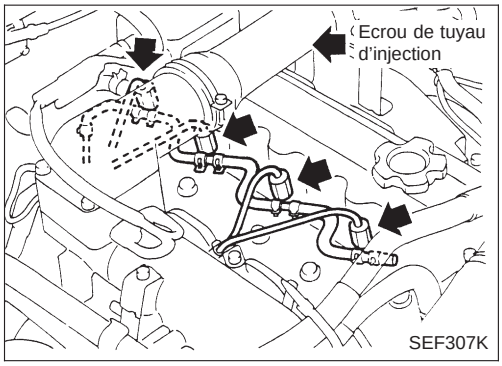
2. Si l'injecteur n'est pas normal, le régler ou le nettoyer, ou bien le remplacer.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Système de purge de carburant



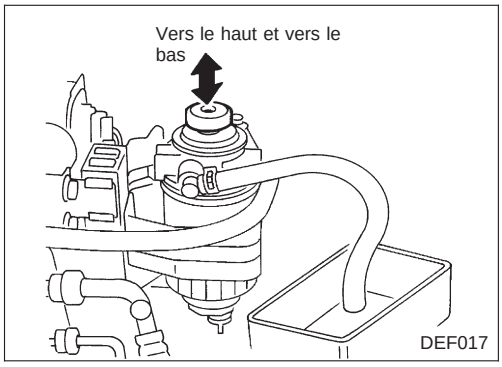
Il faut purger l'air du système lorsque la pompe à injection est déposée ou lorsque le système d'alimentation est réparé.
Protéger la pompe et les supports de moteur des éclaboussures de carburant avec des chiffons.
Si le moteur ne démarre pas après avoir purgé l'air, desserrer les tubes à injection du côté injecteur et lancer le moteur jusqu'à ce que le trop-plein de carburant s'écoule du tube à injection. Serrer les écrous évasés du tube à injection.
Si le moteur ne fonctionne pas régulièrement après son démarrage, l'emballer trois fois.



ATTENTION :
Essuyer toute trace de carburant qui serait sorti au moment de la purge de l'air à chaque étape.

- **Etape 1 : purge du filtre à carburant et de la pompe à injection**

1. Desserrer la vis de purge d'air de la pompe à injection.
2. Déplacer la pompe d'amorçage de filtre à carburant vers le haut et vers le bas jusqu'à ce qu'il n'y ait plus d'air qui s'échappe de la vis de purge d'air.
3. Serrer la vis de purge d'air.



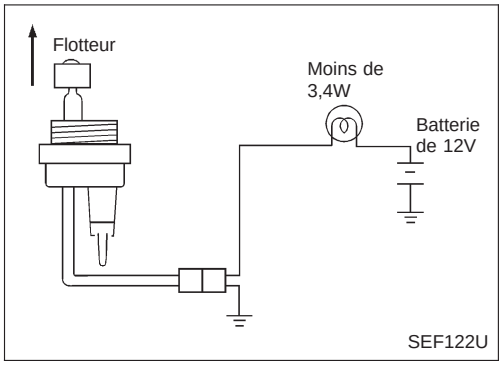
- **Etape 2 : purge d'air du tube à injection de carburant et du tube de trop-plein**

1. Desserrer les écrous du tube à injection du côté porte-injecteur.
2. Déplacer la pompe d'amorçage de filtre à carburant vers le haut et vers le bas jusqu'à ce qu'il n'y ait plus d'air qui s'échappe des écrous du tube à injection.
3. Serrer les écrous évasés du tube à injection.
   : 20 - 25 N·m (2,0 - 2,5 kg-m)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Purge du filtre à carburant

1. Déplacer la pompe d'amorçage de haut en bas pour purger l'air du filtre à carburant.
2. Lorsque l'air est totalement évacué de la pompe à carburant, le fonctionnement de la pompe d'amorçage devient sensiblement lourd. Arrêter la pompe.



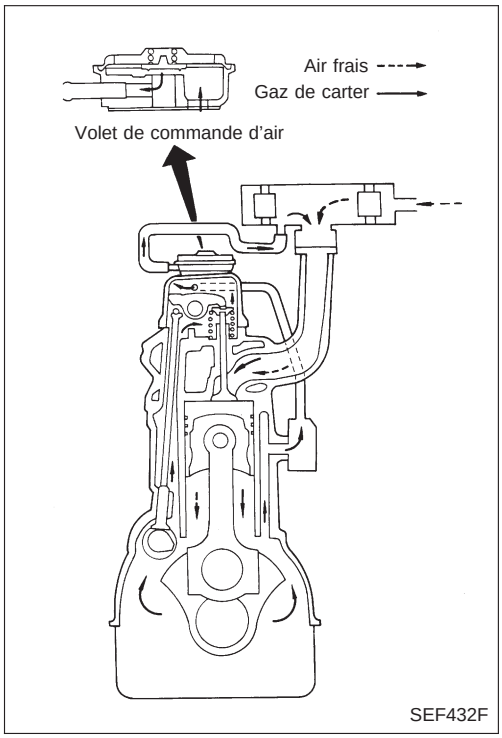
Contrôle de la pompe d'amorçage

Avant de vérifier la pompe d'amorçage, s'assurer que le filtre à carburant est rempli de carburant.

1. Débrancher le flexible de retour de carburant.

Placer un récipient adéquat sous l'extrémité du flexible.

2. Actionner la pompe d'amorçage et vérifier le trop-plein du carburant qui s'écoule de l'extrémité du flexible. Si tel n'est pas le cas, remplacer la pompe d'amorçage.

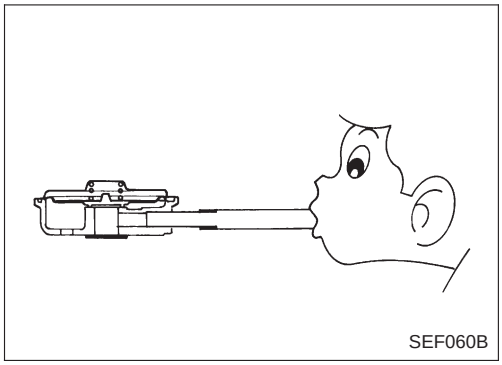


Contrôle du contact de filtre à carburant

1. Déposer le connecteur du filtre et du contact du filtre à carburant.
2. Tourner la clé d'allumage sur ''ON''. Lever le flotteur pour s'assurer que la lampe témoin s'allume.

Couple de serrage du contact de filtre à carburant :
: 3,9 - 5,9 N·m (0,4 - 0,6 kg-m)

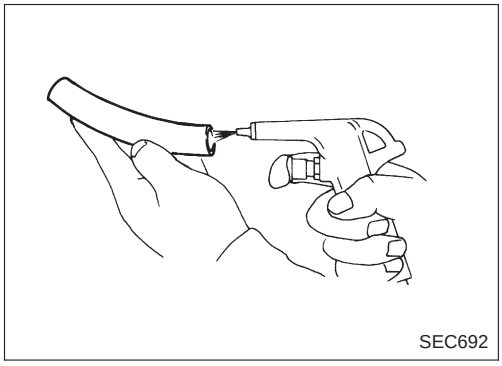
Jeter l'ancien joint d'huile et le remplacer par un joint neuf.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SEF432F

Description



Le système de ventilation du carter de type ouvert est utilisé comme un système d'aspiration des gaz du carter.
Le système d'aspiration des gaz du carter de type ouvert empêche les gaz de pénétrer dans l'atmosphère et maintient le carter interne à pression constante.
Lors du fonctionnement de la vanne, le collecteur d'admission est alimenté en gaz de carter par le volet de commande d'air.
Ceci est activé par la pression du cache-culbuteurs interne. Lorsque le débit de l'air d'admission est réduit par le corps de papillon, la pression du cache-culbuteurs interne diminue. La soupape de commande des émissions de carter maintient alors les cache-culbuteurs à pression constante de façon à ce que l'air ou la poussière ne soit pas aspiré autour du joint d'huile de vilebrequin.

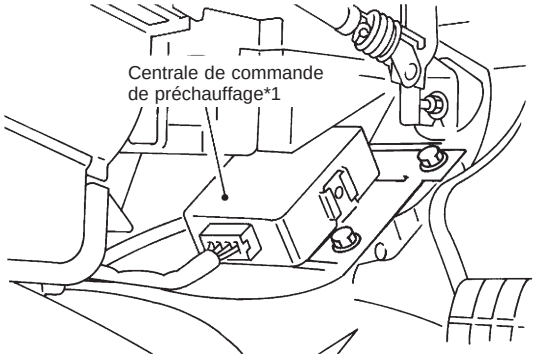
SEF060B

Inspection

VOLET DE COMMANDE D'AIR

1. Déposer le cache-culbuteurs.
2. Déposer la vanne de commande du cache-culbuteurs.
3. Après avoir bouché l'orifice central avec du ruban adhésif, vérifier que de l'air passe par l'orifice d'admission en soufflant de l'air par l'orifice d'échappement, et qu'il n'y a pas de passage d'air par aspiration.

SEC692



FLEXIBLE DE VENTILATION

1. Vérifier les flexibles et les raccords de flexible pour déceler toute présence de fuite.
2. Débrancher tous les flexibles et les nettoyer à l'air comprimé. Remplacer tous les flexibles qui ne peuvent pas être débouchés de façon satisfaisante.

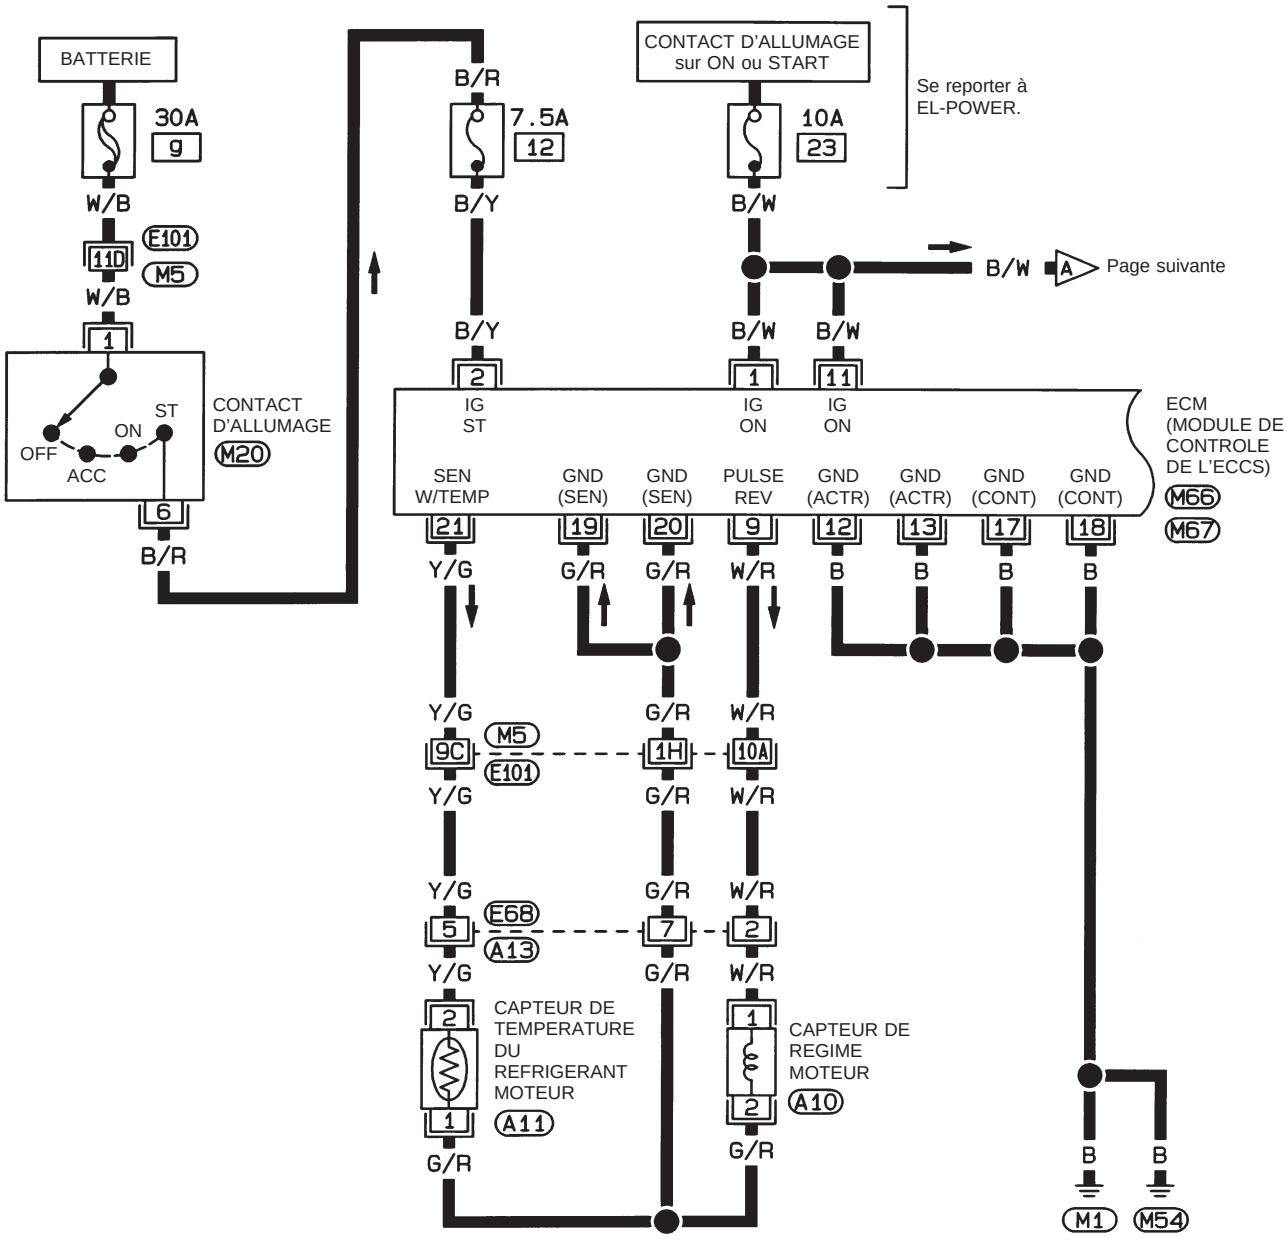
Description

Lorsque la température du réfrigérant est inférieure à 50°C, le relais s'enclenche au moment où le contact d'allumage est mis sur ''ON''. Dès lors, un courant électrique passe dans les bougies de préchauffage qui sont instantanément chauffées. Après un délai de T_1 secondes, l'indicateur est automatiquement éteint à partir de l'unité de commande. Le relais est automatiquement coupé après avoir fonctionné pendant T_2 secondes ou après le temps de démarrage, selon la première éventualité.
Le relais reste allumé pendant T_3 secondes après que le contact d'allumage a été remis sur ''ON'' depuis ''START''. Ces dispositifs améliorent les performances de la combustion du moteur après le démarrage.
Lorsque la température du réfrigérant est supérieure à 50°C, le relais n'est activé que lors du lancement du moteur.



T_1 : env. 2 - 6	[sec.]	(Varie en fonction de la température du réfrigérant).
T_2 : 30	[sec.]	(Quand la température du réfrigérant est inférieure à 50°C).
5	[sec.]	(Quand la température du réfrigérant est supérieure à 50°C).
T_3 : 600	[sec.]	(Quand la température du réfrigérant est inférieure à 50°C).
0	[sec.]	(Quand la température du réfrigérant est supérieure à 50°C).

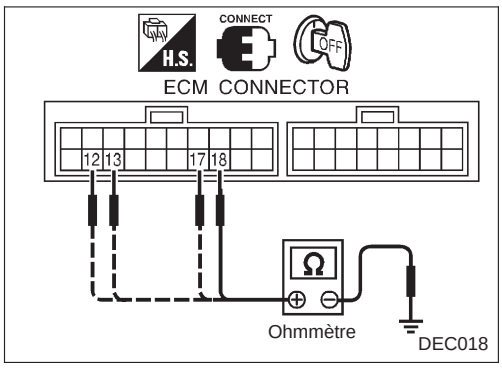
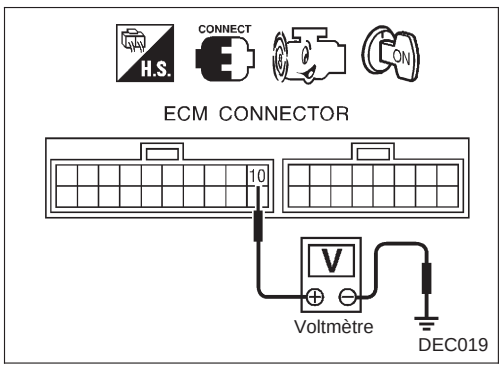
Inspection du circuit de l'unité de commande de préchauffage (Pour les pays froids)



Enrouler la surface de plancher. Vérifier l'unité de commande de préchauffage.

CIRCUIT D'ALIMENTATION ELECTRIQUE

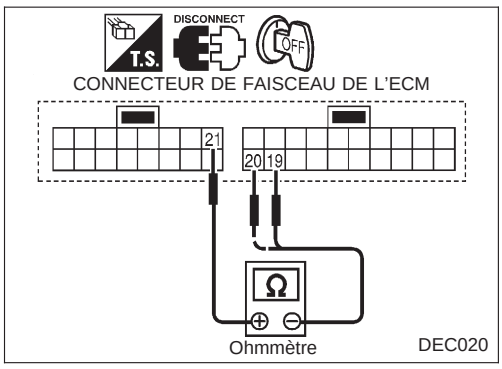
Mettre le contact d'allumage sur ON et vérifier la tension entre la borne ① ou ⑪ et la masse de carrosserie.



Tension : environ 12V

CIRCUIT DE MASSE

Vérifier la continuité entre les bornes ⑫, ⑬, ⑰ ou ⑱ et la masse de carrosserie.

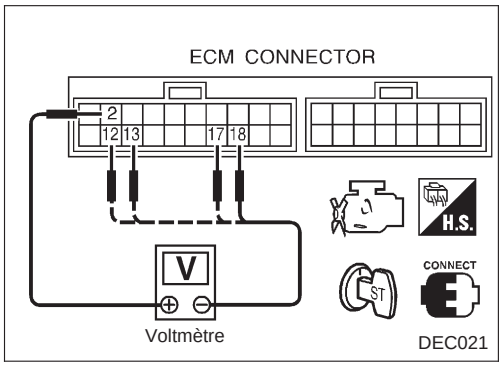


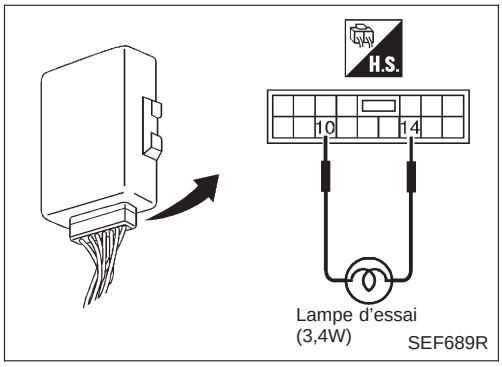
Il doit y avoir continuité.

CIRCUIT DU CAPTEUR DE VITESSE DU VEHICULE

Vérifier que la tension entre la borne ⑩ et la masse de carrosserie varie quand le véhicule fonctionne ou que les roues arrière sont levées en position deux roues motrices.

Tension : env. 5V



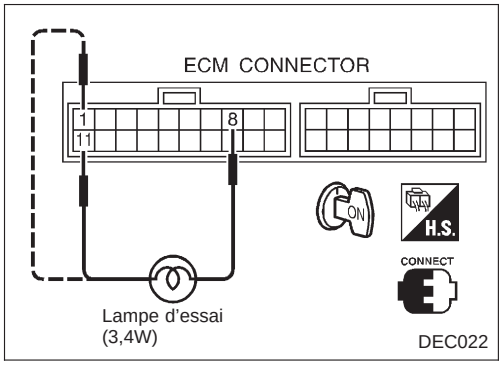


CIRCUIT DU CAPTEUR DE TEMPERATURE DU REFRIGERANT MOTEUR

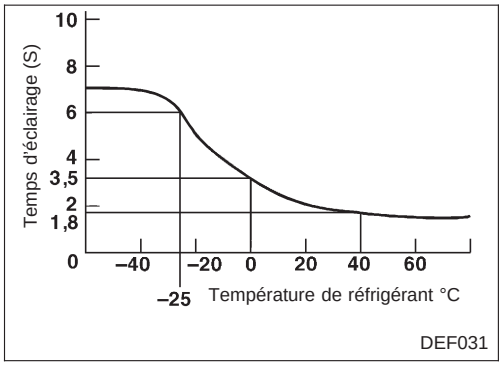
Vérifier la continuité entre les bornes ㉑ et ⑲ ou ⑳.

Mesurer la résistance à la température de manière similaire à celle indiquée au chapitre ''CAPTEUR DE TEMPERATURE DU REFRIGERANT MOTEUR'', ''Inspection des composants'', EC-215.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

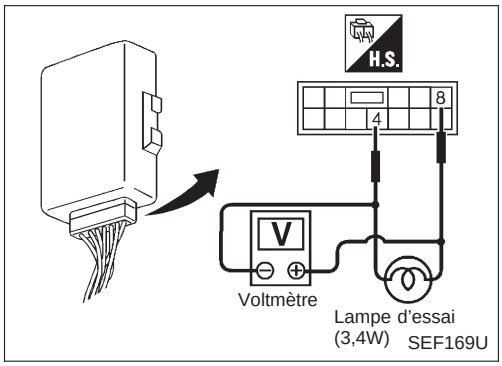


Inspection du circuit de l'unité de commande de préchauffage (Pour les pays froids) (Suite)



CIRCUIT D'ENTREE DU SIGNAL DE DEMARRAGE

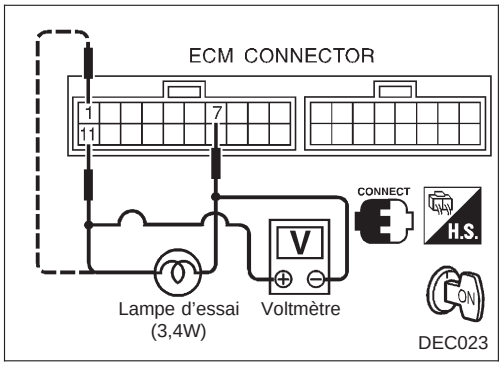
1. Mettre le contact d'allumage sur ''OFF''.
2. Débrancher le connecteur de faisceau de la borne ''S'' du démarreur.
3. Vérifier la tension de borne entre les bornes ②, ⑫, ⑬, ⑰ ou ⑱ lorsque le contact d'allumage est sur ''START''.
   Tension : environ 12V

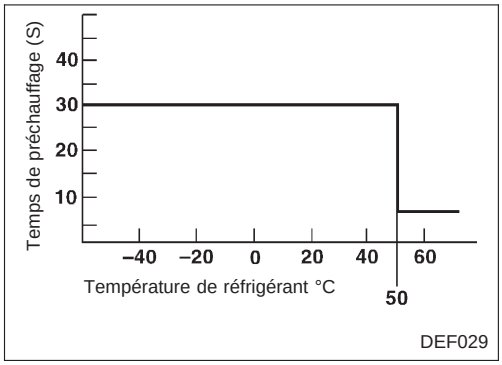


CIRCUIT DE COMMANDE D'INDICATEUR DE PRECHAUFFAGE

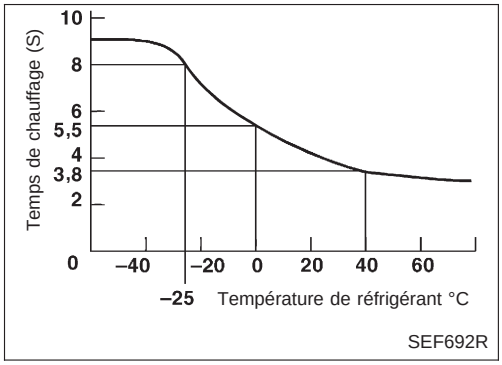
1. Mettre le contact d'allumage sur ''OFF''.
2. Laisser le connecteur de faisceau relié au boîtier de contrôle de préchauffage.
3. Brancher la lampe d'essai sur le boîtier de contrôle de préchauffage comme indiqué.
4. Mettre le contact d'allumage sur ''ON'' et mesurer le laps de temps durant lequel la lampe d'essai reste allumée.
   Temps pendant lequel la lampe d'essai doit rester allumée :
   Env. 2 à 6 secondes.
   (Le temps varie en fonction de la température du liquide de refroidissement).

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



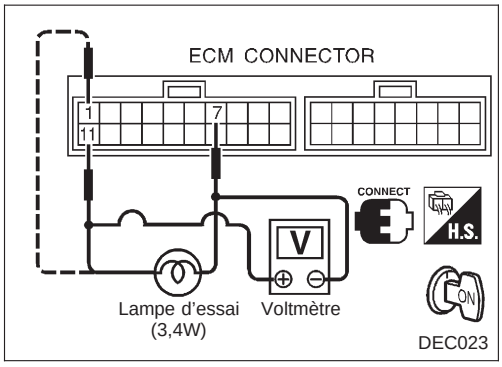


Inspection du circuit de l'unité de commande de préchauffage (Pour les pays froids) (Suite)

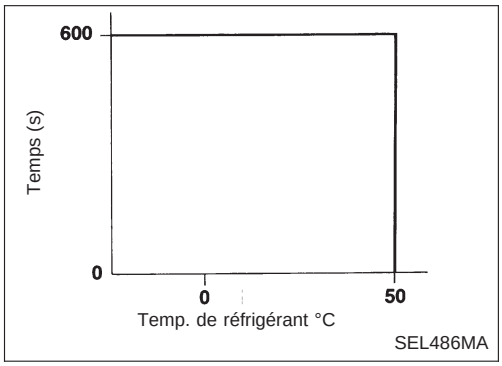


CIRCUIT DE COMMANDE DE PRECHAUFFAGE

1. Mettre le contact d'allumage sur ''OFF''.
2. Laisser le connecteur de faisceau relié au boîtier de contrôle de préchauffage.
3. Brancher la lampe d'essai à l'unité de commande de préchauffage comme indiqué ci-dessous.
4. Mettre le contact d'allumage sur ''ON'' et mesurer la tension au moment où la lampe d'essai reste allumée.

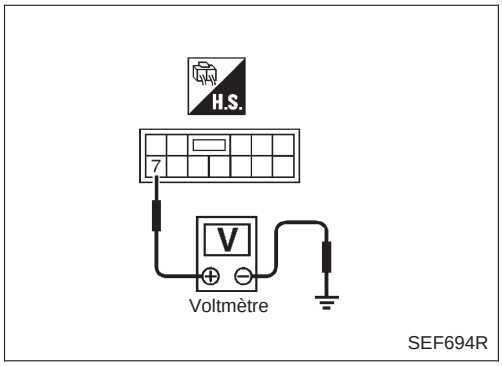


Il devrait y avoir tension de la batterie pendant 30 secondes à une température du réfrigérant inférieure à 50°C.
Il devrait y avoir tension de la batterie pendant 5 secondes à une température du réfrigérant supérieure à 50°C.



- **Le temps sera raccourci si le contact d'allumage est coupé seulement pendant un court instant.**
  Pour mesurer le temps, laisser le contact d'allumage sur ''OFF'' pendant plus de 1 minute, puis tourner le contact d'allumage sur ''ON''.
- **Lorsque la température du réfrigérant est inférieure à 10°C, la tension de la batterie doit apparaître pendant 30 secondes.**

CIRCUIT DE COMMANDE DE POST-CHAUFFAGE

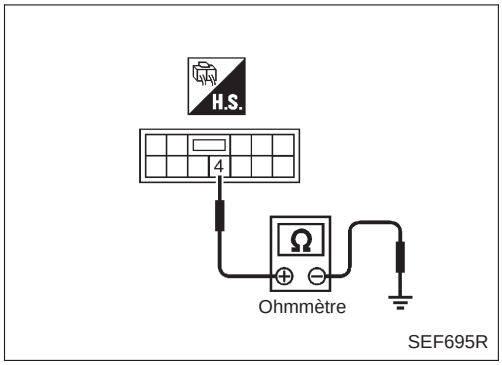


1. Brancher la lampe d'essai sur le boîtier de contrôle de préchauffage comme indiqué.
2. Mettre le contact d'allumage sur ''START'' et faire tourner le moteur, puis mesurer la tension à la borne de la bougie de préchauffage au moment où la lampe d'essai reste allumée.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection du circuit de l'unité de commande de préchauffage (Pour les pays froids) (Suite)

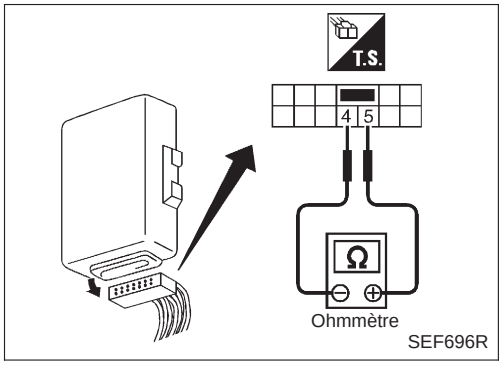
Il devrait y avoir tension de la batterie pendant 10 minutes à une température du réfrigérant inférieure à 50°C.
(Si la vitesse du véhicule est supérieure à 20 km/h, la tension à la borne de la bougie de préchauffage doit chuter à 0V. Si la vitesse chute en dessous de 10 km/h, la tension de la batterie doit apparaître.)
La tension ne devrait pas apparaître à une température de plus de 50°C.



Inspection du circuit de l'unité de commande de préchauffage (Sauf pour les pays froids)

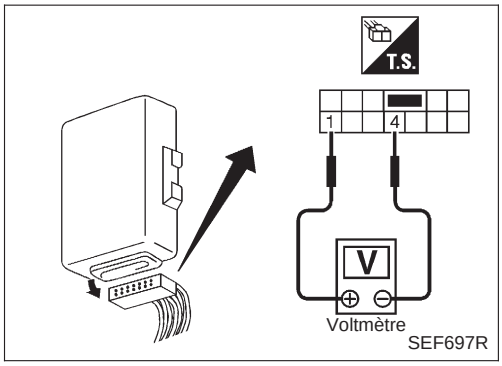
CIRCUIT D'ALIMENTATION ELECTRIQUE

Mettre le contact d'allumage sur ON et vérifier la tension entre la borne ⑦ et la masse de carrosserie.



Tension : environ 12V

CIRCUIT DE MASSE

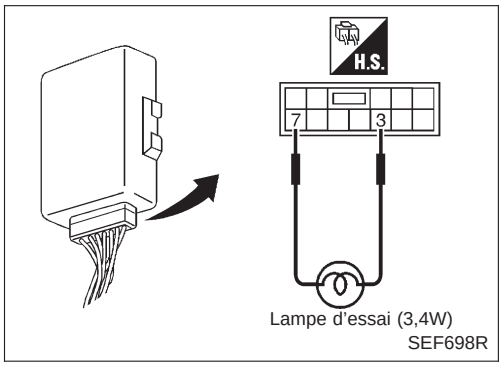


Vérifier la continuité entre la borne ④ et la masse de carrosserie.

Il doit y avoir continuité.

CIRCUIT DU CAPTEUR DE TEMPERATURE DU REFRIGERANT MOTEUR

Vérifier la continuité entre les bornes ⑤ et ④.
Mesurer la résistance à la température de manière similaire à celle indiquée au chapitre ''CAPTEUR DE TEMPERATURE DU REFRIGERANT MOTEUR'', ''Inspection des composants'', EC-215.



CIRCUIT D'ENTREE DU SIGNAL DE DEMARRAGE

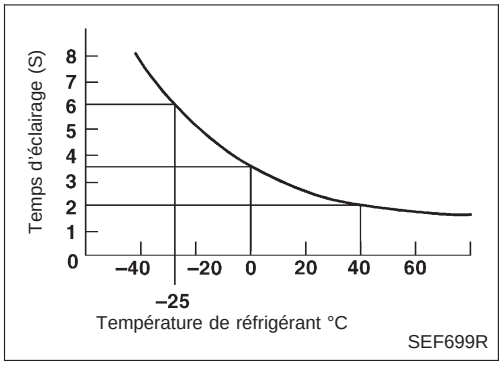
1. Mettre le contact d'allumage sur ''OFF''.
2. Débrancher le connecteur de faisceau de la borne ''S'' du démarreur.
3. Vérifier la tension de borne entre les bornes ① et ④ lorsque le contact d'allumage est sur ''START''.

Tension : environ 12V

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Lampe d'essai (3,4W)
SEF698R

Inspection du circuit de l'unité de commande de préchauffage (Sauf pour les pays froids) (Suite)



CIRCUIT DE COMMANDE D'INDICATEUR DE PRECHAUFFAGE

1. Mettre le contact d'allumage sur ''OFF''.
2. Laisser le connecteur de faisceau relié au boîtier de contrôle de préchauffage.
3. Brancher la lampe d'essai sur le boîtier de contrôle de préchauffage comme indiqué.
4. Mettre le contact d'allumage sur ''ON'' et mesurer le laps de temps où la lampe d'essai reste allumée.

   Temps pendant lequel la lampe d'essai doit rester allumée :

   Env. 2 à 6 secondes.

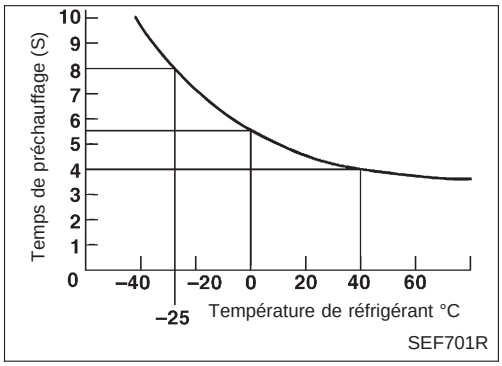
   (Le temps varie en fonction de la température du liquide de refroidissement).

SEF699R

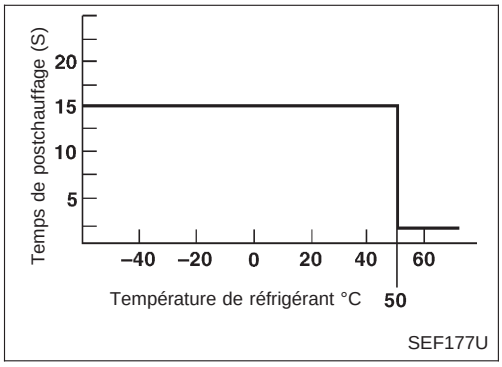
SEF169U

CIRCUIT DE COMMANDE DE PRECHAUFFAGE

Commande de préchauffage



1. Mettre le contact d'allumage sur ''OFF''.
2. Laisser le connecteur de faisceau relié au boîtier de contrôle de préchauffage.
3. Connecter la lampe d'essai sur le boîtier de contrôle de préchauffage comme indiqué.
4. Mettre le contact d'allumage sur ''ON'' et mesurer la tension de la borne au moment où la lampe d'essai clignote.



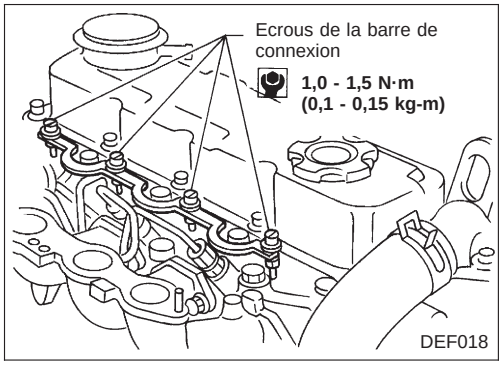
1) A une température du réfrigérant inférieure à 50°C, la tension de la batterie apparaît pendant 15 secondes.

- **La tension de la batterie doit exister pendant 4 à 8 secondes*, puis être coupée alternativement pendant le reste du temps.**

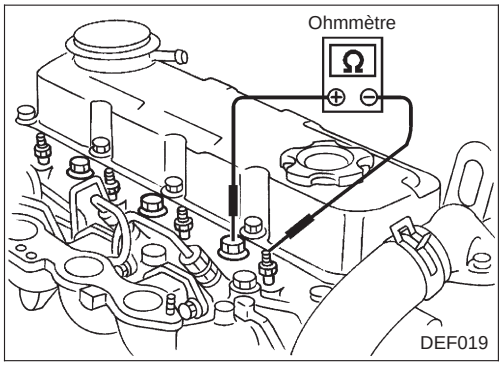
  *** Temps de préchauffage (varie en fonction de la température du liquide de refroidissement)**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection du circuit de l'unité de commande de préchauffage (Sauf pour les pays froids) (Suite)



- **Le temps sera raccourci si le contact d'allumage est coupé seulement pendant un court instant.**
  Pour mesurer le temps, laisser le contact d'allumage sur ''OFF'' pendant plus de 1 minute, puis tourner le contact d'allumage sur ''ON''.
  La lampe d'essai s'allume et s'éteint environ 1 à 3 fois après s'être allumée.



2) A une température du réfrigérant supérieure à 50°C, la tension de la batterie apparaît pendant environ 3 secondes.

Commande de postchauffage

1. Mettre le contact d'allumage sur ''OFF''.
2. Laisser le connecteur de faisceau relié au boîtier de contrôle de préchauffage.
3. Brancher la lampe d'essai à l'unité de commande de préchauffage comme indiqué dans le ''Contrôle de préchauffage''.
4. Mettre le contact d'allumage sur ''START'' puis à nouveau sur ''ON''. Mesurer la tension aux bornes et compter le nombre de fois où la lampe d'essai clignote.

1) A une température du réfrigérant inférieure à 50°C, la tension de la batterie apparaît de façon intermittente pendant 15 secondes. La lampe d'essai clignote environ 3 fois.
2) A une température du réfrigérant supérieure à 50°C, la tension de la batterie apparaît pendant 2 secondes.

Inspection des composants

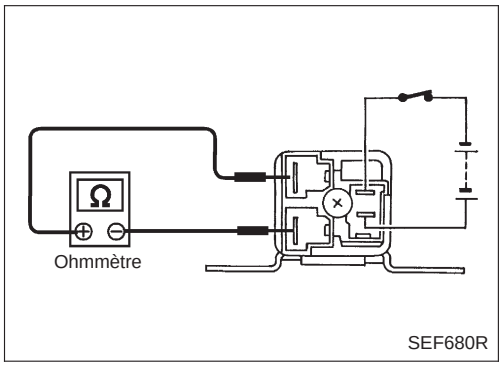
ECROUS DE BARRE DE CONNEXION DES BOUGIES DE PRECHAUFFAGE

S'assurer que les écrous de la barre de connexion des bougies de préchauffage, ainsi que l'écrou de faisceau, sont correctement installés.

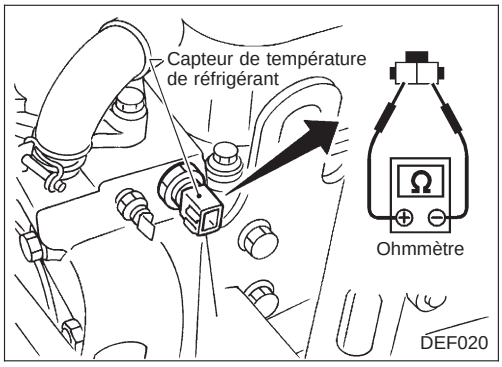
BOUGIE DE PRECHAUFFAGE

Déposer la barre de connexion des bougies de préchauffage et effectuer un test de continuité entre chaque bougie de préchauffage et la culasse.

Pas de continuité ... remplacer la bougie de préchauffage.



Les moteurs TD25 sont équipés de deux bougies de préchauffage en céramique disponibles chez le fabricant.
Une marque de couleur orange ou bleue est apposée sur la tête de la bougie de préchauffage.
Ne pas les interchanger dans un moteur. Ne pas les utiliser si elles sont tombées parterre.



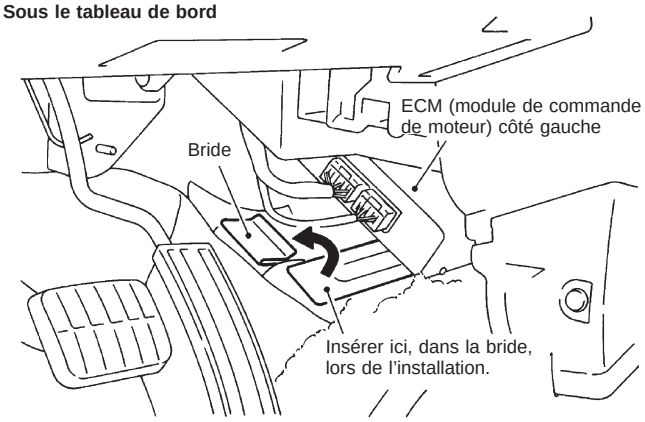
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection des composants (Suite)

RELAIS DE PRECHAUFFAGE

Le relais de préchauffage est normallement ouvert.

CAPTEUR DE TEMPERATURE DU REFRIGERANT MOTEUR



Débrancher le connecteur de faisceau de température du réfrigérant moteur et mesurer la résistance.

Température du réfrigérant °C	Résistance kΩ
−25	19
0	5,6
20	2,5
40	1,2

Inspection du système

FONCTIONNEMENT GENERAL

1. Démarrer le moteur et le laisser chauffer suffisamment.
2. S'assurer que le diaphragme de la vanne EGR et le mouvement de l'axe de commande de chambre de papillon (utiliser les doigts pour s'assurer du mouvement de diaphragme de vanne EGR) sous les conditions suivantes.

   Au ralenti :

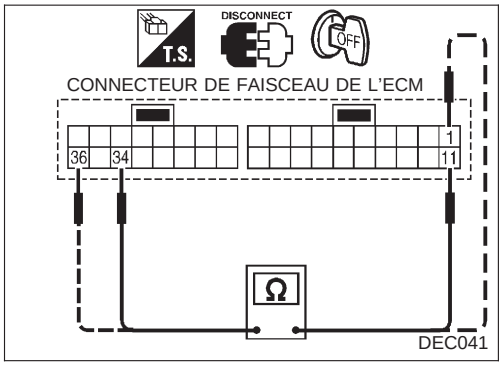
   Le diaphragme et la tige ne bougent pas.

   En emballant le moteur du ralenti à un régime de 1 000 à 2 800 tr/mn :

   Le diaphragme et la tige bougent.

   En maintenant le régime moteur entre 2 900 et 3 200 tr/mn :

   Le diaphragme et la tige demeurent en position ouverte.



CIRCUIT D'ALIMENTATION ELECTRIQUE

1. Mettre le contact d'allumage sur ''OFF''.
2. Débrancher le connecteur de faisceau de l'électrovanne EGRC A et B.
3. Mettre le contact d'allumage sur ''ON''.

4. Vérifier la tension entre la borne ② et la masse.

   Tension : tension de la batterie

CIRCUIT DU SIGNAL DE SORTIE

1. Mettre le contact d'allumage sur ''OFF''.
2. Débrancher le connecteur de faisceau de l'ECM.
3. Vérifier la continuité du faisceau entre les bornes.

   Il doit y avoir continuité.

   Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité.

   Electrovanne EGRC A :

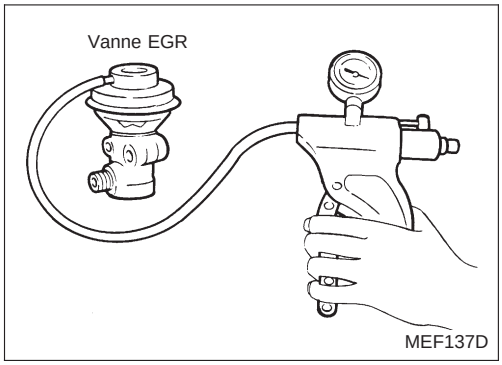
   Borne ㊱ de l'ECM et borne ① ou ⑪

   Electrovanne EGRC B :

   Borne ㉞ de l'ECM et borne ① ou ⑪

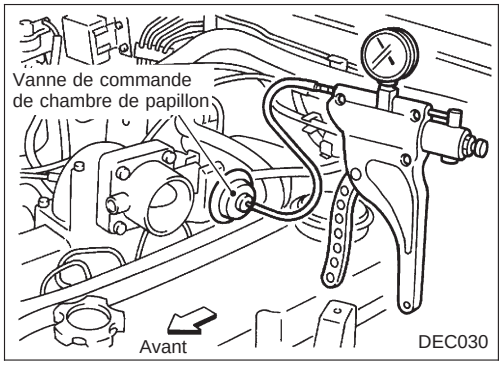
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection du système (Suite)



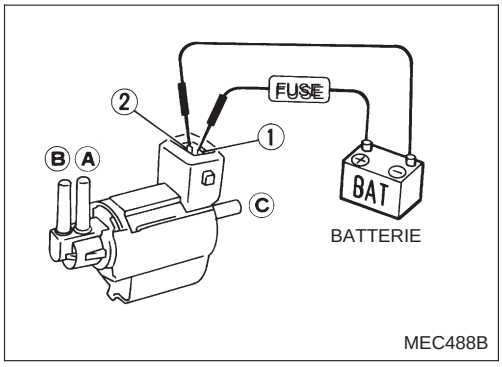
CIRCUIT DU SIGNAL D'ENTREE

1. Mettre le contact d'allumage sur ''OFF''.
2. Débrancher le connecteur de faisceau de l'ECM.
3. Vérifier la continuité du faisceau entre les bornes.
   Il doit y avoir continuité.
   Si le résultat est bon, vérifier si le faisceau n'est pas court-circuité.
   Potentiomètre :
   Borne (31) de l'ECM et borne (19) ou (20).
   Borne (23) de l'ECM et borne (19) ou (20).
   Capteur de régime moteur :
   Borne (9) de l'ECM et borne (19) ou (20).
   Capteur de température du réfrigérant moteur :
   Se reporter à ''Inspection du circuit de l'unité de commande de préchauffage'' dans ''SYSTEME DE PRECHAUFFAGE RAPIDE'', EC-209.



Inspection des composants

Vanne EGR

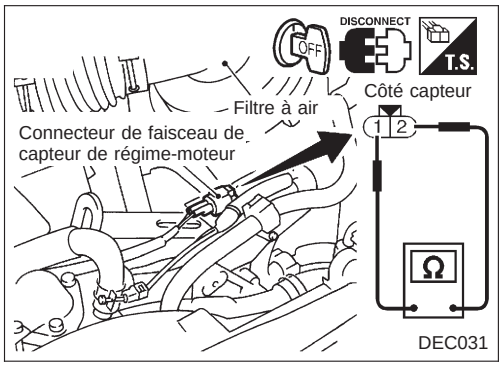


Appliquer une dépression à l'orifice de dépression de la vanne EGR à l'aide d'une pompe à vide manuelle.
Le diaphragme de la vanne EGR doit se soulever.
Si le résultat est mauvais, remplacer la vanne EGR.

Vanne de commande de chambre de papillon

Appliquer une dépression à l'orifice de dépression de la soupape de commande de chambre de papillon à l'aide d'une pompe à vide manuelle.
La vanne de commande de chambre de papillon doit être fermée.
Si le résultat est mauvais, remplacer la soupape de commande de chambre de papillon.

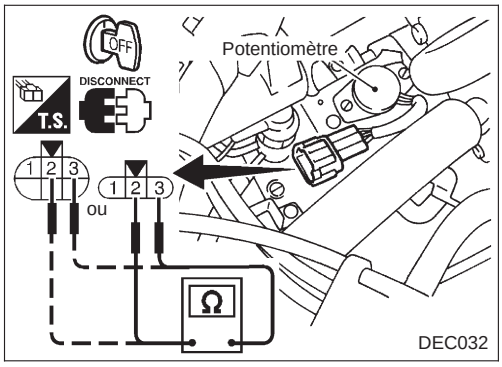
Electrovanne EGRC A et B



Vérifier la continuité du passage de l'air.

Condition	Continuité du passage d'air entre (A) et (B)	Continuité du passage d'air entre (A) et (C)
Courant continu de 12V entre les bornes (1) et (2) du relais	Oui	Non
Aucun courant alimenté	Non	Oui

Si le résultat est mauvais, remplacer l'(les) électrovanne(s).



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection des composants (Suite)

Capteur de régime moteur

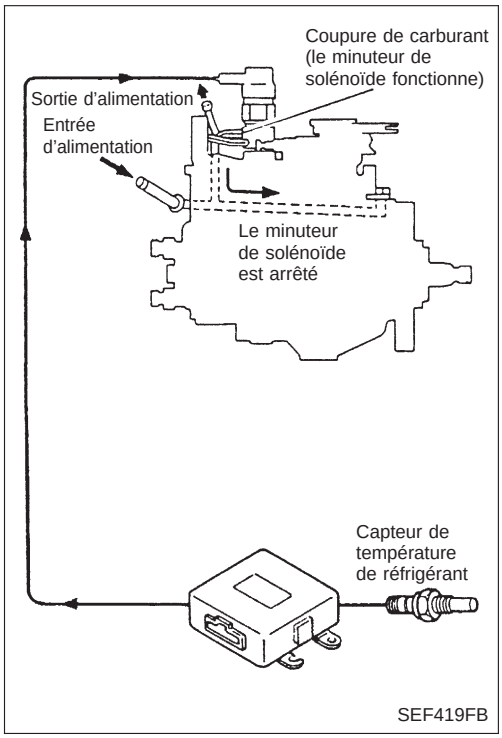
1. Débrancher le connecteur de faisceau du capteur de régime moteur.
2. Vérifier la résistance entre les bornes ① et ②.
   Résistance : environ 1,6 kΩ (à 25°C)
   Si le résultat est mauvais, remplacer le capteur.

Potentiomètre

1. Débrancher le connecteur de faisceau du potentiomètre.
2. S'assurer que la résitance entre les bornes ② et ③ change lorsque l'accélérateur est utilisé.

Condition de la pédale d'accélérateur	Résistance kΩ (à 20°C)
Complètement relâchée	Environ 0,7
Partiellement enfoncée	0,7 - 5
Enfoncée à pleine course	Environ 5

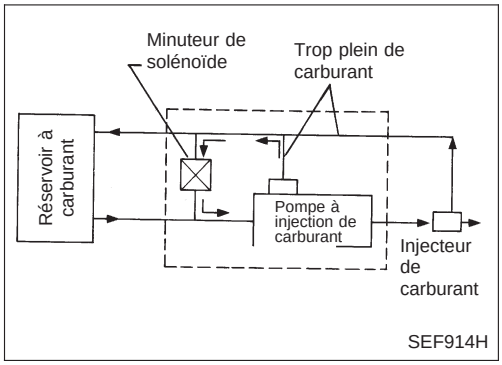
Si le résultat est mauvais, remplacer le potentiomètre.



Capteur de pression atmosphérique

Ce capteur est à l'intérieur de l'ECM et n'est pas rempla vrait pas fonctionner dans des conditions de pressions atmosphériques inférieures à 90,0 kPa (900 mbar, 675 mmHg).

Capteur de température du réfrigérant moteur

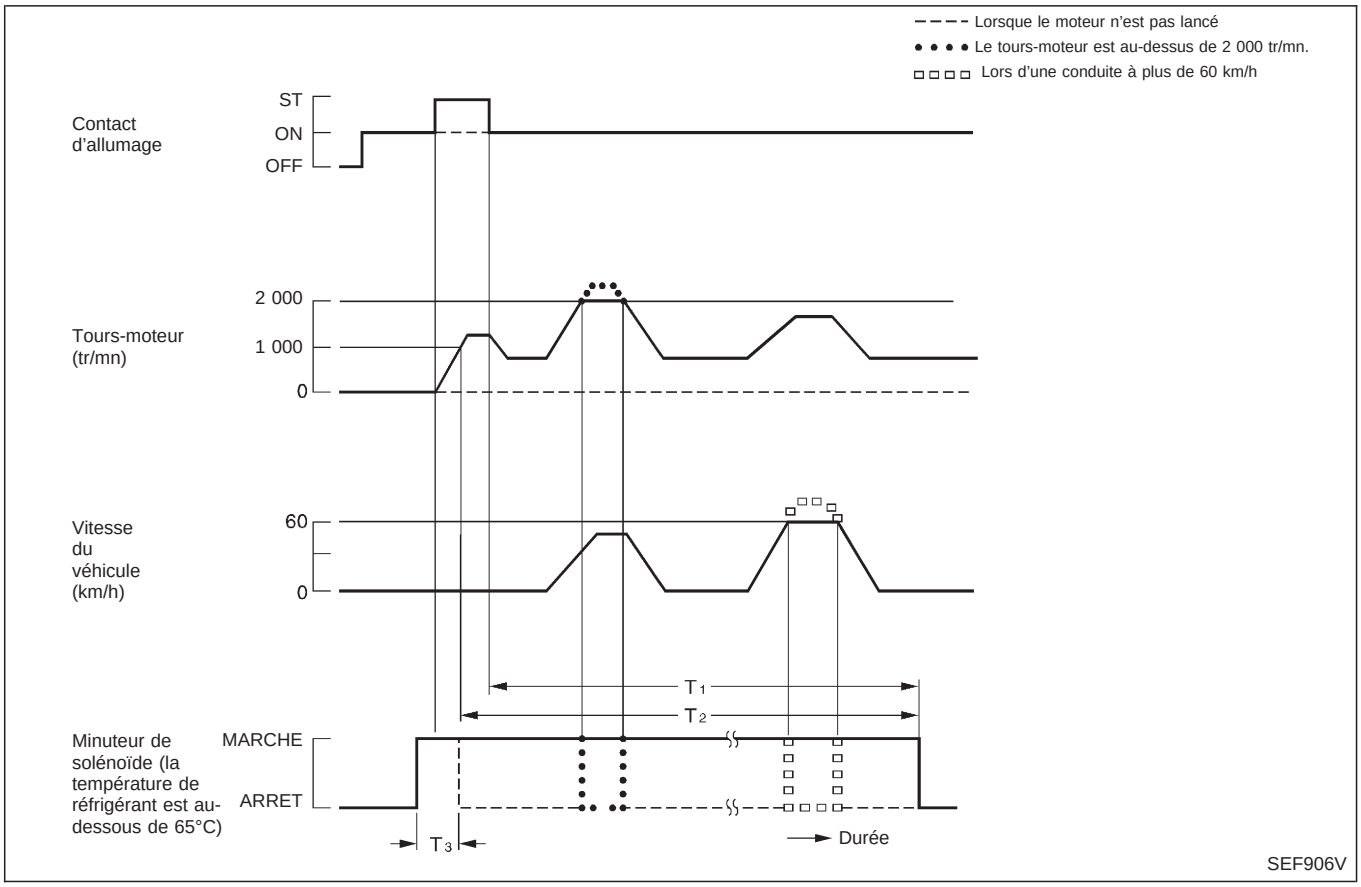


Consulter ''Inspection des composants'', ''SYSTEME DE PRECHAUFFAGE RAPIDE'', EC-214.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

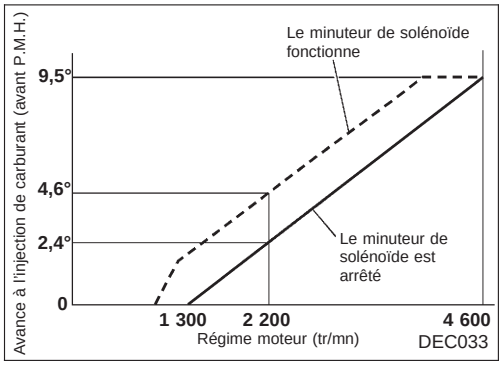
Description

Pour améliorer le démarrage, les modèles pour pays froids sont équipés d'un minuteur de solénoïde. Son objet est d'avancer l'avance à l'injection de carburant en fonction de la température du réfrigérant pendant une certaine période suivant le démarrage du moteur.
Le minuteur est contrôlé par le signal depuis le boîtier de commande de préchauffage (ou de l'ECM). En condition de démarrage à froid, l'unité de commande envoie un signal pour activer le mécanisme d'avancement de la pompe à injection.
Consulter ''Schéma de câblage'', ''SYSTEME DE PRECHAUFFAGE RAPIDE'', EC-203.



Fonctionnement

Une partie du carburant du conduit de retour est renvoyée à l'entrée de la pompe à injection quand le minuteur de solénoïde est coupé. Lors du démarrage à froid, le minuteur de solénoïde s'enclenche pour stopper le retour de carburant à l'admission. Ceci augmente la pression de carburant dans la pompe à injection de sorte que l'avance à l'injection progresse. La durée de l'avance à l'injection de carburant varie en fonction des changements de température du liquide de refroidissement.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Fonctionnement (Suite)

Quand la température du réfrigérant est inférieure à 65°C et que le moteur tourne dans les conditions définies par le régime moteur et le potentiomètre, le minuteur de solénoïde fonctionne. Il s'allume lorsque le contact d'allumage est tourné sur la position ''START''.
Le minuteur de solénoïde reste enclenché pendant T_1 ou T_2 secondes. Le T_1 démarre lorsque le régime moteur a atteint plus de 1 000 tr/mn sur la position START. Le T_2 démarre après que le contact d'allumage a été ramené à la position ON avec le moteur en marche.
Si le moteur ne démarre pas en T_3 secondes ou s'il s'arrête pendant plus de T_3 secondes, le chronomètre de solénoïde s'éteint. Il s'arrête également si le régime du moteur dépasse 2 000 tr/mn ou si la vitesse du véhicule dépasse 60 km/h, cependant il est rétabli si ces situations sont en dessous de la limite.

T_1, T_2 : 30 [sec.]
T_3 : env. 1 [sec.]

CARACTERISTIQUES DU MINUTEUR

Les illustrations indiquent les différences de l'avance à l'injection de carburant par rapport au régime moteur lorsque le minuteur de solénoïde est actionné ou non.
Lorsque le minuteur de solénoïde s'enclenche, l'avance à l'injection progresse d'environ 2°. Ainsi, le démarrage à froid du moteur par temps froid est grandement amélioré.

Inspection

CIRCUIT DE COMMANDE DU MINUTEUR DE SOLENOIDE

1. Connecter la lampe d'essai sur le boîtier de contrôle de préchauffage comme indiqué.
2. Débrancher le connecteur de faisceau de la borne ''S'' du moteur de démarreur.
3. S'assurer que la lampe d'essai s'allume quand le contact d'allumage est mis sur ''START''.
4. Mesurer le laps de temps durant lequel la lampe d'essai reste allumée lorsque le contact d'allumage est tourné de ''ON'' sur ''START''.

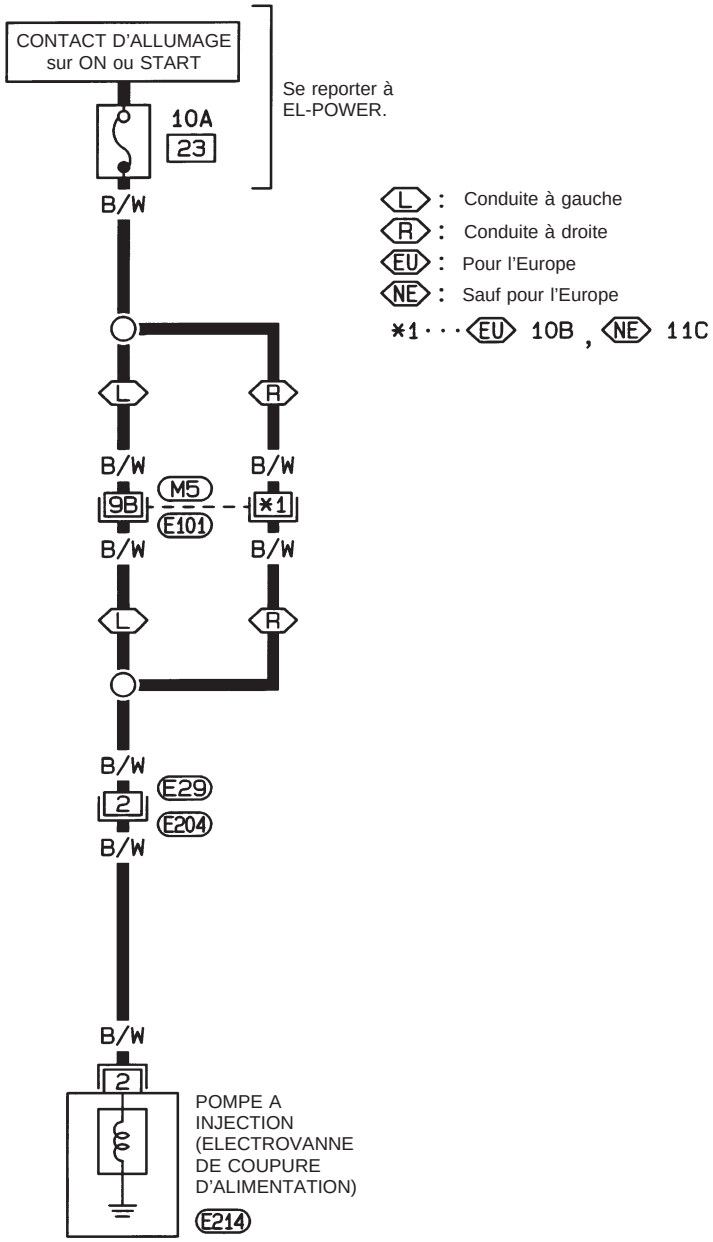
Temps pendant lequel la lampe d'essai doit rester allumée :

Environ 30 secondes à une température du réfrigérant inférieure à 65°C
0 seconde à une température du réfrigérant supérieure à 65°C.

MINUTEUR DE SOLENOIDE

1. Débrancher le faisceau de minuterie du solénoïde et s'assurer que le solénoïde émet un bruit de déclic lorsque la batterie est branchée et débranchée.
   Si le solénoïde comporte un défaut, le remplacer.

Rebrancher le connecteur après contrôle.



COURSE DU PISTON DE MINUTEUR (avec un appareil d'essai de pompe)

Mesurer les courses du piston de distribution aux régimes spécifiés de la pompe à injection quand le minuteur de solénoïde est allumé et éteint.
Consulter ''Calibrage standard de la pompe à injection'' dans les SDS.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

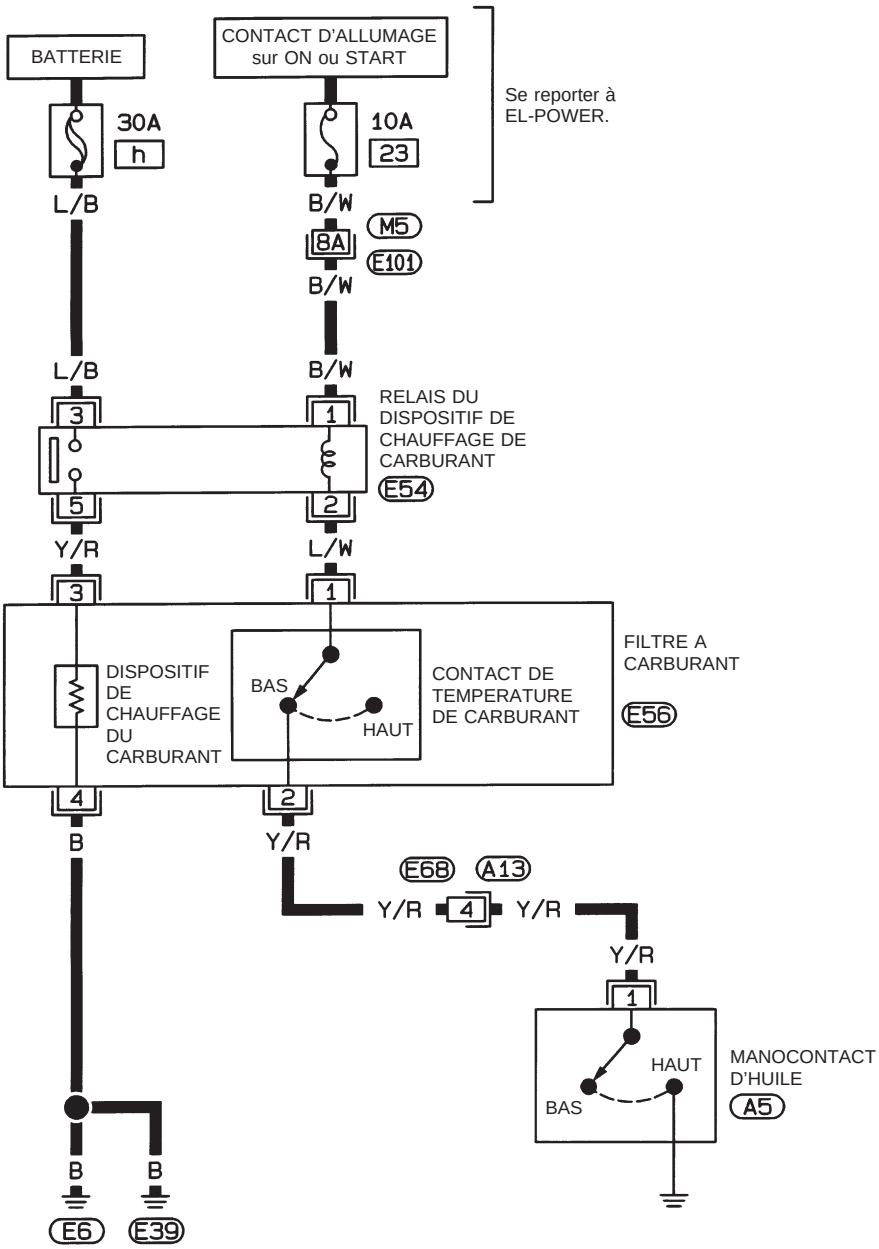
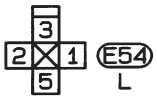
Description



Ce système permet d'éviter au filtre à carburant de se boucher avec de la cire de carburant.
Le système du dispositif de chauffage de carburant est actionné lorsque le contact de température de carburant et le manocontact d'huile fonctionnent.
Le contact de température de carburant est enclenché lorsque la température du carburant passe en-dessous de −15°C. Il reste enclenché jusqu'à ce que la température du carburant atteigne environ 0°C.
Si la température du carburant ne décroît pas au-dessous de −15°C, le contact de température de carburant ne s'enclenchera pas même si la température du carburant est au-dessous de 0°C.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

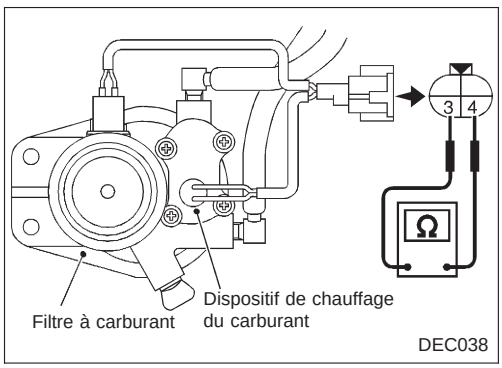
Inspection du système



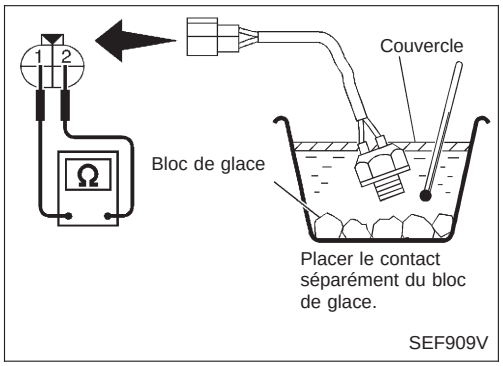
1. Mettre le contact d'allumage sur ''OFF''. Débrancher le connecteur de faisceau du contact de température de carburant.
2. Brancher le câble au plomp, comme indiqué, entre les bornes du contact de température de carburant.

3. Faire tourner le moteur à un régime de 1 000 tr/mn. Après quelques minutes, s'assurer que le dispositif de chauffage de carburant est chaud.

Faire attention à ne pas se brûler.

4. Si le dispositif de chauffage de carburant ne fonctionne pas, vérifier le faisceau de câble et les composants électriques du système de dispositif de chauffage du carburant.

Inspection des composants

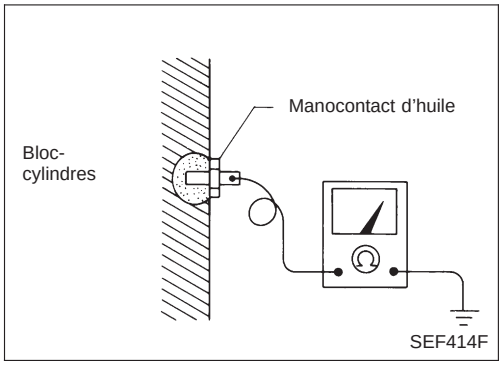


Dispositif de chauffage du carburant

1. Vérifier la continuité du dispositif de chauffage de carburant.
2. Si le dispositif de chauffage de carburant fonctionne mal, remplacer le dispositif de chauffage du filtre de carburant.

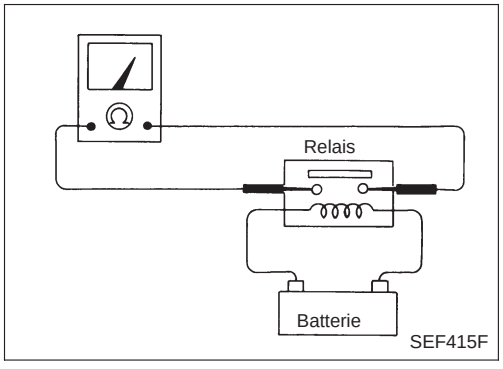
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection des composants (Suite)



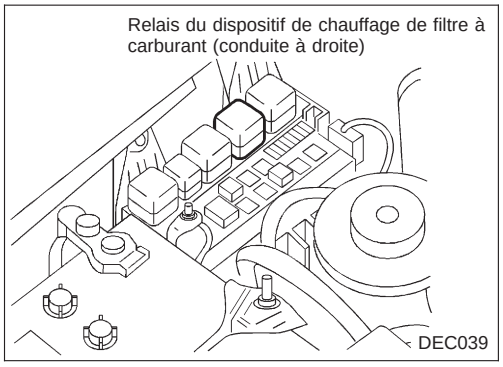
Contact de température de carburant

Déposer le contact de température de carburant et vérifier l'opération en changeant la température atmosphérique à l'aide d'un bloc de glace.



Température °C	Fonctionnement	Continuité
Diminué à moins 11 - 19	ARRET → MARCHE	MARCHE : existe.
Augmenté jusqu'à environ 0	Marche → Arrêt	ARRET : n'existe pas.

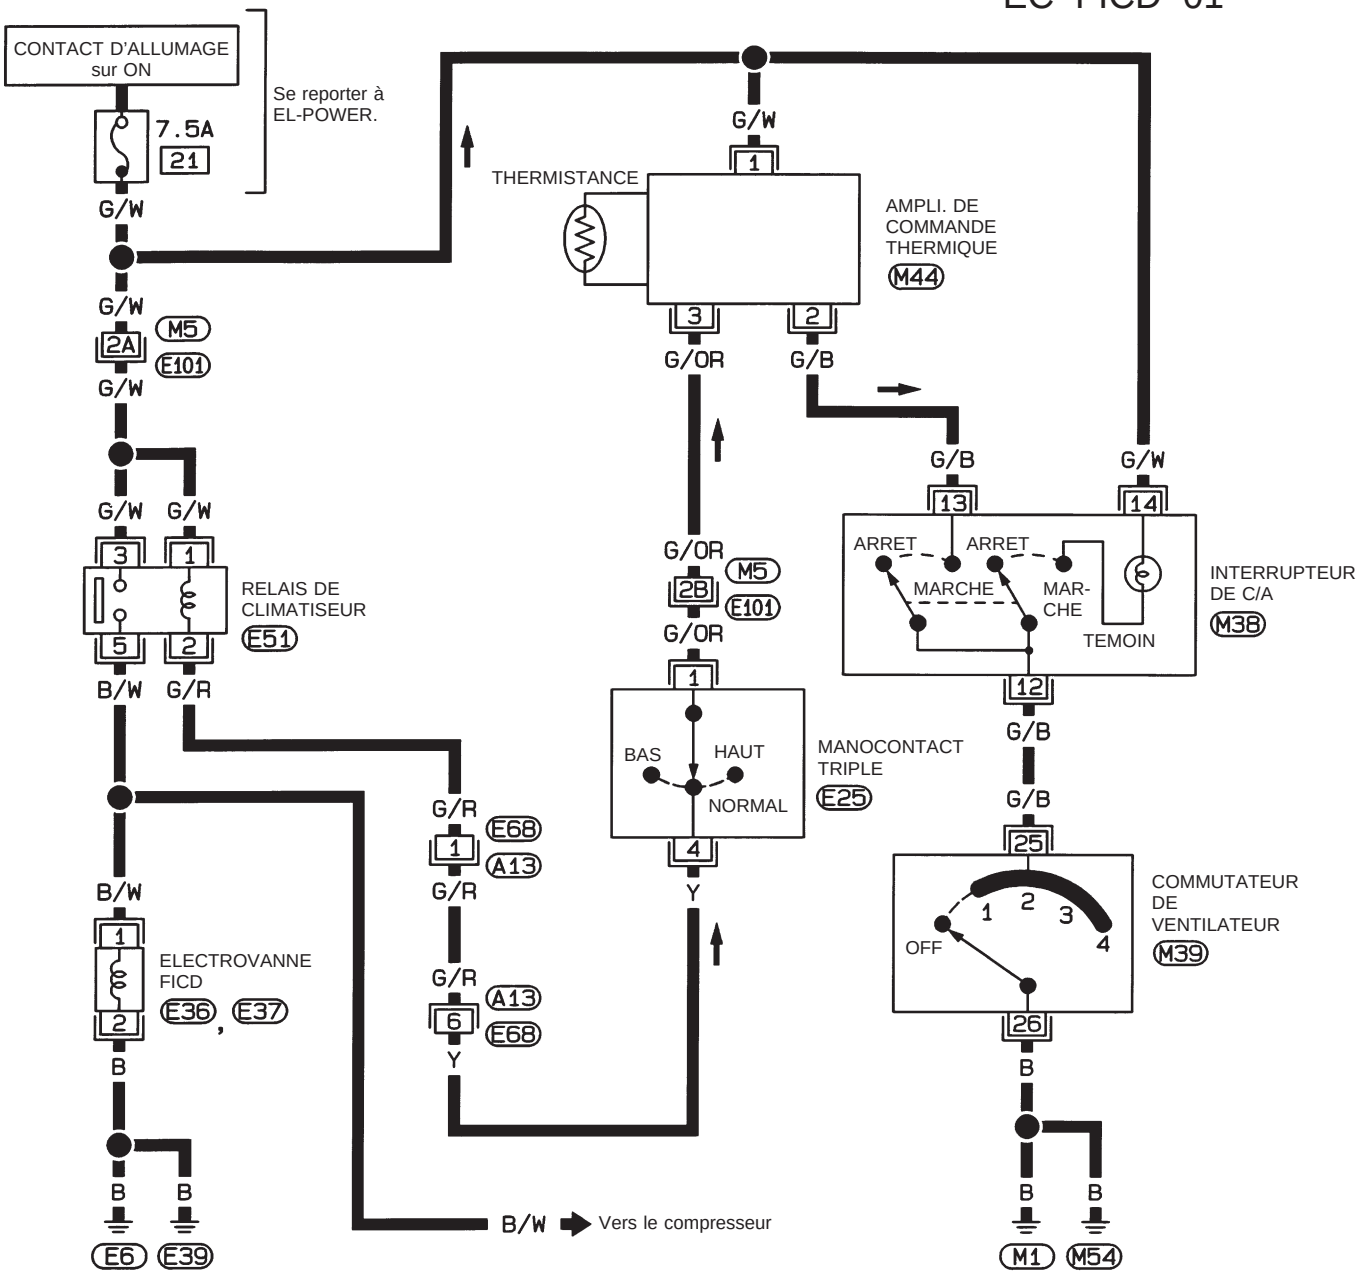
Si le résultat est mauvais, remplacer le contact de température de carburant.
Au montage, utiliser un nouveau joint torique.
AVERTISSEMENT :
Ne pas toucher le contact de température de carburant refroidi à main nue.



Manocontact d'huile

1. Faire tourner le moteur à un régime de 1 000 tr/mn.
2. Vérifier la continuité du manocontact d'huile.
3. Si le contact de pression d'huile comporte un défaut, le remplacer.

Relais du dispositif de chauffage de carburant



1. Vérifier le fonctionnement du relais du dispositif de chauffage de carburant.
2. Si le relais du dispositif de chauffage de carburant ne fonctionne pas, le remplacer.

Inspection des composants électriques

Electrovanne FICD

1. Débrancher les connecteurs de faisceau de l'électrovanne FICD et les flexibles à dépression.
2. Brancher le connecteur de l'électrovanne à la batterie et des flexibles à dépression appropriés à l'électrovanne comme indiqué dans la figure.
3. Insuffler de l'air dans les flexibles.
   Présence de débit d'air : bon
   Absence de débit d'air : mauvais

Si le résultat est mauvais, remplacer l'électrovanne FICD.

COMPOSANTS RELATIFS AU CLIMATISEUR

Calibrage standard de la pompe à injection (Suite)

Position de mesure de l'angle du levier de commande

Mesurer les angles (α, β) du levier de commande.

Réglage du minuteur de charge

1. Fixer le levier de commande dans une position satisfaisant aux conditions suivantes.
   Régime de la pompe : 1 100tr/mn
   Quantité de carburant injecté : 33,0±0,5 mℓ/1 000 course
2. Levier de commande positionné comme décrit au numéro 1 ci-dessus, régler le manchon du régulateur de façon à ce que la course du minuteur soit conforme aux valeurs spécifiées (élément 2 - 7).

Position du levier de commande			Valeurs spécifiées	
Régime de la pompe tr/mn	Quantité de carburant injecté mℓ/1 000 course	Pression de suralimentation kPa (mbar, mmHg)	Course du minuteur mm	Valeur de réduction de la course du minuteur mm
1 100	33,0±1,0	–	1,7	0,3±0,3
1 100	20,0±2,5*	–	1,1*	0,9±0,4*

* : Valeur de référence

Réglage du potentiomètre

1. Maintenir le levier de commande dans la position de ralenti.
2. Régler le potentiomètre de façon à ce que la tension de sortie soit de 5,64±0,03V. Puis fixer le potentiomètre.
3. Après avoir réglé le potentiomètre, déposer le faux boulon puis confirmer les spécifications de tension de sortie du potentiomètre ci-dessous.

Régime de la pompe tr/mn	Q'té d'njection de carburant mℓ/1 000 course	Tension de sortie V	Angle du levier de commande	Remarques
1 075	23,3±1,0	5,64±0,03	–	Point de réglage
–	1,34*	–	Ralenti	Point de vérification
–	Supérieur à 9,7	–	Plein	Point de vérification

* : Valeur de référence (Tension d'entrée : 10V)

Système de retenue supplémentaire ‘‘COUSSIN GONFLABLE’’ (SRS) (modèles à 4 roues motrices)

Utilisé avec une ceinture de sécurité, le ‘‘COUSSIN GONFLABLE’’ (air bag) du système de retenue supplémentaire contribue à réduire les risques ou la gravité des blessures subies par le conducteur en cas de collision frontale. Le système de retenue supplémentaire se compose d’un module de coussin gonflable (air bag) (situé dans le moyeu du volant), d’une unité de capteur de diagnostic, d’un témoin avertisseur, d’un faisceau de câblage et d’un câble spiralé. Les informations nécessaires à l’entretien en toute sécurité du système figurent à la **section RS** de ce Manuel de Réparation.

AVERTISSEMENT :

- **Pour ne pas affecter le fonctionnement du SRS, ce qui augmenterait les risques de blessures graves ou mortelles en cas de collision entraînant le déploiement du coussin gonflable (air bag), toutes les opérations d’entretien doivent être effectuées par un concessionnaire NISSAN agréé.**
- **Un entretien incorrect, y compris une mauvaise dépose ou repose du SRS, pourra entraîner des risques de blessures dues au déploiement accidentel du système.**
- **Ne pas utiliser d’équipement d’essai électrique sur les circuits connexes au SRS sauf si indiqué dans ce manuel de réparation. Les faisceaux de câblage électrique du SRS sont équipés d’une gaine d’isolation jaune, soit juste devant les connecteurs de faisceau, soit sur le faisceau tout entier, pour une identification plus rapide.**

Système de retenue supplémentaire ‘‘COUSSIN GONFLABLE’’ (SRS) (modèles à 2 roues motrices)

Utilisé avec une ceinture de sécurité, le ‘‘COUSSIN GONFLABLE’’ (air bag) du système de retenue supplémentaire contribue à réduire les risques ou la gravité des blessures subies par le conducteur en cas de collision frontale. Le système de retenue supplémentaire se compose d’un module de coussin gonflable (air bag) (situé dans le moyeu du volant), d’une unité de capteur de diagnostic, d’un témoin avertisseur et d’un câble spiralé. Les informations nécessaires à l’entretien en toute sécurité du système figurent à la **section RS** de ce Manuel de Réparation.

AVERTISSEMENT :

- **Pour ne pas affecter le fonctionnement du SRS, ce qui augmenterait les risques de blessures graves ou mortelles en cas de collision entraînant le déploiement du coussin gonflable (air bag), toutes les opérations d’entretien doivent être effectuées par un concessionnaire NISSAN agréé.**
- **Un entretien incorrect, y compris une mauvaise dépose ou repose du SRS, pourra entraîner des risques de blessures dues au déploiement accidentel du système.**
- **Ne pas utiliser d’équipement d’essai électrique sur les circuits connexes au SRS.**

Description

CONNECTEUR DE FAISCEAU

- Tous les connecteurs de faisceau ont été modifiés pour éviter qu'ils ne se desserrent ou ne se débranchent par accident.
- Le connecteur peut être débranché en enfonçant ou en soulevant la languette de verrouillage.

ATTENTION :
Ne pas tirer le faisceau lors du débranchement du connecteur.

[Exemple]

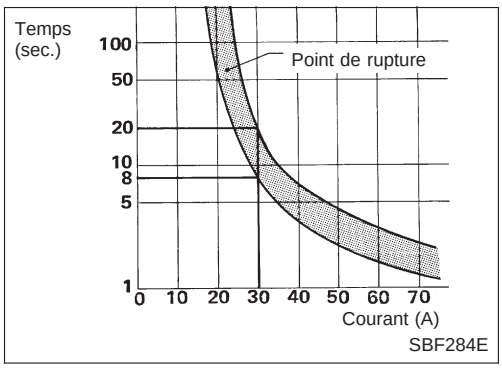
Fusible

a. Si un fusible saute, veiller à corriger l'origine de la défaillance avant de le remplacer.
b. Utiliser un fusible de l'ampérage spécifié. Ne jamais utiliser un fusible d'une valeur nominale supérieure à celle spécifiée.
c. Ne pas reposer le fusible à moitié ; toujours insérer correctement le fusible dans le porte-fusible.
d. Déposer le fusible ''ELEC B'' si le véhicule n'est pas utilisé pendant une longue période.



Raccord à fusible

Il est possible de repérer un raccord à fusible fondu à l'oeil nu, ou du bout du doigt. S'il y a un doute quant à son état, vérifier à l'aide d'un vérificateur de circuit ou d'une lampe d'essai.

ATTENTION :

- **Si un raccord à fusible fond, il se peut que le circuit correspondant (alimentation ou circuit porteur de forte intensité) soit en court-circuit. Dans un tel cas, il convient de procéder à une vérification soigneuse et de corriger le défaut.**
- **Ne jamais recouvrir l'extérieur d'un raccord à fusible de ruban adhésif en vinyle. Important : ne jamais laisser un raccord à fusible entrer en contact avec un faisceau de câblage ou toute autre pièce recouverte de vinyle ou de caoutchouc.**

Inspection du rupteur

Par exemple, dans le cas d'un courant de 30A, le circuit est coupé en 8 à 20 secondes.

Les rupteurs sont utilisés dans les systèmes suivants.

- Lève-glace électrique
- Verrouillage électrique de porte
- Circuit de multi-télécommande

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

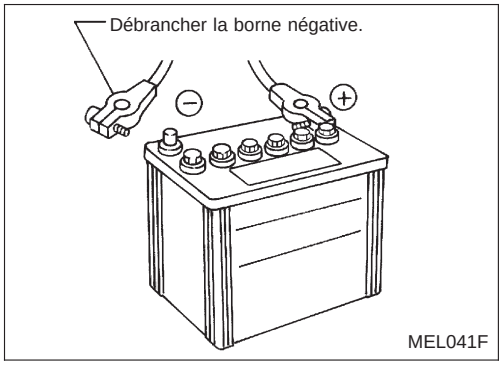
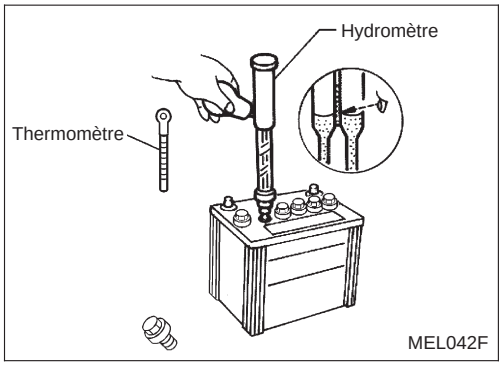
ATTENTION :
S'il est nécessaire de mettre le moteur en marche avec une batterie d'appoint et des câbles,
a. Utiliser une batterie d'appoint de 12 volts.
b. Après avoir raccordé les câbles de la batterie, s'assurer qu'ils sont fermement fixés aux bornes, afin d'assurer un bon contact.
c. Ne jamais rajouter de l'eau distillée par l'orifice servant à contrôler la densité.



Comment manipuler la batterie



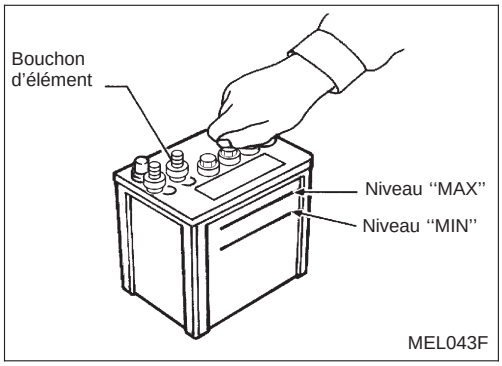
METHODES DE PREVENTION CONTRE L'EXCES DE DECHARGE

Les précautions suivantes doivent être prises pour éviter de décharger avec excès une batterie.

- La surface de la batterie (en particulier le haut) doit toujours rester propre et au sec.
- Les cosses doivent être propres et bien serrées.
- Contrôler le niveau d'électrolyte lors de toute révision périodique.
  Ceci s'applique aussi aux batteries désignées par ''entretien faible'' et ''sans entretien''.

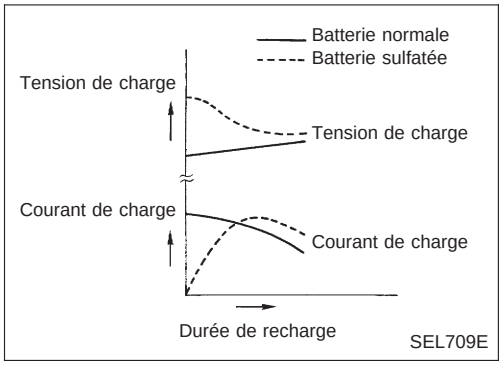
- Lorsque le véhicule ne va pas être utilisé pendant une longue période, débrancher la borne négative de la batterie.

- Vérifier l'état de charge de la batterie.
  Vérifier périodiquement la densité d'électrolyte. Toujours garder un œil sur l'état de charge, pour éviter tout excès de décharge.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Comment manipuler la batterie (Suite)

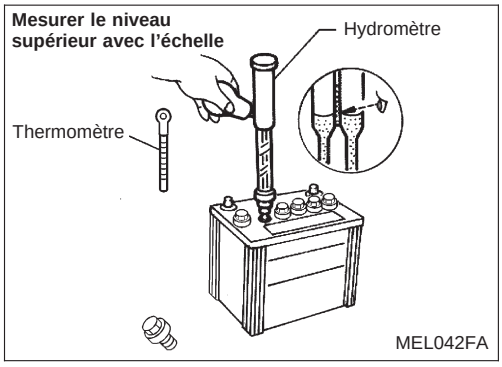


CONTROLE DE LA DENSITE DE L'ELECTROLYTE

AVERTISSEMENT :

Ne jamais laisser l'électrolyte entrer en contact avec la peau, les yeux, les tissus ou les surfaces peintes. Après avoir touché une batterie, ne pas se toucher les yeux ou se les frotter avant de s'être soigneusement lavé les mains. Si de l'acide entre en contact avec les yeux, la peau ou les vêtements, rincer immédiatement à l'eau claire pendant 15 minutes et consulter un médecin.

- Déposer le bouchon d'élément à l'aide d'un outil adéquat.
- Rajouter de l'eau distillée jusqu'au repère de niveau MAXI.



SULFATAGE

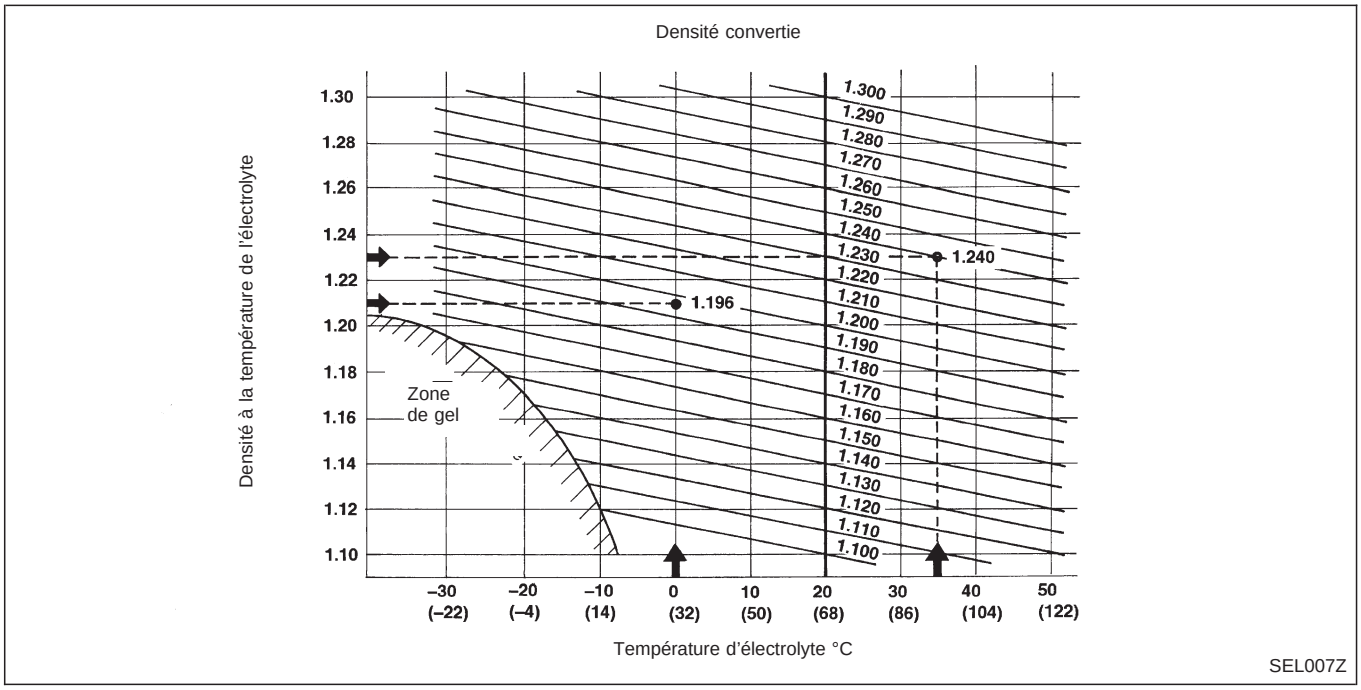
La batterie se décharge complètement lorsqu'elle est inutilisée pendant longtemps et que sa densitée chute au dessous de 1 100. Cela peut entraîner le sulfatage des plaques d'élément.

Pour déterminer si une batterie a été ''sulfatée'', noter sa tension et son courant lors de sa recharge. Comme indiqué dans la figure, si la batterie a été sulfatée, on observe un courant moindre et une tension supérieure au stade initial de la recharge.

Une batterie sulfatée devra parfois être remise en état au moyen d'une recharge longue et lente, pendant 12 heures ou plus, suivi d'un test de capacité de batterie.

VERIFICATION DE LA DENSITE

1. Lire les indications de l'hydromètre et du thermomètre au niveau des yeux.

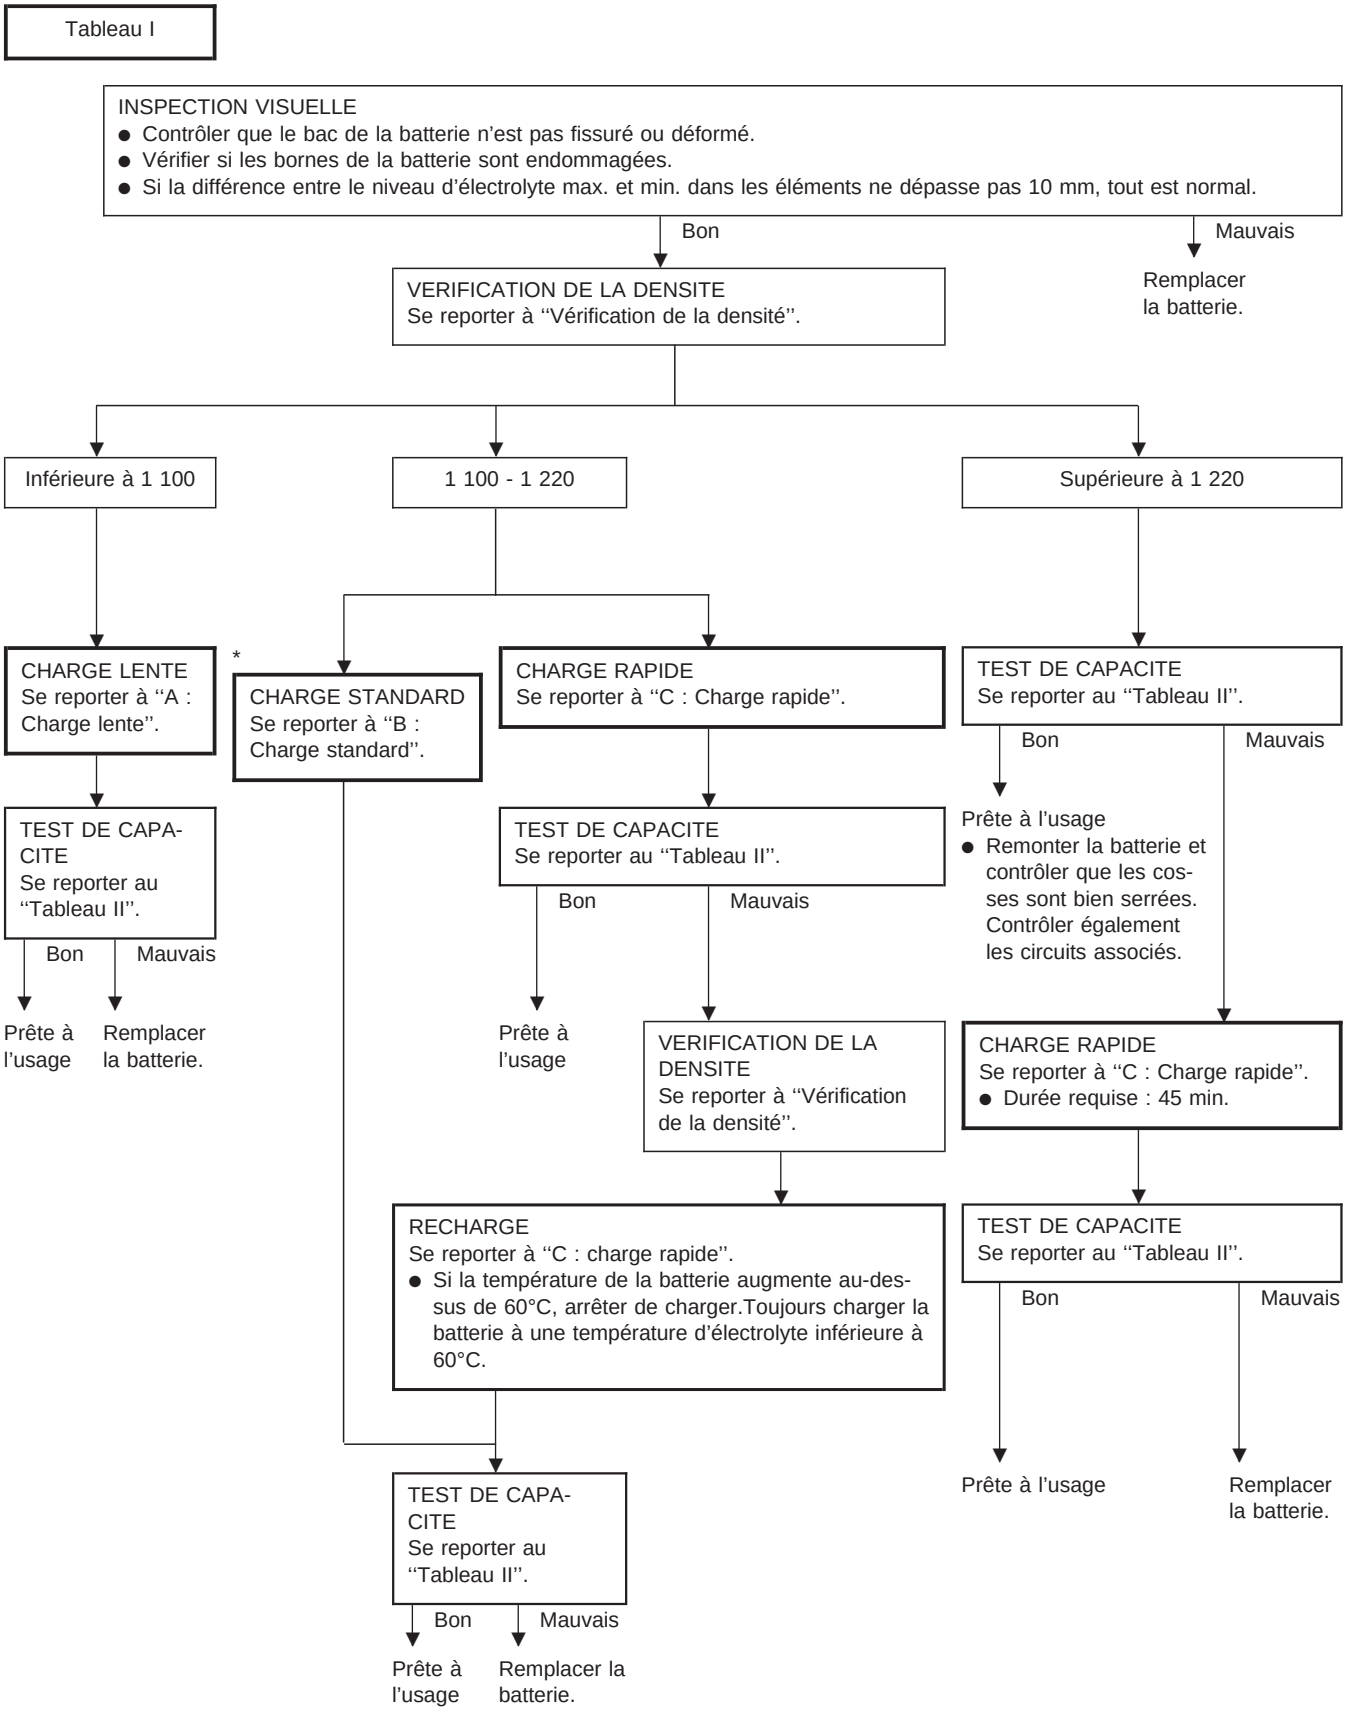


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Comment manipuler la batterie (Suite)

2. Convertir la valeur relevée en densité à 20°C.

Exemple :



- Quand la température de l'électrolyte est de 35°C et la densité de l'électrolyte de 1 230, la densité convertie à 20°C est de 1 240.
- Quand la température de l'électrolyte est de 0°C et la densité de l'électrolyte de 1 210, la densité convertie à 20°C est de 1 196.

C : CHARGE RAPIDE

Déterminer le réglage du courant de charge initial et la durée de charge à partir de la densité en se reportant à la figure 6.

↓

Charger la batterie.

↓

Passer à "TEST DE CAPACITE".

Fig. 6 REGLAGE DU COURANT DE CHARGE INITIAL ET TEMPS DE CHARGE (Charge rapide)

TYPE DE BATTERIE		28B19R(L) 34B19R(L)	46B24R(L) 55B24R(L) 50D23R(L)	55D23R(L) 65D26R(L) 80D26R(L)	75D31R(L) 95D31R(L) 115D31R(L) 95E41R(L)	130E41R(L)
COURANT [A]		10 (A)	15 (A)	20 (A)	30 (A)	40 (A)
DENSITE SPECIFIQUE CONVERTIE	1 100 - 1 130	2,5 heures				
	1 130 - 1 160	2 heures				
	1 160 - 1 190	1,5 heures				
	1 190 - 1 220	1 heure				
	Supérieure à 1 220	0,75 heure (45 min.)				

- Vérifier le type de batterie et déterminer le courant spécifié à partir des indications du tableau ci-dessus.
- Après le début de la recharge, il est inutile d'ajuster le courant de charge.

ATTENTION :

- **Ne pas avoir recours à la méthode de charge rapide pour une batterie dont la densité est inférieure à 1 100.**
- **Régler le courant de charge initial en fonction de la valeur spécifiée à la figure 6. Si la capacité du chargeur ne permet pas d'obtenir l'intensité prescrite, régler le courant de charge aussi près que possible de cette valeur.**
- **Ne pas approcher de flammes de la batterie pendant la charge.**
- **Pour connecter le chargeur, brancher les fils conducteurs en premier, puis mettre le chargeur sous tension. Ne pas commencer par mettre le chargeur sous tension : ceci pourrait produire des étincelles.**
- **Faire attention à l'élévation de la température de la batterie étant donné que l'opération de charge rapide implique un passage de courant considérable.**
  Si la température de la batterie augmente au-dessus de 60°C, arrêter de charger. Toujours charger la batterie à une température d'électrolyte inférieure à 60°C.
- **Ne jamais dépasser le temps de charge spécifié dans la figure 6 car, si on le dépasse, on risque de provoquer une détérioration de la batterie.**

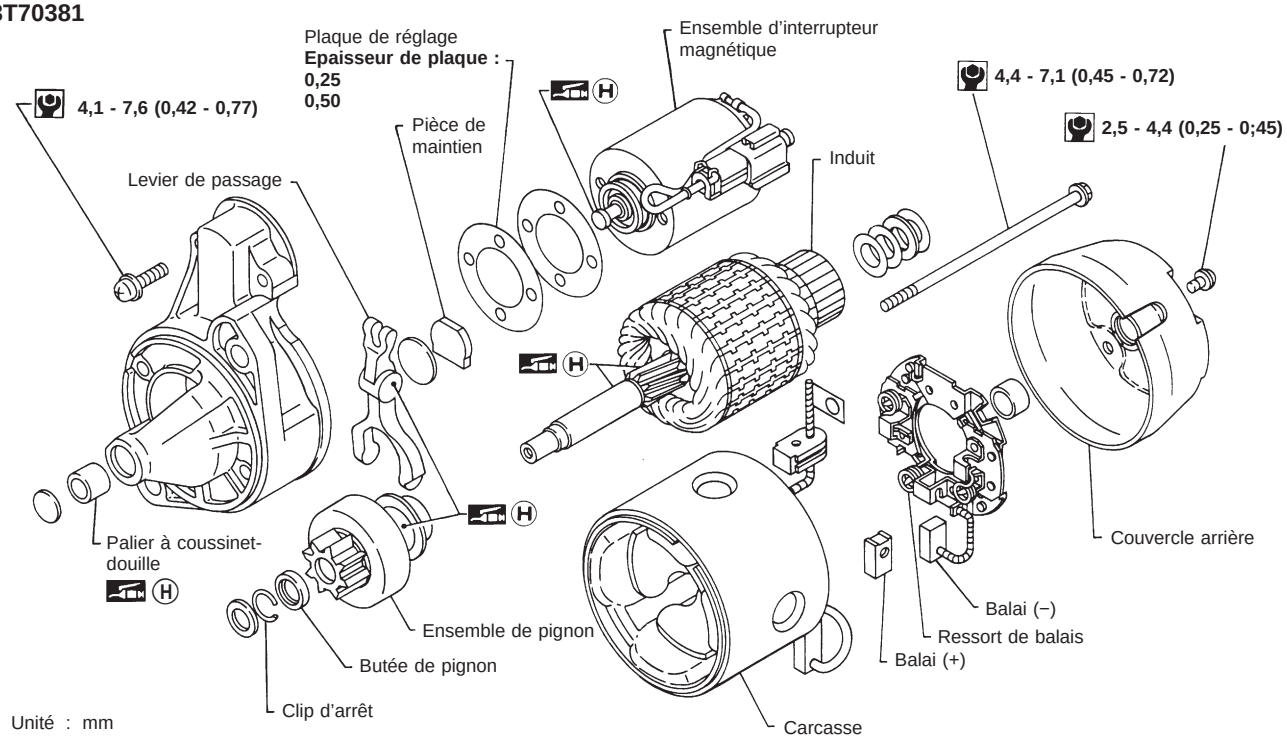
Diagnostics des défauts

S'il y a une anomalie, débrancher immédiatement la borne négative de la batterie.

Le démarreur ne s'arrête pas. → Remplacer le contact magnétique.

Le moteur ne démarre pas.

Est-ce qu'on peut lancer le moteur ?
- Oui → Est-ce que le moteur tourne normalement ?
  - Oui → Vérifier le système d'allumage/carburant.
  - Non (tourne lentement). → Vérifier la batterie comme suit :
    - Condition de charge
    - Raccords de borne
    - Corrosion de borne
    - Bon → Réparer le démarreur.
    - Mauvais → Ⓐ
- Non → Est-ce que le démarreur tourne ?
  - Oui → Est-ce que l'arbre de pignon tourne ?
    - Oui → Vérifier l'embrayage de pignon.
    - Non → Vérifier le pignon de réduction, l'induit et l'arbre de pignon.
  - Non → Vérifier le fusible et le raccord à fusible.
    - Mauvais → Remplacer.
    - Bon → Vérifier la batterie comme suit :
      - Condition de charge
      - Raccords de borne
      - Corrosion de borne
      - Mauvais → Ⓐ
        - Charger la batterie.
        - Réparer les raccords et retirer la corrosion des bornes de la batterie.
      - Bon → Vérifier le câblage du système de démarrage.
        - Mauvais → Réparer.
        - Bon → L'interrupteur magnétique produit-il le bruit caractéristique d'enclenchement ?
          - Non → Remplacer l'interrupteur magnétique.
          - Oui → Contrôler l'état du pignon et la denture de la couronne.
            - Mauvais
              - Régler la course du pignon.
              - Contrôler le mécanisme de manoeuvre du pignon.
              - Contrôler la couronne dentée.
            - Bon → Le démarreur tourne-t-il à vide lorsque le branchement suivant est effectué ?



- Oui → Remplacer l'interrupteur magnétique.
- Non → Réparer le démarreur.

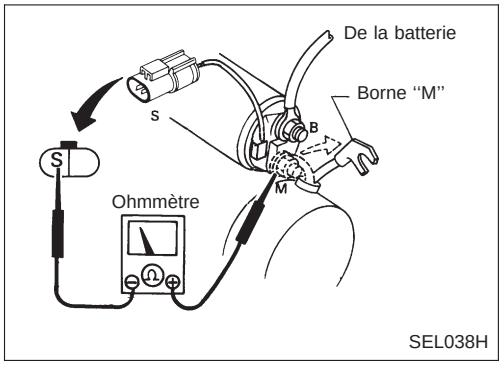
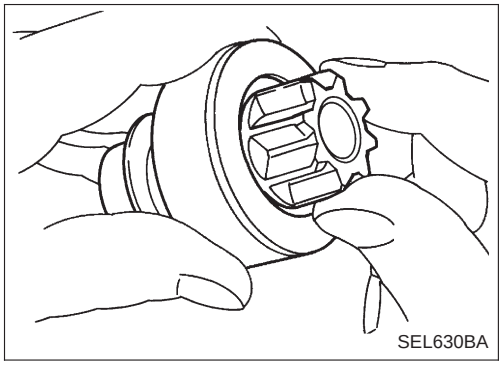
Dépose et repose



Inspection

VERIFICATION DE L'INTERRUPTEUR MAGNETIQUE

- Avant de commencer la vérification, débrancher le câble de masse de la batterie.
- Débrancher la borne "M" du démarreur.



1. Effectuer un essai de continuité (entre la borne "S" et le corps d'interrupteur).

- Absence de continuité ... Remplacer.

2. Effectuer un essai de continuité (entre les bornes "S" et "M").

- Absence de continuité ... Remplacer.

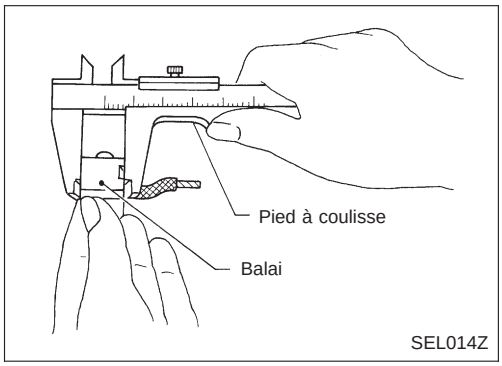
CONTROLE PIGNON/EMBRAYAGE

1. Vérifier les dents du pignon.

- Remplacer le pignon si les dents sont usées ou endommagées (dans ce cas, contrôler également l'état des dents de la couronne).

2. Vérifier les dents du pignon réducteur (selon modèles).

- Remplacer le pignon réducteur si les dents sont usées ou endommagées (dans ce cas, contrôler également l'état des dents du pignon d'arbre d'induit).



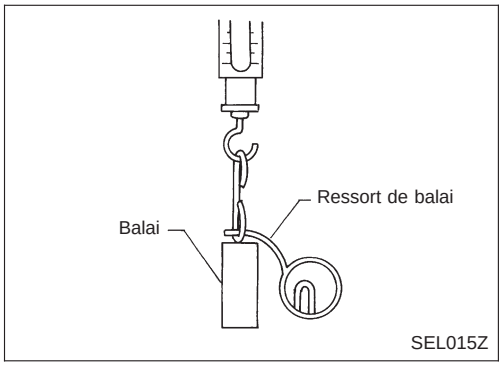
3. Vérifier si le pignon se bloque dans un sens et tourne librement dans le sens inverse.

- S'il se bloque ou tourne dans les deux sens ou qu'une résistance inhabituelle est évidente ... Remplacer.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (Suite)

VERIFICATION DES BALAIS

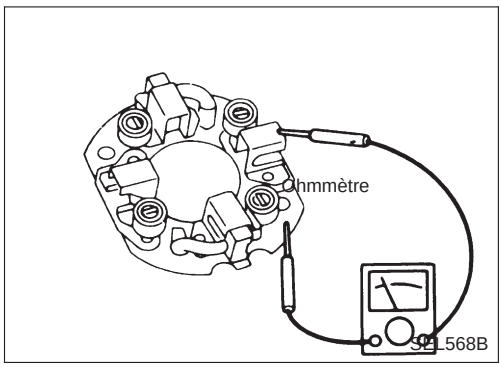


Balais

Vérifier le degré d'usure de chaque balai.

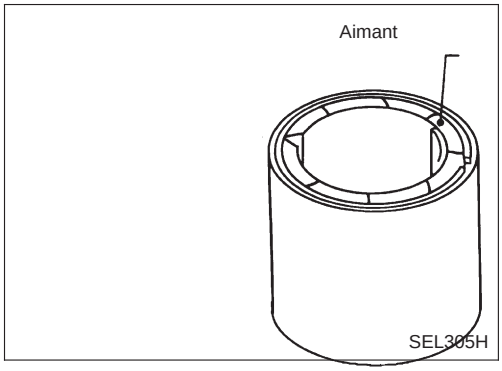
Limite d'usure (longueur) :
Se reporter aux SDS, EL-34.

- Usure excessive ... Remplacer.



Pression du ressort de balais

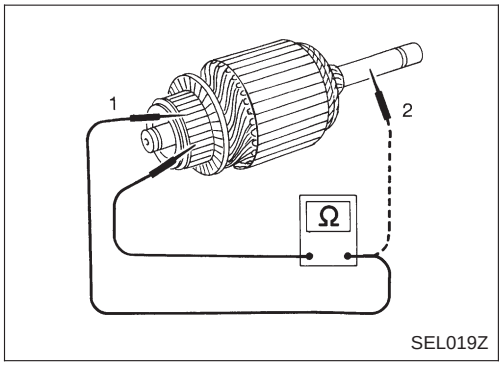
Vérifier la pression du ressort des balais en séparant le ressort des balais.



Pression du ressort (avec balai neuf) :
Se reporter aux SDS, EL-34.

- Si la valeur obtenue n'est pas conforme ... Remplacer.

Porte-balais

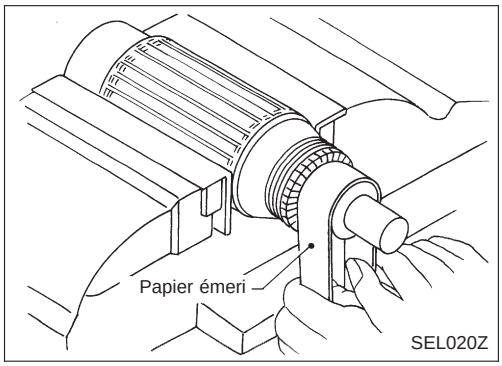


1. Effectuer un essai d'isolation entre le porte-balai (côté positif) et son embase (côté négatif).
- Il y a continuité ... Remplacer.
2. Vérifier si le mouvement du balai est bien régulier.
- Remplacer le porte-balais s'il est tordu et le nettoyer si sa paroi de coulissement est sale.

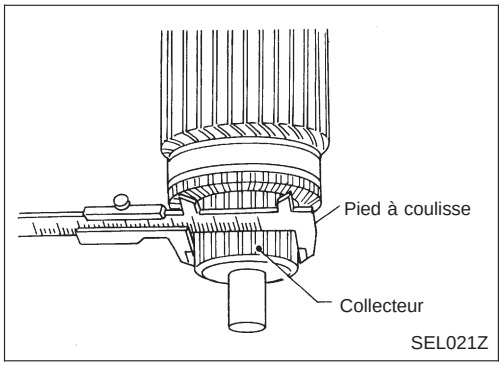
VERIFICATION DE LA CARCASSE

L'aimant est fixé à la carcasse par de la résine. Contrôler que l'aimant est bien fixé à la carcasse et qu'il n'y a aucune fissure. Remplacer les pièces défectueuses comme un ensemble.

ATTENTION :
Ne pas serrer la carcasse dans un étau et ne pas la frapper avec un maillet.

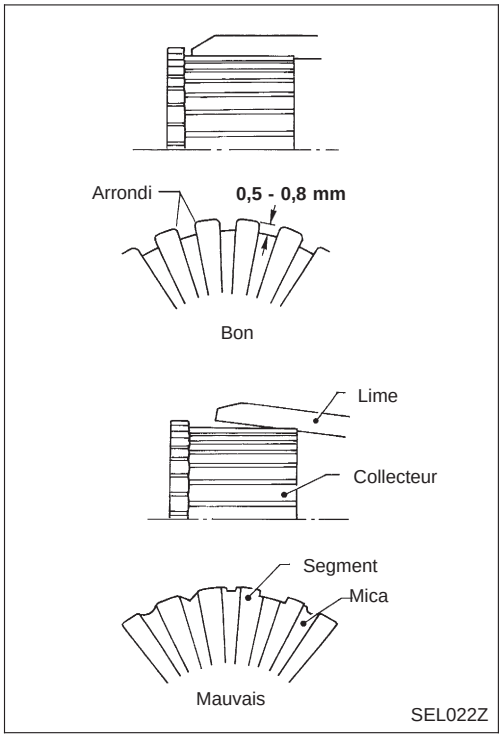


VERIFICATION DE L'INDUIT



1. Effectuer un essai de continuité (entre les deux segments côte à côte).
- Absence de continuité ... Remplacer.
2. Effectuer un essai d'isolation (entre chaque segment de collecteur et l'arbre).
- Il y a continuité ... Remplacer.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

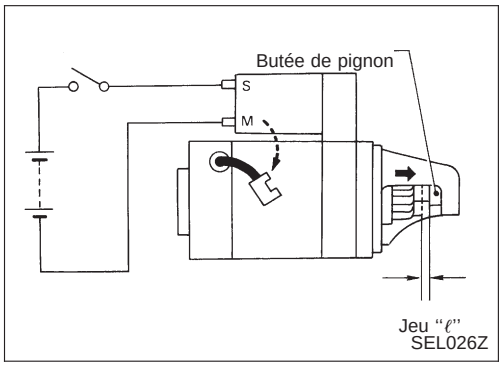


Inspection (Suite)

3. Vérifier la surface du collecteur.
- Rugueuse ... poncer doucement avec un papier émeri n° 500 - 600.

4. Vérifier le diamètre du collecteur.
Diamètre minimum du collecteur :
Se reporter aux SDS, EL-34.
- Inférieur à la valeur spécifiée ... Remplacer.

5. Vérifier la profondeur des isolants en mica depuis la surface du collecteur.
- Moins de 0,2 mm ... Limer jusqu'à 0,5 à 0,8 mm



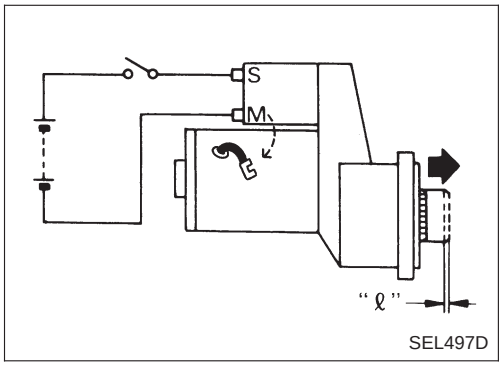
Remontage

Lubrifier de graisse haute température le roulement, les pignons et les surfaces de friction lors du remontage du démarreur. Observer avec soin les instructions suivantes.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Remontage (Suite)

REGLAGE DE LA DIMENSION DE DEPASSEMENT DU PIGNON

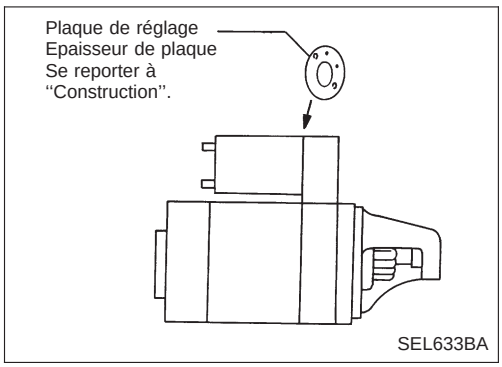


Jeu "ℓ"

Le pignon étant chassé vers l'extérieur par l'interrupteur magnétique, repousser le pignon vers l'arrière pour éliminer le jeu, et mesurer le jeu "ℓ" entre le bord avant du pignon et la butée.

Jeu "ℓ" :

Se reporter aux SDS, EL-34.



Mouvement "ℓ"

Comparer le mouvement "ℓ" dans la hauteur de pignon lorsque le pignon est poussé vers l'extérieur avec l'interrupteur magnétique sous tension et lorsqu'on le sort à la main jusqu'à ce qu'il touche la butée.

Mouvement "ℓ" :

Se reporter aux SDS, EL-34.

- Le jeu n'est pas dans les valeurs spécifiées ... Le régler à l'aide de la plaque de réglage.

Diagnostics des défauts

Avant de faire un essai d'alternateur, s'assurer que la batterie est complètement chargée. Pour cet essai, il faut disposer d'un voltmètre de 30 volts et de sondes d'essais convenables. L'alternateur peut être facilement vérifié en se référant au tableau d'inspection.

- **Avant de démarrer, inspecter le raccord à fusible.**
- **Utiliser une batterie complètement chargé.**

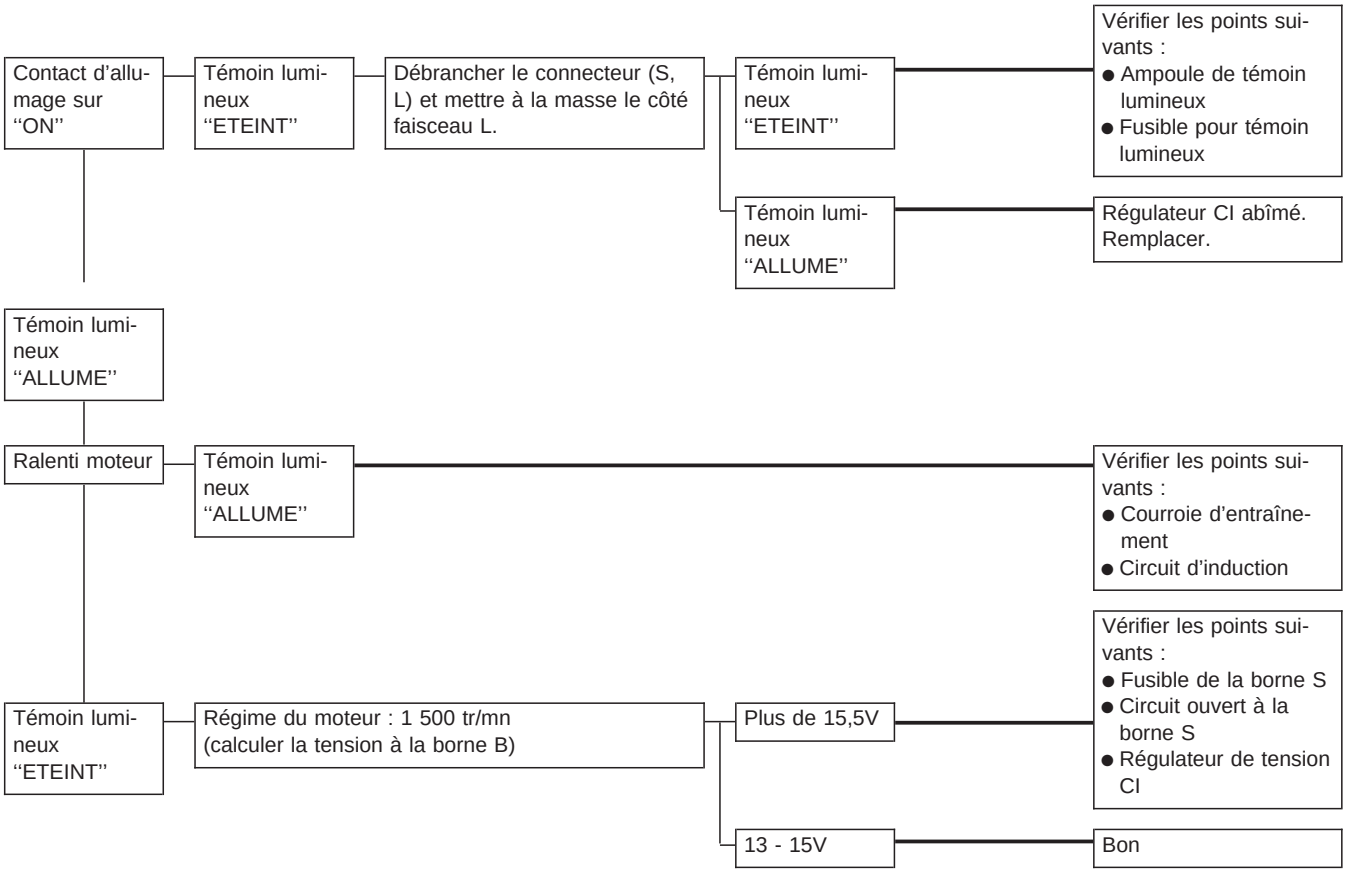
MOTEURS A ESSENCE

Témoin lumineux : témoin de "CHARGE" des instruments combinés

Note :

- **Si le résultat de l'inspection est satisfaisant même si le système de charge ne fonctionne pas, vérifier le raccord de la borne B (vérifier le couple de serrage).**
- **Lorsque le circuit d'induction est ouvert, vérifier l'état de la bobine, de la bague collectrice et du balai du rotor. Si nécessaire, remplacer les pièces défectueuses par des nouvelles.**

Témoin de défaut



Le témoin "CHARGE" s'allume grâce à la fonction d'alarme du régulateur CI (circuit intégré) si l'un des symptômes suivants se présente lorsque l'alternateur est en marche :

- Le circuit d'induction est ouvert.
- Une tension excessive est produite.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostics des défauts (Suite)

MOTEUR DIESEL

Témoin lumineux :Témoin lumineux "CHARGE" dans les instruments combinés

Dépose et repose

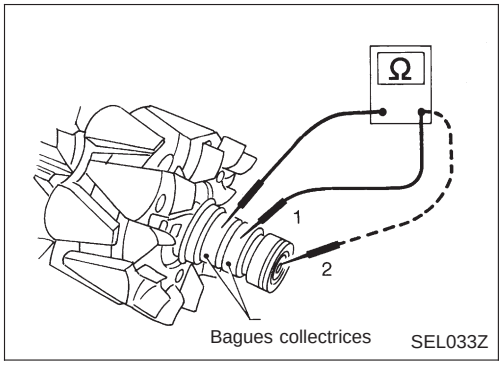
ATTENTION :

- **Commencer la procédure d'entretien après avoir déposé la borne négative de la batterie.**
- **Déposer aussi le capot inférieur, selon modèles, avant l'entretien.**

Démontage

COUVERCLE ARRIERE

ATTENTION :



Le couvercle arrière peut être difficile à déposer parce qu'un anneau est utilisé pour verrouiller la cuvette externe du roulement arrière. Pour faciliter la dépose du couvercle arrière, chauffer seulement le boîtier de roulement avec un fer à souder de 200W.

Ne pas utiliser un pistolet à air chaud car cela pourrait abîmer l'ensemble de diode.

ROULEMENT ARRIERE

ATTENTION :

- **Ne pas réutiliser le roulement arrière après la dépose. Remplacer par un neuf.**
- **Ne pas lubrifier la cuvette externe du roulement arrière.**

Inspection

VERIFICATION DU ROTOR

1. Test de résistance

   Résistance : se reporter aux SDS, EL-42.

- Si la valeur obtenue n'est pas conforme ... Remplacer le rotor.

2. Effectuer un essai d'isolation.

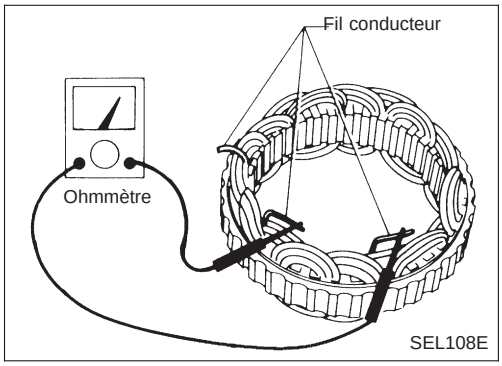
- Il y a continuité ... Remplacer le rotor.

3. Vérifier le degré d'usure des bagues collectrices.

   Diamètre externe minimum de la bague collectrice :
   Se reporter aux SDS, EL-42.

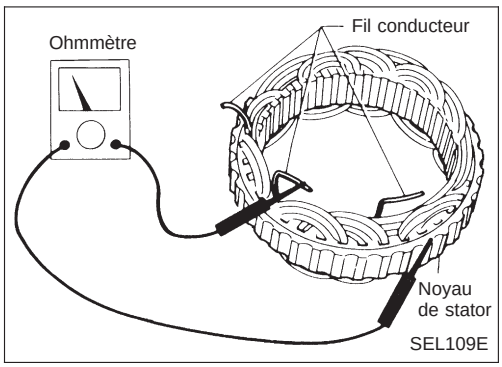
- Si la valeur obtenue n'est pas conforme ... Remplacer le rotor.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



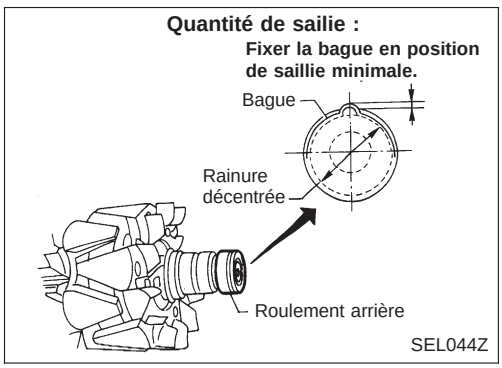
Inspection (Suite)

VERIFICATION DES BALAIS



1. Vérifier le mouvement régulier du balai.
- Mouvement irrégulier ... Vérifier le porte-balai et le nettoyer.
2. Vérifier l'usure du balai.
- Remplacer le balai s'il est usé jusqu'àu repère limite.

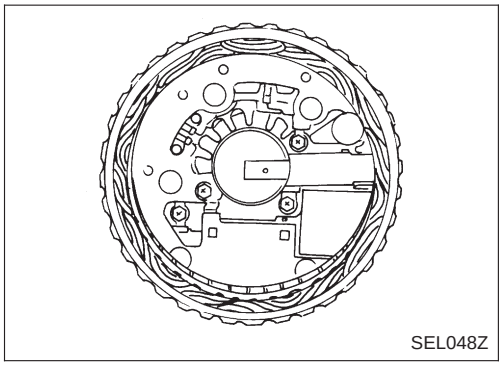
VERIFICATION DU STATOR



1. Essai de continuité
- Absence de continuité ... Remplacer le stator.

2. Essai de masse
- Il y a continuité ... Remplacer le stator.

Remontage

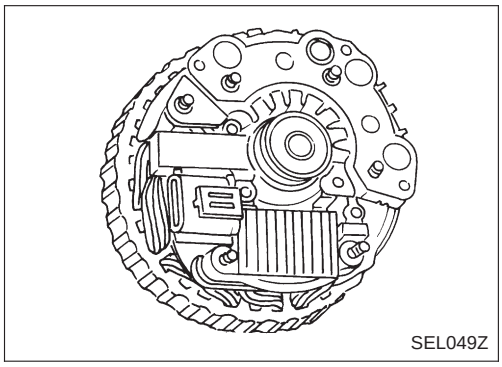


REGLAGE DE LA BAGUE DE ROULEMENT ARRIERE

- Fixer la bague dans la rainure de roulement arrière de façon qu'elle s'approche de la partie adjacente autant que possible.

ATTENTION :
Ne pas réutiliser le roulement arrière après la dépose.

REPOSE DU COUVERCLE ARRIERE



1. Mettre en place l'ensemble de balais, l'ensemble de diode, l'ensemble de régulateur et le stator.
2. Pousser les balais vers le haut avec les doigts et les reposer sur le rotor.

Veiller à ne pas endommager la paroi de coulissement de la bague collectrice.

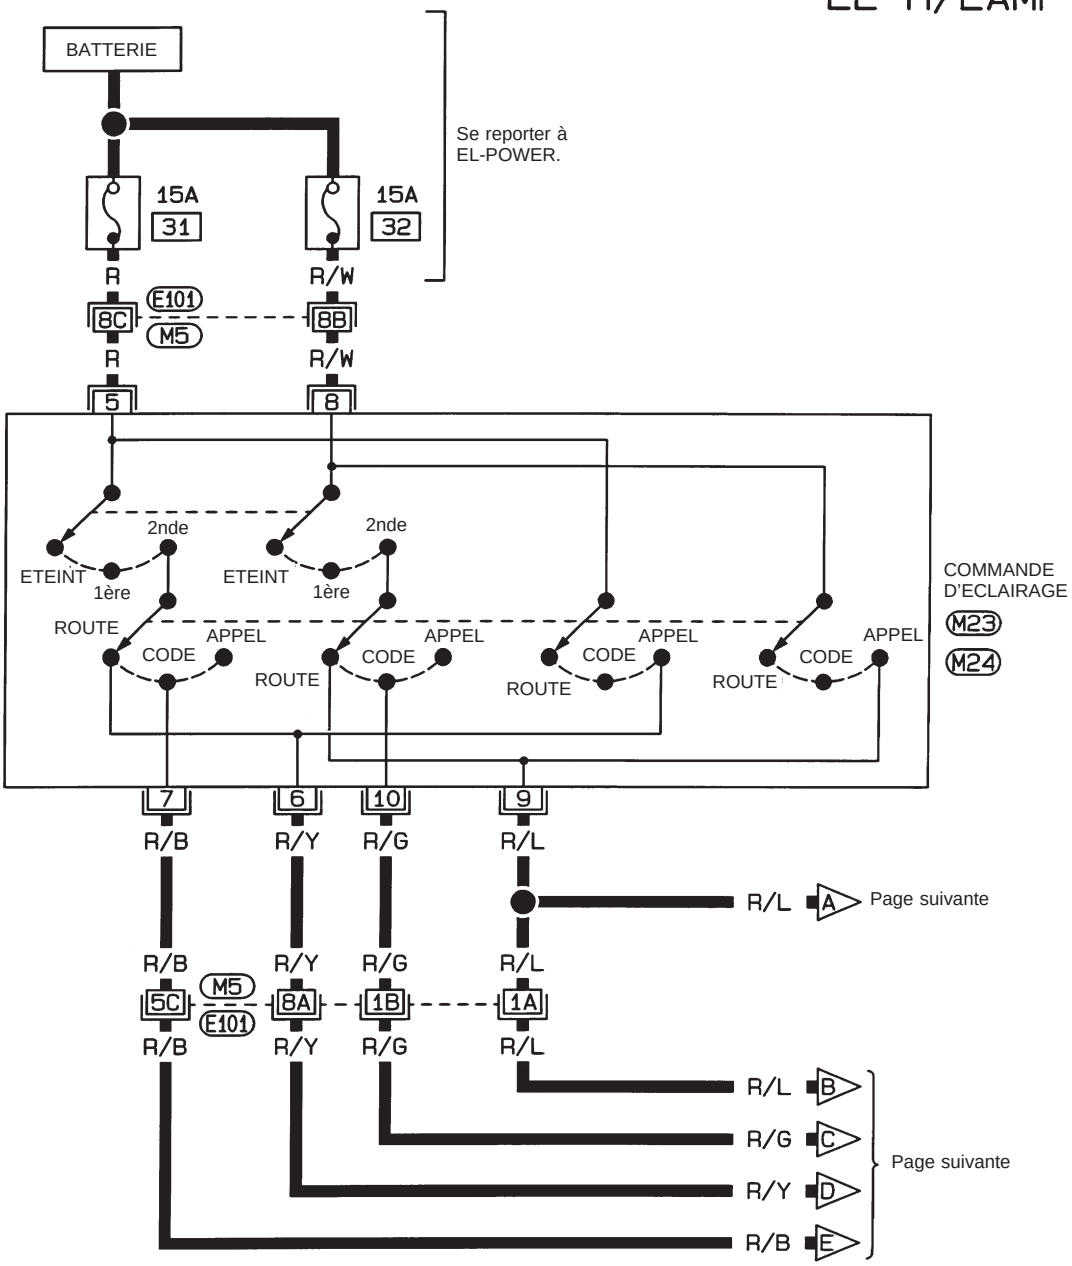
Remplacement

Pour la dépose et la repose du câble spiralé, se reporter à la section RS ["Repose – Module de coussin gonflable et câble spiralé", "SYSTEME DE RETENUE SUPPLEMENTAIRE (SRS)"]

- Chaque interrupteur peut être remplacé sans qu'il soit nécessaire de déposer la base de commande combinées.

- Pour déposer la base de la commande combinée, déposer la vis fixant la base.



- Avant de reposer le volant, aligner les goupilles de guidage avec les vis qui fixent la commande combinée comme indiqué dans l'illustration.

Diagnostics des défauts

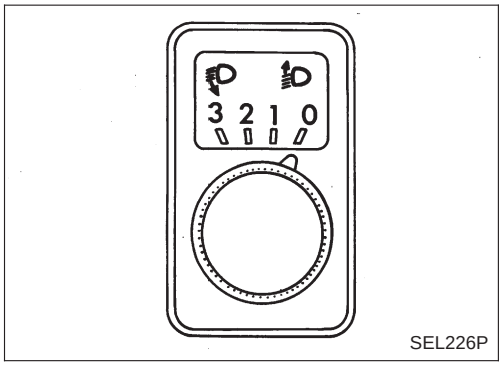
Symptôme	Cause possible	Ordre de réparation
Les phares gauche ne fonctionnent pas.	1. Ampoule 2. Masses (E6) et (E39) 3. Fusible de 15A 4. Commutateur d'éclairage	1. Vérifier l'ampoule. 2. Vérifier les masses (E6) et (E39). 3. Vérifier le fusible de 15A (n° 32, situé dans la boîte à fusibles et de raccords à fusibles). Vérifier si la tension positive de la batterie est présente à la borne (8) de la commande d'éclairage. 4. Vérifier la commande d'éclairage.
Les phares droit ne fonctionnent pas.	1. Ampoule 2. Masses (E6) et (E39) 3. Fusible de 15A 4. Commutateur d'éclairage	1. Vérifier l'ampoule. 2. Vérifier les masses (E6) et (E39). 3. Vérifier le fusible de 15A (n° 31, situé dans la boîte à fusibles et de raccords à fusibles). Vérifier si la tension positive de la batterie est présente à la borne (5) de la commande d'éclairage. 4. Vérifier la commande d'éclairage.
Les feux de route gauche ne fonctionnent pas, mais le feu de code gauche fonctionne.	1. Ampoules 2. Circuit ouvert des feux de route gauche 3. Commutateur d'éclairage	1. Vérifier les ampoules. 2. Vérifier le câble R/L entre la commande d'éclairage et les phares gauche pour voir si le circuit n'est pas ouvert. 3. Vérifier la commande d'éclairage.
Le feu de code gauche ne fonctionne pas, mais le feu de route gauche fonctionne.	1. Ampoule 2. Circuit ouvert du feu de code gauche 3. Commutateur d'éclairage	1. Vérifier l'ampoule. 2. Vérifier le câble R/G entre la commande d'éclairage et le phare gauche pour voir si le circuit n'est pas ouvert. 3. Vérifier la commande d'éclairage.
Les feux de route droit ne fonctionnent pas, mais le feu de code droit fonctionne.	1. Ampoules 2. Circuit ouvert des feux de route droit 3. Commutateur d'éclairage	1. Vérifier les ampoules. 2. Vérifier le câble R/Y entre la commande d'éclairage et les phares droit pour voir si le circuit n'est pas ouvert. 3. Vérifier la commande d'éclairage.
Le feu de code droit ne fonctionne pas mais le feu de route droit fonctionne.	1. Ampoule 2. Circuit ouvert du feu de code droit 3. Commutateur d'éclairage	1. Vérifier l'ampoule. 2. Vérifier le câble R/B entre la commande d'éclairage et le phare droit pour voir si le circuit n'est pas ouvert. 3. Vérifier la commande d'éclairage.
Le témoin de feux de route ne fonctionne pas.	1. Ampoule 2. Masses (M1) et (M54) 3. Circuit ouvert du feu de route	1. Vérifier l'ampoule des instruments combinés. 2. Vérifier les masses (M1) et (M54). 3. Vérifier le câble R/L entre la commande d'éclairage et les instruments combinés pour voir si le circuit n'est pas ouvert.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Remplacement des ampoules

Le phare est de type faisceau semi-étanche doté d'une ampoule halogène remplaçable. L'ampoule peut être remplacée depuis le compartiment moteur sans avoir à déposer l'optique de phare du véhicule.

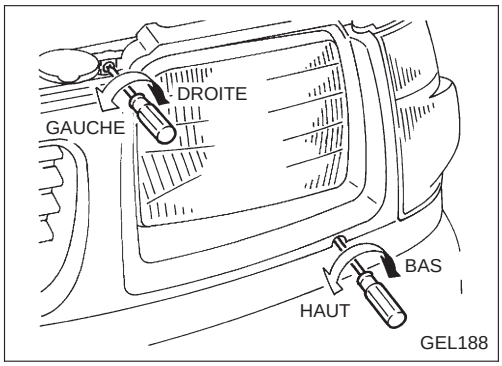
- **Lors de la manipulation de l'ampoule halogène, ne toucher que le culot en plastique. Ne jamais toucher l'ampoule en verre.**



1. Débrancher le câble de batterie.
2. Débrancher le connecteur de faisceau à l'arrière de l'ampoule.
3. Enlever le capuchon en caoutchouc.
4. Pousser et lever la broche de retenue pour la desserrer.
5. Déposer l'ampoule de phare avec précaution. Ne pas secouer ou tourner l'ampoule pour l'enlever.
6. Reposer dans l'ordre inverse de la dépose.

ATTENTION :
Ne pas laisser l'optique de phare sans ampoule pendant trop longtemps. La poussière, la condensation, les fumées, etc. peuvent pénétrer à l'intérieur de l'optique et diminuer les performances du phare. Déposer l'ampoule du phare de l'optique de phare juste avant qu'une ampoule neuve soit installée.

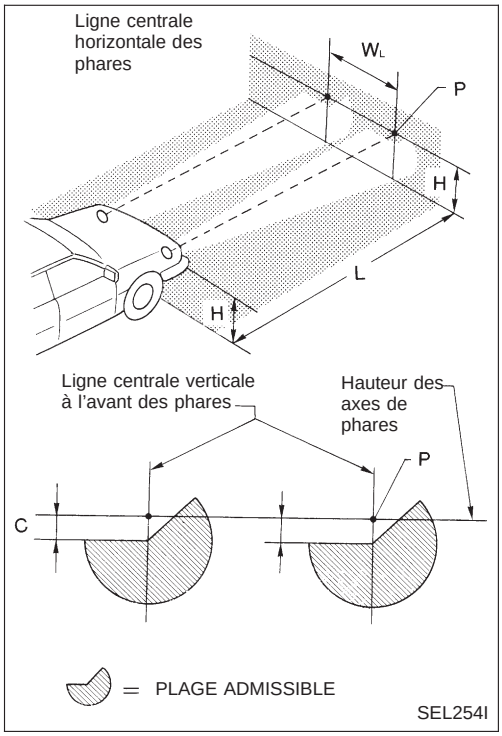
Réglage des faisceaux



Lors du réglage des faisceaux, utiliser un appareil de réglage, un écran de réglage ou un appareil de contrôle des projecteurs. Les dispositifs de réglage doivent être en bon état, étalonnés et utilisés conformément aux manuels d'utilisation correspondants.
En l'absence de dispositif de réglage, le réglage des faisceaux doit être effectué comme indiqué ci-dessous :
Pour plus de détails, consulter la réglementation du pays concerné.

a. **Tous les pneumatiques doivent être correctement gonflés.**
b. **Amener le véhicule ainsi que l'appareil d'essai sur une seule et même surface parfaitement plane.**
c. **S'assurer que le véhicule est à vide (liquide de refroidissement, huile moteur au bon niveau et réservoir plein) à l'exception du conducteur (ou poids équivalent mis à la place du conducteur).**

ATTENTION :
Vérifier que le commutateur de réglage des faisceaux est en position ''0'' lors du réglage des faisceaux sur les véhicules équipés d'un dispositif de contrôle de réglage des faisceaux.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Feu de code

1. Allumer les codes.
2. Utiliser les vis de réglage pour effectuer le réglage des faisceaux.

- **Commencer par serrer la vis de réglage à fond puis régler en desserrant progressivement la vis.**

- **Régler les phares de manière à ce que l'axe principal du faisceau soit parallèle à la ligne centrale de la carrosserie et aligné sur le point P de l'illustration.**
- **La figure ci-contre est prévue pour le réglage des phares dans les pays où l'on roule à droite. Cette indication doit être inversée en ce qui concerne les pays où la conduite se fait à gauche.**
- **Les lignes pointillées de l'illustration représentent le centre de chaque phare.**

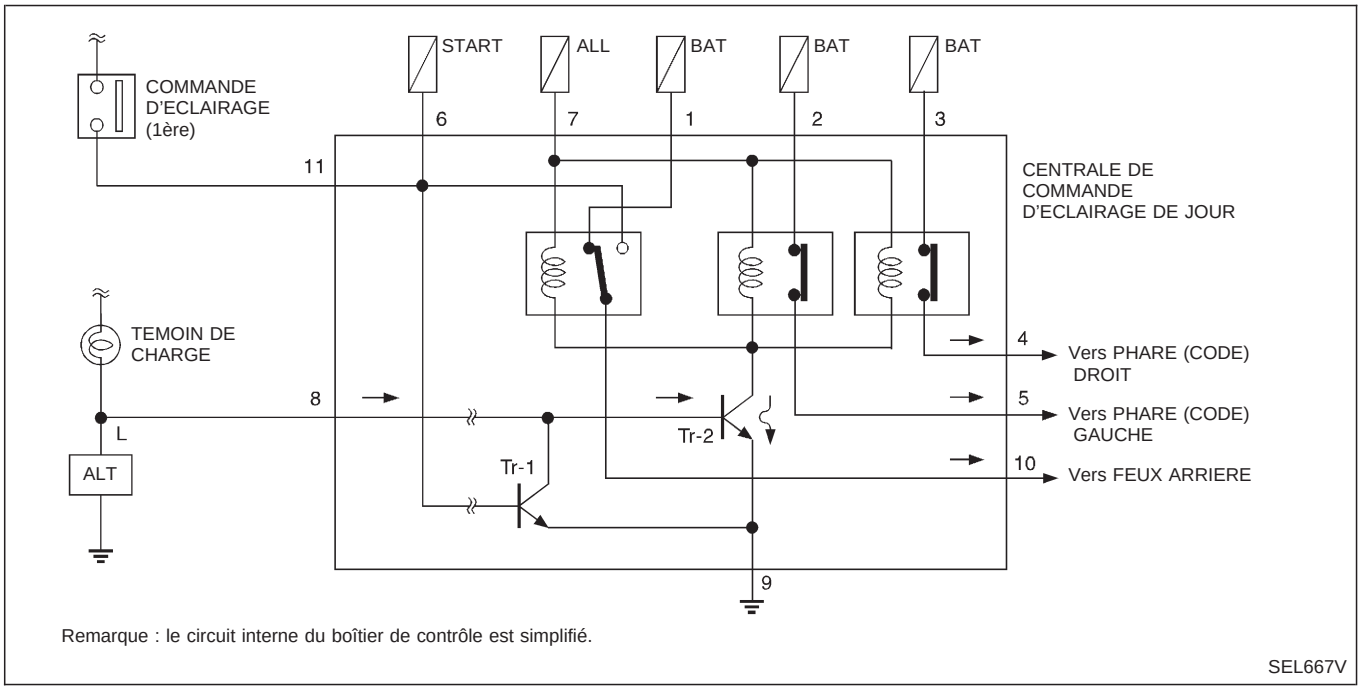
"H" : Ligne centrale horizontale des phares
"W_L" : Distance entre axes des phares
"L" : 5 000 mm
"C" : 65 mm

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description du système

FONCTIONNEMENT

Le système de phares sur les véhicules pour l’Europe du Nord comporte une centrale d’éclairage de jour. L’unité fonctionne pour allumer automatiquement les feux de codes, de stationnement, arrière et de plaque d’immatriculation et l’éclairage de tableau de bord dans les conditions suivantes.



- Le moteur est en marche avec la commande d’éclairage sur la position ‘‘OFF’’.

Si l’une des conditions suivantes se présente, le fonctionnement de l’éclairage de jour est annulé.

- Contact d’allumage sur une position autre que ‘‘ON’’
- Moteur arrêté
- Commande d’éclairage sur la 1ère ou 2ème position.

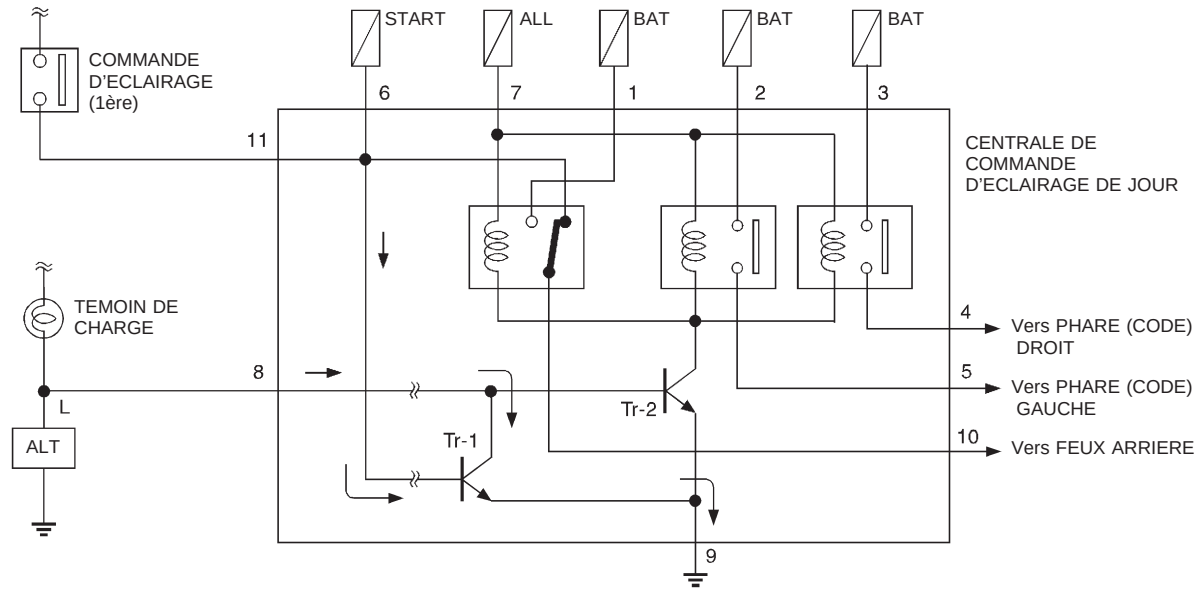
Si le système d’éclairage de jour est annulé, les fonctions de la commande d’éclairage sont les mêmes que celles du système d’éclairage conventionnel.

L’ECLAIRAGE DE JOUR FONCTIONNE
[Avec moteur en marche et la commande d’éclairage sur la position OFF (ARRET)]

Remarque : le circuit interne du boîtier de contrôle est simplifié.

SEL667V

Avec moteur en marche, l’alimentation est fournie



- depuis la borne L de l’alternateur
- à travers la borne ⑧ de l’unité de commande de l’éclairage de jour
- à la base du transistor 2 dans l’unité de commande de l’éclairage de jour.

Le transistor-2 met à la masse tous les relais. Puis les relais sont activés pour éclairer les phares.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

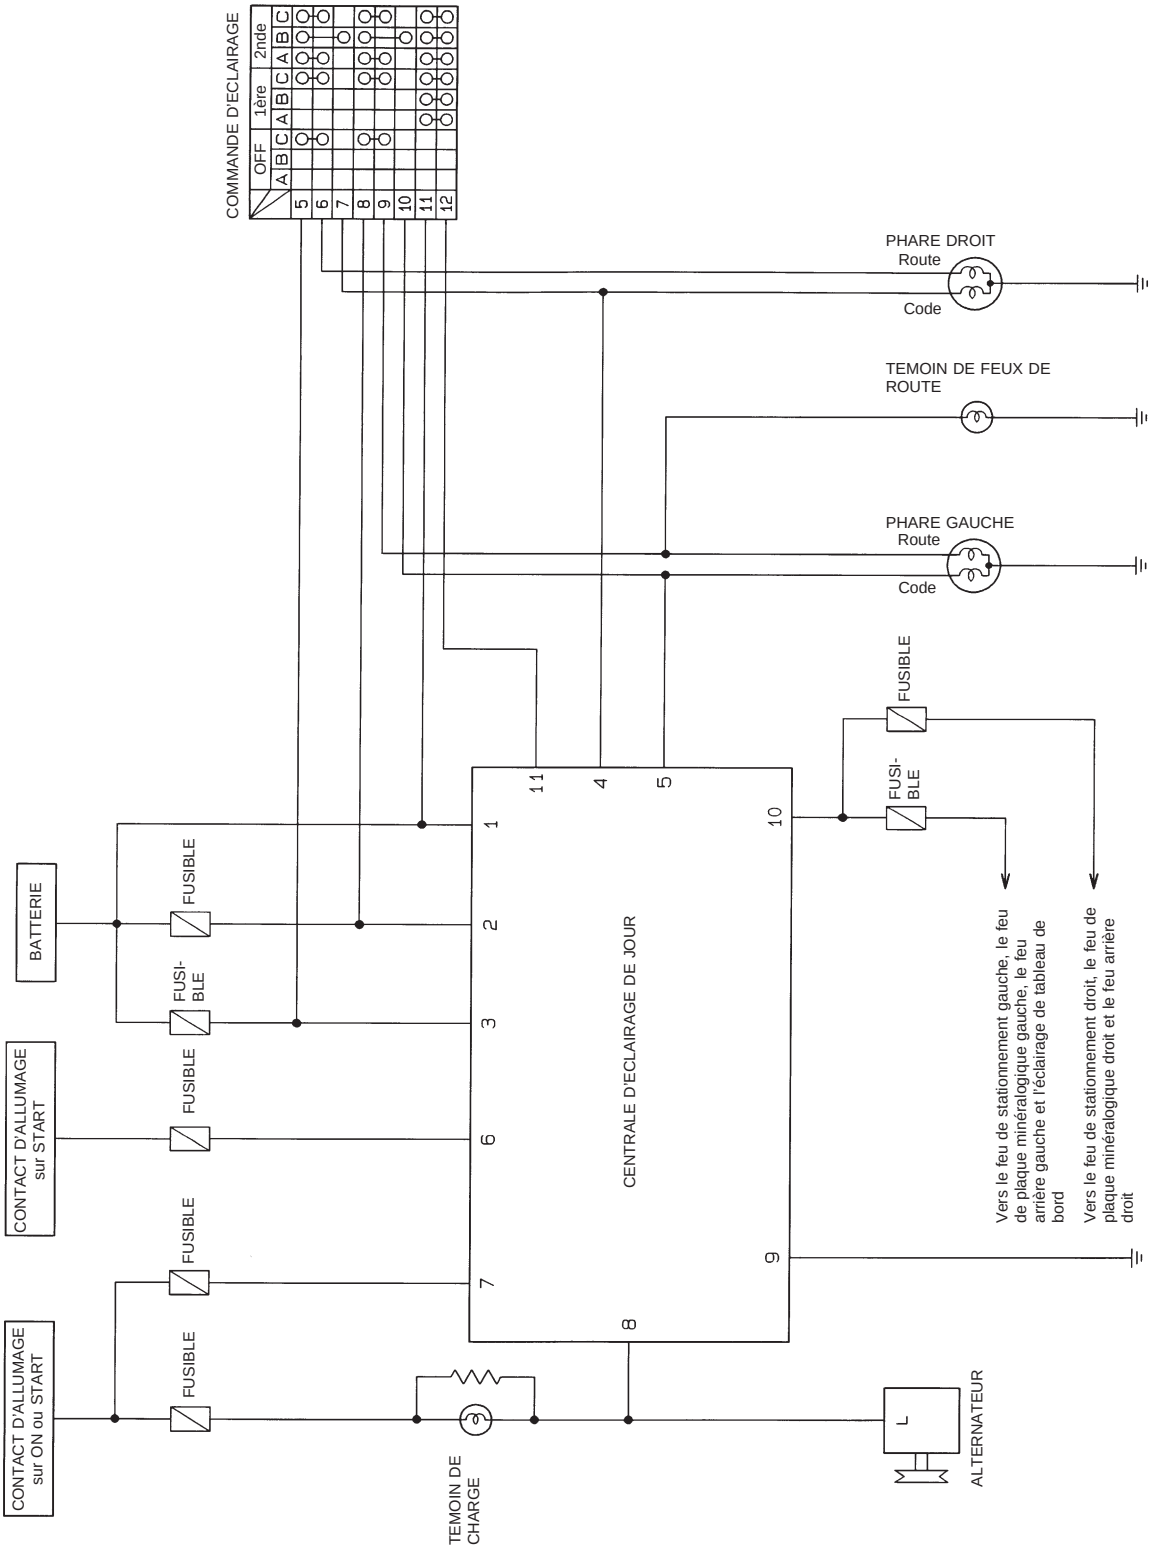
Description du système (Suite)

L’ECLAIRAGE DE JOUR EST ANNULE
[Commande d’éclairage sur la 1ère ou 2ème position ou le contact d’allumage sur START (DEMARRAGE)]

Remarque : le circuit interne du boîtier de contrôle est simplifié.

SEL668V

- Contact d’allumage sur la position START
- La commande d’éclairage est sur la 1ère ou 2ème position.



Lorsque l’une des conditions ci-dessus existe, l’alimentation est fournie

- à la base du transistor 1 dans l’unité de commande de l’éclairage de jour
- à travers la borne ⑪ ou ⑥ de l’unité de commande de l’éclairage de jour.

Puis, le cheminement de l’alimentation électrique vers le transistor-2 est interrompu pour annuler le fonctionnement de l’éclairage de jour.

Description du système

Le système de phares sur les véhicules avec conduite à droite pour l'Europe comprend un système de mise en veilleuse des codes. L'unité actionne les deux feux de codes à mi-éclairage dans les conditions suivantes.

- La commande d'éclairage est sur la 1ère position, avec le contact d'allumage sur ''ON''. Dans d'autres conditions, la mise en veilleuse des codes est annulée et les fonctions de la commande d'éclairage sont les mêmes que celles du système d'éclairage conventionnel.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description du système

FONCTIONNEMENT DU CIRCUIT

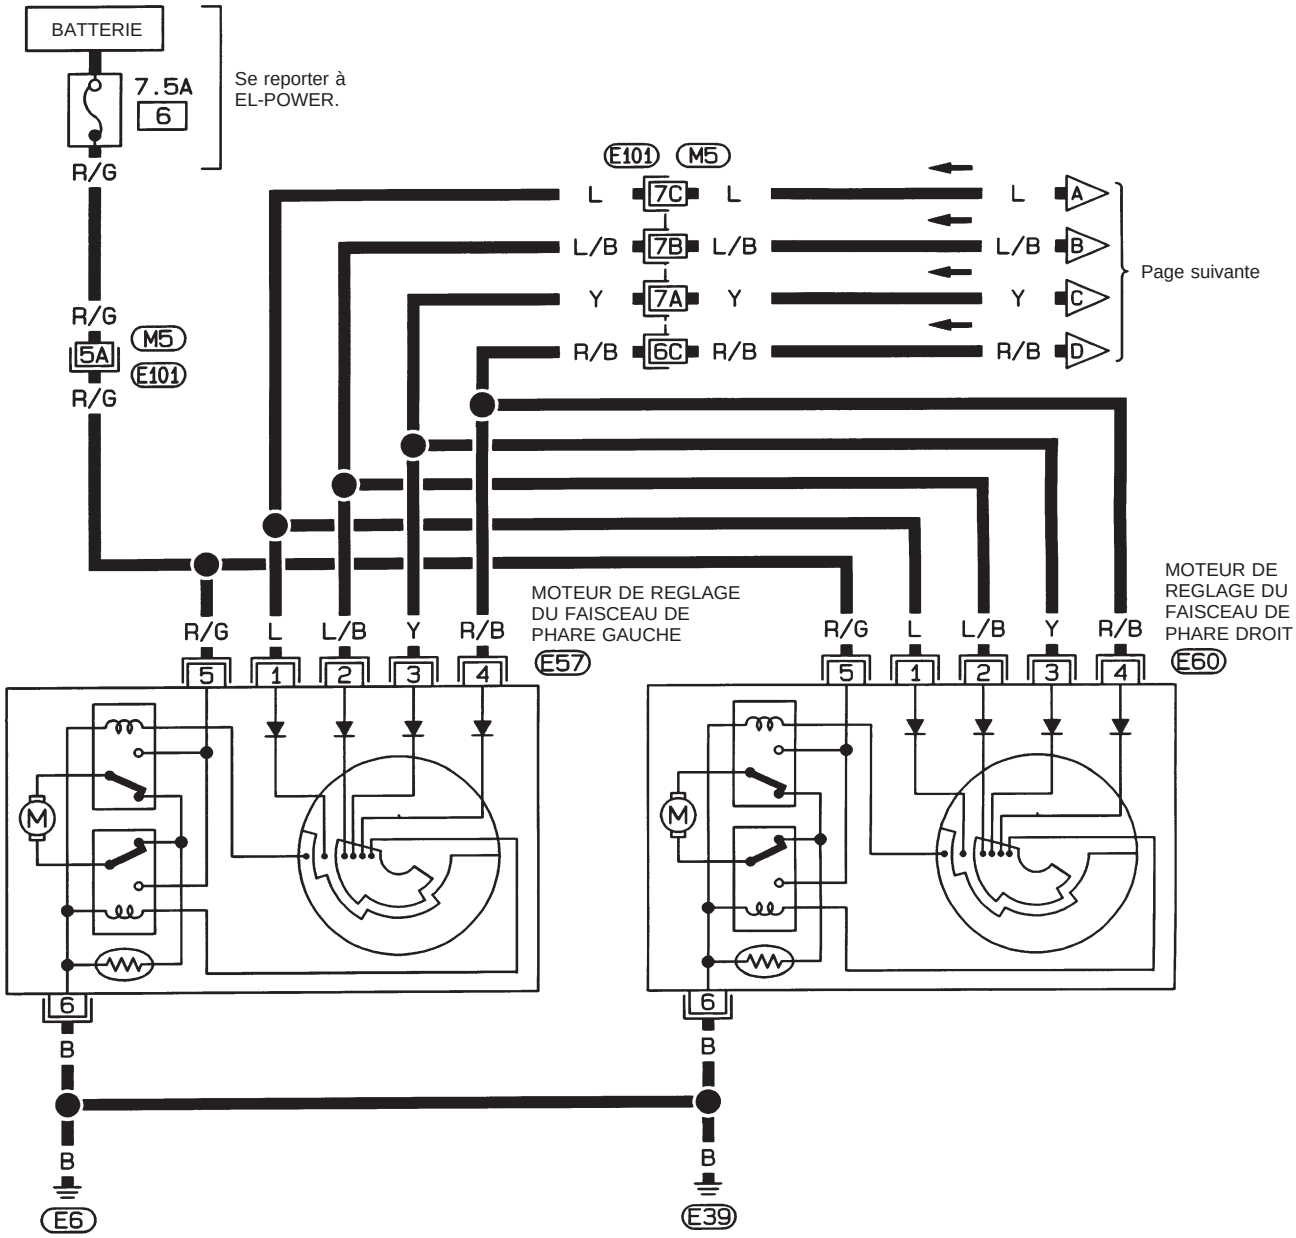
[Exemple]

Commutateur de réglage des faisceaux ‘‘0’’

- Lorsque la commande de réglage est sur ‘‘0’’, le moteur ne démarrera pas. Ceci est dû au fait que les bornes d’alimentation sont positionnées dans la partie non conductrice du capteur de l’ensemble rotatif.

Commutateur de réglage des faisceaux ‘‘0’’ → ‘‘1’’

- Lorsque la commande de réglage est déplacée de ‘‘0’’ à ‘‘1’’, la partie conductrice du capteur active le relais. Le moteur est alimenté par l’intermédiaire du relais. Les phares bougeront alors en direction ‘‘BAS’’.
- Le moteur continue à tourner lorsque l’élément rotatif du capteur se déplace du point A au point B.
- Les bornes d’alimentation seront alors positionnées dans la partie non conductrice, interrompant alors l’alimentation du moteur. Le moteur s’arrêtera alors.



Commutateur de réglage des faisceaux ‘‘1’’ → ‘‘0’’

- Lorsque la commande de réglage est déplacée de ‘‘1’’ à ‘‘0’’, la partie conductrice du capteur active le relais. Le moteur est alimenté par l’intermédiaire du relais. Le moteur tournera pour déplacer les phares en direction ‘‘HAUT’’.
- Quand l’élément rotatif du capteur se déplace du point B au point A, le moteur s’arrêtera.

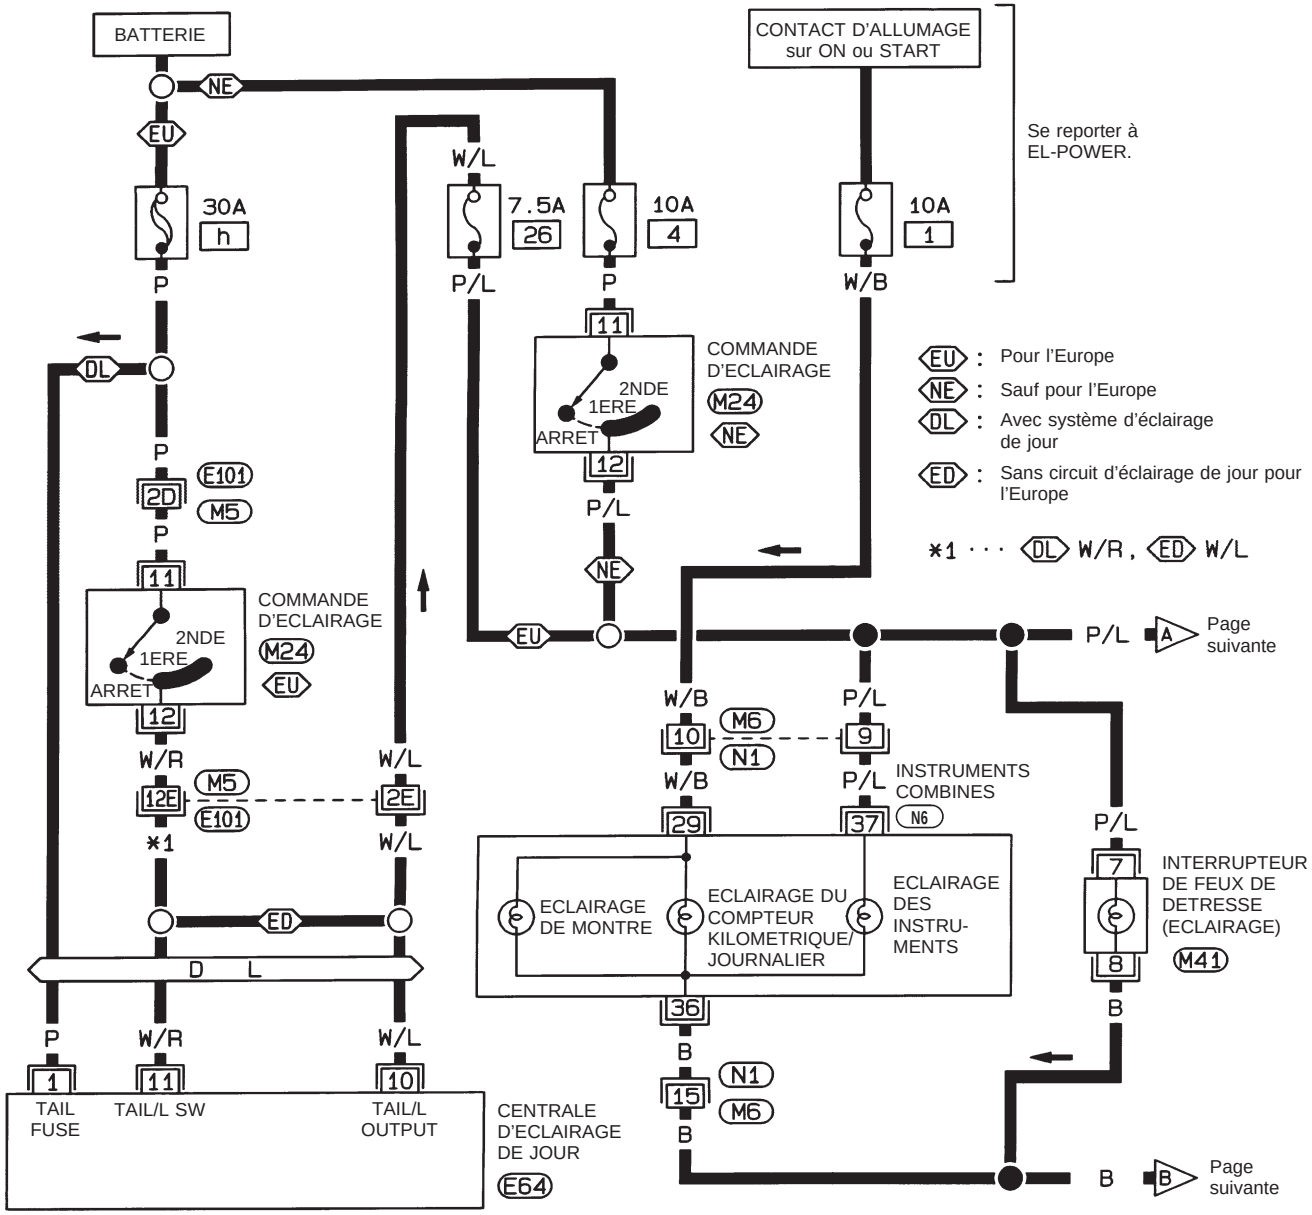
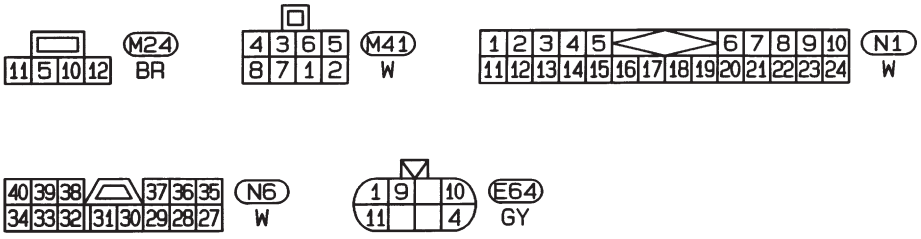
Diagnostics des défauts

Symptôme	Cause possible	Ordre de réparation
Les clignotants et les feux de détresse ne fonctionnent pas.	1. Interrupteur de feux de détresse 2. Centrale de clignotants combinée 3. Circuit ouvert de la centrale de clignotants combinée	1. Vérifier l'interrupteur de feux de détresse. 2. Se reporter à ''Vérification de la centrale de clignotants combinée''. 3. Vérifier le câble de la centrale clignotante combinée pour voir si le circuit est ouvert.
Les clignotants ne fonctionnent pas alors que les feux de détresse fonctionnent.	1. Fusible de 7,5A 2. Interrupteur de feux de détresse 3. Commande de clignotants 4. Circuit ouvert de la commande de clignotant	1. Vérifier le fusible de 7,5A (n° 3, situé dans le boîtier à fusibles). Mettre le contact d'allumage sur ''ON''et vérifier qu'une tension positive de la batterie est appliquée à la borne ② de l'interrupteur des feux de détresse. 2. Vérifier l'interrupteur de feux de détresse. 3. Vérifier la commande de clignotant. 4. Vérifier le câble G entre la centrale clignotante combinée et la commande de clignotant pour voir si le circuit est ouvert.
Les feux de détresse ne fonctionnent pas mais les clignotants fonctionnent.	1. Fusible de 10A 2. Interrupteur de feux de détresse 3. Circuit ouvert de l'interrupteur de feux de détresse	1. Vérifier le fusible de 10A (n° 5, situé dans le boîtier à fusibles). Vérifier si la tension positive de la batterie est présente à la borne ③ de l'interrupteur des feux de détresse. 2. Vérifier l'interrupteur de feux de détresse. 3. Vérifier le câble G entre la centrale clignotante combinée et l'interrupteur de feux de détresse pour voir si le circuit est ouvert.
Le clignotant avant ou latéral, droit ou gauche ne fonctionne pas.	1. Ampoule 2. Masses E6 et E39	1. Vérifier l'ampoule. 2. Vérifier les masses E6 et E39.
Le clignotant arrière droit ou gauche ne fonctionne pas.	1. Ampoule 2. Masses M1 et M54	1. Vérifier l'ampoule. 2. Vérifier les masses M1 et M54.
Les clignotants gauche et droit ne fonctionnent pas.	1. Masse	1. Vérifier les masses M1 et M54.
Le clignotant gauche ou droit ne fonctionne pas.	1. Ampoule	1. Vérifier l'ampoule des instruments combinés.



Vérification de la centrale de clignotants combinée



- Avant la vérification, s'assurer que les ampoules répondent aux spécifications.
- Raccorder une batterie et une ampoule d'essai à la centrale de clignotants combinée, comme illustré ci-contre. La centrale de clignotants combinée fonctionne bien si l'ampoule clignote lorsque le courant est envoyé au circuit.

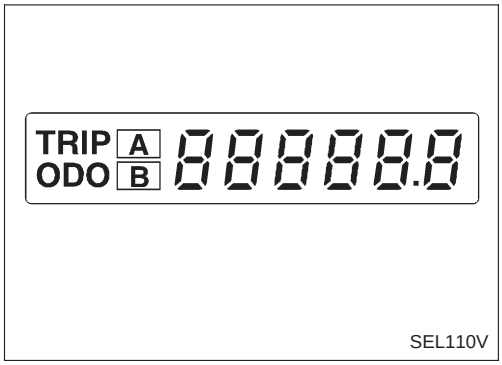
Description du système des instruments à commande intégrée



INSTRUMENTS A COMMANDE INTEGREE

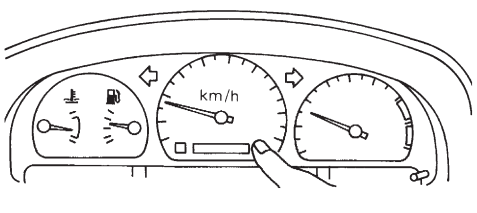
Le compteur de vitesse, le compteur kilométrique/journalier, le compte-tours, la jauge de carburant et la jauge de température d'eau sont entièrement contrôlés par le boîtier de contrôle intégré au compteur de vitesse.

Fonctionnement des instruments/jauges et contrôle des segments de compteur kilométrique/journalier en mode de diagnostic

FONCTION DE DIAGNOSTIC

- Les segments du compteur kilométrique/journalier peuvent être vérifiés en mode de diagnostic.
- Les instruments/Jauges peuvent être vérifiés en mode de diagnostic.

SEL110V



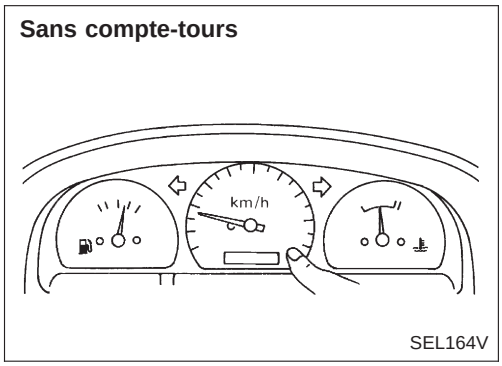
COMMENT PASSER D'UN MODE DE DIAGNOSTIC A L'AUTRE

1. Mettre le contact d'allumage sur ''ON'' et placer le compteur kilométrique/journalier en position ''TRIP A'' ou ''TRIP B''.
2. Mettre le contact d'allumage sur ''OFF''.
3. Mettre le contact d'allumage sur ''ON'' tout en poussant sur le bouton de réglage du compteur kilométrique/journalier.
4. Vérifier que le compteur kilométrique journalier indique ''000.0''.
5. Appuyer sur le bouton de réglage du compteur kilométrique/journalier plus de trois fois en 5 secondes.
6. Tous les segments du compteur kilométrique/journalier numérique doivent être allumés.

REMARQUE : Si certains segments ne s'allument pas, le compteur de vitesses (boîtier de contrôle des instruments combinés) ainsi que le compteur kilométrique/journalier doivent être remplacés.

A ce stade, les instruments à commande intégrée sont passés en mode de diagnostic.

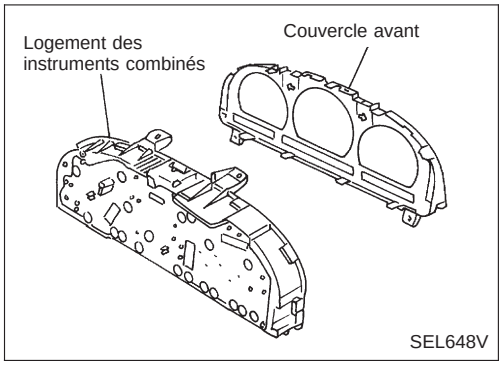
Avec compte-tours



SEL163V

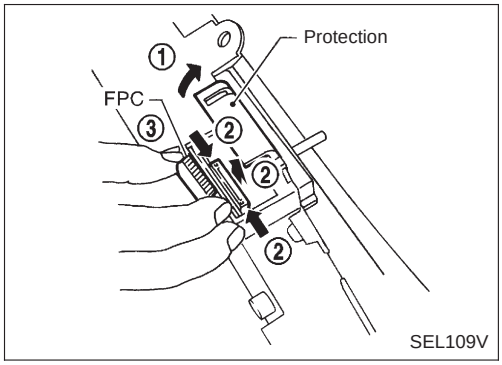
7. Appuyer sur le bouton de réglage du compteur kilométrique/journalier. Lorsque le bouton de réglage du compteur électrique/journalier est enclenché, l'indication sur chaque instrument/jauge doit être comme celle illustrée à gauche, s'il n'y a pas de défaut.

Note : Il faut environ 1 minute pour que l'indicateur de la jauge de réservoir à carburant se stabilise.



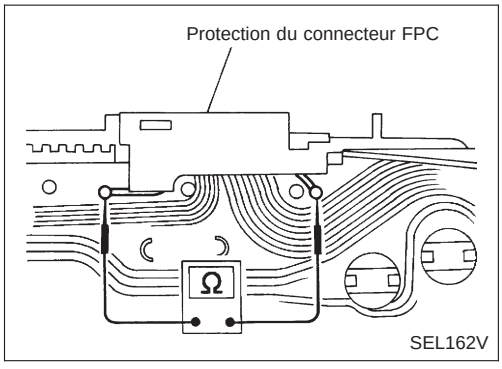
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Fonctionnement des instruments/jauges et contrôle des segments de compteur kilométrique/journalier en mode de diagnostic (Suite)



Circuit imprimé souple (FPC)

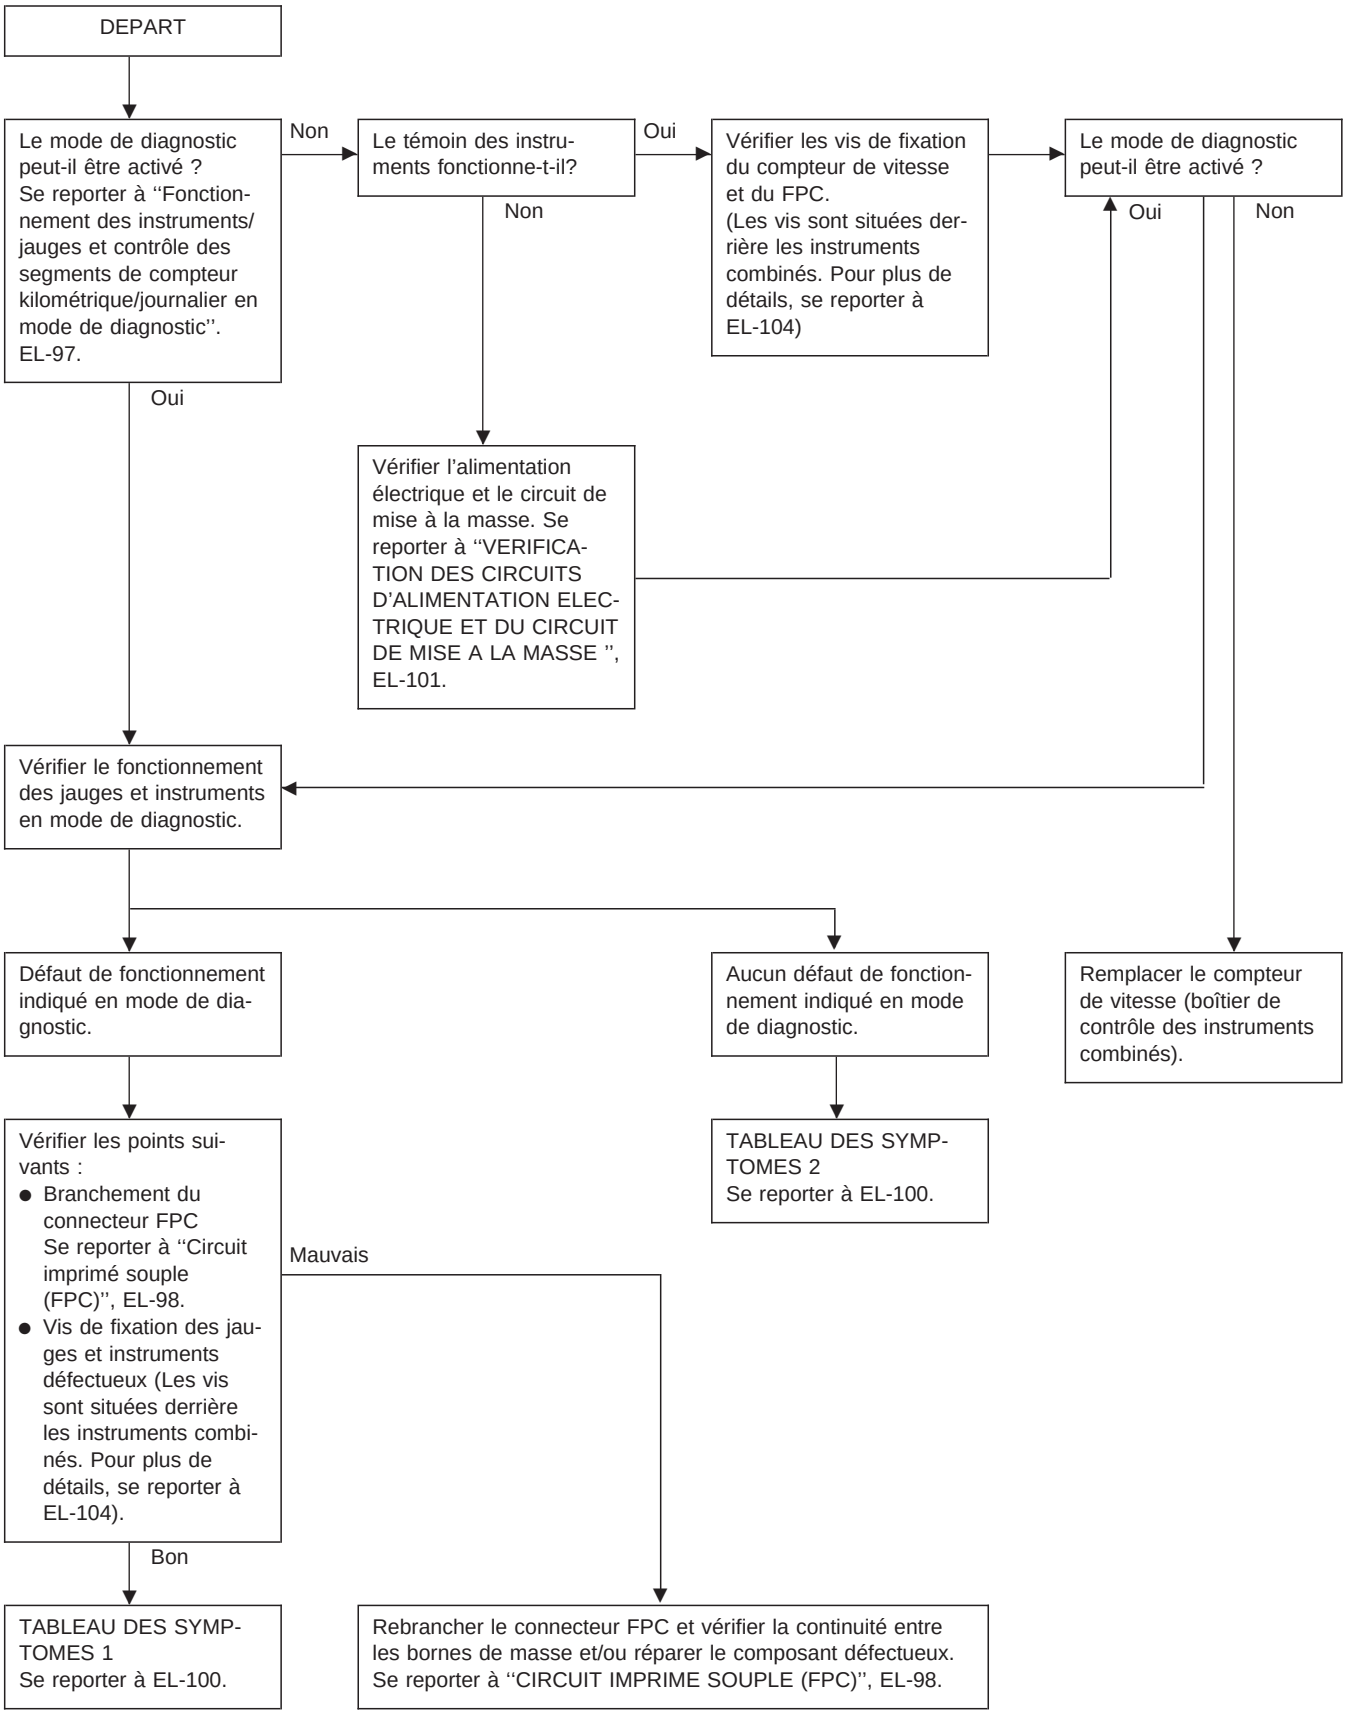
Le compte-tours, la jauge de réservoir à carburant et la jauge de température d'eau sont connectés au boîtier de contrôle des instruments combinés (compteur de vitesse) par le connecteur du circuit imprimé souple (FPC). Lors du remplacement ou de la dépose/repose des instruments à commande intégrée (compteur de vitesse), débrancher et rebrancher le connecteur FPC en procédant comme suit :



DEBRANCHEMENT

1. Déposer le couvercle avant du logement des instruments combinés.

2. Ouvrir le cache de la protection du connecteur.
3. Déverrouiller le connecteur en maintenant ses deux extrémités et en le tirant vers le haut.
4. Débrancher le FPC en le tirant vers le haut.



BRANCHEMENT

1. Insérer le FPC dans le connecteur puis verrouiller le connecteur en poussant le FPC vers le bas.
2. Vérifier si le FPC est correctement branché.
3. Vérifier la continuité aux bornes d'essai pour s'assurer que le FPC est fermement branché.
   Résistance : 0Ω
4. Fermer le cache de la protection du connecteur.

Diagnostics des défauts

VERIFICATION PRELIMINAIRE

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostics des défauts (Suite)

Avant de procéder au diagnostic de défaut ci-dessous, effectuer le contrôle préliminaire, EL-99.

TABLEAU DES SYMPTOMES 1 (DEFAUT DE FONCTIONNEMENT INDIQUE EN MODE DE DIAGNOSCTIC)

Symptôme	Causes possibles	Ordre de réparation
Le compteur de vitesse et/ou le compteur kilométrique/journalier indiquent un défaut en mode de diagnostic.	● Compteur de vitesse (boîtier de contrôle des instruments intégré)	● Remplacer le compteur de vitesse (boîtier de contrôle des instruments intégré).
Plusieurs instruments/jauges présentent un défaut en mode de diagnostic.		
Le compte-tours, la jauge de carburant ou la jauge de température d'eau indique un défaut en mode de diagnostic.	● Instruments/Jauges ● Compteur de vitesse (boîtier de contrôle des instruments intégré)	1. Vérifier la résistance des jauges et instruments qui présentent un défaut. Si la résistance est mauvaise, remplacer la jauge/l'instrument. Se reporter à ''CONTROLE DE LA RESISTANCE DES INSTRUMENTS/JAUGES'', EL-104. 2. Si la resistance est bonne, remplacer le compteur de vitesse (boîtier de contrôle des instruments intégré).

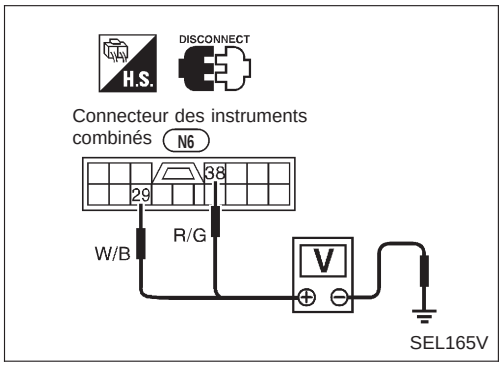

TABLEAU DES SYMPTOMES 2 (AUCUN DEFAUT DE FONCTIONNEMENT INDIQUE EN MODE DE DIAGNOSCTIC)

Symptôme	Causes possibles	Ordre de réparation
Le compteur de vitesse et le compteur kilométrique/journalier sont défectueux.	1. Capteur - Compteur de vitesse et compteur kilométrique/journalier 2. Connecteur FPC 3. Compteur de vitesse (boîtier de contrôle des instruments intégré)	1. Vérifier le capteur de vitesse du véhicule. INSPECTION/CAPTEUR DE VITESSE DU VEHICULE (Se reporter à EL-102). 2. Vérifier le connecteur FPC.Se reporter à ''CIRCUIT IMPRIME SOUPLE (FPC)'', EL-98. 3. Remplacer le compteur de vitesse (boîtier de contrôle des instruments intégré).
Plusieurs instruments/jauges sont défectueux (sauf compteur de vitesse, compteur kilométrique/journalier).	1. Connecteur FPC 2. Compteur de vitesse (boîtier de contrôle des instruments intégré)	1. Vérifier le connecteur FPC. Se reporter à ''CIRCUIT IMPRIME SOUPLE (FPC)'', EL-98. 2. Remplacer le compteur de vitesse (boîtier de contrôle des instruments intégré).
Le compte-tours, la jauge de carburant ou la jauge de température d'eau est défectueux.	1. Capteur/Signal de régime moteur - Compte-tours - Jauge à carburant - Jauge de temp. d'eau 2. Connecteur FPC 3. Compteur de vitesse (boîtier de contrôle des instruments intégré)	1. Vérifier le capteur des jauges et instruments défectueux. INSPECTION/SIGNAL DE REGIME MOTEUR (Se reporter à EL-102). INSPECTION/JAUGE DE RESERVOIR A CARBURANT (Se reporter à EL-103). INSPECTION/TRANSMETTEUR THERMIQUE (Se reporter à EL-103). 2. Vérifier le connecteur FPC. Se reporter à ''CIRCUIT IMPRIME SOUPLE (FPC)'', EL-98. 3. Remplacer le compteur de vitesse (boîtier de contrôle des instruments intégré).

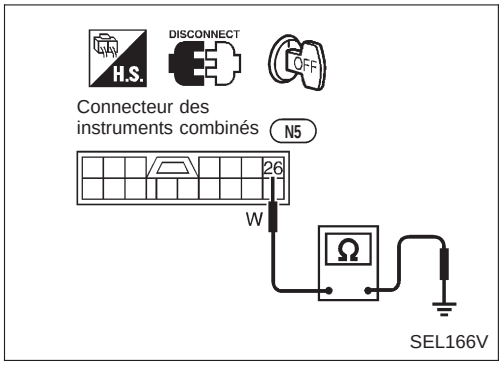
Diagnostics des défauts (Suite)

VERIFICATION DES CIRCUITS D'ALIMENTATION ELECTRIQUE ET DU CIRCUIT DE MISE A LA MASSE



Vérification du circuit de l'alimentation électrique

Bornes		Position du contact d'allumage		
⊕	⊖	OFF	Acc	ON
㊳	Masse	Tension de la batterie	Tension de la batterie	Tension de la batterie
㉙	Masse	0V	0V	Tension de la batterie

Si le résultat n'est pas satisfaisant, vérifier les points suivants.

- Fusible de 7,5A [n° 6, situé dans le boîtier à fusibles (J/B)]
- Fusible de 10A [n° 1, situé dans le boîtier à fusibles (J/B)]
- Faisceau ouvert ou court-circuité entre le fusible et les instruments combinés

Vérification du circuit de masse

Bornes	Continuité
㉖ - Masse	Oui

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostics des défauts (Suite)

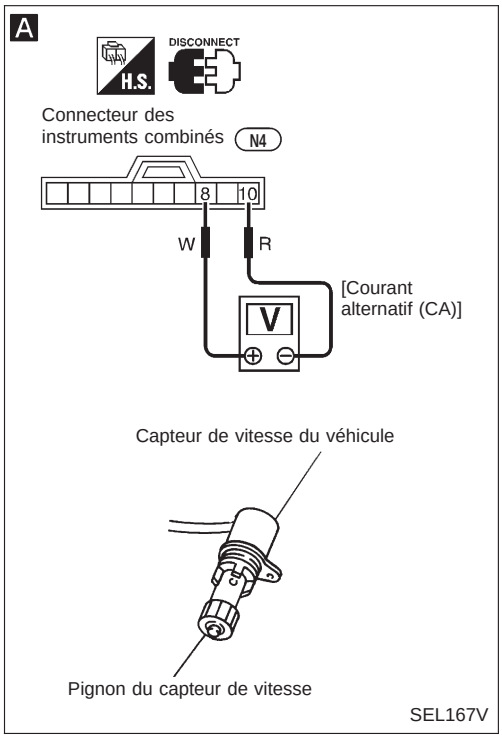
INSPECTION/CAPTEUR DE VITESSE DU VEHICULE

A

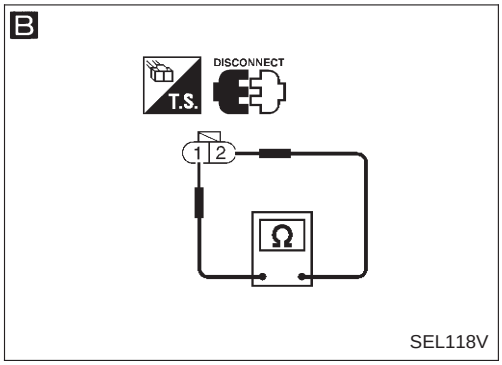
VERIFICATION DE LA SORTIE DU CAPTEUR DE VITESSE DU VEHICULE.
1. Déposer le capteur de vitesse du véhicule de la transmission.
2. Vérifier la tension entre les bornes ⑧ et ⑩ des instruments combinés tout en tournant rapidement le pignon du capteur de vitesse.
   Tension : environ 0,5V

Bon → Le capteur de vitesse du véhicule fonctionne correctement.

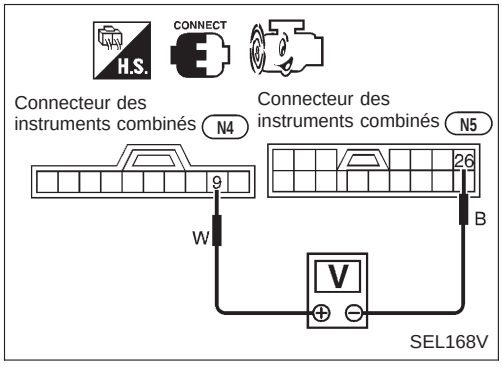
Mauvais ↓



B



VERIFICATION DU CAPTEUR DE VITESSE DU VEHICULE.
Vérifier la résistance entre les bornes ① et ② du capteur de vitesse du véhicule.
Résistance : Environ 250Ω



Mauvais → Remplacer le capteur de vitesse du véhicule.

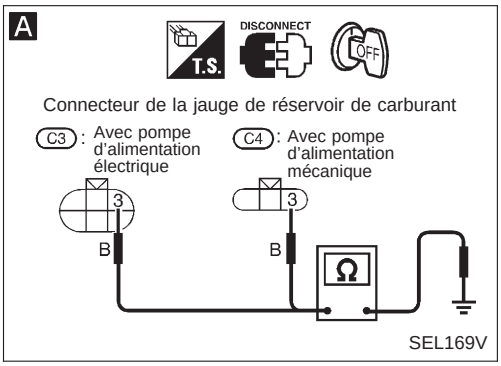
Bon ↓

Vérifier le faisceau ou le connecteur entre le compteur de vitesse et le capteur de vitesse du véhicule.

INSPECTION/SIGNAL DE REGIME MOTEUR (Modèles avec compte-tours)

Moteur	Elément de contrôle	Bornes ⊕	Bornes ⊖	Explication
Injection	Tension du courant continu	⑨	㉖	Tr/mn élevé = tension élevée Tr/mn inférieur = basse tension La tension variera en fonction du régime moteur.
Diesel (TD25)				
Carburateur	Tension du courant alternatif			

Si le résultat n'est pas satisfaisant, vérifier le point suivant.



Moteur	Elément de contrôle
Injection	● Faisceau ouvert ou court-circuité et raccords
Carburateur	● Faisceau ouvert ou court-circuité et raccords ● Résistance etc.
Diesel	● Faisceau ouvert ou court-circuité et raccords ● Capteur de régime moteur etc.

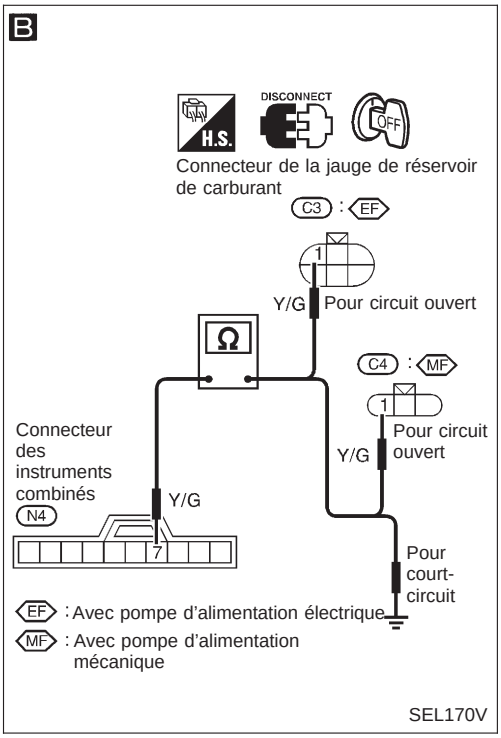
Diagnostics des défauts (Suite)

INSPECTION/JAUGE DE RESERVOIR A CARBURANT

A

VERIFIER LE CIRCUIT DE MISE A LA MASSE DE LA JAUGE DE RESERVOIR A CARBURANT.
Vérifier la continuité du faisceau entre la borne ③ de la jauge de réservoir à carburant et la masse.
Il doit y avoir continuité.

Mauvais → Réparer le faisceau ou le connecteur.



Bon ↓

VERIFIER LES JAUGES.
Se reporter à ''CONTROLE DE LA JAUGE DE RESERVOIR A CARBURANT'', (EL-104).

Mauvais → Réparer ou remplacer. Se reporter à la section FE.

Bon ↓

B

VERIFIER LE FAISCEAU.
1. Débrancher le connecteur N4 des instruments combinés ainsi que le connecteur de la jauge de réservoir à carburant.
2. Vérifier la continuité du faisceau entre la borne ⑦ des instruments combinés et la borne ① de la jauge de réservoir à carburant.

Il doit y avoir continuité.

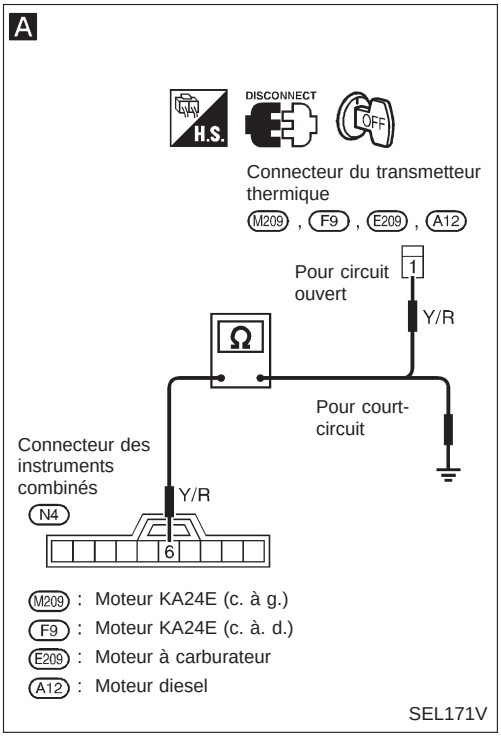
3. Vérifier la continuité entre la borne ⑦ des instruments combinés et la masse.

Il ne doit pas y avoir continuité.

Mauvais → Réparer le faisceau ou le connecteur.

Bon ↓

La jauge de réservoir à carburant fonctionne correctement.



INSPECTION/TRANSMETTEUR THERMIQUE

VERIFIER LE TRANSMETTEUR THERMIQUE.
Se reporter à ''CONTROLE DU TRANSMETTEUR THERMIQUE', (EL-105).

Mauvais → Réparer ou remplacer.

Bon ↓

A

VERIFIER LE FAISCEAU.
1. Débrancher le connecteur N4 des instruments combinés ainsi que le connecteur du transmetteur thermique.
2. Vérifier que le faisceau n'est pas ouvert ou en court-circuit entre la borne ⑥ des instruments combinés et la borne ① du transmetteur thermique.
3. Vérifier la continuité entre la borne ⑥ des instruments combinés et la masse.

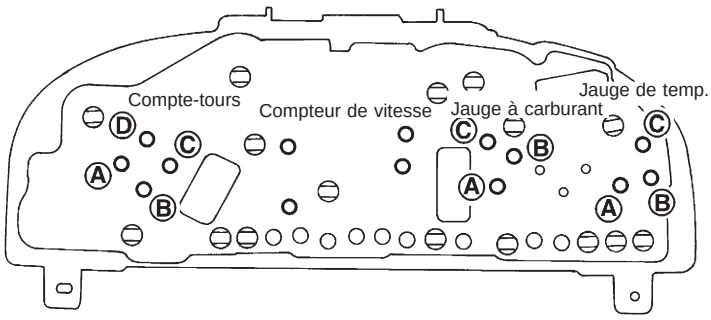
Il ne doit pas y avoir continuité.

Mauvais → Réparer le faisceau ou le connecteur.

Bon ↓

Le transmetteur thermique fonctionne correctement.

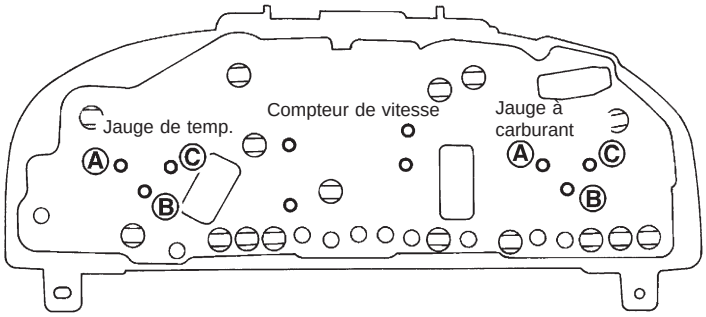
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Inspection des composants électriques

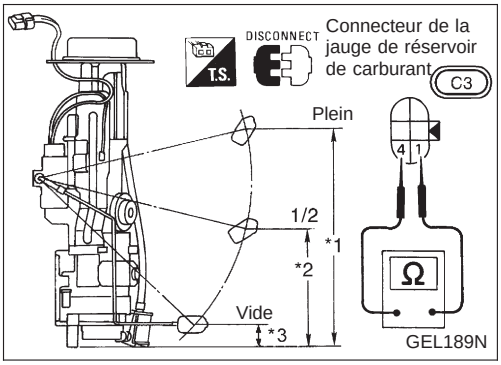
CONTROLE DE LA RESISTANCE DES INSTRUMENTS/JAUGES

1. Débrancher le connecteur FPC. Se reporter à EL-98.
2. Vérifier la résistance entre les vis de montage des jauges et instruments.



Vis		Résistance Ω
Compte-tours	Jauge Carburant/ Temp.	
A - C	A - C	Environ 70 - Environ 140
B - D	B - C	Environ 90 - Environ 170

Avec compte-tours

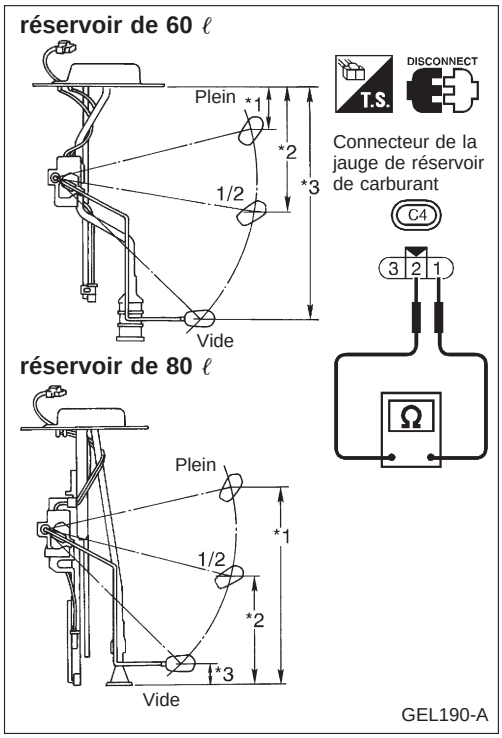


SEL172V

Sans compte-tours

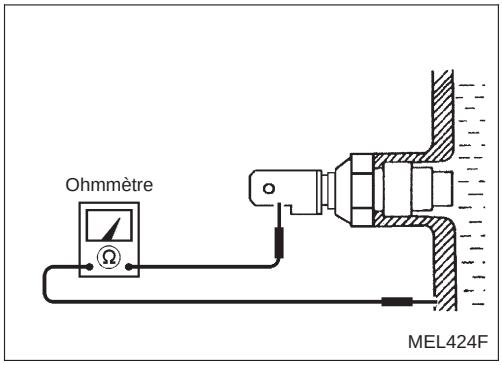
SEL173V

CONROLE DE LA JAUGE DE RESERVOIR A CARBURANT (Avec pompe d'alimentation électrique)



● Pour la dépose, consulter la section FE.

Contrôler la résistance entre les bornes ① et ④.



Ohmmètre		Position du flotteur mm				Valeur de résistance (Ω)
(+)	(−)			réservoir 60ℓ	réservoir 80ℓ	
①	④	*1	Plein	253	247	Environ 4 - 6
		*2	1/2	130	130	27 - 35
		*3	Vide	27	26	78 - 85

*1 et *3 : Lorsque la tige du flotteur est en contact avec la butée.

AVERTISSEUR SONORE D'ECLAIRAGE

1. Appliquer un courant continu de 12V sur les bornes ⑩ et ④ de l'unité d'avertisseur sonore.
   Le témoin sonore doit sonner.

2. Appliquer une tension de 12V sur les bornes ⑩, ⑪ et ④ de l'unité d'avertisseur sonore.
   Le témoin sonore ne doit pas sonner.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description du système

FONCTIONNEMENT DE L'ESSUIE-GLACE

La commande d'essuie-glace est contrôlée par un levier intégré à la commande combinée.
Il existe deux ou trois positions de la commande d'essuie-glace :

- Vitesse LENTE (LO)
- Vitesse RAPIDE (HI)
- Vitesse intermittente (INT) (modèles équipés d'un essuie-glace à balayage intermittent seulement)

Lorsque le contact d'allumage est sur la position Acc ou ON, l'alimentation est fournie

- par le fusible de 20A (n° 16, situé dans le boîtier à fusibles)
- à la borne ④ du moteur d'essuie-glace.

Fonctionnement de l'essuie-glace à vitesse lente et rapide

La masse est également fournie à la borne ⑰ de la commande d'essuie-glace par les masses M1 et M54 de carrosserie.
Lorsque la commande d'essuie-glace est placée sur la position LENTE, la masse est fournie

- par la borne ⑭ de la commande d'essuie-glace
- à la borne ② du moteur d'essuie-glace.

Lorsque l'alimentation électrique et la masse sont fournies, le moteur d'essuie-glace fonctionne en vitesse lente.
Lorsque la commande d'essuie-glace est placée sur la position RAPIDE, la masse est fournie

- par la borne ⑯ de la commande d'essuie-glace
- à la borne ③ du moteur d'essuie-glace.

Lorsque l'alimentation électrique et la masse sont fournies, le moteur d'essuie-glace fonctionne en vitesse rapide.

Fonctionnement de l'arrêt automatique

Lorsque la commande d'essuie-glace est sur ARRET, le moteur d'essuie-glace continue à tourner jusqu'à ce que les bras d'essuie-glaces aient repris leur position de repos.
Quand les bras d'essuie-glaces ne sont pas à la position repos en bas du pare-brise alors que la commande d'essuie-glace est sur ARRET, la masse est fournie

- de la borne ⑭ de la commande d'essuie-glace
- à la borne ② du moteur d'essuie-glace afin que le moteur d'essuie-glace tourne toujours en vitesse lente.

La masse est également fournie

- par la borne ⑬ de la commande d'essuie-glace
- vers la borne ② de l'amplificateur de l'essuie-glace (uniquement modèles avec essuie-glace à position intermittente)
- par la borne ⑦ de l'amplificateur d'essuie-glace (uniquement modèles avec essuie-glace à position intermittente)
- à la borne ⑤ du moteur d'essuie-glace
- par la borne ⑥ du moteur d'essuie-glace, et
- par les masses de carrosserie M1 et M54.

Lorsque les bras d'essuie-glaces regagnent leur position de repos, les bornes ④ et ⑤ du moteur d'essuie-glace sont branchées à la place des bornes ⑤ et ⑥. Le moteur d'essuie-glace immobilise alors les bras d'essuie-glace en position de repos.

Fonctionnement intermittent

Le moteur d'essuie-glace actionne les bras de l'essuie-glace, à vitesse lente, à un intervalle d'environ 7 secondes. Cette fonction est commandée par l'amplificateur de l'essuie-glace.
Lorsque la commande d'essuie-glace est placée sur la position INT., la masse est fournie

- à la borne ① de l'amplificateur de l'essuie-glace
- de la borne ⑮ de la commande d'essuie-glace
- par les masses de carrosserie M1 et M54.
- à la borne ② du moteur d'essuie-glace
- par la borne ⑭ de la commande d'essuie-glace
- à la borne ⑬ de la commande d'essuie-glace
- par la borne ② de l'amplificateur d'essuie-glace
- à la borne ③ de l'amplificateur de l'essuie-glace
- par les masses de carrosserie M1 et M54.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description du système (Suite)

Lorsque l'alimentation électrique et la masse sont fournies, le moteur d'essuie-glace fonctionne en vitesse lente de façon intermittente.

FONCTIONNEMENT DU LAVE-GLACE

Lorsque le contact d'allumage est sur la position Acc ou ON, l'alimentation est fournie

- par le fusible de 20A (n°) 16, situé dans le boîtier à fusibles)
- à la borne (1) du moteur de lave-glace.

Avec essuie-glace à balayage intermittent

Lorsque le levier est placé sur la position LAVE, la masse est fournie

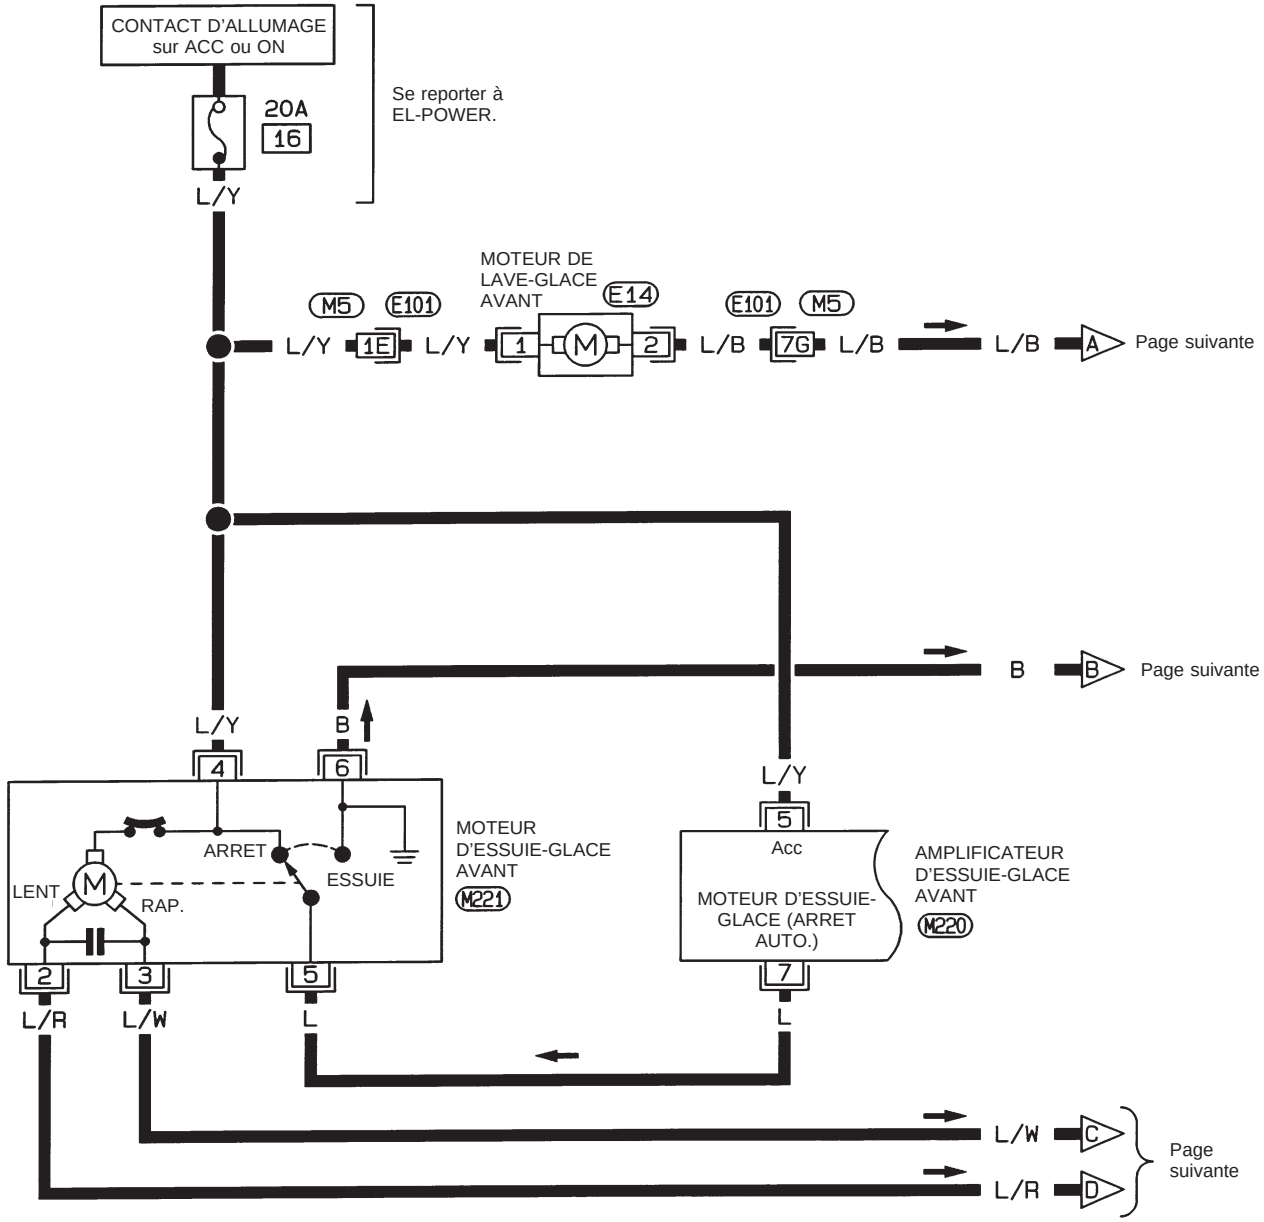
- à la borne (2) du moteur de lave-glace, et
- à la borne (6) de l'amplificateur de l'essuie-glace
- de la borne (18) de la commande d'essuie-glace
- par la borne (17) de la commande d'essuie-glace, et
- par les masses de carrosserie (M1) et (M54).

Lorsque l'alimentation électrique et la masse sont fournies, le moteur de lave-glace fonctionne.

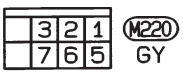
Lorsque le levier est placé sur la position LAVE pendant une seconde ou plus, le moteur d'essuie-glace fonctionne à vitesse lente pendant environ 3 secondes après que le levier est relâché. Cette fonction est commandée par l'amplificateur de l'essuie-glace de la même manière qu'en position intermittente.

Sans essuie-glace à balayage intermittent

Lorsque le levier est placé sur la position LAVE, la masse est fournie



- à la borne (2) du moteur de lave-glace
- de la borne (18) de la commande d'essuie-glace
- par la borne (17) de la commande d'essuie-glace, et
- par les masses de carrosserie (M1) et (M54).



Lorsque l'alimentation électrique et la masse sont fournies, le moteur de lave-glace fonctionne.

Diagnostics des défauts

PROCEDURE DE DIAGNOSTIC 1

SYMPTOME : L'essuie-glace à balayage intermittent ne fonctionne pas.

Vérifier si l'essuie-glace fonctionne avec la commande d'essuie-glace sur la position Lo (Lent).

Mauvais → Vérifier les points suivants.
- Fusible de 20A (n° 16, situé dans le boîtier à fusibles)
- Moteur de l'essuie-glace
- Commande de l'essuie-glace
- Faisceau ouvert ou court-circuit du faisceau

Bon ↓

A

1) Tourner la commande d'essuie-glace avant sur OFF.
2) Débrancher le connecteur de l'ampli. d'essuie-glace.
3) Vérifier la tension entre la borne ② de l'ampli. d'essuie-glace et la masse.
Il doit y avoir tension de la batterie.

Mauvais → Vérifier les points suivants.
- Commande de l'essuie-glace
- Faisceau ouvert ou court-circuité entre la borne ② de l'ampli. d'essuie-glace et la borne ⑬ de la commande d'essuie-glace

Bon ↓

B

VERIFIER LE SIGNAL D'ENTREE DE LA COMMANDE DE POSITION INTERMITTENTE.
Vérifier la continuité du faisceau entre la borne ① de l'ampli. d'essuie-glace et la masse.

Position de la commande d'essuie-glace	Continuité
ARRET	Non
INT.	Oui

Mauvais → Vérifier les points suivants.
- Commande de l'essuie-glace
- Faisceau ouvert ou court-circuité entre la borne ① de l'ampli. d'essuie-glace et la borne ⑮ de la commande d'essuie-glace
- Circuit de mise à la masse pour la borne ⑰ de la commande d'essuie-glace avant

Bon ↓

C

VERIFIER L'ALIMENTAION ELECTRIQUE DE L'AMPLI. D'ESSUIE-GLACE.
Vérifier la tension entre la borne ⑤ de l'ampli. d'essuie-glace et la masse quand le contact d'allumage est sur "ACC".
Il doit y avoir tension de la batterie.

Mauvais → Vérifier les points suivants.
- Fusible de 20A (n° 16, situé dans le boîtier à fusibles)
- Faisceau ouvert ou court-circuité entre l'ampli. d'essuie-glace et le fusible

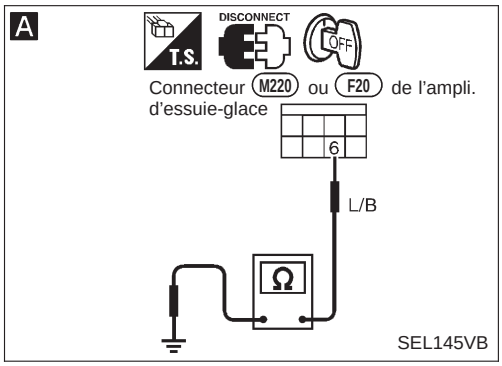
Bon ↓

D

VERIFIER LE CIRCUIT DE MASSE DE L'AMPLI. D'ESSUIE-GLACE.
Vérifier la continuité du faisceau entre la borne ③ de l'ampli. d'essuie-glace et la masse de carrosserie.
Il doit y avoir continuité.

Mauvais → Réparer le faisceau ou le connecteur.

Bon ↓



Remplacer l'ampli. d'essuie-glace.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

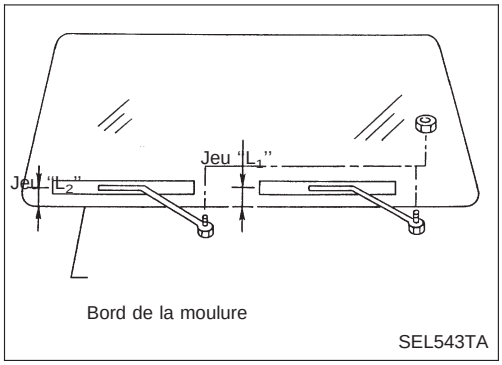
Diagnostics des défauts (Suite)

PROCEDURE DE DIAGNOSTIC 2

SYMPTOME : L'essuie-glace et le lave-glace fonctionnent individuellement mais pas en combinaison.

A

VERIFIER LE SIGNAL D'ENTREE DE LA COMMANDE DE LAVE-GLACE.
1) Mettre le contact d'allumage sur "OFF".
2) Débrancher le connecteur de l'ampli. d'essuie-glace.
3) Vérifier la continuité du faisceau entre la borne (6) de l'ampli. d'essuie-glace et la masse.

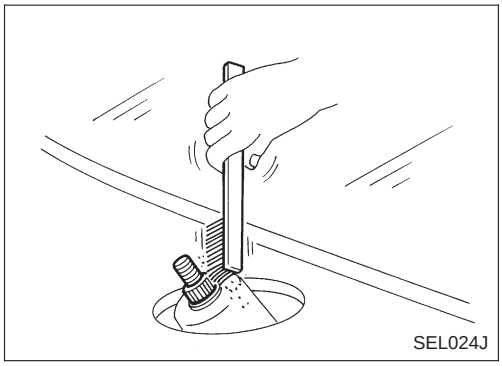


Position de la commande de lave-glace	Continuité
ARRET	Non
MARCHE	Oui

Mauvais → Vérifier si le faisceau est ouvert ou en court-circuit entre la borne (6) de l'ampli. d'essuie-glace et la borne (18) de la commande d'essuie-glace.

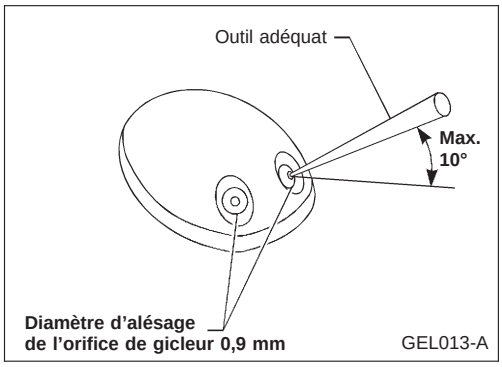
Bon ↓

Aller à la procédure de diagnostic 1.



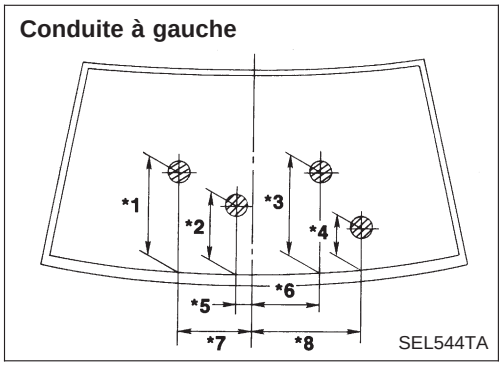
Mauvais → Remplacer l'ampli. d'essuie-glace.

Repose et réglage de l'essuie-glace

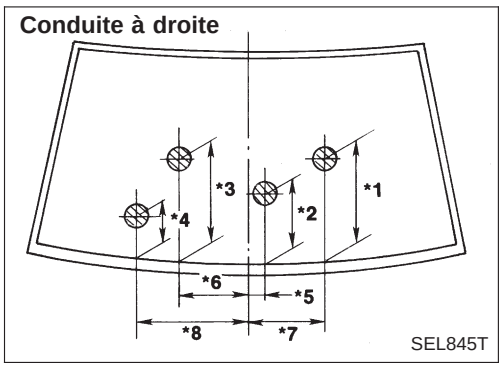


1. Avant de monter les bras d'essuie-glaces, actionner la commande afin de mettre le moteur d'essuie-glace en marche puis la couper (arrêt automatique).
2. Soulever le balai d'essuie-glace puis le reposer sur le pare-brise de manière à régler le centre des balais aux jeux "L_1" & "L_2", et serrer l'écrou tout de suite après.
3. Ejecter le liquide de lave-glace. Mettre le moteur d'essuie-glace en marche puis placer la commande sur ARRET.
4. Veiller à ce que les balais d'essuie-glaces s'arrêtent bien en respectant les jeux "L_1" & "L_2".
   Jeu "L_1" : 20 - 30 mm
   Jeu "L_2" : 20 - 30 mm

- Serrer les écrous du bras d'essuie-glace au couple spécifié.
  Essuie-glace avant : 12,7 - 17,7 N·m (1,3 - 1,8 kg-m)



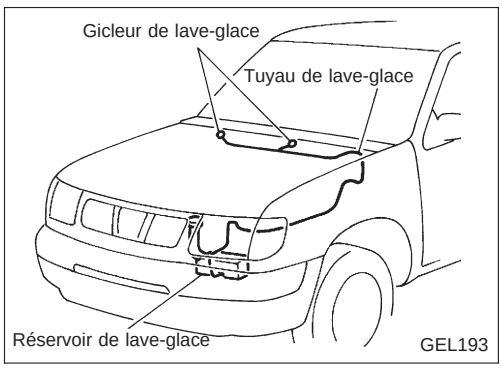
- **Avant la repose du bras d'essuie-glace, nettoyer son pivot de la manière indiquée sur l'illustration. Cela réduira la possibilité de desserrage du bras d'essuie-glace.**



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Réglage du gicleur de lave-glace

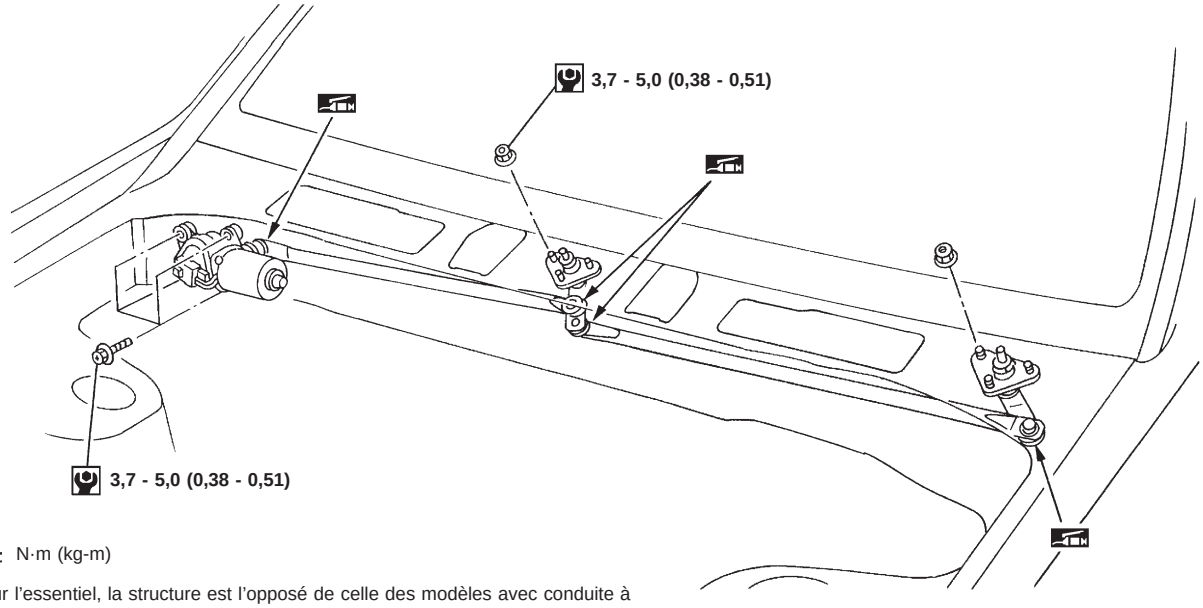
- Régler les gicleurs de lave-glace avec un outil adéquat comme indiqué sur la figure ci-contre.
  Gamme réglable : ±10°



Unité : mm

*1	470	*5	60
*2	215	*6	225
*3	380	*7	255
*4	180	*8	460

* : Les diamètres de ces cercles sont inférieurs à de 60 mm.



Disposition du tuyau de lave-glace

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Timonerie d'essuie-glace

Conduite à gauche*

: N·m (kg-m)

* Pour l'essentiel, la structure est l'opposé de celle des modèles avec conduite à droite.

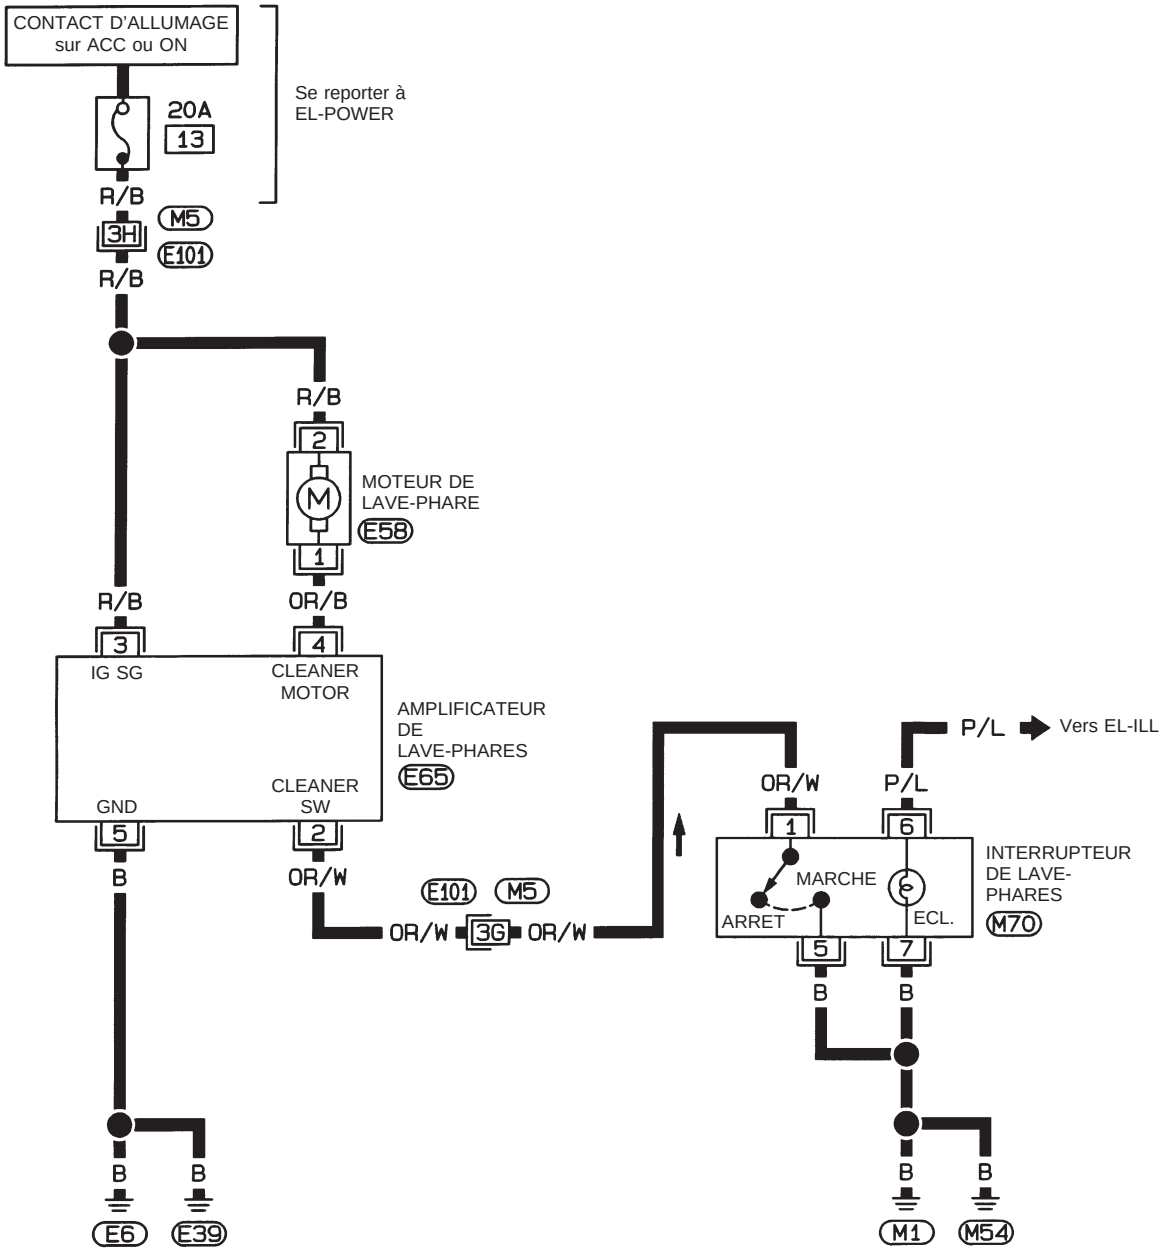
GEL194

DEPOSE

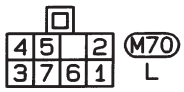
1. Déposer les 4 boulons qui fixent le moteur d'essuie-glace.
2. Désaccoupler le moteur d'essuie-glace de la timonerie d'essuie-glace au niveau du joint à rotule.
3. Déposer la timonerie d'essuie-glace.

Veiller à ne pas casser le soufflet en caoutchouc du joint à rotule.

REPOSE



- Graisser le joint à rotule avant la repose.



1. La repose se fait dans le sens inverse de la dépose.

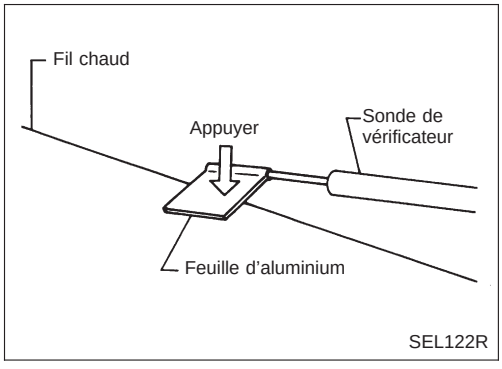
Inspection des composants électriques

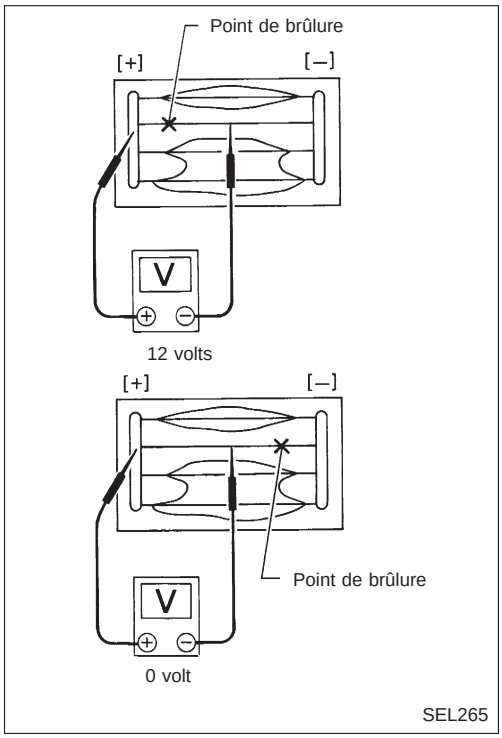
INTERRUPTEUR DE DESEMBUAGE DE LUNETTE ARRIERE



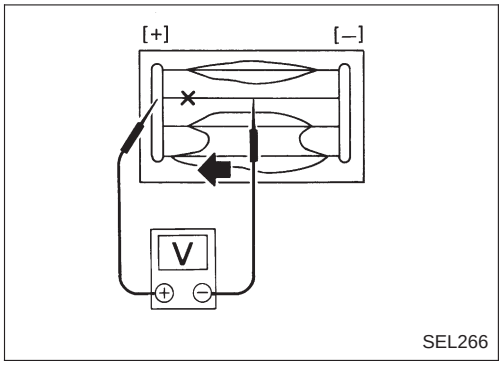
Vérifier la continuité entre les bornes lorsque l'interrupteur de désembuage de lunette arrière est enfoncé et relâché.

Bornes	Condition	Continuité
① - ②	L'interrupteur de désembuage de lunette arrière est enfoncé	Oui
	L'interrupteur de désembuage de lunette arrière est relâché	Non

Vérification des filaments



1. Fixer la sonde d'un voltmètre (sur la plage des volts) sur la partie médiane de chaque filament.

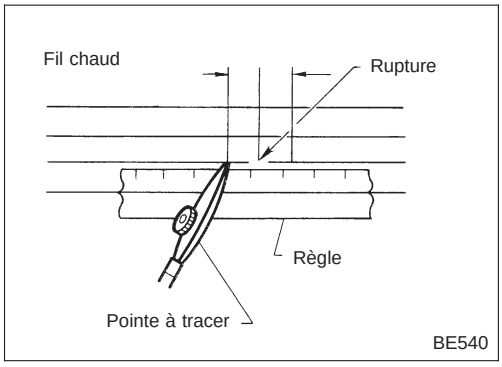


- **Pour mesurer la tension, entourer la pointe de la sonde négative d'une feuille d'aluminium. Appliquer ensuite l'aluminium sur le filament en appuyant du doigt.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Vérification des filaments (Suite)

2. Si un filament est brûlé, le voltmètre enregistre 0 ou 12V.



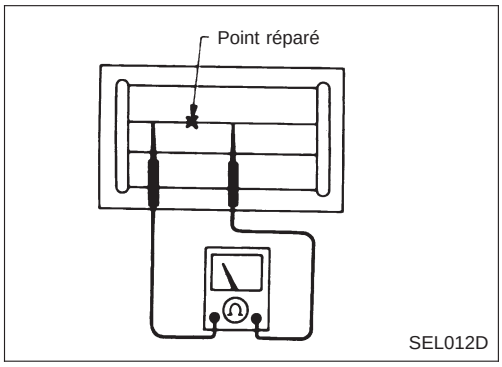
3. Pour localiser les endroits brûlés, déplacer la sonde vers la gauche et la droite le long du filament. L'aiguille de l'appareil retombe brusquement quand la sonde passe sur le point-brûlé.

Remise en état du filament

EQUIPEMENT DE REPARATION

1. Pâte d'argent conductive (Dupont n° 4817 ou équivalent)
2. Règle de 30 cm de long
3. Pointe à tracer
4. Pistolet à air chaud
5. Alcool
6. Chiffon

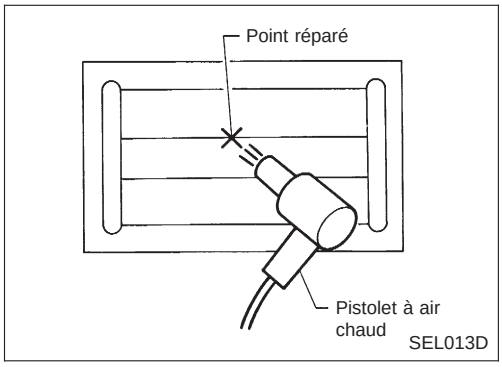
PROCEDURE DE REPARATION



1. Bien nettoyer le filament brisé ainsi que la zone avoisinante avec un chiffon imbibé d'alcool.
2. Apposer un petit peu de pâte d'argent conductive sur le bout de la pointe à tracer.

Secouer le conteneur de pâte d'argent avant l'usage.

3. Disposer la règle sur le verre, le long du filament brisé. Déposer la pâte d'argent conductive sur le point prisé à l'aide de la pointe à tracer. Recouvrir légèrement de pâte le fil chaud de part et d'autre de la brisure (sur 5 mm de préférence).

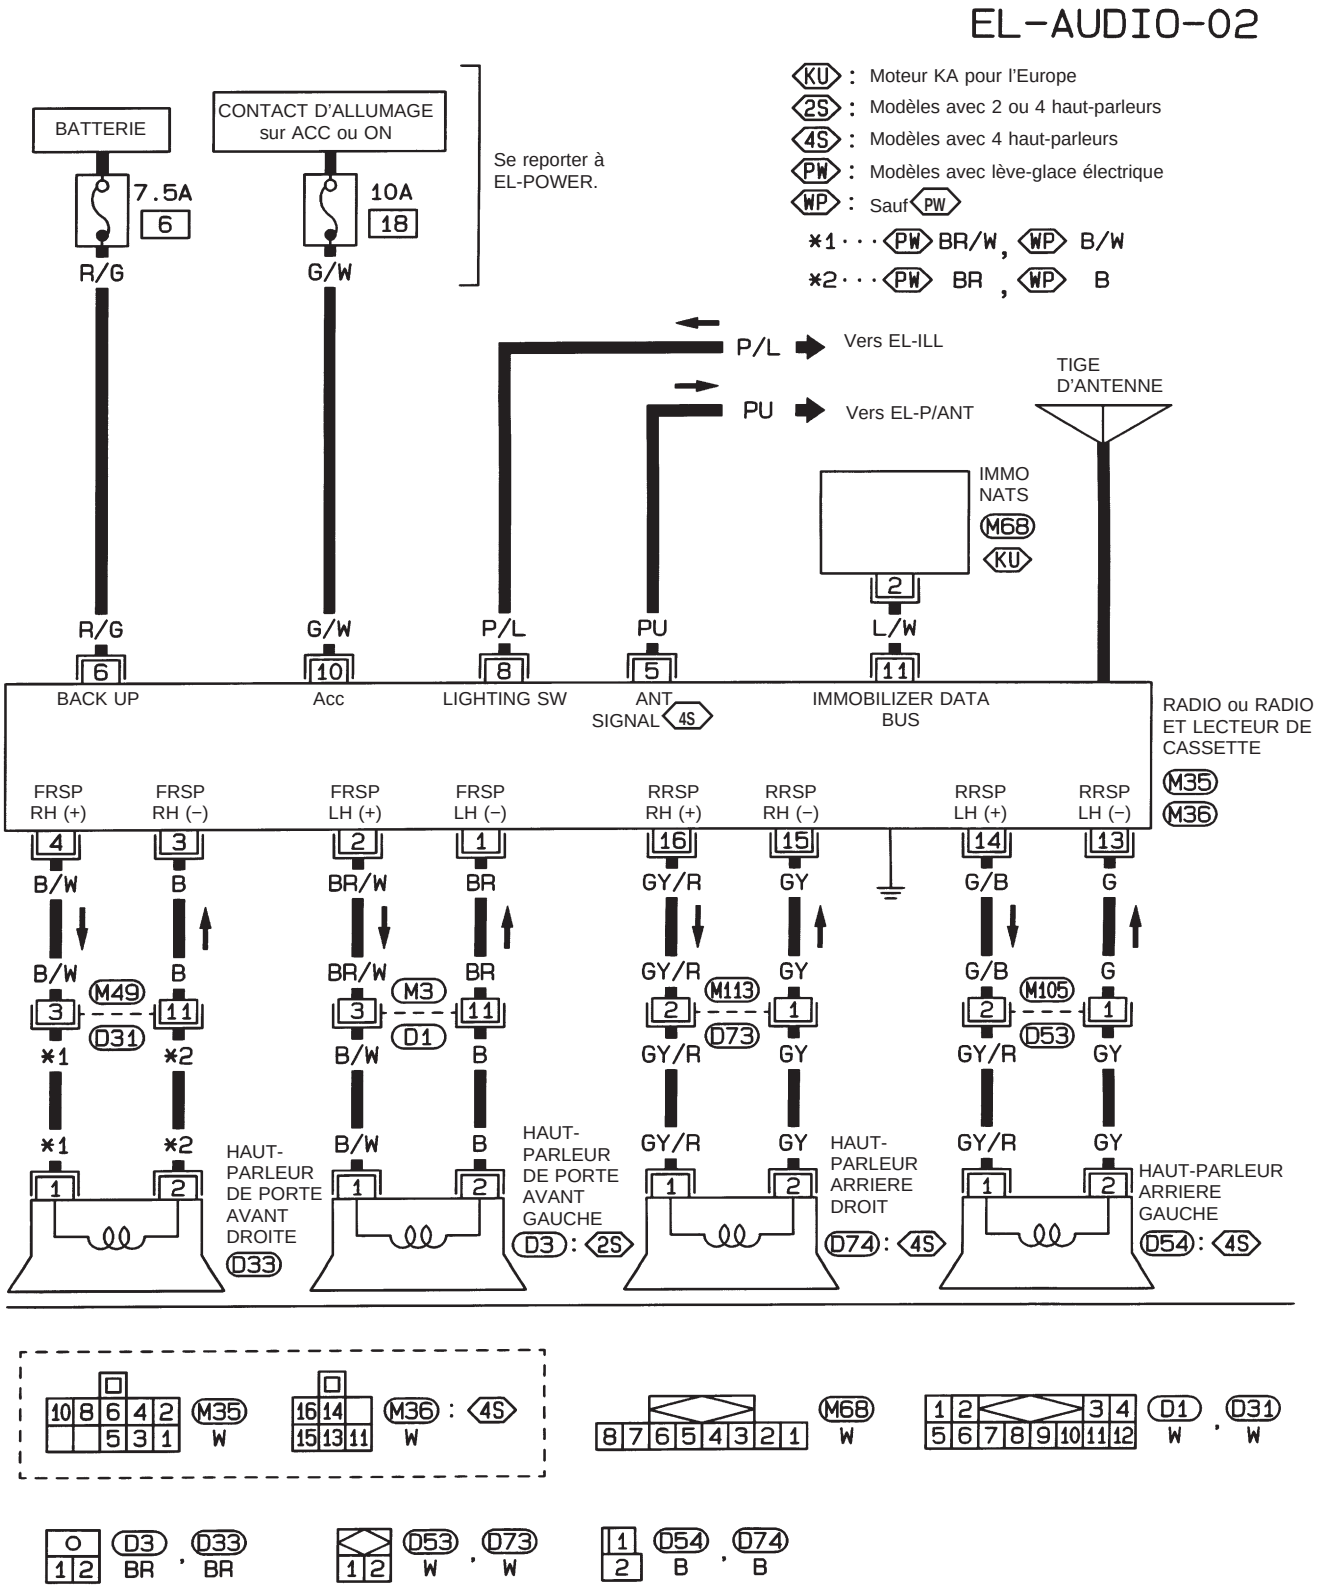


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Remise en état du filament (Suite)

4. Après la remise en état, effectuer un essai de continuité du filament concerné. Cette vérification devrait être menée 10 minutes après l'application de la pâte d'argent.

Ne pas toucher la zone réparée pendant l'essai.



5. Envoyer un jet constant d'air chaud sur la zone remise en état pendant environ 20 minutes à l'aide d'un pistolet à air chaud. Eloigner la sortie d'air chaud de 3 cm par rapport à la zone remise en état. Si l'on ne dispose pas de pistolet à chaleur, il convient de laisser sécher la zone réparée pendant 24 heures.

Diagnostics des défauts

Symptôme	Causes possibles	Ordre de réparation
Radio inopérante (pas d'affichage digital ni de son émis par les haut-parleurs).	1. Fusible de 10A 2. Mauvaise mise à la masse du boîtier radio 3. Radio	1. Vérifier le fusible de 10A (n° 18, situé dans le boîtier à fusibles). Mettre le contact d'allumage sur ''ON''et vérifier qu'une tension positive de la batterie est appliquée à la borne ⑩ de la radio. 2. Vérifier la masse du boîtier de radio. 3. Déposer la radio pour réparation.
Les commandes de la radio fonctionnent, mais aucun son n'est émis par les haut-parleurs.	1. Puissance de la radio 2. Radio	1. Vérifier les tensions de la sortie de la radio. 2. Déposer la radio pour réparation.
Les stations mémorisées s'effacent quand le contact d'allumage est sur OFF.	1. Fusible de 7,5A 2. Radio	1. Vérifier le fusible de 7,5A (n° 6, situé dans le boîtier à fusibles) et vérifier qu'une tension positive de la batterie est appliquée à la borne ⑥ de la radio. 2. Déposer la radio pour réparation.
Les haut-parleurs individuels émettent des parasites ou ne fonctionnent pas.	1. Haut-parleur 2. Puissance de la radio 3. Circuit de haut-parleur 4. Radio	1. Vérifier le haut-parleur. 2. Vérifier les tensions de la sortie de la radio. 3. Vérifier que les câbles ne sont pas ouverts ou court-circuités entre la radio et le haut-parleur. 4. Déposer la radio pour réparation.
Les stations de la radio sont faibles ou bruyantes.	1. Antenne 2. Mauvaise connexion à la masse de la radio 3. Radio	1. Vérifier l'antenne. 2. Vérifier la masse de radio. 3. Déposer la radio pour réparation.
La radio émet des parasites quand le moteur est en marche.	1. Mauvaise connexion à la masse de la radio 2. Fixations de la masse desserrées ou manquantes 3. Condenseur d'allumage ou condenseur antiparasite du chauffage de lunette arrière 4. Alternateur 5. Bobine d'allumage ou câblage secondaire 6. Radio	1. Vérifier la masse de radio. 2. Vérifier les fixations de la masse. 3. Remplacer le condenseur d'allumage ou le condenseur antiparasite du désembuage de lunette arrière. 4. Vérifier l'alternateur. 5. Vérifier la bobine d'allumage et le câblage secondaire. 6. Déposer la radio pour réparation.
La radio émet des parasites lorsque les accessoires sont allumés (bruits secs ou de moteur).	1. Mauvaise connexion à la masse de la radio 2. Antenne 3. Masse d'accessoires 4. Accessoires défectueux	1. Vérifier la masse de radio. 2. Vérifier l'antenne. 3. Vérifier la masse d'accessoires. 4. Remplacer les accessoires.

INSPECTION DES HAUT-PARLEURS

1. Débrancher le connecteur de faisceau du haut-parleur.
2. Mesurer la résistance entre les bornes ① et ② du haut-parleur.
- La résistance devrait être 2 - 4Ω.
3. A l'aide de câbles volants, brancher momentanément une batterie de 9V entre les bornes ① et ② du haut-parleur.
- On doit entendre un vrombissement ou un bruit sec momentané.

INSPECTION D'ANTENNE

A l'aide d'un câble volant, fixer une masse auxiliaire entre l'antenne et la carrosserie.
- Si cela améliore la réception, vérifier la connexion à la masse de l'antenne (à la surface de la carrosserie).
- Si cela n'améliore pas la réception, vérifier le câble d'alimentation principal pour vérifier qu'il n'y a pas de court-circuit ou de circuit ouvert.

INSPECTION DE LA RADIO

Toutes les inspections de tension doivent être effectuées dans les conditions suivantes :
- Contact d'allumage sur ''ON'' ou ''Acc''
- Radio allumée.
- Radio branchée (si la radio a été déposée pour une inspection, appliquer une masse au boîtier à l'aide d'un câble volant).

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Système CATS (code)/Pour l'Europe, conduite à droite

REMARQUE :
- **Ce système est utilisé pour les radios équipées d'un indicateur de code sur tous les modèles.**
- **Le modèle pour l'Europe, conduite à gauche, avec moteur KA24E, est équipé d'une fonction antivol NATS intégrée à la radio comme option, qui rend le système de code inopérant.**

DESCRIPTION

Grâce à un code personnel à quatre chiffres connu seulement du propriétaire du véhicule, l'éventualité d'un vol de la radio est considérablement réduite car sans le code, la radio ne peut pas être activée. En mode d'utilisation normale, l'appareil n'est pas bloqué et reste normalement utilisable.
Cependant, si quelqu'un tente d'enlever la radio ou si le câble de batterie est débranché de la batterie, le système antivol est activé et la radio est ''verrouillée''. L'utilisation d'un code personnel uniquement connu du propriétaire est le seul moyen pour débloquer l'appareil.

DEVERROUILLAGE DU BOITIER (Comment entrer un numéro de code personnel)

- Si l'alimentation de la batterie du véhicule est interrompue par accident, la radio se verrouillera. Pour déverrouiller l'unité, procéder comme suit :

1. Appuyer sur le bouton de commande du volume et d'alimentation pour mettre la radio en marche.
2. ''CODE IN'' s'affiche.
3. Entrer son code personnel en appuyant sur les boutons de présélection (1 à 4).
4. Appuyer sur le bouton ^ .
5. Si le numéro du code entré est correct, la radio s'allume.

Lorsque le code est incorrect

1. Si le code enregistré est incorrect, la radio reste inopérante pendant 10 secondes lors des trois premières tentatives, puis le mode d'entrée de code s'affiche automatiquement (''CODE IN'').
2. Si le code est incorrect la quatrième fois, la radio devient inopérante pendant 60 minutes et ''----'' s'affiche. Après 60 minutes, le mode d'entrée de code est automatiquement actionné (''CODE IN'' s'affiche).

REMARQUE :
Si l'opération ci-dessus se répète 17 fois, l'unité se verrouillera et ''LOCKED'' s'affichera.

3. Une fois ''LOCKED'' affiché, la radio peut repasser en mode d'entrée de code seulement trois fois (seulement 3 tentatives sont possibles pour déverrouiller la radio).

a. Appuyer sur le bouton de commande du volume et d'alimentation tout en appuyant sur les boutons MOD et TA.
b. La radio revient alors au mode d'entrée de code.

ATTENTION :
Si la troisième tentative est infructueuse, la radio se verrouillera définitivement.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Liaison audio NATS/Pour l'Europe, conduite à gauche (KA24E)

DESCRIPTION

Le modèle pour l'Europe, conduite à gauche, avec moteur KA24E, est équipé d'une fonction antivol NATS intégrée à la radio comme option.
La liaison avec l'IMMO NATS implique que la radio ne fonctionne en principe que si elle est branchée à l'IMMO NATS assorti, auquel la radio avait été initialement associée sur la chaîne de fabrication.
Puisque le fonctionnement de la radio devient impossible après que la liaison avec le NATS a été interrompue, le vol de la radio est simplement vain puisqu'un équipement spécial serait nécessaire pour réinitialiser la radio.

Procédure d'initialisation pour les radios reliées à l'IMMO NATS

Les radios neuves seront délivrées aux usines en condition ''NEW'', c'est-à-dire prêtes à être reliées au NATS du véhicule.
Lorsque la radio en condition ''NEW'' est allumée pour la première fois à l'usine, cela déclenche la communication avec le boîtier de contrôle d'immobilisateur du véhicule (IMMO) et un code (le code de radio) est envoyé à l'IMMO. L'IMMO gardera alors ce code dans sa mémoire (permanente), propre à chaque radio.
Une fois que l'IMMO a reçu le code, le NATS confirme à la radio qu'il a bien reçu son code. Plus tard, la radio fonctionnera normalement.
Pendant le déroulement de l'initialisation, ''NEW'' s'affiche sur la radio. Normalement, la communication entre la radio et l'IMMO prend si peu de temps (300 ms) que la radio semble s'allumer directement sans afficher ''NEW''.

Fonctionnement normal

Chaque fois que la radio est allumée après l'initialisation, le code de la radio est vérifié entre le boîtier de radio et le NATS avant que la radio devienne opérationnelle. Pendant le déroulement de la vérification du code, ''WAIT'' s'affiche sur la radio. Une fois de plus la communication demande si peu de temps (300ms) que la radio semble s'allumer directement sans afficher ''WAIT''.

Quand la radio est verrouillée

Si la radio est reliée au NATS du véhicule (système d'immobilisation), tout branchement ou débranchement de la liaison entre la radio et l'IMMO entraînera le passage de la radio en mode de verrouillage (''SECURE''), mode dans lequel le boîtier de radio est entièrement inopérant. Par conséquent, la réparation de la radio devient impossible, à moins que la radio ne revienne en condition ''NEW'', position pour laquelle un équipement de décodage est nécessaire.
Blaupunkt et Clarion ont tous deux mis à disposition de leurs représentants autorisés pour l'entretien des ''décodeurs'' pouvant ramener le boîtier de radio en condition ''NEW''. Ceci permet d'allumer la radio, après quoi la réparation peut être effectuée. Par la suite, quand la radio réparée est délivrée de nouveau au dernier utilisateur, elle est en condition ''NEW'' pour rendre possible toute nouvelle liaison de la radio au système d'immobilisation du véhicule. Par conséquent, toute réparation de la radio ne pourra être faite que par un représentant autorisé Blaupunkt ou Clarion.

Note :
Le fabricant de radio des modèles Nissan D22 pour l'Europe est ''Clarion''.

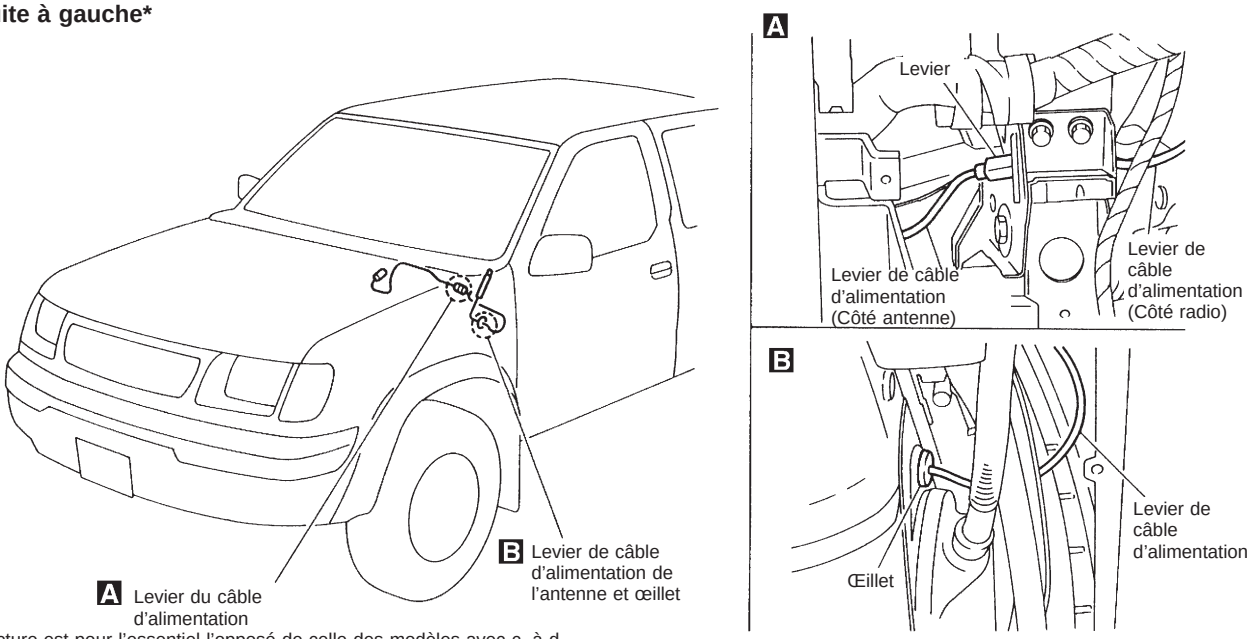
PROCEDURE D'ENTRETIEN

Eléments	Procédure d'entretien	Description
Débranchement de la batterie	Pas de manipulation supplémentaire nécessaire.	–
La radio a besoin d'être réparée	Toute réparation doit être faite par un représentant autorisé par le fabricant de radio puisque la radio ne peut pas être mise en marche à moins qu'elle ne soit en condition ''NEW'', ce qui nécessite un équipement de décodage spécial.	–

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Liaison audio NATS/Pour l'Europe, conduite à gauche (KA24E) (Suite)

Eléments	Procédure d'entretien	Description
Remplacement de la radio par une pièce neuve	Pas de manipulation supplémentaire nécessaire.	La radio est délivrée en condition ''NEW''.
Transfert de la radio sur un autre véhicule/ remplacement de la radio par une pièce ''ancienne''	La radio a besoin d'être remise en condition ''NEW'' par un représentant autorisé par le fabricant de la radio.	–
Remplacement de l'IMMO par une pièce neuve	Pas de manipulation supplémentaire nécessaire.	Le nouvel IMMO sera reconnu par la radio puisqu'un code ''vide'' a été enregistré dans la mémoire de l'IMMO. Si la radio reconnaît ce code ''vide'', la procédure d'entrée du code CATS correct sera lancée, après quoi la radio reviendra à la procédure d'initialisation.
Remplacement de l'IMMO par une pièce ancienne	La radio a besoin d'être remise en condition ''NEW'' par un représentant autorisé par le fabricant de la radio.	Si un code de radio a déjà été mis en mémoire dans l'IMMO, la radio ne peut pas y être reliée. Après avoir allumé la radio, ''SECURE'' s'affichera après 1 minute.
Pas de communication de l'IMMO à la radio	1. Si le NATS ne fonctionne pas correctement, vérifier le système NATS. 2. Une fois le NATS réparé, faire installer la radio en condition ''NEW'' par un représentant autorisé par le fabricant de la radio.	Après avoir allumé la radio, la radio affichera ''SECURE'' après 1 minute. Il est n'est pas possible d'utiliser la radio avant que la communication soit de nouveau établie, ou après que la radio soit installée par un représentant autorisé par le fabricant de la radio.



REMARQUE : Une liste des représentants autorisés par les fabricants de la radio est disponible dans le bulletin technique TB-EL 96-001 publié par Nissan Europe N.V.

HEL379A

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description du système

L'alimentation est permanente
- depuis le raccord à fusible 30A (Lettre [b], situé dans le raccord de fusible et le boîtier à fusibles)
- à la borne (1) du rupteur de circuit
- à travers la borne (2) du rupteur de circuit
- vers la borne (3) du relais de lève-glace électrique.

Lorsque le contact d'allumage est sur la position ''ON'' ou ''START'', l'alimentation est fournie
- à travers le fusible de 10A (n° [14], situé dans le boîtier à fusibles)
- vers la borne (2) du relais de lève-glace électrique.

Le relais de lève-glace électrique est mis à la masse à sa borne (1)
- à travers les masses de carrosserie (M1) et (M54).

Le relais de lève-glace électrique est actionné et l'alimentation est fournie
- à travers la borne (5) du relais de lève-glace électrique
- à la borne (1) de l'interrupteur principal de lève-glace électrique
- vers la borne (5) de l'interrupteur auxiliaire de lève-glace électrique.

FONCTIONNEMENT MANUEL

Porte côté conducteur

La masse est fournie
- à la borne (3) de l'interrupteur principal de lève-glace électrique
- par les masses de carrosserie (M1) et (M54).

VITRE MONTEE
Lorsque l'interrupteur côté conducteur, intégré à l'interrupteur principal de lève-glace électrique, est enclenché vers le haut, l'alimentation est fournie
- à la borne (2) du régulateur de lève-glace électrique côté conducteur
- à travers la borne (9) de l'interrupteur principal de lève-glace électrique.

La masse est fournie
- à la borne (1) du régulateur de lève-glace électrique côté conducteur
- à travers la borne (8) de l'interrupteur principal de lève-glace électrique.

Puis, le moteur monte la vitre jusqu'à ce que l'interrupteur soit relâché.

VITRE BAISSEE
Lorsque l'interrupteur côté conducteur, intégré à l'interrupteur principal de lève-glace électrique, est enclenché vers le bas, l'alimentation est fournie
- à la borne (1) du régulateur de lève-glace électrique côté conducteur
- à travers la borne (8) de l'interrupteur principal de lève-glace électrique.

La masse est fournie
- à la borne (2) du régulateur de lève-glace électrique côté conducteur
- à travers la borne (9) de l'interrupteur principal de lève-glace électrique.

Puis, le moteur baisse la vitre jusqu'à ce que l'interrupteur soit relâché.

Porte côté passager avant

La masse est fournie
- vers la borne (3) de l'interrupteur principal de lève-glace électrique
- à travers les masses de carrosserie (M1) et (M54).

REMARQUE :
Les nombres entre parenthèses indiquent les numéros des bornes, lorsque l'interrupteur de lève-glace est actionné respectivement dans le sens de l'ouverture et de la fermeture.

FONCTIONNEMENT DE L'INTERRUPTEUR PRINCIPAL
L'alimentation est fournie
- à travers les bornes ((5) et (6)) de l'interrupteur principal de lève-glace électrique
- aux bornes ((4), (3)) de l'interrupteur auxiliaire de lève-glace électrique avant.

L'opération suivante est la même que celle concernant les interrupteurs auxiliaires.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description du système (Suite)

FONCTIONNEMENT DES INTERRUPTEURS AUXILLIAIRES
L'alimentation est fournie
- à travers la borne ② ou ① de l'interrupteur auxiliaire de lève-glace électrique avant
- aux bornes (② et ①) du régulateur de lève-glace électrique côté passager avant.

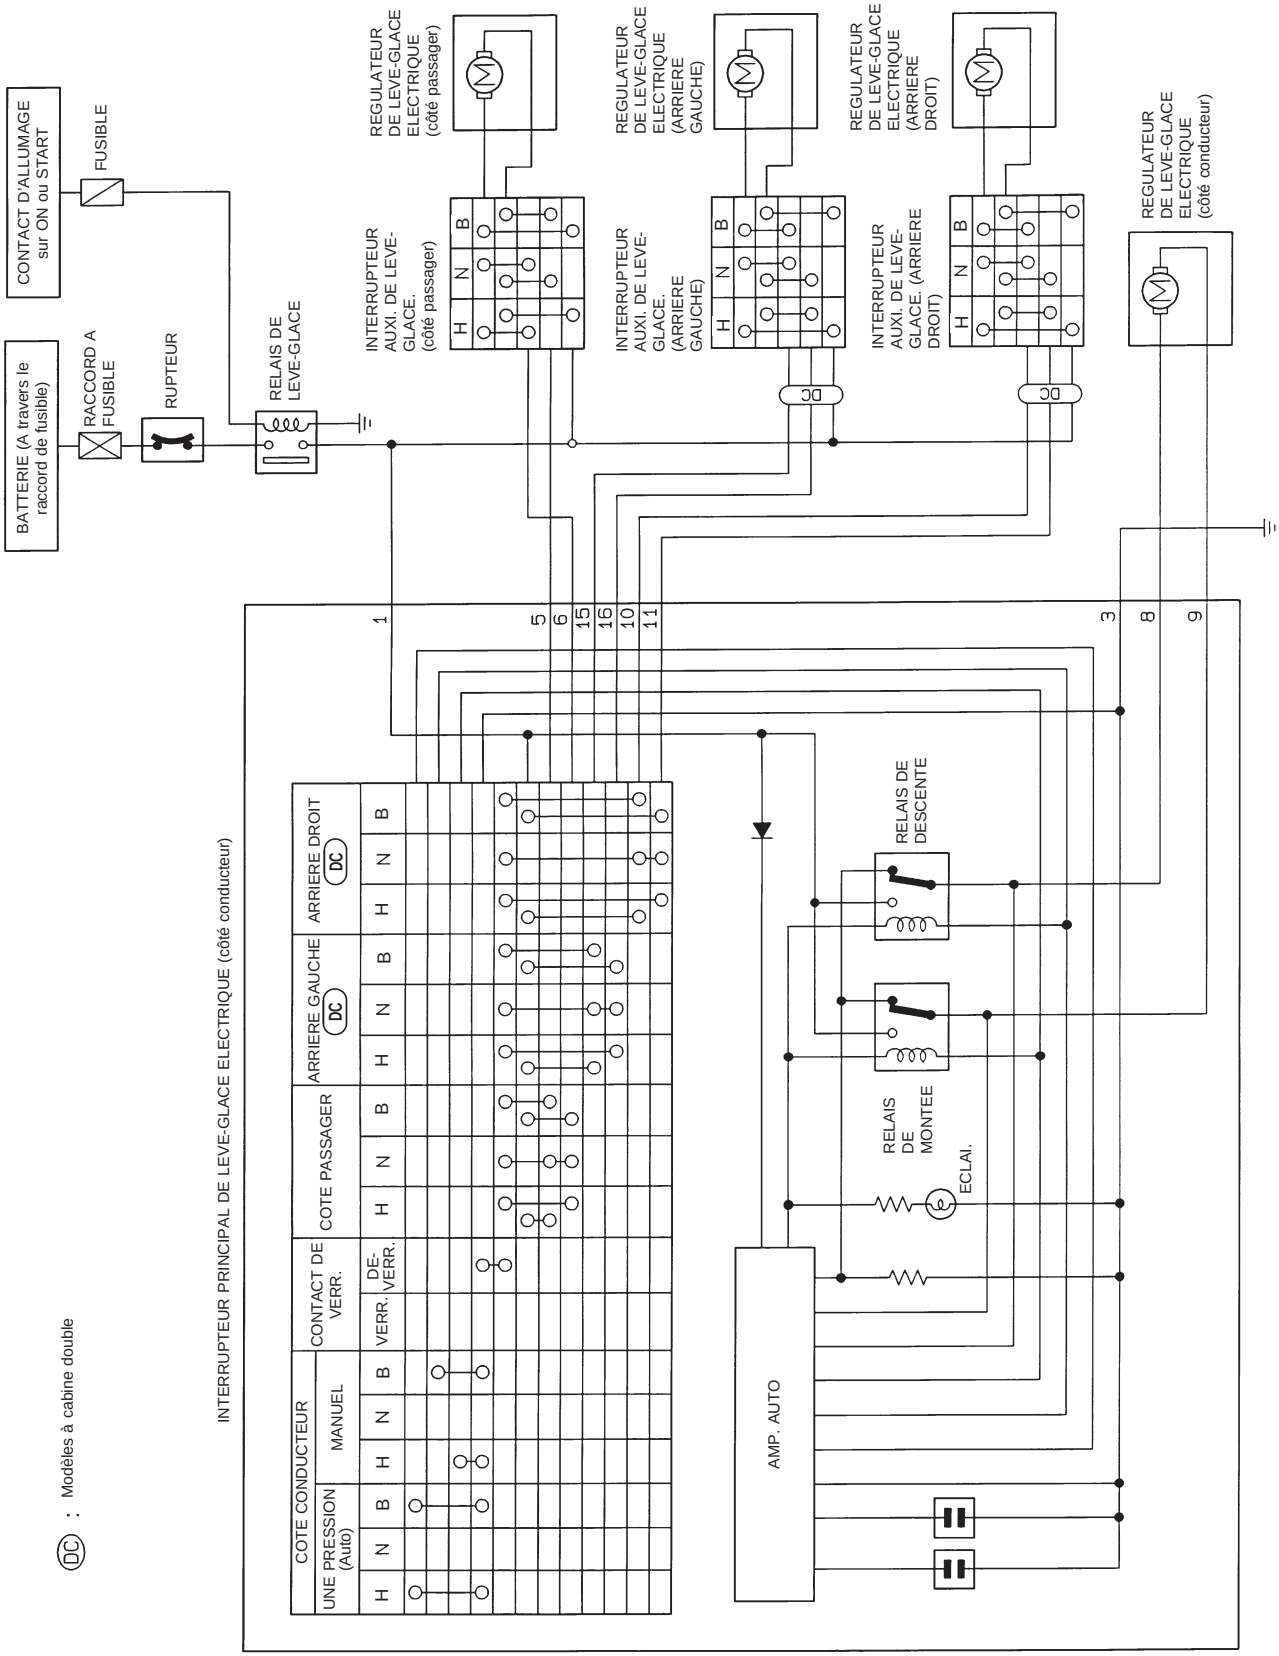
La masse est fournie
- aux bornes (① et ②) du régulateur de lève-glace électrique côté passager avant
- à travers la borne ① ou ② de l'interrupteur auxiliaire de lève-glace électrique avant
- aux bornes (③, ④) de l'interrupteur auxiliaire de lève-glace électrique avant
- à travers les bornes (⑥ et ⑤) de l'interrupteur principal de lève-glace électrique.

Le moteur monte ou descend les vitres jusqu'à ce que l'interrupteur soit relâché.

Porte arrière

Les vitres des portes arrière se monteront et se descendront de la même manière que la vitre du passager avant.

FONCTION AUTO



La fonction AUTO du lève-glace électrique permet au conducteur d'ouvrir ou de fermer sa fenêtre sans avoir à maintenir l'interrupteur dans la position correspondante.
Quand la position AUTO de l'interrupteur principal est enclenchée puis désenclenchée, la fenêtre du conducteur s'ouvre ou se ferme entièrement.

VERROUILLAGE DE LEVE-GLACE ELECTRIQUE

Le verrouillage de lève-glace électrique est conçu de façon à ce qu'aucune vitre ne fonctionne, à l'exception de celle du conducteur.
Lorsque l'interrupteur de verrouillage est en position de verrouillage, la masse des interrupteurs auxiliaires de lève-glace intégrés à l'interrupteur principal est déconnectée. Ceci empêche le moteur du lève-glace électrique de fonctionner.

Diagnostics des défauts

Symptôme	Cause possible	Ordre de réparation
Aucun lève-glace ne peut être actionné par l'un des interrupteurs.	1. Fusible de 10A, raccord à fusible de 30A et rupteur (M52)	1. Vérifier le fusible de 10A (n° 14, situé dans le boîtier à fusibles), le fusible de 30A (lettre b, situé dans le raccord à fusibles et le boîtier à fusibles) et le rupteur (M52). Mettre le contact d'allumage sur ''ON'' et vérifier qu'une tension positive de la batterie est appliquée à la borne (1) de l'interrupteur principal de lève-glace électrique et à la borne (5) des interrupteurs auxiliaires.
	2. Masses (M1) et (M54)	2. Vérifier les masses (M1) et (M54).
	3. Relais de lève-glace	3. Vérifier le relais de lève-glace électrique.
	4. Circuit ouvert/court-circuit de l'interrupteur principal de lève-glace	4. Vérifier que le câble W n'est pas ouvert ou en court-circuit entre le relais de lève-glace électrique et l'interrupteur principal de lève-glace électrique.
Le lève-glace électrique du conducteur ne peut pas être actionné mais les autres fenêtres peuvent l'être.	1. Circuit du régulateur de lève-glace électrique du conducteur	1. Vérifier que le faisceau n'est pas ouvert ou court-circuité entre l'interrupteur principal et le régulateur de lève-glaces électrique.
	2. Régulateur de lève-glace électrique du conducteur	2. Vérifier le régulateur de lève-glace électrique côté conducteur.
Le lève-glace électrique du passager ne peut pas être actionné.	1. Interrupteurs auxiliaires de lève-glace.	1. Vérifier les interrupteurs auxiliaires de lève-glace électrique.
	2. Régulateurs de lève-glace électrique du passager	2. Vérifier le régulateur de lève-glace électrique du passager.
	3. Interrupteur principal de lève-glace	3. Vérifier l'interrupteur principal de lève-glace.
	4. Circuit du lève-glace électrique	4-1. Vérifier que le faisceau n'est pas ouvert ou court-circuité entre l'interrupteur principal et les interrupteurs auxiliaires de lève-glaces électriques. 4-2. Vérifier que le faisceau n'est pas ouvert ou court-circuité entre les interrupteurs auxiliaires et le régulateur de lève-glace électrique.
Le lève-glace électrique du passager ne peut pas être actionné à l'aide de l'interrupteur principal de lève-glace mais peut l'être à l'aide des interrupteurs auxiliaires.	1. Interrupteur principal de lève-glace	1. Vérifier l'interrupteur principal de lève-glace.
La fonction auto. du lève-glace électrique du conducteur ne peut être actionnée à l'aide de l'interrupteur principal de lève-glace électrique.	1. Interrupteur principal de lève-glace	1. Vérifier l'interrupteur principal de lève-glace.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description du système

L'alimentation est permanente
- à travers le raccord à fusibles 30A (Lettre (n° [b], situé dans le boîtier à fusibles et le raccord à fusibles)
- à la borne ① du rupteur de circuit
- à travers la borne ② du rupteur de circuit
- à la borne ③ de la minuterie de verrouillage de porte.

La masse est fournie à la borne ① de la minuterie du verrouillage par les masses de carrosserie (M54) et (M1).

ENTREE

Lorsque le contact de verrou. et déverrou. de porte (interrupteur principal de lève-glace) est sur la position ''LOCKED'' (VERR), le signal de masse est fourni
- à la borne ⑤ de la minuterie de verrouillage de porte
- à travers la borne ⑭ du contact de verrou. et déverrou. de porte
- à la borne ③ du contact de verrou. et déverrou. de porte
- à travers les masses de carrosserie (M1) et (M54).

Lorsque le contact de verrou. et déverrou. de porte (interrupteur principal de lève-glace) est sur la position ''UNLOCKED'' (DEVERR), le signal de masse est fourni
- à la borne ⑧ de la minuterie de verrouillage de porte
- à travers la borne ⑦ du contact de verrou. et déverrou. de porte
- à la borne ③ du contact de verrou. et déverrou. de porte
- à travers les masses de carrosserie (M1) et (M54).

Le canon de clé côté conducteur et le bouton de verrouillage côté conducteur sont connectés au contact de verrouillage au moyen d'une tige. Quand le du bouton de verrouillage est sur la position ''DEVERR.'', le signal de masse est fourni
- à la borne ⑥ de la minuterie de verrouillage de porte
- à travers la borne ② du contact du bouton de verrouillage
- à travers la borne ① du contact du bouton de verrouillage côté conducteur
- à travers les masses de carrosserie (M1) et (M54).

Quand la commande du bouton de verrouillage est sur la position ''VERR.'', le signal de masse est interromptu.

Le verrouillage de porte fonctionne en fonction des positions du contact de verrouillage et déverrouillage de porte (interrupteur principal de lève-glace) et du contact de bouton de verrouillage.

SORTIE

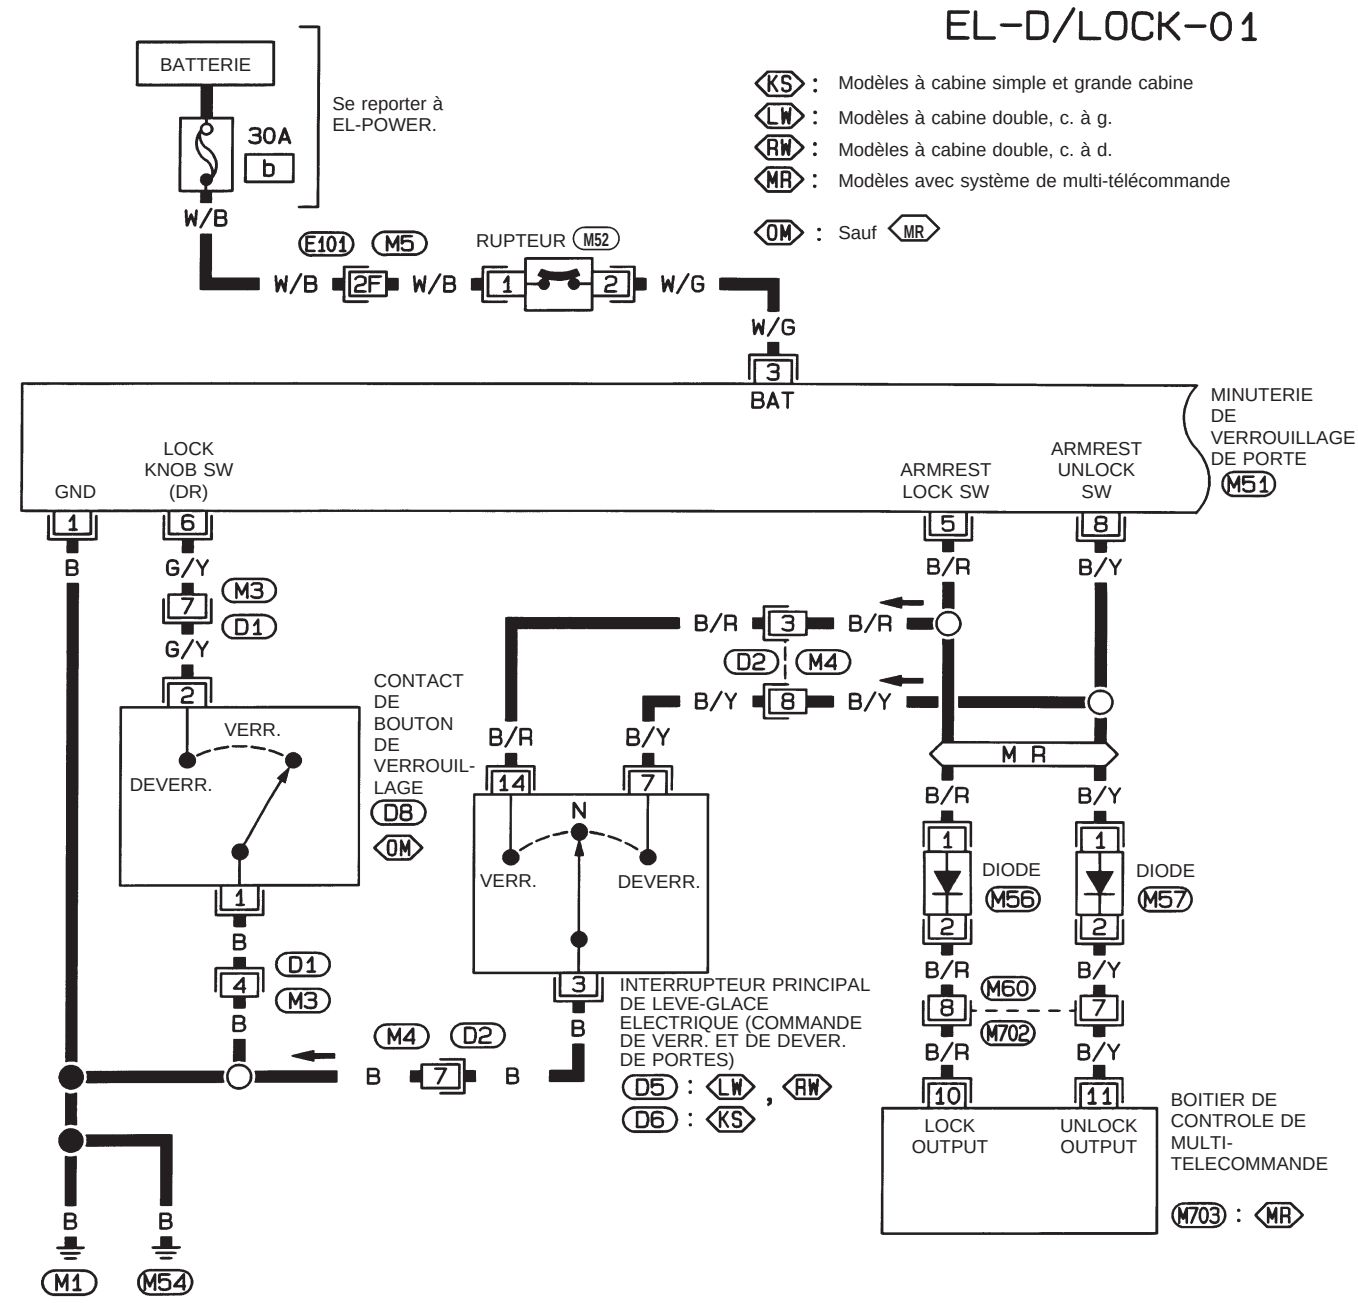
Déverrouillage

La masse est fournie
- vers l'actionneur de verrouillage de porte côté passager, vers la borne ① de l'actionneur de verr. des portes arrière gauche et droite (cabine double)
- à travers la borne ② de la minuterie de verrouillage de porte.

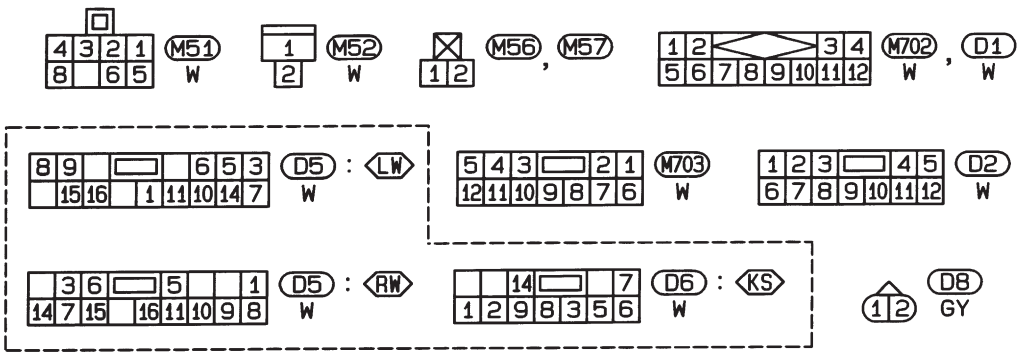
L'alimentation est fournie
- vers l'actionneur de verrouillage de porte côté passager, vers la borne ② de l'actionneur de verr. des portes arrière gauche et droite (double cabine)
- à travers la borne ④ de la minuterie de verrouillage de porte.

Les portes sont alors déverrouillées.

Verrouillage



La masse est fournie
- à l'actionneur de verrouillage de porte côté passager, à la borne ② de l'actionneur de verr. des portes arrière gauche et droite
- à travers la borne ④ de la minuterie de verrouillage de porte.



L'alimentation est fournie
- à l'actionneur de verrouillage de porte côté passager, à la borne ① de l'actionneur de verr. des portes arrière gauche et droite
- à travers la borne ② de la minuterie de verrouillage de porte.

Les portes sont alors verrouillées.

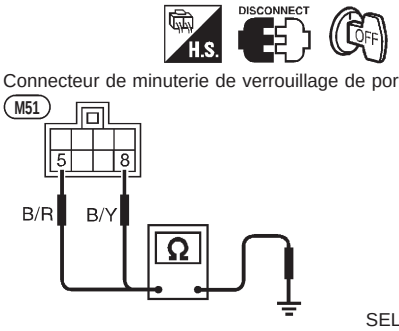
Bornes	Continuité
① - Masse	Oui



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostic des défauts (Suite)

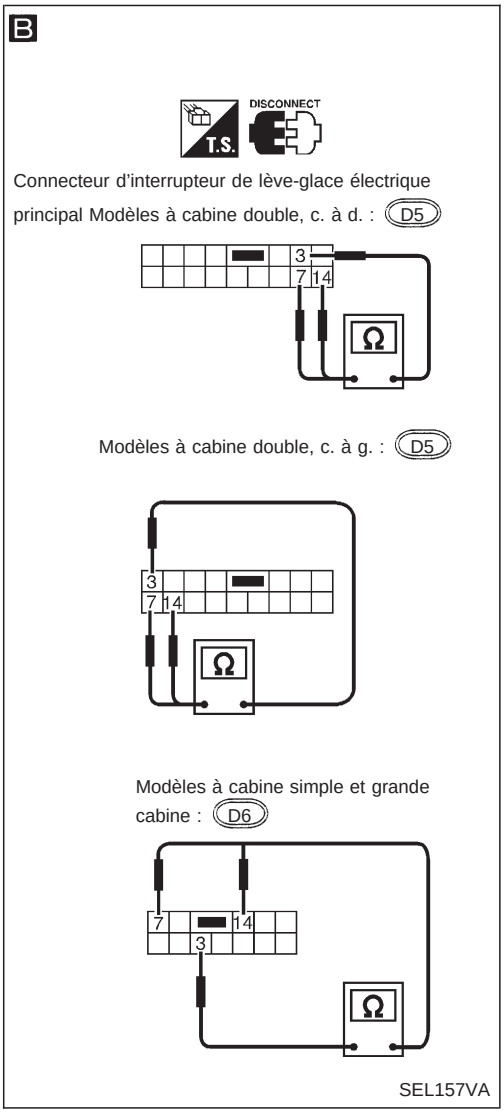
PROCEDURE DE DIAGNOSTIC 1

(Vérification du contact de verrouillage et de déverrouillage de portes)

A

VERIFICATION DU SIGNAL D'ENTREE DE LA COMMANDE DE VERROUILLAGE ET DE DEVERROUILLAGE DE PORTES.

1. Débrancher le connecteur de la minuterie de verrouillage de porte.
2. Vérifier la continuité entre la borne (5) ou (8) du boîtier de contrôle et la masse.



Bornes	Position du contact de verrouillage et de déverrouillage	Continuité
(5) - Masse	Verrouillage	Oui
	N et Déverrouillage	Non
(8) - Masse	Déverrouillage	Oui
	N et Verrouillage	Non

Bon → Le contact de verrouillage et de déverrouillage fonctionne correctement.

Mauvais ↓

B

B

VERIFICATION DE LA COMMANDE DE VERROUILLAGE ET DE DEVERROUILLAGE DE PORTES

1. Débrancher le connecteur de contact de verrouillage et de déverrouillage de porte.
2. Vérifier la continuité entre les bornes de l'interrupteur principal de lève-glace (Interrupteur de verrouillage/déverrouillage de porte).

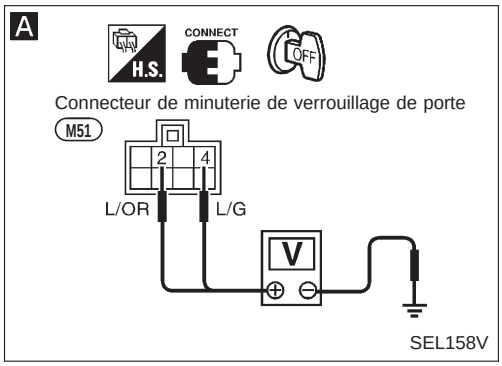
Condition	Bornes		
	3	7	14
Verrouillage	○		○
N	Absence de continuité		
Déverrouillage	○	○	

Mauvais → Remplacer l'interrupteur de verrouillage et déverrouillage de porte.

Bon ↓

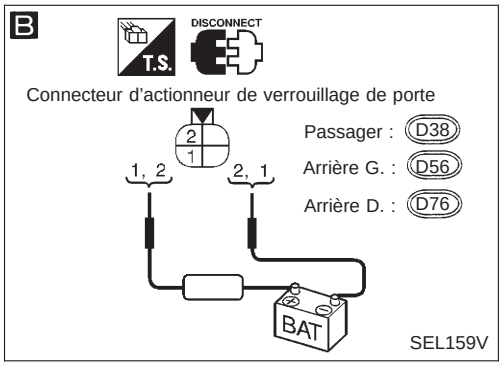
Vérifier les points suivants.

- Circuit de mise à la masse pour le contact de verrouillage et de déverrouillage de porte
- Faisceau ouvert ou court-circuité entre l'interrupteur de verrouillage et de déverrouillage de porte et le connecteur de la minuterie de verrouillage de porte



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostic des défauts (Suite)



PROCEDURE DE DIAGNOSTIC 2

(Vérification de l'actionneur de verrouillage de porte)

A

B

A

VERIFICATION DU CIRCUIT DE L'ACTIONNEUR DE VERROUILLAGE DE PORTE.
Vérifier la tension de l'actionneur de verrouillage de porte.

Position du contact de bouton de verrouillage	Bornes ⊕	Bornes ⊖	Tension (V)
Verrouillage	②	masse	Tension de la batterie
Déverrouillage	④	masse	

Mauvais → Remplacer la minuterie de verrouillage de porte (avant de remplacer le boîtier de contrôle, effectuer la PROCEDURE DE DIAGNOSTIC 1.)

Bon ↓

B

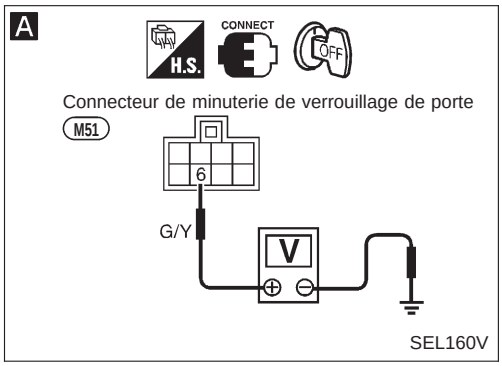
VERIFICATION DE L'ACTIONNEUR DE VERROUILLAGE DE PORTE.
1. Débrancher le connecteur d'actionneur de verrouillage de porte.
2. Appliquer une tension de 12V sur l'actionneur de verrouillage de porte et vérifier le fonctionnement.

Fonctionnement de l'actionneur de verrouillage de porte	Bornes ⊕	Bornes ⊖
Déverrouillé → Verrouillé	①	②
Verrouillé → Déverrouillé	②	①

Mauvais → Remplacer l'actionneur de verrouillage des portes.

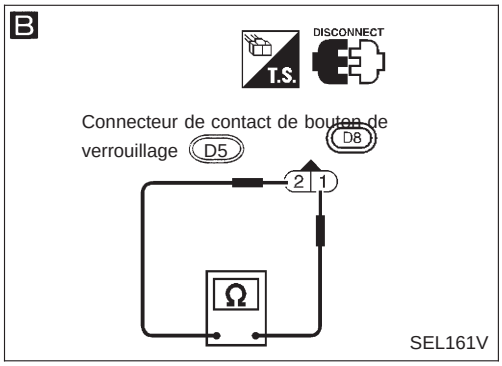
Bon ↓

Réparer le faisceau entre le connecteur de la minuterie de verrouillage de porte et l'actionneur de verrouillage de porte.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostic des défauts (Suite)



PROCEDURE DE DIAGNOSTIC 3

(Vérification du contact du bouton de verrouillage, côté conducteur)

A

B

A

VERIFIER LE SIGNAL D'ENTREE DE LE CONTACT DU BOUTON DE VERROUILLAGE.
Vérifier la tension entre la borne ⑥ de la minuterie de verrouillage et la masse.

Position du contact de bouton de verrouillage	Tension (V)
Verrouillage	Environ 12
Déverrouillage	0

Bon → Le contact du bouton de verrouillage de porte du conducteur fonctionne correctement.

Mauvais ↓

B

VERIFIER LE CONTACT DU BOUTON DE VERROUILLAGE.
1. Débrancher le connecteur de contact de bouton de verrouillage de porte côté conducteur.
2. Vérifier la continuité des bornes du contact du bouton de verrouillage.

Bornes	Condition	Continuité
① - ②	Verrouillé	Non
	Déverrouillé	Oui

Mauvais → Remplacer le contact de bouton de verrouillage.

Bon ↓

Vérifier les points suivants.
- Circuit de mise à la masse pour le contact de bouton de verrouillage
- Faisceau ouvert ou court-circuité entre le contact de bouton de verrouillage de porte et la minuterie de verrouillage de porte

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description du système

FONCTIONS

Le système de contrôle de la multi-télécommande est doté des fonctions suivantes.
- Verrouillage de porte
- Déverrouillage de porte
- Rappel de feux de détresse

FONCTIONNEMENT DU VERROUILLAGE

Pour verrouiller la porte à l'aide de la multi-télécommande, il faut que les deux signaux suivants soient reçus.
- Contact de clé sur OFF (quand la clé d'allumage n'est pas dans le cylindre de contact d'allumage).
- Tous les contacts de portes FERMES

Quand le signal de VERR. est entré dans le boîtier de contrôle de la multi-télécommande (l'antenne du système est combinée avec le boîtier de contrôle de la multi-télécommande), la masse est fournie
- à travers la borne ⑩ de la multi-télécommande
- à la borne ⑤ de la minuterie de verrouillage de porte et
- à la borne ① du relais 3 (VERR.) de la multi-télécommande.

La minuterie de verrouillage de porte fonctionne pour verrouiller les portes (sauf celle du conducteur) et le relais-3 de la multi-télécommande (VERR.) est activé pour verrouiller la porte du conducteur.

FONCTIONNEMENT DU DEVERROUILLAGE

Pour déverrouiller la porte à l'aide de la multi-télécommande, il faut que les deux signaux suivants soient reçus.
- Contact de clé sur OFF (quand la clé d'allumage n'est pas dans le cylindre de contact d'allumage)

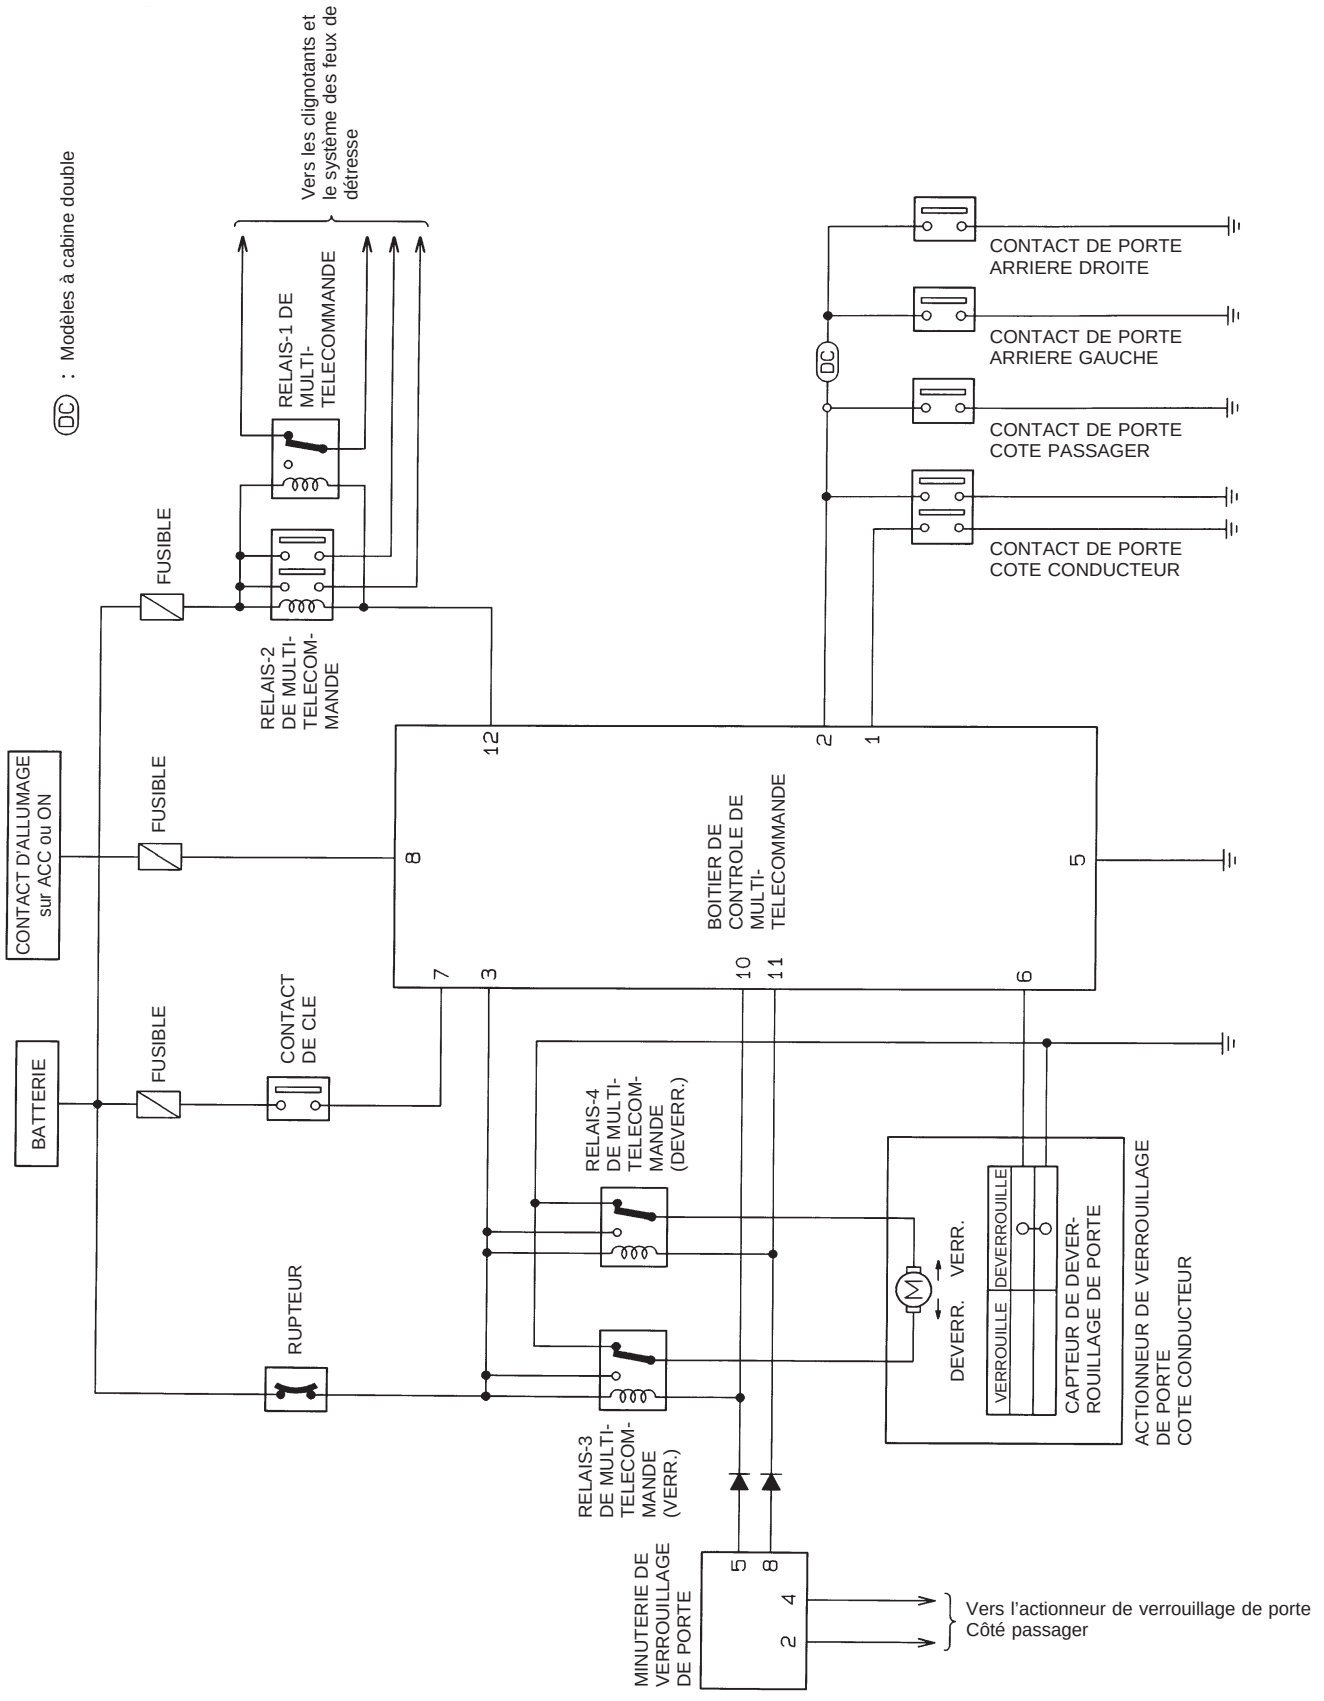
Quand le signal de DEVERR. est entré dans le boîtier de contrôle de la multi-télécommande (l'antenne du système est combinée avec le boîtier de contrôle de la multi-télécommande), la masse est fournie
- à travers la borne ⑪ de la multi-télécommande
- à la borne ⑧ de la minuterie de verrouillage de porte et
- à la borne ① du relais 4 (DEVERR.) de la multi-télécommande.

La minuterie de verrouillage de porte fonctionne pour déverrouiller les portes (sauf celle du conducteur) et le relais-4 de la multi-télécommande (DEVERR.) est activé pour déverrouiller la porte du conducteur.

RAPPEL DE FEUX DE DETRESSE

Quand les portes sont verrouillées ou déverrouillées par la multi-télécommande, la masse est fournie
- vers la borne ① du relais 1 et 2 de multi-télécommande
- à travers la borne ⑫ de la multi-télécommande.

Puis les relais sont activés et les feux de détresse clignotent comme suit
- Fonctionnement de verrouillage : clignote une fois
- Fonctionnement de déverrouillage : clignote deux fois



SAISIE DU CODE D'IDENTIFICATION DE LA MULTI-TELECOMMANDE

Un maximum de quatre télécommandes peut être entré. Toute tentative pour entrer la télécommande effacera les codes d'identification entrés précédemment. Il faut par conséquent s'assurer que le propriétaire du véhicule a remis toutes les multi-télécommandes lorsqu'une saisie de code d'identification est effectuée.
Pour entrer la saisie du code d'identification, il faut que les signaux suivants soient intégrés au boîtier de contrôle de la multi-télécommande.
- Signal VERR. côté conducteur (depuis le capteur de déverrouillage de porte du conducteur)
- Signal FERME de contact de porte
- Signal du contact de clé (INSEREE/RETIREE)
- Alimentation électrique des accessoires
- Signal de la multi-télécommande

Pour plus de détails sur la procédure, se reporter à ''Procédure d'entrée du code d'identification'' à la page EL-184.

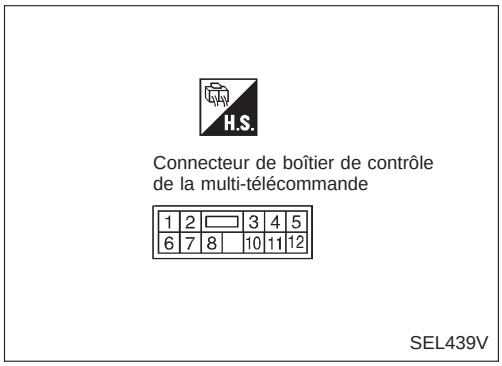
Diagnostics des défauts

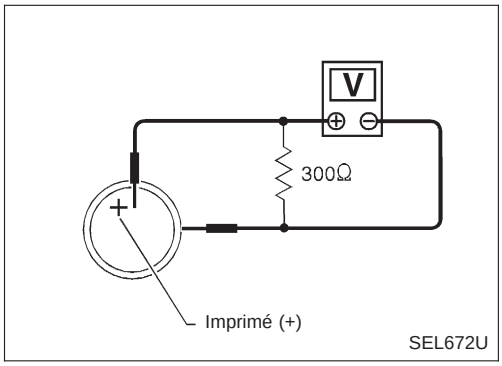
TABLEAU DES SYMPTOMES

Symptôme	Cause possible	Diagnostic/procédure d'entretien
Aucune porte ne peut être verrouillée ou déverrouillée par la multi-télécommande (voir NOTE).	1. Batterie de la télécommande 2. Contact de clé (insérer) 3. Contact de porte 4. Circuit d'alimentation électrique pour le boîtier de contrôle de la multi-télécommande 5. Circuit de masse du boîtier de contrôle de la multi-télécommande 6. Télécommande	1. Vérifier la batterie de la télécommande. Se reporter à EL-182. 2. Vérifier le signal du contact de clé (insérer) à la borne ⑦ du boîtier de la multi-télécommande. 3. Vérifier le signal du contact de porte aux bornes ① et ② du boîtier de contrôle de multi-télécommande. 4. S'assurer qu'il y a une tension de la batterie à la borne ③ du boîtier de contrôle de multi-télécommande. 5. Vérifier la continuité entre la borne ⑤ du boîtier de contrôle de multi-télécommande et la masse. 6. Remplacer la multi-télécommande. Se reporter à EL-184.
La porte du conducteur ne peut pas être verrouillée ou déverrouillée par l'actionnemnet de la multi-télécommande.	1. Circuit de l'actionneur de verrouillage de porte du conducteur	1. Vérifier le circuit de l'actionneur de verrouillage de porte côté conducteur. Se reporter à EL-183.
Les portes autres que celle du conducteur ne peuvent pas être verrouillées ou déverrouillées par l'actionnement de la multi-télécommande. (si le système de verrouillage électrique des portes ne fonctionne pas correctement, vérifier le système de verrouillage électrique des portes. Se reporter à EL-171).	1. Signal de verr./déverr. de la centrale de commande intelligente	● Lorsque le verrouillage n'est pas possible : Vérifier la continuité entre la borne ⑩ du boîtier de contrôle de multi-télécommande et la borne ⑤ de la minuterie de verrouillage. ● Quand le déverrouillage n'est pas possible : Vérifier la continuité entre la borne ⑪ du boîtier de contrôle de multi-télécommande et la borne ⑧ de la minuterie de verrouillage.
Le rappel de feux de détresse ne fonctionne pas correctement.	1. Fusible de 10A 2. Relais-1 et 2 de la multi-télécommande 3. Circuit du rappel de feux de détresse	1. Vérifier le fusible de 10A (n° 5 , situé dans le boîtier à fusibles). 2. Vérifier le relais-1 et 2 de multi-télécommande. 3. Vérifier si le faisceau est ouvert ou en court-circuit entre les relais et la borne ⑫ de la multi-télécommande
Le nouveau code d'identification de la multi-télécommande ne peut pas être entré.	1. Batterie de la télécommande 2. Contact de clé (insérer) 3. Contact de porte 4. Capteur de déverrouillage de porte côté conducteur 5. Circuit d'alimentation électrique des accessoires du boîtier de contrôle de multi-télécommande 6. Télécommande	1. Vérifier la pile de la télécommande. Se reporter à EL-182. 2. Vérifier le signal du contact de clé (insérer) à la borne ⑦ du boîtier de la multi-télécommande. 3. Vérifier le signal du contact de porte aux bornes ① et ② du boîtier de contrôle de multi-télécommande. 4. Vérifier le signal de capteur de déverrouillage de porte (côté conducteur) à la borne ⑥ du boîtier de contrôle de la multi-télécommande. 5. S'assurer qu'il y a une tension de la batterie à la borne ⑧ du boîtier de contrôle de multi-télécommande lorsque le contact d'allumage est sur la position ACC. 6. Remplacer la multi-télécommande. Se reporter à EL-184.

Se reporter au ''TABLEAU D'INSPECTION DU BOITIER DE CONTROLE DE MULTI-TELECOMMANDE'' de la page suivante pour vérifier les signaux du boîtier de contrôle.
REMARQUE :



- Le fonctionnement de déverrouillage de la multi-télécommande ne fonctionne pas lorsque la clé est insérée dans le cylindre.
- Le fonctionnement du verrouillage de la multi-télécommande ne fonctionne pas quand la clé est insérée dans le cylindre ou si l'une des portes est ouverte.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostics des défauts (Suite)

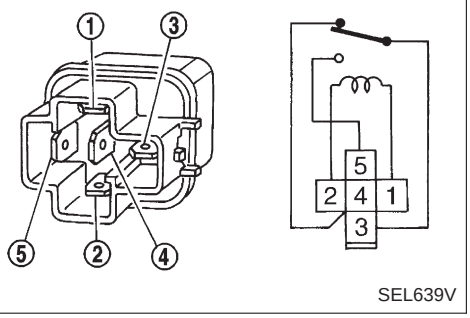
TABLEAU D'INSPECTION DU BOITIER DE CONTROLE DE MULTI-TELECOMMANDE

N° borne	Connexions	Condition		Tension (V) (valeurs approximatives)
1	Contact de porte côté conducteur	Porte côté conducteur	Ouvert	0
			Fermé	12
2	Contact de porte (toutes les portes)	L'une des portes est ouverte		0
		Toutes les portes sont fermées		12
3	Source d'alimentation (BAT)	–		12
5	Masse	–		–
6	Capteur de déverrouillage de porte côté conducteur	Porte côté conducteur	Verrouillé	5
			Déverrouillé	0
7	Contact de clé (insérer)	La clé est dans le cylindre de contact d'allumage		12
		La clé n'est pas dans le cylindre de contact d'allumage		0
8	Alimentation électrique des accessoires	Contact d'allumage	ARRET	0
			Acc ou ON	12
10	Signal de verrouillage	Le bouton VERR. de la télécommande est enclenché (Toutes les portes sont fermées et la clé ne se trouve pas dans le cylindre de contact d'allumage)		0
		A l'exception des conditions ci-dessus.		12
11	Signal de déverrouillage	Le bouton DEVERR. de la télécommande est enclenché (La clé n'est pas dans le cylindre de contact d'allumage).		0
		A l'exception des conditions ci-dessus.		12
12	Relais-1, 2 de la multi-télécommande	Le bouton VERR./DEVERR. de la télécommande est enclenché (Toutes les portes sont fermées et la clé ne se trouve pas dans le cylindre de contact d'allumage)		0
		A l'exception des conditions ci-dessus.		12

VERIFIVATION DE LA BATTERIE DE LA MULTI-TELECOMMANDE

Déposer la batterie et mesurer la tension entre les bornes positive ⊕ et négative ⊖ de la batterie.

Mesure de la borne		Valeur de standard
⊕	⊖	
Borne positive de batterie ⊕	Borne négative de batterie ⊖	2,5 - 3,0V



Note :
La télécommande ne fonctionne pas si la batterie n'est pas correctement installée.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

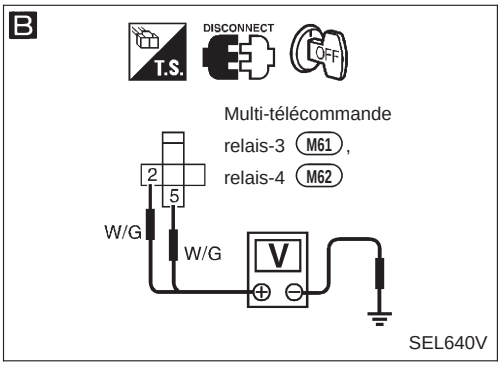
Diagnostics des défauts (Suite)

VERIFICATION DE L'ACTIONNEUR DE VERROUILLAGE DE PORTE COTE CONDUCTEUR

A

SEL639V

VERIFIER LES RELAIS-3, 4 DE LA MULTI-TELECOMMANDE.



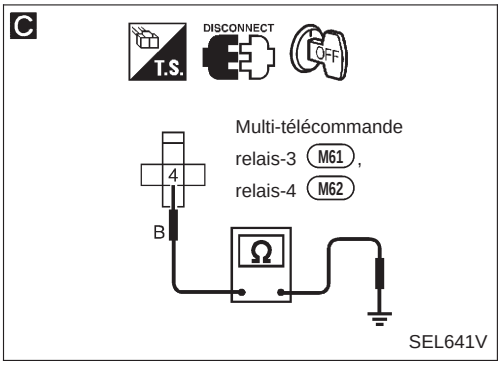
condition		Continuité entre les bornes ③ et ④	Continuité entre les bornes ③ et ⑤
La tension de la batterie n'est pas appliquée entre chaque borne	① et ②	Oui	Non
La tension de la batterie est appliquée entre chaque borne	① et ②	Non	Oui

Pendant que la tension de la batterie est appliquée aux bornes du relais, insérer le fusible dans le circuit.

Mauvais → Remplacer le relais.

Bon ↓

B



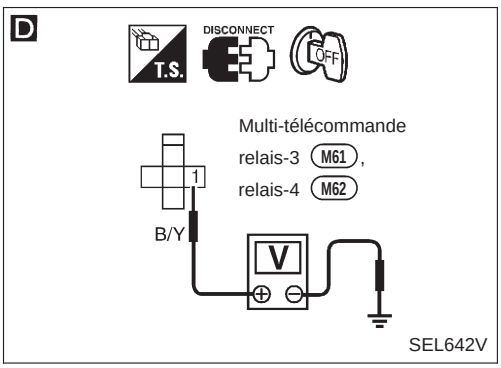
SEL640V

VERIFIER L'ALIMENTATION ELECTRIQUE DES RELAIS.
Vérifier la tension entre les bornes ②, ⑤ du relais-3, 4 de multi-télécommande et la masse.
Il doit y avoir tension de la batterie.

Mauvais → Vérifier les points suivants.
- Fusible de 30A (n° h, situé dans le raccord à fusibles et le boîtier à fusibles).
- Vérifier si le faisceau est ouvert ou en court-circuit entre le fusible et le relais.

Bon ↓

C



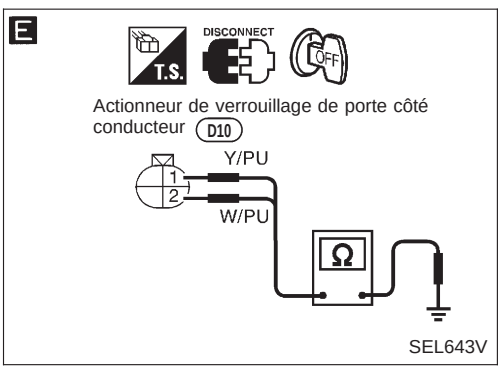
SEL641V

VERIFIER LE CIRCUIT DE MISE A LA MASSE DES RELAIS.
Vérifier la continuité entre la borne ④ du relais-3, 4 de la multi-télécommande et la masse.
Il doit y avoir continuité.

Mauvais → Réparer le faisceau.

Bon ↓

D



SEL642V

VERIFIER LE SIGNAL DE VERR./DEVERR. DES RELAIS.
Vérifier la tension entre la borne ① du relais-3, 4 de multi-télécommande et la masse.
Il devrait y avoir une tension de 5V.

Mauvais → Vérifier si le faisceau est ouvert ou en court-circuit entre le relais de la multi-télécommande et le boîtier de la multi-télécommande.

Bon ↓

E

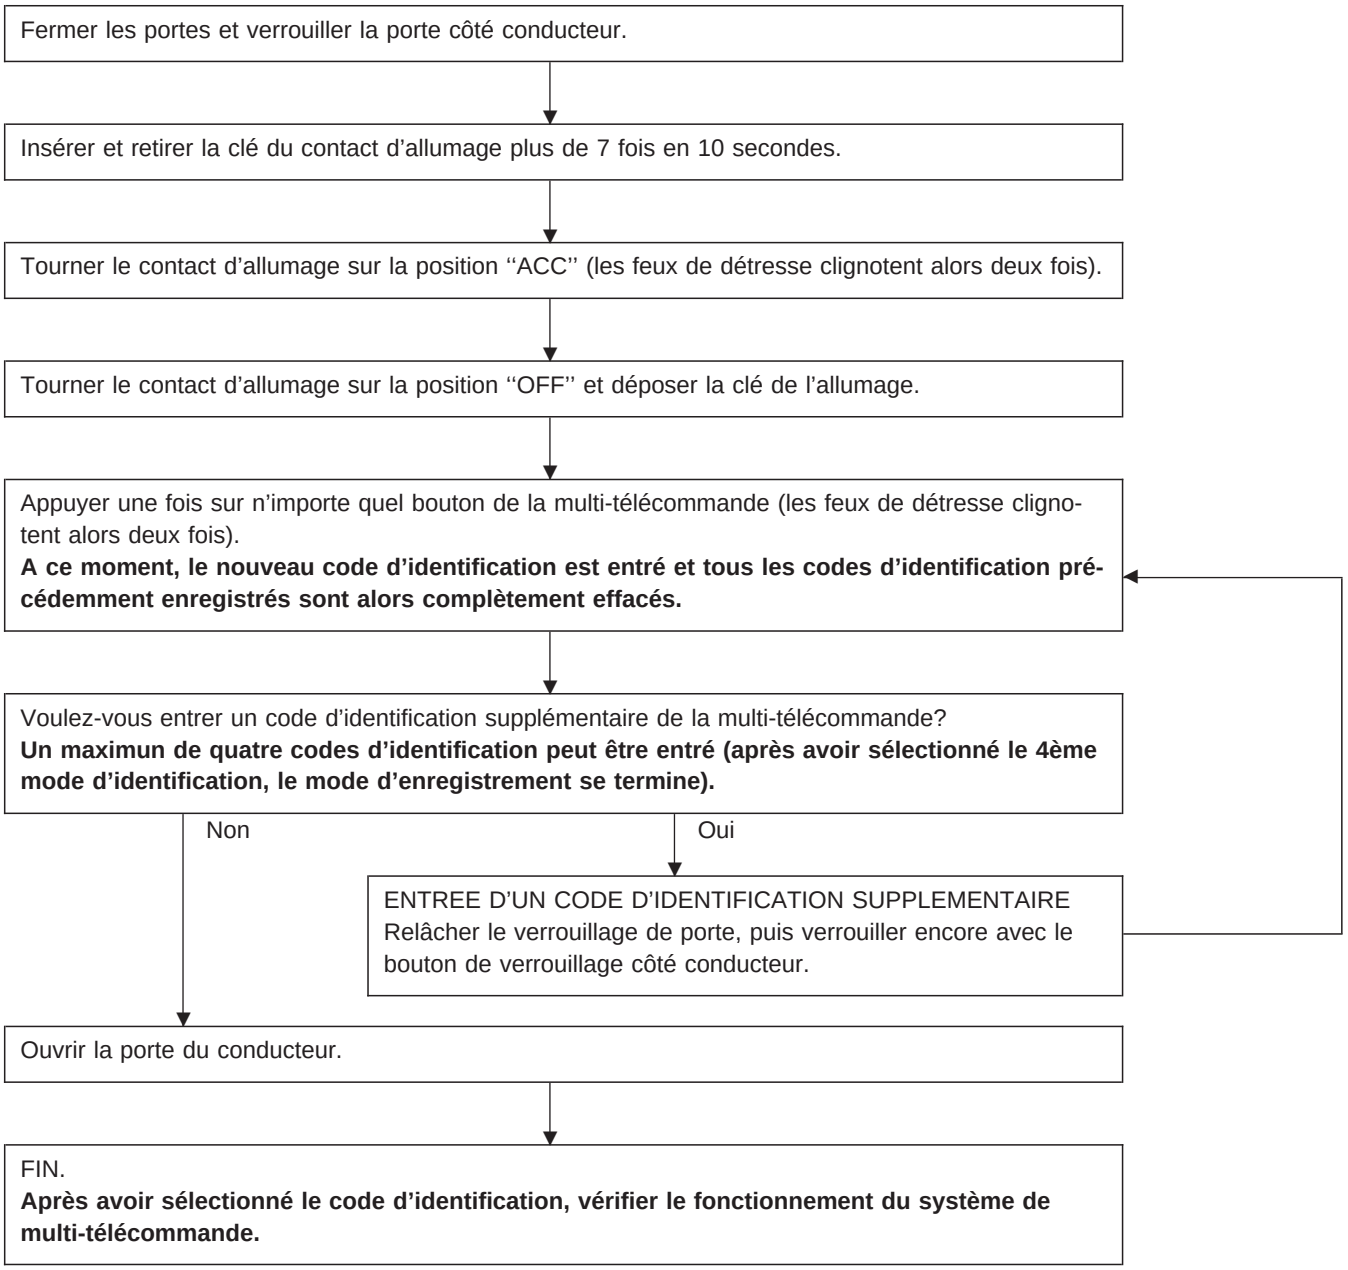
SEL643V

VERIFICATION DU CIRCUIT DE L'ACTIONNEUR DE VERROUILLAGE DE PORTE.
1. Brancher les relais.
2. Débrancher le connecteur de verrouillage de porte côté conducteur.
3. Vérifier la continuité du faisceau entre l'actionneur de verrouillage de porte côté conducteur et les relais.
   Il doit y avoir continuité.

Mauvais → Vérifier si le faisceau est ouvert ou en court-circuit entre les relais de la multi-télécommande et l'actionneur de verrouillage de porte.

Bon ↓

Remplacer l'actionneur de verrouillage des portes.

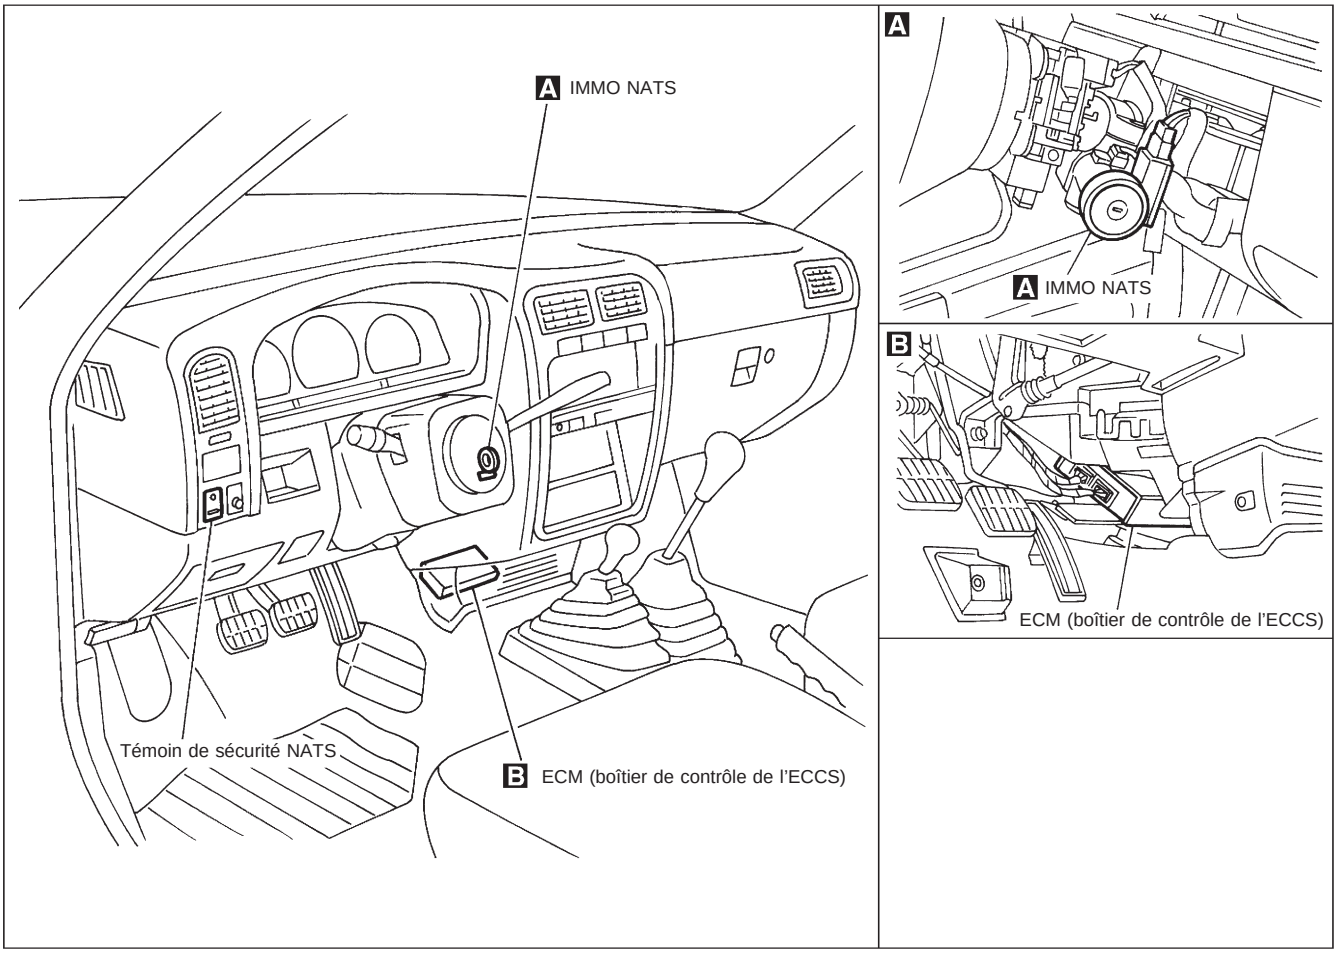


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure d'entrée du code d'identification

Note :
Un maximum de quatre télécommandes peut être entré. Toute tentative pour entrer la télécommande effacera les codes d'identification entrés précédemment. Il faut par conséquent s'assurer que le propriétaire du véhicule a remis toutes les multi-télécommandes lorsqu'une saisie de code d'identification est effectuée.
Entrer le code d'identification (ID) manuellement lorsque :
- la multi-télécommande ou le boîtier de contrôle est remplacé.
- une multi-télécommande supplémentaire est activée.

Pour entrer le code d'identification, suivre les procédures ci-dessous.



PROCEDURE

REMARQUE :
- **S'il est nécessaire d'activer plus de deux nouvelles télécommandes, répéter la procédure d''entrée de code d'identification supplémentaire'' pour chaque nouvelle télécommande.**
- **Tout code d'identification entré après la désactivation du mode de ''programmation'' ne sera pas accepté.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Emplacement des composants et des connecteurs de faisceau

SEL649V

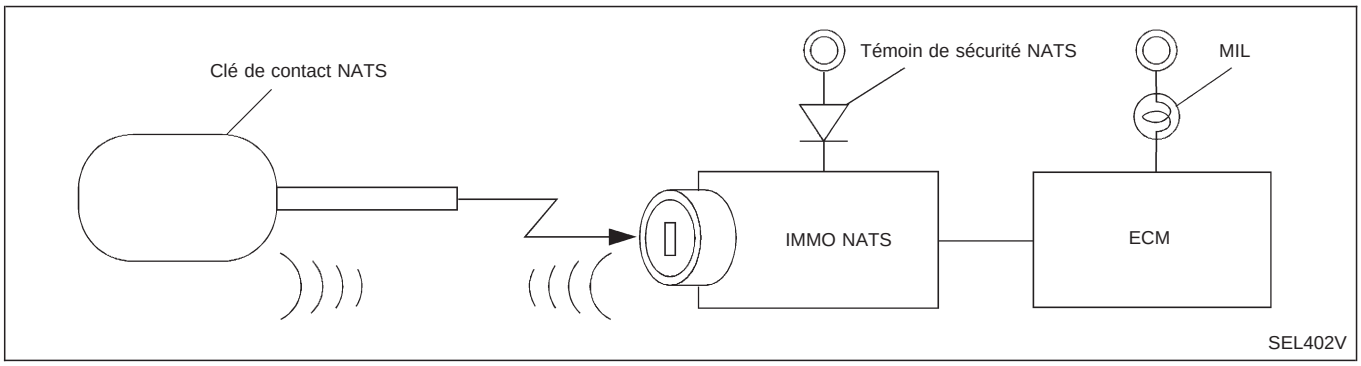
Description du système

Le système NATS présente les fonctions d'immobilisation suivantes :

- Dans la mesure où seules les clés de contact NATS dont les numéros d'identification ont été enregistrés dans l'ECM et l'IMMO du système NATS permettent de démarrer le moteur, le système NATS rend impossible l'utilisation d'un véhicule volé sans clé NATS.
  Cela signifie que le système NATS immobilisera le moteur si quelqu'un tente de le démarrer sans utiliser une clé NATS enregistrée.
- Les deux numéros d'identification des clés délivrées initialement ont été enregistrés dans le système NATS.
  A la demande du propriétaire du véhicule, un maximum de quatre numéros d'identification de clés peuvent être enregistrés dans les composants du système NATS.
- Le témoin de sécurité NATS clignote lorsque le contact d'allumage est sur ''OFF'' ou ''Acc''. De cette façon, toute personne étrangère est avertie que le système est équipé d'un système antivol.
- Lorsque le NATS détecte un défaut, le témoin de défaut (MIL) clignote.
- Tous les diagnostics des défauts du système NATS, l'initialisation du système et l'enregistrement de numéros d'identification de clés de contact NATS supplémentaires doivent être effectués à l'aide du matériel CONSULT et du logiciel CONSULT NATS.
  Une fois l'initialisation du système NATS terminée, le numéro d'identification de la clé de contact introduite est automatiquement enregistré dans le système NATS. Puis, si nécessaire, l'enregistrement de numéros d'identification de clé NATS supplémentaires peut être effectué.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description du système (Suite)

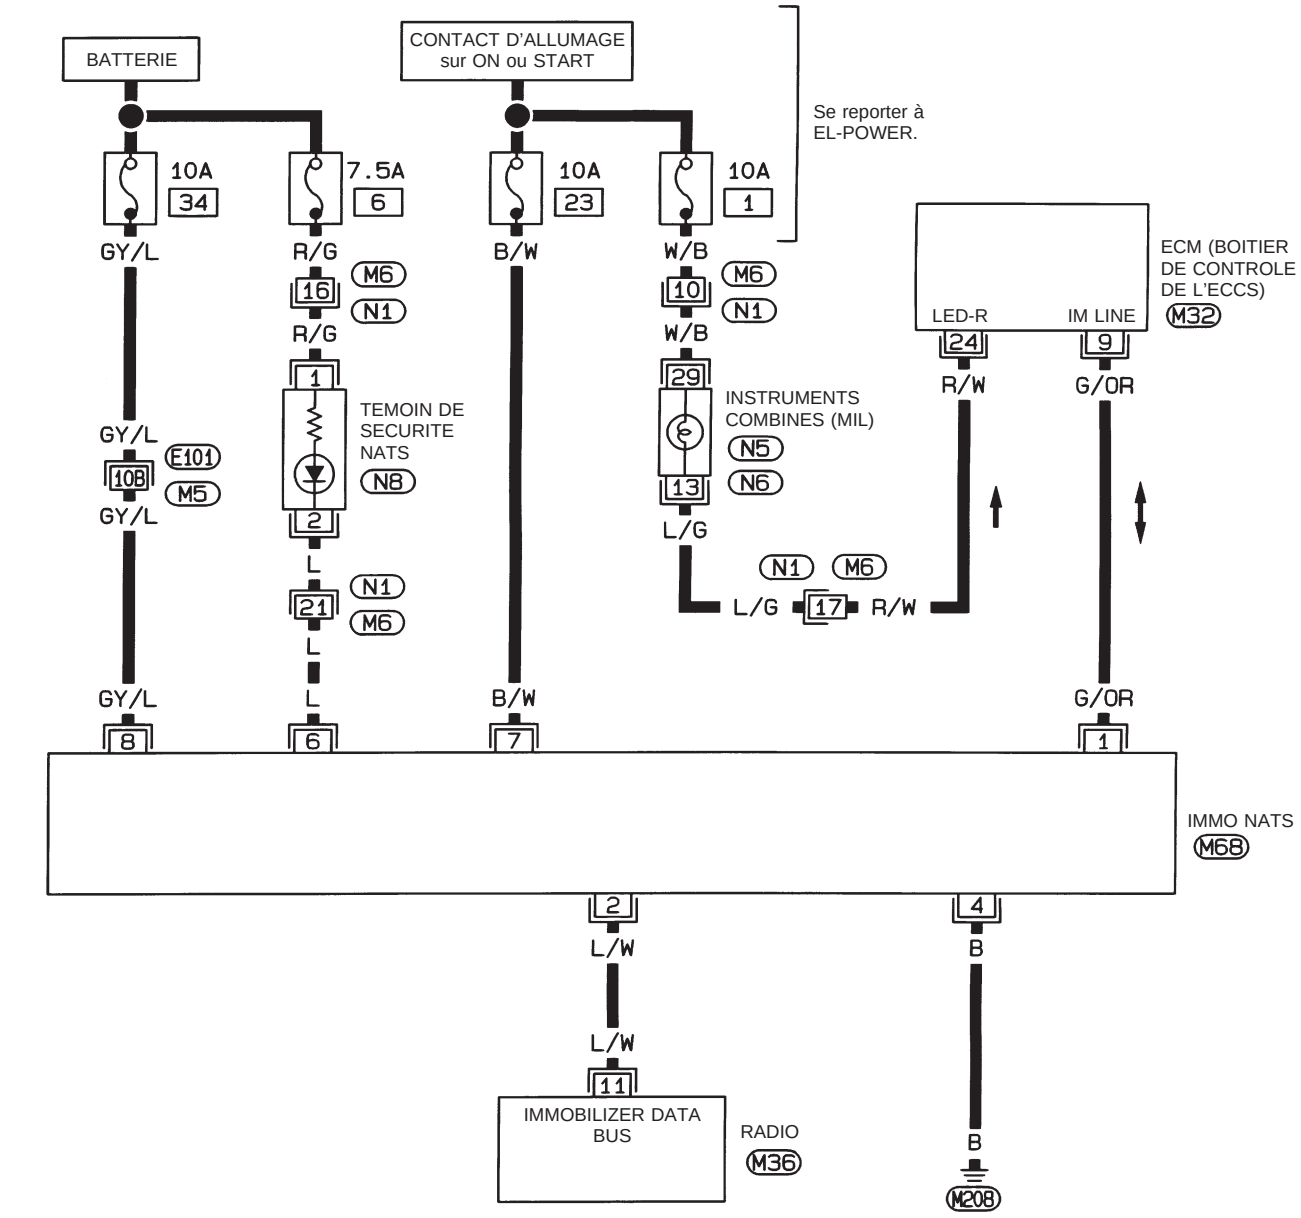


Pour les procédures d'initialisation du NATS et l'enregistrement d'un numéro d'identification de clé de contact NATS, se reporter au Manuel d'Utilisation CONSULT, NATS.

- **Lors de la réparation d'une panne du système NATS (indiquée par le clignotement du témoin de défaut MIL) ou lors de l'enregistrement d'un autre numéro d'identification de clé de contact NATS, il peut s'avérer nécessaire de réenregistrer le numéro d'identification de la clé originale. Il faut par conséquent s'assurer que le propriétaire du véhicule a remis toutes ses clés.**

Composition du système

La fonction d'immobilisation du NATS comprend :



- Une clé de contact NATS
- Boîtier de commande de l'immobilisateur NATS (IMMO NATS) situé dans le canon de clé de contact
- Un module de contrôle du moteur (ECM)
- Un témoin de sécurité NATS
- Un témoin de défaut (MIL)

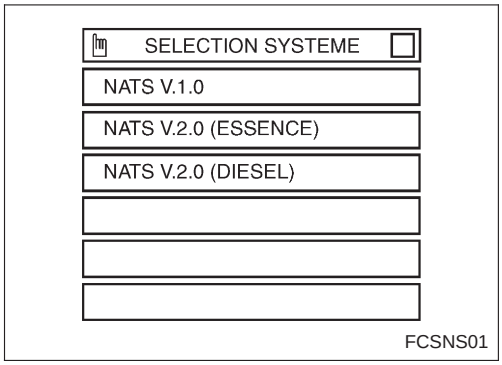
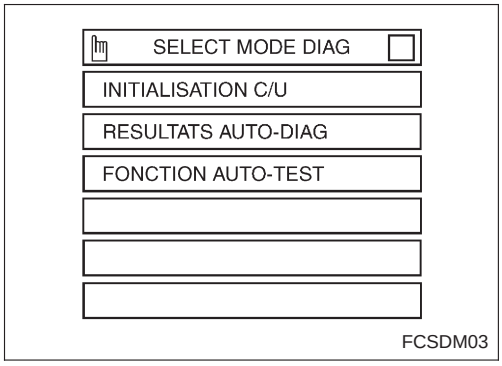
CONSULT

PROCEDURE D'INSPECTION CONSULT



1. Mettre le contact d'allumage sur ''OFF''.
2. Brancher le CONSULT sur le connecteur de liaison des données de diagnostic pour CONSULT.



3. Insérer la carte-programme NATS dans le CONSULT.

: Carte programme NATS-F940

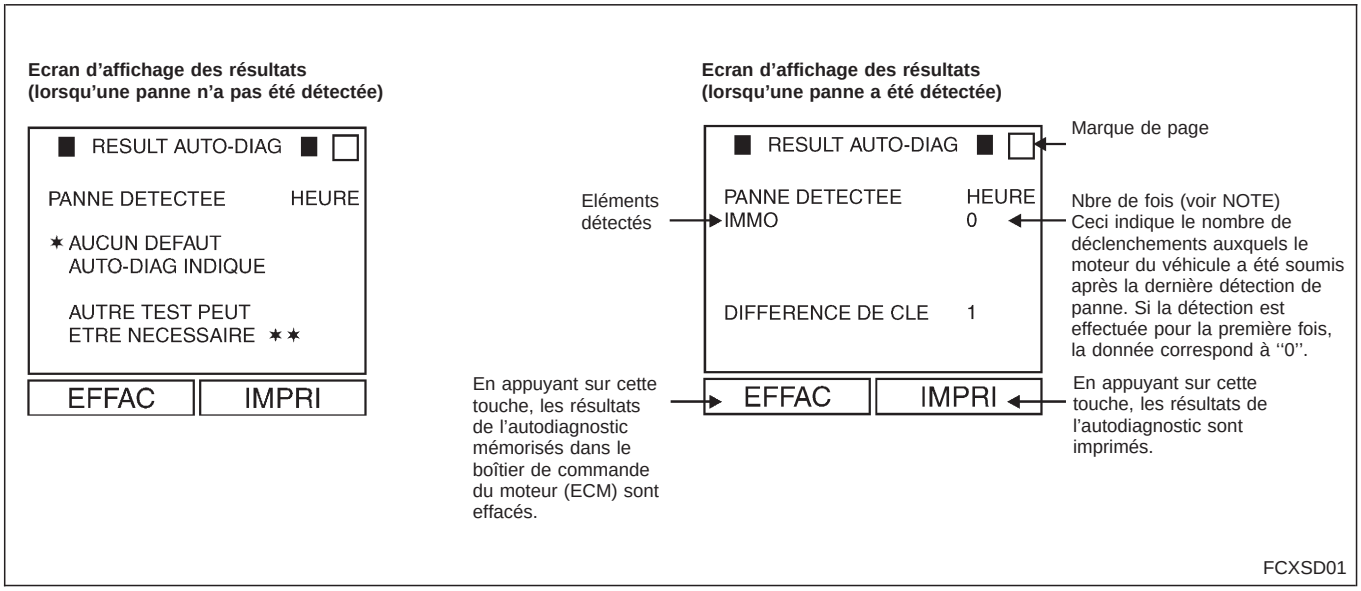
4. Mettre le contact d'allumage sur ''ON''.
5. Appuyer sur ''DEPART''.

6. Appuyer sur ''NATS V.2.0 (ESSENCE)''.

7. Effectuer chaque mode d'essai de diagnostic conformément à chaque procédure d'entretien.

Pour de plus amples informations, se reporter au Manuel d'Utilisation CONSULT, NATS V.2.0 (ESSENCE).

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



CONSULT (Suite)

FONCTION DU MODE D'ESSAI DE DIAGNOSTIC DE CONSULT

MODE D'ESSAI DE DIAGNOSTIC CONSULT	Description
INITIALISATION C/U	Lors du remplacement de l'un des trois composants suivants, l'initialisation C/U est nécessaire. [clé de contact NATS/IMMO/ECM]
FONCTION AUTO-TEST	L'ECM vérifie lui-même sa propre interface de communication NATS.
RESULTATS DE L'AUTODIAGNOSTIC	Les éléments détectés (affichés sur l'écran) sont indiqués dans le tableau ci-dessous.

REMARQUE :
Lorsqu'une nouvelle initialisation est effectuée, tous les numéros d'identification enregistrés auparavant seront effacés. Dès lors, toutes les clés de contact NATS doivent être réenregistrées.
Le moteur ne peut être démarré avec une clé non enregistrée. Dans ce cas, le système peut afficher ''DIFFERENCE DE CLE'' ou ''MODE BLOCAGE'' sur l'écran CONSULT comme résultat de l'autodiagnostic.

COMMENT LIRE LES RESULTATS D'AUTODIAGNOSTIC

REMARQUE :
- **Si le nombre de déclenchement est supérieur à 1, le témoin MIL ne clignote pas.**
- **Les informations sur la durée ne sont pas indiquées pour ce modèle.**

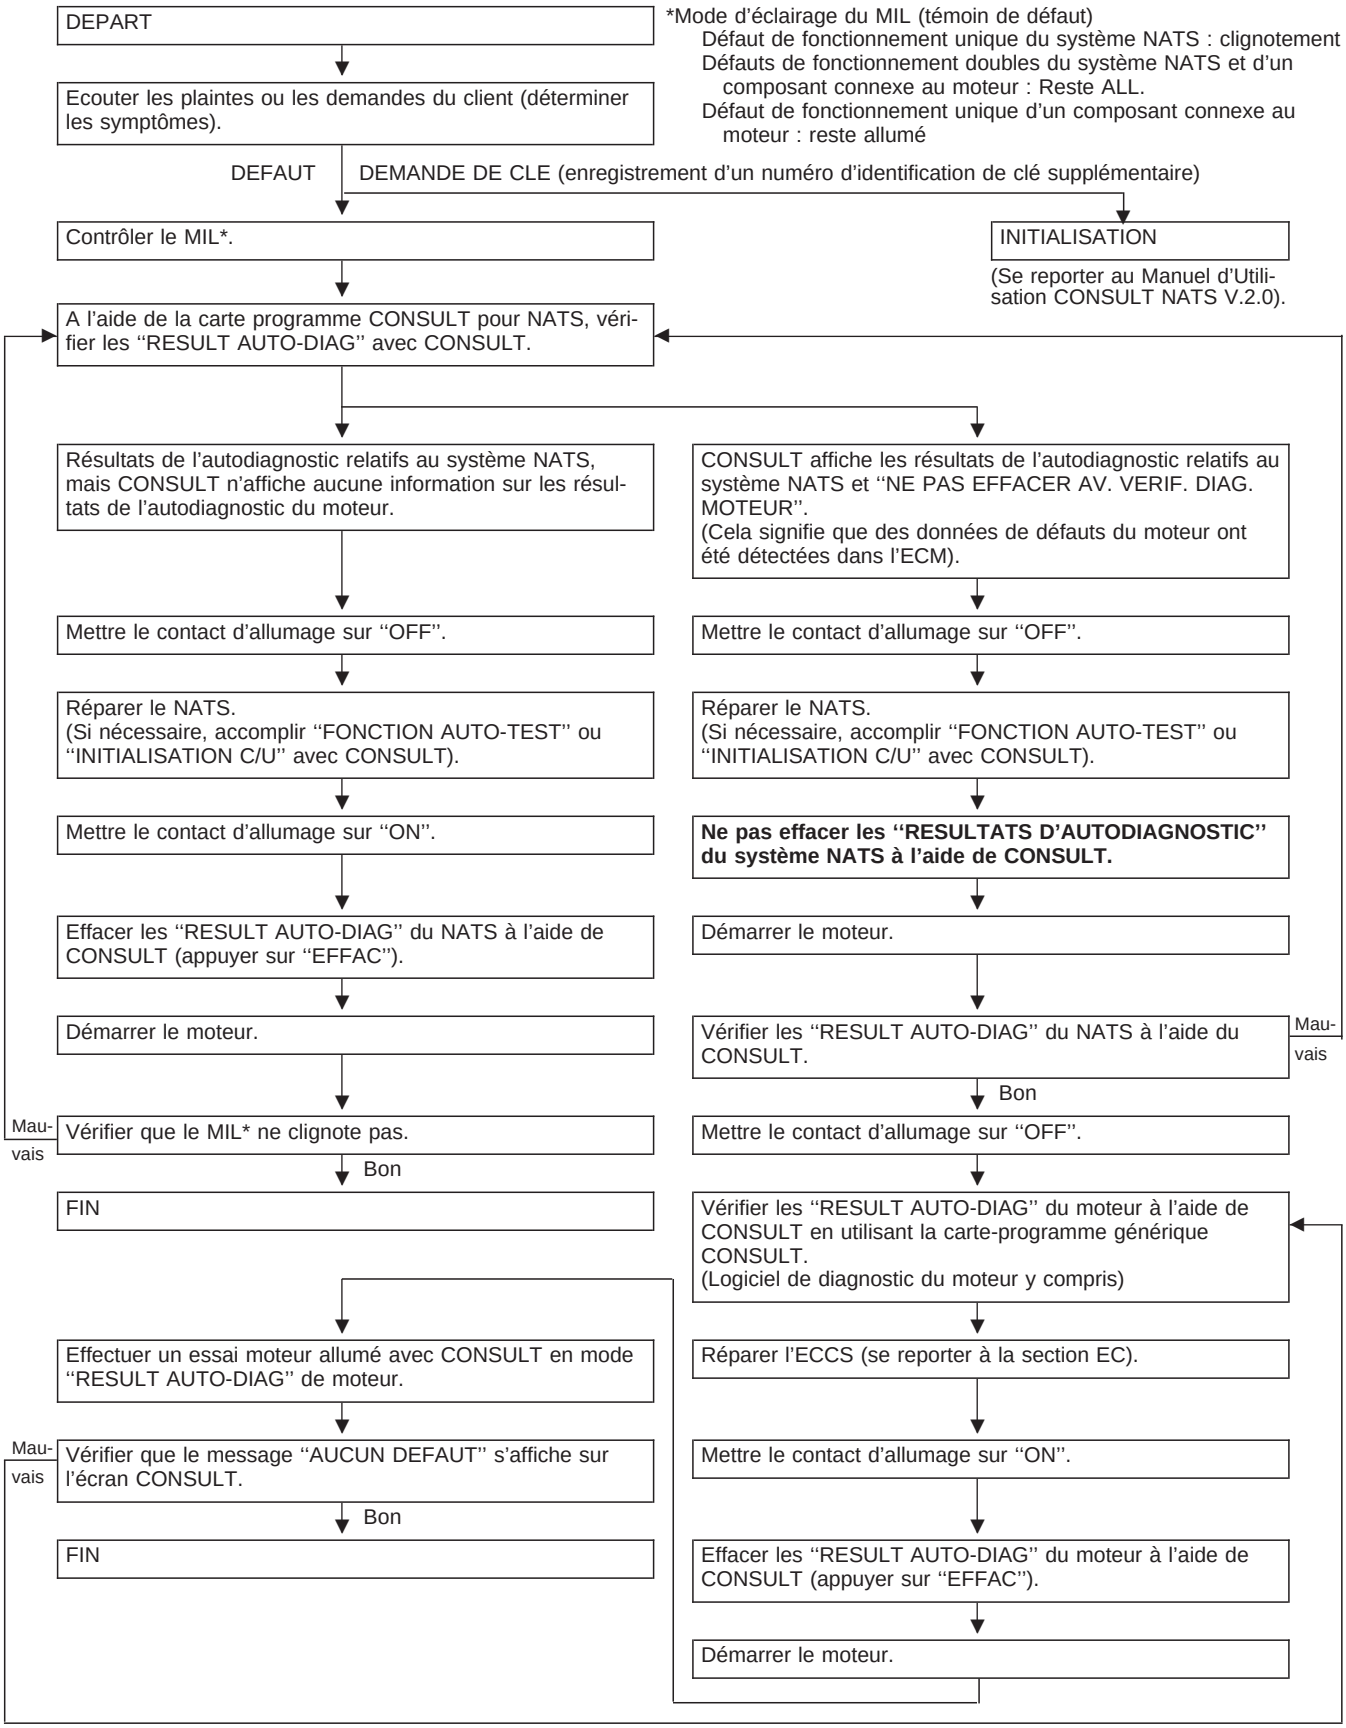


TABLEAU DES RESULTATS D'AUTODIAGNOSTIC

Eléments détectés (termes affichés sur l'écran)	Description	Page de référence
IMMO	L'ECM reçoit le signal de l'IMMO indiquant que l'IMMO est défectueux.	EL-192
ECM	L'ECM est défectueux.	EL-192
LIGNE ECM/IMMO	Communication impossible entre l'ECM et l'IMMO.	EL-193
DIFFERENCE DE CLE	L'IMMO peut recevoir le signal d'identification de la clé mais le résultat de la vérification entre le code d'identification de la clé et l'IMMO est mauvais.	EL-195
LIGNE IMMO/CLE	L'IMMO ne reçoit pas le signal d'identification de la clé.	EL-196
CONTRAD ID IMM/ECM	Le résultat de la vérification du code d'identification entre l'IMMO et l'ECM est mauvais. Le système doit être initialisé.	EL-196
INTERFERENCES	Interférences sonores affectant les lignes de communication NATS pendant la communication.	EL-197
NE PAS EFFACER AV. VERIF. DIAG. MOTEUR	Des données de défauts du moteur et du système NATS ont été détectées dans l'ECM.	EL-190
MODE BLOCAGE	Lorsqu'on utilise une clé de contact non enregistrée ou que l'on effectue la procédure de démarrage deux ou trois fois de suite alors que la clé, l'IMMO ou l'ECM sont défectueux, le système NATS changera le mode et en sélectionnera un qui empêche le démarrage du moteur.	EL-198

PROCEDURE DE DIAGNOSTIC 5

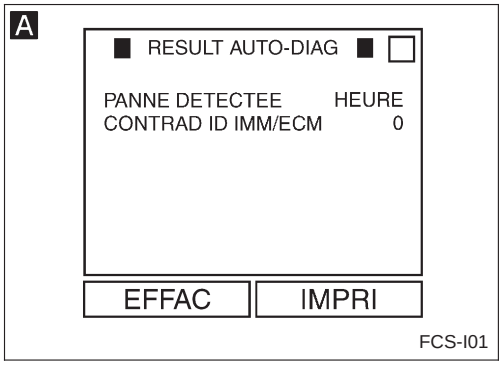
Résultats de l'autodiagnostic : ''LIGNE IMMO/CLE'' affiché sur l'écran CONSULT

A

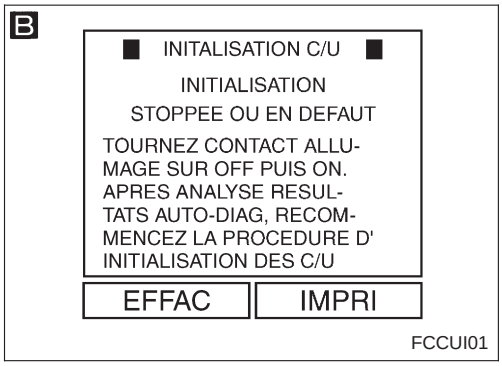
Vérifier les ''RESULT AUTO-DIAG'' de ''LIGNE IMMO/CLE'' affichés sur l'écran CONSULT.

↓ Bon

VERIFICATION DE LA PUCE D'IDENTIFICATION DE CLE DE CONTACT NATS.
Le moteur peut-il être démarré avec une autre clé de contact NATS enregistrée ?



Oui → ● Mauvais fonctionnement de la puce d'identification de la clé.
1. Remplacer la clé de contact.
2. Effectuer l'initialisation avec CONSULT.
Pour la procédure d'initialisation, se reporter au ''Manuel d'Utilisation CONSULT NATS V.2.0'' (ESSENCE).



Non ↓

● L'IMMO est défectueux.
1. Remplacer l'IMMO.
2. Effectuer l'initialisation avec CONSULT.
Pour la procédure d'initialisation, se reporter au ''Manuel d'Utilisation CONSULT NATS V.2.0''.

PROCEDURE DE DIAGNOSTIC 6

Résultats de l'autodiagnostic : ''CONTRAD ID IMM/ECM'' s'affiche sur l'écran CONSULT

A

S'assurer que ''CONTRAD ID IMM/ECM*'' de ''RESULT AUTO-DIAG'' est affiché sur l'écran CONSULT.

* ''CONTRAD ID IMM/ECM'' : Le code d'identification enregistré de l'IMMO est en contradiction avec celui de l'ECM.

↓

EFFECTUER L'INITIALISATION.
Effectuer l'initialisation avec CONSULT.
Réenregistrer tous les numéros d'identification de clé de contact NATS.
Pour la procédure d'initialisation, se reporter au ''Manuel d'Utilisation CONSULT NATS V.2.0''.
Le système peut-il être initialisé ?
Note : Si l'initialisation est abandonnée ou avortée, l'écran CONSULT affichera le message B .

Non → ● L'ECM est défectueux.
1. Remplacer l'ECM.
2. Effectuer l'initialisation avec CONSULT.
Pour la procédure d'initialisation, se reporter au ''Manuel d'Utilisation CONSULT NATS V.2.0'' (ESSENCE).

Oui ↓

FIN.
(L'initialisation du système n'a pas été terminée).

Diagnostics des défauts (Suite)

PROCEDURE DE DIAGNOSTIC 8

Résultats de l'autodiagnostic : ''MODE BLOCAGE'' affiché sur l'écran CONSULT

A

B

A

S'assurer que ''MODE BLOCAGE'' de ''RESULT AUTO-DIAG'' est affiché sur l'écran CONSULT.

↓

1. Couper le contact.
2. Mettre le contact d'allumage à l'aide d'une clé enregistrée.
   (Ne pas démarrer le moteur). Attendre 5 secondes.
3. Couper le contact d'allumage.
4. Répéter à deux reprises les étapes 2 et 3 (trois cycles au total).
5. Démarrer le moteur.

Le moteur peut-il être démarré ?

Oui → Le système fonctionne correctement.
(Le système n'est plus en ''MODE BLOCAGE'').

↓ Non

VERIFIER L'INSTALLATION DE L'IMMO NATS.
Se reporter à ''Comment remplacer l'IMMO NATS'' à la page EL-199.

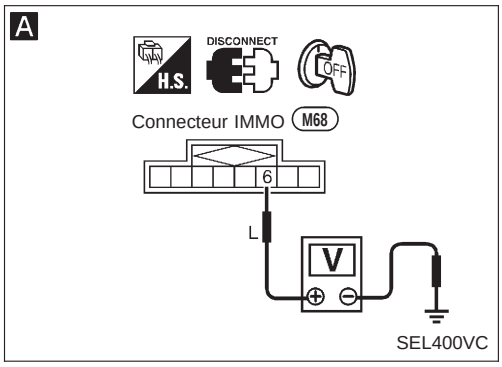
Mauvais → Reposer correctement l'IMMO NATS.

↓ Bon

EFFECTUER L'INITIALISATION.
Effectuer l'initialisation avec CONSULT.
Pour la procédure d'initialisation, se reporter au ''Manuel d'Utilisation CONSULT NATS V.2.0'' (ESSENCE).
Le système peut-il être initialisé ?
Note : Si l'initialisation est abandonnée ou avortée, l'écran CONSULT affichera le message B .

Oui → Le système fonctionne correctement.

↓ Non



Passer à la PROCEDURE DE DIAGNOSTIC 5, EL-196 pour vérifier la ''LIGNE IMMO/CLE''.

Diagnostics des défauts (Suite)

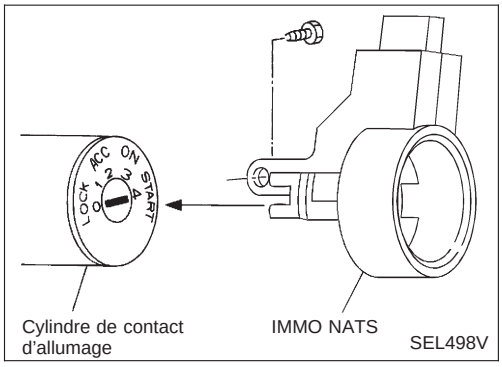
PROCEDURE DE DIAGNOSTIC 9

Vérification du témoin de sécurité

A

VERIFIER LE CIRCUIT DU TEMOIN.

1. Débrancher le connecteur de l'IMMO NATS.
2. Vérifier la tension entre la borne ⑥ de l'IMMO NATS et la masse.
   Il doit y avoir tension de la batterie.



Mauvais →

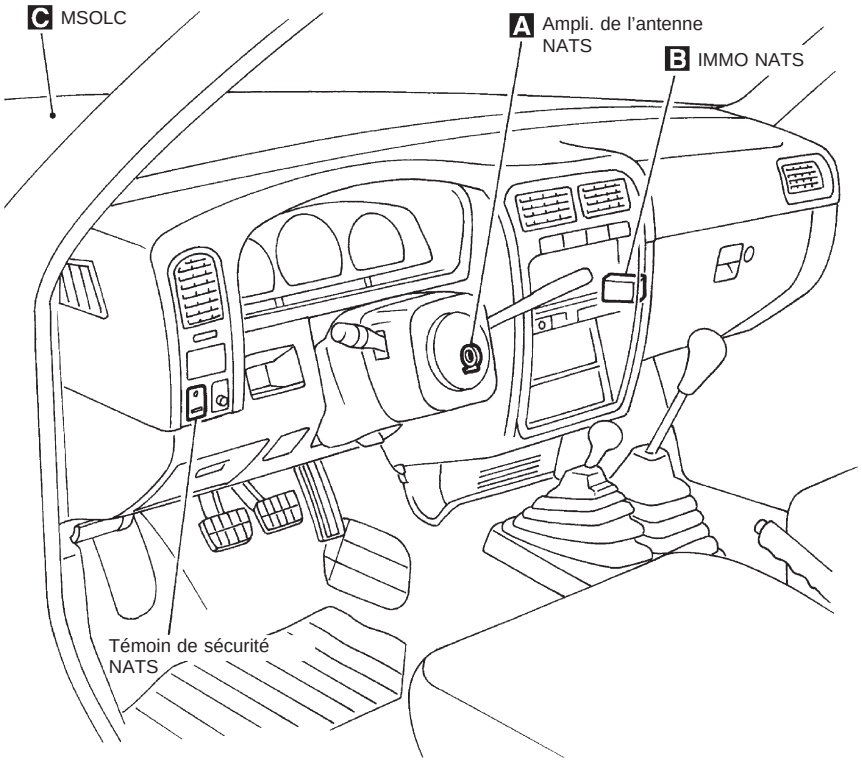
Vérifier les points suivants.

- Fusible de 7,5A (n° 6, situé dans le boîtier à fusibles)
- Témoin de sécurité
- Faisceau ouvert ou court-circuit du faisceau entre le fusible et le témoin de sécurité
- Faisceau ouvert ou court-circuit du faisceau entre l'IMMO NATS et le témoin de sécurité

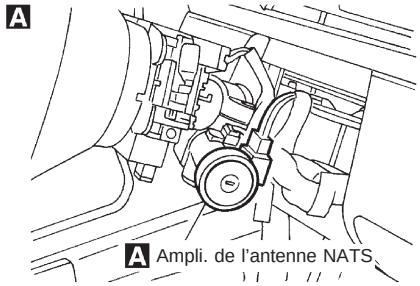
Bon ↓

EFFECTUER L'INITIALISATION.
Effectuer l'initialisation avec CONSULT. Pour la procédure d'initialisation, se reporter au ''Manuel d'Utilisation CONSULT NATS V.2.0'' (ESSENCE).

Comment remplacer l'IMMO NATS



REMARQUE :



- **Si l'IMMO NATS n'est pas correctement reposé, le système NATS ne fonctionnera pas normalement et les RESULTATS DE L'AUTODIAGNOSTIC affichés sur l'écran CONSULT indiqueront ''MODE BLOCAGE'' ou ''LIGNE IMMO/CLE''.**

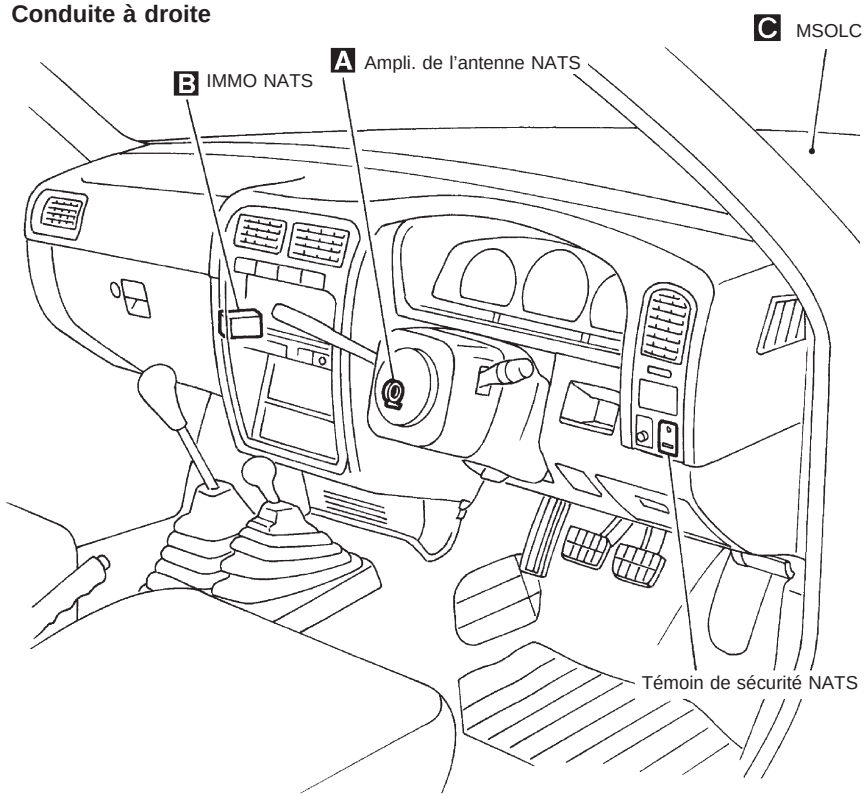
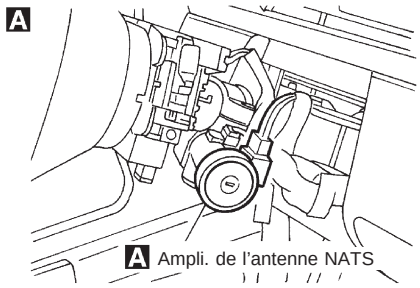
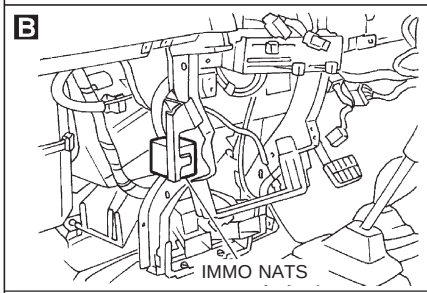
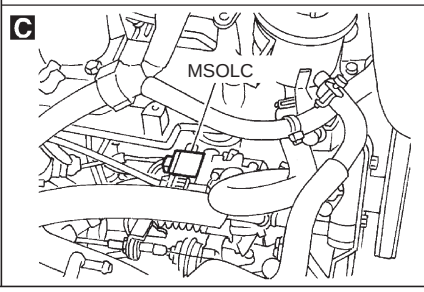
Emplacement des composants et des connecteurs de faisceau

Conduite à gauche







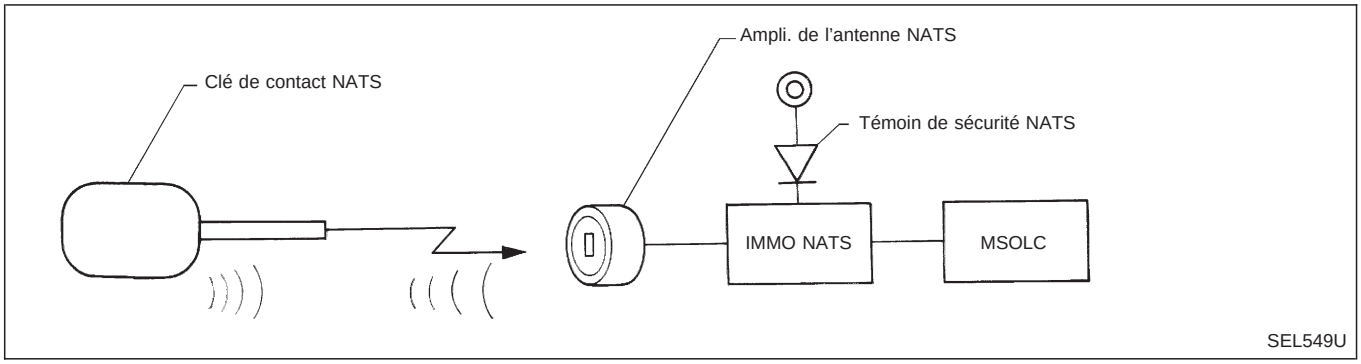


Conduite à droite

SEL650V

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

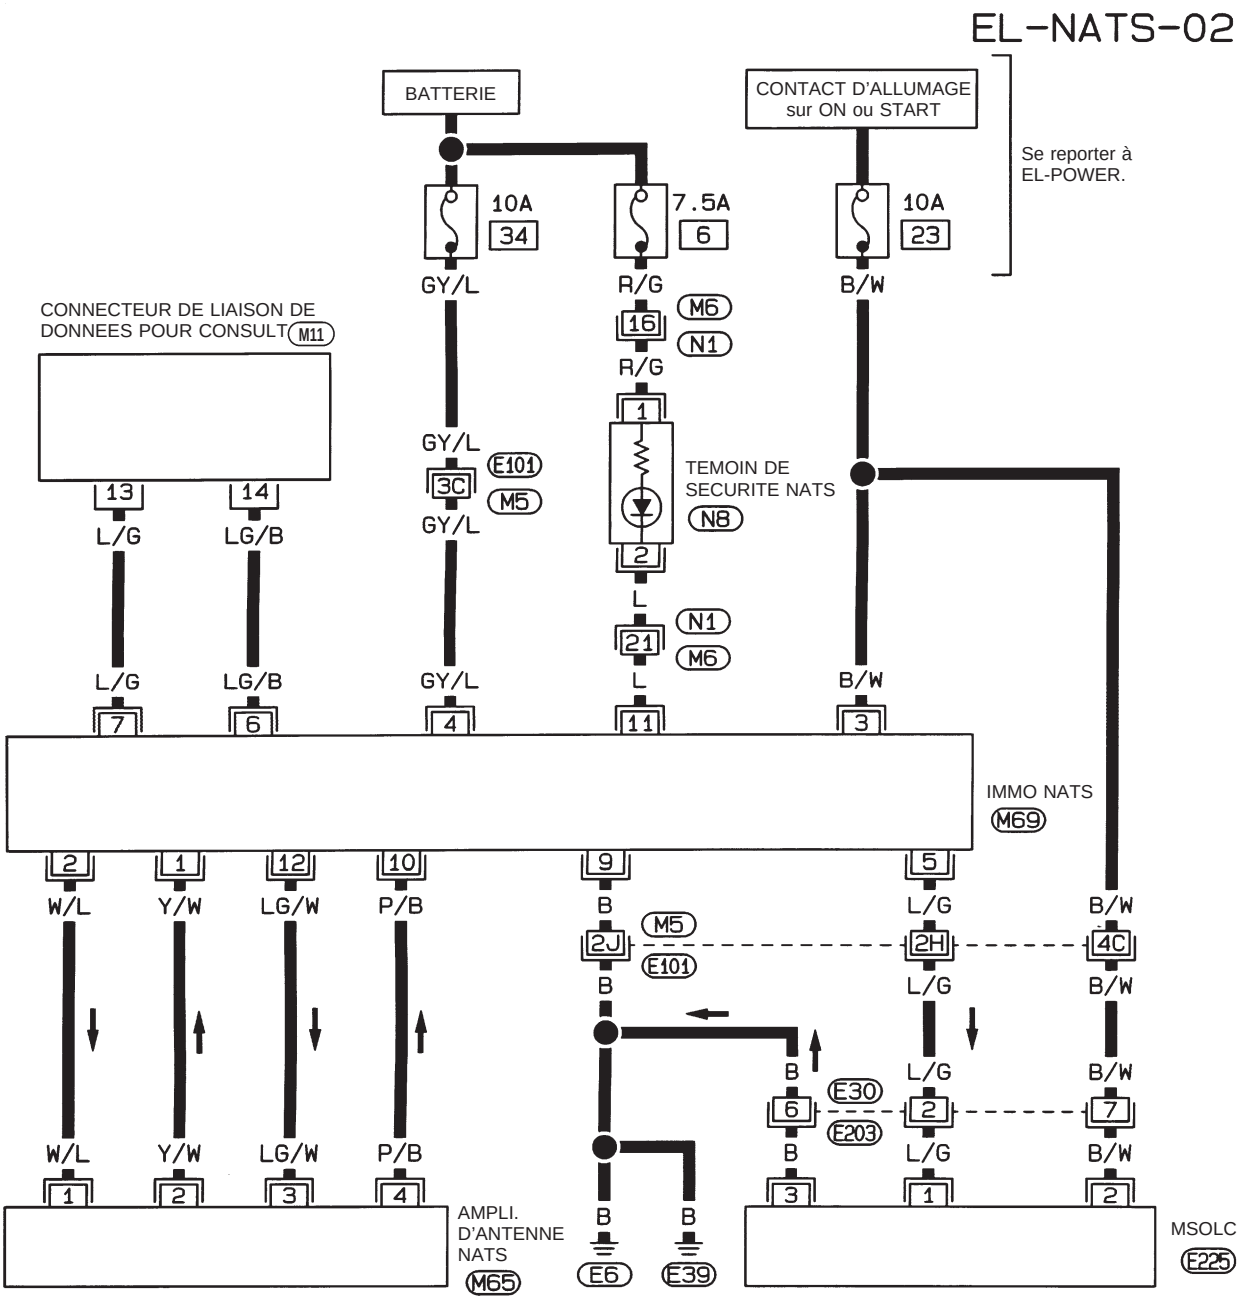
Description du système



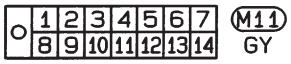
Le système NATS présente les fonctions d'immobilisation suivantes :

- Seules les clés de contact NATS, dont les numéros d'identification ont été enregistrés dans le boîtier de contrôle d'immobilisateur du NATS (IMMO NATS) permettent au moteur de marcher. Le NATS empêche donc l'utilisation d'un véhicule volé sans clé de contact enregistrée NATS.
- Les deux numéros d'identification des clés délivrées initialement ont été enregistrés dans le système NATS.
  A la demande du propriétaire du véhicule, un maximum de quatre numéros d'identification de clés peuvent être enregistrés dans les composants du système NATS.
- Le témoin de sécurité NATS clignote lorsque le contact d'allumage est sur ''OFF'' ou ''Acc''. De cette façon, toute personne étrangère est avertie que le système est équipé d'un système antivol.
- Lorsque le NATS détecte un problème, le témoin de sécurité du NATS s'allume alors que le moteur tourne ou que le contact d'allumage est sur la position ''ON''.
- Lors de l'entretien de NATS (diagnostics des défauts, initialisation du système NATS, l'enregistrement de numéros d'identification de clé NATS supplémentaires), le matériel CONSULT et le logiciel CONSULT sont nécessaires.
- Il existe deux types d'initialisation du NATS, l'une est ''INITIALISATION DU SYSTEME'' et l'autre est ''INITIALISATION DE L'IMMO''.
  Une fois l'initialisation du système NATS terminée, le numéro d'identication de la clé de contact introduite est automatiquement enregistré dans le système NATS. Puis, si nécessaire, l'enregistrement de numéros d'identification de clé NATS supplémentaires peut être effectué.
  Pour les procédures d'initialisation du NATS et l'enregistrement d'un numéro d'identification de clé de contact NATS, se reporter au Manuel d'Utilisation CONSULT, NATS V.2.0 (Diesel).
- **Lors de la réparation d'une panne du système NATS (indiquée par le clignotement du témoin de défaut MIL) ou lors de l'enregistrement d'un autre numéro d'identification de clé de contact NATS, il peut s'avérer nécessaire de réenregistrer le numéro d'identification de la clé originale. Il faut par conséquent s'assurer que le propriétaire du véhicule a remis toutes ses clés.**

Composition du système



La fonction d'immobilisation du NATS comprend :



- Une clé de contact NATS
- Un ampli. d'antenne NATS situé dans le canon de clé de contact
- Un boîtier de commande de l'immobilisateur NATS (IMMO NATS)
- Module de solénoïde codé situé dans l'ensemble de pompe à injection (MSOLC)
- Un témoin de sécurité NATS

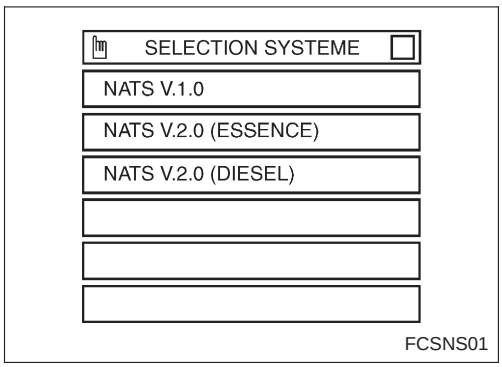
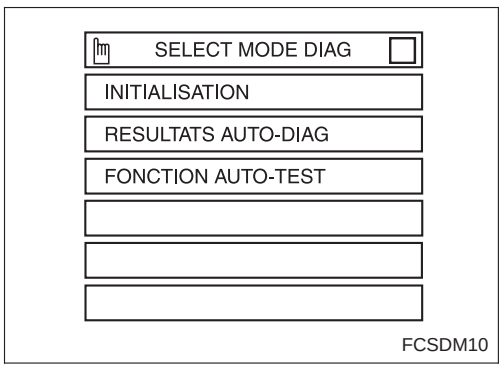
CONSULT

PROCEDURE D'INSPECTION CONSULT



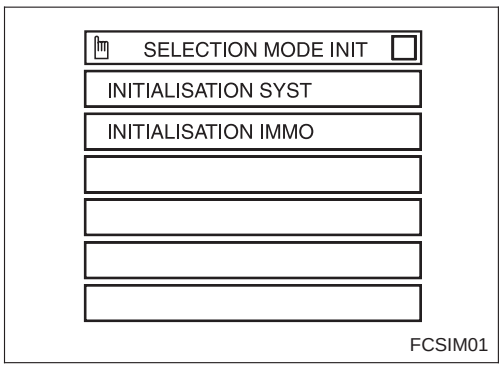
1. Mettre le contact d'allumage sur ''OFF''.
2. Brancher le CONSULT sur le connecteur de liaison des données de diagnostic pour CONSULT.



3. Insérer la carte-programme NATS dans le CONSULT.

◀ : Carte programme NATS-F940

4. Mettre le contact d'allumage sur ''ON''.
5. Appuyer sur ''DEPART''.



6. Appuyer sur ''NATS V.2.0 (DIESEL).

7. Effectuer chaque mode d'essai de diagnostic conformément à chaque procédure d'entretien.

Pour de plus amples informations, se reporter au Manuel d'Utilisation CONSULT, NATS V.2.0 (diesel).

REMARQUE :
Deux types d'initialisations (initialisation du système et initialisation de l'IMMO) sont disponibles. Pour plus de détails, se reporter à ''INITIALISATION'' à la page suivante.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

CONSULT (Suite)

FONCTION DU MODE D'ESSAI DE DIAGNOSTIC DE CONSULT

Mode d'essai de diagnostic CONSULT	Description
INITIALISATION C/U	Deux types d'initialisations sont disponibles. Pour plus de détails, se reporter à ''INITIALISATION'' indiqué dessous.
FONCTION AUTO-TEST	L'IMMO contrôle lui-même sa propre interface de communication NATS.
RESULTATS DE L'AUTODIAGNOSTIC	Les résultats de l'autodiagnostic peuvent être lus puis effacés rapidement.

INITIALISATION

Type d'initialisation	Description
INITIALISATION DU SYSTEME	Tous les numéros d'identification de clés de contact enregistrées de l'IMMO et de MSOLC peuvent être enregistrés. **Cela prend environ 16 minutes.** Lorsque le composant suivant est remplacé, l'initilalisation est nécessaire. ● IMMO ● MSOLC
INITIALISATION DE L'IMMO	Tous les numéros d'identification de clés de contact enregistrées de l'IMMO peuvent être initialisés et de nouveaux numéros d'identification enregistrés. Lorsque le composant suivant est remplacé ou la nouvelle clé d'allumage NATS est enregistrée, l'initilalisation est nécessaire. ● Une clé de contact NATS

REMARQUE :
Lorsqu'aucune des initialisations n'a été effectuée, tous les codes d'identification entrés précédemment s'effaceront. Toutes les clés de contact NATS doivent donc être enregistrées de nouveau.
Si une clé non enregistrée est utilisée pour démarrer le moteur, le système peut afficher ''ID CLE [DIFFERENCE]'' sur l'écran CONSULT comme résultat de l'autodiagnostic.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

CONSULT (Suite)

COMMENT LIRE LES RESULTATS D'AUTODIAGNOSTIC

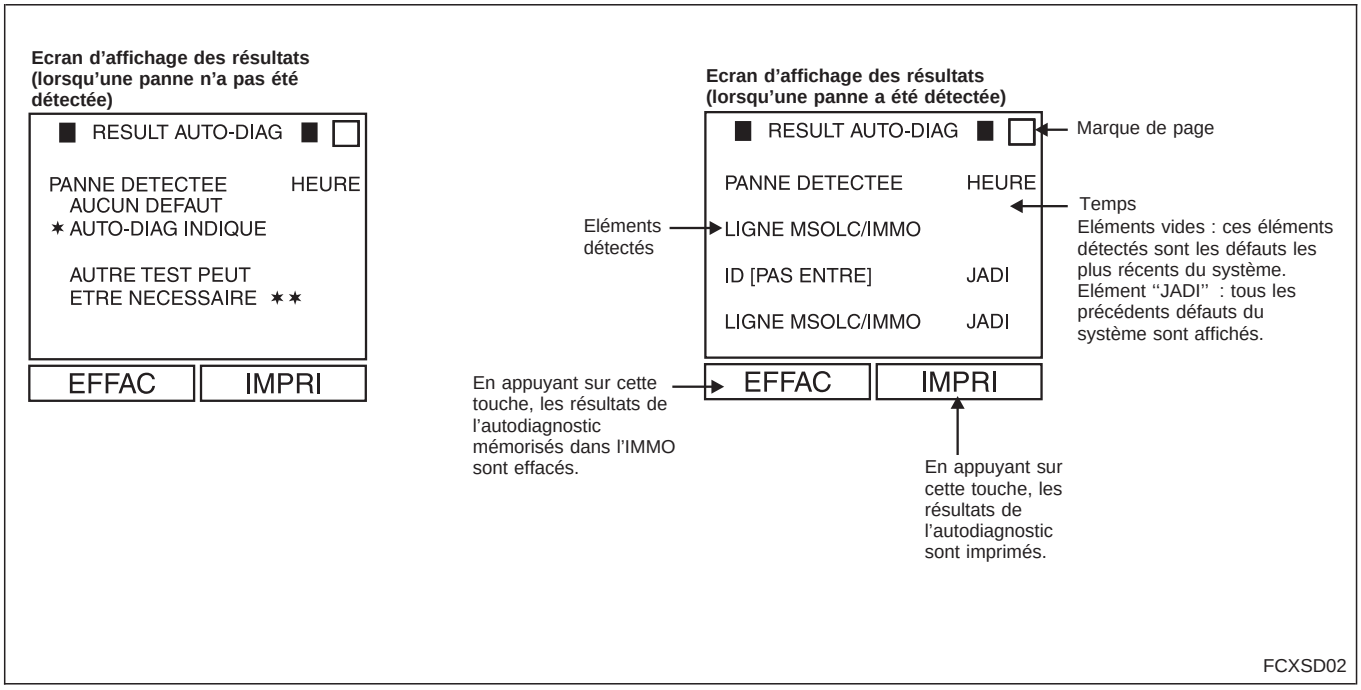


TABLEAU DES RESULTATS D'AUTODIAGNOSTIC

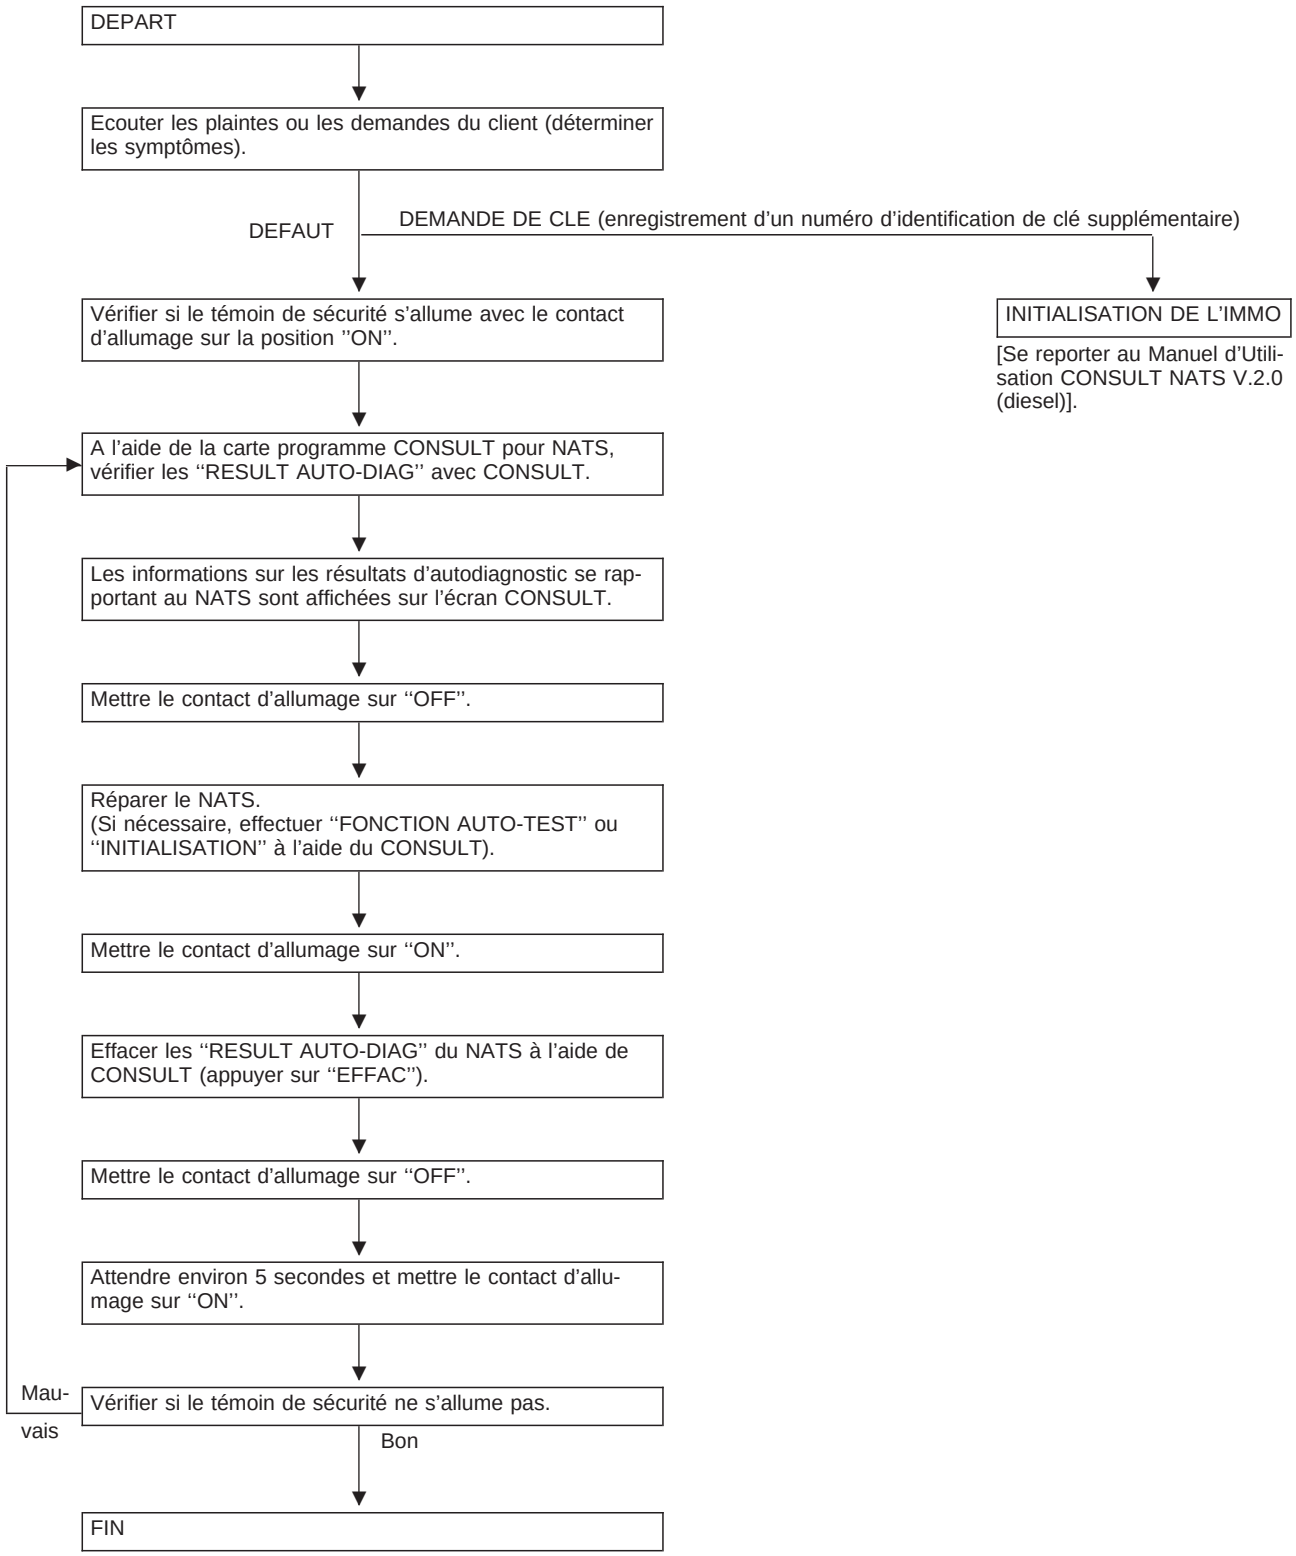

Eléments détectés (termes affichés sur l'écran)	Description	Page de référence
IMMO	L'IMMO est défectueux.	EL-209
MSOLC	L'IMMO a reçu du MSOLC le signal d'anomalie de fonctionnement du MSOLC.	EL-209
LIGNE MSOLC/IMMO	Communication impossible entre le MSOLC et l'IMMO.	EL-210
ID CLE [DIFFERENCE]	L'IMMO peut recevoir le signal d'identification de la clé mais le résultat de la vérification entre le code d'identification de la clé et l'IMMO est mauvais.	EL-212
ID CLE [PAS ENTRE]	L'IMMO ne reçoit pas le signal d'identification de la clé. Dans la cas de nombreuses pannes, seul cet élément peut être affiché avant les autres éléments défectueux.	EL-213
CONTRAD ID IMM/MSC	Le résultat de la vérification de l'identification entre l'IMMO et le MSOLC est mauvais. Le système doit être initialisé.	EL-215

REMARQUE :
Quand CONSULT affiche ''IMPOSSIBLE CONTINUER'' sur son écran, cela signifie que CONSULT ne parvient pas à accéder au NATS. Dans ce cas, effectuer la procédure de diagnostic 7, EL-216.

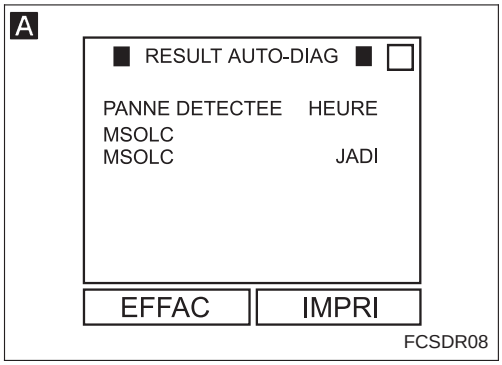
PROCEDURE DE DIAGNOSTIC 1

Résultats de l’autodiagnostic :

‘‘IMMO’’ affiché sur l’écran CONSULT



A

S’assurer que ‘‘IMMO’’ de ‘‘RESULT AUTO-DIAG’’ est affiché sur l’écran CONSULT.

↓

- L’IMMO est défectueux.

1. Remplacer l’IMMO.
2. Effectuer l’initialisation du système à l’aide du CONSULT.
   Pour la procédure d’initialisation, se reporter au ‘‘manuel d’utilisation NATS V2.0 (Diesel)’’.

PROCEDURE DE DIAGNOSTIC 2

Résultats de l’autodiagnostic :

‘‘MSOLC’’ affiché sur l’écran CONSULT

A

S’assurer que ‘‘MSOLC’’ de ‘‘RESULT AUTO-DIAG’’ est affiché sur l’écran CONSULT.

↓

- Le MSOLC est défectueux.

1. Remplacer le MSOLC (voir NOTE).
2. Effectuer l’initialisation du système à l’aide du CONSULT.
   Pour la procédure d’initialisation, se reporter au ‘‘manuel d’utilisation NATS V2.0 (Diesel)’’.

REMARQUE :
Lors du remplacement MSOLC, ce dernier ne peut pas être déposé de l’ensemble de pompe d’injection en raison de sa construction antivol. L’ensemble de pompe d’injection devrait être entièrement déposé avec MSOLC, et avec une unité de rechange d’entretien de liaison.

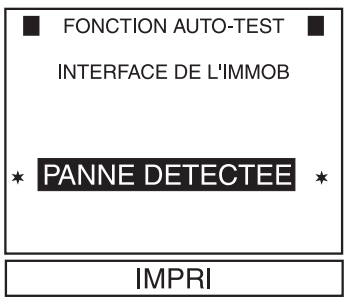
Court-circuit lors de la vérification du circuit électrique SEL455VA

F



FCSDM03

G

FCSFC03

H

FCSFC04

Ⓐ

E

VERIFIER SI LA LIGNE DE COMMUNICATION EST COURT-CIRCUITEE.

1. Débrancher le connecteur du MSOLC et celui de l'IMMO.
2. Vérifier la continuité entre la borne ⑤ de l'IMMO et la masse.
   Il ne doit pas y avoir continuité.
3. Mettre le contact d'allumage sur "ON".
4. Vérifier la tension entre la borne ⑤ de l'IMMO et la masse.
   Il ne doit pas y avoir de tension.

Mauvais → Réparer le faisceau.

Bon

F

FONCTION AUTO-TEST

1. Brancher le connecteur de l'IMMO et débrancher le connecteur du MSOLC.
2. Mettre le contact d'allumage sur "ON".
3. Appuyer sur "FONCTION AUTO-TEST" sur l'écran "SELECT MODE DIAG" de CONSULT.

G

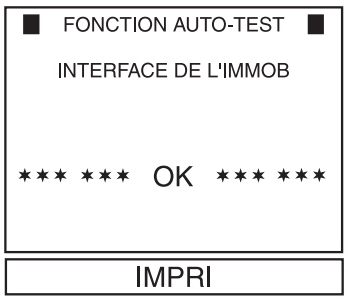
Appuyer sur "DEPART". L'IMMO contrôlera alors lui-même sa propre interface de communication.

Mauvais → **H**

- L'IMMO est défectueux.

1. Remplacer l'IMMO.
2. Effectuer l'initialisation du système à l'aide du CONSULT.
   Pour la procédure d'initialisation, se reporter au "manuel d'utilisation NATS V2,0 (Diesel)".

Bon



I

- Le MSOLC est défectueux.

1. Remplacer le MSOLC.
2. Effectuer l'initialisation du système à l'aide du CONSULT. Pour la procédure d'initialisation, se reporter au "manuel d'utilisation NATS V2,0 (Diesel)".

FCIII01

PROCEDURE DE DIAGNOSTIC 4

Résultats de l'autodiagnostic :

''ID CLE [DIFFERENCE]'' affiché sur l'écran CONSULT

A

S'assurer que ''ID CLE [DIFFERENCE] de ''RESULT AUTO-DIAG'' est affiché sur l'écran CONSULT.

↓

1. Couper le contact d'allumage et attendre 1 minute.
   (Le témoin de sécurité commencera à clignoter au bout de 1 minute).
2. Mettre le contact d'allumage à l'aide d'une clé enregistrée.
   (Ne pas démarrer le moteur). Attendre 5 secondes.
3. Couper le contact d'allumage.
4. Répéter à deux reprises les étapes 2 et 3 (trois cycles au total).
5. Démarrer le moteur.
   Le moteur peut-il être démarré ?

Oui → Le système fonctionne correctement.

↓ Non

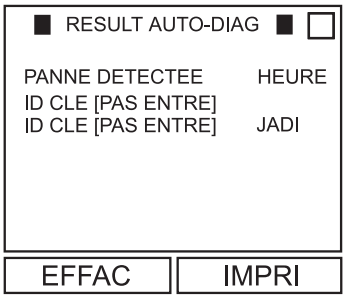
EFFECTUER L'INITIALISATION DE L'IMMO.
Effectuer l'initialisation de l'IMMO à l'aide du CONSULT.
Pour la procédure d'initialisation, se reporter au ''manuel d'utilisation NATS V2,0 (Diesel)''.
Le système peut-il être initialisé ?
Note : Si l'initialisation est abandonnée ou avortée, l'écran CONSULT affichera le message B.

Oui → Le système fonctionne correctement.

↓ Non

Aller à la procédure de diagnostic 5, EL-213 pour vérifier ''ID CLE [PAS ENTRE]''.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Diagnostics des défauts (Suite)

PROCEDURE DE DIAGNOSTIC 5

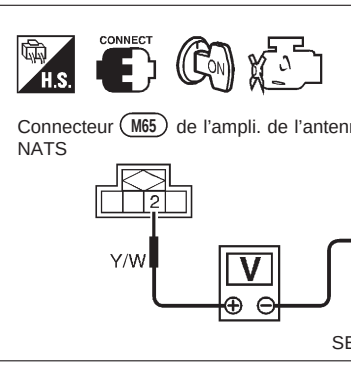
Résultats de l’autodiagnostic :

“ID CLE [PAS ENTRE]” affiché sur l’écran CONSULT

A

FCSDR11

S’assurer que “ID CLE [PAS ENTRE] de “RESULT AUTO-DIAG” est affiché sur l’écran CONSULT.



Bon

VERIFICATION DE LA PUCE D’IDENTIFICATION DE CLE DE CONTACT NATS.
Démarrer le moteur avec une autre clé de contact NATS enregistrée.
Le moteur peut-il être démarré ?

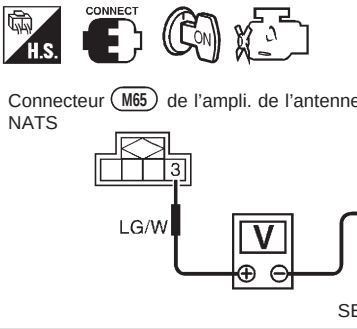
Oui →
- Mauvais fonctionnement de la puce d’identification de la clé.
1. Remplacer la clé de contact.
2. Effectuer l’initialisation de l’IMMO à l’aide du CONSULT. Pour la procédure d’initialisation, se reporter au “manuel d’utilisation NATS V2,0 (Diesel)”.

Non

B

SEL634V

VERIFIER LA FONCTION 1 DE L’IMMO.
1. Mettre le contact d’allumage sur “ON”.
2. Vérifier la tension entre la borne (2) de l’IMMO et la masse.



Durée (après avoir mis le contact d’allumage sur “ON”).	Tension [V]
Pendant environ 0,5 sec.	Environ 2,3 - 5
Après 1 sec.	0

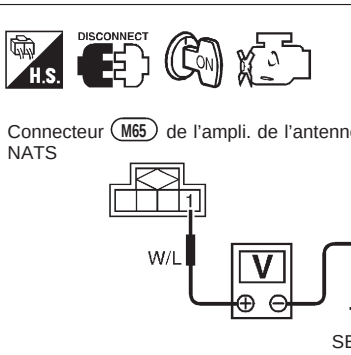
Note :
Ne pas retirer l’ampli. d’antenne NATS du canon de clé.

Mauvais →
Vérifier que les faisceaux ne sont pas ouverts ou court-circuités entre l’IMMO et l’ampli. d’antenne NATS. Si le faisceau fonctionne correctement, remplacer l’IMMO. Après avoir remplacé l’IMMO, effectuer l’initialisation du système à l’aide du CONSULT.
Pour la procédure d’initialisation, se reporter au “manuel d’utilisation NATS V2,0 (Diesel)”.

Bon

C

SEL635V



VERIFIER LA FONCTION 2 DE L’IMMO.
1. Mettre le contact d’allumage sur “ON”.
2. Vérifier la tension entre la borne (3) de l’ampli. d’antenne NATS et la masse.
   Tension : 6 sec. après avoir mis le contact d’allumage sur “ON”
   Environ 4,5 - 5,3V

Note :
Ne pas retirer l’ampli. d’antenne NATS du canon de clé.

Mauvais →
Vérifier que les faisceaux ne sont pas ouverts ou court-circuités entre l’IMMO et l’ampli. d’antenne NATS. Si le faisceau fonctionne correctement, remplacer l’IMMO. Après avoir remplacé l’IMMO, effectuer l’initialisation du système à l’aide du CONSULT.
Pour la procédure d’initialisation, se reporter au “manuel d’utilisation NATS V2,0 (Diesel)”.

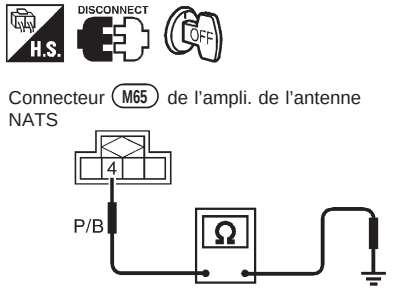
Bon

D

SEL636V

VERIFICATION DE LA TENSION DE SORTIE DE L’IMMO.
1. Mettre le contact d’allumage sur “ON”.
2. Vérifier la tension entre la borne (1) de l’ampli. d’antenne NATS et la masse.
   Tension : plus de 4,7V

Mauvais →
Vérifier que les faisceaux ne sont pas ouverts ou court-circuités entre l’IMMO et l’ampli. d’antenne NATS. Si le faisceau fonctionne correctement, remplacer l’IMMO. Après avoir remplacé l’IMMO, effectuer l’initialisation du système à l’aide du CONSULT.
Pour la procédure d’initialisation, se reporter au “manuel d’utilisation NATS V2,0 (Diesel)”.



Bon

(A)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostics des défauts (Suite)

E

Ⓐ

E

VERIFIER LE CIRCUIT DE LIGNE DE MASSE DE L'AMPLI. D'ANTENNE.

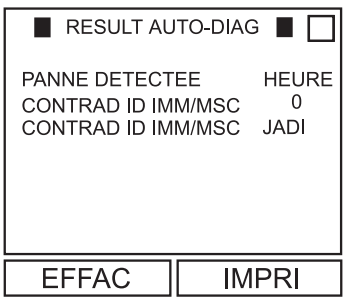
1. Mettre le contact d'allumage sur ''OFF''.
2. Vérifier la continuité entre la borne ④ de l'ampli. d'antenne NATS et la masse.
   Il doit y avoir continuité.

Mau-vais → Vérifier si le faisceau n'est pas ouvert ou court-circuité entre l'ampli. d'antenne NATS et l'IMMO. Si le faisceau fonctionne correctement, remplacer l'IMMO. Après avoir remplacé l'IMMO, effectuer l'initialisation du système à l'aide du CONSULT. Pour la procédure d'initialisation, se reporter au ''manuel d'utilisation NATS V2,0 (Diesel)''.

Bon

L'ampli. d'antenne NATS est défectueux.
Bien maintenir le corps de l'ampli. lors du remplacement de l'ampli. Veiller à ne pas tirer sur le faisceau de l'ampli.

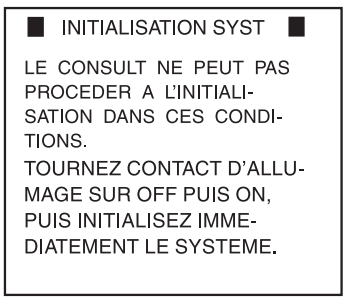
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Diagnostics des défauts (Suite)

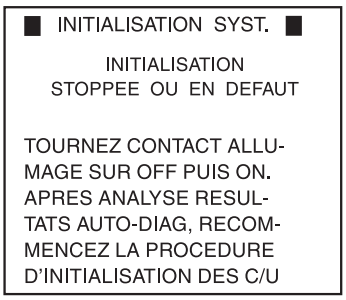
PROCEDURE DE DIAGNOSTIC 6

Résultats de l’autodiagnostic :



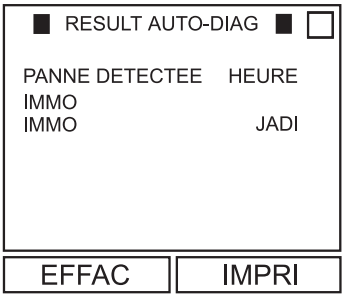
‘‘CONTRAD ID IMM/MSC’’ affiché sur l’écran CONSULT

A



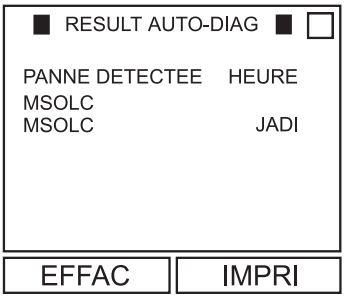
FCSDR12

B



FCSIC01

C



FCSIC02

D

FCSDR07

E

FCSDR08

A

S’assurer que ‘‘CONTRAD ID IMM/MSC*’’ de ‘RESULT AUTO-DIAG’’ est affiché sur l’écran CONSULT.

* ‘‘CONTRAD ID IMM-MSC’’ : L’ID enregistrée de l’IMMO ne correspond pas à celle du MSOLC.

Effectuer l’initialisation du système à l’aide du CONSULT. Réenregistrer tous les numéros d’identification de clé de contact NATS. Pour la procédure d’initialisation, se reporter au ‘‘Manuel d’Utilisation CONSULT NATS V2,0 (Diesel)’’.

Initialisation incomplète

B

Tourner la clé d’allumage et l’interrupteur de mise en marche de CONSULT sur OFF. Puis tourner la clé d’allumage sur ‘‘ON’’.

Initialisation incomplète ou défaut du CONSULT

C

Confirmation des résultats d’initialisation du système ‘‘INITIALISATION STOPPEE OU EN DEFAUT’’ affichés sur l’écran CONSULT.

Initialisation achevée

Démarrer le moteur.

Bon

FIN

VERIFICATION DES RESULTATS DE L’AUTODIAGNOSTIC.
1. Mettre le contact d’allumage sur ‘‘OFF’’ et ‘‘ON’’.
2. Appuyer sur ‘‘RESULT AUTO-DIAG’’ sur l’écran ‘‘SELECT MODE DIAG’’ de CONSULT.

‘‘IMMO’’ est affiché.

‘‘MSOLC’’ est affiché.

D

Si ‘‘IMMO’’ s’affiche sur l’écran CONSULT, l’IMMO ne fonctionne pas correctement.

Remplacer l’IMMO.

E

Si ‘‘MSOLC’’ s’affiche sur l’écran CONSULT, MSOLC ne fonctionne pas correctement.

Remplacer le MSOLC.

Effectuer l’initialisation du système à l’aide du CONSULT. Pour la procédure d’initialisation, se reporter au ‘‘Manuel d’Utilisation CONSULT NATS V2,0 (Diesel)’’.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostics des défauts (Suite)

PROCEDURE DE DIAGNOSTIC 7

Résultats de l’autodiagnostic :

‘‘IMPOSSIBLE CONTINUER’’ affiché sur l’écran CONSULT.

A

VERIFIER L’ECRAN CONSULT.
1. Appuyer sur ‘‘NATS V.2,0 (DIESEL) sur ‘‘SELECT NATS SYSTEM’’ de l’écran.
2. Confirmation de ‘‘IMPOSSIBLE CONTINUER’’ affiché sur l’écran CONSULT.

↓

B

VERIFIER SI LE CIRCUIT EST OUVERT ENTRE L’IMMO ET LE CONSULT.
1. Débrancher le connecteur de l’IMMO et le CONSULT du connecteur de liaison des données.
2. Vérifier la continuité entre les bornes de l’IMMO et les bornes du connecteur de diagnostic.

Borne d’IMMO	Borne du connecteur de liaison des données	Continuité
⑦	⑬	Oui
⑥	⑭	Oui

Mauvais → Réparer le faisceau.

Bon ↓

C

VERIFIER S’IL Y A COURT-CIRCUIT ENTRE L’IMMO ET LE CONSULT.
1. Débrancher le connecteur de l’IMMO et le CONSULT du connecteur de liaison des données.
2. Vérifier la continuité entre la borne ⑥, ⑦ du connecteur de l’IMMO et la masse.
   Il ne doit pas y avoir continuité.
3. Mettre le contact d’allumage sur ‘‘ON’’.
4. Vérifier la tension entre les bornes ⑥, ⑦ de l’IMMO et la masse.
   Il ne doit pas y avoir de tension.

Mauvais → Réparer le faisceau.
Note :
Si le circuit est court-circuité au niveau du circuit d’alimentation, il se peut que l’IMMO soit soit endommagée. Après réparation, effectuer à nouveau l’autodiagnostic à l’aide du CONSULT.

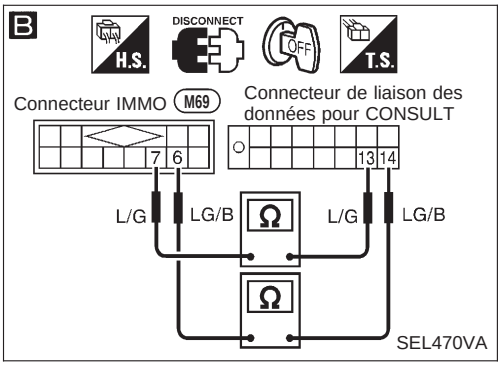
Bon ↓

D

VERIFIER LE CIRCUIT DE L’ALIMENTATION ELECTRIQUE DE L’AMPLI. D’ANTENNE NATS.
1. Débrancher le connecteur de l’ampli. d’antenne NATS.
2. Mettre le contact d’allumage sur ‘‘ON’’.
3. Vérifier la tension entre la borne ① de l’ampli. d’antenne NATS et la masse.
   Tension : plus de 4,7V

Mauvais (0V) → La ligne de plus de 5V de l’ampli. d’antenne NATS est court-circuitée avec la ligne de masse. Réparer le faisceau ou les connecteurs.

Bon ↓



Ⓐ

A

IMPOSSIBLE
CONTINUER
1. Couper le CONTACT et CONSULT.
2. Recommencer du début.

SEL867UE

F

SEL868UE

G

SEL453VA

Ⓐ

E

VERIFIER LE CIRCUIT DE L'ALIMENTATION ELECTRIQUE DE L'IMMO.
Vérifier la tension entre la borne ④ de l'IMMO et la masse à l'aide de CONSULT ou d'un testeur.
Tension : tension de la batterie

Mauvais → Vérifier les points suivants.
- Fusible de 10A (n° 34, situé dans le raccord à fusible et dans le boîtier à fusibles)
- Faisceau ouvert ou court-circuit du faisceau entre le fusible et le connecteur de l'IMMO

Bon ↓

F

VERIFIER SI LE SIGNAL DU CONTACT D'ALLUMAGE EST ALLUME.
Vérifier la tension entre la borne ③ de l'IMMO et la masse à l'aide de CONSULT ou d'un testeur.
Tension : tension de la batterie

Mauvais → Vérifier les points suivants.
- Fusible de 10A (n° 23, situé dans le boîtier à fusibles)
- Faisceau ouvert ou court-circuit du faisceau entre le fusible et le connecteur de l'IMMO

Bon ↓

G

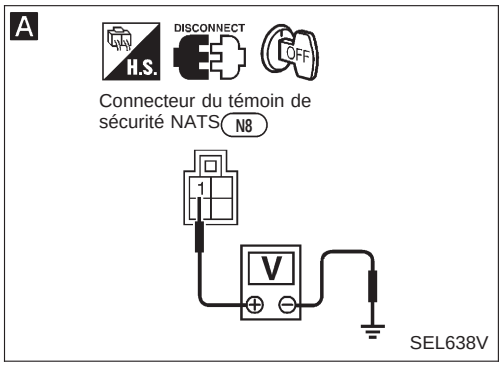
VERIFIER LE CIRCUIT DE MISE A LA MASSE DE L'IMMO.
Vérifier la continuité du faisceau entre la borne ⑨ de l'IMMO et la masse.
Il doit y avoir continuité.

Mauvais → Réparer le faisceau.

Bon ↓

- L'IMMO est défectueux.

1. Remplacer l'IMMO.
2. Effectuer l'initialisation du système à l'aide du CONSULT.
   Pour la procédure d'initialisation, se reporter au ''Manuel d'Utilisation CONSULT NATS V2,0 (Diesel)''.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostics des défauts (Suite)

PROCEDURE DE DIAGNOSTIC 8

‘‘LE TEMOIN DE SECURITE NATS NE S’ALLUME PAS’’

A

VERIFIER LE CIRCUIT D’ALIMENTATION ELECTRIQUE DU TEMOIN.
Vérifier la tension entre la borne ① du témoin de sécurité et la masse.
Il doit y avoir tension de la batterie.

Mauvais → Vérifier les points suivants.
- Fusible de 7,5A (n° 6, situé dans le boîtier à fusibles)
- Faisceau ouvert ou court-circuit du faisceau entre le fusible et le témoin de sécurité

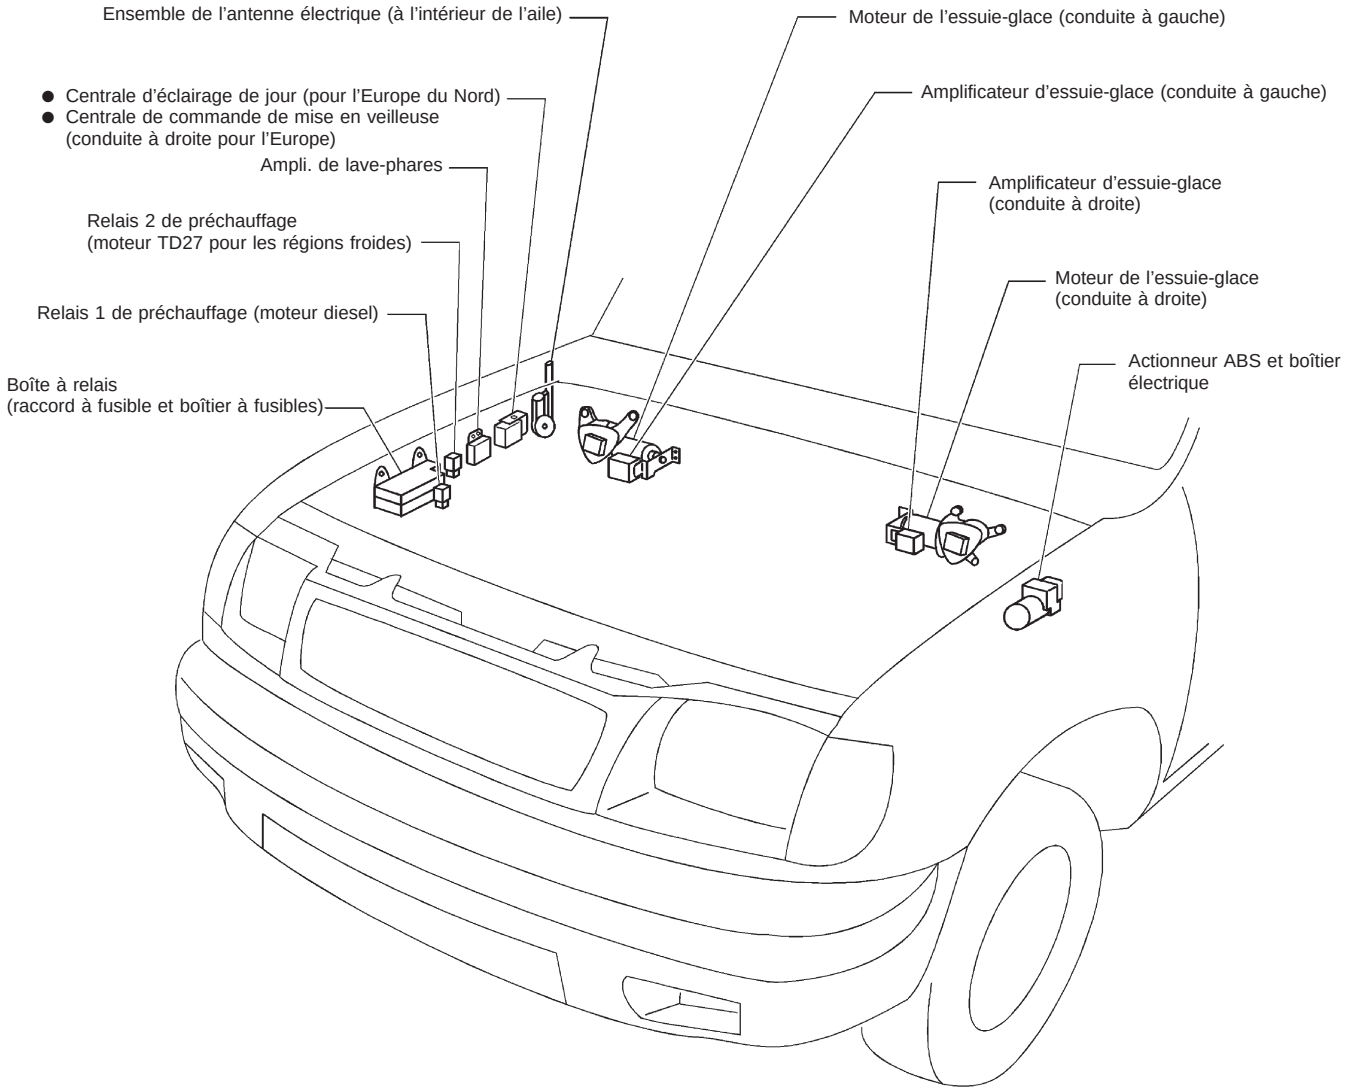
Bon ↓

Vérifier le témoin de sécurité.

Mauvais → Remplacer le témoin de sécurité.

Bon ↓

EFFECTUER L’INITIALISATION.
Effectuer l’initialisation de l’IMMO à l’aide du CONSULT.
Pour la procédure d’initialisation, se reporter au ‘‘manuel d’utilisation NATS V2,0 (Diesel)’’.
Le témoin de sécurité fonctionne-t-il une fois l’initialisation terminée?



Non → Vérifier que les faisceaux ne sont pas ouverts ou court-circuités entre l’IMMO NATS et le témoin de sécurité.

Oui ↓

Comment lire un schéma de disposition des faisceaux

Exemple :

Les dispositions de faisceau suivantes utilisent une grille pour aider à localiser les connecteurs sur les dessins :

- Faisceau principal (tableau de bord, compartiment moteur)
- Faisceau de compartiment moteur
- Faisceau de commande du moteur

Pour utiliser une figure quadrillée

1) Rechercher le numéro du connecteur voulu dans la liste des connecteurs.
2) Rechercher la figure quadrillée.
3) Sur le dessin, rechercher l'intersection entre la colonne indiquée par une lettre et la rangée de chiffre.
4) Rechercher le numéro du connecteur dans la zone d'intersection.
5) Suivre la ligne (le cas échéant) jusqu'au connecteur.

SYMBOLE DE CONNECTEUR

Les principaux symboles des connecteurs (dans la disposition du faisceau) sont indiqués ci-dessous.

Type de connecteur	Type étanche		Type standard	
	Mâle	Femelle	Mâle	Femelle
● Cavité : moins de 4 ● Connecteur de relais				
● Cavité : de 5 à 8				
● Cavité : plus de 9				
● Borne de masse etc.	–

Utiliser le tableau ci-dessous pour déterminer la signification des codes de schémas de câblage.
Se reporter aux codes des schémas de câblage dans l'index pour connaître l'emplacement (le numéro de page) de chaque schéma de câblage.

Code	Section	Nom du schéma de câblage
AAC/V	EC	Soupape IACV-AAC
ABS	BR	Système anti-enrayeur des freins
A/C, M	HA	Climatiseur manuel
AUDIO	EL	Audio
BACK/L	EL	Feux de recul
BUZZER	EL	Témoin sonore
CHARGE	EL	Système de charge
CHOKE	EC	Starter automatique
CIGAR	EL	Allume-cigare
CLOCK	EL	Montre
CMPS	EC	Capteur d'angle d'arbre à cames
COOL/F	LC	Commande du ventilateur de refroidissement
DEF	EL	Désembuage de lunette arrière
DIMDIP	EL	Phares – avec système de mise en veilleuse des codes
D/LOCK	EL	Verrouillage électrique de porte
DTRL	EL	Phares - avec système d'éclairage de jour
ECTS	EC	Capteur de température du moteur
EGRC/V	EC	EGRC – Electrovanne
FCUT	EC	Electrovanne de coupure de carburant
F/HEAT	EC	Système de chauffage de carburant
FICD	EC	Electrovanne FICD
FIPOT	EC	Pot ISC-FI
FPCM	EC	Module de commande de pompe à carburant
F/PUMP	EC	Pompe d'alimentation
F/RTN	EC	Electrovanne de commande de retour de carburant
GLOW	EC	Circuit de préchauffage rapide
H/AIM	EL	Commande de réglage des phares
HEATER	HA	Chauffage
H/LAMP	EL	Phares
HLC	EL	Lave-phares
HO2S	EC	Sonde à oxygène chauffée
HORN	EL	Avertisseur sonore
H/SEAT	EL	Siège chauffant

Code	Section	Nom du schéma de câblage
IATS	EC	Capteur de température d'air d'admission
IDLE	EC	Electrovanne IACV de contrôle de montée en ralenti
IGN	EC	Système d'allumage
IGN/SG	EC	Signal d'allumage
ILL	EL	Eclairage
INJECT	EC	Injecteur
INT/L	EL	Plafonnier et spot de lecture
MAFS	EC	Débitmètre d'air
MAIN	EC	Alimentation électrique principale et circuit et de mise à la masse
METER	EL	Compteur de vitesse, compte-tours et jauge de température et de carburant
MIL/DL	EC	Témoin MIL et connecteur de liaison des données de diagnostic pour CONSULT
MIRROR	EL	Rétroviseur électrique de porte
MULTI	EL	Système de contrôle de multi-télécommande
NATS	EL	Système antivol Nissan (NATS)
P/ANT	EL	Antenne électrique
PGC/V	EC	Electrovanne de commande de purge de cartouche
PLA	EC	Commande d'avance à charge partielle
PNP/SW	EC	Contact de stationnement/point mort
POWER	EL	Disposition de l'alimentation électrique
PST/SW	EC	Manocontact d'huile de direction assistée
R/FOG	EL	Feu antibrouillard arrière
SRS	RS	Système de retenue supplémentaire
S/SIG	EC	Signal de démarrage
START	EL	Circuit de démarrage
STOP/L	EL	Feu de stop
SWL/V	EC	Electrovanne de contrôle de vanne de commande de tourbillon

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Code	Section	Nom du schéma de câblage
TAIL/L	EL	Feux de stationnement, éclairage de plaque d'immatriculation et feux arrière
TPS	EC	Capteur de position de papillon
TURN	EL	Clignotants et feux de détresse

Code	Section	Nom du schéma de câblage
VSS	EC	Capteur de vitesse du véhicule
WARN	EL	Témoins lumineux
WINDOW	EL	Lève-glace électrique
WIPER	EL	Essuie-glace et lave-glace avant

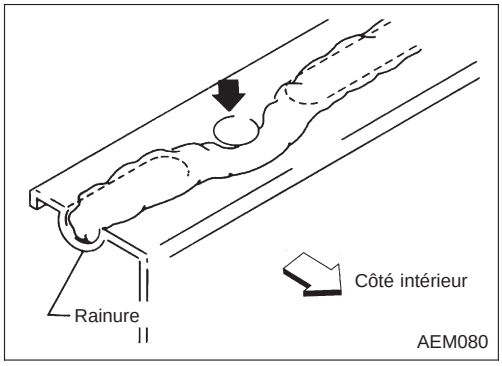
Pièces nécessitant un serrage angulaire

- Utiliser une clé angulaire pour le serrage final des pièces de moteur suivantes :
  (1) Boulons de culasse
  (2) Ecrous de chapeau de bielle pour moteurs à essence
- Ne pas utiliser une valeur de serrage pour le serrage final.
- La valeur de serrage de ces pièces est valable pour une étape préliminaire.
- S'assurer que le filetage et les surfaces d'assise sont propres et enduits d'une couche d'huile moteur.



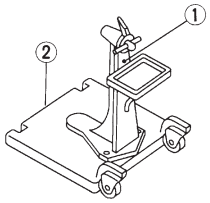
Procédé d'application du joint liquide

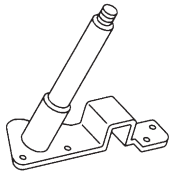
a. Utiliser un grattoir pour déposer toutes les traces de l'ancien joint liquide des surfaces de contact et des rainures. Nettoyer également toutes les taches d'huile présentes sur ces zones.

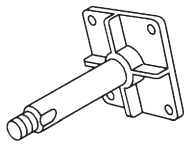
b. Appliquer une couche régulière de joint liquide sur les surfaces de contact (utiliser un joint liquide d'origine ou un produit équivalent).

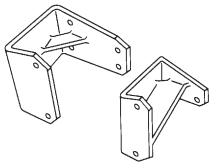
- **Pour le carter d'huile, s'assurer que le diamètre du joint liquide est de 3,5 à 4,5 mm pour les moteurs à essence.**
- **Pour les parties autres que le carter d'huile, s'assurer que le diamètre du joint liquide est de 2 à 3 mm pour les moteurs à essence, et de 2,5 à 3,5 mm pour les moteurs diesel.**

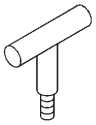
c. Appliquer du joint liquide autour des surfaces intérieures des orifices de boulons (sauf indication contraire).





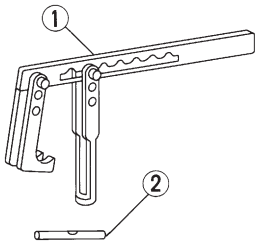


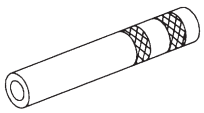


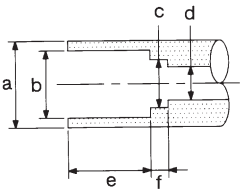


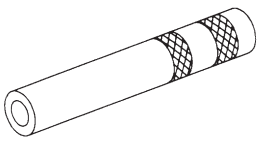
d. Le montage doit être fait dans les 5 minutes qui suivent l'application du joint.

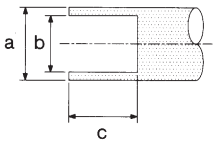
e. Attendre au moins 30 minutes avant de faire le plein d'huile moteur et de liquide de refroidissement.

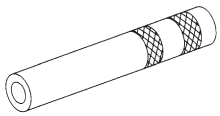


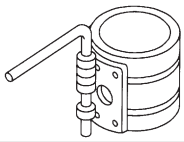


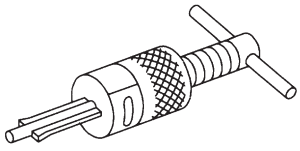


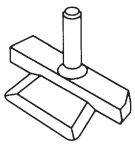












Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Mesure de la pression de compression

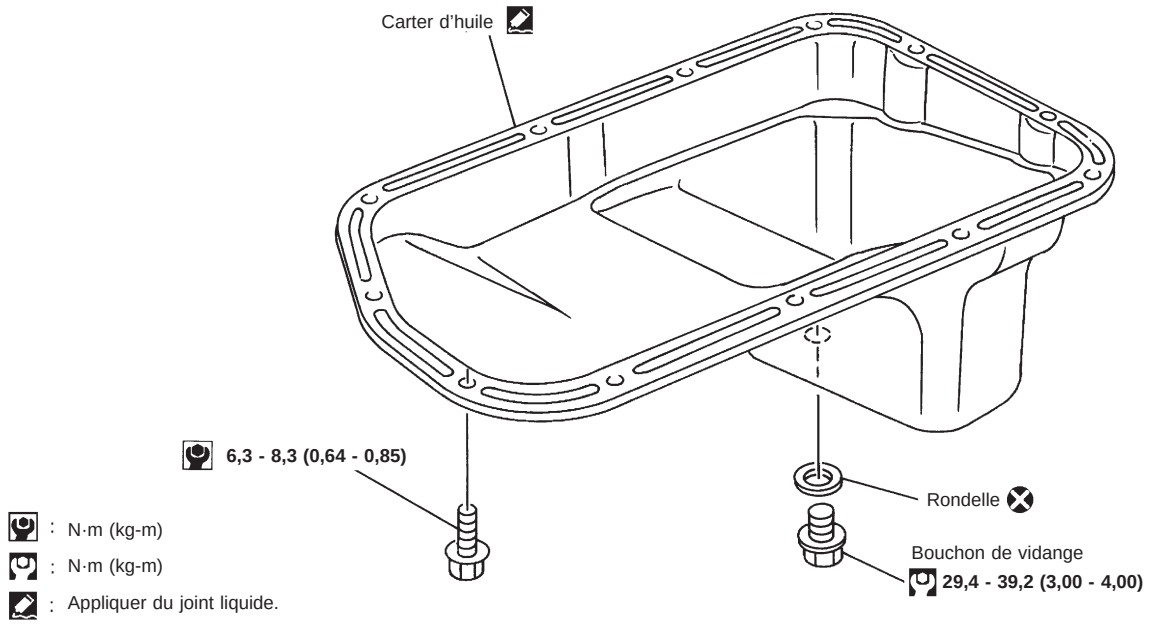
1. Faire chauffer le moteur.
2. Couper le contact.
3. Détendre la pression d'alimentation.
   Se reporter à la section EC (''Détente de la pression d'alimentation'', ''PROCEDURE D'ENTRETIEN DE BASE'').
4. Déposer toutes les bougies d'allumage.
5. Débrancher le câble central du distributeur.

6. Monter un indicateur de compression sur le cylindre n° 1.
7. Enfoncer la pédale d'accélérateur jusqu'au plancher pour maintenir le papillon d'accélérateur ouvert à fond.
8. Lancer le moteur et noter la lecture maximum de l'indicateur de compression.
9. Répéter cette mesure sur chacun des cylindres en procédant de la même façon.

- **Toujours utiliser une batterie ayant sa pleine charge pour obtenir le régime moteur spécifié.**

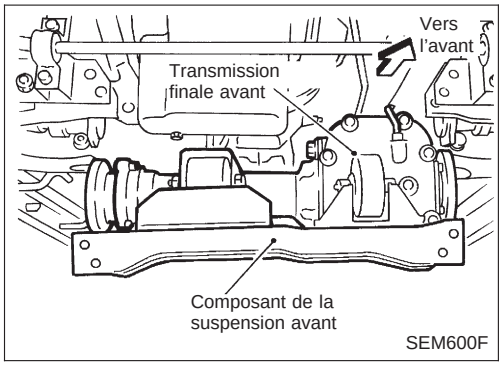
Pression de compression :
kPa (bar, kg/cm^2)/tr/mn
Standard
1 324 (13,24, 13,5)/300
Minimum
981 (9,8, 10)/300
Limite de différence entre les cylindres
98 (0,98, 1,0)/300

10. Si la compression est basse dans un ou plusieurs cylindres :



a. verser une petite quantité d'huile moteur dans les cylindres par les trous de bougie d'allumage.
b. contrôler de nouveau la compression.

- **Si une adjonction d'huile facilite la compression, il se peut que les segments de piston soient usés ou endommagés. Dans ce cas, remplacer les segments de piston après avoir contrôlé le piston.**
- **Si la pression reste faible, une soupape peut être collée ou son siège déformé. Contrôler et réparer la soupape et le siège de soupape (consulter les SDS). Si la soupape ou le siège de soupape sont excessivement endommagés, les remplacer.**
- **Si la compression reste basse dans deux cylindres voisins :**



a. il peut s'agir d'une fuite du joint de culasse, ou
b. les composants des soupapes des deux cylindres peuvent être endommagés. Inspecter et réparer si nécessaire.

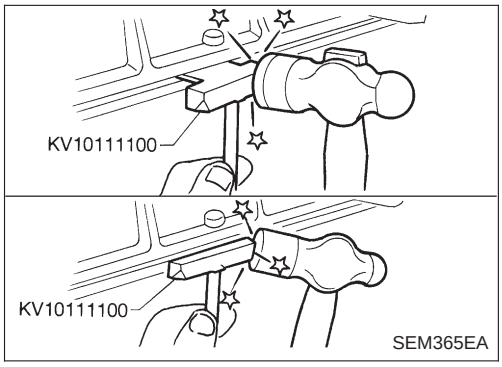
SEC. 110



SEM566F

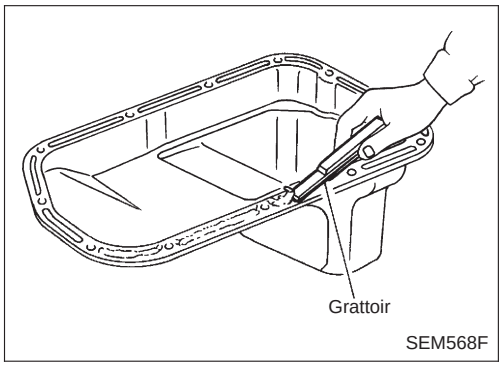
SEM600F

SEM567F

SEM365EA

Dépose

1. Soulever le véhicule et le laisser reposer sur des chandelles de sécurité.
2. Déposer la protection inférieure du moteur.
3. Vidanger l'huile moteur.
4. Déposer la transmission finale avant avec la traverse de suspension du différentiel. Se reporter à la section PD (''Dépose et repose'', ''Transmission finale avant'') – modèles 4X4 uniquement.
5. Déposer le boulon du composant de suspension avant (droit et gauche).
6. Déposer les boulons de carter d'huile.
7. Déposer le carter d'huile.

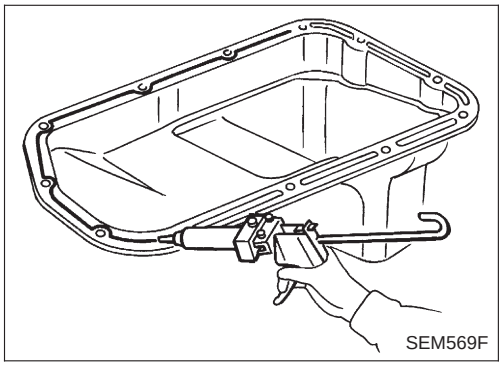


a. Introduire l'outil spécial entre le bloc-cylindres et le carter d'huile.

- **Veiller à ne pas détériorer les surfaces de contact en aluminium.**
- **Ne pas introduire de tournevis car cela endommagerait le flasque du carter d'huile.**

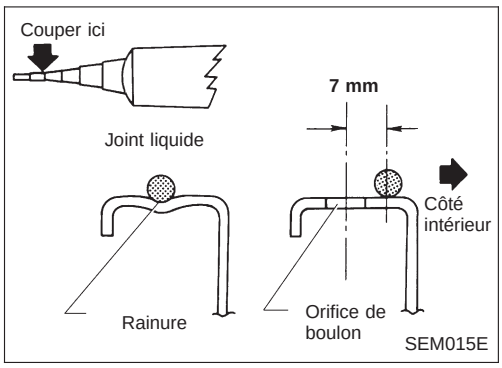
b. Faire glisser l'outil spécial en frappant sur son côté avec un marteau.

8. Retirer le carter d'huile par l'avant.



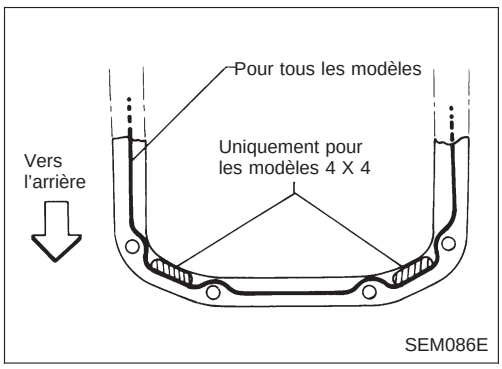
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Repose



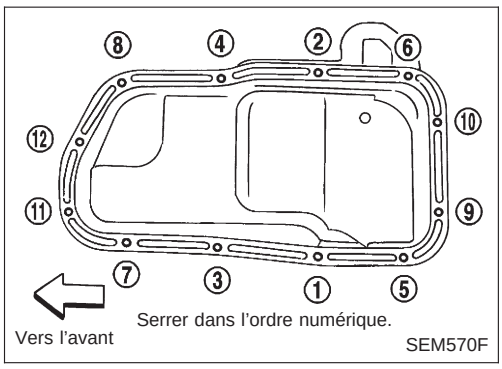
1. Utiliser un grattoir pour déposer le joint liquide ancien de la surface d'appui du carter d'huile.

- **Enlever également toute trace de joint liquide de la surface d'appui du bloc-cylindres.**



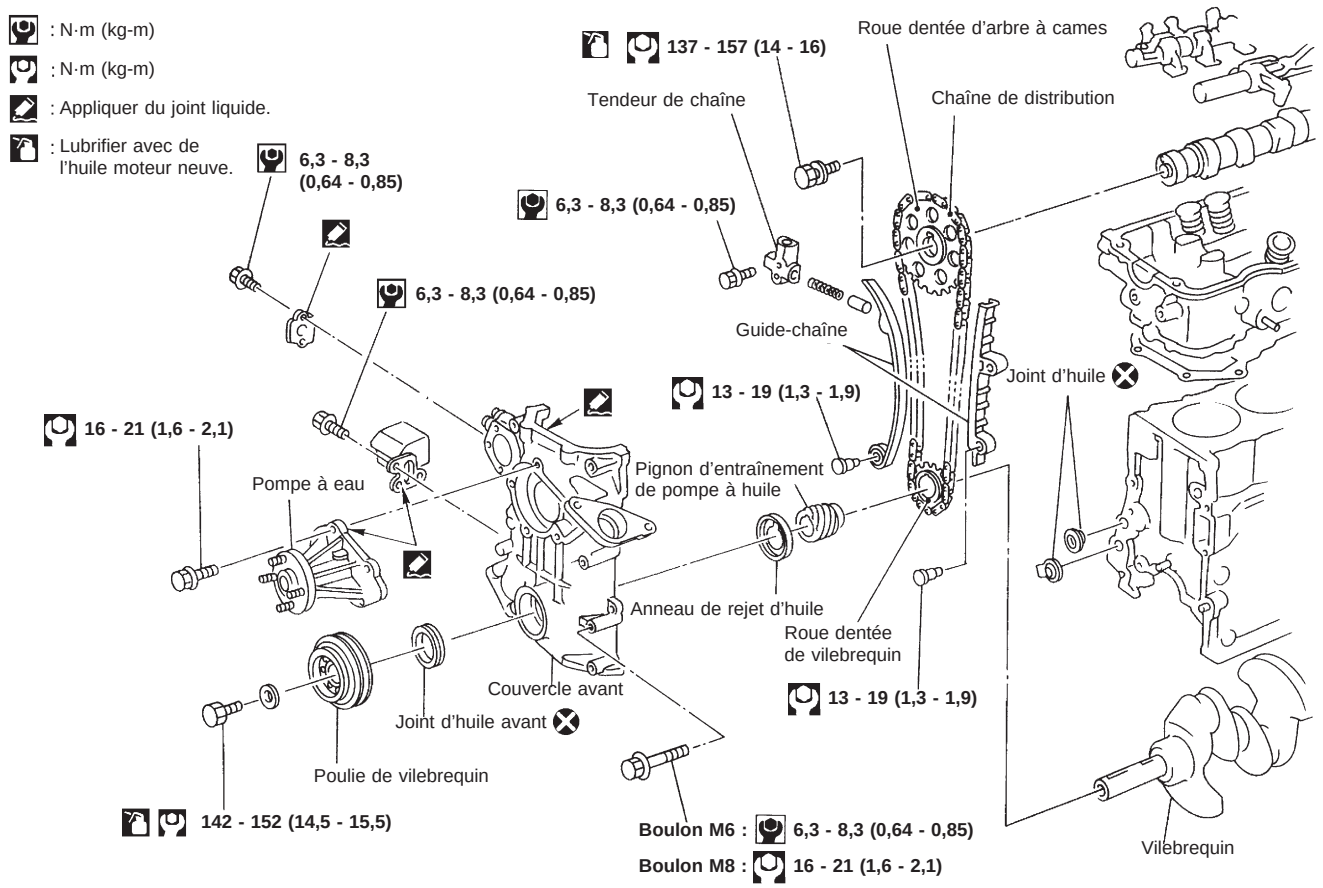
2. Enduire d'un cordon uniforme de joint liquide la surface d'appui du carter d'huile.

- **Utiliser le joint liquide d'origine ou un produit équivalent.**
- **Enduire la rainure de la surface d'appui.**
- **Tolérer un jeu de 7 mm autour de l'orifice du boulon.**



- **S'assurer que le diamètre du joint liquide est de 3,5 à 4,5 mm.**
- **L'assemblage doit être effectué dans les 5 minutes qui suivent l'application du joint.**

3. Reposer le carter d'huile.



- **Serrer les boulons de carter d'huile dans l'ordre numérique.**
  : 6,3 - 8,3 N·m (0,64 - 0,85 kg-m)
- **Attendre au moins 30 minutes avant de faire le plein d'huile moteur.**

4. Reposer les pièces dans l'ordre inverse de la dépose.

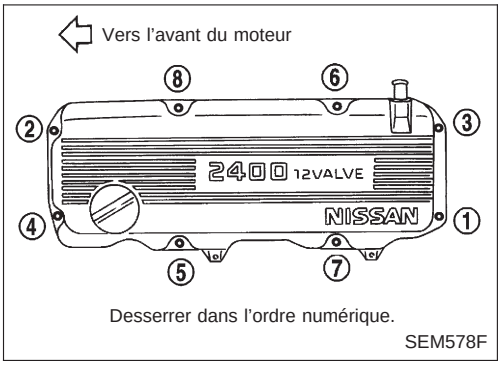
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SEC. 120•130•135

ATTENTION :

- **Après avoir déposé la chaîne de distribution, ne pas faire tourner séparément le vilebrequin et l'arbre à cames car les soupapes heurteraient les têtes de piston.**
- **Lors de la repose des culbuteurs, des arbres à cames, du tendeur de chaîne, des joints d'huile ou d'autres pièces coulissantes, lubrifier les surfaces de contact avec de l'huile moteur neuve.**
- **Lors de la repose de la culasse, des roues dentées d'arbre à cames, de la poulie de vilebrequin et des supports d'arbre à cames, enduire les filetages des boulons et les surfaces d'assise d'huile moteur neuve.**

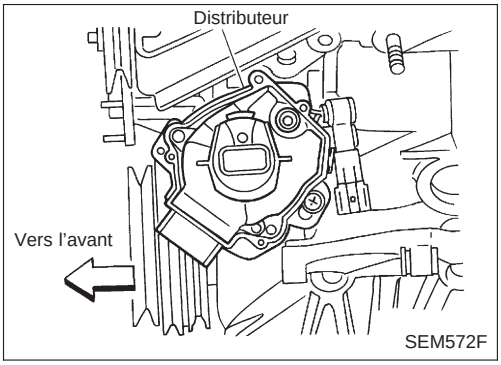
Dépose



1. Débrancher la borne de batterie.
2. Déposer le filtre à air et le conduit d'entrée d'air.
3. Vidanger le liquide de refroidissement en déposant le bouchon de vidange du bloc-cylindres et le robinet de vidange du radiateur.
4. Déposer le flexible de chauffage et les flexibles de radiateur.
5. Déposer le radiateur, y compris le capot et le ventilateur de refroidissement.
6. Enlever les courroies suivantes.

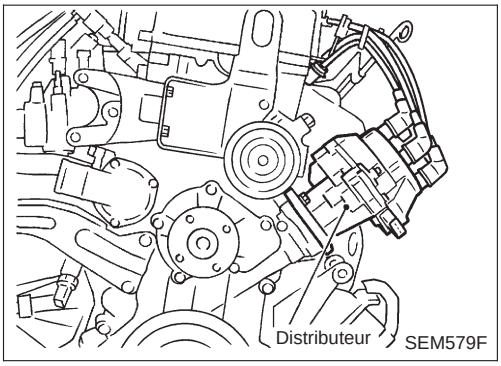
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Dépose (Suite)



- Courroie d'entraînement de la direction assistée
- Courroie d'entraînement du compresseur
- Courroie d'entraînement d'alternateur

7. Déposer le câble de commande d'accélérateur.
8. Débrancher le collecteur d'échappement du tuyau avant d'échappement.
9. Déposer les flexibles PCV du cache-culbuteurs.
10. Déposer l'alternateur et le support.
11. Déposer la pompe à huile de direction assistée et son support du moteur.
12. Déposer les flexibles à dépression, les flexibles à carburant, les câbles, le faisceau, les connecteurs, etc.
13. Déposer tous les câbles à haute tension.

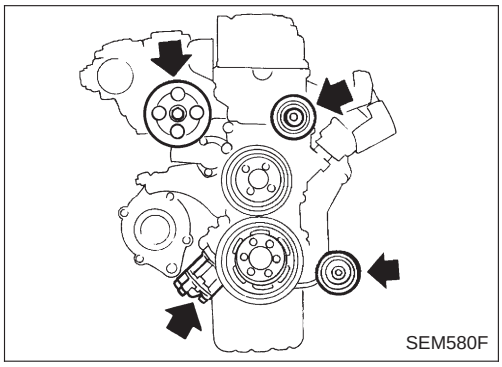


Desserrer dans l'ordre numérique.
SEM578F

14. Déposer le cache-culbuteurs.
- Desserrer les boulons dans l'ordre numérique comme illustré sur la figure.

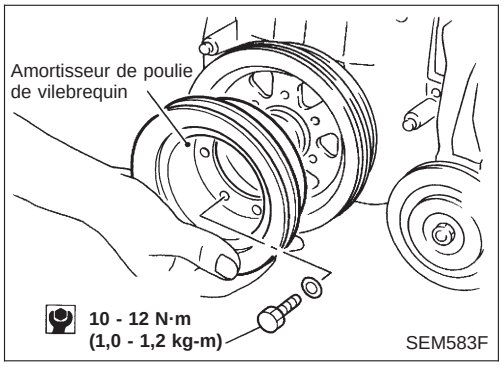
SEM572F

15. Déposer toutes les bougies d'allumage.
16. Placer le piston n° 1 à son P.M.H. dans sa course de compression.



SEM579F

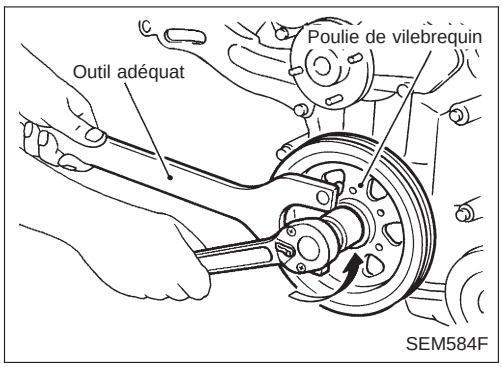
17. Déposer le distributeur.



Ne pas tourner le rotor lorsque le distributeur est déposé.

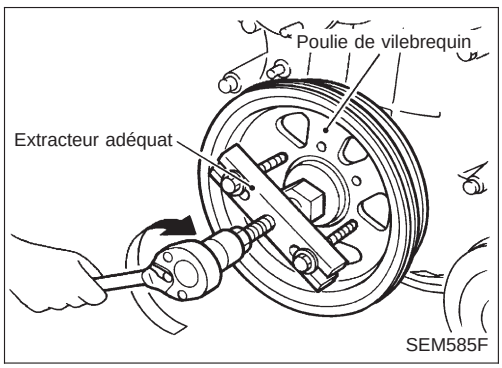
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Dépose (Suite)



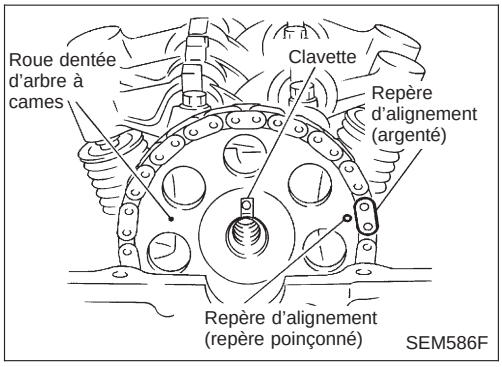
SEM580F

18. Déposer les pièces suivantes.
- Pompe de direction assistée, poulie intermédiaire et supports de pompe de direction assistée
- Poulie intermédiaire de compresseur
- Pompe à huile et arbre d'entraînement de pompe



SEM583F

19. Déposer l'amortisseur de la poulie de vilebrequin.

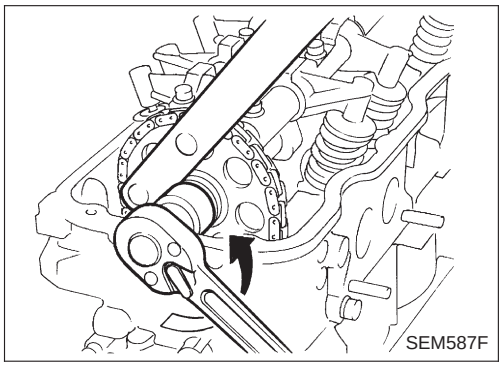


SEM584F

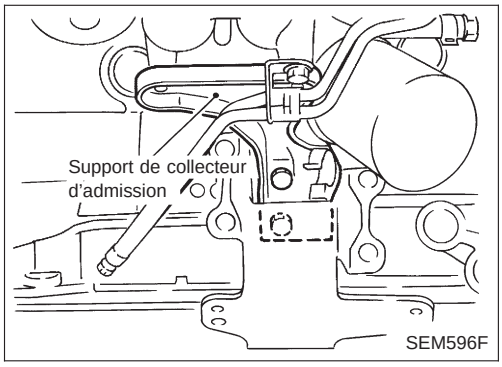
20. Desserrer le boulon de la poulie de vilebrequin.

SEM585F

21. Déposer la poulie de vilebrequin à l'aide d'un extracteur adéquat.



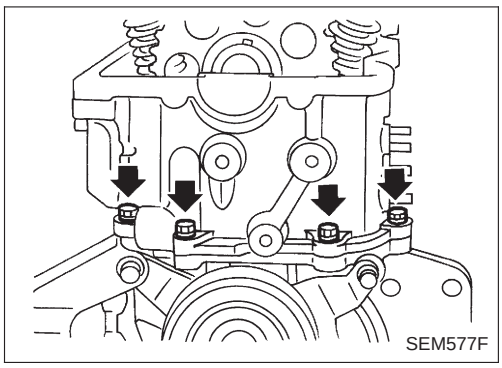
SEM586F



- **Faire tourner le vilebrequin jusqu'à ce que la clavette sur la roue dentée d'arbre à cames soit placée en haut.**

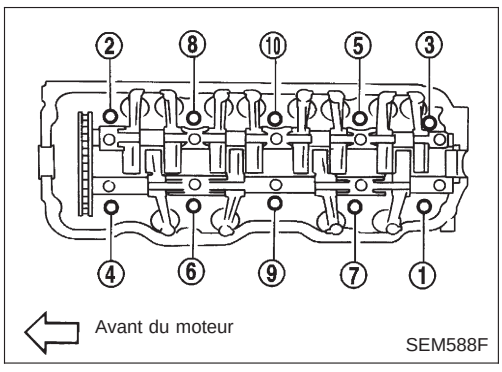
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Dépose (Suite)



SEM587F

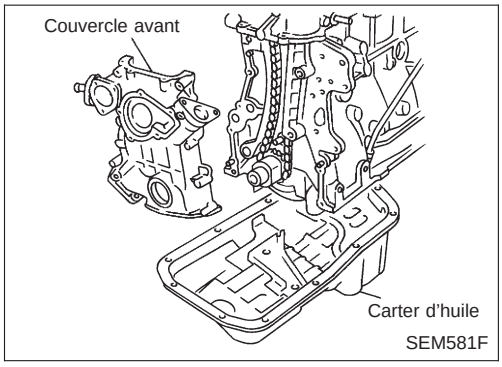
22. Déposer le boulon de la roue dentée d'arbre à cames.



SEM596F

23. Déposer le boulon fixant le collecteur d'admission à son support.

SEM577F

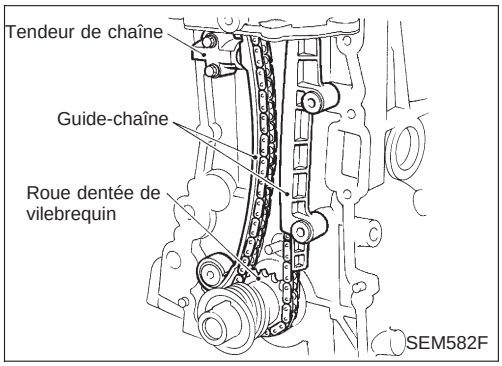


24. Déposer le couvercle de distribution avant des boulons de la culasse.

SEM588F

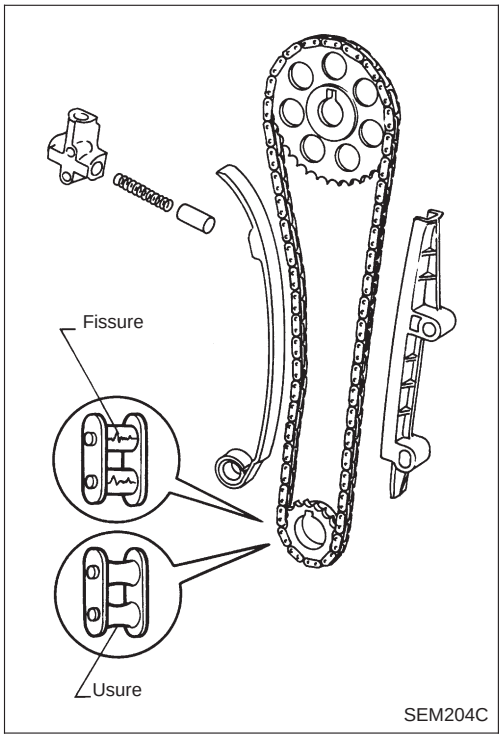
25. Déposer les boulons de culasse.
- **Desserrer en ordre numérique.**
- **Une dépose dans l'ordre incorrect peut entraîner une déformation ou une fêlure de la culasse.**
- **Desserrer les boulons de la culasse en deux ou trois étapes.**

26. Déposer la culasse avec les collecteurs d'admission et d'échappement.



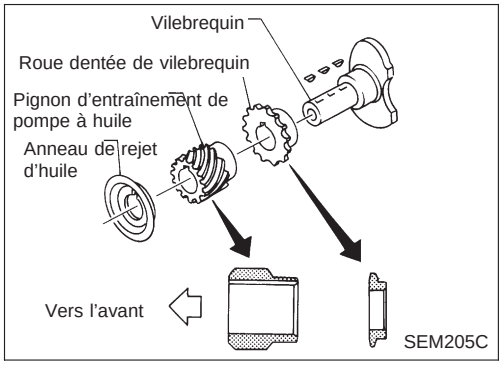
SEM581F

27. Déposer le carter d'huile (se reporter à CARTER D'HUILE, EM-10).
28. Déposer le couvercle avant.
- Rechercher les traces de fuites d'huile au niveau du joint d'huile avant. Remplacer le joint en cas de fuite.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

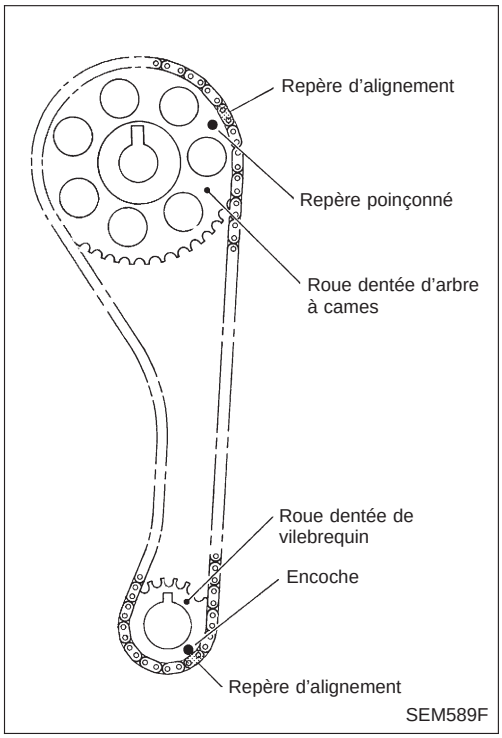
Dépose (Suite)



29. Déposer les pièces suivantes.
- Tendeur de chaîne
- Guide-chaînes
- Chaîne de distribution et roue dentée d'arbre à cames
- Anneau de rejet d'huile, pignon d'entraînement de pompe à huile et roue dentée de vilebrequin

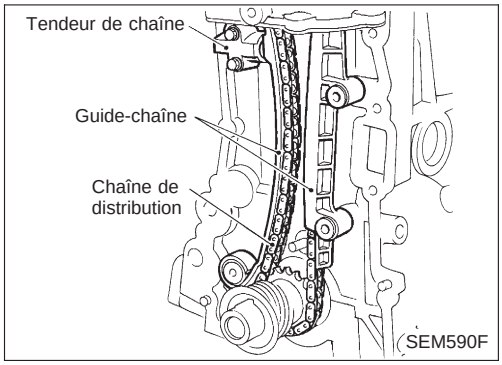
Inspection

- **Contrôler la présence de fissures ou de signes d'usure excessive aux chaînons. Remplacer la chaîne si cela est nécessaire.**



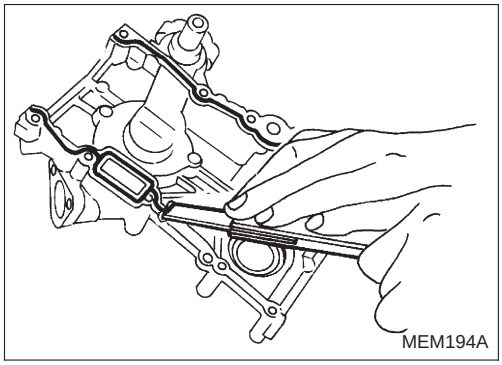
Repose

1. Reposer la roue dentée de vilebrequin, le pignon d'entraînement de pompe à huile et l'anneau de rejet d'huile.
- **S'assurer que les repères d'alignement de la roue de vilebrequin sont dirigés vers l'avant du moteur.**



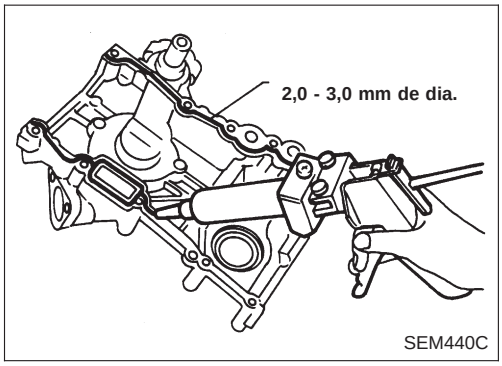
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Repose (Suite)



2. Positionner le vilebrequin de façon à ce que le piston n° 1 soit au P.M.H. (clavette à 12 heures). Monter la chaîne de distribution sur la roue dentée de vilebrequin de façon à ce que son repère d'alignement soit aligné avec le repère d'alignement sur la roue dentée de vilebrequin.
3. Reposer provisoirement la culasse avec un joint neuf. Positionner l'arbre à cames de telle sorte que la clavette soit à 12 heures.

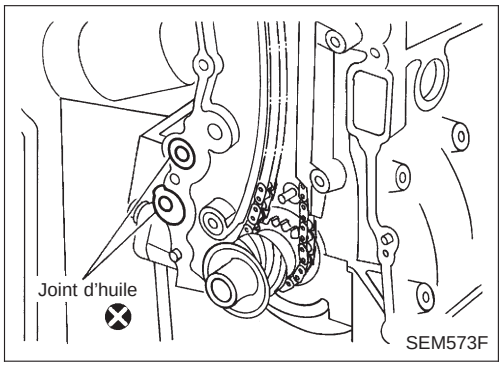
- **Reposer la chaîne de distribution en alignant ses repères d'alignement sur ceux de la roue de vilebrequin et de la roue dentée d'arbre à cames.**



4. Reposer la chaîne de distribution, les guide-chaînes de distribution et le tendeur de chaîne.

5. Avant de reposer le couvercle avant, enlever toute trace de joint liquide de la surface d'appui à l'aide d'un grattoir.

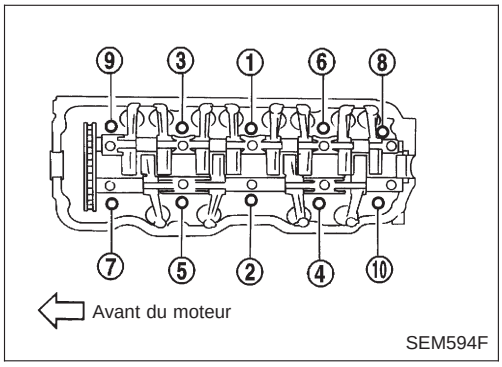
- **Enlever également toute trace de joint liquide de la surface d'appui du bloc-cylindres.**



6. Appliquer un cordon uniforme de joint liquide sur le couvercle avant.

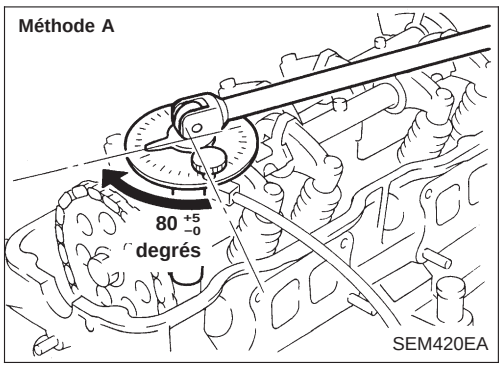
- **Utiliser le joint liquide d'origine ou un produit équivalent.**
- **Veiller à installer le joint d'huile avant neuf dans le bon sens. Se reporter à EM-21.**

7. Appliquer de la graisse à base de lithium sur la lèvre d'étanchéité du joint d'huile de vilebrequin.



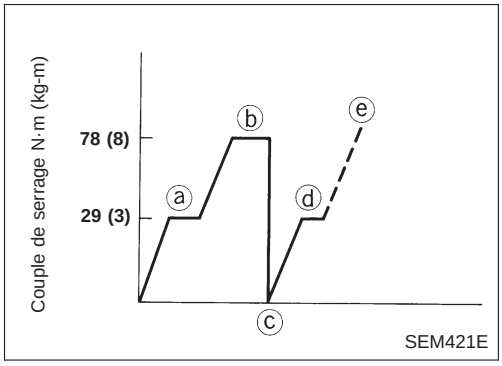
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Repose (Suite)



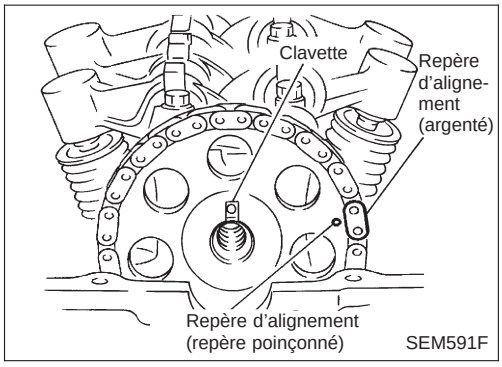
8. Reposer le couvercle avant.
- **Veiller à ne pas endommager le joint plat de la culasse.**
- **Veiller à ne pas endommager le joint d'huile avant lors de la repose du couvercle avant.**

9. Reposer le carter d'huile (se reporter à CARTER D'HUILE, EM-10).



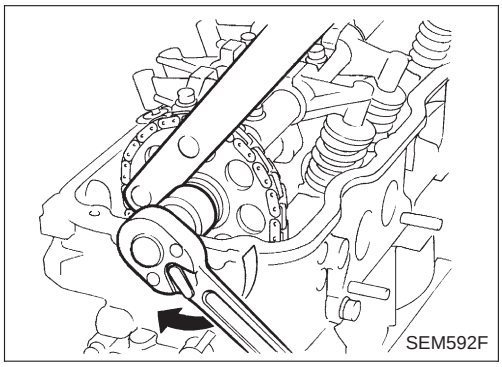
10. Serrer les boulons de la culasse.
- ⓐ **Serrer tous les boulons à un couple de 29 N·m (3 kg-m).**
- ⓑ **Serrer tous les boulons à un couple de 78 N·m (8 kg-m).**
- ⓒ **Desserrer entièrement tous les boulons.**
- ⓓ **Serrer tous les boulons à un couple de 25 à 34 N·m (2,5 à 3,5 kg-m).**

ⓔ **Méthode A : Tourner tous les boulons de 80 $^{+5}_{-0}$ degrés dans le sens des aiguilles d'une montre à l'aide d'une clé angulaire.**



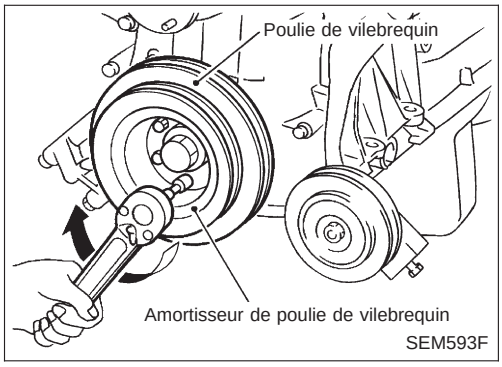
Méthode B : Si l'on ne dispose pas d'une clé angulaire, serrer tous les boulons à un couple de 74 à 83 N·m (7,5 à 8,5 kg-m).

	Couple de serrage N·m (kg-m)
ⓐ	29 (3)
ⓑ	78 (8)
ⓒ	0 (0)
ⓓ	29 ± 5 (3 ± 0,5)
ⓔ	80 $^{+5}_{-0}$ degrés ou 78 ± 5 (8,0 ± 0,5)



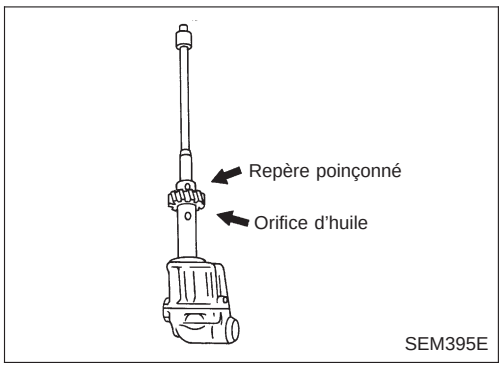
11. Reposer les roues dentées d'arbre à cames.

Aligner le repère d'alignement de la chaîne de distribution sur le repère d'alignement de la roue dentée d'arbre à cames.



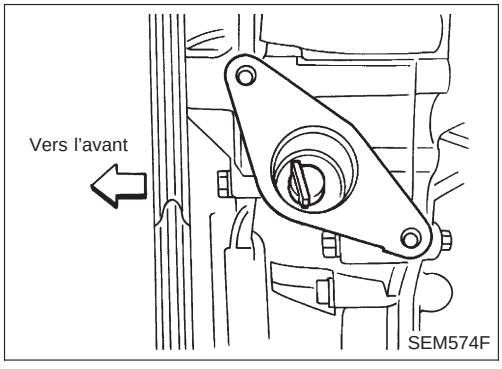
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Repose (Suite)



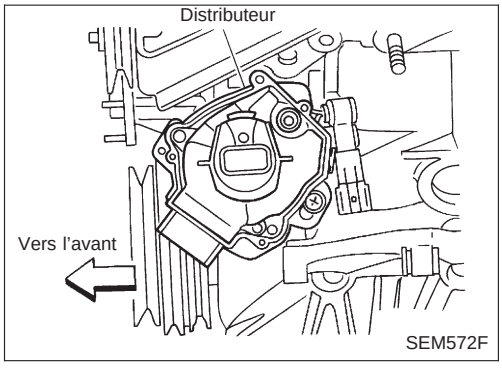
SEM592F

- Bloquer les arbres à cames comme indiqué ci-contre, et serrer au couple spécifié.
  : 137 - 157 N·m (14,0 - 16,0 kg-m)



SEM593F

12. Reposer la poulie de vilebrequin et l'amortisseur de la poulie de vilebrequin.

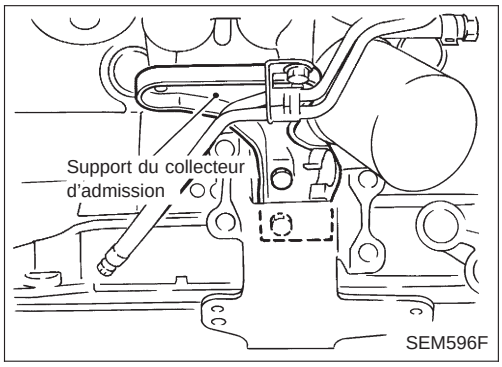


SEM395E

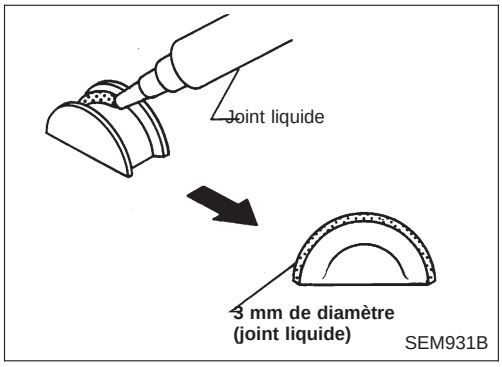
13. Reposer l'arbre d'entraînement du distributeur et la pompe à huile avec un joint plat neuf dans le couvercle avant.
a. Assembler la pompe à huile et l'arbre d'entraînement en alignant le repère poinçonné sur l'arbre de commande avec l'orifice d'huile.

SEM574F

b. S'assurer que l'arbre d'entraînement est installé comme indiqué sur la figure.

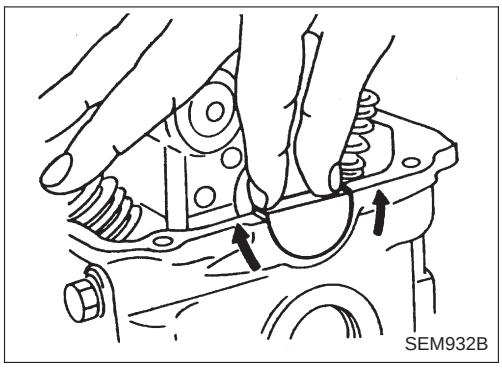


SEM572F

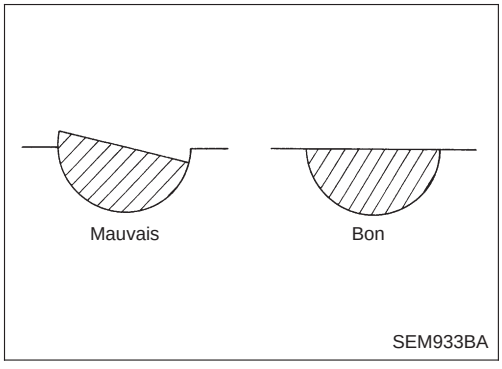


14. Reposer le distributeur.
15. S'assurer que le piston n° 1 est au P.M.H. et que le rotor de distributeur est sur la position d'étincelle du cylindre n° 1.

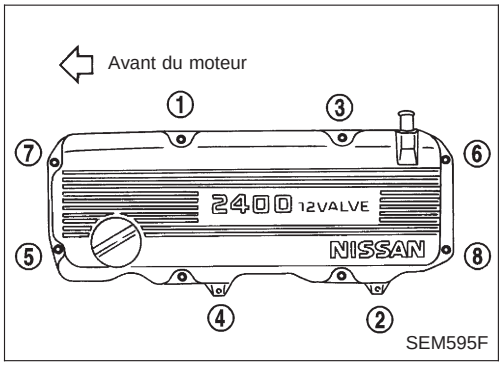
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Repose (Suite)

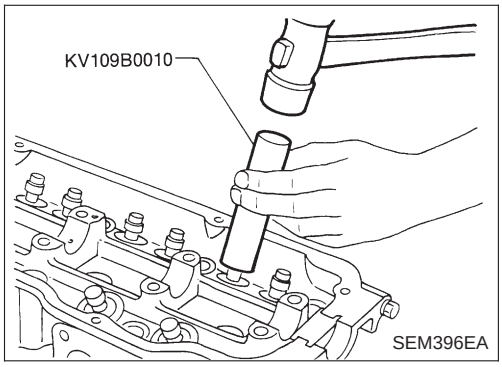


16. Reposer les boulons extérieurs de culasse.
17. Reposer le support du collecteur d'admission.



18. Reposer les bouchons en caoutchouc comme suit :
a. Enduire de joint liquide les bouchons en caoutchouc.
- **Remplacer les bouchons en caoutchouc par des pièces neuves.**
- **Les bouchons en caoutchouc doivent être reposés dans les 5 minutes qui suivent l'application du joint liquide.**

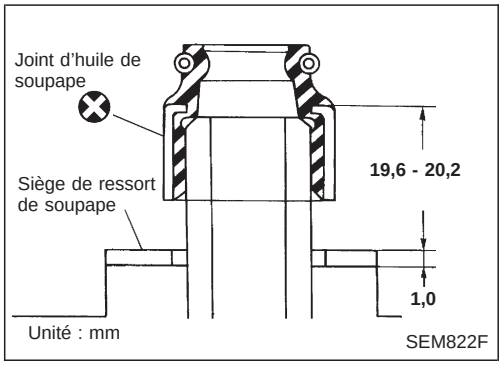
b. Reposer les bouchons en caoutchouc, puis les déplacer avec les doigts de façon à enduire uniformément de joint liquide la surface de la culasse.
- **Les bouchons en caoutchouc doivent arriver au ras de la surface.**
- **Ne pas mettre le moteur en marche dans les 30 minutes suivant la repose du cache-culbuteurs.**
- **Nettoyer l'excès de joint liquide de la tête de culasse.**



19. Reposer le cache-culbuteurs.
Méthode de serrage du cache-culbuteurs :
(1) Serrer les boulons ① - ② dans cet ordre à un couple de 3 N·m (0,3 kg-m).
(2) Serrer les écrous ④ - ③ - ② - ① - ⑧ - ⑦ - ⑥ - ⑤ - ④ - ③ - ② - ① dans cet ordre à un couple de 7 à 11 N·m (0,7 à 1,1 kg-m).
20. Reposer les pièces dans l'ordre inverse de la dépose.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

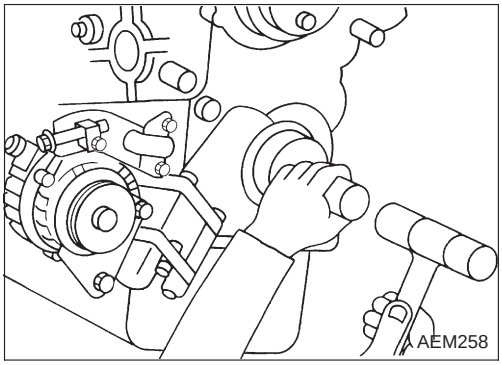
Joint d'huile de soupape



1. Déposer le cache-culbuteurs.
2. Déposer l'axe des culbuteurs (se reporter à ''Démontage'', au chapitre ''CULASSE'', page EM-26).
3. Déposer le ressort de soupape et le joint d'huile de soupape avec l'outil spécial ou un outil approprié.

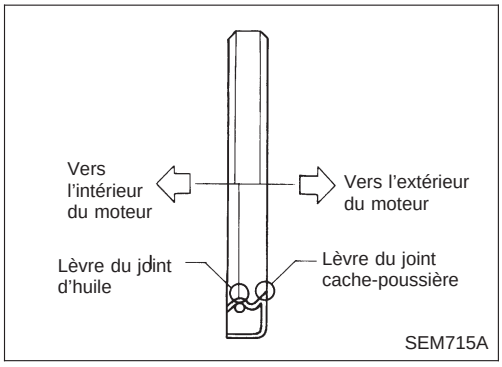
● **Le piston concerné doit être réglé à son P.M.H. pour empêcher la soupape de tomber.**

4. Enduire d'huile moteur un joint d'huile de soupape neuf et monter le joint à l'aide d'un outil spécial.



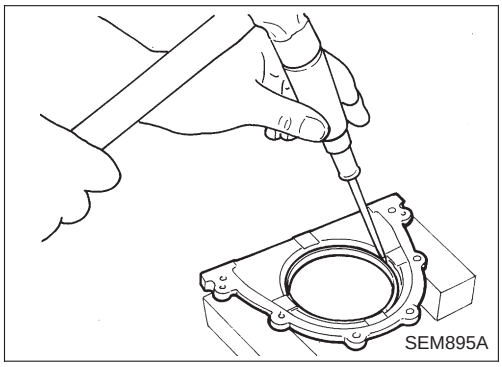
● **Avant de monter le joint d'huile de soupape, monter le siège de ressort de soupape.**

Joint d'huile avant



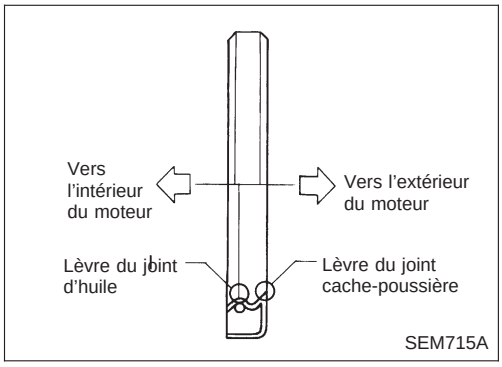
1. Déposer le capot de radiateur et la poulie de vilebrequin.
2. Déposer le joint d'huile avant.

● **Prendre garde à ne pas rayer le couvercle avant.**



3. Enduire d'huile moteur le nouveau joint d'huile et monter le joint à l'aide d'un outil adéquat.

● **Reposer le joint d'huile neuf dans le sens indiqué.**

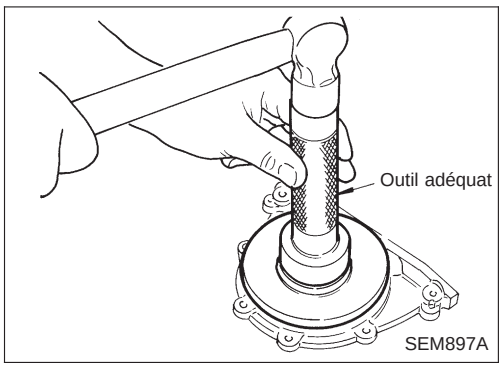


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

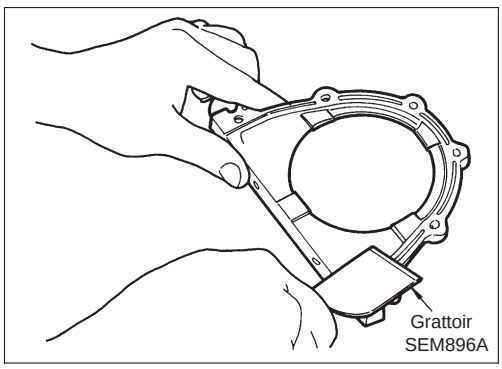
SEM895A

Joint d'huile arrière

1. Déposer le volant-moteur.
2. Déposer la retenue du joint d'huile arrière.
3. Séparer le joint d'huile arrière de la retenue.



- **Prendre garde à ne pas rayer la retenue du joint d'huile arrière.**

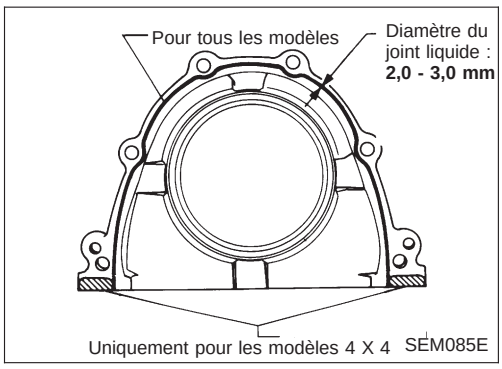


SEM715A

4. Enduire d'huile moteur le nouveau joint d'huile et monter le joint à l'aide d'un outil adéquat.

- **Reposer le joint d'huile neuf dans le sens indiqué.**

SEM897A

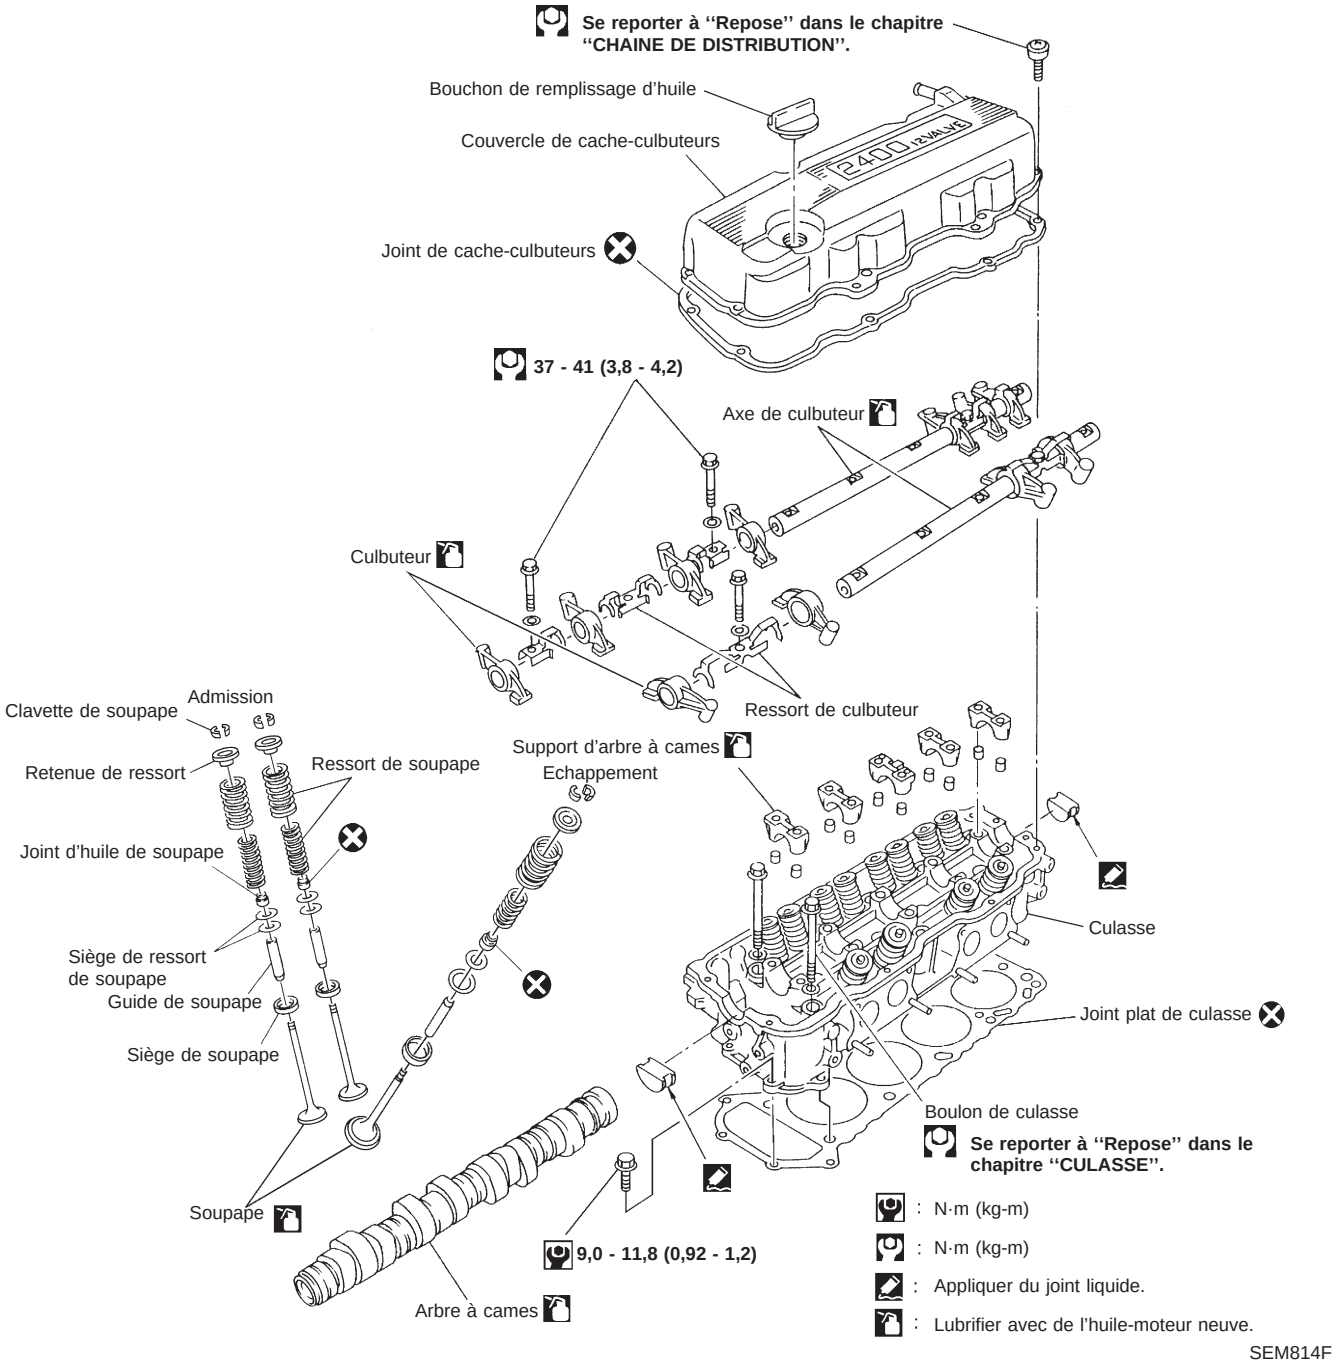


SEM896A

5. Reposer la retenue du joint d'huile arrière.

a. Avant de reposer la retenue de joint d'huile arrière, enlever toute trace de joint liquide de la surface d'appui à l'aide d'un grattoir.

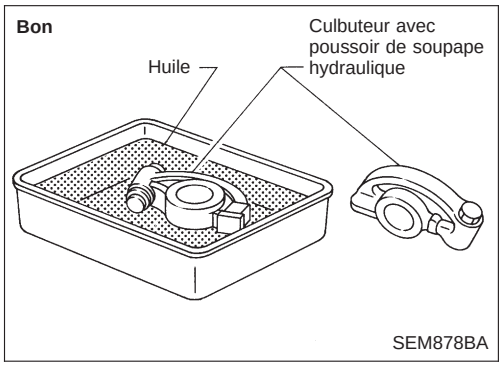
- **Enlever également toute trace de joint liquide de la surface d'appui du bloc-cylindres.**



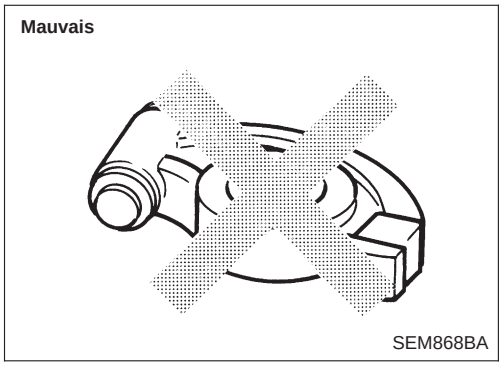
SEM085E

b. Appliquer un cordon uniforme de joint liquide sur la surface d'appui de la retenue du joint d'huile arrière.

- **Utiliser le joint liquide d'origine ou un produit équivalent.**
- **Appliquer le joint liquide sur la surface intérieure des trous de boulons.**



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



SEC. 111•130

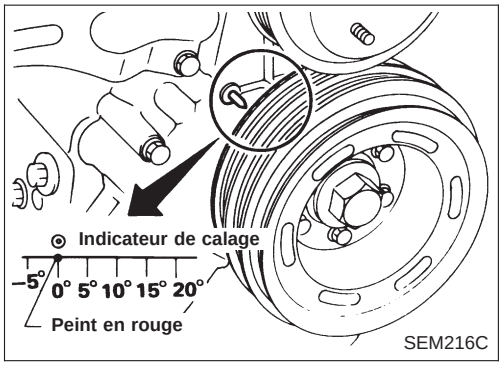
SEM814F

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Joint d'huile arrière

ATTENTION :

- **Lors de la repose des culbuteurs, de l'arbre à cames et du joint d'huile, lubrifier les surfaces de contact avec de l'huile moteur neuve.**
- **Lors du serrage des boulons de culasse et des boulons d'axe de culbuteurs, lubrifier les filetages des boulons et les surfaces d'appui avec de l'huile moteur neuve.**
- **Des poussoirs de soupape hydraulique sont montés sur chaque culbuteur. Si le poussoir de soupape hydraulique est posé sur le côté, l'air risque de pénétrer à l'intérieur, même s'il est monté sur un culbuteur. Lors de la dépose des culbuteurs, les poser en position droite ou les plonger dans un bain d'huile moteur neuve.**
- **Ne pas démonter les poussoirs de soupape hydrauliques.**
- **Attacher des étiquettes sur les poussoirs de soupape afin de ne pas les mélanger par la suite.**

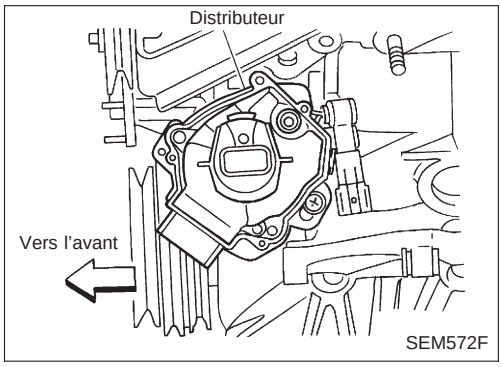


Dépose

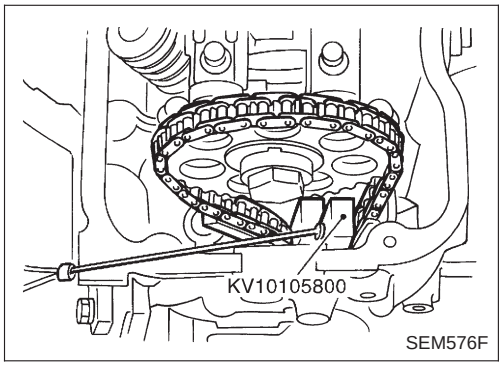
1. Relâcher la pression d'alimentation. Se reporter à la section EC (''Décharge de la pression d'alimentation'').
2. Vidanger le liquide de refroidissement du radiateur et du bouchon de vidange du bloc-moteur.
3. Déposer les pièces suivantes.

- Courroie d'entraînement de la direction assistée
- Pompe de direction assistée, poulie intermédiaire et supports de direction assistée
- Flexibles de dépression de vanne de commande de tourbillon et d'électrovanne de commande de pression
- Support de câble d'accélérateur

4. Déposer les boulons fixant le collecteur primaire d'admission au collecteur d'admission.
5. Déposer les boulons fixant le collecteur d'admission à la culasse en levant le collecteur vers le haut.
6. Déposer le couvercle du collecteur d'échappement et le collecteur d'échappement.
7. Déposer le cache-culbuteurs.

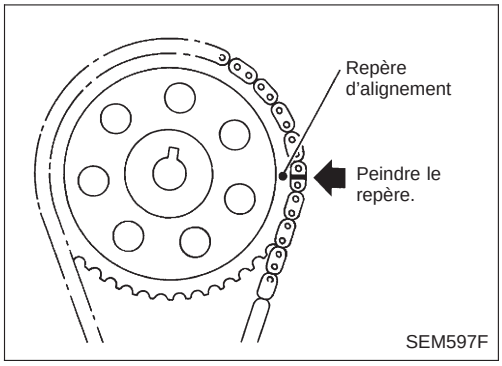


- **Lors de la dépose du cache-culbuteurs, ne pas heurter celui-ci contre le culbuteur.**

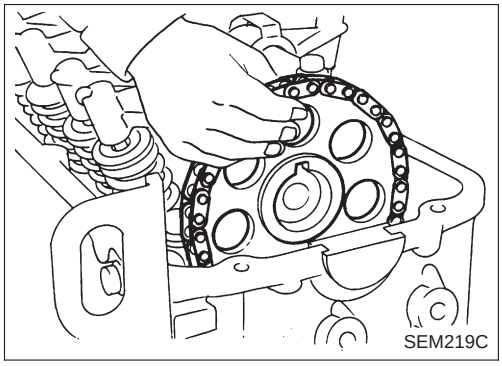


8. Placer le piston n° 1 à son P.M.H. dans sa course de compression.

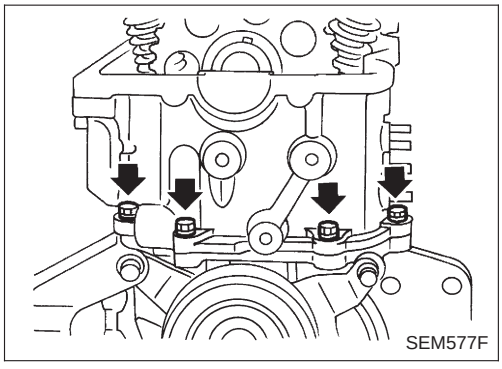
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Dépose (Suite)

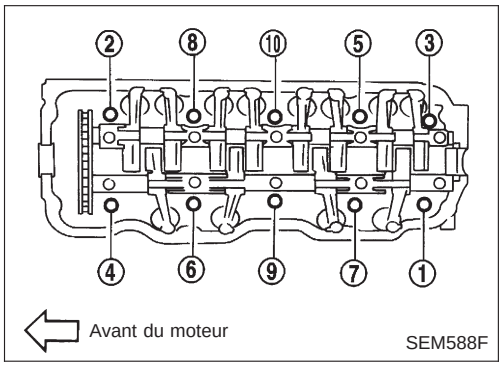


- S'assurer que le cylindre n° 1 est au P.M.H. en observant la position du rotor de distributeur.



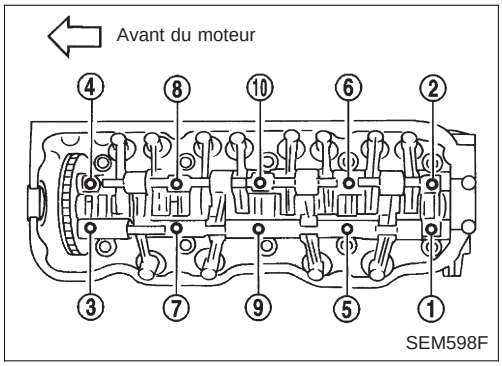
9. Desserrer le boulon de roue dentée d'arbre à cames.
- Maintenir la chaîne de distribution à l'aide d'un outil spécial comme indiqué sur la figure.

10. Tracer des repères à la peinture sur la chaîne de distribution correspondant aux repères d'alignement sur la roue dentée d'arbre à cames.



11. Déposer la roue dentée d'arbre à cames.

12. Déposer le couvercle de distribution avant des boulons de la culasse.

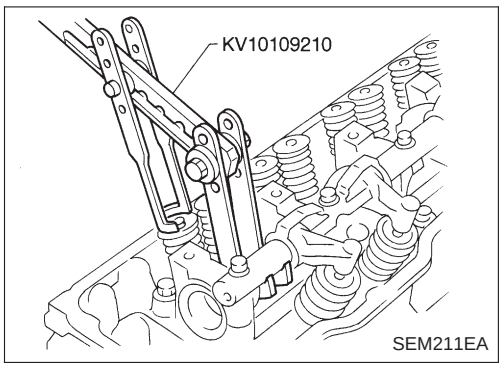


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

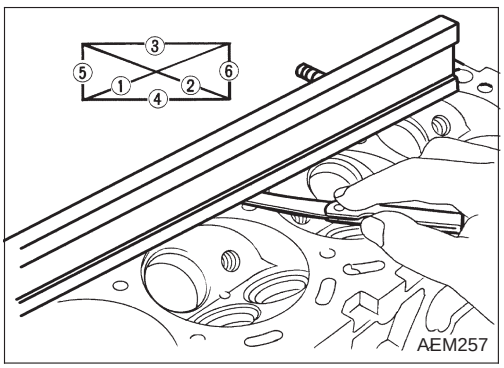
Dépose (Suite)

13. Déposer la culasse.
- **Desserrer en ordre numérique.**
- **Une dépose dans l'ordre incorrect peut entraîner une déformation ou une fêlure de la culasse.**
- **Desserrer les boulons de la culasse en deux ou trois étapes.**

Démontage



1. Déposer l'axe des culbuteurs.



a. Lors du desserrage des boulons, les desserrer de façon égale en partant de l'extérieur, et en séquence.

b. Les boulons doivent être desserrés en deux ou trois étapes.

2. Déposer l'arbre à cames.
- **Avant de déposer l'arbre à cames, mesurer son jeu axial (consulter ''Inspection'').**

3. Déposer les composants de la soupape à l'aide de l'outil spécial.
4. Déposer les joints d'huile de soupape (se reporter à ''REMPLACEMENT DES JOINTS D'HUILE'', EM-21).

Inspection

DEFORMATION DE LA CULASSE

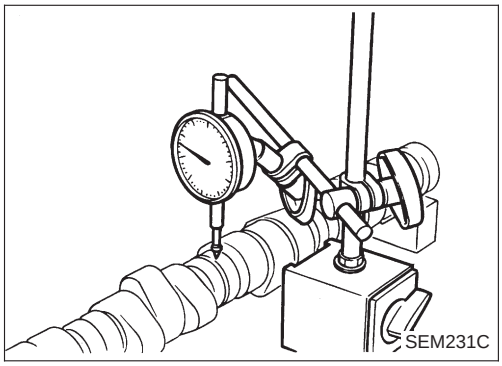
- Nettoyer la surface de la culasse.
- Utiliser une règle et une jauge d'épaisseur fiables pour contrôler la planéité de la surface de culasse.
- Effectuer le contrôle dans les six positions indiquées sur la figure.

Planéité de la surface de culasse : mm
Standard
Moins de 0,03
Limite
0,1

Si la culasse n'est pas plane, la remplacer ou la rectifier.

Limite de rectification :
La limite de rectification de la culasse est déterminée par celle du bloc-cylindres.
La quantité de rectification de la culasse est ''A''
La quantité de rectification du bloc-cylindres est ''B''
La limite maximum est la suivante :
A + B = 0,2 mm

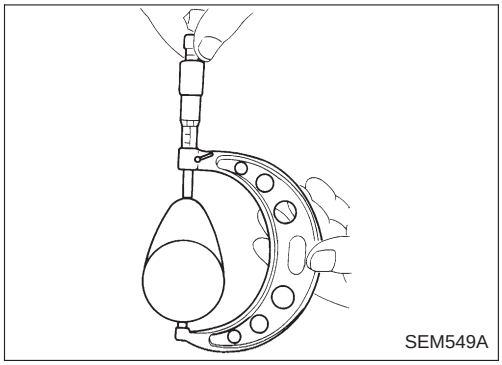
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Inspection (Suite)

Après avoir rectifié la culasse, s'assurer que l'arbre à cames peut être tourné librement à la main. Si une résistance est ressentie, la culasse doit être remplacée.

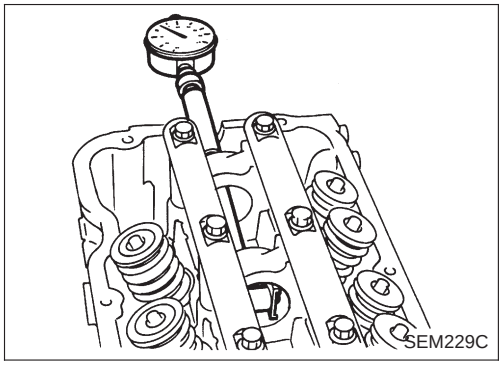
Hauteur nominale de la culasse :
98,8 - 99,0 mm



VERIFICATION VISUELLE DE L'ARBRE A CAMES

Vérifier si l'arbre à cames ne présente pas des traces de rayures, de grippage et d'usure.

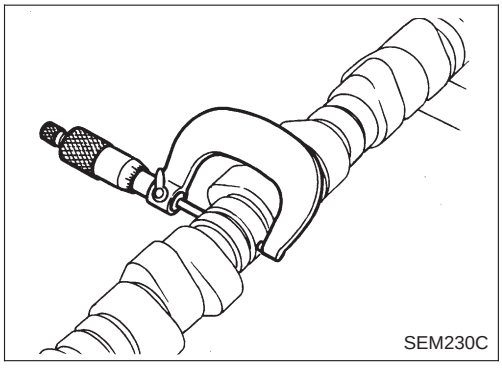
SEM231C



VOILE DE L'ARBRE A CAMES

1. Mesurer le voile de l'arbre à cames au tourillon central.
   Voile (indication totale du comparateur) :
   0 - 0,02 mm
2. Si la lecture excède la limite, remplacer l'arbre à cames.

SEM549A

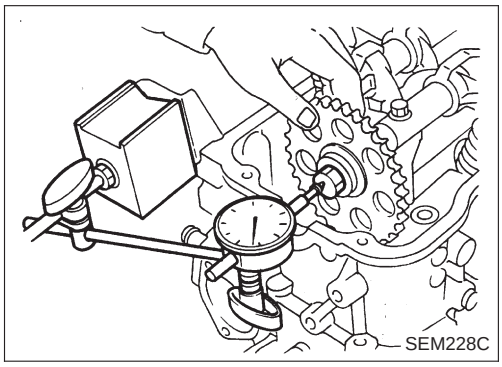


HAUTEUR DES CAMES DE L'ARBRE A CAMES

1. Mesurer la hauteur des cames de l'arbre à cames.
   Hauteur standard des cames :
   44,43 - 44,58 mm
   Limite d'usure de la hauteur de came :
   0,2 mm
2. Si l'usure dépasse la limite, remplacer l'arbre à cames.

SEM229C

JEU DU TOURILLON D'ARBRE A CAMES

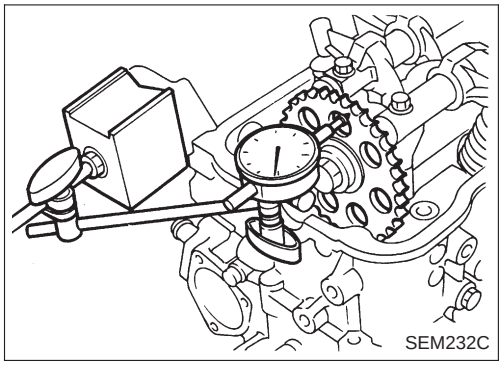


1. Reposer le support d'arbre à cames et l'axe des culbuteurs et serrer les boulons au couple spécifié.
2. Mesurer le diamètre intérieur du palier d'arbre à cames.
   Diamètre intérieur standard :
   33,000 - 33,025 mm

SEM230C

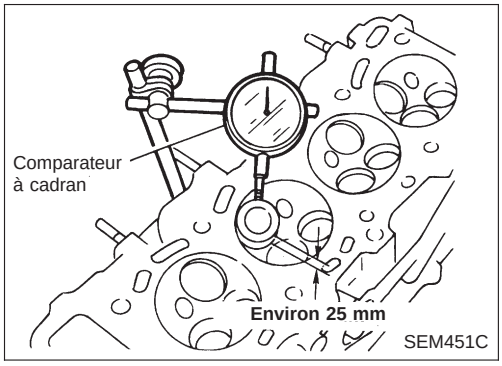
3. Mesurer le diamètre extérieur du tourillon d'arbre à cames.
   Diamètre extérieur standard :
   32,935 - 32,955 mm
4. Si le jeu dépasse la limite, remplacer l'arbre à cames et/ou la culasse.
   Jeu du tourillon d'arbre à cames : mm
   Standard
   0,045 - 0,090
   Limite
   0,12

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



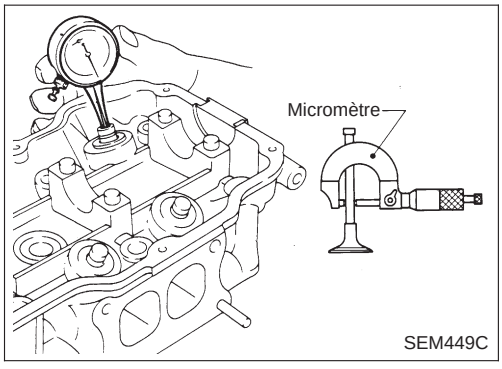
Inspection (Suite)

JEU AXIAL DE L'ARBRE A CAMES



1. Monter l'arbre à cames sur la culasse.
2. Mesurer le jeu axial de l'arbre à cames.
   Jeu axial de l'arbre à cames : mm
   Standard
   0,07 - 0,15
   Limite
   0,2
3. Si le jeu axial dépasse la limite, remplacer l'arbre à cames et remesurer son jeu axial.

- Si le jeu axial dépasse la limite après avoir remplacé l'arbre à cames, remplacer la culasse.



VOILE DE LA ROUE DENTEE D'ARBRE A CAMES

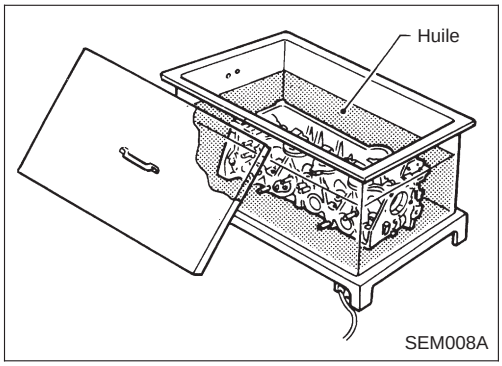
1. Monter la roue dentée sur l'arbre à cames.
2. Mesurer le voile de la roue dentée d'arbre à cames.
   Voile (indication totale du comparateur) :
   Limite 0,12 mm
3. Si la lecture excède la limite, remplacer la roue dentée d'arbre à cames.

JEU DU GUIDE DE SOUPAPE

1. Mesurer la déflexion de la soupape comme indiqué sur la figure (l'usure de la soupape et du guide de soupape se produit surtout dans ce sens).
   Limite de déflexion de la soupape (indication du comparateur à cadran) :
   0,15 mm

2. Si la lecture trouvée excède la limite, vérifier le jeu entre la soupape et le guide de soupape.

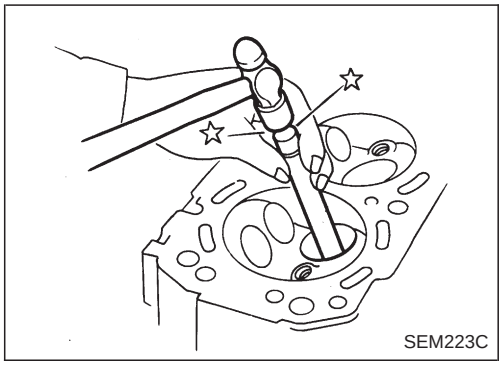
a. Mesurer le diamètre de la queue de soupape et le diamètre intérieur du guide de soupape.
b. Vérifier que le jeu mesuré est dans la fourchette de tolérance.
   Jeu entre la soupape et le guide de soupape = diamètre interne du guide de soupape − diamètre de queue de soupape : mm
   Standard
   Admission
   0,020 - 0,053



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

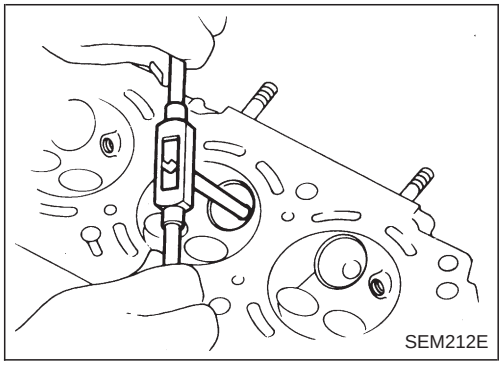
Inspection (Suite)

Echappement
0,040 - 0,070
Limite 0,1

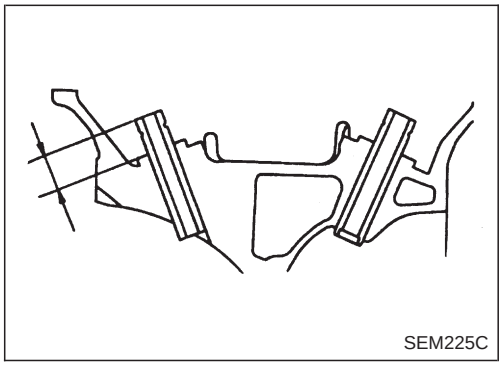


c. Si le jeu mesuré excède la limite, remplacer la soupape, puis remesurer le jeu.

- Si le jeu dépasse toujours la limite après avoir remplacé la soupape, remplacer le guide de soupape.



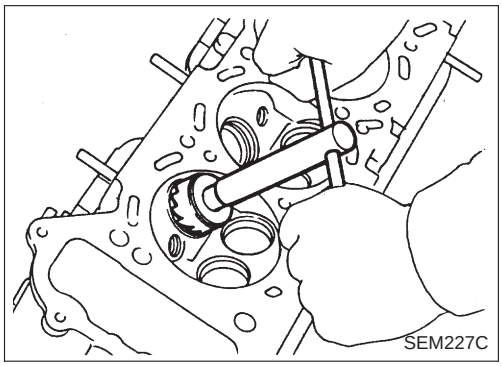
REMPLACEMENT DU GUIDE DE SOUPAPE



1. Pour déposer le guide de soupape, chauffer la culasse à une températures de 110 à 130°C.

2. Chasser le guide de soupape à l'aide d'un maillet et d'un outil adéquat ou encore d'une presse [sous une pression de 20 kN (2 tonnes)].

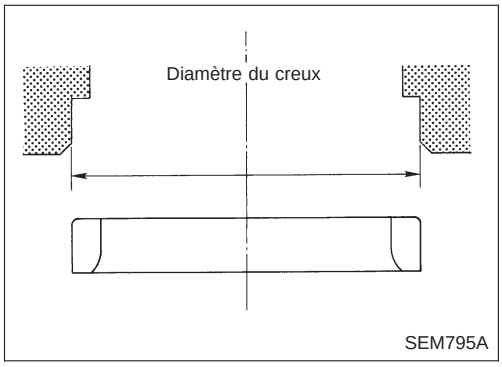
3. Réaléser le trou du guide de soupape dans la culasse.
Diamètre du trou de guide de soupape (pour pièces pour l'entretien) : mm
Admission
11,175 - 11,196
Echappement
12,175 - 12,196



4. Chauffer la culasse à une température de 110 à 130°C et adapter à la presse le guide de soupape dans la culasse.
Partie en saillie "L" :
14,9 - 15,1 mm
5. Réaléser le guide de soupape.
Dimension de finition : mm
Admission
7,000 - 7,018
Echappement
8,000 - 8,018

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (Suite)

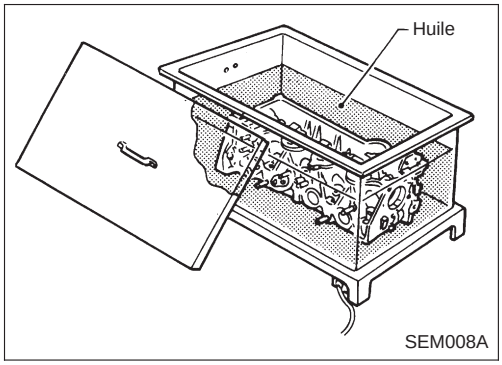


SIEGES DE SOUPAPE

SEM227C

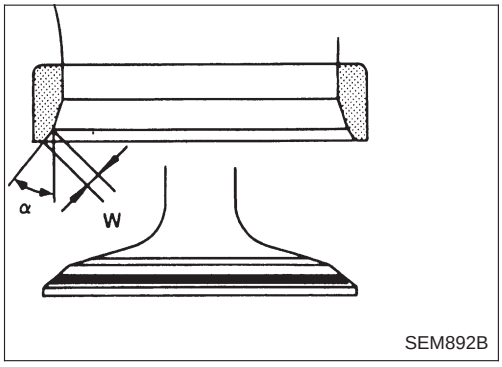
Inspecter les sièges de soupape pour détecter les traces de piqûres sur la surface de contact. Rectifier ou remplacer en cas d'usure excessive.

- **Avant de rectifier les sièges de soupape, vérifier l'usure des soupapes et des guides des soupapes. Si ces pièces sont usées, les remplacer. Puis rectifier le siège de soupape.**
- **Travailler à deux mains pour obtenir une surface rectifiée uniforme.**



REMPLACEMENT DU SIEGE DE SOUPAPE POUR PIECES D'ENTRETIEN

SEM795A

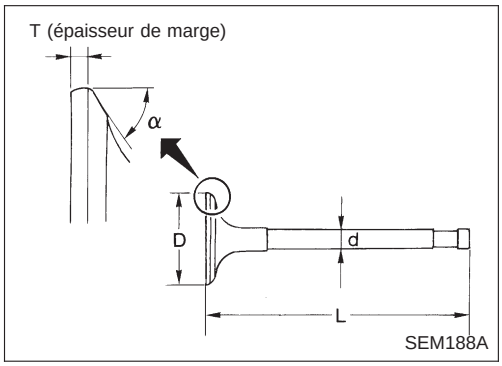


1. Les anciens sièges peuvent être déposés à l'aide d'une perceuse, jusqu'à ce qu'ils s'effritent. Régler la butée de profondeur de la machine de façon à ne pas aléser au delà du fond du creux de siège dans la culasse.
2. Réaléser le creux de la culasse.
   Dimension de réalésage du siège de soupape d'entretien
   Surdimensionné (0,5) : mm
   Admission 36,500 - 36,516
   Echappement 42,500 - 42,516

Utiliser le centre du guide de soupape lors du réalésage pour s'assurer que les sièges s'adapteront correctement.

SEM008A

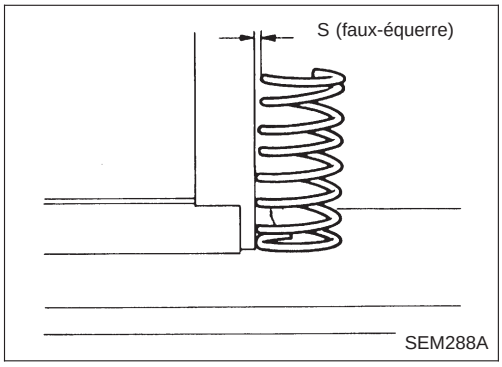
3. Chauffer la culasse à une température de 110 à 130°C.
4. A la presse, monter le siège de soupape jusqu'à ce qu'il soit bien calé dans le fond.



SEM892B

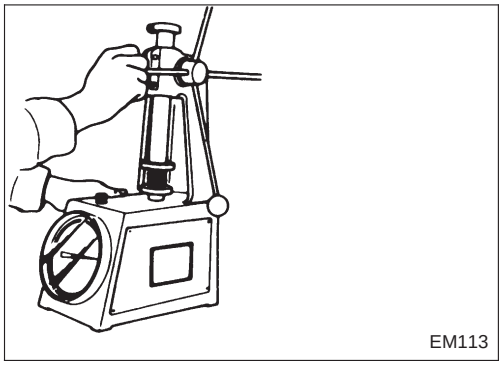
5. A l'aide d'un outil approprié, tailler ou fraiser le siège de soupape à la dimension requise indiquée dans les SDS, EM-94.
6. Après la taille, roder les sièges de soupape avec un composé de rodage.
7. Vérifier l'état des sièges de soupape.
   Angle d'assise "α" :
   45 deg.
   Largeur de contact "W" : mm
   Admission 1,6 - 1,7
   Echappement 1,7 - 2,1

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Inspection (Suite)

DIMENSIONS DES SOUPAPES

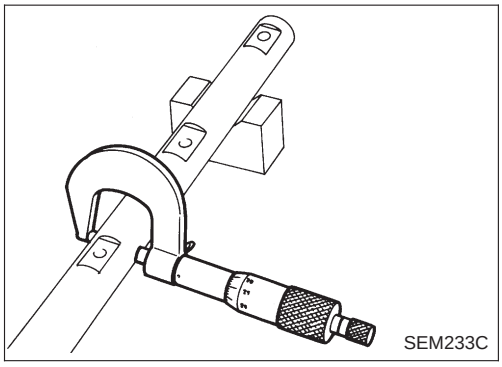


Vérifier les dimensions de chaque soupape. Se reporter aux SDS, EM-95.
Quand la tête de soupape est usée au-delà de la marge d'épaisseur de 0,5 mm, remplacer la soupape.
La tolérance de rectification de la queue de soupape est de 0,2 mm ou moins.

RESSORTS DE SOUPAPE

Equerrage

1. Mesurer la dimension ''S''.
   Faux-équerre ''S'' : mm
   Extérieur
   Admission: moins de 2,5
   Echappement: moins de 2,3
   Intérieur
   Admission: moins de 2,3
   Echappement: moins de 2,1
2. Si la limite est dépassée, remplacer les ressorts.

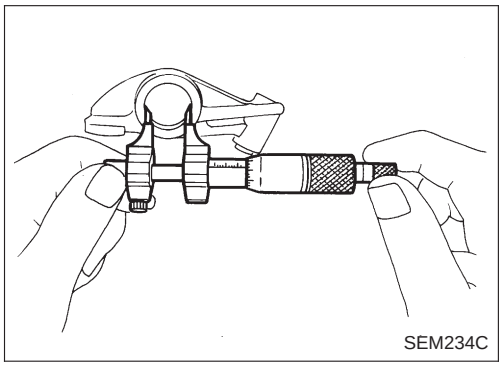


Pression

Vérifier la pression du ressort de soupape à la hauteur de ressort spécifiée.

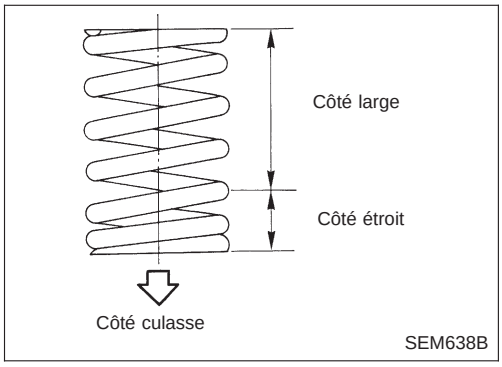
Pression : N (kg) à une hauteur de mm
Standard
Extérieur
Admission 604,1 (61,6) à 37,6
Echappement 640,4 (65,3) à 34,1
Intérieur
Admission 284,4 (29,0) à 32,6
Echappement 328,5 (33,5) à 29,1
Limite
Extérieur
Admission 567,8 (57,9) à 37,6
Echappement 620,8 (63,3) à 34,1
Intérieur
Admission 266,8 (27,2) à 32,6
Echappement 318,7 (32,5) à 29,1

Si la limite est dépassée, remplacer les ressorts.



AXE DE CULBUTEUR ET CULBUTEUR

1. Vérifier si les axes de culbuteurs présentent des traces de rayures, de grippage et d'usure.
2. Vérifier le diamètre extérieur de l'axe de culbuteurs.
   Diamètre :
   21,979 - 22,000 mm



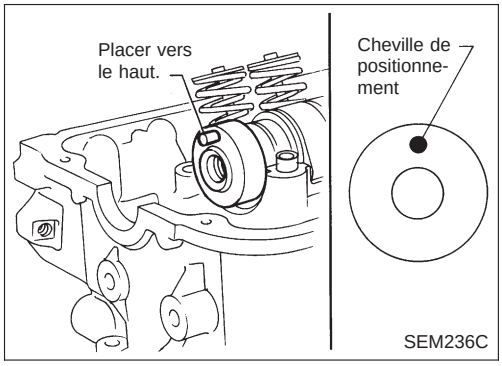
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (Suite)

SEM234C

3. Contrôler le diamètre intérieur du culbuteur.
   Diamètre :
   22,012 - 22,029 mm
   Jeu entre culbuteur et axe :
   0,012 - 0,050 mm

- **Lors de la vérification, maintenir le culbuteur avec le poussoir de soupape hydraulique en position verticale pour empêcher l'air de pénétrer dans le poussoir de soupape hydraulique.**

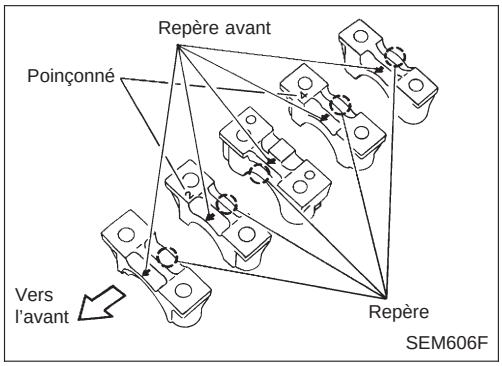


SEM638B

Remontage

1. Monter les composants de la soupape.

- **Toujours utiliser un joint d'huile de soupape neuf. Se reporter au titre ''REMPLACEMENT DU JOINT D'HUILE''.**
- **Avant de reposer le joint d'huile de soupape, reposer le siège de ressort intérieur de soupape.**
- **Reposer le ressort extérieur de soupape (à spires inégales), avec le côté étroit tourné vers la culasse.**
- **Après avoir assemblé les composants de la soupape, utiliser un maillet à tête plastique pour frapper légèrement l'extrémité de la queue de soupape afin d'assurer un montage correct.**

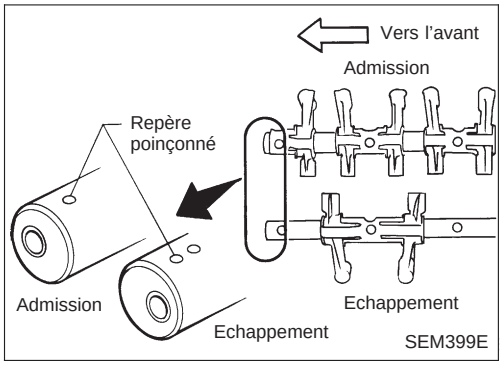


SEM236C

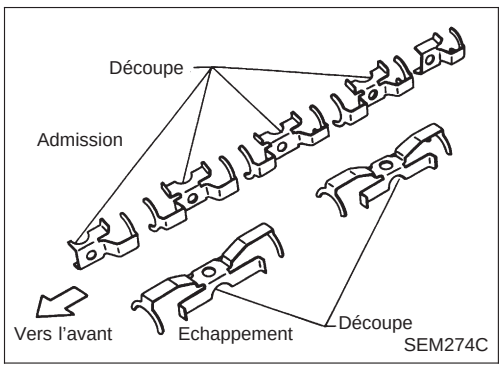
2. Reposer l'arbre à cames en dirigeant la cheville de positionnement vers l'avant du moteur et en la plaçant vers le haut.

- **Appliquer de l'huile moteur sur l'arbre à cames lors de son montage dans la culasse.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

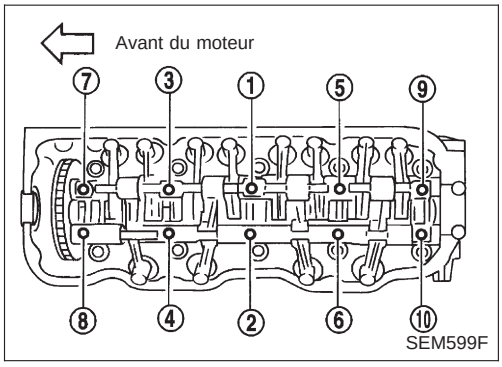


Remontage (Suite)



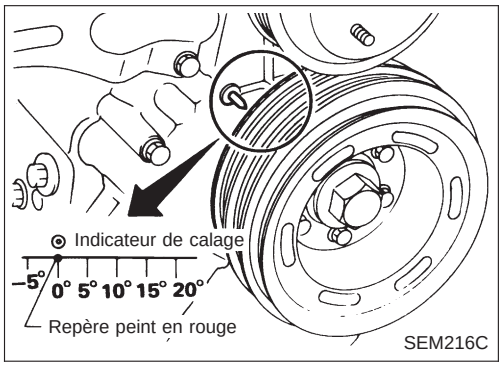
3. Reposer les supports d'arbre à cames.

- **Le repère avant est poinçonné sur le support d'arbre à cames.**



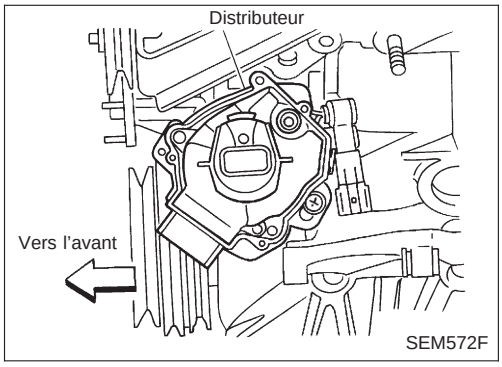
Emplacement (en partant de l'avant)	Identification	
	Repère	Poinçonné
N° 1	51	–
N° 2	52	2
N° 3	53	–
N° 4	52	4
N° 5	55	–

4. Reposer l'axe des culbuteurs avec les culbuteurs.

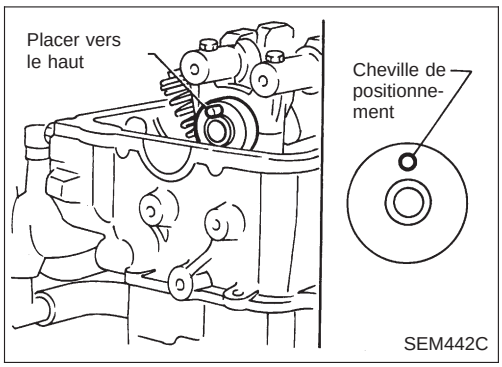


- Poser la retenue avec la découpe orientée dans la direction indiquée sur la figure ci-contre.

5. Serrer les boulons comme indiqué sur la figure ci-à gauche.

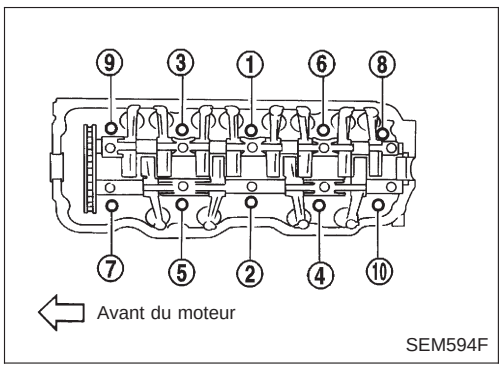


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Repose

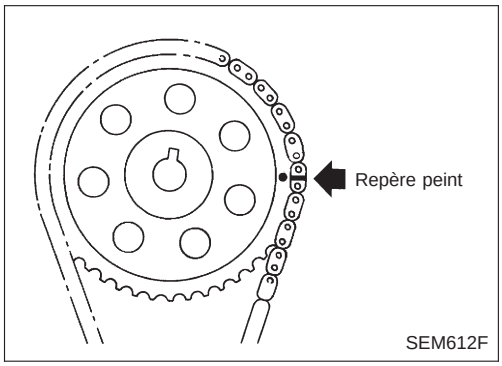
1. Mettre le piston n° 1 au P.M.H. de sa course de compression, de la manière suivante :



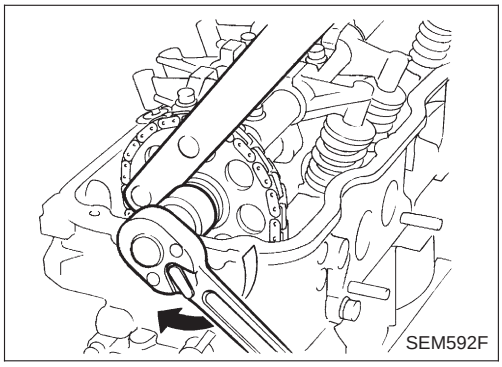
a. Aligner le repère de la poulie de vilebrequin sur la position ‘‘0°’’ et confirmer que la tête du rotor du distributeur est positionnée comme indiqué ci-contre.

b. Vérifier que la cheville de positionnement de l’arbre à cames est placée vers le haut.

2. Reposer la culasse avec le joint plat neuf et serrer les boulons de culasse dans l’ordre numérique.



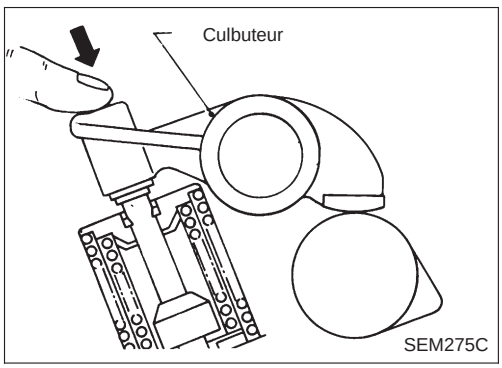
- **Ne pas faire tourner le vilebrequin et l’arbre à cames séparément, car les soupapes heurteraient les têtes de piston.**
- **Procédure de serrage**



a. Serrer tous les boulons à un couple de 29 N·m (3,0 kg-m).
b. Serrer tous les boulons à un couple de 78 N·m (8,0 kg-m).
c. Desserrer entièrement tous les boulons.
d. Serrer tous les boulons à un couple de 25 à 34 N·m (2,5 à 3,5 kg-m).
e. Tourner tous les boulons de 80^{+5}_{-0} degrés dans le sens des aiguilles d’une montre à l’aide d’une clé angulaire. Si l’on ne dispose pas d’une clé angulaire, serrer tous les boulons à un couple de 74 à 83 N·m (7,5 à 8,5 kg-m).

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

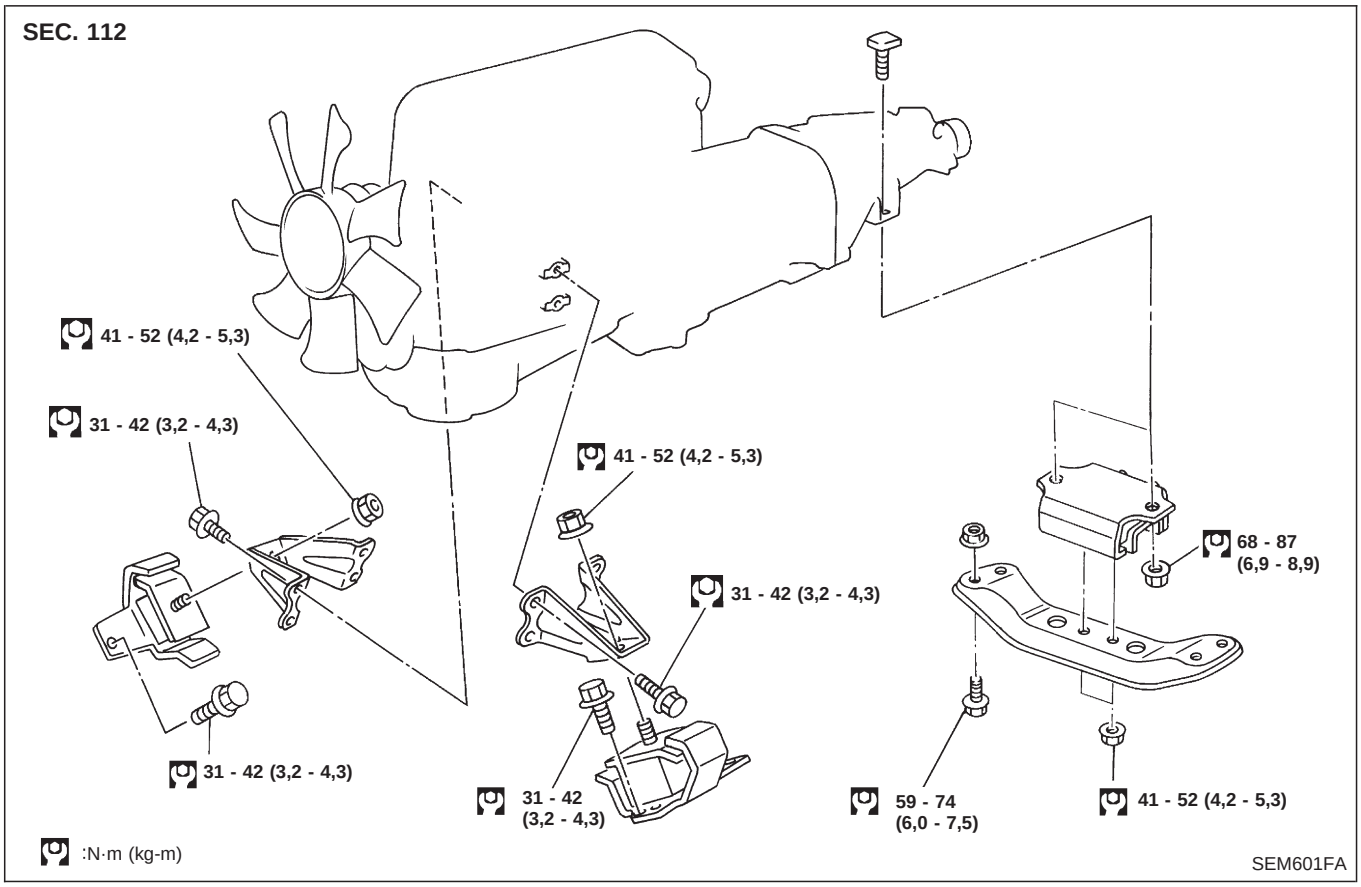
Repose (Suite)



3. Monter la chaîne sur la roue dentée d'arbre à cames en alignant tous les repères. Puis reposer la roue dentée d'arbre à cames sur l'arbre à cames.

4. Serrer le boulon de roue dentée d'arbre à cames.

5. Reposer les bouchons en caoutchouc. Se reporter à CHAINE DE DISTRIBUTION, EM-20.

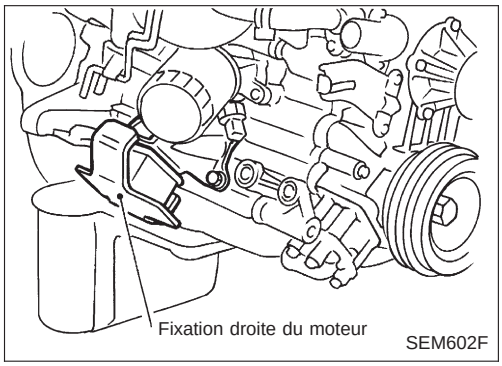


6. Vérifier le poussoir de soupape hydraulique.
a. Enfoncer le poussoir de soupape hydraulique avec les doigts.
- **S'assurer que la vérification s'effectue avec le culbuteur en position libre.**

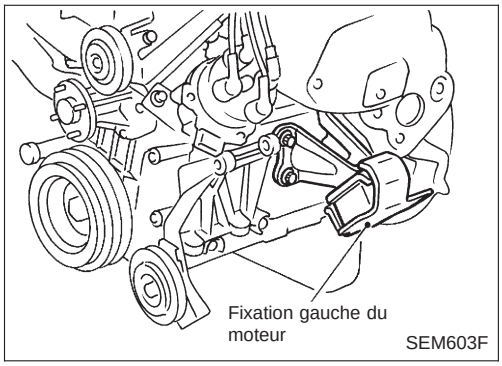
b. Si le poussoir de soupape se déplace de plus d'1 mm, cela signifie que de l'air est à l'intérieur.
c. Purger l'air en faisant tourner le moteur à 1 000 tr/mn à vide pendant 20 minutes.
d. Si les poussoirs de soupape hydrauliques font encore du bruit, les remplacer et purger l'air en procédant comme indiqué à l'étape c.
7. Reposer le cache-culbuteurs. Se reporter à CHAINE DE DISTRIBUTION, EM-20.
- **S'assurer qu'il n'y a pas d'interférence entre le culbuteur et le cache-culbuteurs.**

8. Reposer les collecteurs d'admission et d'échappement. Se reporter à ''COMPOSANTS EXTERNES'', à la page EM-8.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



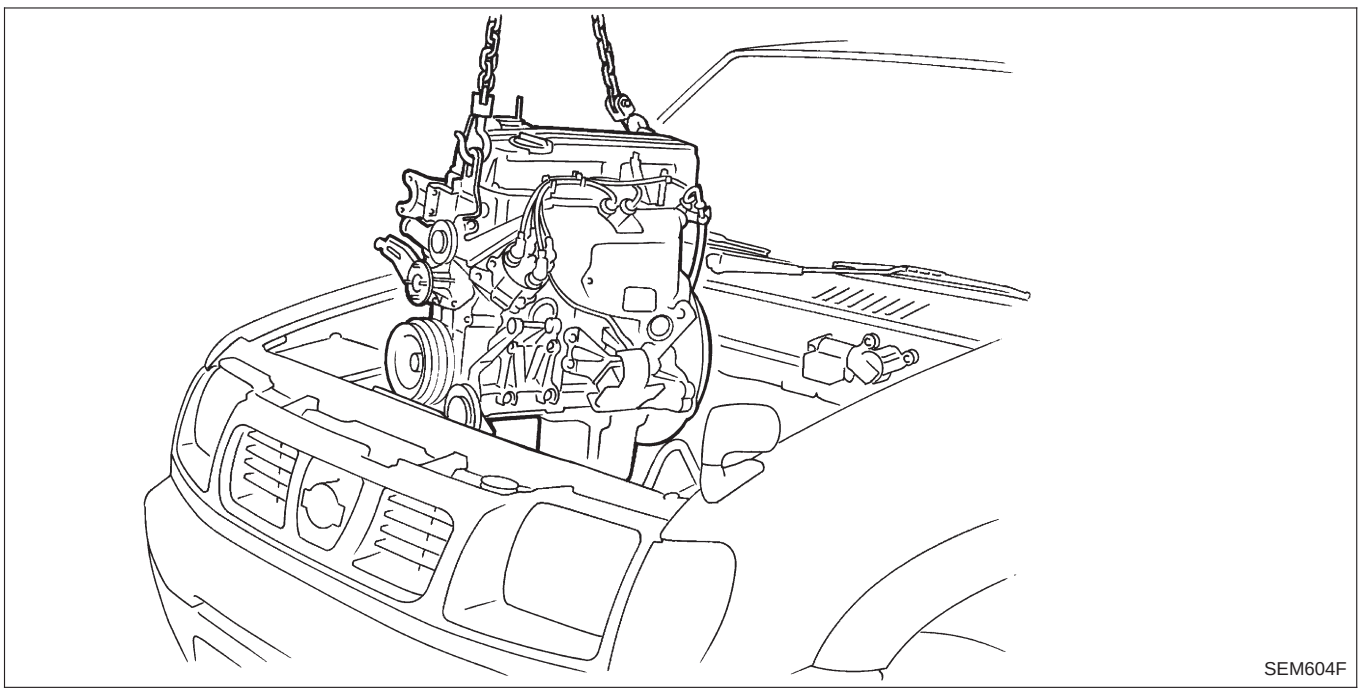
AVERTISSEMENT :



- **Garer le véhicule sur un sol plat et dur.**
- **Placer des cales à l'avant et à l'arrière des roues arrière.**
- **Ne pas déposer le moteur tant que le circuit d'échappement n'a pas complètement refroidi.**
  Faute de quoi, on risque de se brûler et/ou de provoquer un incendie dans la conduite de carburant.
- **Avant de déconnecter le flexible d'alimentation, détendre la pression d'alimentation. Se reporter à la section EC (''Détente de la pression d'alimentation'').**
- **Veiller à soulever le moteur et la boîte de vitesses en toute sécurité.**
- **Pour les moteurs qui ne sont pas équipés d'élingues de levage moteur, utiliser les élingues et les boulons de levage appropriés décrits dans le CATALOGUE DES PIECES DETACHEES.**

ATTENTION :

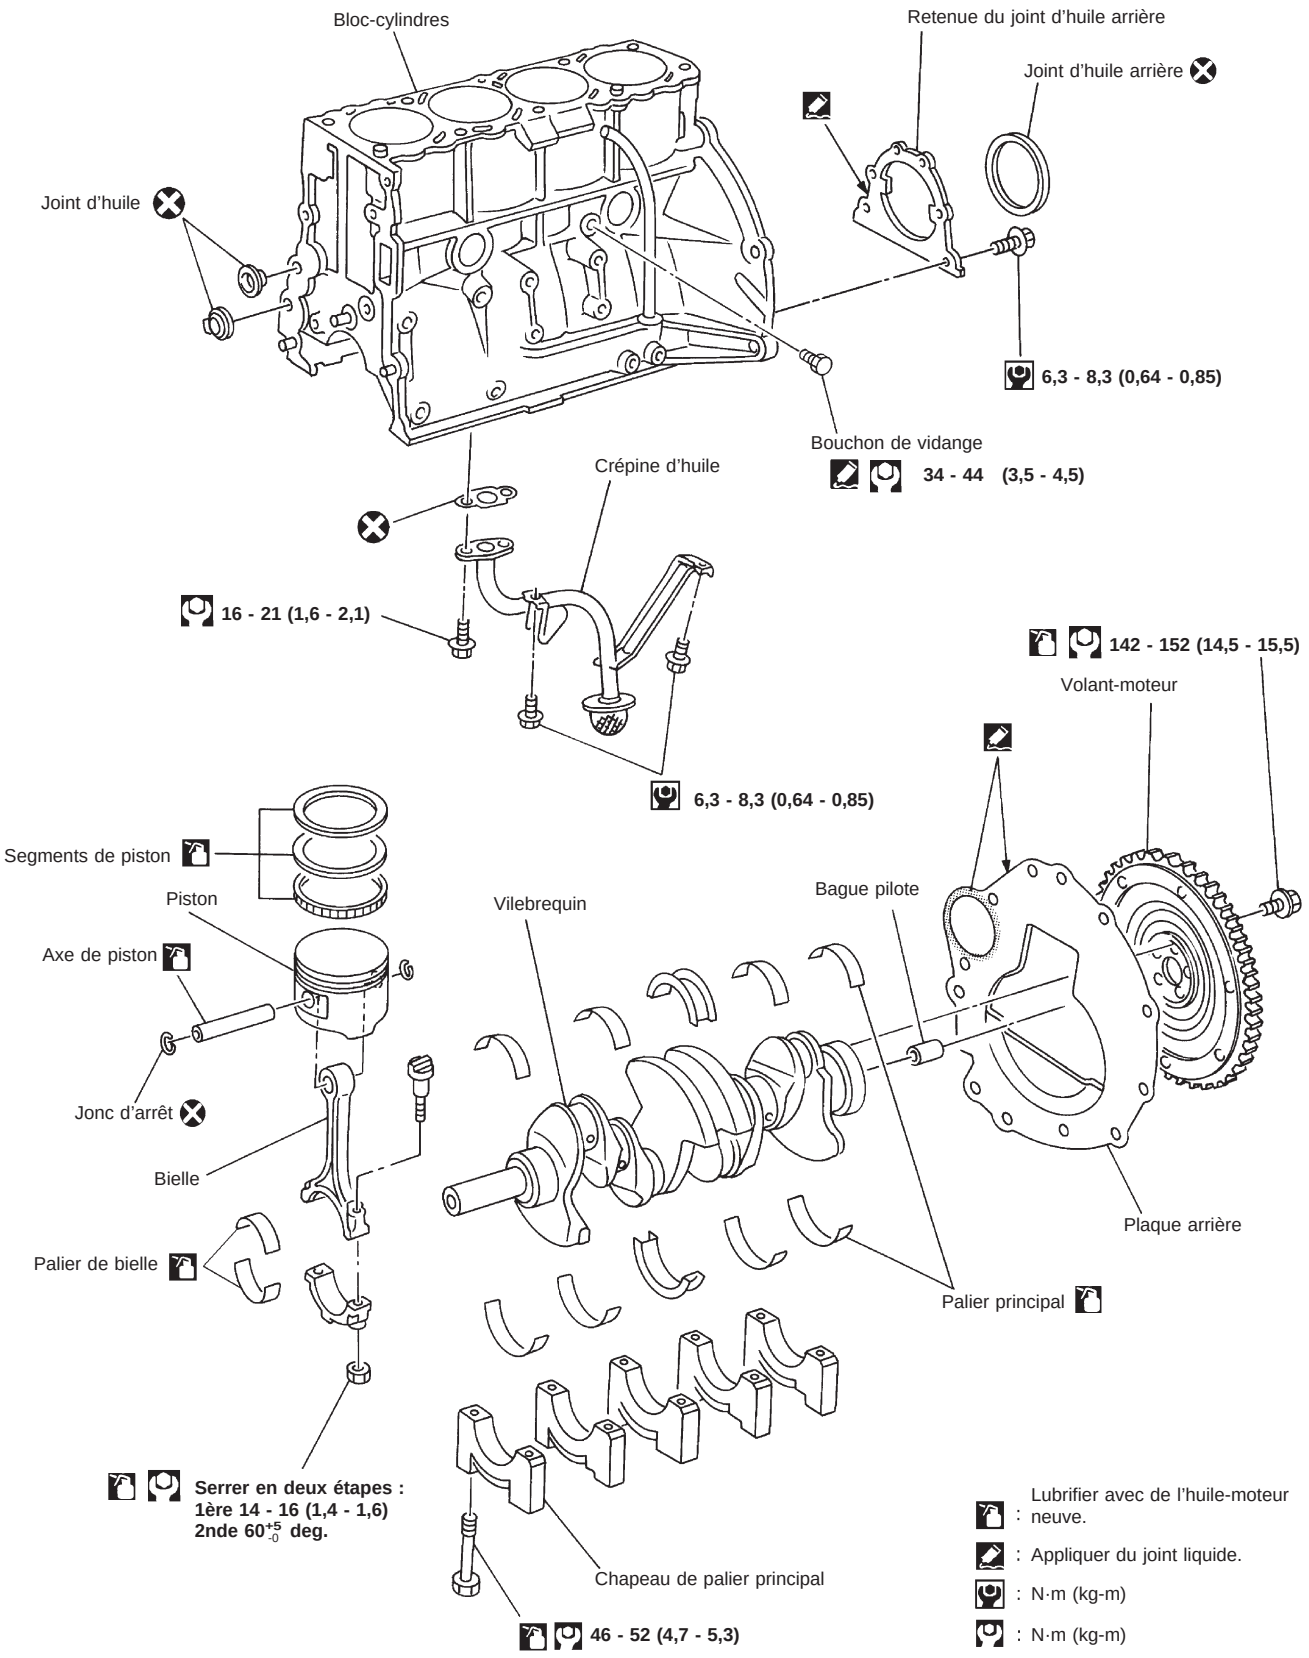
- **Lors du levage du moteur, veiller à ne pas heurter les pièces environnantes. Prendre particulièrement soin de la gaine du câble d'accélérateur, des conduites de frein et du maître-cylindre de frein.**
- **Lorsque l'on soulève le moteur, toujours utiliser les élingues en toute sécurité.**
- **Pour les modèles à 4 roues motrices, appliquer un joint d'étanchéité entre le moteur et la transmission. Se reporter à la section MT (''Dépose et repose'').**



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Dépose

1. Vidanger le liquide de refroidissement du bloc-moteur et du radiateur. Se reporter à la section MA (‘‘Remplacement du liquide de refroidissement moteur’’ au chapitre ‘‘ENTRETIEN DU MOTEUR’’).
2. Détendre la pression d’alimentation. Se reporter à la section EC (‘‘Détente de la pression d’alimentation’’).
3. Déposer le câble négatif de la batterie.
4. Déposer le capot. Se reporter à la section BT.
5. Déposer les courroies d’entraînement de direction assistée, d’alternateur et de compresseur de C/A.
6. Déposer le radiateur. Se reporter à la section LC (‘‘Radiateur’’, ‘‘CIRCUIT DE REFROIDISSEMENT DU MOTEUR’’).
7. Déposer le protecteur de chaleur du collecteur d’échappement.
8. Débrancher le circuit d’échappement du collecteur d’échappement.
9. Déverser le liquide de refroidissement. Se reporter à la section HA (‘‘Procédure d’entretien R-134a’’, ‘‘PROCEDURES D’ENTRETIEN’’).
10. Débrancher les conduites de liquide de refroidissement. Se reporter à la section HA (‘‘Canalisations de réfrigération’’, ‘‘PROCEDURES D’ENTRETIEN’’).
11. Débrancher le câble d’accélérateur, les flexibles à dépression, les connecteurs électriques, les flexibles de chauffage et le flexible de servo à dépression.
12. Déposer les quatre boulons de la pompe de direction assistée.
13. Déposer la boîte de vitesses. Se reporter à la section MT (‘‘Dépose’’ au chapitre ‘‘DEPOSE ET REPOSE’’).
14. Déposer les fixations du moteur gauche et droite.
15. Déposer le moteur.

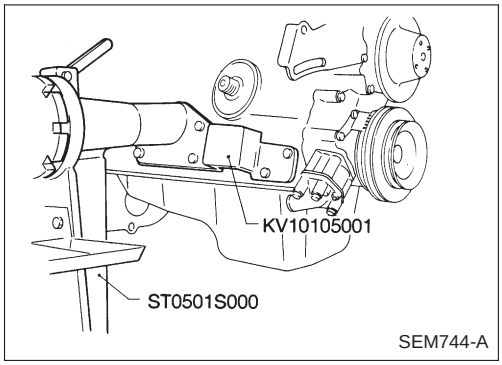


Repose

- Reposer dans l’ordre inverse de la dépose.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SEC. 110•120•135•150•210

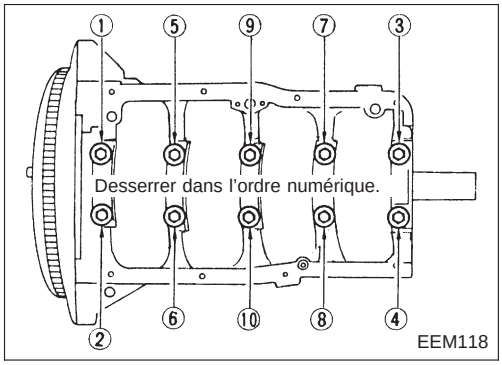


SEM812F

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

ATTENTION :

- **Lors de la repose de pièces coulissantes (paliers, pistons, etc.), lubrifier les surfaces de contact avec de l'huile moteur neuve.**
- **Lors de la dépose des pièces telles que paliers et chapeaux de palier, ranger les pièces démontées dans l'ordre et le sens corrects.**
- **Lors de la repose des écrous de bielle et des boulons de chapeau de palier principal, appliquer de l'huile moteur neuve sur les filetages et surfaces d'assise.**
- **Ne laisser aucun matériau magnétique venir en contact avec les dents de la couronne du volant-moteur ou avec le plateau d'entraînement.**



SEM744-A

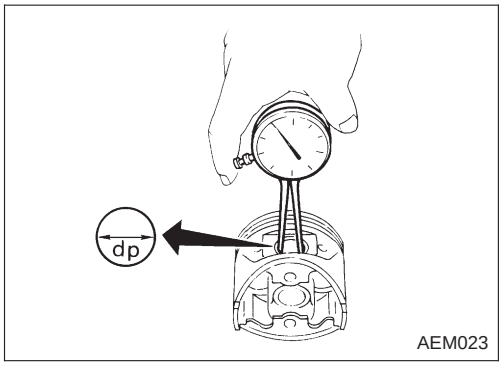
Démontage

PISTON ET VILEBREQUIN

1. Déposer le collecteur d'admission.
2. Poser le moteur sur un plan de travail.
3. Vidanger le liquide de refroidissement et l'huile.
4. Déposer le carter d'huile.
5. Déposer la pompe à eau.
6. Déposer la chaîne de distribution.
7. Déposer la culasse.
8. Déposer les pistons avec la bielle.

EEM118

9. Déposer les chapeaux de paliers et le vilebrequin.

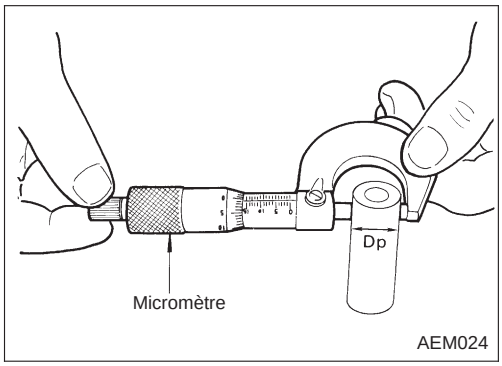


- **Avant de déposer les chapeaux de paliers, mesurer le jeu axial du vilebrequin. Se reporter à EM-47.**
- **Les boulons doivent être desserrés en deux ou trois étapes.**

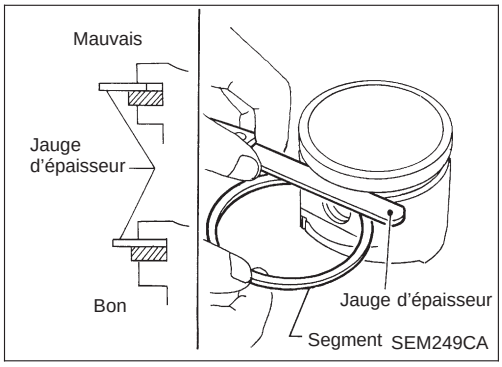
Inspection

JEU ENTRE LE PISTON ET L'AXE DE PISTON

1. Mesurer le diamètre intérieur du trou de l'axe de piston ''dp''.



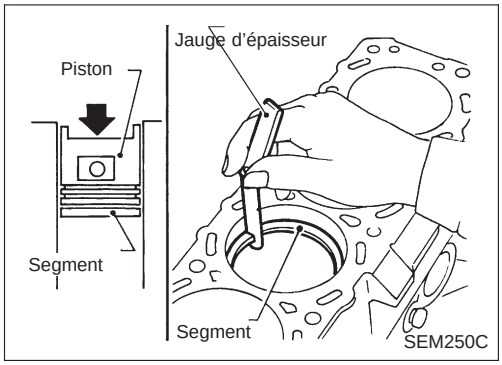
Diamètre standard ''dp'' :
21,002 - 21,008 mm



AEM023

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (Suite)

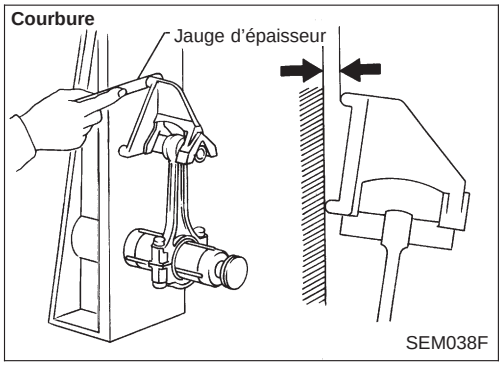


2. Mesurer le diamètre extérieur de l'axe de piston ''Dp''.
   Diamètre standard ''Dp'' :
   20,993 - 20,998 mm
3. Calculer le jeu de l'axe de piston.
   dp − Dp = 0,008 - 0,012 mm
   En cas de dépassement de ces valeurs, remplacer le piston avec l'axe.

JEU LATERAL DU SEGMENT DE PISTON

Jeu latéral : mm
Segment de feu 0,01 - 0,03
Segment de compression 0,03 - 0,07
Segment racleur 0,085 - 0,115
Limite maximum de jeu latéral :
0,1 mm

Remplacer les segments si la valeur n'est pas conforme aux spécifications.
Si le jeu dépasse la limite maximum avec un segment neuf, remplacer le piston.

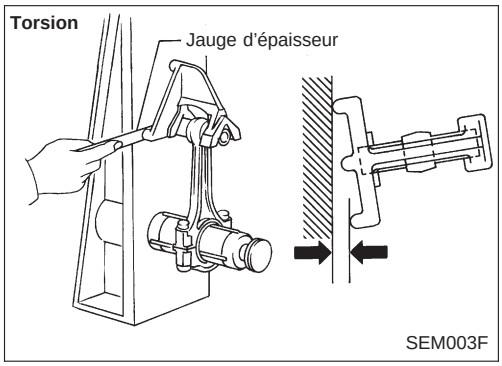


COUPE DE SEGMENT DE PISTON

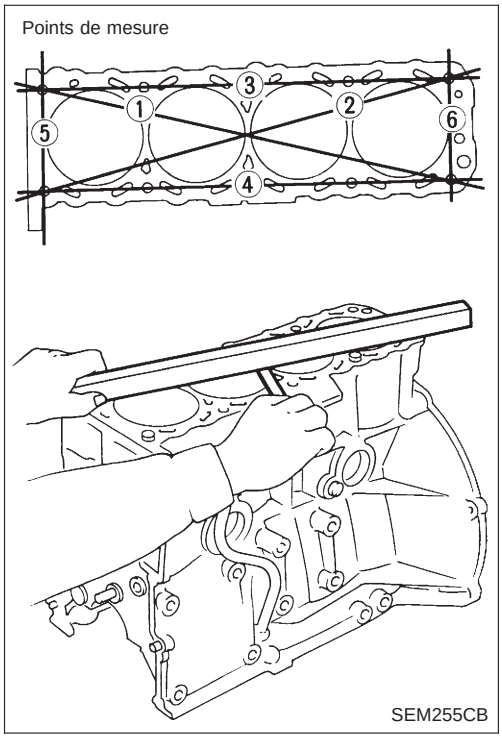
Coupe de segment : mm
Segment de feu
0,28 - 0,43
Segment de compression
0,45 - 0,60
(R ou T est poinçonné sur le segment).
0,55 - 0,70
(N est poinçonné sur le segment).
Segment racleur
0,20 - 0,60
Limite maximum de coupe de segment :
0,5 mm

Remplacer les segments si la valeur n'est pas conforme aux spécifications. Si le jeu dépasse la limite maximum avec un segment neuf, réaléser le cylindre et utiliser un piston et des segments surdimensionnés. Se reporter aux SDS, EM-97.

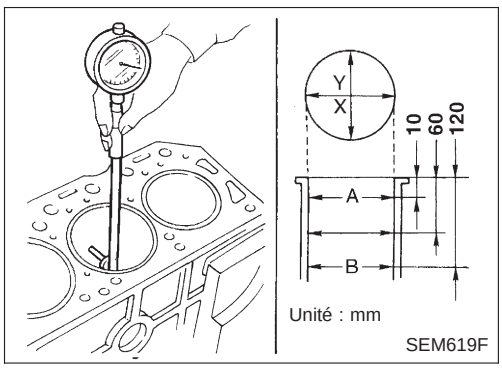
- Lors du remplacement du piston, vérifier que la surface du bloc-cylindres ne présente pas de traces de griffures ou de grippage. Si des traces de griffures ou de grippage sont évidentes, poncer l'alésage de cylindre ou remplacer le bloc-cylindres.



COURBURE ET TORSION DES BIELLES



Courbure : mm
Limite 0,15 par longueur de 100
Torsion : mm
Limite 0,3 par longueur de 100



En cas de dépassement de ces valeurs, remplacer l'ensemble de la bielle.

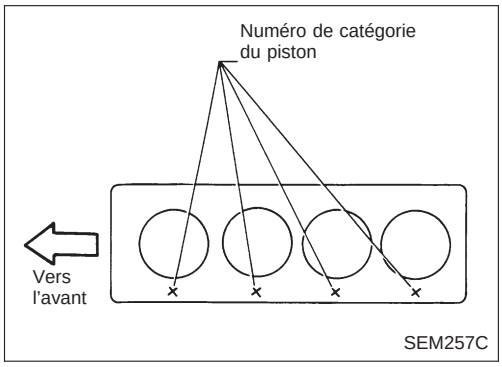
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (Suite)

DEFORMATION ET USURE DU BLOC-CYLINDRES

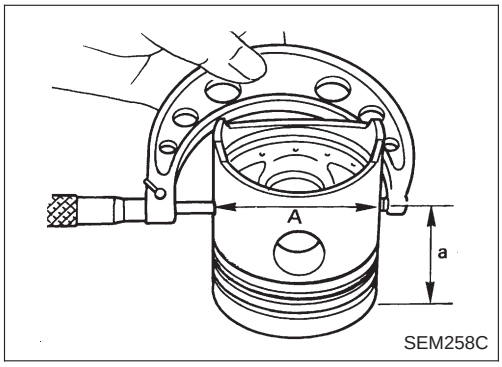
1. Nettoyer la surface supérieure du bloc-cylindres.
   Utiliser une règle et une jauge d'épaisseur fiables pour contrôler la planéité de la surface du bloc-cylindres. Effectuer le contrôle dans les six positions indiquées sur la figure.
   Limite :
   0,1 mm
2. En cas de voilage excessif, rectifier.
   La limite de rectification du bloc-cylindres est déterminée par celle de la culasse.

La quantité de rectification de la culasse est "A"
La quantité de rectification du bloc-cylindres est "B"
La limite maximum est la suivante :
A + B = 0,2 mm
Hauteur nominale du bloc-cylindres depuis le centre du vilebrequin :
246,95 - 247,05 mm



3. En cas de besoin, remplacer le bloc-cylindres.

JEU ENTRE LE PISTON ET L'ALESAGE



1. A l'aide d'un comparateur à cadran, mesurer l'alésage du cylindre en recherchant usure, faux-rond ou conicité.
   Diamètre intérieur standard :
   Se reporter aux SDS, EM-93.
   Limite d'usure : 0,2 mm
   Faux-rond (X − Y) standard : 0,015 mm
   Conicité (A − B) standard : 0,010 mm
   Réaléser tous les cylindres quand la limite est dépassée. En cas de besoin, remplacer le bloc-cylindres.
2. Rechercher toutes traces de rayures et de grippage. Si l'on constate des traces de grippage, roder.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (Suite)

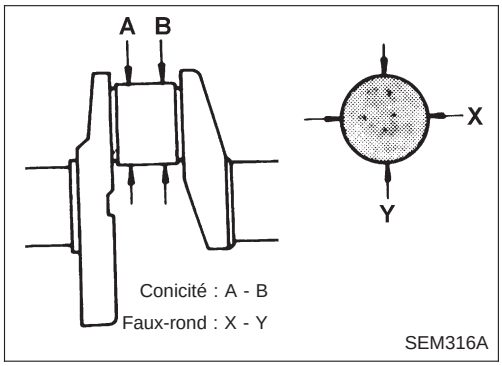
- **Si le bloc-cylindres et le piston doivent être remplacés, utiliser un piston dont le numéro de catégorie correspond à celui poinçonné sur la surface supérieure du bloc-cylindres.**

3. Mesurer le diamètre de jupe de piston.
   Diamètre de piston ''A'' :
   Se reporter aux SDS, EM-97.
   Point de mesure ''a'' (distance du fond) :
   Environ 52 mm
4. Vérifier que le jeu entre le piston et l'alésage est dans la fourchette de tolérance.
   Jeu entre le piston et l'alésage ''B'' :
   0,020 - 0,040 mm
5. Déterminer le piston surdimensionné en fonction de l'usure du cylindre.

Des pistons surdimensionnés sont disponibles pour l'entretien. Se reporter aux SDS, EM-97.

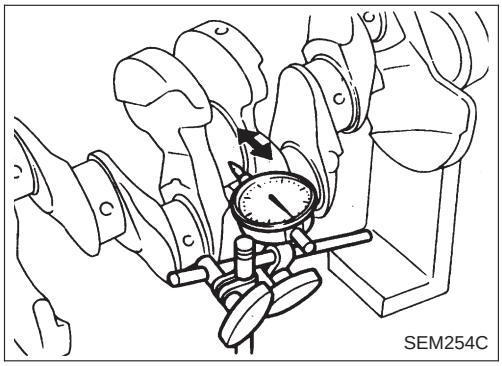
6. La dimension de l'alésage du cylindre est déterminée en ajoutant le jeu entre le piston et l'alésage au diamètre de piston ''A''.
   Calcul du réalésage :
   D = A + B − C où,
   D : Diamètre d'alésage
   A : Diamètre de piston mesuré
   B : Jeu entre piston et alésage
   C : Tolérance de finition 0,02 mm
7. Reposer les chapeaux de paliers principaux et serrer les boulons au couple spécifié. Cela empêchera la déformation des alésages de cylindre.
8. Aléser les cylindres.

- **Si un cylindre doit être réalésé, tous les cylindres doivent également être réalésés.**
- **Ne pas aléser trop profondément l'alésage du cylindre à chaque passe. Ne pas tailler plus de 0,05 mm par passe.**



9. Roder les cylindres pour obtenir le jeu entre le piston et l'alésage spécifié.
10. Mesurer l'alésage final du cylindre en recherchant s'il y a un faux-rond ou une conicité.

- **La mesure doit être prise une fois que l'alésage du cylindre est refroidi.**



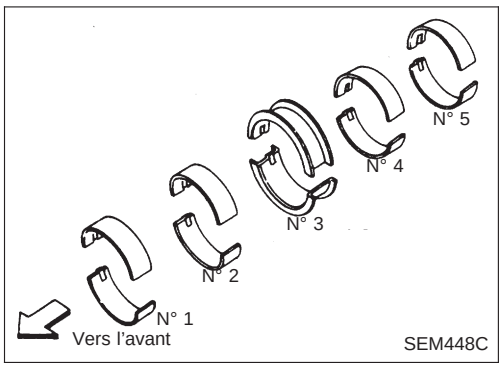
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (Suite)

VILEBREQUIN

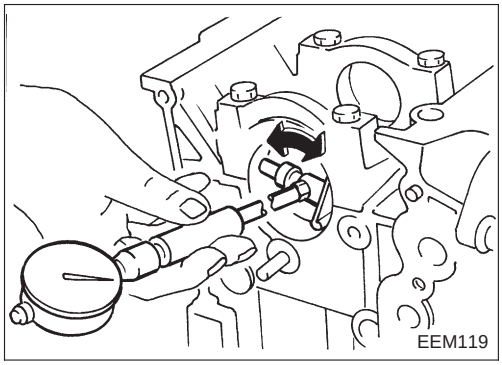
1. Vérifier si les tourillons principaux et manetons de vilebrequin ne sont pas rayés, usés ou fissurés.
2. Mesurer les tourillons avec un micromètre, pour rechercher conicité ou faux-rond.
   Faux-rond (X − Y) : mm
   Tourillon : moins de 0,01
   Maneton : moins de 0,005
   Conicité (A − B) : mm
   Tourillon : moins de 0,01
   Maneton : moins de 0,005

3. Mesurer le voile du vilebrequin.
   Voile (indication totale du comparateur) :
   Moins de 0,10 mm



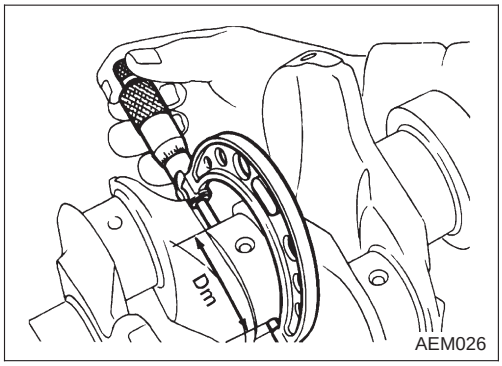
JEU DES PALIERS

- Utiliser la méthode A ou la méthode B. La méthode A est conseillée car elle est plus précise.



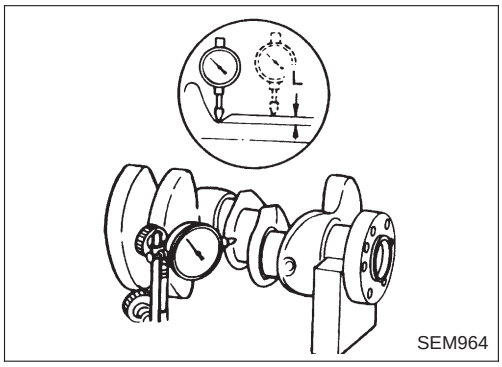
Méthode A (avec une jauge d'alésage et un micromètre)

Palier principal

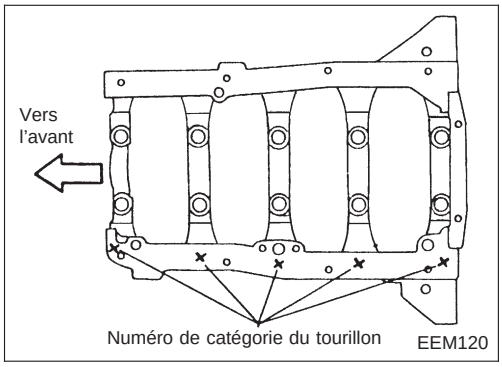


1. Mettre les paliers principaux à leur place sur le bloc-cylindres et sur le chapeau de palier principal.

2. Monter le chapeau de palier principal sur le bloc-cylindres.
- **Serrer tous les boulons en 2 ou 3 étapes dans l'ordre correct.**
3. Mesurer le diamètre intérieur ''A'' de chaque palier principal.



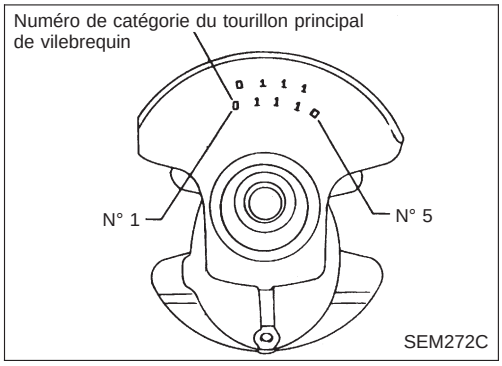
4. Mesurer le diamètre extérieur ''Dm'' de chaque tourillon principal du vilebrequin.
5. Calculer le jeu du palier principal.
   Jeu de palier principal = A − Dm
   Standard :
   0,020 - 0,047 mm
   Limite :
   0,1 mm



6. Remplacer le palier si les limites sont dépassées.
7. Si le jeu ne peut pas être réglé dans la fourchette standard de palier, réusiner le tourillon de vilebrequin et utiliser un palier sous-dimensionné.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

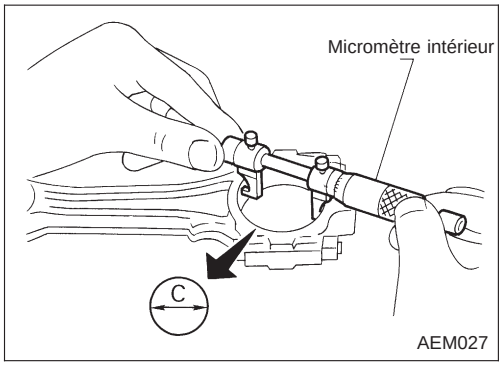
Inspection (Suite)



a. Lors du réusinage du tourillon de vilebrequin, confirmer que la dimension des filets ''L'' est supérieure à la limite spécifiée.
''L'' : 0,1 mm
b. Consulter les SDS pour rectifier le vilebrequin et connaître les pièces d'entretien disponibles.

8. En cas de réutilisation du vilebrequin, mesurer le jeu et choisir l'épaisseur du palier principal.
Si le vilebrequin ou le bloc-cylindres est remplacé, choisir l'épaisseur des paliers principaux comme suit :

a. Le numéro de catégorie de chaque tourillon principal du bloc-cylindres est poinçonné sur le bloc-cylindres correspondant. Ces numéros de catégorie sont poinçonnés en chiffres arabes ou romains.



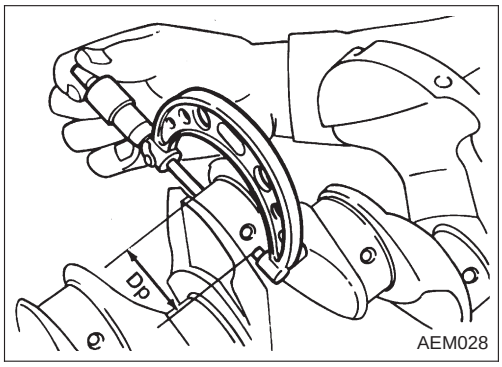
b. Le numéro de catégorie de chaque tourillon principal de vilebrequin est poinçonné sur le vilebrequin correspondant. Ces numéros de catégorie sont poinçonnés en chiffres arabes ou romains.

c. Choisir un palier principal d'épaisseur convenable en se reportant à l'exemple ou au tableau suivant.

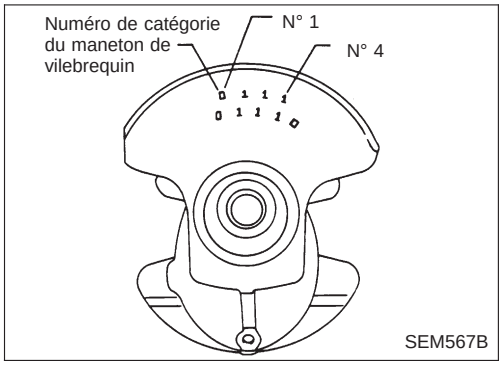
Exemple :
Numéro de catégorie du tourillon principal : 1
Numéro de catégorie du tourillon de vilebrequin : 2
Numéro de catégorie du palier principal = 1 + 2
= 3 (jaune)

Numéro de catégorie du palier principal et couleur d'identification :

		Numéro de catégorie du tourillon principal		
		0	1	2
Numéro de catégorie du tourillon de vilebrequin	0	0 (Noir)	1 (Marron)	2 (Vert)
	1 ou I	1 (Marron)	2 (Vert)	3 (Jaune)
	2 ou II	2 (Vert)	3 (Jaune)	4 (Bleu)



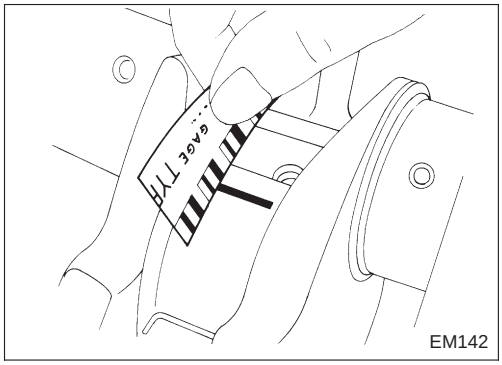
Palier de bielle (tête de bielle)



1. Monter le palier de bielle sur la bielle et le chapeau.
2. Monter le chapeau de bielle sur la bielle.
● **Serrer les boulons au couple spécifié.**
3. Mesurer le diamètre intérieur ''C'' de chaque palier.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

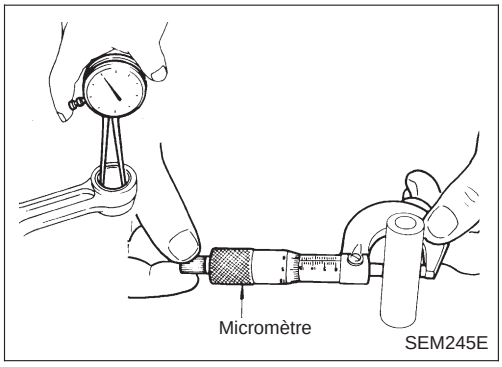
Inspection (Suite)



4. Mesurer le diamètre extérieur ‘‘Dp’’ de chaque maneton de vilebrequin.
5. Calculer le jeu du palier de bielle.
   Jeu du palier de bielle
   = C − Dp : mm
   Standard
   0,010 - 0,035
   Limite
   0,09
6. Remplacer le palier si les limites sont dépassées.
7. Si le jeu ne peut pas être réglé dans la fourchette standard de palier, réusiner le tourillon de vilebrequin et utiliser un palier sous-dimensionné. Se reporter à l’étape 7 du titre ‘‘JEU DES PALIERS – palier principal’’.

8. Si le vilebrequin doit être remplacé, choisir le palier de bielle selon le tableau suivant.

Numéro de catégorie des paliers de bielle :
Ces numéros de catégorie sont poinçonnés en chiffres arabes ou romains.



Numéro de catégorie du maneton	Numéro de catégorie du palier de bielle
0	0
1 ou I	1
2 ou II	2

Méthode B (avec une jauge ‘‘plastigage’’)

ATTENTION :

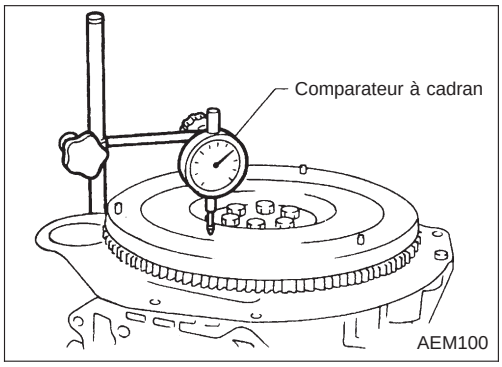
- **Ne pas faire tourner le vilebrequin ni la bielle lorsque la jauge ‘‘plastigage’’ est introduite.**
- **Lorsque le jeu de palier dépasse la limite spécifiée, s’assurer que l’on a bien monté le palier adéquat. Puis, si l’on a un jeu excessif de palier, prendre un palier principal plus épais ou un palier sous-dimensionné de manière à obtenir le jeu de palier spécifié.**

JEU DE LA BAGUE DE PALIER DE BIELLE (pied de bielle)

1. Mesurer le diamètre intérieur ‘‘C’’ de la bague.
2. Mesurer le diamètre extérieur ‘‘Dp’’ de l’axe de piston.
3. Calculer le jeu de la bague de palier de bielle.
   C − Dp =
   −0,015 à −0,033 mm (standard)
   Si hors spécifications, remplacer la bielle et/ou le jeu de piston avec l’axe.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (Suite)



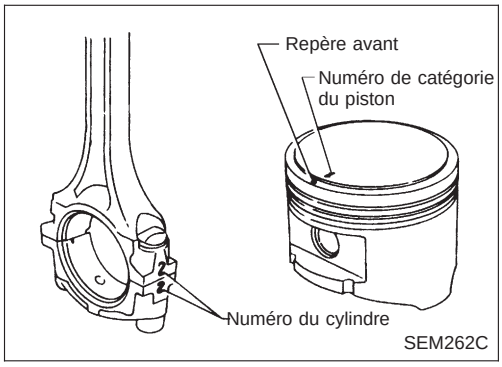
VOILE DU VOLANT-MOTEUR

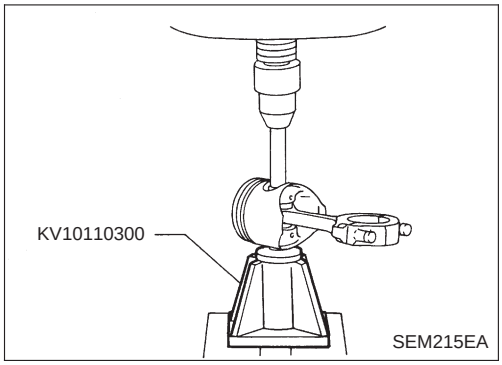
Voile (indication totale du comparateur) :

Volant-moteur : moins de 0,1 mm

ATTENTION :

Ne laisser aucun matériau magnétique venir en contact avec les dents de la couronne.



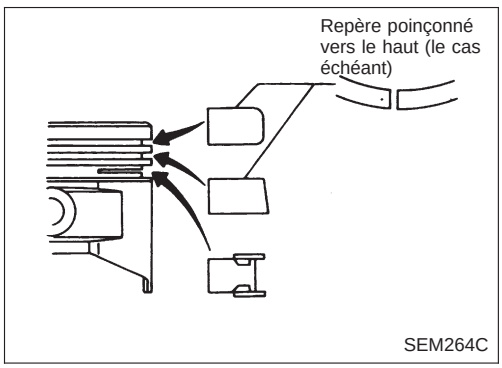


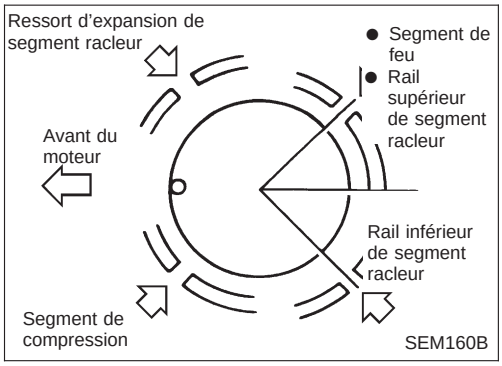
Remontage

PISTON

1. Réchauffer le piston à une température de 60 à 70°C et remonter le piston, l'axe de piston et la bielle.

- **Aligner les sens du piston et de la bielle.**
- **Les numéros qui sont matricés sur la bielle et le chapeau correspondent à chaque cylindre.**
- **Après remontage, s'assurer que la bielle bascule en douceur.**

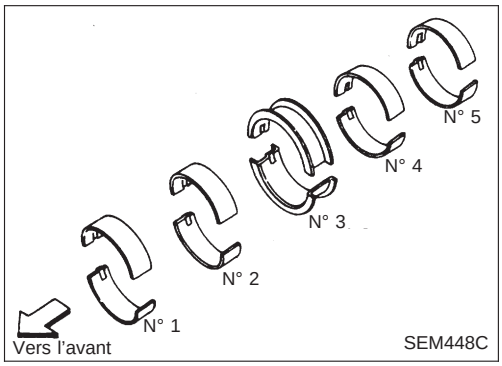




2. Reposer les segments de piston comme indiqué.

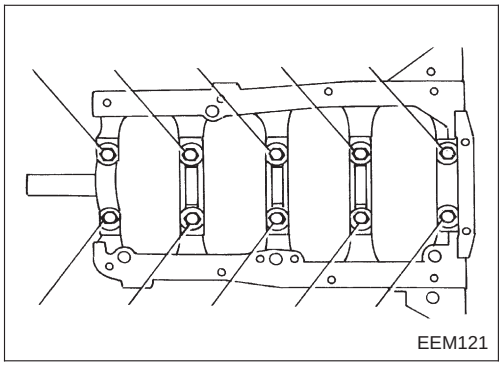
ATTENTION :

- **Lorsque les segments de piston ne sont pas remplacés, ils doivent être reposés dans leur position d'origine.**
- **Lorsque les segments de piston sont remplacés et qu'aucun repère poinçonné n'est visible, les segments de piston peuvent être montés indifféremment d'un côté ou de l'autre.**



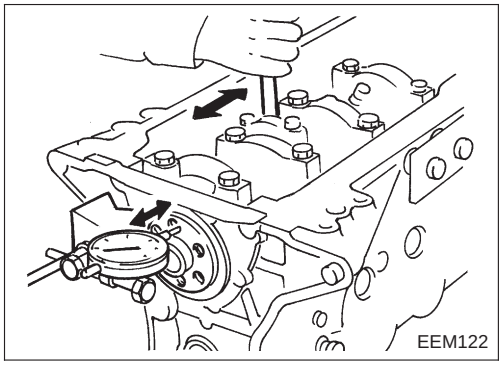
3. Aligner les segments de piston de façon à ce que les coupes soient positionnées comme indiqué.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Remontage (Suite)

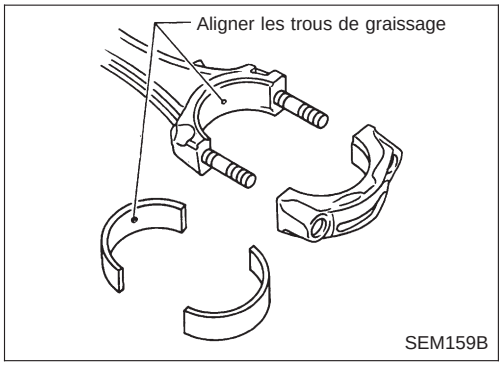
VILEBREQUIN



1. Mettre les paliers principaux à leur place sur le bloc-cylindres et sur les chapeaux de paliers principaux.

- **Vérifier que les paliers principaux sont de la taille qui convient. Se reporter à EM-43.**
- **Appliquer de l'huile moteur neuve sur les surfaces de palier.**

2. Monter le vilebrequin et les chapeaux de paliers principaux, et serrer les boulons au couple spécifié.

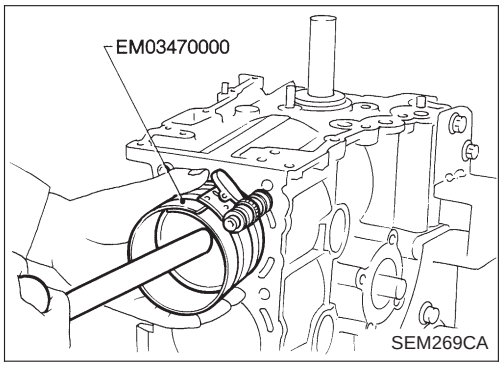


- **Appliquer de l'huile moteur neuve sur les filets et les épaulements des boulons.**
- **Avant de serrer les boulons de chapeaux de palier, mettre le chapeau de palier en place en déplaçant le vilebrequin dans le sens axial.**
- **Serrer progressivement les boulons de chapeaux de paliers, en 2 ou 3 étapes. Commencer par le palier central et progresser vers l'extérieur comme indiqué sur l'illustration.**
- **Après avoir serré les boulons des chapeaux de paliers, s'assurer que le vilebrequin tourne facilement à la main.**

3. Mesurer le jeu axial du vilebrequin.

Jeu axial du vilebrequin : mm
Standard
0,05 - 0,18
Limite
0,3

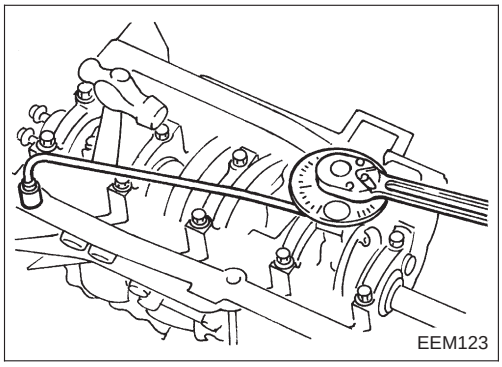
Si la limite est dépassée, remplacer le palier par une pièce neuve.



4. Reposer les paliers de bielle sur les bielles et les chapeaux de bielle.

- **Vérifier si la taille des paliers convient. Se reporter à EM-45.**
- **Remonter les paliers de sorte que le trou de graissage de la bielle soit aligné sur celui du palier.**
- **Appliquer de l'huile moteur neuve sur les surfaces des paliers, sur les filets et les épaulements des boulons.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

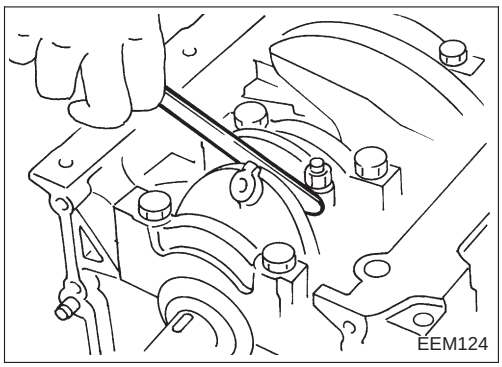


Remontage (Suite)

5. Monter les pistons avec les bielles.

a. Les monter dans les cylindres correspondants à l'aide de l'outil spécial.

- **Disposer les pièces de manière à ce que la marque de repère avant sur les têtes de piston soit tournée vers l'avant du moteur.**
- **S'assurer que la bielle ne raye pas la paroi de cylindre.**
- **S'assurer que les boulons de bielle ne rayent pas les tourillons de vilebrequin.**
- **Appliquer de l'huile moteur neuve aux segments et aux surfaces de coulissement du piston.**



b. Monter les chapeaux de palier de bielle.
Serrer les écrous de chapeau de palier de bielle en suivant la procédure suivante.

Ecrou de palier de bielle :

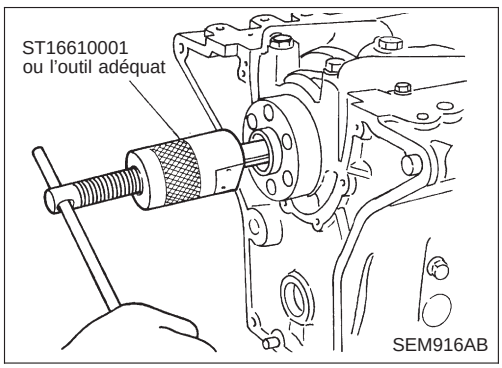
(1) Serrer à un couple de 14 à 16 N·m (1,4 à 1,6 kg-m).

(2) Serrer les boulons à 60^{+5}_{0} degrés dans le sens des aiguilles d'une montre à l'aide d'une clé angulaire.

Si l'on ne dispose pas d'une clé angulaire, serrer tous les boulons à un couple de 38 à 44 N·m (3,9 à 4,5 kg-m).

6. Mesurer le jeu latéral de bielle.

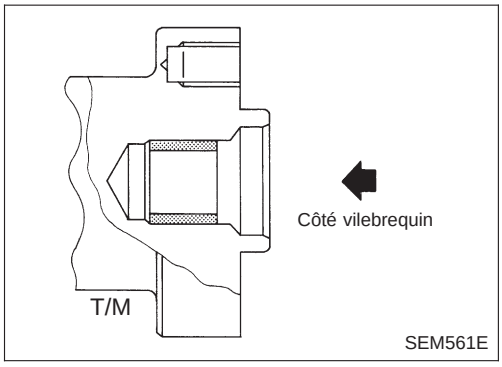
Jeu latéral de la bielle : mm



Standard

0,2 - 0,4

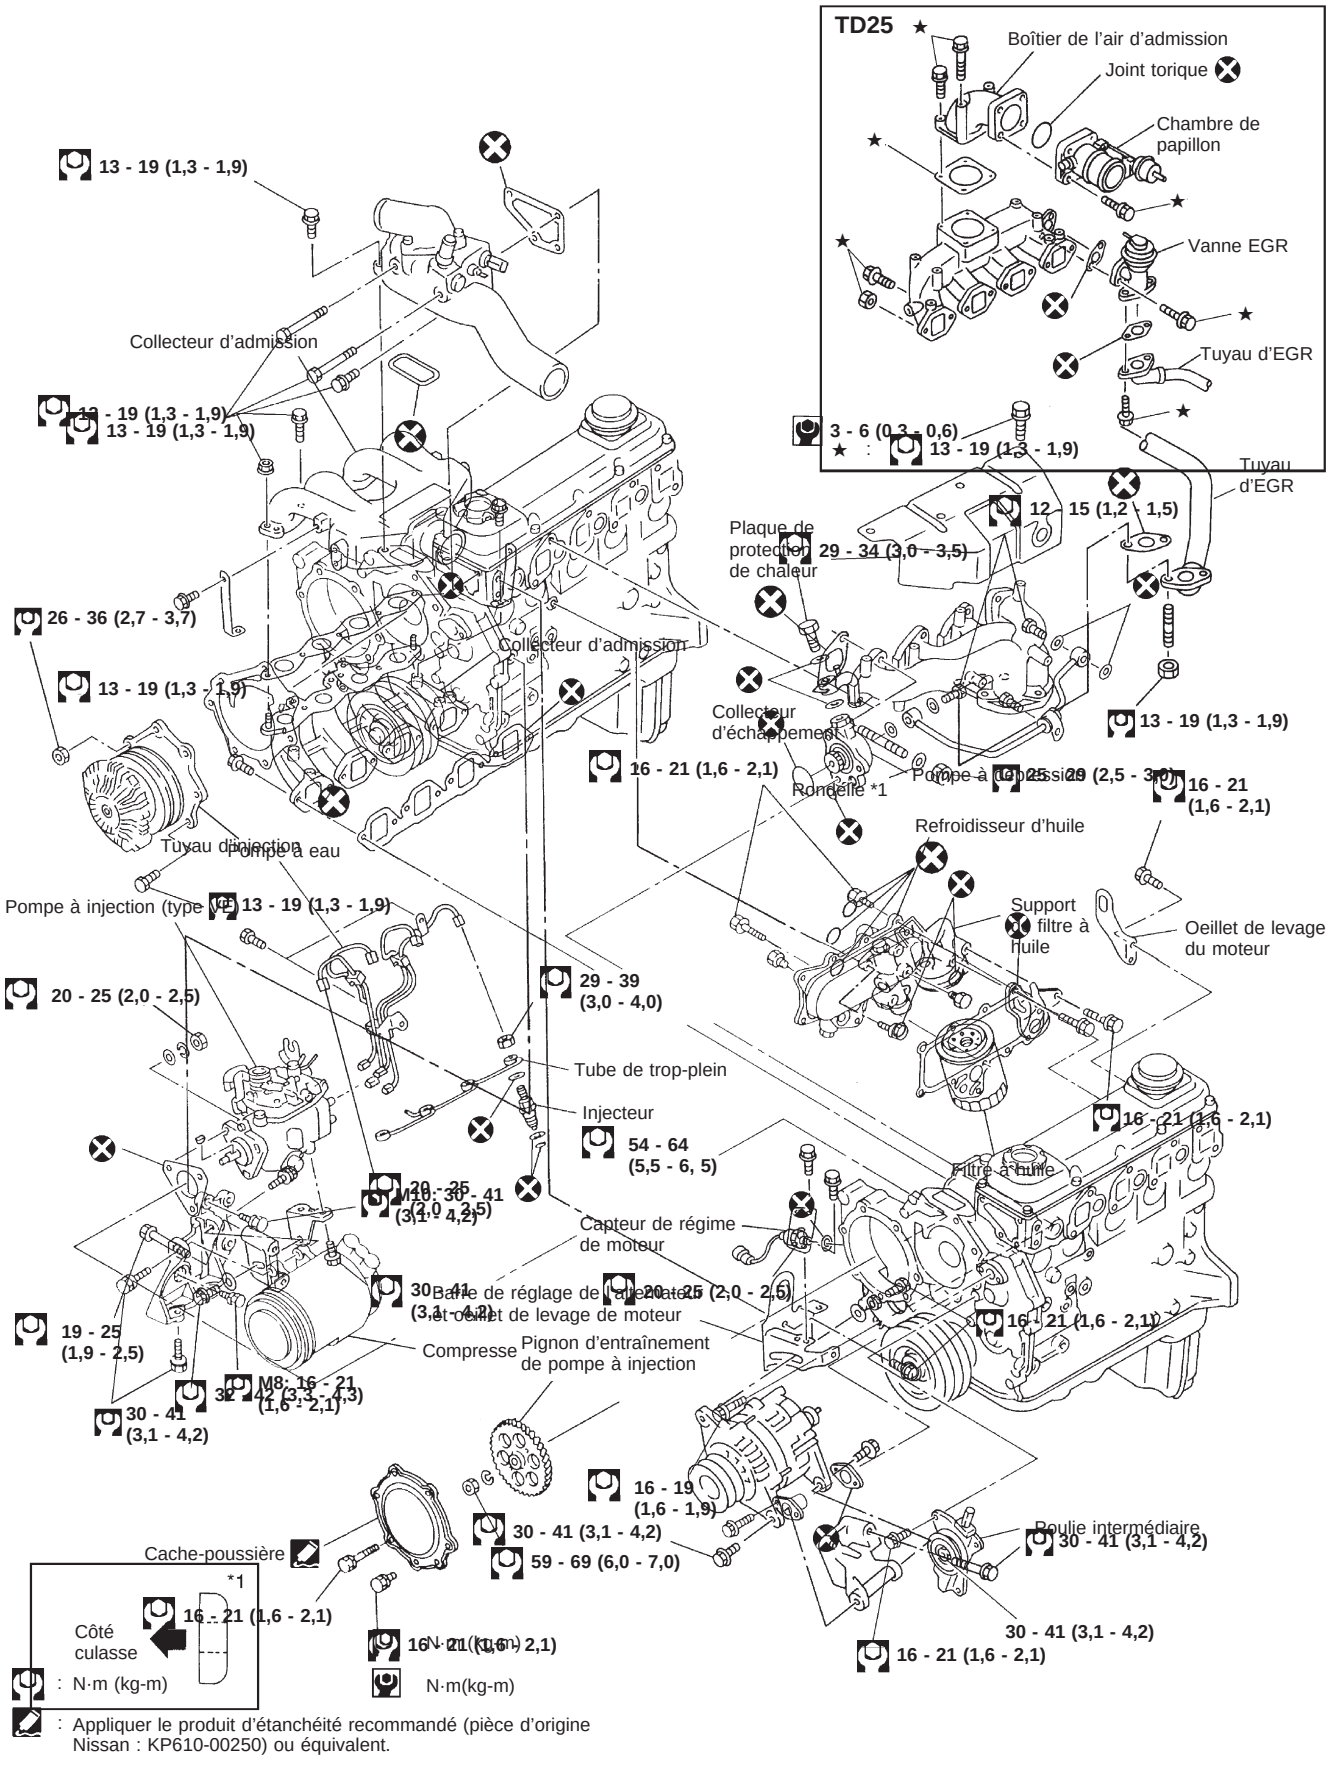
Limite



0,6

Si la limite est dépassée, remplacer la bielle et/ou le vilebrequin.

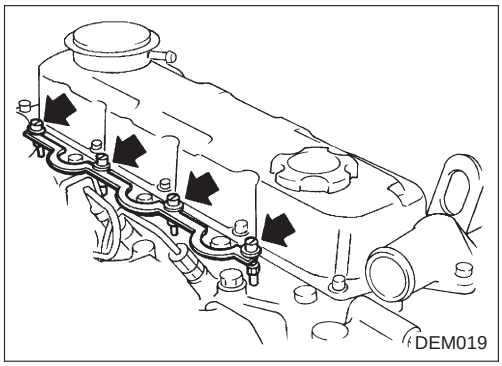
REMPLACEMENT DE LA BAGUE PILOTE



1. Déposer la bague pilote.

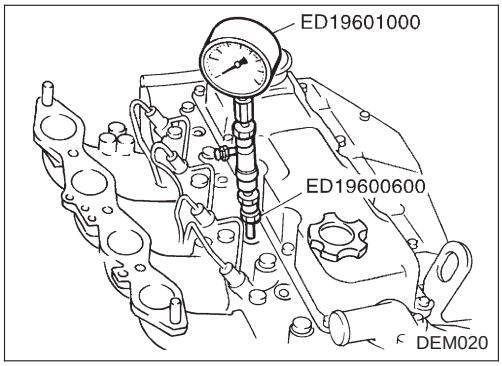
2. Reposer la bague pilote.
TD

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



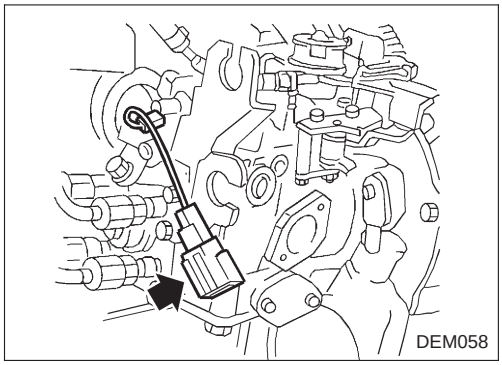
SEC. 135·150·238·236·273

DEM105N



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Mesure de la pression de compression

1. Faire chauffer le moteur.
2. Arrêter le moteur. Déposer la plaque et les bougies de préchauffage.

3. Fixer l'adaptateur d'indicateur de compression sur la culasse.
   Adaptateur d'indicateur de compression :
   : 15 - 20 N·m (1,5 - 2,0 kg-m)

4. Débrancher le connecteur du câble de solénoïde de coupure d'alimentation.
5. Démarrer le moteur, puis relever les données du comparateur à cadran.

- **La mesure de la compression du moteur doit être effectuée le plus vite possible.**

Pression de compression :

Unité : kPa (bar, kg/cm^2)/200 tr/mn

Standard	2 942 (29,4, 30)
Minimum	2 452 (24,5, 25)
Limite de différence entre les cylindres	294 (2,9, 3)

6. Si la compression dans un ou plusieurs cylindres est faible, verser une petite quantité d'huile moteur dans les cylindres à travers les orifices de préchauffage, puis retester la compression.

- **Si une adjonction d'huile facilite la pression de compression, il y a de fortes chances pour que les segments de piston soient usés ou endommagés.**
- **Si la pression reste faible, une soupape peut être collée ou son siège déformé.**
- **Si l'on manque de compression dans deux cylindres voisins quelconques, et si l'adjonction d'huile ne modifie pas la compression, cela signifie que la surface du joint présente une fuite.**
  Ce problème peut entraîner la présence d'huile et d'eau dans les chambres de combustion.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

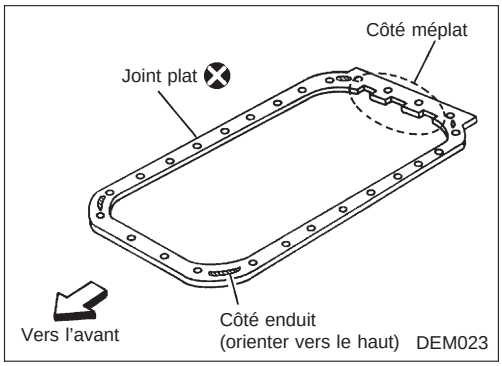
11	Soulever le moteur. Si nécessaire, débrancher le tuyau d'échappement.	○	○
12	Déposer le carter d'huile.	○	○

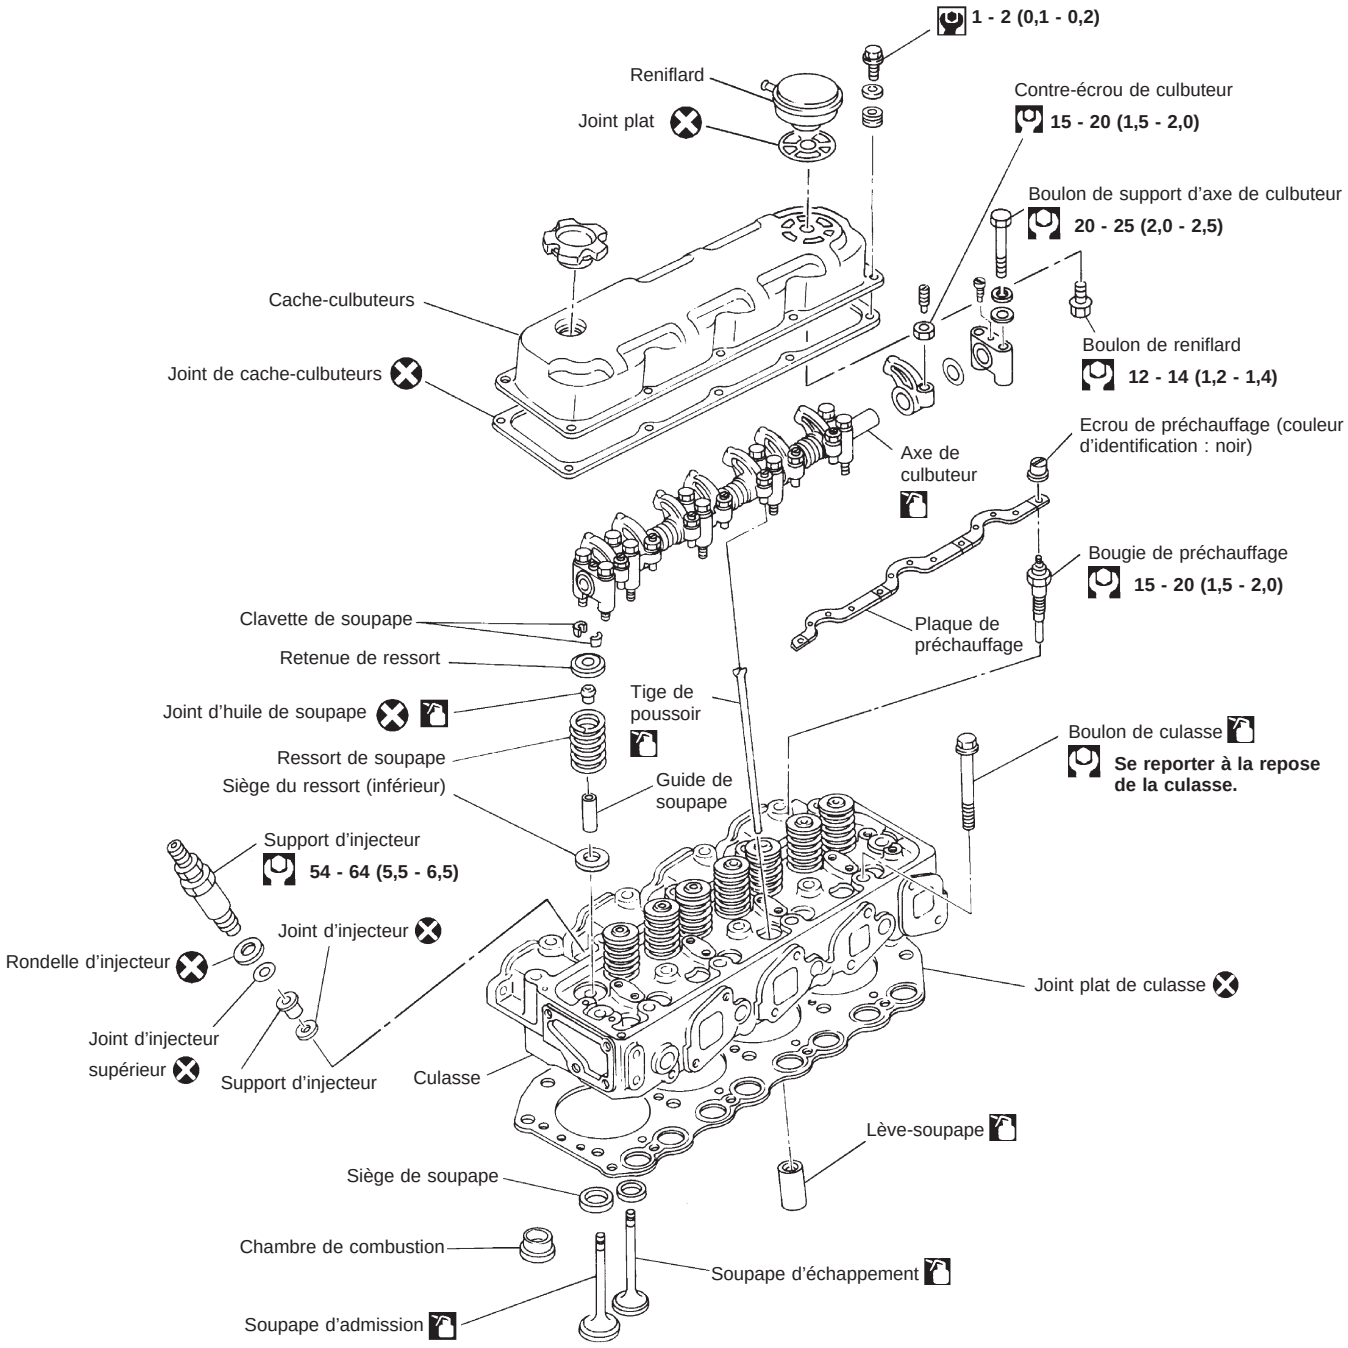


AVERTISSEMENT :
- **Placer le véhicule sur une surface plane et solide.**
- **Mettre des cales à l'avant et à l'arrière des roues arrière.**
- **Le carter d'huile ne doit pas être déposé avant le refroidissement complet des circuits d'échappement et de refroidissement.**
  Faute de quoi, on risque de se brûler et/ou de provoquer un incendie dans la conduite de carburant.
- **Lors de la dépose des boulons ou écrous de montage du moteur avant et/ou arrière, soulever légèrement le moteur pour un travail en toute sécurité.**

ATTENTION :
- **Lorsque l'on soulève le moteur, veiller à ne pas le cogner les pièces adjacentes, en particulier l'extrémité de la gaine du câble d'accélérateur, les conduites de frein et le maître-cylindre de frein.**
- **Pour le couple de serrage, se reporter à la page EM-72, et aux sections MT et PD.**

Déposer les boulons du carter d'huile dans l'ordre indiqué.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

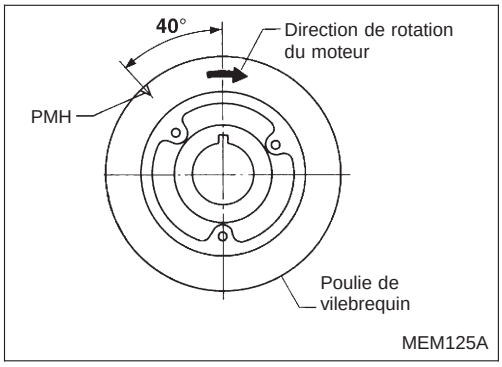


Repose

1. Reposer le joint plat de carter d'huile en orientant la surface enduite face au bloc-cylindres et l'encoche face à l'arrière du moteur.
2. Serrer tous les boulons dans l'ordre inverse de la dépose. Pour le couple de serrage du carter d'huile et la correction du sens d'installation de la rondelle du bouchon de vidange, se reporter à la page EM-72.

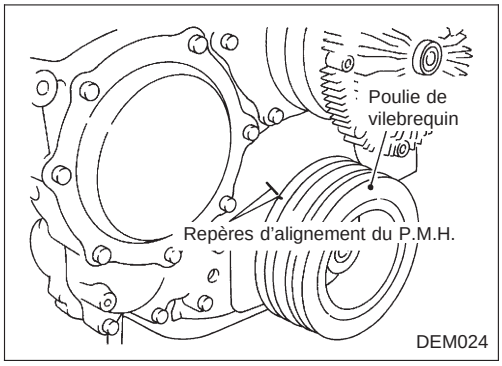
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SEC. 111•130•185•220



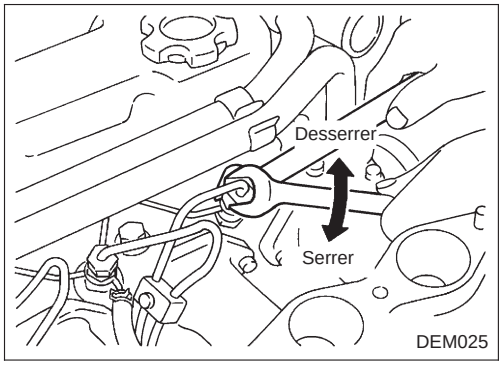
DEM110

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

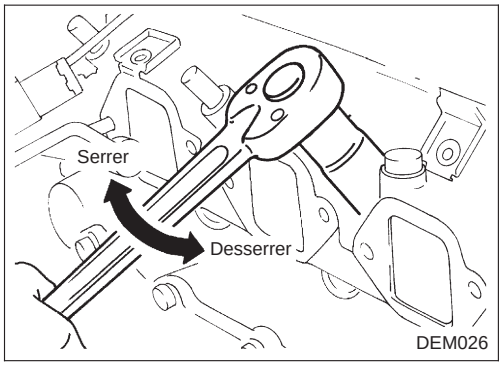


ATTENTION :

- **Lors du montage des pièces coulissantes telles que culbuteurs, arbre à cames et joint d'huile, veiller à appliquer une couche d'huile moteur neuve sur leurs surfaces de frottement.**
- **Lors du serrage des boulons de culasse et des boulons d'axe de culbuteurs, enduire d'huile moteur neuve les parties filetées et les faces d'assise des boulons.**

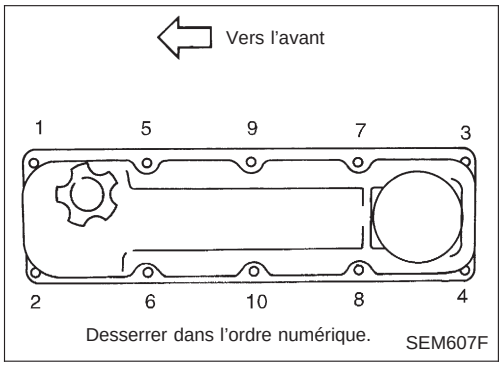


Dépose

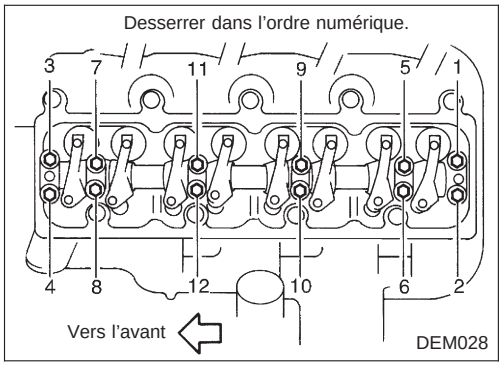


1. Placer le cylindre n° 1 au P.M.H. (point mort haut) dans sa course de compression.
2. Vidanger le liquide de refroidissement à partir des bouchons de vidange situés sur le bloc-cylindres et le radiateur.
3. Déposer le filtre à air et/ou le conduit d'air.
4. Déposer le boulon de réglage de l'alternateur.
5. Débrancher le collecteur d'échappement du tuyau d'échappement avant.
6. Débrancher le flexible de sortie du radiateur et le flexible d'entrée d'eau du logement de thermostat.
7. Déposer le carter d'admission d'air.

8. Déposer le tuyau d'injection de carburant et le tube de trop-plein.



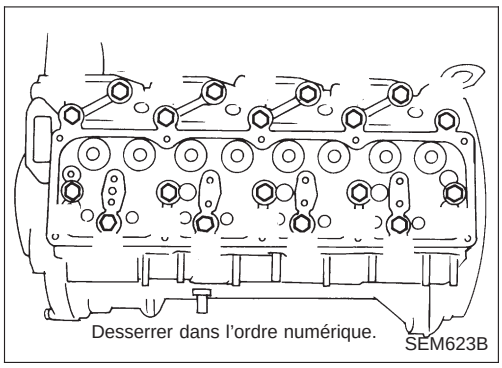
9. Déposer le porte-injecteur et le joint de l'injecteur supérieur à l'aide d'une douille de profondeur.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

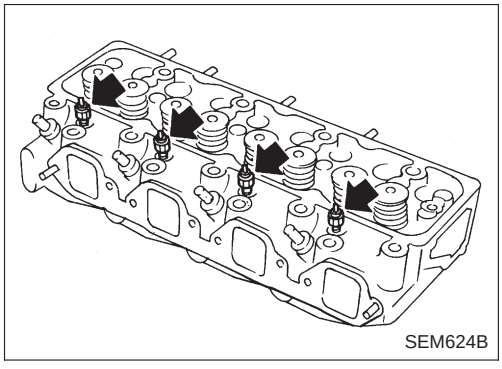
Dépose (Suite)

10. Déposer le cache-culbuteurs.

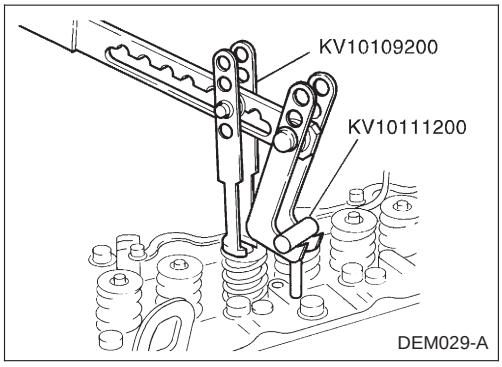


11. Déposer l'axe des culbuteurs avec les culbuteurs.
12. Déposer les tiges de poussoirs.

13. Déposer les boulons de culasse dans l'ordre numérique, puis déposer la culasse.



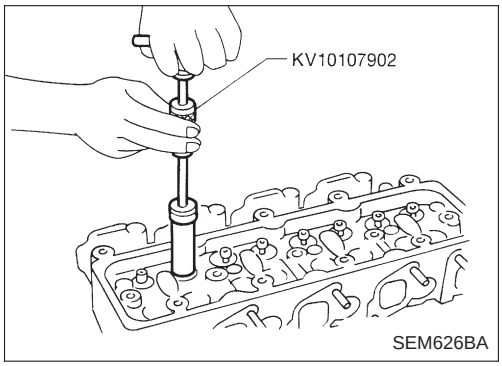
Une dépose dans l'ordre incorrect peut entraîner une déformation ou une fêlure de la culasse.



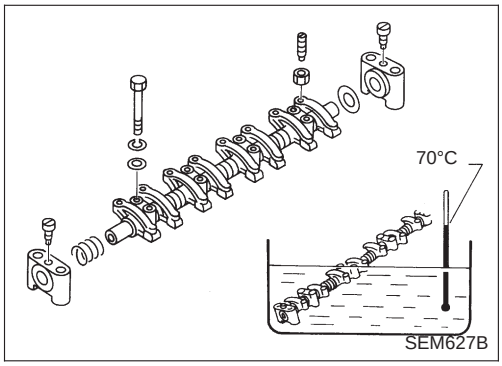
Démontage

1. Déposer les pièces suivantes :

a. Collecteur d'admission
b. Collecteur d'échappement
c. Logement de thermostat
d. Barre de réglage d'alternateur et œillet de levage du moteur
e. Plaque et bougies de préchauffage

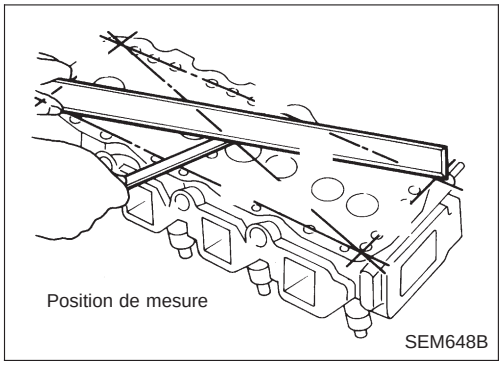


2. Déposer les composants de la soupape à l'aide de l'outil spécial.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

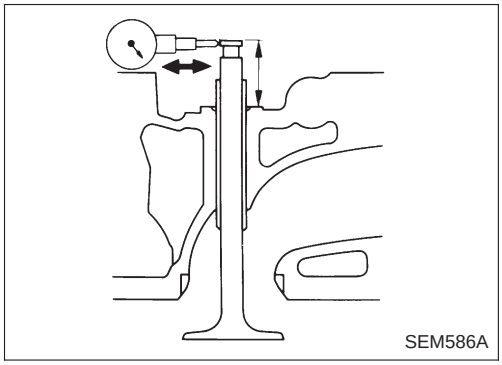
Démontage (Suite)



3. Déposer les joints d'huile de soupape à l'aide de l'outil spécial.

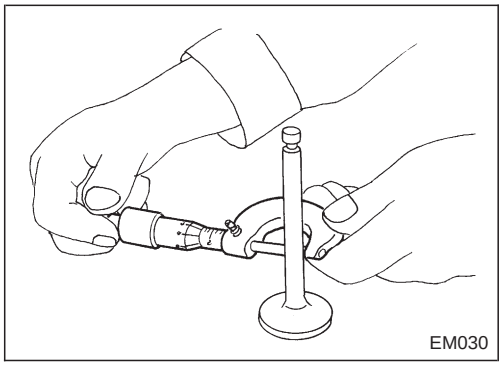
4. Démonter l'axe de culbuteur.
a. Déposer le boulon de serrage de l'axe de culbuteur.
b. Déposer le culbuteur et le support de l'axe de culbuteur.

S'il est difficile de déposer le support de l'axe de culbuteur, plonger l'axe de culbuteur dans de l'huile à une température de 70°C pendant quelques minutes, puis déposer le support.



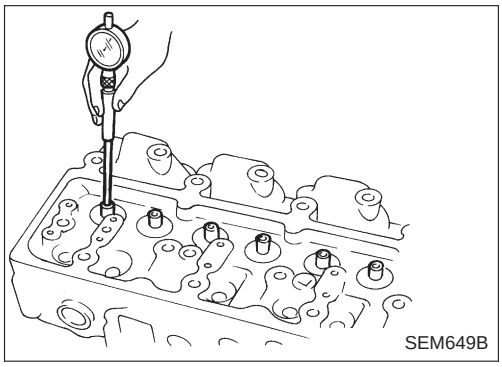
Inspection

DEFORMATION DE LA CULASSE



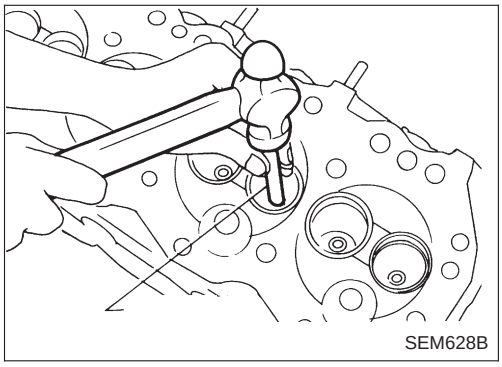
Déformation de la culasse : mm
Standard
Moins de 0,07
Limite
0,2

Si hors spécification, corriger à l'aide d'une meuleuse de surface. La hauteur de la culasse doit être supérieure à 89,7 mm une fois que la surface a été rectifiée.



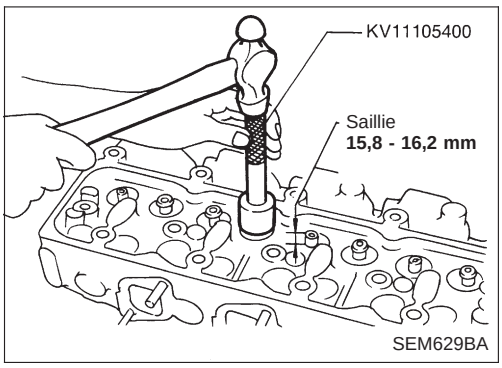
JEU DE GUIDE DE SOUPAPE

- **Mesurer le jeu de soupape dans le sens parallèle au culbuteur (l'usure se fait généralement surtout dans ce sens).**
  Jeu entre queue de soupape et guide : mm
  Limite
  Admission 0,15
  Echappement 0,20
  Déflexion admissible maximum
  (lecture du comparateur à cadran)
  Admission 0,30
  Echappement 0,40
- **Pour déterminer la pièce de rechange correcte, mesurer le diamètre de la queue de soupape et le diamètre intérieur du guide de soupape.**
  Diamètre de la queue de soupape : mm
  Standard
  Admission
  7,962 - 7,977
  Echappement
  7,945 - 7,960



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

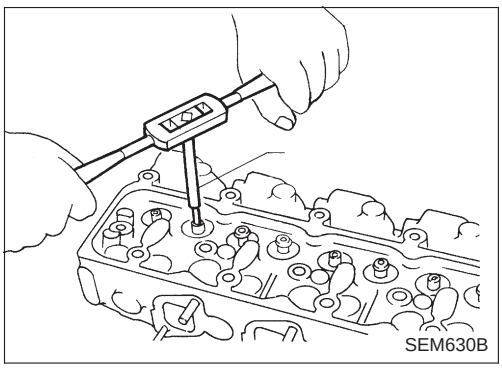
Inspection (Suite)



SEM649B

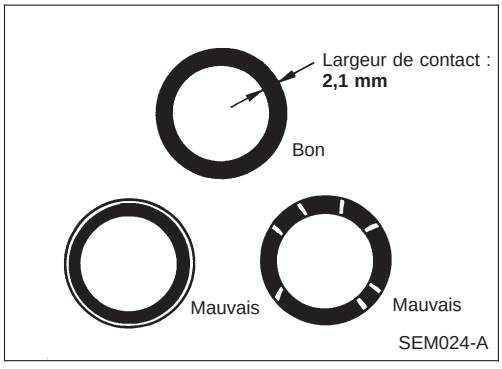
Diamètre intérieur du guide de soupape :
8,000 - 8,015 mm

REMPLACEMENT DU GUIDE DE SOUPAPE



SEM628B

1. Chasser le guide de soupape avec une presse [sous une pression de 20 kN (2 tonnes)] ou encore avec un marteau et un outil adéquat.



SEM629BA

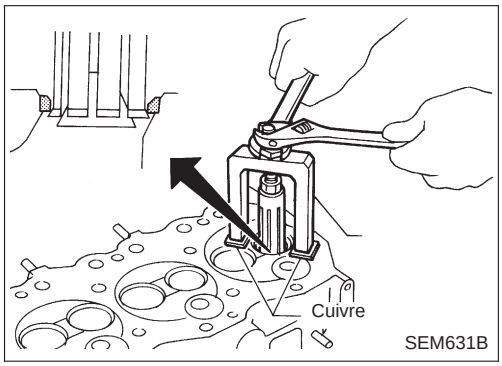
2. Enfoncer le guide de soupape d'entretien dans la culasse à l'aide de l'outil adéquat jusqu'à ce que le guide dépasse de 15,8 à 16,2 mm.

SEM630B

3. Réaléser le guide de soupape.
   Dimension de finition :
   8,000 - 8,015 mm

SIEGES DE SOUPAPE

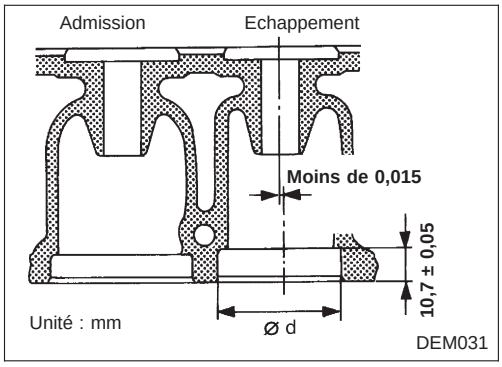
SEM024-A



Contrôler les sièges de soupape en recherchant des traces de piqûres sur la surface de contact de la soupape, et rectifier le siège ou le remplacer en cas d'usure excessive.

- **Avant de rectifier les sièges de soupape, vérifier l'état d'usure de la soupape et du guide de soupape. En cas d'usure, les remplacer. Puis rectifier le siège de soupape.**
- **Travailler à deux mains pour obtenir une surface rectifiée uniforme.**

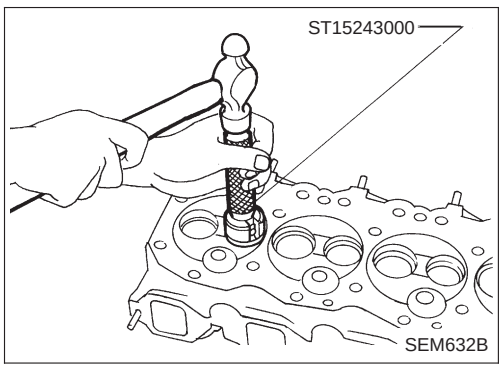
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Inspection (Suite)

REMPLACEMENT DU SIEGE DE SOUPAPE POUR PIECES D'ENTRETIEN

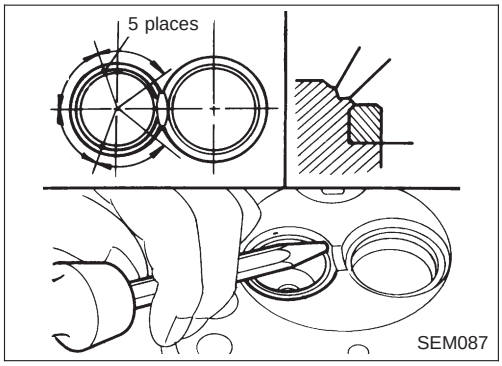
1. Les anciens sièges peuvent être déposés à l'aide d'une perceuse jusqu'à ce qu'ils s'effritent, ou les sièges de soupape peuvent être déposés à l'aide de l'outil spécial.



Placer un siège en cuivre entre la surface de contact de l'outil et la culasse.

2. Si le siège de soupape du côté échappement est surdimensionné, aléser sa surface de contact (du côté de la culasse) selon les dimensions indiquées dans le tableau ci-dessous. Se reporter à l'illustration de gauche pour connaître les procédures d'usinage.

Unité : mm

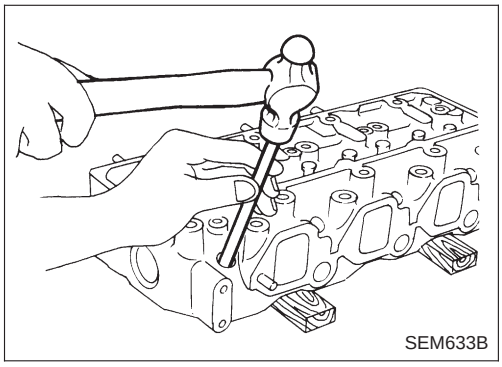


Siège de soupape surdimensionné	Diamètre de l'alésage "d"
	TD25
0,2	38,695 - 38,710
0,4	38,895 - 38,910

3. Placer des sièges de soupape neufs sur de la neige carbonique, puis les laisser refroidir pendant cinq minutes.

AVERTISSEMENT :
Ne pas toucher les sièges de soupape refroidis à main nue.

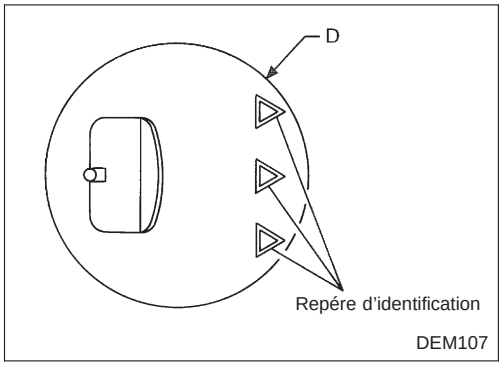
4. Chauffer la culasse à une température de 80°C.
5. Reposer les sièges de soupape refroidis sur la culasse à l'aide de l'outil.



6. Poinçonner le siège de soupape d'échappement à cinq endroits.

Lors du poinçonnage du siège de soupape, choisir différents emplacements que ceux choisis auparavant.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Inspection (Suite)

7. Tailler ou fraiser les sièges de soupape à l'aide de l'outil approprié, selon les dimensions spécifiées dans les SDS, EM-102.
8. Après la taille, roder les sièges de soupape avec un composé de rodage.
9. Vérifier la surface de contact des sièges de soupape.

SEM633B

CHAMBRE DE COMBUSTION

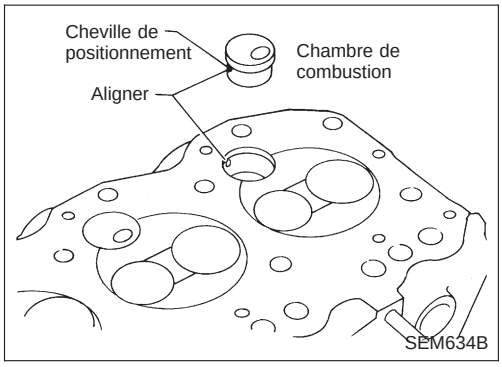
Vérifier si la chambre de combustion ne présente pas de fissures ou autres dommages. En cas de besoin, la remplacer.

DEM107

REMPLACEMENT DE LA CHAMBRE DE COMBUSTION

En principe, il ne faut pas déposer la chambre de combustion.

1. Déposer la chambre de combustion de manière à ce que la culasse ne puisse pas être endommagée.



2. Reposer la chambre de combustion.

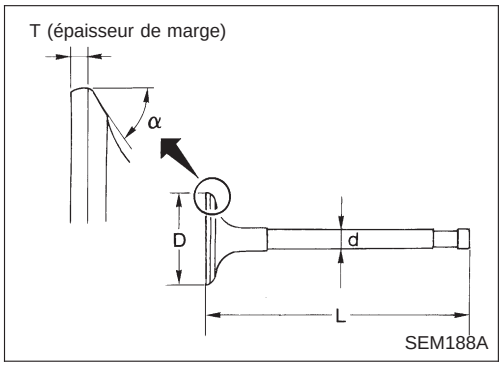
Identification des chambres de combustion

Repère d'identification (sur la chambre de combustion)	Diamètre extérieur "D" mm	Moteur
3 endroits	37	TD25

(1) Refroidir la chambre de combustion avec de la neige carbonique pendant environ 5 à 10 minutes.

AVERTISSEMENT :
Ne pas toucher la chambre de combustion refroidie à main nue.

SEM634B



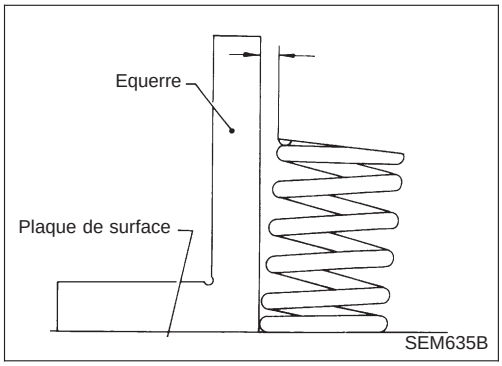
(2) Aligner la cheville de la chambre de combustion sur l'encoche de la culasse et monter la chambre de combustion à l'aide d'un maillet à tête souple.

3. Vérifier la mesure de la saillie de la chambre à combustion.
   Saillie :
   Standard
   −0,05 à 0,10 mm

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (Suite)

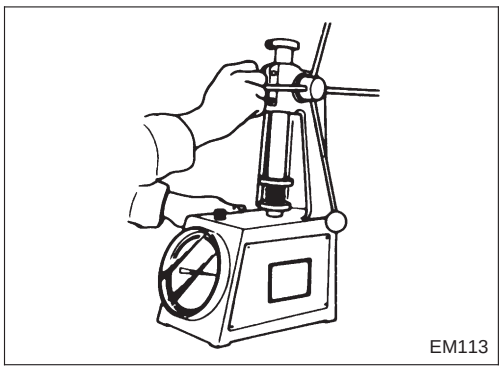
DIMENSIONS DES SOUPAPES



Vérifier les dimensions de chaque soupape. Pour les dimensions, consulter les SDS.

Quand la marge d'épaisseur de la tête de soupape est usée au-delà de 0,5 mm, remplacer la soupape.

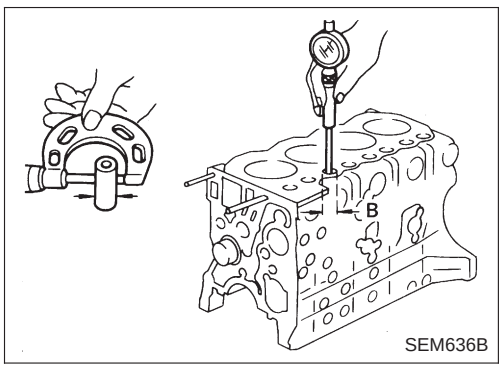
La tolérance de rectification de la queue de soupape est de 0,2 mm ou moins.



EQUERRAGE DU RESSORT DE SOUPAPE

Disposer le ressort de soupape le long d'une équerre. Faire tourner le ressort pour mesurer tout écartement entre le haut du ressort et l'équerre.

Faux-équerre ''S'' :
Moins de 2,3 mm



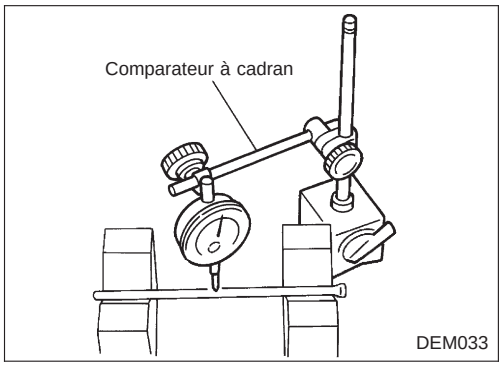
CHARGE DE COMPRESSION DES RESSORTS DE SOUPAPE

Se reporter aux SDS, EM-101.

POUSSOIR DE SOUPAPE ET TIGE DE POUSSOIR

Poussoir de soupape

1. Vérifier si les surfaces des poussoirs de soupapes ne sont pas excessivement usées.
2. Les remplacer par des pièces neuves si trop usées.

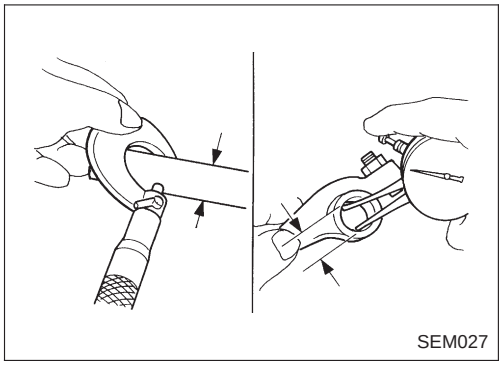


a. L'extrémité du poussoir de soupape doit être régulière.

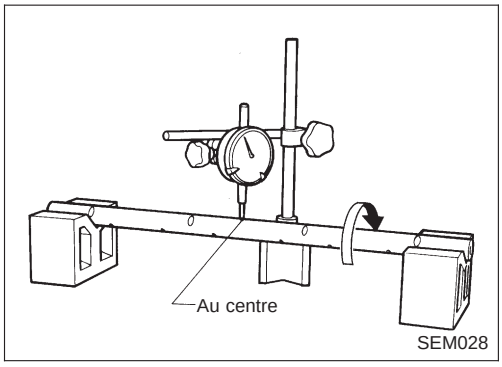
b. Jeu entre poussoir de soupape et orifice de poussoir : mm
Standard
0,030 - 0,073
Limite
Moins de 0,20
Diamètre extérieur du poussoir de soupape ''A'' :
Standard
25,960 - 25,970 mm
Diamètre ''B'' de l'orifice de poussoir de soupape du bloc-cylindres :
Standard
26,000 - 26,033 mm

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection (Suite)



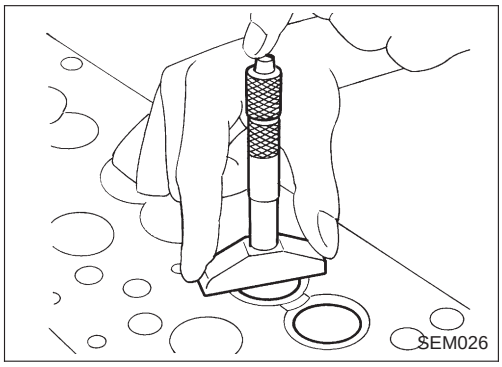
Tige de poussoir



1. Vérifier si les surfaces des tiges de poussoirs ne sont pas excessivement usées.
2. Les remplacer si trop usées ou endommagées.
3. Vérifier que la tige de poussoir n'est pas courbée à l'aide d'un comparateur à cadran.
   Courbure maximum admissible
   (indication totale du comparateur) :
   Moins de 0,5 mm

AXE DE CULBUTEUR ET CULBUTEUR

1. Vérifier que les culbuteurs de soupape, les supports et les axes de culbuteurs ne présentent pas de rayures, d'usure ou de déformations. Remplacer si nécessaire.



2. Vérifier le jeu entre les culbuteurs et l'axe de culbuteur. Si le jeu dépasse les limites spécifiées, remplacer les axes ou les culbuteurs concernés.
   Jeu spécifié : mm
   Standard
   0,014 - 0,056
   Limite
   Moins de 0,15
   Diamètre externe d'axe de culbuteur ''A'' :
   Standard
   19,979 - 20,000 mm
   Diamètre interne d'axe de culbuteur ''B'' :
   Standard
   20,014 - 20,035 mm

3. Vérifier la courbure de l'axe de culbuteur au centre. Si la courbure est dans les limites spécifiées, la redresser ; et si elle est supérieure à la norme, remplacer l'axe de culbuteur.
   Courbe de l'axe de culbuteur
   (indication totale du comparateur) :
   Limite
   Moins de 0,3 mm

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

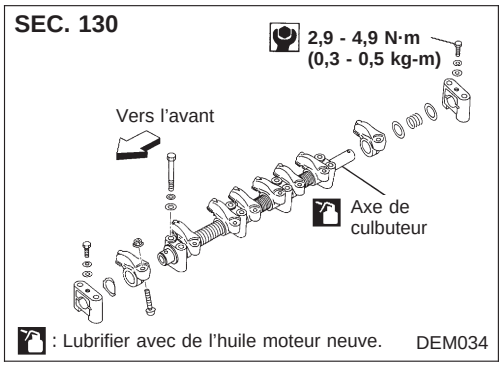
Inspection (Suite)

MESURE DE LA DISTANCE ENTRE LA CULASSE ET LA SOUPAPE

Mesurer la distance entre la surface de culasse et les soupapes d'admission et d'échappement. Si la distance spécifiée est dépassée, remplacer la(les) soupape(s) ou le(s) siège(s) de soupape(s).

Distance spécifiée : mm

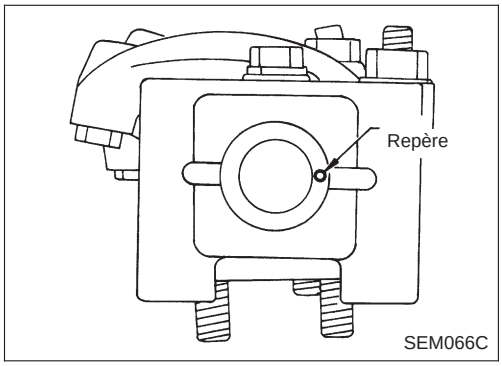
Standard



Admission et échappement

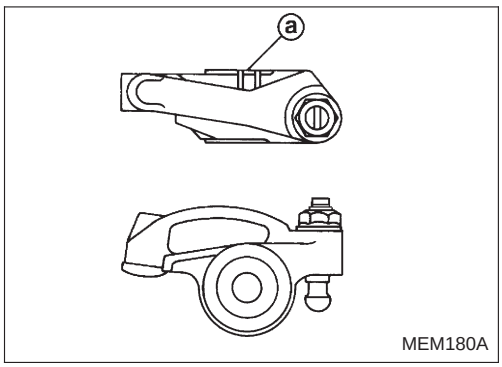
0,7 - 1,3

Limite



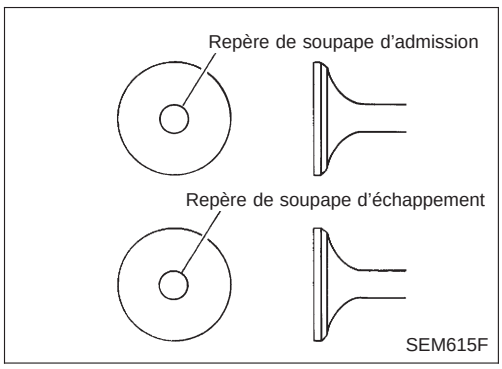
Moins de 1,7 pour les soupapes d'admission et d'échappement

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Remontage

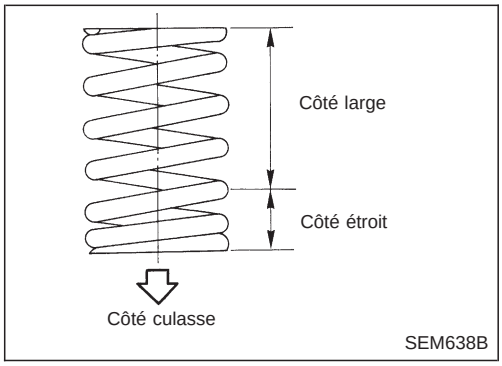
1. Remonter les pièces des composants de l'axe culbuteur.



- **Placer les marques poinçonnées vers l'avant du moteur.**

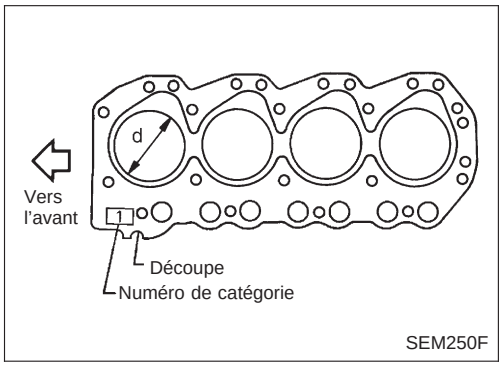
Identification des culbuteurs

Repère d'identification (à la surface ⓐ du culbuteur)	A utiliser avec
Deux lignes	Admission
Aucune ligne	Echappement



2. Monter les divers éléments de la soupape.

Identification des soupapes



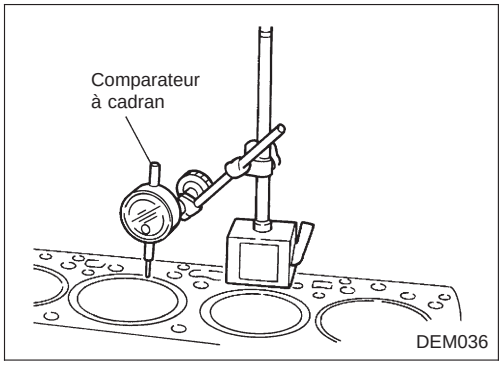
Repère d'identification (sur la soupape d'admission et d'échappement)		Moteur
Soupape d'admission	Soupape d'échappement	
2	B	TD25

- **Toujours utiliser un joint d'huile de soupape neuf (se reporter à EM-69).**

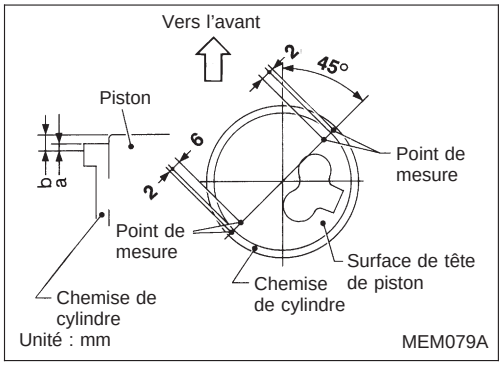
- **Reposer le ressort de soupape (à spires inégales), avec le côté étroit tourné vers la culasse.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Repose



1. Reposer le joint de culasse.



Identification des joints de culasse

Identification de l'orifice de découpe (sur le joint de culasse)	Diamètre intérieur "d" mm	Moteur
2	94,4	TD25

a. Si le joint de culasse seul doit être remplacé, poser un joint de la même catégorie que celui déposé.

b. Lors du remplacement ou de la réparation du bloc-cylindres, de la culasse, du piston, de la bielle et du vilebrequin, sélectionner les joints plats comme suit :

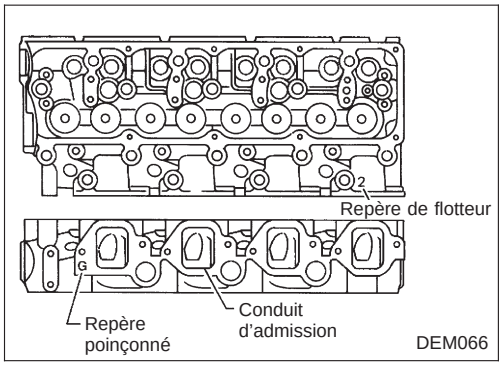
● **Choix de l'épaisseur de joint plat (moteur TD25)**

(1) Mesurer le dépassement du piston de la surface du bloc-cylindres.

a. Mesurer le dépassement a et a' (hauteur de la chemise de cylindre au dessus du bloc-cylindres) en deux points pour chaque cylindre.

b. Mesurer le dépassement b et b' (hauteur du piston au dessus du bloc-cylindres) en deux points, lorsque le piston est au point mort haut.

c. Calculer la hauteur de dépassement du piston au dessus de la chemise de cylindre b - a (b′ - a′).



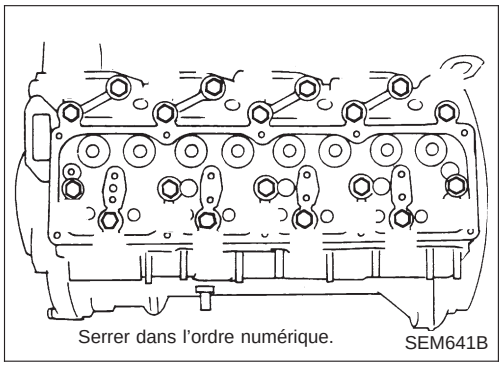
d. Calculer la valeur moyenne des deux dépassements H_L pour chaque piston (hauteur du piston au dessus de la chemise de cylindre).

(2) Choisir le joint de culasse adéquat correspondant à la plus grande quantité de dépassement des quatre pistons.

Unité : mm

Valeurs moyennes des dépassements de piston H_L	Epaisseur du joint		Numéro de catégorie du joint
	Pièces neuves	Sous forme d'ensemble	
Moins de 0,168	1,35	1,20	2
0,168 - 0,218	1,40	1,25	3
Plus de 0,218	1,45	1,30	4

S'assurer que le piston n° 1 est au P.M.H. dans sa course de compression.

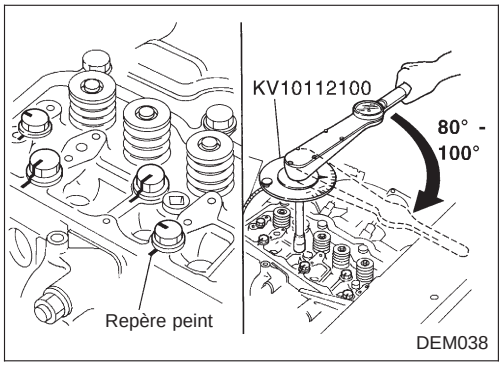


2. Reposer la culasse.

Repère d'identification de la culasse

Numéro d'identification (sur la culasse)		Moteur
Repère de flotteur	Repère poinçonné	
2	L	TD25

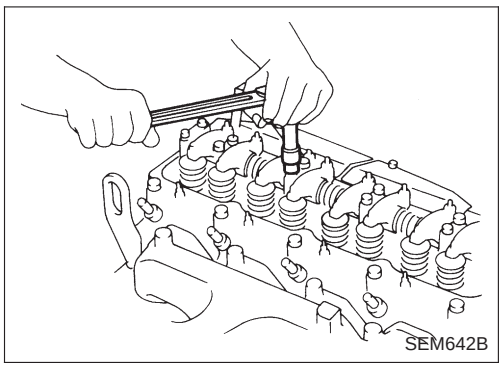
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



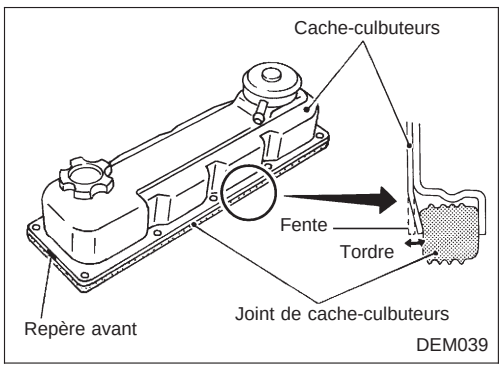
Repose (Suite)

3. Appliquer de l'huile moteur sur les filets et les épaulements des boulons et serrer les boulons de culasse à l'aide de l'outil adéquat.

ATTENTION :



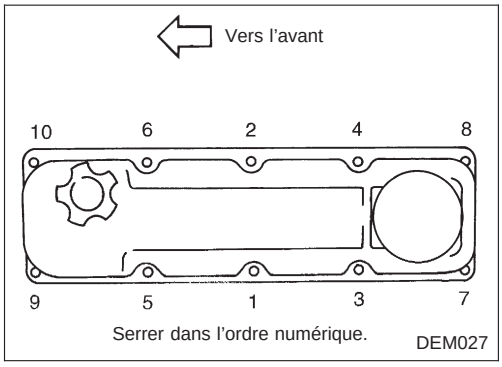
- **Procédure de serrage**
  1er : Serrer les boulons au couple de 39 - 44 N·m (4,0 - 4,5 kg-m).
  2nd : Serrer les boulons au couple de 59 - 64 N·m (6,0 - 4,5 kg-m).



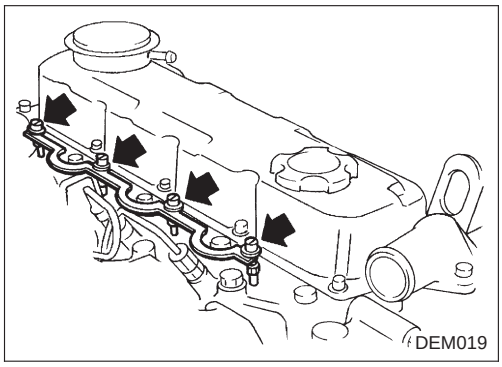
3ème :

(1) Tracer un repère à la peinture sur le côté échappement de la culasse et des boulons de culasse comme indiqué.
(2) Tourner tous les boulons de 90±10 degrés dans le sens des aiguilles d'une montre.
(3) Vérifier que le repère peint sur chaque boulon est face à l'avant du véhicule.

- **Toujours vérifier l'angle de serrage du boulon au moyen d'une clé angulaire ou d'un rapporteur. Ne pas contrôler visuellement.**

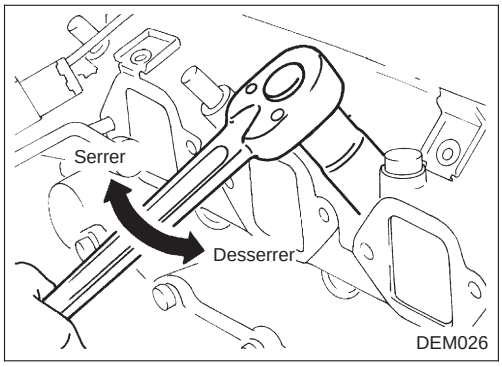


4. Appliquer de l'huile moteur et reposer les tiges de poussoirs.
5. Reposer l'axe de culbuteur.
   Régler provisoirement le jeu des soupapes d'admission et d'échappement.
   Se reporter à ''Réglage du jeu des soupapes d'admission et d'échappement'' au chapitre ''ENTRETIEN DU MOTEUR'' dans la section MA.

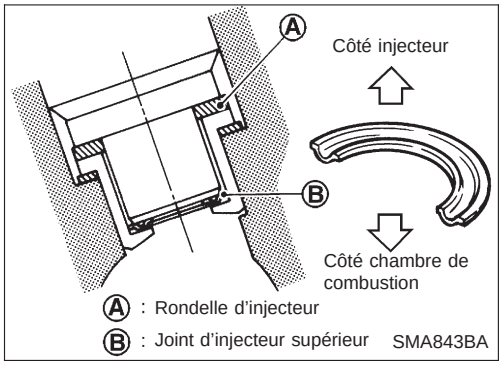


6. Reposer l'ensemble de cache-culbuteurs.

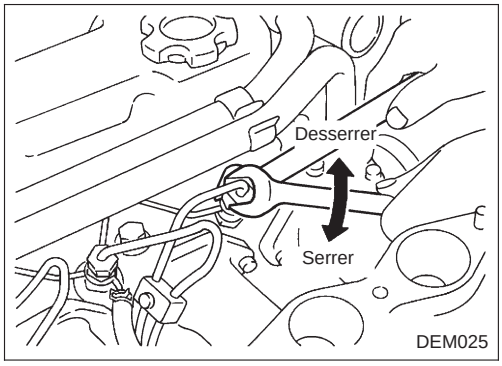
- S'assurer que le repère ''F'' sur la plaque du cache-culbuteurs est dirigé vers le haut et se trouve à l'extrémité avant.
- Lors du remplacement du joint de cache-culbuteurs, tordre légèrement la fente de la tôle chicane du cache-culbuteurs, afin de maintenir le joint. Ne pas tordre le joint.
- **Serrer les boulons dans l'ordre numérique et au couple prescrit (comme indiqué dans l'illustration ci-en haut).**



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

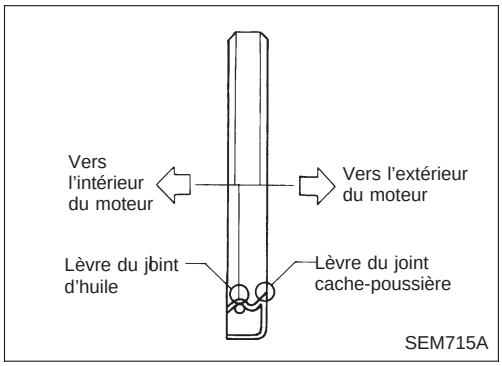


Repose (Suite)

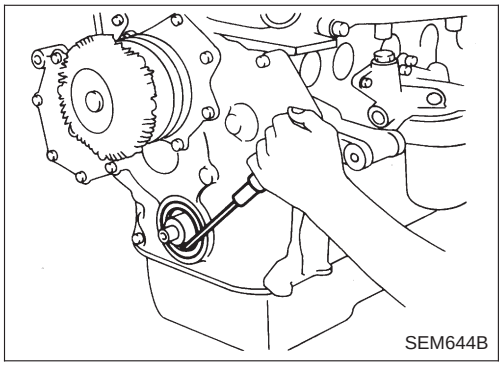


7. Reposer les bougies et la plaque de préchauffage.

8. Reposer un joint d'injecteur supérieur neuf et l'injecteur.
- **Toujours remplacer le joint d'injecteur et la rondelle.**



9. Reposer le tube de trop-plein et le tuyau d'injection.

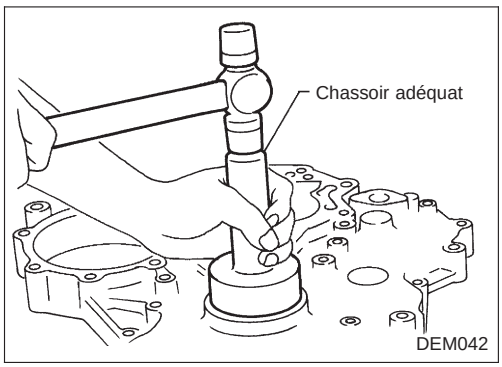


10. Brancher le flexible d'entrée d'eau du logement de thermostat et le flexible du radiateur.
11. Après avoir remonté toutes les pièces démontées, remplir le radiateur et le moteur de liquide de refroidissement neuf par l'orifice de remplissage.

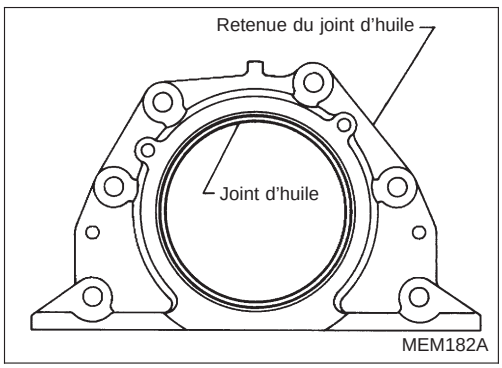
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SENS DE REPOSE DU JOINT D'HUILE

- Lors de la repose d'un joint avant ou arrière neuf, s'assurer que son sens de montage est correcte.



JOINT D'HUILE AVANT DE VILEBREQUIN

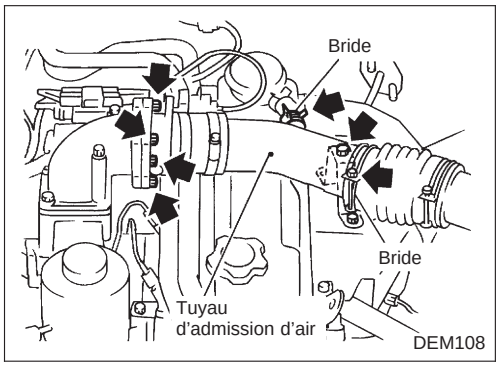


1. Déposer le capot de radiateur.
2. Déposer le ventilateur de refroidissement.
3. Déposer les courroies d'entraînement.
4. Déposer la poulie de vilebrequin.
5. Déposer le joint d'huile de vilebrequin.

- Veiller à ne pas endommager les surfaces d'étanchéité du vilebrequin.

6. Enduire d'huile moteur le joint d'huile neuf et le mettre en place.

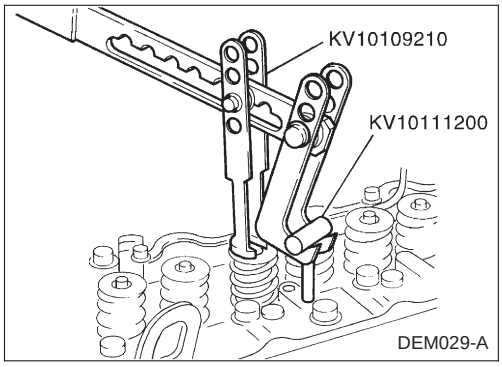
- Enfoncer le joint d'huile jusqu'à ce qu'il entre en contact avec le couvercle avant.



JOINT D'HUILE ARRIERE DE VILEBREQUIN

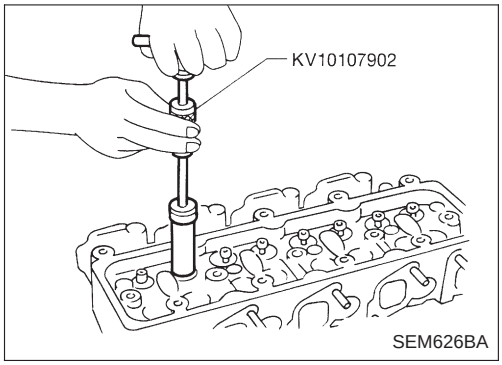
1. Démonter la boîte de vitesses.
2. Déposer l'ensemble de couvercle d'embrayage.
3. Déposer le volant et la plaque arrière.
4. Déposer le carter d'huile et le joint plat de carter d'huile.
5. Déposer l'ensemble de retenue de joint d'huile et le joint plat de retenue.

- **Remplacer le joint d'huile et l'ensemble de retenue comme un tout (type monobloc combiné avec un joint d'huile).**

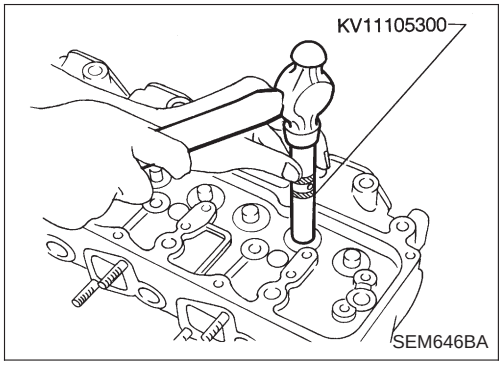


6. Enduire d'huile moteur le joint d'huile et mettre en place une nouvelle pièce de retenue de joint d'huile.

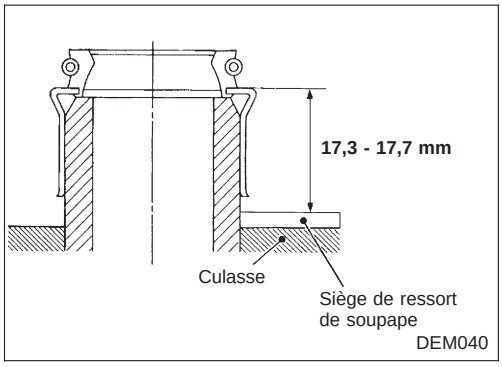
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



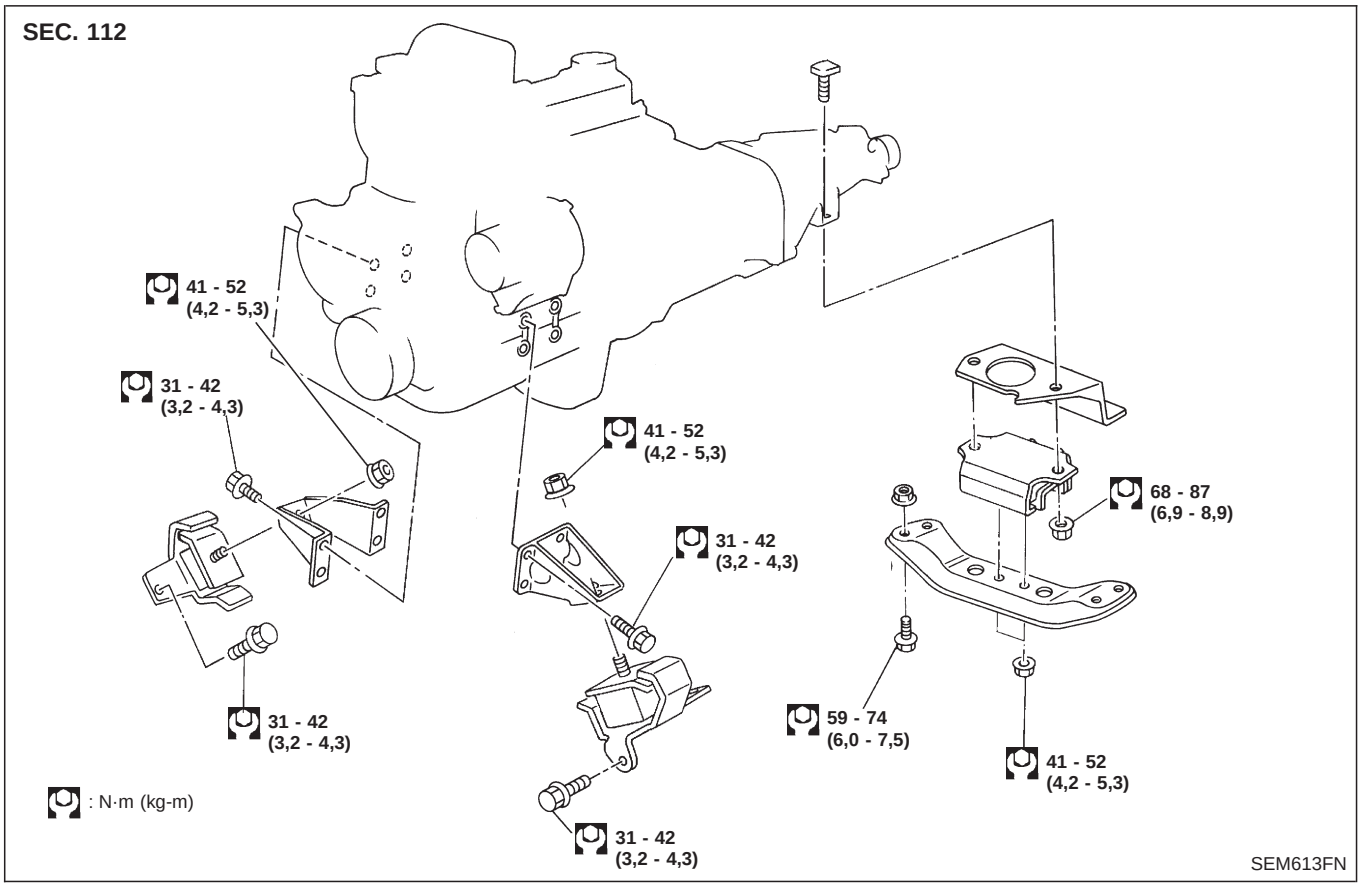
JOINT D'HUILE DE QUEUE DE SOUPAPE



1. Déposer les pièces suivantes.
- Chambre de papillon et tuyau d'admission d'air



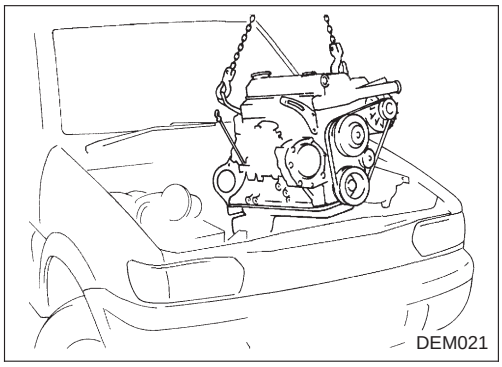
2. Déposer le cache-culbuteurs.
3. Déposer l'ensemble de l'axe des culbuteurs.
4. Déposer le ressort de soupape.



5. Déposer les joints d'huile de soupape.

6. Appliquer de l'huile moteur sur le joint d'huile de soupape et le mettre en place.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



AVERTISSEMENT :

- **Garer le véhicule sur un sol plat et dur.**
- **Placer des cales à l'avant et à l'arrière des roues arrière.**
- **Ne pas déposer le moteur tant que le circuit d'échappement n'a pas complètement refroidi.**
  Faute de quoi, on risque de se brûler et/ou de provoquer un incendie dans la conduite de carburant.
- **Veiller à soulever le moteur et la boîte de vitesses en toute sécurité.**
- **Pour les moteurs qui ne sont pas équipés d'élingues de levage moteur, utiliser les élingues et les boulons de levage appropriés décrits dans le CATALOGUE DES PIECES DETACHEES.**

ATTENTION :

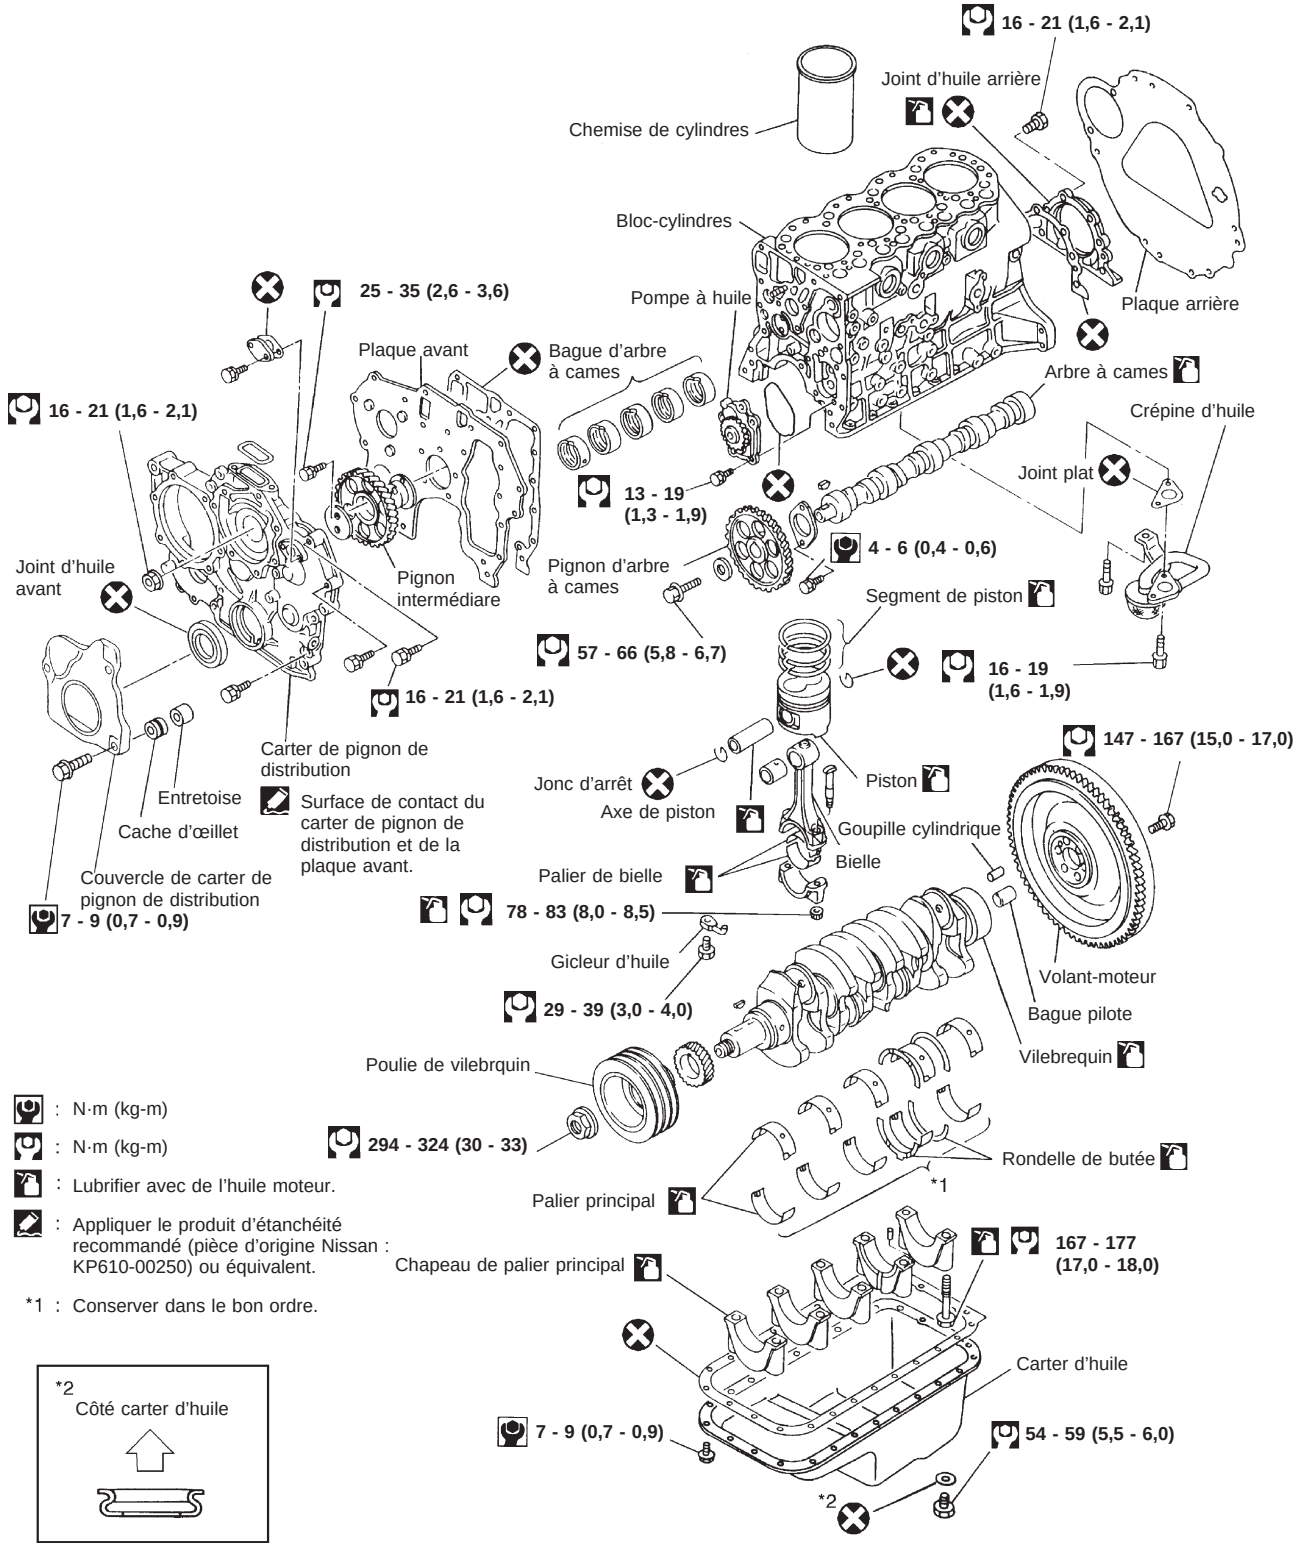
- **Lors du levage du moteur, veiller à ne pas heurter les pièces environnantes. Prendre particulièrement soin de la gaine du câble d'accélérateur, des conduites de frein et du maître-cylindre de frein.**
- **Lorsque l'on soulève le moteur, toujours utiliser les élingues en toute sécurité.**
- **Pour les modèles à 4 roues motrices, appliquer un joint d'étanchéité entre le moteur et la boîte de vitesses. Se reporter à la section MT (''Dépose et repose'').**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Dépose

1. Déposer la protection inférieure du moteur et le capot.
2. Vidanger le liquide de refroidissement.
3. Déposer les flexibles à dépression, les tuyaux de carburant, les câbles, les faisceaux, les connecteurs, etc.
4. Déposer le radiateur, son capot et le ventilateur de refroidissement.
5. Déposer les courroies d'entraînement.
6. Déposer la pompe à huile de direction assistée et le compresseur de climatiseur.
7. Déposer le tuyau d'échappement avant.
8. Déposer la boîte de vitesses du véhicule.

Se reporter à la section MT.



9. Installer les élingues de levage moteur.
10. Soulever le moteur au moyen des élingues de levage et déposer les boulons de fixation du moteur des deux côtés.
11. Déposer le moteur du véhicule.

Repose

- Reposer dans l'ordre inverse de la dépose.

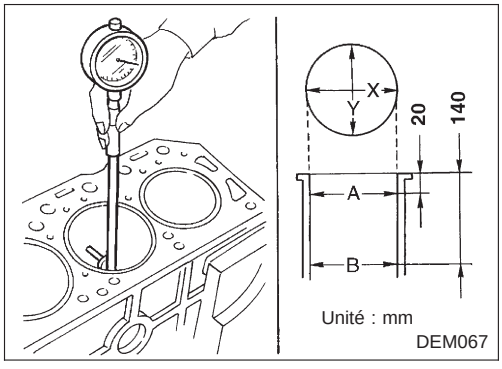
19. Déposer le chapeau de palier et le vilebrequin.
Conserver les paliers et ses chapeaux dans l'ordre convenable.

Inspection et remplacement

DEFORMATION DU BLOC-CYLINDRES

Si hors spécification, le remplacer.

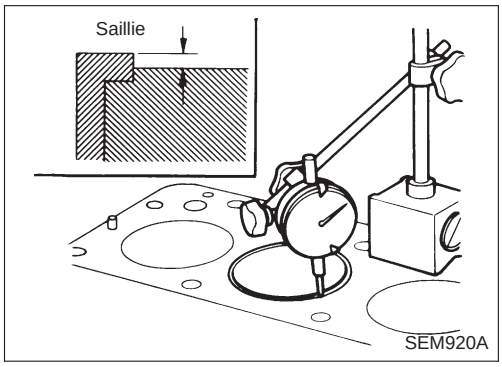


Déformation du bloc-cylindres : mm
Standard : moins de 0,05
Limite 0,2

SEM038

- Eliminer toutes les traces de joint du bloc-cylindres. Lors de la dépose du joint, ne pas laisser des morceaux de ce dernier pénétrer dans les passages d'huile et d'eau de refroidissement.

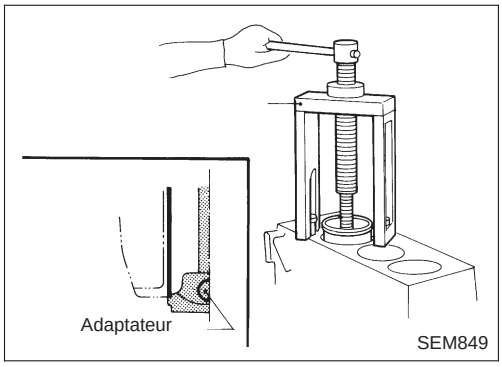
USURE DE LA CHEMISE DE CYLINDRE



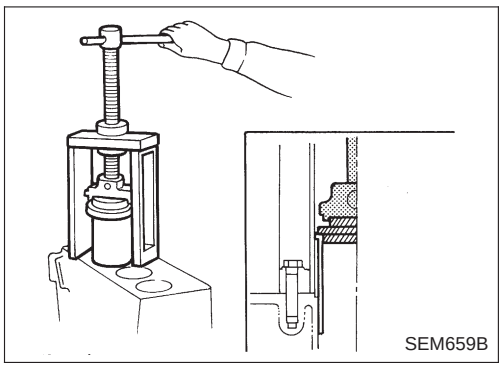
Unité : mm
DEM067

1. A l'aide d'une jauge d'alésage, mesurer l'alésage de la chemise de cylindre en recherchant s'il y a faux-rond et conicité. Si hors spécification, remplacer la chemise de cylindre.
   Diamètre interne standard :
   92,900 - 92,930 mm
   Se reporter aux SDS, EM-104.
   Limite d'usure :
   0,20 mm
   Faux-rond (X − Y) standard :
   0,020 mm
   Conicité (A − B) standard :
   0,020 mm
2. Rechercher des traces de rayures ou de grippage. Si l'on constate des traces de grippage, remplacer la chemise de cylindre.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



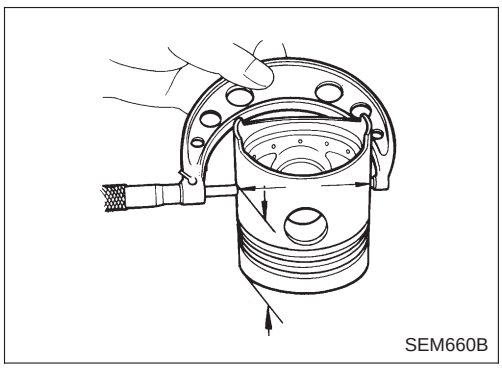
Inspection et remplacement (Suite)



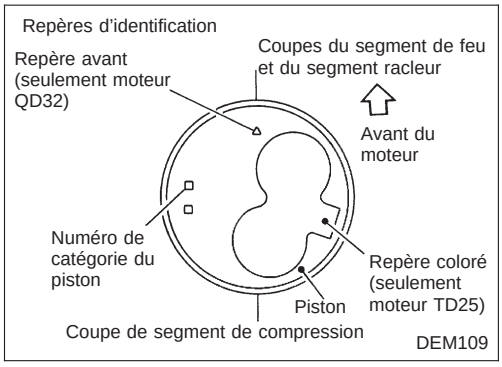
3. Vérifier la mesure du dépassement de la chemise de cylindre.
   Dépassement de la chemise de cylindre
   Standard
   0,02 - 0,09 mm
   Déviation de chaque cylindre :
   Moins de 0,05 mm

CHEMISE DE CYLINDRE

Remplacement



1. Déposer la chemise de cylindre à l'aide de l'outil spécial.

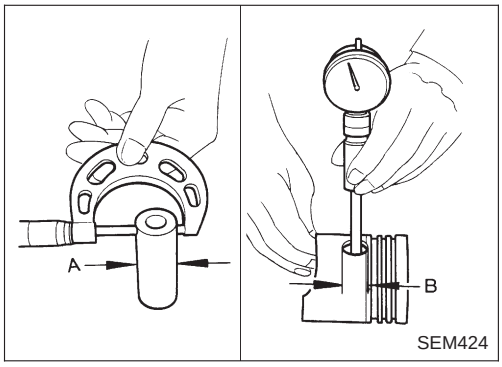


2. Reposer la chemise de cylindre à l'aide de l'outil spécial.
3. Vérifier la mesure du dépassement de la chemise de cylindre.

JEU ENTRE LE PISTON ET LA PAROI DU CYLINDRE

1. Mesurer le diamètre du piston et l'alésage des cylindres.
   Diamètre de piston ''A'' :
   Se reporter aux SDS, EM-105.
   Point de mesure ''a''
   (distance à partir du haut) : mm
   70
2. Vérifier si le jeu du piston est dans la gamme spécifiée.
   Jeu du piston :
   0,05 - 0,07 mm

Combinaison du piston et de l'alésage du cylindre

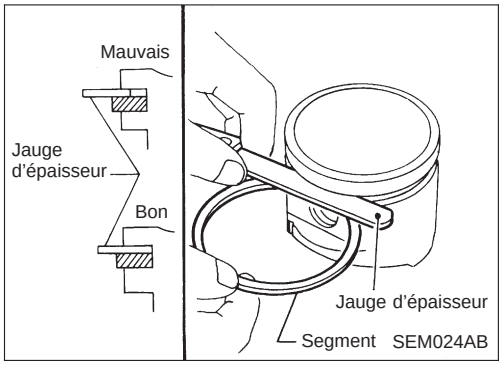


Utiliser la même catégorie de pistons pour un même moteur.

Numéro de catégorie de l'alésage de cylindre	Numéro de catégorie du piston		
	1	2	3
1	Bon	Mauvais	Mauvais
2	Possible	Bon	Mauvais
3	Possible	Possible	Bon

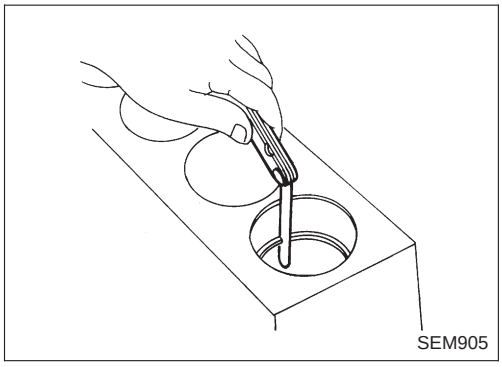
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection et remplacement (Suite)



Se reporter aux SDS, EM-104, pour trouver le numéro de catégorie de l'alésage du cylindre.

JEU ENTRE LE PISTON ET L'AXE DE PISTON

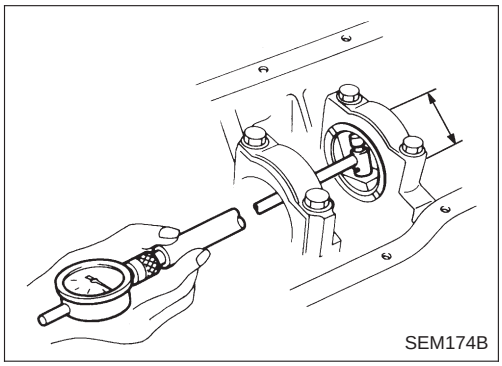


Vérifier le jeu entre les pistons et leurs axes.

Jeu (A − B) : mm
Standard
−0,003 à 0,012
Limite
Moins de 0,10

JEU LATERAL DU SEGMENT DE PISTON

Jeu latéral : mm
Segment de feu
0,06 - 0,10
Segment de compression
0,04 - 0,08
Segment racleur
0,02 - 0,06
Limite maximum de jeu latéral : mm
Segment de feu 0,50
Segment de compression 0,30
Segment racleur 0,15



COUPE DE SEGMENT DE PISTON

Coupe de segment standard : mm
Segment de feu
0,30 - 0,45
Segment de compression
0,20 - 0,35
Segment racleur
0,15 - 0,35
Limite maximum de coupe de segment :
1,5 mm

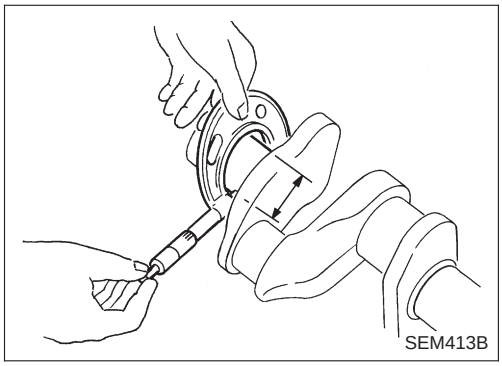
Inspection et remplacement (Suite)



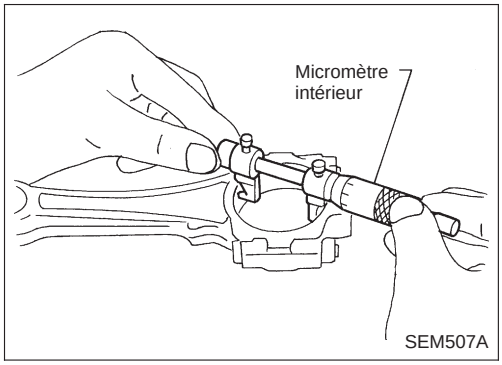
JEU DU PALIER PRINCIPAL

SEM174B

1. Monter les paliers principaux sur le bloc-cylindres et sur le chapeau de palier principal.
2. Monter le chapeau de palier principal sur le bloc-cylindres.

- **Appliquer de l'huile moteur sur la partie filetée et sur la surface d'appui des boulons.**
- **Serrer tous les boulons au couple spécifié, dans l'ordre prescrit et en deux ou trois étapes. Se reporter à EM-89.**

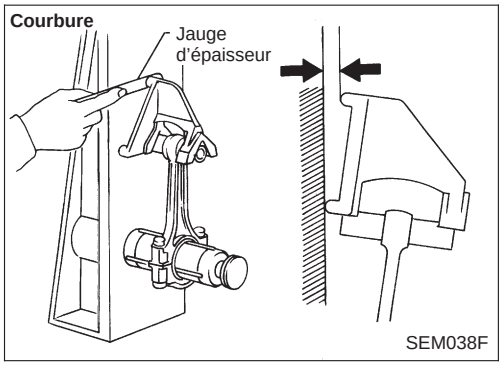
3. Mesurer le diamètre intérieur ''A'' de chaque palier principal.



SEM413B

4. Mesurer le diamètre extérieur ''Dm'' du tourillon principal du vilebrequin.
5. Calculer le jeu du palier principal.
   Jeu de palier principal = A − Dm
   Standard :
   0,035 - 0,087 mm
   Limite :
   Moins de 0,15 mm

JEU DE PALIER DE BIELLE

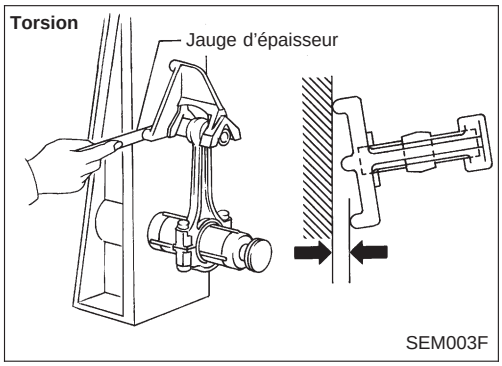


1. Monter le palier de bielle sur la bielle et le chapeau.
2. Monter le chapeau de bielle sur la bielle, puis serrer au couple spécifié.

Appliquer de l'huile moteur sur la partie filetée des boulons et sur la surface d'assise des écrous.

SEM507A

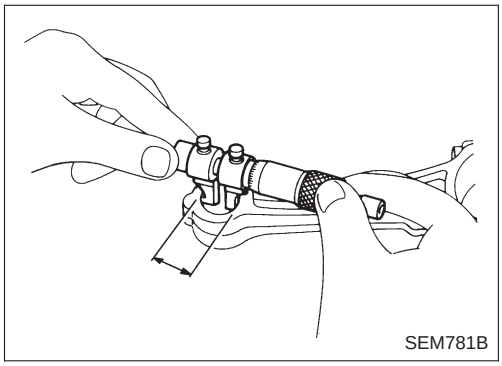
3. Mesurer le diamètre interne ''A'' du palier.
4. Mesurer le diamètre extérieur ''Dp'' du maneton de vilebrequin.
5. Calculer le jeu de palier de bielle.
   Jeu de palier de bielle = A − Dp
   Standard :
   0,035 - 0,081 mm
   Limite :
   Moins de 0,15 mm



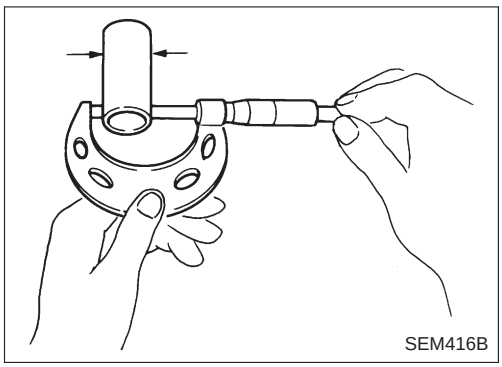
SEM038F

COURBURE ET TORSION DES BIELLES

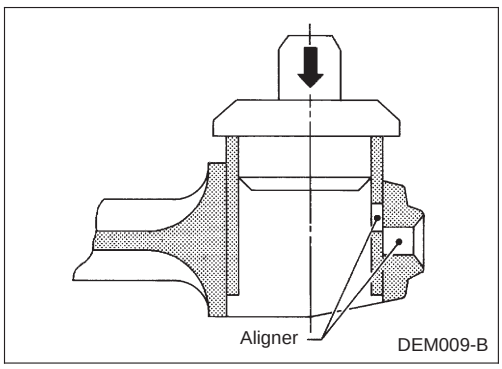
Courbure et torsion : mm
Limite
0,075 par longueur de 100



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



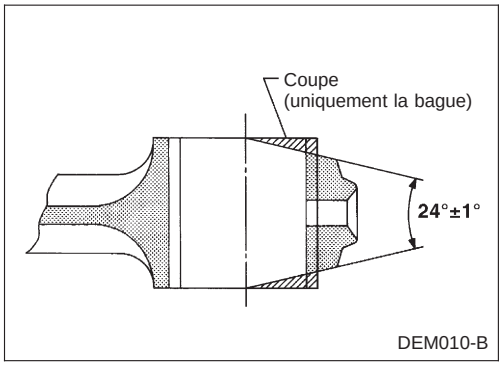
Inspection et remplacement (Suite)



JEU DE LA BAGUE DE PIED DE BIELLE

1. Mesurer le diamètre interne ''A'' des bagues de pied de bielle.

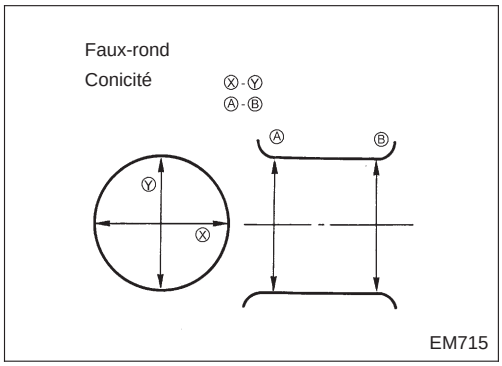
2. Mesurer le diamètre externe ''D'' de l'axe de piston.
3. Calculer le jeu de la bague de pied de bielle.
   Jeu de la bague de pied de bielle = A − D
   Standard :
   0,025 - 0,045 mm
   Limite :
   0,15 mm



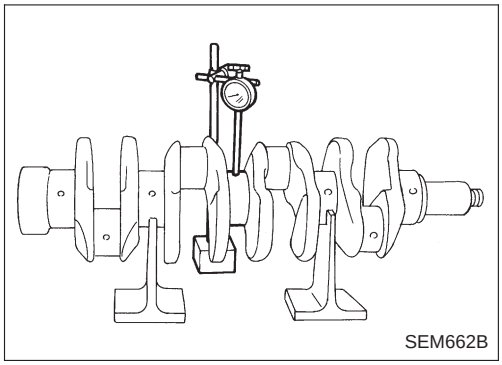
REMPLACEMENT DE LA BAGUE DE PIED DE BIELLE

1. Insérer la bague de pied de bielle jusqu'à ce qu'elle soit au même niveau que l'extrémité de la bielle.

Veiller à aligner correctement les orifices d'huile.

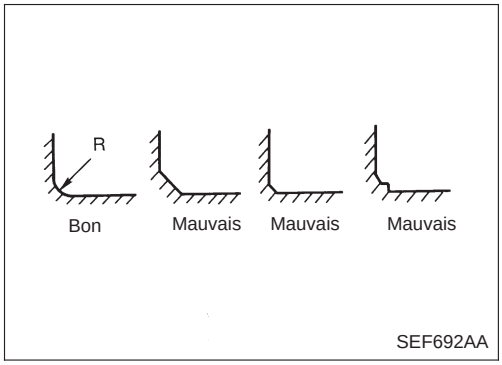


2. Lorsque la bague de pied de bielle est introduite, aléser la bague.
   Diamètre intérieur de la bague de pied de bielle : mm
   Taille finie
   TD25
   30,025 - 30,038
3. Usiner la bague de telle sorte qu'elle soit au niveau de la surface conique du pied de bielle.
4. Eliminer les bavures sur la bague usinée.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection et remplacement (Suite)



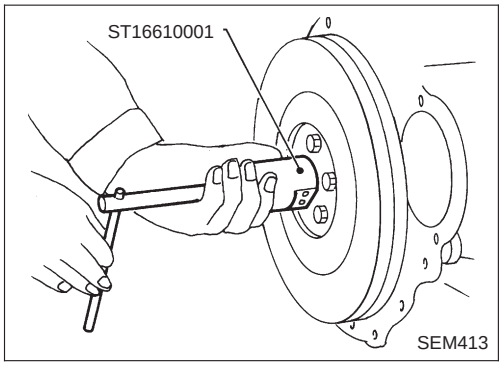
VILEBREQUIN

1. Vérifier si les tourillons et les manetons de vilebrequin ne sont pas rayés, usés en cône, usés ou fissurés. En cas de défaut mineur rectifier avec un tissu fin à polir.
2. Mesurer les tourillons et manetons avec un micromètre, pour rechercher conicité ou faux-rond.
   Faux-rond (X − Y) : mm
   Standard
   Moins de 0,01
   Limite
   0,02
   Conicité (A − B) : mm
   Standard
   Moins de 0,01
   Limite
   0,02

3. Vérifier le voile du vilebrequin.
   Voile [TIR (indication totale du comparateur)] : mm
   Standard
   0 - 0,03
   Limite
   0,10

RECTIFICATION DU TOURILLON ET DU MANETON DE VILEBREQUIN

Lorsque l'on utilise des paliers principaux et des paliers de bielles sous-dimensionnés, la finition des tourillons et des manetons de vilebrequin doit correspondre aux paliers.

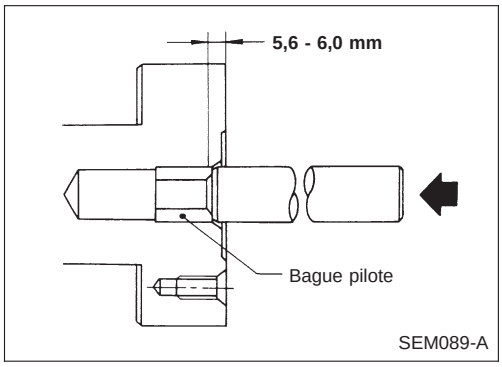


R : Tourillon de vilebrequin 3,0 mm
Maneton 3,5 mm

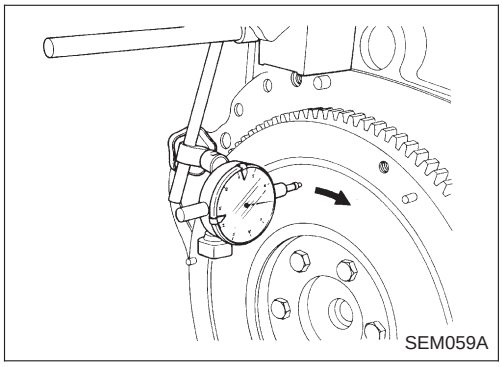
ATTENTION :

- **S'assurer par la même occasion que la largeur de la surface n'augmente pas.**
- **Ne pas tenter de rectifier le contrepoids du vilebrequin.**

BAGUE PILOTE DE VILEBREQUIN



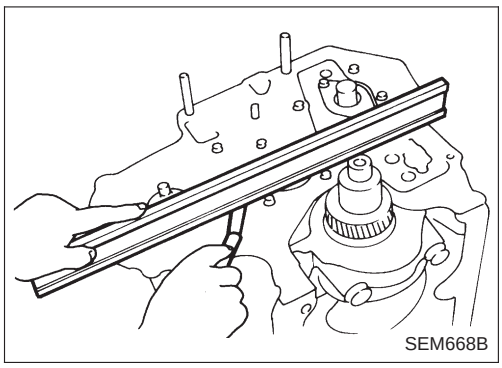
Remplacement



1. Extraire la bague au moyen de l'outil.

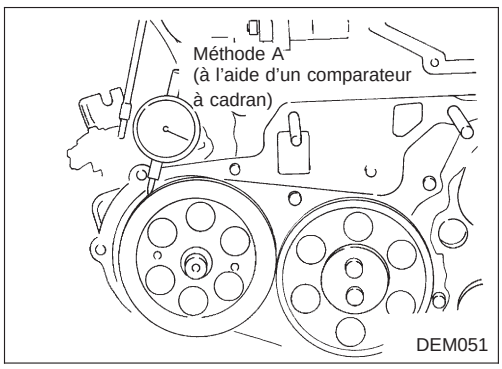
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection et remplacement (Suite)



2. Insérer la bague pilote jusqu'à ce que la distance entre l'extrémité du flasque et la bague soit à la valeur spécifiée.
   Distance :
   Env. 5,6 - 6,0 mm

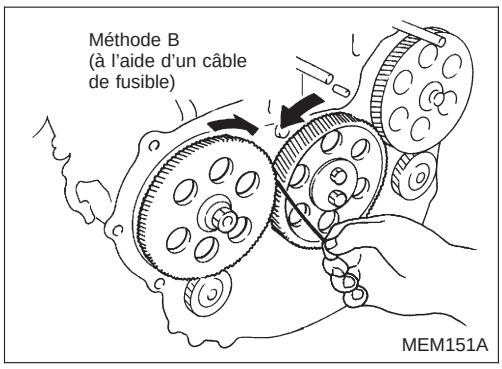
VOILE DU VOLANT-MOTEUR



Voile (indication totale du comparateur) :
Moins de 0,15 mm

PLAQUE AVANT

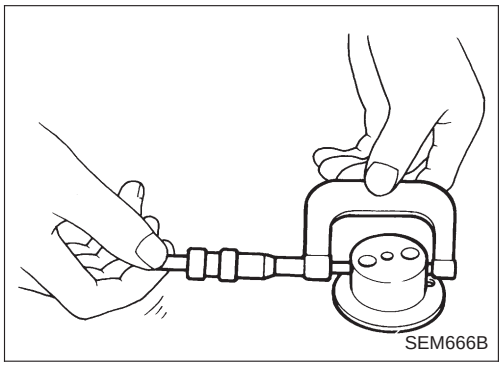
Vérifier que la plaque avant ne présente pas de déformations. Si elle est hors spécifications, applatir ou remplacer la plaque avant.



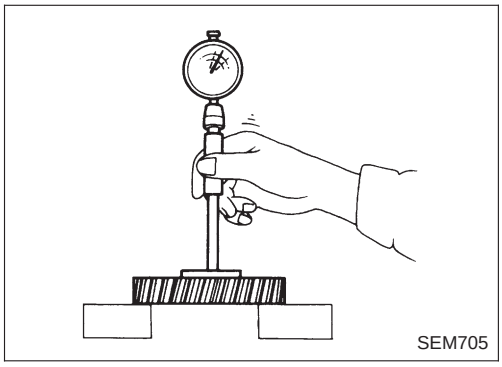
Limite de déformation :
0,2 mm

TRAIN DE PIGNONS

Pignon d'entraînement d'arbre à cames, pignon d'entraînement de pompe à injection, pignon de pompe à huile, pignon intermédiaire et pignon de vilebrequin



1. Si les dents et la clavette du pignon sont rayées ou excessivement endommagées, remplacer le pignon et la clavette.
2. Vérifier le jeu du train de pignons avant le démontage et après le remontage.
   Méthode A (à l'aide d'un comparateur à cadran)
   Méthode B (en utilisant un câble de fusible)
   Si hors spécification, remplacer le pignon.
   Battement : mm
   Standard
   0,07 - 0,11
   Limite
   0,20

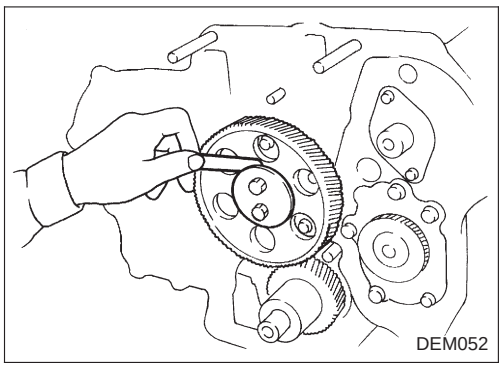


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection et remplacement (Suite)

JEU DE LA BAGUE DE PIGNON INTERMEDIAIRE

SEM666B

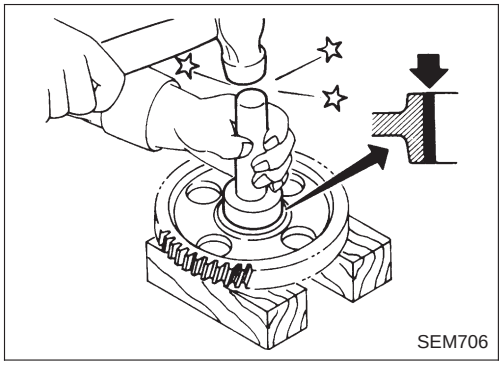


1. Mesurer le diamètre externe de l'arbre de pignon intermédiaire.

SEM705

2. Mesurer le diamètre interne de la bague de pignon intermédiaire.
3. Calculer le jeu de la bague de pignon intermédiaire.

Jeu de la bague : mm
Standard
0,025 - 0,061
Limite
0,20



JEU AXIAL DE PIGNON INTERMEDIAIRE

DEM052

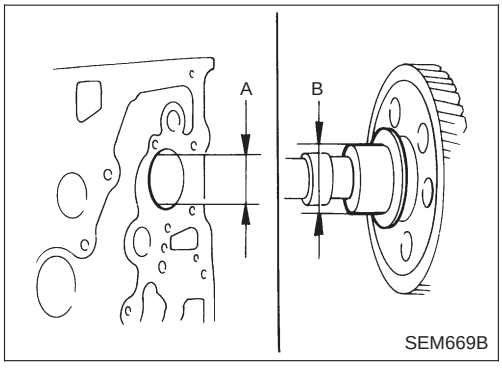
Mesurer le jeu axial de pignon intermédiaire entre la plaque à engrenages et le pignon.

Jeu axial de pignon intermédiaire : mm
Standard
0,03 - 0,14
Limite
Moins de 0,3

REMPLACEMENT DE LA BAGUE DE PIGNON INTERMEDIAIRE

SEM706

1. Utiliser un outil adéquat pour remplacer la bague.
2. Aléser la bague de pignon intermédiaire.



Taille finie :
42,00 - 42,02 mm

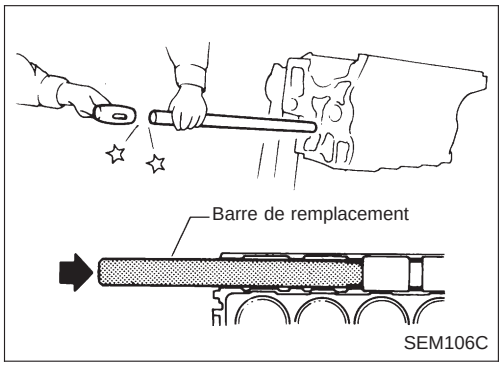
Arbre de pignon intermédiaire

Reposer l'arbre de pignon intermédiaire de telle sorte que l'orifice d'huile de l'arbre soit dirigé vers le haut.

ARBRE A CAMES ET BAGUE D'ARBRE A CAMES

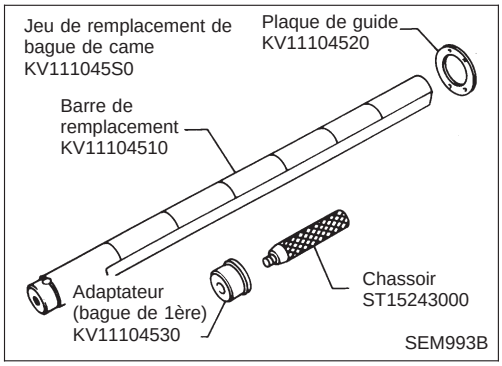
Jeu de la bague d'arbre à cames

SEM669B



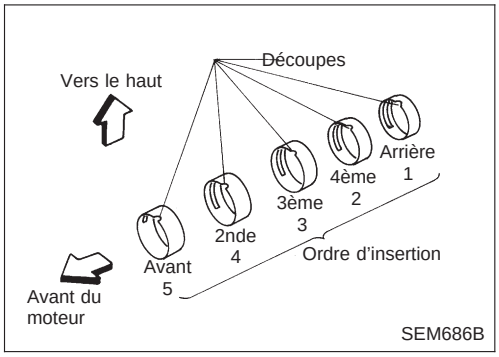
Mesurer le diamètre interne de la bague d'arbre à cames et le diamètre externe du tourillon d'arbre à cames à l'aide d'un comparateur adéquat.

Jeu entre l'arbre à cames et la bague (A − B) : mm
Standard
0,020 - 0,109
Limite
Moins de 0,15

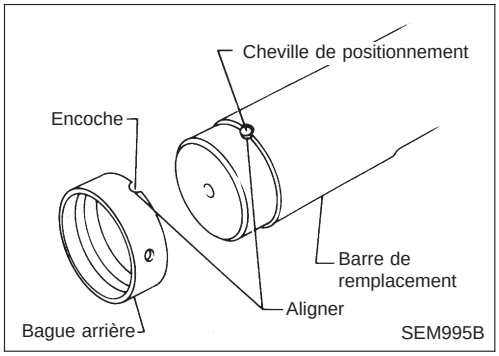


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

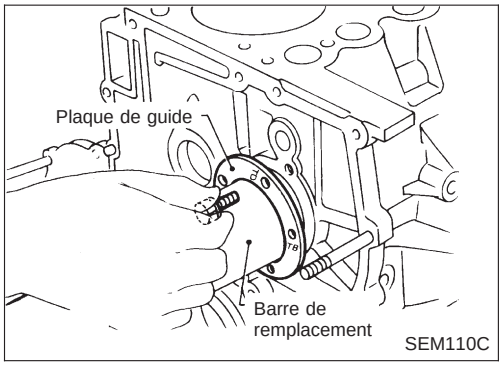
Inspection et remplacement (Suite)



REMPLACEMENT DE LA BAGUE D'ARBRE A CAMES



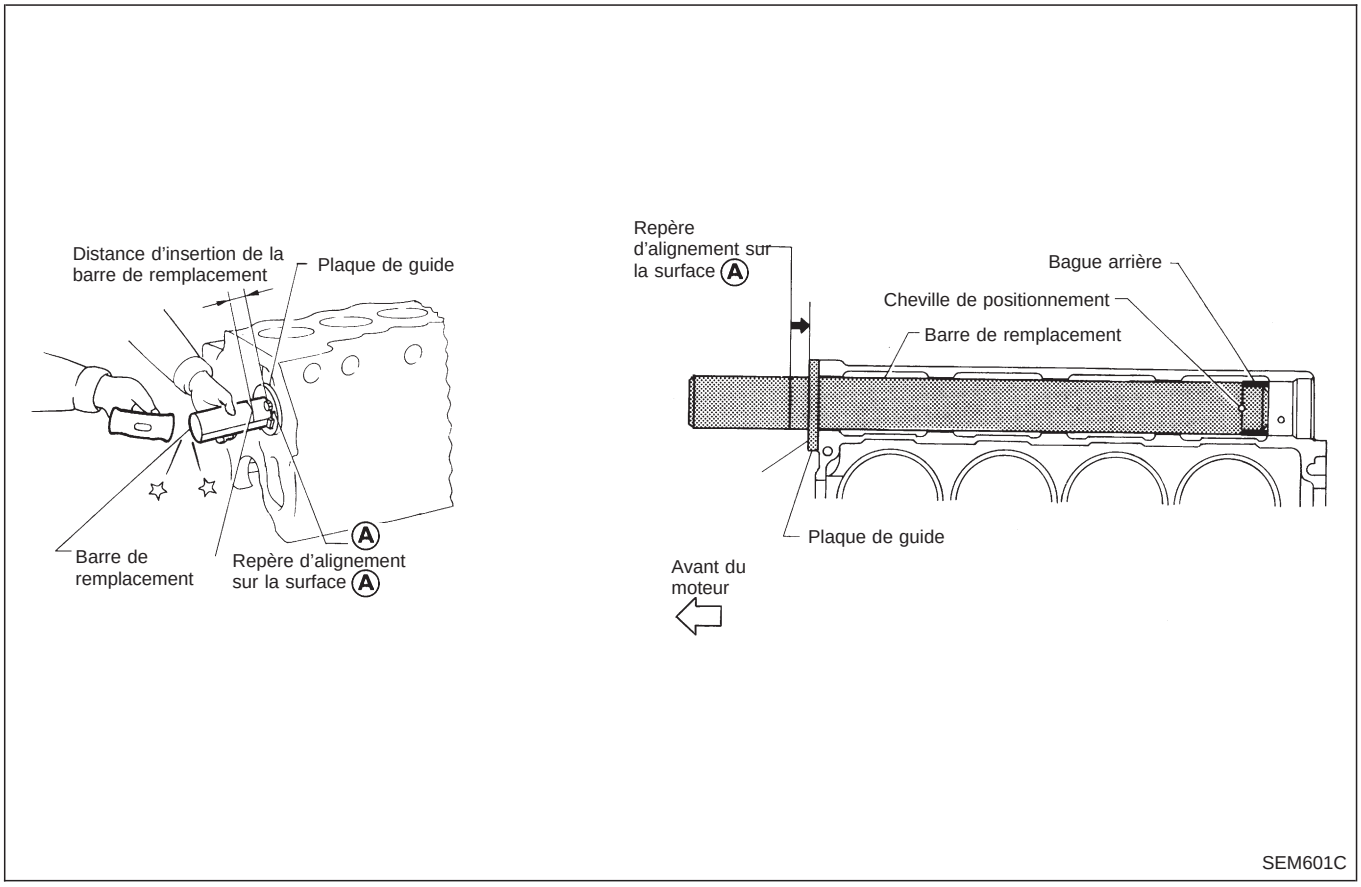
1. A l'aide de l'outil spécial, déposer les bagues d'arbre à cames du moteur. Certaines bagues doivent être cassées afin de pouvoir les déposer.



2. A l'aide de l'outil spécial, reposer les bagues d'arbre à cames comme suit :

(1) Reposer les bagues d'arbre à cames dans l'ordre suivant : ''arrière'', ''4ème'', ''3ème'', ''2nde'' et ''avant''. Toutes les bagues doivent être reposées de l'avant.
(2) Orienter la découpe vers le haut et vers l'avant du moteur lors de la repose.

(3) Bague d'arbre à cames arrière
- Aligner l'encoche de la bague arrière sur la cheville de positionnement de la barre de remplacement avant la repose.

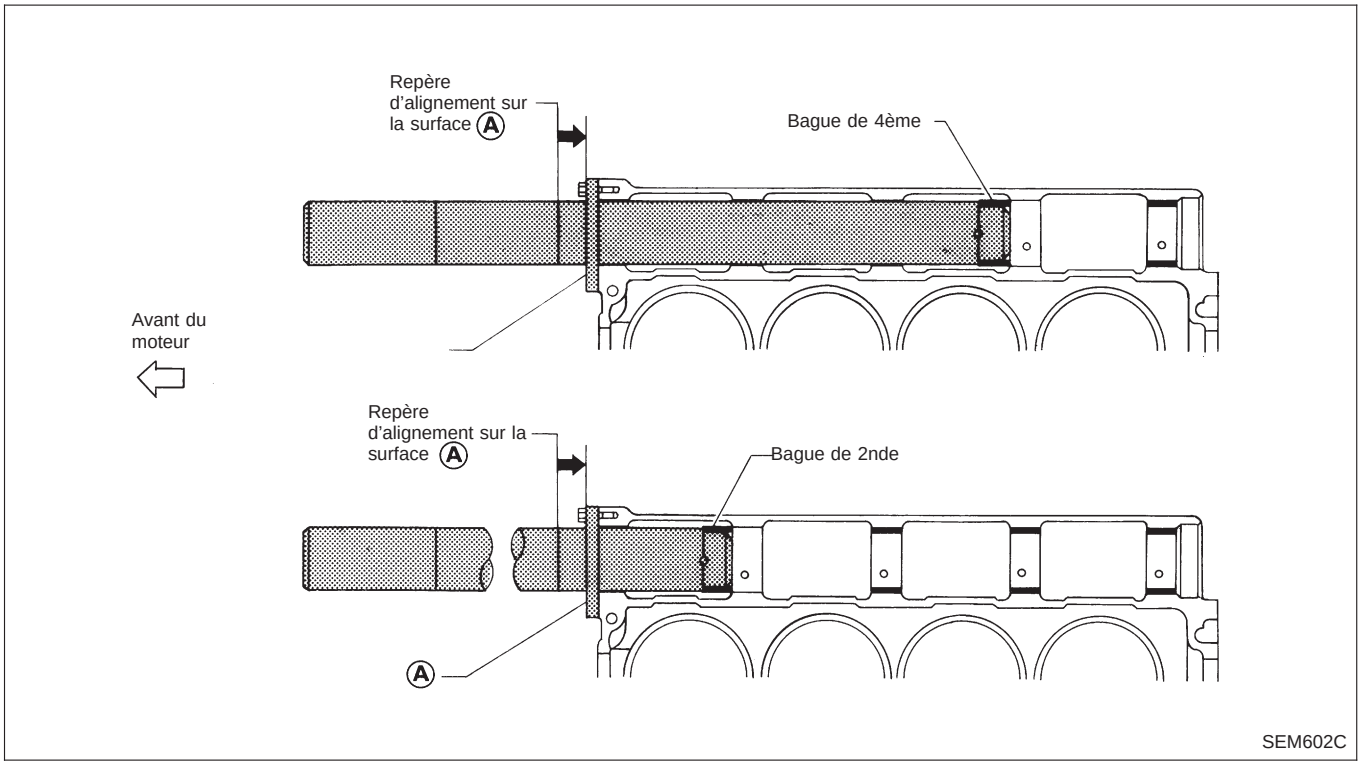


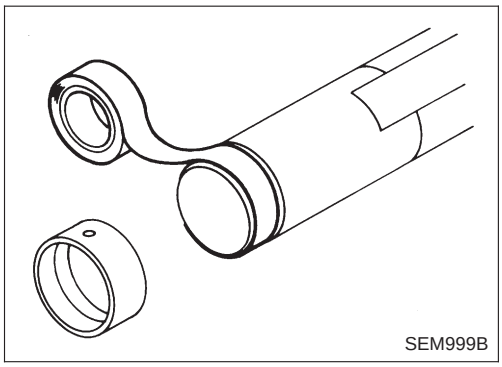
- Insérer la bague arrière avec la barre de remplacement dans le moteur.
  Reposer la plaque de guide avec les orifices de boulons (du côté du repère ''TD'') dirigés vers le haut du bloc-cylindres. Serrer les boulons.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection et remplacement (Suite)

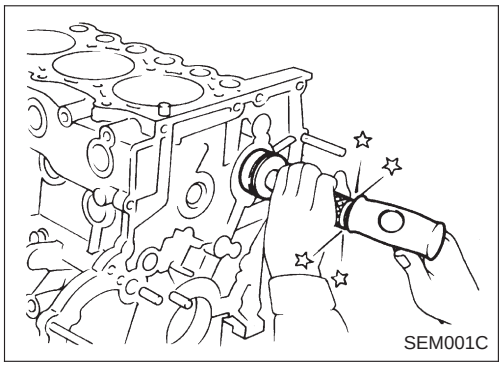
- Insérer la barre de remplacement jusqu'à ce que son repère d'alignement soit aligné sur l'extrémité du guide de remplacement.
  Déposer le jeu de remplacement.
  Après la repose, vérifier que les orifices d'huile des bagues d'arbre à cames sont correctement alignés sur ceux du bloc-cylindres.





Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

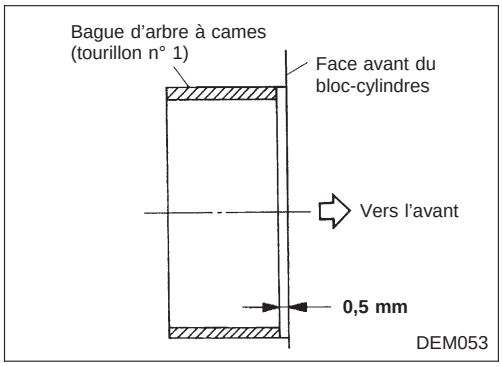
Inspection et remplacement (Suite)



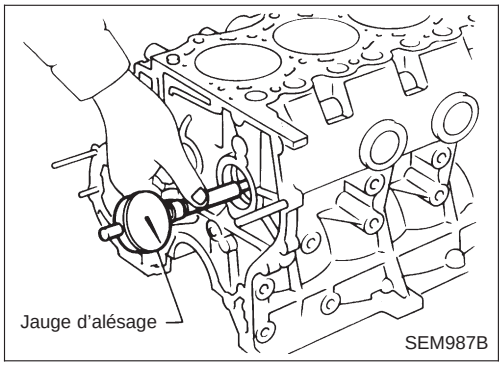
(4) Bagues d'arbre à cames de 4ème, 3ème et 2nde

- Reposer de la même manière que pour la bague d'arbre à cames arrière.

- Lors de l'installation des bagues de 4ème à 2nde sur la barre de remplacement, scotcher la barre afin d'empêcher tout mouvement.



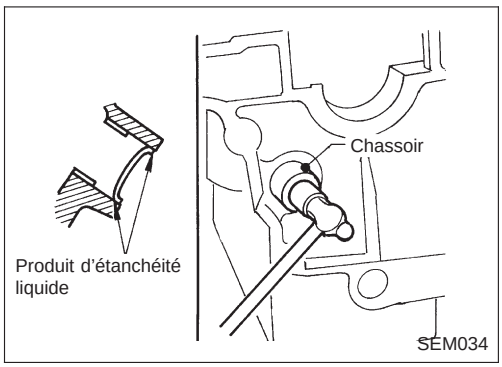
(5) Bague de l'arbre à cames avant



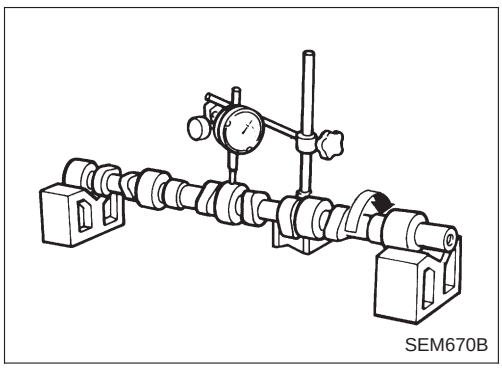
- A l'aide de l'adaptateur de bague de 1ère, placer la bague d'arbre à cames avant de telle sorte que l'orifice d'huile du bloc-cylindres soit aligné avec l'orifice d'huile de la bague.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection et remplacement (Suite)



- Enfoncer la bague jusqu'à ce que son extrémité avant dépasse de 0,5 mm de la surface avant du bloc-cylindres.

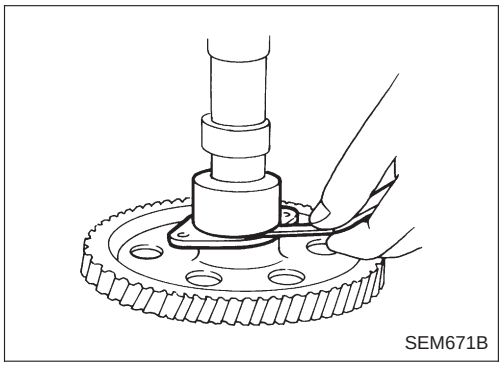


3. Vérifier le jeu de la bague d'arbre à cames.

Se reporter aux SDS, EM-103.

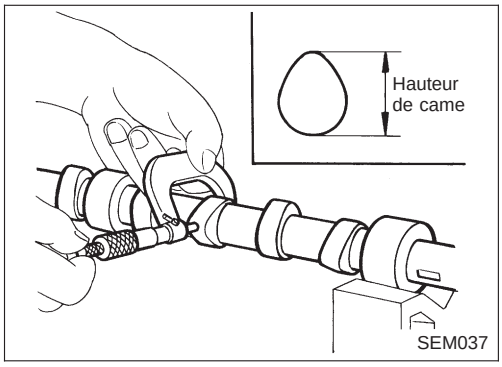
4. Reposer le bouchon aveugle neuf dans l'orifice de bague d'arbre à cames arrière à l'aide d'un chassoir.

Appliquer un joint d'étanchéité liquide.



ALIGNEMENT DE L'ARBRE A CAMES

1. Vérifier si le tourillon d'arbre à cames et la surface de came ne présentent pas de courbures, d'usure ou de dommages.
   Si le défaut est hors spécification, remplacer.
2. Vérifier la courbure de l'arbre à cames au niveau du tourillon central.
   Si la courbure est supérieure à la limite spécifiée, réparer ou remplacer l'arbre à cames.



Courbure de l'arbre à cames
(indication totale du comparateur) : mm
Standard
Moins de 0,02
Limite
Moins de 0,06

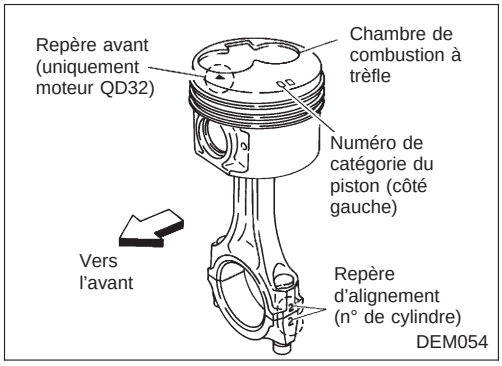
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection et remplacement (Suite)

SEM671B

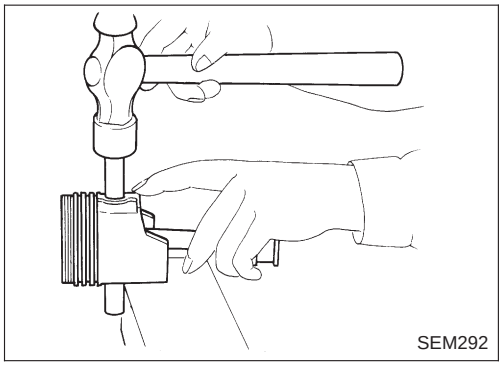
3. Mesurer le jeu axial d'arbre à cames entre la plaque de positionnement et le pignon. S'il est hors spécification, remplacer la plaque de positionnement de l'arbre à cames.
   Jeu axial d'arbre à cames : mm
   Standard
   0,08 - 0,28
   Limite
   Moins de 0,5

SEM037



4. Mesurer la hauteur des cames de l'arbre à cames. S'il est hors spécification, remplacer l'arbre à cames.
   Hauteur de came : mm
   Standard
   Admission
   41,88 - 41,92
   Echappement
   41,88 - 41,92
   Limite
   Admission
   Moins de 41,40
   Echappement
   Moins de 41,40

Remontage

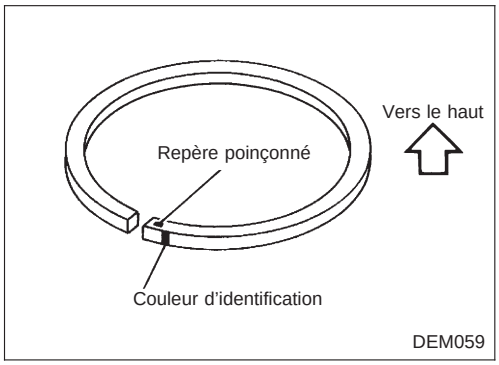


PISTON

Remonter les pistons, les axes de piston, les joncs d'arrêt et les bielles.

a. Les numéros qui sont matricés sur la bielle et le chapeau correspondent à chaque cylindre. On doit faire attention de ne pas intervertir les divers éléments, y compris les paliers.

DEM054



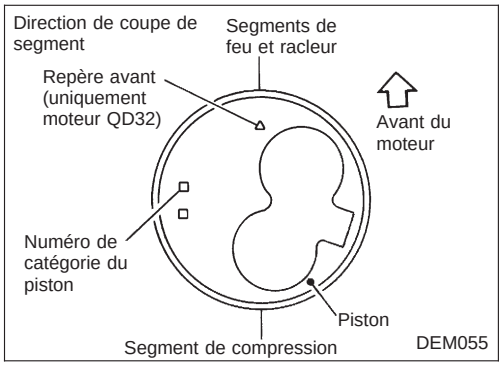
SEM292

b. Lors de l'introduction de l'axe de piston dans la bielle, chauffer le piston à l'aide d'un appareil de chauffage ou avec de l'eau chaude (environ 60 à 70°C), puis enduire d'huile moteur l'axe et le pied de bielle.

c. Après remontage, s'assurer que le piston bascule en douceur.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Remontage (Suite)



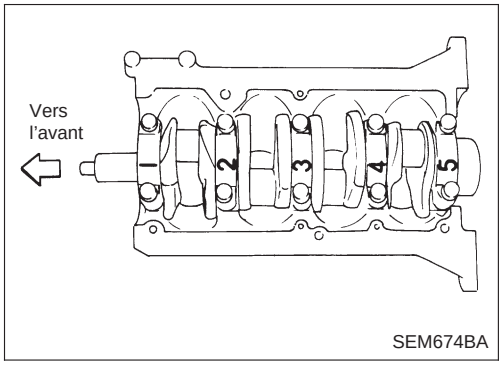
Reposer l'ensemble de pistons.

ATTENTION :

- **Tendre les segments de piston suffisamment pour qu'ils puissent s'adapter dans les rainures de piston.**
- **Toujours installer les segments de piston neufs en dirigeant leurs repères vers le haut.**

	Couleur d'identification
Segment de feu	Jaune
Segment de compression	Rouge

- **Reposer le segment de piston n° 1 de telle sorte que sa coupe soit orientée vers l'axe de piston ; puis reposer les segments de pistons de façon à ce que leurs coupes se trouvent à 180° les unes des autres.**



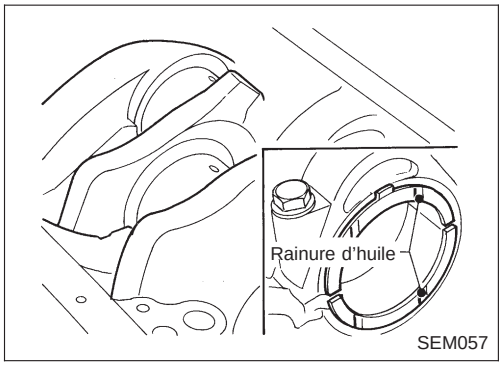
VILEBREQUIN

1. Reposer le vilebrequin.

(1) Poser les paliers principaux dans la position adéquate sur le bloc-cylindres.

a. Si le vilebrequin, le bloc-cylindres ou le palier principal est réutilisé, il est nécessaire de mesurer le jeu du palier principal.

b. Les paliers supérieurs sont dotés d'un orifice de passage d'huile et d'une rainure de graissage, ce qui n'est pas le cas pour les paliers inférieurs.



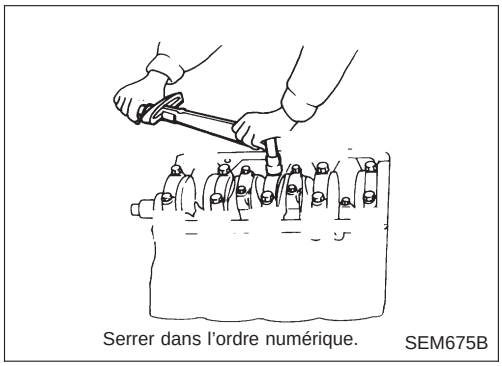
(2) Appliquer de l'huile moteur sur le tourillon et le maneton de vilebrequin, puis reposer le vilebrequin.

(3) Reposer les chapeaux de paliers principaux.

a. Reposer le chapeau de palier principal avec le numéro face à l'avant du véhicule.

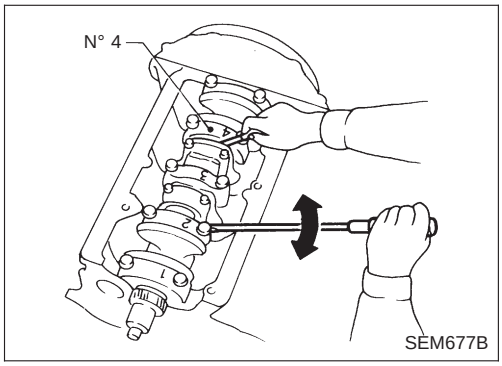
b. Appliquer de l'huile moteur sur les surfaces de contact du chapeau de palier principal et du bloc-cylindres.

c. Reposer le joint d'huile arrière. Appliquer de l'huile moteur sur la surface de contact de l'extrémité arrière du joint d'huile et du vilebrequin.



(4) Reposer la rondelle de butée du vilebrequin sur le 4ème tourillon en partant de l'avant.

Reposer la rondelle de butée de telle sorte que la rainure d'huile soit face au vilebrequin.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Remontage (Suite)

Serrer dans l'ordre numérique. SEM675B

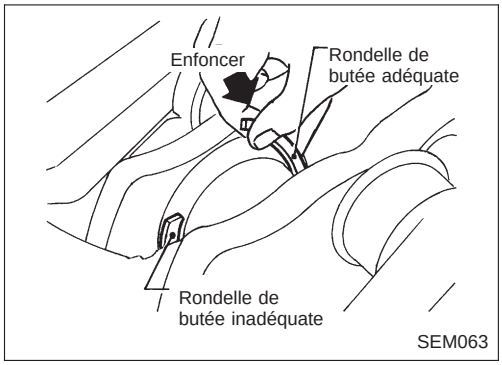
(5) Serrer progressivement les boulons de chapeaux de paliers principaux par étape, en commençant par deux ou trois étapes distinctes du palier central, et en progressant vers l'extérieur et en séquence.

: 167 - 177 N·m (17,0 - 18,0 kg-m)

SEM677B

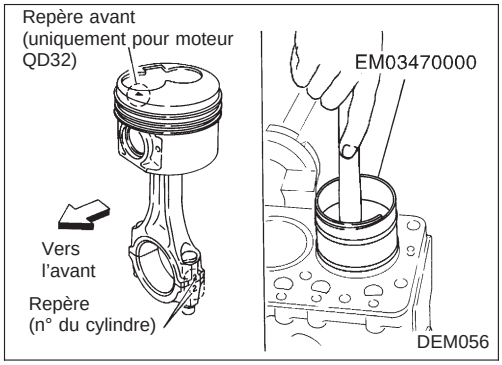
(6) Mesurer le jeu axial libre du vilebrequin au niveau du palier n° 4.

Jeu axial libre du vilebrequin : mm



Standard

0,055 - 0,140

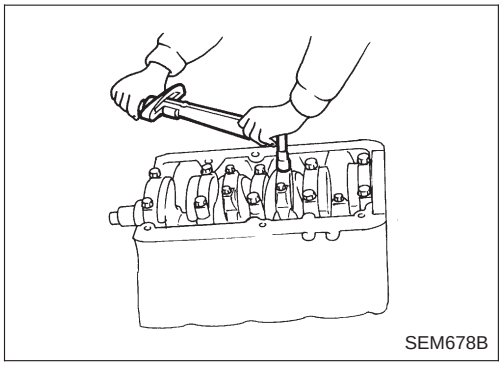


Limite

0,40

Si hors spécification, remplacer la rondelle de butée du palier principal n° 4. Se reporter aux SDS, EM-108.

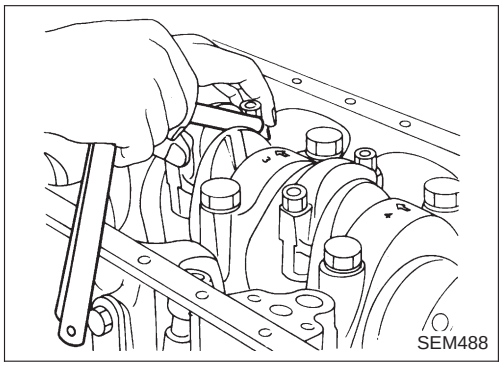
SEM063



DEM056

2. Monter les pistons avec les bielles.

(1) Les monter dans les cylindres correspondants à l'aide de l'outil spécial.



- **Prendre garde de ne pas rayer la paroi du cylindre avec la bielle.**
- **Insérer la bielle. Veiller à ce que sa tête n'entre pas en contact avec le gicleur d'huile.**
- **Enduire d'huile moteur la paroi de cylindre, le piston et le palier.**
- **La chambre de combustion à trèfle sur la culasse doit se trouver du côté droit du moteur.**

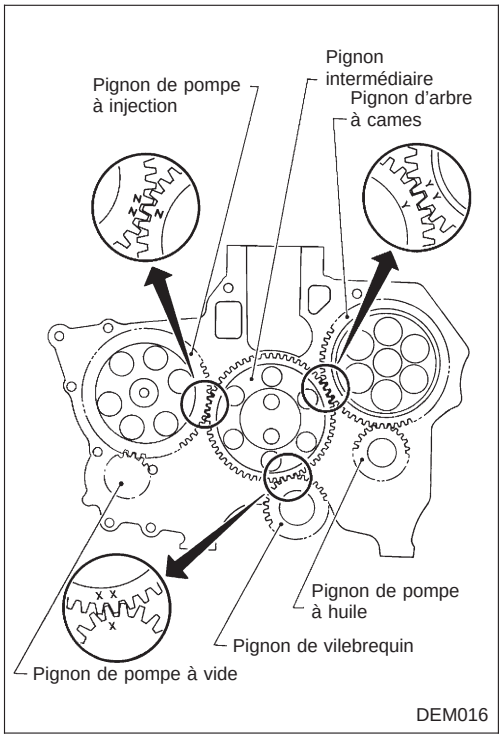
SEM678B

(2) Monter les chapeaux de palier de bielle.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Remontage (Suite)

SEM488



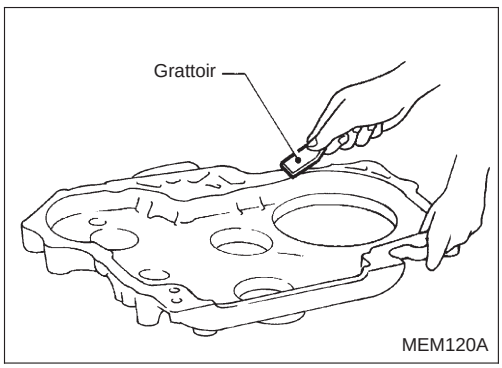
3. Mesurer le jeu latéral de bielle.

Jeu latéral de la bielle : mm
Standard
0,10 - 0,22
Limite
0,22

Si la limite est dépassée, remplacer la bielle et/ou le vilebrequin.

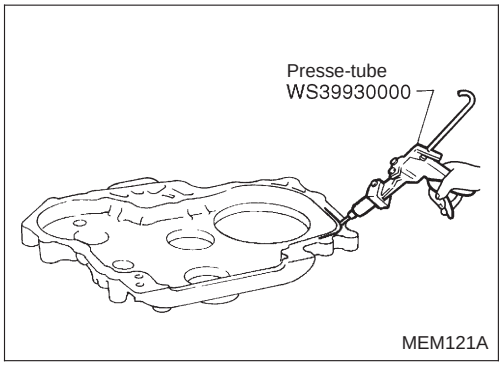
TRAIN DE PISTONS

1. Placer le piston n° 1 à son P.M.H. durant sa course de compression.
2. Aligner chaque repère de pignon et reposer les pignons.



DEM016

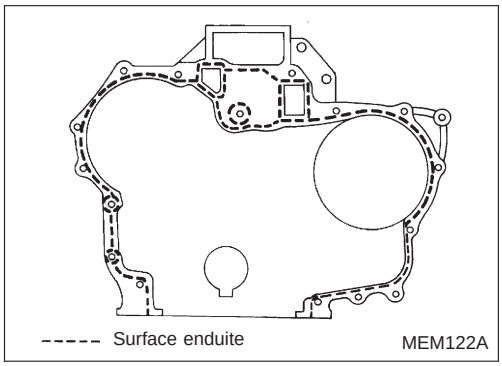
CARTER DE PIGNON DE DISTRIBUTION



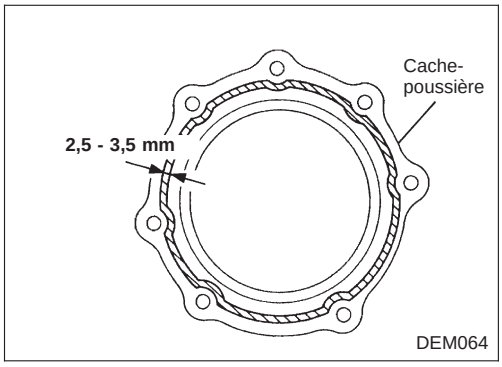
Repose

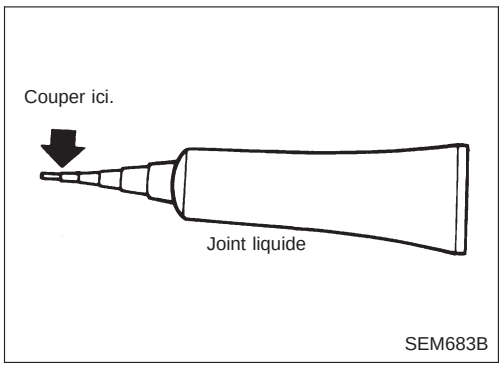
1. Avant de reposer le carter de pignon distribution, déposer toute trace de joint liquide de la surface de contact à l'aide d'un grattoir. Retirer également toute trace de joint liquide de la surface de contact de la plaque avant.

MEM120A



2. Appliquer un cordon uniforme de joint liquide sur la surface de contact du carter de distribution et du cache-poussière.





MEM121A

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Remontage (Suite)

- **S'assurer que le diamètre du joint liquide est de 2,5 à 3,5 mm.**
- **Fixer le carter de distribution sur la plaque avant dans les 10 minutes suivant la pose du joint.**
- **Attendre au moins 30 minutes avant de remplir de liquide de refroidissement moteur ou de démarrer le moteur.**
- **Utiliser le joint liquide d'origine ou un produit équivalent.**

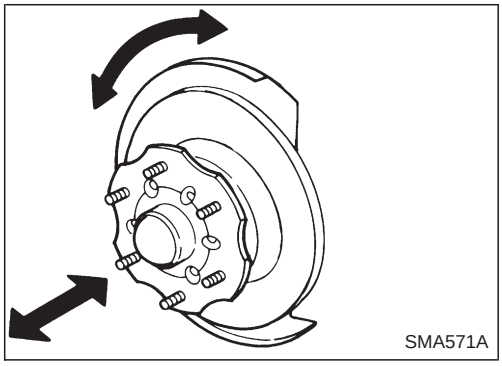
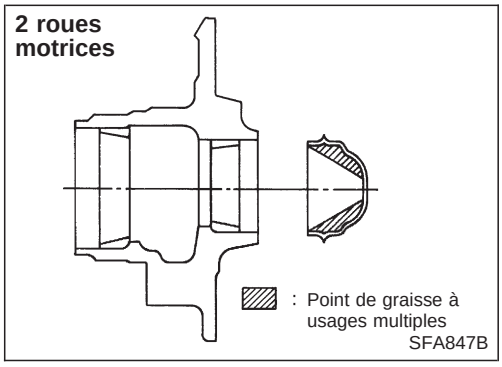
SMA525A



Pièces de l’essieu et de la suspension avant

Vérifier le jeu excessif, les fissures, l’usure ou l’état général des pièces de la suspension avant et de l’essieu avant.

- Secouer chacune des roues avant pour détecter tout jeu excessif.
  Si l’on relève un desserrage, régler le jeu axial du roulement de roue, puis contrôler le jeu axial de la rotule.
- S’assurer que la goupille fendue est correctement introduite.
- Resserrer tous les écrous et boulons au couple spécifié.
  : Se reporter à “SUSPENSION AVANT”, FA-28.
- Vérifier que l’essieu avant et les pièces de suspension avant ne présentent pas d’usure, de fissures ou d’autres dommages.



SFA813B

- Vérifier que l’amortisseur ne présente pas de fuites d’huile et d’autres dommages.
- Vérifier que la rotule de la suspension ne présente pas de fuites de graisse et que le cache-poussière de la rotule n’est ni fissuré, ni endommagé.

SMA571A

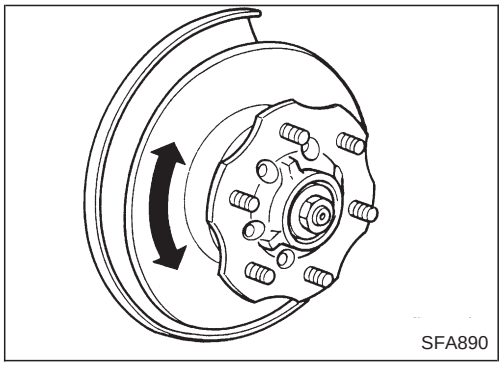
Roulements des roues avant

- Vérifier que les roulements de roues tournent librement.
- Vérifier le jeu axial.
  Jeu axial : 0 mm
- Régler la précharge du roulement de roue en cas de jeu axial ou si le roulement de roue ne tourne pas librement.

SFA847B

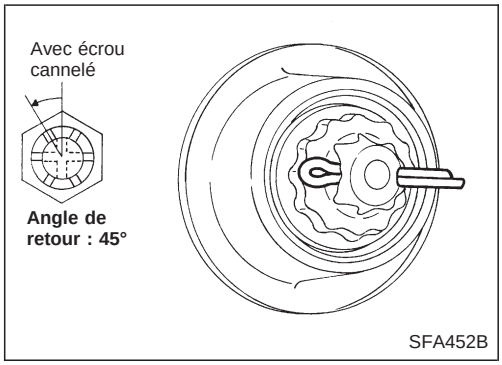
REGLAGE DE LA PRECHARGE (2 roues motrices)

Régler la précharge du roulement de roue après avoir remplacé le roulement de roue ou remonté l’essieu avant.



1. Avant le réglage, nettoyer minutieusement toutes les pièces pour empêcher la pénétration de poussières.
2. Enduire modérément de graisse à usages multiples les pièces suivantes :

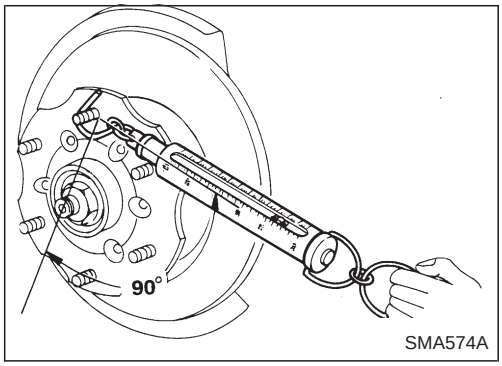
- La surface de frottement du pivot
- La surface de contact entre la rondelle de verrouillage et le roulement de roue externe
- Le capuchon de moyeu (comme indiqué ci-contre)



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Roulements des roues avant (Suite)

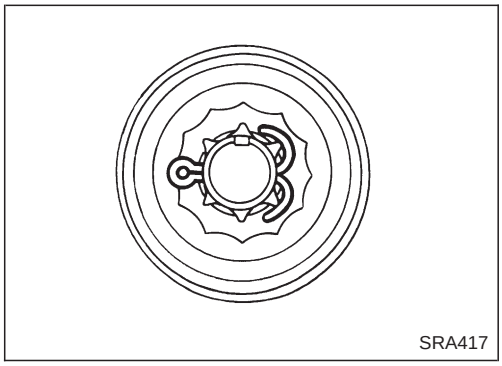
- La lèvre de joint à graisse



SFA890

3. Serrer le contre-écrou de roulement de roue au couple spécifié.
   : 34 - 39 N·m (3,5 - 4,0 kg-m)
4. Tourner le moyeu de roue plusieurs fois dans les deux sens afin d'assoir correctement le roulement de roue.
5. Serrer à nouveau le contre-écrou de roulement de roue au couple spécifié.
   : 34 - 39 N·m (3,5 - 4,0 kg-m)

SFA452B



6. Tourner le contre-écrou du roulement de roue de 45 degrés dans le sens inverse des aiguilles d'une montre.
7. Monter le couvercle de réglage et la nouvelle goupille fendue. Aligner la fente de la goupille fendue en desserrant l'écrou de 15 degrés ou moins.

SMA574A

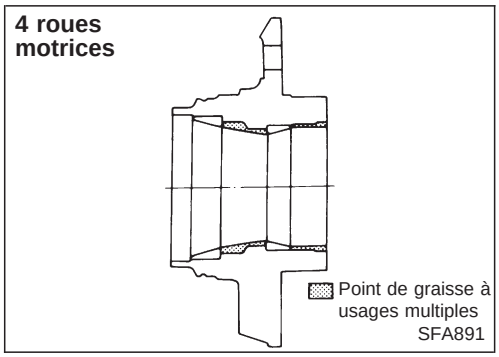
8. Mesurer la précharge de roulement de roue et le jeu axial.
   Jeu axial : 0 mm
   Précharge du roulement de roue
   (valeur mesurée au boulon de moyeu de roue) :
   Joint à graisse neuf
   9,8 - 28,4 N (1,0 - 2,9 kg)
   Joint à graisse usagé
   9,8 - 23,5 N (1,0 - 2,4 kg)

Répéter les procédures ci-dessus jusqu'à l'obtention d'une précharge de roulement correcte.

SRA417

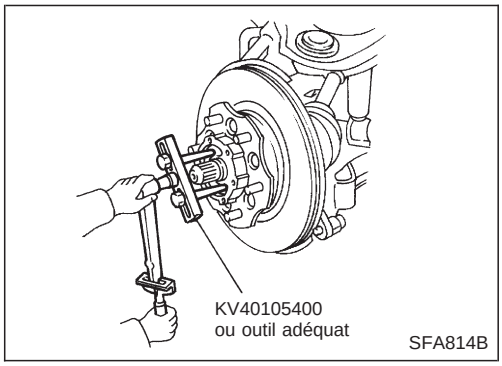
9. Ecarter les goupilles fendue.
10. Monter le capuchon de moyeu.

REGLAGE DE LA PRECHARGE (4 roues motrices)



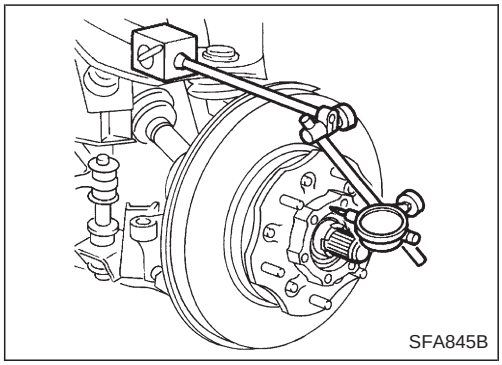
Régler la précharge du roulement de roue après avoir remplacé le roulement de roue ou remonté l'essieu avant.

Régler la précharge du roulement de roue comme suit :

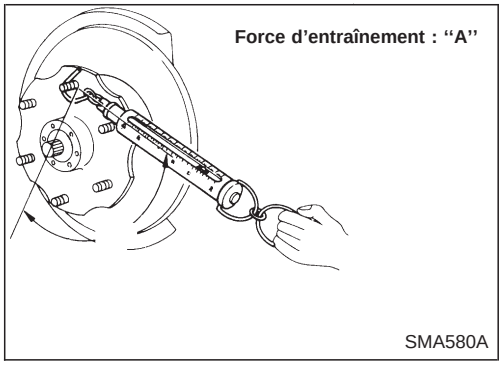


1. Avant le réglage, nettoyer minutieusement toutes les pièces pour empêcher la pénétration de poussières.

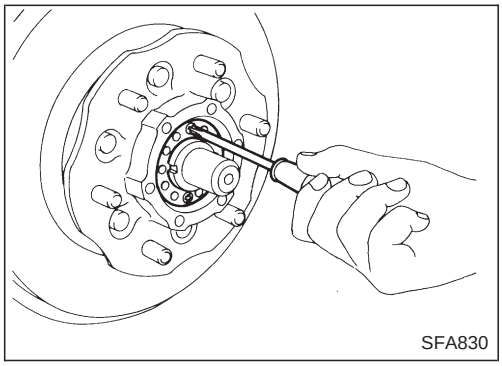
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Roulements des roues avant (Suite)



2. Enduire avec modération les pièces suivantes de graisse à usages multiples :
- La partie filetée du pivot
- La surface de contact entre la rondelle de roulement de roue et le roulement de roue externe
- La lèvre de joint à graisse
- Le moyeu de roue (comme indiqué ci-contre)



3. Serrer le contre-écrou du roulement de roue à l'aide de l'outil spécial.
   : 78 - 98 N·m (8 - 10 kg-m)
4. Tourner le moyeu de roue plusieurs fois dans les deux sens.
5. Desserrer le contre-écrou de roulement de roue de sorte que le couple devienne 0 N·m (0 kg-m).
6. Resserrer le contre-écrou de roulement de roue à l'aide de l'outil spécial.
   : 0,5 - 1,5 N·m (0,05 - 0,15 kg-m)

7. Tourner le moyeu de roue plusieurs fois dans les deux sens.
8. Resserrer le contre-écrou de roulement de roue à l'aide de l'outil spécial.
   : 0,5 - 1,5 N·m (0,05 - 0,15 kg-m)
9. Mesurer le jeu axial du roulement de roue.
   Jeu axial : 0 mm

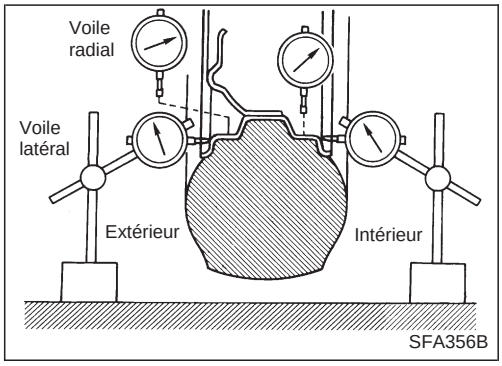
10. Mesurer la force d'entraînement "A" au boulon de moyeu de roue.

11. Reposer la rondelle de verrouillage en serrant le contre-écrou de 15 à 30 degrés.
12. Tourner le moyeu de roue plusieurs fois dans les deux sens afin d'asseoir correctement le roulement de roue.
13. Mesurer la force d'entraînement "B" au boulon de moyeu de roue. Se reporter à l'étape 10.
14. La précharge "C" du roulement de roue peut être calculée comme indiqué ci-après.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Roulements des roues avant (Suite)

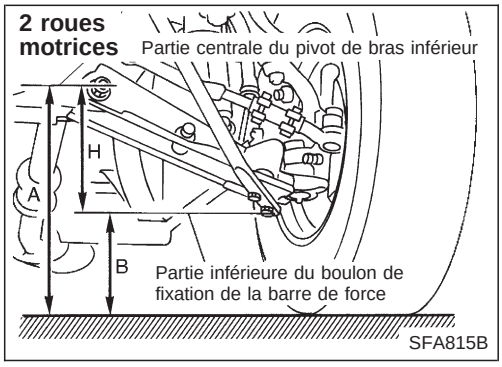
C = B − A



Précharge du roulement de roue "C" :
7,06 - 20,99 N

15. Répéter les étapes 3 à 14 jusqu'à l'obtention d'un jeu axial et d'une précharge de roulement de roue corrects.
16. Reposer le moyeu à roue libre.

Alignement des roues avant

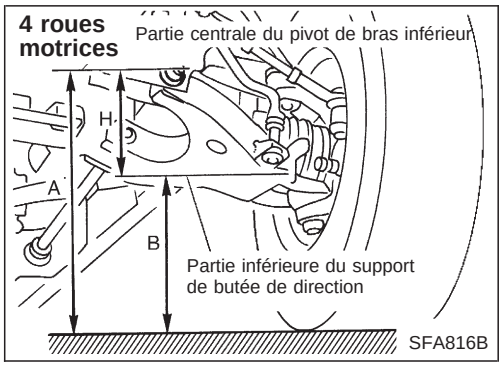


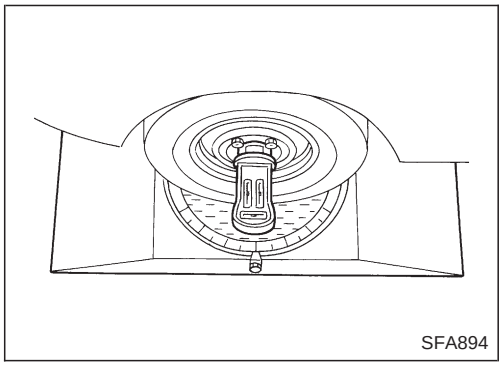
Avant de vérifier l'alignement des roues avant, effectuer une inspection préliminaire (à vide*).

* : Avec plein de carburant, de liquide de refroidissement et d'huile moteur. Pneu de secours, cric, outillage et tapis dans la position requise.

INSPECTION PRELIMINAIRE

1. Vérifier que les pneus ne présentent pas d'usure et ont une pression de gonflage correcte.
2. Vérifier le voile des roues externe et interne.
   Moyenne du voile des roues [(valeur du voile externe + valeur du voile interne) x 0,5] :
   Se reporter aux SDS, FA-38.
3. Vérifier le serrage des roulements de roues avant.
4. Vérifier le serrage de la suspension avant.
5. Vérifier le serrage de la timonerie de direction.
6. Vérifier que les amortisseurs avant fonctionnent correctement, en effectuant l'essai de rebond standard.





7. Mesurer la hauteur du véhicule (à vide) : H = A − B mm
   Se reporter aux SDS, FA-39.

a. Faire fonctionner la suspension avant en faisant balancer de haut en bas l'avant du véhicule 4 ou 5 fois pour s'assurer que le réglage en hauteur est neutre.
b. Mesurer l'alignement des roues.
   Se reporter aux SDS, FA-39.
c. Si l'alignement des roues n'est pas dans les normes, régler la position du véhicule.
   Se reporter aux SDS, FA-39.
d. Régler l'alignement des roues.
   Se reporter aux SDS, FA-39.

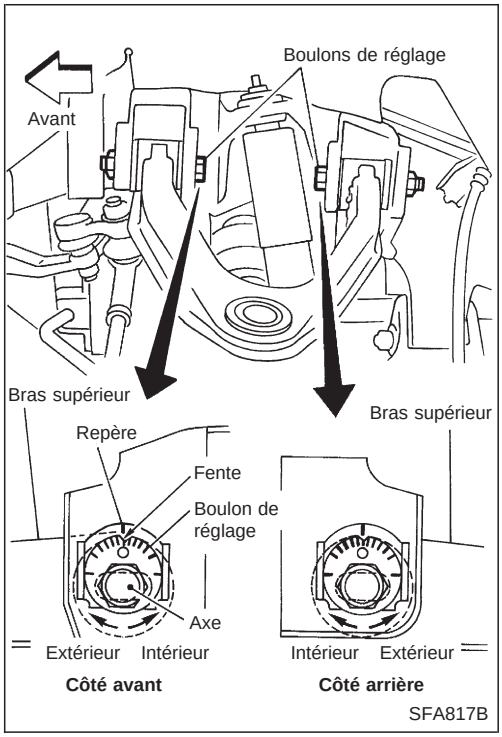
Alignement des roues avant (Suite)



ANGLES DE CARROSSAGE, DE CHASSE ET D'INCLINAISON DU PIVOT DE FUSEE

Avant de procéder au contrôle des angles de carrossage, de chasse et d'inclinaison du pivot de fusée, faire balancer le véhicule de haut en bas sur une jauge d'angle de braquage afin de minimiser la friction. S'assurer que le véhicule est correctement positionné.

- Mesurer les angles de carrossage, de chasse et d'inclinaison du pivot de fusée des roues droite et gauche à l'aide d'une jauge d'alignement appropriée, et régler selon les procédures suivantes.

  Angles de carrossage, de chasse et d'inclinaison du pivot de fusée :

  Se reporter aux SDS, FA-39.

- Dans les deux cas suivants, serrer temporairement les boulons de réglage tout en alignant les repères sur les fentes comme indiqué sur l'illustration ci-à gauche, et mesurer les angles de carrossage, de chasse et d'inclinaison du pivot de fusée :
  (1) Lors du remplacement du bras supérieur ou d'autres pièces de la suspension par des neuves
  (2) Lorsque des repères à la peinture n'ont pas été faits sur les boulons de réglage avant les procédures de démontage de la suspension
- Si les repères sont déjà peints lors du démontage de la suspension, aligner ces derniers sur les fentes, puis serrer temporairement les boulons de réglage. Mesurer les angles de carrossage, de chasse et d'inclinaison du pivot de fusée.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Alignement des roues avant (Suite)

REGLAGE

1. Les angles de carrossage et de chasse se règlent en ajustant les boulons de réglage.

● Si l'inclinaison du pivot de fusée est hors spécifications, vérifier si les pièces de la suspension avant ne sont pas usées ou endommagées. Remplacer les pièces défectueuses par des neuves.

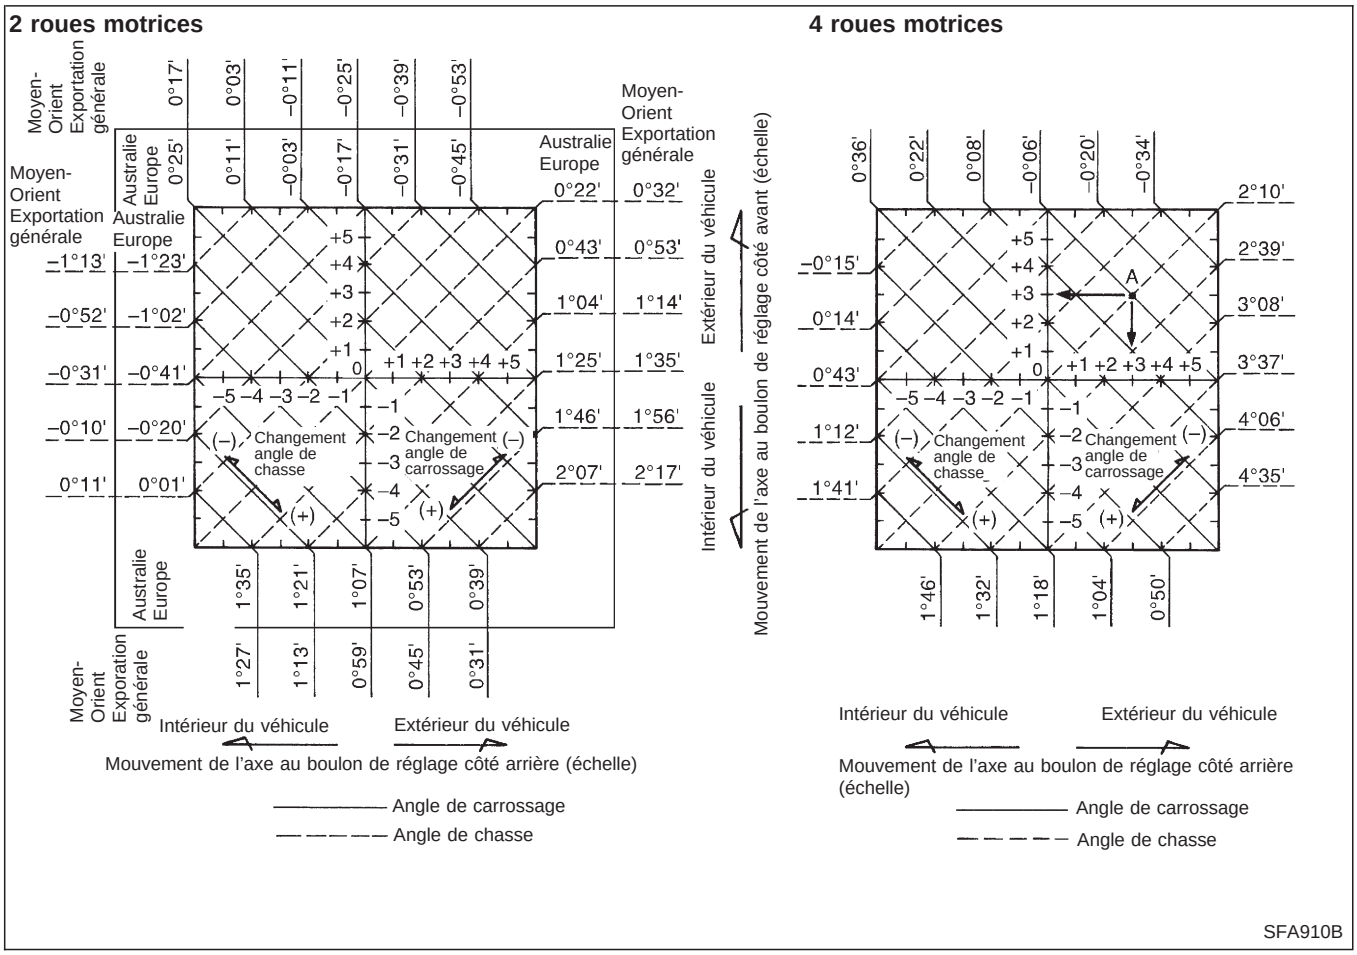
2. A partir de la valeur mesurée, relever les coordonnées (ou : graduations) au niveau du point d'intersection dans le graphique.

a. Si les coordonnées (ou : graduations) au point d'intersection sont positives, déplacer l'axe vers l'extérieur en tournant le boulon de réglage correspondant sur la graduation indiquée.

b. Si les coordonnées (ou : graduations) au point d'intersection sont négatives, déplacer l'axe vers l'intérieur en tournant le boulon de réglage correspondant sur la graduation indiquée.
Après avoir correctement déplacé le(s) axe(s), serrer les boulons de réglage avant et arrière aux couples prescrits.

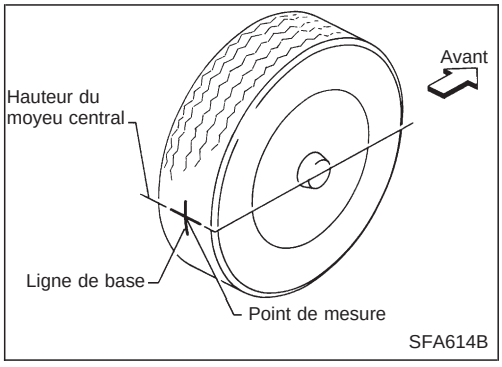
3. Remesurer pour s'assurer que les angles de carrossage et de chasse sont dans les normes spécifiées.

[Exemple]



a. Les valeurs mesurées correspondent aux deux valeurs indiquées ci-dessous : (voir tableau pour les modèles 4 roues motrices).
Angle de carrossage : −0°06
Angle de chasse : 2°10

b. Rapporter les deux valeurs ci-dessus au graphique, et déterminer le point ''A''.



c. Les coordonnées (ou : graduations) indiquent que les boulons de réglage avant et arrière doivent être tournés vers l'extérieur de 3 graduations.
Tourner les boulons de réglage d'une valeur correspondant à 3 graduations.

Alignement des roues avant (Suite)

SFA910B

SFA614B

SFA234AC

PINCEMENT

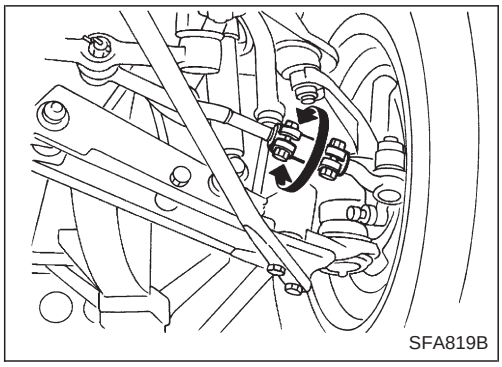
Mesurer le pincement selon la procédure suivante.

AVERTISSEMENT :

- **Toujours réaliser la procédure suivante sur une surface plane.**
- **S'assurer que personne ne se trouve devant le véhicule avant de le pousser.**

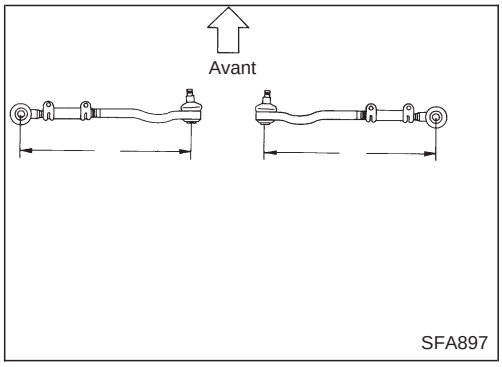
1. Faire balancer de haut en bas l'avant du véhicule pour stabiliser l'assiette.
2. Pousser le véhicule vers l'avant sur environ 5 m.
3. Faire une marque sur la ligne de base de la bande de roulement (côté arrière) des deux pneus, à la même hauteur que l'axe central du moyeu. Ce repère est un point de mesure.
4. Mesurer la distance ''A'' (côté arrière).
5. Pousser lentement le véhicule vers l'avant de façon à faire tourner les roues de 180 degrés (1/2 tour).

- **Si les roues ont tourné de plus de 180 degrés (1/2 tour), recommencer la procédure décrite ci-dessus depuis le début. Ne jamais faire reculer le véhicule.**



6. Mesurer la distance ''B'' (côté avant).

Pincement total :



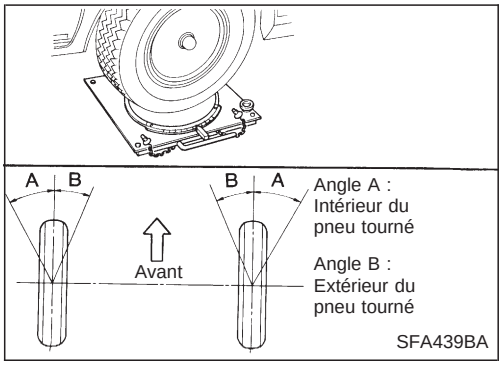
Se reporter aux SDS, FA-39.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Alignement des roues avant (Suite)

SFA819B

7. Régler le pincement en faisant varier la longueur des deux barres d'accouplement de direction.
a. Desserrer les boulons de fixation ou les contre-écrous.
b. Régler le pincement en tournant les tuyaux des barres d'accouplement gauche et droite de façon égale.



SFA897

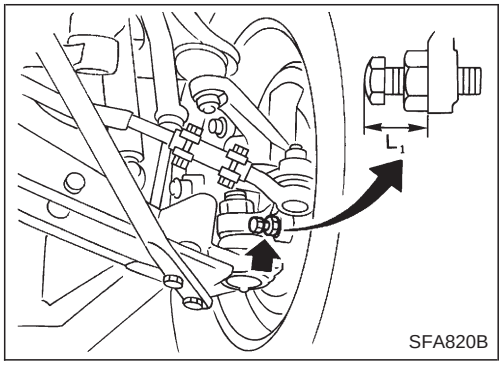
S'assurer que les barres d'accouplement sont vissées de plus de 35 mm dans les tuyaux.
S'assurer que les barres d'accouplement ont la même longueur.

Longueur standard (A = B) :
2 roues motrices
343,9 mm
4 roues motrices
297,6 mm

c. Serrer les boulons de fixation ou les contre-écrous au couple spécifié.

SFA439BA

ANGLE DE BRAQUAGE DES ROUES AVANT

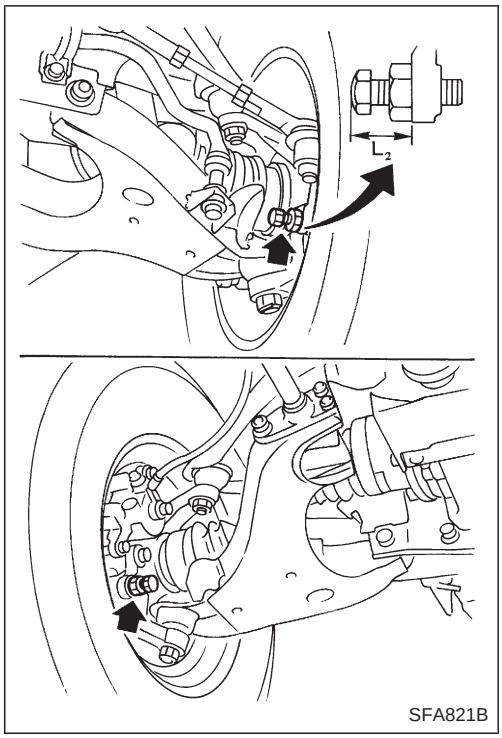


1. Mettre les roues dans la position de marche en ligne droite. Puis pousser le véhicule vers l'avant jusqu'à ce que les roues avant reposent correctement sur la jauge d'angle de braquage.
2. Tourner le volant à bout de course vers la droite et vers la gauche et mesurer l'angle de braquage.

- Pour les modèles avec direction assistée, tourner le volant à la butée, et appliquer une force (à la circonférence du volant) de 98 à 147 N (10 à 15 kg), le moteur tournant au ralenti.
- **Ne pas maintenir le volant en butée pendant plus de 15 secondes.**

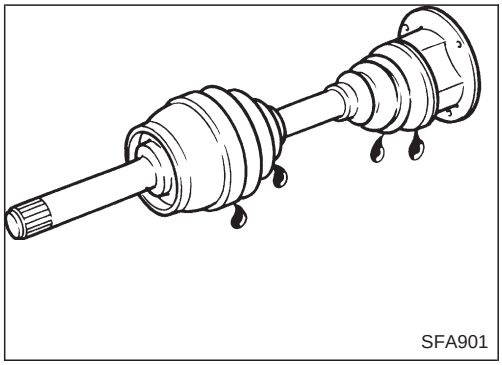
Angle de braquage de roue (braquage total) :
Se reporter aux SDS, FA-39.

3. Régler le boulon de butée si nécessaire.



Longueur standard "L_1" (2 roues motrices) :
20 mm
Contre-écrou du boulon de butée :
: 39-49 N·m (4,0 - 5,0 kg-m)

SFA820B

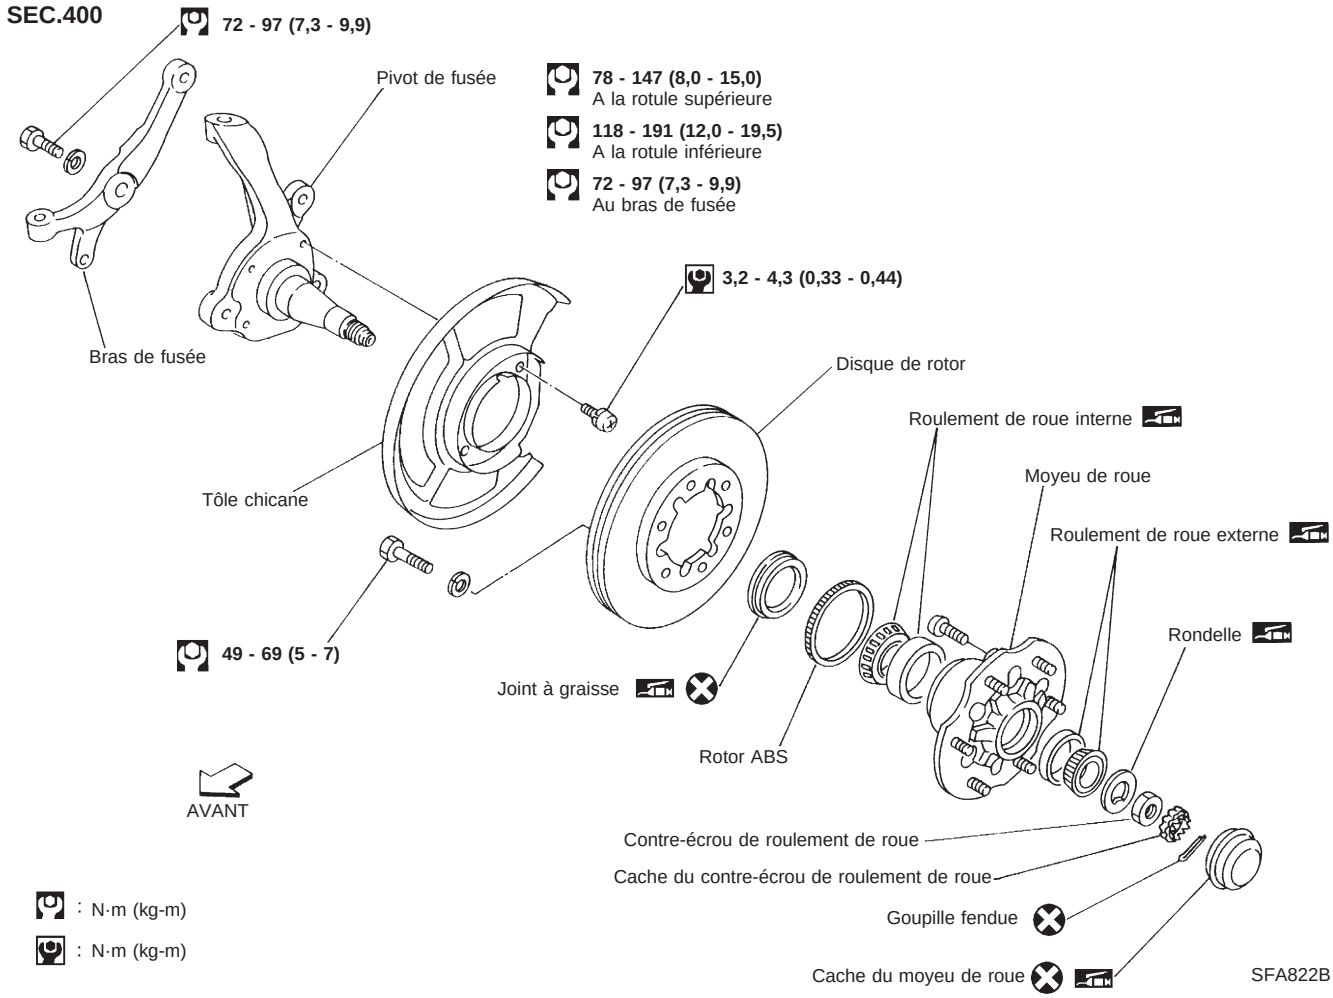


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Alignement des roues avant (Suite)

SFA821B

Longueur standard "L_2" (4 roues motrices) :
26,5 mm
Contre-écrou de boulon de butée :
: 76-98 N·m (7,8 - 10,0 kg-m)



SFA901

Semi-arbre

- Vérifier qu'il n'y a pas de fuites de graisse et de dommages.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Moyeu débrayable manuel – 4 roues motrices –

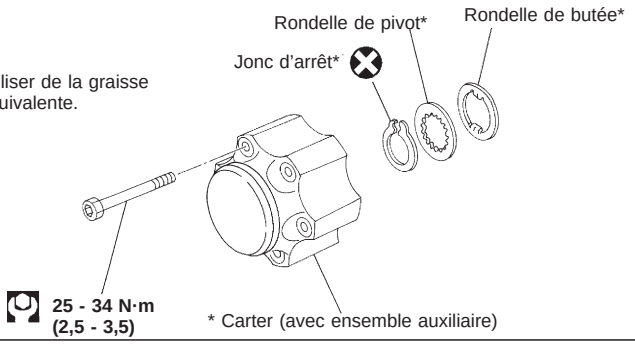
DEPOSE ET REPOSE

1. Tourner la poignée du moyeu débrayable manuel sur la position ''FREE''.
2. Déposer le moyeu débrayable manuel.
3. Déposer le jonc d'arrêt, puis extraire l'embrayage d'entraînement.
4. Lors de la repose du moyeu débrayable manuel, s'assurer que le moyeu est sur la position ''FREE''.

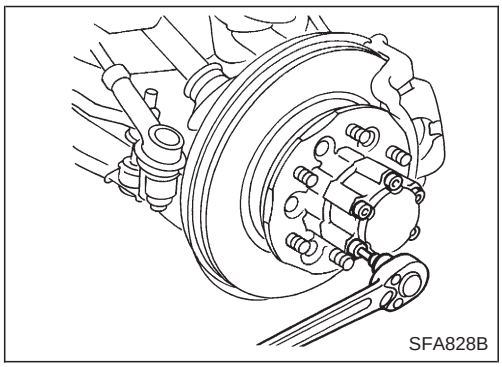
Enduire les pièces indiquées dans l'illustration ci-dessus de graisse à usages multiples.

5. Vérifier le fonctionnement du moyeu débrayable manuel après sa repose.

INSPECTION



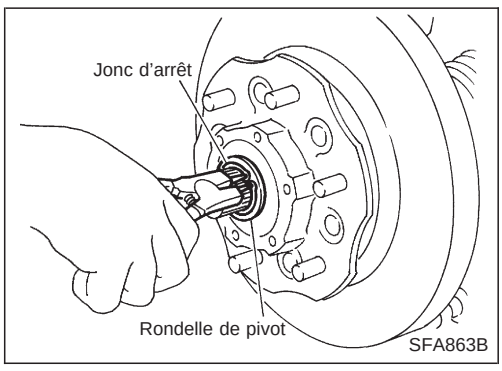
- Vérifier que la poignée tourne correctement et librement.
- Vérifier que l'embrayage tourne correctement dans la carrosserie.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Moyeu débrayable automatique – 4 roues motrices –

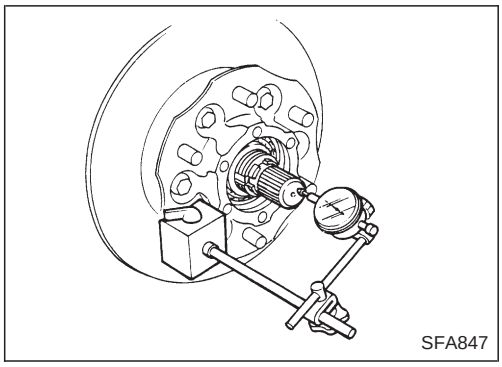
SEC. 400



*: Zones de lubrification
Lors de la repose du moyeu débrayable automatique, utiliser de la graisse NISSAN D'ORIGINE (KRC 19-00025) ou une graisse équivalente.

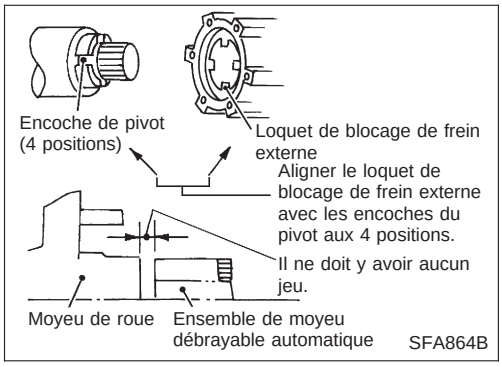
SFA828B

Dépose



1. Placer le moyeu débrayable automatique sur la position ''FREE''.
2. Déposer le moyeu débrayable automatique.

3. Déposer le jonc d'arrêt.
4. Déposer la rondelle de pivot et la rondelle de butée.
5. Après la repose du moyeu débrayable automatique, vérifier son fonctionnement.

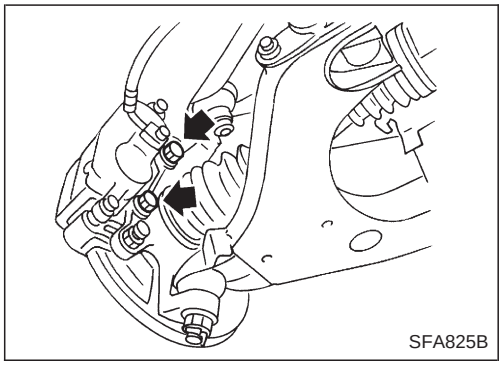


Lors de sa repose, appliquer de la graisse recommandée sur les pièces indiquées dans l'illustration.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

SFA847

Repose

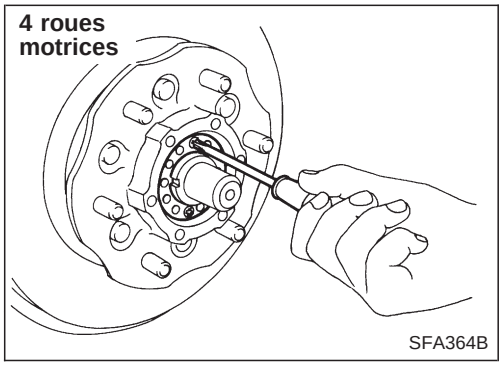


1. Lors de la repose sur le semi-arbre des pièces enduites du moyeu (comme la rondelle de butée ou la rondelle de pivot), sélectionner le jonc d'arrêt adéquat de façon à ce que le jeu libre entre le semi-arbre et ses pièces enduites soit dans les limites spécifées.
   Jeu axial :
   0,45 mm ou moins
   Taille du jonc d'arrêt :
   Se reporter aux SDS.

SFA864B

2. Reposer l'ensemble du moyeu débrayable automatique sur le moyeu de roue.

- Lors de la repose du moyeu débrayable automatique, veiller à aligner le loquet de blocage de frein externe avec l'encoche du pivot.
- Après avoir introduit l'ensemble de moyeu débrayable automatique dans l'alésage du moyeu de roue, s'assurer qu'il n'y a pas de jeu entre l'ensemble du moyeu débrayable automatique et le moyeu de roue.



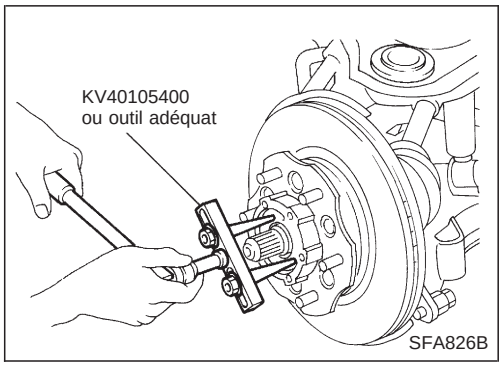
SFA825B

Moyeu de roue etdisque de rotor

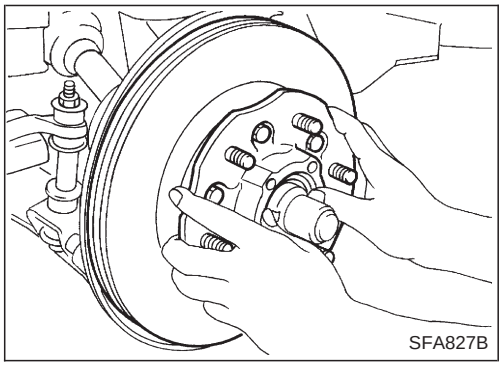
DEPOSE ET REPOSE

1. Déposer l'ensemble de moyeu débrayable – 4 roues motrices –.
   Se reporter à ''Moyeu débrayable automatique – 4 roues motrices –'', FA-17, ou ''Moyeu débrayable manuel – 4 roues motrices –'', FA-16.
2. Déposer l'étrier de frein sans débrancher la ligne hydraulique.

Veiller à ne pas enfoncer la pédale de frein car le piston serait éjecté.
S'assurer que le flexible de frein n'est pas tordu.



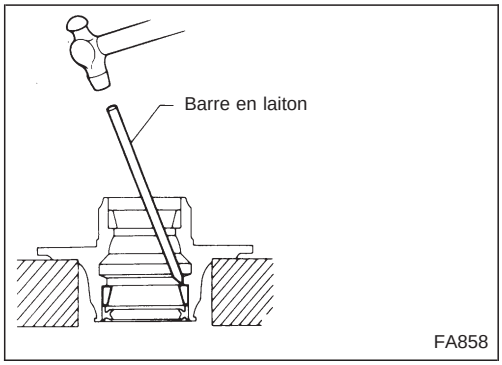
SFA364B



3. Déposer la rondelle de verrouillage – 4 roues motrices –.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Moyeu de roue etdisque de rotor (Suite)



4. Déposer le contre-écrou de roulement de roue.
   2 roues motrices : avec l'outil adéquat
   4 roues motrices : avec l'outil spécial

5. Déposer le moyeu de roue et le roulement de roue.

Veiller à ne pas laisser tomber le roulement externe.

6. Après la repose du moyeu de roue et du roulement de roue, régler la précharge du roulement de roue.
   Se reporter à ''REGLAGE DE LA PRECHARGE'', ''Roulements des roues avant'', ''ENTRETIEN SUR LE VEHICULE'', FA-5.

DEMONTAGE

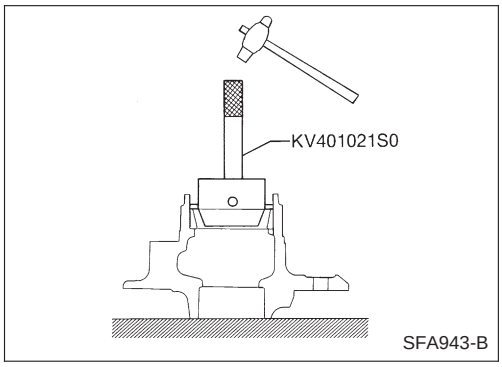
- Déposer les cages extérieures de roulement à l'aide d'une barre en laiton appropriée.

INSPECTION

Nettoyer soigneusement les roulements de roue et le moyeu de roue.

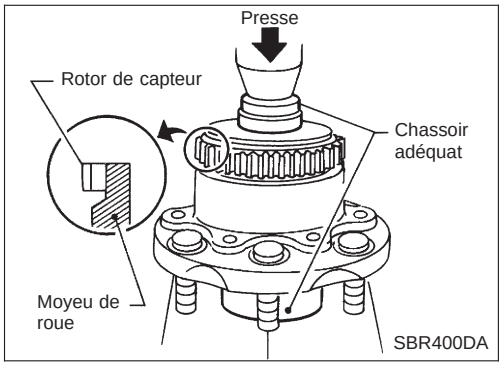
Roulements de roues

- S'assurer que les roulements de roue tournent librement et sont exempts de bruits, de fissures, de corrosions et d'usure.



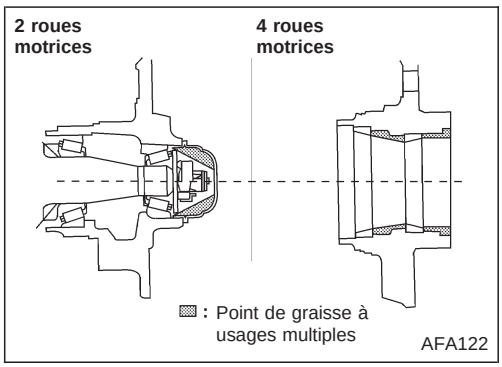
Moyeu de roue

- Vérifier que le moyeu de roue n'est pas fissuré en conduisant un essai magnétique ou un essai par ressuage.

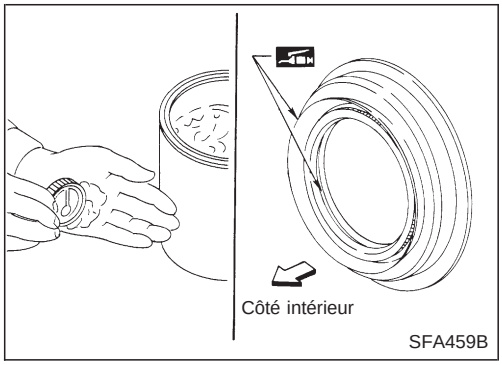


Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

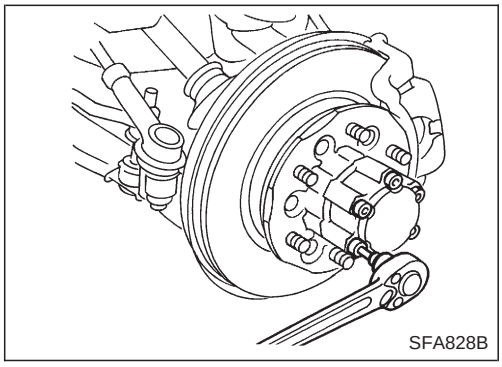
Moyeu de roue etdisque de rotor (Suite)



REMONTAGE



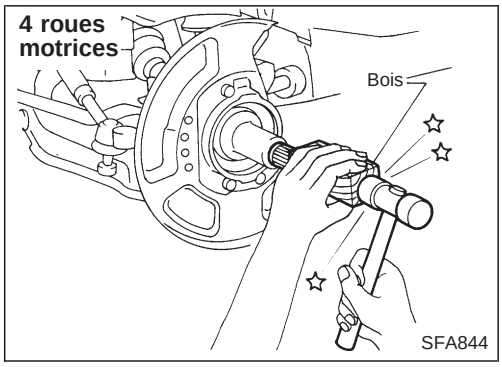
1. Reposer la cage extérieure de roulement à l'aide de l'outil spécial jusqu'à ce qu'elle ait une bonne assise dans le moyeu.



2. Reposer le rotor de capteur en utilisant un chassoir et une presse adéquats (modèles avec ABS).
   Remplacer toujours le rotor de capteur par un neuf.
   Veiller au sens du rotor de capteur avant comme indiqué sur l'illustration.

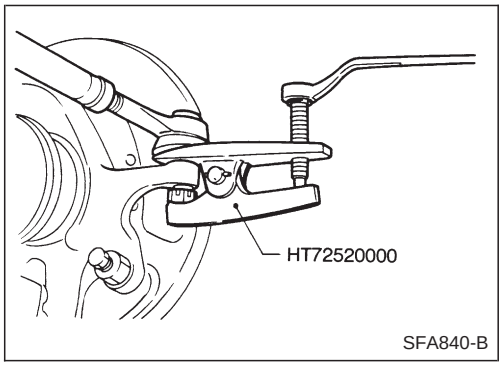
3. Enduire le moyeu de roue et le cache du moyeu de graisse à usages multiples.

4. Enduire chaque cône de roulement de graisse à usages multiples.
5. Enduire la lèvre du joint à graisse de graisse à usages multiples, puis reposer le joint dans le moyeu de roue à l'aide d'un chassoir adéquat.



Pivot de fusée

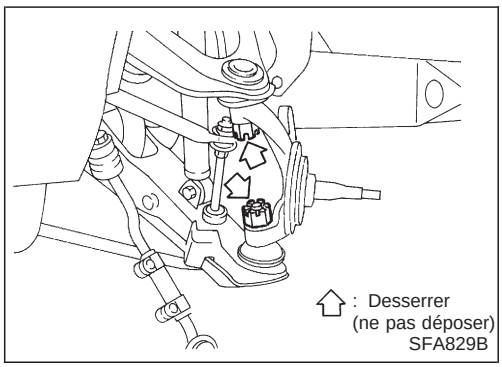
DEPOSE



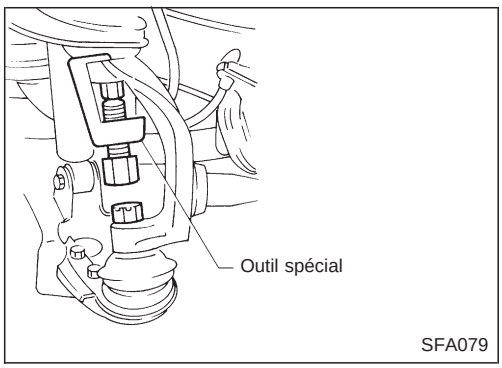
1. Déposer l'ensemble de moyeu débrayable. – 4 roues motrices –
   Se reporter à ''Moyeu débrayable automatique – 4 roues motrices –'', FA-17, ou ''Moyeu débrayable manuel – 4 roues motrices –'', FA-16.
2. Déposer le moyeu de roue et le disque de rotor.
   Se reporter à ''Moyeu de roue et disque de rotor'', FA-18.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Pivot de fusée (Suite)



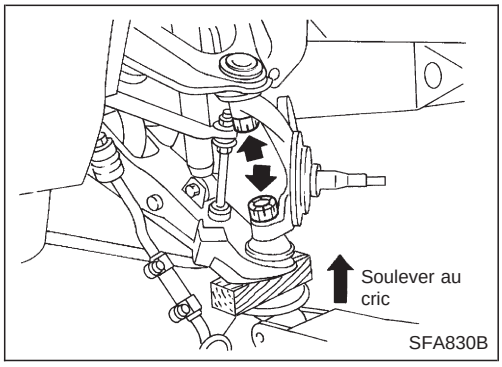
3. Séparer le semi-arbre du pivot de fusée en tappant légèrement sur l'extrémité du semi-arbre – 4 roues motrices –.



4. Séparer la barre d'accouplement du pivot de fusée à l'aide de l'outil spécial.

Reposer l'écrou à l'envers sur le goujon pour éviter d'endommager les filets du goujon.

5. Séparer le pivot de fusée des rotules.



a. Desserrer (sans les déposer) les écrous de serrage des rotules supérieure et inférieure.

b. Séparer le pivot de fusée des goujons de rotules supérieure et inférieure à l'aide de l'outil spécial.

Durant l'intervention susmentionnée, ne jamais déposer les écrous de joint à rotule que l'on a desserrés à l'étape (a) ci-dessus.

Outil spécial :
2 roues motrices
ST29020001
4 roues motrices
HT72520000

c. Déposer les écrous de serrage de la rotule.

Soutenir le bras inférieur avec un cric.

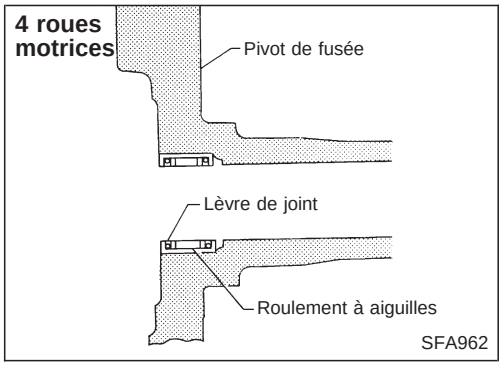
d. Déposer le pivot de fusée des bras supérieur et inférieur.

INSPECTION

Pivot de fusée

- Vérifier que le pivot de fusée ne présente pas de déformations, de fissures et d'autres dommages en conduisant un essai magnétique ou un essai par ressuage.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

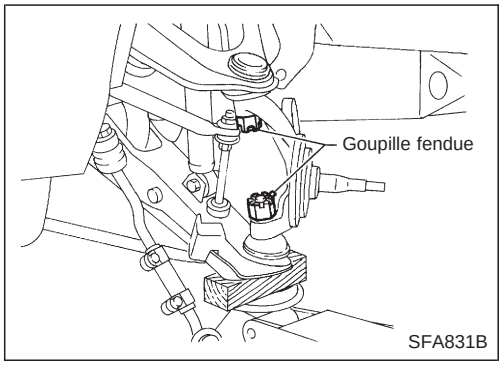


Pivot de fusée (Suite)

Entretoise de roulement – 2 roues motrices –

- Vérifier si l'entretoise de roulement n'est pas endommagée.

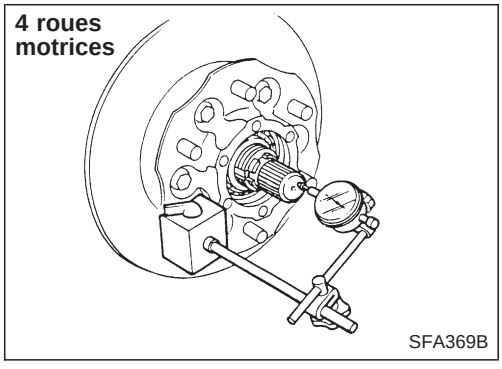
Roulement à aiguilles – 4 roues motrices –



- Vérifier si le roulement à aiguilles ne présente pas d'usure, d'éraflures, de corrosion, de piqûres et de marques de brûlures.

REPOSE

1. Reposer le roulement à aiguilles sur le pivot de fusée.
   – 4 roues motrices –

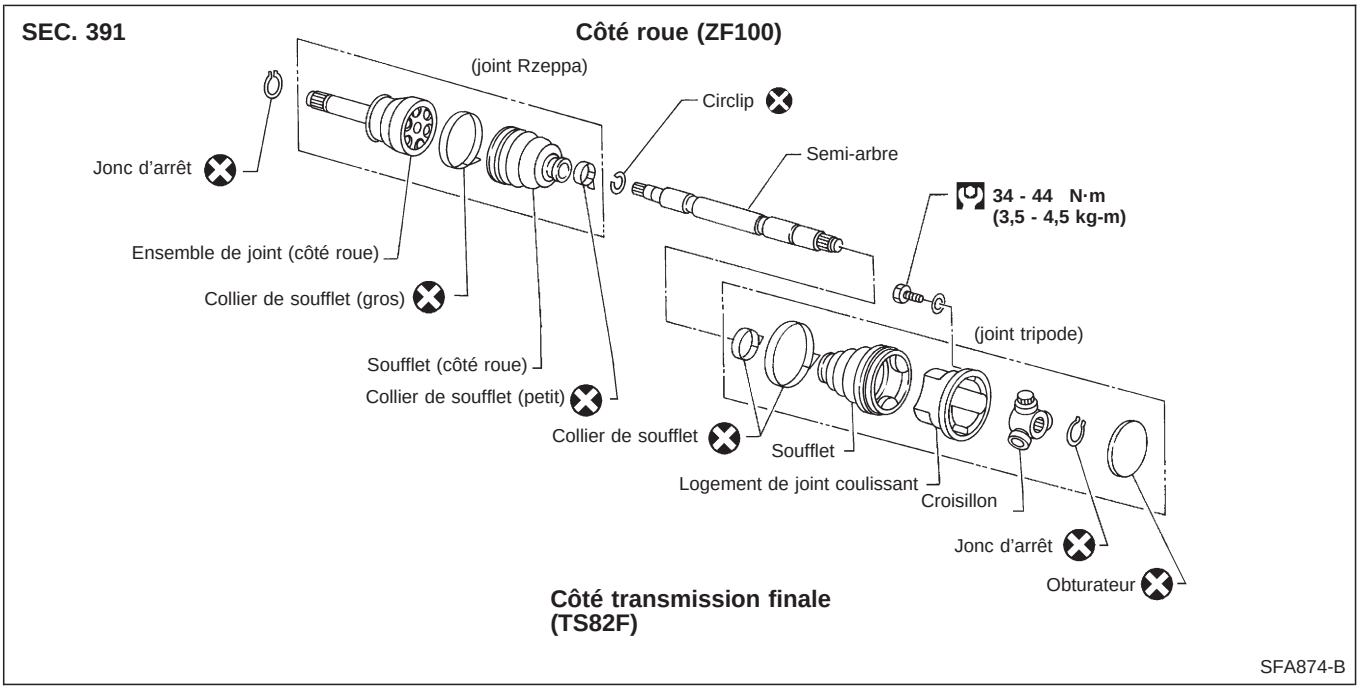


S'assurer que le roulement à aiguilles est correctement orienté.
Enduire de graisse à usages multiples.

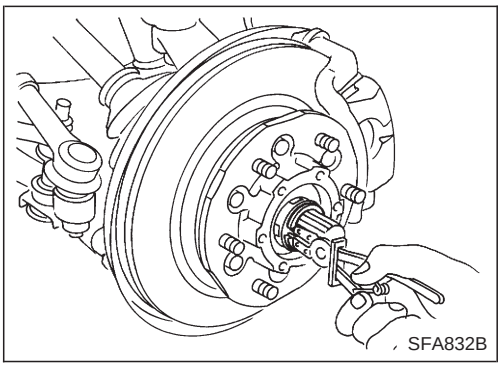
2. Reposer le pivot de fusée sur les rotules supérieure et inférieure avec le bras inférieur soulevé au cric.

ATTENTION :
S'assurer que de l'huile ou de la graisse n'entre pas en contact avec les parties coniques de la rotule, du pivot de fusée et avec les filetages de la rotule.

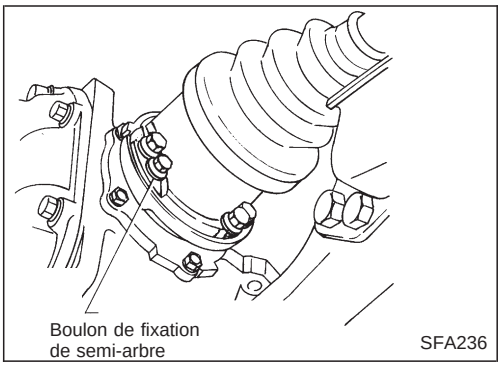
3. Attacher la barre d'accouplement au pivot de fusée.



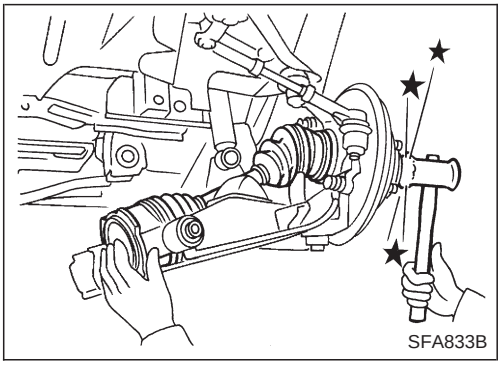
4. Après la repose du pivot de fusée, régler la précharge du roulement de roue. Se reporter à ''REGLAGE DE LA PRECHARGE'', ''Roulements des roues avant'', ''ENTRETIEN SUR LE VEHICULE'', FA-5.
5. Après la repose du semi-arbre, vérifier son jeu axial.



Ne pas réutiliser le jonc d'arrêt une fois déposé.



Se reporter à ''Semi-arbre – 4 roues motrices –'', FA-23.



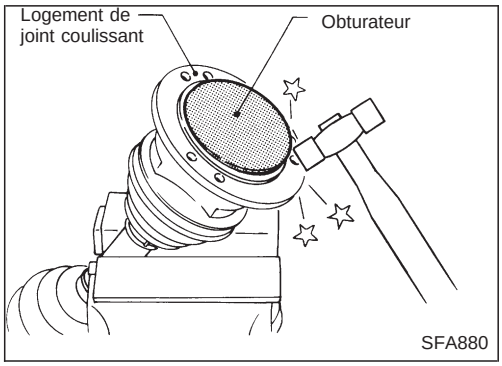
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Semi-arbre – 4 roues motrices –

DEPOSE

1. Déposer le moyeu débrayable ou la bride d'entraînement et le jonc d'arrêt. Se reporter à ''Moyeu débrayable automatique – 4 roues motrices –'', FA-17, ou ''Moyeu débrayable manuel – 4 roues motrices –'', FA-16.
2. Déposer la barre de torsion. Se reporter à ''Barre de torsion'', ''SUSPENSION AVANT'', FA-30.
3. Déposer le boulon de fixation inférieur de l'amortisseur.
4. Déposer le bras inférieur, les boulons de fixation.

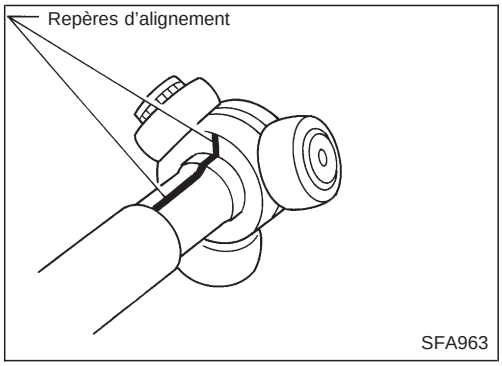
Soutenir le bras inférieur avec un cric.



5. Déposer les boulons qui fixent le semi-arbre à la transmission finale.

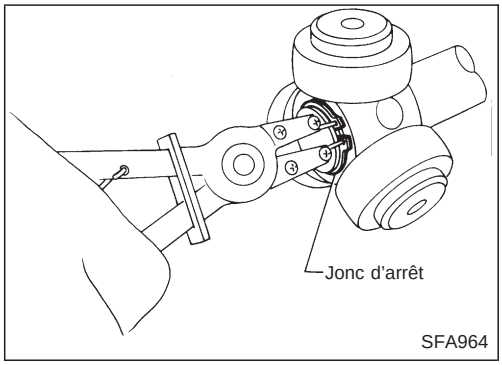
6. Déposer le semi-arbre du pivot de fusée en tappant légèrement sur l'extrémité du semi-arbre.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

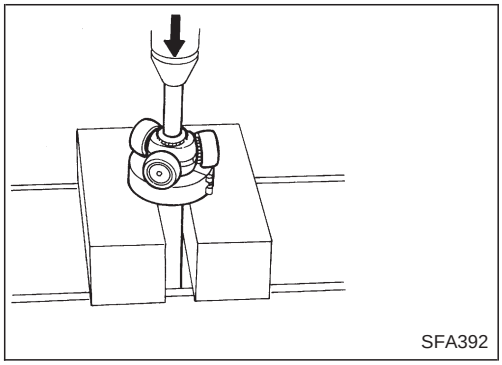


Semi-arbre – 4 roues motrices – (Suite)

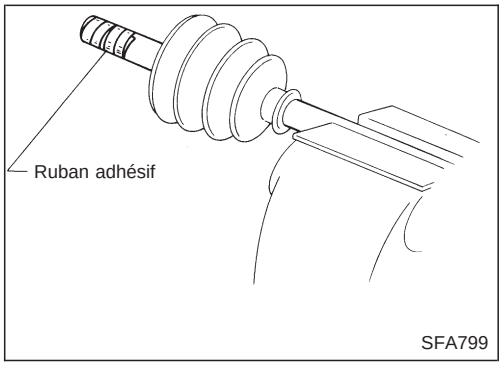
DEMONTAGE



Côté transmission de l'essieu (TS82F)



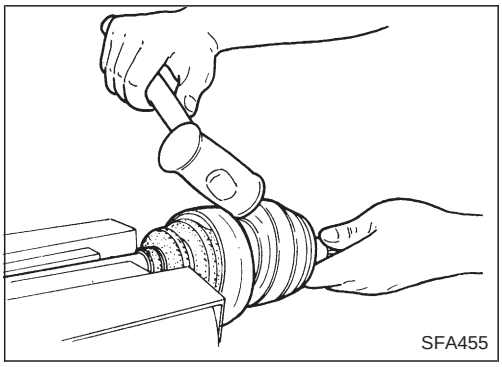
1. Déposer l'obturateur du logement de joint coulissant en frappant légèrement autour du logement de joint coulissant.
2. Déposer les colliers de soufflet.



3. Déplacer le soufflet et le logement de joint coulissant vers le côté roue, et tracer des repères d'alignement.

4. Déposer le jonc d'arrêt.

5. Détacher l'ensemble croisillon à la presse.



6. Retirer le soufflet.

Recouvrir les cannelures du semi-arbre avec du ruban adhésif afin de ne pas endommager le soufflet.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Semi-arbre – 4 roues motrices – (Suite)

SFA455

Côté roue (ZF100)

ATTENTION :
Le joint du côté roue ne peut être démonté.

- Avant de séparer l'ensemble de joint, tracer des repères sur le semi-arbre et l'ensemble de joint.
- Séparer le joint à l'aide de l'outil adéquat.

Veiller à ne pas endommager les filetages du semi-arbre.

- Déposer les colliers de soufflet.

INSPECTION

Nettoyer soigneusement toutes les pièces dans du solvant et les sécher à l'air comprimé. Vérifier si les pièces ne sont pas déformées ou autrement endommagées.

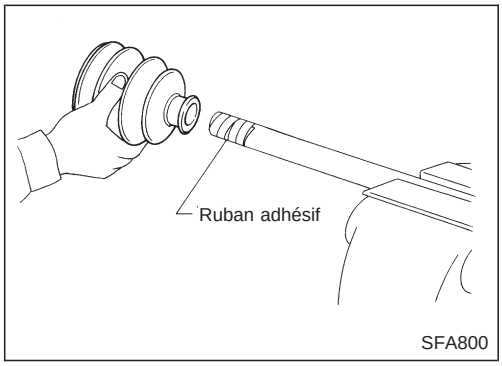
Semi-arbre

Remplacer le semi-arbre s'il est tordu ou fêlé.

Soufflet

Vérifier que le soufflet ne présente pas de fatigue, de fissures et d'usure. Remplacer le soufflet avec des colliers neufs.

Ensemble de joint (côté transmission de l'essieu)



- Remplacer toute pièce du joint à double décalage qui présente des signes de rayures, de rouille, d'usure ou de jeu excessif.
- Vérifier que les cannelures ne sont pas déformées. Remplacer si nécessaire.
- Vérifier que le logement de joint coulissant n'est pas endommagé. Remplacer si nécessaire.

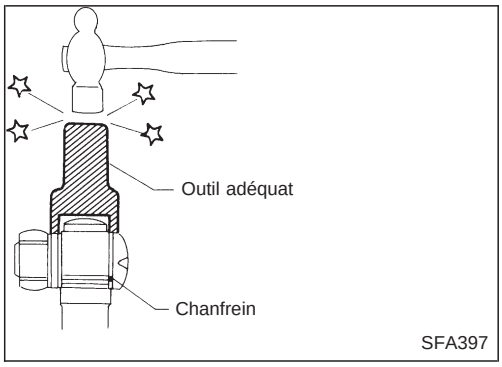
Ensemble joint (côté roue)

Remplacer l'ensemble joint s'il est déformé ou endommagé.

REMONTAGE

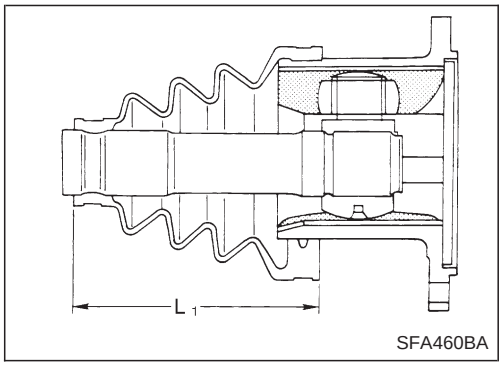
- **Après avoir remonté le semi-arbre, s'assurer qu'il coulisse sans difficulté dans toute sa course.**
- **Utiliser la GRAISSE D'ORIGINE NISSAN ou un équivalent après chaque révision.**

SFA800



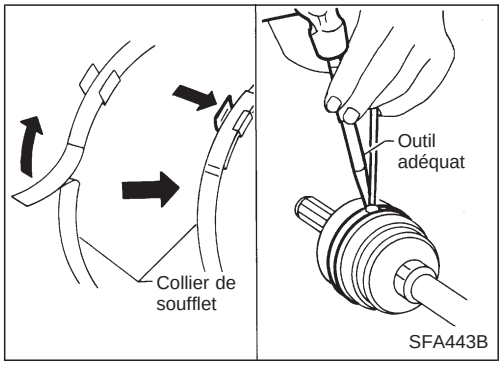
Côté transmission de l'essieu (TS82F)

1. Reposer le nouveau petit collier de soufflet, le soufflet et le logement de joint coulissant sur le semi-arbre.



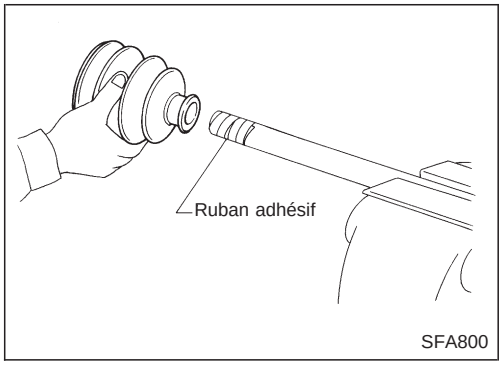
Recouvrir les cannelures du semi-arbre avec du ruban adhésif afin de ne pas endommager le soufflet lors de la repose.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



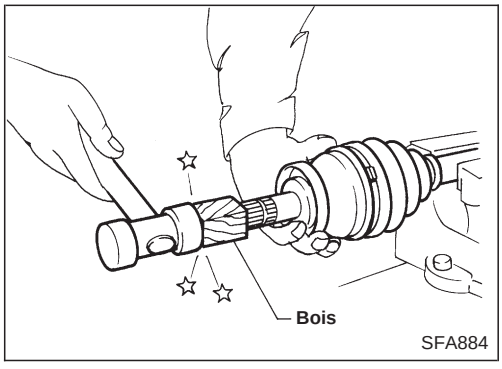
Semi-arbre – 4 roues motrices – (Suite)

2. Reposer l'ensemble croisillon correctement, en s'assurant que les repères sont bien alignés.
- **Monter à la presse en s'assurant que le chanfrein des cannelures du croisillon est face à l'arbre.**
3. Reposer un jonc d'arrêt neuf.



4. Enduire de graisse.
   Quantité de graisse spécifiée :
   95 à 105 g
5. S'assurer que le soufflet est correctement reposé sur la rainure du semi-arbre. Monter le soufflet de manière à ce qu'il ne gonfle pas ou ne se déforme pas une fois que sa longueur est égale à "L_1".
   Longueur "L_1" : 95 - 97 mm

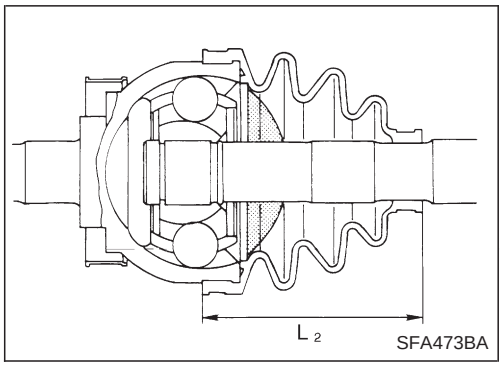
6. Serrer fermement le nouveau collier de soufflet large à l'aide d'un outil approprié, puis serrer le nouveau petit collier de soufflet.
7. Reposer un obturateur neuf sur le logement de joint coulissant en le frappant légèrement.



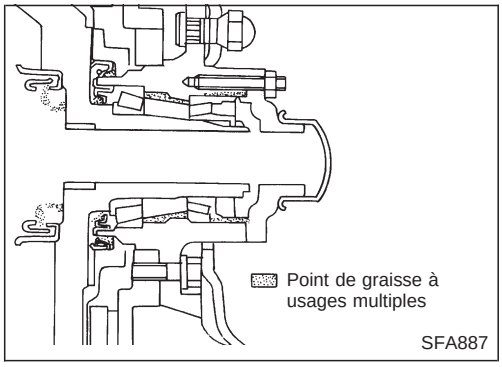
Enduire la surface d'appui de l'obturateur de produit d'étanchéité.

Côté roue (ZF100)

1. Reposer le nouveau petit collier de soufflet et le soufflet sur le semi-arbre.



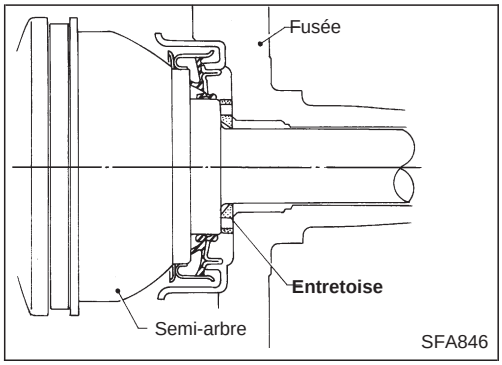
Recouvrir les cannelures du semi-arbre avec du ruban adhésif afin de ne pas endommager le soufflet lors de la repose.



2. Monter l'ensemble joint sur le semi-arbre en le frappant légèrement.
   Fixer fermement l'ensemble joint, en s'assurant que les marques de repères faites lors du démontage sont correctement alignées.

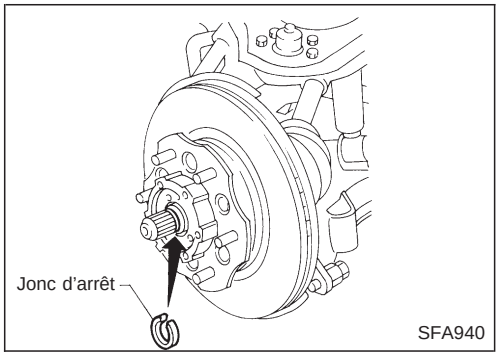
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Semi-arbre – 4 roues motrices – (Suite)



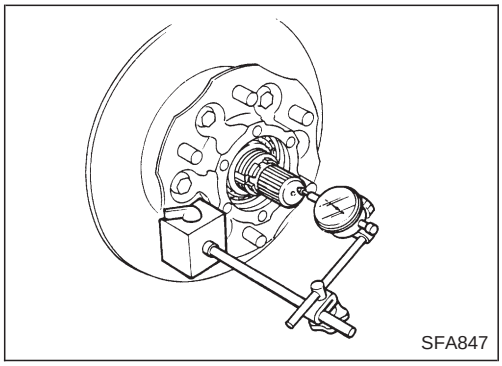
3. Enduire le semi-arbre de la quantité appropriée de graisse.
   Quantité de graisse spécifiée :
   135 à 145 g
4. S'assurer que le soufflet est correctement reposé sur la rainure du semi-arbre. Monter le soufflet de manière à ce qu'il ne gonfle pas ou ne se déforme pas une fois que sa longueur est égale à "L_2".
   Longueur "L_2" : 96 - 98 mm
5. Serrer fermement le nouveau collier de soufflet large à l'aide d'un outil approprié.
6. Serrer le nouveau petit collier de soufflet.

REPOSE



1. Enduire de graisse à usages multiples.

2. Reposer l'entretoise de roulement sur le semi-arbre.

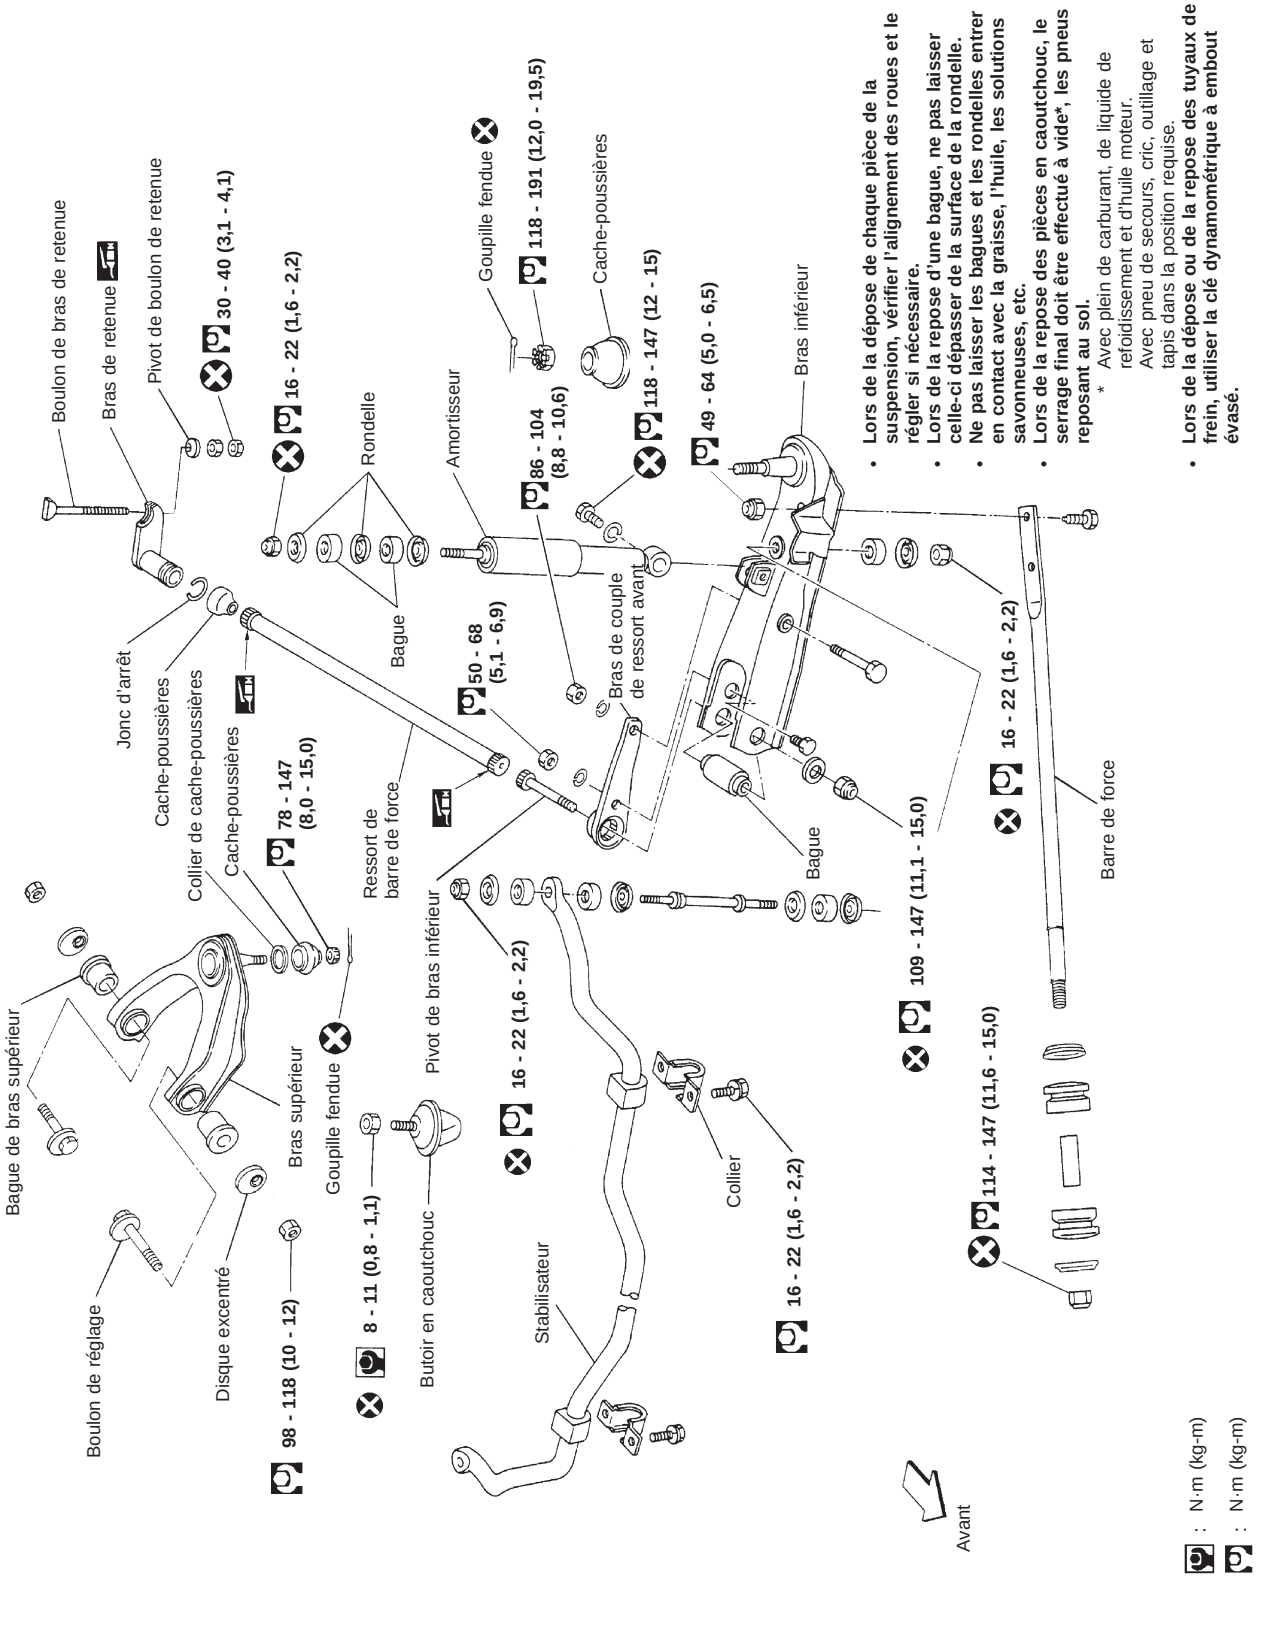


S'assurer que l'entretoise de roulement est correctement orientée.

3. Après la repose du moyeu et du roulement de roue, régler la précharge du roulement de roue. Se reporter à "REGLAGE DE LA PRECHARGE", "Roulements des roues avant", "ENTRETIEN SUR LE VEHICULE", FA-6.

4. Lors de la repose du semi-arbre, régler son jeu axial en choisissant un jonc d'arrêt adéquat.

a. Reposer temporairement un jonc d'arrêt neuf sur le semi-arbre de même épaisseur que celui qui a été déposé.



b. Placer le comparateur à cadran sur l'extrémité du semi-arbre.
c. Mesurer le jeu axial du semi-arbre.
   Jeu axial : 0,45 mm ou moins
d. Si le jeu axial n'est pas dans la limite spécifiée, choisir un autre jonc d'arrêt.

1,1 mm	**1,3 mm**
1,5 mm	**1,7 mm**
1,9 mm	**2,1 mm**
2,3 mm

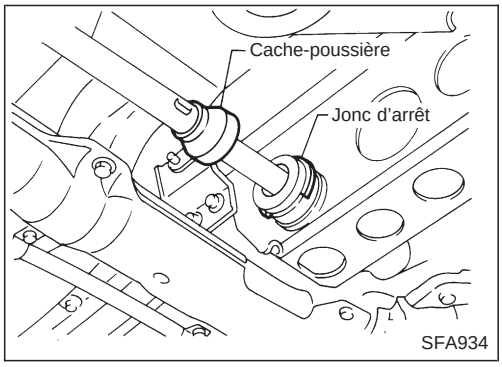
Amortisseur



DEPOSE ET REPOSE

1. Soutenir le bras inférieur avec un cric.
2. Déposer le boulon et l'écrou qui supportent l'amortisseur.

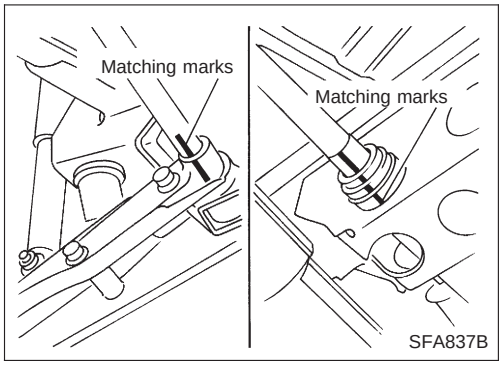
INSPECTION

Nettoyer toutes les pièces, à l'exception des pièces non métalliques, avec un solvant approprié, et les sécher à l'air comprimé.
Chasser la salissure et la poussière des pièces non métalliques à l'air comprimé.

- Vérifier qu'il n'y a pas de fuites d'huile et de fissures. Remplacer si nécessaire.
- Vérifier que la tige de piston ne présente pas de fissures, de déformation et d'autres dommages. Remplacer si nécessaire.
- Vérifier que les pièces en caoutchouc ne sont pas usées, fissurées, endommagées et déformées. Remplacer si nécessaire.

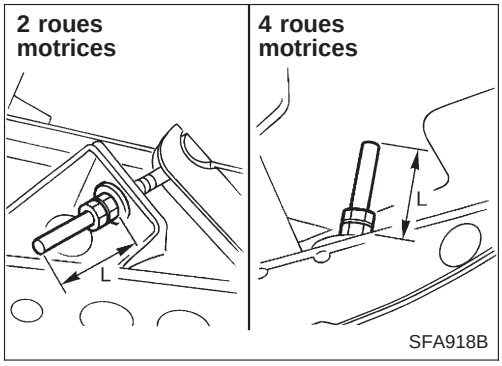
SFA934

Barre de torsion



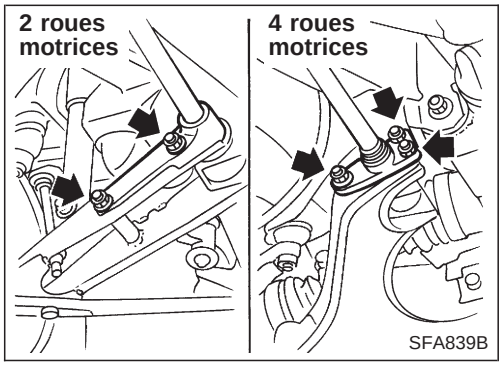
DEPOSE

1. Déplacer le cache-poussière.
2. Tracer des repères d'alignement à la peinture sur la barre de torsion et son bras correspondant.



Toujours indiquer un repère à la peinture ; ne pas écrire sur les pièces concernées.

3. Mesurer la saillie ''L'' du boulon du bras de retenue, et déposer le contre-écrou et l'écrou de réglage.



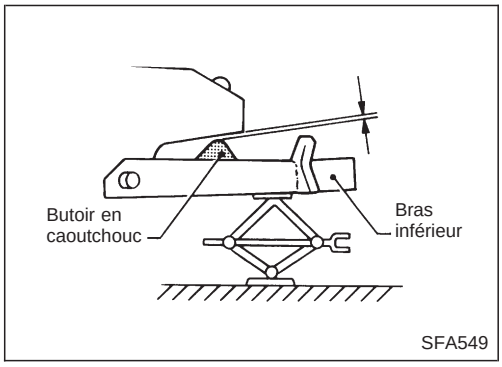
Avant de déposer les écrous, s'assurer que la force de torsion est éliminée des barres de torsion.

SFA837B

SFA918B

SFA839B

4. Détacher le jonc d'arrêt du bras de retenue.

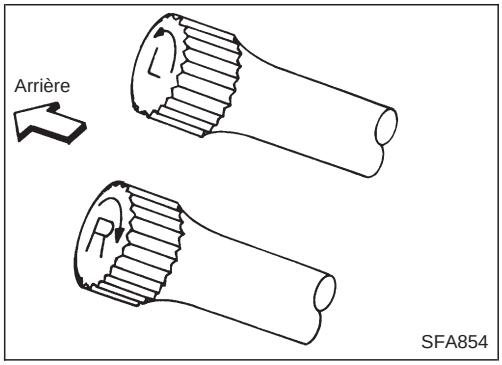


- Extraire le bras de retenue par l'arrière, puis retirer la barre de torsion par l'arrière – 2 roues motrices –.
- Déposer le bras de couple – 2 roues motrices –.
- Déposer les écrous de fixation du bras de couple, puis retirer la barre de torsion par l'avant avec le bras de couple – 4 roues motrices –.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

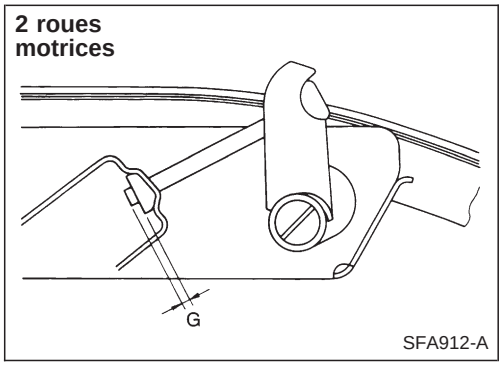
Barre de torsion (Suite)

INSPECTION



- Vérifier que la barre de torsion n'est pas usée, tordue, courbée ou endommagée.
- Vérifier si les cannelures de chaque pièce ne sont pas fissurées, usées, tordues ou endommagées.
- Vérifier si le cache-poussière ne présente pas de fissures.

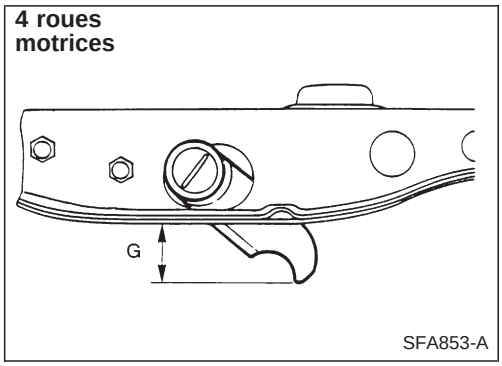
INSTALLATION ET REGLAGE



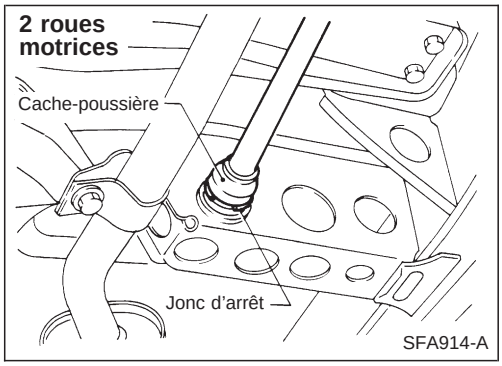
Le réglage de l'écrou de réglage du bras de retenue se fait uniquement dans le sens du serrage.
Ne pas régler en desserrant le boulon de réglage du bras de retenue.

1. Reposer le bras de couple sur le bras inférieur – 2 roues motrices –.
2. Enduire les cannelures de barre de torsion de graisse à usages multiples.
3. Placer le bras inférieur dans une position où le jeu du butoir en caoutchouc "C" est de 0.
   Jeu "C" : 0 mm

4. Reposer la barre de torsion – 2 roues motrices –.
   Reposer la barre de torsion, y compris le bras de couple – 4 roues motrices –.



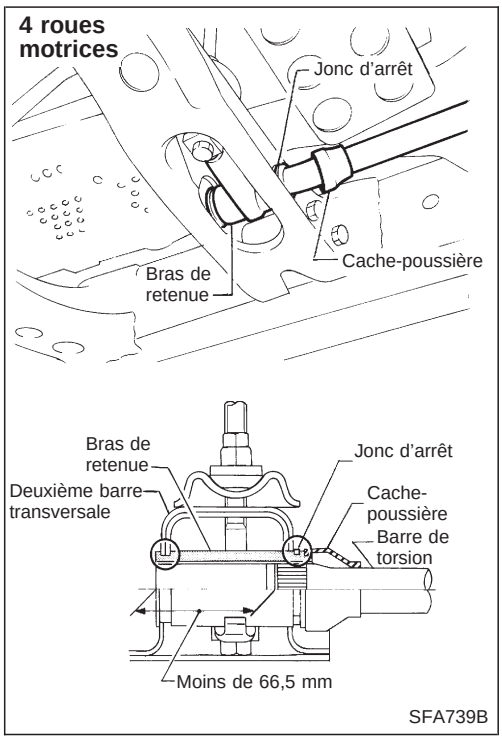
Veiller à reposer correctement les barres de torsion droite et gauche.



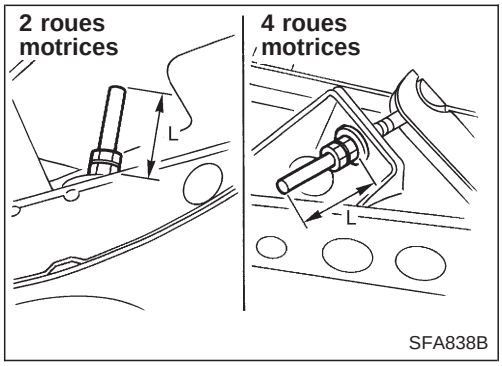
5. Tout en alignant le bras de retenue sur le repère, le reposer sur de la barre de torsion.
   Si une de barre de torsion ou un bras de retenue neufs sont reposés, régler la longueur du bras de retenue selon la dimension indiquée dans l'illustration ci-contre.
   Longueur standard "G" :
   2 roues motrices
   6 - 18 mm
   4 roues motrices
   22 - 36 mm

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Barre de torsion (Suite)



6. Reposer le jonc d'arrêt sur le bras de retenue et le cache-poussière.

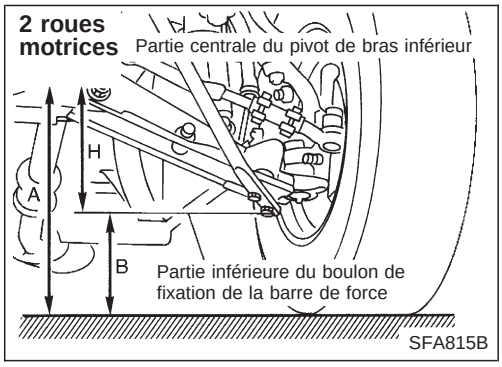


– 2 roues motrices –

S'assurer que le jonc d'arrêt est correctement reposé sur la rainure du bras de retenue.

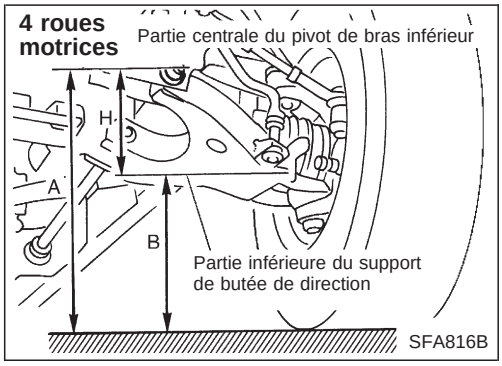
– 4 roues motrices –

S'assurer que le jonc d'arrêt et le bras de retenue sont correctement reposés.



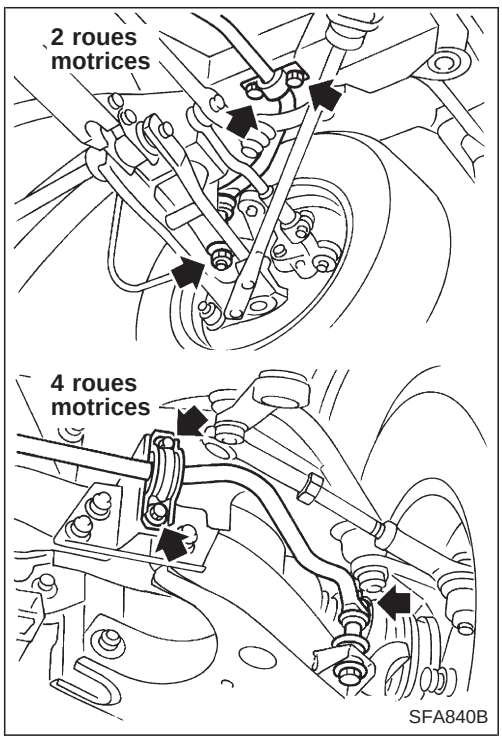
7. Serrer l'écrou de réglage de façon à ce que la longueur de la barre de torsion corresponde à la dimension "L" mesurée auparavant lors de sa dépose. Serrer le contre-écrou au couple spécifié.
   Si une barre de torsion ou un bras de retenue neufs sont reposés, serrer l'écrou de réglage à la dimension indiquée dans l'illustration ci-à gauche, puis serrer le contre-écrou au couple spécifié.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Barre de torsion (Suite)

Longueur standard ‘‘L’’ :
2 roues motrices
46 mm
4 roues motrices
70 mm

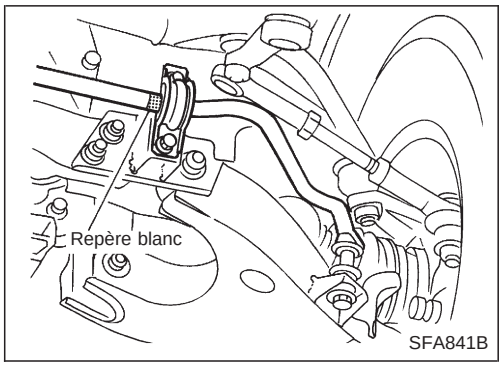


8. Faire balancer de haut en bas le véhicule avec les pneus au sol (à vide) pour éliminer la friction de la suspension.
9. Mesurer l’assiette ‘‘H’’ du véhicule.

a. Actionner la suspension avant en faisant balancer l’avant du véhicule 4 ou 5 fois de haut en bas pour s’assurer qu’il est à une hauteur neutre.
b. Mesurer l’assiette du véhicule . . . Cote ‘‘H’’.
H = A − B mm ‘‘à vide’’
Se reporter à ‘‘ALIGNEMENT DES ROUES (à vide)’’, ‘‘SDS’’, FA-39.

10. Si la hauteur au sol du véhicule n’est pas dans la limite admissible, régler l’assiette.
Se reporter à ‘‘ALIGNEMENT DES ROUES (à vide)’’, ‘‘SDS’’, FA-39.
11. Vérifier l’alignement des roues si nécessaire.
Se reporter à ‘‘ALIGNEMENT DES ROUES (à vide)’’, ‘‘SDS’’, FA-39.

Barre stabilisatrice



DEPOSE

- Déposer les boulons de raccordement de la barre stabilisatrice et les boulons de collier.

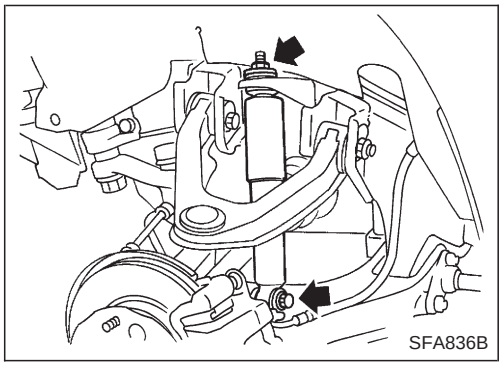
INSPECTION

- Vérifier que la barre stabilisatrice n’est pas tordue et déformée.
  Remplacer si nécessaire.
- Vérifier que la bague en caoutchouc ne présente pas de fissures, d’usure et de détérioration.
  La remplacer si nécessaire.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

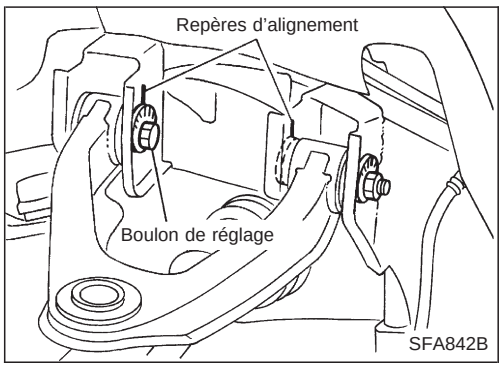
REPOSE

- Reposer la bague à côté du repère peint en blanc sur la barre stabilisatrice.



Bras supérieur

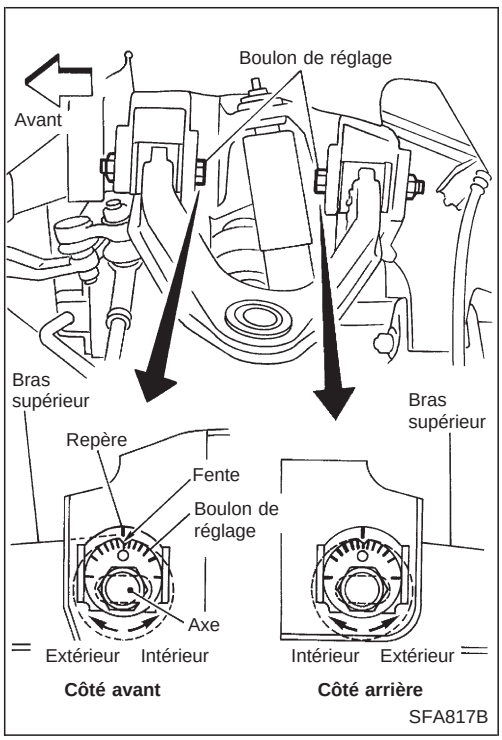
DEPOSE



1. Déposer l'amortisseur. Se reporter à ''Amortisseur'', FA-30.
2. Séparer le goujon de rotule supérieure du pivot de fusée.

Soutenir le bras inférieur avec un cric.

Se reporter à ''Pivot de fusée'', ''ESSIEU AVANT'', FA-20.

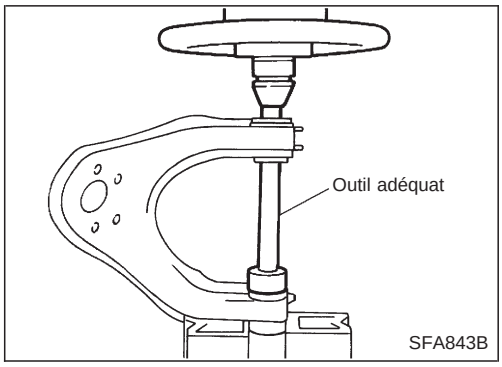


3. Tracer des marques de repères sur les boulons de réglage et les déposer.

REPOSE

1. Tout en alignant les boulons de réglage sur les repères, reposer le bras supérieur.
   Si un bras supérieur neuf ou tout autre pièce de la suspension est installé, aligner le repère sur la fente comme indiqué dans l'illustration ci-contre, puis reposer le bras supérieur.
   Se reporter à ''Alignement des roues avant'', ''ENTRETIEN SUR LE VEHICULE'', FA-8.
2. Reposer l'amortisseur.
3. Serrer les boulons de réglage à vide, les pneus reposant au sol.
4. Après la repose, vérifier l'alignement des roues. Régler si nécessaire. Se reporter à FA-8.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

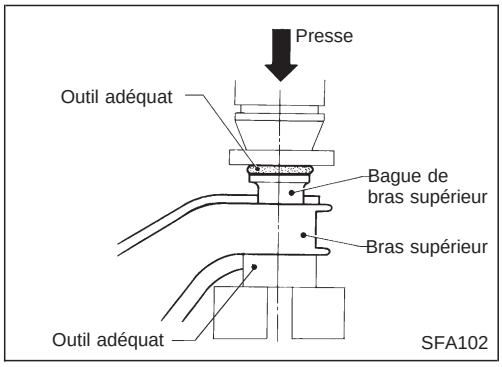


Bras supérieur (Suite)

DEMONTAGE

- Démonter à la presse les bagues du bras supérieur.

INSPECTION

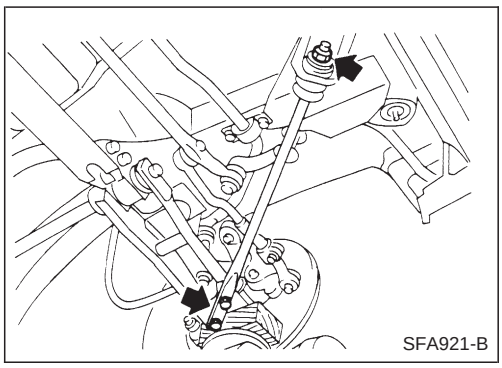


- Vérifier si les boulons de réglage et les bagues en caoutchouc ne sont pas endommagés. Remplacer si nécessaire.
- Vérifier si le bras supérieur ne présente pas de déformations et de fissures. Remplacer si nécessaire.

REMONTAGE

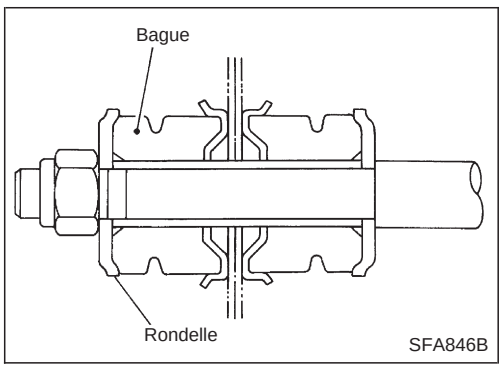
1. Appliquer de l'eau savonneuse sur la bague en caoutchouc.
2. Adapter à la presse la bague du bras supérieur.

Enfoncer la bague de sorte que sa bride entre bien en contact avec la surface du collier de bras supérieur.



Barre de force

DEPOSE ET REPOSE



1. Déposer les écrous de fixation du bras inférieur et du châssis.

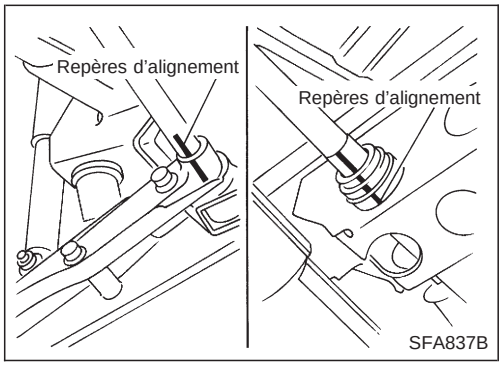
Soutenir le bras inférieur avec un cric.

2. Reposer la barre de force.

S'assurer que les bagues et les rondelles sont correctement reposées.

INSPECTION

- Vérifier si la barre de force ne présente pas de déformations ni de fissures. Remplacer si nécessaire.
- Vérifier si les bagues en caoutchouc ne sont pas endommagées. Remplacer si nécessaire.

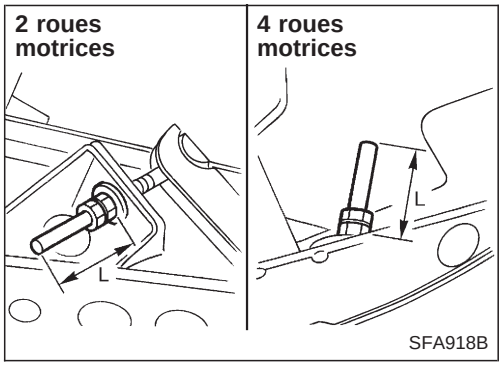


Bras inférieur

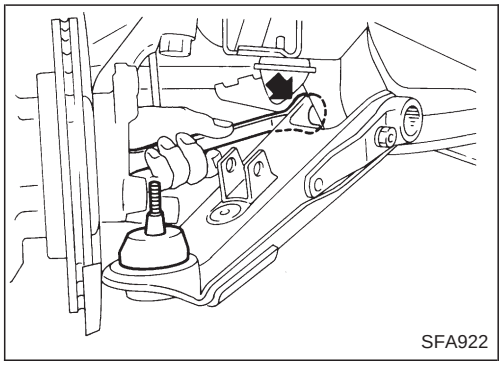
DEPOSE ET REPOSE

1. Déposer la barre de torsion. Se reporter à ''DEPOSE'', ''Barre de torsion'', FA-30.

Tracer des repères et mesurer la dimension ''L'' lors du desserrage de l'écrou de réglage jusqu'à ce qu'il n'y ait plus de tension dans la barre de torsion.

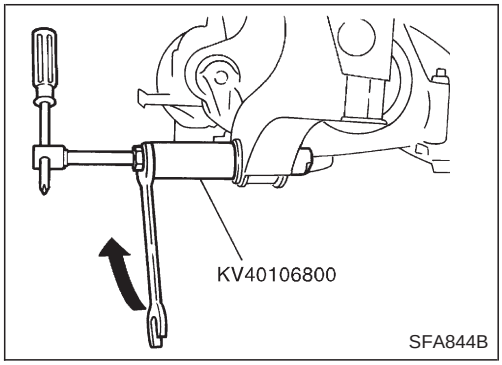


2. Déposer le boulon de fixation inférieur de l'amortisseur.
3. Déposer le boulon de raccordement de la barre stabilisatrice.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Bras inférieur (Suite)



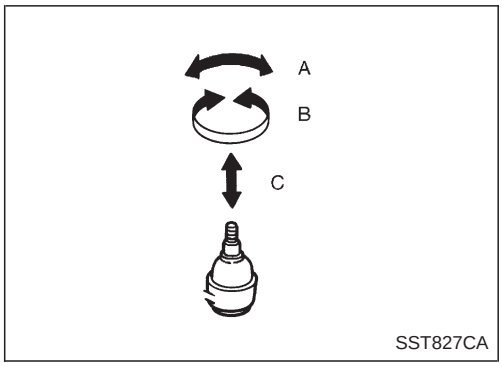
4. Déposer le semi-arbre – 4 roues motrices –.
   Se reporter à ‘‘Semi-arbre – 4 roues motrices –’’, ‘‘ESSIEU AVANT’’, FA-23.

5. Séparer la rotule du bras inférieur du pivot de fusée.
   Se reporter à ‘‘Pivot de fusée’’, ‘‘ESSIEU AVANT’’, FA-20.

6. Déposer l’écrou de fixation du bras inférieur avant.

7. Déposer la bague du pivot de bras inférieur du châssis à l’aide d’un outil spécial.
8. Après la repose du bras inférieur, régler l’alignement des roues et la hauteur du véhicule. Se reporter à ‘‘Alignement des roues avant’’, ‘‘ENTRETIEN SUR LE VEHICULE’’, FA-8.

INSPECTION



Bras inférieur et pivot de bras inférieur

- Vérifier s’ils ne sont pas déformés et fissurés. Remplacer si nécessaire.

Bague de bras inférieur

- Vérifier la présence de déformations et de dommages. Remplacer si nécessaire.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Joint à rotule supérieur et joint à rotule inférieur

DEPOSE ET REPOSE

- Séparer le pivot de fusée des bras supérieur et inférieur. Se reporter à ‘‘Pivot de fusée’’, ‘‘ESSIEU AVANT’’, FA-20.

INSPECTION

- Vérifier le jeu des joints. Si la rotule est usée et le jeu axial excessif, ou si le joint est difficile à basculer, remplacer le bras supérieur ou inférieur.

Force de basculement (point de mesure : orifice de la goupille) ‘‘A’’ :
Bras supérieur
16,7 - 79,4 N (1,7 - 8,1 kg)
Bras inférieur
2 roues motrices 13,7 - 166,7 N (1,4 - 17 kg)
4 roues motrices 0 - 67,7 N (0 - 6,9 kg)
Couple de rotation ‘‘B’’ :
Bras supérieur
1,0 - 4,9 N·m (10 - 50 kg-cm)
Bras inférieur
2 roues motrices 1,0 - 3,9 N·m (10 - 40 kg-cm)
4 roues motrices 0 - 4,9 N·m (0 - 50 kg-cm)
Jeu axial ‘‘C’’ :
Bras supérieur
0 mm
Bras inférieur
2 roues motrices 0,1 - 1,0 mm
4 roues motrices 0,2 mm ou moins

- Vérifier si le soufflet n’est pas endommagé. Remplacer le cache-poussière et sa bride, si nécessaire.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Caractéristiques générales

Type de suspension	Ressort de barre de torsion de liaison transversale double indépendante
Type d'amortisseur	Hydraulique à double effet
Stabilisateur	Equipement standard ou en option

Inspection et Réglage

ROULEMENT DE ROUE

2 roues motrices

Jeu axial du roulement de roue mm	0
Contre-écrou de roulement de roue	
Couple de serrage N·m (kg-m)	34 - 39 (3,5 - 4,0)
Angle de retour degré	45° - 60°
Couple de démarrage du roulement de roue	
Au boulon de moyeu de roue Avec un joint à graisse neuf N (kg)	9,8 - 28,4 (1,0 - 2,9)
Avec un joint à graisse usagé N (kg)	9,8 - 23,5 (1,0 - 2,4)

4 roues motrices

Contre-écrou de roulement de roue	
Couple de serrage N·m (kg-m)	78 - 98 (8 - 10)
Resserrage du couple après desserrage du contre-écrou de roulement de roue N·m (kg-m)	0,5 - 1,5 (0,05 - 0,15)
Jeu axial mm	0
Force au démarrage du boulon de moyeu de roue N (kg)	A
Angle de braquage degré	15° - 30°
Force au démarrage au boulon de moyeu de roue N (kg)	B
Précharge du roulement de roue au boulon de moyeu de roue N (kg)	
B − A	7,06 - 20,99 (0,72 - 2,14)

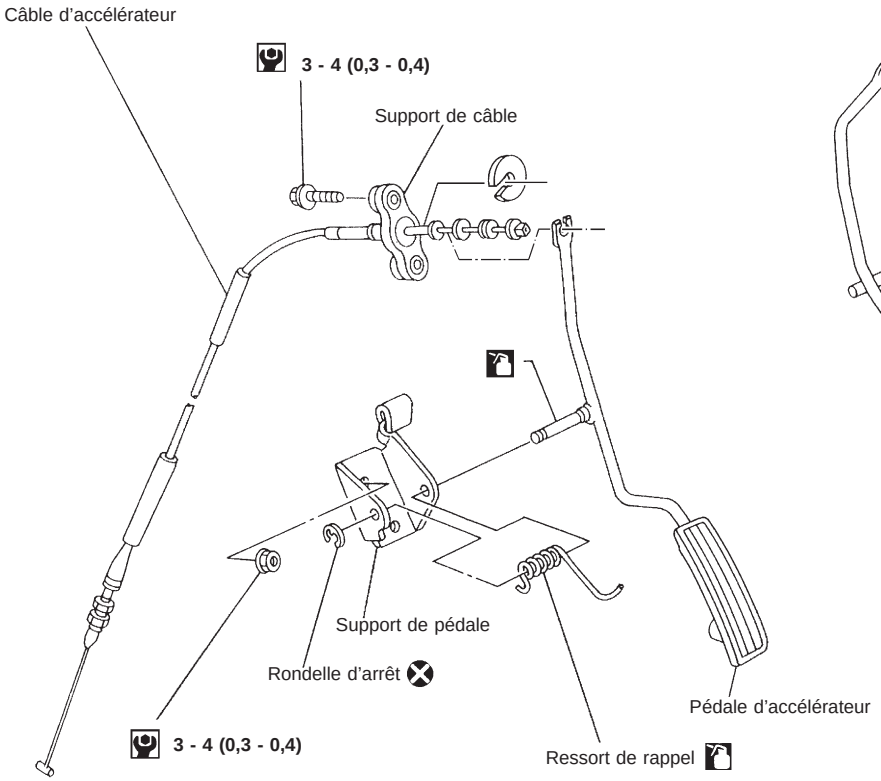
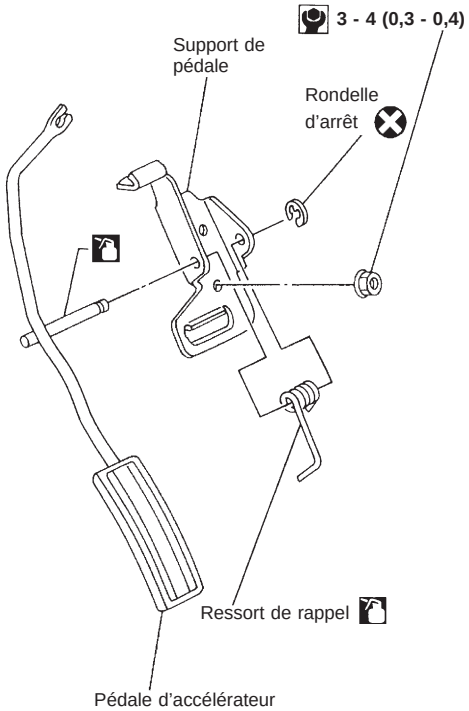
KV10114400 Clé pour sonde à oxygène chauffée	 NT636 Desserrage ou serrage de la sonde à oxygène chauffée **a = 22 mm**



Système de commande d'accélérateur

ATTENTION :



- **Lors de la dépose du câble d'accélérateur, repérer la position initiale du contre-écrou.**
- **Contrôler que le papillon s'ouvre complètement lorsque la pédale d'accélérateur est enfoncée à fond. Vérifier également qu'il revient à la position de ralenti lorsque la pédale est relâchée.**
- **S'assurer que les pièces de la commande d'accélérateur n'entrent pas en contact avec des pièces voisines.**
- **Lors du branchement du câble d'accélérateur, veiller à ne pas tordre ou effilocher le câble.**

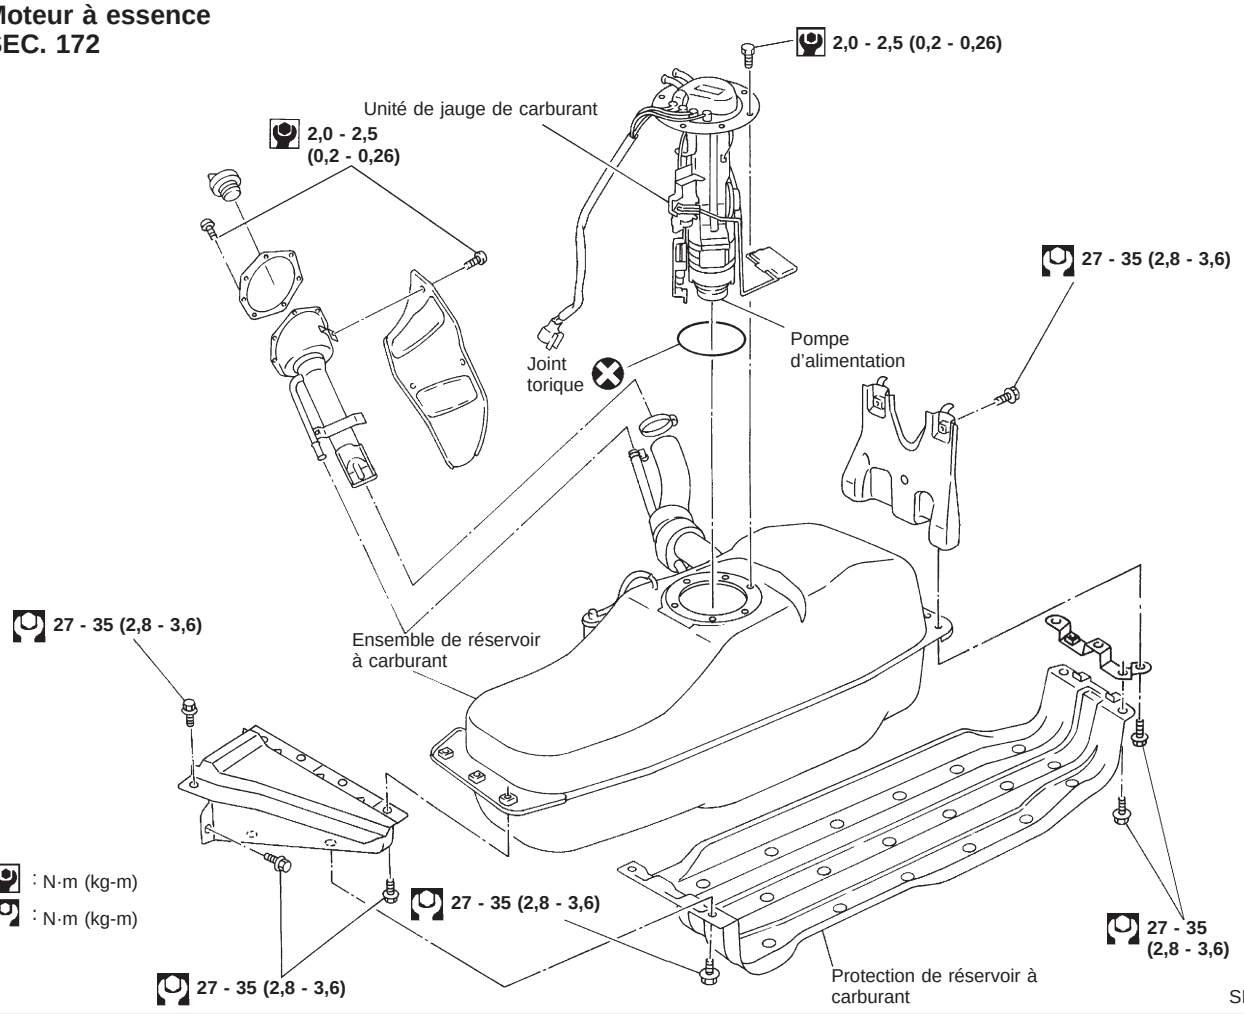
Réglage du câble d'accélérateur

1. Desserrer le contre-écrou, puis agir sur l'écrou de réglage jusqu'à ce que le tambour de papillon commence à se déplacer.
2. A partir de cette position, desserrer l'écrou de réglage de 1,5 à 2 tours, puis le bloquer avec le contre-écrou.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

AVERTISSEMENT :

Lors du remplacement des pièces de canalisation d'alimentation, veiller à observer les règles suivantes :



- **Accrocher dans l'atelier une pancarte : ''ATTENTION : RISQUE D'INCENDIE''.**
- **Ne pas fumer lors d'une intervention sur le circuit d'alimentation. Ne pas approcher de flammes ni d'étincelles de la zone de travail.**
- **S'assurer que l'on a débranché le câble de masse de la batterie avant de procéder aux opérations.**
- **S'assurer que l'on dispose dans l'atelier d'un extincteur au CO_2.**
- **Vidanger le réservoir à carburant, verser le carburant vidangé dans un récipient anti-déflagration et serrer fermement le couvercle.**

ATTENTION :

- **Avant de débrancher le flexible d'alimentation des modèles avec moteur ECCS, relâcher la pression d'alimentation dans la canalisation de carburant. Consulter le titre ''Remplacement du filtre à carburant'' à la section MA.**
- **Ne débrancher aucune canalisation d'alimentation sauf en cas de nécessité absolue.**
- **Boucher les ouvertures de flexibles et de tuyauterie pour empêcher la pénétration de poussières ou de saletés.**
- **Toujours remplacer les joints toriques et les colliers par des pièces neuves.**
- **Ne pas plier ou tordre le flexible et le tuyau lors de leur installation.**
- **Ne pas serrer excessivement les colliers de serrage des flexibles afin de ne pas endommager ces derniers.**
- **Lors de la repose du clapet anti-retour de carburant, respecter le sens de la flèche (consulter le titre ''SYSTEME DE CONTROLE DES EMISSIONS EVAPORATIVES'' à la section EC).**
- **Serrer les boulons au couple spécifié.**
- **Après la repose, faire tourner le moteur et vérifier qu'il n'y a pas de fuites de carburant au niveau des raccords.**

SEF180A

ATTENTION :

- **Lors du remontage, toujours remplacer les joints d'échappement par des joints neufs. Si du joint colle à la surface du flasque, gratter entièrement la surface comme indiqué sur la figure.**
- **Faire tourner le moteur et rechercher la présence de fuites de gaz d'échappement aux raccords des tuyaux, puis contrôler tout le système pour voir s'il ne présente pas de bruits anormaux.**
- **S'assurer que les supports de fixation et les isolants de montage sont correctement montés et ne sont pas soumis à des contraintes anormales. Un montage incorrect provoquerait des bruits et vibrations excessifs.**
- **Mettre au rebut toute sonde à oxygène chauffée qui serait tombée d'une hauteur de plus de 0,5 m sur une surface dure telle qu'un sol en béton ; utiliser une sonde neuve.**

AVANT-PROPOS

Ce manuel contient les travaux d'entretien et de réparation concernant les véhicules NISSAN PICKUP, série des modèles D22.

A des fins de sécurité et pour que le rendement des véhicules concernés soit optimal, prière de lire ce manuel complètement. Avant de commencer à entreprendre des travaux, il est particulièrement important d'avoir parfaitement assimilé les PRECAUTIONS signalées dans la section GI.

Toutes les informations contenues dans ce manuel sont basées sur les données de production les plus récentes au moment de la réalisation du manuel. Nous nous réservons le droit de modifier les caractéristiques et les méthodes de travail à n'importe quel moment et sans avis préalable.

NOTE IMPORTANTE DE SECURITE

Un entretien correctement effectué est essentiel, aussi bien pour la sécurité des mécaniciens que pour le fonctionnement adéquat du moteur. Les méthodes d'entretien reprises dans ce manuel de réparation sont décrites de telle manière que le travail puisse être effectué en sécurité et avec précision. Les entretiens varient selon les procédures, les connaissances du technicien et l'outillage, ainsi que les pièces disponibles. Dès lors, toute personne utilisant les procédures d'entretien, un outillage ou des pièces qui ne sont pas spécifiquement recommandées par NISSAN doit auparavant être absolument certain que ceci n'entraîne de danger ni pour sa propre sécurité, ni pour celle du moteur.

Pour que l'entretien puisse être exécuté en toute sécurité et de manière correcte, il importe que les précautions suivantes soient rigoureusement respectées. Ces précautions ne sont pas indiquées dans chaque section.

SGI646

Précautions pour le système de retenue supplémentaire (SRS) ''COUSSIN GONFLABLE'' (modèles avec 4 roues motrices)

Utilisé avec une ceinture de sécurité, le coussin gonflable du système de retenue supplémentaire contribue à réduire les risques et la gravité des blessures subies par le conducteur en cas de collision frontale. Le système de retenue supplémentaire se compose d'un module de coussin gonflable (situé dans le moyeu du volant), d'un boîtier de capteurs de diagnostic, d'un témoin avertisseur, d'un faisceau de câblage et d'un câble spiralé. Les informations nécessaires à l'entretien sans danger du système se trouvent à la **section RS** de ce manuel de réparation.

AVERTISSEMENT :

- **Pour ne pas affecter le fonctionnement du SRS, ce qui augmenterait les risques de blessures graves ou mortelles en cas de collision entraînant le déploiement du coussin gonflable (air bag), toutes les opérations d'entretien doivent être effectuées par un concessionnaire NISSAN agréé.**
- **Un entretien incorrect, y compris une mauvaise dépose ou repose du SRS, pourra entraîner des risques de blessures dues au déploiement accidentel du système.**
- **Ne pas utiliser d'équipement d'essai électrique sur les circuits connexes du SRS sauf sur indication de ce manuel de réparation. Les faisceaux de câblage électrique du SRS sont équipés d'une gaine d'isolation jaune soit juste devant les connecteurs de faisceau, soit sur le faisceau tout entier pour une identification plus rapide.**

Précautions pour le système de retenue supplémentaire (SRS) ''COUSSIN GONFLABLE'' (modèles avec 2 roues motrices)

Utilisé avec une ceinture de sécurité, le coussin gonflable (air bag) du système de retenue supplémentaire contribue à réduire les risques ou la gravité des blessures subies par le conducteur en cas de collision frontale. Le système de retenue supplémentaire se compose d'un module de coussin gonflable (situé dans le moyeu du volant), d'un boîtier de capteurs de diagnostic, d'un témoin avertisseur et d'un câble spiralé. Les informations nécessaires à l'entretien sans danger du système se trouvent à la **section RS** de ce manuel de réparation.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Précautions pour le système de retenue supplémentaire (SRS) ‘‘COUSSIN GONFLABLE’’ (modèles avec 2 roues motrices) (Suite)

AVERTISSEMENT :

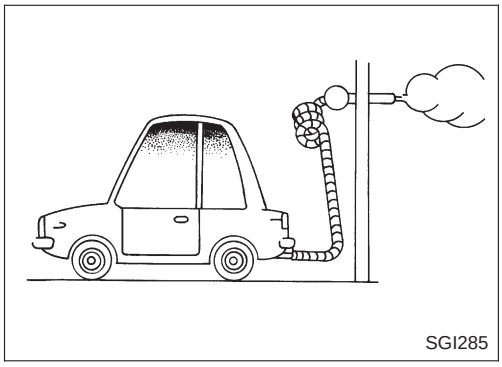
- **Pour ne pas affecter le fonctionnement du SRS, ce qui augmenterait les risques de blessures graves ou mortelles en cas de collision entraînant le déploiement du coussin gonflable (air bag), toutes les opérations d’entretien doivent être effectuées par un concessionnaire NISSAN agréé.**
- **Un entretien incorrect, y compris une mauvaise dépose ou repose du SRS, pourra entraîner des risques de blessures dues au déploiement accidentel du système.**
- **Ne pas utiliser d’équipement d’essai électrique sur les circuits connexes du SRS.**

SGI916

Précautions pour le système NATS

Système NATS (système antivol NISSAN)

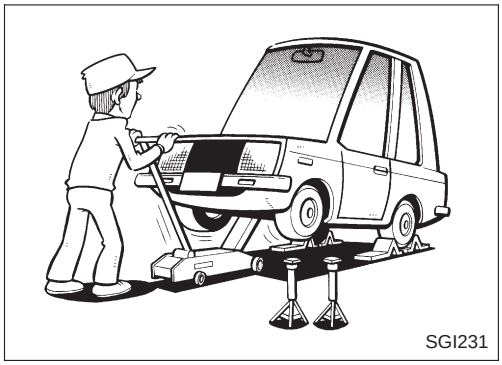
Le système NATS immobilisera le moteur si quelqu’un tente de le démarrer sans utiliser une clé NATS enregistrée.
Les codes d’identification des deux clés de contact d’origine ont été enregistrés pour le système NATS.
Le témoin de sécurité NATS est situé sur le tableau de bord. Le témoin clignote lorsque le contact d’allumage est placé sur ‘‘OFF’’ ou ‘‘Acc’’. De cette façon, le système NATS indique à toute personne extérieure que le véhicule est équipé d’un système antivol.



- Moteur à essence :
  Lorsque le système NATS détecte une panne, le témoin de défaut (MIL) clignote.
  Ce clignotement indique que le système antivol ne fonctionne pas ; une réparation rapide s’impose alors.
- Moteur diesel :
  Lorsque le système NATS détecte une panne alors que le moteur est en marche ou que le contact d’allumage est sur ‘‘ON’’, le témoin NATS s’allume.
  Ce clignotement indique que le système antivol ne fonctionne pas ; une réparatin rapide s’impose alors.
- Le matériel CONSULT et le logiciel CONSULT NATS sont nécessaires à l’entretien du systène NATS (diagnostics des défauts, initialisation du système et enregistrement de numéros d’identification de clés NATS supplémentaires).
  Pour les procédures d’initialisation du NATS et d’enregistrement du numéro d’identification de la clé de contact NATS, consulter le Manuel d’utilisation CONSULT NATS.

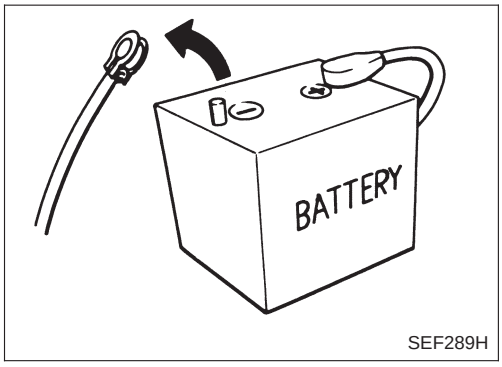
Le logiciel CONSULT NATS (carte programme et manuel d’utilisation) doit donc être gardé strictement confidentiel de façon à maintenir l’intégrité de la fonction antivol.

- Lors de la réparation d’une panne du système NATS (diagnostics des défauts, initialisation du système ou enregistre-



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

ment d'autres numéros d'identification de clés de contact NATS), il peut s'avérer nécessaire de réenregistrer le numéro d'identification de la clé originale.
Un maximum de quatre codes d'identification de clés peut être enregistré dans le système NATS.



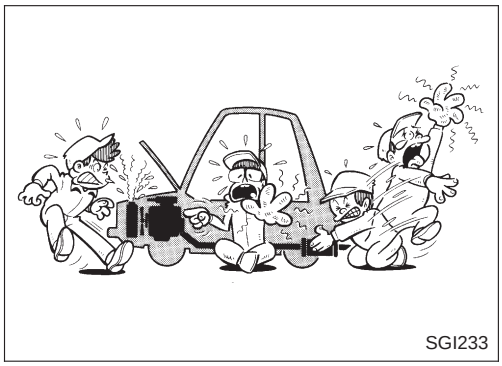
SGI285

Précautions générales

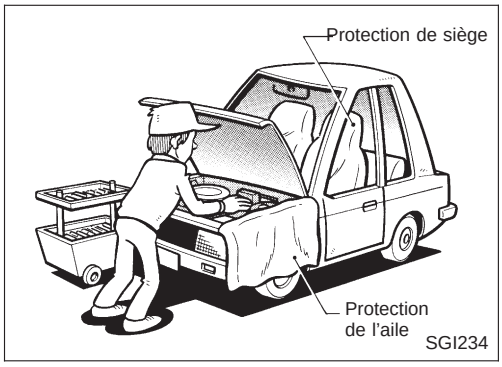
- Ne pas faire tourner le moteur pendant une période prolongée sans une bonne ventilation des gaz d'échappement.
  La zone de l'atelier doit être bien ventilée et ne pas comporter de matériaux inflammables. Manipuler avec précaution les produits inflammables ou toxiques tels que l'essence, le gaz réfrigérant, etc. Lorsqu'on travaille dans une fosse ou dans une zone close, bien aérer la zone avant de travailler avec des matériaux dangereux.
  Ne pas fumer pendant que l'on travaille sur le véhicule.

SGI231

- Avant de mettre le véhicule sur cric, mettre des cales ou d'autres pièces de blocage au niveau des roues pour empêcher le déplacement du véhicule. Après levage avec un cric, caler le véhicule avec des chandelles de sécurité aux endroits adéquats désignés pour le levage avant de travailler sur le véhicule.
  Toutes ces opérations doivent se faire sur une surface horizontale.
- Lors de la dépose d'un composant lourd, comme le moteur ou l'ensemble boîte-pont/boîte de vitesses, prendre garde de ne pas perdre l'équilibre et de ne pas les laisser tomber. Veiller également à ce qu'ils ne viennent pas heurter les pièces voisines et tout particulièrement les tuyaux de freinage et le maître-cylindre.



SEF289H



- Avant de commencer des réparations qui ne nécessitent pas d'alimentation de la batterie :
  Couper le contact.
  Débrancher la borne négative de la batterie.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Précautions générales (Suite)

SGI233

- Pour éviter de graves brûlures :
  Eviter tout contact avec les pièces métalliques chaudes.
  Ne pas enlever le bouchon du radiateur lorsque le moteur est chaud.

SGI234

- Avant l'entretien du véhicule :
  Protéger les ailes, les rembourrages et le tapis de sol au moyen de recouvrements appropriés.
  Veiller à ne pas érafler la peinture avec des clés, boucles ou boutons.
- Avant inspection ou montage, nettoyer toutes les pièces démontées à l'aide du liquide ou du solvant indiqué.
- Remplacer par des pièces neuves les joints d'étanchéité, les joints plats, les garnitures, les joints toriques, les rondelles de bloquage, les goupilles fendues, les écrous autobloquants, etc.
- Remplacer les cuvettes interne et externe des roulements à rouleaux coniques et des roulements à aiguilles sous forme d'ensemble.
- Disposer les pièces démontées en fonction de leur emplacement et de leur ordre de montage.
- Ne pas toucher les bornes des composants électriques qui contiennent des micro-ordinateurs (tels que les ECM).
  L'électricité statique pourrait endommager les composants électroniques internes.
- Après avoir débranché les flexibles de dépression ou d'air, fixer une étiquette pour y indiquer les bons raccordements.
- N'utiliser que les liquides et lubrifiants spécifiés dans ce manuel.
- Le cas échéant, utiliser des adhésifs et des enduits d'étanchéité approuvés, ou des produits équivalents.
- Utiliser les outils et l'outillage spécial conseillés, quand ils sont spécifiés pour effectuer des réparations correctes, sûres et efficaces.
- Lors de réparations des circuits d'alimentation, d'huile, d'eau, de dépression ou d'échappement, vérifier l'absence de fuites sur les canalisations en question.
- Evacuer de la manière appropriée l'huile ou le solvant vidangé qui a été utilisé pour nettoyer les pièces.

AVERTISSEMENT :
Pour empêcher l'ECM d'enregistrer les codes de défaut de diagnostic, ne pas débrancher par inadvertance les connecteurs de faisceau qui dépendent des systèmes ECCS et TCM (module de commande de la transmission). Les

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

connecteurs doivent être débranchés uniquement lorsque l'on travaille dans la PROCEDURE DE TRAVAIL des DIAGNOSTICS DES DEFAUTS à la section EC.

Précautions pour le système d'injection de carburant multipoint ou pour le moteur commandé par l'ECCS

- Avant de brancher ou de débrancher un connecteur de faisceau du système d'injection de carburant multipoint ou de l'ECM (boîtier de contrôle de l'ECCS) :
  Mettre le contact d'allumage sur la position ''OFF''.
  Débrancher la borne négative de la batterie.
  L'ECM risquerait sinon d'être endommagé.
- Avant de débrancher la canalisation sous pression de carburant entre la pompe d'alimentation et les injecteurs, s'assurer que l'on a dépressurisé.
- Veiller à ne pas heurter de composants tels que l'ECM et le débitmètre d'air.

Précautions pour le catalyseur à trois voies (selon modèles)

Si une grande quantité d'essence non brûlée passe dans le catalyseur, la température du catalyseur sera excessive. Pour empêcher ceci, suivre les instructions ci-dessous :

- Utiliser seulement de l'essence sans plomb. Le carburant au plomb endommagera sérieusement le catalyseur à trois voies.
- Lorsqu'on contrôle l'étincelle d'allumage ou que l'on mesure le taux de compression du moteur, les essais doivent être effectués rapidement et en cas de besoin seulement.
- Ne pas faire tourner le moteur lorsque le niveau du carburant dans le réservoir est bas ; sinon le moteur pourrait avoir des ratés d'allumage et le catalyseur risquerait d'être endommagé.

Ne pas placer le véhicule sur un matériau inflammable. Conserver les matériaux inflammables à l'écart du tuyau d'échappement et du catalyseur à trois voies.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Précautions pour les huiles moteur

Un contact prolongé et répété avec des huiles moteur usagées peut entraîner un cancer de la peau. Eviter tout contact direct entre l'huile usagée et la peau.
En cas de contact avec la peau, laver soigneusement avec du savon ou un produit de nettoyage pour les mains le plus rapidement possible.

PRECAUTIONS POUR LA PROTECTION DE LA SANTE

- Eviter les contacts prolongés et répétés avec les huiles et tout particulièrement les huiles moteur usagées.
- Porter des vêtements de protection, y compris des gants imperméables chaque fois que possible.
- Ne pas mettre de chiffons graisseux dans ses poches.
- Eviter de tacher les vêtements, plus particulièrement les sous-vêtements, avec de l'huile.
- Ne pas porter de vêtements très tachés ou de chaussures imprégnées d'huile. Les bleus de travail doivent être lavés régulièrement.
- Soigner immédiatement les coupures et les plaies ouvertes.
- Appliquer des crèmes de protection avant le début de chaque période de travail pour faciliter le nettoyage de la peau.
- Nettoyer à l'eau savonneuse pour s'assurer que toute l'huile est enlevée (l'emploi de produits de nettoyage spéciaux et de brosses à ongles est conseillé). Les préparations contenant de la lanoline remplacent les agents gras naturels qui ont été supprimés.
- Ne pas nettoyer la peau à l'aide d'essence, de kérosène, de diesel, de gasoil, de diluants ou de solvants.
- Si des troubles de la peau se manifestent, consulter un médecin immédiatement.
- Chaque fois que possible, dégraisser les pièces avant de les manipuler.
- Chaque fois qu'il y a un risque de contact avec les yeux, porter une protection oculaire comme par exemple des lunettes de chimie ou des protections faciales. De plus, l'atelier doit comporter des installations permettant le nettoyage des yeux.

PRECAUTIONS POUR LA PROTECTION DE L'ENVIRONNEMENT

La combustion de l'huile moteur usagée dans des petits radiateurs ou chaudières n'est recommandée que pour les unités de conception approuvées. Le système de chauffage doit être conforme aux réglementations en vigueur sur la pollution des petits brûleurs de moins de 0,4 MW. En cas de doute, vérifier auprès du service responsable et/ou du fabricant de l'appareil agréé.
Se débarrasser des huiles et des filtres à huile usagés auprès des sites agréés d'élimination des déchets ou auprès de l'organisme de récupération des déchets pétroliers par le circuit des sociétés agréées d'élimination des déchets. En cas de doute, demander conseil aux autorités locales quant aux moyens d'élimination.
Il est illégal de verser les huiles usagées sur le sol, dans les égouts ou dans les cours d'eau.
Les réglementations sur la pollution de l'environnement varient selon les pays.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Précautions pour le carburant

MOTEUR A ESSENCE :

Modèles avec catalyseur à trois voies ... essence sans plomb ayant un indice d'octane supérieur à 91 (RON)

ATTENTION :

Ne pas utiliser d'essence contenant du plomb. Ne jamais utiliser de carburant contenant du plomb pour ne pas endommager le catalyseur à trois voies.

Sauf modèles ci-dessus ... essence sans plomb ou plombée ayant un indice d'octane supérieur à 88 (RON)

Utiliser du carburant sans plomb si cela est indiqué sur le volet du bouchon du réservoir.

MOTEUR DIESEL* :

Pour l'Europe : Carburant diesel ayant un indice de cétane supérieur à 50

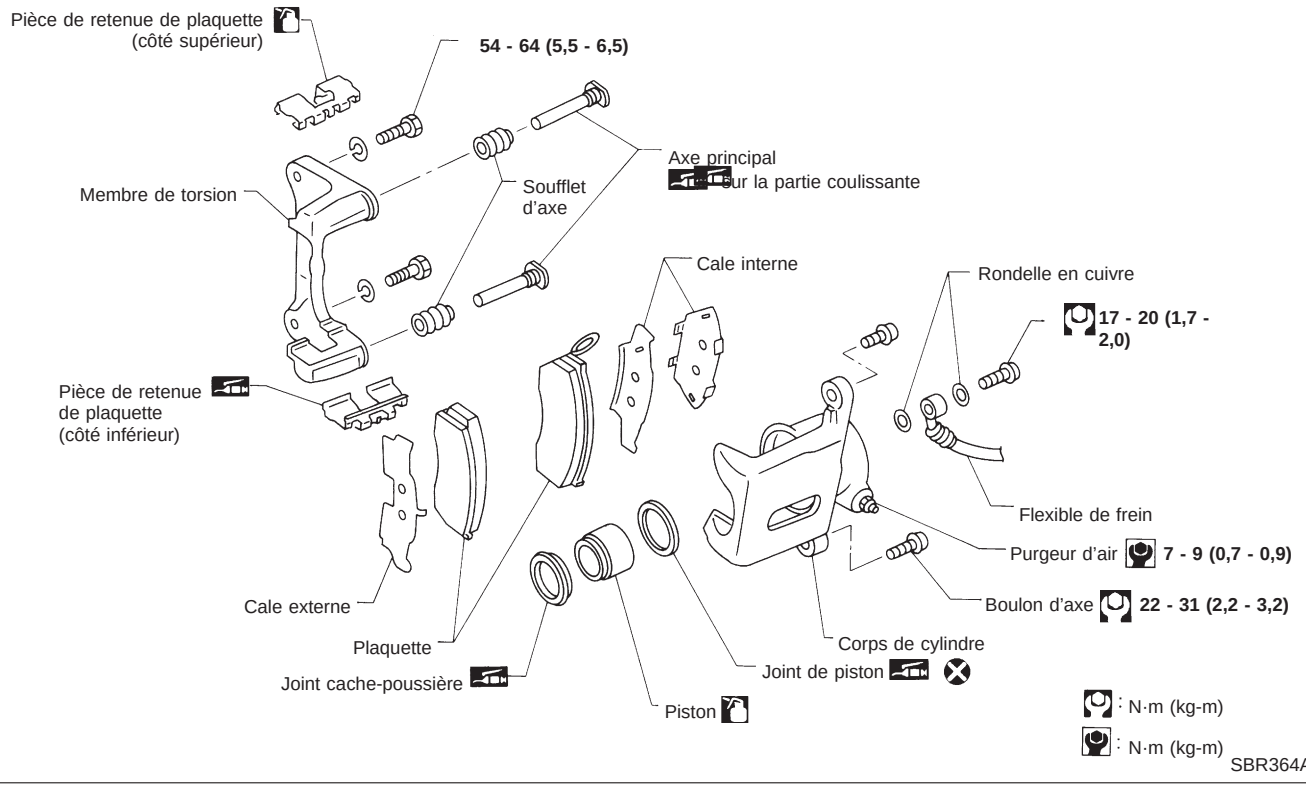
Sauf pour l'Europe : Carburant diesel ayant un indice de cétane supérieur à 45

* Si deux types de carburant diesel sont disponibles, utiliser le plus approprié, été ou hiver, en fonction des conditions atmosphériques suivantes.

- Au-dessus de −7°C ... carburant diesel de type été.
- En dessous de −7°C ... carburant diesel de type hiver.

ATTENTION :

- **Ne pas utiliser de carburant domestique, essence ou autres carburants dans un moteur diesel. De tels carburants pourraient endommager le moteur.**
- **Ne pas utiliser de carburant d'été à des températures inférieures à −7°C. De la cire peut se former dans le carburant par temps froid, empêchant alors le moteur de bien tourner.**
- **Ne pas ajouter d'essence ou d'autres carburants au carburant diesel.**



Précautions pour la climatisation

Utiliser un matériel agréé de récupération du liquide de refroidissement chaque fois que le système de climatisation doit être vidangé. Consulter la section HA (''Procédure d'entretien du HFC-134a (R-134a)'', ''PROCEDURES D'ENTRETIEN'') pour des instructions plus spécifiques.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

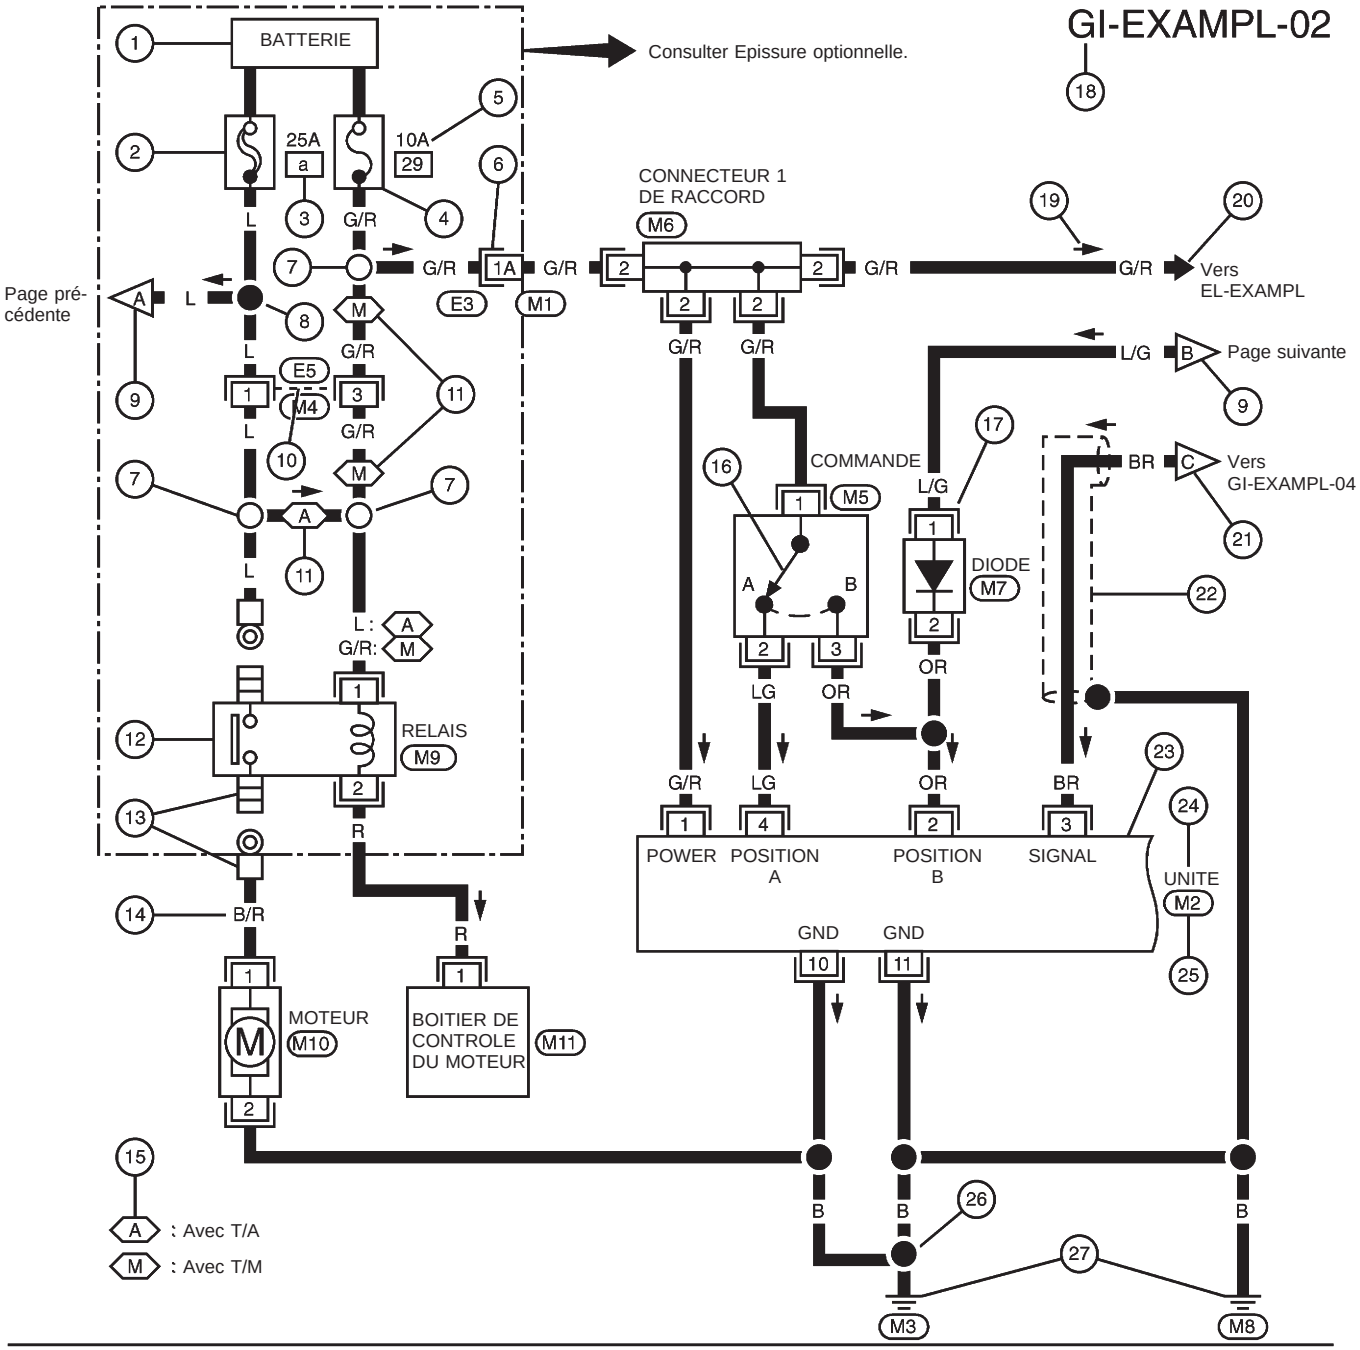
- Un **INDEX** est fourni à la fin de ce Manuel afin de pouvoir trouver rapidement le sujet et la page que l'on recherche.
- La première page comporte une **TABLE DE REFERENCE RAPIDE** avec plusieurs carrés noirs (ex. BR). Pour trouver rapidement la première page de la section souhaitée, rechercher le carré correspondant.
- Les **TABLES DES MATIERES** sont indiquées en première page de chaque section.
- Le **TITRE** se trouve en haut de chaque page ; il indique soit une pièce, soit un système particulier.
- Le **NUMERO DE PAGE** de chaque section se compose de deux lettres indiquant la section suivies d'un numéro (ex ''BR-5'').
- Les **GRANDES ILLUSTRATIONS** sont des vues éclatées (voir ci-dessous) contenant les couples de serrage, les points de graissage, le numéro de section du **CATALOGUE DES PIECES DETACHEES** (ex. SEC. 440) ainsi que d'autres informations nécessaires pour des réparations éventuelles.
  Les illustrations ne doivent être utilisées qu'à titre de référence pour la réalisation d'opérations d'entretien. Pour commander des pièces, consulter le **CATALOGUE DES PIECES DETACHEES** approprié.

''Exemple''
SEC. 440

- Les **PETITES ILLUSTRATIONS** montrent des points importants tels que le contrôle, l'emploi d'outils spéciaux, un tour de main particulier, une étape difficile ou délicate qui n'est pas montrée dans les grandes illustrations précédentes.
  Le remontage, le contrôle et les réglages des organes de construction complexes tels que la boîte/pont ou boîte de vitesses automatique, etc. sont, au besoin, détaillés étape par étape.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

- Les **SYMBOLES ET ABREVIATIONS** suivants sont employés :



,	:	Couple de serrage
	:	Enduire de graisse. Utiliser la graisse à usages multiples recommandée, sauf indication contraire.
	:	Enduire d'huile.
	:	Appliquer du produit d'étanchéité.
	:	Contrôler.
	:	Toujours remplacer après chaque démontage.
Ⓟ	:	Mettre de la vaseline.
ATF	:	Enduire d'huile pour boîte automatique.
★	:	Sélectionner l'épaisseur adéquate.
☆	:	Réglage nécessaire.
SDS	:	Caractéristiques et valeurs de réglage
LH, RH	:	Gauche, Droite
FR, RR	:	Avant, arrière
T/M	:	Boîte-pont/boîte de vitesses manuelle
T/A	:	Boîte-pont/boîte de vitesses automatique
4x4,		
4WD	:	4 roues motrices
2WD	:	2 roues motrices
C/A	:	Climatiseur
P/S	:	Direction assistée
SST	:	Outillage spécial
SAE	:	Society of Automotive Engineers, Inc.
ATF	:	Huile pour boîte automatique
D_1	:	Position D, première vitesse
D_2	:	Position D, deuxième vitesse
D_3	:	Position D, troisième vitesse
D_4	:	Position D, quatrième vitesse

EPISSURE OPTIONNELLE

Epissure optionnelle

SGI942

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description

Numéro	Elément	Description
①	Condition d'alimentation électrique	● Ceci indique la condition où le circuit reçoit une tension de batterie positive (peut être opéré).
②	Raccord à fusible	● La ligne double indique qu'il s'agit d'un raccord à fusible. ● Le cercle non hachuré indique l'arrivée de courant, et le cercle hachuré la sortie de courant.
③	Emplacement du fusible/ raccord à fusible	● Ceci indique l'emplacement du raccord à fusible ou du fusible dans le raccord à fusible ou la boîte à fusibles. Pour connaître la disposition, consulter la section EL (''DISPOSITION DE L'ALIMENTATION ELECTRIQUE'').
④	Fusible	● La ligne simple indique qu'il s'agit d'un fusible. ● Le cercle non hachuré indique l'arrivée de courant, et le cercle hachuré la sortie de courant.
⑤	Ampérage	● Ceci indique l'ampérage du raccord à fusible ou du fusible.
⑥	Connecteurs	● Ceci indique que le connecteur (E3) est femelle et que le connecteur (M1) est mâle. ● Le fil G/R est situé dans la borne A1 des deux connecteurs. ● Les numéros de bornes comportant une référence alphanumérique (1A, 5B, etc.) indiquent la présence de connecteurs de type super raccord multiple (SMJ). Consulter la page GI-18.
⑦	Epissure optionnelle	● Le cercle non hachuré indique que l'épissure est optionnelle et dépend de l'application du véhicule.
⑧	Epissure	● Le cercle hachuré indique que l'épissure figure en permanence sur le véhicule.
⑨	Page adjacente	● Cette flèche indique que le circuit continue sur la page adjacente. ● Le A correspondra au A de la page précédente ou suivante.
⑩	Connecteur commun	● Les lignes en pointillé reliant les bornes indiquent que ces bornes font partie du même connecteur.
⑪	Abréviation d'option	● Indique que le circuit est optionnel, et dépend de l'application du véhicule.
⑫	Relais	● Montre une représentation interne du relais. Pour plus de détails, consulter la section EL (''RELAIS NORMALISES'').
⑬	Connecteurs	● Indique que le connecteur est relié à la carrosserie ou à une borne par un boulon ou un écrou.
⑭	Couleur du câble	● Ceci indique le code de couleur du câble. B = Noir — BR = Marron W = Blanc — OR = Orange R = Rouge — P = Rose G = Vert — PU = Violet L = Bleu — GY = Gris Y = Jaune — SB = Bleu ciel LG = Vert clair — CH = Marron foncé DG = Vert foncé Dans le cas d'un fil de couleur rayé, la couleur de base est indiquée d'abord, suivi de la couleur de la rayure : Exemple : L/W = Bleu à rayures blanches
⑮	Description d'option	● Ceci fournit une description de l'abréviation d'option utilisée sur la page.
⑯	Interrupteur	● Indique qu'il y a continuité entre les bornes 1 et 2 lorsque l'interrupteur est sur la position A. Il y a continuité entre les bornes 1 et 3 lorsque l'interrupteur est sur la position B.
⑰	Composants d'un ensemble	● La borne du connecteur dans le composant indique qu'il s'agit d'un ensemble incorporé à un faisceau.

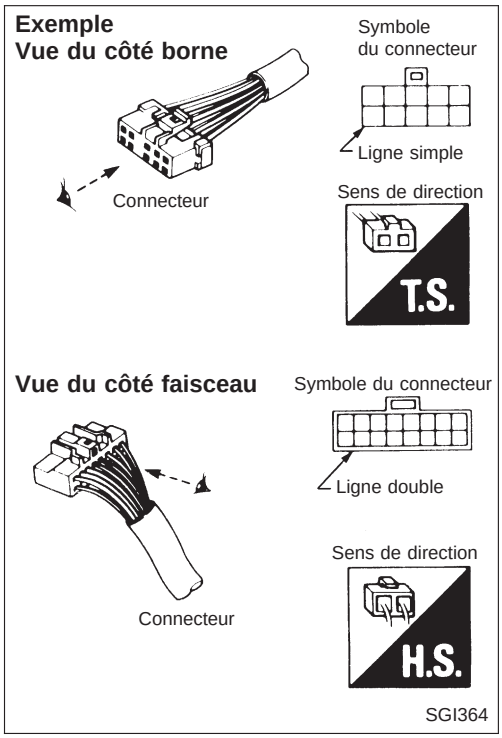
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description (Suite)

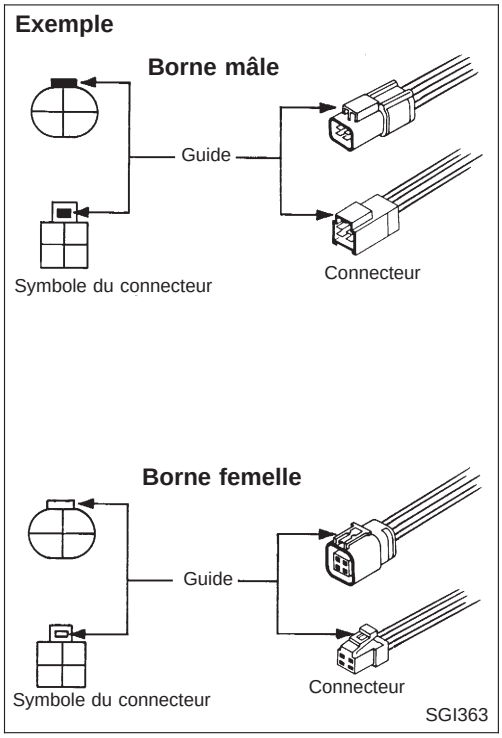
Numéro	Elément	Description
⑱	Code de cellule	● Ainsi, chaque page du schéma de câblage peut être identifiée par section, système et numéro de page du schéma de câblage.
⑲	Flèche de trajet du courant	● La flèche représente le trajet du courant électrique surtout lorsque le sens de trajet normal (verticalement vers le bas ou horizontalement de gauche à droite) est difficile à suivre. ● Une flèche double ‘‘◀▶’’ indique que le courant peut circuler dans les deux sens selon le fonctionnement du circuit.
⑳	Branchement du système	● Ceci indique que le circuit est relié à un autre système identifié par un code de cellule (section et circuit).
㉑	Page adjacente	● Cette flèche indique que le circuit se poursuit sur une autre page identifiée par un code de cellule. ● Le C correspondra au C d’une autre page à l’intérieur du système, autre que la page précédente ou suivante.
㉒	Ligne blindée	● La ligne entourée d’un cercle en pointillé indique un fil blindé.
㉓	Case de composant entourée d’une ligne ondulée	● Indique qu’une autre partie du composant est également montrée sur une autre page (indiquée par une ligne ondulée) du système.
㉔	Nom du composant	● Ceci indique le nom d’un composant.
㉕	Numéro de connecteur	● Ceci indique le numéro du connecteur. ● La lettre indique le faisceau dans lequel se situe le connecteur. Exemple : **M** : faisceau principal. Pour plus de détails et pour localiser le connecteur, consulter la section EL (‘‘Faisceau principal’’, ‘‘DISPOSITION DES FAISCEAUX’’). Une grille de coordonnées est fournie pour faciliter l’identification des connecteurs dans le cas de faisceaux complexes.
㉖	Masse (GND)	● La ligne épissée et mise à la masse sous la couleur du câble, indique que la ligne de masse est épissée au connecteur de masse.
㉗	Masse (GND)	● Ceci indique la mise à la masse.
㉘	Vues de connecteurs	● Cette zone montre les faces des composants côté connecteur dans le schéma de câblage.
㉙	Composant commun	● Les connecteurs entourés d’une ligne brisée indiquent qu’ils appartiennent au même composant.
㉚	Couleur de connecteur	● Ceci indique le code de couleur du connecteur. Pour la signification du code, se référer aux codes de couleur des fils, au numéro ⑭ de ce tableau.
㉛	Boîte à fusibles et de raccords à fusibles	● Ceci indique la disposition du/des raccord(s) à fusible(s) et du/des fusible(s), utilisée pour identifier les connecteurs au chapitre ‘‘DISPOSITION DE L’ALIMENTATION ELECTRIQUE’’ à la section EL. Le carré non hachuré montre l’arrivée de courant, et le carré hachuré la sortie de courant.
㉜	Zone de référence	● Ceci indique qu’il existe de plus amples informations sur le super raccord multiple (SMJ) et les connecteurs de raccord (J/C) à la page dépliante. Consulter la page GI-18 pour plus de détails.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description (Suite)



SYMBOLES DE CONNECTEURS



La plupart des symboles de connecteurs figurant sur les schémas de câblage sont représentés du côté borne.

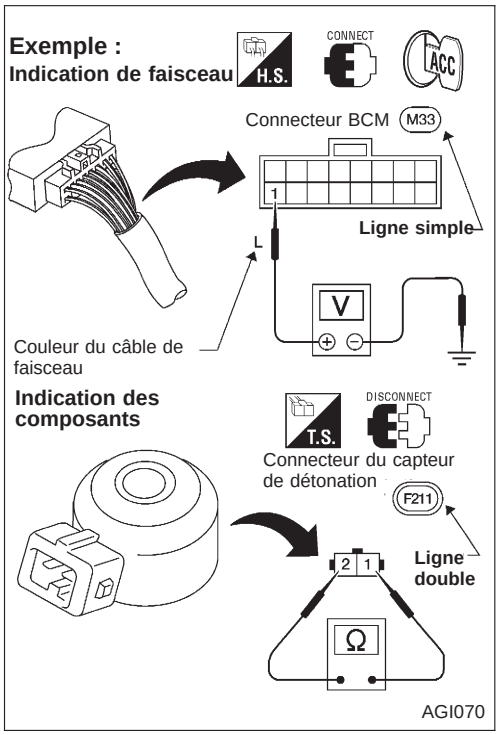
- Les symboles des connecteurs représentés côté borne sont entourés d'un trait simple et suivis d'une flèche indiquant le sens 

.
- Les symboles des connecteurs représentés côté faisceau sont entourés d'une double ligne et suivis d'une flèche indiquant le sens 

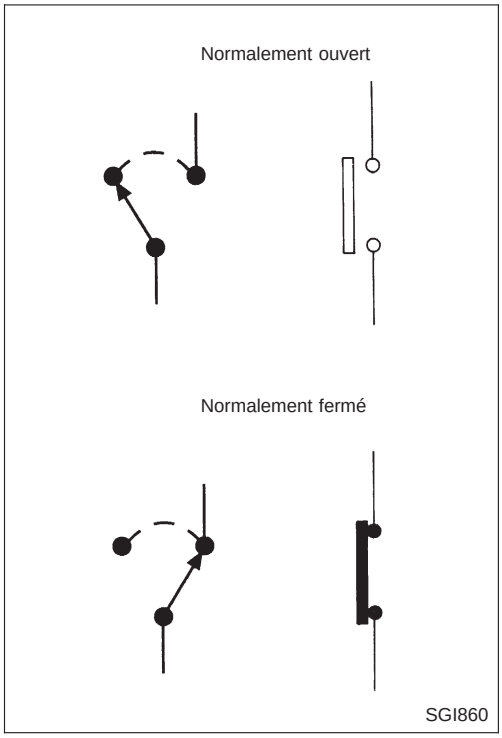
.

- Bornes mâles et femelles
  Les guides de connecteurs pour les bornes mâles sont représentés en noir sur les schémas de câblage ; les guides de connecteurs pour les bornes femelles sont en blanc.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Description (Suite)



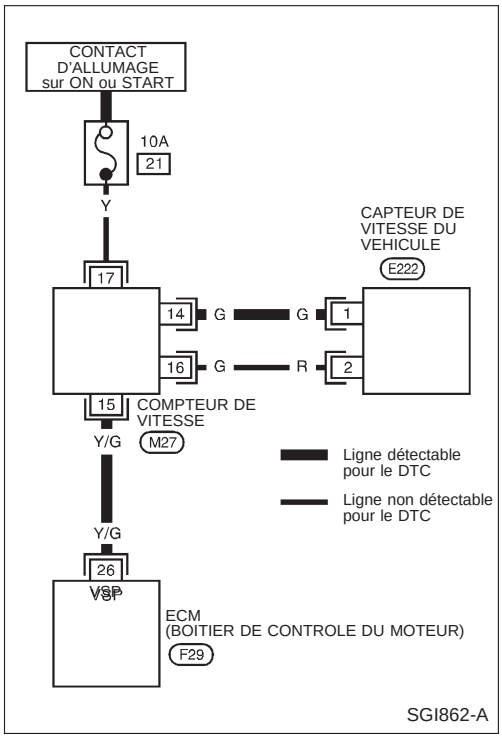
Indication du faisceau

- Les lettres figurant à côté de la sonde de l'appareil d'essai renvoient à la couleur du câble (connecteur) de faisceau.
- Les numéros de connecteurs entourés d'une simple ligne (M33) renvoient aux connecteurs de faisceau.

Indication des composants

- Les numéros de connecteur entourés d'une double ligne (F211) renvoient aux connecteurs des composants.

POSITIONS DES INTERRUPTEURS



Les interrupteurs représentés dans les schémas de câblage correspondent à un véhicule en condition ''normale''.
Un véhicule est en condition ''normale'' lorsque :

- le contact d'allumage est sur ''OFF'',
- les portes, capot, capot du coffre/hayon sont fermées,
- les pédales ne sont pas enfoncées, et
- le frein à main est desserré.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description (Suite)

LIGNES DETECTABLES ET NON DETECTABLES

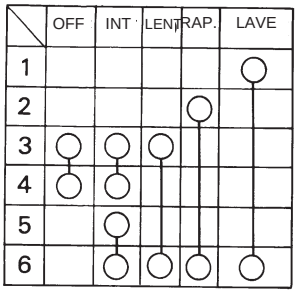
Certains schémas de câblage utilisent deux types de lignes d'épaisseur différente représentant des fils.

- Une ligne régulière (plus épaisse) représente une ''ligne détectable pour le DTC (code de défaut de diagnostic)''. Une ''ligne détectable pour le DTC'' est un circuit dans lequel l'ECM (boîtier de contrôle du moteur) peut détecter les défauts grâce au système de l'autodiagnostic.
- Une ligne moins épaisse représente une ''ligne non-détectable pour le DTC''. Une ''ligne non-détectable pour le DTC'' est un circuit dans lequel l'ECM ne peut pas détecter les défauts grâce au système de l'autodiagnostic.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

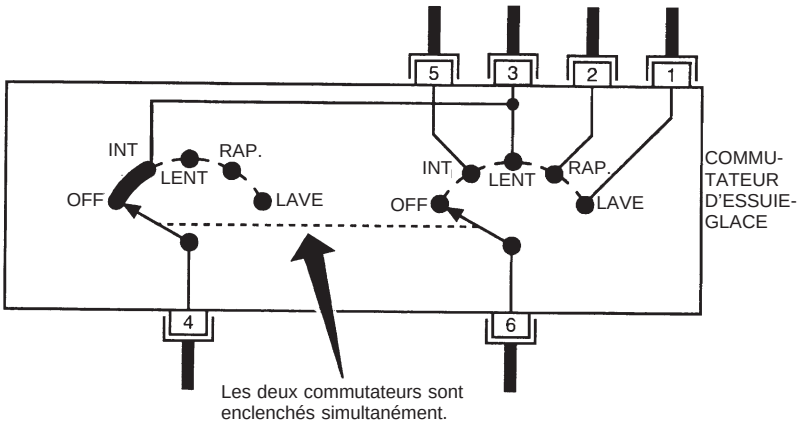
Description (Suite)

COMMUTATEUR MULTIPLE



La continuité du commutateur multiple est décrite des deux façons indiquées ci-dessous.

- L'organigramme est utilisé dans les diagrammes schématiques.
- Le diagramme est utilisé dans les schémas de câblage.



Exemple

(ORGANIGRAMME DE COMMUTATEUR)

COMMUTATEUR D'ESSUIE-GLACE

(DIAGRAMME DE COMMUTATEUR)

Continuité du circuit du commutateur d'essuie-glace

POSITION DU COMMUTATEUR	CONTINUITE DU CIRCUIT
OFF	3 – 4
INT	3 – 4, 5 – 6
LENT	3 – 6
RAP.	2 – 6
LAVE	1 – 6

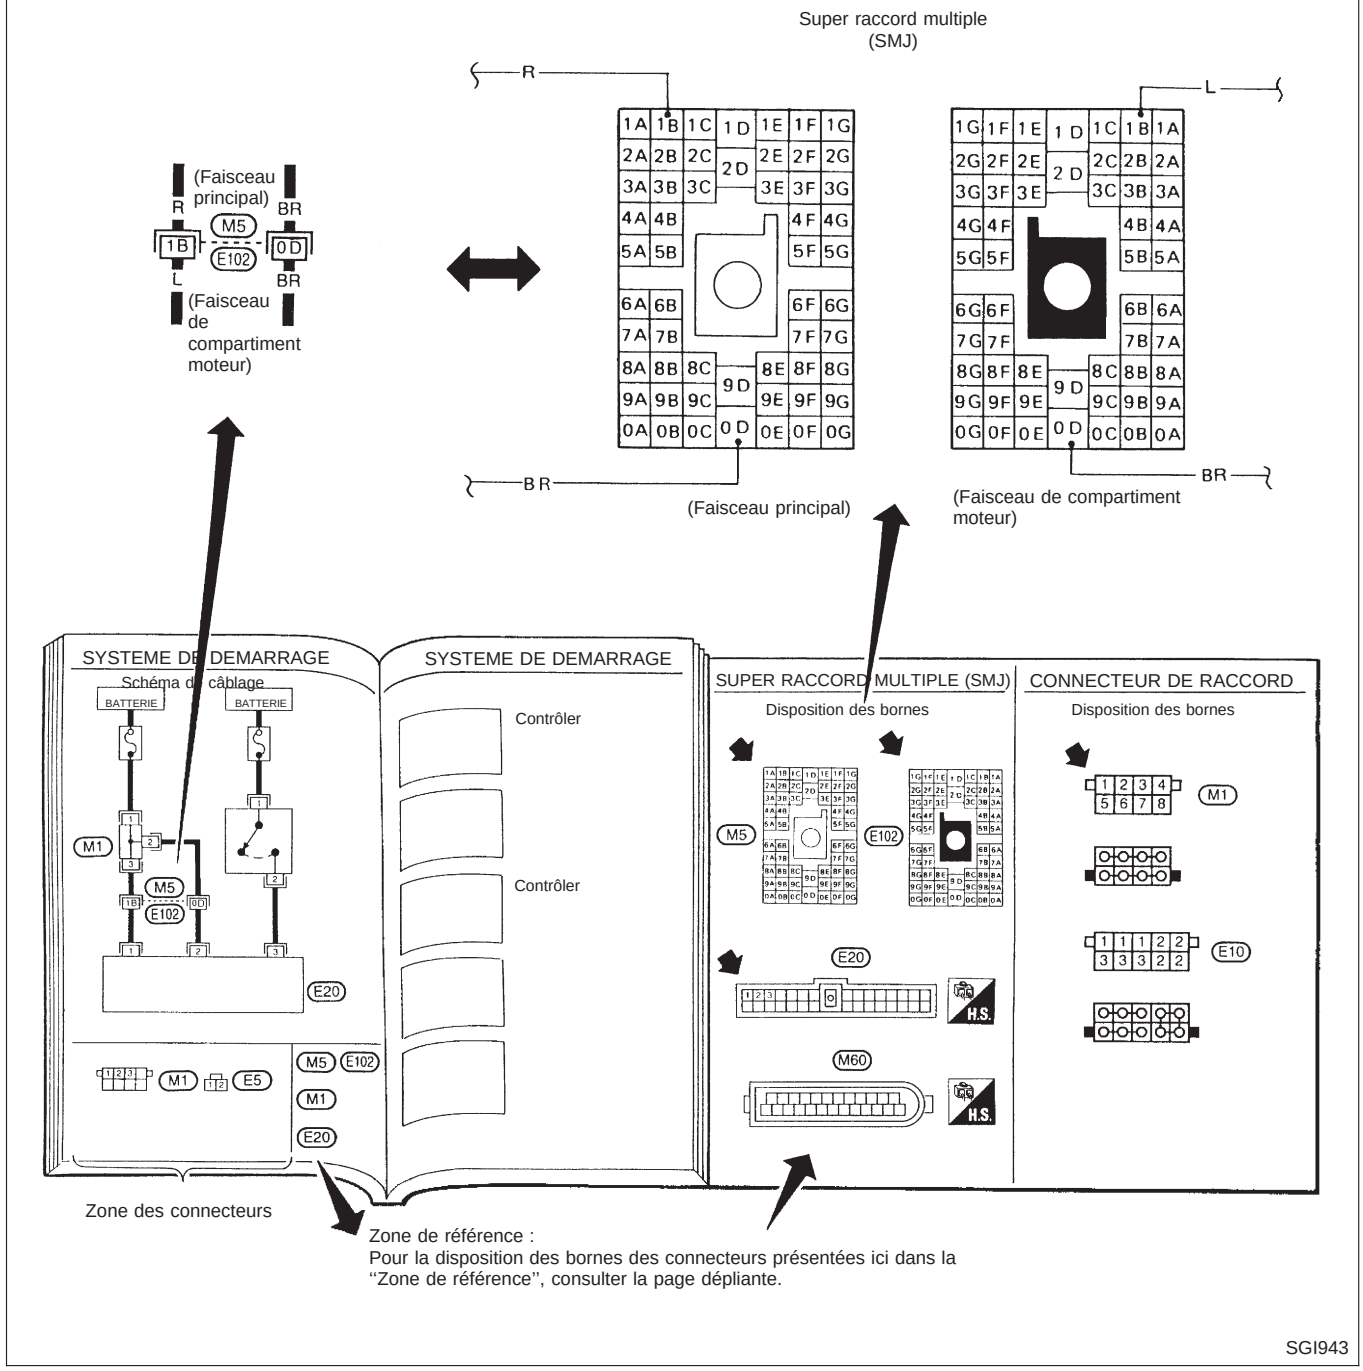
SGI875

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Description (Suite)

PAGE DEPLIANTE

La page dépliante doit être ouverte lors de la lecture des schémas de câblage.



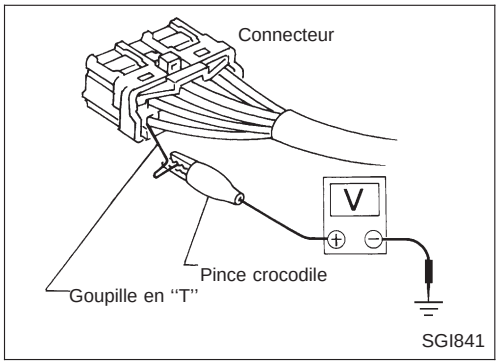
Super raccord multiple (SMJ)

Dans les schémas de câblage, les connecteurs sous forme de bornes ayant des numéros de borne indiqués par un code alphanumérique (1B, 0D etc.) sont des connecteurs de type SMJ.
Si les numéros des connecteurs apparaissent dans la zone de référence, ces mêmes symboles ne figurent pas dans la zone des connecteurs. Pour la disposition des bornes de ces connecteurs, se reporter à la page dépliante située à la fin de ce manuel.

Connecteur de raccord

Les symboles de connecteurs de raccords sont indiqués dans la zone des connecteurs du schéma de câblage concerné. La page dépliante contient également la disposition du câblage interne de même que les symboles de connecteurs de raccords.

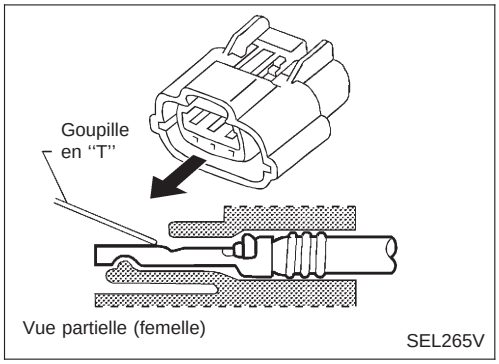
Exemple



SGI943

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Comment vérifier les connecteurs à l'aide d'une sonde

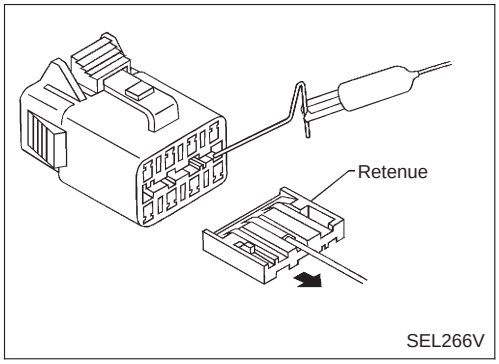


Une mauvaise introduction de la sonde dans le connecteur lors des contrôles du circuit pourra endommager le connecteur et entraîner un faux contact.
La sonde d'un multimètre numérique (DMM) peut ne pas s'adapter correctement à la cavité du connecteur. Pour sonder correctement le conneceur, suivre les procédures suivantes à l'aide d'une goupille ''T''. Pour un contact optimal, tenir la goupille en ''T'' à l'aide d'une pince crocodile.

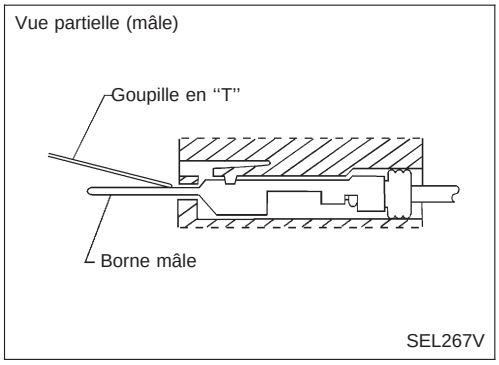
INTRODUIRE LA SONDE DU COTE FAISCEAU

Pour les connecteurs de type standard (pas de type étanche), la sonde devra être introduite du côté faisceau avec la goupille en ''T''.

- **Si le connecteur est muni d'un couvercle arrière, tel un connecteur de l'ECM, déposer le couvercle arrière avant de sonder la borne.**
- **Ne pas sonder un connecteur étanche du côté faisceau. Le joint séparant le câble du connecteur risquerait d'être endommagé.**



INTRODUIRE LA SONDE DU COTE BORNE

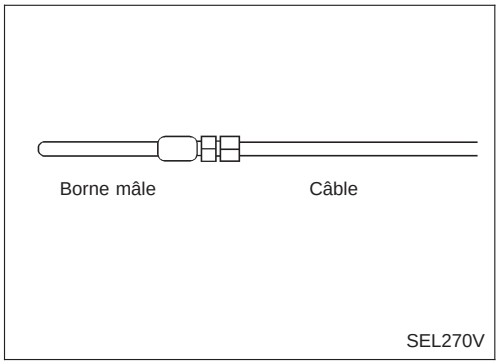


Borne femelle

- Il y a une petite encoche sur chaque borne femelle. Sonder chaque borne à l'aide de la goupille en ''T'' à travers l'encoche.

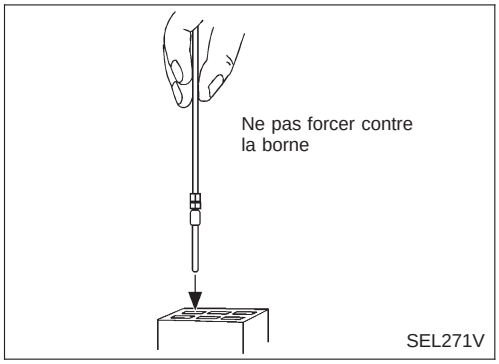
Ne pas introduire d'objet autre qu'une borne mâle de même type dans une borne femelle.

- Certains connecteurs ne comportent pas d'encoche au-dessus de chaque borne. Pour sonder chaque borne, déposer la retenue du connecteur afin de pouvoir introduire la sonde.



Borne mâle

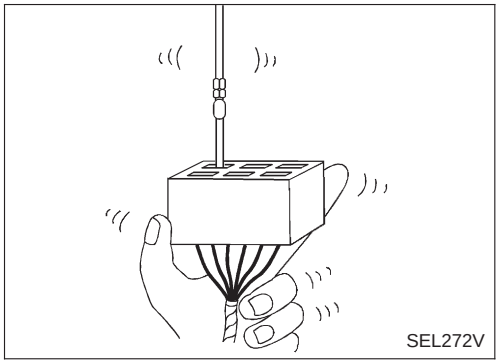
Sonder avec précaution la surface de contact de chaque borne à l'aide de la goupille en ''T''.
Ne pas plier la borne.



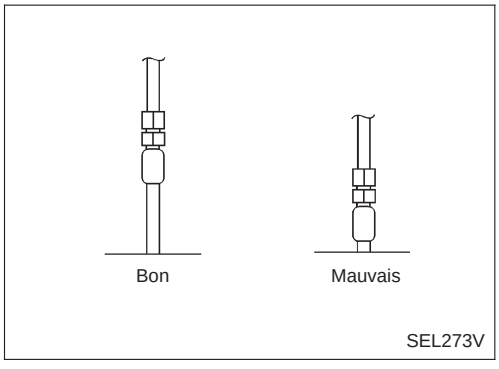
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Comment vérifier si les ressorts de contact des bornes sont élargis

Un ressort de contact élargi pourra entraîner des signaux intermittents dans le circuit.
Si un circuit s'ouvre de manière intermittente, suivre la procédure suivante afin de rechercher la présence de câbles ouverts et de vérifier si le ressort de contact de borne femelle est élargi.

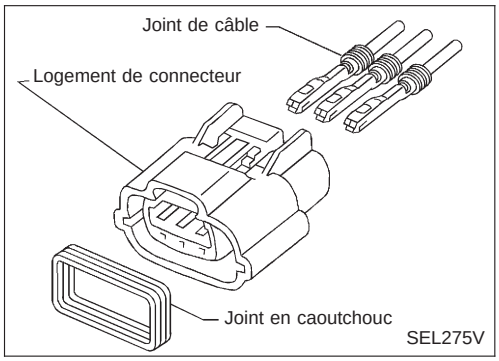


1. Assembler une borne mâle et une longueur de câble d'environ 10 cm. **Utiliser une borne mâle adaptée à la borne femelle.**
2. Débrancher le connecteur défectueux et le maintenir, le côté de la borne vers le haut.



3. Tout en tenant le câble de la borne mâle, essayer d'insérer la borne mâle dans la borne femelle.

Ne pas forcer la borne mâle dans la borne femelle avec les mains.

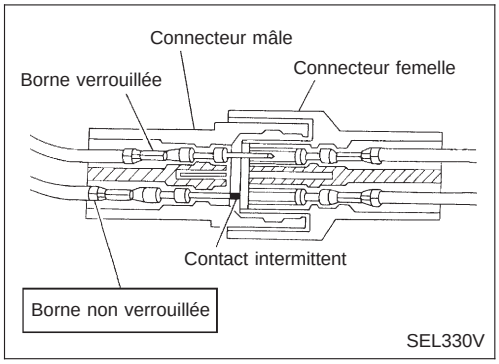


4. Tout en bougeant le connecteur, vérifier si la borne mâle peut être insérée facilement ou non.

- Si la borne mâle peut être facilement insérée dans la borne femelle, remplacer la borne femelle.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection des connecteurs étanches



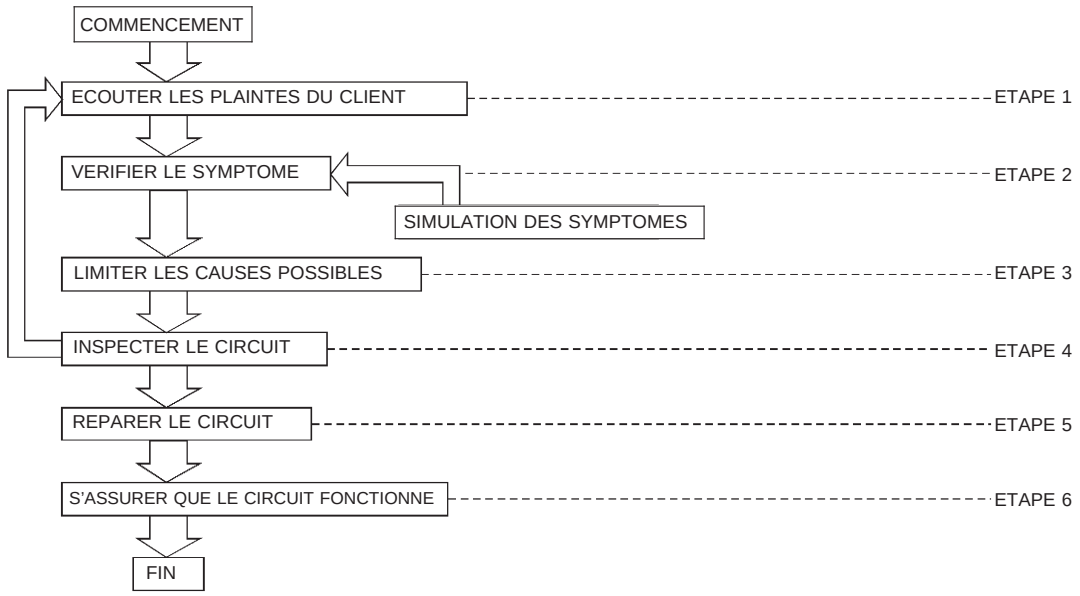
Une infiltration d'eau dans le connecteur peut court-circuiter les circuits internes. Cela pourrait entraîner des problèmes intermittents.
Vérifier les points suivants pour préserver les caractéristiques d'étanchéité.

INSPECTION DU JOINT EN CAOUTCHOUC

- La plupart des connecteurs étanches sont équipés d'un joint en caoutchouc entre les connecteurs mâles et femelles. Si le joint manque, les performances d'étanchéité pourront ne pas répondre aux spécifications.
- Le joint en caoutchouc peut se détacher lorsque l'on débranche les connecteurs. A chaque fois que les connecteurs sont rebranchés, s'assurer que le joint en caoutchouc est correctement installé de part et d'autre du connecteur mâle ou femelle.

INSPECTION DU JOINT DE CABLE

Le joint de câble doit être installé dans la zone d'insertion du câble d'un connecteur étanche. S'assurer que le joint est correctement installé.



Inspection du verrouillage de borne

Rechercher les bornes desserrées en tirant sur le câble à l'extrémité du connecteur. Une borne desserrée peut entraîner des signaux intermittents dans le circuit.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de travail

ETAPE	DESCRIPTION
ETAPE 1	Recueillir des informations détaillées sur les conditions et les circonstances accompagnant le problème. Les renseignements suivants sont essentiels pour permettre une bonne analyse : **QUOI** Modèle du véhicule, moteur, transmission et circuit (par ex. radio). **QUAND** Date, heure du jour, conditions atmosphériques, fréquence. **OU** Etat de la route, altitude et type de circulation. **COMMENT** Symptômes du système, conditions de fonctionnement (interaction avec d'autres composants). Régularité des révisions et si des accessoires ont été ajoutés.
ETAPE 2	Faire fonctionner le système, effectuer un essai de conduite si nécessaire. Vérifier les paramètres du problème. Si le problème ne se répète pas, se reporter au chapitre ''Essais de simulation de problèmes'' à la page suivante.
ETAPE 3	S'équiper des outils de diagnostic adéquats, y compris : LA DISPOSITION DE L'ALIMENTATION ELECTRIQUE Les descriptions du fonctionnement du système Les sections du Manuel de Réparation correspondantes. Vérifier s'il existe un Bulletin d'Entretien. Décider par où commencer le diagnostic en se basant sur sa propre connaissance du système et les observations du client.
ETAPE 4	Inspecter le système pour vérifier qu'aucune pièce ne coince et que les connecteurs ne sont pas desserrés ou que le câblage n'est pas endommagé. Déterminer quels sont les circuits et composants concernés et établir un diagnostic à l'aide des schémas de disposition de l'alimentation électrique et de disposition des faisceaux.
ETAPE 5	Réparer ou remplacer le circuit ou le composant à l'origine de l'incident.
ETAPE 6	Faire fonctionner le circuit dans tous les modes. Vérifier que le système fonctionne correctement sous toutes les conditions. S'assurer que l'on n'a pas créé de nouveaux problèmes par inadvertance au cours des différentes étapes du diagnostic ou de la réparation.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Essais de simulation des problèmes

INTRODUCTION

Il arrive que le problème ne se manifeste pas lorsque la voiture est amenée au garage. Si possible, recréer les conditions présentes au moment de l'incident. Ceci permettra d'éviter d'obtenir un diagnostic de type ''aucun défaut indiqué''. La section suivante décrit certaines techniques permettant de simuler les conditions et circonstances pendant lesquelles le client a rencontré des problèmes d'origine électrique.

Cette section est articulée autour des six parties suivantes :
- Vibrations du véhicule
- Sensibilité à la chaleur
- Gel
- Infiltration d'eau
- Charge électrique
- Démarrage à froid ou à chaud

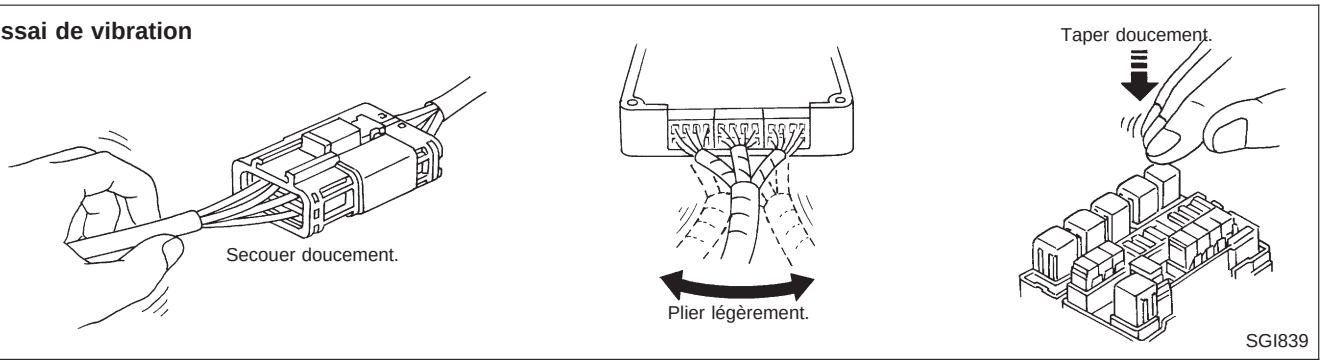
Obtenir une description précise du problème auprès du client. Ces renseignements sont essentiels pour simuler les circonstances accompagnant le problème.

VIBRATIONS DU VEHICULE

Le problème peut se produire ou s'aggraver lorsque l'on conduit sur une route accidentée ou lorsque le moteur vibre (ralenti, climatisation en marche). Dans ce cas, rechercher un problème lié aux vibrations. Se reporter à l'illustration ci-dessous.

Connecteurs et faisceau

Identifier les connecteurs et le faisceau de câblage qui pourraient affecter le circuit électrique que l'on inspecte. Secouer **doucement** chaque connecteur et faisceau tout en observant le système pour voir si le problème se reproduit. Cet essai peut indiquer la présence d'un mauvais branchement ou d'un branchement desserré.



Conseil

Les connecteurs peuvent être exposés à l'humidité. Il est possible qu'une fine couche de corrosion se soit formée sur les bornes du connecteur. Ce problème ne pourra être révélé par une inspection visuelle si le connecteur n'est pas débranché. Un problème, qui se produit de façon intermittente, peut être dû à la corrosion. Il est recommandé de débrancher, d'inspecter et de nettoyer les bornes des connecteurs connexes du circuit.

Capteurs et relais

Exercer **délicatement** une légère vibration sur les capteurs et les relais du circuit inspectés.
Cet essai peut indiquer la présence d'un capteur ou d'un relais mal fixé ou desserré.

Essai de vibration

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

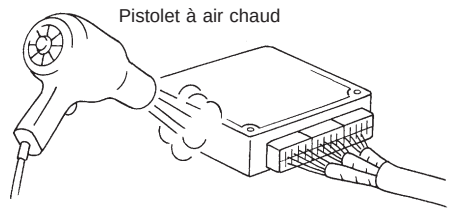
Essais de simulation des problèmes (Suite)

Compartiment moteur

Les vibrations du véhicule ou du moteur peuvent être la cause de multiples problèmes électriques. Contrôler les points suivants :

- Connecteurs mal fixés.
- Faisceau de câblage trop court et tendu ou secoué par les vibrations du moteur.
- Câbles passant sur des supports ou des composants mobiles.
- Câbles de masse desserrés, sales ou corrodés.
- Câbles disposés trop près des composants chauds.

Lorsque l'on inspecte les composants sous le capot, commencer par vérifier l'intégrité des connexions de mise à la masse (consulter l'''INSPECTION DE LA MASSE'' décrite ci-après). Vérifier tout d'abord si le système est correctement mis à la masse. Vérifier ensuite qu'il n'y a pas de connexions desserrés en **secouant doucement** les câbles ou les composants comme décrit précédemment. Vérifier la continuité du câblage à l'aide des schémas de câblage.



Derrière le tableau de bord

Un faisceau mal disposé ou mal fixé peut se coincer lors de l'installation des accessoires. Un faisceau disposé le long d'un support ou à proximité d'une vis peut être affecté par les vibrations du véhicule.

Sous les sièges

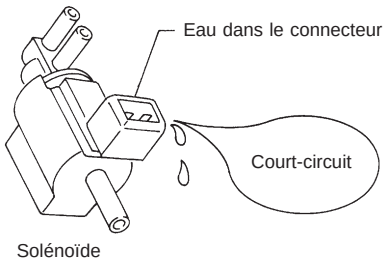
Un faisceau mal fixé ou desserré peut entraîner le coincement du câblage dans les composants des sièges (tels que les glissières de sièges) lorsque le véhicule vibre. Si le câblage passe sous les sièges, vérifier qu'il n'est pas endommagé ou coincé.

Test de chaleur

Ne pas faire chauffer à plus de 60°C

SGI842

SENSIBILITE A LA CHALEUR



Le problème peut se produire lorsque la température est élevée ou après que le véhicule a été garé pendant un court instant. Dans ces cas là, le problème sera probablement lié à une sensibilité à la chaleur.
Pour déterminer si un composant est sensible à la chaleur, le chauffer à l'aide d'un pistolet à air chaud ou de tout appareil équivalent.
Ne pas chauffer les composants à plus de 60°C. Si le problème se produit lorsque l'on chauffe l'unité, remplacer ou isoler correctement le composant.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Essais de simulation des problèmes (Suite)

GEL

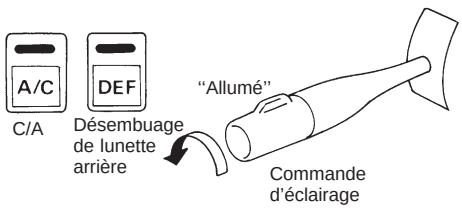
Test de gel

SGI843

Le client peut mentionner que le problème disparaît lorsque la voiture se réchauffe (en hiver). Il se peut que le problème soit dû à la présence d'eau qui gèlerait quelque part dans le système de câblage/électrique.
Il existe deux méthodes permettant de vérifier cette hypothèse. La première nécessite que le client laisse sa voiture au garage pour la nuit. S'assurer que la température soit assez basse pour que le problème puisse ainsi se manifester. Laisser la voiture garée à l'extérieur pour la nuit. Le matin, effectuer un diagnostic rapide et complet des composants électriques qui pourraient être affectés.
La seconde méthode consiste à placer le composant que l'on suppose être défectueux dans un congélateur et de l'y laisser assez longtemps pour permettre à l'eau de geler. Reposer le composant sur le véhicule et vérifier si le problème se reproduit. Si c'est le cas, réparer ou remplacer le composant.

INFILTRATION D'EAU

Test d'infiltration d'eau



SGI844

Le problème ne peut se produire que lorsque le temps est humide, qu'il pleut ou qu'il neige. Dans ces cas là, il se peut que le problème soit dû à l'infiltration d'eau dans un composant électrique. Cette condition peut être simulée en aspergeant la voiture ou en la faisant passer au lavage automatique.
Ne pas verser de l'eau directement sur les composants électriques.

CHARGE ELECTRIQUE

Test de charge électrique

SGI845

Le problème peut être lié à une sensibilité aux charges électriques. Effectuer un diagnostic avec tous les accessoires allumés (y compris climatisation, désembuage de lunette arrière, radio, feux antibrouillard).

DEMARRAGE A FROID OU A CHAUD

Il est possible que parfois un problème électrique se produise uniquement lors d'un démarrage à froid. Il peut également se produire lorsque la voiture est redémarrée à chaud, quelques instants après avoir coupé le contact. Dans ces deux cas, il sera peut-être nécessaire de conserver la voiture pendant la nuit pour effectuer un diagnostic correct.

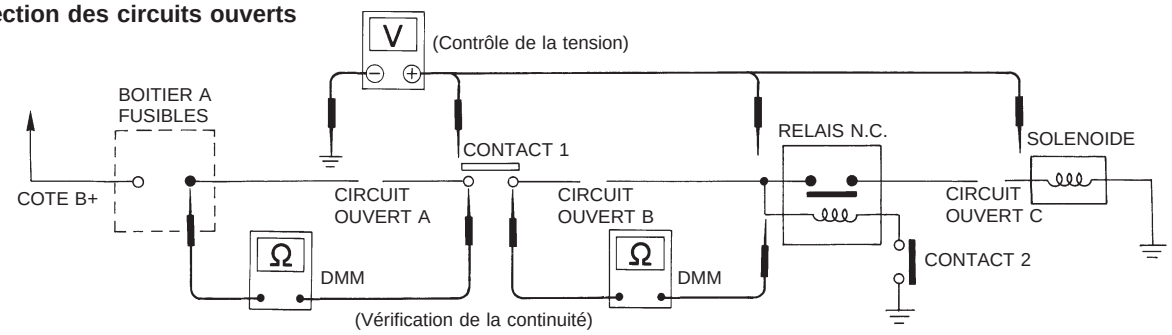
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection du circuit

INTRODUCTION

En règle générale, tester des circuits électriques ne présente pas de difficultés si l'on procède de façon logique et organisée. Avant de commencer, il est indispensable de se munir de toutes les informations disponibles sur le système que l'on veut inspecter. Se familiariser également avec le fonctionnement du circuit. Cela permettra d'utiliser l'équipement approprié et de suivre les procédures de tests correctes.
S'il est nécessaire de simuler les vibrations d'un véhicule lorsque l'on teste les composants électriques, **secouer doucement** le faisceau de câblage ou le composant électrique.

CIRCUIT OUVERT — Un circuit est ouvert lorsqu'il n'y a pas continuité dans une section de ce circuit.



COURT-CIRCUIT — Il existe deux types de courts-circuits.

- COURT-CIRCUIT — Lorsqu'un circuit entre en contact avec un autre circuit et entraîne une modification de la résistance normale.
- COURT-CIRCUIT DE MASSE — Lorsqu'un circuit entre en contact avec une source ayant un contact à la masse et qu'il est mis à la masse.

RECHERCHE ''D'OUVERTURES'' DANS LE CIRCUIT

Avant de commencer à diagnostiquer et à tester le circuit, tracer un croquis schématique du circuit. Ceci permettra d'effectuer logiquement les différentes étapes du diagnostic. Le fait de tracer le croquis permettra également de se familiariser avec le circuit.

Inspection des circuits ouverts

Méthode de vérification de la continuité

Cette méthode permet d'identifier une ouverture dans le circuit. Le multimètre numérique (DMM) réglé sur la fonction de résistance indiquera qu'un circuit est ouvert et supérieur à la limite (pas de signal sonore ou d'ohms). S'assurer que l'on commence toujours avec le multimètre numérique réglé sur le niveau de résistance maximum.
Afin de bien comprendre le diagnostic des circuits ouverts, se reporter au schéma ci-dessus.

1. Débrancher le câble négatif de la batterie.
2. Progresser d'une extrémité du circuit à l'autre (dans ce cas à la boîte de fusibles).
3. Brancher l'une des sondes du multimètre numérique à la borne du boîtier à fusibles, côté charge.
4. Brancher l'autre sonde sur le côté boîtier à fusibles (alimentation) du contact 1. Une résistance nulle ou minimum indiquera qu'il y a une bonne continuité dans une partie du circuit. Si le circuit était ouvert, le multimètre numérique indiquerait une condition de résistance infinie ou supérieure à la limite (point A).
5. Brancher les sondes entre le contact 1 et le relais. Une résistance nulle ou minimum indiquera qu'il y a une bonne continuité dans une partie du circuit. Si le circuit était ouvert, le multimètre numérique indiquerait une condition de résistance infinie ou supérieure à la limite (point B).
6. Brancher les sondes entre le relais et le solénoïde. Une résistance nulle ou minimum indiquera qu'il y a une bonne continuité dans une partie du circuit. Si le circuit était ouvert, le multimètre numérique indiquerait une condition de résistance infinie ou supérieure à la limite (point C).

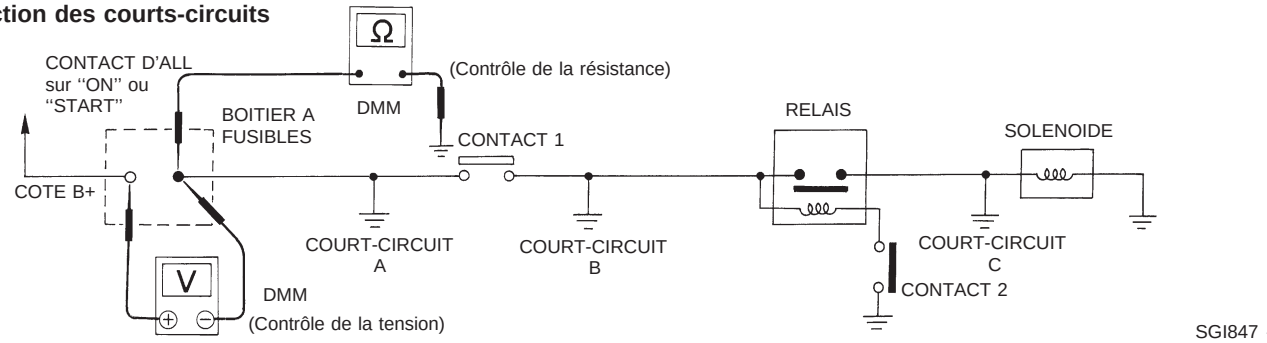
La méthode décrite dans l'exemple précédent permet de diagnostiquer n'importe quel circuit.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection du circuit (Suite)

Méthode de vérification de la tension

Afin de bien comprendre le diagnostic des circuits ouverts, se reporter au schéma précédent.
Cette méthode permet d'identifier si un circuit sous tension est ouvert en recherchant méthodiquement la présence d'une tension. Pour ce faire, régler le multimètre numérique sur la fonction tension.



1. Brancher l'une des sondes du multimètre sur une masse correcte.
2. Effectuer le test en progressant d'une extrémité du circuit à l'autre.
3. Le contact 1 étant ouvert, vérifier la tension au contact 1 à l'aide de la sonde.
   Il y a tension ; le circuit est ouvert en aval du contact 1.
   Il n'y a pas de tension ; le circuit est ouvert entre le boîtier à fusibles et le contact 1 (point A).
4. Fermer le contact 1 et tester le relais.
   Il y a tension ; le circuit est ouvert en aval du relais.
   Il n'y a pas de tension ; le circuit est ouvert entre le contact 1 et le relais (point B).
5. Fermer le relais et tester au solénoïde.
   Il y a tension ; le circuit est ouvert en aval du solénoïde.
   Il n'y a pas de tension ; le circuit est ouvert entre le relais et le solénoïde (point C).

Cette méthode permet de diagnostiquer n'importe quel circuit alimenté.

RECHERCHE DE ''COURTS-CIRCUITS'' DANS LE CIRCUIT

Pour simplifier le problème des courts-circuits dans le circuit, se référer au schéma ci-dessous.

Inspection des courts-circuits

Méthode de vérification de la résistance

1. Débrancher le câble négatif de la batterie et retirer le fusible grillé.
2. Débrancher toutes les charges (contact 1 ouvert, relais et solénoïde déconnectés) alimentées par le fusible.
3. Débrancher l'une des sondes de l'ohmmètre sur le côté charge de la borne du fusible. Connecter l'autre sonde à une masse que l'on sait être bonne.
4. Le contact 1 étant ouvert, vérifier la continuité.
   Il y a continuité ; le court-circuit est entre la borne du fusible et le contact 1 (point A).
   Il n'y a pas continuité ; le court-circuit est en aval du contact 1.
5. Fermer le contact 1 et déconnecter le relais. Placer des sondes sur le côté charge de la borne du fusibles et sur une masse que l'on sait être bonne. Vérifier ensuite la continuité.
   Il y a continuité ; le court-circuit est entre le contact 1 et le relais (point B).
   Il n'y a pas continuité ; le court-circuit est en aval du relais.
6. Fermer le contact 1 et connecter provisoirement les contacts de relais à l'aide d'un câble volant. Placer des sondes sur le côté charge de la borne du fusible et sur une masse que l'on sait être bonne. Vérifier ensuite la continuité.
   Il y a continuité ; le court-circuit est entre le relais et le solénoïde (point C).
   Il n'y a pas continuité ; vérifier le solénoïde étape par étape.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection du circuit (Suite)

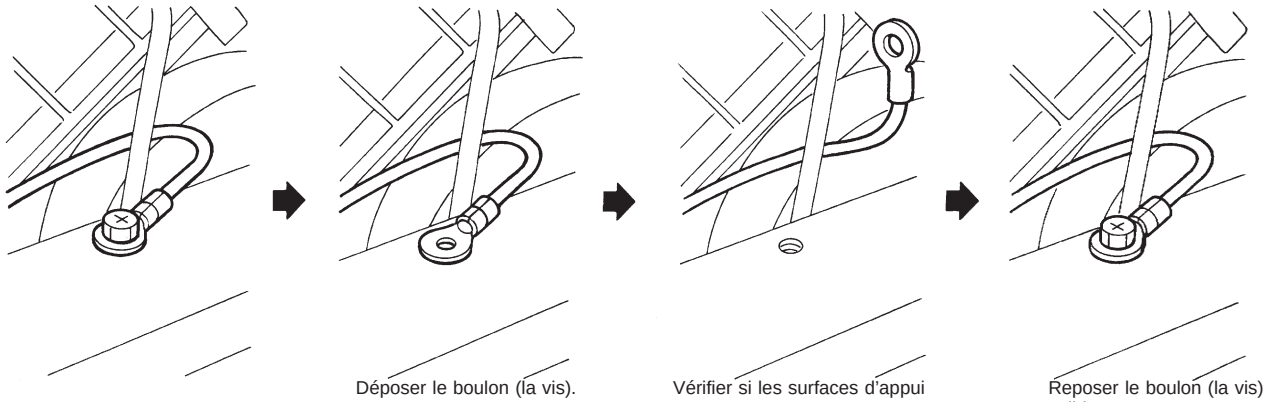
Méthode de vérification de la tension

1. Déposer le fusible grillé et déconnecter toutes les charges (par ex. contact 1 ouvert, relais et solénoïde déconnectés) alimentées par le fusible.
2. Tourner la clé de contact sur ''ON'' ou ''START''. Vérifier la tension de la batterie du côté B + de la borne du fusible (un câble relié au côté B+ de la borne du boîtier à fusibles et un câble relié à une masse testée).
3. Le contact 1 étant ouvert et les câbles du multimètre étant connectés aux deux bornes du fusible, vérifier la tension.
   Il y a tension ; le court-circuit est entre le boîtier à fusibles et le contact 1 (point A).
   Il n'y a pas de tension ; le court-circuit est en aval du contact 1.
4. Le contact 1 étant fermé, le relais et le solénoïde déconnectés et les câbles du multimètre connectés aux deux bornes du fusible, vérifier la tension.
   Il y a tension ; le court-circuit est entre le contact 1 et le relais (point B).
   Il n'y a pas de tension ; le court-circuit est en aval du relais.
5. Le contact 1 étant fermé, relayer les contacts connectés provisoirement avec le câble volant. Vérifier la tension.
   Il y a tension ; le court-circuit est en aval du relais ou entre le relais et le solénoïde déconnecté (point C).
   Il n'y a pas de tension ; vérifier l'alimentation du boîtier à fusibles étape par étape.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection du circuit (Suite)

INSPECTION DE LA MASSE



Les connexions de masse sont très importantes pour le bon fonctionnement des circuits électriques et électroniques. Les connexions de masse sont souvent exposées à l'humidité, la saleté et autres éléments de corrosion. La corrosion (rouille) peut se transformer en résistance non voulue. Cette résistance non voulue peut affecter le fonctionnement d'un circuit.

Les circuits électroniques sont très sensibles à une mise à la masse correcte. Une masse desserrée ou corrodée peut radicalement affecter un circuit électronique contrôlé. Une mauvaise mise à la masse ou une masse corrodée peuvent facilement affecter les circuits. Même lorsque la connexion de masse semble être propre, elle peut être recouverte d'un mince film de rouille sur sa surface.

Respecter les indications suivantes lors de l'inspection d'une mise à la masse :

1. Déposer le boulon, la vis ou l'attache de masse.
2. Inspecter les surfaces de contact pour voir si elles ne sont pas ternies, sales, rouillées, etc.
3. Nettoyer selon les besoins pour assurer un bon contact.
4. Reposer correctement le boulon ou la vis.
5. Vérifier si la présence d'accessoires supplémentaires ne gêne pas le fonctionnement du circuit de masse.
6. Si plusieurs fils sont sertis dans un seul oeillet, vérifier que les sertissages sont corrects. S'assurer que tous les fils sont propres, correctement fixés et qu'ils assurent une bonne trajectoire de masse. Si des fils multiples passent par un seul oeillet, s'assurer qu'aucun des fils de masse ne présente une isolation excessive.

Inspection de la masse

SGI853

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection du circuit (Suite)

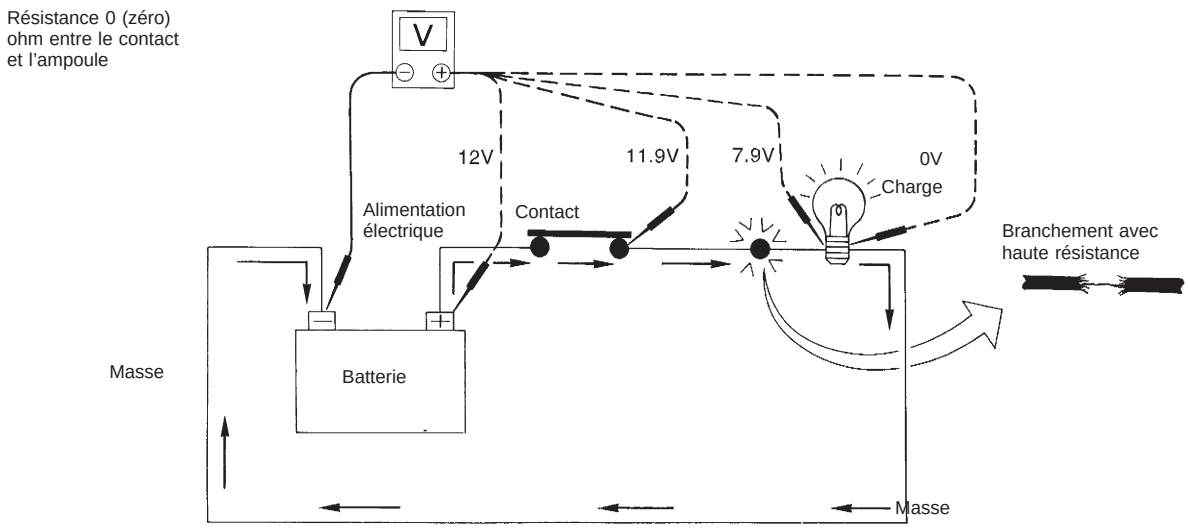
TEST DE CHUTES DE TENSION

Les tests de chutes de tension servent souvent à identifier les composants ou les circuits possédant une résistance excessive. Une chute de tension dans un circuit est causée par une résistance **lorsque le circuit est activé.**

Vérifier le câble de l'illustration. Lorsqu'on mesure la résistance à l'aide d'un ohmmètre, un contact établi à l'aide d'un seul toron de fil donnera une lecture de 0 ohm. Ceci indique que le circuit est bon. Lorsque le circuit est sous tension, un seul toron de fil n'est pas capable de porter le courant. Ce toron unique possède une résistance élevée au courant. Ceci sera identifié comme une chute de tension légère.

Les situations suivantes peuvent être à l'origine d'une résistance non voulue :

- Câblage insuffisant (un seul toron pour exemple)
- Des contacts de commutateurs corrodés
- Connexions ou épissures desserrées



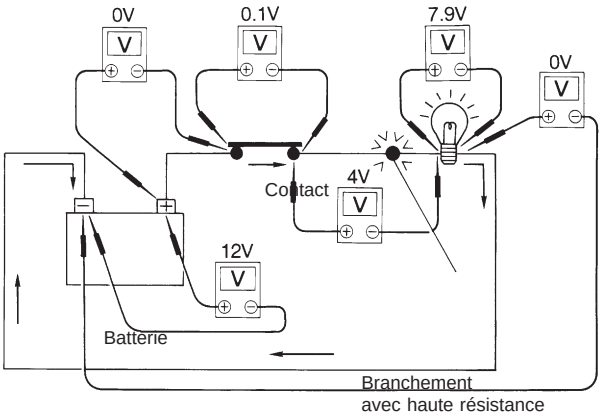
S'il est nécessaire d'effectuer des réparations, utiliser toujours un appareil de mesure similaire ou plus gros.

Mesurer une chute de tension - méthode accumulée

1. Brancher le voltmètre au connecteur ou à la partie du circuit que l'on veut tester. Le câble positif du voltmètre doit être plus proche de l'alimentation et le câble négatif plus proche de la masse.
2. Mettre le circuit sous tension.
3. Le voltmètre indiquera combien de volts sont nécessaires pour ''pousser'' le courant à travers cette partie du circuit.

On remarquera dans l'illustration qu'il existe une chute de tension excessive de 4,1 volts entre la batterie et l'ampoule.

Symptôme : l'ampoule éclaire faiblement ou n'éclaire pas



SGI974

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection du circuit (Suite)

Mesurer une chute de tension - étape par étape

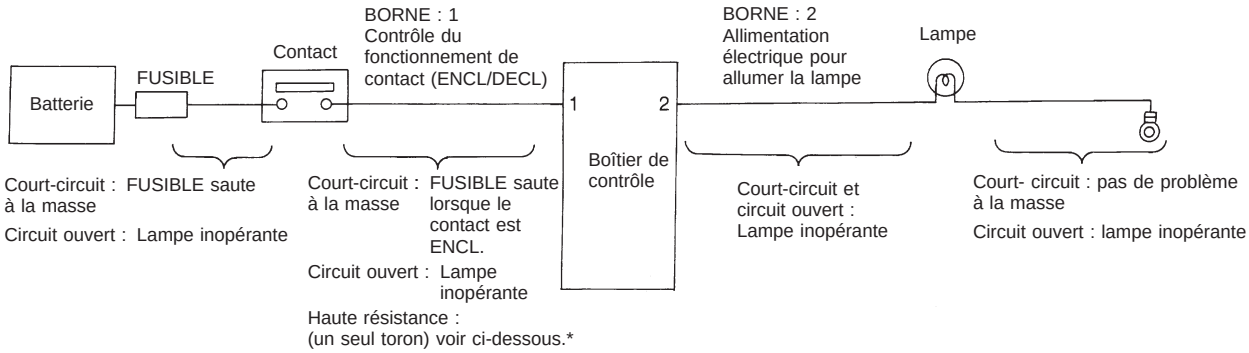
La méthode par étapes est extrêmement utile pour isoler les chutes excessives dans les systèmes de basse tension (comme celles des ‘‘Systèmes commandés par ordinateur’’).
Les circuits des ‘‘systèmes commandés par ordinateur’’ fonctionnent avec une intensité de courant très basse.
Le fonctionnement du système (commandé par ordinateur) peut être affecté par une variation de la résistance dans le système. Une telle variation de la résistance peut être due à une mauvaise connexion, une mauvaise installation, un diamètre de fil incorrect ou à la corrosion.
Le test de chute de tension par étapes permet d'identifier un composant ou un câble dont la résistance est trop élevée.

1. Brancher le voltmètre comme indiqué, en commençant à la batterie et en effectuant un tour autour du circuit.
2. Une chute de tension excessive indiquera qu'un composant ou un fil doit être réparé. Comme l'indique l'illustration, un branchement incorrect cause une chute de 4 volts de tension.

L'organigramme suivant indique quelques chutes de tension maximum admissibles. Ces valeurs sont données à titre d'exemple, la valeur exacte pour chaque composant pouvant varier.

COMPOSANT	CHUTE DE TENSION
Câble	Négligeable <,001 volts
Connexions de masse	Environ 0,1 volts
Contacts entre le contact	Environ 0,3 volts

SGI854



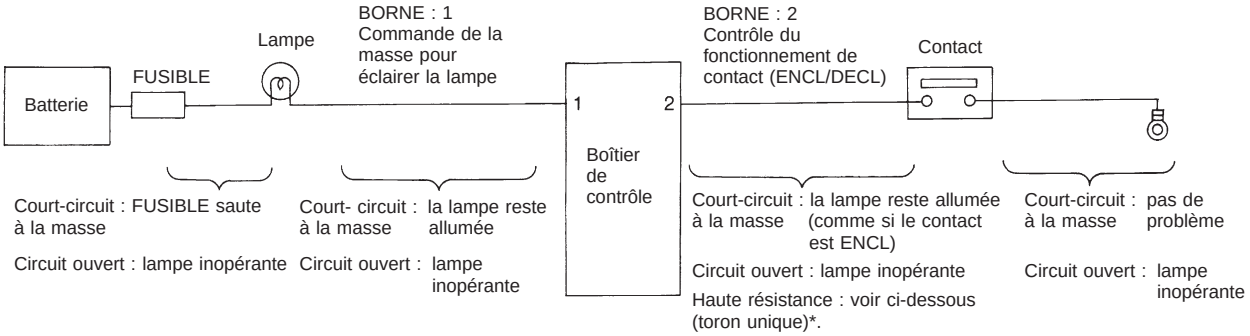
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection du circuit (Suite)

CONTROLE DU CIRCUIT DE BOITIER DE CONTROLE

Description du système : lorsque le contact est mis, le boîtier de contrôle actionne l'éclairage.

Cas 1



Organigramme des tensions entrée/sortie

N° de broche	Elément	Position	Valeur tension [V]	Dans le cas d'une haute résistance tel un seul toron [V] *
1	Contact	Contact ENCLEN.	Tension batterie	Inf. à la tension de la batterie Environ 8 (exemple)
		DECLEN.	Environ 0	Environ 0
2	Lampe	Contact ENCLEN.	Tension batterie	Environ 0 (lampe inopérante)
		DECLEN.	Environ 0	Environ 0

La valeur de la tension est basée sur la masse de carrosserie.

* : Si une haute résistance existe dans le circuit à côté du contact (causée par un seul toron), la borne 1 ne détecte pas la tension de la batterie. L'ECM ne détecte pas le contact même s'il est mis sur la position ''ON''. Par conséquent, l'ECM ne fournit pas d'alimentation électrique pour éclairer la lampe.

Cas 2

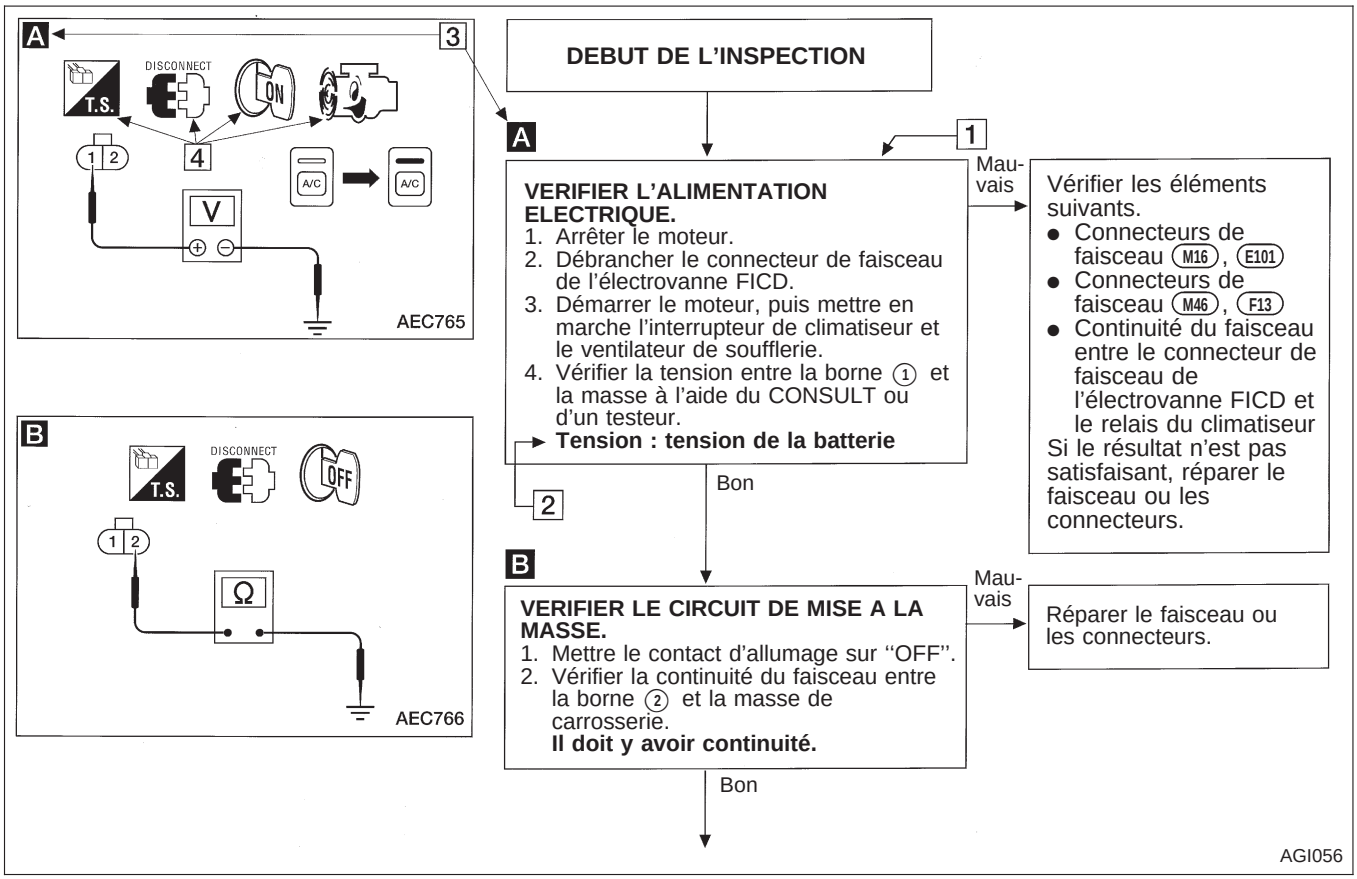
Organigramme des tensions entrée/sortie

N° de broche	Elément	Position	Valeur tension [V]	Dans le cas d'une haute résistance tel un seul toron [V] *
1	Lampe	Contact ENCLEN.	Environ 0	Tension de la batterie (lampe inopérante)
		DECLEN.	Tension de la batterie	Tension de la batterie
2	Contact	Contact ENCLEN.	Environ 0	Sup. à 0 Environ 4 (exemple)
		DECLEN.	Environ 5	Environ 5

La valeur de la tension est basée sur la masse de carrosserie.

* : Si une haute résistance existe dans le circuit à côté du contact (causée par un seul toron), la borne 2 ne détecte pas environ 0V. L'ECM ne détecte pas le contact même s'il est mis sur la position ''ON''. Par conséquent, l'ECM ne commande pas la masse pour éclairer la lampe.

AGI059



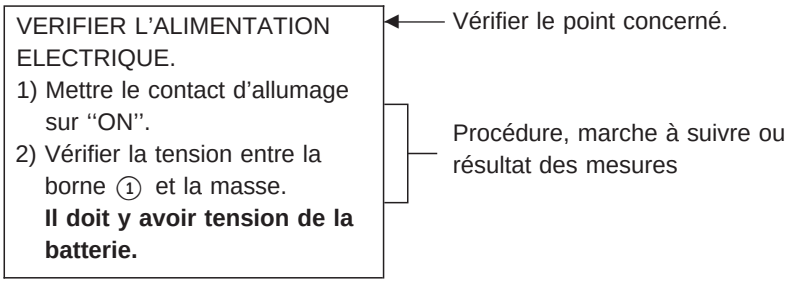
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

NOTE :

L'organigramme indique les procédures à suivre pour diagnostiquer correctement les défauts. Observer les instructions suivantes avant de procéder au diagnostic.

1) **Utiliser le tableau ci-dessous après avoir localisé les causes probables du défaut en appliquant une ''Vérification préliminaire'', un ''Tableau des symptômes'' ou une ''Procédure de travail''.**
2) **Après les réparations, contrôler que le défaut a bien été totalement éliminé.**
3) **Se reporter à l'emplacement des composants et du connecteur de faisceau des systèmes décrits dans chaque section pour identifier/localiser les composants et connecteurs de faisceau.**
4) **Se reporter au schéma de circuit pour effectuer un contrôle ponctuel.**
   Si l'on doit vérifier, de manière plus détaillée, la continuité du circuit entre les connecteurs de faisceau ; comme par exemple lorsqu'un faisceau auxiliaire est utilisé, il faut se reporter au ''schéma de câblage'' de chaque section et à la ''disposition du faisceau'' dans la section EL pour l'identification des connecteurs de faisceau.
5) **Lors de la vérification de la continuité des circuits, le contact d'allumage doit être coupé (''OFF'').**
6) **Avant de vérifier la tension aux connecteurs, vérifier la tension de la batterie.**
7) **Après avoir effectué les Procédures de diagnostic et l'Inspection des composants électriques, toujours s'assurer que tous les connecteurs de faisceau sont rebranchés correctement.**

Exemple



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Comment lire cet organigramme

1 Marche à suivre et procédure de diagnostic

Commencer par diagnostiquer le défaut en appliquant les procédures encadrées, telles qu'indiquées dans l'exemple ci-dessous.

A

2 Résultats des mesures

Les résultats requis sont indiqués en caractères gras dans l'encadré correspondant, comme indiqué ci-dessous :
Leurs significations sont les suivantes :

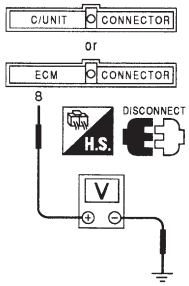
Tension de la batterie → 11 à 14V ou environ 12V
Tension : environ 0V → inférieure à 1V

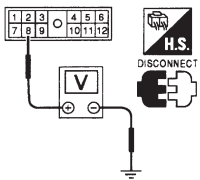
3 Correspondance des renvois et symboles apparaissant dans le texte et les illustrations

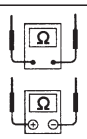
Les illustrations sont fournies en tant qu'aide visuelle pour les procédures d'intervention. Par exemple, le symbole A apparaissant dans la partie supérieure gauche de chaque illustration correspond au même symbole sur l'organigramme de procédures pour faciliter l'identification. De façon plus précise, la procédure correspondant à la rubrique ''VERIFIER L'ALIMENTATION ELECTRIQUE'' est indiquée par l'illustration A .

4 Symboles utilisés dans les illustrations

Les symboles utilisés dans les illustrations font référence à des mesures ou procédures. Avant de procéder au diagnostic d'un défaut, se familiariser avec chaque symbole utilisé.







MARQUE DE DIRECTION

Se reporter aux ''SYMBOLES DE CONNECTEURS'' à la page GI-14.

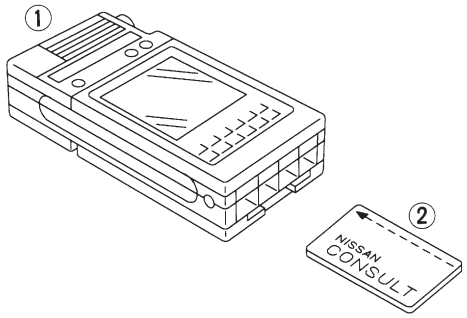
Remplacement de la pile au lithium

Le CONSULT contient une pile au lithium. Lors du remplacement de la pile, observer les indications suivantes :

AVERTISSEMENT :



Remplacer la pile au lithium uniquement par une de type SANYO Electric Co. , Ltd, CR2032. L'utilisation d'une autre pile peut entraîner un risque d'incendie ou d'explosion. Un mauvais traitement de la batterie peut également entraîner un risque d'incendie ou de brûlure chimique. Ne pas recharger, démonter ou jeter au feu.

Conserver la pile hors de portée des enfants et mettre les piles usées au rebut conformément aux réglementations locales.

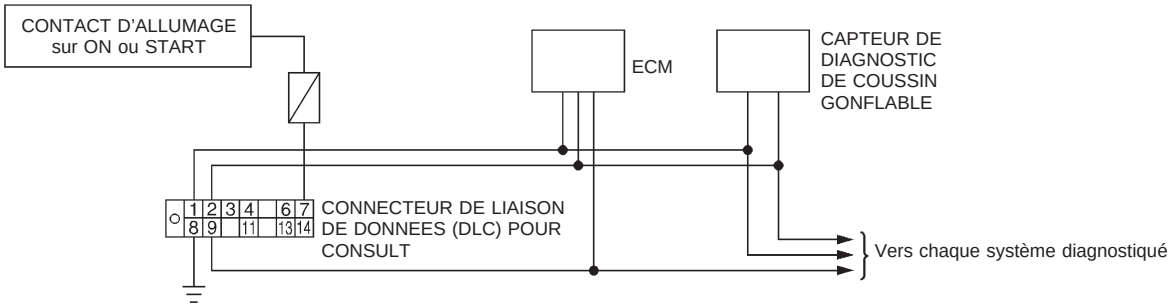
Procédure de charge



1. Tout en appuyant sur les touches en haut à gauche et en haut à droite du tableau à contact CONSULT, presser sinmultanément le contact ''ON''. Tout en pressant le contact ''ON'', continuer d'appuyer sur les deux touches de coin jusqu'à ce que l'image suivante apparaisse.
2. Si l'initialisation a été faite correctement, le message suivant apparaîtra en haut de l'écran d'afficahge : (Initialisation par carte. Insérer la carte, Bon ?)
3. Insérer la carte programme dans le lecteur de carte programme CONSULT.
4. Appuyer sur la touche ''Y'' sur le tableau de contact.
5. Maintenant le chargement du programme commence.
6. Quand le message ''Initialisation terminée'' apparaît, toucher le contact ''OFF''.

SGI983

Circuit de connecteur de liaison de données (DLC) pour CONSULT

Exemple

SGFI984

PROCEDURE D'INSPECTION

Si CONSULT ne peut pas effectuer un dignostic correct du système, vérifier les points suivants.

Symptôme	Points à vérifier
CONSULT ne peut accéder à aucun système.	● Circuit d'alimentation électrique (borne 7) et circuit de mise à la masse (borne 8). (Pour plus de détails sur le circuit, se reporter au ''Schéma de câblage des connecteurs MIL et de liaison de données'' à la section EC). ● Câble CONSULT DDL
CONSULT ne peut pas accéder à un système individuel (mais peut accéder à d'autres systèmes).	● Carte de programme de CONSULT (vérifier la carte de programme CONSULT corespondant au système. Se reporter à GI-0.) ● Alimentation électrique et circuit de mise à la masse de l'unité de commande du système (Pour le détail du circuit, se reporter au schéma de câblage de chaque système). ● Circuit ouvert ou court-circuit entre le système et le connecteur de liaison de données pour CONSULT (Pour le détail du circuit, se reporter au schéma de câblage de chaque système).

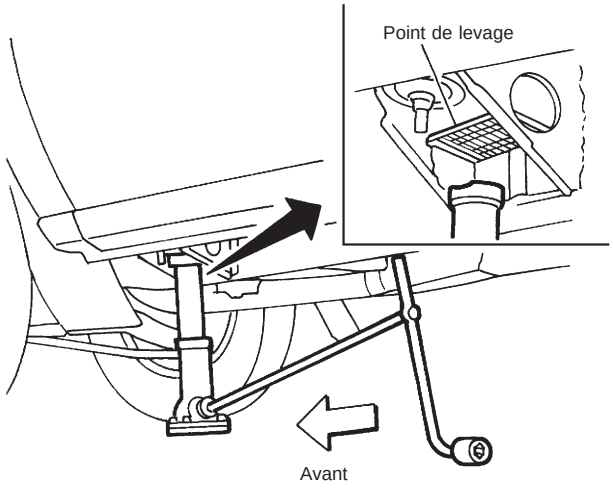
AVERTISSEMENT :

- **Ne jamais se glisser sous un véhicule soutenu uniquement par un cric. Toujours faire reposer le châssis sur des chandelles de sécurité lorsque l'on est amené à travailler sous le véhicule.**
- **Placer des cales à l'avant et à l'arrière des roues sur le sol.**



Cric pantographe

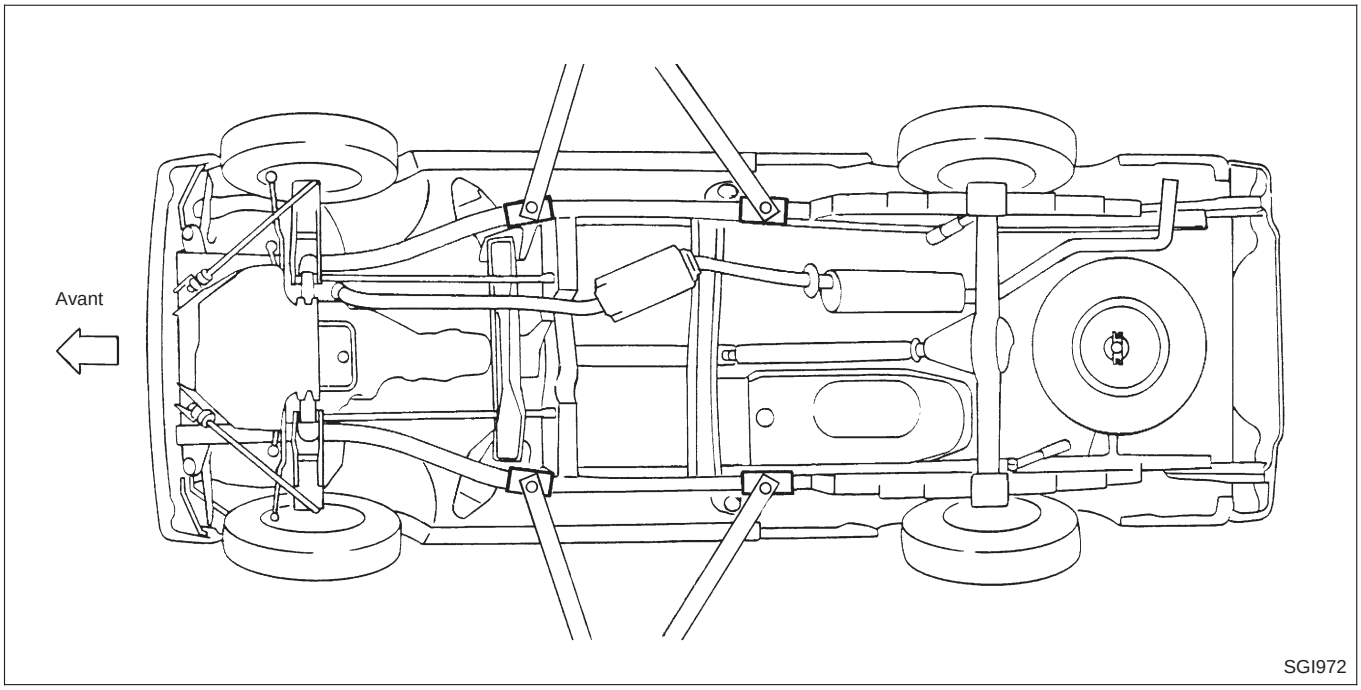
Cric rouleur et chandelles de sécurité

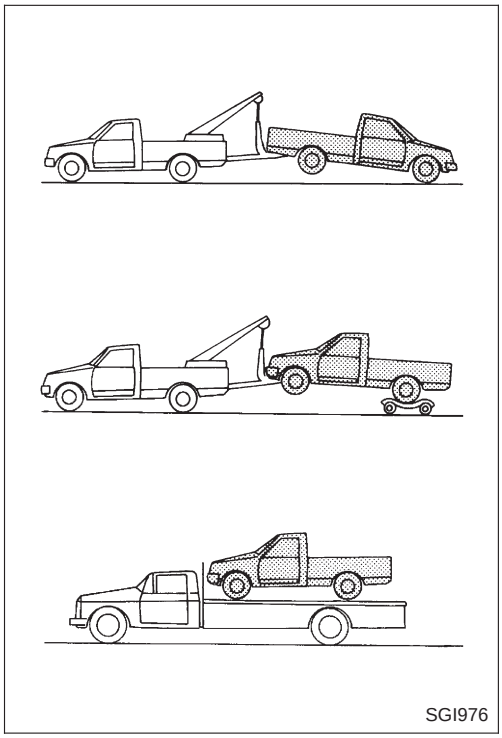


ATTENTION :
Placer un bloc de bois ou de caoutchouc entre les chandelles de sécurité et la carrosserie du véhicule lorsque le support est plat.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Elévateur à 2 colonnes

AVERTISSEMENT :
Lors du levage du véhicule, écarter les bras de levage le plus possible afin que l'avant et l'arrière du véhicule soient convenablement équilibrés.
En disposant le bras de levage, veiller à ce qu'il n'entre pas en contact avec les tuyaux de frein, les câbles de frein et les canalisations d'alimentation.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Remorquage par une dépanneuse

ATTENTION :

- **Respecter toute réglementation locale en vigueur concernant le remorquage.**
- **Il est nécessaire d'utiliser un équipement de remorquage adéquat afin d'éviter d'endommager le véhicule lors du remorquage.**
- **Pour tout remorquage, attacher des chaînes de sécurité.**
- **Lors du remorquage, s'assurer que la transmission, la direction et la chaîne cinématique sont en bon état. Si l'un des ensembles est endommagé, utiliser un chariot de garage.**
- **Lors d'un remorquage avec les roues avant au sol :**
  Tourner la clé de contact sur la position ''OFF'' et bloquer le volant de direction en position droite à l'aide d'une corde ou d'un dispositif équivalent. Ne jamais mettre la clé de contact sur la position ''LOCK''. Cela pourrait endommager le mécanisme de verrouillage de la direction.
- **Lors d'un remorquage avec les roues arrière au sol, desserrer le frein de stationnement et placer le levier de changement de vitesses au point mort (position ''N'').**
- **Ne jamais remorquer de véhicule par l'arrière (en marche arrière) avec les quatre roues au sol, car cela pourrait entraîner des dommages graves à la boîte de vitesses, nécessitant des réparations onéreuses.**
- **Pour modèle à 4 roues motrices :**
  Mettre les moyeux de roue libre en position de roue libre. Déplacer le levier de passage de boîte de transfert sur la position ''2H'' et le levier de passage de boîte de vitesses sur la position de point mort (''N'').

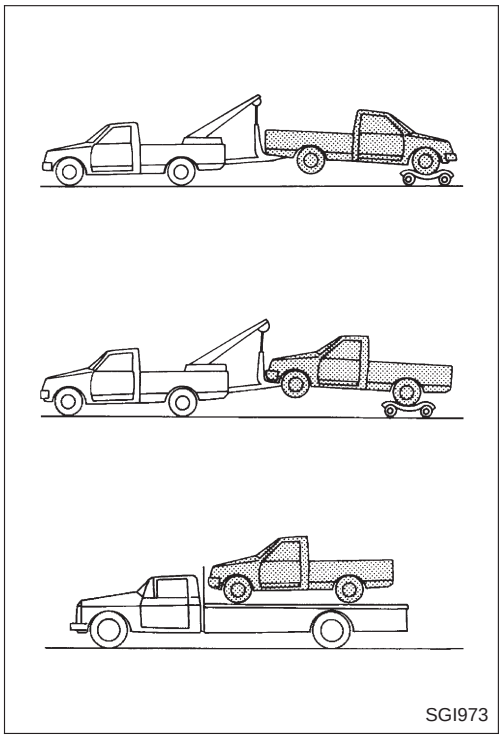
MODELES A 2 ROUES MOTRICES

NISSAN recommande que le véhicule soit remorqué avec les roues motrices (arrière) décollées du sol, comme indiqué sur l'illustration.

Remorquage avec les quatres roues au sol ou avec les roues arrière au sol

Respecter les limitations de vitesse et de distance suivantes imposées pour le remorquage.

Vitesse : moins de 95 km/h
Distance : moins de 800 km



Si les données de vitesse ou de distance s'avèrent plus importantes, déposer au préalable l'arbre de transmission pour éviter d'endommager la boîte de vitesses.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Remorquage par une dépanneuse (Suite)

MODELES A 4 ROUES MOTRICES

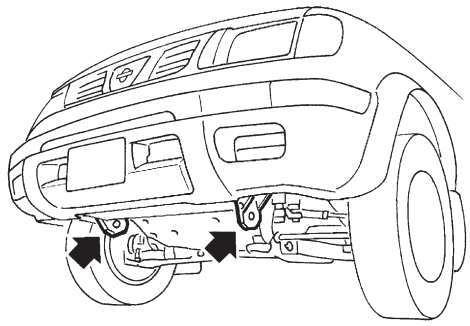
NISSAN recommande l'utilisation d'un chariot de garage pour le remorquage des modèles à quatre roues motrices, comme indiqué dans l'illustration.

SGI973

Remorquage avec les quatres roues au sol ou avec les roues avant ou arrière au sol

Respecter les limitations de vitesse et de distance suivantes imposées pour le remorquage.

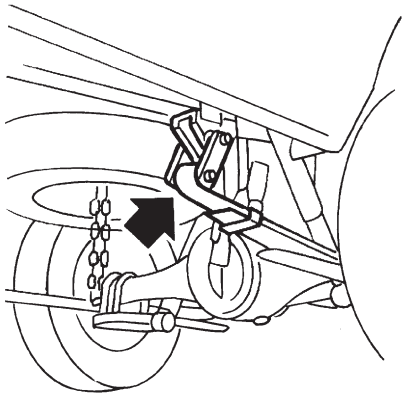
Vitesse : moins de 95 km/h
Distance : moins de 800 km



Si les données de vitesse ou de distance s'avèrent plus importantes, déposer au préalable les arbres de transmission avant et arrière pour éviter d'endommager la boîte de vitesses.

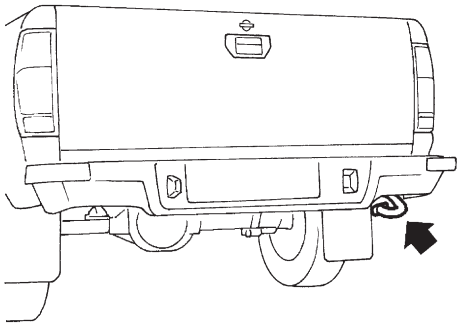
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Points de remorquage



Ne jamais remorquer un véhicule en utilisant uniquement les points de remorquage. Pour ne pas risquer d'endommager le véhicule pendant le remorquage, il est nécessaire d'utiliser un équipement de remorquage approprié.

Avant



SGI968

Arrière

SGI926

Arrière (selon modèles)

SGI969

DEPANNAGE DU VEHICULE (dégager un véhicule embourbé)

- Les dispositifs de remorquage doivent être orientés de façon à ne toucher aucun élément des systèmes de suspension, direction, freinage ou refroidissement.
- Toujours tirer le câble de remorquage en ligne droite, dans l'axe avant ou arrière du véhicule. Ne pas soumettre le véhicule à un effort latéral.
- Les dispositifs de traction tels que cordes et sangles en matière textile ne sont pas recommandés pour le remorquage ou le dépannage du véhicule.

Liste de terminologie SAE J1930

Tous les termes en rapport avec le système des gaz d'échappement, utilisés dans cette publication conformément à la liste de terminologie SAE J1930, sont listés. En conséquence, les acronymes/abréviations ainsi que les termes sont indiqués dans ce tableau.

*** : Pas applicable

ACRONYME/ ABREVIATION	TERME
ACL	Filtre à air
BARO	Pression barométrique
BAROS-BCDD	Capteur de pression barométrique BCDD
CMP	Angle d'arbre à cames
CMPS	Capteur d'angle d'arbre à cames
CARB	Carburateur
CAC	Refroidisseur d'air de suralimentation
CL	Boucle fermée
Contact CTP	Contact de ralenti
Contact CPP	Contact d'embrayage
Système CFI	Système d'injection continue
Système CTOX	Séparateur périodique à oxydation continue
CKP	Angle de vilebrequin
CKPS	Capteur d'angle de vilebrequin
DLC	Connecteur de liaison des données
DLC pour CONSULT	Connecteur de diagnostic pour CONSULT
DTM	Mode de diagnostic
Sélecteur DTM	Sélecteur de mode d'essai de diagnostic
DTM I	Mode I
DTM II	Mode II
DTC	Code de défaut
Système DFI	Système d'injection directe
Système DI	Commande de calage d'allumage
Système EC	Controle de l'ECCS
Réchauffeur de mélange EFE	Réchauffeur de mélange
Système EFE	Commande de réchauffeur de mélange
EEPROM	Mémoire morte programmable effaçable électriquement
Cartouche EVAP	Cartouche d'évaporation des émissions
Système EI	Commande de calage d'allumage
ECM	Boîtier de contrôle de l'ECCS
ECT	Température du moteur
ECTS	Capteur de temp. moteur
EM	Modification du moteur
RPM	Régime moteur
EPROM	Mémoire morte programmable effaçable
Système EVAP	Système d'évaporation des émissions
Vanne EGR	Vanne EGR
Vanne EGRC-BPT	Vanne de transduction de contre-pression (BPT)
Electrovanne EGRC	Electrovanne de commande EGR

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Liste de terminologie SAE J1930 (Suite)

ACRONYME/ ABREVIATION	TERME
Capteur de temp. EGRT	Capteur de température des gaz d'échappement
FEEPROM	Mémoire morte programmable effaçable électriquement
FEPROM	Mémoire morte programmable effaçable
FFS	Capteur de flexible d'alimentation
Système FF	Système de flexible d'alimentation
Système FT	Répartiteur de carburant
HO2S	Sonde à oxygène chauffée
Système IAC	Commande de régime de ralenti
Régulateur d'air-IACV	Régulateur d'air
Vanne IACV-AAC	Vanne de commande d'air auxiliaire (AAC)
Electrovanne IACV-FICD	Electrovanne FICD
Electrovanne de montée en ralenti-IACV	Electrovanne de commande de montée en ralenti
ISC-FI pot	Pot FI de commande du régime ralenti
Système ISC	Système de commande du régime ralenti
IC	Commande d'allumage
ICM	Module de commande d'allumage
Système IFI	Système d'injection indirecte
IA	Air d'admission
IATS	Sonde de température d'air d'admission
KS	Capteur de détonation
MIL	Témoin CHECK ENGINE
MAP	Pression absolue du collecteur
MAPS	Capteur de pression absolue du collecteur
MDP	Pression différentielle du collecteur
MDPS	Capteur de pression différentielle du collecteur
MST	Température de la surface de collecteur
MSTS	Capteur de température de la surface de collecteur
MVZ	Partie à dépression du collecteur
MVZS	Capteur de partie à dépression du collecteur
MAFS	Débitmètre d'air
Electrovanne MC	Electrovanne de commande de richesse de mélange air/carburant
Système MFI	Commande d'injection multipoint
NVRAM	Mémoire à accès sélectif non inconstant
Système OBD	Autodiagnostic
OL	Boucle ouverte
OC	Catalyseur à oxydation
Système OC	Système de catalyseur à oxydation
O2S	Sonde à oxygène
Contact PNP	Contact de stationnement/point-mort
Système PTOX	Séparateur périodique à oxydation
PCV	Ventilation du carter moteur
PCV valve	Soupape de ventilation du carter moteur
PCM	Module de commande du groupe motopropulseur
PROM	Mémoire morte programmable

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Liste de terminologie SAE J1930 (Suite)

ACRONYME/ ABREVIATION	TERME
Electrovanne PAIRC	Electrovanne de commande d'injection d'air secondaire pulsé
Système PAIR	Système d'injection d'air secondaire pulsé
Vanne PAIR	Vanne d'injection d'air secondaire pulsé
RAM	Mémoire à accès sélectif
ROM	Mémoire morte
ST	Outil de balayage
Pompe AIR	Pompe à injection d'air secondaire
Système AIR	Système d'injection d'air secondaire
Système SFI	Système d'injection multi-point séquentielle
SRI	Indicateur de rappel d'entretien
Système SPL	Système du limiteur de fumée
SC	Suralimentation
SCB	Dérivation de suralimentation
SRT	Contrôle fonctionnel du système
TVV	Vanne thermique à dépression
TWC	Catalyseur trois voies
Système TWC	Système de catalyseur trois voies
TWC + OC	Catalyseur trois voies + oxydation
Système TWC + OC	Système catalyseur trois voies + oxydation
TB	Boîtier de papillon
Système TBI	Système d'injection à boîtier de papillon
TP	Position de papillon
TPS	Capteur de position de papillon
Contact TP	Contact de position de papillon
Electrovanne TCC	Electrovanne d'embrayage de convertisseur de couple
TCM	Module de commande de transmission
TC	Turbocompresseur
VSS	Capteur de vitesse du véhicule
VAFS	Débitmètre d'air
WU-OC	Catalyseur à oxydation d'échauffement
Système WU-OC	Système de catalyseur à oxydation d'échauffement
WU-TWC	Catalyseur trois voies d'échauffement
Système WU-TWC	Système de catalyseur trois voies d'échauffement
Contact WOTP	Contact de papillon grand ouvert

Lecture des schémas de câblage :

- **Lire la section GI : ‘‘COMMENT LIRE LES SCHEMAS DE CABLAGE’’.**
- **Voir la section EL, ‘‘DISPOSITION DE L’ALIMENTATION ELECTRIQUE’’ pour connaître les circuits de distribution de l’alimentation électrique.**

Se reporter aux chapitres ‘‘COMMENT LIRE LES ORGANIGRAMMES DANS LES DIAGNOSTICS DES DEFAUTS’’ et ‘‘COMMENT EFFECTUER UN DIAGNOSTIC EFFICACE EN CAS D’INCIDENT ELECTRIQUE’’ à la section GI pour effectuer les diagnostics des défauts.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Système de retenue supplémentaire (SRS) ‘‘COUSSIN GONFLABLE’’ (modèles à 4 roues motrices)

Utilisé avec une ceinture de sécurité, le coussin gonflable du système de retenue supplémentaire contribue à réduire les risques et la gravité des blessures subies par le conducteur en cas de collision frontale. Le système de retenue supplémentaire se compose d’un module de coussin gonflable (situé dans le moyeu du volant), d’un boîtier de capteurs de diagnostic, d’un témoin avertisseur, d’un faisceau de câblage et d’un câble spiralé. Les informations nécessaires à l’entretien sans danger du système se trouvent à la **section RS** de ce manuel de réparation.

AVERTISSEMENT :

- **Pour ne pas affecter le fonctionnement du SRS, ce qui augmenterait les risques de blessures graves ou mortelles en cas de collision entraînant le déploiement du coussin gonflable (air bag), toutes les opérations d’entretien doivent être effectuées par un concessionnaire NISSAN agréé.**
- **Un entretien incorrect, y compris une mauvaise dépose ou repose du SRS, pourra entraîner des risques de blessures dues au déploiement accidentel du système.**
- **Ne pas utiliser d’équipement d’essai électrique sur les circuits connexes du SRS sauf sur indication de ce manuel de réparation. Les faisceaux de câblage électrique du SRS sont équipés d’une gaine d’isolation jaune soit juste devant les connecteurs de faisceau, soit sur le faisceau tout entier pour une identification plus rapide.**

Système de retenue supplémentaire (SRS) ‘‘COUSSIN GONFLABLE’’ (modèles à 2 roues motrices)

Utilisé avec une ceinture de sécurité, le coussin gonflable (air bag) du système de retenue supplémentaire contribue à réduire les risques ou la gravité des blessures subies par le conducteur en cas de collision frontale. Le système de retenue supplémentaire se compose d’un module de coussin gonflable (situé dans le moyeu du volant), d’un boîtier de capteurs de diagnostic, d’un témoin avertisseur et d’un câble spiralé. - **Ne pas utiliser d’équipement d’essai électrique sur les circuits connexes du SRS.**

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Précautions d'emploi du HFC-134a (R-134a)

AVERTISSEMENT :

- **Les réfrigérants CFC-12 (R-12) et HFC-134a (R-134a) ne sont pas compatibles. Ces réfrigérants ne doivent jamais être mélangés, même en très petites quantités. Si les réfrigérants sont mélangés, il est probable que le compresseur tombera en panne.**
- **N'utiliser que le lubrifiant spécifié pour le système de climatisation HFC-134a (R-134a) et les composants HFC-134a (R-134a). Si un lubrifiant différent est utilisé, il est probable que le compresseur tombera en panne.**
- **Le lubrifiant spécifié pour HFC-134a (R-134a) absorbe rapidement l'humidité contenue dans l'atmosphère. Les précautions de manipulation suivantes doivent être observées :**
  - **a : Lors de la dépose des composants de réfrigération d'un véhicule, poser immédiatement sur ces composants des bouchons (d'étanchéité) de façon à minimiser la pénétration d'humidité contenue dans l'atmosphère.**
  - **b : Lors de l'installation sur un véhicule des composants de réfrigération, ne déposer les bouchons d'étanchéité que juste avant de connecter les composants. Brancher tous les composants du circuit de réfrigérant aussi vite que possible afin de minimiser la pénétration d'humidité dans le système.**
  - **c : N'utiliser que le lubrifiant spécifié conservé dans une bouteille hermétique. Refermer immédiatement et hermétiquement toutes les bouteilles de lubrifiant. Si les récipients ne sont pas hermétiques, le lubrifiant sera saturé d'humidité et ne pourra pas être utilisé.**
  - **d : Eviter d'inhaler du réfrigérant C/A, ou des vapeurs ou brouillard de lubrifiant. L'exposition peut irriter les yeux, le nez et la gorge. N'utiliser que l'équipement de récupération/ recyclage agréé pour effectuer le délestage du réfrigérant HFC-134a (R-134a). En cas de délestage accidentel, ventiler la zone de travail avant de reprendre l'opération d'entretien. Il est possible d'obtenir de plus amples informations sur la santé et la sécurité auprès des fabricants de réfrigérants et de lubrifiants.**
  - **e : Ne pas laisser le lubrifiant (huile de circuit de climatisation Nissan, type S) entrer en contact avec des pièces en polystyrène expansé. Cela pourrait provoquer des dommages.**

Précautions générales pour l'emploi du réfrigérant

AVERTISSEMENT :

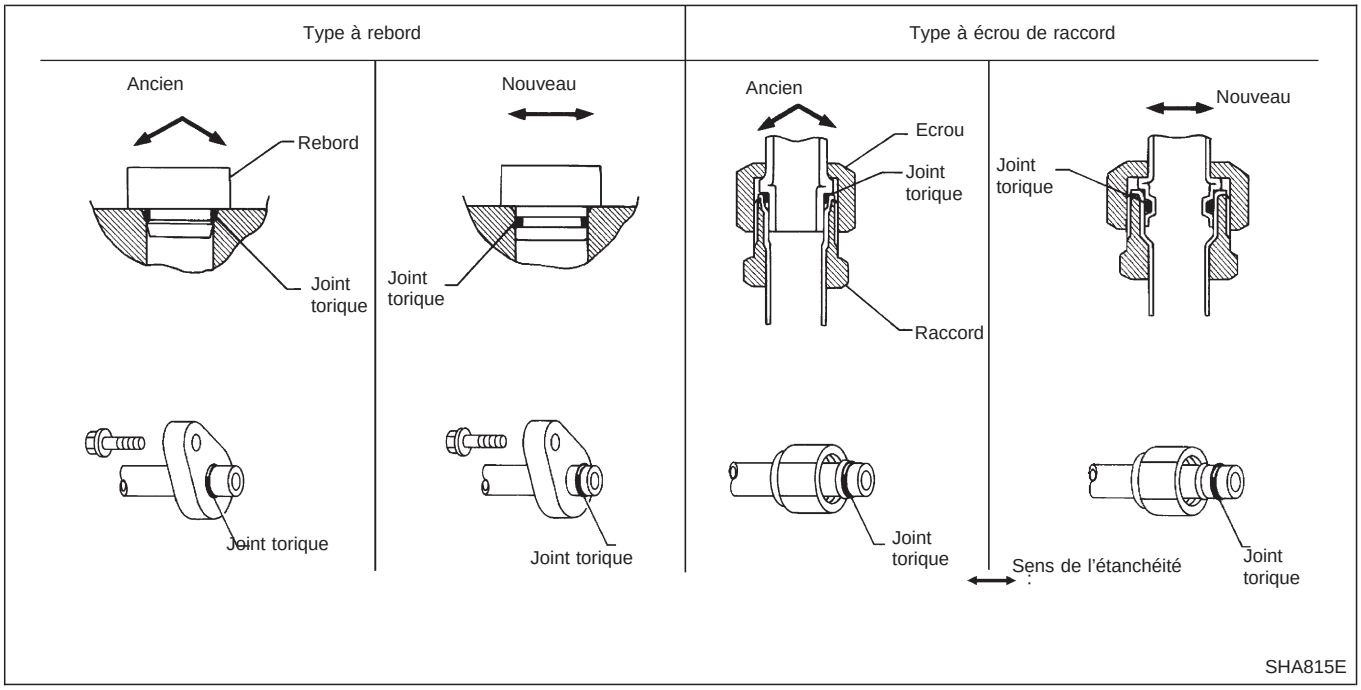
- **Ne pas décharger de réfrigérant dans l'air. Utiliser un équipement de récupération/recyclage agréé pour récupérer le réfrigérant chaque fois que l'on procède à un délestage du système de climatisation.**
- **Toujours porter des lunettes et des gants de protection lorsque l'on travaille avec du réfrigérant ou sur un système de climatisation.**
- **Ne pas conserver ou chauffer les bouteilles de réfrigérant à plus de 52°C.**
- **Ne pas chauffer une bouteille de réfrigérant avec une flamme nue ; si un chauffage de la bouteille est nécessaire, placer le bas de la bouteille dans un seau d'eau chaude.**
- **Ne pas laisser tomber, percer ou incinérer intentionnellement les bouteilles de réfrigérant.**
- **Garder le réfrigérant à l'écart de toute flamme nue : la combustion du réfrigérant produit des gaz toxiques.**
- **Le réfrigérant prendra la place de l'oxygène, il faut alors veiller à travailler dans une zone de travail correctement ventilée, de façon à éviter les risques d'asphyxie.**
- **Ne pas introduire d'air comprimé dans une bouteille de réfrigérant ou dans des composants de réfrigérant.**

Précautions pour les raccords de réfrigérant

Un nouveau type de raccord de réfrigérant a été introduit pour chaque conduit de réfrigération sauf pour les parties suivantes.

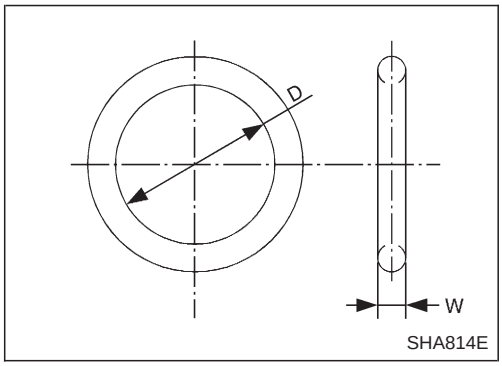
- Vanne d'expansion à unité de refroidissement
- Condenseur au réservoir de liquide

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Précautions pour les raccords de réfrigérant (Suite)

CARACTERISTIQUES DU NOUVEAU TYPE DE RACCORD DE REFRIGERANT



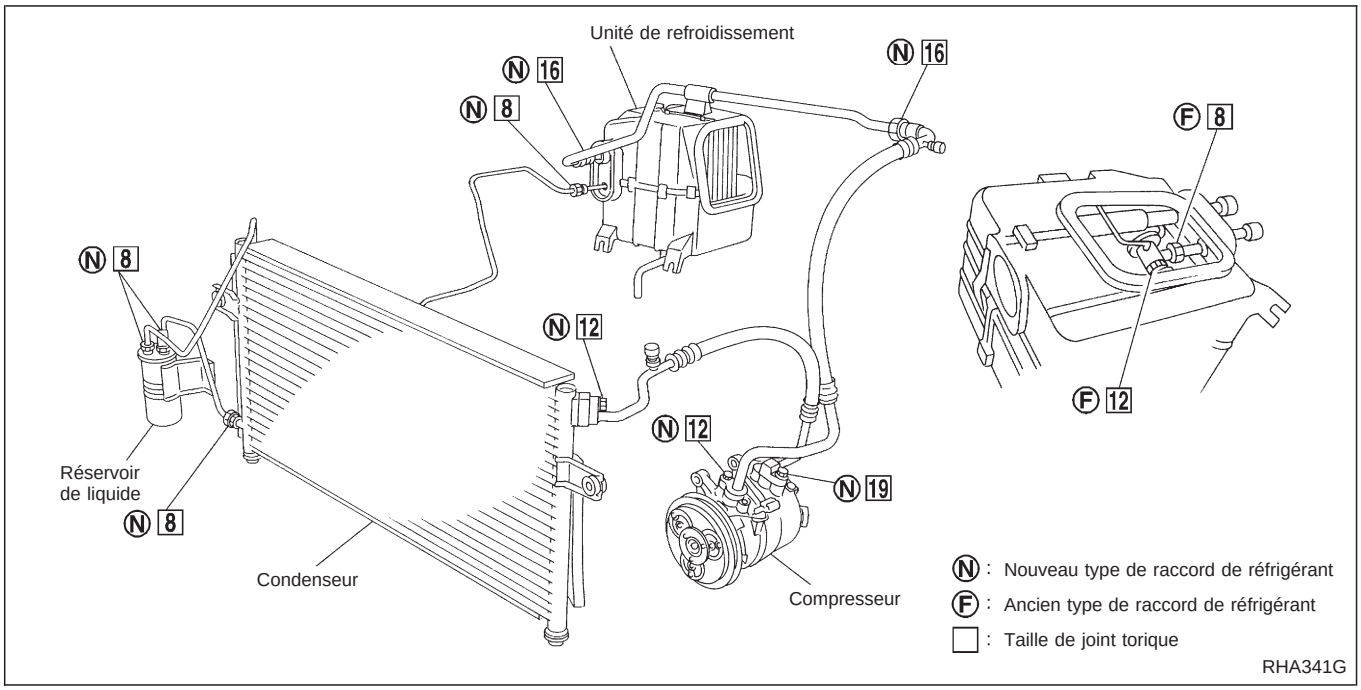
- Le joint torique a été déplacé. Il est désormais fourni avec une rainure pour une repose adéquate. Ceci élimine les risques de voir le joint torique être coincé ou endommagé dans la partie de raccordement. Le sens d'étanchéité du joint torique est maintenant positionné à la verticale, en relation avec la surface de contact de la partie de raccordement, de façon à améliorer les caractéristiques de l'étanchéité.
- La force de réaction du joint torique n'apparaîtra pas dans le sens qui entraîne l'extraction du joint, facilitant ainsi les raccords de tuyauterie.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Précautions pour les raccords de réfrigérant (Suite)

ATTENTION :
Les nouveaux et les anciens raccords de réfrigérant utilisent des configurations de joint torique différentes. Ne pas mélanger les joints toriques car ils ne sont pas interchangeables. Si un joint torique inadéquat est installé, le réfrigérant fuira au niveau ou autour du raccord.

Numéros et caractéristiques des pièces de joint torique



Type de raccord	Taille de joint torique	Numéro de pièce	D mm	W mm
Nouveau	8	92471 N8210	6,8	1,87
Ancien		92470 N8200	6,07	1,78
Nouveau	12	92472 N8210	10,9	2,43
Ancien		92475 71L00	11,0	2,4
Nouveau	16	92473 N8210	13,6	2,43
Ancien		92475 72L00	14,3	2,3
Nouveau	19	92474 N8210	16,5	2,43
Ancien		92477 N8200	17,12	1,78

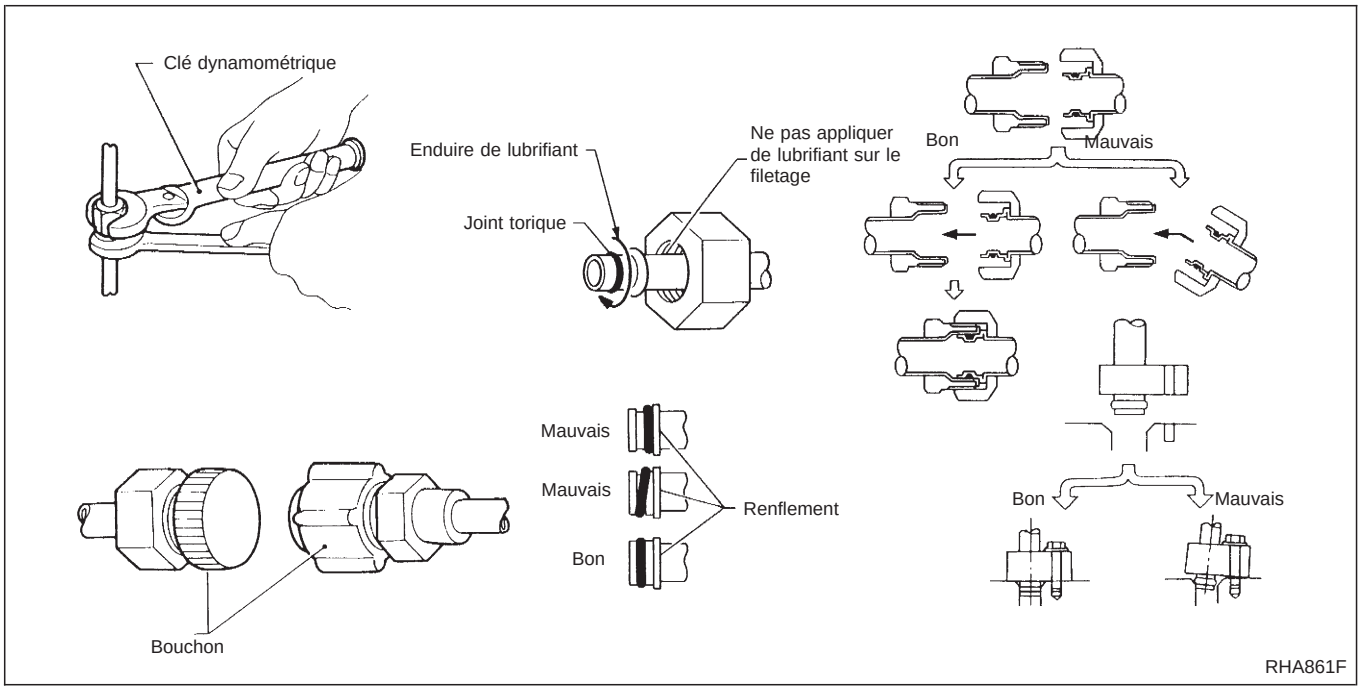
Conduite à gauche

Conduite à droite

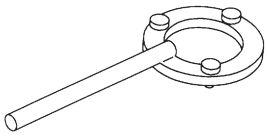


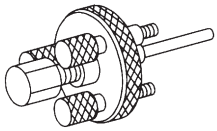
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

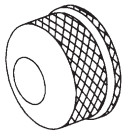
Précautions pour les raccords de réfrigérant (Suite)

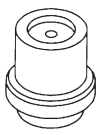
AVERTISSEMENT :
S'assurer que tout le réfrigérant est délesté dans l'équipement de recyclage et que la pression du circuit est inférieure à la pression atmosphérique. Ensuite, desserrer progressivement le raccord du flexible latéral de délestage et le déposer.
ATTENTION :
Prendre garde aux points suivants en ce qui concerne le remplacement ou le nettoyage des pièces constitutives du circuit de réfrigération.

- **Entreposer le compresseur une fois déposé dans la position qu'il occupait lorsqu'il était monté sur la voiture. Faute de quoi le lubrifiant s'écoulera dans la chambre de basse pression.**
- **Lors du branchement des canalisations, toujours utiliser une clé dynamométrique et une clé d'immobilisation.**
- **Après avoir déconnecté les canalisations, boucher immédiatement tous les orifices pour empêcher la pénétration de saletés et d'humidité.**
- **Lors de l'installation d'un climatiseur dans le véhicule, connecter les canalisations en dernier lieu. Ne pas déposer les capuchons d'étanchéité des canalisations et des autres composants jusqu'au moment du branchement.**
- **Laisser les composants entreposés dans des locaux plus froids se réchauffer à la température ambiante de la zone de travail avant de déposer les capuchons d'étanchéité. Ceci préviendra la formation de condensation dans les composants du circuit de climatisation.**
- **Eliminer soigneusement l'humidité du circuit de réfrigération avant de charger le réfrigérant.**
- **Toujours remplacer les joints toriques usagés.**
- **Lors du branchement des canalisations, enduire de lubrifiant les parties indiquées dans l'illustration. Veiller à ne pas enduire les filetages de lubrifiant.**
  Nom du lubrifiant : Huile du système de climatisation Nissan de type R (sauf pour le Moyen-Orient)
  Huile du système de climatisation Nissan de type S (pour le Moyen-Orient)
  Numéro de pièce : KLH00-PAGR0 (sauf pour le Moyen-Orient)
  KLH00-PAGS0 (pour le Moyen-Orient)
- **Les joints toriques doivent être parfaitement attachés au renflement des tuyaux.**
- **Serrer l'écrou au couple spécifié après avoir enfoncé le tube concerné dans le raccord jusqu'à ce que le joint torique disparaisse.**
- **Après un branchement de conduite, procéder à un essai de fuite et veiller à ce qu'il n'y ait aucune fuite au niveau des raccords. En cas de fuite de gaz, débrancher la conduite en question et remplacer son joint torique. Puis serrer le raccordement du siège d'étanchéité au couple spécifié.**









Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Précautions pour l'entretien sur le compresseur

- **Boucher toutes les ouvertures pour empêcher la pénétration d'humidité et de substances étrangères.**
- **Entreposer le compresseur une fois déposé dans la position qu'il occupait lorsqu'il était monté dans la voiture.**
- **Lors du remplacement ou de la réparation du compresseur, suivre à la lettre les instructions fournies au chapitre ''Contrôle de la quantité de lubrifiant dans le compresseur''. Se reporter à HA-52.**
- **Veiller à ce que les surfaces de friction entre l'embrayage et la poulie soient propres. Si la surface est contaminée par du lubrifiant, l'essuyer à l'aide d'un chiffon propre humidifié avec du diluant.**
- **Après avoir effectué l'entretien du compresseur, tourner l'arbre de compresseur à la main de plus de cinq tours dans les deux sens. Cela permettra une répartition égale du lubrifiant dans le compresseur. Après avoir installé le compresseur, faire tourner le moteur au ralenti afin que le compresseur fonctionne pendant une heure.**
- **Après avoir remplacé l'embrayage magnétique du compresseur, appliquer une tension sur l'embrayage neuf et vérifier son fonctionnement.**

Outillage et équipement d'entretien du HFC-134a (R-134a)

Ne jamais mélanger de réfrigérant HFC-134a et/ou son lubrifiant spécifié avec du réfrigérant CFC-12 (R-12) et/ou son lubrifiant.
Des équipements d'entretien séparés et non interchangeables doivent être utilisés pour chaque type de réfrigérant/lubrifiant.
Les raccords des bouteilles de réfrigérant, des flexibles d'entretien et de l'équipement d'entretien (équipement pour manipulation de réfrigérant et/ou lubrifiant) diffèrent entre les systèmes CFC-12 (R12) et HFC-134a (R-134a). Cela vise à prévenir le mélange de réfrigérants et de lubrifiants différents.
Ne jamais utiliser d'adaptateurs entre des raccords de tailles différentes : cela entraînera la contamination du réfrigérant/lubrifiant provoquant une panne du compresseur.

Nom de l'outil	Description	Note

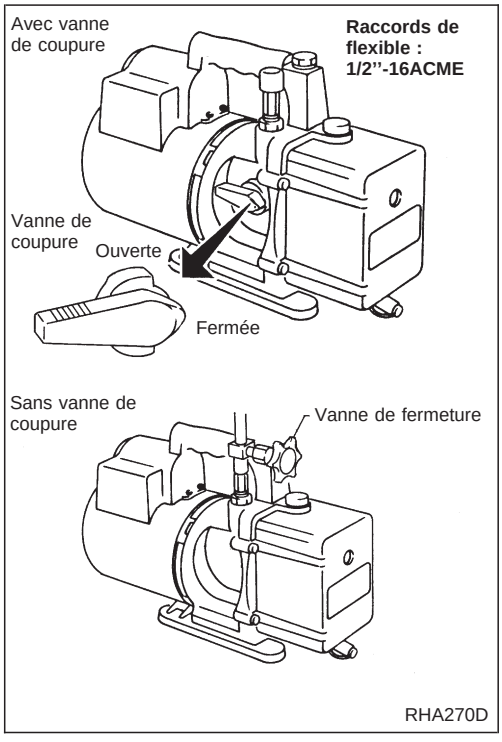
Pompe à vide (y compris la vanne de coupure)	 NT203	Capacité : ● Volume d'air déplacé : 4 CFM ● Calibre en microns : 20 microns ● Contenance en huile : 482 g Taille du raccord : filetage ● 1/2″-16 ACME

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Précautions pour l'équipement d'entretien

EQUIPEMENT DE RECUPERATION/RECYCLAGE

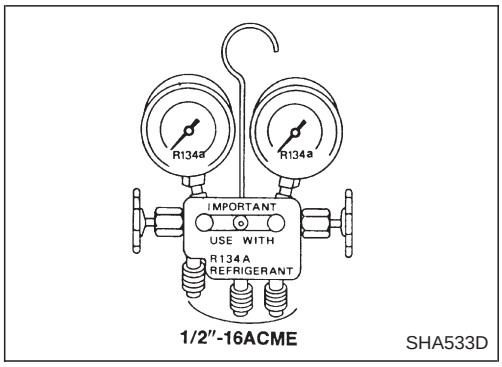
Veiller à suivre les instructions du fabricant en ce qui concerne le fonctionnement et l'entretien des machines. Ne jamais introduire dans la machine un réfrigérant autre que celui qui est préconisé.

DETECTEUR ELECTRONIQUE DE FUITES

Veiller à suivre les instructions du fabricant en ce qui concerne le fonctionnement et l'entretien des appareils de contrôle.

POMPE A VIDE

Le lubrifiant contenu dans la pompe à dépression n'est pas compatible avec le lubrifiant spécifié pour les systèmes de climatisation à réfrigérant HFC-134a (R-134a). Le côté évent de la pompe à dépression est exposé à la pression atmosphérique. Le lubrifiant contenu dans la pompe à dépression peut donc passer de la pompe au flexible d'entretien lorsque la pompe est coupée après l'évacuation (mise sous vide) et qu'elle est connectée au flexible.

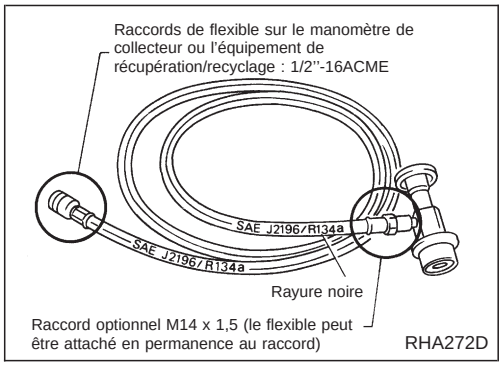


Pour empêcher ce flux, utiliser la vanne manuelle située près de la connexion entre le flexible et la pompe en procédant de la manière suivante :

- Les pompes à dépression sont normalement équipées d'une vanne de coupure manuelle qui fait partie intégrante de la pompe. Fermer cette vanne pour isoler le flexible d'entretien de la pompe.
- Pour les pompes qui ne sont pas équipées d'une vanne de coupure, utiliser un flexible équipé d'une vanne à fermeture manuelle située près de l'extrémité de la pompe. Fermer la vanne pour isoler le flexible de la pompe.
- Si le flexible est équipé d'une vanne à fermeture automatique, déconnecter le flexible de la pompe. Tant que le flexible est connecté, la vanne reste ouverte et le lubrifiant peut passer.

Certaines vannes unidirectionnelles s'ouvrent lorsqu'une dépression est appliquée et se ferment lorsqu'il n'y a pas de dépression. Ces vannes peuvent limiter la capacité de la pompe à créer un vide important et sont déconseillées.

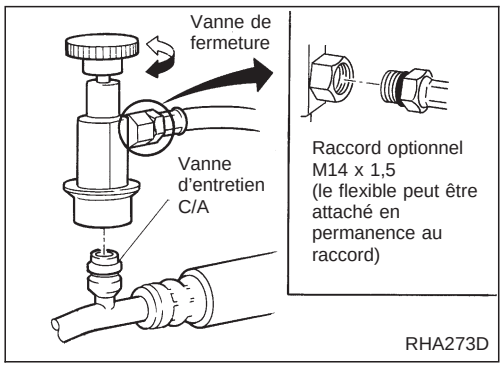
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Précautions pour l'équipement d'entretien (Suite)

SHA533D

JEU DE RAMPE MANOMETRIQUE

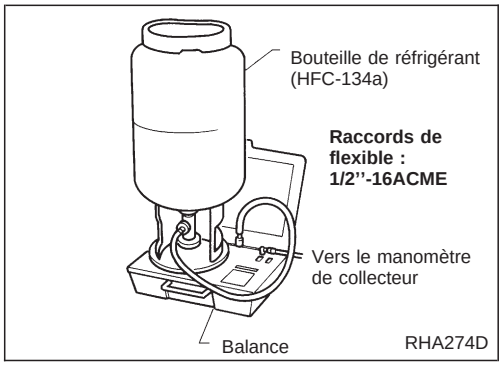


S'assurer que l'avant du manomètre indique bien R-134a ou 134a. S'assurer que la rampe manométrique est équipée de raccords filetés de 1/2″-16 ACME pour les flexibles d'entretien. S'assurer que le jeu de manomètre n'a été utilisé que pour le réfrigérant HFC-134a (R-134a) et les lubrifiants spécifiés.

RHA272D

FLEXIBLES D'ENTRETIEN

S'assurer que les flexibles d'entretien comportent les inscriptions décrites (flexible de couleur avec une bande noire). Tous les flexibles doivent être équipés d'un dispositif de coupure positif (manuel ou automatique) situé près de l'extrémité des flexibles opposée au manomètre.



RHA273D

RACCORDS D'ENTRETIEN

Ne jamais tenter de connecter des raccords d'entretien du HFC-134a (R-134a) à un système de climatisation CFC-12 (R-12). Les raccords HFC-134a (R-134a) ne permettent pas d'établir une connexion correcte avec le système CFC-12 (R-12). Une connexion incorrecte aurait pour conséquence un déchargement et une contamination.

Rotation de la vanne à fermeture	Vanne d'entretien de climatiseur
Dans le sens des aiguilles d'une montre	Ouverte
Dans le sens contraire des aiguilles d'une montre	Fermée

RHA274D

BALANCE DE REFRIGERANT

Vérifier que la balance n'a pas été utilisée avec un réfrigérant autre que le réfrigérant HFC-134a (R-134a) et les lubrifiants spécifiés. Si la balance contrôle électroniquement le débit du réfrigérant, le raccord du flexible doit être de 1/2″-16 ACME.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Précautions pour l’équipement d’entretien (Suite)

BOUTEILLE DE CHARGE

L’utilisation d’une bouteille de charge est déconseillée. Du réfrigérant pourrait se décharger dans l’atmosphère par la vanne supérieure de la bouteille lorsqu’on remplit la bouteille de réfrigérant. Par ailleurs, la précision d’une bouteille de charge est généralement inférieure à celle d’une balance électronique ou d’un bon équipement de recyclage et de recharge.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

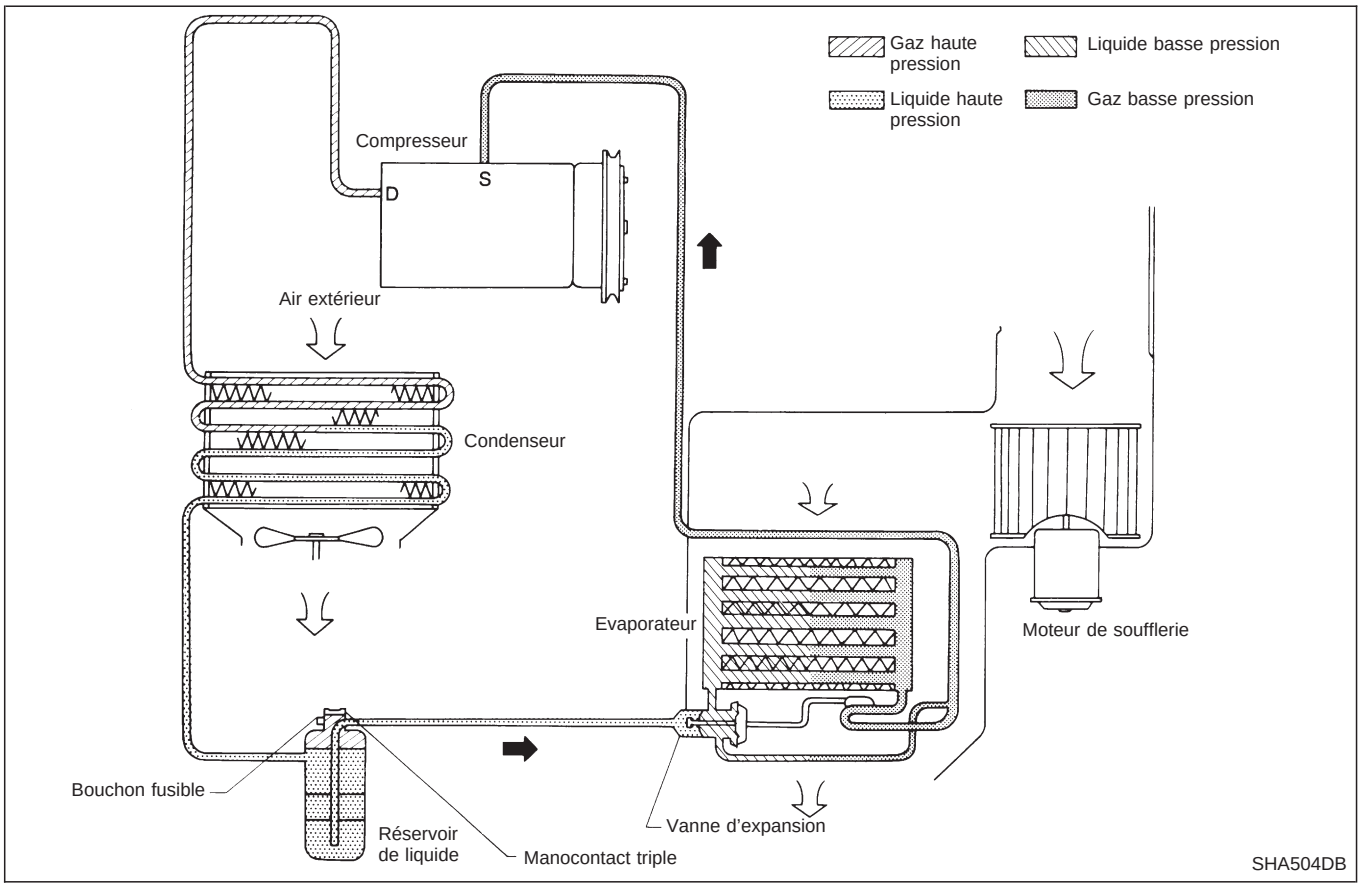
Cycle de réfrigération

CIRCULATION DU REFRIGERANT

La circulation du réfrigérant obéit à un schéma standard. Le réfrigérant passe par le compresseur, le condenseur, le réservoir de liquide, l'évaporateur et retourne dans le compresseur.
L'évaporation du réfrigérant par le serpentin de l'évaporateur est commandée par une soupape d'expansion égalisée à l'extérieur et placée à l'intérieur de l'enceinte de l'évaporateur.

PROTECTION CONTRE LE GEL

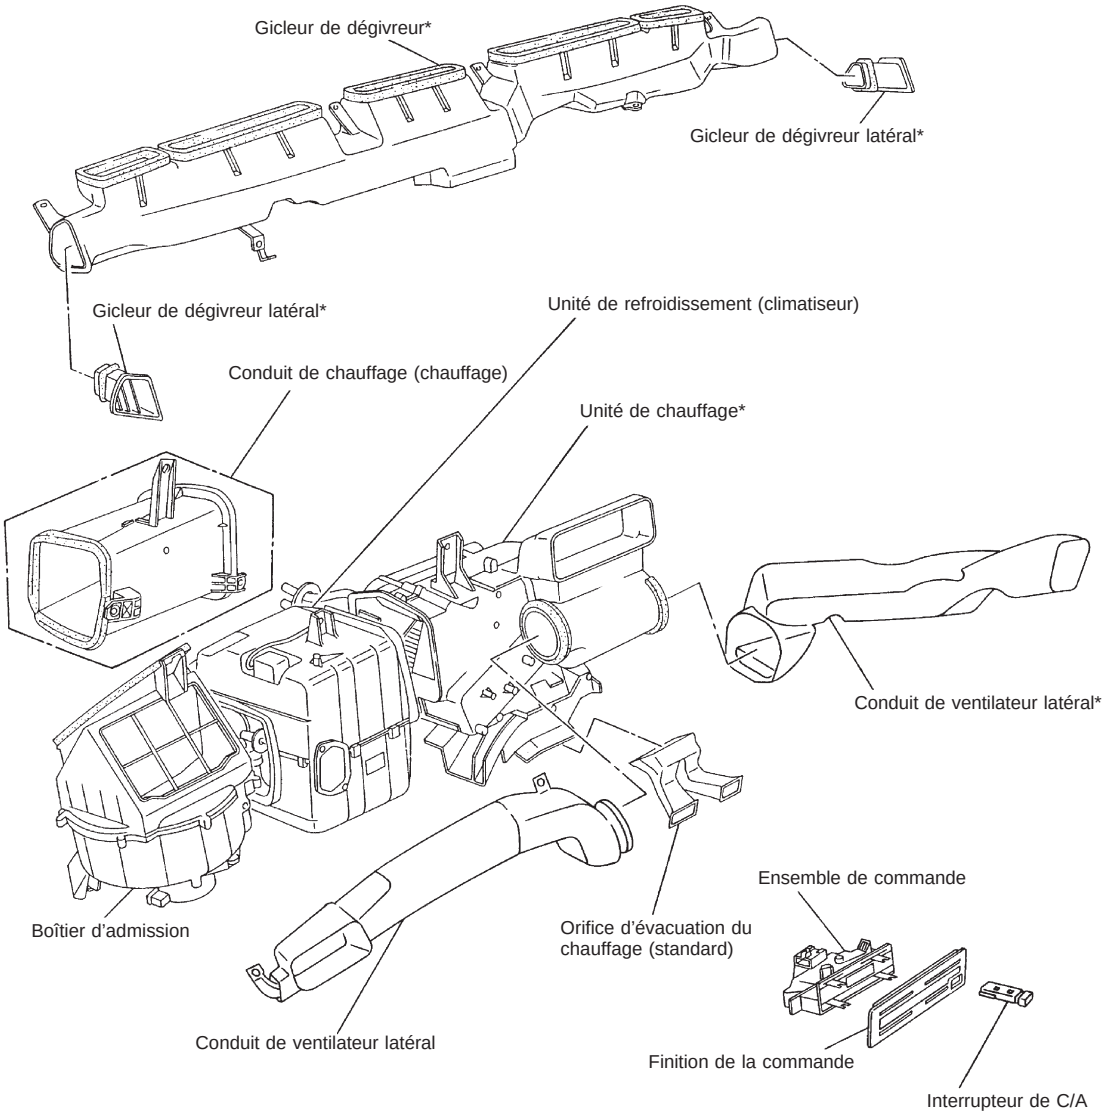
Le compresseur fonctionne selon un cycle de marche/arrêt pour maintenir la température de l'évaporateur dans une gamme spécifiée. Lorsque la température du serpentin de l'évaporateur chute au-dessous d'un certain point, l'amplificateur de commande thermique interrompt le fonctionnement du compresseur. Lorsque la température du serpentin de l'évaporateur dépasse la température spécifiée, l'amplificateur de commande thermique met le compresseur en marche.



PROTECTION DU SYSTEME DE REFRIGERANT

Manocontact triple

Le manocontact triple est situé sur le réservoir de liquide. Si la pression du système dépasse ou est inférieure aux spécifications, le manocontact s'ouvre pour interrompre le fonctionnement de l'embrayage de compresseur.



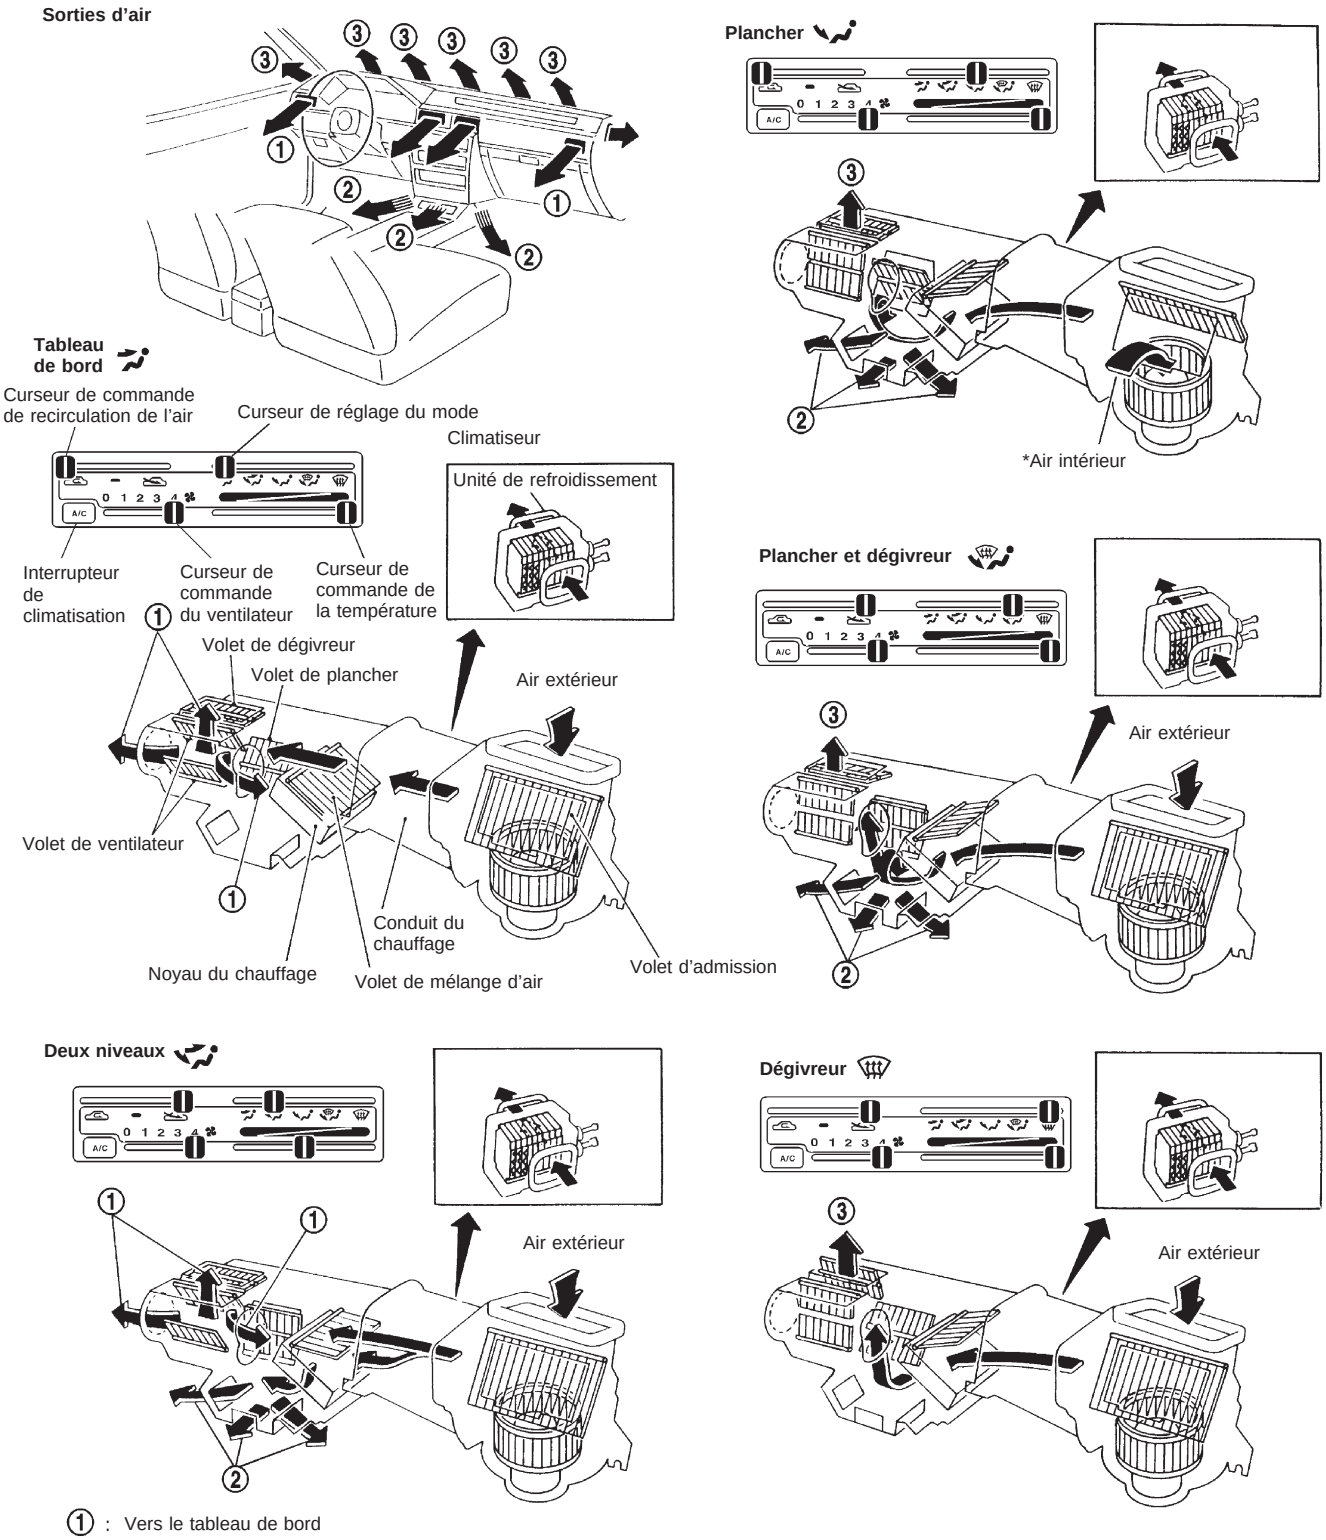
Bouchon fusible

Le bouchon s'ouvre lorsque la température dépasse 105°C, permettant ainsi la décharge du réfrigérant dans l'atmosphère. Si ce bouchon est fondu et ouvert, contrôler la canalisation de réfrigérant et remplacer le réservoir de liquide.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Disposition des composants

* : Pour la dépose, il est nécessaire de déposer l'ensemble des instruments de bord.



Cette illustration concerne les modèles avec conduite à droite.
La disposition pour les modèles avec conduite à gauche est symétriquement opposée.

Fonctionnement des commandes

CURSEUR DE COMMANDE DU VENTILATEUR

Ce curseur allume et éteint le ventilateur, et contrôle sa vitesse.

CURSEUR DE REGLAGE DU MODE

Ce curseur permet de sélectionner l'ouïe par laquelle l'air va sortir.

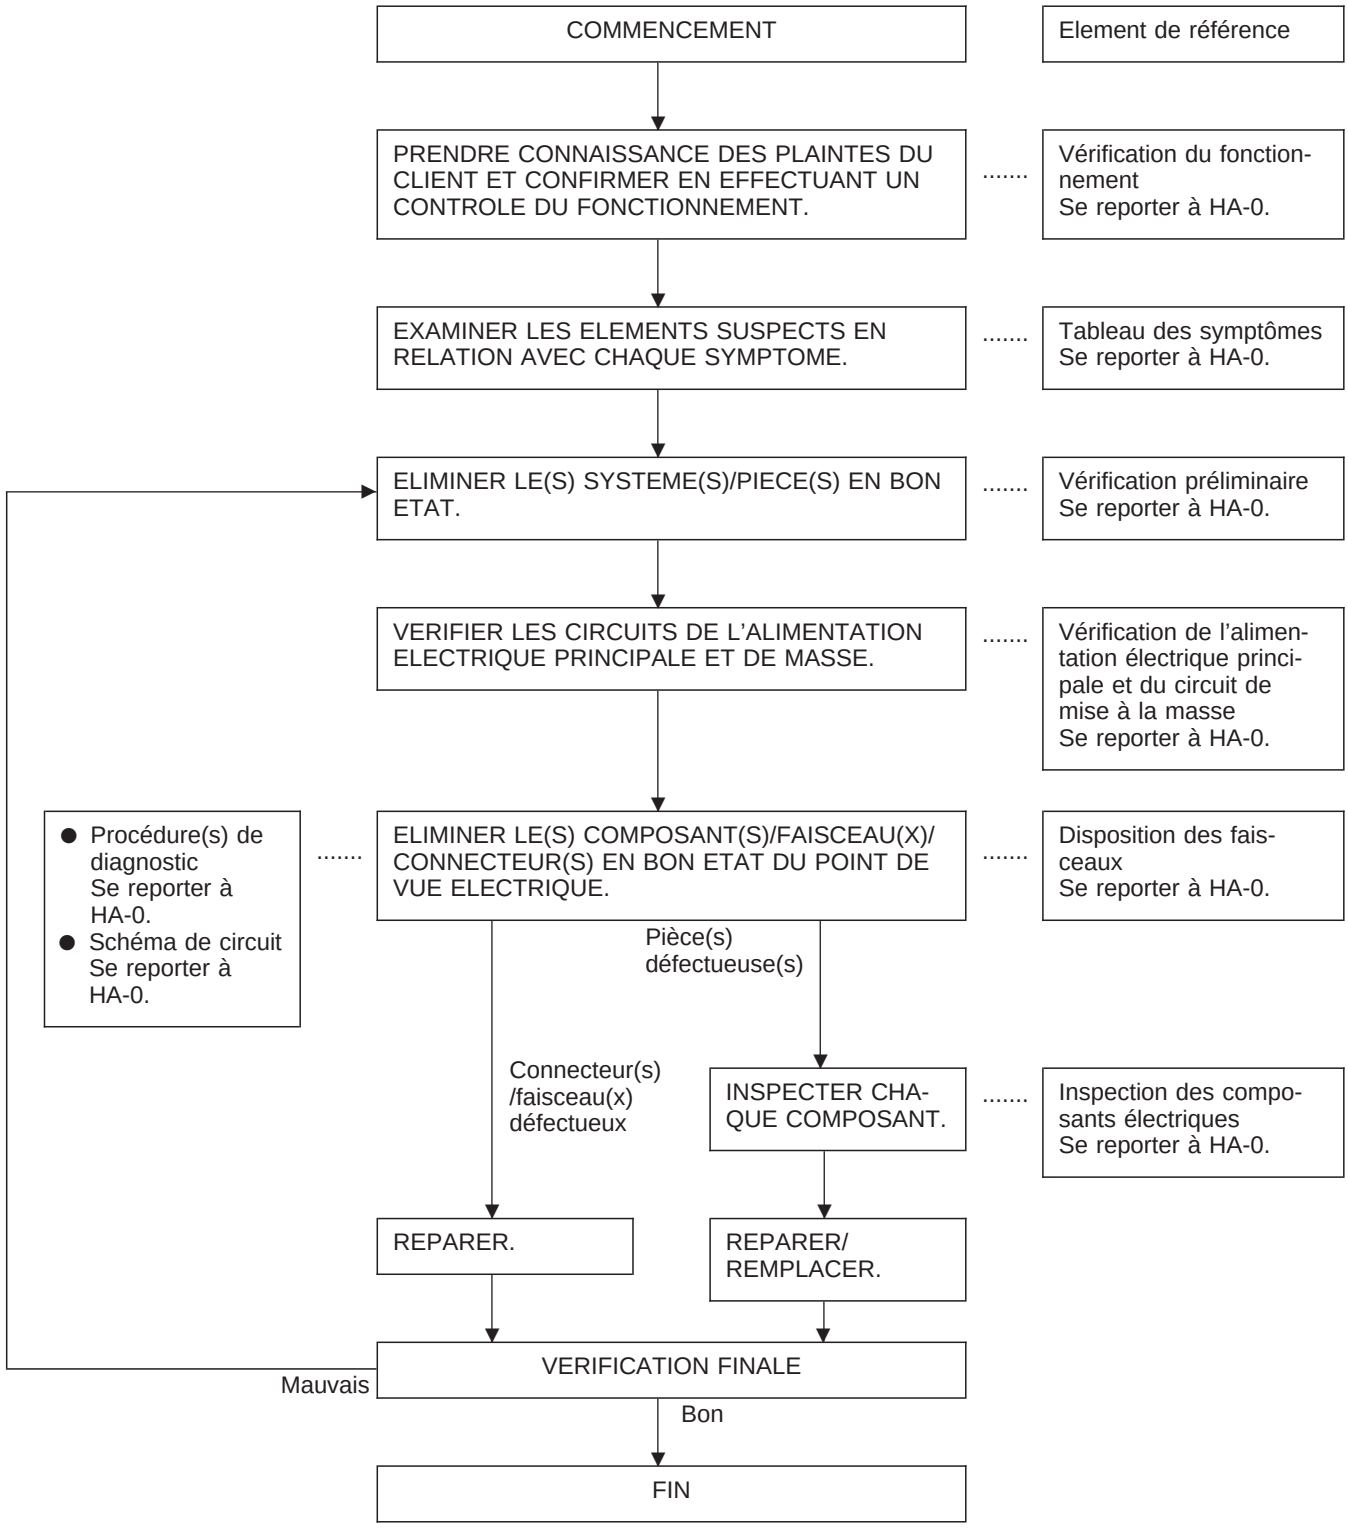
CURSEUR DE COMMANDE DE LA TEMPERATURE

Ce curseur permet de régler la température de l'air dans l'habitacle.

CURSEUR DE COMMANDE DE RECIRCULATION DE L'AIR

Position AIR FRAIS :
L'air extérieur est aspiré à l'intérieur du compartiment passager.
Position recirculation (REC) :
L'air intérieur circule à nouveau dans le véhicule.

INTERRUPTEUR DE CLIMATISATION



Cette touche commande le système de climatisation. Si la touche est enfoncée alors que le ventilateur est en marche, le compresseur sera activé. Le témoin s'allumera également.

La fonction de refroidissement d'air du climatiseur n'est effective que lorsque le moteur tourne.

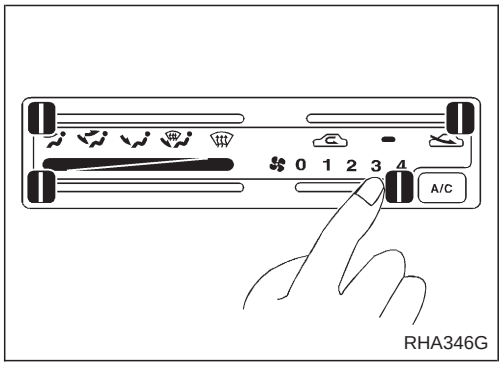
Comment effectuer un diagnostic des défauts permettant une réparation rapide et efficace

SCHEMA DE PRINCIPE



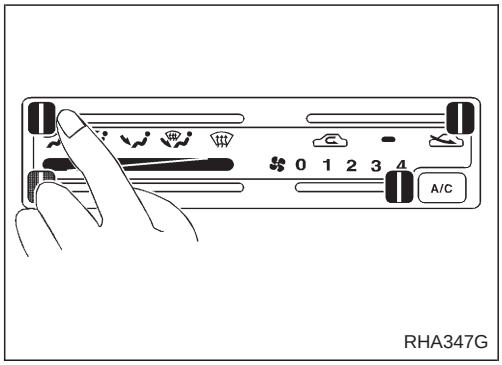
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Vérification du fonctionnement

L'objet du contrôle de fonctionnement est de confirmer que le système fonctionne correctement.

CONDITIONS :

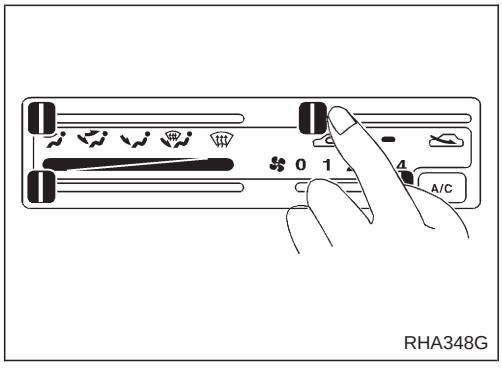
- **Moteur en marche à une température normale de fonctionnement.**



RHA346G

PROCEDURE :

1. Vérifier la soufflerie.

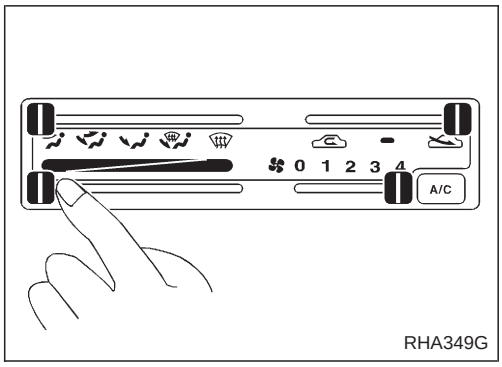


a. Amener le curseur de commande du ventilateur sur la 1ère vitesse.
   La soufflerie doit fonctionner en vitesse 1.
b. Amener le curseur de commande du ventilateur sur la 2ème vitesse et continuer de vérifier la vitesse de soufflerie jusqu'à ce que les quatre vitesses aient été vérifiées.
c. Laisser la soufflerie en vitesse 4.

RHA347G

2. Vérifier l'alimentation en air.

a. Amener le curseur de réglage du mode sur la position .
b. S'assurer que tout l'air alimenté sort par les ouïes au tableau de bord.
c. Amener le curseur de réglage du mode sur la position .
d. S'assurer que l'air alimenté sort par les ouïes au tableau de bord et au plancher.
e. Amener le curseur de réglage du mode sur la position .
f. S'assurer que l'air alimenté sort par les ouïes au plancher, avec un peu d'air s'échappant des ouïes du dégivreur.
g. Amener le curseur de réglage du mode sur la position .
h. S'assurer que l'air alimenté sort par les ouïes du plancher avec un peu d'air s'échappant des ouïes du dégivreur.
i. Amener le curseur de réglage du mode sur la position .
j. S'assurer que tout l'air alimenté sort par les ouïes du dégivreur.

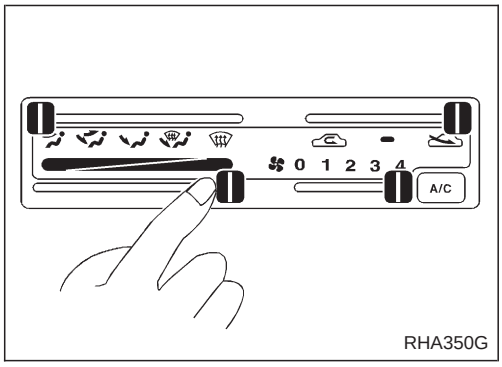


RHA348G

3. Vérifier la recirculation de l'air

a. Amener le curseur de commande de recirculation sur la position REC .
b. Etre attentif au changement de position du volet d'admission d'air (le bruit de la soufflerie doit se modifier légèrement).

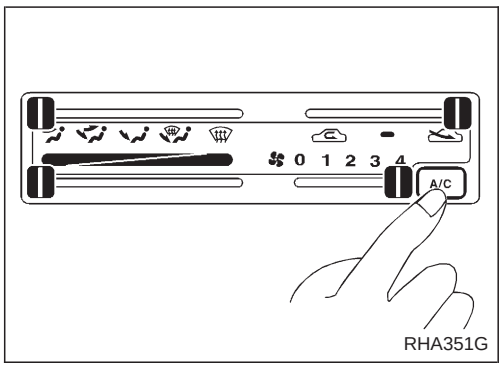
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com



Vérification du fonctionnement (Suite)

RHA349G

4. Vérifier la diminution de la température.



a. Amener le curseur de commande de la température sur la position froid maxi.
b. Vérifier la présence d'air froid aux ouïes de sortie d'air.

RHA350G

5. Vérifier l'augmentation de la température.

a. Amener le curseur de commande de la température sur la position chaud maxi.
b. Vérifier la présence d'air chaud aux ouïes de sortie d'air.

RHA351G

6. Vérifier l'interrupteur de climatisation.

Régler le curseur de commande du ventilateur sur la position désirée (1 à 4) et appuyer sur la touche de climatisation pour mettre en marche le climatiseur.
Le témoin s'allumera lorsque le climatiseur se met en marche.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Vérification préliminaire

VERIFICATION PRELIMINAIRE 1

Le climatiseur ne souffle pas d'air froid.

EST-CE QUE DE L'AIR SORT DES BOUCHES DE VENTILATION ?
Condition :
- Moteur en marche à température de fonctionnement.
- Le contact d'allumage, l'interrupteur de climatiseur et l'interrupteur de ventilateur sont sur MARCHE.
- Le curseur de réglage du mode est en position ''tableau de bord'' et le curseur de commande de la température est à la position de froid maxi.

Non → EST-CE QUE LE MOTEUR DE SOUFFLERIE FONCTIONNE NORMALEMENT ?

Oui → VERIFIER LA PRESENCE DE GEL SUR LE SERPENTIN DE L'EVAPORATEUR.
Déposer l'unité d'admission. Vérifier si l'évaporateur gèle.

Mauvais (Gel). → VERIFIER LE FONCTIONNEMENT DE L'AMPLI. DE COMMANDE THERMIQUE.
Se reporter à ''Inspection des composants électriques'', HA-0.

Bon (Pas de gel). → VERIFIER LE CONDUIT DE VENTILATION POUR DECELER TOUTE FUITE D'AIR.

Non → VERIFIER LE FONCTIONNEMENT DE LA SOUFFLERIE.
Passer à la **Procédure de diagnostic 1**, HA-0.

Oui → VERIFIER LE FONCTIONNEMENT DU COMPRESSEUR.

Mauvais → VERIFIER LA TENSION DE LA COURROIE DE COMPRESSEUR.
Se reporter à la section MA (''Vérification des courroies d'entraînement'', ''ENTRETIEN DU MOTEUR'').

Mauvais → Régler ou remplacer la courroie de compresseur.

Bon → VERIFIER LE REFRIGERANT.
Brancher le manomètre du collecteur, puis vérifier la pression du système.
Se reporter au ''Tableau de rendement'', HA-0.

Bon → Passer à la **Procédure de diagnostic 2,** HA-0.

Mauvais → RECHERCHER LES FUITES DE REFRIGERANT.

Bon → VERIFIER LA PRESSION DU CYCLE DE REFRIGERATION AVEC LE MANOMETRE A COLLECTEUR CONNECTE.
Se reporter au Tableau de rendement, HA-0.

Mauvais → Passer aux **Diagnostics de l'essai de rendement**, HA-0.

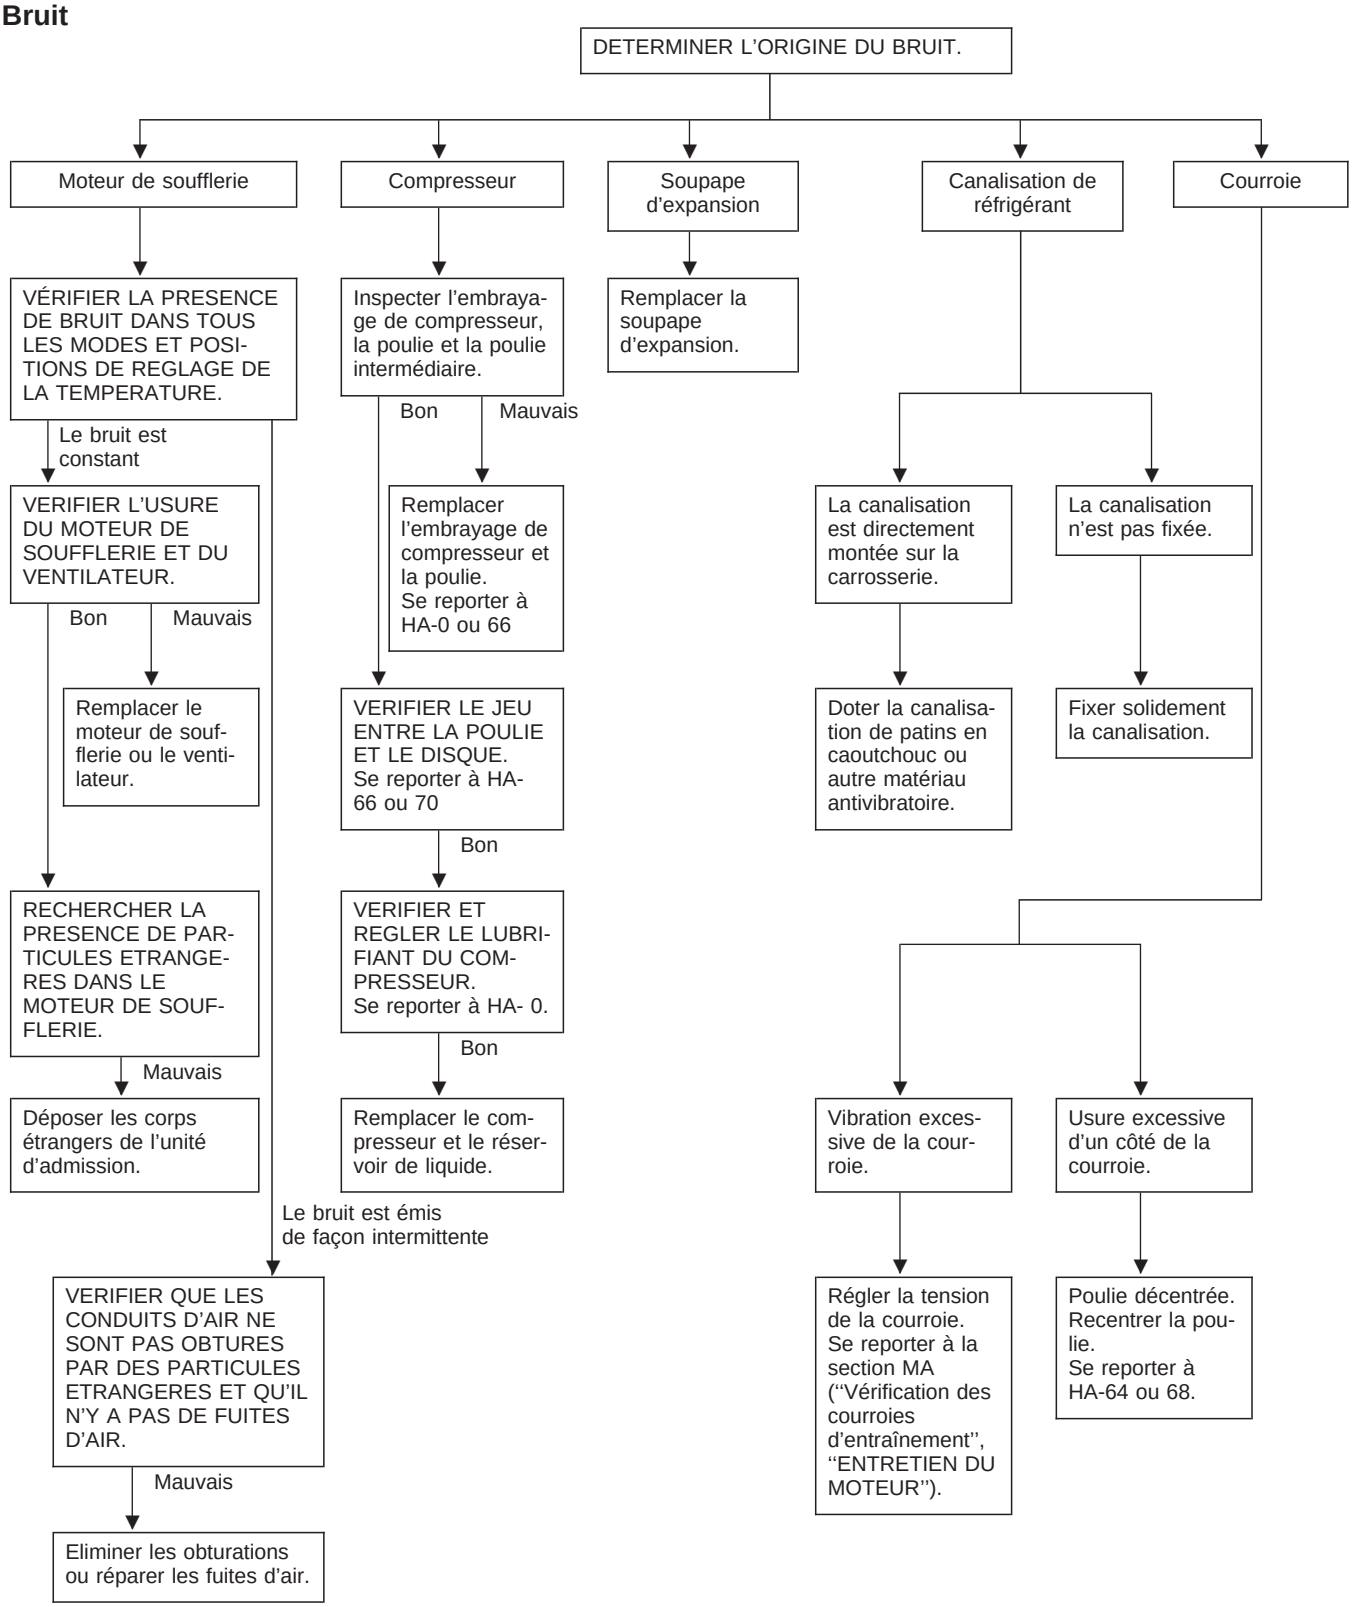
Bon → VERIFIER LE FONCTIONNEMENT DU ROBINET D'EAU.
Sauf pour les modèles avec conduite à droite
Chauffer le moteur avant vérification.
Se reporter à ''Réglage de la timonerie de commande'', HA-0.

Mauvais → Régler ou remplacer le robinet d'eau.

Bon → VERIFIER LE CABLE DE COMMANDE DE LA TEMPERATURE.
Se reporter à ''Réglage de la timonerie de commande'', HA-0.

Mauvais → Régler le câble de commande de la température.

Bon → INSPECTER VISUELLEMENT LE VOLET DE MELANGE D'AIR.
L'accès se fait en déposant le tableau de bord.



Mauvais → Remplacer le volet de mélange d'air.

Bon → VERIFIER LE FONCTIONNEMENT DE L'AMPLI. DE COMMANDE THERMIQUE.
Se reporter à ''Inspection des composants électriques'', HA-0.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

VERIFICATION PRELIMINAIRE 2

Bruit

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Vérification préliminaire (Suite)

VERIFICATION PRELIMINAIRE 3

Chauffage insuffisant

L'AIR SORT-IL DES AERATEURS DU PLANCHER ?
Condition :
- Véhicule à température de fonctionnement.
- Le contact d'allumage et l'interrupteur de ventilateur sont mis sur ''ON''.
- Le curseur de réglage du mode est sur ''plancher'' et le curseur de commande de la température est sur la position de chaud maxi.

Non → VERIFIER LE FONCTIONNEMENT DU MOTEUR DE SOUFFLERIE. Passer à la **Procédure de diagnostic 1**, HA-0.

Oui ↓

Vérifier les points suivants :
- Niveau de réfrigérant. Se reporter à la section MA.
- Présence de fuites ou de noeuds sur les flexibles.
- Bouchon de radiateur. Se reporter à la section LC (''CIRCUIT DE REFROIDISSEMENT DU MOTEUR'').
- Air dans le système de refroidissement.

Mauvais → Réparer ou remplacer si nécessaire.

Bon ↓

VERIFIER LE FONCTIONNEMENT DU ROBINET D'EAU.
Sauf pour les modèles avec conduite à droite
Chauffer le moteur avant la vérification.
Se reporter à ''Réglage de la timonerie de commande'', HA-0.

Mauvais → Régler ou remplacer le robinet d'eau.

Bon ↓

VERIFIER LE CABLE DE COMMANDE DE LA TEMPERATURE.
Se reporter à ''Réglage de la timonerie de commande'', HA-0.

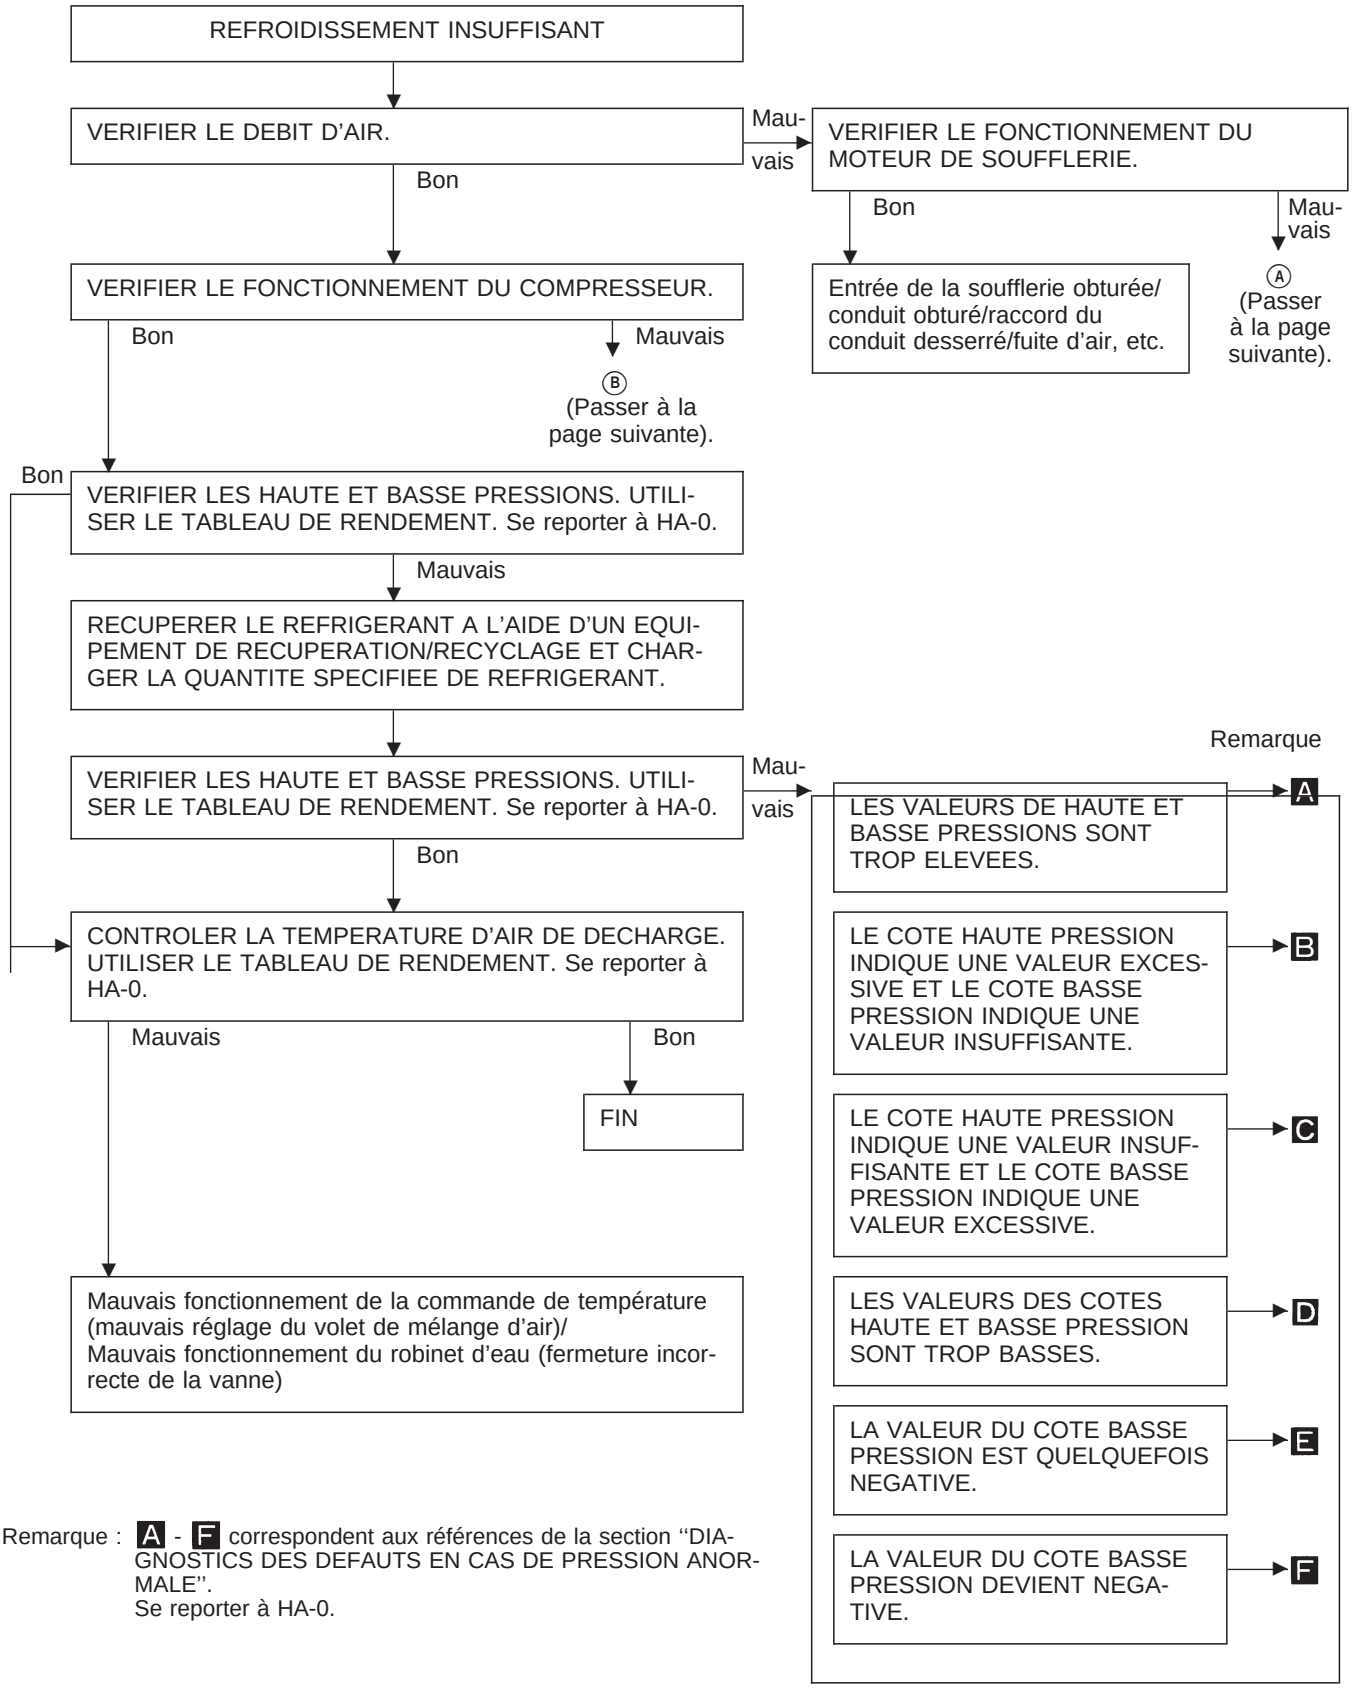
Mauvais → Régler le câble de commande de la température.

Bon ↓

INSPECTER VISUELLEMENT LE VOLET DE MELANGE D'AIR.
L'accès se fait en déposant le tableau de bord.

Mauvais → Remplacer le volet de mélange d'air.

Bon ↓



VERIFIER AU TOUCHER LES FLEXIBLES D'ENTREE ET DE SORTIE DU CHAUFFAGE.

- Les deux flexibles sont froids → VERIFIER L'INSTALLATION DU THERMOSTAT.
  - Bon → Remplacer le thermostat. Se reporter à la section LC (''Thermostat'', ''CIRCUIT DE REFROIDISSEMENT DU MOTEUR'').
- Les deux flexibles sont chauds → VERIFIER QUE LES FLEXIBLES DE CHAUFFAGE SONT CORRECTEMENT INSTALLES.
  - Bon → Purger le noyau de chauffage, vidanger et remplir avec du réfrigérant. Effectuer un nouvel essai.
    - Entrée très chaude, Sortie chaude → Le système est BON
    - Les deux flexibles sont chauds → Remplacer le noyau du chauffage.

Diagnostics de l'essai de rendement

REFROIDISSEMENT INSUFFISANT

Remarque : A - F correspondent aux références de la section ''DIAGNOSTICS DES DEFAUTS EN CAS DE PRESSION ANORMALE''.
Se reporter à HA-0.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Ⓐ

- Ventilateur de moteur de soufflerie défectueux
  - Ventilateur desserré/ventilateur et carter mal connectés/ventilateur déformé.
- Circuit électrique défectueux.
  - Câblage ou circuits des composants rompus, ou mauvaise connexion/défaut de résistance ou d'amplificateur, etc. /Fusible grillé ou tension faible de la batterie.
- Circuit interne du moteur de soufflerie défectueux.

Ⓑ

- L'embrayage magnétique ne s'enclenche pas.
  - VERIFIER L'EMBRAYAGE MAGNETIQUE.
    Inspecter le circuit de la bobine et le jeu entre le disque et la poulie.
  - VERIFIER LE CIRCUIT ELECTRIQUE.
    Inspecter le circuit de câblage et des composants.
  - VERIFIER L'ACTIVATION DES DISPOSITIFS DE SECURITE/ PROTECTION. Inspecter les dispositifs tels que le manocontact etc.
- Glissement de l'embrayage magnétique.
  - Mauvais fonctionnement des pièces internes de l'embrayage, du compresseur.
  - Présence de particules extérieures sur la surface de frottement de l'embrayage ou jeu excessif au disque.
  - Circuit électrique défectueux (mauvaise connexion, tension insuffisante de la batterie, etc.).
- Glissement de la courroie.
  - CONTROLER LA COURROIE DE COMPRESSEUR ET SA TENSION. Se reporter à la section MA (''Vérification des courroies d'entraînement'', ''ENTRETIEN DU MOTEUR'').

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Tableau de rendement

CONDITION D'ESSAI

L'essai doit être effectué comme suit :

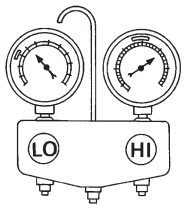
Emplacement du véhicule : A l'intérieur ou à l'ombre (dans un local bien aéré)
Portes : Fermées
Vitres de porte : Ouvertes
Capot : Ouvert
Réglage de la TEMP. : FROID maxi.
Alimentation en air : OUIE DE TABLEAU DE BORD
Position du levier d'ADMISSION : (Recyclage)
Vitesse du VENTILATEUR : 4ème vitesse
Régime du moteur : 1 500 tr/mn

Faire fonctionner le système de climatisation pendant 10 minutes avant d'effectuer les mesures.

INTERPRETATION DES RESULTATS DE L'ESSAI

Tableau des températures d'air de recirculation et d'air débité

Air intérieur (air de recirculation) à l'entrée de l'ensemble de soufflerie		Température d'air débité par l'ouïe d'aération centrale °C
Humidité relative %	Température d'air °C	
50 - 60	20	6,6 - 9,4
	25	9,6 - 11,8
	30	13,5 - 16,5
	35	17,5 - 21,2
	40	21,4 - 25,9
60 - 70	20	9,4 - 11,2
	25	11,8 - 14,1
	30	16,5 - 19,5
	35	21,2 - 24,9
	40	25,9 - 30,3



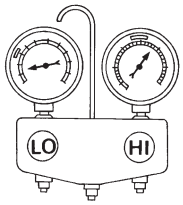


Tableau des pressions de fonctionnement par rapport aux températures d'air ambiant.

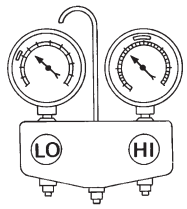
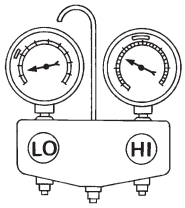
Air ambiant		Haute pression (côté décharge) kPa (bar, kg/cm^2)	Basse pression (côté aspiration) kPa (bar, kg/cm^2)
Humidité relative %	Température d'air °C		
50 - 70	20	971 - 1 187 (9,71 - 11,87, 9,9 - 12,1)	59 - 69 (0,59 - 0,69, 0,6 - 0,7)
	25	991 - 1 206 (9,91 - 12,06, 10,1 - 12,3)	69 - 78 (0,69 - 0,78, 0,7 - 0,8)
	30	1 187 - 1 442 (11,87 - 14,42, 12,1 - 14,7)	88 - 108 (0,88 - 1,08, 0,9 - 1,1)
	35	1 402 - 1 716 (14,02 - 17,16, 14,3 - 17,5)	108 - 127 (1,08 - 1,27, 1,1 - 1,3)
	40	1 628 - 1 981 (16,28 - 19,81, 16,6 - 20,2)	127 - 157 (1,27 - 1,57, 1,3 - 1,6)

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

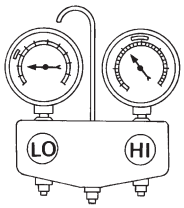


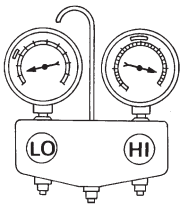


Diagnostics des défauts en cas de pression anormale

Lorsque la pression du côté haute ou basse pression du circuit est anormale, effectuer un diagnostic à l'aide d'une rampe manométrique. La marque située au dessus de la graduation de la rampe dans le tableau suivant indique la pression standard (normale). Toutefois, comme la pression standard (normale) varie d'un véhicule à l'autre, se reporter à la page HA-28 (tableau des pressions de fonctionnement par rapport aux températures d'air ambiant).

Indication du manomètre	Cycle du réfrigérant	Cause probable	Mesure à prendre
Les valeurs des haute et basse pressions sont trop élevées. A  AC359A	● La pression baisse immédiatement après que de l'eau est projetée sur le condenseur.	Charge excessive de réfrigérant dans le cycle de réfrigération.	Réduire la quantité de réfrigérant jusqu'à obtention de la pression spécifiée.
	L'aspiration d'air par le ventilateur de refroidissement est insuffisante.	Fonction de refroidissement insuffisante du condenseur. ↓ ① Les ailettes du condenseur sont obstruées. ② Mauvaise rotation du ventilateur de refroidissement.	● Nettoyer le condenseur. ● Vérifier et réparer le ventilateur de refroidissement si nécessaire.
	● Le tuyau basse pression n'est pas froid. ● Lorsque le compresseur est arrêté, la haute pression diminue jusqu'à une valeur d'environ 196 kPa (2,0 bar, 2 kg/cm^2). Après quoi elle descend progressivement.	Mauvais échange de chaleur dans le condenseur. (après l'arrêt du compresseur, la haute pression baisse trop lentement). ↓ Air dans le circuit de réfrigération.	Purger et recharger le système à plusieurs reprises.
	Le moteur tend à surchauffer.	Défaut des systèmes de refroidissement du moteur.	Vérifier et réparer chaque système de refroidissement du moteur.
	● Une section du tuyau basse pression est plus froide que les sections proches de la sortie de l'évaporateur. ● Les plateaux sont parfois recouverts de givre.	● Trop de réfrigérant liquide du côté basse pression ● Débit de délestage de réfrigérant trop important. ● La soupape d'expansion s'ouvre à peine comparé à la spécification. ↓ ① Installation incorrecte de la vanne thermique. ② Mauvais réglage de la soupape d'expansion.	Remplacer la soupape d'expansion.
Le côté haute pression indique une valeur excessive et le côté basse pression indique une valeur insuffisante. B  AC360A	La partie supérieure du condenseur et le côté haute pression sont chauds alors que le réservoir de liquide n'est pas aussi chaud.	Le tube haute pression ou les pièces situées entre le compresseur et le condenseur sont colmatés ou écrasés.	● Vérifier et réparer ou remplacer les pièces défectueuses. ● Vérifier que le lubrifiant n'est pas contaminé.

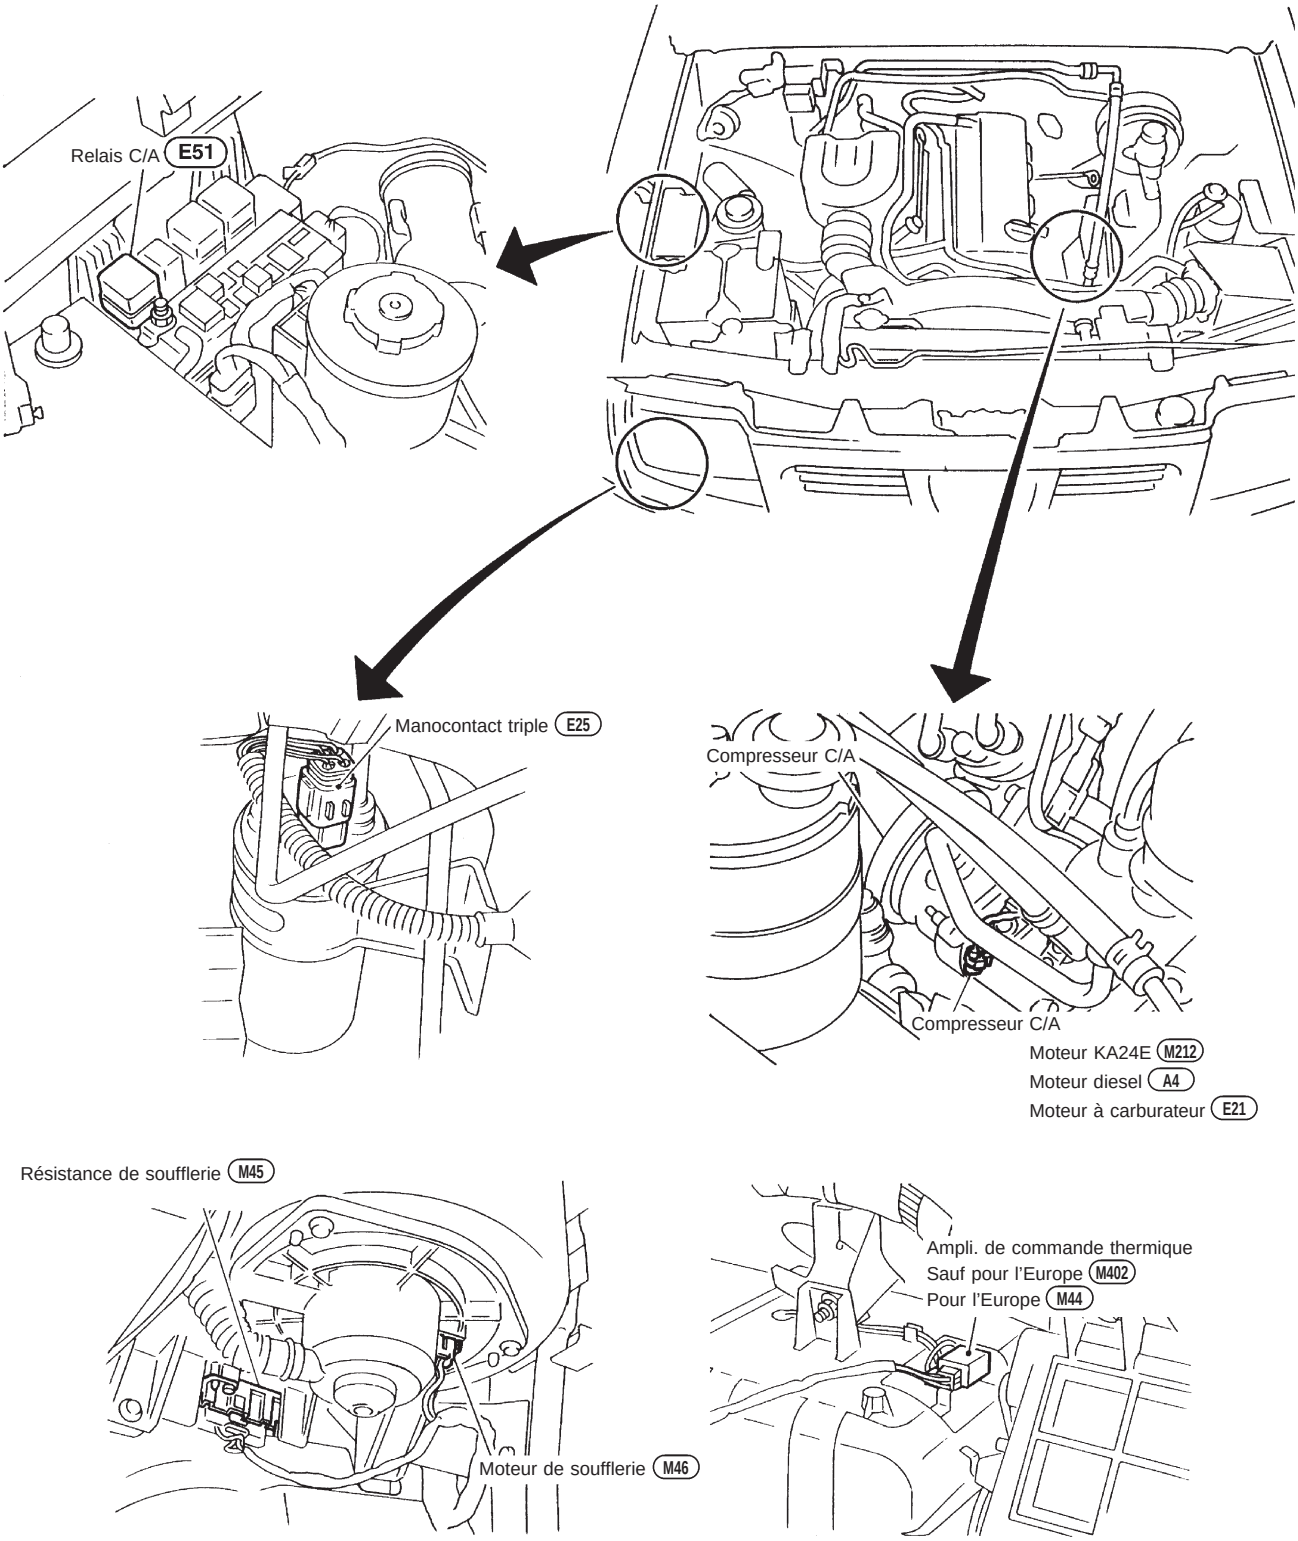




Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostics des défauts en cas de pression anormale (Suite)

Indication du manomètre	Cycle du réfrigérant	Cause probable	Mesure à prendre
Le côté haute pression indique une valeur insuffisante et le côté basse pression indique une valeur excessive. C  AC356A	Les côtés haute et basse pression s'égalisent peu après l'arrêt du compresseur.	Le fonctionnement de la pression du compresseur est mauvais. ↓ Dommages à l'intérieur de la garniture de compresseur.	Remplacer le compresseur.
	Pas de différence de température entre les côtés haute et basse pression.	Le fonctionnement de la pression du compresseur est mauvais. ↓ Dommages à l'intérieur de la garniture de compresseur.	Remplacer le compresseur.
Les valeurs des côtés haute et basse pression sont trop basses. D  AC353A	● Il y a une grande différence de température entre la sortie et l'admission du récepteur-séchoir. La température de sortie est extrêmement basse. ● L'admission du réservoir de liquide et la soupape d'expansion sont givrées.	L'intérieur du réservoir de liquide est partiellement colmaté.	● Remplacer le réservoir de liquide. ● Vérifier que le lubrifiant n'est pas contaminé.
	● La température à l'admission de la soupape d'expansion est extrêmement basse en comparaison avec les zones à proximité du réservoir de liquide. ● L'entrée de la soupape d'expansion peut être givrée. ● Des différences de température se produisent quelque part du côté haute pression.	Le tuyau haute pression situé entre le réservoir de liquide et la soupape d'expansion est bouché.	● Vérifier et réparer les pièces défectueuses. ● Vérifier que le lubrifiant n'est pas contaminé.
	● La soupape d'expansion et le réservoir de liquide sont chauds ou juste refroidis lorsqu'on les touche.	Charge de réfrigérant basse. ↓ Fuite des raccords ou composants.	Vérifier que le réfrigérant ne présente pas de fuites. Se reporter à ''Vérification des fuites de réfrigérant'', HA-0.
	Il y a une grande différence de température entre l'admission et la sortie de la soupape d'expansion alors que la soupape elle-même est givrée.	La soupape d'expansion se ferme à peine, comparé à la spécification. ↓ ① Mauvais réglage de la soupape d'expansion. ② Mauvais fonctionnement de la vanne thermique ③ La sortie et l'admission peuvent être bouchées.	● Retirer les corps étrangers à l'air comprimé. ● Vérifier que le lubrifiant n'est pas contaminé.
	Une section du tuyau basse pression est plus froide que les sections proches de la sortie de l'évaporateur.	Le tuyau basse pression est bouché ou écrasé.	● Vérifier et réparer les pièces défectueuses. ● Vérifier que le lubrifiant n'est pas contaminé.
	Le débit d'air est insuffisant ou trop faible.	Le fonctionnement de la pression du compresseur est mauvais.	Remplacer le compresseur.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Diagnostics des défauts en cas de pression anormale (Suite)

Indication du manomètre	Cycle du réfrigérant	Cause probable	Mesure à prendre
La valeur du côté basse pression est quelquefois négative. E  AC354A	● Le système de climatiseur ne fonctionne pas et ne refroidit pas l'air du compartiment de façon cyclique. ● Le système fonctionne de façon continue pendant un certain laps de temps après l'arrêt et le redémarrage du compresseur.	Le réfrigérant n'est pas délesté périodiquement. ↓ L'humidité a givré l'entrée et la sortie de la soupape d'expansion. ↓ De l'eau est mélangée au réfrigérant.	● Purger l'eau du réfrigérant ou remplacer le réfrigérant. ● Remplacer le réservoir de liquide.
La valeur du côté basse pression devient négative. F  AC362A	Le réservoir de liquide ou l'avant/l'arrière du tuyau de la soupape d'expansion est gelé ou couvert de buée.	Le côté haute pression est fermé et le réfrigérant ne circule pas. ↓ La soupape d'expansion ou le réservoir de liquide a givré.	Laisser le système reposer. Le mettre à nouveau en marche pour vérifier si le problème est lié à la présence d'eau ou de particules étrangères. ● Si le problème est dû à l'eau, le refroidissement initial s'effectue correctement. L'eau gèle ensuite et bloque le tuyau. Purger l'eau du réfrigérant ou remplacer le réfrigérant. ● Si le problème est dû à la présence de particules étrangères, déposer la soupape d'expansion et retirer les particules à l'air comprimé sec. ● Si aucune des méthodes indiquées ci-dessus ne résout le problème, remplacer la soupape d'expansion. ● Remplacer le réservoir de liquide. ● Vérifier que le lubrifiant n'est pas contaminé.

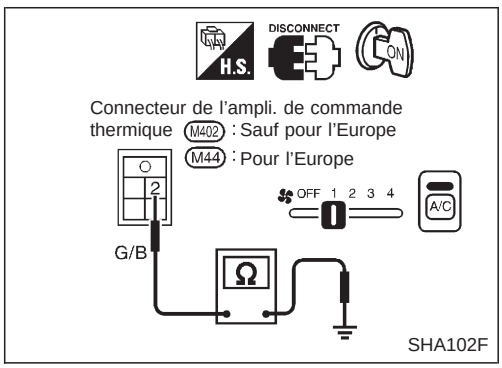
Vérification de l'alimentation électrique principale et du circuit de mise à la masse

VERIFICATION DU FUSIBLE DE L'ALIMENTATION ELECTRIQUE DU SYSTEME DE C/A

Vérifier les fusibles suivants.

- Fusible de 15A (n° 19 et 20) du moteur de soufflerie.
- Fusible de 7,5A (n° 21) de l'ampli. de commande thermique.

Pour de plus amples détails sur le circuit, se reporter au ''Schéma de câblage''.



VERIFICATION DE L'AMPLI. DE COMMANDE THERMIQUE

Vérification du circuit d'alimentation électrique

Vérifier le circuit d'alimentation électrique de l'ampli. de commande thermique lorsque le contact d'allumage est sur ''ON''.

1. Débrancher le connecteur de faisceau de l'ampli. de commande thermique.
2. Brancher le voltmètre du côté faisceau.
3. Mesurer la tension à travers la borne ① et la masse de carrosserie.

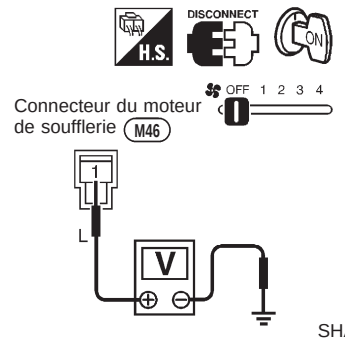
Borne du voltmètre		Tension
⊕	⊖	
①	Masse de carrosserie	Environ 12V

Vérification du circuit de mise à la masse

Vérifier le circuit de mise à la masse de la carrosserie de l'ampli. de commande thermique avec le contact d'allumage sur ''ON'' et les interrupteurs de climatiseur et de ventilateur sur MARCHE.

1. Débrancher le connecteur de faisceau de l'ampli. de commande thermique.
2. Brancher l'ohmmètre du côté faisceau.
3. Vérifier la continuité entre la borne ② et la masse de carrosserie.

Borne d'ohmmètre		Continuité
⊕	⊖	
②	Masse de carrosserie	Oui



Si le circuit de mise à la masse ne fonctionne pas correctement, vérifier les points suivants.

- Interrupteur de climatiseur (se reporter à HA-0).
- Commutateur de ventilateur (se reporter à HA-0).
- Faisceau ouvert ou court-circuit entre l'ampli. de commande thermique et l'interrupteur de climatiseur
- Faisceau ouvert ou court-circuit entre les interrupteurs de climatiseur et de ventilateur
- Circuit de mise à la masse de l'interrupteur de ventilateur

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

	PANNE	N° d'organigramme

Procédure de diagnostic 1

SYMPTOME : le moteur de soufflerie ne tourne pas.

- **Effectuer la VERIFICATION PRELIMINAIRE 1 avant de se reporter à l'organigramme suivant.**

Vérifier si le moteur de soufflerie tourne correctement à chaque vitesse du ventilateur.
Effectuer les vérifications dans l'ordre indiqué à gauche.

5 → Ⓔ
4 → Ⓓ
3 → Ⓒ
2 → Ⓑ

(Passer à la page suivante).

A — 1

VERIFIER L'ALIMENTATION ELECTRIQUE DU MOTEUR DE SOUFFLERIE.
Débrancher le connecteur de faisceau du moteur de soufflerie.
Y a-t-il une tension d'environ 12 V entre la borne ① du faisceau de moteur de soufflerie et la masse de carrosserie ?

Non → Vérifier les fusibles de 15A (n° 19 et n° 20, situés dans le boîtier à fusibles). (se reporter à "DISPOSITION DE L'ALIMENTATION ELECTRIQUE" dans la section EL et à son schéma de câblage).

Oui ↓

B

1. Déplacer le curseur de commande du ventilateur sur n'importe quelle position exceptée la position ARRET.
2. Vérifier la continuité du circuit entre la borne ② du faisceau de moteur de soufflerie et la masse de carrosserie.
   Il doit y avoir continuité.

Mauvais → Rebrancher le connecteur de faisceau du moteur de soufflerie.

Bon ↓

VERIFIER LE MOTEUR DE SOUFFLERIE.
(Se reporter à Inspection des composants électriques) (HA-45).

Mauvais ↓

Remplacer le moteur de soufflerie.

C

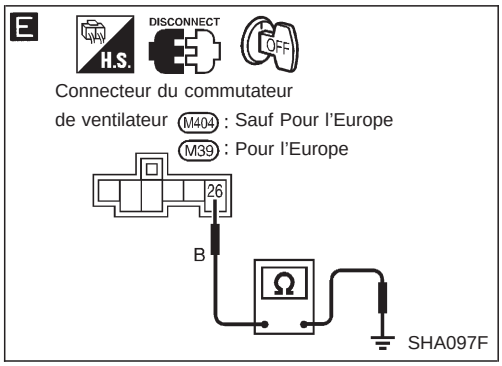
VERIFIER LE CIRCUIT DU MOTEUR DE SOUFFLERIE ENTRE LE MOTEUR DE SOUFFLERIE ET LA RESISTANCE.
Y a-t-il une tension d'environ 12 V entre la borne ① du faisceau de la résistance et la masse de carrosserie ?

Non → Débrancher les connecteurs de faisceau du moteur de soufflerie et de la résistance.

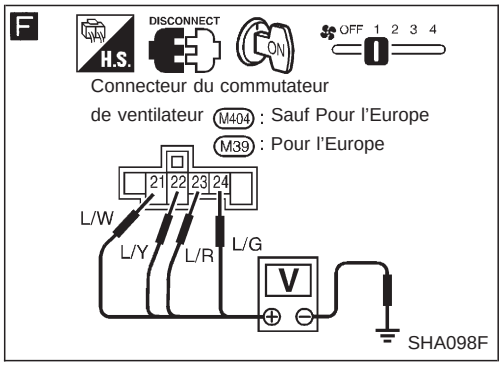
Oui ↓

Débrancher le connecteur de faisceau de l'interrupteur de ventilateur.

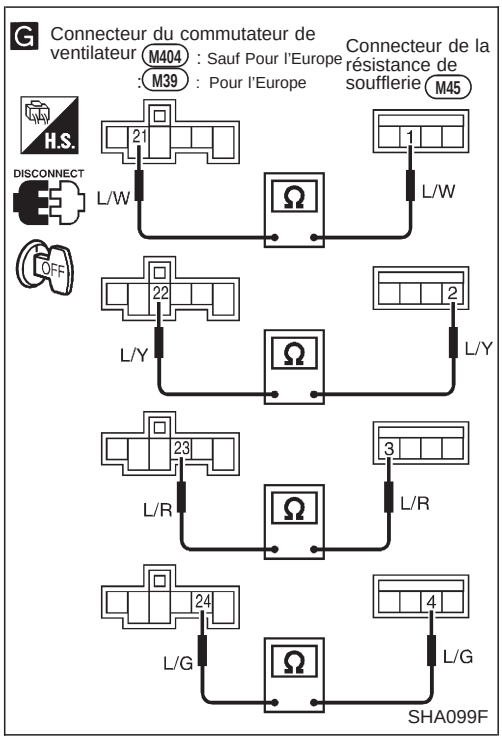
Ⓐ
(Passer à la page suivante).



D — Note



Vérifier la continuité du circuit entre la borne ② du faisceau de moteur de soufflerie et la borne ① du faisceau de résistance.
Il doit y avoir continuité.
Si le résultat est satisfaisant, vérifier que le faisceau n'est pas court-circuité.



Note :
Si le résultat est mauvais après vérification de la continuité du circuit, réparer le faisceau ou le connecteur.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic 1 (Suite)

Ⓐ

E

Note

VERIFIER LE CIRCUIT DE MASSE DE L'INTERRUPTEUR DE VENTILATEUR.
Vérifier la continuité du circuit entre la borne Ⓐ26 du faisceau de commutateur de ventilateur et la masse de carrosserie.

Bon

VERIFIER LA RESISTANCE DE SOUFFLERIE APRES L'AVOIR DEBRANCHEE.
(Se reporter à Inspection des composants électriques) (HA-0).

2 → Ⓑ
3 → Ⓒ
4 → Ⓓ

Bon

Mauvais

Remplacer la résistance.

Ⓔ

Rebrancher le connecteur de faisceau de la résistance.

1 2 3 4 5

F

VERIFIER LE CIRCUIT DE L'INTERRUPTEUR DE VENTILATEUR.
Y a-t-il une tension d'environ 12 V entre chaque borne du faisceau de commutateur de ventilateur et la masse de carrosserie ?

N° d'organigramme	N° de borne (+)	N° de borne (-)	Tension
2	Ⓐ24	Masse de carrosserie	Environ 12V
3	Ⓐ23		
4	Ⓐ22		
5	Ⓐ21		

Oui

Non

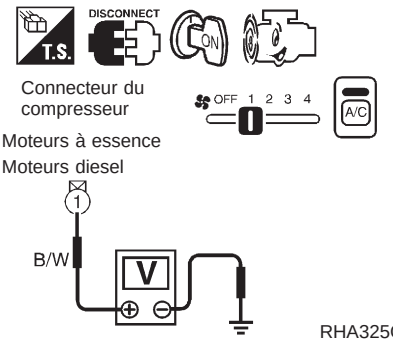
G

Note

Vérifier la continuité du circuit entre la borne du faisceau de commutateur de ventilateur et la borne du faisceau de résistance.

N° de borne		Continuité
Commutateur de ventilateur	Résistance	
Ⓐ21	Ⓑ1	Oui
Ⓐ22	Ⓑ2	
Ⓐ23	Ⓑ3	
Ⓐ24	Ⓑ4	

Si le résultat est satisfaisant, vérifier que le faisceau n'est pas court-circuité.



DEBRANCHER LE COMMUTATEUR DE VENTILATEUR ET LE VERIFIER.
(Se reporter à Inspection des composants électriques) (HA-0).

Mauvais → Remplacer le commutateur de ventilateur.

Remarque :
Si le résultat est mauvais après vérification de la continuité du circuit, réparer le faisceau ou le connecteur.

SAUF POUR LES MOTEURS KA

SYMPTOME : L'embrayage magnétique ne s'enclenche pas lorsque l'interrupteurs de climatiseur et le commutateur de ventilateur sont enclenchés.

- **Effectuer la VERIFICATION PRELIMINAIRE 1 avant de se reporter à l'organigramme suivant.**

A

VERIFIER L'ALIMENTATION ELECTRIQUE DU COMPRESSEUR.
Débrancher le connecteur de faisceau du compresseur.
Y a-t-il une tension d'environ 12 V entre la borne (1) du faisceau de compresseur et la masse de carrosserie ?

Oui → Vérifier les points suivants.
- Bobine d'embrayage magnétique
- Protecteur thermique (sauf pour le Moyen-Orient)

Mauvais → Remplacer l'embrayage magnétique. Se reporter à HA-0.

Non ↓

B Note

Vérifier la continuité du circuit entre la borne (5) du faisceau de relais de climatiseur et la borne (1) du faisceau de compresseur.
Il doit y avoir continuité.
Si le résultat est satisfaisant, vérifier que le faisceau n'est pas court-circuité.

Bon ↓

C

VERIFIER L'ALIMENTATION ELECTRIQUE DU RELAIS DE CLIMATISEUR.
Y a-t-il une tension d'environ 12 V entre la borne (3) du faisceau de relais de climatiseur et la masse de carrosserie ?

Non → Vérifier le circuit de l'alimentation électrique et le fusible de 7,5A (n° 21, situé dans le boîtier à fusibles). (se reporter à "DISPOSITION DE L'ALIMENTATION ELECTRIQUE" dans la section EL et à son schéma de câblage).

Oui ↓

D

VERIFIER L'ALIMENTATION ELECTRIQUE DU RELAIS DE CLIMATISEUR.
Y a-t-il une tension d'environ 12 V entre la borne (1) du faisceau de relais de climatiseur et la masse de carrosserie ?

Oui → Vérifier le circuit de l'alimentation électrique et le fusible de 7,5A (n° 21, situé dans le boîtier à fusibles). (se reporter à "DISPOSITION DE L'ALIMENTATION ELECTRIQUE" dans la section EL et à son schéma de câblage).

Non ↓

VERIFIER LE RELAIS DE CLIMATISEUR APRES L'AVOIR DEBRANCHE.
Se reporter à HA-0.

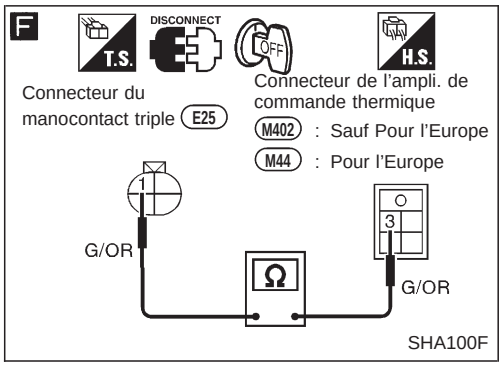
Mauvais → Remplacer le relais de climatiseur.

Bon ↓

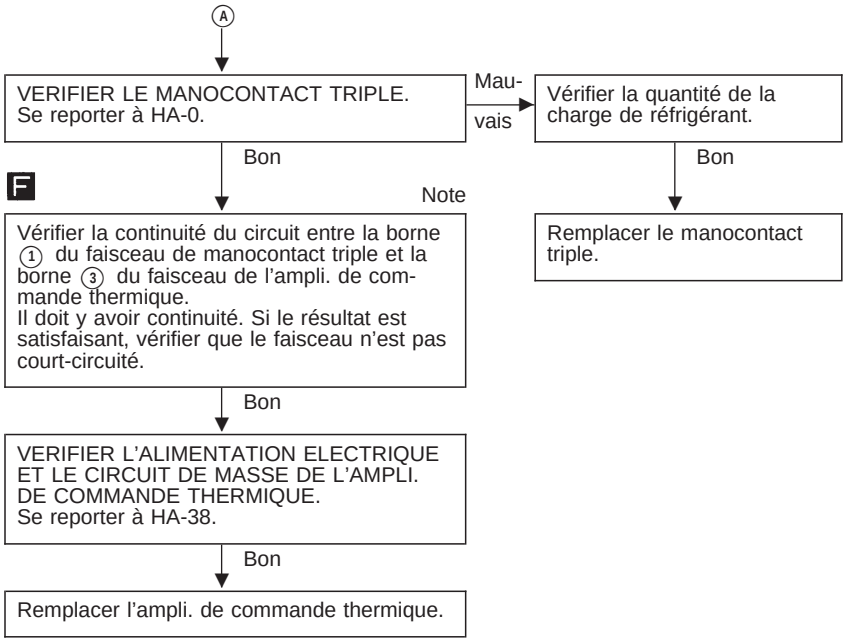
Rebrancher le relais de climatiseur.

E Note

Vérifier la continuité du circuit entre la borne (2) du faisceau de relais C/A et la borne (4) du faisceau de manocontact triple.
Il doit y avoir continuité.
Si le résultat est satisfaisant, vérifier que le faisceau n'est pas court-circuité.



Bon ↓



(A) (Passer à la page suivante).

Remarque :
Si le résultat est mauvais après vérification de la continuité du circuit, réparer le faisceau ou le connecteur.

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Procédure de diagnostic 2 (Suite)

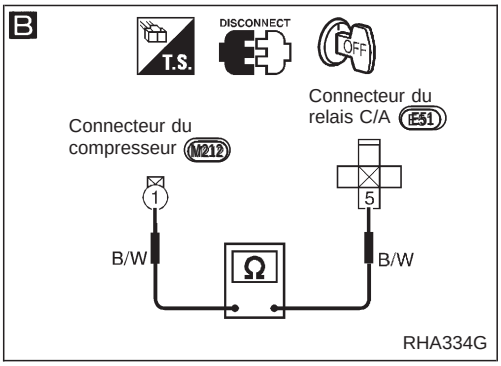
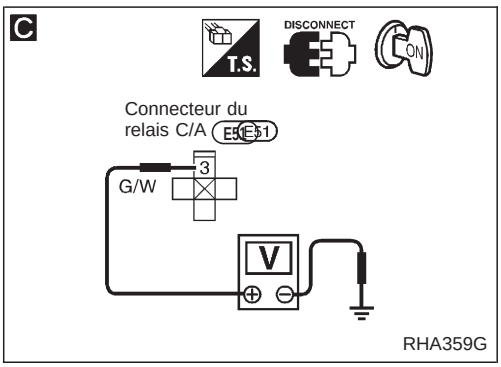
Procédure de diagnostic 2 (Suite)

POUR LES MOTEURS KA

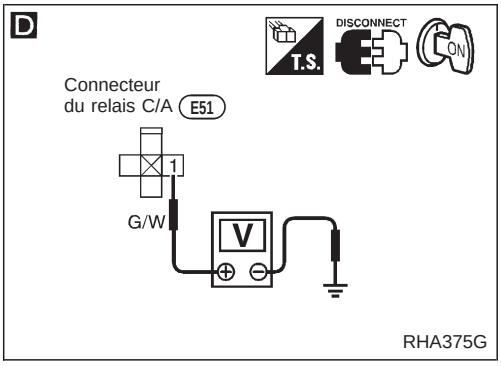


SYMPTOME : L'embrayage magnétique ne s'enclenche pas lorsque l'interrupteurs de climatiseur et le commutateur de ventilateur sont enclenchés.

- **Effectuer la VERIFICATION PRELIMINAIRE 1 avant de se reporter à l'organigramme suivant.**



A



B

C

D

A

VERIFIER L'ALIMENTATION ELECTRIQUE DU COMPRESSEUR.
Débrancher le connecteur de faisceau du compresseur.
Y a-t-il une tension d'environ 12 V entre la borne (1) du faisceau de compresseur et la masse de carrosserie ?

Oui → Vérifier les points suivants.
- Bobine d'embrayage magnétique
- Protecteur thermique

Mauvais → Remplacer l'embrayage magnétique. Se reporter à HA-0.

Non ↓

B

Vérifier la continuité du circuit entre la borne (5) du faisceau de relais de climatiseur et la borne (1) du faisceau de compresseur.
Il doit y avoir continuité.
Si le résultat est satisfaisant, vérifier que le faisceau n'est pas court-circuité.

Note

Bon ↓

C

VERIFIER L'ALIMENTATION ELECTRIQUE DU RELAIS DE CLIMATISEUR.
Y a-t-il une tension d'environ 12 V entre la borne (3) du faisceau de relais de climatiseur et la masse de carrosserie ?

Non → Vérifier le circuit de l'alimentation électrique et le fusible de 7,5A (n° 21, situé dans le boîtier à fusibles).
(se reporter à "DISPOSITION DE L'ALIMENTATION ELECTRIQUE" dans la section EL et à son schéma de câblage).

Oui ↓

D

VERIFIER L'ALIMENTATION ELECTRIQUE DU RELAIS DE CLIMATISEUR.
Y a-t-il une tension d'environ 12 V entre la borne (1) du faisceau de relais de climatiseur et la masse de carrosserie ?

Non → Vérifier le circuit de l'alimentation électrique et le fusible de 7,5A (n° 21, situé dans le boîtier à fusibles).
(se reporter à "DISPOSITION DE L'ALIMENTATION ELECTRIQUE" dans la section EL et à son schéma de câblage).

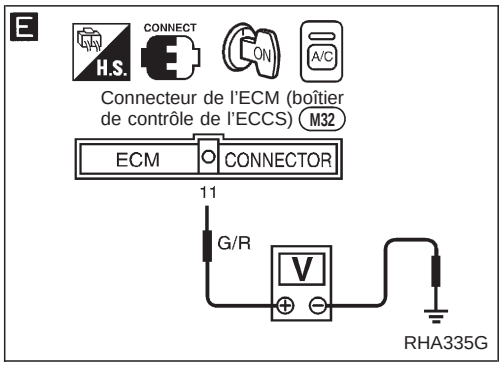
Oui ↓

VERIFIER LE RELAIS DE CLIMATISEUR APRES L'AVOIR DECONNECTE.
Se reporter à HA-0.

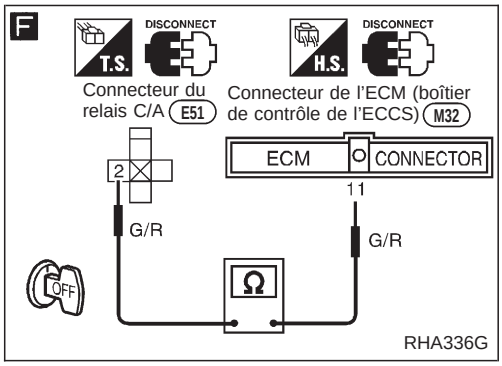
Mauvais → Remplacer le relais de climatiseur.

Bon ↓

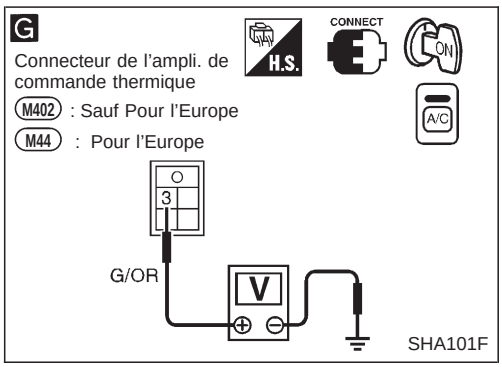
Reconnecter le relais de climatiseur.



↓



(A)
(Passer à la page suivante).



Remarque :
Si le résultat est mauvais après vérification de la continuité du circuit, réparer le faisceau ou le connecteur.

Procédure de diagnostic 2 (Suite)

Ⓐ

E

VERIFIER LE CIRCUIT COTE BOBINE DU RELAIS DE CLIMATISEUR.
Déconnecter le connecteur de faisceau de l'ECM (boîtier de contrôle de l'ECCS).
Y a-t-il une tension d'environ 12 V entre la borne ⑪ du faisceau de l'ECM (boîtier de contrôle de l'ECCS) et la masse de carrosserie ?

Non → **F** Note
Vérifier la continuité du circuit entre la borne ② du faisceau de relais de climatiseur et la borne ⑪ du faisceau de l'ECM (boîtier de contrôle de l'ECCS).
Il doit y avoir continuité.
Si le résultat est satisfaisant, vérifier que le faisceau n'est pas court-circuité.

Oui

Reconnecter le connecteur de faisceau de l'ECM (boîtier de contrôle de l'ECCS).

VERIFIER L'ALIMENTATION ELECTRIQUE ET LE CIRCUIT DE MASSE DE L'AMPLI. DE COMMANDE THERMIQUE.
Se reporter à HA-38.

Bon

G

VERIFIER LA TENSION DE L'AMPLI. DE COMMANDE THERMIQUE.
Y a-t-il une tension d'environ 5 V entre la borne ③ du faisceau de l'ampli. de commande thermique et la masse de carrosserie ?

Oui → Remplacer l'ampli. de commande thermique.

Non

H

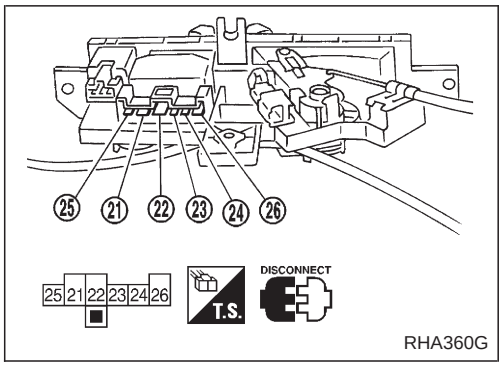
Vérifier la continuité du circuit entre la borne ③ du faisceau de l'ampli. de commande thermique et la borne ① du faisceau de manocontact triple.
Il doit y avoir continuité.
Si le résultat est satisfaisant, vérifier que le faisceau n'est pas court-circuité.

Bon

VERIFIER LE MANOCONTACT TRIPLE.
Se reporter à HA-0.

Mauvais → Remplacer le manocontact triple.

Bon



I Note
Vérifier la continuité du circuit entre la borne ㊶ du faisceau de l'ECM (boîtier de contrôle de l'ECCS) et la borne ④ du faisceau de manocontact triple.
Il doit y avoir continuité.
Si le résultat est satisfaisant, vérifier que le faisceau n'est pas court-circuité.

Bon

VERIFIER LE BOITIER DE CONTROLE DE L'ECCS.
Se reporter à la section EC.

Note :
Si le résultat est mauvais après vérification de la continuité du circuit, réparer le faisceau ou le connecteur.

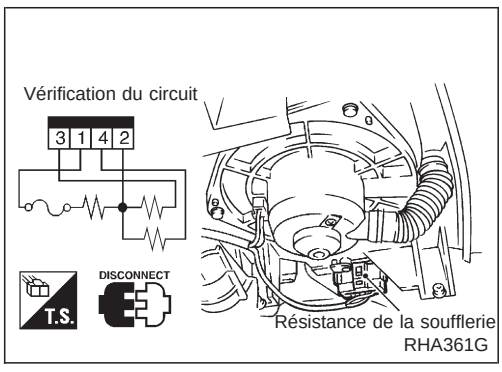
RHA360G

Inspection des composants électriques

COMMUTATEUR DE VENTILATEUR



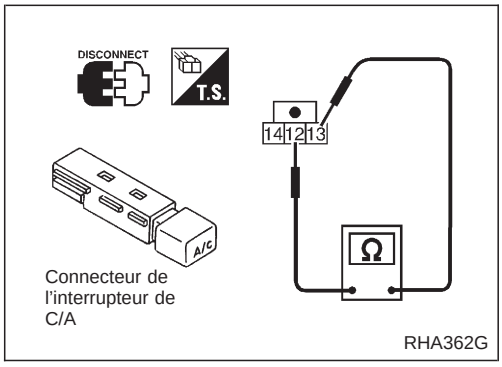
Vérifier la continuité entre les bornes à chaque position de la commande.

Position du curseur	Continuité entre les bornes
Arrêt	
1	㉔ — ㉖ — ㉕
2	㉓ — ㉖ — ㉕
3	㉒ — ㉖ — ㉕
4	㉑ — ㉖ — ㉕

MOTEUR DE SOUFFLERIE

S'assurer que le moteur de soufflerie tourne librement.

- S'assurer que l'intérieur de l'unité d'admission ne contient aucune particule étrangère.



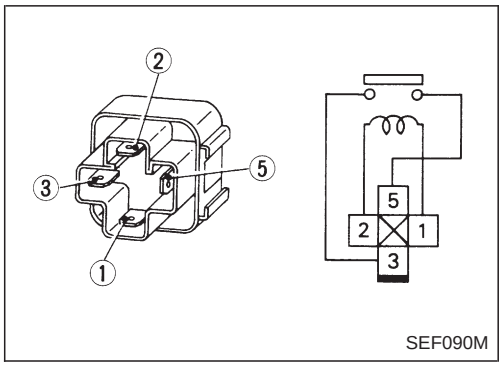
RHA361G

RESISTANCE DE SOUFFLERIE

Vérifier la résistance entre les bornes.

N° de borne		Résistance
⊕	⊖	
③	①	Environ 1,4 - 1,6Ω
④		Environ 2,5 - 2,8Ω
②		Environ 0,5 - 0,6Ω

RHA362G



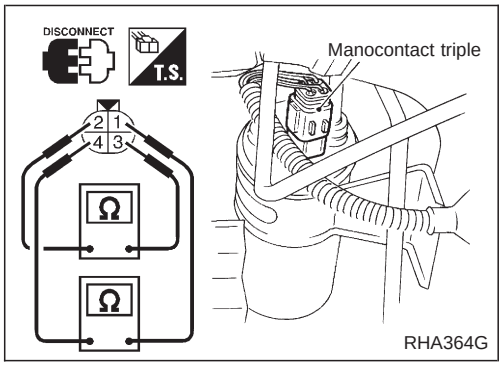
INTERRUPTEUR DE CLIMATISEUR

Vérifier la continuité entre les bornes à chaque position de la commande.

Condition de l'interrupteur	N° de borne		Continuité
C/A	⊕	⊖	
Marche	⑬	⑫	Oui
Arrêt			Non

Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection des composants électriques (Suite)



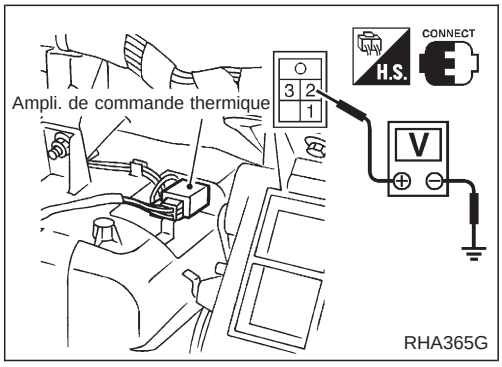
SEF090M

RELAIS DE CLIMATISEUR

Vérifier la continuité entre les bornes ③ et ⑤.

Conditions	Continuité
Alimentation en courant continu de 12 volts entre les bornes ① et ②	Oui
Pas d'alimentation	Non

Si le résultat n'est pas satisfaisant, remplacer le relais.



RHA364G

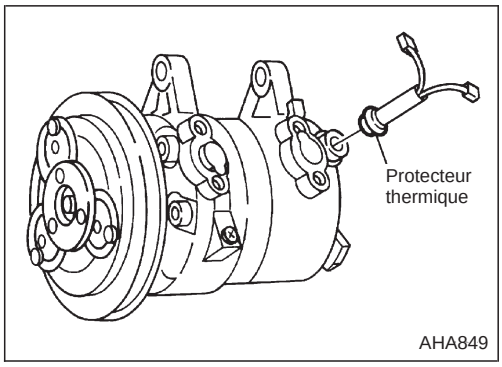
MANOCONTACT TRIPLE

	Bornes	Pression de la canalisation côté haute pression kPa (bar, kg/cm²)	Fonctionnement	Continuité
Côté basse pression	① - ④	Augmentant jusqu'à 152,0 - 201,0 (1,520 - 2,010, 1,55 - 2,05)	Marche	Existe.
		Diminuant jusqu'à 152,0 - 201,0 (1,520 - 2,010, 1,55 - 2,05)	Arrêt	N'existe pas.
Côté pression moyenne*	② - ③	Augmentant jusqu'à 1 422 - 1 618 (14,22 - 16,18, 14,5 - 16,5)	Marche	Existe.
		Diminuant jusqu'à 1 128 - 1 422 (11,28 - 14,22, 11,5 - 14,5)	Arrêt	N'existe pas.
Côté haute pression	① - ④	Diminuant jusqu'à 2 059 - 2 256 (20,6 - 22,6, 21 - 23)	Marche	Existe.
		Augmentant jusqu'à 2 648 - 2 844 (26,5 - 28,4, 27 - 29)	Arrêt	N'existe pas.

*Pour le fonctionnement du moteur de ventilateur de refroidissement

RHA365G

AMPLI. DE COMMANDE THERMIQUE



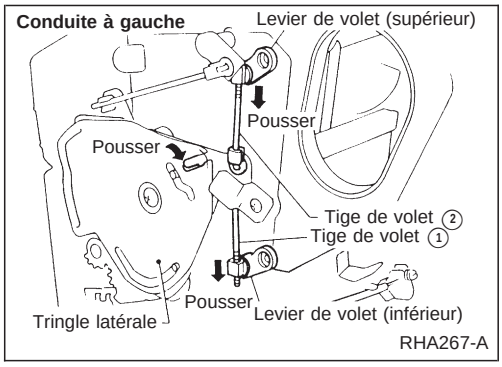
Température de l'air de sortie de l'évaporateur °C	Fonctionnement de l'ampli. thermique	Vérificateur
Diminuant jusqu'à 0,1 à 0,9	Mettre sur ARRET	Environ 12V
Augmentant jusqu'à 2,5 à 3,5	Mettre sur MARCHE	Environ 0V

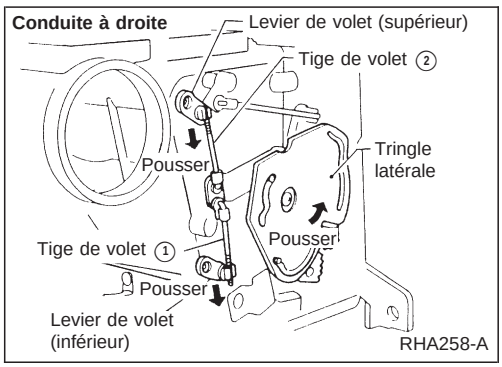
Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

Inspection des composants électriques (Suite)

PROTECTEUR THERMIQUE (pour DKV-14C)

Température du compresseur °C	Fonctionnement
Augmentant jusqu'à 145 - 155 environ	Mettre sur ARRET
Diminuant jusqu'à 130 - 140 environ	Mettre sur MARCHE



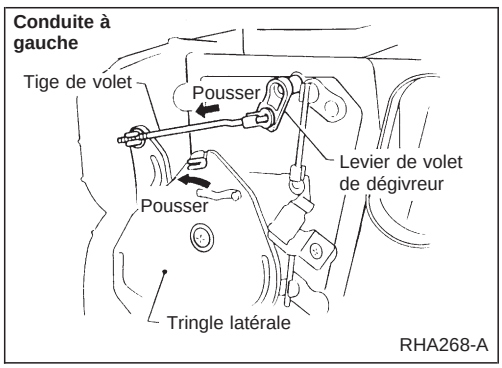


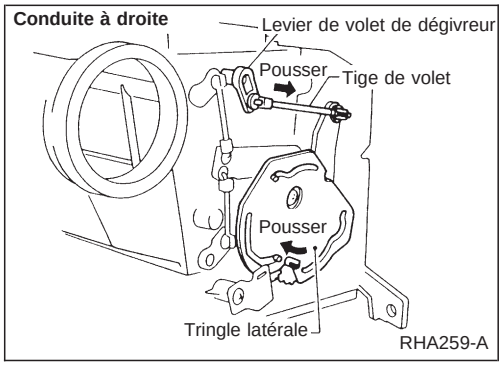
Réglage de la timonerie de commande

TIGE DE COMMANDE DU VOLET DE VENTILATEUR

- **Lors du réglage de la tige de commande du volet, débrancher tout d'abord le câble de commande du mode de la tringle latérale.**
  Rebrancher et réajuster le câble de commande du mode.

1. Déplacer la tringle latérale dans le sens de la flèche.
2. Tout en maintenant les leviers des volets inférieur et supérieur de ventilateur dans le sens de la flèche, connecter les tiges ① et ② aux leviers de volets de ventilateur correspondants, dans cet ordre.

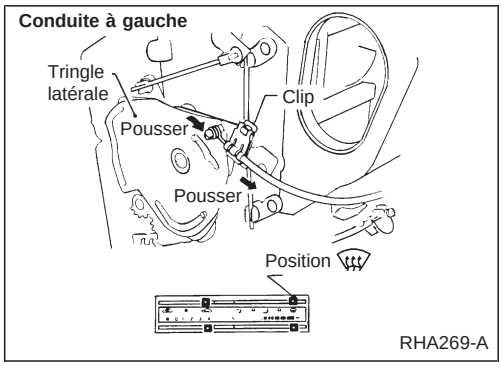




TIGE DE COMMANDE DU VOLET DE DEGIVREUR

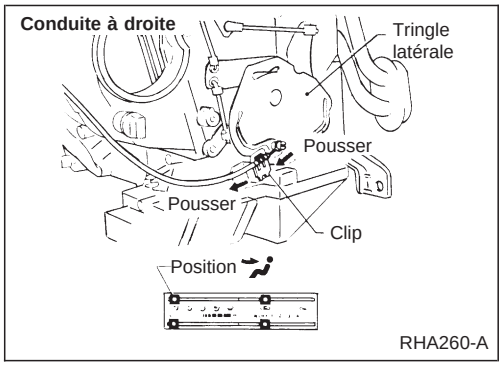
- **Lors du réglage de la tige de commande du volet, débrancher tout d'abord le câble de commande du mode de la tringle latérale.**
  Rebrancher et réajuster le câble de commande du mode.

1. Déplacer la tringle latérale dans le sens de la flèche.
2. Brancher la tige sur la tringle latérale tout en poussant le levier du volet de dégivreur dans le sens de la flèche.



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

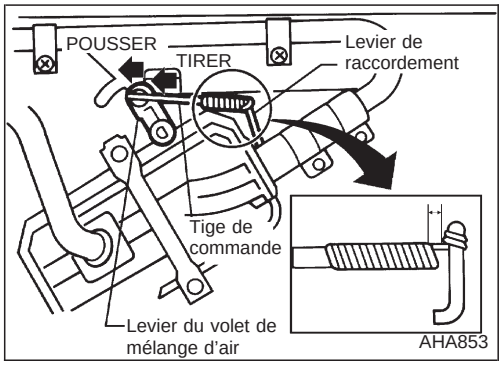
Réglage de la timonerie de commande (Suite)



CABLE DE COMMANDE DE MODE

Conduite à gauche

- Placer le curseur de réglage du mode sur la position . Régler la tringle latérale sur le mode dégivrage. (DEF)
  Tirer le câble externe dans le sens de la flèche, puis le serrer.
- **Après la repose du câble de commande de mode, vérifier qu'il fonctionne correctement.**



Conduite à droite

- Placer le curseur de réglage du mode sur la position . Régler la tringle latérale sur le mode aération au tableau de bord.
  Tirer le câble externe dans le sens de la flèche, puis le serrer.
- **Après la repose du câble de commande de mode, vérifier qu'il fonctionne correctement.**

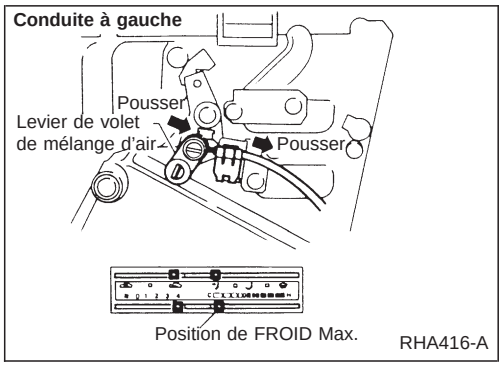
TIGE DE COMMANDE DE ROBINET D'EAU

Conduite à gauche et pour le Moyen-Orient

- **Lors du réglage de la tige de commande du robinet d'eau, débrancher tout d'abord le câble de commande de la température du levier du volet de mélange d'air, puis régler la tige de commande. Rebrancher le câble de commande de la température et le réajuster (se reporter à l'élément suivant).**

1. Pousser le levier de volet de mélange d'air dans le sens de la flèche.
2. Tirer la tige de commande du robinet d'eau dans le sens de la flèche de façon à créer un jeu d'environ 2 mm entre les extrémités de la tige et le levier de raccordement ; puis connecter la tige au levier de volet.

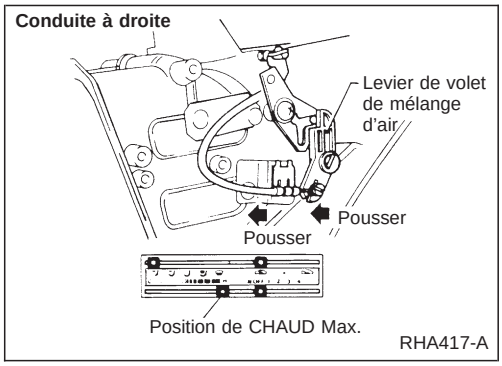
- **Après avoir connecté la tige de commande du robinet d'eau, vérifier qu'elle fonctionne correctement.**



Simpo PDF Merge and Split Unregistered Version - http://www.simpopdf.com

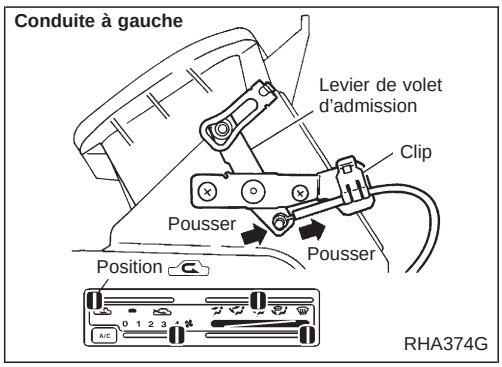
Réglage de la timonerie de commande (Suite)

CABLE DE COMMANDE DE LA TEMPERATURE



Conduite à gauche

- Placer le curseur de commande de la température sur la position de FROID maxi. Positionner le levier de mélange d'air en mode de froid maxi. Tirer le câble externe dans le sens de la flèche, puis le serrer.
- **Après la repose du câble de commande de température, vérifier qu'il fonctionne correctement.**



Conduite à droite
